13	1 Replace the affected HO2S. Refer to 6C1-3 Engine Management – V6 – Service Operations. Did you complete the replacement?	—	Go to Step 15	—
14	1 Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Did you complete the replacement?	—	Go to Step 15	—
15	1 Use Tech 2 to clear the DTCs. 2 Turn OFF the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame / Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 16

16	1 Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	—	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, clear all DTCs and verify correct operation				

7.13 DTC P0196, P0197 or P0198

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0196 – Engine Oil Temperature Sensor Range / Performance
- DTC P0197 – Engine Oil Temperature Voltage Low
- DTC P0198 – Engine Oil Temperature Voltage High

Circuit Description

The ECM applies a positive 5 V reference voltage to the engine oil temperature (EOT) sensor through the 5 V reference circuit and the ground through the low reference circuit.

The EOT sensor is a variable resistor that measures the temperature of the engine oil. This sensor provides signal voltage to the ECM that is proportional to the oil temperature off the engine.

The ECM monitors and compares the EOT sensor signal voltage against a specified range. An EOT sensor circuit DTC sets if the ECM detects the EOT sensor signal voltage is outside the specified range.

Conditions for Running the DTC

DTC P0196, P0197 and P0198 run continuously when the engine is running.

Conditions for Setting the DTC

DTC P0196

The ECM detects the engine oil temperature sensor is not within 100°C of the modelled temperature

NOTE

The modelled temperature is the temperature that the ECM expects to see given current engine operating conditions.

DTC P0197

The ECM detects the engine oil temperature is less than -35°C for longer than 3 seconds.

DTC P0198

The ECM detects the engine oil temperature is greater than 170°C for longer than 3 seconds.

Conditions for Clearing DTC

The EOT sensor circuit DTCs are Type C DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type C DTC sets and conditions for clearing Type C DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the EOT sensor operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.

- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

5 Test signal circuit of the EOT sensor. This circuit should display a voltage within the specified range.

6 Measures the integrity of the EOT sensor low reference circuit. Removal of the Fuse 29 enables the ECM to power down completely prior to the test procedure.

DTC P0196, P0197 or P0198 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	Test the engine cooling system for correct operation. Refer to 6B1 Engine Cooling – V6. Was any fault found and rectified?	Go to Step 11	Go to Step 3
3	Inspect the engine oil condition. Refer to 6A1 Engine Mechanical – V6. Was any fault found and rectified?	Go to Step 11	Go to Step 4
4	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0196, P0197 or P0198 fail this ignition cycle?	Go to Step 5	Refer to Additional Information in this DTC
5	1 Switch off the ignition. 2 Disconnect the EOT sensor wiring connector. 3 Switch on the ignition with the engine not running. 4 Using a digital multimeter, measure the voltage between the EOT sensor signal circuit and the ECM housing. Does the multimeter display 4.8 – 5.2 V?	Go to Step 6	Go to Step 7
6	1 Switch off the ignition. 2 Remove ECM / TCM Fuse 29 from the engine compartment fuse and relay panel assembly. 3 Using a digital multimeter, measure the resistance between the EOT sensor low reference circuit and the ECM housing. **NOTE** Install the ECM Fuse 29 to the engine compartment fuse and relay panel assembly after completing this test. Does the multimeter display 5 Ω?	Go to Step 9	Go to Step 8
7	Test EOT sensor signal circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 10

Step	Action	Yes	No
8	Test the EOT sensor low reference circuit for a high resistance and open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. **NOTE** The EOT sensor shares the low reference circuit with other sensors. A fault condition in the low reference circuit may trigger DTCs on sensors that share this circuit. Refer to 3 Wiring Diagrams and Connector Charts in this Section, to assist diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 10
9	Replace the EOT sensor. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 11	—
10	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 11	—
11	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the conditions for the engine oil pressure sensor circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 12
12	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0201 – Injector 1 Control Circuit Malfunction
- DTC P0202 – Injector 2 Control Circuit Malfunction
- DTC P0203 – Injector 3 Control Circuit Malfunction
- DTC P0204 – Injector 4 Control Circuit Malfunction
- DTC P0205 – Injector 5 Control Circuit Malfunction
- DTC P0206 – Injector 6 Control Circuit Malfunction
- DTC P0261 – Injector 1 Control Circuit Low Voltage
- DTC P0262 – Injector 1 Control Circuit High Voltage
- DTC P0264 – Injector 2 Control Circuit Low Voltage
- DTC P0265 – Injector 2 Control Circuit High Voltage
- DTC P0267 – Injector 3 Control Circuit Low Voltage

- DTC P0268 – Injector 3 Control Circuit High Voltage
- DTC P0270 – Injector 4 Control Circuit Low Voltage
- DTC P0271 – Injector 4 Control Circuit High Voltage
- DTC P0273 – Injector 5 Control Circuit Low Voltage
- DTC P0274 – Injector 5 Control Circuit High Voltage
- DTC P0276 – Injector 6 Control Circuit Low Voltage
- DTC P0277 – Injector 6 Control Circuit High Voltage

Circuit Description

The engine control relay applies ignition positive voltage to the fuel injector ignition circuit. The ECM applies a pulse width modulated (PWM) ground to the injector control circuit through a device within the ECM called a driver to control each fuel injector on time.

The driver has a feedback circuit that is pulled-up when the voltage is approximately 3.3 V. The ECM monitors the driver feedback circuit to determine if the control circuit is open, shorted to ground or shorted to a positive voltage.

A fuel injector control circuit DTC sets if the ECM detects a fault condition in a fuel injector control circuit.

Conditions for Running the DTC

Run continuously once the following conditions are met:

- the battery voltage is 10.0 – 16.0 V, and
- engine speed is greater than 80 rpm

Conditions for Setting the DTC

DTC P0201,P0202, P0203, P0204, P0205 or P0206

The ECM detects an open circuit fault condition in a fuel injector circuit.

DTC P0261, P0264, P0267, P0270, P0273 and P0276

The ECM detects a short to ground fault condition in the control circuit a fuel injector.

DTC P0262, P0265, P0268, P0271, P0274 and P0277

The ECM detects a short to voltage fault condition in the control circuit of a fuel injector.

Conditions for Clearing the DTC

The fuel injector control circuit DTCs are Type B DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type B DTC sets and conditions for clearing Type B DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the fuel injector operation.
- Using Tech 2, observe the appropriate fuel injector status parameter while wriggle testing related harness and connectors. Tech 2 reading will change from Ok to Fault if there is an intermittent fault condition in the harness or connector being tested.
- Perform the fuel injector coil test to help isolate an intermittent condition. Refer to 6.2 Fuel Injector Coil Test in this Section.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

3 Determines if there is a fault condition in the ignition voltage supply circuit. The fuel injectors for each bank of the engine are fused separately. If all DTCs for a single bank are set, there may be a fault in one of the ignition supply circuits.

5 Verifies the ECM is sending control voltage to the fuel injector.

6 Tests if the feed back voltage circuit within the ECM is providing the correct voltage.

DTC P0201 to P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 and P0277 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Using Tech 2, select the DTC display function. Does DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277 set?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Disconnect the fuel injector interconnect harness connector. Refer to 6C1-3 Engine Management – V6 – Service Operations. 2 Switch on the ignition with the engine not running. 3 Connect a test lamp between the ignition voltage circuit of the appropriate fuel injector, ECM side of the interconnect connector, and the ECM housing. Does the test lamp illuminate?	Go to Step 4	Go to Step 5
4	1 Switch on the ignition with the engine not running. 2 Using a digital multimeter, measure the voltage between the appropriate fuel injector control circuit, ECM side of the interconnect connector, and the ECM housing. Does the multimeter display 2.6 – 4.6 mV?	Go to Step 7	Go to Step 6
5	Repair the open circuit or short to ground fault condition in the ignition voltage circuit of the appropriate fuel injector. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures. Was the repair completed?	Go to Step 10	—
6	Test the control circuit of the appropriate fuel injector, between the interconnect connector and the ECM, for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 10	Go to Step 9

Step	Action	Yes	No
7	1 Remove the upper intake manifold. Refer to 6A1-Engine Mechanical – V6. 2 Test the control circuit and the ignition voltage circuit of the appropriate fuel injector, between the interconnect connector and the appropriate fuel injector connector, for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 10	Go to Step 8
8	Replace the appropriate fuel injector. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 10	—
9	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 10	—
10	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the fuel injector control circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 11
11	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.15 DTC P0219

DTC Descriptor

This diagnostic procedure supports DTC P0219 – Engine Overspeed Condition.

Circuit Description

The ECM continually monitors the engines operating environment. A engine over-speed condition DTC sets if the ECM detects an engine speed in excess of 7200 RPM.

NOTE

An over-speed condition will occur when a low gear on a manual transmission vehicle has been selected whilst the vehicle is travelling at high road speed. This DTC will not set if the engine is free-revved as the ECM will limit engine speed.

Conditions for Running the DTC

DTC P0219 runs continuously when the following conditions are met:

- The vehicle is fitted with a manual transmission
- The engine is running.
- The ignition voltage is between 10.0 – 16.0 V.

Conditions for Setting the DTC

The ECM detects an engine speed in excess of 7200 RPM for 1 second or longer.

Conditions for Clearing the DTC

The engine over-speed DTC is a Type C DTC. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type C DTCs set and conditions for clearing Type C DTCs.

Additional Information

- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P0219 Diagnostic Table

Step	Action	Yes	No
1	Has the diagnostic system check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 5 Using Tech 2, select the DTC display function. Does DTC P0219 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 4	—
4	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC P0219 fail this ignition cycle?	Go to Step 2	Go to Step 5
5	Using Tech 2, select the DTC display function. Are there any DTCs displayed?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.16 DTC P0300

DTC Descriptor

This diagnostic procedure supports the following DTC:

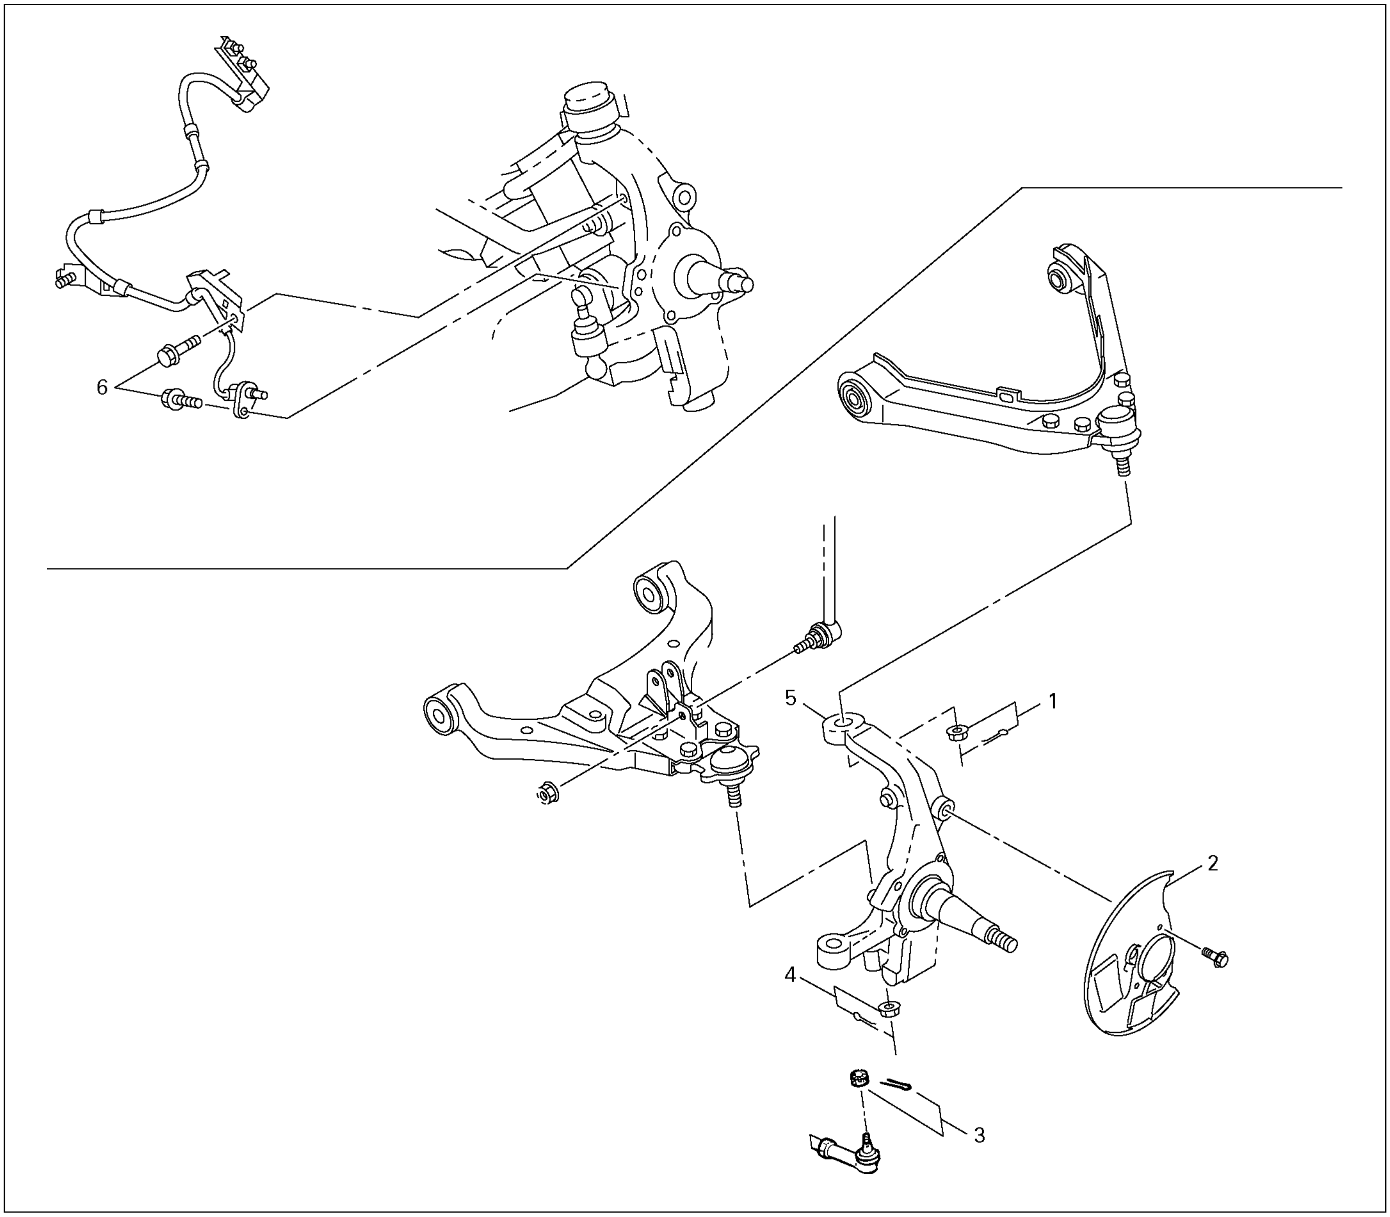
DTC P0300 Engine Misfire Detected.

Circuit Description

The engine control module (ECM) uses information from the crankshaft position (CKP) sensor and the camshaft position (CMP) sensors to determine when an engine misfire is occurring. By monitoring variations in the crankshaft rotation speed for each cylinder, the ECM is able to detect individual misfire events. A misfire rate that is high enough can cause

Knuckle

Knuckle and Associated Parts



Legend

(1) Nut and Cotter Pin
(2) Back Plate
(3) Nut and Cotter Pin
(4) Nut and Cotter Pin
(5) Knuckle
(6) Bolt

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the brake caliper. Refer to Disc Brakes in Brake section.
4. Remove the hub assembly. Refer to Front Hub and Disk in this section.
5. Remove tie-rod end from the knuckle. Refer to Power Steering Unit in Steering section.

3-way catalytic converter damage. The malfunction indicator lamp (MIL) will flash ON and OFF when the conditions for catalytic converter damage are present. DTCs P0301 through P0306 correspond to cylinders 1 through 6. If the ECM is able to determine that a specific cylinder is misfiring, the DTC for that cylinder will set. If the misfire rate is sufficient to cause emission levels to exceed a predetermined value, this DTC sets.

Conditions for Running the DTC

- DTCs P0121, P0122, P0123, P0221, P0222, P0223, P0335, P0336, or P0338 are not set.
- The engine speed is between 400 – 7,000 rpm and steady.
- The delivered torque signal is more than 10 percent at idle.
- The delivered torque signal is between 9 – 30 percent with the transmission in drive.
- The intake air temperature (IAT) is more than –30° C.
- The fuel level is more than 12 percent.
- The torque management is not active.
- DTC P0300 runs continuously when the above conditions exist for at least 1,000 engine revolutions.

Conditions for Setting the DTC

- The ECM detects a crankshaft rotation speed variation indicating a misfire rate sufficient to cause emissions levels to exceed mandated standards.
- The condition above exists for more than 4 seconds.

Action Taken When the DTC Sets

- The control module activates the MIL on the second ignition cycle that the diagnostic runs and fails.
- The control module records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive ignition cycle, the control module records the operating conditions at the time of the failure. The control module writes the operating conditions to the Freeze Frame and updates the Failure Records.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the malfunction indicator lamp (MIL) after four consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC, Last Test Failed, clears when the diagnostic runs and passes.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- Use Tech 2 to clear the MIL and the DTC.

Additional Information

- A misfire DTC could be caused by an excessive vibration from sources other than the engine. Inspect for the following possible sources:
  - A tyre or wheel that is out of round or out of balance
  - Variable thickness brake rotors
  - An unbalanced drive shaft
  - Certain rough road conditions
  - A damaged accessory drive component or belt
- A misfire DTC could be caused by a camshaft actuator stuck in the full advance or retard position.
- For an intermittent condition, refer to 5.2 Intermittent Fault Conditions in this Section.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2 This step determines if there is a current condition.

4 If the Misfire Current Counters are incrementing, but the engine is NOT misfiring, this indicates a mechanical condition. For example, an accessory drive belt could cause this condition.

DTC P0300 - Engine Misfire Detected

Step	Action	Yes	No
1	Has the Diagnostic System Check been completed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	**NOTE** The engine may only misfire when the engine is under a load. An engine load may be necessary to verify the condition. 1 Start the engine. 2 Use Tech 2 to monitor the Misfire Current Cyl 1 – 6 parameters. Are any of the Misfire Current Counters incrementing?	Go to Step 4.	Go to Step 3
3	1 Clear the DTC. 1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0300 fail this ignition cycle?	Go to Step 4	Refer to Additional Information in this Section
4	Is the engine misfiring?	Go to Step 5	Go to Symptoms Diagnostics in this Section
5	1 Observe the DTC information using Tech 2. Is DTC P0201-P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P0335, P0336, P0338, P0351-P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, or P2316 also set?	Go to the appropriate DTC Table in this Section	Go to Step 6
6	Is there an engine mechanical noise?	Go to Symptoms in 6A1 Engine Mechanical	Go to Step 7
7	Is there more than one cylinder specific misfire DTC set?	Go to Step 8	Go to DTC 301 – 306
8	Are there any heated oxygen sensor (HO2S) DTCs set?	Go to the appropriate DTC Table in this Section	Go to Step 9

Step	Action	Yes	No
9	1 Inspect or test for the following conditions: • Inspect the vacuum hoses for splits, kinks, and proper connections. • Inspect the throttle body and the intake manifold for vacuum leaks. • Inspect the crankcase ventilation valve and / or system for any vacuum leaks. • Test for the correct fuel pressure. Refer to 6C Fuel System – V6. • Inspect the fuel system for any restrictions, leaks or fuel contamination. Refer to 6C Fuel System – V6. • Inspect for fouled or damaged spark plugs. Determine what caused the spark plugs to foul. Refer to 6C1-3 Engine Management – Service Operations. • Inspect the exhaust system for restrictions. Refer to 6F Exhaust System – V6. • Inspect the engine control grounds for being clean, tight, and in the correct location. • Inspect for a camshaft actuator stuck in the full advance or retard position. 2 Repair as required. Did you find and correct the condition?	Go to Step 10	Go to Symptoms in 6A1 Engine Mechanical – V6
10	1 Use Tech 2 to clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the Conditions for Running DTC 300. Did the DTC fail this ignition?	Go to Step 2	Go to Step 11
11	1 Using Tech 2, select the DTC display function. Does Tech display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
	When all diagnosis and repairs are completed, clear all DTCs and verify correct operation		

7.17 DTC P0301, P0302, P0303, P0304, P0305 or P0306

DTC Descriptor

This diagnostic procedure supports the following DTCs:

- DTC P0301 – Cylinder 1 Misfire Detected
- DTC P0302 – Cylinder 2 Misfire Detected
- DTC P0303 – Cylinder 3 Misfire Detected
- DTC P0304 – Cylinder 4 Misfire Detected
- DTC P0305 – Cylinder 5 Misfire Detected
- DTC P0306 – Cylinder 6 Misfire Detected

Circuit Description

The engine control module (ECM) uses information from the crankshaft position (CKP) sensor and the camshaft position (CMP) sensor to determine when an engine misfire is occurring. By monitoring variations in the crankshaft rotation speed for each cylinder, the ECM is able to detect individual misfire events. A misfire rate that is high enough can cause 3-way catalytic converter damage. The malfunction indicator lamp (MIL) will flash ON and OFF when the conditions for catalytic converter damage are preset. DTCs P0301 – P0306 correspond to cylinders 1 to 6. If the ECM is able to determine that a specific cylinder is misfiring, the DTC for that cylinder sets.

Conditions for Running the DTC

- DTCs P0121, P0122, P0123, P0221, P0222, P0223, P0335, P0336, or P0338 are not set.
- The engine speed is between 400 – 7,000 rpm and steady.
- The delivered torque signal is more than 10 percent at idle with the transmission in neutral.
- The delivered torque signal is between 10 – 30 percent with the transmission in drive.
- The intake air temperature (IAT) is more than –30° C.
- The engine run time is more than 45 seconds.
- The fuel level is more than 12 percent.
- The torque management is not active.
- DTCs P0301, P0302, P0303, P0304, P0305, and P0306 run continuously when the above conditions exist for at least 1,000 engine revolutions.

Conditions for Setting the DTC

- The ECM detects a crankshaft rotation speed variation indicating a single cylinder misfire rate sufficient to cause emissions levels to exceed mandated standards.
- The condition exists for more than 4 seconds.

Action Taken When the DTC Sets

- The control module activates the MIL on the second ignition cycle that the diagnostic runs and fails.
- The control module records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive ignition cycle, the control module records the operating conditions at the time of the failure. The control module writes the operating conditions to the Freeze Frame and updates the Failure Records.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the malfunction indicator lamp (MIL) after four consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC, Last Test Failed, clears when the diagnostic runs and passes.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- Use Tech 2 to clear the MIL and the DTC.

Additional Information

- A misfire DTC could be caused by an excessive vibration from sources other than the engine. Check for the following possible sources:
  - Tyre or wheel out of round or balance
  - Variable thickness brake rotor or drum
  - Drive shaft not balanced
  - Certain rough road conditions

– Damaged accessory drive belt

- For an intermittent condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since a fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P0301, P0302, P0303, P0304, P0305 or P0306 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been completed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	Were you sent here from DTC P0300?	Go to Step 3	Go to 7.16 DTC P0300 in this Section
3	1 Ignition OFF. 2 Remove the ignition coil of the misfiring cylinder, but leave the electrical connector connected. Refer to 6C1-3 Engine Management – V6 – Service Operations. 3 Inspect the ignition coil boot for the following conditions: – Holes. – Tears. – Carbon tracking. – Oil contamination or water intrusion. Did you find a condition with the ignition coil boot?	Go to Step 12	Go to Step 4
4	1 Remove the fuel pump fuse from the under-hood fuse and relay centre. 2 Install the J 26792 Spark Tester to the ignition coil boot and a good ground. 3 Crank the engine while observing J 26792. Does the spark tester spark and is the spark consistent?	Go to Step 5	Go to Electronic Ignition System Diagnosis
5	1 Ignition OFF. 2 Remove the spark plug from the cylinder that indicated a misfire. 3 Inspect the spark plug. Refer to 6C1-3 Engine Management – V6 – Service Operations. Does the spark plug appear to be OK?	Go to Step 9	Go to Step 6
6	Is the spark plug oil or coolant fouled?	Inspect the spark plugs. Go to 6C1-3 Engine Management – V6 – Service Operations	Go to Step 7
7	Is the spark plug gas fouled?	Go to Step 10	Go to Step 9
8	Does the spark plug show any signs of being cracked, worn, or incorrectly gap?	Go to Step 11	Go to Step 9

Step	Action	Yes	No
9	1 Swap the suspected spark plug with another cylinder that is operating correctly. 2 Start the engine. 3 Operate the engine within the conditions that the misfire occurred. 4 Use Tech 2 to monitor the Misfire Current Counters. Did the misfire move with the spark plug?	Go to Step 11	Go to Step 10
10	**NOTE** • Make sure all the fuel injectors operate. High resistance in a fuel injector circuit causes the fuel injector to be inoperative without setting a fuel injector DTC. • Return to this diagnostic after you complete the Fuel Injector Coil Test. 1 Perform the fuel injector coil test. Refer to 6.2 Fuel Injector Coil Test in this Section. Did you find and correct the condition?	Go to Step 13	Go to 5 Symptoms Diagnostics in this Section
11	1 Replace the spark plug. Refer to 6C1-3 Engine Management – V6 – Service Operations. Did you complete the replacement?	Go to Step 13	—
12	1 Replace the ignition coil. Refer to 6C1-3 Engine Management – V6 – Service Operations. Did you complete the replacement?	Go to Step 13	—
13	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running DTC P0301 to P0306. Do any Cylinder Engine Misfire DTCs fail this ignition cycle?	Go to Step 2	Go to Step 14
14	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, clear all DTCs and verify correct operation			

7.18 DTC P0324

DTC Descriptor

This diagnostic procedure supports DTC P0324 – Knock Sensor Module Performance

Circuit Description

The ECM supplies the ground to the knock sensor (KS) low reference circuit. The KS produces a signal voltage, which is proportional to the level of the engine vibration or spark knock.

When the ECM detects an excessive spark knock, it retards the ignition timing until the spark knock stops.

The KS circuitry within the ECM receives, amplifies, filters and evaluates the KS signal voltage. The ECM performs the following tests to determine if the ECM internal KS circuitry is functioning correctly.

Test One

The ECM performs the following:

1 Turns off the knock sensor signal circuits.

2 Applies different test signals to the ECM internal KS circuitry.

3 Verifies each test signal output response is within range.

4 If the ECM detects any of the tested signals are not within the normal range, DTC P0324 sets.

Test Two

The ECM performs the following:

1 Turns off the knock sensor signal circuits.

2 Tests for any output response when no test signals are applied.

3 If the ECM detects an output response, DTC P0324 sets.

Test Three

1 Turns off the knock sensor signal circuits.

2 Generates an internal test pulse then monitors the return signal.

3 If the return test pulse is less than a calibrated threshold, DTC P0324 sets.

DTC P0324 sets if the ECM detects an incorrect response to the ECM internal KS circuitry tests.

Conditions for Running the DTC

Condition One

Runs continuously once the following conditions are met:

- The ECM is controlling the ignition spark.
- The engine speed is less than 2,300 rpm and steady.
- The volumetric efficiency is steady.

Condition Two

Runs continuously once the following conditions are met:

- The ECM is controlling the ignition spark.
- The engine speed is 1,000 – 4,000 rpm
- The engine coolant temperature is greater than 60° C.
- The volumetric efficiency is steady.

Condition Three

Runs continuously once the following conditions are met:

- The ECM is controlling the ignition spark.
- The engine speed is less than 2,300 rpm and steady.
- The engine coolant temperature is greater than 40° C.
- The volumetric efficiency is steady.

Conditions for Setting the DTC

The ECM detects an incorrect response to an internal ECM KS circuitry test.

Conditions for Clearing the DTC

DTC P0324 – Knock Sensor (KS) Module Performance is a Type B DTC. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type B DTC sets and conditions for clearing Type B DTC.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the knock sensor (KS) system operation.
- The ECM turns off the KS signal circuits when performing the ECM internal KS circuitry tests. DTC P0324 sets if there is a fault condition in the internal ECM KS circuitry. Therefore, the KS and the KS signal circuits are not tested in DTC P0324 Diagnostic Table.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following number refers to the step number in the diagnostic table:

3 A crankshaft sensor DTC may trigger DTC P0324.

DTC P0324 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0324 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Are DTCs relating to the CKP Sensor Circuit also set?	Refer to 7.20 DTC P0335, P0336, P0337 or P0338 in this Section	Go to Step 4
4	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 5	—
5	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running DTC P0324. Does DTC P0324 fail this ignition cycle?	Go to Step 2	Go to Step 6
6	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.19 DTC P0327, P0328, P0332 or P0333

DTC Descriptor

This diagnostic procedure supports the following DTCs:

- DTC P0327 – Knock Sensor Circuit Low Frequency (Bank 1)
- DTC P0328 – Knock Sensor Circuit High Frequency (Bank 1)
- DTC P0332 – Knock Sensor Circuit Low Frequency (Bank 2)
- DTC P0333 – Knock Sensor Circuit High Frequency (Bank 2)

Circuit Description

The ECM supplies the ground to the knock sensor (KS) low reference circuit. The KS produces a signal voltage, which is proportional to the level of the engine vibration or spark knock.

When the ECM detects an excessive spark knock, it retards the ignition timing until the spark knock stops.

To differentiate between a normal engine vibration and the vibration created by a spark knock, the ECM samples the KS signal under different engine speeds and load condition. The ECM uses this samples to determine maximum and minimum KS signal voltage produced when the engine is running under normal conditions.

A knock sensor circuit DTC sets if the ECM detects the KS signal voltage is outside the normal range.

Conditions for Running the DTC

DTC P0327 and P0332

Run continuously once the following conditions are met:

- DTCs P0324, P0335, P0342 and P0343 ran and passed.
- The ECM controls the ignition spark.
- Engine speed is greater than 2000 rpm and steady.
- The engine coolant temperature is greater than 60ºC.
- The volumetric efficiency is steady.

DTC P0328 or P0333

Run continuously once the following conditions are met:

- The ECM controls the ignition spark.
- Engine speed is greater than 2,000 rpm and steady.
- The engine coolant temperature is greater than 60°C.
- The volumetric efficiency is steady.

Conditions for Setting the DTC

DTC P0327 and P0332

The ECM detects the KS signal voltage is less than the minimum KS signal normal range for at least 10 seconds.

DTC P0328 and P0333

The ECM detects the KS signal voltage is greater than the maximum KS signal normal range.

Conditions for Clearing DTC

The knock sensor circuit DTCs are Type B DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type B DTC sets and conditions for clearing Type B DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the knock sensor (KS) system operation.
- Preconditions for running knock sensor circuit DTCs requires that DTC P0324 has ran and passed. Therefore, the diagnostic table for the knock sensor circuit DTCs is developed with the assumption the ECM internal KS circuitry is functioning correctly.
- Excessive engine mechanical noise or engine knocking condition may trigger knock sensor circuit DTCs.
- The knock sensor must be tightened correctly. Refer to 6C1-3 Engine Management – V6 – Service Operations.
- The mounting between the knock sensor and engine must be free of burrs, casting flash and foreign material.
- The knock sensor head must be clear from hoses, brackets and engine wiring.
- If the knock sensor lead is damaged in any way, the sensor must be replaced.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

3 Identifies engine mechanical fault conditions that may trigger knock sensor circuit DTCs.

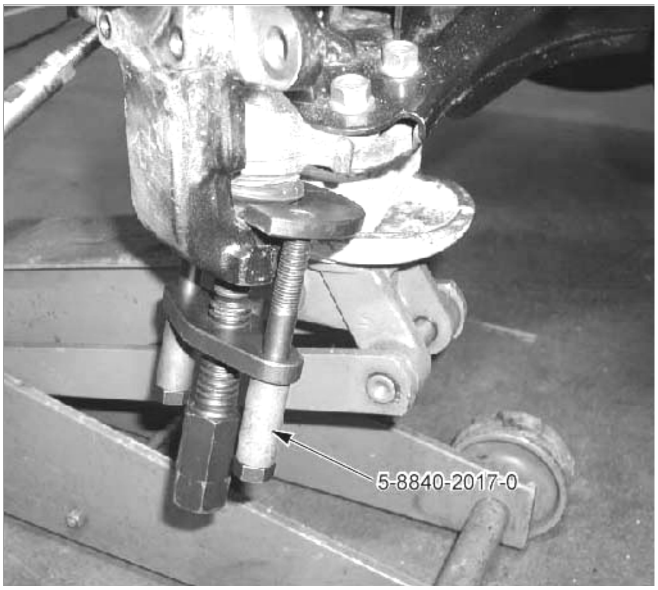
4 Identifies KS fault conditions that may trigger knock sensor circuit DTCs.

DTC P0327, P0328, P0332 and P0333 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0327, P0328, P0332 or P0333 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Check the engine for excessive mechanical engine noise or engine knocking fault condition. Refer to 6A1 Engine Mechanical – V6. Was any fault found and rectified?	Go to Step 7	Go to Step 4
4	Inspect the appropriate KS for the following fault condition. Refer to 6C1-3 Engine Management – V6 – Service Operations. • incorrect KS attaching bolt torque value, • burrs, casting flash or foreign material between the knock sensor and engine, • hoses, brackets or engine wiring touching the KS, and • damaged KS wiring harness. • sensor wiring harness for conditions that may induce electromagnetic interference. Refer to 5.2 Intermittent Fault Conditions in this Section. Was any fault found and rectified?	Go to Step 7	Go to Step 5

6. Remove the stabilizer link nuts. Right and left.
7. Remove the wheel speed sensor from the knuckle.
8. Remove back plate.
9. Remove lower ball joint by using remover 5-8840-2017-0.

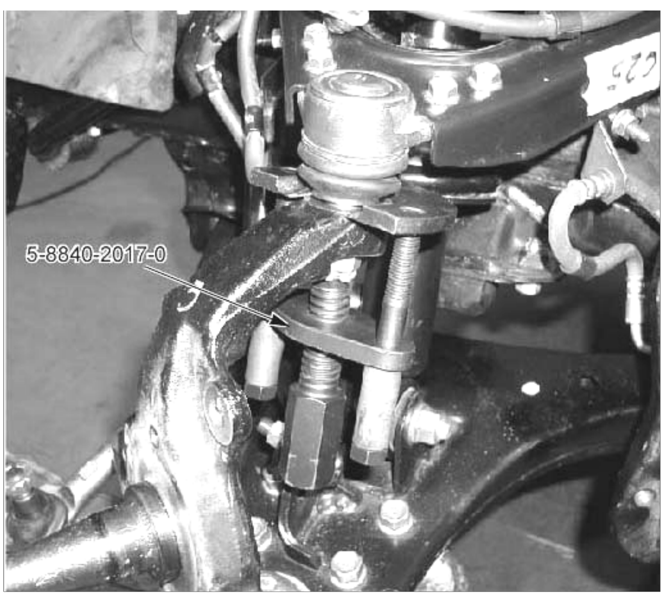
CAUTION: Be careful not to damage the ball joint boot.



P1010009

10. Remove upper ball joint by using remover 5-8840-2017-0.

CAUTION: Be careful not to damage the ball joint boot.



P1010011

11. Remove knuckle.

Inspection and Repair

Make the necessary adjustments or parts replacement if wear, damage, corrosion or any other abnormal condition is found during inspection.

Check the following parts:

- Knuckle
- Knuckle arm

Installation

1. Install knuckle assembly.
2. Install upper ball joint and tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

   Torque: 98 N·m (10.0 kgf·m/72 lb·ft)
3. Install lower ball joint and tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

   Torque: 147 N·m (15.0 kgf·m/108 lb·ft)
4. Install back plate.
5. Install wheel speed sensor.
6. Install stabilizer link nut. Right and left.

Step	Action	Yes	No
5	Test the appropriate KS signal circuit and low reference circuit for a high resistance, open circuit, short to ground or short to voltage or shorted together fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 7	Go to Step 6
6	Replace the faulty KS. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 7	—
7	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the knock sensor circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 8
8	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.20 DTC P0335, P0336, P0337 or P0338

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0335 – Crankshaft Position Sensor Circuit Malfunction
- DTC P0336 – Crankshaft Position Sensor Signal Range / Performance
- DTC P0337 – Crankshaft Position Sensor Circuit Low Duty Cycle
- DTC P0338 – Crankshaft Position Sensor Circuit High Duty Cycle

Circuit Description

The ECM applies the ground to the crankshaft position (CKP) sensor low reference circuit.

The CKP sensor in conjunction with the 58X reluctor wheel generates an AC signal voltage. The amplitude and frequency of the signal generated is proportional to the engine speed. The ECM uses this signal from the CKP sensor signal circuit to determine the engine rpm

In addition, the CKP sensor sends a signal to the ECM when piston No. 1 and piston No. 4 are at the top dead centre position. The ECM monitors both the CKP signal and the camshaft position (CMP) sensor signal to determine the compression stroke of piston No. 1.

A CKP sensor DTC sets if the ECM detects a fault condition in the CKP sensor signal circuit.

Conditions for Running the DTC

DTC P0335

Runs continuously once the following conditions are met:

- The engine is cranking or running.
- The ECM detects greater than 8 CMP sensor pulses.

DTC P0336

Runs continuously once the following conditions are met:

- DTCs P0341, P0342 and P0343 ran and passed.
- The engine is cranking or running.
- The ECM detects a valid CMP signal.

DTC P0337 and P0338

Runs continuously once the following conditions are met:

- DTCs P0341, P0342 and P0343 ran and passed.
- The engine is cranking or running.
- The ECM detects a valid CMP signal.

Conditions for Setting the DTC

DTC P0335

The ECM does not detect a signal from the CKP sensor for 5 seconds.

DTC P0336

The ECM loses the crankshaft reference position and has to re-synchronise the crankshaft to camshaft one or more times during six consecutive crankshaft revolutions.

DTC P0337

The ECM detects less than 58 reference signal pulses from the CKP sensor in the last eight consecutive crankshaft revolutions.

DTC P0338

The ECM detects more than 58 reference signal pulses from the CKP sensor in the last eight consecutive crankshaft revolutions.

Conditions for Clearing DTC

The CKP sensor circuit DTCs are Type B DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type B DTC sets and conditions for clearing Type B DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the CKP sensor operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- If the ECM has stored and learned the camshafts reference position, the ECM will utilise the camshaft position (CMP) sensor signal in place of the CKP signal when there is fault condition in the CKP circuit. This will enable the engine to operate in a limp mode when there is a CKP circuit fault condition.
- During a limp mode, the following DTCs may set and should be ignored.
  - DTC P0324 – Knock Sensor Module Performance
  - DTC P01011 – Intake Camshaft Position Actuator Park Position Bank 1
- The following fault condition may trigger DTC P0338:
  - Fault condition in the CMP sensor circuits.
  - Misaligned CKP sensor reluctor wheel or incorrect reluctor wheel installation.
  - Excessive crankshaft end play that alters the alignment of the reluctor wheel.
  - Obstruction between the CKP sensor and the reluctor wheel.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

3 The ECM supplies 2.5 V to signal circuit of the CKP sensor circuit to reduce the electro-magnetic interference (EMI). If the voltage is not within range, this indicates there is an ECM or an ECM circuit fault condition.

4 The ECM supplies 2.5 V to low reference circuit of the CKP sensor circuit to reduce the electro-magnetic interference (EMI). If the voltage is not within range, this indicates there is an ECM or an ECM circuit fault condition.

DTC P0335 to P0338 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Increase the engine speed to 1000 rpm for 30 seconds. 4 Using Tech 2, select the DTC display function. Does DTC P0335, P0336, P0337 or P0338 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Disconnect the CKP sensor connector. 2 Switch on the ignition with the engine not running. 3 Using a digital multimeter, measure the voltage between the signal circuit of the sensor connector and a good ground. Does the multimeter display 2 – 3 V?	Go to Step 4	Go to Step 7
4	Using a digital multimeter, measure the voltage between the CKP sensor low reference circuit and a good ground. Does the multimeter display 2 – 3 V?	Go to Step 5	Go to Step 7
5	Using a digital multimeter, measure the resistance between the ground shield circuit of the CKP sensor at the ECM connector and the ECM housing. Does the multimeter display 5 Ω?	Go to Step 6	Go to Step 7
6	Perform the following CKP sensor inspection: • Inspect the sensor wiring harness for conditions that may induce electromagnetic interference. Refer to 5.2 Intermittent Fault Conditions in this Section. • Inspect the sensor for incorrect sensor installation or incorrect attaching bolt torque value. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was any fault found and rectified?	Go to Step 11	Go to Step 9
7	Test the CKP sensor signal circuit and low reference circuit for a high resistance, open circuit, short to ground, short to voltage or shorted together fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 10

Step	Action	Yes	No
8	Repair the open or high resistance fault condition in the CKP sensor ground shield circuit. Refer to 8A Electrical - Body and Chassis for information on electrical repair procedures. Was the repair completed?	Go to Step 11	—
9	Replace CKP sensor. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 11	—
10	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 11	—
11	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the CKP sensor circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 12
12	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.21 DTC P0341, P0342 or P0343

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0341 – Intake Camshaft Position Sensor Range / Performance (Bank 1)
- DTC P0342 – Intake Camshaft Position Sensor Low Voltage (Bank 1)
- DTC P0343 – Intake Camshaft Position Sensor High Voltage (Bank 1)

Circuit Description

The ECM applies 5 V to the camshaft position (CMP) sensors through the 5 V reference and ground through the low reference circuit.

The CMP sensor is a Hall effect switch. In conjunction with a 4X reluctor wheel, the CMP sensors provide a signal voltage to the ECM. The ECM uses this signal voltage to determine the position of the camshafts.

The ECM compares the CMP signal voltage to the number of crankshaft revolutions. A CMP sensor DTC sets if the ECM detects a fault condition in the CMP sensor circuits.

Conditions for Running the DTC

The engine is running.

Conditions for Setting the DTC

DTC P0342

The ECM detects no pulses from the CMP sensor signal circuit and the CMP sensor signal voltage is low in correlation with the number of crankshaft revolutions.

DTC P0341

The ECM detects a signal from the CMP sensor signal circuit and the sensor signal range is not within the predetermined parameter or the when the CMP sensor does not correlate with the crankshaft position.

DTC P0343

The ECM detects no pulses from the CMP sensor signal circuit and the CMP sensor signal voltage is always high.

Conditions for Clearing the DTC

The CMP sensor circuit DTCs are Type B DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type B DTCs set and conditions for clearing Type B DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the CMP sensor operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

3 Tests the signal circuit of the CMP sensor. This circuit is pulled-up to about 5 V.

4 Measures the integrity of the CMP sensor low reference circuit. Removal of the ECM Fuse 29 enables the ECM to power down completely prior to the test procedure.

DTC P0341, P0342 or P0343 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Increase the engine speed to 1000 rpm for 30 seconds. 4 Using Tech 2, select the DTC display function. Does P0341, P0342, P0343 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Switch off the ignition. 2 Disconnect the appropriate CMP sensor wiring connector. 3 Switch on the ignition with the engine not running. 4 Using a digital multimeter, measure the voltage between the signal circuit of the appropriate CMP sensor and the ECM housing. Does the multimeter display 4.8 – 5.2 V?	Go to Step 4	Go to Step 7

Step	Action	Yes	No
4	1 Switch off the ignition. 2 Remove ECM Fuse 29 from the engine compartment fuse and relay panel assembly. 3 Using a digital multimeter, measure the resistance between the CMP sensor low reference circuit and the ECM housing. **NOTE** Install the ECM Fuse 29 to the engine compartment fuse and relay panel assembly after completing this test. Does the multimeter display 5 Ω?	Go to Step 5	Go to Step 8
5	Test the signal circuit of the CMP sensor for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 6
6	Perform the following CMP sensor inspection: • Inspect the sensor wiring harness for conditions that may induce electromagnetic interference. Refer to 5.2 Intermittent Fault Conditions in this Section. • Inspect the sensor for incorrect sensor installation or incorrect attaching bolt torque value. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Inspect the CMP sensor reluctor wheel for damage or conditions that causes misalignment. Was any fault found and rectified?	Go to Step 11	Go to Step 9
7	Test the CMP sensor 5 V reference circuit for a high resistance, open circuit, short to voltage or short to ground fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. **NOTE** Each CMP sensor shares a common 5 V reference circuit. A fault condition in the 5 V reference circuit may trigger DTCs on all CMP sensors. Refer to 3 Wiring Diagrams and Connector Charts in this Section, to assist diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 10
8	Test the CMP sensor low reference circuit for a high resistance or an open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. **NOTE** The CMP sensor shares the low reference circuit with other sensors. A fault condition in the low reference circuit may trigger DTCs on sensors that share this circuit. Refer to 3 Wiring Diagrams and Connector Charts in this Section, to aid diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 10
9	Replace the appropriate CMP sensor. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 11	—

Step	Action	Yes	No
10	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 11	—
11	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the CMP Sensor Circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 12
12	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0351 – Ignition Coil Cylinder 1 Circuit Malfunction
- DTC P0352 – Ignition Coil Cylinder 2 Circuit Malfunction
- DTC P0353 – Ignition Coil Cylinder 3 Circuit Malfunction
- DTC P0354 – Ignition Coil Cylinder 4 Circuit Malfunction
- DTC P0355 – Ignition Coil Cylinder 5 Circuit Malfunction
- DTC P0356 – Ignition Coil Cylinder 6 Circuit Malfunction
- DTC P2300 – Ignition Coil Cylinder 1 Circuit Low Voltage
- DTC P2301 – Ignition Coil Cylinder 1 Circuit High Voltage
- DTC P2303 – Ignition Coil Cylinder 2 Circuit Low Voltage
- DTC P2304 – Ignition Coil Cylinder 2 Circuit High Voltage
- DTC P2306 – Ignition Coil Cylinder 3 Circuit Low Voltage
- DTC P2307 – Ignition Coil Cylinder 3 Circuit High Voltage
- DTC P2309 – Ignition Coil Cylinder 4 Circuit Low Voltage
- DTC P2310 – Ignition Coil Cylinder 4 Circuit High Voltage
- DTC P2312 – Ignition Coil Cylinder 5 Circuit Low Voltage
- DTC P2313 – Ignition Coil Cylinder 5 Circuit High Voltage
- DTC P2315 – Ignition Coil Cylinder 6 Circuit Low Voltage
- DTC P2316 – Ignition Coil Cylinder 6 Circuit High Voltage

Circuit Description

The engine control relay applies positive voltage to the ignition voltage circuit of the ignition coil and the ignition coil dual line ground circuits are directly connected to ground.

The ECM applies control voltage to the control circuit of the ignition coil during the calculated dwell period that allows current flow to the ignition coil primary winding to generate a magnetic flux field. At the appropriate firing point, the ECM interrupts the control voltage applied to the ignition coil.

Interruption of voltage applied to the control circuit of the ignition coil primary winding induces the transfer of electrical energy from the ignition coil primary winding to the ignition coil secondary winding, which triggers the ignition coil to produce a spark at the spark plug.

An ignition coil control circuit DTC sets if the ECM detects a fault condition in the control circuit of an ignition coil.

Conditions for Running the DTC

Run continuously once the following conditions are met:

- The engine is running.
- The engine speed is 480 – 5,000 rpm
- The battery voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

DTC P0351, P0352, P0353, P0354, P0355 or P0356

The ECM detects an open circuit fault condition in the ignition coil control circuit.

DTC P2300, P2303, P2306, P2309, P2312 or P2315

The ECM detects a short to ground fault condition in the ignition coil control circuit.

DTC P2301, P2304, P2307, P2310, P2313 and P2316

The ECM detects a short to voltage fault condition in the ignition coil control circuit.

Conditions for Clearing the DTC

The ignition coil control circuit DTCs are Type B DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type B DTC sets and conditions for clearing Type B DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the ignition coil operation.
- A short to voltage fault condition damages the ignition coil. Do not replace the ignition until this fault condition is rectified.
- The ignition coils for each bank of the engine are fused separately. If all DTCs for a single bank are set, there may be a fault in one of the ignition supply circuits.
- The ignition coils for each bank of the engine have a separate ground connections. If all DTCs for a single bank are set, there may be a fault in one of the ground circuits.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

3 Determines if there is a fault condition in the ignition voltage supply circuit.

5 Determines if there is a fault condition in the ground circuits of the ignition coil.

6 Tests if the ECM is commanding the ignition coil on and off.

DTC P0351 to P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Using Tech 2, select the DTC display function. Does DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2037, P2309, P2310, P2312, P2313, P2315 or P2316 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Disconnect the wiring connector of the appropriate ignition coil. 2 Switch on the ignition with the engine not running. 3 Connect a test lamp between the ignition voltage circuit of the appropriate ignition coil connector and the ECM housing. Does the test lamp illuminate?	Go to Step 4	Go to Step 6
4	Connect a test lamp between a 12 V and each of the ground circuits of the ignition coil connector. Does the test lamp illuminate?	Go to Step 5	Go to Step 7
5	1 Start the engine. 2 Using a digital multimeter, measure the frequency at the control circuit of the ignition coil. Does the multimeter display 3 – 20 Hz?	Go to Step 9	Go to Step 8
6	Repair the high resistance or open circuit fault condition at the ignition voltage circuit of the ignition coil. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures. Was the repair completed?	Go to Step 11	—
7	Repair the high resistance or open circuit fault condition at the ignition coil ground circuits. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures. Was the repair completed?	Go to Step 11	—
8	Test the appropriate ignition coil control circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 10
9	CAUTION **A short to voltage fault condition damages the ignition coil. Do not replace the ignition until this fault condition is rectified.** Replace the faulty ignition coil. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 11	—

Step	Action	Yes	No
10	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 11	—
11	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the ignition coil control circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 12
12	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.23 DTC P0420 or P0430

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0420 Catalyst System Low Efficiency Bank 1
- DTC P0430 Catalyst System Low Efficiency Bank 2

Circuit Description

To maintain a reasonably low emission level of hydrocarbons (HC), carbon monoxide (CO), and oxides of nitrogen (NOx) a 3-way catalytic converter (TWC) is used. The catalyst within the converter promotes a chemical reaction that oxidizes the HC and CO present in the exhaust gas. This reaction converts the gases into harmless water vapour and carbon dioxide. The catalyst also reduces the NOx, converting the NOx into nitrogen. The engine control module (ECM) monitors this process using the post catalyst heated oxygen sensor (HO2S) signal. The post-catalyst HO2S located in the exhaust stream after the TWC, produces an output signal that indicates the oxygen storage capacity of the catalyst. The oxygen storage capacity (OSC) determines the ability of the catalyst to convert the exhaust emissions effectively. If the catalyst is functioning correctly, the post-catalyst HO2S signal will be far less active than the signal produced by the pre-catalyst HO2S.

To determine OSC, the ECM commands a rich air / fuel mixture until all oxygen is removed from the catalyst. The ECM then commands a lean air / fuel mixture and monitors the rear heated oxygen sensors to calculate the oxygen storage capacity. The catalyst is operated in this mode until one of the following conditions occur:

- The oxygen stored in the catalyst exceeds a calibrated threshold, which is determined from the rear HO2S signal.
- The rear HO2S indicates the catalyst to be completely saturated with oxygen, which is determined from the rear HO2S signal.

If the ECM detects the average OSC is less than a threshold, this DTC sets. This indicates that the TWC oxygen storage capacity is below a threshold considered acceptable.

Conditions for Running the DTC

- Before the ECM can report, the following DTCs must run and pass:
  DTC P0420 or P0430 failed, DTCs P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0053, P0056, P0057, P0058, P0059, P0101, P0102, P0103, P0121, P0122, P0123, P0130, P0131, P0132, P0133, P0135, P0137, P0138, P0139, P0140, P0141, P0150, P0151, P0152, P0153, P0155, P0157, P0158, P0159, P0160, P0161, P0221, P0222, P0223, P0335, P0336, P0338, P167A, P167B, P2096, P2097, P2098, P2099, P2195, P2196, P2197, P2198, P2232, P2235, P2237, P2240, P2243, P2247, P2251, P2254, P2270, P2271, P2272, P2273, P2297, P2298, P2626, and P2629.
- The following DTCs are not set:
  DTCs P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0053, P0056, P0057, P0058, P0059, P0101, P0102, P0103, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0125, P0130, P0131, P0132, P0133, P0135, P0137, P0138, P0139, P0140, P0141, P0150, P0151, P0152, P0153, P0155, P0157,

3. Remove speed sensor harness nut.
4. Remove brake fluid hose nut.

P0158, P0159, P0160, P0161, P0221, P0222, P0223, P0300, P0301-P0306, P0443, P0458, P0459, P0496, P167A, P167B, P2096, P2097, P2098, P2099, P2100, P2101, P2107, P2119, P2122, P2123, P2127, P2128, P2138, P2176, P2177, P2178, P2179, P2180, P2187, P2188, P2189, P2190, P2195, P2196, P2197, P2198, P2232, P2235, P2237, P2240, P2243, P2247, P2251, P2254, P2270, P2271, P2272, P2273, P2297, P2298, P2626, and P2629.

- The engine speed is 1,040 – 3,000 rpm.
- The air flow into the engine is between 7.0 – 16.0 g/s and not changing more than 3.0 g/s
- The engine intake air temperature (IAT) at engine start-up is more than –30° C.
- The engine is operating for more than 7 minutes.
- The engine is operating in Closed Loop.
- The calculated TWC temperature is between 500 – 750° C and steady.
- The above conditions exist for approximately 17 minutes.
- DTCs P0420 and P0430 run once a drive cycle. The ECM will attempt to run this diagnostic up to three times a drive cycle.

Conditions for Setting the DTC

The ECM determines that the catalyst efficiency has degraded below a calibrated threshold for more than 4 seconds.

Action Taken When the DTC Sets

- The control module activates the malfunction indicator lamp (MIL) on the second consecutive ignition cycle that the diagnostic runs and fails.
- The control module records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive ignition cycle, the control module records the operating conditions at the time of the failure. The control module writes the operating conditions to the Freeze Frame and updates the Failure Records.

Conditions for Clearing the DTC

The EVAP Purge Solenoid Valve Control Circuit DTCs are Type B DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type B DTC sets and conditions for clearing Type B DTCs.

P0420 or P0430 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been completed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	Are any other DTCs set?	Go to the appropriate DTC Table in this Section	Go to Step 3
3	1 Inspect for the following conditions: • The catalytic converter is an original equipment part. • Inspect the exhaust system for leaks, damage, loose or missing hardware in the area from the converter to the heated oxygen sensor 2. • The HO2S 2 is secure and the wiring is not damaged or contacting the exhaust. Did you find and correct the condition?	Go to Step 5	Go to Step 4

Step	Action	Yes	No
4	**NOTE** Before replacing the 3-way catalytic converter (TWC), correct any conditions that may have damaged the converter. 1 Replace the catalytic converter. Refer to the appropriate procedure in 6F Exhaust System – V6. Did you complete the replacement?	Go to Step 5	—
5	1 Using Tech 2, clear the DTC/s. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the EVAP purge solenoid valve control circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 6
6	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, clear all DTCs and verify correct operation			

7.24 DTC P0443, P0458 or P0459

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0443 – Evaporative Emission Control System Purge Solenoid Circuit Malfunction
- DTC P0458 – Evaporative Emission Control System Purge Solenoid Circuit Low Voltage
- DTC P0459 – Evaporative Emission Control System Purge Solenoid Circuit High Voltage

Circuit Description

The Engine control relay applies ignition positive battery voltage to the evaporative emission (EVAP) purge solenoid.

Using a device called a driver, the ECM applies a pulse width modulated (PWM) ground to the EVAP solenoid control circuit to purge the fuel vapour from the EVAP canister into the intake manifold.

The driver has a feedback circuit that is pulled-up to a voltage. The ECM monitors the driver feedback circuit to determine if the control circuit is open, shorted to ground or shorted to a positive voltage.

An EVAP purge solenoid valve control circuit DTC sets if the ECM detects the voltage on the EVAP solenoid control circuit outside the predetermined range when the solenoid is commanded off.

Conditions for Running the DTC

DTC P0443 and P0458

Runs continuously once the following conditions are met:

- The engine speed is greater than 80 rpm
- The ignition voltage is 10.0 – 16.0 V.
- The ECM has commanded the EVAP Purge Solenoid Valve on and off at least once during the ignition cycle.

DTC P0459

Runs continuously once the following conditions are met:

- The engine speed is greater than 80 rpm
- The ignition voltage is 10.0 – 16.0 V.
- The fuel system is in closed loop.
- The engine speed is above idle.
- The engine is at operating temperature.
- The ECM has commanded the EVAP Purge Solenoid Valve on and off with a duty cycle of greater than 2.5%.

Conditions for Setting the DTC

DTC P0443

The ECM detects the voltage on the EVAP solenoid control circuit is not within the predetermined range when the solenoid is commanded off.

DTC P0458

The ECM detects the voltage on the EVAP solenoid control circuit is less than 2.6 V when the solenoid is commanded off.

DTC P0459

The ECM detects the voltage on the EVAP solenoid control circuit is greater than 4.6 V when the solenoid is commanded on.

Conditions for Clearing the DTC

The EVAP Purge Solenoid Valve Control Circuit DTCs are Type B DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type B DTC sets and conditions for clearing Type B DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the EVAP Purge Solenoid Valve operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following number refers to the step number in the diagnostic table:

4 Tests the feedback voltage from the ECM.

DTC P0443, P0458 or P0459 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section

Step	Action	Yes	No
2	1 Switch off the ignition for 30 seconds. 2 Allow the engine to reach the normal operating temperature or operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0443, P0458 or P0459 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Disconnect the EVAP solenoid valve wiring connector. 2 Switch on the ignition with the engine not running. 3 Connect a test lamp between the EVAP solenoid valve ignition voltage circuit and the ECM housing. Does the test lamp illuminate?	Go to Step 4	Go to Step 5
4	1 Switch on the ignition with the engine not running. 2 Using a digital multimeter, measure the voltage between the EVAP solenoid valve control circuit and the ECM housing. Does the multimeter display 2.6 – 4.6 V?	Go to Step 7	Go to Step 6
5	Repair the high resistance, open circuit or short to ground fault condition at the EVAP solenoid valve ignition voltage circuit. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures Was the repair completed?	Go to Step 9	—
6	Test the control circuit of the EVAP solenoid valve for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 9	Go to Step 8
7	Replace the EVAP solenoid valve. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 9	—
8	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 9	—
9	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the EVAP purge solenoid valve control circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 10
10	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.25 DTC P0460, P0461, P0462 or P0463

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0460 – Fuel Level Sensor Range / Performance

- DTC P0461 – Fuel Level Sensor Range / Performance
- DTC P0462 – Fuel Level Sensor Low Voltage
- DTC P0463 – Fuel Level Sensor High Voltage

Circuit Description

The fuel level sensor changes resistance based on the fuel level in the fuel tank. The engine control module (ECM) monitors changes in the resistance of the sensor to determine the fuel level. This information is then sent to the instrument cluster via the GM LAN serial data circuit.

When the fuel tank is full, the sensor resistance is high and the ECM senses high signal voltage. When the fuel tank is empty, the sensor resistance is low and the ECM senses a low signal voltage.

When the ECM senses a signal voltage outside the normal operating range of the sensor, a fuel level sensor DTC will set.

Conditions for Running the DTC

The ignition is on.

Conditions for Setting the DTC

DTC P0461

The ECM detects that greater than 170 km have been accumulated and the fuel level in the fuel tank has not changed by at least 3.0 litres.

DTC P0462

The ECM detects the fuel level signal voltage is less than 0.5 V for 20 seconds.

DTC P0463

The ECM detects the fuel level signal voltage is greater than 4.5 V for 20 seconds.

Conditions for Clearing the DTC

The fuel level sensor circuit DTCs are Type C DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type C DTCs set and conditions for clearing Type C DTCs.

Additional Information

- Refer to 8A Electrical-Body and Chassis for further information on the fuel gauge system.
- Depending on the current fuel level, it may be difficult to locate a malfunctioning sending unit. The malfunction may only occur when the fuel level is full or near empty. The fuel sender unit may need to be removed for further diagnosis. A fuel level sensor that has an intermittent condition may cause a DTC to set. Remove the fuel level sensor to test the resistance of the sensor, refer to 6C Fuel System – V6 for this procedure. Replace the sensor if the resistance is not within the specified range.
- The following may occur with a fuel level sensor DTC set:
  - The vehicle fuel gauge displays empty.
- Since a fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P0461, P0462 or P0463 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC or road test the vehicle under various driving condition. 3 Using Tech 2, select the DTC display function. Does DTC P0461, P0462, P0463 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Switch off the ignition. 2 Disconnect the fuel level sensor wiring connector. 3 Switch on the ignition with the engine not running. 4 Using a digital multimeter, measure the voltage between the fuel level signal circuit and the ECM housing. Does the multimeter indicate 4.8 – 5.2 V?	Go to Step 4	Go to Step 5
4	1 Switch off the ignition. 2 Remove ECM Fuse F29 from the engine compartment fuse and relay panel assembly. 3 Using a digital multimeter, measure the resistance between the fuel level sensor low reference circuit and the ECM housing. **NOTE** Install the ECM Fuse F29 to the engine compartment fuse and relay panel assembly after completing this test. Does the multimeter indicate less than 5 Ω?	Go to Step 7	Go to Step 6
5	Test the fuel level sensor signal circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 9	Go to Step 8
6	Test the fuel level sensor low reference circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 9	Go to Step 8
7	Replace the fuel level sensor. Refer to 6C Fuel System – V6s. Was the repair completed?	Go to Step 9	–
8	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 9	–
9	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Do any fuel level sensor DTCs fail this ignition cycle?	Go to Step 2	Go to Step 10

Step	Action	Yes	No
10	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.26 DTC P0480, P0691 or P0692

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0480 – Cooling Fan Relay 1 Circuit Malfunction
- DTC P0691 – Cooling Fan Relay 1 Circuit Low Voltage
- DTC P0692 – Cooling Fan Relay 1 Circuit High Voltage

Circuit Description

The engine control relay applies ignition positive battery voltage to the ignition circuit of the engine cooling fan relay 1 and relay 2. Using a device called a driver, the ECM performs the following tasks:

- grounds the engine cooling fan relay 1 control signal circuit to operate the small engine cooling fan, or
- grounds the engine cooling fan relay 2 control signal circuit to operate both the small engine cooling fan and the large engine cooling fan.

The driver has a feedback circuit that is pulled-up to a voltage. The ECM monitors the driver feedback circuit to determine if the control circuit is open, shorted to ground or shorted to a positive voltage.

A cooling fan relay control circuit DTC sets if the ECM detects a fault condition in the engine cooling fan relay control circuit.

Conditions for Running the DTC

Run continuously once the following conditions are met:

- the ignition voltage is 10 – 16 V,
- the engine speed is greater than 40 rpm, and
- the ECM driver transitions from on to off or from off to on.

Conditions for Setting the DTC

DTC P0480

The ECM detects an open circuit fault condition in the control circuit of the engine cooling fan relay 1.

DTC P0691

The ECM detects a short to ground fault condition in the control circuit of the engine cooling fan relay 1.

DTC P0692

The ECM detects a short to voltage fault condition in the control circuit of the engine cooling fan relay 1.

Conditions for Clearing DTC

The cooling fan relay control circuit DTCs are Type B DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type B DTCs set and conditions for clearing Type B DTCs.

Additional Information

- Refer to 6B1 – Engine Cooling – V6 for details of the engine cooling fan operation.

- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical-Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P0480, P0691 & P0692 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Allow the engine to reach the normal operating temperature. 4 Increase the engine speed to 2,000 rpm for 10 seconds or operate the vehicle within the conditions for setting the DTC. 5 Using Tech 2, select the DTC display function. Does DTC P0480, P0691 or P0692 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Remove the appropriate engine cooling fan relay. Refer to 8A Electrical-Body and Chassis. 2 Connect a test lamp between the ignition voltage circuit of the engine cooling fan relay and the ECM housing. 3 Switch on the ignition with the engine not running. Does the test lamp illuminate?	Go to Step 4	Go to Step 5
4	1 Switch off the ignition. 2 Connect a test lamp between the control circuit of the appropriate engine cooling fan relay and a 12 V. 3 Switch on the ignition with the engine not running. 4 Using Tech 2, command the appropriate engine cooling fan relay on and then off. Does the test lamp turn on and off when the engine cooling fan relay is commanded on and off?	Go to Step 7	Go to Step 6
5	Repair the high resistance or open circuit fault condition in the ignition voltage circuit of the engine cooling fan relay. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures. Was the repair completed?	Go to Step 9	—
6	Test the engine cooling fan relay control circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 9	Go to Step 8
7	Replace the faulty engine cooling fan relay. Refer to 8A Electrical-Body and Chassis. Was the repair completed?	Go to Step 9	—

Step	Action	Yes	No
8	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 9	—
9	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the cooling fan relay control circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 10
10	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.27 DTC P0500

DTC Descriptor

This diagnostic procedure supports DTC P0500 – Vehicle Speed Sensor Circuit Malfunction (Manual Transmission).

Circuit Description

Vehicle speed information is provided to the engine control module (ECM) by the vehicle speed sensor (VSS). The ignition control relay applies ignition positive voltage to the VSS, and the ground circuit of the VSS is directly connected to ground.

The VSS is a Hall effect switch. In conjunction with an 18 tooth reluctor wheel, the VSS provide a signal voltage to the ECM. The ECM uses this signal voltage to determine vehicle speed.

If the ECM detects no vehicle speed, while other sensors indicate that the vehicle is moving, then DTC P0500 sets.

Conditions for Running the DTC

Runs once the following conditions are met:

- The engine coolant temperature is greater than 40º C,
- the ECM is in fuel shut-off mode, and
- the engine speed is between 1,520 and 3,520 rpm

Conditions for Setting the DTC

The ECM detects a speed of less than 0 km/h for 8 seconds continuously, or 50 seconds cumulative.

Conditions for Clearing the DTC

The vehicle speed sensor circuit malfunction DTC is a Type C DTC. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type C DTCs set and conditions for clearing Type C DTCs.

Additional Information

- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Refer to 6C1-1 Engine Management – V6 – General Information for details on:
  - VSS operation, and
  - fuel shut-off mode.

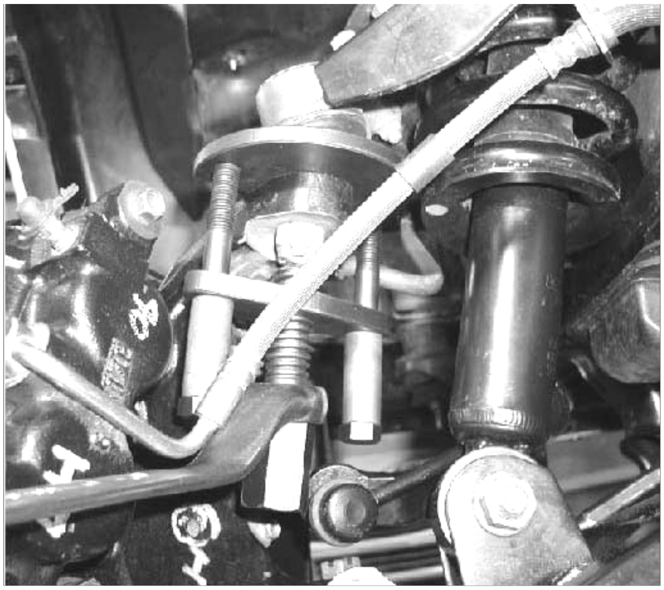
- Refer to 7B1 Manual Transmission – V6 for VSS replacement procedures.
- Since a fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P0500 Diagnostic Table

Step	Action	Yes	No
1	Has the diagnostic system check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0500 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Switch off the ignition. 2 Disconnect the wiring connector from the VSS. 3 Connect a test lamp between the ignition circuit of the VSS and ground. 4 Switch on the ignition with the engine not running. Does the test lamp illuminate?	Go to Step 5	Go to Step 4
4	Repair the high resistance or open circuit fault condition in the ignition circuit of the VSS. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures. Was the repair completed?	Go to Step 12	—
5	1 Connect a test lamp between the ground circuit and ignition circuit of the VSS. 2 Switch on the ignition with the engine not running. Does the test lamp illuminate?	Go to Step 7	Go to Step 6
6	Repair the high resistance or open circuit fault condition in the ground circuit of the VSS. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures. Was the repair completed?	Go to Step 12	—

5. Remove link nut.
6. Remove upper ball joint by using remover 5-8840-2017-0.

CAUTION: Be careful not to damage the ball joint boot.



P1010005

7. Remove upper control arm nut.
8. Remove upper control arm bolt.
9. Remove upper ball joint bolt and nut.
10. Remove upper ball joint.
11. Remove upper control arm assembly.
12. Remove bushing.

Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal conditions are found during inspection.

Check the following parts:

- Upper control arm
- Bushing

Installation

1. Install bushing by using installer 5-8840-0257-0 and 5-8840-2327-0.

P1010062

2. Install upper ball joint and tighten it to the specified torque.

   Torque: 31 N·m (3.2 kgf·m/23 lb·ft)

3. Install nut and cotter pin then tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

   Torque: 98 N·m (10.0 kgf·m/72 lb·ft)

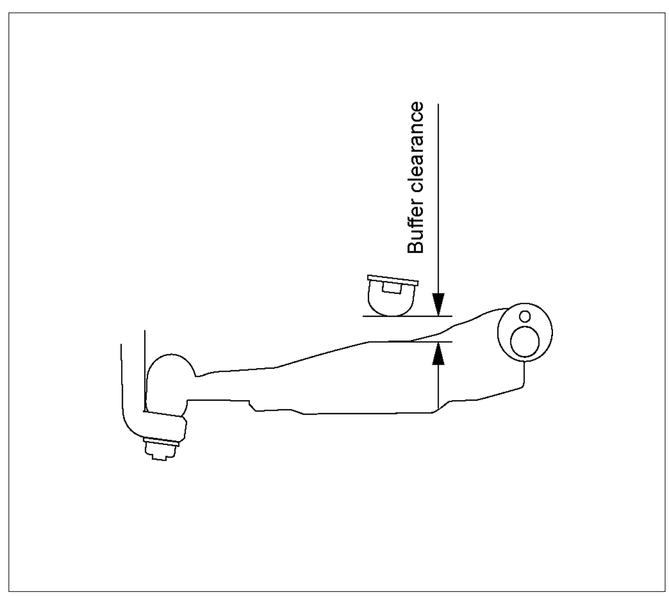
4. Install upper control arm assembly.
5. Install upper control arm bolt and nut.

NOTE: Apply oil to the thread.

NOTE: Tighten the bolt with the parts in the position shown in the illustration below.

Buffer clearance: 25.9 mm (1.02 in)

Torque: 137 N·m (14.0 kgf·m/101 lb·ft)



RTW53ASH000201

6. Install brake fluid hose nut.
7. Install speed sensor harness nut.

Step	Action	Yes	No
7	**CAUTION** **To avoid damage to the drive axles, support the lower control arms in the normal horizontal position. Do not run the vehicle in gear with the wheels hanging down at full travel.** 1 Raise the vehicle and support the drive axles with safety stands. Refer to 0A General Information for the location of jacking and support points. 2 Connect a fused jumper wire between the ground circuit of the connector and the ground circuit of the VSS. 3 Connect a fused jumper wire between the ignition circuit of the connector and the ignition circuit of the VSS. 4 Using connector test adaptor kit J 35616-A, connect a digital multimeter between the VSS signal circuit and ground. 5 Place the transmission in neutral. 6 Rotate the rear wheels by hand while observing the multimeter. Does the multimeter indicate greater than 0.15 V AC?	Go to Step 10	Go to Step 8
8	Perform the following VSS inspection: • Inspect the VSS wiring harness for conditions that may induce electromagnetic interference. Refer to 5.2 Intermittent Fault Conditions in this Section. • Inspect the VSS for incorrect installation or incorrect attaching bolt torque value. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Inspect the VSS sensor reluctor wheel for damage or conditions that causes misalignment. Was any fault found and rectified?	Go to Step 12	Go to Step 9
9	Replace the VSS. Refer to 7B1 Manual Transmission – V6. Was the repair completed?	Go to Step 12	—
10	Test the VSS signal circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 12	Go to Step 11
11	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 12	—
12	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC P0500 fail this ignition cycle?	Go to Step 2	Go to Step 13

Step	Action	Yes	No
13	Using Tech 2, select the DTC display function. Are there any DTCs displayed?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.28 DTC P0504 or P0571

DTC Descriptor

This diagnostic procedure supports:

- DTC P0504 – Brake Switch Circuit Malfunction.
- DTC P0571 – Cruise Control Brake Switch Circuit

Circuit Description

The brake switch assembly is comprised of two individual switches, a stop lamp switch and cruise control cancel switch. The ECM uses inputs from both of these switches for enabling cruise control, brake torque management etc. For further information on the brake switch assemblies, refer to 6C1–1 Engine Management – V6 – General Information.

The ECM monitors both switches, and if the signals do not correlate, DTC P0504 will set. If the ECM determines that a fault exists in the cruise control cancel circuit, DTC0571 will set.

Conditions for Running the DTC

Run continuously once the following conditions are met:

- The ignition is switched on.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

The ECM detects one of the following conditions:

- Only one switch signal is present when the vehicle accelerates or decelerates rapidly ten times.

NOTE
The ECM will count over several drive cycles.

- A signal is seen from the stop lamp switch and cruise control cancel switch when the vehicle accelerates rapidly.
- The ECM does not detect a signal from the switches during braking.

Conditions for Clearing the DTC

The brake switch circuit DTC is a Type B DTC. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type B DTCs set and conditions for clearing Type C DTCs.

Additional Information

- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Refer to 6C1-1 Engine Management – V6 – General Information for details of the brake switch operation.
- Refer to 8C Cruise Control – HFV6 for brake pedal switch operation and testing.
- Since a fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following number refers to the step numbers in the diagnostic table:

3 A fault condition in the stop lamp switch assembly may trigger these DTCs.

DTC P0504 or P0571 Diagnostic Table

Step	Action	Yes	No
1	Has the diagnostic system check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0504 or DTC P0571 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Ignition ON, engine OFF. 2 On Tech 2 select: **Engine** / **V6 Engine** / **Data Display** / **Cruise Control Data**. 3 Observe the status of the brake lamp switch and cruise control cancel switch. 4 Fully depress the brake pedal. Does Tech 2 display change from **Inactive** to **Active** in all switches when the pedal is pressed?	Refer to Additional Information in this DTC	Go to Step 4
4	Did the brake lamp switch Tech 2 status fail to change?	Go to Step 5	Go to Step 9
5	1 Disconnect the wiring connector from the brake switch assembly. Refer to 8C Cruise Control. 2 Ignition ON. 3 Connect a test lamp between the voltage circuit of the stop lamp switch and a good ground. Does the test lamp illuminate?	Go to Step 7	Go to Step 6
6	1 Repair the high resistance or open circuit fault condition in the voltage circuit of the stop lamp switch. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures. Was the repair completed?	Go to Step 14	—
7	1 Test the stop lamp switch. Refer to 8C Cruise Control – HFV6. Was any fault found and rectified?	Go to Step 14	Go to Step 8
8	1 Test the control circuit of the stop lamp switch for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was the repair completed?	Go to Step 14	Go to Step 13
9	1 Disconnect the wiring connectors from the brake switch assembly. Refer to 8C Cruise Control – HFV6. 2 Ignition ON. 3 Connect a test lamp between the voltage circuit of the cruise control cancel switch and a good ground. Does the test lamp illuminate?	Go to Step 11	Go to Step 10

Step	Action	Yes	No
10	1 Repair the high resistance or open circuit fault condition in the voltage circuit of the cruise control cancel switch. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures. Was the repair completed?	Go to Step 14	—
11	1 Test the cruise control cancel switch. Refer to 8C Cruise Control – HFV6. Was any fault found and rectified?	Go to Step 14	Go to Step 12
12	1 Test the control circuits of the cruise control cancel switch for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was the repair completed?	Go to Step 14	Go to Step 13
13	1 Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 14	—
14	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC P0504 or P571 fail this ignition cycle?	Go to Step 2	Go to Step 2
15	1 Using Tech 2, select the DTC display function. Are there any DTCs displayed?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.29 DTC P0506, P0507, P0638, P1551, P2100, P2101, P2119 or P2176

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0506 – Idle Speed Control rpm Too Low
- DTC P0507 – Idle Speed Control rpm Too High
- DTC P0638 – Commanded Versus Actual Throttle Position Correlation
- DTC P1551 – Throttle Control Lower Position Not Reached During Learning Mode
- DTC P2100 – Throttle Control Motor Malfunction
- DTC P2101 – Throttle Control Position Range / Performance
- DTC P2119 – Closed Throttle Position Range / Performance
- DTC P2176 – Throttle Control Lower Position not Learned

Circuit Description

The ECM monitors and evaluates the accelerator pedal position (APP) sensors signal voltage along with other sensor inputs to determine the desired throttle opening. To control the throttle plate movement, the ECM applies a pulse width modulated (PWM) signal voltage to the throttle actuator motor through the throttle actuator motor control circuits.

- At engine idle speed or when no current is flowing into the throttle actuator motor, a constant force return spring holds the throttle plate at a constant seven percent throttle opening position.

- To control the throttle opening, the ECM applies PWM voltage to the throttle actuator motor. The ECM increases this PWM voltage duty cycle to increase the throttle opening.
- To decrease the throttle opening from the seven percent rest position, the ECM reverses the polarity of the throttle actuator motor control circuit then applies a PWM voltage to the throttle actuator motor.

In addition, the ECM monitors the signal voltage applied to the throttle actuator motor control circuit. A TAC motor control circuit DTC sets if the ECM detects a fault condition in the TAC circuits or motor performance.

Conditions for Running the DTC

DTC P0506 and P0507

Runs continuously once the following conditions are met:

- DTCs P0112, P0113, P0117, P0118, P0121, P0122, P0123, P0221, P0222, P0223, P0443, P0446, P0455, P0458 and P0459 are not set.
- The ignition is switched on.
- The vehicle speed is 0 km/h.
- The engine coolant temperature is greater than 60°C.
- The intake air temperature is greater than -10.5°C.
- The volumetric efficiency is less than 35 percent.
- The EVAP purge solenoid is off.

DTC P0638

Runs continuously once the following conditions are met:

- The ignition is switched on.
- The ignition voltage is greater than 7 V.

DTC P2100

Runs continuously once the following conditions are met:

- DTC P2101 ran and passed.
- The ignition is switched on.

DTC P2101

Runs continuously once the following conditions are met:

- The battery voltage is greater than 7 V.
- The ignition is switched on.

DTC P1551, P2119 and P2176

Runs continuously once the following conditions are met:

- The ignition is switched on.
- The vehicle speed is 0 km/h.
- The engine speed is less than 40 rpm
- The engine coolant temperature is 5 – 60°C.
- The intake air temperature is 5 – 60°C.
- The ignition voltage is greater than 10 V.
- The APP is less than 15 percent.

Conditions for Setting the DTC

DTC P0506

The actual engine speed is less than the desired idle speed by at least 100 rpm for 10 seconds.

DTC P0507

The actual engine speed is greater than the desired idle speed by at least 200 rpm for 10 seconds or the ECM detects three fuel cut-offs due to an engine over speed condition while the engine is idling.

DTC P0638

The ECM detects the commanded duty cycle is greater than 80 percent for longer than 0.6 second.

DTC P1551

The ECM detects the TP sensor angle is outside the predetermined range of 1.8 – 13.0 percent when the TAC motor is deactivated.

DTC 2100

The ECM detects that its internal TAC motor output driver does not deactivate when commanded off.

DTC P2101

The ECM detects the difference between the commanded and the actual throttle opening is greater than 10 percent.

DTC P2119

The ECM determines the throttle plate didn't return to the rest position within 720 milliseconds.

DTC P2176

One of the following conditions exist:

- The TP sensor 1 voltage is outside the range of 0.2 – 0.9 V during the throttle learn procedure.
- The TP sensor 2 voltage is outside the range of 4.2 – 4.8 V during the throttle learn procedure.
- The throttle learn procedure is not learned after an ECM replacement.

Conditions for Clearing DTC

The TAC motor control circuit DTCs are Type A DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type A DTC sets and conditions for clearing Type A DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the Throttle Actuator Control System operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

4 A constant force return spring holds the throttle plate at a constant seven percent throttle opening position and should move in either direction under spring pressure and without binding.

8 When the ignition is switched on, the ECM operates the throttle actuator motor to verify the integrity of the TAC system prior to start up. This can be seen by the momentary flash of the test lamp as the ignition is switched on.

P0506, P0507, P0638, P1551, P2100, P2101, P2119 or P2176 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Start the engine. 4 Quickly depress the accelerator pedal to wide-open throttle then release pedal. Repeat this procedure several times. 5 Using Tech 2, select the DTC display function. Does DTC P0506, P0507, P0638, P1551, P2100, P2101, P2119 or P2176 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Is DTC P0121, P0122, P0123, P0221, P0222 or P0223 also set?	Go to the appropriate DTC table.	Go to Step 4
4	1 Disconnect the throttle actuator wiring connector. **WARNING** **Accidental operation of the TAC motor while performing throttle plate inspection may cause severe personal injury. Refer to 6C1-3 Engine Management – V6 – Service Operations for additional precautions on throttle body service procedure.** 2 Inspect the throttle plate for the following: • excessive dirt build-up in the throttle body, • not in rest position, • binding open or binding close, • binding when moving from open to close or close to open position, and • free to move open or close without spring pressure. Was any fault found and rectified?	Go to Step 13	Go to Step 5
5	Inspect the engine for fault conditions that causes incorrect idle speed. Refer to 5.12 Rough, Unstable, Incorrect Idle or Stalling in this Section. Was any fault found and rectified?	Go to Step 13	Go to Step 6
6	1 Switch on the ignition with the engine not running. 2 Using a digital multimeter, measure the voltage between the TAC positive circuit and the ECM housing. Does the multimeter display 2 – 4 V?	Go to Step 7	Go to Step 9
7	1 Switch on the ignition with the engine not running. 2 Using a digital multimeter, measure the voltage between the TAC negative control circuit and the ECM housing. Does the multimeter display 2 – 4 V?	Go to Step 8	Go to Step 9

Step	Action	Yes	No
8	1 Switch off the ignition. 2 Connect Tool No. J34730-405 injector test lamp between the positive and negative control circuit of the TAC. 3 Switch on the ignition for about 5 seconds then switch off while observing the test lamp. Does the test lamp illuminate briefly each time the ignition cycles?	Go to Step 11	Go to Step 10
9	Test the TAC control circuit that measured outside the specified value for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 13	Go to Step 12
10	Test the positive and negative control circuits of the TAC for a shorted together fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 13	Go to Step 12
11	Replace the throttle body assembly. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 13	—
12	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 13	—
13	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the TAC motor control circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 14
14	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.30 DTC P0513, P0633, P1629, P1632, P1677, P1678 or P1679

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0513 – Wrong Transponder Key
- DTC P0633 – Immobiliser Function Not Programmed
- DTC P1629 – Immobiliser Fuel Enable Signal Not Received
- DTC P1632 – Immobiliser Fuel Disable Signal Received
- DTC P1677 – Immobiliser Function Not Enabled
- DTC P1678 – Engine Control Module Identification Failed
- DTC P1679 – Immobiliser Environment Identification Failed

Circuit Description

The engine control module (ECM), the powertrain interface module (PIM) and the immobiliser control unit (ICU) are integral parts of the vehicle immobiliser system. The immobiliser system authenticates the security code programmed into each of these modules to prevent unauthorised vehicle operation. This authentication process includes the following steps:

1 At predetermined situations, the ICU sends a security code to the PIM.

2 When the ignition is switched ON, the PIM receives and compares this security code from the ICU against the security code programmed into the PIM.

3 Once the PIM receives the correct security code from the ICU, it sends a security code to the ECM.

4 The ECM receives and compares this security code from the PIM against the security code programmed into the ECM.

5 The authentication process is complete once the ECM receives the correct security code from the PIM within the specified time frame.

6 The ECM allows normal vehicle operation.

NOTE

If any of these authentication processes fail, the vehicle will not start and DTCs will set. For further information on the immobiliser system, refer to 11A Immobiliser.

Conditions for Running the DTC

Conditions for running the DTC are:

- The ignition is switched on.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

P0513

The ECM receives an incorrect response from the PIM during the immobiliser authentication process.

P0633

An attempt is made to start the engine before the immobiliser function has been programmed into a new PIM.

P1629

The ECM has not received a fuel enable password from the ICU.

P1632

The ECM receives an incorrect response from the PIM during the immobiliser authentication process.

P1677

An attempt is made to start the vehicle after the ECM was reset.

P1678

The ECM does not receive a valid response from the PIM when an attempt is made to start the engine.

P1679

The ECM receives a message from the PIM stating that it can't authenticate to the ICU.

Conditions for Clearing the DTC

Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type B DTC sets and conditions for clearing Type B DTCs.

Additional Information

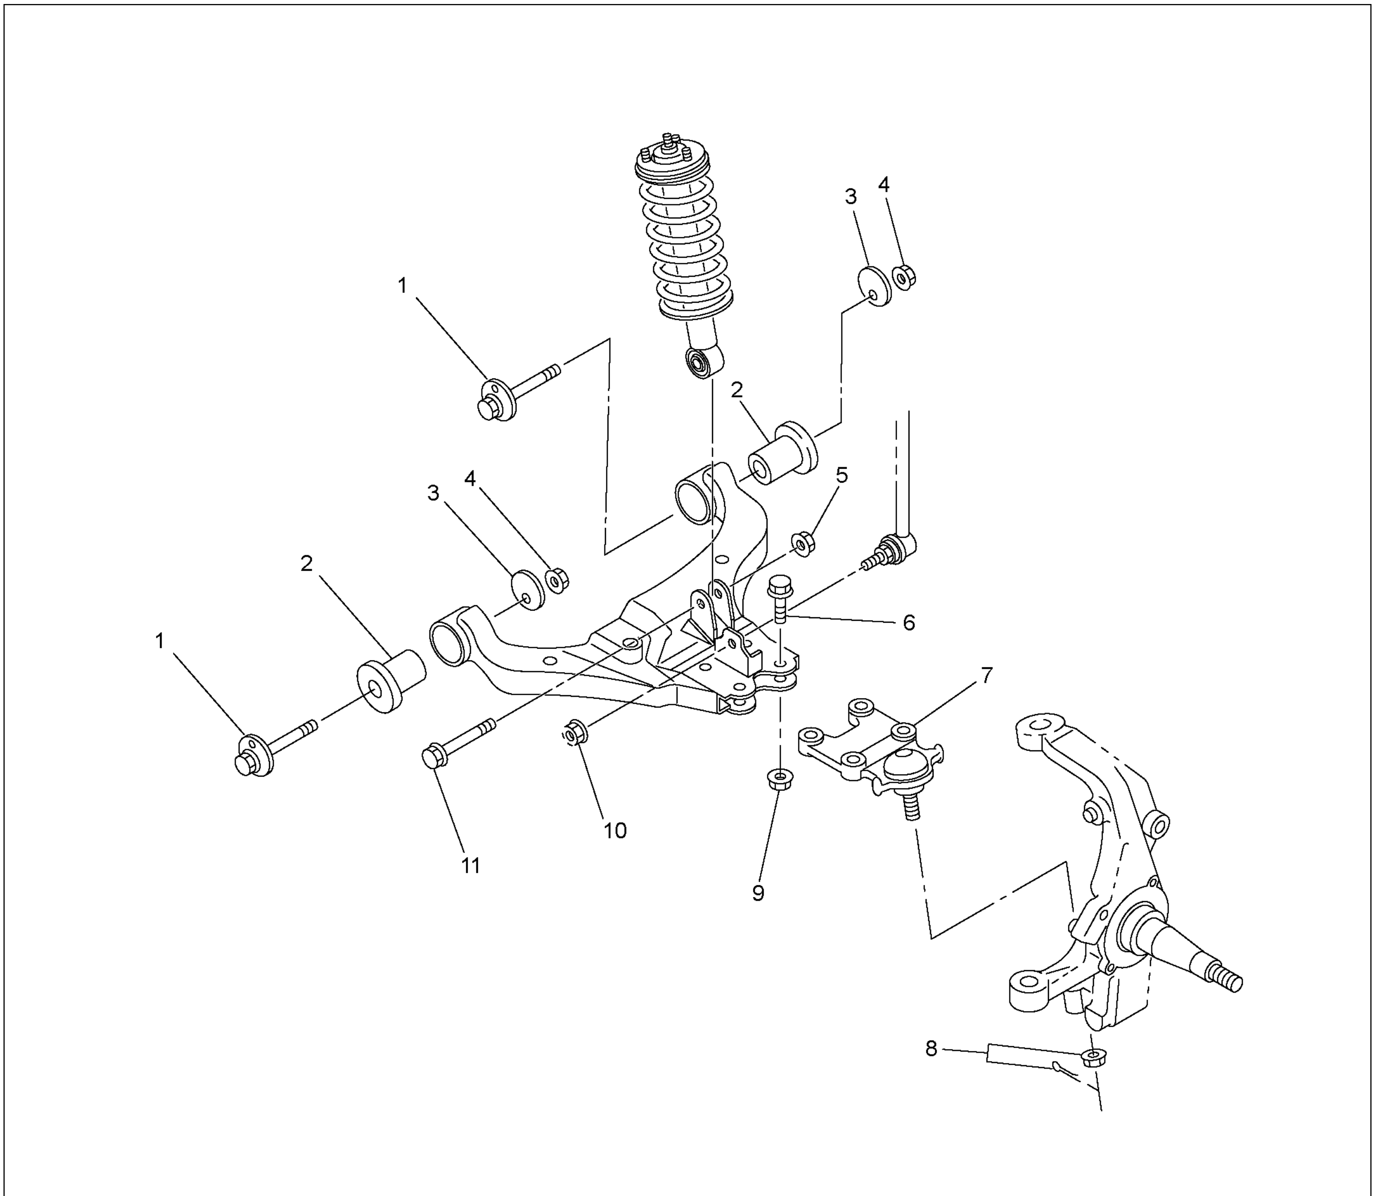
- Refer to 6C1-1 Engine Management –V6 – General Information for details of the ECM operation.
- Refer to 11A Immobiliser for the following information:
  - ICU link to PIM, and
  - Immobiliser System.
- Since a fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P0513, P0633, P1629, P1632, P0633, P1677, P1678, P1679 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for setting the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0513, P1629, P1632, P0633, P1677, P1678 or P1679 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Using Tech 2, perform the ICU Link to ECM / PIM procedure. Refer to 6E1 Powertrain Interface Module – V6. Has the linking procedure been performed correctly?	Go to Step 7	Go to Step 4
4	Test the Immobiliser system. Refer to 11A Immobiliser. Has any fault been found and rectified?	Go to Step 7	Go to Step 5
5	1 Test all ground circuits of the PIM for a high resistance or an open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. 2 Test the PIM ignition supply voltage circuit for a high resistance, open circuit or short to ground fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Has any fault been found and rectified?	Go to Step 7	Go to Step 6
6	Replace the PIM. Refer to 6E1 Powertrain Interface Module – V6. Has the repair been completed?	Go to Step 7	—
7	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Do any of the immobiliser DTCs fail this ignition cycle?	Go to Step 2	Go to Step 8

Lower Control Arm

Lower Control Arm and Associated Parts



Legend

(1) Cam bolt
(2) Bush
(3) Cam plate
(4) Lower Control Arm Nut
(5) Shock Absorber Nut
(6) Lower Ball Joint Bolt
(7) Lower Ball Joint
(8) Nut and cotter pin
(9) Lower Ball Joint Nut
(10) Link Nut
(11) Shock Absorber Bolt

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the tie-rod end from the knuckle. Refer to Power Steering Unit in Steering section.

Step	Action	Yes	No
8	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

7.31 DTC P0521, P0522 or P0523

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0521 – Oil Pressure Sensor Range / Performance
- DTC P0522 – Oil Pressure Sensor Voltage Low
- DTC P0523 – Oil Pressure Sensor Voltage High

Circuit Description

The ECM applies a positive 5 V reference voltage to the engine oil pressure (EOP) sensor through the 5 V reference circuit and the ground through the low reference circuit.

The EOP sensor provides signal voltage to the ECM that is proportional to the oil pressure generated by the engine oil pump. The ECM monitors the EOP sensor signal voltage. If the ECM detects a low oil pressure condition, it sends a serial data communication signal to the instrument cluster to illuminate the check oil warning icon.

The ECM monitors and compares the EOP sensor signal voltage against a specified range. An EOP sensor circuit DTC sets if the ECM detects the EOP sensor signal voltage is outside the specified range.

Conditions for Running the DTC

DTC P0521, P0522 and P0523 run continuously when the engine is running.

Conditions for Setting the DTC

P0521

The ECM detects engine oil pressure is:

- greater than 800 kPa at idle, or
- engine rpm is greater than 2000 rpm and oil pressure is less than 8 kPa.

P0522

The oil pressure sensor signal voltage is less than 0.2 V for more than 10 seconds.

P0523

The oil pressure sensor signal voltage is more than 4.9 V for more than 10 seconds.

Conditions for Clearing DTC

The EOP sensor circuit DTCs are Type B DTC. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type B DTC sets and conditions for clearing Type B DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the EOP sensor operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

4 Test signal circuit of the EOP sensor. This circuit should display a voltage within the specified range.

5 Measures the integrity of the EOP sensor low reference circuit. Removal of the ECM Fuse 29 enables the ECM to power down completely prior to the test procedure.

P0521 to P0523 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0521, P0522 or P0523 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Switch off the ignition. 2 Disconnect the EOP sensor wiring connector. 3 Switch on the ignition with the engine not running. 4 Using a digital multimeter, measure the voltage between the EOP sensor 5 V reference circuit and the ECM housing. Does the multimeter display 4.8 – 5.2 V?	Go to Step 4	Go to Step 6
4	1 Connect a 3 A fused jumper wire between the EOP sensor 5 V reference circuit and the EOP sensor signal circuit. 2 Switch on the ignition with the engine not running. 3 Using Tech 2, observe the EOP sensor parameter. Does Tech 2 display 780 – 980 kPa?	Go to Step 5	Go to Step 7
5	1 Switch off the ignition. 2 Remove ECM / TCM Fuse 29 from the engine compartment fuse and relay panel assembly. 3 Using a digital multimeter, measure the resistance between the EOP sensor low reference circuit and the ECM housing. **NOTE** Install the ECM Fuse 29 to the engine compartment fuse and relay panel assembly after completing this test. Does the multimeter display 5 Ω?	Go to Step 9	Go to Step 8
6	Test the EOP sensor 5 V reference circuit for an open, short to ground or high resistance fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 10
7	Test EOP sensor signal circuit for short to ground fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 10

Step	Action	Yes	No
8	1 Disconnect the ECM wiring connector. 2 Test the EOP sensor low reference circuit for a high resistance and open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. **NOTE** The EOP sensor shares the low reference circuit with other sensors. A fault condition in the low reference circuit may trigger DTCs on sensors that share this circuit. Refer to 3 Wiring Diagrams and Connector Charts in this Section, to assist diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 10
9	Replace the EOP sensor. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 11	—
10	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 11	—
11	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the for the engine oil pressure sensor circuit DTCs s fail this ignition cycle?	Go to Step 2	Go to Step 12
12	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.32 DTC P0532 or P0533

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0532 – A/C Pressure Sensor Voltage Low
- DTC P0533 – A/C Pressure Sensor Voltage High

Circuit Description

The ECM supplies a positive 5 V reference voltage to the air-conditioning (A/C) refrigerant pressure sensor through reference circuit and the ground through the low reference circuit.

The A/C pressure sensor provides signal voltage to the ECM through the signal circuit that is proportional to the A/C refrigerant pressure. The ECM monitors the signal voltage of the A/C pressure sensor to determine the refrigerant pressure.

- The A/C pressure sensor voltage increases as the refrigerant pressure increases.
- When the ECM detects the refrigerant pressure exceeds a predetermined value, the ECM activates the cooling fans to reduce the refrigerant pressure.
- When the ECM detects the refrigerant pressure is too high or too low, the ECM disables the A/C clutch to protect the A/C compressor from damage.

An A/C refrigerant pressure sensor circuit DTC sets if the ECM detects the A/C pressure sensor signal is not within the specified range for 3 seconds.

Conditions for Running the DTC

DTC P0532 and P0533 run continuously when the engine is running or when the A/C is switched on.

Conditions for Setting the DTC

DTC P0532

The A/C refrigerant pressure signal voltage is less than 0.2 V for longer than 3 seconds.

DTC P0533

The A/C refrigerant pressure signal voltage is greater than 4.9 V for longer than 3 seconds.

Conditions for Clearing the DTC

The A/C refrigerant pressure sensor circuit DTCs are Type C DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type C DTC sets and conditions for clearing Type C DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the A/C Refrigerant Pressure Sensor operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- The A/C refrigerant pressure sensor circuit diagnostic table is developed with the assumption the A/C refrigerant system is functioning correctly. Therefore, rectify any A/C refrigerant system fault conditions before proceeding with this diagnostic procedure.
  - An A/C refrigerant low-pressure fault condition may cause DTC P0532 to set.
  - An A/C refrigerant high-pressure fault condition may cause DTC P0533 to set.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 Determines if there is an A/C refrigerant system fault condition.

6 Measures the integrity of the A/C Refrigerant Pressure Sensor low reference circuit. Removal of the ECM Fuse 29 enables the ECM to power down completely prior to the test procedure.

DTC P0532 or P0533 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	Test the A/C refrigerant system. Refer to 2A Heater and Air-conditioning. Was any fault found and rectified?	Go to Step 12	Go to Step 3

Step	Action	Yes	No
3	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0532 or P0533 fail this ignition cycle?	Go to Step 4	Refer to Additional Information in this DTC
4	1 Switch off the ignition. 2 Disconnect the A/C pressure sensor connector. 3 Switch on the ignition with the engine not running. 4 Using a digital multimeter, measure the voltage between the A/C pressure sensor 5 V reference circuit and the ECM housing. Does the multimeter display 4.8 – 5.2 V?	Go to Step 5	Go to Step 7
5	1 Connect a 3 A fused jumper wire between the A/C pressure sensor 5 V reference circuit and signal circuit. 2 Switch on the ignition with the engine not running. 3 Using Tech 2, observe the ECM A/C pressure voltage parameter. Does Tech 2 display **4.8 – 5.2 V**?	Go to Step 6	Go to Step 8
6	1 Switch off the ignition. 2 Remove ECM Fuse 29 from the engine compartment fuse and relay panel assembly. 3 Using a digital multimeter, measure the resistance between the A/C refrigerant pressure low reference circuit and the ECM housing. **NOTE** Install the ECM Fuse 29 to the engine compartment fuse and relay panel assembly after completing the test. Does the multimeter display 5Ω?	Go to Step 10	Go to Step 9
7	Test the A/C pressure sensor 5 V reference circuit for a high resistance, open circuit, short to ground, or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 12	Go to Step 11
8	Test the A/C pressure sensor signal circuit for a high resistance, open circuit, short to ground, or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 12	Go to Step 11
9	Test the A/C pressure sensor low reference circuit for a high resistance or open circuit condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 12	Go to Step 11
10	Replace the A/C pressure sensor. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 12	—
11	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 12	—

Step	Action	Yes	No
12	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the A/C refrigerant pressure sensor circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 13
13	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.33 DTC P0560, P0562 or P0563

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0560 – System Voltage Malfunction
- DTC P0562 – System Voltage Low Voltage
- DTC P0563 – System Voltage High Voltage

Circuit Description

Battery voltage is supplied continuously to the engine control module (ECM) through the continuous battery supply circuit and the ground through the ground connection of the ECM housing to the engine.

Turning the ignition switch on activates the ignition control relay, which directs ignition positive voltage from the battery to the ECM switched battery supply circuit which activates the ECM. The ECM then applies control voltage to the control circuit of the engine control relay to activate the engine control relay. The engine control relay supplies ignition voltage to the various engine management system components.

The ECM monitors the battery voltage circuits to ensure the voltage available to the engine management system stays within the specified range. Incorrect system voltage may cause incorrect engine management system operation or component malfunction.

An ECM system voltage DTC sets if the ECM detects the voltage available to any of the ECM voltage supply circuit is outside the specified range.

Conditions for Running the DTC

DTCs P0560, P0563 and P0563 runs continuously when the engine is running at speeds greater than 1500 rpm

Conditions for Setting the DTC

DTC P0560

The ECM detects the ignition 1, ignition 2 or switched battery supply voltage is out of the specified range for 30 seconds.

DTC P0562

The ECM detects the ECM system voltage is less than 11 V for 5 seconds.

DTC P0563

The ECM detects the ECM system voltage is greater than 16 V.

Conditions for Clearing the DTC

The ECM system voltage DTCs are Type C DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type C DTC sets and conditions for clearing Type C DTCs.

Additional Information

- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Refer to 6C1-1 Engine Management – V6 – General Information for details of the ECM operation.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P0560, P0562 or P0563 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Increase the engine speed to 1500 rpm or operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0560, P0562, or P0563 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Test the battery condition. Refer to 6D1-3 Battery – V6. Was any fault found and rectified?	Go to Step 9	Go to Step 4
4	Test the charging system operation. Refer to 6D1-1 Charging System – V6. Was any fault found and rectified?	Go to Step 9	Go to Step 5
5	Test all the ECM fuses. Refer to 8A Electrical - Body and Chassis. Was any fault found and rectified?	Go to Step 9	Go to Step 6
6	Check the ECM ground connections for corrosion, loose terminal or incorrect position. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 9	Go to Step 7
7	Test the following circuits for a high resistance or open circuit fault condition. • Continuous battery supply circuit, • switched battery supply circuit, • ignition 1 circuit, and • ignition 2 circuit. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 9	Go to Step 8
8	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 9	—

Step	Action	Yes	No
9	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the ECM system voltage DTCs fail this ignition cycle?	Go to Step 2	Go to Step 10
10	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.34 DTC P0601, P0602, P0604 or P0606

DTC Description

This diagnostic procedure supports the following DTCs:

- DTC P0601 – Replace Electronic Control Unit (ECU)
- DTC P0602 – Program Electronic Control Unit (ECU)
- DTC P0604 – Replace Electronic Control Unit (ECU)
- DTC P0606 – Replace Electronic Control Unit (ECU)

Circuit Description

The engine control module (ECM) is the control centre of the engine management system. The programming and calibration needed by the ECM to control the functionality of the engine management system are stored in the ECM read only memory (ROM).

An ECM internal circuit, programming or memory fault DTC sets if there is an internal microprocessor integrity fault condition with the ECM or if the ECM is not programmed.

Conditions for Running the DTC

DTC P0601

Runs once when the checksum calculation at power down is completed in the last ignition cycle.

DTC P0602 and P0606

Runs continuously when the ignition is switched on with the engine not running.

DTC P0604

Runs once when the read / write test at power-down is completed in the last ignition cycle.

Conditions for Setting the DTC

DTC P0601

The ECM detects an incorrect ROM checksum for greater than 30 seconds.

DTC P0602

The ECM programming is incomplete.

DTC P0604

The ECM detects an error in the RAM for 6 seconds.

DTC P0606

There is an internal ECM circuit fault condition for 6 seconds.

Conditions for Clearing the DTC

The ECM Internal Circuit, Programming or Memory Fault DTCs are Type A DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type A DTC sets and conditions for clearing Type A DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the ECM operation.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P0601, P0602, P0604 and P0606 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0601, P0602, P0604 or P0606 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Test all ECM fuses and ground connections. Refer to 8A Electrical - Body and Chassis. Was any fault found and rectified?	Go to Step 6	Go to Step 4
4	Attempt to program the ECM. Was the programming successful?	Go to Step 6	Go to Step 5
5	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 6	—
6	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the ECM internal circuit, programming or memory fault DTCs fail this ignition cycle?	Go to Step 2	Go to Step 7
7	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.35 DTC P0615, P0616 or P0617

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0615 – Starter Relay Circuit Malfunction
- DTC P0616 – Starter Relay Circuit Low Voltage
- DTC P0617 – Starter Relay Circuit High Voltage

Circuit Description

The engine control relay applies battery voltage to the coil circuit of the starter relay through the ignition circuit. When the ignition switched is turned to the Start position and all the conditions required to enable an engine cranking is met, the ECM grounds the starter relay control circuit to activate the starter relay. When active, the starter relay applies battery voltage to the starter motor solenoid control circuit to operate the starter motor. Refer to 6D1-2 Starting System – V6 for information on the cranking system operation.

The ECM monitors the control circuit of the starter relay for conditions that are incorrect for the commanded state. A starter relay control circuit DTC sets if the ECM detects a fault condition in the starter relay control circuit.

Conditions for Running the DTC

DTCs P0615, P0616 and P0617 run continuously once the following conditions are met:

- The ignition is switched on
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

The ECM detects a condition that is incorrect for the starter relay commanded state.

Conditions for Clearing the DTC

The starter relay control circuit DTCs are Type C DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type C DTCs set and conditions for clearing Type C DTCs.

Additional Information

- Refer to 6D1-2 Starting System – V6 for information on the cranking system operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following number refers to the step number in the diagnostic table:

3 A fault condition in the starting system or immobiliser system may trigger this DTC.

DTC P0615, P0616 or P0617 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section

4. Support lower control arm with a jack.
5. Remove the link nut.
6. Remove the nut and cotter pin.
7. Remove the shock absorber lower end from the lower control arm.
8. Remove the lower ball joint from the lower control arm.
9. Remove lower control arm nut and cam plate.
10. Remove cam bolt.
11. Remove lower control arm.
12. Remove bushing.

Inspection and Repair

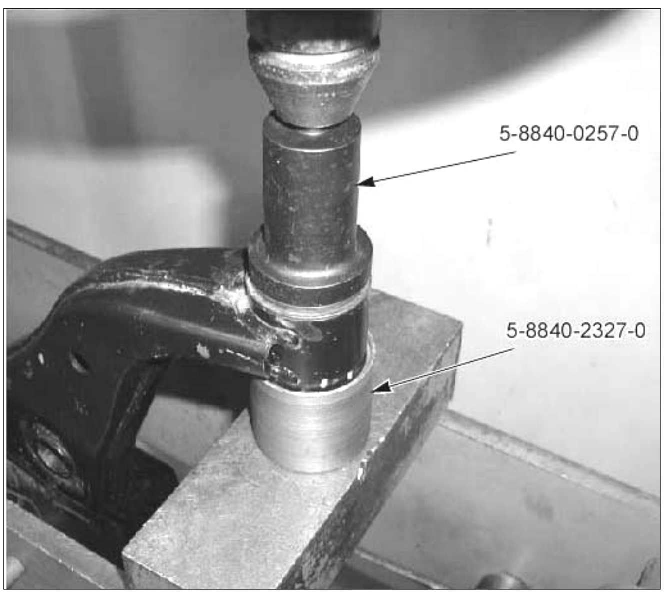
Make the necessary adjustments or parts replacement if wear, damage, corrosion or any other abnormal condition is found during inspection.

Check the following parts:

- Lower control arm
- Bushing

Installation

1. Install rear bushing by using installer 5-8840-0257-0 and 5-8840-2327-0.



P1010063

2. Install lower control arm.
3. Install cam bolt.
4. Install lower ball joint and tighten it to the specified torque.

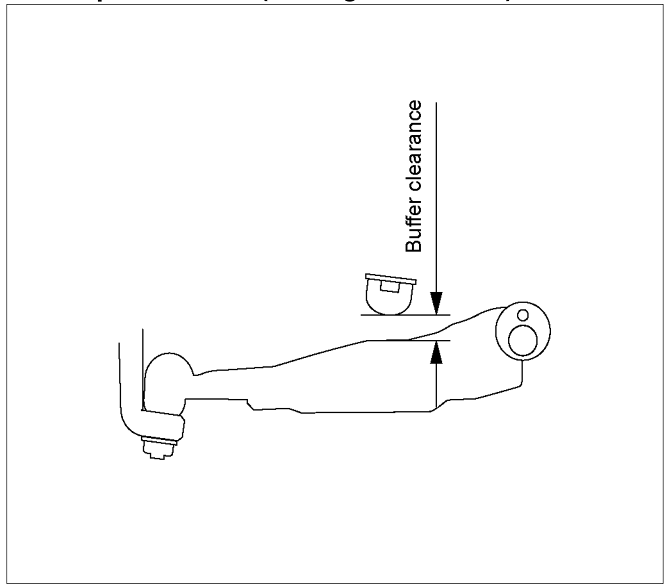
Torque: 127 N·m (13.0 kgf·m/94 lb·ft)

5. Install shock absorber and tighten it to the specified torque.

NOTE: Apply oil to the thread.

NOTE: Tighten the lower control arm nut with the parts in the position shown in the illustration below.

Torque: 137 N·m (14.0 kgf·m/101 lb·ft)



RTW53ASH000201

6. Install stabilizer link and tighten it to the specified torque.

Torque: 50 N·m (5.1 kgf·m/37 lb·ft)

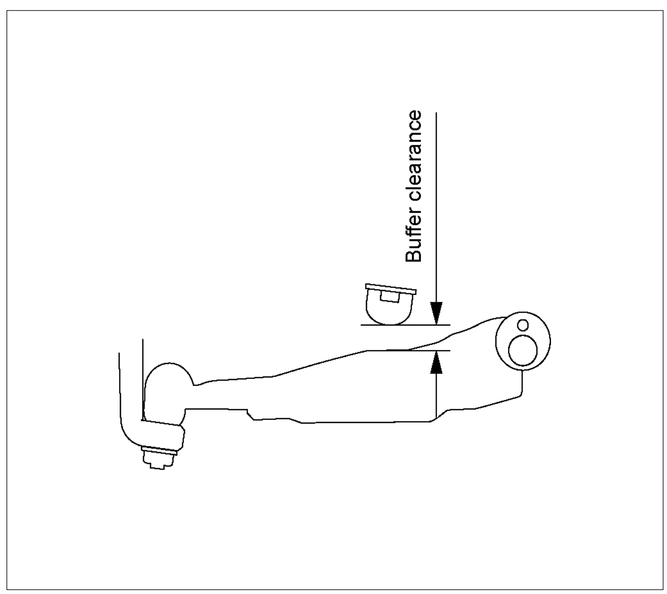
7. Install lower control arm nut and cam plate and tighten lower link nut finger-tight.

NOTE: Apply oil to the thread.

NOTE: Tighten the lower control arm nut with the parts in the position shown in the illustration below.

Buffer clearance: 25.9 mm (1.02 in)

Torque: 186 N·m (19.0 kgf·m/137 lb·ft)



RTW53ASH000201

8. Install nut and cotter pin then tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 147 N·m (15.0 kgf·m/108 lb·ft)

Step	Action	Yes	No
2	1 Switch off the ignition for 30 seconds. 2 Turn the ignition switch to the Start position or operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0615, P0616 and P0617 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Check for a fault condition in the following systems which can disable the starting system: • Starting System, refer to 6D1-2 Starting System – V6. • Immobiliser System, refer to 11A Immobiliser. Was any fault found and rectified?	Go to Step 10	Go to Step 4
4	1 Remove the starter relay. Refer to 8A Electrical - Body and Chassis. 2 Connect a test lamp between the ignition circuit of the starter relay and a good ground. 3 Switch on the ignition. Does the test lamp illuminate when the ignition switch is turned to the on position?	Go to Step 5	Go to Step 6
5	1 Connect a test lamp between the control circuit of the starter relay and a 12 V. 2 Turn the ignition switch to the Start position and then release it back to the on position. Does the test lamp turn on when the ignition switch is turned to the Start position and then turn off when the ignition switch returns to the on position?	Go to Step 8	Go to Step 7
6	Repair the ignition voltage circuit of the starter relay for a high resistance or open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures. Was the repair completed?	Go to Step 10	—
7	Test the control circuit of the starter relay for a high resistance, open circuit, short to ground or a short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 10	Go to Step 9
8	Replace the starter relay. Refer to 8A Electrical - Body and Chassis. Was the repair completed?	Go to Step 10	—
9	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 10	—
10	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does the starter relay control circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 11
11	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK

Step	Action	Yes	No
When all diagnosis and repairs are completed, check the system for correct operation.			

7.36 DTC P0625 or P0626

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0625 – Alternator F Terminal Low Voltage
- DTC P0626 – Alternator F Terminal High Voltage

Circuit Description

The voltage regulator within the generator regulates the generator charge output by increasing or decreasing the generator on time. The generator field (Gen F) duty cycle output signal represents the generator on time. Refer to 6D1-1 Charging System – V6 for details of the charging system operation.

The ECM monitors the Gen F terminal output signal to calculate Gen F duty cycle percentage. This enables the ECM to provide engine idle compensation based on electrical loads and to detect a fault condition in the generator operation.

A Generator F-terminal circuit DTC sets if the ECM detects the Gen F duty cycle is outside the specified range for a predetermined set of parameters.

Conditions for Running the DTC

DTC P0625

Runs continuously when the following conditions are met:

- There is no generator, CKP sensor or CMP sensor DTC set.
- The engine speed is less than 3000 rpm
- The generator is not commanded off.

DTC P0626

Runs continuously when the following conditions are met:

- There is no generator, CKP sensor or CMP sensor DTC set.
- The ignition is switched on with the engine not running

Conditions for Setting the DTC

DTC P0625

The ECM detects the Gen F Terminal Signal parameter is less than five percent for 15 seconds.

DTC P0626

The ECM detects the Gen F Terminal Signal parameter is greater than five percent for 15 seconds.

Conditions for Clearing DTC

The Generator F-terminal circuit are Type C DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type C DTC sets and conditions for clearing Type C DTCs.

Additional Information

- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Refer to 6C1-1 Engine Management – V6 – General Information for details of the ECM operation.

- Refer to 6D1-1 Charging System – V6 for details of the charging system operation.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P0625 or P0626 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0625 or P0626 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Test the charging system for any fault condition that may cause incorrect generator operation. Refer to 6D1-1 Charging System – V6. Was any fault found and rectified?	Go to Step 6	Go to Step 4
4	Test the Gen F signal circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 6	Go to Step 5
5	Replace the ECM. Refer to Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 7	—
6	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the Generator F-terminal circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 8
7	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.37 DTC P0627, P0628 or P0629

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0627 – Fuel Pump Relay Circuit Malfunction
- DTC P0628 – Fuel Pump Relay Voltage Low
- DTC P0629 – Fuel Pump Relay Voltage High

Circuit Description

The ground circuit of the fuel pump relay coil is directly connected to ground. When the ignition switch is turned on and all the conditions required to enable fuel pump operation are met, the ECM applies battery voltage to the fuel pump relay control circuit to operate the fuel pump. Refer to 6C Fuel System – V6 for further information.

The ECM monitors the control circuit of the fuel pump relay for conditions that are incorrect for the commanded state. A fuel pump relay control circuit DTC sets if the ECM detects a fault condition in this circuit.

Conditions for Running the DTC

Run continuously once the following conditions are met:

- the ignition is switched on, and
- the ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

The ECM detects a condition that are incorrect for the fuel pump relay commanded state.

Conditions for Clearing the DTC

The fuel pump relay control circuit DTCs are Type C DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type C DTCs set and conditions for clearing Type C DTCs.

Additional Information

- Refer to 6C Fuel System – V6 for details of the fuel pump operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P0627 to P0629 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Turn the ignition switch to the Start position or operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0627, P0628 and P0629 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Remove the fuel pump relay. Refer to 8A Electrical - Body and Chassis. 2 Connect a test lamp between the ground circuit of the fuel pump relay and a 12 V. Does the test lamp illuminate?	Go to Step 4	Go to Step 5
4	1 Connect a test lamp between the control circuit and ground circuit of the fuel pump relay. 2 Using Tech 2, command the fuel pump relay on. Does the test lamp switch from off to on as Tech 2 commands the fuel pump relay from off to on?	Go to Step 7	Go to Step 6

Step	Action	Yes	No
5	Repair the high resistance or open circuit fault condition in the ground circuit of the fuel pump relay. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures. Was the repair completed?	Go to Step 9	—
6	Test the control circuit of the fuel pump relay for a high resistance, open circuit, short to ground or a short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 9	Go to Step 8
7	Replace the fuel pump relay. Refer to 8A Electrical - Body and Chassis. Was the repair completed?	Go to Step 9	—
8	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 9	—
9	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does the fuel pump relay control circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 10
10	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.38 DTC P0645, P0646 or P0647

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0645 – A/C Relay Circuit Malfunction.
- DTC P0646 – A/C Relay Voltage Low.
- DTC P0647 – A/C Relay Voltage High.

Circuit Description

The engine control relay applies battery voltage to the coil circuit of the air-conditioning (A/C) clutch relay through the ignition circuit. Using a device called a driver, the ECM grounds control circuit of the A/C relay to activate the A/C clutch and operate the A/C compressor. Refer to 2A Heater and Air-conditioning for details of the A/C compressor operation.

The driver has a feedback circuit that is pulled-up to a voltage. The ECM monitors the driver feedback circuit to determine if the control circuit is open, shorted to ground or shorted to a positive voltage.

An A/C relay control circuit DTC sets if the ECM detects a fault condition in the A/C relay control circuit.

Conditions for Running the DTC

DTC P0645, P0646 or P0647 runs continuously once the following conditions are met:

- The ignition voltage is 10 – 16 V.
- The engine speed is greater than 80 rpm

Conditions for Setting the DTC

Conditions for Setting DTC P0645

The ECM detects an open circuit fault condition in the A/C relay control circuit.

Conditions for Setting DTC P0646

The ECM detects a short to ground fault condition in the A/C relay control circuit.

Conditions for Setting DTC P0647

The ECM detects a short to voltage fault condition in the A/C relay control circuit.

Conditions for Clearing the DTC

The A/C relay control circuit DTCs are Type C DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type C DTCs set and conditions for clearing Type C DTCs.

Additional Information

- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Refer to 2A Heater and Air-conditioning for details of the A/C system operation.
- Since a fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following number refers to the step numbers in the diagnostic table:

3 A fault condition in the HVAC system may trigger this DTC.

DTC P0645, P0646 or P0647 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Switch on the A/C system or operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0645 P0646 or P0647 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Check for a fault condition in the HVAC system, which can disable the AC compressor clutch. Refer to 2A Heater and Air-conditioning for details of the A/C compressor operation. Was any fault found and rectified?	Go to Step 10	Go to Step 4
4	1 Remove the A/C relay. Refer to 8A Electrical - Body and Chassis. 2 Connect a test lamp between the ignition circuit of the A/C relay coil and the ECM housing. 3 Switch on the ignition with the engine not running. Does the test lamp illuminate?	Go to Step 5	Go to Step 6

Step	Action	Yes	No
5	1 Connect a test lamp between the control circuit of the A/C relay and a 12 V. 2 Switch on the ignition with the engine not running. 3 Using Tech 2, command the A/C relay on and then off. Does the test lamp turn on and off when the A/C relay is commanded on and off?	Go to Step 8	Go to Step 7
6	Repair the high resistance or open circuit fault condition in the ignition voltage circuit of the A/C relay. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures. Was the repair completed?	Go to Step 10	—
7	Test the control circuit of the A/C relay for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 10	Go to Step 9
8	Replace the A/C relay. Refer to 8A Electrical - Body and Chassis. Was the repair completed?	Go to Step 10	—
9	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 10	—
10	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the A/C relay control circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 11
11	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.39 DTC P0685, P0686 or P0687

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0685 – Engine Control Ignition Relay Circuit Malfunction
- DTC P0686 – Engine Control Ignition Relay Circuit Low Voltage
- DTC P0687 – Engine Control Ignition Relay Circuit High Voltage

Circuit Description

The supply voltage circuit of the engine control relay is directly connected to battery voltage. When the ignition switch is turned on, the ECM grounds the relay control circuit to provide ignition voltage to various sensors and components that controls the engine operation.

The ECM monitors the control circuit of the engine control relay for conditions that are incorrect for the commanded state. An engine control relay circuit DTC sets if the ECM detects a fault condition in this circuit.

Conditions for Running the DTC

DTCs P0685, P0686 and P0687 run continuously once the following conditions are met:

- The ignition is switched on
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

The ECM detects a condition that is incorrect for the engine control relay commanded state.

Conditions for Clearing the DTC

The engine control relay control circuit DTCs are Type C DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type C DTCs set and conditions for clearing Type C DTCs.

Additional Information

- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following number refers to the step number in the diagnostic table:

4 Removal of the ECM Fuse 29 enables the ECM to power down completely prior to the test procedure.

DTC P0685, P0686 or P0687 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Turn the ignition switch to the Start position or operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0685, P0686 and P0687 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Remove the engine control relay. Refer to 8A Electrical - Body and Chassis. 2 Connect a test lamp between the battery voltage circuit of the engine control relay and a good ground. Does the test lamp illuminate?	Go to Step 4	Go to Step 5
4	1 Switch off the ignition. 2 Remove and reinstall the ECM fuse 29 from the engine compartment fuse and relay panel assembly. 3 Connect a test lamp between the control circuit and the battery voltage circuit of the engine control relay. 4 Switch on the ignition. Does the test lamp switches from off to on when the ignition switch is turned form off to on?	Go to Step 7	Go to Step 6

Step	Action	Yes	No
5	Repair the high resistance or open circuit fault condition in the battery voltage circuit of the engine control relay. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures. Was the repair completed?	Go to Step 9	—
6	Test the control circuit of the engine control relay for a high resistance, open circuit, short to ground or a short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 9	Go to Step 8
7	Replace the engine control relay. Refer to 8A Electrical - Body and Chassis. Was the repair completed?	Go to Step 9	—
8	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 9	—
9	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does the engine control relay control circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 10
10	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.40 DTC P0700

DTC Descriptor

This diagnostic procedure supports DTC P0700 – Malfunction Indicator (MI) Request from Transmission Control Module (TCM).

Circuit Description

The engine control module (ECM) communicates directly with the transmission control module (TCM) and other control modules connected to the GM LAN serial data communication circuit through the GM LAN protocol.

DTC P0700 – Malfunction Indicator Request from TCM sets if the following condition exists:

- The TCM detects an emission related fault condition and sets a TCM DTC that represent the fault condition.
- The ECM receives a serial data signal from the TCM requesting the illumination of the malfunction indicator.

Conditions for Running the DTC

DTC P0700 runs continuously when the ignition is switched on.

Conditions for Setting the DTC

The ECM receives a serial data signal from the TCM requesting the illumination of the malfunction indicator lamp (MIL).

Conditions for Clearing the DTC

DTC P0700 – Malfunction Indicator Request from TCM is a Type A DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type A DTC sets and conditions for clearing Type A DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the ECM operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Secion, for the system wiring diagram and connector charts.

DTC P0700 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0700 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Are other powertrain DTCs also set?	Go to the appropriate DTC Table in this Section	Refer to 7C2 Automatic Transmission – 4L60E – Electrical Diagnosis
When all diagnosis and repairs are completed, check the system for correct operation.			

7.41 DTC P0704

DTC Descriptor

This diagnostic procedure supports DTC P0704 – Clutch Switch Input Circuit Malfunction.

Circuit Description

The clutch pedal switch disengages the cruise control when the clutch is depressed, in much the same way that the brake pedal switch is used to disengage the cruise control feature.

The cruise control cancel switch is normally closed when the clutch pedal is at rest, opening when the pedal is pressed. Activation of this switch removes the signal to the ECM which will then deactivate the cruise control.

Conditions for Running the DTC

Runs continuously when the ignition is switched and the engine is running.

Conditions for Setting the DTC

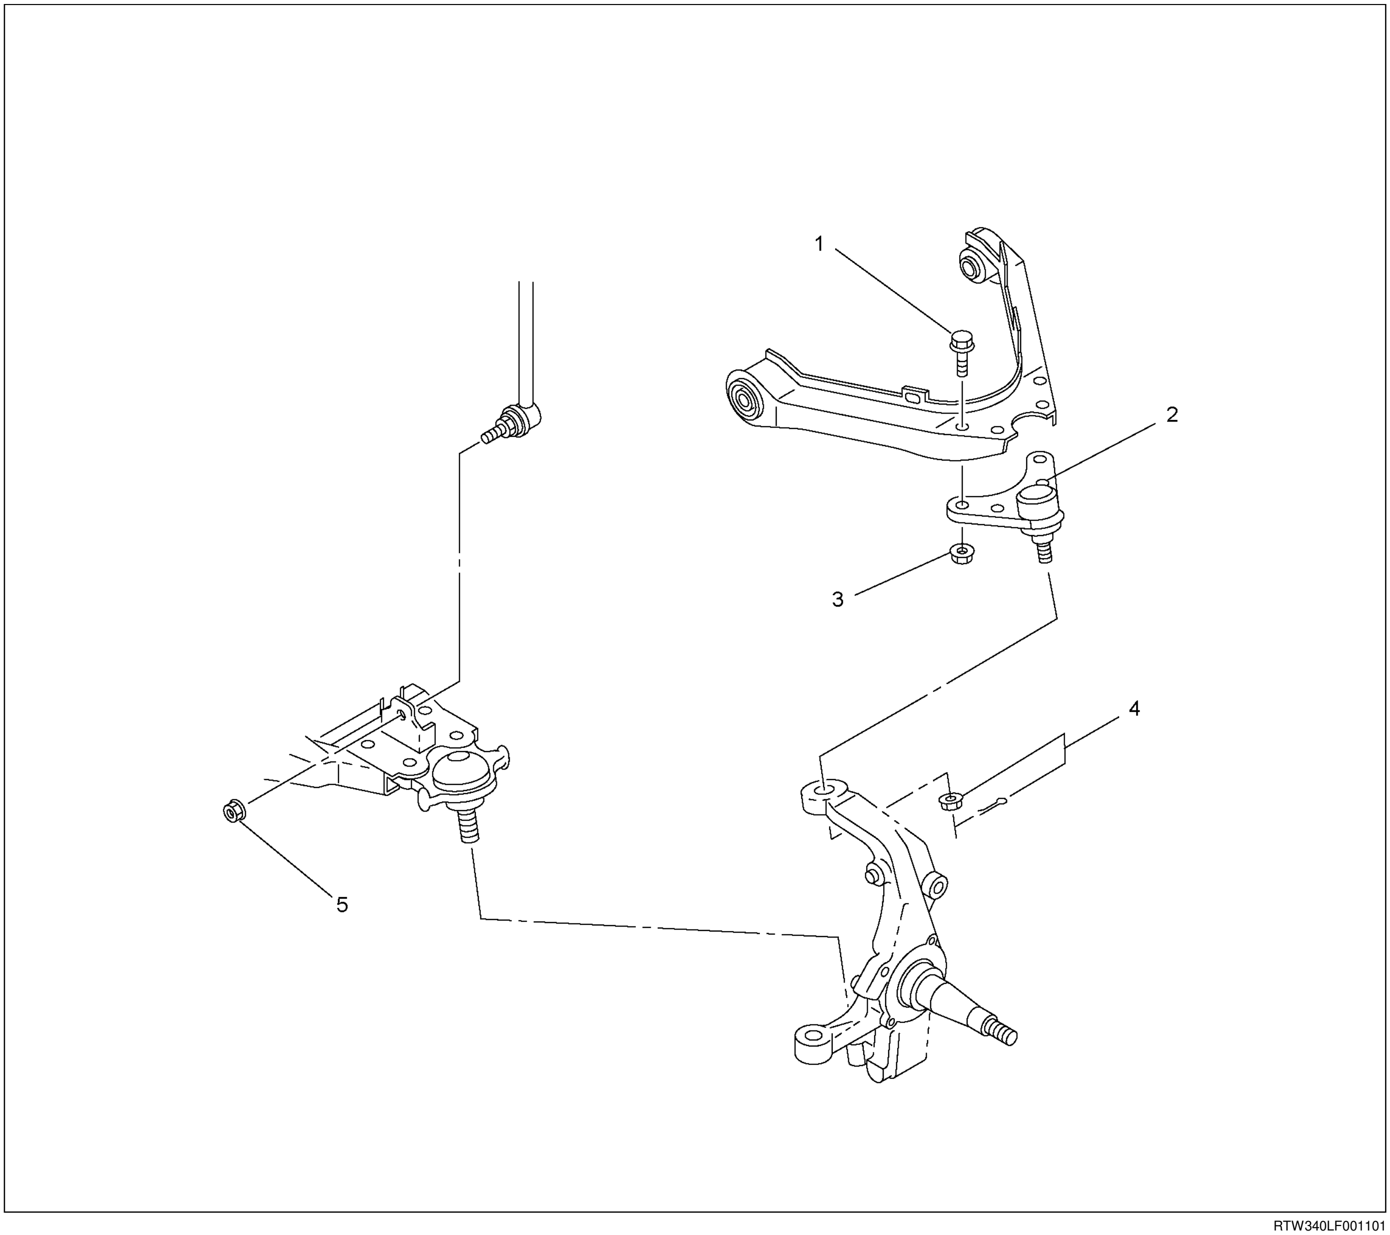
The ECM detects 15 gear changes with less than three clutch switch inputs.

NOTE

The ECM determines that a gear change has been performed by the engine speed / vehicle speed ratio.

Upper Ball Joint

Upper Ball Joint and Associated Parts



Legend

(1) Upper Ball Joint Bolt
(2) Upper Ball Joint
(3) Upper Ball Joint Nut
(4) Nut and Cotter Pin
(5) Link Nut

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to wheel in this section.
3. Remove link nut.
4. Remove upper ball joint nut and cotter pin, then use remover 5-8840-2017-0 to remove the upper ball joint from the knuckle.

CAUTION: Be careful not to damage the ball joint boot and brake hose.

Conditions for Clearing the DTC

The clutch switch circuit DTC is a Type C DTC. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type C DTCs set and conditions for clearing Type C DTCs.

Additional Information

- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Refer to 6C1-1 Engine Management – V6 – General Information for details of the clutch switch operation.
- Refer to 8C Cruise Control for clutch pedal switch operation and testing.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P0704 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0704 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Switch on the ignition with the engine not running. 2 On Tech 2 select: **Engine** / **V6 Engine** / **Data Display** / **Engine Data 1**. 3 Observe the status of the cruise control cancel switch. 4 Depress the clutch pedal. Does Tech 2 display change from Inactive to Active when the pedal is pressed?	Refer to Additional Information in this DTC	Go to Step 4
4	1 Disconnect the wiring connector from the cruise control cancel switch. Refer to 8C Cruise Control – HFV6. 2 Switch on the ignition. 3 Connect a test lamp between the voltage circuit of cruise control cancel clutch switch and a ground. Does the test lamp illuminate?	Go to Step 6	Go to Step 5
5	Repair the high resistance or open circuit fault condition in the voltage circuit of the clutch switch. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures. Was the repair completed?	Go to Step 9	—
6	Test the cruise control cancel clutch switch. Refer to 8C Cruise Control – HFV6. Was any fault found and rectified?	Go to Step 9	Go to Step 7

7	Test the control circuit of the cruise control clutch switch, which failed for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 9	Go to Step 8
8	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 9	—
9	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC P0704 fail this ignition cycle?	Go to Step 2	Go to Step 11
10	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.42 DTC P0850

DTC Descriptor

This diagnostic procedure supports DTC P0850 – Park / Neutral Signal Circuit Incorrect Signal.

Circuit Description

The Park / Neutral (P / N) switch is a part of the automatic transmission gear selector position switch assembly.

The P / N switch is a normally open switch that closes when the transmission is shifted to Park or Neutral position. The ECM applies a reference 12 V to the signal circuit of the P / N switch when it is open. When the transmission is shifted to the Park or Neutral position, the P / N switch closes and pulls the P/ N switch signal circuit to ground.

DTC P0850 sets when the ECM detects a fault condition in the P / N switch circuit.

Conditions for Running the DTC

DTC P0850 runs continuously when the ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

DTC P0850 sets when the ECM detects one of the following fault conditions:

- The P / N switch signal circuit is pulled to ground for 100 seconds while the TCM sends a signal that the transmission is in gear.
- The P / N switch signal circuit is 12 V for 100 seconds while the TCM sends a signal the transmission is in park or neutral.

Conditions for Clearing the DTC

DTC P0850 is a Type 'C' DTC. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type 'C' DTCs set and conditions for clearing Type 'C' DTCs.

Additional Information

- The ECM uses the transmission range data to enable engine cranking when DTC P0850 sets.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Refer to 6C1-1 Engine Management – V6 – General Information for details of the park / neutral switch operation.

- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P0850 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch on the ignition. 2 Using Tech 2, observe the status of the automatic transmission gear position. 3 Shift the transmission lever across all gear levels. Does Tech 2 display **P/N** when the transmission is in park or neutral and **In Gear** when the transmission lever is in other positions?	Go to Step 3	Go to Step 4
3	1 Switch off the ignition for 30 seconds. 2 Switch on the ignition. 3 Shift the transmission lever across all gear levels. Does DTC P0850 fail this ignition cycle?	Go to Step 4	Refer to Additional Information in this DTC
4	1 Remove the transmission position switch wiring connector. Refer to 7C4 Automatic Transmission_4L60E – On-vehicle Servicing. 2 Connect a test lamp between the ground circuit of the transmission switch and a 12 V source. Does the test lamp illuminate?	Go to Step 5	Go to Step 6
5	1 Connect a 3 A jumper wire between the signal circuit of the park / neutral signal circuit and a good ground. 2 Using Tech 2, observe the status of the transmission gear. Does Tech 2 display a change from **In Gear** to **P/N** when the jumper wire is connected?	Go to Step 8	Go to Step 7
6	Repair the high resistance or open circuit fault condition in the ground circuit of the transmission position switch. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures. Was the repair completed?	Go to Step 10	—
7	Test the signal circuit of the park / neutral switch for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 10	Go to Step 9
8	Replace the transmission position switch. Refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Was the repair completed?	Go to Step 10	—
9	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 10	—

Step	Action	Yes	No
10	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC P0850 fail this ignition cycle?	Go to Step 2	Go to Step 11
11	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.43 DTC P1648

DTC Descriptor

This diagnostic procedure supports DTC P1648 – Wrong Security Code Entered.

Circuit Description

Tech 2 is used to program the engine control module (ECM). Before any programming, a security code must be entered into Tech 2. The ECM will check if the code entered is correct before continuing. If the security code is incorrect, DTC P1648 sets.

Conditions for Running the DTC

Conditions for running the DTC are:

- The ignition is switched on.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

An incorrect security code is entered into Tech 2 when attempting to program the ECM.

Action Taken When the DTC Sets

When the DTC sets, the malfunction indicator lamp (MIL) is not displayed.

Conditions for Clearing the DTC

The immobiliser security code is a Type ‘C’ DTC. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type ‘C’ DTC sets and conditions for clearing Type ‘C’ DTCs.

Additional Information

- Refer to 6C1-1 Engine Management –V6 – General Information for details of the ECM operation.
- Refer to 6C1-3 Engine Management –V6 – Service Operations for details on resetting the ECM.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

4 This step tests the ECM ground circuits and supply voltage.

DTC P1648 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Using Tech 2, select the DTC display function. **NOTE** Do not attempt to perform any Tech 2 function that requires the ECM security code to be entered. Does DTC P1648 fail this ignition cycle?	Go to Step 4	Go to Step 3
3	Using Tech 2, attempt a programming function that requires the ECM security code to be entered. Refer to 6C1-3 Engine Management –V6 – Service Operations for details on resetting the ECM. Has the programming function been successfully performed?	System OK	Go to Step 4
4	1 Test all ECM ground circuits for a high resistance or an open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. 2 Test the ECM ignition supply voltage circuit for a high resistance, open circuit or short to ground fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Has any fault been found and rectified?	Go to Step 6	Go to Step 5
5	Replace the ECM. Refer to 6C1-3 Engine Management –V6 – Service Operations for details on replacing the ECM. Has the repair been completed?	Go to Step 6	—
6	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. Does DTC P1648 fail this ignition cycle?	Go to Step 2	Go to Step 7
7	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

7.44 DTC P1668, P2500 or P2501

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P1668 – Generator L Terminal Circuit Malfunction
- DTC P2500 – Generator L Terminal Low Voltage
- DTC P2501 – Generator L Terminal High Voltage

Circuit Description

The engine control module (ECM) applies a signal voltage to the Generator L (GEN L) terminal circuit to control the load of the generator on the engine. Refer to 6D1-1 Charging System for details of the charging system operation.

A GEN L terminal circuit DTC sets if the ECM detects the Gen L circuit voltage is outside the specified range for a predetermined set of parameters.

Conditions for Running the DTC

DTC P1668

Runs continuously when one of the following conditions are met:

- Ignition on Test – The ignition is switched on with the engine not running for 5 seconds.
- Engine Run Test – The engine is running at speed less than 3,000 rpm

DTC P2500

Runs continuously when the following conditions are met:

- There is no generator, CKP sensor or CMP sensor DTC set.
- The engine is running.
- The generator is not commanded off.

DTC P2501

Runs continuously when the following conditions are met:

- There is no generator, CKP sensor or CMP sensor DTC set.
- The ignition is switched on with the engine not running.

Conditions for Setting the DTC

DTC P1668

- Ignition on Test – the ECM detects a high signal voltage on the Gen L for 5 seconds.
- Engine Run Test – the ECM detects a low signal voltage on the Gen L for 5 seconds.

DTC P2500

The ECM detects a low signal voltage on the Gen L for 15 seconds.

DTC P2501

The ECM detects a high signal voltage on the Gen L for 5 seconds.

Conditions for Clearing DTC

The Generator L-terminal circuit are Type C DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type C DTC sets and conditions for clearing Type C DTCs.

Additional Information

- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Refer to 6C1-1 Engine Management – V6 – General Information for details of the ECM operation.
- Refer to 6D1-1 Charging System – V6 for details of the charging system operation.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P1668, P2500 or P2501 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P1668, P2500 or P2501 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Test the charging system for any fault condition that may cause incorrect generator operation. Refer to 6D1-1 Charging System – V6. Was any fault found and rectified?	Go to Step 6	Go to Step 4
4	Test the Gen L signal circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 6	Go to Step 5
5	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 6	—
6	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the Generator L terminal circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 7
7	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.45 DTC P1845

DTC Descriptor

This diagnostic procedure supports DTC P1845 – Engine Torque Reduction Malfunction

Circuit Description

The ECM monitors and compares the engine torque output against the maximum allowable engine torque. Refer to 6C1-1 Engine Management – V6 – General Information for details of the engine torque limit management operation.

If the requested torque is higher than the maximum allowable torque, the ECM applies engine torque limitation and DTC P1845 – Engine Torque Reduction Malfunction sets.

Conditions for Running the DTC

DTC P1845 runs continuously when the engine is running at speeds greater than 40 rpm.

Conditions for Setting the DTC

The engine torque output exceeds the maximum allowable torque output for 10 minutes.

Conditions for Clearing the DTC

DTC P1845 – Engine Torque Reduction Malfunction is a Type 'C' DTC. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type 'C' DTC sets and conditions for clearing Type 'C' DTC.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the Engine Torque Limit Management operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following number refers to the step number in the diagnostic table:

4 Fault conditions that apply excessive load on the engine may trigger this DTC.

DTC P1845 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC or road test the vehicle under various driving condition. 3 Using Tech 2, select the DTC display function. Does DTC P1845 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Are there any other ECM or TCM DTCs set?	Refer to the appropriate DTC table.	Go to Step 4
4	Inspect for fault conditions in the engine or transmission that applies excessive load on the engine. Was any fault found and rectified?	Go to Step 6	Go to Step 5
5	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 6	—
6	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC P1845 fail this ignition cycle?	Go to Step 2	Go to Step 7

Step	Action	Yes	No
7	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.46 DTC P2096 or P2098

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P2096 Post Catalyst O2 Sensor Fuel Trim Below Lower Limit (Bank 1)
- DTC P2098 Post Catalyst O2 Sensor Fuel Trim Below Lower Limit (Bank 2)

Circuit Description

The wide band heated oxygen sensor 1 measures the amount of oxygen in the exhaust system and provides more information than the switching style HO2S2. The wide band sensor consists of an oxygen sensing cell, an oxygen pumping cell, and a heater. The exhaust gas sample passes through a diffusion gap between the sensing cell and the pumping cell. The engine control module (ECM) supplies a voltage to the HO2S and uses this voltage as a reference to the amount of oxygen in the exhaust system. An electronic circuit within the ECM controls the pump current through the oxygen pumping cell, maintaining a constant voltage in the oxygen sensing cell. The ECM monitors the voltage variation in the sensing cell and attempts to keep the voltage constant by increasing or decreasing the amount of current flow, or oxygen ion flow, to the pumping cell. By measuring the amount of current required to maintain the voltage in the sensing cell, the ECM can determine the concentration of oxygen in the exhaust. The HO2S voltage is displayed as a lambda value. A lambda value of 1 is equal to a stoichiometric air fuel ratio of 14.7:1. Under normal operating conditions, the lambda value will remain around 1. When the fuel system is lean, the oxygen level will be high and the lambda signal will be high or more than 1. When the fuel system is rich, the oxygen level will be low, and the lambda signal will be low or less than 1. The ECM uses this information to maintain the correct air / fuel ratio.

Fuel trim biasing is used by the ECM to keep the post catalyst HO2S voltage within a range of 580 – 665 mV as possible. This allows optimal catalyst efficiency under light load conditions, such as at idle or a steady cruise. The ECM constantly monitors how lean or rich the fuel trim bias is commanded. If the ECM detects that the fuel trim bias is commanded lean for more than a calibrated amount, DTC P2096 or P2098 sets.

Conditions for Running the DTC

- Before the ECM can report DTC P2096 or P2098 failed, DTCs P0030, P0031, P0032, P0041, P0050, P0051, P0052, P0101, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2231, P2234, P2237, P2240, P2243, P2247, P2251, P2254, P2270, P2271, P2273, P2626, and P2629 must run and pass.
- The engine is operating for more than 2 seconds.
- The post catalyst fuel trim control is enabled.
- The front and rear HO2S are in Closed Loop.
- DTCs P2096and P2098 run continuously once the above conditions are met for more than 40 seconds.

Conditions for Setting the DTC

The post catalyst fuel trim correction factor is biased lean by more than 3 percent of the HO2S lambda value for more than 4 seconds.

Action Taken When the DTC Sets

- The ECM activates the malfunction indicator lamp (MIL) on the second consecutive ignition cycle that the diagnostic runs and fails.
- The ECM records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive ignition cycle, the control module records the operating conditions at the time of the failure. The control module writes the operating conditions to the Freeze Frame and updates the Failure Records.

Conditions for Clearing the MIL/DTC

These post catalyst fuel trim system DTCs are Type 'B' DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type 'C' DTC sets and conditions for clearing Type 'B' DTCs.

Use Tech 2 to clear the MIL and the DTC.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the post catalyst oxygen sensor operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since a fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.
- The lower connector of the ECM is connector X1 and the upper connector of the ECM is connector X2. Refer to 3.2 ECM Connector End Views in this Section, for pin and circuit identification.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2 This step determines if a condition exists.

4 This step is testing for a rear HO2S sensor circuit condition. A circuit condition sets this DTC.

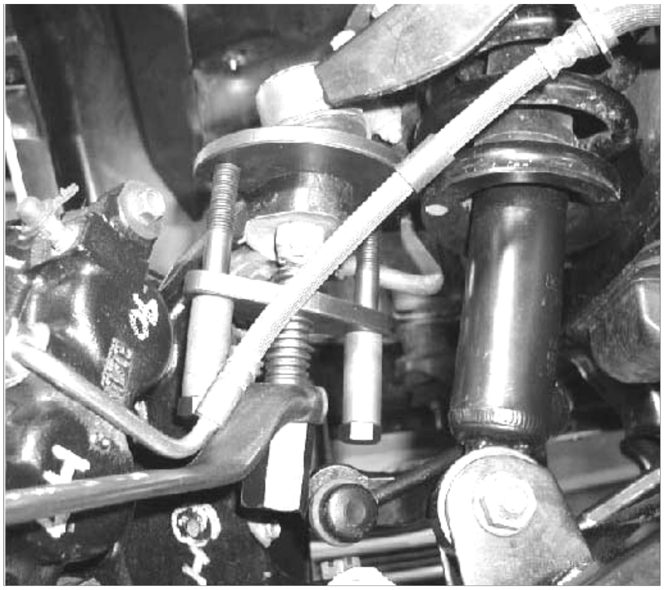
7 This step inspects for the rear sensors being connected to the correct bank of the engine. This condition causes this DTC to set.

8 This step is testing for an intermittent circuit condition. Thoroughly inspect the HO2S circuits for an intermittent circuit condition.

9 This step is testing for an intermittent circuit condition. Thoroughly inspect the HO2S circuits for an intermittent circuit condition.

DTC P2096 or P2098 Diagnostic Table

Step	Action	Value(s)	Yes	No
1	Has the Diagnostic System Check been completed?	—	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	**WARNING** **Refer to Road-testing, in 1.5 Warning Caution and Notes in this Section.** 1 Switch off the ignition for 30 seconds. **NOTE** The rear heated oxygen sensors (HO2S) must be in Closed Loop for this diagnostic to run. A road load condition is necessary to obtain Closed Loop. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P2096 or P2098 fail this ignition cycle?	—	Go to Step 3	Refer to Additional Information in this DTC



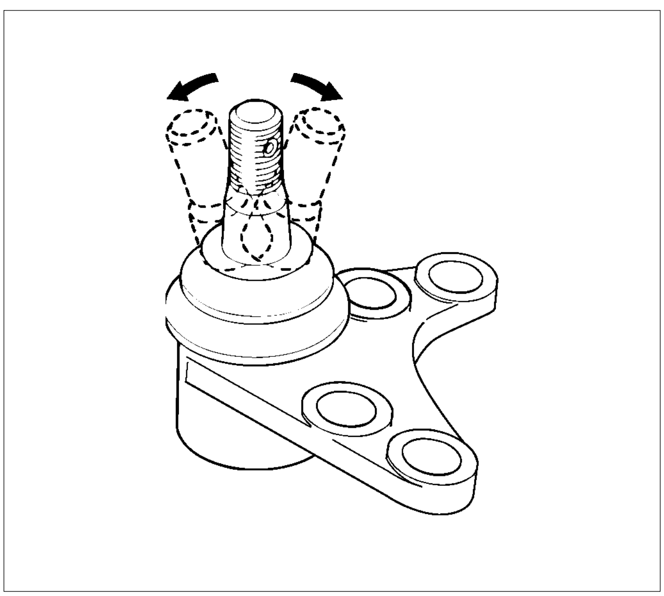
P1010005

5. Remove upper ball joint bolt and nut.
6. Remove upper ball joint.

Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal conditions are found during inspection.

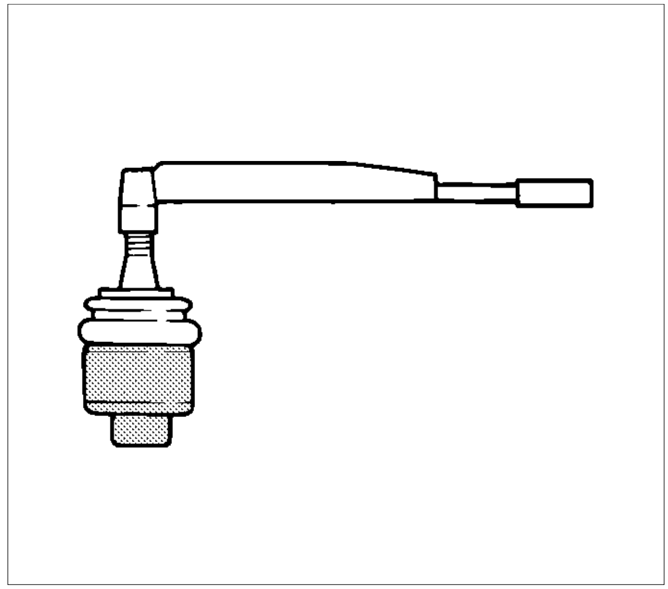
- Inspect the lower end of the boot for damage or grease leaks. Move the ball joint as shown in the figure to confirm its normal movement.
- Inspect screw/taper area of ball for damage.
- If any defects are found by the above inspections, replace the ball joint assembly with new one.



450R300030

- After moving the ball joint 4 or 5 times, attach nut then measure the preload.

Starting torque: 1.3-3.2 N·m (0.13-0.33 kgf·m/0.9-2.4 lb·ft)



450RS024

If the above limits specified are exceeded, replace the ball joint assembly.

Installation

1. Install upper ball joint.
2. Install upper ball joint bolt and nut, and then tighten them to the specified torque.

Torque: 31 N·m (3.2 kgf·m/23 lb·ft)

3. Install nut and cotter pin then tighten the nut to the specified torque with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 98 N·m (10.0 kgf·m/72 lb·ft)

4. Install link nut, then tighten to the specified torque.

Torque: 50 N·m (5.1 kgf·m/37 lb·ft)

3	Is DTC P0041, P0137, P0138, P0140, P0157, P0158, or P0160 also set?	—	Go to the appropriate DTC Table in this Section	Go to Step 4
4	1 Operate the engine above 1,200 rpm for 30 seconds. 2 Use Tech 2 to observe appropriate rear heated oxygen sensor (HO2S) voltage Is the voltage more or less than the specified value?	60 mV	Go to Step 7	Go to Step 5
5	1 Turn OFF the ignition. 2 Disconnect the appropriate HO2S. 3 Ignition ON, engine OFF. 4 Use Tech 2 to observe the oxygen sensor (HO2S) voltage parameter. Is the voltage within the specified range?	350 – 550 mV	Go to Step 12	Go to Step 6
6	1 Test the appropriate HO2S signal circuit for a short to ground. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 14
7	1 Inspect the rear HO2S for being connected to the correct bank of the engine. If the sensors are connected to the incorrect bank, swap the connectors as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 8
8	1 Shake the related HO2S harnesses for the front sensor between the HO2S harness connector and the engine control module (ECM) while monitoring the appropriate HO2S lambda parameter. Does the HO2S parameter change abruptly while moving the related harnesses?	—	Go to Step 15	Go to Step 9
9	1 Shake the related HO2S harnesses for the rear sensor between the HO2S harness connector and the ECM while monitoring the appropriate HO2S voltage parameter. Does the HO2S parameter change abruptly while moving the related harnesses?	—	Go to Step 15	Go to Step 10

10	1 Ignition OFF. 2 Disconnect the front and rear HO2S. 3 Inspect the front and rear HO2S for the following conditions: – Damaged wiring between the HO2S and the ECM – An intermittent circuit condition causes this DTC to set. – Terminal corrosion or water intrusion in the HO2S harness connectors. – The correct terminal tension. – The HO2S is securely installed. – Any exhaust leaks – Refer to 6F Exhaust System – V6. 4 Repair as necessary. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 11
11	1 Disconnect the ECM. 2 Test the appropriate front HO2S circuits for being shorted together between the HO2S connector and the ECM. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 13
12	1 Test for shorted terminals and for poor connections at the HO2S. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 17
13	1 Test for shorted terminals and for poor connections at the ECM. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 16
14	1 Test for shorted terminals and for poor connections at the ECM. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
15	1 Repair the circuit as necessary. Refer to 8A Electrical - Body and Chassis. Did you complete the repair?	—	Go to Step 19	—
16	1 Replace the appropriate HO2S. Refer to the Oxygen Sensor 1 procedure, in 6C1- Engine Management – V6 Service Operations. Did you complete the replacement?	—	Go to Step 19	—
17	1 Replace the appropriate HO2S. Refer to the Oxygen Sensor 2 procedure, in 6C1- Engine Management – V6 Service Operations. Did you complete the replacement?	—	Go to Step 19	—
18	1 Replace the ECM. Refer to Engine Control Module (ECM) Remove, Reinstall and ECM Reset in 6C1- Engine Management – V6 Service Operations. Did you complete the replacement?	—	Go to Step 19	—

19	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC P2096 or P2098 fail this ignition cycle?	—	Go to Step 2	Go to Step 20
20	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	—	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, clear all DTCs and verify correct operation				

7.47 DTC P2097 or P2099

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P2097 Post Catalyst O2 Sensor Fuel Trim Above Upper Limit (Bank 1)
- DTC P2099 Post Catalyst O2 Sensor Fuel Trim Above Upper Limit (Bank 2)

Circuit Description

The wide band heated oxygen sensor 1 measures the amount of oxygen in the exhaust system and provides more information than the switching style HO2S2. The wide band sensor consists of an oxygen sensing cell, an oxygen pumping cell, and a heater. The exhaust gas sample passes through a diffusion gap between the sensing cell and the pumping cell. The engine control module (ECM) supplies a voltage to the HO2S and uses this voltage as a reference to the amount of oxygen in the exhaust system. An electronic circuit within the ECM controls the pump current through the oxygen pumping cell, maintaining a constant voltage in the oxygen sensing cell. The ECM monitors the voltage variation in the sensing cell and attempts to keep the voltage constant by increasing or decreasing the amount of current flow, or oxygen ion flow, to the pumping cell. By measuring the amount of current required to maintain the voltage in the sensing cell, the ECM can determine the concentration of oxygen in the exhaust. The HO2S voltage is displayed as a lambda value. A lambda value of 1 is equal to a stoichiometric air fuel ratio of 14.7:1. Under normal operating conditions, the lambda value will remain around 1. When the fuel system is lean, the oxygen level will be high and the lambda signal will be high or more than 1. When the fuel system is rich, the oxygen level will be low, and the lambda signal will be low or less than 1. The ECM uses this information to maintain the correct air / fuel ratio.

Fuel trim biasing is used by the ECM to keep the post catalyst HO2S voltage within a range of 580 – 665 mV as possible. This allows optimal catalyst efficiency under light load conditions, such as at idle or a steady cruise. The ECM constantly monitors how lean or rich the fuel trim bias is commanded. If the ECM detects that the fuel trim bias is commanded rich for more than a calibrated amount, DTC P2097 or P2099 sets.

Conditions for Running the DTC

- Before the ECM can report DTC P2096 or P2098 failed, DTCs P0030, P0031, P0032, P0041, P0050, P0051, P0052, P0101, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2231, P2234, P2237, P2240, P2243, P2247, P2251, P2254, P2270, P2271, P2273, P2626, and P2629 must run and pass.
- The engine is operating for more than 2 seconds.
- The post catalyst fuel trim control is enabled.
- The front and rear HO2S are in Closed Loop.
- DTCs P2097 and P2099 run continuously once the above conditions are met for more than 40 seconds.

Conditions for Setting the DTC

The post catalyst fuel trim correction factor is biased rich by more than –3 percent of the HO2S lambda value for more than 4 seconds.

Action Taken When the DTC Sets

- The ECM activates the malfunction indicator lamp (MIL) on the second consecutive ignition cycle that the diagnostic runs and fails.
- The ECM records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive ignition cycle, the control module records the operating conditions at the time of the failure. The control module writes the operating conditions to the Freeze Frame and updates the Failure Records.

Conditions for Clearing the MIL/DTC

These post catalyst fuel trim system DTCs are Type 'B' DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type 'C' DTC sets and conditions for clearing Type 'B' DTCs.

Use Tech 2 to clear the MIL and the DTC.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the post catalyst oxygen sensor operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since a fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.
- The lower connector of the ECM is connector X1 and the upper connector of the ECM is connector X2. Refer to 3 Wiring Diagrams and Connector Charts in this Section, for pin and circuit identification.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2 This step determines if a condition exists.

4 This step is testing for a rear HO2S sensor circuit condition. A circuit condition sets this DTC.

7 This step inspects for the rear sensors being connected to the correct bank of the engine. This condition causes this DTC to set.

8 This step is testing for an intermittent circuit condition. Thoroughly inspect the HO2S circuits for an intermittent circuit condition.

9 This step is testing for an intermittent circuit condition. Thoroughly inspect the HO2S circuits for an intermittent circuit condition.

DTC P2096 or P2098 Diagnostic Table

Step	Action	Value(s)	Yes	No
1	Has the Diagnostic System Check been completed?	—	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section

2	**WARNING** **Refer to Road-testing, in 1.5 Warning Caution and Notes in this Section.** 1 Switch off the ignition for 30 seconds. **NOTE** The rear heated oxygen sensors (HO2S) must be in Closed Loop for this diagnostic to run. A road load condition is necessary to obtain Closed Loop. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P2097 or P2099 fail this ignition cycle?	—	Go to Step 3	Refer to Additional Information in this DTC
3	Is DTC P0041, P0137, P0138, P0140, P0157, P0158, or P0160 also set?	—	Go to the appropriate DTC Table in this Section	Go to Step 4
4	1 Operate the engine above 1,200 rpm for 30 seconds. 2 Use Tech 2 to observe appropriate rear heated oxygen sensor (HO2S) voltage. Is the voltage less than the specified value?	1,050 mV	Go to Step 7	Go to Step 5
5	1 Ignition OFF. 2 Disconnect the appropriate HO2S. 3 Ignition ON, engine OFF. 4 Use Tech 2 to observe the oxygen sensor (HO2S) voltage parameter. Is the voltage within the specified range?	350 – 550 mV	Go to Step 12	Go to Step 6
6	1 Test the appropriate HO2S signal circuit for a short to voltage. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 14
7	1 Inspect the rear HO2S for being connected to the correct bank of the engine. If the sensors are connected to the incorrect bank, swap the connectors as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 8
8	1 Shake the related HO2S harnesses for the front sensor between the HO2S harness connector and the engine control module (ECM) while monitoring the appropriate HO2S lambda parameter. Does the HO2S parameter change abruptly while moving the related harnesses?	—	Go to Step 15	Go to Step 9
9	1 Shake the related HO2S harnesses for the rear sensor between the HO2S harness connector and the ECM while monitoring the appropriate HO2S voltage parameter. Does the HO2S parameter change abruptly while moving the related harnesses?	—	Go to Step 15	Go to Step 10

10	1 Ignition OFF. 2 Disconnect the front and rear HO2S. 3 Inspect the front and rear HO2S for the following conditions: – Damaged wiring between the HO2S and the ECM – An intermittent circuit condition causes this DTC to set. – Terminal corrosion or water intrusion in the HO2S harness connectors. – The correct terminal tension. – The HO2S is securely installed. – Any exhaust leaks – Refer to 6F Exhaust System – V6. 4 Repair as necessary. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 11
11	1 Disconnect the ECM. 2 Test the appropriate front HO2S circuits for being shorted together between the HO2S connector and the ECM. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 13
12	1 Test for shorted terminals and for poor connections at the ECM. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 17
13	1 Test for shorted terminals and for poor connections at the ECM. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 16
14	1 Test for shorted terminals and for poor connections at the ECM. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
15	1 Repair the circuit as necessary. Refer to 8A Electrical - Body and Chassis. Did you complete the repair?	—	Go to Step 19	—
16	1 Replace the appropriate HO2S. Refer to the Oxygen Sensor 1 procedure, in 6C1- Engine Management – V6 Service Operations. Did you complete the replacement?	—	Go to Step 19	—
17	1 Replace the appropriate HO2S. Refer to the Oxygen Sensor 2 procedure, in 6C1- Engine Management – V6 Service Operations. Did you complete the replacement?	—	Go to Step 19	—
18	1 Replace the ECM. Refer to Engine Control Module (ECM) Remove, Reinstall and ECM Reset in 6C1- Engine Management – V6 Service Operations. Did you complete the replacement?	—	Go to Step 19	—

19	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC P2097 or P2099 fail this ignition cycle?	—	Go to Step 2	Go to Step 20
20	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	—	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, clear all DTCs and verify correct operation				

7.48 DTC P2105

DTC Descriptor

This diagnostic procedure supports DTC P2105 – Throttle Control Forced Engine Shutdown.

Circuit Description

The ECM monitors and evaluates the accelerator pedal position (APP) sensors signal voltage along with other sensor inputs to determine the desired throttle opening. To control the throttle plate movement, the ECM applies a pulse width modulated (PWM) signal voltage to the throttle actuator motor through the throttle actuator motor control circuits.

- At engine idle speed or when no current is flowing into the throttle actuator control (TAC) motor, a constant force return spring holds the throttle plate at a constant seven percent throttle opening position.
- To control the throttle opening, the ECM applies PWM voltage to the TAC motor. The ECM increases this PWM voltage duty cycle to increase the throttle opening.

To decrease the throttle opening from the seven percent rest position, the ECM reverses the polarity of the TAC motor control circuit then applies a PWM voltage to the TAC motor.

The ECM monitors the ignition supply voltage to ensure the correct operation of the engine management components and sensors. DTC P2105 sets if the ECM detects an incorrect ignition voltage.

Conditions for Running the DTC

DTC P2105 runs continuously when the ECM completed the power-down process in the last ignition cycle.

Conditions for Setting the DTC

The ECM detects an incorrect voltage level at the ignition supply circuits.

Conditions for Clearing the DTC

DTC P2105 – Throttle Actuator Control (TAC) Module Internal Circuit is a Type A DTC. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type A DTC sets and conditions for clearing Type A DTC.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the TP actuator operation.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P2105 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P2105 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Remove the ECM / TCM Fuse 32 from the engine compartment relay panel assembly. **NOTE** Voltage may be available at both terminals of Fuse 32 because of normal voltage feed back condition. Therefore, the fuse must be removed prior to testing. 2 Inspect the ECM / TCM Fuse 32 for an open circuit fault condition. Was any fault found and rectified?	Go to Step 7	Go to Step 4
4	1 Remove the engine control relay from the engine compartment relay panel assembly. 2 Test the ignition circuit of the ECM, from the fuse terminal to the Engine control relay for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. **NOTE** The engine control relay supplies ignition voltage to other components and sensors through the ECM ignition circuit. A fault condition in this ignition circuit may trigger DTCs on components or sensors connected to this circuit. Was any fault found and rectified?	Go to Step 7	Go to Step 5
5	Disconnect the vehicle side wiring connector of the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Test both ignition circuits of the ECM, from the fuse terminal to the ECM wiring connector for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 7	Go to Step 6
6	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 7	—
7	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC P2105 fail this ignition cycle?	Go to Step 2	Go to Step 8
8	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK

Step	Action	Yes	No
When all diagnosis and repairs are completed, check the system for correct operation.			

7.49 DTC P2107

DTC Descriptor

This diagnostic procedure supports DTC P2107 – Throttle Control Malfunction.

Circuit Description

The ECM applies 5 V to the throttle position (TP) sensor 1 through the 5 V reference circuit 2701 and the ground through the low reference circuit 2752. TP sensor 1 and TP sensor 2 share a common 5 V reference circuit and a common low reference circuit.

The TP sensor 1 and TP sensor 2 have individual signal circuits with opposite functionality. These signal circuits provide the ECM with a signal voltage that is proportional to the throttle plate movement.

- The TP sensor 1 signal voltage is less than 1 V when the throttle plate is in closed position, which increases to greater than 4 V when the throttle plate is moved to wide-open throttle.
- The TP sensor 2 signal voltage is greater than 4 V when the throttle plate is in closed position, which decreases to less than 1 V when the throttle plate is moved to wide-open throttle.

The ECM monitors and evaluates the accelerator pedal position (APP) sensors signal voltage along with other sensor inputs to determine the desired throttle opening. To control the throttle plate movement, the ECM applies a pulse width modulated (PWM) signal voltage to the throttle actuator motor through the throttle actuator motor control circuits.

- At engine idle speed or when no current is flowing into the throttle actuator control (TAC) motor, a constant force return spring holds the throttle plate at a constant seven percent throttle opening position.
- To control the throttle opening, the ECM applies PWM voltage to the TAC motor. The ECM increases this PWM voltage duty cycle to increase the throttle opening.

To decrease the throttle opening from the seven percent rest position, the ECM reverses the polarity of the TAC motor control circuit then applies a PWM voltage to the TAC motor.

If the ECM detects the TP sensor 1 amplification output does not correlate with the TP sensor 1 signal voltage during a predetermined sets of conditions, DTC P2107 sets.

Conditions for Running the DTC

DTC P2107 runs continuously once the following conditions are met:

- The vehicle speed is 0 km/h.
- The engine speed is less than 40 rpm
- The engine coolant temperature is 5 – 60° C.
- The intake air temperature is 5 – 60° C.
- The ignition voltage is greater than 10 V.
- The APP is less than 15 percent.
- The ECM is performing the closed throttle test with the ignition switched on and the engine not running.

Conditions for Setting the DTC

The ECM detects that its internal TP sensor 1 amplification output does not correlate with the TP sensor 1 signal voltage.

Conditions for Clearing the DTC

DTC P2107 – Throttle Actuator Control Module Internal Circuit is a Type 'C' DTC. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type 'C' DTC sets and conditions for clearing Type 'C' DTC.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the TP sensor operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P2107 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P2107 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 4	—
4	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC P2107 fail this ignition cycle?	Go to Step 2	Go to Step 5
5	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.50 DTC P2122, P2123, P2127, P2128 or P2138

DTC Descriptors

This diagnostic procedure supports the following DTCs:

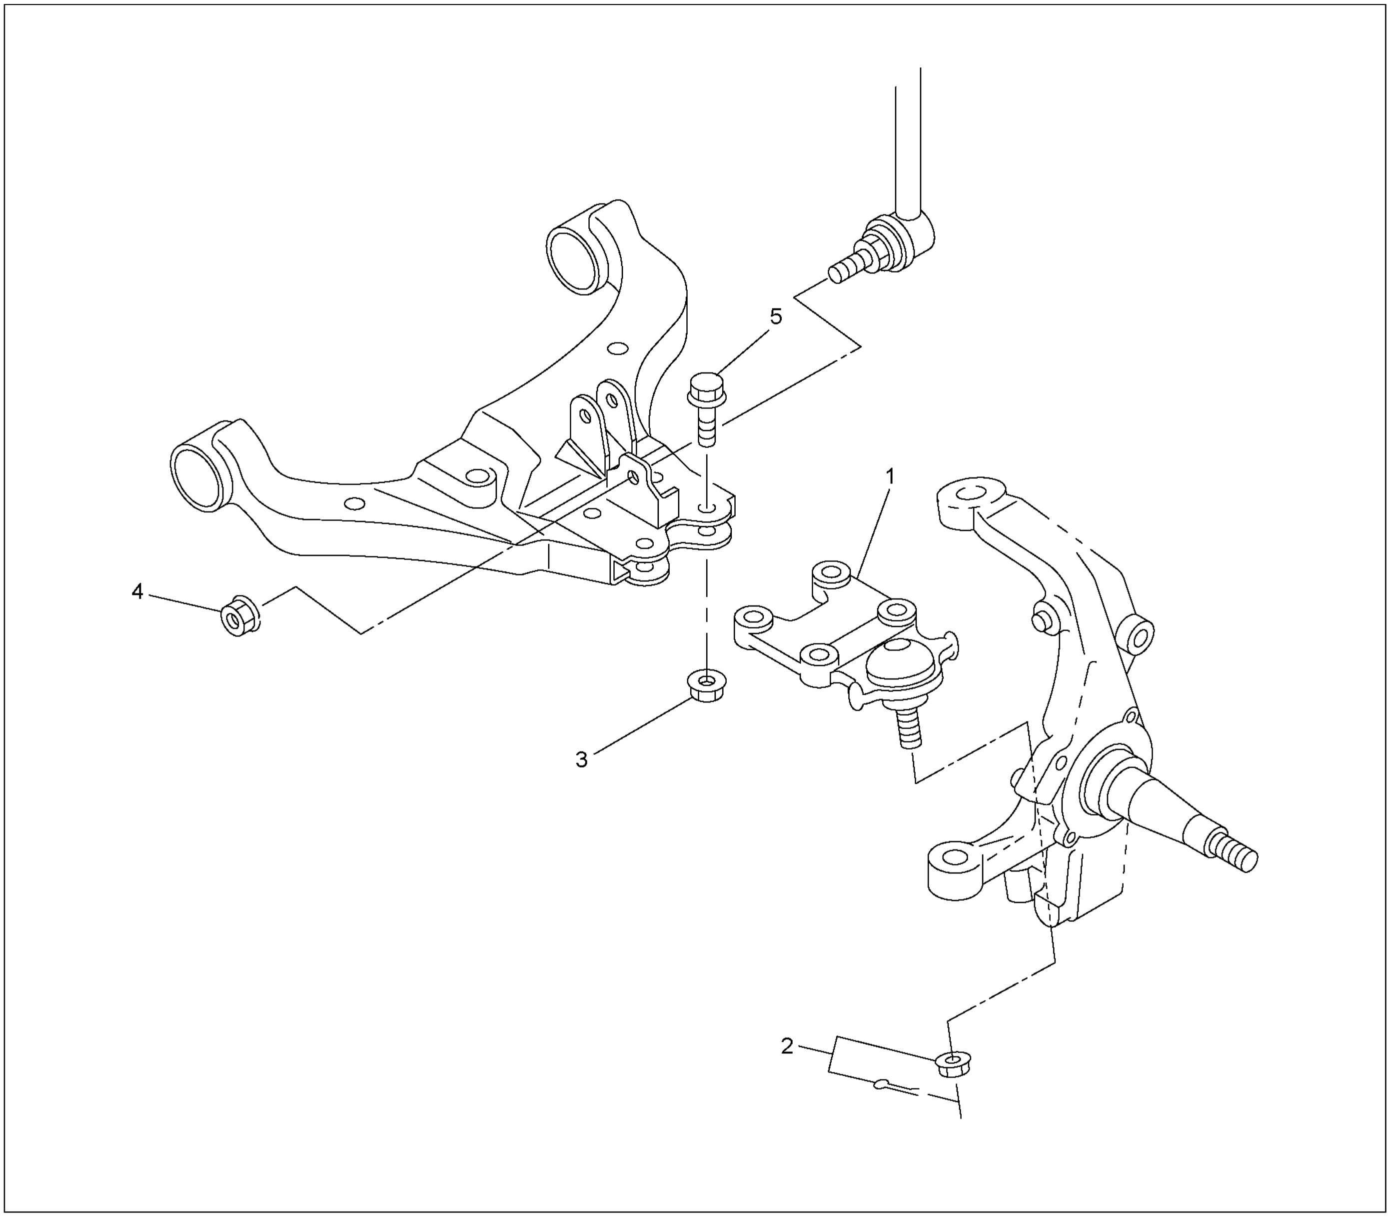
- DTC P2122 – Accelerator Pedal Position Sensor 1 Voltage Low
- DTC P2123 – Accelerator Pedal Position Sensor 1 Voltage High
- DTC P2127 – Accelerator Pedal Position Sensor 2 Voltage Low
- DTC P2128 – Accelerator Pedal Position Sensor 2 Voltage High
- DTC P2138 – Accelerator Pedal Position Sensor 1 – 2 Correlation

Circuit Description

The ECM applies a separate 5 V reference circuit and low reference circuit to the accelerator pedal position (APP) sensor 1 and sensor 2. The APP sensors produce a signal voltage that represents the accelerator pedal position.

Lower Ball Joint

Lower Ball Joint and Associated Parts



RTW340LF002201

Legend

(1) Lower Ball Joint
(2) Nut and Cotter Pin
(3) Lower Ball Joint Nut
(4) Link Nut
(5) Lower Ball Joint Bolt

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the link nut.
4. Support lower control arm with a jack.
5. Remove lower ball joint nut and cotter pin, then use remover 5-8840-2017-0 to remove the lower ball joint from the knuckle.

- The APP sensor 1 signal voltage increases from 1 V at rest position to greater than 4 V when the accelerator pedal is fully depressed.
- The APP sensor 2 signal voltage increases from 0.5 V at rest position to greater than 2 V when the accelerator pedal is fully depressed.

The ECM monitors and evaluates the APP sensors signal voltage along with other sensor inputs to determine the desired throttle opening. An APP sensor circuit DTC sets if the signal voltage of the APP sensor is outside the predetermined range.

Conditions for Running the DTC

DTC P2122, P2123, P2127, P2128 and P2138 runs continuously once the following conditions are met:

- The ignition is switched on.
- The ignition voltage is greater than 7 V.

Conditions for Setting the DTC

DTC P2122

The ECM determines the APP sensor 1 signal voltage is less than 0.84 V.

DTC P2123

The ECM determines the APP sensor 1 signal voltage is greater than 4.82 V.

DTC P2127

The ECM determines the APP sensor 2 signal voltage is less than 0.66 V.

DTC P2128

The ECM determines the APP sensor 2 signal voltage is greater than 4.82 V.

DTC P2138

The ECM detects the difference between the APP sensor 1 and sensor 2 signal voltage is greater than the predetermined value.

Conditions for Clearing DTC

The APP sensor circuit DTCs are Type ‘A’ DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type ‘A’ DTC sets and conditions for clearing Type ‘A’ DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the APP sensor operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 Tests the APP sensor internal circuits throughout its range of motion. If the DTC fails while performing this test, there is an internal fault condition in the APP sensor internal circuitry.

5 Measures the integrity of the TP sensor low reference circuit. Removal of the ECM Fuse 29 enables the ECM to power down completely prior to the test procedure.

DTC P2122, P2123, P2127, P2128 or P2138 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Quickly depress the accelerator pedal to wide-open throttle then release pedal. Repeat this procedure several times or operate the vehicle within the conditions for running the DTC. 4 Using Tech 2, select the DTC display function. Does DTC P2122, P2123, P2127, P2128 or P2138 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Disconnect the APP sensor wiring connector. 2 Switch on the ignition with the engine not running. 3 Using a digital multimeter, measure the voltage between the 5 V reference circuit of the appropriate APP sensor and the ECM housing. Does the multimeter display 4.8 – 5.2 V?	Go to Step 4	Go to Step 6
4	1 Connect a 3 A fused jumper wire between the 5 V reference circuit and the signal circuit of the appropriate APP sensor. 2 Switch on the ignition with the engine not running. 3 Using Tech 2, observe the voltage parameter appropriate APP sensor. Does Tech 2 display **4.8 – 5.2 V**?	Go to Step 5	Go to Step 7
5	1 Switch off the ignition. 2 Remove ECM / TCM Fuse 29 from the engine compartment fuse and relay panel assembly. 3 Using a DMM, measure the resistance between the appropriate TP sensor low reference circuit and the ECM housing. **NOTE** Install the ECM Fuse 29 to the engine compartment fuse and relay panel assembly after completing this test. Does the multimeter display 5 Ω?	Go to Step 9	Go to Step 8
6	Test the 5 V reference circuit of the appropriate APP sensor for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 10
7	Test the signal circuit of the appropriate APP sensor for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 10
8	Test the low reference circuit of the appropriate APP sensor for a high resistance or an open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 10

Step	Action	Yes	No
9	Replace the accelerator pedal assembly. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 11	—
10	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 11	—
11	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the APP Sensor Circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 12
12	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.51 DTC P2177 or P2179

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P2177 Fuel Trim System Lean at Cruise or Accel Bank 1
- DTC P2179 Fuel Trim System Lean at Cruise or Accel Bank 2

Circuit Description

The engine control module (ECM) controls the air / fuel metering system to provide the best possible combination of driveability, fuel economy, and emission control. Fuel delivery is controlled differently during Open and Closed Loop. During Open Loop, the ECM determines fuel delivery based on sensor signals without heated oxygen sensor (HO2S) input. During Closed Loop, the HO2S inputs are added and used by the ECM to calculate short and long term fuel trim fuel delivery adjustments. If the HO2S indicate a lean condition, fuel trim values will be above 0 percent. If the HO2S indicate a rich condition, fuel trim values will be below 0 percent. Short term fuel trim values change rapidly in response to the HO2S signals. Long term fuel trim makes coarse adjustments to maintain an air / fuel ratio of 14.7:1. If the ECM detects an excessively lean condition, this DTC sets.

Conditions for Running the DTC

- Before the ECM can report DTC P2177 or P2179 failed, DTCs P0101, P0121, P0122, P0123, P0133, P0153, P0221, P0222, P0223, P0336, P0338, P0443, P0458, P0459, P0461, P0462, P0463, P2066, P2067, and P2068 must run and pass.
- The fuel system is in closed loop.
- The long fuel trim is active.
- The engine coolant temperature (ECT) is more than 60° C.
- The evaporative emission (EVAP) canister purge solenoid valve is not enabled.
- The intake air temperature (IAT) is less than 60° C.
- The fuel level is more than 11.6 percent.
- The amount of air flow into the engine is more than 7,000 grams.
- DTC P2177 and P2179 runs continuously once the above conditions are met for at least 300 seconds.

Conditions for Setting the DTC

- The Total Fuel Trim Avg. is more than 23 percent.
- The condition exists for 4 seconds.

Action Taken When the DTC Sets

- The control module illuminates the malfunction indicator lamp (MIL) on the second consecutive ignition cycle that the diagnostic runs and fails.
- The control module records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive ignition cycle, the control module records the operating conditions at the time of the failure. The control module writes the operating conditions to the Freeze Frame and updates the Failure Records.

Conditions for Clearing the MIL/DTC

- The control module turns OFF the malfunction indicator lamp (MIL) after four consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC, Last Test Failed, clears when the diagnostic runs and passes.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- Use Tech 2 to clear the MIL and the DTC.

Additional Information

- A fuel system delivery condition causes this DTC to set. Thoroughly inspect all items that cause a lean condition.
- Any un-metered air into the engine causes this DTC to set. Thoroughly inspect all areas of the engine for vacuum leaks.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2 This step determines if there is a current condition.

4 If DTC P2177 and P2179 are set at the same time, this indicates that both banks of the engine are operating lean. Inspect for items that would cause both banks of the engine to operate lean.

5 Disconnecting the mass air flow (MAF) sensor determines if the MAF sensor signal is skewed. If the Short Term FT parameter changes more than the specified value, there is a condition with the MAF sensor. A MAF sensor condition can cause this DTC without setting a MAF DTC. If there is a MAF sensor condition, the MAF sensor parameters will appear to be within range.

6 A vacuum leak causes DTC P2177 and P2179 to set at the same time. Inspect all areas of the engine for a vacuum leak. Also inspect the PCV valve for being the correct one for this application. Make sure that the engine oil fill cap is in place and that it is tight. Verify that the engine oil dip stick is fully seated.

DTC P2177 or P2179 Diagnostic Table

Step	Action	Value(s)	Yes	No
1	Has the Diagnostic System Check been completed?	—	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section

2	**NOTE** If any DTCs are set, except P2177 or P2179, refer to those DTCs before proceeding with this diagnostic. 1 Idle the engine at the normal operating temperature. 2 Check that the fuel system is operating in Closed Loop. 3 Observe the Total Fuel Trim Avg. parameter for bank 1 or bank 2 with a scan tool. Is the Total Fuel Trim Avg. less than the specified value indicated?	23%	Go to Step 3	Go to Step 4
3	1 Use Tech 2 to clear the DTC/s. 2 Ignition OFF for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the Conditions for Running the DTC. Does the DTC fail this ignition cycle?	—	Go to Step 4	Refer to Additional Information in this DTC
4	Are both banks of the engine operating lean?	—	Go to Step 5	Go to Step 7
5	1 Start the engine. **NOTE** Additional DTCs will set when the MAF sensor disconnected. 2 Disconnect the mass air flow (MAF) sensor harness connector while the engine is operating. 3 Observe the Short Term FT parameter for bank 1 and bank 2, using Tech 2. 4 Reconnect the MAF sensor after completing this step. Does the Short Term FT parameter for both banks of the engine change more than the specified value with the MAF sensor disconnected?	20%	Go to 7.6 DTC P0101, P0102 or P0103in this Section	Go to Step 6

6	1 Inspect for the following conditions: – The vacuum hoses for splits, kinks, and proper connections. – The throttle body and the intake manifold for vacuum leaks. – The crankcase ventilation valve and system for leaks. – The air intake system after the MAF sensor for vacuum leaks. – Contaminated fuel. Refer to 6.5 Alcohol / Contaminants in Fuel Diagnosis in this Section. – Lean injectors – refer to 6.2 Fuel Injector Coil Test in this Section. – The engine control ground points for being clean, tight, and in the correct locations. – A high engine oil level condition. A high engine oil level causes oil residue to form on the mass air flow (MAF) sensor, causing a lean indication. The MAF sensor does not need to be replaced. – An engine mechanical condition. Did you find and correct the condition?	—	Go to Step 8	Go to Additional Information in this DTC
7	1 Inspect for the following conditions: – Vacuum leaks that only affect one bank of the engine--For example, the intake manifold, the injector O-rings. – Lean injectors--Refer to 6.2 Fuel Injector Coil Test in this Section. – Exhaust leaks, missing or loose exhaust hardware. Refer to 6F Exhaust System – V6. – The heated oxygen sensors (HO2S) are installed securely and the electrical connectors are not contacting the exhaust system. – An engine mechanical condition. Did you find and correct the condition?	—	Go to Step 8	Refer to Additional Information in this DTC
8	Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Did DTC P2177 or P2179 fail this ignition cycle?	—	Go to Step 2	Go to Step 9
9	1 Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	—	Go to the appropriate DTC Table in this Section	System OK

When all diagnosis and repairs are completed, clear all DTCs and verify correct operation

7.52 DTC P2178 or P2180

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P2178 Fuel Trim System Rich at Cruise or Accel Bank 1
- DTC P2180 Fuel Trim System Rich at Cruise or Accel Bank 2

Circuit Description

The engine control module (ECM) controls the air / fuel metering system to provide the best possible combination of driveability, fuel economy, and emission control. Fuel delivery is controlled differently during Open and Closed Loop. During Open Loop, the ECM determines fuel delivery based on sensor signals without heated oxygen sensor (HO2S) input. During Closed Loop, the HO2S inputs are added and used by the ECM to calculate short and long term fuel trim fuel delivery adjustments. If the HO2S indicates a lean condition, fuel trim values will be above 0 percent. If the HO2S indicates a rich condition, fuel trim values will be below 0 percent. Short term fuel trim values change rapidly in response to the HO2S signals. Long term fuel trim makes coarse adjustments to maintain an air / fuel ratio of 14.7:1. If the ECM detects an excessively rich condition, this DTC sets.

Conditions for Running the DTC

- Before the ECM can report DTC P2178 or P2180 failed, DTCs P0101, P0121, P0122, P0123, P0133, P0153, P0221, P0222, P0223, P0336, P0338, P0443, P0458, P0459, P0461, P0462, P0463, P2066, P2067, and P2068 must run and pass.
- The fuel system is in closed loop.
- The long fuel trim is active.
- The engine coolant temperature (ECT) is more than 60° C.
- The evaporative emission (EVAP) canister purge solenoid valve is not enabled.
- The intake air temperature (IAT) is less than 60° C.
- The fuel level is more than 11.6 percent.
- The amount of air flow into the engine is more than 7,000 grams.
- DTC P2178 and P2180 run continuously once the above conditions are met for at least 300 seconds.

Conditions for Setting the DTC

- The Total Fuel Trim Avg. is less than –22 percent.
- The condition exists for 4 seconds.

Action Taken When the DTC Sets

- The control module illuminates the malfunction indicator lamp (MIL) on the second consecutive ignition cycle that the diagnostic runs and fails.
- The control module records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive ignition cycle, the control module records the operating conditions at the time of the failure. The control module writes the operating conditions to the Freeze Frame and updates the Failure Records.

Conditions for Clearing the MIL/DTC

- The Fuel Trim System circuit DTCs are Type ‘B’ DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type ‘B’ DTC sets and conditions for clearing Type ‘B’ DTCs.
- Use Tech 2 to clear the MIL and the DTC.

Additional Information

- A fuel delivery condition causes this DTC to set. Thoroughly inspect all items that could cause a rich condition.

- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2 This step determines whether the fault is present.

4 If DTC P2178 and DTC P2180 set at the same time, then both banks of the engine are operating rich. Inspect items that would cause both banks of the engine to operate rich.

5 Disconnecting the mass air flow (MAF) sensor determines if the MAF sensor signal is skewed. If the Short Term FT parameter changes more than the specified value, there is a condition with the MAF sensor. A MAF sensor condition can cause this DTC without setting a MAF DTC. If there is a MAF sensor condition, the MAF sensor parameters will appear to be within range.

DTC P2178 or P2180 Diagnostic Table

Step	Action	Value(s)	Yes	No
1	Has the Diagnostic System Check been completed?	—	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	**NOTE** If any DTCs are set, except P2178 and DTC P2180, refer to those DTCs before proceeding with this diagnostic. 1 Idle the engine at the normal operating temperature. 2 Check that the fuel system is in Closed Loop. 3 Observe the Total Fuel Trim Avg. parameter for bank 1 and / or bank 2 with Tech 2. Is the Total Fuel Trim Avg. less than the specified value?	–22%	Go to Step 3	Go to Step 4
3	1 Observe the Freeze Frame and / or the Failure records data for this DTC. 2 Turn the ignition OFF for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame and / or the Failure records data. Does the DTC fail this ignition cycle?	—	Go to Step 4	Refer to Additional Information in this DTC.
4	Are both banks of the engine operating rich?	—	Go to Step 5	Go to Step 7

5	1 Start the engine. **NOTE** Additional DTCs will set when the MAF sensor is disconnected. 2 Disconnect the mass air flow (MAF) sensor harness connector while the engine is operating. 3 Observe the Short Term FT parameter for Bank 1 and bank 2 with Tech 2. 4 Reconnect the MAF sensor after completing this step. Does the Short Term FT parameter for both banks of the engine change more than the specified value with the MAF sensor disconnected?	20%	Go to 7.6 DTC P0101, P0102 or P0103 in this Section	Go to Step 6
6	1 Inspect for the following conditions: – A collapsed air intake duct – A restricted air filter element – The MAF sensor for foreign objects – Excessive fuel in the crankcase – Change the oil as necessary. – Contaminated fuel. Refer to 6.5 Alcohol / Contaminants in Fuel Diagnosis in this Section. – The ECM grounds for being clean, tight, and in the correct locations – An engine mechanical condition – refer to 6A1 – Engine Mechanical V6. Did you find and correct the condition?	—	Go to Step 8	Go to 6C Fuel System – V6
7	1 Inspect for the following conditions: – Rich injectors – refer to 6.2 Fuel Injector Coil Test in this Section – Restricted exhaust system – refer to 6F Exhaust System – V6 – An engine mechanical condition – refer to 6A1 – Engine Mechanical V6. Did you find and correct the condition?	—	Go to Step 8	Go to Additional Information in this Section.
8	1 Switch off the ignition for 30 seconds. 2 Using Tech 2, clear the DTCs and reset the fuel trim system. 3 Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame / Failure Records. Did DTC P2178 and / or P2180 fail this ignition cycle?	—	Go to Step 2	Go to Step 9
9	1 Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	—	Go to the appropriate DTC Table in this Section	System OK

7.53 DTC P2187 or P2189

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P2187 Fuel Trim System Lean at Idle Bank 1
- DTC P2189 Fuel Trim System Lean at Idle Bank 2

Circuit Description

The engine control module (ECM) controls the air / fuel metering system to provide the best possible combination of driveability, fuel economy, and emission control. Fuel delivery is controlled differently during Open and Closed Loop. During Open Loop, the ECM determines fuel delivery based on sensor signals without heated oxygen sensor (HO2S) input. During Closed Loop, the HO2S inputs are added and used by the ECM to calculate short and long term fuel trim fuel delivery adjustments. If the HO2S indicate a lean condition, fuel trim values will be above 0 percent. If the O2S indicate a rich condition, fuel trim values will be below 0 percent. Short term fuel trim values change rapidly in response to the HO2S signals. Long term fuel trim makes coarse adjustments to maintain an air / fuel ratio of 14.7:1. If the ECM detects an excessively lean condition, this DTC sets.

Conditions for Running the DTC

- Before the ECM can report DTC P2187 or P2189 failed, DTCs P0101, P0121, P0122, P0123, P0133, P0153, P0221, P0222, P0223, P0336, P0338, P0443, P0458, P0459, P0461, P0462, P0463, P2066, P2067, and P2068 must run and pass.
- The fuel system is in closed loop.
- The long fuel trim is active.
- The engine coolant temperature (ECT) is more than 60° C.
- The evaporative emission (EVAP) canister purge solenoid valve is not enabled.
- The intake air temperature (IAT) is less than 60° C.
- The fuel level is more than 11.6 percent.
- The amount of air flow into the engine is more than 7000 grams.
- DTC P2187 and P2189 runs continuously once the above conditions are met for at least 300 seconds.

Conditions for Setting the DTC

- The Total Fuel Trim Avg. is more than 40 percent.
- The LT FT Idle / Decel is more than seven percent.
- The condition exists for four seconds.

Action Taken When the DTC Sets

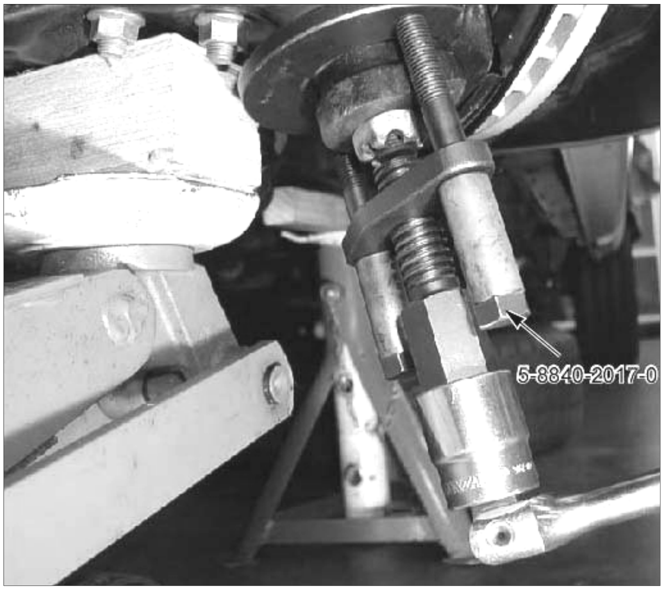
The control module illuminates the malfunction indicator lamp (MIL) on the second consecutive ignition cycle that the diagnostic runs and fails.

The control module records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive ignition cycle, the control module records the operating conditions at the time of the failure. The control module writes the operating conditions to the Freeze Frame and updates the Failure Records.

Conditions for Clearing the MIL/DTC

- The Fuel Trim System circuit DTCs are Type ‘B’ DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type ‘B’ DTC sets and conditions for clearing Type ‘B’ DTCs.
- Use Tech 2 to clear the MIL and the DTC.

CAUTION: Be careful not to damage the ball joint boot.



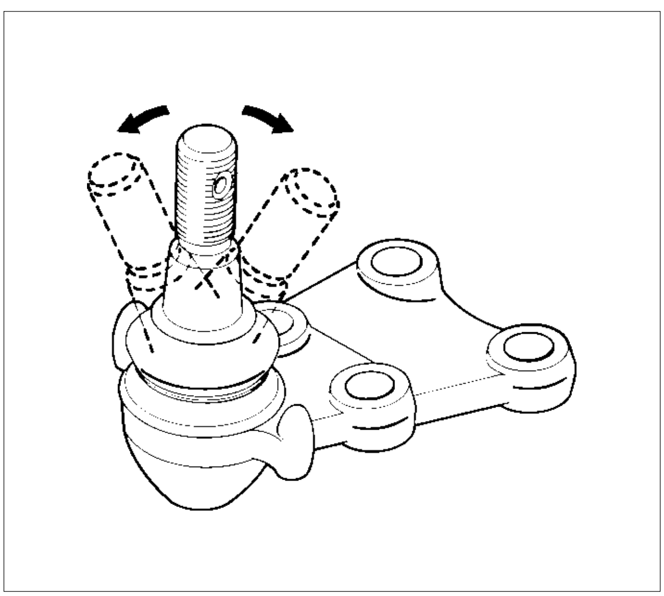
P1010003

6. Remove lower ball joint nut.
7. Remove lower ball joint bolt.
8. Remove lower ball joint.

Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal condition is found during inspection.

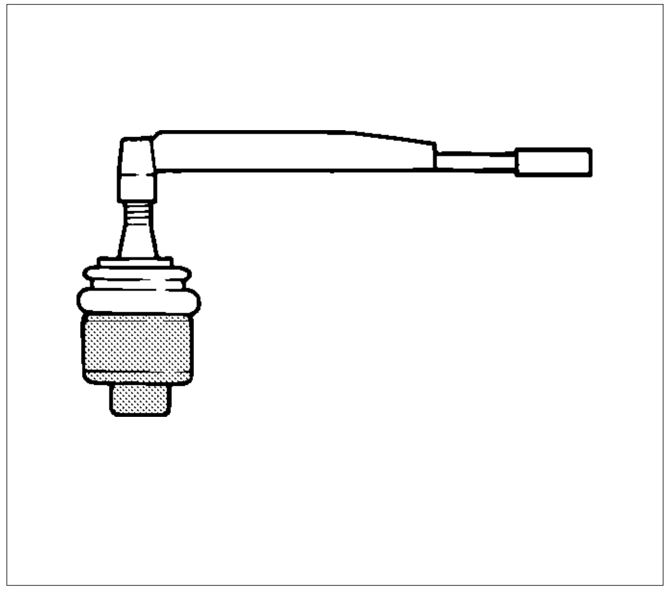
- Inspect the lower end of the boot for damage or grease leaks. Move the ball joint as shown in the figure to confirm its normal movement.
- Inspect screw/taper area of ball for damage.
- If any defects are found by the above inspections, replace the ball joint assembly with new one.



450RS026

- After moving the ball joint 4 or 5 times, attach nut then measure the preload.

Starting torque: 2.5-6.4 N·m (0.26-0.65 kgf·m/1.9-4.7 lb·ft)



450RS024

- If the above limits specified are exceeded, replace the ball joint assembly.

Installation

1. Install lower ball joint.
2. Install lower ball joint bolt.
3. Install lower ball joint nut and tighten it to the specified torque.

Torque: 127 N·m (13.0 kgf·m/94 lb·ft)

4. Install ball joint nut, then tighten it to the specified torque with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 147 N·m (15.0 kgf·m/108 lb·ft)

5. Install link nut, then tighten to the specified torque.

Torque: 50 N·m (5.1 kgf·m/37 lb·ft)

Additional Information

- A fuel delivery condition causes this DTC to set. Thoroughly inspect all items that could cause a rich condition.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2 This step determines if there is a current condition.

4 If DTC P2187 and P2189 are set at the same time, this indicates that both banks of the engine are operating lean. Inspect for items that would cause both banks of the engine to operate lean.

5 Disconnecting the mass air flow (MAF) sensor determines if the MAF sensor signal is skewed. If the Short Term FT parameter changes more than the specified value, there is a condition with the MAF sensor. A MAF sensor condition can cause this DTC without setting a MAF DTC. If there is a MAF sensor condition, the MAF sensor parameters will appear to be within range.

6 A vacuum leak causes DTC P2187 and P2189 to set at the same time. Inspect all areas of the engine for a vacuum leak. Also inspect the positive crankcase ventilation (PCV) valve for being the correct one for this application. Make sure that the engine oil fill cap is in place and that it is tight. Verify that the engine oil dip stick is fully seated.

DTC P2187 or P2189 Diagnostic Table

Step	Action	Value(s)	Yes	No
1	Has the Diagnostic System Check been completed?	—	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	**NOTE** If any DTCs are set, except P2187 and DTC P2189, refer to those DTCs before proceeding with this diagnostic. 1 Idle the engine at the normal operating temperature. 2 The fuel system is in Closed Loop. 3 Observe the Total Fuel Trim Avg. parameter for bank 1 and / or bank 2 with a scan tool. Is the Total Fuel Trim Avg. less than the specified value?	40%	Go to Step 3	Go to Step 4
3	1 Observe the Freeze Frame and / or the Failure records data for this DTC. 2 Turn the ignition OFF for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame and / or the Failure records data. Does the DTC fail this ignition cycle?	—	Go to Step 4	Refer to Additional Information in this DTC.
4	Are both banks of the engine operating lean?	—	Go to Step 5	Go to Step 7

5	1 Start the engine. **NOTE** Additional DTCs will set when the MAF sensor is disconnected. 2 Disconnect the mass air flow (MAF) sensor harness connector while the engine is operating. 3 Observe the Short Term FT parameter for bank 1 and bank 2 with Tech 2. 4 Reconnect the MAF sensor after completing this step. Does the Short Term FT parameter for both banks of the engine change more than the specified value with the MAF sensor disconnected?	20%	Go to 7.6 DTC P0101, P0102 or P0103 in this Section	Go to Step 6
6	1 Inspect for the following conditions: – Vacuum hoses for splits, kinks, and proper connections. – The throttle body and the intake manifold for vacuum leaks. – The crankcase ventilation valve and system for leaks. – Air intake system after the MAF sensor for vacuum leaks. – Contaminated fuel – Refer to 6.5 Alcohol / Contaminants in Fuel Diagnosis in this Section. – Lean injectors – Refer to 6.2 Fuel Injector Coil Test in this Section. – The ECM grounds for being clean, tight, and in the correct locations – A high engine oil level condition. A high engine oil level causes oil residue to form on the MAF sensor, causing a lean indication. The MAF sensor does not need to be replaced. – An engine mechanical condition – refer to 6A1 – Engine Mechanical V6. Did you find and correct the condition?	—	Go to Step 8	Refer to Additional Information and Test Descriptionin this DTC
7	1 Inspect for the following conditions: – Vacuum leaks that only affect one bank of the engine – For example, the intake manifold, the injector O-rings. – Lean injectors – refer to 6.2 Fuel Injector Coil Test in this Section – Exhaust leaks, missing or loose exhaust hardware. – The heated oxygen sensor (HO2S) is installed securely and the electrical connector is not contacting the exhaust system. – An engine mechanical condition – 6A1 – Engine Mechanical V6. Did you find and correct the condition?	—	Go to Step 8	Refer to Additional Information in this DTC.

8	Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Did DTC P2179 or P2189 fail this ignition cycle?	—	Go to Step 2	Go to Step 9
9	1 Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	—	Go to the appropriate DTC Table in this Section	System OK

7.54 DTC P2188 or P2190

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P2188 Fuel Trim System Rich at Idle Bank 1
- DTC P2190 Fuel Trim System Rich at Idle Bank 2

Circuit Description

The engine control module (ECM) controls the air / fuel metering system to provide the best possible combination of driveability, fuel economy, and emission control. Fuel delivery is controlled differently during Open and Closed Loop. During Open Loop, the ECM determines fuel delivery based on sensor signals without heated oxygen sensor (HO2S) input. During Closed Loop, the HO2S inputs are added and used by the ECM to calculate short and long term fuel trim fuel delivery adjustments. If the HO2S indicate a lean condition, fuel trim values will be above 0 percent. If the O2S indicate a rich condition, fuel trim values will be below 0 percent. Short term fuel trim values change rapidly in response to the HO2S signals. Long term fuel trim makes coarse adjustments to maintain an air / fuel ratio of 14.7:1. If the ECM detects an excessively rich condition, this DTC sets.

Conditions for Running the DTC

- Before the ECM can report DTC P2188 or P2190 failed, DTCs P0101, P0121, P0122, P0123, P0133, P0153, P0221, P0222, P0223, P0336, P0338, P0443, P0458, P0459, P0461, P0462, P0463, P2066, P2067, and P2068 must run and pass.
- The fuel system is in Closed Loop.
- The long fuel trim is active.
- The engine coolant temperature (ECT) is more than 60°C (140°F).
- The evaporative emission (EVAP) canister purge solenoid valve is not enabled.
- The intake air temperature (IAT) is less than 60°C (140°F).
- The fuel level is more than 11.6 percent.
- The amount of air flow into the engine is more than 7 000 grams.
- DTC P2188 and P2190 runs continuously once the above conditions are met for at least 300 seconds

Conditions for Setting the DTC

- The Total Fuel Trim Avg. is less than –40 percent.
- The LT FT Idle / Decel is less than -7 percent.
- The condition exists for 4 seconds.

Action Taken When the DTC Sets

- The control module activates the malfunction indicator lamp (MIL) on the second consecutive ignition cycle that the diagnostic runs and fails.
- The control module records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive ignition cycle, the control module records the operating conditions at the time of the failure. The control module writes the operating conditions to the Freeze Frame and updates the Failure Records.

Conditions for Clearing the MIL/DTC

- The control module turns OFF the malfunction indicator lamp (MIL) after four consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC, Last Test Failed, clears when the diagnostic runs and passes.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- Use Tech 2 to clear the MIL and the DTC.

Additional Information

- A fuel delivery condition causes this DTC to set. Thoroughly inspect all items that cause a rich condition.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2 This step determines whether the fault is present.

4 If DTC P2188 and P2190 set at the same time, then both banks of the engine are operating rich. Inspect items that would cause both banks to operate rich.

5 Disconnecting the mass air flow (MAF) sensor determines if the MAF sensor signal is skewed. If the Short Term FT parameter changes more than the specified value, there is a condition with the MAF sensor. A MAF sensor condition can cause this DTC without setting a MAF DTC. If there is a MAF sensor condition, the MAF sensor parameters will appear to be within range.

DTC P2188 or P2190 Diagnostic Table

Step	Action	Value(s)	Yes	No
1	Has the Diagnostic System Check been completed?	—	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	**NOTE** If any DTCs are set, except P2188 and P2190, refer to those DTCs before proceeding with this diagnostic. 1 Idle the engine at the normal operating temperature. 2 Check that the fuel system is in Closed Loop. 3 Observe the Total Fuel Trim Avg. parameter for bank 1 and / or bank 2 with Tech 2. Is the Total Fuel Trim Avg. less than the specified value?	–40%	Go to Step 3	Go to Step 4

3	1 Observe the Freeze Frame and / or the Failure Records data for this DTC. 2 Turn the ignition OFF for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame and / or the Failure Records data. Does the DTC fail this ignition cycle?	—	Go to Step 4	Go to Additional Information in this DTC.
4	Are both banks of the engine operating rich?	—	Go to Step 5	Go to Step
5	1 Start the engine. **NOTE** Additional DTCs will set with the mass air flow (MAF) sensor disconnected. 2 Disconnect the MAF sensor harness connector while the engine is operating. 3 Observe the Short Term FT parameter for Bank 1 and Bank 2 with Tech 2. 4 Connect the MAF sensor after completing this step. Does the Short Term FT parameter for both banks of the engine change more than the specified value with the MAF sensor disconnected?	20%	Go to 7.6 DTC P0101, P0102 or P0103	Go to Step 5
6	1 Inspect for the following conditions: – A collapsed air intake duct – A restricted air filter element – Inspect the MAF sensor for foreign objects. – Excessive fuel in the crankcase – Change the oil as necessary. – Contaminated fuel. Refer to 6.5 Alcohol / Contaminants in Fuel Diagnosisin this Section. – The engine control grounds for being clean, tight, and in the correct locations – An engine mechanical condition – refer to 6A1 – Engine Mechanical V6. Did you find and correct the condition?	—	Go to Step 8	Go to 6C Fuel System – V6
7	1 Inspect for the following conditions: – Rich injectors – Refer to 6.2 Fuel Injector Coil Test in this Section – Restricted exhaust system – Refer to 6F Exhaust System – V6. – An engine mechanical condition – refer to 6A1 – Engine Mechanical V6. Did you find and correct the condition?	—	Go to Step	Go to Additional Information in this DTC

8	1 Turn OFF the ignition for 30 seconds. 2 Using Tech 2, clear the DTCs and reset the fuel trim system. 3 Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame / Failure Records. Did DTC P2188 and / or P2190 fail this ignition cycle?	—	Go to Step 2	Go to Step 9
9	1 Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	—	Go to the appropriate DTC Table in this Section	System OK

7.55 DTC P2195 or P2197

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P2195 – B1S1 O2 Sensor – System Too Lean (Bank 1 Sensor 1)
- DTC P2197 – B2S1 O2 Sensor – System Too Lean (Bank 2 Sensor 1)

Circuit Description

The wide band heated oxygen sensor 1 (HO2S1) measures the amount of oxygen in the exhaust system and provides more information than the switching style HO2S2. The wide band sensor consists of an oxygen sensing cell, an oxygen pumping cell, and a heater. The exhaust gas sample passes through a diffusion gap between the sensing cell and the pumping cell. The engine control module (ECM) supplies a voltage to the HO2S and uses this voltage as a reference to the amount of oxygen in the exhaust system. An electronic circuit within the ECM controls the pump current through the oxygen pumping cell, maintaining a constant voltage in the oxygen sensing cell.

The ECM monitors the voltage variation in the sensing cell and attempts to keep the voltage constant by increasing or decreasing the amount of current flow, or oxygen ion flow, to the pumping cell. By measuring the amount of current required to maintain the voltage in the sensing cell, the ECM can determine the concentration of oxygen in the exhaust. The HO2S voltage is displayed as a lambda value. A lambda value of 1 is equal to a stoichiometric air fuel ratio of 14.7:1.

Under normal operating conditions, the lambda value will remain around 1. When the fuel system is lean, the oxygen level will be high and the lambda signal will be high or more than 1. When the fuel system is rich, the oxygen level will be low, and the lambda signal will be low or less than 1. The ECM uses this information to maintain the correct air / fuel ratio.

Conditions for Running the DTC

- Before the ECM can report DTC P2195 or P2197 failed, DTCs P0137, P0138, P0140, P0141, P0157, P0158, P0160, P0161, P2270, P2271, P2272, and P2273 must run and pass.
- The front and rear heated oxygen sensors are at operating temperature.
- The rear HO2S voltage signal is more than 850 mV.
- The front HO2S is more than 1.08 lambda.
- The Loop Status for both the front and rear sensors is Closed Loop.
- DTCs P2195 and P2197 run continuously once the above conditions are met.

Conditions for Setting the DTC

Condition 1

- The ECM detects that the front HO2S is operating too lean while the rear HO2S is operating too rich and the ECM detects that the fuel trim is at maximum control,

  OR

- The rear fuel trim, long and short term, is more than a threshold.
- This DTC sets after the air flow coming into the engine accumulates to more than 200 grams and the above conditions are met for more than 4 seconds.

Condition 2

- The ECM detects that the rear HO2S is operating too rich while the ECM is commanding a lean air / fuel mixture.
- This DTC sets after the air flow coming into the engine accumulates to more than 800 grams and the above condition is met for more than 4 seconds.

Action Taken When the DTC Sets

- The ECM activates the malfunction indicator lamp (MIL) on the second consecutive ignition cycle that the diagnostic runs and fails.
- The ECM records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive ignition cycle, the control module records the operating conditions at the time of the failure. The control module writes the operating conditions to the Freeze Frame and updates the Failure Records.

Conditions for Clearing the MIL/DTC

- The control module turns OFF the malfunction indicator lamp (MIL) after four consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC, Last Test Failed, clears when the diagnostic runs and passes.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- Use Tech 2 to clear the MIL and the DTC.

Additional Information

- A HO2S fault condition may cause this DTC to set. Thoroughly inspect all items that could cause a lean condition.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since a fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2 This step determines if a condition exists.

5 This step is testing for a rear HO2S sensor circuit condition. A circuit condition sets this DTC.

8 This step is testing for an intermittent circuit condition. Thoroughly inspect the HO2S circuits for an intermittent circuit condition.

9 This step is testing for an intermittent circuit condition. Thoroughly inspect the HO2S circuits for an intermittent circuit condition.

DTC P2195 or P2197 Diagnostic Table

Step	Action	Value(s)	Yes	No
1	Has the Diagnostic System Check been completed?	—	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section

2	1 Allow the engine to reach operating temperature. 2 Operate the vehicle within the parameters specified in Conditions for Running the DTC. 3 Observe the diagnostic trouble code (DTC) information, using Tech 2. Did DTC P2195 or DTC P2197 fail this ignition?	—	Go to Step 4	Go to Step 3
3	1 Observe the Freeze Frame and/or the Failure records data for this DTC. 2 Turn the ignition OFF for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame and / or the Failure records data. Does the DTC fail this ignition cycle?	—	Go to Step 4	Refer to Additional Information in this DTC.
4	Is DTC P0041, P0137, P0138, P0140, P0157, P0158, or P0160 also set?	—	Go to the appropriate DTC Table in this Section	Go to Step 5
5	1 Operate the engine above 1,200 RPM for 30 seconds. 2 Observe the appropriate rear HO2S voltage, using Tech 2. Is the voltage more than the specified value?	60 mV	Go to Step 8	Go to Step 6
6	1 Ignition OFF. 2 Disconnect the appropriate rear heated oxygen sensor (HO2S). 3 Ignition ON, engine OFF. 4 Observe the appropriate rear HO2S voltage parameter with Tech 2. Is the voltage within the specified range?	350 – 550 mV	Go to Step 12	Go to Step 7
7	1 Test the appropriate rear HO2S signal circuit for a short to ground. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 14
8	1 Shake the related HO2S harnesses for the front sensor between the HO2S harness connector and the engine control module (ECM) while monitoring the appropriate HO2S lambda parameter. Does the HO2S parameter change abruptly while moving the related harnesses?	—	Go to Step 15	Go to Step 9
9	1 Shake the related HO2S harnesses for the rear sensor between the HO2S harness connector and the ECM while monitoring the appropriate HO2S voltage parameter. Does the HO2S parameter change abruptly while moving the related harnesses?	—	Go to Step 15	Go to Step 10

10	1 Ignition OFF. 2 Disconnect the front and rear heated oxygen sensors. 3 Inspect the front and rear heated oxygen sensors for the following conditions: – For damaged wiring between the HO2S and the ECM – An intermittent circuit condition may cause this DTC to set. – For terminal corrosion or water intrusion in the HO2S harness connectors. – For the correct terminal tension. – The HO2S is securely installed and not damaged. – For any exhaust leaks – Refer to 6F Exhaust System – V6. 8 Repair as necessary. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 11
11	1 Disconnect the ECM. 2 Test the appropriate front heated oxygen sensor circuits for being shorted together between the HO2S connector and the ECM. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 13
12	1 Test for shorted terminals and for poor connections at the HO2S. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 17
13	1 Test for shorted terminals and for poor connections at the ECM. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 16
14	1 Test for shorted terminals and for poor connections at the ECM. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
15	1 Repair the circuit as necessary. Refer to 8A Electrical - Body and Chassis. Did you complete the repair?	—	Go to Step 19	—
16	1 Replace the HO2S 1. Refer to the Oxygen Sensor 1 procedure, in 6C1- Engine Management – V6 Service Operations. Did you complete the replacement?	—	Go to Step 19	—
17	1 Replace the HO2S 2. Refer to the Oxygen Sensor 2 procedure, in 6C1- Engine Management – V6 Service Operations. Did you complete the replacement?	—	Go to Step 19	—

18	1 Replace the ECM. Refer to Engine Control Module (ECM) Remove, Reinstall and ECM Reset in 6C1- Engine Management – V6 Service Operations. Did you complete the replacement?	—	Go to Step 19	—
19	1 Clear the DTCs, using Tech 2. 2 Turn OFF the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC P2195 or P2197 fail this ignition cycle?	—	Go to Step 2	Go to Step 20
20	1 Using Tech 2, select the DTC display function. Does Tech 2 display any DTC?	—	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, clear all DTCs and verify correct operation				

7.56 P2196 or P2198

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P2196 – B1S1 O2 Sensor – System Too Rich (Bank 1 Sensor 1)
- DTC P2198 – B2S1 O2 Sensor – System Too Rich (Bank 2 Sensor 1)

Circuit Description

The wide band heated oxygen sensor 1 (HO2S1) measures the amount of oxygen in the exhaust system and provides more information than the switching style HO2S2. The wide band sensor consists of an oxygen sensing cell, an oxygen pumping cell, and a heater. The exhaust gas sample passes through a diffusion gap between the sensing cell and the pumping cell. The engine control module (ECM) supplies a voltage to the HO2S and uses this voltage as a reference to the amount of oxygen in the exhaust system. An electronic circuit within the ECM controls the pump current through the oxygen pumping cell, maintaining a constant voltage in the oxygen sensing cell.

The ECM monitors the voltage variation in the sensing cell and attempts to keep the voltage constant by increasing or decreasing the amount of current flow, or oxygen ion flow, to the pumping cell. By measuring the amount of current required to maintain the voltage in the sensing cell, the ECM can determine the concentration of oxygen in the exhaust. The HO2S voltage is displayed as a lambda value. A lambda value of 1 is equal to a stoichiometric air fuel ratio of 14.7:1.

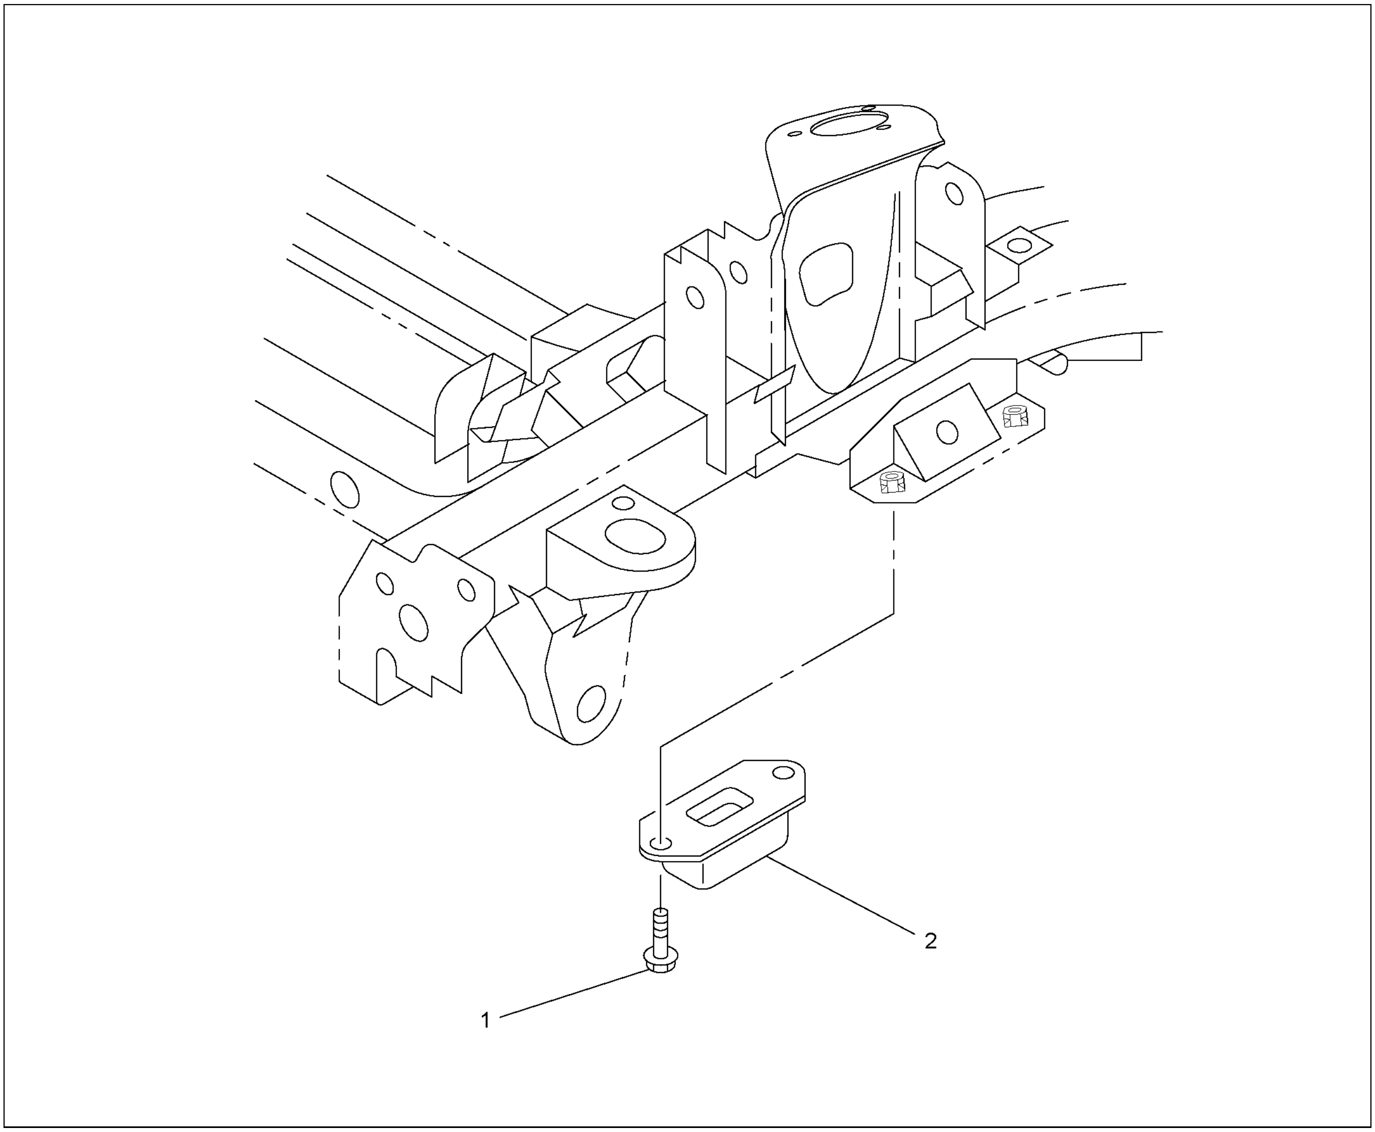
Under normal operating conditions, the lambda value will remain around 1. When the fuel system is lean, the oxygen level will be high and the lambda signal will be high or more than 1. When the fuel system is rich, the oxygen level will be low, and the lambda signal will be low or less than 1. The ECM uses this information to maintain the correct air / fuel ratio.

Conditions for Running the DTC

- Before the ECM can report DTC P2196 or P2198 failed, DTCs P0137, P0138, P0140, P0141, P0157, P0158, P0160, P0161, P2270, P2271, P2272, and P2273 must run and pass.
- The front and rear heated oxygen sensors are at operating temperature.
- The rear HO2S voltage signal is more than 150 mV.
- The front HO2S is more than 0.92 lambda.
- The Loop Status for both the front and rear sensors is Closed Loop.
- DTCs P2196 and P2198 run continuously once the above conditions are met.

Bump Rubber

Bump Rubber and Associated Parts



Legend

(1) Bolt

(2) Bump Rubber

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove bolt.
3. Remove bump rubber.

Inspection and Repair

Make the necessary adjustments or parts replacement if wear, damage, corrosion or any other abnormal condition is found during inspection.

Check the following parts:

- Bump Rubber

Installation

1. Install bump rubber.
2. Install bolt, then tighten it to the specified torque.

Torque: 42 N·m (4.3 kgf·m/31 lb·ft)

Conditions for Setting the DTC

Condition 1

- The ECM detects that the front HO2S is operating too rich while the rear HO2S is operating too lean and the ECM detects that the fuel trim is at minimum control,

  OR
- The rear fuel trim, long and short term, is less than a threshold.
- This DTC sets after the air flow coming into the engine accumulates to more than 200 grams and the above conditions are met for more than 4 seconds.

Condition 2

- The ECM detects that the rear HO2S is operating too lean while the ECM is commanding a rich air / fuel mixture.
- This DTC sets after the air flow coming into the engine accumulates to more than 800 grams and the above condition is met for more than 4 seconds.

Action Taken When the DTC Sets

- The ECM activates the malfunction indicator lamp (MIL) on the second consecutive ignition cycle that the diagnostic runs and fails.
- The ECM records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive ignition cycle, the control module records the operating conditions at the time of the failure. The control module writes the operating conditions to the Freeze Frame and updates the Failure Records.

Conditions for Clearing the MIL/DTC

- The control module turns OFF the malfunction indicator lamp (MIL) after four consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC, Last Test Failed, clears when the diagnostic runs and passes.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- Use Tech 2 to clear the MIL and the DTC.

Additional Information

- A HO2S fault condition may cause this DTC to set. Thoroughly inspect all items that could cause a rich condition.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since a fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2 This step determines if a condition exists.

5 This step is testing for a rear HO2S sensor circuit condition. A circuit condition sets this DTC.

8 This step is testing for an intermittent circuit condition. Thoroughly inspect the HO2S circuits for an intermittent circuit condition.

9 This step is testing for an intermittent circuit condition. Thoroughly inspect the HO2S circuits for an intermittent circuit condition.

DTC P2196 or P2198 Diagnostic Table

Step	Action	Value(s)	Yes	No
1	Has the Diagnostic System Check been completed?	—	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Allow the engine to reach operating temperature. 2 Operate the vehicle within the parameters specified in Conditions for Running the DTC. 3 Observe the diagnostic trouble code (DTC) information, using Tech 2. Did DTC P2196 or DTC P2198 fail this ignition?	—	Go to Step 4	Go to Step 3
3	1 Observe the Freeze Frame and / or the Failure records data for this DTC. 2 Turn the ignition OFF for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame and / or the Failure records data. Does the DTC fail this ignition cycle?	—	Go to Step 4	Refer to Additional Information in this DTC.
4	Is DTC P0041, P0137, P0138, P0140, P0157, P0158, or P0160 also set?	—	Go to the appropriate DTC Table in this Section	Go to Step 5
5	1 Operate the engine above 1,200 RPM for 30 seconds. 2 Observe the appropriate rear HO2S voltage, using Tech 2. Is the voltage less than the specified value?	1,050 mV	Go to Step 8	Go to Step 6
6	1 Ignition OFF. 2 Disconnect the appropriate rear heated oxygen sensor (HO2S). 3 Ignition ON, engine OFF. 4 Observe the appropriate rear HO2S voltage parameter with Tech 2. Is the voltage within the specified range?	350 – 550 mV	Go to Step 12	Go to Step 7
7	1 Test the appropriate rear HO2S signal circuit for a short to voltage. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 14
8	1 Shake the related HO2S harnesses for the front sensor between the HO2S harness connector and the engine control module (ECM) while monitoring the appropriate HO2S lambda parameter. Does the HO2S parameter change abruptly while moving the related harnesses?	—	Go to Step 15	Go to Step 9

9	1 Shake the related HO2S harnesses for the rear sensor between the HO2S harness connector and the ECM while monitoring the appropriate HO2S voltage parameter. Does the HO2S parameter change abruptly while moving the related harnesses?	—	Go to Step 15	Go to Step 10
10	1 Ignition OFF. 2 Disconnect the front and rear heated oxygen sensors. 3 Inspect the front and rear heated oxygen sensors for the following conditions: – For damaged wiring between the HO2S and the ECM – An intermittent circuit condition may cause this DTC to set. – For terminal corrosion or water intrusion in the HO2S harness connectors. – For the correct terminal tension. – The HO2S is securely installed and not damaged. – For any exhaust leaks – Refer to 6F Exhaust System – V6. 8 Repair as necessary. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 11
11	1 Disconnect the ECM. 2 Test the appropriate front heated oxygen sensor circuits for being shorted together between the HO2S connector and the ECM. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 13
12	1 Test for shorted terminals and for poor connections at the HO2S. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 17
13	1 Test for shorted terminals and for poor connections at the ECM. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 16
14	1 Test for shorted terminals and for poor connections at the ECM. Refer to 8A Electrical - Body and Chassis. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
15	1 Repair the circuit as necessary. Refer to 8A Electrical - Body and Chassis. Did you complete the repair?	—	Go to Step 19	—
16	1 Replace the HO2S 1. Refer to the Oxygen Sensor 1 procedure, in 6C1- Engine Management – V6 Service Operations. Did you complete the replacement?	—	Go to Step 19	—

17	1 Replace the HO2S 2. Refer to the Oxygen Sensor 2 procedure, in 6C1- Engine Management – V6 Service Operations. Did you complete the replacement?	—	Go to Step 19	—
18	1 Replace the ECM. Refer to Engine Control Module (ECM) Remove, Reinstall and ECM Reset in 6C1- Engine Management – V6 Service Operations. Did you complete the replacement?	—	Go to Step 19	—
19	1 Clear the DTCs, using Tech 2. 2 Turn OFF the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC P2196 or P2198 fail this ignition cycle?	—	Go to Step 2	Go to Step 20
20	1 Using Tech 2, select the DTC display function. Does Tech 2 display any DTC?	—	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, clear all DTCs and verify correct operation				

7.57 DTC P2227, P2228 or P2229

DTC Descriptor

This diagnostic procedure supports the following DTCs:

- DTC P2227 – Barometric Pressure Sensor Circuit Range / Performance
- DTC P2228 – Barometric Pressure Sensor Voltage Low
- DTC P2229 – Barometric Pressure Sensor Voltage High

Circuit Description

The ECM applies a positive 5 V reference voltage to the barometric pressure (BARO) sensor through the 5 V reference circuit and the ground through the low reference circuit.

The BARO sensor provides signal voltage to the ECM that is proportional to the atmospheric pressure changes through the signal circuit. The ECM uses the BARO signal voltage to maintain the correct fuel delivery at different altitudes.

The ECM monitors and compares the BARO sensor signal voltage against a specified range. A BARO pressure sensor circuit DTC sets if the ECM detects the BARO sensor signal voltage is outside the specified range.

Conditions for Running the DTC

DTC P2227

Runs continuously once the following conditions are met for 3 seconds:

- DTCs P0121, P0122, P0123, P0221, P0222 or P0223 are not set.
- The engine is running.

DTC P2228 and P2229

Runs continuously once the following conditions are met for 3 seconds:

- DTCs P0101, P0102 or P0103 are not set.

- The engine is running.

Conditions for Setting the DTC

DTC P2227

The ECM detects the BARO pressure changed greater than 5 kPa within 20 seconds or the BARO pressure changed greater than 30 kPa since the last ignition cycle.

DTC P2228

The ECM detects the BARO sensor signal voltage is less than 0.20 V.

DTC P2229

The ECM detects the BARO sensor signal voltage is greater than 4.8 V for longer than 2.0 seconds.

Conditions for Clearing DTC

The BARO pressure sensor circuit DTCs are Type 'B' DTC. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type 'B' DTC sets and conditions for clearing Type 'B' DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the BARO Sensor operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

4 Test signal circuit of the BARO sensor. This circuit should display a voltage within the specified range.

5 Measures the integrity of the TP sensor low reference circuit. Removal of the ECM Fuse 29 enables the ECM to power down completely prior to the test procedure.

DTC P2227 P2228 or P2229 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P2227, P2228 or P2229 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC

Step	Action	Yes	No
3	1 Switch off the ignition. 2 Disconnect the BARO sensor wiring connector. 3 Switch on the ignition with the engine not running. 4 Using a digital multimeter, measure the voltage between the BARO sensor signal circuit and the ECM housing. Does the multimeter display 4.5 – 5.5 V?	Go to Step 4	Go to Step 6
4	1 Switch on the ignition with the engine not running. 2 Using a digital multimeter, measure the voltage between the BARO sensor 5 V reference circuit and the ECM housing. Does the multimeter display 4.8 – 5.2 V?	Go to Step 5	Go to Step 7
5	1 Switch off the ignition. 2 Remove ECM / TCM Fuse 29 from the engine compartment fuse and relay panel assembly. 3 Using a digital multimeter, measure the resistance between the BARO sensor low reference circuit and the ECM housing. **NOTE** Install the ECM Fuse 29 to the engine compartment fuse and relay panel assembly after completing this test. Does the multimeter display 5 Ω?	Go to Step 9	Go to Step 8
6	Test BARO sensor signal circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 10
7	Test the BARO sensor 5 V reference circuit for an open, short to ground or high resistance fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. **NOTE** The BARO sensor shares the 5 V reference circuit with other sensors. A fault condition in the 5 V reference circuit may trigger DTCs on sensors that share this circuit. Refer to 3 Wiring Diagrams and Connector Charts in this Section, to assist diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 10
8	1 Disconnect the ECM wiring connector. 2 Test the BARO sensor low reference circuit for a high resistance and open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 10
9	Replace the BARO sensor. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 11	—
10	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 11	—

Step	Action	Yes	No
11	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the BARO pressure sensor circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 12
12	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.58 DTC P2231, P2232, P2234, P2235, P2251 or P2254

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P2231 – O2 Sensor Signal Interference by Heater Circuit (Bank 1, Sensor 1)
- DTC P2232 – O2 Sensor Signal Short to Heater Circuit (Bank 1, Sensor 2)
- DTC P2234 – O2 Sensor Signal Interference by Heater Circuit (Bank 2, Sensor 1)
- DTC P2235 – O2 Sensor Signal Short to Heater Circuit (Bank 2, Sensor 2)
- DTC P2251 – O2 Sensor Ground Circuit Malfunction (Bank 1, Sensor 1)
- DTC P2254 – O2 Sensor Ground Circuit Malfunction (Bank 2, Sensor 1)

Circuit Description

The Engine control relay applies positive voltage to the heater ignition voltage circuits of the HO2S. The ECM applies a pulse width modulated (PWM) ground to the heater control circuit of the HO2S through a device within the ECM called a driver, to control the HO2S rate of heating.

O2 Sensor 1

The ECM maintains the voltage between the reference signal circuit and low reference circuit of the HO2S 1 to about 450 mV by increasing or decreasing the oxygen content in the HO2S diffusion gap. To achieve this, the ECM controls the current applied to the oxygen pumping cell in the HO2S.

- If the air / fuel mixture in the exhaust is balanced (lambda = 1), the oxygen pumping cell current is zero.
- If the exhaust gas in the HO2S 1 diffusion gap is lean, the ECM applies a positive current to the oxygen pumping cell to discharge oxygen from the diffusion gap.
- If the exhaust gas in the HO2S 1 diffusion gap is rich, the ECM applies a negative current to the oxygen pumping cell to draw oxygen into the diffusion gap.

The pumping current required to maintain the HO2S 1 signal circuit voltage to about 450 mV is proportional to the level of oxygen concentration in the exhaust gas. The ECM monitors and evaluates the oxygen pumping current to determine the level of oxygen concentration in the exhaust.

An HO2S signal circuit shorted to heater control circuit DTC sets if the ECM detects the HO2S signal voltage is increasing or decreasing at the same rate as the HO2S heater control circuit.

O2 Sensor 2

The ECM applies a voltage of approximately 450 mV between the reference signal circuit and low reference circuit of the HO2S 2 while the sensor temperature is less than the operating range.

Once the HO2S 2 reaches operating temperature, the sensor varies this reference signal voltage, which constantly fluctuates between the high voltage output and the low voltage output.

The low voltage output is 0 – 450 mV, which occurs if the air fuel mixture is lean.

The high voltage output is 450 – 1,000 mV, which occurs if the air fuel mixture is rich.

The ECM monitors, stores and evaluates the HO2S 2 voltage fluctuation information to determine the level of oxygen concentration in the exhaust.

Conditions for Running the DTC

DTC P2231 or P2234

Run continuously once the following conditions are met:

- DTCs P0030, P0031, P0032, P0050, P0051, P0052, P0053, P0059, P0130, P0135, P0150 or P0155 are not set.
- The HO2S heater control is enabled.
- The HO2S heater duty cycle is greater than 5 percent.
- The HO2S is at operating temperature for 10 seconds.
- The ECM does not detect an engine misfire fault condition.
- The fuel injectors are enabled.
- The ignition voltage is 10.5 – 18 V.
- The calculated exhaust temperature is less than 800°C.
- The MAF sensor signal output is steady within 3 percent of the airflow into the engine.

DTC P2232 and P2235

Run continuously once the following conditions are met:

- The engine is running.
- The HO2S is at operating temperature for longer than 90 seconds.
- The fuel injectors are enabled.
- The ignition voltage is greater than 10.5 V.
- The calculated exhaust temperature is 250 – 800°C.

DTC P2251 and P2254

Run continuously once the following conditions are met:

- DTCs P0030, P0031, P0032, P0050, P0051 and P0052 ran and passed.
- The HO2S heater control is enabled.
- The ECM internal sensing element resistance is greater than 570 Ω.
- The ECM detects the internal HO2S signal voltage is 1.47 – 1.53 V.
- The HO2S is at operating temperature.

Conditions for Setting the DTC

DTC P2231 or P2234

The ECM detects the following conditions:

- The internal HO2S signal voltage changes greater than 100 mV as the heater control switches.
- The above condition occurs 18 times in the last 10 seconds.

DTC P2232 or P2235

The ECM detects the following conditions:

- The internal HO2S signal voltage switches at the same rate as the heater circuit.
- The above condition occurs 4 times out of 6 as the heater is turned off.

DTC P2251 or P2254

The ECM detects the following conditions:

- The internal HO2S signal voltage changes greater than 10 mV as the heater control switches.
- The above condition occurs 20 times in the last 10 seconds.

Conditions for Clearing the DTC

The HO2S signal circuit shorted to heater control circuit DTCs are Type 'B' DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type 'B' DTC sets and conditions for clearing Type 'B' DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the HO2S system operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- The HO2S must be tightened correctly. A loose HO2S will trigger these DTCs.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P2231, P2232, P2234, P2235, P2251or P2254 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Allow the engine to reach the normal operating temperature. 4 Increase the engine speed to 2,000 rpm for 10 seconds. 5 Using Tech 2, select the DTC display function. Does DTC P2231, P2232, P2234, P2235, P2251 or P2254 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Disconnect the appropriate HO2S connector. 2 From the HO2S to the sensor wiring connector, test the following circuit for a shorted to the sensor heater control circuit fault condition: • Reference signal circuit, • low reference circuit, • pump current, • input pump current. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found?	Go to Step 6	Go to Step 4

Step	Action	Yes	No
4	1 Disconnect the ECM and the appropriate HO2S connector. 2 From the HO2S wiring connector to the ECM wiring connector, test the following circuit for a shorted to the sensor heater control circuit fault condition: • Reference signal circuit, • low reference circuit, • pump current, • input pump current. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 8	Go to Step 7
6	Replace the appropriate HO2S. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 8	—
7	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 8	—
8	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the O2 Sensor Signal Circuit Shorted to Heater Control Circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 9
9	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.59 DTC P2237, P2238, P2239, P2240, P2241 or P2242

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P2237 – O2 Sensor Pump Current Circuit Malfunction (Bank 1, Sensor 1)
- DTC P2238 – O2 Sensor Pump Current Circuit Low Voltage (Bank 1, Sensor 1)
- DTC P2239 – O2 Sensor Pump Current Circuit High Voltage (Bank 1, Sensor 1)
- DTC P2240 – O2 Sensor Pump Current Circuit Malfunction (Bank 2, Sensor 1)
- DTC P2241 – O2 Sensor Pump Current Circuit Low Voltage (Bank 2, Sensor 1)
- DTC P2242 – O2 Sensor Pump Current Circuit High Voltage (Bank 2, Sensor 1)

Circuit Description

The engine control relay applies positive voltage to the heater ignition voltage circuits of the HO2S #1. The ECM applies a pulse width modulated (PWM) ground to the heater control circuit of the HO2S through a device within the ECM called a Driver, to control the HO2S rate of heating.

The ECM maintains the voltage between the reference signal circuit and low reference circuit of the HO2S #1 to about 450 mV by increasing or decreasing the oxygen content in the HO2S diffusion gap. To achieve this, the ECM controls the current applied to the oxygen pumping cell in the HO2S.

Special Tools (4×2 Except High Ride Suspension)

ILLUSTRATION	PART NO. PART NAME

- If the air / fuel mixture in the exhaust is balanced (lambda = 1), the oxygen pumping cell current is zero.
- If the exhaust gas in the HO2S #1 diffusion gap is lean, the ECM applies a positive current to the oxygen pumping cell to discharge oxygen from the diffusion gap.
- If the exhaust gas in the HO2S #1 diffusion gap is rich, the ECM applies a negative current to the oxygen pumping cell to draw oxygen into the diffusion gap.

The pumping current required to maintain the HO2S #1 signal circuit voltage to about 450 mV is proportional to the level of oxygen concentration in the exhaust gas. The ECM monitors and evaluates the oxygen pumping current to determine the level of oxygen concentration in the exhaust.

An HO2S pumping current control circuit DTC sets if the ECM detects the HO2S #1 signal voltage is outside the predetermined range.

Conditions for Running the DTC

Condition 1

Run continuously once the following conditions are met:

- DTCs P0101, P0121, P0122, P0123, P0133, P0135, P0153, P0155, P0221, P0222, P0223, P0336 and P0338 ran and passed.
- The ECM is commanding the lambda outside the range of 0.97 – 1.03.
- The engine is operating in closed loop.
- The HO2S heater is at operating temperature.

Condition 2

Run continuously once the following conditions are met:

- DTCs P0101, P0121, P0122, P0123, P0133, P0135, P0153, P0155, P0221, P0222, P0223, P0336 and P0338 ran and passed.
- The ECM is commanding the lambda rich and then lean periodically with a change of greater than 2 percent.
- The ECM detects the internal HO2S signal voltage is 1.48 – 1.52 V.
- The HO2S is 0.97 – 1.03 lambda.
- The engine is operating in closed loop.
- The HO2S heater is at operating temperature.

Condition 3

Run continuously once the following conditions are met:

- DTCs P0133 and P0153 ran and passed.
- The HO2S heater is at operating temperature.

Conditions for Setting the DTC

Condition 1

The ECM detects the following conditions:

- The internal HO2S signal voltage change is 1.52 – 1.48 V.
- The above condition exists and 200 grams of exhausts gas has passed.

Condition 2

The ECM stores the fuel trim control values. This DTC sets if the ECM detects a deviation of greater than 10 percent within 1.5 seconds between the stored value and the current value of the fuel trim.

Condition 3

The ECM detects that 5 seconds after decel fuel shut-off, the internal HO2S signal voltage is less than 1.7 V.

Conditions for Clearing the DTC

The HO2S pumping current control circuit DTCs are Type 'B' DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section for action taken when Type 'B' DTC sets and conditions for clearing Type 'B' DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the HO2S system operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Inspect the HO2S wiring harness for contact with the exhaust system.
- The HO2S must be tightened correctly. A loose HO2S will trigger these DTCs.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical-Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section for the system wiring diagram and connector charts.
- The following table illustrates the typical voltages for the HO2S circuits:

HO2S Voltages	
Conditions: • Ignition ON, Engine OFF • HO2S Disconnected	
HO2S Circuit	**Voltage**
Heater Control	4.6 – 5.0 V
Heater Supply Voltage	B+
Reference Voltage	2.6 – 3.1 V
Low Reference	2.2 – 2.7 V
Pump Current	Less than 0.5 A
Input Pump Current	Less than 0.5 A

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 When performing this test, the HO2S should react immediately.

4 Connecting a jumper wire between the HO2S reference signal circuit and the low reference circuit causes the ECM to apply signal voltage to the pumping current and input pumping current.

DTC P2237, P2238, P2239, P2240 or P2242 Diagnostic Table

Step	Action	Value(s)	Yes	No
1	Has the Diagnostic System Check been completed?	—	Go to Step 2	Refer to 4.4 Diagnostic System Check
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Allow the engine to reach the normal operating temperature. 4 Increase the engine speed to 2,000 rpm for 10 seconds. 5 Using Tech 2, select the DTC display function. Does DTC P2237, P2238, P2239, P2240, P2241, P2242, fail this ignition cycle?	—	Go to Step 3	Refer to Additional Information in this DTC

3	Are DTCs relating to the reference circuit of the HO2S also set? (e.g. 7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298)	—	Go to the appropriate DTC Table in this Section	Go to Step 4
4	1 Disconnect the appropriate HO2S wiring connector. 2 Ignition ON, engine OFF. 3 Using a digital multimeter, measure the voltage between the input pump current circuit and a good ground. Is the voltage more than the specified value?	50 mV	Go to Step 8	Go to Step 5
5	1 Ignition ON, engine OFF. 2 Using a digital multimeter, measure the voltage between the pump current circuit and a good ground. is the voltage display more than the specified value?	50 mV	Go to Step 8	Go to Step 6
6	1 Connect a 3 A fused jumper wire between the HO2S reference signal circuit and the low reference circuit. 2 Ignition ON, engine OFF. 3 Using a digital multimeter, measure the voltage between the input pump current circuit and a good ground. Is the voltage reading within the specified range?	4.8 – 5.2 V	Go to Step 7	Go to Step 8
7	1 Connect a 3 A fused jumper wire between the HO2S reference signal circuit and the low reference circuit. 2 Ignition ON, engine OFF. 3 Using a digital multimeter, measure the voltage between the pump current circuit and a good ground. Is the voltage reading within the specified range?	4.8 – 5.2 V	Go to Step 9	Go to Step 10
8	1 Test the input pump current and the pump current circuit of the HO2S for a high resistance, open circuit, short to ground, short to voltage or shorted together fault condition. Refer to 8A Electrical-Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	—	Go to Step 12	Go to Step 11
9	1 Test or inspect for the following conditions that may cause the HO2S to detect an incorrect air / fuel mixture: • Lean or rich fuel injector fuel delivery, • Contaminated fuel, • Low fuel line pressure, • Exhaust leak near the HO2S, and • Leak in the crankcase or vacuum line. Was any fault found and rectified?	—	Go to Step 12	Go to Step 10

10	1 Replace the appropriate HO2S. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	—	Go to Step 12	—
11	1 Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	—	Go to Step 12	—
12	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the HO2S pumping current control circuit DTCs fail this ignition cycle?	—	Go to Step 2	Go to Step 13
12	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	—	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, clear all DTCs and verify correct operation				

7.60 DTC P2626, P2627, P2628, P2629, P2630 or P2631

DTC Descriptors

- DTC P2626 – O2 Sensor Pump Current Trim Circuit Malfunction (Bank 1, Sensor 1)
- DTC P2627 – O2 Sensor Pump Current Trim Circuit Low Voltage (Bank 1, Sensor 1)
- DTC P2628 – O2 Sensor Pump Current Trim Circuit High Voltage (Bank 1, Sensor 1)
- DTC P2629 – O2 Sensor Pump Current Trim Circuit Malfunction (Bank 2, Sensor 1)
- DTC P2630 – O2 Sensor Pump Current Trim Circuit Low Voltage (Bank 2, Sensor 1)
- DTC P2631 – O2 Sensor Pump Current Trim Circuit High Voltage (Bank 2, Sensor 1)

Circuit Description

The wide band heated oxygen sensor (HO2S) measures the amount of oxygen in the exhaust system and provides more information than the switching style HO2S. The wide band sensor consists of an oxygen sensing cell, an oxygen pumping cell, and a heater. The exhaust gas sample passes through a diffusion gap between the sensing cell and the pumping cell. The engine control module (ECM) supplies a voltage to the HO2S and uses this voltage as a reference to the amount of oxygen in the exhaust system.

An electronic circuit within the ECM controls the pump current through the oxygen pumping cell in order to maintain a constant voltage in the oxygen sensing cell. The ECM monitors the voltage variation in the sensing cell and attempts to keep the voltage constant by increasing or decreasing the amount of current flow, or oxygen ion flow, to the pumping cell. By measuring the amount of current required to maintain the voltage in the sensing cell, the ECM can determine the concentration of oxygen in the exhaust.

The HO2S voltage is displayed as a lambda value. A lambda value of 1 is equal to a stoichiometric air fuel ratio of 14.7:1. Under normal operating conditions, the lambda value will remain around 1. When the fuel system is lean, the oxygen level will be high and the lambda signal will be high or more than 1. When the fuel system is rich, the oxygen level will be low, and the lambda signal will be low or less than 1. The ECM uses this information to maintain the correct air / fuel ratio.

Conditions for Running the DTC

- Before the ECM can report DTC P2626 or P2629 failed, DTCs P0101, P0121, P0122, P0123, P0221, P0222, P0223, P0336, and P0338 must run and pass.
- The engine is operating.

- The ignition voltage is between 10.7 – 18.0 volts.
- The fuel system is in fuel shut-off mode.
- The calculated exhaust temperature is less than 750°C.
- The heated oxygen sensors are at operating temperature.
- DTC P2626 and P2629 runs continuously once the above conditions are met.

Conditions for Setting the DTC

- The ECM internal HO2S voltage is more than 4.81 volts.
- The condition exists for more than 4 seconds or 600 seconds if the fuel level is less than 12 percent.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) on the second consecutive ignition cycle that the diagnostic runs and fails.
- The control module records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive ignition cycle, the control module records the operating conditions at the time of the failure. The control module writes the operating conditions to the Freeze Frame and updates the Failure Records.

Conditions for Clearing the DTC

- The ECM turns OFF the malfunction indicator lamp (MIL) after four consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC, Last Test Failed, clears when the diagnostic runs and passes.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- Use Tech 2 to clear the MIL and the DTC.

Additional Information

- Use the J 35616 Connector Test Adapter Kit for any test that requires probing the ECM harness connector or a component harness connector.
- The lower connector of the ECM is connector A43-X1 and the upper connector of the ECM is connector A43-X2. Refer to 3 Wiring Diagrams and Connector Charts.
- The front wide band sensors do not toggle or switch like a switching HO2S. The front HO2S signals will be relatively stable for an idling engine.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical-Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section for the system wiring diagram and connector charts.
- The following table illustrates the typical voltages for the HO2S circuits:

HO2S Voltages	
Conditions: • Ignition ON, Engine OFF • HO2S Disconnected	
HO2S Circuit	**Voltage**
Heater Control	4.6 – 5.0 V
Heater Supply Voltage	B+
Reference Voltage	2.6 – 3.1 V

Low Reference	2.2 – 2.7 V
Pump Current	Less than 0.5 A
Input Pump Current	Less than 0.5 A

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2 This step determines if the condition exists. The HO2S lambda parameter should react immediately to the changes in throttle position when performing this test.

5 This step determines if there is a condition with the pumping current circuit. Connecting a jumper wire between the reference voltage and the low reference circuits causes the ECM to command the pumping current and the input pumping current circuits.

DTC P2626, P2627, P2628, P2629, P2630 or P2631 Diagnostic Table

Step	Action	Value(s)	Yes	No
1	Has the Diagnostic System Check been completed?	—	Go to Step 2	Refer to 4.4 Diagnostic System Check
2	1 Start engine and allow to reach operating temperature. 2 Cycle the throttle from idle to wide open throttle (WOT), 3 times within 5 seconds. 3 Use Tech 2 to observe the affected HO2S lambda value Does the affected HO2S lambda value react immediately to the above action?	—	Go to Step 3	Go to Step 4
3	1 Observe the Freeze Frame / Failure Records for this DTC. 2 Turn OFF the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame / Failure Records. Does P2626 P2627, P2628, P2629, P2630 or P2631 fail this ignition?	—	Go to Step 4	Go to Additional Information in this DTC
4	Is DTC P0131, P0132, P0151 or P0152 also set?	—	Go to the appropriate DTC Table in this Section	Go to Step 5
5	1 Ignition OFF. 2 Disconnect the appropriate heated oxygen sensor (HO2S). 3 Ignition ON, engine OFF. 4 Connect a 3-amp fused jumper wire between the reference voltage circuit and the low reference circuit of the HO2S. 5 Measure the voltage between the pump current circuit and a good ground. Is the voltage more than the specified value?	1.0 V	Go to Step 7	Go to Step 6

6	1 Test the pump current circuit of the HO2S for an open. Refer to 8A Electrical-Body and Chassis. Did you find and correct the condition?	—	Go to Step 11	Go to Step 8
7	1 Test for an intermittent and for a poor connection at the appropriate HO2S. Refer to 8A Electrical-Body and Chassis. Did you find and correct the condition?	—	Go to Step 11	Go to Step 9
8	1 Test for an intermittent and for a poor connection at the engine control module (ECM). Refer to 8A Electrical-Body and Chassis. Did you find and correct the condition?	—	Go to Step 11	Go to Step 10
9	1 Replace the HO2S. Refer to 6C1-3 Engine Management – V6 – Service Operations. Did you complete the replacement?	—	Go to Step 11	—
10	1 Replace the ECM. Refer to 6C1-3 Engine Management –V6 – Service Operations for details on replacing the ECM. Did you complete the replacement?	—	Go to Step 11	—
11	1 Use Tech 2 to clear the DTCs. 2 Turn OFF the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame / Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 12
12	1 Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	—	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, clear all DTCs and verify correct operation				

7.61 DTC U0001

DTC Descriptor

This diagnostic procedure supports DTC U0001 – No Communication with CAN-Bus (High Speed).

Circuit Description

The engine control module (ECM) communicates directly with the control modules connected to the GM LAN serial data communication circuit through the GM LAN protocol.

However, the immobiliser control unit (ICU) communicates with the ECM using the keyword 2000 protocol. Since the GM LAN and keyword 2000 protocols are not compatible, a powertrain interface module (PIM) is integrated into the serial data system to serve as a gateway. This gateway allows communication between the two protocols. Refer to 6E1 Powertrain Interface Module – V6 for further information on the GM LAN serial data communication circuit.

DTC U0001 sets if the ECM detects a fault condition in the serial data communication circuit.

Conditions for Running the DTC

DTC U0001 runs continuously when the following conditions are met:

The ignition voltage is 10.0 – 16.0 V.

The vehicle power mode requires serial data communication.

Conditions for Setting the DTC

The ECM detects a specified number of transmitted messages are not valid.

Conditions for Clearing the DTC

The Serial Data Communication Circuit DTCs are Type ‘C’ DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type ‘C’ DTC sets and conditions for clearing Type ‘C’ DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the ECM operation.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following number refers to the step numbers in the diagnostic table:

1 The following tests are included in the Diagnostic System Check.

- Tests the integrity of the GM LAN serial data communication circuit.
- Tests for fault conditions on the vehicle immobiliser system stored in the ICU.

DTC U0001 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC U0001 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 4	—
4	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC U0001 fail this ignition cycle?	Go to Step 2	Go to Step 5
5	Using Tech 2, select the DTC display function. Are there any DTCs displayed?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.62 DTC U0101

DTC Description

This diagnostic procedure supports the following DTC:

- DTC U0101 – CAN-Bus No Communication With TCM (Transmission Control Module)

Circuit Description

The Engine Control Module (ECM) communicates directly with the control modules connected to the GM LAN serial data communication circuit through the GM LAN protocol.

However, the immobiliser control unit (ICU) communicates with the ECM using the keyword 2000 protocol. Since the GM LAN and keyword 2000 protocols are not compatible, a powertrain interface module (PIM) is integrated into the serial data system to serve as a gateway. This gateway allows communication between the two protocols. Refer to 6E1 Powertrain Interface Module – V6 for further information on the GM LAN serial data communication circuit.

A serial data communication circuit – TCM DTC sets if the ECM detects an invalid signal from the TCM.

Conditions for Running the DTC

DTC U0101 runs continuously when the following conditions are met:

- The ignition is on for longer than 3 seconds.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

The ECM did not receive a valid signal from the TCM within the specified time frame.

Conditions for Clearing the DTC

This Serial Data Communication Circuit DTC is a Type C DTC. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type C DTC sets and the conditions required for clearing Type C DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the ECM operation.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following number refers to the step numbers in the diagnostic table:

1 The following tests are included in the Diagnostic System Check.

  - Tests the integrity of the GM LAN serial data communication circuit.
  - Tests for fault conditions on the vehicle immobiliser system stored in the ICU.

DTC P0864 and U0101 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section

Step	Action	Yes	No
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC U0101 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Using Tech 2, attempt to communicate with the PIM. Does the PIM failed to communicate?	Refer to the 6E1 Powertrain Interface Module – V6	Go to Step 4
4	Are DTCs also set in the PIM?	Refer to 6E1 Powertrain Interface Module – V6	Go to Step 5
5	Are DTCs that may trigger a fault condition in the serial data communication circuit also set in the TCM?	Refer to 7C2 Automatic Transmission – 4L60E – Electrical Diagnosis	Go to Step 6
6	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Was the repair completed?	Go to Step 7	—
7	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the serial data communication circuit – TCM DTCs fail this ignition cycle?	Go to Step 2	Go to Step 8
8	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.63 DTC U0155 or U0423

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC U0155 – CAN-Bus No Communication With Gateway
- DTC U0423 – CAN-Bus Invalid Data From Gateway

Circuit Description

The Engine Control Module (ECM) communicates directly with the control modules connected to the GM LAN serial data communication circuit through the GM LAN protocol.

However, the immobiliser control unit (ICU) communicates with the ECM using the keyword 2000 protocol. Since the GM LAN and keyword 2000 protocols are not compatible, a powertrain interface module (PIM) is integrated into the serial data system to serve as a gateway. This gateway allows communication between the two protocols. Refer to 6E1 Powertrain Interface Module – V6 for further information on the GM LAN serial data communication circuit

A PIM serial data communication circuit DTC sets if the ECM detects an invalid signal from the PIM.

Conditions for Running the DTC

DTCs U0155 and U0423 run continuously when the following conditions are met:

- The engine is running.

SECTION 1
HEATER AND AIR CONDITIONING

TABLE OF CONTENTS

SECTION 3C

FRONT SUSPENSION
(4×2 High Ride Suspension, 4×4)

TABLE OF CONTENTS

- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

The ECM did not receive a valid signal from the PIM within the specified time frame.

Conditions for Clearing the DTC

The PIM serial data communication circuit DTCs are Type C DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type C DTC sets and conditions for clearing Type C DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the ECM operation.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following number refers to the step numbers in the diagnostic table:

1 The following tests are included in the Diagnostic System Check.

- Tests the integrity of the GM LAN serial data communication circuit.
- Tests for fault conditions on the vehicle immobiliser system stored in the ICU.

DTC U0155 or U0423 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC U0155, or U0423 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this Section
3	Replace the PIM. Refer to 6E1 Powertrain Interface Module – V6. Was the repair completed?	Go to Step 4	—
4	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the PIM serial data communication circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 5
5	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

8 HFV6 Engine – Tech 2 Functions

8.1 Introduction

CAUTION

Do not use a Tech 2 that displays faulty data; have the Tech 2 repaired. The use of a faulty Tech 2 can result in misdiagnosis and the unnecessary replacement of parts.

From the Main Menu, having selected **Diagnostics** / **2006** / **RA Rodeo** / **Engine**, the Tech 2 functions for the HFV6 engine, include:

F0: Diagnostic Trouble Codes

F1: Data Display

F2: OBD Data

F3: Snapshot

F4: Actuator Test

F5: Additional Functions

F6: Programming

8.2 Tech 2 Functions

F0: Diagnostic Trouble Codes

When this test mode is initiated, DTCs stored by the ECM can be displayed or cleared. When entered, there are three additional modes for selection:

F0: Read DTC Information: All DTCs stored in the ECM will be displayed.

F1: Clear Engine & Transmission DTCs: Clears all current DTCs in the ECM and TCM memories.

F2: Freeze Frame/Failure Records: Shows the Freeze Frame information. Freeze Frames are types of snapshots stored in the ECM memory.

F1: Data Display

- Use the Tech 2 Data List under the following conditions:
- The Diagnostic System Check – HFV6 Engine has been completed.
- The On-Board Diagnostics are functioning correctly.
- No DTCs are present.

NOTE

- Tech 2 values from an engine that is operating correctly may be used for comparison with the engine you are diagnosing. The Tech 2 engine data lists represent typical values that would be seen on a normal operating engine.
- The Tech 2 Data Definitions list that follows the Data Lists, is arranged in alphabetical order and contains a brief description of all of the engine related parameters that are available.

The following 'typical' Tech 2 values were recorded under the following conditions:

Ignition ON:	Engine Running
• Engine stopped, ignition in the ON position.	• Engine running.
• Closed throttle.	• Closed throttle.
• Transmission selector in the Park position (Automatic Transmission) or Neutral (Manual Transmission.	• Transmission selector in the Park position (Automatic Transmission) or Neutral (Manual Transmission.
• Engine, transmission at ambient temperature.	• Engine, transmission at normal operating temperature.
• Accessories are OFF.	• Accessories are OFF.
• Brake pedal is not applied.	• Brake pedal not applied.

NOTE

The values quoted in the following data lists are only intended to provide the Technician with an indication of the values to be expected.

When 'F1 Data Display' is selected, there are 12 data lists provided, that can save time when diagnosing symptomatic conditions.

Engine Data 1

Engine Data 2

EVAP Data

Fuel Trim Data

O2 Sensor Data

TAC Data (Throttle Actuator Control)

Cooling/HVAC Data

Cruise Control Data

Electrical/Theft Data

Instrument Data

ODM Data (Output Driver Module)

Misfire Data

F2: OBD Data

In this test mode, Tech 2 displays engine management data parameters relating to the OBD (On Board Diagnostic) for the engine being diagnosed. Refer to 8.5 OBD Data for specific detail.

F3: Snapshot

In this test mode, Tech 2 captures data before and after a snapshot triggering event that may or may not set a DTC.

F4: Actuator Test

In this test mode, Tech 2 performs software override commands to the ECM, to assist in problem isolation during diagnostics. When entering this mode, there are 9 actuators that can be tested for operational integrity. The 9 tests available are:

F0: Fuel Pump Relay Test

F1: Electronic Throttle Control Test

F2: A/C Relay Test

F3: Cooling Fan PWM

F4: Alternator L Terminal

F5: EVAP Purge Solenoid

F6: Engine Speed Control

F7: Starter Relay Test

F8: Fuel Injector Balance

F5: Additional Functions

When this selection is made from the Tech 2 screen, an additional two choices are provided:

F0: System Identification: In this mode, Tech 2 will display the engine identification screen.

F1: Security Information: When selected, this mode displays various engine management data parameters relating to the security system.

F6: Programming

Within this selection, there are five programming selections available:

F0: Immobiliser Link to ECM/PIM

F1: Reset ECU

F2: Fuel Trim Reset

F3: Reset Engine Oil Life

F4: Throttle Body Relearn

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNECESSARY SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU/GM will call out those fasteners that require a replacement after removal. ISUZU/GM will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

8.4 Tech 2 Data Definitions

NOTE

This listing is arranged in alphabetical order and defines each parameter shown in the Data Lists.

A/C Cutoff Mode (Air Conditioning): This parameter displays whether the control module is commanding the A/C compressor clutch relay OFF for a number of reasons, among which is; operating pressure outside given parameters or throttle position at wide open throttle (WOT).

A/C Disengagement 1 – 8 History: The parameter displays the last 8 air conditioning (A/C) compressor disengages in order from 1 to 8 with 8 being the most recent. There are 8 possible causes listed for the A/C compressor to disengage; High Pressure, Engine Speed, Battery Voltage, Stall Prevention, Full Load, Performance, Engine Temperature or Signal not Present. Any of these causes need to be outside calibrated values, to cause the A/C to disengage.

A/C Pressure Sensor (Air Conditioning): This parameter displays the voltage from the A/C high side pressure sensor signal circuit to the control module.

A/C Pressure Sensor (Air Conditioning): This parameter displays the pressure in kPa from the A/C high side pressure sensor signal circuit to the control module.

A/C Relay (Air Conditioning): This parameter displays the state of the A/C clutch relay control circuit, either as ‘ON’ or ‘OFF’.

A/C Relay Status: This parameter displays the state of the A/C request input to the control module from the heating, ventilation, and air conditioning (HVAC) controls.

A/C Request: Represents the commanded state of the A/C clutch control relay. Clutch should be engaged when ON is displayed.

Actual Gear: This parameter displays the transmission range input to the control module, determined directly from the decoding of the PRNDL – A, B, C, and P inputs from the transmission internal mode switch (IMS).

Actual Gear: Based on the evaluation of the PRNDL – A, B, C, and P inputs, the ECM determines whether the parameter is valid or invalid.

Actual Intake Camshaft Position (Bank 1 or Bank 2): This parameter displays the actual intake camshaft position in degrees of crankshaft angle.

Alternator L Terminal Duty Cycle: This parameter displays the ECM commanded state of the voltage regulator on the alternator, expressed as a percentage from 0 to 100.

APP Sensor 1 (Accelerator Pedal Position): This parameter displays the actual voltage on the APP sensor 1 signal circuit as measured by the ECM, that can range from 0.9 – 4.5 volts.

APP Sensor 2 (Accelerator Pedal Position): This parameter displays the actual voltage on the APP sensor 1 signal circuit as measured by the ECM, that can range from 0.45 – 2.25 volts.

APP Sensor 1 and 2 Correlation (Accelerator Pedal Position): This parameter displays ‘Okay’ under normal operating conditions or ‘Fault’ if the control module detects the signal voltage from APP sensor 1 that is not in the correct relationship to APP sensor 2.

Average Injection Time (Bank 1 or Bank 2): This parameter displays the average pulse width of the fuel injectors for each bank of the engine as determined by the ECM.

B1/B2 S1 O2 Sensor 1 (Bank 1 or Bank 2 Sensor 1): This parameter displays the lambda output from the HO2S to the ECM. A lambda below 1.0 indicates a rich exhaust, while a lambda above 1.0 indicates a lean exhaust.

B1/B2 S2 O2 Sensor 2 (Bank 1 or Bank 2 Sensor 2): This parameter displays the mV output from the HO2S to the ECM. A lower voltage indicates a lean exhaust, while a higher voltage indicates a rich exhaust.

B1/B2 S1 O2 Sensor Heater (Bank 1 or Bank 2 Sensor 1): This parameter displays the resistance of the sensing element within the ECM. The front sensors are normally regulated to 80 ohms.

B1/B2 S1/S2 O2 Sensor Heater Circuit Status (Bank 1 or Bank 2 Sensor 1 or Sensor 2): The parameter displays 'Fault' if the oxygen sensor heater control circuit is open, shorted to ground, or shorted to voltage. The parameter displays 'Undefined' until the circuit has been commanded ON.

Barometric Pressure: This parameter displays the barometric pressure in kPa. The ECM uses the barometric pressure for fuel control to compensate for altitude differences.

Barometric Pressure: This parameter displays the barometric pressure voltage. The control module uses the barometric pressure for fuel control to compensate for altitude differences.

Brake Lamp Switch: This parameter displays the status of the brake lamp switch. When the brake pedal is pressed the switch contacts close causing the vehicles brake lamps to illuminate.

Brake Switch Signal Status: This parameter displays the position of the torque converter clutch (TCC) brake pedal switch input to the ECM.

Calculated ECT – Closed Loop Fuel Control (Engine Coolant Temperature): This parameter displays the modelled temperature that the control module calculates from air entering the engine, coolant temperature, and ambient air temperature. If the actual engine coolant temperature does not reach this calculated temperature within a predetermined amount of time, a DTC will set.

Calculated ECT – Thermostat Diagnosis (Engine Coolant Temperature): This parameter displays the modelled temperature that the control module calculates from air entering the engine, coolant temperature, and ambient air temperature. If the actual engine coolant temperature does not reach this calculated temperature within a predetermined amount of time, a DTC will set.

Calculated Pedal Position: This parameter displays the angle of the accelerator pedal position (APP) as calculated by the ECM, using the signals from the APP sensors, as a percentage of throttle opening.

Calculated Throttle Position: This parameter displays the percentage of throttle opening, based on the two TP sensor inputs to the ECM.

Catalyst Protection Mode: This parameter displays if the control module is commanding catalytic converter protection or not.

Catalyst Temperature (Bank 1 or Bank 2): This parameter displays the catalytic converter temperature as calculated by the control module.

Clutch Pedal Switch: This parameter displays the state of the clutch pedal as determined by the ECM from the clutch start switch position.

Clutch Pedal Switch: This parameter displays the state of the clutch pedal as determined by the ECM from the clutch pedal switch.

Commanded Exhaust Camshaft Position (Bank 1 or Bank 2): This parameter displays the exhaust camshaft position in percent of range as commanded by the control module.

Commanded Exhaust Camshaft Position (Bank 1 or Bank 2): This parameter displays the exhaust camshaft position in crankshaft degrees, as commanded by the ECM.

Commanded Intake Camshaft Position (Bank 1 or Bank 2): This parameter displays the intake camshaft position in crankshaft degrees, as commanded by the ECM.

Commanded B1/B2 S1 O2 Sensor Heater (Bank 1 or Bank 2 Sensor 1): This parameter displays the state of the oxygen sensor heater control circuit, as a percentage.

Commanded B1/B2 S1 O2 Sensor Value (Bank 1 or Bank 2 Sensor 1): This parameter displays the lambda output from the HO2S to the ECM. A lambda below 1.0 indicates a rich exhaust, while a lambda above 1.0 indicates a lean exhaust.

Coolant Temperature: This parameter displays the temperature of the engine coolant based on input to the control module from the engine coolant temperature (ECT) sensor.

Crank Request: This parameter displays whether the ignition switch has been cycled to the crank position, requesting the ECM to activate the starter relay.

Cruise Control Active: This parameter displays the status of the cruise control system as determined by the ECM.

Cruise Control Switch: This parameter displays the state of the cruise control on/off switch input to the control module.

Cruise Control Disengagement Reason: The parameter displays which of a possible 28 causes for the cruise control to disengage.

CC Disengagement 1 – 8 History (Cruise Control): The parameter displays the last 8 cruise control disengages in order from 1 to 8, with 8 being the most recent. There are about 28 possible causes for the cruise control to disengage.

Cruise Resume/Acceleration Switch: This parameter displays the state of the cruise control resume/accel switch position input to the ECM.

Cruise Set / Coast Switch: This parameter displays the state of the cruise controls set/decel. switch position input to the ECM.

Cycles of Misfire: This parameter displays the number of misfire tests during 200 engine revolutions.

Cylinder 1 – 6 Injector Circuit Status: This parameter displays the state of the fuel injector control circuit. The parameter displays 'Fault' if the fuel injector control circuit is open, shorted to ground, or shorted to voltage. This parameter displays 'Undefined Status' until the control circuit has been commanded 'On'.

Dec. Fuel Cutoff (Deceleration): This parameter displays the status of the ECM operating mode, used to turn off the fuel injectors and the evaporative emission (EVAP) canister purge valve during certain deceleration conditions.

Desired Engine Idle Speed: This parameter displays the desired engine idle speed as commanded by the ECM.

Desired Throttle Position: This parameter displays the desired throttle position (TP) angle commanded by the ECM.

Distance Since DTC Cleared: This parameter displays the distance (km) travelled since any diagnostic trouble code (DTC) has been cleared from the ECM memory.

DTC Set This Ignition: This parameter displays Yes if a DTC set on the current ignition cycle.

ECM Immobilized: This parameter displays 'Yes' when an internal control module reset occurs. Tech 2 will display 'No' under normal operating conditions.

Electronic Throttle Control Learn Counter: When the ECM performs a throttle body relearn procedure, the throttle plate is commanded to move from the rest position (7% open) to full closed (0%), then to around 10% open.
At the start of this procedure, the Tech 2 'TAC Learn Counter' parameter should display 0, then count up to 11 after the procedure is completed. If the counter did not start at 0 or if the counter did not end at 11, a fault has occurred and a DTC should set.

Engine Control Ignition Relay: This parameter displays the state of the control circuit for control module power relay as commanded by the ECM.

Engine Control Ignition Relay Feedback: This parameter displays the voltage available at the engine control ignition relay pin of the control module.

Engine Load: This parameter displays the calculated engine load in percent based on inputs to the control module from various engine sensors.

Engine Oil Life Remaining: This parameter displays the percentage of engine oil life remaining. The controller calculates the engine oil life by monitoring engine load, collant temperature and engine speed.

Engine Oil Pressure: This parameter displays the oil pressure in kPa from the ECM, developed from the engine oil pressure (EOP) sensor input.

Engine Oil Pressure Sensor: This parameter displays 'High' if the engine oil pressure is within the correct range. If the ECM detects that the engine oil pressure is not within the correct range, Tech 2 will display 'Low'.

Engine Runtime: This parameter displays the time elapsed since the engine was started.

Engine Speed: This parameter displays the speed of the engine crankshaft rotation from information received from the CKP sensor. If there is a CKP sensor DTC, the ECM calculates the engine speed from one of the camshaft position (CMP) sensors.

EVAP Purge Solenoid (Evaporative Emission): This parameter displays the on-time or duty cycle of the EVAP canister purge solenoid commanded by the ECM. Zero percent indicates no purge. One hundred percent indicates full purge.

EVAP Purge Solenoid Valve Circuit Status (Evaporative Emission): This parameter displays the state of the EVAP purge solenoid control circuit. The parameter displays 'Fault' if the EVAP purge solenoid control circuit is open, shorted to ground, or shorted to voltage. The parameter displays 'Undefined Status' until the circuit has been established as 'OK'.

Cooling Fan Relay: This parameter displays the control module commanded state of the fan relay control circuit.

Cooling Fan Relay Circuit Status: This parameter displays the state of the fan relay control circuit. The parameter displays ‘Fault’ if the fan relay control circuit is open, shorted to ground, or shorted to voltage. The parameter displays ‘Undefined’ until the relay control circuit has been determined as being ‘OK’.

Fuel Level: This parameter displays the amount of fuel in the fuel tank in litres, as calculated by the ECM from data received from the fuel level sensor.

Fuel Level Sensor: This parameter displays the voltage received from the fuel level sensor in the fuel tank, by the ECM.

Fuel Pump Relay Circuit Status: This parameter displays the state of the fuel pump relay control circuit. The parameter displays ‘Fault’ if the fuel pump relay control circuit is open, shorted to ground, or shorted to voltage. The parameter displays ‘Undefined’ until the relay control circuit has been determined as being ‘OK’.

Fuel Pump Relay: This parameter displays the ECM commanded state of the fuel pump relay control circuit.

Fuel Trim Learn: This parameter displays ‘Enabled’ when conditions are appropriate for enabling long term fuel trim corrections. This indicates that the long term fuel trim is adapting continuing amounts of short term fuel trim. If Tech 2 displays ‘Disabled’, then long term fuel trim will not respond to changes in short term fuel trim.

Ignition Accessory Signal: This parameter displays ‘On’ when the control module detects a voltage at the ignition ‘ACC’ terminal, X1-4 of the ignition switch.

Ignition On Signal: This parameter displays ‘On’ when the control module detects a voltage at the ignition ‘IGN’ terminal X1-3 of the ignition switch.

Initial Brake Apply Signal: This parameter displays the status of the brake lamp switch. Before the cruise control can be activated, this switch contact must be open circuit when the brake pedal is pressed.

Injection Time Cylinder 1 – 6: This parameter displays the amount of fuel injector On-time or pulse width as commanded by the ECM.

Intake Air Temperature: This parameter displays the temperature of the air entering the air induction system based on input to the ECM from the intake air temperature (IAT) sensor.

Knock Sensor Signal (Bank 1 or Bank 2): This parameters displays the voltage input to the control module from the knock sensor (KS).

Knock Retard: This parameter indicates the amount of spark advance in crankshaft degrees, that the ECM removes from the ignition control (IC) spark advance in response to the signal from the knock sensors.

Knock Retard Cylinder 1 – 6: This parameter displays the knock retard as commanded by the ECM for cylinders 1-6. Each cylinder is controlled individually based on both knock sensor signal inputs.

Loop Status B1S1 / B2S1 (Bank 1 or Bank 2 Sensor 1): This parameter displays the state of the fuel control system as commanded by the ECM. ‘Closed’ Loop operation indicates that the ECM is controlling the fuel delivery based on the oxygen sensors input signal. In ‘Open’ Loop operation the ECM ignores the oxygen sensor input signal and bases the amount of fuel to be delivered on other sensor inputs.

LTFT Idle/Deceleration (Bank 1 or Bank 2) (Long Term Fuel Trim): This parameter displays the commanded Long Term Fuel Trim correction by the ECM for bank 1 or bank 2 for idle and deceleration conditions.

LTFT Cruise/Acceleration (Bank 1 or Bank 2) (Long Term Fuel Trim): This parameter displays the commanded Long Term Fuel Trim correction by the ECM for bank 1 or bank 2 for cruise and acceleration conditions.

Malfunction Indicator (MI): This parameter displays the commanded (‘On, ‘Off’ or ‘Flashing’) state of the malfunction indicator lamp (MIL) control circuit by the ECM.

Malfunction Indicator (MI) Circuit Status: This parameter displays the state of the MIL control circuit. The parameter displays ‘Fault’ if the MIL control circuit is open, shorted to ground, or shorted to voltage. This parameter displays ‘Undefined Status’ until the circuit has been determined as being ‘OK’.

Mass Air Flow: This parameter displays the measured quantity (g/s) of air flowing into the engine during all operating conditions.

Mass Air Flow Sensor: This parameter displays the signal voltage from the mass air flow (MAF) sensor to the ECM.

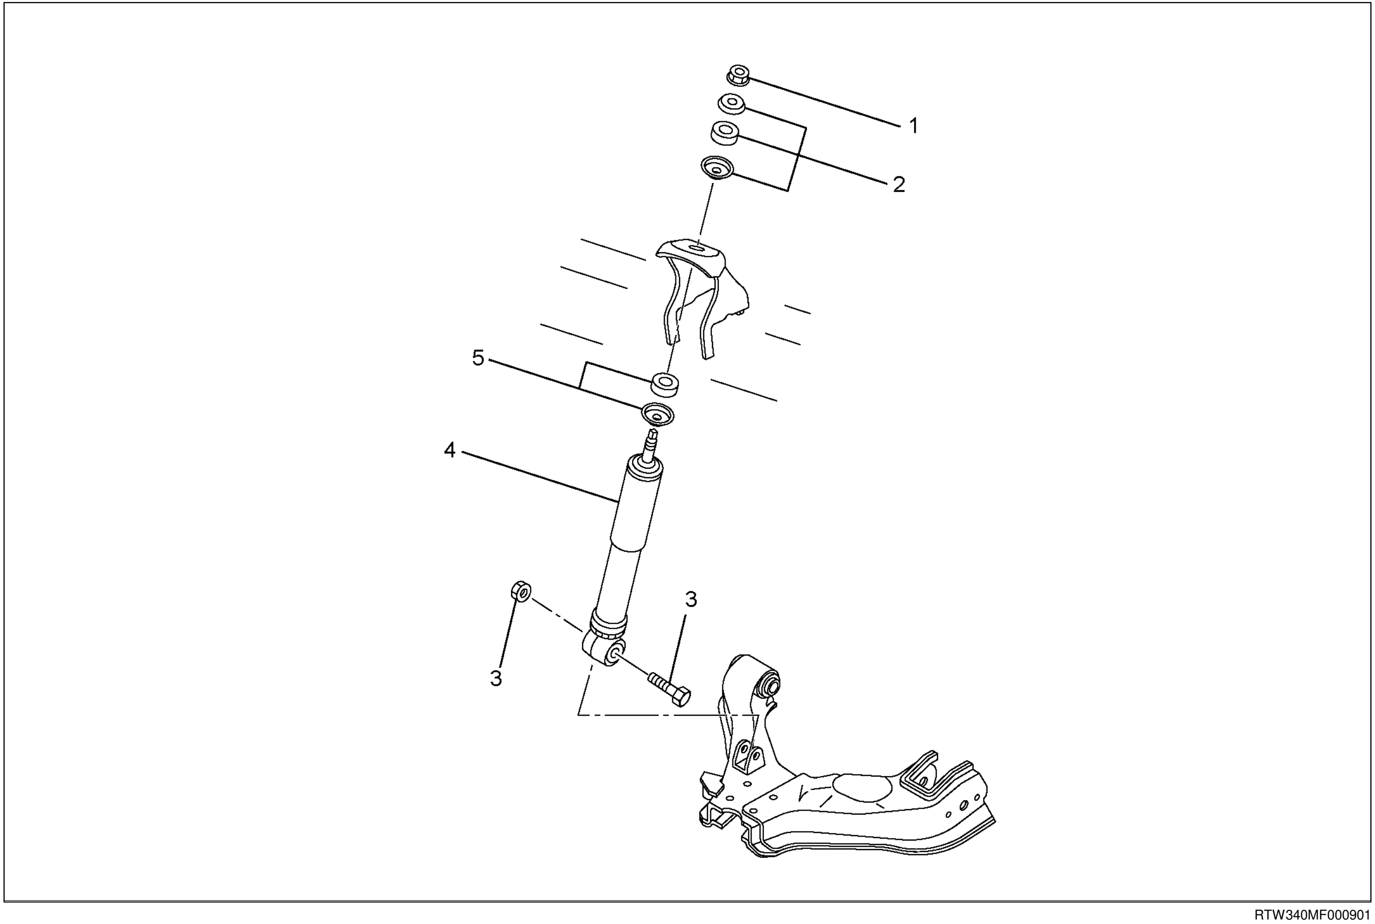
Misfire Current Cyl. #1 – #6: Tech 2 displays a range of 0 – 200 counts. This parameter displays the number of misfires that have been detected during the last 200 cylinder firing events. The counters may normally display some activity, but the activity should be nearly equal for all of the cylinders, and in low numbers.

Misfire History Cyl. #1 – #6: Tech 2 displays a range of 0 – 65,535 counts. The misfire history counters display the total level of misfire that has been detected on each cylinder. The misfire history counters will not update or show any activity until a misfire DTC P0300 has become active. The misfire history counters will update every 200 cylinder firing events.

Oil Level: When the ECM receives information from the engine oil level switch, where the engine oil level is within preset parameters, Tech 2 will display ‘Normal’. If not within preset parameters, the display will show ‘Low’.

Shock Absorber

Shock Absorber and Associated Parts



Legend

(1) Shock Absorber Nut
(2) Rubber Bushing and Washer
(3) Shock Absorber Bolt and Nut
(4) Shock Absorber
(5) Rubber Bushing and Washer

Removal

1. Raise the vehicle and support it with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel Replacement in this section.
3. Remove bolt and nut.
4. Remove nut.
5. Remove rubber bushing and washer.
6. Remove shock absorber.
7. Remove rubber bushing and washer.

Inspection and Repair

Make necessary correction or replace parts if wear, damage, corrosion or any other abnormal condition is found through inspection.

Check the following parts:

- Shock absorber
- Rubber bushing

Installation

1. Install rubber bushing and washer.
2. Install shock absorber.
3. Install rubber bushing and washer.
4. Install shock absorber nut, then tighten it to the specified torque.

Torque: 20 N·m (2.0 kgf·m/14 lb·ft)

5. Install shock absorber bolt and nut, and then tighten to the specified torque.

Torque: 93 N·m (9.5 kgf·m/69 lb·ft)

Oil Temperature Sensor: This parameter displays the engine oil temperature in degrees C.

Power Enrichment: This parameter displays the status of the operating mode of the ECM used to increase fuel delivery during certain acceleration conditions.

Reduced Engine Power: This parameter displays when the ECM is commanding reduced engine power due to a throttle actuator control (TAC) system condition.

Requested Torque: This parameter displays the calculated amount torque requested of the ECM by the Transmission Control Module (TCM).

Short Term Fuel Trim (Bank 1 or Bank 2): This parameter displays the short-term correction to the fuel delivery by the ECM in response to oxygen sensor 1 or 2. If the oxygen sensor indicates a lean air/fuel mixture, the control module will add fuel, increasing the short term fuel trim above 0. If the oxygen sensor indicates a rich air/fuel mixture, the control module will reduce fuel decreasing the short term fuel trim below 0.

Spark Advance: This parameter displays the amount of spark advance the ECM is commanding on the ignition control circuits. The ECM determines the desired advance.

Starter Relay: This parameter displays the Em's commanded state of the starter motor relay control circuit.

Starter Relay Circuit Status: This parameter displays the state of the starter relay control circuit. The parameter displays 'Fault' if the starter relay control circuit is open, shorted to ground, or shorted to voltage. The parameter displays Undefined Status' until the circuit has been determined as being 'OK'. This parameter may not change if Tech 2 is used to command the relay control circuit ON.

Start Up ECT (Engine Coolant Temperature): This parameter displays the temperature of the engine coolant on start up based on input to the ECM from the ECT sensor.

Start Up IAT (Intake Air Temperature): This parameter displays the temperature of the intake air at start in the air induction system based on input to the ECM from the IAT sensor.

Time Since Engine Off: This parameter displays the amount of time (hours:minutes:seconds) that has elapsed since the engine was last cycled OFF.

Total Fuel Trim (Bank 1 or Bank 2): This parameter displays the overall fuel trim from the idle/decel cell and the cruise/accel cell.

Total Misfire: This parameter displays the total number of cylinder firing events that the control module detected as misfires for the last 200 crankshaft revolution sample period.

TP Sensor 1 (Throttle Position): This parameter displays the actual voltage on the TP sensor 1 signal circuit as measured by the ECM.

TP Sensor 1 Learned Lower Position (Throttle Position): This parameter displays the learned minimum value of TP sensor 1 as recorded by the ECM during the last learn procedure.

TP Sensor 2 (Throttle Position): This parameter displays the actual voltage on the TP sensor 2 signal circuit as measured by the ECM.

TP Sensor 2 Learned Lower Position (Throttle Position): This parameter displays the learned minimum value of TP sensor 2 as recorded by the ECM during the last learn procedure.

TP Sensor 1-2 Correlation (Throttle Position): This parameter displays 'Fault' when the ECM detects that TP sensor 1 voltage signal is not within the correct relationship to TP sensor 2. Tech 2 displays 'Okay' under normal operating conditions.

Transmission Gear: This parameter displays the position of the transmission gear selector that is transmitted over the serial data circuit from the TCM.

Transmission Gear Selector Signal: This parameter displays the position of the transmission gear selector that is transmitted over the serial data circuit from the TCM.

Vehicle Speed: This parameter displays the speed of the vehicle as calculated by the TCM from information received from the vehicle speed sensor (VSS).

Volumetric Efficiency: This parameter displays the volumetric efficiency of the engine as calculated by the control module.

8.5 OBD Data

Tech 2 Display	Units Displayed	Typical Values	
		Ignition On	Engine Running
B1S1 O2 Sensor (Bank 1 Sensor 1)	mA	0.008	0

B1S1 Lambda Value (Bank 1 Sensor 1)	:1 (= Lambda)	1.000	1.003
B1S2 O2 Sensor (Bank 1 Sensor 2)	mV	440	445
B1S2 Short Term Fuel Trim (Bank 1 Sensor 2)	%	99.2%	99.2%
B2S1 O2 Sensor (Bank 2 Sensor 1)	mA	0.000	0.024
B2S1 Lambda Value (Bank 2 Sensor 1)	:1 (= Lambda)	1.003	0.995
B2S2 O2 Sensor (Bank 2 Sensor 2)	mV	440	475
B2S2 Short Term Fuel Trim (Bank 2 Sensor 2)	%	99.2	99.2
Fuel System 1 Automatic Control Loop	—	—	—
Fuel System 2 Automatic Control Loop	—	—	—
Calculated Load	%	100.0	18.8
Engine Coolant Temperature	°C	56	90
B1 Short Term Fuel Trim (Bank 1)	%	0.0	–0.8
B1 Long Term Fuel Trim (Bank 1)	%	0.0	0.0
B2 Short Term Fuel Trim (Bank 2)	%	0.0	0.8
B2 Long Term Fuel Trim (Bank 2)	%	0.0	0.0
Engine Speed	RPM	0	588
Vehicle Speed	km/h	0	0
Ignition Timing Advance for Cylinder 1	°CA	0	13
Intake Air Temperature	°C	47	32
Mass Air Flow	g/s	0.00	2.75
Absolute TP (Throttle Position)	%	14.5	
OBD Requirements to which Vehicle is Designed	EOBD	—	—
Distance While MIL is Activated	km	0	0

8.6 Actuator Tests

Fuel Pump Relay Test

This test allows the Technician to turn the fuel pump on and off.

NOTE

To avoid the possibility of engine flooding and subsequent catalytic converter damage, Tech 2 will deactivate the fuel pump relay after 2 seconds.

Precondition: Ignition 'On', engine 'Off'.

Electronic Throttle Control Test

This selection from the Tech 2 Actuator Test menu, provides two parameters; the Calculated Throttle Position and the Desired Throttle Position. As the Technician increases or decreases the throttle opening in 10% increments, each of the two parameters should be the same.

Preconditions: Ignition 'On', engine 'Off', vehicle speed is 0 km/h, there are no vehicle speed DTCs set and the ECM is not performing a throttle learn procedure.

A/C Relay Test

Allows the Technician to turn the air conditioning relay 'On' and 'Off'.

Precondition: Ignition 'On'.

Cooling Fan (PWM)

WARNING

Take care that no-one can access the engine compartment during these tests!

This test allows the Technician to turn the cooling fan on in increments to its maximum speed.

Precondition: Ignition 'On' Air conditioning is 'Off'..

Alternator L Terminal

This test allows the Technician to turn 'On' and 'Off', the commanded state of the voltage regulator in the alternator. 'On' displays a commanded state of 99%, while 'Off' displays a commanded state of 0%.

Precondition: Engine running.

EVAP Purge Solenoid

This test allows the Technician to control the EVAP purge solenoid valve. The normal commanded state is '0%'. The system will increase or decrease the amount of purge by changing the duty cycle of the purge valve in 10% increments within a range of 0 – 100%. The system will remain in the commanded state until cancelled by Tech 2.

NOTE

The EVAP Purge Solenoid Command parameter may not change states when using this output control.

Precondition: Ignition 'On', engine 'Off'.

Engine Speed Control

CAUTION

Other DTCs may set when the Engine Speed Control function is used. Disregard those DTCs that set under this condition.

Allows the increase / decrease of the engine speed in 20 – 30 rpm increments from the base idle speed, up to 1,600 rpm.

NOTE

If the engine coolant temperature is below the prescribed minimum, a message to that effect is displayed and access to engine speed control is blocked.

Preconditions: Engine running, engine temperature above 80°C, transmission in Park or Neutral.

Starter Motor Relay Test

WARNING

The engine will crank and start during the starter relay test.

Allows the Technician to turn the starter relay 'On', thereby activating the starter motor and cranking the engine.

Preconditions: Apply park brake, firmly apply foot brake, ignition 'On', engine 'Off', transmission in Park or Neutral.

Fuel Injector Balance

This test allows the Technician to check the fuel flow through each injector when the engine is not running. The sequence of events are:

1 Install a fuel pressure gauge to the fuel rail.

2 Select 'Fuel Injector Balance Test', from the 'Actuator Test' menu on Tech 2

3 Activate the fuel injector balance test with Tech 2. This action activates the fuel pump and stabilises the fuel delivery system fuel pressure. The fuel pump is then turned off.

4 Note the stabilised fuel rail pressure.

5 When the pump is turned 'Off', the injector is activated for a pre-determined time.

6 The fuel pressure drop is then noted from the fuel pressure gauge.

NOTE

For a detailed procedure and analysis of fuel injector condition, refer to 5.3 Fuel Injector Balance Test.

8.7 Programming

F0: ICU Link to ECM/PIM: Should the ECM, PIM or ICU be replaced, the modules must be security linked to each other. If this linking procedure is not performed, the vehicle will not crank nor run. For additional information relating to Tech 2 and the linking procedure, refer to 11A – Immobiliser.

NOTE

After an ECU reset, the ignition switch must be turned Off for at least 10 seconds and then turned On for at least one minute, before attempting communication between Tech 2 and the ECU.

Preconditions: TIS approval (TIS 2000 Security Access) must be obtained, the four digit security number entered into Tech 2 and the theft deterrent system disarmed. Then the ignition must be turned 'On', using a programmed remote coded key.

F1: Reset ECU: This function erases the security link between the Engine Control Module (ECM) and the Powertrain Interface Modules (PIM). If this procedure is performed, the engine will not crank nor run. A ICU Link to ECM/PIM procedure will need to be performed. For additional information relating to the ICU Link to ECM/PIM procedure, refer to 11A – Immobiliser.

NOTE

After an ECU reset, the ignition switch must be turned Off for at least 10 seconds and then turned On for at least one minute, before attempting communication between Tech 2 and the ECU.

Preconditions: The four digit security code must be entered into Tech 2 and the theft deterrent system must be disarmed and the ignition switched 'On' with a programmed remote coded key.

F2: Fuel Trim Reset: This function resets the fuel trim data values learned by the ECM.

F3: Throttle Body Relearn: In this mode, Tech 2 commands the throttle plate from its rest position to full closed then to about 10% open. This procedure takes approximately 6 – 8 seconds. At the start of this procedure, the Tech 2, 'Electronic Throttle Control Learn Counter' parameter should display '0' then count up to 11, after the procedure is completed. If the counter does not start at '0', nor display a count of '11' at the conclusion of the procedure, a fault has occurred and a DTC will set.

6C1-3
Engine Management – V6 – Service Operations

ATTENTION

Before performing any service operation or other procedure described in this Section, refer to 1.4 Warning Caution and Notes for correct workshop practices with regard to safety and / or property damage.

1 General Information

1.1 General Description

This Section describes the correct service procedures to repair and test components of the V6 engine management system. Emphasis is placed on the proper procedures and repair of components related to this specific system.

For component description, operation and location, refer to 6C1-1 Engine Management – V6 – General Information.

Engine cylinder identification follows the international standard OBD II. This standard calls for the engine cylinder bank number one to be identified by the location of cylinder number one. Therefore the numbering for the V6 engine is:

- 1, 3, 5 – Right-hand side (Bank 1).
- 2, 4, 6 – Left-hand side (Bank 2).

The engine firing order is 1, 2, 3, 4, 5, 6.

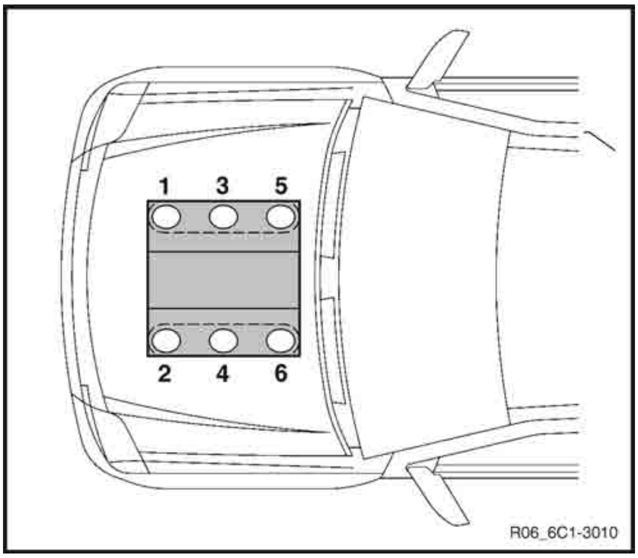


Figure 6C1-3 – 1

1.2 Service Precautions and Requirements

Service Precautions

WARNING

The following safety and precautionary directions must be followed when servicing the engine management system otherwise personal injury and / or improper system operation may occur:

- If working on a vehicle which has been subjected to an under bonnet thermal incident (fire), wear appropriate protective clothing to prevent personal injury. Components that contain fluoro-elastomer may produce a corrosive bi-product when subjected to extreme heat.
- Disconnection of the battery affects certain vehicle electronic systems. Refer to the battery disconnection procedure in 6D1-3 Battery – V6 before disconnecting the battery.
- Disconnect the battery negative lead when performing the following procedures:
  - disconnecting the engine control module (ECM) connectors, or
  - charging the battery.
- Disconnect the battery negative lead and the ECM connectors before attempting any electric welding on the vehicle.
- Do not start the engine if the battery terminal is not properly secured to the battery.
- Do not disconnect or reconnect the following while the ignition is switched on or when the engine is running:
  - any engine management system component wiring connector, or
  - battery terminal leads.

- Ensure the correct procedure for disconnecting and connecting engine management system wiring connectors is always followed.
- Ensure that all wiring connectors are fitted correctly.
- The engine management system wiring connectors are designed to fit only one way; there are indexing tabs and slots on both halves of the connector. Forcing the connector into place is not necessary if it is being installed with the correct orientation. Failure to take care to match the indexing tabs and slots correctly can cause damage to the connector, the module, or other vehicle components or systems.
- Never touch the connector pins of any electronic component, such as an ECM, as electrostatic discharge (ESD) damage may result.
- When steam or pressure cleaning engines, do not direct the cleaning nozzle at engine management system components.
- Never subject the ECM to temperatures less than -40° C and greater than 125° C.
- Prior to disconnection or removal of any components associated with the fuel system, clean the area around any connection points to avoid possible contamination of the fuel system.
- A depressurised fuel system contains fuel in the fuel system and fuel lines that can be spilled during service operations. To reduce the chance of personal injury, cover the fittings with a shop towel to absorb any fuel spillage prior to performing the service operation. Once the service operation has been completed, place the towel in an approved container for disposal.
- To avoid accidental fuel discharge, it is advisable to disconnect the battery and remove the fuel pump relay if the fuel line between the fuel pump and the fuel rail is to be disconnected / open for an indefinite period.
- Always tighten fasteners to the correct tightening torque, and where indicated in the service procedure, follow the correct tightening sequence, precautions and recommendations to prevent premature failure of the fastener or component.
- After removing components, such as the upper or lower intake manifold, front engine pipe, heated oxygen sensor, etc. always plug any openings to prevent dirt and other contaminants from entering.
- Do not use silicone based assembly lubricants as damage to the heated oxygen sensors may result.

CAUTION

Use of incorrect electrical test equipment when performing engine management service procedures could result in incorrect results or component damage.

- Use only the test equipment specified in the diagnostic tables. Use of other test equipment may either give incorrect results or damage serviceable components, refer to, 6C1-2 Engine Management – V6 – Diagnostics.
- After completing the required service operations, road test the vehicle to ensure correct engine management system operation.

Service Requirements

Basic Knowledge Required

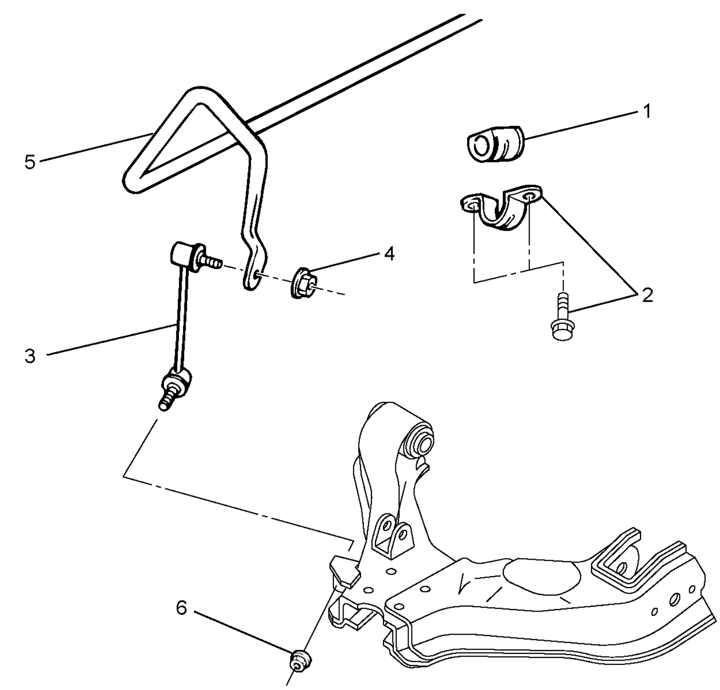
CAUTION

A lack of basic understanding of electronics, electrical wiring circuits and use of electrical circuit testing tools when performing certain service procedures could result in incorrect results or damage to components.

In addition, a general understanding of the engine management system and its component operation is essential to prevent misdiagnosis and component damage.

Stabilizer Bar

Stabilizer Bar and Associated Parts



RTW340MF000401

Legend

(1) Rubber Bushing
(2) Bracket and Bolt
(3) Link
(4) Link Nut
(5) Stabilizer Bar
(6) Link Nut

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove the stone guard.
3. Remove wheel and tire assembly. Refer to Wheel Replacement in this section.
4. Remove link nut.

CAUTION: Be careful not to break the ball joint boot.

5. Remove link.
6. Remove bracket.
7. Remove stabilizer bar.
8. Remove rubber bushing.

Inspection and Repair

Make necessary correction or replace parts if wear, damage, corrosion or any other abnormal condition is found through inspection.
Check the following parts:

- Stabilizer bar
- Rubber bushing
- Link ball joint

Basic Diagnostic Tools Required

CAUTION

Use of incorrect electrical circuit diagnostic tools when performing certain service procedures could result in incorrect diagnostic results or damage to components.

The following electrical circuit testing tools are required to perform the diagnostic procedures detailed in this Section:

- Test lamp, refer to 8A Electrical – Body and Chassis for further information.
- Digital multimeter with 10 MΩ ohms impedance, refer to 8A Electrical – Body and Chassis for further information.
- Connector test adapter kit Tool No. J35616-A.

1.3 Service Operations Not Covered In This Section

There are situations where components and/or procedures related to the powertrain management system are covered in other Sections of the service documentation. To aid technicians in locating the necessary service procedures for these components and/or procedures, refer to the stated references.

Air-conditioning System

For A/C pressure switch replacement procedure, refer to 2A Heater and Air-conditioning.

Electrical Components

For the following electrical system component replacement procedures, refer to the appropriate Sections as follows:

- Extended brake pedal travel switch and stop lamp switch service operations, refer to 5C Brakes.
- Fuse and relay locations, refer to 8A Electrical-Body and Chassis.
- Cruise control switch assembly service operations, refer to 8C Cruise Control – HFV6.
- Powertrain interface module PIM removal and installation procedure, refer to 6E1 Powertrain Interface Module – V6.
- Neutral start and back-up lamp switch, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing.
- Vehicle speed sensor service operations, refer to:
  - 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing
  - 7B1 Manual Transmission – V6

Fuel System

For the following fuel system component replacement procedures, refer to 6C Fuel System – V6.

- Fuel system cleaning,
- Fuel system leak and pressure test,
- Fuel feed hose to fuel rail replacement,
- Fuel line quick connect fittings,
- Evaporative emission control canister,
- Fuel filter,
- Fuel hose / pipes layout,
- Fuel pump motor assembly and fuel pressure regulator assembly,
- Fuel sender assembly service operations.

Transmission – Automatic

For automatic transmission sensors and components, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing.

Transmission – Manual

For manual transmission sensors and other components, refer to 7B1 Manual Transmission – V6.

1.4 Warning Caution and Notes

This Section contains various WARNINGS, CAUTIONS and NOTE statements that you must observe carefully to reduce the risk of death or injury during service, repair procedures or vehicle operation. Incorrect service or repair procedures may damage the vehicle or cause operational faults. WARNINGS, CAUTION and NOTE statements are not exhaustive. GM Holden LTD can not possibly warn of all the potentially hazardous consequences of failure to follow these instructions.

Definition of WARNING, CAUTION and NOTE Statements

Diagnosis and repair procedures in this Section contain both general and specific WARNING, CAUTION and NOTE statements. GM Holden LTD is dedicated to the presentation of service information that helps the technician to diagnose and repair the systems necessary for proper operation of the vehicle. Certain procedures may present a hazard to the technician if they are not followed in the recommended manner. WARNING, CAUTION and NOTE statements are designed to help prevent these hazards from occurring, but not all hazards can be foreseen.

WARNING defined

A WARNING statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in death or injury. A WARNING statement alerts you to take necessary action or not to take a prohibited action. If a WARNING statement is ignored, the following consequences may occur:

- Death or injury to the technician or other personnel working on the vehicle,
- Death or injury to other people in or near the workplace area, and / or
- Death or injury to the driver / or passenger(s) of the vehicle or other people, if the vehicle has been improperly repaired.

CAUTION defined

A CAUTION statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in damage to or destruction of equipment, or corruption of data. If a CAUTION statement is ignored, the following consequences may occur:

- Damage to the vehicle,
- Unnecessary vehicle repairs or component replacement,
- Faulty operation or performance of any system or component being repaired,
- Damage to any system or components which depend on the proper operation of the system or component being repaired,
- Faulty operation or performance of any systems or components which depend on the proper operation or performance of the system or component under repair,
- Damage to fasteners, basic tools or special tools and / or
- Leakage of coolant, lubricant or other vital fluids.

NOTE defined

A NOTE statement immediately precedes or follows an operating procedure, maintenance practice or condition that requires highlighting. A NOTE statement also emphasises necessary characteristics of a diagnostic or repair procedure. A NOTE statement is designed to:

- Clarify a procedure,
- Present additional information for accomplishing a procedure,

- Give insight into the reasons for performing a procedure in the recommended manner, and / or
- Present information that gives the technician the benefit of past experience in accomplishing a procedure with greater ease.

2 General Service Operations

2.1 Accelerator Pedal Position Sensor

Remove

1 Turn the ignition switch off.

2 Disconnect the wiring harness connector (1) from the accelerator pedal position (APP) sensor (2) by depressing the latch in the direction of the arrow.

NOTE

If difficulty is experienced in disconnecting the harness connector from the APP sensor, remove the sensor and mounting bracket assembly and then disconnect the harness connector.

3 Remove the nut (3), two places, attaching the APP sensor and bracket assembly to the dash panel.

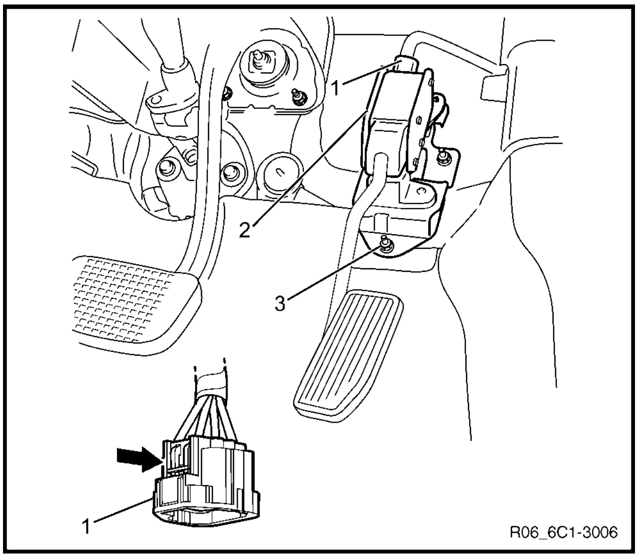


Figure 6C1-3 – 2

Reinstall

Reinstallation of the accelerator pedal position (APP) sensor is the reverse of the removal procedure, noting the following:

1 Reinstall the bolts attaching the APP sensor to the support bracket and tighten to the correct torque specification.

Accelerator pedal position sensor attaching bolt torque specification ....8.5 – 11.5 Nm

2 Road test the vehicle and check for correct operation.

2.2 Air Cleaner Assembly

Air Cleaner Upper Housing

Remove

1 Turn the ignition switch off.

2 Remove the mass air flow (MAF) sensor, refer to 2.20 Mass Air Flow Sensor.

3 Release the retaining clip (1), two places, attaching the air cleaner upper housing (2) to the air cleaner lower housing (3).

4 Rotate the upper housing in the direction of the arrow and withdraw the housing while disengaging the two outer retaining lugs (4).

5 If necessary, remove the air cleaner element (5).

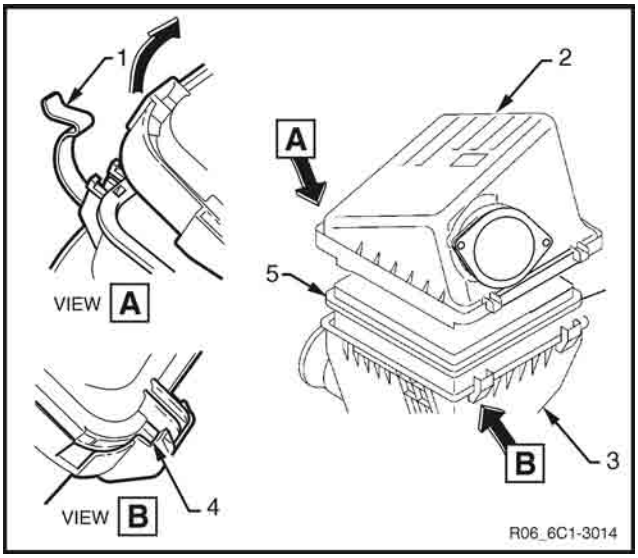

Figure 6C1-3 – 3

Reinstall

Reinstallation of the air cleaner upper housing is the reverse of the removal procedure, noting the following:

CAUTION

Ensure the air cleaner sealing rubber is correctly located in the air cleaner lower housing. Failure to do this may result in engine damage due to unfiltered air entering the engine intake system.

1 Reinstall the air cleaner element.

2 Reinstall the air cleaner upper housing aligning the outer retaining lugs.

3 Reinstall the air cleaner upper housing ensuring the upper housing retaining clips are correctly located.

4 Road test the vehicle and check for correct operation, taking particular note that no air leaks are evident.

Air Cleaner Lower Housing Assembly

Remove

1 Turn the ignition switch off.

2 Remove the air cleaner upper housing as described previously.

3 Using a suitable lever, gently lever the locking tangs (1) of the lower housing insulator sleeve back to clear the lower housing retaining bolt (2). Repeat this process for each of the remaining two sleeves.

4 Remove the three bolts retaining the lower housing (3) to the fender inner panel and remove the housing.

5 If required, remove the insulator sleeve and air cleaner lower housing insulator (4).

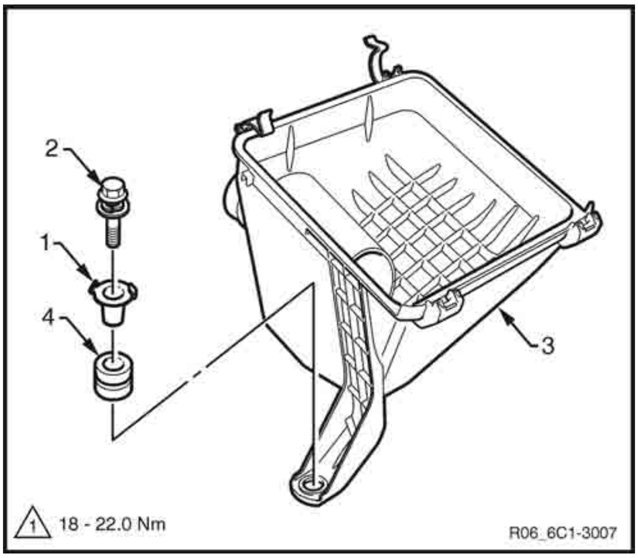

Figure 6C1-3 – 4

Reinstall

1 Reinstall the air cleaner lower housing attaching bolt and tighten to the correct torque specification.

Air cleaner lower housing attaching bolt torque specification ....18.0 – 22.0 Nm

2 Using a suitable hammer and pin punch, position the locking tang against the bolt head.

3 Road test the vehicle and check for correct operation.

2.3 Barometric Pressure Sensor

Remove

1 Turn the ignition switch off.

2 Disconnect the wiring harness connector (1) from the barometric pressure (BARO) sensor (2).

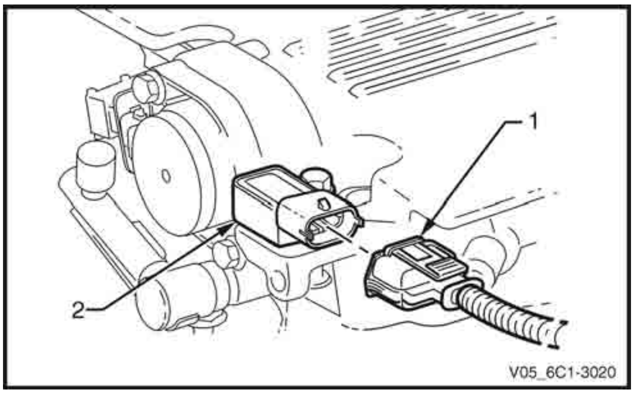

Figure 6C1-3 – 5

3 Remove the bolt (1) attaching the BARO sensor (2) to the upper intake manifold (3).

4 Remove the BARO sensor from the manifold by first, twisting the sensor to release it, and then pulling it upwards to remove it.

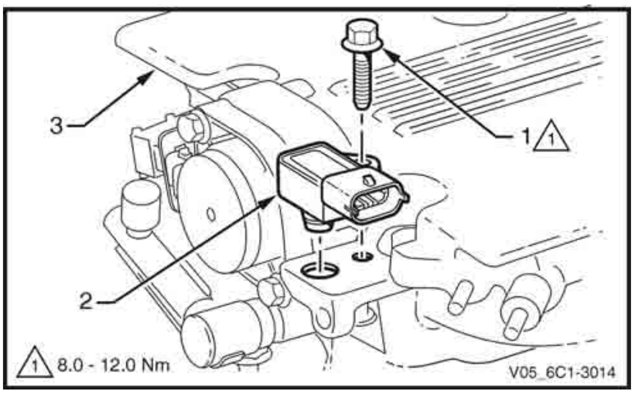

Figure 6C1-3 – 6

Reinstall

Reinstallation of the barometric pressure (BARO) sensor is the reverse of the removal procedure, noting the following:

CAUTION

Ensure the BARO sensor is fully seated before tightening the attaching bolt to the specified torque.

1 Reinstall the BARO sensor bolt and tighten to the correct torque specification.

Barometric pressure sensor attaching bolt torque specification ....8.0 – 12.0 Nm

2 Road test the vehicle and check for correct operation.

2.4 Camshaft Position Sensor

Remove

1 Turn the ignition switch off.

2 Disconnect the wiring harness connector (1) from the CMP sensor (2).

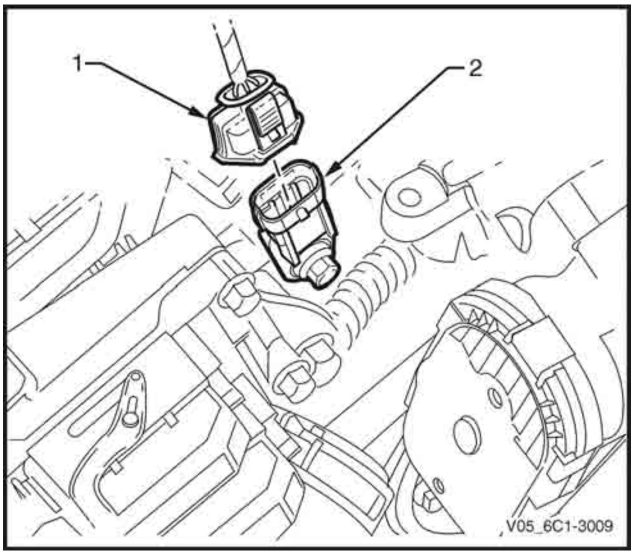

Figure 6C1-3 – 7

CAUTION

Clean the area around the CMP sensor before removal to avoid debris from entering the engine.

3 Remove the CMP sensor attaching bolt (1).

4 Remove the CMP sensor (2) by first twisting the sensor to release it, and then pulling it away from the front engine cover to remove it.

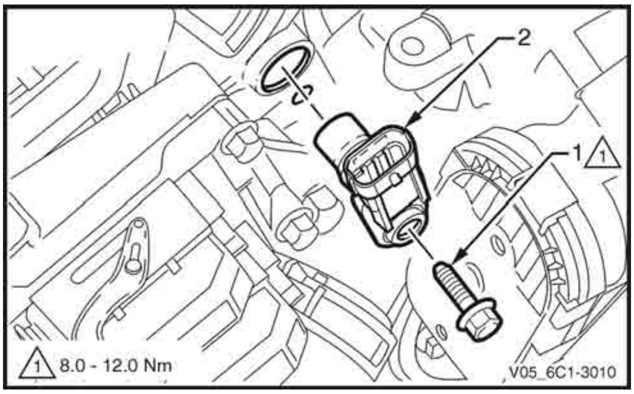

Figure 6C1-3 – 8

Reinstall

Reinstallation of the camshaft position (CMP) sensor is the reverse of the removal procedure, noting the following:

1 Lubricate the CMP sensor O-ring with clean engine oil.

2 Reinstall the CMP sensor by pushing in on the sensor to engage the sensor O-ring in the front engine cover.

CAUTION

Ensure the CMP sensor is fully seated before tightening the attaching bolt to the specified torque.

3 Reinstall the CMP sensor bolt and tighten to the correct torque specification.

Camshaft position sensor attaching bolt torque specification ....8.0 – 12.0 Nm

4 Road test the vehicle and check for correct operation, taking particular note there is no engine oil leak from the CMP sensor.

2.5 Crankshaft Position Sensor

Remove

1 Turn the ignition switch off.

2 Raise the front of the vehicle and support on safety stands, refer to 0A General Information for location of the jacking points.

3 Disconnect the wiring harness connector (1) from the crankshaft position (CKP) sensor (2).

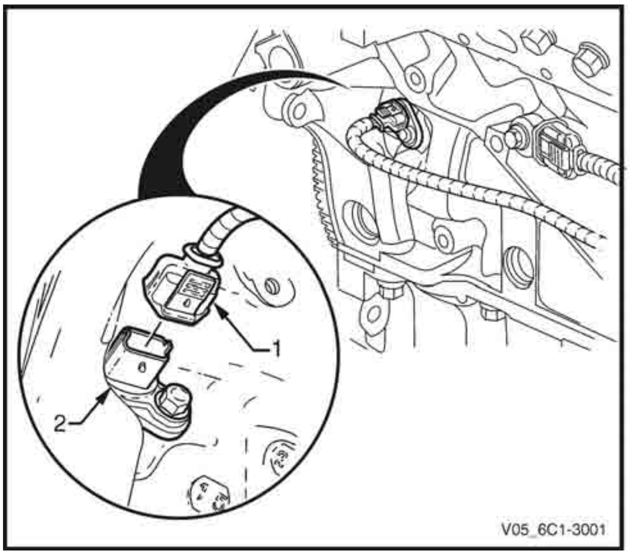

Figure 6C1-3 – 9

CAUTION

Clean the area around the CKP sensor before removal to avoid debris from entering the engine.

4 Remove the CKP sensor attaching bolt (1).

5 Remove the CKP sensor (2), by first twisting the sensor to release it, and then pulling it away from the engine block to remove it.

6 If required, test the CKP sensor, refer to the Test in this Section.

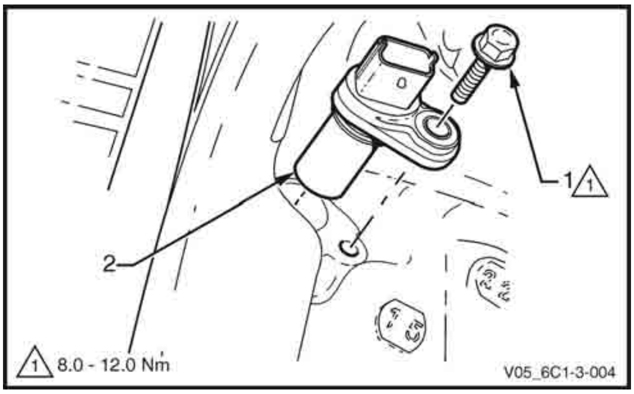

Figure 6C1-3 – 10

Test

CAUTION

To prevent component and damage use connector test adaptor kit J 35616-A.

Resistance Check

1 Connect a digital ohmmeter using connector test adaptor kit J 35616-A to the crankshaft position (CKP) sensor.

2 Measure the resistance across terminals 1 and 2.

3 Compare the reading against the specification.

CKP sensor resistance @ 20°C .... 850 – 1040 Ω

4 If the resistance is not within specification, replace the CKP sensor.

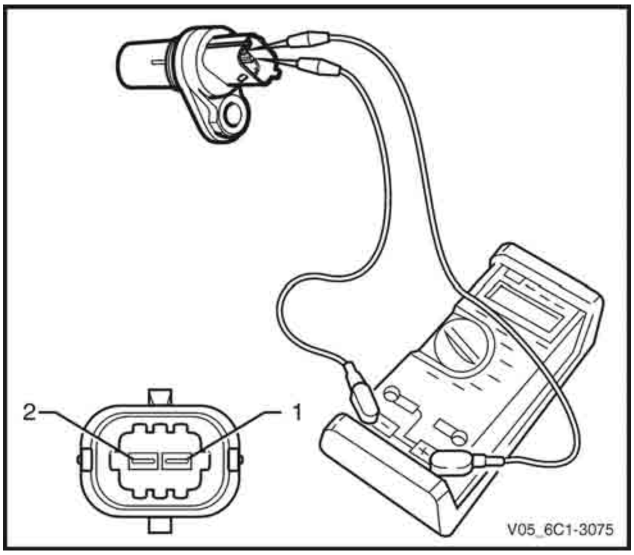

Figure 6C1-3 – 11

Reinstall

Reinstallation of the crankshaft position (CKP) sensor is the reverse of the removal procedure, noting the following:

1 Lubricate the CKP sensor O-ring with clean engine oil.

2 Reinstall the CKP sensor by pushing down on the sensor to engage the sensor O-ring in the engine block.

CAUTION

Ensure the CKP sensor is fully seated before tightening the attaching bolt to the specified torque.

3 Reinstall the CKP sensor bolt and tighten to the correct torque specification.

Crankshaft position sensor attaching bolt torque specification ....8.0 – 12.0 Nm

4 Road test the vehicle and check for correct operation, taking particular note there is no engine oil leak from the CKP sensor.

Installation

1. Install rubber bushing.
2. Install stabilizer bar.
3. Install bracket and bolt then tighten it to the specified torque.

Torque: 25 N·m (2.5 kgf·m/18 lb·ft)

4. Install link.
5. Install link nut, then tighten it to the specified torque.

Torque: 50 N·m (5.1 kgf·m/37 lb·ft)

2.6 Engine Coolant Temperature Sensor

Remove

WARNING

To avoid serious personal injury, never remove the engine coolant temperature (ECT) sensor when the engine is hot. Allow the engine to cool to ambient temperature (less than 50°C) before performing this procedure.

1 Turn the ignition switch off.

WARNING

To avoid serious personal injury, never remove the coolant filler cap when the engine is hot. Allow the engine to cool to ambient temperature (less than 50°C) before performing this procedure.

2 Allow the engine to cool to ambient temperature less than 50°C, and slowly remove coolant filler cap located on the coolant outlet housing.

3 Drain approximately two litres of coolant into a suitable container, refer to 6B1 – Engine Cooling – V6.

4 Disconnect the wiring harness connector (1) from the ECT sensor (2).

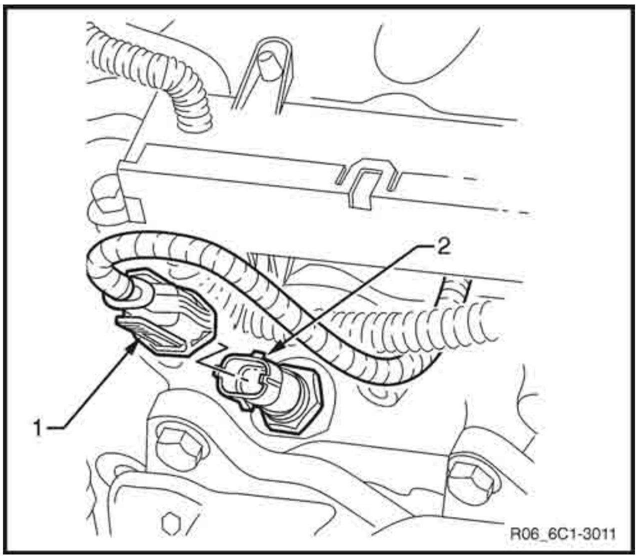

Figure 6C1-3 – 12

CAUTION

Clean the area around the ECT before removal to avoid debris from entering the engine.

5 Remove the ECT sensor (1).

NOTE

If coolant leaks from the cylinder head as the sensor is removed, screw the sensor back into the cylinder head and drain more coolant from the cooling system.

6 If required, test the ECT sensor, refer to the Test in this Section.

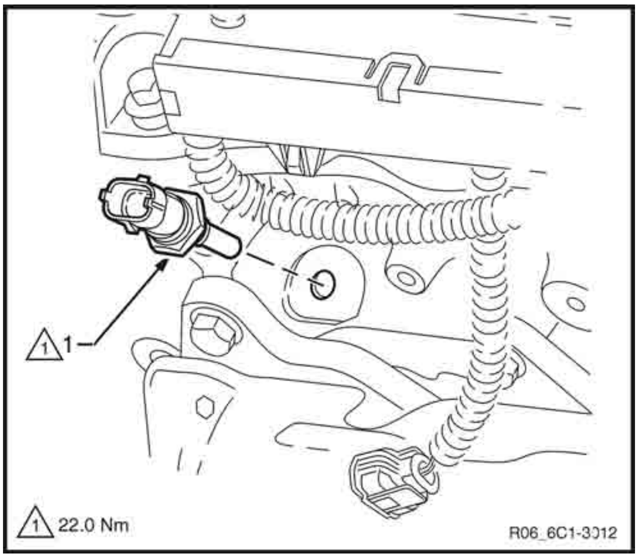

Figure 6C1-3 – 13

Test

CAUTION

To prevent component damage, use connector test adaptor kit J 35616-A.

Resistance Check

1 Suspend the engine coolant temperature (ECT) sensor and a suitable thermometer in a container of 50/50 DEX-COOL® long life coolant or equivalent and water.

NOTE

Neither the ECT sensor or thermometer should rest on the bottom of the container due to an uneven concentration of heat at this point when the container is heated.

2 Connect a digital ohmmeter using connector test adaptor kit J 35616-A to the ECT sensor.

3 Measure the resistance across terminals 1 and 2.

4 Whilst heating the container, observe the resistance values as the temperature increases and compare the temperature / resistance change to the specifications.

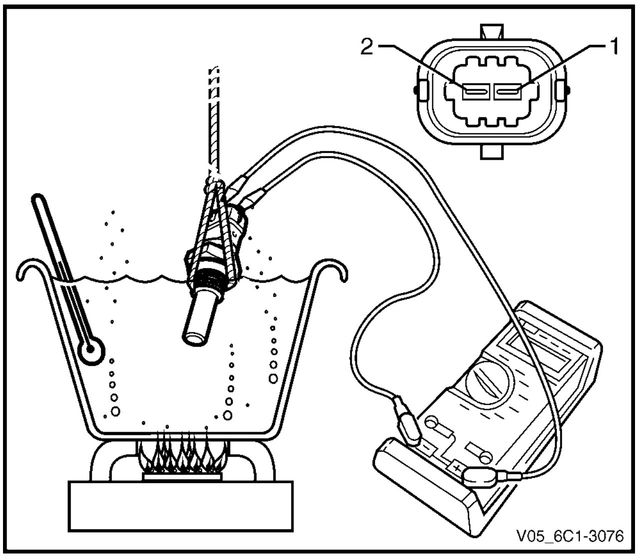

Figure 6C1-3 – 14

5 If the resistance is not within specifications, replace the ECT sensor.

Engine Coolant Temperature Vs Resistance	
Temperature °C	**Resistance – Ohms (Ω)**
-40	40490 – 50136
-20	14096 – 16827
-10	8642 – 10152
0	5466 – 6326
20	2351 – 2649
25	1941 – 2173
40	1118 – 1231
60	573 – 618
80	313 – 332
100	182 – 191
120	109 – 116
140	68 – 74

Reinstall

Reinstallation of the engine coolant temperature (ECT) sensor is the reverse of the removal procedure, noting the following:

1 Tighten the ECT sensor to the correct torque specification.

Engine coolant temperature sensor
torque specification..22.0 Nm

2 Refill the cooling system, refer to 6B1 Engine Cooling – V6.

3 Road test the vehicle and check for correct operation, taking particular note there is no coolant leakage.

2.7 Engine Control Module

Service of the engine control module (ECM) should normally consist of either replacement or ECM programming. If the diagnostic procedures call for the ECM to be replaced, it should be first checked to ensure it is the correct part. If it is, replace the faulty ECM.

CAUTION

Do not touch the ECM connector pins as electrostatic discharge (ESD) damage may result.

CAUTION

When removing or reinstalling the ECM wiring harness connector/s, ensure the ignition switch is in the OFF position and the battery has been disconnected. Failure to do so may result in damage to the ECM and / or associated componentry.

Disconnection of the battery affects certain vehicle electronic systems. Refer to 6D1-3 Battery - V6 before disconnecting the battery.

Remove

CAUTION

If replacing the ECM, it must be reset prior to removal. Failure to perform this procedure will result in the inability to test the ECM for warranty purposes, refer to ECM Reset in this Section.

1 Turn the ignition switch off.

2 Disconnect the battery.

3 Disconnect the engine harness connector (1) and the front body harness connector (2) from the ECM (3). To release each connector, lift the connector locking lever (4) whilst simultaneously pushing the connector locking slide (5), refer to Figure 6C1-3 – 15.

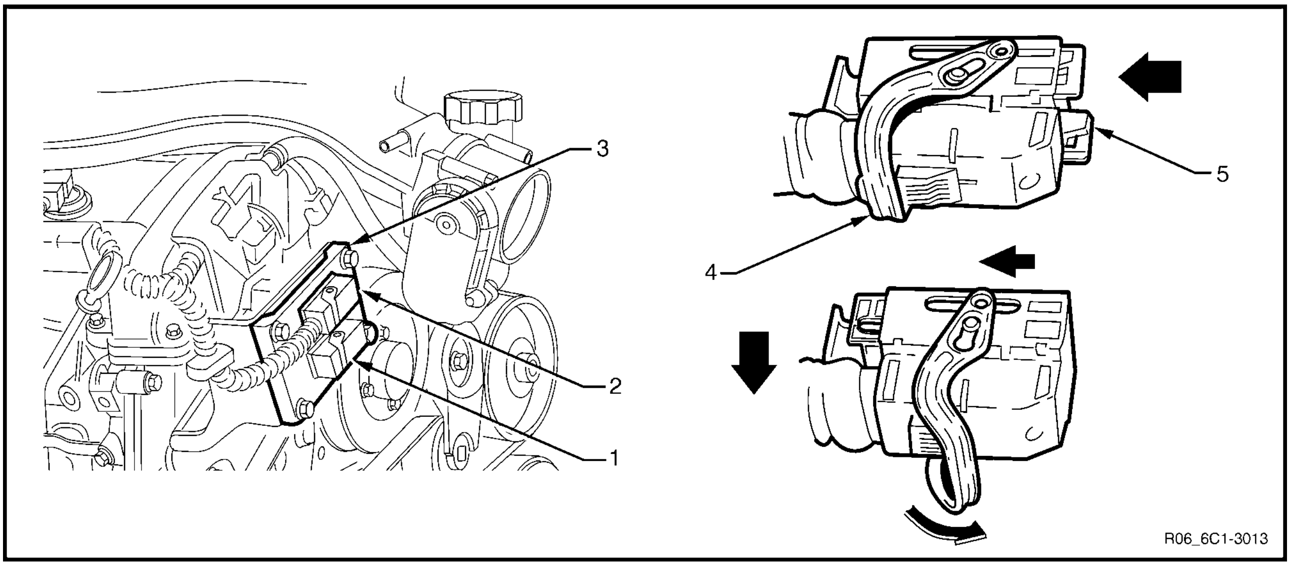

Figure 6C1-3 – 15

4 Remove the screw (1) attaching the ground terminal (2) to the ECM (3).

5 Remove the bolt (4), four places, attaching the ECM to the mounting bracket (5) and remove the ECM.

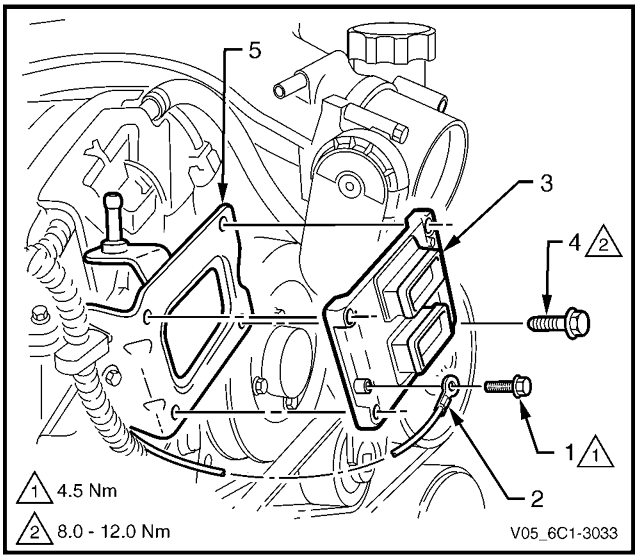

Figure 6C1-3 – 16

Reinstall

Reinstallation of the engine control module (ECM) is the reverse of the removal procedure, noting the following:

NOTE

During installation of the ECM, the SICHTMUSTER ME 9.6 label (1) is positioned at the top right-hand corner.

1 Reinstall ECM attaching bolts and tighten to the correct torque specification.

Engine control module attaching bolt torque specification ....8.0 – 12.0 Nm

2 Reinstall the ground terminal screw and tighten to the correct torque specification.

Ground terminal attaching screw torque specification ....4.5 Nm

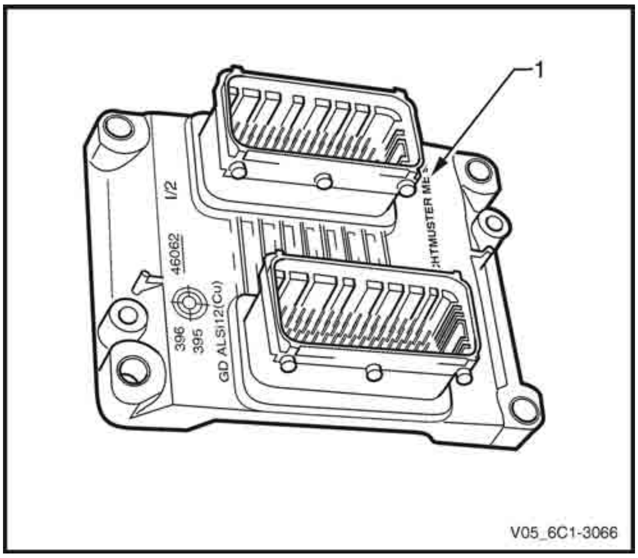

Figure 6C1-3 – 17

3 Reinstall the main vehicle wiring harness connector, and engine wiring harness connector, ensuring the connector locking lever is fully seated, refer to Figure 6C1-3 – 15.

4 If the ECM has been replaced, perform the following procedures:

- ECM service programming, 6E1 Powertrain Interface Module – V6.
- ECM / PIM / ICU security link, refer to 6E1 Powertrain Interface Module – V6.
- Main diagnostic table functional check, refer to 6C1-2 Engine Management – V6 – Diagnostics.

5 If the ECM has been removed, but not replaced, perform the main diagnostic table functional check, refer to 6C1-2 Engine Management – V6 – Diagnostics.

6 Start the vehicle and allow to idle.

ECM Reset

CAUTION

Do not perform the reset procedure within sixty seconds of turning the ignition on. Failure to comply may result in the ECM failing to reset.

When an ECM is installed onto a vehicle, it is security linked to the Immobiliser Control Unit (ICU) and powertrain interface module (PIM). Once this linking has been performed, the ECM cannot be installed in any other vehicle unless the security linking between the ICU and the PIM has been reset using the following procedure.

NOTE

Prior to resetting the ECM, obtain the Security Code. This information is found on the vehicle security card issued with the vehicle when new. For further information on the vehicle security card, refer to 6E1 Powertrain Interface Module – V6.

1 Connect Tech 2 to the data link connector (DLC) and turn the ignition on.

2 On Tech 2 select **Engine** / **V6 Engine** / **Programming** / **Reset ECU**.

NOTE

When Tech 2 requests programming approval, obtain TIS approval.

3 When Tech 2 displays **Enter Security Code**, enter the security code, press the **Enter** key and then the **Okay** soft key.

CAUTION

The engine will not start after the ECM has been reset.

4 When Tech 2 displays **Do you really want to Reset?**, press the **Reset** soft key.

5 When Tech 2 displays **Stop Engine - Turn Off Ignition**, turn the ignition off and press the **Confirm** soft key.

6 When Tech 2 displays **Turn Ignition On**, turn the ignition on and press the **Confirm** soft key.

7 When Tech 2 displays **Reset Completed Successfully**, press the **Confirm** soft key to return to the Tech 2 Programming screen.

2.8 Engine Control Module Bracket Assembly

Remove

1 Remove the engine control module (ECM), refer to 2.7 Engine Control Module.

2 Remove the bolt (1) and the two bolts (2), attaching the ECM bracket assembly (3) to the front engine cover and remove.

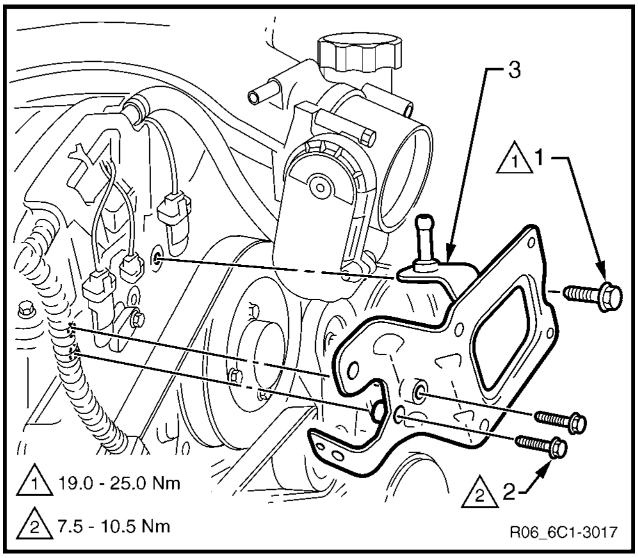

Figure 6C1-3 – 18

Reinstall

Reinstallation of the engine control module (ECM) bracket assembly is the reverse of the removal procedure, noting the following:

1 Tighten the ECM bracket assembly bolts to the correct torque specification.

Engine control module bracket assembly attaching bolt torque specification (6mm)........................7.5 – 10.5 Nm
Engine control module bracket assembly attaching bolt bolt torque specification (8mm)...............19.0 – 25.0 Nm

2 Perform the main diagnostic table functional check, refer to 6C1-2 Engine Management – V6 – Diagnostics.

3 Road test the vehicle and check for correct operation.

2.9 Engine Oil Level and Temperature Sensor

WARNING

To avoid personal injury, take care when draining the engine oil or removing the engine oil level and temperature sensor whilst the engine is hot. Allow the engine to cool before performing this procedure.

Remove

1 Turn the ignition switch off.

2 Raise the front and rear of the vehicle and support on safety stands, refer to 0A General Information for location of the jacking points.

3 Drain the engine oil, refer to 6A1 Engine Mechanical – V6.

CAUTION

Clean the area around the engine oil level and temperature sensor (1) before removal to avoid debris from entering the engine.

4 Disconnect the wiring harness connector (2) from the engine oil level and temperature sensor.

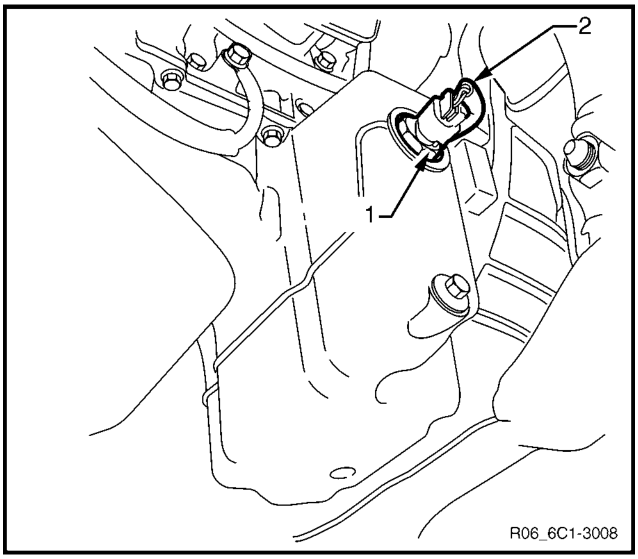

Figure 6C1-3 – 19

5 Using a 11/8" deep socket and socket bar, remove the engine oil level and temperature sensor (1).

6 If required, test the Engine Oil Level and Temperature sensor as follows, refer to the Test in this Section.

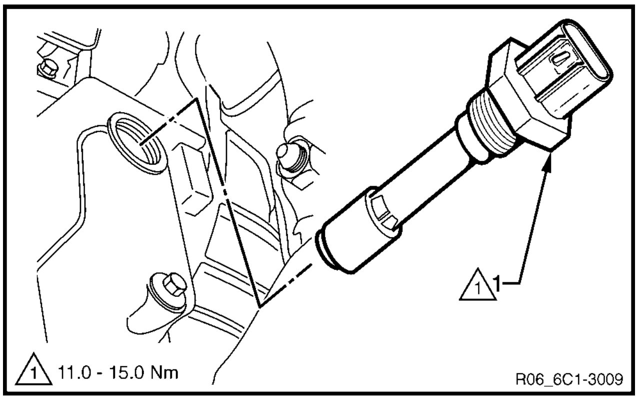

Figure 6C1-3 – 20

Test

Engine Oil Level Sensor Check

1 With the aid of an assistant, perform the following:

   a Whilst holding the engine oil level and temperature sensor (1) in a level position, connect a digital ohmmeter using connector test adaptor kit J 35616-A to terminals A and C, refer to Figure 6C1-3 – 21.

   b With the flat surface of the float (2) positioned at the bottom, ensure continuity does not exist.

   c Push the float upwards so the magnetic pin (3), on the inside of the float (the side of the float with the flat side) contacts the engine oil level sensor. Check for continuity whilst holding the float in this position.

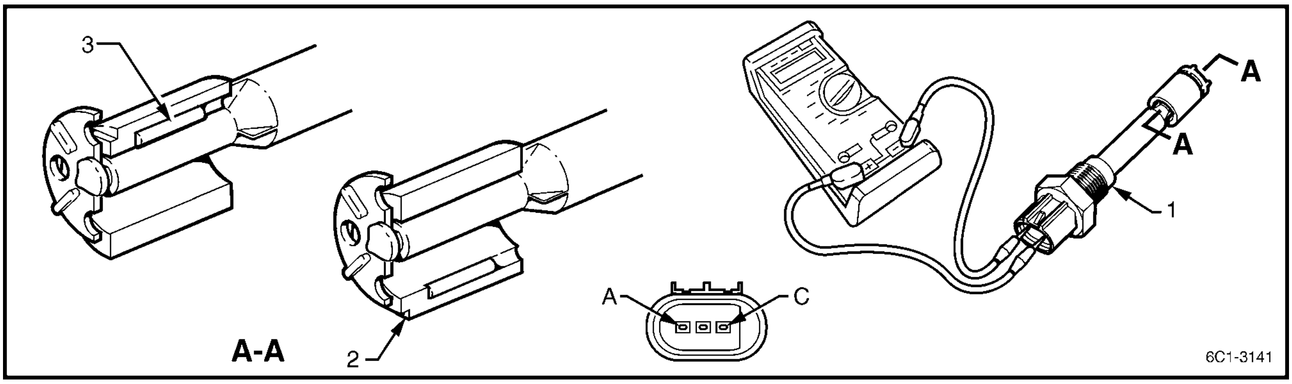

Figure 6C1-3 – 21

2 If any of the above tests fail, replace the engine oil level sensor.

Reinstall

Reinstallation of the engine oil level and temperature sensor is the reverse of the removal procedure, noting the following:

1 Lubricate the O-ring and threaded portion of the sensor with clean engine oil.

2 Tighten the engine oil level and temperature sensor to the correct torque specification.

Engine oil level and temperature sensor torque specification – wet........................11.0 – 15.0 Nm

3 Refill the engine with engine oil, refer to 6A1 Engine Mechanical – V6.

4 Road test the vehicle and check for correct operation, taking particular note there is no engine oil leakage from the oil level and temperature sensor.

2.10 Engine Oil Pressure Sensor

WARNING

To avoid personal injury, take care when removing the engine oil pressure sensor when the engine is hot. Allow the engine to cool before performing this procedure.

Remove

1 Turn the ignition switch off.

CAUTION

Clean the area around the engine oil pressure sensor before removal to avoid debris from entering the engine.

2 Disconnect the wiring harness connector (1) from the engine oil pressure sensor.

NOTE

A small amount of oil will drain from the oil filter housing when the engine oil pressure sensor is removed. Use a shop towel to absorb the oil.

3 Using special tool J 41712 or a 11/16" deep socket and socket bar, remove the engine oil pressure sensor (1).

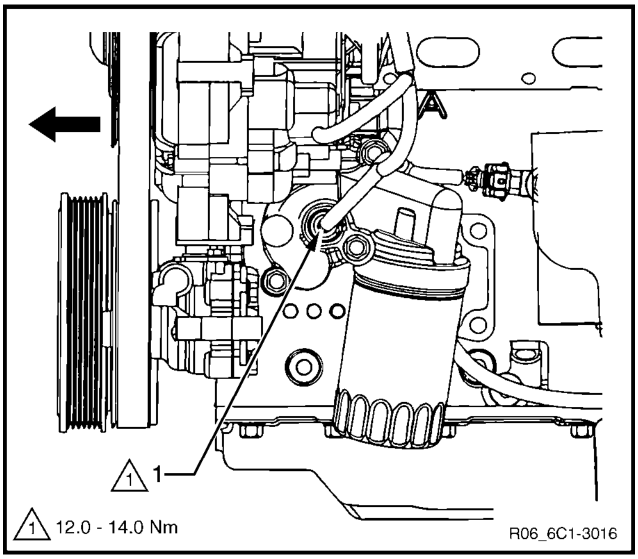

Figure 6C1-3 – 22

Reinstall

Reinstallation of the engine oil pressure sensor is the reverse of the removal procedure, noting the following:

1 Tighten the engine oil pressure sensor to the correct torque specification.

Engine oil pressure sensor torque specification ....12.0 – 14.0 Nm

2 Check the engine oil level and top up if necessary, refer to 6A1 Engine Mechanical – V6.

2.11 Evaporative Emission (EVAP) Canister Purge Valve Quick Connect Fittings

Disconnect

CAUTION

Clean the area around the evaporative emission (EVAP) canister purge valve before disconnecting the quick connect fitting to avoid debris from entering EVAP canister purge valve.

Locking Lever Type

1 Rotate the quick connect locking lever (1) in the direction of the arrow.

2 Whilst holding the lever against its stop (2), pull the hose away from the EVAP canister purge valve.

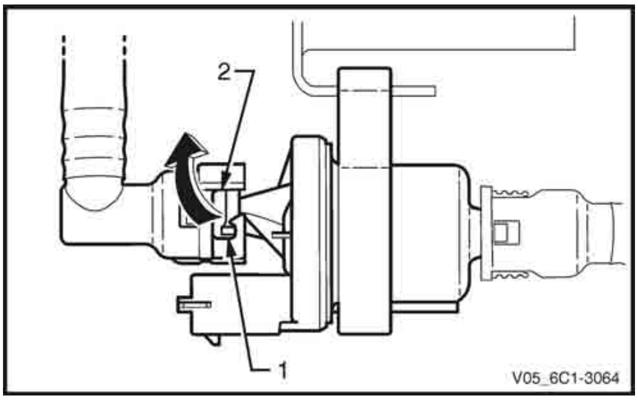

Figure 6C1-3 – 23

Latch Type

1 Push the quick connect fitting (1) in the direction of arrow.

2 Whilst pressing the two latches (2) in the direction of the arrows, pull the quick connect fitting (3) away from the EVAP canister purge valve.

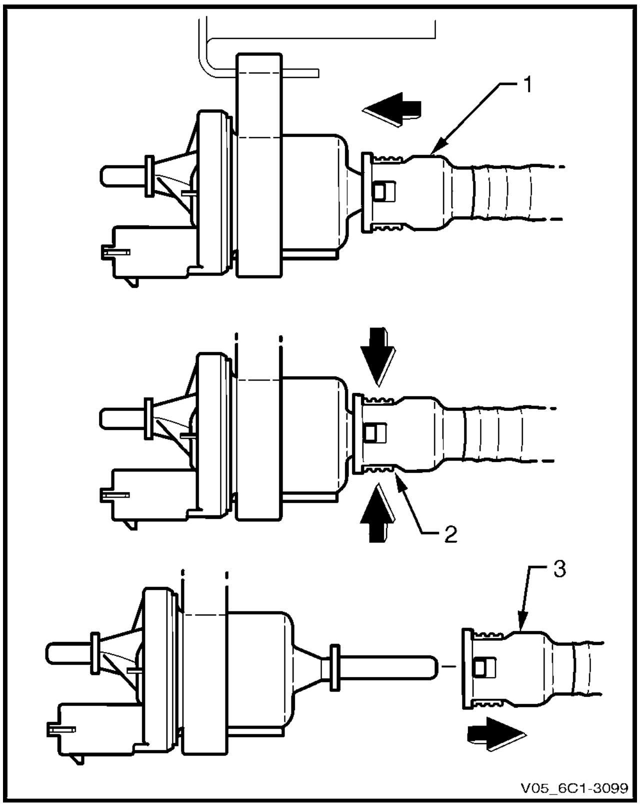

Figure 6C1-3 – 24

Connect

1 Lubricate the evaporative emission (EVAP) canister purge valve with clean engine oil.

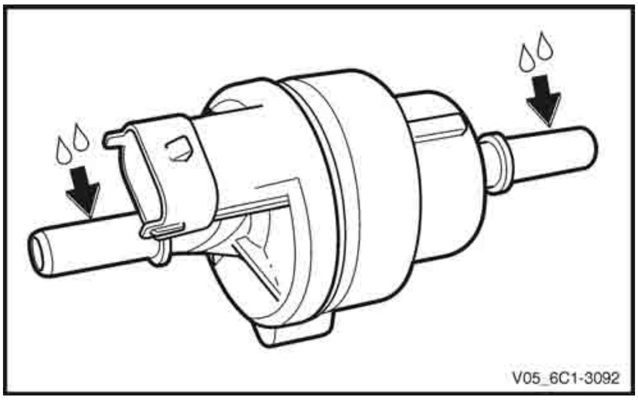

Figure 6C1-3 – 25

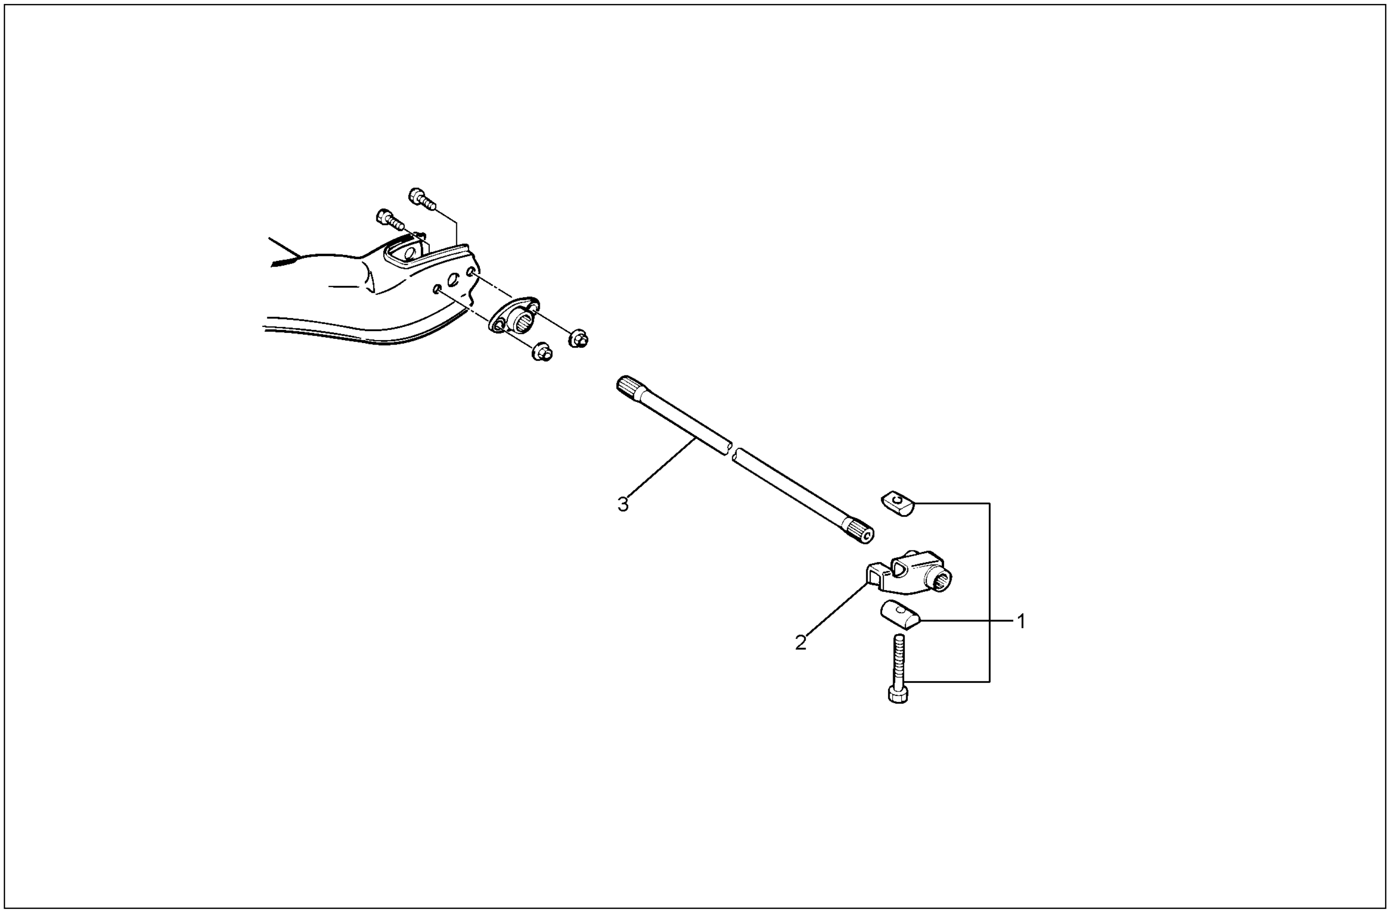
Torsion Bar

Torsion Bar and Associated Parts



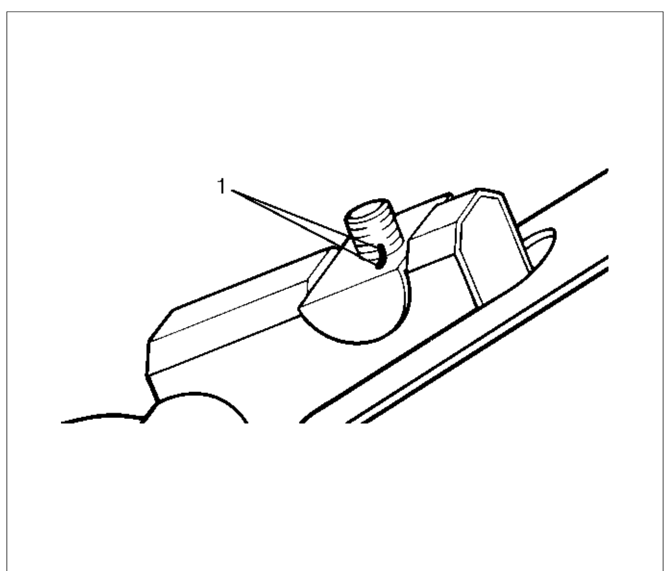
RTW340MF000501

Legend

(1) Adjust Bolt, End Piece and Seat
(2) Height Control Arm
(3) Torsion Bar

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Apply the setting marks (1) to the adjust bolt and end piece, then remove adjust bolt, end piece and seat.



410RS004

2 Push the hose quick connect fitting onto the purge valve fitting. There will be an audible click as the quick connect fitting engages.

3 Check the locking lever has returned to its rest position.

4 Check the quick connect fittings have fully engaged by gently pulling the quick connect fitting away from the purge valve.

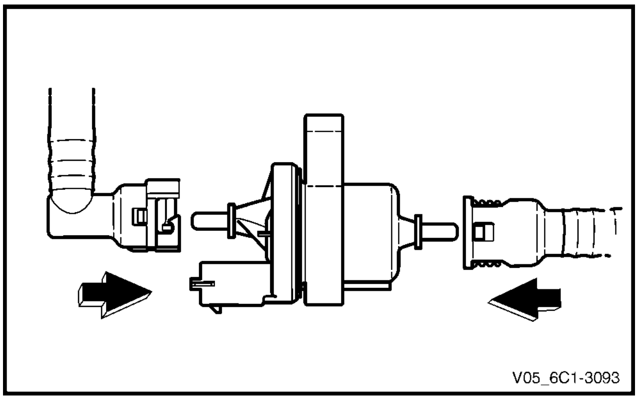


Figure 6C1-3 – 26

2.12 Evaporative Emission Canister Purge Valve

Remove

1 Turn the ignition switch off.

2 Disconnect the wiring harness connector (1) from the evaporative emission (EVAP) canister purge valve (2).

3 Disconnect the two EVAP canister purge valve hoses (3 and 4), refer to 2.11 Evaporative Emission (EVAP) Canister Purge Valve Quick Connect Fittings.

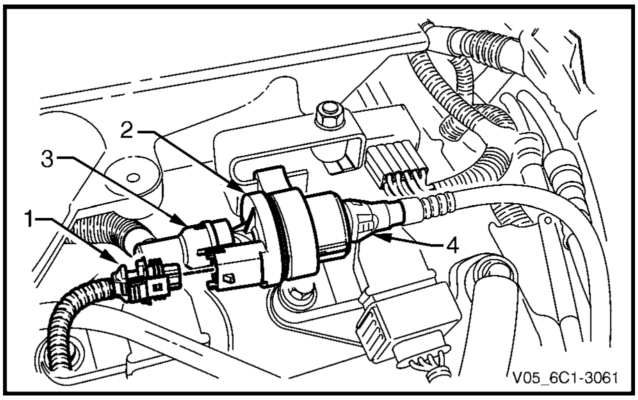

Figure 6C1-3 – 27

4 Slide the EVAP canister purge valve (1) from the purge valve mounting bracket (2).

5 If required, test the EVAP canister purge valve, refer to the Test in this Section.

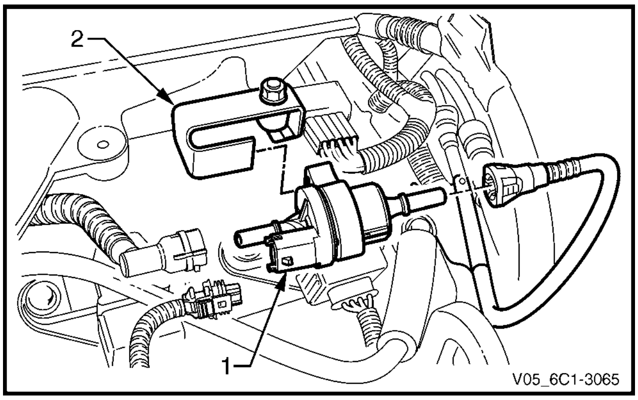

Figure 6C1-3 – 28

Test

CAUTION

To prevent component damage:

- **Use connector test adaptor kit J 35616-A.**
- **When applying 12 V to a component, always use a 3 A fused wire.**

Resistance Check

1 Using a digital ohmmeter and connector test adaptor kit J 35616-A, measure the resistance across terminals 1 and 2.

2 Compare the reading against the specification.

3 If the resistance is not within specification, replace the EVAP canister purge valve.

EVAP canister purge valve resistance @ 20°C	24.0 – 28.0 Ω

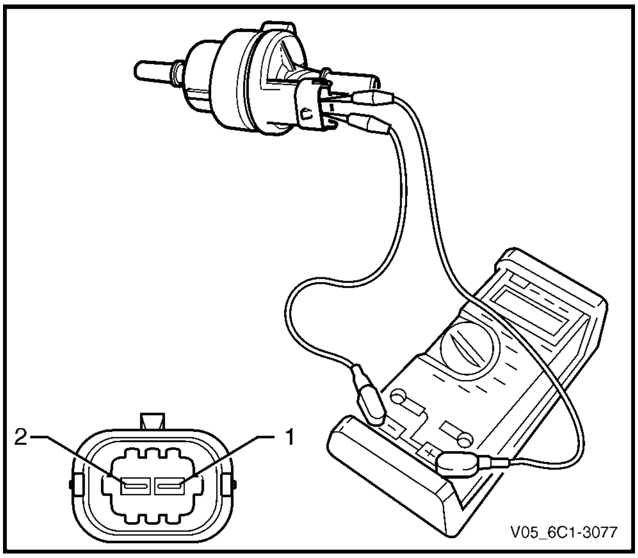

Figure 6C1-3 – 29

Functional Test

1 Attempt to blow air through the EVAP canister purge valve inlet port (1). If air passes through the valve, the valve is faulty and should be replaced.

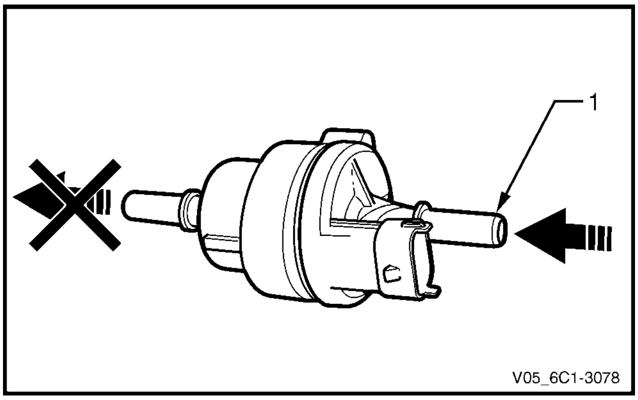

Figure 6C1-3 – 30

2 Using connector test adaptor kit J 35616-A, connect a 12 V battery, an on / off switch and a 3 A fused wire to the EVAP canister purge valve terminals as follows:

- Positive lead to terminal 1.
- Negative lead to terminal 2.

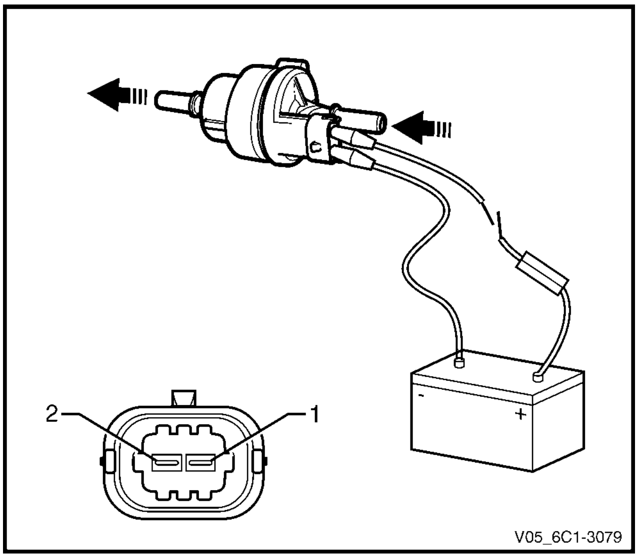

Figure 6C1-3 – 31

CAUTION

Do not apply 12 V to the EVAP canister purge valve continuously for more than three seconds as the EVAP canister purge valve will be damaged.

3 Turn the switch on, and listen for an audible click as the EVAP canister purge valve operates. Whilst the switch is in the on position, blow air through the inlet port.

4 If no air passes through the EVAP canister purge valve, check the valve inlet and outlet ports for any obstructions and rectify if necessary. If there are no obstructions, replace the valve.

Reinstall

Reinstallation of the evaporative emission canister purge valve is the reverse of the removal procedure, noting the following:

1 Connect the purge valve hose quick connect fittings, refer to 2.11 Evaporative Emission (EVAP) Canister Purge Valve Quick Connect Fittings.

2 Road test the vehicle and check for correct operation, taking particular note that no air leaks are evident.

2.13 Fuel Rail Assembly

WARNING

A depressurised fuel system contains residual fuel that can be spilled during service operations, refer to 6C Fuel System – V6 for further information on handling fuel.

Remove

1 Depressurise the fuel system, refer to 6C Fuel System - V6.

2 Turn the ignition switch off.

NOTE

After removing the upper intake manifold, plug the lower manifold opening to prevent dirt and other contaminants from entering.

3 Remove the upper intake manifold assembly, refer to 6A1 Engine Mechanical – V6.

4 Disconnect the fuel feed hose from the fuel rail, refer to 6C Fuel System - V6. Plug the fuel line openings to prevent dirt and other contaminants from entering.

5 Slide the engine wiring harness connector retaining latch (1) in the direction of the arrow to disconnect the connector from the fuel injector harness.

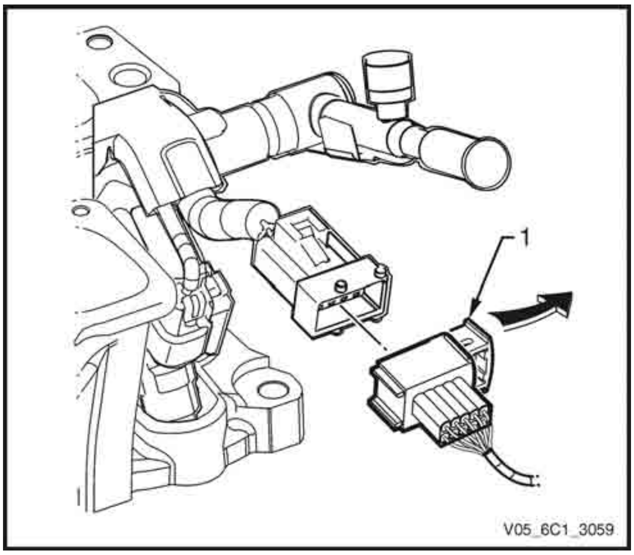

Figure 6C1-3 – 32

CAUTION

Clean around the area where the fuel injectors enter the lower intake manifold.

6 Remove the bolt (1), three places, attaching the fuel rail to the lower intake manifold.

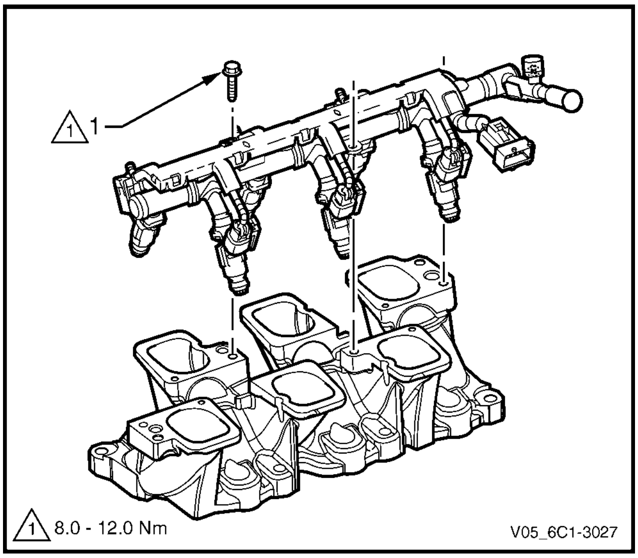

Figure 6C1-3 – 33

CAUTION

Care must be taken when removing the fuel rail and injector assembly to prevent damage to the injector spray tips and injector harness connector terminals.

Support the fuel rail and injector assembly after removal.

7 Remove the fuel rail and injector assembly.

8 Plug all fuel line and manifold openings after removal to prevent dirt and other contaminants from entering.

Disassemble

Fuel Injector

Remove

For each fuel injector:

1 Slide the fuel injector wiring connector locking tab (1) upwards in the direction of the arrow.

2 Disconnect the connector from the fuel injector.

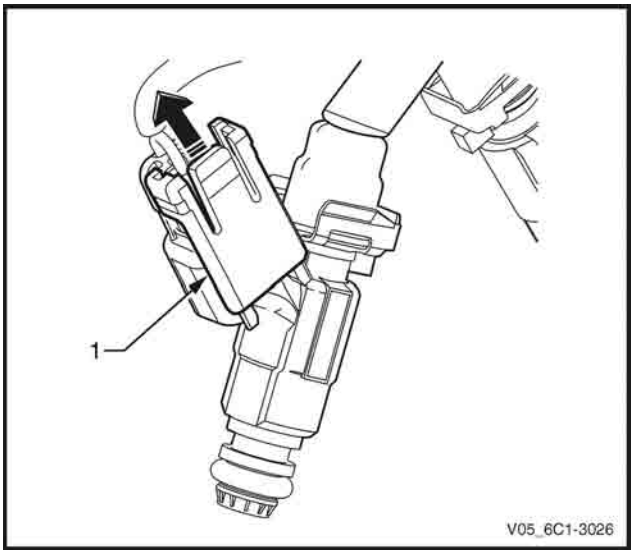

Figure 6C1-3 – 34

3 Using a flat blade screwdriver, remove the fuel injector retaining clip (1) from the fuel injector (2). Discard the retaining clip.

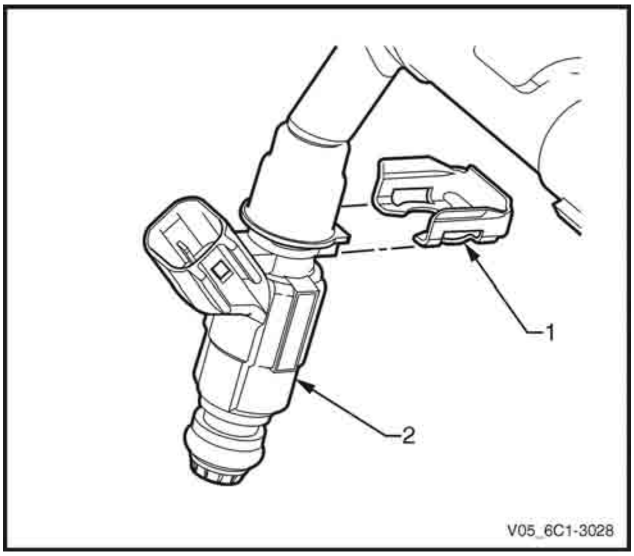

Figure 6C1-3 – 35

4 Remove the fuel injector (1) from the fuel rail.

5 Remove and discard the fuel injector seals (2).

6 As required, repeat for the remaining injectors and test each fuel injector, refer to the Test in this Section.

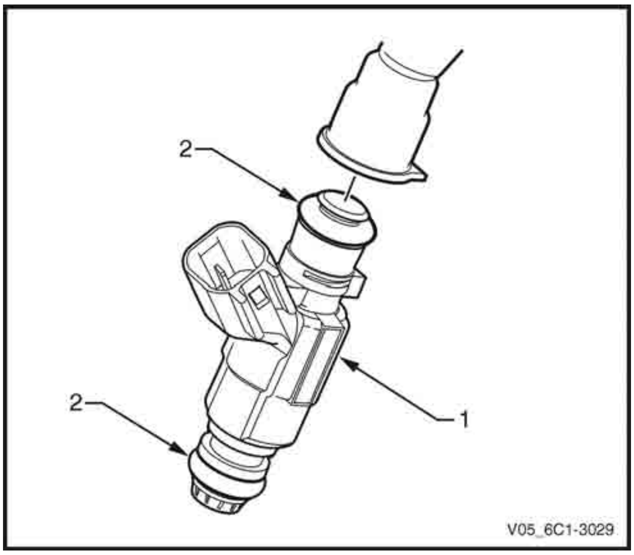

Figure 6C1-3 – 36

Test

CAUTION

To prevent component damage use connector test adaptor kit J 35616-A.

1 Connect a digital ohmmeter using connector test adaptor kit J 35616-A to the fuel injector.

2 Measure the resistance across terminals A and B.

3 Compare the reading against the specification.

Fuel injector resistance @ 20°C .... 11.4 – 12.6 Ω

4 If the resistance is not within specifications, replace the fuel injector.

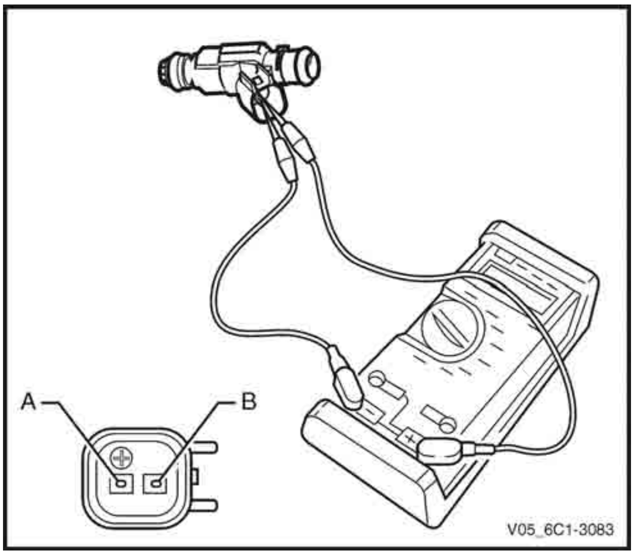

Figure 6C1-3 – 37

Reinstall

Reinstallation of the fuel injector is the reverse of the removal procedure, noting the following:

1 Install new fuel injector seals and lubricate with clean engine oil.

2 Install a new fuel injector retaining clip, refer to Figure 6C1-3 – 35.

Fuel Injector Wiring Harness Assembly

Remove

1 For each fuel injector wiring harness connector, slide the locking tab (1) upwards in the direction of the arrow and disconnect the connector from the fuel injector.

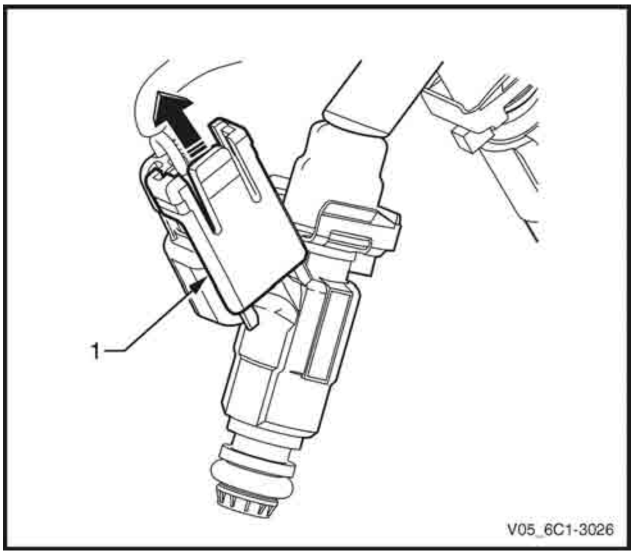

Figure 6C1-3 – 38

2 Unclip the fuel injector harness assembly (1), three places, from the fuel rail.

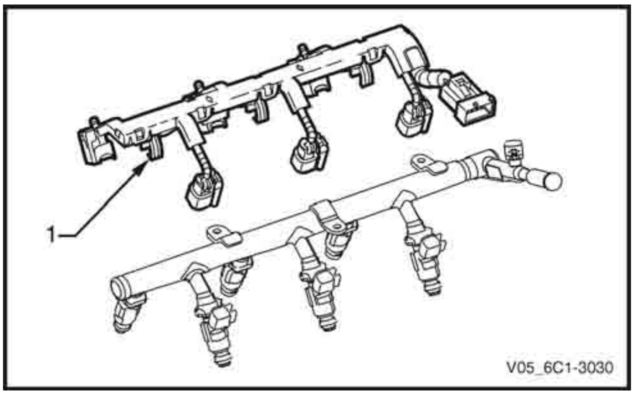

Figure 6C1-3 – 39

3 Using a flat blade screwdriver, prise the fuel injector harness upper tray retainer (1), eight places, from the lower tray locking tang (2).

4 Remove the fuel injector harness from the lower tray.

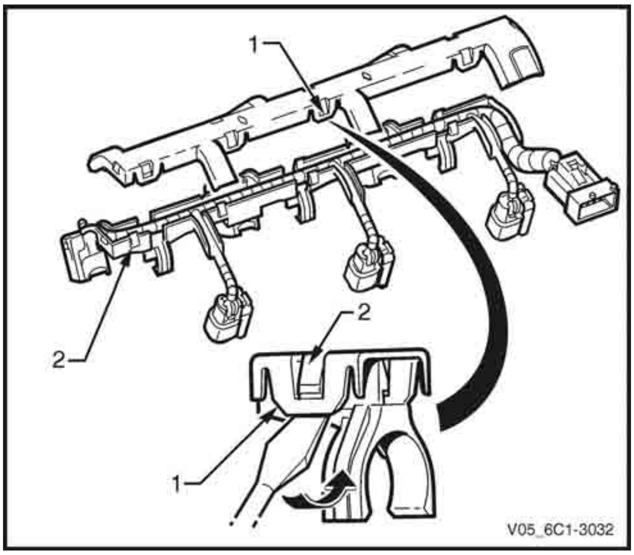

Figure 6C1-3 – 40

Reinstall

Reinstallation of the fuel injector wiring harness assembly is the reverse of the removal procedure, noting the following:

CAUTION

Ensure there is no undue strain placed on the fuel injector wiring harness (1) once it has been positioned in the tray (2).

1 Lay the fuel injector wiring harness in the lower tray.

2 Clip the upper and lower fuel injector harness trays together, ensuring that all eight retainers are correctly seated.

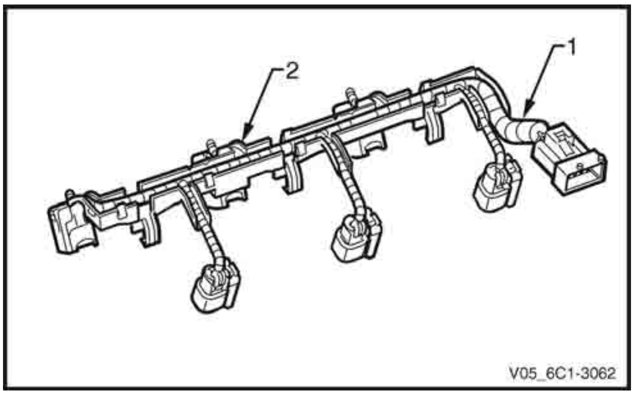

Figure 6C1-3 – 41

Reinstall

Reinstallation of the fuel rail assembly is the reverse of the removal procedure, noting the following:

1 Lubricate the fuel injector O-rings with engine oil.

2 Carefully reinstall the fuel rail and injector assembly.

CAUTION

Ensure the fuel injectors are correctly seated in the lower intake manifold, and the fuel rail attaching brackets are correctly located prior to tightening the attaching bolts.

3 Reinstall the fuel rail attaching bolts and tighten to the correct torque specification.

Fuel rail attaching bolt torque specification ....8.0 – 12.0 Nm

4 Reconnect the fuel feed hose to the fuel rail, refer to 6C Fuel System - V6.

5 Inspect the fuel rail and quick connect fitting for leaks, refer to 6C Fuel System - V6.

6 Road test the vehicle and check for correct operation.

2.14 Heated Oxygen Sensor

WARNING

To avoid the possibility of personal injury, allow the exhaust pipe to cool to ambient temperature (less than 50°C) before attempting to remove the oxygen sensor.

Service Precautions

- Handle the HO2S carefully. Do not drop it, and keep it free of grease, dirt and other contaminants. Do not use cleaning solvents of any type on the HO2S.
- Do not repair the HO2S or any of its parts. Replace the HO2S if any damage is evident.
- The HO2S may be difficult to remove when the engine is cold. Excessive force may damage the threads in the exhaust manifold or exhaust pipe.

- If the HO2S has been removed, but not replaced, anti-seize compound must be applied to the threads prior to installation. New HO2S will already have the anti-seize compound applied.
- For vehicles with the six wire HO2S sensor, under no circumstances should the protective cover (1) be removed, or the gortex filter (2) be covered and / or sealed.

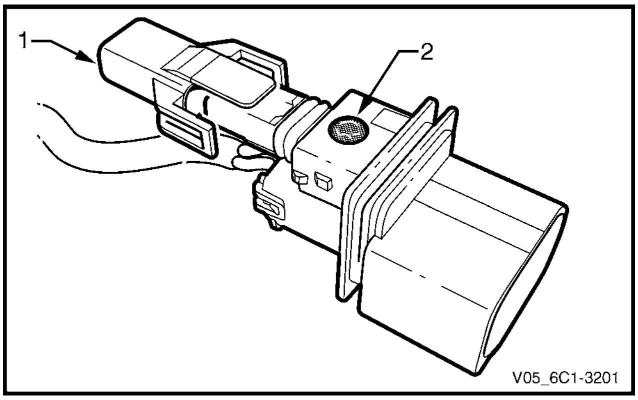

Figure 6C1-3 – 42

Six Wire Sensor

The replacement procedure for Bank 1 and Bank 2 six wire heated oxygen sensor (HO2S) are typically the same, with the following procedure being specific to Bank 1.

Remove

1 Turn the ignition switch off.

2 Unclip the HO2S wiring harness connector assembly (1) from the ignition coil wiring harness tray, refer to Figure 6C1-3 – 43. View A refers to Bank 1, and View B refers to Bank 2.

3 Slide the connector locking tang (2) away from the harness connector.

4 Separate the harness connector (3).

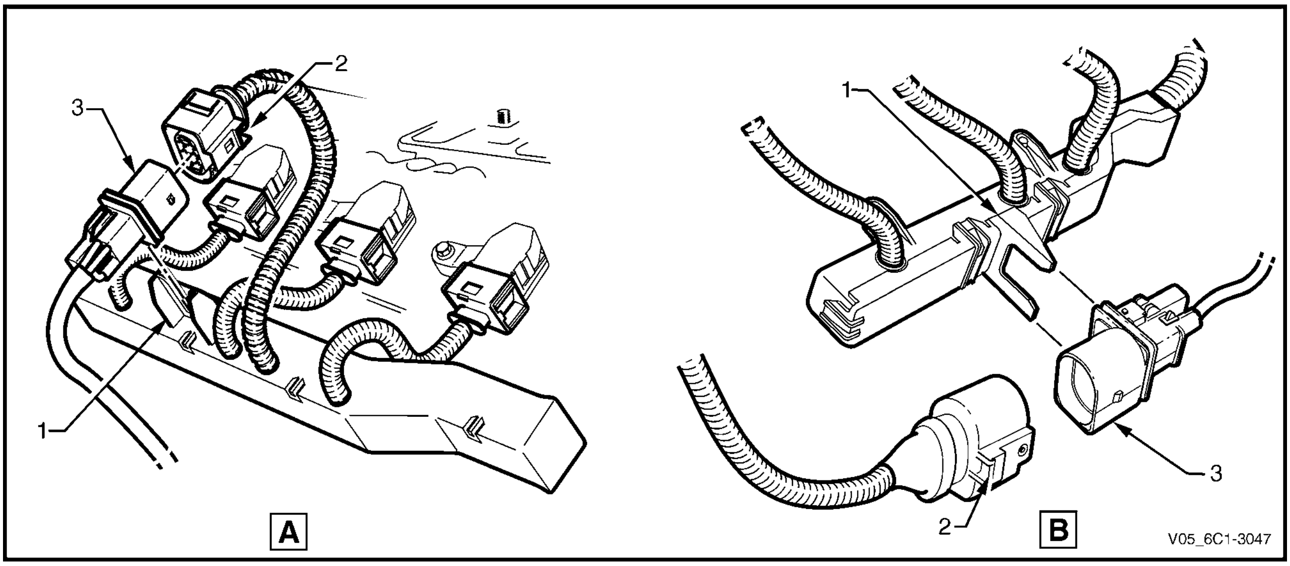

Figure 6C1-3 – 43

5 Raise the front of the vehicle and support on safety stands. Refer to 0A General Information for location of the jacking points.

6 Unscrew the HO2S (1) from the exhaust pipe and remove.

7 If required, test the HO2S, refer to the Test in this Section.

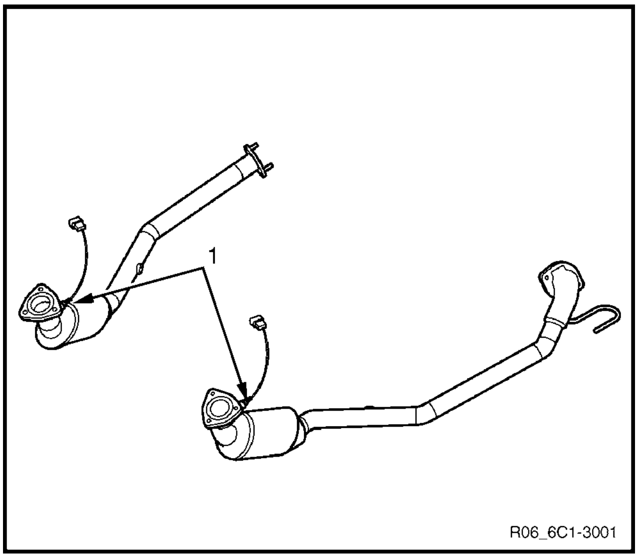

Figure 6C1-3 – 44

Reinstall

Reinstallation of the heated oxygen sensor (HO2S) is the reverse of the removal procedure, noting the following:

1 Ensure the protective cover (1) is securely in place, and the gortex filter (2) has not been covered or sealed.

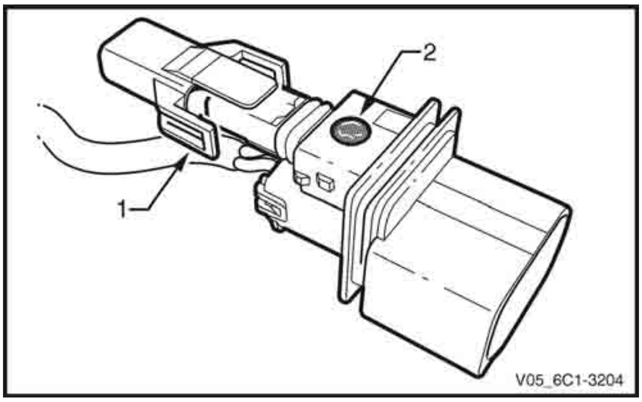

Figure 6C1-3 – 45

CAUTION

A special anti-seize compound is used on the HO2S threads. A new HO2S will already have the anti-seize compound applied to the threads.

If a HO2S has been removed, but not replaced, an anti-seize compound must be applied to the threads prior to installation.

2 Coat the cleaned threads of the HO2S with anti-seize compound.

3 Tighten the HO2S to the correct torque specification.

Heated oxygen sensor torque specification ....40.0 – 50.0 Nm

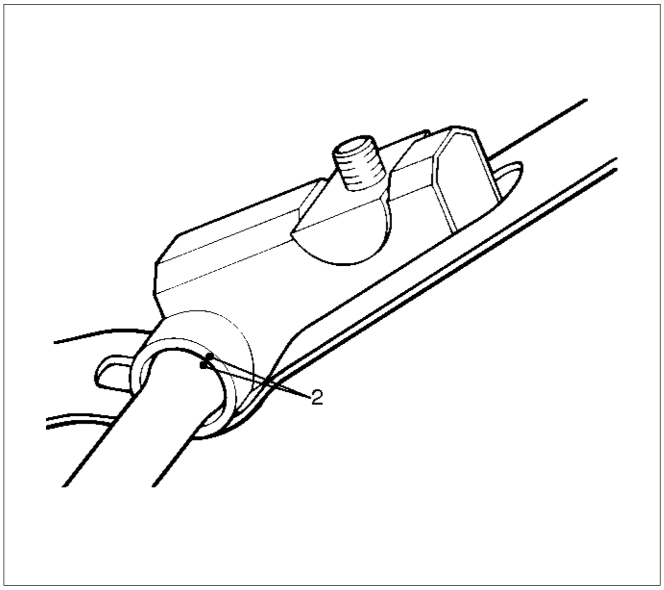
4 Road test the vehicle and check for correct operation, taking particular note that no exhaust leakage is evident.

Four Wire Sensor

The replacement procedure for Bank 1 (RHS) and Bank 2 (LHS) four wire heated oxygen sensor (HO2S) are typically the same, with the following procedure being specific to Bank 2.

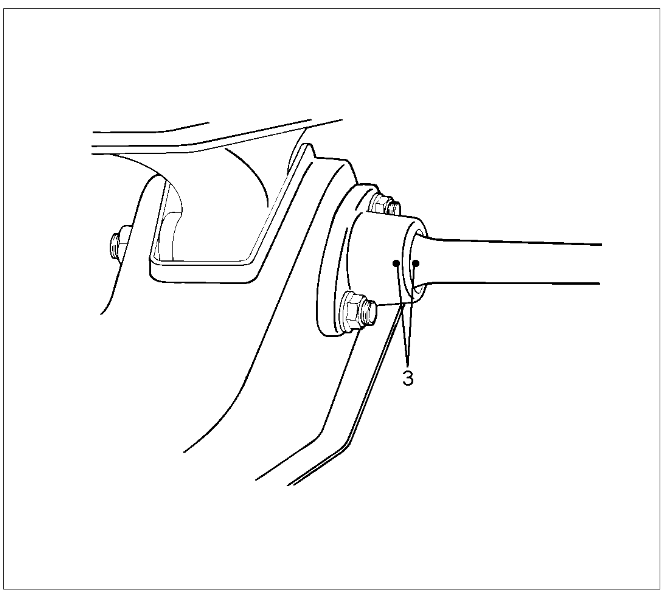
3. Apply the setting marks (2) to the height control arm and torsion bar, then remove height control arm.

NOTE: “Besco chassis grease” should be applied on contact area of height control arm with frame.
(RH & LH Both side)



410RS005

4. Apply the setting marks (3) to the torsion bar and lower control arm, and then remove torsion bar.



RTW340SH000301

Inspection and Repair

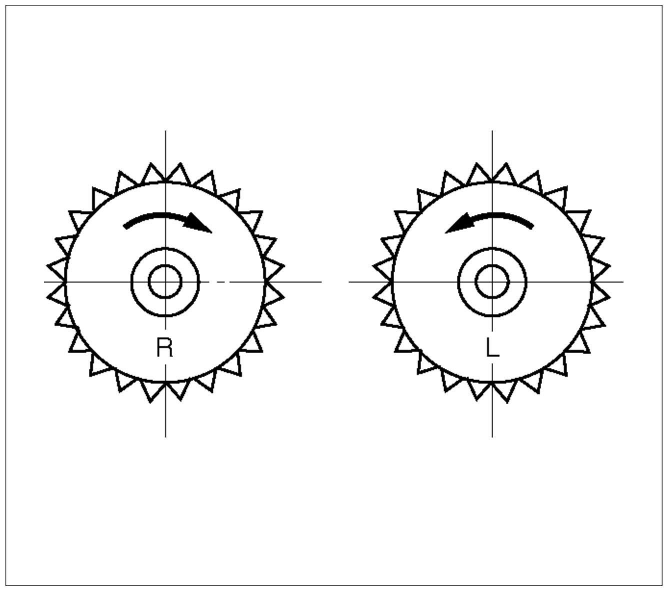
Make necessary correction or replace parts if wear, damage, corrosion or any other abnormal condition is found through inspection.

Check the following parts:

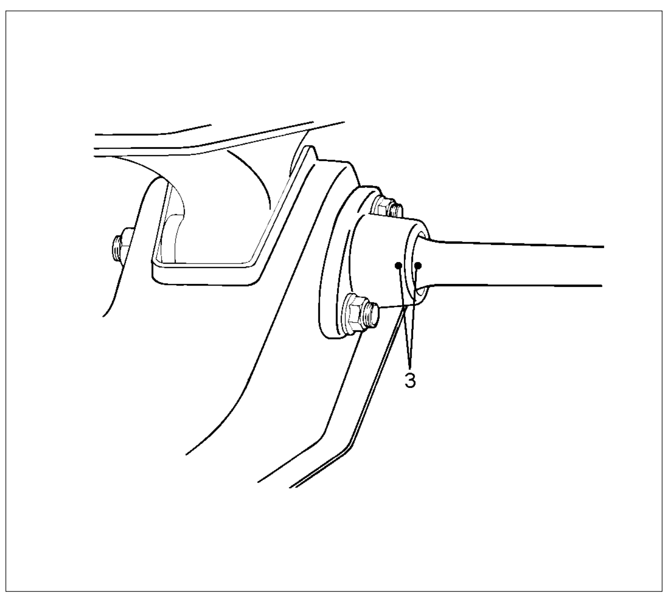
- Torsion bar
- Height control arm
- Adjust bolt
- Rubber seat

Installation

1. Apply grease to the serrated portions, then install torsion bar. Make sure the bars are on their correct respective sides and align the setting marks (3).



410RS007



RTW340SH000301

Remove

1 Turn the ignition switch off.

2 Raise the vehicle and support on safety stands, refer to 0A General Information for location of the jacking points.

3 Unclip the HO2S wiring harness (1) from the transmission.

4 Depress the harness connector retaining clip (2) and separate the harness connectors.

5 Unscrew the HO2S (3) from the exhaust pipe and remove.

6 If required, test the HO2S, refer to the Test in this Section.

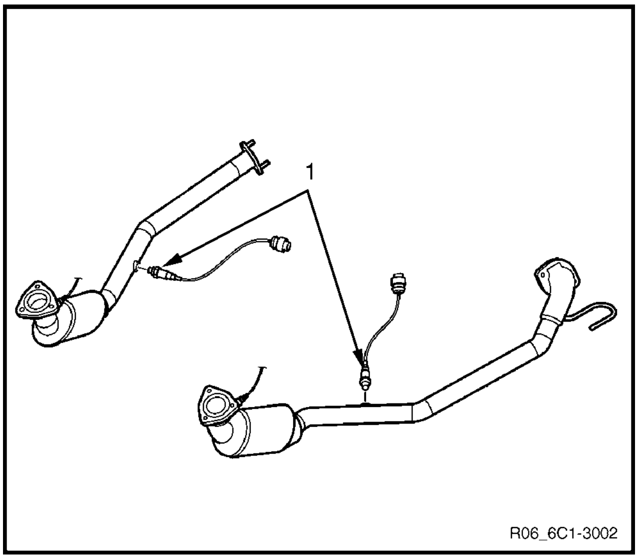


Figure 6C1-3 – 46

Reinstall

Reinstallation of the heated oxygen sensor (HO2S) is the reverse of the removal procedure, noting the following:

CAUTION

A special anti-seize compound is used on the HO2S threads. A new HO2S will already have the anti-seize compound applied to the threads.

If a HO2S has been removed, but not replaced, then anti-seize compound must be applied to the threads prior to installation.

1 Coat the cleaned threads of the sensor with anti-seize compound.

2 Tighten the HO2S to the correct torque specification.

Heated oxygen sensor torque specification ....40.0 – 50.0 Nm

3 Road test the vehicle and check for correct operation, taking particular note that no exhaust leakage is evident.

Test

CAUTION

Under no circumstances should battery voltage be applied to the heated oxygen sensor (HO2S) heater.

CAUTION

To prevent component damage use connector test adaptor kit J 35616-A.

Heater Resistance Check – Six Wire HO2S

1 Connect a digital ohmmeter using connector test adaptor kit J 35616-A to the HO2S.

2 Measure the resistance across terminals 3 and 4.

3 Compare the reading against the specification.

HO2S heater resistance @ 20°C .... 8.0 – 10.0 Ω

4 If the resistance is not within specification, replace the HO2S.

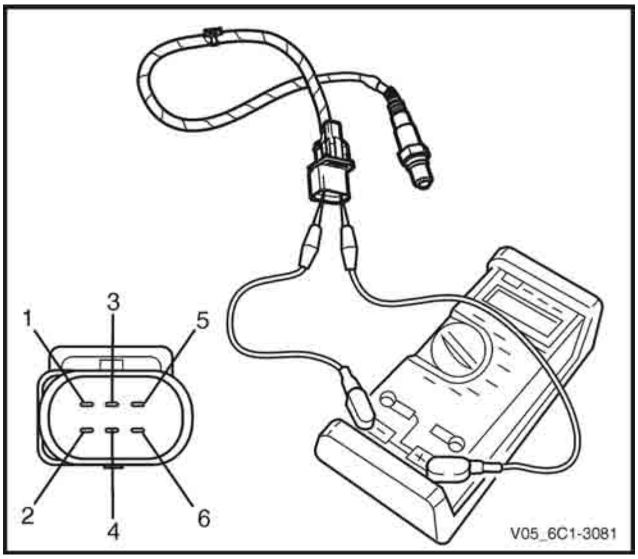

Figure 6C1-3 – 47

Heater Resistance Check – Four Wire HO2S

1 Connect a digital ohmmeter using connector test adaptor kit J 35616-A to the HO2S.

2 Measure the resistance across terminals 1 and 2.

3 Compare the reading against the specification.

HO2S heater resistance @ 20°C .... 8.0 – 10.0 Ω

4 If the resistance is not within specification, replace the HO2S.

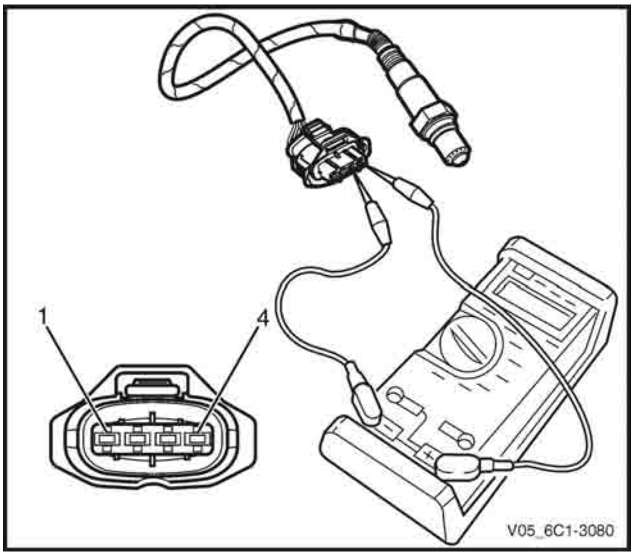

Figure 6C1-3 – 48

2.15 Ignition Coil

Ignition Coils

The replacement procedure for all ignition coils is the same except for the removal of the ignition coil on cylinder No's 1, 3 and 4, it is necessary to remove the upper intake manifold assembly.

Remove

1 Turn the ignition switch off.

NOTE

If the upper intake manifold has been removed, plug the lower manifold openings to prevent dirt and other contaminants from entering.

2 If required, remove the upper intake manifold assembly, refer to 6A1 Engine Mechanical – V6.

3 Using a flat-blade screwdriver, slide the connector retaining latch (1) in the direction of the arrow.

4 Remove the wiring harness connector from the ignition coil (2).

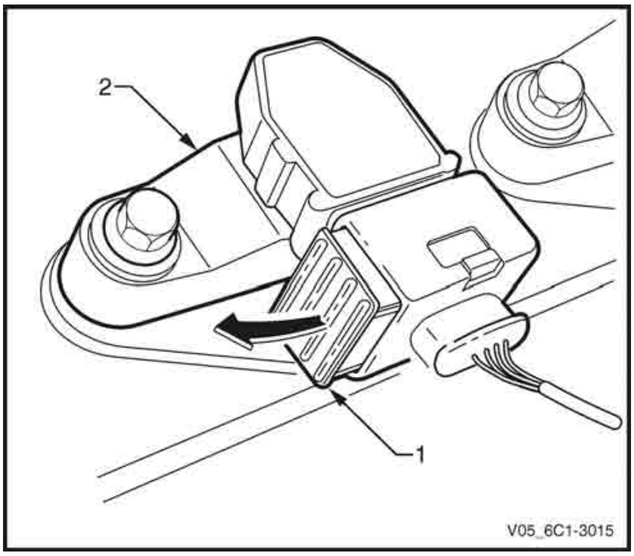

Figure 6C1-3 – 49

CAUTION

Clean the area around the ignition coil before removal to avoid debris from entering the engine.

5 Fully loosen the bolt (1) attaching the ignition coil (2) to the camshaft cover.

NOTE

The ignition coil bolts are captive. Do not attempt to remove the bolts from the ignition coil.

6 Remove the ignition coil by first, twisting the coil to release it, and then pulling the ignition coil upwards to remove it.

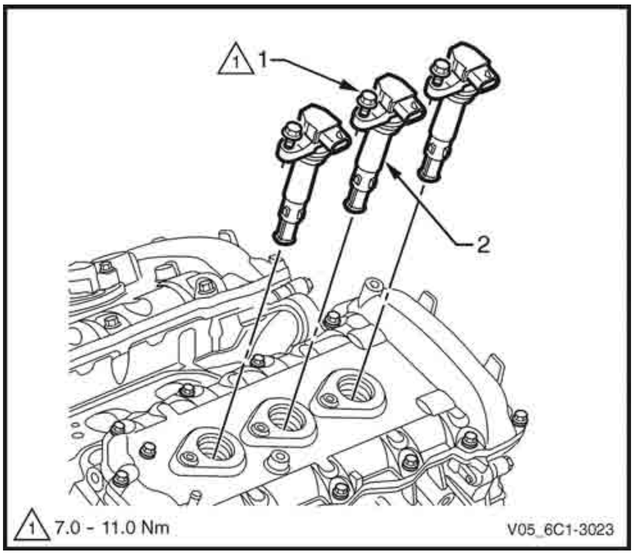

Figure 6C1-3 – 50

Disassemble

CAUTION

Do not use a sharp implement such as a knife to cut the ignition coil boot (1) from the ignition coil. Using a sharp implement may damage the ignition coil insulator (2).

1 Using your thumb, work the ignition coil boot off the ignition coil insulator.

NOTE

Take care the spring (3) does not become dislodged as the boot is removed.

To aid removal of the boot, use a blunt instrument to lift the boot edge away from the coil insulator and spray a release agent between the boot and the coil insulator.

2 Remove the spring from the ignition coil insulator.

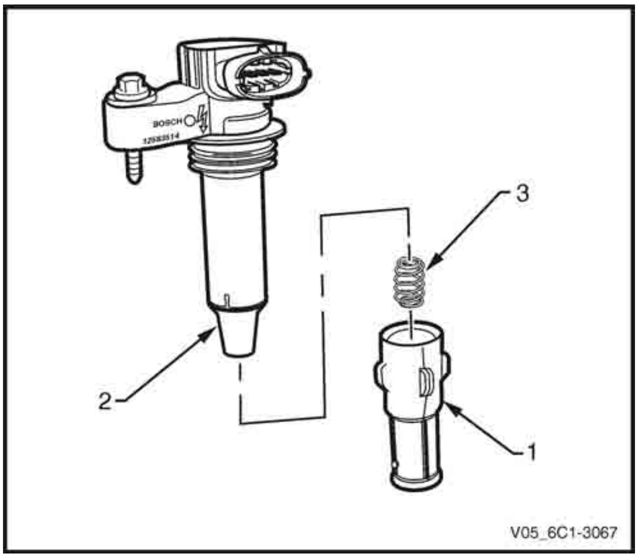

Figure 6C1-3 – 51

Reassemble

1 Position the spring (3) in the insulator recess, refer to Figure 6C1-3 – 51.

2 Lubricate the ignition coil insulator (1) with talcum powder.

3 Fit the ignition coil boot, ensuring it is fully seated at the top of the insulator.

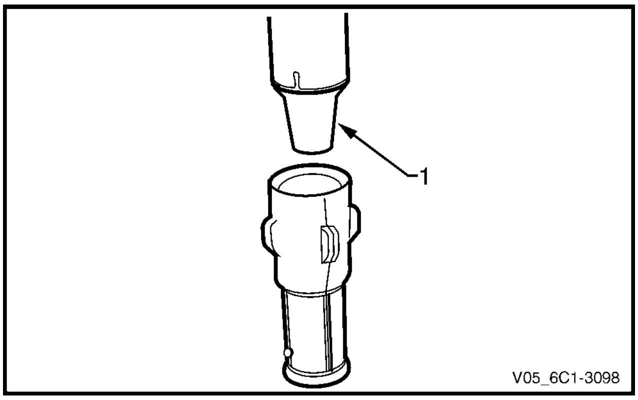

Figure 6C1-3 – 52

Test

CAUTION

Never probe the ignition coil with a 12 V tester as the ignition coil will be damaged.

Due to the internal components of the ignition coil assembly, it is not possible to perform any primary and / or secondary resistance checks. For further information on the ignition coil operation, refer to 6C1-1 Engine Management – V6 – General Information.

Reinstall

Reinstallation of the ignition coil is the reverse of the removal procedure, noting the following:

1 Lubricate the ignition coil sealing rubber (1) with clean engine oil, and the inside of the ignition coil boot (2) with talcum powder.

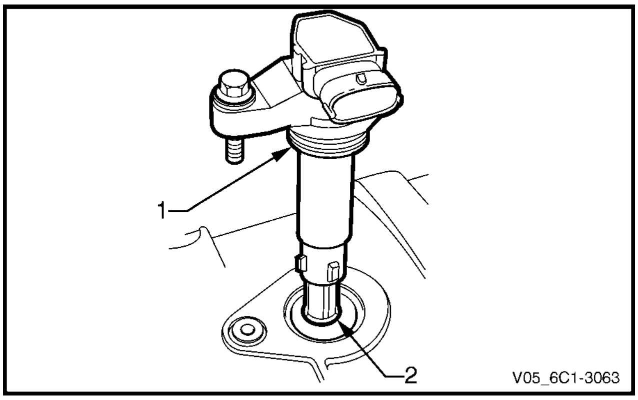

Figure 6C1-3 – 53

2 Reinstall the ignition coil by pushing down on the ignition coil to engage the sealing rubber in the camshaft cover.

CAUTION

Ensure the ignition coil is fully seated before tightening the attaching bolt to the specified torque.

3 Reinstall the ignition coil bolt and tighten to the correct torque specification.

Ignition coil attaching bolt torque specification ....7.0 – 11.0 Nm

4 Road test the vehicle and check for correct operation.

2.16 Intake Air Duct Assembly

Remove

1 Turn the ignition switch off.

2 Disconnect the crankcase ventilation hose (1) from the air intake duct (2).

3 Loosen the two air intake duct retaining clamps (3),

4 Pull the air intake duct away from the throttle body.

5 Pull the air intake duct away from the mass air flow sensor.

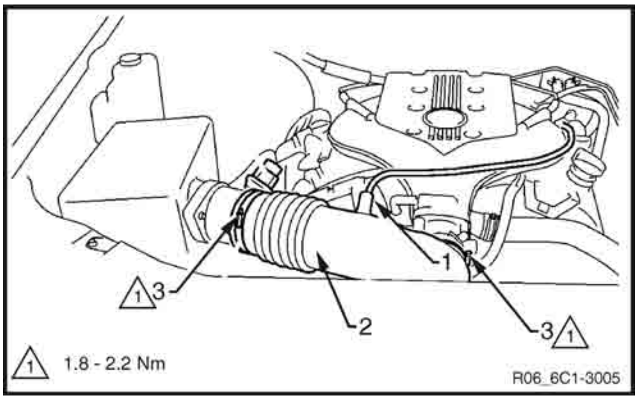

Figure 6C1-3 – 54

Reinstall

Reinstallation of the air intake duct is the reverse of the removal procedure, noting the following:

CAUTION

Ensure the air intake duct sealing rubber is correctly positioned on the throttle body. Failure to do this may result in engine damage due to unfiltered air entering the engine intake system.

1 Reinstall the air intake duct and tighten the retaining clamps to the correct torque specification.

Air intake duct retaining clamp torque specification ....1.8 – 2.2 Nm

2 Road test the vehicle and check for correct operation, taking particular note that no air leaks are evident.

2.17 Intake Air Temperature Sensor

The intake air temperature (IAT) sensor is part of the mass air flow (MAF) sensor assembly, refer to 2.20 Mass Air Flow Sensor for the replacement procedure.

Test

CAUTION

To prevent component damage use connector test adaptor kit J 35616-A.

Resistance Check

CAUTION

Do not use a high temperature heat gun as damage to the MAF sensor will result.

1 Connect a digital ohmmeter using connector test adaptor kit J 35616-A to the MAF sensor.

2 Whilst holding a thermometer (3), use a commercially available hair dryer (4) to blow warm air through the MAF sensor.

3 Measure the resistance across terminals 1 and 2.

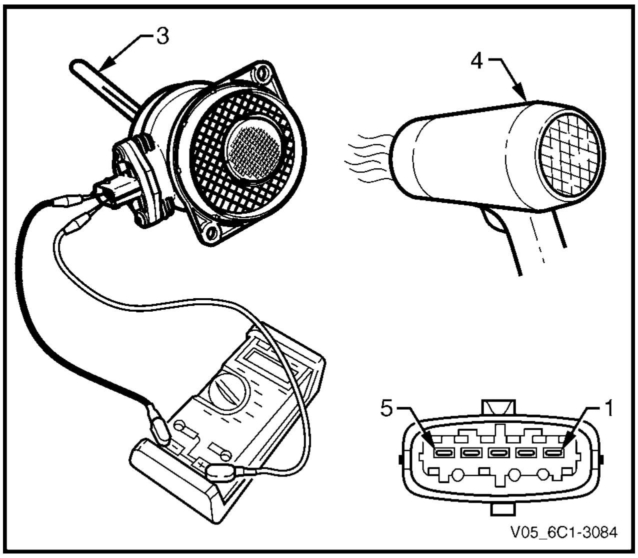

Figure 6C1-3 – 55

4 Observe the resistance values as the temperature increases and compare the temperature / resistance change to the specifications.

5 If the resistance is not within specifications, replace the MAF sensor.

Intake Air Temperature Vs Resistance	
Temperature °C	**Resistance – Ohms (Ω)**
-40	35140 – 43760
-20	12660 – 15120
-10	7943 – 9307
0	5119 – 5892
20	2290 – 2551
25	1900 – 2100
40	1096 – 1238
60	565 – 654
80	312 – 370
100	184 – 222
120	114 – 141
140	74 – 93

2.18 Knock Sensor, Bank 2 (LHS)

Remove

1 Turn the ignition switch off.

2 Disconnect Bank 2 pre-catalytic converter HO2S wiring harness connector, refer to 2.14 Heated Oxygen Sensor.

3 Raise the front of the vehicle and support on safety stands. Refer to 0A General Information for location of the jacking points.

4 Remove the starter motor heat shield, refer to 6D1-2 Starting System – V6.

5 Disconnect the wiring harness connector (1) from the knock sensor (2).

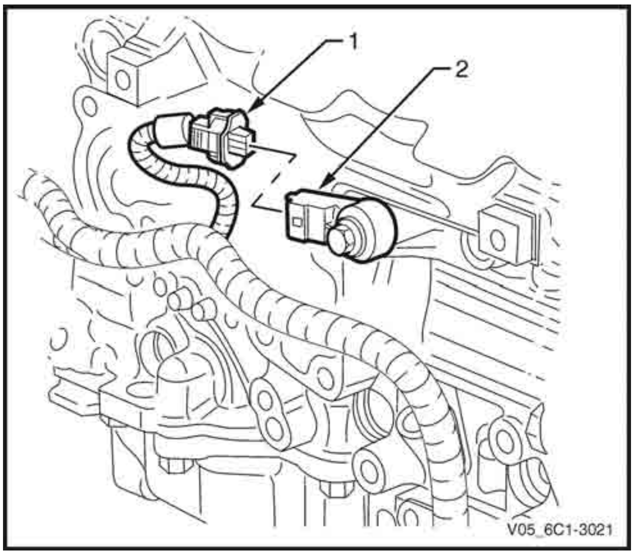

Figure 6C1-3 – 56

6 Remove the bolt (1) attaching the knock sensor (2) to the engine block and remove the knock sensor.

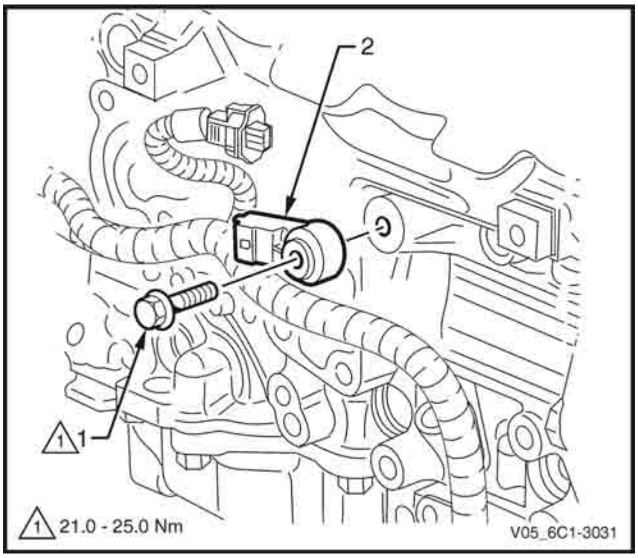

Figure 6C1-3 – 57

Reinstall

Reinstallation of the knock sensor is the reverse of the removal procedure, noting the following:

1 Ensure the knock sensor mounting surface is flat and free of any dirt, oxidisation, etc.

CAUTION

Ensure the knock sensor is fully seated and correctly aligned before tightening the attaching bolt.

Do not over-tighten the attaching bolt as incorrect operation of the knock sensor may result.

2 Reinstall the knock sensor and bolt (1). Align the knock sensor so that it is parallel to the engine oil pan mounting surface (2), ± 3° (3).

3 Tighten the knock sensor bolt to the correct torque specification.

Knock sensor attaching bolt torque specification	21.0 – 25.0 Nm

4 Road test the vehicle and check for correct operation, taking particular note that no exhaust leaks are evident.

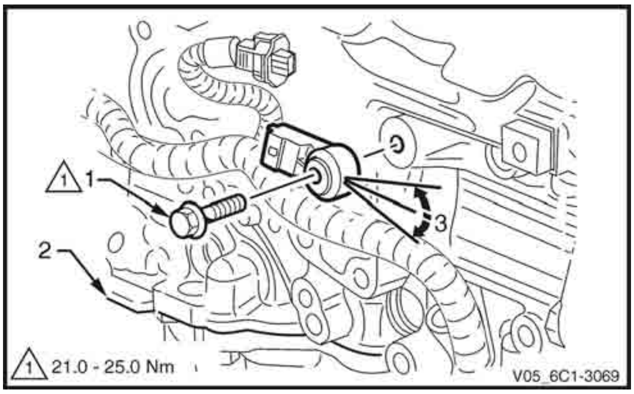

Figure 6C1-3 – 58

2.19 Knock Sensor, Bank 1 (RHS)

Remove

1 Turn the ignition switch off.

2 Raise the front of the vehicle and support on safety stands, refer to 0A General Information for location of the jacking points.

3 Disconnect the wiring harness connector (1) from the knock sensor (2).

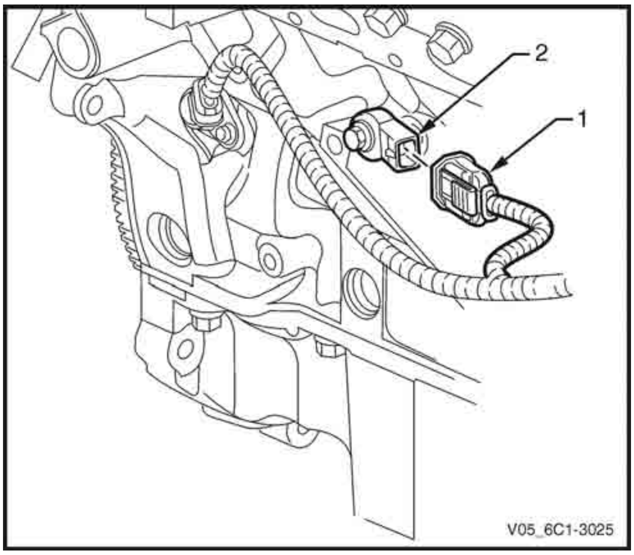

Figure 6C1-3 – 59

4 Remove the bolt (1) attaching the knock sensor (2) to the engine block, and remove the knock sensor.

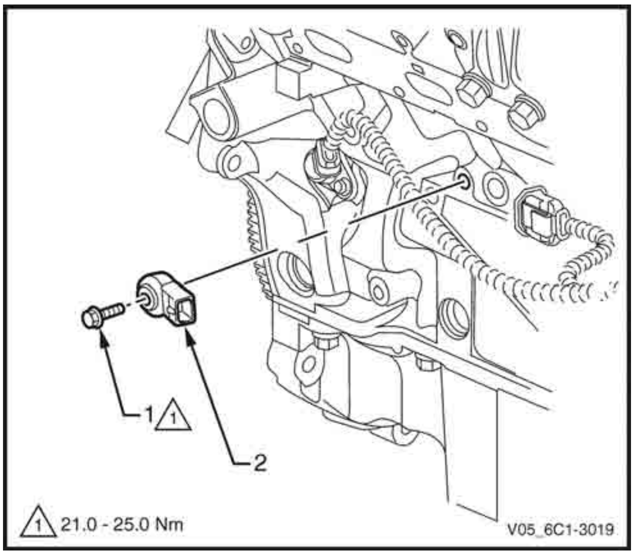

Figure 6C1-3 – 60

Reinstall

Reinstallation of the knock sensor is the reverse of the removal procedure, noting the following:

1 Ensure the knock sensor mounting surface is flat and free of any dirt, oxidisation, etc.

CAUTION

Ensure the knock sensor is fully seated before tightening the attaching bolt.

Do not over-tighten the attaching bolt as incorrect operation of the knock sensor may result.

2 Reinstall the knock sensor and bolt (1). Align the knock sensor so that it is parallel to the engine oil pan mounting surface (2), ± 3° (3).

3 Tighten the knock sensor bolt to the correct torque specification.

Knock sensor attaching bolt torque specification ....21.0 – 25.0 Nm

4 Road test the vehicle and check for correct operation.

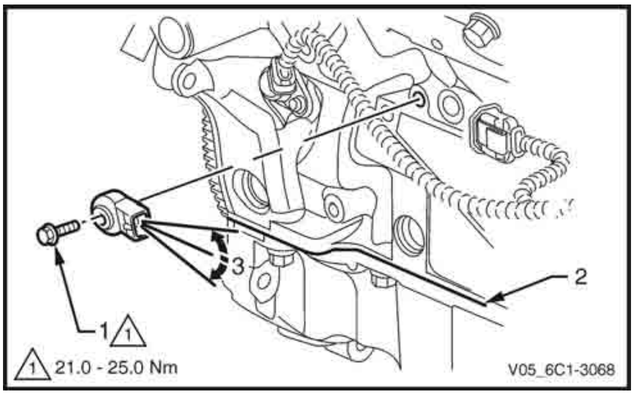

Figure 6C1-3 – 61

2.20 Mass Air Flow Sensor

The intake air temperature (IAT) sensor is part of the mass air flow (MAF) Sensor. For the IAT sensor test procedure refer to 2.17 Intake Air Temperature Sensor.

Handling Precautions

WARNING

Under no circumstances should the MAF sensor retaining screws (1) be loosened or removed as the MAF will become unserviceable and will require replacement.

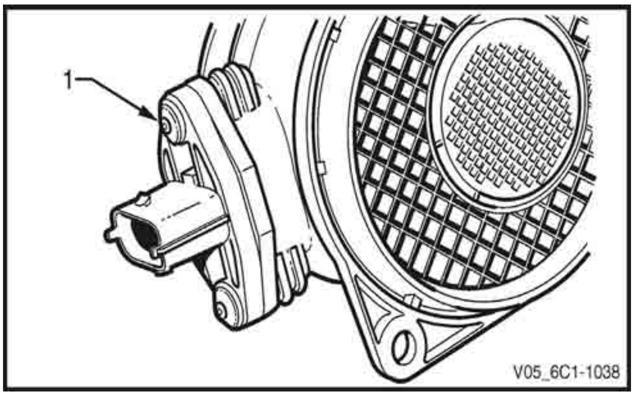

Figure 6C1-3 – 62

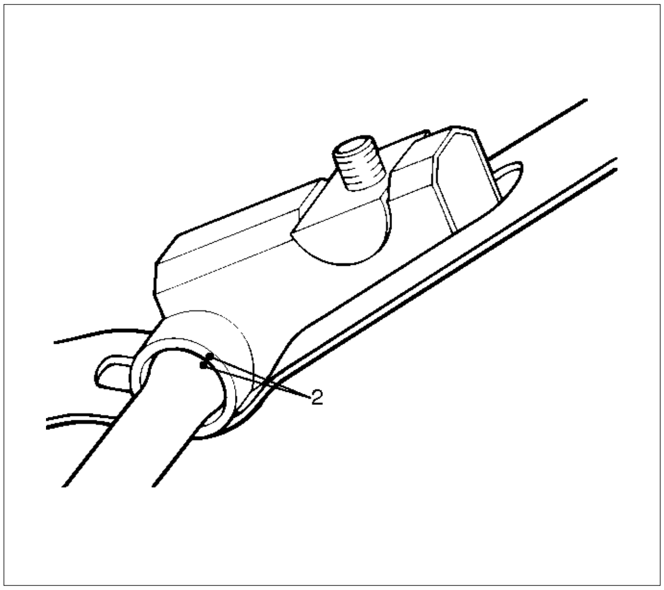
Remove

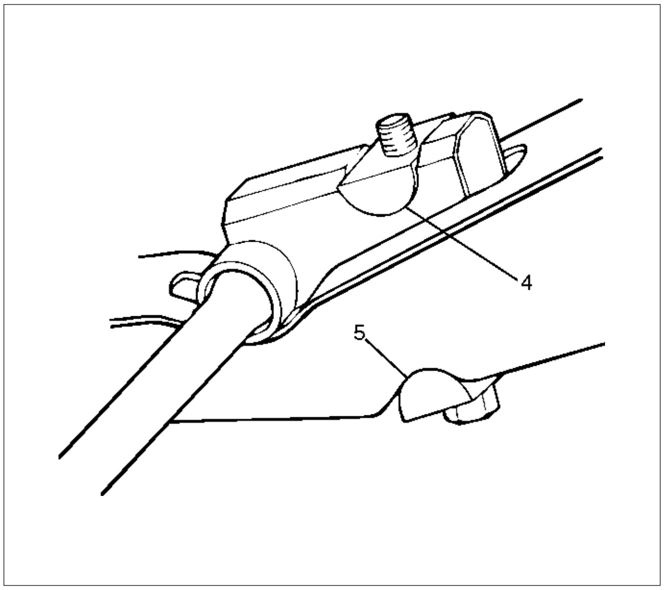
1 Turn the ignition switch off.

2. Apply grease to the portion that fits into the bracket then install height control arm and align the setting marks (2).



410RS005

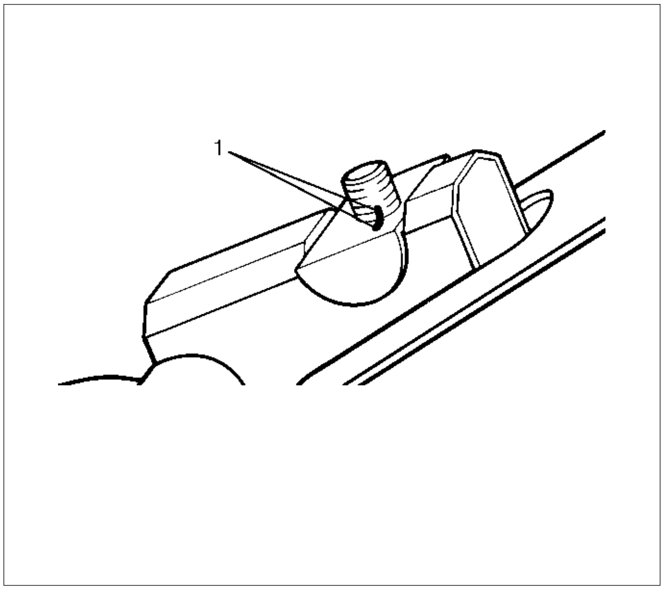
3. Apply grease to the bolt portion of the end piece (4). Apply grease to the portion of the seat (5) that fits into the bracket.



410RS008

4. Apply grease to the serrated portions.
5. Install adjust bolt and seat, then turn the adjust bolt to the setting mark (1) applied during disassembly.

NOTE: Adjust the trim height. Refer to Front End Alignment Inspection and Adjustment in Steering section.



410RS004

2 Disconnect the wiring harness connector (1) from the MAF sensor.

3 Remove the air intake duct, refer to 2.16 Intake Air Duct Assembly.

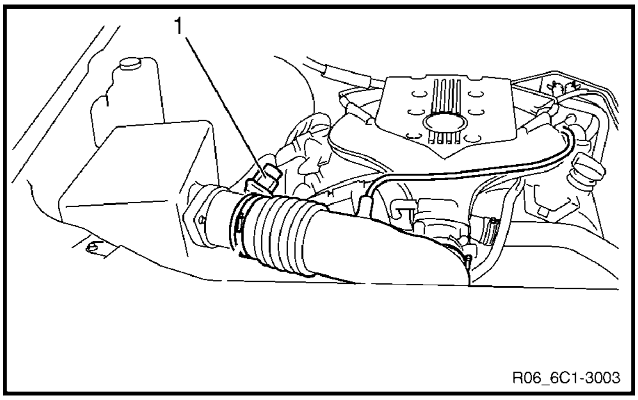


Figure 6C1-3 – 63

5 Remove the nut (1), two places, attaching the MAF sensor (2) to the upper air cleaner housing (3).

6 Position the flexible air intake duct away from the MAF sensor and remove the MAF sensor.

NOTE

The MAF sensor seal (4) is part of the air cleaner upper housing and is not serviced as a separate item.

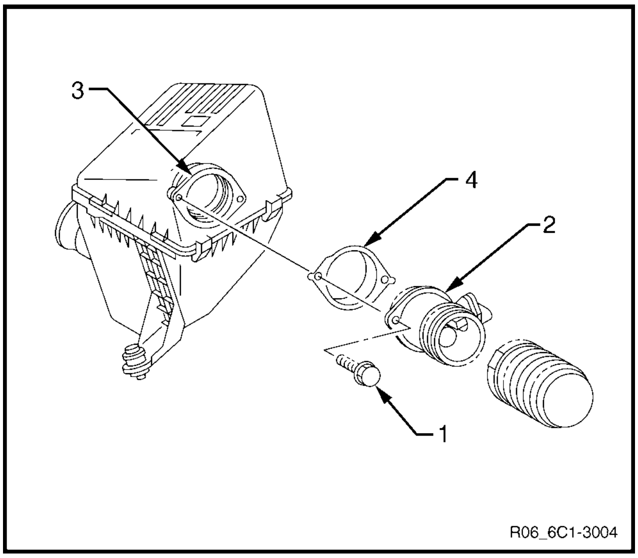

Figure 6C1-3 – 64

Reinstall

Reinstallation of the mass air flow (MAF) sensor is the reverse of the removal procedure, noting the following:

WARNING

Care must be taken not to over tighten the MAF sensor attaching nuts. Over tightening the nuts may cause damage to the MAF sensor seal and allow unfiltered air to enter the air intake system.

1 Tighten the MAF sensor nuts to the correct torque specification.

Mass air flow sensor attaching nut torque specification ....1.8 – 2.2 Nm

2 Tighten the air intake duct retaining clamp screw to the correct torque specification.

Air intake duct retaining clamp torque specification ....1.8 – 2.5 Nm

3 Start the engine and check for any air leaks between the air intake duct, the MAF and the upper air cleaner housing.

4 Road test the vehicle and check for correct operation, taking particular note that no air leaks are evident.

2.21 Schrader Valve – Fuel Pressure Gauge Connection Point

CAUTION

If the Schrader valve is to be removed but not replaced immediately, it is advisable to disconnect the battery to avoid possible fuel discharge if an accidental attempt is made to start the engine.

Disconnection of the battery affects vehicle electronic systems. Refer to 6D1-3 Battery – V6 before disconnecting the battery.

Remove

1 Depressurise the fuel system, refer to 6C Fuel System - V6.

2 Turn the ignition off.

CAUTION

A small amount of fuel may be released when servicing the fuel pressure test point. To reduce the chance of personal injury, cover the fuel pressure test point with a shop towel to absorb any fuel spillage when the Schrader valve sealing cap and Schrader valve are removed. After the procedure, place the towel in an approved container for disposal.

3 Remove the Schrader valve sealing cap (1).

4 Remove the Schrader valve (2) using a standard valve core removal tool.

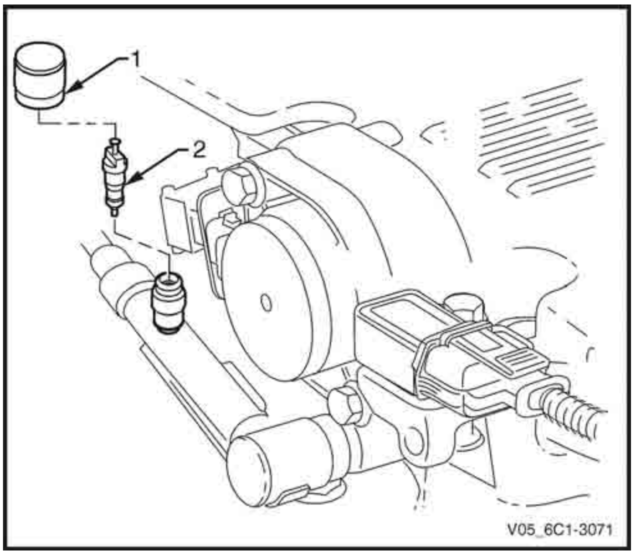

Figure 6C1-3 – 65

Reinstall

Reinstallation of the Schrader valve is the reverse of the removal procedure, noting the following:

1 Inspect the fuel rail and quick connect fitting for leaks, refer to 6C Fuel System - V6.

2 Road test the vehicle and check for correct operation.

2.22 Spark Plugs

Service Precautions

1 Allow the engine to cool (to at least 50°C) before attempting to remove spark plugs. Attempting to remove spark plugs from a hot engine may cause the plug / cylinder head threads to bind, resulting in tearing of the alloy cylinder head threads.

2 Clean the spark plug recess area before removing any spark plug. Failure to do so could result in engine damage because of dirt or other foreign material entering the cylinder head or by the contamination of the cylinder head threads. The contaminated threads may then prevent the correct seating of the new or replaced plug. If required, use a thread chaser to clean the threads of any contamination where this is suspected.

3 Under no circumstances should the spark plug/s gap be adjusted. If the gap is not within specifications, replace the spark plug.

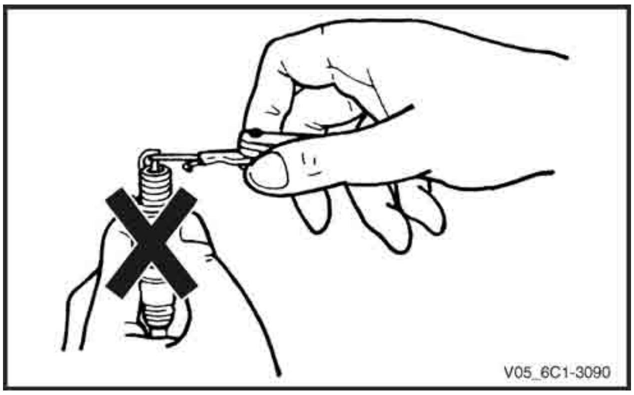

Figure 6C1-3 – 66

Remove

1 Turn the ignition switch off.

2 Remove the ignition coil/s, refer to 2.15Ignition Coil.

3 Using a suitable spark plug socket, loosen the spark plug slightly and then re-tighten to break away any carbon deposits on the threads.

WARNING

Wear eye protection to avoid injury.

4 Loosen the spark plug once again one or two turns, then use compressed air to remove any foreign material that may otherwise enter the combustion chamber.

5 Remove the spark plug (1).

6 Repeat as required for the remaining spark plugs.

NOTE

Place each spark plug in the same order as that of removal. This will enable any abnormal spark plug condition to be identified with the cylinder.

NOTE

If the spark plugs are removed for an indefinite period before installation, plug the spark plug openings to prevent foreign particle ingress.

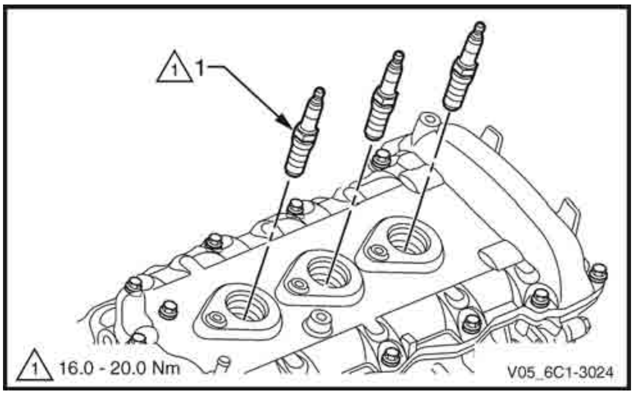

Figure 6C1-3 – 67

7 Repeat steps 2 to 5 for the remaining spark plugs as required.

Inspect

The spark plugs must not be re-gapped. If the gap of a spark plug is outside the specified range, replace the spark plug. In addition, replace spark plugs that shows excessive dirt deposit or broken insulators.

1 Replace any plug that has cracked and / or broken insulation or loose electrodes.

2 Inspect the spark plugs for defects. Refer to Analysis of Spark Plug Condition in this Section for identification of the condition of spark plugs.

3 Ensure the threads are clean and in good order.

4 Use a round wire feeler gauge to check the spark plug gap. If the gap is not within specifications, replace the spark plug.

Spark plug gap	1.1 – 1.2 mm

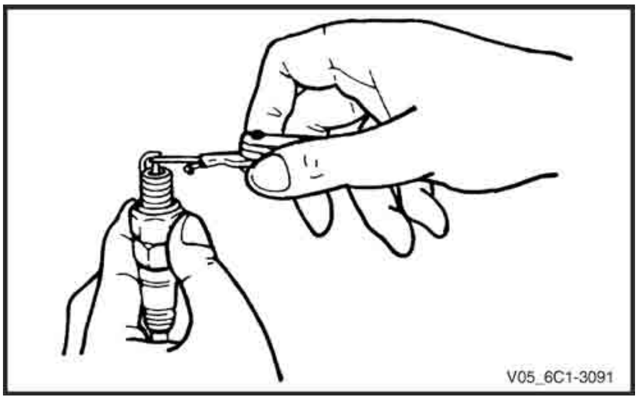

Figure 6C1-3 – 68

Spark Plug Inspection

Poor Spark Plug Performance

A spark plug can perform poorly due to wear, dirt, carbon fouling, excessive electrode wear, a broken insulator or excessive gap.

Worn or Dirty Plugs

Worn or dirty plugs can give satisfactory operation while the vehicle is idling, but break down under load.

This can cause:

- poor fuel economy,
- power loss,
- acceleration loss,
- difficult starting, or
- poor engine performance.

Carbon Fouling

Carbon fouling is indicated by black carbon deposits. The black deposits are usually the result of slow-speed driving and short runs. In these circumstances, the optimum engine operating temperature is seldom reached.

Fouling can also be caused by:

- worn piston rings,
- faulty ignition,
- rich fuel mixture, or
- spark plugs that are rated too cold.

Excessive Electrode Wear

This often indicates:

- the engine is operating at high speeds,
- the engine is operating at levels that are consistently greater than normal,
- a plug that is rated too hot,
- excessively lean fuel mixture, or

- plug/s overheating due to insufficient tightening (caused by combustion gases leaking past the threads).

Broken Insulator

Broken insulators are usually the result of improper installation or carelessness.

Breaks in the upper insulator can result from a poor fitting spark plug socket or impact. The cracked insulator may not show up until oil or moisture penetrates the crack. The crack is often just below the crimped part of the shell and may not be visible.

Breaks in the lower insulator often result from careless re-gapping and are usually visible.

This can also result from the plug operating too hot. For example, in periods of high speed operation or under heavy loads.

Analysis of Spark Plug Condition

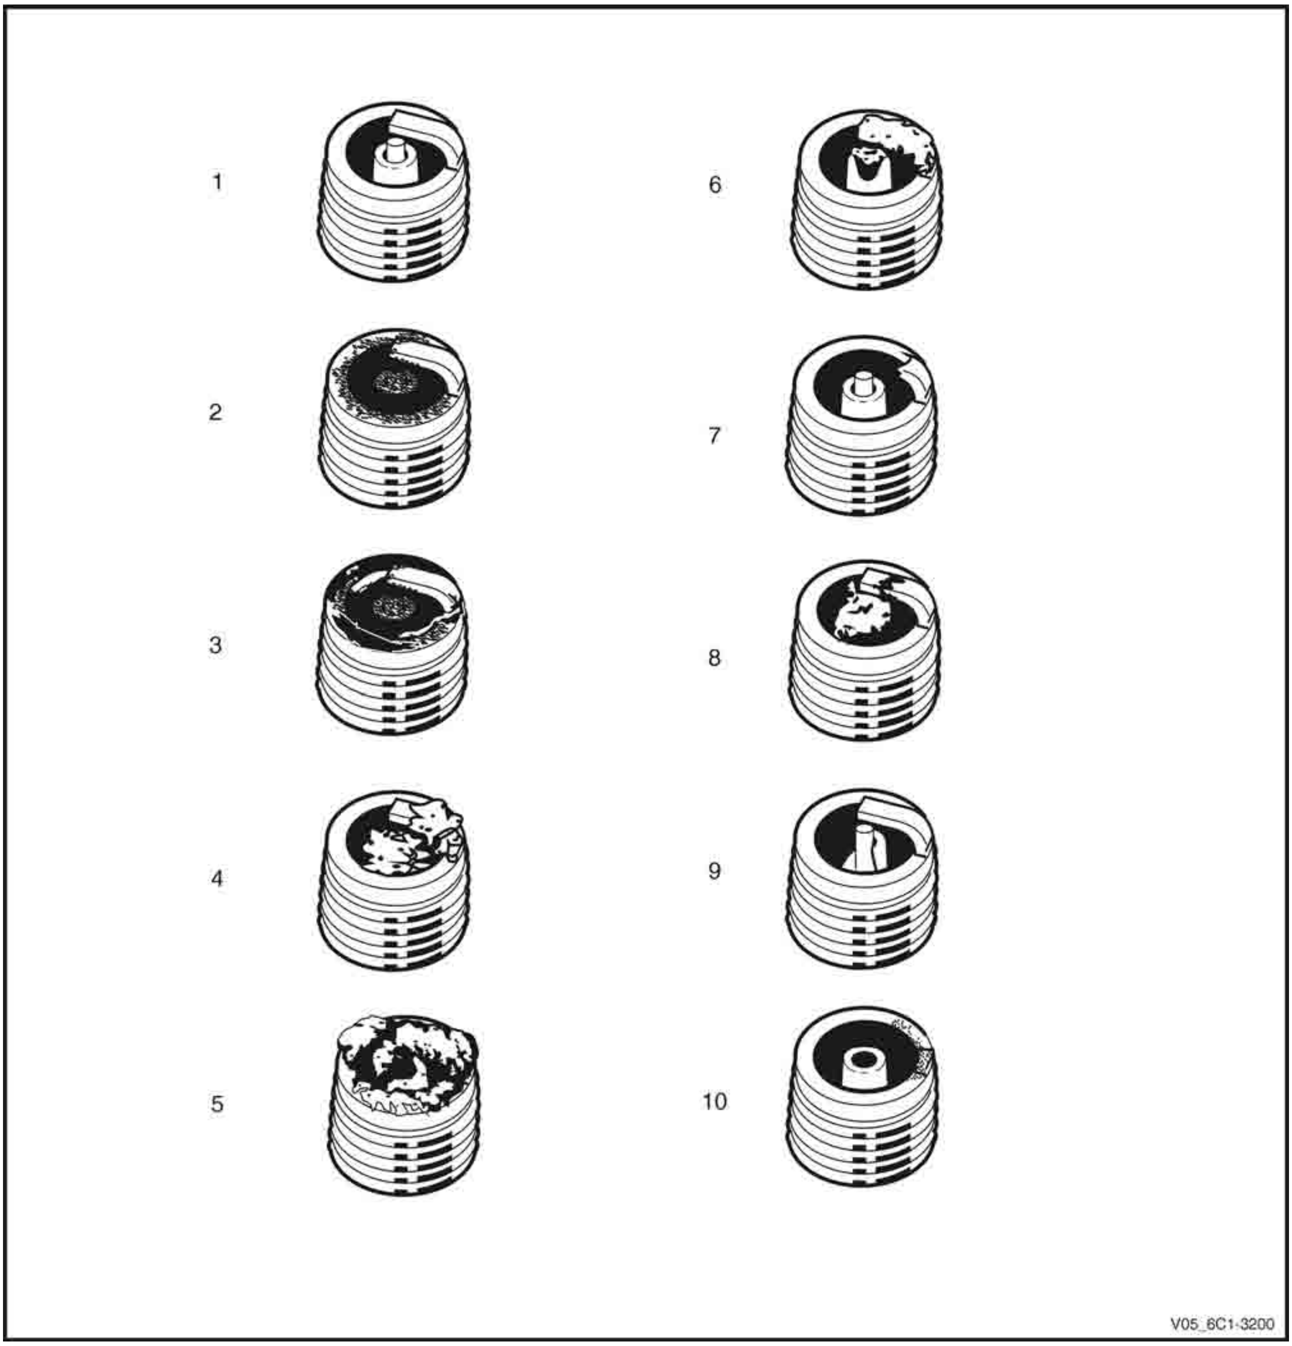

Figure 6C1-3 – 69

Legend

1 Normal
2 Carbon Fouled
3 Oil Fouled
4 Deposit Fouling A
5 Deposit Fouling B
6 Deposit Fouling C
7 Detonation
8 Pre-ignition
9 Heat Shock Failure
10 Insufficient Installation Torque

Normal Operation (1)

Brown or greyish-tan deposits and slight electrode wear indicate correct spark plug heat range and mixed periods of high and low speed driving.

Carbon Fouled (2)

Dry, fluffy black carbon deposits possibly due to poor ignition output, a weak coil, excessive idling or slow speeds under light load. If spark plug temperatures remain too low for normal combustion, the deposits are not burned off.

Oil Fouled (3)

Wet, oily deposits with minor electrode wear possibly due to oil leaking past worn piston rings.

Breaking in a new or recently overhauled engine before the rings are fully seated may also result in this condition.

Deposit Fouling A (4)

Red brown, yellow and white coloured coatings on the insulator tip which are by-products of combustion. They come from fuel and lubricating oil which generally contain additives. Most powdery deposits have no adverse effect on spark plug operation, however, they may cause intermittent missing under severe operating conditions.

Deposit Fouling B (5)

Deposits similar to those identified in deposit fouling A (4). These are also by-products of combustion from fuel and lubricating oil. Excessive valve stem clearances and / or defective intake valve seals allow too much oil to enter the combustion chamber. The deposits will accumulate on the portion of the spark plug that projects into the chamber and will be heaviest on the side facing the intake valve. If this condition is only detected in one or two cylinders, check the valve stem seals.

Deposit Fouling C (6)

Most powdery deposits identified in deposit fouling A (4) have no adverse effect on the operation of the spark plug as long as they remain powdery.

Under certain conditions of operation however, these deposits melt and form a shiny glaze coating on the insulator. When hot, this acts as a good electrical conductor allowing the current to flow along the deposit instead of sparking across the gap.

Detonation (7)

Commonly referred to as engine knock or pinging, detonation causes severe shocks inside the combustion chamber causing damage to parts.

Pre-ignition (8)

Burnt or blistered insulator tip and badly eroded electrodes probably due to the excessive heat.

This is often caused by a cooling system blockage, sticking valves, improperly installed spark plugs or plugs that are the wrong heat rating (too hot).

Sustained high speed with a heavy load can produce temperatures high enough to cause pre-ignition.

Heat Shock Failure (9)

A rapid increase in spark plug tip temperature under severe operating conditions can cause heat shock and result in fractured insulators. This is a common cause of broken and cracked insulator tips.

Insufficient Installation Torque (10)

Poor contact between the spark plug and the cylinder head seat.

The lack of proper heat transfer that results from poor seat contact causes overheating of the spark plug. In many cases, severe damage occurs. Dirty threads in the cylinder head can cause the plug to seize before it is seated.

Ensure the cylinder head and spark plug threads are free of deposits, burrs and scale before installation.

Reinstall

Reinstallation of the spark plug is the reverse of the removal procedure, noting the following:

CAUTION

- **Discard the spark plug if it has been dropped.**
- **Do not use anti-seize compound or similar lubricant on the spark plug threads.**

1 Using a suitably sized rubber tube attached to the spark plug terminal post, hand start each spark plug into the cylinder head thread.

CAUTION

Failure to tighten a spark plug to the correct torque specification may result in premature spark plug failure, and / or engine damage.

2 Tighten the spark plug/s to the correct torque specification.

Spark plug torque specification...............16.0 – 20.0 Nm

3 Road test the vehicle and check for correct operation.

2.23 Throttle Body Assembly

Handling Precautions

CAUTION

Under no circumstances should the clip (1), six places, retaining the cover plate (2) to the throttle body be removed. If the cover is removed, the vacuum seal between the cover plate and the throttle body will be broken. This will allow the ingress of foreign particles and / or moisture and render the throttle body unserviceable

The throttle body must not be subjected to any form of shock such as dropping it. If the throttle body is subjected to shock, damage may result to the fragile motor magnets within the throttle body.

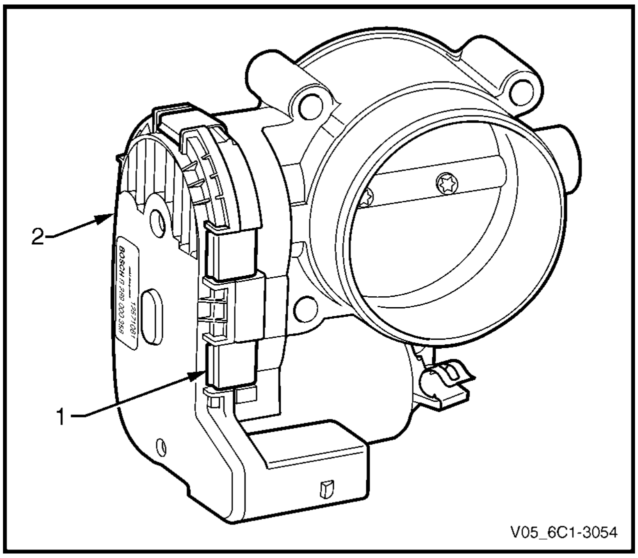

Figure 6C1-3 – 70

Remove

1 Turn the ignition switch off.

2 Loosen the air intake duct to throttle body assembly retaining clamp (1).

3 Pull the air intake duct (2) away from the throttle body assembly.

NOTE

If difficulty is experienced in removing the air intake duct from the throttle body, completely remove the air intake duct assembly, refer to 2.16 Intake Air Duct Assembly.

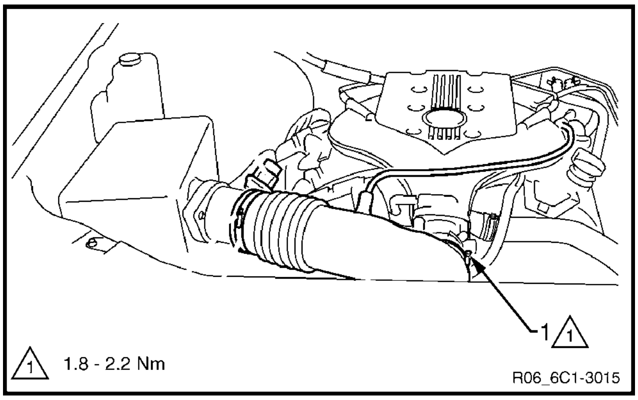

Figure 6C1-3 – 71

4 Unclip the wiring harness from the retaining clip (1).

CAUTION

Do not use any mechanical device such as a screwdriver to disengage the harness connector (2) from the throttle body.

5 Disconnect the wiring harness connector by:

NOTE

When sliding the connector lock, take care not to disengage it from the connector.

- Sliding the connector lock (3) in the direction of the arrow, then
- press the connector latch in the direction of the arrow (4), and remove the connector from the throttle body.

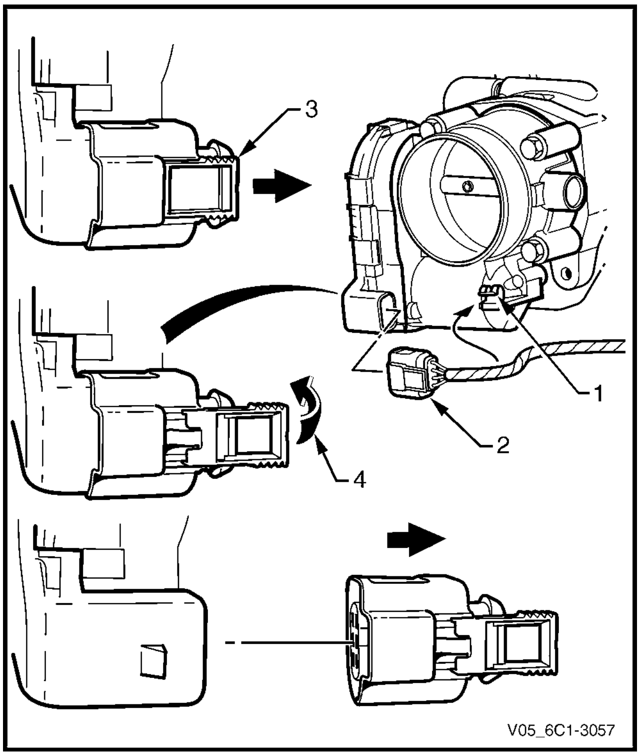

Figure 6C1-3 – 72

6 Remove the four bolts (1), attaching the throttle body (2) to the upper intake manifold (3).

7 Remove the throttle body and gasket (4).

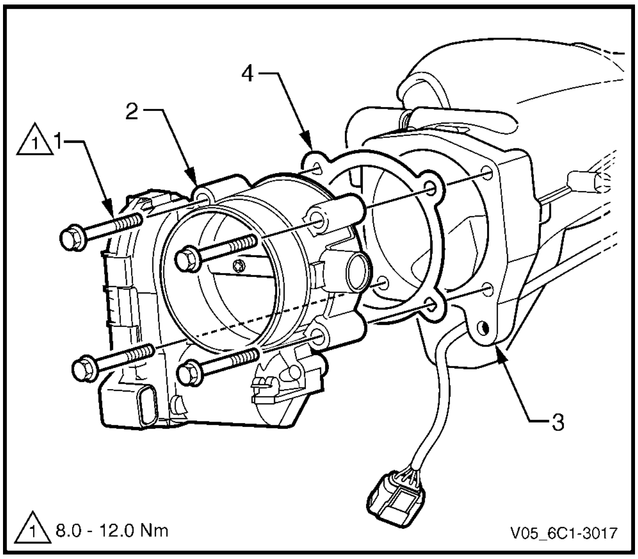

Figure 6C1-3 – 73

Inspect

The following throttle body inspection procedure may be carried out with the throttle body installed on the vehicle. Prior to performing a throttle body on-vehicle inspection:

- Turn the ignition switch off.
- Disconnect the throttle body wiring harness connector. Refer to Remove in this Section.
- Remove the air intake duct, refer to 2.16 Intake Air Duct Assembly.

WARNING

To avoid serious personal injury, never attempt to rotate the throttle plate manually whilst the throttle body harness connector is connected to the throttle body.

1 Fully open the throttle plate by hand and inspect the throttle body bore and throttle plate for any deposits.

CAUTION

When cleaning / inspecting the throttle body:

- **Do not subject the throttle body assembly to an immersion cleaner or a strong solvent. Damage to the throttle position sensor and / or sealed throttle shaft bearings will result.**
- **Never use a wire brush or scraper to clean the throttle body. A wire brush or sharp tool may damage the throttle body components.**

2 Use a clean shop towel and a spray type hydro-carbon cleaner to clean the throttle body bore and throttle plate. If necessary, use a parts cleaning brush to remove heavy deposits.

3 Inspect the throttle body for a binding throttle plate by fully opening and closing the throttle plate by hand. It should open and close smoothly.

4 Inspect the throttle body for a bent or damaged throttle plate, cracks, corrosion, or distortion in the throttle body housing.

NOTE

The throttle body contains no serviceable parts and should not be disassembled. If the throttle body is damaged it must be replaced as an assembly.

5 If the throttle body is affected by any of the above conditions, it must be replaced.

6 If an on-vehicle throttle body inspection was performed, perform the following:

- Reinstall the air intake duct, refer to 2.16 Intake Air Duct Assembly.
- Reconnect the throttle body wiring harness connector, refer to Reinstall in this Section.
- Road test the vehicle and check for correct operation, taking particular note that no air leaks are evident.

Reinstall

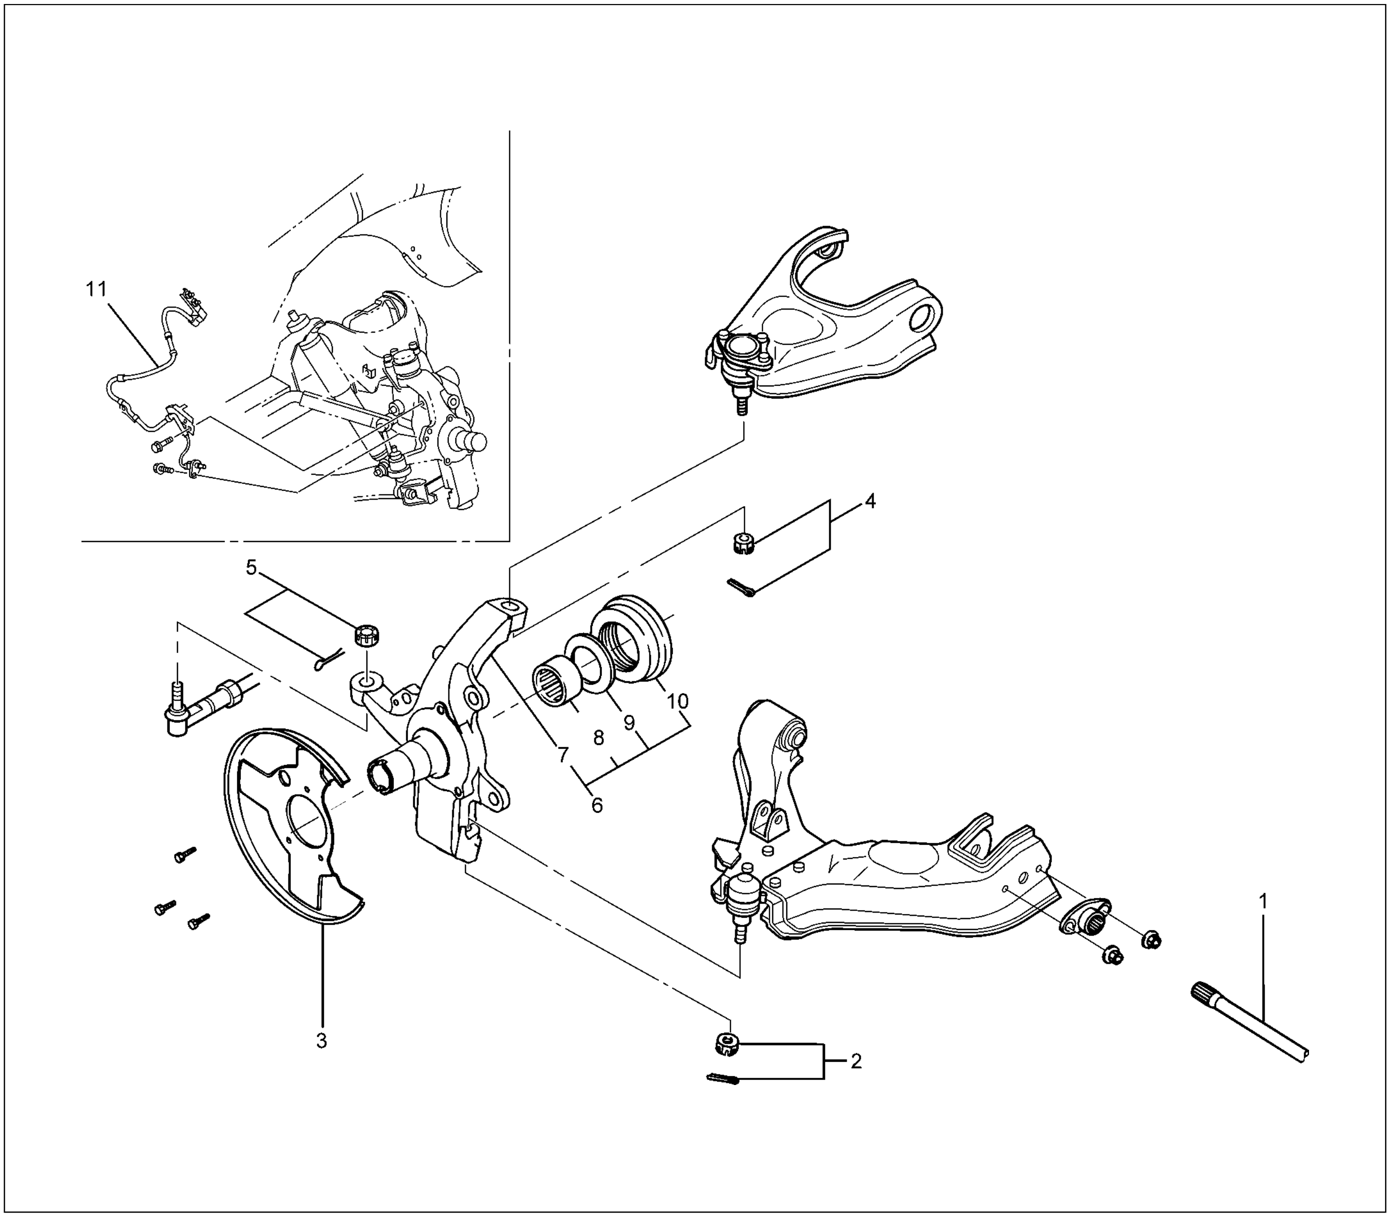
Reinstallation of the throttle body assembly is the reverse of the removal procedure, noting the following:

1 Ensure the throttle body and upper intake manifold mating surfaces are clean and free of foreign material.

2 Install a new throttle body to upper intake manifold gasket.

Knuckle

Knuckle and Associated Parts



RUW63CLF000101

Legend

(1) Torsion Bar

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the brake caliper. Refer to Disc Brakes in Brake section.

3 Reinstall the throttle body bolts and tighten to the correct torque specification.

Throttle body assembly attaching bolt torque specification ....8.0 – 12.0 Nm

CAUTION

After reinstalling the wiring harness connector, ensure the connector latch (1) and connector lock (2) have fully engaged.

4 Reinstall the wiring harness connector to the throttle body, ensuring the connector latch and connector slide have fully engaged.

5 Ensure the wiring harness is correctly routed and attached securely in the throttle body harness retaining clip (3).

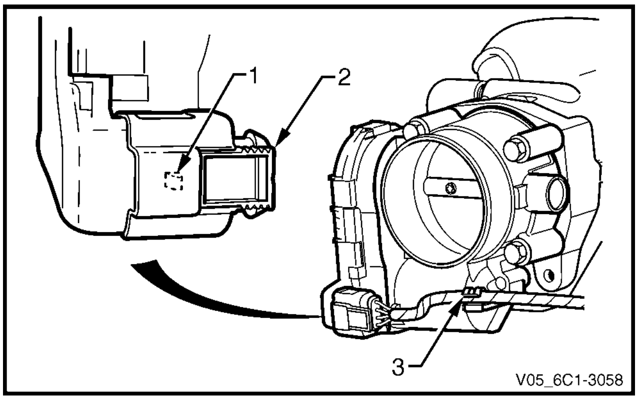

Figure 6C1-3 – 74

6 Road test the vehicle and check for correct operation, taking particular note that no air leaks are evident.

3 Specifications

Accelerator Pedal Position Sensor 1

Type .... Three wire potentiometer
Accelerator pedal at rest .... Less than 1.25 V
Accelerator pedal fully depressed .... 5.0 V maximum

Accelerator Pedal Position Sensor 2

Type .... Three wire potentiometer
Accelerator pedal at rest .... Less than 1.25 V
Accelerator pedal fully depressed .... 5.0 V maximum

Camshaft Position (CMP) Sensor

Type .... Hall effect, interrupted ring triggered
Air gap .... 0.1 – 1.8 mm
Air gap adjustment .... No adjustment

Crankshaft Position (CKP) Sensor

Type .... Inductive magnetic type
Coil resistance @ 20°C .... 850 – 1040 Ω
Air gap .... 0.1 – 1.5 mm
Air gap adjustment .... No adjustment

Engine Coolant Temperature Sensor

Type .... Negative temperature
.... coefficient thermistor

Engine Coolant Temperature Vs Resistance

6 Special Tools

Tool Number	Illustration	Description	Tool Classification
7000086i		**Tech 2 scan tool** Used for diagnosis of vehicle electrical systems. Previously released.	Mandatory
3588		**Digital Multimeter** Previously released as j 39200, 3545 GM.	Available
J 35616		**Connector Test Adaptor Kit** Used when carrying out electrical diagnostic circuit checks. Previously released.	Desirable
J 34142-a		**Un-powered Test Lamp** Previously released as CT-40-C and also commercially available. Must have a current draw less than 0.3 A.	Mandatory
J 34730-2C		**Injector Test Light** Used to check for power and the control circuit of the fuel injector, for proper operation. Also previously released as ST- 8329	Mandatory
J 39021		**Fuel Injector Coil / Balance Tester** Used in conjunction with a DMM for testing the fuel injector coil windings and for injector balance testing. Previously released	Mandatory
J 44602		**Injector Test Adapter**	Mandatory

J 41712		**Oil Pressure Sensor Socket** Used in conjunction with 3/8" drive socket equipment to remove / reinstall oil pressure sensor. Previously released	Desirable
J 23738-A		**Vacuum Pump (20 in. Hg Minimum)** Used for many applications where a controlled vacuum is required to be applied. Previously released and also commercially available	Mandatory
N/A		**Technical Information System (TIS) CD ROM** Available to Authorised Dealers.	Mandatory

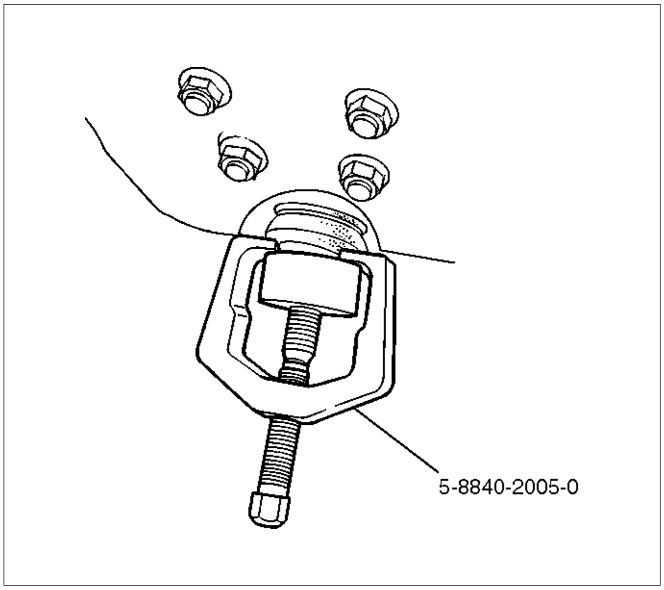
6D1-1
Charging System – V6

ATTENTION

Before performing any service operations or other procedure described in this Section, refer to 1.2 WARNING, CAUTION and NOTES for correct workshop practices with regard to safety and / or property damage.

4. Remove the hub assembly. Refer to Front Hub and Disk in this section.
5. Remove tie-rod end from the knuckle. Refer to Power Steering Unit in Steering section.
6. Remove the speed sensor from the knuckle.
7. Loosen torsion bar by height control arm adjust bolt, and then remove torsion bar. Refer to Torsion Bar in this section.
8. Remove speed sensor harness.
9. Remove back plate.
10. Remove lower ball joint by using remover 5-8840-2005-0.

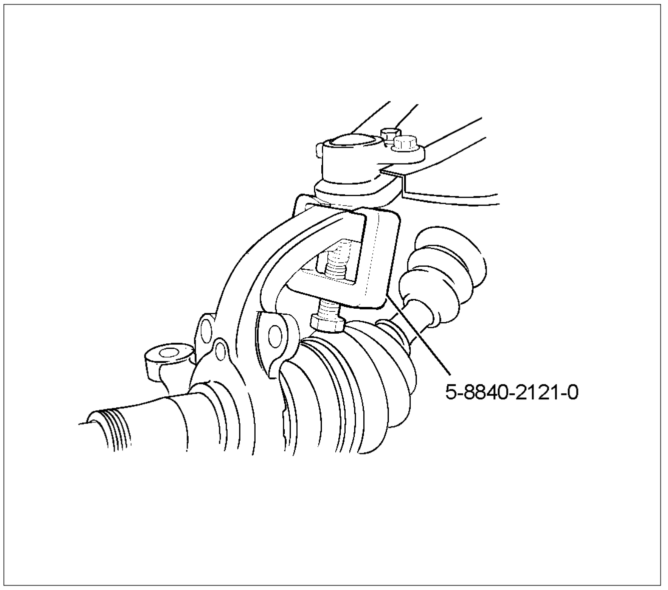
CAUTION: Be careful not to damage the ball joint boot.



901RW271

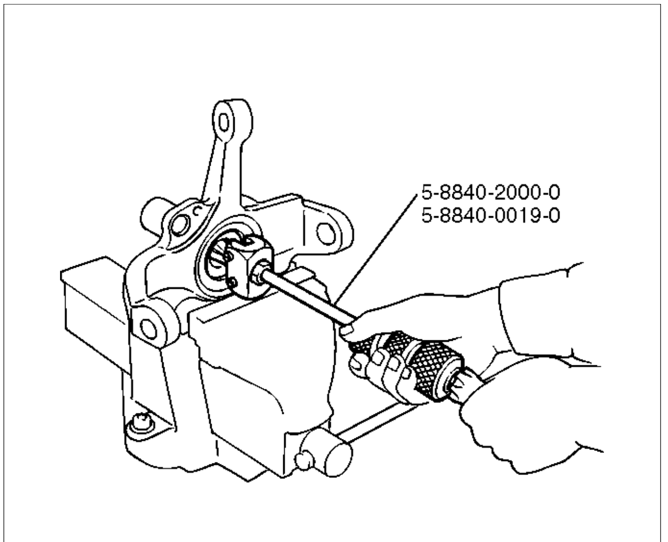
11. Remove upper ball joint by using remover 5-8840-2121-0.

CAUTION: Be careful not to damage the ball joint boot.



901RW272

12. Remove knuckle assembly.
13. Remove oil seal. If replacement required. (4×4 Model Only)
14. Remove washer. If replacement required. (4×4 Model Only)
15. Remove needle bearing by using remover 5-8840-2000-0 and sliding hammer 5-8840-0019-0. If replacement required. (4×4 Model Only)



(4×4 Model Only)

RTW340SH00401

1 General Information

1.1 Components

Generator

The Mitsubishi generator can be identified visually by its two lower and one upper mounting lugs.

It is mounted to the lower right-hand side of the engine block. It is driven by the same drive belt that drives other engine ancillaries and requires no periodic drive belt adjustment.

The generator has three phases, incorporating a rotor with six pole pairs fitted and two internal cooling fans; one on the drive-end and one on the slip-ring end. The rotor is supported by ball bearings in both the drive and slip-ring end housings. Surrounding the rotor is a stator, which has a three phase delta connected output winding construction on a ring shaped lamination pack.

The output of the stator winding is rectified by eight diodes that are contained within the slip-ring end housing. Excitation current is supplied to the rotor field coil via the voltage regulator, the brushes and slip-rings. The electronic voltage regulator requires no adjustment in service.

The generator has four external connections (refer to Figure 6D1-1 1):

- Generator – Terminal P-9 to the battery positive terminal P-1 via fuse SBF1,
- Generator – E-4 pin 1 to the ECM connection E-60 pin 43 – regulator monitoring,
- Generator – E-4 pin 2 to the ECM connection E60 pin 21 – battery voltage sensing, and
- ground connection via the installation bolts.

Generator Types

The vehicle is fitted with a 120 amp generator.

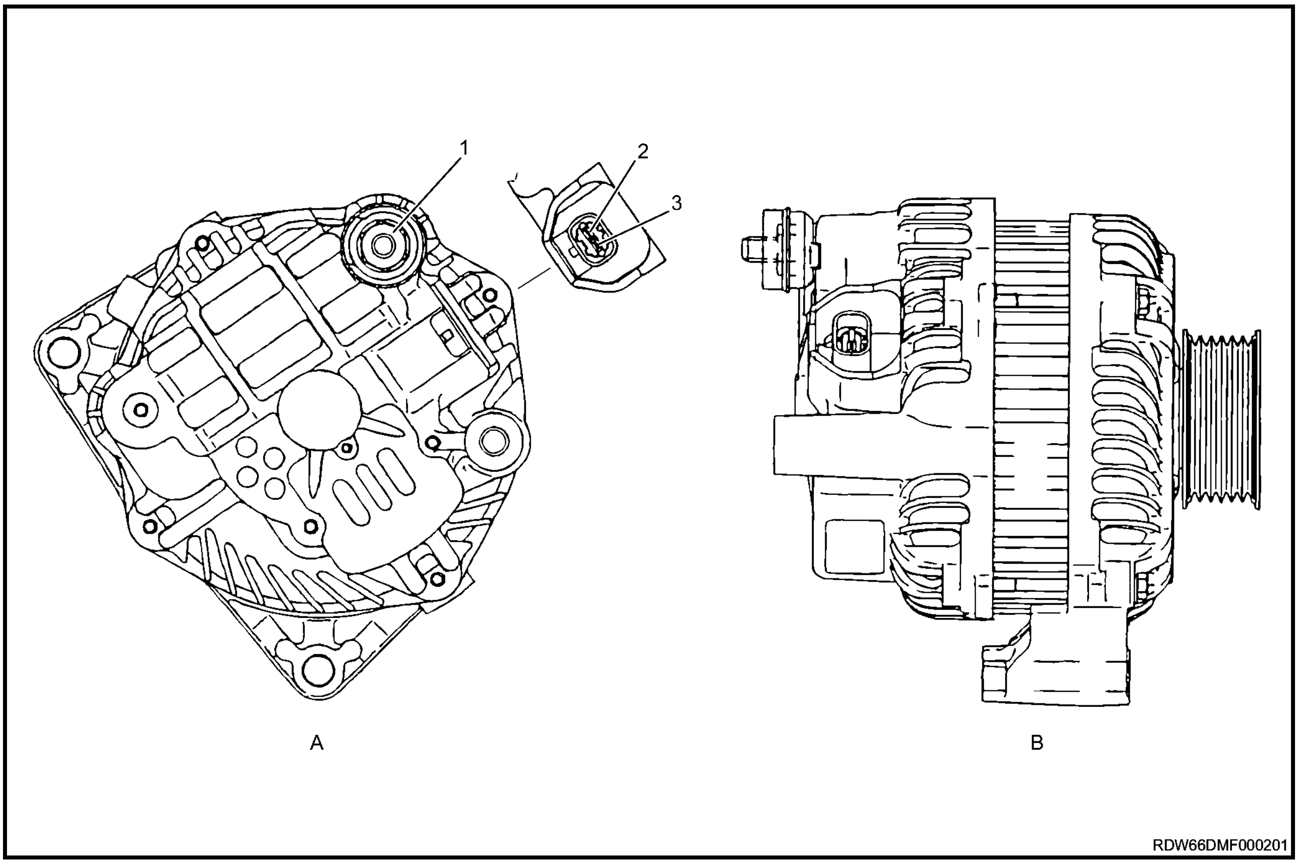


Figure 6D1-1 1

Legend

A	Rear View of Generator	1	Generator –Terminal P-9
B	Side View of Generator	2	Generator – E-4 pin 2
		3	Generator – E-4 pin 1

Voltage Regulator

The electronic voltage regulator requires no adjustment in service.

1.2 WARNING, CAUTION and NOTES

This Section contains various WARNINGS, CAUTIONS and NOTE statements that you must observe carefully to reduce the risk of death or injury during service, repair procedures or vehicle operation. Incorrect service or repair procedures may damage the vehicle or cause operational faults. WARNINGS, CAUTION and NOTE statements are not exhaustive. HOLDEN LTD can not possibly warn of all the potentially hazardous consequences of failure to follow these instructions.

Definition of WARNING, CAUTION and NOTE Statements

Diagnosis and repair procedures in this Section contain both general and specific WARNING, CAUTION and NOTE statements. HOLDEN LTD is dedicated to the presentation of service information that helps the technician to diagnose and repair the systems necessary for proper operation of the vehicle. Certain procedures may present a hazard to the technician if they are not followed in the recommended manner. WARNING, CAUTION and NOTE statements are designed to help prevent these hazards from occurring, but not all hazards can be foreseen.

WARNING defined

A WARNING statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in death or injury. A WARNING statement alerts you to take necessary action or not to take a prohibited action. If a WARNING statement is ignored, the following consequences may occur:

- Death or injury to the technician or other personnel working on the vehicle,

- Death or injury to other people in or near the workplace area, and / or
- Death or injury to the driver / or passenger(s) of the vehicle or other people, if the vehicle has been improperly repaired.

CAUTION defined

A CAUTION statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in damage to or destruction of equipment, or corruption of data. If a CAUTION statement is ignored, the following consequences may occur:

- Damage to the vehicle,
- Unnecessary vehicle repairs or component replacement,
- Faulty operation or performance of any system or component being repaired,
- Damage to any system or components which depend on the proper operation of the system or component being repaired,
- Faulty operation or performance of any systems or components which depend on the proper operation or performance of the system or component under repair,
- Damage to fasteners, basic tools or special tools and / or
- Leakage of coolant, lubricant or other vital fluids.

NOTE defined

A NOTE statement immediately precedes or follows an operating procedure, maintenance practice or condition that requires highlighting. A NOTE statement also emphasises necessary characteristics of a diagnostic or repair procedure. A NOTE statement is designed to:

- Clarify a procedure,
- Present additional information for accomplishing a procedure,
- Give insight into the reasons for performing a procedure in the recommended manner, and / or
- Present information that gives the technician the benefit of past experience in accomplishing a procedure with greater ease.

1.3 System Operation

Operation

With the ignition switch in the ON position and the engine at rest, current is supplied via the regulator to generator connector E-4 pin 1 and to the engine control module ECM connector E-60 pin 43. This initiates current flow (within the regulator) from the generator connection P-9, to the brushes and rotor winding, to ‘excite’ the circuit.

The current in the rotor winding creates magnetic fields between adjacent rotor poles.

With the engine running, the rotor spins, the stator windings cut through this field and induce voltage. As the engine speed is increased, this induced voltage increases. Current then flows through the three-phase diode bridge in the rectifier to convert the AC voltage to DC. This is supplied to the generator connector P-9 output and then to the battery terminal via fuse SBF1.

The regulator monitors the voltage to the battery. When this voltage reaches approximately 14.5 V, the regulator opens the circuit through the rotor winding, causing the generator output voltage to drop. When the regulator senses a voltage below a preset voltage, the regulator closes the circuit through the rotor winding and voltage to the battery again increases. This cycle repeats very rapidly.

Alternator Warning

NOTE

All generator faults are displayed as Check Alternator Warning on the instrument cluster MFD, refer to 8A Electrical Body and Chassis.

The ECM monitors the voltage on connector E-60 pin 21 and pin 43.

The voltage at the generator connector E-4 pin 2 will remain low when a fault condition is detected in the generator or associated external circuits. The voltage remains low (while the ignition switch is on) until the fault is repaired.

NOTE

For more information on the alternator warning refer to 8A Electrical Body and Chassis.

Fault conditions include the following:

- open circuit or excessive voltage drop in circuit 1,
- open circuit in the generator phase connection,
- overcharging conditions,
- short circuit in the regulator output stage,
- open circuit in the rotor winding,
- poor contact between the rectifier and the regulator, and / or
- high resistance in the fusible link assembly.

2 Diagnosis

2.1 Diagnostic General Information

Basic Diagnostic Tools Required

CAUTION

Use of incorrect electrical circuit diagnostic tools when performing the generator diagnostic procedures could result in incorrect diagnostic results or damage to components.

The following electrical circuit testing tools are required to perform the diagnostic procedures detailed in this Section:

- digital multimeter with 10 mega ohms impedance, and
- connector test adapter kit Tool No. KM609.

For further information on the use of these tools, refer to 8A Electrical Body and Chassis.

2.2 Tech 2 Data List

The Tech 2 displays the status of certain charging system parameters.

To view the data list:

1 Connect Tech 2 to the DLC.

2 On Tech 2 select:
Engine / **V6 Engine** / **Data Display** / **Data List** / **Electrical/Theft Data**.

Tech 2 Parameter	Units Displayed	Typical Display Values
Alternator L Terminal D	Percentage	Various

2.3 Diagnostic Systems Check

Step	Action	Yes	No
1	1 Connect Tech 2 to the DLC. 2 Ignition ON, engine OFF. 3 On Tech 2 select: **Engine** / **V6 Engine** / **Diagnostic Trouble codes** / **Read DTC's.** Are there any set DTC's?	Go to the appropriate DTC table in 6C1-2 Engine Management – V6 – Diagnostics.	Refer to 2.5 Charging System Inoperative / Malfunctioning

Reference to following information will assist when diagnosing charging circuit faults:

- for battery testing, refer to 6D1-3 Battery – V6,
- for wiring diagram details, refer to Figure 6D1-1 2, and
- for electrical component locations, refer to 8A Electrical Body and Chassis.

2.4 Wiring Diagram

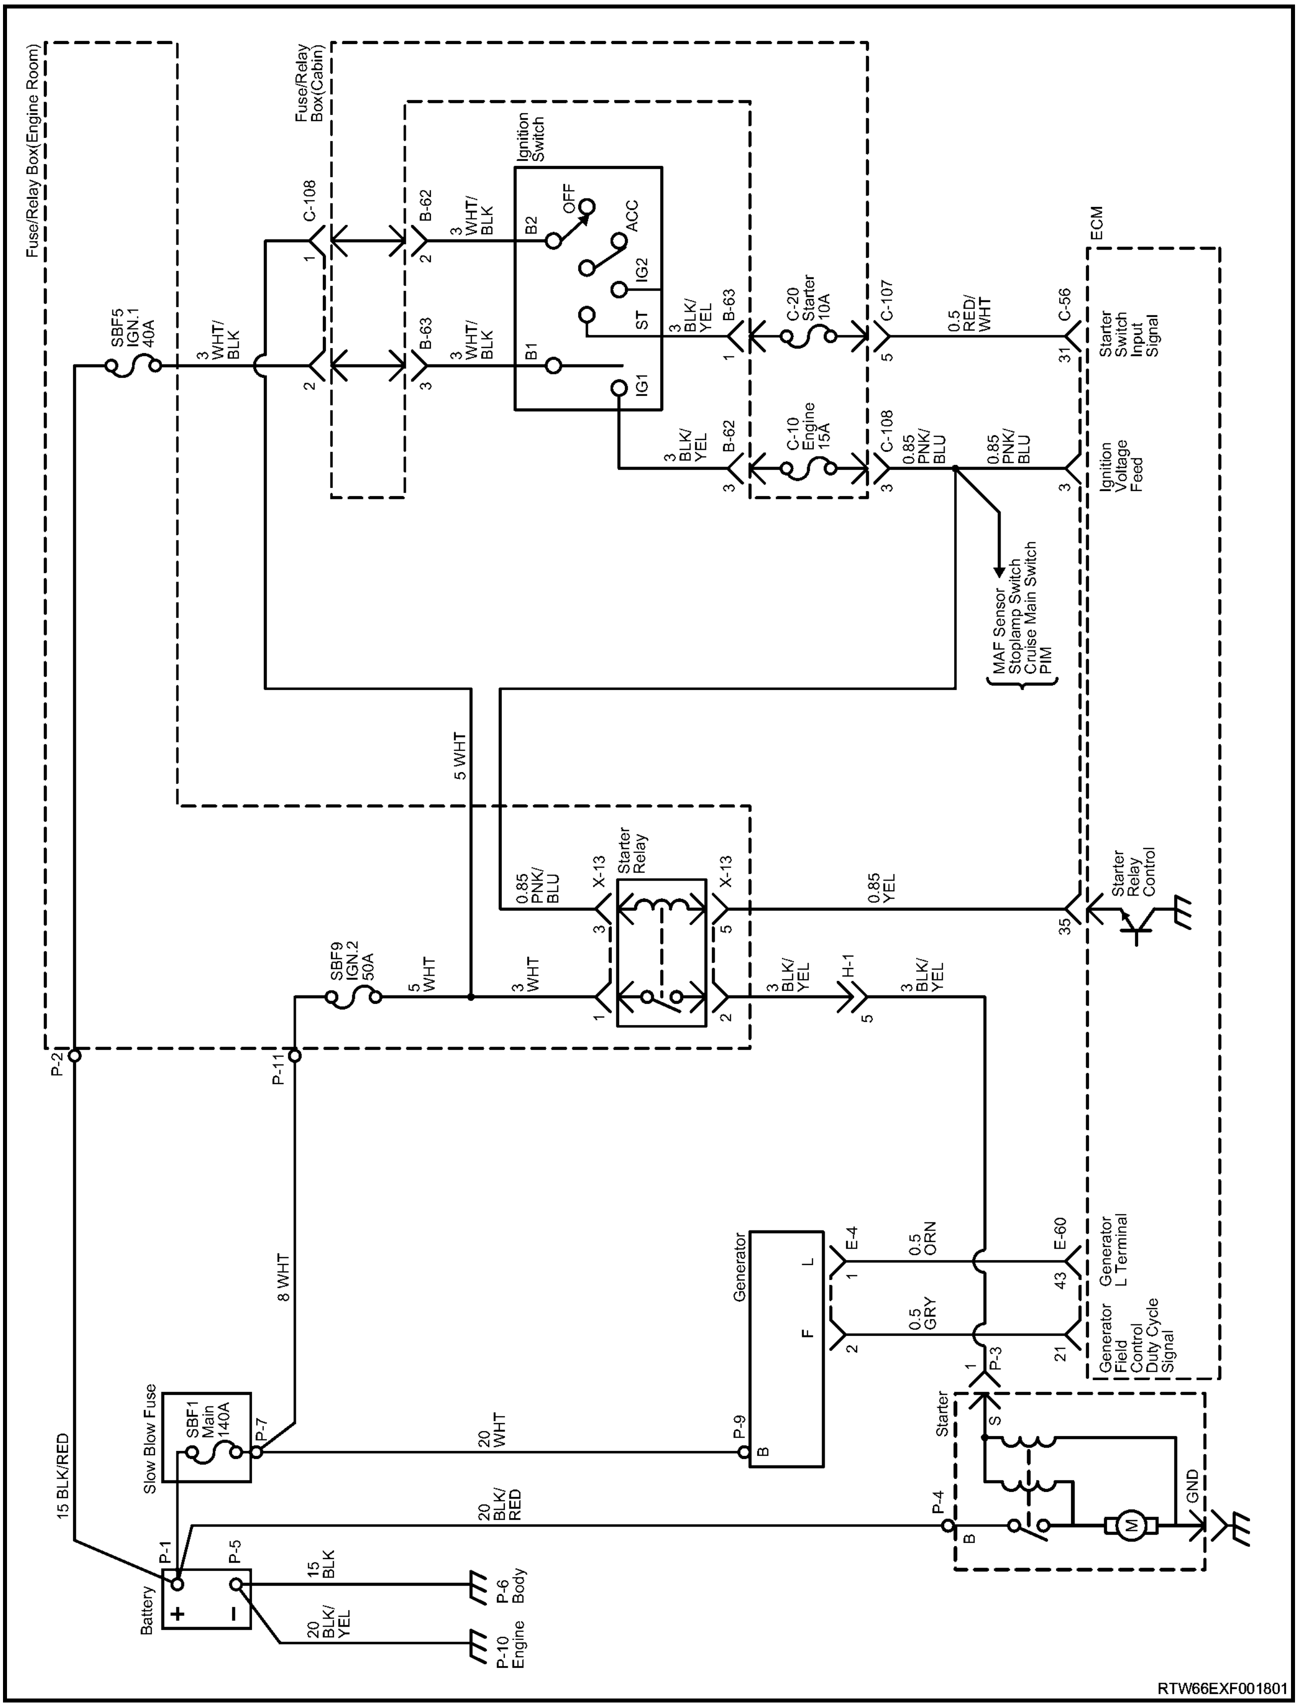

Figure 6D1-1 2

2.5 Charging System Inoperative / Malfunctioning

Diagnostic Table Notes

Reference to following information will assist when diagnosing charging system faults.

1 For all wiring harness fault diagnoses, refer to 8A Electrical Body and Chassis.

2 For wiring harness repairs, refer to 8A Electrical Body and Chassis.

3 Refer to 8A Electrical Body and Chassis for harness routing.

4 Ensure the battery, cables and connections are in good order. Refer to 6D1-3 Battery – V6.

Diagnostic Table 120A Generator

Step	Action	Yes	No
1	Did you review 1.3 System Operation?	Go to Step 2	Go to 1.3 System Operation
2	Did you read 2.3 Diagnostic Systems Check	Go to Step 3	Go to 2.3 Diagnostic Systems Check
3	Perform the Generator On-vehicle Checks Was the generator serviceable?	Go to step 4	Replace the generator. Go to Step 5
4	Perform the Charging Circuit Voltage Drop Test. Was the wiring serviceable?	Go to 8A Electrical Body and Chassis Go to Step 5	Repair as required (refer to Note 2). Go to Step 5
5	Operate the system to verify the repair. Did you correct the condition?	System OK	Go to Step 2
When all diagnosis and repairs are completed, check the system for correct operation.			

3 Minor Service Operations

3.1 Safety Precautions

Observe the following precautions. Failure to observe these precautions will result in serious damage to the generator.

- Only use the generator and voltage regulator in a negative ground system.
- Always refer to 1.2 WARNING, CAUTION and NOTES before disconnecting the battery.
- When installing a battery, fit the positive (+) cable to the battery before fitting the negative cable.
- When a slave battery is used for starting purposes, ensure that both batteries are connected in parallel. That is, positive terminals connected and negative terminals connected.
- Only use jumper leads that have surge protection.
- Disconnect both battery cables when charging the battery. This isolates the generator from the battery and from the external charging equipment.
- Do not operate the generator within an open circuit or without a battery in the circuit.
- Do not disconnect the battery while the generator is running.
- Do not attempt to polarise the generator.
- Do not connect generator connector E-4 pin 1 to 12 V (the battery or ignition circuits).
- Some battery powered timing lights can produce high transient voltages when connected or disconnected. Only disconnect or connect timing lights when the engine is switched off.

CAUTION

Ensure the generator connector E-4 pin 1 has a maximum sinking current of 50mA.

3.2 Maintenance

Regular Checks

Check the following at regular intervals:

- generator terminals – for corrosion and loose connections,
- wiring – for continuity and damaged insulation,
- mounting bolts – for tightness,
- drive belt – for alignment and wear, and
- drive pulley – for damage and warping.

NOTE

The drive-belt adjustment for the engine ancillaries (i.e. generator and water pump) is provided by a spring-loaded tensioner. Therefore, the drive belt does not require manual adjustment.

Lubrication

High tolerance bearings are used in this generator. If the bearings are removed during the generator disassembly, new bearings must be installed to restore the generator to original specification. The ball bearings supporting the rotor shaft are pre-lubricated and sealed. Do not attempt to lubricate these during servicing.

3.3 On-vehicle Testing

Generator On-vehicle Checks

Prerequisites

Before testing the generator output, ensure that:

- all generator circuit connections are clean and tight,
- the generator is always connected to the battery during testing (to prevent damage to the diodes),
- the battery is fully charged, and
- the specific gravity does not vary more than 0.025 between cells. (It is recommended the average specific gravity is 1.260 or higher). Refer to 6D1-3 Battery – V6.

Carry out a load test on the battery to determine its ability to supply and accept current. This is a good indicator of the general condition of the battery. For details of battery testing, refer to 6D1-3 Battery – V6.

Inspect the drive belt and tensioner markings to determine if the drive belt is within operating limits. Replace the belt if it is excessively worn or outside the operating range of the tensioner.

For further details, refer to 6A1 Engine Mechanical – V6.

Generator Test

Regulating Voltage Test

NOTE

Leave the generator E-4 wiring harness connector connected, as it provides initial field excitation.

1 Ensure the ignition switch is in the OFF position and all electrical equipment is turned off.

CAUTION

Refer to 1.2 WARNING, CAUTION and NOTES before disconnecting the battery.

2 Disconnect the battery ground cable P-5 at the battery.

3 Disconnect the generator positive lead P-9 from the generator . Connect the positive lead of a multimeter set to measure current (1) to P-9 (2).

4 Connect that multimeter's negative lead to the disconnected generator positive lead (3).

5 Connect the positive lead of a multimeter set to measure voltage (4) to P-9 (5).

6 Connect that multimeter's negative lead to a good ground connection on the generator housing (6).

CAUTION

Insulate the terminal of the generator positive lead P-9 to prevent contact with any metal part of the vehicle. If the terminal is grounded, damage to the charging circuit can result when the battery is reconnected.

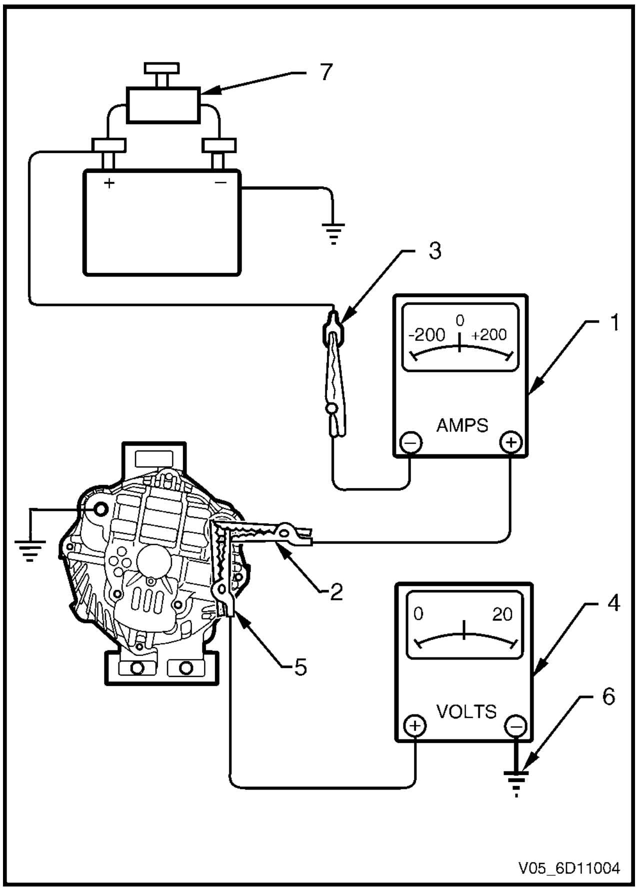

Figure 6D1-1 3

7 Reconnect the battery ground cable P-5.

8 Fit a loading device (7) across the battery terminals, e.g. an adjustable carbon pile.

CAUTION

The loading device must have a minimum power consumption of 1000 W.

9 Record the voltage reading before starting the engine. (This reading should increase when the engine is running, indicating generator output.).

10 Start the engine.

11 Increase the engine speed to the value outlined in the chart below.

12 Using the reading from the multimeter set to measure current, adjust the loading device to apply a load within the range outlined in the chart below.

13 Using the multimeter set to measure voltage, check the generator output voltage against the specification.

Engine RPM	1300
Load	5.0 – 10 A
Output Voltage	13.8 – 15.4 V

Load Regulation Test

NOTE

The decrease in the voltage recorded during this test should not exceed 0.5 V from the readings obtained for the Regulating Voltage Test. If the decrease in the regulating voltage is greater than 0.5 V, the regulator is defective. Replace the regulator.

14 Increase the engine speed to the value outlined in the chart below.

15 Using the reading from the multimeter set to measure current, adjust the loading device to apply a load of about 90% of the generator's full output.

16 Using the multimeter set to measure voltage, check the generator output voltage against the specification.

Engine RPM	1900
Load	90 A
Output Voltage	13.8 – 15.4 V

Full Load Output Test

CAUTION

Keep the time for this test to a minimum to avoid undue heating and high engine speeds.

17 Increase the engine speed to the value outlined in the chart below .

18 Using the reading from the multimeter set to measure voltage, adjust the loading device to increase the load until the generator output voltage drops to 13.5 V. Full generator output, outlined in the chart below, is required.

19 Record the current reading displayed on the multimeter set to measure current.

PAGE

Inspection and Repair

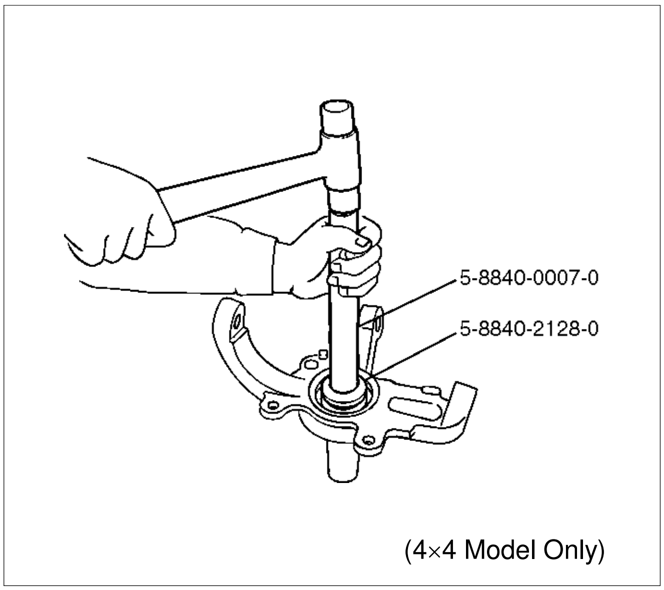
Make necessary correction or replace parts if wear, damage, corrosion or any other abnormal condition is found through inspection.

Check the following parts:

- Knuckle
- Thrust washer (4×4 Model Only)

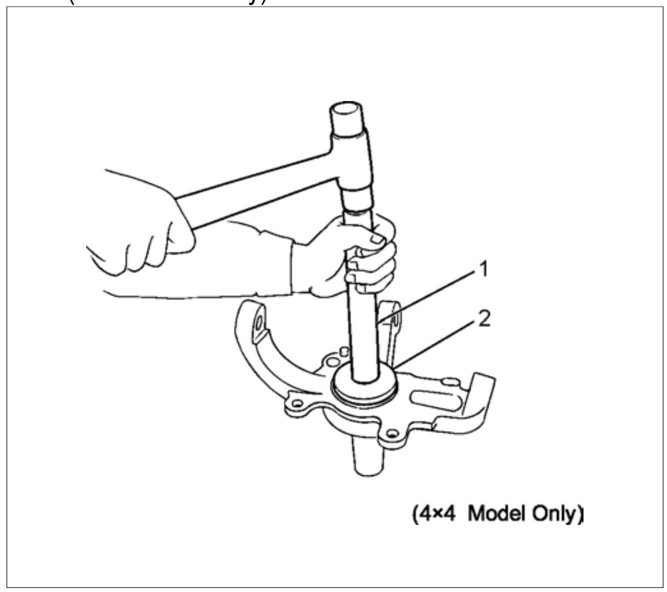
Installation

1. Apply appropriate amount of multipurpose type grease to the new bearing (Approx. 5 g (0.18 oz)) and install needle bearing by using installer 5-8840-2128-0 and grip 5-8840-0007-0. (4×4 Model Only)



901RW275

2. Apply multipurpose type grease to the thrust washer, and install washer with chamfered side facing knuckle. (4×4 Model Only)
3. Use a new oil seal, and apply multipurpose type grease to the area surrounded by the lip (approx. 2 g (0.07 oz)). Then use installer 5-8840-2851-0 (2) and grip 5-8840-0007-0 (1) to install oil seal. After fitting the oil seal to the installer, drive it to the knuckle using a hammer or bench press until the tool front face contacts with the thrust washer. (4×4 Model Only)



RTW73CSH000101

4. Install knuckle assembly.
5. Install upper ball joint and tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 98 N·m (10.0 kgf·m/72 lb·ft)

6. Install lower ball joint and tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 147 N·m (15.0 kgf·m/108 lb·ft)

7. Install back plate.
8. Install speed sensor harness.
9. Install torsion bar; refer to *Torsion Bar in this section.*

NOTE: Adjust the trim height. Refer to *Front End Alignment Inspection and Adjustment in Steering.*

20 Reduce the engine speed to idle.

CAUTION

On completion of the generator output test, return the engine to idle and disconnect the loading device from the battery terminals. This prevents excessive battery discharge.

21 Stop the engine.

22 Disconnect the battery ground cable P-5 at the battery.

23 Remove the multimeters.

24 Reconnect the generator positive lead P-9.

25 Reconnect the battery ground cable P-5 to the battery.

Engine RPM	1900
Load	5.0 – 10 A
Output Voltage	13.8 – 15.4 V

Charging Circuit Voltage Drop Test

Prerequisites

Before testing the generator output, ensure that:

- all generator circuit connections are clean and tight,
- the generator is always connected to the battery during testing (to prevent damage to the diodes),
- the battery is fully charged, and
- the specific gravity does not vary more than 0.025 between cells. (It is recommended the average specific gravity is 1.260 or higher). Refer to 6D1-3 Battery – V6.

Carry out a load test on the battery to determine its ability to supply and accept current. This is a good indicator of the general condition of the battery. For details of battery testing, refer to 6D1-3 Battery – V6.

Inspect the drive belt and tensioner markings to determine if the drive belt is within operating limits. Replace the belt if it is excessively worn or outside the operating range of the tensioner.

For further details, refer to 6A1 Engine Mechanical – V6.

Voltage Drop Test

CAUTION

Ensure the generator connections are clean and tight.

1 Connect the positive lead of a multimeter set to measure voltage to the generator terminal P-9.

2 Connect the negative lead of the multimeter to the battery positive post.

3 Switch the headlamps on.

4 Start the engine.

5 Increase the engine speed to approximately 2500 r.p.m.

6 Record the voltage reading.

7 Reduce the engine speed to idle.

8 Connect the positive lead of a multimeter set to measure voltage to the battery negative post.

9 Connect the negative lead of the multimeter to the generator housing.

9 Increase the engine speed to approximately 2500 r.p.m.

10 Record the voltage reading.

11 Reduce the engine speed to idle.

12 Check the two readings. If the readings exceed 0.3 V, there is a high resistance in the charging circuit.

13 Trace the cause and correct the problem, refer to 8A Electrical Body and Chassis.

4 Major Service Operations

4.1 Generator

Remove

CAUTION

Refer to 1.2 WARNING, CAUTION and NOTES before disconnecting the battery.

1 Disconnect the battery ground lead P-5. Refer to 8A Electrical Body and Chassis.

2 Insert a ½ inch drive socket bar into the tensioner arm and rotate the tensioner arm clockwise.

3 Remove the drive belt from the generator pulley and release the tensioner. Refer to 6A1 Engine Mechanical – V6 for further details as required.

4 Pull the battery harness cap back from generator terminal P-9 (3), remove the nut (4) and remove the positive lead (2) from the generator (5).

5 Disengage the connector retaining clip and remove the connector E-4, (1) from the generator.

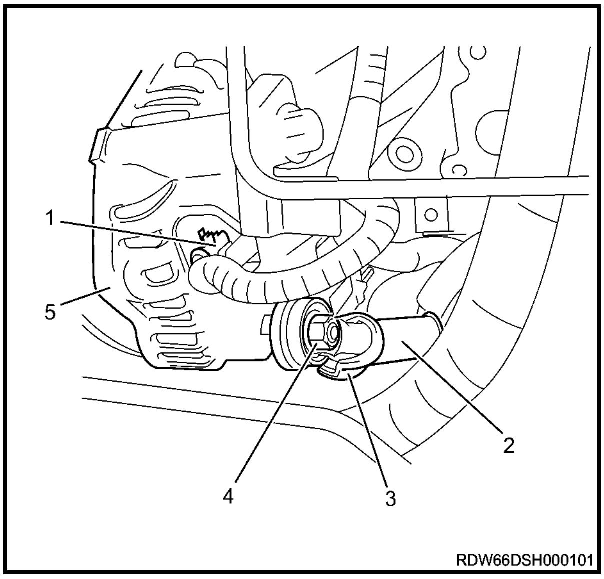


Figure 6D1-1 4

6 Remove the three bolts (1, 2, 4) retaining the generator (3) to the generator bracket.

7 Remove the generator assembly from the vehicle.

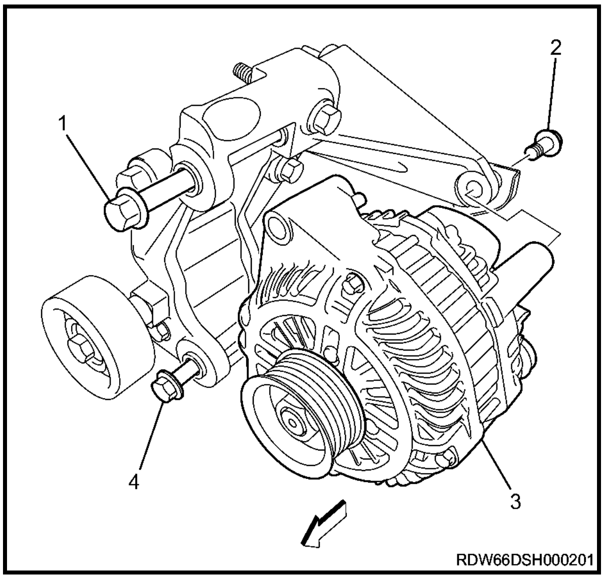

Figure 6D1-1 5

Reinstall

Reinstallation of the generator is the reverse of the removal procedure, noting the following:

1 Tighten all fasteners to the correct torque specification.

2 Reconnect the battery ground lead.

3 Start the engine.

4 Check the generator warning indicator operation.

5 Check the drive belt is correctly routed and aligned.

6 Check the generator output. Refer to 3.3 On-vehicle Testing.

7 Check the voltage regulator operation. Refer to 3.3 On-vehicle Testing.

8 Turn the ignition switch off.

Generator mounting bolts .... (1)	58.0 Nm

4.2 Generator Mounting Bracket

Remove

1 Remove the idler pulley bolt (7) then the idler pulley (6), Refer to 4.1 Generator.

2 Remove the bolts (1, 2, 3 ,4); five places attaching the generator mounting bracket (5) to the engine block.

3 Remove the generator mounting bracket from the vehicle.

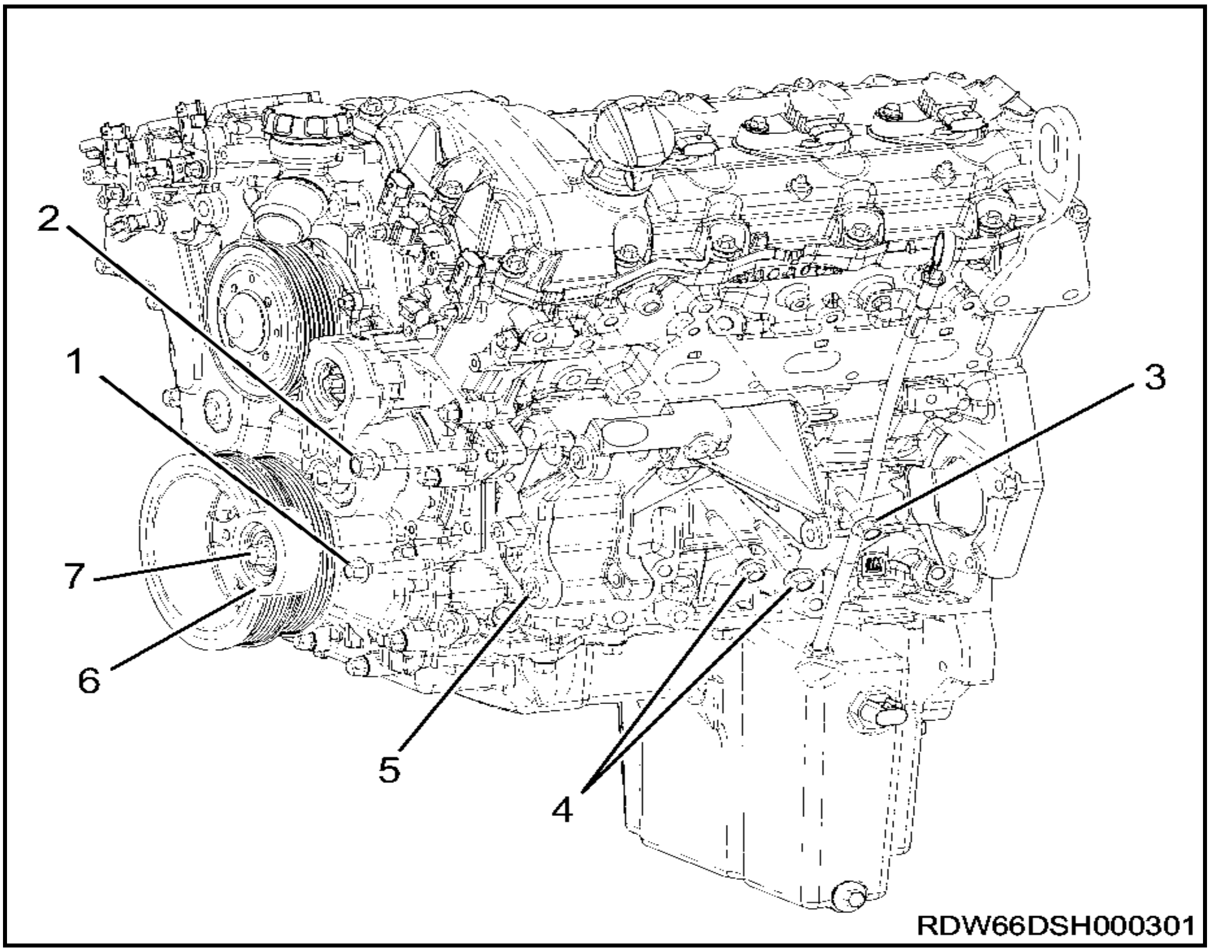

Figure 6D1-1 6

Reinstall

Reinstallation of the generator mounting bracket and generator is the reverse of the removal procedure, noting the following:

1 Tighten all fasteners to the correct torque specification.

2 Reinstall the generator, refer to 4.1 Generator.

Generator mounting bracket bolts ...	(1)	40.0 – 60.0 Nm
Generator mounting bracket bolts ...	(2)	100.0 Nm

- (10) Speed Sensor harness
- (11) Nut and Cotter Pin
- (12) Upper Ball Joint, Bolt and Nut

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the brake caliper and disconnect brake pipe. Refer to Disc Brakes in Brake section.

1 General Information

All HFV6 engines are fitted with a Mitsubishi starter motor. This consists of a solenoid switch on a DC motor. The motor has permanent magnet excitation, which has the advantage of low weight a with high output torque and is visually identifiable by the absence of pole-shoe retaining screws.

The starter motor does not have field coil windings or pole shoes. These parts have been replaced by six permanent magnets that are held in the pole housing by clips. The positive brushes are now part of the brush plate assembly.

The solenoid switch is the only component of the starter motor assembly that is serviced separately. If any other parts require replacement, the starter motor must be replaced.

1.1 WARNING, CAUTION and NOTES

This Section contains various WARNINGS, CAUTIONS and NOTE statements that you must observe carefully to reduce the risk of death or injury during service, repair procedures or vehicle operation. Incorrect service or repair procedures may damage the vehicle or cause operational faults. WARNINGS, CAUTION and NOTE statements are not exhaustive. HOLDEN LTD can not possibly warn of all the potentially hazardous consequences of failure to follow these instructions.

Definition of WARNING, CAUTION and NOTE Statements

Diagnosis and repair procedures in this Section contain both general and specific WARNING, CAUTION and NOTE statements. HOLDEN LTD is dedicated to the presentation of service information that helps the technician to diagnose and repair the systems necessary for proper operation of the vehicle. Certain procedures may present a hazard to the technician if they are not followed in the recommended manner. WARNING, CAUTION and NOTE statements are designed to help prevent these hazards from occurring, but not all hazards can be foreseen.

WARNING defined

A WARNING statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in death or injury. A WARNING statement alerts you to take necessary action or not to take a prohibited action. If a WARNING statement is ignored, the following consequences may occur:

- Death or injury to the technician or other personnel working on the vehicle,
- Death or injury to other people in or near the workplace area, and / or
- Death or injury to the driver / or passenger(s) of the vehicle or other people, if the vehicle has been improperly repaired.

CAUTION defined

A CAUTION statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in damage to or destruction of equipment, or corruption of data. If a CAUTION statement is ignored, the following consequences may occur:

- Damage to the vehicle,
- Unnecessary vehicle repairs or component replacement,
- Faulty operation or performance of any system or component being repaired,
- Damage to any system or components which depend on the proper operation of the system or component being repaired,
- Faulty operation or performance of any systems or components which depend on the proper operation or performance of the system or component under repair,
- Damage to fasteners, basic tools or special tools and / or
- Leakage of coolant, lubricant or other vital fluids.

NOTE defined

A NOTE statement immediately precedes or follows an operating procedure, maintenance practice or condition that requires highlighting. A NOTE statement also emphasises necessary characteristics of a diagnostic or repair procedure. A NOTE statement is designed to:

- Clarify a procedure,
- Present additional information for accomplishing a procedure,
- Give insight into the reasons for performing a procedure in the recommended manner, and / or

Present information that gives the technician the benefit of past experience in accomplishing a procedure with greater ease.

1.2 Components

Starting System Components

The main components of the starting system are:

- battery,
- wiring,
- ignition switch,
- theft deterrent engine crank inhibitor (a function of the theft deterrent system),
- park / neutral and back-up switch (on vehicles with 4 speed automatic transmission),
- engine control module (ECM),
- start relay,
- solenoid switch, and
- starter motor.

Starter Motor and Solenoid Switch Components

Solenoid Switch

The solenoid switch is used to activate the DC motor and has two windings; the pull-in winding and the hold-in winding. The pull-in winding has heavier wire and is grounded through the DC motor winding and brushes. The hold-in winding is grounded through the solenoid casing.

Planetary Drive Train

The planetary drive train consists of an internally toothed ring gear and three planetary gear wheels, which rotate on sleeve bearings on the planetary drive shaft. The ring gear is keyed into the drive-end housing and is made from high-grade polyamide with mineral additives.

When the starter motor operates, the armature turns the planetary gears inside the fixed planetary ring gear. This drives the planetary shaft at a reduced speed ratio which turns the drive assembly. A fork lever in the drive-end housing forces the drive assembly forward to engage with the flexplate / flywheel ring gear on the engine and transmit cranking torque.

An internal clutch allows the drive assembly pinion gear to rotate freely when the engine starts. This prevents the armature from being driven at excessive speed by the engine.

Armature

The armature shaft is supported at each end by oil absorbent, sintered metal bushes; one in the commutator end shield and one in the planetary drive shaft. The front end of the armature has a gear profile. This meshes with the three planetary gear wheels. These in turn, mesh with the internal teeth of the ring gear.

Brushes

A brush plate supports four commutator brushes. This plate is fixed to the commutator end shield with two retaining screws. Two negative brushes are grounded to the pole housing. The two positive brushes are insulated from the pole housing and connected to the solenoid switch M terminal, refer to Figure 6D1-2 – 1.

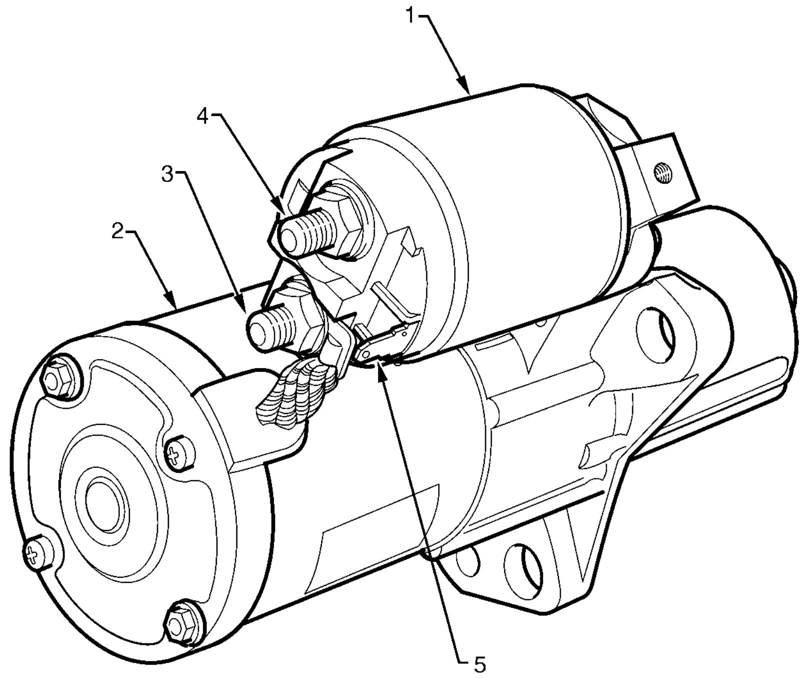

Figure 6D1-2 – 1

Legend

1	Solenoid Switch	4	Connector P-4
1	Starter Motor	5	Connector P-3 – pin 1
3	Starter Motor terminal M		

1.3 System Operation

Operation

The ECM controls the activation of the start relay in response to inputs from:

- ignition switch,
- battery,
- theft deterrent engine crank inhibitor (a function of the theft deterrent system),
- park / neutral and back-up switch (on vehicles with 4 speed automatic transmission),

The start relay controls the operation of the start solenoid.

The start solenoid controls operation of the starter motor and the drive assembly.

Sequence of Operation

1 When the ignition switch is turned to the START position, a signal is also sent to the ECM to request the engine to crank.

- For automatic vehicles the transmission must be in either park (P) or neutral (N) for the ECM to allow cranking to commence.
- The ECM will only allow cranking if the battery voltage is above the minimum battery voltage threshold value, refer to 6C1-1 Engine Management – V6 – General Information for further information.

2 The ECM operates the start relay which provides power to the pull-in winding of the start solenoid.

3 Current flow to the pull-in winding develops powerful magnetism which pulls in the solenoid switch plunger.

4 The plunger closes the switch contacts connecting battery voltage to the DC motor and pivots the fork lever to engage the drive assembly to the flexplate / flywheel ring gear. Closing the solenoid switch contacts deactivates the pull-in winding, the hold-in winding remains active.

5 With the solenoid switch contacts closed, current flows from the battery through the DC motor, which rotates the armature at high speed and provides cranking torque.

2 Diagnostics

2.1 Diagnostic General Information

NOTE

There is a minimum battery voltage threshold value. If the battery voltage is below the set value, the ECU will inhibit cranking. Refer to 6C1-1 Engine Management – V6 – General Information for further information.

Basic Diagnostic Tools Required

CAUTION

Use of incorrect electrical circuit diagnostic tools when performing the cruise control diagnostic procedures could result in incorrect diagnostic results or damage to components.

The following electrical circuit testing tools are required to perform the diagnostic procedures detailed in this Section:

- digital multimeter with 10 meg ohms impedance, and
- connector test adapter kit Tool No. KM609.

For further information on the use of these tools, refer to 8A Electrical Body and Chassis.

2.2 Tech 2 Data List

The Tech 2 displays the status of certain starting system parameters.

To view the data list:

1 Connect Tech 2 to the DLC.

2 On Tech 2 select:
Engine / **V6 Engine** / **Data Display** / **Data List** / **Electrical** / **Theft Data**.

Tech 2 Parameter	Units Displayed	Typical Display Values
Crank Request	Inactive / Active	Inactive
Starter Relay	Off / On	Off

2.3 Diagnostic Systems Check

Step	Action	Yes	No
1	Is the fault specifically isolated to this system / module?	Go to Step 2	Go to 0D Vehicle Diagnostics
2	1 Connect Tech 2 to the DLC. 2 Ignition ON, engine OFF. 3 On Tech 2 select: **Engine** / **V6 Engine** / **Diagnostic Trouble codes** / **Read DTC's.** Are there any set DTC's?	Go to the appropriate DTC table in 6C1-2 Engine Management – V6 – Diagnostics.	Refer to 2.5 Starting System Inoperative / Malfunctioning

2.4 Wiring Diagram

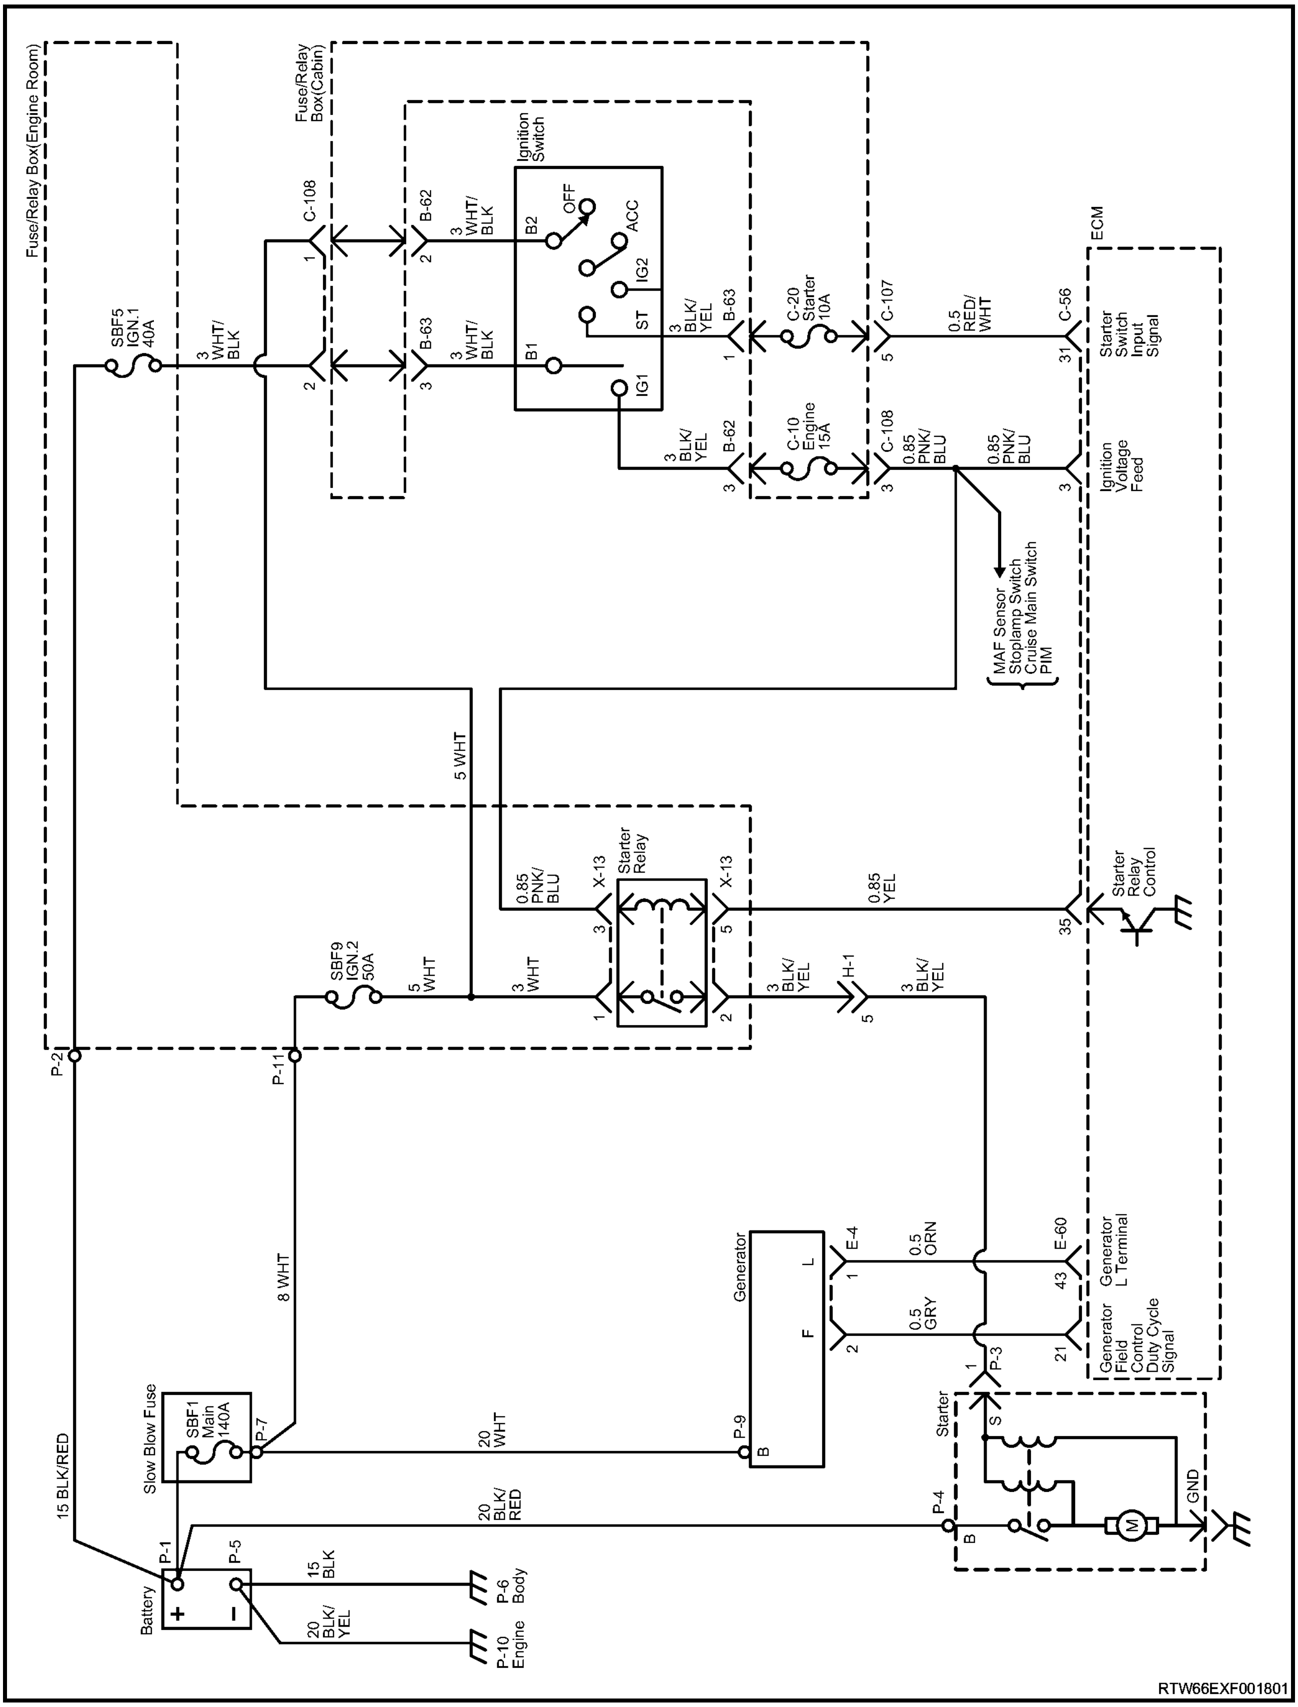

Figure 6D1-2 – 2

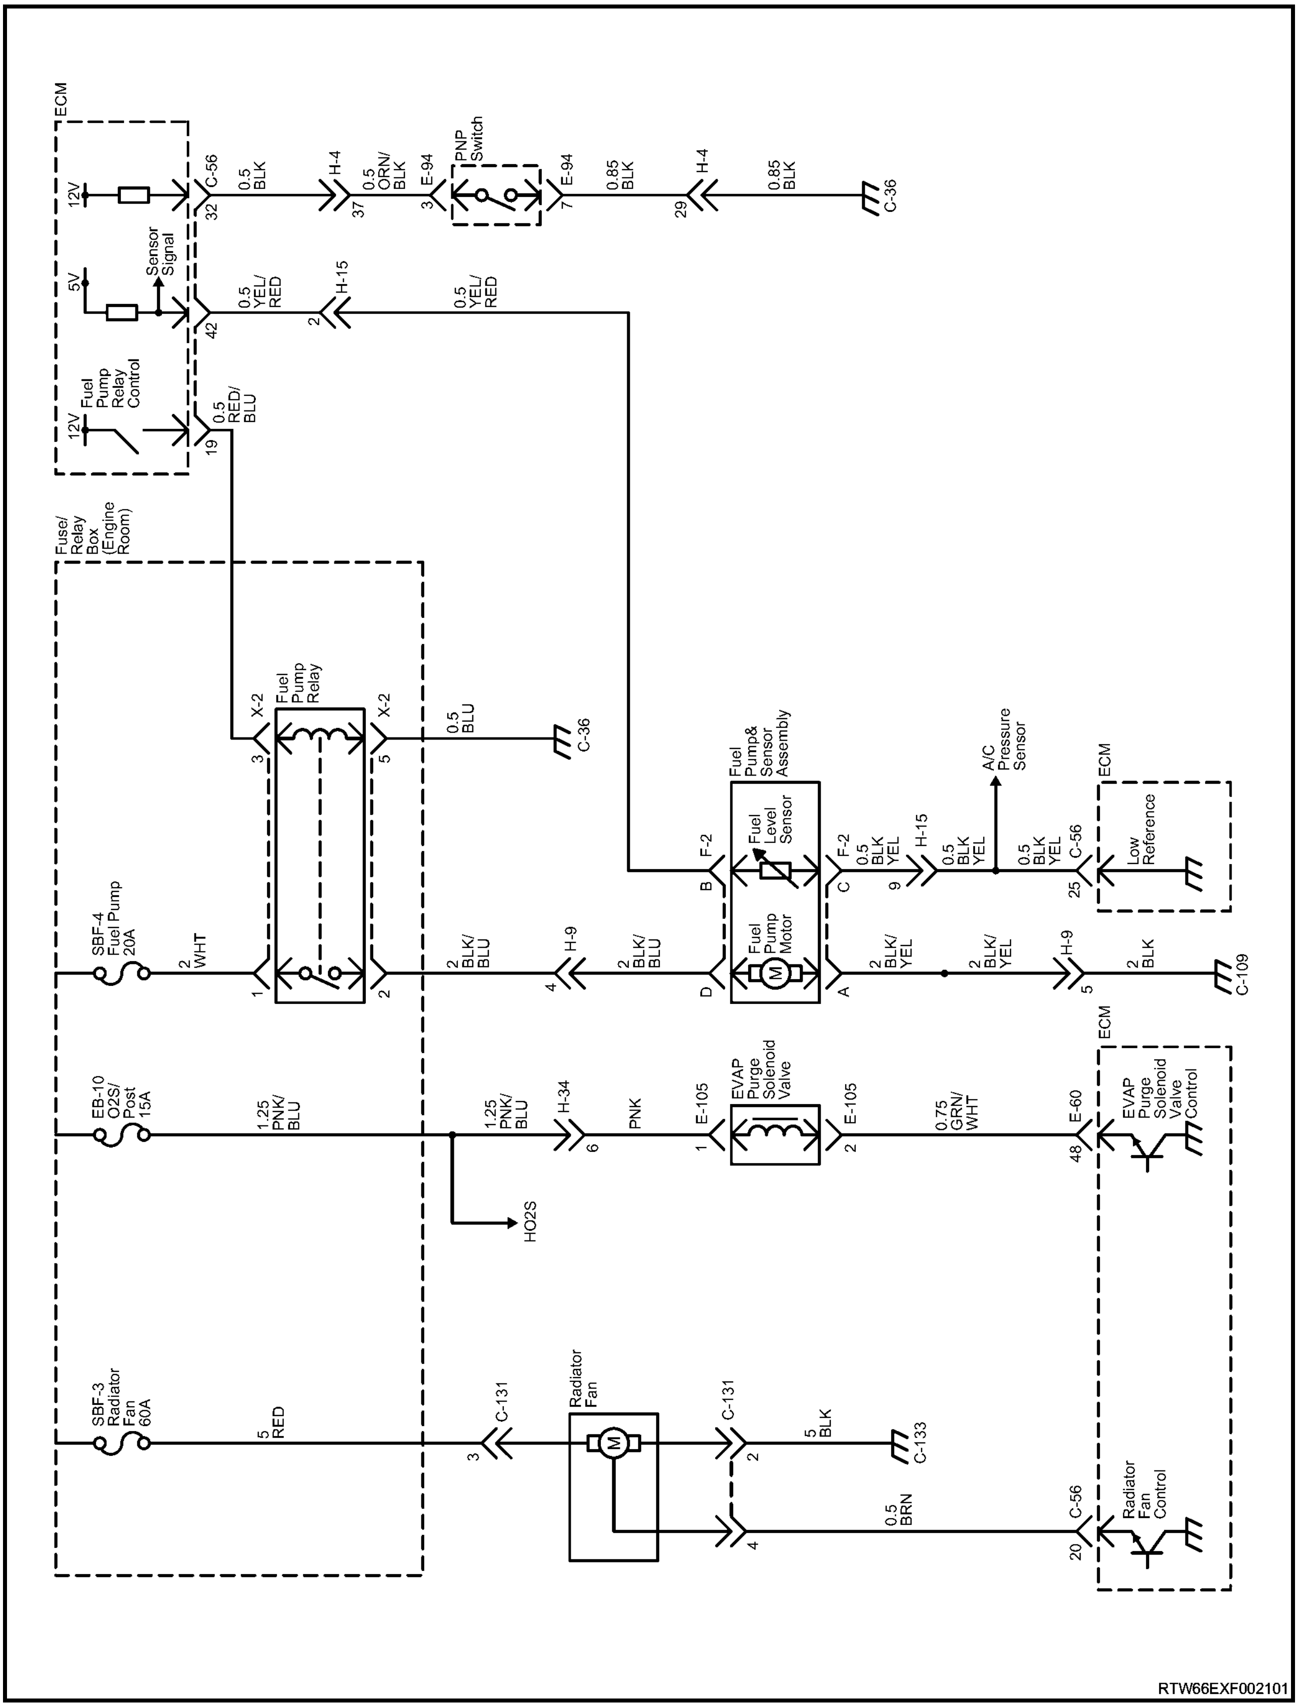

Figure 6D1-2 – 3

2.5 Starting System Inoperative / Malfunctioning

Circuit Description

The battery cable supplies a constant connection from the battery to starter solenoid connector P – 4.

When the ignition switch is turned to the START position, 12 V is applied to the ECM connector C – 56 pin 31.

For vehicles with 4 speed automatic transmission, when the transmission is in park (P) or neutral (N), the park / neutral and back-up switch grounds ECM connector C – 56 pin 32.

The ECM provides a ground for the start relay, ECM connector C – 56 pin 35 to start relay connector X – 13 pin 5.

When activated the start relay provides 12 V to starter solenoid connector P – 3 pin 1.

The solenoid closes its switch contacts to connect the battery voltage at the solenoid switch terminal P – 4 terminal B to the DC motor. The pull-in winding of the solenoid switch is grounded through the DC motor winding and brushes. The hold-in winding is grounded through the solenoid casing. The DC motor is grounded through the starter motor casing.

Refer to 2.4 Wiring Diagram to aid in diagnosis.

Diagnostic Table Notes

Reference to following information will assist when diagnosing starting circuit faults:

1 If the battery, starter motor and fuel system are deemed as serviceable and a ‘no crank’ and / or ‘no start’ condition exists, refer to the following Sections as required:

  a 11A Immobiliser for theft deterrent engine crank inhibitor related faults

  b 6C1-2 Engine Management V6 Diagnostics, for starter relay circuit faults

2 For all wiring harness fault diagnoses, refer to 8A Electrical Body and Chassis.

3 For wiring harness repairs, refer to 8A Electrical Body and Chassis.

4 Refer to 8A Electrical Body and Chassis for harness routing.

5 Ensure the battery, cables and connections are in good order. Refer to 8A Electrical Body and Chassis.

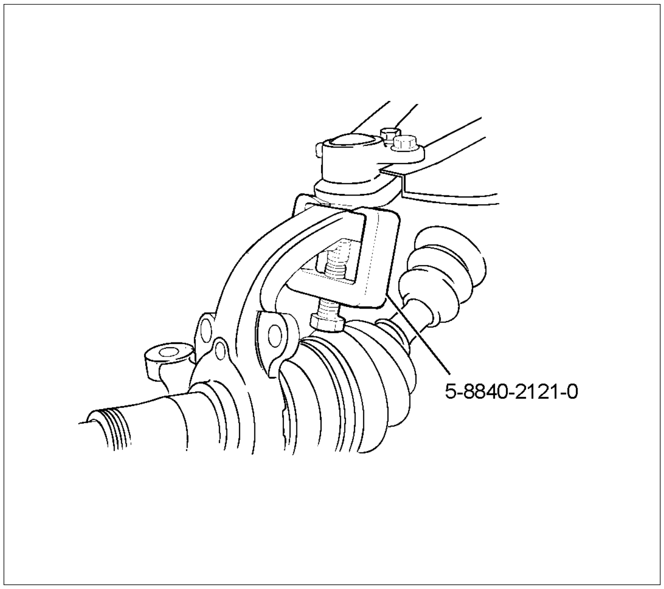
Diagnostic Table

Step	Action	Yes	No
1	Did you review 1.3 System Operation?	Go to Step 2	Go to 1.3 System Operation
2	Did you read 2.3 Diagnostic Systems Check	Go to Step 3	Go to 2.3 Diagnostic Systems Check
3	Turn the ignition switch to the START position and then release it. Did the engine crank or were there any clicking or chattering sounds from the solenoid?	Go to Diagnostic Table – Slow Cranking, Solenoid Clicks or Chatters	Go to Step 4
4	Inspect fusible link SBF9, refer to 8A Electrical Body and Chassis. Is fusible link SBF9 blown?	Replace the faulty fusible link (refer to Note 3). If the fusible link blows again, repair or replace the circuit from SBF9 to the starter relay X – 13 pin 1 or ignition switch B – 62 pin 2 (refer to Note 2)	Go to Step 5

Step	Action	Yes	No
5	Inspect fusible link SBF1, refer to 8A Electrical Body and Chassis. Is fusible link SBF1 blown?	Replace the faulty fusible link (refer to Note 3). If the fusible link blows again, repair or replace the circuit from SBF1 connection P – 7 and engine compartment fuse panel connector B – 63 pin 3, (refer to Note 2)	Go to Step 6
6	Inspect fuse SBF5, refer to 8A Electrical Body and Chassis. Is fuse SBF5 blown?	Replace the faulty fuse (refer to Note 3). If the fuse blows again, repair or replace the circuit from SBF5 to the cabin fuse panel connector C – 108 pin 2 (refer to Note 2)	Go to Step 7
7	Inspect fuse C20, refer to 8A Electrical Body and Chassis. Is fuse F15 blown?	Replace the faulty fuse (refer to Note 3). If the fuse blows again, repair or replace the circuit from fuse C20 to the ECM connector C – 56 pin 31 (refer to Note 2)	Go to Step 8
8	**NOTE** On automatic vehicles ensure that park (P) or neutral (N) is selected. Turn the headlamps on. Turn the dome lamps on. Turn the ignition switch to the START position. Do the lamps dim?	Go to Step 9	Go to Step 10
9	Perform the 3.3 On-Vehicle Testing. Did you correct the condition?	Go to Step 21	Go to Step 2

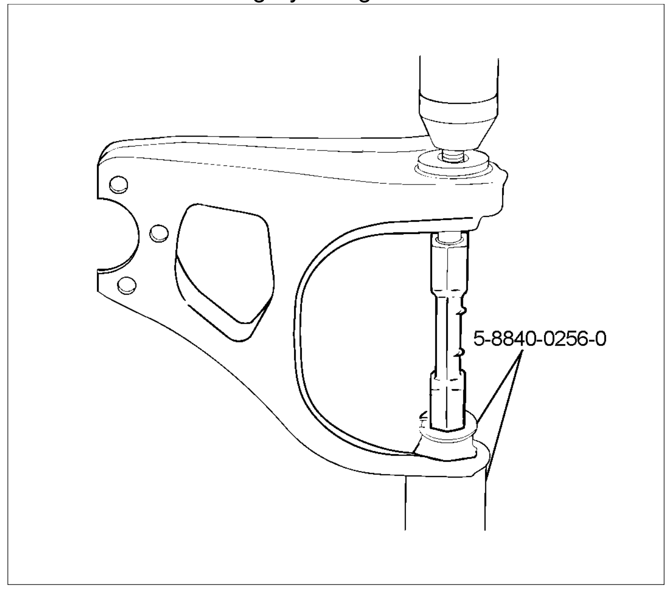
4. Support lower control arm with a harness.
5. Remove speed sensor harness.
6. Remove nut and cotter pin then remove knuckle using remover 5-8840-2121-0.

CAUTION: Be careful not to damage the ball joint boot.

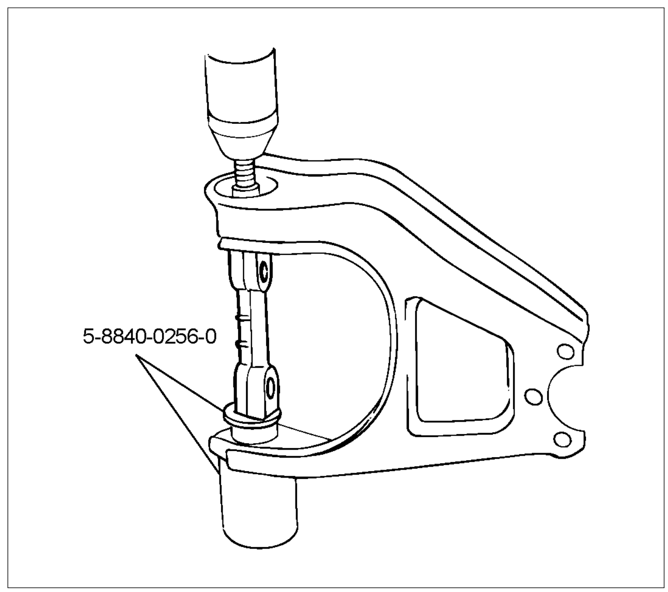


RTW340SH000401

7. Remove upper ball joint.
8. Remove bolt and plate.
9. Remove nut assembly.
10. Remove camber shims and note the positions and number of shims.
11. Remove caster shims and note the positions and number of shims.
12. Remove upper control arm assembly.
13. Remove upper control arm nut.
14. Remove plate.
15. Remove bushing by using remover 5-8840-0256-0.



RTW340SH000501



RTW340SH000601

16. Remove fulcrum pin.

Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal conditions are found through inspection.

Check the following parts:

- Upper control arm
- Bushing
- Fulcrum pin

Step	Action	Yes	No
10	1 Connect Tech 2 to the DLC. 2 Ignition on, engine off. 3 On Tech 2 select: **Engine** / **V6 Engine** / **Data Display** / **Data List** / **Electrical/Theft Data.** 4 On Tech 2 scroll to **Crank Request.** 5 While monitoring Tech 2, turn the ignition switch to START. Does Tech 2 display the following: **Inactive** with the ignition switch in the ON position, **Active** with the ignition switch in the START position?	Go to Step 15	Go to Step 11
11	1 Disconnect the ECM connector C – 56. 2 Using a multimeter set to measure voltage, back probe between the harness connector C56 – X2 pin 31 and ground. 3 With the aid of an assistant, monitor the voltage on the multimeter and turn the ignition switch to START. • With the ignition switch in the START position, the multimeter should display battery voltage • With the ignition switch in the ON position, the multimeter should display 0 V Does the multimeter display as described?	Refer to 6C1 - 3 Engine Management – V6 – Service Operations for further diagnosis. Go to Step 21	Go to Step 12
12	Test the ignition switch, refer to 3B Steering. Is the ignition switch serviceable?	Go to Step 13	Replace the faulty ignition switch. Refer to 3B Steering Go to Step 21
13	Check for short to ground or open circuit from the ignition switch start terminal to the ECM connector C – 56 pin 31. Was the circuit serviceable?	Go to Step 14	Repair as required (refer to Note 2). Go to Step 21
14	Check for short to ground or open circuit from the ignition switch terminal B1 to the fuse SBF5. Was the circuit serviceable?	Go to Step 2	Repair as required (refer to Note 2). Go to Step 21
15	**NOTE** This procedure is only required on vehicles fitted with manual transmissions. If the vehicle is fitted with an automatic transmission, go to Step 16 1 Scroll to **Starter Relay** 2 While monitoring Tech 2, turn the ignition switch to START. Does Tech 2 display the following: **Off** with the ignition switch in the ON position, **On** with the ignition switch in the START position?	Go to Step 21	Go to Step 16

Step	Action	Yes	No
16	1 Scroll to **Starter Relay** 2 Ensure the transmission is in park (P) or neutral (N). 3 While monitoring Tech 2, turn the ignition switch to START. Does Tech 2 display the following: **Off** with the ignition switch in the ON position, **On** with the ignition switch in the START position?	Go to Step 18	Go to Step 17
17	1 Disconnect the ECM connector C – 56. 2 Using a multimeter set to measure voltage, back probe between the harness connector C – 56 pin 32 and ground. 3 With the aid of an assistant, monitor the voltage on the multimeter. • Place the transmission in park (P), the multimeter should display 0 V • Place the transmission in neutral (N), the multimeter should display 0 V Does the multimeter display as described?	Refer to 6C1 - 3 Engine Management – V6 – Service Operations for further diagnosis. Go to Step 21	For vehicles fitted with the 4 speed automatic transmission refer to 7C2 Automatic Transmission – 4L60E – On-vehicle Servicing for further diagnosis of the park / neutral and back-up switch. Go to Step 21
18	Test the starter relay. Refer to 6C1-2 Engine Management – V6 – Diagnostics. Is the starter relay serviceable?	Go to Step 19	Repair or replace as required Go to Step 21
19	1 Using a multimeter set to measure voltage, back probe between the harness connector P – 3 pin 1 and ground. 2 With the aid of an assistant, monitor the voltage on the multimeter. • Turn the ignition switch to START, the multimeter should display 7.0 V Does the multimeter display as described?	Repair or replace the starter motor as required. Refer to 4 Major Service Operations. Go to Step 21	Go to Step 20
20	Check for short to ground or open circuit from connector P – 3 pin 1 and the starter relay connector X-13 pin 2. Was the circuit serviceable?	Go to Step 2	Repair as required (refer to Note 2). Go to Step 21
21	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 2
When all diagnosis and repairs are completed, check the system for correct operation.			

Diagnostic Table – Slow Cranking, Solenoid Clicks or Chatters

Step	Action	Yes	No
1	Did you review 1.3 System Operation?	Go to Step 2	Go to 1.3 System Operation.
2	Did you read 2.3 Diagnostic Systems Check	Go to Step 3	Go to 2.3 Diagnostic Systems Check.
3	Perform the 3.3 On-Vehicle Testing. Did you correct the condition?	Go to Step 4	Repair or replace the starter motor. Refer to 4 Major Service Operations. Go to Step 4
4	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 2
When all diagnosis and repairs are completed, check the system for correct operation.			

3 Minor Service Operations

3.1 Safety Precautions

Observe the following precautions. Failure to observe these precautions can result in serious damage to components.

- Refer to 1.1 WARNING, CAUTION and NOTES in this Service Information before disconnecting the battery.
- Use the starter motor on a negative ground system only.
- When installing a battery, attach the positive (+) cable to the battery first. Then attach the negative cable.
- When using a slave battery for starting purposes, ensure that both batteries are connected in parallel, that is. positive to positive terminals and negative to negative terminals.
- Only use jumper leads that have surge protection.

3.2 Maintenance

Regular Checks

Check the following at regular intervals:

- Starter motor terminals – for corrosion and loose connectors.
- Wiring – for damaged insulation.
- Mounting bolts – for tightness.
- Battery terminals – for clean and secure connections.

3.3 On-Vehicle Testing

NOTE

The battery must be fully charged and in serviceable condition before beginning these tests, refer to 8A Electrical Body and Chassis.

Engine Compartment Relay And Fuse Panel

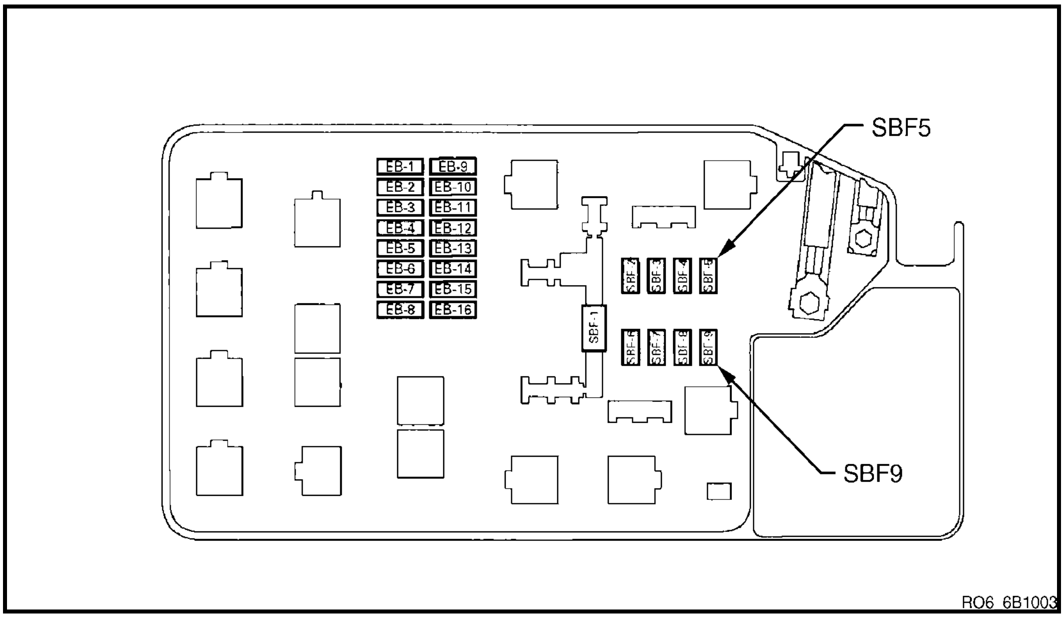


Figure 6D1-2 – 4

1 Remove fuses SBF5 and SBF9 from the engine compartment fuse panel to disable the ignition and prevent the engine from starting, refer to 8A Electrical Body and Chassis.

2 Chock the wheels.

3 For vehicles fitted with automatic transmission ensure the transmission is in P (park) or N (neutral) and the hand brake is applied.

4 Ensure the engine is at room temperature or normal operating temperature and in good working order.

Bad Connection Test

A bad connection appears as a voltage reading when the multimeter leads are connected to two different positive (or negative) connections.

1 Using a multimeter set to measure voltage, connect the multimeter's positive lead to the positive battery post.

2 Connect the multimeter's negative lead to the starter motor M terminal.

3 Record the voltage that displayed during cranking.

4 Repeat this with the multimeter's negative lead connected to the solenoid switch connector P – 4 pin B (circuit 1).

5 Also repeat this connecting the multimeter's negative lead to the battery cable strands.

6 Restore all connections that show a significant resistance (voltage reading).

Starter Motor Ground Test

1 Using a multimeter set to measure voltage, connect the multimeter's positive lead (1) to the negative battery post.

CAUTION

Connect the lead to the actual battery post and not to the cable or connector.

2 Connect the multimeter's negative lead (2) to the starter motor housing.

3 Record the voltage that displayed during cranking.

4 Repeat this connecting the multimeter's negative lead to the battery cable strands.

5 Restore all ground connections that show a significant resistance.

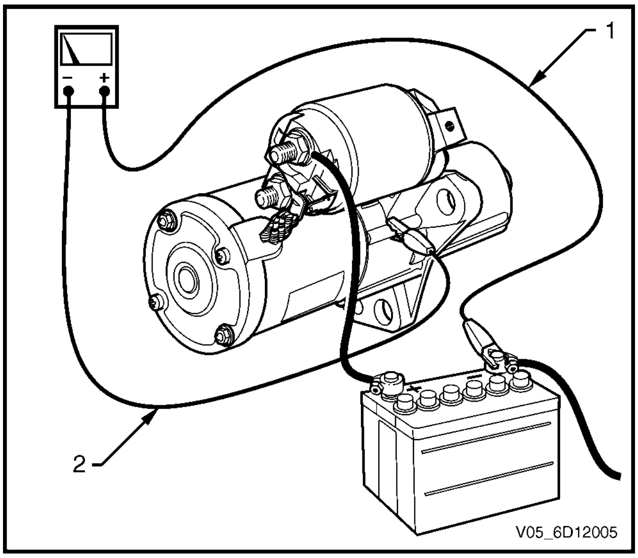

Figure 6D1-2 – 5

Switching Circuit Test

1 Using a multimeter set to measure voltage, connect the multimeter's negative lead (1) to the solenoid switch connector P – 3 pin 1.

2 Connect the multimeter's positive lead (2) to the positive battery post.

3 Crank the engine.

4 Record the voltage that displayed during cranking.

Maximum switching circuit voltage difference	2.5 V

5 If the voltage is above the specification, test the solenoid switching circuit to locate the cause of the high resistance and restore the connection.

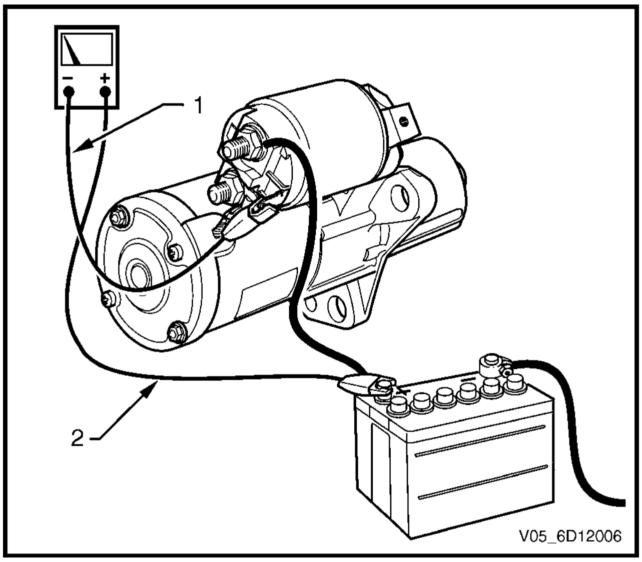

Figure 6D1-2 – 6

Cranking Voltage Test

1 Using a multimeter set to measure voltage, attach the multimeter's negative lead to ground and the multimeter's positive lead to starter solenoid connector P – 3 pin 1 (3) of the solenoid switch.

CAUTION

Do not crank the engine for more than 30 seconds at a time. Allow 2 minutes for the starter motor to cool down between tests.

3 Crank the engine.

4 Record the voltage that displayed during cranking.

Minimum cranking voltage	9.0 V

5 Remove and repair or replace the starter motor and solenoid switch if the voltage is below the specifications and cranks poorly. Refer to 4 Major Service Operations.

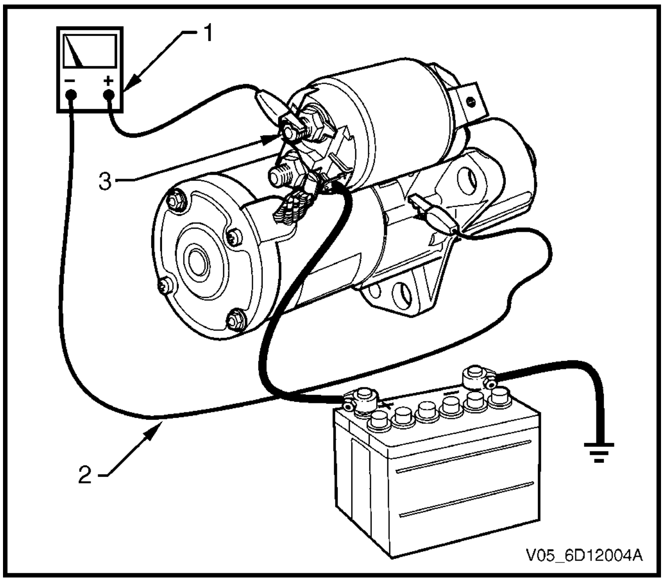

Figure 6D1-2 – 7

Current Draw Test

1 Using a multimeter set to measure voltage, attach the multimeter's positive lead to the positive battery post.

2 Attach the same multimeter's negative lead to the negative battery post.

3 Using a multimeter set to measure current, attach the multimeter's positive lead to the battery post.

4 Connect the negative lead of the multimeter set to measure current to a battery loading device, for example a carbon pile.

5 Connect the free lead of the battery loading device to the negative battery terminal.

6 Set the battery loading device to maximum resistance (open).

7 Crank the engine.

8 Record the voltage that displayed during cranking.

9 With the ignition in the OFF position, adjust the battery loading device so the reading of the multimeter set to measure voltage matches the reading recorded in the last step.

10 Record the current draw from the battery loading device.

11 Set the battery loading device back to 'open'.

12 Check the current draw is within specifications.

Cranking current range	100 – 140 A

13 Remove and repair or replace the starter motor and solenoid switch if the current draw is outside the specification. Refer to 4 Major Service Operations.

4 Major Service Operations

CAUTION

Disconnection of the battery affects certain vehicle electronic systems. Refer to 00 Warnings, Cautions and Notes before disconnecting the battery.

4.1 Starter Motor

Remove

WARNING

The starter motor is in close proximity to the left-hand side exhaust manifold and engine pipe. Allow the engine to cool before attempting to remove the starter motor.

1 Refer to 1.1 WARNING, CAUTION and NOTES in this Service Information before disconnecting the battery.

2 Disconnect the battery ground lead.

3 Raise the front of the vehicle. For jacking locations, refer to 0A General Information.

4 Put safety stands in place.

5 Fit the front lifting bracket: EN–46114 (1) to the engine, then hook the chains from the engine hoist onto the front lifting bracket.

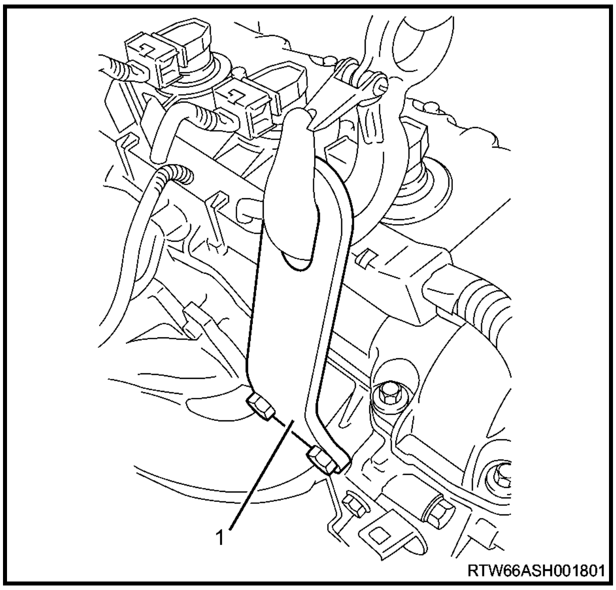

Figure 6D1-2 – 8

6 Fit the rear lifting brackets: EN–46114 (1) to the engine, then hook the chains from the engine hoist onto the rear lifting bracket.

7 Remove the oil level indicator tube, Refer to 6A1 Engine Mechanical – V6.

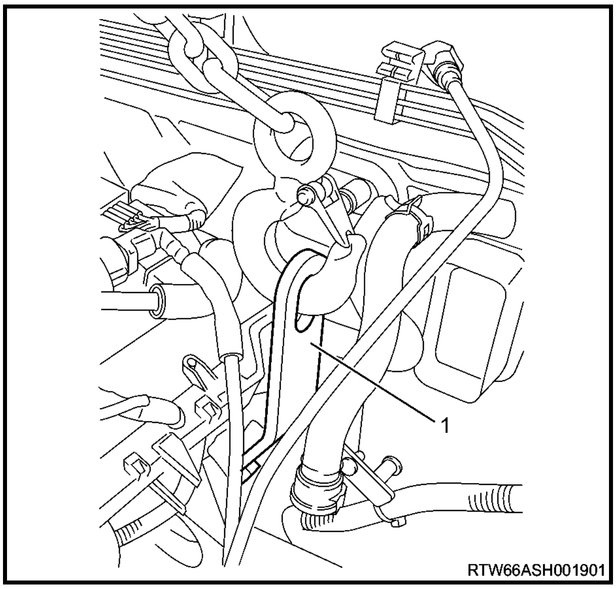

Figure 6D1-2 – 9

8 Remove the left hand side knock sensor (1) from the engine block.

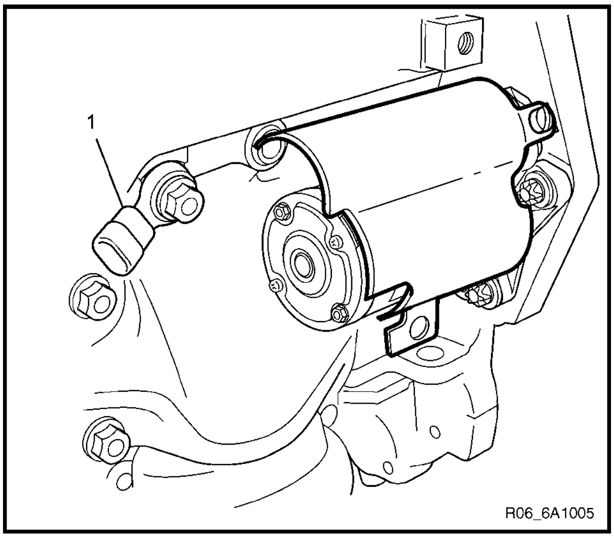

Figure 6D1-2 – 10

9 Remove the left hand side engine mount, then using the engine hoist raise the engine to give sufficient clearance to remove the starter motor.

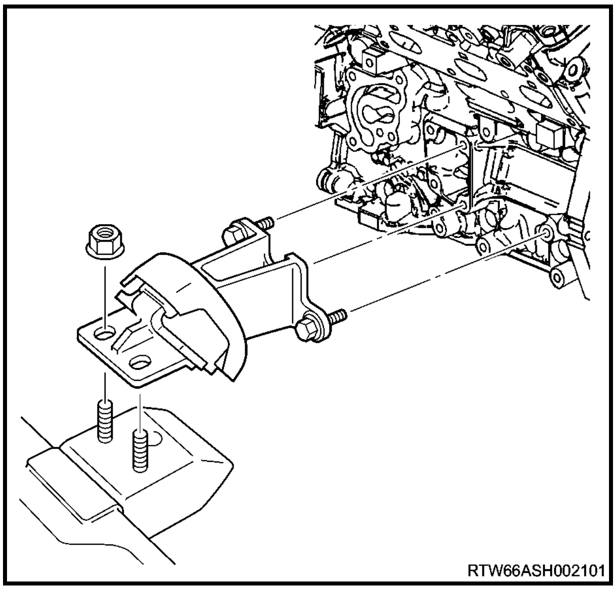

Figure 6D1-2 – 11

10 Unclip the oil level sensor harness from the heat shield (1).

11 Remove the heat shield attaching screw (2).

12 Remove the lower starter motor attaching bolt (3).

13 Remove the heat shield.

14 Remove the upper starter motor retaining bolt (3).

15 Remove the starter motor from the engine block and lower the starter motor as far as possible to gain access to the wiring harness connections.

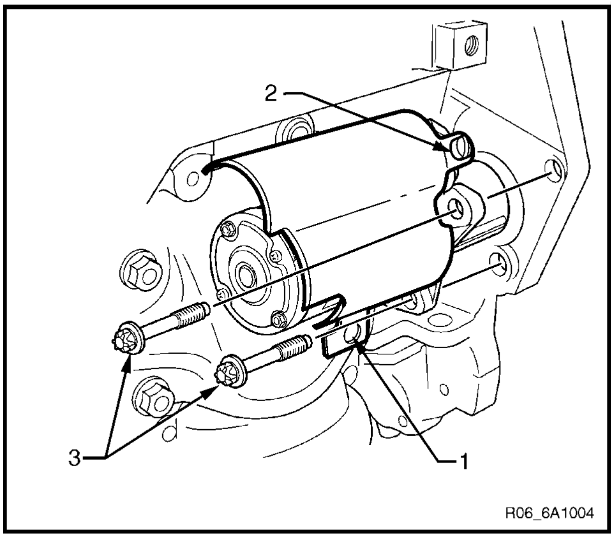

Figure 6D1-2 – 12

16 Remove the wiring harness connector P – 3 (1) from the solenoid switch (2).

17 Remove the flange nut (3) and battery connector P – 4 (4) from the solenoid switch.

18 Remove the starter motor from the vehicle.

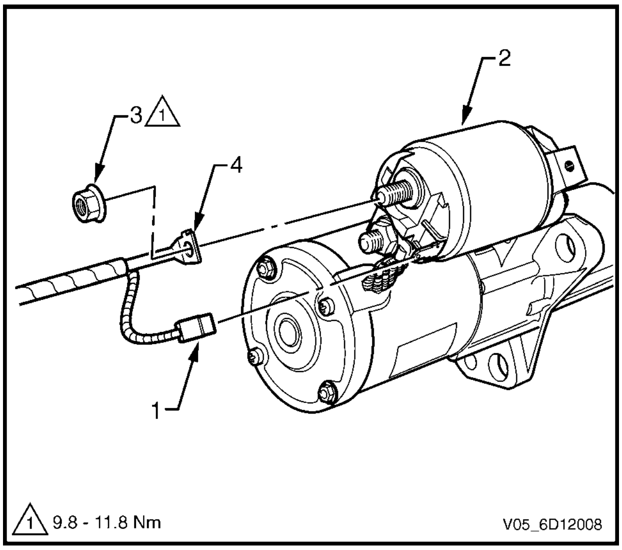

Figure 6D1-2 – 13

Reinstall

Reinstallation of the starter motor is the reverse of the removal procedure noting the following:

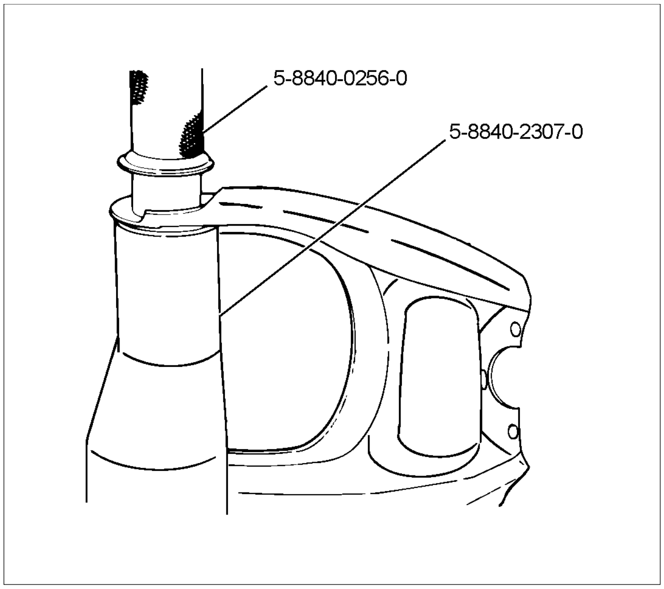
1 Tighten all fasteners to the correct torque specification.

Solenoid switch connector P – 4 nut (B+) torque specification	10.0 Nm
Starter motor heat shield lower bolts torque specification	23.0 Nm
Starter motor heat shield upper screw torque specification	3.0 – 5.0 Nm
Starter motor mounting bolt torque specification	45.0 Nm
Knock sensor bolt torque specification	23.0 Nm

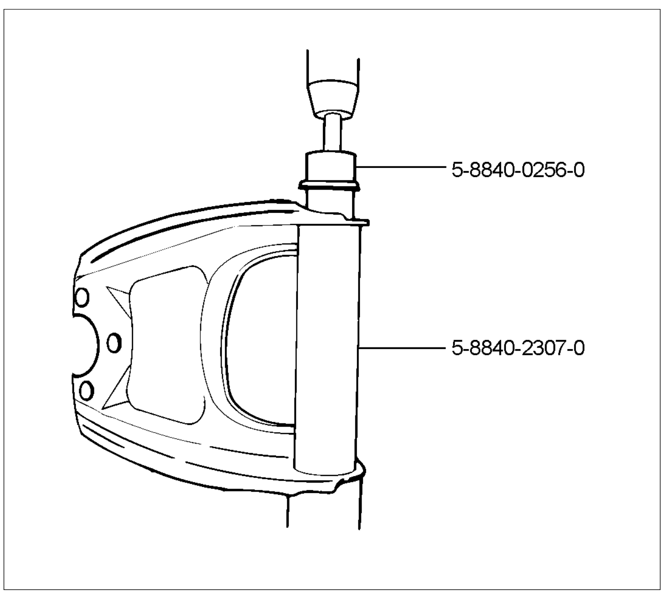
2 Check the starter motor operates correctly.

Installation

1. Install fulcrum pin.
2. Install bushing by using installer 5-8840-0256-0 and 5-8840-2307-0.



RTW340SH000701



RTW340SH000801

3. Install upper ball joint and tighten it to the specified torque.

Torque: 57 N·m (5.8 kgf·m/42 lb·ft)

4. Install nut and cotter pin then tighten the nut to the specified torque, with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 98 N·m (10.0 kgf·m/72 lb·ft)

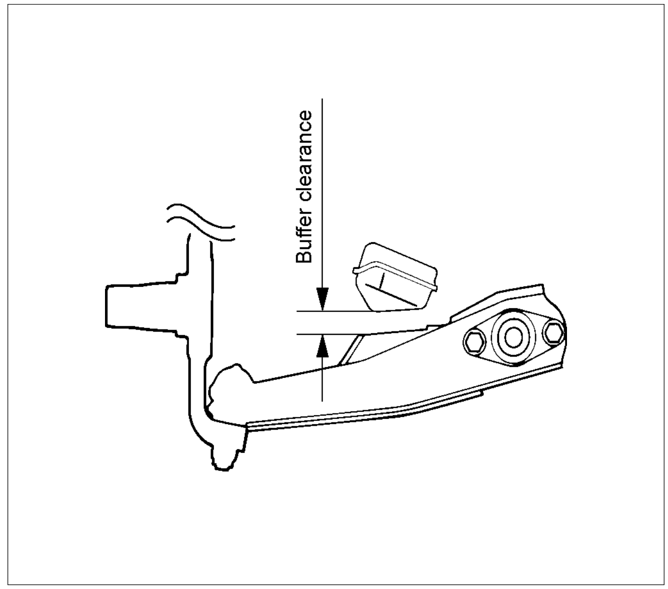
5. Install plate.
6. Install upper control arm nut and tighten fulcrum pin nut finger-tight.

NOTE: Apply oil to the thread.

NOTE: Tighten the nut with the parts in the position shown in the illustration below.

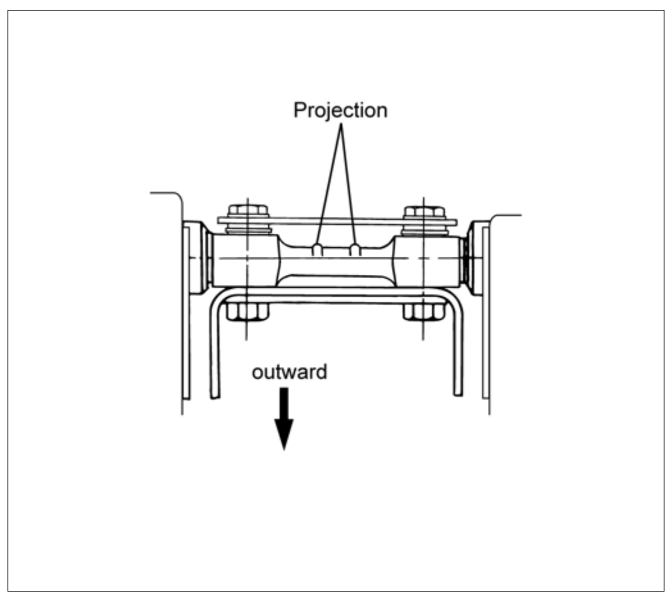
Buffer clearance: 29.7 mm (1.17 in)

Torque: 108 N·m (11.0 kgf·m/80 lb·ft)



RTW53ASH000301

7. Install upper control arm assembly with the fulcrum pin projections turned inward.



RTW53CSH000101-X

8. Install the caster shims (b) between the chassis frame and fulcrum pin.

4.3 Starter Motor Bench Tests

Preliminary Checks

1. Check the drive assembly is fully retracted.
2. Check the drive assembly pinion turns freely on the planetary drive shaft.
3. Perform the No Load Test (as outlined in this Section) if the drive assembly is not fully retracted.
4. Disassemble and service the starter motor if it fails the No Load test, refer to 4.4 Starter Motor Disassemble and Reassemble in this Section.

Pull-in Test

1. Clamp the starter motor, by the mounting lug in the drive-end housing, in a vice with soft jaws.
2. Remove the nut (1) and washer (2) from the solenoid switch M terminal (3).
3. Remove the braided cable (4) from the solenoid switch M terminal.

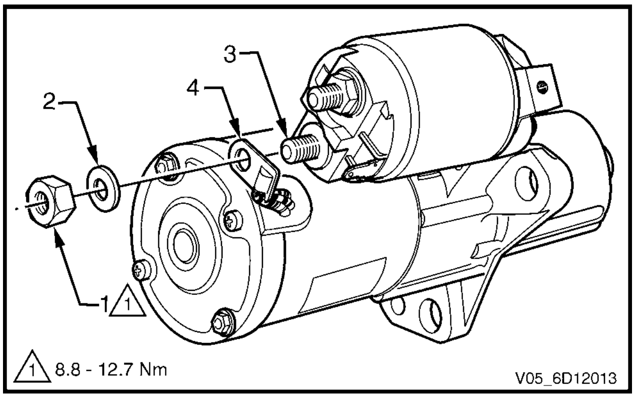


Figure 6D1-2 – 14

4. Connect the starter motor to an auxiliary battery, as follows:
   a. Connect the test lead (1) between the battery negative post to the solenoid switch M terminal (3).
   b. Connect the test lead (2) battery positive post.
5. Momentarily hold the free end of test lead (2) to solenoid switch terminal P – 3.
6. Check the solenoid switch activates and the drive assembly moves outward.
7. Disassemble and service the starter motor if the solenoid switch activates but the drive assembly does not move, refer to 4.4 Starter Motor Disassemble and Reassemble in this Section.
8. Replace the solenoid switch if it does not activate (there is no sound or movement).

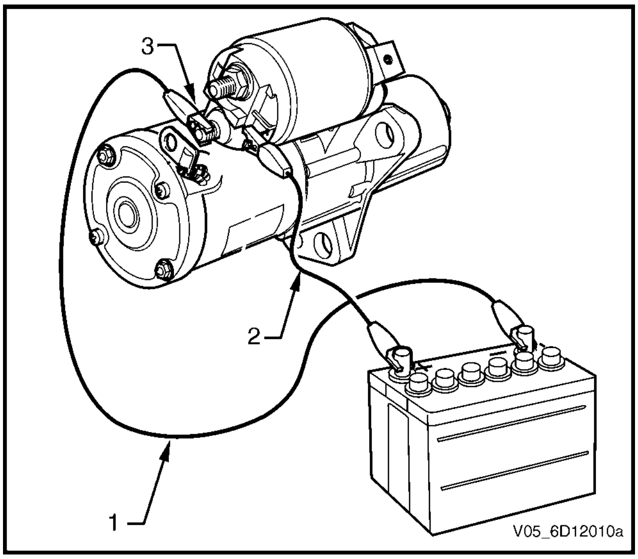

Figure 6D1-2 – 15

Hold-in Test

1 Connect the starter motor to an auxiliary battery, as follows:

   a Connect the test lead (1) between the battery negative post to the solenoid switch M terminal.

   b Connect the test lead (2) from the battery positive post to solenoid switch terminal P – 3.

   c Connect the test lead (3) to the starter motor casing.

2 Disconnect the test lead (1) from the M terminal of the solenoid switch.

3 Check the drive assembly remains extended.

4 Replace the solenoid switch if the drive assembly returns back into the starter motor.

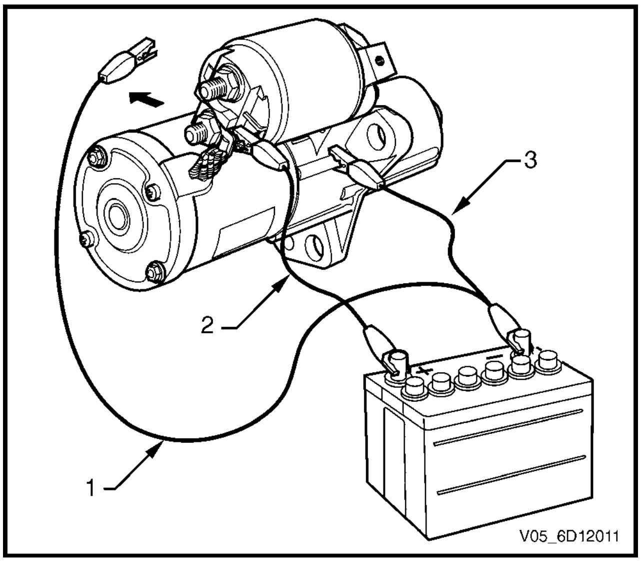

Figure 6D1-2 – 16

Drive Assembly Return Test

1 Connect the starter motor to an auxiliary battery, as follows:

   a Connect the test lead (1) between the battery negative post to the solenoid switch M terminal.

   b Connect the test lead (2) from the battery positive post to solenoid switch terminal P – 3.

   c Connect the test lead (3) to the starter motor casing.

2 Disconnect the test lead (1) from the M terminal of the solenoid switch.

3 Disconnect the negative lead (2) from the starter motor casing.

4 Check the drive assembly returns back into the starter motor.

5 Replace the solenoid switch if the drive assembly does not retract.

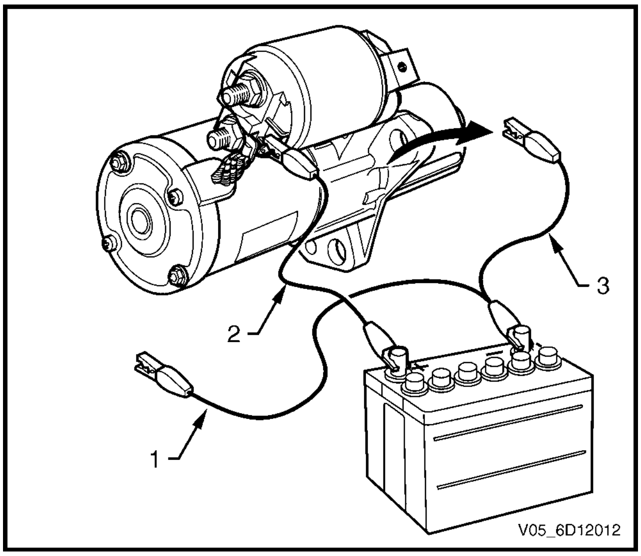

Figure 6D1-2 – 17

No Load Test

1 Clamp the starter motor securely to a test bench.

2 Connect the starter motor as shown in Figure 6D1-2 – 18, Close the start switch to activate the starter motor.

4 Record the speed of the planetary drive shaft, current draw and the voltage.

5 Check the readings are within the specifications.

Minimum r.p.m.	2370
Maximum current draw	90 A
M Terminal voltage	12 ± 0.1 V

6 Disassemble and service the starter motor if the readings are not within the specifications, refer to 4.4 Starter Motor Disassemble and Reassemble.

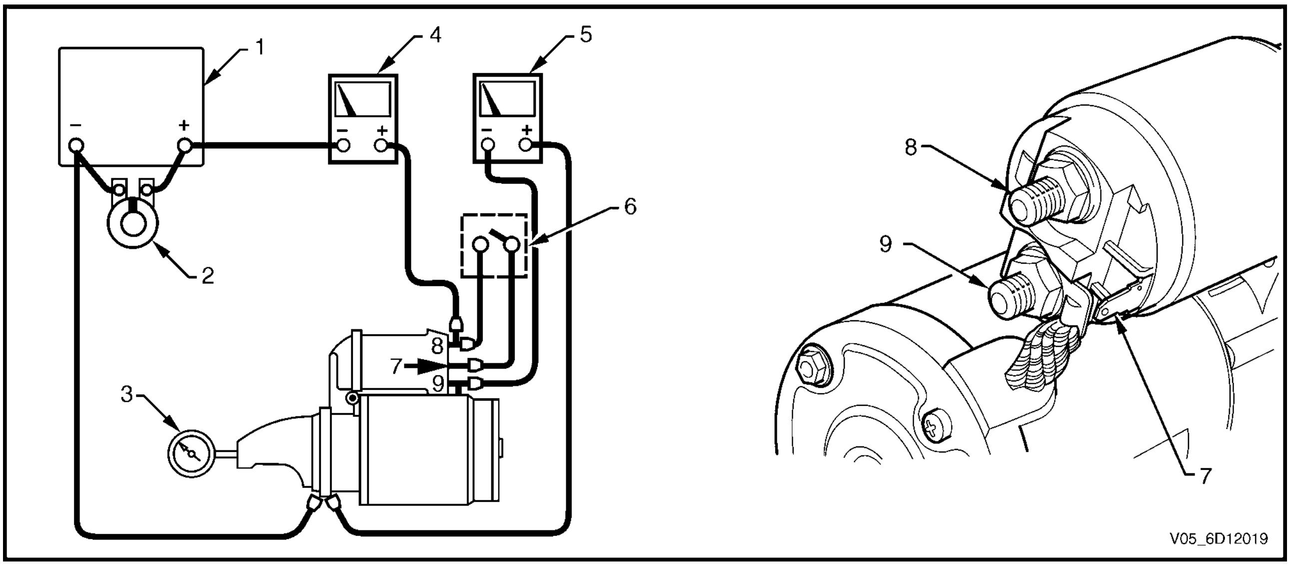

Figure 6D1-2 – 18

Legend

1 Battery
2 Carbon Pile
3 Shaft Speed Indicator
4 Multimeter set to measure current
5 Multimeter set to measure voltage
6 Start Switch
7 Solenoid Switch P – 3 pin 1
8 Solenoid Switch P – 4 pin B
9 Solenoid Switch M terminal

4.4 Starter Motor Disassemble and Reassemble

Disassemble

1 Clamp the starter motor, by the mounting lug in the drive-end housing, in a vice with soft jaws.

2 Remove the nut (1) and washer (2) from the solenoid switch M terminal (3).

3 Remove the braided cable (4) from the M terminal.

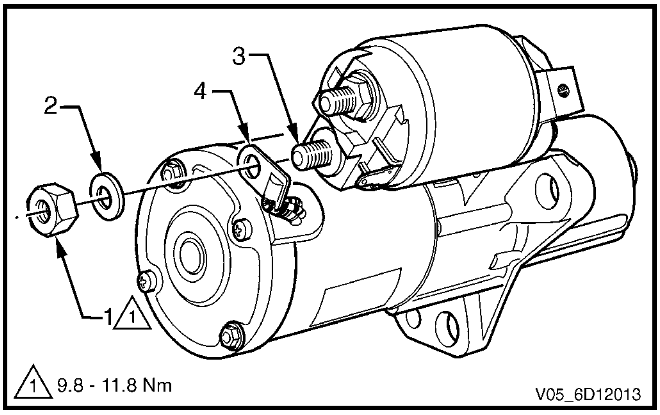

Figure 6D1-2 – 19

4 Scribe aligning marks (1) on the drive-end housing (2) and the solenoid switch housing (3) to aid reassembly.

CAUTION

When using an impact driver, avoid damaging the drive-end housing or rounding the screw slots of the solenoid switch mounting screws.

5 Remove the two solenoid switch mounting screws (4). It may be necessary to loosen the mounting screws using an impact driver.

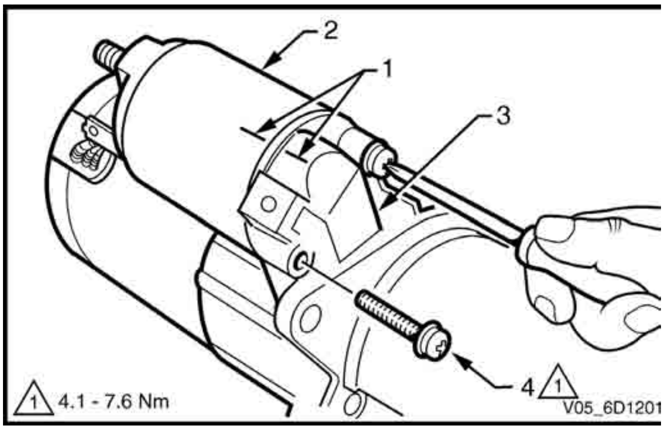

Figure 6D1-2 – 20

6 Remove the solenoid switch from the drive-end housing.

CAUTION

Do not lose the plunger return spring.

7 Unhook and remove the solenoid switch plunger (1) from the drive assembly fork lever (2).

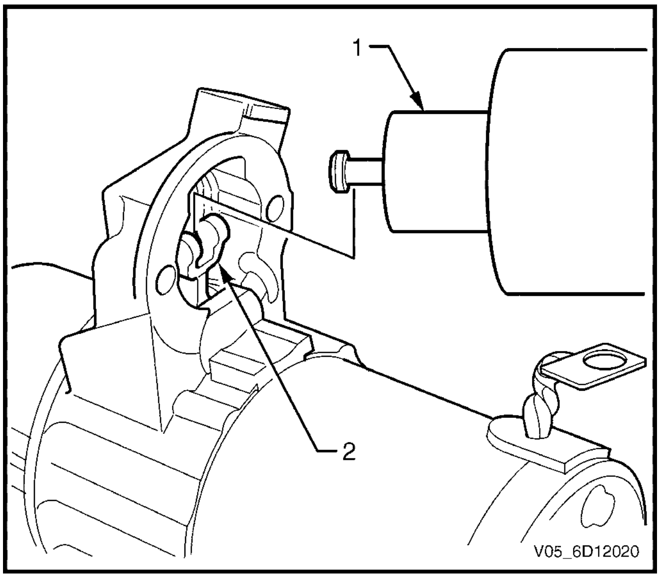

Figure 6D1-2 – 21

Reassemble

1 Reassemble the solenoid in the reverse order of the disassembly procedure noting the following points.

WARNING

Dry all parts thoroughly before assembly, taking care not to breathe in any vapours.

2 Lightly coat the solenoid switch plunger with 10% molybdenum disulphide grease.

CAUTION

Excess grease can enter the contact chamber of the solenoid switch and cause contact problems. Do not use too much grease.

3 Hook the plunger over the fork lever.

4 Insert the return spring into the plunger.

5 Slide solenoid switch over the plunger.

6 Align the solenoid switch with drive-end housing ensuring the solenoid switch terminal P – 4 faces away from the pole housing.

7 Install and tighten the solenoid switch mounting screws.

Solenoid switch mounting screw torque specification ....4.1 – 7.6 Nm

8 With the starter motor reassembled, perform a No Load Test, refer to 4.3 Starter Motor Bench Tests.

9 If the starter motor fails the No Load Test specification, replace the starter motor.

4.5 Solenoid Switch Tests

Test the Solenoid Switch

1 Inspect the solenoid switch for any external damage.

2 Replace the solenoid switch if it displays significant damage.

3 Install the return spring and plunger into the solenoid switch.

4 Check the movement of the plunger, as follows:

a Depress the plunger fully.

b Release the plunger.

c If the plunger sticks or binds in the switch bore, clean or replace the solenoid switch assembly as required.

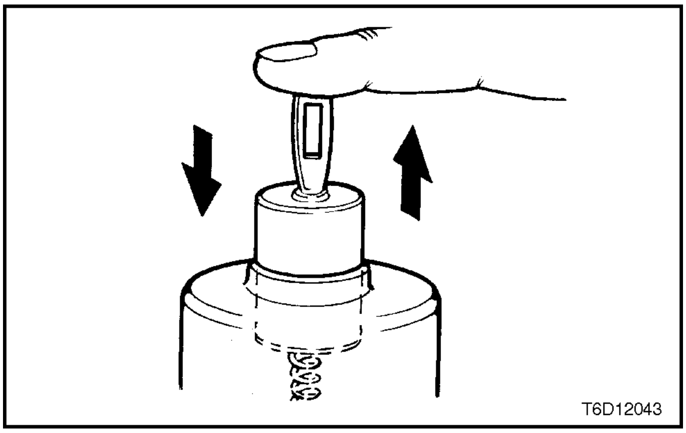

Figure 6D1-2 – 22

5 Connect a multimeter set to measure resistance between the solenoid switch M terminal (1) and the solenoid switch terminal P – 3 (2).

6 Record the resistance reading.

7 Replace the solenoid switch if the resistance is outside the specification.

Pull-in winding resistance @ 20°C................................0.33 – 0.37 Ω

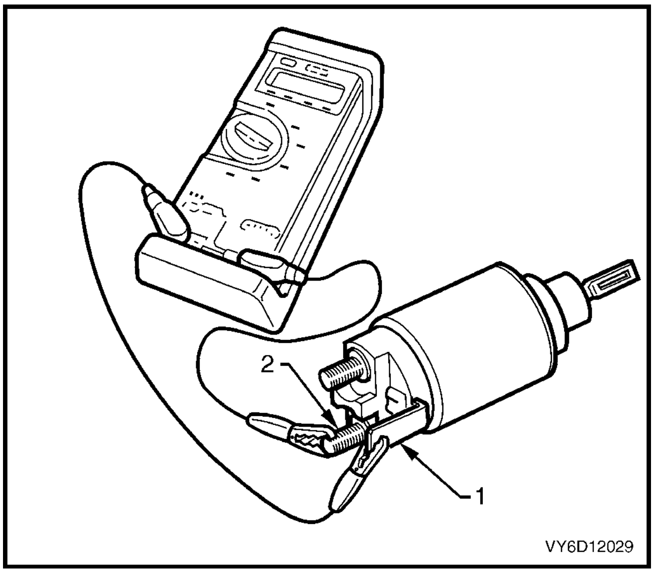

Figure 6D1-2 – 23

8 Connect a multimeter set to measure resistance between the solenoid switch housing (1) and the solenoid switch terminal P – 3 (2).

9 Replace the solenoid switch if the resistance is outside the specification.

Hold-in winding resistance @ 20°.................................0.75 – 0.87 Ω

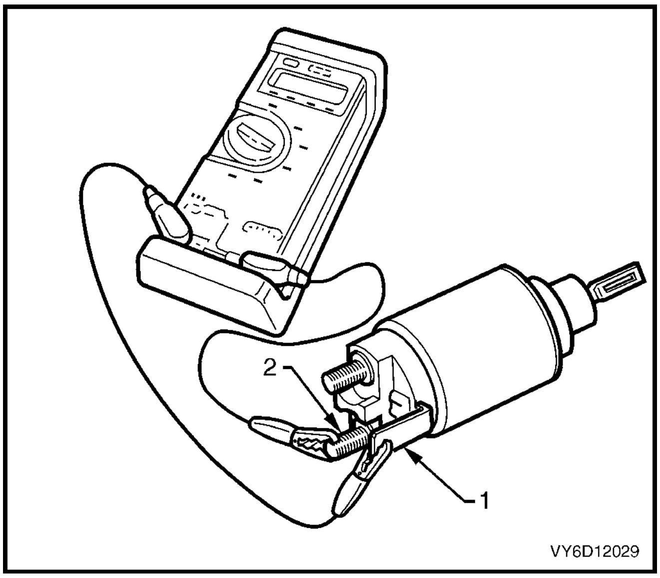

Figure 6D1-2 – 24

10 Fit a rubber band (1) around the plunger and switch housing to avoid ejecting the plunger.

11 Hold the solenoid switch vertically with the plunger pointing upwards.

12 Use a power supply (2) capable of supplying 30 A or use a battery and a variable resistor.

13 Set the power supply to 3.0 V.

14 Connect the power supply negative lead to the solenoid switch body.

15 Connect the power supply positive lead to the solenoid switch terminal P – 3 (5).

16 Connect a test lamp (3) between the solenoid switch terminal P – 4 (7) and the battery.

17 Connect a multimeter set to measure voltage (4) between the solenoid switch terminal P – 3 (5) and the solenoid switch housing.

18 Press the solenoid plunger in until the test lamp illuminates.

19 Allow the plunger to move out by 8 – 10 mm.

20 Hold the plunger in this position.

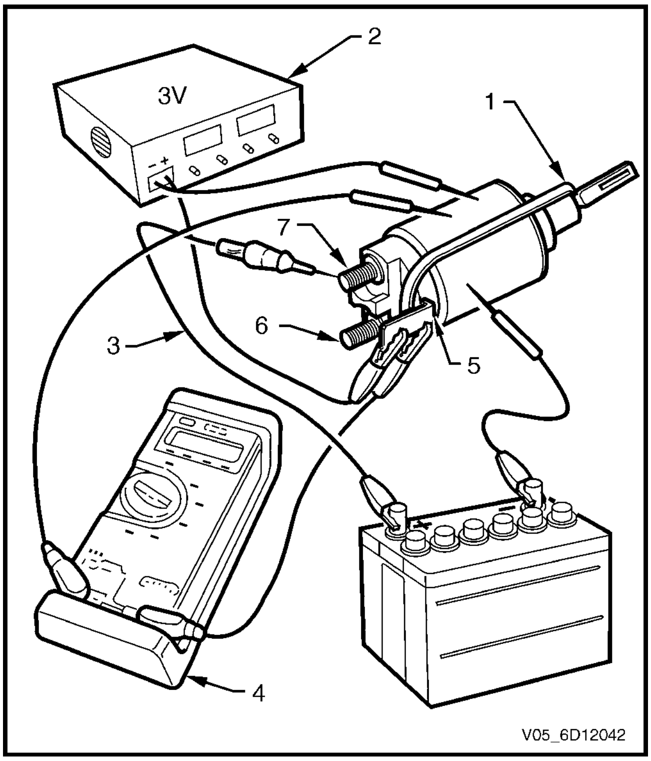

Figure 6D1-2 – 25

CAUTION

The test duration for the following step should be no more than 2 seconds.

21 Slowly increase the power supply voltage on the solenoid switch terminal P – 3 until the plunger pulls in.

22 Record the multimeter reading and reduce the voltage applied to the solenoid switch terminal P – 3.

23 Replace the solenoid switch if the voltage reading is significantly higher than the specification.

Pull-in voltage @ 20°C..8.0 V

24 Check the continuity across the main contacts in the switch.

25 Increase the voltage on the solenoid switch terminal P – 3 (5) until the plunger pulls in.

26 Ensure the test lamp illuminates fully.

27 Replace the solenoid switch if the test lamp illuminates poorly.

28 Set the power supply to 12 V (1).

29 Connect the power supply positive lead to the solenoid switch terminal P – 3 (2).

30 Connect the power supply negative lead to the solenoid switch housing (3).

31 Press the plunger in fully.

32 Release the plunger. The hold-in winding should hold the plunger in.

33 Replace the solenoid switch if the winding does not hold the plunger in.

34 Decrease the voltage until the plunger releases.

35 Record the multimeter reading.

36 Replace the solenoid switch if the voltage reading is significantly higher than the specification.

Hold-in voltage @ 20°C..........................1.7 – 3.0 V

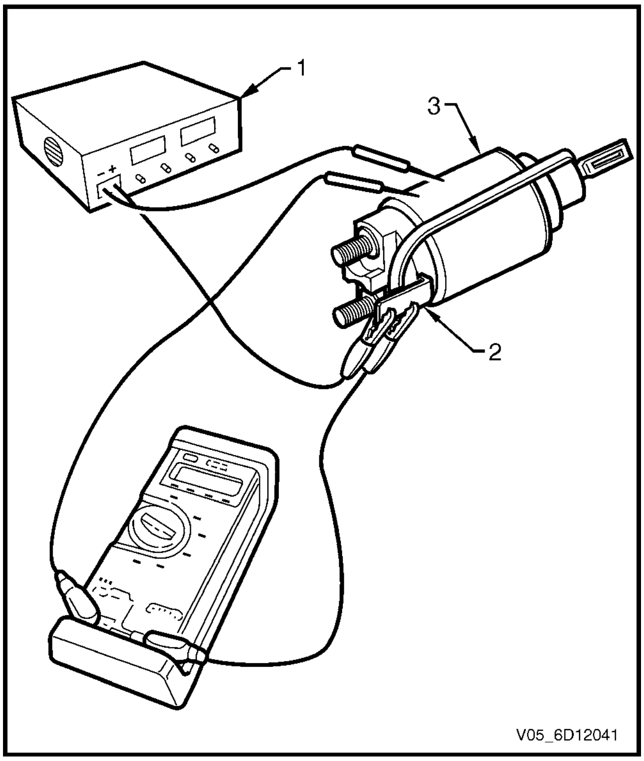

Figure 6D1-2 – 26

37 Connect a test lamp between the solenoid switch terminal P – 4 and the 12 volt power supply.

38 Press the plunger in until the test lamp illuminates.

39 Attempt to press the plunger into the solenoid switch housing a further 1 mm.

40 Replace the solenoid switch if the plunger cannot move at least a further 1 mm.

41 Connect the positive lead of a 24 volt power supply (1) to the positive lead of a multimeter set to measure voltage.

42 Connect the negative lead of a 24 volt power supply to the solenoid switch housing (2).

43 Connect the multimeter negative lead to the solenoid switch terminal P – 4 (3).

44 Press the plunger (4) in fully.

45 Release the plunger. The plunger should return to its rest position.

46 Replace the solenoid switch if the plunger does not return.

NOTE

This indicates the windings have an internal winding short circuit. When the solenoid switch is connected in this way, the winding fields are in opposition to each other.

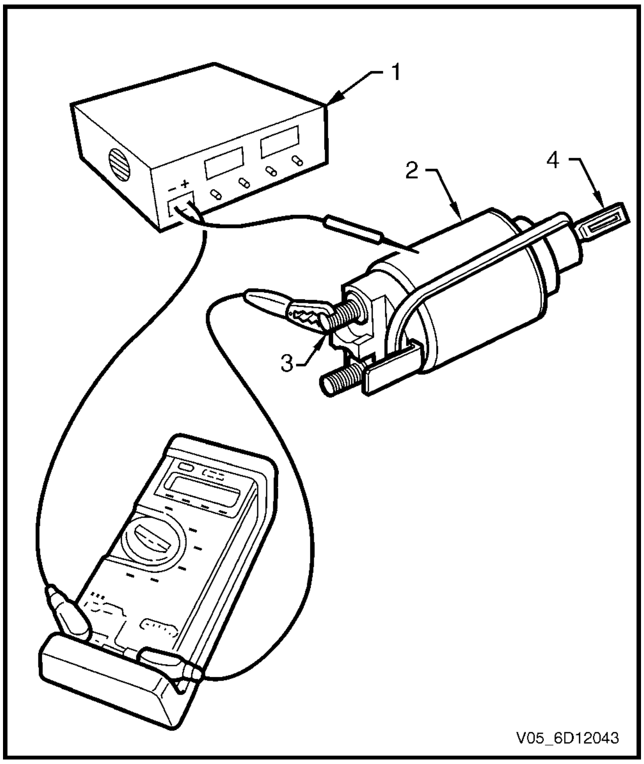

Figure 6D1-2 – 27

5 Specifications

Type..Six Pole Permanent Magnet, Four Brush, Planetary Drive

Rotation (Drive-End View) .... Clockwise

Number of Pinion Teeth...10

No load:

Minimum RPM 2370

Maximum Current Draw...65 A at 12.0 ± 0.1 V

M Terminal Voltage.. 12 ± 1 V

Locked:

Maximum Current (Including Solenoid Switch) .... 780 A

M Terminal Voltage.. 4 V

Minimum Torque.. 20 Nm

Solenoid detached:

Pull-in Winding Resistance @ 20°C ....0.33 – 0.37 Ω

Hold-in Winding Resistance @ 20°C ....0.75 – 0.87 Ω

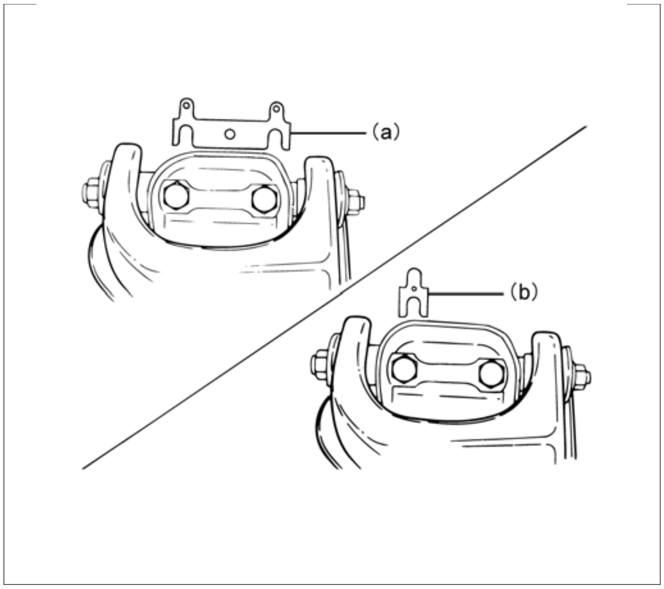
Pull-in Voltage @ 20°C ....8 V @ 20°C

Hold-in Voltage @ 20°C.. 1.7 – 3.0 V

6 Torque Wrench Specifications

	Nm
Solenoid Switch Mounting Screw	4.1 – 7.6
Solenoid Switch Terminal M Nut	10.0
Solenoid Switch Terminal P – 3 Nut	10.0
Starter Motor Mounting Bolt	45.0
Knock Sensor Bolt	23.0 Nm
Starter Motor Heat Shield Lower Bolt	23.0 Nm
Starter Motor Heat Shield Upper Screw	3.0 – 5.0 Nm

9. Install the camber shims (a) between the chassis frame and fulcrum pin.



RTW53CSH000201

10. Install nut assembly.
11. Install bolt and plate (a), and then tighten the bolt to the specified torque.

Torque: 152 N·m (15.5 kgf·m/112 lb·ft)

NOTE: Apply oil to the thread.

12. Install speed sensor harness.

7 Special Tools

Tool Number	Illustration	Description	Tool Classification
KM609		**Connector Test Adaptor Kit** Used when carrying out electrical diagnostic circuit checks. Previously released	Desirable
3588 (J39200)		**Digital Multimeter** Must have at least 10 MΩ input impedance and be capable of reading frequencies. Previously released.	Available
EN – 46114		**Engine Lifting Brackets**	Available

6D1-3
Battery – V6

ATTENTION

Before performing any service operation or other procedure described in this Section, refer to 1.1 WARNING, CAUTION and NOTES for correct workshop practices with regard to safety and/or property damage.

1 General Information

The vehicle is fitted with a 12 V battery located in the front right-hand corner of the engine compartment. The battery provides:

- power for cranking the engine,
- power for a limited time when the electrical load exceeds the generator output,
- power for the accessories when the engine is not running, and
- a voltage stabilising load for the electrical system.

1.1 WARNING, CAUTION and NOTES

This Section contains various WARNINGS, CAUTIONS and NOTE statements that you must observe carefully to reduce the risk of death or injury during service, repair procedures or vehicle operation. Incorrect service or repair procedures may damage the vehicle or cause operational faults. WARNINGS, CAUTION and NOTE statements are not exhaustive. HOLDEN LTD can not possibly warn of all the potentially hazardous consequences of failure to follow these instructions.

Definition of WARNING, CAUTION and NOTE Statements

Diagnosis and repair procedures in this Section contain both general and specific WARNING, CAUTION and NOTE statements. HOLDEN LTD is dedicated to the presentation of service information that helps the technician to diagnose and repair the systems necessary for proper operation of the vehicle. Certain procedures may present a hazard to the technician if they are not followed in the recommended manner. WARNING, CAUTION and NOTE statements are designed to help prevent these hazards from occurring, but not all hazards can be foreseen.

WARNING defined

A WARNING statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in death or injury. A WARNING statement alerts you to take necessary action or not to take a prohibited action. If a WARNING statement is ignored, the following consequences may occur:

- Death or injury to the technician or other personnel working on the vehicle,
- Death or injury to other people in or near the workplace area, and / or
- Death or injury to the driver / or passenger(s) of the vehicle or other people, if the vehicle has been improperly repaired.

CAUTION defined

A CAUTION statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in damage to or destruction of equipment, or corruption of data. If a CAUTION statement is ignored, the following consequences may occur:

- Damage to the vehicle,
- Unnecessary vehicle repairs or component replacement,
- Faulty operation or performance of any system or component being repaired,
- Damage to any system or components which depend on the proper operation of the system or component being repaired,
- Faulty operation or performance of any systems or components which depend on the proper operation or performance of the system or component under repair,
- Damage to fasteners, basic tools or special tools and / or
- Leakage of coolant, lubricant or other vital fluids.

NOTE defined

A NOTE statement immediately precedes or follows an operating procedure, maintenance practice or condition that requires highlighting. A NOTE statement also emphasises necessary characteristics of a diagnostic or repair procedure. A NOTE statement is designed to:

- Clarify a procedure,
- Present additional information for accomplishing a procedure,
- Give insight into the reasons for performing a procedure in the recommended manner, and / or

Present information that gives the technician the benefit of past experience in accomplishing a procedure with greater ease.

1.2 Battery Terminals and Cables

The cables attached to the battery posts provide power and ground connections for the vehicle electrical system. These battery cables attach to the battery posts via nut-tightened terminals. The battery is held in position by a hold-down bracket and bolts. Refer to Figure 6D1-3 – 1.

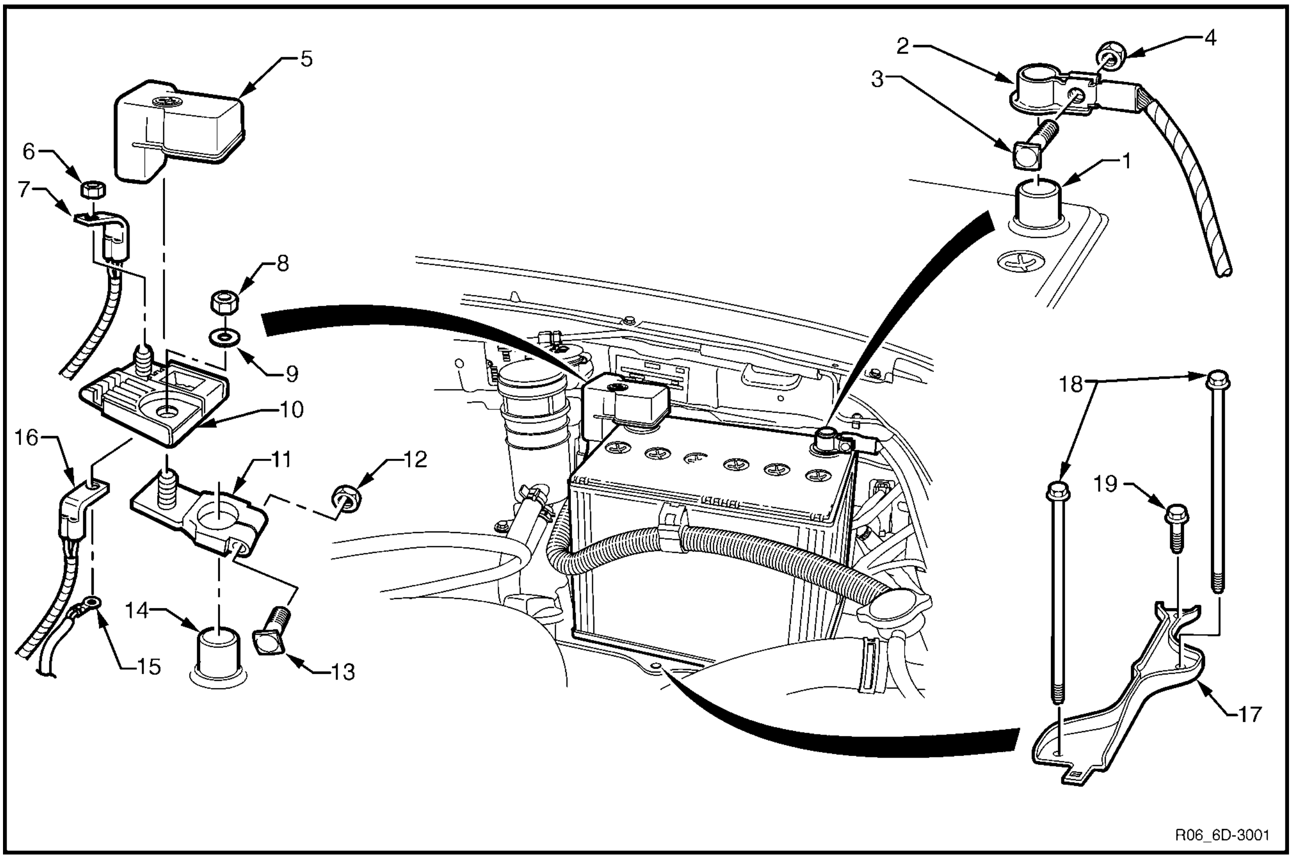


Figure 6D1-3 – 1

Legend

1	Negative Battery Post	7	Battery Positive Cable Assembly	13	Positive Battery Terminal Bolt
2	Negative Battery Terminal	8	Battery Fuse Box Nut	14	Positive Battery Post
3	Negative Battery Terminal Bolt	9	Battery Fuse Box Washer	15	Battery Positive Cable Assembly
4	Negative Battery Terminal Nut	10	Main Fuse Box Supply	16	Battery Positive Cable Assembly
5	Positive Connection Cover	11	Positive Battery Terminal	17	Battery Hold Down Bracket
6	Battery Positive Cable Nut	12	Positive Battery Terminal Nut	18	Battery Hold Down Bolts
				19	Battery Hold Down Bolt

1.3 Battery Ratings

There are two battery ratings to consider when replacing a battery, reserve capacity (RC) and cold cranking amps (CCA). Ensure the replacement battery meets or exceeds these rating specifications.

Reserve Capacity

The RC of a battery is the amount of time (measured in minutes) the vehicle will travel at night with minimum electrical load and no generator input.

This time is measured as the time taken for the battery voltage to reduce to 10.5 V from the following initial conditions:

- a fully charged battery at 25°C, and
- discharged at a constant current of 25 A.

Cold Cranking Amps

The CCA rating indicates the ability of the battery to maintain enough voltage for ignition requirements while supplying engine cranking current for long enough to start the engine under severely cold conditions.

The rating is the minimum amperage maintained when the engine is cranked for 30 seconds. The battery must maintain at least 7.2 V at 18°C.

Ratings

A specification label on the top of the battery displays the original equipment part number.

All vehicles are fitted with a low maintenance, 85 minute RC and 430 CCA battery.

2 Safety Precautions

WARNING

- **Battery fluid contains sulphuric acid, which can cause serious injury. Do not allow liquid from the battery to contact eyes or skin. If contact occurs, flush the area immediately with running water and contact a physician.**
- **Lead acid batteries produce explosive gases. Keep sparks, flames and lighted cigarettes away from the battery, especially when the battery is being charged. Failure to follow this warning could result in a battery explosion.**
- **Metal objects that touch a battery terminal can produce sparks that can cause serious burns. When working near a battery, take extra care with metal objects including tools and items of jewellery, especially rings and metal watchbands.**

CAUTION

Do not allow liquid from the battery to contact clothing or painted surfaces. If contact occurs, flush the area immediately with running water.

When working with or near the battery, always:

- Wear safety glasses and work gloves.
- Remove items of jewellery such as rings and metal watchbands.
- Ensure the ignition is switched off when connecting or disconnecting battery cables, battery charging equipment or battery jumper cables. Failing to do so can damage the vehicle electronic components.
- Disconnect the negative battery cable before disconnecting the positive cable from the battery. Inversely, connect the positive battery cable to the battery before connecting the negative cable. This reduces the possibility of shorting the battery to ground while working near the positive connections.

3 Diagnosis

3.1 Diagnostic Procedures

Introduction

This test is used to aid in diagnosing faults with the vehicle where the battery seems to be at fault.

With the increased use of electronic sensors and computer control, the battery is much more than just a component used to start a car. Low battery voltage can:

- affect the operation of the vehicle control modules and cause driveability problems, and
- cause the control modules to set diagnostic trouble codes (DTCs).

For example if a control module senses low battery voltage, it may increase fuel injector timing to increase engine rpm to increase the generator output.

Therefore consider the state of charge of the battery any time a customer complains of a driveability related problem.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

1 Checks the operator understands the safety precautions for working with batteries.

2 Checks if the vehicle is fitted with a battery of the correct specification.

3 Checks if the battery appears serviceable by performing the battery inspection procedure.

4 Checks if the battery loses charge over an extended period. If so the likely problem is excess current draw while the vehicles ignition is in the off position.

5 Checks the state of charge of the battery.

6 Checks if the battery is capable of delivering the required load by performing the load test procedure.

Diagnostic Table Notes

1 For all wiring harness fault diagnosis, refer to 8A Electrical Body & Chassis.

2 For wiring harness repairs, refer to 8A Electrical Body & Chassis.

3 Refer to 6D1 – 3 Battery – V6.

Diagnostic Table

Step	Action	Yes	No
1	Have you read and understood the safety precautions for working with batteries?	Go to Step 2	Refer to 2 Safety Precautions
2	Check the battery fitted is the correct specification recommended for the vehicle? Refer to 5 Specifications. Is the battery the correct specification?	Go to Step 3	Replace the battery with the correct specification
3	Perform the battery inspection, refer to 3.2 Battery Inspection. Does the battery appear serviceable?	Go to Step 4	Replace the battery, refer to 4.1 Battery
4	Does the customer complain the battery loses charge if the engine is not started for an extended period?	Preform the battery current draw test, refer to 3.5 Battery Current Draw Test	Go to Step 5

Step	Action	Yes	No
5	Perform the hydrometer test, refer to 3.3 Hydrometer Test. Is the battery fully charged?	Go to Step 6	Fully charge the battery, refer to 4.2 Battery Charge
6	Load test the battery, refer to 3.4 Load Test. Does the battery pass the load test?	Battery Serviceable. Refer to: 6D1–1 Charging System – V6.	Replace the battery, refer to 4.1 Battery
When all diagnosis and repairs are completed, check the system for correct operation.			

3.2 Battery Inspection

1 Read and obey the safety precautions for working with batteries, refer to 2 Safety Precautions.

2 Check the battery terminals and around the battery area for corrosion deposits. Remove any deposits as follows:

a Scrub the area with a stiff brush.

b Treat the area with a solution of warm water and baking soda or ammonia.

c Rinse with clean water.

3 Check the battery posts, if they are loose, burned, pitted or damaged in any way replace the battery. Refer to 4.1 Battery.

4 Check the battery case, if it is cracked or damaged replace the battery. Refer to 4.1 Battery.

5 Remove each filler cap (1) and check the electrolyte level is at the bottom of the filler-neck tube (2).

6 If the level is low, carefully add distilled water to the cell until the level reaches the bottom of the filler-neck tube.

NOTE

Do not overfill the cells, but maintain the level at least 20 mm above the separator plates (3).

7 If the electrolyte usage seems excessive, check the battery case is not faulty.

NOTE

Normal electrolyte usage is less than 30 ml per 10,000 kilometres (or slightly more for long, continuous running or in high temperatures).

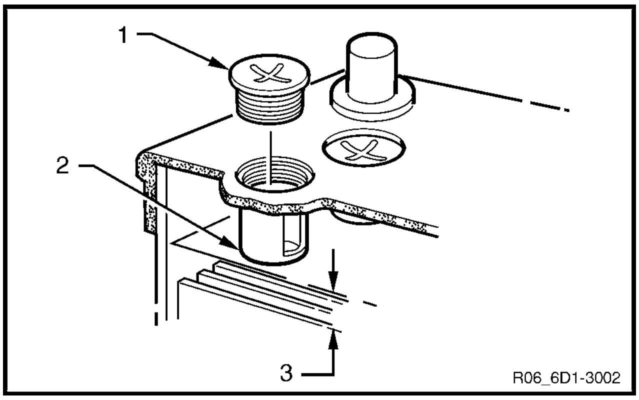

Figure 6D1-3 – 2

8 Ensure the battery hold-down bolts (2 & 3) and bracket (1) firmly secure the battery.

Battery hold-down bolt torque specification ....8.0 – 10.0 Nm

9 Check the cable insulation for damage or wear along the cable. Replace the cable as required.

10 Check the cables do not have broken or frayed strands and are secure in the terminals. Repair as required.

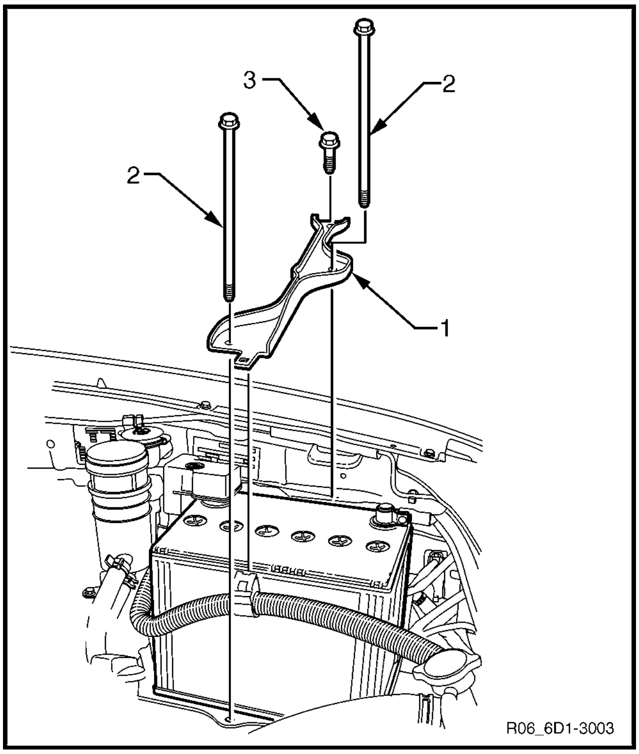

Figure 6D1-3 – 3

11 Ensure the terminal clamp (2) sits below the top of the battery post (1).

12 Check the terminal clamps are attached to the battery posts securely. Replace the terminals as required.

13 Tighten the terminal clamp nuts to the correct torque specification.

Battery terminal nut torque specification ....2.0 – 5.0 Nm

14 Smear the battery posts and terminals with petroleum jelly to resist corrosion.

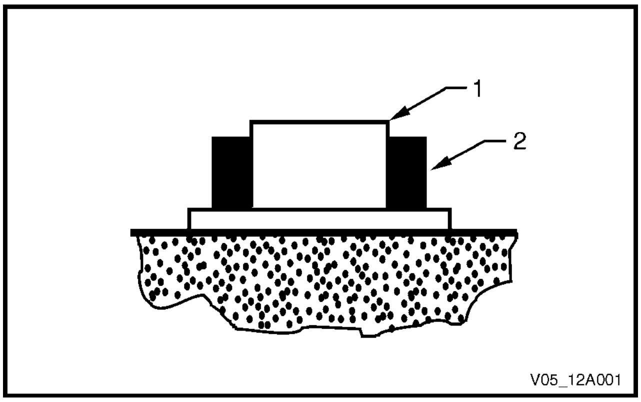

Figure 6D1-3 – 4

3.3 Hydrometer Test

As a lead-acid battery discharges, sulphur elements in the electrolyte move from the electrolyte solution into the lead battery plates. This removes the sulphuric acid from the electrolyte and changes it to water. Therefore the concentration of sulphuric acid in the electrolyte indicates the state of charge.

The concentration of sulphuric acid can be measured using a hydrometer. The state of charge is measured in terms of specific gravity; the lower the specific gravity reading, the lower the state of charge.

NOTE

If distilled water has been added to the battery, do not use the hydrometer until the battery has been charged for at least 30 minutes.

1 Read and obey the safety precautions for working with batteries, refer to 2 Safety Precautions.

2 Remove the battery filler caps.

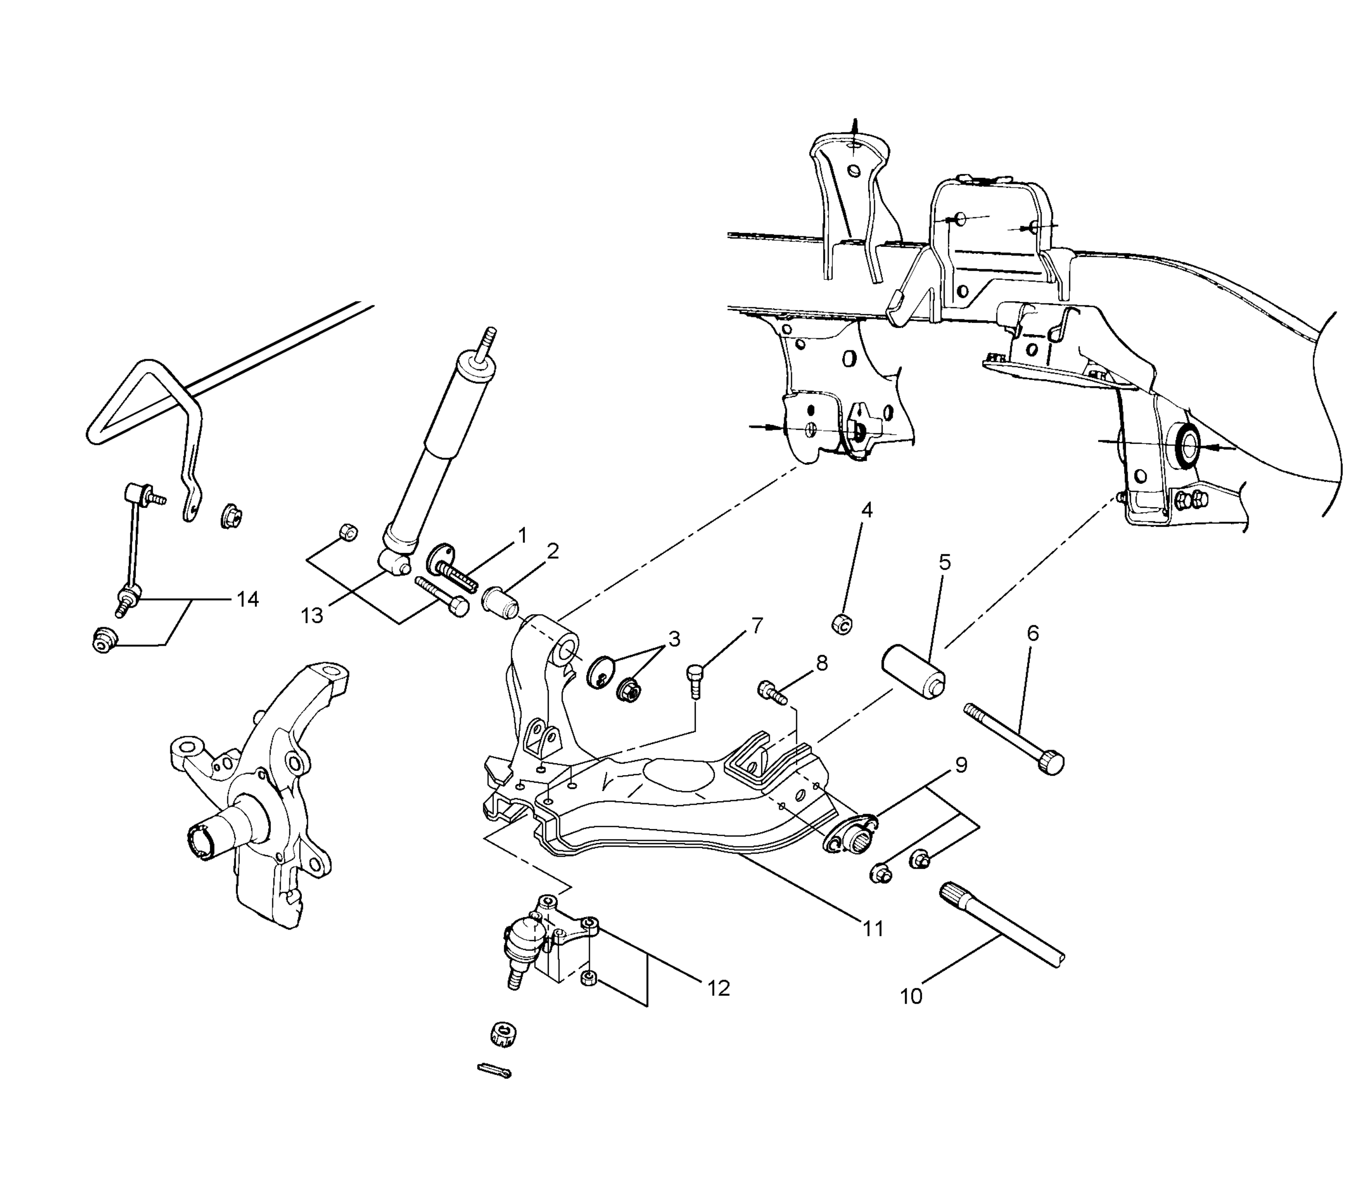
3 Force the air out of the hydrometer bulb.

4 Hold the hydrometer vertically in the cell with the pick-up tube submerged.

5 Draw in sufficient liquid to lift the hydrometer float freely when the bulb is fully released.

Lower Control Arm

Lower Control Arm and Associated Parts



RTW33CLF000201

Legend

- (1) Cam Bolt
- (2) Bush, Front
- (3) Cam Plate and Nut
- (4) Nut, Rear
- (5) Bush, Rear
- (6) Bolt, Rear
- (7) Bolt, Lower Ball Joint
- (8) Bolt, Torsion Bar Arm
- (9) Torsion Bar Arm Bracket and Nut
- (10) Torsion Bar
- (11) Lower Control Arm
- (12) Lower Ball Joint and Nut
- (13) Shock Absorber, Bolt and Nut
- (14) Stabilizer Link and Nut

6 Still holding the hydrometer vertically, record the reading.

7 Put the electrolyte back into the cell.

8 Repeat steps 3 to 7 for each cell.

9 Determine the temperature of the battery by temporarily placing a thermometer (1) into one of the cells (2).

10 Install the battery filler caps.

11 Calculate the temperature-compensated readings: add 0.004 for every 5°C above 27°C or subtract 0.004 for every 5°C below 27°C.

12 Determine the state of charge of the battery using the temperature-compensated readings and the table below.

NOTE

The specific gravity of a charged battery should not vary more than 0.025 between cells. Larger variations indicate defective cells and the battery must be replaced, refer to 4.1 Battery.

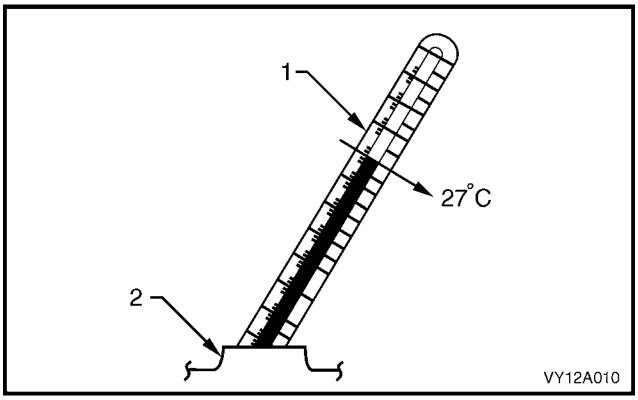


Figure 6D1-3 – 5

Battery Condition	Specific Gravity Reading
Fully charged	1.240 to 1.260
Requires charging	< 1.190
Fully discharged	1.110 to 1.130

3.4 Load Test

Load testing the battery with a high rate discharge (HRD) tester simulates using the starter motor and checks if the battery is in serviceable condition. The battery must be at least 65% charged before commencing this test.

NOTE

HRD testers are available with either fixed or variable loads. The operating procedures may vary from brand to brand, therefore follow the manufacturer's instructions.

High Rate Discharge Load Test

1 Read and obey the safety precautions for working with batteries, refer to 2 Safety Precautions.

2 Ensure the state of the battery is at least 65% charged. Refer to 3.3 Hydrometer Test.

3 Refer to Warning, Caution and Notes in this section, before disconnecting the battery.

4 Disconnect the battery negative terminal.

5 Disconnect the battery positive terminal.

6 Connect the HRD tester to the battery terminals ensuring correct polarity.

7 Set the tester switches to suit the battery size.

Fixed load tester:

a Apply the load for approximately 10 seconds to remove any surface charge.

b Wait 15 seconds for the battery to recover.

Variable load tester:

a Apply a 300 A load for approximately 15 seconds to remove any surface charge.

b Wait 15 seconds for the battery to recover.

8 If possible, set the selector to 50% of rapid discharge current (or three times the 20 hour discharge rate).

9 Apply the load test for 10 seconds and record the battery voltage. If one cell is faulty it will gas excessively or overheat. This indicates a faulty battery.

10 Recharge the battery if the voltage is at or below the minimum voltage specified by the HRD manufacturer (or 9.6 V).

11 Replace the battery if the voltage is below the minimum voltage specified by the HRD manufacturer (or below 9.6 V after the battery is charged and the test is repeated). Refer to 4.1 Battery.

12 Connect the battery positive terminal.

13 Connect the battery negative terminal.

Alternate Load Test

If HRD test equipment is not available, test the battery as follows:

1 Read and obey the safety precautions for working with batteries, refer to 2 Safety Precautions.

2 Ensure the state of the battery is at least 65% charged. Refer to 3.3 Hydrometer Test.

3 Connect a voltmeter (1) between the battery terminals.

4 Turn the headlights on to high-beam for 10 seconds to remove any surface charge from the battery.

5 Remove fuses EB11 and EB12 from the engine compartment fuse and relay housing. This prevents vehicle ignition and fuel injection while cranking the engine.

6 Crank the engine and read the voltmeter. At temperatures above 5°C, the voltage of a fully charged battery should not fall below 9.6 V.

NOTE

- If the battery and engine temperatures are below 5°C, the voltage may fall to 9 V.
- Try to avoid activating the starter motor continuously for more than 30 seconds. If activating the starter motor for 30 seconds, allow the starter motor to cool for 3 minutes.

7 Replace the battery if a cell gasses excessively or overheats or if the voltage falls away quickly.

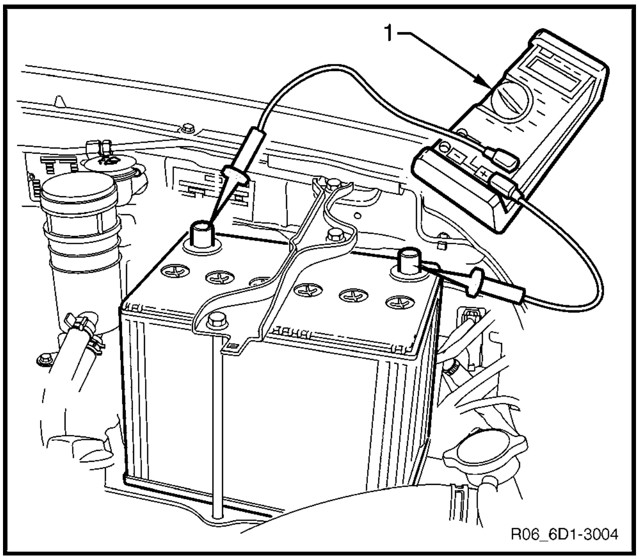

Figure 6D1-3 – 6

3.5 Battery Current Draw Test

The following test determines if excess current is being drawn from the battery whilst the vehicle has all accessories turned off. Excess current draw will cause the battery to go flat if the vehicle is not started for an extended period.

Test Preparation

1 Read and obey the safety precautions for working with batteries, refer to 2 Safety Precautions.

2 If the battery is flat, temporarily install a good battery for the duration of the test.

3 Ensure the vehicle starts and the accessories operate normally.

4 Ensure the theft deterrent system operates normally. Refer to 11A Immobiliser.

5 Open all the side windows for access purposes.

6 Switch the ignition off.

7 Check that all interior illumination is off, including any compartment lighting.

8 Close all doors.

9 Lock the doors and activate the theft deterrent system to arm the vehicle.

10 If the multimeter contains fuses, check they are serviceable.

Test Procedure

1 Switch the multimeter to the mA current range (1).

2 Connect the positive test lead (2) to the fused mA terminal of the multimeter.

3 Connect the negative test (3) lead to the common terminal of the multimeter.

4 Connect large alligator clips to the ends of both test leads.

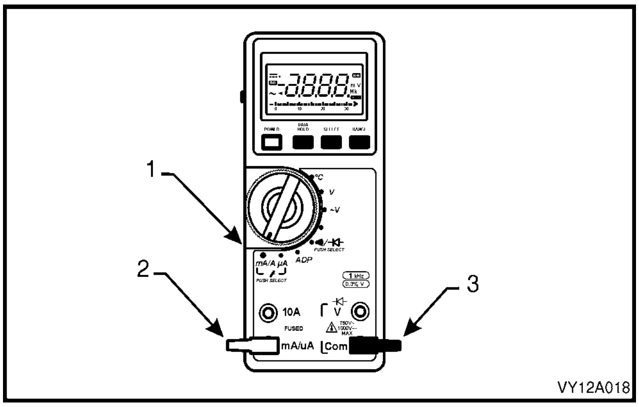

Figure 6D1-3 – 7

5 Connect the negative test lead clip to the threads of the battery negative terminal clamp (1).

6 Connect the positive lead's clip to the threads of a convenient engine bolt (2).

CAUTION

Do not turn on the ignition switch while this test is in progress. It will blow the multimeter's low current fuse.

7 Check the multimeter connections are secure.

8 Disconnect the vehicle's main electrical earth by removing the battery negative terminal cable retaining nut (3) and separating the cable from the battery clamp.

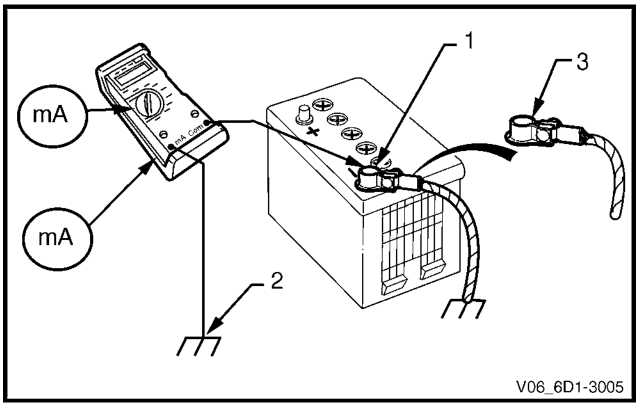

Figure 6D1-3 – 8

9 Read the vehicle's battery saver current on the multimeter. The multimeter reading should be within 16 – 30 mA (fluctuating).

10 If the multimeter reading is higher than specified, refer to Fault Diagnosis in this Section, otherwise restore the vehicle to its prior condition, refer to Restore in this Section.

Fault Diagnosis

CAUTION

Do not open any doors during this inspection. If the doors must be opened, reinstall the battery terminal to the battery clamp to protect the multimeter's fuse from blowing. Alternatively, use the higher (10 A) fuse rated terminal on the multimeter until the source of the higher current draw has been found.

1 Visually inspect the vehicle for illuminated lamps and components activated by energised relays.

2 If the cause of the excessive current draw is not apparent, remove one fuse (or circuit breaker) at a time to determine the circuit group that is drawing excess current. Refer to 8A Electrical Body & Chassis for fuse grouping location.

3 When the circuit group is determined, install the fuse / circuit breaker and identify the specific circuit within this group that is drawing the excess current. Disconnect the wiring harness connectors in this circuit group one at a time. Refer to 8A Electrical Body & Chassis.

4 When the cause is disconnected, the multimeter reading should drop to the correct reading as outlined in Step 9 of the Test Procedure in this Section.

5 If required, remove the components in this circuit one at a time to determine the cause of the excessive standing current. Refer to 8A Electrical Body & Chassis.

6 Repair the fault, refer to 8A Electrical Body & Chassis.

7 Ensure any fuses, circuit breakers and connectors that have been removed are secure.

Restore

1 Reconnect the electrical earth cable to the battery terminal and tighten the nut to the correct torque specification.

Battery terminal nut torque specification ....2.0 – 5.0 Nm

2 Disconnect the multimeter connections.

4 Service Operations

4.1 Battery

Remove

CAUTION

Disconnection of the battery affects certain vehicle electronic systems. Refer to 1.1 WARNING, CAUTION and NOTES before disconnecting the battery.

1 Read and obey the safety precautions for working with batteries, refer to 2 Safety Precautions.

2 Disconnect the negative battery terminal (1).

3 Disconnect the positive battery terminal (2).

4 Remove the battery hold-down bolts (3 & 4) three places, and the battery hold-down bracket (5).

5 Lift the battery out of the engine compartment.

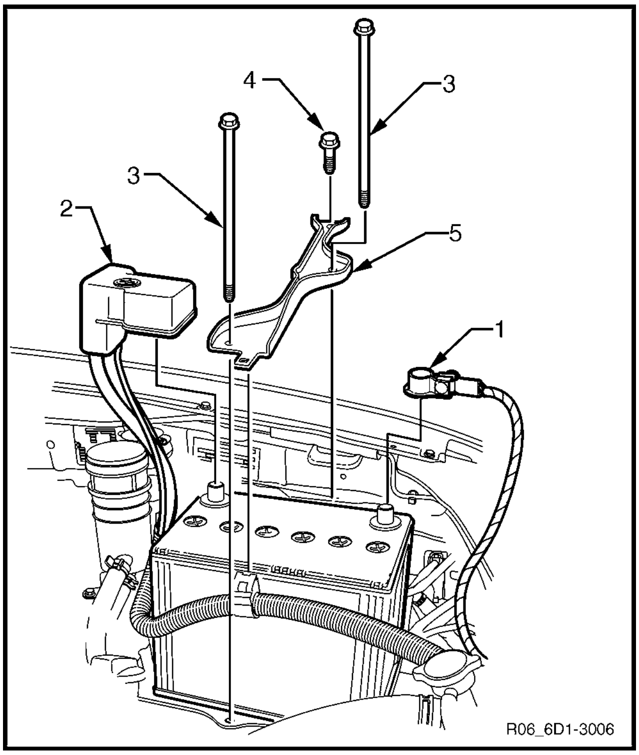

Figure 6D1-3 – 9

Reinstall

NOTE

Before installing a used battery perform steps 1 to 10 of the battery inspection, refer to 3.2 Battery Inspection.

1 Ensure the battery tray, cables and terminals are clean and free from corrosion and moisture.

2 Ensure that no foreign objects such as loose nuts or stones are located in the battery tray.

3 Place the battery onto the battery tray and ensure the battery sits level.

4 Install the battery hold down bracket and tighten the bolt to the specified torque.

Battery hold-down bolt torque specification	8.0 – 10.0 Nm

5 Install the positive terminal onto the positive battery post. Ensure the terminal sits below the top of the post and tighten the terminal nut to the correct specification.

Battery terminal nut torque specification	2.0 – 5.0 Nm

6 Install the negative terminal onto the negative battery post. Ensure the terminal sits below the top of the post and tighten the terminal nut to the correct specification.

Battery terminal nut torque specification	2.0 – 5.0 Nm

7 Smear the battery posts and cable terminals with petroleum jelly to inhibit corrosion.

4.2 Battery Charge

Safety Precautions

Read and obey the general safety precautions for working with batteries, refer to 2 Safety Precautions.

The battery releases an explosive hydrogen and oxygen gas mixture during charging. Ensure there are no naked flames or sparks near the battery.

Flat batteries can be safely boost-charged, however avoid excessive charging current if the battery is more than half charged. Slow charging is best.

Fast charging can substantially boost a battery, but slow charging is required to fully charge the battery.

Do not use a fast charger:

- for starting the vehicle,
- if the specific gravity readings are not uniform between battery cells, refer to 3.3 Hydrometer Test,
- if the specific gravity readings are above 1.20, refer to 3.3Hydrometer Test,
- if the electrolyte is discoloured with brown sediment, and
- if any of the above three conditions develop after beginning a fast charge.

Battery Charge Procedure

CAUTION

Disconnection of the battery affects certain vehicle electronic systems. Refer to Warning, Caution and Notes in this section before disconnecting the battery.

1 Perform steps 1 to 10 of the battery inspection, refer to 3.2 Battery Inspection.

2 Remove the battery from the vehicle. Refer to 4.1 Battery.

3 If required remove the battery filler caps. Let the caps rest loosely on top of the filler tubes.

CAUTION

Always ensure the connections are to the correct polarity and follow the manufacturer's recommendations for battery charging.

4 Connect the battery to the battery charger.

5 Set the charging current using the following table as a guide.

NOTE

Charging a battery at higher current rates can significantly reduce the life of the battery.

Charge Rate	Initial Current	Maximum Time Required
Slow charge	4 A	24 hours
Fast charge	35 A	2 hours

6 After a few minutes, check the colour and specific gravity of the electrolyte. Refer to 3.3 Hydrometer Test.

7 Monitor the electrolyte temperature while the battery is charging. If the electrolyte temperature reaches 55°C:

a switch the charging current off,

b allow the battery to cool,

c reduce the charging current, and

d restart charging the battery.

NOTE

For the best results, charge the battery with the electrolyte and plates at room temperature. An extremely cold battery may not appear to accept current for several hours after starting the battery charger. If the battery does not appear to accept charge after several hours replace the battery.

8 For slow charging check the voltage and specific gravity each hour or more regularly for fast charging. Stop the charging when there is no change in voltage or electrolyte specific gravity over three checks.

9 If the battery was fast charged connect the battery to a slow-charger for a few hours to bring the battery to the fully charged condition. Ensure the last few hours of charge do not exceed 1 A.

10 Tighten the filler caps. Ensure they are secure.

11 Install the battery in the vehicle. Refer to 4.1 Battery.

4.3 Emergency Jump Starting Procedure

Safety Precautions

- Read and obey the general safety precautions for working with batteries, refer to 2 Safety Precautions.
- Do not allow the vehicles to touch each other during the jump starting procedure.
- Ensure the assisting vehicle battery has the same voltage rating and connects negative to ground. If this is not the case, serious injury and damage to electrical equipment can result.
- Do not push or tow the vehicle to start it. Damage can result when unburnt fuel reaches the catalytic converter and ignites.
- Do not start the vehicle using a fast charger.
- When using jumper leads, treat both the booster battery and the discharged battery with care.
- Do not allow sparks, flame or smoking near the battery.
- Ensure that metal tools or jumper cables do not simultaneously contact the battery positive terminal and any other metal part of the vehicle.

Jump Starting Procedure

1 Position the assisting vehicle so the batteries of both vehicles are close together, refer to Figure 6D1-3 – 10.

2 Apply the park brake on both vehicles.

3 Ensure that P (park) is selected for automatic transmission and N (neutral) is selected for manual transmissions.

4 Turn off the ignition, lights and all other electrical loads.

5 Check the battery filler caps on both batteries are tight.

6 Place a wet cloth over the battery filler caps of each battery.

7 Attach one end of the red jumper cable to the positive terminal of the booster battery.

8 Attach the other end of the same cable to the positive terminal of the discharged battery.

9 Attach one end of the black jumper cable to the negative terminal of the booster battery.

10 Attach the other end to a solid stationary, metallic point on the engine of the disabled vehicle.

NOTE

Do not connect this end directly to the negative post of the discharged battery.

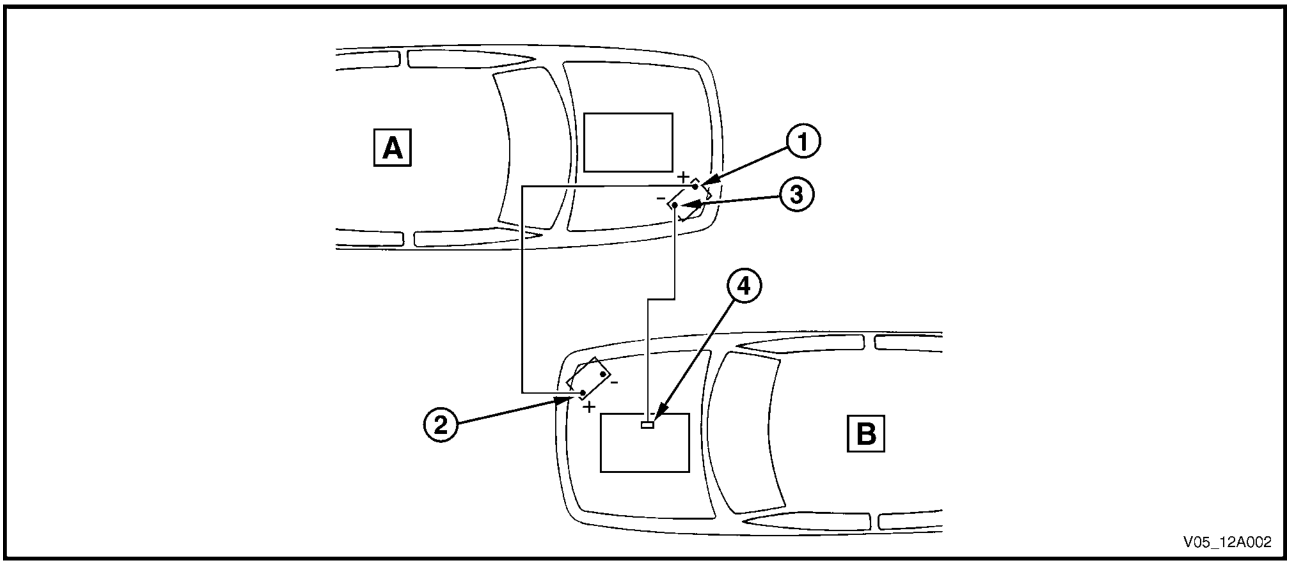

Figure 6D1-3 – 10

Legend

Order of hook-up:

1 Booster vehicle, positive terminal
2 Disabled vehicle, positive terminal
3 Booster vehicle, negative terminal
4 Disabled vehicle, engine ground point

A Booster vehicle
B Disabled vehicle

11 Ensure the jumper cables are not on or near drive pulleys, cooling fans or other points that will move when the engine is started.

12 Start the engine in the booster vehicle and run the engine at a moderate speed for a few minutes.

13 Start the engine in the disabled vehicle.

NOTE

If the engine in the disabled vehicle does not start within 30 seconds, stop cranking the engine and fix the cause. Refer to 3 Diagnosis.

14 When the engine starts, allow both engines to idle for approximately seven minutes. This allows the voltage levels in both vehicles to balance.

15 Leave the vehicles running and remove the jumper cables in the reverse sequence to attaching them. When removing each clamp, take care to ensure that it does not touch any other metal.

16 Discard the wet cloths covering the battery filler caps of both batteries.

4.4 Dry Charged Batteries

Storage

Dry charged batteries are fully charged when manufactured and contain no electrolyte until activated. The dry charged can be stored indefinitely with no servicing until activated.

Activation

1 Remove the battery filler caps.

2 Add 1.265 specific gravity electrolyte to each cell to the correct level.

3 Wait several minutes.

4 Check the electrolyte level and add more electrolyte (not water) as required. After a dry charged battery is activated, it becomes a wet battery.

Post Activation Tests

Although a dry charged battery can be put into service immediately after activation, the following tests are recommended:

1 Check the voltage of the battery after adding the electrolyte.

2 If the reading is less than 10 V, replace the battery.

3 Check the specific gravity of the electrolyte in each cell, refer to 3.3 Hydrometer Test.

4 If any reading shows more than a 0.030 drop from the initial electrolyte reading, slow-charge the battery before use. Refer to 4.2 Battery Charge.

5 Check the cells for violent gassing. If violent gassing is detected evenly across all cells, slow-charge the battery before use. If violent gassing is not even across all cells, replace the battery.

5 Specifications

Rated Voltage .... 12 V

Cold Cranking Amps .... 430 A minimum

Reserve Capacity .... 85 minutes minimum

20 Hour Discharge .... 55 A / hour minimum

5 Second Voltage @ 25° C .... 150 A 10.4 + / – 0.2 V

.... 400 A 8.4 + / – 0.2 V

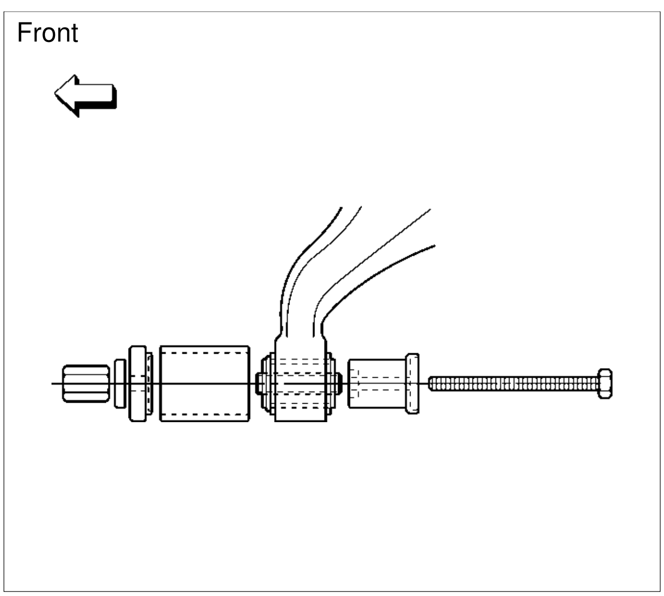
Number of Plates (per cell) 11

NOTE

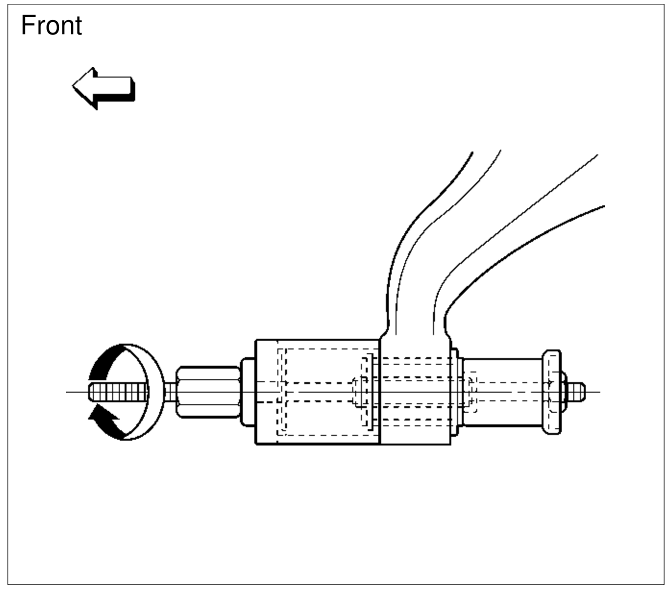
Specified ratings when tested in accordance with Australian Standard AS 2149-1990

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the tie-rod end from the knuckle. Refer to Power Steering Unit in Steering section.
4. Remove the retaining ring from the front axle driving shaft to release the shaft from hub. Refer to Front Hub and Disc in Driveline/Axle section.
5. Support lower control arm with a jack.
6. Remove cam plate and nut.
7. Remove rear nut.
8. Remove torsion bar; refer to Torsion Bar in this section.
9. Remove torsion bar arm bracket.
10. Disconnect the stabilizer link at the lower control arm.
11. Remove the shock absorber lower end from the lower control arm.
12. Remove the lower ball joint from the lower control arm.
13. Remove cam bolt.
14. Remove rear bolt.
15. Remove lower control arm.
16. Remove torsion bar arm bolt.
17. Remove lower ball joint bolt.
18. Remove front bushing by using remover 5-8840-2123-0.

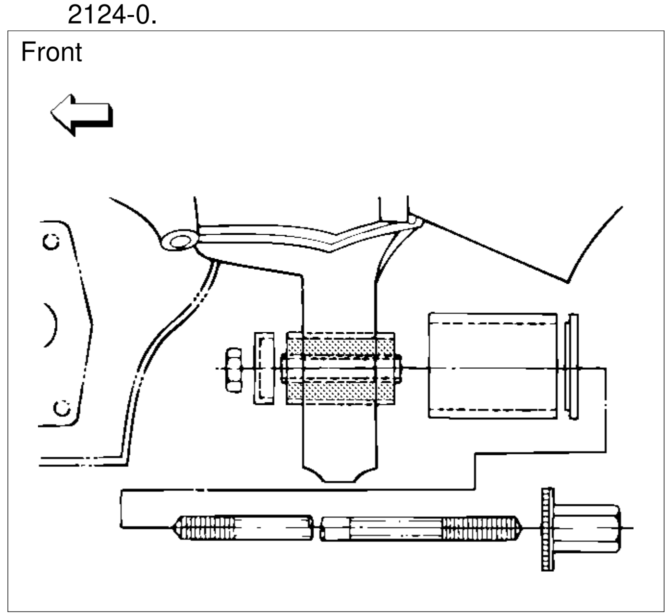


901RW154

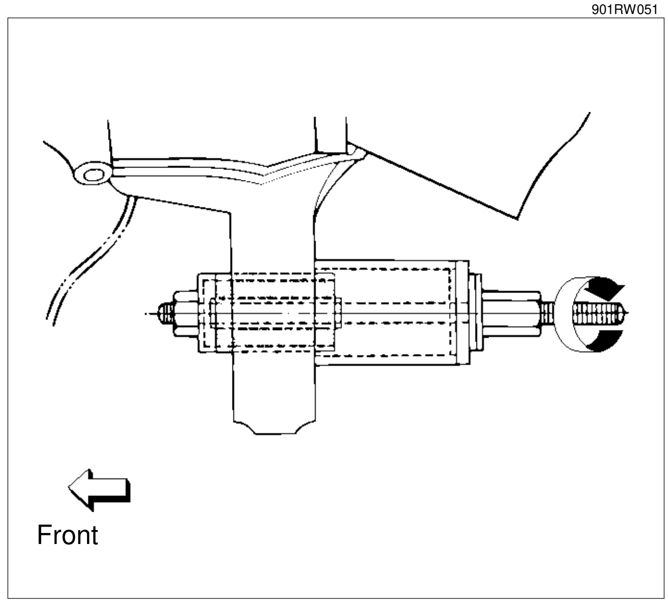


901RW155

19. Remove rear bushing by using remover 5-8840-2124-0.



901RW051



901RW052

6 Torque Wrench Specifications

Battery Hold-Down Bolts ....8.0 – 10.0 Nm

Battery Terminal Nut..2.0 – 5.0 Nm

6E1
Powertrain Interface Module – V6

ATTENTION

Before performing any service operation or other procedure described in this Section, refer to 1.2 Warning Caution and Notes for correct workshop practices with regard to safety and / or property damage.

1 General Information

A powertrain interface module (PIM) is fitted that incorporates the following functionality:

- Communication protocol between the engine control module (ECM) and transmission control module (TCM) is General Motors Local Area Network (GM LAN).
- Communication protocol between the PIM and immobiliser control unit is keyword 2000.
- ECM to PIM and PIM to immobiliser control unit (ICU) authentication for vehicle security.
- The following switches, where fitted, input directly into the PIM:
    - Automatic transmission power mode switch.
    - Automatic transmission 3rd gear start switch.
    - Cruise control switch.

1.1 General Description

Serial Data Communication

The various electronic control modules communicate with each other through the serial data bus. The ECM and TCM communicate on the serial data bus using the GM LAN communication protocol. Figure 6E1 – 2 shows the serial data layout.

NOTE

Serial data components shown in Figure 6E1 – 2 will vary depending on vehicle options.

Bus

A bus is a physical circuit or circuits which provides a communication path between two or more control modules.

GM LAN Serial Data Bus

The GM LAN bus is a two wire circuit (1), refer to Figure 6E1 – 1. The GM LAN bus circuits are terminated with cut-off resistors (2) which are located inside the two control modules at either end of the bus circuit. The purpose of these cut-off resistors is to prevent data from returning as an echo after reaching the end of the GM LAN bus circuit.

NOTE

- For illustration purposes, the cut-off resistors are shown outside of the control modules.
- The two control modules with the cut-off resistors are the PIM and the ECM.

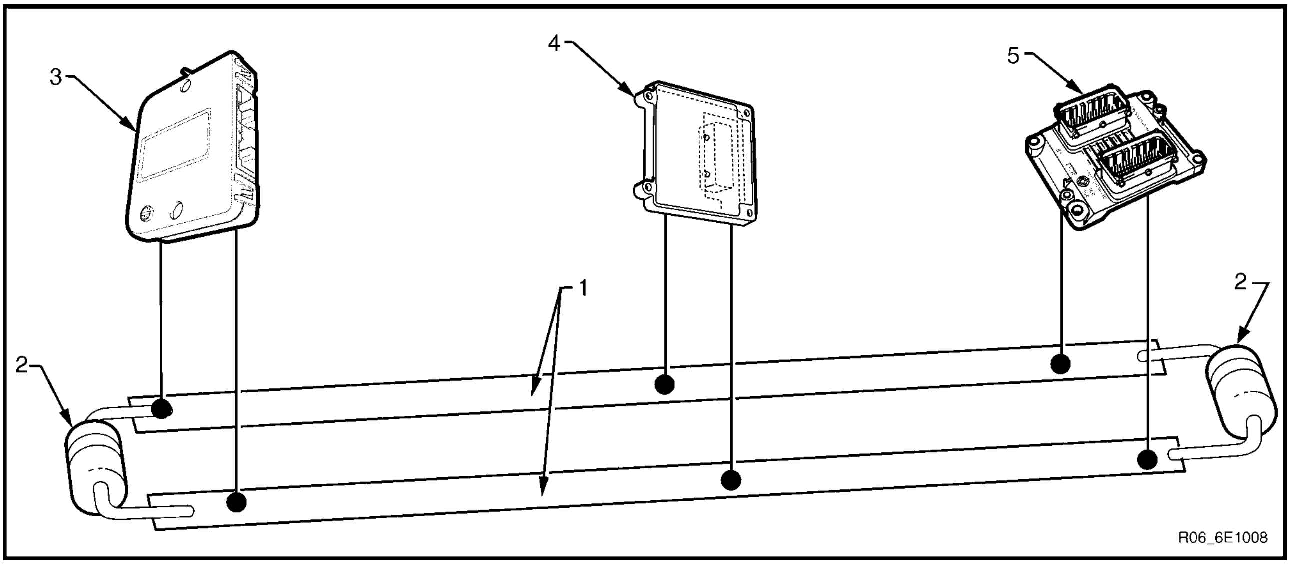

Figure 6E1 – 1

3	Powertrain Interface Module (PIM)		

Serial Data

When information is sent from one control module to another via the serial data bus, the information sent is known as serial data. Serial data in its electronic form, is made up of rapidly changing high to low voltage pulses strung together. Each string of voltage pulses represents a message.

- GM LAN serial data has two data lines along which serial data is sent. These lines are known as CAN_HI and CAN_LO.
  - CAN HI – The CAN HI data line is a 3.6 V data line that toggles the voltage between 2.5 V and 3.6 V (referenced to ground). When there is no communication on the CAN HI data line, the system voltage is 2.5 V.
  - CAN LO – The CAN LO data line is a 2.5 V data line that toggles the voltage between 2.5 V and 1.4 V (referenced to ground). When there is no communication on the CAN LO data line, the system voltage is 2.5 V.

Serial Data Communication Protocols

General Motors Local Area Network (GM LAN)

GM LAN is a communication protocol based on the Controller Area Network physical layer. The main difference between GM LAN and CAN is the way in which the messages are structured.

Serial Data Layout

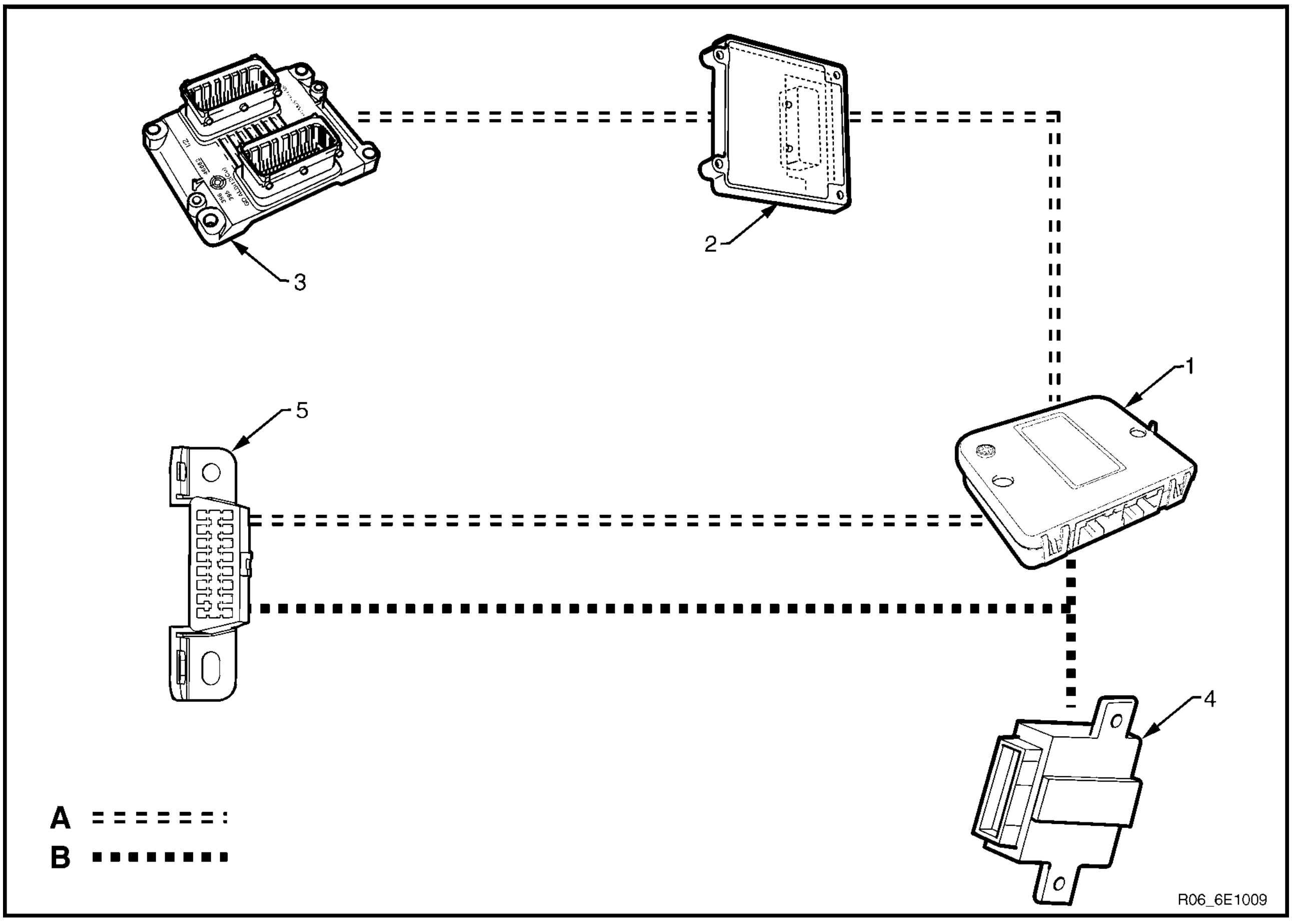

Figure 6E1 – 2

Legend

2	Transmission Control Module (TCM)	A	GM LAN Serial Data Circuit
3	Engine Control Module (ECM)	B	Keyword 2000 Serial Data Circuit
4	Immobiliser Control Unit (ICU)		

NOTE

Serial data Components shown in Figure 6E1 – 2 will vary depending on vehicle options.

1.2 Warning Caution and Notes

This Section contains various WARNINGS, CAUTIONS and NOTE statements that you must observe carefully to reduce the risk of death or injury during service, repair procedures or vehicle operation. Incorrect service or repair procedures may damage the vehicle or cause operational faults. WARNINGS, CAUTION and NOTE statements are not exhaustive. GM HOLDEN LTD can not possibly warn of all the potentially hazardous consequences of failure to follow these instructions.

Definition of WARNING, CAUTION and NOTE Statements

Diagnosis and repair procedures in this Section contain both general and specific WARNING, CAUTION and NOTE statements. GM HOLDEN LTD is dedicated to the presentation of service information that helps the technician to diagnose and repair the systems necessary for proper operation of the vehicle. Certain procedures may present a hazard to the technician if they are not followed in the recommended manner. WARNING, CAUTION and NOTE statements are designed to help prevent these hazards from occurring, but not all hazards can be foreseen.

Inspection and Repair

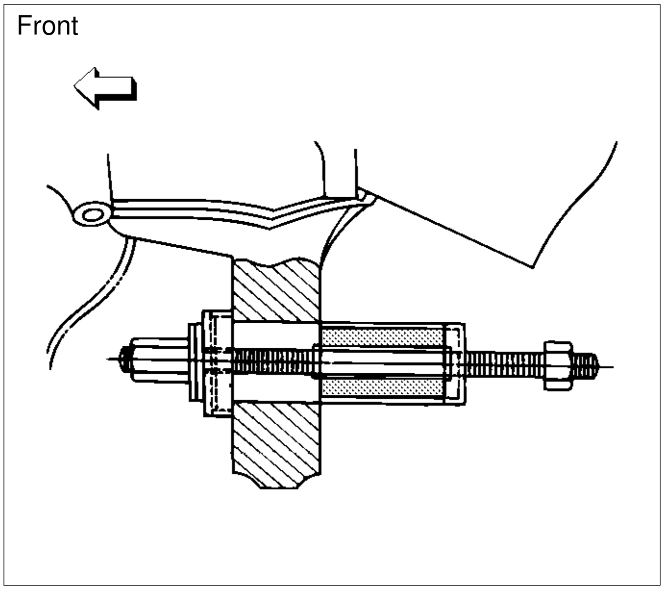
Make necessary correction or replace parts if wear, damage, corrosion or any other abnormal condition is found through inspection.

Check the following parts:

- Lower control arm
- Bushing

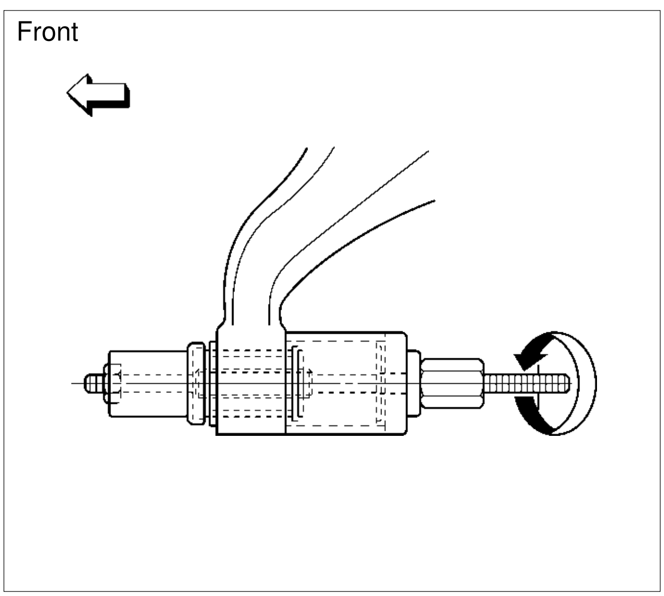
Installation

1. Install rear bushing by using installer 5-8840-2124-0.



901RW053

2. Install front bushing by using installer 5-8840-2123-0.



901RW156

3. Install lower ball joint bolt.
4. Install torsion bar arm bolt.
5. Install lower control arm.
6. Install rear bolt.
7. Install cam bolt so the hole and projection are upward.
8. Install lower ball joint and tighten it to the specified torque.

Torque: 127 N·m (13.0 kgf·m/94 lb·ft)

9. Install shock absorber and tighten it to the specified torque.

Torque: 93 N·m (9.5 kgf·m/69 lb·ft)

10. Install stabilizer link and tighten it to the specified torque.

Torque: 50 N·m (5.1 kgf·m/37 lb·ft)

11. Install torsion bar arm bracket and tighten it to the specified torque.

Torque: 116 N·m (11.8 kgf·m/85 lb·ft)

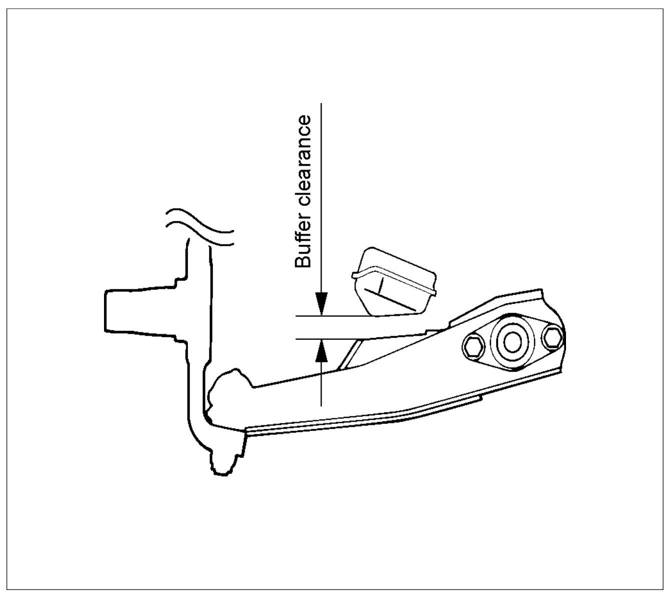
12. Install Torsion bar; refer to Torsion Bar in this section.
13. Install rear nut and tighten nut finger-tight.

NOTE: Apply oil to the thread.

NOTE: Tighten the nut or bolt with the parts in the position shown in the illustration below.

Buffer clearance: 29.7 mm (1.17 in)

Torque: 235 N·m (24.0 kgf·m/174 lb·ft)



RTW53ASH000301

WARNING defined

A WARNING statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in death or injury. A WARNING statement alerts you to take necessary action or not to take a prohibited action. If a WARNING statement is ignored, the following consequences may occur:

- Death or injury to the technician or other personnel working on the vehicle,
- Death or injury to other people in or near the workplace area, and / or
- Death or injury to the driver / or passenger(s) of the vehicle or other people, if the vehicle has been improperly repaired.

CAUTION defined

A CAUTION statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in damage to or destruction of equipment, or corruption of data. If a CAUTION statement is ignored, the following consequences may occur:

- Damage to the vehicle,
- Unnecessary vehicle repairs or component replacement,
- Faulty operation or performance of any system or component being repaired,
- Damage to any system or components which depend on the proper operation of the system or component being repaired,
- Faulty operation or performance of any systems or components which depend on the proper operation or performance of the system or component under repair,
- Damage to fasteners, basic tools or special tools and / or
- Leakage of coolant, lubricant or other vital fluids.

NOTE defined

A NOTE statement immediately precedes or follows an operating procedure, maintenance practice or condition that requires highlighting. A NOTE statement also emphasises necessary characteristics of a diagnostic or repair procedure. A NOTE statement is designed to:

- Clarify a procedure,
- Present additional information for accomplishing a procedure,
- Give insight into the reasons for performing a procedure in the recommended manner, and / or
- Present information that gives the technician the benefit of past experience in accomplishing a procedure with greater ease.

3	3rd Start Switch – Automatic Transmission	6	Transmission Control Module (TCM)

NOTE

Components shown in Figure 6E1 – 4 will vary depending on vehicle options.

3 Component Description and Operation

3.1 Powertrain Interface Module

The powertrain interface module (PIM) is located behind the right-hand lower hinge pillar trim.

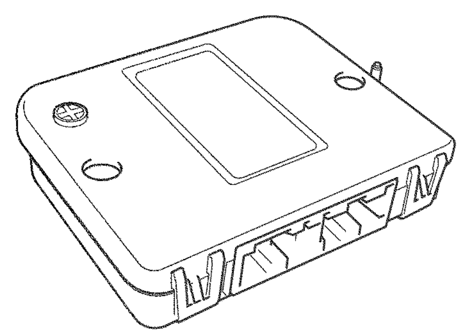

Figure 6E1 – 5

The PIM performs the following functions:

- The PIM acts as the communication gateway between the GM LAN communications protocol and keyword 2000 protocol.
- The PIM converts analogue signals from the cruise control switches into digital serial data.
- The PIM upon inputs received from the engine control module (ECM), transmission control module (TCM) and immobiliser control unit (ICU) controls the operation of the following instruments and warning lamps:
  - Speedometer
  - Tachometer
  - Check Transmission Lamp
  - 3rd Gear Start Lamp
  - Power Mode Switch Lamp
  - Automatic Transmission Oil Temp Lamp
  - Cruise Set Lamp
  - Oil Pressure Lamp
  - Service Vehicle Soon (SVS) Lamp
  - Charge Warning Lamp
  - PRNDL Lamps
- The PIM is responsible for authenticating the immobiliser control unit (ICU) prior to the engine control module (ECM) authenticating the PIM. If any of these authentication processes fail, the vehicle will not start. For further information on the immobiliser system, refer to 11A Immobiliser System.

3.2 Powertrain Interface Module Gateway Components

Engine Control Module

The ECM is located at the right front of the engine assembly.

The ECM communicates directly with the transmission control module (TCM) and PIM via the serial data network.

The ECM is also an integral part of the vehicle security system. For further information on vehicle security, refer to 11A Immobiliser System.

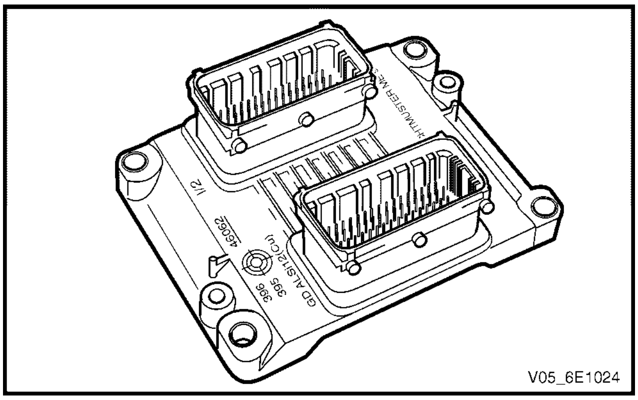

Figure 6E1 – 6

Immobiliser Control Unit

The immobiliser control unit (ICU) is mounted to the left of the steering column.

The ICU in conjunction with the, powertrain interface module (PIM) and engine control module (ECM) immobilises the engine. The ICU communicates with the ECM via the PIM. Refer to 11A Immobiliser for further information on the immobiliser system.

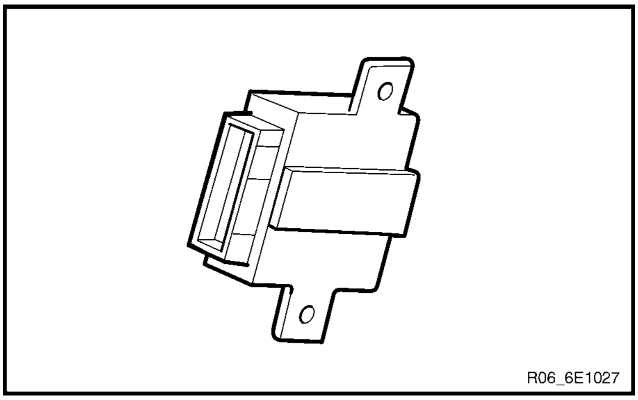

Figure 6E1 – 7

Automatic Transmission Control Module

The transmission control module (TCM) is located under the right-hand rear drivers seat, beneath the carpet.

The TCM's primary role is to efficiently control transmission shift points according to current driving and vehicle operating conditions. To effectively do this, the TCM requires information from other vehicle systems such as the engine management and automatic transmission systems.

This information exchanged is achieved by connecting the various system control modules via the serial data network. For further information on the serial data network, refer to 1 General Information.

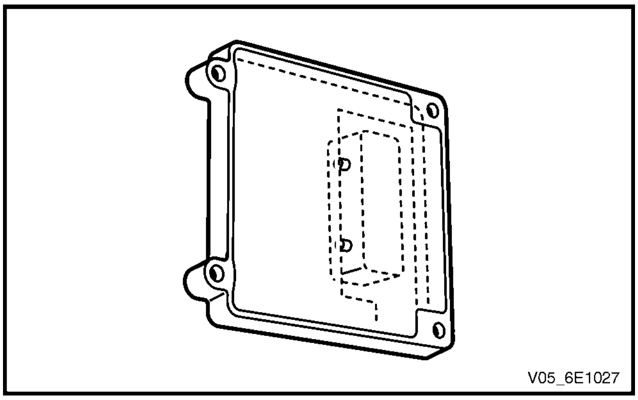

Figure 6E1 – 8

3.3 Powertrain Interface Module Direct Input Switches

The following switches are direct wired to the PIM. These switches use the PIM to convert their input signals into serial data, which is then used by the various vehicle control modules to perform varying functions.

Cruise Control Switch

The cruise control switch is located on the left-hand side of the steering column.

The switch is comprised of three momentary contact switches which control the following functions:

- cruise control push button switch (ON–OFF),
- cruise control resume – accelerate (RES–ACCEL), and
- cruise control set – decelerate (SET–DECEL).

The three cruise control switches directly input into the PIM. When any of these switches are activated, the PIM sends a message on the serial data bus to the ECM. For further information on the cruise control system, refer to 8C Cruise Control – HFV6.

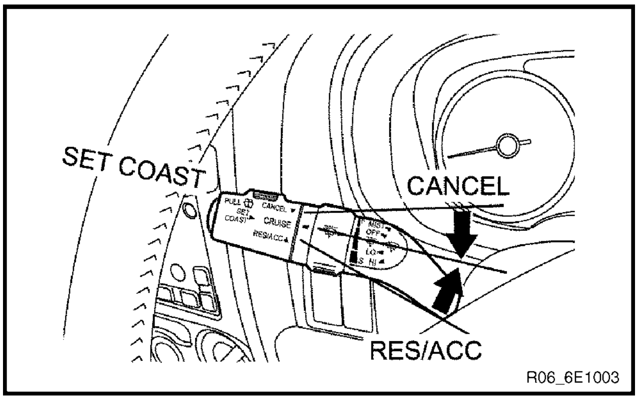

Figure 6E1 – 9

Power Mode Switch – Automatic Transmission

The power mode switch is located at the front of the floor console, forwards of the 3rd start switch.

The power mode switch is an on-off rocker type switch that changes the transmission shift points. The power mode switch inputs directly into the PIM. When the switch is in the on position, the PIM sends a message on the serial data bus to the Transmission Control Module (TCM). For further information on the automatic transmission, refer to:

7C1 Automatic Transmission – 4L60E – General Information.

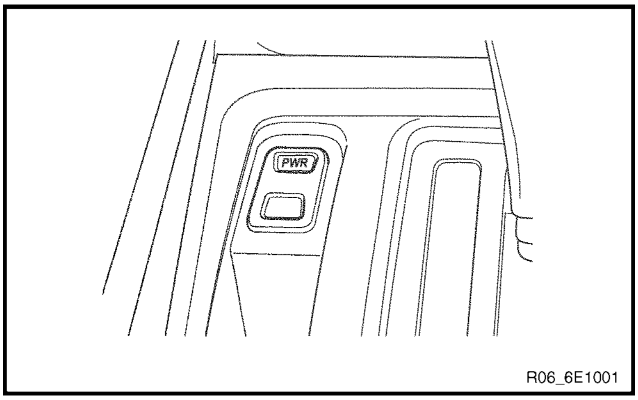

Figure 6E1 – 10

3rd Start Switch – Automatic Transmission

The 3rd start switch is located at the front of the floor console, behind the power mode switch.

The 3rd start switch is a momentary contact switch that enables the vehicle to be driven from the stationery position in 3rd. The 3rd start switch inputs directly into the PIM. When the switch is pressed, the PIM sends a message on the serial data bus to the transmission control module (TCM). For further information on the automatic transmission, refer to 7C1 Automatic Transmission – 4L60E – General Information.

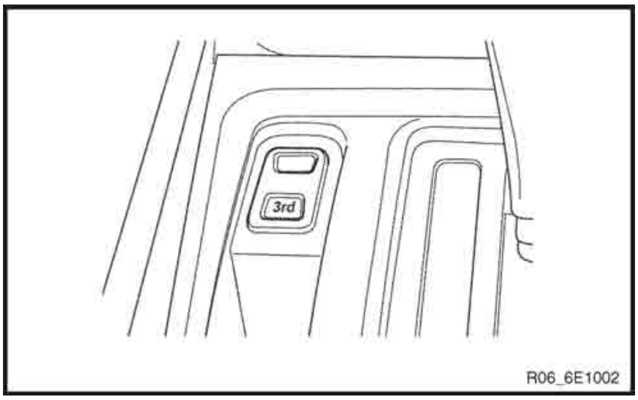

Figure 6E1 – 11

4 Diagnostics

4.1 Diagnostic General Descriptions

The powertrain interface module (PIM) diagnostic procedure is organised in a logical structure that begins with the Diagnostic System Check. The Diagnostic System Check directs the diagnostic procedure to the logical steps or appropriate diagnostic table required to diagnose a PIM fault condition.

The diagnostic tables locate a faulty circuit or component through a logical based process of elimination. Correct use of the diagnostic tables is essential to reduce diagnostic time and to prevent misdiagnosis.

In addition, the Diagnostic System Check provides the following information:

- identification of the PIM,
- condition of the diagnostic circuit, and
- identification and status of the DTCs if present.

Diagnostic Trouble Code (DTC) Tables

The diagnostic procedure is directed to a diagnostic trouble code (DTC) table if there are DTCs currently stored in the PIM.

The diagnostic tables are designed to locate a faulty circuit or component through a logical based process of elimination. The diagnostic tables are developed with the following assumptions:

- the vehicle functioned correctly at the time of assembly,
- there are no multiple faults, and
- the problem currently exists.

Multiple DTCs

When performing a DTC check and there are multiple DTCs, the diagnostic process must begin with the most likely DTC that may trigger other DTCs.

Knowledge of the PIM and Tech 2 limitations are important to reduce diagnostic time and to prevent misdiagnosis. Refer to 7.1 Diagnostic Requirements, Precautions and Preliminary Checks.

Diagnostic Trouble Codes (DTCs)

When the ignition switch is turned on, the PIM performs an internal integrity check that detects and isolates any internal faults. The PIM also monitors the direct input switches such as the cruise control and the serial data bus for messages from the control modules on the GM LAN bus. If a fault is detected by the PIM, it will log a Diagnostic Trouble Code (DTC) that represents the fault detected. The DTCs stored in the PIM may be accessed using Tech 2.

Status of DTCs

The PIM designates the DTCs logged into a Current or History DTC.

Current DTCs

If the fault condition that triggers the DTC is present during the last PIM self test, that DTC will be designated as a current DTC.

History DTCs

If the fault condition that triggers the DTC is not present during the last PIM self test, that DTC will be designated as a history DTC.

Conditions for Clearing DTCs

- If there is no DTC logged in the current PIM self test, the current DTC will be cleared.
- If there is no DTC logged after 100 consecutive drive cycles, the history DTC will be cleared.

Tech 2 PIM Diagnostic Tests

Tech 2 Limitations

Some DTCs trigger other DTCs to set, which causes Tech 2 to display multiple DTCs. In those situations, Tech 2 may display more DTCs than is needed to rectify a fault.

When Tech 2 displays an output function, it displays only the command given by the PIM. If a connector is disconnected, that fault will not register in the PIM output function. Tech 2 does not verify the command action.

The service technician must understand the system being diagnosed as well as the correct use and limitations of Tech 2 to be able to perform diagnostic procedures efficiently and successfully.

Tech 2 Intermittent Fault Tests

The following are lists of Tech 2 diagnostic tests that may be used to diagnose intermittent faults:

- Wiggle test the suspected PIM wiring harness and connector while observing Tech 2 operating parameters of the circuit being tested. If Tech 2 read-out fluctuates during this procedure, check the wiring harness circuit for loose connection.
- Road test the vehicle in conditions that trigger the intermittent fault while an assistant observes the suspected Tech 2 operating parameter data.
- Capture and store data in the Snapshot mode when the fault occurs. The stored data may be replayed at a slower rate to aid in diagnostics. Refer to Tech 2 User Instructions for more information on the Snapshot function.
- Operate suspected components to test their operation using Tech 2 Output Control Data.

7 Diagnostics Starting Point

7.1 Diagnostic Requirements, Precautions and Preliminary Checks

Basic Knowledge Required

CAUTION

A lack of basic understanding of electronics, electrical wiring circuits and use of electrical circuit testing tools when performing the PIM diagnostic procedures could result in incorrect diagnostic results or damage to components.

In addition, understanding of the Engine Management System is essential to prevent misdiagnosis and component damage. Refer to 6C1-1 Engine Management – V6 – General Information.

Basic Diagnostic Tools Required

CAUTION

Use of incorrect electrical circuit diagnostic tools when performing the PIM diagnostic procedures could result in incorrect diagnostic results or damage to components.

The following electrical circuit testing tools are required to perform the diagnostic procedures detailed in this Section:

- Tech 2.
- Test lamp, refer to 8A Electrical - Body and Chassis for further information.
- Digital multimeter with 10 MΩ impedance, refer to 8A Electrical - Body and Chassis for further information.
- Connector test adapter kit Tool No. J35616-A.

Diagnostic Precautions

CAUTION

In addition to the safety and precautionary measures listed in 11.1 Safety and Precautionary Measures, the following diagnostic precautions must be observed when performing any PIM diagnostic procedure:

- Use only the test equipment specified in the diagnostic tables. Other test equipment may either give incorrect results or damage serviceable components.
- Do not clear any DTCs unless instructed.
- The fault must be present when using the DTC Diagnostic Tables. Otherwise, misdiagnosis or replacement of serviceable parts may occur.
- Always use connector adapters such as those contained in connector test adapter kit Tool No. J35616-A to prevent connector terminal damage.

- Thorough inspection of the wiring circuits and connectors listed in the diagnostic procedures must be performed, otherwise misdiagnosis may occur.
- Inspect the electrical circuitry or connector terminals that are suspected to be causing the complaint for the following conditions:
  - backed-out connector terminals,
  - improper wiring connector mating,
  - broken wiring connector locks,
  - damaged connector terminals, and
  - physical damage to the wiring harness.
- Before replacing a component, inspect its connector terminal for corrosion or deformation that may cause the fault condition.

Preliminary Checks

The PIM preliminary check examines easily accessible components which may cause problems with the PIM. This visual and physical inspection procedure may quickly identify the fault condition and eliminate the need for additional diagnosis.

- Refer to Service Techlines for relevant information regarding the fault condition.
- Ensure the battery is fully charged.
- Check the battery connections for corrosion or a loose terminal.
- Perform a visual and physical inspection of the following:
  - PIM component wiring harness and terminals for proper connections, pinches or cuts, and
  - PIM wiring harness routing which may be positioned very close to a high voltage or high current devices such as aftermarket audio systems.

NOTE

High voltage or high current devices may induce electrical noise on a circuit, which can interfere with normal circuit operation.

  - The PIM is sensitive to Electro Magnetic Interference (EMI). Check for incorrect aftermarket theft deterrent devices, lights or mobile phone installations if an intermittent malfunction is suspected.

7.2 Diagnostic System Check

Step	Action	Yes	No
1	Have you met the basic diagnostic requirements listed in the PIM Diagnostic Starting Point?	Go to Step 2	Refer to 7.1 Diagnostic Requirements, Precautions and Preliminary Checks
2	Have you read the Diagnostic Precautions?	Go to Step 3	Refer to 7.1 Diagnostic Requirements, Precautions and Preliminary Checks
3	Have you performed the Preliminary Checks?	Go to Step 4	Refer to 7.1 Diagnostic Requirements, Precautions and Preliminary Checks

Step	Action	Yes	No
4	Using Tech 2, attempt to communicate with the PIM. Does Tech 2 communicate with the PIM?	Go to Step 5	Refer to 7.3 Powertrain Interface Module – Module Communication Check Failure Diagnostic Table
5	Using Tech 2, view and record all DTCs. Does Tech 2 display any DTCs?	Go to Step 6	Refer to Intermittent Fault Conditions.
6	Does DTC C0550 fail this ignition cycle?	Refer to 9.1 DTC C0550 – PIM Internal Fault Diagnostic Table	Go to Step 7
7	Does DTC U2100 fail this ignition cycle?	Refer to 9.2 DTC U2100 – No Communication With CAN Bus (High Speed) Diagnostic Table	Go to Step 8
8	Does DTC U2106 fail this ignition cycle?	Refer to 9.4 DTC U2106 – CAN Bus No Communication With Transmission Control Module	Go to Step 9
9	Does DTC U2105 fail this ignition cycle?	Refer to 9.3 DTC U2105 – CAN Bus No Communication With Engine Control Module Diagnostic Table	Go to Step 10
10	Does Tech 2 display multiple DTCs?	Refer to the DTC Table of the fault condition that is most likely to trigger multiple DTCs. Refer to 4.1 Diagnostic General Descriptions for information on multiple DTCs fault condition	Refer to the relevant DTC table
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

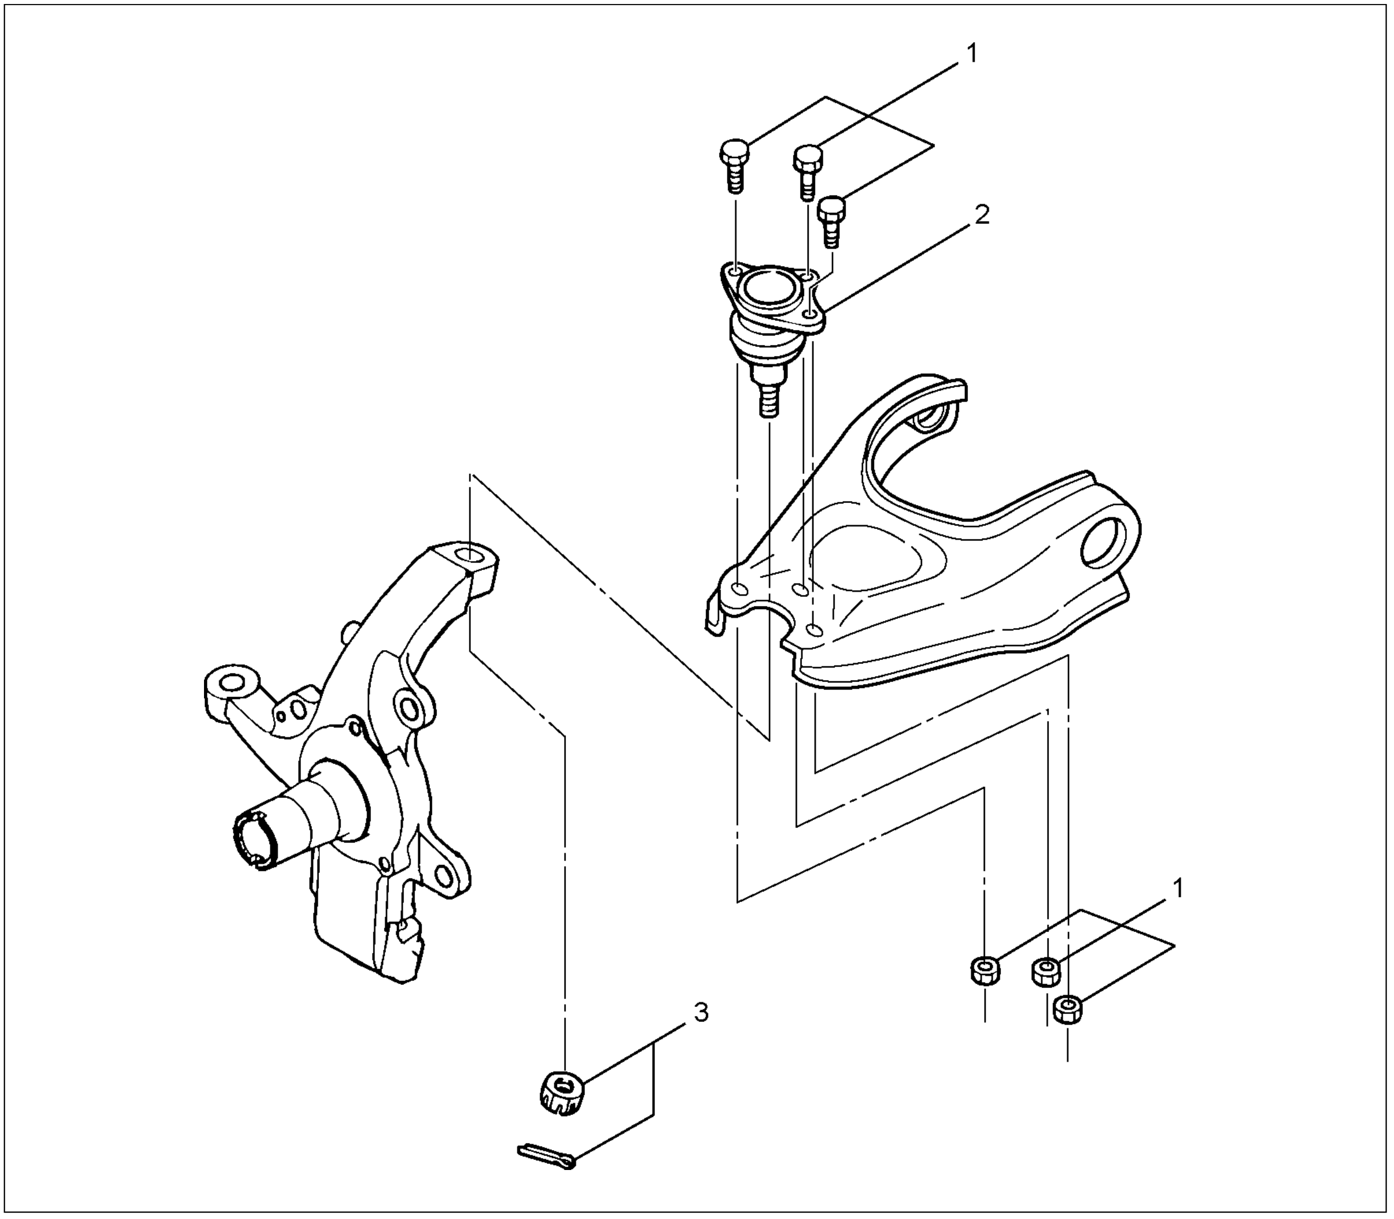
7.3 Powertrain Interface Module – Module Communication Check Failure Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 7.2 Diagnostic System Check
2	Test the following PIM circuits for a high resistance, open circuit or short to ground fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical diagnosis: • 12 V battery supply circuit, • 12 V ignition circuit, and • ground circuit. Has any fault been found and rectified?	Go to Step 10	Go to Step 3
3	1 Disconnect the ECM harness connector. 2 Switch off the ignition for 10 seconds. 3 Using Tech 2, attempt to communicate with the PIM. **NOTE** Other DTCs may set when the ECM connector is disconnected and the ignition is switched on. Disregard DTCs that set under this condition on this DTC Table. Does Tech 2 communicate with the PIM?	Go to Step 4	For vehicles with automatic transmissions, go to Step 5. For vehicles with manual transmission go to Step 8
4	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Has the repair been completed?	Go to Step 10	—
5	1 Disconnect the TCM harness connector. 2 Switch off the ignition for 10 seconds. 3 Using Tech 2, attempt to communicate with the PIM. Does Tech 2 communicate with the PIM?	Go to Step 6	Go to Step 8
6	Test serial data circuits between the TCM and ECM for a short to voltage, short to ground or short together condition. Has any fault been found and rectified?	Go to Step 10	Go to Step 7
7	Replace the TCM. Refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Has the repair been completed?	Go to Step 10	—
8	Test serial data circuits between the PIM and ECM for vehicles with manual transmission, or between the PIM and TCM for vehicles with automatic transmission for a high resistance or open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on wiring circuit testing and repair. Has any fault been found and rectified?	Go to Step 10	Go to Step 9
9	Replace the PIM. Refer to 11.2 Powertrain Interface Module. Has the repair been completed?	Go to Step 10	—
10	Using Tech 2, attempt to communicate with the PIM. Does Tech 2 communicate with the PIM?	Go to Step 11	Refer to 7.2 Diagnostic System Check

Step	Action	Yes	No
11	1 Using Tech 2, clear all DTCs. 2 Switch off the ignition for 30 seconds. 3 Check for DTCs. Does Tech 2 display any PIM DTCs?	Refer to 7.2 Diagnostic System Check	Go to Step 7
12	Does Tech 2 display any other DTCs?	Refer to the appropriate Section	System OK
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

Upper Ball Joint

Upper Ball Joint and Associated Parts



RTW440LF001401

Legend

(1) Bolt and Nut

(2) Upper Ball Joint

(3) Nut and Cotter Pin

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove the speed sensor from the knuckle.
3. Remove upper ball joint nut and cotter pin, then use remover 5-8840-2121-0 to remove the upper ball joint from the knuckle.

Intermittent Fault Conditions

8.1 Intermittent Conditions Diagnostic Table

Description

A fault condition is intermittent if one of the following conditions exists:

- The fault condition is not always present.
- The fault condition cannot be presently duplicated.
- There is no Current DTC but a History DTC is stored.

Diagnostic Table

Checks	Actions

Preliminary	• Perform the Preliminary Checks, refer to 7.1 Diagnostic Requirements, Precautions and Preliminary Checks.
	• Gather information from the customer regarding the conditions that trigger the intermittent fault such as:
	  • At what engine or ambient temperature range does the fault occur?
	  • Does the fault occur when operating aftermarket electrical equipment inside the vehicle?
	  • Does the fault occur on rough roads or in wet road conditions?
	• If the intermittent fault is a start and then stall condition, check immobiliser system. Refer to 11A Immobiliser.

Harness / Connector	Install Tech 2 and perform the Tech 2 Intermittent Fault Tests. Refer to 4.1 Diagnostic General Descriptions for information on Tech 2 ECU diagnostic tests.

Warning Indicator	The following conditions may cause an intermittent Malfunction Indicator Lamp fault with no DTC listed:
	• Electromagnetic Interference (EMI) caused by a faulty relay, ECM controlled solenoid, switch or other external source.
	• Incorrect installation of aftermarket electrical equipment such as the following:
	  • mobile phones,
	  • theft deterrent alarms,
	  • lights, or
	  • radio equipment.
	• Loose PIM ground connections.

Checks	Actions
Temperature Related	The Tech 2 Freeze Frame / Failure Records or Snapshot data may be used if applicable to the fault condition. Refer to 4.1 Diagnostic General Descriptions for information on Tech 2 ECU diagnostic tests. • If the intermittent fault is heat related, review the Tech 2 data in relationship to the following: • high ambient temperature, • underhood / engine generated heat, • circuit generated heat due to a poor electrical connection or high electrical load, and • higher than normal load conditions (towing, etc.). • If the intermittent fault is related to cold ambient or engine temperature, review the Tech 2 data in relationship to the following: • low ambient temperature, and • the fault condition that occurs only on a cold start situation.
Additional Tests	• Check for incorrect installation of aftermarket electrical equipment such as the following: • mobile phones, • theft deterrent alarms, • lights, or • radio equipment. • Check for electromagnetic Interference (EMI) caused by a faulty relay, ECM controlled solenoid or switch. The fault is triggered when the relay or solenoid is activated. • Check the A/C compressor clutch and some relays that contain a clamping diode or resistor for an open circuit. • Check the generator for a faulty rectifier bridge that may allow A/C noise into the PIM electrical circuit.
When all diagnosis and repairs are completed, check the engine management system for correct operation.	

9 DTC Tables

9.1 DTC C0550 – PIM Internal Fault

DTC Description

This diagnostic procedure supports the following DTCs:

- DTC C0550 – EEPROM Error.
- DTC C0550 – Internal Control Module Read Only Memory (ROM Error).
- DTC C0550 – Internal Control Module Random Access Memory (RAM) Error.

Circuit Description

The powertrain interface module (PIM) is the control centre for the communication language conversion between GM LAN serial data and keyword 2000 serial data. If there is an internal microprocessor integrity fault condition with the PIM, DTC C0550 will set.

Additional Information

- Refer to 6 Wiring Diagram and Connector Chart for the following information:
  - PIM connector illustration and terminal assignment, and
  - PIM wiring diagram.
- For intermittent fault conditions, refer to Intermittent Fault Conditions.
- Since fault conditions in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

Conditions for Running the DTC

- Conditions for running the DTC are:
  - The ignition is switched on.
  - The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

An internal PIM fault exists.

Action Taken When the DTC Sets

The action taken when any of these DTCs set will depend on the severity of the error. This may vary from no visual or audible warnings to a Malfunction Indicator Lamp and / or Service Vehicle Soon warning lamp displayed on the instrument cluster.

Conditions for Clearing the DTC

Refer to 4.1 Diagnostic General Descriptions for information on the conditions for clearing DTCs.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 This step checks if the DTC is current, and if so, indicates the PIM has an internal problem.

3 This step checks the PIM ground and 12 V battery supply.

DTC C0550 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 7.2 Diagnostic System Check
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for setting DTC C0550. 3 Using Tech 2, select the DTC display function. Does C0550 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this Section
3	1 Test all ground circuits of the PIM for a high resistance or an open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. 2 Test the PIM fuses and replace as required. Refer to 8A Electrical-Body and Chassis. 3 Test the PIM battery supply voltage circuit for a high resistance, open circuit or short to ground fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Has any fault been found and rectified?	Go to Step 5	Go to Step 4
4	Replace the PIM. Refer to 11.2 Powertrain Interface Module. Has the repair been completed?	Go to Step 5	—
5	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC C0550 fail this ignition cycle?	Go to Step 2	Go to Step 6
6	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table	System OK
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

9.2 DTC U2100 – No Communication With CAN Bus (High Speed)

DTC Description

This diagnostic procedure supports DTC U2100 – CAN Bus-off.

Circuit Description

The transmission control module (TCM) and engine control module (ECM) transmit and receive data using the GM LAN serial data protocol, while the immobiliser control unit (ICU) uses Keyword 2000 serial data protocol.

As the GM LAN and keyword 2000 protocols are not compatible, a powertrain interface module (PIM) is integrated into the serial data system to enable communication between the two different protocols. The PIM also integrates with the instrument cluster assembly.

The PIM will detect if a short to ground or a short to voltage condition occurs on GM LAN circuits. If either of these conditions occur, DTC U2100 sets.

Additional Information

- Refer to 6 Wiring Diagram and Connector for the following information:

- PIM connector illustration and terminal assignment, and
- PIM wiring diagram.

- For intermittent fault conditions, refer to Intermittent Fault Conditions.
- Since fault conditions in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

Conditions for Running the DTC

Conditions for running the DTC are:

- The ignition is switched on.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

The PIM detects a short to ground or short to voltage on the GM LAN circuits when the ignition is switched on and the short condition exists for greater than five seconds.

NOTE

This DTC will only set when the ignition has initially been turned to the ON position, and will not set when the vehicle is being driven.

Action Taken When the DTC Sets

- When the DTC sets, the following warning lamps are displayed on the instrument cluster:
  - Malfunction Indicator Lamp, and
  - Service Vehicle Soon.

Conditions for Clearing the DTC

Refer to 4.1 Diagnostic General Descriptions for information on the conditions for clearing DTCs.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

3 This step establishes if there is a fault with the ECM.

6 This step tests GM LAN serial data circuits between the TCM and the ECM.

8 This step tests GM LAN serial data circuits between the PIM and ECM (vehicles with manual transmission) or PIM and TCM (vehicles with automatic transmission).

9 This step tests GM LAN serial data circuits between the PIM and the data link connector.

DTC U2100 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 7.2 Diagnostic System Check

Step	Action	Yes	No
2	1 Switch off the ignition for 10 seconds. 2 Operate the vehicle within the conditions for setting DTC U2100. 3 Using Tech 2, select the DTC display function. Does DTC U2100 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this Section
3	1 Disconnect the ECM harness connector. 2 Switch off the ignition for 10 seconds. 3 Operate the vehicle within the conditions for setting DTC U2100. 4 Using Tech 2, select the DTC display function and check if DTC U2100 fails this ignition cycle. **NOTE** Other DTCs may set when the ECM connector is disconnected and the ignition is switched on. Disregard DTCs that set under this condition on this DTC Table. Does DTC U2100 fail this ignition cycle?	For vehicles with automatic transmissions, go to Step 5. For vehicles with manual transmission go to Step 8	Go to Step 4
4	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Has the repair been completed?	Go to Step 11	—
5	1 Disconnect the TCM harness connector. 2 Switch off the ignition for 10 seconds. 3 Using Tech 2, attempt to communicate with the PIM. Does Tech 2 communicate with the PIM?	Go to Step 6	Go to Step 8
6	Test serial data circuits between the TCM and ECM for a short to voltage, short to ground or short together condition. Refer to 8A Electrical - Body and Chassis for information on wiring circuit testing and repair. Has any fault been found and rectified?	Go to Step 11	Go to Step 7
7	Replace the TCM. Refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing Has the repair been completed?.	Go to Step 11	—
8	Test serial data circuits between the PIM and ECM for vehicles with manual transmission, or between the PIM and TCM for vehicles with automatic transmission for a high resistance or open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on wiring circuit testing and repair. Has any fault been found and rectified?	Go to Step 11	Go to Step 9
9	Test serial data circuits and between the PIM and the data link connector for a short to voltage, short to ground or short together condition. Refer to 8A Electrical - Body and Chassis for information on wiring circuit testing and repair. Has any fault been found and rectified?	Go to Step 11	Go to Step 10
10	Replace the PIM. Refer to 11.2 Powertrain Interface Module. Has the repair been completed?	Go to Step 11	—

Step	Action	Yes	No
11	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC U2100 fail this ignition cycle?	Go to Step 2	Go to Step 12
12	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table	System OK
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

9.3 DTC U2105 – CAN Bus No Communication With Engine Control Module

DTC Description

This diagnostic procedure supports DTC U2105 – CAN Bus No Communication From ECM (Engine Control Module).

Circuit Description

The transmission control module (TCM) and engine control module (ECM) transmit and receive data using the GM LAN serial data protocol, while the immobiliser control unit (ICU) uses Keyword 2000 serial data protocol.

As the GM LAN and keyword 2000 protocols are not compatible, a powertrain interface module (PIM) is integrated into the serial data system to enable communication between the two different protocols. The PIM also integrates with the instrument cluster assembly.

The PIM continuously receives messages from the ECM. If the PIM does not receive a message within a predetermined time, DTC U2105 sets.

Additional Information

- Refer to 6 Wiring Diagram and Connector for the following information:
  - PIM connector illustration and terminal assignment, and
  - PIM wiring diagram.
- Refer to 6C1-2 Engine Management – V6 – Diagnostics for diagnostic information.
- For intermittent fault conditions, refer to Intermittent Fault Conditions.
- Since fault conditions in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

Conditions for Running the DTC

Conditions for running the DTC are:

- The ignition is switched on.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

The PIM does not receive a message from the ECM for 100 milliseconds.

Action Taken When the DTC Sets

- When the DTC sets, the following warning lamps may be displayed on the instrument cluster:

- Malfunction Indicator Lamp,
- Service Vehicle Soon

Conditions for Clearing the DTC

Refer to 4.1 Diagnostic General Descriptions for information on the conditions for clearing DTCs.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

4 This step tests GM LAN serial data circuits and the GM LAN component closest to the ECM.

5 This step tests the integrity of the ECM 12 V ignition circuit and ground connections.

6 This step tests the internal GM LAN CAN_HI circuit in the GM LAN component.

7 This step tests the internal GM LAN CAN_LO circuit in the GM LAN component.

DTC U2105 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 7.2 Diagnostic System Check
2	1 Switch off the ignition for 10 seconds. 2 Operate the vehicle within the conditions for setting DTC U2105. 3 Using Tech 2, select the DTC display function. Does DTC U2105 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this Section
3	Using Tech 2, attempt to communicate with the ECM. Does Tech 2 communicate with the ECM?	Go to Step 10	Go to Step 4
4	Test serial data circuits between the ECM and PIM (vehicles with manual transmission), or ECM and TCM (vehicles with automatic transmission) for a high resistance or open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on wiring circuit testing and repair. Has any fault been found and rectified?	Go to Step 11	Go to Step 5
5	Test the following ECM circuits for a high resistance, open circuit or short to ground fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical diagnosis: • 12 V battery supply circuit, • 12 V accessory supply circuit, and • all ECM ground connections. Has any fault been found and rectified?	Go to Step 11	Go to Step 6

Step	Action	Yes	No
6	1 Disconnect the PIM harness connector (vehicles with manual transmission), or TCM harness connector (vehicles with automatic transmission). 2 Using a digital multimeter, measure the resistance between the two CAN_LO terminals of either the PIM or TCM. **NOTE** Refer to 5 GM LAN Serial Communication Circuit and 6 Wiring Diagram and Connector for the appropriate GM LAN component terminal identification. Does the digital multimeter display infinity?	Go to Step 8	Go to Step 7
7	Using a digital multimeter, measure the resistance between the two CAN_HI terminals of either the PIM (vehicles with manual transmission) or TCM (vehicles with automatic transmission). Does the digital multimeter display infinity?	Go to Step 8	Go to Step 9
8	Replace the PIM (vehicles with manual transmission) or TCM (vehicles with automatic transmission). Refer to one of the following for the component replacement procedure: • 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing, or • 11.2 Powertrain Interface Module. Has the repair been completed?	Go to Step 11	—
9	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Has the repair been completed?	Go to Step 11	—
10	Replace the PIM. Refer to 11.2 Powertrain Interface Module. Has the repair been completed?	Go to Step 11	—
11	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC U2105 fail this ignition cycle?	Go to Step 2	Go to Step 12
12	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table	System OK

When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.

9.4 DTC U2106 – CAN Bus No Communication With Transmission Control Module

DTC Description

This diagnostic procedure supports DTC U2106 – CAN Bus No Communication With TCM (Transmission Control Module).

Circuit Description

The transmission control module (TCM) and engine control module (ECM) transmit and receive data using the GM LAN serial data protocol, while the immobiliser control unit (ICU) uses Keyword 2000 serial data protocol.

As the GM LAN and keyword 2000 protocols are not compatible, a powertrain interface module (PIM) is integrated into the serial data system to enable communication between the two different protocols. The PIM also integrates with the instrument cluster assembly.

The PIM continuously receives messages from the TCM. If the PIM does not receive a message within a predetermined time, DTC U2106 sets.

Additional Information

- Refer to 6 Wiring Diagram and Connector for the following information:
  - PIM connector illustration and terminal assignment, and
  - PIM wiring diagram.
- For intermittent fault conditions, refer to Intermittent Fault Conditions.
- Since fault conditions in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

Conditions for Running the DTC

Conditions for running the DTC are:

- The ignition is switched on.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

The PIM does not receive a message from the TCM for 1000 milliseconds, during the current ignition cycle.

Action Taken When the DTC Sets

- When the DTC sets, the following warning lamps may be displayed on the instrument cluster:
  - Malfunction Indicator Lamp,
  - Service Vehicle Soon.

Conditions for Clearing the DTC

Refer to 4.1 Diagnostic General Descriptions for information on the conditions for clearing DTCs.

Test Description

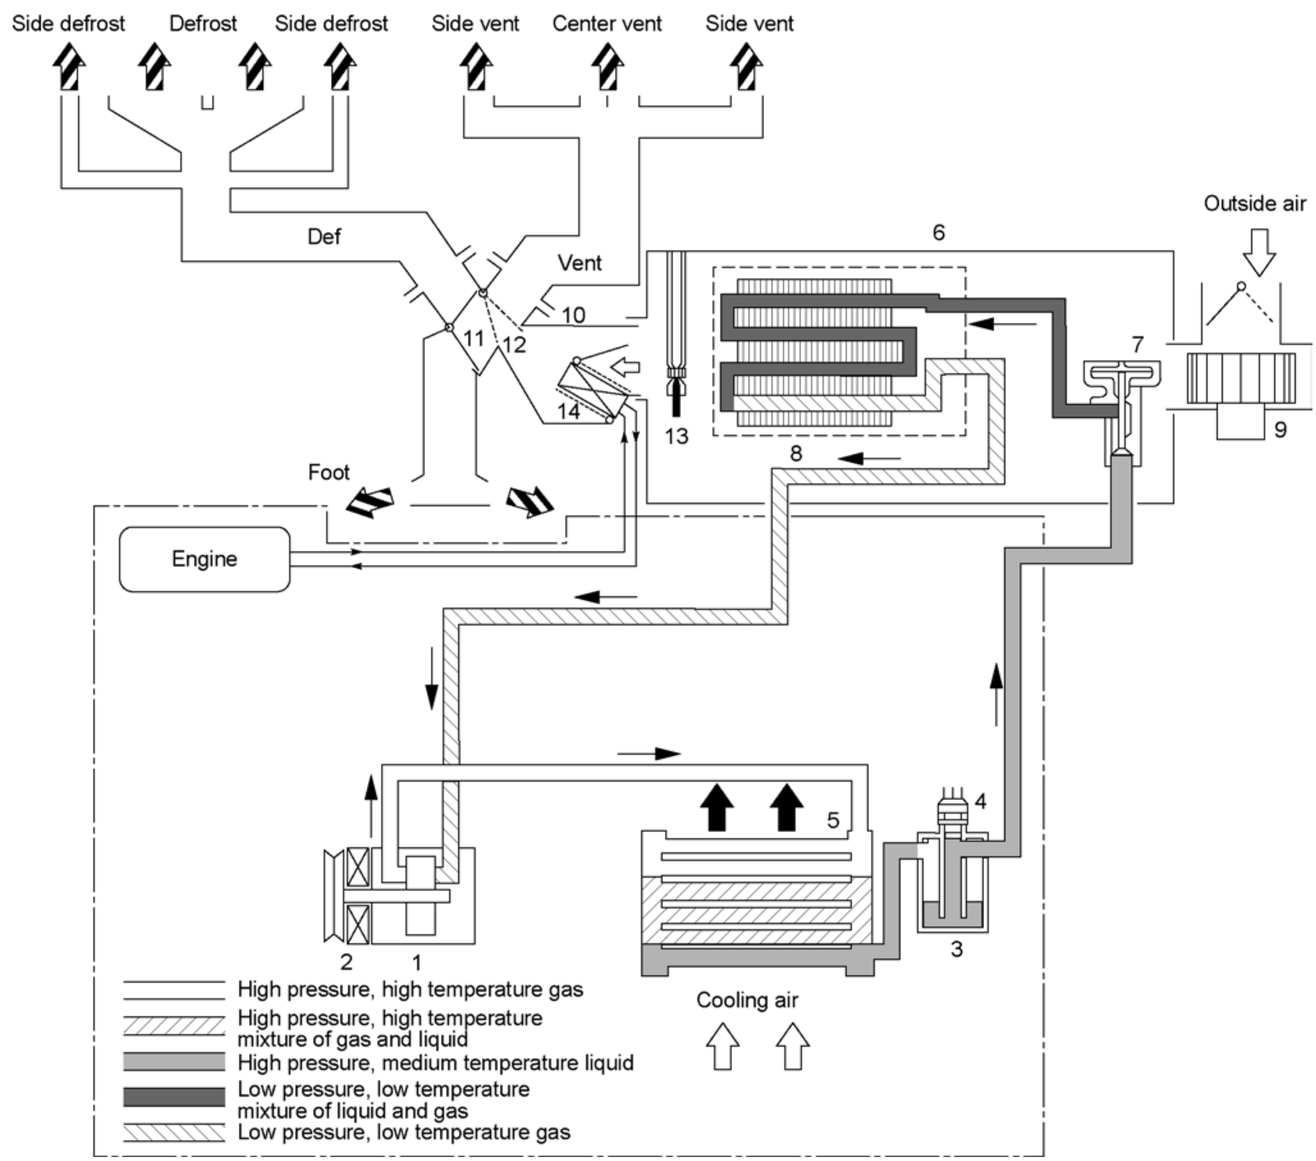
The following numbers refer to the step numbers in the diagnostic table:

4 This step tests the TCM power and ground circuits.

5 This step tests GM LAN serial data circuits between the TCM and the PIM.

GENERAL DESCRIPTION

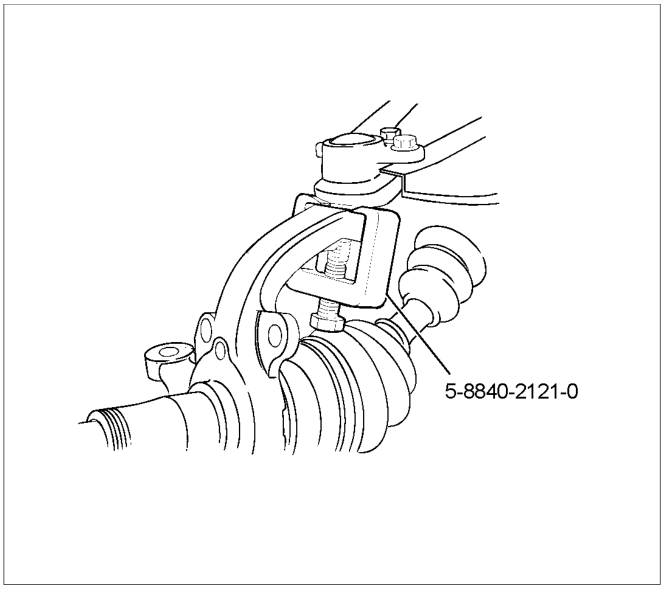
COOLING SYSTEM



1.	Compressor	8.	Evaporator core
2.	Magnetic clutch	9.	Blower motor
3.	Receiver/Drier	10.	Heater unit
4.	Triple pressure switch	11.	Mode (DEF/FOOT) control door
5.	Condenser	12.	Mode (VENT) control door
6.	Evaporator assembly	13.	Electronic thermostat
7.	Expansion valve	14.	Heater core

RTW610LF000101

CAUTION: Be careful not to damage the ball joint boot.



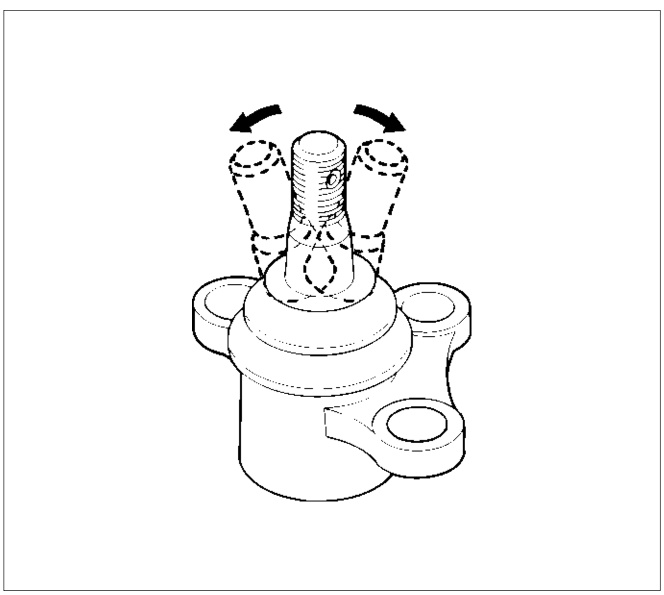
RTW340SH000401

4. Remove bolt and nut.
5. Remove upper ball joint.

Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal conditions are found through inspection.

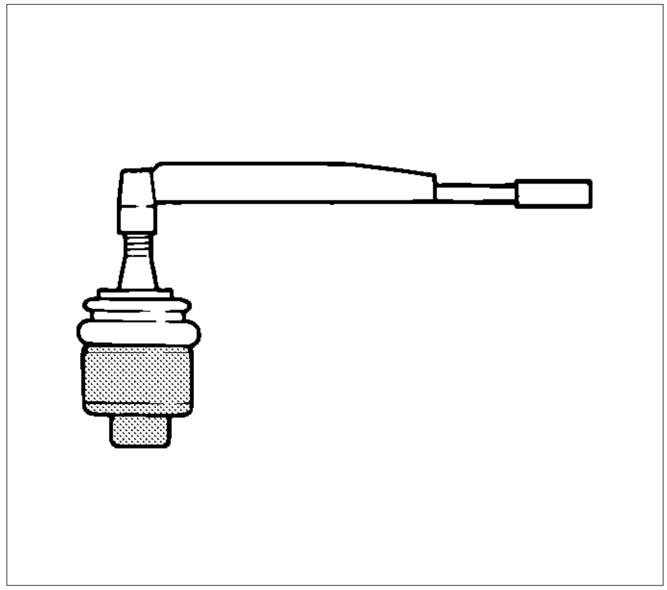
- Inspect the lower end boot for damage or grease leak. Move the ball joint as shown in the figure to confirm its normal movement.
- Inspect screw/taper area of ball for damage.
- If any defects are found by the above inspections, replace the ball joint assembly with new one.



450RS023

- After moving the ball joint 4 or 5 times, attach nut, then measure the preload.

Starting torque: 1.3-3.2 N·m (0.13-0.33 kgf·m/0.9-2.4 lb·ft)



450RS024

If the above limits specified are exceeded, replace the ball joint assembly.

Installation

1. Install upper ball joint.
2. Install bolt and nut, and then tighten them to the specified torque.

Torque: 57 N·m (5.8 kgf·m/42 lb·ft)

3. Install nut and cotter pin, and then tighten the nut to the specified torque with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 98 N·m (10.0 kgf·m/72 lb·ft)

6 This step tests the internal GM LAN CAN_HI circuit in the PIM.

7 This step tests the internal GM LAN CAN_LO circuit in the PIM.

DTC U2106 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 7.2 Diagnostic System Check
2	1 Switch off the ignition for 10 seconds. 2 Operate the vehicle within the conditions for setting DTC U2106. 3 Using Tech 2, select the DTC display function. Does DTC U2106 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this Section
3	Using Tech 2, attempt to communicate with the TCM. Does Tech 2 communicate with the TCM?	Go to Step 9	Go to Step 4
4	Test the following TCM circuits for a high resistance, open circuit or short to ground fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical diagnosis: • 12 V battery supply voltage circuit, • 12 V accessory supply circuit, • Ignition Control Relay 12 V supply circuit, and • all TCM ground connections. Has any fault been found and rectified?	Go to Step 10	Go to Step 5
5	Test serial data circuits between the TCM and PIM for a high resistance or open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on wiring circuit testing and repair. Has any fault been found and rectified?	Go to Step 10	Go to Step 6
6	1 Disconnect the PIM harness connector. 2 Using a digital multimeter, measure the resistance between the two CAN_LO terminals of the PIM. **NOTE** Refer to 5 GM LAN Serial Communication Circuit and 6 Wiring Diagram and Connector for the appropriate GM LAN component terminal identification. Does the digital multimeter display infinity?	Go to Step 9	Go to Step 7
7	Using a digital multimeter, measure the resistance between the two CAN_HI terminals of the PIM. Does the digital multimeter display infinity?	Go to Step 9	Go to Step 8
8	Replace the TCM. Refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Has the repair been completed?	Go to Step 10	—
9	Replace the PIM. Refer to 11.2 Powertrain Interface Module. Has the repair been completed?	Go to Step 10	—

Step	Action	Yes	No
10	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC U2106 fail this ignition cycle?	Go to Step 2	Go to Step 11
11	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table	System OK
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

9.5 DTC B0565 – Coolant Temperature Gauge Circuit High Current

Information not available at time of publication

9.6 DTC B0575 – Fuel Gauge Circuit High Current

Information not available at time of publication

9.7 DTC B3598 – Cruise Control Cancel Signal Malfunction

DTC Description

This diagnostic procedure supports DTC B3628 – Cruise Control Cancel Switch Stuck.

Circuit Description

The cruise control cancel switch is a normally open switch that closes when the switch is activated. When activated, the switch supplies signal voltage to the cruise control cancel signal circuit. The powertrain interface module (PIM) converts the signal voltage input into serial data, which is used by the engine control module (ECM) to cancel cruise control operation.

Additional Information

- Refer to 8C Cruise Control – HFV6 for the following information:
  - Cruise control switch description, operation and inspection procedures, and
  - Cruise control wiring diagram.
- Refer to 6 Wiring Diagram and Connector for the following information:
  - PIM connector illustration and terminal assignment, and
  - PIM wiring diagram.
- For intermittent fault conditions, refer to Intermittent Fault Conditions.
- Since fault conditions in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

Conditions for Running the DTC

Conditions for running the DTC are:

- The ignition is switched on.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

The PIM detects the cruise control cancel function of the cruise control switch assembly is in the CANCEL position for 120 seconds or more.

Action Taken When the DTC Sets

When the DTC sets, there is no warning lamp displayed on the instrument cluster.

If the cruise control is active at the time the DTC sets, the PIM will disable cruise control.

Conditions for Clearing the DTC

Refer to 4.1 Diagnostic General Descriptions for information on the conditions for clearing DTCs.

NOTE

If the fault is not evident for greater than 120 seconds, the DTC will become a history DTC and cruise control can be resumed.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 This step tests the cruise control cancel switch using Tech 2.

6 This step tests the cruise control cancel switch signal circuit.

DTC B3628 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 7.2 Diagnostic System Check
2	Using Tech 2, view the cruise control cancel switch status parameter in the PIM data list. Does Tech 2 display **Active**?	Go to Step 4	Go to Step 3
3	1 Switch off the ignition for 10 seconds. 2 Operate the vehicle within the conditions for setting DTC B3628. 3 Using Tech 2, select the DTC display function. Does DTC B3628 fail this ignition cycle?	Go to Step 4	Refer to Additional Information in this Section
4	1 Disconnect connector B-59 from the cruise control switch assembly. 2 Using Tech 2, view the cruise control cancel switch status parameter in the PIM data list. Does Tech 2 display **Active**?	Go to Step 6	Go to Step 5
5	Replace the cruise control switch assembly, refer to 8C Cruise Control – HFV6. Has the repair been completed?	Go to Step 8	—
6	Test the cruise control cancel switch signal circuit for a short to voltage. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Has any fault been found and rectified?	Go to Step 8	Go to Step 7
7	Replace the PIM. Refer to 11.2 Powertrain Interface Module. Has the repair been completed?	Go to Step 8	—
8	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC B3628 fail this ignition cycle?	Go to Step 2	Go to Step 9
9	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table	System OK
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

9.8 DTC B3627 – Cruise Control Resume Signal Malfunction

DTC Description

This diagnostic procedure supports DTC B3627 – Cruise Control Resume Switch Stuck.

Circuit Description

The cruise control resume switch is a normally open switch that closes when the switch is activated. When activated, the switch supplies signal voltage to the cruise control resume signal circuit. The powertrain interface module (PIM) converts the signal voltage input into serial data, which is used by the engine control module (ECM) to resume cruise control operation.

Additional Information

- Refer to 8C Cruise Control – HFV6 for the following information:
  - Cruise control switch description, operation and inspection procedures, and
  - Cruise control wiring diagram.
- Refer to 6 Wiring Diagram and Connector for the following information:
  - PIM connector illustration and terminal assignment, and
  - PIM wiring diagram.
- For intermittent fault conditions, refer to Intermittent Fault Conditions.
- Since fault conditions in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

Conditions for Running the DTC

Conditions for running the DTC are:

- The ignition is switched on.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

The PIM detects the cruise control resume function of the cruise control switch assembly is in the RESUME position for 120 seconds or more.

Action Taken When the DTC Sets

When the DTC sets, there is no warning lamp displayed on the instrument cluster.

If the cruise control is active at the time the DTC sets, the PIM will disable cruise control.

Conditions for Clearing the DTC

Refer to 4.1 Diagnostic General Descriptions for information on the conditions for clearing DTCs.

NOTE

If the fault is not evident for greater than 120 seconds, the DTC will become a history DTC and cruise control can be resumed.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 This step tests the cruise control resume switch using Tech 2.

6 This step tests the cruise control resume switch signal circuit.

DTC B3627 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 7.2 Diagnostic System Check
2	Using Tech 2, view the cruise control resume switch status parameter in the PIM data list. Does Tech 2 display **Res** / **Accel**?	Go to Step 4	Go to Step 3
3	1 Switch off the ignition for 10 seconds. 2 Operate the vehicle within the conditions for setting DTC B3627. 3 Using Tech 2, select the DTC display function. Does DTC B3627 fail this ignition cycle?	Go to Step 4	Refer to Additional Information in this Section
4	1 Disconnect connector B-59 from the cruise control switch assembly. 2 Using Tech 2, view the cruise control resume switch status parameter in the PIM data list. Does Tech 2 display **Res** / **Accel**?	Go to Step 6	Go to Step 5
5	Replace the cruise control switch assembly, refer to 8C Cruise Control – HFV6. Has the repair been completed?	Go to Step 8	—
6	Test the cruise control resume switch signal circuit for a short to voltage. 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Has any fault been found and rectified?	Go to Step 8	Go to Step 7
7	Replace the PIM. Refer to 11.2 Powertrain Interface Module. Has the repair been completed?	Go to Step 8	—
8	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC B3627 fail this ignition cycle?	Go to Step 2	Go to Step 9
9	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table	System OK
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

9.9 DTC B3628 – Cruise Control Set Signal Malfunction

DTC Description

This diagnostic procedure supports DTC 3598 – Cruise Control Set Switch Stuck.

Circuit Description

The cruise control set switch is a normally open switch that closes when the switch is activated. When activated, the switch supplies signal voltage to the cruise control set signal circuit. The powertrain interface module (PIM) converts the signal voltage input into serial data, which is used by the engine control module (ECM) to set the vehicle speed.

Additional Information

- Refer to 8C Cruise Control – HFV6 for the following information:
  - Cruise control switch description, operation and inspection procedures, and
  - Cruise control wiring diagram.
- Refer to 6 Wiring Diagram and Connector for the following information:
  - PIM connector illustration and terminal assignment, and
  - PIM wiring diagram.
- For intermittent fault conditions, refer to Intermittent Fault Conditions.
- Since fault conditions in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

Conditions for Running the DTC

Conditions for running the DTC are:

- The ignition is switched on.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

The PIM detects the cruise control set function of the cruise control switch assembly is in the SET position for 120 seconds or more.

Action Taken When the DTC Sets

When the DTC sets, there is no warning lamp displayed on the instrument cluster.

If the cruise control is active at the time the DTC sets, the PIM will disable cruise control.

Conditions for Clearing the DTC

Refer to 4.1 Diagnostic General Descriptions for information on the conditions for clearing DTCs.

NOTE

If the fault is not evident for greater than 120 seconds, the DTC will become a history DTC and cruise control can be resumed.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 This step tests the cruise control set switch using Tech 2.

6 This step tests the cruise control set switch signal circuit.

DTC 3598 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 7.2 Diagnostic System Check
2	Using Tech 2, view the cruise control set switch status parameter in the PIM data list. Does Tech 2 display **Active**?	Go to Step 4	Go to Step 3
3	1 Switch off the ignition for 10 seconds. 2 Operate the vehicle within the conditions for setting DTC 3598. 3 Using Tech 2, select the DTC display function. Does DTC 3598 fail this ignition cycle?	Go to Step 4	Refer to Additional Information in this Section
4	1 Disconnect connector B-59 from the cruise control switch assembly. 2 Using Tech 2, view the cruise control set switch status parameter in the PIM data list. Does Tech 2 display **Active**?	Go to Step 6	Go to Step 5
5	Replace the cruise control switch assembly, refer to 8C Cruise Control – HFV6. Has the repair been completed?	Go to Step 8	—
6	Test the cruise control set switch signal circuit for a short to voltage. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Has any fault been found and rectified?	Go to Step 8	Go to Step 7
7	Replace the PIM. Refer to 11.2 Powertrain Interface Module. Has the repair been completed?	Go to Step 8	—
8	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC 3598 fail this ignition cycle?	Go to Step 2	Go to Step 9
9	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table	System OK
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

9.10 DTC B3794 – Cruise Control On/Off Signal Malfunction

DTC Description

This diagnostic procedure supports DTC B3794 – Cruise Control On/Off Switch Stuck.

Circuit Description

The cruise control on / off switch is a normally open switch that closes when the switch is activated. When activated, the switch supplies signal voltage to the cruise control on signal circuit. The powertrain interface module (PIM) converts the signal voltage input into serial data, which is used by the engine control module (ECM) to enable or disable the cruise control system, and by the instrument cluster to display cruise control status.

Additional Information

- Refer to 8C Cruise Control – HFV6 for the following information:
  - Cruise control switch description, operation and inspection procedures, and
  - Cruise control wiring diagram.
- Refer to 6 Wiring Diagram and Connector for the following information:
  - PIM connector illustration and terminal assignment, and
  - PIM wiring diagram.
- For intermittent fault conditions, refer to Intermittent Fault Conditions.
- Since fault conditions in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

Conditions for Running the DTC

Conditions for running the DTC are:

- The ignition is switched on.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

The PIM detects the cruise control on / off function of the cruise control on/off switch is in the ON position for 120 seconds or more.

Action Taken When the DTC Sets

When the DTC sets, there is no warning lamp displayed on the instrument cluster.

If the cruise control is active at the time the DTC sets, the PIM will disable cruise control.

Conditions for Clearing the DTC

Refer to 4.1 Diagnostic General Descriptions for information on the conditions for clearing DTCs.

NOTE

If the fault is not evident for greater than 120 seconds, the DTC will become a history DTC and cruise control can be resumed.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 This step tests the cruise control on / off switch using Tech 2.

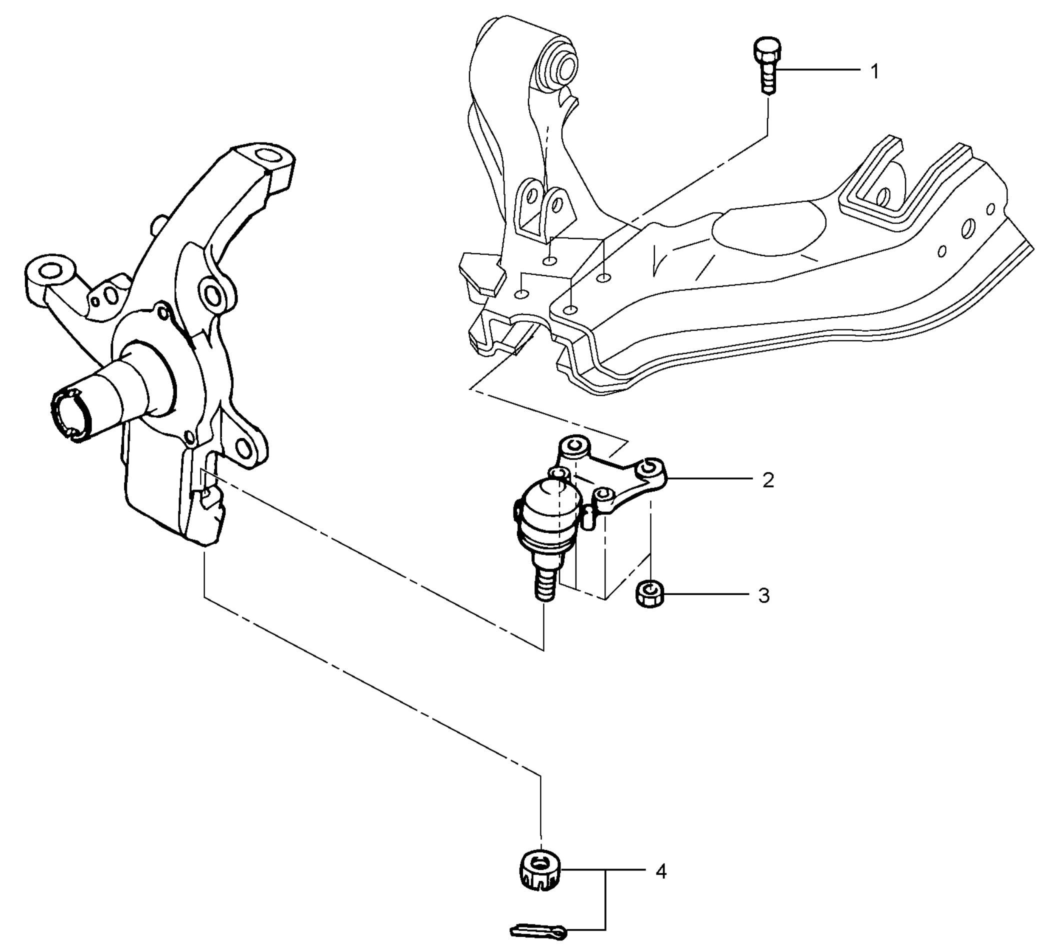
6 This step tests the cruise control on / off switch signal circuit.

DTC B3794 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 7.2 Diagnostic System Check
2	Using Tech 2, view the cruise control on / off switch status parameter in the PIM data list. Does Tech 2 display **Active**?	Go to Step 4	Go to Step 3
3	1 Switch off the ignition for 10 seconds. 2 Operate the vehicle within the conditions for setting DTC B3794. 3 Using Tech 2, select the DTC display function. Does DTC B3794 fail this ignition cycle?	Go to Step 4	Refer to Additional Information in this Section
4	1 Disconnect connector B-67 from the cruise control on/off switch. 2 Using Tech 2, view the cruise control on / off switch status parameter in the PIM data list. Does Tech 2 display **Active**?	Go to Step 6	Go to Step 5
5	Replace the cruise control on/off switch, refer to 8C Cruise Control – HFV6. Has the repair been completed?	Go to Step 8	—
6	Test the cruise control on / off switch signal circuit for a short to voltage. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Has any fault been found and rectified?	Go to Step 8	Go to Step 7
7	Replace the PIM. Refer to 11.2 Powertrain Interface Module. Has the repair been completed?	Go to Step 8	—
8	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC B3794 fail this ignition cycle?	Go to Step 2	Go to Step 9
9	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table	System OK
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

Lower Ball Joint

Lower Ball Joint and Associated Parts



RTW340LF001601

Legend

(1) Lower Ball Joint Bolt
(2) Lower Ball Joint
(3) Lower Ball Joint Nut
(4) Nut and Cotter Pin

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel in this section.
3. Remove the tie-rod end from the knuckle. Refer to Power Steering Unit in Steering section.
4. Remove the retaining ring from the front axle driving shaft to release the shaft from hub. Refer to Front Hub and Disc in Driveline/Axle section.
5. Support lower control arm with a jack.
6. Remove lower ball joint nut and cotter pin, then use remover 5-8840-2005-0 to remove the lower ball joint from the knuckle.

9.11 DTC B3902 – Immobiliser Malfunction

DTC Descriptors

This diagnostic procedure supports DTC B3902 – Immobiliser Malfunction.

Circuit Description

The engine control module (ECM), the powertrain interface module (PIM) and the immobiliser control unit (ICU) are integral parts of the vehicle immobiliser system. The immobiliser system authenticates the security code programmed into each of these modules to prevent unauthorised vehicle operation. This authentication process includes the following steps:

1 At predetermined situations, the ICU sends a security code to the PIM.

2 When the ignition is switched ON, the PIM receives and compares this security code from the ICU against the security code programmed into the PIM.

3 Once the PIM receives the correct security code from the ICU, it sends a security code to the ECM.

4 The ECM receives and compares this security code from the PIM against the security code programmed into the ECM.

5 The authentication process is complete once the ECM receives the correct security code from the PIM within the specified time frame.

6 The ECM allows normal vehicle operation.

NOTE

If any of these authentication processes fail, the vehicle will not start and DTCs will set. For further information on the immobiliser system, refer to 11A Immobiliser.

Conditions for Running the DTC

Conditions for running the DTC are:

- The ignition is switched on.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

B3902

Ignition set to the ON position.

Conditions for Clearing the DTC

Refer to 4.1 Diagnostic General Descriptions for information on the conditions for clearing DTCs.

Additional Information

- Refer to 6C1-1 Engine Management –V6 – General Information for details of the ECM operation.
- Refer to 11A Immobiliser for immobiliser system information:
- Refer to 12.4 Immobiliser Link to ECM / PIM for immobiliser link to ECM / PIM.
- Since a fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- For an intermittent fault condition, refer to Intermittent Fault Conditions in this section.

- To assist diagnosis, refer to 6 Wiring Diagram and Connector Chart for the system wiring diagram and connector charts in this section.

DTC B3902 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 7.2 Diagnostic System Check
2	Using Tech 2, perform the ICU ID check procedure. Is the ID number displayed by Tech 2?	Go to Step 3	Go to Step 5
3	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for setting the DTC. 3 Using Tech 2, select the DTC display function. Does DTC B3902 fail this ignition cycle?	Go to Step 4	Refer to Additional Information in this Section
4	Test the Immobiliser system. Refer to 11A Immobiliser. Has any fault been found and rectified?	Go to Step 8	Go to Step 7
5	1 Test all ground circuits of the ICU for a high resistance or an open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. 2 Test the ICU ignition supply voltage circuit for a high resistance, open circuit or short to ground fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Has any fault been found and rectified?	Go to Step 8	Go to Step 6
6	Replace the ICU. Refer to 11A Immobiliser. Was the repair completed?	Go to Step 8	—
7	Replace the PIM. Refer to 11.2 Powertrain Interface Module. Was the repair completed?	Go to Step 8	—
8	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Do any of the immobiliser DTCs fail this ignition cycle?	Go to Step 2	Go to Step 9
9	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table	System OK
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

9.12 DTC P0318 – Vertical Acceleration Sensor

DTC Description

This diagnostic procedure supports the Vertical Acceleration Sensor (VAS).

Circuit Description

The vertical acceleration sensor monitors vertical movement of the vehicle. The powertrain interface module (PIM) converts the signal voltage input into serial data, which is used by.

Additional Information

- Refer to 6 Wiring Diagram and Connector Chart for the following information:
  - PIM connector illustration and terminal assignment, and
  - PIM wiring diagram.
- For intermittent fault conditions, refer to Intermittent Fault Conditions.
- Since fault conditions in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

Conditions for Running the DTC

Conditions for running the DTC are:

- The ignition is switched on.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

The DTC will set when the PIM detects a low voltage of <0.41 volts for one second.

The DTC will set when the PIM detects a high voltage of >4.59 volts for one second.

Action Taken When the DTC Sets

When the DTC sets, there is no warning lamp displayed on the instrument cluster.

Conditions for Clearing the DTC

The DTC is cleared at the next ignition cycle.

Refer to 4.1 Diagnostic General Descriptions for information on the conditions for clearing DTCs.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 This step tests the vertical acceleration sensor using Tech 2.

6 This step tests the ground circuit.

Vertical Acceleration Sensor Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to additional information
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Using Tech 2, select the DTC display function. Does DTC P0318 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Switch on the ignition with the engine not running. 2 Using a digital multimeter, measure the voltage between the VAS reference circuit and a good ground. Refer to 6 Wiring Diagram and Connector Chart. Does the multimeter display approximately 5.0 V?	Go to Step 4	Go to Step 7

Step	Action	Yes	No
4	Using a digital multimeter, measure the resistance between the VAS earth circuit and a good ground. Refer to 6 Wiring Diagram and Connector Chart. Does the multimeter display approximately 5.0 Ω?	Go to Step 5	Go to Step 8
5	1 Remove the VAS from its mounting bracket on the vehicle chassis. 2 Switch on the ignition with the engine not running. 3 While rapidly moving the sensor in a vertical up and down motion, Use a digital multimeter to measure the voltage between the VAS output signal circuit and a good ground. Does the multimeter display 1.8 – 3.3 V?	Go to Step 6	Go to Step 9
6	Perform the following VAS inspection: • Inspect the sensor wiring harness for conditions that may induce electromagnetic interference. Refer to Intermittent Fault Conditions in this Section. • Inspect the sensor for incorrect sensor installation or incorrect attaching nut torque value. Refer to 11.3 Vertical Acceleration Sensor. Was any fault found and rectified?	Go to Step 11	Go to Step 7
7	Test the VAS signal circuit and 5V reference circuit for a high resistance, open circuit, short to ground, short to voltage or shorted together fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 9
8	Repair the open or high resistance fault condition in the VAS ground circuit. Refer to 8A Electrical - Body and Chassis for information on electrical repair procedures. Was the repair completed?	Go to Step 11	—
9	Replace the VAS. Refer to 11.3 Vertical Acceleration Sensor. Was the repair completed?	Go to Step 11	—
10	Replace the PIM. Refer to 11.2 Powertrain Interface Module. Was the repair completed?	Go to Step 11	—
11	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does the VAS circuit DTC fail this ignition cycle?	Go to Step 2	Go to Step 13
12	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

9.13 DTC P0500, P0502 or P0503 – Vehicle Speed Sensor Signal Malfunction

DTC Descriptors

This diagnostic procedure supports the following DTC's:

- DTC P0500 – Vehicle speed sensor open circuit, short circuit to battery voltage, short circuit to ground, or undefined error
- DTC P0502 – Vehicle speed sensor sensor low voltage
- DTC P0503 – Vehicle speed sensor intermittant fault

Circuit Description

The PIM applies the ground to the vehicle speed sensor (VSS) low reference circuit.

The VSS in conjunction with the 40X reluctor wheel generates an AC signal voltage. The amplitude and frequency of the signal generated is proportional to the vehicle speed. The PIM uses this signal from the VSS signal circuit to determine the vehicle speed.

A VSS DTC sets if the PIM detects a fault condition in the VSS signal circuit.

Conditions for Running the DTC

DTC P0500

Runs continuously once the following condition is met:

- The ignition is on and the vehicle is stationary.

DTC P0502

Runs continuously once the following condition is met:

- The first time the ignition is on and the vehicle starts to move from the stationary position.

DTC P0503

Runs continuously once the following condition is met:

- The ignition is on and the vehicle is mobile.

Conditions for Setting the DTC

DTC P0500

When the PIM reads back the 15 consecutive readings within 0.5 seconds.

DTC P0502

If the reading is >9.1 Km/Hr the DTC will be set.

DTC P0503

The DTC will set when the sensor detects an occurance of 15 times within 0.5 seconds.

Conditions for Clearing DTC

The DTC's will clear on the next ignition cycle.

Additional Information

- Refer to 7B1_Manual Transmission.

- For an intermittent fault condition, refer to Intermittent Fault Conditions in this Section.
- The VSS in conjunction with the 40X reluctor wheel generates an AC signal voltage. The amplitude and frequency of the signal generated is proportional to the vehicle speed. The PIM uses this signal from the VSS signal circuit to determine the vehicle speed.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 6 Wiring Diagram and Connector Chart in this Section, for the system wiring diagram and connector charts.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

3 The PIM supplies 2.5 V to signal circuit of the VSS circuit to reduce the Electro Magnetic interference (EMI). If the voltage is not within range, this indicates there is an PIM fault or a PIM circuit fault condition.

4 The PIM supplies 2.5 V to low reference circuit of the VSS circuit to reduce the Electro Magnetic interference (EMI). If the voltage is not within range, this indicates there is a PIM fault or a PIM circuit fault condition.

DTC P0335 to P0338 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to additional information
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Using Tech 2, select the DTC display function. Does DTC P0500, P0502, P0503 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Disconnect the VSS connector. 2 Switch on the ignition with the engine not running. 3 Using a digital multimeter, measure the voltage between the signal circuit of the sensor connector and a good ground. Does the multimeter display 2 – 3 V?	Go to Step 4	Go to Step 7
4	Using a digital multimeter, measure the voltage between the VSS low reference circuit and a good ground. Does the multimeter display 2 – 3 V?	Go to Step 5	Go to Step 7
5	Using a digital multimeter, measure the resistance between the ground shield circuit of the VSS at the PIM connector and the PIM housing. Does the multimeter display approximately 5 Ω?	Go to Step 6	Go to Step 7
6	Perform the following VSS inspection: • Inspect the sensor wiring harness for conditions that may induce electromagnetic interference. Refer to Intermittent Fault Conditions in this Section. • Inspect the sensor for incorrect sensor installation or incorrect attaching bolt torque value. Refer to 7B1_Manual Transmission. Was any fault found and rectified?	Go to Step 11	Go to Step 9

Step	Action	Yes	No
7	Test the VSS signal circuit and low reference circuit for a high resistance, open circuit, short to ground, short to voltage or shorted together fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 11	Go to Step 10
8	Repair the open or high resistance fault condition in the VSS ground shield circuit. Refer to 8A Electrical - Body and Chassis for information on electrical repair procedures. Was the repair completed?	Go to Step 11	—
9	Replace the VSS. Refer to 7B1_Manual Transmission. Was the repair completed?	Go to Step 11	—
10	Replace the PIM. Refer to 11.2 Powertrain Interface Module. Was the repair completed?	Go to Step 11	—
11	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the VSS circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 12
12	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

9.14 DTC P0633 – Immobiliser Function Not Programmed

DTC Descriptors

This diagnostic procedure supports DTC P0633 – Immobiliser Function Not Programmed.

Circuit Description

The engine control module (ECM), the powertrain interface module (PIM) and the immobiliser control unit (ICU) are integral parts of the vehicle immobiliser system. The immobiliser system authenticates the security code programmed into each of these modules to prevent unauthorised vehicle operation. This authentication process includes the following steps:

1. At predetermined situations, the ICU sends a security code to the PIM.
2. When the ignition is switched ON, the PIM receives and compares this security code from the ICU against the security code programmed into the PIM.
3. Once the PIM receives the correct security code from the ICU, it sends a security code to the ECM.
4. The ECM receives and compares this security code from the PIM against the security code programmed into the ECM.
5. The authentication process is complete once the ECM receives the correct security code from the PIM within the specified time frame.
6. The ECM allows normal vehicle operation.

NOTE

If any of these authentication processes fail, the vehicle will not start and DTCs will set. For further information on the immobiliser system, refer to 11A Immobiliser.

Conditions for Running the DTC

Conditions for running the DTC are:

- The ignition is switched on.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

P0633

An attempt is made to start the engine before the immobiliser function has been programmed into a new PIM.

Conditions for Clearing the DTC

Refer to 4.1 Diagnostic General Descriptions for information on the conditions for clearing DTCs.

Additional Information

- Refer to 6C1-1 Engine Management –V6 – General Information for details of the ECM operation.
- Refer to 11A Immobiliser for immobiliser system information:
- Refer to 12.4 Immobiliser Link to ECM / PIM for immobiliser link to ECM / PIM.
- Since a fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- For an intermittent fault condition, refer to Intermittent Fault Conditions.
- To assist diagnosis, refer to 6 Wiring Diagram and Connector Chart for the system wiring diagram and connector charts.

DTC P0633 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 7.2 Diagnostic System Check
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for setting the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0513, P1629, P1632, P0633, P1677, P1678 or P1679 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this Section
3	Using Tech 2, perform the ICU Link to ECM / PIM procedure. Refer to 12.4 Immobiliser Link to ECM / PIM. Has the linking procedure been performed correctly?	Go to Step 7	Go to Step 4
4	Test the Immobiliser system. Refer to 11A Immobiliser. Has any fault been found and rectified?	Go to Step 7	Go to Step 5

Step	Action	Yes	No
5	1 Test all ground circuits of the PIM for a high resistance or an open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. 2 Test the PIM ignition supply voltage circuit for a high resistance, open circuit or short to ground fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Has any fault been found and rectified?	Go to Step 7	Go to Step 6
6	Replace the PIM. Refer to 11.2 Powertrain Interface Module. Has the repair been completed?	Go to Step 7	—
7	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Do any of the immobiliser DTCs fail this ignition cycle?	Go to Step 2	Go to Step 8
8	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table	System OK
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

9.15 DTC P1611 – Wrong Security Code Entered

DTC Description

This diagnostic procedure supports DTC P1611 – Wrong Security Code Entered.

Circuit Description

Tech 2 is used to program the powertrain interface module (PIM). Before any programming, a security code must be entered into Tech 2. The PIM will check if the code entered is correct before continuing. If the security code is incorrect, DTC P1611 sets.

After an incorrect security code is entered, the PIM prevents any further attempts to enter a code until a predetermined wait time elapses. There are several wait time stages, and for each stage, an incorrect security code may be entered three times before the lockout time is escalated to the next stage. The lockout stages are as follows:

- Stage 1 wait time is 10 seconds.
- Stage 2 wait time is 10 seconds.
- Stage 3 wait time is 10 minutes.
- Stage 4 wait time is 20 minutes.
- Stage 5 wait time is 40 minutes.
- Stage 6 wait time is 80 minutes.

Additional Information

- Refer to 12.4 Immobiliser Link to ECM / PIM for PIM Security Code.
- Refer to 6 Wiring Diagram and Connector for the following information:
  - PIM connector illustration and terminal assignment, and
  - PIM wiring diagram.

- For intermittent fault conditions, refer to Intermittent Fault Conditions.
- Since fault conditions in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

Conditions for Running the DTC

Conditions for running the DTC are:

- The ignition is switched on.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

An incorrect security code is entered into Tech 2 when attempting to program the PIM.

Action Taken When the DTC Sets

When the DTC sets, the following action is taken:

- The vehicle will not start whilst the PIM is in a lock-out state.

NOTE

When the DTC sets, there is no warning lamp displayed on the instrument cluster.

Conditions for Clearing the DTC

Refer to 4.1 Diagnostic General Descriptions for information on the conditions for clearing DTCs.

Test Description

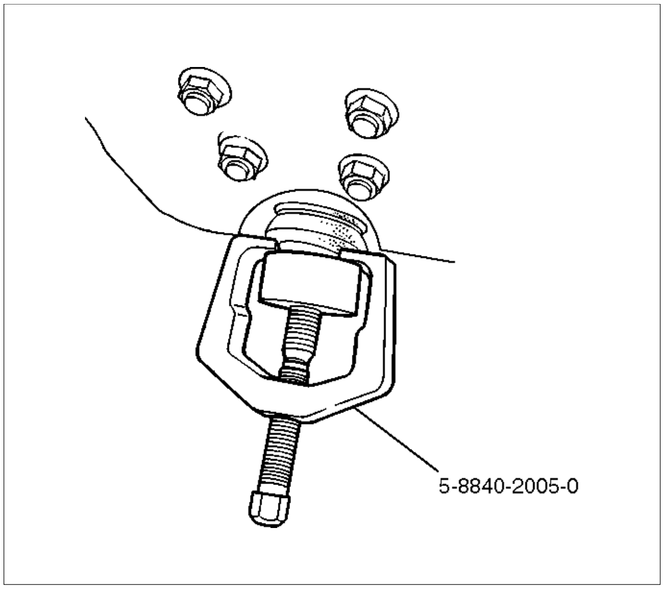
The following number refers to the step numbers in the diagnostic table:

4 This step tests the PIM ground circuits and supply voltage.

DTC P1611 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 7.2 Diagnostic System Check
2	1 Switch off the ignition for 30 seconds. 2 Using Tech 2, select the DTC display function. **NOTE** Do not attempt to perform any Tech 2 function that requires the PIM security code to be entered. Does DTC P1611 fail this ignition cycle?	Go to Step 5	Go to Step 3
3	Using Tech 2, attempt a programming function that requires the PIM security code to be entered. Refer to 12 PIM Security and Programming. Has the programming function been successfully performed?	System OK	Go to Step 4

CAUTION: Be careful not to damage the ball joint boot.



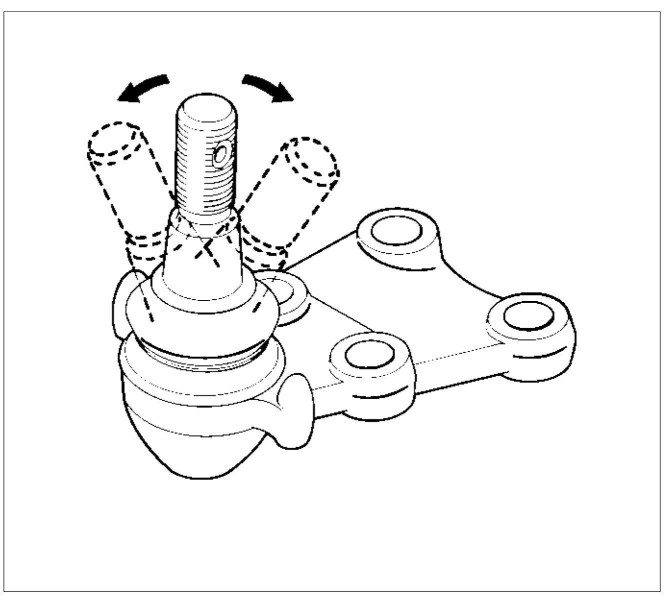
901RW271

7. Remove lower ball joint nut.
8. Remove lower ball joint bolt.
9. Remove lower ball joint.

Inspection and Repair

Make necessary parts replacement if wear, damage, corrosion or any other abnormal condition is found through inspection.

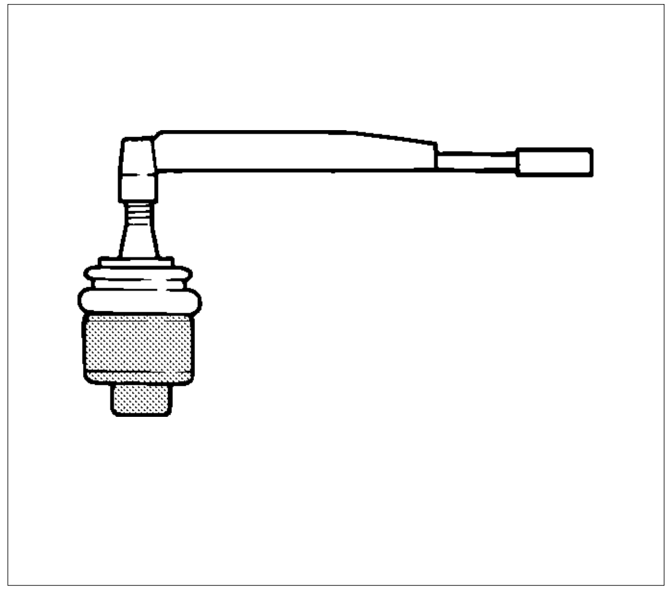
- Inspect the lower end boot for damage or grease leak. Move the ball joint as shown in the figure to confirm its normal movement.
- Inspect screw/taper area of ball for damage.
- If any defects are found by the above inspections, replace the ball joint assembly with a new one.



450RS026

- After moving the ball joint 4 or 5 times, attach nut then measure the preload.

Starting torque: 2.5-6.4 N·m (0.25-0.65 kgf·m/1.8-4.7 lb·ft)



450RS024

- If the above limits specified are exceeded, replace the ball joint assembly.

Installation

1. Install lower ball joint.
2. Install lower ball joint bolt.
3. Install lower ball joint nut and tighten it to the specified torque.

Torque: 127 N·m (13.0 kgf·m/94 lb·ft)

4. Install ball joint nut, then tighten it to the specified torque with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 147 N·m (15.0 kgf·m/108 lb·ft)

Step	Action	Yes	No
4	1 Test all ground circuits of the PIM for a high resistance or an open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. 2 Test the PIM ignition supply voltage circuit for a high resistance, open circuit or short to ground fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Has any fault been found and rectified?	Go to Step 6	Go to Step 5
5	Replace the PIM. Refer to 11.2 Powertrain Interface Module. Has the repair been completed?	Go to Step 6	—
6	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. Does DTC P1611 fail this ignition cycle?	Go to Step 2	Go to Step 7
7	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table	System OK
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

9.16 DTC B0981 – 3rd Start Switch Signal Malfunction

DTC Description

This diagnostic procedure supports DTC B0981 – 3rd Start Switch Signal Malfunction.

Circuit Description

The 3rd start mode switch is a normally open switch that closes when the switch is activated. When activated, the switch supplies signal ground to the 3rd start ground signal circuit. The powertrain interface module (PIM) converts the signal ground input into serial data, which is used by the automatic transmission control module (TCM) to enable or disable the 3rd start mode, and by the instrument cluster to display power mode status.

Additional Information

- For the 4L60E automatic transmission, refer to 7C1 Automatic Transmission – 4L60E – General Information:
  - Power mode switch description, operation and inspection procedure, and
  - TCM wiring diagram.
- Refer to 6 Wiring Diagram and Connector for the following information:
  - PIM connector illustration and terminal assignment, and
  - PIM wiring diagram.
- For intermittent fault conditions, refer to Intermittent Fault Conditions.
- Since fault conditions in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

Conditions for Running the DTC

Conditions for running the DTC are:

- The ignition is switched on.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

The PIM detects the power mode switch is activated for 120 seconds or more.

Action Taken When the DTC Sets

When the DTC sets, there is no warning lamp displayed on the instrument cluster.

Conditions for Clearing the DTC

Refer to 4.1 Diagnostic General Descriptions for information on the conditions for clearing DTCs.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 This step tests the power mode switch using Tech 2.

6 This step tests the power mode switch signal circuit.

DTC B0980 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 7.2 Diagnostic System Check
2	Using Tech 2, view the power mode switch status parameter in the PIM data list. Does Tech 2 display **Power**?	Go to Step 4	Go to Step 3
3	1 Switch off the ignition for 10 seconds. 2 Operate the vehicle within the conditions for setting DTC B0980. 3 Using Tech 2, select the DTC display function. Does DTC B0980 fail this ignition cycle?	Go to Step 4	Refer to Additional Information in this Section
4	1 Disconnect connector S22 – X1 from the power mode switch. 2 Using Tech 2, view the power mode switch status parameter in the PIM data list. Does Tech 2 display **Power**?	Go to Step 6	Go to Step 5
5	Replace the power mode switch. Refer to 10 Cab. Has the repair been completed?	Go to Step 8	—
6	Test the power mode switch ground signal circuit for a short to ground. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Has any fault been found and rectified?	Go to Step 8	Go to Step 7
7	Replace the PIM. Refer to 11.2 Powertrain Interface Module. Has the repair been completed?	Go to Step 8	—
8	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does DTC B0980 fail this ignition cycle?	Go to Step 2	Go to Step 9

Step	Action	Yes	No
9	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table	System OK
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

10 Diagnostics For Non DTC Faults

10.1 PRND32L Display Diagnostics

Circuit Description

The powertrain interface module (PIM) receives transmission gear status via the GM Lan serial data bus from the transmission control module (TCM) it is then sent to the instrument cluster by the PIM via a series of hard wired connections to illuminate the appropriate gear position indicator within the instrument cluster. Some of these components do not set a DTC, in the event of a component failure. The following diagnostic procedures are devised to assist in these cases.

Additional Information

- Refer to 7.2 Diagnostic System Check to monitor DTC's.
- Refer to 8A Electrical Body and Chassis for the following information:
  - Automatic transmission Neutral Start and Back-up Lamp Switch and wiring,
  - TCM wiring diagram.
- Refer to 6 Wiring Diagram and Connector Chart for the following information:
  - PIM connector illustration and terminal assignment, and
  - PIM wiring diagram.
- For intermittent faults, refer to Intermittent Fault Conditions.
- Check for an intermittent fault in the wiring harness or connectors, if a fault cannot be found the system is serviceable.

Since fault conditions in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

1 This step tests for DTC's in the overall system.

2 This step manually tests the PRND32L display.

4 This step uses Tech 2 to drive each indicator on.

7 This step tests for shorts to voltage.

8 This step tests neutral start and back-up lamp switch and automatic transmission.

12 This step tests the instrument cluster circuits.

15 This step manually tests the PRND32L display.

PRND32L Display Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to Diagnostic System Check in this section
2	1 Turn the ignition to the ON position. 2 Move the gear select lever through each gear position and check the instrument cluster PRND32L display. Does each indicator display an off to on condition?	Refer to Additional Information in this section	Go to Step 3
3	Are any of the indicators permanently illuminated?	Go to Step 5	Go to Step 4
4	1 Using Tech 2 select, **Body** / **PIM** / **Miscellaneous Tests** / **Status Indicators** / **PRNDL Lamps.** 2 Using the Tech 2 soft keys step through the sequence of illuminating each PRND32L indicator in turn. Does each indicator display an off to on condition?	Go to Step 8	Go to Step 10
5	Disconnect the TCM harness connector. Refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Is the indicator in Step 3 still permanently illuminated?	Go to Step 6	Go to Step 8
6	Disconnect the PIM harness connector. Refer to 11.2 Powertrain Interface Module in this Section. Is the indicator in Step 3 still permanently illuminated?	Go to Step 7	Go to Step 14
7	Turn the ignition to the ON position, test for a short to voltage of the relevant circuits from the PIM to the instrument cluster. Refer to 6 Wiring Diagram and Connector Chart. Was any fault found and rectified?	Go to step 15	Go to step 12
8	Check the neutral start and back-up lamp switch and automatic transmission for correct operation. Refer to 7C2 Automatic Transmission – 4L60E – Electrical Diagnosis. Was any fault found and rectified?	Go to Step 15	Go to 9
9	Replace the TCM. Refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Has the repair been completed?	Go to Step 15	—
10	1 Disconnect the instrument cluster harness connector. 2 Turn the ignition to the ON position. 3 While sequencing each PRND32L indicator, back probe the relevant connector pins at the rear of the instrument cluster. Refer to 6 Wiring Diagram and Connector Chart. Does the multimeter display a change from 0 to 10 Volts as each PRND32L indicator position is selected?	Go to Step 12	Go to 11
11	Test for high resistance, open circuit, a short to ground of the relevant circuits from the PIM to the instrument cluster. Refer to 6 Wiring Diagram and Connector Chart. Was any fault found and rectified?	Go to Step 15	Go to Step 14

Step	Action	Yes	No
12	Test the following instrument cluster circuits for a high resistance, open circuit or short to ground fault condition: • all 12 V battery supply circuits • all instrument cluster ground connections Was any fault found and rectified?	Go to Step 15	Go to Step 13
13	Replace the instrument cluster. Has the repair been completed?	Go to Step 15	—
14	Replace the PIM. Has the repair been completed?	Go to step 15	—
15	1 Turn the ignition to the ON position. 2 Move the gear select lever through each gear position and check the PRND32L display. Does each indicator display an off to on condition?	System OK	Go to step 2
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

10.2 Warning Signal and Status Indicators Diagnostics

Circuit Description

The powertrain interface module (PIM) is connected to the instrument cluster by a series of hard wired connections to illuminate the appropriate warnings and indicators within the instrument cluster. Some of these components do not set a DTC, in the event of a component failure. The following diagnostic procedures are devised to assist in these cases.

Additional Information

- Refer to 7.2 Diagnostic System Check to monitor DTC's.
- Refer to 8A Electrical Body and Chassis for the following information:
  - Automatic transmission PRND32L switch and wiring,
  - TCM wiring diagram.
- Refer to 6 Wiring Diagram and Connector Chart for the following information:
  - PIM connector illustration and terminal assignment, and
  - PIM wiring diagram.
- For intermittent faults, refer to Intermittent Fault Conditions.
- Check for an intermittent fault in the wiring harness or connectors, if a fault cannot be found the system is serviceable.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

1 This step tests for DTC's in the overall system.

2 This step manually tests the warning indicators.

5 This step uses Tech 2 to drive each status indicator on.

6 This step uses Tech 2 to drive each warning indicator on.

9 This step tests the wiring harness between the PIM and the Instrument Cluster.

Hard-wired Warning Signals

Display	Indicator
CHECK TRANS	Lamp
3rd START	Lamp
POWER	Lamp
A/T OIL TEMP	Lamp
CRUISE SET	Lamp
OIL	Lamp
THERMO	Gauge
SVS	Lamp
CHARGE	Lamp
TACHO	Gauge

Warning Signal and Status Indicator Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to Additional Information
2	Turn the Ignition to the ON position, observe if all warning and status indicators illuminate during the Instrument Cluster start up sequence. Do all indicators illuminate?	Go to Step 3	Go to step 4
3	1 Start the vehicles engine. 2 Are any of the warning or status indicators permanently illuminated?	Go to Step 7	Go to Step 4
4	Using Tech 2. Are any DTC's set which may cause incorrect operation of the warning or status indicators?	Refer to the relevant DTC's section	Go to Step 5
5	1 Using Tech 2 select, **Body** / **PIM** / **Miscellaneous Tests** / **Status Indicators.** 2 Select and activate in turn **Cruise Control ON Lamp** / **Cruise Control Set Lamp** / **Power Drive Lamp.** Does each indicator illuminate?	Go to Step 6	Go to Step 8
6	1 Using Tech 2 select, **Body** / **PIM** / **Miscellaneous Tests** / **Warnings.** 2 Select and activate in turn, **ALT** / **Oil Pressure** / **Service Soon** / **A/T Oil Temp** / **Check Trans.** Does each warning illuminate?	Go to Step 15	Go to Step 8
7	Disconnect the PIM harness connector. Refer to 11.2 Powertrain Interface Module in this section. Is the indicator/warning in Step 3 still permanently illuminated?	Go to Step 9	Go to Step 12
8	Remove and test the lamp from the malfunctioning warning. Was the lamp found to be faulty and replaced?	Go to Step 15	Go to Step 14

Step	Action	Yes	No
9	Test for high resistance, open circuit, a short to ground of the relevant circuits from the PIM to the instrument cluster. Refer to 6 Wiring Diagram and Connector Chart. Was any fault found and rectified?	Go to Step 16	Go to step 10
10	Turn the ignition to the ON position, test for a short to voltage of the relevant circuits from the PIM to the instrument cluster. Refer to 6 Wiring Diagram and Connector Chart. Was any fault found and rectified?	Go to Step 16	Go to Step 11
11	Disconnect the PIM. Test for a short to voltage of the relevant circuits from the PIM to the instrument cluster. Was any fault found and rectified?	Go to Step 13	Go to Step 12
12	Disconnect the instrument cluster. Test for a short to voltage of the relevant circuits from the PIM to the instrument cluster. Was any fault found and rectified?	Go to Step 16	Go to Step 14
13	Replace the PIM. Has the repair been completed?	Go to Step 16	—
14	Test the following instrument cluster circuits for a high resistance, open circuit or short to ground fault condition: • all 12 V battery supply circuits • all instrument cluster ground connections Was any fault found and rectified?	Go to Step 16	Go to Step 15
15	Replace the instrument cluster. Has the repair been completed?	Go to Step 16	—
16	Turn the Ignition to the ON position, observe if all warning indicators illuminate during the Instrument Cluster start up sequence. Do all indicators function correctly?	System serviceable	Go to step 3
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

10.3 Tachometer Diagnostics

Circuit Description

The powertrain interface module (PIM) receives the tachomer signal from the engine control module (ECM), it is then sent to the instrument cluster by the PIM via a hard wired connection to drive the tachometer which displays the engine RPM. Some of these components do not set a DTC, in the event of a component failure. The following diagnostic procedures are devised to assist in these cases.

Additional Information

- Refer to 7.2 Diagnostic System Check to monitor DTC's.
- Refer to 8A Electrical Body and Chassis for the following information:
  - ECM wiring diagram.
- Refer to 6 Wiring Diagram and Connector Chart for the following information:
  - PIM connector illustration and terminal assignment, and
  - PIM wiring diagram.
- For intermittent faults, refer to Intermittent Fault Conditions.
- Check for an intermittent fault in the wiring harness or connectors, if a fault cannot be found the system is serviceable.

Since fault conditions in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

1 This step tests for DTC's in the overall system.

2 This step uses the instrument cluster self test to check the function of the tachometer.

3 This step uses Tech 2 to drive the tachometer.

6 This step tests for tachometer drive frequency.

10 This step tests the in-vehicle function of the tachometer.

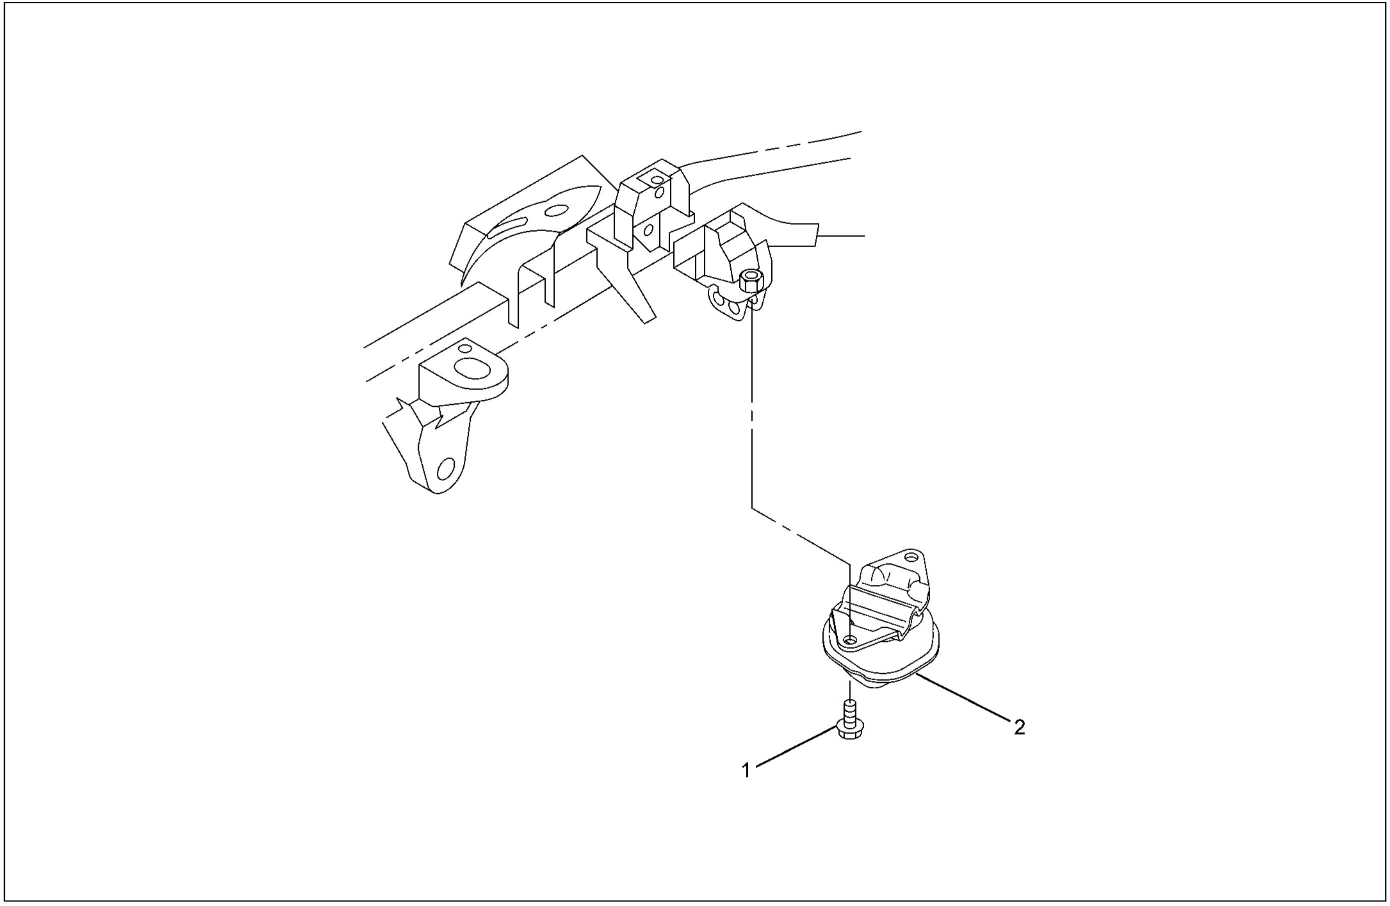
Tachometer Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to Additional Information
2	Test the function of the tachometer using the instrument cluster self diagnostic test procedure, refer to 8A Electrical Body and Chassis. Does the tachometer display 3000 RPM?	Go to Step 3	Go to Step 7
3	1 Using Tech 2 select, **Body / PIM / Miscellaneous Tests / Gauge Control Tests / Tachometer.** 2 Using the Tech 2 soft keys step the tacho through different RPM ranges. Does the tachometer respond to the Tech 2 commands?	Go to Step 5	Go to Step 4

4	Test for high resistance, open circuit, a short to ground of the relevant circuits from the PIM to the instrument cluster. Refer to 6 Wiring Diagram and Connector Chart. Was any fault found and rectified?	Go to Step 10	Go to Step 5
5	Turn the ignition to the ON position, test for a short to voltage of the relevant circuits from the PIM to the instrument cluster. Refer to 6 Wiring Diagram and Connector Chart. Was any fault found and rectified?	Go to Step 10	Go to Step 6
6	Measure the frequency at the tachometer signal output from the ECM, refer to 8A Electrical Body and Chassis. Is the tachometer frequency present?	Go to Step 7	Refer to 6C1-2 Engine Management Diagnostics
7	Replace the PIM. Has the repair been completed?	Go to Step 10	—
8	Test the following instrument cluster circuits for a high resistance, open circuit or short to ground fault condition: • all 12 V battery supply circuits • all instrument cluster ground connections Was any fault found and rectified?	Go to Step 10	Go to Step 9
9	Replace the instrument cluster. Has the repair been completed?	Go to Step 10	—
10	Start the vehicles engine. Does the tachometer function normally?	System OK	Go to Step 2
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

Bump Rubber

Bump Rubber and Associated Parts



RTW63CMF000101

Legend

(1) Bolt

(2) Bump Rubber

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove bolt.
3. Remove bump rubber.

Inspection and Repair

Make necessary correction or replace parts if wear, damage, corrosion or any other abnormal condition is found through inspection.

Check the following parts:

- Bump Rubber

Installation

1. Install bump rubber.

NOTE: Arrow points to the outer side of vehicle after assembly to vehicle.

2. Install bolt, then tighten it to the specified torque.

Torque: 42 N·m (4.3 kgf·m/31 lb·ft)

10.4 Temperature Gauge Diagnostics

Circuit Description

The powertrain interface module (PIM) receives engine temperature status via the GM Lan serial data bus from the engine control module (ECM) it is then sent to the instrument cluster by the PIM via a hard wired connection to drive the temperature gauge to the appropriate position. Some of these components do not set a DTC, in the event of a component failure. The following diagnostic procedures are devised to assist in these cases.

Additional Information

- Refer to 7.2 Diagnostic System Check to monitor DTC's.
- Refer to 8A Electrical Body and Chassis for the following information:
  - ECM wiring diagram.
- Refer to 6 Wiring Diagram and Connector Chart for the following information:
  - PIM connector illustration and terminal assignment, and
  - PIM wiring diagram.
- For intermittent faults, refer to Intermittent Fault Conditions.
- Check for an intermittent fault in the wiring harness or connectors, if a fault cannot be found the system is serviceable.

Since fault conditions in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

1 This step tests for DTC's in the overall system.

2 This step uses the instrument cluster self test to check the function of the temperature gauge.

3 This step uses Tech 2 to drive the temperature gauge.

6 This step tests for set DTC's in the ECM.

11 This step tests the in-vehicle function of the temperature gauge.

Temperature Gauge Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to Additional Information
2	Test the function of the temperature gauge using the instrument cluster self diagnostic test procedure, refer to 8A Electrical Body and Chassis. Does the temperature gauge display a mid point reading on the dial?	Go to Step 3	Go to Step 9
3	1 Using Tech 2 select, **Body** / **PIM** / **Miscellaneous Tests** / **Gauge Control Tests** / **Temperature Gauge.** 2 Using the Tech 2 soft keys step the temperature gauge through the different ranges. Does the temperature gauge respond to the Tech 2 commands?	Go to Step 6	Go to Step 4
4	Test for high resistance, open circuit, a short to ground of the relevant circuits from the PIM to the instrument cluster. Refer to 6 Wiring Diagram and Connector Chart. Was any fault found and rectified?	Go to Step 11	Go to Step 5
5	Turn the ignition to the ON position, test for a short to voltage of the relevant circuits from the PIM to the instrument cluster. Refer to 6 Wiring Diagram and Connector Chart. Was any fault found and rectified?	Go to Step 11	Go to Step 6
6	Using Tech 2 select, **Body** / **ECM** / **Diagnostic Trouble Codes.** Are any DTC's set that will effect the operation of the temperature gauge?	Go to Step 7	Go to Step 8
7	Was any fault found and rectified?	Go to Step 11	—
8	Replace the PIM. Has the repair been completed?	Go to Step 11	—
9	Test the following instrument cluster circuits for a high resistance, open circuit or short to ground fault condition: • all 12 V battery supply circuits • all instrument cluster ground connections Was any fault found and rectified?	Go to Step 11	Go to Step 10
10	Replace the instrument cluster. Has the repair been completed?	Go to Step 11	—
11	Start the vehicles engine. Does the temperature gauge function normally?	System OK	Go to Step 2
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

11 Service Operations

11.1 Safety and Precautionary Measures

WARNING

The following safety and precautionary measures must be followed when servicing and diagnosing the powertrain interface module (PIM) System. Otherwise, personal injury and / or improper braking system operation may occur:

- When using electric welding equipment, disconnect the wiring harness connector from the PIM.
- Never disconnect or reconnect the PIM wiring harness connector when the ignition is switched ON.
- Do not touch the PIM connector pins or soldered components on the PIM circuit board to prevent possible Electrostatic Discharge damage.
- To avoid wiring connector terminal damage, always use suitable wiring harness test leads (such as those in Tool No, J35616) when performing tests on the PIM wiring connector.
- The PIM is extremely sensitive to Electro Magnetic Interference (EMI). Ensure the PIM wiring harness is routed correctly and securely fitted to mounting clips when performing service procedures.
- Due to the sensitive nature of the PIM circuitry, specific wiring repair procedures have been developed. These procedures and instructions are detailed in 8A Electrical - Body and Chassis and are the only recommended and approved wiring repair methods.
- Ensure that all wiring harness connectors are seated correctly.
- Never disconnect the battery from the vehicle electrical system while the engine is running.
- Always disconnect the battery from the vehicle electrical system before charging.
- Do not use a fast charger for starting the vehicle.
- Ensure the battery cable terminals are secure.
- Before installing a new PIM, ensure the correct type is fitted. Always refer to the latest spare parts information.

11.2 Powertrain Interface Module

CAUTION

Do not touch the powertrain interface module pins as Electrostatic Discharge (ESD) damage may result. For further information on ESD, refer to 1.2 Warning Caution and Notes.

CAUTION

When replacing the PIM, the PIM must be reset prior to removal. Failure to perform this procedure will result in the inability to:

- **Test the PIM for warranty purposes.**
- **Install the PIM into other vehicles.**

Remove

1 If replacing the PIM, reset the PIM prior to PIM removal. Refer to PIM Reset in this Section.

2 Turn the ignition switch off.

3 Remove Fuse EB-4, refer to 8A Electrical-Body and Chassis.

4 Remove the right-hand front body hinge pillar trim assembly, refer to 10 Cab.

5 Disconnect the wiring harness connector (1) from the powertrain interface module (PIM) (2).

6 Remove the bolt (3) attaching the PIM to the hinge pillar inner panel.

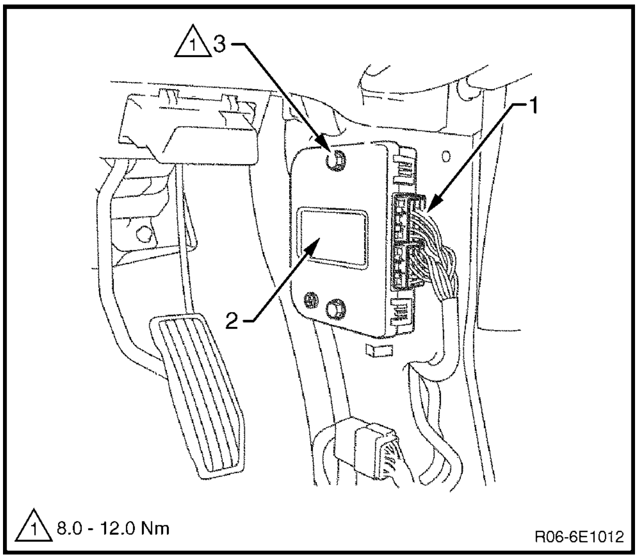


Figure 6E1 – 16

Reinstall

Reinstallation of the PIM is the reverse of the removal procedure, noting the following:

1 Tighten the attaching bolt to the correct torque specification.

PIM attaching bolt torque specification	8.0 – 12.0 Nm

2 If the PIM has been replaced, perform the following procedures:

- PIM service programming, refer to 12.4 Immobiliser Link to ECM / PIM.
- PIM Configuration, refer to 12.3 PIM Configuration.
- Diagnostic system check, refer to 7.2 Diagnostic System Check.

3 Road test the vehicle and check for correct vehicle operation.

11.3 Vertical Acceleration Sensor

Remove

1 Turn the ignition switch off.

2 Using a hoist raise the vehicle to a suitable working height.

3 Remove the VAS connector.

4 Remove the nut (1) securing the VAS to the mounting bracket.

5 Remove the VAS (2) from the mounting bracket.

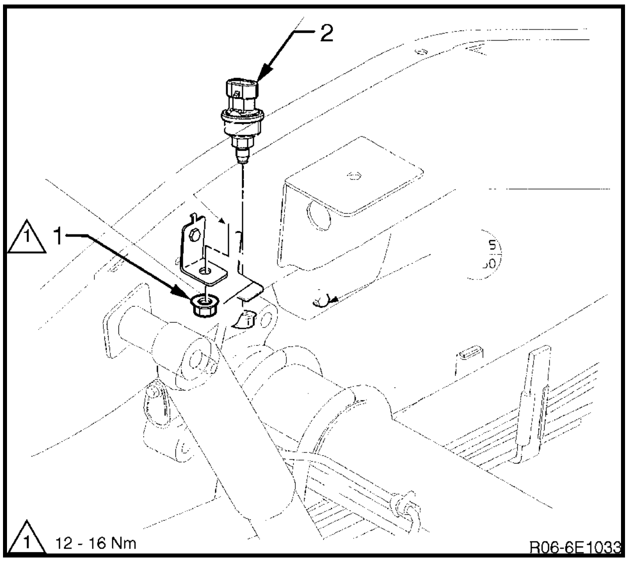

Figure 6E1 – 17

Reinstall

Reinstallation of the VAS is the reverse of the removal procedure, noting the following:

1 Tighten the attaching nut to the correct torque specification.

VAS attaching nut torque specification	12.0 – 16.0 Nm

2 Check the system for correct operation, refer to 7.2 Diagnostic System Check.

3 Road test the vehicle and check for correct vehicle operation.

12 PIM Security and Programming

12.1 Security and Programming Information

Car Pass Card

When performing certain powertrain interface module (PIM) programming functions using Tech 2, you may be prompted to enter a four digit Security Code (1). This information is found on the car pass card issued with the vehicle when new. If the card is unavailable, contact the GM Holden Technical Assistance (TAS) centre to obtain the relevant Security Code.

Security Code

The security code is required when performing certain PIM, ICU and ECM programming functions. When Tech 2 requests the security code to be entered, and an incorrect code is entered, the PIM will go into a security wait time stage. This wait time stage will prevent any further attempts to enter the security code until the wait time has elapsed.

Should a second incorrect security code be entered after the initial wait time has elapsed, the PIM will go into a second wait time stage. The wait time will increase each time an incorrect code is entered. When the correct code is entered the wait time will reset back to its original value of 10 seconds.

NOTE

The ignition switch must be in the ON position with the battery connected during the wait time period.

The wait time stages are as follows:

- Stage 1 = 10 seconds.
- Stage 2 = 10 seconds.
- Stage 3 = 10 minutes.
- Stage 4 = 20 minutes.
- Stage 5 = 40 minutes.
- Stage 5 = 80 minutes.

Tech 2 PIM Security Information Data List

The Tech 2 PIM Security Information Data List displays the PIM's current security status.

To view the data list:

1 Connect Tech 2 to the data link connector (DLC) and turn the ignition switch on.

2 On Tech 2 select: **Body** / **Powertrain Interface Module** / **Security** / **Security Information**.

NOTE

The Tech 2 PIM Security Information Data List typical display values are obtained from a correctly operating vehicle under the following conditions:

- ignition switched on,
- engine not running, and
- vehicle is stationary.

Tech 2 Parameter	Units Displayed	Typical Display Values
ICU / PIM Status	Yes / No	Yes
Security Code Programmed	Yes / No	Yes
Security Wait Time	Inactive / Active	Inactive
Security Wait Time	Inactive / 0:00:00	Inactive
Security Code Correct Enter	Yes / No	Yes
Security Code Reset Counter	0	0

12.2 PIM Reset Procedure

CAUTION

Do not perform the reset procedure within sixty seconds of turning the ignition switch on. Failure to comply may result in the PIM failing to reset.

When a PIM has been installed into a vehicle, it is security linked to the immobiliser control unit (ICU) and engine control module (ECM). Once this linking has been performed, the PIM cannot be installed in any other vehicle, unless the security linking between the ICU and the ECM has been reset using the following procedure:

1 Prior to resetting the PIM, obtain the Security Code. For further information, refer to 12.1 Security and Programming Information.

2 Connect Tech 2 to the data link connector (DLC) and turn the ignition switch on.

3 On Tech 2 select: **Body** / **Powertrain Interface Module** / **Security** / **Reset PIM**.

NOTE

When Tech 2 requests programming approval, obtain TIS approval.

NOTE

If a Tech 2 screen displaying **Security Wait Time Active, Please Wait!** appears after selecting the Reset PIM option, an incorrect security code has been previously entered. Refer to 12.1 Security and Programming Information for further information.

4 When Tech 2 displays **Enter Security Code,** enter the security code, press the **Enter** key and then the **Okay** soft key.

CAUTION

The engine will not start after the PIM has been reset.

5 When Tech 2 displays **Do you really want to Reset?**, press the **Reset** soft key.

CAUTION

Do not turn the ignition switch off within 60 seconds of performing the PIM reset procedure. Failure to comply may result in the PIM failing to reset.

6 When Tech 2 displays **Reset Completed Successfully**, press the **Confirm** soft key to return to the Tech 2 **Security** screen.

12.3 PIM Configuration

Configuring the PIM

Programming Transmission Variant

1 Connect Tech 2 to the data link connector (DLC).

2 On Tech 2 select: **Body** / **Powertrain Interface Module** / **Program** / **Program Variant Configuration.**

3 Press the **Modify** soft key.

4 Using the up or down arrow selection keys, select either manual or automatic transmission.

5 Press the **Confirm** soft key. Tech 2 reverts to the main Tech 2 **Program Variant Configuration** screen where the selection made in the previous step is displayed.

6 Press the **Program** soft key. The changes are now programmed into the PIM.

CAUTION

Do not turn the ignition switch off within 60 seconds of configuring the PIM. Failure to comply may result in the changes failing to be programmed into the PIM.

7 When notified that the programming was successful, press the **Confirm** soft key to return to the Tech 2 **Program** screen.

Programming the VIN

1 Connect Tech 2 to the data link connector (DLC).

2 On Tech 2 select: **Body** / **Powertrain Interface Module** / **Program** / **Program VIN**.

3 Enter the VIN using the Tech 2 arrow selection keys.

NOTE

The left and right arrow selection keys move the Tech 2 cursor along the VIN number, whilst the up and down selection arrows change the character value.

Numbers can also be entered by pressing the number key's on Tech 2.

4 After entering the VIN number, press the **Enter** key. The changes are now programmed into the PIM.

CAUTION

Do not turn the ignition switch off within 60 seconds of programming the VIN. Failure to comply may result in the changes failing to be programmed into the PIM.

5 When notified that the programming was successful, press the **Confirm** soft key to return to the Tech 2 **Program** screen.

12.4 Immobiliser Link to ECM / PIM

CAUTION

Do not perform the Immobiliser Link to ECM / PIM procedure within sixty seconds of turning the ignition switch on. Failure to comply may result in the PIM failing to link.

When the powertrain interface module (PIM) has been replaced, it is necessary to security link the PIM to the immobiliser control unit (ICU) and engine control module (ECM) before the vehicle will start.

NOTE

This linking procedure between the ECM and PIM is also known as the Immobiliser Function Programming.

1 Prior to performing the linking procedure, obtain the security code. For further information, refer to 12.1Security and Programming Information.

2 Connect Tech 2 to the data link connector (DLC).

3 On Tech 2 select: **Body** / **Powertrain Interface Module** / **Security** / **Immobiliser Link to ECM** / **PIM**.

4 When Tech 2 displays **Immobiliser Replaced**, press the **No** soft key.

5 When Tech 2 displays **PIM or ECM Replaced?**, press the **Yes** soft key.

NOTE

When Tech 2 requests programming approval, obtain TIS approval.

6 When Tech 2 displays **Enter Security Code**, enter the security code and press the **Enter** key and then the **Okay** soft key.

7 When Tech 2 displays **Confirm Security Code,** re-enter the security code, press the **Enter** key and then the **Okay** soft key.

8 When Tech 2 displays **Select Immobiliser Programming Routine**, use the up or down arrow selection keys, to select the **PIM Replaced** option and press the **Enter** key.

9 When Tech 2 displays **Stop Engine – Turn Off Ignition**, turn the ignition switch off and press the Confirm soft key.

10 When Tech 2 displays **Turn Ignition On**, turn the ignition switch on and press the **Confirm** soft key.

CAUTION

Do not turn the ignition switch off within 60 seconds of performing the ICU Link to ECM / PIM procedure. Failure to comply may result in the PIM failing to link with the ICU / ECM.

11 When Tech 2 displays **Programming Successful**, press the **Confirm** soft key to return to the Tech 2 **Security** screen.

13 Powertrain Interface Module – Tech 2 Functions

13.1 Introduction

CAUTION

Do not use a Tech 2 that displays faulty data; have the Tech 2 repaired. The use of a faulty Tech 2 can result in misdiagnosis and the unnecessary replacement of parts.

From the Main Menu, having selected **Diagnostics** / **2006** / **RA Rodeo** / **Body**, the Tech 2 functions for the Powertrain Interface, include:

F0: Diagnostic Trouble Codes

F1: Diagnostic Data Display

F2: Snapshot

F3: Miscellaneous Tests

F4: Additional Functions

F5: Program

F6: Security

13.2 Tech 2 Functions

F0: Diagnostic Trouble Codes

When this test mode is initiated, DTCs stored by the ECM can be displayed or cleared. When entered, there are two additional modes for selection:

F0: Read DTC Info Ordered By Priority: All DTCs stored in the ECM will be displayed.

F1: Clear DTC Information: Clears all current DTCs in the ECM and TCM memories.

F1: Diagnostic Data Display

- Use the Tech 2 Data List under the following conditions:
- The Diagnostic System Check – V6 Engine has been completed.
- The On-Board Diagnostics are functioning correctly.
- No DTCs are present.

NOTE

The values quoted in the following data list are only intended to provide the Technician with an indication of the values to be expected.

F2: Snapshot Options

In this test mode, Tech 2 captures data before and after a snapshot triggering event that may or may not set a DTC.

Trigger Type : Manual Trigger

F0: Manual Trigger

Trigger Point : Centre

F4: Beginning

F5: Centre

F6: End

F3: Miscellaneous Tests

F0: Warnings

F1: Status Indicators

F2: Gauge Control Tests

F4: Additional Functions

When this selection is made from the Tech 2 screen, an additional choice is provided:

F0: Read PIM Information

F5: Program

Within this selection, there are two programming selections available:

F0: Program Variant Configuration

F1: Program VIN

F6: Security

F0: Immobiliser Link To ECM/PIM

F1: Reset PIM

F2: Security Information

13.3 Powertrain Interface Module Data List

Diagnostic Data Display

Tech 2 Display	Units Displayed	Switch On	Switch Off

13.4 Miscellaneous Tests

F0: Warnings

F0: Alternator

This test checks the alternator warning lamp turns On and Off when selected on Tech 2.

F1: Oil Pressure Telltale Test

This test checks the Oil Pressure warning lamp turns On and Off when selected on Tech 2.

F2: Service Vehicle Soon Lamp Test

This test checks the Service Vehicle Soon warning lamp turns On and Off when selected on Tech 2.

F3: AT Oil Temperature Lamp

This test checks the Oil Temperature warning lamp turns On and Off when selected on Tech 2.

F4: AT Telltale Test

This test checks the Automatic Transmission warning lamp turns On and Off when selected on Tech 2.

F1: Status Indicators

F0: Cruise Control On Lamp

This test checks the Cruise Control On status lamp turns On and Off when selected on Tech 2.

F1: Cruise Control Set Lamp

This test checks the Cruise Control Set status lamp turns On and Off when selected on Tech 2.

F2: PRNDL Lamps

This test checks the all the Automatic Transmission status lamps turn On and Off when selected on Tech 2.

F3: Power Drive Lamp

This test checks the Power Drive status lamp turns On and Off when selected on Tech 2.

F2: Gauge Control Tests

F0: Tachometer

This test checks the operation of the Tachometer by driving the pointer in 1000 rpm steps to 6000 rpm when selected on Tech 2.

F1: Temperature Gauge

This test checks the operation of the Temperature gauge by driving the pointer to the Cold, Mid and High positions when selected on Tech 2.

F2: Fuel Gauge

This test checks the operation of the Fuel gauge by driving the pointer from zero in 20% increments to full when selected on Tech 2.

13.5 Security

F0: Immobiliser Link To ECM/PIM

Should the ECM, PIM or ICU be replaced, the modules must be security linked to each other. If this linking procedure is not performed, the vehicle will not crank nor run. For additional information relating to Tech 2 and the linking procedure, refer to 11A – Immobiliser.

NOTE

After an ECU reset, the ignition switch must be turned Off for at least 10 seconds and then turned On for at least one minute, before attempting communication between Tech 2 and the ECU.

Preconditions: TIS approval (TIS 2000 Security Access) must be obtained, the four digit security number entered into Tech 2 and the theft deterrent system disarmed. Then the ignition must be turned 'On', using a programmed remote coded key.

F1: Reset PIM

This function erases the security link between the Engine Control Module (ECM) and the Powertrain Interface Modules (PIM). If this procedure is performed, the engine will not crank nor run. A ICU Link to ECM/PIM procedure will need to be performed. For additional information relating to the ICU Link to ECM/PIM procedure, refer to 11A – Immobiliser.

NOTE

After an ECU reset, the ignition switch must be turned Off for at least 10 seconds and then turned On for at least one minute, before attempting communication between Tech 2 and the ECU.

Preconditions: The four digit security code must be entered into Tech 2 and the ignition switched 'On' with a programmed remote coded key.

F2: Security Information

The security code is required when performing certain PIM, ICU and ECM programming functions. When Tech 2 requests the security code to be entered, and an incorrect code is entered, the PIM will go into a security wait time stage. This wait time stage will prevent any further attempts to enter the security code until the wait time has elapsed.

Should a second incorrect security code be entered after the initial wait time has elapsed, the PIM will go into a second wait time stage. The wait time will increase each time an incorrect code is entered. When the correct code is entered the wait time will reset back to its original value of 10 seconds.

NOTE

The ignition switch must be in the ON position with the battery connected during the wait time period.

The wait time stages are as follows:

- Stage 1 = 10 seconds.
- Stage 2 = 10 seconds.
- Stage 3 = 10 minutes.
- Stage 4 = 20 minutes.
- Stage 5 = 40 minutes.
- Stage 5 = 80 minutes.

Tech 2 PIM Security Information Data List

The Tech 2 PIM Security Information Data List displays the PIM's current security status.

To view the data list:

1 Connect Tech 2 to the data link connector (DLC) and turn the ignition switch on.

2 On Tech 2 select: **Body** / **Powertrain Interface Module** / **Security** / **Security Information**.

NOTE

The Tech 2 PIM Security Information Data List typical display values are obtained from a correctly operating vehicle under the following conditions:

- ignition switched on,
- engine not running, and
- vehicle is stationary.

Tech 2 Parameter	Units Displayed	Typical Display Values
Security Code Programmed	Yes / No	Yes
Security Wait Time	Inactive / Active	Inactive
Security Wait Time	Inactive / 0:00:00	Inactive
Security Code Reset Counter	0	0

14 Specifications

Exhaust System – V6

ATTENTION

Before performing any service operations or other procedure described in this Section, refer to 1.3 WARNING, CAUTION and NOTES for correct workshop practices with regard to safety and / or property damage.

TROUBLESHOOTING

1. VIBRATION, SHOCK, AND SHIMMY OF STEERING WHEEL

Checkpoint		Problem	Countermeasure
Check vehicle trim height	NG	Incorrect	Adjust
OK			
Check shock absorber or attaching nut and bolt	NG	Malfunction or loose	Replace or retighten
OK			
Check upper and lower link bushings	NG	Worn	Replace
OK			
Check suspension ball joint	NG	Worn	Replace
OK			
Check wheel alignment	NG	Faulty	Adjust
OK			
Check front axle	NG	Check steering unit and linkage	Replace

- Improperly adjusted or worn front wheel bearing.
- Worn or incorrectly adjusted wheel bearing.

Replace; refer to Section 4C "Front Wheel Drive"

- Insufficiently tightened steering gear housing.
- Wear of steering linkage.
- Excessive backlash due to improper adjustment of the steering gear box.
- Worn column bearing, weakened column bearing spring, or loose clamp.

Replace; refer to Section 3B "Steering"

- Improper tire pressure.
- Imbalance and deformation of frond wheel.
- Unevenly worn tire or insufficient tightening of wheel nuts.

Replace; refer to Section 3E "Wheel and Tires"

1 General Information

Information contained within this section describes the general exhaust system.

1.1 Emission Reductions

Through developments in various vehicle emissions reduction systems, significant reductions in emissions have been achieved. The developments have been primarily concerned with refinements in engine calibration and the optimisation of exhaust system catalytic converter configurations.

The catalytic converter is similar to a muffler in appearance however, within the outer stainless steel shell (4), there is a ceramic monolith (1) which is honeycombed in the direction of exhaust flow, as shown. The ceramic monolith is surrounded by a mat (2), which has the primary function of holding the monolith firmly in place to prevent any contact with the inner shell (3). A mesh seal (5 and 6) at each end of the converter prevents exhaust gases from fouling and eroding the mat.

Surfaces of the ceramic monolith that are exposed to exhaust gases are coated with a catalytic material. This material contains rhodium and platinum, which act to facilitate the chemical reactions necessary to oxidise carbon monoxide and hydrocarbons into harmless carbon dioxide.

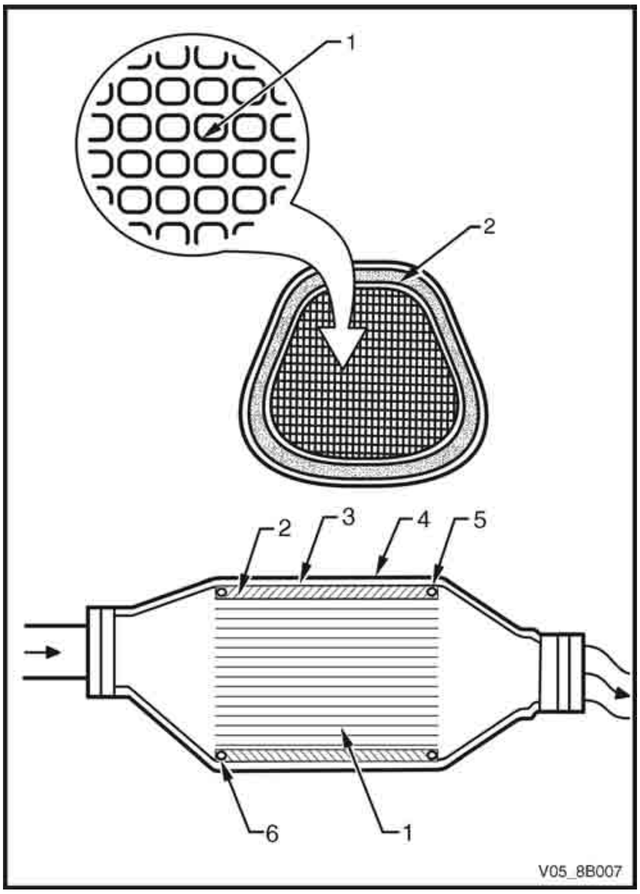

Figure 6F– 1

The catalytic converter is a substance that accelerates a chemical reaction without itself being changed. Engine exhaust gases contain carbon monoxide (CO), hydrocarbons (HC) and oxides of nitrogen (NO_x). When the exhaust gases flow through the monolith, reactions with the catalytic converter occur. CO and HC are converted by oxidation with oxygen (O_2) in the exhaust gases to produce carbon dioxide (CO_2) and water vapour (H_2O). NO_x is converted by reduction with CO to produce nitrogen (N_2) and CO_2. The converter is called a three-way type because it simultaneously converts three components of exhaust gas (CO, HC and NO_x) to harmless natural gases, refer to Figure 6F– 2

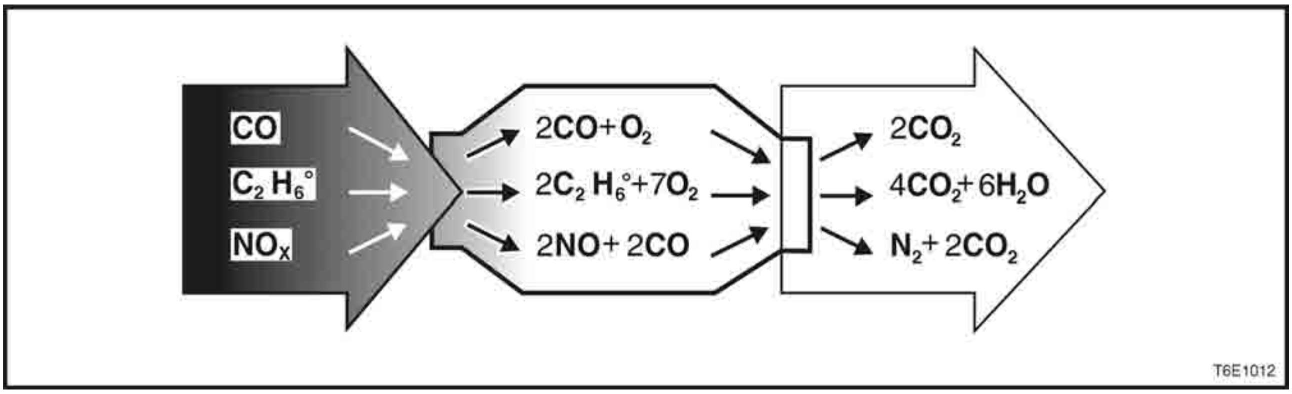

Figure 6F– 2

CAUTION

The Catalytic converter can be damaged or rendered ineffective, if:

- **operated outside the limits of the closed loop mixture control system**
- **the engine burns excessive amount of oil**
- **the exhaust temperature at the converter is too high (exceeds 840°C).**

The catalytic material is very sensitive to the effects of a rich or lean fuel mixture, which may cause the temperature of the converter to rise rapidly. The catalytic converter normally operates at approximately 600°C.

The catalytic converter is also sensitive to the use of leaded petrol. Using leaded fuel can cause deposits to form in the converter, which restrict exhaust flow and prevent the catalyst from working. This will result in an increase in exhaust backpressure and converter temperature.

NOTE

The use of unleaded petrol results in black tailpipe deposits rather than the grey colour that some people may normally associate with an acceptable combustion condition. This black colour resulting from the use of unleaded fuel does not necessarily indicate a state of poor engine tune. For V6 engines, Refer to: 6C1 – 1 Engine Management General Information.

Euro 3 Emissions Standards

The Euro 3 emissions standard is a European standard which aims at setting vehicle emissions targets to encourage vehicle manufacturers to reduce harmful vehicle emissions such as Carbon Monoxide (CO), Hydrocarbons (HC) and the various oxides of Nitrogen (NOx).

WARNING

This vehicle is fitted with a supplemental restraint system (SRS). Refer to section 9A Restraints, in order to determine whether you are performing service on or near the SRS components or the SRS wiring.

CAUTION

Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. Isuzu will identify those fasteners that require a replacement after removal and fasteners that require thread lockers or thread sealant. Unless otherwise specified, do not use supplemental coatings (Paints, greases or corrosion inhibitors) on thread fasteners or fastener joints. Generally such coatings adversely effect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and torque specifications.

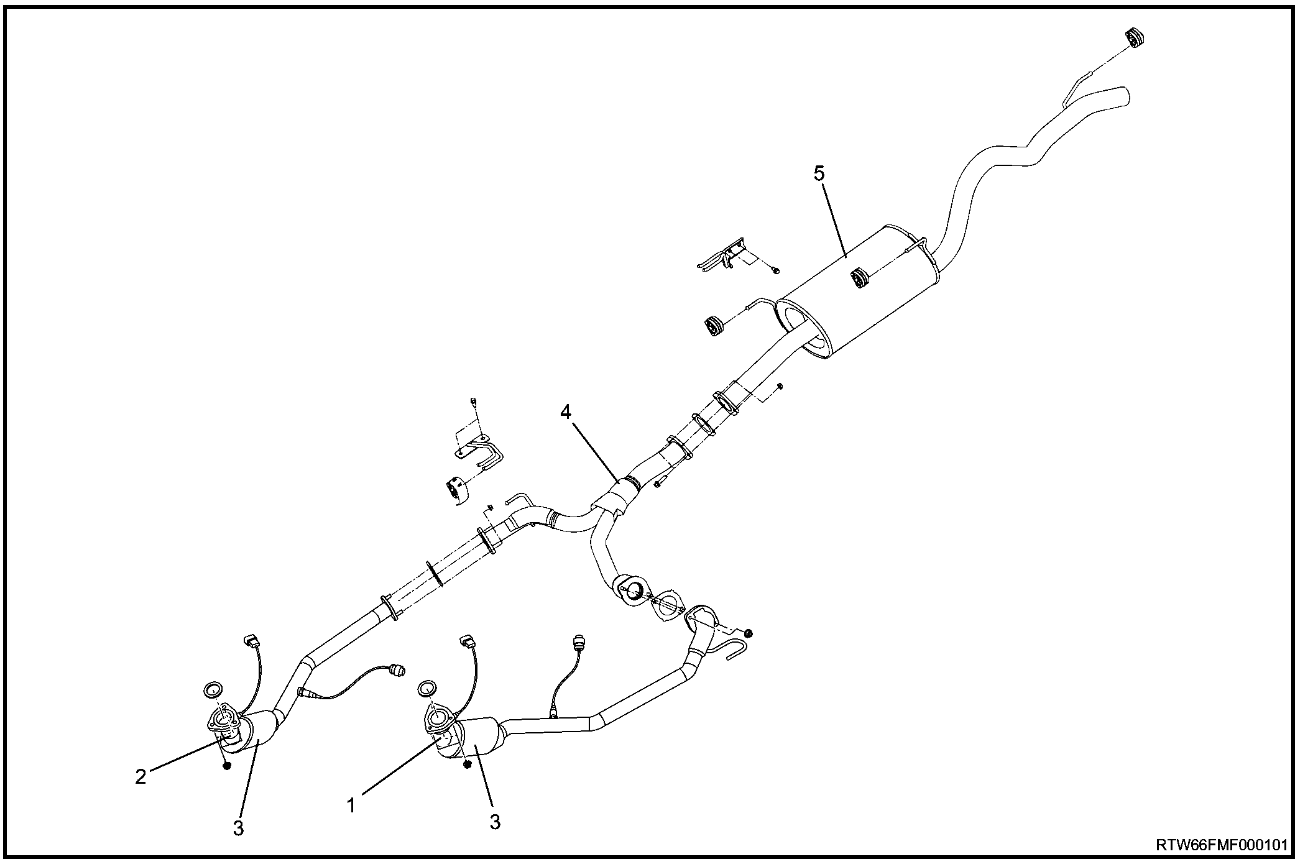

Figure 6F– 3

Legend

1 Front Exhaust Pipe LH side
2 Front Exhaust Pipe RH side
3 Three Way Catalytic Converter
4 Centre Exhaust Pipe
5 Exhaust Silencer and Tail Pipe

1.2 General Description

When inspecting or replacing the exhaust system components, make sure there is adequate clearance from all points on the underbody to prevent overheating of the floor pan and possible damage to the passenger compartment insulation and trim materials. Check complete exhaust system and nearby body areas and rear compartment lid for broken , damaged, missing or misaligned components, open seams, holes, loose connections or other deterioration which could permit exhaust fumes to seep into the rear compartment or passenger compartment. Dust or water in the rear compartment may be an indication of a problem in one of these areas. Any faulty areas should be corrected immediately.

Various types of hangers are used to support exhaust systems, these include conventional rubber straps, rubber rings or rubber blocks. The installation of exhaust system supports is very important, Improperly installed supports can cause annoying vibrations which can be difficult to diagnose.

Service Notes

1. Vehicles fitted with catalytic converters should not be operated with leaded petrol. Lead will contaminate the ceramic monolith.
2. Do not drop the catalytic converter as it will damage the ceramic monolith.
3. Replace the catalytic converter if it is damaged.
4. Do not allow water, oil or fuel to enter the converter as the ceramic monolith will be contaminated.
5. Do not use engine and/or fuel additives unless approved by General Motors. Many additives contain phosphorous that will contaminate the ceramic monolith.
6. The vehicle must not be started by pushing or towing, as unburned fuel could reach the catalytic converter and destroy the ceramic monolith. Always use jumper leads to start a vehicle that has a flat or defective battery.
7. When carrying out a compression test, for V6 engines use Tech 2 to ensure the output control Engine Compression Test is set to enable, refer to 6A1 Engine Mechanical. This prevents fuel injection and ignition during engine cranking.
8. Do not drive the vehicle with the engine misfiring or with any of the spark plug leads disconnected, as the catalytic converter will overheat.
9. Do not coast downhill with the engine misfiring or with any of the spark plug leads disconnected.
10. The catalytic converter is serviceable as part of the front exhaust assembly only. Refer to the service operations in this section for details of front exhaust pipe assembly removal and reinstallation.
11. The exhaust flange gaskets must be replaced whenever a new exhaust pipe, muffler or catalytic converter is installed.

1.3 WARNING, CAUTION and NOTES

This Section contains various WARNINGS, CAUTIONS and NOTE statements that you must observe carefully to reduce the risk of death or injury during service, repair procedures or vehicle operation. Incorrect service or repair procedures may damage the vehicle or cause operational faults. WARNINGS, CAUTION and NOTE statements are not exhaustive. HOLDEN LTD can not possibly warn of all the potentially hazardous consequences of failure to follow these instructions.

1.1 Definition of WARNING, CAUTION and NOTE Statements

Diagnosis and repair procedures in this Section contain both general and specific WARNING, CAUTION and NOTE statements. HOLDEN LTD is dedicated to the presentation of service information that helps the technician to diagnose and repair the systems necessary for proper operation of the vehicle. Certain procedures may present a hazard to the technician if they are not followed in the recommended manner. WARNING, CAUTION and NOTE statements are designed to help prevent these hazards from occurring, but not all hazards can be foreseen.

WARNING defined

A WARNING statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in death or injury. A WARNING statement alerts you to take necessary action or not to take a prohibited action. If a WARNING statement is ignored, the following consequences may occur:

- Death or injury to the technician or other personnel working on the vehicle,
- Death or injury to other people in or near the workplace area, and / or
- Death or injury to the driver / or passenger(s) of the vehicle or other people, if the vehicle has been improperly repaired.

CAUTION defined

A CAUTION statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in damage to or destruction of equipment, or corruption of data. If a CAUTION statement is ignored, the following consequences may occur:

- Damage to the vehicle,
- Unnecessary vehicle repairs or component replacement,

- Faulty operation or performance of any system or component being repaired,
- Damage to any system or components which depend on the proper operation of the system or component being repaired,
- Faulty operation or performance of any systems or components which depend on the proper operation or performance of the system or component under repair,
- Damage to fasteners, basic tools or special tools and / or
- Leakage of coolant, lubricant or other vital fluids.

NOTE defined

A NOTE statement immediately precedes or follows an operating procedure, maintenance practice or condition that requires highlighting. A NOTE statement also emphasises necessary characteristics of a diagnostic or repair procedure. A NOTE statement is designed to:

- Clarify a procedure,
- Present additional information for accomplishing a procedure,
- Give insight into the reasons for performing a procedure in the recommended manner, and / or
- Present information that gives the technician the benefit of past experience in accomplishing a procedure with greater ease.

2 Front and Centre Exhaust Pipe

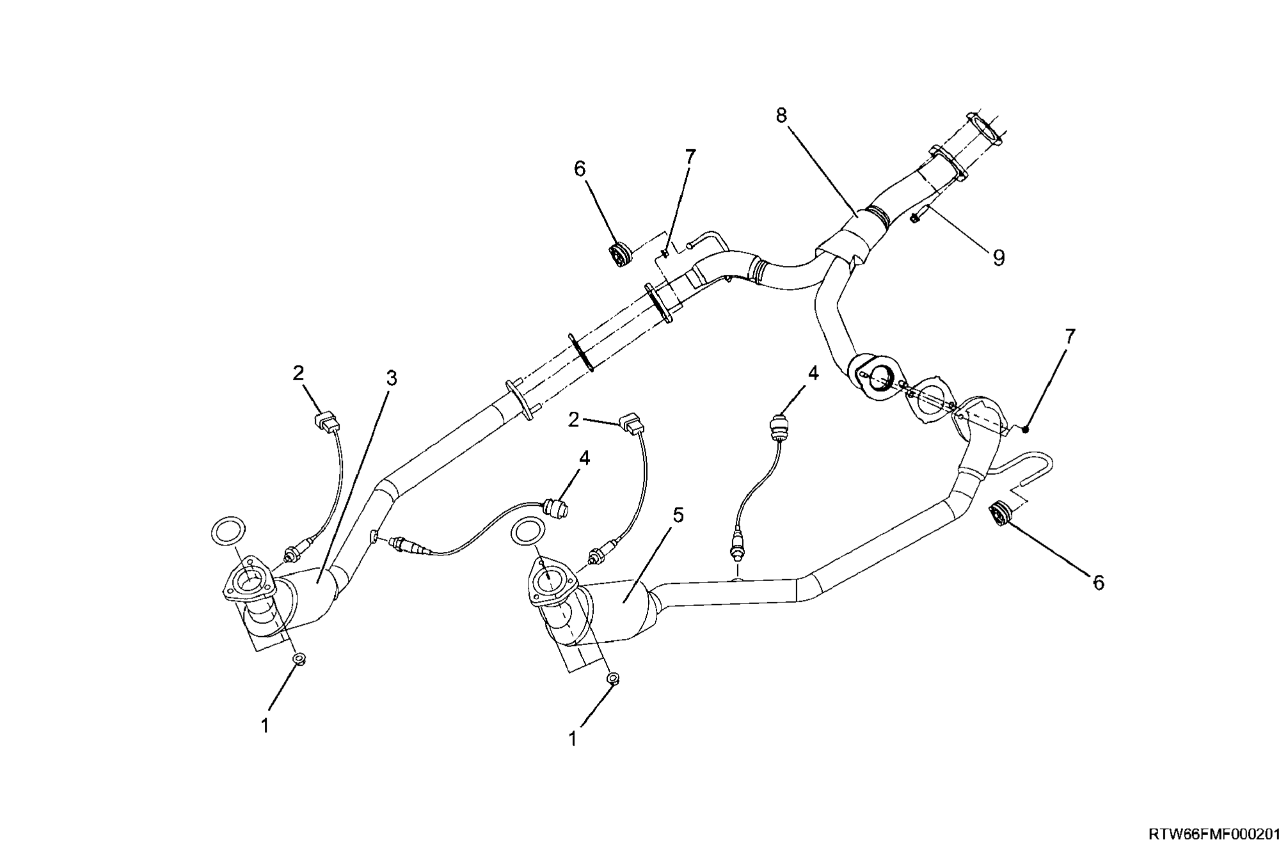

Figure 6F– 4

1	Front Exhaust Flange Nuts	6	Front Exhaust Pipe Mounting Rubber
2	Front O2 Sensor	7	Centre Exhaust Flange Attaching Nuts
3	Three Way Catalytic Converter RH side	8	Centre Exhaust Pipe
4	Rear O2 Sensor	9	Rear Exhaust Flange Nuts
5	Three Way Catalytic Converter LH side		

Removal

1. Disconnect the battery ground cable.
2. Remove the suspension cross member, Refer to 7B1 Manual transmission.
3. Remove the two front torsion bar springs, Refer to 3C Suspension.
4. Disconnect the O2 sensor harness connectors (2 and 4), two each bank.
5. Remove the front exhaust flange attaching nuts (1), three each bank.
6. Remove the centre exhaust pipe flange nuts (7), two each bank.
7. Remove the centre exhaust pipes from the rubber mounts (6).
8. Remove the front left and right hand exhaust pipes from the vehicle.
9. Remove the two rear exhaust flange nuts and bolts (9).
10. Remove the centre exhaust pipe from the vehicle.
11. Remove the O2 sensors if required, Refer to 6C1 – 1 Engine Management General Info.

NOTE:

- Support the exhaust system at all times.
- Clean the threads of the attaching bolts, nuts, studs and flanges with a suitable cleaning solvent.
- Apply a high temperature anti-seize compound to the manifold front pipe flange joint studs, then align the flange over the studs.

Reinstallation

1. Install any removed O2 sensors, Refer to 6C1 – 1 Engine Management General Info.
2. Position the centre exhaust pipe into location under the vehicle.
3. Install the two rear exhaust flange nuts and bolts (9).
4. Position the front exhaust pipes into location under the vehicle.
5. Install the centre exhaust pipes into the rubber mounts (6).
6. Install the exhaust flange fixing nuts (1), three each bank.
7. Install the rear exhaust pipe flange nuts (7), two each bank.
8. Reconnect the O2 sensor harness connectors (4), two each bank.
9. Install the two front torsion bar springs, Refer to 3C Suspension.
10. Install the suspension cross member, Refer to 7B1 Manual transmission.
11. Reconnect the battery ground cable.

O2 Sensor
tightening torque..50 Nm

Front Exhaust Flange Nuts
tightening torque......................................40.0 – 60.0 Nm

Centre Exhaust Flange Nuts
tightening torque..43 Nm

Rear Exhaust Flange Nuts
tightening torque..43 Nm

3 Silencer and Rear Exhaust Pipe

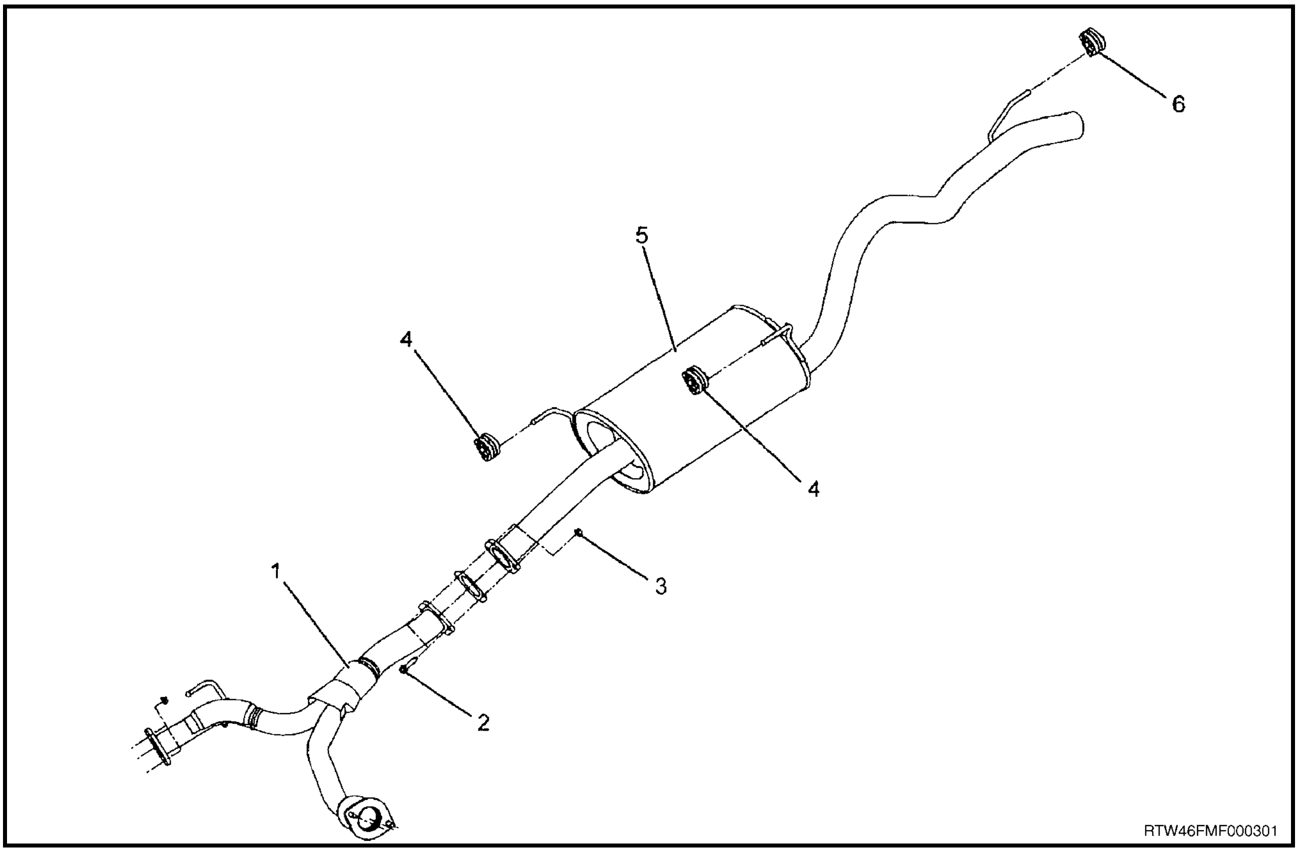

Figure 6F– 5

1	Centre Exhaust Pipe	4	Exhaust Silencer Mounting Rubber
2	Exhaust Flange Bolts	5	Exhaust Silencer and Tail Pipe
3	Exhaust Flange Nuts	6	Rear Exhaust Pipe Mounting Rubber

Removal

1. Disconnect the battery ground cable.
2. Remove the exhaust flange bolts (2) and nuts (3).
3. Remove the silencer and rear exhaust pipe mounting rubbers (4 and 6).
4. Remove the silencer and exhaust pipe from the vehicle.

NOTE:

- Support the exhaust system at all times.
- Clean the threads of the attaching bolts, nuts, studs and flanges with a suitable cleaning solvent.

Reinstallation

1. Position the silencer and exhaust pipe into the vehicle.
2. Install the silencer and rear exhaust pipe mounting rubbers (4 and 6).
3. Install the exhaust pipe flange bolts (2) and nuts (3).
4. Reconnect the battery ground cable.

Rear Exhaust Flange Nuts tightening torque..43 Nm

4 Torque Wrench Specifications

	Nm
Front Exhaust Flange Nuts	40.0 – 60.0
Centre Exhaust Flange Nuts	43.0
Rear Exhaust Flange Nuts	43.0
O2 Sensor	50.0

4L60E MODEL

TABLE OF CONTENTS

PAGE

7C1
Automatic Transmission – 4L60E – General Information

ATTENTION

Before performing any service operation or other procedure described in this Section, refer to Warnings, Cautions and Notes for correct workshop practices with regard to safety and/or property damage.

1 Section Descriptions

Service information for the Hydra-matic 4L60E Automatic transmission has been divided into five Sections to assist the technician to quickly locate the correct service, maintenance and diagnostic information.

The following provides a brief outline of each of the Sections.

- 7C1 Automatic Transmission – 4L60E – General Information
- 7C2 Automatic Transmission – 4L60E – Electrical Diagnosis
- 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis
- 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing

The following provides a brief outline of each of the Sections.

1.1 WARNINGS, CAUTIONS and NOTES

This Section contains various WARNINGS, CAUTIONS and NOTE statements that you must observe carefully to reduce the risk of death or injury during service, repair procedures or vehicle operation. Incorrect service or repair procedures may damage the vehicle or cause operational faults. WARNINGS, CAUTION and NOTE statements are not exhaustive. GM HOLDEN LTD can not possibly warn of all the potentially hazardous consequences of failure to follow these instructions.

Definition of WARNING, CAUTION and NOTE Statements

Diagnosis and repair procedures in this Section contain both general and specific WARNING, CAUTION and NOTE statements. GM HOLDEN LTD is dedicated to the presentation of service information that helps the technician to diagnose and repair the systems necessary for proper operation of the vehicle. Certain procedures may present a hazard to the technician if they are not followed in the recommended manner. WARNING, CAUTION and NOTE statements are designed to help prevent these hazards from occurring, but not all hazards can be foreseen.

WARNING Defined

A WARNING statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in death or injury. A WARNING statement alerts you to take necessary action or not to take a prohibited action. If a WARNING statement is ignored, the following consequences may occur:

- Death or injury to the technician or other personnel working on the vehicle,
- Death or injury to other people in or near the workplace area, and / or
- Death or injury to the driver / or passenger(s) of the vehicle or other people, if the vehicle has been improperly repaired.

CAUTION Defined

A CAUTION statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in damage to or destruction of equipment, or corruption of data. If a CAUTION statement is ignored, the following consequences may occur:

- Damage to the vehicle,
- Unnecessary vehicle repairs or component replacement,
- Faulty operation or performance of any system or component being repaired,
- Damage to any system or components which depend on the proper operation of the system or component being repaired,
- Faulty operation or performance of any systems or components which depend on the proper operation or performance of the system or component under repair,
- Damage to fasteners, basic tools or special tools and / or
- Leakage of coolant, lubricant or other vital fluids.

NOTE Defined

A NOTE statement immediately precedes or follows an operating procedure, maintenance practice or condition that requires highlighting. A NOTE statement also emphasises necessary characteristics of a diagnostic or repair procedure. A NOTE statement is designed to:

- Clarify a procedure,
- Present additional information for accomplishing a procedure,
- Give insight into the reasons for performing a procedure in the recommended manner, and / or
- Present information that gives the technician the benefit of past experience in accomplishing a procedure with greater ease.

1.2 7C1 Automatic Transmission – 4L60E – General Information

This section provides general information about the automatic transmission, including:

- A glossary of terms,
- Transmission identification information,
- Electrical overview of the Transmission Control Module (TCM),
- Some notes that address safe workshop practices,
- Service notes relating to fasteners and consumable items used at various stages throughout this section,
- Special tools required to work on the transmission,
- Fastener torque specifications, and
- Transmission specifications.

For all information relating to the mechanical construction and function of the 4L60E automatic transmission, refer to the General Motors Powertrain Group Electronically Controlled Automatic Transmission Technician's Guide.
This guide includes such information as:

- Transmission Cutaway Views,
- Principles of Operation,
- Power Flow,
- Complete Hydraulic Circuits,
- Bushing and Bearing Locations,
- Seal Locations and
- Illustrated Parts List.

NOTE

Specifications quoted in this General Motors Powertrain Group Electronically Controlled Automatic Transmission Technician Guide may not be for the vehicle you are working on. For correct specifications refer to
7 Transmission Specifications.

Recommendations

When servicing the transmission, all parts should be cleaned and inspected. Individual units should be reassembled before disassembly of other units to avoid confusion and interchanging of parts.

a Thoroughly clean the transmission exterior before removal of any component.

b Disassembly and reassembly must be made on a clean work bench. Cleanliness is of the utmost importance, the bench tools and parts must be kept clean at all times.

c Before installing screws and other fasteners into aluminium parts, dip screw threads into transmission fluid to prevent galling aluminium threads and to prevent screws from seizing.

d To prevent thread stripping, always use a torque wrench when installing screws or nuts.

e If threads in aluminium parts are stripped or damaged, the parts can be made serviceable by the use of commercially available thread inserts.

f Protective tools must be used when assembling seals to prevent damage. The slightest flaw in the sealing surface of the seal can cause an oil leak.

g Aluminium castings and valve parts are very susceptible to nicks, burrs, etc. and should be handled with care.

h Expand Internal snap rings and compress external snap rings if they are to be re-used to ensure proper seating when reinstalled.

i Do not re-use removed O-rings, gaskets and oil seals.

j Teflon oil seal rings should not be removed unless damaged.

k During assembly of each unit, all internal moving parts must be lubricated with transmission fluid.

Oil Cooler Pipes

Should any transmission fluid cooling pipe suffer accidental damage, a genuine replacement pipe must be fitted. Refer to the current release of PartFinder™ to determine the correct part number for the particular engine and pipe involved. Reworking of damaged pipes or hand made replacements are not permitted.

Clean and Inspect

CAUTION

Do not use solvents on neoprene seals, composition faced clutch plates or thrust washers as damage to parts may occur.

After complete disassembly of a component, wash all metal parts in a clean solvent and dry with compressed air. Blow oil passages out and check to make sure they are not obstructed, small passages should be checked with tag wire. All parts should be inspected to determine if replacement is required.

Pay particular attention to the following:

- Inspect linkage and pivot points for excessive wear.
- Bearing and thrust surfaces of all parts should be checked for excessive wear and scoring.
- Check for broken seal rings, damaged ring lands and damaged threads.
- Inspect seals for damage.
- Mating surfaces of castings should be checked for burrs. Irregularities may be removed by lapping the surface with emery paper laid on a flat surface, such as a piece of plate glass.
- Castings should be checked for cracks and porosity.

1.3 7C2 Automatic Transmission – 4L60E – Electrical Diagnosis

For transmissions fitted to V6 engines, the electrical diagnosis is in this Section. A new electrical circuit and control module has been introduced for automatic transmissions fitted to the V6 engines.

1.4 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis

Information contained in 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis will assist in the diagnosis of the mechanical and hydraulic components in the 4L60E automatic transmission, while the transmission remains installed on the vehicle.

Examples of the type of diagnostic information contained within this section are:

- transmission functional test,
- line pressure information,
- transmission fluid diagnosis,
- symptom diagnosis and
- shift speed charts.

1.5 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing

Information in 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing covers transmission fluid level checking, as well as specific information for servicing some components while the transmission remains installed on the vehicle. This Section also covers the transmission removal and reinstallation to the vehicle.

2 General information

The hydra-matic 4L60E automatic transmission is fitted to vehicles with HFV6 engine. The mechanical and internal electrical operation of the transmission unit is controlled by the transmission control module (TCM) for HFV6 engine.

- For information on the mechanical operation of the transmission, refer to General Motors Powertrain Group Electronically Controlled Automatic Transmission Technician's Guide.
- For further information on the TCM, refer to 3.1 Transmission Control Module.

2.1 Transmission Control Module – HFV6

Vehicles fitted with a V6 engine and the 4L60E transmission have a new control module and data bus architecture from previous models. This is due to the introduction of the new V6 engine. Mechanically, the transmission has not changed. V6 equipped vehicles are now fitted with T42 – Delphi with GMPT software, transmission control module (TCM) to control all transmission operations. For further information on the TCM and its operation, refer to 3 Transmission Control Module Operation Overview.

2.2 Transmission Identification

The 4L60E automatic transmission application and identification can be determined from the stamping at the rear of the transmission , in the location (7) as shown in Figure 7C1 – 1.

Identification is as follows:

(1) model year,

- (6 = 2006).

(2) Broad Cast Code Identifier,

- HHD = RWD – 3.6 litre HFV6
- HLD = 4WD – 3.6 litre HFV6

(D = model 4L60E).

(3) Manufacturer Source Code,

- (4 = Ramos).

(4) Julian date (day of the year).

(5) Shift Build,

- 'A','B','J' = First shift,
- 'C','H','W' = Second shift.

(6) Individual transmission serial number.

6 Individual Transmission Serial Number
7 Identification Stamping Location

2.3 Economy, Power and Cruise Modes

The programming in the transmission control module (TCM) allows for different shift patterns, which are driver controllable through the use of the power (PWR) button. The power button is located in the centre console.

Economy Mode

The calibration for this mode is for maximum comfort, with minimal intrusion of engine noise and smooth shifts under all driving conditions. When additional power is required for acceleration, full throttle upshifts are similar to those calibrated for the power mode.

Power Mode

When activated, the TCM modifies the transmission calibration in the following ways:

1 When the throttle is less than 80% open, later upshift points are provided.

2 Shift time is reduced.

3 The torque converter clutch (TCC) will be applied in both the third and fourth speed ranges.

Cruise Mode

When the driver activates the cruise control (where fitted), the power icon in the instrument clusters multi-function display (MFD) will be deactivated (provided the vehicle was operating in power mode) and the transmission shift pattern will switch to the cruise control pattern. When in this mode, the TCM modifies the shift pattern so that earlier downshift and later upshift points are provided.

Through the electronic programming of the logic processes contained in the TCM, the frequency of gear shifting and torque converter clutch application and release is minimised. The end result of these logic processes, is that a quick series of upshifts and downshifts (e.g. a '4 – 3 – 4' shift pattern) is minimised.

2.4 System Protection Devices

Should 1st gear be selected and left in that range, the TCM will protect the engine from an over-speeding condition by upshifting to 2nd gear at a pre-determined point. Similarly, the TCM provides high speed, downshift protection by preventing a manual shift into 1st gear above pre-determined engine speeds.

Under severe operating conditions such as towing in high ambient temperatures, fluid temperatures can rise to a point where lubrication breakdown can occur. In addition to having an oil cooler fitted to the vehicle, the 4L60E transmission is also fitted with a transmission fluid temperature sensor located in the Transmission Range (TR) Pressure Switch Assembly (PSA).

When fluid temperatures in excess of 135°C are sensed, the torque converter clutch is applied as programmed, in 3rd or 4th gear. This action reduces further the fluid temperature during normal operation of the torque converter. While these high fluid temperatures are sensed however, torque converter clutch apply is not available when the throttle opening is above 50%.

Similarly, when the fluid temperature is below 29°C, the TCM prevents torque converter clutch apply.

If a condition occurs, preventing electronic control of the transmission's functions, a 'Fail Safe' mode will default the transmission to 3rd gear when either Drive or 3 is selected, applying also maximum line pressure. While in this mode, the vehicle operator can still manually select 2, 1, Reverse, Park or Neutral, should the need arise.

2.5 Self Diagnosis

If any transmission operation controlled by the TCM begins to operate outside its pre-set parameters, the TCM has the ability to store a range of diagnostic codes which can be accessed by the servicing technician, thereby localising the problem.

2.6 TCM Sensors and Actuators

As indicated earlier, there are a number of sensors and switches providing input information for the TCM programming that will allow the TCM to change the shift pattern, shift feel and torque converter clutch operation.

The TCM does this by comparing this input information with its predetermined values on shift pattern, fluid pressure maps, shift duration parameters, extreme heat protection programming and adaptive controls.

In addition, each input signal and output actuator operation is also monitored and if outside its pre-set parameters, a diagnostic code is logged for future reference by the servicing technician.

3 Transmission Control Module Operation Overview

3.1 Transmission Control Module

With the introduction of the new HFV6 engine, the powertrain architecture has been redesigned to accommodate this introduction. With this design, a new bus architecture and protocol has also been introduced. The new bus connects the following modules:

- engine control module (ECM),
- transmission control module (TCM),
- powertrain interface module (PIM) and
- ABS module.

The protocol used to communicate between these modules is called General Motors Local Area Network (GM LAN) which is based on Controller Area Network (CAN) communication protocol. For further information on GM LAN protocol and data bus structure, refer to 6E1 Powertrain Interface Module – V6.

Component Location

The TCM (1) is located under the instrument panel, it is attached to a bracket mounted to the firewall as shown in Figure 7C1 – 2.

For the other components using the GM LAN databus, refer to 6E1 Powertrain Interface Module – V6.

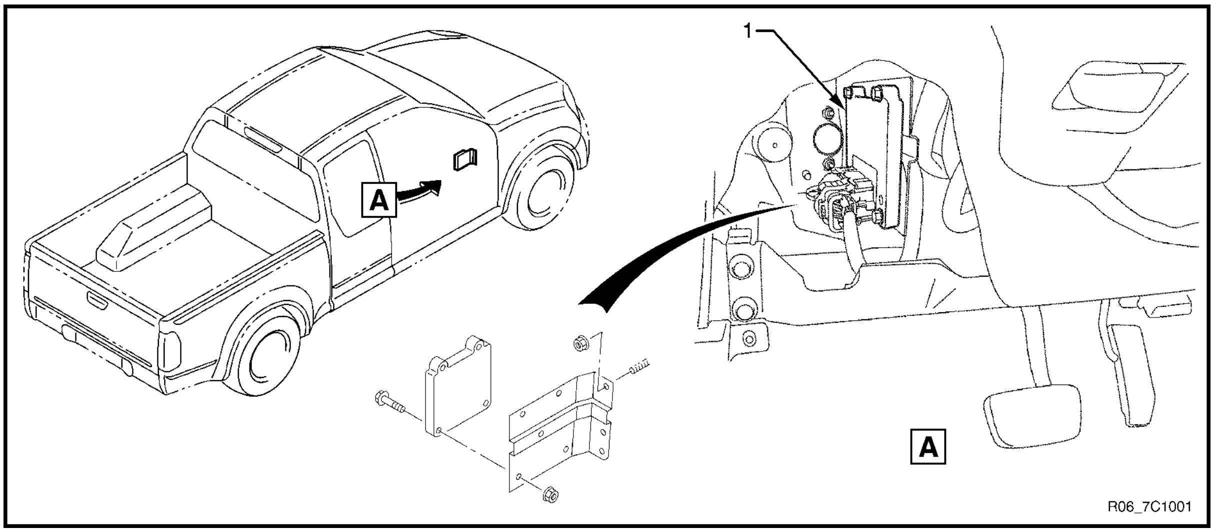

Figure 7C1 – 2

Transmission Control Module Data Transfer

The TCM uses various information to control the shift of the transmission. Besides the direct inputs from the various transmission sensors directly into the TCM, the TCM uses data from the GM LAN databus.
The inputs/outputs directly connected to the TCM from the transmission are:

- shift solenoids,
- torque converter clutch control,
- pressure control solenoid,
- transmission fluid temperature sensor and
- vehicle speed sensor.

Refer to 3.2 TCM Wiring Diagrams.

The transmission also receives inputs from the park/neutral position and back up lamp switch assembly.

The TCM needs other various data parameters to control the transmission correctly. These include throttle plate angle, whether cruise control is engaged and active or not, engine RPM etc. These are provided to the TCM from the ECM via serial data using GM LAN communication protocol.

The TCM also supplies information that is used by other components and systems within the vehicle such as the engine control module (ECM) and instrument cluster. Any information that is required on the body side of the data bus (UART protocol) is translated by the powertrain interface module (PIM). For further information on the data bus structure, the PIM and its operation, refer to 6E1 Powertrain Interface Module – V6.

Continued from the previous page

Checkpoint		Problem	Countermeasure
Tire pressure or wheel nuts	NG	Improper or instufficient tightening	Adjust or tighten
OK			
Tire tread (right and left)	NG	Difference in wear and tear	Replace (tire)

Transmission Control Module Operation

The TCM processes data every 10 milliseconds from various sensors, such as throttle position, vehicle speed, gear range, temperature, engine load and other inputs. The TCM compares all its various inputs with the internal programming and calibration of the TCM using this data, a signal is transmitted to the valve body shift solenoids, which activate the shift valves for precise shift control. Shift points are therefore precisely controlled and are identical from vehicle to vehicle. The TCM also control torque converter clutch apply and release.

Shift feel is also electronically controlled by the TCM, by signals sent to the variable force solenoid, which controls fluid line pressure and it is this pressure that precisely determines how the shifts will feel. In this way, the TCM electronically synchronises the engine and transmission into a single integrated powertrain system for optimum performance, shift timing, fuel efficiency and emission control.

3.2 TCM Wiring Diagrams

For details of the transmission control module (TCM) wiring diagrams, refer to 8A Electrical-Body and Chassis.

4 Transmission Definitions and Abbreviations

The following definitions and abbreviations are provided to establish a common language and assist the user in describing transmission related conditions. The use of these terms and/or conditions can be found in the various parts of the automatic transmission sections, but more particularly in 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis.

4.1 Throttle Position Related Definitions

Throttle Position	Definition
Minimum Throttle	The least amount of throttle opening required for an upshift.
Light Throttle	Approximately 1/4 of accelerator pedal travel (25% Throttle Position).
Medium Throttle	Approximately 1/2 of accelerator pedal travel (50% Throttle Position).
Heavy Throttle	Approximately 3/4 of accelerator pedal travel (75% Throttle Position).
Wide Open Throttle (WOT)	Full travel of the accelerator pedal (100% Throttle Position).
Full Throttle Detent Downshift	A quick apply of the accelerator pedal to its full travel, forcing a downshift.
Zero Throttle Coast Down	A full release of the accelerator pedal while the car is in motion and in drive range.
Engine Braking	A condition where the engine is used to slow the car by manually downshifting during a zero throttle coast down.

4.2 Noise Condition Related Definitions

Noise Condition	Definition
Planetary Gear Noise	A whine related to car speed most noticeable in first gear or reverse. Becomes less noticeable after an upshift.
Pump Noise	A high pitch whine increasing with engine r.p.m.

4.3 General Definitions

General	Definition
Accumulator	A component of the transmission that absorbs hydraulic pressure during the apply of a clutch or band. Accumulators are designed to control the quality of a shift from one gear range to another.
Adaptive Learning	Programming within the TCM that automatically adjusts hydraulic pressures in order to compensate for changes in the transmission (i.e. component wear).
Applied	An 'Applied Component' is holding another component to which it is splined or assembled to. Also referred to as "engaged".
Apply Components	Hydraulically operated clutches, servo’s, bands and mechanical one-way roller or sprag clutches that drive or hold members of a planetary gear set.
Apply Plate	A steel clutch plate in a clutch pack, located next to the (apply) piston.
Backing Plate	A steel plate in a clutch pack that is usually the last plate in that clutch assembly (furthest from the clutch piston).
Band	An apply component that consists of a flexible strip of steel and friction material that wraps around a drum. When applied, it tightens around the drum and prevents the drum from rotating.
Brake Switch	An electrical device that provides signals to the transmission control module (TCM), based on the position of the brake pedal. The TCM uses this information to apply or release the torque converter clutch (TCC).
Centrifugal Force	A force that is imparted on an object (due to rotation) that increases as that object moves further away from a centre-point of rotation.

General	Definition
Check Ball	A spherical, hydraulically controlled component (usually of steel) that either seals or opens fluid circuits. It is also referred to as a check valve.
Clutch Pack	An assembly of components generally consisting of clutch plates, an apply plate and a backing plate.
Clutch Plate	A hydraulically activated component that has two basic designs: (1) all steel, or (2) a steel core with friction material bonded to one or two sides of the plate.
Control Valve Body	A machined metal casting that contains valve trains and other hydraulically controlled components that shift the transmission.
Coupling Speed	The speed at which a vehicle is travelling and no longer requires torque multiplication through the torque converter. At this point, the stator 'free wheels' to allow fluid leaving the turbine to flow directly to the pump. (Also see Torque Converter).
De-energise(d)	To interrupt the electrical current that flows to an electronically controlled device, making it electrically inoperable.
Direct Drive	A condition in a gears set where the input speed and input torque equals the output speed and output torque. The gear ratio through the gear set is 1:1.
Downshift	A change in a gear ratio where both input speed and torque increases.
Duty Cycle	In reference to an electronically controlled solenoid, it is the amount of time (expressed as a percentage) that current flows through the solenoid coil.
Energise(d)	To supply a current to an electronically controlled device, enabling it to perform its designed function.
Engine Compression Braking	A condition where compression from the engine is used with the transmission to decrease vehicle speed.
Exhaust	The release of fluid pressure from a hydraulic circuit. (The words 'exhausts' and 'exhausting' are also used and have the same intended meaning.)
Fail-safe Mode	A condition whereby a component (i.e. engine or transmission) will partially function even if its electrical circuit is disabled.
Fluid	In this Section of the Service Manual, 'fluid' refers primarily to automatic transmission fluid (or ATF) and, for the Hydra-matic 4L60E transmission, the only recommended fluid is Dexron® III.
Fluid Pressure	A pressure that is consistent throughout a given fluid circuit.
Force	A measurable effort that is exerted on an object (component).
Freewheeling	A condition where power is lost through a driving or holding device (i.e. roller or sprag clutches).
Friction Material	A heat and wear resistant fibrous material, bonded to clutch plates and bands.
Gear	A round, toothed device that is used for transmitting torque through other components.
Gear Range	A specific speed to torque ratio at which the transmission is operating (i.e. 1st gear, 2nd gear etc.).
Gear Ratio	Revolutions of an input gear as compared to the revolutions of an output gear. It can also be expressed as the number of teeth on a gear as compared to the number of teeth on a gear that it is in mesh with.
Hydraulic Circuit	A fluid passage which often includes the mechanical components in that circuit designed to perform a specific function.
Input	A starting point for torque, revolutions or energy into another component of the transmission.
Internal Gear	The outermost member of a gear set that has gear teeth in constant mesh with the planetary pinion gears of the gear set.
Land (Valve Land)	The larger diameters of a spool valve that contact the valve bore or bushing.

General	Definition
Line Pressure	The main fluid pressure in a hydraulic system created by the pump and pressure regulator valve.
Manual Valve	A spool valve that distributes fluid to various hydraulic circuits and is mechanically linked to the gear selector lever.
Orifice	A restricting device (usually a hole in the spacer plate) for controlling pressure build up into another circuit.
Overdrive	An operating condition in the gear set allowing output speed to be higher than input speed and output torque to be lower than input torque.
Overrunning	The function of a one-way mechanical clutch that allows the clutch to freewheel during certain operating conditions of the transmission.
Pedal Position	The percentage angle of the accelerator pedal as displayed by Tech 2.
Pinion Gears	Pinion gears (housed in a carrier) that are in constant mesh with a circumferential internal gear and centralised sun gear.
Planetary Gear Set	An assembly of gears that consists of an internal gear, planet pinion gears with a carrier, and a sun gear.
Pressure	A measurable force that is exerted on an area and expressed as kilopascals (kPa).
Pulse Width Modulated (PWM)	An electronic signal that continuously cycles the On and Off time of a device (such as a solenoid) while varying the amount of On time.
Race (Inner or Outer)	A highly polished steel surface that contacts bearings or sprag or roller elements.
Reduction (Gear Reduction)	An operating condition in the gear set allowing output speed to be lower than input speed and output torque to be higher than input torque.
Residual Fluid Pressure	Excess pressure contained within an area after the supply pressure has been terminated.
Roller Clutch	A mechanical clutch (holding device) consisting of roller bearings assembled between inner and outer races.
Servo	A spring loaded device consisting of a piston in a bore that is operated (stroked) by hydraulic pressure to apply or release a band.
Spool Valve	A round hydraulic control valve often containing a variety of land and valley diameters.
Sprag Clutch	A mechanical clutch (holding device consisting of "figure eight" like elements assembled between inner and outer races.
Staking	The effect of deforming, peening over or riveting a shaft to provide a solid mounting.
Throttle Position	The travel of the throttle plate that is expressed in percentages and measured by Tech 2.
Torque	A measurable twisting force expressed in terms of Newton metres (Nm).
Torque Converter	A component of an automatic transmission, (attached to the engine flex plate) that transfers torque from the engine to the transmission through a fluid coupling.
Torx® Plus Bit	A special tool used for the removal of the bell housing. Precision tip fit means that cam out of the bolt head is virtually eliminated. **NOTE** Torx® Plus Bits are different from normal Torx® Bits
Transmission Control Module (TCM)	An electronic device that manages the vehicle's engine and automatic transmission functions.
Variable Capacity Pump	The device that provides fluid for operating the hydraulic circuits in the transmission. The amount of fluid supplied varies depending on vehicle operating conditions.

4.4 Abbreviations

Abbreviation	Definition
2WD	Two Wheel Drive.
AC	Alternating Current
A/C	Air Conditioning
AFL	Actuator Feed Limit
4WD	Four Wheel Drive
DC	Direct Current
D.C	Duty Cycle
DLC	Diagnostic Link Connector
DTC	Diagnostic Trouble Code
ECM	Engine Control Module
ECT Sensor	Engine Coolant Temperature Sensor.
ETC	Electronic Throttle Control
N.C	Normally Closed
N.O.	Normally Open
PCS	Pressure Control Solenoid (or Force Motor)
PIM	Powertrain Interface Module
PWM	Pulse Width Modulated
RWD	Rear Wheel Drive.
TCC	Torque Converter Clutch.
TCM	Transmission Control Module
TFP Switch	Transmission Fluid Pressure Manual Valve Position Switch
TFT	Transmission Fluid Temperature Sensor.
TP Sensor	Throttle Position Sensor.
VS Sensor	Vehicle Speed Sensor.

5 Service Notes

In the interests of safety to personnel, equipment and to the vehicle and its components, read and adhere to the following notes whenever servicing operations are to be carried out on the Hydra-matic 4L60E automatic transmission. In addition, some of this information also refers to sound workshop practices and, to achieve the design life of affected components.

Fasteners

- Always reinstall fasteners in the same locations as they were removed.
- If a fastener requires replacement, always use a part of the correct part number or of equal size and strength or stronger.

General Workshop Practice

- Keep work area and tools clean.
- To avoid unnecessary contamination, always clean the exterior of the transmission before removing any parts.
- Do not use wiping cloths or rags because of the risk of lint being trapped in the transmission.
- Do not use solvents on:
  - neoprene seals,
  - composition faced clutch plates, or
  - thrust washers.
- Always wear eye protection when using compressed air.
- Blow out all passages with compressed air. Only probe small passages with soft, thin wire.
- Handle parts with care to avoid nicks and scratches.
- Do not remove Teflon oil seal rings unless damaged or performing a complete overhaul.
- Expand internal snap rings and compress external snap rings to maximise retention and security.
- Lubricate all internal parts with transmission fluid (only use Dexron® III), as they are being installed.
- When installing cap screws into aluminium castings:
  - always use a torque wrench and
  - stripped or damaged threads in aluminium castings may be reconditioned by using commercially available thread inserts.
- Once removed, replace all gaskets, seals and O-rings with new parts.
- Always use seal protectors where indicated and do not use gasket cement or sealant on any joined face unless specified to do so.

6 Torque Specifications

Oil pan attaching bolt	12.0 Nm
Shift selector base plate attaching nut	7.0 Nm
Spring plate attaching screw	2.0 Nm
Selector lever knob attaching screw	2.0 Nm
Selector cable bracket attaching bolt	22.0 Nm
Heat shield front attaching screw	15.0 – 35.0 Nm
Heat shield rear attaching screw	9.0 Nm
Manual shaft linkage attaching nut	25.0 Nm
Neutral start and back-up lamp switch attaching screw	15.0 – 35.0 Nm
Vehicle speed sensor attaching bolt	11.0 - 14.0 Nm
Transmission mount attaching bolt	50.0 Nm
Transmission support attaching bolt and nut	50.0 – 65.0 Nm
Transmission mount attaching nut	52.0 Nm
Heat shield to transmission support attaching bolt	52.0 Nm
Extension housing attaching bolt	42.0 – 48.0 Nm
1 – 2 Accumulator cover attaching bolt	12.0 Nm
TCC solenoid attaching bolt	12.0 Nm
Control valve body attaching bolt	12.0 Nm
Transmission fluid pressure (TFP) manual valve position switch attaching bolt	12.0 Nm
Manual detent spring attaching bolt	23.0 Nm
Spacer plate support plate attaching bolt	12.0 Nm
Filler tube bracket attaching bolt	20.0 – 35.0 Nm
Vent pipe attaching bolt	6.0 Nm
Transmission cooler lines bracket attaching screw	23.0 Nm
Torque converter housing attaching bolt	52.0 – 66.0 Nm
Torque converter to flexplate attaching bolt	60.0 – 70.0 Nm
Torque converter cover attaching bolt	12.0 – 16.0 Nm
TCM bracket attaching nut	7.0 Nm
TCM attaching bolt and nut	7.0 Nm
Oil Pump Cover to Pump Body Attaching Bolt	25.0 Nm
Pressure Control Solenoid Retainer Attaching Bolt	12.0 Nm
Forward Accumulator Cover Attaching Bolt	12.0 Nm
Oil Pump to Transmission Case Attaching Bolt	30.0 Nm
Torque Converter Housing to Transmission Case Attaching Bolt	65.0 – 75.0 Nm

7 Transmission Specifications

7.1 General

Type

Hydra-matic 4L60E

Special Features

Electronically controlled shift pattern, feel and torque

Converter clutch operation

Overdrive 4th speed range

Selector Location .... Floor mounted console

Gear Ratios

Park (P) .... –

Reverse (R) 2.29

Neutral (N) .... –

Drive (D – 4) 0.7

Drive (D – 3) 1.0

Second (2) 1.63

First (1) 3.06

Shift Speeds

Refer to 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis

Oil Pressure

Refer to 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis

Torque Converter

Number of Elements .... 3 plus torque converter clutch

Torque Converter Diameter and End Play

HFV6 .... 258 mm

End Play .... 0.1 – 0.5 mm

Lubricant

Type recommended .... Dexron® III

Capacity .... Nominal only. Check when transmission is at operating temperature

Service Refill .... 4.8 litres

Total (Dry) .... 8.8 litres

Fluid Cooling .... Transmission fluid to engine coolant in one radiator tank

Clutches and Band

2 – 4 Band:

Type .... Composition lined, steel band

Operation: .... Servo

Adjustment: .... Selective Apply Pin

Pin Size and Identification.

65.82 – 66.12 mm .... 1 Groove

67.23 – 67.53 mm .... 2 Groove

68.64 – 68.94 mm .... No Groove

Reverse Input Clutch

Type .... Multiple wet disc

Backing plate .... (1) Selective

Clutch plate (numbers):

Steel 4

Composition 4

Belleville 1

Backing Plate .... 1 (Selective)

Backing plate, identification and thickness:

'2' .... 7.25 – 7.41 mm

'3' .... 6.52 – 6.68 mm

'4' .... 5.79 – 5.95 mm

Backing plate travel .... 1.02 – 1.94 mm

Forward Clutch

Type .... Multiple wet disc

Clutch plate, (number):

Flat steel plates .... (5)

Composition plates .... (5)

Waved steel plate .... (1)

Backing plate .... (1) Selective

Backing plate, identification and thickness:

'A' .... 6.97 – 7.07 mm

'B' .... 6.38 – 6.48 mm

'C' .... 5.79 – 5.89 mm

'D' .... 5.20 – 5.30 mm

'E' .... 4.61 – 4.71 mm

Backing plate travel .... 0.87 – 1.88 mm

Overrun Clutch

Type .... Multiple wet disc

Clutch plates, (number):

Flat steel .... (2)

Composition .... (2)

3 – 4 Clutch

Type .... Multiple wet disc

Clutch plates, (number):

Flat steel .... (5)

Composition .... (6)

Stepped apply plate .... (1)

Backing plate .... (1) Selective

Backing plate, identification and thickness:

'A' .... 5.88 – 5.68 mm

'B' .... 4.99 – 4.76 mm

'C' .... 4.10 – 3.90 mm

Backing plate travel .... 2.10 – 0.90 mm

Low and Reverse Clutch

Type .... Multiple wet disc

Clutch plates (number):

Flat steel .... (5)

Composition .... (5)

Waved flat steel .... (1)

Selective flat steel plate .... (1) Selective

Selective plate, (identification) and thickness,
measured dimension:

28.06 – 27.54 mm (identification NONE) .... 1.68 – 1.83 mm

28.59 – 28.07 mm (identification '0') .... 1.17 – 1.31 mm

27.54 – 27.03 mm (identification '1') .... 2.20 – 2.34 mm

Transmission End Play Check

Transmission end play check specification .... 0.13 – 0.92 mm

Identification and washer thickness:

67 .... 1.87 – 1.97 mm

68 .... 2.04 – 2.14 mm

69.. 2.21 – 2.31 mm
70.. 2.38 – 2.48 mm
71.. 2.55 – 2.65 mm
72.. 2.72 – 2.82 mm
73.. 2.89 – 2.99 mm
74.. 3.06 – 3.16 mm

3. INSTABILITY OF VEHICLE

Checkpoint		Problem	Countermeasure
Vehicle trim height	NG	Incorrect	Adjust
OK			
Rubber bushings for upper and lower links. (4 × 2 Except high ride suspension)	NG	Worn	Replace
OK			
Steering linkage and upper and lower links	NG	Worn or deformed	Replace
OK			
Wheel alignment	NG	Incorrect	Adjust
OK			
Tire pressure	NG	Incorrect	Adjust
OK			
Road wheel	NG	Deformed or unbalanced	Adjust

8 Special Tools

The following pages list and illustrate the special service tools required. The tools are classified into the following categories:

Mandatory: When required to perform routine maintenance operations and adjustments, or are required to carry out fault diagnosis procedures.

Desirable: These tools should be considered for purchase since their use will greatly facilitate performing designated tasks and permit achievement of standard times.

Unique: These tools are those that must be employed when overhauling major assemblies or performing relatively large tasks.

Available: Are those tools that are of a general nature for which commercially available equivalents exist, or tools which have had previous application.

Unless otherwise specified, all tools are available from:

SPX Australia PTY. LTD.
Service Solutions
28 Clayton Road
Notting Hill, Victoria, 3168
Telephone: (03) 9544 6222
Facsimile: (03) 9544 5222

Tool Number	Illustration	Description	Tool Classification
700-4208		**Pass-Thru Connector Remover** Used to release the four locking tangs on the Pass-Thru connector from the transmission case. Previously released	Desirable
J6125-1B		**Slide Hammer** Used for a number of bush removal operations. Previously released	Unique
J8092		**Driver Handle** Used for a number of bush installation operations. Previously released	Unique
J8433		**Puller** Used with J21427-01 to remove the output speed sensor ring from the main shaft. Previously released	Unique
J8763-02		**Holding Fixture** Used in conjunction with holding fixture base J3289-20 to hold automatic transmission. Previously released.	Unique

J21368		**Oil Pump Alignment Band** Used to align the two oil pump sections before tightening the securing bolts. Previously released	Unique
J21426		**Rear Seal Installer** Used to install the extension housing oil seal. Previously released	Unique
J21427-01		**Puller Adaptor** Used with J8433 to remove the output speed sensor ring from the main shaft. Previously released	Unique
J21465-2		**Installer** Used with driver J8092 to install the front stator shaft bush. Previously released	Unique
J21465-15		**Remover** Used in conjunction with slide hammer J6125-1B to remove the stator shaft front bushing. Previously released	Unique
J23062-14		**Bush Remover** Used in conjunction with driver handle J8092. Previously released	Unique
J23327-1		**Clutch Spring Compressor** Needed to compress the clutch, before dismantling. Plate J42628 is also required. Previously released	Unique
J23907		**Slide Hammer** Used with J29369-2 to remove the reaction carrier shaft bushes. Previously released	Unique
J25016		**Oil Pump Seal Installer** Used to install the oil pump oil seal. Previously released	Unique

J25018-A		**Clutch Spring Compressor Adaptor** Used with compressor J23327 to compress the reverse input clutch during disassembly. Previously released	Unique
J25019-4		**Bush Installer** Used in conjunction with J8092 Installer Handle. Previously Released	Unique
J25019-9		**Bush Installer** Used in conjunction with driver handle J8092. Previously released	Unique
J25019-14		**Bush Remover** Used with slide hammer J6125-1B. Previously released	Unique
J25019-16		**Bush Remover** Used with slide hammer J6125-1B. Previously released	Unique
J29369-2		**Universal Bush Remover** Used with slide hammer J23907. Previously released	Unique
J29882		**Inner Overrun Clutch Seal Protector** Used to protect the inner, overrun clutch piston seal from damage during installation. Previously released	Unique
J29883		**Inner Forward Clutch Seal Protector** Used to protect the inner, forward clutch piston seal from damage during installation. Previously released	Unique
J33037		**2 – 4 Band Apply Pin Tool** Used to check the selective apply pin length. Previously released	Unique

J34196-B		**Bush Remover/Installer Set** Used for various applications, described in the text. Previously released	Unique
J34627		**Snap Ring Pliers** Specific purpose is to assist in the removal/replacement of the output shaft snap ring. Previously released	Unique
J35138		**Torque Converter End Play** To be used in conjunction with commercially available magnetic stand and dial indicator. Previously released	Unique
J36352		**Speed Sensor Installer & Gauging Tool** Needed to correctly install the output speed sensor ring to the main shaft. Comprises sleeve, J36352-6 and C-washer J36352-4. Previously released	Unique
J36418-B		**Turbine Shaft Seal Installer & Resizer** Used to install and re-size the turbine shaft seal. Comprises J36418-1B installer and J36418-2A resizer. Previously released	Unique
J37789-A		**Oil Pump Remover** Used with J39119 to remove the oil pump assembly. Previously released	Unique
J38735-3		**Stator Shaft Sealing Ring Installer** Used with J39855-1 to install the stator shaft seal. Previously released	Unique
J39119		**Oil Pump Remover Adaptor** Used with J37789-A to remove the oil pump assembly. Previously released	Unique

J39855-1		**Stator Shaft Seal Expander** Used to expand the stator shaft seal prior to installation. Previously released	Unique
J39855-2		**Stator Shaft Seal Resizer** Used to re-size the stator shaft seal after installation. Previously released	Unique
J41510		**T50 Torx Plus® Bit** Used to loosen and tighten the torque converter housing to transmission case bolts. Also released as 6194. Previously released	Unique
J41778-1		**Oil Pump Bush Installer** Used with a bench press. Previously released	Unique
J41778-2		**Support Plate** Used to support the oil pump during bush installation. Previously released	Unique
J42628		**Plate** Used with clutch spring compressor, J23327-1. Previously released	Unique
16296		**12 Volt Black Light** Used with special, fluorescent dyes for tracing a variety of fluid leaks. Also previously released as J42220	Desirable
70000861		**Tech 2 Diagnostic Tool** Previously released	Mandatory
J21867		**Pressure Gauge And Hose Assembly** Previously released	Mandatory

J28431-B		**Fluorescent Oil Dye** Supplied in packs of 24, 1 oz bottles. Suitable for black light tracing of engine, transmission and power steering fluid leaks. Previously released	Desirable
AU525		**Quick-Connect Release Tool** This tool is used on all engines with automatic transmission. Previously released	Mandatory
AU583		**Selector Shaft Seal Remover/ Installer** Use to remove and install the manual shaft oil seal, with the transmission installed in the vehicle. Previously released	Unique
J25025-B		**Dial Indicator Stand and Guide Pin Set** Used for the guide pins for aligning the control valve body spacer plate. Previously released	Unique
J41623-B		**Cooler Line Disconnect Tool** Used to disconnect cooler lines at the transmission end, Quick-Connects. Previously released	Mandatory
7380 (J25765-A)		**Pre-load gauge (3/8" drive)** Used in several applications. In 7C5 it is used in conjunction with J33037 to measure selective apply pin length. (0-17 Nm.) Previously released	Mandatory
E308 (56750) (49V012001)		**Seal Remover** Used as a universal seal remover. Previously released	Available
J35616-C		**Electronic Kit** Used in conjunction with a multimeter for measuring voltages and resistances without damaging wiring harness connectors. Previously released	Desirable
J44152		**Jumper Harness** Used for checking automatic transmission during diagnostic checks. Previously released	Mandatory

J39200		**Digital Multimeter** Tool no. J39200 previously released, or use commercially available equivalent. Must have 10 meg ohm input impedance. Previously released	Available

7C2
Automatic Transmission – 4L60E – Electrical Diagnosis

ATTENTION

Before performing any service operation or other procedure described in this Section, refer to 00 Warnings, Cautions and Notes for correct workshop practices with regard to safety and/or property damage.

4. STIFF STEERING WHEEL

Checkpoint		Problem	Countermeasure
Upper and ball joint	NG	Stiff or damaged or lack of grease	Replace
OK			
Wheel alignment	NG	Incorrect	Adjust
OK			
Steering gear	NG	Worn or damaged	Replace
OK			
Steering linkage	NG	Deformed	Replace
OK			
Steering gear box or steering linkage	NG	Insufficient lubricants or impurities present; or excessively worn	Replace the part
OK			
Steering column with turn signal switch	NG	Interference abrasion	Replace
OK			
Tire pressure	NG	Improper	Adjust

1 General Information

1.1 Introduction

This Section covers the electrical diagnostic for the 4L60E automatic transmission when mated to a V6 engine.

1.2 General Description

The 4L60E automatic transmission incorporates electronic controls that utilise a transmission control module (TCM) to control shift points through:

- the 1-2 and 2-3 shift solenoid valves,
- the 3-2 downshift solenoid valve,
- a torque converter clutch (TCC) solenoid valve,
- apply and release through the TCC pulse width modulated (PWM) solenoid valve, and
- line pressure through the pressure control (PC) solenoid valve.

Electrical signals from various sensors provide information to the TCM about the following:

- vehicle speed,
- throttle position,
- engine coolant temperature,
- transmission fluid temperature,
- gear range selector position,
- engine speed,
- converter turbine speed, and
- engine load braking and operating mode.

The TCM uses this information to determine the precise moment to upshift or downshift, apply or release the TCC and what fluid pressure is needed to apply the clutches. This type of control provides consistent and precise shift points and shift quality based on the operating conditions of the vehicle.

Figure 7C2 – 1 shows the location of the internal electronic components in the transmission.

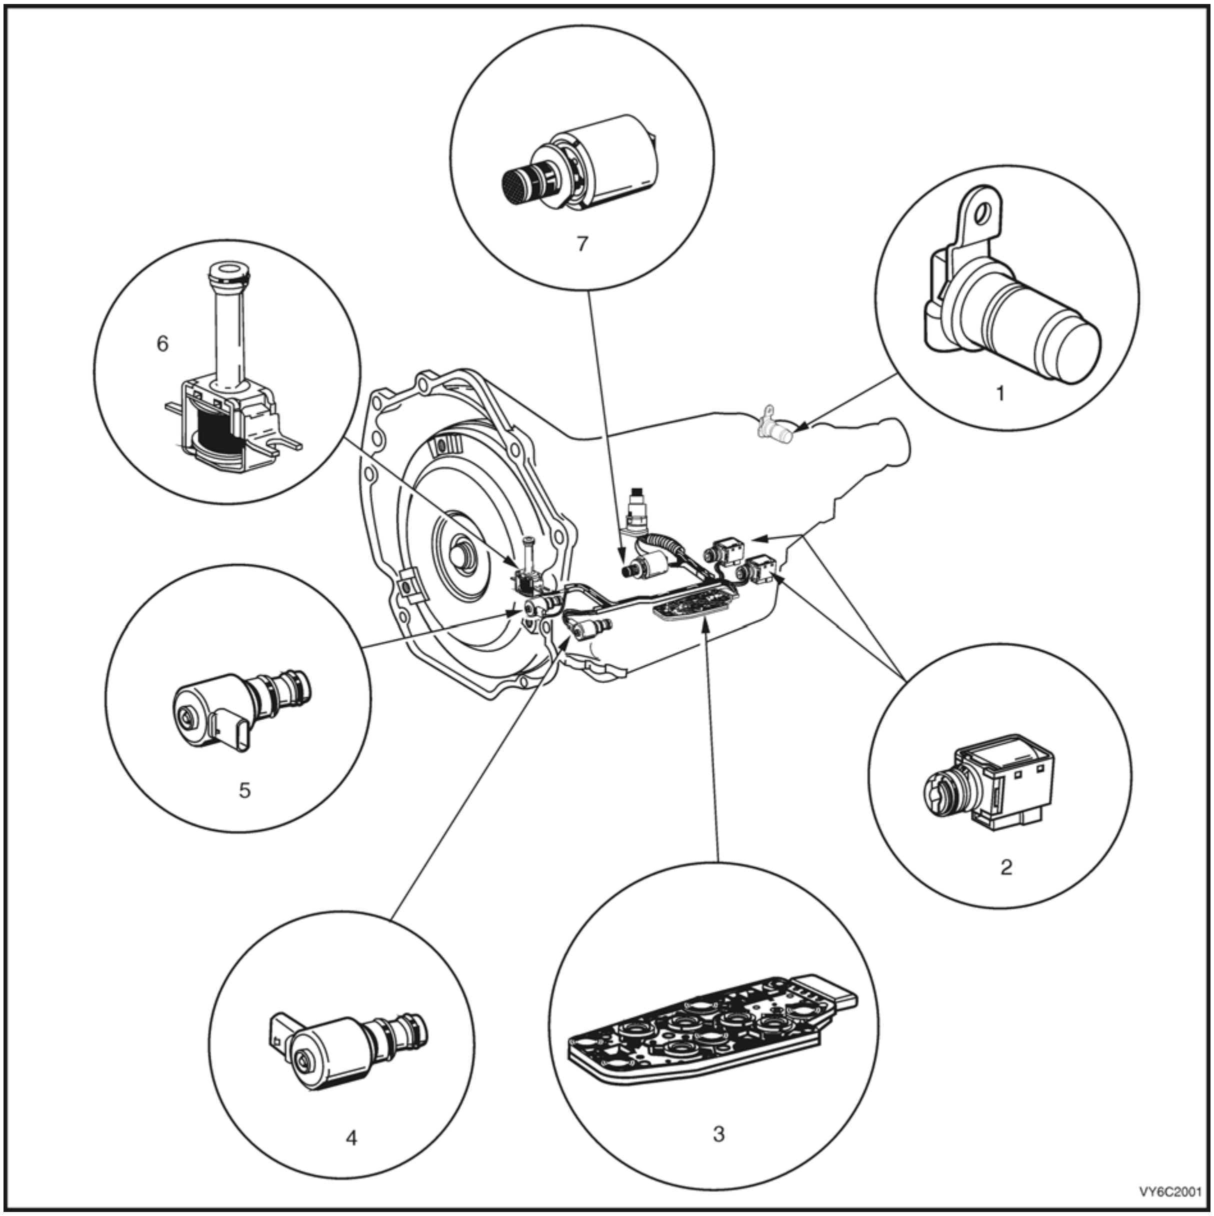

Figure 7C2 – 1

Legend

1	Vehicle Speed Sensor	5	Torque Converter Clutch Pulse Width Modulation (TCC PWM) Solenoid Valve
2	1-2 Shift Solenoid (Solenoid A) and 2-3 Shift Solenoid (Solenoid B)	6	Torque Converter Clutch (TCC) Solenoid Valve
3	Automatic Transmission Fluid Pressure (TFP) Manual Valve Position	7	Pressure Control (PC) Solenoid Valve
4	3-2 Downshift Solenoid		

Transmission Adaptive Functions

The 4L60E automatic transmission uses a line pressure control system, which has the ability to adapt the system line pressure to compensate for normal wear within the transmission, such as the clutch pack fibre plates, seals, springs, etc. The adapt feature is similar in function to the long term/short term fuel trim feature of the engine management system.

The 4L60E automatic transmission uses the adapt function for garage shifts, upshifts and torque converter clutch (TCC) application. The TCM monitors the engine torque to determine if the shift is occurring too fast or too slow and adjusts the pressure control solenoid to maintain the correct shift feel.

Limp Home Mode Description

If a major electrical system failure occurs which could affect vehicle safety or damage the transmission during normal operation, the TCM enters a limp home mode. In the limp home mode, the transmission operates in the following manner:

- The pressure control solenoid is off and the line pressure is at maximum to minimise clutch slippage.
- The TCC solenoid is off, therefore the torque converter clutch is disabled.
- The two shift solenoids are turned off. The transmission will operate in fourth gear if the vehicle has successfully completed a 1-2 upshift in the current ignition cycle. If the vehicle has not completed a 1-2 upshift in the current ignition cycle, the transmission will operate in third gear. If the transmission is operating in fourth gear, third gear may be obtained if the engine is stopped briefly and re-started.

In limp home mode, the gear selector lever is ineffective at selecting forward gear ranges. In third or fourth gear, heat builds up in the transmission quickly, particularly in stop and go traffic. Excessive heat build-up may cause transmission failure if the vehicle is driven for extended distances in limp home mode.

1.3 Transmission Indicators and Messages

For information pertaining to the instrument cluster and the transmission information it displays, refer to the RA Rodeo Owner Handbook.

1.4 Electronic Component Description

For all other electrical components not covered in this section, refer to General Motors Powertrain Group Electronically Controlled Automatic Transmission Technician's Guide.

Transmission Control Module (TCM)

The Transmission Control Module (TCM) is located under the instrument panel, next to the brake pedal assembly and connects directly to the transmission wiring harness. A single 49-way connector is used to make the connection between the vehicle wiring harness and the TCM.

To access the connector for diagnosis:

1 Ensure the ignition switch is in the OFF position.

2 Disconnect the connector (1) from the transmission control module (TCM) (2) as follows, refer to Figure 7C2 – 2:

   a remove the securing pin (3),

   b press the locking tab and swing the lever (4) to free the connector,

   c remove the connector.

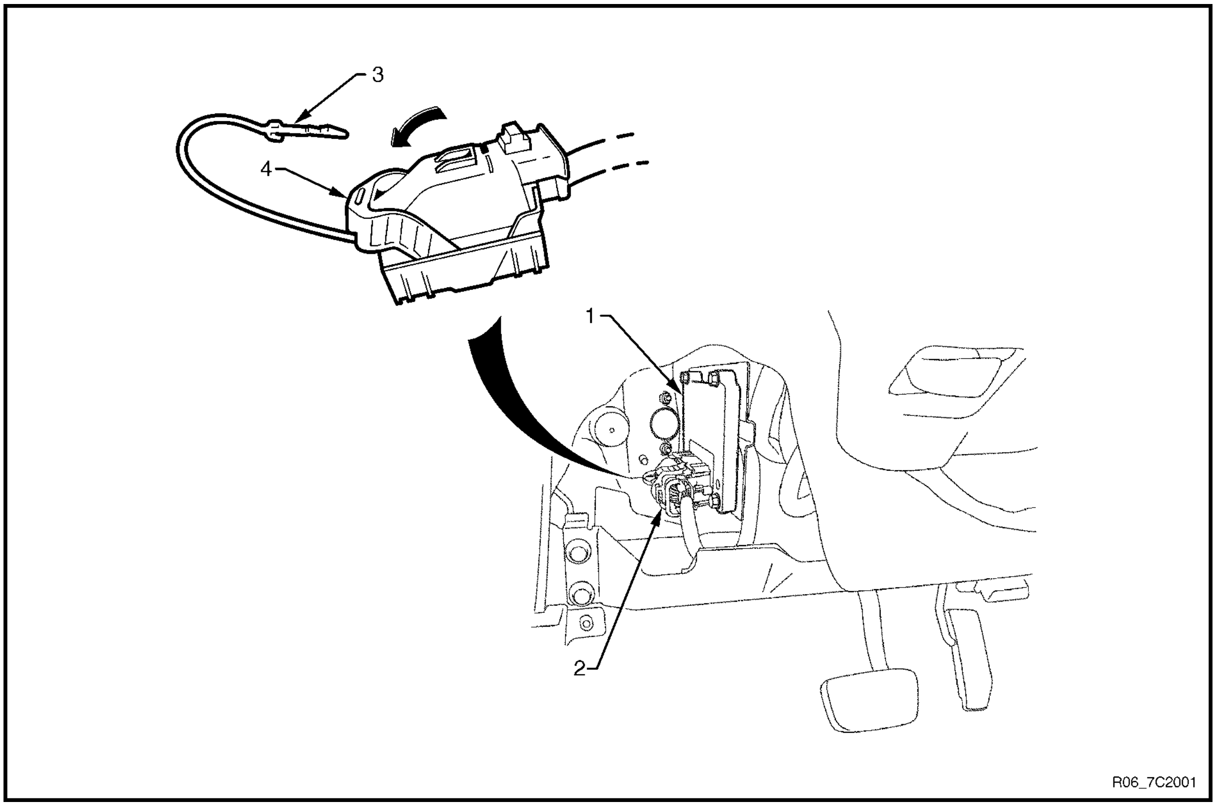

Figure 7C2 – 2

The TCM is an electronic control module receiving input or providing output to control the operation of the 4L60E automatic transmission.

The TCM receives the following inputs from the engine control module (ECM):

- engine speed and torque values,
- engine intake air temperature (IAT), accelerator pedal position (APP) information,
- engine coolant temperature (ECT),
- driver selected shift mode, and
- air-conditioning (A/C) status.

The ECM provides this data to the TCM through the databus.

Other TCM inputs are:

- battery and ignition voltage,
- brake switch status,
- transmission fluid temperature (TFT), and

vehicle speed sensor (VSS).

The TCM provides the following outputs to control the automatic transmission:

- shift solenoids to control transmission shifting,
- torque converter clutch (TCC) pulse width modulated (PWM) solenoid operation to control the apply and release of the torque converter clutch assembly, and
- pressure control (PC) solenoid to regulate the transmission line pressure.

Other TCM outputs provided to the ECM / PIM are:

- MIL illumination request,
- vehicle speed,

- transmission fluid temperature,
- commanded gear status,
- TCC status, and
- torque reduction requests.

2 Wiring Diagrams and Connector Chart

For wiring diagrams and connector information, refer to 8A Electrica-Body and Chassis.

3 Tech 2 Information

3.1 Tech 2 Diagnostics

Tech 2, with the appropriate software, cables and adapters, when connected to the serial data link connector (DLC) can read seat and exterior rear-view mirror serial data. The DLC is attached to the instrument panel trim retainer beneath the steering wheel.

1 DLC

2 DLC Adapter

3 DLC Cable

4 Tech 2

For additional general information on connecting and operating Tech 2, refer to 0C Tech 2.

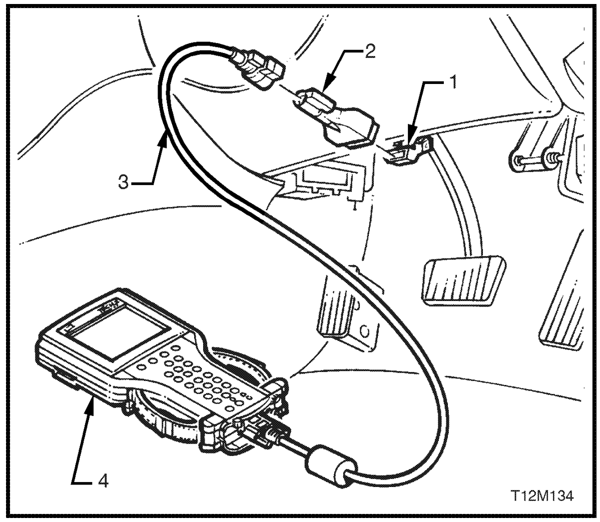

Figure 1A7 – 3

Test Modes

Tech 2 has six test modes for diagnosing the transmission. To get to these various test modes, on Tech 2 select:
Diagnostics / **Model Year** / **Model** / **Vehicle Type** / **Transmission** / **Automatic Transmission**
and follow Tech 2's prompts. This will then display the following menu operations.

Diagnostic Trouble Codes

If **Diagnostic Trouble Codes** is selected, a selection list is displayed which contains:

- **Read DTC Information** – Once selected, both current and history diagnostic trouble codes (DTCs) stored in the transmission control module will be displayed.
- **Clear Engine & Transmission DTC(s)** – Once selected, DTCs stored in the transmission control module (TCM) and engine control module (ECM) memory may be cleared.
- **Freeze Frame / Failure Records** – Shows Freeze Frame / Failure Records information. Freeze Frame / Failure Records are types of snapshots stored in the memory of the TCM and contain data parameters from the TCM at the time the DTC set.

NOTE

For a complete list of TCM DTCs, refer to 4.8 Diagnostic Trouble Code List. For further information on Tech 2 and it functions, refer to 0C Tech 2.

Data Display

If **Data Display** is selected, a selection list is displayed which contains:

- **Transmission Data** – Once is selected, a list of transmission components and the TCM inputs are displayed along with their status.
- **TCC Data** – Once selected, displays specific parameter information about the torque converter clutch controlling devices and their circuits.
- **1-2 Shift Data** – Once selected, displays specific parameter information about the 1-2 shift solenoid valve (shift solenoid A) and its circuits.

- **2-3 Shift Data** – Once this mode is selected, displays specific parameter information about the 2-3 shift solenoid valve (shift solenoid B) and its circuits.
- **3-4 Shift Data** – Once selected, displays information on 3-4 shift timing.
- **3-2 Downshift Data** – Once selected, displays information on 3-2 downshift timing.
- **Pressure Control Solenoid Data** – Once selected, displays specific parameter information about the PC solenoid and its circuits.
- **Transmission Adapts** – Once selected, it has further sub menus:
  - **1-2 Adapt Data** – In this mode Tech 2 continuously monitors and displays 1-2 TAP cell data parameters.
  - **2-3 Adapt Data** –In this mode Tech 2 continuously monitors and displays 2-3 TAP cell data parameters.
  - **3-4 Adapt Data** –In this mode Tech 2 continuously monitors and displays 3-4 TAP cell data parameters.
  - **Steady State Adapt Data** – In this mode Tech 2 continuously monitors and displays Steady State TAP data parameters.
- **System Identification:** In this mode, Tech 2 will display the transmission identification screen. The following items will be displayed; Identifier, Partnumber, Hardware Partnumber, Alpha Code, Software Version Number, Software Partnumber, VIN Digit 1-10, VIN Digit 11-17.

NOTE

Further information about the Data Display mode and the data parameter is contained in 3.2 Data Display.

Snapshot

In this test mode, Tech 2 captures TCM data before and after a forced manual trigger.

Additional Functions

If **Additional Functions** is selected, a selections list is displayed which contains:

- **System Identification**– In this mode, Tech 2 will display the transmission identification screen. The following items will be displayed; Identifier, Partnumber, Hardware Partnumber, Alpha Code, Software Version Number, Software Partnumber.

Miscellaneous Tests

If **Miscellaneous Functions** is selected, a selections list is displayed which contains:

- **TCC Solenoid** –Tech 2 can command the TCC solenoid on and off. Tech 2 will display whether the TCC solenoid is active or inactive.
- **TCC PWN Solenoid** – Tech 2 can command the TCC PWM solenoid on and off. Tech 2 will display whether the TCC PWM solenoid is active or inactive and torque percentage.
- **TCC Apply** – Tech 2 can command the TCC on when the vehicle is above 50 km/h.
- **Shift Solenoid A** – Tech 2 can command the shift solenoid A (1-2 shift solenoid) on and off.
- **Shift Solenoid B** – Tech 2 can command the shift solenoid B (2-3 shift solenoid) on and off.
- **3/2 Downshift Solenoid** – Tech 2 can command the 3/2 downshift solenoid (3-2 shift solenoid) on and off.
- **Gear Control** – Tech 2 can incrementally command shift solenoid states to correspond to relative gear states. The TCM will only allow single shift increments or decrements and does not allow a shift if it causes the engine RPM to exceed a calibrated limit.
- **Pressure Control Solenoid** – This function allows the user to control state of the pressure control solenoid in increments of 100 mA.

NOTE

For operating parameters of the Miscellaneous Test, refer to 3.4 Miscellaneous Tests.

Programming

If **Programming** is selected, a selection list is displayed which contains:

- **Reset TAP Cells** – This test allows the user to reset the Transmission Adapt (TAP) cells by pressing the **Reset** soft key.

NOTE

Upon resetting the TAP cells the TCM loses all learnt adaptive functions. When the vehicle is first driven after this, the shifts may be harsh. This harshness will ease as the TCM relearns the TAP cells.

3.2 Data Display

If **Data Display** is selected, a selection list is displayed which contains the following:

Transmission Data

Once this mode, a list of transmission components and the TCM inputs are displayed along with their status.

Transmission Data Parameters

For definitions of the parameters in this table, refer to 3.3 Tech 2 Data Definitions.

Tech 2 Parameter	Units Displayed	Typical Data Value
Engine Torque	Nm	Varies
Throttle Position	Percent	Varies
Engine Speed	RPM	Varies
AT Input Speed	N/A	N/A
AT Output Speed	RPM	Varies
Vehicle Speed	km/h	0
Commanded Gear	1,2,3,4	1
Shift Solenoid A	On / Off	Varies
Shift Solenoid B	On / Off	Varies
3-2 Downshift Solenoid	On/Off	On
Estimated Gear Ratio	Ratio	8.00:1
Speed Ratio	Ratio	8.00:1
Torque Converter Efficiency	Ratio	.00:1
TFP Switch A	Open 12 V / Closed 0 V	Varies
TFP Switch B	Open 12 V / Closed 0 V	Varies
TFP Switch C	Open 12 V / Closed 0 V	Varies
Engine Coolant Temperature	°C	Varies
Transmission Fluid Temp	°C	Varies
Transmission Hot Mode	On/Off	Off
PCS Actual Current	Amps	Varies (0.1 – 1.1 A)
PCS Desired Current	Amps	Varies (0.1 – 1.1 A)
PCS Duty Cycle	Percent	Varies

Tech 2 Parameter	Units Displayed	Typical Data Value
High Side Driver 1	N/A	N/A
TCC Solenoid	On / Off	Varies
TCC PWM Solenoid	Percent	0%
TCC Slip Speed	RPM	+/-50 RPM from Engine Speed
Transmission Range (TR)	Park/Neutral, Reverse, Drive4, Drive3, Drive2, Drive1 or Invalid	Park/Neutral
TR Switch A	Open 12 V / Closed 0 V	Varies
TR Switch B	Open 12 V / Closed 0 V	Varies
TR Switch C	Open 12 V / Closed 0 V	Varies
TR Switch P	Open 12 V / Closed 0 V	Varies
Latest Shift	Seconds	Varies
1-2 Shift Time	Seconds	Varies
2-3 Shift Time	Seconds	Varies
3-4 Shift Time	Seconds	Varies
Cruise Control	Active / Inactive	Varies
A/C Clutch	On / Off	Varies
Ignition Voltage	Volts	12-14 V
Shift Pattern	Normal / Power / Cruise	Varies
4 Wheel Drive Low	Active / Inactive	Inactive

TCC Data

Once this mode is selected, displays specific parameter information about the torque converter clutch controlling devices and their circuits.

TCC Data Parameters

For definitions of the parameters in this table, refer to 3.3 Tech 2 Data Definitions.

Tech 2 Parameter	Units Displayed	Typical Data Value
TCC Solenoid	On / Off	Varies
TCC PWM Solenoid	Percent	0%
TCC Slip Speed	RPM	+/-50 RPM from Engine Speed
TCC Duty Cycle Circuit	Open or Shorted / Short to Battery / Okay	Okay
Throttle Position	Percent	Varies
Engine Speed	RPM	Varies
AT Input Speed	N/A	N/A
AT Output Speed	RPM	Varies
Engine Torque	Nm	Varies
Vehicle Speed	km/h	0
Commanded Gear	1,2,3,4	1
Engine Coolant Temperature	°C	Varies

Tech 2 Parameter	Units Displayed	Typical Data Value
Transmission Fluid Temp	°C	Varies
Estimated Gear Ratio	Ratio	8.00:1
Transmission Hot Mode	On / Off	Off

1-2 Shift Data

Once this mode is selected, displays specific parameter information about the 1-2 shift solenoid valve and its circuits.

1-2 Shift Data Parameters

For definitions of the parameters in this table, refer to 3.3 Tech 2 Data Definitions.

Tech 2 Parameter	Units Displayed	Typical Data Value
Shift Solenoid A	On / Off	Varies
Shift Solenoid B	On / Off	Varies
Commanded Gear	1,2,3,4	1
1-2 Shift Time	Seconds	Varies
1-2 Shift Error	Seconds	Varies
Shift Solenoid A Circuit	Open or Shorted / Short to Battery / Okay	Okay
Throttle Position	Percent	Varies
Engine Speed	RPM	Varies
AT Input Speed	N/A	N/A
AT Output Speed	RPM	Varies
Vehicle Speed	km/h	0
Estimated Gear Ratio	Ratio	8.00:1

2-3 Shift Data

Once this mode is selected, displays specific parameter information about the 2-3 shift solenoid valve and its circuits.

2-3 Shift Data Parameters

For definitions of the parameters in this table, refer to 3.3 Tech 2 Data Definitions.

Tech 2 Parameter	Units Displayed	Typical Data Value
Shift Solenoid A	On / Off	Varies
Shift Solenoid B	On / Off	Varies
Commanded Gear	1,2,3,4	1
2-3 Shift Time	Seconds	Varies
2-3 Shift Error	Seconds	Varies
Shift Solenoid B Circuit	Open or Shorted / Short to Battery / Okay	Okay
Throttle Position	Percent	Varies
Engine Speed	RPM	Varies
AT Input Speed	N/A	N/A
AT Output Speed	RPM	Varies

Tech 2 Parameter	Units Displayed	Typical Data Value
Vehicle Speed	km/h	0
Estimated Gear Ratio	Ratio	8.00:1

3-4 Shift Data

Once this mode is selected, displays information on 3-4 shift timing.

3-4 Shift Data Parameters

For definitions of the parameters in this table, refer to 3.3 Tech 2 Data Definitions.

Tech 2 Parameter	Units Displayed	Typical Data Value
Shift Solenoid A	On / Off	Varies
Shift Solenoid B	On / Off	Varies
Commanded Gear	1,2,3,4	1
3-4 Shift Time	Seconds	Varies
3-4 Shift Error	Seconds	Varies
Throttle Position	Percent	Varies
Engine Speed	RPM	Varies
AT Input Speed	N/A	N/A
AT Output Speed	RPM	Varies
Vehicle Speed	km/h	0
Estimated Gear Ratio	Ratio	8.00:1

3-2 Downshift Data

Once this mode is selected, displays information on 3-2 downshift timing.

3-2 Downshift Data Parameters

For definitions of the parameters in this table, refer to 3.3 Tech 2 Data Definitions.

Tech 2 Parameter	Units Displayed	Typical Data Value
3-2 Downshift Solenoid	On / Off	Varies
Commanded Gear	1,2,3,4	1
3-2 Downshift Solenoid Circuit	Open or Shorted / Short to Battery / Okay	Okay
Throttle Position	Percent	Varies
Engine Speed	RPM	Varies
AT Input Speed	N/A	N/A
AT Output Speed	RPM	Varies
Vehicle Speed	km/h	0
Estimated Gear Ratio	Ratio	8.00:1

Pressure Control Solenoid Data

Displays specific parameter information about the PC solenoid and its circuits.

Pressure Control Solenoid Data Parameters

For definitions of the parameters in this table, refer to 3.3 Tech 2 Data Definitions.

Tech 2 Parameter	Units Displayed	Typical Data Value
PCS Actual Current	Amps	Varies (0.1 – 1.1 A)
PCS Desired Current	Amps	Varies (0.1 – 1.1 A)
PCS Duty Cycle	Percent	Varies
Engine Speed	RPM	Varies
Transmission Fluid Temp	°C	Varies
Throttle Position	Percent	Varies
Vehicle Speed	km/h	0
Commanded Gear	1,2,3,4	1

Transmission Adapts

Once this is selected, it has further sub menus.

1-2 Adapt Data

In this mode Tech 2 continuously monitors and displays 1-2 TAP cell data parameters.

1-2 Adapt Data Parameter

For definitions of the parameters in this table, refer to 3.3 Tech 2 Data Definitions.

Tech 2 Parameter	Units Displayed	Typical Data Value
1-2 Shift Time	Seconds	Varies
1-2 Shift Error	Seconds	Varies
Current TAP Cell	4-16	Varies
Throttle Position	Percent	Varies
1-2 Tap Cell (1 – 17)	kPa	Varies

2-3 Adapt Data

In this mode Tech 2 continuously monitors and displays 2-3 TAP cell data parameters.

2-3 Adapt Data Parameters

For definitions of the parameters in this table, refer to 3.3 Tech 2 Data Definitions.

Tech 2 Parameter	Units Displayed	Typical Data Value
2-3 Shift Time	Seconds	Varies
2-3 Shift Error	Seconds	Varies
Current TAP Cell	4-16	Varies
Throttle Position	Percent	Varies
2-3 Tap Cell (1 – 17)	kPa	Varies

3-4 Adapt Data

In this mode Tech 2 continuously monitors and displays 3-4 TAP cell data parameters.

3-4 Adapt Data Parameters

For definitions of the parameters in this table, refer to 3.3 Tech 2 Data Definitions.

Tech 2 Parameter	Units Displayed	Typical Data Value
3-4 Shift Time	Seconds	Varies
3-4 Shift Error	Seconds	Varies
Current TAP Cell	4-16	Varies
Throttle Position	Percent	Varies
3-4 Tap Cell (1 – 17)	kPa	Varies

Steady State Adapt Data

In this mode TECH 2 continuously monitors and displays Steady State TAP data parameters.

Steady State Adapt Data Parameters

For definitions of the parameters in this table, refer to 3.3 Tech 2 Data Definitions.

Tech 2 Parameter	Units Displayed	Typical Data Value
Current TAP Cell	4-16	Varies
Throttle Position	Percent	Varies
Gear (1-4) TAP Cell	kPa	Varies
TCC (1-4) TAP Cell	kPa	Varies
Reverse Gear TAP Cell	kPA	Varies

3.3 Tech 2 Data Definitions

1-2 Shift Error: This parameter displays the difference between the desired 1-2 shift time and the actual 1-2 shift time. A positive number indicates a firm or fast shift and the actual shift time was shorter than the desired shift time. A negative number indicates a soft or slow shift and the actual shift time was longer than the desired shift time. This value is only accurate if the shift was adaptable.

1-2 Shift Time: This parameter displays the actual time of the last 1-2 shift. The shift time is based on the engine r.p.m. drop after the commanded 1-2 shift. This value is only accurate if the shift was adaptable.

1-2 TAP Cell (1-17): This parameter displays the amount of transmission adaptive pressure (TAP), based on 17 Nm of engine torque increment per cell, added to or subtracted from shift pressure during a 1-2 upshift. A positive number indicates that long shifts have been detected and PC solenoid pressure has been added to decrease shift time. A negative number indicates that short shifts have been detected and PC solenoid pressure has been subtracted to increase shift time.

2-3 Shift Error: This parameter displays the difference between the desired 2-3 shift time and the actual 2-3 shift time. A positive number indicates a firm or fast shift, the actual shift time was shorter than the desired shift time. A negative number indicates a soft or slow shift, the actual shift time was longer than the desired shift time. This value is only accurate if the shift was adaptable.

2-3 Shift Time: This parameter displays the actual time of the last 2-3 shift. The shift time is based on the engine r.p.m drop after the commanded 2-3 shift. This value is only accurate if the shift was adaptable.

2-3 TAP Cell (1-17): This parameter displays the amount of transmission adaptive pressure (TAP), based on 17 Nm of engine torque increment per cell, added to or subtracted from shift pressure during a 2-3 upshift. A positive number indicates that long shifts have been detected and PC solenoid pressure has been added to decrease shift time. A negative number indicates that short shifts have been detected and PC solenoid pressure has been subtracted to increase shift time.

3-4 Shift Error: This parameter displays the difference between the desired 3-4 shift time and the actual 3-4 shift time. A positive number indicates a firm or fast shift, the actual shift time was shorter than the desired shift time. A negative number indicates a soft or slow shift, the actual shift time was longer than the desired shift time. This value is only accurate if the shift was adaptable.

3-4 Shift Time: This parameter displays the actual time of the last 3-4 shift. The shift time is based on the engine r.p.m. drop after the commanded 3-4 shift. This value is only accurate if the shift was adaptable.

3-4 TAP Cell (1-17): This parameter displays the amount of transmission adaptive pressure (TAP), based on 17 Nm of engine torque increment per cell, added to or subtracted from shift pressure during a 3-4 upshift. A positive number indicates that long shifts have been detected and PC solenoid pressure has been added to decrease shift time. A negative number indicates that short shifts have been detected and PC solenoid pressure has been subtracted to increase shift time.

A/C Clutch: This parameter displays the condition of the sirconditioning compressor as either **On** or **Off**.

AT Output Speed: This parameter displays the rotational speed of the transmission output shaft. Tech 2 displays output shaft speed as revolutions per minute (RPM).

Commanded Gear: This parameter displays the current commanded state of the shift solenoid valves. Tech 2 displays **1**, **2**, **3** or **4**.

Current TAP Cell: This parameter displays the current transmission adaptive pressure (TAP) cell in use for transmission line pressure adaptation. The cells are based on 17 Nm of engine torque. The higher the engine torque, the higher the current TAP cell. The last cell used will remain displayed until the next adaptable upshift occurs.

Engine Coolant Temperature: This parameter displays the input signal from the engine coolant temperate (ECT) sensor. ECT is high at 151°C when the signal voltage is low, 0 V. ECT is low at -40°C when the signal voltage is high, 5 V.

Engine Speed: This parameter displays the rotational speed of the engine expressed as revolutions per minute.

Engine Torque: This parameter displays the calculated value based on engine load, throttle position, mass air flow, and other engine inputs. This parameter is accurate to within 20 Nm of actual measured engine torque.

Estimated Gear Ratio: This parameter displays the estimated turbine speed divided by the transmission output speed. Estimated turbine speed is calculated from engine speed and engine torque.

Ignition Voltage: This parameter displays the system voltage measured at the ignition feed.

Latest Shift: This parameter displays the actual time of the last upshift. This value is only accurate if the shift was adaptable.

PCS Actual Current: This parameter displays the current flow through the pressure control solenoid circuit, which is measured by the control module. High current flow results in low line pressure. Low current flow results in high line pressure.

PCS Duty Cycle: This parameter displays the commanded state of the pressure control solenoid, expressed as a percentage of energised on time. A reading of low percent indicates zero on time, non-energised, or no current flow. A high percent at idle indicates maximum on time, energised, or high current flow.

PCS Desired Current: This parameter displays the commanded current of the pressure control solenoid circuit. High current results in low line pressure. Low current results in high line pressure.

Shift Pattern: This parameter displays **Normal**, **Power** or **Cruise** depending on what mode the transmission is in.

Shift Solenoid A: This parameter displays the commanded state of the 1-2 shift solenoid valve. When the transmission is in 1^{st} and 4^{th} gear, the display should indicate **On**; current is flowing through the solenoid. When the transmission is in 2^{nd} and 3^{rd} gear, the display should indicate **Off**; current is not flowing through the solenoid.

Shift Solenoid A Circuit: This parameter displays whether an open or a short to ground, short to battery or the circuit is okay in the 1-2 shift solenoid valve feedback signal. The 1-2 shift solenoid valve must be commanded off and on.

Shift Solenoid B: This parameter displays the commanded state of the 2-3 shift solenoid valve. When the transmission is in 1^{st} and 4^{th} gear, the display should indicate **On**; current is flowing through the solenoid. When the transmission is in 2^{nd} and 3^{rd} gear, the display should indicate **Off**; current is not flowing through the solenoid.

Shift Solenoid B Circuit: This parameter displays whether an open or a short to ground, short to battery or the circuit is okay in the 2-3 shift solenoid valve feedback signal. The 2-3 shift solenoid valve must be commanded off and on.

Speed Ratio: This parameter displays the calculated speed ratio of the transmission.

TCC Duty Cycle Circuit: This parameter displays whether an open or a short to ground, short to battery or the circuit is okay in the TCC PWM solenoid valve feedback signal. The TCC PWM solenoid valve must be commanded off and on.

TCC Solenoid: This parameter displays the commanded sate of the TCC solenoid. **On** indicates a commanded energised state; current is flowing through the solenoid. **Off** indicates a commanded non-energised state; current is not flowing through the solenoid. This commanded state occurs at various vehicle speeds between applications.

TCC Slip Speed: This parameter displays the difference between transmission output speed and engine speed. A negative value indicates the engine speed is less than the output speed, deceleration. A positive value indicates the engine speed is greater than the output speed, acceleration. A value of zero indicates the engine speed is equal to the output speed, TCC applied.

TCC PWM Solenoid: This parameter displays the commanded percentage of on time for the TCC PWM solenoid. A high percentage represents an on, energised, commanded state.0 percent represents an off, non-energised, commanded state.

TFP Gear: This parameter displays **Park/Neutral**, **Reverse**, **Drive4**, **Drive3**, **Drive2**, **Drive1** or **Invalid**. This parameter is the decoded status of the three A/B/C inputs from the automatic transmission fluid pressure manual valve position switch. If a valid combination of inputs is not detected, invalid will be displayed.

TFP Swi A/B/C: This parameter displays **Open 12 V** / **Closed 0 V** for each switch. This parameter indicates the statues of the three inputs from the automatic transmission fluid pressure manual valve position switch assembly.

Throttle Position: This parameter displays a calculated value, which is determined by the accelerator pedal position and the actual throttle position, used to optimise transmission controls. It represents the driver's intended requested for torque or acceleration. The range is 0-100%, 0% represents an idle or coast request and 100% represents a request for wide open throttle (WOT).

Torque Converter Efficiency: This parameter displays a ratio of 0.00:1 to 2:1. The ratio is calculates by multiplying the speed ratio by a value related to the 'K factor' of the torque converter. The 'K factor' is the looseness or tightness of the torque converter for a given torque. The nearer the torque converter is to full coupling, i.e. 1:1, the closer the torque converter efficiency number will be to 1.

TR Switch A/B/C/P: This parameter displays the status of the four inputs from the transmission range switch. Tech 2 displays **Open 12V** / **Closed 0 V**. **Open 12 V** indicates an ignition voltage input to the control module. **Closed 0 V** indicates a zero voltage input to the control module.

Transmission Fluid Temperature: This parameter displays the input signal of the transmission fluid temperature sensor. Transmission fluid temperature is high, 151°C, when signal voltage is low, 0 V. Transmission fluid temperature is low, -40°C, when signal voltage is high, 5 V.

Transmission Hot Mode: This parameter displays the automatic transmission fluid temperature (TFT) and displays **On** or **Off**. **Off** indicates the TFT has not exceeded 130°C. **On** indicates the TFT has exceeded 130°C and has not cooled to 120°C for greater than 5 seconds. These numbers are approximate and differ with transmissions.

Vehicle Speed: This parameter displays the speed at which the vehicle is travelling. Tech 2 displays vehicle speed as kilometres per hour (km/h). The vehicle speed is calculates based on the input signal from the automatic transmission output shaft speed sensor.

3.4 Miscellaneous Tests

Tech 2 Miscellaneous Tests	Description

Shift Solenoid A	• The TCM commands the 1-2 shift solenoid valve on and off. Tech 2's Shift Solenoid A Parameter should match the commanded state. Tech 2's Commanded Gear parameter should correspond with the shift solenoid combination. Refer to 5.6 Shift Solenoid Valve State and Gear Ratio.
	• When the ignition is on, and the engine is off, there no limits to this control. The solenoid remains on until commanded off, and vice versa. When the test is exited, the solenoid state is determined by the TCM.
	• When the engine is running, the following control limits apply:
	  • Only sequential gear changes are allowed. For example, 1st to 3rd is not allowed. If a non-sequential gear change is attempted, the message **Non-sequential gear changes not allowed**. **Gear changes must be made in order** appears on Tech 2.
	  • The vehicle speed must be below a calibrated value. If the vehicle speed is too high, the message **Vehicle speed too high** appears on Tech 2.
	  • The engine speed must be below a calibrated value. If the engine speed is too high, the message **Engine speed too high** appears on Tech 2.
	  • Downshifts are allowed only when the vehicle speed is below a calibrated value. If the vehicle speed is too high, the message **Eng. is on and veh. speed to hi for 3-2 or 2-1 downshift** appears on Tech 2.
	  • The gear requested may not be greater than the current selected transmission range (PRNDL). For example, 3rd gear is not allowed if the transmission range is D2. If the gear requested is greater than the current selected transmission range, the message **Eng. running and gear request is greater than the current TR** appears on Tech 2.
	  • The solenoid remains on until commanded off, and vice versa. When the test is exited, the solenoid state is determined by the TCM.

Continued from the previous page

Checkpoint		Problem	Countermeasure
Tire pressure	NG	Improper	Adjust
OK			
Steering linkage and steering gear	NG	Worn	Replace
OK			
Front wheel bearing	NG	Incorrect adjustment or abrasion	Adjust or replace
OK			
Steering unit fixing bolts and linkage	NG	Loose	Retighten
OK			
Lubricating oil and grease to steering linkage	NG	Insufficient	Replace

Shift Solenoid B	• The TCM commands the 2-3 shift solenoid valve on and off. Tech 2's Shift Solenoid B parameter should match the commanded state. Tech 2's Commanded Gear parameter should correspond with the shift solenoid combination. Refer to 5.6 Shift Solenoid Valve State and Gear Ratio.
	• When the ignition is on, and the engine is off, there no limits to this control. The solenoid remains on until commanded off, and vice versa. When the test is exited, the solenoid state is determined by the TCM.
	• When the engine is running, the following control limits apply:
	  • Only sequential gear changes are allowed. For example, 1st to 3rd is not allowed. If a non-sequential gear change is attempted, the message **Non-sequential gear changes not allowed. Gear changes must be made in order** appears on Tech 2.
	  • The vehicle speed must be below a calibrated value. If the vehicle speed is too high, the message **Vehicle speed too high** appears on Tech 2.
	  • The engine speed must be below a calibrated value. If the engine speed is too high, the message **Engine speed too high** appears on Tech 2.
	  • Downshifts are allowed only when the vehicle speed is below a calibrated value. If the vehicle speed is too high, the message **Eng. is on and veh. speed to hi for 3-2 or 2-1 downshift** appears on Tech 2.
	  • The gear requested may not be greater than the current selected transmission range (PRNDL). For example, third gear is not allowed if the transmission range is D2. If the gear requested is greater than the current selected transmission range, the message **Eng. running and gear request is greater than the current TR** appears on Tech 2.
	  • The solenoid remains on until commanded off, and vice versa. When the test is exited, the solenoid state is determined by the TCM.

3-2 Downshift Solenoid	• The TCM commands the 3-2 shift solenoid valve on and off. Tech 2's 3-2 Downshift Sol. parameter should match the commanded state.
	• When the ignition is on, and the engine is off, there are no limits to this control. The solenoid remains on until commanded off, and vice versa. When the test is exited, the solenoid state is determined by the TCM.
	• When the engine is running, the following control limits apply:
	  • The transmission range (PRNDL) must be Park or Neutral. If the transmission range is not in Park or Neutral, the message :**Engine running and transmission range is not Park/Neutral** appears on Tech 2.
	  • The solenoid remains on until commanded off, and vice versa. When the test is exited, the solenoid state is determined by the TCM.

Clear TAPS (Transmission Adaptive Pressures)	• The TCM clears (or resets) the TAP cells to the original base value. • There are no limits to using this test. It may be performed with the engine running or when the ignition is on, and the engine is off.

<table>
<tr><td>PC Solenoid</td><td>

The TCM commands the current to the pressure control solenoid to control transmission line pressure. As the current increases, the line pressure decreases. As the current decreases, the line pressure increases. The current range is 0.00 – 1.10 A and may be commanded in one-tenth of an amp increments.
When the ignition is on, and the engine is off, the reference (commanded) amperage may be controlled within calibrated limits. Tech 2's parameter PCS Desired Current changes by the parameter PCS Actual Current does not change. The reference current remains until commanded otherwise.
When the engine is running, the following control limits apply:

When the transmission range is Park or Neutral, the reference (commanded) current may be controlled within calibrated limits. The engine speed must be less than 1,500 r.p.m. If the engine speed is great than 1,500 r.p.m, the message TR in park/neutral and engine speed over 1,500 RPM appears on Tech 2. Both Tech 2 parameters PCS Desired Current and PCS Actual Current parameters change. Both current readings remain until commanded otherwise.
When the transmission range is not in Park or Neutral, the reference current can only be controlled less than the current determined by the TCM. The TCM does not allow a value to be selected that may cause damage to the transmission. If the requested amperage is more than allowed by the TCM, the message Requested current for the PC Solenoid is too high appears on Tech 2.
Transmission range DTCs must not be active. If a transmission range DTC is active, the message Engine running with transmission DTC present appears on Tech 2.

</td></tr>
<tr><td>Gear Control</td><td>

The TCM commands upshifts and downshifts. Tech 2's Commanded Gear parameter should correspond with the shift solenoid combination. Refer to 5.6 Shift Solenoid Valve State and Gear Ratio.
When the ignition is on, and the engine is off, there are no limits to this control. The Tech 2 shift solenoid states changes to match the Commanded Gear selected.
When the engine is running, the following control limits apply:

The TCM does not allow a shift if it causes the engine r.p.m. to exceed a calibrated limit. If a gear is requested and the engine speed is too high, the message Engine speed too high appears on Tech 2.
The TCM does not allow a 3-2 or 2-1 downshift if the vehicle speed exceeds a calibrated limit. If either downshift is requested and the vehicle speed is too high, the message Eng. is on and veh. Speed too hi for 3-2 or 2-1 downshift appears on Tech 2.
The TCM does not allow a 4-3 downshift if this vehicle speed exceeds a calibrated limit. If a 4-3 downshift is requested and the vehicle speed is too high, the message Vehicle speed to high appears on Tech 2.
The TCM does not allow an upshift if the vehicle speed exceeds a calibrated limit. If an upshift is requested and the vehicle speed is too high, the message Vehicle speed to high appears on Tech 2.
The TCM does not allow an upshift that is greater than the current selected transmission range (PRNDL). For example 3rd gear is not allowed if the transmission range is D2. If an upshift is requested that is greater than the current selected transmission range, the message Eng. running and gear request is greater than the current TR appears on Tech 2.

</td></tr>
</table>

TCC Control Solenoid	• The TCM commands the duty cycle of the TCC PWM solenoid. The duty cycle is represented by a percentage of on (energised) time. Approximately 90-100 percent duty cycle represents an on (energised) commanded state. Zero percent represents an off (non-energised) commanded state. Tech 2 TCC PWM Solenoid parameter should match the commanded state.
	• When the ignition is on, and the engine is off, there are no limits to this control. The solenoid remains on (90-100 percent duty cycle) until commanded off (zero percent duty cycle), and vice versa. When the test is exited, the solenoid duty cycle is determined by the TCM.
	• When the engine is running, the following control limits apply:
	  • If the transmission range is Park, and the transmission is in hot mode, the TCC control solenoid may not be commanded off. If the solenoid is requested off, the message **TCC OFF command disabled in Hot Mode** appears on Tech 2.
	  • The TCC control solenoid may not be commanded off for more than a calibrated amount of time. If the solenoid is commanded off for a certain amount of time, the message **TCC OFF time has been exceeded** appears on Tech 2.

TCC Apply	• The TCM commands the TCC enable solenoid valve on and off. Tech 2's TCC Solenoid parameter should match the commended state.
	• When the ignition is on, and the engine is off, there are no limits to this control. The solenoid remains on until commanded off, and vice versa. When the test is exited, the solenoid state is determined by the TCM.
	• When the engine is running, the following control limits apply:
	  • If the transmission range is Park or Neutral, the TCC enable solenoid may not be commanded off for more than a calibrated amount of time. If the solenoid is commanded off for a certain amount of time, the message **TCC OFF time has been exceeded** appears on Tech 2.
	  • If the transmission range is Park or Neutral and the TCC control solenoid duty cycle is less than maximum capacity, the TCC solenoid may not be commanded on. If the solenoid is requested on during these conditions, the message **TCC Control Solenoid is not set to maximum Pressure** appears on Tech 2.
	  • If the TCC control solenoid duty cycle is less than maximum capacity, the TCC solenoid may not be commanded on. If the solenoid is commanded on during these conditions the message **TCC Control Solenoid is not set to maximum Pressure** appears on Tech 2.
	  • If the transmission is in hot mode, the TCC solenoid may not be commanded off. If the solenoid is requested off the message **TCC OFF command disabled in Hot Mode** appears on the scan tool display.

4 Diagnostics

4.1 Introduction

The transmission diagnostic procedure is organised in a logical structure that begins with the diagnostic system check and as such must always be used as the starting point. The diagnostic system check directs the technician to the logical steps necessary to diagnose a transmission driveability fault condition.

4.2 Basic Knowledge Required

CAUTION

A lack of basic understanding regarding electronics, electrical wiring circuits and use of electrical circuit testing tools when performing any diagnostic procedure, could result in incorrect diagnostic results or damage to system components.

Understanding of the following is required to perform any of the diagnostic procedures detailed in this Service Information:

- Basic electronics,
- Electrical wiring circuits,
- Electrical circuits testing, and
- Correct use of basic system diagnostic tools.

4.3 Diagnostic Precautions

CAUTION

When tests are required on connector terminals, use the adapters in connector adaptor kit J35616-C to prevent damage to terminals.

The following precautions must be observed when performing all diagnostic procedures. Otherwise, incorrect diagnostic results or damage to system components will occur:

1 Disconnection of the battery affects certain vehicle electronic systems.

2 Disconnect the battery negative lead when performing the following procedures:

   - Disconnecting the electronic control module wiring harness connector/s or
   - Charging the battery.

3 Disconnect the battery terminal ground lead and the electronic control module wiring harness connector before attempting any electric arc welding on the vehicle.

4 Do not start the engine if the battery terminal is not properly secured to the battery.

5 Do not disconnect or reconnect any of the following while the ignition is switched on or when the engine is running:

   - Any electronic control module or system component electrical wiring connector, or
   - Battery terminal leads.

6 Ensure that the correct procedure for disconnecting and connecting system electrical wiring harness connectors is always followed. For information on the correct procedure for disconnecting and connecting specific wiring connectors, refer to 8A Electrical-Body and Chassis.

7 Ensure that all wiring harness connectors are fitted correctly and secure.

8 When steam or pressure cleaning vehicle components, such as engines, transmissions, etc., do not direct the cleaning nozzle at any system electrical wiring harness connectors or components.

9 Do not clear any DTCs unless instructed.

10 The fault must be present when using the Diagnostic Trouble Code (DTC) Diagnostic Tables. Otherwise, misdiagnosis or replacement of good parts may occur.

11 Do not touch any electronic control module connector pins or soldered components on the circuit board. This is required to avoid the possibility of electrostatic discharge damage.

12 Use only the test equipment specified in the diagnostic tables, as other test equipment may give incorrect results or damage good components.

13 Electronic control modules are designed to withstand normal current draws associated with vehicle operation. However, the following fault conditions or incorrect test procedure may overload internal control module circuits and irreparably damage the control module:

- A short to voltage fault condition in any of the control module low reference circuits may cause internal and/or sensor damage. Therefore, any short to voltage fault condition in the control module low reference circuits must be rectified before replacing a faulty component.
- A short to ground fault condition in any of the control module 5 volts reference circuits may cause internal control module and/or sensor damage. Therefore, any short to ground fault condition in the control module 5 volt reference circuits must be rectified before replacing a faulty component.
- When using a test light to test an electrical circuit, do not use any of the control module low reference circuits or 5 volts reference circuits as a reference point. Otherwise, excessive current draw from the test light may damage the control module.

14 Disregard DTCs that set while performing the following diagnostic Steps:

- Using the Tech 2 output control function, or
- Disconnecting a control module system sensor connector then switching the ignition ON.

15 After completing the required diagnostics and service operations, road test the vehicle to ensure correct system operation.

4.4 Preliminary Checks

The Preliminary Checks is a set of visual and physical checks or inspections that may quickly identify a control module system fault condition:

1 Refer to relevant Service Techlines for information regarding the fault condition.

2 Ensure that the battery is fully charged.

3 Inspect the battery connections for corrosion or a loose terminal.

4 Ensure that all relevant control module system related fuses are serviceable.

5 Inspect for incorrect aftermarket theft deterrent devices, lights or mobile phone installation.

6 Ensure that there is no speaker magnet positioned too close to any electronic module that contains relays.

7 Inspect the system wiring harness for proper connections, pinches or cuts.

8 Ensure that all control module related electrical wiring connectors are fitted correctly.

9 Inspect the control module ground connections for corrosion, loose terminal or incorrect position.

10 Ensure that the resistance between the control module housing and the battery ground cable is less than 0.5 ohms.

11 Check that the control module and its mounting bracket is secure.

12 Check all control module related components for correct installation.

13 Check the control module and related wiring harness routing to ensure that no rubbing or cutting of the wiring harness by sharp body components can occur.

4.5 Diagnostic Trouble Code Tables

The diagnostic system check and the DTC list, directs the technician to the appropriate diagnostic trouble code (DTC) tables if there is a DTC currently stored in the TCM.

The diagnostic tables locate a faulty circuit or component through a logic based on the process of elimination. These diagnostic tables are developed with the following assumptions:

- the vehicle functioned correctly at the time of assembly,
- there are no multiple faults, and
- the problem currently exists.

Understanding and the correct use of the diagnostic tables are essential to reduce diagnostic time and to prevent misdiagnosis.

Multiple DTCs Fault Condition

Some fault conditions trigger multiple component DTCs even if the fault condition exists only on a single component. If there are multiple DTCs stored in the TCM, the service technician must view and record all DTCs logged.

Relationship between the logged DTCs can then be analysed to determine the source of the fault condition. Always begin the diagnostic process with the DTC table of the fault condition that may trigger other DTCs to set.

The following fault conditions may trigger multiple DTCs:

- a fault in the serial data communication circuit,
- a system voltage that is too low may cause incorrect transmission tem operation or transmission component malfunction,
- a system voltage that is too high may damage the TCM and/or other components,
- fault condition in the TCM Read Only Memory (ROM) or Random Access Memory (RAM),
- fault condition in the TCM internal circuitry or programming, or
- improperly connected sensor or component wiring connector.

If there are no obvious faults to begin a multiple DTC fault condition diagnostic procedure, refer to the Conditions for Running the DTC in each diagnostic.

4.6 Diagnostic Trouble Code Definitions

The TCM constantly performs self-diagnostic tests on the transmission and it components. When the TCM detects a fault condition in the transmission operating parameters, the TCM sets a DTC to represents that fault condition. The following are the types of DTCs programmed in the TCM. In addition, DTCs are classified as either Current or History DTC.

- Type A – Emission Related DTCs,
- Type B – Emission Related DTCs, and
- Type C – Non-emission Related DTCs.

NOTE

Depending on the type of DTC set, the TCM may command the malfunction indiciator lamp (MIL) to display on the instrument cluster and warn the driver there is a fault in the transmission. Refer to the RA Rodeo Owner Manual for further information on the MIL.

Type A – Emission Related DTCs

The TCM takes the following action when a Type A DTC runs and fails:

- sets a current Type A DTC that represents the fault condition,
- illuminates the MIL, and

- records the operating condition at the time the diagnostic fails and stores this information in the Freeze Frame/ Failure Record.

Type B – Emission Related DTCs

The TCM takes the following actions when a Type B DTC runs and fails.

- On the first time a Type B DTC fails:
  - sets a current Type B DTC that represents the fault condition, and
  - records the operating conditions at the time the fault sets and stores this information in the Failure Records.
- On the second consecutive ignition cycle that a Type B DTC fails:
  - illuminates the MIL, and
  - records the operating condition at the time the diagnostic fails and stores this information in the Freeze Frame/ Failure Record.

Conditions for Clearing Type A or Type B DTCs

- The current DTC clears when there is no fault condition in the current TCM self-diagnostics.
- If there are no DTCs logged after six consecutive ignition cycles, the TCM deactivates the MIL.
- Type A or Type B History DTC clears when there is no fault condition after 40 consecutive warm-up cycles.
- Use of Tech 2 to clear DTCs.

Type C – Non-emission Related DTCs

The TCM takes the following action when a Type C DTC runs and fails:

- sets a current Type C DTC that represents the fault condition,
- records the operating conditions at the time the DTC is logged and stores this information in the Failure Record, and

NOTE

The MIL does not illuminate when a Type C DTC sets.

Conditions for Clearing Type C DTCs

- The current DTC clears when there is no fault condition in the current TCM self-diagnostics.
- Type C History DTC clears when there is no fault condition after 40 consecutive warm-up cycles.
- Use of Tech 2 to clear DTCs.

Current DTCs

A DTC is a Current DTC if the fault condition that triggers the DTC is present during the last TCM self-diagnostics.

History DTCs

A DTC is a History DTC if the fault condition that triggers the DTC is not present during the last TCM self-diagnostics.

4.7 Diagnostic System Check

Description

This section procedure is organised in a logical structure that begins with the diagnostic system check. The diagnostic system check directs you in a logical direction to the appropriate Section or diagnostic procedure.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

1 Within this document there are a number of requirements that must be met before you can start diagnosis. Refer to 4.2 Basic Knowledge Required, 4.3 Diagnostic Precautions and 4.4 Preliminary Checks.

2 Checks if there is data communication between Tech 2 and the TCM.

3 Checks if the TCM has set any DTCs. If no DTCs have set, the functional test must be performed, which diagnoses the hydro-mechanical functions of the transmission.

Step	Action	Yes	No
1	Have you read the Basic Diagnostic Requirements, Diagnostic Precautions and Preliminary Checks?	Go to Step 3	Refer to Note 1
2	1 Connect Tech 2 to the DLC. 2 On Tech 2 select: **Transmission** / **Automatic Transmission** and follow the instruction on Tech 2. Does Tech 2 display the TCM specifications?	Go to Step 4	Refer to 6E1 Powertrain Interface Module
3	On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information** Does Tech 2 display any DTCs?	Go to 4.8 Diagnostic Trouble Code List	Perform the Functional Test, refer to 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis

4.8 Diagnostic Trouble Code List

NOTE

If the DTC listed on Tech 2 is not contained in this list, refer to OD Vehicle Diagnostics.

DTC	Type	Description	Diagnostic Table
P0218	C	Transmission Fluid Overtemperature	4.9 DTC P0218 – Transmission Fluid Overtemperature
P0562	C	System Voltage Low	4.10 DTC P0562 – System Voltage Low
P0563	C	System Voltage High	4.11 DTC P0563 – System Voltage High
P0601	A	Transmission Control Module (TCM) Read Only Memory (ROM)	4.12 DTC P0601 to P0604 or P1621 – TCM Malfunction
P0602	A	Transmission Control Module (TCM) Not Programmed	4.12 DTC P0601 to P0604 or P1621 – TCM Malfunction
P0603	A	Transmission Control Module (TCM) Random Access Memory (RAM)	4.12 DTC P0601 to P0604 or P1621 – TCM Malfunction
P0604	A	Transmission Control Module (TCM) Long Term Memory Performance	4.12 DTC P0601 to P0604 or P1621 – TCM Malfunction
P0711	C	Transmission Fluid Temperature (TFT) Sensor Performance	4.13 DTC P0711 to P0713 – Transmission Fluid Temperature Sensor
P0712	C	Transmission Fluid Temperature (TFT) Sensor Circuit Low Voltage	4.13 DTC P0711 to P0713 – Transmission Fluid Temperature Sensor

DTC	Type	Description	Diagnostic Table
P0713	C	Transmission Fluid Temperature (TFT) Sensor Circuit High Voltage	4.13 DTC P0711 to P0713 – Transmission Fluid Temperature Sensor
P0719	C	Brake Switch Circuit High Input (Stuck On)	4.14 DTC P0719 – Brake Switch Circuit High Input (Stuck On)
P0722	B	Vehicle Speed Sensor Circuit Low Voltage	4.15 DTC P0722 – Vehicle Speed Sensor Circuit Low Voltage
P0723	B	Vehicle Speed Sensor Circuit Intermittent	4.16 DTC P0723 – Vehicle Speed Sensor Circuit Intermittent
P0724	C	Brake Switch Circuit Low Input (Stuck Off)	4.17 DTC P0724 – Brake Switch Circuit Low Input (Stuck Off)
P0741	B	Torque Converter Clutch (TCC) System – Stuck Off	4.18 DTC P0741 – Torque Converter Clutch System – Stuck Off
P0742	B	Torque Converter Clutch (TCC) System – Stuck On	4.17 DTC P0724 – Brake Switch Circuit Low Input (Stuck Off)
P0751	B	1-2 Shift Solenoid (SS) Valve Performance – No First or Fourth Gear	4.20 DTC P0751 – 1-2 Shift Solenoid Valve Performance – No First or Fourth Gear
P0752	B	1-2 Shift Solenoid (SS) Valve Performance – No Second or Third Gear	4.21 DTC P0752 – 1-2 Shift Solenoid Valve Performance – No Second or Third Gear
P0756	A	2-3 Shift Solenoid (SS) Valve Performance – No First or Second Gear	4.22 DTC P0756 – 2-3 Shift Solenoid Valve Performance – No First or Second Gear
P0757	A	2-3 Shift Solenoid (SS) Valve Performance - No Third or Fourth Gear	4.23 DTC P0757 – 2-3 Shift Solenoid Valve Performance – No Third or Fourth Gear
P0787	A	3-2 Shift Solenoid (SS) Control Circuit Low Voltage	4.24 DTC P0787 – 3-2 Shift Solenoid Control Circuit Low Voltage
P0788	A	3-2 Shift Solenoid (SS) Control Circuit High Voltage	4.25 DTC P0788 – 3-2 Shift Solenoid Control Circuit High Voltage
P0894	B	Transmission Component Slipping	4.26 DTC P0894 – Transmission Component Slipping
P0961	C	Line Pressure Control (PC) Solenoid System Performance	4.27 DTC P0961 – Line Pressure Control Solenoid System Performance
P0973	B	1-2 Shift Solenoid (SS) Control Circuit Low Voltage	4.28 DTC P0973 – 1-2 Shift Solenoid Control Circuit Low Voltage
P0974	B	1-2 Shift Solenoid (SS) Control Circuit High Voltage	4.29 DTC P0974 – 1-2 Shift Solenoid Control Circuit High Voltage
P0976	A	2-3 Shift Solenoid (SS) Control Circuit Low Voltage	4.30 DTC P0976 – 2-3 Shift Solenoid Control Circuit Low Voltage
P0977	A	2-3 Shift Solenoid (SS) Control Circuit High Voltage	4.31 DTC P0977 – 2-3 Shift Solenoid Control Circuit High Voltage
P1621	A	Transmission Control Module (TCM) Long Term Memory Performance	4.12 DTC P0601 to P0604 or P1621 – TCM Malfunction
P1810	B	Transmission Fluid Pressure (TFP) Position Switch Circuit	4.32 DTC P1810, P1815 and P1816 – Transmission Fluid Pressure Position Switch
P1815	B	Transmission Fluid Pressure (TFP) Valve Position Switch - Start in Wrong Range	4.32 DTC P1810, P1815 and P1816 – Transmission Fluid Pressure Position Switch

DTC	Type	Description	Diagnostic Table
P1816	B	Transmission Fluid Pressure (TFP) Valve Position Switch Indicates Park/Neutral (P/N) with Drive Ratio	4.32 DTC P1810, P1815 and P1816 – Transmission Fluid Pressure Position Switch
P2763	B	Torque Converter Clutch (TCC) Pressure Control (PC) Solenoid Control Circuit High Voltage	4.33 DTC P2763 – Torque Converter Clutch Pressure Control Solenoid Control Circuit High Voltage
P2764	B	Torque Converter Clutch (TCC) Pressure Control (PC) Solenoid Control Circuit Low Voltage	4.34 DTC P2764 – Torque Converter Clutch Pressure Control Solenoid Control Circuit Low Voltage
P2769	B	Torque Converter Clutch (TCC) Enable Solenoid Control Circuit Low Voltage	4.35 DTC P2769 – Torque Converter Clutch Enable Solenoid Control Circuit Low Voltage
P2770	B	Torque Converter Clutch (TCC) Enable Solenoid Control Circuit High Voltage	4.36 DTC P2770 – Torque Converter Clutch Enable Solenoid Control Circuit High Voltage
U0073	B	ECM CAN Bus Error	4.37 DTC U0073 and U0100 – CAN-Bus No Communication With ECM (Engine Control Module)
U0100	B	ECM CAN Bus Error	4.37 DTC U0073 and U0100 – CAN-Bus No Communication With ECM (Engine Control Module)

4.9 DTC P0218 – Transmission Fluid Overtemperature

DTC Description

This diagnostic procedure supports DTC P0218 Transmission Fluid Overtemperature.

Circuit Description

The flow of transmission fluid starts in the bottom pan and is drawn through the filter, control valve body assembly, transmission case and into the oil pump assembly. The oil pump assembly pressurises the fluid and directs it to the pressure regulator valve where it becomes the main supply of fluid to the various components and hydraulic circuits in the transmission. Hot fluid exiting the torque converter flows through the converter clutch apply valve and into the transmission cooler lines, to the oil cooler located in the vehicle radiator, and auxiliary cooler if equipped. From the cooler, fluid returns to cool and lubricate the front of the transmission. In forward drive ranges, D4 fluid from the manual valve is routed through an orificed cup plug in the rear of the transmission case to feed the rear lube fluid circuit.

When the transmission control module (TCM) detects a high transmission fluid temperature (TFT) for a long period of time, DTC P0218 sets. DTC P0218 is a type C DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- No DTCs P0711, P0712 or P0713.
- The ignition switch is on for 5 seconds.

Conditions for Setting the DTC

The TFT is greater than 130°C for 600 seconds (10 minutes).

Action Taken When the DTC Sets

- The TCM does not request the ECM to illuminate the MIL.
- The TCM freezes transmission adapt functions.

6. EXCESSIVE STEERING WHEEL PLAY

Checkpoint		Problem		Countermeasure
Upper, and lower links, bushing (4 × 2 Except high ride suspension)	NG	Worn		Replace
OK				
Steering linkage	NG	Worn		Replace
OK				
Front wheel bearing	NG	Incorrect adjustment or abrasion		Adjust or replace

- The TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as Failure Records.
- The TCM stores DTC P0218 in TCM history.

Conditions for Clearing the DTC

- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the fault no longer exists and the DTC passes.

Diagnostic Aids

- Tech 2's **Transmission Fluid Temp.** should rise steadily to a normal operating temperature, then stabilise.
- Ask about the customer's driving habits, trailer towing, etc. Trailer towing should occur in D3.
- Refer to Symptoms - Automatic Transmission in 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 Low transmission fluid can cause the transmission to overheat.

3 This step inspects for airflow restrictions or damage, which may result in the transmission overheating.

4-5 Decreased line pressure will cause the transmission to overheat. The torque converter stator is the pump for the transmission fluid. If the torque converter is damaged, it may not be producing the required pressure.

DTC P0218 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 Inspect for correct transmission fluid level, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Did you perform the fluid checking procedure?	Go to Step 3	Perform the transmission fluid checking procedure, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing

Step	Action	Yes	No
3	1 Inspect the engine cooling system and transmission cooling system for the following conditions: • Air flow restrictions • Air flow blockage • Debris 2 Inspect the transmission cooling system for damaged cooler lines. 3 Check the flow rate of the transmission fluid, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Did you find and correct the condition?	Go to Step 6	Go to Step 4
4	Test for correct line pressure, refer to 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis. Did you find and correct the condition?	Go to Step 6	Go to Step 5
5	Diagnose the torque converter stator, refer to 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis. Did you find and correct the condition?	Go to Step 6	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis
6	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 Start and idle the engine until it reaches normal operating temperature. 4 On Tech 2 select: **Data Display** / **Transmission Data.** 5 Drive the vehicle for 10 minutes. 6 On Tech 2, monitor the **Transmission Fluid Temp.** and ensure it has stabilised and is less than 129°C. 7 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0218 set?	Go to Step 2	Go to Step 7
7	On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.10 DTC P0562 – System Voltage Low

DTC Description

This diagnostic procedure supports DTC P0562 System Voltage Low.

Circuit Description

The transmission control module (TCM) continuously monitors the system voltage on the battery and ignition circuits. Lower than normal voltage may be inadequate to operate the transmission control solenoids properly. Improper solenoid operation may cause erratic transmission operation and tie-up conditions, which may result in internal damage.

When the TCM detects low voltage, DTC P0562 sets. DTC P0562 is a type C DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

The engine speed is greater than 1,200 r.p.m.

Conditions for Setting the DTC

The TCM detects system voltage less than 11 V for 10 seconds.

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the MIL.
- The TCM records the operating conditions when the conditions for setting the DTC are met. The TCM records this information as a Failure Record.
- The TCM stores DTC P0562 in TCM history.

Conditions for Clearing the DTC

- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- Tech 2 can clear the DTC.

Diagnostic Aids

- Observe the instrument cluster's multi-function display messaging that would indicate the electrical system requires service.
- Inspect for the following conditions:
  - Loose or damaged terminals at the generator, and
  - Loose or worn generator drive belt.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

3 The alternator warning indicator will illuminate if there is a problem with the charging system of the vehicle.

4 Checks the charging system voltage with a nominal load.

5 Checks if the ignition voltage measurement reported by the TCM is within acceptable parameters.

7 Checks if there is battery voltage supplied to the TCM.

8 Checks if there is battery voltage supplied through the ignition circuit to the TCM.

9 Checks the ground circuits of the TCM.

DTC P0562 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check

Step	Action	Yes	No
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 Using a multimeter set to measure voltage, probe across the battery terminals. Does the multimeter display greater than 11 V?	Go to Step 3	Check the serviceability of the battery, refer to 8A Electrical-Body and Chassis
3	1 Start the engine. 2 Allow the engine to warm up to normal operating temperature. Is the alternator fail warning indicator illuminated?	Refer to 6D1-1 Charging system – V6	Go to Step 4
4	1 Turn on the high beam headlamps. 2 Turn the HVAC fan control to the highest speed setting. 3 Turn on the rear window demister. 4 Increase the engine speed to 1,500 r.p.m. 5 Using a multimeter set to measure voltage, probe across the battery terminals. Does the multimeter display 12.5 – 14.5 V?	Go to Step 5	Refer to 6D1-1 Charging system – V6
5	1 Increase the engine speed to 1,500 r.p.m. 2 On Tech 2 select: **Data Display** / **Transmission Data** Does Tech 2 display the **Ignition Voltage** parameter within 12.5 – 14.5 V?	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis	Go to Step 6
6	Check the fuses EB-4 and C-8 for serviceability. Are the fuses serviceable?	Go to Step 7	Replace the affected fuse(s). If the fuse(s) blow again, check for a short to ground in the fuses circuit Go to Step 13
7	1 Turn off the ignition. 2 Disconnect the TCM connector C-96. 3 Using a multimeter set to measure voltage, probe between connector C-96 pin 32 and a known ground. Does the multimeter display battery voltage?	Go to Step 8	Check measured circuits for an open, high resistance or short to ground Repair or replace the affected circuit

Step	Action	Yes	No
8	1 Using a multimeter set to measure voltage, probe between connector C-96 pin 31 and a known ground. 2 Turn on the ignition, with the engine off. Does the multimeter display battery voltage?	Go to Step 9	Check measured circuits for an open, high resistance or short to ground Repair or replace the affected circuit
9	Using a multimeter set to measure resistance, probe between connector C-96 pin 49 and a known ground. Does the multimeter display continuity?	Got to Step 10	Check measured circuit for an open or high resistance Repair or replace affected circuit
10	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing Is the action complete?	Go to Step 11	—
11	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 Operate the vehicle under the following conditions: a Start the engine. b Allow the engine to warm up to normal operating temperature. c Raise the engine speed to at least 1,200 r.p.m. d TCM voltage must be greater than 11 V for 12 seconds. 4 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0562 set?	Go to Step 2	Go to Step 12
12	On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.11 DTC P0563 – System Voltage High

DTC Description

This diagnostic procedure supports DTC P0563 System Voltage High.

Circuit Description

The transmission control module (TCM) continuously monitors the system voltage on the battery and ignition circuits. Higher than normal voltage may cause the solenoids inside the transmission to operate improperly or damage solid-state components inside the TCM.

When the TCM detects high voltage, DTC P0563 sets. DTC P0563 is a type C DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

The ignition is on.

Conditions for Setting the DTC

The TCM detects system voltage greater than 18 V for 10 seconds.

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the MIL.
- The TCM records the operating conditions when the conditions for setting the DTC are met. The TCM records this information as a Failure Record.
- The TCM stores DTC P0563 in TCM history.

Conditions for Clearing the DTC

- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- Tech 2 can clear the DTC.

Diagnostic Aids

- Observe the instrument cluster's multi-function display for messaging that would indicate the electrical system requires service.
- Use Tech 2 to inspect all other modules for voltage related DTCs.
- Running the engine with a battery charger attached may cause DTC P0563 to set.
  - Inspect the charging circuit for high resistance.
  - Inspect the vehicle battery for open or sulphated cells.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

3 The alternator warning indicator will illuminate if there is a problem with the charging system of the vehicle.

4 Checks the charging system voltage with a minimal load.

5 Checks if there is a difference between the Tech 2 reading and the voltage measure in an earlier step.

DTC P0563 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check

Step	Action	Yes	No
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0562 set?	Refer to 4.10 DTC P0562 – System Voltage Low	Go to Step 3
3	1 Start the engine. 2 Allow the engine to warm up to normal operating temperature. Is the alternator fail warning indicator illuminated?	Refer to 6D1-1 Charging system – V6	Go to Step 4
4	1 Turn off all electrical accessories. 2 Increase the engine speed to 2,000 r.p.m. 3 Using the multimeter set to measure voltage, probe across the battery terminals. Record the measurement for reference. Does the multimeter display 12.5 – 14.5 V?	Go to Step 5	Refer to 6D1-1 Charging system – V6
5	1 Leave the engine running. 2 On Tech 2 select: **Data Display** / **Transmission Data** and observe the **Ignition Voltage** on Tech 2. 3 Increase the engine speed to 2,000 r.p.m. Is the difference between the voltage displayed on Tech 2 and the voltage measurement in Step 4 greater than 1.0 V?	Go to Step 7	Go to Step 6
6	Did DTC P0563 reset?	Go to Step 7	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis
7	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Is the action complete?	Go to Step 8	—

Step	Action	Yes	No
8	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 On Tech 2 select: **Data Display** / **Transmission Data** 4 Operate the vehicle under the following conditions: a Start the engine. b Allow the engine to warm up to normal operating temperature. c Observe the **Ignition Voltage** on Tech 2. d **Ignition Voltage** must remain below 18 V for 12 seconds. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0563 set?	Go to Step 2	Go to Step 9
9	On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.12 DTC P0601 to P0604 or P1621 – TCM Malfunction

DTC Description

This diagnostic procedure supports the following DTCs:

- DTC P0601 Transmission Control Module (TCM) Read Only Memory (ROM),
- DTC P0602 Transmission Control Module (TCM) Not Programmed,
- DTC P0603 Transmission Control Module (TCM) Long Term Memory Reset,
- DTC P0604 Transmission Control Module (TCM) Random Access Memory (RAM), and
- DTC P1621 Transmission Control Module (TCM) Long Term Memory Performance.

Circuit Description

The internal fault detection is handled inside the transmission control module (TCM). No external circuits are involved. These DTCs are type A DTCs.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

The TCM runs the program to detect an internal fault when the engine is running. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The TCM has detected an internal malfunction.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL.
- The TCM allows the vehicle to operate in transmission protection mode.
- The TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- The ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the third consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission-related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is off long enough to power down the TCM.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 DTC P0602 indicates the TCM is not programmed.

DTC P0601 to P0604 or P1621 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0602 set?	Go to Step 3	Go to Step 4
3	1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 Program the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. 4 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0602 set?	Go to Step 4	Go to Step 5
4	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Did you complete the replacement?	Go to Step 5	—

Step	Action	Yes	No
5	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes / Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 Start the engine. 4 On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Have any of the DTCs in this procedure set?	Go to Step 2	Go to Step 6
6	On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.13 DTC P0711 to P0713 – Transmission Fluid Temperature Sensor

DTC Description

This diagnostic procedure supports the following DTCs:

- DTC P0711 – Transmission Fluid Temperature (TFT) Sensor Performance,
- DTC P0712 – Transmission Fluid Temperature (TFT) Sensor Circuit Low Voltage, and
- DTC P0713 – Transmission Fluid Temperature (TFT) Sensor Circuit High Voltage.

Circuit Description

The automatic transmission fluid temperature (TFT) sensor is part of the automatic transmission fluid pressure (TFP) manual valve position switch. The automatic TFT sensor is a negative coefficient thermistor. The transmission control module (TCM) supplies a 5 volt reference signal to the sensor and measures the voltage drop in the circuit. When the transmission fluid is cold, the sensor resistance is high and the TCM detects high signal voltage. As the fluid temperature increases, the resistance of the sensor decreases, which lowers the signal voltage. This diagnostic monitors the TFT circuit. The circuit may be functional, but not in the normal operating range. This diagnostic indicates stuck, erratic, intermittent, skewed, or inaccurate values, indicating poor system performance. The TFT range is -40 – 151°C.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

DTC P0711

- No DTC P0117, P0118, P0722 or P0723.
- DTC P0711 has not passed in the current ignition cycle.
- The engine run time is greater than 5 seconds.
- The transmission fluid temperature is -39 – 149°C.
- For conditions 1 and 2 in Conditions for Setting the DTC, the engine coolant temperature is greater than 70°C and has changed by at least 50°C since start-up.
- For conditions 1 and 2 in Conditions for Setting the DTC, the TCC slip speed is 120 r.p.m. or greater for 600 seconds (10 minutes) cumulatively.

DTC P0712

The engine run time is greater than 5 seconds.

7. GRATING TIRE NOISE

Checkpoint		Problem	Countermeasure
Wheel alignment	NG	Incorrect	Adjust
OK			
Knuckle spindle and steering linkage	NG	Deformed	Replace
OK			
Suspension fixing bolt	NG	Loose	Replace
OK			
Tire pressure	NG	Improper	Adjust

DTC P0713

- No DTCs P0722, P0723.
- The output shaft speed is greater than 200 r.p.m. for 200 seconds (3 minutes and 20 seconds) cumulative.
- The TCC slip speed is greater than 120 r.p.m. for 200 seconds (3 minutes and 20 seconds) cumulative.
- The engine run time is greater than 5 seconds.

Conditions for Setting the DTC

DTC P0711

One of the following conditions occurs:

Condition 1

- The transmission fluid temperature at start-up is -40 – 21°C.
- The vehicle speed is greater than 8 km/h for 900 seconds (15 minutes) cumulatively.
- The transmission fluid temperature has not changed by more than 2°C since start-up for 100 seconds (1 minute and 40 seconds).

Condition 2

- The transmission fluid temperature at start-up is 129 – 150°C.
- The vehicle speed is greater than 8 km/h for 600 seconds (10 minutes) cumulatively.
- The transmission fluid temperature has not changed by more than 2°C since start-up for 100 seconds (1 minute and 40 seconds).

Condition 3

The transmission fluid temperature has changed by 20°C or greater within 250 milliseconds and it has done this 14 times within 7 seconds.

DTC P0712

The TCM detects a transmission fluid temperature of 150°C or more for 2 seconds.

DTC P0713

The TCM detects a transmission fluid temperature of -39°C or less for 25 seconds.

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the MIL.
- The TCM freezes transmission adaptive functions.
- The TCM calculates a default transmission fluid temperature based on engine coolant temperature, intake air temperature and engine run time.
- The TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- The TCM stores the DTC in TCM history.

Conditions for Clearing the DTC

- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission-related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the fault no longer exists and the DTC passes.

Diagnostic Aids

- Tech 2 displays the transmission fluid temperature in degrees. After the transmission is operating, the fluid temperature should rise steadily to a normal operating temperature, then stabilise.
- Verify the customer's driving habits, trailer towing, etc. Trailer towing should occur in D3.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

3 Checks the hardware components that affect the transmission fluid temperature.

4 Checks there is power supplied to the TFT sensor.

5 Checks the TFT sensor high reference circuit for serviceability.

6 Check the TFT sensor for serviceability.

7 Checks the TFT sensor low reference circuit for serviceability.

DTC P0711 to P0713 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission / Automatic Transmission / Diagnostic Trouble Codes / Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes / Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 On Tech 2 select: **Data Display / Transmission Data** 8 Drive the vehicle and observe Tech 2 for either of the following conditions: • The **Trans. Fluid Temp**. does not change more than 2.25°C in 409 seconds since start-up • The **Trans. Fluid Temp**. changes more than 20°C in 200 milliseconds 14 times within 7 seconds • The **Trans. Fluid Temp**. less than -39°C? Does Tech 2 display any of the above conditions?	Go to Step 4	Go to Step 3

Step	Action	Yes	No
3	Inspect the transmission and related components for the following: • transmission fluid level, • transmission fluid cooling system restrictions / blockages, • debris in the transmission fluid, • incorrect line pressure, • torque converter stator operation, and • transmission overload. Was a fault found and rectified?	Go to Step 10	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis
4	1 Switch off the ignition. 2 Disconnect connector E-95 from the transmission. 3 Using a multimeter set to measure voltage, probe between harness connector E-95 pin 16 and a known ground. Does the multimeter display 4.8 – 5.2 V?	Go to Step 6	Go to Step 5
5	Test the TFT sensor signal circuit (between connectors E-95 pin 16 and C-96 pin 35) for a high resistance, open circuit, short to ground or short to voltage fault condition. Did you find and correct the condition?	Go to Step 10	Go to Step 9
6	1 Switch off the ignition. 2 Remove the TCM fuses C-8 and EB-4, refer to 8A Electrical-Body and Chassis. 3 Using a multimeter set to measure resistance, probe between connector E95 pin 15 and a known ground. Does the multimeter display less than 5 Ω?	Go to Step 8	Go to Step 7
7	Using a multimeter, test between E-95 pin 15 and C-96 pin 30 for high resistance, open circuit, short to ground or short to voltage fault condition. Was any fault found and rectified?	Go to Step 10	—
8	Replace the TFT sensor, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. **NOTE** Check for damaged wiring (short to ground, short to voltage, high resistance or open circuit) or poor connections inside the transmission assembly before replacing the TFT sensor. Was the repair complete?	Go to Step 10	—
9	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing Was the repair completed?	Go to Step 10	—

Step	Action	Yes	No
10	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes / Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC or within the conditions in the Failure Records. 5 On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Have any of the DTCs in this procedure set?	Go to Step 2	Go to Step 11
11	On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.14 DTC P0719 – Brake Switch Circuit High Input (Stuck On)

DTC Description

This diagnostic procedure supports DTC P0719 Brake Switch Circuit High Voltage.

Circuit Description

The transmission control module (TCM) has a direct input from the stop lamp switch assembly. When the brake pedal is pressed, 12 V is supplied to the TCM through connector C-96 pin 42.

When the TCM detects a voltage on the stop lamp switch signal circuit during acceleration, then DTC P0719 sets. DTC P0719 is a type C DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- No DTCs P0722, P0723 or P0724.
- The vehicle speed is 8 – 40 km/h for 6 seconds, then greater than 40 km/h for 7 seconds.

Conditions for Setting the DTC

The TCM detects voltage on the stop lamp switch signal circuit during acceleration.

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the MIL.
- The TCM records the operating conditions when the conditions for setting the DTC are met. The TCM records this information as a Failure Record.
- The TCM stores DTC P0719 in TCM history.

Conditions for Clearing the DTC

- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- Tech 2 can clear the DTC.

Diagnostic Aids

CAUTION

- **Verify if the brake pedal position sensor is adjusted properly, refer to 8B Cruise Control.**
- **Test drive the vehicle if a switch or circuit condition cannot be located. An intermittent condition may be duplicated during a test drive.**
- **Application of the brake pedal while accelerating may cause this DTC to set.**

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 Checks the stop lamp switch is serviceable.

4 Checks if there is a stop lamp switch signal to the TCM.

DTC P0719 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	1 Connect Tech 2 to the DLC. 2 On Tech 2 select: **Engine** / **V6 Engine** / **Data Display** / **Cruise** / **Traction Data.** 3 Turn on the ignition, with the engine off. **NOTE** Ensure the brake pedal is in the rest position. Does the **Stop Lamp Pedal Switch** parameter indicate **Inactive**?	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis	Go to Step 3
3	Test the stop lamp switch assembly, refer to 8B Cruise Control. Is the stop lamp switch assembly serviceable?	Go to Step 4	Replace the stop lamp switch assembly.
4	1 Disconnect connector C-96 from the TCM. 2 Using a multimeter set to measure voltage, probe between harness connector C-96 pin 42 and a known ground. **NOTE** Ensure the brake pedal is in the rest position. Does the multimeter display battery voltage?	Repair or replace affected circuit Go to Step 6	Go to Step 5
5	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Service. Did you complete the replacement?	Go to Step 6	—

Step	Action	Yes	No
6	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes / Clear Engine & Transmission DTCs** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 Operate the vehicle under the following conditions: • Turn on the ignition, with the engine off for at least 2 seconds. • Start the vehicle and idle for 5 seconds. • Drive in D4 from 0 – 60 km/h 8 times in 1 ignition cycle. 4 On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Has DTC P0719 set?	Go to Step 2	Go to Step 7
7	On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.15 DTC P0722 – Vehicle Speed Sensor Circuit Low Voltage

DTC Description

This diagnostic procedure supports DTC P0722 Vehicle Speed Sensor Circuit Low Voltage.

Circuit Description

The vehicle speed sensor (VSS) provides vehicle speed information to the transmission control module (TCM). The VSS is a permanent magnet generator. The sensor is mounted in the extension housing facing the rear internal gear which is splined to the output shaft assembly. As the output shaft and internal gear rotate, the toothed rotor of the internal gear produces AC voltage as the rotor teeth pass through the magnetic field of the sensor. The AC voltage level and the number of pulses increase as the speed of the vehicle increases. The TCM converts the voltage to vehicle speed. The TCM uses the output shaft speed signal to determine shift timing and torque converter clutch (TCC) scheduling.

If the TCM detects no vehicle speed when there is engine speed in a drive gear range, then DTC P0722 sets. DTC P0722 is a type B DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- No DTCs P0723, P1810, P1815 or P1816.
- Ignition voltage is 8 – 18 V.
- TFT is -40°C – 150°C.
- The engine run time is greater than 5 seconds.
- The throttle position is greater than 12 percent.
- The engine torque is 108 – 882 Nm.

Conditions for Setting the DTC

The transmission output shaft speed is less than 50 r.p.m. for 3 seconds.

Action Taken When the DTC Sets

- The TCM illuminates the MIL during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM calculates vehicle speed from the automatic transmission engine r.p.m. and commanded gear.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0722 in TCM history.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is off long enough to power down the TCM.

Diagnostic Aids

- Inspect the rear internal gear teeth for damage.
- Visually inspect the VSS for cracks or damage.
- Ensure the VSS is properly torqued to the extension housing.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 Disable the traction control system when performing this step. When the ignition key is cycled off and then cycled back on, the traction control system defaults to on.

3 Checks the VSS for correct resistance.

4 Checks if the VSS and associated circuits are shorted to ground.

5 Checks the VSS produces an AC voltage when the output shaft is rotated.

6 Checks the integrity of the circuits between the TCM and the VSS.

DTC P0722 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check

Step	Action	Yes	No
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 Raise and support the rear axle assembly, refer to 0A General Information. 8 Start the engine. 9 Disable the traction control system. 10 Place the transmission in any drive range. 11 On Tech 2 select: **Data Display** / **Transmission Data.** With the drive wheels rotating, does the Tech 2 **AT Output Speed** parameter increase with the drive wheel speed?	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis	Go to Step 3
3	1 Turn off the ignition. 2 Disconnect connector E-44 from the sensor. 3 Using a multimeter set to measure resistance, probe across the speed sensor pins 1 and 2. Does the multimeter display 976 – 2354 Ω?	Go to Step 4	Go to Step 6
4	1 Using a multimeter set to measure resistance, probe between connector E-44 pin 1 and a known ground. 2 Using a multimeter set to measure resistance, probe between connector E-44 pin 2 and a known ground. Does the multimeter display greater than 50 kΩ in both instances?	Go to Step 5	Go to Step 6
5	1 Place the transmission in neutral. 2 Using a multimeter set to measure AC voltage, probe across the speed sensor pins 1 and 2. 3 Rotate a rear wheel by hand. Does the multimeter display 0.3 V AC?	Go to Step 6	Go to Step 7

Step	Action	Yes	No
6	1 Disconnect connector C-96 from the TCM. 2 Test circuits speed sensor circuits (between C-96 pin 16 and E-44 pin 2; C-96 pin 41 and E-44 pin 1) for the following conditions: • Short to ground • Open circuit • Short together Did you find and correct the condition?	Go to Step 9	Go to Step 8
7	Replace the vehicle speed sensor, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Service. Did you complete the replacement?	Go to Step 9	—
8	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Service. Did you complete the replacement?	Go to Step 9	—
9	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 Operate the vehicle so the transmission output speed is greater than 500 r.p.m. for 3 seconds. 4 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0722 set?	Go to Step 2	Go to Step 9
10	On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.16 DTC P0723 – Vehicle Speed Sensor Circuit Intermittent

DTC Description

This diagnostic procedure supports DTC P0723 Vehicle Speed Sensor Circuit Intermittent.

Circuit Description

The vehicle speed sensor (VSS) provides vehicle speed information to the transmission control module (TCM). The VSS is a permanent magnet generator. The sensor is mounted in the extension housing facing the rear internal gear which is splined to the output shaft assembly. As the output shaft and internal gear rotate, the toothed rotor of the internal gear produces AC voltage as the rotor teeth pass through the magnetic field of the sensor. The AC voltage level and the number of pulses increase as the speed of the vehicle increases. The TCM converts the voltage to vehicle speed. The TCM uses the output shaft speed signal to determine shift timing and torque converter clutch (TCC) scheduling.

If the TCM detects an unrealistic drop in output shaft speed, DTC P0723 sets. DTC P0723 is a type B DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- No DTCs P0722, P1810, P1815 or P1816.

- Ignition voltage is 8 – 18 V.
- TFT is -40°C and 150°C.
- The engine run time is greater than 5 seconds.
- The throttle position is greater than 12 percent.
- The engine torque is 108 – 882 Nm.

Conditions for Setting the DTC

The transmission output shaft speed drops greater than 1,000 r.p.m. for at least 3.4 seconds.

Action Taken When the DTC Sets

- The TCM illuminates the MIL during the second consecutive trip in which the conditions for setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM calculates vehicle speed from the automatic transmission input shaft speed sensor and commanded gear.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0723 in TCM history.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is off long enough to power down the TCM.

Diagnostic Aids

- Inspect the rear internal gear teeth for damage.
- Visually inspect the VSS for cracks or damage.
- Ensure the VSS is properly torqued to the transmission housing.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 Disable the traction control system when performing this step. When the ignition key is cycled off and then cycled back on, the traction control system defaults to on.

3 Checks the VSS for correct resistance.

4 Checks if the VSS and associated circuits are shorted to ground.

5 Checks the VSS produces an AC voltage when the output shaft is rotated.

6 Checks the integrity of the circuits between the TCM and the VSS.

8. EXCESSIVELY OR PARTIALLY WORN TIRE

Checkpoint		Problem	Countermeasure
Tire pressure	NG	Improper	Adjust
OK			
Wheel alignment	NG	Incorrect	Adjust
OK			
Front wheel bearing	NG	Faulty	Replace
OK			
Brake adjustment	NG	Incorrect	Adjust
OK			
Tire rotation	NG	Not rotated	Rotate tires at recomended intervals

DTC P0723 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 Raise and support the rear axle assembly, refer to 0A General Information. 8 Start the engine. 9 Disable the traction control system. 10 Place the transmission in D3 range. 11 With the drive wheels rotating, slowly accelerate to 2,000 r.p.m. and hold. Road test the vehicle if necessary. 12 On Tech 2 select: **Data Display** / **Transmission Data.** With the drive wheels rotating, does the Tech 2 **AT Output Speed** parameter drop or fluctuate more than 1,300 r.p.m.?	Go to Step 3	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis
3	1 Turn off the ignition. 2 Disconnect connector E-44 from the sensor. 3 Using a multimeter set to measure resistance, probe across the speed sensor pins 1 and 2. Does the multimeter display 976 – 2354 Ω?	Go to Step 4	Go to Step 7
4	1 Using a multimeter set to measure resistance, probe between connector E-44 pin 1 and a known ground. 2 Using a multimeter set to measure resistance, probe between connector E-44 pin 2 and a known ground. Does the multimeter display greater than 50 kΩ in both instances?	Go to Step 5	Go to Step 7
5	1 Place the transmission in neutral. 2 Using a multimeter set to measure AC voltage, probe across the speed sensor pins 1 and 2. 3 Rotate a rear wheel by hand. Does the multimeter display 0.3 V AC?	Go to Step 6	Go to Step 7

Step	Action	Yes	No
6	1 Disconnect connector C-96 from the TCM. 2 Test circuits speed sensor circuits (between C-96 pin 16 and E-44 pin 2; C-96 pin 41 and E-44 pin 1) for the following conditions: • Short to ground, • Short to battery, • Open circuit, and • Short together. Did you find and correct the condition?	Go to Step 9	Go to Step 8
7	Replace the vehicle speed sensor, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Service. Did you complete the replacement?	Go to Step 9	—
8	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Service. Did you complete the replacement?	Go to Step 9	—
9	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 On Tech 2 select: **Data Display** / **Transmission Data.** 4 Operate the vehicle ensuring the transmission output speed drop is less than 500 r.p.m. for 2 seconds and output speed is greater than 500 r.p.m. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0723 set?	Go to Step 2	Go to Step 10
10	On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.17 DTC P0724 – Brake Switch Circuit Low Input (Stuck Off)

DTC Description

This diagnostic procedure supports DTC P0724 Brake Switch Circuit Low Voltage.

Circuit Description

The transmission control module receives a direct input from the stop lamp switch assembly. When the brake pedal is pressed, 12 V is supplied to the TCM through connector C-96 pin 42.

When the TCM detects an open or short to ground on the stop lamp signal circuit during stopping then DTC P0724 sets. DTC P0724 is a type C DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- No DTCs P0719, P0722 or P0723.
- The vehicle speed is greater than 40 km/h for 7 seconds, then 8 – 40 km/h for 5 seconds, then less than 8 km/h.
- Continuously eight times once the previous criteria have been met.

Conditions for Setting the DTC

The TCM detects an open or short to ground on the stop lamp switch signal circuit when the circuit should be high, battery voltage.

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the MIL.
- The TCM records the operating conditions when the conditions for setting the DTC are met. The TCM records this information as a Failure Record.
- The TCM stores DTC P0724 in TCM history.

Conditions for Clearing the DTC

- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- Tech 2 can clear the DTC.

Diagnostic Aids

CAUTION

- **Verify the brake pedal position sensor is adjusted properly, refer to 8B Cruise Control.**
- **Test drive the vehicle if a switch or circuit condition cannot be located. An intermittent condition may be duplicated during a test drive.**

Test Description

The following numbers refer to the step numbers in the diagnostic table:

3 Checks if the stop lamp switch is serviceable.

4 Checks if there is a stop lamp switch signal to the TCM.

DTC P0724 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	1 Connect Tech 2 to the DLC. 2 On Tech 2 select: **Engine / V6 Engine / Data Display / Cruise / Traction Data.** 3 Turn on the ignition, with the engine off. 4 Press the brake pedal. Does the **Stop Lamp Pedal Switch** parameter indicate **Active**?	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis	Go to Step 3

Step	Action	Yes	No
3	Test the stop lamp switch assembly, refer to 8B Cruise Control. Is the stop lamp switch assembly serviceable?	Go to Step 4	Replace the stop lamp switch assembly
4	1 Disconnect connector C-96 from the TCM. 2 Using a multimeter set to measure voltage, probe between harness connector C-96 pin 42 and a known ground. 3 Press the brake pedal. Does the multimeter display battery voltage?	Go to Step 5	Repair or replace affected circuit Go to Step 6
5	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Did you complete the replacement?	Go to Step 6	—
6	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 Operate the vehicle under the following conditions: • Turn on the ignition, with the engine off for at least 2 seconds. • Start the vehicle and idle for 5 seconds. • Drive in D4 from 0 – 60 km/h then brake, eight times in one ignition cycle. 4 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0724 set?	Go to Step 2	Go to Step 7
7	On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.18 DTC P0741 – Torque Converter Clutch System – Stuck Off

DTC Description

This diagnostic procedure supports DTC P0741 Torque Converter Clutch (TCC) System - Stuck Off.

Circuit Description

The torque converter clutch (TCC) solenoid valve is a normally-open exhaust valve that is used with the torque converter clutch pulse width modulation (TCC PWM) solenoid valve to control fluid acting on the converter clutch apply valve. The TCC solenoid valve attaches to the transmission case assembly extending into the pump cover. When grounded by the transmission control module (TCM), the TCC solenoid valve stops converter signal oil from exhausting. This causes converter signal oil pressure to increase and move the converter clutch apply valve against spring force and into the apply position. In this position, release fluid is open to an exhaust port and converter feed fluid fills the apply fluid circuit. The converter feed fluid applies the TCC. When the TCM no longer provides a ground path, the TCC solenoid valve de-energizes and apply fluid exhausts, releasing the TCC.

When the TCM detects high torque converter slip when the TCC is commanded off, then DTC P0741 sets. DTC P0741 is a type B DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- No DTCs P0722, P0723, P0742, P2763 or P2764.
- The IMS range is D2, D3 or D4.
- Ignition voltage is 8 – 18 V.
- The transmission fluid temperature is greater than 20°C.
- The engine torque is 108 – 881 Nm.
- The throttle position is greater than 10 percent.
- The gear ratio is within the following ranges:
    - 1.41:1 – 1.56:1 — 2nd gear,
    - 0.95:1 – 1.05:1 — 3rd gear.
- The TCC is commanded on 0.1 seconds.
- The TCC duty cycle is greater than 60 percent for more than 3 seconds.

Conditions for Setting the DTC

The TCM commands the TCC on, and the TCC slip is greater than 250 r.p.m. for 3 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive drive trip in which the conditions for setting the DTC are met.
- The TCM inhibits TCC.
- The TCM inhibits 4th gear if the transmission is in Hot Mode.
- The TCM commands elevated line pressure.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0741 in TCM history.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is off long enough to power down the TCM.

Diagnostic Aids

- Inspect the transmission fluid lines to the radiator. The lines may be pinched, blocked or twisted.
- Contamination may cause the TCC apply valve to stick in the valve body.
- Internal damage to the torque converter may prevent TCC application.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 This step tests the hydraulic state of the TCC. When the TCM commands the TCC solenoid valve off, the slip speed should increase.

3 Checks the mechanical components that cause the DTC and their state.

DTC P0741 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 On Tech 2 select: **Automatic Transmission** / **Data Display** / **Transmission Data.** 8 Drive the vehicle in the D4 drive range in second, third, or fourth gear under steady acceleration, with a TP angle at 20%. On Tech 2, while **TCC Solenoid** status is **On**, is the **TCC Slip Speed** within **-20 to +20 RPM**?	Refer to Diagnostic Aids within this Section	Go to Step 3
3	The TCC system is hydraulically stuck off. Inspect for the following conditions: • TCC PWM solenoid valve mechanically stuck in the off position or leaking. • TCC regulator apply valve stuck in the off position. • TCC solenoid valve stuck in the off position or leaking. • TCC enable valve stuck in the off position. • Incorrectly aligned, damaged or leaking valve body gasket. • Inspect the forward clutch input housing assembly for the input shaft fluid seal ring leaking or worn. Did you find and correct any of the above conditions?	Go to Step 4	—

Step	Action	Yes	No
4	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes / Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 On Tech 2 select: **Automatic Transmission / Data Display / Transmission Data.** 4 Drive the vehicle in D4 with the TCC on and the throttle above 10%. Ensure Tech 2 displays **TCC Slip Speed** between **-25 to +25 RPM** for 3 seconds. 5 On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Has DTC P0741 set?	Go to Step 2	Go to Step 5
5	On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.19 DTC P0742 – Torque Converter Clutch System – Stuck On

DTC Description

This diagnostic procedure supports DTC P0742 Torque Converter Clutch (TCC) System – Stuck On.

Circuit Description

The torque converter clutch (TCC) solenoid valve is a normally-open exhaust valve that is used with the torque converter clutch pulse width modulation (TCC PWM) solenoid valve to control fluid acting on the converter clutch apply valve. The TCC solenoid valve attaches to the transmission case assembly extending into the pump cover. When grounded by the transmission control module (TCM), the TCC solenoid valve stops converter signal oil from exhausting. This causes converter signal oil pressure to increase and move the converter clutch apply valve against spring force and into the apply position. In this position, release fluid is open to an exhaust port and converter feed fluid fills the apply fluid circuit. The converter feed fluid applies the TCC. When the TCM no longer provides a ground path, the TCC solenoid valve de-energizes and apply fluid exhausts, releasing the TCC.

When the TCM detects low torque converter slip when the TCC is commanded off, then DTC P0742 sets. DTC P0742 is a type B DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- No DTCs P0722, P0723, P0741 P02763, P02764, P02769 or P02770.
- Ignition voltage is 8 – 18 V.
- The engine run time is greater than 5 seconds.
- The IMS range is D4.
- The transmission fluid temperature is 10 – 130°C.
- The engine speed is 500 – 6,500 r.p.m. for 5 seconds, then 800 – 4,400 r.p.m.
- The engine torque is 156 – 881 Nm.
- The throttle position is greater than 10 percent.
- The transmission is not in 1st gear and the gear ratio is 0.95:1 – 1.56:1.

- The vehicle speed is greater than 15 km/h.
- TCC is commanded off.

Conditions for Setting the DTC

The following conditions occur four times in one ignition cycle:

- The TCM commands the TCC off.
- The TCC slip is -15 – +15 r.p.m. for greater than 3 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive drive trip in which the conditions for setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0742 in TCM history.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is off long enough to power down the TCM.

Diagnostic Aids

The TCC fluid hydraulically applies the TCC, possibly causing an engine stall, under the following conditions:

- The TCC is hydraulically stuck in the on position
- The parking brake is applied.
- Any gear range is selected.
- Contamination may cause the TCC apply valve to intermittently stick in the valve body.
- Internal damage in the torque converter may cause no TCC apply.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 This step tests the hydraulic state of the TCC. When the TCM commands the TCC solenoid valve off, the slip speed should increase.

3 Checks the mechanical components that cause the DTC and their state.

DTC P0742 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check

Step	Action	Yes	No
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 On Tech 2 select: **Automatic Transmission** / **Data Display** / **Transmission Data.** 8 Drive the vehicle in the D4 drive range in second, third, or fourth gear under steady acceleration, with a TP angle at 10%. On Tech 2, while **TCC Solenoid** status is **On**, is the **TCC Slip Speed** within **-20 to +20 RPM**?	Go to Step 3	Refer to Diagnostic Aids within this Section
3	The TCC is hydraulically stuck ON. Inspect for the following: • Blocked exhaust orifice in the TCC solenoid valve. • Converter clutch apply valve stuck in the apply position. • Incorrectly aligned or damaged valve body gasket. • Restricted release passage. • Restricted transmission cooler line. Did you find and correct the condition?	Go to Step 4	—
4	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 On Tech 2 select: **Automatic Transmission** / **Data Display** / **Transmission Data.** 4 Drive the vehicle in D4 with the TCC ON and the throttle above 10%. Ensure Tech 2 displays **TCC Slip Speed** between **100 – 2,500 RPM** for 3 seconds. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0742 set?	Go to Step 2	Go to Step 5
5	On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.20 DTC P0751 – 1-2 Shift Solenoid Valve Performance – No First or Fourth Gear

DTC Description

This diagnostic procedure supports DTC P0751 1-2 Shift Solenoid (SS) Valve Performance – No First or Fourth Gear.

Circuit Description

The 1-2 shift solenoid (SS) valve controls the fluid flow acting on the 1-2 and 3-4 shift valves. The 1-2 SS valve is a normally-open exhaust valve that is used with the 2-3 SS valve, to allow four different shifting combinations.

If the transmission control module (TCM) detects a 2-2-3-3 shift pattern, then DTC P0751 sets. DTC P0751 is a type B DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- No DTCs P0722, P0723, P0742, P0894, P0973, P0974, P0976, P0977 or P1815.
- Ignition voltage is 8 – 18 V.
- The engine r.p.m. is 500 – 6,500 r.p.m. for greater than 5 seconds.
- The transmission fluid temperature is 20 – 130°C.
- The throttle position is greater than 10 percent.
- The input shaft speed is 200 – 6,800 r.p.m.
- The output shaft speed is greater than 100 r.p.m.

Conditions for Setting the DTC

Both of the following conditions must occur twice during the same trip:

- Fail Case 1: The TCM commands 1st gear and the resulting gear ratio is 1.44:1 – 1.50:1 for 2 seconds.
- Fail Case 2: The TCM commands 4th gear and the resulting gear ratio is 0.98:1 – 1.03:1 for 4 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0751 in TCM history during the second consecutive trip in which the conditions for setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is off long enough to power down the TCM.

TABLE OF CONTENTS

Diagnostic Aids

- If you clear DTC P0751, and then cannot reset DTC P0751, the following conditions may exist:
  - Fluid contamination,
  - Blocked fluid circuits, or
  - Restricted fluid circuits.
- Refer to 5.6 Shift Solenoid Valve State and Gear Ratio.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 This step tests the TCM commanded all shifts, all shift solenoid valves responded correctly, and if all the shifts did not occur.

3 Checks the mechanical components that cause the DTC and their state.

DTC P0751 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission / Automatic Transmission / Diagnostic Trouble Codes / Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes / Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 Drive the vehicle in D4 range under the following conditions: • Accelerate the vehicle • Ensure the TCM commands 1st, 2nd, 3rd and 4th gears. Did you detect a 2-2-3-3 shift pattern?	Go to Step 3	Refer to Diagnostic Aids within this Section
3	Inspect the shift solenoid/hydraulic circuit for the following conditions: • An internal malfunction. • Damaged seals on the shift solenoid valve. Perform the shift solenoid leak test, refer to 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis. Did you find and correct the condition?	Go to Step 4	—

Step	Action	Yes	No
4	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes / Clear Engine & Transmission DTCs** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 Drive the vehicle in D4 range under the following conditions, only if traffic and road conditions permit: • Hold the throttle at 20%, and • Accelerate to 88 km/h. 4 On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Has DTC P0751 set?	Go to Step 2	Go to Step 5
5	On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.21 DTC P0752 – 1-2 Shift Solenoid Valve Performance – No Second or Third Gear

DTC Description

This diagnostic procedure supports DTC P0752 1-2 Shift Solenoid (SS) Valve Performance – No Second or Third Gear.

Circuit Description

The 1-2 shift solenoid (SS) valve controls the fluid flow acting on the 1-2 and 3-4 shift valves. The 1-2 SS valve is a normally-open exhaust valve that is used with the 2-3 SS valve, to allow four different shifting combinations.

When the transmission control module (TCM) detects a 1-1-4-4 shift pattern, then DTC P0752 sets. DTC P0752 is a type B DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- No DTCs P0722, P0723, P0742, P0894, P0973, P0974, P0976, or P0977.
- Ignition voltage is 8 – 18 V.
- The engine run time is greater than 5 seconds.
- The transmission fluid temperature is 20 – 130°C.
- The throttle position is greater than 10 percent.
- The output shaft speed is greater than 150 r.p.m.
- The engine torque is 108 – 882 Nm.

Conditions for Setting the DTC

The TCM commands 2nd gear and the resulting gear ratio is 2.42:1 – 2.52:1, 1st gear ratio for 2 seconds twice during the same trip.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits 3-2 downshifts if the vehicle speed is greater than 40 km/h.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0752 in TCM history during the second consecutive trip in which the conditions for setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is off long enough to power down the TCM.

Diagnostic Aids

- If you clear DTC P0752, and then cannot reset DTC P0752, the following conditions may exist:
  - Fluid contamination,
  - Blocked fluid circuits, or
  - Restricted fluid circuits.
- Refer to 5.6 Shift Solenoid Valve State and Gear Ratio.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 This step tests the TCM commanded all shifts, all shift solenoid valves responded correctly, and if all the shifts did not occur.

3 Checks the mechanical components that cause the DTC and their state.

DTC P0752 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check

Step	Action	Yes	No
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 Drive the vehicle in D4 range under the following conditions: • Accelerate the vehicle, and • Ensure the TCM commands 1st, 2nd, 3rd and 4th gears. Did you detect a 1-1-4-4 shift pattern?	Go to Step 3	Refer to Diagnostic Aids within this Section
3	Inspect the shift solenoid/hydraulic circuit for the following conditions: • An internal malfunction. • Damaged seals on the shift solenoid valve. Perform the shift solenoid leak test, refer to 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis. Did you find and correct the condition?	Go to Step 4	—
4	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 Drive the vehicle in D4 range under the following conditions, only if traffic and road conditions permit: • Hold the throttle at 20%, and • Accelerate to 88 km/h. 4 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0752 set?	Go to Step 2	Go to Step 5
5	On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.22 DTC P0756 – 2-3 Shift Solenoid Valve Performance – No First or Second Gear

DTC Description

This diagnostic procedure supports DTC P0756 2-3 Shift Solenoid (SS) Valve Performance – No First or Second Gear.

Circuit Description

The 2-3 shift solenoid (SS) valve controls the fluid flow acting on the 2-3 shift valves. The 2-3 SS valve is a normally-open exhaust valve that is used with the 1-2 SS valve, to allow four different shifting combinations.

When the transmission control module (TCM) detects a 4-3-3-4 shift pattern, then DTC P0756 sets. DTC P0756 is a type A DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- No DTCs P0120, P0722, P0723, P0742, P0973, P0974, P0976, P0977 or P1815.
- The engine torque is 108 – 882 Nm.
- The engine run time is greater than 5 seconds.
- The transmission fluid temperature is 20 – 130°C.
- The throttle position is greater than 10 percent.
- The output shaft speed is greater than 150 r.p.m.

Conditions for Setting the DTC

Both of the following conditions must occur twice during the same trip:

- Fail Case 1: The TCM commands 1st gear when the output shaft speed is 200 r.p.m. or greater, the engine torque is 40 – 350 Nm, and the resulting gear ratio is 0.73:1 – 0.77:1 for 2.8 seconds.
- Fail Case 2: The TCM commands 2nd gear when the engine torque is 36 – 350 Nm and the resulting gear ratio is 1.56:1 – 1.64:1 for 1 second.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive trip in which the conditions for setting the DTC are met.
- The TCM inhibits 1st gear.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0756 in TCM history.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.

- The TCM cancels the DTC default actions when the ignition is off long enough to power down the TCM.

Diagnostic Aids

- If you clear DTC P0756, and then cannot reset DTC P0756, the following conditions may exist:
  - Fluid contamination,
  - Blocked fluid circuits, or
  - Restricted fluid circuits.
- Refer to 5.6 Shift Solenoid Valve State and Gear Ratio.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 This step tests the TCM commanded all shifts, all shift solenoid valves responded correctly, and if all the shifts did not occur.

3 Checks the mechanical components that cause the DTC and their state.

DTC P0756 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission / Automatic Transmission / Diagnostic Trouble Codes / Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes / Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 Drive the vehicle in D4 range under the following conditions: • Accelerate the vehicle, and • Ensure the TCM commands 1st, 2nd, 3rd and 4th gears. Did you detect a 4-3-3-4 shift pattern?	Go to Step 3	Refer to Diagnostic Aids within this Section

Step	Action	Yes	No
3	1 Inspect the shift solenoid/hydraulic circuit for the following conditions: • Debris or chips in the AFL oil passage. • Debris or chips restricting oil flow in passage #29 of the case or through the spacer plate gasket into the valve body. • A cracked 2-3 shift solenoid. • A 2-3 shift valve which is stuck or hung up in the valve body bore. • A 2-3 shuttle valve which is stuck or hung up in its bore. • Damaged seals on the shift solenoid valves. Perform the shift solenoid leak test, refer to 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis. 2 Clean and inspect the related valves, bores and the valve body for debris or contamination. Did you find and correct the condition?	Go to Step 4	—
4	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 Drive the vehicle in D4 range under the following conditions, only if traffic and road conditions permit: • Hold the throttle at 40%, and • Accelerate to 64 km/h. 4 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0756 set?	Go to Step 2	Go to Step 5
5	On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.23 DTC P0757 – 2-3 Shift Solenoid Valve Performance – No Third or Fourth Gear

DTC Description

This diagnostic procedure supports DTC P0757 2-3 Shift Solenoid (SS) Valve Performance – No Third or Fourth Gear.

Circuit Description

The 2-3 shift solenoid (SS) valve controls the fluid flow acting on the 2-3 shift valves. The 2-3 SS valve is a normally-open exhaust valve that is used with the 1-2 SS valve to allow four different shifting combinations.

When the transmission control module (TCM) detects a 1-2-2-1 shift pattern, then DTC P0757 sets. DTC P0757 is a type A DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- No DTCs P0120, P0722, P0723, P0742, P0973, P0974, P0976, P0977 or P1815.
- The engine torque is 108 – 882 Nm.
- The engine run time is greater than 5 seconds.
- The transmission fluid temperature is 20 – 130°C.
- The throttle position is greater than 10 percent.
- The output shaft speed is greater than 150 r.p.m.

Conditions for Setting the DTC

The TCM commands 3rd gear and the resulting gear ratio is a 1.44:1 – 1.52:1, 1st gear, for 2.25 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive trip in which the conditions for setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits 4th gear.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0757 in TCM history during the second consecutive trip in which the conditions for setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is off long enough to power down the TCM.

Diagnostic Aids

- If you clear DTC P0757, and then cannot reset DTC P0757, the following conditions may exist:
  - Fluid contamination,
  - Blocked fluid circuits, or
  - Restricted fluid circuits.
- Refer to 5.6 Shift Solenoid Valve State and Gear Ratio.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 This step tests the TCM commanded all shifts, all shift solenoid valves responded correctly, and if all the shifts did not occur.

3 Checks the mechanical components that cause the DTC and their state.

DTC P0757 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 Drive the vehicle in D4 range under the following conditions: • Accelerate the vehicle, and • Ensure the TCM commands 1st, 2nd, 3rd and 4th gears. Did you detect a 1-2-2-1 shift pattern?	Go to Step 3	Refer to Diagnostic Aids within this Section
3	Inspect the shift solenoid/hydraulic circuit for the following conditions: • An internal malfunction • Damaged seals on the shift solenoid valve. Perform the shift solenoid leak test, refer to 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis. Did you find and correct the condition?	Go to Step 4	—
4	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 Drive the vehicle in D4 range under the following conditions, only if traffic and road conditions permit: • Hold the throttle at 15%, and • Accelerate to 80 km/h. 4 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0757 set?	Go to Step 2	Go to Step 5

Step	Action	Yes	No
5	On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.24 DTC P0787 – 3-2 Shift Solenoid Control Circuit Low Voltage

DTC Description

This diagnostic procedure supports the following DTC:

DTC P0787 3-2 Shift Solenoid (SS) Control Circuit Low Voltage.

Circuit Description

The 3-2 shift solenoid (SS) valve is a normally-closed, 3-port, on/off device that controls the 3-2 downshift. The solenoid attaches to the control valve body within the transmission. The solenoid receives ignition voltage through the ignition circuit. The transmission control module (TCM) controls the solenoid by providing a ground path on the 3-2 shift solenoid valve control circuit. During a 3-2 downshift, the 2-4 band applies as the 3-4 clutch releases. The TCM varies the timing between the 3-4 clutch release and the 2-4 band apply depending on the vehicle speed and the throttle position.

When the TCM detects a continuous open or short to ground in the 3-2 SS valve circuit, then DTC P0787 sets. DTC P0787 is a type A DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- The system voltage is 10 – 18 V.
- The engine speed is greater than 450 r.p.m. for 5 seconds.
- Vehicle speed is less than 200 km/h.

Conditions for Setting the DTC

The TCM commands the solenoid off and the voltage feedback remains low, 0 V.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive trip in which the conditions for setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM commands 3rd gear.
- The TCM inhibits TCC engagement.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0787 in TCM history during the second consecutive trip in which the conditions for setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.

- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is off long enough to power down the TCM.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

4 Checks the ability of the TCM to control the solenoid.

5 Checks for supply voltage to the 3-2 SS valve.

6 Checks the ability of the TCM and wiring to control the ground circuit.

8 Checks the resistance of the control valve body wiring harness and the 3-2 SS valve.

9 Checks if the 3-2 SS or control valve body wiring harness is shorted to the transmission housing.

13 Checks if the control valve body wiring harness is shorted to ground.

14 Checks if any of the other solenoids in the transmission are shorted to ground.

DTC P0787 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. Are any of the following DTCs also set? • P0961 • P0973 • P0976 • P2764 • P2769.	Go to Step 3	Go to Step 4
3	Inspect fuse C-8 and check if it is blown, refer to 8A Electrical-Body and Chassis. Is the fuse blown?	Replace the fuse Go to Step 12	Go to Step 5

Step	Action	Yes	No
4	1 On Tech 2 select: **Automatic Transmission** / **Miscellaneous Tests** / **3-2 Downshift Solenoid.** 2 With Tech 2 command the 3-2 shift solenoid **ON** and **OFF**. Does Tech 2 display the **3-2 Downshift Solenoid** as **Active** and **Inactive** respectively?	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis	Go to Step 5
5	1 Turn off the ignition. 2 Disconnect connector E-95 from the transmission. **NOTE** Additional DTCs may set 3 Install Tool No. J 44152 Jumper Harness (20 pins) on to the harness connector E-95. 4 Turn on the ignition, with the engine off. 5 Using a test lamp, probe between connector E-95 pin 10 and a known ground. Does the test lamp illuminate?	Go to Step 6	Test between E-95 pin 10 and C-107 pin 9 for an open circuit Repalce affected circuit Go to Step 18
6	1 Using a test lamp, probe connector E-95 pin 10 with the ground lead to connector E-95 pin 11. 2 On Tech 2 select: **Automatic Transmission** / **Miscellaneous Tests** / **3-2 Downshift Solenoid.** 3 With Tech 2 command the 3-2 shift solenoid **ON** and **OFF** three times. Does the test lamp turn on and off with each command?	Go to Step 8	Go to Step 7
7	Is the test lamp always illuminates?	Go to Step 15	Go to Step 16
8	1 Remove Tool No. J44152 from the harness connector E-95 and install on to the transmission connector E-95. 2 Using a multimeter set to measure resistance, probe across transmission connector E-95 pins 10 and 11. Does the multimeter display 20 – 32 Ω?	Go to Step 9	Go to Step 10
9	1 Using a multimeter set to measure resistance, probe between: • Transmission connector E-95 pin 10 and a known ground. • Transmission connector E-95 pin 11 and a known ground. Does the multimeter display greater than 250 kΩ in both instances?	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis	Go to Step 11
10	1 Remove Tool No. J44152 from the transmission. 2 Gain access to the 3-2 SS and the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. 3 Disconnect the internal connector from the 3-2 SS. 4 Using a multimeter set to measure resistance, probe across the 3-2 SS pins. Does the multimeter display 20 – 32 Ω?	Replace the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Go to Step 18	Replace the 3-2 SS, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Go to Step 18

Step	Action	Yes	No
11	1 Remove Tool No. J44152 from the transmission. 2 Gain access to the 3-2 SS and the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. 3 Disconnect the internal connector from the 3-2 SS. 4 Using a multimeter set to measure resistance, probe between each of the 3-2 SS pins and the transmission case. Does the multimeter display 250 kΩ in both instances?	Replace the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Go to Step 18	Replace the 3-2 shift solenoid, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Go to Step 18
12	Using a multimeter, test between E-95 pin 10 and C-107 pin 9 for a short to ground. Did you find and correct the condition?	Go to Step 18	Go to Step 13
13	1 Gain access to the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. 2 Test for a short to ground in the control valve body wiring harness. Did you find a short to ground condition?	Replace the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Go to Step 18	Go to Step 14
14	1 Test each solenoid in the transmission for a short to ground, refer to 8A Electrical-Body and Chassis. 2 Replace the faulty solenoid as necessary. Did you complete the replacement?	Go to Step 18	—
15	Using a multimeter, test between E-95 pin 11 and C-96 pin 14 for a short to ground. Did you find and correct the condition?	Go to Step 18	Go to Step 17
16	Using a multimeter, test between E-95 pin 11 and C-96 pin 14 for an open circuit. Did you find and correct the condition?	Go to Step 18	Go to Step 17
17	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Did you complete the replacement?	Go to Step 18	—
18	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 On Tech 2 select: **Automatic Transmission** / **Data Display** / **Transmission Data.** 4 Drive the vehicle in D3 or D4 and perform a 3-2 downshift. Ensure the **3-2 Downshift Solenoid** parameter displays **On** when the shift occurs. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0787 set?	Go to Step 2	Go to Step 19
19	On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK

Step	Action	Yes	No
When all diagnosis and repairs are completed, check the system for correct operation.			

4.25 DTC P0788 – 3-2 Shift Solenoid Control Circuit High Voltage

DTC Description

This diagnostic procedure supports DTC P0788 3-2 Shift Solenoid (SS) Control Circuit High Voltage.

Circuit Description

The 3-2 shift solenoid (SS) valve is a normally-closed, 3-port, on/off device that controls the 3-2 downshift. The solenoid attaches to the control valve body within the transmission. The solenoid receives ignition voltage through the ignition 1 circuit. The transmission control module (TCM) controls the solenoid by providing a ground path on the 3-2 shift solenoid valve control circuit. During a 3-2 downshift, the 2-4 band applies as the 3-4 clutch releases. The TCM varies the timing between the 3-4 clutch release and the 2-4 band apply depending on the vehicle speed and the throttle position.

When the TCM detects a continuous short to voltage in the 3-2 shift solenoid valve control circuit, then DTC P0788 sets. DTC P0788 is a type A DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- The system voltage is 10 – 18 V.
- The engine speed is 450 r.p.m. for 5 seconds.
- The engine is not in fuel cut off.

Conditions for Setting the DTC

DTC P0788 sets if the TCM commands the solenoid on and the voltage feedback remains high, battery voltage.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM commands 3rd gear.
- The TCM inhibits TCC engagement.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0788 in TCM history during the second consecutive trip in which the conditions for setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is off long enough to power down the TCM.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 Checks for a short to voltage in the 3-2 SS signal circuit.

3 Checks for the serviceability of the 3-2 SS.

DTC P0788 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 Turn off the ignition. 8 Disconnect connector E-95 from the transmission. **NOTE** Additional DTCs may set 9 Install Tool No. J 44152 Jumper Harness (20 pins) on to the harness connector E-95. 10 Turn on the ignition, with the engine off. 11 Using a test lamp and Tool No. J 35616-C, probe between connector E-95 pin 11 and a known ground. Does the test lamp illuminate?	Go to Step 5	Go to Step 3
3	1 Install Tool No. J 44152 to the transmission connector E-95. 2 Using a multimeter set to measure resistance, probe across transmission connector E-95 pins 10 and 11. Does the multimeter display less than 20 Ω?	Go to Step 4	Go to Step 6

Step	Action	Yes	No
4	1 Remove Tool No. J44152 from the transmission. 2 Gain access to the 3-2 SS and the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. 3 Disconnect the internal connector from the 3-2 SS. 4 Using a multimeter set to measure resistance, probe across the 3-2 SS pins. Does the multimeter display less than 20 Ω?	Replace the 3-2 SS, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing Go to Step 7	Replace the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Go to Step 7
5	Using a multimeter, test between E-95 pin 11 and C-96 pin 14 for a short to voltage. Did you find and correct the condition?	Go to Step 7	Go to Step 6
6	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Did you complete the replacement?	Go to Step 7	—
7	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes / Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 On Tech 2 select: **Automatic Transmission / Data Display / Transmission Data.** 4 Drive the vehicle in D3 or D4 and perform a 3-2 downshift. Ensure the **3-2 Downshift Solenoid** parameter displays **On** when the shift occurs and **Off** in all other instances 5 On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Has DTC P0787 set?	Go to Step 2	Go to Step 8
8	On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.26 DTC P0894 – Transmission Component Slipping

DTC Description

This diagnostic procedure supports DTC P0894 Transmission Component Slipping.

Circuit Description

The transmission control module (TCM) monitors the difference between engine speed and transmission output speed. In D3 drive range with the TCC engaged, the engine speed should closely match the transmission output speed. In D4 drive range, with the TCC engaged, the TCC slip speed should be -20 to +50 r.p.m.

When the TCM detects excessive TCC slip when the TCC should be engaged, then DTC P0894 sets. DTC P0894 is a type B DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- No DTCs P0122, P0123, P0722, P0723, P0741, P0742, P0751, P0752, P0756, P0757, P0973, P0974, P1810, P1815, P1816, P2763 or P2764.
- The engine speed is greater than 450 r.p.m. for 5 seconds.
- The engine is not in fuel cut-off.
- The engine torque is 108 Nm – 882 Nm.
- The vehicle speed is 48 – 177 km/h.
- The engine speed is 1,200 – 3,750 r.p.m.
- The speed ratio is 0.70 – 2.25, speed ratio is engine speed divided by the transmission output speed.
- The gear range is D4.
- The commanded gear is not 1st gear.
- The TFT is 20 – 130°C.
- The shift solenoid performance diagnostic counters are zero.

Conditions for Setting the DTC

DTC P0894 sets if the following conditions occur for three TCC cycles.

- The TCC is commanded on for 5 seconds.
- The throttle position is greater than 10 percent.
- The TCC slip speed is 100 – 550 r.p.m. for 10 seconds.

NOTE

The following actions may occur before the DTC sets, if the:

- TCC is commanded on for 10 seconds, and
- the TCC is at 75 percent duty cycle for 5 seconds, and
- the TP angle is 10 – 99 percent, and
- the transmission slip counter has incremented to either 1 or 2, out of 3 to increment the fail counter for the current ignition cycle,

then the following slip conditions and actions may increment the fail counter for the current ignition cycle. These conditions must occur sequentially.

Condition 1

If the TCC slip speed is 100 – 550 r.p.m. for 10 seconds, then the TCM will command maximum line pressure and freeze shift adapts from being updated.

Condition 2

If Condition 1 is met and the TCC slip speed is 100 – 550 r.p.m. for 10 seconds, then the TCM will command the TCC off for 1.5 seconds.

Condition 3

If Condition 2 is met and the TCC slip speed is 100 – 550 r.p.m. for 10 seconds, then the fail counter on the current ignition cycle is incremented.

The above slip conditions and actions may be disregarded if the TCC is commanded off at any time, because of a driving manoeuvre, sudden acceleration or deceleration.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive trip in which the conditions for setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC.
- The TCM inhibits 4th gear if in hot mode.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0894 in TCM history during the second consecutive trip in which the conditions for setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is off long enough to power down the TCM.

Diagnostic Aids

- Bronze material found in the transmission oil pan may indicate stator shaft bushing wear. If bushing wear is suspected, inspect the stator shaft and the input, turbine, shaft for damage.
- Perform the Torque Converter Diagnosis Procedure, refer to 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

3 Checks the torque converter for slippage while in a commanded lock-up state.

4-12 Checks the mechanical components that cause the DTC and their state.

13 When the TAP cells are cleared the TCM needs to relearn the TAP cells for the transmission. As such, when the vehicle is first driven, the shifts may be harsh. The transmission shifts should become smoother the more the vehicle is driven until the TCM has relearned all TAP cells.

DTC P0894 Diagnostic Table

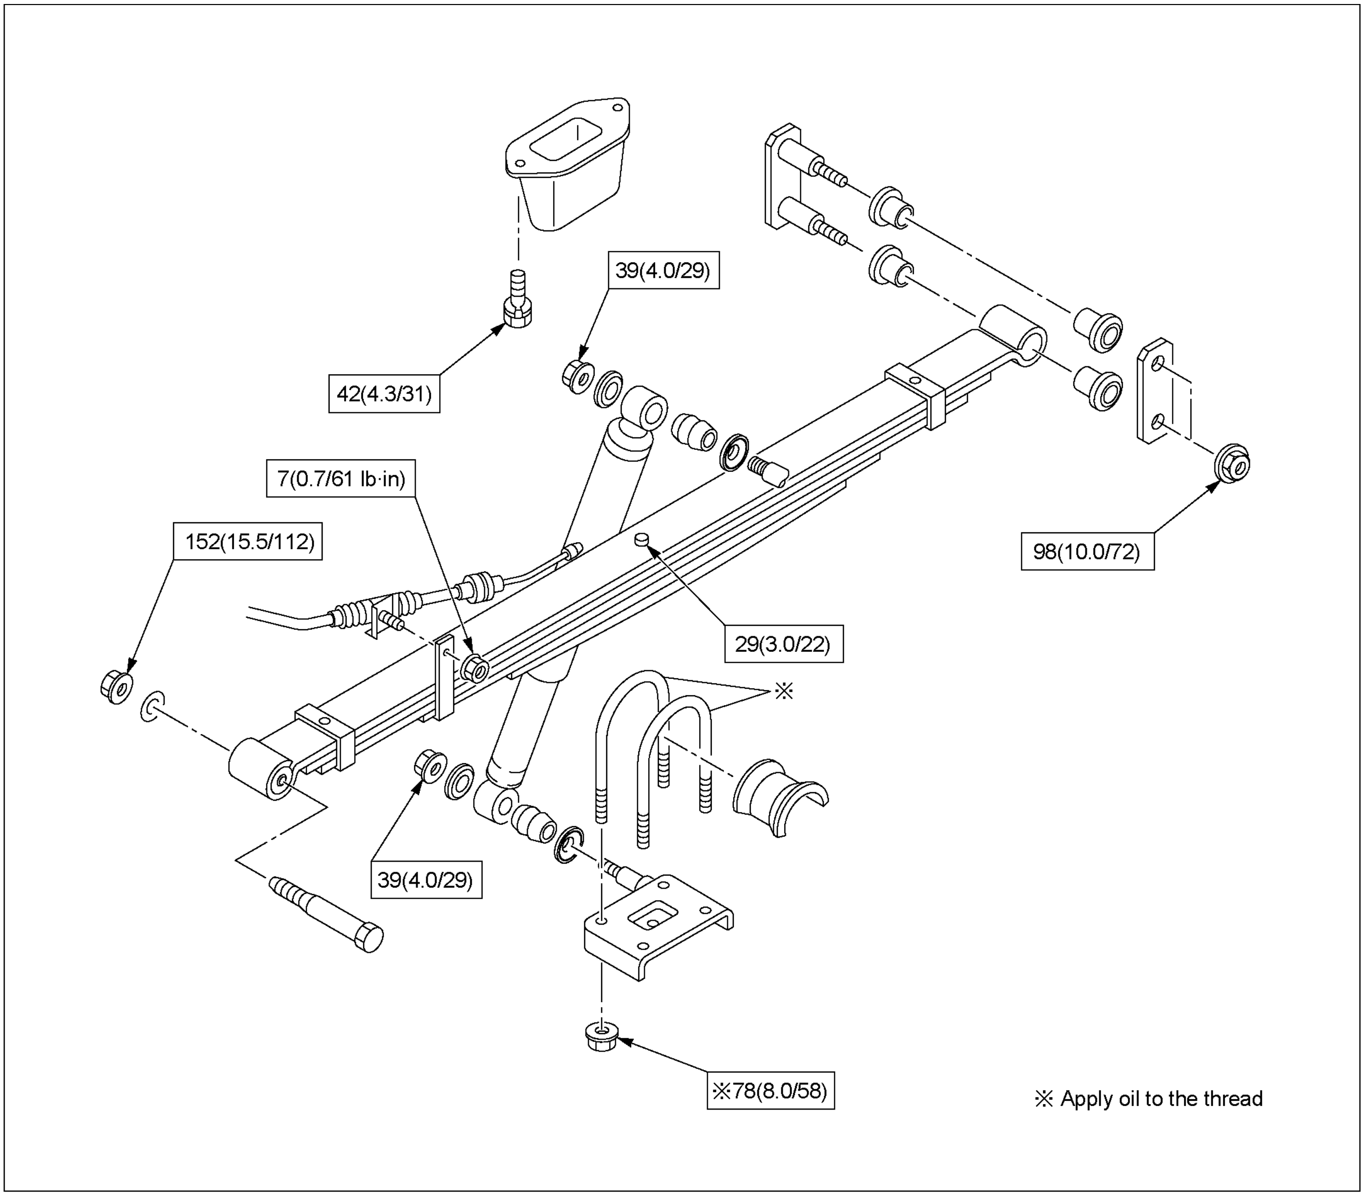
Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	Inspect for correct transmission fluid level, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Did you perform the fluid checking procedure?	Go to Step 3	Check the transmission fluid level, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing

Step	Action	Yes	No
3	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. **NOTE** It may be necessary to allow multiple TCC cycles to occur to verify a slipping condition. It may also be necessary to ensure the transmission is warm before performing this step. 7 On Tech 2 select: **Automatic Transmission** / **Data Display** / **Transmission Data.** 8 Drive the vehicle in 4th gear with the TCC commanded on. On Tech 2, while **TCC Solenoid** status is **On**, is the **TCC Slip Speed** within **130 – 800 RPM** for 7 seconds?	Go to Step 4	Refer to Diagnostic Aids within this Section
4	1 Inspect the torque converter clutch (TCC) solenoid valve for the following conditions: • internal malfunction, such as sediment or damage, and • damaged seals, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. 2 Inspect the torque converter clutch pulse width modulation (TCC PWM) solenoid valve for the following conditions: • internal malfunction, such as sediment or damage, and • damaged seals, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Did you find and correct the condition?	Go to Step 14	Go to Step 5

Step	Action	Yes	No
5	1 Inspect the 1-2 shift solenoid (SS) valve for the following conditions: • internal malfunction, such as sediment or damage, and • damaged seals, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. 2 Inspect the 2-3 shift solenoid (SS) valve for the following conditions: • internal malfunction, such as sediment or damage, and • damaged seals, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. 3 Inspect the 3-2 shift solenoid valve assembly for the following conditions: • internal malfunction, such as sediment or damage, and • damaged seals, 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Did you find and correct the condition?	Go to Step 14	Go to Step 6
6	Inspect the valve body assembly for the following conditions: • stuck regulator apply valve, and • scored regulator apply valve body, refer to 7C5 Automatic Transmission – 4L60E – Unit Repair. Did you find and correct the condition?	Go to Step 13	Go to Step 7
7	Inspect the torque converter assembly for the following conditions: • front stator shaft bushing for wear, • stator roller clutch not holding, and • external damage/leaks, refer to 7C5 Automatic Transmission – 4L60E – Unit Repair. Did you find and correct the condition?	Go to Step 13	Go to Step 8
8	Inspect the oil pump assembly for the following conditions: • a stuck converter clutch valve, • the converter clutch valve is assembled backwards, • a incorrectly position converter clutch valve retaining ring, • a cocked converter clutch outer valve spring, • a incorrectly positioned pump to case gasket, • restricted orifice cup plugs, • damaged orifice cup plugs, and • over-tightened, or unevenly tightened pump body to cover bolts, refer to 7C5 Automatic Transmission – 4L60E – Unit Repair. Did you find and correct the condition?	Go to Step 13	Go to Step 9

Torque Specifications

N·m(kgf·m/lb·ft)



RTW73DLF000401

Step	Action	Yes	No
9	Inspect the input housing and shaft assembly for the following conditions: • cut turbine shaft O-ring seal, • damaged turbine shaft O-ring seal, • restricted turbine shaft retainer and ball assembly, and • damaged turbine shaft retainer and ball assembly, refer to 7C5 Automatic Transmission – 4L60E – Unit Repair. Did you find and correct the condition?	Go to Step 13	Go to Step 10
10	1 Inspect the 2-4 band assembly for the following conditions: • worn 2-4 band, • damaged 2-4 band, • incorrectly positioned 2-4 band, • incorrectly assembled 2-4 band, and • the band anchor pin is not engaged, refer to 7C5 Automatic Transmission – 4L60E – Unit Repair. 2 Inspect the 2-4 servo assembly for the following conditions: • restricted apply passages in the 2-4 servo assembly, • blocked apply passages in the 2-4 servo assembly, • nicks or burrs on the 2nd apply piston pin, • damaged 2nd apply piston pin, • incorrect 2nd apply piston pin, • nicks or burrs on the pin bore in the case, • damaged fourth servo piston, • incorrectly assembled fourth servo piston, • damaged servo bore in the case, • missing piston seals, • cut piston seals, • damaged piston seals, • porosity in the pistons, • porosity in the cover, • porosity in the case, • damaged piston seal grooves, • plugged orifice cup plug, and • missing orifice cup plug, refer to 7C5 Automatic Transmission – 4L60E – Unit Repair. Did you find and correct the condition?	Go to Step 13	Go to Step 11

Step	Action	Yes	No
11	Inspect the forward clutch assembly for the following conditions: • worn clutch plates, • porosity in the forward clutch piston, • damaged forward clutch piston, • missing forward clutch piston inner and outer seals, • cut forward clutch piston inner and outer seals, • damaged forward clutch piston inner and outer seals, • missing input housing to forward clutch housing O-ring seal, • cut input housing to forward clutch housing O-ring seal, • damaged input housing to forward clutch housing O-ring seal, • damaged forward clutch housing, • damaged forward clutch housing retainer and ball assembly, and • forward clutch housing retainer and ball assembly is not sealing, refer to 7C5 Automatic Transmission – 4L60E – Unit Repair. Did you find and correct the condition?	Go to Step 13	Go to Step 12
12	Inspect the 3-4 clutch assembly for the following conditions: • worn clutch plates, • porosity in the 3-4 clutch piston, • damaged 3-4 clutch piston, • missing 3-4 clutch inner and outer seals, • cut 3-4 clutch inner and outer seals, • damaged 3-4 clutch inner and outer seals, • damaged 3-4 clutch spring assembly, • damaged 3-4 clutch apply ring, • damaged piston seal grooves, • blocked orifice cup plug, and • missing orifice cup plug, refer to 7C5 Automatic Transmission – 4L60E – Unit Repair. Did you find and correct the condition?	Go to Step 13	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis
13	1 Change the transmission fluid and filter. 2 Inspect for correct transmission fluid level, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. 3 Add new fluid as necessary. **NOTE** The Clear TAPS function will clear all adapt cells. This may affect transmission performance. The TCM will update the transmission adapt cell values as the vehicle is driven. 4 On Tech 2 select: **Transmission** / **Programming** / **Reset TAP Cells** and follow Tech 2 instructions. Did you complete the above procedure?	Go to Step 14	—

Step	Action	Yes	No
14	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes / Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 On Tech 2 select: **Automatic Transmission / Data Display / Transmission Data.** 4 Operate the vehicle under the following conditions: • Drive the vehicle in D4, with the TCC on, and a throttle position at 20%. • On Tech 2 ensure the **TCC Slip Speed** is **-20 to +50 RPM** for at least 7 seconds. 5 On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Has DTC P0894 set?	Go to Step 2	Go to Step 15
15	On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.27 DTC P0961 – Line Pressure Control Solenoid System Performance

DTC Description

This diagnostic procedure supports DTC P0961 Line Pressure Control (PC) Solenoid System Performance.

Circuit Description

The pressure control (PC) solenoid valve is an electronic device that regulates transmission line pressure based on the current flow through its coil winding. The magnetic field produced by the coil moves the solenoid's internal valve, which varies pressure to the pressure regulator valve. The transmission control module (TCM) controls the PC solenoid valve by applying a varying amount of current to the solenoid. The applied current can vary from 0.1 – 1.1 A. Low current, 0.1 A, indicates high line pressure. High current, 1.1 A, indicates low line pressure. The duty cycle of the PC solenoid valve is expressed as a percentage of energised on time. Zero percent indicates zero on time, non-energised, or no current flow. Approximately 60 percent at idle indicates maximum on time, energised, or high current flow. The TCM determines the appropriate line pressure for a given load by comparing the throttle position, the engine speed and other inputs.

When the TCM detects a continuous open or short to ground in the PC solenoid valve circuit, then DTC P0961 sets. DTC P0961 is a type C DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- The system voltage is 8 – 18 V.
- The engine is running.

Conditions for Setting the DTC

The PC solenoid valve duty cycle reaches its high limit, approximately 95 percent, or low limit, approximately 2 percent.

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the MIL.

- The TCM records the operating conditions when the conditions for setting the DTC are met. The TCM records this information as a Failure Record.
- The TCM freezes transmission adaptive functions.
- The TCM commands maximum line pressure.
- The TCM stores DTC P0961 in TCM history.

Conditions for Clearing the DTC

- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- Tech 2 can clear the DTC.

Diagnostic Aids

DTC P0961 may set under low voltage conditions caused by high electrical system demands.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 Checks the ability of the TCM to control the solenoid.

3 Checks the resistance of the control valve body wiring harness and the PC solenoid.

5 Checks the serviceability of the PC solenoid circuits contained in the control valve body wiring harness.

6-8 Checks the serviceability the power and signal circuits between the TCM and the transmission.

DTC P0961 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check

Step	Action	Yes	No
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 On Tech 2 select: **Miscellaneous Tests** / **Pressure Control Solenoid.** 8 Using Tech 2, turn the pressure control solenoid on and off three times. Does Tech 2 display the PCS as **On** and **Off** when commanded by Tech 2?	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis	Go to Step 3
3	1 Turn off the ignition. 2 Disconnect connector E-95 from the transmission. 3 Install Tool No. J 44152 Jumper Harness (20 pins) on to the transmission connector E-95. 4 Using the multimeter set to measure resistance, probe across transmission connector E-95 pins 1 and 2. Does the multimeter display 3 – 7 Ω?	Go to Step 4	Go to Step 5
4	Using the multimeter set to measure resistance, probe between connector E-95 pin 2 and the transmission case. Does the multimeter display greater than 250 kΩ?	Go to Step 6	Go to Step 5
5	Using a multimeter, test between E-95 pin 1 & E-95 pin 2 and the solenoid for the following: • open circuit, • short together, and • short to ground. Did you find any of the conditions tested?	Replace the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Go to Step 11	Replace the PC solenoid valve, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing Go to Step 11
6	1 Disconnect Tool No. J 44152 from connector E-95. 2 Connect E-95 to the transmission. 3 Disconnect connector E-95 from the TCM. 4 Using a multimeter set to measure resistance, probe between connector C-96 pins 17 and 40. Does the multimeter display 3 – 7 Ω?	Go to Step 7	Go to Step 8

Step	Action	Yes	No
7	Using a multimeter set to measure resistance, probe between connector C-96 pin 40 and a known ground. Does the multimeter display greater than 250 kΩ?	Go to Step 9	Go to Step 8
8	Using a multimeter, test between E-95 pin 2 & C-96 pin 40 and E-95 pin 1 & C-96 pin 17 for the following: • open circuit, • short together, and • short to ground. Did you find any of the conditions tested?	Repair or replace the affected circuit Go to Step 11	—
9	Using a multimeter, test between E-95 pin 1 & E-95 pin 2 and the solenoid for a short to voltage. Did you find and correct the condition?	Go to Step 11	Go to Step 10
10	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Did you complete the replacement?	Go to Step 11	—
11	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 On Tech 2 select: **Data Display** / **Pressure Control Solenoid Data.** 4 Start the engine and ensure the difference on Tech 2 between the **PCS Actual Current** and the **PCS Desired Current** is less than 16 mA. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0961 set?	Go to Step 2	Go to Step 20
12	On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
	When all diagnosis and repairs are completed, check the system for correct operation.		

4.28 DTC P0973 – 1-2 Shift Solenoid Control Circuit Low Voltage

DTC Description

This diagnostic procedure supports DTC P0973 1-2 Shift Solenoid (SS) Control Circuit Low Voltage.

Circuit Description

The 1-2 shift solenoid (SS) valve controls the fluid flow acting on the 1-2 and 3-4 shift valves. The solenoid is a normally-open exhaust valve. With the 2-3 SS valve, the 1-2 SS valve allows four different shifting combinations. The solenoid attaches to the control valve body within the transmission. The 1-2 SS valve receives ignition voltage through the ignition voltage circuit. The transmission control module (TCM) controls the solenoid by providing the ground path on the 1-2 SS valve control circuit.

When the TCM detects a continuous open or short to ground in the 1-2 SS valve circuit, then DTC P0973 sets. DTC P0973 is a type B DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- The engine run time is greater than 5 seconds.
- The 1-2 SS is commanded on.

Conditions for Setting the DTC

DTC P0973 sets when either of the following conditions occurs for 4.3 seconds:

- The TCM detects an open in the 1-2 shift solenoid valve circuit when the 1-2 SS is commanded on.
- The TCM detects a short to ground in the 1-2 shift solenoid valve circuit when the 1-2 SS is commanded on.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive drive trip in which the conditions for setting the DTC are met.
- The TCC commands maximum line pressure.
- The TCM inhibits 3-2 shift if vehicle speed is less than 40 km/h.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0973 in TCM history.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is off long enough to power down the TCM.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

4 Checks the ability of the TCM to control the solenoid.

5 Checks for supply voltage to the 1-2 SS valve.

6 Checks the ability of the TCM and wiring to control the ground circuit.

8 Checks the resistance of the control valve body wiring harness and the 1-2 SS valve.

9 Checks if the 1-2 SS or control valve body wiring harness is shorted to the transmission housing.

13 Checks if the control valve body wiring harness is shorted to ground.

14 Checks if any of the other solenoids in the transmission are shorted to ground.

DTC P0973 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. Are any of the following DTCs also set? • P0787 • P0976 • P2764 • P2769.	Go to Step 3	Go to Step 4
3	Inspect fuse C-8 and check if it is blown, refer to 8A Electrical-Body and Chassis. Is the fuse blown?	Replace the fuse Go to Step 12	Go to Step 5
4	1 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Miscellaneous Tests** / **Shift Solenoid A.** 2 With Tech 2 command the shift solenoid A **ON** and **OFF**. 3 On Tech 2 select: **Data Display** / **1-2 Shift Data.** Does Tech 2 display the **Shift Solenoid A Circuit** as **Okay**?	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis	Go to Step 5
5	1 Turn off the ignition. 2 Disconnect connector E-95 from the transmission. **NOTE** Additional DTCs may set. 3 Install Tool No. J 44152 Jumper Harness (20 pins) on to the harness connector E-95. 4 Turn on the ignition, with the engine off. 5 Using a test lamp, probe between connector E-95 pin 10 and a known ground. Does the test lamp illuminate?	Go to Step 6	Go to Step 15

Step	Action	Yes	No
6	1 Using a test lamp, probe connector E-95 pin 10 with the ground lead to connector E-95 pin 4. 2 On Tech 2 select: **Automatic Transmission / Miscellaneous Tests / Shift Solenoid A.** 3 With Tech 2 command the shift solenoid A **On** and **Off** three times. Does the test lamp turn on and off with each command?	Go to Step 8	Go to Step 7
7	Is the test lamp always illuminated?	Go to Step 16	Go to Step 17
8	1 Remove Tool No. J44152 from the harness connector E-95 and install on to the transmission connector E-95. 2 Using a multimeter set to measure resistance, probe across transmission connector E-95 pins 10 and 4. Does the multimeter display 19 – 31 Ω?	Go to Step 9	Go to Step 10
9	Using a multimeter set to measure resistance, probe between: • Transmission connector E-95 pin 10 and a known ground. • Transmission connector E-95 pin 4 and a known ground. Does the multimeter display greater than 250 kΩ in both instances?	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis	Go to Step 11
10	1 Remove Tool No. J44152 from the transmission. 2 Gain access to the 1-2 SS and the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. 3 Disconnect the internal connector from the 1-2 SS. 4 Using a multimeter set to measure resistance, probe across the 1-2 SS pins. Does the multimeter display 19 – 31 Ω?	Replace the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing Go to Step 19	Replace the 1-2 SS, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Go to Step 19
11	1 Remove Tool No. J44152 from the transmission. 2 Gain access to the 1-2 SS and the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. 3 Using a multimeter set to measure resistance, probe between each of the 1-2 SS pins and a known ground. Does the multimeter display 250 kΩ in both instances?	Replace the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing Go to Step 19	Replace the 1-2 SS, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Go to Step 19
12	Using a multimeter, test between E-95 pin 10 and C-107 pin 9 for a short to ground. Did you find and correct the condition?	Go to Step 19	Go to Step 13
13	1 Gain access to the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. 2 Test for a short to ground in the control valve body wiring harness. Did you find a short to ground condition?	Replace the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing Go to Step 19	Go to Step 14

Step	Action	Yes	No
14	1 Test each solenoid for a short to ground. 2 Replace the faulty solenoid as necessary. Did you complete the replacement?	Go to Step 19	—
15	Using a multimeter, test between E-95 pin 10 and C-107 pin 9 for an open circuit. Did you find and correct the condition?	Go to Step 19	—
16	Using a multimeter, test between E-95 pin 4 and C-96 pin 2 for a short to ground. Did you find and correct the condition?	Go to Step 19	Go to Step 18
17	Using a multimeter, test between E-95 pin 4 and C-96 pin 2 for an open circuit. Did you find and correct the condition?	Go to Step 19	Go to Step 18
18	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Did you complete the replacement?	Go to Step 19	—
19	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 On Tech 2 select: **Data Display** / **1-2 Shift Data.** 4 Drive the vehicle in D4 and ensure the following conditions are met:: • The TCM commands the **Shift Solenoid A On** and the **Shift Solenoid A Circuit** status parameter displays Okay. • The TCM commands the **Shift Solenoid A Off** and the **Shift Solenoid A Circuit** status parameter displays Okay. • All conditions are met for 5 seconds. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0973 set?	Go to Step 2	Go to Step 20
20	On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.29 DTC P0974 – 1-2 Shift Solenoid Control Circuit High Voltage

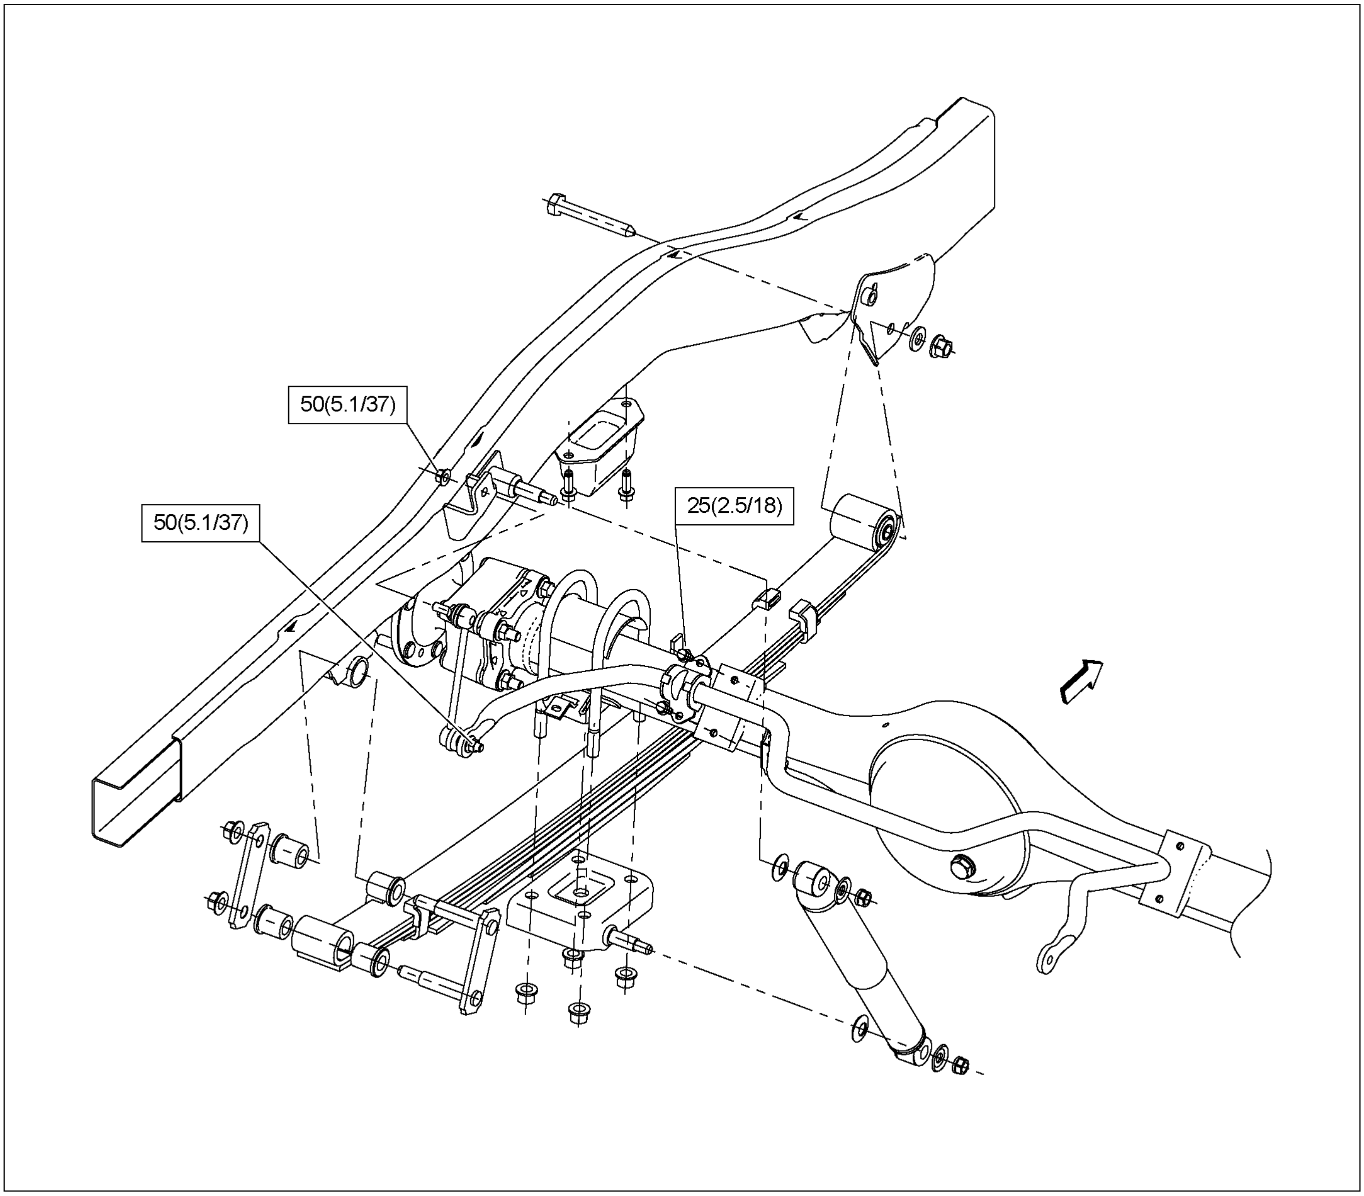
DTC Description

This diagnostic procedure supports DTC P0974 1-2 Shift Solenoid (SS) Control Circuit High Voltage.

Circuit Description

The 1-2 shift solenoid (SS) valve controls the fluid flow acting on the 1-2 and 3-4 shift valves. The solenoid is a normally-open exhaust valve. With the 2-3 SS valve, the 1-2 SS valve allows four different shifting combinations. The solenoid

N·m(kgf·m/lb·ft)



RTW73DLF000301

attaches to the control valve body within the transmission. The 1-2 SS valve receives ignition voltage through the ignition voltage circuit. The transmission control module (TCM) controls the solenoid by providing the ground path on the 1-2 SS valve control circuit.

When the TCM detects a continuous short to voltage in the 1-2 shift solenoid valve control circuit, then DTC P0974 sets. DTC P0974 is a type A DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- The system voltage is 8 – 18 V.
- The engine speed is 500 r.p.m. for 5 seconds.

Conditions for Setting the DTC

DTC P0974 sets if the TCM commands the solenoid on and the voltage feedback remains high, battery voltage.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC engagement.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0974 in TCM history during the second consecutive trip in which the conditions for setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is off long enough to power down the TCM.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 Checks the ability of the TCM to command the 1-2 SS valve.

3 Checks for a short to voltage in the 1-2 SS signal circuit.

4 Checks the serviceability of the 1-2 SS and the control valve body wiring harness.

4.30 DTC P0976 – 2-3 Shift Solenoid Control Circuit Low Voltage

DTC Description

This diagnostic procedure supports DTC P0976 2-3 Shift Solenoid (SS) Control Circuit Low Voltage.

Circuit Description

The 2-3 shift solenoid (SS) valve controls the fluid flow acting on the 2-3 shift valves. The solenoid is a normally-open exhaust valve. With the 1-2 SS valve, the 2-3 SS valve allows four different shifting combinations. The solenoid attaches to the control valve body within the transmission. The 2-3 SS valve receives voltage through the ignition voltage circuit. The transmission control module (TCM) controls the solenoid by providing the ground path on the 2-3 SS valve control circuit.

When the TCM detects a continuous open or short to ground in the 2-3 SS valve control circuit, then DTC P0976 sets. DTC P0976 is a type A DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- The engine run time is greater than 5 seconds.
- The 2-3 SS is commanded on.

Conditions for Setting the DTC

DTC P0976 sets when either of the following conditions occurs for 4.3 seconds:

- The TCM detects an open in the 2-3 shift solenoid valve circuit when the 2-3 SS is commanded on.
- The TCM detects a short to ground in the 2-3 shift solenoid valve circuit when the 2-3 SS is commanded on.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL.
- The TCC commands maximum line pressure.
- The TCM inhibits 3-2 shift if vehicle speed is less than 40 km/h.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0976 in TCM history.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is off long enough to power down the TCM.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

4 Checks the ability of the TCM to control the solenoid.

5 Checks for supply voltage to the 2-3 SS valve.

6 Checks the ability of the TCM and wiring to control the ground circuit.

8 Checks the resistance of the control valve body wiring harness and the 2-3 SS valve.

9 Checks if the 2-3 SS or control valve body wiring harness is shorted to the transmission housing.

13 Checks if the control valve body wiring harness is shorted to ground.

14 Checks whether any of the other solenoids in the transmission are shorted to ground.

When all diagnosis and repairs are completed, check the system for correct operation.			

4.31 DTC P0977 – 2-3 Shift Solenoid Control Circuit High Voltage

DTC Description

This diagnostic procedure supports DTC P0977 2-3 Shift Solenoid (SS) Control Circuit High Voltage.

Circuit Description

The 2-3 shift solenoid (SS) valve controls the fluid flow acting on the 2-3 shift valves. The solenoid is a normally-open exhaust valve. With the 1-2 SS valve, the 2-3 SS valve allows four different shifting combinations. The solenoid attaches to the control valve body within the transmission. The 2-3 SS valve receives voltage through the ignition voltage circuit. The transmission control module (TCM) controls the solenoid by providing the ground path on the 2-3 SS valve control circuit.

When the TCM detects a continuous short to voltage in the 2-3 shift solenoid valve control circuit, then DTC P0977 sets. DTC P0977 is a type A DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- The system voltage is 8 – 18 V.
- The engine speed is 500 r.p.m. for 5 seconds.

Conditions for Setting the DTC

DTC P0977 sets if the TCM commands the solenoid on and the voltage feedback remains high, battery voltage.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive trip in which the conditions for setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC engagement.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0977 in TCM history during the second consecutive trip in which the conditions for setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is off long enough to power down the TCM.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

3 Checks for a short to voltage in the 2-3 SS signal circuit.

4 Checks the serviceability of the 2-3 SS.

DTC P0977 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check

Step	Action	Yes	No
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Miscellaneous Tests** / **Shift Solenoid B.** 8 With Tech 2 command the shift solenoid B **ON** and **OFF** three times. 9 On Tech 2 select: **Data Display** / **2-3 Shift Data.** Does Tech 2 display the **Shift Solenoid B Circuit** as **Okay**?	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis	Go to Step 3
3	1 Turn off the ignition. 2 Disconnect connector E-95 from the transmission. **NOTE** Additional DTCs may set. 3 Install Tool No. J 44152 Jumper Harness (20 pins) on to the harness connector E-95. 4 Turn on the ignition, with the engine off. 5 Using a test lamp, probe between connector E-95 pin 3 and a known ground. Does the test lamp illuminate?	Go to Step 6	Go to Step 4
4	1 Install Tool No. J44152 on to the transmission connector E-95. 2 Using a multimeter set to measure resistance, probe across transmission connector E-95 pins 10 and 3. Does the multimeter display less than 20 Ω?	Go to Step 5	Go to Step 7
5	1 Remove Tool No. J44152 from the transmission. 2 Gain access to the 2-3 SS and the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. 3 Disconnect the internal connector from the 2-3 SS. 4 Using a multimeter set to measure resistance, probe across the 2-3 SS pins. Does the multimeter display less than 20 Ω?	Replace the 2-3 SS, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Go to Step 8	Replace the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing Go to Step 8

Step	Action	Yes	No
6	Using a multimeter, test between E-95 pin 3 and C-96 pin 30 for a short to voltage. Did you find and correct the condition?	Go to Step 8	Go to Step 7
7	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing Did you complete the replacement?	Go to Step 8	—
8	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 On Tech 2 select: **Data Display** / **2-3 Shift Data.** 4 Drive the vehicle in D4 and ensure the following conditions are met:: • The TCM commands the **Shift Solenoid B On** and the **Shift Solenoid B Circuit** status parameter displays **Okay**. • The TCM commands the **Shift Solenoid B Off** and the **Shift Solenoid B Circuit** status parameter displays **Okay**. • All conditions are met for 5 seconds. 4 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P0977 set?	Go to Step 2	Go to Step 9
9	On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.32 DTC P1810, P1815 and P1816 – Transmission Fluid Pressure Position Switch

DTC Description

This diagnostic procedure supports the following DTCs:

- DTC P1810 Transmission Fluid Pressure (TFP) Position Switch Circuit.
- DTC P1815 Transmission Fluid Pressure (TFP) Valve Position Switch – Start in Wrong Range.
- DTC P1816 Transmission Fluid Pressure (TFP) Valve Position Switch Indicates Park/Neutral (P/N) with Drive Ratio.

Circuit Description

The automatic transmission fluid pressure (TFP) manual valve position switch consists of five pressure switches (two normally-closed and three normally-open) and a transmission fluid temperature (TFT) sensor combined into one unit. The combined unit mounts on the valve body. The transmission control module (TCM) supplies ignition voltage for each range signal. By grounding one or more of these circuits through various combinations of the pressure switches, the TCM detects which manual valve position you select. The TCM compares the actual voltage combination of the switches to a TFP manual valve position switch combination chart stored in memory.

The TFP manual valve position switch cannot distinguish between park and neutral because the monitored valve body pressures are identical. With the engine off and the ignition switch on, the TFP manual valve position switch indicates

REAR SUSPENSION

GENERAL DESCRIPTION

Rear suspension absorbs vibration from the road surface thus preventing vehicle damage, as well as providing a comfortable ride.

Components parts

- Spring between the body and the axle case
- Spring shackle connecting the spring to the body
- Clamp and U-bolt fixing the axle case to the spring
- Shock absorber as a countermeasure for vibration

park/neutral. Disconnecting connector E-95 from the transmission removes the ground potential for the three range signals to the TCM. In this case, with the engine off, and the ignition switch on, D2 will be indicated.

When the TCM detects an invalid state of the TFP manual valve position switch circuit by deciphering the TFP manual valve position switch inputs, then either DTC P1810, P1815 or P1816 sets. All theses DTCs are a type B DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

DTC P1810

- The system voltage is 8 – 18 V.
- The engine speed is greater than 500 r.p.m. for 5 seconds.

DTC P1815

- No DTCs P0722 or P0723.
- The system voltage is 8 – 18 V.
- The engine speed is less than 50 r.p.m., then 50 – 650 r.p.m. for 0.75 seconds, then greater than 650 r.p.m. for 5 seconds.
- Output shaft speed less than 250 r.p.m.

DTC P1816

- No DTCs P0722 or P0723.
- The system voltage is 8 – 18 V.
- The engine speed is less than 50 r.p.m., then 50 – 650 r.p.m. for 0.75 seconds, then greater than 650 r.p.m. for 5 seconds.
- Output shaft speed less than 250 r.p.m.

Conditions for Setting the DTC

DTC P1810

DTC P1810 sets when the TCM detects an invalid TFP manual valve position switch state for 60 seconds.

DTC P1815

DTC P1815 sets when the TCM detects D2 only, TFP manual valve position switch state after engine start for 7 seconds.

DTC P1816

DTC P1816 sets when the TCM detects one of the following conditions for 13 seconds:

- park/neutral indicated with a 1st gear ratio,
- park/neutral indicated with a 2nd gear ratio,
- park/neutral indicated with a 3rd gear ratio, or
- park/neutral indicated with a 4th gear ratio.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive trip in which the conditions for setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC engagement.

- The TCM commands 4th gear.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores the DTC in TCM history during the second consecutive trip in which the conditions for setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is off long enough to power down the TCM.

Diagnostic Aids

- Refer to the 5.3 Transmission Fluid Pressure Manual Valve Position Switch Logic for the normal range signals and the invalid combinations. On the table, LOW is 0 V, HI is ignition voltage.
- Sediment in the valve body may cause improper operation of the TFP manual valve position switch. If the presence of sediment is suspected, clean the valve body and replace the TFP manual valve position switch.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

3 Checks the indicated range signal to the selected manual valve position.

4-5 Checks for correct voltage from the TCM to the transmission inline 20-way connector.

6 Checks if there is a short between any of the signal circuits.

DTC P1810, P1815 and P1816 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	Inspect for correct transmission fluid level, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Did you perform the fluid checking procedure?	Go to Step 3	Refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing

Step	Action	Yes	No
3	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 Start the engine and idle at normal operating temperature. 8 Apply the brake pedal. 9 On Tech 2 select: **Data Display** / **Transmission Data.** 10 Select each transmission range: P, R, N, D4, D3, D2 and D1. Does each selected transmission range match the **TFP Gear** displayed on Tech 2?	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis	Go to Step 4
4	1 Turn off the ignition. 2 Disconnect connector E-95 from the transmission. **NOTE** Additional DTCs may set. 3 Turn on the ignition, with the engine off. Does Tech 2 display **Open 12V** for any of the **TFP Switch. A**/**B**/**C** parameters?	Go to Step 5	Go to Step 7
5	1 Turn off the ignition. 2 Install Tool No. J 44152 Jumper Harness (20 pins) on to the harness connector E-95. 3 Turn on the ignition, with the engine off. 4 Using a multimeter set to measure voltage, probe between the following pins and ground: • connector E-95 pin 5, • connector E-95 pin 13, and • connector E-95 pin 12. Did the multimeter display 10 – 12 V for all the tests?	Go to Step 6	Go to Step 8

Step	Action	Yes	No
6	1 Disconnect connector C-96 from the TCM. 2 Using a multimeter set to measure resistance, probe across the following pins: • connector E-95 pins 5 and 13, • connector E-95 pins 5 and 12, and • connector E-95 pins 12 and 13. Does the multimeter display continuity in any of the tests?	Go to Step 9	Go to Step 10
7	Test the circuit (A/B/C) that displayed **Closed** on Tech 2, for a short to ground between connector E-95 and C-96. Did you find and correct the condition?	Go to Step 12	Go to Step 11
8	Test the signal circuits of the TFP manual valve position switch that did not indicate battery voltage for an open circuit between connectors E-95 and C-96. Did you find and correct the condition?	Go to Step 12	Go to Step 11
9	Test the affected signal circuits of the TFP manual valve position switch for a shorted together condition between E-95 and C-96. Did you find and correct the condition?	Go to Step 12	Go to Step 11
10	Test the TFP circuits for an open circuit or shorted condition between connector E-95 and the TFP manual valve position switch. Did you find a condition?	Replace the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Go to Step 12	Replace the TFP manual valve position switch, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Go to Step 12
11	Replace the TCM refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Did you complete the replacement?	Go to Step 12	—
12	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 Operate the vehicle under the following conditions: • Turn on the ignition, with the engine off for at least 2 seconds. • Start the vehicle and idle for 5 seconds. • Drive in D4 until the TCC locks for 10 seconds. • Continue to run the engine for at least 60 seconds from start-up. 4 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P1810 set?	Go to Step 2	Go to Step 13

Step	Action	Yes	No
13	On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.33 DTC P2763 – Torque Converter Clutch Pressure Control Solenoid Control Circuit High Voltage

DTC Description

This diagnostic procedure supports DTC P2763 Torque Converter Clutch (TCC) Pressure Control (PC) Solenoid Control Circuit High Voltage.

Circuit Description

The torque converter clutch pulse width modulation (TCC PWM) solenoid valve controls the fluid acting on the converter clutch valve. The converter clutch valve controls the TCC application and release. The solenoid attaches to the control valve body within the transmission. The solenoid receives voltage through ignition voltage circuit. The transmission control module (TCM) controls the solenoid by providing a ground path on the TCC PWM solenoid valve control circuit. Current flows through the solenoid coil according to the duty cycle, percentage of on and off time. The TCC PWM solenoid valve provides a smooth engagement of the TCC by operating during a duty cycle percent of on time.

When the TCM detects a continuous short to voltage in the TCC PWM solenoid valve control circuit, then DTC P2763 sets. DTC P2763 is a type A DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- The system voltage is 8 – 18 V.
- The engine speed is 500 r.p.m. for 5 seconds.

Conditions for Setting the DTC

DTC P2763 sets if the TCM commands the solenoid on and the voltage feedback remains high, battery voltage.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive trip in which the conditions for setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC engagement.
- The TCM inhibits 4th gear if in hot mode.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P2763 in TCM history during the second consecutive trip in which the conditions for setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.

- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is off long enough to power down the TCM.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 Checks for a short to voltage in the TCC PWM solenoid valve signal circuit.

3 Checks the serviceability of the TCC PWM solenoid valve.

DTC P2763 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Miscellaneous Tests** / **TCC PWM Solenoid.** 8 With Tech 2 command the TCC PWM solenoid **ON** and **OFF** three times. 9 On Tech 2 select: **Data Display** / **TCC Data.** Does Tech 2 display the **TCC Duty Cycle Circuit** as **Okay**?	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis	Go to Step 3

Step	Action	Yes	No
3	1 Turn off the ignition. 2 Disconnect connector E-95 from the transmission. **NOTE** Additional DTCs may set 3 Install Tool No. J 44152 Jumper Harness (20 pins) on to the harness connector E-95. 4 Turn on the ignition, with the engine off. 5 Using a test lamp, probe between connector E-95 pin 11 and a known ground. Does the test lamp illuminate?	Go to Step 6	Go to Step 4
4	1 Install Tool No. J44152 on to the transmission connector E-95. 2 Using a multimeter set to measure resistance, probe across transmission connector E-95 pins 10 and 11. Does the multimeter display less than 20 Ω?	Go to Step 5	Go to Step 7
5	1 Remove Tool No. J44152 from the transmission. 2 Gain access to the TCC PWM solenoid and the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. 3 Disconnect the internal connector from the TCC PWM solenoid. 4 Using a multimeter set to measure resistance, probe across the TCC PWM solenoid pins. Does the multimeter display less than 20 Ω?	Replace the TCC PWM solenoid, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Go to Step 8	Replace the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing Go to Step 8
6	Using a multimeter, test between E-95 pin 11 and C-96 pin 14 for a short to voltage. Did you find and correct the condition?	Go to Step 8	Go to Step 7
7	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Did you complete the replacement?	Go to Step 8	—
8	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes / Clear Engine & Transmission DTCs.** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 On Tech 2 select: **Data Display / TCC Data.** 4 Drive the vehicle in D4 and ensure the **TCC Duty Cycle Circuit** parameter displays **Okay** for 5 seconds. 5 On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Has DTC P2763 set?	Go to Step 2	Go to Step 9
9	On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.34 DTC P2764 – Torque Converter Clutch Pressure Control Solenoid Control Circuit Low Voltage

DTC Description

This diagnostic procedure supports DTC P2764 Torque Converter Clutch (TCC) Pressure Control (PC) Solenoid Control Circuit Low Voltage.

Circuit Description

The torque converter clutch pulse width modulation (TCC PWM) solenoid valve controls the fluid acting on the converter clutch valve. The converter clutch valve controls the TCC application and release. The solenoid attaches to the control valve body within the transmission. The solenoid receives voltage through ignition voltage circuit. The transmission control module (TCM) controls the solenoid by providing a ground path on the TCC PWM solenoid valve control circuit. Current flows through the solenoid coil according to the duty cycle, percentage of on and off time. The TCC PWM solenoid valve provides a smooth engagement of the TCC by operating during a duty cycle percent of on time.

When the TCM detects a continuous open or short to ground in the TCC PWM solenoid valve control circuit, then DTC P2764 sets. DTC P2764 is a type A DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- The system voltage is 8 – 18 V.
- The engine speed is 500 r.p.m. for 5 seconds.

Conditions for Setting the DTC

DTC P2764 sets when either of the following conditions occurs for 5 seconds:

- The TCM detects an open in the TCC PWM shift solenoid valve circuit when the TCC PWM is commanded on.
- The TCM detects a short to ground in the TCC PWM shift solenoid valve circuit when the TCC PWM is commanded on.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC engagement.
- The TCM inhibits 4th gear if in hot mode.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P2764 in TCM history during the second consecutive trip in which the conditions for setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

4 Checks the ability of the TCM to control the solenoid.

5 Checks for supply voltage to the TCC PWM solenoid valve.

6 Checks the ability of the TCM and wiring to control the ground circuit.

8 Checks the resistance of the control valve body wiring harness and the TCC PWM solenoid valve.

9 Checks if the TCC PWM solenoid valve or control valve body wiring harness is shorted to the transmission housing.

13 Checks if the control valve body wiring harness is shorted to ground.

14 Checks if any of the other solenoids in the transmission are shorted to ground.

DTC P2764 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. Are any of the following DTCs also set? • P0787 • P0973 • P0976 • P2769.	Go to Step 3	Go to Step 4
3	Inspect fuse C-8 and check if it is blown, refer to 8A Electrical-Body and Chassis. Is the fuse blown?	Replace the fuse Go to Step 12	Go to Step 5

Step	Action	Yes	No
4	1 On Tech 2 select: **Transmission / Automatic Transmission / Miscellaneous Tests / TCC PWM solenoid.** 2 With Tech 2 command the TCC PWM solenoid **ON** and **OFF** three times. 3 On Tech 2 select: **Data Display / TCC Data.** Does Tech 2 display the **TCC Duty Cycle Circuit** as **Okay**?	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis	Go to Step 5
5	1 Turn off the ignition. 2 Disconnect connector E-95 from the transmission. **NOTE** Additional DTCs may set. 3 Install Tool No. J 44152 Jumper Harness (20 pins) on to the harness connector E-95. 4 Turn on the ignition, with the engine off. 5 Using a test lamp, probe between connector E-95 pin 10 and a known ground. Does the test lamp illuminate?	Go to Step 6	Go to Step 15
6	1 Using a test lamp, probe connector E-95 pin 10 with the ground lead to connector E-95 pin 19. 2 On Tech 2 select: **Automatic Transmission / Miscellaneous Tests / TCC PWM Solenoid.** 3 With Tech 2 command the TCC PWM Solenoid **On** and **Off** three times. Does the test lamp turn on and off with each command?	Go to Step 8	Go to Step 7
7	Is the test lamp always illuminated?	Go to Step 16	Go to Step 17
8	1 Remove Tool No. J44152 from the harness connector E-95 and install on to the transmission connector E-95. 2 Using a multimeter set to measure resistance, probe across transmission connector E-95 pins 10 and 19. Does the multimeter display 10 – 15 Ω?	Go to Step 9	Go to Step 10
9	Using a multimeter set to measure resistance, probe between: • Transmission connector E-95 pin 10 and a known ground. • Transmission connector E-95 pin 19 and a known ground. Does the multimeter display greater than 250 kΩ in both instances?	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis	Go to Step 11
10	1 Remove Tool No. J44152 from the transmission. 2 Gain access to the TCC PWM solenoid and the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. 3 Disconnect the internal connector from the TCC PWM solenoid. 4 Using a multimeter set to measure resistance, probe across the TCC PWM solenoid pins. Does the multimeter display 10 – 15 Ω?	Replace the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing Go to Step 19	Replace the TCC PWM solenoid, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Go to Step 19

When all diagnosis and repairs are completed, check the system for correct operation.			

4.35 DTC P2769 – Torque Converter Clutch Enable Solenoid Control Circuit Low Voltage

DTC Description

This diagnostic procedure supports DTC P2769 Torque Converter Clutch (TCC) Enable Solenoid Control Circuit Low Voltage.

Circuit Description

The torque converter clutch (TCC) solenoid valve is an electrical device that is used with the torque converter clutch pulse width modulation (TCC PWM) solenoid valve to control TCC apply and release. The TCC solenoid valve attaches to the transmission case assembly extending into the pump cover. The TCC solenoid valve receives voltage through ignition voltage circuit. The transmission control module (TCM) controls the solenoid by providing the ground path on the TCC solenoid valve control circuit. The TCM monitors the throttle position (TP) voltage, the vehicle speed and other inputs to determine when to energize the TCC solenoid valve.

NOTE

The TCC solenoid valve is part of the control valve body wiring harness. To replace the solenoid valve, the control valve body harness must be replaced.

When the TCM detects a continuous open or short to ground in the TCC solenoid valve control circuit, then DTC P2769 sets. DTC P2769 is a type B DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- The system voltage is 8 – 18 V.
- The engine speed is 500 r.p.m. for 5 seconds.

Conditions for Setting the DTC

DTC P2769 sets when either of the following conditions occurs for 5 seconds:

- The TCM detects an open in the TCC solenoid valve circuit when the TCC is commanded on.
- The TCM detects a short to ground in the TCC shift solenoid valve circuit when the TCC is commanded on.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive trip in which the conditions for setting the DTC are met.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC engagement.
- The TCM inhibits 4th gear if in hot mode.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.

- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P2769 in TCM history during the second consecutive trip in which the conditions for setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.

Diagnostic Aids

With the TCC engaged, the TCC slip speed should be -20 – +40 r.p.m.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

4 Checks for supply voltage to the 3-2 SS valve.

5 Checks the ability of the TCM and wiring to control the ground circuit.

7 Checks the resistance of the control valve body wiring harness and the TCC solenoid valve.

8 Checks if the TCC solenoid valve or control valve body wiring harness is shorted to the transmission housing.

10 Checks if the control valve body wiring harness is shorted to ground.

11 Checks whether any of the other solenoids in the transmission are shorted to ground.

DTC P2769 Diagnostic Table

1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check

2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. Are any of the following DTCs also set? • P0787 • P0973 • P0976 • P2764.	Go to Step 3	Go to Step 4
3	Inspect fuse F8 and check if it is blown, refer to 8A Electrical-Body and Chassis. Is the fuse blown?	Replace the fuse Go to Step 9	Go to Step 5
4	1 Turn off the ignition. 2 Disconnect connector E-95 from the transmission. **NOTE** Additional DTCs may set. 3 Install Tool No. J 44152 Jumper Harness (20 pins) on to the harness connector E-95. 4 Turn on the ignition, with the engine off. 5 Using a test lamp, probe between connector E-95 pin 10 and a known ground. Does the test lamp illuminate?	Go to Step 7	Go to Step 12
5	1 Using a test lamp, probe connector E-95 pin 10 with the ground lead to connector E-95 pin 20. 2 On Tech 2 select: **Automatic Transmission** / **Miscellaneous Tests** / **TCC Solenoid.** 3 With Tech 2 command the **TCC Solenoid On** and **Off** three times. Does the test lamp turn on and off with each command?	Go to Step 7	Go to Step 6
6	Is the test lamp always illuminated?	Go to Step 13	Go to Step 14

7	1 Remove Tool No. J44152 from the harness connector X121 – X1 and install on to the transmission connector X121 – X1. 2 Using a multimeter set to measure resistance, probe across transmission connector E-95 pins 10 and 20. Does the multimeter display 21 – 33 Ω?	Go to Step 8	Replace the control valve body wiring harness and TCC solenoid, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing Go to Step 16
8	Using a multimeter set to measure resistance, probe between: • Transmission connector E-95 pin 10 and a known ground. • Transmission connector E-95 pin 20 and a known ground. Does the multimeter display greater than 250 kΩ in both instances?	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis	Replace the control valve body wiring harness and TCC solenoid, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing Go to Step 16
9	Using a multimeter, test between E-95 pin 10 and C-107 pin 9 for a short to ground. Did you find and correct the condition?	Go to Step 16	Go to Step 10
10	1 Gain access to the control valve body wiring harness, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. 2 Test for a short to ground in the control valve body wiring harness. Did you find a short to ground condition?	Replace the control valve body wiring harness and TCC solenoid, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing Go to Step 16	Go to Step 11
11	1 Test each solenoid for a short to ground. 2 Replace the faulty solenoid as necessary. Did you complete the replacement?	Go to Step 16	—
12	Using a multimeter, test between E-95 pin 10 and C-107 pin 9 for an open circuit. Did you find and correct the condition?	Go to Step 16	—
13	Using a multimeter, test between E-95 pin 20 and C-96 pin 25 for a short to ground. Did you find and correct the condition?	Go to Step 16	Go to Step 15
14	Using a multimeter, test between E-95 pin 20 and C-96 pin 25 for an open circuit. Did you find and correct the condition?	Go to Step 16	Go to Step 15
15	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Did you complete the replacement?	Go to Step 16	—

16	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes / Clear Engine & Transmission DTCs** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 On Tech 2 select: **Miscellaneous Tests / TCC Solenoid.** 4 Drive the vehicle in D4. With Tech 2 command the TCC solenoid valve **On** for 5 seconds and **Off** for 5 seconds 5 On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Has DTC P2769 set?	Go to Step 2	Go to Step 17
17	On Tech 2 select: **Diagnostic Trouble Codes / Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.36 DTC P2770 – Torque Converter Clutch Enable Solenoid Control Circuit High Voltage

DTC Description

This diagnostic procedure supports DTC P2770 Torque Converter Clutch (TCC) Enable Solenoid Control Circuit High Voltage.

Circuit Description

The torque converter clutch (TCC) solenoid valve is an electrical device that is used with the torque converter clutch pulse width modulation (TCC PWM) solenoid valve to control TCC apply and release. The TCC solenoid valve attaches to the transmission case assembly extending into the pump cover. The TCC solenoid valve receives voltage through ignition voltage circuit. The transmission control module (TCM) controls the solenoid by providing the ground path on the TCC solenoid valve control circuit. The TCM monitors the throttle position (TP) voltage, the vehicle speed and other inputs to determine when to energize the TCC solenoid valve.

NOTE

The TCC solenoid valve is part of the control valve body wiring harness. To replace the solenoid valve, the control valve body harness must be replaced.

When the TCM detects a continuous short to voltage in the TCC solenoid valve control circuit, then DTC P2770 sets. DTC P2770 is a type B DTC.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

- The system voltage is 8 – 18 V.
- The engine speed is 500 r.p.m. for 5 seconds.

Conditions for Setting the DTC

DTC P2770 sets if the TCM commands the solenoid on and the voltage feedback remains high, battery voltage.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive trip in which the conditions for setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC engagement.
- The TCM inhibits 4th gear if in hot mode.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P2770 in TCM history during the second consecutive trip in which the conditions for setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is off long enough to power down the TCM.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 Checks for a short to voltage in the TCC solenoid valve signal circuit. Isolates whether the TCM or the TCC solenoid valve and control valve body wiring harness are at fault.

DTC P2770 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check
2	1 Turn off the ignition. 2 Disconnect connector E-95 from the transmission. **NOTE** Additional DTCs may set. 3 Install Tool No. J 44152 Jumper Harness (20 pins) on to the harness connector E-95. 4 Turn on the ignition, with the engine off. 5 Using a test lamp, probe connector E-95 pin 20 to ground. Does the test lamp illuminate?	Go to Step 3	Replace the internal wiring harness and TCC solenoid valve, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Go to Step 5
3	Using a multimeter, test between E-95 pin 20 and C-96 pin 25 for a short to voltage. Did you find and correct the condition?	Go to Step 5	Go to Step 4

Step	Action	Yes	No
4	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Service Did you complete the replacement?	Go to Step 5	—
5	Perform the following procedure to verify the repair: 1 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs** 2 Follow the instructions on Tech 2 and clear any DTCs. 3 Drive the vehicle in D4. 4 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has DTC P2770 set?	Go to Step 2	Go to Step 6
6	On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Does Tech 2 display any DTCs you have not diagnosed?	Refer to 4.8 Diagnostic Trouble Code List	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

4.37 DTC U0073 and U0100 – CAN-Bus No Communication With ECM (Engine Control Module)

DTC Description

This diagnostic procedure supports:

DTC U0073 – CAN-Bus No Communication With ECM (Engine Control Module)

DTC U0100 – CAN-Bus No Communication With ECM (Engine Control Module)

Circuit Description

The Transmission Control Module (TCM) communicates directly with the control modules connected to the GM LAN serial data communication circuit through the GM LAN protocol. The first module that CAN-Bus is connected to is the Engine Control Module (ECM).

DTC U0073 or DTC U0100 will set if communications between the TCM and ECM are lost.

Refer to 2 Wiring Diagrams and Connector Chart to aid in diagnosis.

Conditions for Running the DTC

DTC U0073 and DTC U0101 runs continuously when the following conditions are met:

- The ignition is on for longer than 3 seconds.
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

DTC U0073

The TCM detects a short to ground between C-96 pin 7 and C-96 pin 49 within the specified time frame

DTC U0100

The TCM detects a short to ground between both C-96 pin 6 & 7 and C-96 pin 49 within the specifed time frame.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the MIL during the second consecutive trip in which the conditions for setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits TCC engagement.
- At the time of the first failure, the TCM records the operating conditions when the conditions for setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the conditions for setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores either DTC U0073 or DTC U0100 in TCM history during the second consecutive trip in which the conditions for setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the fourth consecutive drive trip in which the TCM does not send a MIL illumination request.
- Tech 2 can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is off long enough to power down the TCM.

Test Description

The following number refers to the step numbers in the diagnostic table:

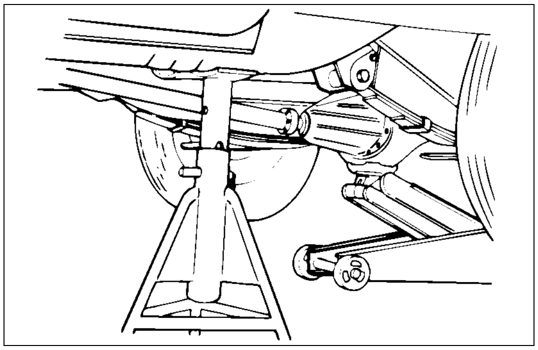
1 The following tests are included in the Diagnostic System Check.

  - Tests the integrity of the GM LAN serial data communication circuit.
  - Tests for fault conditions on the vehicle immobiliser system stored in the ICU.

DTC P0864 and U0101 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.7 Diagnostic System Check

Step	Action	Yes	No
2	1 Connect Tech 2 to the DLC. 2 Turn on the ignition, with the engine off. **NOTE** Before clearing the DTC, use the Tech 2 Freeze Frame/Failure Record to record the transmission parameters at the time the DTC set. Using Tech 2 to clear the DTC(s) erases the Freeze Frame/Failure Record records from the TCM. 3 On Tech 2 select: **Transmission** / **Automatic Transmission** / **Diagnostic Trouble Codes** / **Freeze Frame.** 4 Select the relevant DTC and note the parameters at the time of the DTC setting. 5 On Tech 2 select: **Diagnostic Trouble Codes** / **Clear Engine & Transmission DTCs.** 6 Follow the instructions on Tech 2 and clear the DTCs. 7 Operate the vehicle within the conditions for running the DTC. 8 On Tech 2 select: **Diagnostic Trouble Codes** / **Read DTC Information.** Has either DTC PU0073 or DTC U0100 set?	Go to Step 3	Check for an intermittent fault in the circuit, refer to 8A Electrical-Body and Chassis
3	Using Tech 2, attempt to communicate with the PIM. Does the PIM failed to communicate?	Refer to the 6E1 Powertrain Interface Module – V6	Go to Step 4
4	Are DTCs also set in the PIM?	Refer to 6E1 Powertrain Interface Module – V6	Go to Step 5
5	Replace the TCM, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing. Was the repair completed?	Go to Step 6	—
6	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the serial data communication circuit – TCM DTCs fail this ignition cycle?	Go to Step 2	Go to Step 78
7	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			



F03L100003

Removal

- Jack up the rear axle and place chassis stands under the frame near the front end of the rear spring brackets.

Note:

- **Be careful not to stretch the flexible brake hose or parking brake cable.**
- **Support the vehicle on the specified jack point.**

1. Remove the parking brake cable from the leaf spring.
2. Loosen the shock absorber fixing nut and remove the nut and special washer from the lower clamp.
3. Remove the shock absorber fixing nut and washer at frame side.
4. Lifting the rear axle using a jack, remove the shock absorber and lower the jack.
5. Remove the U bolt fixing nut.
6. Take out the U bolt, seat and lower clamp.
7. Support the leaf spring using a jack and remove the shackle pin fixing nuts.
8. Drive out the shackle pin, using a brass bar and hammer.
9. Remove the shackle plate and rubber bushings.
10. Remove the nut and drive out the shackle using a brass bar and hammer.
11. Remove the leaf spring.
12. Remove the bump rubber.

5 Electrical Specifications

5.1 Transmission Fluid Temperature (TFT) Sensor Specifications

Temperature	Minimum Resistance	Normal Resistance	Maximum Resistance	Signal
°C	Ω	Ω	Ω	Volts
-40	90636	100707	110778	5.00
-30	47416	52684	57952	4.78
-20	25809	28677	31545	4.34
-10	14558	16176	17794	3.89
0	8481	9423	10365	3.45
10	5104	5671	6238	3.01
20	3164	3515	3867	2.56

40	1313	1459	1605	1.10
50	876	973	1070	3.25
60	600	667	734	2.88
70	420	467	514	2.56
80	299	332	365	2.24
90	217	241	265	1.70
100	159	177	195	1.42
110	119	132	145	1.15
120	89.9	99.9	109.9	0.87
130	69.1	76.8	84.5	0.60
140	53.8	59.8	65.8	0.32
150	42.5	47.2	51.9	0.00

5.2 Range Reference

Range	Park	Reverse	Neutral	4				3			2		1	
Gear				1st	2nd	3rd	4th	1st	2nd	3rd	1st **	2nd	1st	2nd ***
Shift Solenoid A (1-2 Shift Solenoid)	ON*	ON*	ON*	ON	OFF	OFF	ON	ON	OFF	OFF	ON	OFF	ON	OFF
Shift Solenoid B (2-3 Shift Solenoid)	ON*	ON*	ON*	ON	ON	OFF	OFF	ON	ON	OFF	ON	ON	ON	ON
2-4 Band	-	-	-	-	A	-	A	-	A	-	-	A	-	A
Reverse Input Clutch	-	A	-	-	-	-	-	-	-	-	-	-	-	-

Range	Park	Reverse	Neutral	4				3			2		1	
Overrun Clutch	-	-	-	-	A	A	-	-	A	A	A	A	A	A
Forward Clutch	-	-	-	A	A	A	A	A	A	A	A	A	A	A
Forward Sprag Clutch Assembly	-	-	-	H	H	H	-	H	H	H	H	H	H	H
3-4 Clutch	-	-	-	-	-	A	A	-	-	A	-	-	-	-
Lo/Roller Clutch	-	-	-	H	-	-	-	H	-	-	H	-	H	-
Lo/Rev Clutch	A	A	-	-	-	-	-	-	-	-	-	-	A	-

A = Applied

H = Holding

ON = Solenoid is energised

OFF = Solenoid is de-energised

* Shift solenoid state is a function of the vehicles speed and may change if the vehicle speed increases sufficiently

** Manual shift from second to first gear is electronically prevented under normal operating conditions

*** Manual shift from first to second gear is only available above approximately 48 – 56 km/h

5.3 Transmission Fluid Pressure Manual Valve Position Switch Logic

Gear Selector Position	Signal A	Signal B	Signal C
Park/Neutral	Open 12 V	Closed 0 V	Open 12 V
Reverse	Closed 0 V	Closed 0 V	Open 12 V
Drive 4	Open 12 V	Closed 0 V	Closed 0 V
Drive 3	Open 12 V	Open 12 V	Closed 0 V
Drive 2	Open 12 V	Open 12 V	Open 12 V
Drive 1	Closed 0 V	Open 12 V	Open 12 V
Invalid	Closed 0 V	Open 12 V	Closed 0 V
	Closed 0 V	Closed 0 V	Closed 0 V

5.4 Transmission Range Switch Logic

Gear Selector Position	Signal A	Signal B	Signal C	Signal P
Park (P)	Closed 0 V	Open 12 V	Open 12 V	Closed 0 V
Reverse (R)	Closed 0 V	Closed 0 V	Open 12 V	Open 12 V
Neutral (N)	Open 12 V	Closed 0 V	Open 12 V	Closed 0 V
Drive 4 (OD)	Open 12 V	Closed 0 V	Closed 0 V	Open 12 V
Drive 3 (3)	Closed 0 V	Closed 0 V	Closed 0 V	Closed 0 V
Drive 2 (2)	Closed 0 V	Open 12 V	Closed 0 V	Open 12 V
Drive 1 (1)	Open 12 V	Open 12 V	Closed 0 V	Closed 0 V

5.5 Component Resistance

Component	Pass/Thru Pins	Resistance at 20°C	Resistance at 100°C	Resistance to Ground (Case)
Shift Solenoid A (1-2 Shift Solenoid Valve)	A, E	19 – 24 Ω	24 – 31 Ω	Greater than 250 kΩ
Shift Solenoid B (2-3 Shift Solenoid Valve)	B, E	19 – 24 Ω	24 – 31 Ω	Greater than 250 kΩ
TCC Solenoid Valve	T, E	21 – 26 Ω	26 – 33 Ω	Greater than 250 kΩ
TCC PWM Solenoid Valve	U, E	10 – 11 Ω	13 – 15 Ω	Greater than 250 kΩ
3-2 Shift Solenoid Valve	S, E	20 – 24 Ω	29 – 32 Ω	Greater than 250 kΩ
Pressure Control Solenoid Valve	C, D	3 – 5 Ω	4 – 7 Ω	Greater than 250 kΩ
*Transmission Fluid Temperature (TFT) Sensor	M, L	3088 – 3942 Ω	159.3 – 198.0 Ω	Greater than 10 MΩ
Vehicle Speed Sensor	A, B	1420Ω @ 25°C	2140 Ω @ 150°C	Greater than 10 MΩ

***:** The resistance of this device is necessarily temperature dependent and will therefore vary far more than any other device. Refer to 5.1 Transmission Fluid Temperature (TFT) Sensor Specifications.

5.6 Shift Solenoid Valve State and Gear Ratio

Gear	1-2 Shift Solenoid	2-3 Shift Solenoid	Gear Ratio
1	ON	ON	3.059:1
2	OFF	ON	1.625:1
3	OFF	OFF	1.000:1
4	ON	OFF	0.696:1

5.7 Line Pressure

Pressure Control Solenoid Current (Amp)	Approximate Line Pressure (PSI)
0.00	198 – 227
0.10	197 – 226
0.20	189 – 221
0.30	181 – 216
0.40	168 – 205
0.50	154 – 193
0.60	137 – 175
0.70	114 – 156
0.80	90 – 132
0.90	64 – 105
1.00	53 – 85
1.10	53 – 68

6 Special Tools

For a complete listing of all the special tools used for servicing the 4L60E hydra-matic automatic transmission, refer to 7C1 Automatic transmission – 4L60E – General Information.

7C4
Automatic Transmission – 4L60E – On-vehicle Servicing

ATTENTION

Before performing any service operation or other procedure described in this Section, refer to General Information Warnings, Cautions and Notes for correct workshop practices with regard to safety and/or property damage.

1 General Information

This Section describes the removal and reinstallation procedures of the four speed 4L60E hydra-matic automatic transmission as well as the service operations which can be performed with the transmission still fitted to the vehicle.

1.1 General Service Information

Description

The shift selector mechanism is linked to the transmission manual shaft with a selector cable. A heat protector is fitted over the neutral start and back-up switch and manual shaft select lever.

For rear wheel drive (RWD) vehicles an extension housing is fitted to the rear of the transmission case.
Four wheel drive (4WD) vehicles have an adaptor housing and transfer case fitted to the rear of the transmission case, for description and service operation refer to 7D Transfer Case and Adaptor Housing.

The four speed 4L60E hydra-matic automatic transmission is fitted with a filler tube, a breather hose and a vent pipe for hot fluid overflow.

The transmission fluid is driven through a cooler within the radiator via the cooler line/hose assemblies to maintain normal operating temperature.

Service Information

WARNING

Throughout the service operations within this Section, when handling retaining clips, using compressed air or cleaning fluids, wear safety equipment to avoid personal injury.

Refer to 7C1 Automatic Transmission – 4L60E – General Information for the following:

- information relating to mechanical and electrical operations,
- abbreviations, transmission specifications, special tools and torque wrench specifications,
- servicing, cleaning and inspection procedure recommendations.

It is essential to read and understand the General Information, Warnings, Cautions and Service Notes contained in that same Section, before any service operation is performed on the four speed 4L60E hydra-matic automatic transmission or any associated components.
Failure to comply with the procedures and service notes can affect the reliable and efficient operation of this automatic transmission.

1.2 WARNINGS, CAUTIONS and NOTES

This Section contains various WARNINGS, CAUTIONS and NOTE statements that you must observe carefully to reduce the risk of death or injury during service, repair procedures or vehicle operation. Incorrect service or repair procedures may damage the vehicle or cause operational faults. WARNINGS, CAUTION and NOTE statements are not exhaustive. GM HOLDEN LTD can not possibly warn of all the potentially hazardous consequences of failure to follow these instructions.

Definition of WARNING, CAUTION and NOTE Statements

Diagnosis and repair procedures in this Section contain both general and specific WARNING, CAUTION and NOTE statements. GM HOLDEN LTD is dedicated to the presentation of service information that helps the technician to diagnose and repair the systems necessary for proper operation of the vehicle. Certain procedures may present a hazard to the technician if they are not followed in the recommended manner. WARNING, CAUTION and NOTE statements are designed to help prevent these hazards from occurring, but not all hazards can be foreseen.

WARNING Defined

A WARNING statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in death or injury. A WARNING statement alerts you to take necessary action or not to take a prohibited action. If a WARNING statement is ignored, the following consequences may occur:

- Death or injury to the technician or other personnel working on the vehicle,
- Death or injury to other people in or near the workplace area, and / or
- Death or injury to the driver / or passenger(s) of the vehicle or other people, if the vehicle has been improperly repaired.

CAUTION Defined

A CAUTION statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in damage to or destruction of equipment, or corruption of data. If a CAUTION statement is ignored, the following consequences may occur:

- Damage to the vehicle,
- Unnecessary vehicle repairs or component replacement,
- Faulty operation or performance of any system or component being repaired,
- Damage to any system or components which depend on the proper operation of the system or component being repaired,
- Faulty operation or performance of any systems or components which depend on the proper operation or performance of the system or component under repair,
- Damage to fasteners, basic tools or special tools and / or
- Leakage of coolant, lubricant or other vital fluids.

NOTE Defined

A NOTE statement immediately precedes or follows an operating procedure, maintenance practice or condition that requires highlighting. A NOTE statement also emphasises necessary characteristics of a diagnostic or repair procedure. A NOTE statement is designed to:

- Clarify a procedure,
- Present additional information for accomplishing a procedure,
- Give insight into the reasons for performing a procedure in the recommended manner, and / or
- Present information that gives the technician the benefit of past experience in accomplishing a procedure with greater ease.

2 Maintenance Operations

2.1 Transmission Fluid

When adding or changing the transmission fluid, use only the recommended automatic transmission fluid, refer to 0B Maintenance and Lubrication.

For the automatic transmission fluid diagnosis, refer to 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis.

Transmission Fluid Colour

New transmission fluid is red in colour due to a dye that is added to the fluid so it can be distinguished from other oils and lubricants. The red dye is not permanent and as such, is not an indicator of the quality of the fluid.
As the vehicle is driven the transmission fluid will quickly look darker in colour and appear to be a light brown. A dark brown colour with a distinctively burnt odour may indicate fluid deterioration and the need for fluid replacement.

NOTE

A dark brown fluid colour observed, coupled with a reported delayed shift pattern may only indicate that fluid replacement is required. This is not a definite indication of a potential transmission failure.

Transmission Fluid Level

NOTE

Carry out this operation with the transmission at normal operating temperature (82 – 94°C), as the temperature greatly affects the fluid level.

1 Drive the vehicle for a distance of at least 25 km to bring the transmission up to normal operating temperature.

CAUTION

If the transmission is not at normal operating temperature and the correct procedure is not followed, the result could be a false reading of the fluid level on the transmission fluid indicator.

2 If the vehicle has been operated under any of the following conditions, switch the engine off and allow the transmission to cool for approximately thirty minutes:

- in high ambient temperatures above 32° C,
- at sustained high speeds,
- in heavy stop / start city traffic during hot weather, or
- towing.

3 Park the vehicle on level ground.

4 Move the gear selector to the Park position and apply the park brake.

5 Allow the engine to idle for 3 minutes with the accessories turned off.

6 Lift the locking lever (1) on the transmission fluid indicator, then remove the indicator from the filler tube (2) and check the fluid colour, condition and level.

CAUTION

Do not overfill the transmission. Overfilling can cause aeration resulting in fluid loss, shift complaints and possible damage to the transmission.

7 If the transmission fluid level is low, add only enough of the recommended fluid until its level shows onto the crosshatch hot area (3) of the fluid indicator.

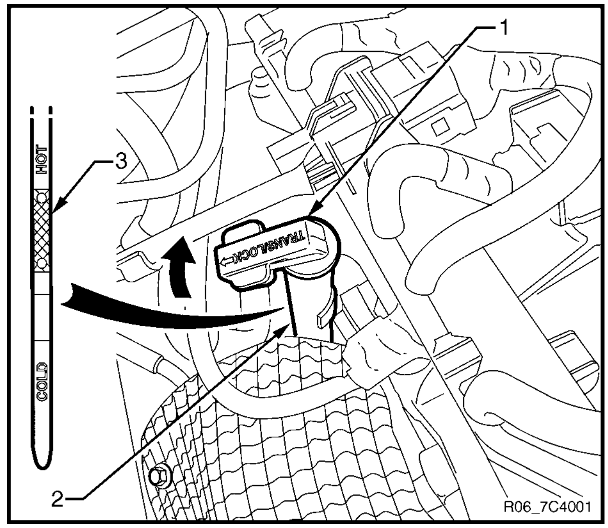

Figure 7C4 – 1

2.2 Reverse Flush and Flow Rate Test

It is essential to perform a reverse flush and oil cooler flow rate test after any of the following:

- the transmission is repaired or replaced,
- fluid contamination is suspected, or
- whenever the oil pump and/or torque converter is replaced.

NOTE

The reverse flush must be completed prior to conducting a flow rate test.

Reverse Flush

1 Disconnect both cooler hose/line assemblies at the transmission and at the radiator cooler, refer to 3.17 Transmission Cooler Line/Hose Assemblies.

2 Check the cooler hose/line to radiator cooler fittings for damage, replace as required.

WARNING

To avoid personal injury, wear safety glasses when using compressed air.

3 Carefully check the radiator cooler lower fitting to see if any foreign material is evident at this point. If foreign material is found, remove it with a suitable tool and/or compressed air at a reduced pressure of approximately 345 kPa blown in the reverse direction through the cooler.

4 Using compressed air at a reduced pressure of approximately 345 kPa blown in a reverse direction, clean the cooler hose/line assemblies.

5 Reconnect the cooler outlet line to the transmission and both cooler hose/line assemblies to the radiator cooler fittings, refer to 3.17 Transmission Cooler Line/Hose Assemblies.

NOTE

Do not reconnect the cooler inlet line at the transmission end. This line needs to be left disconnected to perform the flow rate test.

6 Perform the flow rate test, refer to Flow Rate Test in this Section.

INSPECTION AND REPAIR

Make correction or replace parts if wear, damage or abnormal conditions are found through inspection.

Visual Check

Inspect the following parts for wear, damage, nuts or other abnormal conditions.

- Leaf spring assembly
- Clip
- Center bolt
- U-bolt
- Spring pin
- Shackle pin
- Shock absorber
- Rubber bumper
- Rubber bushing
- Bump rubber seat

Shackle Pin

Shackle Pin diameter	mm (in)
17.93 - 18.00 (0.706 - 0.709)	

Spring Pin

Spring Pin Diameter	mm (in)
13.8 - 14.0 (0.543 - 0.551)	

Shock Absorber

Inspection operation of shock absorber

If no resistance is felt while expanding the shock absorber, it indicates that the absorber is faulty.

NOTE

This will also flush the cooler hose/line assemblies and cooler with transmission fluid.

7 If the flow rate is satisfactory, reconnect the cooler inlet line to the transmission, refer to 3.17 Transmission Cooler Line/Hose Assemblies.

8 Lower the vehicle, check and top up the transmission fluid to the correct level as required, refer to 2.1 Transmission Fluid.

Flow Rate Test

CAUTION

Do not run the engine any longer than absolutely necessary, as a fluid level too low can cause aeration and foaming.

1 Ensure the transmission fluid is at the recommended level or slightly above, refer to 2.1 Transmission Fluid.

2 Disconnect the cooler inlet line at the transmission quick-connect fitting, refer to 3.17 Transmission Cooler Line/Hose Assemblies.

3 Place a suitable size container underneath the disconnected cooler inlet line.

4 With the selector lever in the P position, start the engine and observe the fluid flow into the container after all the air bubbles have ceased and a steady flow is evident. Measure the flow rate over 20 seconds and ensure it is within the specification.

Transmission fluid flow rate specification per 20 Seconds:	
Temperature:	
Ambient	0.7 Litres
86° – 93° C	1.2 Litres

5 If the flow rate is less than the specification, the cause of the low flow rate must be located and rectified. Possible cause could include:

- restricted cooler within the radiator tank,
- kinked or damaged transmission cooler hose/line assemblies, or
- internal transmission fault such as a faulty pump.

6 Reinstall the cooler inlet line to the transmission quick-connect fitting, refer to 3.17 Transmission Cooler Line/Hose Assemblies.

3 Service Operations

3.1 Fluid Change and Filter Replacement

WARNING

To avoid personal injury take note of the following:

- **Avoid accidental hot oil spillage by performing fluid change only when the transmission fluid is cold.**
- **Wear safety glasses and gloves when using compressed air and cleaning fluids.**

Remove

1 Raise the vehicle and support in a safe manner, refer to 0A General Information.

2 Clean all dirt from around the oil pan and the transmission case.

3 Place a suitable sized drain tray under the transmission.

4 Hold the oil pan (1) in place and remove the oil pan bolts (2) from the front and both sides.

NOTE

Leave the three rear oil pan bolts in place.

5 Loosen the three rear oil pan bolts by about 4 turns each. While still supporting the oil pan, lightly tap the sides with a rubber hammer to break the gasket (3) seal.

6 Lower the front of the oil pan and drain the fluid into a suitable container.

7 Remove the three remaining rear bolts and the oil pan from the transmission.

8 Remove the oil pan gasket and discard.

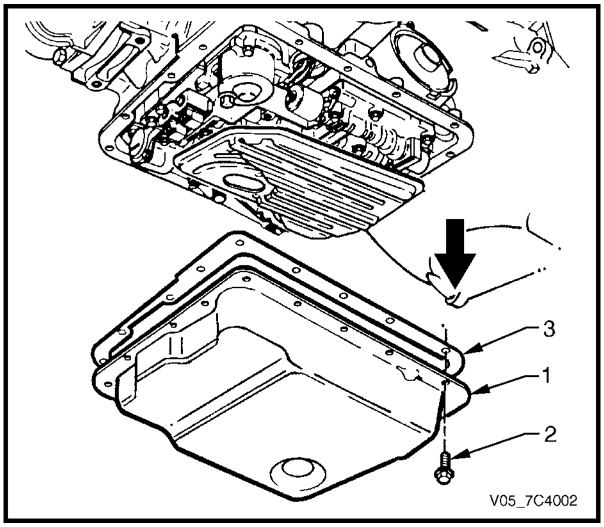

Figure 7C4 – 2

9 Remove the oil filter (1) by pulling down while twisting the filter and remove it from the transmission.

10 Open the filter by prising the metal crimping away from the top of the filter and pull it apart.

11 Inspect the filter material for particles that may indicate evidence of a potential transmission problem. Examples of the type of material are:

- clutch friction material,
- bronze slivers, indicating bush wear and
- steel particles.

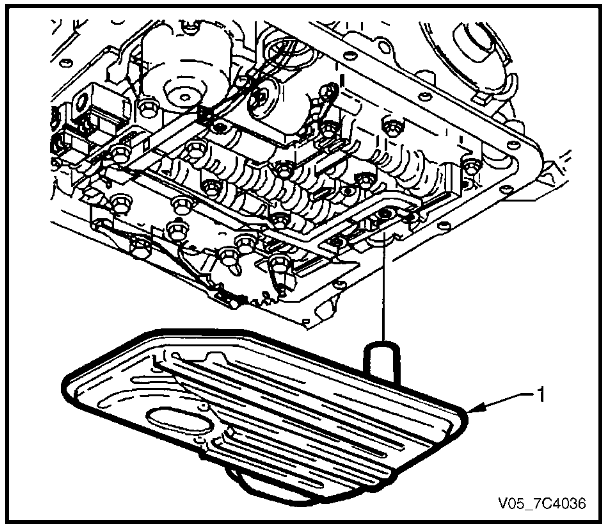

Figure 7C4 – 3

CAUTION

Take care not to scratch the oil pump bore, as fluid leakage could occur from this point or the pump may suck in air, causing the fluid to aerate.

12 Using suitable circlip pliers (1) or a two legged puller and slide hammer, remove the oil filter seal (2) taking care not to scratch the oil pump bore (3) during the process. Discard the seal.

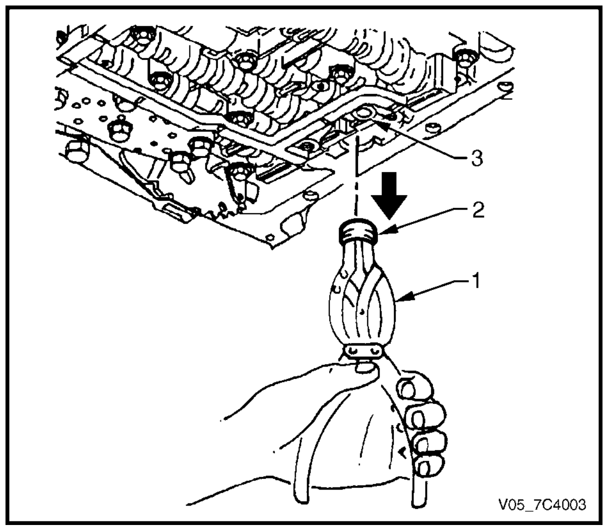

Figure 7C4 – 4

Reinstall

1 Clean the oil pan in a commercially available cleaning fluid and blow dry using compressed air.

NOTE

Ensure all traces of the old gasket are removed from the transmission and oil pan.

2 Wipe the transmission case gasket mating surface with a clean lint free cloth.

3 Lubricate a new oil filter seal (1) with clean transmission fluid and install into the oil pump bore (2) using a suitable sized socket or piece of tubing.

4 Install a new filter into the transmission case.

5 Check if the magnet is functional and located in the designated position in the oil pan. Install a new gasket and reinstall the oil pan.

6 Tighten the bolts attaching the oil pan to the correct torque specification.

Oil pan attaching bolt torque specification	12.0 Nm

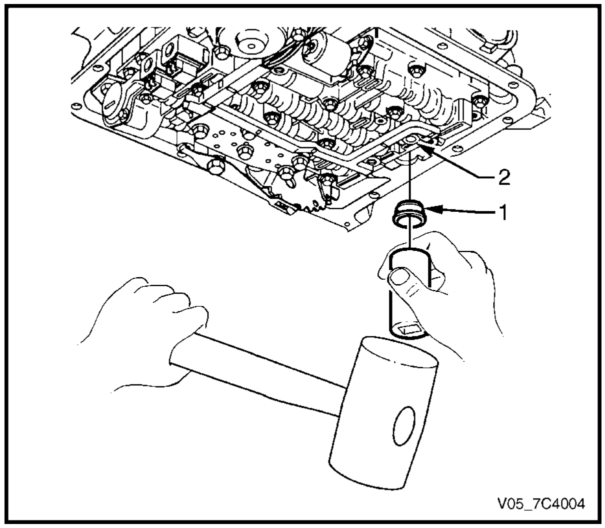

Figure 7C4 – 5

7 Lower vehicle and add approximately 4.8 litres of automatic transmission fluid.

8 Operate the vehicle for about 24 km or until normal transmission operating temperature is reached, refer to 2.1 Transmission Fluid.

9 Ensure there are no fluid leaks from the oil pan area, rectify as required.

10 Check and top up the transmission fluid to the correct level as required, refer 2.1 Transmission Fluid.

3.2 Shift Selector Assembly

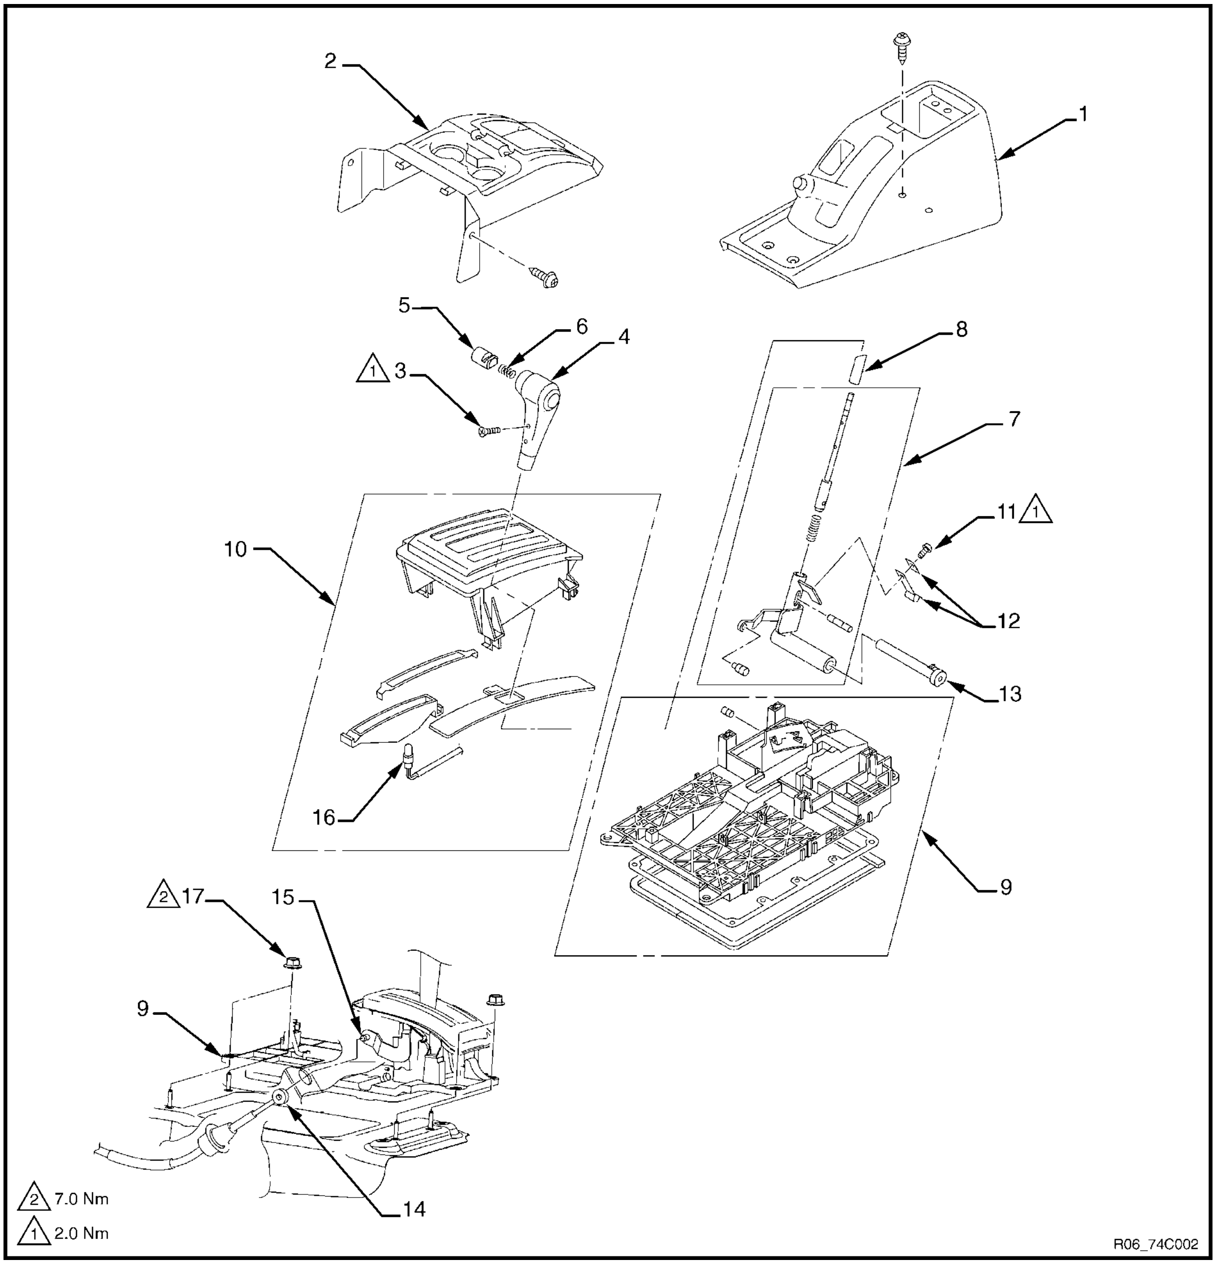

Figure 7C4 – 6

Legend

1	Rear Console	7	Selector Lever Assembly	13	Grooved Pin
2	Front Console	8	Sleeve	14	Selector Cable
3	Screw – Knob	9	Base Plate	15	Selector Lever Linkage
4	Knob	10	Upper Housing Assembly	16	Lamp
5	Button – Knob	11	Screw – Spring Plate	17	Nut – Base Plate
6	Spring – Knob	12	Spring Plate		

Remove

1 Remove the front and rear console, refer to 10 Cab.

2 Position the transmission selector lever to the N position.

3 Remove the screw (3), two places, attaching the selector lever knob (4), refer to Figure 7C4 – 6.

4 Remove the knob together with the button (5) and spring (6) from the selector lever assembly (7).

5 Turn the sleeve (8) counter clockwise to remove it, make note of the number of turns required to free it.

6 Remove the harness connectors from the base plate (9).

7 Remove the upper housing (10) which is held in place by four latched fasteners.

8 Remove the attaching screw (11) and spring plate (12).

9 Remove the grooved pin (13).

10 Using a small flat blade screwdriver, gently prise the upper end of the selector cable (14) from the pin on the selector lever linkage (15).

11 Remove the selector lever assembly by pressing the rod down (lever in the N position).

12 If required, remove the lamp (16) from its socket by aligning the groove in the socket and the protruding part of the lamp.

13 If required, remove the nut (17), four places, and the shift selector base plate.

Reinstall

1 Apply MULTEMP No 2 grease, or equivalent to the selector lever as indicated in Figure 7C4 – 7.

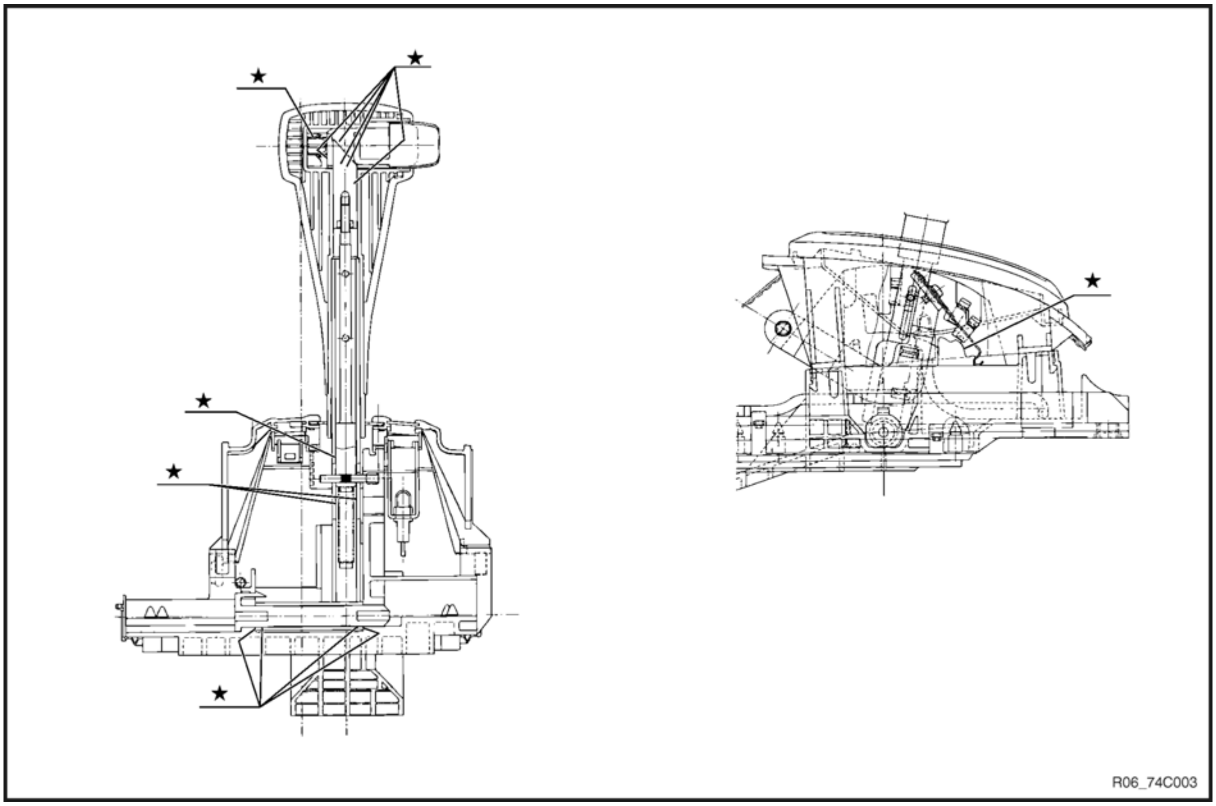

Figure 7C4 – 7

2 If required, install the shift selector base plate (9) and tighten the nut (17), four places, to the correct torque specification, refer to Figure 7C4 – 6.

Shift selector base plate attaching nut torque specification ....7.0 Nm

3 Install the selector lever assembly (7) to the base plate:

a insert and secure the rod,

b insert the paw led end of the selector lever linkage (15) into the base plate hole,

c attach the end of the selector cable to the pin on the selector lever linkage, d Install the grooved pin (13) in the selector lever.

4 Insert the grooved pin in the base plate détente groove until it touches the front wall. The selector lever is in the N position.

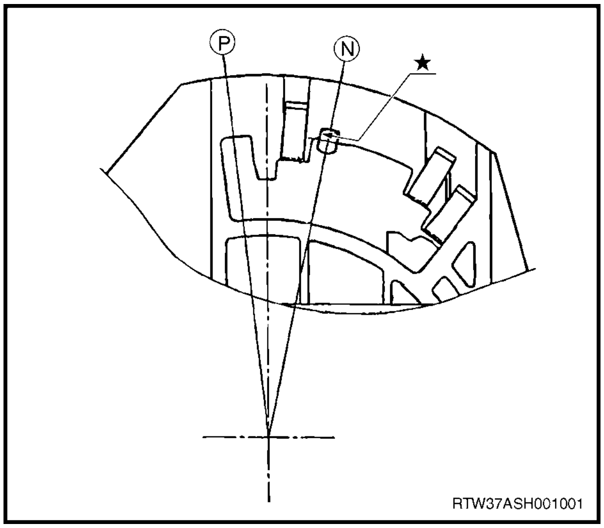

Figure 7C4 – 8

5 Install the spring plate (12) and tighten the screw (11) to the correct torque specification, refer to Figure 7C4 – 6.

Spring plate attaching screw torque specification ....2.0 Nm

6 With the selector lever knob temporarily installed, ensure the grooved pin of the selector lever moves smoothly in the base plate détente groove.

7 Temporarily install the sleeve (8).

8 If previously removed, install the lamp (16) by aligning the groove in the socket and the protruding part of the lamp and rotate the lamp 90 degrees clockwise.

9 Attach the harness connectors to the base plate.

10 Position the transmission selector lever to the P position.

11 Install the sleeve (8) by rotating it clockwise the same number of turns as noted on removal.

12 Fit the upper housing (10) over the selector lever assembly, do not secure at this stage.

13 Install the knob (4) together with the button (5) and spring (6) to the selector lever assembly.

14 Adjust the clearance (2) between the base plate détente groove and the grooved pin by moving the selector lever knob sleeve (1).

Base plate détente groove and grooved pin clearance............................... 0.2 – 1.0 mm

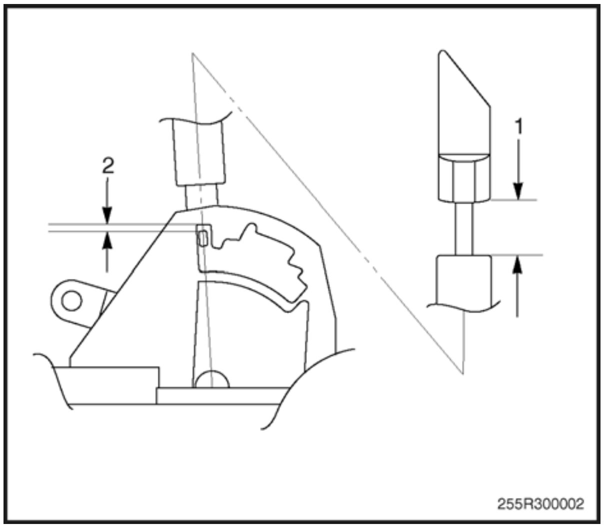

Figure 7C4 – 9

15 Install the screw (3), two places, attaching the knob and tighten to the correct torque specification, refer to Figure 7C4 – 6.

Selector lever knob attaching screw torque specification ....2.0 Nm

16 Secure the upper housing (10) to the base plate with the four latched fasteners.

17 Install the front and rear console, refer to 10 Cab.

3.3 Selector Cable Assembly

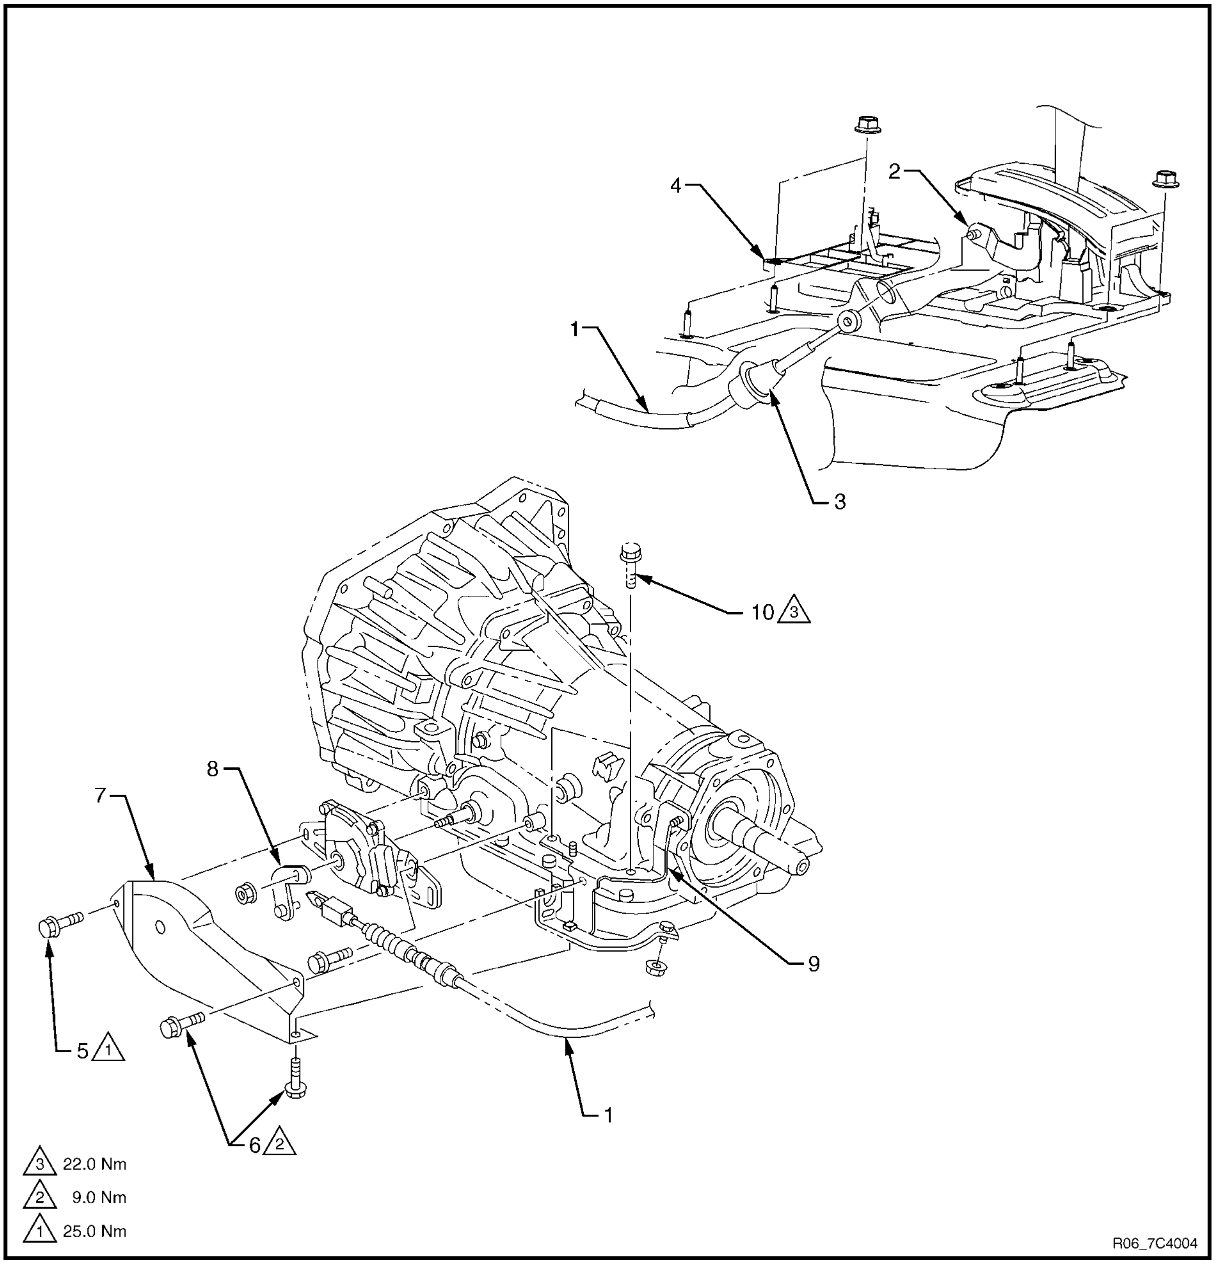

Figure 7C4 – 10

Legend

1	Selector Cable	6	Screw – Heat Shield
2	Selector Lever Linkage	7	Heat Shield
3	Retaining Pawl – Selector Cable	8	External Manual Shaft Linkage
4	Shift Selector Base Plate	9	Bracket
5	Screw – Heat Shield	10	Bolt – Bracket

Remove

1 Remove the front and rear console, refer to 10 Cab.

2 Position the transmission selector lever to the N position.

3 Using a small flat blade screwdriver, gently prise the upper end of the selector cable (1) from the pin on the selector lever linkage (2), refer to Figure 7C4 – 10.

4 Press on the selector cable retaining pawl (3) to remove the cable from the shift selector base plate (4).

5 Raise the vehicle and support in a safe manner, refer to 0A General Information for the location of support points.

6 Remove the three attaching screws (5 and 6) and the heat shield (7).

7 Using a small flat blade screwdriver, gently prise the transmission end of the selector cable from the transmission external manual shaft linkage (8).

8 Remove the clip and selector cable from the bracket (9).

9 Pull the selector cable free from the bottom of the vehicle.

10 If required, remove the two attaching bolts (10) and the selector cable bracket.

Reinstall

1 Install the selector cable (1) toward the inside of the cabin from under the vehicle, refer to Figure 7C4 – 10.

2 Push the end of the selector cable into the shift selector base plate (4).

3 Attach the end of the selector cable to the pin on the selector lever linkage (2).

4 If required, install the selector cable bracket (9), tighten the two attaching bolts (10) to the correct torque specification.

Selector cable bracket attaching bolt torque specification ....22.0 Nm

5 Fit the selector cable to the bracket and install the clip on the marking of the selector cable.

6 Ensure the selector lever is in the N position.

7 Ensure the transmission external manual shaft linkage (8) is in the N position.

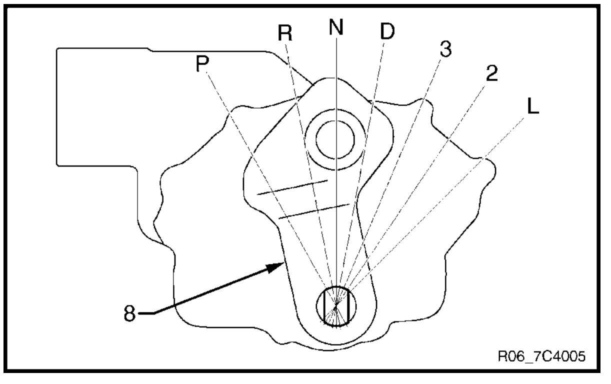

Figure 7C4 – 11

8 Slide the cover (3) in the direction shown by the arrow (1).

9 Using a small flat blade screwdriver, move the lock piece (4) from the position indicated by the arrow (2). Continue to move the lock piece until the adjuster (5) position begins to change.

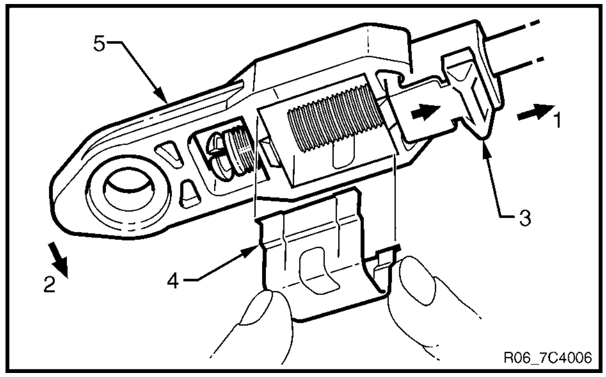

Figure 7C4 – 12

10 Connect the selector cable to the transmission external manual shaft linkage.

11 Insert the lock piece in the adjuster to engage with the serrated cable end (cable length adjustment).

12 Slide the cover (1) on the adjuster and secure the lock piece.

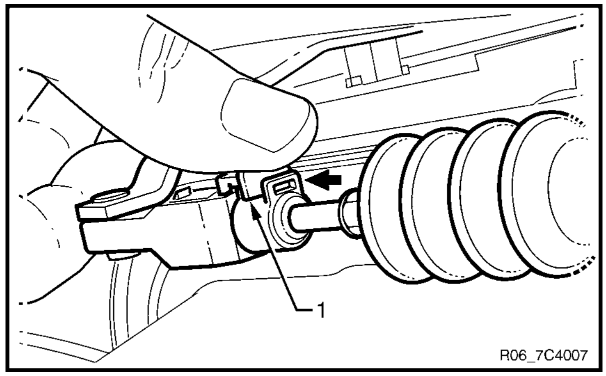

Figure 7C4 – 13

13 Install the heat shield (7) and tighten the attaching screws (1 and 6) to the correct torque specification, refer to Figure 7C4 – 10.

Heat shield front attaching screw torque specification	25.0 Nm
Heat shield rear attaching screw torque specification	9.0 Nm

14 Move the selector lever to the P position and press the selector lever knob button five times.

15 Ensure the selector lever moves smoothly to each of its positions.

16 Check if the shift position indicated by the selector lever and the actual shift position are the same, rectify if required.

17 Lower the vehicle to the ground. Ensure the engine can only be started with the transmission selector lever in Park or Neutral position and the back-up lamps work correctly. If required, adjust the neutral start and back-up lamp switch, refer to 3.4 Neutral Start and Back-up Lamp Switch.

18 Ensure the gear selection operates correctly.

19 Install the front and rear console, refer to 10 Cab.

3.4 Neutral Start and Back-up Lamp Switch

Remove

1 Position the transmission selector lever to the P position.

2 Raise the vehicle and support in a safe manner, refer to 0A General Information for the location of support points.

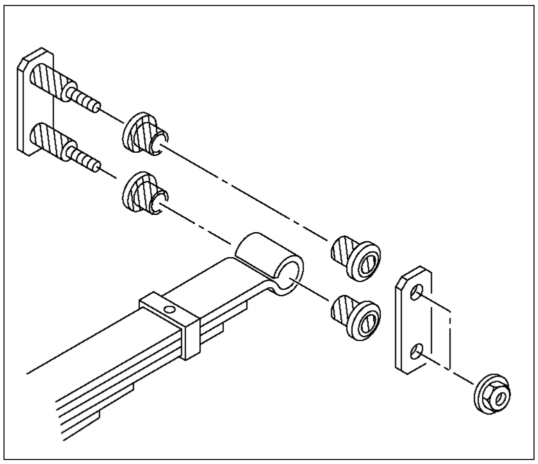
Installation

1. Install the bump rubber and bolt and tighten it to the specified torque.

Torque	N·m (kgf·m/lb·ft)
42 (4.3/31)	

2. Install the leaf spring.
   - The leaf spring assembly should be installed so that the built-in rubber bush is toward the front.
   - Align the holes of the spring eye and frame bracket.
   - Insert the spring pin toward vehicle inner side, through the frame bracket holes and the spring bush hole.
   - Tighten the nut a little and, after the vehicle is lowered, tighten it to the specified torque.

Torque	N·m (kgf·m/lb·ft)
152 (15.5/112)	

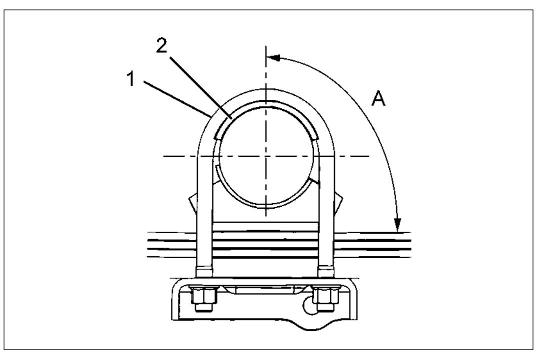


RTW340LF000101

   - Apply rubber grease to inside and outside of the rubber bushing.
   - Install the rubber bushings into the hole in the frame side bracket and the spring rear eye.
   - Install the shackle pin and shackle plate.
   - Tighten the nuts a little and, after vehicle is lowered, tighten it to the specified torque.

Torque	N·m (kgf·m/lb·ft)
98 (10.0/72)	

3. Support the lower clamp under the leaf spring.
4. Apply oil to the thread portion of U bolt.
   Install the U bolt (1) and seat (2) on the rear axle and insert the U bolt in the lower clamp holes.



RTW63DSH000101

Tolerance of assembling the seat

A
90° ±2°

5. Tighten the nut to the specified torque.
NOTE: Apply oil to the thread.

Torque	N·m (kgf·m/lb·ft)
78 (8.0/58)	

6. Install the shock absorber and inner washer on the lower clamp pin and frame side pin.
7. Install the washer and nut on the frame side pin and tighten the nut to the specified torque.

Torque	N·m (kgf·m/lb·ft)
39 (4.0/29)	

8. Install the washer and nut on the lower clamp pin and tighten the nut to the specified torque.

Torque	N·m (kgf·m/lb·ft)
39 (4.0/29)	

3 Remove the three attaching screws (1 and 2) and the heat shield (3).

4 Hold the transmission manual shaft linkage (4) with an adjustable wrench and remove the linkage attaching nut (5).

5 Carefully remove the manual shaft linkage and selector cable from the transmission manual shaft (6).

6 Prise the connector position assurance (CPA) securing pin (7) from the neutral start and back-up lamp switch (8) taking care not to break the pin in the process. Disconnect the connector (9) from the switch assembly by pulling down the release bar (10).

NOTE

The connector will automatically disconnect at the same time the release bar is withdrawn.

7 Remove the attaching screw (11) and slide the switch assembly over the transmission manual shaft to remove it.

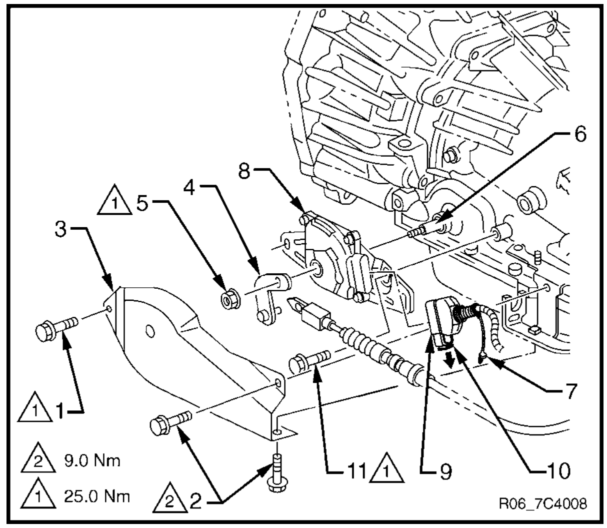


Figure 7C4 – 14

Reinstall

1 Slide the neutral start and back-up lamp switch (8) over the transmission manual shaft (6) and reinstall the two attaching screws (1 and 11), tighten them finger tight until the adjustment process has been completed, refer to Figure 7C4 – 14.

2 Install the manual shaft linkage (4) and the attaching nut (5). Hold the linkage with an adjustable wrench and tighten the nut to the correct torque specification.

Manual shaft linkage attaching nut torque specification ....25.0 Nm

3 Install the connector (9) but do not reinsert the CPA securing pin (7) at this stage.

4 Check the shift selector linkage operation and adjust as required, refer to 3.2 Shift Selector Assembly.

5 Check and adjust as required the neutral start and back-up lamp switch as described in this Section, refer to Adjust.

Adjust

1 Raise the vehicle and support in a safe manner, refer to 0A General Information for the location of support points.

2 If required, loosen the neutral start and back-up lamp switch (8) as follows, refer to Figure 7C4 – 14:

a Remove the three attaching screws (1 and 2) and the heat shield (3).

b Prise the connector position assurance (CPA) securing pin (7) from the neutral start and back-up lamp switch taking care not to break the pin in the process.

c Disconnect connector (9) from the switch assembly by pulling down the release bar (10).

NOTE

The connector will automatically disconnect at the same time the release bar is withdrawn.

d Loosen the screw (11) attaching the switch and refit the front screw (1) keep them finger tight.

e Reinstall the connector (9) but do not reinsert the CPA securing pin at this stage.

3 Rotate the neutral start and back-up lamp switch back and forth until a central position is attained and then lightly tighten the front screw (1) to prevent the switch from rotating.

WARNING

Ensure the four wheels are off the ground before performing the starting test.

4 With the ignition switched to the ON position, check if the engine can only be started in the Park and Neutral shift selector positions and ensure the back-up lamps illuminate when Reverse is selected. A further minor adjustment may be required to achieve this state.

NOTE

To gain access to the rear attaching screw (11) it will be necessary to remove the connector.

5 After the switch has been adjusted, tighten the rear attaching screw (11) to the correct torque specification.

Neutral start and back-up lamp switch attaching screw torque specification	25.0 Nm

6 Reinstall the connector and the CPA securing pin.

7 Remove the switch front attaching screw (1).

8 Install the heat shield (3) and tighten the attaching screws (1 and 2) to the correct torque specification.

Heat shield front attaching screw torque specification	25.0 Nm
Heat shield rear attaching screw torque specification	9.0 Nm

9 Lower the vehicle to the ground and re-check the operation of the neutral start and back-up lamp switch. The vehicle must start only with the shift selector in the Park or Neutral positions and the back-up lamps should only illuminate when Reverse is selected.

3.5 Vehicle Speed Sensor

NOTE

For the speed sensor fitted to four wheel drive vehicles (4WD), refer to 7D Transfer Case and Adaptor Housing.

Remove

1 Raise the vehicle and support in a safe manner, refer to 0A General Information for the location of support points.

2 Disconnect connector (1) from the vehicle speed sensor (2).

3 Remove the bolt (3) attaching the speed sensor to the transmission extension housing.

4 With a pulling and turning motion, remove the speed sensor and O-ring seal (4) from the transmission extension housing, discard the O-ring.

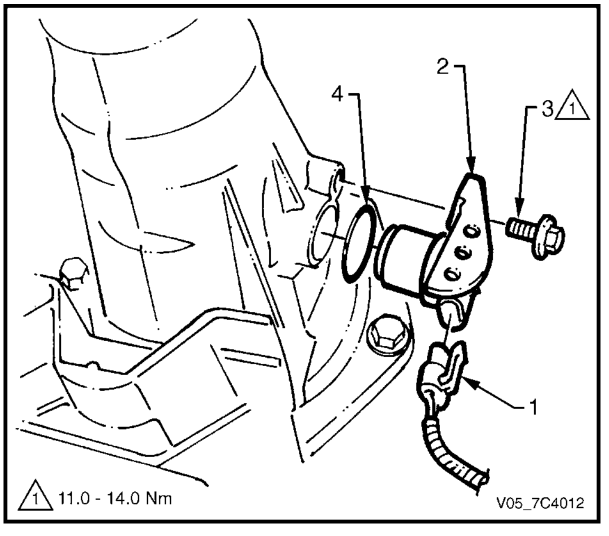

Figure 7C4 – 15

Reinstall

1 Lubricate a new O-ring seal with petroleum jelly and install it to the vehicle speed sensor.

2 Install the speed sensor to the transmission extension housing.

3 Install the attaching bolt and tighten to the correct torque specification.

Vehicle speed sensor attaching bolt torque specification .... 12.0 Nm

4 Connect the connector to the speed sensor.

5 Lower the vehicle to the ground.

3.6 Manual Shaft Oil Seal

Replace

NOTE

This procedure requires the use of special tool No. AU583.

1 Raise the vehicle and support in a safe manner, refer to 0A General Information for the location of support points.

2 Remove the neutral start and back-up lamp switch, refer to 3.4 Neutral Start and Back-up Lamp Switch.

3 Assemble the seal remover, Tool No. AU583-3 (1) by installing the remover nut, Tool No. AU583-4 (2) with its threaded inner diameter closest to the hexagonal head of the seal remover tool. Install the nut up to the hexagonal head.

4 Install the assembled seal remover tool over the manual shaft (3) engaging the tapered thread end (4) into the seal.

CAUTION

Do not over tighten the seal remover tool in the seal.

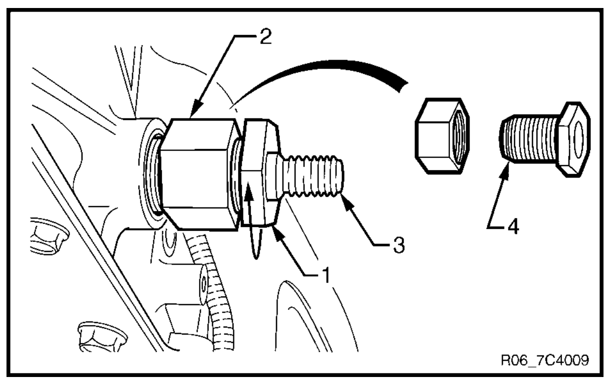

Figure 7C4 – 16

5 Rotate the hexagonal head of the seal remover tool clockwise, until the thread grips the steel shell of the seal.

6 While holding the hexagonal head of the seal remover tool (1) rotate the remover nut (2) clockwise, until it contacts the transmission case.

7 Continue rotating the remover nut until the seal is pulled into the remover nut cavity.

8 Remove and discard the seal.

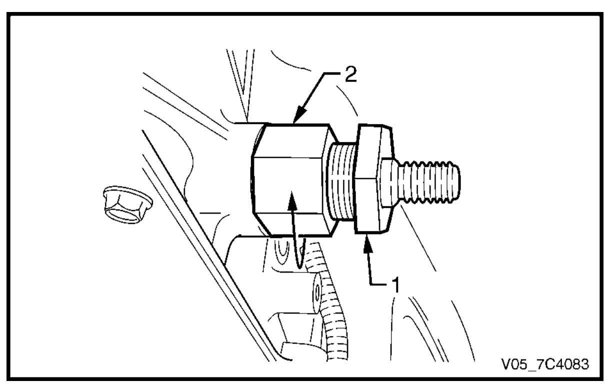

Figure 7C4 – 17

9 Install the seal protector, Tool No. AU583-1 (1) into one of the two plastic seal installers, Tool No. AU583-2 (2).

NOTE

Two plastic seal installers are required because of the restricted space between the end of the manual shaft and the floor pan.

10 Lubricate the lip of a new seal (3) with clean automatic transmission fluid and install it over the seal protector sleeve, with the steel casing facing the installer tool.

11 Install the seal protector with the new seal and installer tool over the manual shaft (4) and up to the transmission case.

CAUTION

If the seal protector sleeve jams on the manual shaft, the flats on the shaft locating the selector lever will be burred. Use a fine file to remove any burrs and then proceed.

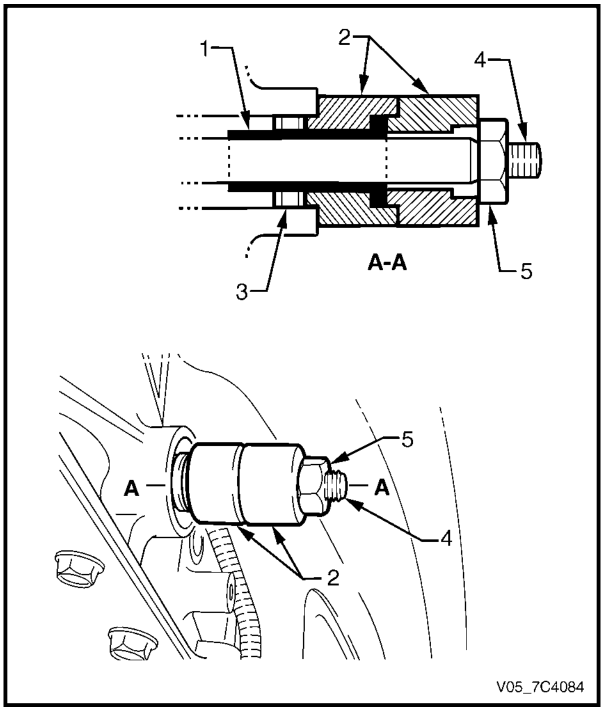

Figure 7C4 – 18

12 Fit the second plastic seal installer over the manual shaft until it seats against the first installer.

13 Install the manual shaft linkage attaching nut (5) and tighten it to drive the seal in position into the transmission case.

14 Remove the seal installer and protector tools from the manual shaft.

15 Reinstall the neutral start and back-up lamp switch, refer to 3.4 Neutral Start and Back-up Lamp Switch.

16 Lower the vehicle to the ground and as required, check and top up the automatic transmission fluid level, refer to 2.1 Transmission Fluid.

3.7 Transmission Support and Mount

Remove

1 Raise the vehicle and support in a safe manner, refer to 0A General Information for the location of support points.

2 Support the transmission with a Jack, do not place the support underneath the extension housing or the oil pan, refer to Figure 7C4 – 19.

3 Remove the clip (1) holding the fuel feed and fuel vapour lines on the transmission support (2).

4 Remove the bolt (3) attaching the heat shield (4) to the transmission support.

5 Remove the two nuts (5) attaching the transmission mount to the support.

6 Remove the four bolts and nuts (6) attaching the transmission support to the under body side rails and remove the support.

7 If required, remove the two bolts (7) attaching the transmission mount (8) to the extension housing and remove the mount.

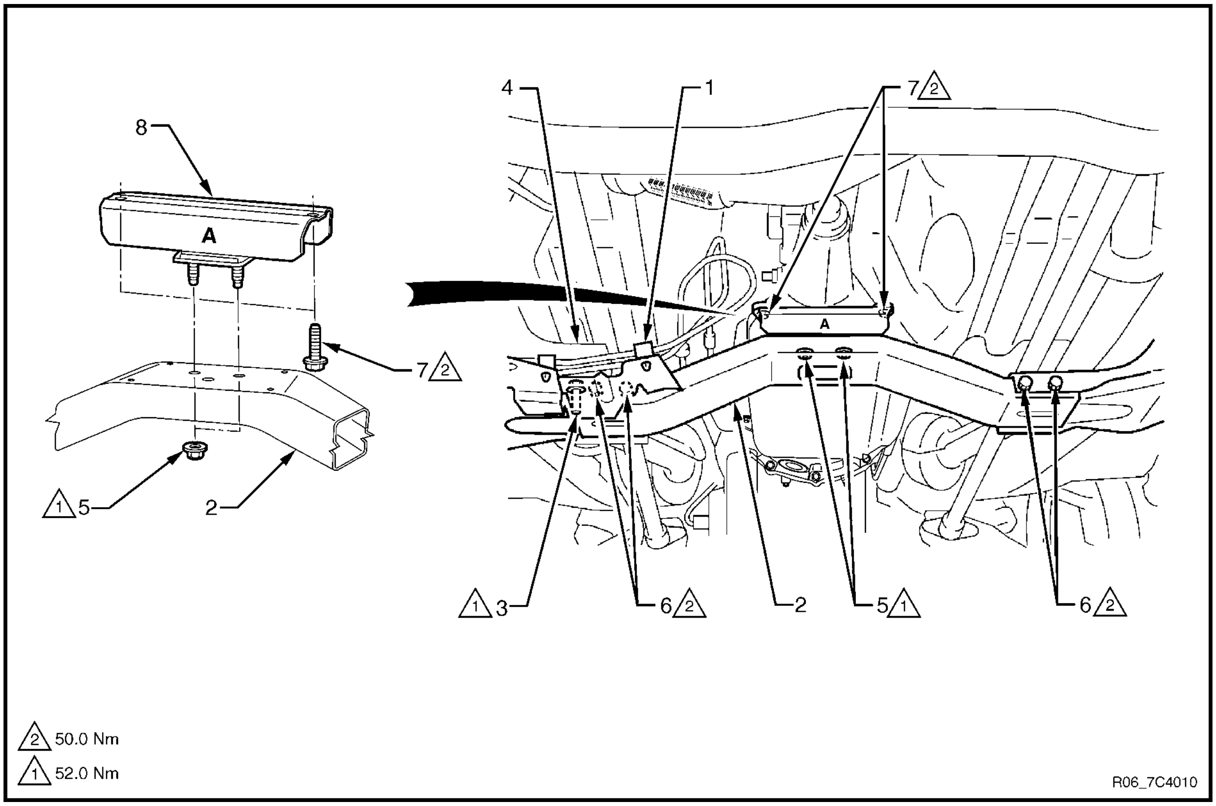

Figure 7C4 – 19

Legend

1	Fuel Feed and Vapour Lines Clip	5	Transmission Mount Nuts
2	Transmission Support	6	Transmission Support Bolts
3	Heat Shield Bolt	7	Transmission Mount Bolts
4	Heat Shield	8	Transmission Mount

Reinstall

1 If required, install the transmission mount (8) onto the extension housing, tighten the two attaching bolts (7) to the correct torque specification, refer to Figure 7C4 – 19.

Transmission mount attaching bolt torque specification ....50.0 Nm

2 Install the transmission support (2) to the under body side rails and tighten the four attaching bolts and nuts (6) to the correct torque specification.

Transmission support attaching bolt and nut torque specification ....50.0 Nm

3 Install and tighten the transmission mount two attaching nuts (5) to the correct torque specification.

Transmission mount attaching nut torque specification.....................................52.0 Nm

4 Install the bolt (3) attaching the heat shield (4) to the transmission support, tighten to the correct torque specification.

Heat shield to transmission support attaching bolt torque specification......................52.0 Nm

5 Reinstall the clip (1) holding the fuel feed and fuel vapour lines on the transmission support.

6 Lower the vehicle to the ground.

3.8 Extension Housing Oil Seal, RWD

Replace

1 Raise the vehicle and support in a safe manner, refer to 0A General Information for the location of support points.

2 Remove the rear propeller shaft, refer to 4A Propeller Shaft.

3 Place a suitable size drip tray underneath rear of transmission.

CAUTION

Take care not to scratch the machined seal recess in the extension housing as transmission fluid may weep past the outer diameter of the installed seal.

4 Using the seal remover, Tool No. E308 (1) or equivalent, prise the oil seal (2) from rear of the extension housing (3) and discard the seal.

5 Thoroughly clean around the seal bore in the extension housing and ensure there are no burrs.

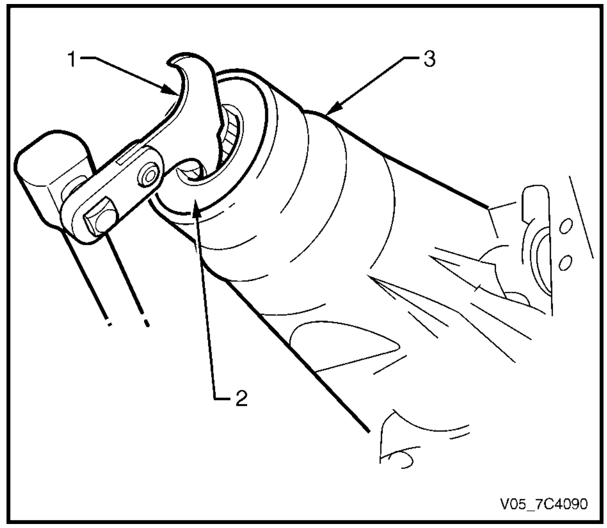

Figure 7C4 – 20

6 Use the seal installer, Tool No. J21426 (1) and a soft faced hammer to tap a new oil seal (2) into place in the extension housing (3).

7 Install the rear propeller shaft, refer to 4A Propeller Shaft.

8 Lower the vehicle to the ground and check the fluid level, refer to 2.1 Transmission Fluid.

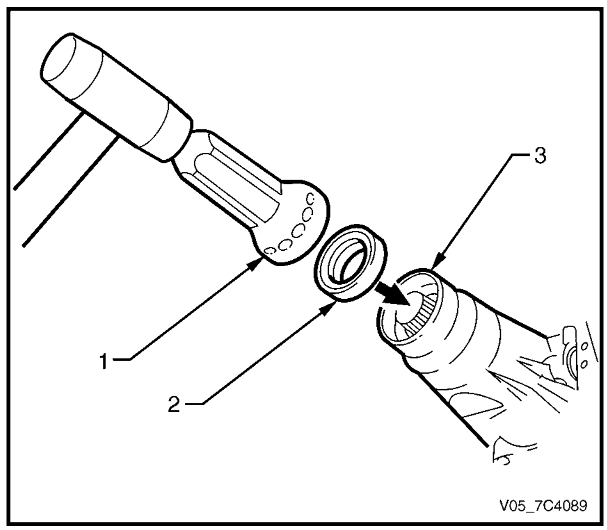

Figure 7C4 – 21

3.9 Extension Housing and Rear Bush, RWD

Remove

1 Raise the vehicle and support in a safe manner, refer to 0A General Information for the location of support points.

2 As required, remove the following components:

a Rear propeller shaft, refer to 4A Propeller Shaft.

b Transmission support and mount assembly, refer to 3.7 Transmission Support and Mount.

c Vehicle speed sensor, refer to 3.5 Vehicle Speed Sensor.

3 Remove the bolt (1), six places, attaching the extension housing (2) to the transmission case.

4 Remove the extension housing and seal (3) from the rear of the transmission case, discard the seal.

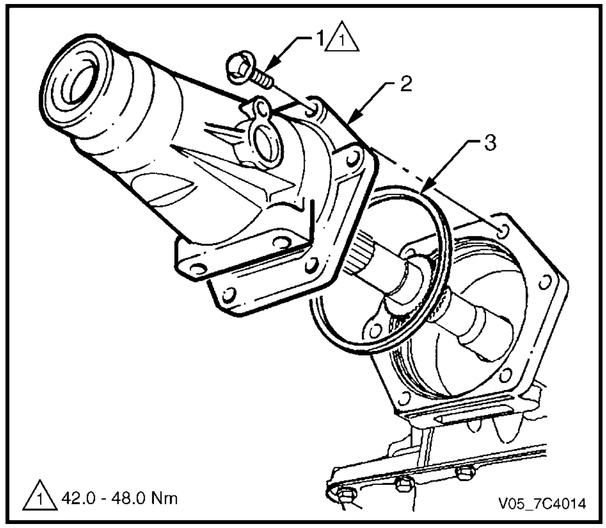

Figure 7C4 – 22

CAUTION

Take care not to scratch the machined seal recess in the extension housing as transmission fluid may weep past the outer diameter of the installed seal.

5 If the extension housing rear bush is to be replaced, remove the oil seal (1) from the extension housing (2), using a suitable removing tool such as Tool No. E308 and discard the seal.

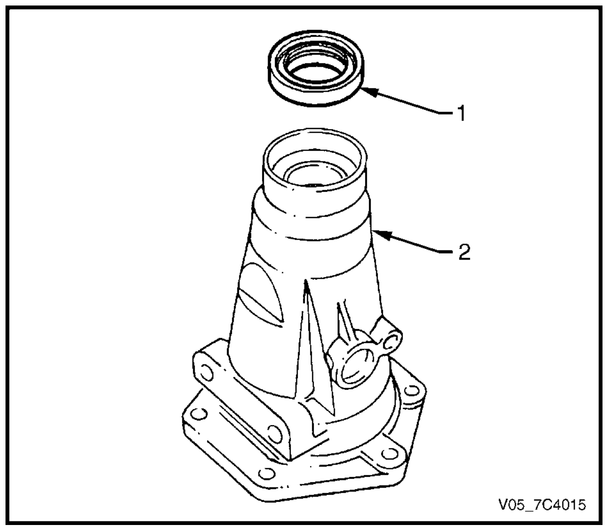

Figure 7C4 – 23

NOTE

Before removal, take note of the orientation of the split in the bush to assist in the replacement process.

6 If required, using the bush remover, Tool No. J23062-14 (1) and driver handle, Tool No. J8092 (2), press the bush (3) out of the extension housing (4) and discard.

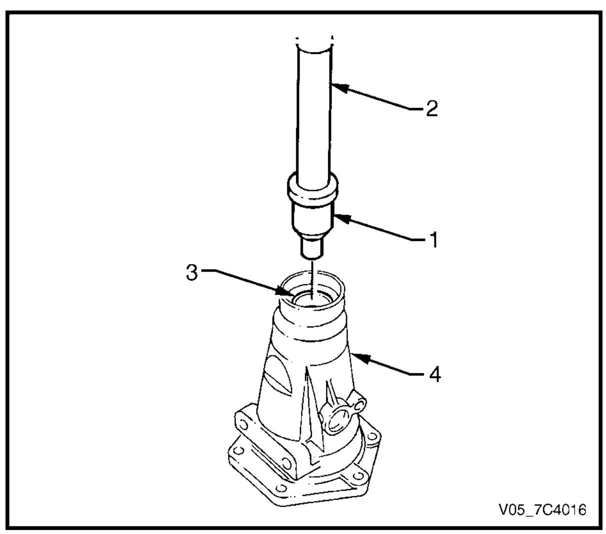

Figure 7C4 – 24

7 Lubricate the outside of a new bush with automatic transmission fluid to reduce the chance of material pick-up.

8 Ensure the split in the new bush (1) is in the same orientation as noted previously and Install it into the extension housing (2) using the installer tool, Tool No. J34196-4 (3) and driver handle, Tool No. J8092 (4).

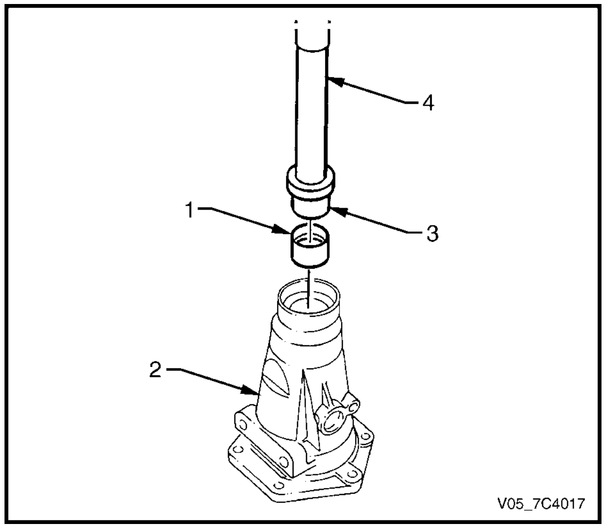

Figure 7C4 – 25

Reinstall

Installation of the extension housing is the reverse of the removal procedure, noting the following:

1 If required, install a new oil seal in the extension housing, refer to 3.8 Extension Housing Oil Seal.

2 Lubricate a new seal with clean automatic transmission fluid and fit to the extension housing mounting flange.

3 Tighten the six bolts attaching the extension housing to the correct torque specification.

Extension housing attaching bolt torque specification .... 42.0 – 48.0 Nm

3.10 Adaptor Housing, 4WD

Remove and Reinstall

For service operation of the transmission adaptor housing for 4WD vehicles, refer to 7D Transfer Case and Adaptor Housing.

3.11 Shift Solenoid Locations

Location and Identification

Legend

1. Transmission Fluid Pressure (TFP) Manual Valve Position Switch.
2. 1 – 2 Shift Valve Solenoid A.
3. 2 – 3 Shift Valve Solenoid B.
4. Pressure Control Solenoid (PCS).
5. Torque Converter Clutch Pulse Width Modulated (TCC PWM) Solenoid.
6. 3 – 2 Control Solenoid.

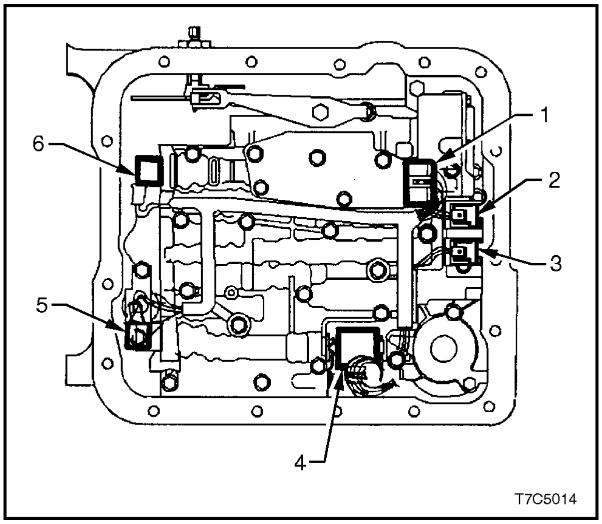

Figure 7C4 – 26

To service the TCC PWM solenoid, refer to 3.13 Control Valve Body Harness.

3.12 1 – 2 Accumulator Assembly

WARNING

Throughout this Section when using compressed air and cleaning fluids, wear safety glasses and gloves to avoid personal injury.

Remove

1. Remove the oil pan and filter, refer to 3.1 Fluid Change and Filter Replacement.
2. Remove the two short bolts (1) and one long bolt (2) attaching the accumulator cover (3) and remove the cover.
3. Using low pressure compressed air applied to the drilling in the cover, remove the 1 – 2 accumulator piston and seal assembly (4) and the two springs (5 and 6).
4. Remove the seal from the piston and discard the seal.

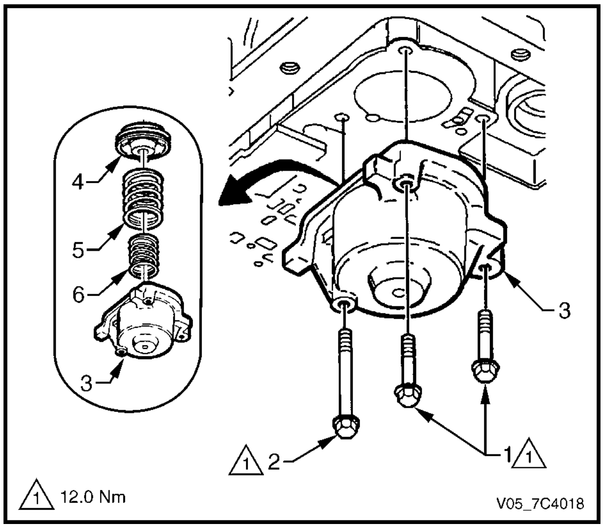

Figure 7C4 – 27

Clean and Inspect

1. Clean all components in a commercially available cleaning fluid and blow dry using compressed air.
2. Inspect the springs and ensure they are not distorted or broken, replace as required.
3. Inspect all machined surfaces for damage, wear or burrs.

Reinstall

Reinstallation of the 1 – 2 accumulator assembly is the reverse of the removal procedure, noting the following:

1. Lubricate a new seal with petroleum jelly and install it to the piston. Ensure the piston seal does not bind in the piston groove.
2. Tighten the three bolts attaching the accumulator cover to the correct torque specification.

1 – 2 Accumulator cover attaching bolt torque specification ....12.0 Nm

3.13 Control Valve Body Harness

Remove

1. Raise the vehicle and support in a safe manner, refer to 0A General Information for the location of support points.
2. As required, remove the oil pan and filter, refer to 3.1 Fluid Change and Filter Replacement.
3. Disconnect the control valve body harness connectors from all electrical components except the torque converter clutch (TCC) solenoid, which is hard wired. Connectors identification:
   - Transmission Fluid Pressure (TFP) Manual Valve Position Switch (1)
   - 1 – 2 Shift Valve Solenoid A (2)
   - 2 – 3 Shift Valve Solenoid B (3)
   - Pressure Control Solenoid (PCS) (4)
   - Torque Converter Clutch Pulse Width Modulated (TCC PWM) Solenoid (5)
   - 3 – 2 Control Solenoid (6).

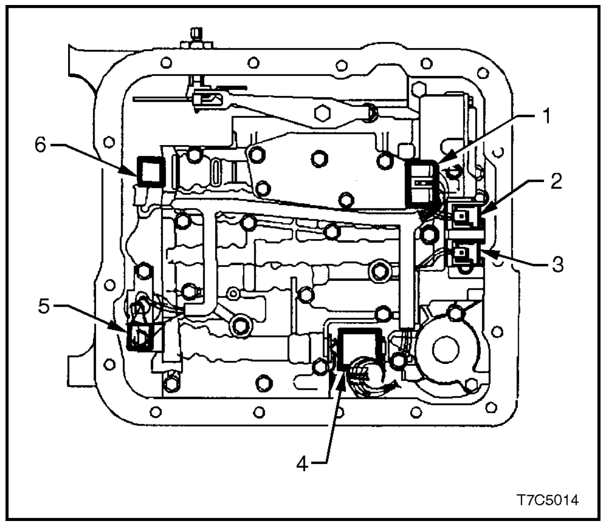

Figure 7C4 – 28

9. Install the parking brake cable on the leaf spring and tighten the nut at its bracket.

Torque	N·m (kgf·m/lb·in)
7 (0.7/61)	

CAUTION

To prevent personal injury, wear safety glasses when removing the clip.

NOTE

Note the following when removing the solenoid:

- If required, rotate the solenoid until the flat part of the clip becomes visible.
- The removal is only necessary to access the TCC solenoid attaching bolts.

4 Using a hooked piece of wire or a small flat blade screwdriver, remove the clip (1) retaining the TCC PWM solenoid (2).

5 With a twisting and pulling motion remove the TCC PWM solenoid from the control valve body, remove and discard the O-ring.

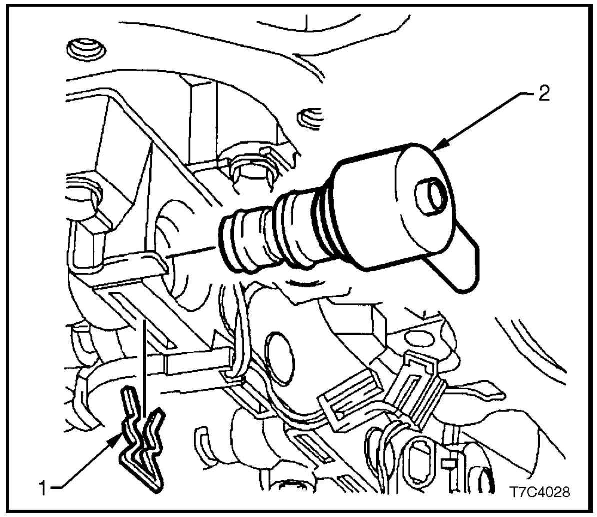

Figure 7C4 – 29

6 Remove the two bolts (1) attaching the TCC solenoid assembly (2) to the control valve body.

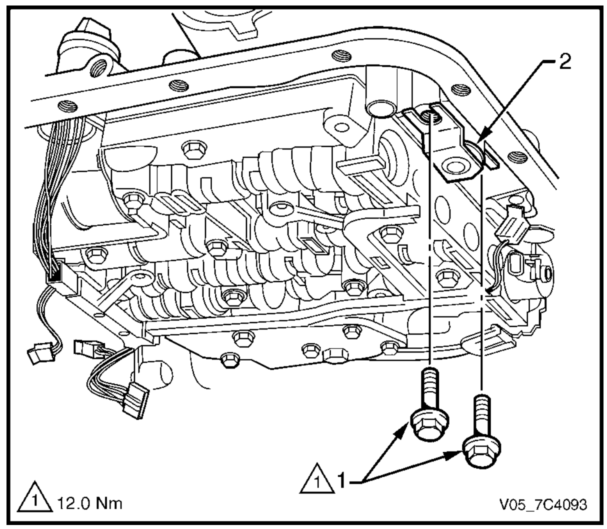

Figure 7C4 – 30

7 Withdraw the TCC solenoid assembly (1) from the control valve body (oil pump housing), remove and discard the O-ring.

8 Lower the harness (2) and TCC solenoid, allow it to hang from the pass-thru connector (3).

9 Remove the control valve body, refer to 3.14 Control Valve Body.

NOTE

This is necessary to provide clearance for the pass-thru connector to be removed.

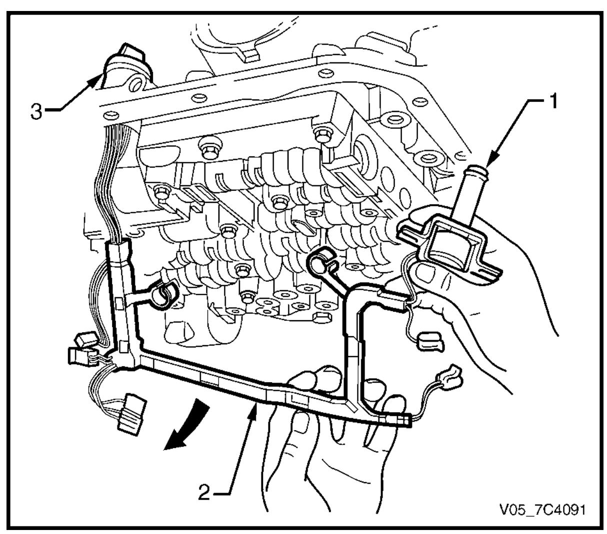

Figure 7C4 – 31

10 Lower the transmission to provide clearance between the floor pan and the pass-thru connector located at the right-hand rear of the transmission case.

11 Install the connector release, Tool No. 700-4208 (1) over the pass-thru connector and use hand force to push the tool down compressing the four retaining tangs on the connector.

12 Pull the pass-thru connector free from the transmission case and remove the control valve body harness and TCC solenoid assembly from the transmission.

13 Remove the O-ring from the pass-thru connector and discard.

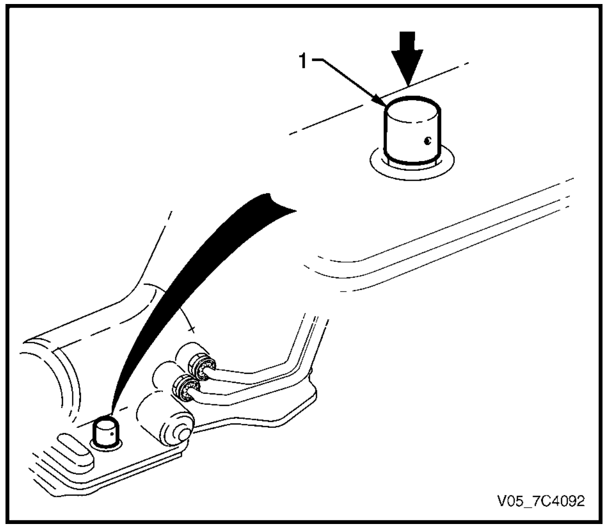

Figure 7C4 – 32

Reinstall

1 Lubricate a new O-ring with petroleum jelly and fit it to the pass-thru connector.

2 Reinstall the pass-thru connector up through the hole in the transmission case pushing it in until all four retaining tangs have emerged on the outside of the transmission case. Gently pull on the connector to check if engagement is secured.

3 Reinstall the control valve body, refer to 3.14 Control Valve Body.

4 Lubricate a new O-ring with petroleum jelly and fit it to the TCC solenoid (2).

5 Reinstall the TCC solenoid assembly in the control valve body , tighten the two attaching bolts (1) to the correct torque specification.

TCC solenoid attaching bolt torque specification	12.0 Nm

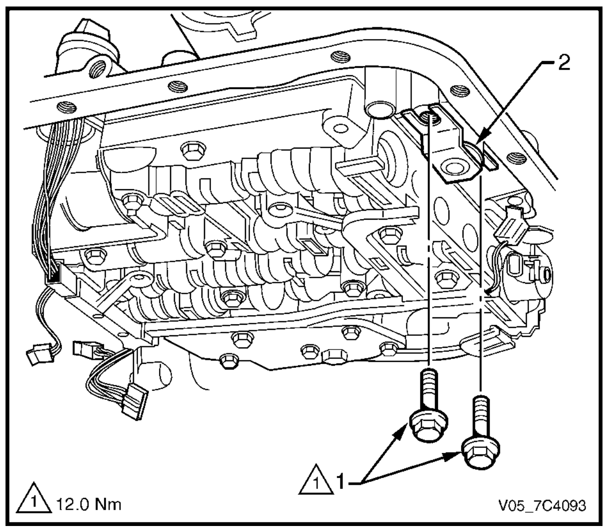

Figure 7C4 – 33

6 Lubricate a new O-ring with petroleum jelly and fit it to the TCC PWM solenoid (2).

7 Reinstall the TCC PWM solenoid in the control valve body and secure it with the retaining clip (1).

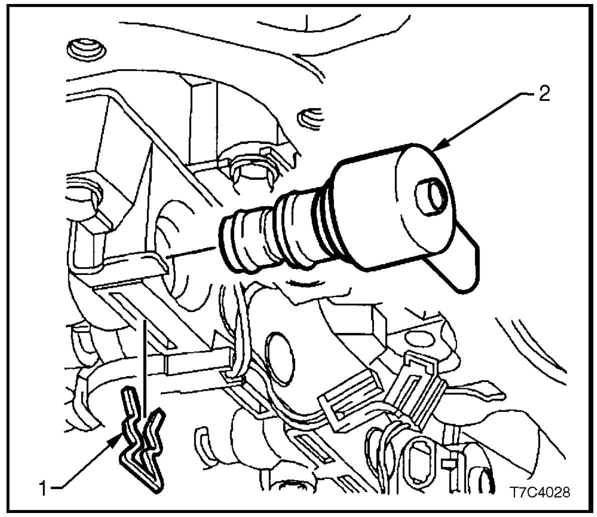

Figure 7C4 – 34

8 Reconnect the control valve body harness connectors. Connectors identification:

- Transmission Fluid Pressure (TFP) Manual Valve Position Switch (1)
- 1 – 2 Shift Valve Solenoid A (2)
- 2 – 3 Shift Valve Solenoid B (3)
- Pressure Control Solenoid (PCS) (4)
- Torque Converter Clutch Pulse Width Modulated (TCC PWM) Solenoid (5)
- 3 – 2 Control Solenoid (6).

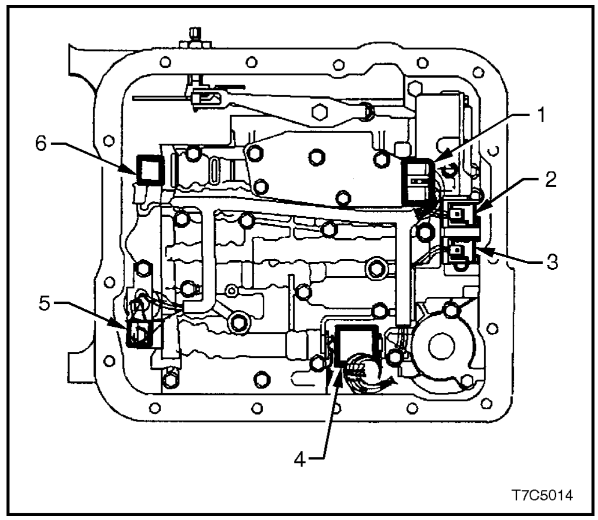

Figure 7C4 – 35

9 Secure the harness frame to the control valve body, place the tab between the valve body and pressure switch in location (1) and press the harness frame in position on bolt bosses (2 and 3).

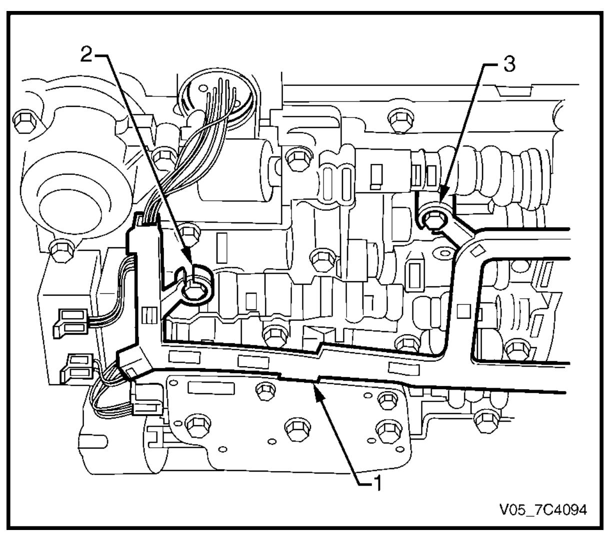

Figure 7C4 – 36

10 Reinstall the oil pan and filter and fill the transmission with the recommended automatic transmission fluid, refer to 3.1 Fluid Change and Filter Replacement.

11 Lower vehicle to the ground.

12 Road test until the transmission has reached operating temperature. Re-check the fluid level and for any fluid leaks from the oil pan area, refer to 2.1 Transmission Fluid.

3.14 Control Valve Body

Remove

1 Partially remove the control valve body harness until it hangs from the pass-thru connector, refer to 3.13 Control Valve Body Harness.

2 Remove the three long bolts (1) and the two short bolts (2) attaching the transmission fluid pressure (TFP) manual valve position switch assembly (3), remove the switch and discard the shield (4).

3 Remove the attaching bolt (5) and the manual detent spring (6).

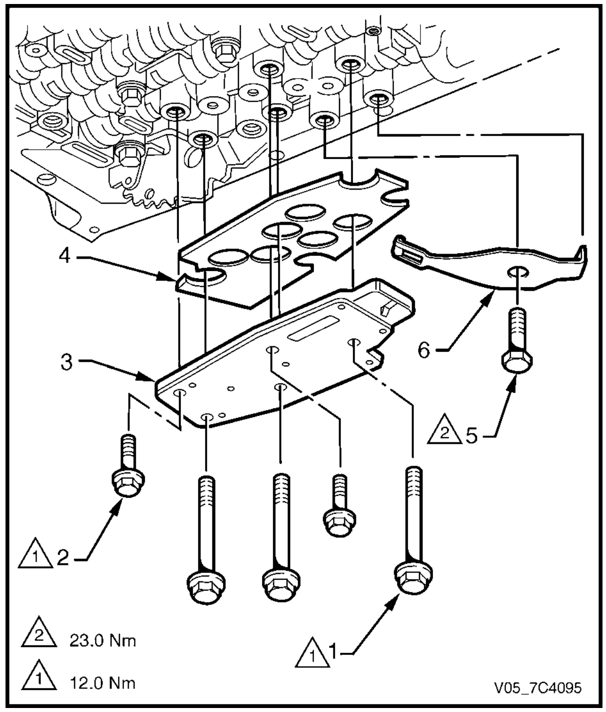

Figure 7C4 – 37

CAUTION

In the following procedure support the control valve body before removing the last bolt.

NOTE

The removal may be more manageable by removing the bolts in a spiral pattern starting from the outside, removing the centre bolt last.

4 Remove the fourteen remaining bolts (1) attaching the control valve body.

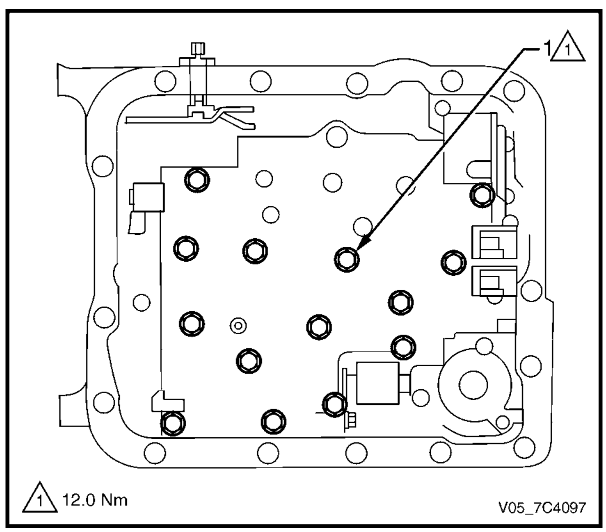

Figure 7C4 – 38

CAUTION

Keep the control valve body level when lowering it to prevent the loss of the checkballs located in the body passages.

5 Carefully lower the control valve body (1) from the transmission case. As the valve body is being lowered, rotate it slightly to disconnect the manual valve link (2) from the manual valve (3) and remove the control valve body.

6 Remove the manual valve link from the inner detent lever (4).

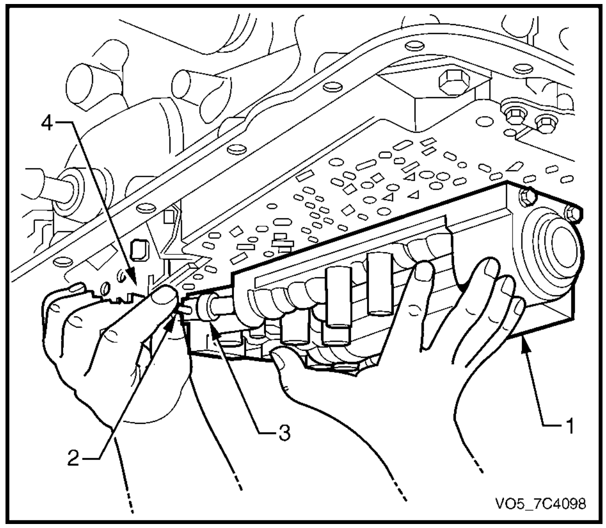

Figure 7C4 – 39

Reinstall

Different bolt sizes are used to attach the control valve body and components, Figure 7C4 – 40 shows the location of the attachment bolts with the letters referring to their dimensions.

NOTE

For clarity, the control valve body harness is not shown in the illustration.

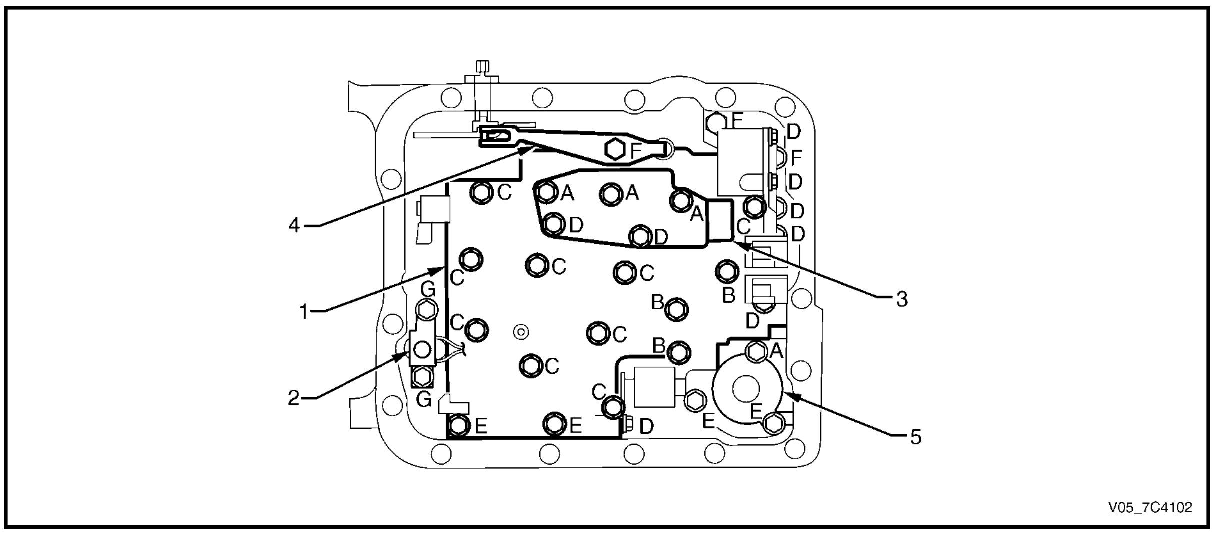

Figure 7C4 – 40

Legend

1	Control Valve Body	A	Bolt M6 x 1.00 x 65.0
2	Torque Converter Clutch (TCC) Solenoid	B	Bolt M6 x 1.00 x 54.4
3	Transmission Fluid Pressure (TFP) Manual Valve Position Switch	C	Bolt M6 x 1.00 x 47.5
		D	Bolt M6 x 1.00 x 18.0
4	Manual Detent Spring	E	Bolt M6 x 1.00 x 35.0
5	1 – 2 Accumulator Cover	F	Bolt M6 x 1.25 x 20.0
		G	Bolt M6 x 1.00 x 12.0

1 Ensure the spacer plate gasket is in a satisfactory condition, replace as required, refer to 3.15 Spacer Plate, Check Balls, Filter Screens and 3 – 4 Accumulator.

2 If required, reinstall the seven checkballs (1) in the control valve body securing them with petroleum jelly.

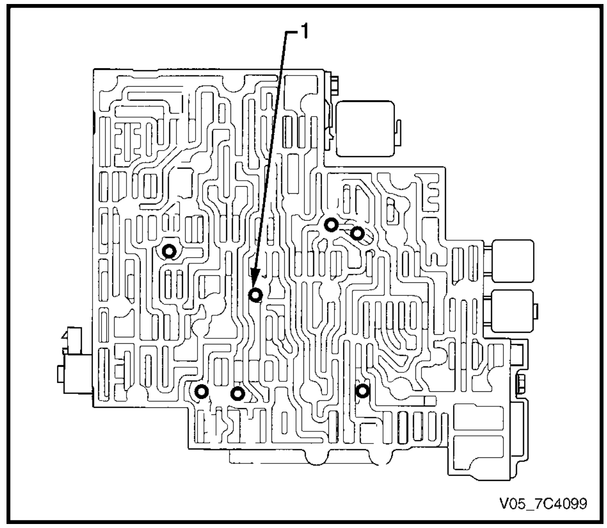

Figure 7C4 – 41

3 Reinstall the manual valve link (1) to the inner detent lever (2), refer to Figure 7C4 – 42.

4 While supporting the control valve body (3), rotate it slightly and connect the manual valve link with the manual valve (4).

CAUTION

Take care not to damage the two filter screens attached to the spacer plate during this operation.

5 Position the manual valve forward to retain the link connection and carefully raise the valve body into position.

6 Check if the manual valve link is correctly reinstalled in the detent lever and manual valve.

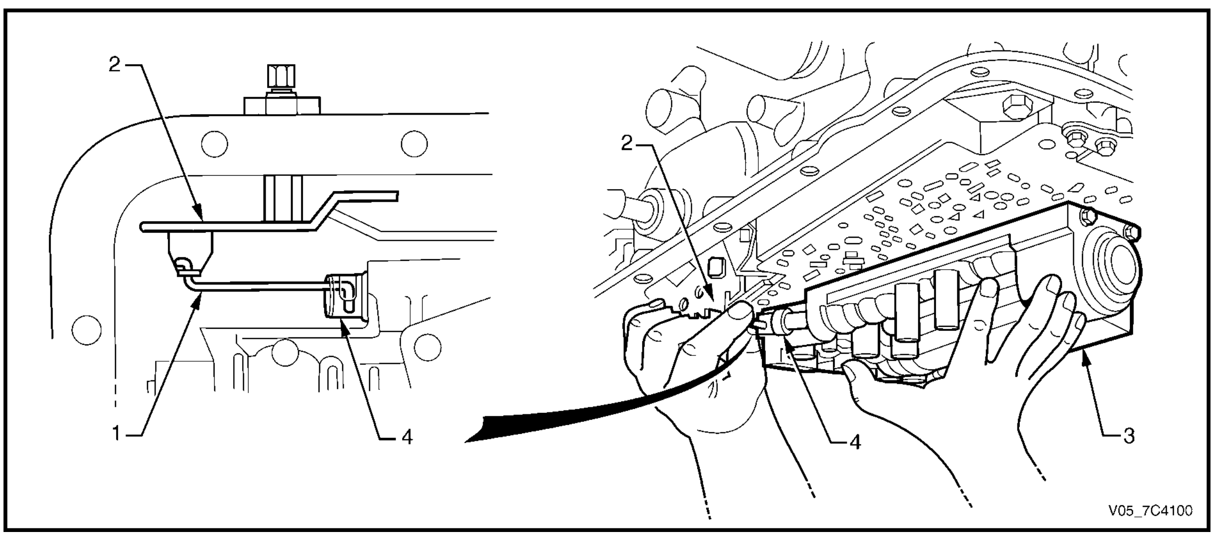

Figure 7C4 – 42

CAUTION

When reinstalling the bolts throughout this procedure, ensure to use the correct bolt dimension in each location.

7 Reinstall one bolt (1) (M6 X 1.0 X 47.5) hand tight in the centre of the control valve body to hold it in place, at location C as shown.

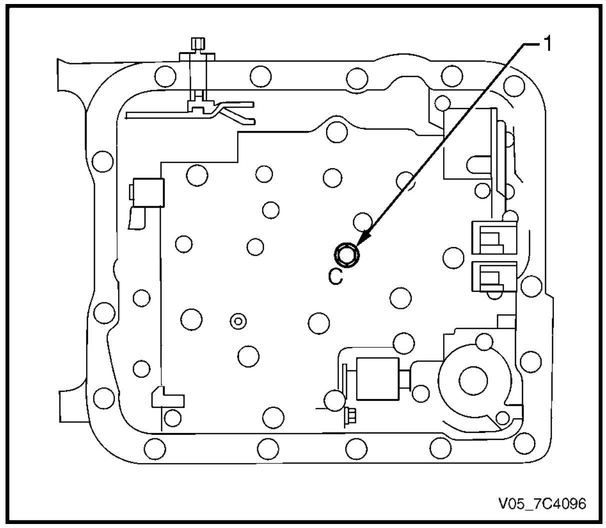

Figure 7C4 – 43

8 Reinstall hand tight only, the remainder of the fourteen bolts (1) attaching the control valve body directly.

NOTE

Refer to Figure 7C4 – 40 for each bolt dimension and corresponding location.

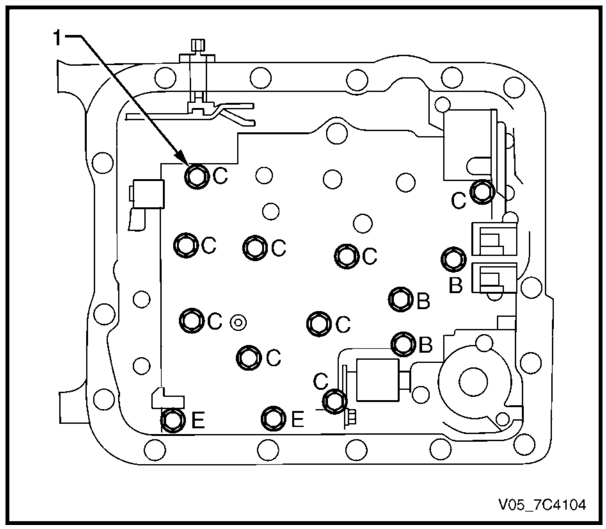

Figure 7C4 – 44

9 Fit a new shield (1) to the transmission fluid pressure (TFP) manual valve position switch (2) and reinstall to the control valve body.

NOTE

Refer to Figure 7C4 – 40 for bolt dimension and corresponding location.

10 Reinstall the three long bolts (3) and the two short bolts (4) hand tight only.

11 Reinstall the manual detent spring (5) and the attaching bolt (6) hand tight only.

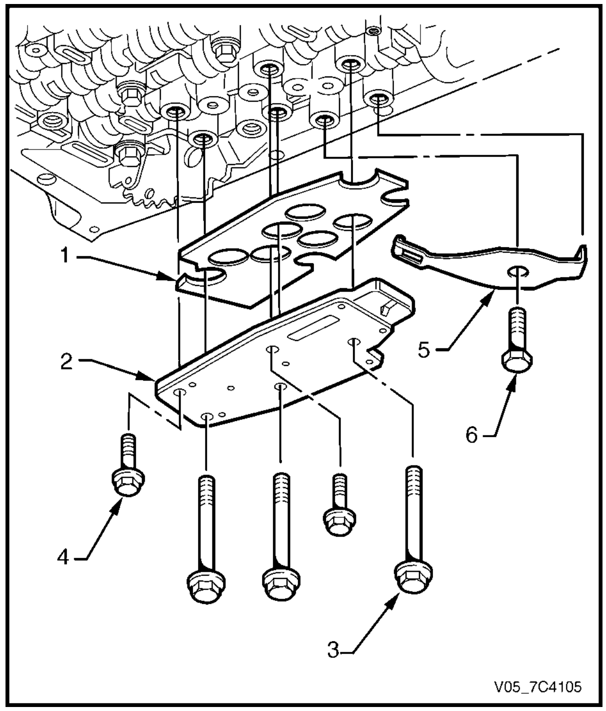

Figure 7C4 – 45

CAUTION

The control valve body bolts must be tightened in an outward spiral starting from the centre. Failure to follow this pattern may distort the valve body causing the valves to jam in their bores.

12 Follow the sequence starting from the centre as shown by the arrows to tighten the following bolts to the correct torque specification:

- fourteen bolts (1) attaching the control valve body,
- five bolts (2) attaching the transmission fluid pressure (TFP) manual valve position switch and
- one bolt (3) attaching the manual detent spring.

Control valve body attaching bolt torque specification	12.0 Nm
Transmission fluid pressure (TFP) manual valve position switch attaching bolt torque specification	12.0 Nm
Manual detent spring attaching bolt torque specification	23.0 Nm

13 Reinstall the control valve body harness , refer to 3.13 Control Valve Body Harness.

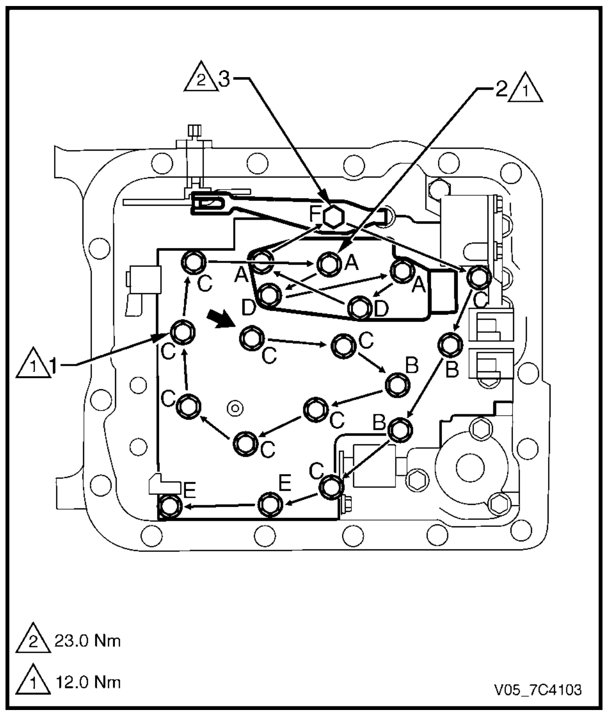

Figure 7C4 – 46

3.15 Spacer Plate, Check Balls, Filter Screens and 3 – 4 Accumulator

Remove

1 Remove the control valve body, refer to 3.14 Control Valve Body.

2 Remove the three attaching bolts (1) and the plate (2) supporting the spacer plate.

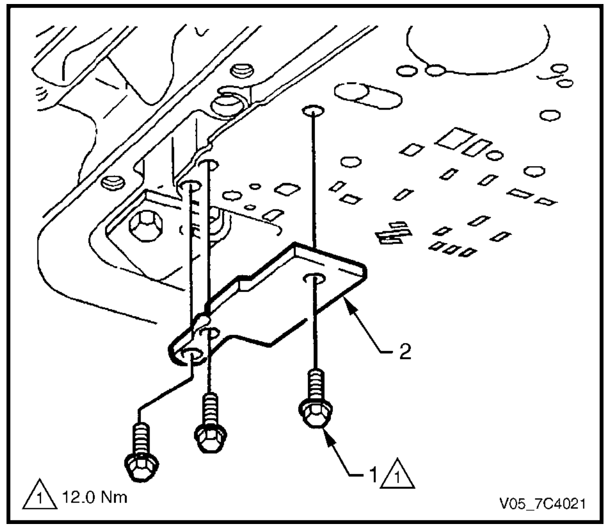

Figure 7C4 – 47

CAUTION

The 3 – 4 accumulator spring (1) may push the spacer plate away from transmission case when the 1 – 2 accumulator assembly is removed.

3 While supporting the spacer plate (2), carefully remove the 1 – 2 accumulator assembly (3), refer to 3.12 1 – 2 Accumulator Assembly.

CAUTION

As the spacer plate and gaskets are lowered from the transmission, a check ball and the 3 – 4 accumulator spring may drop. Do not lose the check ball and the spring.

4 Remove the two gaskets (4 and 5) and the spacer plate from the transmission case.

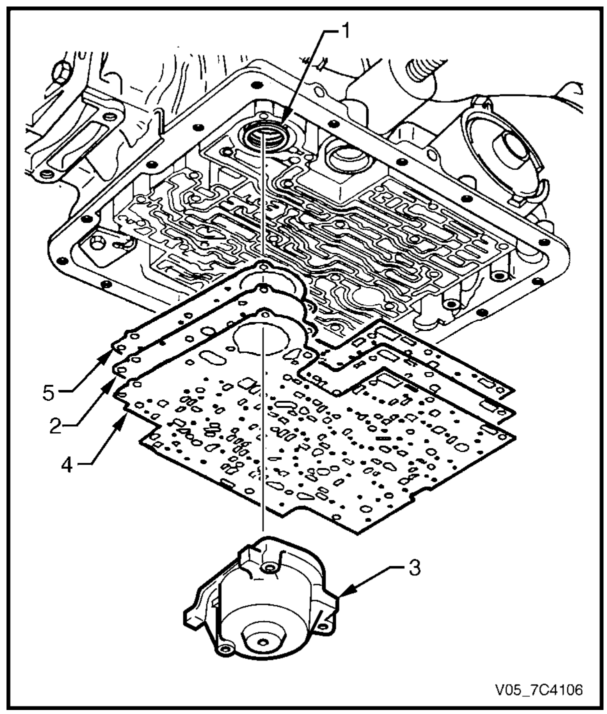

Figure 7C4 – 48

5 If not previously dropped, remove the spring (1).
If required, use snap ring pliers to rotate and pull the 3 – 4 accumulator piston (2) to remove it from the transmission case. Remove and discard the piston seal.

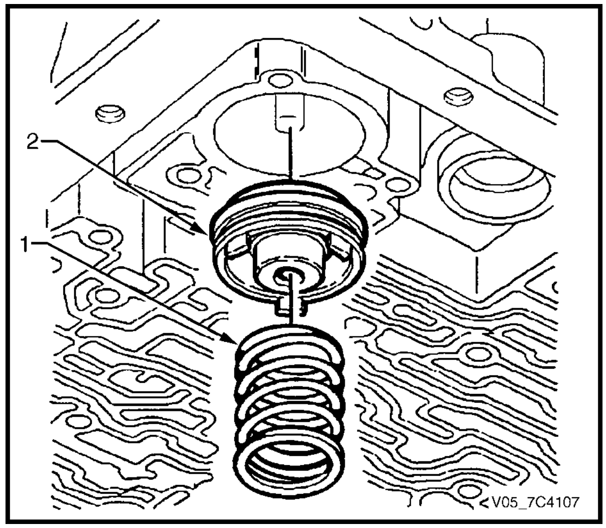

Figure 7C4 – 49

6 Remove the check-ball (1) if not previously dropped. Remove the 3rd accumulator check ball assembly (2), the orifice cup plug (3) and the guide pins (A) from the transmission case.

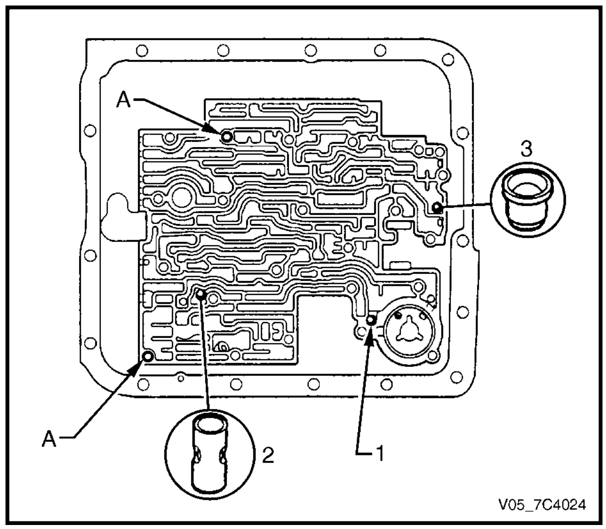

Figure 7C4 – 50

Clean and Inspect

WARNING

To avoid personal injury, wear safety glasses and gloves when using compressed air and cleaning fluids.

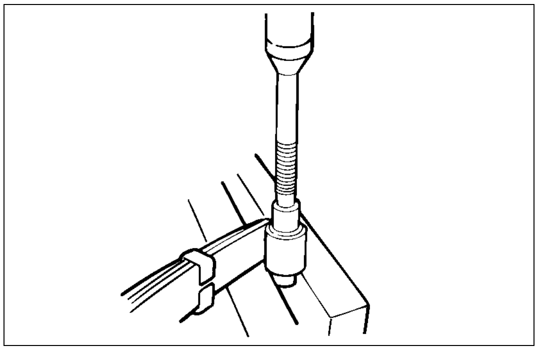
1 Wash all components in a commercially available cleaning fluid and blow dry using compressed air.

2 Inspect the components for the following:

- piston for porosity,
- ring groove or pin hole damage,
- spring for distortion or damage,
- accumulator bore for wear or damage and
- spacer plate, filter screens and check balls for damage.

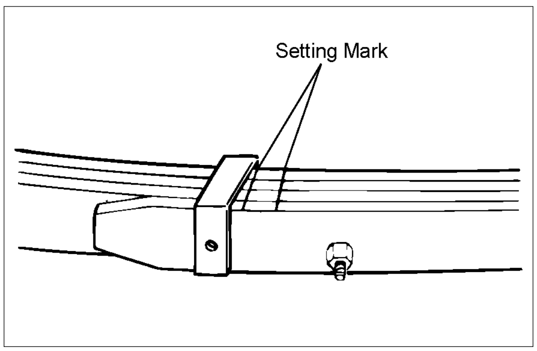
LEAF SPRING ASSEMBLY

Disassembly



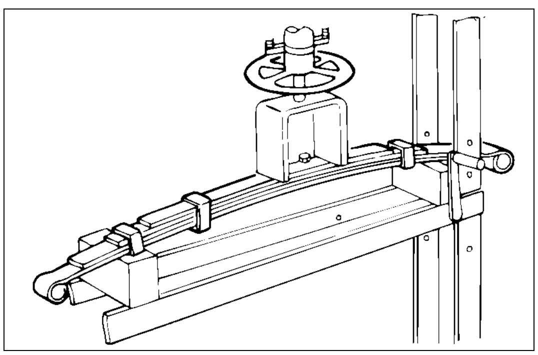
F03L100004

1. Remove the bushing using a bench press and a suitable metal fitting.



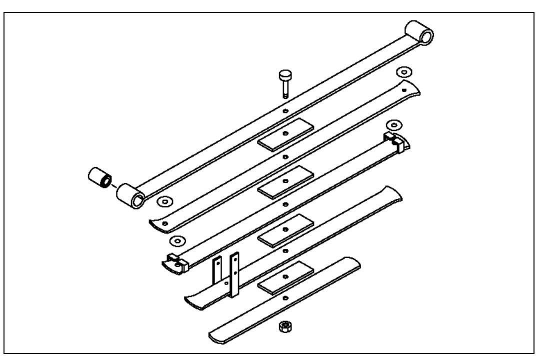
RTW430SH000101

2. Apply a setting mark across the springs before disassembling the leaf spring assembly.



F03L100006

3. Use a bench press and remove the center bolt.
   - Discard center bolt and install a new one.



465R300001

4. Disassemble the leaf spring assembly.

Inspection and Repair

Inspect leaf spring, bush, clips, liners and center spacer for wear, damage, rust or other abnormal conditions and repair or replace if necessary.

Reinstall

1 Lubricate a new seal (1) with petroleum jelly and install it to the 3 – 4 accumulator piston (2).

2 Reinstall the piston onto the pin (3). The piston side with the three lugs (4) must face out of the bore.

3 Reinstall the 3 – 4 accumulator spring, use a small amount of petroleum jelly to hold it in place, as needed.

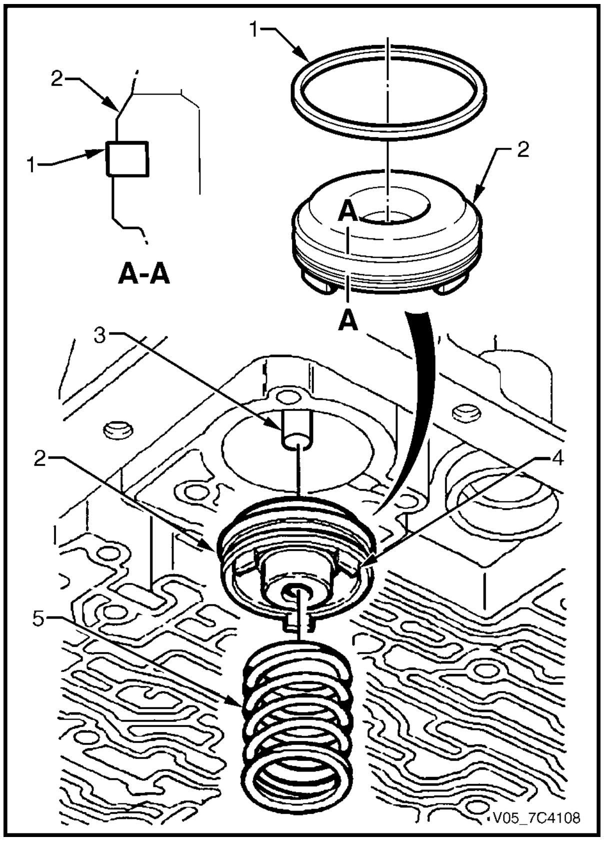


Figure 7C4 – 51

CAUTION

Ensure the guide pins are fully installed with no thread visible. Otherwise the spacer plate gasket could be caught in the thread during installation, resulting in incorrect alignment.

4 Reinstall the guide pins (A) at the correct locations in the transmission case.

5 Reinstall the check ball (1) in the transmission case using a small amount of petroleum jelly to hold it in place.

6 Reinstall the 3rd accumulator check ball assembly (2) and the orifice cup plug (3) in the transmission case.

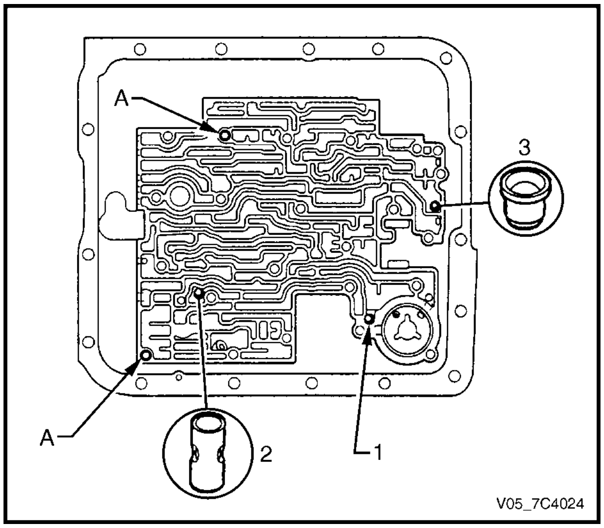

Figure 7C4 – 52

7 If a new spacer plate (1) is installed, it is necessary to fit two filter screens (2 and 3) to the spacer plate.

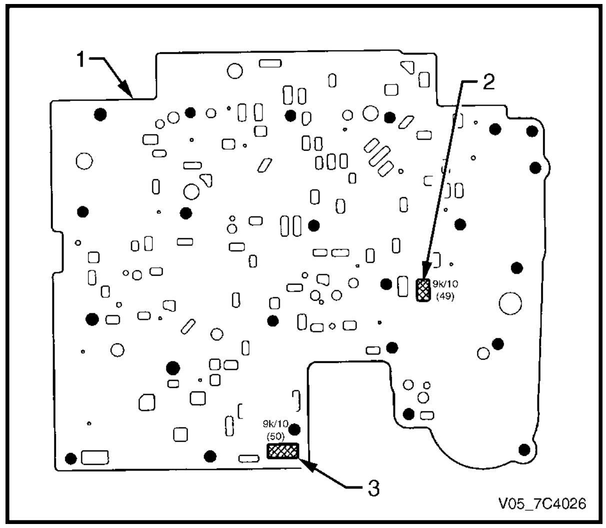

Figure 7C4 – 53

NOTE

When installing the spacer plate locate the gaskets as follows:

- The gasket (2) marked CA is fitted between the spacer plate and the transmission case.
- The gasket (3) marked VB is fitted between the spacer plate and the control valve body.

8 Reinstall the spacer plate (1) with the new gaskets (2 and 3) smeared with petroleum jelly. Hold the spacer plate in place until the 1 – 2 accumulator is reinstalled.

9 While supporting the spacer plate, carefully reinstall the 1 – 2 accumulator assembly (4), refer to 3.12 1 – 2 Accumulator Assembly.

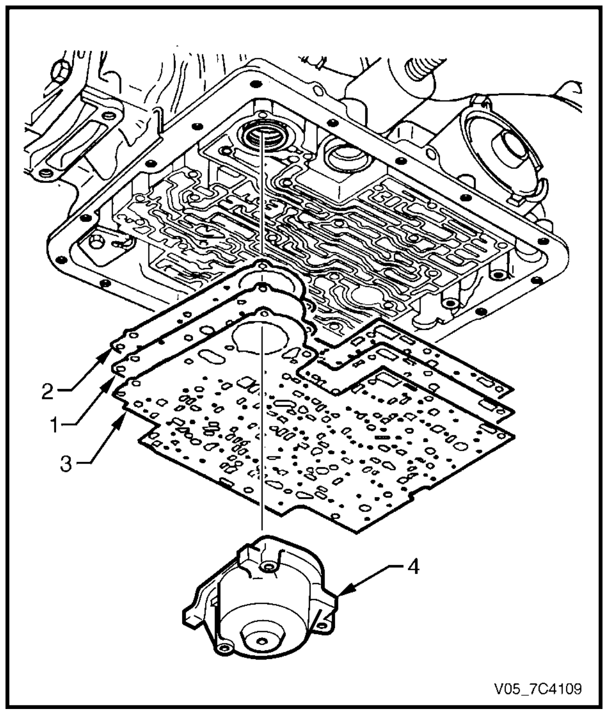

Figure 7C4 – 54

10 Reinstall the plate (2) supporting the spacer plate and tighten the three attaching bolts (1) to the correct torque specification.

Spacer plate support plate attaching bolt torque specification ....12.0 Nm

11 Reinstall the control valve body, refer to 3.14 Control Valve Body.

12 Reinstall the Oil pan and filter and fill the transmission with the recommended automatic transmission fluid, refer to 3.1 Fluid Change and Filter Replacement.

13 Lower vehicle to the ground.

14 Road test until the transmission has reached operating temperature. Re-check the fluid level and for any fluid leaks from the oil pan area, refer to 2.1 Transmission Fluid.

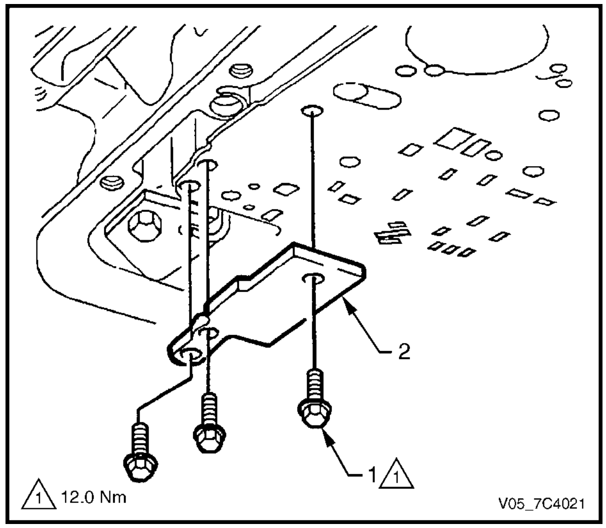

Figure 7C4 – 55

3.16 Filler Tube and Breather Hose

Remove

NOTE

The breather hose and/or vent pipe can be removed independently from the filler tube as described in step 7.

CAUTION

Disconnection of the battery affects certain vehicle electronic systems. Refer to 6D1-3 Battery, before disconnecting the battery.

1 Disconnect the battery ground lead.

2 Release the lock down lever (1) and remove the transmission fluid level indicator from the filler tube (2).

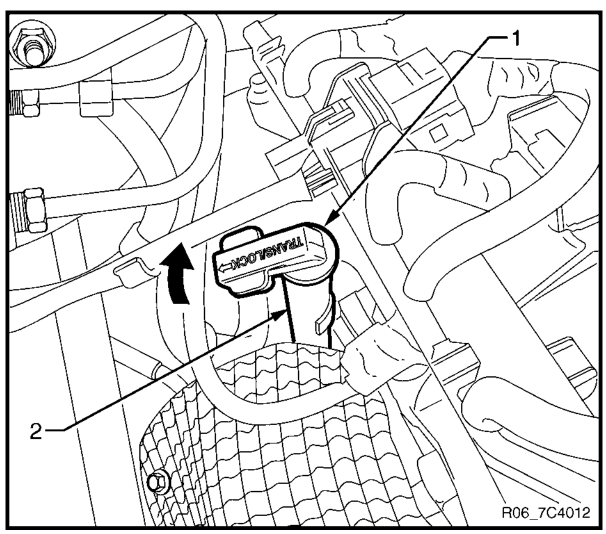

Figure 7C4 – 56

3 Remove the bolt (1) attaching the filler tube (2) to the side of the right-hand cylinder head, refer to Figure 7C4 – 57.

4 Using a twisting and pulling motion, remove the filler tube from the seal (3) in the transmission case.

5 Remove the filler tube from the engine compartment.

6 Remove the filler tube seal from the transmission case and discard.

7 If the breather hose needs to be replaced proceed as follows:

a unclip the breather hose (4) from the harness channel (5).

b Remove the transmission support and lower the rear of the transmission sufficiently to get access to the breather hose, refer to 3.7 Transmission Support and Mount.

c Disconnect the breather hose from the T-joint (6) and the top of the transmission case and remove.

d If required, remove the two bolts (7) attaching the brackets of the vent pipe (8) to the chassis, disconnect from the T-joint and remove the vent pipe.

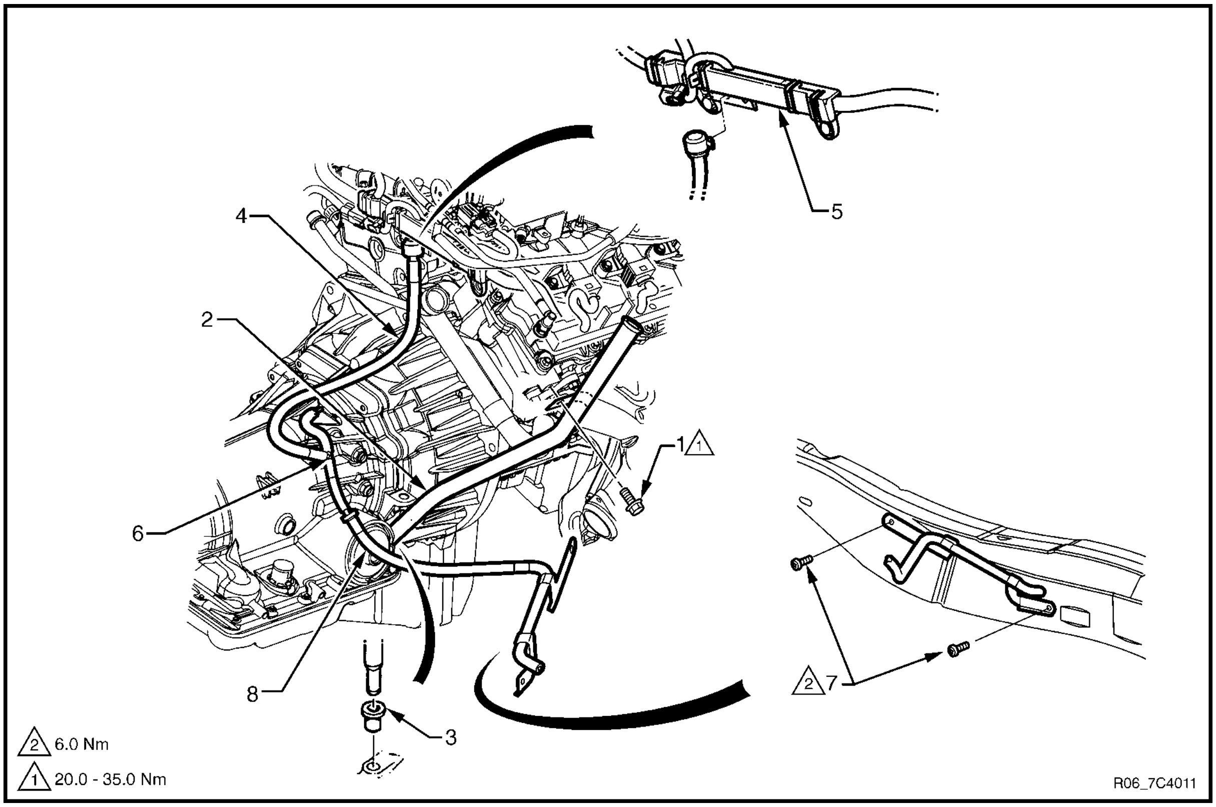

Figure 7C4 – 57

Reinstall

Reinstallation of the transmission filler tube and/or the breather hose is the reverse of the removal procedure, noting the following:

1 Smear a new filler tube seal with clean transmission fluid and fit it to the transmission case.

2 Ensure the transmission breather hose and the harness are secured to the filler tube lower bracket.

3 Tighten the bolt attaching the filler tube bracket to the correct torque specification.

Filler tube bracket attaching bolt torque specification .... 20.0 – 35.0 Nm

4 If required, tighten the two bolts attaching the vent pipe bracket to the chassis to the correct torque specification.

Vent pipe attaching bolt torque specification .... 6.0 Nm

3.17 Transmission Cooler Line/Hose Assemblies

Remove

1 Disconnect the transmission cooler hose/line assemblies from the radiator quick connect fittings as follows:

a Pull back the verifier disc (1) from the quick connect fitting (2) and slide it back along the line.

b Open the release tool, Tool No J-41623-B (3), slip it over the cooler line to be disconnected from the radiator, ahead of the verifier disc.

c Slide the release tool along the cooler line and engage it with the quick-connect fitting.

d While pushing inwards, rotate clockwise the release tool about one sixth of a turn to release the spring clip holding the cooler line.

e With the release tool held in this position, pull back on the cooler line to release it.

f Plug the openings to prevent fluid loss and/or contamination.

g Repeat the procedure to remove the remaining cooler line.

NOTE

If the spring clip and/or O-ring seal in the quick-connect fitting is damaged during the removal process, the complete fitting must be replaced.

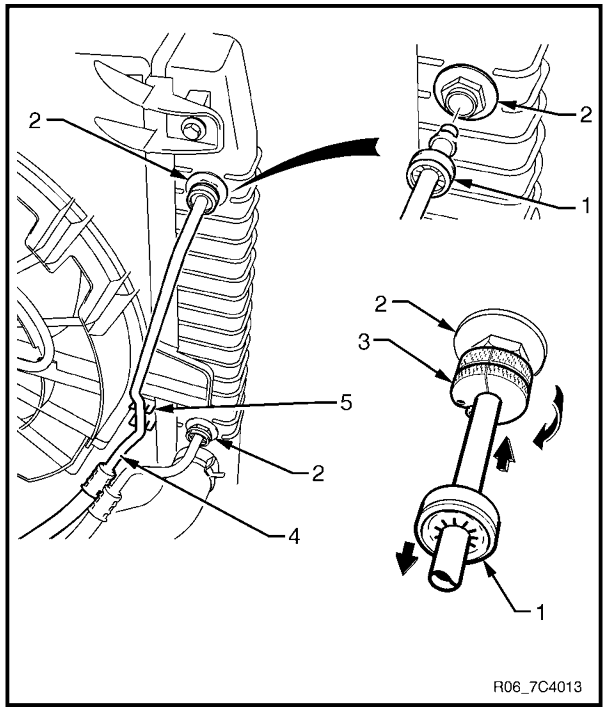

Figure 7C4 – 58

2 Unclip the outlet cooler line (4) from the radiator fan shroud (5).

3 Remove the screw (1) attaching the transmission cooler line bracket (2) to the right-hand side of the engine.

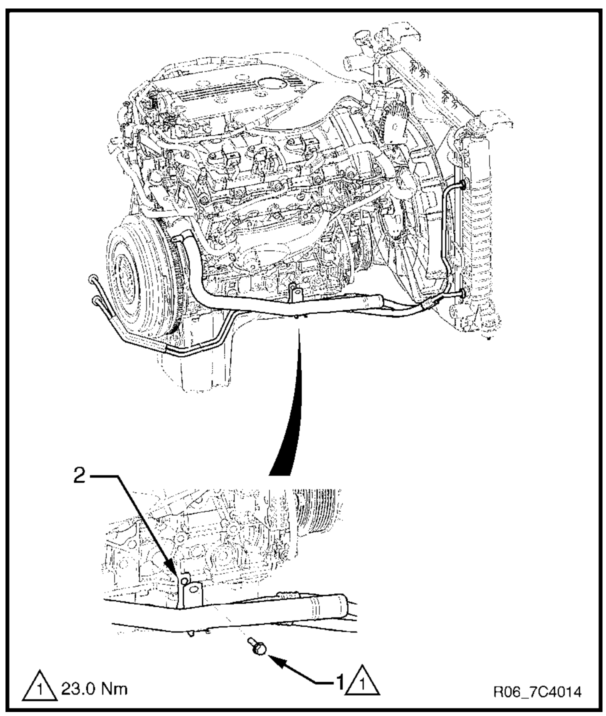

Figure 7C4 – 59

4 Remove the transmission support, refer to 3.7 Transmission Support and Mount.

5 Carefully lower the rear of the transmission sufficiently to get access to the cooler lines.

6 Place a suitable sized drip tray underneath the transmission.

7 With the rear of the transmission lowered, disconnect the cooler lines from the transmission, as follows:

  a Pull back the verifier disc (1) to release it and slide it back along the cooler line (2).

  b Open the release tool, Tool No J-41623-B (3), slip it over the cooler line to be disconnected from the transmission, ahead of the verifier disc.

  c Slide the release tool along the cooler line and engage it with the quick-connect fitting (4).

  d While pushing inwards, rotate clockwise the release tool about one sixth of a turn to release the spring clip holding the cooler line.

  e With the release tool held in this position, pull back on the cooler line to release it.

  f Plug all openings to prevent fluid loss and/or contamination.

  g Repeat this process with the remaining cooler line.

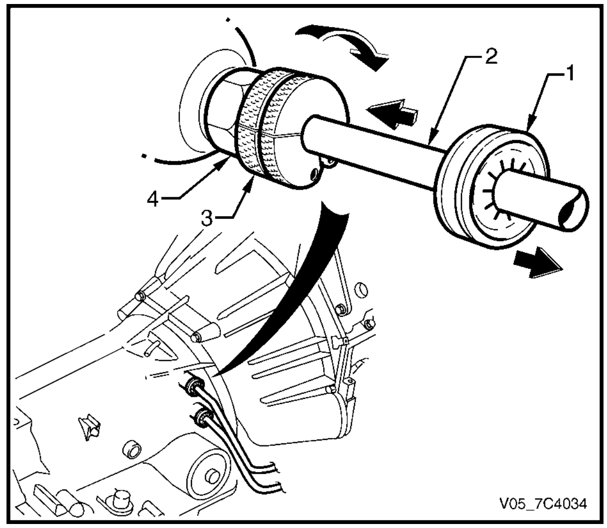

Figure 7C4 – 60

NOTE

If the spring clip and/or O-ring seal in the quick-connect fitting is damaged during the removal process, the complete fitting must be replaced.

8 Carefully remove the two cooler lines from the vehicle.

9 As required, separate the two cooler lines by removing the bracket and the two clips.

Reinstall

1 On the transmission end, ensure the spring clip and/or O-ring seal in each quick-connect fitting is not damaged, replace the complete fitting if required.

2 If required, fit the bracket and the two clips to attach the transmission two cooler lines together.

3 Position the cooler lines in place, attach the cooler line bracket (2) with the screw (1) hand tight to the right-hand side of the engine, refer to Figure 7C4 – 59.

4 Remove the plugs from the cooler lines and transmission fittings and wipe all exposed parts clean.

5 At the transmission end, smear the fluid lines rear fittings with clean automatic transmission fluid and push the quick-connect fittings together.

CAUTION

If the verifier disc does not clip into place, the quick-connect fitting is not engaged, rectify as required.

6 As a security check, push and clip each verification disc into place over the quick-connect fittings. If difficulty is experienced, repeat the installation process until the verification disc can be clipped into place over the transmission quick-connect fitting.

7 Reinstall the transmission support, refer to 3.7 Transmission Support and Mount.

8 Remove the plugs from the cooler lines and radiator fittings and wipe all exposed parts clean.

9 At the radiator end, smear the fluid lines fittings with clean automatic transmission fluid and push the quick-connect fittings together, refer to Figure 7C4 – 58.

CAUTION

If the verifier disc does not clip into place, the quick-connect fitting is not engaged, rectify as required.

10 As a security check, push and clip each verification disc into place over the quick-connect fittings. If difficulty is experienced, repeat the installation process until the verification disc can be clipped into place over the radiator quick-connect fitting.

11 Snap the outlet cooler line (4) in the clip (5) of the radiator fan shroud.

12 Ensure the routeing of the cooler lines is correct and there is no fouling of the lines.

13 Tighten the screw attaching the cooler lines bracket to the correct torque specifications.

Transmission cooler lines bracket attaching screw torque specification ....23.0 Nm

14 If required, top up the transmission fluid level (cold).

15 Start the engine and check for any fluid leak at the fittings. If a leak is found, stop the engine and rectify the leak.

16 Check and top up the transmission fluid to the correct level as required, refer to 2.1 Transmission Fluid.

3.18 Transmission Assembly

Remove

CAUTION

Disconnection of the battery affects certain vehicle electronic systems. Refer to 6D1-3 Battery, before disconnecting the battery.

1 Disconnect the battery ground lead.

2 Raise the vehicle and support in a safe manner, refer to 0A General Information for the location of support points.

3 Remove the heat shield from the neutral start and back-up lamp switch, gently prise the selector cable from the transmission external manual shaft linkage and remove the selector cable from the bracket, refer to 3.3 Selector Cable Assembly.

4 Disconnect the harness connectors from the following:

a Vehicle speed sensor, refer to 3.5 Vehicle Speed Sensor.

b Neutral start and back-up switch, refer to 3.4 Neutral Start and Back-up Lamp Switch.

c For the following on four wheel drive vehicles (4WD), refer to 7D Transfer Case and Adaptor Housing:

- neutral switch,
- 2WD – 4WD shift actuator switch,
- speed sensor.

NOTE

If the battery is connected, avoid turning the ignition switch to the ON position, as the transfer case control module (TTCM) must first be removed (memory to be cleared as Check 4WD Indicator will light).

5 Remove the following components:

a Front and centre exhaust assemblies, refer to 6F Exhaust System.

b Starter motor, refer to 6D1-2 Starting System.

b Rear propeller shaft and for 4WD front propeller shaft, refer to 4A Propeller Shaft.

6 On 4WD vehicle, disconnect the harness two clips from the upper side of the transfer case.

7 From within the starter motor access hole, remove the three bolts (2) attaching the torque converter to the flexplate and discard, refer to Figure 7C4 – 62.

8 Remove the transmission support, refer to 3.7 Transmission Support and Mount.

9 Disconnect the fuel and EVAP pipes three brackets and clips, refer to 6C Fuel System – V6.

CAUTION

Before lowering the transmission take care of the following:

- **Do not strain the harness and connector as the connector pins could be permanently damaged.**
- **Ensure the inlet manifold does not hit the firewall.**

10 Carefully lower the transmission to provide enough clearance to disconnect the harness connector (1).

CAUTION

Do not wiggle the connector from side to side during removal as the connector pins could be permanently damaged.

11 Disconnect the harness connector from the transmission as follows:

a Roll back the dust boot to access the connector.

b Squeeze the widest side of the connector (A) inward and pull it directly upward.

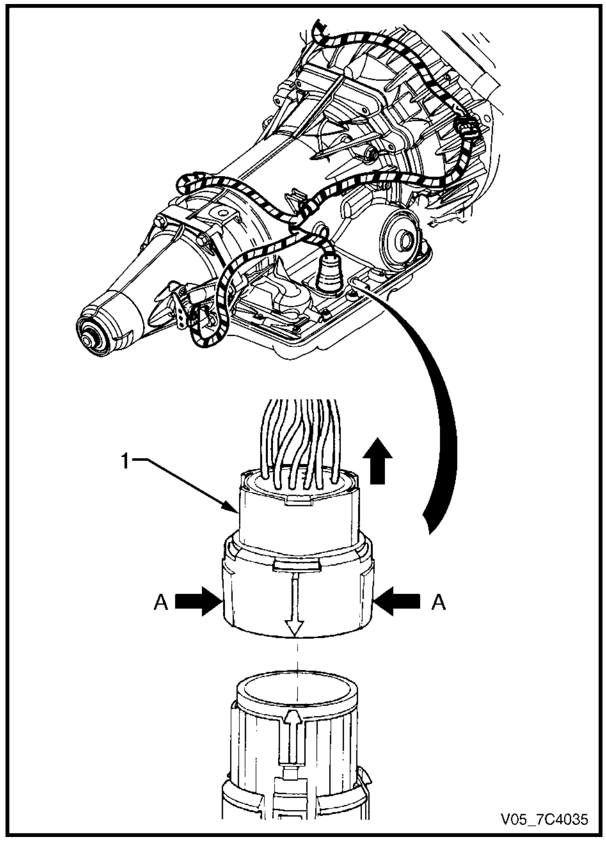

Figure 7C4 – 61

12 Remove the screws attaching the harness clips to the right-hand and left-hand sides of the transmission case, refer to 12O Fuses, Relays and Wiring Harnesses.

13 Place a suitable sized drip tray underneath the transmission.

14 Remove the transmission cooler lines, refer to 3.17 Transmission Cooler Line/Hose Assemblies.

15 Disconnect the breather hose from the top of the transmission case.

CAUTION

Support the transmission when removing the attaching bolts to avoid damage to the torque converter and flexplate. Do not have the transmission hanging.

NOTE

The bolts attaching the torque converter housing are facing forward except for the bolt in position ℑ which is facing rearward.

16 With the transmission supported, using a long socket extension, universal joint and suitable size socket, remove the bolt (1), nine places, attaching the torque converter housing to the engine, in the reverse order of the torque sequence shown in B within Figure 7C4 – 62.

CAUTION

The transmission assembly must not be allowed to rest on its oil pan.

17 Support the transmission assembly on a suitable cradle and secure it. Place a suitable support under the engine oil pan rail to support the engine after the transmission has been removed.

18 Remove the transmission assembly, disengaging the filler tube attached to the engine.

19 Remove the bolt (3) and torque converter cover (4) on the transmission right-hand side, remove the bolt (5) and torque converter cover (6) on the transmission left-hand side.

20 Install a suitable holding tool to prevent the torque converter from becoming dislodged.

21 If required on 4WD vehicle, remove the transfer case, refer to 7D Transfer Case and Adaptor Housing.

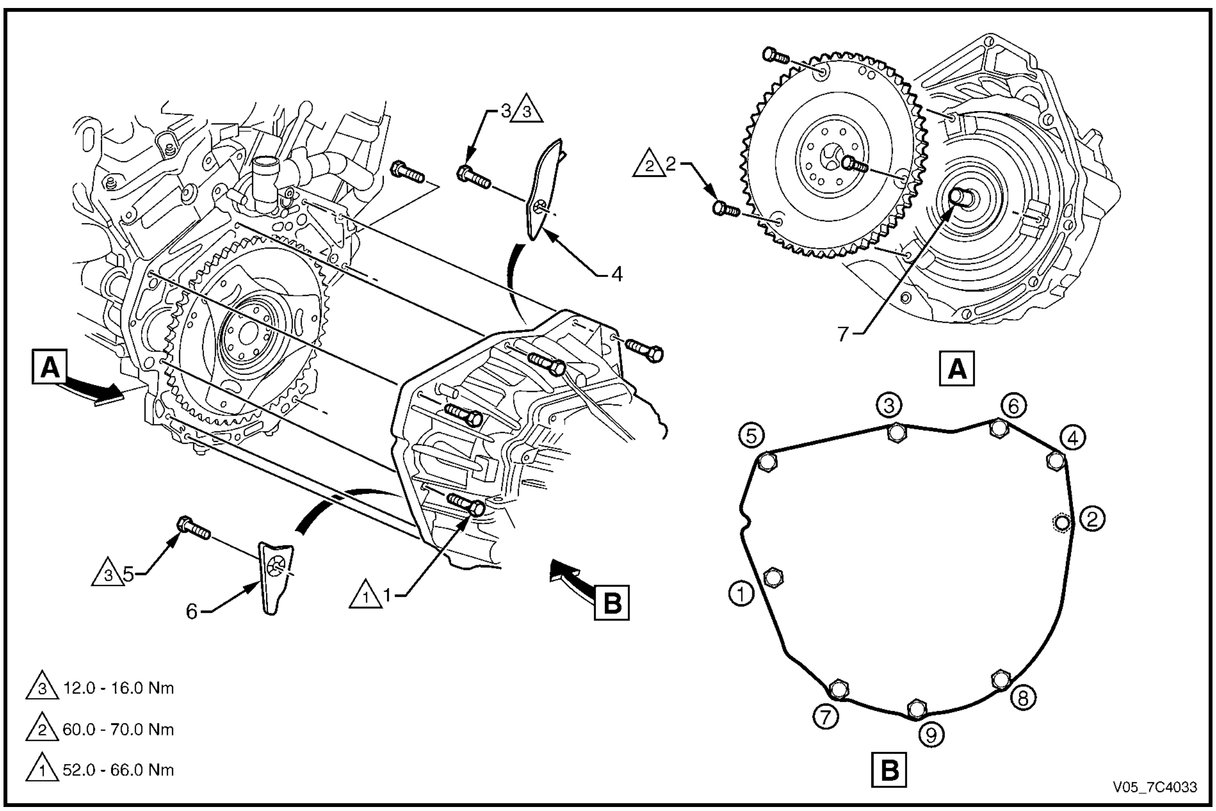

Figure 7C4 – 62

Reinstall

1 If required on 4WD vehicle, reinstall the transfer case, refer to 7D Transfer Case and Adaptor Housing.

2 Ensure the transmission and the engine mating surfaces are clean and free of burrs.

3 Lubricate the torque converter spigot (7) with a small amount of high temperature wheel bearing grease, refer to Figure 7C4 – 62.

4 Install a new filler tube seal into the transmission case.

CAUTION

Support the transmission while installing the attaching bolts to avoid damage to the torque converter and flexplate. Do not have the transmission hanging.

5 Bring the transmission up to the engine, inserting the filler tube and ensuring the locating dowels completely enter the torque converter housing.

6 Reconnect the breather hose to the top of the transmission case.

NOTE

The bolts attaching the torque converter housing are facing forward except for the bolt in position ℑ which is facing rearward.

7 With the transmission supported, install the bolt (1), nine places, attaching the torque converter housing to the engine and tighten to the correct torque specification following the sequence shown in $\boxed{B}$ within Figure 7C4 – 62.

Torque converter housing attaching bolt torque specification	52.0 – 66.0 Nm

8 Remove the access hole cover plate from the lower surface of the housing and push the torque converter forward to meet the flexplate, then hand start three new bolts (2) before tightening to the correct torque specification. Reinstall the access hole cover plate.

Torque converter to flexplate attaching bolt torque specification	60.0 – 70.0 Nm

9 Reinstall the bolt (3) and torque converter cover (4) on the transmission right-hand side and the bolt (5) and torque converter cover (6) on the transmission left-hand side, tighten the bolts to the correct torque specification.

Torque converter cover attaching bolt torque specification	12.0 – 16.0 Nm

10 Reinstall the transmission fluid lines, refer to 3.17 Transmission Cooler Line/Hose Assemblies.

CAUTION

Prior to connecting the harness connector to the transmission, check that all pins and seals are in sound condition and the dust boot is not torn or damaged.

11 Reconnect the transmission harness connector to the transmission as follows:

a Push straight down on the connector body until a click is heard.

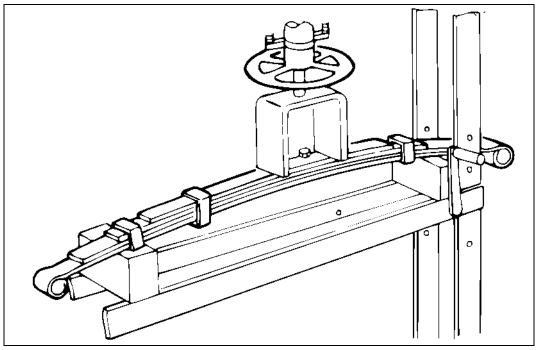
b Reinstall the dust boot ensuring it is correctly located.

12 Attach the harness clips to the right-hand and left-hand sides of the transmission case, refer to 12O Fuses, Relays and Wiring Harnesses.

13 On 4WD vehicle, connect the harness two clips from the upper side of the transfer case.

Reassembly

1. Apply grease to both faces of each leaf spring at reassembly.
2. Set the leaf springs, aligning them to the setting mark made before disassembly.



F03L100006

3. Assemble the leaf springs using a bench press.
4. Apply grease to the outside of the bushing.
   Install a new center bolt and tighten it to the specified torque.

Torque	N·m (kgf·m/lb·ft)
29 (3.0/22)	

5. Install the bushing using a bench press and a suitable metal fitting.

14 Reconnect the fuel and EVAP pipes three brackets and clips, refer to 6C Fuel System – V6.

15 Reinstall the following components:

a Starter motor, refer to 6D1-2 Starting System.

b Transmission support, refer to 3.7Transmission Support and Mount.

c Front and centre exhaust assemblies, refer to 6F Exhaust System.

d Rear propeller shaft and for 4WD front propeller shaft, refer to 4A Propeller Shaft.

16 Reconnect the harness connectors to the following:

a Vehicle speed sensor, refer to 3.5Vehicle Speed Sensor.

b Neutral start and back-up switch, refer to 3.4 Neutral Start and Back-up Lamp Switch.

c For the following on 4WD vehicles, refer to 7D Transfer Case and Adaptor Housing:

- neutral switch,
- 2WD – 4WD shift actuator switch,
- speed sensor.

17 Reinstall the selector cable to the transmission external manual shaft linkage, secure the selector cable to the bracket and attach the heat shield to the neutral start and back-up lamp switch, refer to 3.3 Selector Cable Assembly.

18 Perform a reverse flush of the cooler lines and a flow rate test, refer to 2.2 Reverse Flush and Flow Rate, if either of the following applies:

- the transmission fluid is contaminated,
- the transmission has been replaced,
- the torque converter has been replaced, or
- the transmission oil pump has been replaced.

19 Lower the vehicle to the ground.

20 If required, top up the transmission fluid level (cold).

21 Reconnect the battery ground lead.

22 Start the engine and check for any fluid leaking at the fittings. If a leak is found, stop the engine and rectify the leak.

23 Road test until the transmission has reached operating temperature. Re-check the fluid level and for any fluid leaks, refer to 2.1 Transmission Fluid.

3.19 Transmission Control Module

Remove

1 Ensure the ignition switch is in the OFF position.

2 Disconnect the connector (1) from the transmission control module (TCM) (2) as follows, refer to Figure 7C4 – 63:

a remove the securing pin (3),

b press the locking tab and swing the lever (4) to free the connector,

c remove the connector.

3 Remove the four bolts (5) and nuts (6), then the TCM from the mounting bracket (7).

4 If required, remove the two nuts (8) and the mounting bracket from the firewall.

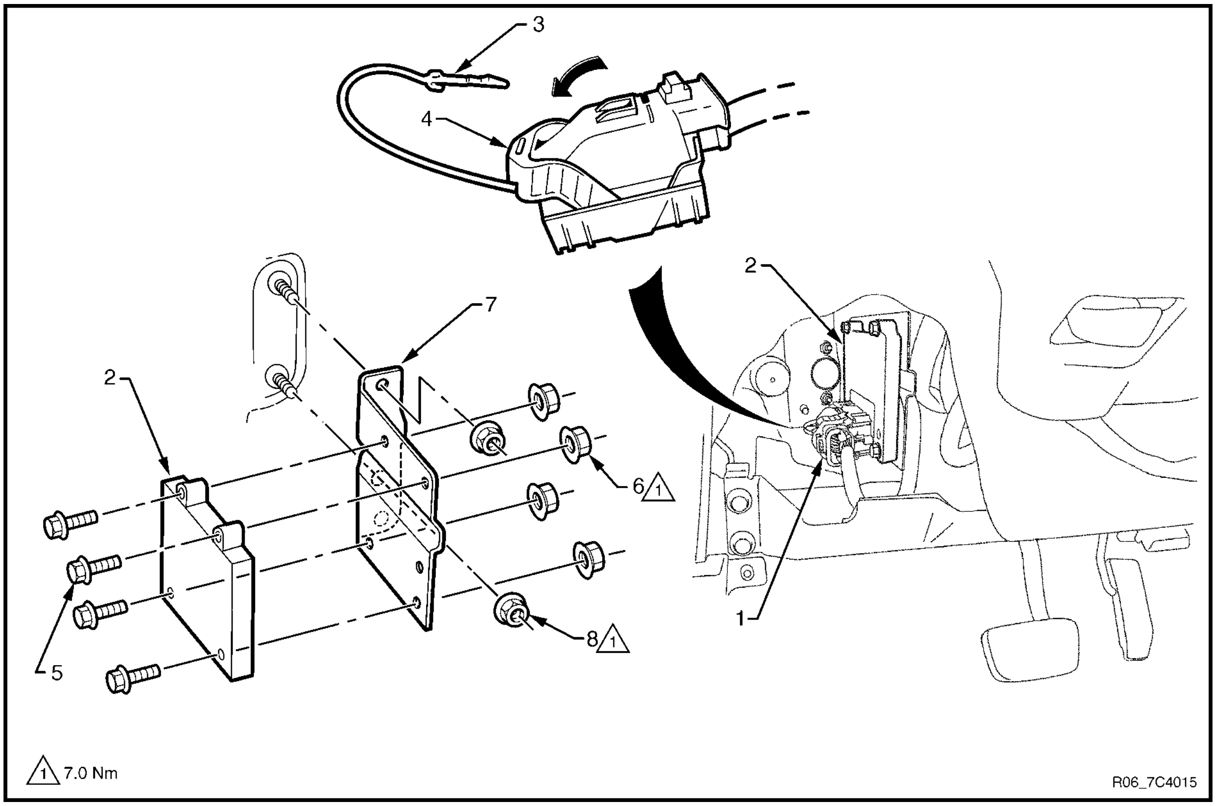


Figure 7C4 – 63

Reinstall

Reinstallation of the transmission control module (TCM) is the reverse of the removal procedure, noting the following:

1 If a new TCM is installed it must be programmed, refer to TCM Programming Procedure in this Section.

2 If required, install the mounting bracket to the firewall and tighten the nuts to the correct torque specification.

TCM bracket attaching nut torque specification ....7.0 Nm

3 Install the TCM onto the bracket and tighten the bolts and nuts to the correct torque specification.

TCM attaching bolt and nut torque specification ....7.0 Nm

4 Lock the connector securely to the TCM by with the locking lever and the securing pin.

5 Using Tech 2, clear any TCM diagnostic trouble code (DTC) that may have set during the removal procedure, refer to 0C Tech 2.

TCM Programming Procedure

1 The transmission control module (TCM) must be programmed with the correct software/calibration. Ensure the following conditions exist before starting the TCM programming procedure:

   a The battery is fully charged.

   b The Tech 2 cable connection at the data link connector (DLC) is secure.

   c The ignition switch is in the ON position.

2 Program the TCM using the latest software for the vehicle, refer to the following:

   a Current release of TIS for the latest software and

   b 0C Tech 2 for TCM service programming.

3 If the TCM fails to program, proceed as follows:

a Ensure the TCM connection is secured.

b Ensure Tech 2 is programmed with the latest software version.

c Attempt to re-program the TCM. Replace the TCM if it still cannot be programmed properly.

4 Specifications

For all 4L60E hydra-matic automatic transmission specifications, refer to 7C1 Automatic transmission – 4L60E – General Information.

5 Torque Wrench Specifications

For a complete listing of all torque wrench specifications for the 4L60E hydra-matic automatic transmission, refer to 7C1 Automatic transmission – 4L60E – General Information.

6 Special Tools

For a complete listing of all the special tools used for servicing the 4L60E hydra-matic automatic transmission, refer to 7C1 Automatic transmission – 4L60E – General Information.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The AW30-40LE is a 4–speed fully electronically controlled automatic transmission. It uses a microcomputer as a control unit to judge driving conditions including throttle opening rate and vehicle speed, then it sets the shifting point in the optimum timing so that best driving performance can be achieved.

In addition, the built–in driving mode select function can select three driving modes according to the driver's preference:

- Normal mode –Normal shift pattern.
- 3rd Start mode –Starts in 3rd gear to reduce slippage on mud, ice or snow.
- Power mode –Delays upshift timing when more powerful acceleration is required.

Also, the built–in fail–safe function (“emergency mode") assures driving performance even if the vehicle speed sensor, throttle signal or any solenoid fails.

Further, the self–diagnostic function conducts diagnosis in a short time when the control system fails, thus improving serviceability.

The major features of AW30-40LE are as follows:

- A compact structure consisting of 2 sets of planetary gears and flat torque converter.
- Electronic control selects the optimum driving mode according to the driving conditions.
- Electronic control maintains the optimum hydraulic pressure for clutch, band brake as well as transmission so that shift feeling is improved.
- Wide gear ratio and high torque rate of torque converter provide excellent starting performance.
- Optimum Lock-up control of each driving mode can have it both ways driving performance and fuel economy.
- Excellent shift quality can be achieved by the torque management control through the CAN communication with the engine.

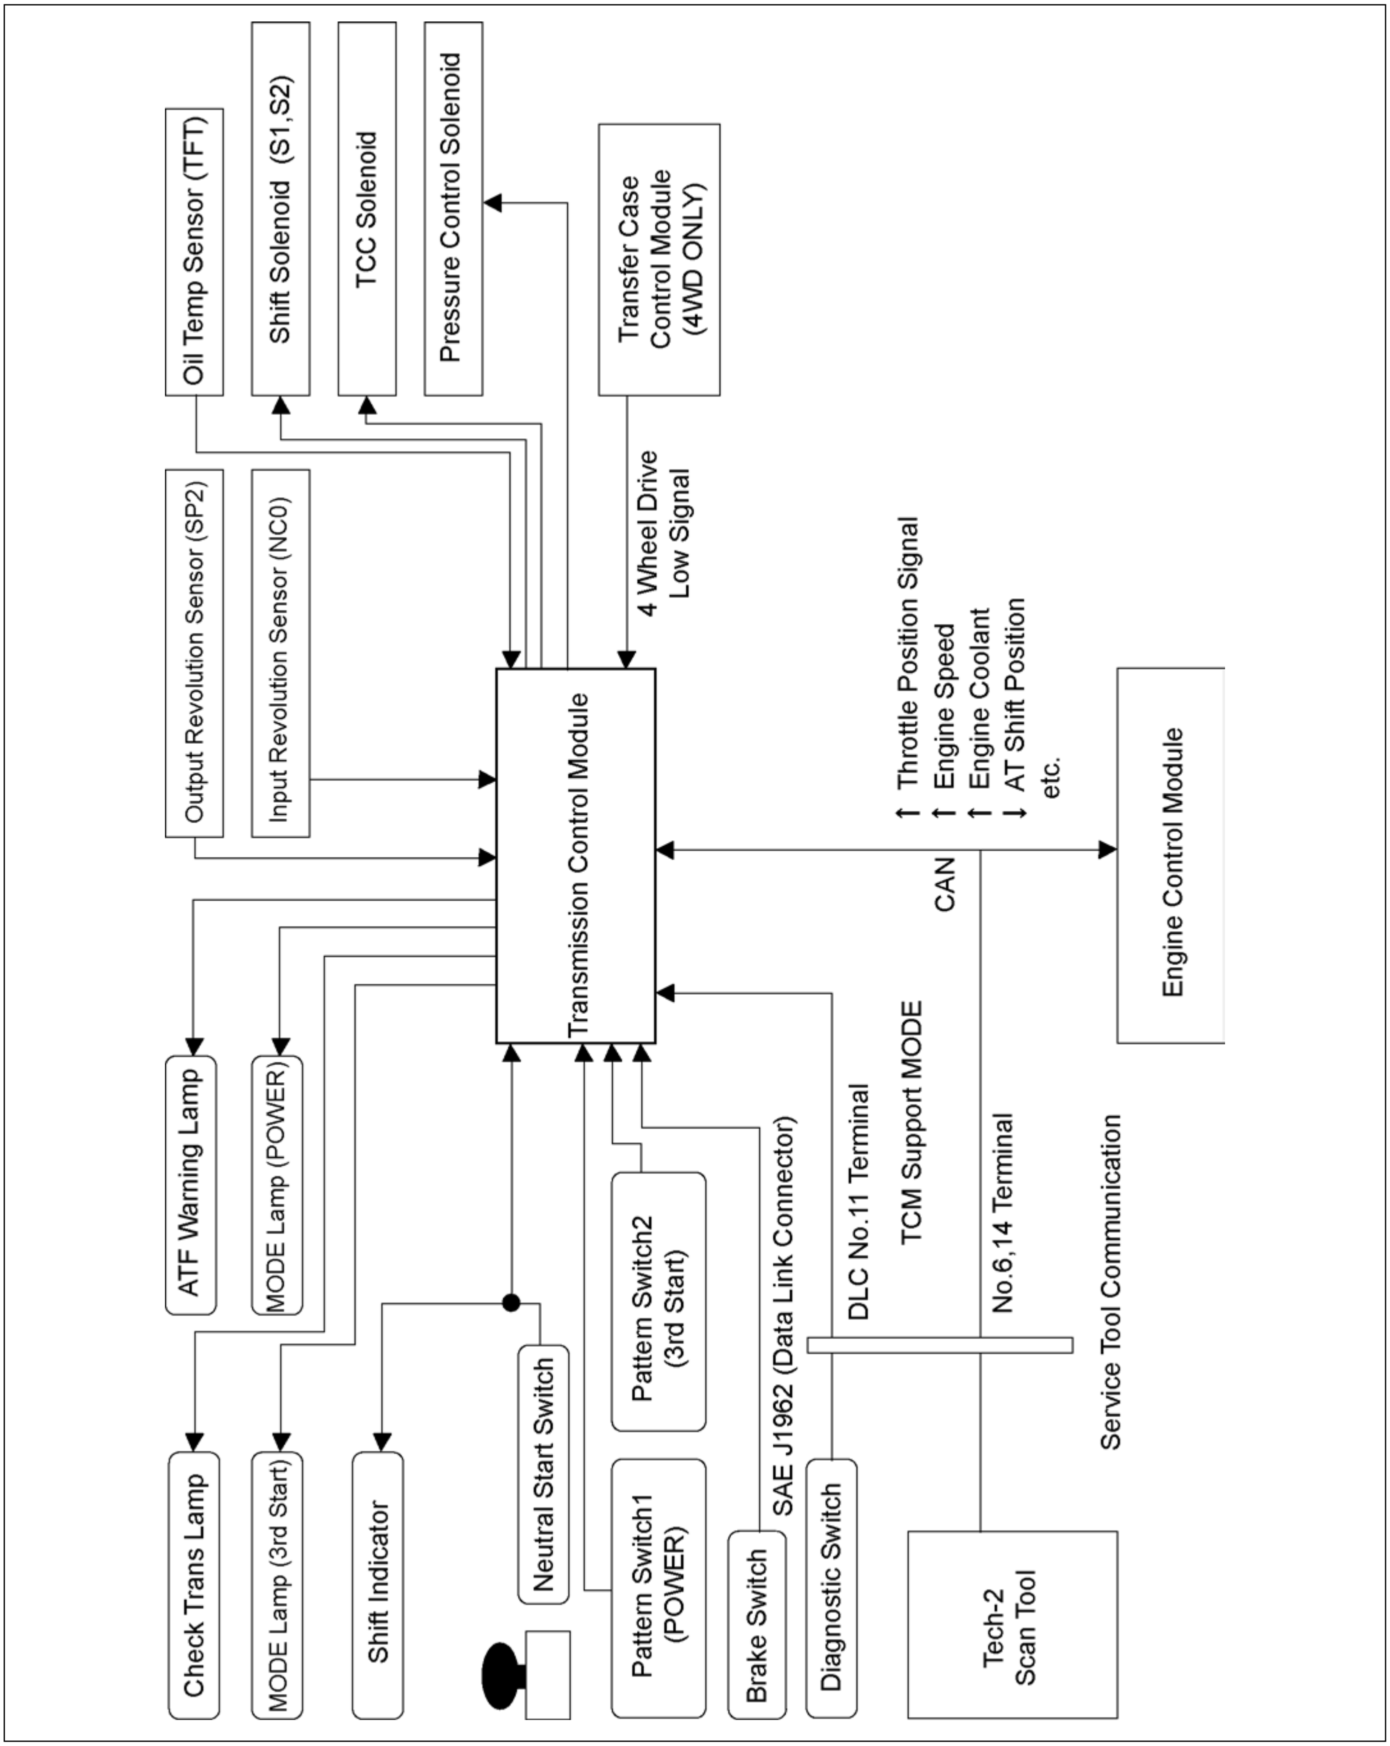
Control System Diagram



RTW77AXF000301

Control and Functions

Item	Description
Shift and lock-up control	Shift and lock-up points can be controlled in accordance with output of S1, S2, and SL solenoids based on "Shift-map" made up of vehicle speed and the opening.
Overdrive off cut control	When the select lever is operated from D to 3, if the vehicle speed is more than 142km/h (89mph), TCM enables to remain overdrive in order to prevent over rev.
Lock-up cut control	Lock-up is inhibited with following condition in order to improve the shift feeling. • 1st gear • Idling • Operating brake switch • L position • During shift change
Driveng mode select control	• The TCM selects a suitable driving mode from the ten kinds for the variety driving condition. 1) Normal mode 2) Power mode 3) 3rd start mode 4) HOT mode 5) L4 mode 6) Up slope1 mode 7) Up slope2 mode 8) Down slope mode 9) Auto cruise mode 10) Warm up mode • The priority of driving mode Normal < Power < Up slope1 < Up slope2 < Down slope < L4 < Warm up < Auto cruise < 3rd start < HOT
Oil temperature compensation control	If the ATF temperature exceeds 130°C (266°F), the TCM selects the HOT mode shift pattern for lock-up, thus preventing the oil temperature from rising. (The HOT mode is released, if the ATF temperature is less than 115°C /239°F.)
3rd start mode control	By selecting 3rd start mode, the vehicle starting can be controls smoothly on low frictional road like a snowy or muddy. 1. Enable condition a) The gear select position is "D" only. b) Vehicle speed is less than 11km/h (7mph). c) Transmission oil temperature is less than 120°C (248°F). d) Accelerator opening is less than 8%. e) Except 3rd start mode. 2. Disable condition a) Turning off the 3rd start mode switch b) Shifting select position to "3", "2", or "L"(3rd start mode is not canceled by selecting "N", "R", or "P") c) Ignition key is turned off. d) Vehicle speed is more than 35km/h (22mph).
L4 mode control	The TCM detects whether the transfer is engaged in high or low based on L4 switch signal, and selects the "Shift-map".

Item	Description
Reverse lock out control	If the select lever is moved to "R" position during forward driving, the TCM prohibits reverse driving by turn off the S1 and turn on the S2 for prevention of danger and protection of the automatic transmission. 1. Enable condition a) Vehicle speed is more than 11km/h (7mph). 2. Disable condition a) Vehicle speed is less than 9km/h (6mph). b) When except "R" position is detected.
Auto cruise mode control	If the auto cruise control can't keep the setting speed like a uphill driving, the TCM selects the auto cruise mode shift pattern for downshifting, thus keeping the vehicle speed.
Warm-up mode control	TCM selects the warm-up mode shift pattern in engine cold condition for improvement of drivability and facilitation of warm-up.
Squat control	When the TCM detects N→D garage shift, the TCM controls 1-3-1 shift by setting timer, in order to improve the shift feel at N→D.
Coast down control	The TCM switches to the coast down control at the coasting, in order to reduce the roughness of shifting.
Uphill control	When the TCM detected uphill, the TCM automatically switches to the uphill mode in two-stage in proportion to inclination pitch to prevent the busy shifting and to obtain an enough torque.
Downhill control	When the TCM detected downhill, the TCM automatically switches to the downhill mode, and shifts to the 3rd or keeps in the 3rd in order to prevent the vehicle acceleration. Then, the brake load is reduced by a moderate engine brake and fuel consumption is improved by the fuel cut.
Line pressure control	The TCM controls the impressed current of the pressure control solenoid based on the throttle opening, and regulates suitable throttle pressure.
Engine truque management control	The TCM controls engine torque for improvement of shift quality or durability under the following conditions. • Upshift and downshift • Garageshift
Indicate driving mode function	The TCM indicates the following driving mode on instrument panel. • Power mode • 3rd start mode
Indicate oil temperature warning function	If the transmission oil temperature sensor senses that transmission oil temperature is greater than 146°C (295°F), the TCM turns on ATF warning lamp. (The warning lamp is turned off, if oil temperature is less than 126°C/259°F.)
Fail-safe function	When trouble occurs to vehicle sensor and each solenoid, TCM automatically exerts fail-safe control not to spoil driveability. • This control is exerted when sensor or actuator is in trouble, while TCM works normally. • The "CHECK TRANS" light flashes to alert the driver, and the transmission must be manually shifted as follows. Select lever position / Gear position: D – 4 (Fourth); 3 – 4 (Fourth); 2 – 3 (Third); L – 3 (Third); R – Reverse Shift are firmer to prevent clutch slip and consequent wear. The fault should be corrected as soon as possible.

Removal

1. Remove the bolt and nut.
2. Take out the stabilizer bar assembly.
3. Remove the nut and take out the link from the stabilizer bar.
4. Take out the cap and bush from the stabilizer bar.

Installation

1. Set the bush and cap on the stabilizer bar.
2. Install the link on the stabilizer bar and tighten the nut to the specified torque.

Torque	N·m (kgf·m/lb·ft)
50 (5.1/37)	

3. Install the stabilizer bar assembly on the rear axle and tighten the bolt to the specified torque.

Torque	N·m (kgf·m/lb·ft)
25 (2.5/18)	

4. Set the stabilizer bar assembly to the frame bracket and tighten the nut to the specified torque.

Torque	N·m (kgf·m/lb·ft)
50 (5.1/37)	

Item	Description
Diagnosis function	• If there is an abnormality in vehicle sensors, each solenoid (S1, S2, SL, STH), or throttle position sensor, "CHECK TRANS" lamp is actuated to warn the drive. But when the abnormality items have been restored to normal, the light does not blink. • Faulty parts are memorized in TCM. If self-diagnosis start signal is inputted, "CHECK TRANS" lamp is blinked and results of diagnosis are indicated. A history of faults remains recorded even when IGN switch is off. If DG1 switch signal is inputted, or by using F1: Clear DTC Information for TECH 2, the records can be erased.
TECH 2	• Output of control data in the TCM • Actuator (Solenoid) operation check • Erasure of trouble code • Output of DTC code

CAN bus systems in automatic transmission control (AW30-40LE)

The automatic transmission control system in AW30-40LE uses high speed CAN bus system .The individual CAN bus systems are connected via two interfaces and can exchange information and data. This allows control modules that are connected to different CAN bus systems to communicate.

High speed CAN bus

Transmission control module in the vehicle that require continuous, rapid communication are connected to the high speed CAN bus. For example, the automatic transmission is continuously notified of the current engine load status. Since the automatic transmission control module has to react immediately to load status changes, rapid communication is required between the engine control module and the automatic transmission control module. The high speed CAN bus in the AW30-40LE is designed as a two-wire CAN bus (twisted pair). The wires are shielded and twisted. The transfer rate is 500 K baud.

Diagnosis

Electronic Diagnosis

How To Diagnose The Problem

1. To avoid incorrect diagnostics, this book needs to be followed accurately. Unless stated, **do not jump directly to a section that could contain the solution. Some important information may be missed.**
2. The sections in CAPITALS and bold are the main sections that can be found in the contents.
3. The go to **"SECTION"** means to continue to check going to the "section".
4. The go through **"SECTION"** means to go through the "section" and then to go back to the place the go through was written.
5. BASIC ELECTRIC CIRCUITS:

   You should understand the basic theory of electricity. This includes the meaning of voltage, amps, ohms, and what happens in a circuit with an open or shorted wire. You should also be able to read and understand wiring diagrams.

Check Trans Indicator

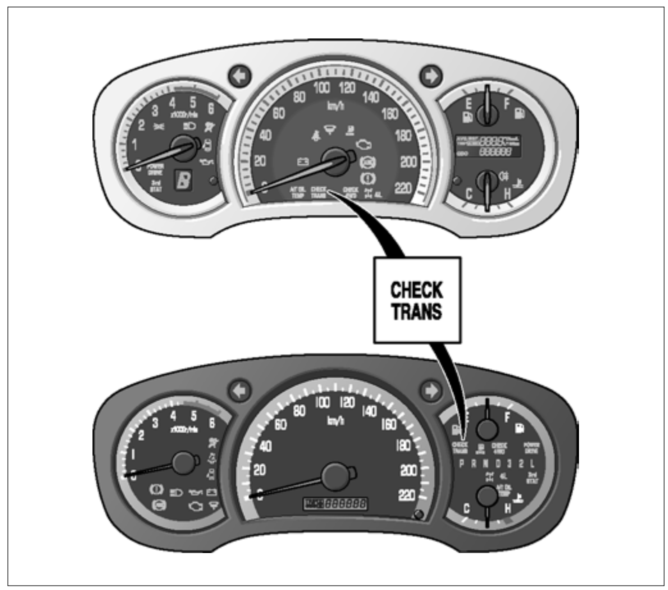
Find CHECK TRANS indicator and verify if it is

A. Flashing: Go to **On-Board Diagnostic (OBD) System Check.**

B. Staying on: Go through **"Check Trans" Check**.

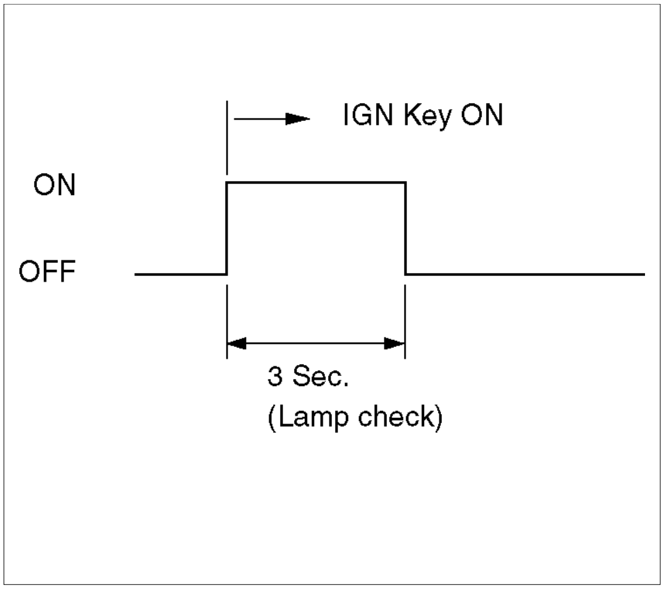
C. Is never "ON" when the ignition key is turned on: Go through **"Check Trans" Check**

D. Is "ON" during 3 seconds at ignition but "OFF" after: Normal operation. No DTC or malfunction.



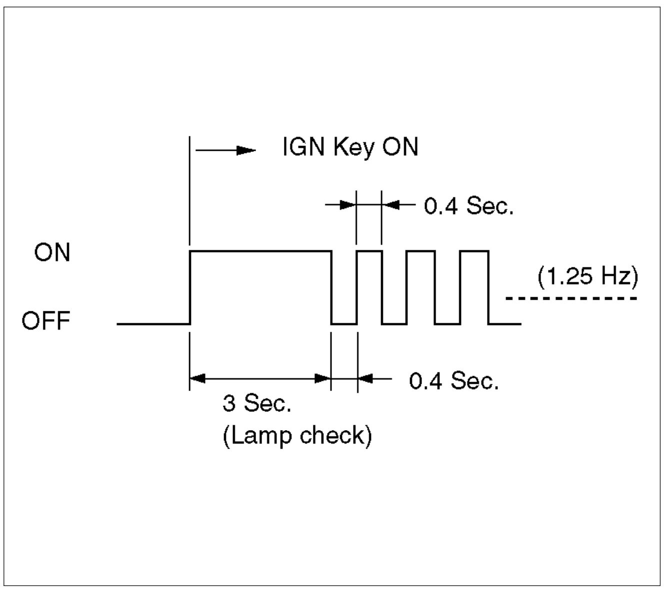
RTW77ASH000101

Normal



C07RY005-1

Abnormal



C07RY00042-1

On-Board Diagnostic (OBD) System Check

This test determines if the transmission or its input or output connections or sensors are failing.

1. Connect the Tech 2: Go through **Tech 2 Operating**.
2. Turn on the ignition but not the engine.
3. Push “F0” on Tech 2 to see the Diagnostic Trouble Code (DTC):
4. Do you have a DTC?

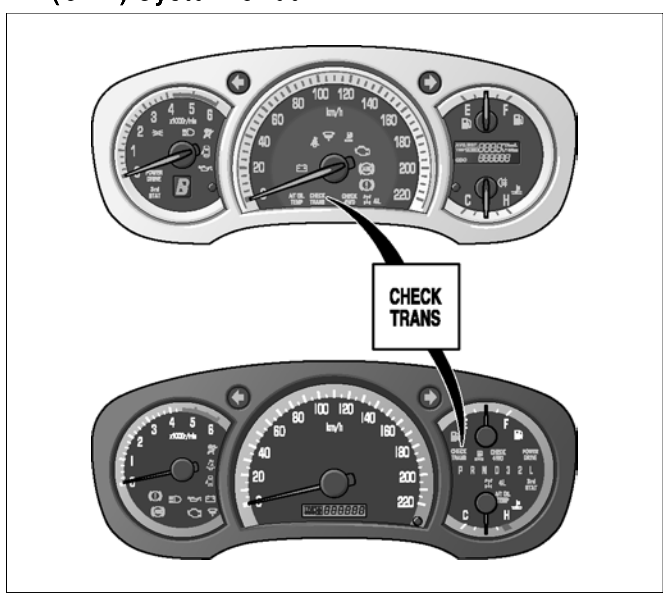
   YES: write down all code numbers and do the **DTC CHECK**

   NO: the DTC can not help you find the problem.

   1. Go through **“Check Trans” Check**
   2. If it is flashing and the flash is 0.4 seconds “ON” and 0.4 seconds “OFF”, this means that you should have a DTC stored. Please recheck go to **On-Board Diagnostic (OBD) System Check** and if you find the same problem, replace the Transmission Control Module (TCM).

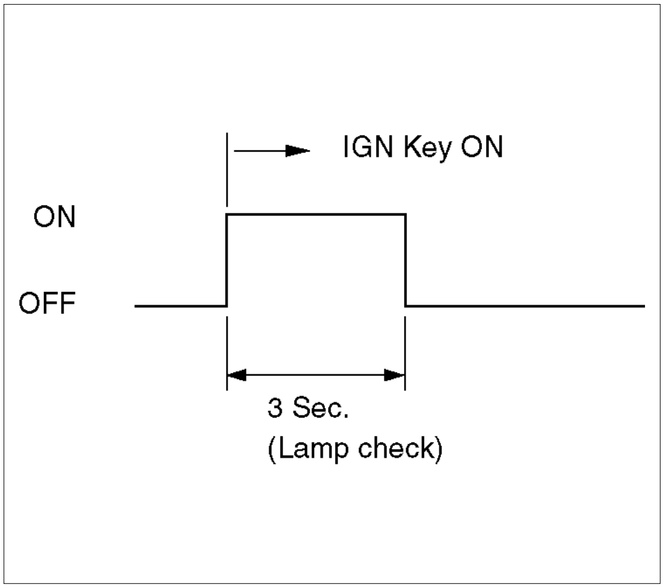
“Check Trans” Check

1. Indicator is “ON” during 3 seconds at ignition but it is “OFF” after the engine starts. The indicator is working normally go to **On-Board Diagnostic (OBD) System Check**.



RTW77ASH000101

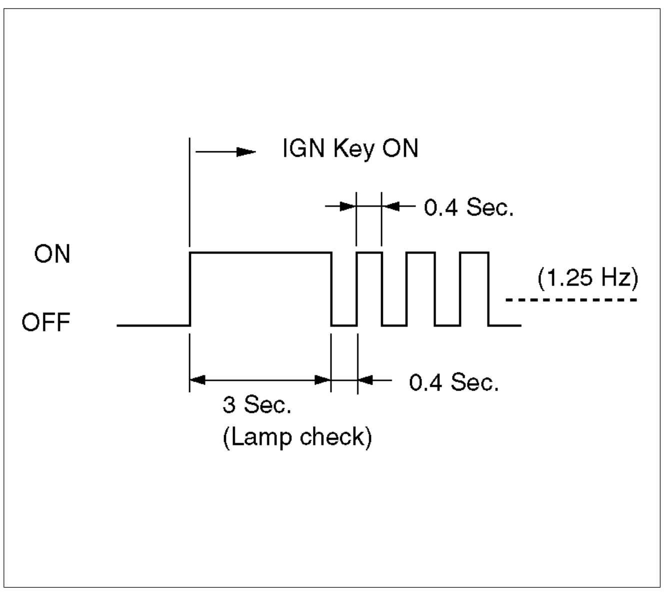
Normal



C07RY005-1

2. Indicator is flashing and the flash is 0.4 seconds "ON" and 0.4 seconds "OFF" always when ignition is on (engine cranked or not). This means that there is a malfunction. Go to **On-Board Diagnostic (OBD) System Check**.

Abnormal



C07RY00042-1

3. Indicator is staying "ON" always when Ignition is "ON".
   1. This means that connection between the lamp and the indicator control unit is shorted to ground.
   2. Verify if instrument panel terminal 25 of connector B–23 is shorted to ground.
   3. Verify if the indicator control unit connector C–95 terminal 3 is shorted to ground.
   4. Verify that the instrument panel terminal 8 of connector B–24 is connected to battery.
   5. If a problem was solved: Go to **Check Trans Indicator**.

      NO: Replace Transmission Control Module (TCM).
4. Indicator is staying "OFF" with the ignition "ON" (engine "OFF").
   1. This means that connection between the lamp and the indicator control unit is shorted to battery or opened.
   2. Verify if instrument panel terminal 25 of connector B–23 is shorted to battery or open.
   3. Verify if the indicator control unit connector C–95 terminal 3 is shorted to battery or open.
   4. Verify that the instrument panel terminal 25 of connector B–23 is connected to battery. If not, check the meter fuse and the connections (terminal 2 of connector H–7) voltage.

5. If a problem was solved: Go to **Check Trans Indicator**.

   NO: Replace Transmission Control Module (TCM).

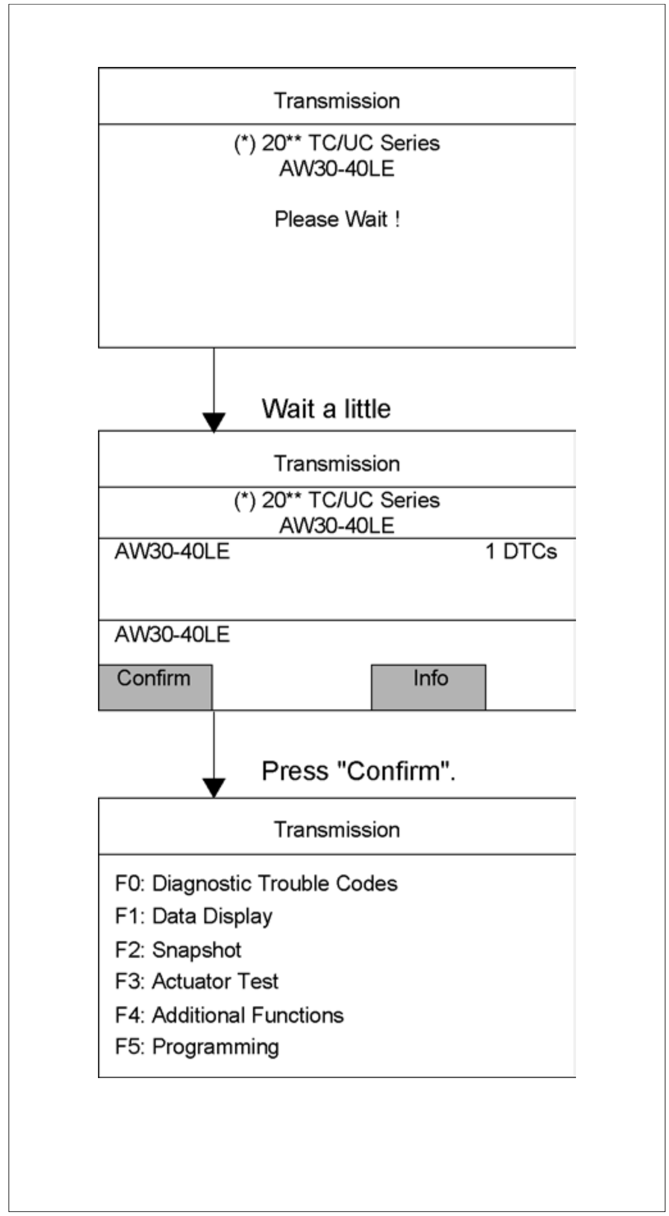
RTW77ALH000501



RTW77ALH000601

Once the test vehicle has been identified an "Application Menu" screen appears. Please select the appropriate application.

The following table shows, which functions are used for the available equipment versions.

- F0: Diagnostic Trouble Codes
  - F0: Read DTC Information
  - F1: Clear DTC Information
- F1: Data Display
- F2: Snapshot
- F3: Actuator Test
  - F0: Solenoid 2-3 Test
  - F1: Solenoid 1-2/3-4 Test
  - F2: Pressure Control Solenoid (PCS)
  - F3: TCC Solenoid Test
  - F4: 3rd Start Lamp Test
  - F5: Power Lamp Test
  - F6: AT Oil Temperature Lamp Test
  - F7: Check Light Test
- F4: Additional Functions
  - F0: Read ECU Identification
- F5: Programming
  - F0: Program Vehicle Identification No.

Diagnostic Trouble Codes

The purpose of the “Diagnostic Trouble Codes” mode is to display stored TCM trouble codes.

When “Diagnostic Trouble Codes” is selected an “Application Menu” screen appears.

Read DTC Information

When “Read DTC Information” is selected, an “Application Menu” appears with a list of DTC information function keys addressing DTC specifics and their origins.

Function key selections may vary for particular vehicle and/or system.

Requested emission-related DTCs

Clear DTC Information

The purpose of the “Clear DTC Information” mode is to command the clearing of stored TCM trouble codes.

When “Clear DTC Information” is selected, a “Clear DTC Information”, warning screen appears. This screen informs you that by cleaning DTC's, “all stored DTC information in controller will be erased”.

Do you want to clear DTC's (Yes/No).

Press either the Yes or No key when answering.

After clearing codes, confirm system operation by test-driving the vehicle.

Allow the vehicle to shift through all four forward gears in a manner which attempts to repeat the failure condition.

NOTE: When the trouble has not been repaired and the trouble code cannot be erased, check the vehicle again.

Data Display

The purpose of the “Data Display” mode is to continuously monitor data parameters.

The current actual values of all important sensors and signals in the system are displayed through F1 mode.

When “Data Display” is selected an “Application Menu” appears. “Transmission Data Display”.

See “Transmission Data” on next page.

Snapshot

When “Snapshot” is selected an “Application Menu” appears.

When “Transmission Snapshot” application is selected from the “Application Menu”, a “Snapshot Menu” appears, displaying several options. “Snapshot” options may vary from one system to another.

“Snapshot” allows a recording of all vehicle parameters. There parameters may then be replayed at a future point in time.

This action allows you to focus on making the condition occur, rather than trying to view all of the data in anticipation of the fault. The snapshot will collect parameter information around a trigger point that you select.

When a snapshot is taken, it is recorded onto the PCMCIA memory card. When the Tech 2 is powered down. Snapshots are not lost.

Actuator Test

The purpose of “Actuator Test” mode is to check for correct operation of electronic system actuators.

Solenoid 2-3 Test, Solenoid 1-2/3-4 and Test TCC Solenoid Test

You can operate the solenoids by pressing the “ON” and “OFF” buttons.

Preconditions: P–N position, no vehicle speed, no engine speed

Pressure Control Solenoid (PCS)

You can set desired PCS Current using the “ON” and “OFF” button. The PCS Data informs about PCS Current, Pressure and Duty Cycle.

Preconditions: P–N position, no engine speed, no vehicle speed

3rd Start Lamp Test, Power Lamp Test, AT Oil Temperature Lamp Test and Check Light Test

You can operate the lamps by pressing the “ON” and “OFF” buttons.

Preconditions: none

NOTE:

Freeze Frame

Freeze Frame is an element of the Diagnostic Management System which stores various vehicle information at the moment an emission-related fault is stored in memory and when the Check Trans Lamp is commanded on. These data can help to identity the cause of a fault. Refer to *Storing And Erasing Freeze Frame Data for more detailed information.*

TROUBLESHOOTING

1. BODY INCLINATION

Checkpoint	Problem	Countermeasure
Spring	Weak or broken	Replace
Shackle pins and bushings	Worn or disintegrated	Replace
	Poorly lubricated	Regrease
Spring brackets and U-bolts	Bolt loosened	Retighten
	Cracked	Replace
Shock absorbers	Bushings worn or disintegrated	Replace
Mounting brackets	Defective	Replace

TRANSMISSION DATA

Scan Tool Parameter	Units Displayed	Typical Data Value at Engine Idle
Operating Conditions: Engine idling/ Engine coolant temperature is between 75 to 85°C(167 to 185°F)/ Accelerator pedal is constant/ Neutral or Park/ Accessories OFF/ Vehicle located at sea level		
Engine Coolant temperature	°C/°F	75 to 85°C (167 to 185°F)

PCS Desired Current	mA	976
PCS Actual Current	mA	976
Speed Ratio		0.89 : 1
TCC Slip Speed	rpm	75

Snapshot Display With TIS2000

Procedures for transferring and displaying Tech2 snapshot data by using TIS2000 [Snapshot Upload] function is described below.

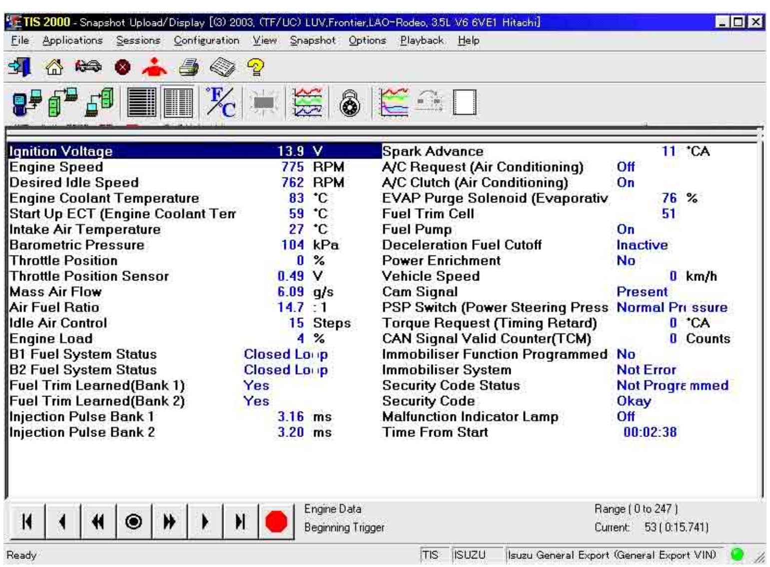
Snapshot data can be displayed with [Snapshot Upload] function included in TIS2000.

By analyzing these data in various methods, trouble conditions can be checked.

Snapshot data is displayed by executing the three steps below shown:

1. Record the snapshot data, in Tech2.

2. Transfer the snapshot data to PC.



After recording the snapshot in Tech2, transfer the data from Tech2 to PC by the below procedures.

1. Start TIS2000.
2. Select [Snapshot Upload] on the TIS2000 start screen.
3. Select [Upload from trouble diagnosis tool (transfer from diagnosis tester)] or click the corresponding icon of the tool bar.
4. Select Tech2, and transfer the recorded snapshot information.
5. Select the transferred snapshot.
6. After ending transfer of the snapshot, data parameter list is displayed on the screen.

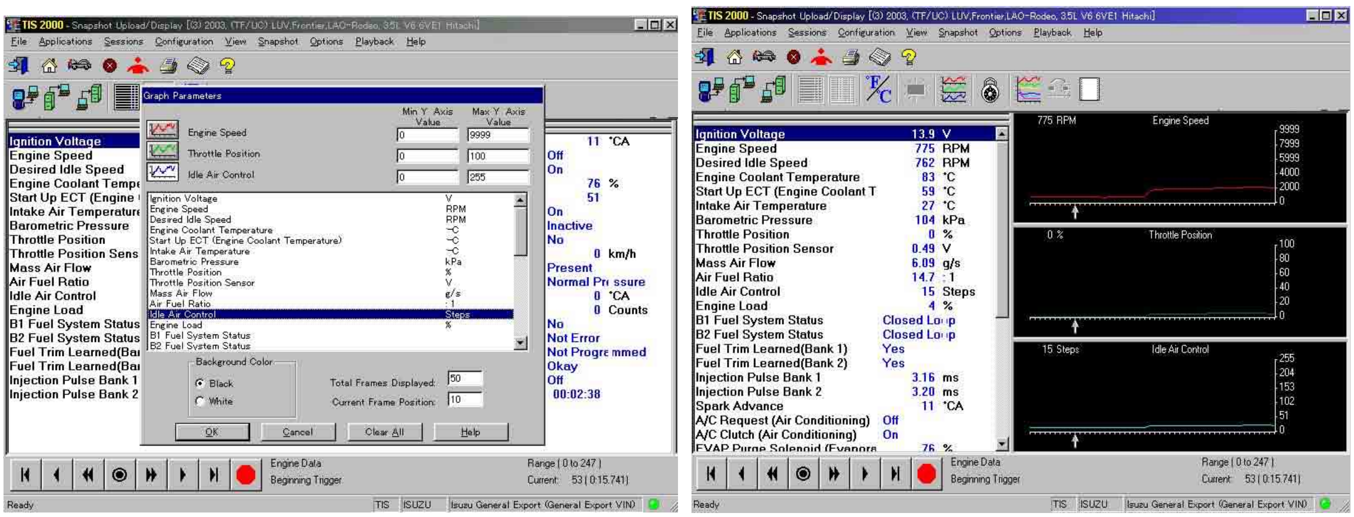
3. Snapshot data is displayed with TIS2000 [Snapshot Upload] function.

Snapshot is stored in the PC hard disk or floppy disk, and can be displayed any time.

Stored snapshot can be displayed by the following procedures.

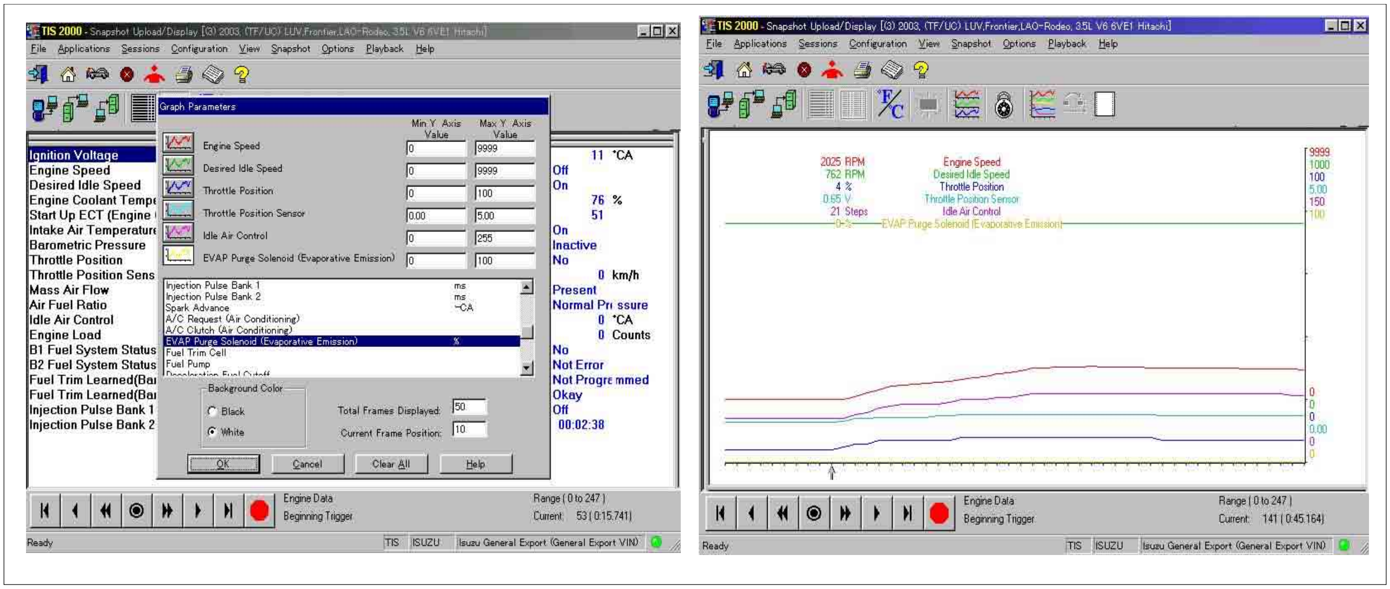
1. Start TIS2000.
2. Select [Snapshot Upload] on the TIS2000 start screen.
3. Select [Open the existing files] or click the corresponding icon of the tool bar.
4. Select the transferred snapshot.
5. Open the snapshot, to display the data parameter list on the screen.

Graph display Values and graphs (Max. 3 graphs):



1. Click the icon for graph display. [Graph Parameter] window opens.
2. Click the first graph icon of the window upper part, and select one parameter from the list of the window lower part. Selected parameter is displayed next to the graph icon. Graph division can be selected in the field on the parameter right side.
3. Repeat the same procedures with the 2nd and 3rd icons.
4. After selecting all parameters to be displayed (Max. 3 parameters), click [OK] button.
5. Parameter selected is displayed in graph form on the right of the data parameter on the screen.
6. Graph display can be moved with the navigation icon.
7. For displaying another parameter by graph, click the parameter of the list, drug the mouse to the display screen while pressing the mouse button and release the mouse button. New parameter is displayed at the position of the previous parameter. For displaying the graph display screen in full size, move the cursor upward on the screen. When the cursor is changed to the magnifying glass form, click the screen. Graph screen is displayed on the whole screen.

Display of graphs on one screen (Max. 6 graphs):



1. Click the 6 graph icon. [Graph Parameter] window opens.
2. Click the graph icon, select the parameter to be displayed from the list and change divisions according to necessity.
3. Repeat the same procedures with the graph icons, from the 2nd to 6th.
4. Click the [OK] button to display.
5. In this case, parameters are displayed only in graph form. All parameters are displayed in one graph.
6. The graph display screen can be moved with the navigation icon.

Service Programming System (SPS)

The procedure to program the control unit by using the Service Programming System (SPS) software contained in TIS2000 is explained below.

NOTE:

- Should Tech2 display "SPS Procedure was not successful", engine will not start, but no DTCs are present, low battery voltage or poor electrical connections should be the primary suspects. Perform the SPS procedure again after rectifying the fault/s.

IMPORTANT:

Perform the following checks before attempting to program the control unit:

- **The Tech2 PCMCIA card is programmed with the latest software release.**
- **The latest release of TIS2000 is loaded on the PC.**
- **The vehicle battery is fully charged.**
- **The control unit to be programmed is connected to the vehicle.**

1. Preparations of TIS 2000

1. Connect Tech 2 to P/C.
2. Check to see if Hardware Key is plugged into Port.
3. Activate TIS 2000 by P/C.
4. On the activating screen of TIS2000, choose "Service Programming System".

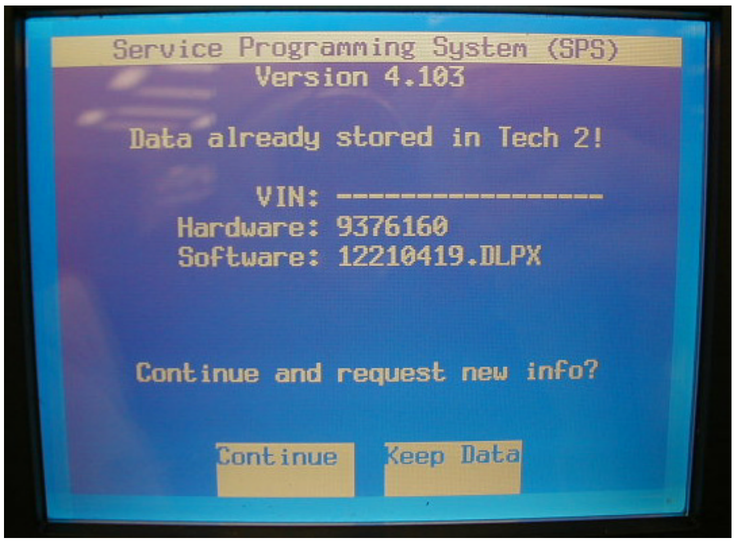
5. On the screen of "Diagnostic Tester and Processing Program Selection", choose the one that will comply with the following.

- Diagnostic tester in use
- New programming by the existing module or new programming by the replaced/new module.
- Fixing position of the control unit.

6. Upon completion of the selection, push the button of "Continue".

2.Demand of Data

1. Connect Tech 2 to the vehicle. When activated by turning on the power of Tech 2, push the "Enter" switch.
2. Turn on the ignition switch (without starting the engine)
3. In the main menu of Diagnostic Tester, push "F1: Service Programming System (SPS)".
4. Push “F0: Request Info” of Tech 2.
5. Where vehicle data has been already saved in Tech 2, the existing data come on display. In this instance, as Tech 2 starts asking whether to keep the data or to continue obtaining a new data from the control unit, choose either of them.



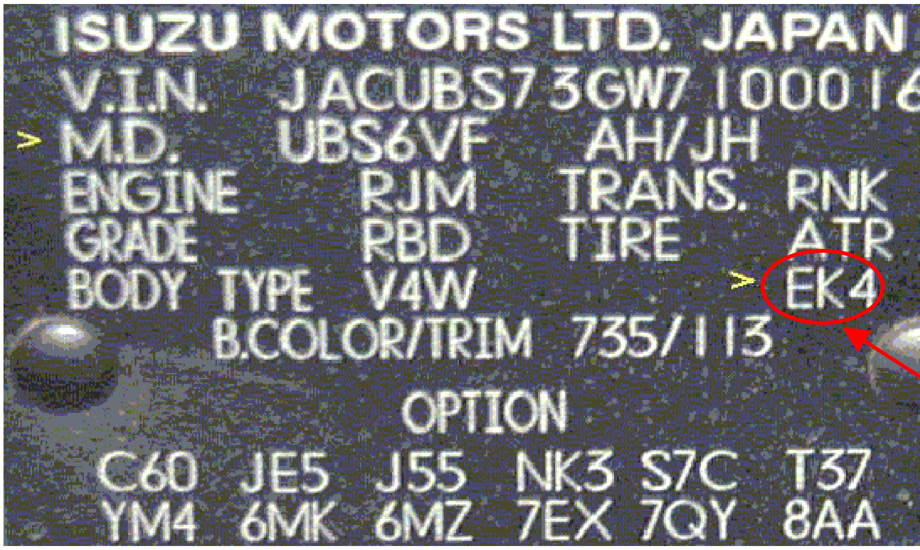
6. If you select “continue”, you have to select “Model Year”, “Vehicle Type”, “Controller Type (Engine)”.
7. After that. then push button and turn Ignition switch tuned on, off, on following Tech 2 display. Tech 2 will read information from controller after this procedure.
8. During obtaining information, Tech 2 is receiving information from the control unit chosen. In replacing the control unit, please be sure to undertake “Obtaining Information” from the new unit. With VIN not being programmed into the new control unit at the time of shipment, "obtaining information" is not complete (because the vehicle model, engine model and model year are specified from VIN). For the procedure get additional information on vehicles, instruction will be provided in dialog form, when TIS2000 is in operation.
9. Following instructions by Tech 2, push the “Exit” switch of Tech 2, turn off the ignition of the vehicle and turn off the power of Tech 2, thereby removing from the vehicle.

3.Data Exchange

1. Connect Tech 2 to P/C, turn on the power and click the “Next” button of P/C.
2. Check VIN of the vehicle and choose “Next”.
3. When a lack of data is asked from among the following menu, enter accordingly.
   Select following Menu
   - Model Year
   - Model
   - Engine type
   - Transmission type
   - Destination code (vehicles for general export)*1
   - Immobiliser

* 1: How to read the destination code

"Destination code can be read from ID Plate affixed on vehicles, while on VIN plate the destination code is described at the right-hand edge of Body Type line. In Fig.-3, the destination code can be read as “EK4” (Europe).



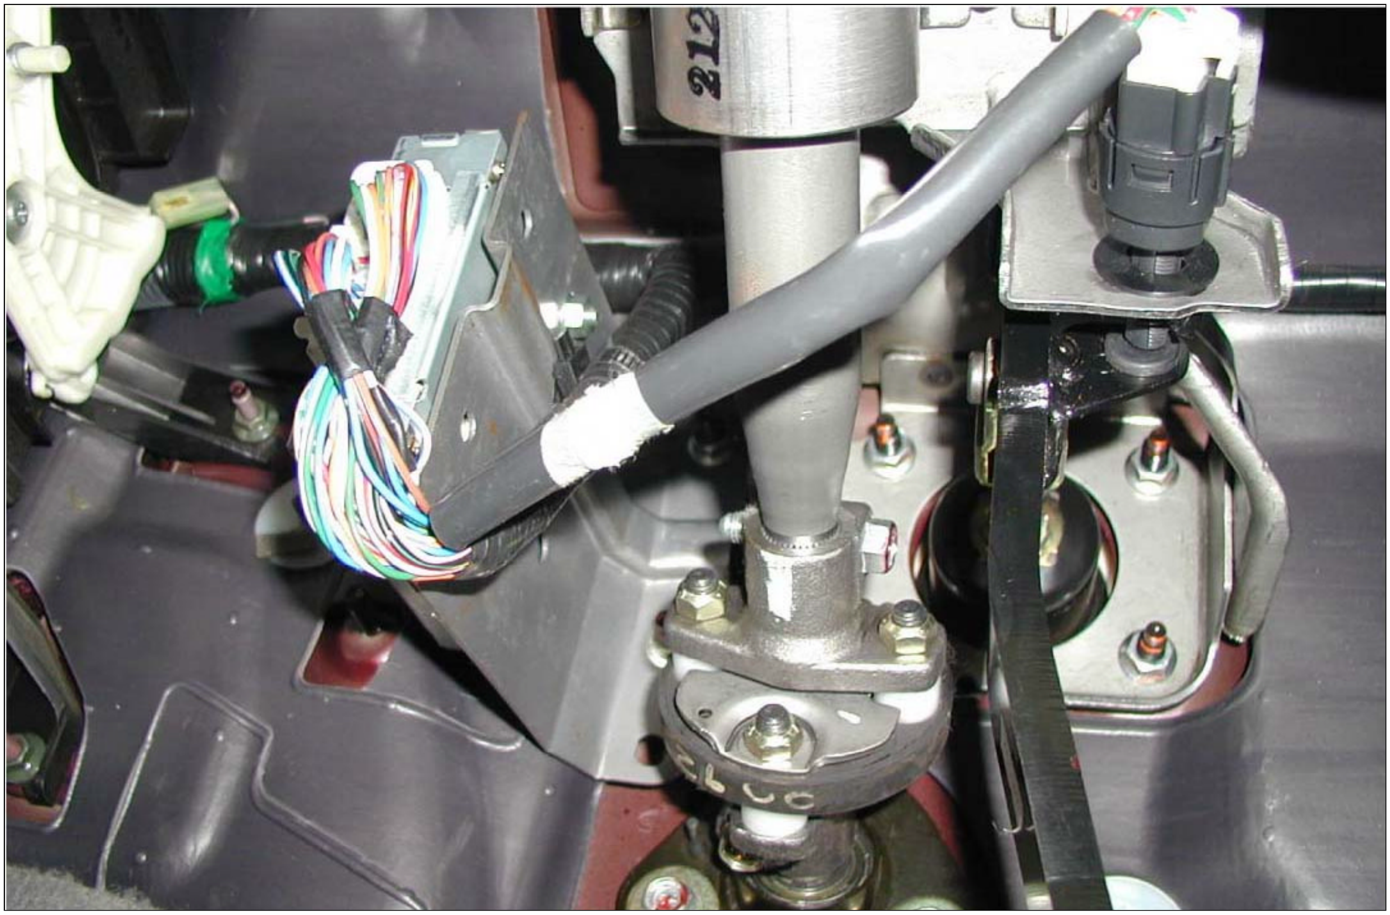
4. After choosing the data, click the “Next” button.
5. When all the necessary information is entered, the “details” of software within the database that match the entered data will appear for confirmation. Click the “Program” switch and then download the new software onto Tech 2.
6. “Data Transfer” comes on display. The progress of downloading will be displayed on the screen in the form of bar graph.
7. Upon finishing the data transfer, turn off the power of Tech-2, removing from P/C.
9. Following “Procedure 2: Demand of Data”, try over again "Information Obtaining" and check to confirm if the data has been correctly re-loaded.
10. Upon finishing confirmation, turn off the ignition of the vehicle and then turn off the power of Tech 2, removing from the vehicle.

4. Programming of TCM

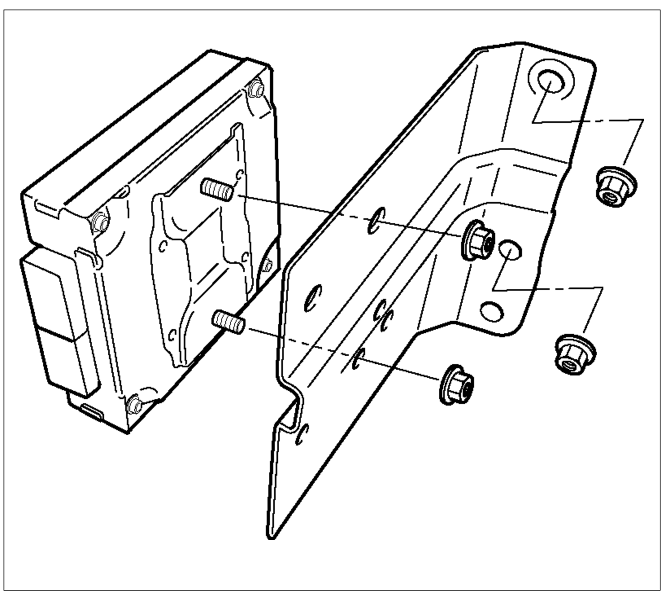
1. Check to see if batteries are fully charged.
2. Connect Tech 2 to Vehicle Diagnostic Connectors.
3. Turn on the power of Tech 2 and the title screen comes on display.
4. Turn on the ignition (without allowing the engine to start)
5. On the title screen of Tech 2, push the "Enter" button.
6. Choose “F: Service Programming System” on the main screen and then choose “F1: Programming”.
7. While data is being transferred, “Downloading” will be displayed on the Tech 2 screen.
8. Upon finishing the data transfer, Tech 2 will display “Reprogramming Successful”. Push the “Exit” button to bring program to completion.

OBD Diagnostic Management System

Transmission Control Module (TCM) Location



P1010052

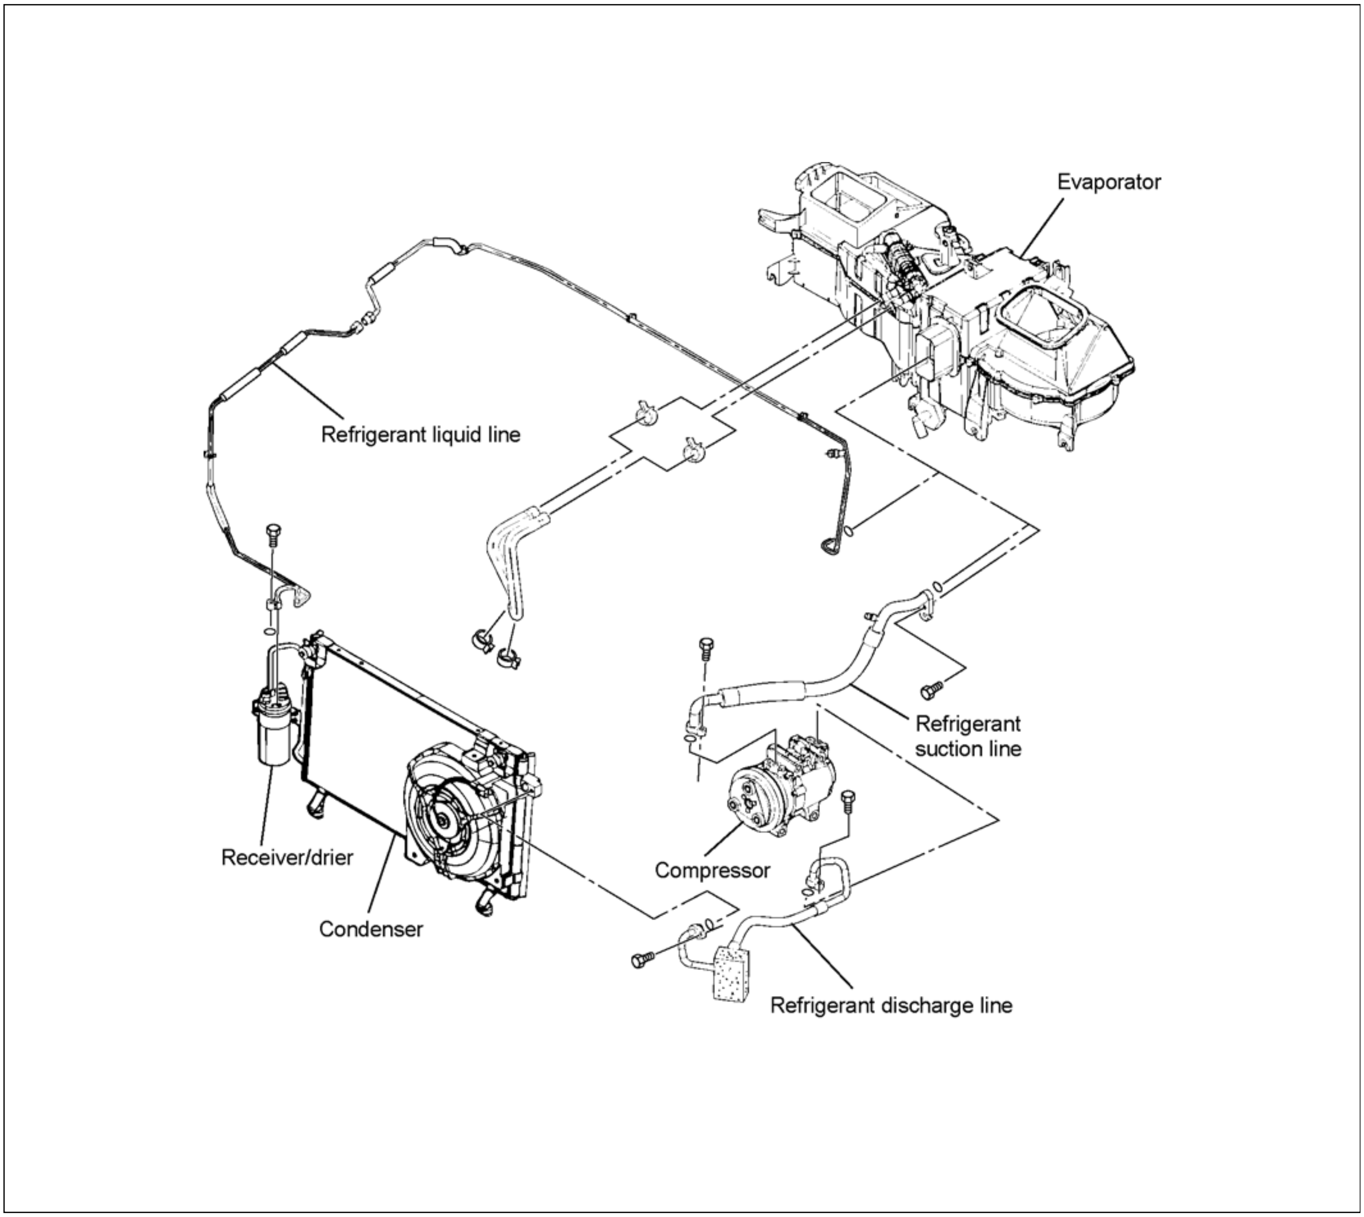


RTW37ASH000301

GENERAL REPAIR INSTRUCTIONS

1. Park the vehicle on level ground and chock the front or rear wheels before lifting the vehicle.
2. Raise the vehicle with a jack set against the axle or the frame.
3. Support the vehicle on chassis stands.
4. Use covers on the vehicle body, seats, and floor to prevent damage and/or contamination.
5. Disconnect the grounding cable from the battery before performing service operations.
   This will prevent cable damage or burning due to short circuiting.
6. Handle brake fluid and antifreeze solution with great care.
   Spilling these liquids on painted surfaces will damage the paint.
7. The use of the proper tool(s) and special tool(s) where specified is essential to efficient, reliable, and safe service operations.
8. Always use genuine ISUZU replacement parts.
9. Discard used cotter pins, gaskets, O-rings, oil seals, lock washers, and self-locking nuts at disassembly.
   Normal function of these parts cannot be guaranteed if they are reused.
10. Prepare new cotter pins, gaskets, O-rings, oil seals, lock washers, and self-locking nuts for installation.
11. Keep the disassembled parts neatly in groups.
    This will facilitate smooth and correct reassembly.
12. Keep fixing nuts and bolts separate.
    Fixing nuts and bolts vary in hardness and design according to installation position.
13. Clean all parts before inspection or reassembly.
14. Clean the oil ports and other openings with compressed air to make certain that they are free from dirt and obstructions.
15. Lubricate the rotating and sliding faces of all moving parts with oil or grease before installation.
16. Use the recommended liquid gasket to prevent leakage.
17. Carefully observe all nut and bolt torque specifications.
18. When removing or replacing parts that require refrigerant to the discharged from the air conditioning system, be sure to use the Vehicle Refrigerant Recovery and Recycling Equipment (VRRRE) to recover and recycle R134a, to promote the aim of the protection of the ozone layer covering the earth.
19. Check and recheck your work. No service operation is complete until you have done this.

(C24SE RHD MODEL)



RTW710LF002101

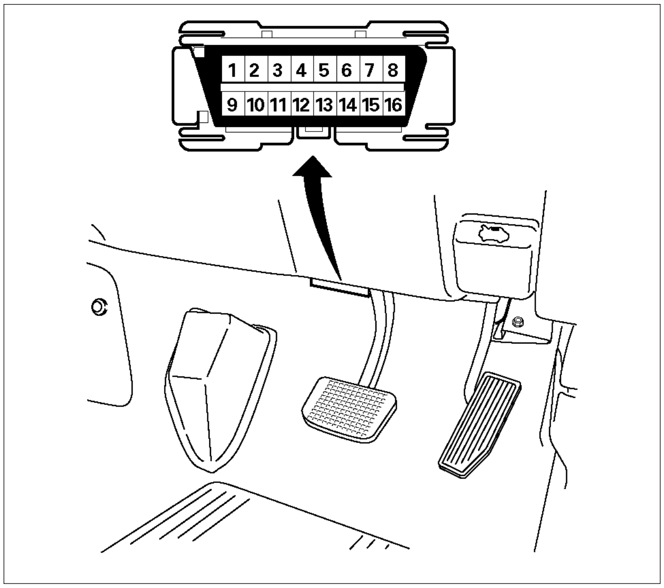
2. REDUCTION IN GROUND CLEARANCE

Checkpoint		Problem	Countermeasure
Condition of load	OK ↓		
Leaf springs	NG	Broken	Replace
↓ OK			
Springs clip bands	NG	Worn or broken	Replace
	NG	Loosened	Retighten
↓ OK			
Bushings	NG	Deteriorated or disintegrated	Replace
	NG	Poorly lubricated	Regrease
	NG	Over lubricated	Wipe off excess grease

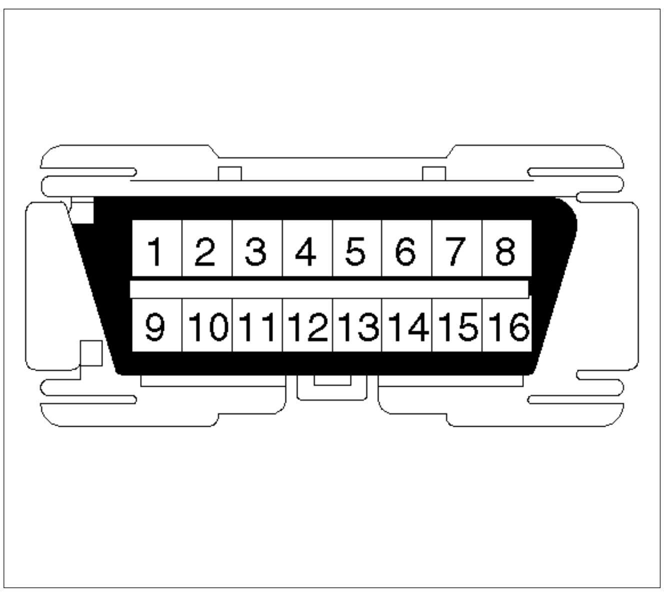
Continued on the next page

16 – Terminal Data Link Connector (DLC)

OBD standardizes Data Link Connector (DLC) configurations. The DLC, formerly referred to as the ALDL, will be a 16–terminal connector found on the lower right side of the driver's side instrument panel. All manufacturers must conform to this 16–terminal standard.



060R300015



810RT022

PIN 1 – Diagnostic request switch

PIN 15 – (Not used)
PIN 16 – Battery voltage

Clear DTC

NOTE: If you clear the DTC (Diagnostic Trouble Codes) you will not be able to read any codes recorded during the last occurrence.

NOTE: To use the DTC again to identify a problem, you will need to reproduce the fault or the problem. This may require a new test drive or just turning the ignition on (this depends on the nature of the fault).

1. IF you have a Tech 2:
    1. Connect the Tech 2 and perform the **Tech 2 Operating.**
    2. Push "F1: Clear DTC Information" in the Application Menu and answer "Yes" to the question "Do you want to clear DTC's?"
        a. When a malfunction still exists and the Tech 2 displays "AW30-40 CODES NOT CLEARED". This means that the problem is still there or that the recovery was not done. Please go to **DTC Check.**
        b. When a malfunction has been repaired and the recovery is done the Tech 2 displays "AW30-40LE CODES CLEARED".
2. When you have no Tech 2, the storaged trouble codes can be cleared by shorting the terminals No.11 and No.4 or 5 (ground) of data link connector with a lead wire for 1 ~ 6 seconds.

DTC Check

1. Diagnostic Trouble Codes (DTC) have been identified by Tech 2.
2. You have written the list of the DTCs. The order of the malfunctions has no meanings for this TCM. Usually only one or two malfunctions should be set for a given problem.
3. Check directly the DTCs you identified. The DTCs are sorted by number. Refer to Diagnostic Trouble Code (DTC) Identification in this section.

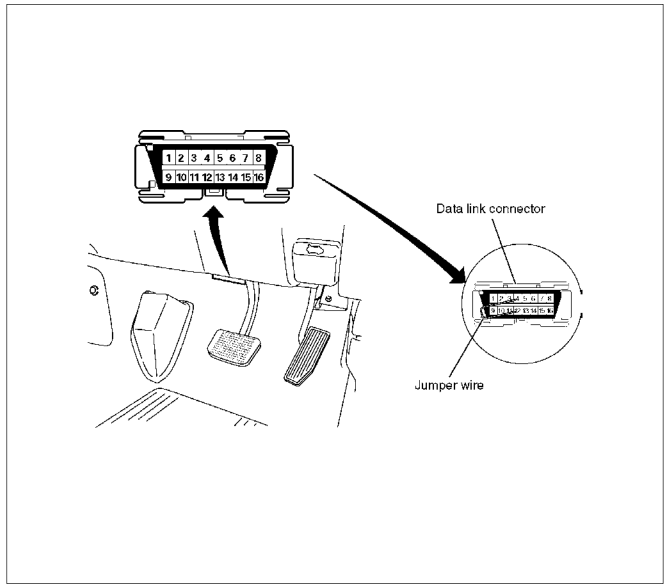
Self-diagnosis code (Flash code) display

- The stored trouble codes can be identified by shorting the terminal No. 11 and No. 4 or No. 5 (ground) data link connector with a lead wire.

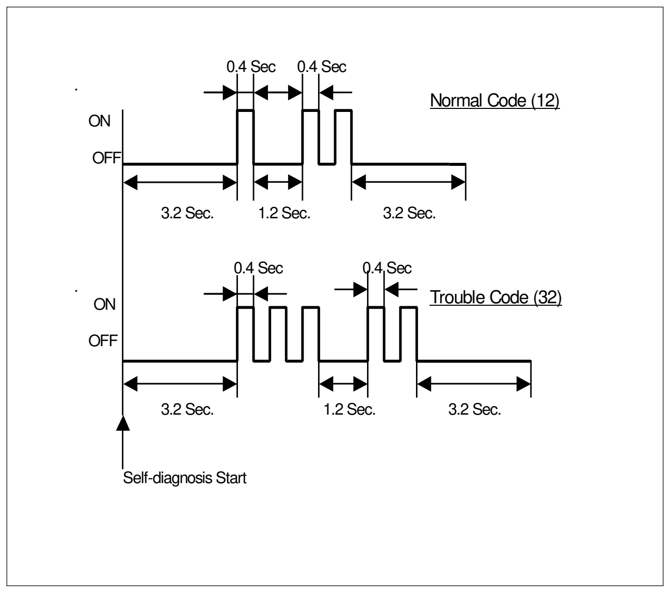
Indication Method:

1. Terminal No. 11 and No. 4 or No. 5 (ground) data link connector are short circuited.
2. Turn the key switch to the ON position.
3. If no trouble code exists, the normal code (12) is indicated repeatedly.

Data Link Connector Short Circuit



Flash Code Illumination Pattern



4. If several trouble codes have occurred at a time, each code is indicated three times in numerical order.

Trouble Code Clear Method:

If you have Tech 2:

Follow the procedure **"DIAGNOSIS WITH TECH 2"** in this manual.

If you have no Tech 2:

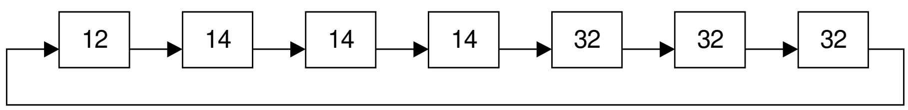
Remove ECM (B) fuse (10A) for at least 10 seconds with the ignition switched off.

NOTE:

If you clear the DTC you will not be able to read any codes recorded during the last occurrence.

To use the DTC again to identify a problem, you will need to reproduce the fault or the problem. This may require a new test drive or just turning the key switch on (this depends on the nature of the fault).

In case DTC 14 & 32 are stored:



TCM Precaution

The TCM can be damaged by:

1. The electrostatic discharge
2. The short circuit of some terminals to voltage or to ground.

Electrostatic Discharge Damage Description:

1. Electronic components used to control systems are often designed to carry very low voltage, and are very susceptible to damage caused by electrostatic discharge. It is possible for less than 100 volts of static electricity to cause damage to some electronic components. By comparison, it takes as much as 4,000 volts for a person to even feel the zap of a static discharge.
2. There are several ways for a person to become statically charged. The most common methods of charging are by friction and induction. An example of charging by friction is a person sliding across a car seat, in which a charge of as much as 25,000 volts can build up. Charging by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges for the same polarity are drained off, leaving the person highly charged with the opposite polarity. Static charges of either type can cause damage, therefore, it is important to use care when handling and testing electronic components.

NOTE: To prevent possible electrostatic discharge damage:

1. Do not touch the TCM connector pins or soldered components on the TCM circuit board.
2. Be sure to follow the guidelines listed below if servicing any of these electronic components:
3. Do not open the replacement part package until it is time to install the part.
4. Avoid touching electrical terminals of the part.
5. Before removing the part from its package, ground the package to a known good ground on the vehicle.
6. Always touch a known good ground before handling the part. This step should be repeated before installing the part if the part has been handled while sliding across the seat, while sitting down from a standing position or while walking some distance.

Information On TCM

1. The Transmission Control Module (TCM) is located in the place of a clutch pedal and is the control center of the electronic transmission control system.

2. The TCM must be maintained at a temperature below 85°C (185°F) at all times. This is most essential if the vehicle is put through a paint baking process. The TCM will become inoperative if its temperature exceeds 85°C (185°F). Therefore, it is recommended that the TCM be removed or that temporary insulation be placed around the TCM during the time the vehicle is in a paint oven or other high temperature process.
3. The TCM is designed to process the various inputs and then respond by sending the appropriate electrical signals to control transmission upshift, downshift, shift feel and torque converter clutch engagement.
4. The TCM constantly interprets information from the various sensors, and controls the systems that affect transmission and vehicle performance. By analyzing operational problems, the TCM is able to perform a diagnostic function by displaying DTC(s) and aid the technician in making repairs.

TCM Diagnostic Trouble Codes

The following table lists the diagnostic trouble codes supported by this vehicle application. If any DTCs not listed here are displayed by a scan tool, the scan tool data may be faulty; notify the scan tool manufacture of any DTCs displayed that are not included in the following table.

DTC No.	Flash Code	DTC NAME	DTC Type	
			EURO 4	Except EURO 4
P0562	72	System Voltage Error (Low)	E	E
P0563	73	System Voltage Error (High)	E	E
P0602	63	Transmission Control Module (TCM) Programming Error	E	E
P0707	17	Transmission Range Sensor Circuit Open	B	D
P0708	17	Transmission Range Sensor Circuit Short	B	D
P0712	15	Transmission Oil Temperature Circuit Short	B	D
P0713	16	Transmission Oil Temperature Circuit Open	B	D
P0717	14	Input Speed Sensor Signal Error	B	D
P0722	11	Output Speed Sensor Signal Error	B	D
P0741	43	Torque Converter Clutch Stuck “OFF”	B	F
P0742	53	Torque Converter Clutch Stuck “ON”	B	F
P0746	45	Pressure Control Solenoid F/B Stuck	B	D
P0751	41	Shift Solenoid S1 Stuck “OFF”	B	D
P0752	51	Shift Solenoid S1 Stuck “ON”	B	F
P0756	42	Shift Solenoid S2 Stuck “OFF”	B	F
P0757	52	Shift Solenoid S2 Stuck “ON”	B	F
P0962	35	Pressure Control Solenoid Circuit Open or GND Short	B	F
P0963	35	Pressure Control Solenoid Circuit Ignition Short	B	D
P0973	31	Shift Solenoid S1 Circuit GND Short	B	D
P0974	31	Shift Solenoid S1 Circuit Open or Ignition Short	B	D
P0976	32	Shift Solenoid S2 Circuit GND Short	B	D
P0977	32	Shift Solenoid S2 Circuit Open or Ignition Short	B	D
P1790	61	Transmission Control Module (TCM) ROM Checksum Error	B	D
P1791	62	Transmission Control Module (TCM) RAM Error	B	D
P2769	33	Torque Converter Clutch Circuit GND Short	B	D
P2770	33	Torque Converter Clutch Circuit Open or Ignition Short	B	D
P2773	75	Transfer 4L Switch Circuit GND Short	B	D
P2774	75	Transfer 4L Switch Circuit Open or Ignition Short	B	D
U2104	65	CAN BUS OFF	A	C
U2105	67	Lost of Communication with ECM	A	C

Diagnostic Trouble Code (DTC) Type Definitions

Emission Related DTC

Action Taken When the DTC Sets - Type A

- The Engine Control Module (ECM) illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM records the operating conditions at the time the diagnostic fails. The ECM stores this information in the Freeze Frame/ Failure Records.

Action Taken When the DTC Sets - Type B

- The ECM illuminates the MIL on the second consecutive driving cycle when the diagnostic runs and fails.
- The ECM records the operating conditions at the time the diagnostic fails, the ECM stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive driving cycle, the ECM records the operating conditions at the time of failure and stores this information in the Freeze Frame and updates the Failure Records.

Conditions for Clearing the MIL/ DTC - Type A or Type B

- The ECM turns OFF the MIL after 3 consecutive driving cycles when the diagnostic runs and does not fail. (Euro 4 Specification)
- The ECM turns OFF the MIL after 1 driving cycle when the diagnostic runs and does not fail. (Except Euro 4 Specification)
- A current DTC clears when the diagnostic runs and passes after 1 driving cycle.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported.
- Use a scan tool to clear the MIL and the DTC.

Non-Emissions Related DTCs

Action Taken When the DTC Sets - Type C or Type D

- The TCM illuminates the Check Trans lamp when the diagnostic runs and fails.
- The TCM records the operating conditions at the time the diagnostic fails. The TCM stores this information in the Failure Records.
- The TCM illuminates the Check Trans on the second consecutive driving cycle when the diagnostic runs and fails.
- The TCM records the operating conditions at the time the diagnostic fails, the TCM stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive driving cycle, the TCM records the operating conditions at the time of failure and stores this information in the Freeze Frame and updates the Failure Records.

Conditions for Clearing the Check Trans Lamp/ DTC - Type C or Type D

- The TCM turns OFF the Check Trans lamp after 1 driving cycle when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and passes after 3 driving cycle.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported.
- Use a scan tool to clear the Check Trans lamp and the DTC.

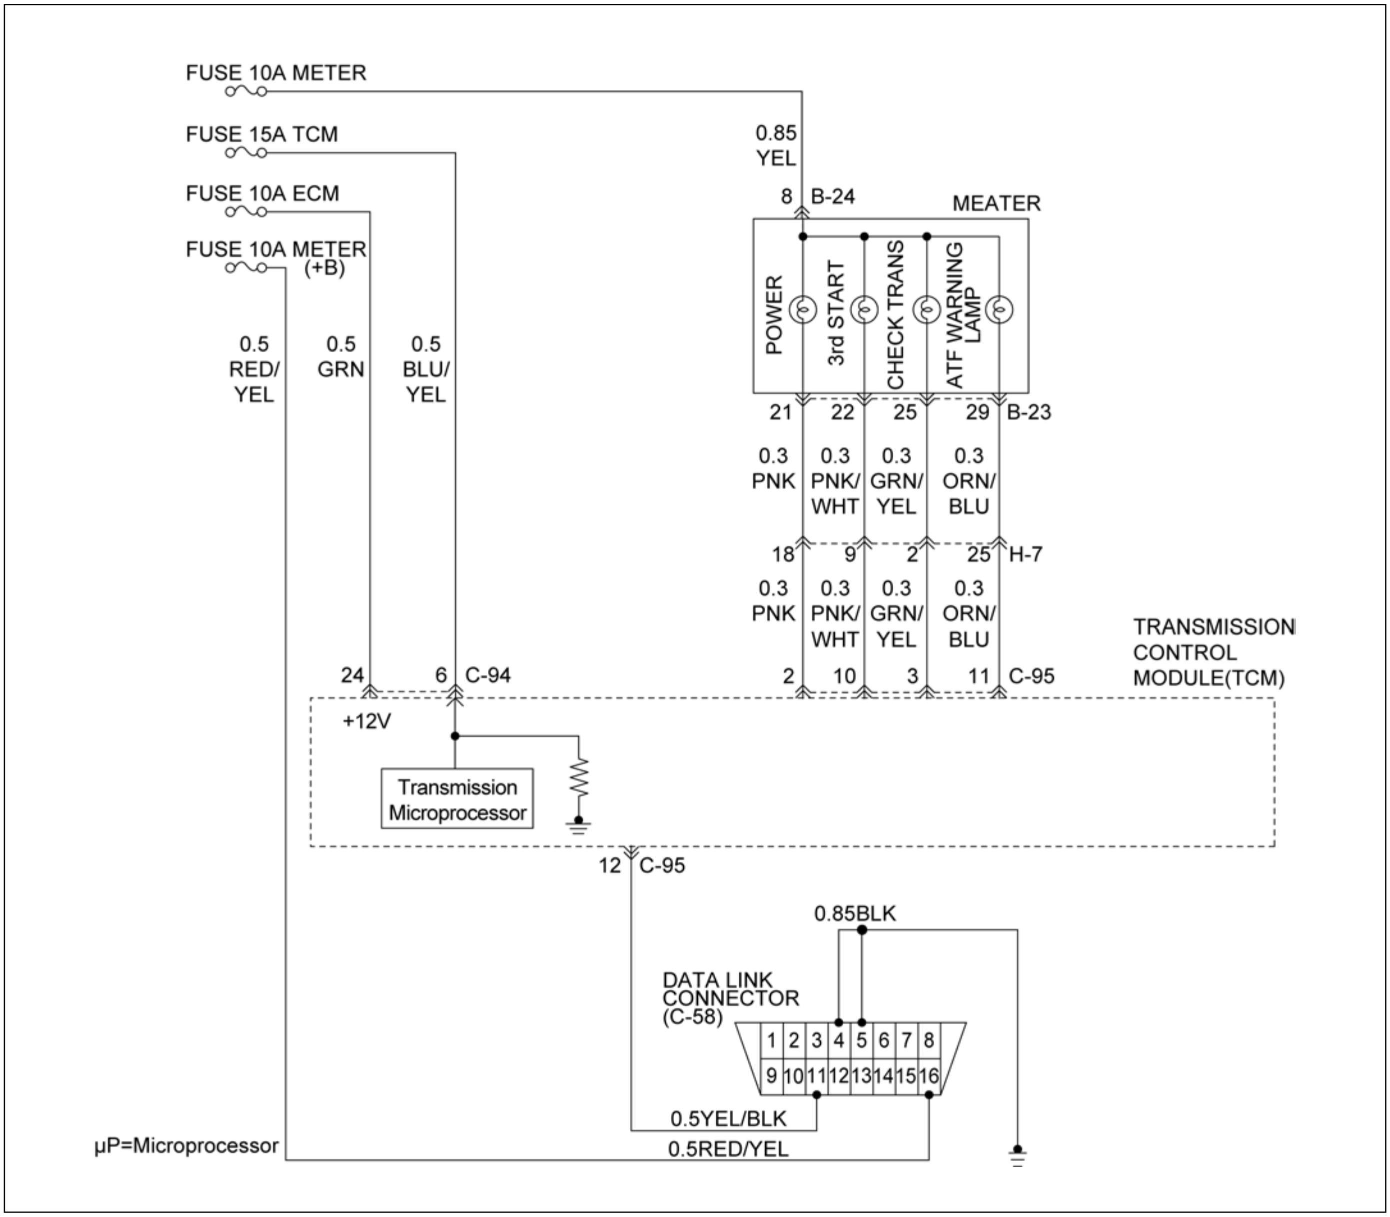
Action Taken When the DTC Sets - Type E or Type F

- The TCM will not illuminate the Check Trans lamp.
- The TCM records the operating conditions at the time the diagnostic fails. The TCM stores this information in the Failure Records.

Conditions for Clearing the DTC - Type E or Type F

- A current DTC clears when the diagnostic runs and passes after 1 driving cycle.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported.
- Use a scan tool to clear the DTC.

DTC P0562 or P0563 (Flash Code 72 or 73)



RTW77ALF001301

Circuit Description

The Transmission Control Module (TCM) monitors the system voltage on the ignition feed terminal to the TCM. A system voltage DTC will set whenever the voltage is below or above a calibrated value.

Condition For Running The DTC

Ignition "ON" and either (1) or (2) conditions are met.

(1) All of the following conditions are met.

- DTC U2104 is not detecting failure of not deciding failure.
- DTC U2105 is not detecting failure or not deciding failure.
- Engine revolution signal is not detecting failure or not deciding failure.
- The engine revolution is more than 1000rpm.
- All of the following conditions are met.
  - Device Control is not operating
  - Disable Normal Communication is receiving enable
  - DTC Clear is not operating

(2) All of the following conditions are met.

- Input revolution sensor is not detecting failure or not deciding failure.
- Input revolution is more than 1000rpm.

- All of the following conditions are met.
  - Device Control is not operating
  - Disable Normal Communication Service is receiving enable
  - DTC Clear is not operating

Condition For Setting The DTC

When the TCM detects following conditions at 20 times continuously.

- Ignition voltage is less than 9 volts for 1 second or more continuously. (DTC P0562)
- Ignition voltage is more than 18 volts for 1 second or more continuously. (DTC P0563)

Action Taken When The DTC Sets

- DTC stored.

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring.
  Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Circuit/System Testing DTC P0562 or P0563

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Using the 5-8840-0285-0 DMM, measure the battery voltage at the battery. Is the battery voltage greater than the specified value?	11.5 V	Go to *Step 3*	Charge battery, then go to *Step 3*
3	1. Install a scan tool. 2. Select “Ignition Volts” on a scan tool. 3. Start the engine and raise the engine speed to the specified value. 4. Load the electrical system by turning on the headlights, high blower, etc. Is the ignition voltage approximately equal to the specified value?	More than 1000 rpm 9.0-18.0 V	Go to *Step 4*	Go to *Starting/ Charging*

Step	Action	Value(s)	YES	NO
4	1. Turn "OFF" the ignition. 2. Disconnect the TCM connector at the TCM. 3. Using the 5-8840-0285-0 DMM, measure the battery voltage between the TCM connector terminal C94 (Pin No.24) Is it approximately equal to battery voltage?	—	Check for excessive current with ignition "OFF" engine "OFF".	Go to *Step 5*
5	1. Check for faulty connections at the TCM harness terminals. 2. Repair as necessary. Was a repair necessary?	—	Go to *Step 8*	Go to *Step 6*
6	1. Check for an open battery feed circuit to the TCM. 2. Repair as necessary. Was a repair necessary?	—	Go to *Step 8*	Go to *Step 7*
7	Replace the TCM. **Important:** The replacement TCM must be programmed. (Refer to SPS for procedure.) Was the action complete?	—	Go to *Step 8*	—
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn "OFF" the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 9*
9	Observe the stored information, Capture Info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	Verify repair

DTC P0602 (Flash Code 63)

Circuit Description

The Service Programming System (SPS) updates the flash calibration files that are stored in a Transmission Control Module (TCM). The calibration file custom-tailors a module to a certain vehicle. The calibration file contains data for things such as spark curves and fuel control. When troubleshooting a driveability problem, diagnosis may call for reprogramming the controller with newer calibration information to correct a customer concern and Vehicle Identification Number (VIN).

Condition for setting the DTC

When a VIN No. is not written into the TCM.

Action Taken When The DTC Sets

- DTC stored.

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

DTC P0602 is indicated when a VIN No. is not written into the TCM. A security lock is performed by SPS. And not replace the TCM when DTC P0602 can repair by SPS.

Checkpoint	Problem	Countermeasure
Continued from the previous page		
OK		
Parts for looseness	NG: Loose	Retighten

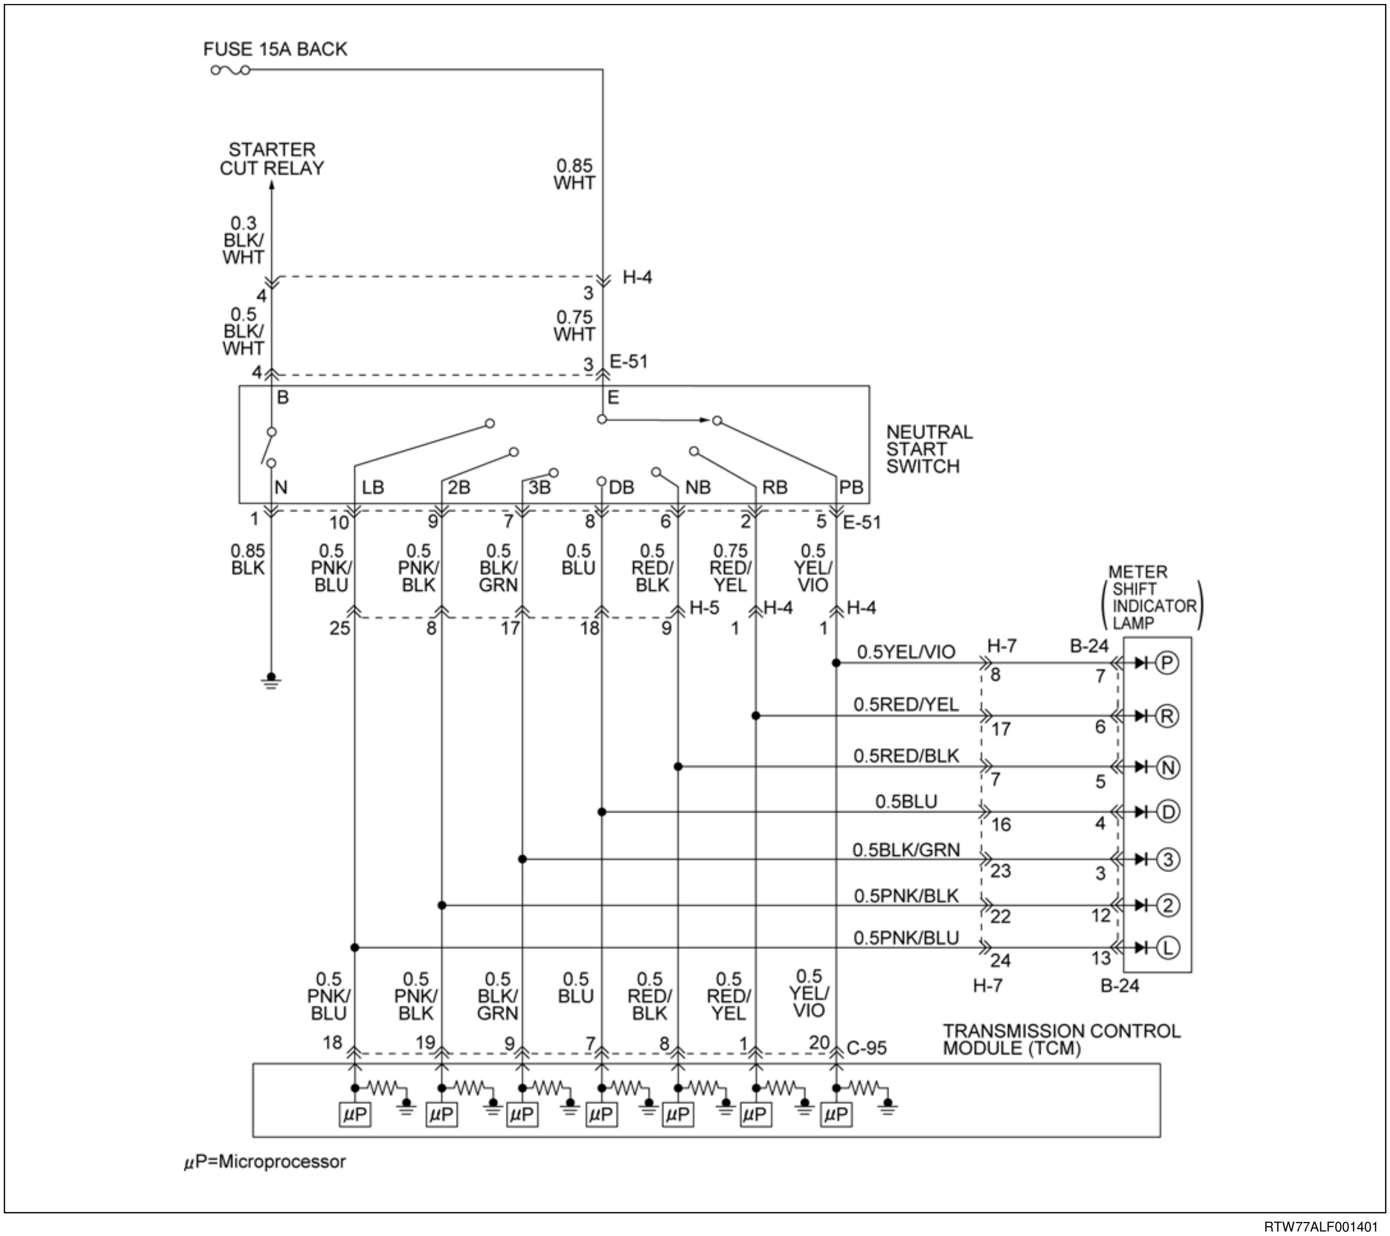
Circuit/System Testing DTC P0602

Step	Action	Value(s)	YES	NO
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Install a scan tool. 2. Turn "ON" the ignition. 3. Check the Vehicle Identification Number (VIN) by the scan tool. Is VIN on the scan tool same as VIN of vehicles?	—	Go to *Step 4*	Go to *Step 3*
3	Write a VIN by a scan tool. (Refer to *SPS* for procedure.) Is the action complete?	—	Go to *Step 4*	—
4	Clear the DTC P0602 with a scan tool. Is the action complete?	—	Go to *Step 5*	—
5	Perform the SPS and perform security lock. (Refer to *SPS* for procedure) Is the action complete?	—	Go to *Step 6*	—
6	Recheck the DTC with a scan tool. 1. Turn "OFF" the ignition. 2. Wait a few seconds. 3. Turn "ON" the ignition. Does a scan tool indicate DTC P0602?	—	Go to *Step 7*	Go to *Step 8*
7	Replace the TCM. **Important:** The replacement TCM must be programmed. (Refer to *SPS* for procedure.) Was the action complete?	—	Go to *Step 8*	—
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn "OFF" the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 9*
9	Observe the stored information, Capture Info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	Verify repair

DTC P0707 or P0708 (Flash Code 17)



Circuit Description

The neutral start switch gives the signals related to the selector lever position (PRND32L) to the Transmission Control Module (TCM). The neutral start switch turns on when the select lever is shifted to the P, R, N, D, 3, 2 or L position. The neutral start switch, which is connected to the starter switch circuit, is available only when the select lever is in the P or N position (Engine run).

The neutral start switch is connected to the transmission manual shaft and mounted on the transmission case.

Condition For Running The DTC

All of the following conditions are met.

(1) All of the following conditions are met for 2 seconds or more continuously.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.
- DTC U2104 is not detecting failure or not deciding failure.
- DTC U2105 is not detecting failure or not deciding failure.
- Engine revolution signal is not detecting failure or not deciding failure.
- The engine revolution is more than 550rpm.

(2) Not emergency mode.

(3) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication service is receiving enable.
- DTC Clear is not operating.

Condition For Setting The DTC

DTC P0707

All of the following conditions are met for 30 seconds or more continuously.

- All of the switches are “OFF”.
- Output revolution is more than 30 km/h (19 mph).
- Output revolution sensor is not detecting failure or not deciding failure.
- The engine revolution is more than 1500 rpm.

DTC P0708

The following condition is met at 10 seconds continuously.

- 2 switches or more are “ON” at the same time.

Action Taken When The DTC Sets

- No 3rd start mode.
- No slope control.
- No coast control.
- No output revolution sensor failure detection.
- No input revolution sensor failure detection.
- Keep oil temperature sensor OPEN failure detection accumulated timer.
- No T/F HI-Low SW failure detection.
- No shift solenoid functional failure detection.
- No L-up solenoid functional failure detection.
- No engine torque reduction at stall.
- Regard as D position. (DTC P0707)
- There is a priority in order of D, 3, 2, L, R, N, and P. (DTC P0708)
- Check Trans “ON”.
- DTC stored.
- MIL request “ON”. (EURO 4 only)

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

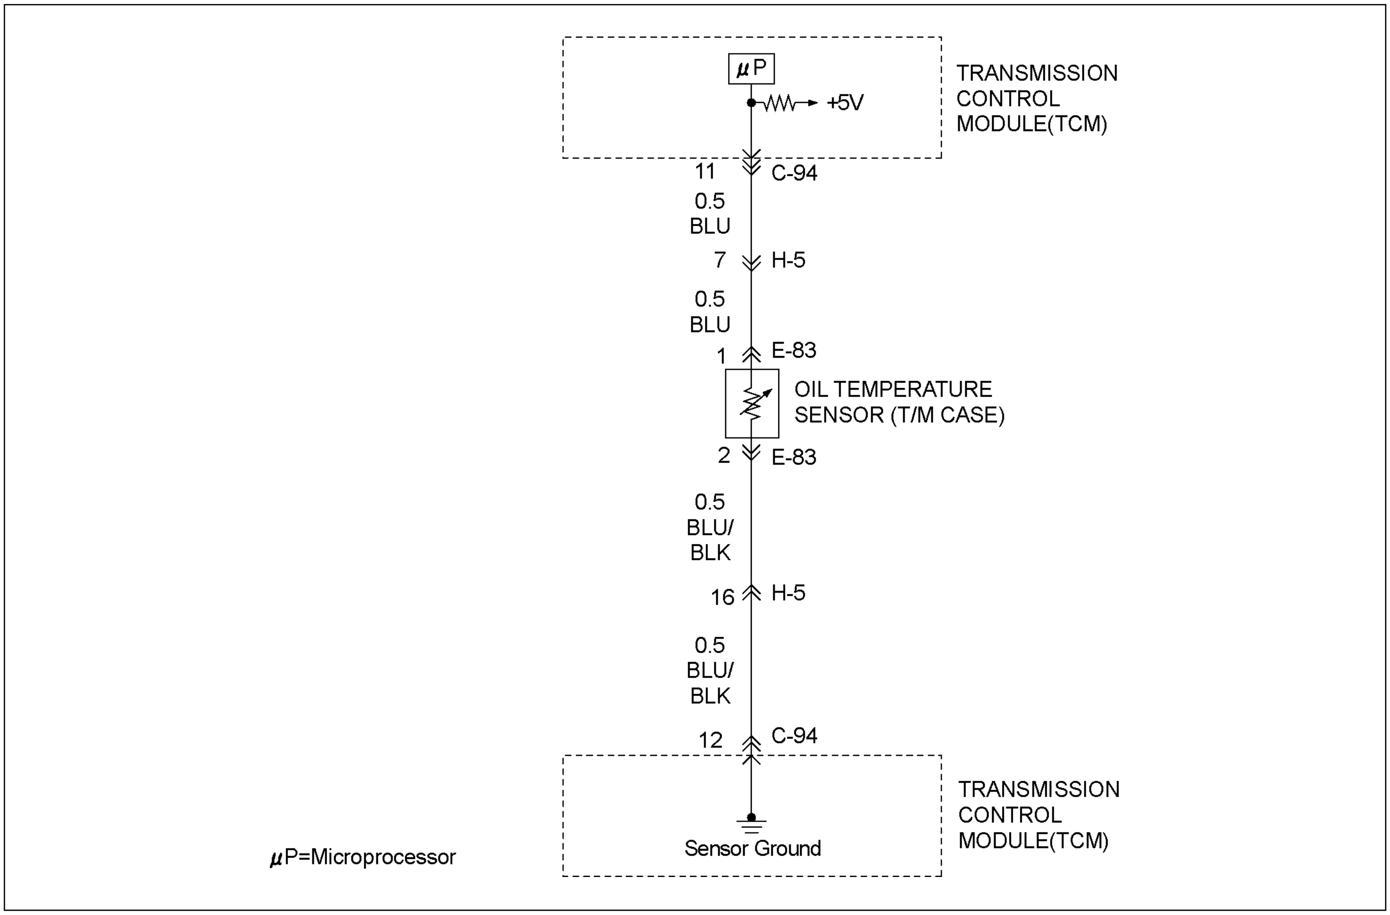
- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring.
  Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check neutral start switch for proper mounting and adjustment. (Refer to section 7A4 Components (1) neutral start switch)

Circuit/System Testing DTC P0707 or P0708

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostics (OBD) System check performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Install a scan tool. 2. Turn “ON” the ignition, with the engine “OFF”. 3. Select each lever position: D, 3, 2, L, N, R and P. Does each selected transmission position match the “Transmission Range” display on a scan tool?	—	Refer to *Diagnostic Aids*	Go to *Step 3*
3	Measure the voltage shifting the select lever every position, between TCM connector terminals and ground which performed selecting to every position. 1. Turn “OFF” the ignition. 2. Disconnect the TCM connector. 3. Turn “ON” the ignition. 4. Connect the 5-8840-0285-0 DMM to the TCM connector terminal and ground. Is the displayed voltage at every position normal?	7~16V	Go to *Step 8*	Go to *Step 4*
4	Measure the voltage between terminals the neutral start switch and ground. 1. Turn “OFF” the ignition. 2. Disconnect the inhibitor switch harness connector. 3. Turn “ON” the ignition. 4. Connect the 5-8840-0285-0 DMM to the each terminal of the neutral start switch harness connector E51-3 and ground. If a problem was found, repair as necessary. Was the problem found?	7~16V	Go to *Step 9*	Go to *Step 5*
5	Measure the resistance shifting the select lever to every position, between terminal neutral start switch connector E51-3 and E51 other terminal. 1. Turn “OFF” the ignition. 2. Disconnect the neutral start switch connector. 3. Connect the DMM to the each terminal of the neutral start switch connector E51-3 and E51-5 or E51-2 or E51-6, E51-8or E51-7or E51-9 or E51-10. If a problem was found repair as necessary. Was the problem found?	Less than 1Ω	Go to *Step 6*	Go to *Step 7*
6	Replace the neutral start switch. Is the action complete?	—	Go to *Step 9*	—

Step	Action	Value(s)	YES	NO
7	Measure he resistance between terminal neutral start switch harness connector E51 and TCM harness connector C-95. 1. Turn “OFF” the ignition. 2. Disconnect the neutral start switch and TCM connector. 3. Connect the jumper wire tot the neutral start switch harness connector E51-2, E51-5, E51-6, E51-7, E51-8, E51-9 and E51-10 and good ground. 4. Connect the 5-8840-0285-0 DMM to the each terminal of the TCM harness connector C95-1, C95-20, C95-8, C95-9, C95-7, C95-19 or C95-18. If the problem was found repair as necessary. Was the problem found?	Less than 1 Ω	Go to *Step 9*	Go to *Step 8*
8	Replace the TCM. **Important:** The replacement TCM must be programmed. (Refer to *SPS* for procedure.) Is the action complete?	—	Go to *Step 9*	—
9	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn “OFF” the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 10*
10	Observe the stored information, Capture Info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	Verify repair

DTC P0712 (Flash Code 15)



RTW77AMF000501

Circuit Description

The oil temperature sensor is a thermistor sensor that is installed in the transmission case and converts temperature changes into continuous electric signals, then outputs them to the Transmission Control Module (TCM). When the ATF temperature is low, the resistance of the sensor (thermistor) goes up, so that the voltage of the TCM signal becomes high.

As the ATF is gradually warmed, the resistance of the sensor goes down and the voltage becomes low. At the normal operating ATF temperature (80°C/176°F) of the transmission, the voltage of the TCM is about 3.7V.

Condition For Running the DTC

(1) All of the following conditions are met for 2 seconds or more continuously.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.
- DTC U2104 is not detecting failure or not deciding failure.
- DTC U2105 is not detecting failure or not deciding failure.
- Engine revolution signal is not detecting failure or not deciding failure.
- The engine revolution is more than 550rpm.

(2) Not Emergency mode

(3) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication is receiving enable.
- DTC Clear is not operating.

Condition for setting the DTC

- The TCM detects following condition for 5 minutes continuously.
- Oil temperature is less than 220°C (428°F).

Action Taken When The DTC Sets

- Control at A/T oil temperature 80°C (176°F).
- No squat control.
- No slope control.
- No 3rd start mode.
- No line pressure reduction at gear change.
- No coast control.
- No line pressure reduction control at garage.
- No shift solenoid functional failure detection.
- No L-up solenoid functional failure detection.
- Check Trans “ON”.
- DTC stored.
- MIL request “ON”. (EURO 4 only)

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

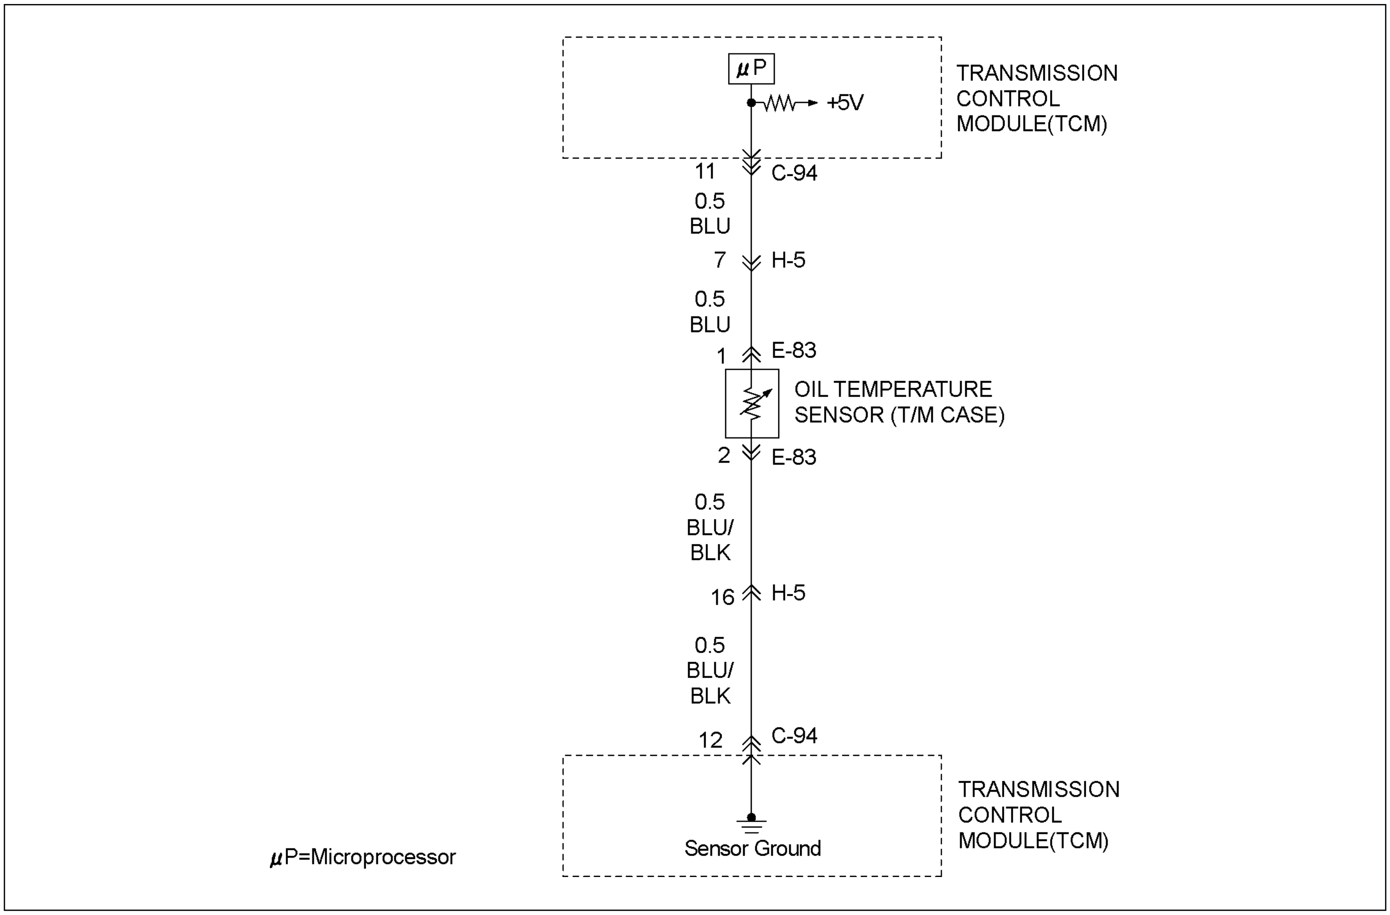
- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check oil temperature sensor for proper mounting and adjustment.

Circuit/System Testing DTC P0712

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	Perform the transmission fluid checking procedure. Refer to checking Transmission Fluid level and Condition in Automatic Transmission 7A section. Was the fluid checking procedure performed?	—	Go to *Step 3*	Refer to Checking Transmission Fluid level and Condition in Automatic Transmission (AW30-40LE) section
3	1. Lift the driving wheels. 2. Start the engine and place the select lever in D position. 3. Wait for 5 minutes. Does a scan tool indicate DTC P0712?	—	Go to *Step 4*	Refer to *Diagnostic Aids*

Step	Action	Value(s)	YES	NO
4	Measure the voltage of the transmission fluid temperature sensor by the 5-8840-0285-0 DMM. 1. Turn “OFF” the ignition. 2. Disconnect the oil temperature sensor connector. 3. Turn “ON” the ignition., with the engine “OFF”. 4. Connect the 5-8840-0285-0 DMM to the each terminal of the oil temperature sensor harness connector E83-2 and E83-1. Does DMM indicate specified value?	About 5V	Go to *Step 5*	Go to *Step 6*
5	Replace the oil temperature sensor. Is the replacement complete?	—	Go to *Step 8*	—
6	Measure the resistance of the wire by the 5-8840-0285-0 DMM. 1. Turn “OFF” the ignition. 2. Disconnect the TCM connector. 3. Install a jumper wire from terminal E83-1 and E83-2 on the mission harness. 4. Connect the 5-8840-0285-0 DMM to the each terminal of the TCM connector C94-11 and C94-12. If a problem is found, repair as necessary. Was the problem found?	Less than 1Ω	Go to *Step 8*	Go to *Step 7*
7	Replace the TCM. **Important:** The replacement TCM must be programmed. (Refer to *SPS* for procedure.) Is the action complete?	—	Go to *Step 8*	—
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn “OFF” the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 9*
9	Observe the stored information, Capture Info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	Verify repair

DTC P0713 (Flash Code 16)



RTW77AMF000501

Circuit Description

The oil temperature sensor is a thermistor sensor that is installed in the transmission case and converts temperature changes into continuous electric signals, then outputs them to the Transmission Control Module (TCM). When the ATF temperature is low, the resistance of the sensor (thermistor) goes up, so that the voltage of the TCM signal becomes high.

As the ATF is gradually warmed, the resistance of the sensor goes down and the voltage becomes low. At the normal operating ATF temperature (80°C/176°F) of the transmission, the voltage of the TCM is about 3.7V.

Condition For Running The DTC

All of the following conditions are met.

(1) Detect the state which the all of the following conditions are met since ignition “ON” for accumulated 15 minutes or more.

- Except P or N position.
- Selector position switch is not detecting failure or not deciding failure.
- Output revolution is more than 600rpm.
- Output revolution sensor is not detecting failure or not deciding failure.

(2) Engine coolant temperature ≧ 50°C (122°F)

(3) Engine coolant temperature signal is not detecting failure or not deciding failure.

Condition For Setting The DTC

The TCM detects following condition for 12 times continuously.

- Oil temperature is more than –10°C (14°F).

Action Taken When The DTC Sets

- Control at A/T oil temperature 80°C (176°F).
- No squat control.
- No slope control.
- No 3rd start mode.
- No line pressure reduction at gear change.
- No coast control.
- No line pressure reduction control at garage.
- No shift solenoid functional failure detection.

- No L-up solenoid functional failure detection.
- Check Trans “ON”.
- DTC stored.
- MIL request “ON”. (EURO 4 only)

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check oil temperature sensor for proper mounting and adjustment.

Circuit/System Testing DTC P0713

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed ?	—	Go to *Step 2*	Go to *OBD System check*
2	Perform the transmission fluid checking procedure. Refer to Checking Transmission Fluid Level and condition Automatic Transmission 7A section. Was the fluid checking procedure performed?	—	Go to *Step 3*	Refer to checking Transmission Fluid Level and Condition Automatic Transmission (AW30-40LE) section
3	1. Lift the driving wheels. 2. Start the engine and place the select lever in D position. 3. Wait for 15 minutes. Does a scan tool indicate DTC P0713?	—	Go to *Step 4*	Refer to *Diagnostic Aids*
4	Observe the voltage of the oil temperature sensor on the Tech 2 data. 1. Turn “OFF” the ignition. 2. Disconnect the oil temperature sensor connector E-83 3. Install a fused jumper wire from terminal E83-2 to E83-1 on the transmission harness. 4. Turn “ON” the ignition. Does a scan tool indicate specified value?	About 0V	Go to *Step 5*	Go to *Step 6*
5	Replace the transmission fluid temperature sensor. If the action complete?	—	Go to *Step 9*	—

3. SPRING BREAKAGE

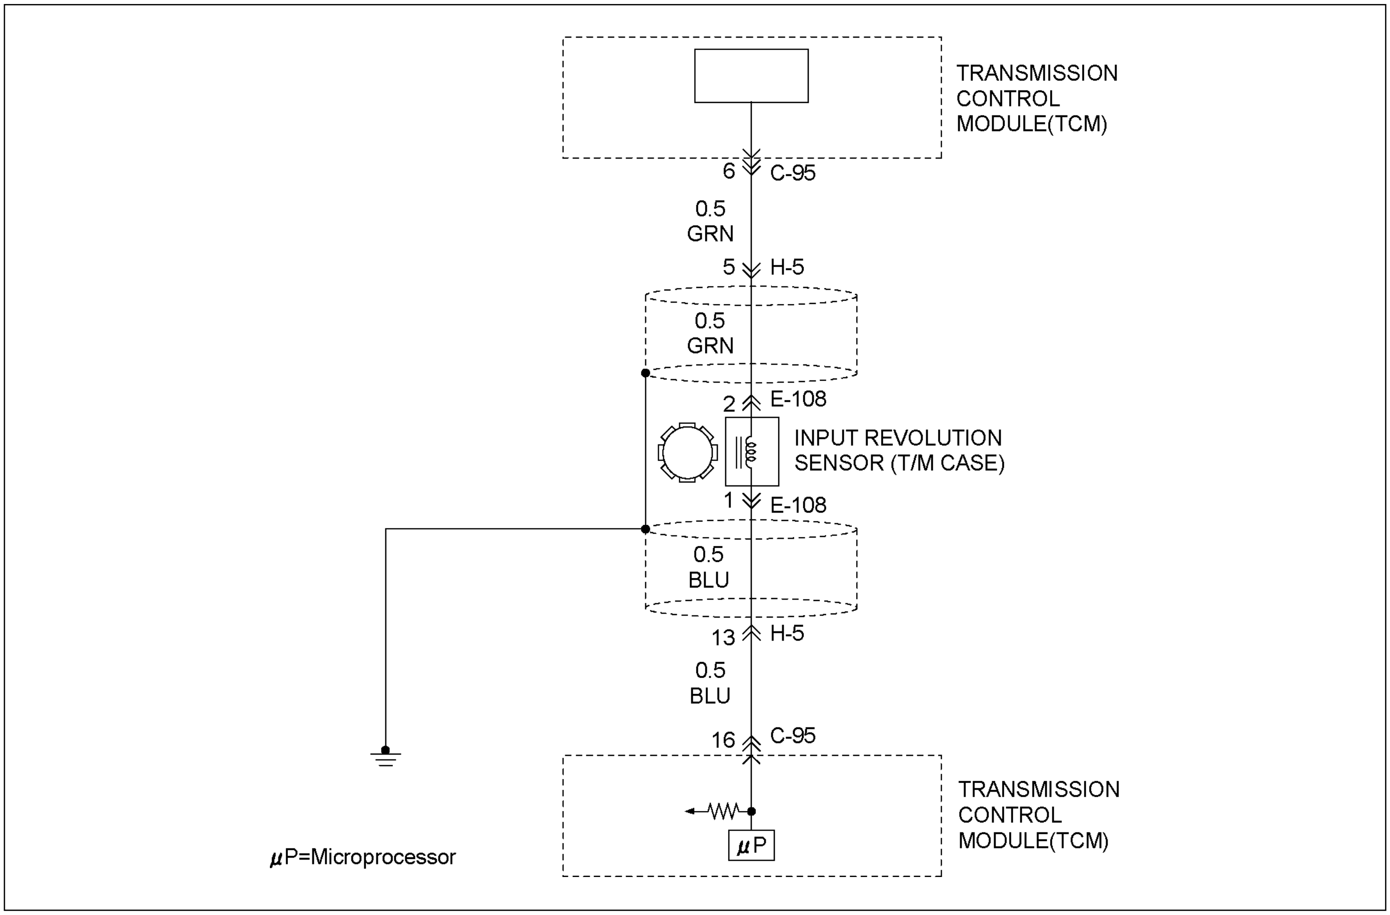
DTC P0717 (Flash Code 14)



RTW77AMF000601

Circuit Description

Input revolution information is provided to TCM by the input revolution sensor. This sensor is located in the transmission case.

The input revolution sensor is an electromagnetic pulse pickup type that generates a speed signal according to the revolution of the transmission OD direct clutch drum. As a result, the sensor sends a sine wave signal (AC) to the TCM, which converts this sine wave signal (pulse voltage) to a RPM signal.

Condition For Running The DTC

All of the following conditions are met.

(1) All of the following conditions are met for 2 seconds or more continuously.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.
- DTC U2104 is not detecting failure or not deciding failure.
- DTC U2105 is not detecting failure or not deciding failure.
- Engine revolution sensor is not detecting failure or not deciding failure.
- The engine revolution is more than 550rpm.

(2) Not emergency mode.

(3) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication Service is receiving enable.
- DTC Clear is not operating.

Condition For Setting The DTC

All of the following conditions are met.

(1) 25 seconds or more passed after changing to the except P/R/N from P/R/N.
If the following condition is met when 25 seconds or more passed after changing, it is considered that 25 seconds or more passed.

- The oil temperature sensor is not detecting failure or not deciding failure, and also oil temperature is more than 20°C (68°F).

(2) Select position switches is not detecting failure or not deciding failure.

(3) Output revolution sensor is not detecting failure or not deciding failure.

(4) Output revolution is more than 600rpm.

(5) If output signal pulse count is more than 9×500, any pulse is not detected from input revolution sensor.

(6) Any pulse is not detected at 2nd from input revolution sensor after condition (9) is met.

(7) Shift solenoid S1 and Shift solenoid S2 are not detecting electric failure or not deciding electric failure.

(8) Shift solenoid S1 and Shift solenoid S2 are not deciding functional failure.
If the following conditions are not met, keep the failure detection counter.

(9) 3.5 seconds or more passed after the gear change signal output.

(10) Not 4th gear.

Action Taken When The DTC Sets

- No L-up.
- No line pressure reduction control at gear shift.
- No torque reduction control.
- No slope control
- No output revolution sensor failure detection.
- Cancel input revolution condition of the “Condition For Running The DTC” of system voltage error detection.
- No shift solenoid failure detection.
- No L-up solenoid failure detection.
- DTC stored.
- Check Trans "ON".
- MIL request "ON". (EURO 4 only)

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring.
  Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check input speed sensor for proper mounting and adjustment.

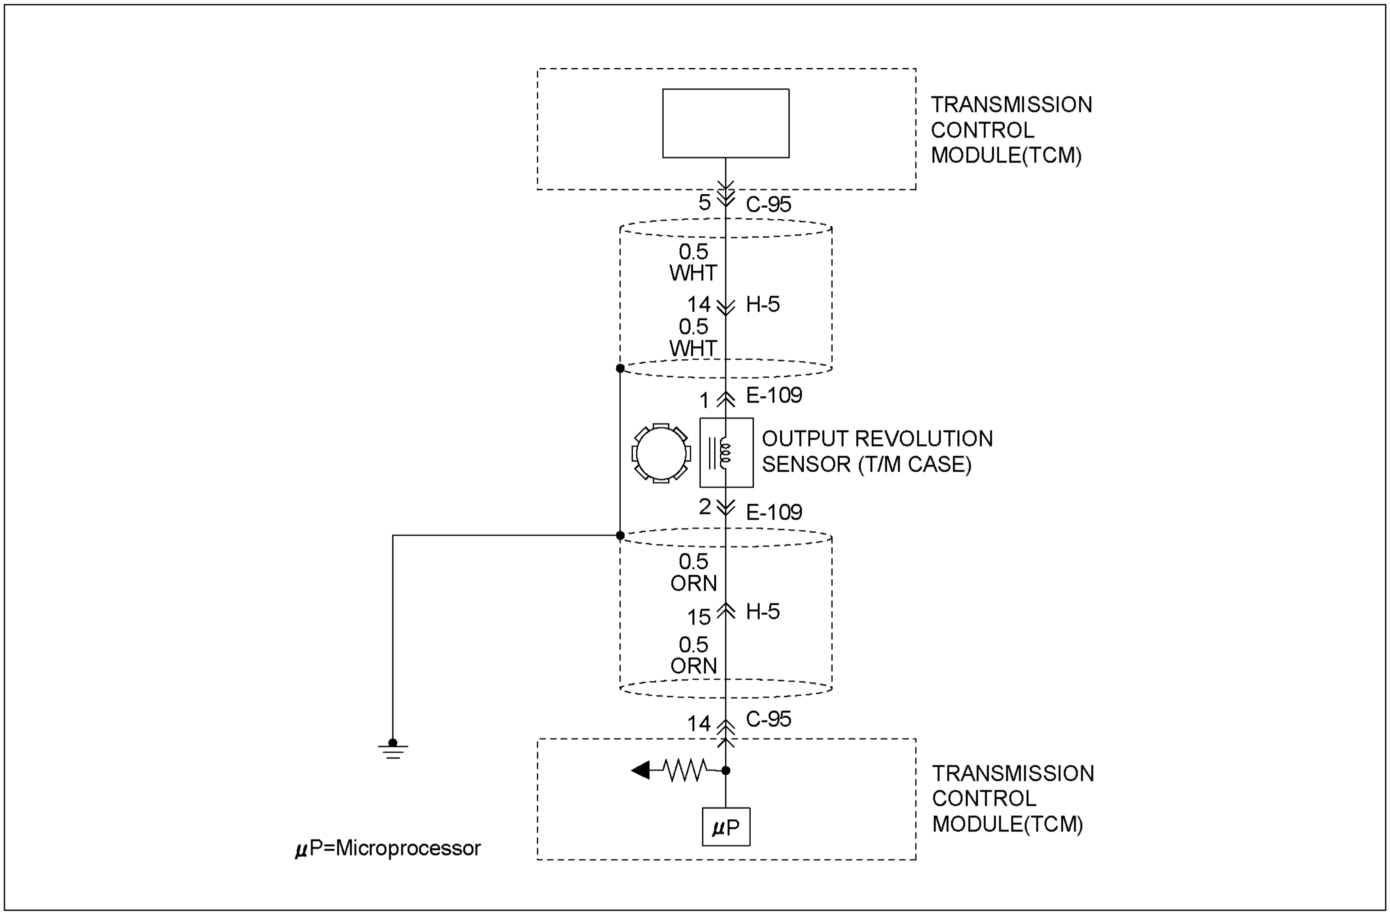
Circuit/System Testing DTC P0717

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System check performed?	—	Go to *Step 2*	Go to *OBD* system check
2	1. Install a scan tool. 2. Turn on the ignition. 3. Review and record scan tool data. 4. Operate the vehicle within scan tool data. Does a scan tool indicate DTC P0717?	—	Go to *Step 3*	Refer to *Diagnostic Aids*

Step	Action	Value(s)	YES	NO
3	Measure voltage of the input revolution sensor by the 5-8840-0285-0 DMM. 1. Turn "ON" the ignition. 2. Engine run. 3. Disconnect the input revolution sensor connector. 4. Measure the voltage between terminals to the input revolution sensor harness connector E108-1 and E108-2. Does DMM indicate specified value?	About 3V	Go to *Step 6*	Go to *Step 4*
4	Measure the resistance of wire by the 5-8840-0285-0 DMM. 1. Turn "OFF" the ignition. 2. Disconnect the TCM connector. 3. Connect the input revolution sensor connector. 4. Measure the resistance between the TCM connector terminal C95-6 and C95-16. Does DMM indicate specified value?	560~680Ω (20°C/68°F)	Go to *Step 7*	Go to *Step 5*
5	Measure the resistance of input revolution sensor by the 5-8840-0285-0 DMM. 1. Turn "OFF" the ignition. 2. Disconnect the input revolution sensor connector. 3. Measure the resistance between terminals of input revolution sensor side connector, E108-1 and E108-2. Does DMM indicate specified value?	560~680Ω (20°C/68°F)	Go to *Step 8*	Go to *Step 6*
6	Replace the input revolution sensor. Is the action complete?	—	Go to *Step 9*	—
7	Replace the TCM. **Important:** The replacement TCM must be programmed. (Refer to *SPS* for procedure.) Is the action complete?	—	Go to *Step 9*	—
8	Check the wire between terminal C95-6 and E108-2 or C95-16 and E108-1. 1. Connect the 5-8840-0285-0 DMM to the each of the TCM connector and input revolution sensor. If the problem found repair as necessary. Was the problem found?	—	Go to *Step 9*	—

Step	Action	Value(s)	YES	NO
9	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn “OFF” the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 10*
10	Observe the stored information, Capture Info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	Verify repair

DTC P0722 (Flash Code 11)



RTW77AMF000701

Circuit Description

Vehicle speed information is provided to the TCM by the output revolution sensor. This sensor is located in the transmission adapter or extension housing.

The output revolution sensor is an electromagnetic pulse pickup type that generates a speed signal according to the revolution of the transmission output shaft. As a result, the sensor sends a sine wave signal (AC) to the TCM, which converts this sine wave signal (pulse voltage) to a RPM signal.

Condition For Running The DTC

All of the following conditions are met.

(1) All of the following conditions are met for 2 seconds ore more continuously.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.
- DTC U2104 is not detecting failure or not deciding failure.
- DTC U2105 is not detecting failure or not deciding failure
- Engine revolution sensor is not detecting failure or not deciding failure.
- The engine revolution is more than 550rpm.

(2) Not emergency mode.

(3) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication Service is receiving enable.
- DTC Clear is not operating.

Condition For Setting The DTC

All of the following conditions are met.

(1) 25 seconds or more passed after changing to the except P/R/N from P/R/N.
If the following condition is met when 25 seconds or more passed after changing, it is considered that 25 seconds or more passed.

- Oil temperature sensor is not detecting failure or not deciding failure, and also oil temperature is more than 20°C (68°F).

(2) Select position switches is not detecting failure or not deciding failure.

(3) Input revolution sensor is not detecting failure or not deciding failure.

(4) Output revolution calculated by input revolution is more than 300rpm.

(5) If input revolution signal pulse count is more than 13 $\times$500, any pulse is not detected from output revolution sensor.

Action Taken When The DTC Sets

- The TCM uses input speed sensor as a vehicle speed.
- No squat control.
- No torque reduction control.
- No line pressure control.
- No use 4th gear.
- No lock-up control.
- No reverse lock out control.
- No slope control.
- Control gear change by calculating vehicle speed from input revolution sensor.
- No coast control.
- No input revolution sensor failure detection.
- Keep oil temperature sensor open failure detection accumulated timer.
- No select position switch (OPEN) failure decision.
- No T/F Hi-Low SW failure detection.
- No shift solenoid functional failure detection.
- No L-up solenoid functional failure detection.
- No lockup “OFF” control at fuel cut.
- Check Trans “ON”.
- DTC stored.
- MIL request “ON”. (EURO 4 only)

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring.
  Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Check output revolution sensor for proper mounting and adjustment.

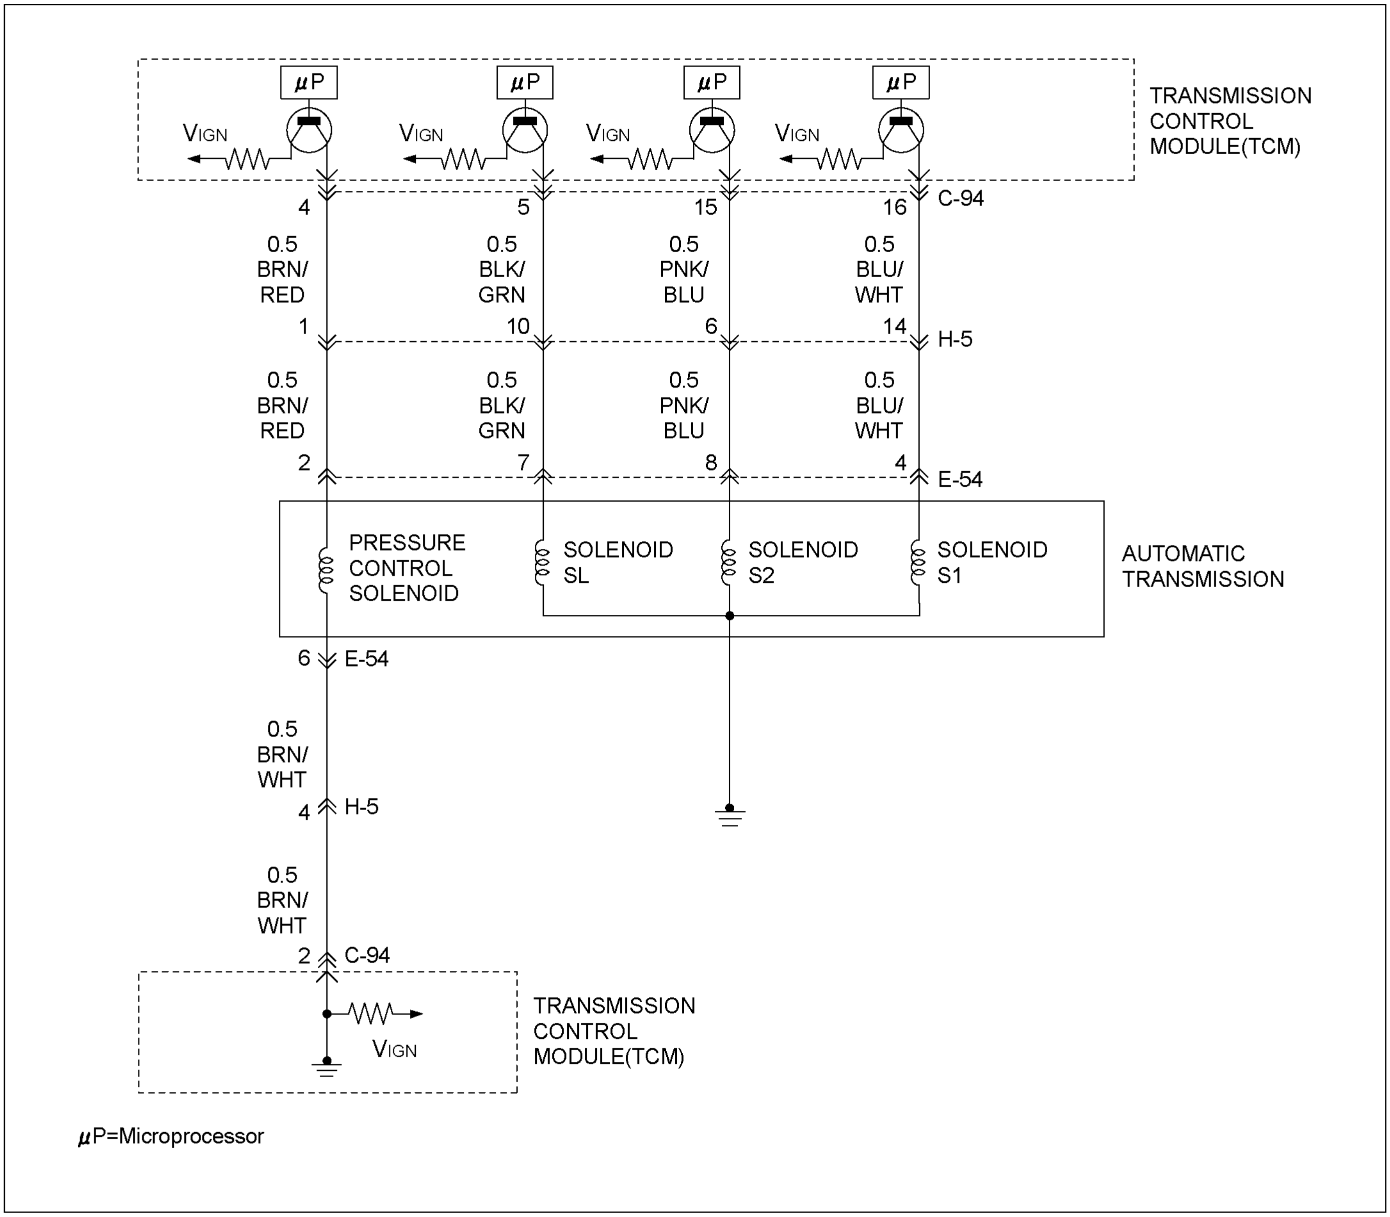
Circuit/System Testing DTC P0722

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System check performed ?	—	Go to *Step 2*	Go to *OBD system check*
2	1. Install a scan tool. 2. Turn on the ignition. 3. Review and record scan tool data. 4. Operate the vehicle within scan tool data. Does a scan tool indicate DTC P0722?	—	Go to *Step 3*	Refer to *Diagnostic Aids*

Step	Action	Value(s)	YES	NO
3	Measure the voltage of the output revolution sensor by the 5-8840-0285-0 DMM. 1. Turn "OFF" the ignition. 2. Lift the driving wheels. 3. Disconnect the output revolution sensor connector. 4. Turn "ON" the ignition with engine idling in gear. 5. Measure the voltage between the output revolution sensor connector terminal E109-1 and E109-2. Does the DMM indicate specified value?	About 3V	Go to *Step 6*	Go to *Step 4*
4	Measure the resistance of wire by the 5-8840-0285-0 DMM. 1. Turn "OFF" the ignition. 2. Disconnect the TCM connector. 3. Connect the output revolution sensor connector. 4. Measure the resistance between the TCM connector terminal C95-5 and C95-14. Does the DMM indicate specified value?	560~680Ω (20°C/68°F)	Go to *Step 7*	Go to *Step 5*
5	Measure the resistance of output revolution sensor by the 5-8840-0285-0 DMM. 1. Turn "OFF" the ignition. 2. Disconnect the output revolution sensor connector. 3. Measure the resistance between terminals at output revolution sensor side connector E109-1 and E109-2. Does the DMM indicate specified value?	560~680Ω (20°C/68°F)	Go to *Step 8*	Go to *Step 6*
6	Replace the output revolution sensor. Is the action complete?	—	Go to *Step 9*	—
7	Replace the TCM. **Important:** The replacement TCM must be programmed. (Refer to *SPS* for procedure.) Is the action complete?	—	Go to *Step 9*	—
8	Check the wire between terminal C95-5 and E109-1 or C95-14 and E109-2. 1. Connect the 5-8840-0285-0 DMM to the each the TCM connector and output revolution sensor. If the problem found repair as necessary. Was the problem found?	—	Go to *Step 9*	—

Step	Action	Value(s)	YES	NO
9	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn “OFF” the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 10*
10	Observe the stored information, Capture Info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	Verify repair

DTC P0741 (Flash Code 43)



RTW77ALF001501

Circuit Description

The lock-up solenoid SL of the torque converter clutch (TCC) controls the lock-up clutch by a signal according to the lock-up position judgment of the Transmission Control Module (TCM) when the vehicle runs.

This function can improve the fuel consumption to almost the same extent as the manual transmission.

The lock-up solenoid SL is put into B+ by the TCM, so that the solenoid is actuated with the result of lock-up.

Condition For Running The DTC

All of the following conditions are met.

(1) All of the following conditions are met for 2 seconds or more continuously.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.
- DTC U2104 is not detecting failure or not deciding failure.
- DTC U2105 is not detecting failure or not deciding failure.
- Engine revolution signal is not detecting failure or not deciding failure.
- The engine revolution is more than 550 rpm.

Continued from the previous page

Checkpoint		Problem	Countermeasure
	NG	Brackets cracked	Replace
	NG	Defective	Replace
OK ↓			
Spring bushing	NG	Worn or disintegrated	Replace
OK ↓			
Center bolts	NG	Loosened	Retighten
	NG	Damaged	Replace

(2) Oil temperature is more than 20°C (68°F), and water temperature signal is more than 70°C (158°F).

(3) 20 seconds or more passed after D position is detected.

(4) Oil temperature sensor is not deciding failure.

(5) Engine coolant temperature sensor is not detecting failure or not deciding failure.

(6) The engine revolution is more than 600 rpm.

(7) Engine revolution sensor is not detecting failure or not deciding failure.

(8) T/F condition is high.

(9) T/F Hi-Low SW is not detecting failure or not deciding failure.

(10) Output revolution sensor is not detecting failure or not deciding failure.

(11) S1 solenoid is not detecting failure or not deciding failure. (Electronic failure)

(12) S2 solenoid is not detecting failure or not deciding failure. (Electronic failure)

(13) L-up solenoid is not detecting failure or not deciding failure. (Electronic failure)

(14) Selector position switch is not detecting failure or not deciding failure.

(15) DTC U2104 is not detecting failure or not deciding failure.

(16) DTC U2105 is not detecting failure or not deciding failure.

(17) Input revolution sensor is not deciding failure.

(18) Throttle signal is not detecting failure or not deciding failure.

(19) Not emergency mode.

(20)Engine torque signal is not detecting failure or not deciding failure.

(21) Pressure control solenoid is not detecting failure not deciding failure.

(22) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication Service is receiving enable.
- DTC Clear is not operating.

Condition For Setting The DTC

The TCM detects following conditions are met for 4 seconds continuously.

- 2 seconds passed after gear change output and L-up “ON”/”OFF” output.
- T/C revolution difference more than 150 rpm for 4.5 seconds continuously.
- 4th gear lock-up “ON”.
- The throttle position is more than 20% and less than 100%.
- The vehicle speed is more than 5 km/h (3 mph) and less than 100 km/h (62 mph).

Action Taken When The DTC Sets

- Check Trans “ON”.
- DTC stored.
- MIL request “ON” (EURO 4 only).

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

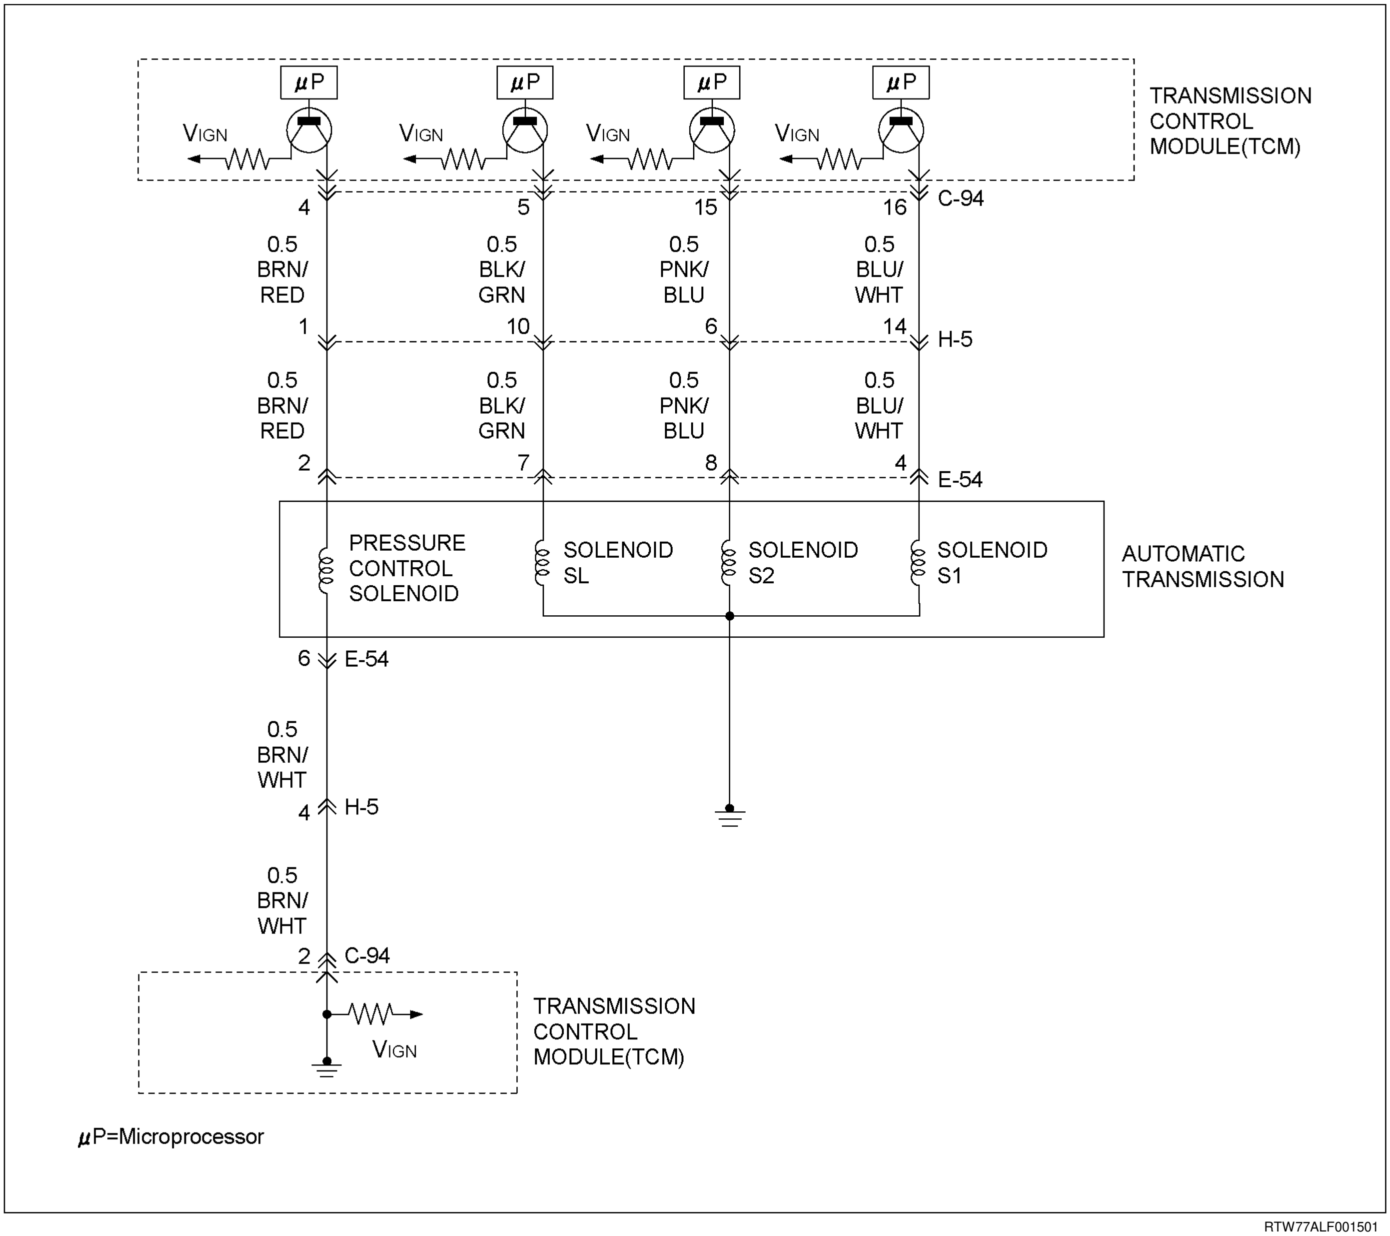
- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Circuit/System Testing DTC P0741

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Install a scan tool. 2. Turn “ON” the ignition. 3. Review and record scan tool data. 4. Operate the vehicle within scan tool data. Does a scan tool indicate DTC P0741?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Perform the transmission fluid checking procedure. Refer to checking Transmission Fluid level and Condition in Automatic Transmission 7A section. If the problem found, repair or replace necessary. Was the problem found?	—	Go to *Step 8*	Go to *Step 4*
4	Observe the TCC slip speed data on a scan tool. 1. Turn “ON” the ignition with the engine “ON”. 2. Road testing the vehicle. 3. The throttle position is more than 20%. 4. The vehicle speed is more than 5 km/h (3 mph). 5. The TCC slip speed is less than 100 rpm at 4th gear L-up. Above conditions were indicated on a scan tool display?	—	Refer to *Diagnostic Aids*	Go to *Step 5*
5	Check the following items. • Check the L-up solenoid valve. (Refer to Section 7A3) • L-up solenoid valve stuck “OFF” the release position (Refer to Section 7A4) • Misaligned or damaged valve body gasket. • Restricted apply passage. If the problem found, replaces as necessary. Was the problem found?	—	Go to *Step 8*	Go to *Step 6*
6	Check the DTC on a scan tool. Is DTC found on a scan tool?	—	Go to *Step 7*	Go to *Step 8*
7	Replace the Torque converter (Refer to Section 7A4). Is the action complete?	—	Go to *Step 8*	—

Step	Action	Value(s)	YES	NO
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn “OFF” the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 9*
9	Observe the stored information, Capture Info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	Verify repair

DTC P0742 (Flash Code 53)



Circuit Description

The lock-up solenoid SL of the torque converter clutch (TCC) controls the lock-up clutch by a signal according to the lock-up position judgment of the Transmission Control Module (TCM) when the vehicle runs.
This function can improve the fuel consumption to almost the same extent as the manual transmission.
The lock-up solenoid SL is put into B+ by the TCM, so that the solenoid is actuated with the result of lock-up.

Condition For Running The DTC

All of the following conditions are met.

(1) All of the following conditions are met for 2 seconds or more continuously.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.
- DTC U2104 is not detecting failure or not deciding failure.
- DTC U2105 is not detecting failure or not deciding failure.
- Engine revolution signal is not detecting failure or not deciding failure.
- The engine revolution is more than 550rpm.

(2) Oil temperature is more than 20°C (68°F), and water temperature signal is more than 70°C (158°F).

(3) 20 seconds or more passed after D position is detected.

(4) Oil temperature sensor is not deciding failure.

(5) Engine coolant temperature sensor is not detecting failure or not deciding failure.

(6) The engine revolution is more than 600 rpm.

(7) Engine revolution sensor is not detecting failure or not deciding failure.

(8) T/F condition is high.

(9) T/F Hi-Low SW is not detecting failure or not deciding failure.

(10) Output revolution sensor is not detecting failure or not deciding failure.

(11) S1 solenoid is not detecting failure or not deciding failure. (Electronic failure)

(12) S2 solenoid is not detecting failure or not deciding failure. (Electronic failure)

(13) L-up solenoid is not detecting failure or not deciding failure. (Electronic failure)

(14) Selector position switch is not detecting failure or not deciding failure.

(15) DTC U2104 is not detecting failure or not deciding failure.

(16) DTC U2105 is not detecting failure or not deciding failure.

(17) Input revolution sensor is not deciding failure.

(18) Throttle signal is not detecting failure or not deciding failure.

(19) Not emergency mode.

(20) Engine torque signal is not detecting failure or not deciding failure.

(21) Pressure control solenoid is not detecting failure not deciding failure.

(22) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication Service is receiving enable.
- DTC Clear is not operating.

Condition For Setting The DTC

The following conditions are detected two times or more between ignition “ON” and ignition “OFF”.

The TCM detects following conditions are met for 1 second continuously.

- 2 second passed after gear change output and L-up “ON”/”OFF” output.
- T/C revolution difference more than 100 rpm for 1 second continuously.
- 3rd gear lock-up “OFF”.

Action Taken When The DTC Sets

- No squat control. (For preventing engine stall)
- Fix 1st gear to prevent engine stall when vehicle speed is and below 10 km/h (6 mph). (Cancel at 15 km/h {9 mph})
- Check Trans “ON”.
- DTC stored.
- MIL request “ON”. (EURO 4 only)

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

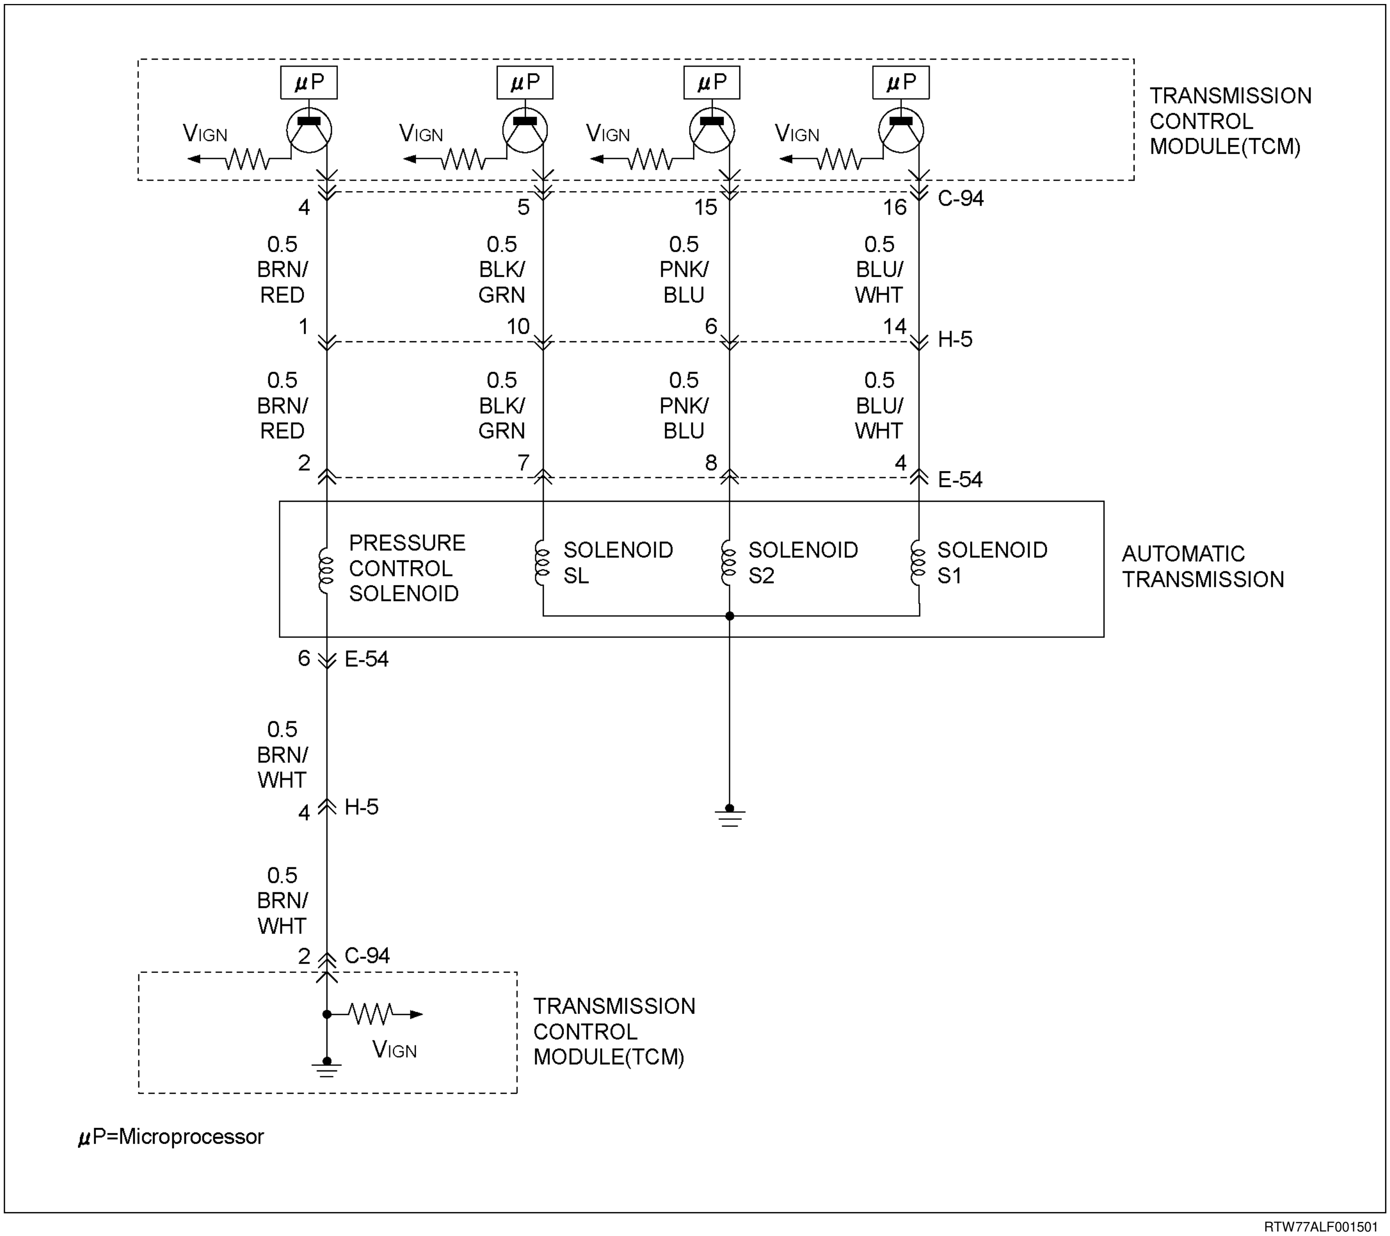
- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring.
  Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Circuit/System Testing DTC P0742

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed? 1. Install the scan tool.	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Install a scan tool. 2. Turn “ON” the ignition. 3. Review and record scan tool data. 4. Operate the vehicle within scan tool data. Does a scan tool indicate DTC P0742?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Perform the transmission fluid checking procedure. Refer to checking Transmission Fluid level and Condition in Automatic Transmission 7A section. If the problem found, repair or replaces necessary. Was the problem found?	—	Go to *Step 8*	Go to *Step 4*
4	Observe the TCC slip speed data on a scan tool. 1. Turn “ON” the ignition with engine “ON”. 2. Road testing the vehicle. 3. The throttle position is more than 20%. 4. The vehicle speed is between 5 km/h (3 mph) and 100 km/h (62 mph). 5. The TCC slip speed is more than 150 rpm at 2nd gear L-up “OFF”. 6. The throttle position is more than 25%. 7. The vehicle speed is between 5 km/h (3 mph) and 80 km/h (50 mph). 8. The T/C revolution difference is less than 100 rpm at 3rd L-up “OFF”. Above conditions were indicated on a scan tool display?	—	Refer to *Diagnostic Aids*	Go to *Step 5*
5	Check the following items. • Check the L-up solenoid valve. (Refer to Section 7A3) • L-up solenoid valve stuck “ON” the release position (Refer to Section 7A4) • Misaligned or damaged valve body gasket. • Restricted apply passage. If the problem found, replaces as necessary. Was the problem found?	—	Go to *Step 8*	Go to *Step 6*
6	Check the DTC on a scan tool. Is DTC found on a scan tool?	—	Go to *Step 7*	Go to *Step 8*

Step	Action	Value(s)	YES	NO
7	Replace the Torque converter (Refer to Section 7A4). Is the action complete?	—	Go to *Step 8*	—
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn “OFF” the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 9*
9	Observe the stored information, Capture Info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	Verify repair

DTC P0746 (Flash Code 45)



Circuit Description

The pressure control solenoid is a PWM duty control solenoid located in the valve body.

The pressure control solenoid is a Transmission Control Module (TCM)-controlled device used to regulate transmission throttle pressure by energizing current from the TCM.

Condition For Running The DTC

All of the following conditions are met.

(1) All of the following conditions are met for 2 seconds or more.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.

(2) Not emergency mode.

(3) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication Service is receiving enable.
- DTC Clear is not operating.

(4) Pressure control solenoid is not detecting failure or not deciding failure.

(5) Feedback AD value keeps less than 1000 for 0.5 seconds and also linear solenoid assured voltage keeps 10.5 volts for 0.5 seconds.

Condition For Setting The DTC

All of the following conditions are met.

- Accumulation of feedback error current value is more than 8A.
- Detect failure twice continuously.

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned "ON", short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Action Taken When The DTC Sets

- No L-up control.
- No line pressure reduction control at gear change.
- No squat control.
- No slope control.
- No torque reduction control.
- No line pressure reduction control at garage.
- Line pressure FULL output.
- No shift solenoid functional failure detection.
- No L-up solenoid functional failure detection.
- Become emergency mode.
- Check Trans "ON".
- DTC stored.
- MIL request "ON". (EURO 4 only)

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for change.

Circuit/System Testing DTC P0746

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Install a scan tool. 2. Turn “ON” the ignition. 3. Record a scan tool data. 4. Operate the vehicle within scan tool data. Does a scan tool indicate DTC P0746?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Perform the transmission fluid checking procedure. Refer to checking Transmission Fluid level and Condition in Automatic Transmission 7A section. If the problem found, repair or replace necessary. Was the problem found?	—	Go to *Step 9*	Go to *Step 4*

Step	Action	Value(s)	YES	NO
4	Measure the resistance of pressure control solenoid. 1. Turn “OFF” the ignition. 2. Disconnect the automatic transmission connector and TCM connector. 3. Measure the resistance between automatic transmission terminal E54-2 and automatic transmission terminal E54-6. Is the resistance specified value?	5 to 5.6Ω at 20°C (68°F)	Go to *Step 5*	Go to *Step 7*
5	Measure the resistance of wire between terminal C94-2 and terminal C94-4. 1. Turn “OFF” the ignition. 2. Connect the automatic transmission connector. 3. Disconnect the TCM connector. 4. Measure the resistance between terminal C94-2 and terminal C94-4. Is the resistance specified value?	5 to 5.6Ω at 20°C (68°F)	Go to *Step 8*	Go to *Step 6*
6	Repair or Replace the wire between terminals C94-2, 4 and terminals E54-6, 2. Is the action complete?	—	Go to *Step 9*	—
7	Replace the pressure control solenoid. (valve body) Is the action complete?	—	Go to *Step 9*	—
8	Replace the TCM. **Important:** The replacement TCM must be programmed (Refer to SPS for procedure). Is the action complete?	—	Go to *Step 9*	—
9	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn “OFF” the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 10*
10	Observe the stored information, Capture info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to *Diagnostic Trouble Code (DTC) List*	Verify repair

4. HARSHNESS

Checkpoint		Problem	Countermeasure
Road test vehicle(Noise has a certain pattern)	NG	Noise does not have any specific pattern	Replace tires

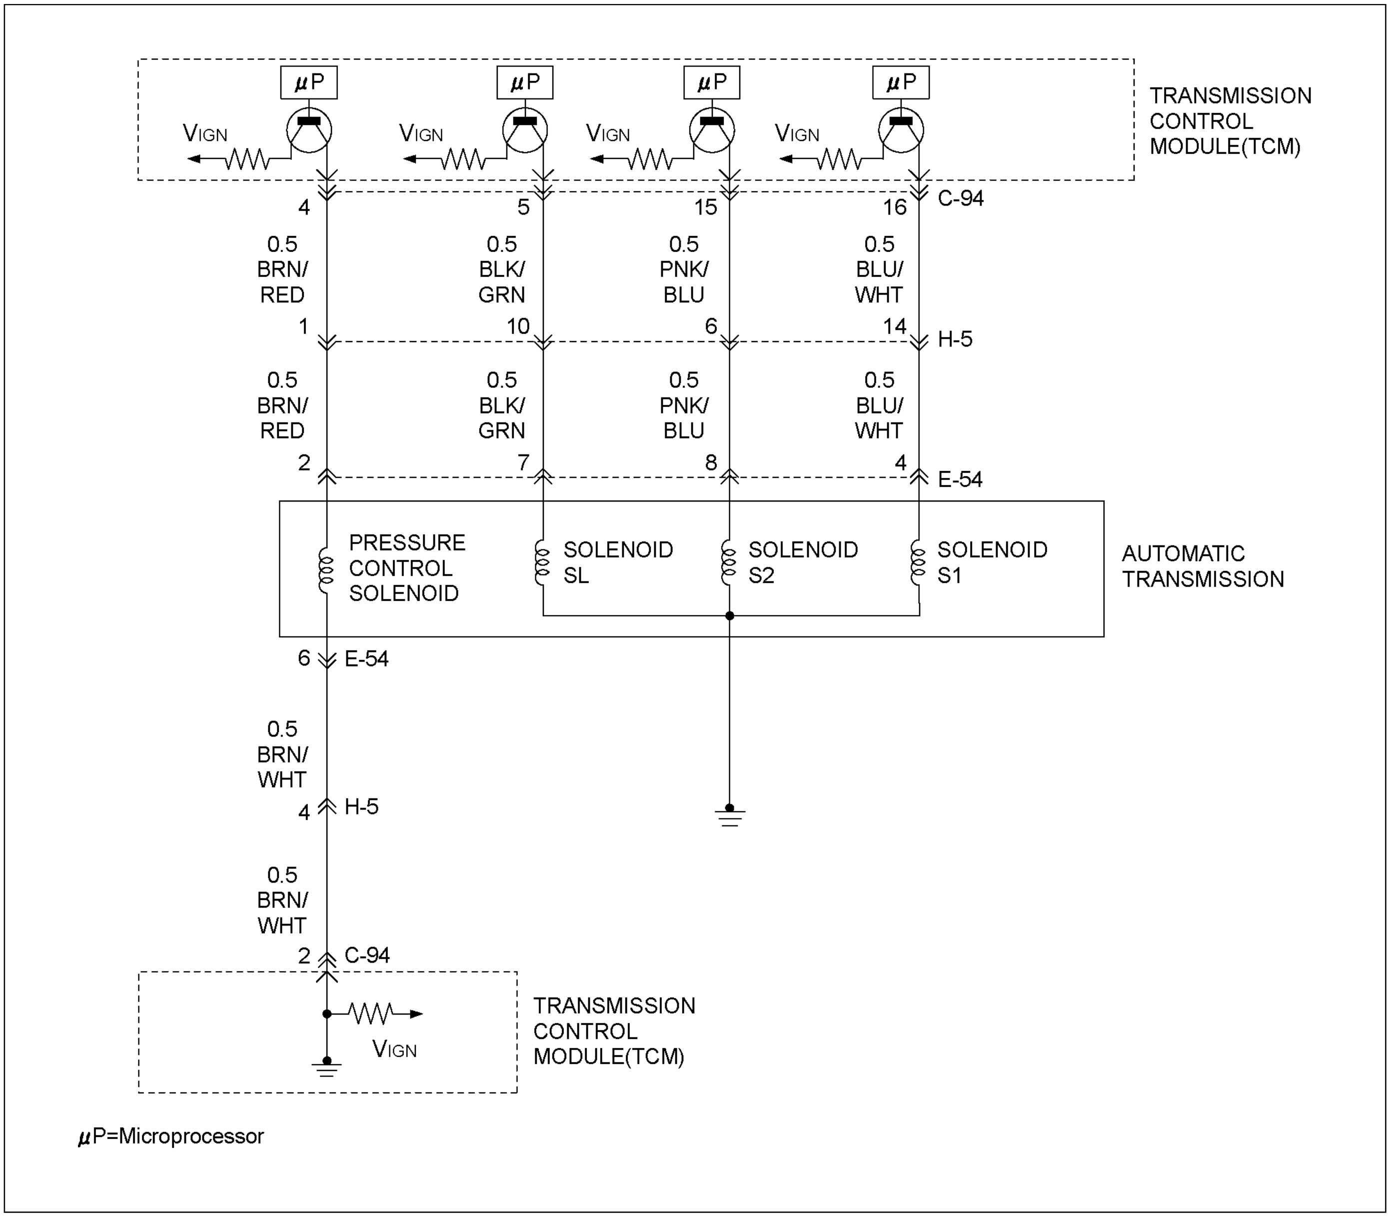
DTC P0751 (Flash Code 41)



RTW77ALF001501

Circuit Description

The shift solenoid S1 changes the hydraulic route with the signals from the TCM according to the vehicle speed and the throttle opening to control shifting. When the solenoid S1 or S2 fails, the hydraulic circuit is mechanically operated as a backup.

Condition For Running The DTC

All of the following conditions are met.

(1) All of the following conditions are met for 2 seconds or more continuously.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.
- DTC U2104 is not detecting failure or not deciding failure.
- DTC U2105 is not detecting failure or not deciding failure.
- Engine revolution signal is not detecting failure or not deciding failure.
- The engine revolution is more than 550rpm.

(2) Oil temperature is more than 20°C (68°F), and water temperature signal is more than 70°C (158°F).

(3) 20 seconds or more passed after D position is detected.

(4) Oil temperature sensor is not deciding failure.

(5) Engine coolant temperature sensor is not detecting failure or not deciding failure.

(6) Engine revolution rpm is more than 600 rpm.

(7) Engine revolution sensor is not detecting failure or not deciding failure.

(8) T/F condition is high.

(9) T/F Hi-Low SW is not detecting failure or not deciding failure.

(10) Output revolution sensor is not detecting failure or not deciding failure.

(11) S1 solenoid is not detecting failure or not deciding failure. (Electric failure)

(12) S2 solenoid is not detecting failure or not deciding failure. (Electric failure)

(13) Selector position switch is not detecting failure or not deciding failure.

(14) DTC U2104 is not detecting failure or not deciding failure.

(15) DTC U2105 is not detecting failure or not deciding failure.

(16) Input revolution sensor is not deciding.

(17) Throttle signal is not detecting failure or not deciding failure.

(18) Not emergency mode.

(19) Engine torque signal is not detecting failure or not deciding failure.

(20) Pressure control solenoid is not detecting failure or not deciding failure.

(21) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication Service is receiving enable.
- DTC Clear is not operating.

Condition For Setting The DTC

The following conditions are detected two times or more between ignition “ON” and ignition “OFF”.

2 second passed after gear change output.

- The TCM detects equivalent of 4th gear ratio for 1 second in case of 1st gear output.
  - The throttle position is more than 8% and less than 100%.
  - The vehicle speed is more than 7 km/h (4 mph).
- The TCM detects equivalent of 3rd gear ratio for 1 second in case of 2nd gear output.
  - The throttle position is more than 8% and less than 100%.
  - The vehicle speed is more than 5 km/h (3 mph) and less than 30 km/h (19 mph).

Action Taken When The DTC Sets

- No input revolution sensor failure detection.
- MIL request “ON”. (EURO 4 only)
- Check Trans “ON”.
- DTC stored.

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

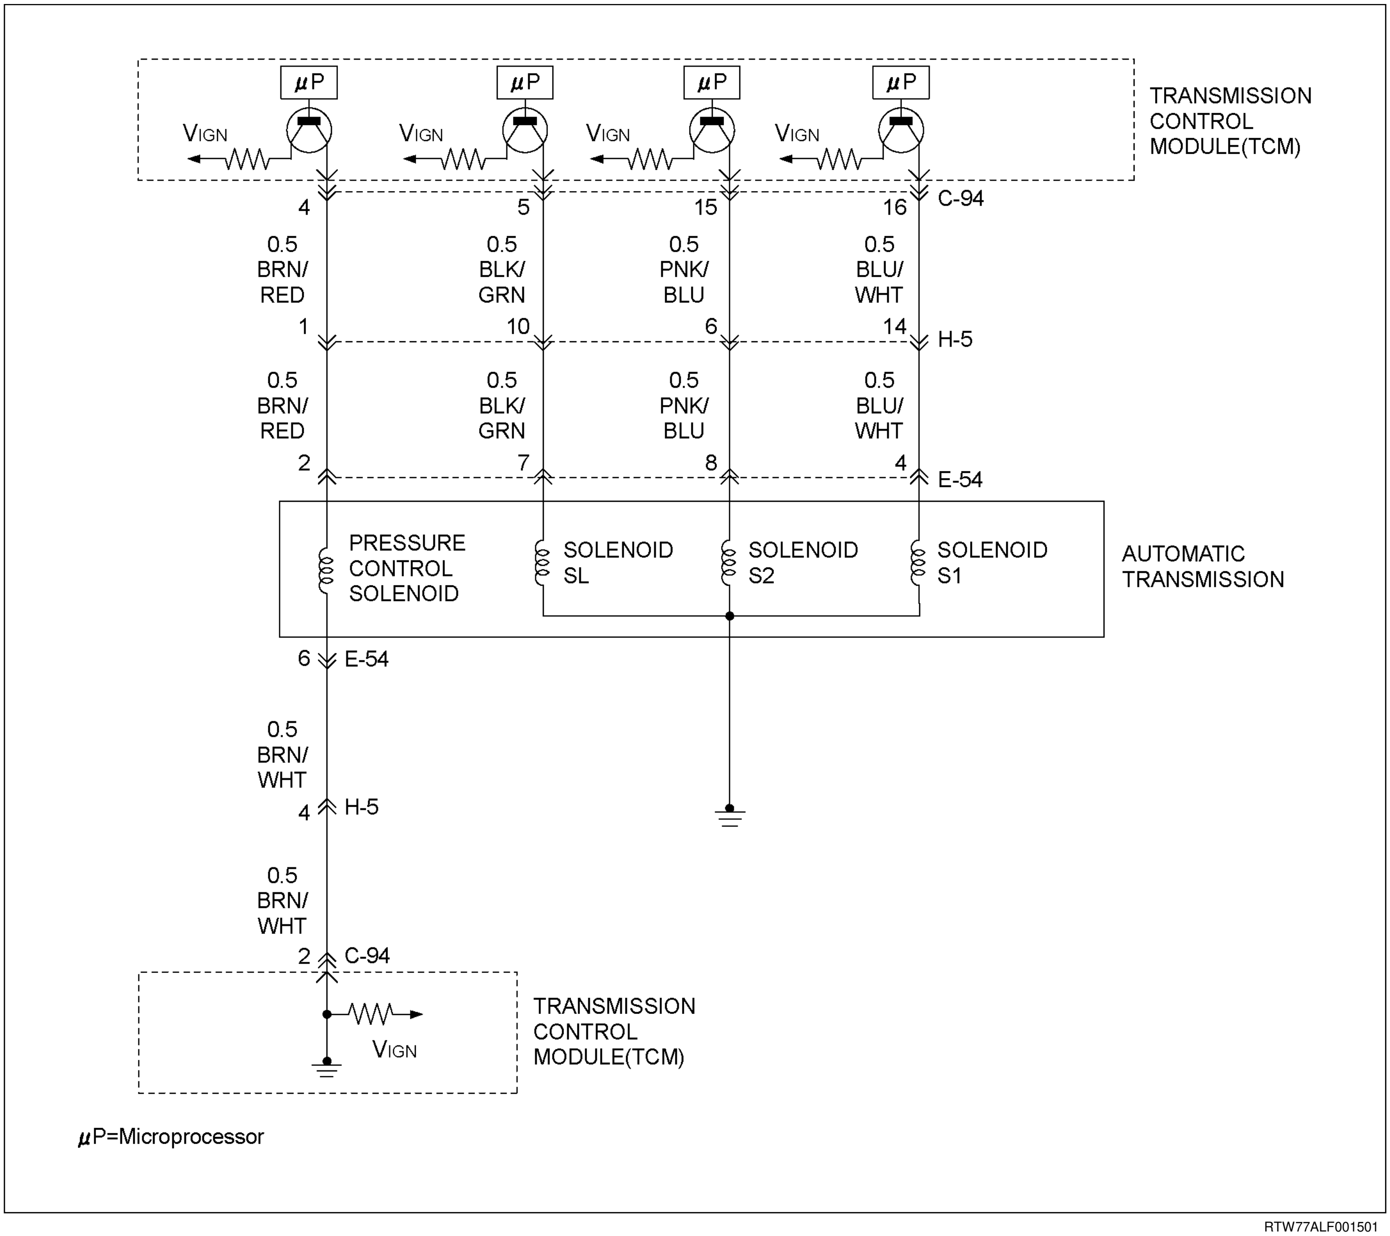
- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring.
  Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Circuit/System Testing DTC P0751

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Install a scan tool. 2. Turn “ON” the ignition. 3. Review and record scan tool data. 4. Operate the vehicle within scan tool data. Does a scan tool indicate DTC P0751?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Perform the transmission fluid checking procedure. Refer to checking Transmission Fluid level and Condition in Automatic Transmission 7A section. If the problem found, repair or replaces necessary. Was the problem found?	—	Go to *Step 8*	Go to *Step 4*
4	Observe the commanded gear and current gear on a scan tool. 1. Turn “ON” the ignition with engine “ON”. 2. Road testing the vehicle. 3. The throttle position is more than 8%. 4. The vehicle speed is more than 5 km/h (3 mph). Did the TCM detect 4th gear ratio in case of 1st gear target, and 3rd gear ratio in case of 2nd gear target? Above conditions were indicated on a scan tool display?	—	Refer to *Diagnostic Aids*	Go to *Step 5*
5	Check the following items. • Check the shift solenoid valve S1. (Refer to Section 7A3) • Shift solenoid valve S1 stuck “OFF” the release position (Refer to Section 7A4) • Misaligned or damaged valve body gasket. • Restricted apply passage. If the problem found, replaces necessary. Was the problem found?	—	Go to *Step 8*	Go to *Step 6*
6	Check the DTC on a scan tool. Is DTC found on a scan tool?	—	Go to *Step 7*	Go to *Step 8*
7	Replace the valve body. (Refer to Section 7A4). Is the action complete?	—	Go to *Step 8*	—

Step	Action	Value(s)	YES	NO
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn “OFF” the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 9*
9	Observe the stored information, Capture info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to *Diagnostic Trouble Code (DTC) List*	Verify repair

DTC P0752 (Flash Code 51)



Circuit Description

The shift solenoid S1 changes the hydraulic route with the signals from the TCM according to the vehicle speed and the throttle opening to control shifting. When the solenoid S1 or S2 fails, the hydraulic circuit is mechanically operated as a backup.

Condition For Running The DTC

All of the following conditions are met.

(1) All of the following conditions are met for 2 seconds or more continuously.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.
- DTC U2104 is not detecting failure or not deciding failure.
- DTC U2105 is not detecting failure or not deciding failure.
- Engine revolution signal is not detecting failure or not deciding failure.
- The engine revolution is more than 550 rpm.

(2) Oil temperature is more than 20°C (68°F), and water temperature signal is more than 70°C (158°F).

(3) 20 seconds or more passed after D position is detected.

(4) Oil temperature sensor is not deciding failure.

(5) Engine coolant temperature sensor is not detecting failure or not deciding failure.

(6) Engine revolution rpm is more than 600 rpm.

(7) Engine revolution sensor is not detecting failure or not deciding failure.

(8) T/F condition is high.

(9) T/F Hi-Low SW is not detecting failure or not deciding failure.

(10) Output revolution sensor is not detecting failure or not deciding failure.

(11) S1 solenoid is not detecting failure or not deciding failure. (Electric failure)

(12) S2 solenoid is not detecting failure or not deciding failure. (Electric failure)

(13) Selector position switch is not detecting failure or not deciding failure.

(14) DTC U2104 is not detecting failure or not deciding failure.

(15) DTC U2105 is not detecting failure or not deciding failure.

(16) Input revolution sensor is not deciding.

(17) Throttle signal is not detecting failure or not deciding failure.

(18) Not emergency mode.

(19) Engine torque signal is not detecting failure or not deciding failure.

(20) Pressure control solenoid is not detecting failure or not deciding failure.

(21) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication Service is receiving enable.
- DTC Clear is not operating.

Condition For Setting The DTC

The following conditions are detected two times or more between ignition “ON” and ignition “OFF”.

2 second passed after gear change output.

- The TCM detects equivalent of 2nd gear ratio for 1 second in case of 3rd gear output.
  - The throttle position is more than 8% and less than 100%.
  - The vehicle speed is more than 5 km/h (3 mph).

Action Taken When The DTC Sets

- No use 4th gear.
- No input revolution Sensor failure detection.
- MIL request “ON”. (EURO 4 only)
- Check Trans “ON”.
- DTC stored.

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Circuit/System Testing DTC P0752

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Install a scan tool. 2. Turn "ON" the ignition. 3. Review and record scan tool data. 4. Operate the vehicle within scan tool data. Does a scan tool indicate DTC P0752?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Perform the transmission fluid checking procedure. Refer to checking Transmission Fluid level and Condition in Automatic Transmission 7A section. If the problem found, repair or replaces necessary. Was the problem found?	—	Go to *Step 8*	Go to *Step 4*
4	Observe the commanded gear and current gear on the scan tool. 1. Turn "ON" the ignition with engine "ON". 2. Road testing the vehicle. 3. The throttle position is more than 8%. 4. The vehicle speed is more than 5 km/h (3 mph). Did the TCM detect 2nd gear ratio in case of 3rd gear target? Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 9*
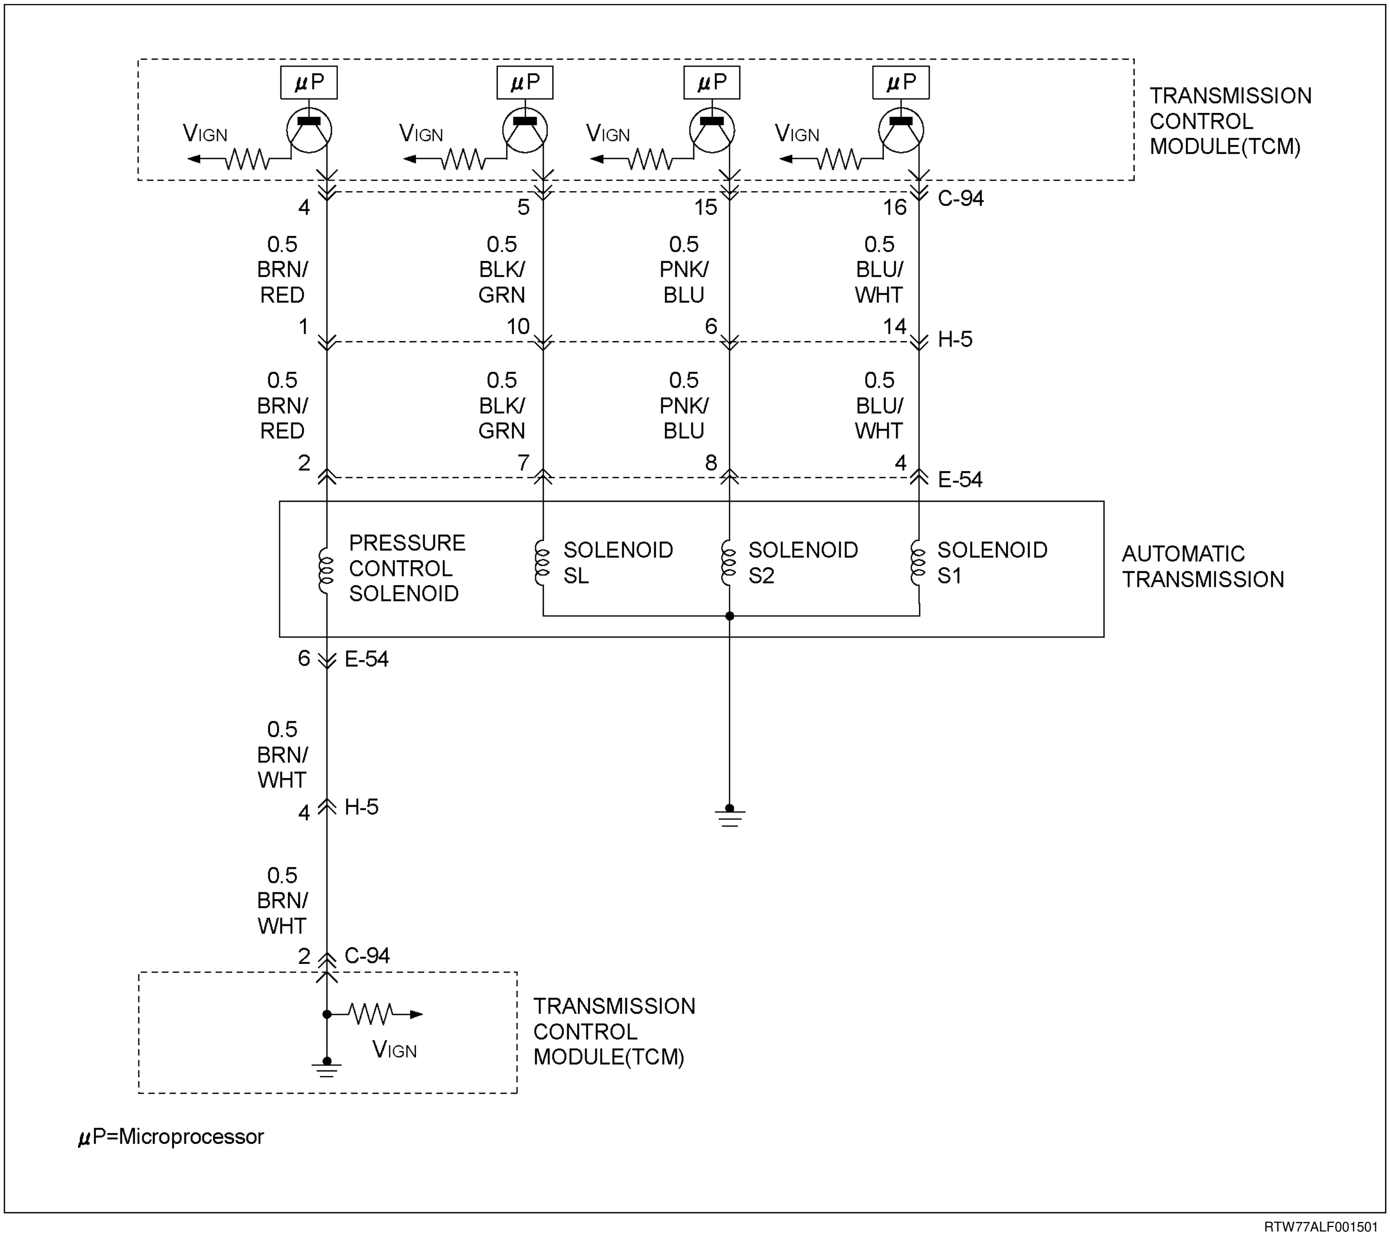
9	Observe the stored information, Capture info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to *Diagnostic Trouble Code (DTC) List*	Verify repair

DTC P0756 (Flash Code 42)



Circuit Description

The shift solenoid S2 changes the hydraulic route with the signals from the TCM according to the vehicle speed and the throttle opening to control shifting. When the solenoid S1 or S2 fails, the hydraulic circuit is mechanically operated as a backup.

Condition For Running The DTC

All of the following conditions are met.

(1) All of the following conditions are met for 2 seconds or more continuously.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.
- DTC U2104 is not detecting failure or not deciding failure.
- DTC U2105 is not detecting failure or not deciding failure.
- Engine revolution signal is not detecting failure or not deciding failure.
- The engine revolution is more than 550rpm.

(2) Oil temperature is more than 20°C (68°F), and water temperature signal is more than 70°C (158°F).

(3) 20 seconds or more passed after D position is detected.

(4) Oil temperature sensor is not deciding failure.

(5) Engine coolant temperature sensor is not detecting failure or not deciding failure.

(6) Engine revolution rpm is more than 600 rpm.

(7) Engine revolution sensor is not detecting failure or not deciding failure.

(8) T/F condition is high.

(9) T/F Hi-Low SW is not detecting failure or not deciding failure.

(10) Output revolution sensor is not detecting failure or not deciding failure.

(11) S1 solenoid is not detecting failure or not deciding failure. (Electric failure)

(12) S2 solenoid is not detecting failure or not deciding failure. (Electric failure)

(13) Selector position switch is not detecting failure or not deciding failure.

(14) DTC U2104 is not detecting failure or not deciding failure.

(15) DTC U2105 is not detecting failure or not deciding failure.

(16) Input revolution sensor is not deciding.

(17) Throttle signal is not detecting failure or not deciding failure.

(18) Not emergency mode.

(19) Engine torque signal is not detecting failure or not deciding failure.

(20) Pressure control solenoid is not detecting failure or not deciding failure.

(21) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication Service is receiving enable.
- DTC Clear is not operating.

Condition For Setting The DTC

The following conditions are detected two times or more between ignition “ON” and ignition “OFF”.

2 second passed after gear change output.

- The TCM detects equivalent of 1st gear ratio for 1 second in case of 2nd gear output.
  - The throttle position is more than 8% and less than 100%.
  - The vehicle speed is more than 5 km/h (3 mph).
- The TCM detects equivalent of 4th gear ratio for 1 second in case of 3rd gear output.
  - The throttle position is more than 8% and less than 100%.
  - The vehicle speed is more than 20 km/h (12 mph).

Action Taken When The DTC Sets

- No input revolution Sensor failure detection.
- MIL request “ON”. (EURO 4 only)
- Check Trans “ON”.
- DTC stored.

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring.
  Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

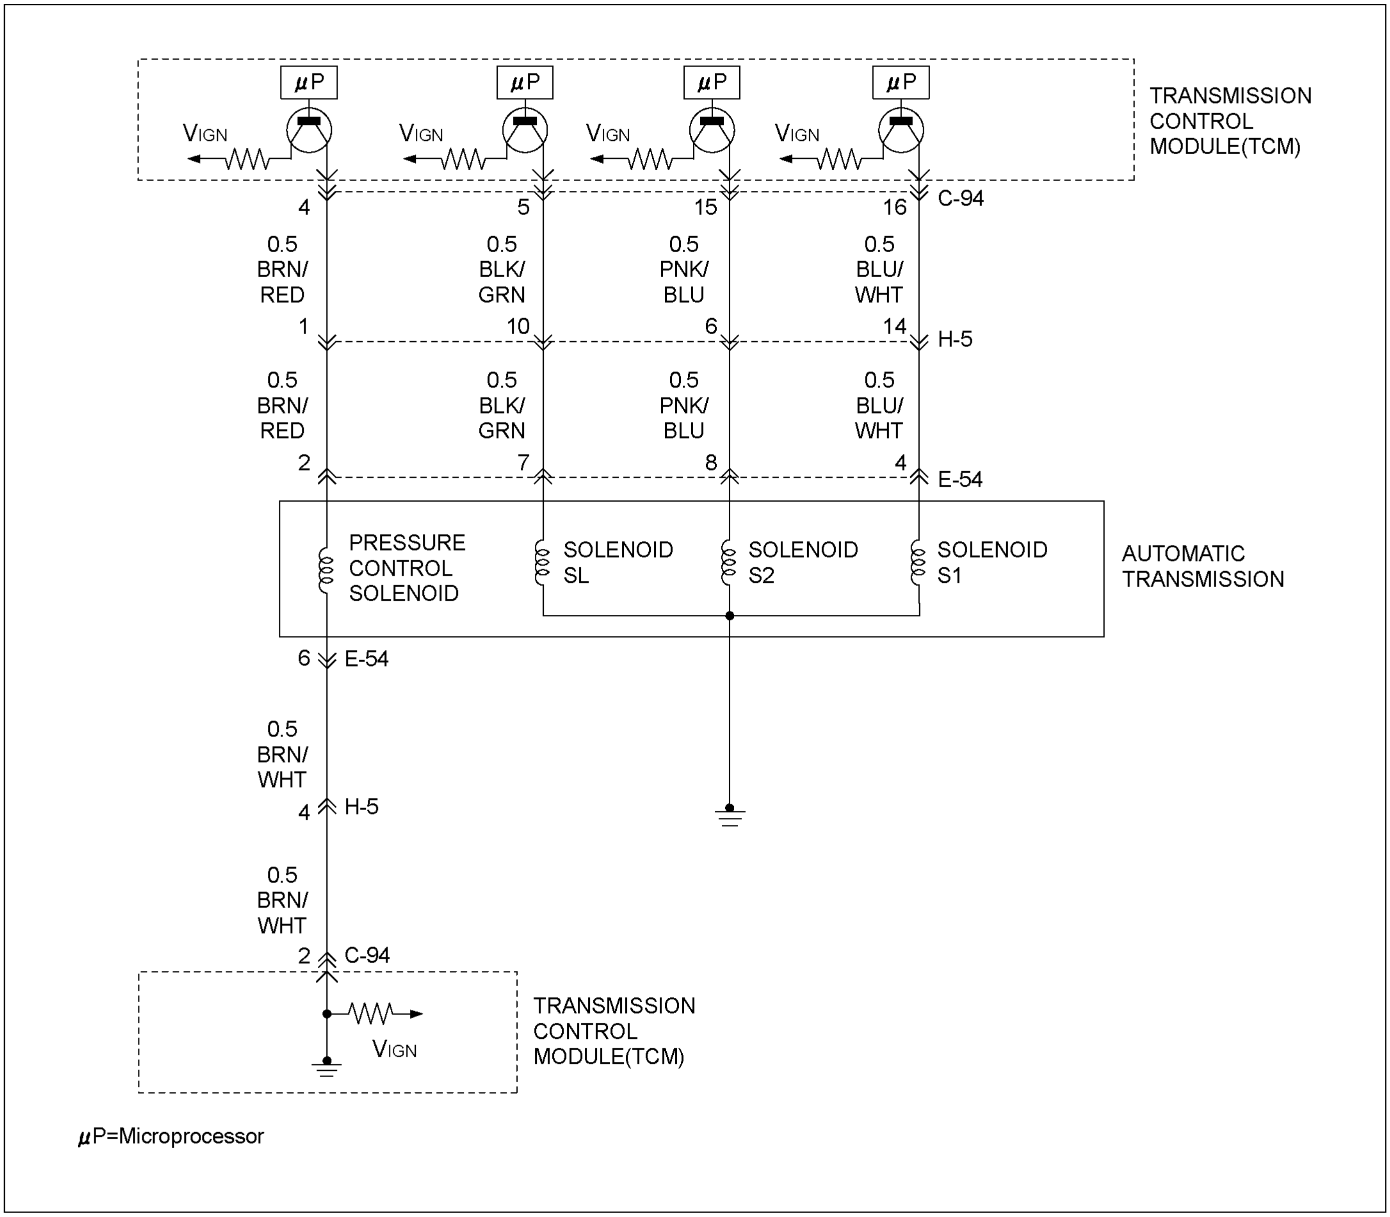
DTC P0757 (Flash Code 52)



RTW77ALF001501

Circuit Description

The shift solenoid S2 changes the hydraulic route with the signals from the TCM according to the vehicle speed and the throttle opening to control shifting. When the solenoid S1 or S2 fails, the hydraulic circuit is mechanically operated as a backup.

Condition For Running The DTC

All of the following conditions are met.

(1) All of the following conditions are met for 2 seconds or more continuously.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.
- DTC U2104 is not detecting failure or not deciding failure.
- DTC U2105 is not detecting failure or not deciding failure.
- Engine revolution signal is not detecting failure or not deciding failure.
- The engine revolution is more than 550 rpm.

(2) Oil temperature is more than 20°C (68°F), and water temperature signal is more than 70°C (158°F).

(3) 20 seconds or more passed after D position is detected.

(4) Oil temperature sensor is not deciding failure.

(5) Engine coolant temperature sensor is not detecting failure or not deciding failure.

(6) Engine revolution rpm is more than 600 rpm.

(7) Engine revolution sensor is not detecting failure or not deciding failure.

(8) T/F condition is high.

(9) T/F Hi-Low SW is not detecting failure or not deciding failure.

(10) Output revolution sensor is not detecting failure or not deciding failure.

(11) S1 solenoid is not detecting failure or not deciding failure. (Electric failure)

(12) S2 solenoid is not detecting failure or not deciding failure. (Electric failure)

(13) Selector position switch is not detecting failure or not deciding failure.

(14) DTC U2104 is not detecting failure or not deciding failure.

(15) DTC U2105 is not detecting failure or not deciding failure.

(16) Input revolution sensor is not deciding.

(17) Throttle signal is not detecting failure or not deciding failure.

(18) Not emergency mode.

(19) Engine torque signal is not detecting failure or not deciding failure.

(20) Pressure control solenoid is not detecting failure or not deciding failure.

(21) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication Service is receiving enable.
- DTC Clear is not operating.

Condition For Setting The DTC

The following conditions are detected two times or more between ignition “ON” and ignition “OFF”.

2 second passed after gear change output.

- The TCM detects equivalent of 2nd gear ratio for 1 second in case of 1st gear output.
  - The throttle position is more than 8% and less than 100%.
  - The vehicle speed is more than 5 km/h (3 mph).
- The TCM detects equivalent of 3rd gear ratio for 1 second in case of 4th gear output.
  - The throttle position is more than 8% and less than 100%.
  - The vehicle speed is more than 5 km/h (3 mph).

Action Taken When The DTC Sets

- No input revolution sensor failure detection.
- MIL request “ON”. (EURO 4 only)
- Check Trans “ON”.
- DTC stored.

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

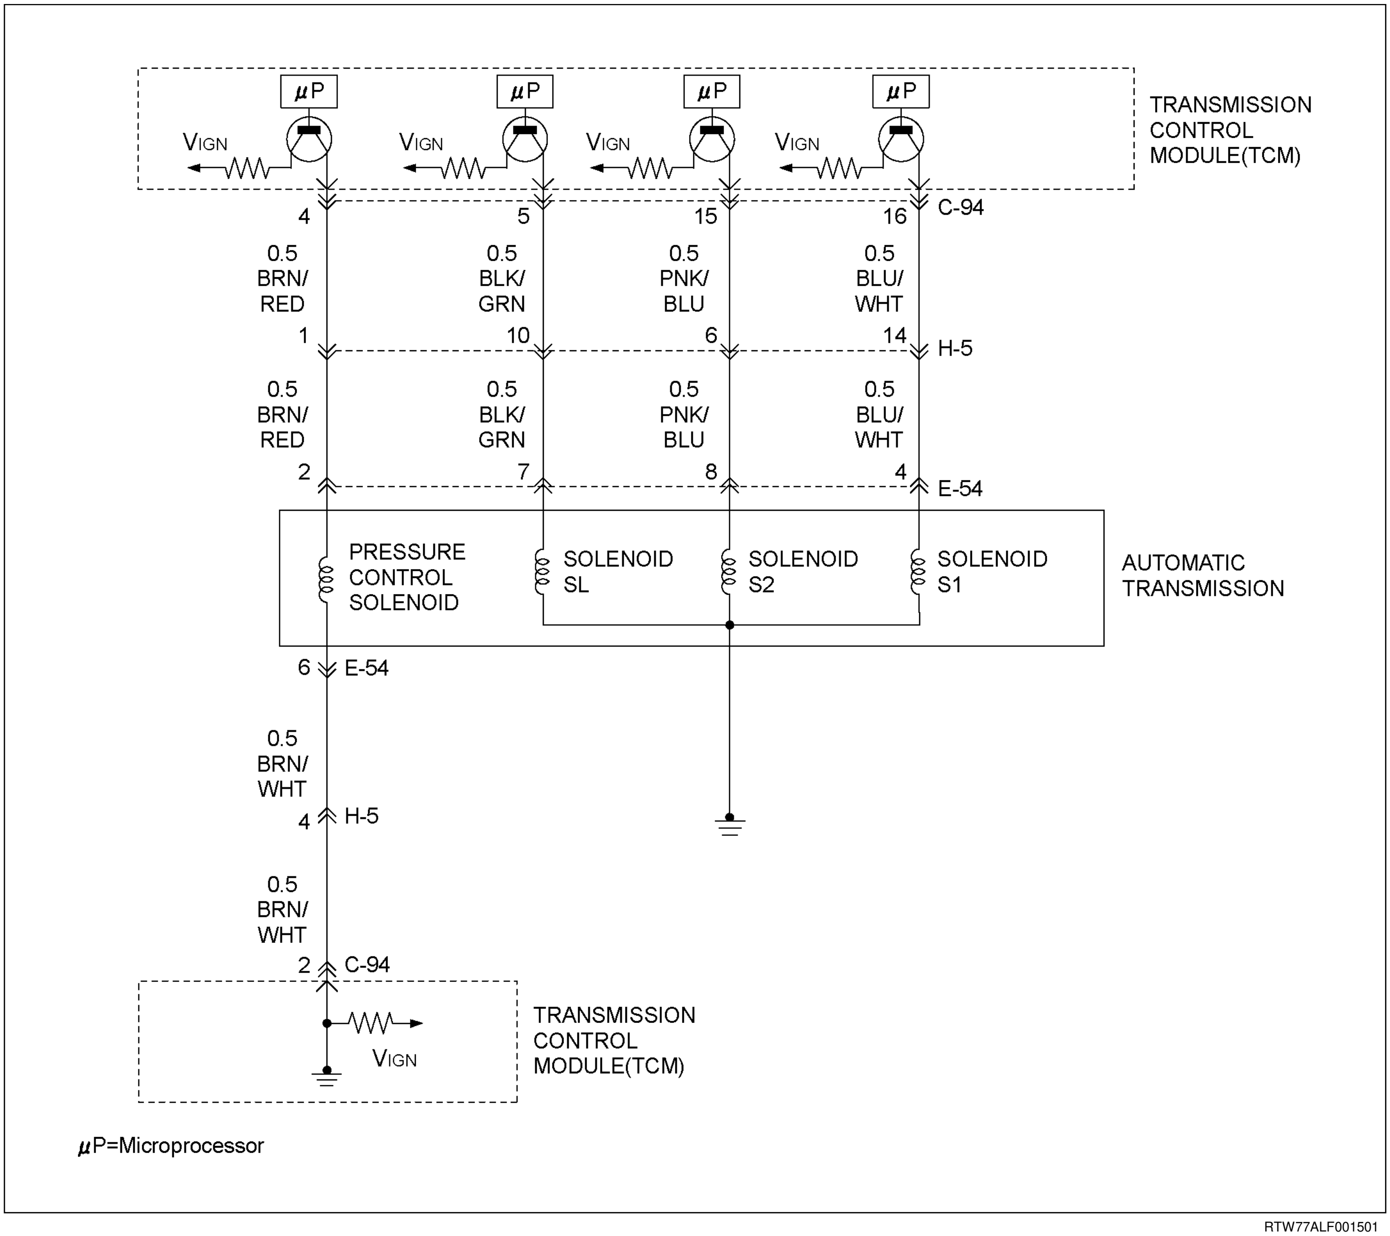
- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring.
  Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Circuit/System Testing DTC P0757

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Install a scan tool. 2. Turn “ON” the ignition. 3. Review and record scan tool data. 4. Operate the vehicle within scan tool data. Does a scan tool indicate DTC P0757?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Perform the transmission fluid checking procedure. Refer to checking Transmission Fluid level and Condition in Automatic Transmission 7A section. If the problem found, repair or replace necessary. Was the problem found?	—	Go to *Step 8*	Go to *Step 4*
4	Observe the commanded gear and current gear on the scan tool. 1. Turn “ON” the ignition with engine “ON”. 2. Road testing the vehicle. 3. The throttle position is more than 8%. 4. The vehicle speed is more than 5 km/h (3 mph). Did the TCM detect 2nd gear ratio in case of 1st gear target, and 3rd gear ratio in case of 4th gear target? Above conditions were indicated on the scan tool display?	—	Refer to *Diagnostic Aids*	Go to *Step 5*
5	Check the following items. • Check the shift solenoid valve S2. (Refer to Section 7A3) • Shift solenoid valve S2 stuck “ON” the release position (Refer to Section 7A4) • Misaligned or damaged valve body gasket. • Restricted apply passage. If the problem found, replaces necessary. Was the problem found?	—	Go to *Step 8*	Go to *Step 6*
6	Check the DTC on a scan tool. Is DTC found on a scan tool?	—	Go to *Step 7*	Go to *Step 8*
7	Replace the valve body. (Refer to Section 7A4). Is the action complete?	—	Go to *Step 8*	—

Step	Action	Value(s)	YES	NO
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn “OFF” the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 9*
9	Observe the stored information, Capture info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to *Diagnostic Trouble Code (DTC) List*	Verify repair

DTC P0962 or P0963 (Flash Code 35)



Circuit Description

The pressure control solenoid is a PWM duty control solenoid located in the valve body.

The pressure control solenoid is a TCM-controled device used to regulate transmission throttle pressure by energizing current from the TCM.

Condition For Running The DTC

All of the following conditions are met.

(1) All of the following conditions are met for 2 seconds or more continuously.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.

(2) Not emergency mode.

(3) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication Service is receiving enable.
- DTC Clear is not operating.

Condition For Setting The DTC

(1) All of the following conditions are met for 12.5 seconds or more continuously. (DTC P0962)

- 1 second or more passed after ignition short failure detection condition is met or ignition short failure is never detected after ignition “ON”.

- Feedback current value is less than 92 mA

(2) All of the following conditions are met for 0.5 seconds or more continuously. (DTC P0963)

- 1 second or more passed after open failure detection condition is met or open failure is not detected after ignition "ON".
- Feedback current value is more than 1357 mA.

Action Taken When The DTC Sets

- No squat control.
- No line pressure reduction control at gear change.
- No lock-up control.
- No slope control.
- No torque reduction control.
- No line pressure reduction control at garage.
- Line pressure FULL output.
- No shift solenoid functional failure detection.
- No L-up solenoid functional failure detection.
- No pressure control solenoid Feedback stuck failure detection.
- Check Trans "ON".
- DTC stored.
- MIL request "ON". (EURO 4 only)

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned "ON", short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

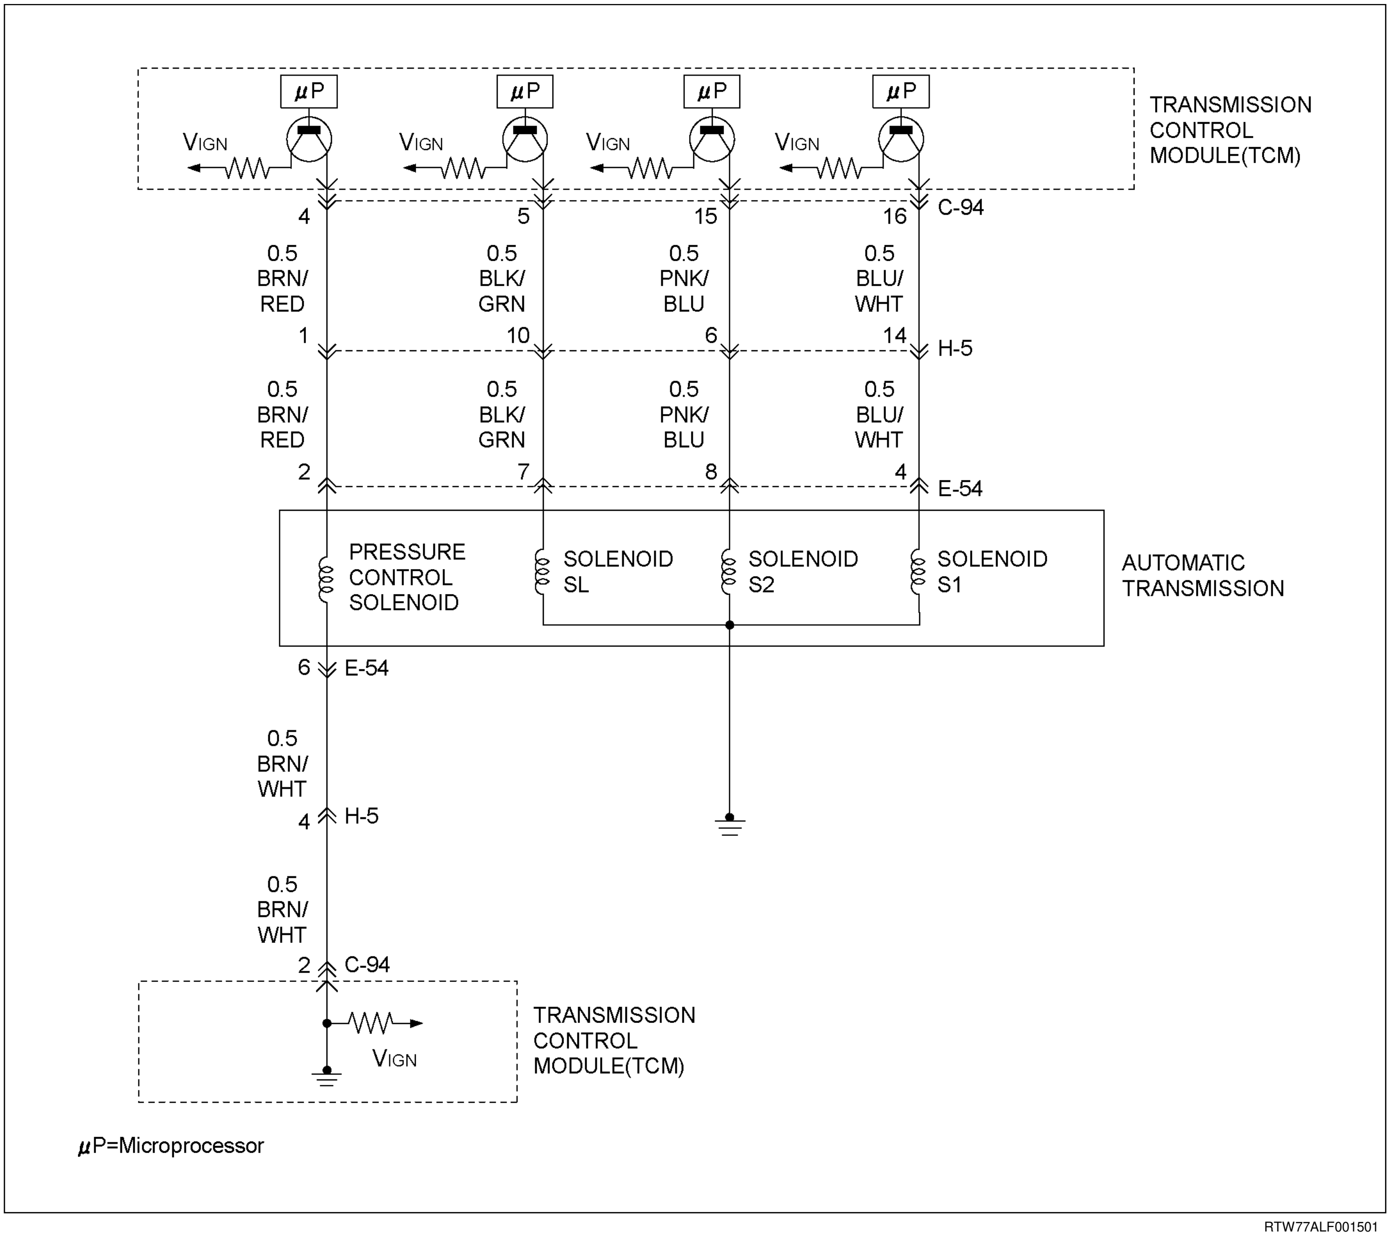
- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring.
  Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Circuit/System Testing DTC P0962 or P0963

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Install a scan tool. 2. Turn "ON" the ignition. 3. Record scan tool data. 4. Operate the vehicle within scan tool data. Does a scan tool indicate DTC P0962 or P0963?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Measure the resistance of pressure control solenoid. 1. Turn "OFF" the ignition. 2. Disconnect the automatic transmission connector. 3. Measure the resistance between automatic transmission terminal E54-2 and automatic transmission terminal E54-6. Is the resistance specified value?	5 to 5.6Ω at 20°C (68°F)	Go to *Step 4*	Go to *Step 7*

Step	Action	Value(s)	YES	NO
4	Measure the resistance of wire between terminal C94-2 and terminal C94-4 1. Turn “OFF” the ignition. 2. Connect the automatic transmission connector. 3. Disconnect the TCM connector. 4. Measure the resistance between terminal C94-2 and terminal C94-4. Is the resistance specified value?	5 to 5.6Ω at 20°C (68°F)	Go to *Step 6*	Go to *Step 5*
5	Repair or Replace the wire between terminals C94-2, 4 and terminals E54-6, 2. Is the action complete?	—	Go to *Step 9*	—
6	Observe the PCS Actual Current data on a scan tool data. 1. Turn “ON” the ignition. Does the scan tool indicate is specified value?	About 1000mA	Go to *Step 9*	Go to *Step 8*
7	Replace the pressure control solenoid. Is the action complete?	—	Go to *Step 9*	—
8	Replace the TCM. **Important:** The replacement TCM must be programmed (Refer to *SPS* for procedure). Is the action complete?	—	Go to *Step 9*	—
9	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn “OFF” the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 10*
10	Observe the stored information, Capture info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to *Diagnostic Trouble Code (DTC) List*	Verify repair

DTC P0973 or P0974 (Flash Code 31)



Circuit Description

The shift solenoid S1 changes the hydraulic route with the signals from the TCM according to the vehicle speed and the throttle opening to control shifting. When the shift solenoid S1 or S2 fails, the hydraulic circuit is mechanically operated as a backup.

Condition For Running The DTC

All of the following conditions are met.

(1) All of the following conditions are met for 2 seconds or more continuously.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.

(2) Not emergency mode.

(3) 0.025 seconds or more passed after the state of power "ON" solenoid is changed.

(4) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication is receiving enable.
- DTC Clear is not operating.

Wheel Size	14 x 5.5JJ	15 x 6.5JJ	15 x 6.5JJ	16 x 7JJ
Tire Pressure				
Front kPa (kgf/cm^2/psi)	245 (2.5/36)	221 (2.25/32)	221 (2.25/32)	200 (2.0/28)
Rear kPa (kgf/cm^2/psi)	441 (4.5/64)	368 (3.75/53)	319 (3.25/46)	270 (2.8/40)

Condition For Setting The DTC

The TCM detects following conditions for 0.5 seconds continuously at shifting.

- Voltage at connector pin is 0V when solenoid is “ON”. (DTC P0973)
- Voltage at connector pin is ignition voltage when solenoid is “OFF”. (DTC P0974)

Action Taken When The DTC Sets

- No L-up control.
- No line pressure reduction control at gear change.
- No torque reduction control.
- No squat control.
- No slope control.
- No line pressure reduction control at garage.
- No input revolution sensor failure detection.
- No shift solenoid failure detection.
- No L-up solenoid failure detection.
- Change to emergency mode.
- Check Trans “ON”.
- DTC stored.
- MIL request “ON”. (EURO 4 only)

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring.
  Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

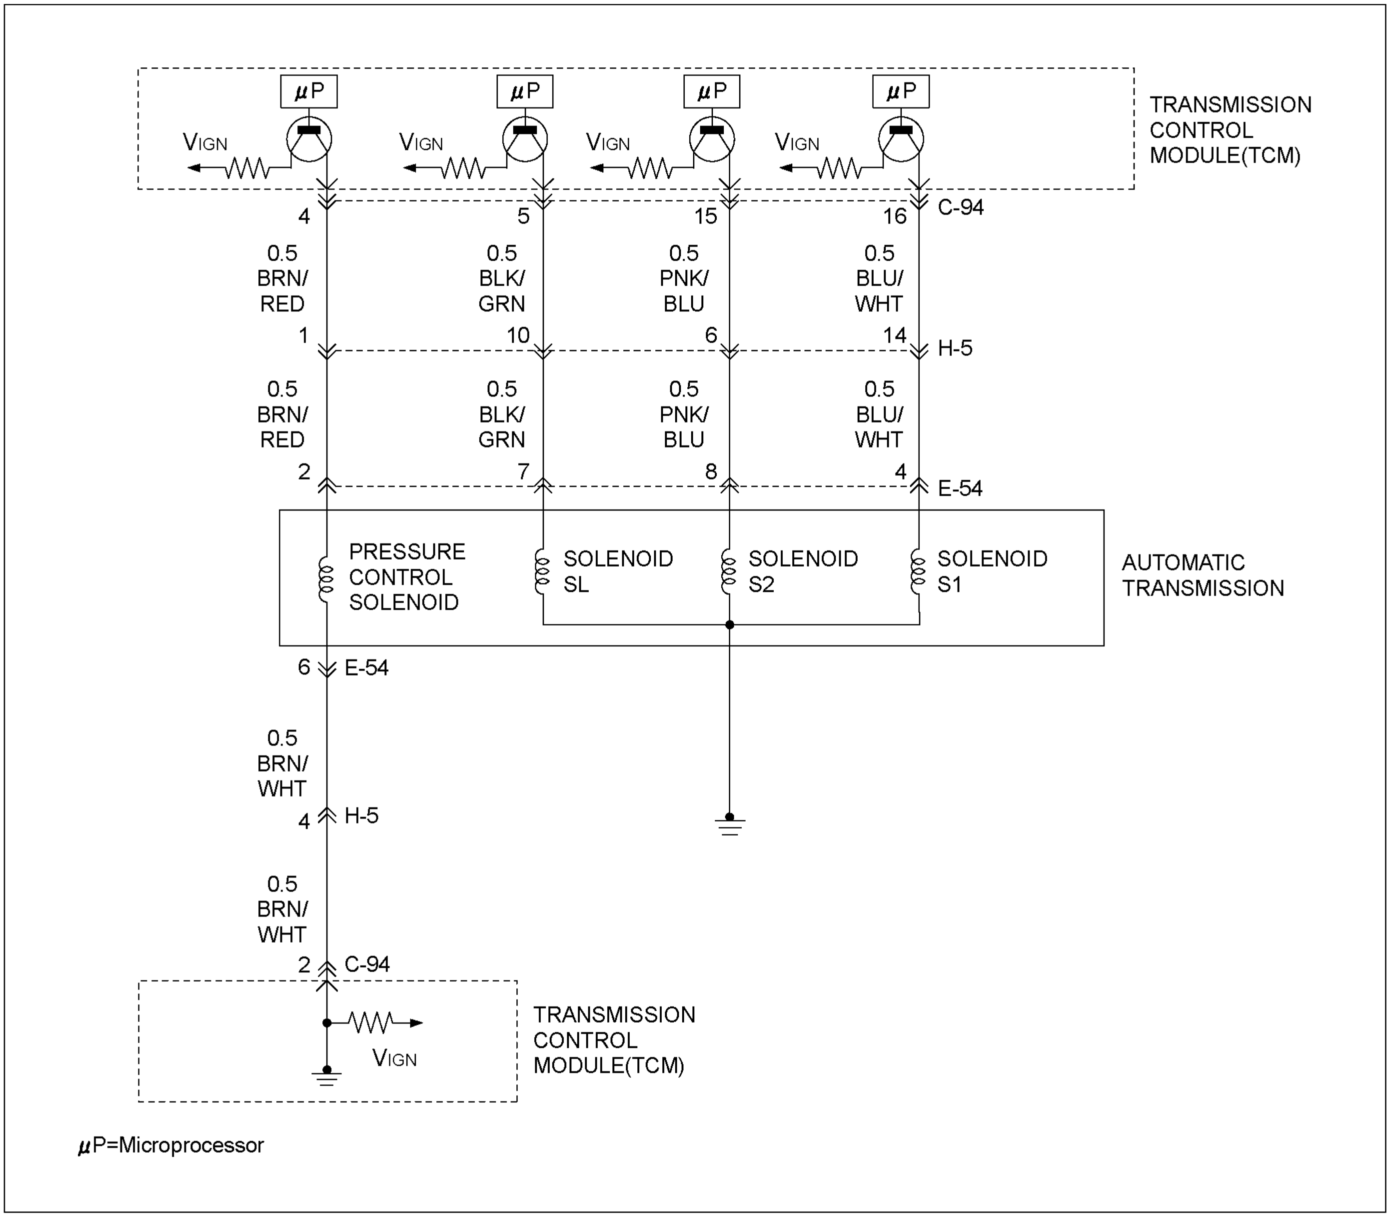
Circuit/System Testing DTC P0973 or P0974

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Install a scan tool. 2. Start the engine. 3. Depress the brake pedal and place the select lever in D position. 4. Press the 3rd start switch. (Turn the 3rd start switch “ON”.) 5. Press the 3rd start switch again. (Turn the 3rd start switch “OFF”.) Does a scan tool indicate DTC P0973 or P0974?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	1. Turn “ON” the ignition with the engine “ON”. 2. Place the selector lever in the “P” position. 3. Measure the voltage between terminal C94-16 and terminal C94-1 (GND) on the TCM pigtail connector by 5-8840-0285-0 DMM. Is the voltage specified value?	8~16V	Go to *Step 4*	Go to *Step 10*

Step	Action	Value(s)	YES	NO
4	1. Turn "OFF" the ignition. 2. Disconnect the TCM connector (C-94). 3. Turn "ON" the ignition. 4. Measure the voltage between terminal C94-16 and terminal C94-1 by 5-8840-0285-0 DMM. Is the voltage specified value?	0V	Go to *Step 5*	Go to *Step 7*
5	1. Turn "OFF" the ignition. 2. Measure the resistance between terminal C94-16 and body ground by 5-8840-0285-0 DMM. Is the resistance specified value?	11~15Ω	Go to *Step 9*	Go to *Step 6*
6	1. Disconnect the automatic transmission connector (E-54). 2. Measure the resistance between terminal E54-4 and body ground by 5-8840-0285-0 DMM. Is the resistance specified value?	11~15Ω	Go to *Step 7*	Go to *Step 8*
7	1. Check for open or short in the wire between terminal C94-16 and terminal E54-4. 2. Repair or replace the wire between terminal C94-16 and terminal E54-4. Is the action complete?	—	Go to *Step 11*	—
8	Replace the S1 solenoid. Is the action complete?	—	Go to *Step 11*	—
9	1. Clear the DTC. 2. Perform the test-driving. 3. Check the DTC. Was DTC P0973 or P0974 stored?	—	Go to *Step 10*	Refer to *Diagnostic Aids*
10	Replace the TCM. **Important:** The replacement TCM must be programmed (Refer to *SPS* for procedure). Is the action complete?	—	Go to *Step 11*	—
11	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn "OFF" the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 12*

Step	Action	Value(s)	YES	NO
12	Observe the stored information, Capture info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to *Diagnostic Trouble Code (DTC) List*	Verify repair

DTC P0976 or P0977 (Flash Code 32)



RTW77ALF001501

Circuit Description

The shift solenoid S2 changes the hydraulic route with the signals from the TCM according to the vehicle speed and the throttle opening to control shifting. When the shift solenoid S1 or S2 fails, the hydraulic circuit is mechanically operated as a backup.

Condition For Running The DTC

All of the following conditions are met.

(1) All of the following conditions are met for 2 seconds or more continuously.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.

(2) Not emergency mode.

(3) 0.025 seconds or more passed after the state of power “ON” solenoid is changed.

(4) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication is receiving enable.
- DTC Clear is not operating.

Condition For Setting The DTC

The TCM detects following conditions for 0.5 seconds continuously at shifting.

- Voltage at connector pin is 0V when solenoid is "ON". (DTC P0976)
- Voltage at connector pin is ignition voltage when solenoid is "OFF". (DTC P0977)

Action Taken When The DTC Sets

- No L-up control.
- No line pressure reduction control at gear change.
- No torque reduction control.
- No squat control.
- No slope control (keep mode).
- No line pressure reduction control at garage.
- No input revolution sensor failure detection.
- No shift solenoid failure detection.
- No L-up solenoid failure detection.
- Change to emergency mode.
- Check Trans "ON".
- DTC stored.
- MIL request "ON". (EURO 4 only)

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned "ON", short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring.
  Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Circuit/System Testing DTC P0976 or P0977

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Install a scan tool. 2. Start the engine. 3. Depress the brake pedal and place the select lever in D position. 4. Press the 3rd start switch. (Turn the 3rd start switch "ON".) 5. Press the 3rd start switch again. (Turn the 3rd start switch "OFF".) Does a scan tool indicate DTC P0976 or P0977?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	1. Turn "ON" the ignition with the engine "ON". 2. Place the selector lever in the "P" position. 3. Measure the voltage between terminal C94-15 and terminal C94-1 on the TCM pigtail connector by 5-8840-0285-0 DMM. Is the voltage specified value?	8~16V	Go to *Step 4*	Go to *Step 5*

Step	Action	Value(s)	YES	NO
4	1. Turn “OFF” the ignition. 2. Disconnect the TCM connector (C-94). 3. Turn “ON” the ignition. 4. Measure the voltage between terminal C94-15 and terminal C94-1 by 5-8840-0285-0 DMM. Is the voltage specified value?	8~16V	Go to *Step 7*	Go to *Step 10*
5	1. Turn “OFF” the ignition. 2. Measure the resistance between terminal C94-15 and body ground by 5-8840-0285-0 DMM. Is the resistance specified value?	11~15Ω	Go to *Step 9*	Go to *Step 6*
6	1. Disconnect the automatic transmission connector (E-54). 2. Measure the resistance between terminal E54-8 and body ground by 5-8840-0285-0 DMM. Is the resistance specified value?	11~15Ω	Go to *Step 7*	Go to *Step 8*
7	1. Check for open or short in the wire between terminal C94-15 and terminal E54-8. 2. Repair or replace the wire between terminal C94-15 and terminal E54-8. Is the action complete?	—	Go to *Step 11*	—
8	Replace the S2 solenoid. Is the action complete?	—	Go to *Step 11*	—
9	1. Clear the DTC. 2. Perform the test-driving. 3. Check the DTC. Was DTC P0976 or P0977 stored?	—	Go to *Step 10*	Refer to *Diagnostic Aids*
10	Replace the TCM. **Important:** The replacement TCM must be programmed (Refer to *SPS* for procedure). Is the action complete?	—	Go to *Step 11*	—

Step	Action	Value(s)	YES	NO
11	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn “OFF” the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 12*
12	Observe the stored information, Capture info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to *Diagnostic Trouble Code (DTC) List*	Verify repair

DTC P1790 (Flash Code 61)

Description

The electrically erasable programable read only memory (EEPROM) is a permanent memory chip that is physically solenoid within the TCM. The EEPROM contans the program and the calibration information that the TCM needs to control powertrain operation.

Unlike the PROM used in past applications, the EEPROM is not replaceable. If the TCM is replaced, the new TCM will need to be programmed. Equipment containing the correct program and calibration for the vehicle is required to program the TCM.

Condition For Running The DTC

ROM check sum calculation is completed.

Condition For Setting The DTC

Following condition is met twice since ignition “ON”.

- ROM check sum calculation result/check sum value saved in ROM.

Action Taken When The DTC Sets

- Change to emergency mode.
- Check Trans “ON”.
- DTC stored.
- MIL request “ON”. (EURO 4 only)

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.5 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Circuit/System Testing DTC P1790

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Install a scan tool. 2. Turn "OFF" the ignition and keep the position for more than 30 seconds. 3. Turn "ON" the ignition. 4. Check the DTC on a scan tool. Does a scan tool indicate DTC P1791?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Perform the SPS for the TCM. Is the action complete?	—	Go to *Step 4*	—
4	Recheck the DTC on the scan tool. Does the scan tool indicate DTC P1790?	—	Go to *Step 5*	Go to *Step 6*
5	Replace the TCM. **Important:** The replacement TCM must be programmed (Refer to *SPS* for procedure). Is the action complete?	—	Go to *Step 6*	—
6	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn "OFF" the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 7*
7	Observe the stored information, Capture info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to *Diagnostic Trouble Code (DTC) List*	Verify repair

DTC P1791 (Flash Code 62)

Description

DTC P1791 is recorded by TCM when there is malfunction in the RAM.

Condition For Running The DTC

Execute only one time after ignition “ON”.

Condition For Setting The DTC

One of the following conditions are met two times continuously.

- Write Ox5a5a5a5a into RAM, and read value is not same as Ox5a5a5a5a.
- Write Oxa5a5a5a5 into RAM, and read value is not same as Oxa5a5a5a5.

Action Taken The DTC Sets

- Check Trans “ON”.
- DTC stored.
- MIL request “ON”. (EURO 4 only)

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

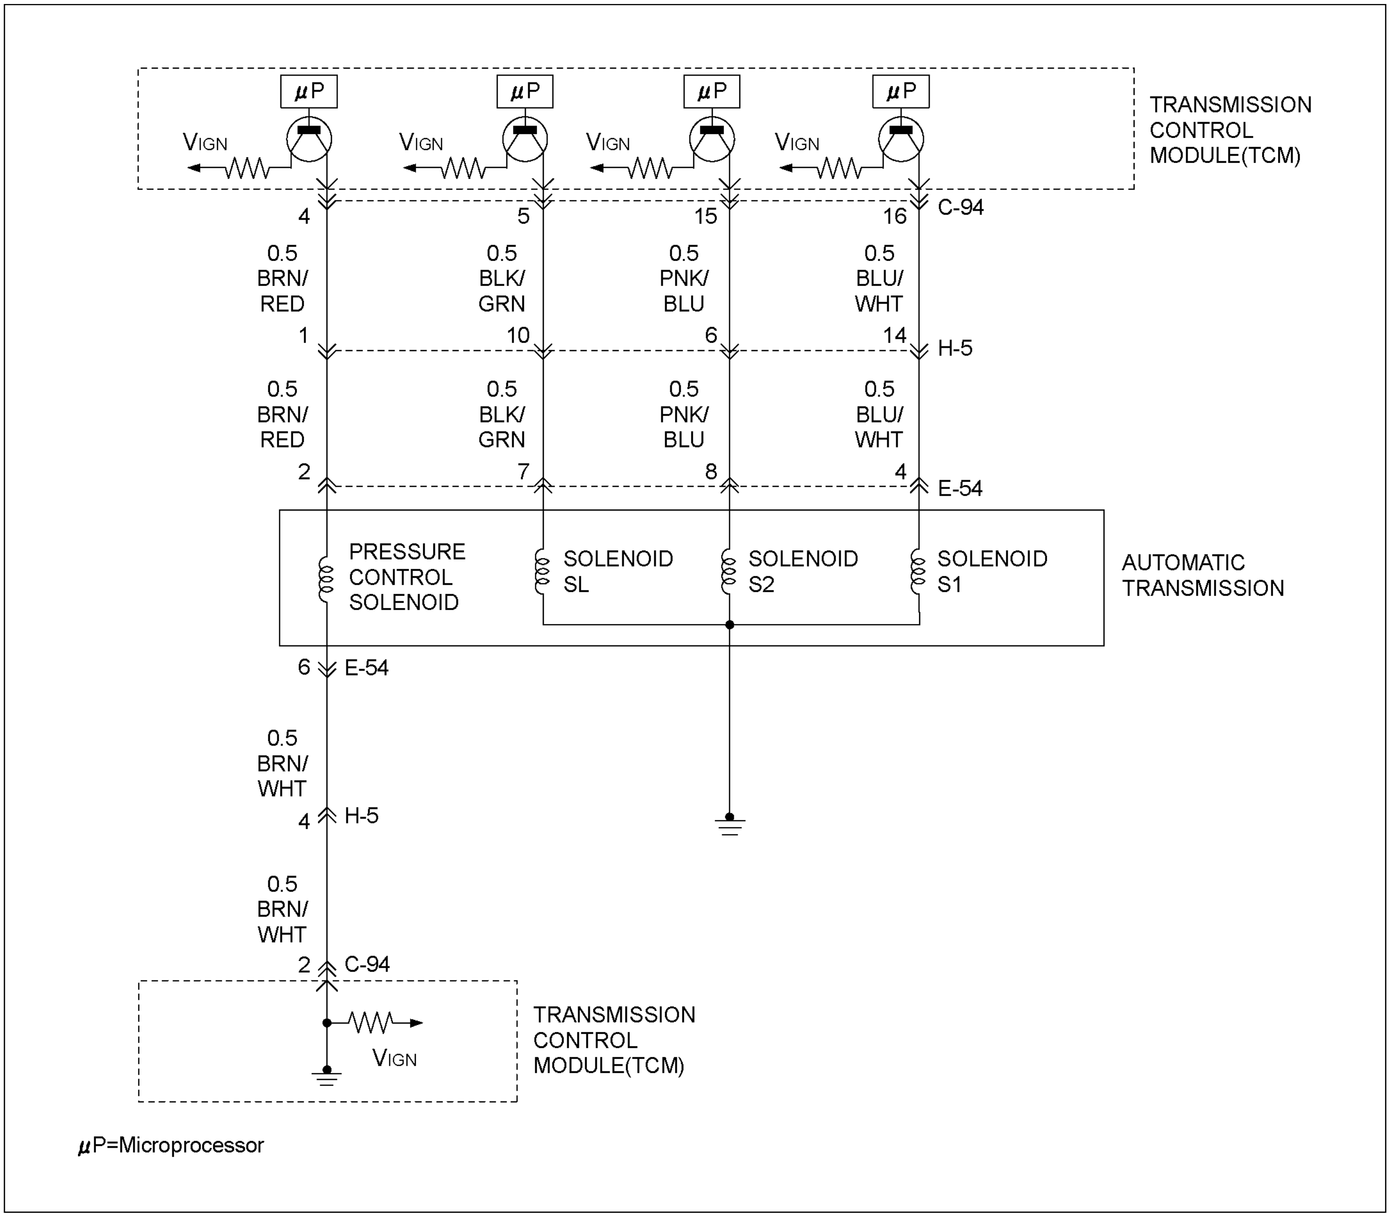
DTC P2769 or P2770 (Flash Code 33)



RTW77ALF001501

Circuit Description

The lock-up solenoid SL of the torque converter clutch (TCC) controls the lock-up clutch by a signal according to the lock-up position judgment of the TCM when the vehicle runs.

This function can improve the fuel consumption to almost the same extent as the manual transmission. The lock-up solenoid SL is put into B+ by the TCM, so that the solenoid is actuated with the result of lock-up.

Condition For Running The DTC

All of the following conditions are met.

(1) All of the following conditions are met for 2 seconds or more continuously.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.

(2) Not emergency mode.

(3) 0.025 seconds or more passed after the state of energized solenoid is changed.

(4) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication is receiving enable.
- DTC Clear is not operating.

Condition For Setting The DTC

The TCM detects following conditions for 0.5 seconds continuously at shifting.

- Voltage at connector pin is 0V when solenoid is “ON”. (DTC P2769)
- Voltage at connector pin is ignition voltage when solenoid is “OFF”. (DTC P2770)

Action Taken When The DTC Sets

- No L-up solenoid functional failure detection.
- No squat control. (DTC P2770)
- The TCM fixes to 1st gear when the vehicle speed is less than 10 km/h (6 mph).
- Check Trans “ON”.
- DTC stored.
- MIL request “ON”. (EURO 4 only)

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.5 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

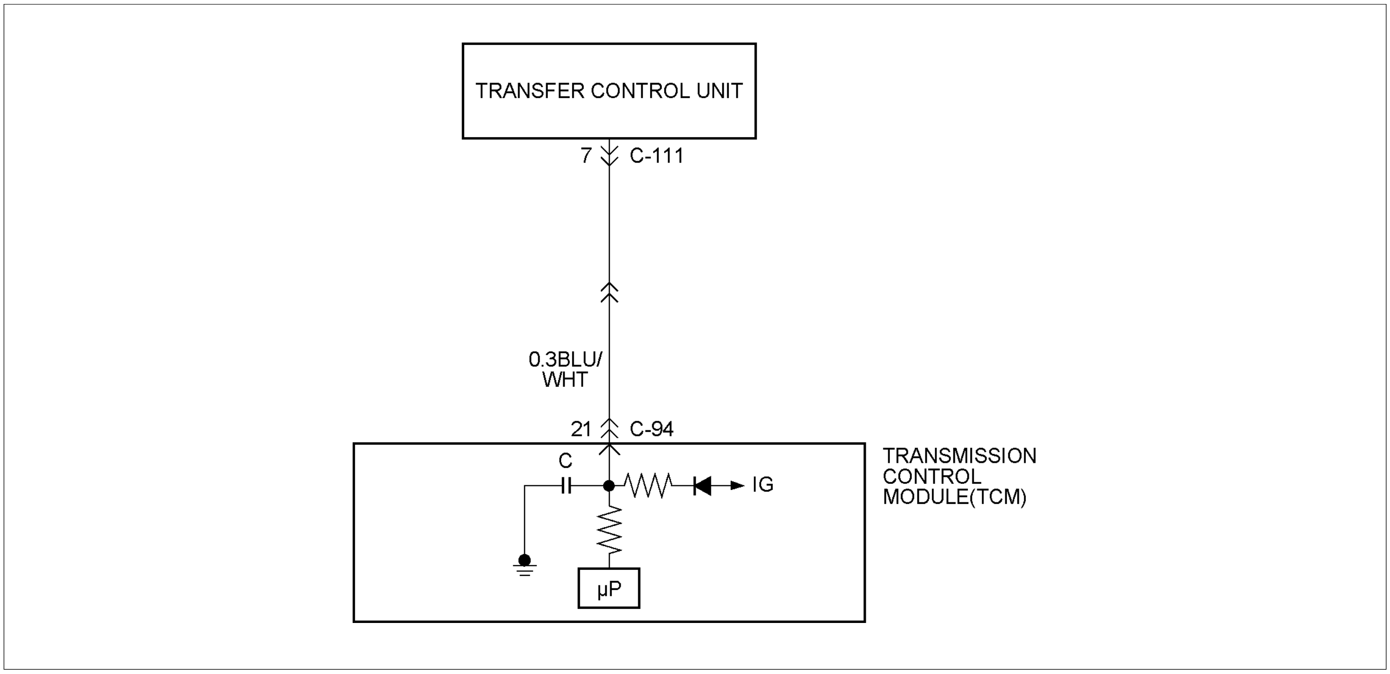
Circuit/System Testing DTC P2769 or P2770

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Install a scan tool. 2. Start the engine. 3. Drive the vehicle in D position. 4. Accelerate the vehicle until the gear position becomes the 4th. 5. Release the accelerator pedal and accelerate the vehicle until the gear position becomes the 4th again. Does a scan tool indicate DTC P2769 or P2770?	—	Go to *Step 3*	Refer to *Diagnostic Aids*

Step	Action	Value(s)	YES	NO
3	1. Turn “ON” the ignition with the engine “ON”. 2. Place the selector lever in the “P” position. 3. Measure the voltage between terminal C94-5 and terminal C94-1 on the TCM pigtail connector by 5-8840-0285-0 DMM. Is the voltage specified value?	8~16V	Go to *Step 4*	Go to *Step 5*
4	1. Turn “OFF” the ignition. 2. Disconnect the TCM connector (C-94). 3. Turn “ON” the ignition. 4. Measure the voltage between terminal C94-5 and terminal C94-1 by 5-8840-0285-0 DMM. Is the voltage specified value?	8~16V	Go to *Step 7*	Go to *Step 10*
5	1. Turn “OFF” the ignition. 2. Measure the resistance between terminal C94-5 and body ground by 5-8840-0285-0 DMM. Is the resistance specified value?	11~15Ω	Go to *Step 9*	Go to *Step 6*
6	1. Disconnect the automatic transmission connector (E-54). 2. Measure the resistance between terminal E54-7 and body ground by 5-8840-0285-0 DMM. Is the resistance specified value?	11~15Ω	Go to *Step 7*	Go to *Step 8*
7	1. Check for open or short in the wire between terminal C94-5 and terminal E54-7. 2. Repair or replace the wire between terminal C94-5 and terminal E54-7. Is the action complete?	—	Go to *Step 11*	—
8	Replace the SL solenoid. Is the action complete?	—	Go to *Step 11*	—
9	1. Clear the DTC. 2. Perform the test-driving. 3. Check the DTC. Was DTC P2769 or P2770 stored?	—	Go to *Step 10*	Refer to *Diagnostic Aids*
10	Replace the TCM. **Important:** The replacement TCM must be programmed (Refer to *SPS* for procedure). Is the action complete?	—	Go to *Step 11*	—

Step	Action	Value(s)	YES	NO
11	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn “OFF” the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 12*
12	Observe the stored information, Capture info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to *Diagnostic Trouble Code (DTC) List*	Verify repair

DTC P2773 or 2774 (Flash Code 75)



RTW77AMF000901

Condition For Running The DTC

All of the following conditions are met.

(1) All of the following conditions are met for 2 seconds or more continuously.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.
- DTC U2104 is not detecting failure or not deciding failure.
- DTC U2105 is not detecting failure or not deciding failure.
- Engine revolution signal is not detecting failure or not deciding.
- The engine revolution is more than 550 rpm.

(2) Not emergency mode.

(3) D, 3, 2, L position point is “ON”.

(4) Shift position signal is not detecting failure or not deciding failure.

(5) The vehicle speed is more than 29 km/h (18 mph) and less than 160 km/h (100 mph).

(6) Speed meter signal is detecting failure or not deciding failure.

(7) Output revolution rpm is more than 1500 rpm.

(8) Output revolution sensor is not detecting failure or not deciding failure.

(9) Throttle opening more than 2%.

(10) Throttle opening signal is not detecting failure or note deciding failure.

(11) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication is receiving enable.
- DTC Clear is not operating.

Condition For Setting The DTC

All of the following conditions are met for 10 seconds continuously. (DTC P2773)

- Transfer 4L switch is “ON”.
- Transfer High judgment by transfer real gear ratio 0.9 < T/F Hi gear ratio < 1.1

All of the following conditions are met for 10 seconds continuously. (DTC P2774)

- Transfer 4L switch is “OFF”.
- Transfer Low judgment by transfer real gear ratio 2.23 < T/F Low gear ratio < 2.73

Action Taken When The DTC Sets

- No shift solenoid functional failure detection.
- No L-up solenoid functional failure detection.
- MIL request “ON”.
- Check Trans “ON”.
- DTC stored.
- MIL request “ON”. (EURO 4 only)

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

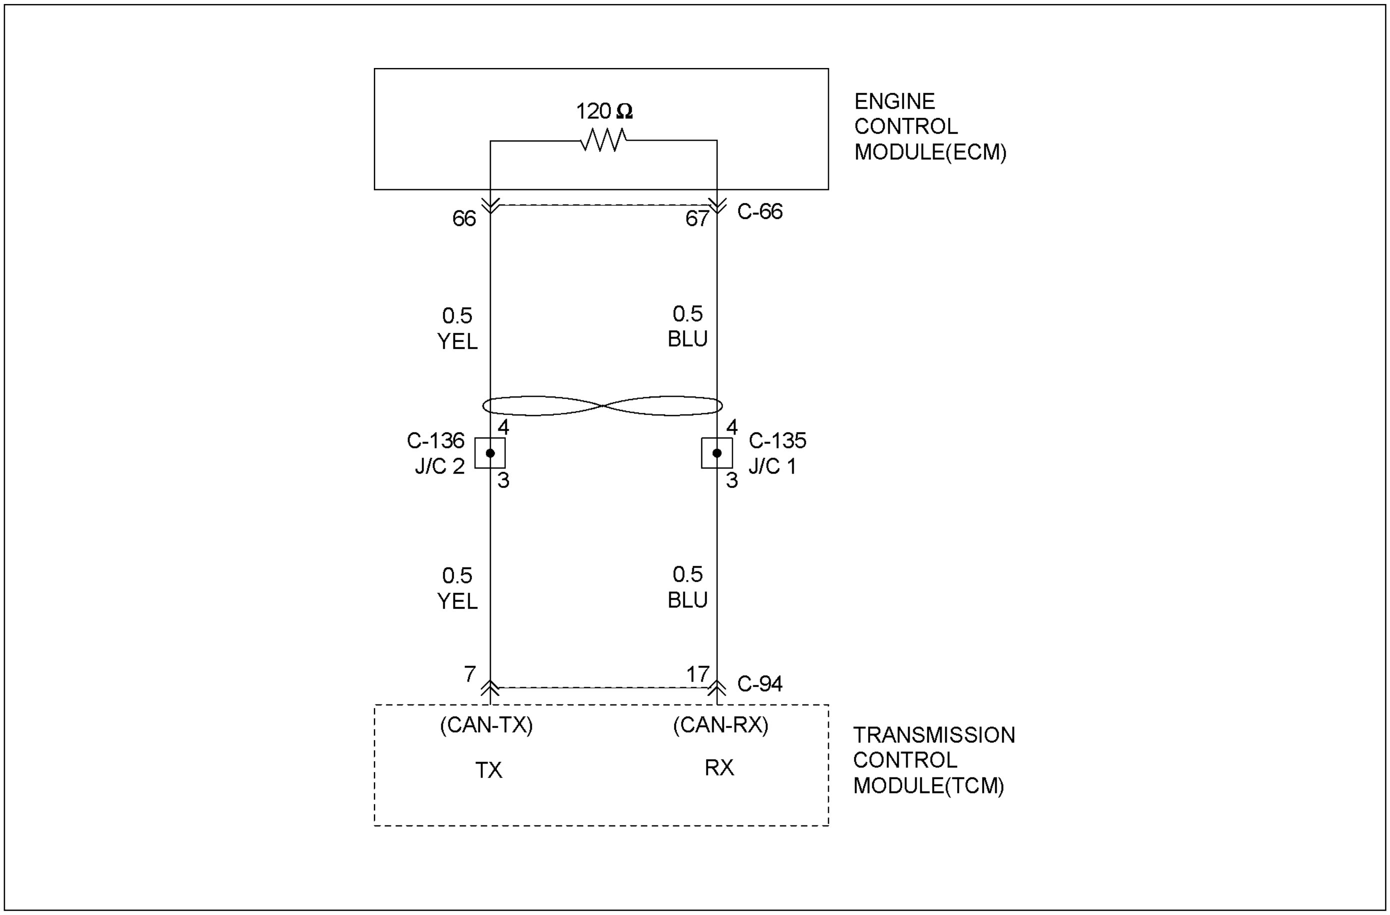
- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.

Circuit/System Testing DTC P2773 or P2774

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Install a scan tool. 2. Turn “ON” the ignition. 3. Review and record scan tool data. 4. Operate the vehicle within scan tool data. Does a scan tool indicate DTC P2773 or P2774?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Observe the 4L signal data of the TCM on the scan tool. 1. Turn “ON” the ignition with engine “ON”. 2. Perform the road testing. 3. Check the 4L signal data on a scan tool. Was the problem found?	—	Go to *Step 4*	Refer to *Diagnostic Aids*
4	Observe the 4L signal data of the TCM on a scan tool. 1. Turn “ON” the ignition with engine “ON”. 2. Perform the road testing. 3. Check the 4L signal data on a scan tool. Is the 4L signal fixed “ON”? (DTC P2773)	—	Go to *Step 6*	Go to *Step 5*
5	Observe the 4L signal data of the TCM on a scan tool. 1. Turn “ON” the ignition with engine “ON”. 2. Perform the road testing. 3. Check the 4L signal data on a scan tool. Is the 4L signal fixed “OFF”? (DTC P2774)	—	Go to *Step 6*	Go to *Step 8*
6	Replace or Repair the wire between the TCM terminal C94-21 and the T/F control unit terminal C111-7. Is the action complete?	—	Go to *Step 9*	—

Step	Action	Value(s)	YES	NO
7	Replace the T/F Control Unit.	—	Go to *Step 9*	—
8	Replace the TCM. **Important:** The replacement TCM must be programmed (Refer to *SPS* for procedure). Is the action complete?	—	Go to *Step 9*	—
9	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn “OFF” the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 10*
10	Observe the stored information, Capture info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to *Diagnostic Trouble Code (DTC) List*	Verify repair

DTC U2104 (Flash Code 65)



RTW77AMF000801

Circuit Description

The automatic transmission control system in AW30-40LE uses high speed CAN bus system. The individual CAN bus systems are connected via two interfaces and can exchange information and data. This allows control modules that are connected to different CAN bus systems to communicate. Transmission control module in the vehicle that requires continuous, rapid communication is connected to the high speed CAN bus. The automatic transmission is continuously notified of the current engine load status. Since the automatic transmission control module has to react immediately to load status changes, rapid communication is required between the engine control module and the automatic transmission control module. The high speed CAN bus in the AW30-40LE is designed as a two-wire CAN bus (twisted pair). The wires are shielded and twisted. The transmission rate is 500K band.

Condition For Running The DTC

All of the following conditions are met.

(1) All of the following conditions are met.

- The following condition is met for 2 seconds or more continuously.
  - The supply voltage is more than 10.2 volts and less than 15.5 volts.
- One of the following conditions is met once after ignition “ON”.
  - Output revolution sensor is not detecting failure or not deciding failure.
    Output revolution is more than 550rpm
  - Input revolution sensor is not detecting failure or not deciding failure.
    Input revolution is more than 550rpm
  - DTC U2104 is not detecting failure or not deciding failure.
    DTC U2105 is not detecting failure or not deciding failure.
    Engine revolution signal is not detecting failure or not deciding failure.
    The engine revolution is more than 550rpm.

(2) All of the following conditions are met.

- Device Control is not operating.
- Disable Normal Communication is receiving enable.
- DTC Clear is not operating.

The following condition at ignition “OFF” form “ON” is detected seven times in total in 1 cycle.

- Receiving BUS “OFF” information from CAN controller.

Action Taken When The DTC Set

- Throttle judgment on torque reduction control, line pressure control at stationary status, line pressure reduction control at gear change and line pressure reduction control at garage. (Throttle opening 100%)
- Line pressure FULL output.
- Throttle judgment on gear change control. (Throttle opening 0%)
- No line pressure reduction control at gear change.
- No torque reduction control.
- No squat control.
- No slope control.
- No L-up control.
- Control Engine rpm at 7000rpm. (No inertia calculation)
- Control actual torque at MAX.
- Control driver torque at MAX.
- Control engine coolant temperature at 80°C (176°F).
- No coast control.
- No 3rd Start mode control.
- No line pressure reduction control at garage.
- No output revolution sensor failure detection.
- No input revolution sensor failure detection.
- No selector position switch failure detection.
- No oil temperature sensor failure detection.
- No T/F Hi-Low SW failure detection.
- No speed mater signal failure detection.
- No throttle signal failure detection.
- No Engine torque signal failure detection.
- No engine coolant temperature signal failure detection.
- No Engine revolution signal failure detection.
- No shift solenoid functional failure detection.
- No L-up solenoid functional failure detection.
- No DTC U2105 failure detection.
- Cancel engine rpm condition of prerequisite of supply voltage failure detection.
- Control vehicle speed of speed meter at 0km/h.
- No torque reduction at stall.
- No cruise control.
- No warm up control.
- DTC stored.
- Check Trans “ON”.
- MIL request “ON”. (EURO 4 only)

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Inspect the wiring for EMI (Electro-Magnetic Interference). Check that all wires are properly routed away from coil, and generator. Also check for improperly installed electrical options. When this test is performed, turn “OFF” on electronic auto parts switches to improperly for a noise preventing.

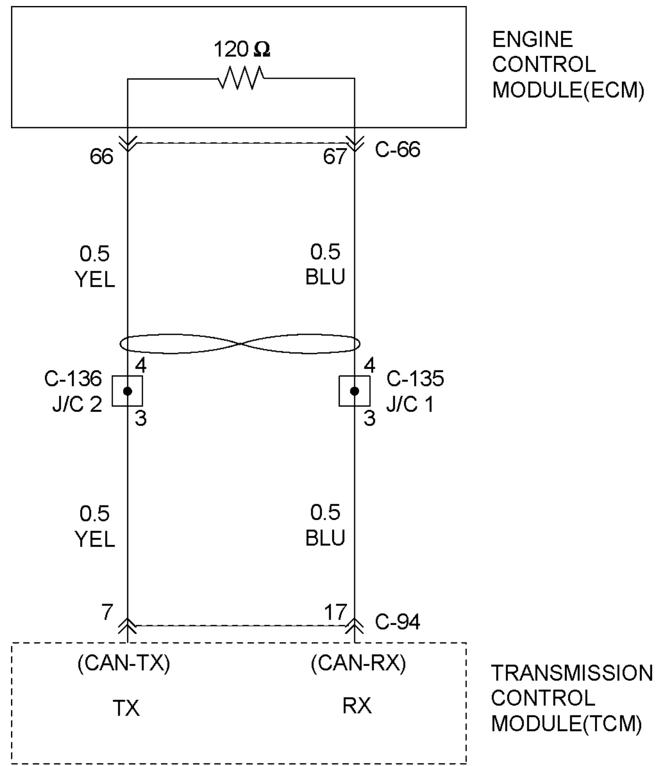
Circuit/System Testing DTCU2104

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Install a scan tool. 2. Turn "ON" the ignition. Does a scan tool indicate DTC U2104?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Observe the data from the ECM on the scan tool. Was the data from the ECM fixed or did not synchronized? (throttle opening, engine speed, etc)	—	Go to step 4	Refer to *Diagnostic Aids*
4	Check the wire between the TCM connector and the ECM connector by 5-8840-0285-0 DMM. 1. Turn "OFF" the ignition. 2. Disconnect the TCM connector. 3. Measure the resistance between terminal C94-7 and terminal C94-17. Is the resistance specified value?	About 60Ω	Go to *Step 7*	Go to *Step 5*
5	Check the resistance of the ECM. 1. Turn "OFF" the ignition. 2. Disconnect the ECM connector. 3. Measure the resistance between the ECM terminal 70 and the ECM terminal 71. Is the resistance specified value?	About 120Ω	Go to step 6	Go to step 8
6	Replace or Repair the wire between the TCM connector C94-7, 17 and the ECM connector E60-70, 71. Is the action complete?	—	Go to step 9	—
7	Replace the TCM. **Important:** The replacement TCM must be programmed (Refer to *SPS* for procedure). Is the action complete?	—	Go to step 9	—
8	Replace the ECM. **Important:** The replacement ECM must be programmed (Refer to *SPS* for procedure). Is the action complete?	—	Go to step 9	—

Step	Action	Value(s)	YES	NO
9	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn "OFF" the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 10*
10	Observe the stored information, Capture info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to *Diagnostic Trouble Code (DTC) List*	Verify repair

DTC U2105 (Flash Code 67)



RTW77AMF000801

Circuit Description

The automatic transmission control system in AW30-40LE uses high speed CAN bus system. The individual CAN bus systems are connected via two interfaces and can exchange information and data. This allows control modules that are connected to different CAN bus systems to communicate. Transmission control modules in the vehicle that require continuous, rapid communication are connected to the high speed CAN bus. The automatic transmission is continuously notified of the current engine load status. Since the automatic transmission control module has to react immediately to load status changes, rapid communication is required between the engine control module and the automatic transmission control module. The high speed CAN bus in the AW30-40LE is designed as a two-wire CAN bus (twisted pair). The wires are shielded and twisted. The transmission rate is 500K band.

Condition For Running The DTC

All of the following conditions are met.

(1) The following condition is met for 2 seconds or more continuously.

- The supply voltage is more than 10.2 volts and less than 15.5 volts.

(2) One of the following conditions is met once after ignition “ON”.

- Output revolution sensor is not detecting failure or not deciding failure.
  Output revolution is more than 550rpm.
- Input revolution sensor is not detecting failure or not deciding failure.
  Input revolution is more than 550rpm.
- DTC U2104 is not detecting failure or not deciding failure U2105.
  DTC U2105 is not detecting failure or not deciding or not deciding failure.
  Engine revolution signal is not detecting failure or not deciding failure.
  The engine revolution is more than 550rpm.

(3) All of the following conditions are met.
- Device Control is not operating.
- Disable Normal Communication is receiving enable.
- DTC Clear is not operating.

(4) DTC U2104 is not detecting failure or not deciding failure.

Condition For Setting The DTC

Detection standard is met for 2.5 second continuously.

Detection standard:

If one or more ID sent from Engine Control Module (ECM) is not completed receiving for 2 basic cycles since last receiving completion.

Action Taken When The DTC Sets

- Throttle judgment on torque reduction control, line pressure control at stationary status, line pressure reduction control at gear change and line pressure reduction control at garage. (Throttle opening 100%)
- Line pressure FULL output.
- Throttle judgment on gear change control (Throttle opening 0%).
- No line pressure reduction control at gear change.
- No torque reduction control.
- No squat control.
- No slope control (keep mode).
- No L-up control.
- Control Engine rpm at 7000rpm (No inertia calculation).
- Control actual torque at MAX.
- Control driver torque at MAX.
- Control engine coolant temperature at 80°C (176°F).
- No coast control.
- No 3rd Start mode control.
- No line pressure reduction control at garage.
- No output revolution sensor failure detection.
- No C-0 rev sensor failure detection.
- No selector position switch failure detection.
- No oil temperature sensor failure detection.
- No T/F Hi-Low SW failure detection (Execute T/F judgment using only T/F-SW).
- No speed mater signal failure detection.
- No throttle signal failure detection.
- No Engine torque signal failure detection.
- No engine coolant temperature signal failure detection.
- No Engine revolution signal failure detection.
- No shift solenoid functional failure detection.
- No L-up solenoid functional failure detection.
- Cancel engine rpm condition of prerequisite of supply voltage failure detection.
- Control vehicle speed of speed meter at 0km/h.
- No torque reduction at stall.
- No cruise control.
- No warm up control.
- Check Trans “ON”.
- DTC stored.
- MIL request “ON”. (EURO 4 only)

Conditions For Clearing The DTC

- The DTC can be cleared from the TCM history by using a scan tool.
- The DTC will be cleared from history when the vehicle has achieved 40 warm-up cycles without a failure reported.
- After more than 1 second has elapsed after the ignition key has been turned “ON”, short between No.11 and No.4 (ground) of DLC (Data Link Connector). Then, after 1 second, but within 6 seconds, discontinue shorting.

Diagnostic Aids

- Inspect the wiring for poor electrical connection at the TCM. Look for possible bent, backed out, deformed or damaged terminals. Check for weak terminal tension as well. Also check for a chafed wire that could short to bare metal or other wiring. Inspect for a broken wire inside the insulation.
- When diagnosing for a possible intermittent short or open condition, move the wiring harness while observing test equipment for a change.
- Inspect the wiring for EMI (Electro-Magnetic Interference). Check that all wires are properly routed away from coil, and generator. Also check for improperly installed electrical options. When this test is performed, turn “OFF” on electronic auto parts switches to improperly for a noise preventing.

Circuit/System Testing DTC U2105

Step	Action	Value(s)	YES	NO
1	Was the On-Board Diagnostic (OBD) System Check performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Install the scan tool. 2. Turn "ON" the ignition. Does the scan tool indicate DTC U2105?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Observe the data from the ECM on a scan tool. Was the data from the ECM fixed or did not synchronized? (throttle opening, engine speed, etc)	—	Go to *Step 4*	Refer to *Diagnostic Aids*
4	Check the wire between the TCM connector and the ECM connector by 5-8840-0285-0 DMM. 1. Turn "OFF" the ignition. 2. Disconnect the TCM connector. 3. Measure the resistance between terminal C94-7 and terminal C94-17. Is the resistance specified value?	About 60Ω	Go to *Step 5*	Go to *Step 7*
5	Check the resistance of the ECM. 1. Turn "OFF" the ignition. 2. Disconnect the ECM connector. 3. Measure the resistance between the ECM terminal E66-66 and the ECM terminal E66-67. Is the resistance specified value?	About 120Ω	Go to *Step 6*	Go to *Step 8*
6	Replace or Repair the wire between the TCM connector C94-7, 17 and the ECM connector E66-66, 67. Is the action complete?	—	Go to *Step 9*	—
7	Replace the TCM. **Important:** The replacement TCM must be programmed (Refer to *SPS* for procedure). Is the action complete?	—	Go to *Step 9*	—
8	Replace the ECM. **Important:** The replacement ECM must be programmed (Refer to *SPS* for procedure). Is the action complete?	—	Go to *Step 9*	—

Step	Action	Value(s)	YES	NO
9	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn "OFF" the ignition. 4. Start the engine. 5. Operate the vehicle within the Conditions For Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to *Step 2*	Go to *Step 10*
10	Observe the stored information, Capture info with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to *Diagnostic Trouble Code (DTC) List*	Verify repair

SECTION 7A3

ON-VEHICLE SERVICE (AW30–40LE)

TABLE OF CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU/GM will call out those fasteners that require a replacement after removal. ISUZU/GM will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

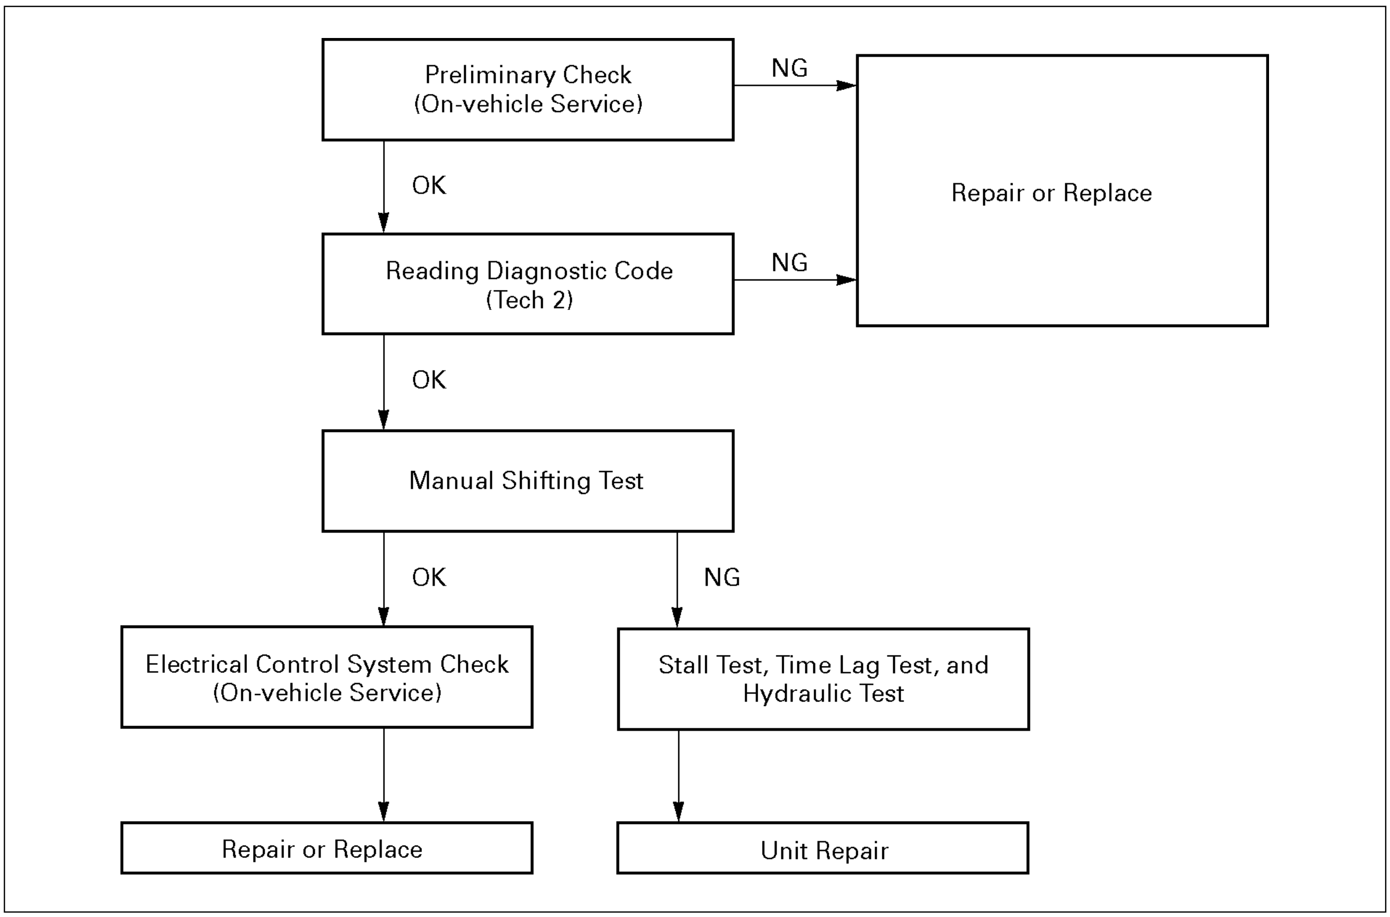
Diagnosis

Basic Troubleshooting

AW30–40LE transmission, with Transmission Control Module (TCM), differs from the Mechanical – Hydraulic control type transmissions. Accordingly, its troubleshooting procedure differs also.

Before troubleshooting an TCM, first determine whether the problem is electrical or mechanical. To do this, just refer to the basic troubleshooting flowchart provided below.

If the cause is already known, using the basic troubleshooting chart below along with the troubleshooting chart should speed the procedure.



F07R200005-X

Troubleshooting Chart

Numbers are arranged in order of probability.

Perform inspections starting with number one and working up.

4×2 High Ride Suspension, 4×4
SEE OWNERS AND
DRIVERS MANUAL FOR
ADDITIONAL INFORMATION

Tire Size	Wheel Size	Tire inflation pressure KPa (kgf/cm^2/psi)	
Front & Rear	**Front & Rear**	**Front**	**Rear**
225/75R15C	15X6.5JJ	221 (2.25/32)	319 (3.25/46)
245/70R16	16X7JJ	200 (2.0/28)	270 (2.8/40)

Note:

- **The air pressure of the tire should be maintained as indicated in the label instruction on the driver's door or frame of driver's door.**
  Lower pressure can cause burst and adverse vehicle handling.
  On the other hand, higher pressure can cause shock-burst and reduce gripping effect.

Manual Shifting Test

NOTE: With this test, it can be determined whether the trouble lies within the electrical circuit or is a mechanical problem in the transmission.

1. Disconnect TCM connector
2. Inspect manual driving operation

   Check that the relation of the position between select lever and gear corresponds to the following table.

   If any abnormality is found in the above test, do perform the stall, time lag or gear shift tests.

Select Lever Position	"D"	"3"	"2"
Gear	OD	OD	3rd

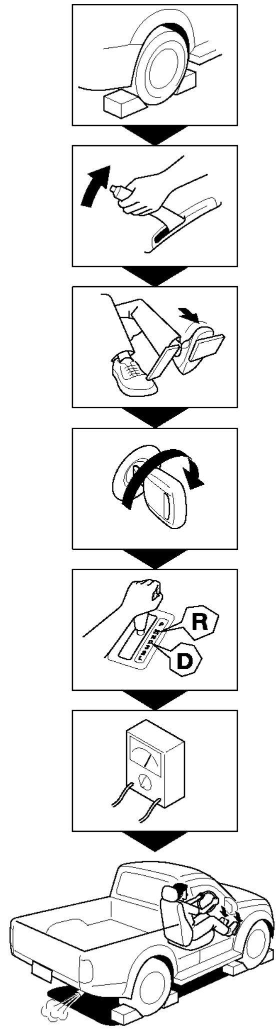
"L"	"R"	"P"
3rd	Reverse	Pawl Lock

RTW77ASH002901

3. Connect TCM connector

   With the engine off, connect the TCM connector.

Stall Test



RTW67ALH000101

The object of this test is to check the overall performance of the transmission and engine by measuring the maximum engine speeds at the "D" and "R" positions.

NOTE:

1. Perform the test at normal operating fluid temperature (50 – 80°C or 122 – 176°F).
2. Do not continuously run this test longer than 5 seconds.

Measure Stall Speed

1. Chock the four wheels.
2. Mount an engine tachometer.
3. Fully apply the parking brake.
4. Step down strongly on the brake pedal with your left foot. (Keep the state until the test is completed)
5. Start the engine.
6. Turn off the A/C.
7. Select into the “D" position. Step all the way down on the accelerator pedal with your right foot. Quickly record the highest speed as soon as the engine speed gets stabilized.
8. Select into the “N” position and maintain the engine idling condition more than 1 minute.

Stall speed: 2300±200 rpm *

* Ambient temperature to be between roughly 10°C (50°F) and 40°C (104°F).

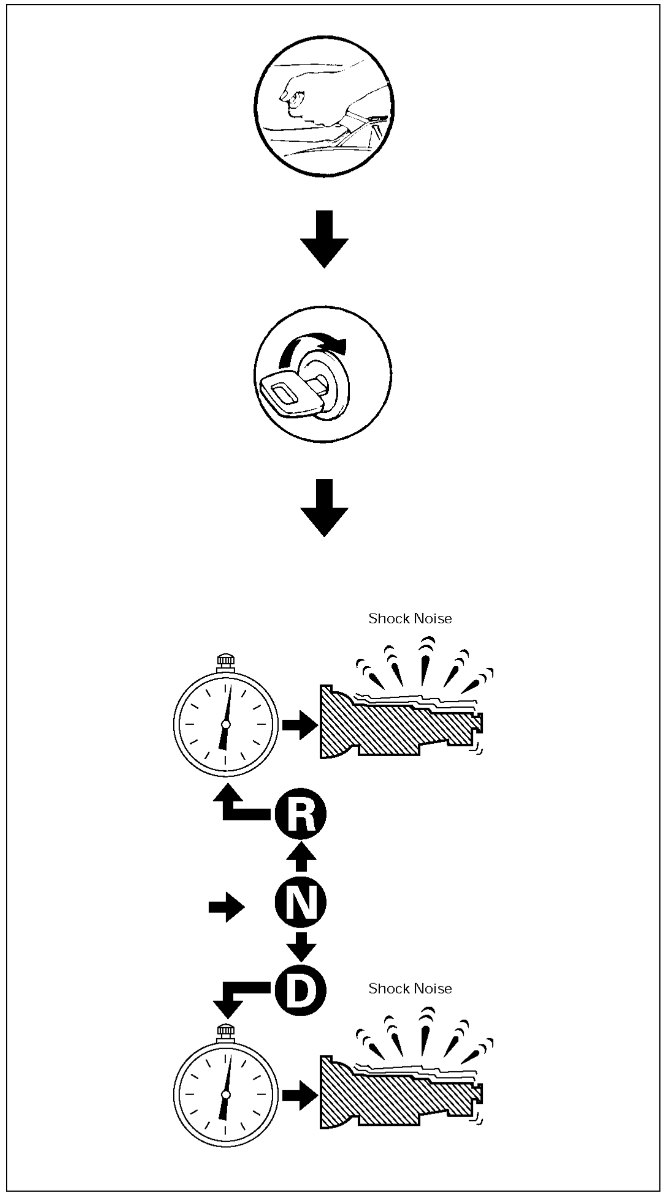
Evaluation

1. If the engine speed is the same for both positions but lower than the specified value:
   - Engine output is insufficient.
   - Stator one-way clutch is not operating properly.

NOTE: If more than 600 rpm below the specified value, the torque converter could be faulty.

2. If the stall speed in “D" position is higher than specified:
   - Line pressure too low
   - Forward clutch slipping
   - No.2 one-way clutch not operating properly
3. If the stall speed in “R" position is higher than specified:
   - Line pressure too low
   - Direct clutch slipping
   - No.3 brake slipping
4. If the stall speed in the “R" and “D" positions are higher than specified:
   - Line pressure too low
   - Improper fluid level

Time Lag Test



F07RY00003

If the shift lever is shifted while the engine is idling, there will be a certain time elapse or lag before the shock can be felt. This is used for checking the condition of the forward clutch, direct clutch, No.3 brake, and No.2 one-way clutch.

NOTE:

1. Perform the test at normal operating fluid temperature (50 – 80°C or 122 – 176°F)
2. Be sure to allow one minute interval between tests.
3. Make three measurements and take the average value.

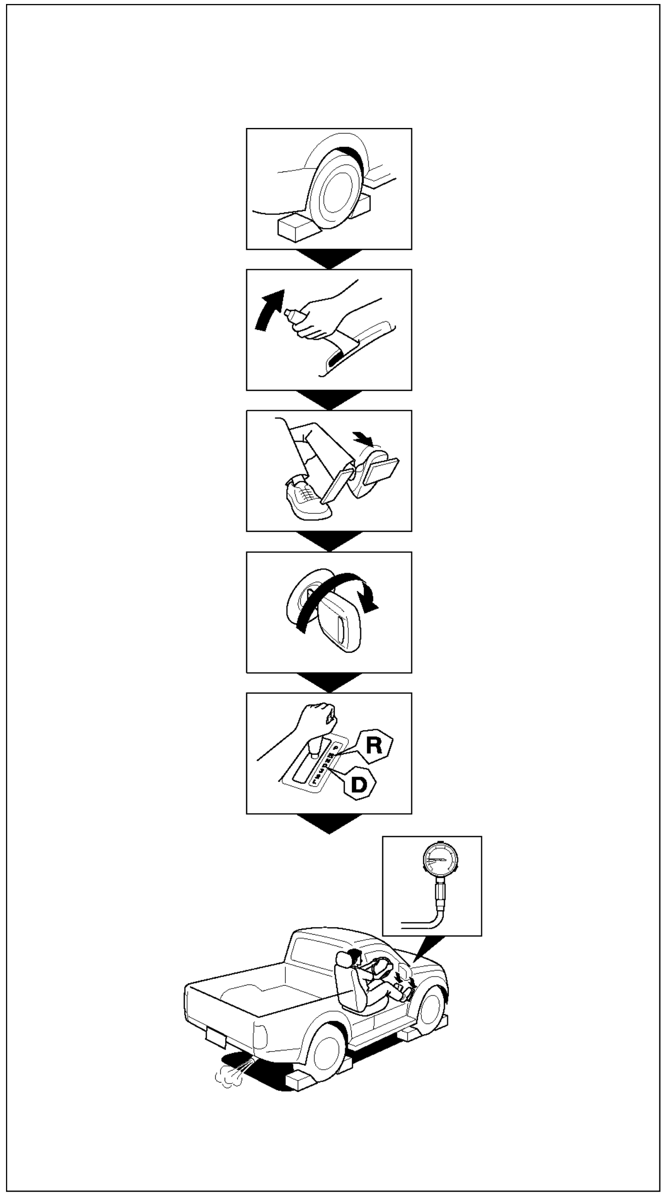
Measure Time Lag

1. Fully apply the parking brake.
2. Start the engine.
   Check idling speed (A/C OFF).
3. Operate the select lever from “N" to “D" position. Using a stopwatch, measure the time it takes from shifting the lever until the shock is felt.
   Time lag: Less than 0.7 seconds
4. In same manner, measure the time lag for “N" → “R".
   Time lag: Less than 1.2 seconds

Evaluation

1. If “N" → “D" time lag is longer than specified:
   - Line pressure too low
   - Forward clutch malfunction
   - No.2 one-way clutch not operating properly
2. If “N" → “R" time lag is longer than specified:
   - Line pressure too low
   - Direct clutch malfunction
   - First and Reverse brake malfunction
3. If both time lag is longer than specified:
   - Line pressure too low

Hydraulic Test



RTW67ALH000201

Preparation

1. Warm up the transmission fluid.
2. Remove the transmission case test plug and mount the hydraulic pressure gauge.

Oil pressure gauge: 5-8840-0093-0

NOTE: Perform the test at normal operating fluid temperature (50 – 80°C or 122 – 176°F).

Measure Line Pressure

1. Fully apply the parking brake and chock the four wheels.
2. Start the engine and check idling rpm.
3. Select into “D" position, step down strongly on the brake pedal with your left foot and while manipulating the accelerator pedal with the right foot, measure the line pressures at the engine speeds specified in the table.
4. In the same manner, perform the test in “R" position.

Engine speed	Line pressure kPa (kg/cm^2/psi)	
	“D" position	“R" position
Idling	349 – 408 (3.6 – 4.2 /51 – 59)	577 – 675 (5.9 – 6.9/84 – 98)
Stall	1,206 – 1,353 (12.3–13.8/175–196)	1,646 – 1,979 (16.8–20.2/239–287)

Evaluation

1. If the measured values at all positions are higher than specified:
   - Pressure control solenoid defective
   - Primary regulator valve defective
2. If the measured values at all positions are lower than specified:
   - Primary regulator valve defective
   - Oil pump defective
   - Pressure control solenoid defective
3. If pressure is low in “D" position only:
   - “D" position circuit fluid leakage
4. If pressure is low in “R" position only:
   - “R" position circuit fluid leakage

Road Test

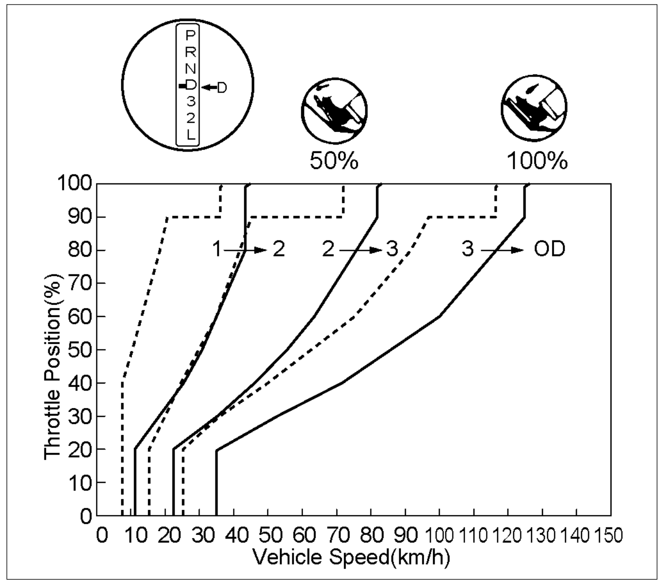
NOTE: Perform the test at normal operating fluid temperature (50 – 80°C or 122 – 176°F).

“D" Position Test in “NORMAL", and “POWER" Pattern

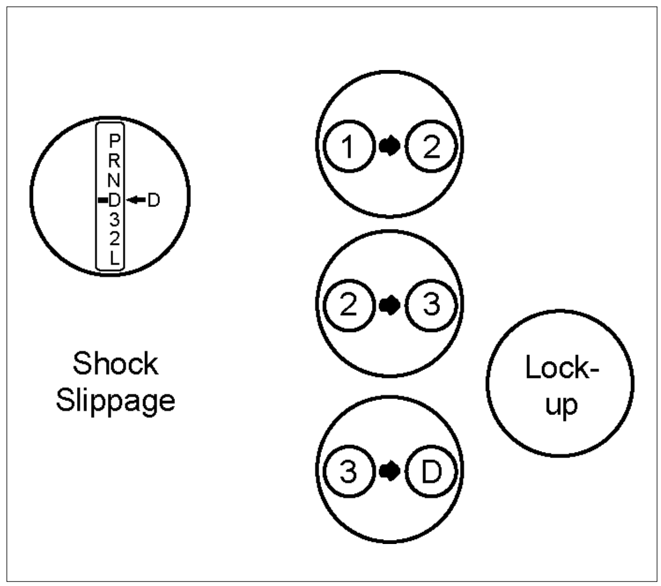
Select into the “D" position and hold the accelerator pedal constant at the 50% and 100% throttle valve opening positions.

Push in one of the pattern selector buttons and check the following:

1. 1–2, 2–3, 3–OD and lock-up, upshifts should take place, and shift points should conform to those shown in the automatic shift diagram.



RTW77ASH003001



RUA37ASH000101

Evaluation

i. If there is no 1→2 upshift:
- Solenoid S2 is stuck
- 1–2 shift valve is stuck

ii. If there is no 2→3 upshift:
- Solenoid S1 is stuck
- 2–3 shift valve is stuck

iii. If there is no 3→OD upshift (throttle valve opening 1/2):
- Solenoid S2 is stuck
- 3–OD shift valve is stuck

iv. If the shift point is defective:
Refer to TROUBLESHOOTING CHART in this section.

v. If the lock-up is defective:
Refer to TROUBLESHOOTING CHART in this section.

2. In the same manner, check the shock and slip at the 1→2, 2→3 and 3→OD upshifts.

NOTE: Drive the vehicle on level ground.

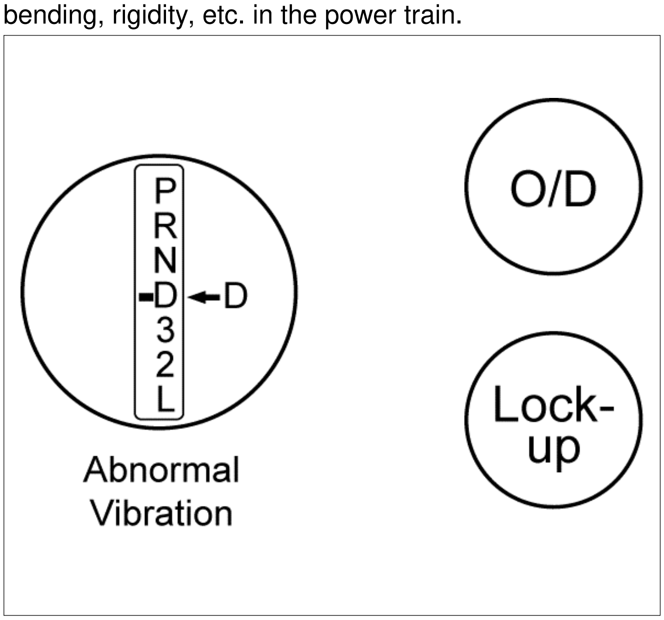
Evaluation

If the shock is excessive:

Refer to TROUBLESHOOTING CHART in this section.

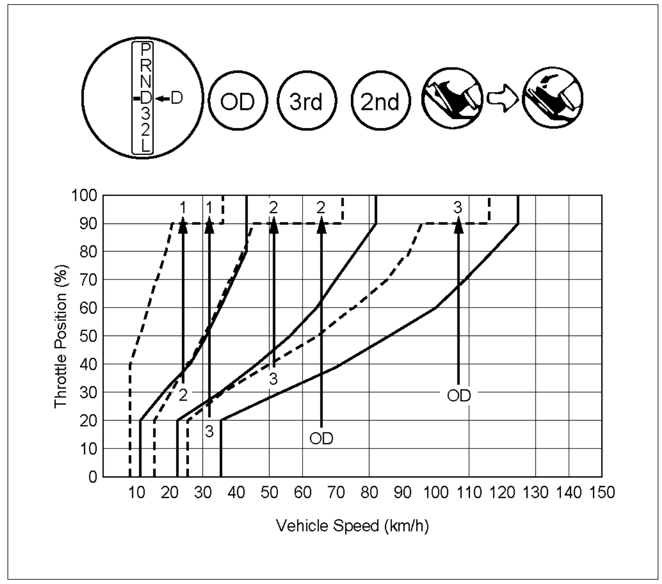
3. Run at “D" position lock-up or OD gear and check for abnormal noise and vibration.

NOTE: The check for the cause of abnormal noise and vibration must be made with extreme care as it could also be due to loss of balance in the propeller shaft, differential, the torque converter, etc. or insufficient bending, rigidity, etc. in the power train.



RUW37ASH000201

4. While running in “D" position, 2nd, 3rd gears and OD, check to see that the possible kick-down vehicle speed limits for 2→1, 3→1, 3→2, OD→3 and OD→2 kick-downs conform to those indicated on the automatic shift diagram.



RTW77ASH003101

5. Check for abnormal shock and slip at kick-down.
6. While running in “D" position, OD gear or “lock-up", shift to “2" and “L" positions and check the engine braking effect at each of these positions.

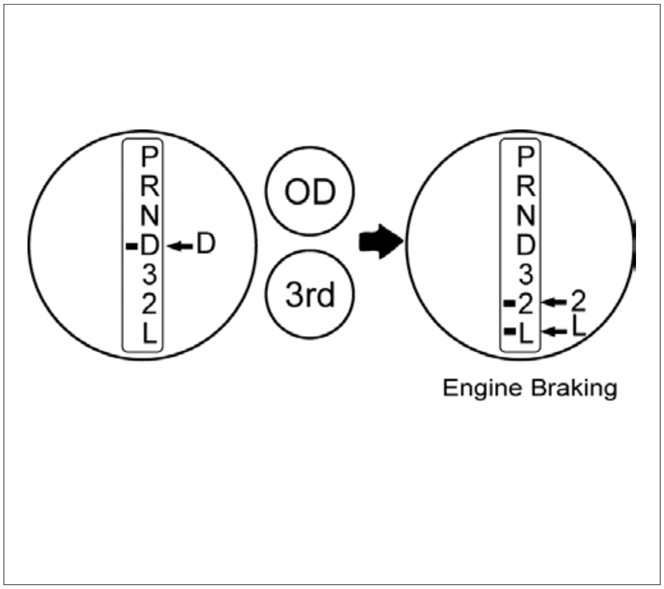
Evaluation

i. If there is no engine braking effect in the “2" position:

- Second coast (No.1) brake is defective.

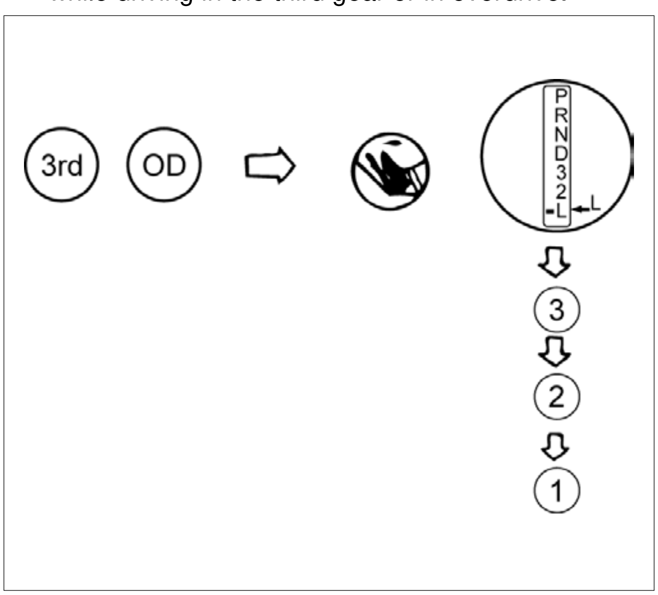
ii. If there is no engine braking effect in the “L" position:

- First and reverse (No.3) brake is defective.



RUW37ASH000301

iii. Also check to see that downshift is made from 3 to 2 or from OD to 3 and then to 2 immediately and that 2→1 downshift point is within the limits shown in the diagram when tested by releasing the accelerator pedal and operaing into “L" position while driving in the third gear or in overdrive.



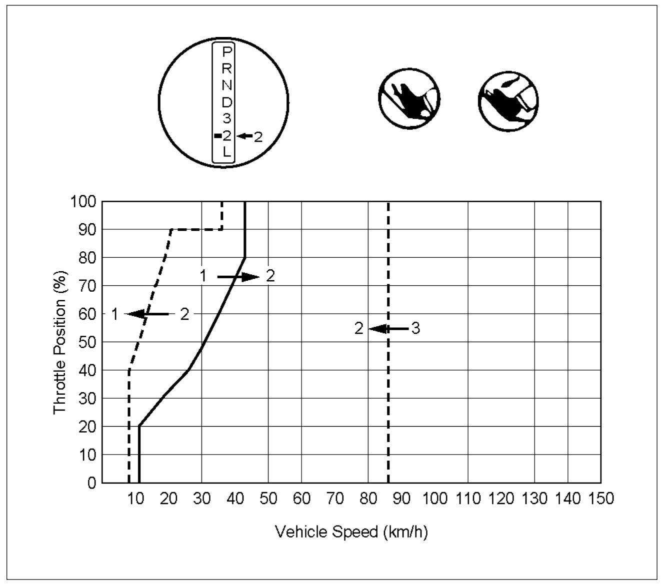
RUW37ASH000401

“2" Position Test

Select into “2" position and, while driving with the accelerator pedal held constantly at the specified point (throttle valve opening 50% and 100%), push in one of the pattern selectors and check on the following points.

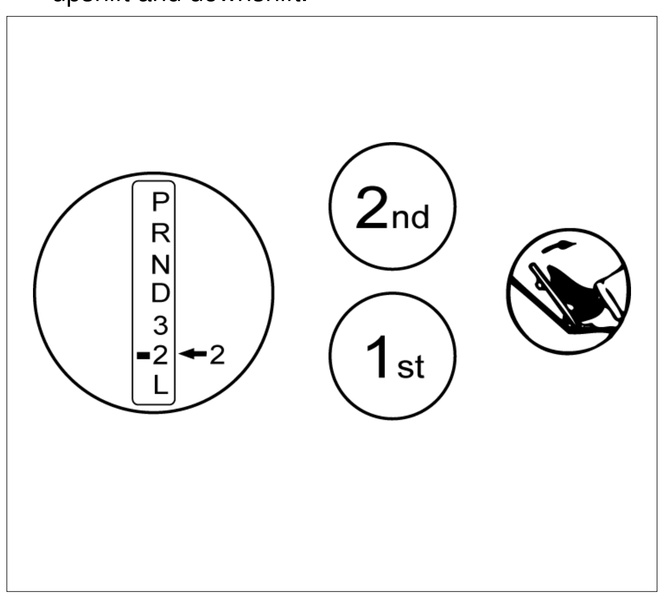
1. At each of the above throttle openings, check to see that the 1→2 upshift takes place and that the shift points conform to those shown on the automatic shift diagram.

NOTE: There is no OD and no lock-up in the “2" position.



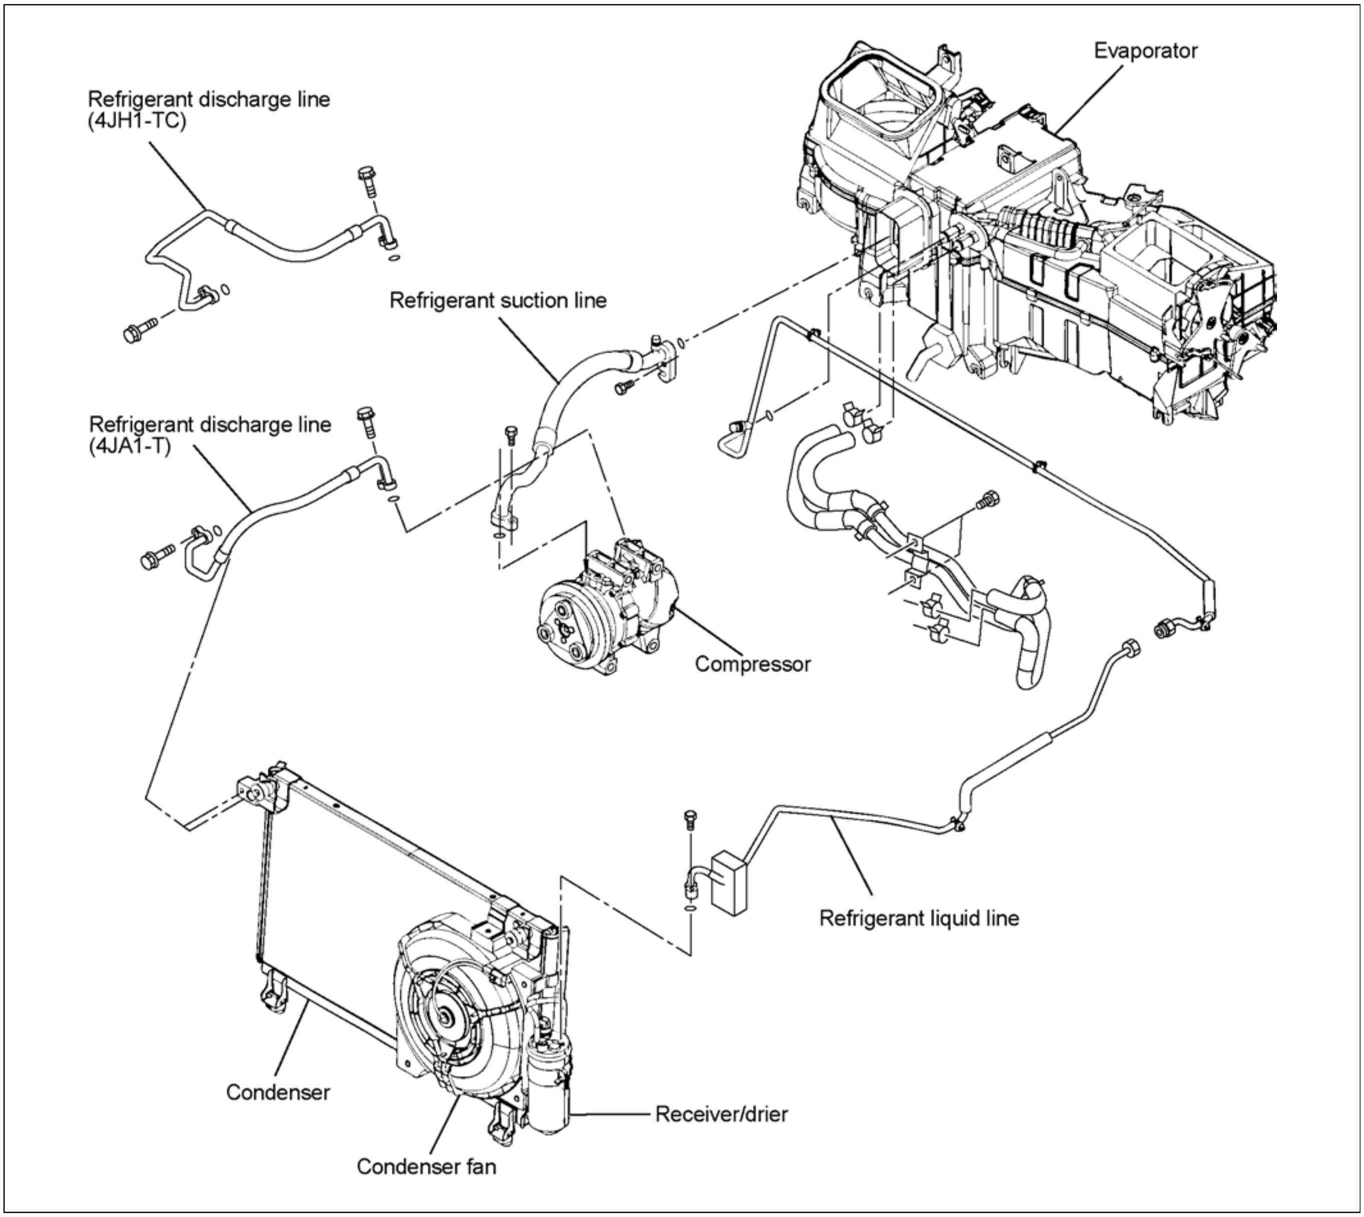
RTW77ASH003201

2. While running in the “2" position and 2nd gear, release the accelerator pedal and check the engine's braking effect.
3. Check for 2→1 downshift and abnormal noise at acceleration and deceleration, and for shock at upshift and downshift.



RUW37ASH000501

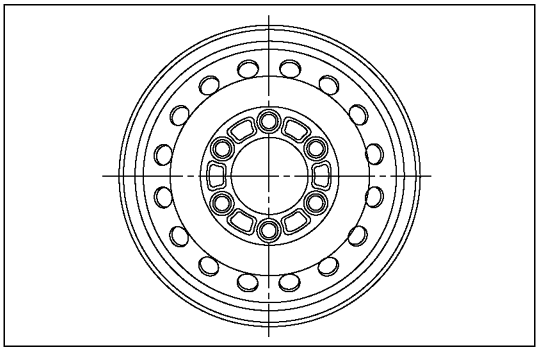
(4JA1-T, 4JH1-TC LHD MODEL)



RTW710LF002201

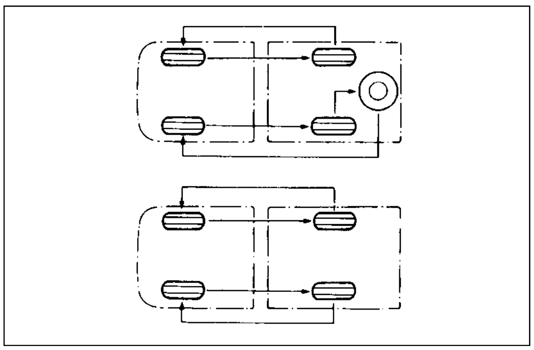
SERVICING

Servicing refers to general maintenance procedures to be performed by qualified service personnel.



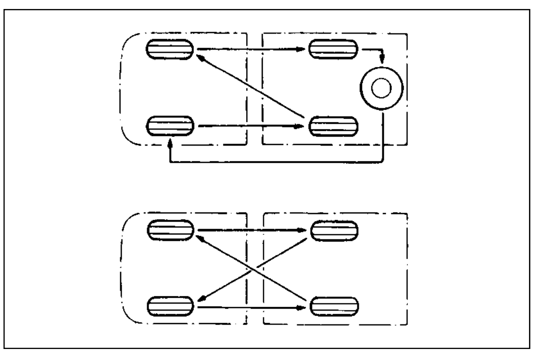
WHEEL NUT TORQUES

Wheel Nut Torque	N·m (kgf·m/lb·ft)
117.7 ± 9.8 (12 ± 1.0 / 86.8 ± 7.2)	



TIRE ROTATION

For of radial tires, interchange the front and the rear wheels on the same side as shown in the figure.

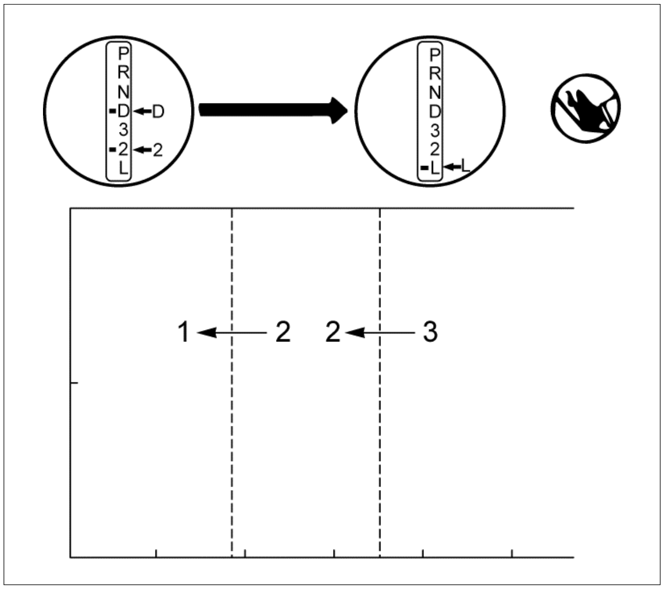


If one-sided tire wear appears on radial tires, rotate the wheels as shown in the figure.

Note:
After rotation, adjust the front and rear tire pressure and be sure to check wheel nut tightness.

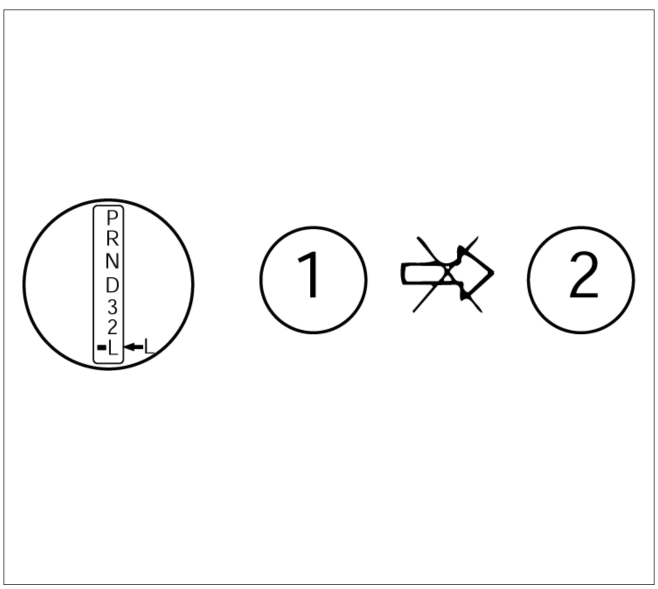
“L" Position Test

1. While running above 80 km/h (50 mph) in the “D" position, release your foot from the accelerator pedal and shift into the “L" position.
   Then check to see that the 2→1 downshift occurs at the specified point shown on the automatic shift diagram.



RUW37ASH000601

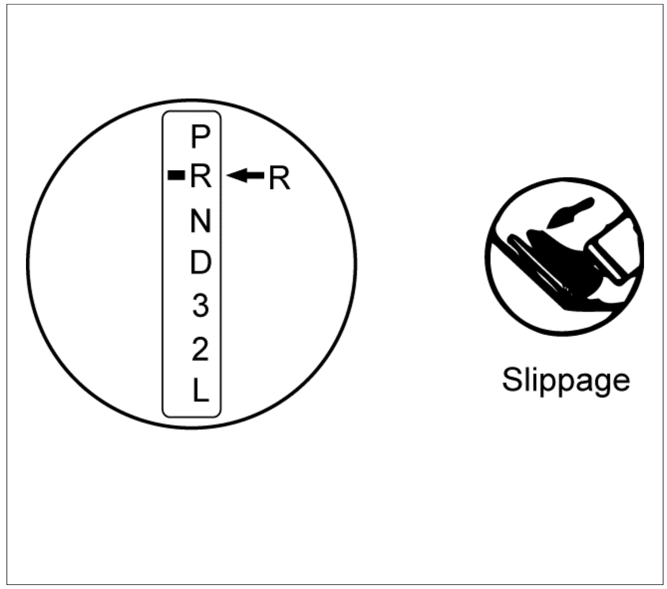
2. While running in the “L" position, check to see that there is no upshift to 2nd gear.
3. While running in the “L" position, release the accelerator pedal and check the engine braking effect.
4. Check for abnormal noise during acceleration and deceleration.



RUW37ASH000701

“R" Position Test

Select into the “R" position and, while starting at full throttle, check for slipping.



RUW37ASH000801

“P" Position Test

Stop the vehicle on a grade (more than 9%) and after shifting into the “P" position, release the parking brake.

Then check to see that the parking lock pawl holds the vehicle in place.

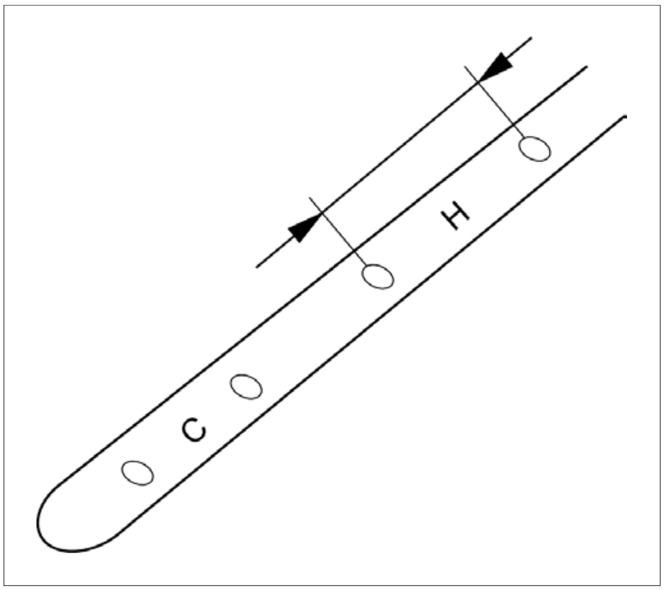
Transmission Fluid Level and Condition

Inspection

Park vehicle on level ground and set parking brake. With the engine idling, move the shift lever through all positions from “P" to “L", then return to position “P". Check to see if the level of fluid comes to “HOT" range of about 75°C (167°F) on the dipstick gauge.

If the level of fluid is too low, replenish to bring it to maximum level in “HOT" range.

Inspection of fluid condition. If the ATF is except normality (refer to the following table) or smells burnt, try to find these cause and replace it.



RUW37ASH002501

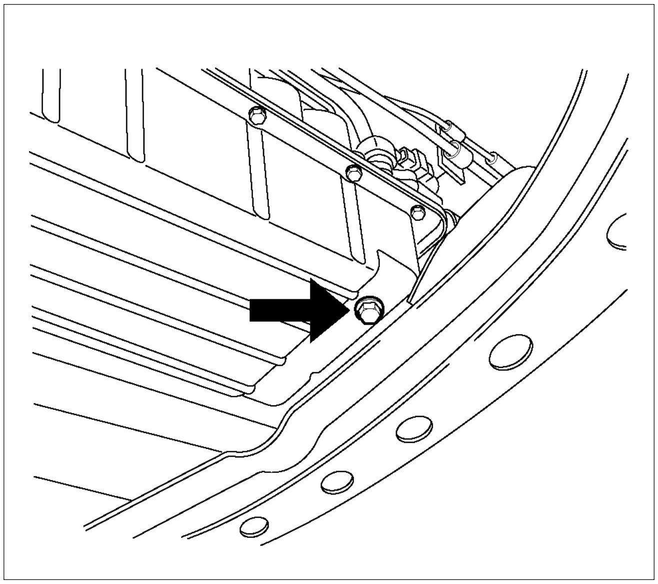
Color or ATF	Condiction
Clear red	Normality
Blackish discoloration	Defects of power train parts (clutches)
White turbidity	Include water
Discoloration of red brown	Deterioration of ATF

ATF Replacement

Inspection

NOTE: Do not overfill.

1. Remove the drain plug from oil pan and drain the fluid.



RUW17ASH013401

2. Reinstall the drain plug securely.

Torque: 19 N·m (1.9 kgf·m/14 lb·ft)

3. With the engine OFF, add new fluid through the filler tube.

Drain and refill	5.2 liter
Dry fill	8.7 liter
Fluid	Exxon Mobil ATF-3309

4. Start the engine and shift the selector into all position from “P" through “L", and then shift into “P".
5. With the engine idling, check the fluid level. Add fluid up to the “COLD" level on the dipstick.
6. The ATF level must be checked again for correct level with the “HOT" level.

NOTE: To prevent fluid leaks, the drain plug gasket must be replaced each time this plug is removed.

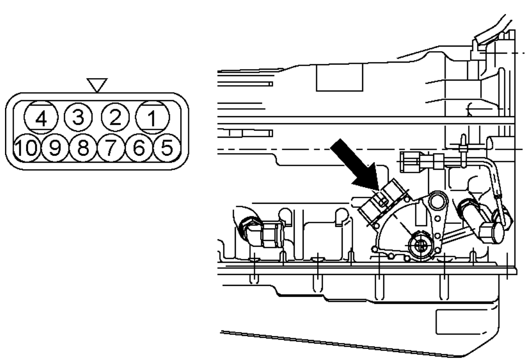
Neutral Start Switch (Mode Switch)

Inspection

With a circuit tester, make a continuity test on the neutral start switch with the moving piece set in each position.

Terminal / Position	1	4	3	5	2	6	8	7	9	10
P	○	○	○	○						
R			○		○					
N	○	○	○			○				
D			○				○			
3			○					○		
2			○						○	
L			○							○

○—○ Continuity



RTW77ASH003401

Removal

Preparation:

Disconnect negative (–) battery cable.

1. Remove the rear side ATF cooler pipe from the transmission elbow.
2. Disconnect neutral start switch connector.
3. Unstake the lock washer, and then remove the shaft nut.
4. Remove the neutral start switch.

Installation

To install, follow the removal steps in the reverse order, noting the following points;

If a engine starts at any selector position except “N” or “P”, the neutral start switch (mode switch) should be adjusted.

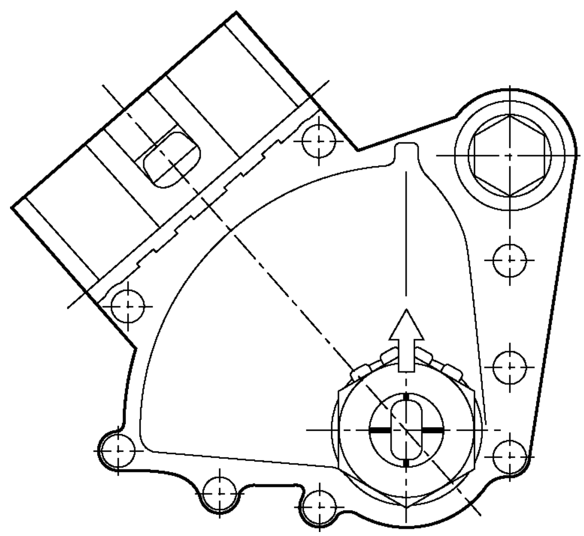
1. Loosen the neutral start switch bolt and set the shift selector to the “N" position.
2. Align the groove and neutral basic line.
3. Hold in position and tighten the bolt and nut.

Torque:

Nut – 7 N·m (0.7 kgf·m/61 lb·in)

Bolt – 13 N·m (1.3 kgf·m/113 lb·in)

4. Lock the nut with the lock washer tubs at two points.

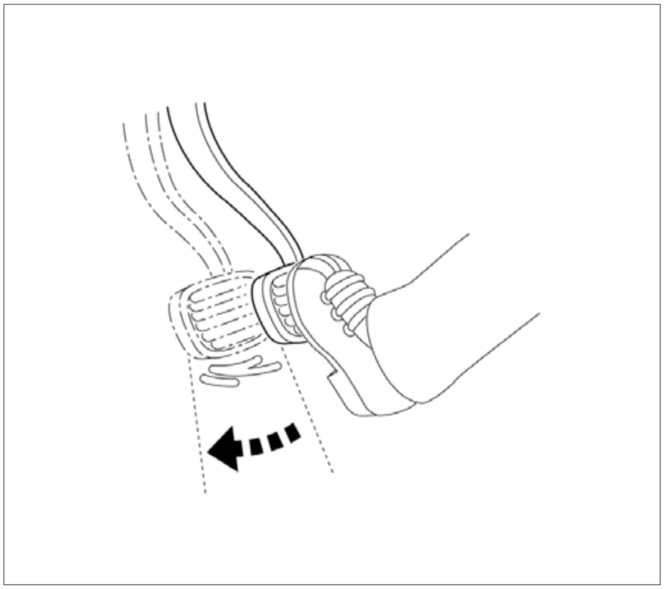


RUW17ASH013601

Brake Signal

Inspection

Check that the brake light comes on when the brake pedal is depressed.



310RW020

Input and Output Revolution Sensor

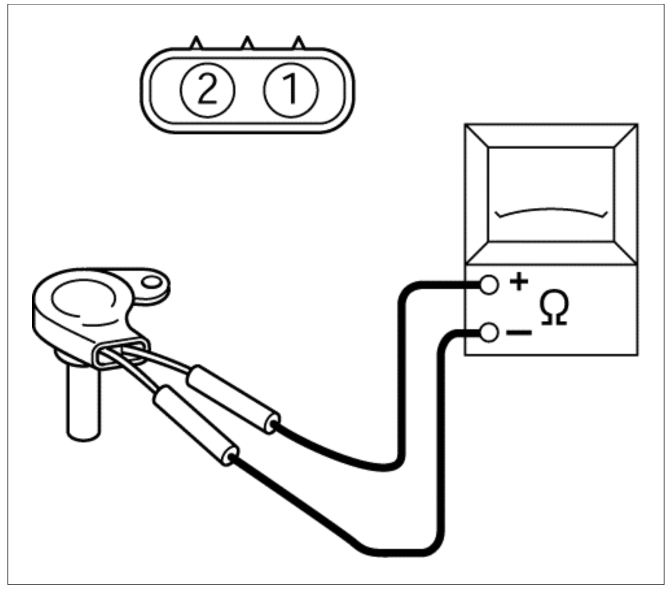
Inspection

1. Disconnect the input and output revolution sensor connector.
2. Use an ohmmeter to measure the resistance between terminals 1 and 2.

Standard resistance

Input revolution sensor: 560 – 680 Ω (at 20°C or 68°F)

Output revolution sensor: 560 – 680 Ω (at 20°C or 68°F)

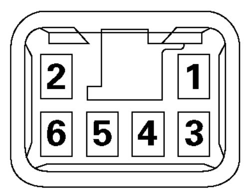


F07RY00018

Power and 3rd Start Switch

Inspection

1. Block the wheels.
2. Disconnect the negative battery cable.
3. Pry out the switch from the floor console.
4. Disconnect the harness connector.
5. Check continuity between terminals (5) and (6) at third (3rd) position.
6. Check continuity between terminals (3) and (6) at power (PWR) position.
7. Replace the power and 3rd start switch if the result of inspection is abnormal.
8. Connect the harness connector.
9. Connect the negative battery cable.
10. Remove the wheel blocks.



Switch Position	Terminal		
	3	6	5
PWR	○	○	
3rd		○	○

238R300003

Solenoid

Inspection

1. Resistance check

- Using an ohmmeter, check the resistance between each terminal (S1/S2/SL) and body.

Solenoid S1, S2 and lock-up solenoid SL resistance:

11 – 15 Ω (at 20°C or 68°F)

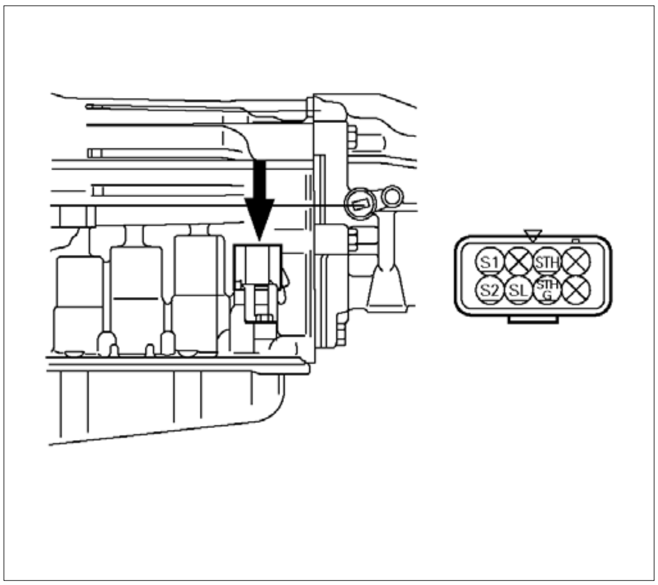
(Reference) 12 – 16 Ω (at 40°C or 104°F)

- Using an ohmmeter, check the resistance between each terminal (STH) and (STHG).

Pressure control solenoid resistance:

5 – 5.6Ω (at 20°C or 68°F)

(Reference) 5.4– 6.1Ω (at 40°C or 104°F)



220L100001

NOTE: If the pressure control solenoid resistance is not within specification, replace the valve body assembly.

2. Operation check

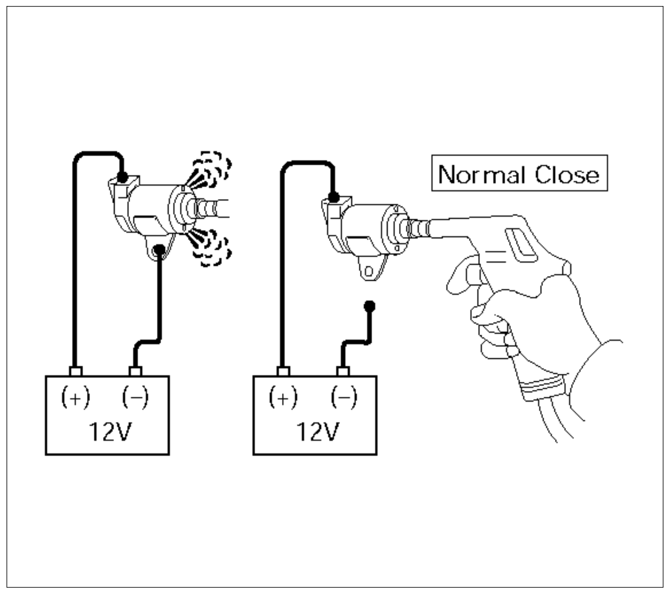
Check the solenoid operation by blowing into an oil hole as shown in the figure.

Solenoid S1 and S2 (Normal close type)

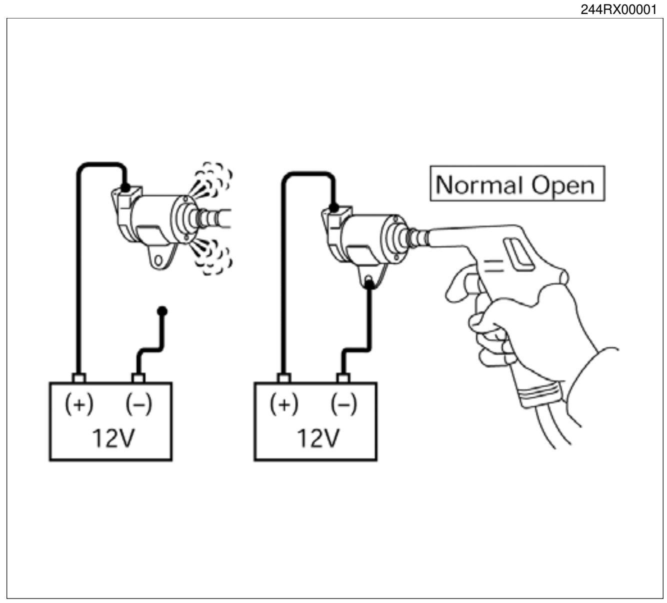
When battery terminal is disconnected	No air leaks
When battery terminal is connected	Air passes through

Lock-up solenoid SL (Normal open type)

When battery terminal is disconnected	Air passes through
When battery terminal is connected	No air leaks



244RX00001

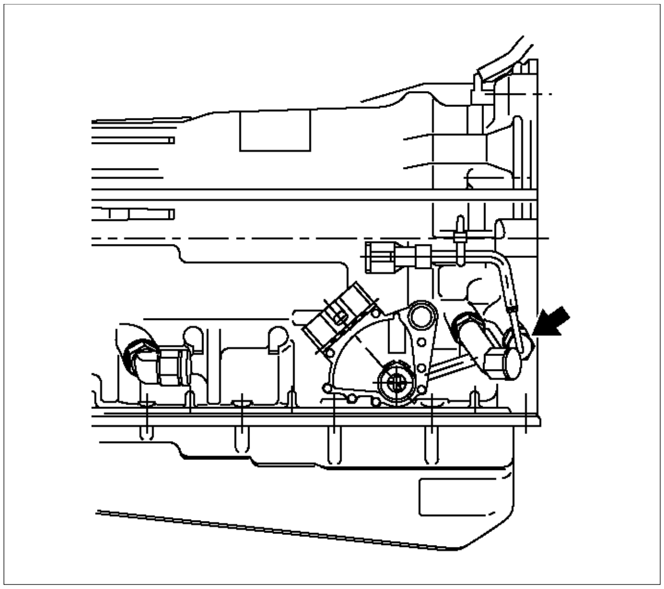


244RY00005

ATF Temperature Sensor

Inspection

1. Disconnect the front side ATF cooler pipe from the elbow and remove the elbow.
2. Remove the ATF temperature sensor from the transmission case.
3. Place the ATF temperature sensor in a container of ATF.



RTW77ASH003501

4. Measure the resistance between each terminal, while warming ATF.

Resistance: 0.5 – 30 kΩ (at 0°C – 120°C or 32°F – 248°F)

5. If either of the measured values exceeds the specified value, replace the ATF temperature sensor.

Torque: 15 N·m (1.5 kgf·m/11 lb·ft)

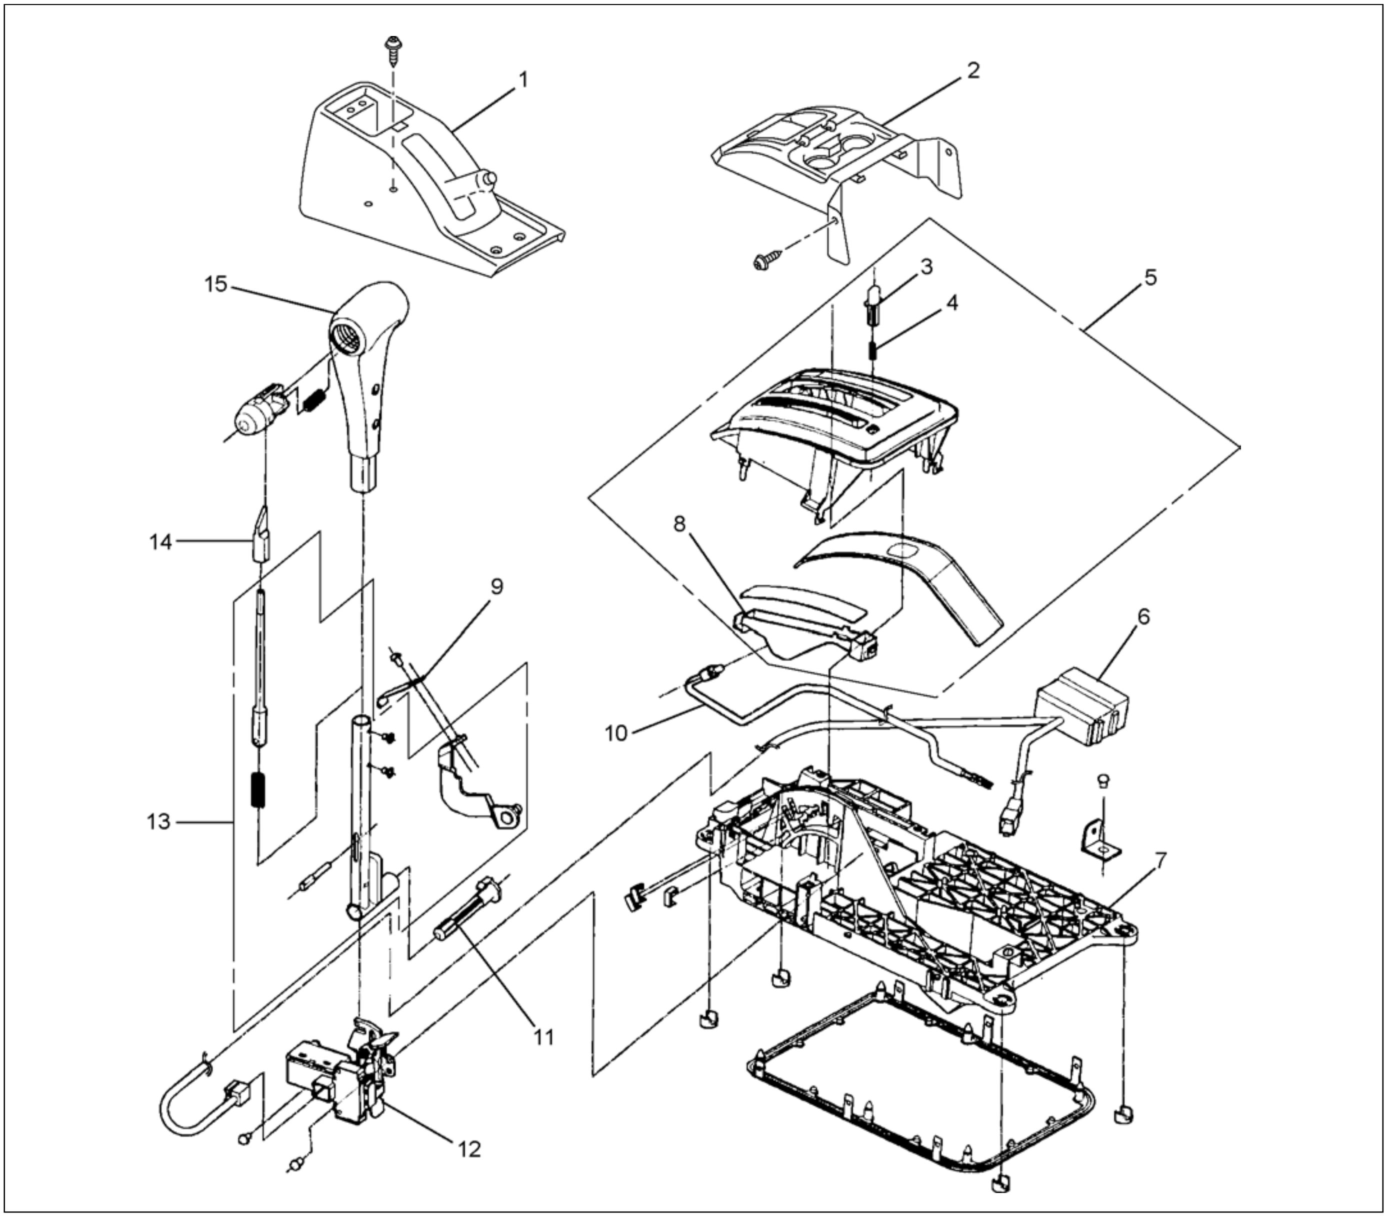
Select Lever



RTW77ALF000201

Legend

1. Rear console
2. Front console
3. Shift lock release button
4. Shift lock button spring
5. Upper housing
6. Interlock controller
7. Base plate
8. Position indicator housing
9. Spring plate
10. Lamp assembly
11. Grooved pin
12. Shift lock unit
13. Lever assembly
14. Sleeve
15. Select lever knob

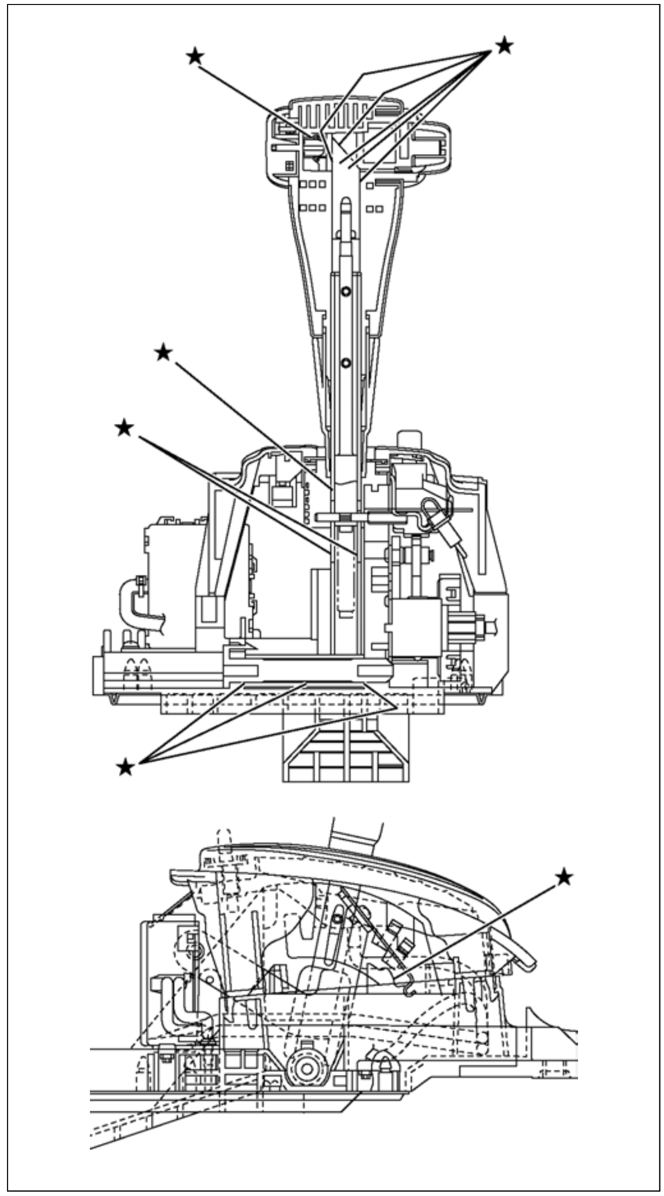
Remove or Disconnect

1. Block the wheels.
2. Disconnect the negative battery cable.
3. Remove the rear console and the front console.
4. Remove the 2 screws fixing the select lever knob.
5. Remove the knob together with the knob button and spring from the lever.
6. Turn the sleeve counterclockwise to remove it. Make a note of the number of turns required to free the sleeve.
7. Remove the harness connectors from the base plate.
8. Remove the upper housing (held in place by 4 latched fasteners).
9. Remove the lamp assembly by turning it counterclockwise.
10. Remove the spring plate.
11. Remove the grooved pin.
12. Disconnect the shift cable from the select lever.
13. Remove the lever assembly by pressing the rod down (lever in N position).
14. Remove the harness connectors from the shift lock unit, then remove the shift lock unit.
15. Remove the interlock controller.
16. If the replacement of shift lock release button or shift lock button spring is required, remove the position indicator housing, the shift lock button spring and shift lock release button can be removed.

Install or Connect

NOTE

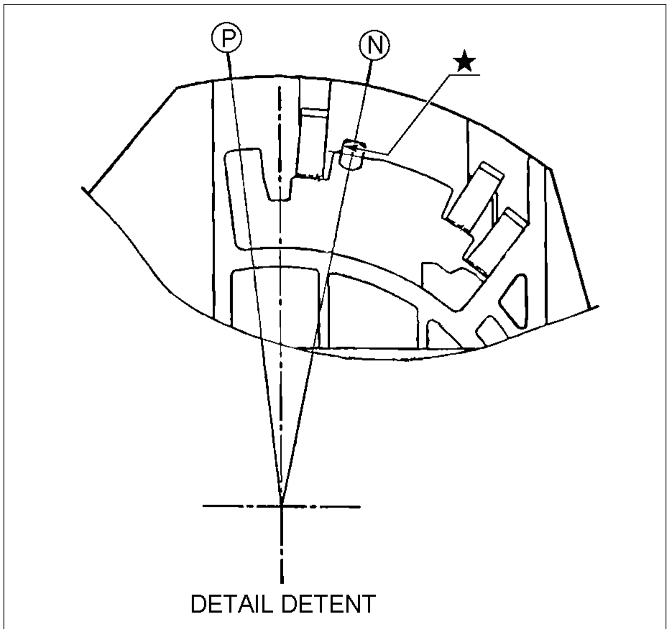
Apply MULTEMP No. 2 grease (or equivalent) to the select lever. Refer to the illustration.



RTW77ALH000201

1. Install the interlock controller.
2. Install the shift lock unit and connect the harness to the shift lock unit.
3. Install the lever assembly to the base plate.
   a. Insert and secure the shaft and connect the cable.
   b. Insert pawled end of the shaft into the base plate hole.
   c. Insert the detent pin of the shaft into detent aperture (lever assembly in N position).
   d. Install the grooved pin.

4. Install the spring plate.
   a. Insert the detent pin into the base plate detent groove until it touches the front wall (lever assembly in N position).



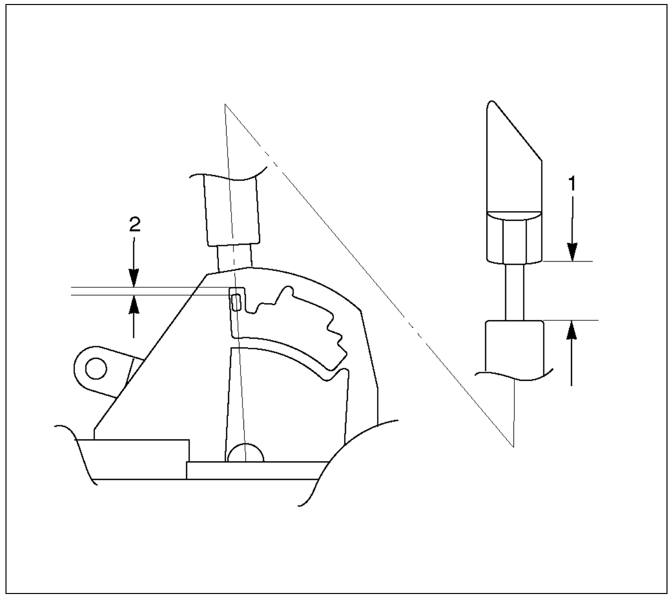
RTW37ASH001001

   b. Stack the short spring plate and tighten the screws to the specified torque.

Screw torque	2 N·m (0.2kgf·m/17 lb·in)

   c. Check that the detent pin moves smoothly in the detent groove (shift knob temporarily installed).
5. Temporarily install the sleeve.
6. Move the lever to the “P” position.
7. Adjust the clearance (2) between the detent plate and the pin by moving the select lever knob sleeve (1).

Detent plate and pin clearance	mm(in)
0.2 - 1.0 (0.01 - 0.04)	

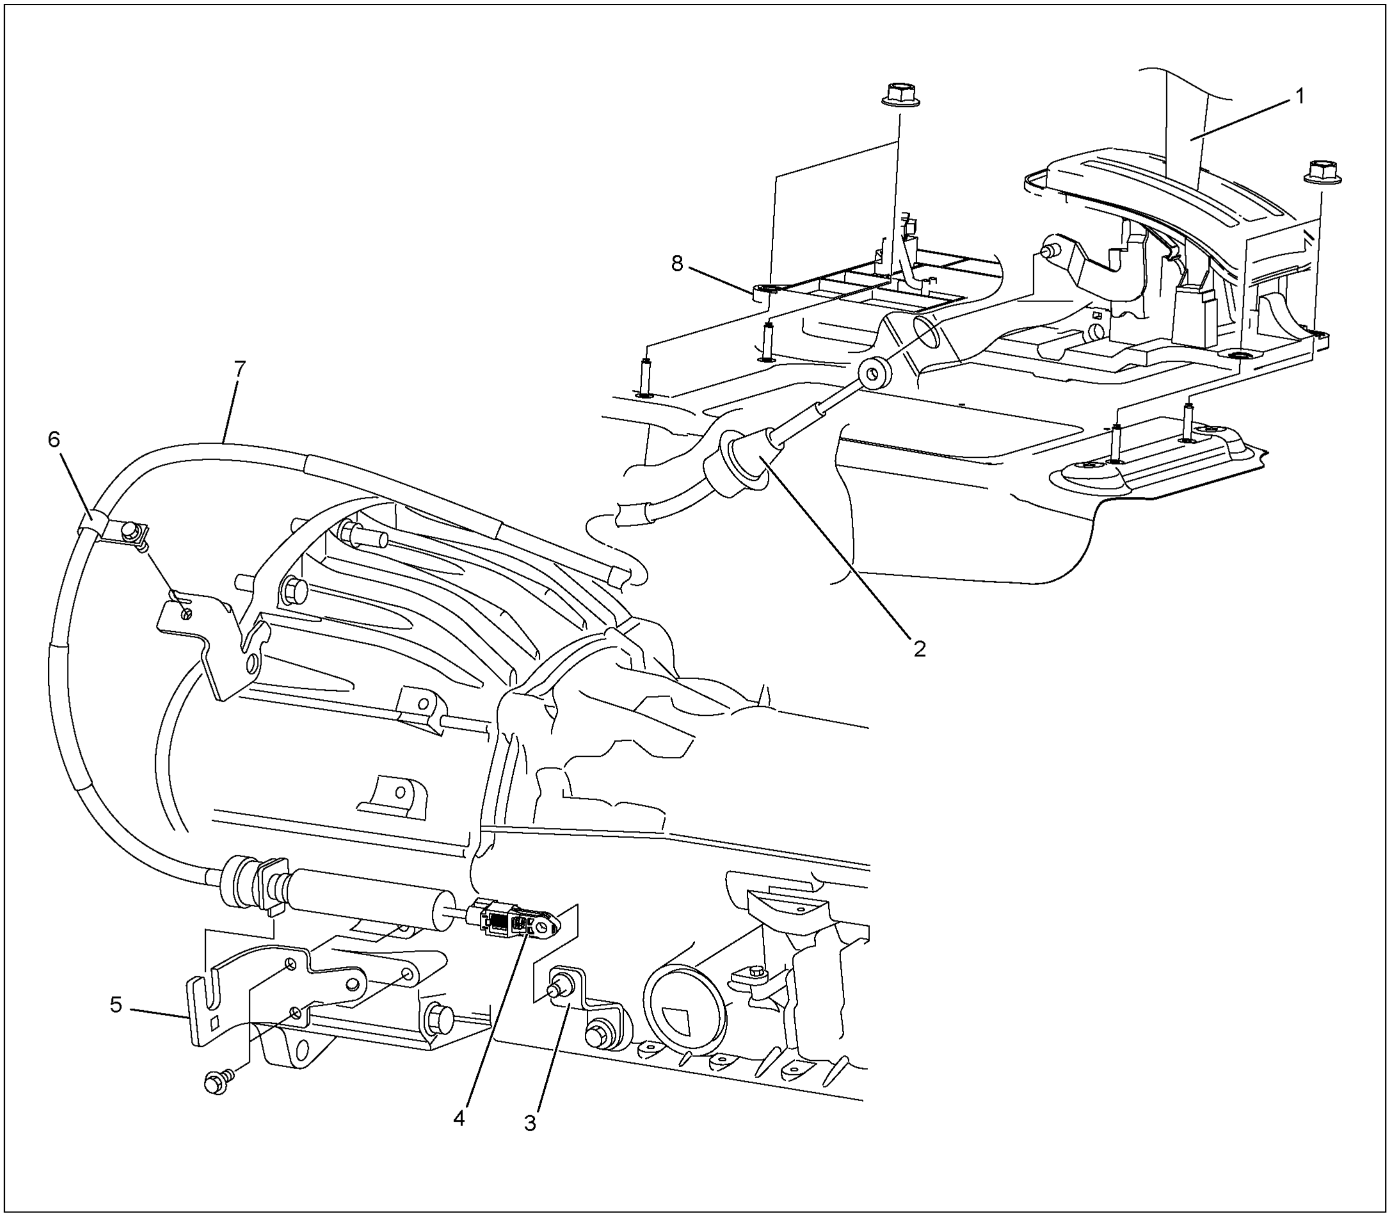


255R300002

8. Install the lamp assembly to the lamp socket.
   a. Align the recessed portion of the lamp socket with the protruding portion of the lamp assembly.
   b. Insert the lamp assembly into the lamp socket and rotate it 90 degrees clockwise.
9. Remove the sleeve and move the lever to the “N” position.
10. Install the upper housing. Make sure that the 4 latched fasteners are securely closed.
11. Attach the harness connectors to the base plate.
12. Install the sleeve (rotate the sleeve clockwise the same number of turns it was rotated counterclockwise at disassembly).
13. Install the knob, the knob button, and the knob spring.
14. Install the 2 screws securing the knob and tighten them to the specified torque.

Screw torque: 2 N·m (0.2kgf·m/17 lb·in)

Shift Cable



RTW77ALF001101

Legend

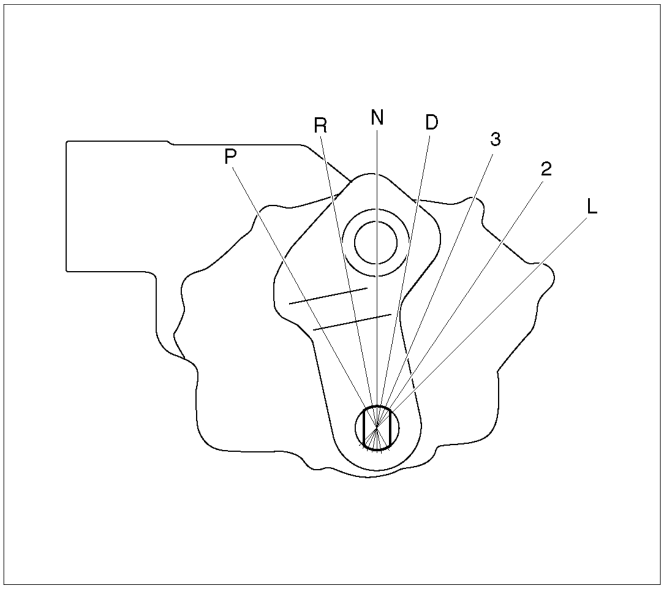
(1) Select lever
(2) Shift cable retaining pawl
(3) Manual shaft select lever
(4) Adjuster
(5) Bracket
(6) Clip
(7) Shift cable
(8) Select lever base

Remove or Disconnect

1. Block the wheels.
2. Disconnect the negative battery cable.
3. Move the select lever to the “N” position.
4. Remove the rear console and front console.
5. Disconnect the shift cable from the select lever.
6. Press on the shift cable retaining pawl to remove the cable from the select lever base.
7. Disconnect the shift cable from the transmission side.
8. Remove the shift cable from the bracket.
9. Pull the shift cable free from the bottom of the vehicle.

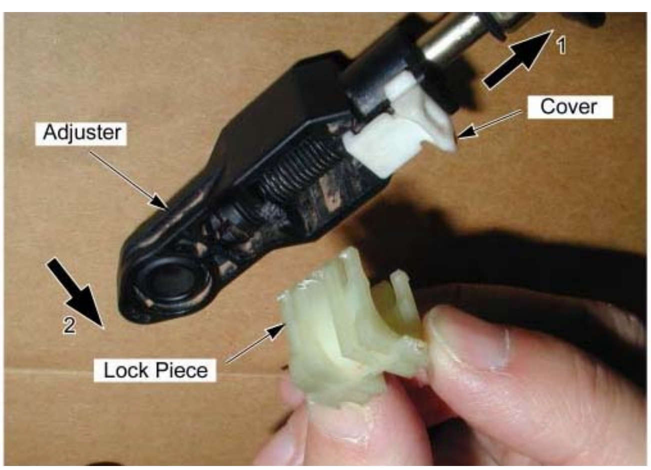
Install or Connect

1. Install the shift cable toward the inside of the cabin from the bottom of the vehicle.
2. Push the shift cable into the select lever base.
3. Connect the shift cable to the select lever.
4. Fix the shift cable to the bracket.
   Install the clip on the marking of shift cable.
5. Check that the select lever is in the “N” position.
6. Check that the transmission is in the “N” position.



249R300002

7. Slide the cover in the direction shown by the arrow (1).
8. Use an ordinary screwdriver to move the lock piece from the position indicated by the arrow (2). Continue to move the lock piece until the adjuster position begins to change.



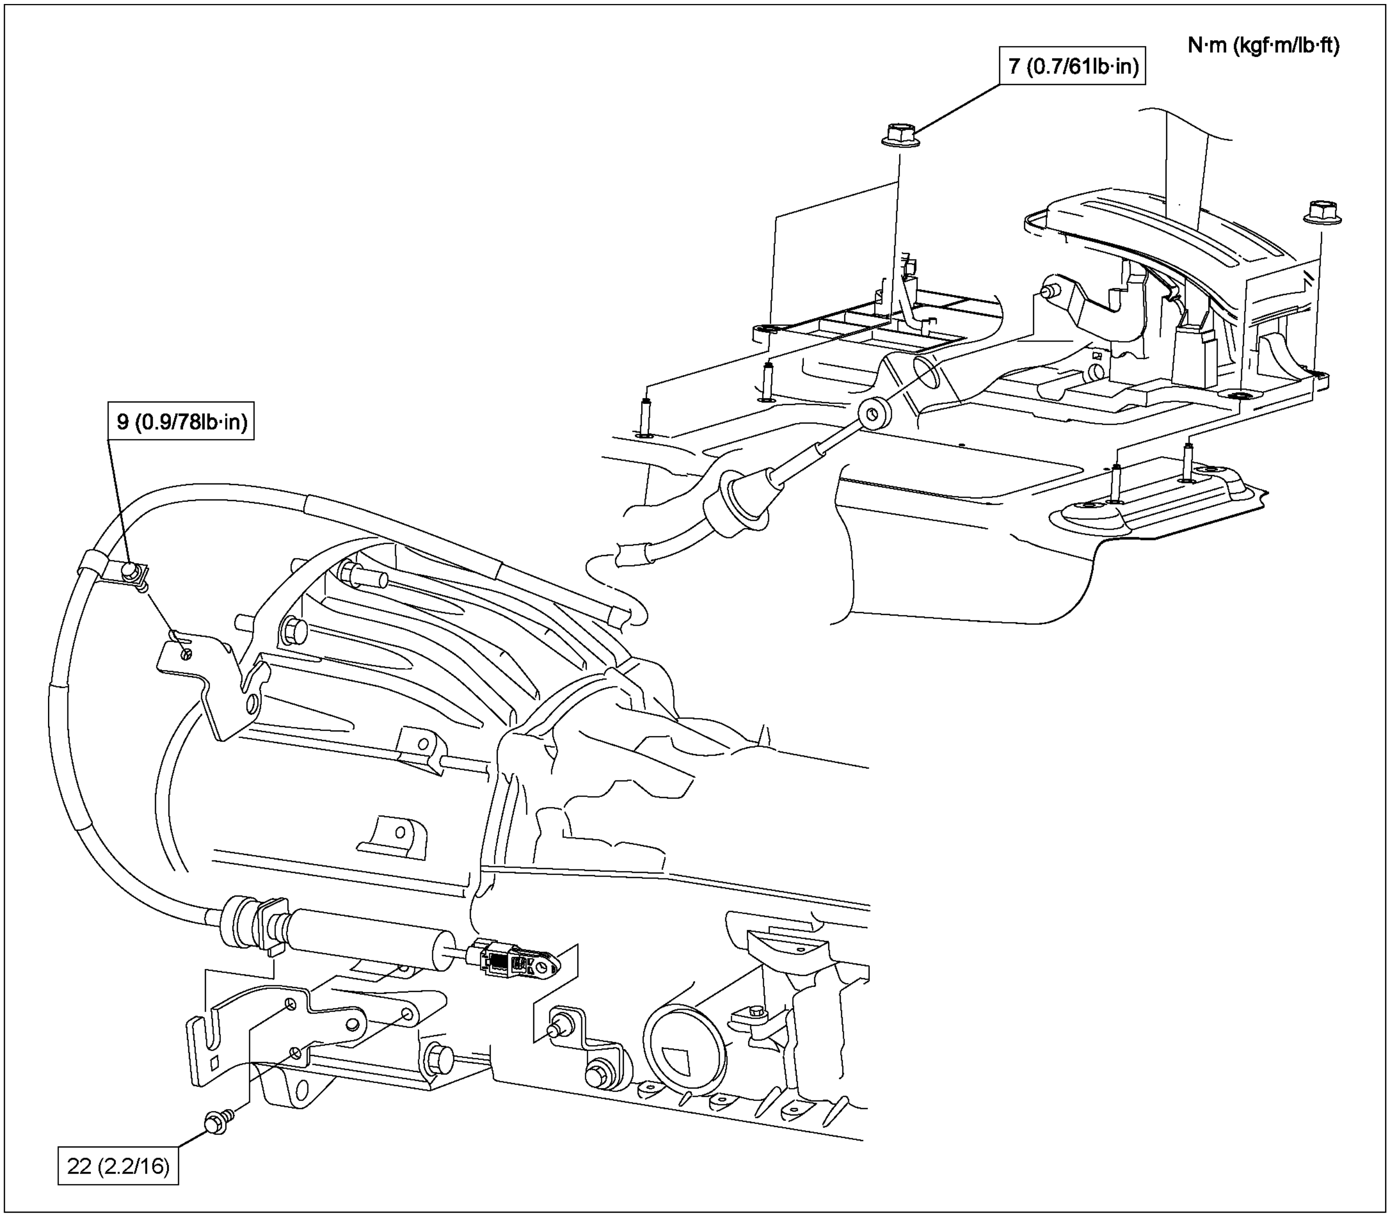
P1010012

9. Connect the shift cable to the manual shaft select lever at the transmission side.
10. Insert the lock piece to the adjuster (cable length adjustment).
11. Slide the cover on the adjuster and secure lock piece.

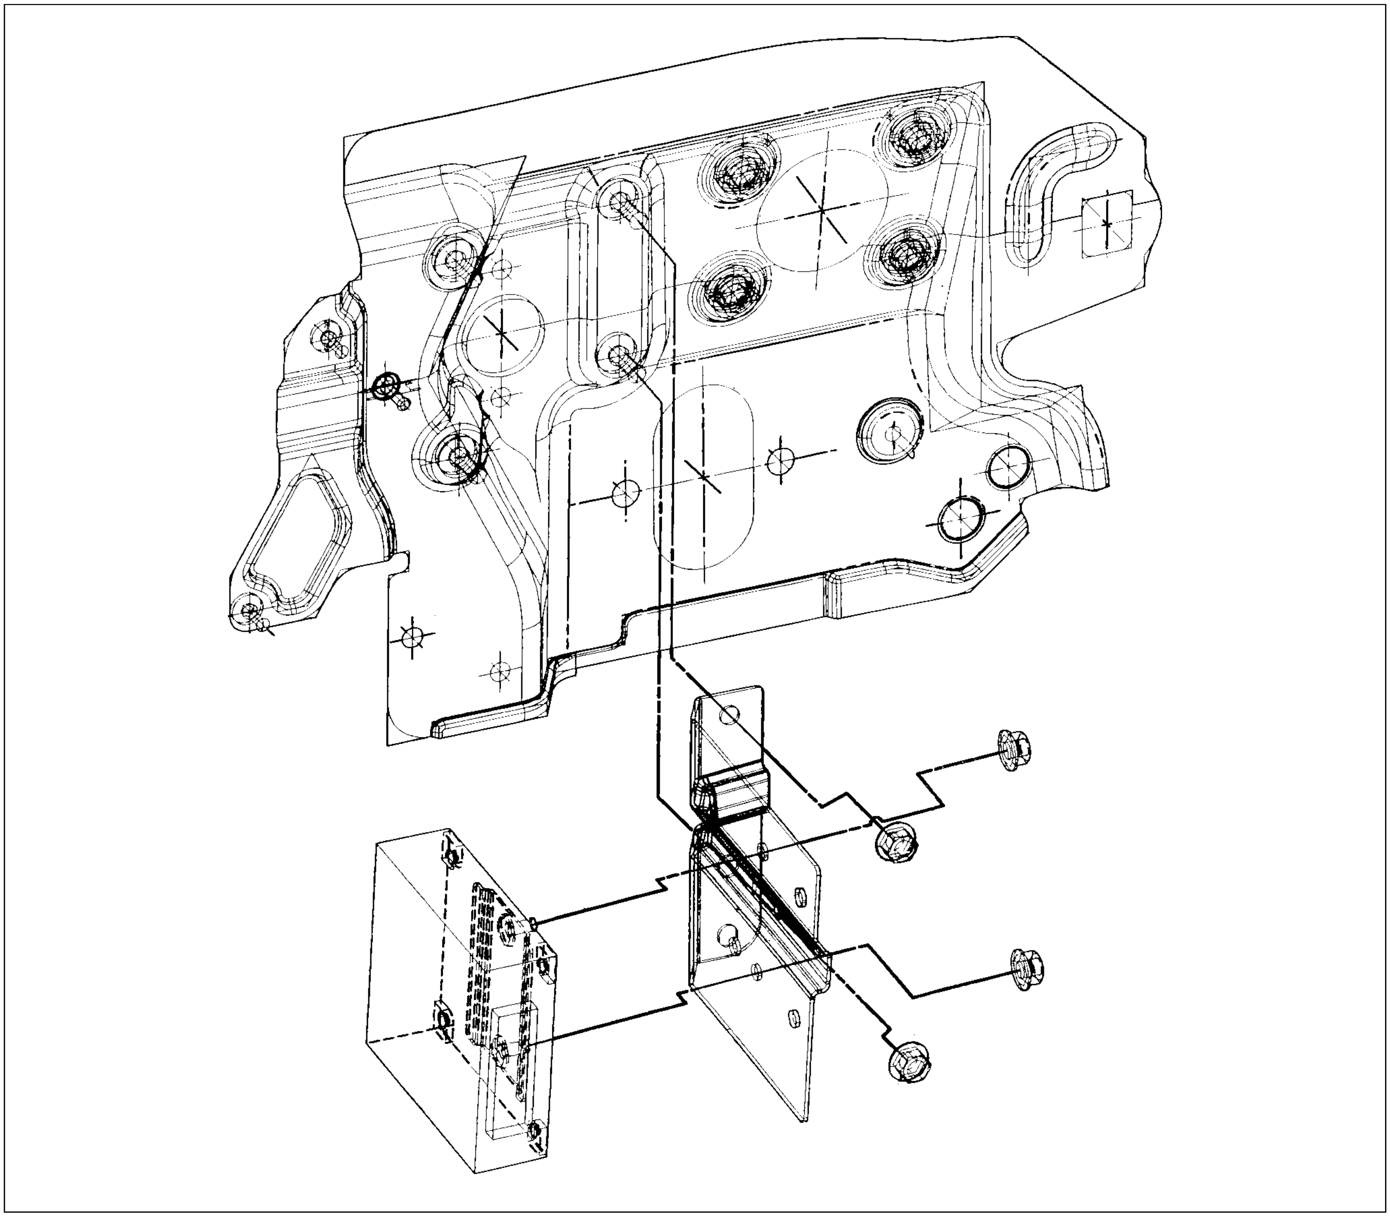
P1010016-2

11. Press the select lever knob button 5 times.
    Then check that the select lever moves smoothly to each of its positions.
13. Check that the shift position indicated by the select lever and the actual shift position are the same.
14. Install the front console and rear console.
15. Connect the negative battery cable.
16. Remove the wheel blocks.

Torque Specifications



Transmission Control Module (TCM)



RTW37ALF001801

Removal

Preparation:

Disconnect negative (–) battery cable.

1. Disconnect the TCM harness connectors.
2. Remove fixing nuts (2 pieces) and TCM with bracket from the car.

NOTE: The TCM is fitted under instrument panel of the driver's compartment by means of two stud bolts.

3. Remove fixing nuts (2 pieces) and remove TCM from bracket.

Installation

To install, follow the removal steps in reverse order.

Shift Solenoid and Lock-Up Solenoid

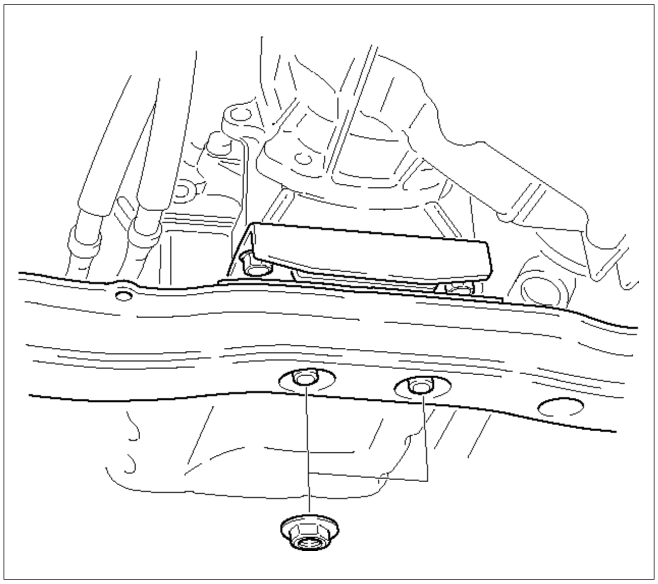
Removal

Preparation:

- Disconnect negative (–) battery cable.
- Drain the fluid.

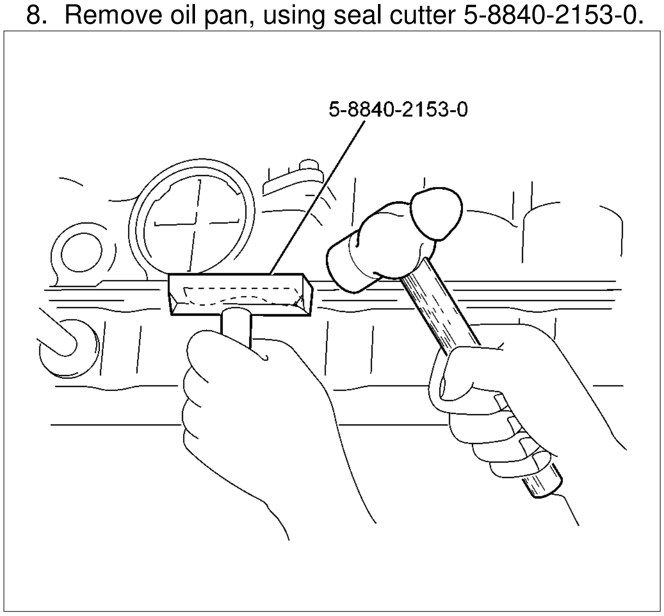
Refer to ATF REPLACEMENT in this section.

1. Remove oil lever gage and oil filler tube.
2. Support transfer case (4×4) or rear cover (4×2) with a transmission jack.
3. Remove engine rear mounting nuts.



F07RW008

4. Remove fule pipe heat protector on tansmission corssmenber.
5. Remove fuel pipe from the crossmenber.
6. Remove transmission crossmenber.
7. Remove the nineteen bolts.
8. Remove oil pan, using seal cutter 5-8840-2153-0.



RUW37ASH002901

NOTE: Do not turn over the transmission as this will contaminate the valve body with foreign materials in the bottom of the oil pan.

Remove oil pan by lifting the transmission case.

Oil pan seal cutter: 5-8840-2153-0

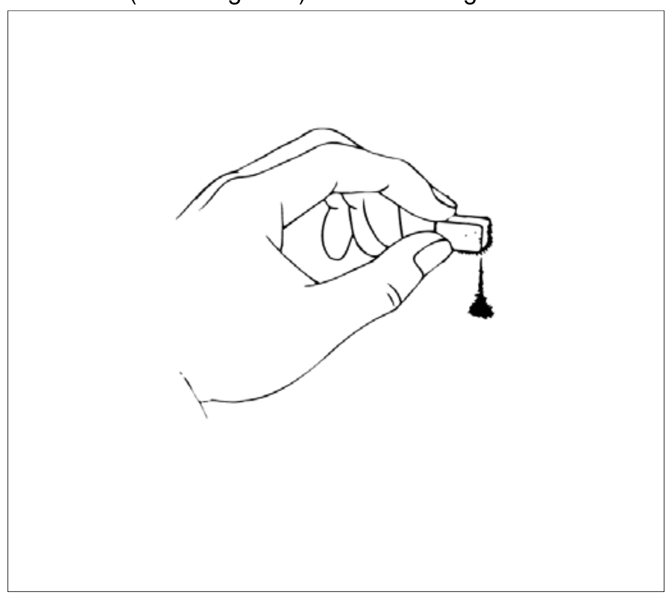
Examine particles in oil pan

Remove the magnet and use it to collect any steel chips.

Look carefully at the chips and particles in the oil pan and on the magnet to anticipate what type of wear you will find in the transmission:

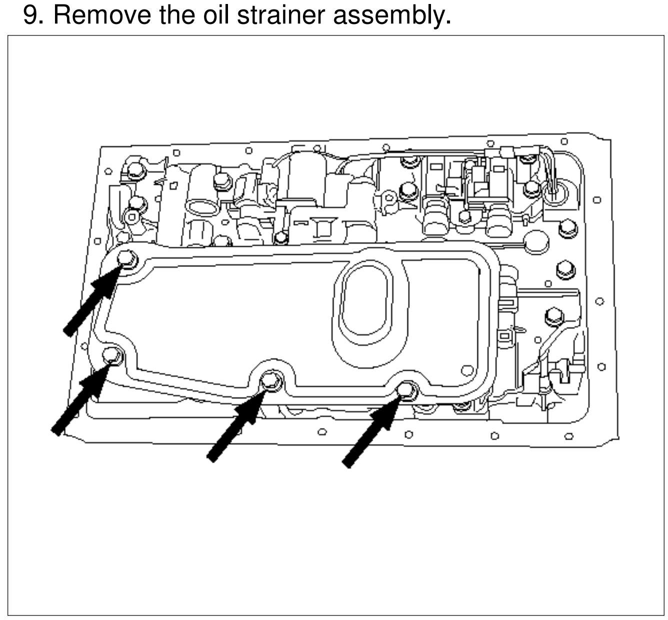
Steel (magnetic).................bearing, gear and clutch plate wear

Brass (non-magnetic)..........bushing wear



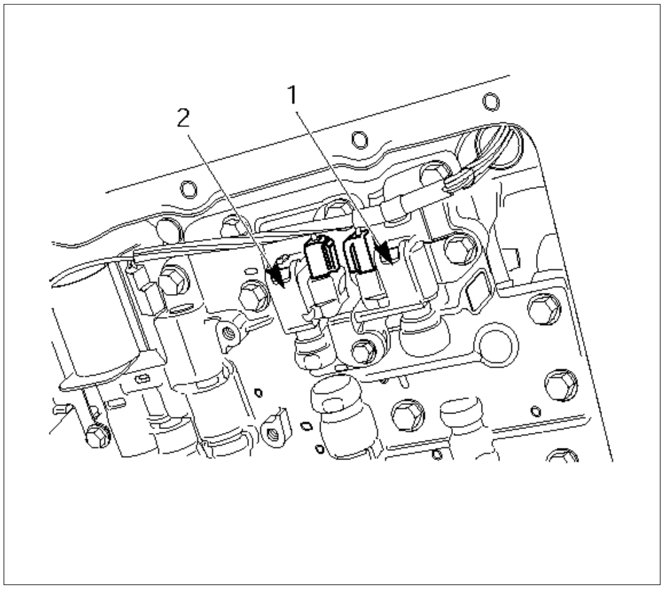
240RY00008

9. Remove the oil strainer assembly.

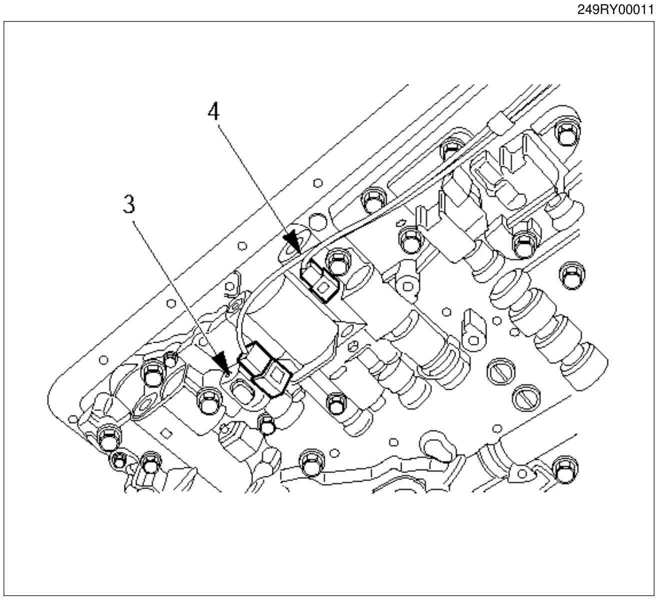


244RY00003

10. Disconnect the solenoid wiring connectors from the shift solenoid S1(1), S2(2), lock-up solenoid(3) and pressure control solenoid(4).



249RY00011



249RY00012

11. Remove each retaining bolts and solenoids. (Except pressure control solenoid:)

    Pressure control solenoid cannot be removed.

Installation

To install, follow the removal steps in reverse order noting the following point;

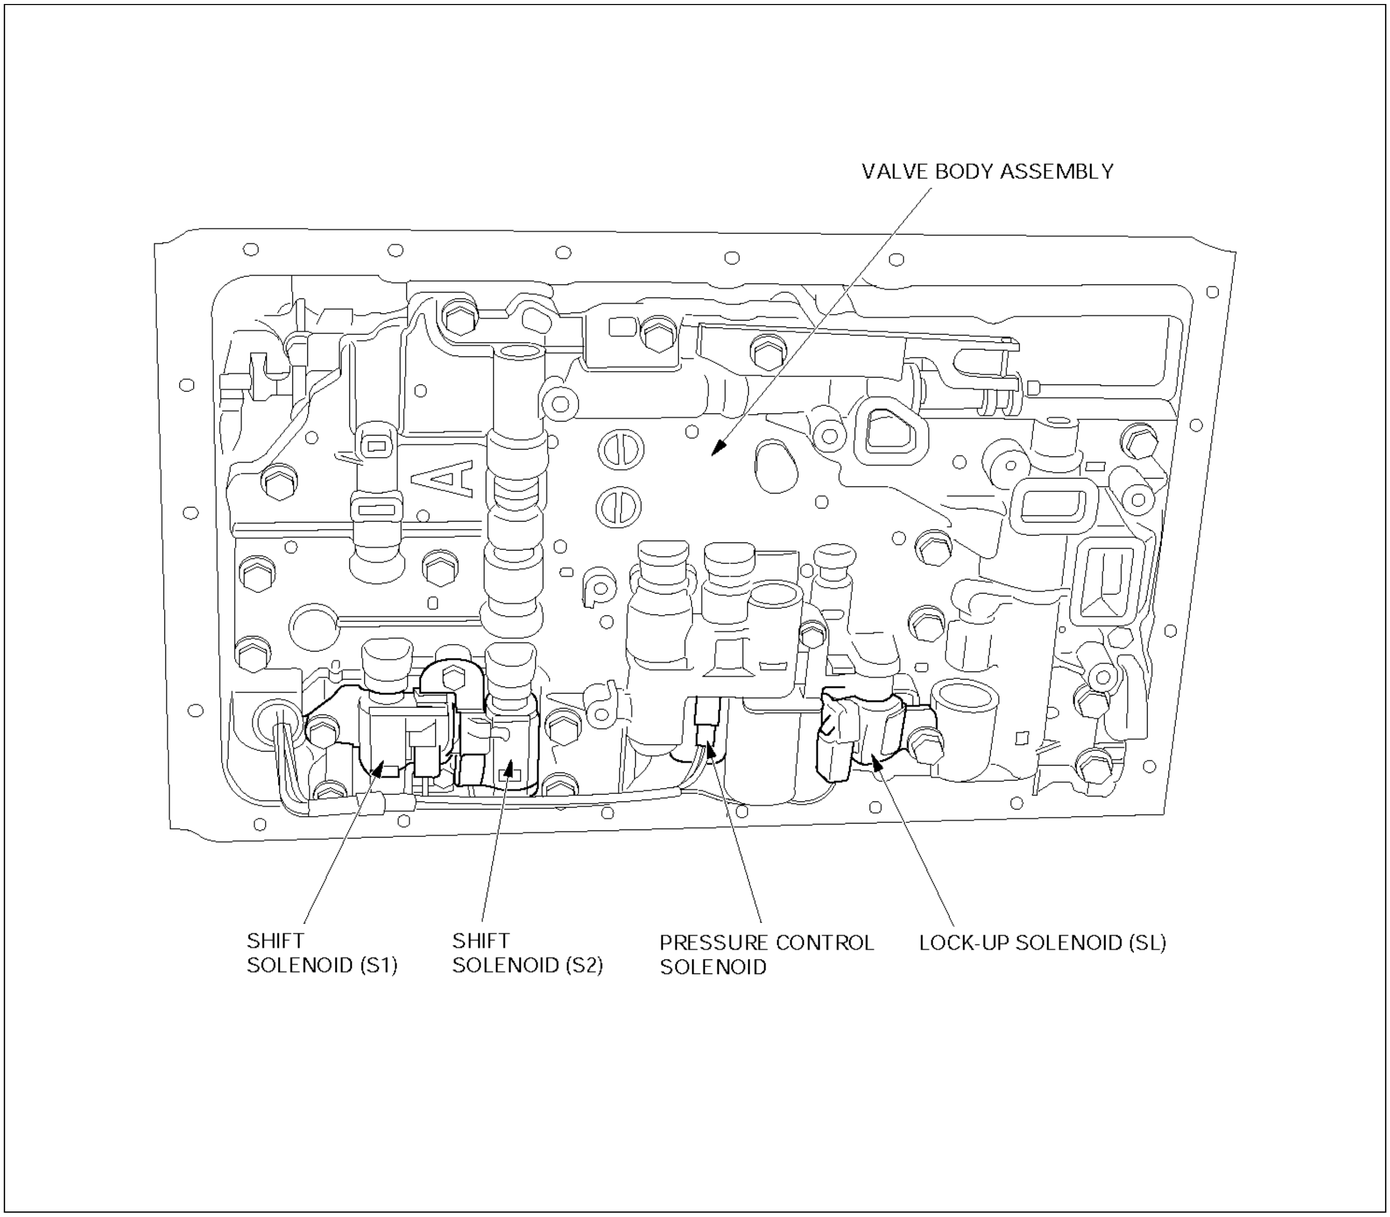
Refer to the section Reassembly of Major Components(2) and Transmission Removal and Installation.

Torque:

Solenoid S1, S2 bolt – 7 N·m (0.7 kgf·m/61 lb·in)

Lock-up solenoid bolt – 10 N·m (1.0 kgf·m/87 lb·in)

Valve Body Assembly and Pressure Control Solenoid



244RY00009

Removal

Preparation:

- Disconnect negative (–) battery cable.
- Drain the fluid.
  Refer to ATF REPLACEMENT in this section.

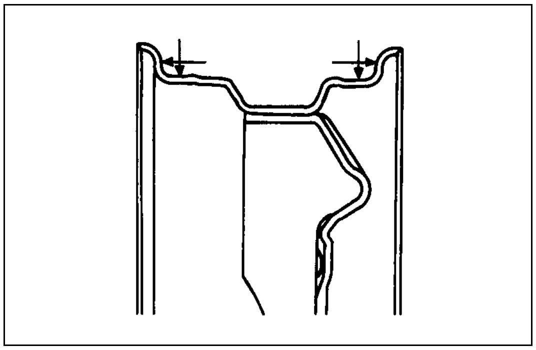
1. Remove the nineteen bolts and oil pan.

INSPECTION AND REPAIR

Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

Visual Check

Inspect all disassembled parts for wear, damage or other abnormal conditions.

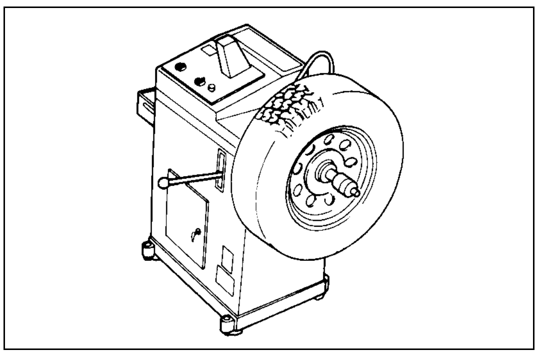


Measure Wheel Runout

mm (in)

Wheel Type	Radial	Lateral
14 inch Steel 15 inch Steel	Less than 1.0 (0.04)	Less than 1.0 (0.04)
15 inch Alumi 16 inch Alumi	Less than 0.4 (0.016)	Less than 0.55 (0.022)

If the measured value exceeds the specified limit, the wheel must be replaced.



Balancing Wheel and Tire

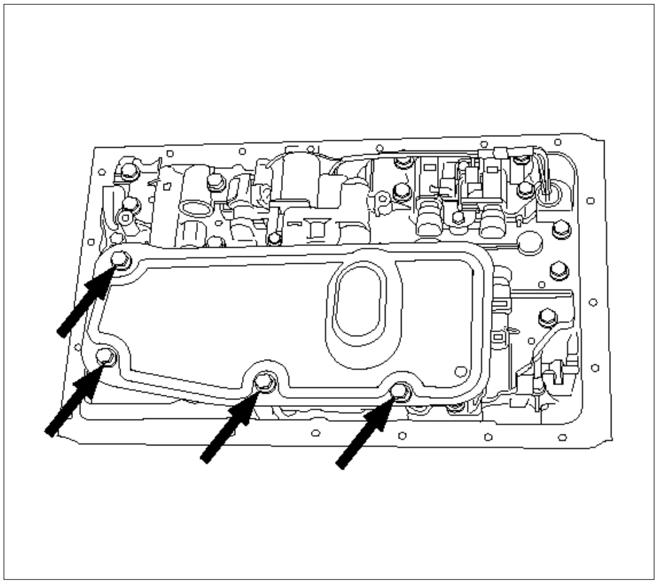
On-vehicle Balancing

On-Vehicle balancing methods very with equipment and tool manufacturers. Be sure to follow each manufacturer's instructions during the balancing operation.

Off- vehicle Balancing

Most electronic off-vehicle balancers are more accurate than the on-vehicle spin balancers. They are easy to use and give a dynamic balance. Although they do not correct drum or disc imbalance (as the on-vehicle spin balancing does), they are very accurate.

2. Remove the oil strainer assembly.



244RY00003

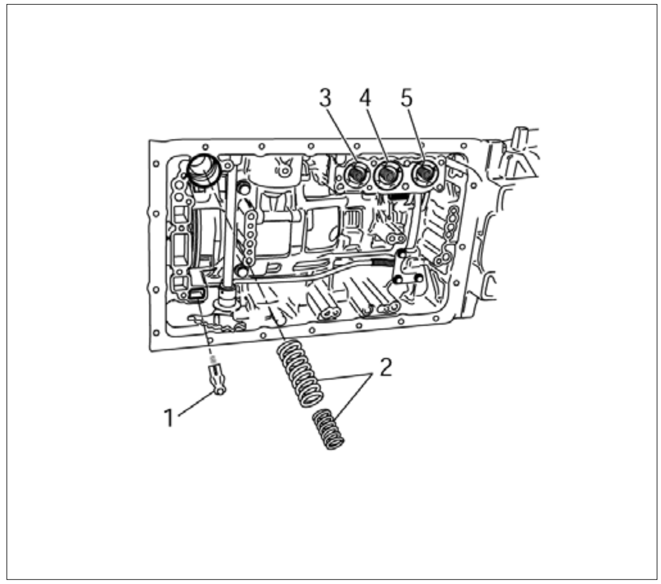
3. Disconnect the solenoid wiring connectors from the solenoids.
4. Remove the twenty bolts from the valve body.
5. Remove the valve body assembly and pressure control solenoid.
   - After removing valve body assembly from the transmission case, loosen the solenoid clamp bolt and remove the pressure control solenoid from the upper valve body assembly.

     Also disconnect the harness connector from the pressure control solenoid.

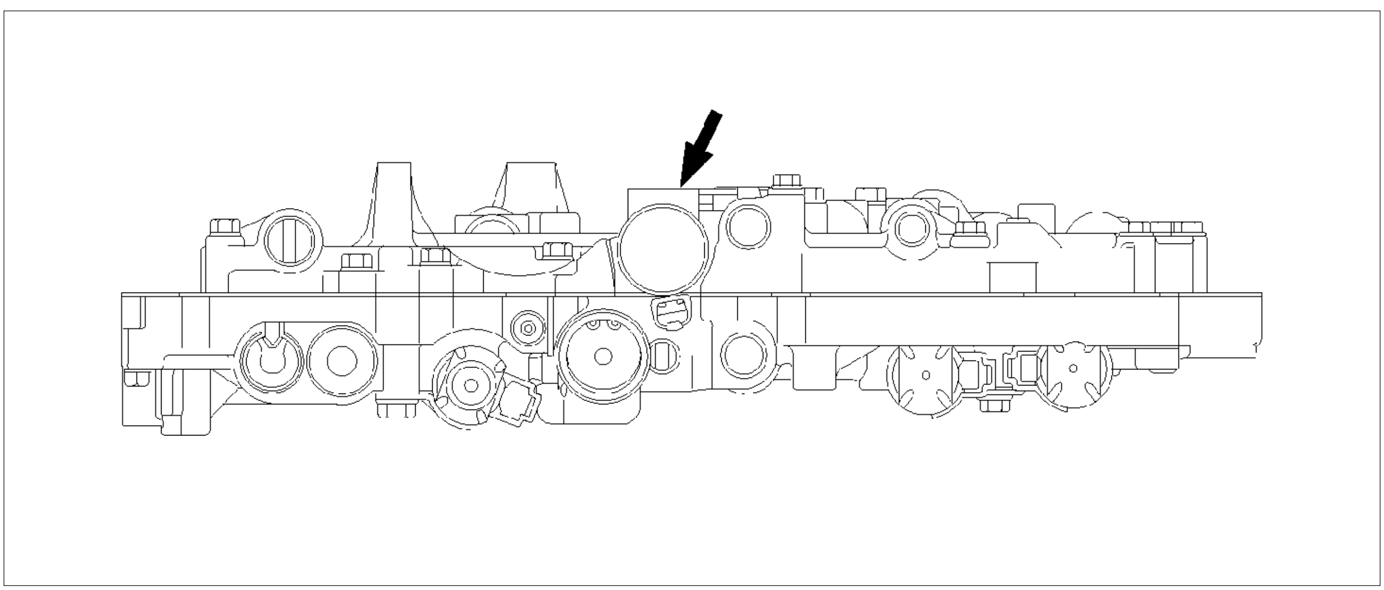
NOTE:

- Two or more persons are required for removal and installation of the valve body assembly and pressure control solenoid.
- The check valve assembly (1) and the C0 accumulator piston springs (2) will fall from the transmission case during removal of valve body assembly.

  Protect these parts from damage. The B0 (3), C2 (4), and B2 (5) accumulator piston and springs may also fall free and must be protected.



244RY00018



244RY00006

Installation

To install, follow the removal steps in reverse order noting the following point;

1. Reinstall the parts removed with the valve body assembly to their assigned positions in the transmission case (check valve assembly, C0 accumulator pistons, etc). Install the valve body assembly to the transmission case.

   Refer to REASSEMBLY OF MAJOR COMPONENTS (2).

2. Solenoid clamp bolt

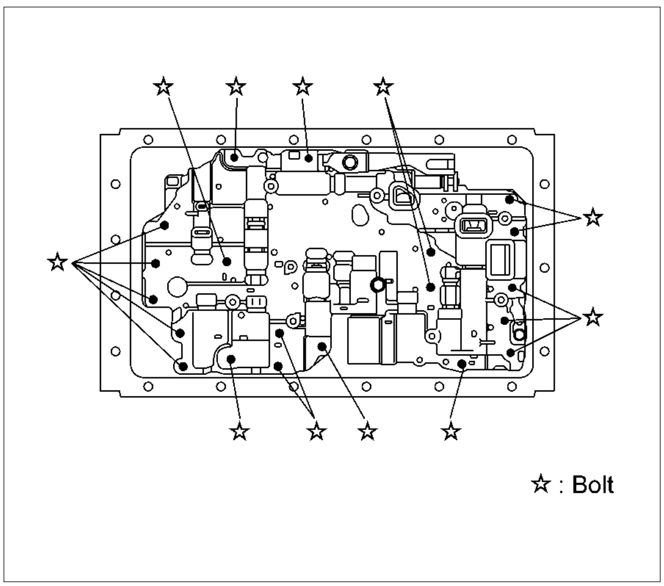
   Torque : 7 N·m (0.7 kgf·m/61 lb·in)

3. Valve body fixing bolts

   Each bolt location is indicated in the figure.

   Torque : 10 N·m (1.0 kgf·m/87 lb·in)

NOTE: Tighten the bolts toward outside equally.



244R200078

4. Oil strainer fixing bolts

   Torque : 10 N·m (1.0 kgf·m/87 lb·in)

5. Oil pan fixing bolts

   Torque : 7.4 N·m (0.75 kgf·m/65 lb·in)

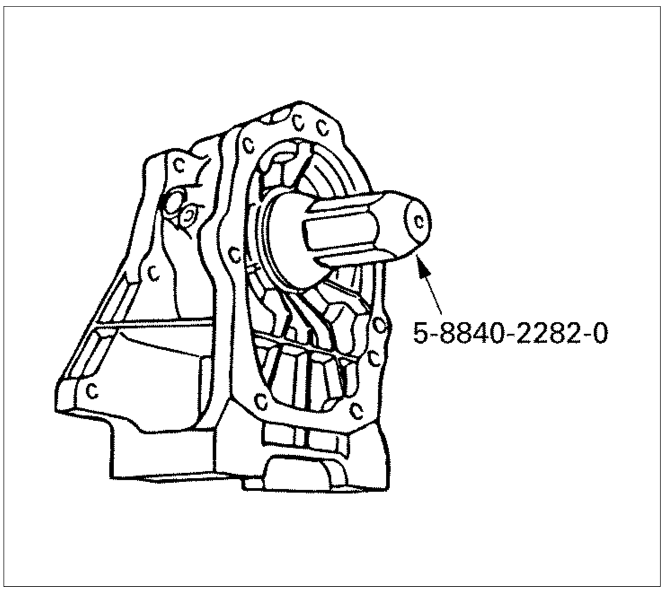
Rear Oil Seal (Adapter Housing, 4×4)

Removal

1. Remove the front and rear propeller shaft assembly from the transfer case.
2. Remove the transfer case assembly from the transmission case.
   Refer to Section 7D TRANSFER.
3. Using a screwdriver, remove the rear oil seal.

Installation

1. Apply ATF to a new rear oil seal lip.
2. Using oil seal installer, install the rear oil seal to the adapter housing.
   Oil seal installer : 5-8840-2282-0



240RY00003

3. Install the transfer case assembly.
   Refer to section 7D TRANSFER.
4. Install the front and rear propeller shaft assembly.

Torque (Propeller shaft flange bolt) :
63 N·m (6.4 kgf·m/46 lb·ft)

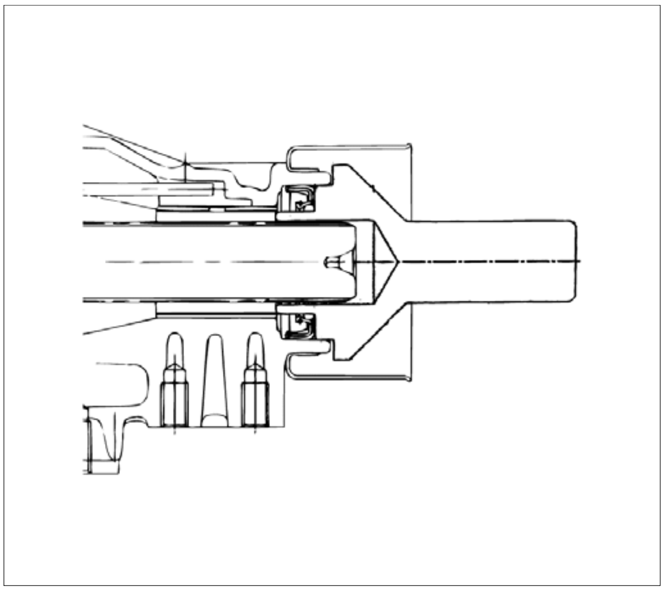
Rear Oil Seal (Extension Housing, 4×2)

Removal

1. Remove the rear propeller shaft assembly.
2. Using a screwdriver, remove the rear oil seal.

Installation

1. Apply ATF to a new rear oil seal lip.
2. Using oil seal installer, install the rear oil seal to the extension housing.
   Oil seal installer : 5-8840-2702-0



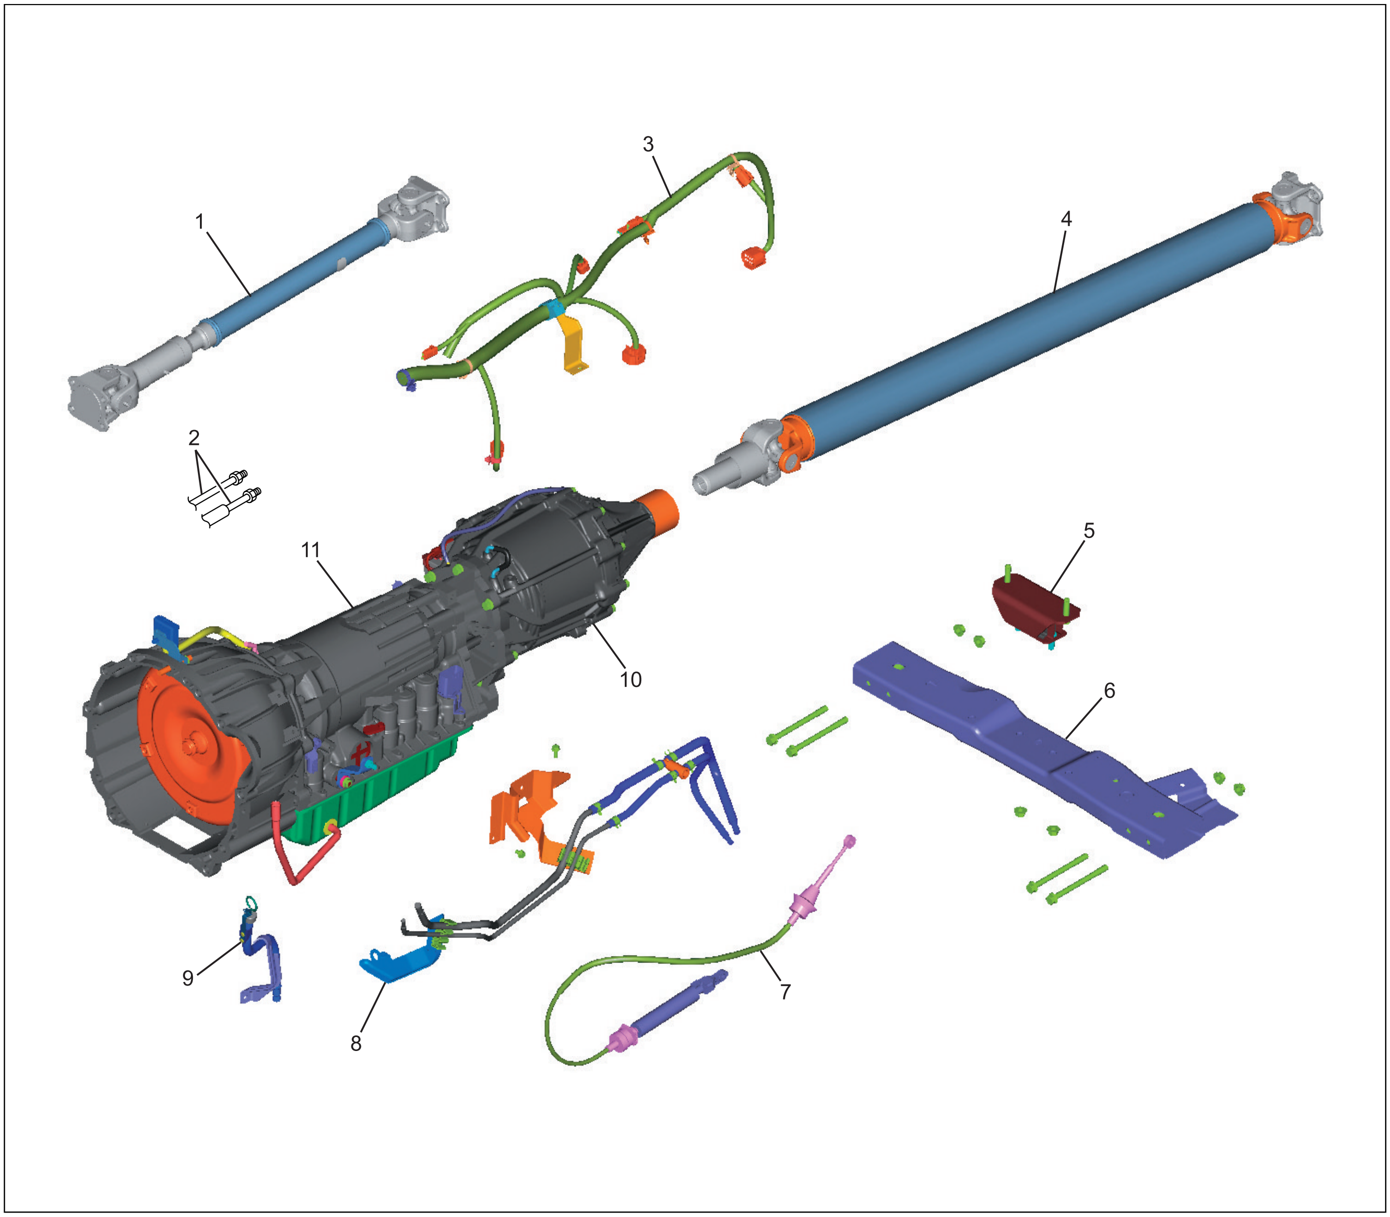
249L100005

3. Install the rear propeller shaft.

   Torque (Flange bolt): 63 N·m (6.4 kgf·m/46 lb·ft)

Transmission Assembly

Transmission and Associated Parts



RTW77ALF000801

Legend

(1) Front Propeller Shaft (4×4 only)

(8) Fuel Pipe Bracket
(9) Oil Level Gauge And Upper Guide Tube
(10) Transfer Assembly (4×4 only)
(11) Transmission Assembly

Removal

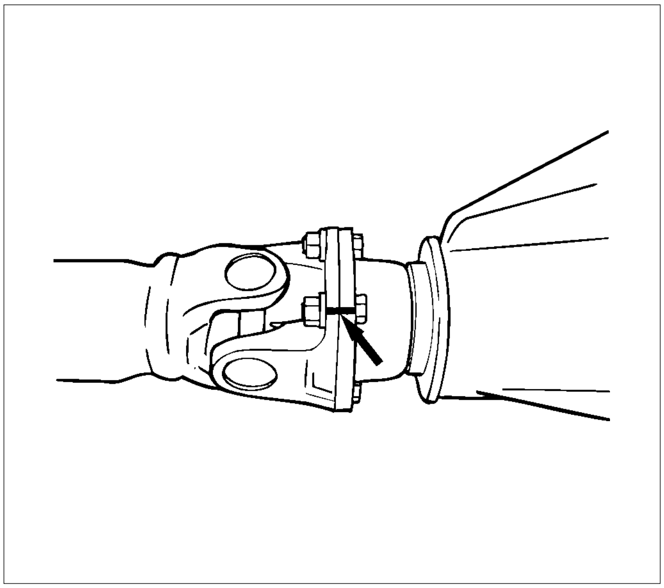
NOTE: Before removing transmission and transfer assembly from vehicle, change the transfer mode to 4×2 using the 4×4 push button switch on dash panel.

1. Disconnect battery ground cable.
2. Raise and support vehicle with suitable stands.
3. Remove the drain plug and drain the transmission oil.
4. Remove the front propeller shaft. (4×4 only)

NOTE: Apply alignment marks on the flange at both front and rear sides.

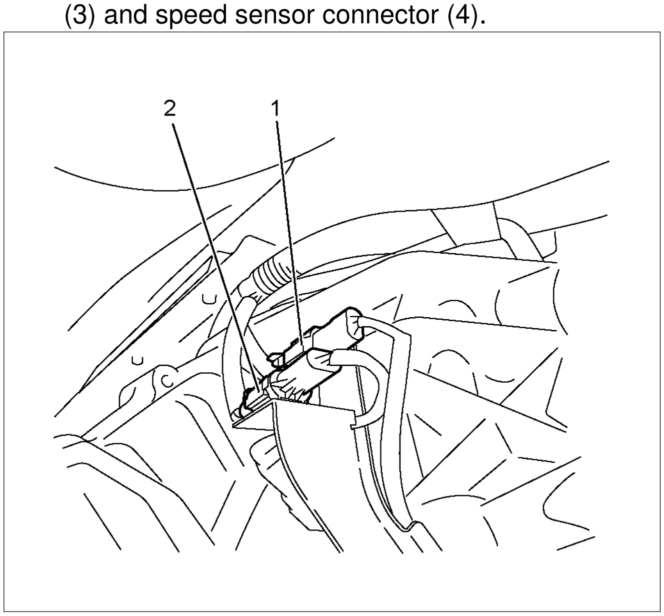
5. Remove the rear propeller shaft.

NOTE: Apply alignment marks on the differential side.

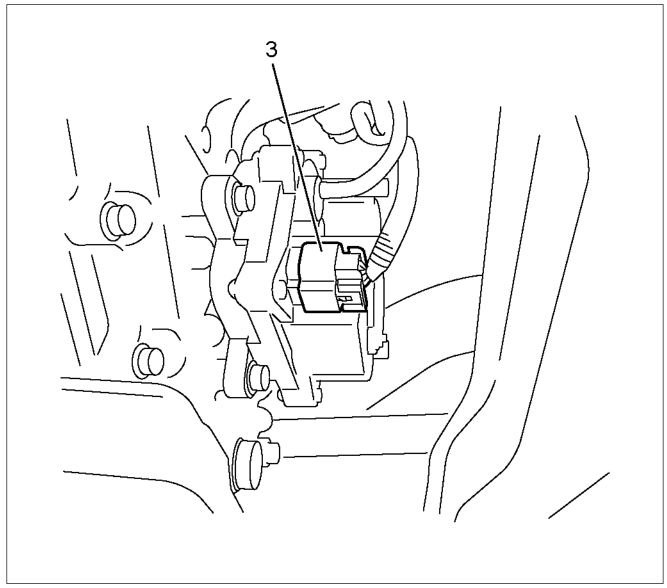


RTW77BSH000201

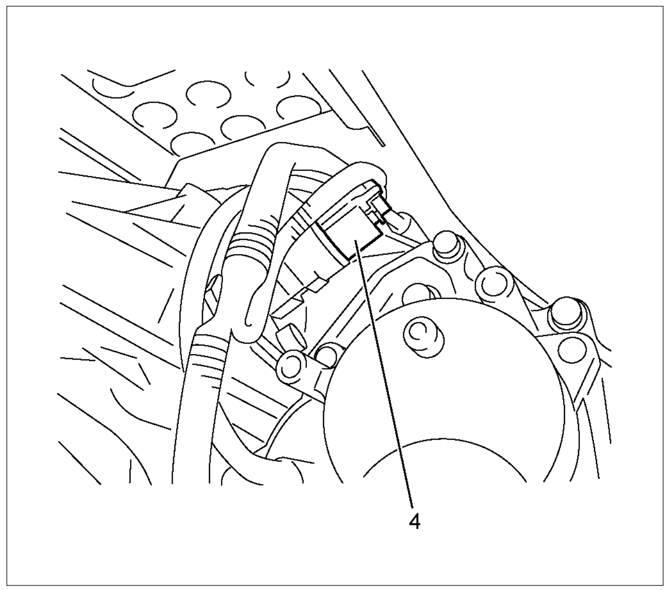
6. Disconnect the 2WD-4WD switch connector (1), neutral switch connector (2), actuator connector (3) and speed sensor connector (4).



RTW77ASH001801

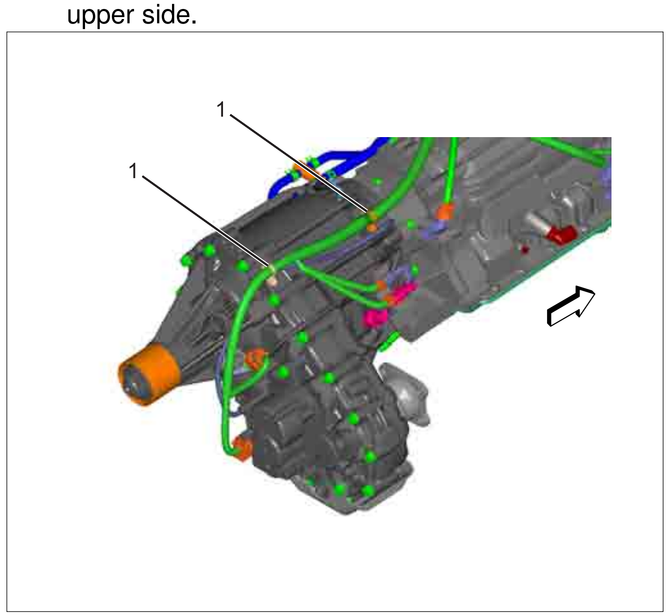


RTW77ASH001901



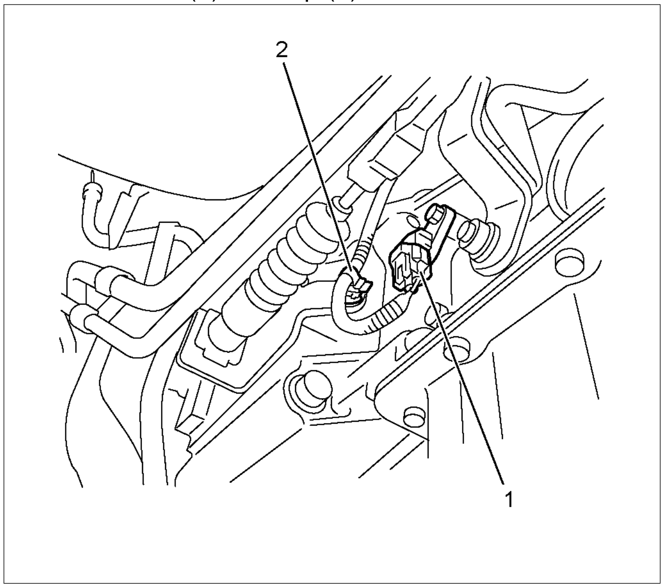
RTW77ASH002001

7. Disconnect two harness clips (1) of the transfer upper side.

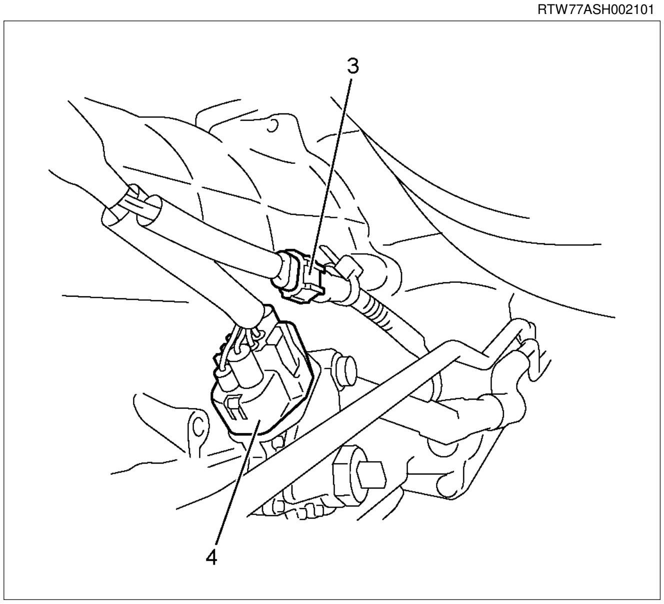


RTW77ASH001601

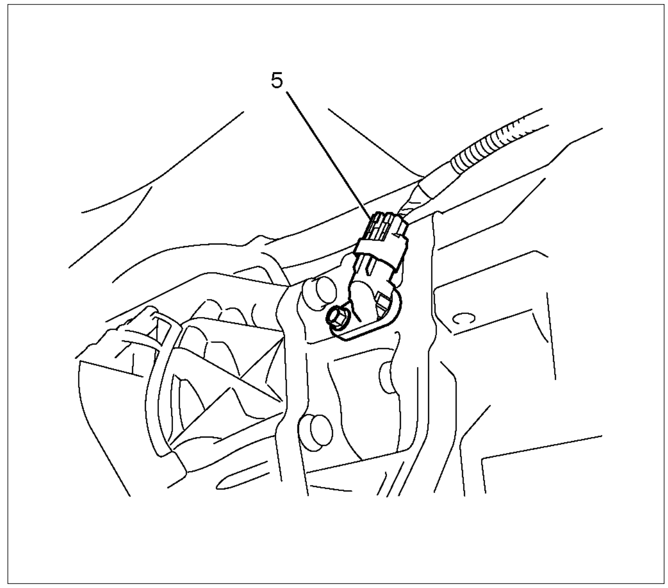
8. Remove the transfer assembly. (4×4 only)
9. Disconnect the input sensor connector (1), ATF temperature sensor connector (3), neutral start (mode) switch connector (4), output sensor connector (5) and clip (2).



RTW77ASH002101

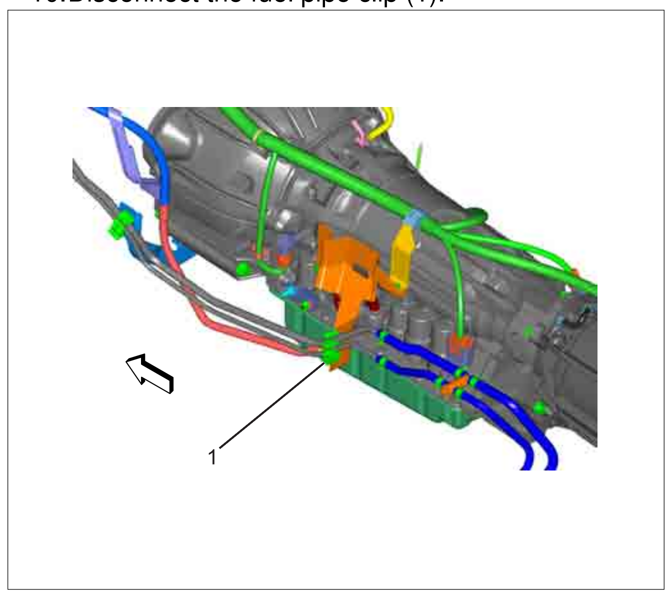


RTW77ASH002201



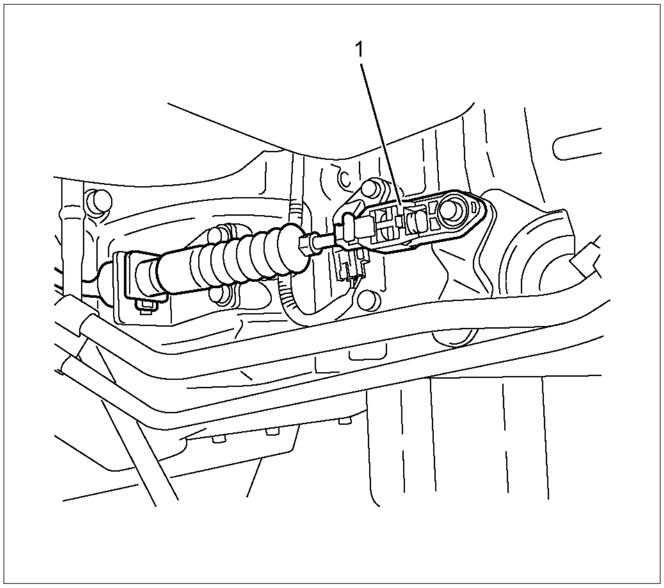
RTW77ASH002301

10. Disconnect the fuel pipe clip (1).



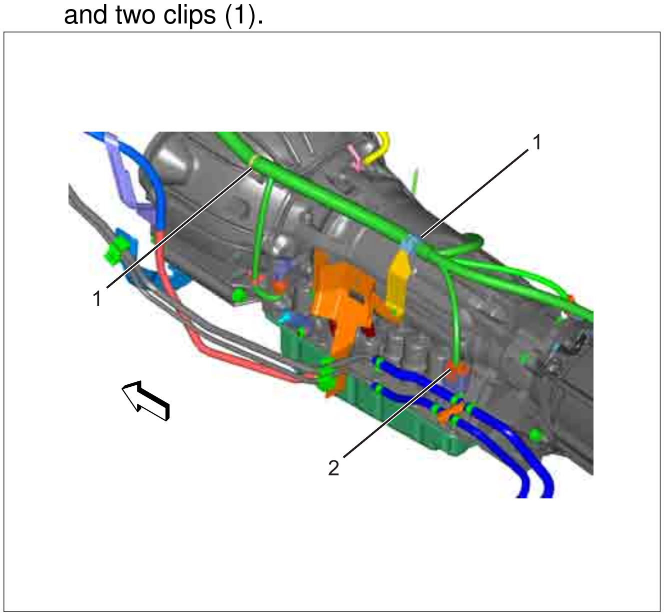
RTW77ASH001301

11.Disconnect the shift cable (1) from the transmission side.



RTW77ASH002801

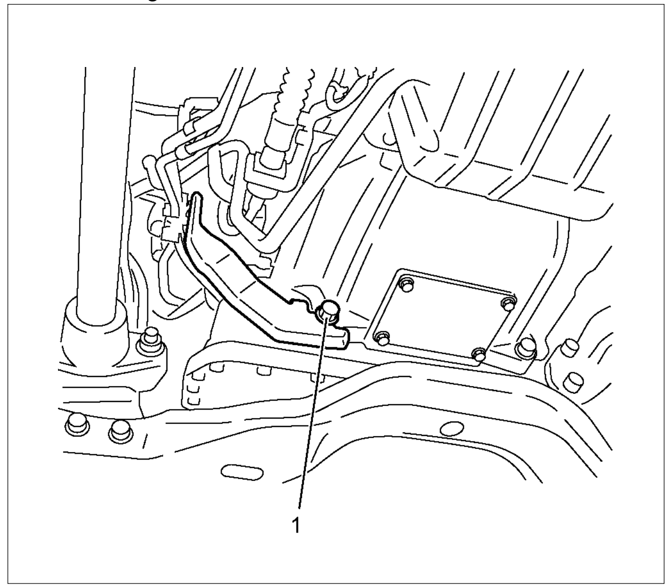
12.Disconnect the transmission harness connector (2) and two clips (1).



RTW77ASH001401

13.Remove the oil level gauge and upper guide tube.

14.Remove the fuel pipe bracket bolt (1) on clutch housing lower left side.

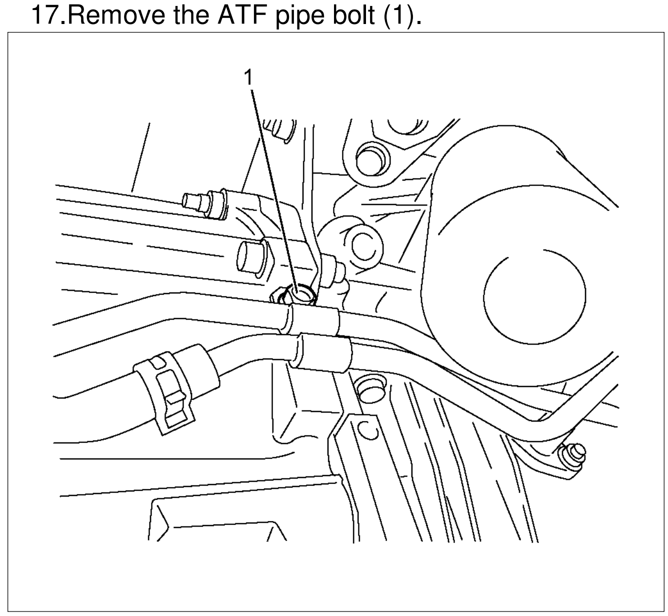


RTW77ASH002401

15.Disconnect the shift cable bracket on the transmission side.

16.Disconnect the starter assembly with shift cable bracket.

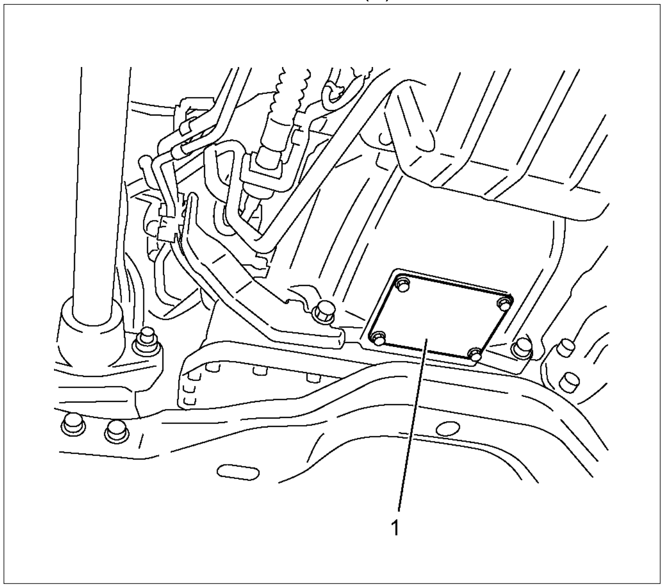
17.Remove the ATF pipe bolt (1).



RTW77ASH002501

18.Disconnect two ATF pipes.

19.Remove the under cover (1).

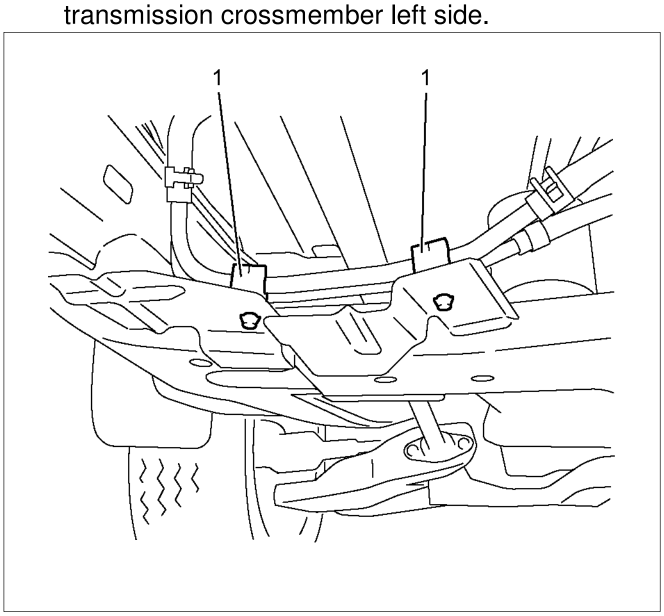


RTW77ASH002601

20.Remove the torque converter bolts by turning the crank shaft.

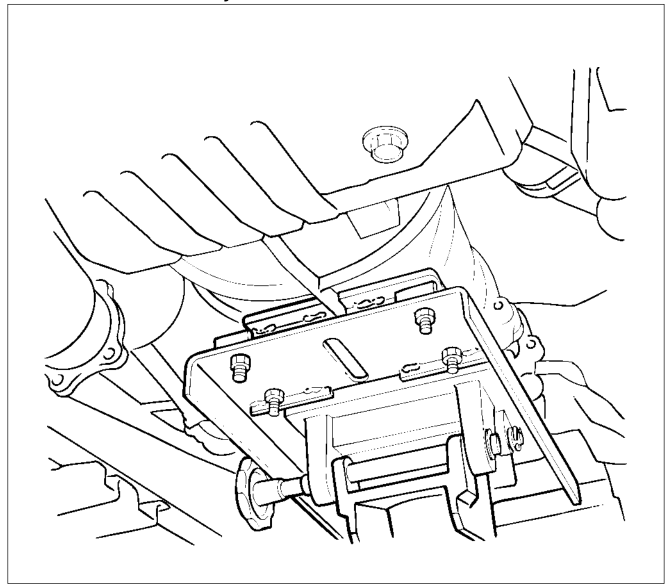
21.Remove the four transmission bolts.

22.Disconnect the two fuel pipe clips (1) on the transmission crossmember left side.



RTW77ASH002701

23.Support transmission assembly with a transmission jack.



RTW77BSH000401

24.Support engine assembly with a engine jack.

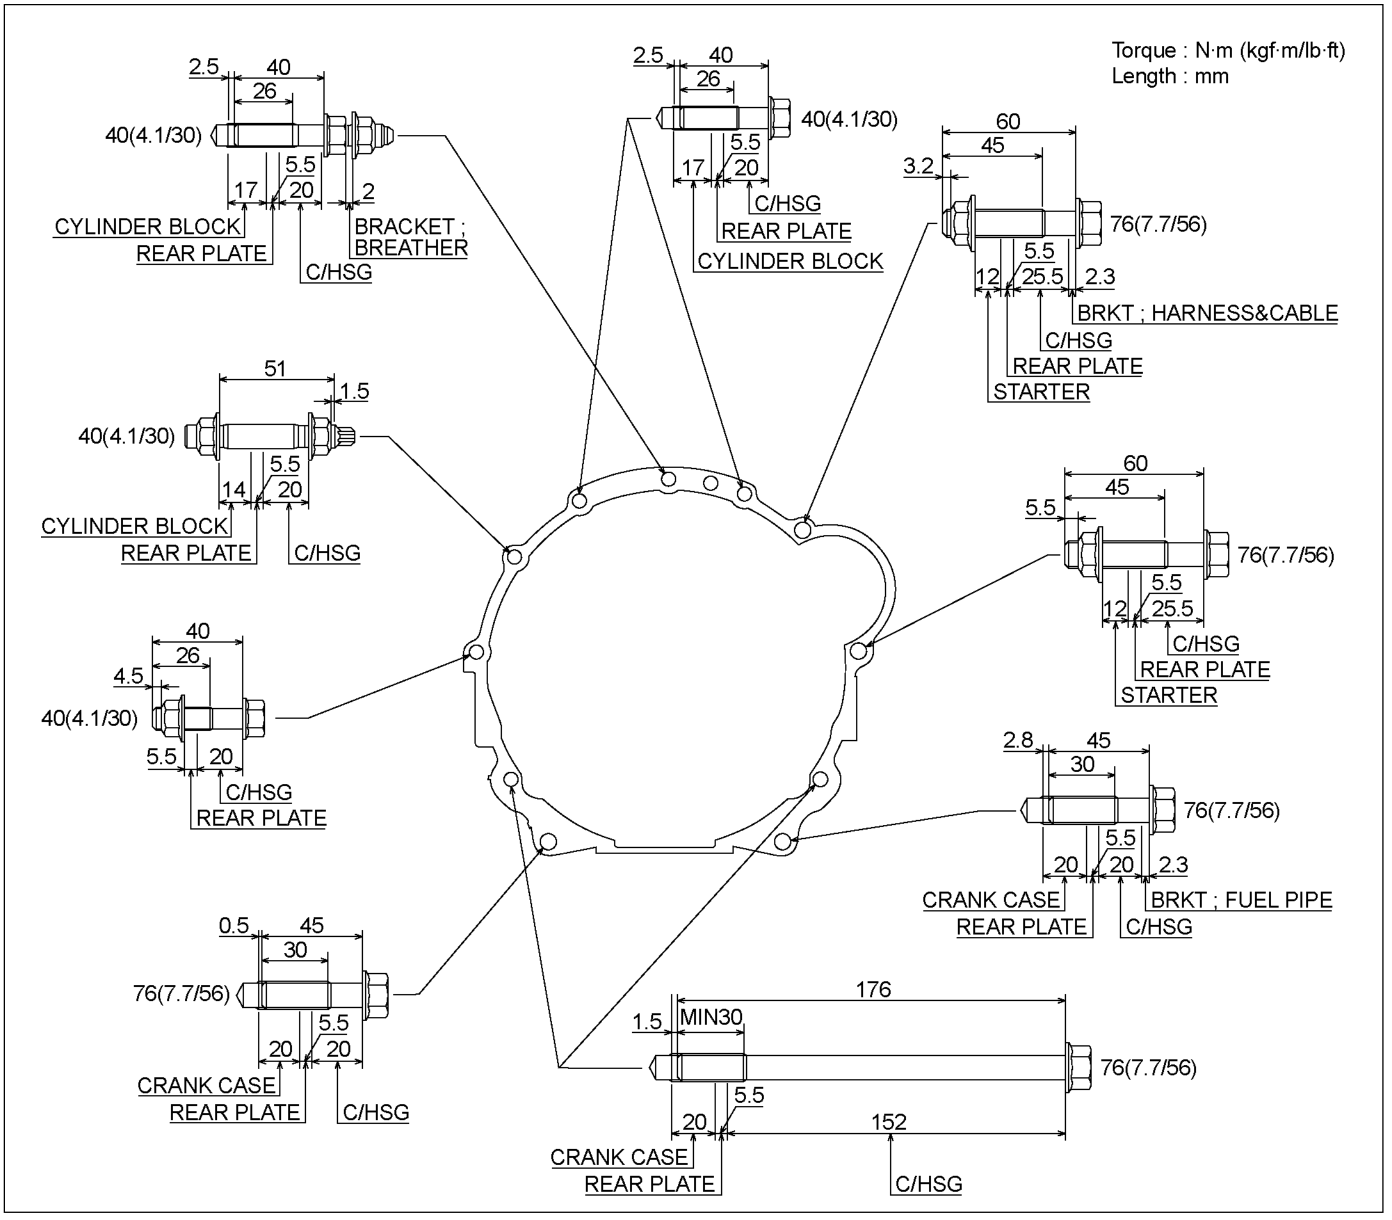
25.Remove the transmission crossmember.

- Remove the transmission mount nuts.
- Remove the transmission crossmember bolts and nuts.

26.Remove the transmission assembly from the vehicle.

Installation

1. Attach the transmission assembly to the engine.
   - Slowly raise transmission jack until front of the transmission assembly is aligned with rear of the engine.
   - Attach the transmission assembly to the engine.
   - Tighten engine transmission bolts as shown in the figure.



RTW77ALF000701

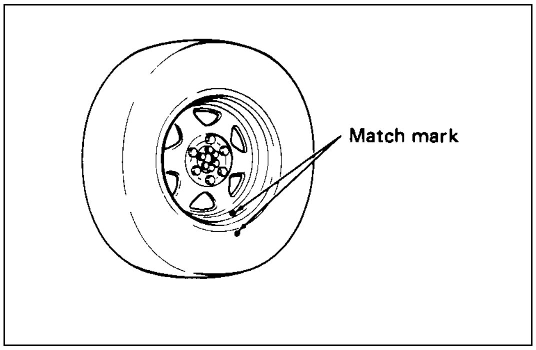
2. Install the transmission crossmember.
   - Install the transmission crossmember bolts and nuts.
   - Install the transmission mount nuts.

Torque: Crossmember ~ Frame

.... **76 N·m (7.8 kgf·m/56 lb·ft)**

Crossmember ~ Transmission mounting

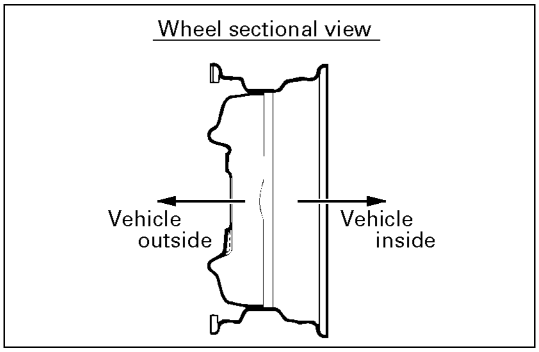
.... **52 N·m (5.3 kgf·m/38 lb·ft)**



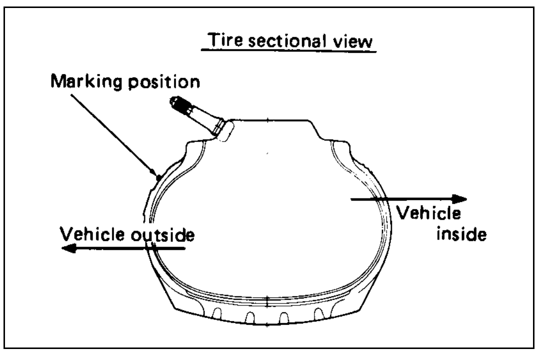
Important Operations

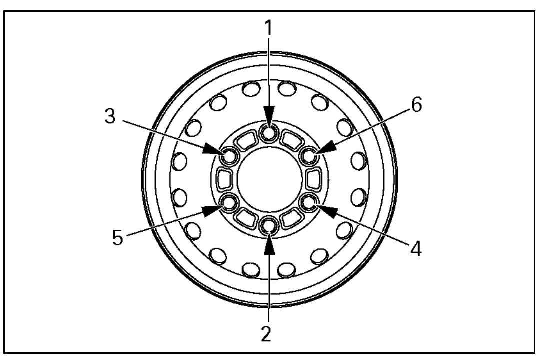
1. Tire Assembly

To assemble, align the match mark (approx. 10mm diameter paint mark) on the wheel with the match mark (approx. 8mm diameter red paint mark) on the tire. If the match mark on the wheel has disappeared, align with air valve instead.



2. Wheel and Tire Assembly



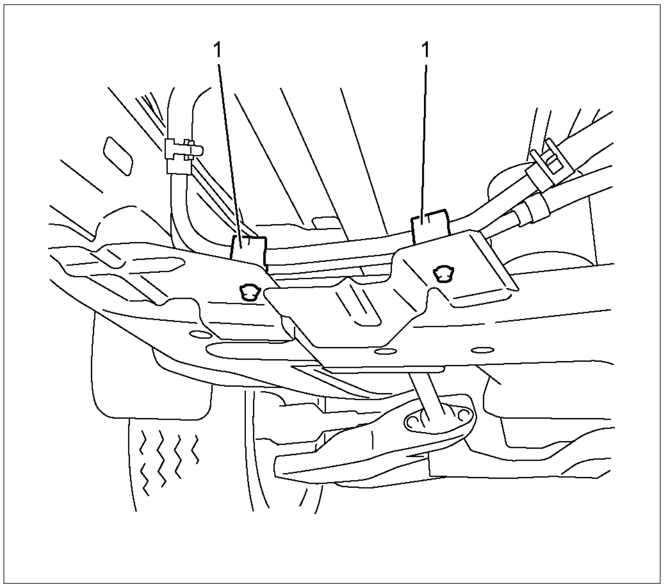


3. Wheel Nut

Tighten wheel nuts in numerical order.

Wheel Nut Torque	N·m (kgf·m/lb·ft)
117.7 ± 9.8 (12 ± 1.0 / 86.8 ± 7.2)	

3. Remove a engine jack.
4. Remove a transmission jack.
5. Connect the two fuel pipe clips (1) on the transmission crossmember left side.



RTW77ASH002701

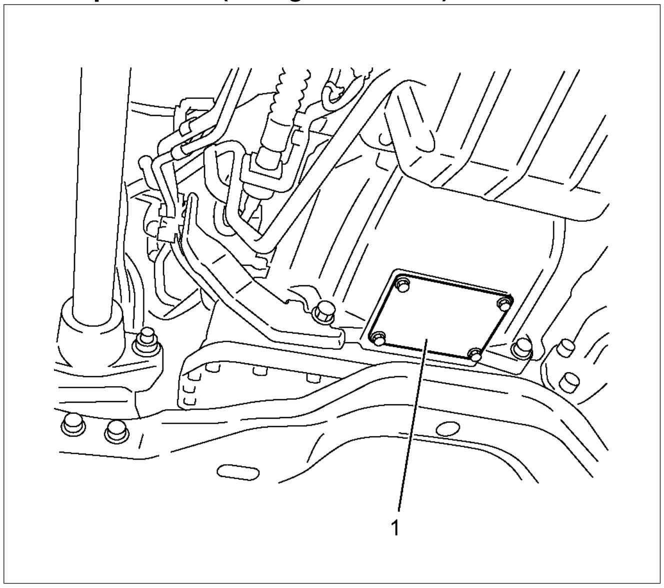
6. Install the torque converter bolts.

Torque: 29 N·m(3.0 kgf·m/22 lb·ft)

NOTE: Do not reuse the torque converter bolts.

7. Install the under cover(1).

Torque: 8 N·m(0.8 kgf·m/69 lb·in)

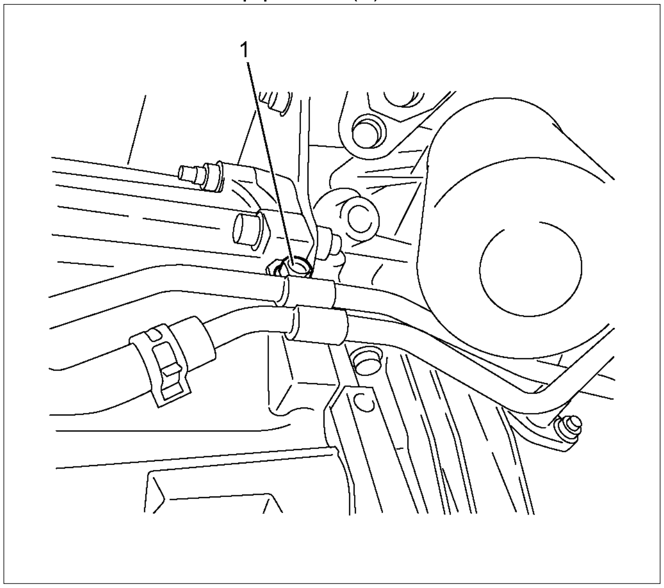


RTW77ASH002601

8. Connect two ATF pipes.

Torque: 44 N·m(4.5 kgf·m/33 lb·ft)

9. Install the ATF pipe bolt (1).



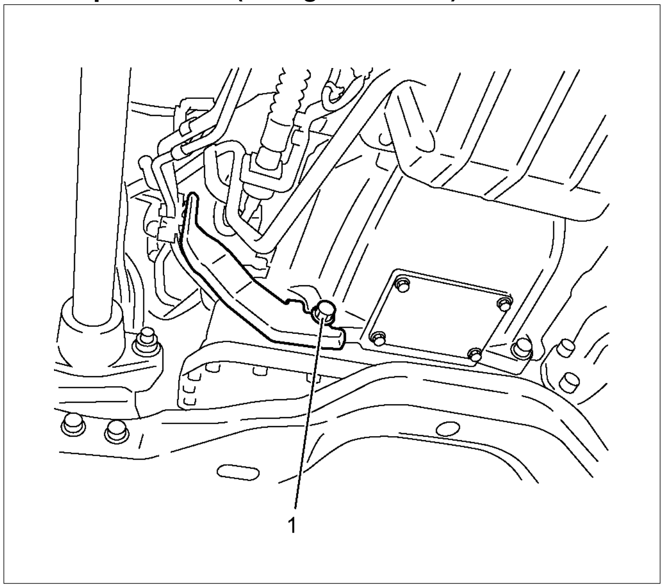
RTW77ASH002501

10. Connect the starter assembly with shift cable bracket.

Torque: 76 N·m(7.7 kgf·m/56 lb·ft)

11. Connect the shift cable bracket on the transmission side.
12. Install the fuel pipe bracket bolt (1) on clutch housing lower left side.

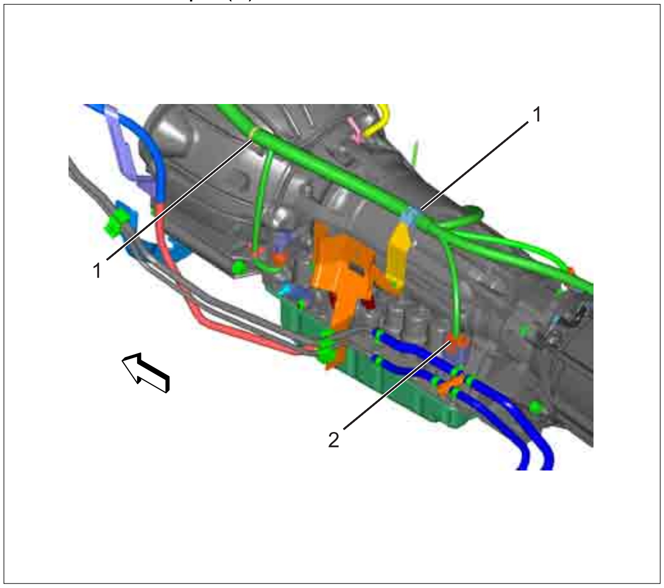
Torque: 76 N·m(7.7 kgf·m/56 lb·ft)



RTW77ASH002401

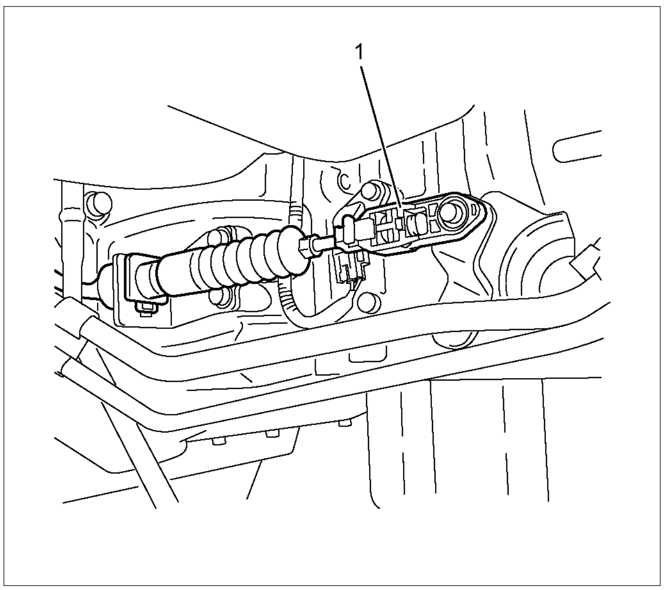
13. Install the oil level gauge and upper guide tube.

14. Connect the transmission harness connector (2) and two clips (1).



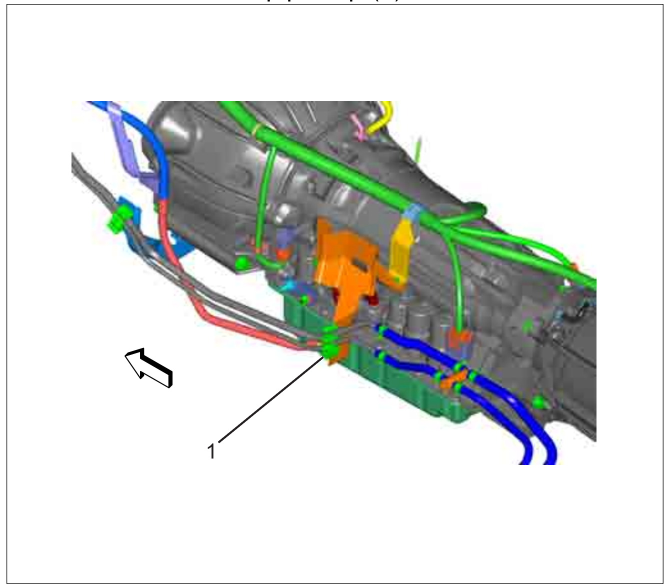
RTW77ASH001401

15. Connect the shift cable (1) to the transmission side.



RTW77ASH002801

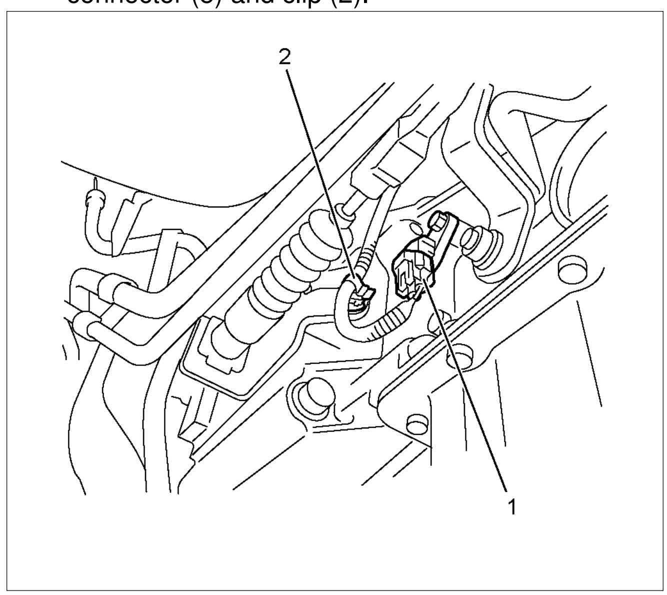
16. Connect the fuel pipe clip (1).



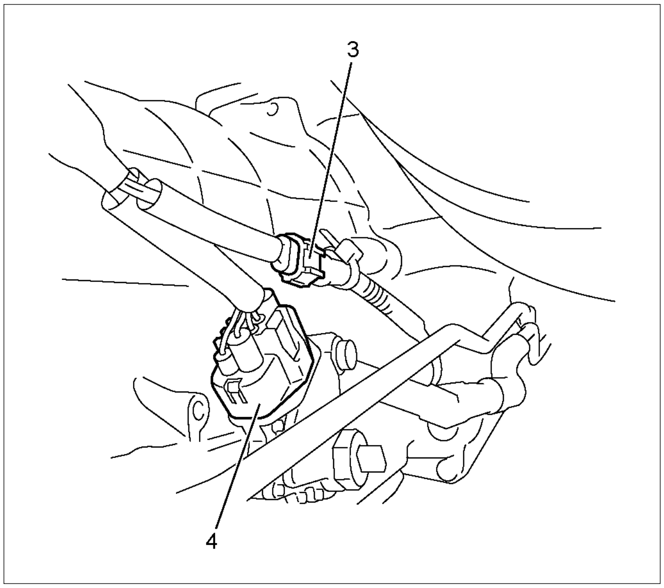
RTW77ASH001301

17. Connect the input sensor harness clip.

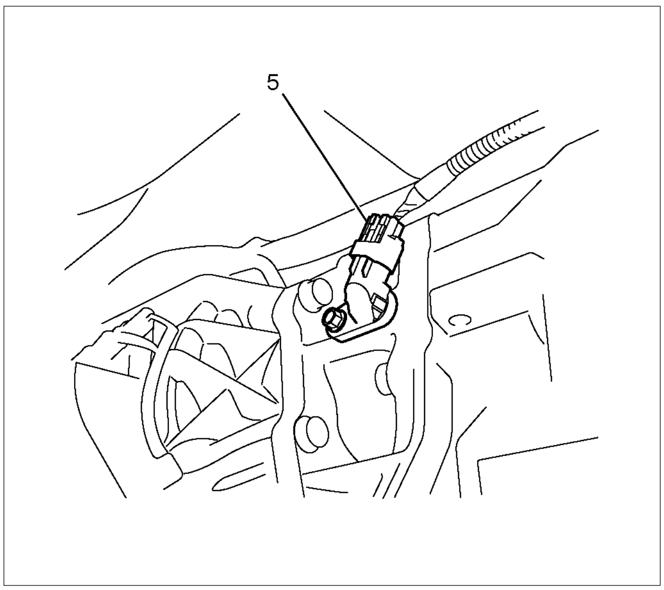
18. Connect the input sensor connector (1), ATF temperature sensor connector (3), neutral start (mode) switch connector (4), output sensor connector (5) and clip (2).



RTW77ASH002101



RTW77ASH002201

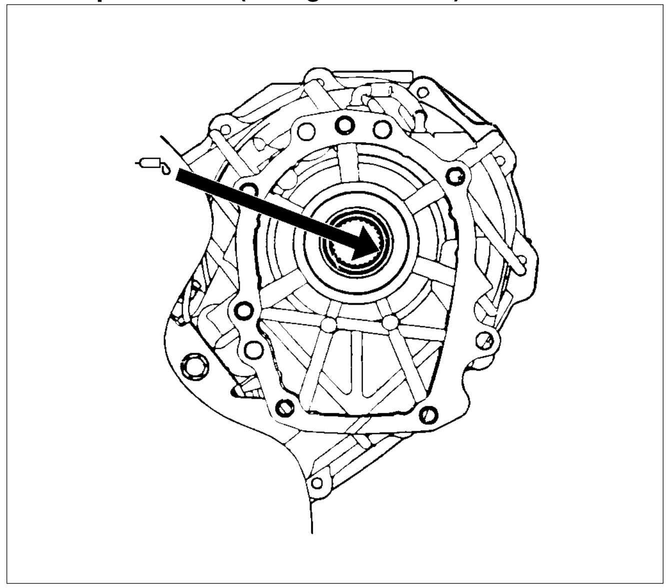


RTW77ASH002301

19.Install the transfer assembly.(4×4 only)

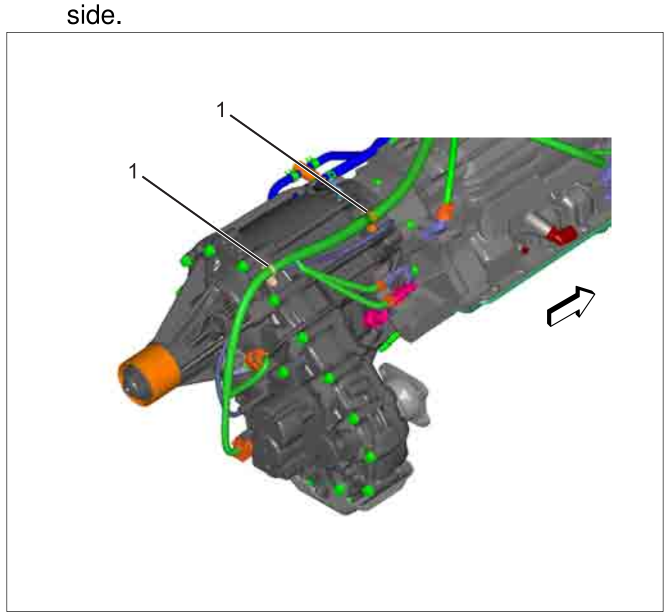
- Apply a thin coat of molybdenum disulfide grease to the input shaft spline.

Torque: 41 N·m(4.2 kgf·m/30 lb·ft)



RTW77ASH001701

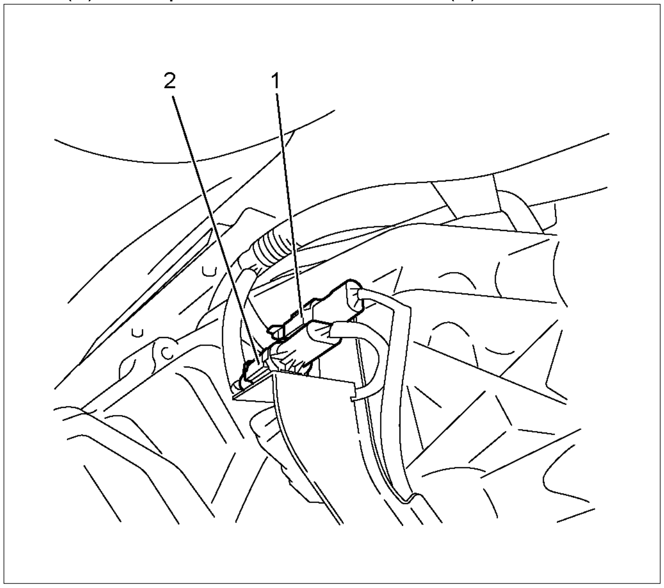
20.Connect two harness clips (1) of the tansfer upper side.



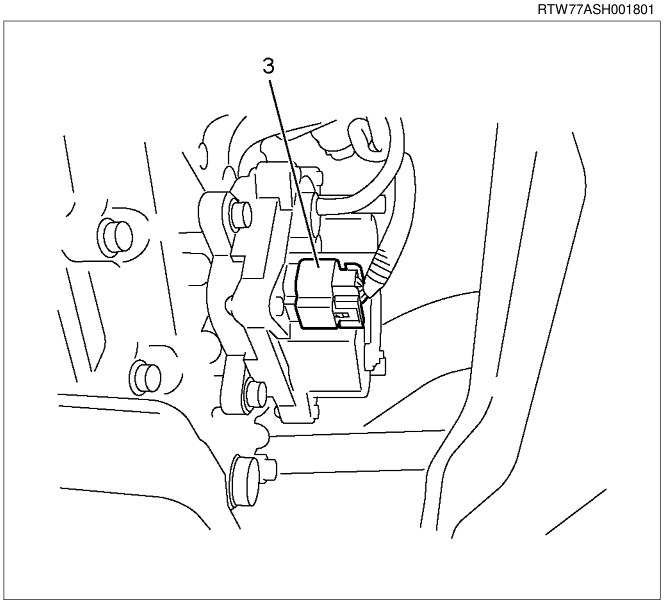
RTW77ASH001601

21.Connect the speed sensor connector.

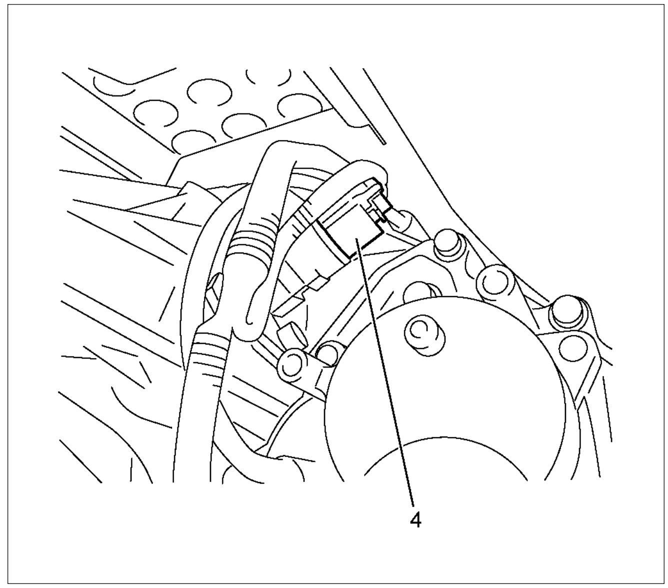
22. Connect the 2WD-4WD switch connector (1), neutral switch connector (2), actuator connector (3) and speed sensor connector (4).



RTW77ASH001801



RTW77ASH001901

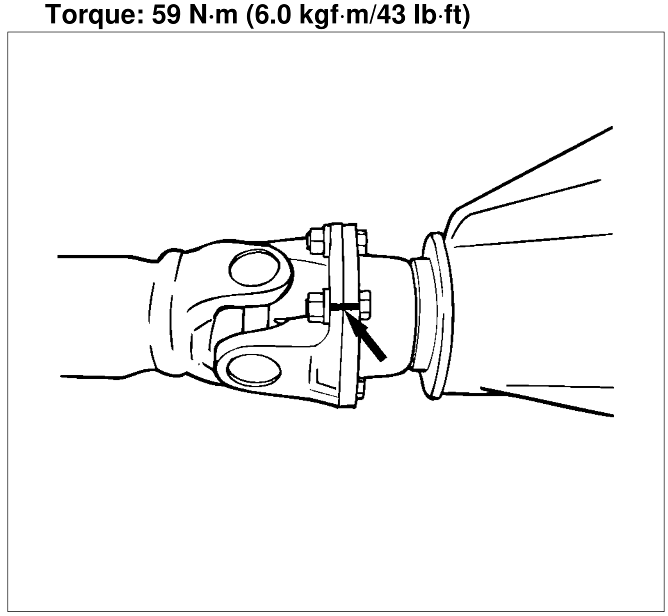


RTW77ASH002001

23. Install the rear propeller shaft.

NOTE: Align alignment marks on the flange.

Torque: 59 N·m (6.0 kgf·m/43 lb·ft)



RTW77BSH000201

24. Install the center bearing on the crossmember.

Torque: 69 N·m (7.0 kgf·m/51 lb·ft)

25. Install the front propeller shaft.(4×4 only)

NOTE: Align alignment marks on the flange.

Torque: 59 N·m (6.0 kgf·m/43 lb·ft)

26. Remove the drain plug from oil pan and drain the fluid.

27. Install the drain plug.

Torque: 19 N·m (1.9 kgf·m/14 lb·ft)

28. Pour the transmission oil.

29. Remove suitable stands.

30. Connect battery ground cable.

Major Components

Disassembly, inspection and reassembly of each component group is indicated in the following chapter. Before reassembly, make sure, again, that all component groups are assembled correctly.

If something wrong is found in a certain component group during assembly, inspect and repair this group immediately.

General Assembly Notes:

1. The automatic transmission is composed of highly precision-finished parts, necessitating careful inspection before assembly because even a small nick could cause fluid leakage or affect performance.
2. Before assembling new clutch discs and brake bands, soak them in automatic transmission fluid for at least thirty minutes.
3. Apply automatic transmission fluid on the sliding or rotating surfaces of parts before assembly.
4. Use petroleum jelly to keep small parts in their palces.
5. Do not use adhesive cements on gaskets and similar parts.
6. When assembling the transmission, be sure to use new gaskets and O-rings.
7. Dry all parts with compressed air - never use shop rags.
8. Be sure to install the thrust bearings and races in the correct direction and position.

Bearing and Race

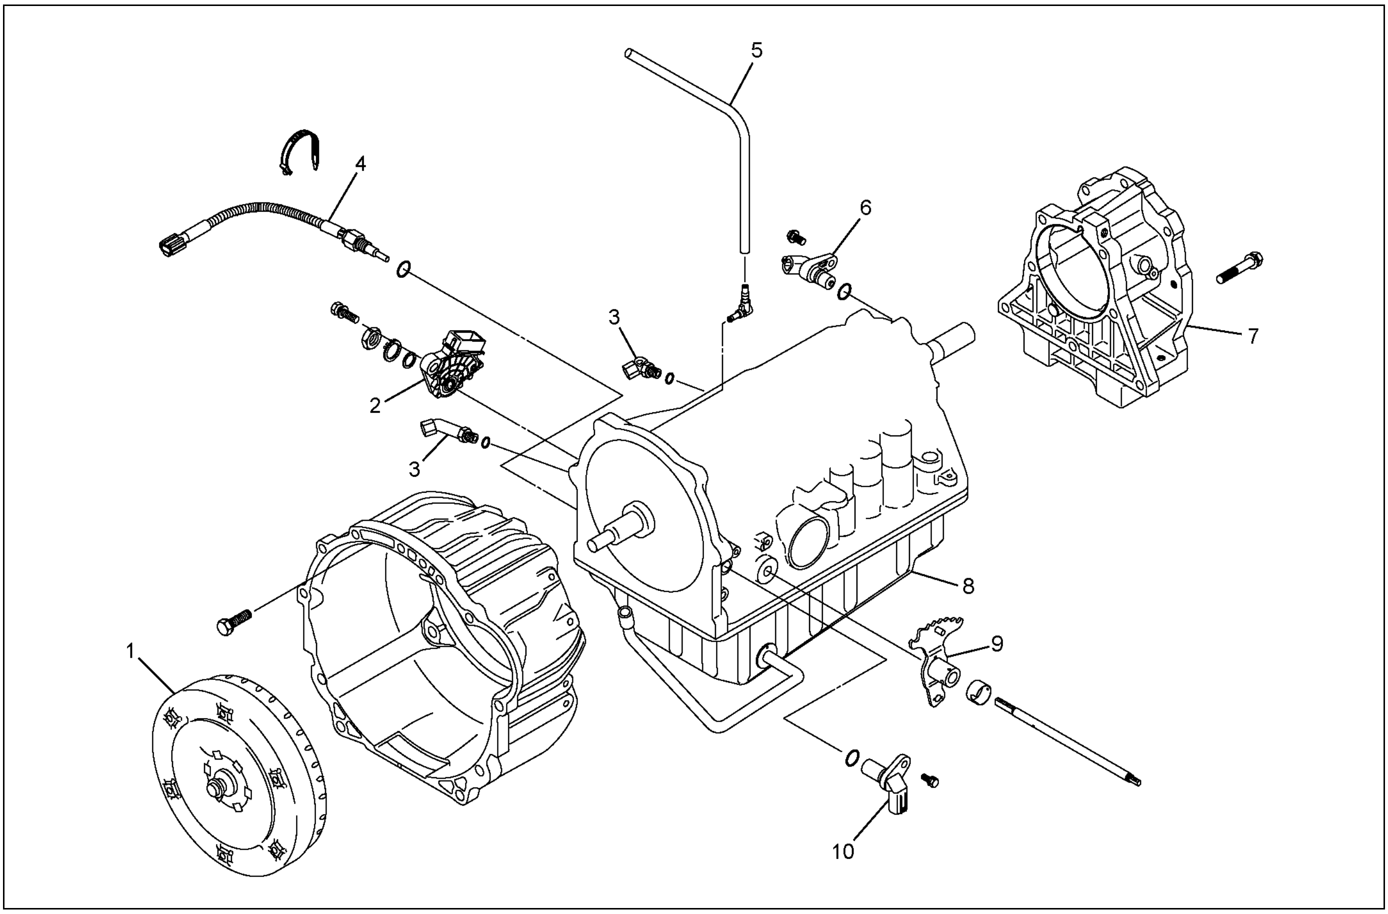
SECTION 7A4

UNIT REPAIR (AW30–40LE)

TABLE OF CONTENTS

Major Components (1)

Major Components (1) and Associated parts



RTW77AMF003801

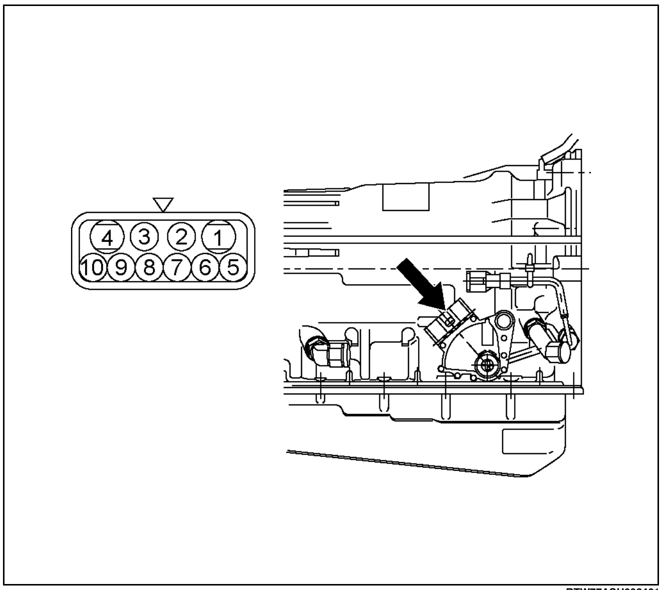
Legend

(1) Torque converter
(2) Neutral start switch
(3) Elbow
(4) Oil temperature sensor
(5) Breather hose
(6) Output revolution sensor
(7) Adapter housing
(8) Transmission assembly
(9) Select lever
(10) Input revolution sensor

Disassembly steps

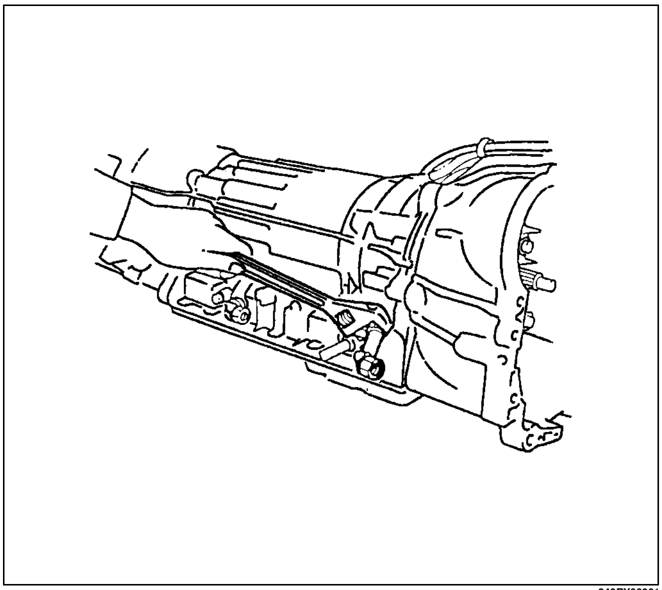
1. Remove the torque converter.
2. Remove the select lever.

3. Remove the neutral start switch (Mode switch).
   - Unstake the lock washer.
   - Remove the nut and bolt, and then remove the neutral start switch.
   - Remove the lock washer.



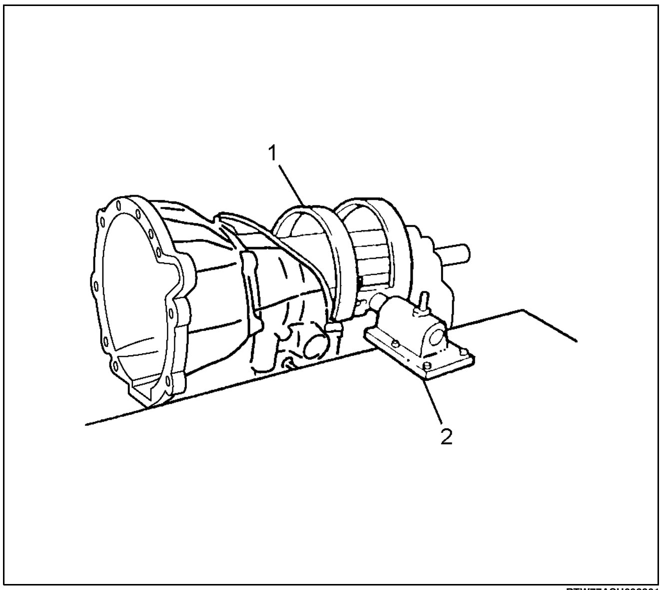
RTW77ASH003401

4. Remove the two elbows from transmission case.



240RY00001

5. Remove the oil temperature sensor.
6. Remove the breather hose.
7. Remove the Input revolution sensor.
8. Remove the output revolution sensor (4×4).
9. Remove the output revolution sensor (4×2).
10. Remove the speedometer sensor, speedometer driven gear and plate (4×2).
11. Remove the extension housing (4×2).
12. Remove the adapter housing (4×4).
13. Remove the transmission assembly.
   - Install special tool to the transmission unit.
     Holding fixture: 5-8840-2152-0 (1)
     Holding fixture base: 5-8840-0003-0 (2)



RTW77ASH003301

Components (1)

Reassembly

1. Install a new gasket and the extension housing (4×2) to the transmission case.

Torque: 36 N·m (3.7 kgf·m/27 lb·ft)

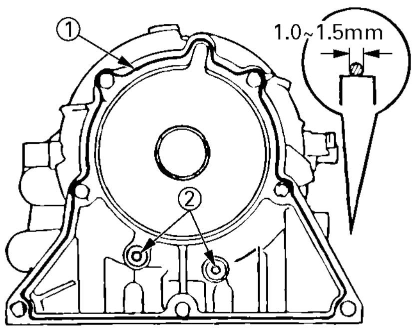
2. Install the speedometer driven gear, plate, and speedometer sensor (4×2).

Torque:

Plate bolt – 15 N·m (1.5 kgf·m/11 lb·ft)

Speedometer sensor – 25 N·m (2.5 kgf·m/18 lb·ft)

3. Install the adapter housing (4×4).
   - Remove any gasket material on the contacting surfaces of the adapter housing and transmission case.



241RY00020

   - Apply liquid gasket (TB1281–B or its equivalent) (1) and install the apply gaskets (2) to the adapter housing as shown in the figure.
   - Install the adapter housing to the transmission case.

Torque: 36 N·m (3.7 kgf·m/27 lb·ft)

4. Install the neutral start switch.
   - Using the transmission select lever, fully turn the manual valve lever shaft back and return two notches.
     It is now in neutral.
   - Insert the neutral start switch onto the manual valve lever shaft and temporarily tighten the adjusting bolt.
   - Install the lock washer and nut.

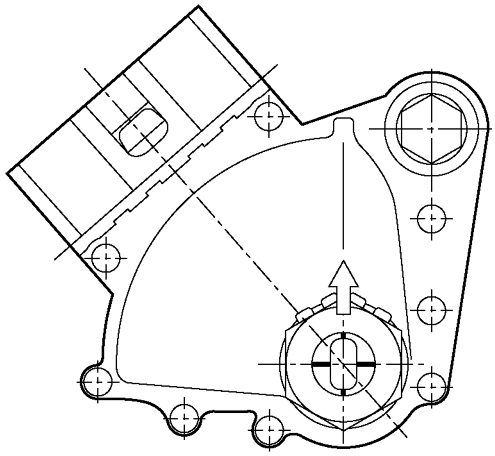
Torque: 7 N·m (0.7 kgf·m/61 lb·in)

   - Align the neutral standard line and the switch groove and tighten the adjusting bolt.

Torque: 13 N·m (1.3 kgf·m/113 lb·in)

   - Bend the tabs of the lock washer.

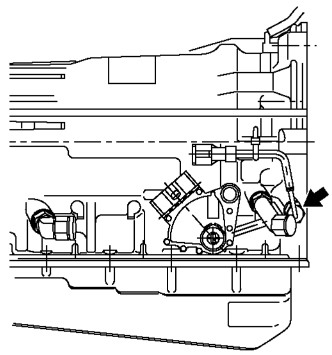
NOTE: Bend at least two of the lock washer tabs.



RUW17ASH013601

5. Install the oil temperature sensor to the transmission case.

Torque: 15 N·m (1.5 kgf·m/11 lb·ft)

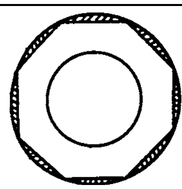


RTW77ASH003501

TROUBLESHOOTING

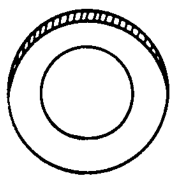
Typical examples of abnormal tire tread wear and major causes :

CAUTION:
Similar wear patterns can be caused by worn suspension parts, misalignment of wheels and tires, and other suspension related problems.



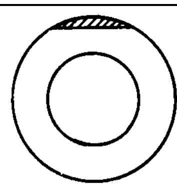
Spotty wear - wear localized on shoulder section. In extreme cases, the tire becomes polygonal in shape.

- Tire or wheel out of round or distorted.
- Hub or knuckle out of round or distorted.
- Play in hub bearings or ball joints.
- Rotating parts out of balance.



Tread wear one-sided.

- Rotating parts out of balance.
- Tire or wheel out of round.
- Hub or knuckle out of round or distorted.

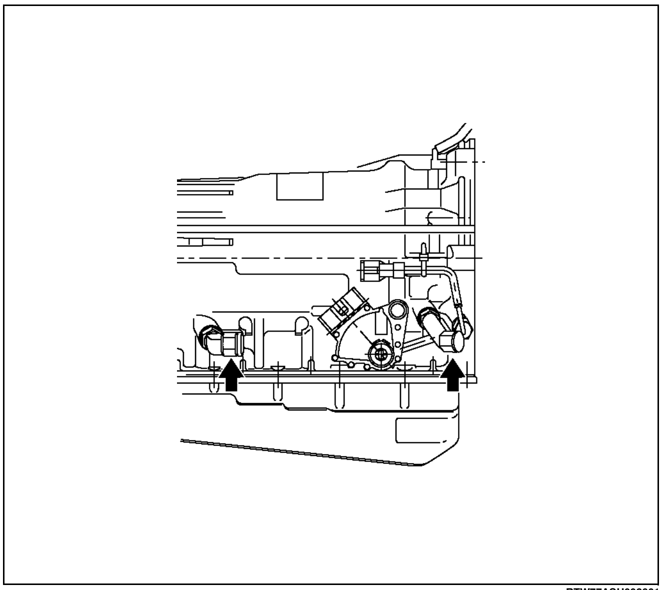


Localized tread wear.

- Once spotty wear develops in tread due to hard braking or abrupt starting, localized wear tends to be accelerated.

6. Install the elbow.
   - Coat new O-rings with ATF, install them to the two elbows.
   - Install the two elbows as shown in the figure.

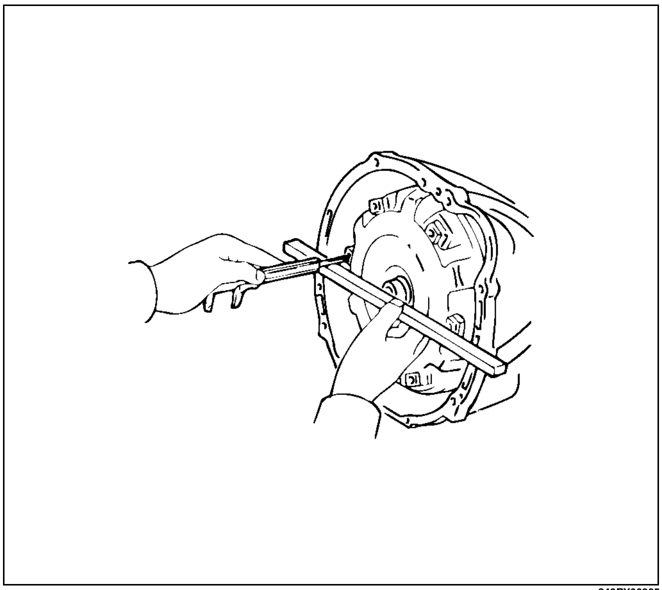
Torque: 29 N·m (3.0 kgf·m/22 lb·ft)



RTW77ASH003601

7. Install the select lever.
8. Install the output revolution sensor (4×2).
9. Install the output revolution sensor (4×4).
10. Install the input revolution sensor.
11. Install the breather hose.
12. Install the torque converter.
    Using calipers and a straightedge, measure the distance from the installed surface of the transmission housing to top of the torque converter nut.

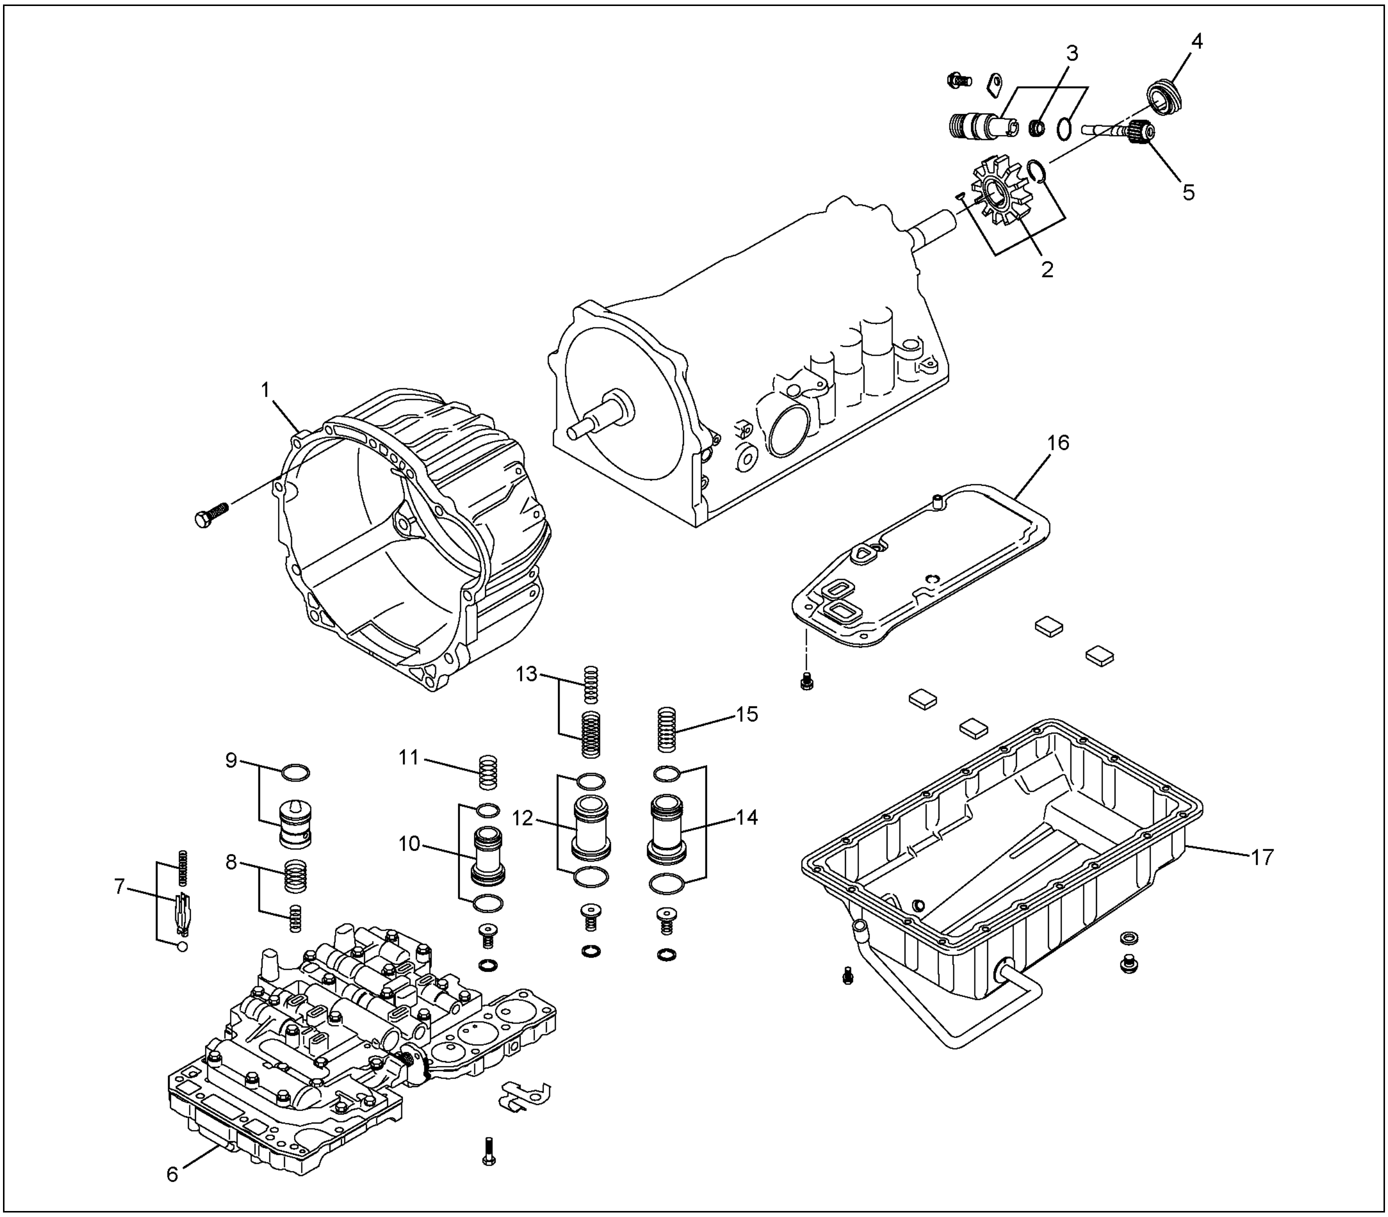
Correct distance: 13.5 mm (0.53 in)



240RY00005

Major Components (2)

Major Componets (2) and Associated Parts



Legend

(1) Converter housing
(2) Snap ring, rotor, key

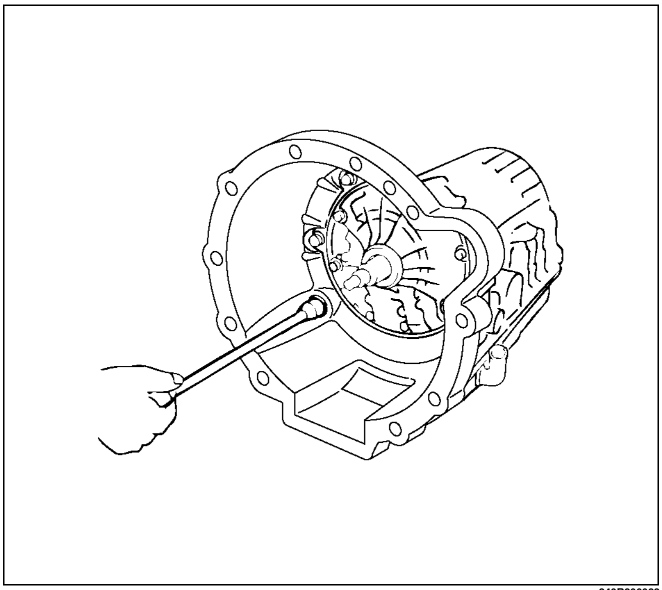
(12) Accumulator piston (C–2), O-ring
(13) Spring
(14) Accumulator piston (B–2), O-ring
(15) Spring
(16) Oil strainer assembly
(17) Oil pan

Disassembly

1. Remove the six bolts and remove the converter housing.

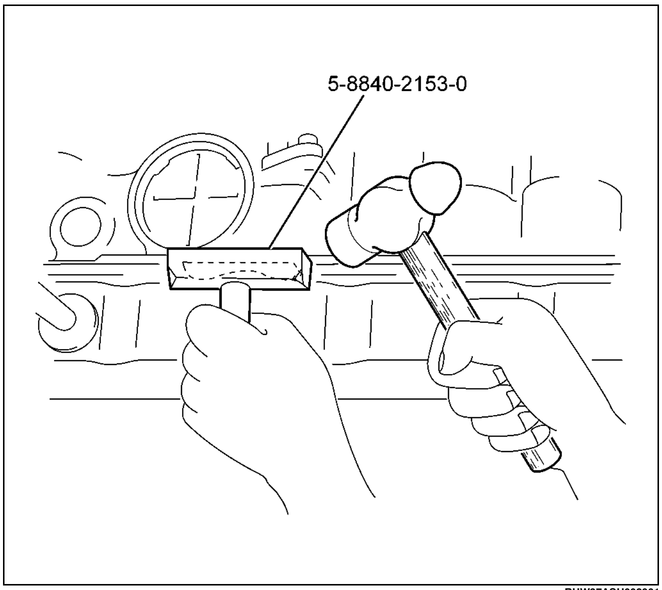


240R200022

2. Remove the oil pan.

NOTE: Do not turn over the transmission as this will contaminate the valve body with foreign materials in the bottom of the oil pan.

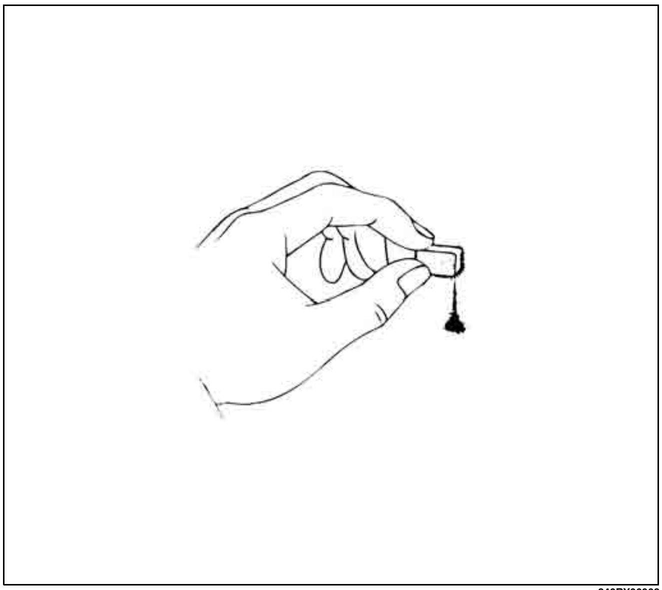
- Remove the nineteen bolts.
- Remove oil pan by lifting the transmission case. Oil pan seal cutter: 5-8840-2153-0



RUW37ASH002901

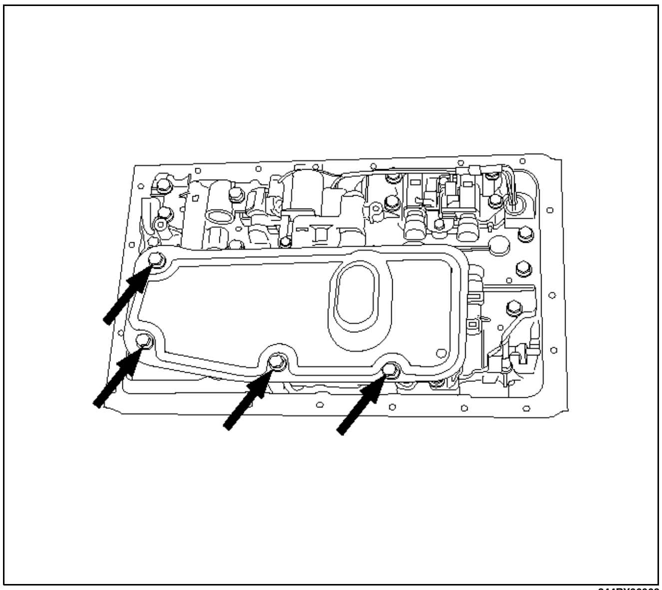
3. Examine particles in oil pan.

- Remove the magnet and use it to collect any steel chips.
- Look carefully at the chips and particles in the oil pan and on the magnet to anticipate what type of wear you will find in the transmission:
  Steel (magnetic) ...... bearing, gear and clutch plate wear
  Brass (non-magnetic)... bushing wear



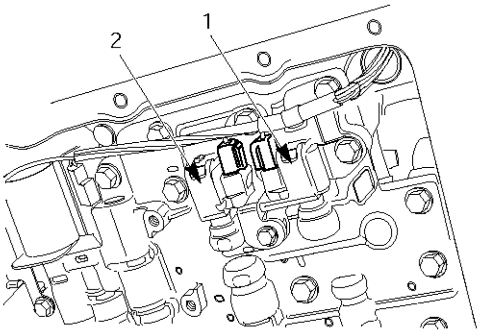
240RY00008

4. Remove the oil strainer assembly.
   Remove four bolts holding the oil strainer.

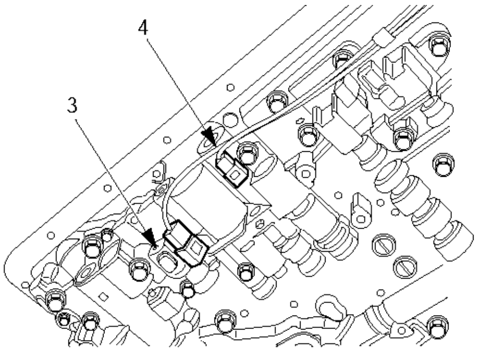


244RY00003

5. Remove the valve body.
   - Disconnect the connectors from the solenoid S1 (1), S2 (2), lock-up solenoid (3) and pressure control solenoid (4).

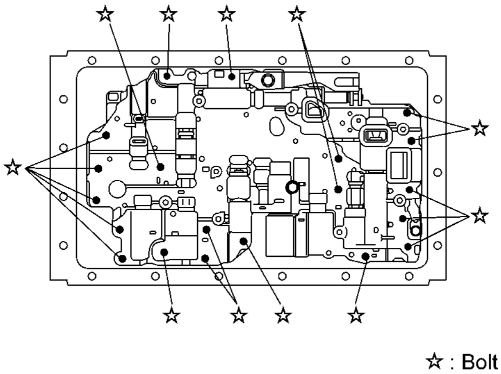


249RY00011



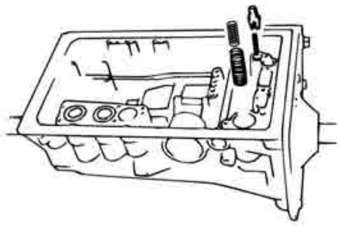
249RY00012

   - Remove the twenty bolts from valve body.



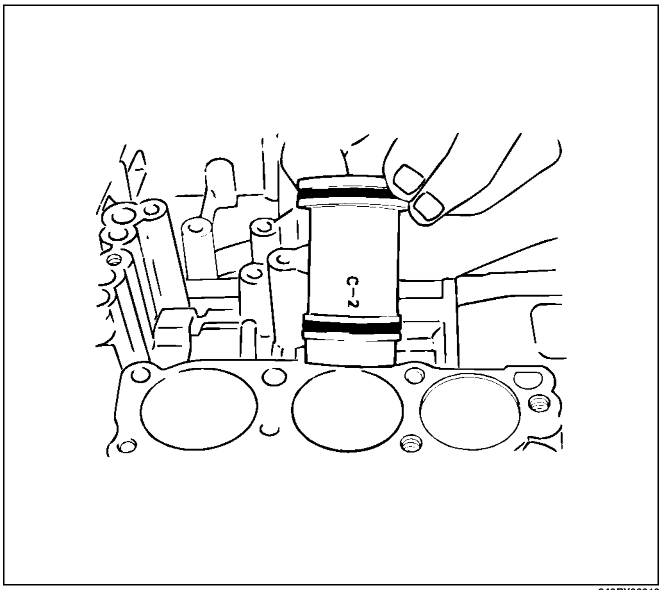
244R200078

6. Remove the check valve and spring.
7. Remove two springs from C–0 accumulator piston.



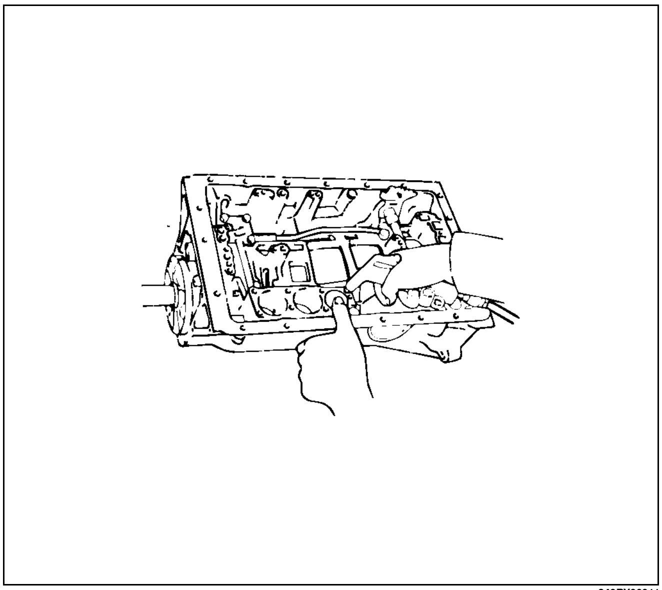
240RY00028

8. Remove the accumulator piston (B–2).
9. Remove the accumulator piston (C–2).
   - Remove accumulator pistons and springs from transmission case.



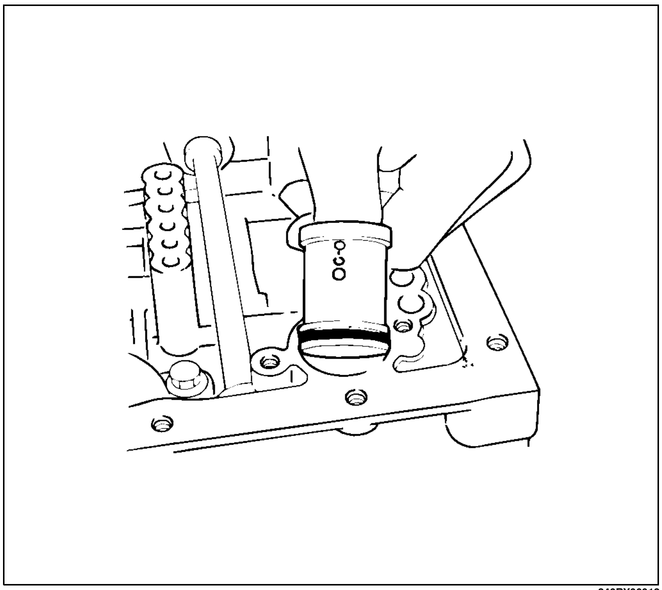
240RY00010

10. Applying compressed air to the oil hole, remove the B–0 accumulator piston and spring.



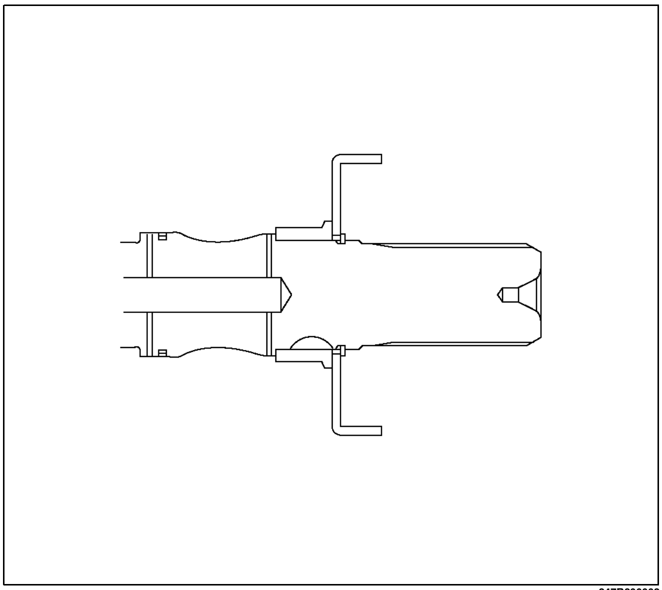
240RY00011

11. Remove the C–0 accumulator piston.



240RY00012

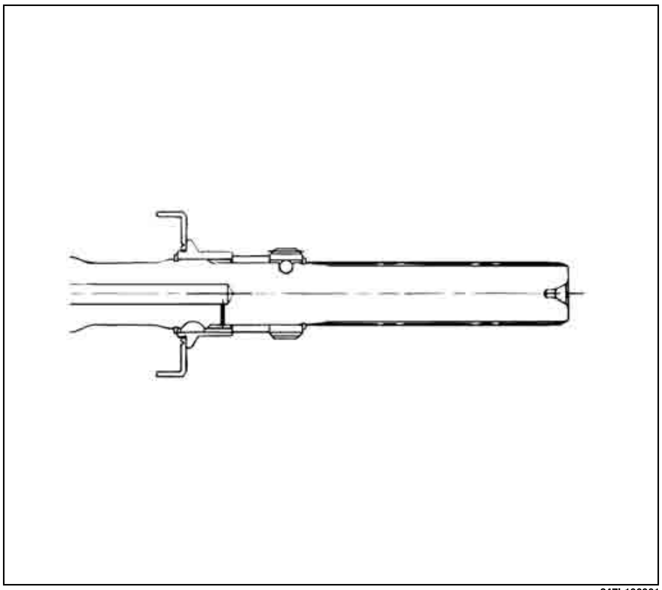
12. Remove the second brake drum gasket.
13. Remove the solenoid wiring.
    - Turn over transmission, remove the solenoid wiring stopper plate from the case.
    - Pull the wiring out of the transmission case.
14. Remove the snap ring, rotor and key (4×4).
    - Remove the snap ring from the output shaft.
    - Remove the rotor and key.



247R200002

15. Remove the snap ring, speedometer sensor drive gear and ball (4×2).
    - Remove the snap ring from the output shaft.
    - Remove the speedometer sensor drive gear, and ball.

16. Remove the spacer, rotor, key and snap ring (4×2).
    - Remove the spacer, rotor and key.
    - Remove the snap ring from the output shaft.



247L100001

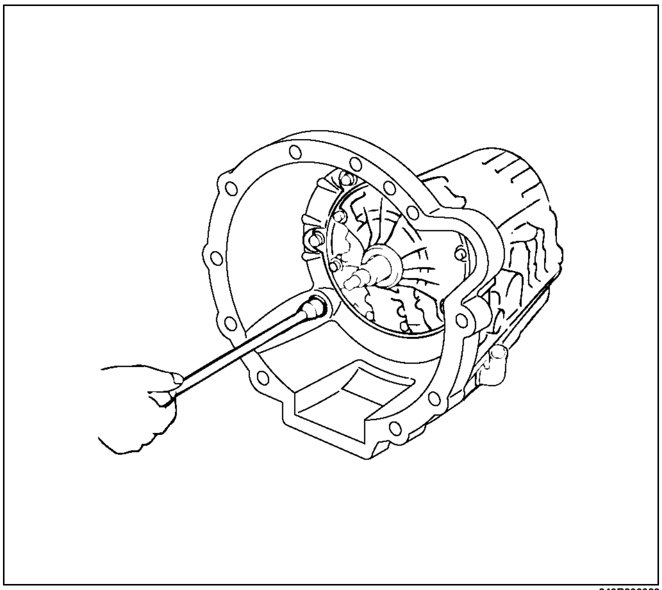
Reassembly

1. Install the converter housing.

Torque:

M10 – 34 N·m (3.5 kgf·m/25 lb·ft)

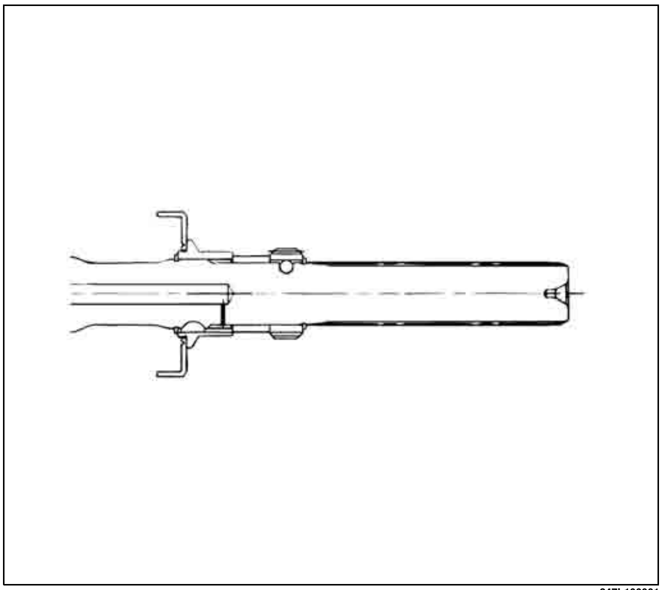
M12 – 57 N·m (5.8 kgf·m/42 lb·ft)



240R200022

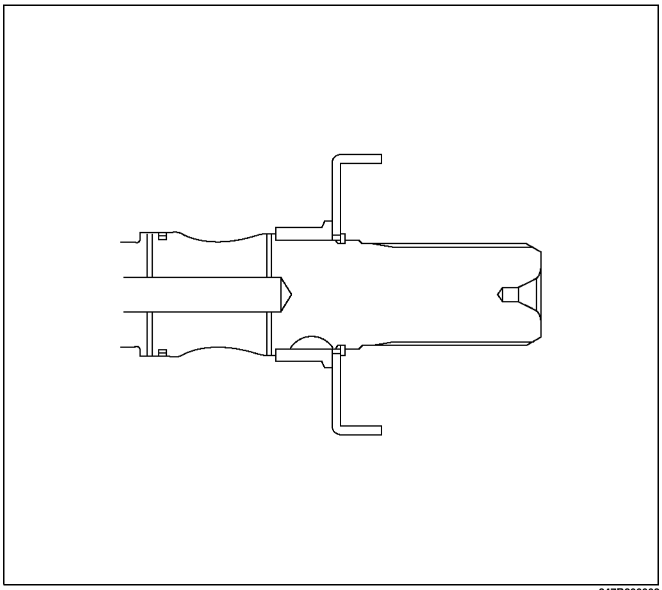
2. Install the snap ring, key and rotor (4×2).
    - Install the snap ring to the output shaft.
    - Install the key and rotor.

3. Install the spacer, ball, speedometer sensor drive gear and snap ring (4×2).
    - Install the spacer, ball and speedometer sensor drive gear.
    - Install the snap ring to the output shaft.



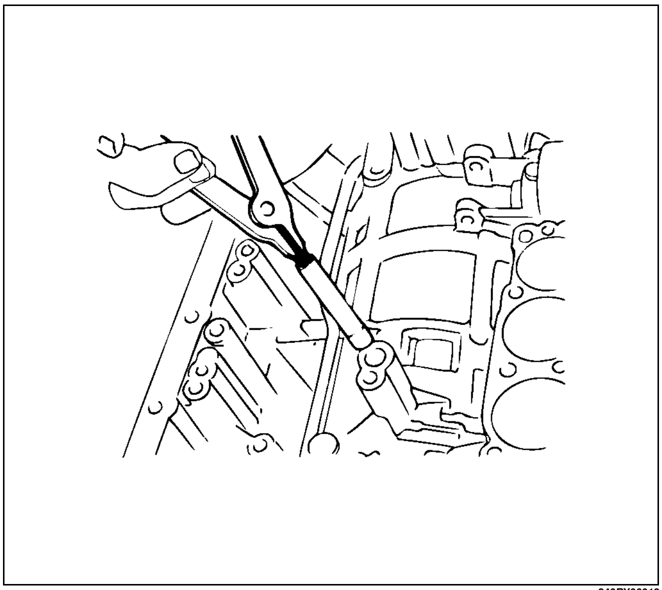
247L100001

4. Install the key, rotor and snap ring (4×4).
    - Install the key and rotor.
    - Install the snap ring to the output shaft.



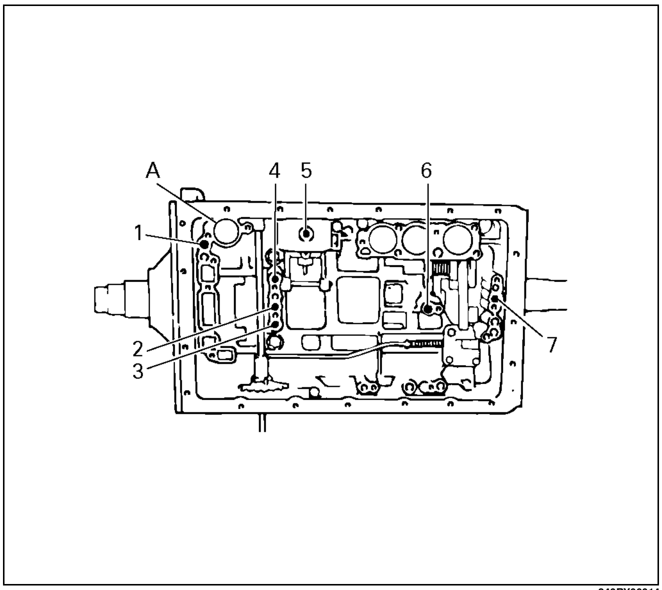
247R200002

5. Install the second brake drum gasket.
   - Install a new second brake drum gasket to the transmission case.



240RY00013

6. Individual piston operation inspection.
   Check for the sound of operation while injecting compressed air into the oil hole indicated in the figure.



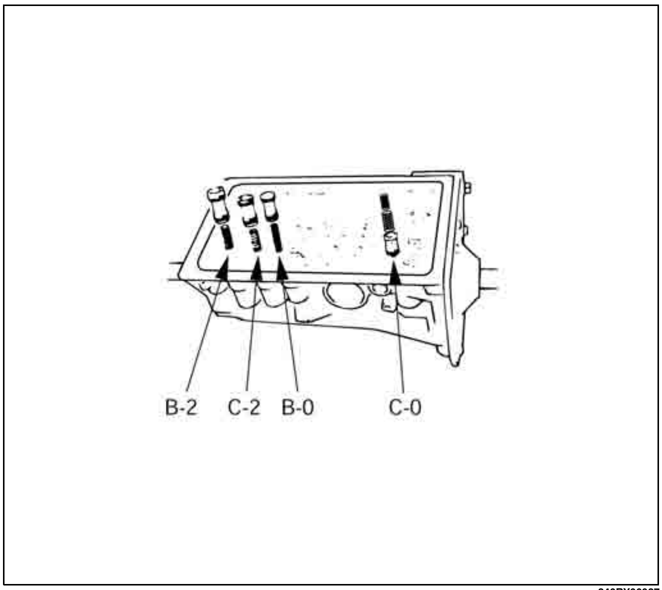
240RY00014

Legend

(1) OD direct clutch
(2) Direct clutch
(3) Forward clutch
(4) OD brake
(5) Second coast brake
(6) Second brake
(7) First and reverse brake
(A) C–0 Accumulator piston hole

NOTE: When inspecting the direct clutch, check with the C–0 accumulator piston hole closed. If there is no noise, disassemble and check the condition of the parts.

7. Install the accumulator pistons.
   - Coat the O–ring with ATF and install it to the piston.
     Install the three springs and four accumulator pistons to the bore as shown in th figure.

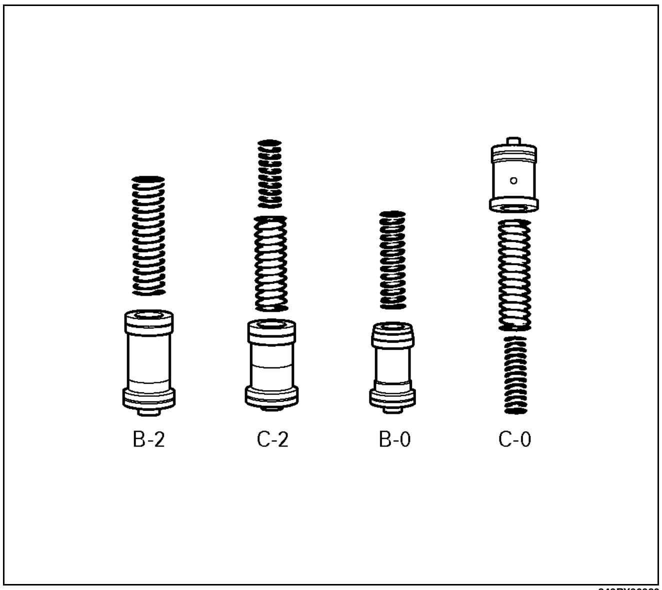


240RY00027

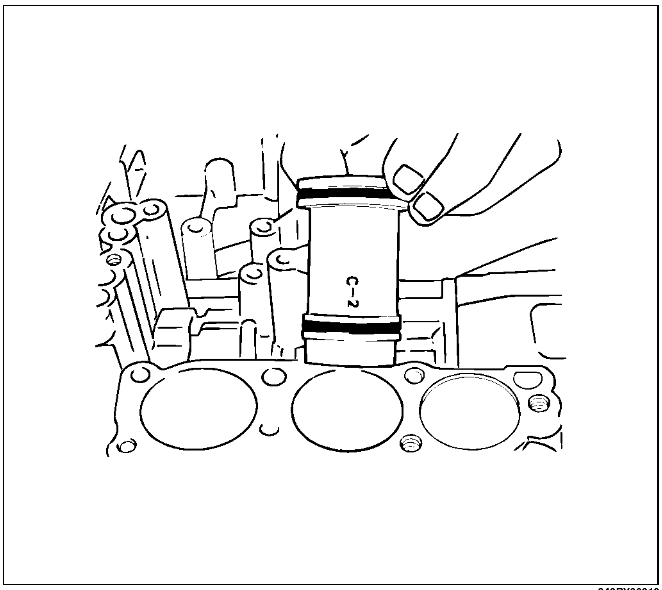
Piston	Outer diameter	Height
B–2	36.8 mm (1.449 in)	62.5 mm (2.461 in)
C–2	36.8 mm (1.449 in)	56.6 mm (2.228 in)
B–0	31.8 mm (1.252 in)	52.0 mm (2.047 in)
C–0	29.8 mm (1.173 in)	44.0 mm (1.732 in)

mm (in)

Spring	Free length	Outer diameter	Color
B–2	75.8 (2.984)	20.1 (0.791)	PURPLE
C–2 (Outer)	64.0 (2.520)	20.3 (0.799)	WHITE& PINK
C–2 (Inner)	42.1 (1.657)	14.7 (0.579)	PINK
B–0	62.0 (2.441)	16.0 (0.630)	GREEN
C–0 (Outer)	74.6 (2.937)	20.9 (0.823)	ORANGE
C–0 (Inner)	46.0 (1.811)	14.0 (0.551)	YELLOW

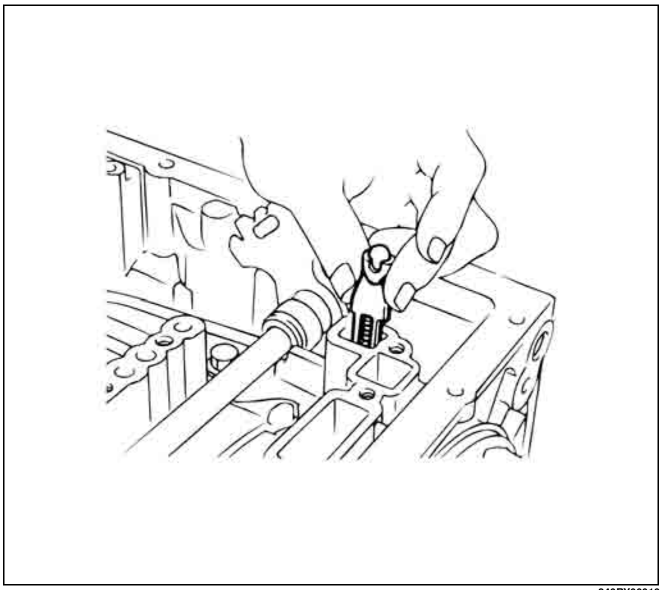


240RY00029



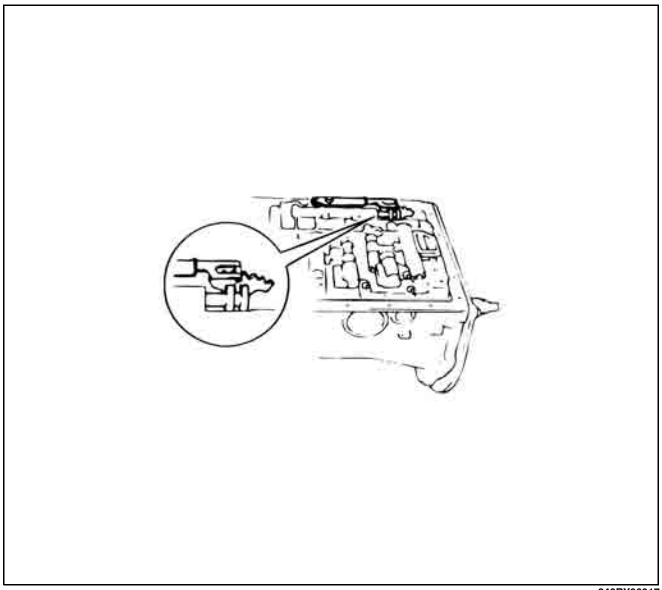
240RY00010

8. Install new check valve and spring.



240RY00016

9. Install the valve body.
   - Align the groove of the manual valve to the pin of the lever.

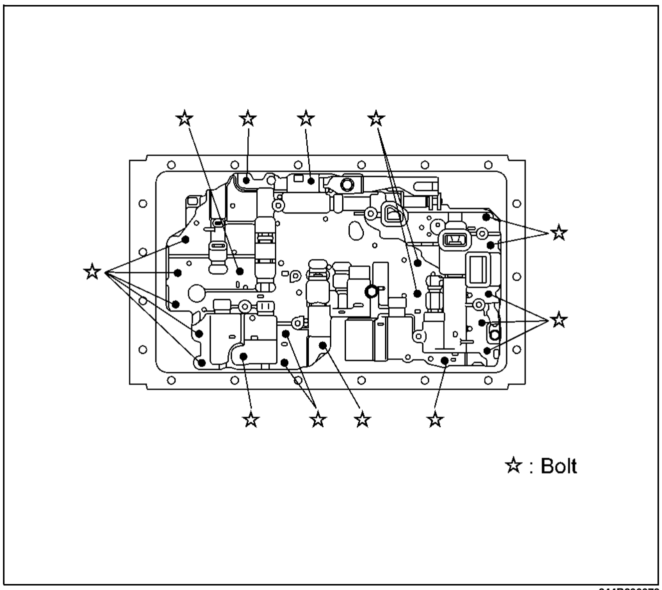


240RY00017

   - Install the twenty bolts.

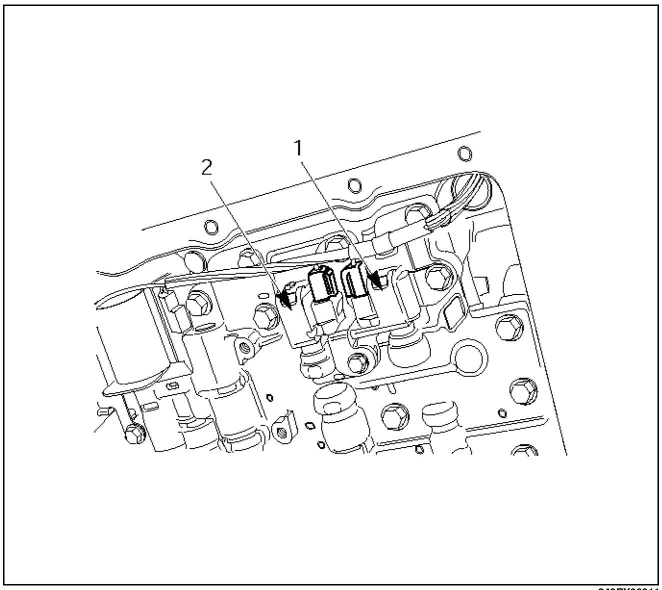
NOTE: Each bolt length (mm) is indicated in the figure.

Torque: 10 N·m (1.0 kgf·m/87 lb·in)

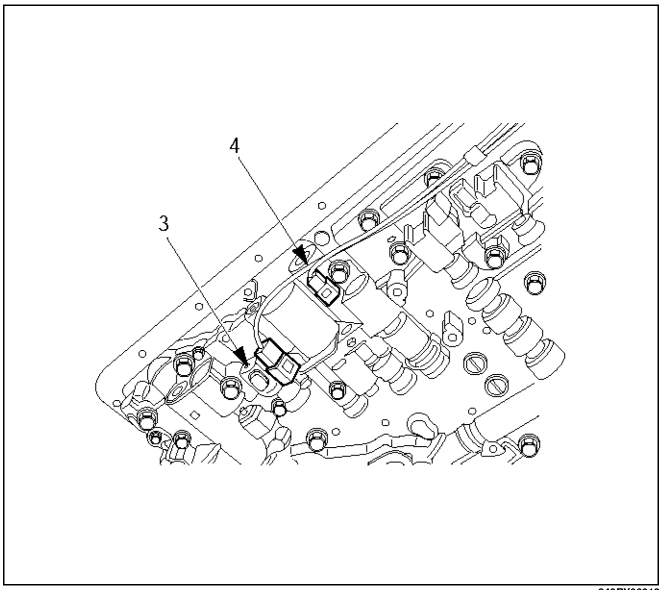


244R200078

10. Install the solenoid wiring.
    Coat a new O-ring with ATF, and install it to the solenoid wiring.
    Insert the solenoid wiring to the case and install the stopper plate.
    Connect the connectors to the solenoid S1 (1), S2 (2), lock-up solenoid (3), and pressure control solenoid (4).

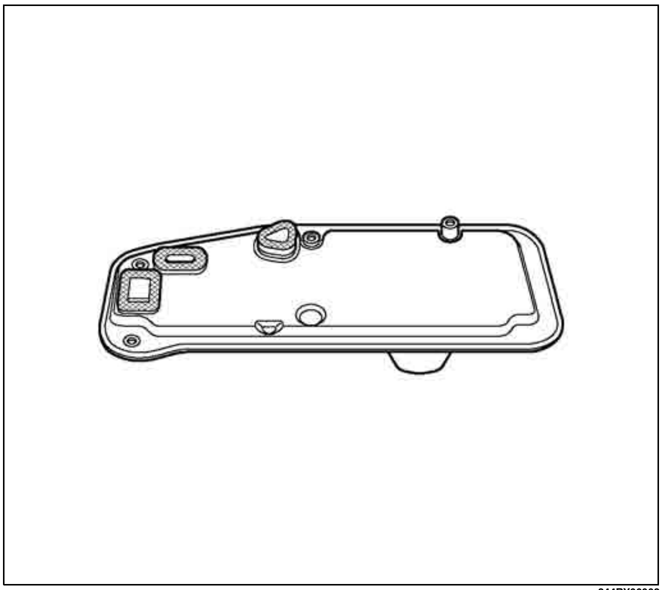


249RY00011



249RY00012

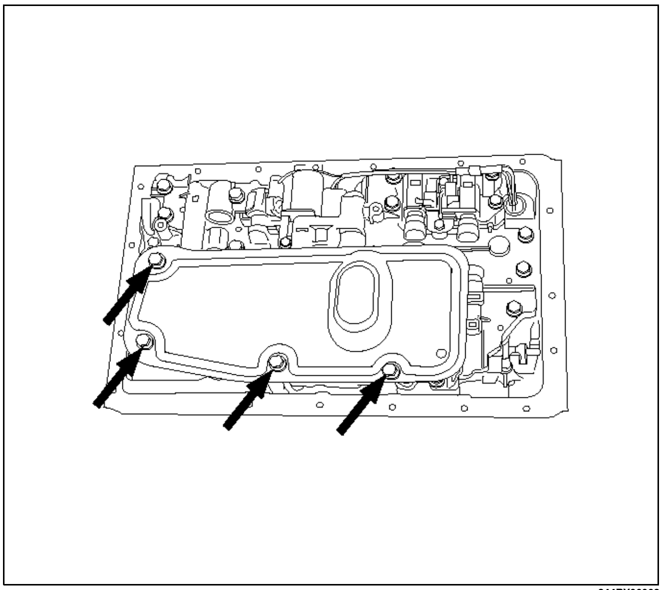
11. Install a new oil strainer assembly with gaskets.



244RY00002

- Install the oil strainer with the gaskets to the valve body. Tighten the four bolts.

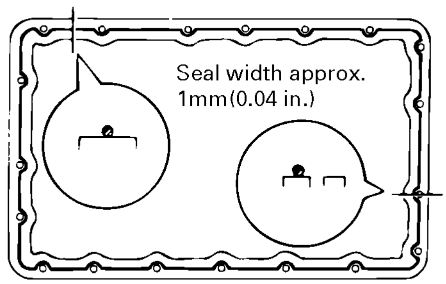
Torque: 10 N·m (1.0 kgf·m/87 lb·in)



244RY00003

12. Install the oil pan.
    Install two magnets in oil pan.
    Remove any gasket material and be careful not to drop oil on the contacting surfaces of the transmission case and oil pan.
    Apply liquid gasket (TB1281 or its equivalent) to the oil pan as shown in the figure.

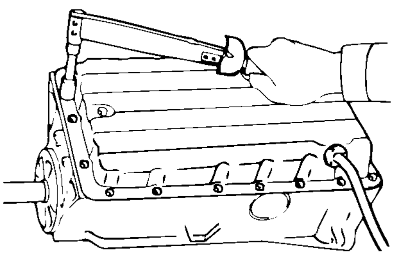
NOTE: Install the oil pan as soon as the seal gasket is applied.



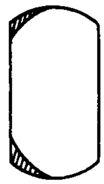
240RY00019

- Install and tighten the nineteen bolts.

Torque: 7.4 N·m (0.75 kgf·m/65 lb·in)



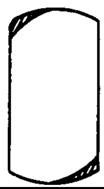
240RY00020



Shoulder wear (generally wear develops on outer shoulder).

Camber or toe-in incorrect.

Shoulder wear caused by repeated hard-cornering.



Wear on shoulders at points opposed to each other.

Tire or wheel out of round or distorted.

Play in bearings or ball joint.

Premature wear on shoulders.

Flexing of tire excessive due to under-inflation.

One-sided feather edging.

Wear caused by repeated hard-cornering.

Camber or toe-in incorrect.

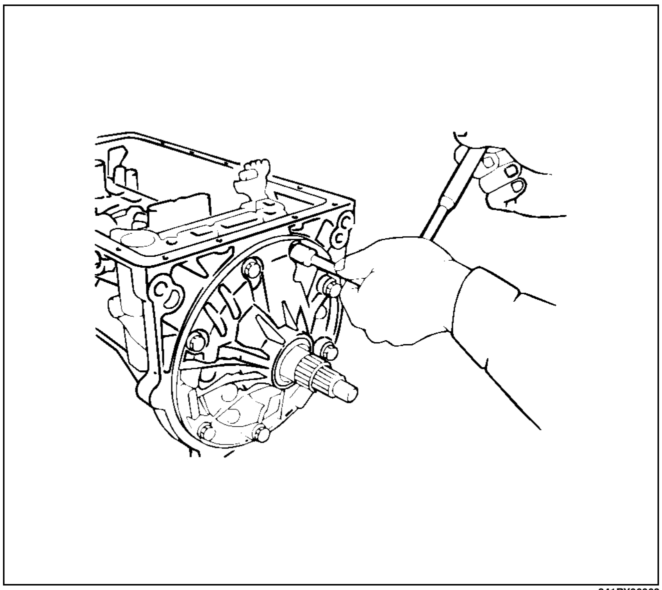
(27) Bearing

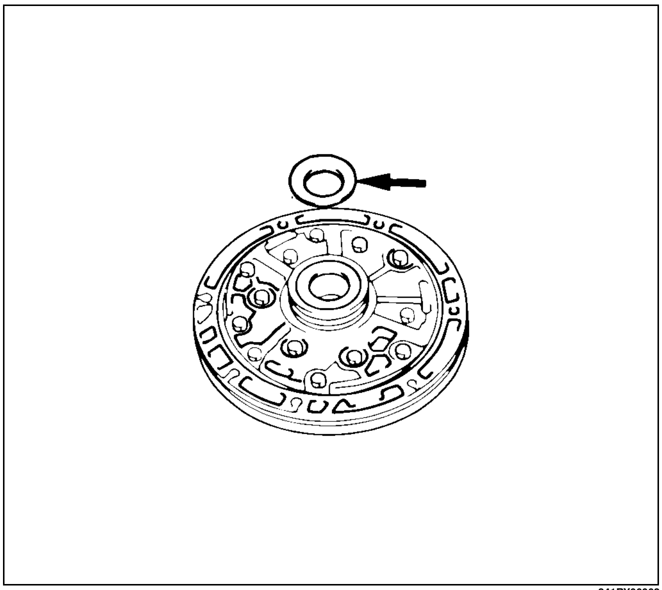
Disassembly

1. Remove seven bolts fixing the oil pump to the transmission case.
   Remove the oil pump.



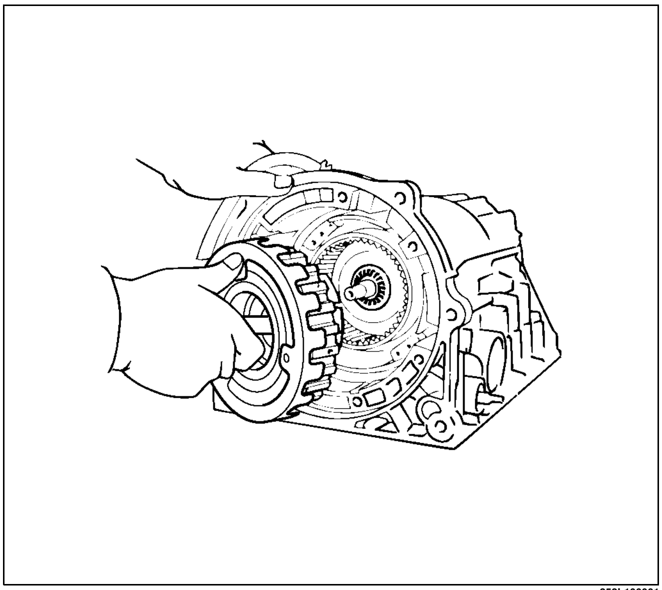
241RY00003

2. Remove race from oil pump.



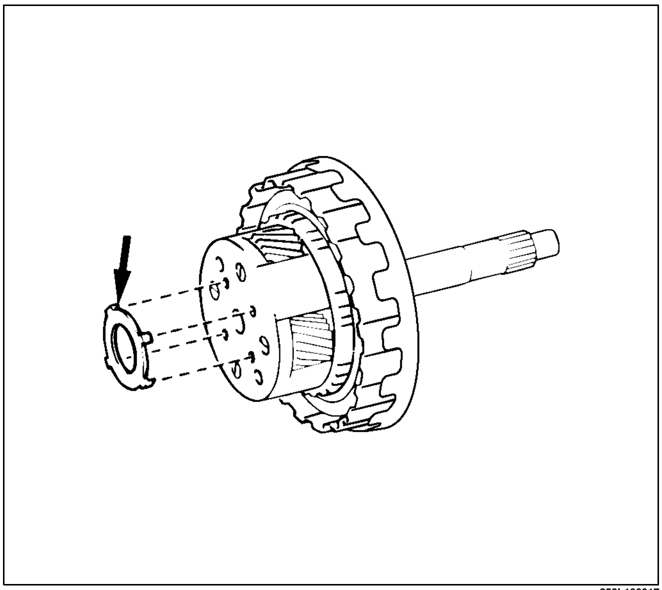
241RY00002

3. Remove the overdrive planetary gear and overdrive direct clutch with thrust needle bearing from the transmission case.



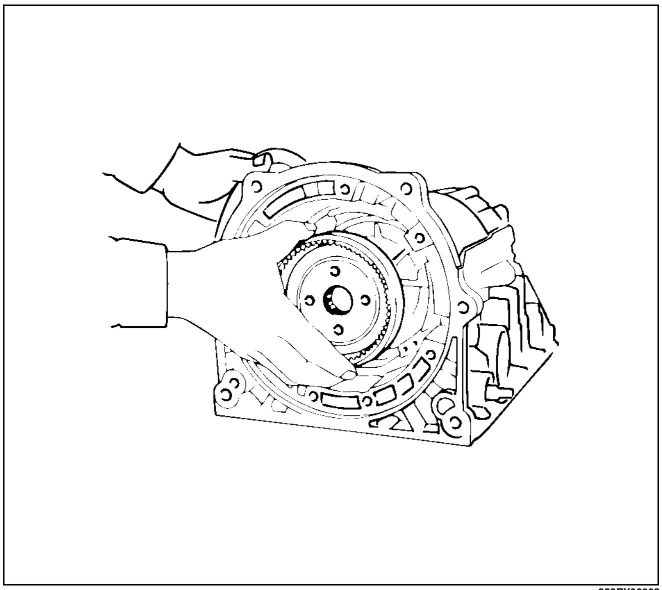
252L100001

4. Remove the race from OD planetary gear.



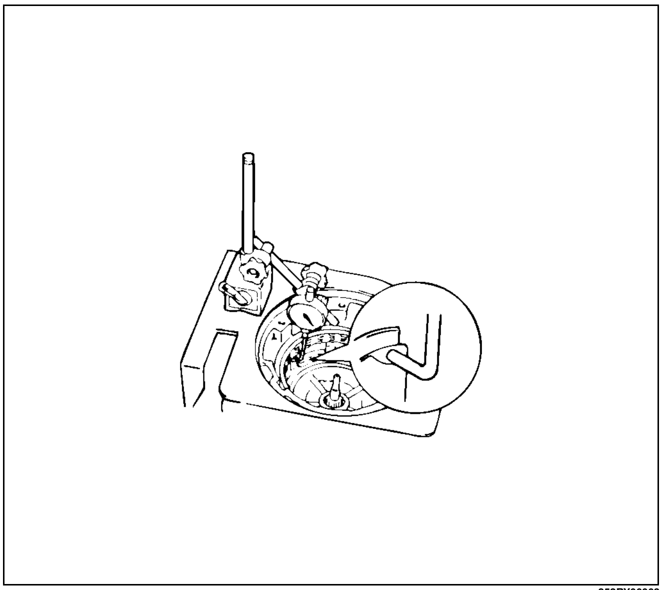
252L100017

5. Remove the overdrive planetary ring gear from the transmission case.



252RY00002

6. Check piston stroke of overdrive brake
   Place a dial indicator onto the overdrive brake piston as shown in the figure.



252RY00003

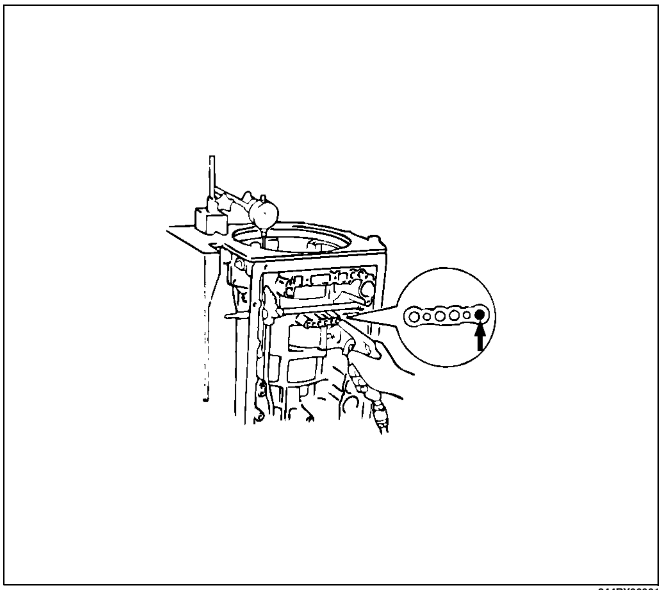
   Measure the stroke applying and releasing the compressed air (390 – 780 kPa or 57 – 114 psi) as shown in the figure.

Piston stroke: 1.75 – 2.05 mm (0.0689 – 0.0807 in)

   If the values are nonstandard, select another flange.

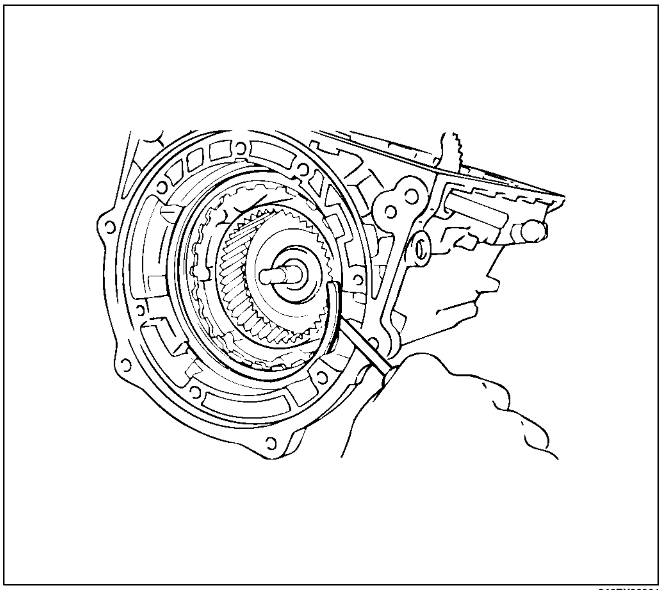
Available flange sizes

3.3 mm (0.130 in)	3.8 mm (0.150 in)
3.5 mm (0.138 in)	3.9 mm (0.154 in)
3.6 mm (0.142 in)	4.0 mm (0.158 in)
3.7 mm (0.146 in)	



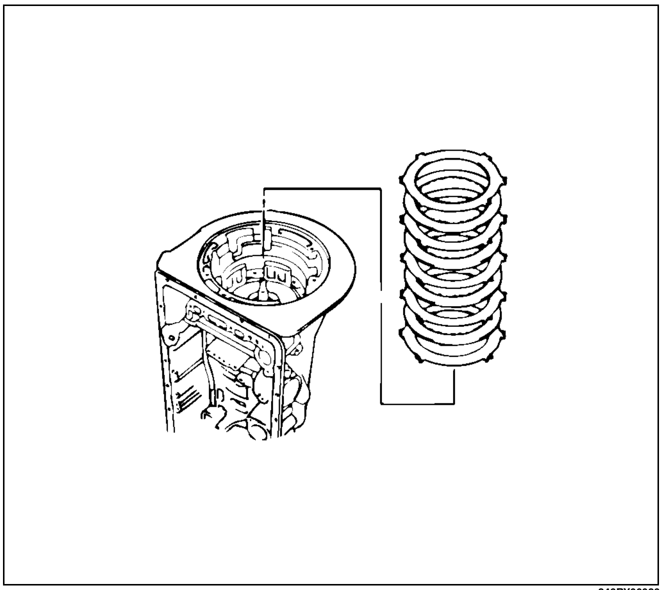
244RY00001

7. Remove the snap ring.



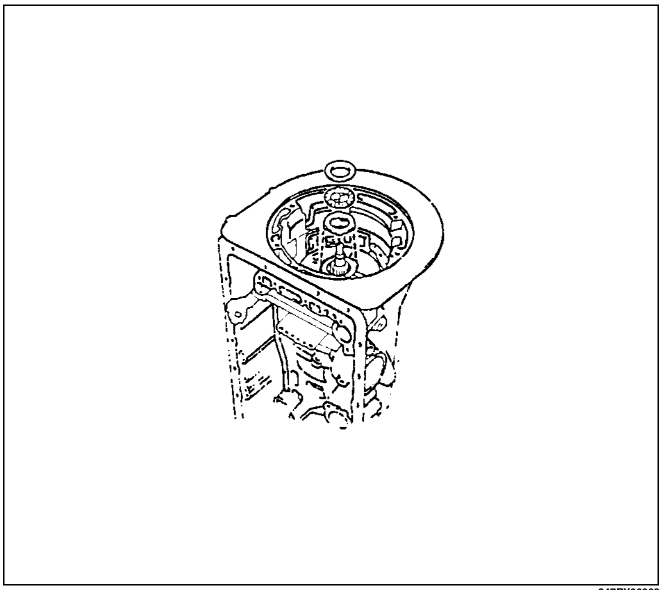
246RY00001

8. Remove one flange, four plates and four discs (B–0).



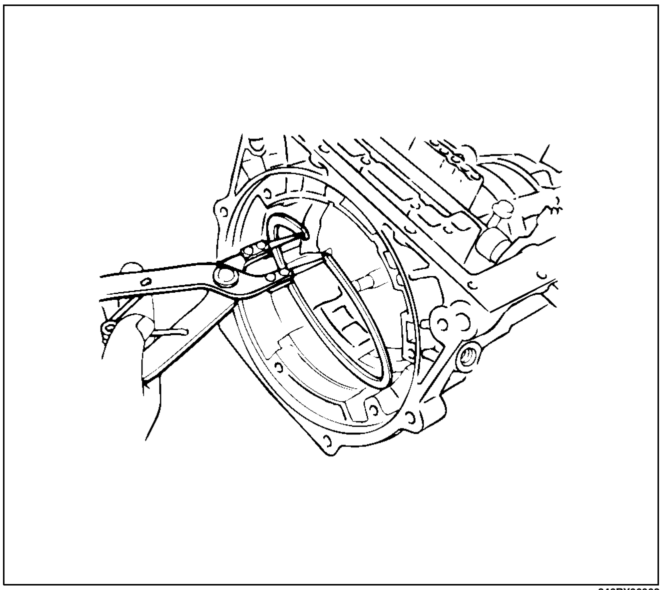
246RY00026

9. Remove the thrust bearing and two races.



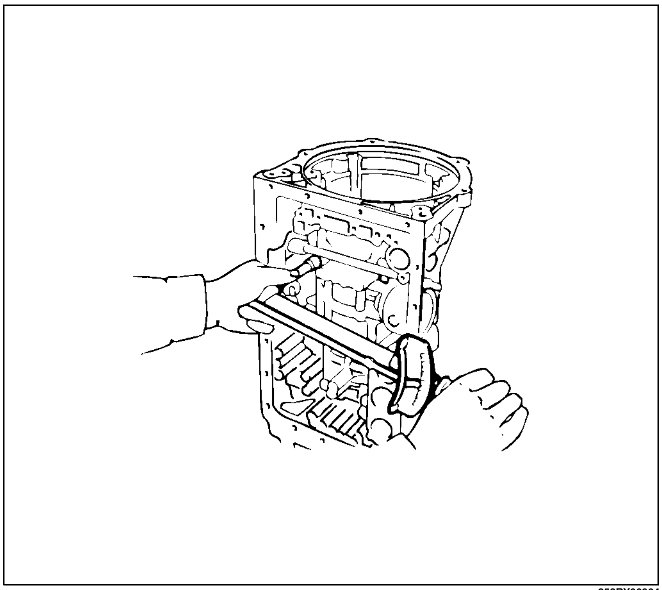
247RY00003

10. Using snap ring pliers, remove the snap ring.



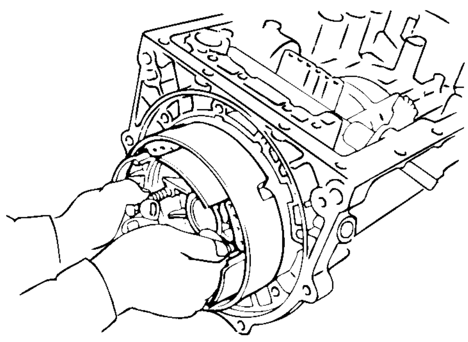
246RY00002

11. Remove the OD support.
    - Remove two bolts fixing the overdrive support assembly to the transmission case.



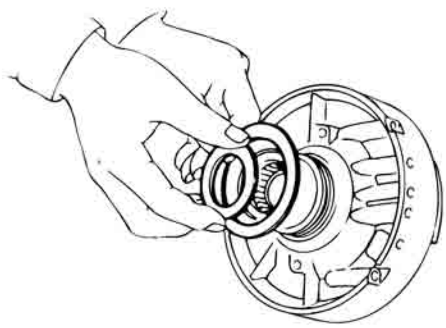
252RY00004

- Install two removed bolts to the OD support, and pull out the OD support assembly.



252RY00005

12. Remove the race from OD support.



252RY00006

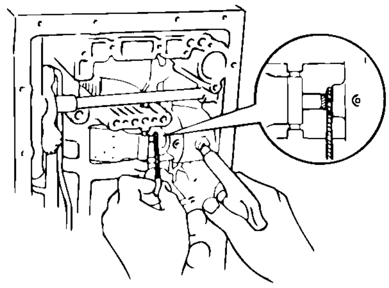
13. Check piston stroke of second coast brake (B–1)
 Place a mark on the second coast brake piston rod as shown in the figure.
 Using feeler gauge, measure the stroke applying the compressed air (390 – 780 kPa or 57 – 114 psi) as shown in the figure.

Piston stroke: 1.5 – 3.0 mm (0.059 – 0.118 in)

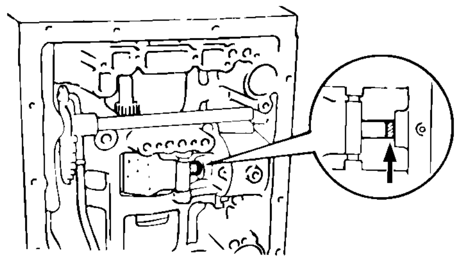
If the values are nonstandard, replace piston rod and recheck piston stroke.
If piston stroke is nonstandard, replace brake band.

There are two piston rods.

Rod length	78.4 mm (3.09 in) 79.9 mm (3.15 in)

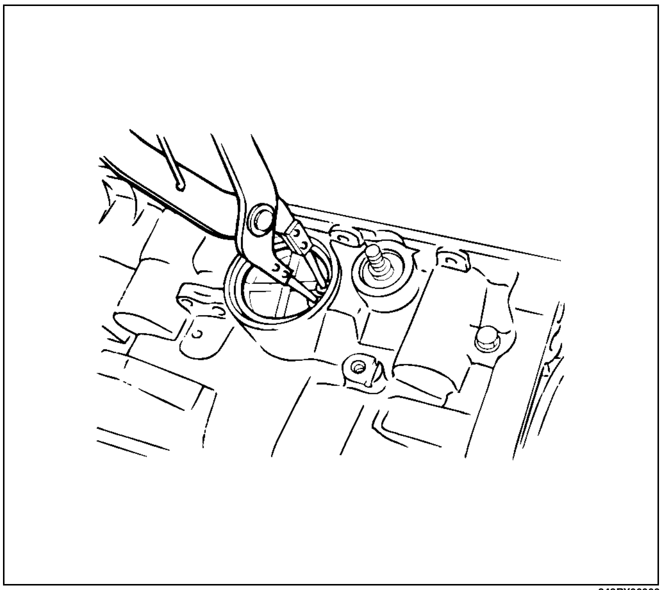


248RY00004



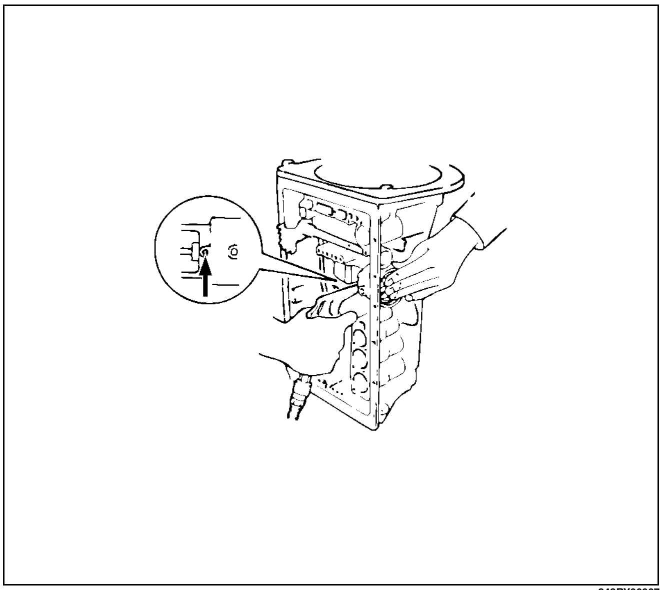
248RY00005

14. Using snap ring pliers, remove the snap ring.



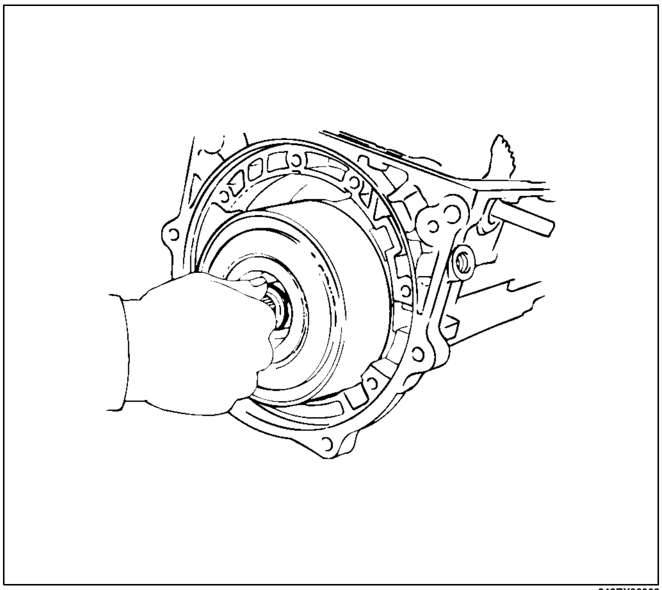
248RY00006

15. Applying compressed air to the oil hole, remove the second coast brake piston assembly.



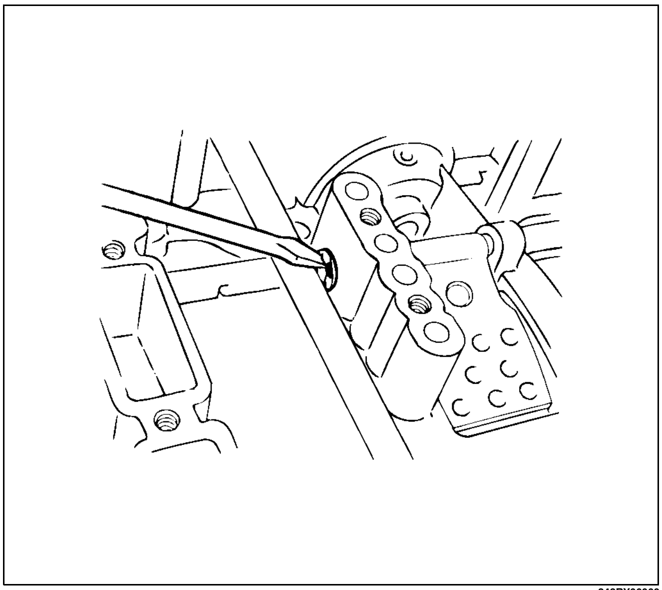
248RY00007

16. Remove the direct clutch and forward clutch from the transmission case.



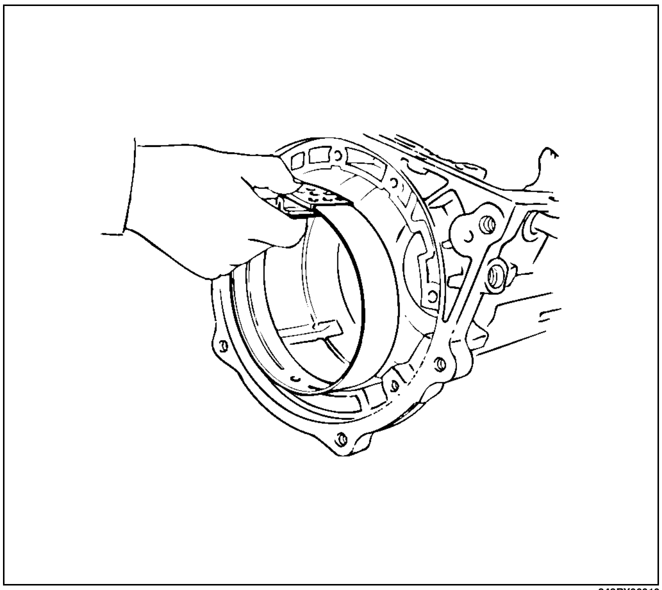
248RY00008

17. Remove the E-ring from the pin.
Remove the pin from the brake band.



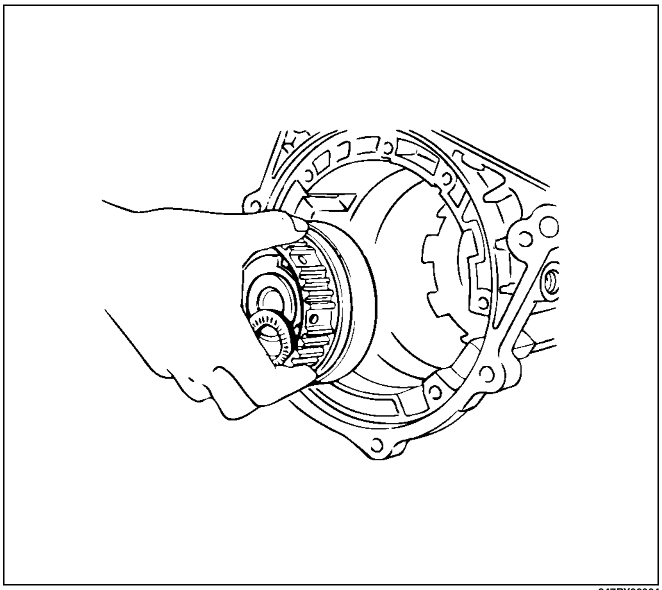
248RY00009

18. Remove the second coast brake band from the transmission case.



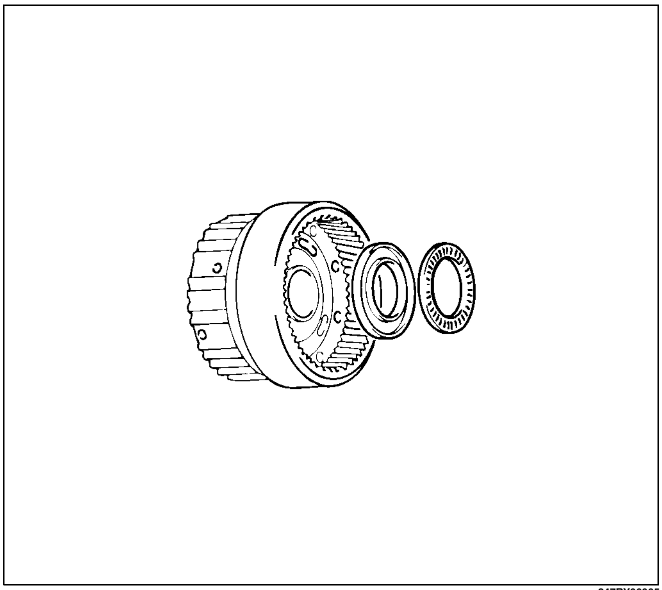
248RY00010

19. Remove the front planetary ring gear from the transmission case.



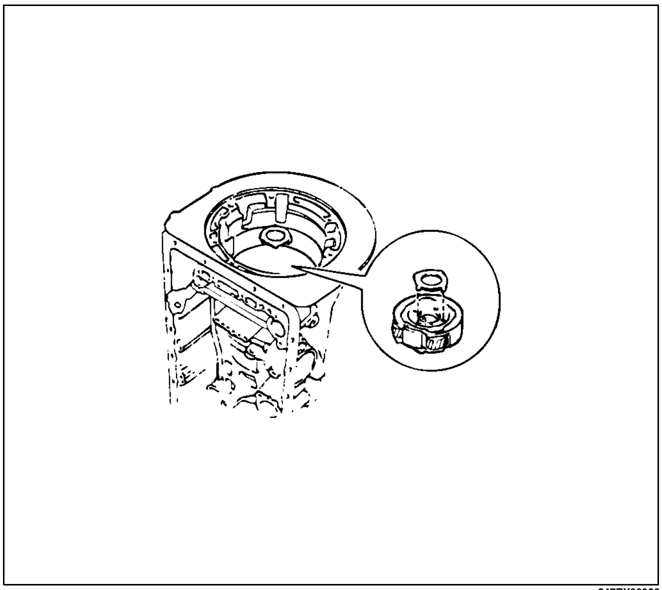
247RY00004

20. Remove the bearing and race.



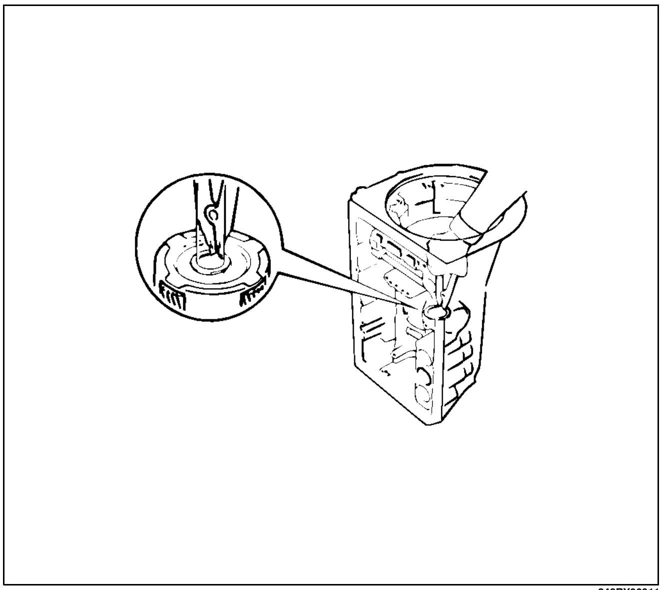
247RY00005

21. Remove the race.



247RY00006

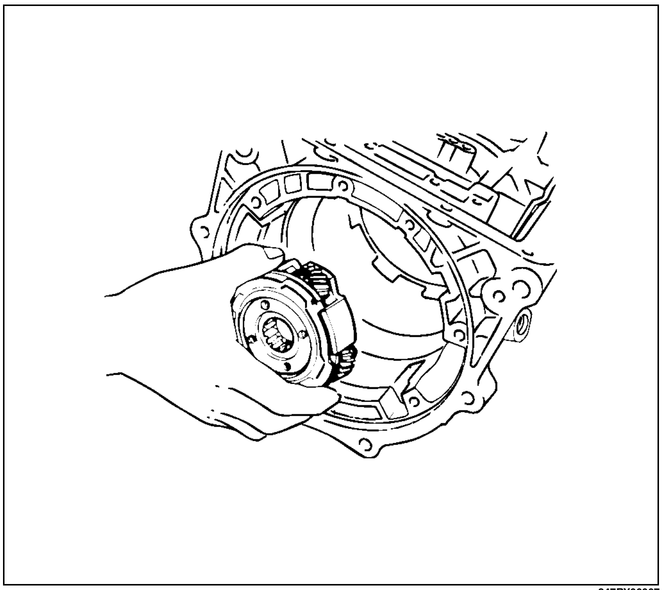
22. Using snap ring pliers, remove the snap ring.



248RY00011

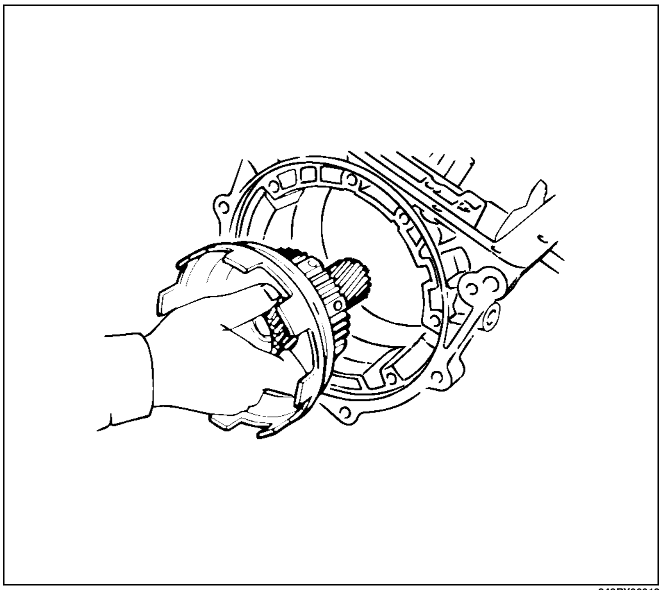
NOTE: Hold the output shaft to prevent it from falling. The output shaft falls when the snap ring is removed.

23. Remove the front planetary gear from the transmission case.



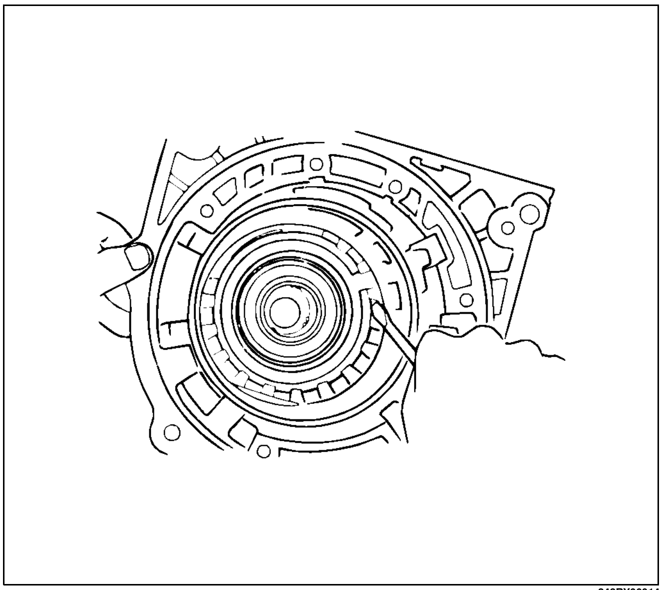
247RY00007

24. Remove sun gear input drum and one-way clutch.



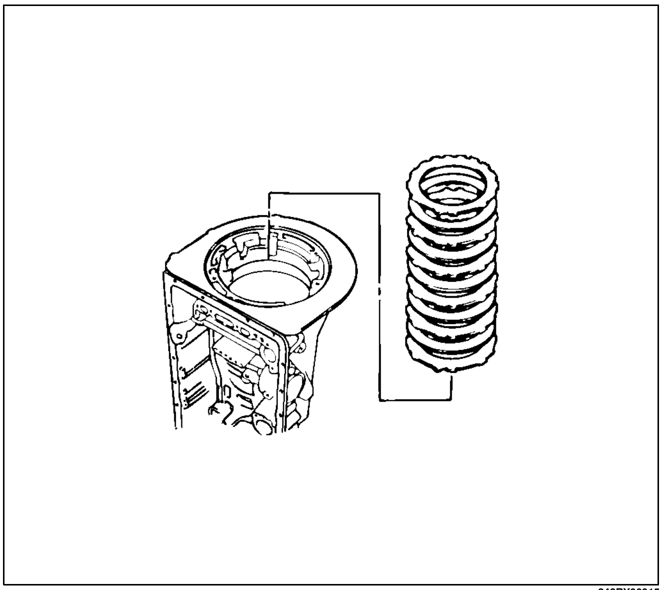
248RY00012

25. Using two screwdrivers, remove the snap ring.



248RY00014

26. Remove, five discs and six plates (B–2).

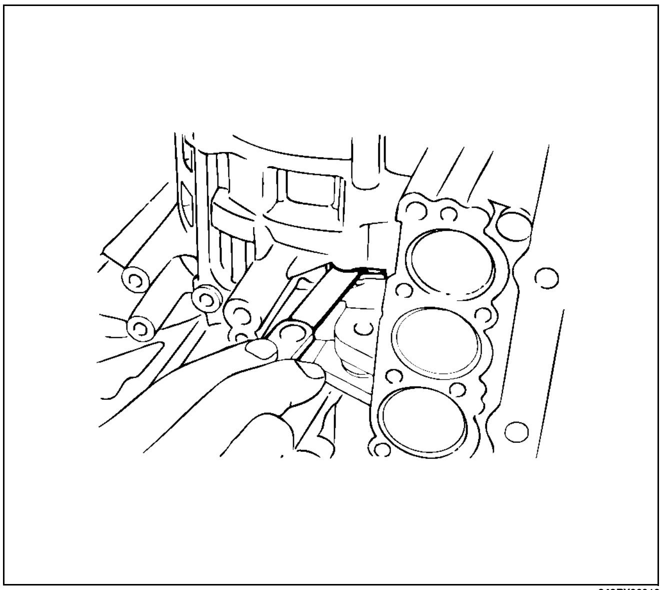


248RY00015

27. Check pack clearance of first and reverse brake (B–3)
Using a feeler gauge, measure the clearance between the plate and second brake drum as shown in the figure.

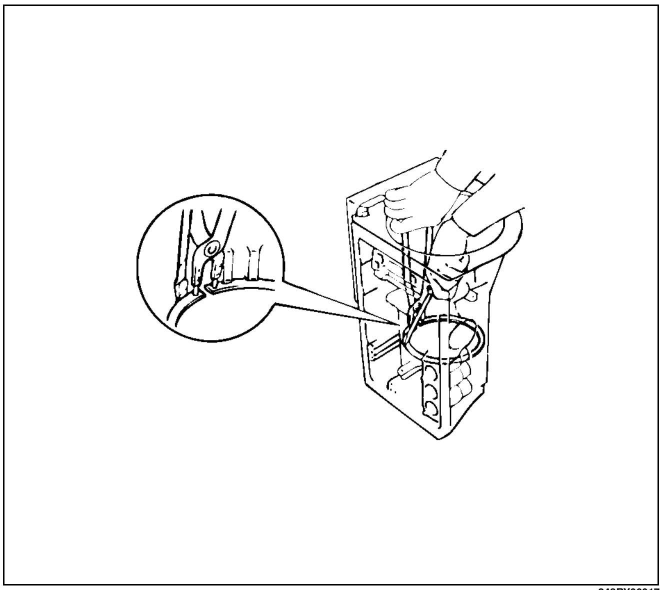
Clearance: 0.70 – 1.22 mm (0.0276 – 0.0480)

If the values are nonstandard, replace the discs.



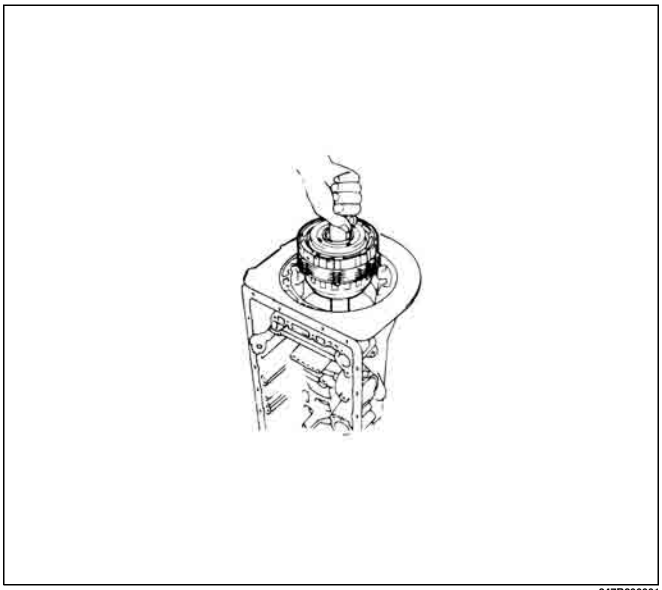
248RY00016

28. Using snap ring pliers, remove the snap ring.



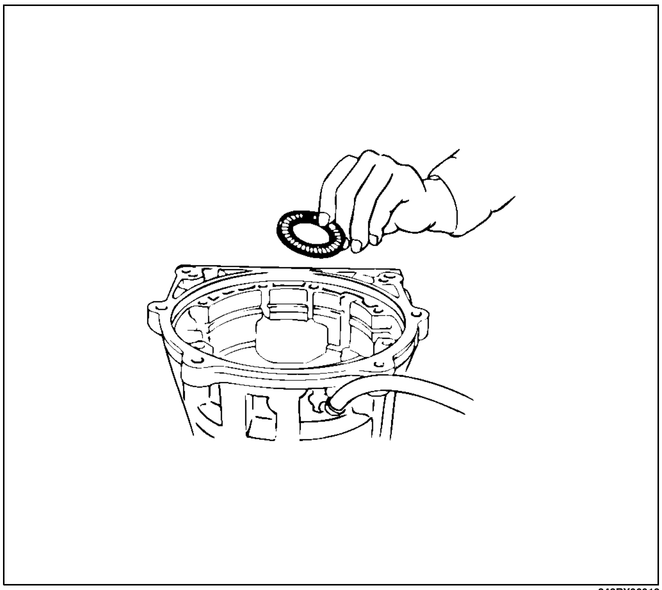
248RY00017

29. Remove the rear planetary gear, second brake drum and output shaft as an assembly.



247R200001

30. Remove the assembled thrust bearing and race from the transmission case.



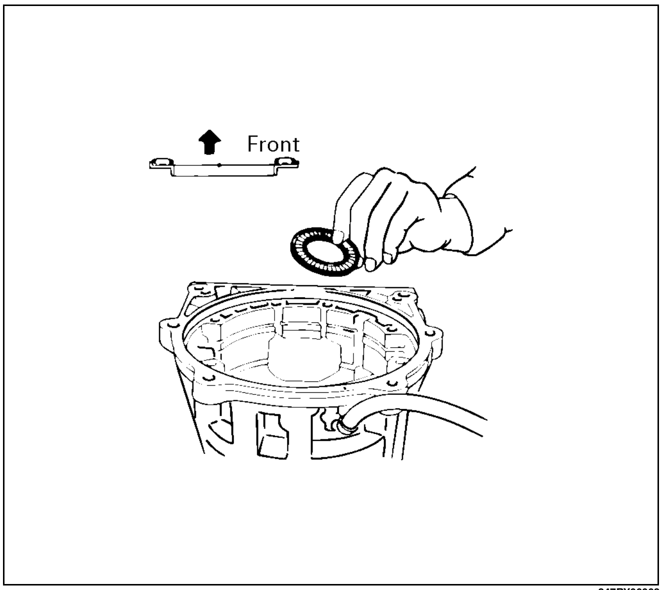
248RY00018

Reassembly

1. Coat the assembled bearing and race with petroleum jelly and install it onto the transmission case.

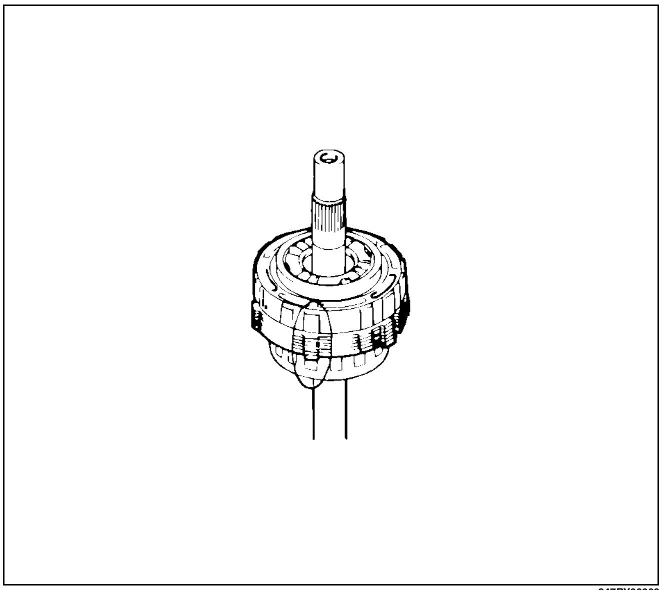
Assembled bearing and race (Reference)

Bearing and race	Diameter
Inside	39.38 mm (1.550 in)
Outside	58.15 mm (2.289 in)



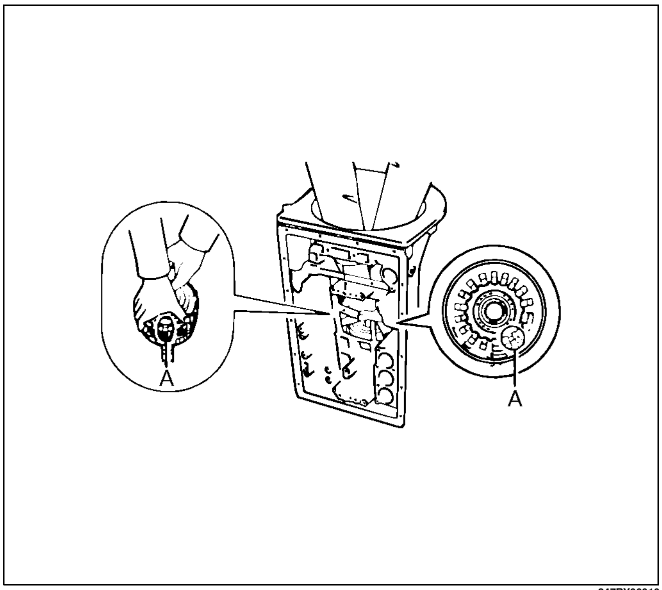
247RY00008

2. Install the rear planetary gear, second brake drum and output shaft.
   - Align the teeth of the second brake drum, flanges, discs and plates as shown in the figure.



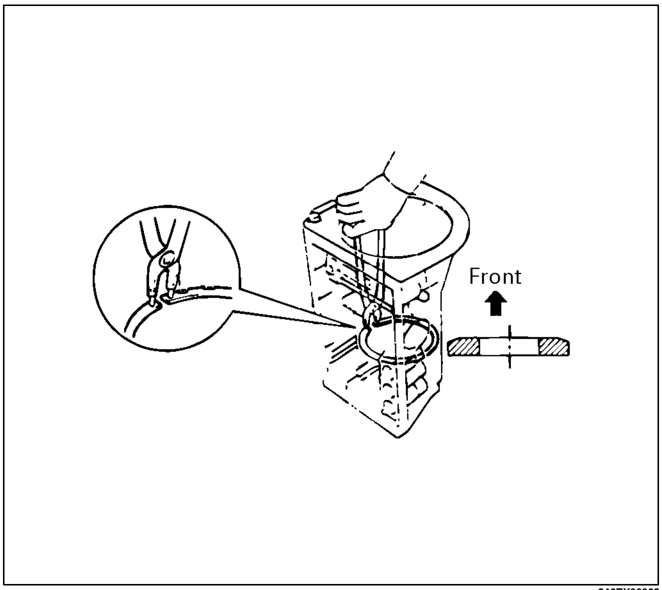
247RY00009

   - Align the splines of the transmission case and the assembled rear planetary gear, second brake drum and output shaft, indicated by A in the figure.



247RY00010

3. Using snap ring pliers, install the snap ring.



246RY00003

SECTION 4

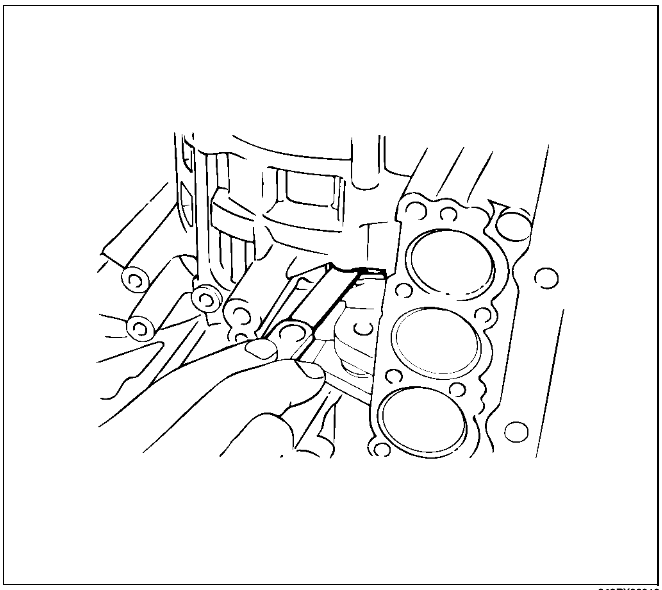
AXLE

TABLE OF CONTENTS

4. Check pack clearance of first and reverse brake.
   Using a thickness gauge, measure the clearance between the plate and second brake drum as shown in the figure.

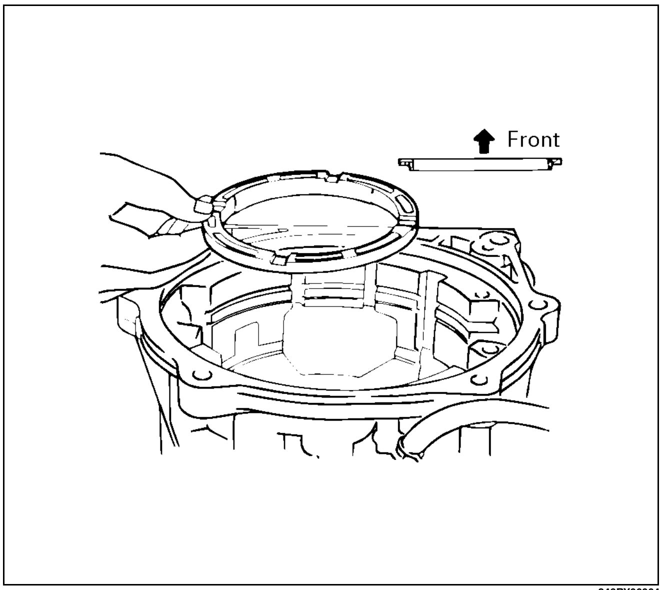
Clearance: 0.70 – 1.22 mm (0.0276 – 0.0480 in)

If the values are nonstandard, check for an improper installation.



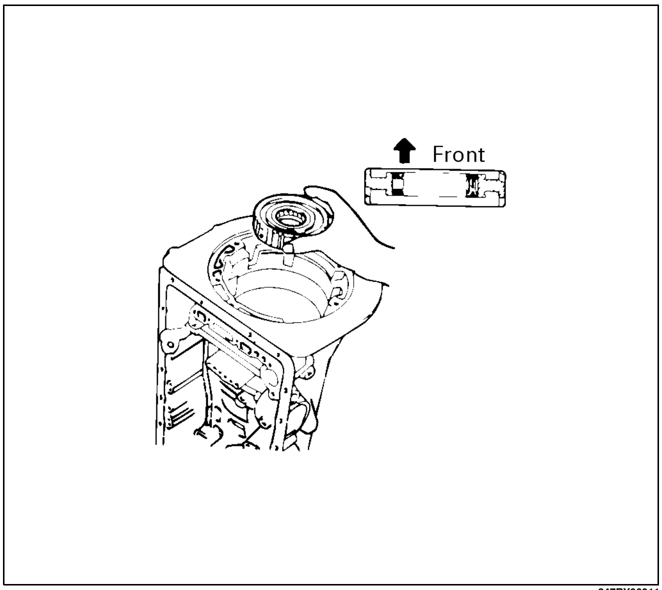
248RY00016

5. Install second brake piston sleeve.



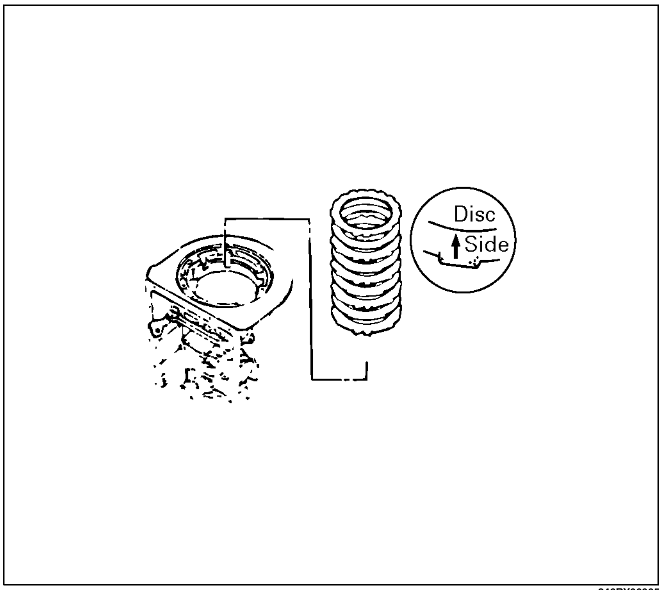
246RY00004

6. Install one-way clutch in the transmission case.



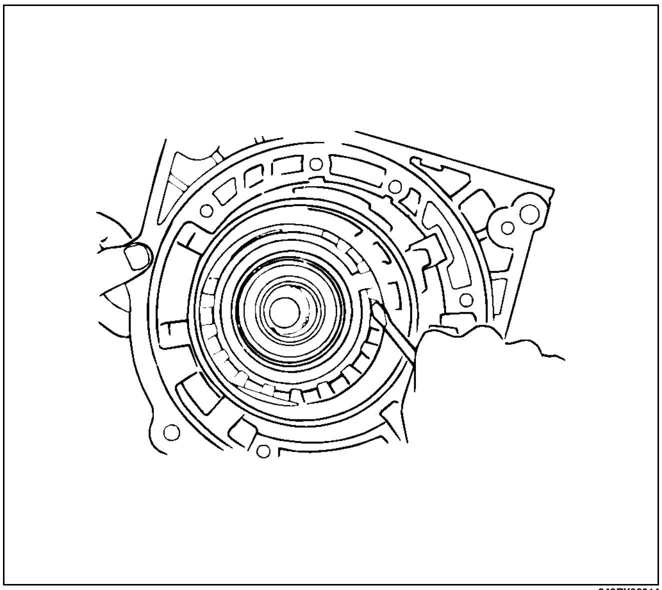
247RY00011

7. Install discs and plates (B–2).
   Instal the 2.5 mm (0.098 in) thick plate with the rounded edge side of the plate facing the disc.
   Alternately install five discs and six plates (Disc first)



246RY00005

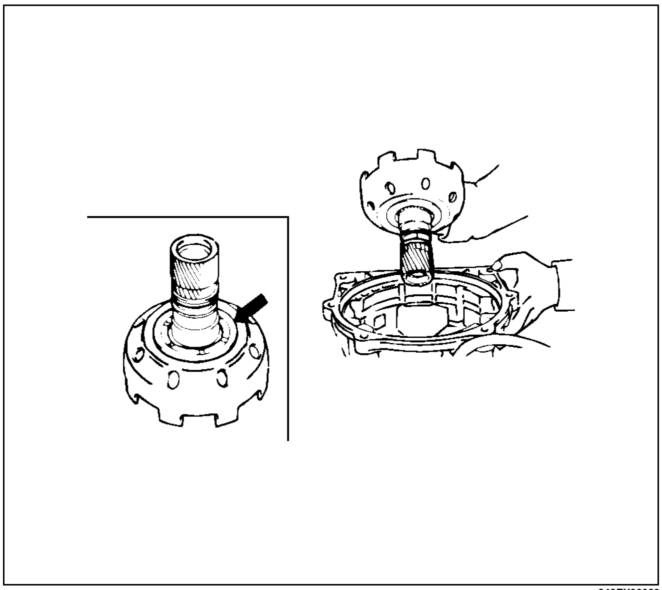
8. Install the snap ring.



248RY00014

9. While turning the sun gear input drum clockwise, install it into the one-way clutch

NOTE: Confirm the thrust washer is installed correctly.



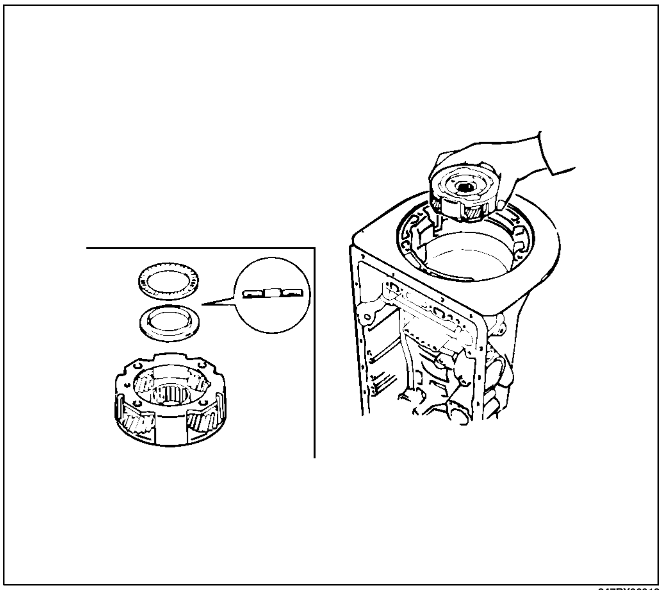
248RY00020

10. Install the front planetary gear and bearing to the sun gear.

NOTE: Confirm the bearing and race is installed correctly.

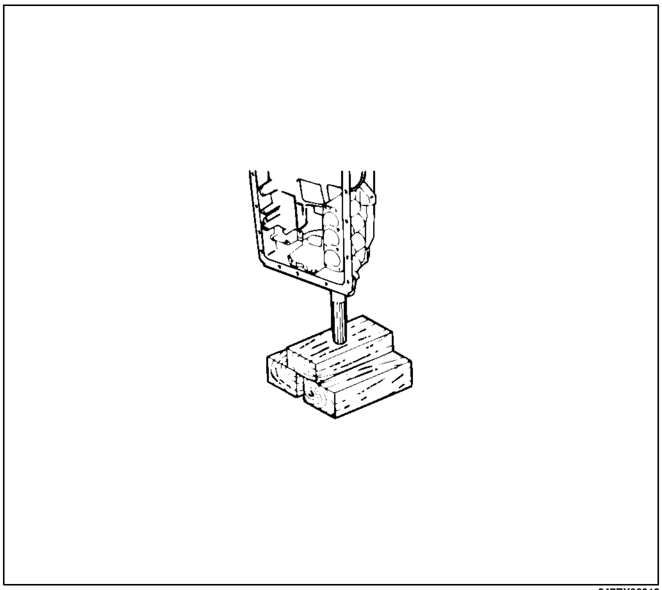
Bearing and race diameter (Reference)

	Inside	Outside
Bearing	35.6 mm (1.40 in)	47.7 mm (1.88 in)
Race	33.7 mm (1.33 in)	47.6 mm (1.87 in)



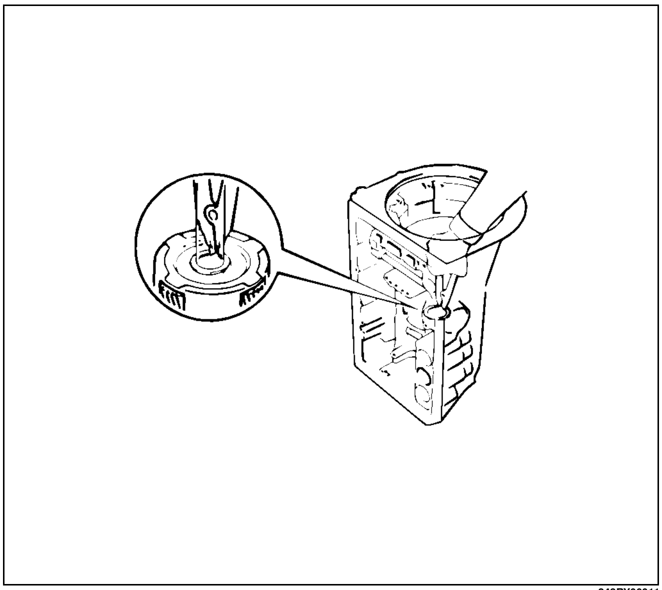
247RY00012

With wooden blocks under the output shaft, stand the transmission on the output shaft.



247RY00013

11. Using snap ring pliers, install the snap ring.

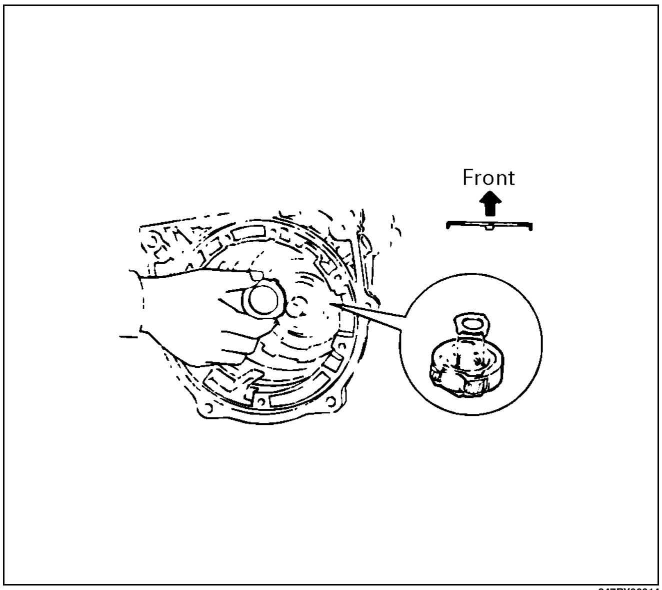


248RY00011

12. Coat the bearing race with petroleum jelly and install it onto the front planetary gear.

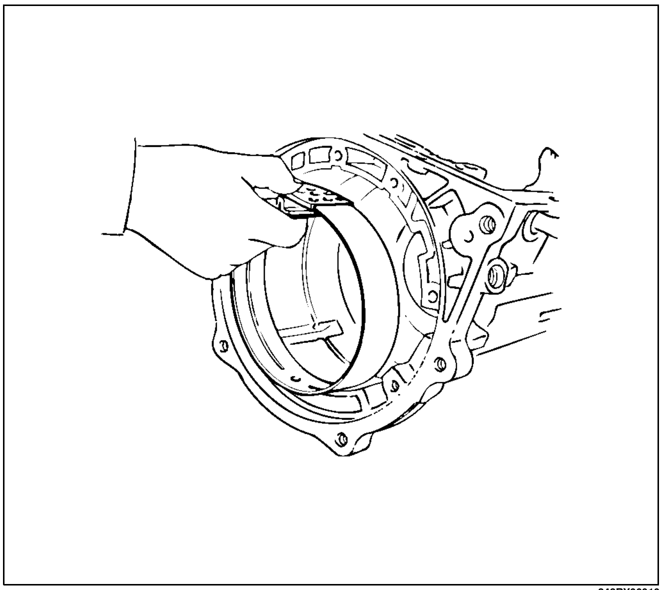
Bearing race diameter (Reference)

Bearing race	Diameter
Inside	34.3 mm (1.350 in)
Outside	47.8 mm (1.882 in)



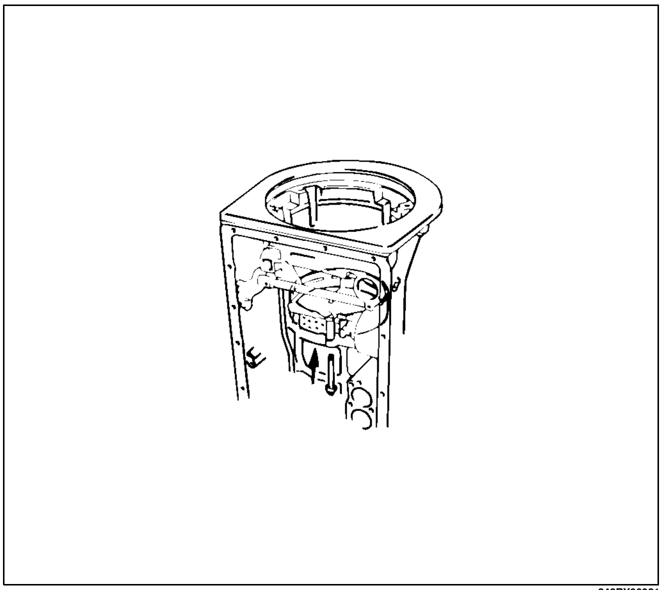
247RY00014

13. Insert the second coast brake band to the transmission case.



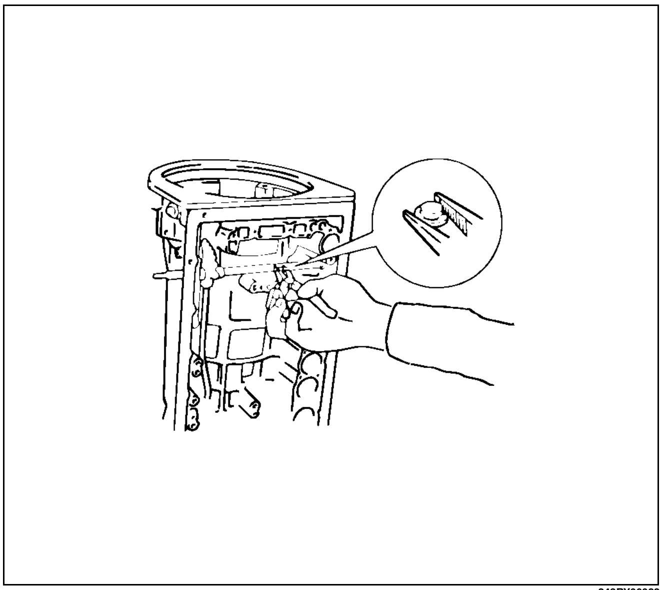
248RY00010

14. Install the E-ring and pin.
    - Install the pin through the brake band.



248RY00021

- Install the E-ring to the pin.

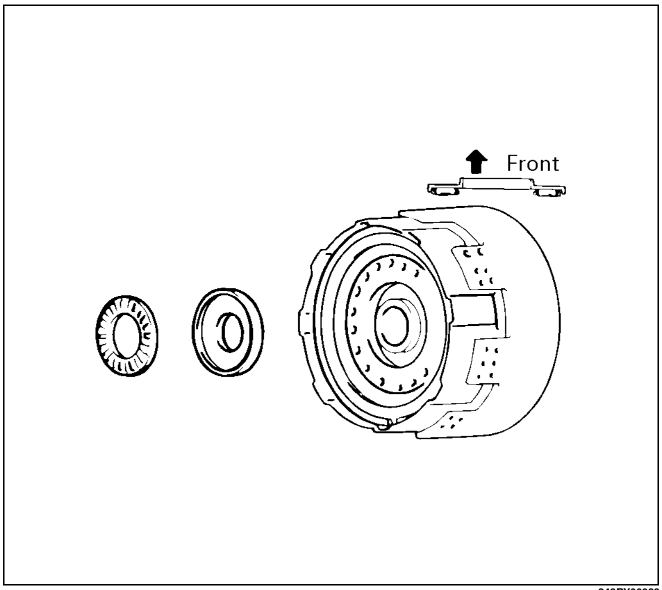


248RY00022

15. Coat the bearing and race with petroleum jelly and install them onto the forward clutch.

Bearing and race diameter (Reference)

	Inside	Outside
Bearing	26.0 mm (1.024 in)	46.7 mm (1.839 in)
Race	26.0 mm (1.024 in)	48.9 mm (1.925 in)

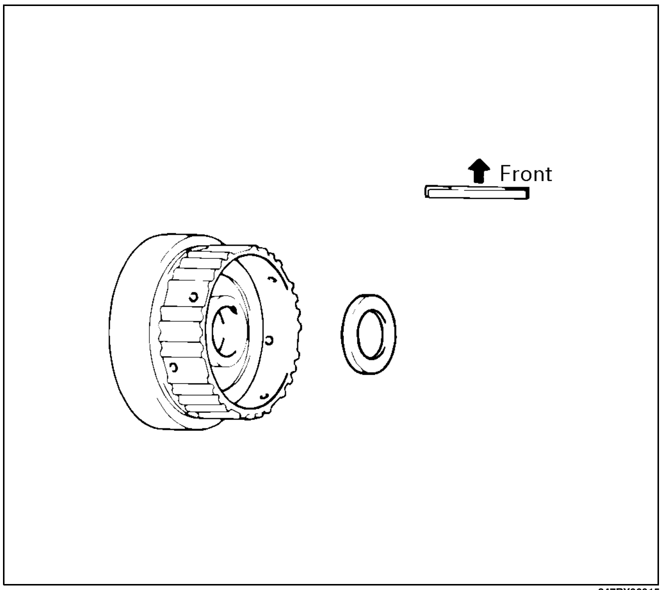


248RY00023

16. Coat the race with petroleum jelly and install it onto the front planetary ring gear.

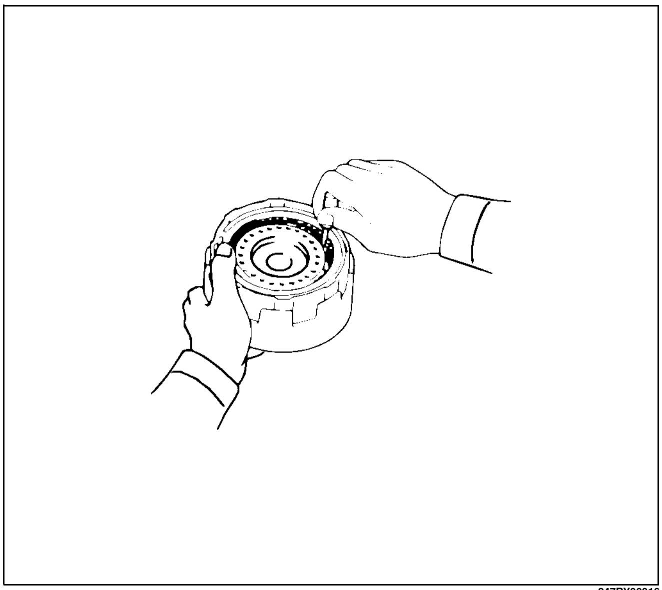
Race diameter (Reference)

	Inside	Outside
Race	26.8 mm (1.055 in)	47.0 mm (1.850 in)



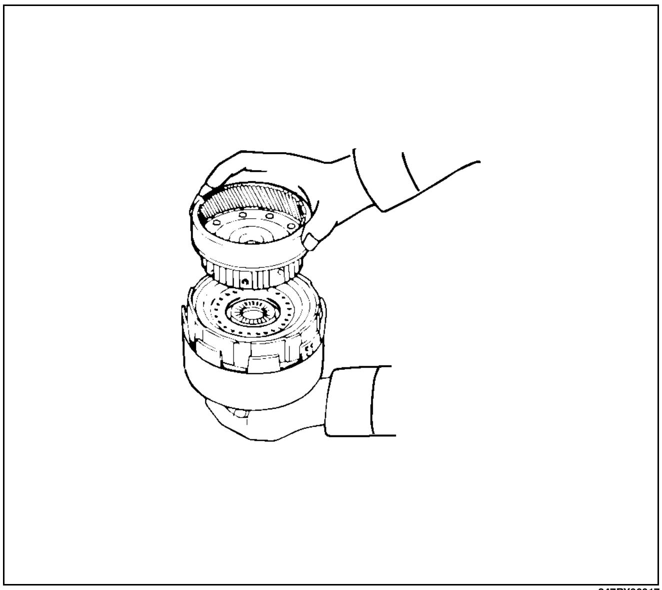
247RY00015

Align the flukes of the discs in the forward clutch.



247RY00016

17. Align the spline of the front planetary gear with the flukes of the discs and install the front planetary gear to the forward clutch.

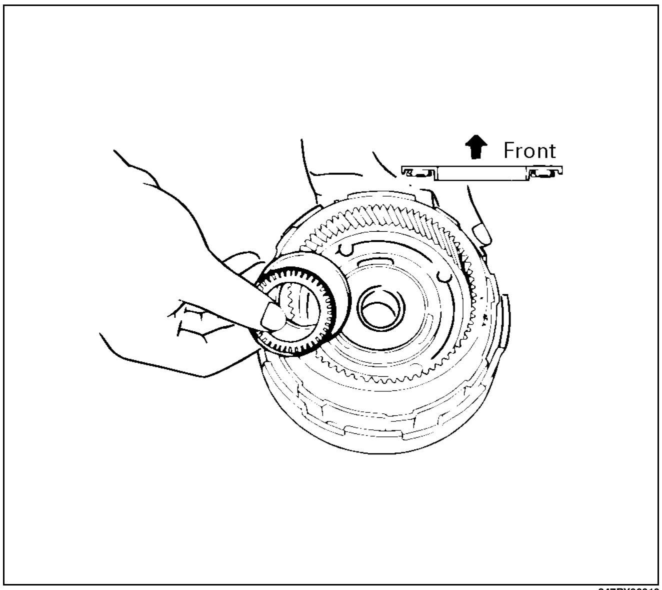


247RY00017

18. Coat the bearing and race with petroleum jelly and install them onto the ring gear.

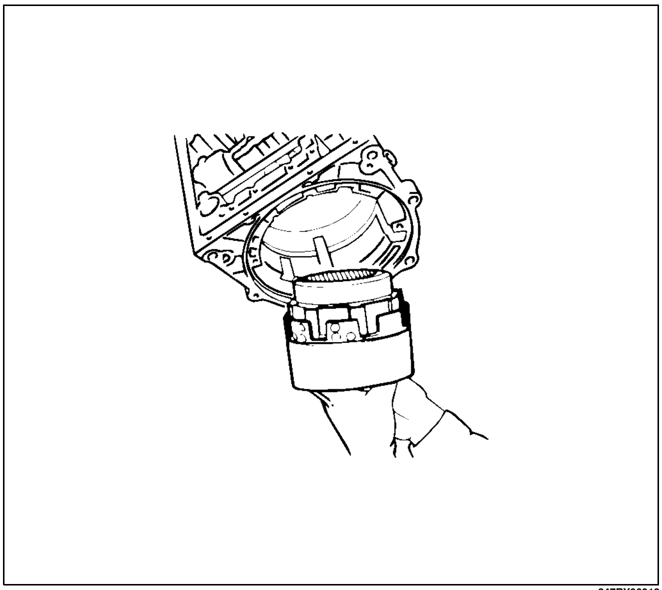
Bearing and race diameter (Reference)

	Inside	Outside
Bearing	35.15 mm (1.384 in)	53.65 mm (2.112 in)
Race	35.15 mm (1.384 in)	53.65 mm (2.112 in)



247RY00019

19. Install the assembled direct clutch, forward clutch and front planetary ring gear into the transmission case.

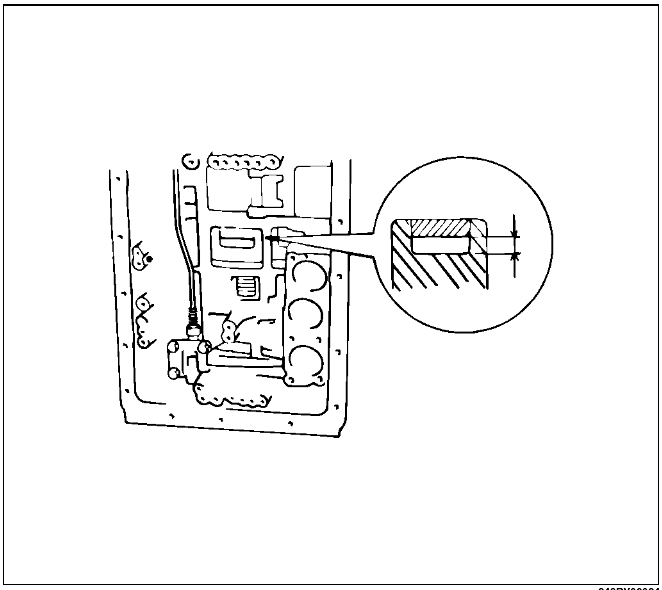


247RY00018

- Using vernier calipers, measure the distance between the sun gear input drum and direct clutch drum as shown in the figure.

Height: 2.5– 4.5 mm (0.098 – 0.177 in)

If the values are nonstandard, check for an improper installation.

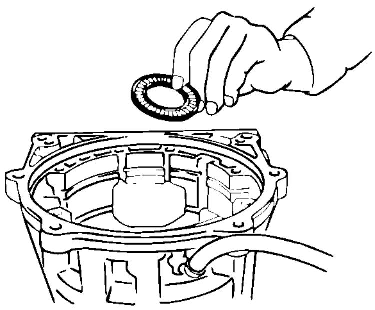


248RY00024

Coat the assembled bearing and race with petroleum jelly and install it onto the forward clutch.

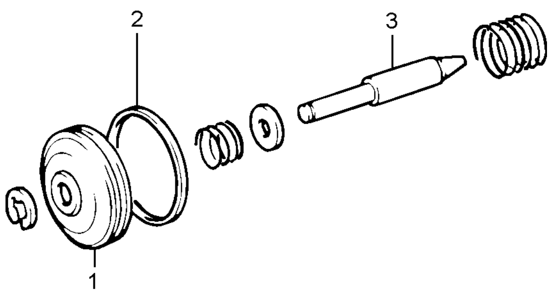
Assembled bearing and race diameter (Reference)

	Inside	Outside
Bearing and race	33.7 mm (1.33 in)	47.8 mm (1.88 in)



248RY00025

20. Assembly second coast brake piston assembly.
    Coat the oil seal ring with ATF and install it to the second coast brake piston.
    Install the washer, spring and piston to the piston rod. Install the E-ring.

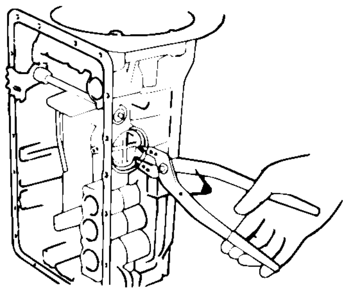


RUW37ASH004401

Legend

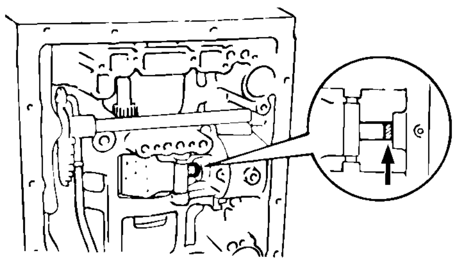
(1) Second coast brake piston
(2) Oil seal
(3) Piston rod

21. Coat two new oil seals with ATF and install them to the piston cover.
    Install the spring, second coast brake piston assembly and piston cover to the transmission case.
    Using snap ring pliers, install the snap ring.



248RY00027

22. Check piston stroke of second coast brake
    Place a mark on the second coast brake piston rod as shown in the figure.

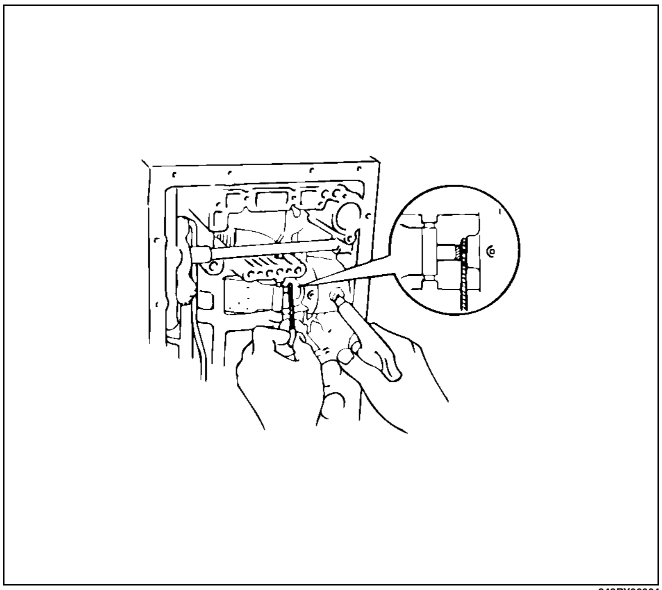


248RY00005

Using wire gauge, measure the stroke by applying the compressed air (390 – 780 kPa or 57 – 114 psi) as shown in the figure.

Piston stroke: 1.5 – 3.0mm (0.059 – 0.118in)

If the values are nonstandard, check for an improper installation.

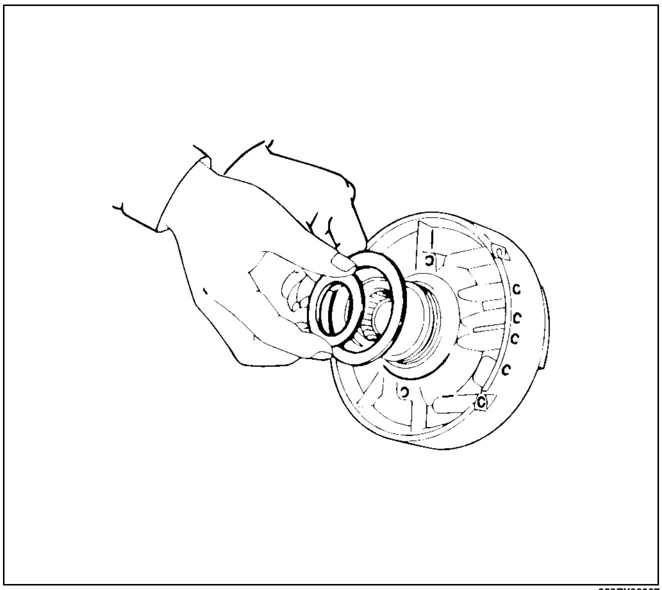


248RY00004

23. Coat the race with petroleum jelly and install it onto the overdrive support assembly.

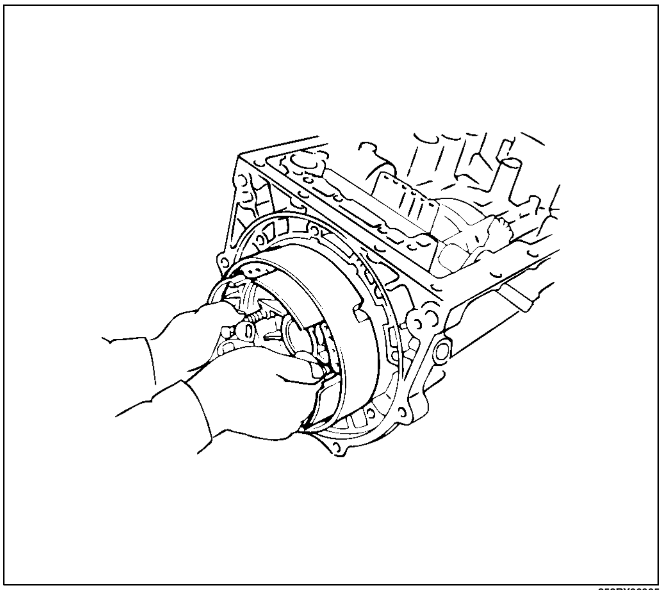
Race diameter (Reference)

	Inside	Outside
Race	36.7 mm (1.44 in)	50.8 mm (2.00 in)



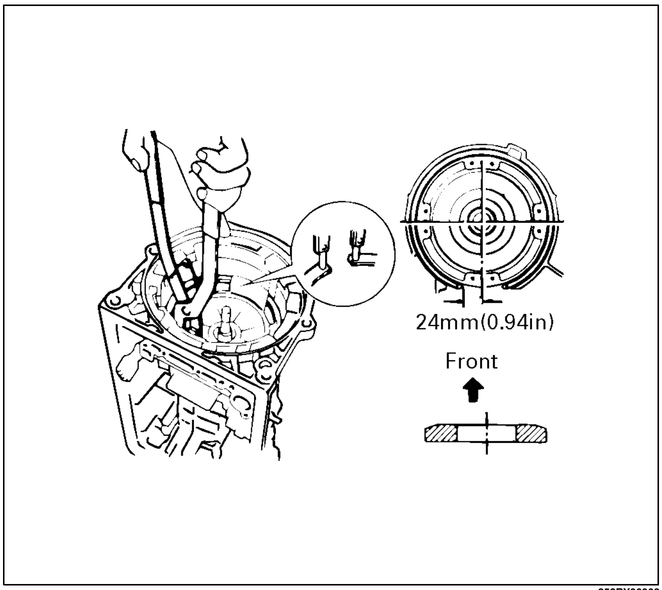
252RY00007

24. Aim the bolt and oil holes of the overdrive support toward the valve hole side, and align them with the bolt hole of the transmission case and insert the overdrive support.



252RY00005

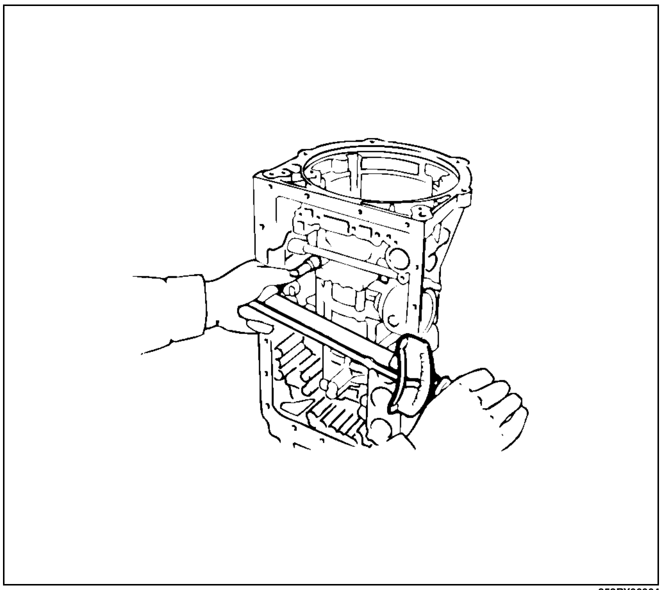
25. Using snap ring pliers, install the snap ring as shown in the figure.



252RY00008

- Install and tighten the two bolts.

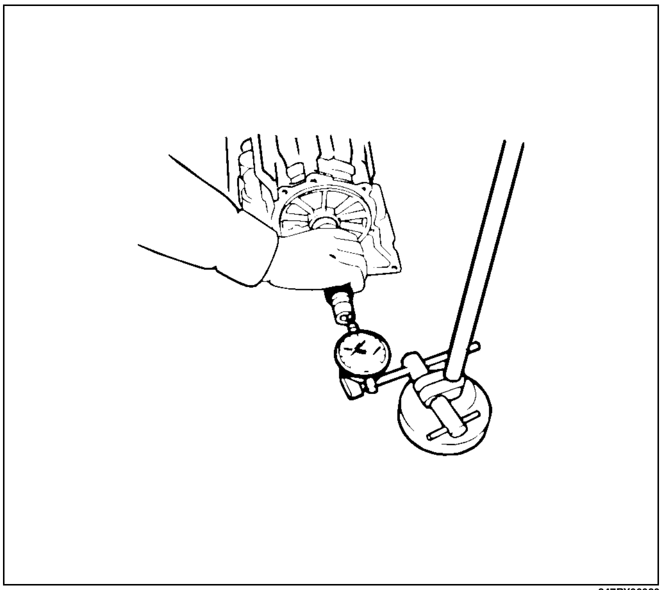
Torque: 25 N·m (2.5 kgf·m / 18 lb·ft)



252RY00004

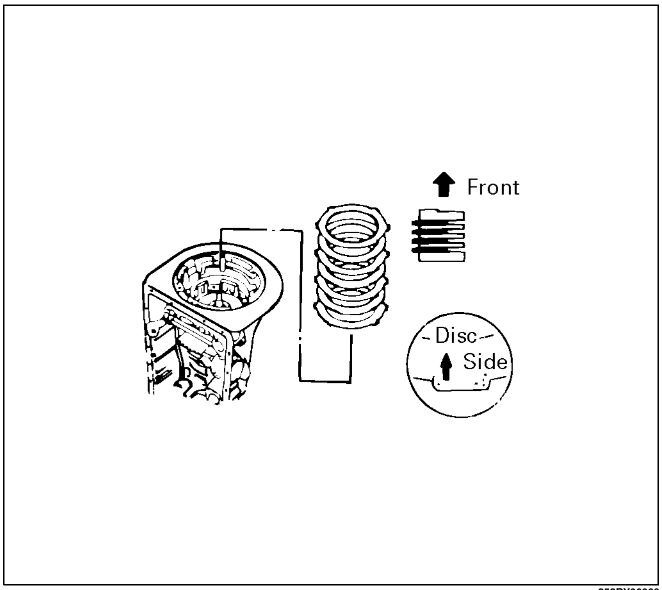
26. Check end of output shaft.
    Using a dial indicator, measure the end play of the output shaft by hand.

End play: 0.27 – 0.86 mm (0.0106 – 0.0339 in)



247RY00020

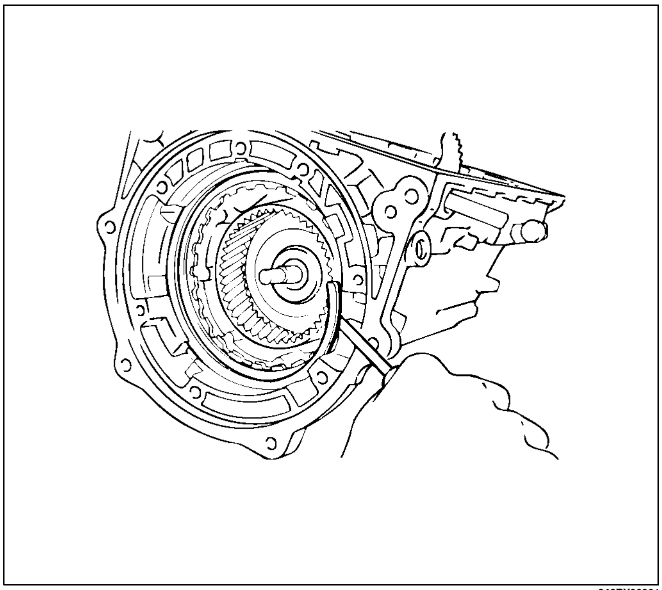
27. Install the (flat ring) 4.0 mm (0.157 in) thick flange with the rounded edge side of the flange facing the disc.
    Alternately install four discs and four plates. (Disc first)



252RY00009

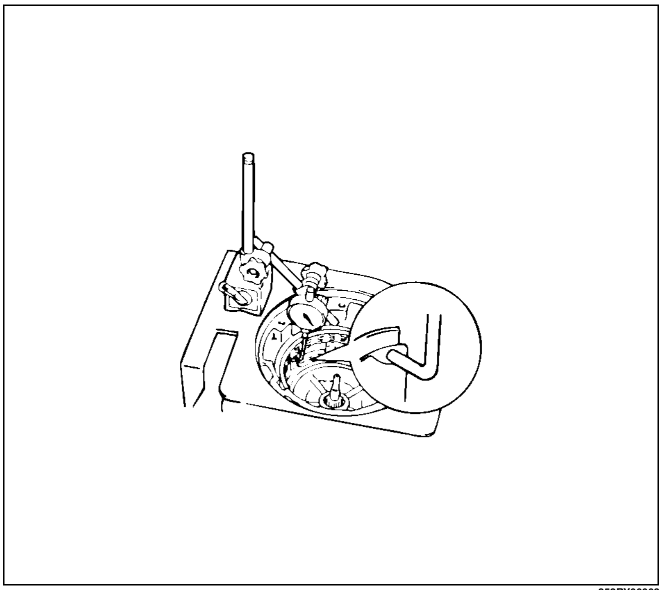
28. Install the (stepped ring) flange with the flat side of the flange facing the disc.
    Install the snap ring.
    Snap ring (Reference)

Inside diameter	167.9 mm (6.61 in)



246RY00001

29. Check piston stroke of overdrive brake.
    Place a dial indicator onto the overdrive brake piston as shown in the figure.



252RY00003

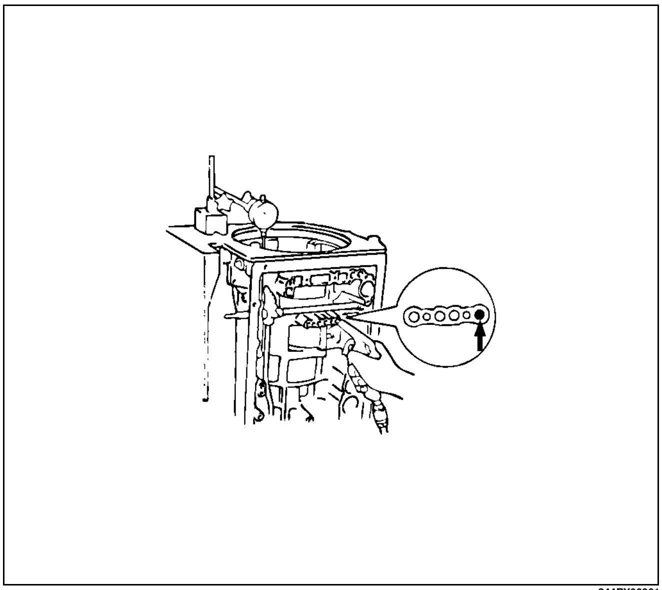
Measure the stroke by applying and releasing the compressed air (390 – 780 kPa or 57 – 114 psi) as shown in the figure.

Piston stroke: 1.75 – 2.05 mm (0.0689 – 0.0807 in)

If the values are nonstandard, check for an improper installation.

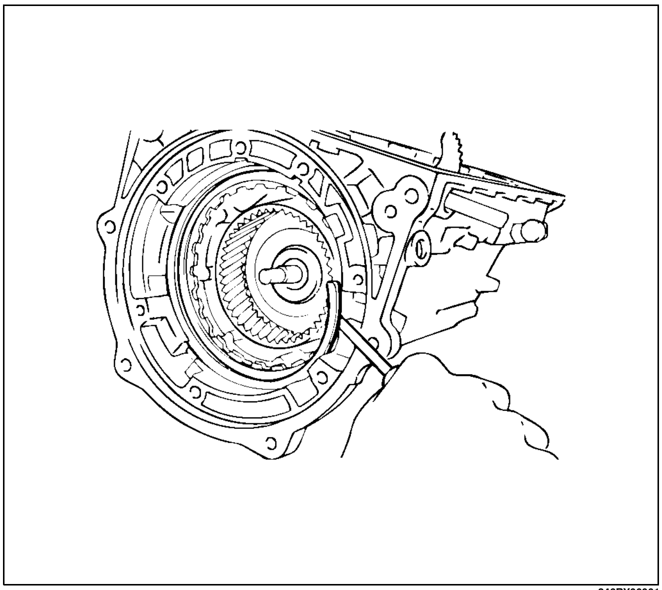
Available flange size

3.3 mm (0.130 in)	3.8 mm (0.150 in)
3.5 mm (0.138 in)	3.9 mm (0.154 in)
3.6 mm (0.142 in)	4.0 mm (0.158 in)
3.7 mm (0.146 in)	



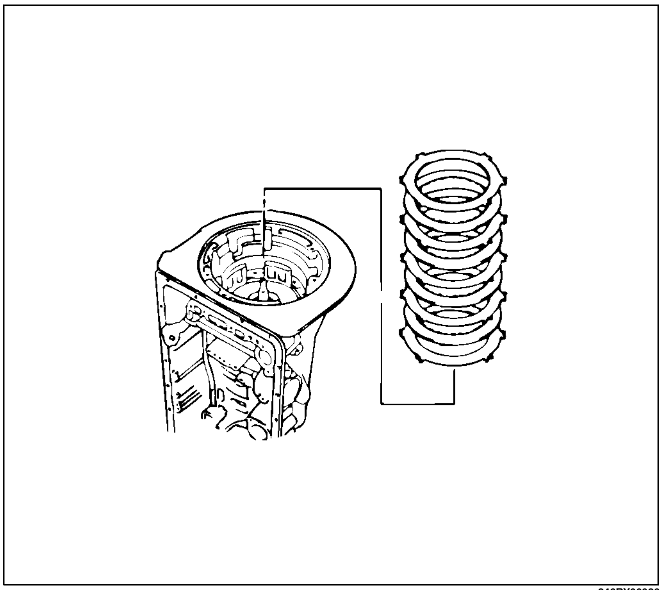
244RY00001

Remove the snap ring.



246RY00001

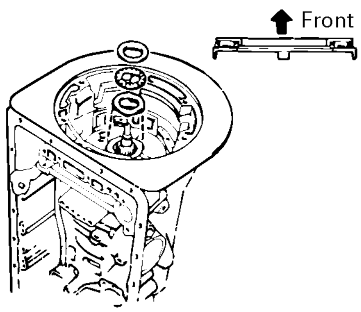
Remove one flange, four plates and four discs.



246RY00026

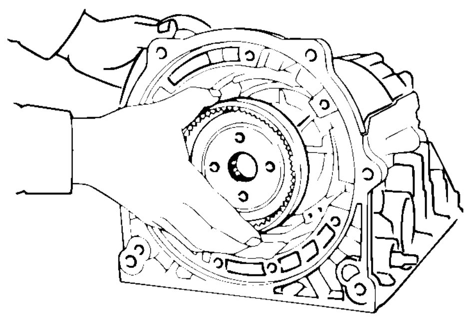
30. Coat the bearing and races with petroleum jelly and install them onto the overdrive support.
Bearing and races diameter (Reference)

	Inside	Outside
Race (Front)	37.2 mm (1.465 in)	58.8 mm (2.315 in)
Bearing and race (Rear)	33.7 mm (1.327 in)	50.1 mm (1.972 in)



252RY00010

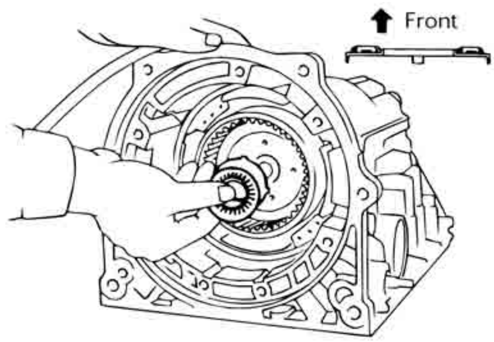
31. Install the overdrive planetary ring gear.



252RY00002

32. Coat the bearing and race with petroleum jelly and install them onto the planetary ring gear.
Bearing and race diameter (Reference)

	Inside	Outside
Bearing and race	24.2 mm (0.953 in)	47.8 mm (1.882 in)

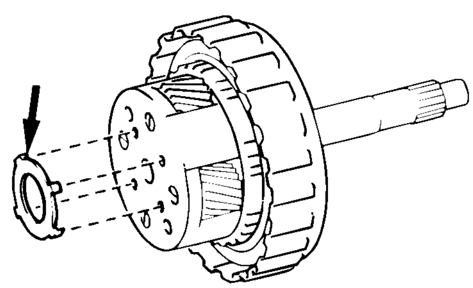


252RY00011

Install the (flat ring) 4.0 mm (0.157 in) thick flange with the rounded edge side of the flange facing the disc.
Alternately install four discs and three plates. (Disc first)
Install the (stepped ring) flange with the flat side of the flange facing the disc.
Install the snap ring.

33. Coat the race with petroleum jelly and install it onto the planetary gear.
Race diameter (Reference)

	Inside	Outside
Race	24.7 mm (0.972 in)	41.8 mm (1.646 in)



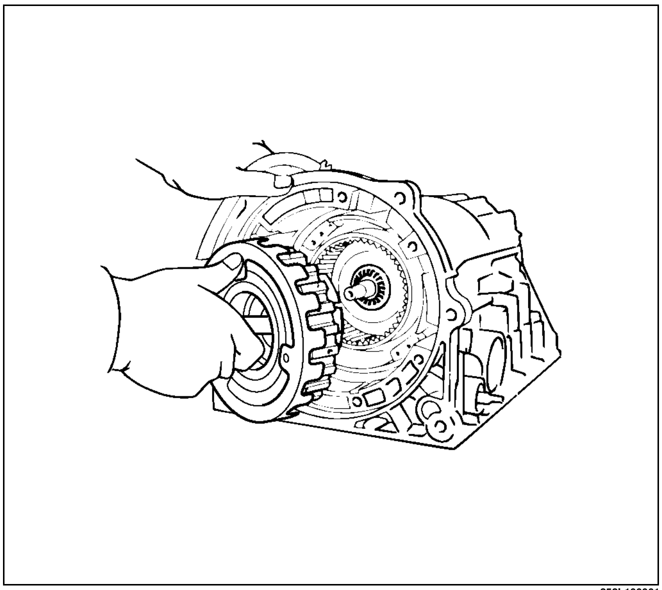
252RY00001

SECTION 4A

PROPELLER SHAFT

TABLE OF CONTENTS

34. Install the overdrive planetary gear and direct clutch.

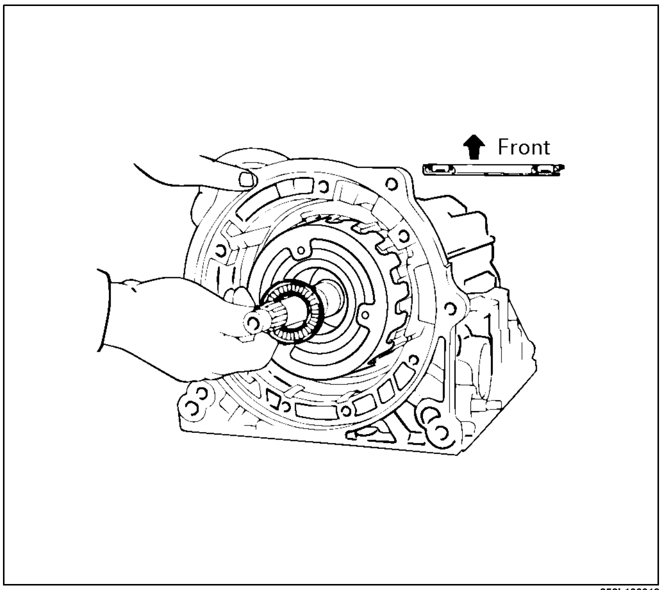


252L100001

35. Coat the assembled bearing and race with petroleum jelly and install it onto the direct clutch.

Bearing and race diameter (Reference)

	Inside	Outside
Bearing and race	28.9 mm (1.138 in)	50.2 mm (1.976 in)

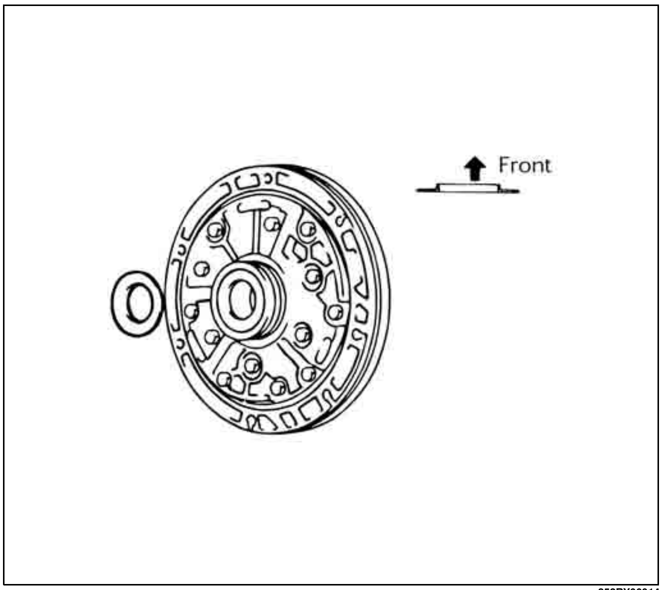


252L100018

36. Coat the race with petroleum jelly and install it onto the oil pump.

Race diameter (Reference)

	Inside	Outside
Race	28.6 mm (1.126 in)	46.5 mm (1.831 in)

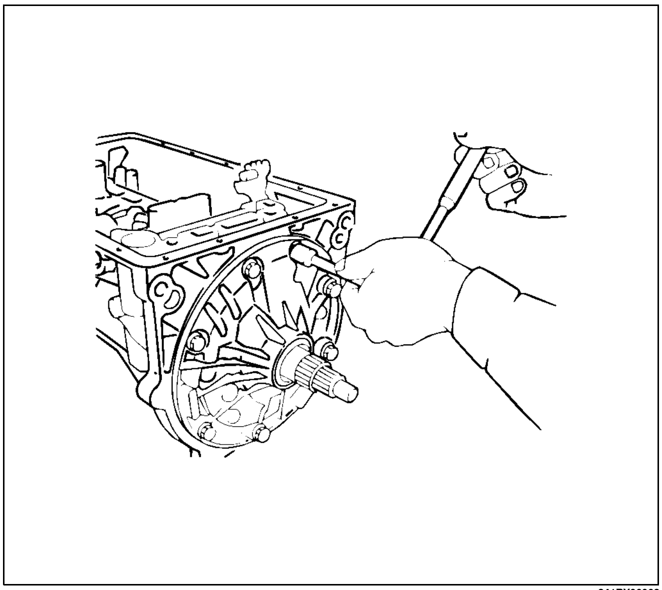


252RY00014

37. Coat the O-ring with ATF and install it around the pump body.
Place the oil pump through the input shaft, and align the bolt holes of the pump body with the transmission case.
Hold the input shaft, and lightly press the oil pump body to slide the oil seal rings on the stator shaft through the direct clutch drum.
CAUTION:
Do not push on the oil pump strongly or the oil seal ring will stick to the direct clutch drum.
Install the seven bolts.

Torque: 22 N·m (2.2 kgf·m/16 lb·ft)

38. Check input shaft rotation.
Make sure the input shaft rotates smoothly.



241RY00003

Diaassembly, Inspection and Reassembly of minor Components

NOTE: The instructions here are organized so that you work on only one component group at a time.
This will help avoid confusion from similar-looking parts of different subassemblies being on your workbench at the same time.
The component groups are inspected and repaired from the converter housing side.
As much as possible, complete the inspection, repair and reassembly before proceeding to the next component group. If a component group cannot be reassembled because parts are being ordered, be sure to keep all parts of that group in separate container while proceeding with disassembly, inspection, repair and reassembly of other component groups.
Recommended ATF type DEXRON III.

General Cleaning Notes:

1. All disassembled parts should be washed clean and any fluid passages and holes should be blown through with compressed air.
2. When using compressed air to dry parts, always aim away from yourself to prevent accidentally spraying automatic transmission fluid in your face.
3. The recommended automatic transmission fluid should be used for cleaning.

Parts Arrangement:

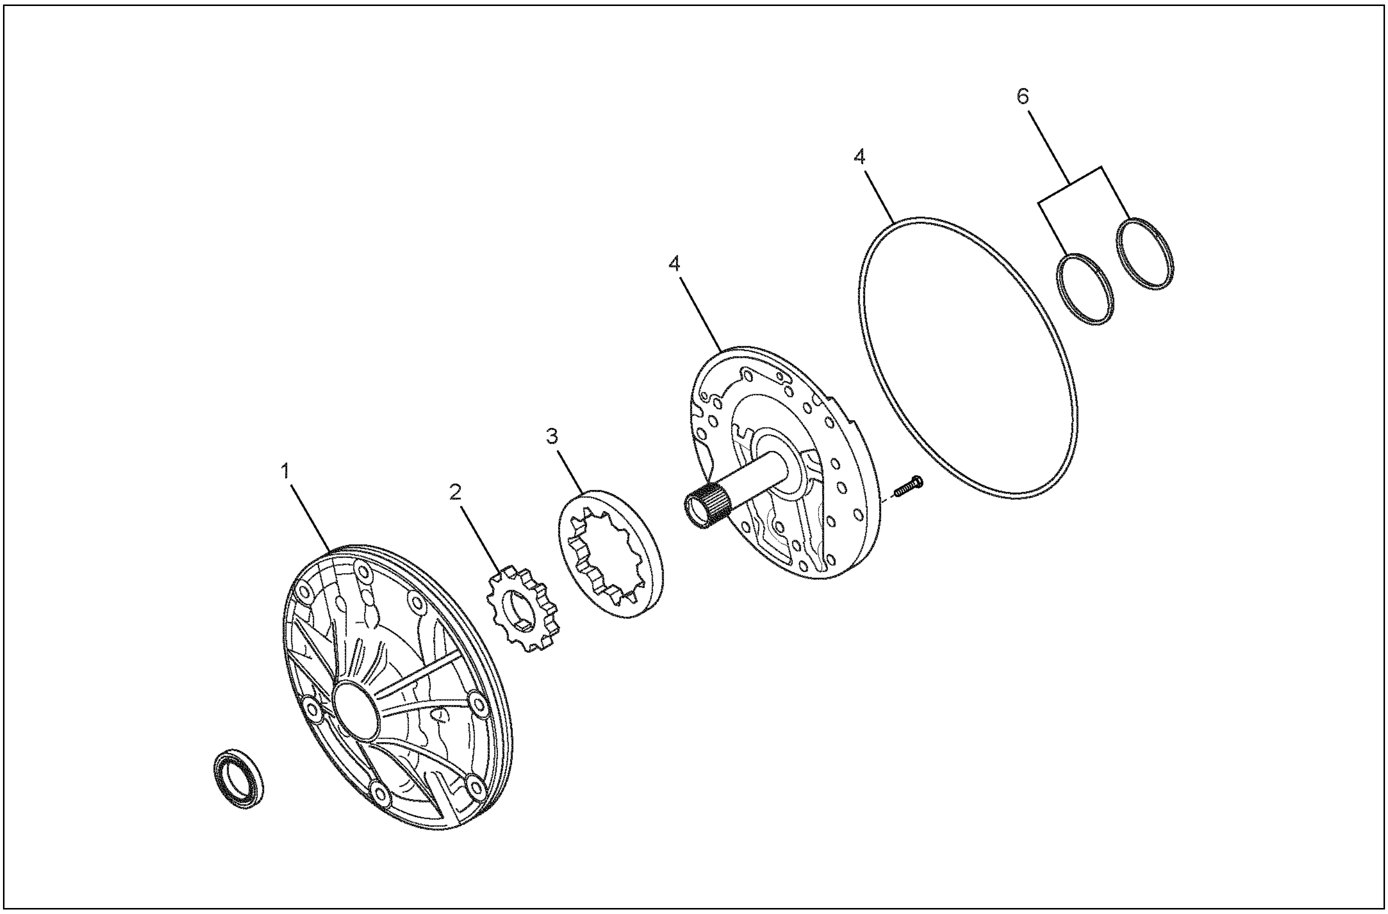
1. After cleaning, the parts should be arranged in proper order to allow performing inspection, repairs, and reassembly with efficiency.
2. When disassembling a valve body, be sure to keep each valve together with the corresponding spring.
3. New brakes and clutches that are to be used for replacement must be soaked in transmission fluid for at least thirty minutes before assembly.

General Assembly:

1. All oil seal rings, clutch discs, clutch plates, rotating parts, and sliding surfaces should be coated with transmission fluid prior to reassembly.
2. All gaskets and rubber O-ring should be replaced.
3. Make sure that the ends of a snap ring are not aligned with one of the cutouts and are installed in the groove correctly.
4. If a worn bushing is to be replaced, the subassembly containing that bushing must be replaced.
5. Check thrust bearings and races for wear or damage. Replace if necessary.
6. Use petroleum jelly or vaseline to keep parts in place.

Oil Pump

Disassembly View



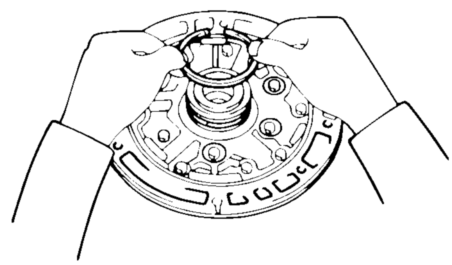
RTW77AMF000201

Legend

(1) Oil pump body
(2) Oil pump drive gear
(3) Oil pump driven gear
(4) Stator shaft
(5) O-ring
(6) Oil seal ring

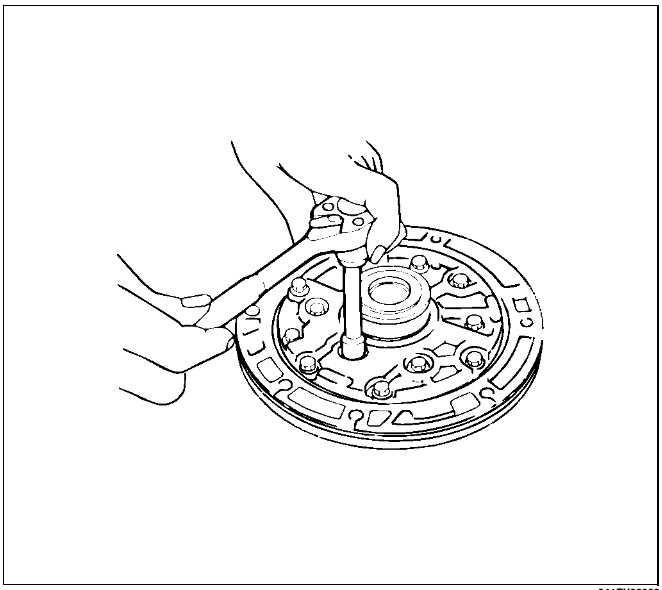
Disassembly

1. Use torque converter as work stand.
   Remove 2 oil seal rings from stator shaft.



241RY00005

2. Remove the O-ring.
3. Remove the stator shaft.
4. Remove the oil pump drive gear.
5. Remove the oil pump driven gear.
6. Remove the oil pump body.
   Remove 13 bolts, and then remove the stator shaft from oil pump body.
   Then remove drive and driven gear.



241RY00006

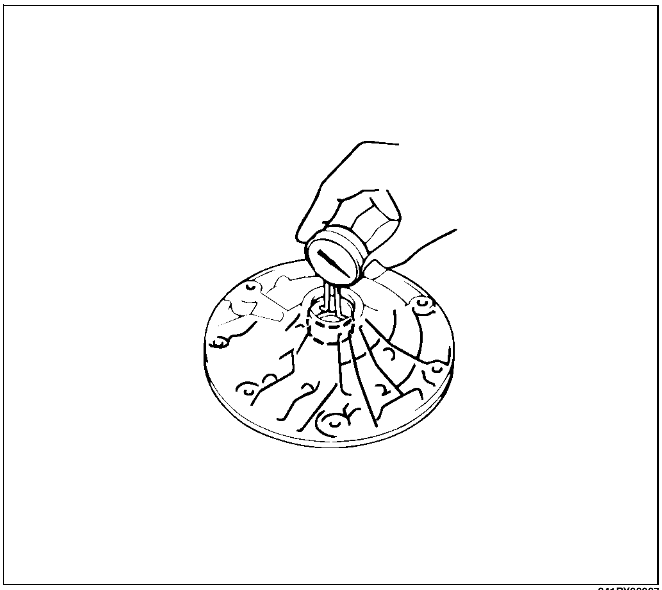
Inspection and Repair

Make necessary correction or parts replacement if wear, damage or any abnormal conditions are found through inspection.

1. Check oil pump body bushing.
   Using a dial indicator, measure the inside diameter of the oil pump body bushing.

   Maximum inside diameter: 38.19mm (1.5035in)

   If the inside diameter is greater than the maximum, replace the oil pump body.



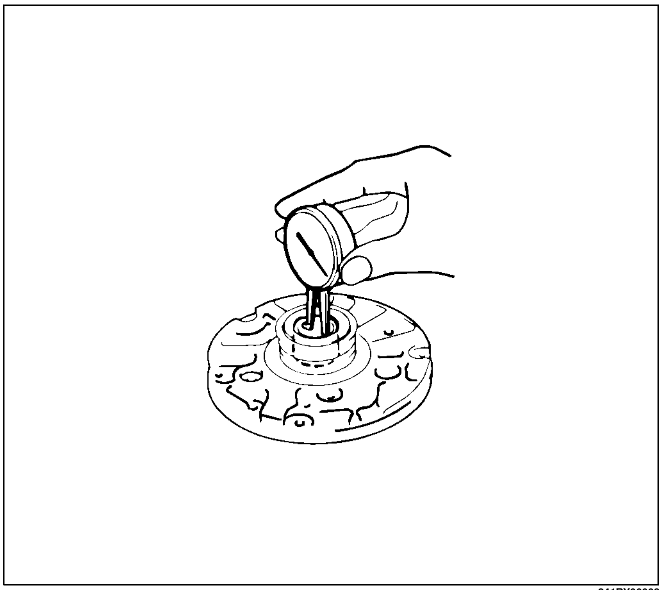
241RY00007

2. Check stator shaft bushing.
   Using a dial indicator, measure the inside diameter of the stator shaft bushing.

   Maximum inside diameter: Front side: 21.58mm (0.8496in)

   Maximum inside diameter: Rear side: 27.08mm (1.0661in)

   If the inside diameter is greater than the maximum, replace the stator shaft.



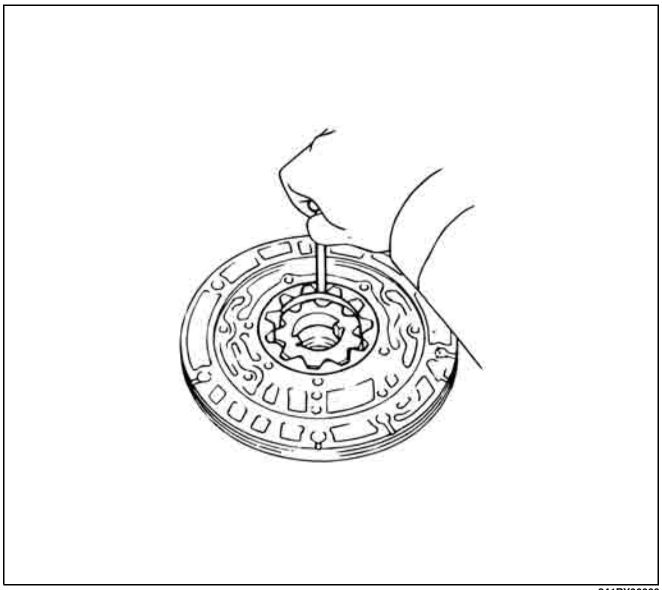
241RY00008

3. Check tip clearance of both gears.
   Measure between the gear teeth and the cresent-shaped part of the pump body.

   Standard tip clearance: 0.11 – 0.14mm (0.0043 – 0.0055in)

   Maximum tip clearance: 0.19mm (0.0075in)

   If the tip clearance is greater than the maximum, replace the drive gear, driven gear or pump body.



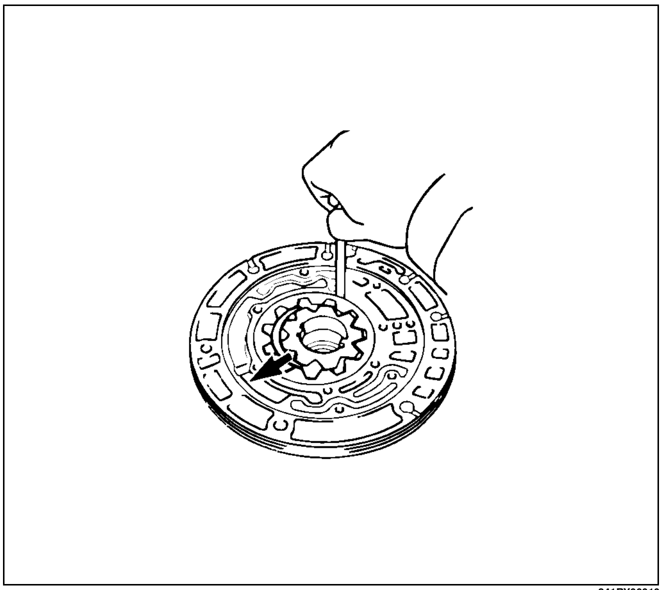
241RY00009

4. Check body clearance of driven gear.
   Push the driven gear to one side of the body.
   Use a feeler gauge, measure the clearance.

Standard body clearance: 0.07 – 0.15 mm (0.0028 – 0.0059 in)

Maximum body clearance: 0.2 mm (0.0079 in)

If the body clearance is greater than the maximum, replace the drive gear, driven gear or pump body.



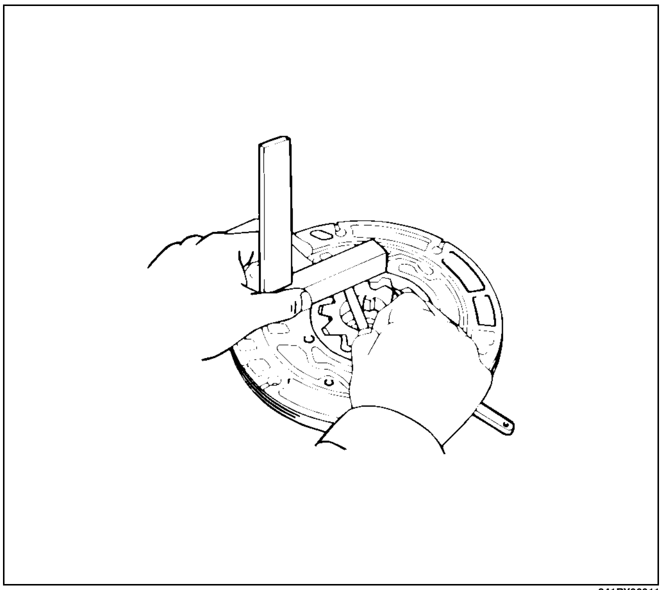
241RY00010

5. Check side clearance of both gears.
   Using a steel straightedge and a feeler gauge, measure the side clearance of both gears.

Standard side clearance: 0.02 – 0.05 mm (0.0008 – 0.0020 in)

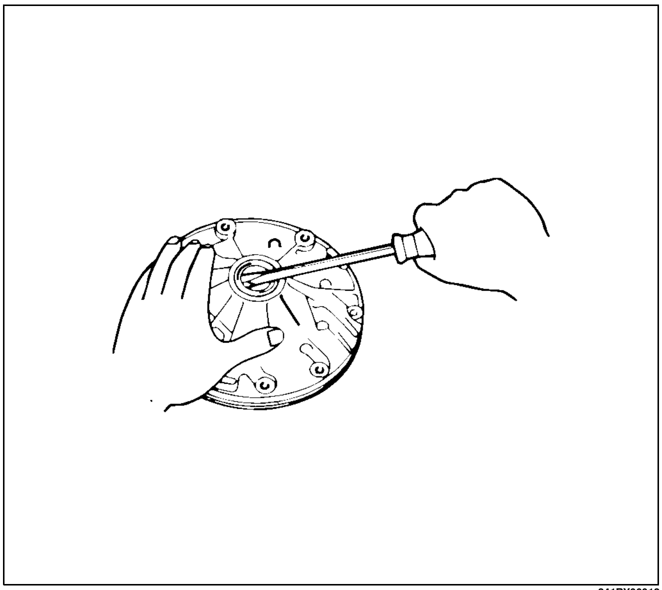
Maximum side clearance: 0.1 mm (0.004 in)

If the side clearance is greater than the maximum, replace the drive gear, driven gear or pump body.



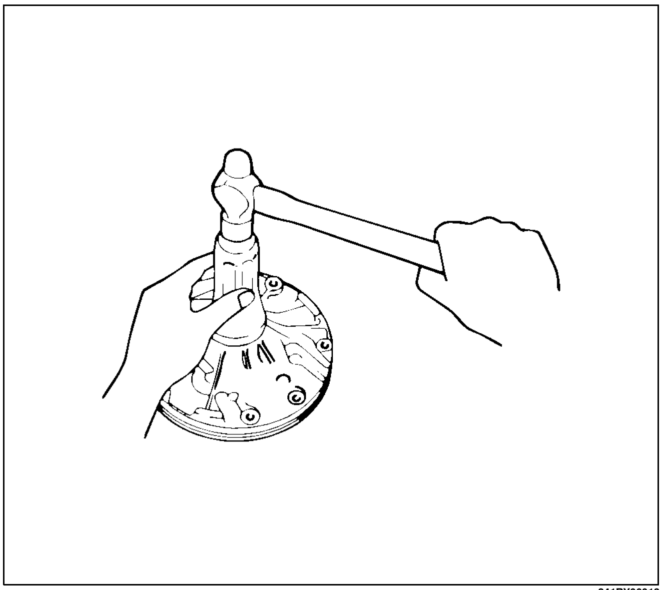
241RY00011

6. Check oil seal.
   Check for wear, damage or cracks.
   If necessary, replace oil seal.
   Pry off the oil seal with a screwdriver.



241RY00012

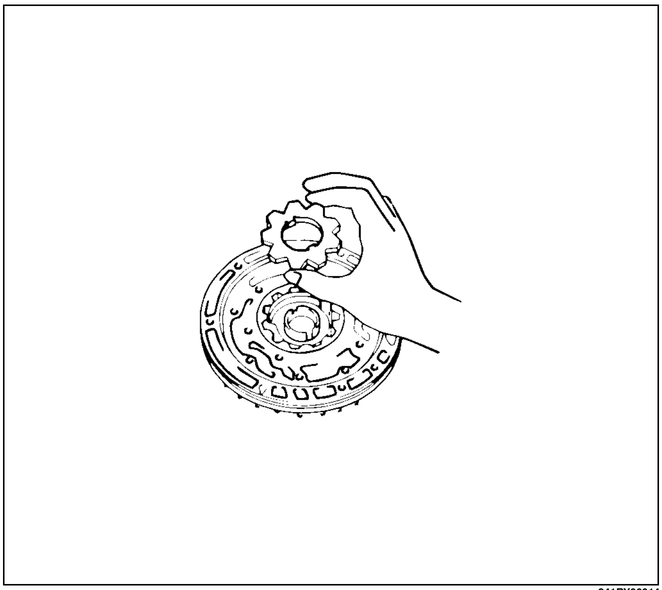
Using special tool, install a new oil seal.
The oil seal end should be flush with the outer edge of the pump body.
Oil seal installer : 5-8840-2256-0
Coat the oil seal lip with multipurpose grease.



241RY00013

Reassembly

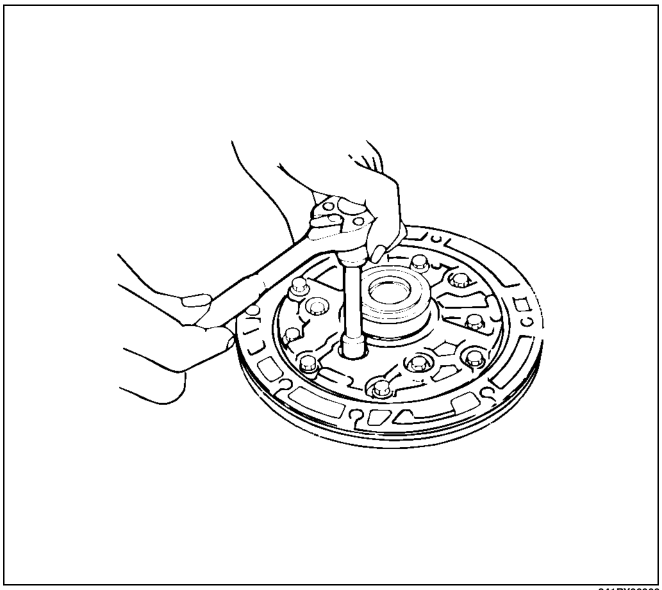
1. Place the oil pump body on the torque converter.
2. Coat the driven gear and drive gear with ATF.
3. Install the driven gear and drive gear.



241RY00014

4. Align the stator shaft with the bolt holes.
   Tighten the thirteen bolts.

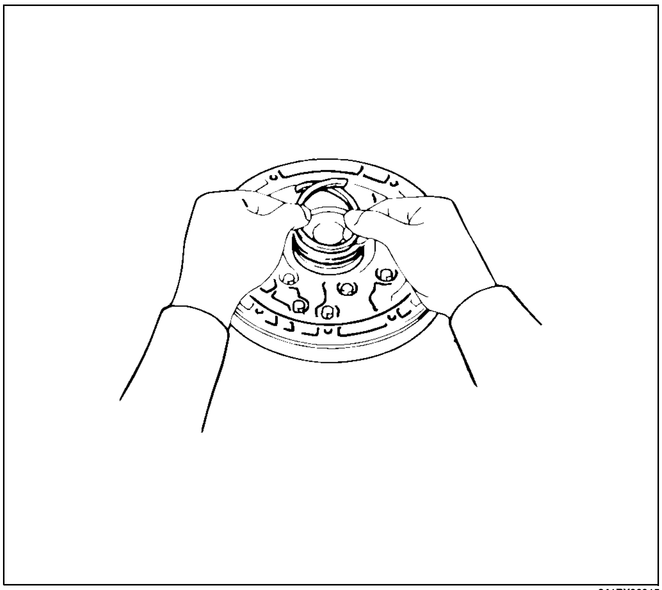
Torque: 10 N·m (1.0 kg·m/87 lb·in)



241RY00006

5. Install the oil seal ring.
   - Coat the oil seal rings with ATF.
   - Contract the oil seal rings as shown, and install them onto the stator shaft.

NOTE: Do not spread the ring ends too much.

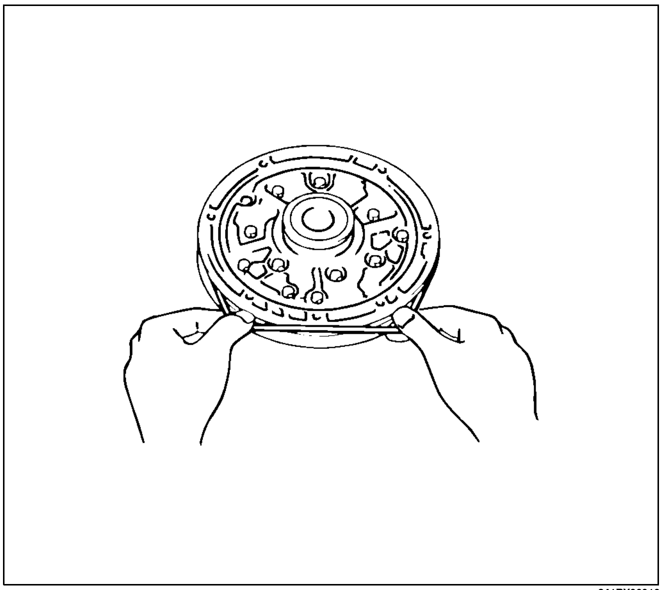


241RY00015

6. Coat a new O-ring with ATF and install it to the oil pump body.

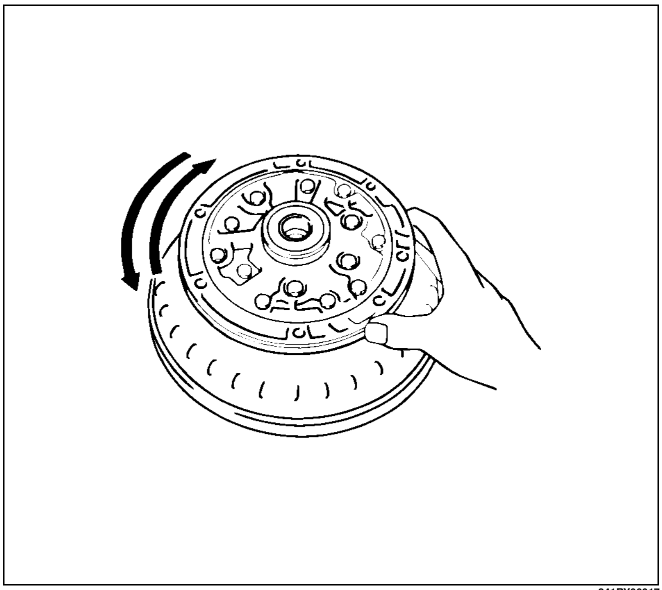
O-ring size (Reference)

Inside diameter	204.9 mm (8.067 in)
Thickness	3.5 mm (0.138 in)



241RY00016

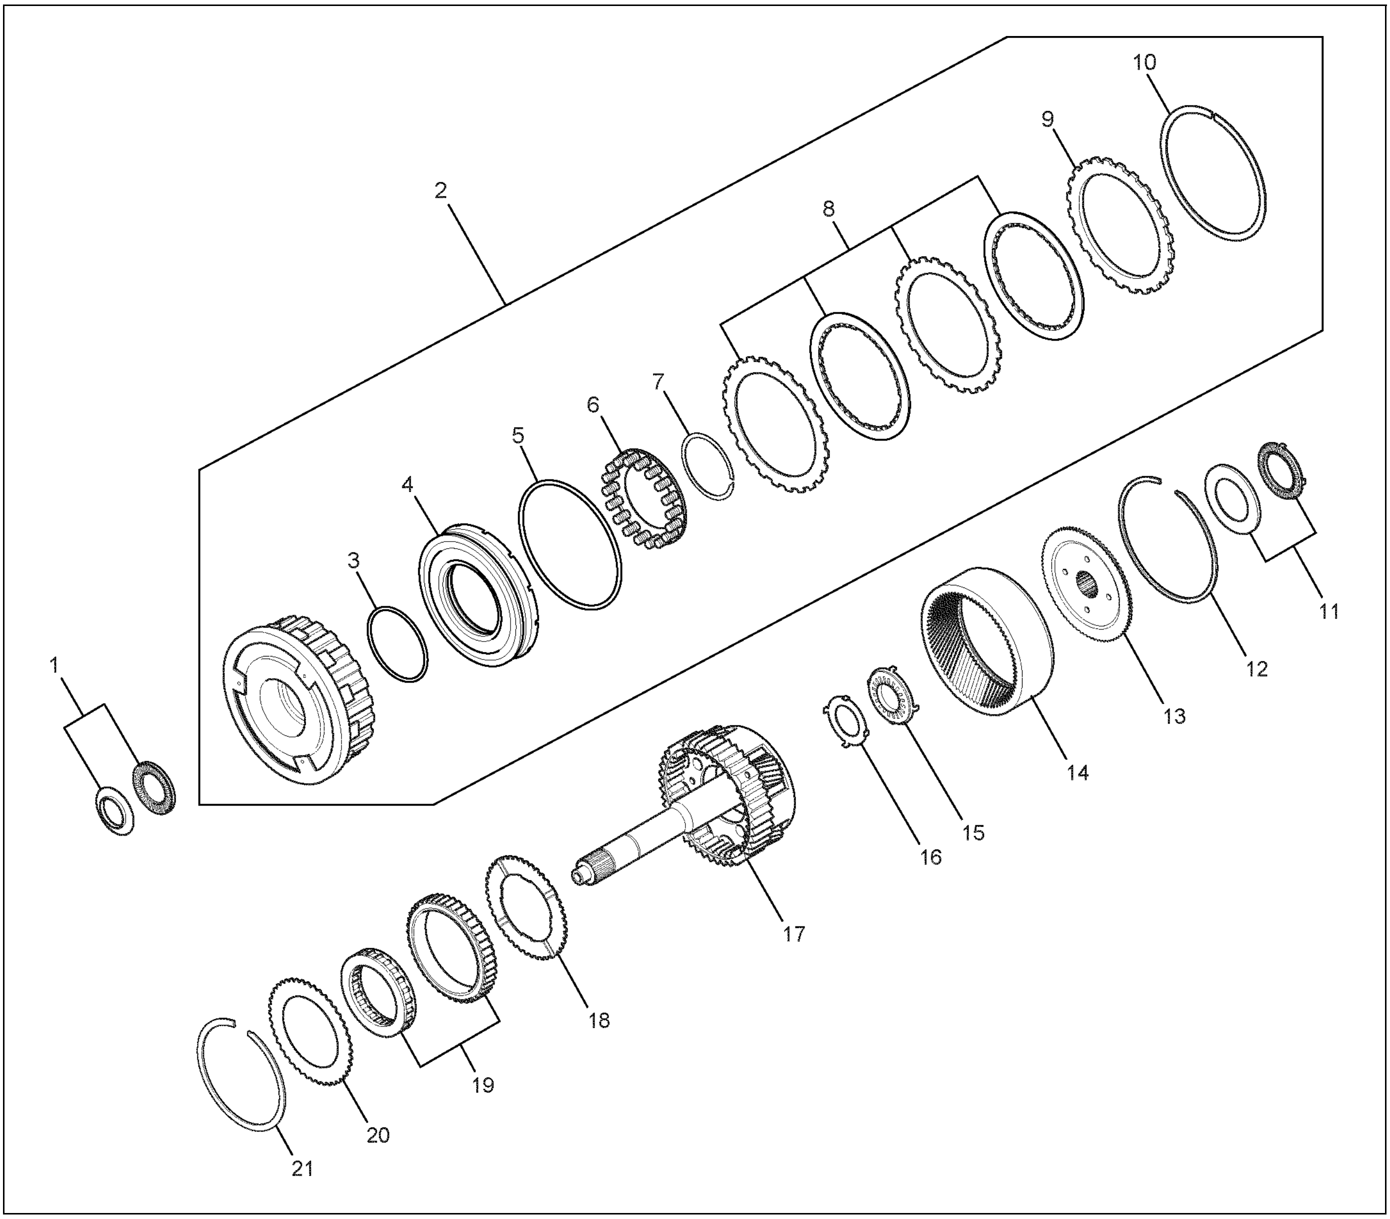
7. Check oil pump drive gear rotation.
   Make sure the drive gear rotates smoothly when installed to the torque converter.



241RY00017

OD Planetary Gear and OD Direct Clutch Assembly (C–0)

Disassembled View

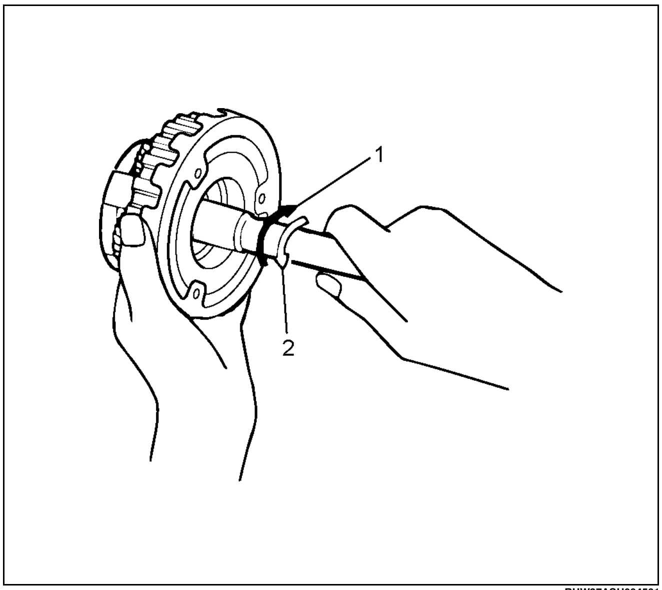


Legend

(1) Thrust bearing
(2) OD direct clutch assembly
(3) O-ring
(4) OD direct clutch piston
(5) O-ring
(6) Piston return spring
(7) Snap ring
(8) Clutch disc
(9) Flange
(10) Snap ring
(11) Thrust bearing
(12) Snap ring
(13) Ring gear flange
(14) OD planetary ring gear
(15) Thrust bearing
(16) Race
(17) OD planetary gear assembly
(18) Thrust washer
(19) OD one-way clutch
(20) Retaining plate
(21) Snap ring

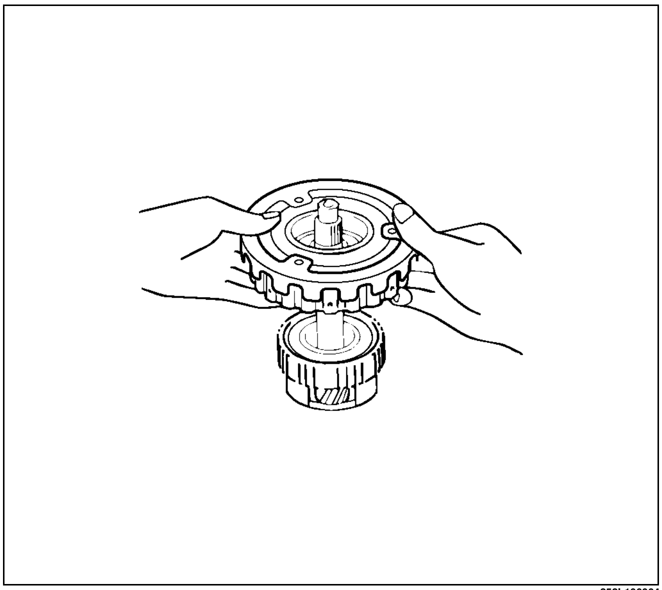
Disassembly

1. Check operation of one-way clutch.
   Hold the OD direct clutch drum and turn the input shaft.
   The input shaft should turn freely clockwise and should lock counterclockwise.



RUW37ASH004501

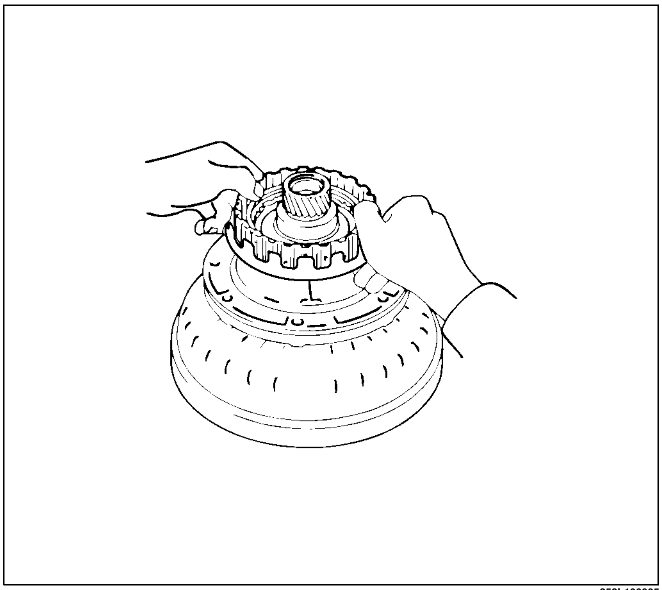
2. Remove OD direct clutch assembly from OD planetary gear assembly.



252L100004

3. Then remove thrust bearing with the race from OD direct clutch drum.

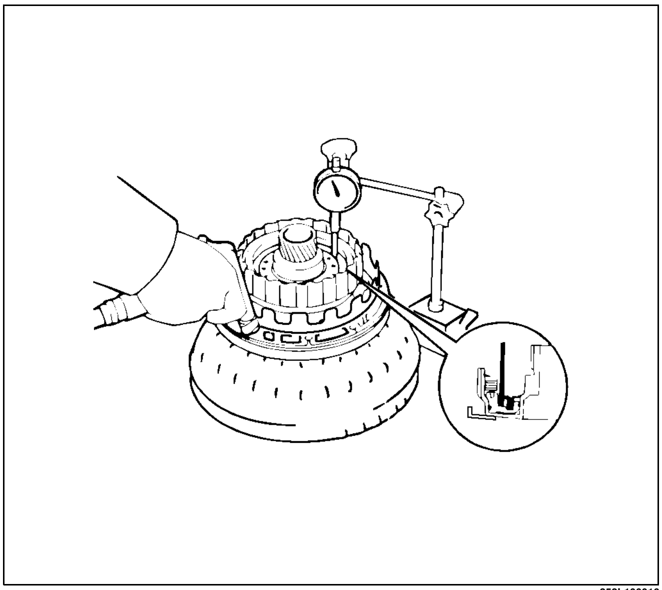
4. Check piston stroke of OD direct clutch (C–0).
   Place the oil pump onto the torque converter, and then place the OD direct clutch assembly onto the oil pump.



252L100005

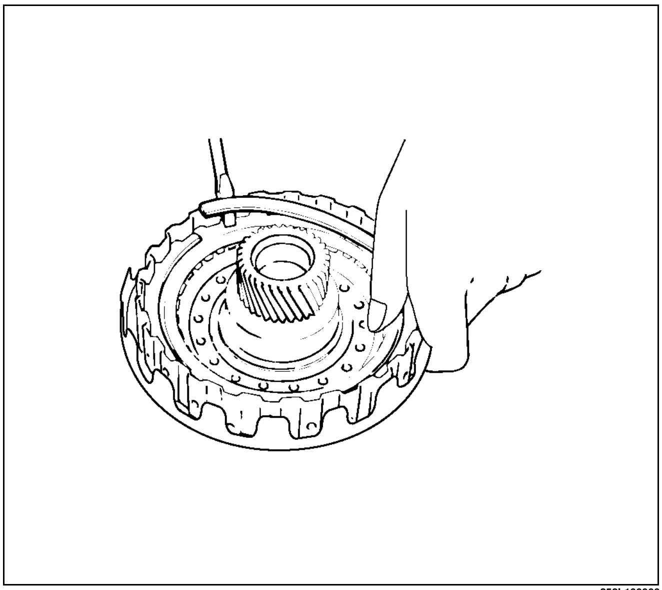
Use a dial indicator, measure the OD direct clutch piston stroke applying and releasing the compressed air (390 – 780 kPa or 57 – 114 psi) as shown.

Piston stroke: 1.85 – 2.15 mm (0.0728 – 0.0846 in)



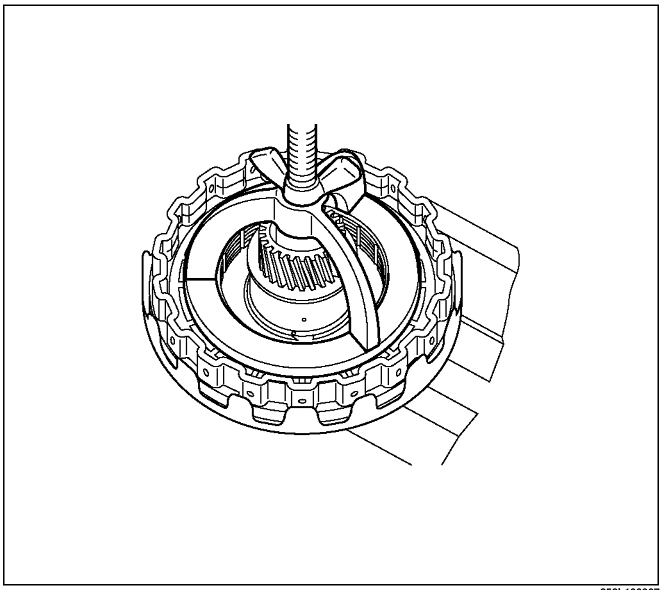
252L100016

5. Remove snap ring from clutch drum.



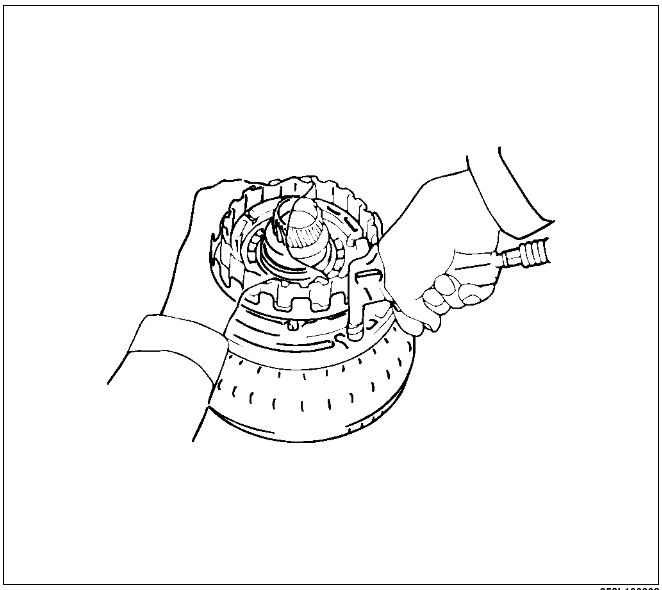
252L100006

6. Remove flange, two discs and two plates.
7. Place special tool on the spring retainer and compress the return spring.
   Using snap ring pliers, remove the snap ring.
   Spring compressor : 5-8840-0195-0



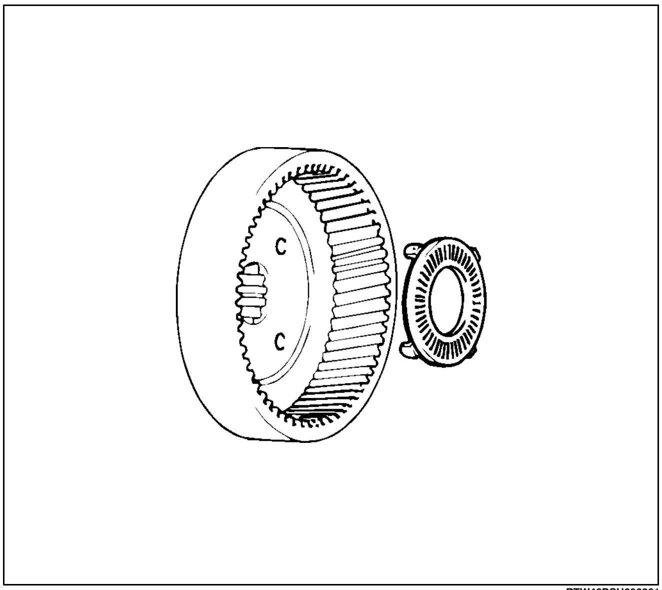
252L100007

8. Remove piston return spring
9. Remove the OD direct clutch piston with O-ring.
   - Place the oil pump onto the torque converter and then place the OD direct clutch onto the oil pump.
   - Holding the OD direct clutch piston by hand, apply compressed air to the oil pump to remove the OD direct clutch piston.
   - Remove the OD direct clutch piston.



252L100008

10. Remove two O–rings from piston.
11. Remove bearing and race from OD planetary ring gear.



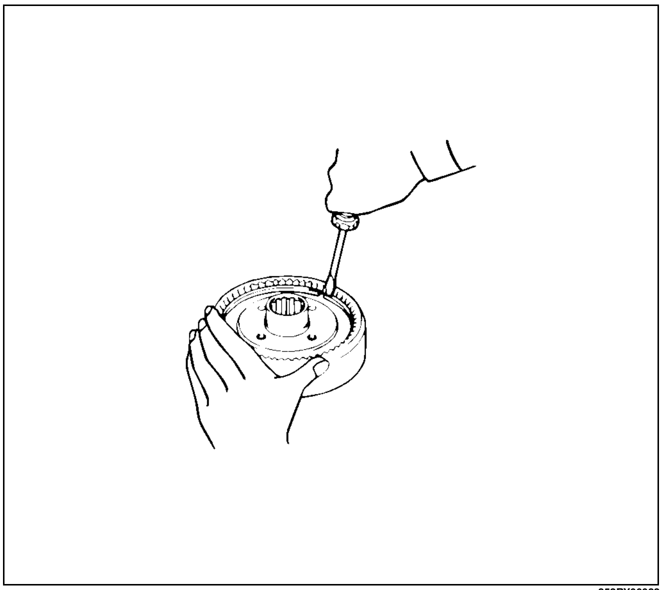
RTW46BSH000301

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNING COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

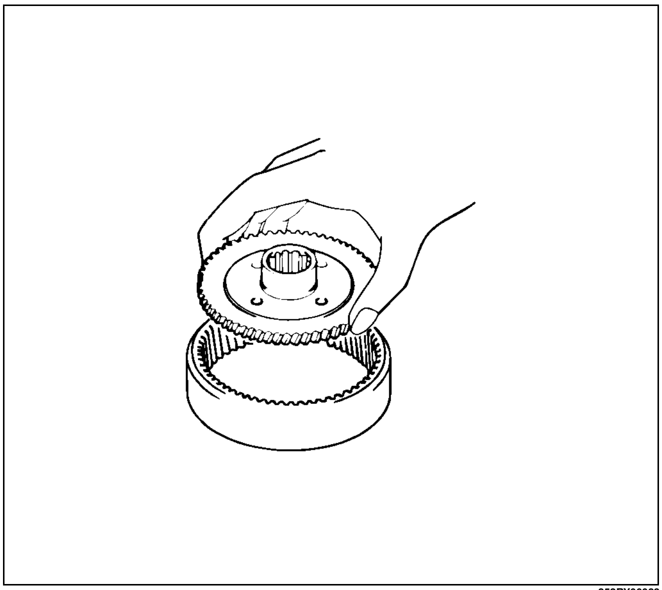
CAUTION : Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU/GM will call out those fasteners that require a replacement after removal. ISUZU/GM will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

12. Remove snap ring.



252RY00022

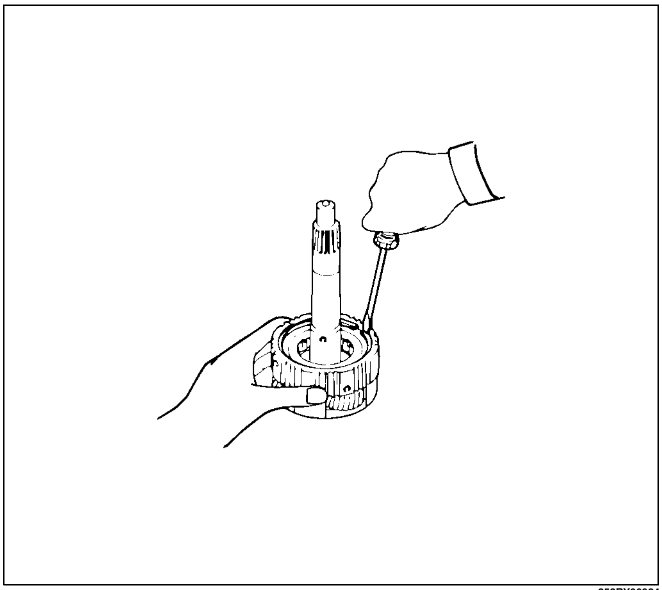
13. Remove ring gear flange from OD planetary ring gear.



252RY00023

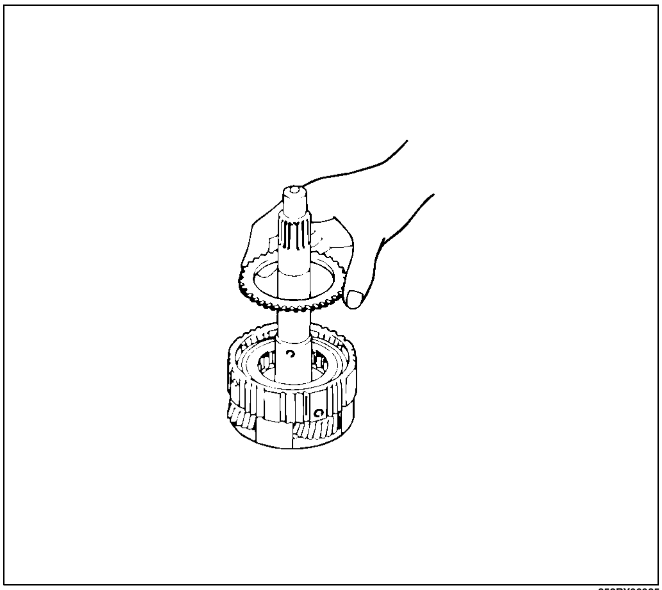
14. Remove the Race.

15. Remove snap ring, using screwdriver.



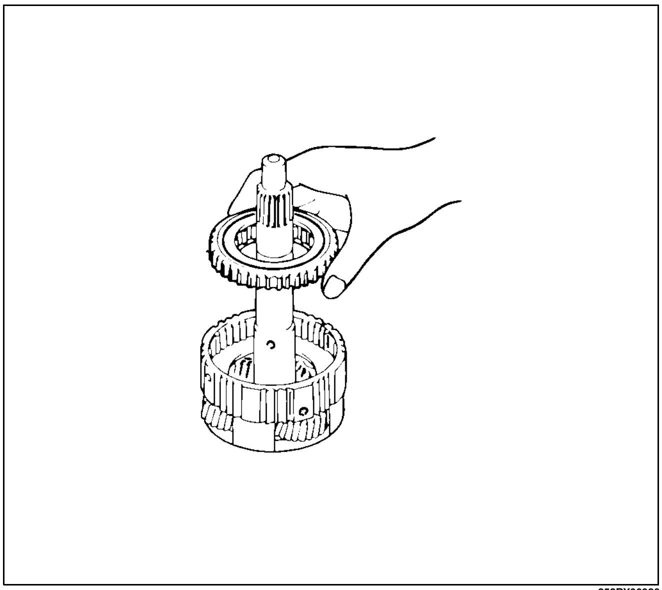
252RY00024

16. Remove retaining plate from OD planetary gear.



252RY00025

17. Remove OD one-way clutch with outer race.



252RY00026

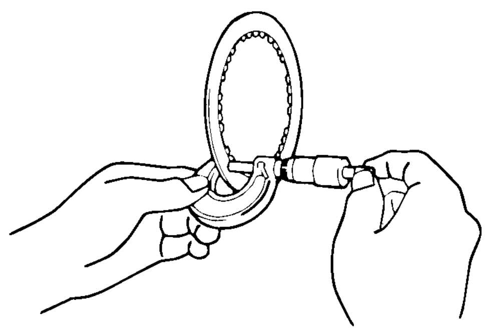
18. Remove the thrust washer.

Inspection and Repair

1. Check discs.
   Using a micrometer, measure the thickness of the discs.

   Minimum thickness: 2.04 mm (0.0803 in)

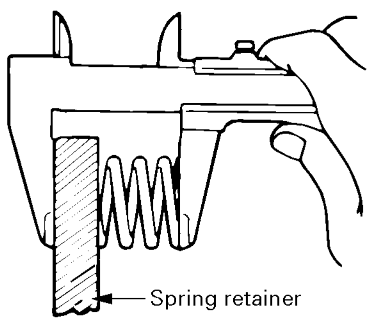
   If the thickness is less than the minimum, replace the disc.



252RY00027

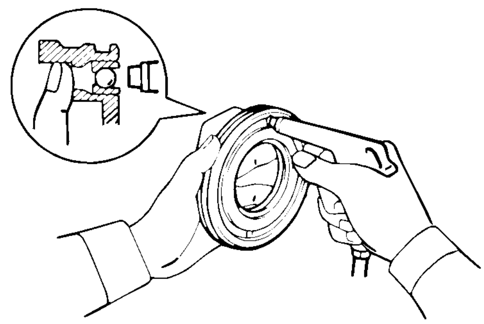
2. Check piston return spring
   Using calipers, measure the free length of the return spring.

   Standard length: 15.8 mm (0.622 in)



252RY00028

3. Check OD direct clutch piston.
   Check that the check ball is free by shaking the piston. Check that the valve does not leak by applying low-pressure compressed air.

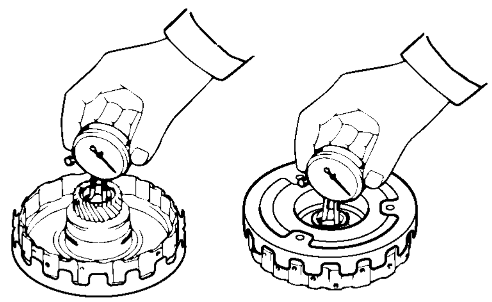


252RY00029

4. Check OD direct clutch drum bushings.
   Using a dial indicator, measure the inside diameter of the OD direct clutch drum bushings.

   Maximum inside diameter: 27.11 mm (1.0673 in)

   If the inside diameter is greater than the maximum, replace the OD direct clutch drum.

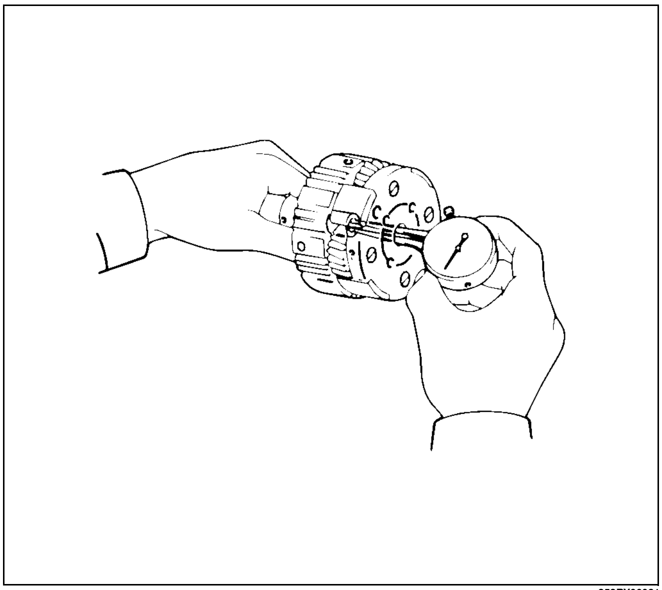


252L100009

5. Check OD planetary gear bushing.
   Using a dial indicator, measure the inside diameter of replace the OD planetary gear bushing.

Maximum inside diameter: 11.27 mm (0.4437 in)

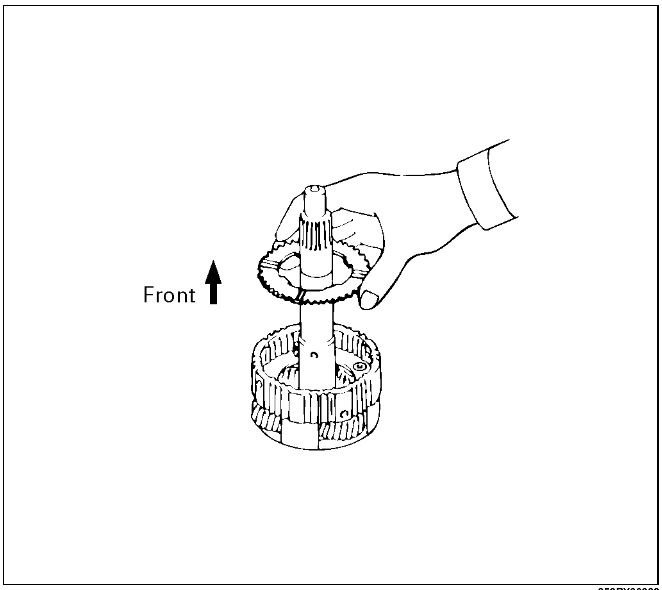
If the inside diameter is greater than the maximum, replace the OD planetary gear.



252RY00031

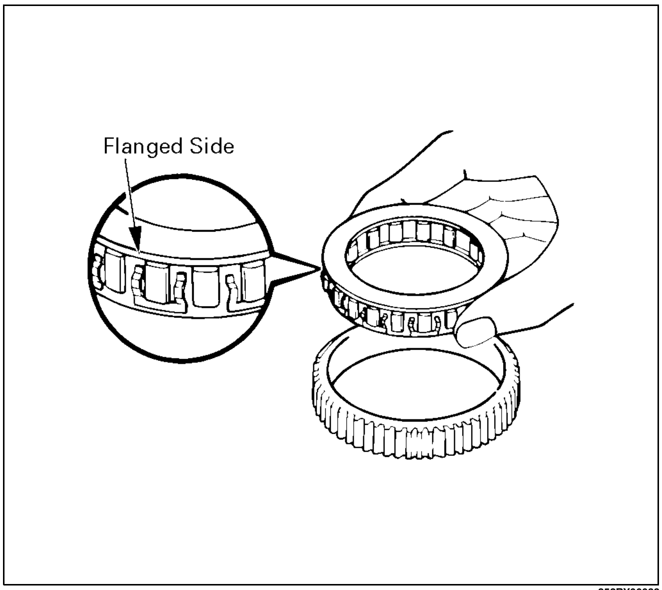
Reassembly

1. Install the thrust washer to the OD planetary gear, facing the grooved side upward.



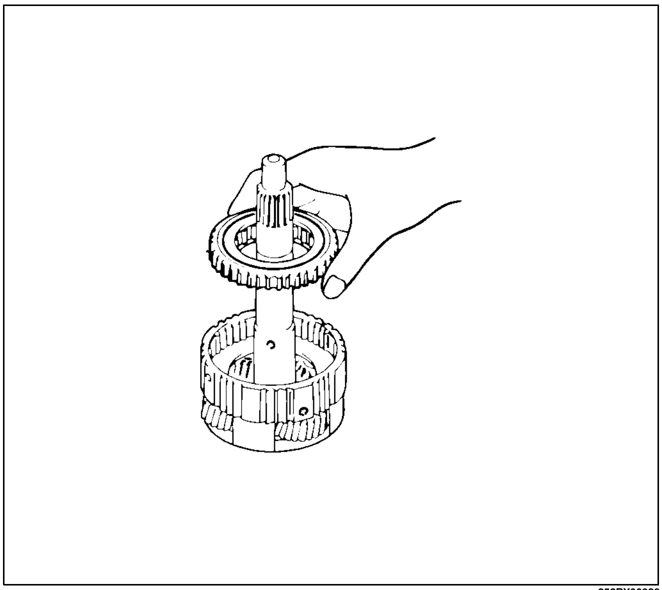
252RY00032

2. Install the one-way clutch into the outer race, with the flanged side of the one-way clutch facing upward.



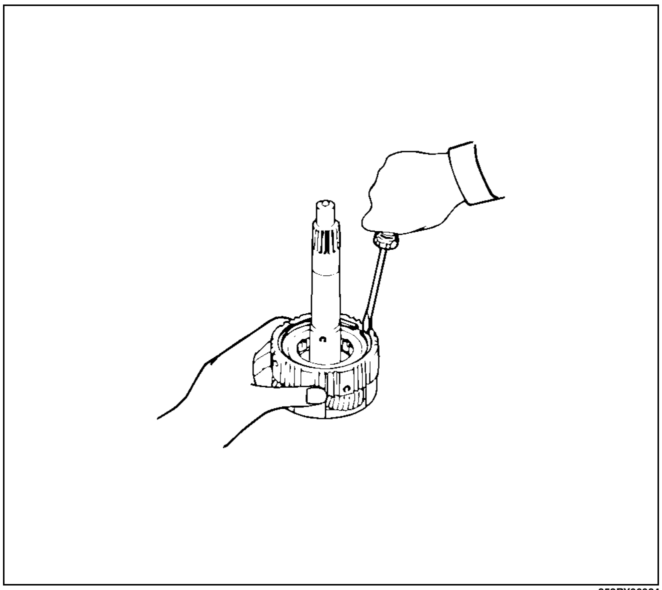
252RY00033

3. Install OD one-way clutch with outer race to overdrive planetary gear.



252RY00026

4. Install retaining plate, then install snap ring, using a screwdriver.

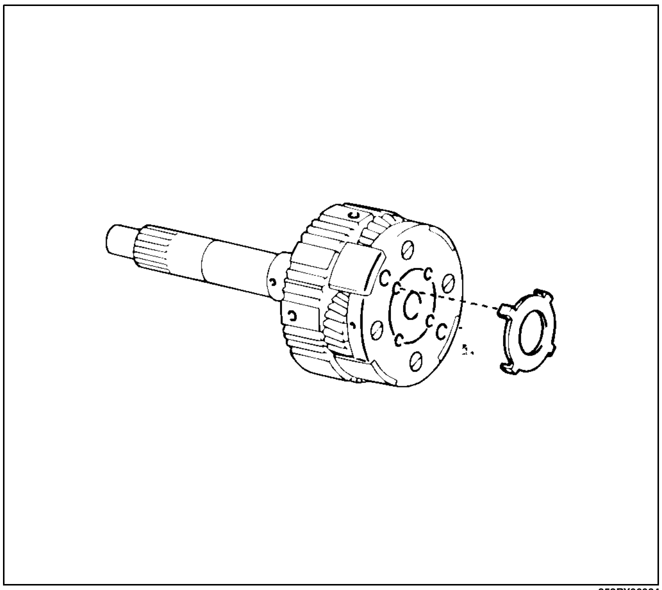


252RY00024

5. Coat the race with petroleum jelly and install it to the planetary gear.

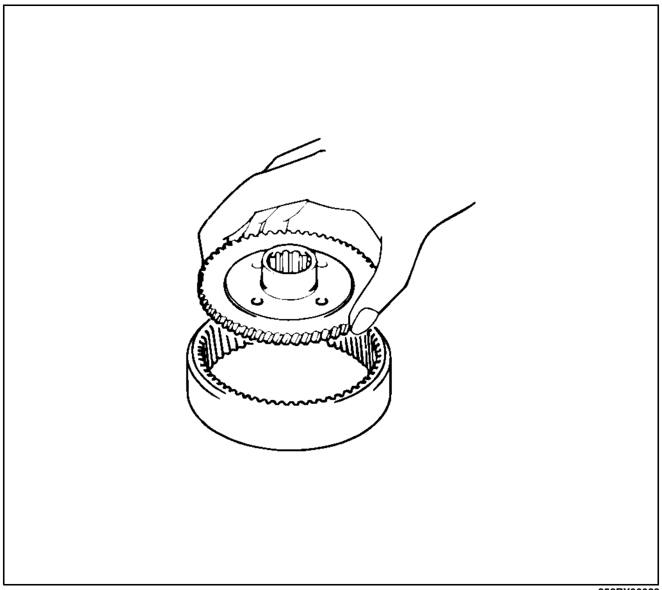
Race diameter (Reference)

Inside diameter	24.7 mm (0.972 in)
Outside diameter	41.8 mm (1.646 in)



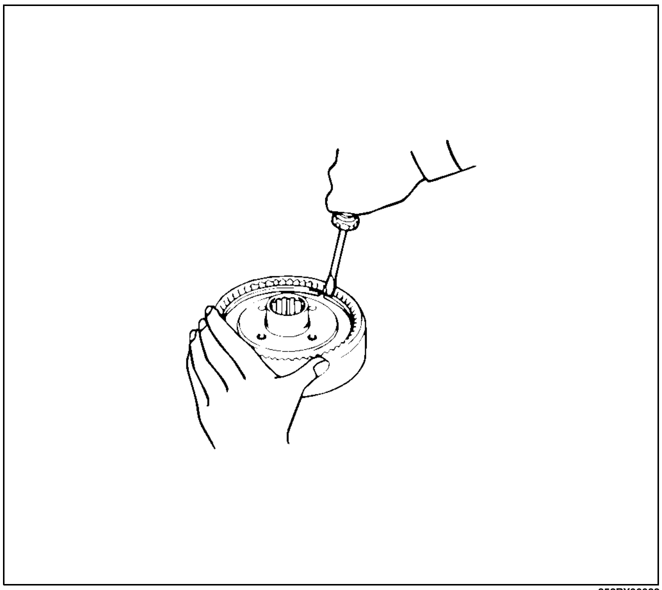
252RY00034

6. Install ring gear flange to OD planetary ring gear.



252RY00023

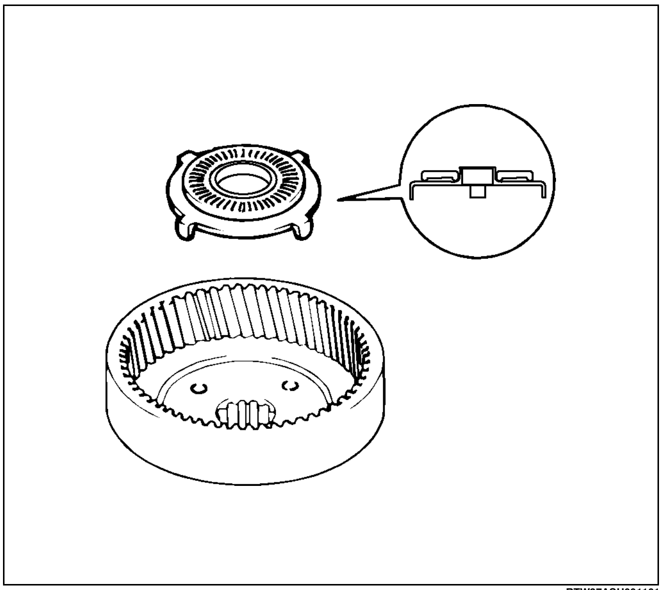
7. Install snap ring, using a screwdriver.



252RY00022

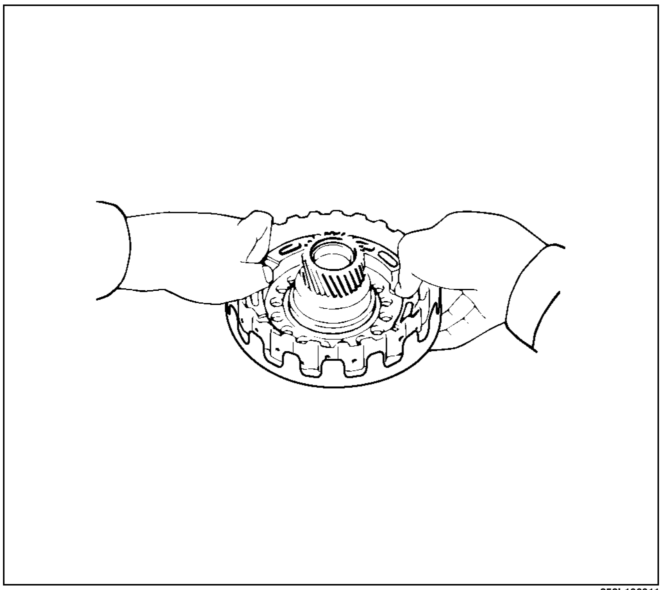
8. Install the race and bearing asm onto the OD planetary ring gear.
Race and bearing asm diameter (Reference)

	Inside	Outside
Bearing and race	24.2 mm (0.953 in)	47.8 mm (1.882 in)



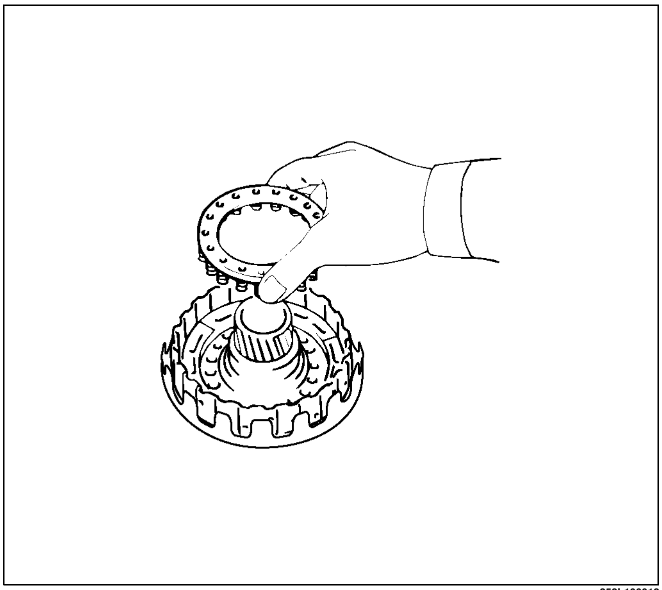
RTW37ASH001101

9. Coat new O-rings with ATF and install them on the OD direct clutch piston.
10. Being careful not to damage the O-rings, press in the OD direct clutch piston into the clutch drum, using both hands.



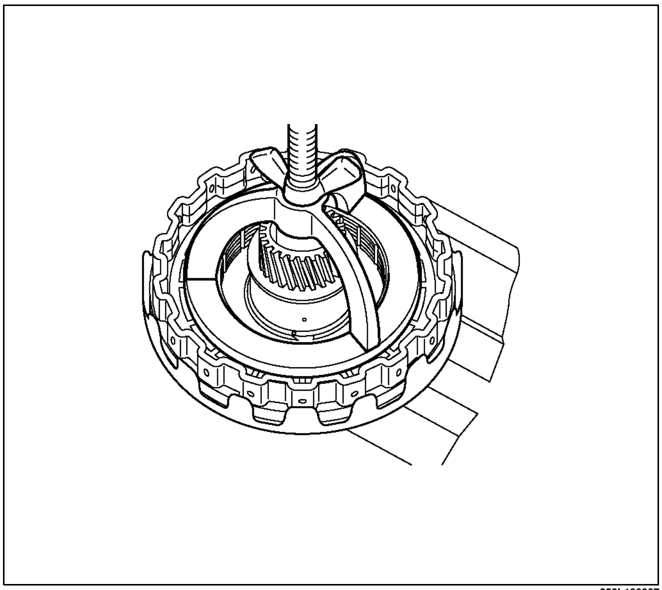
252L100011

11. Install piston return spring.



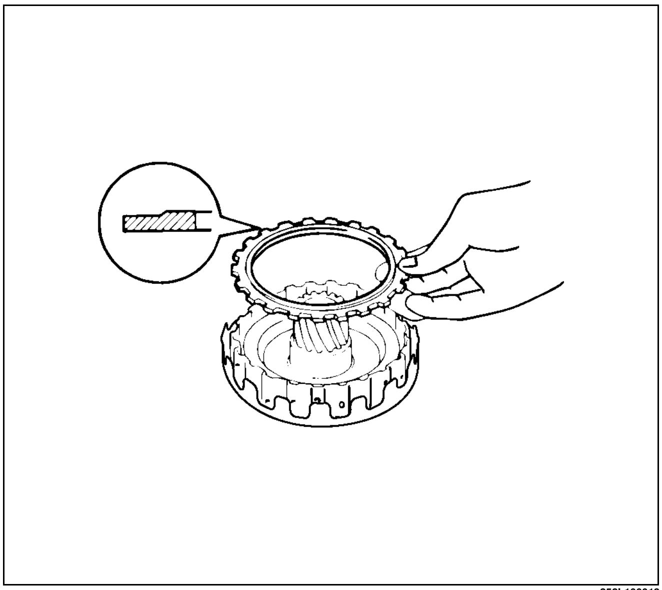
252L100012

12. Place special tool on the spring retainer, and compress the return spring.
Spring compressor : 5-8840-0195-0
Install the snap ring with snap ring pliers.
Be sure the end gap of the snap ring is not aligned with the spring retainer claw.



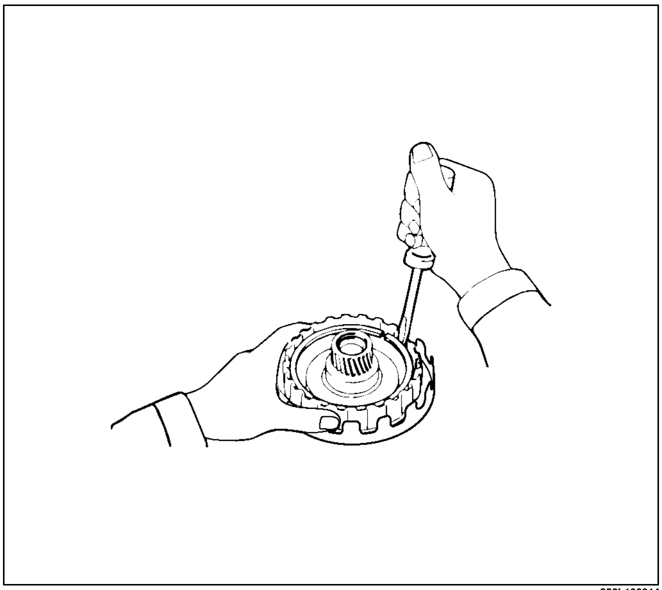
252L100007

13. Install two plates and two discs then install the flange, with the flat side facing downward.



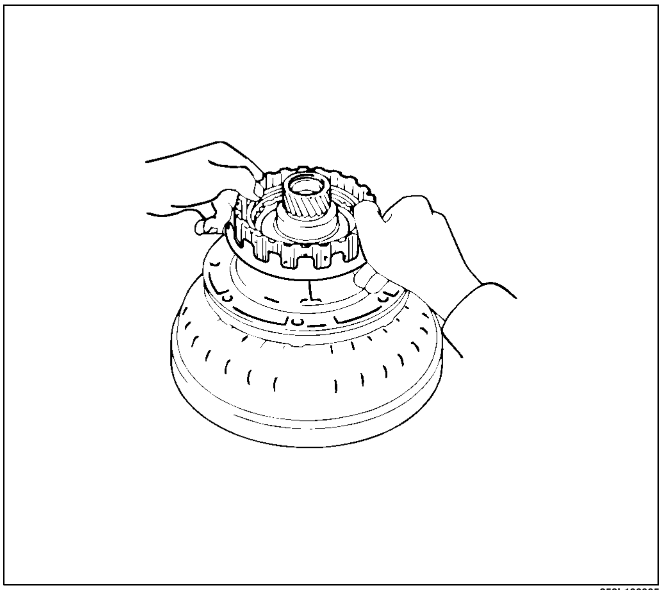
252L100013

14. Install snap ring.



252L100014

15. Check piston stroke of OD direct clutch (C–0)
Place the oil pump onto the torque converter, and then place the OD direct clutch assembly onto the oil pump.



252L100005

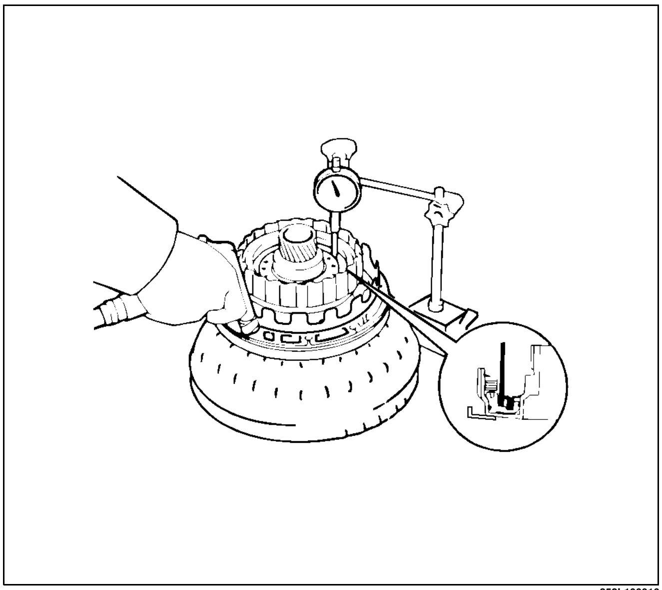
Using a dial indicator, measure the OD direct clutch piston stroke by applying and releasing the compressed air (390 – 780 kPa or 57 – 114 psi) as shown.

Piston stroke: 1.85 – 2.15 mm (0.0729 – 0.0847 in)

If the piston stroke is not within specification, replace the disc and recheck the piston stroke.
If the piston stroke is nonstandard, select another flange.

Flange sizes

Flange thickness	Flange thickness
3.8 mm (0.150 in)	3.4 mm (0.134 in)
3.7 mm (0.146 in)	3.3 mm (0.130 in)
3.6 mm (0.142 in)	3.2 mm (0.126 in)
3.5 mm (0.138 in)	3.1 mm (0.122 in)

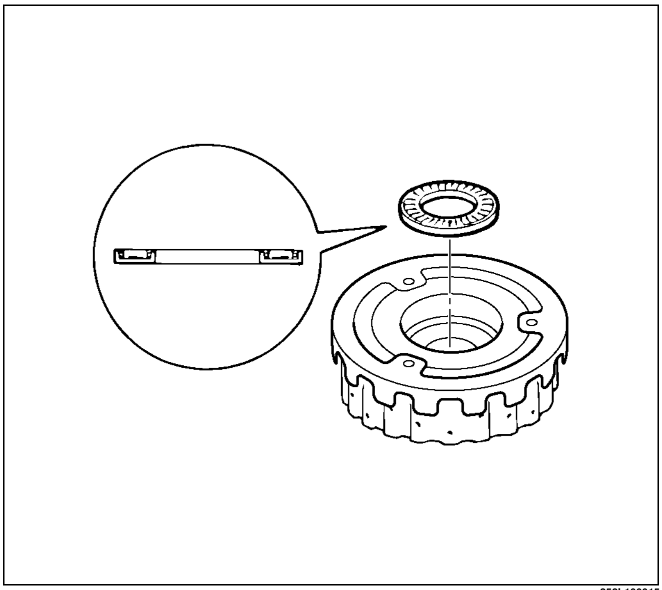


252L100016

16. Coat the assembled bearing and race with petroleum jelly and install it with the race side facing downward.

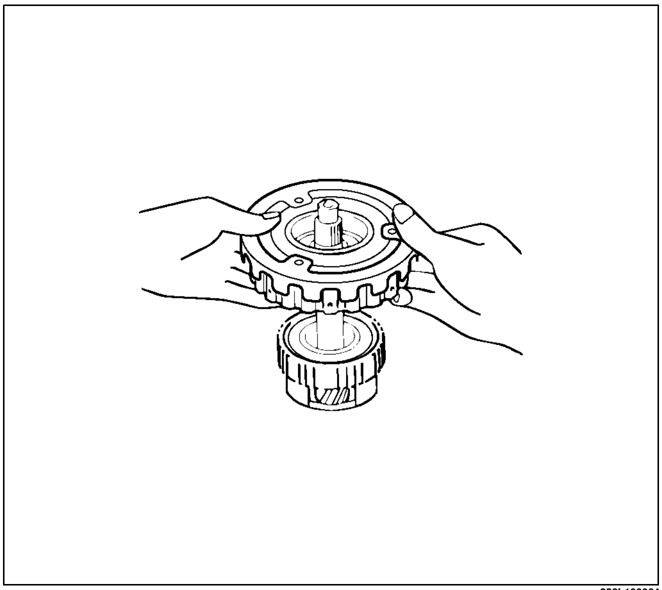
Bearing and race (Reference)

Inside diameter	28.9 mm (1.138 in)
Outside diameter	50.2 mm (1.976 in)



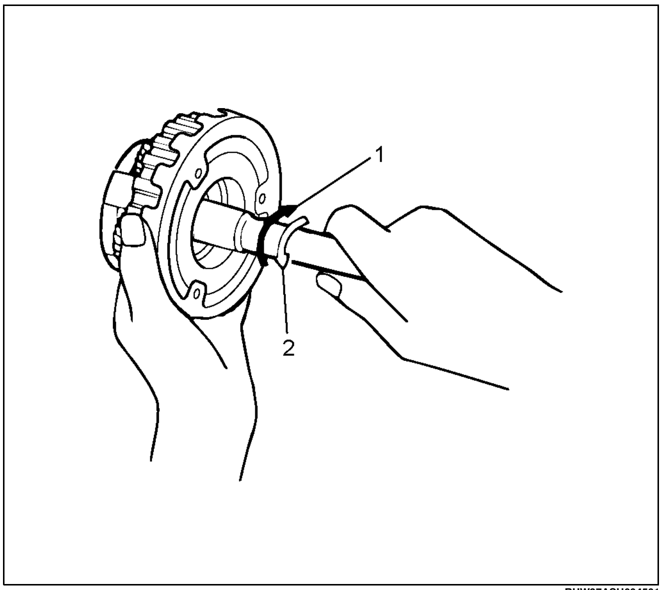
252L100015

17. Align the flukes of discs in the direct clutch.
Install the OD direct clutch assembly onto the OD planetary gear.



252L100004

18. Check operation of one-way clutch
Hold the OD direct clutch drum and turn the input shaft.
The input shaft should turn freely clockwise and should lock counterclockwise.



RUW37ASH004501

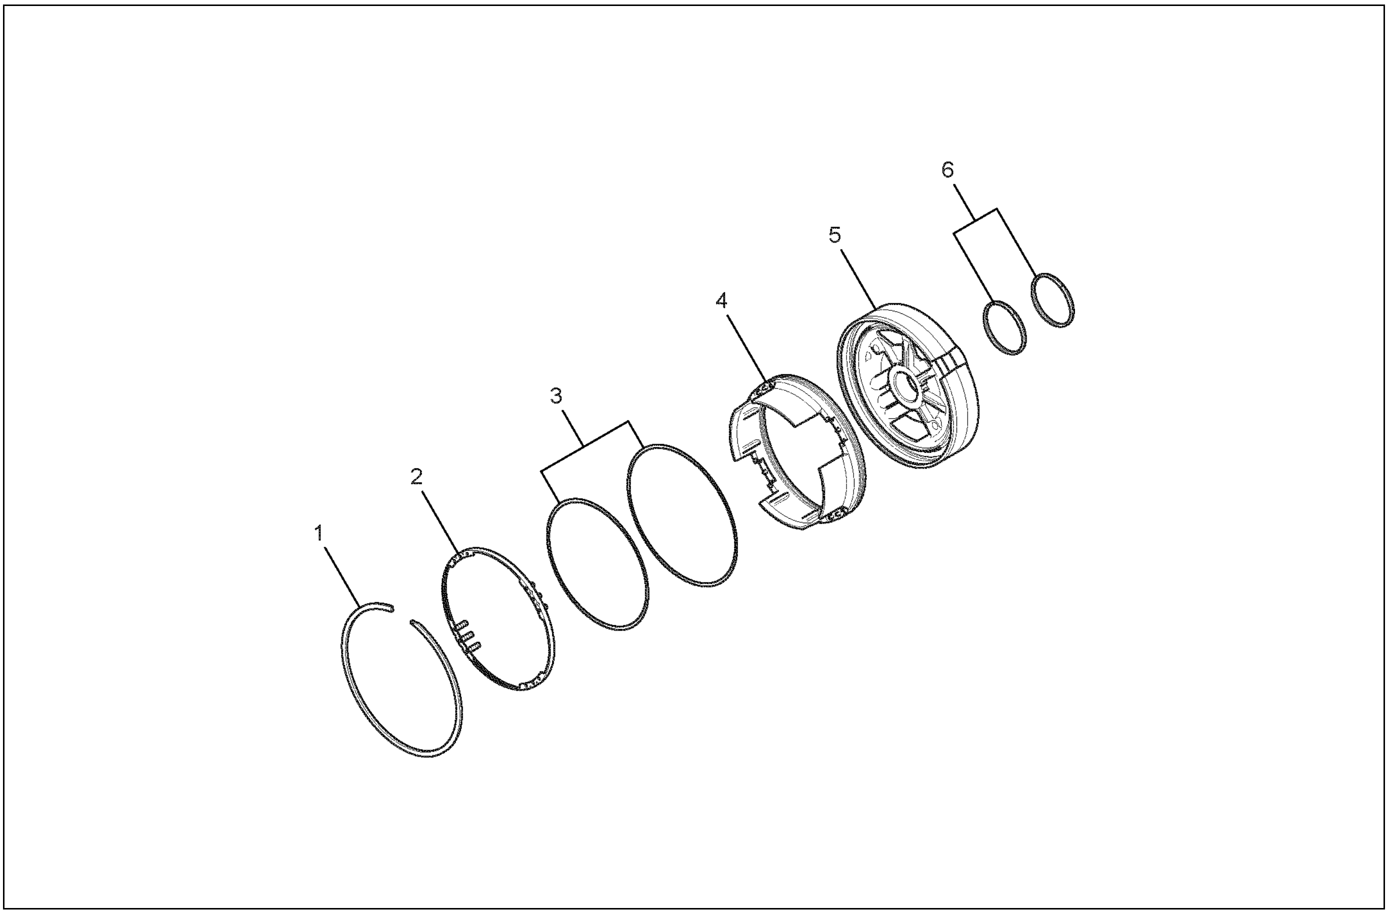
(2) Lock

OD Support Assembly

Disassembled View



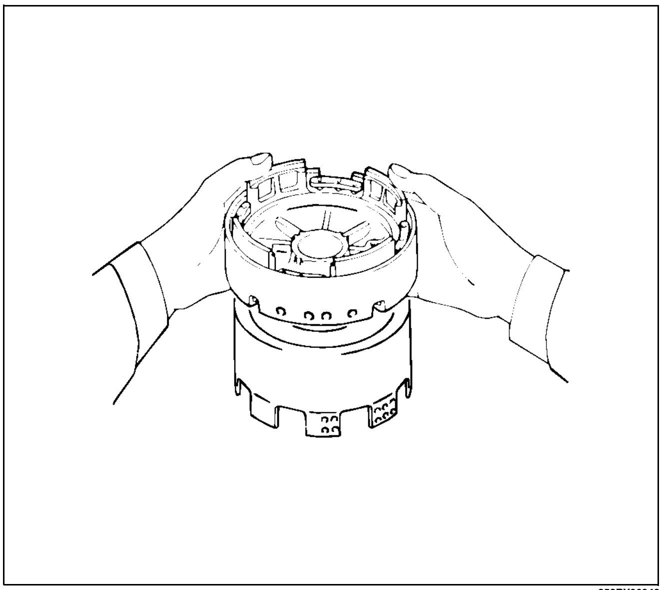
RTW77AMF000301

Legend

(1) Snap ring
(2) Piston return spring
(3) O-ring
(4) OD brake piston
(5) OD support
(6) Oil seal ring

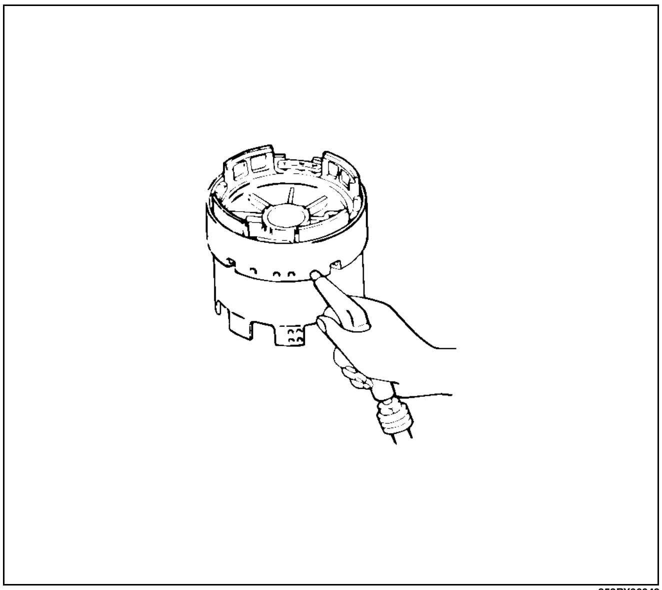
Disassembly

1. Check OD brake piston movement.
   Place the OD support assembly onto the direct clutch assembly.



252RY00042

Apply compressed air into the oil passage as shown, and be sure that the OD brake piston moves smoothly.

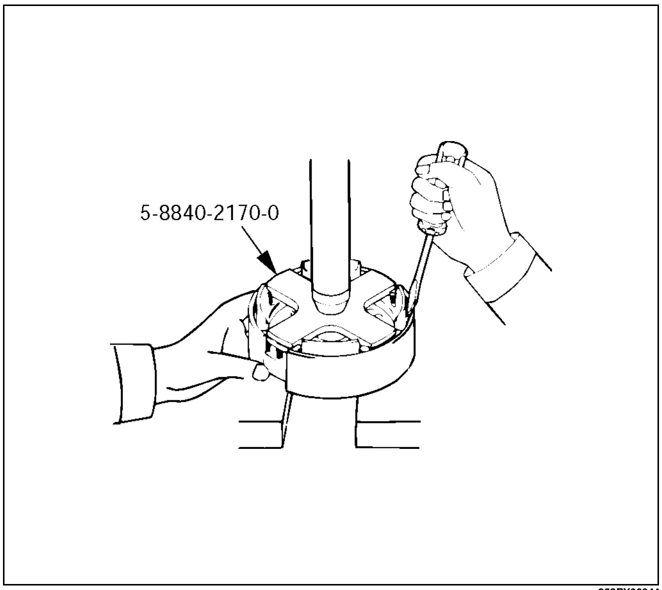


252RY00043

2. Remove the thrust bearing.
3. Remove the race.
4. Remove the thrust washer (plastic).
5. Place special tool on the spring retainer, and compress the return spring with a shop press.

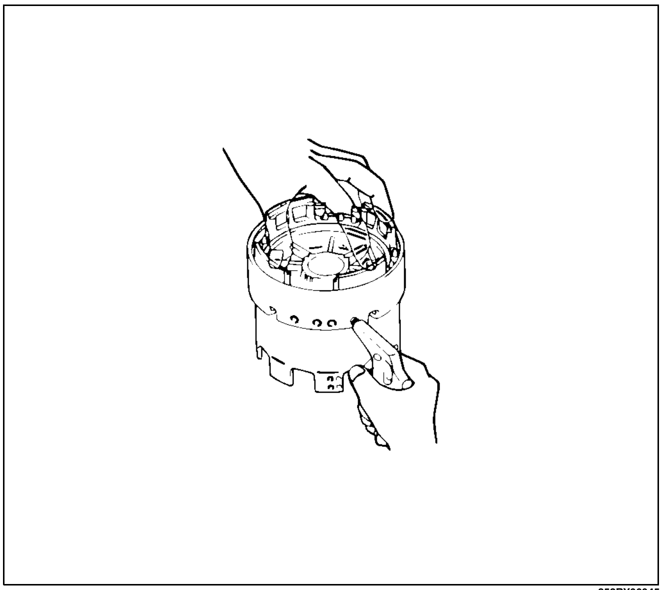
Spring compressor : 5-8840-2170-0

Remove the snap ring with a screwdriver.



252RY00044

6. Romove the piston return spring.
7. Place the OD support onto the direct clutch assembly.
   Hold the OD brake piston so it is not slanted and apply compressed air into the passage to remove the OD brake piston.
   Remove the OD brake piston.



252RY00045

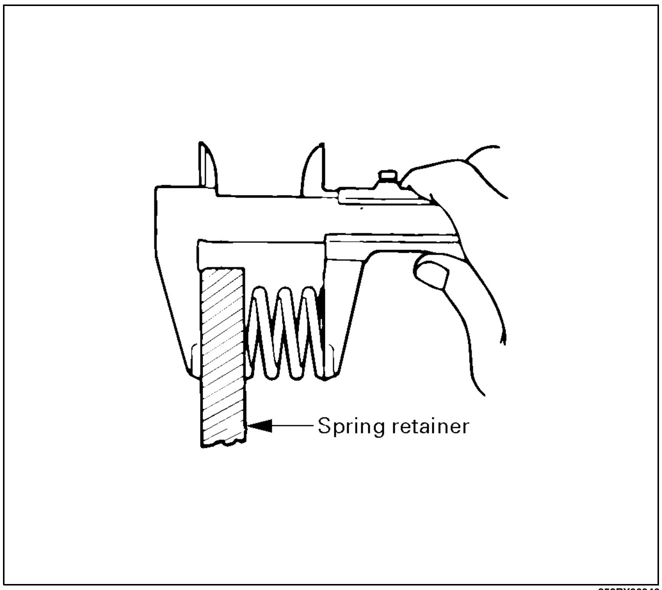
8. Remove the O-ring and oil seal rings from OD support.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage or any abnormal conditions are found through inspection.

1. Check piston return spring
   Using calipers, measure the free length of the return spring.

Standard length: 17.2mm (0.677in)

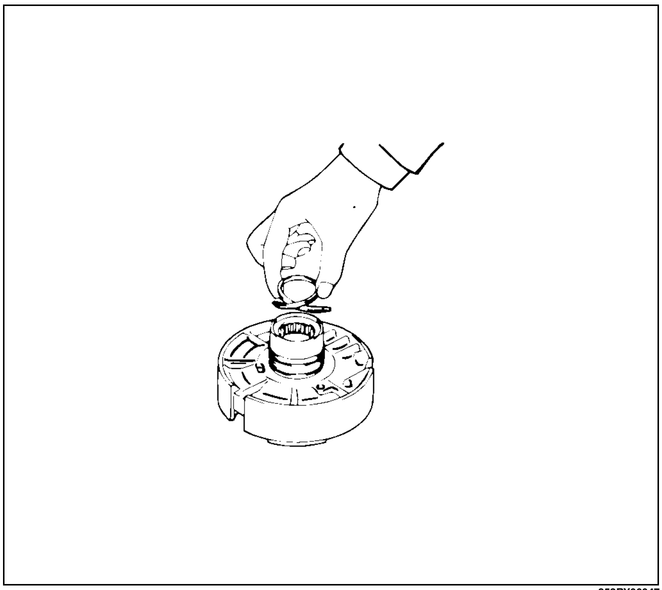


252RY00046

Reassembly

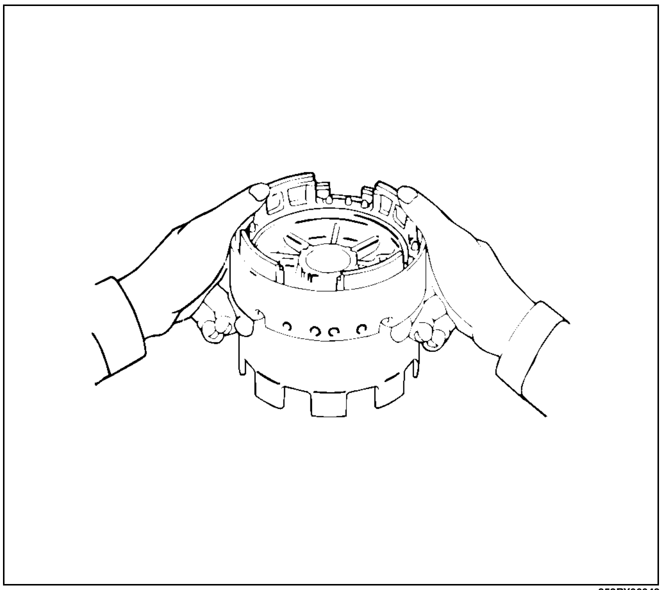
1. Coat the two oil seal rings with ATF.
   Contract the oil seals as shown, and install them onto the OD support.

NOTE: Do not spread the ring ends more than necessary.



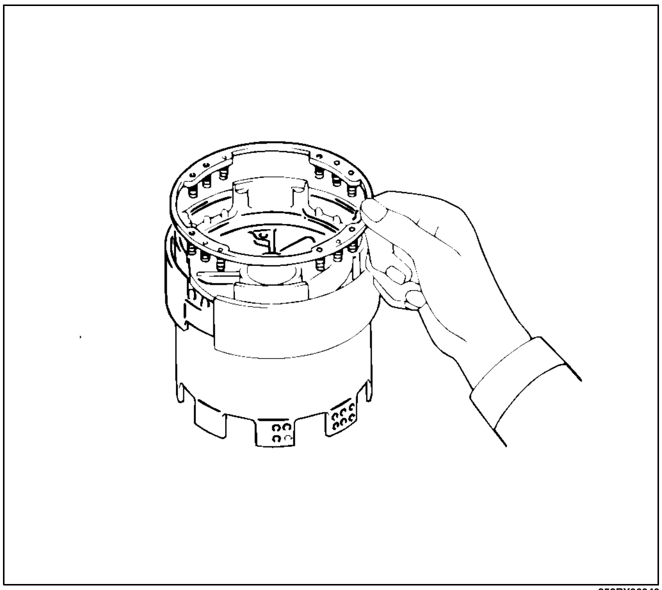
252RY00047

2. Coat two new O-rings with ATF and install them on the OD brake piston.
3. Being careful not to damage the O-rings, press the brake piston into the OD support, using both hands.



252RY00048

4. Install piston return spring.



252RY00049

5. Place special tool on the spring retainer, and compress the return spring with a shop press.
   Spring compressor : 5-8840-2170-0
   Install the snap ring with a screwdriver.
   Be sure the end gap of the snap ring is not aligned with cutout portion of the OD support.

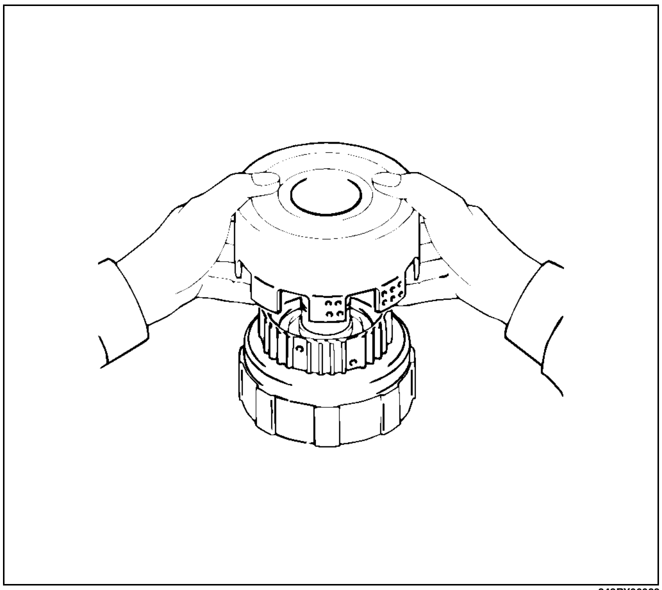
(2) O-ring
(3) Direct clutch piston
(4) Piston return spring
(5) Snap ring
(6) Snap ring
(7) Flange
(8) Plate and disc
Five plates and five discs

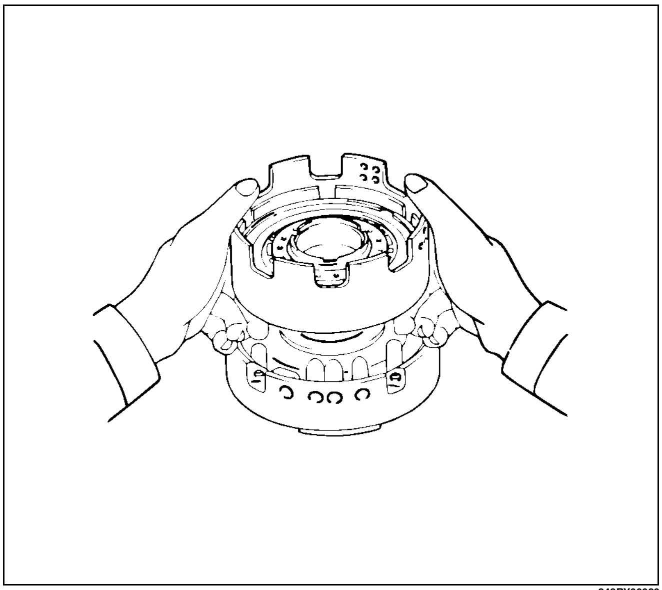
Disassembly

Remove direct clutch drum assembly from forward clutch assembly.



248RY00028

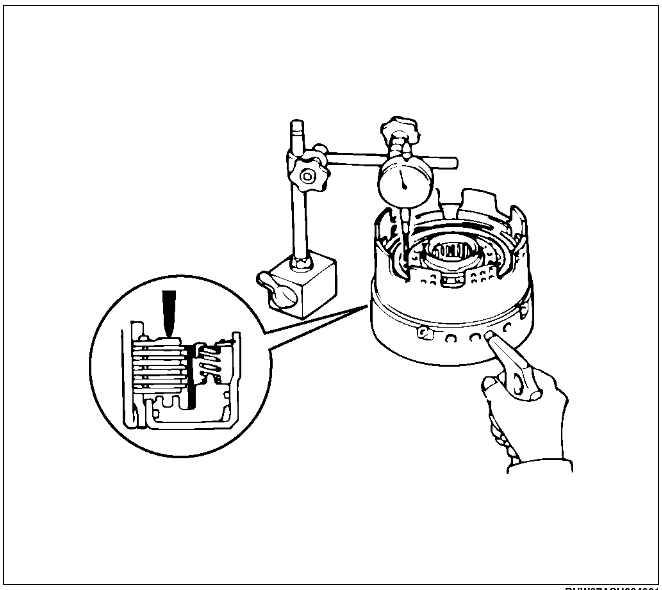
1. Check piston stroke of direct clutch (C–2).
   Place the direct clutch assembly onto the OD support assembly.



248RY00029

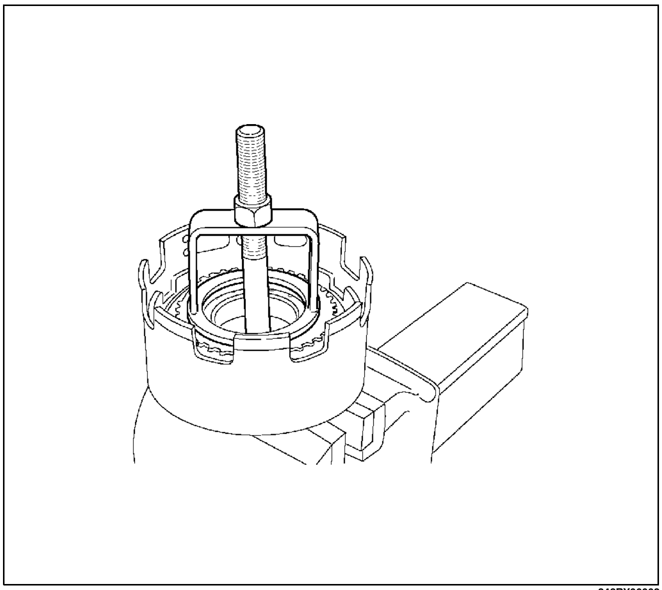
Using a dial indicator, measure the direct clutch piston stroke by applying and releasing compressed air (390 – 780 kPa or 57 – 114 psi) as shown.

Pack clearance: 0.5 – 0.8 mm (0.020 – 0.031 in)



RUW37ASH004901

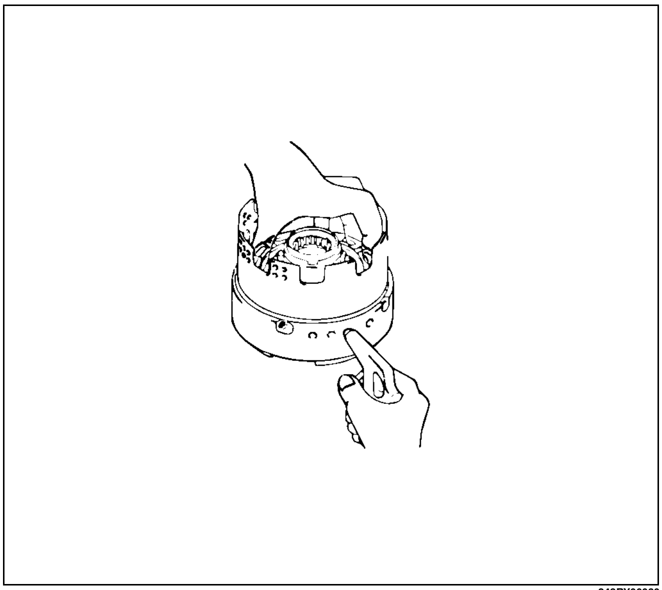
2. Remove the clutch drum thrust washer (Plastic) from the rear end of direct clutch.
3. Remove the snap ring from the direct clutch drum.
4. Remove the flange, plates and discs.
5. Place special tool on the spring retainer and compress the return spring.
   Using snap ring pliers, remove the snap ring.
   Spring compressor : 5-8840-0254-0



248RY00002

6. Remove the piston return spring.

7. Place the direct clutch drum onto the OD support.
   Holding the direct clutch piston by hand, apply compressed air to the OD support to remove the direct clutch piston.
   Remove the direct clutch piston from direct clutch drum.



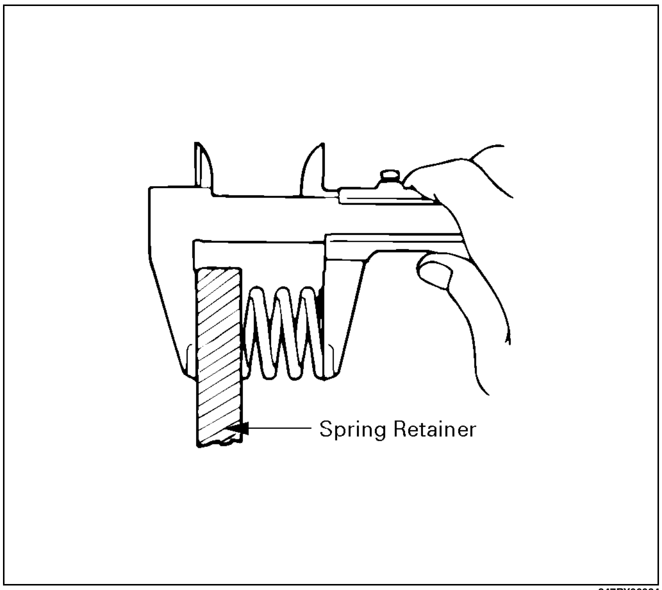
248RY00030

8. Remove two O-rings from piston.

Inspection and Repair

1. Check piston return spring.
   Using calipers, measure the free length of the return spring.

Standard length: 21.3 mm (0.839 in)

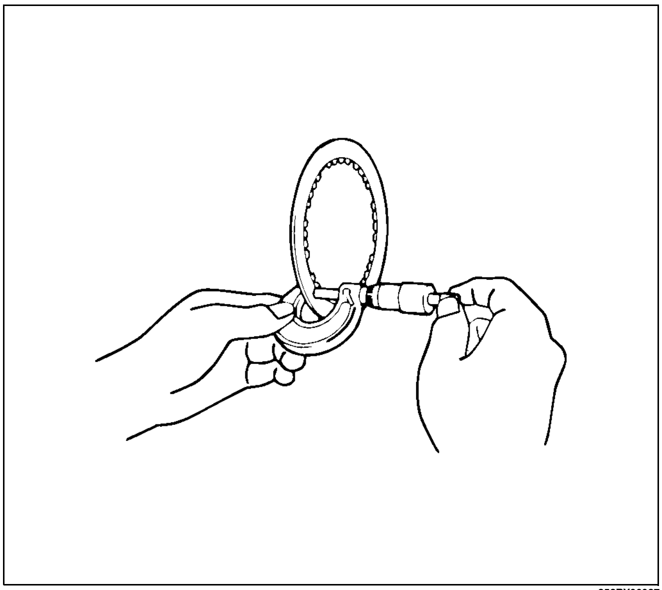


247RY00034

2. Check discs.
   Using micrometer, measure the thickness of the discs.

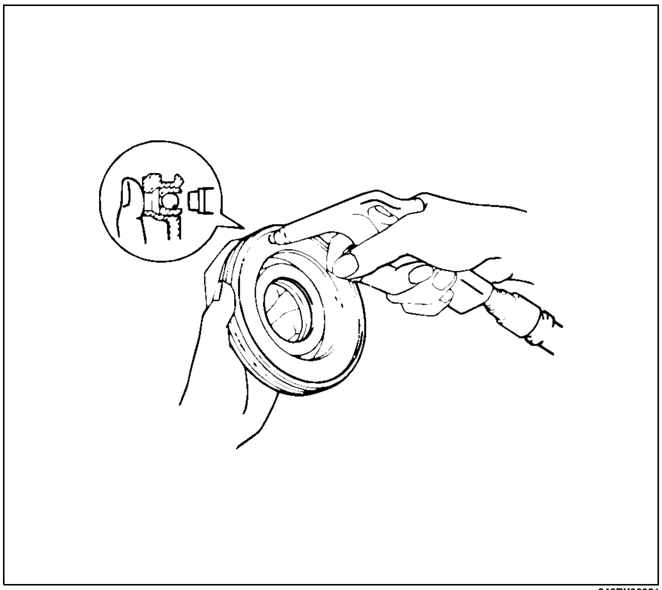
Minimum thickness: 2.04 mm (0.0803 in)

If the thickness is less than the minimum, replace the disc.



252RY00027

3. Check direct clutch piston.
   Check that check ball is free by shaking the piston.
   Check that the valve does not leak by applying low-pressure compressed air.

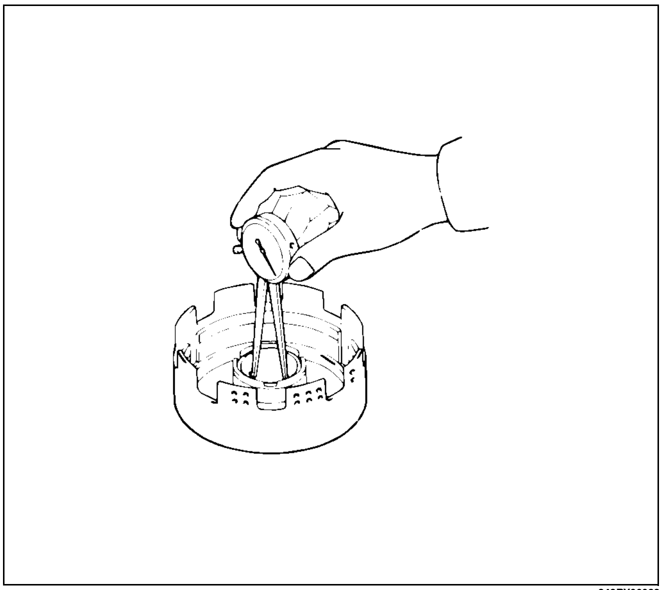


248RY00031

4. Check direct clutch drum bushing.
   Using a dial indicator, measure the inside diameter of the clutch drum bushing.

Maximum inside diameter: 53.99 mm (2.1256 in)

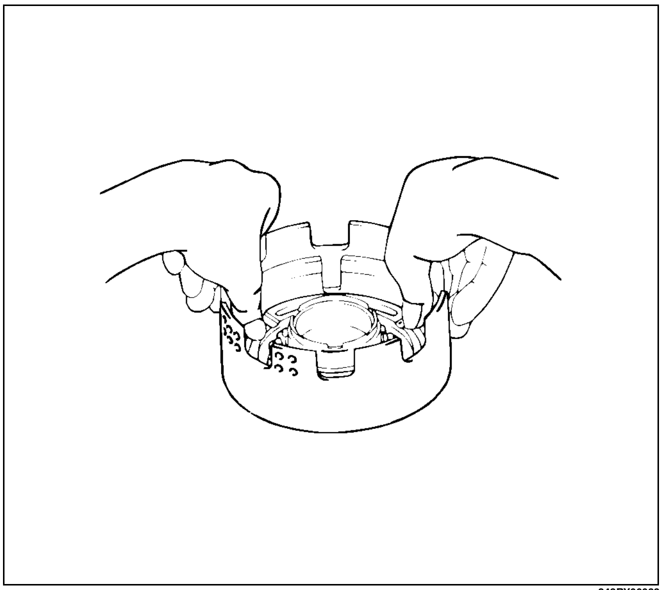
If the inside diamater is greater than the maximum, replace the clutch drum.



248RY00032

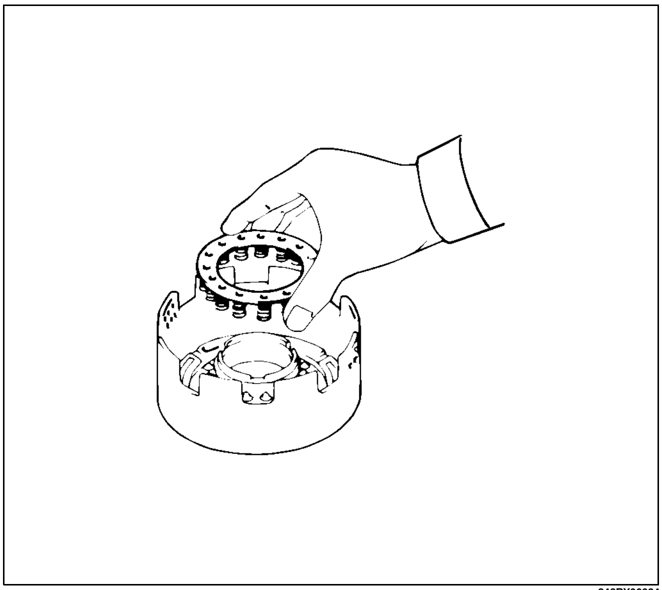
Reassembly

1. Coat new O-rings with ATF and install them on the direct clutch piston.
2. Install direct clutch piston to direct clutch drum.
   Being careful not to damage the O-rings, press in the direct clutch piston into the clutch drum, using both hands.



248RY00033

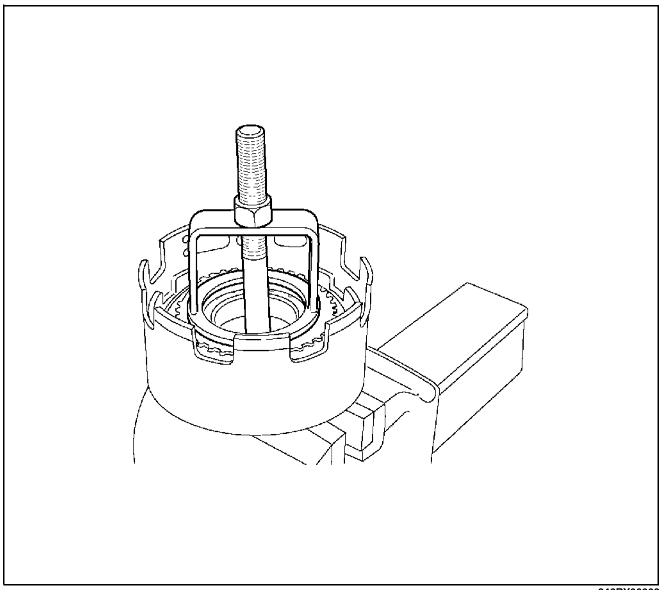
3. Install piston return spring.



248RY00034

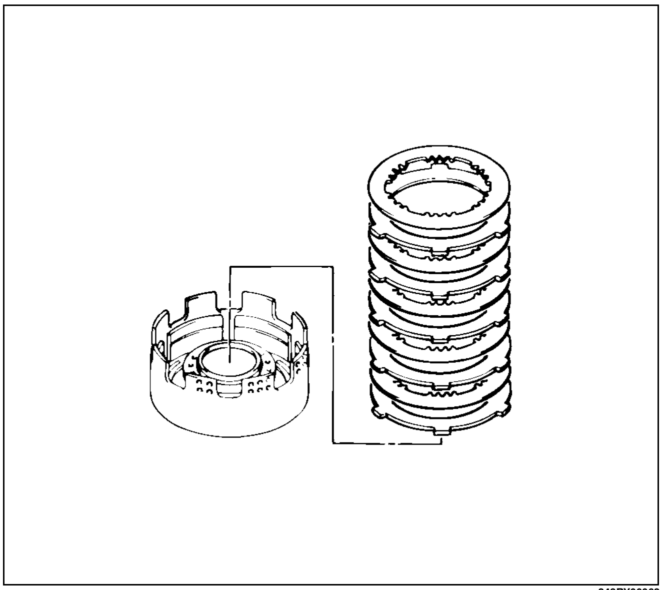
4. Compress piston return spring and install snap ring in groove.
   - Place special tool on the spring retainer, and compress the return spring.
   - Install the snap ring with snap ring pliers.
   - Be sure the end gap of the snap ring is not aligned with the spring retainer claw.

Spring compressor: 5-8840-0254-0



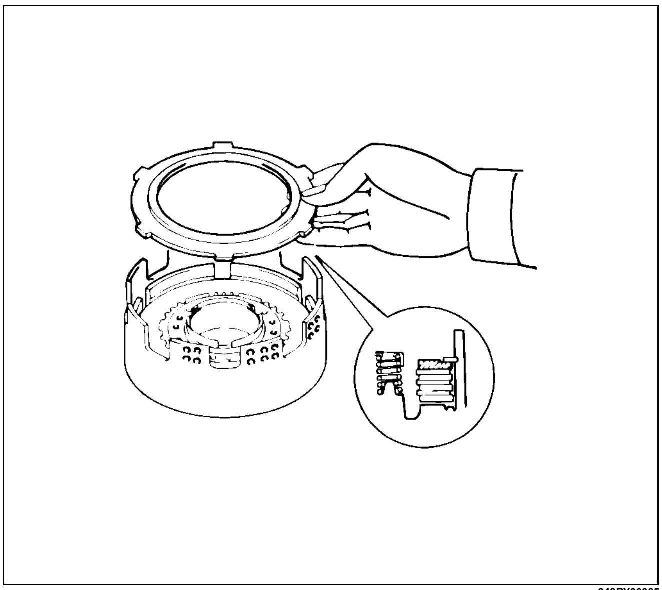
248RY00002

5. Install four plates and four discs.
   Install in order : P–D–P–D–P–D–P–D
   P : Plate, D : Disc



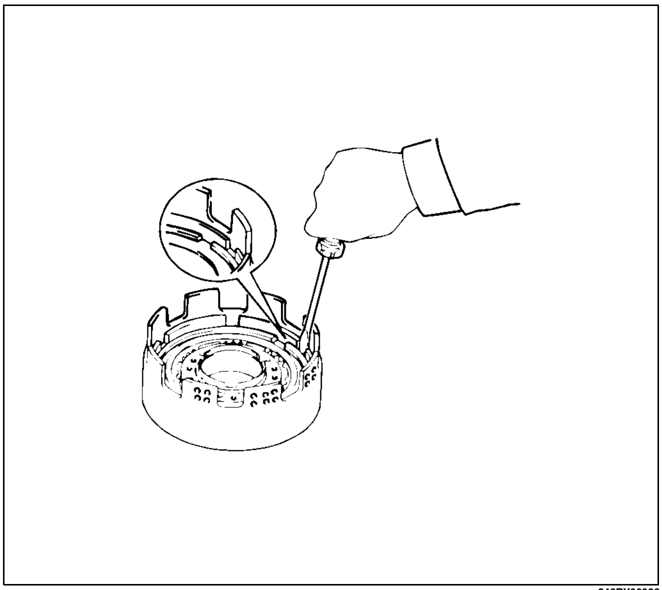
248RY00062

6. Install the flange, with the flat side facing downward.



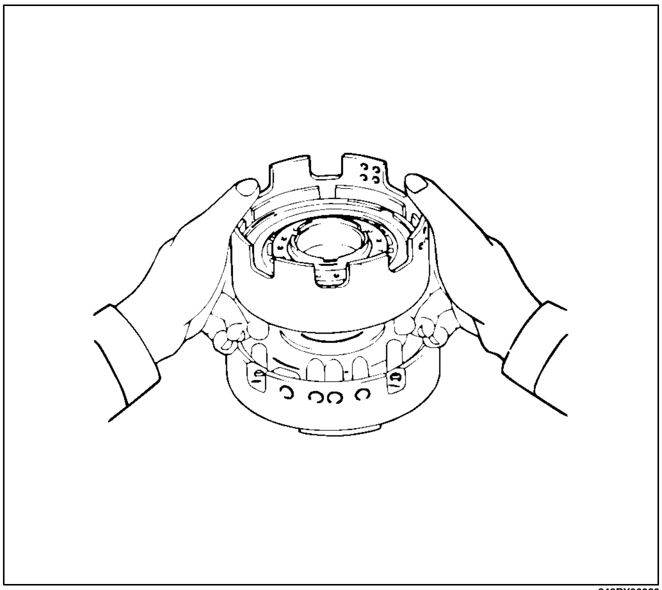
248RY00035

7. Install the snap ring with a screwdriver.
   Be sure the end gap of the snap ring is not aligned with the cutout portion of the direct clutch drum.



248RY00036

8. Check piston stroke of direct clutch (C–2).
   Place the direct clutch assembly onto the OD support assembly.



248RY00029

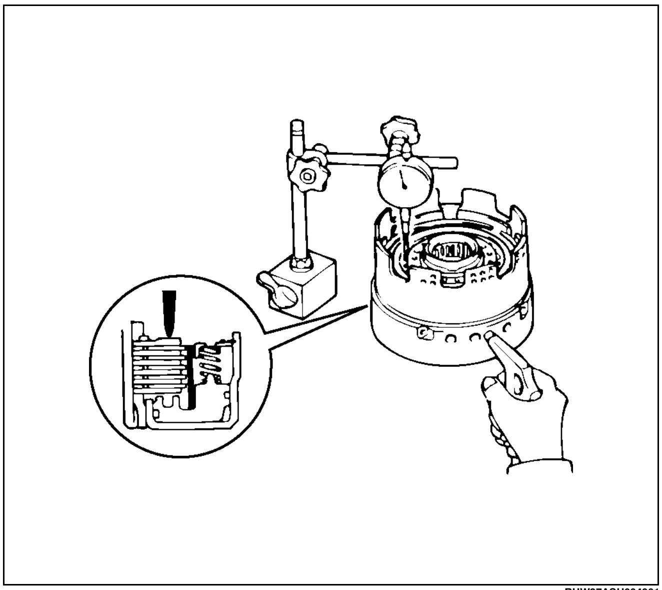
   Using a dial indicator, measure the direct clutch piston stroke by applying and releasing compressed air (390 – 780 kPa or 57 – 114 psi) as shown.

Pack clearance: 0.5 – 0.8 mm (0.020 – 0.031 in)

   If the piston stroke is not within specification, replace the discs and recheck the piston stroke.
   If the piston stroke is nonstandard, select another flange.

Flange sizes

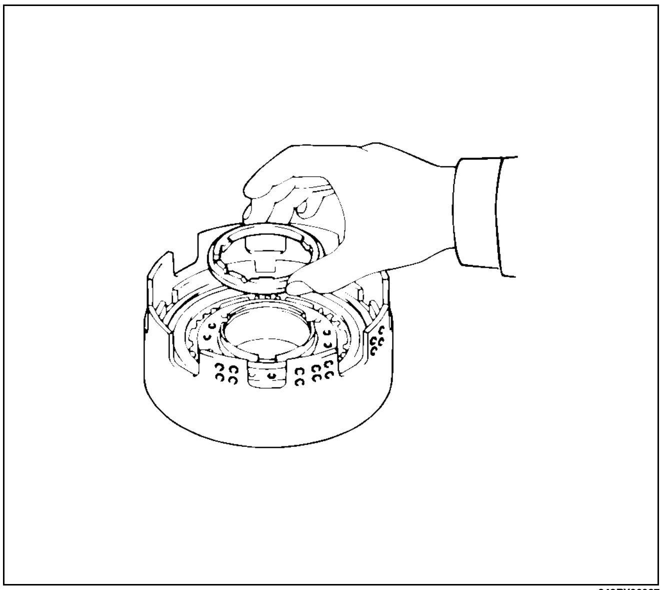
Flange thickness	Flange thickness
3.3mm (0.130in)	3.8mm (0.150in)
3.4mm (0.134in)	—
3.5mm (0.138in)	4.0mm (0.157in)
3.6mm (0.142in)	—
3.7mm (0.146in)	4.2mm (0.165in)



RUW37ASH004901

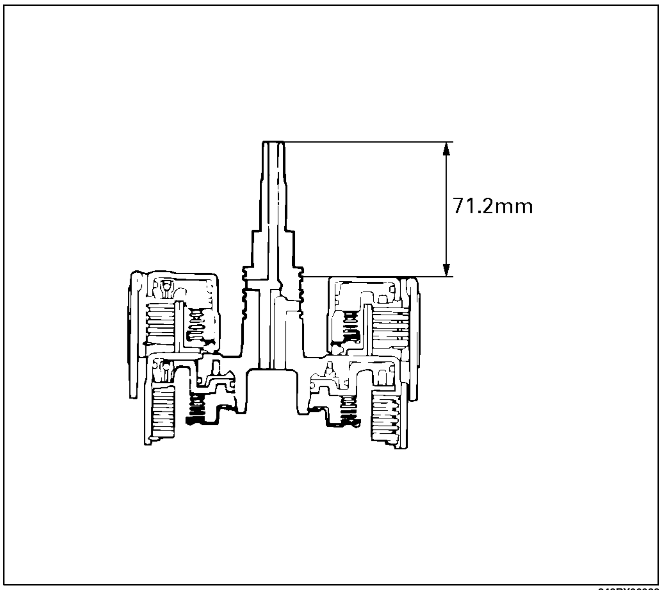
9. Coat the clutch drum thrust washer (plastic) with petroleum jelly and install it onto the direct clutch.

NOTE: Make sure that the lugs fit into the cutout portions on the direct clutch.



248RY00037

Align the flukes of discs in the direct clutch.
Install the direct clutch assembly onto the forward clutch assembly.
Check that the distance from the direct clutch end to the forward clutch end is 71.2mm (2.803in).



248RY00038

Forward Clutch Asseembly (C-1)

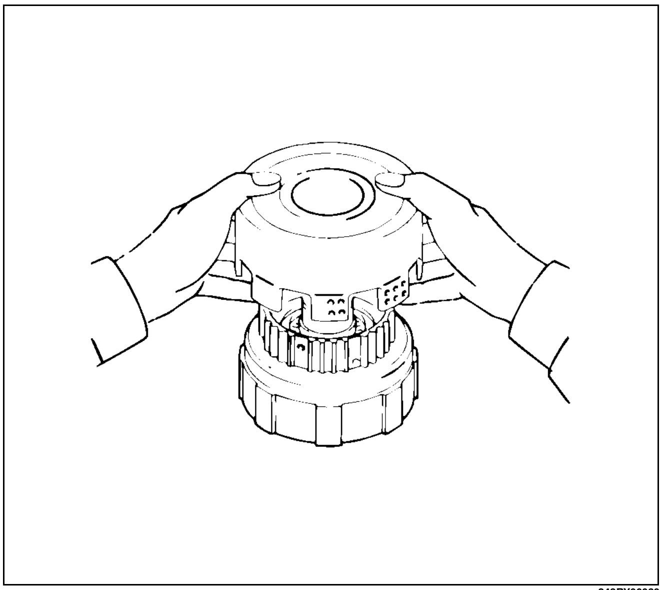
(15) Plate and disc
Six plates and six discs
(16) Cushion plate

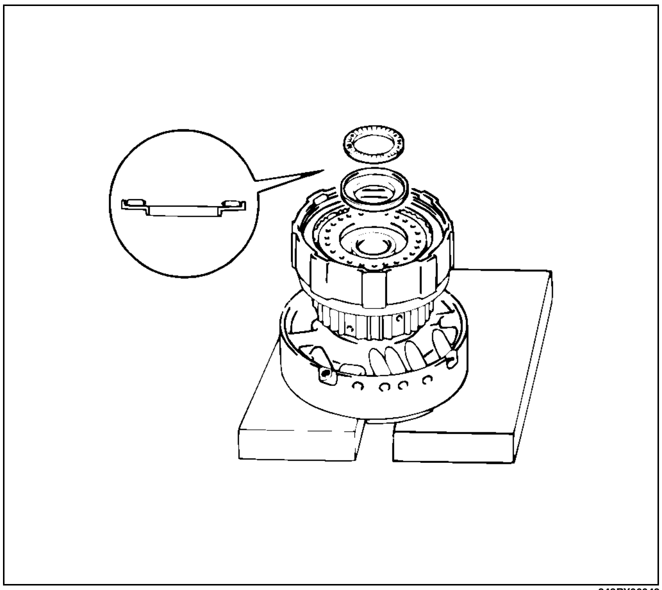
Disassembly

Remove forward clutch assembly from direct clutch assembly.



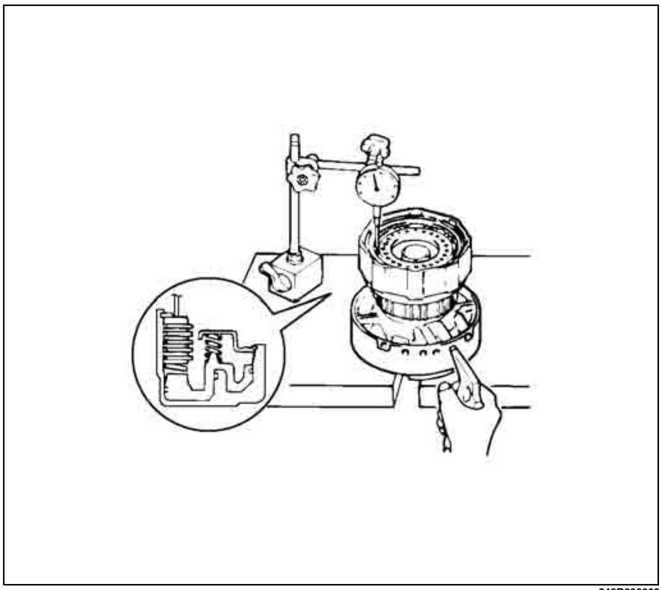
248RY00039

1. Place wooden blocks, etc. to prevent forward clutch shaft from touching the work stand, and place the OD support on them.
   Place the forward clutch onto the OD support and remove the bearing and race.



248RY00048

2. Check piston stroke of forward clutch (C–1).

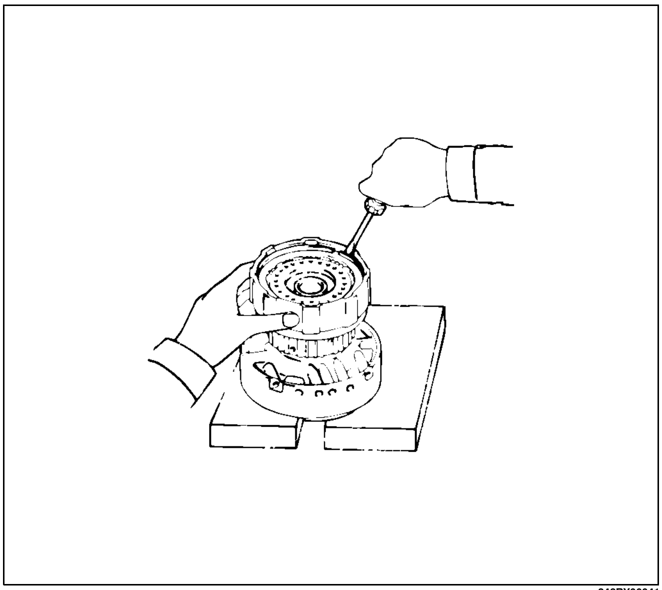


248R200008

   Using a dial indicator, measure the forward clutch piston stroke by applying and releasing compressed air (390 – 780 kPa or 57 – 114 psi) as shown.

Pack clearance: 0.6 – 1.0 mm (0.024 – 0.039 in)

3. Remove snap ring from clutch drum.



248RY00041

4. Remove the flange, disc and plate, and cushion plate.

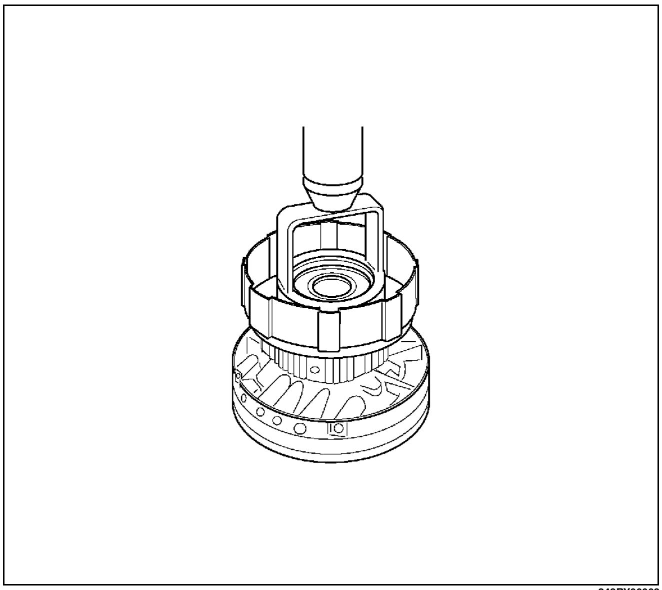
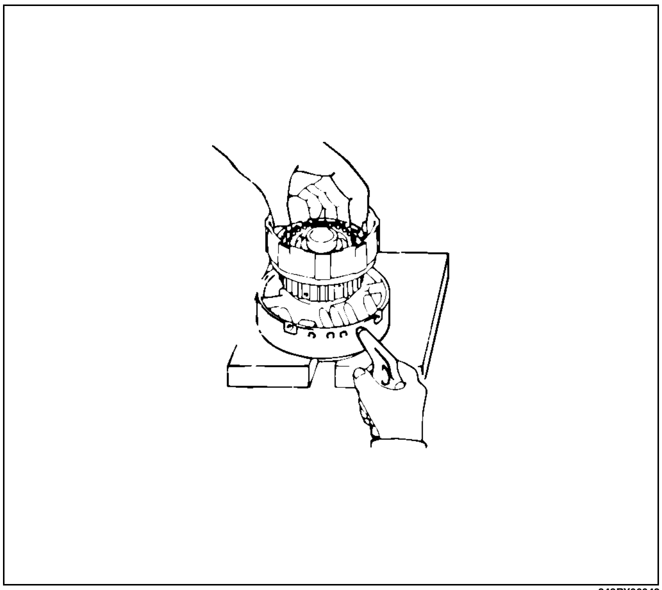
5. Place special tool on the spring retainer and compress the return spring.
   Using snap ring pliers, remove the snap ring.
   Spring compressor : 5-8840-0254-0



248RY00003

6. Remove the piston return spring.
7. Place the forward clutch drum onto the OD support.
   Holding the forward clutch piston by hand, apply compressed air to the OD support to remove the forward clutch piston.

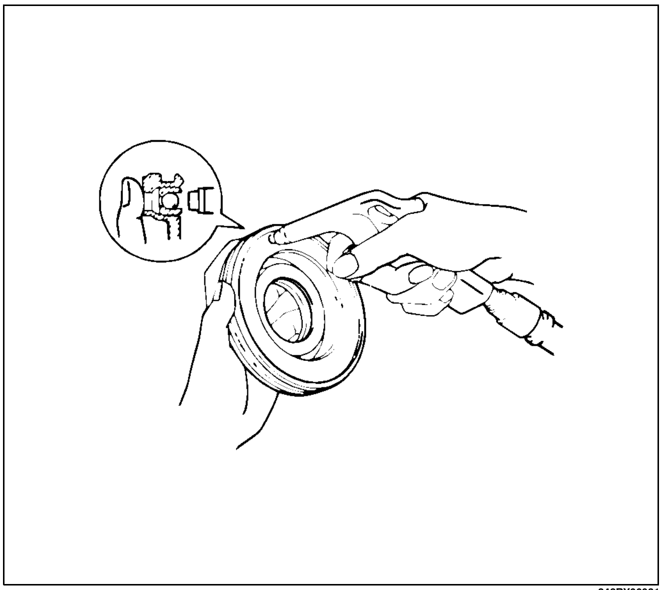


248RY00042

8. Remove the O-rings from piston.
9. Remove the O-ring from forward clutch drum.
10. Remove the oil seal rings and thrust bearing from forward clutch drum.

Inspection and Repair

1. Check forward clutch piston
   Check that check ball is free by shaking the piston.
   Check that the valve does not leak by applying low-pressure compressed air.

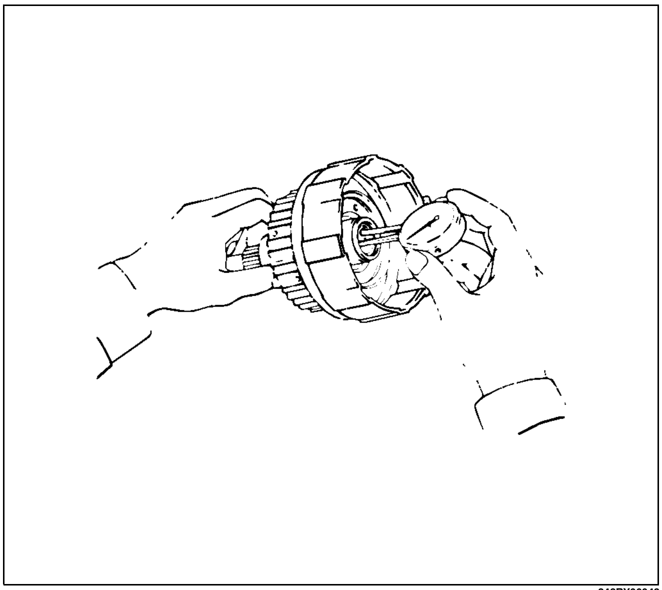


248RY00031

2. Check forward clutch drum bushing.
   Using a dial indicator, measure the inside diameter of the forward clutch drum bushing.

Maximum inside diameter: 24.08 mm (0.948 in)

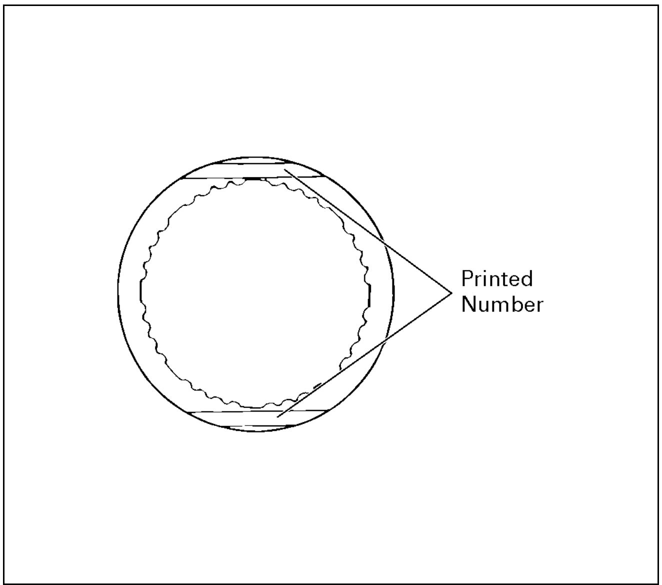
If the inside diameter is greater then the maximum, replace the forward clutch drum.



248RY00043

3. Check disc, plate and flange.
   Check to see if the sliding surface of the disc, plate and flange are worn or burnt. If necessary, replace them.
   - If the lining of the disc is peeling off or discolored, or even if parts of the printed numbers are defaced, replace all discs.

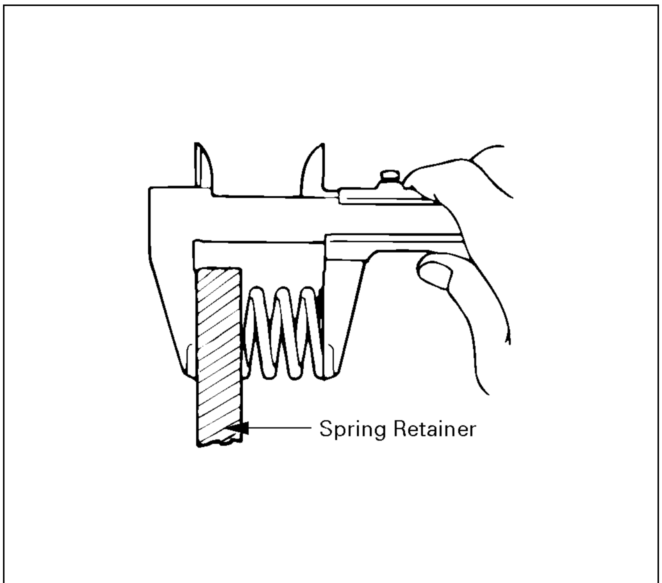
- Before assembling new discs, soak them in ATF for at least fifteen minutes.



248RY00045

4. Check piston return spring.
   Using calipers, measure the free length of the return spring.

Standard length: 19.47 mm (0.7665 in)

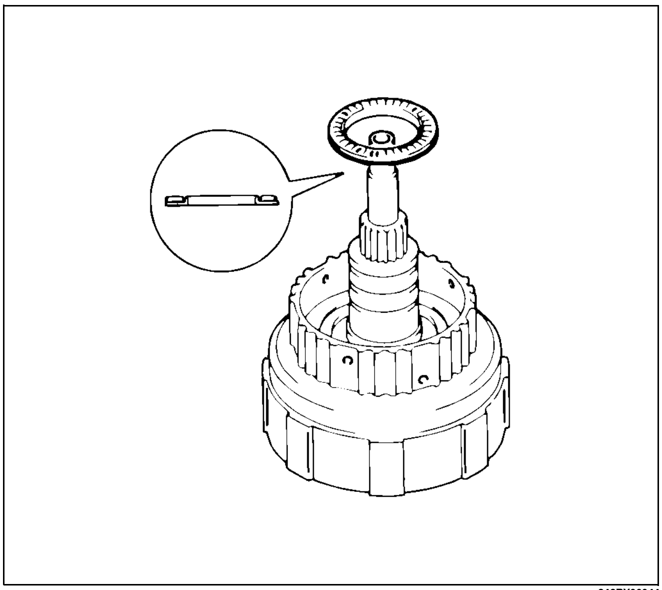


247RY00034

Reassembly

1. Coat the assembled thrust bearing and race with petroleum jelly and install it onto the forward clutch drum, with the race side facing downward.
   Bearing and race (Reference)

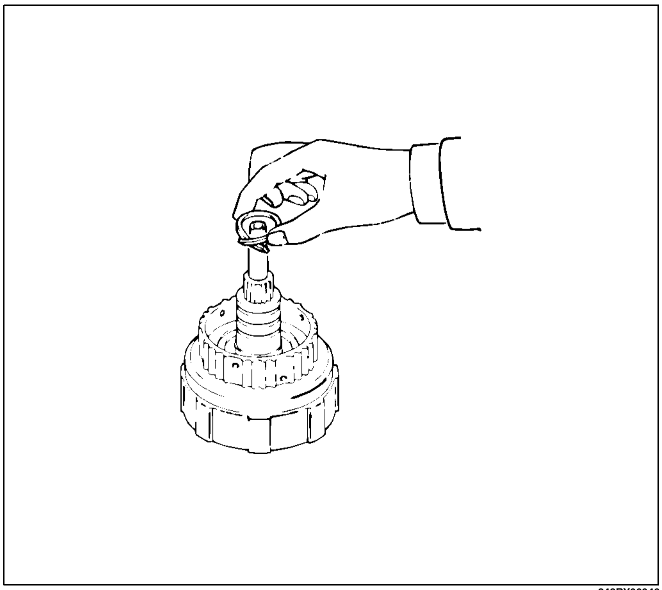
Inside diameter	33.7 mm (1.327 in)
Outside diameter	47.8 mm (1.882 in)



248RY00044

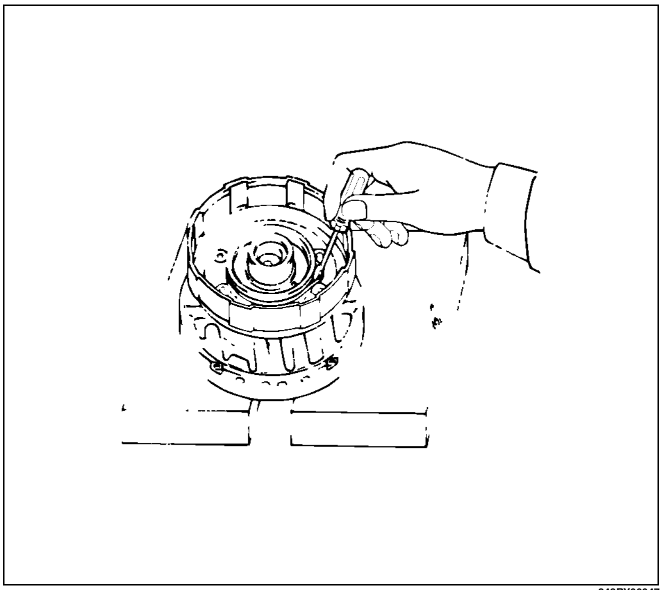
2. Coat the three oil rings with ATF.
   Contract the oil seal rings as shown, and install three oil seal rings onto the forward clutch drum.

NOTE: Do not spread the ring ends more than necessary.



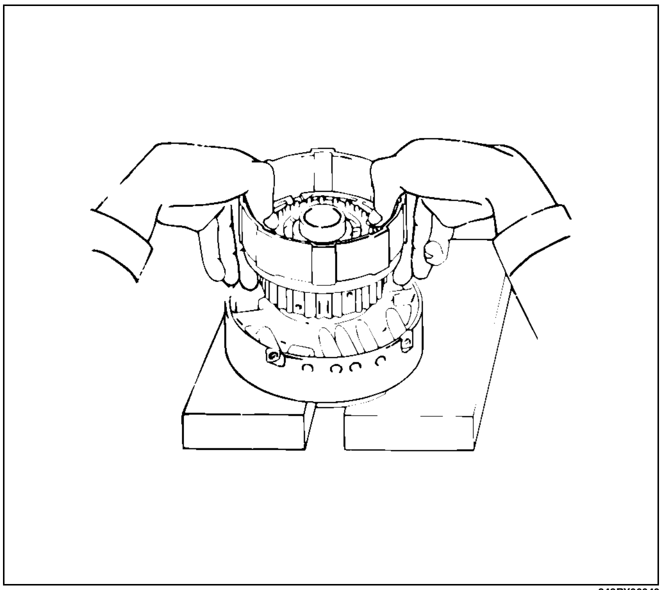
248RY00046

3. Coat a new O-ring with ATF and install O-ring on the forward clutch drum.



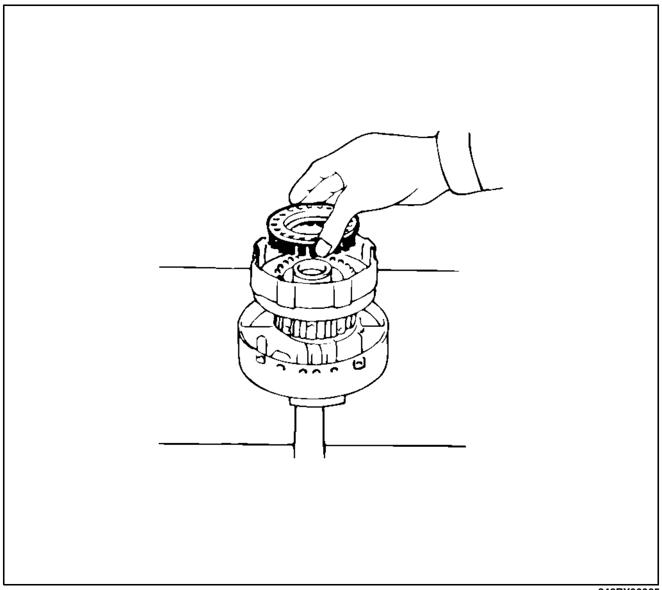
248RY00047

4. Coat new O-rings with ATF and install two O-rings on the forward clutch piston.
5. Being careful not to damage the O-rings, press the forward clutch piston into the forward clutch drum.



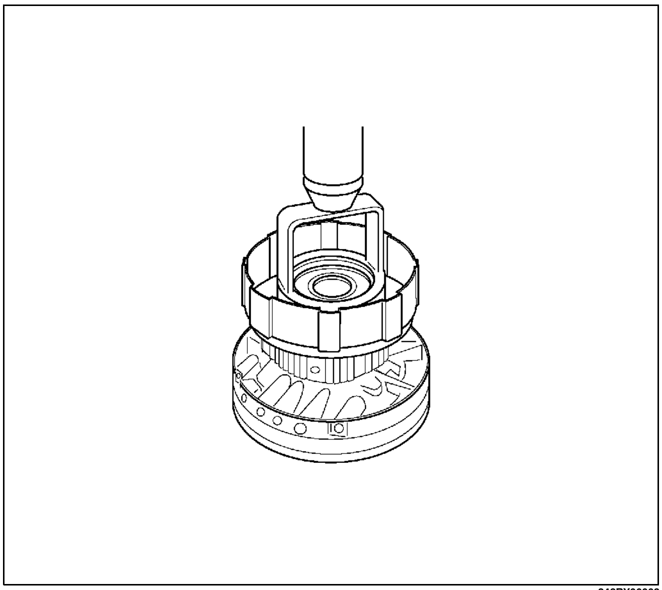
248RY00049

6. Install piston return spring.



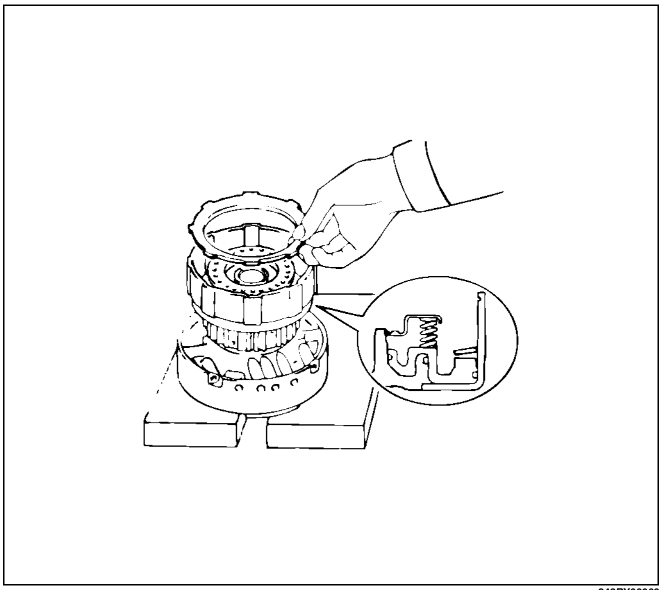
248RY00065

7. Place special tool on the spring retainer, and compress the return spring.
   Spring compressor: 5-8840-0254-0
   Install the snap ring with snap ring pliers.
   Be sure the end gap of the snap ring is not aligned with the spring retainer claw.



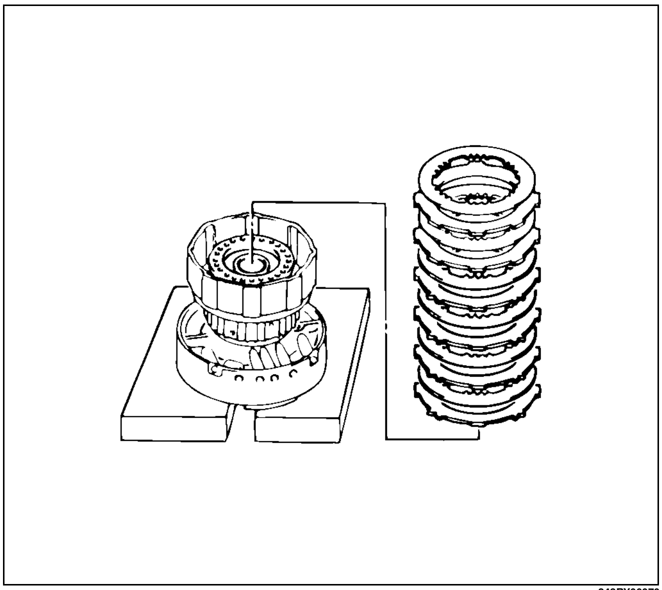
248RY00003

8. Install cushion plate rounded side down as shown.



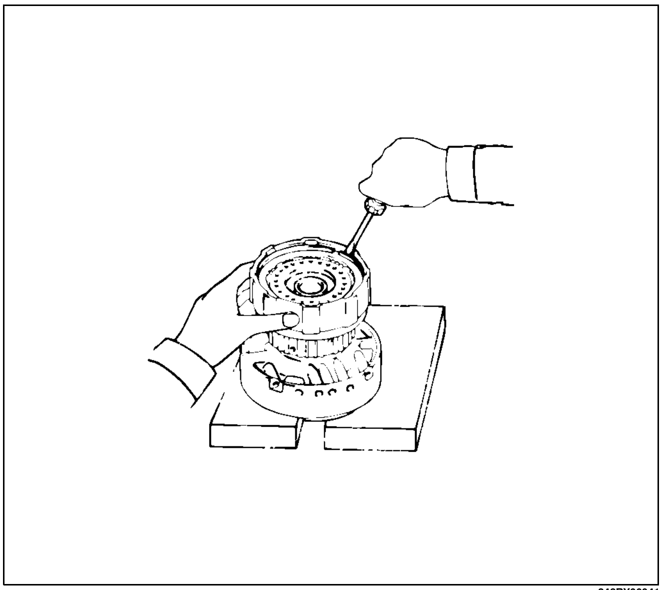
248RY00069

9. Install five discs and five plates.
   Install in order: P–D–P–D–P–D–P–D–P–D
10. And then install the flange, with the rounded edge facing downward.



248RY00070

11. Install the snap ring with a screwdriver.
    Be sure the end gap of the snap ring is not aligned with the cutout portion of the forward clutch drum.



248RY00041

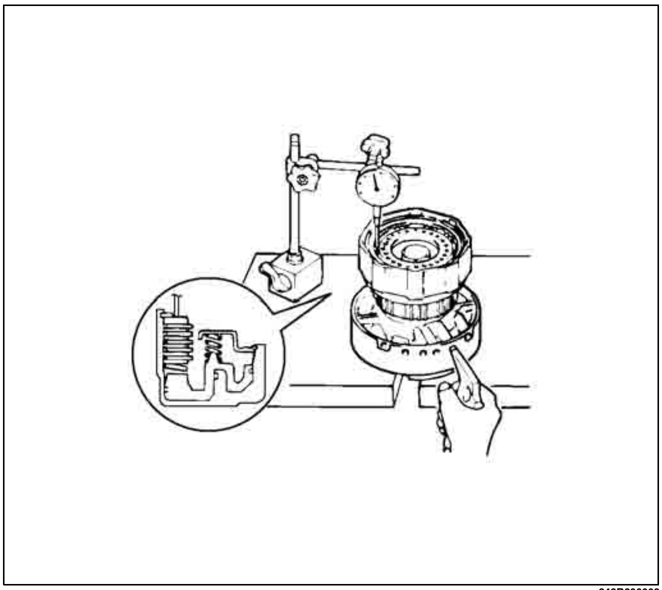
12. Check piston stroke of forward clutch (C–1).
    Using a dial indicator, measure the forward clutch piston stroke by applying and releasing the compressed air (380 – 780 kPa or 57 – 114 psi) as shown.

Pack clearance: 0.6 – 1.0 mm (0.024 – 0.039 in)

If the piston stroke is not within specification, replace the discs, and recheck the piston stroke.

Available flange sizes

3.0mm (0.118in)	3.4mm (0.134in)
4.2mm (0.165in)	3.6mm (0.142in)
4.4mm (0.173in)	3.8mm (0.150in)
3.2mm (0.126in)	4.0mm (0.158in)

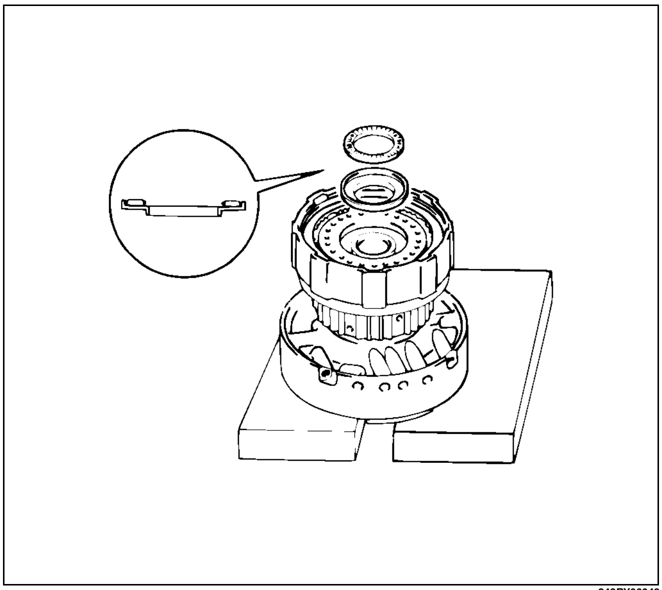


248R200008

13. Coat the race and thrust bearing with petroleum jelly, and install them onto the forward clutch drum.

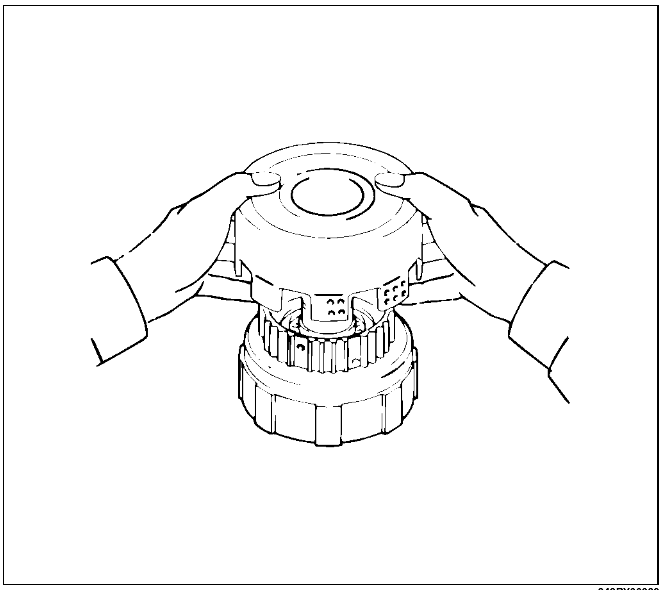
Race and bearing diameter (Reference)

	Inside	Outside
Race	26.0mm (1.024in)	48.9mm (1.925in)
Bearing	26.0mm (1.024in)	46.7mm (1.839in)



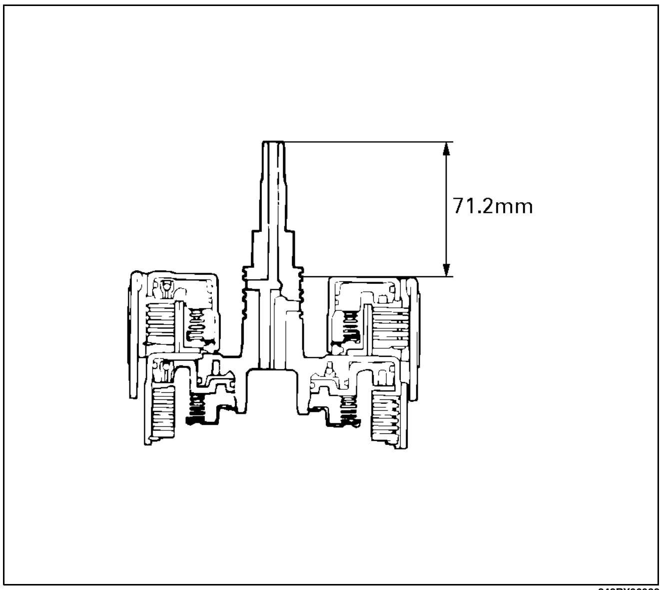
248RY00048

14. Align the flukes of discs in the direct clutch.
    Install the direct clutch assembly onto the forward clutch assembly.



248RY00039

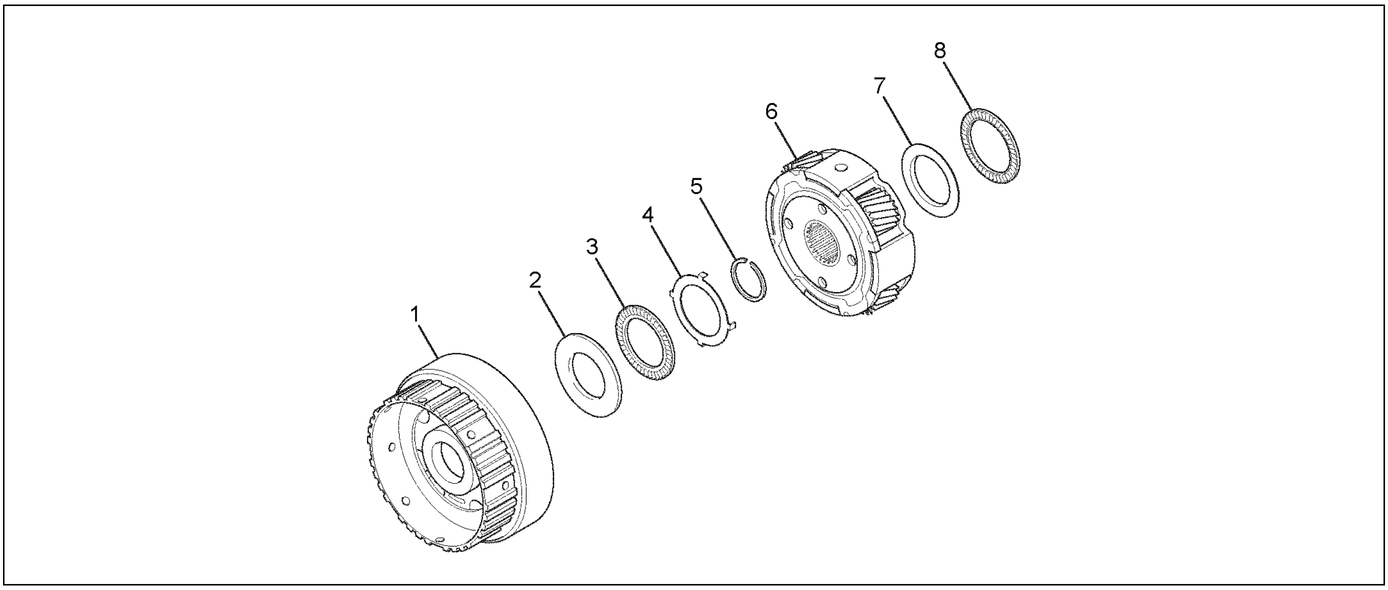
Check that the distance from the direct clutch end to the forward clutch end is 71.2mm (2.803in).



248RY00038

Front Planetary Gear

Disassembled View



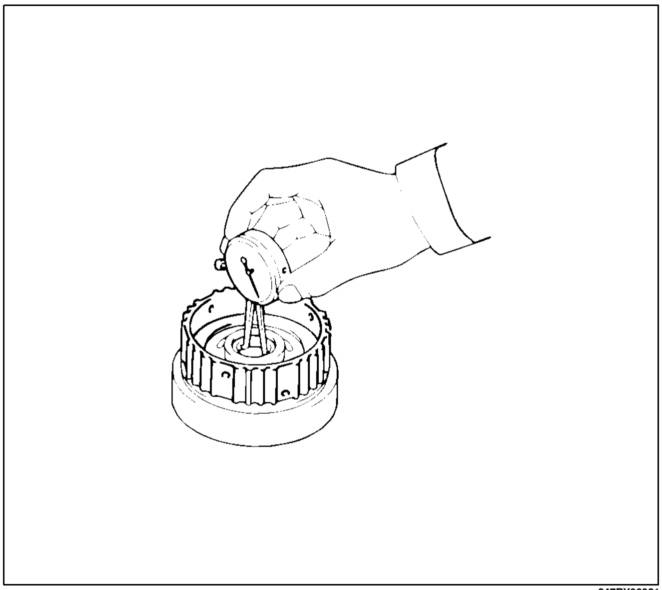
RTW77ASF000201

Legend

(1) Front planetary ring gear
(2) Race
(3) Thrust bearing
(4) Race
(5) Snap ring
(6) Front planetary gear
(7) Race
(8) Thrust bearing

Disassembly

1. Remove the race from front planetary ring gear.
2. Remove the thrust bearing and race from front planetary gear.
3. Remove the race (Metal), thrust bearing and race between front planetary ring gear and front planetary gear.



247RY00021

Inspection and Repair

1. Check front planetary ring gear bushing
   Using a dial indicator, measure the inside diameter of the front planetary ring gear bushing.

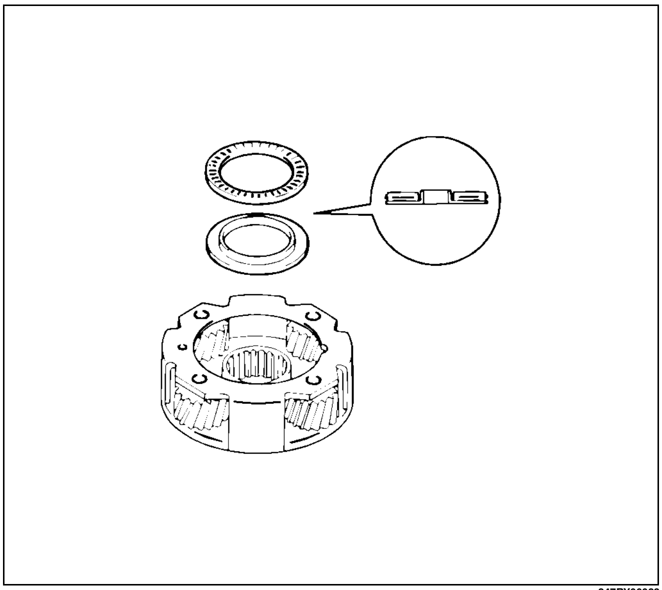
   Maximum inside diameter: 24.08 mm (0.9480 in)

   If the inside diameter is greater than the maximum, replace the front planetary ring gear.

Reassembly

1. Coat the race and thrust bearing with petroleum jelly.
   Install the race and bearing to the rear side of the front planetary gear.
   Race and bearing diameter (Reference)

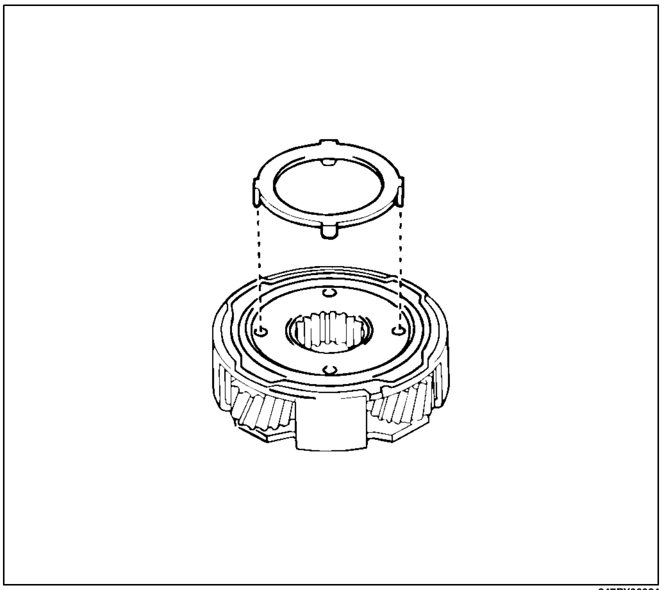
	Inside	Outside
Bearing	35.6mm (1.402in)	47.7mm (1.878in)
Race	33.7mm (1.327in)	47.6mm (1.874in)



247RY00023

2. Turn over the planetary gear and install the race (metal).
   Make sure that the lugs fit into the holes on the front planetary gear.
   Race diameter (Reference)

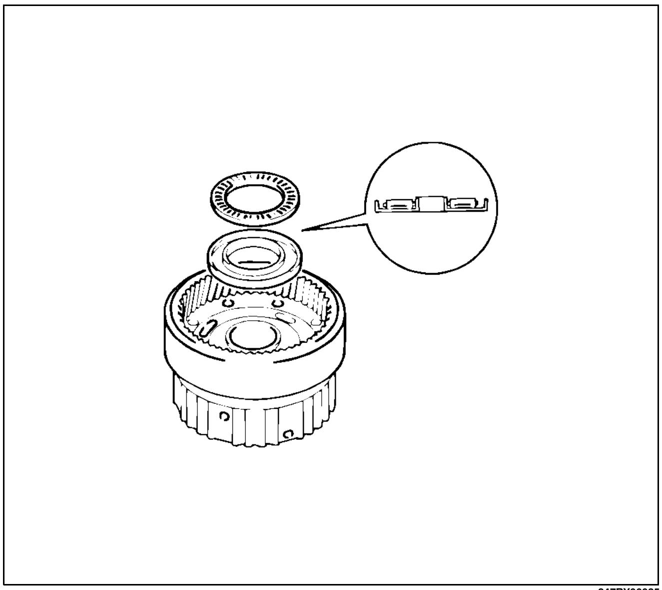
	Inside	Outside
Race	34.3mm (1.350in)	47.8mm (1.882in)



247RY00024

3. Coat the race and thrust bearing with petroleum jelly.
   Install the race and bearing onto the rear side of the front planetary ring gear.
   Race and bearing diameter (Reference)

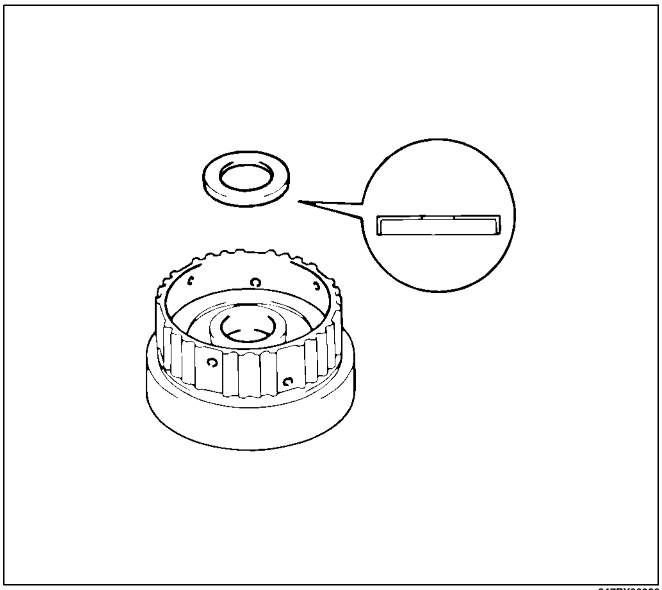
	Inside	Outside
Race	35.15 mm (1.384 in)	53.65 mm (2.112 in)
Bearing	35.15 mm (1.384 in)	53.65 mm (2.112 in)



247RY00025

4. Turn over the planetary ring gear and install the race onto the front side of the front planetary ring gear.
   Race diameter (Reference)

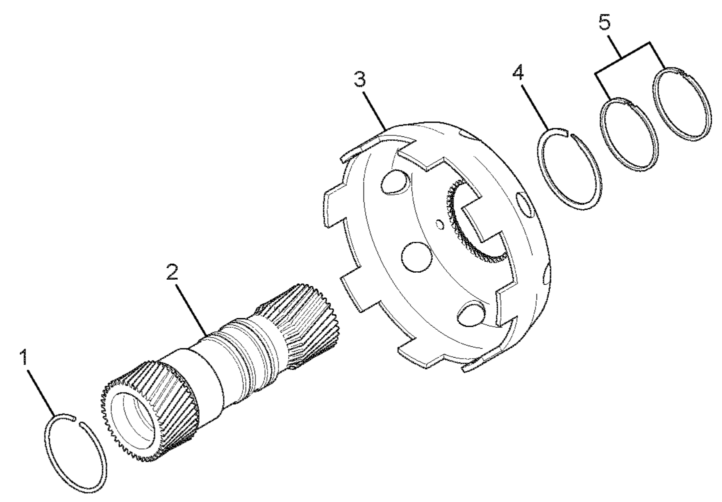
	Inside	Outside
Race	26.8mm (1.055in)	47.0mm (1.850in)



247RY00026

Planetary Sun Gear and No.1 One-Way Clutch

Disassembled View



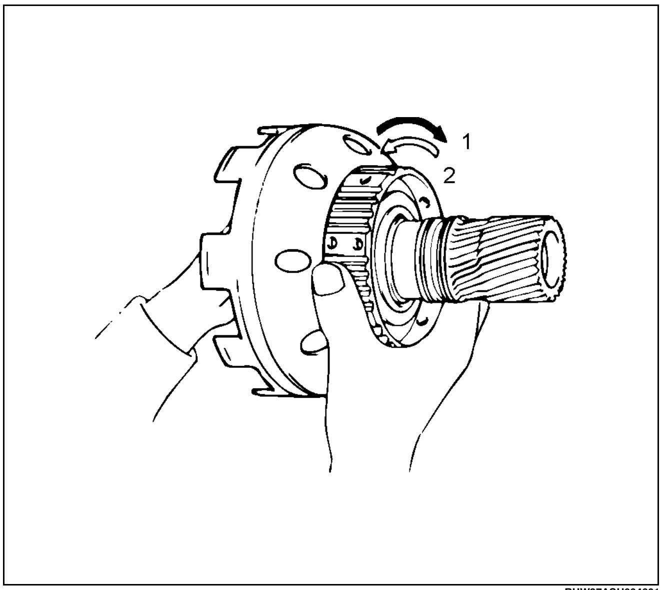
RTW77ASF000301

Legend

(1) Snap ring
(2) Planetary sun gear
(3) Sun gear input drum
(4) Snap ring
(5) Oil seal ring

Disassembly

1. Check operation of No.1 one-way clutch
   Hold the planetary sun gear and turn the second brake hub.
   The second brake hub should turn freely clockwise and should lock counterclockwise.

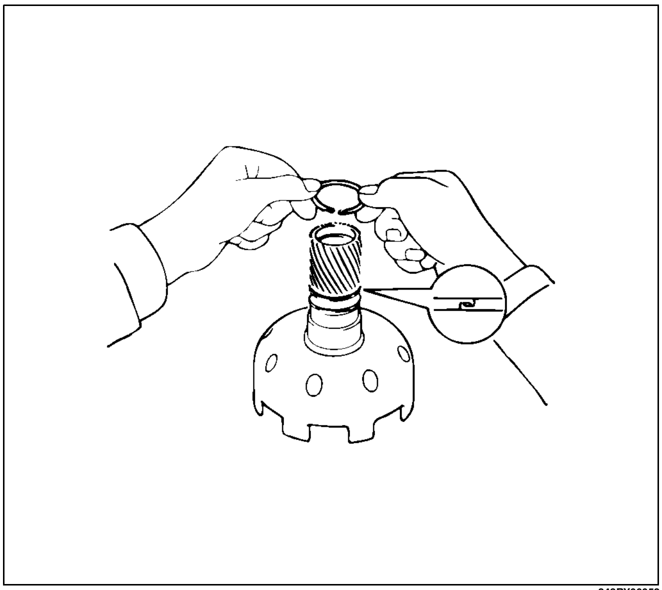


RUW37ASH004601

Legend

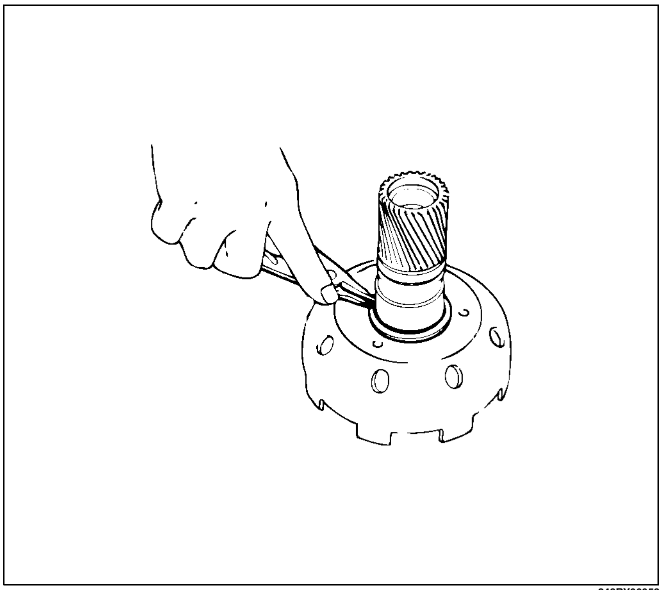
(1) Free
(2) Lock

2. Remove the one-way clutch and second brake hub.
3. Remove the trust washer (plastic).
4. Remove two oil seal rings (metal).



248RY00052

5. Remove the snap ring with snap ring pliers.



248RY00053

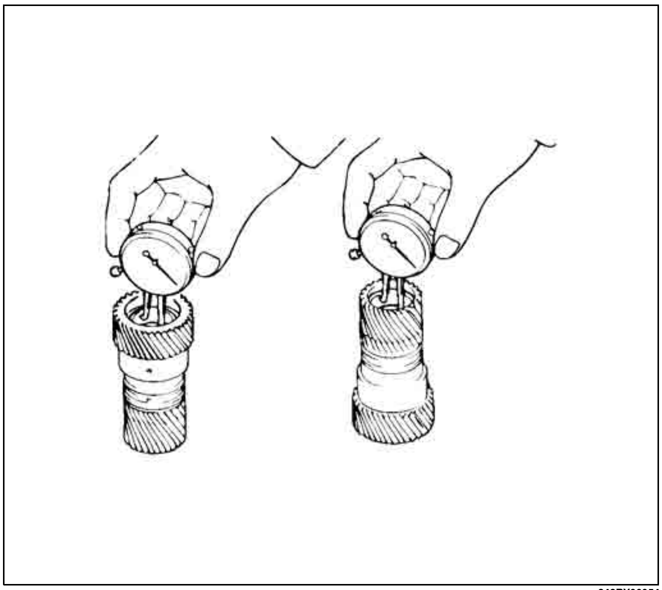
6. Remove the sun gear input drum.
7. Remove the snap ring from planetary sun gear.

Inspection and Repair

1. Check planetary sun gear bushing
   Using a dial indicator, measure the inside diameter of the planetary sun gear bushing.

Maximum inside diameter: 27.08 mm (1.066 in)

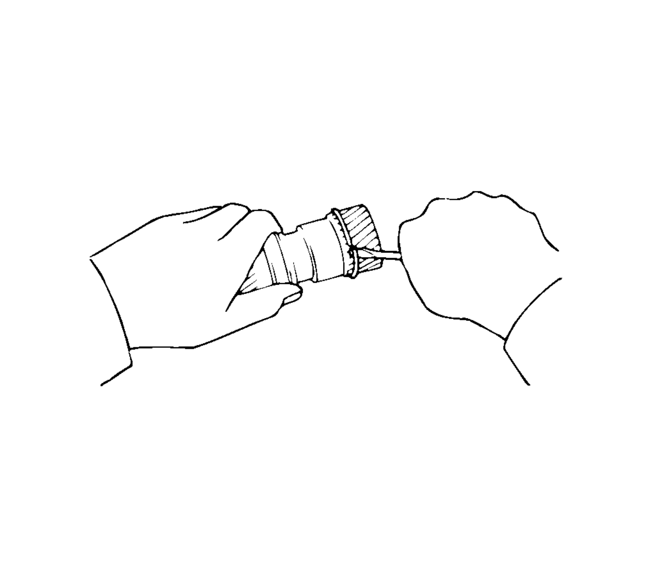
If the inside diameter is greater than the maximum, replace the planetary sun gear.



248RY00054

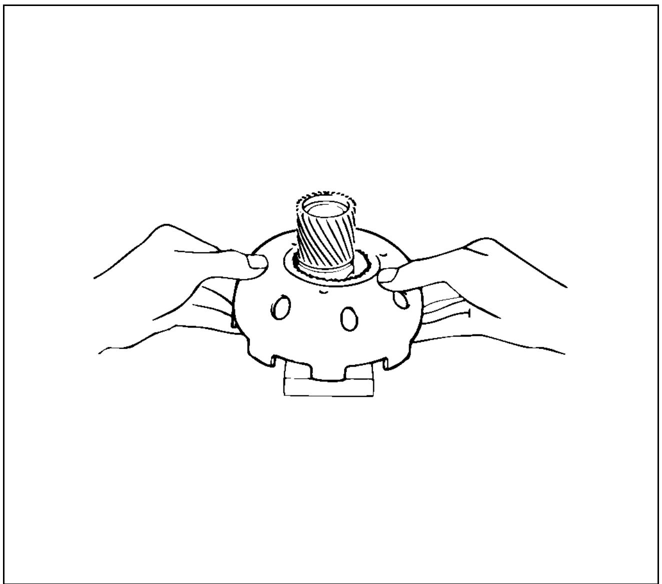
Reassembly

1. Install snap ring to planetary sun gear.



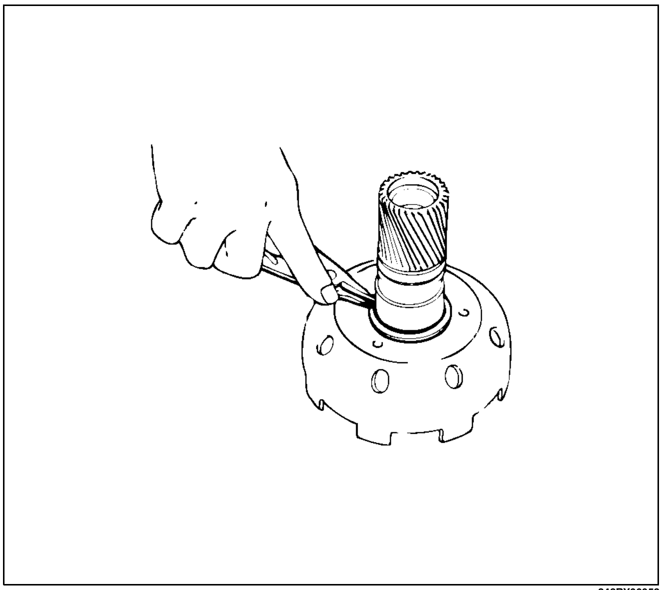
248RY00055

2. Place a wooden block, etc. as a work stand and place the planetary sun gear onto it.
   Install the sun gear input drum onto the planetary sun gear.



248RY00056

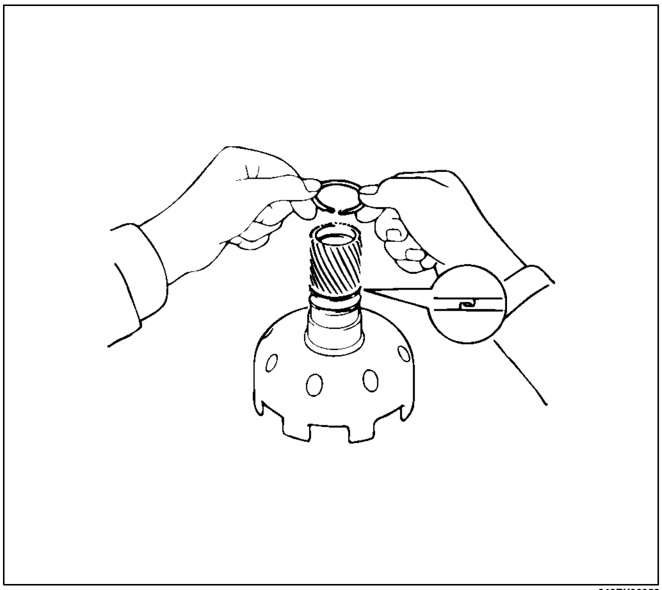
3. Install snap ring with snap ring pliers.



248RY00053

4. Coat the two oil seal rings (metal) with ATF.
   Install the two oil seal rings onto the planetary sun gear.

NOTE: Do not spread the ring ends too much.



248RY00052

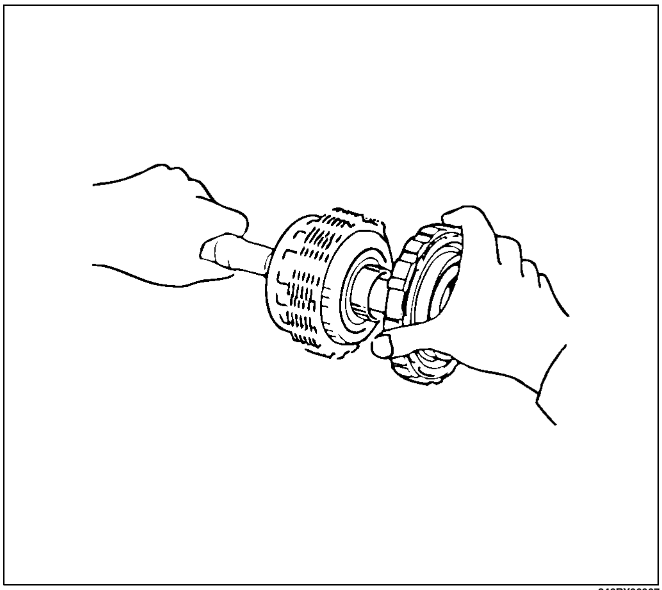
(3) Snap ring
(4) Spring retainer
(5) Piston return spring
(6) Piston sleeve
(7) Second brake piston
(8) O-ring
(9) Second brake drum

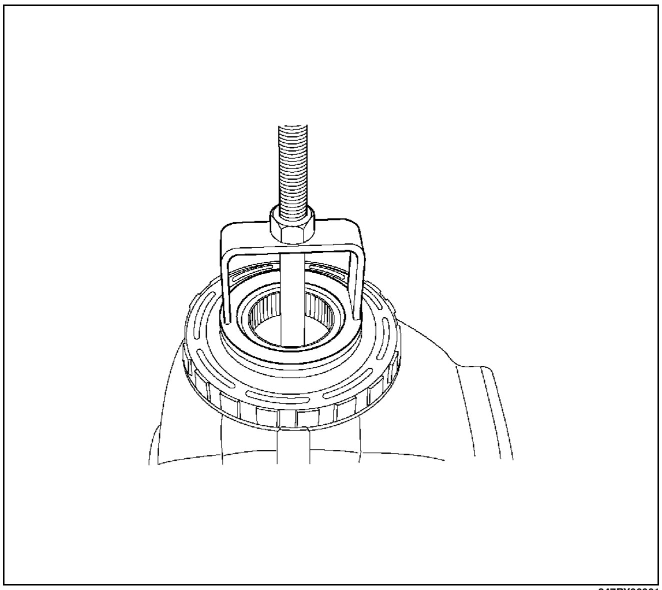
Disassembly

1. Remove second brake assembly from output shaft.



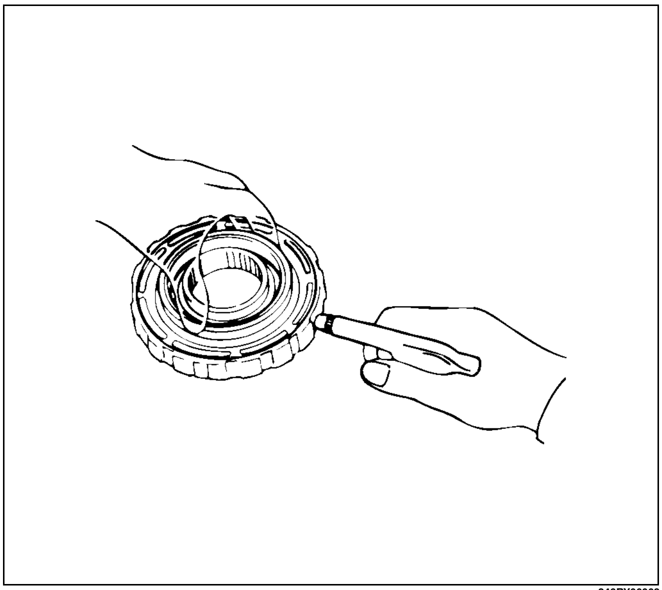
246RY00007

2. Remove the hrust washer (plastic).
3. Place special tool on the spring retainer, and compress the return spring.
   Spring compressor: 5-8840-0254-0
   Remove the snap ring with snap ring pliers.



247RY00001

4. Remove the spring retainer and piston return spring.
5. Romove piston sleeve.
6. Holding the second brake piston by hand, apply compressed air to the second brake drum to remove the second brake piston.
   Remove the second brake piston from the second brake drum.



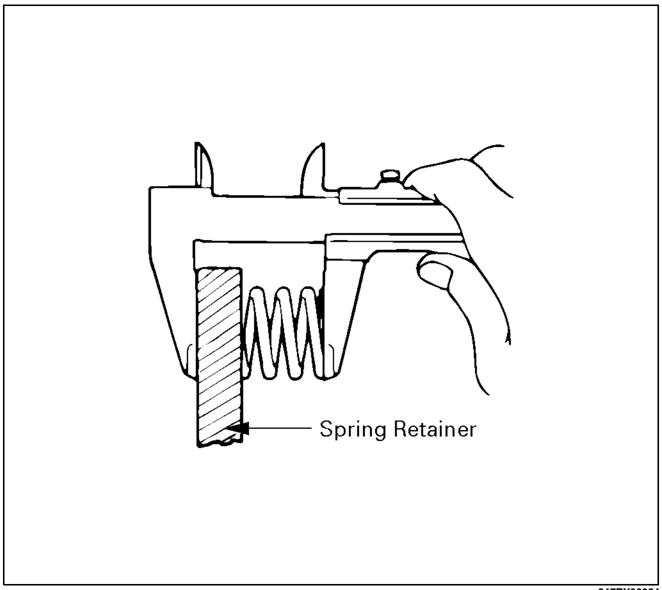
246RY00008

7. Remove the o-rings from the second brake piston.

Inspection and Repair

1. Check piston return spring.
   Using calipers, measure the free length of the return spring.

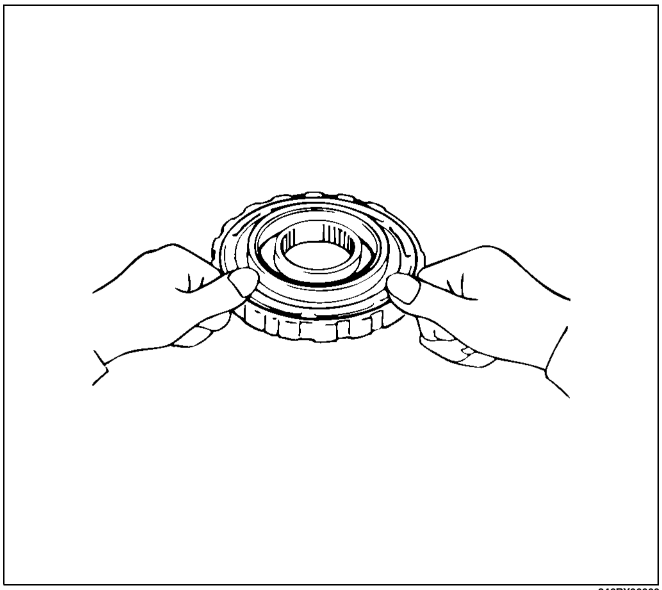
Standard length: 18.38 mm (0.724 in)



247RY00034

Reassembly

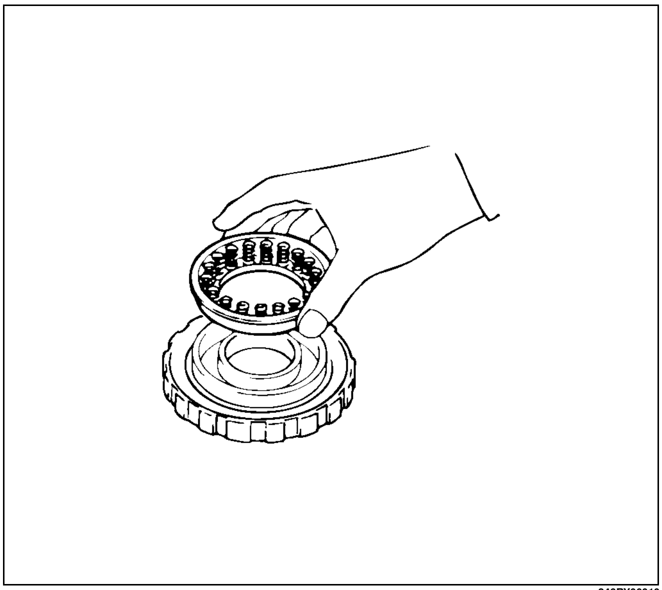
1. Coat new O-rings with ATF and install them on the second brake piston.



246RY00009

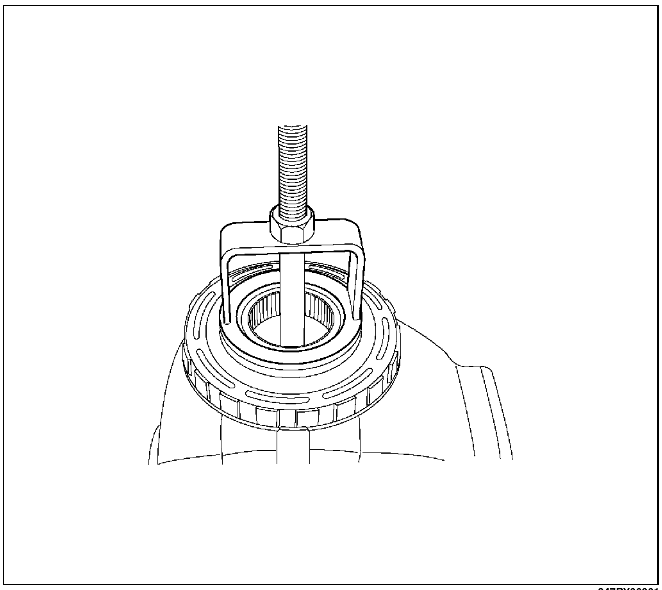
2. Being careful not to damage the O-rings, press in the second brake piston into the second brake drum.
3. Install piston sleeve.

4. Install piston return spring.



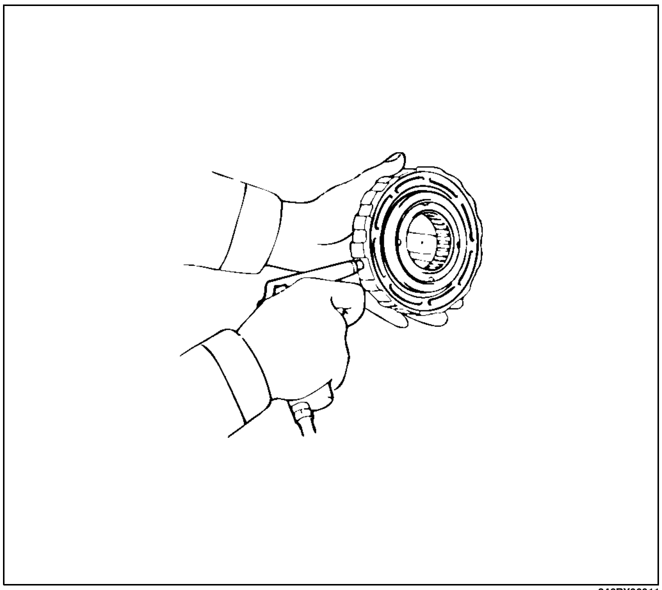
246RY00010

5. Install spring retainer.
6. Place special tool on the spring retainer, and compress the return spring.
   Spring compressor: 5-8840-0254-0
   Install the snap ring with snap ring pliers.
   Be sure the end gap of the snap ring is not aligned with the spring retainer claw.



247RY00001

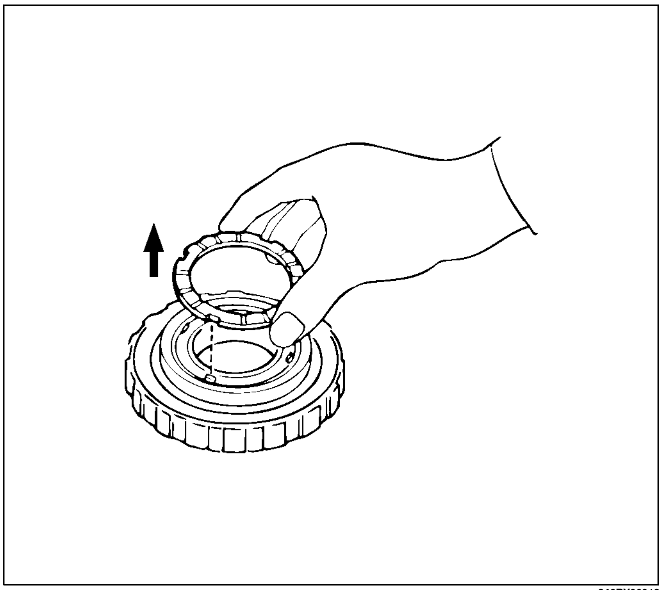
7. Check second brake piston movement.
   Make sure the second brake piston moves smoothly when applying and releasing the low compressed air to the second brake drum.



246RY00011

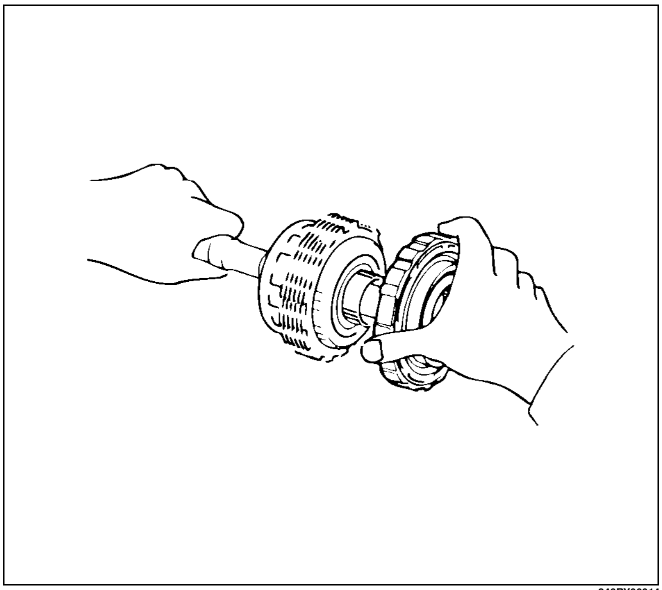
8. Coat the thrust washer (plastic) with petroleum jelly and install it to the second brake piston, with the grooved side facing upward.

NOTE: Make sure that the cutout portions of the thrust washer match the teeth of the spring retainer.



246RY00012

9. Install second brake assembly to output shaft.



246RY00014

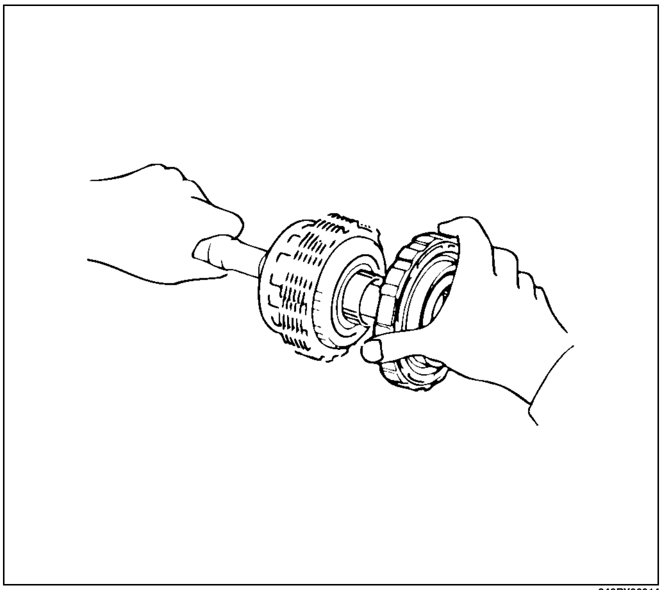
(9) Rear planetary ring gear
(10) Ring gear flange
(11) Snap ring
(12) Thrust needle roller bearing
(13) Output shaft

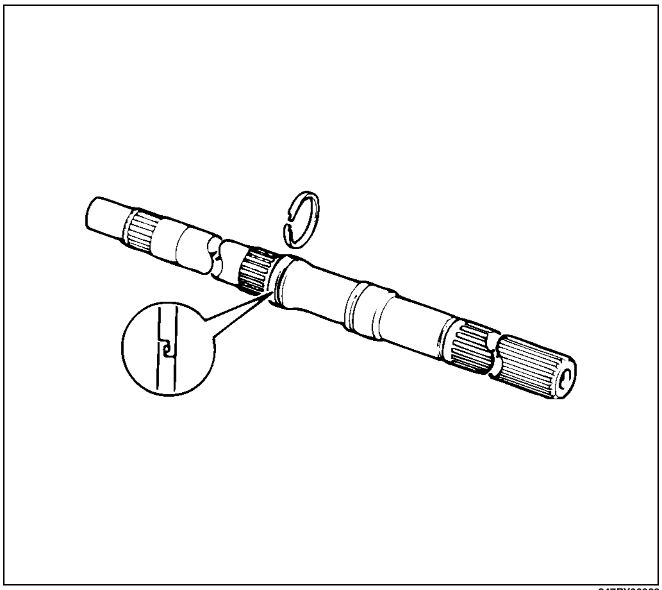
Disassembly

1. Remove second brake assembly from output shaft.



246RY00014

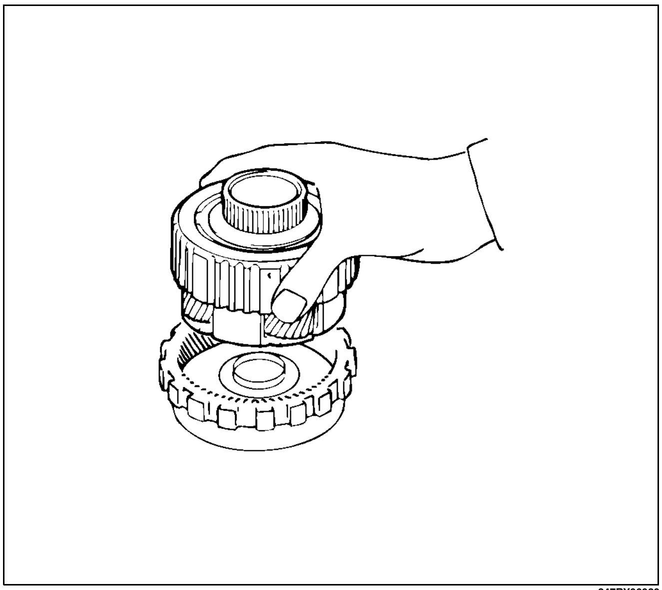
2. Remove oil seal ring from output shaft.



247RY00028

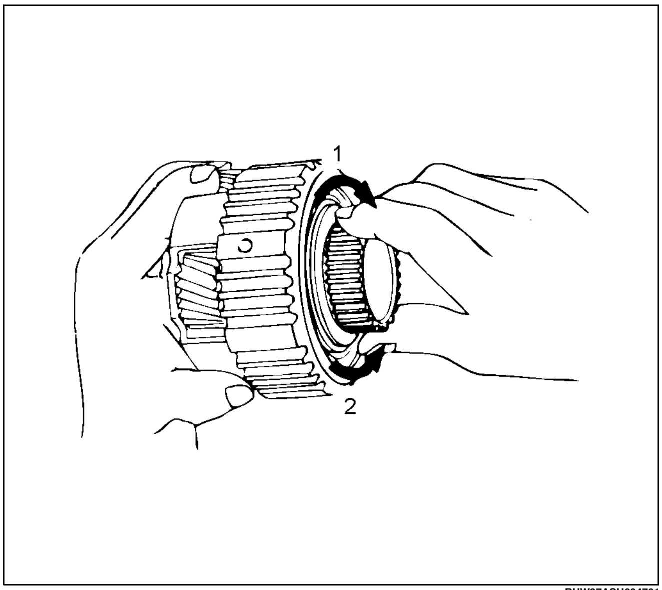
3. Remove the seven discs, seven plates and flange (B–3).

4. Remove rear planetary gear from rear planetary ring gear.



247RY00029

5. Check operation of No.2 one-way clutch.
   Hold the planetary gear and turn the one-way clutch inner race.
   The one-way clutch inner race should turn freely counterclockwise and should lock clockwise.

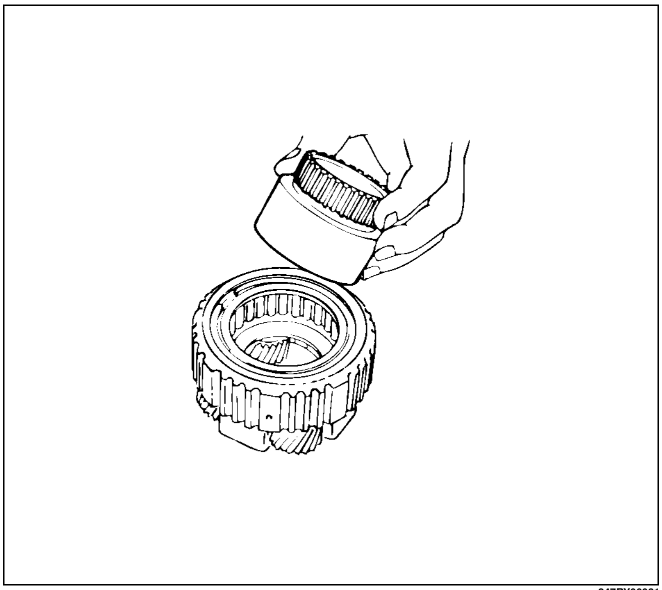


RUW37ASH004701

Legend

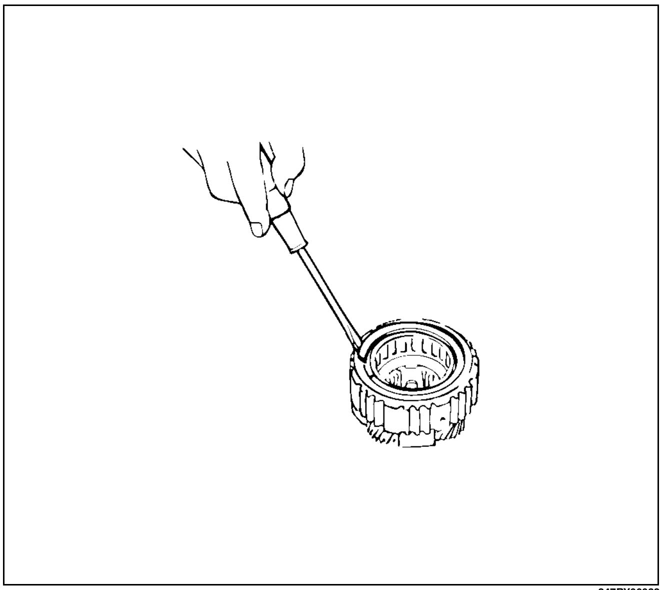
(1) Lock
(2) Free

6. Remove the one-way clutch inner race from the rear planetary gear.



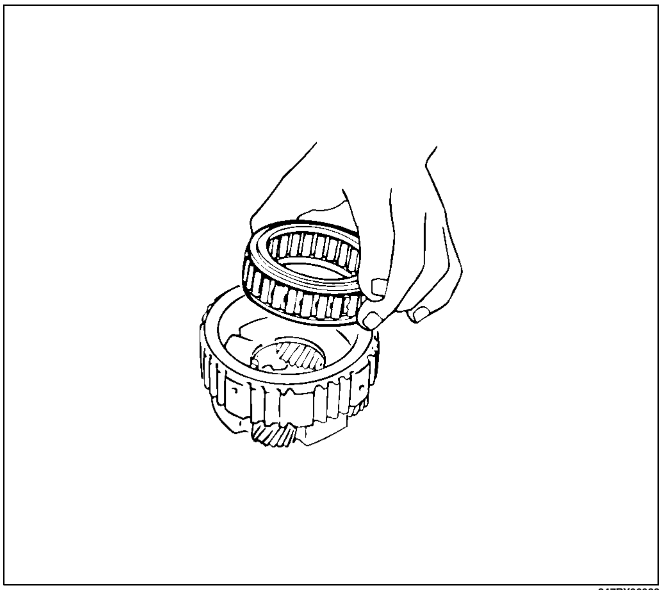
247RY00031

7. Remove the snap ring with a screwdriver.



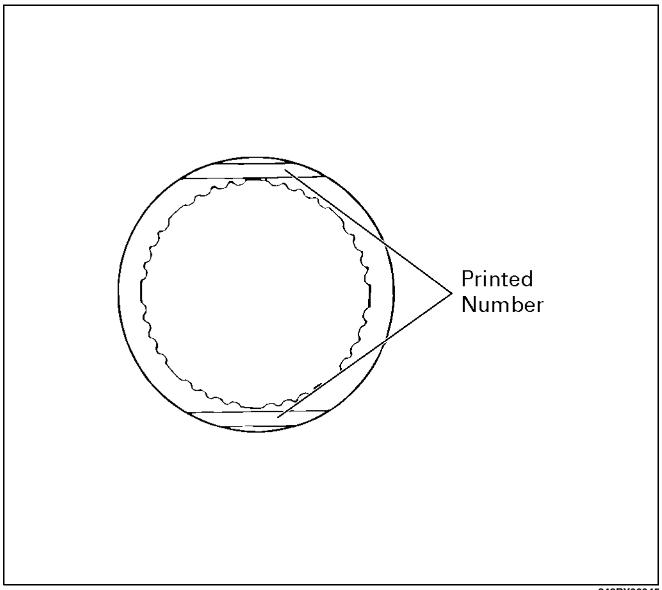
247RY00032

8. Remove the one-way clutch with retainers from the planetary gear.



247RY00033

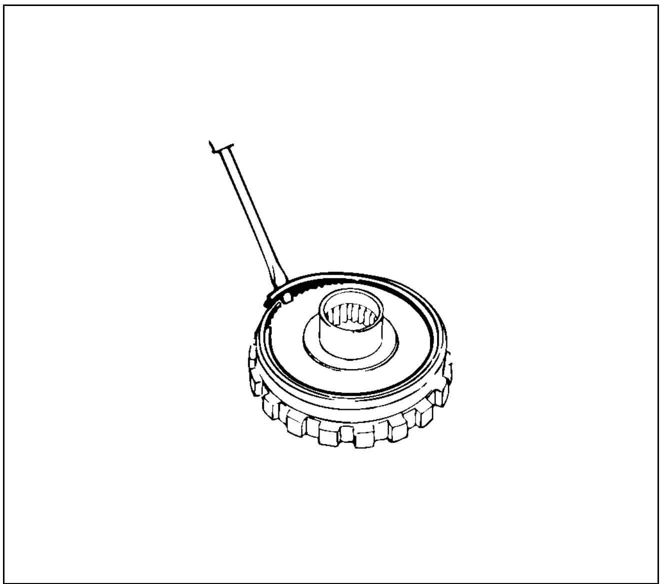
9. Remove the thrust washer (plastic) from front side of rear planetary gear.
10. Remove the thrust washer (plastic) from rear side of rear planetary gear.
11. Remove the thrust bearing and race from front side of ring gear flange.
12. Remove the snap ring from rear planetary ring gear.
13. Remove the ring gear flange from rear planetary ring gear.
14. Check disc, plate and flange.
    Check to see if the sliding surface of the disc, plate and flange are worn or burnt. If necessary, replace them.
    - If the lining of the disc is peeling off or discolored, or even if parts of the printed numbers are defaced, replace all discs.
    - Before assembling new discs, soak them in ATF for at least fifteen minutes.



248RY00045

Reassembly

1. Install ring gear flange to the rear planetary ring gear.
2. Install snap ring to the rear planetary ring gear.

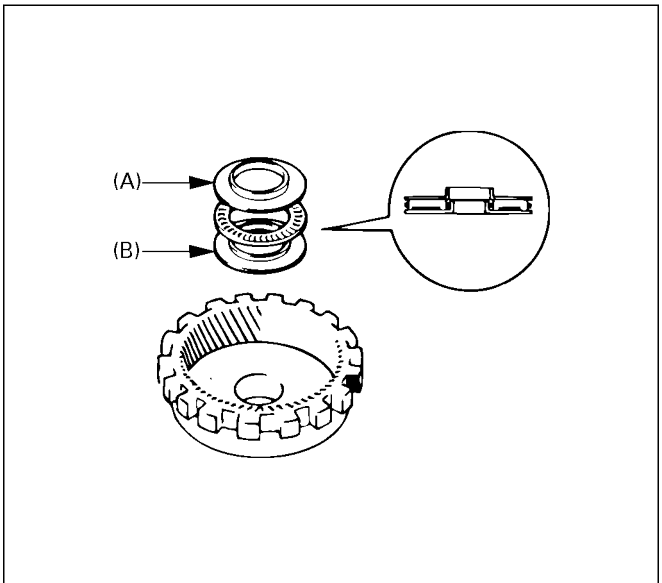


247RY00035

3. Coat the races and bearing with petroleum jelly, and install them onto the rear planetary ring gear.

Races and bearing diameter (Reference)

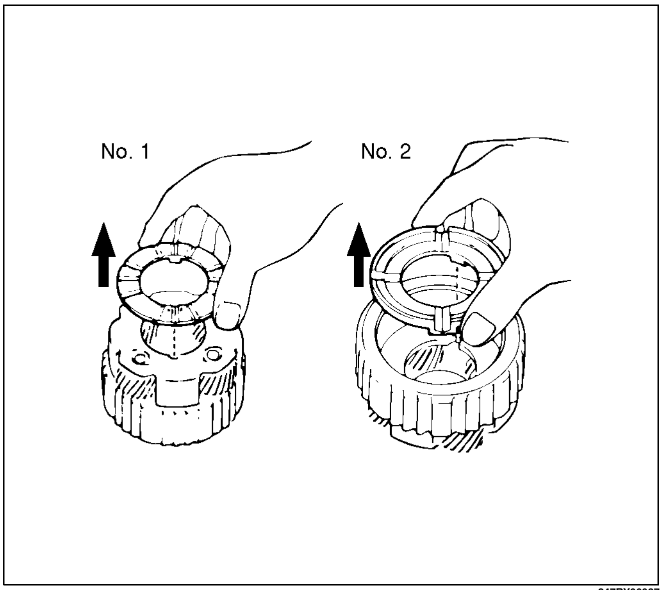
	Inside	Outside
Race (A)	28.5 mm (1.122 in)	44.2 mm (1.740 in)
Bearing and race (B)	27.7 mm (1.091 in)	44.2 mm (1.740 in)



247RY00036

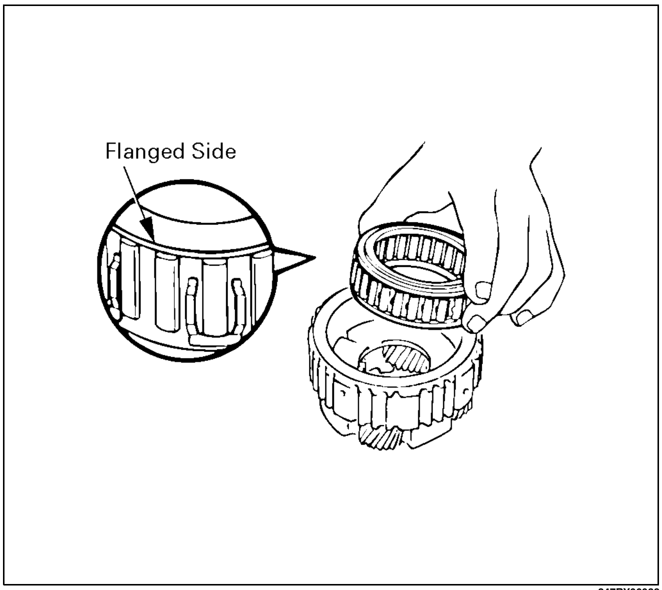
4. Coat the thrust washers (plastic) with petroleum jelly.
   Install the thrust washers onto both sides of the rear planetary gear, facing the grooved side upward.

NOTE: Make sure that the lugs fit into the cutout portions on the rear planetary gear.



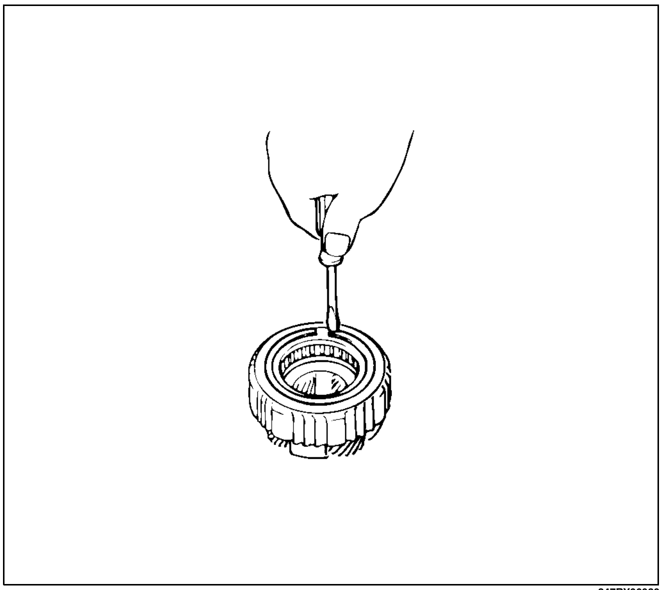
247RY00037

5. Install the one-way clutch with the flanged side facing upward onto the rear planetary gear.



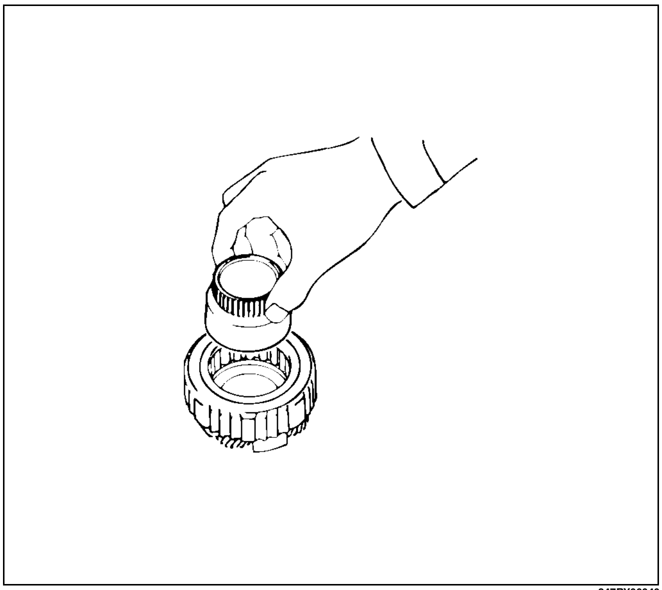
247RY00038

6. Install snap ring.



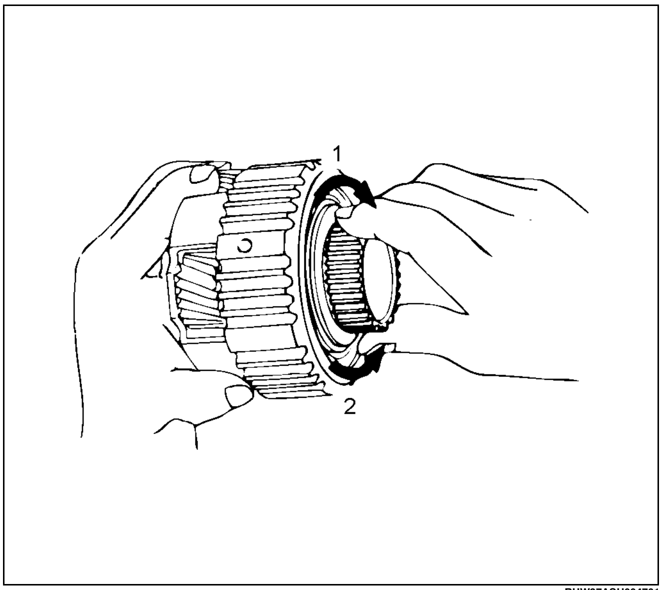
247RY00039

7. While turning counterclockwise, install one-way clutch inner race to rear planetary gear.



247RY00040

8. Check operation of one-way clutch.
   Hold the planetary gear and turn the one-way clutch inner race.
   The one-way clutch inner race should turn freely counterclockwise and should lock clockwise.



RUW37ASH004701

Legend

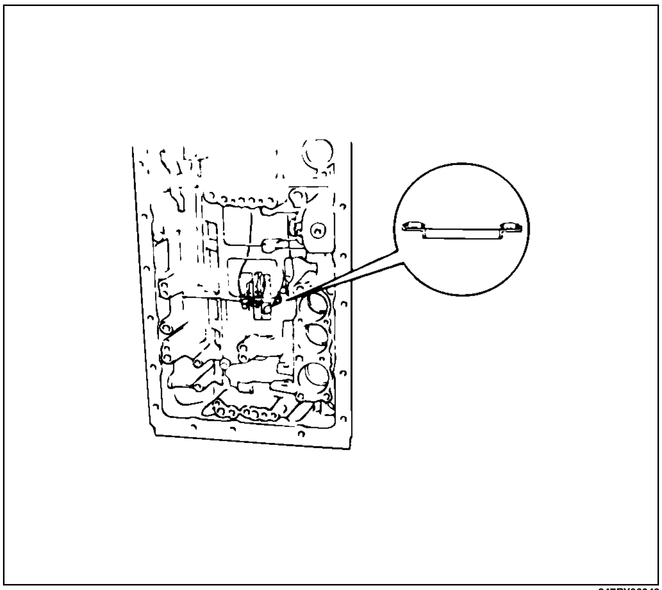
(10) Rear planetary gear assembly and output shaft

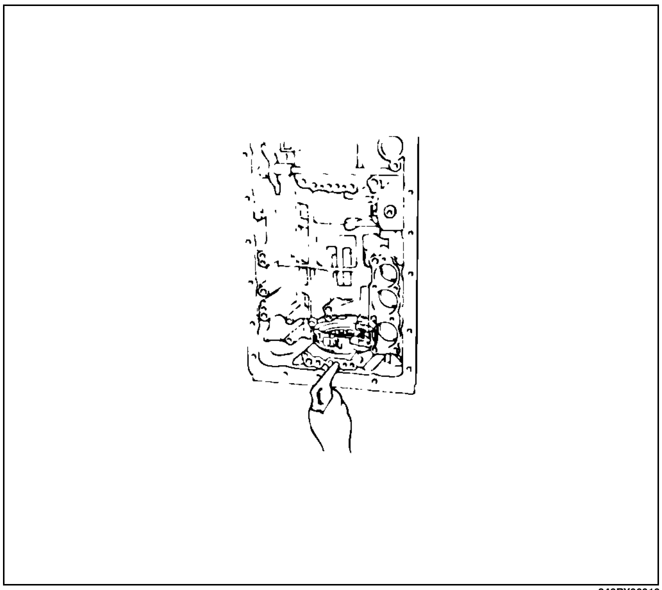
Disassembly

1. Remove assembled thrust bearing and race from transmission case.



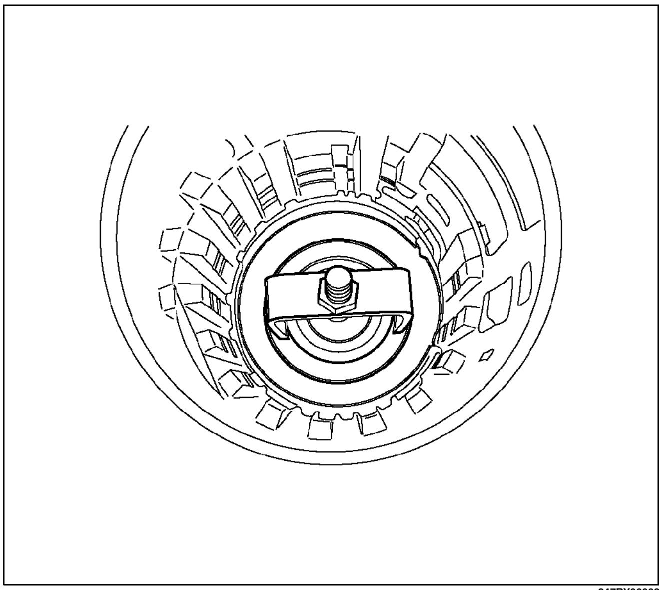
247RY00043

2. Check first and reverse brake piston movement. Make sure that first and reverse brake piston moves smoothly when applying and releasing the compressed air into the transmission case.



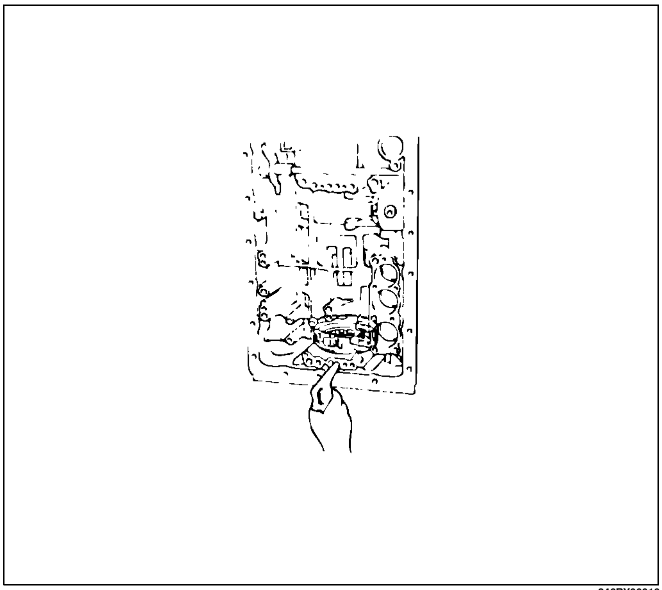
246RY00016

3. Set special tool on the spring retainer, and compress the return spring.
   Spring compressor: 5-8840-0254-0
   Remove the snap ring with snap ring pliers.



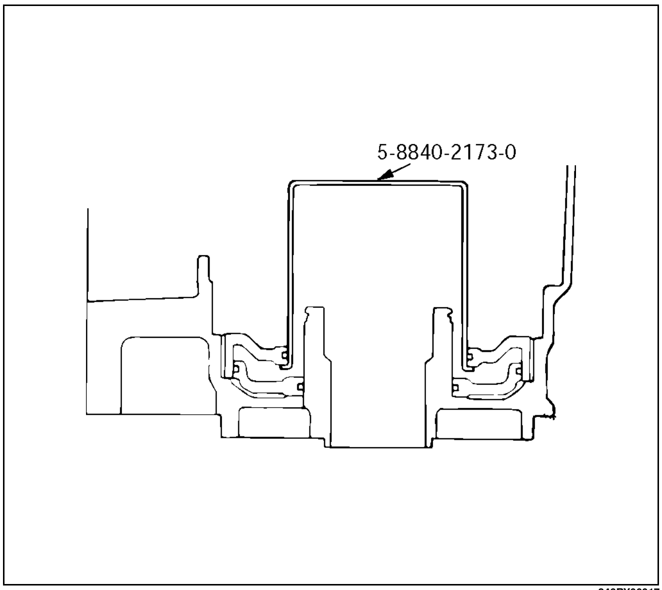
247RY00002

4. Remove the piston return spring.
5. Remove the first and reverse brake piston No.2.
   Holding the first and reverse brake piston No.2 by hand, apply compressed air to the transmission case to remove the first and reverse brake piston No.2.
   Remove the first and reverse brake piston No.2.
   If the piston does not pop out with compressed air, lift the piston out with needle-nose pliers.



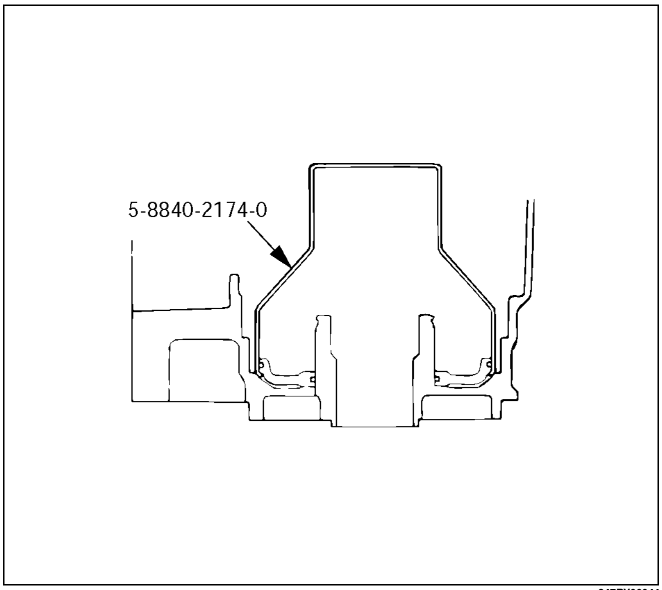
246RY00016

6. Remove the O-ring from first and reverse brake piston No.2.
7. Remove the reaction sleeve.
   Insert special tool behind the reaction sleeve and gradually lift it out of the transmission case.
   Reaction sleeve puller: 5-8840-2173-0



246RY00017

8. Remove the O-ring from reaction sleeve.
9. Remove the first and reverse brake piston No.1.
   Insert special tool behind the first and reverse brake piston No.1 and gradually lift it out of the transmission case.
   Piston puller: 5-8840-2174-0

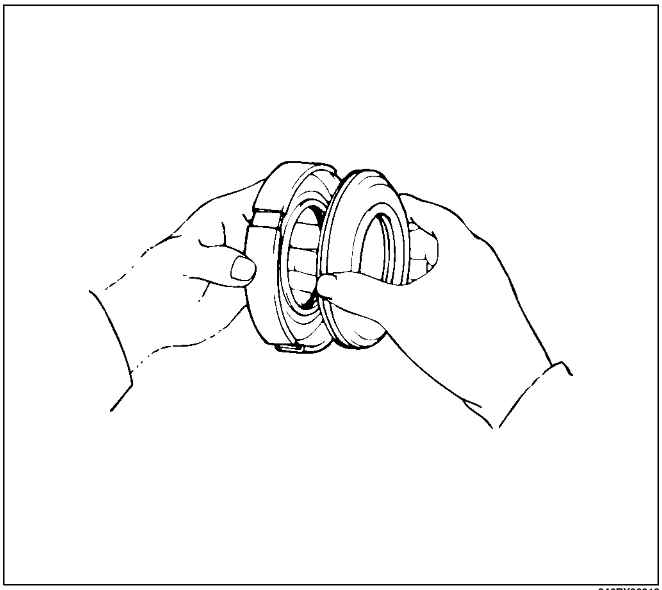


247RY00044

10. Remove the O-rings from first and reverse brake pistion No.1.

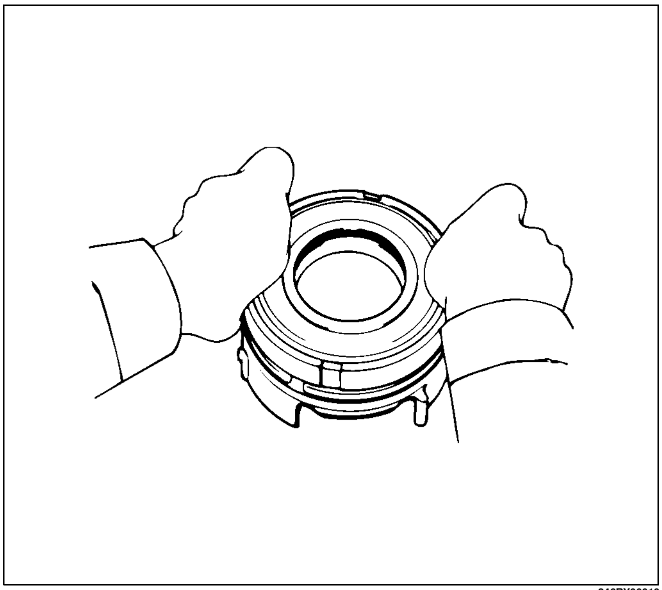
Reassembly

1. Coat three new O-rings with ATF.
   Install the two O-rings on the No.1 piston.
2. Install the O-ring on the reaction sleeve.
3. Install the first and reverse brake piston No.1 to the reaction sleeve.



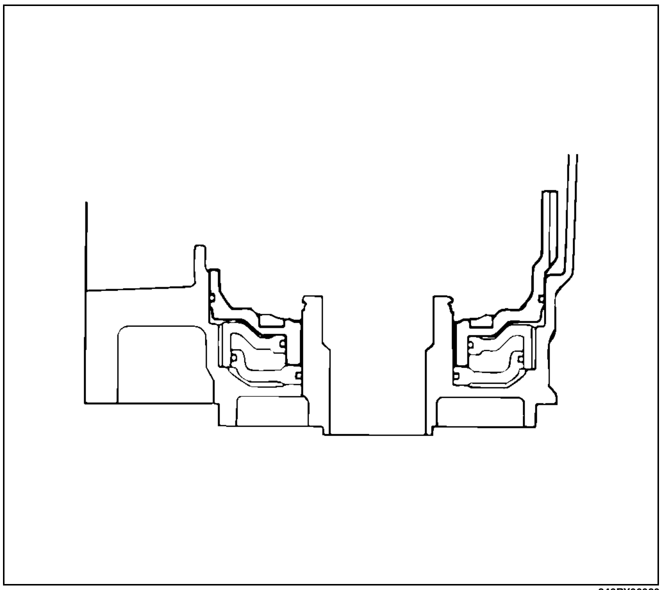
246RY00018

4. Coat a new O-ring with ATF and install it on the first and reverse brake piston No.2.
5. Install the first and reverse brake piston No.1 with reaction sleeve onto the first and reverse brake piston No.2.



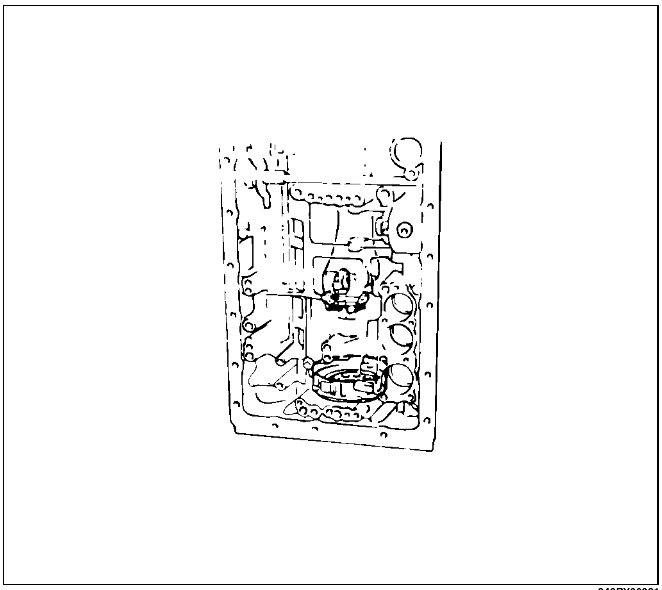
246RY00019

6. Align the teeth of the first and reverse brake piston No.2 into the proper grooves.
   Being careful not to damage the O-rings, press in the first and reverse brake piston No.2 with No.1 into the transmission case.



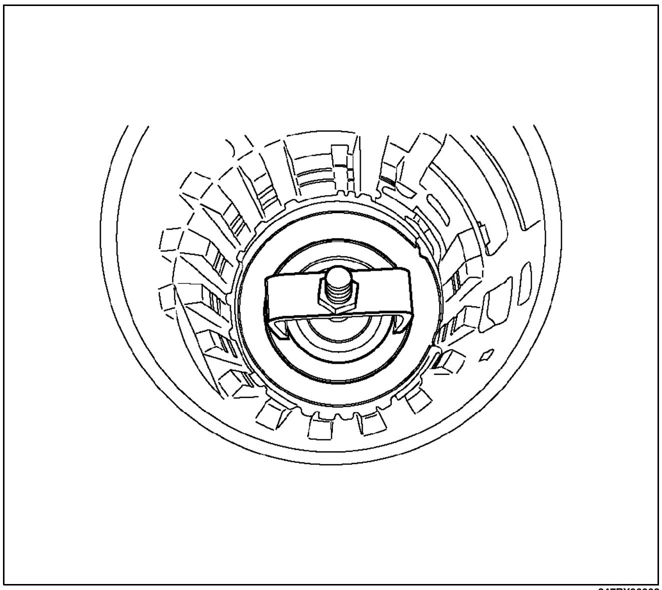
246RY00020

7. Place piston return spring onto first and reverse brake piston No.2.



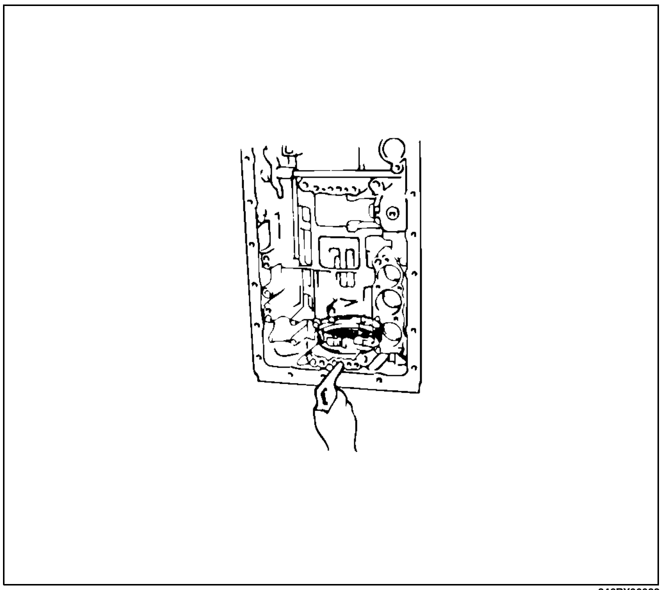
246RY00021

8. Set special tool as shown, and compress the return spring with special tool.
   Spring compressor: 5-8840-0254-0
   Install the snap ring with snap ring pliers.
   Be sure the end gap of the snap ring is not aligned with the spring retainer claw.



247RY00002

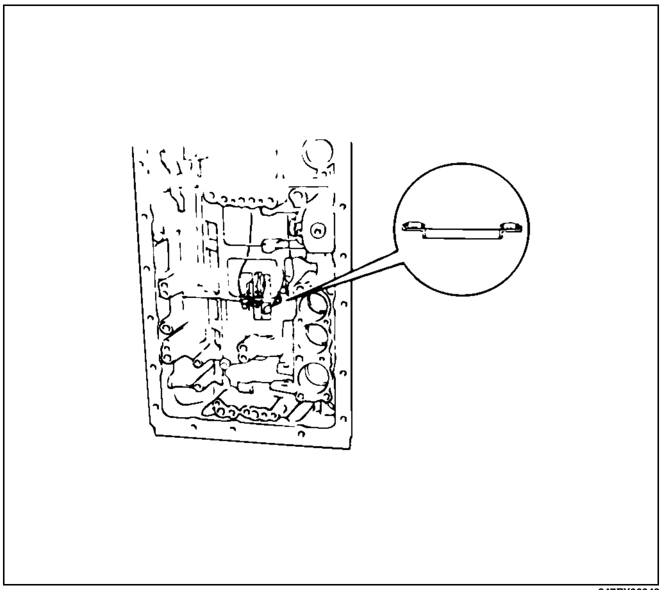
9. Check first and reverse brake piston movement.
   Make sure the first and reverse brake piston moves smoothly when applying and releasing the compressed air into the transmission case.



246RY00022

10. Coat the assembled bearing and race with petroleum jelly.
    Install the assembled bearing and race facing the bearing side upward.
    Bearing and race diameter (Reference)

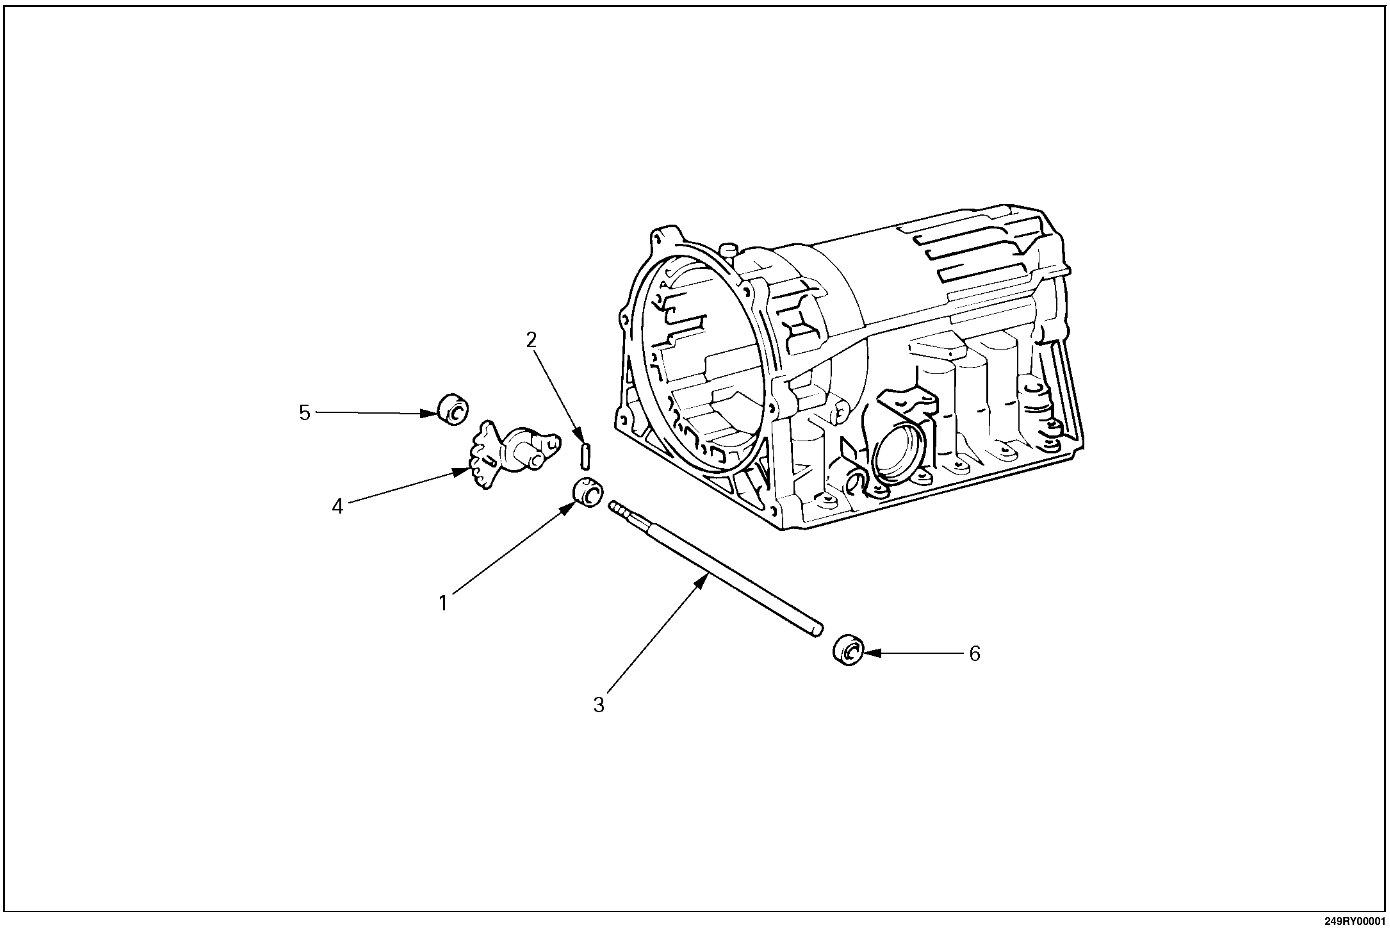
Inside diameter	39.38 mm (1.550 in)
Outside diameter	58.15 mm (2.289 in)



247RY00043

Transmission Case

Disassembled View

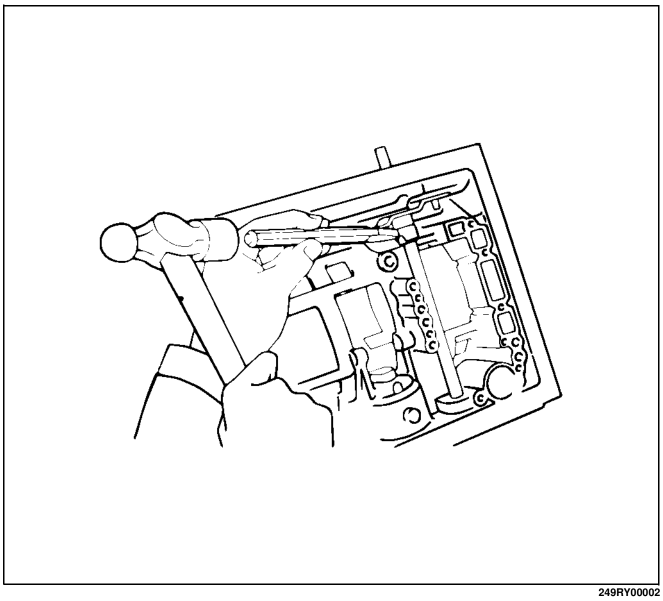


Legend

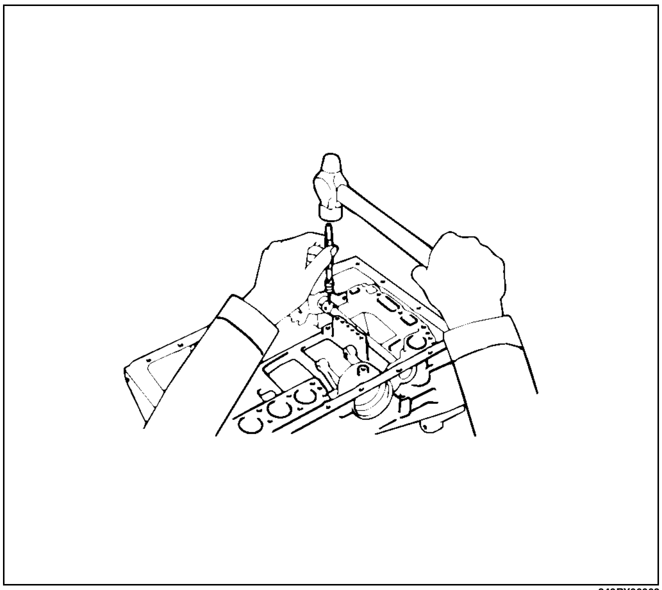
(1) Spacer
(2) Pin
(3) Manual valve lever shaft
(4) Manual valve lever
(5) Oil seal
(6) Oil seal

Disassembly

1. Using a chisel, cut off the spacer and remove it from the shaft.

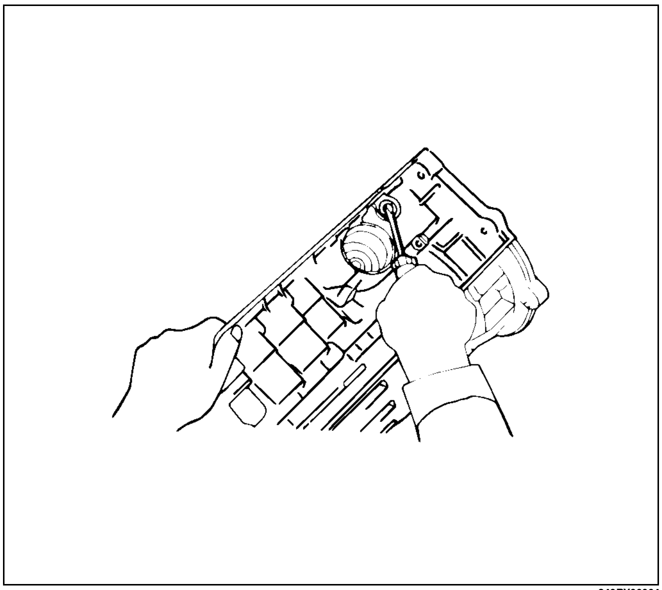


2. Using a punch, drive out the pin.



249RY00003

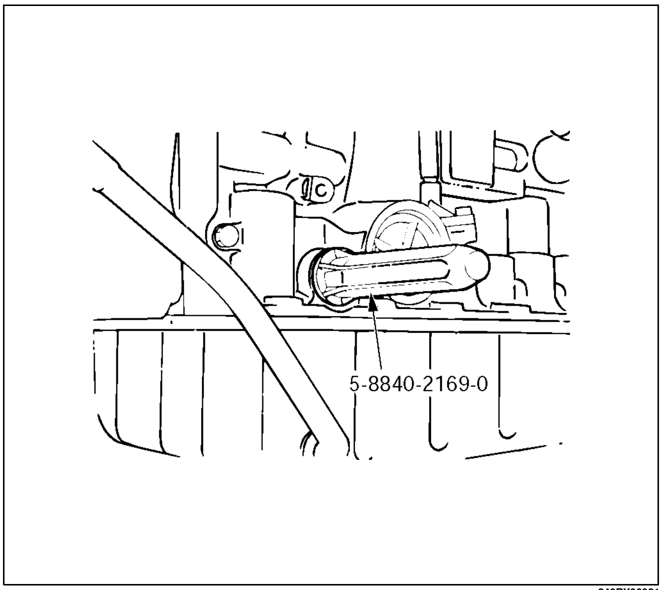
3. Pull the manual valve lever shaft out through the case by the threads.
4. Take out the manual valve lever.
5. Using a screwdriver, remove the oil seals.



249RY00004

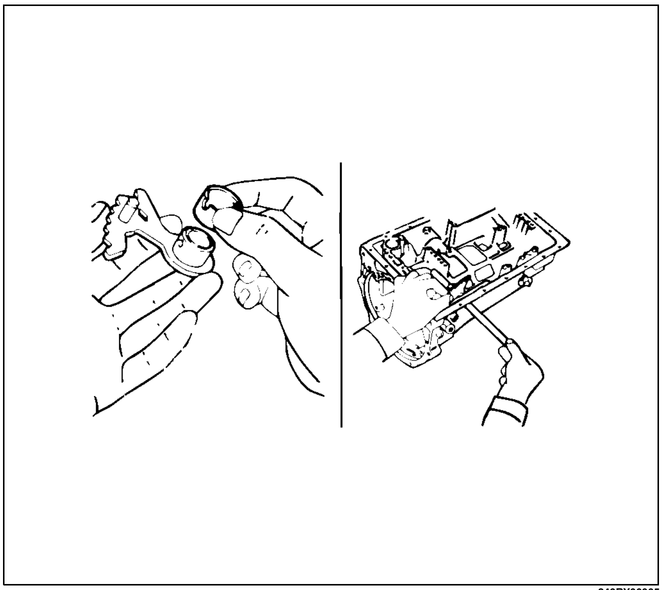
Reassembly

1. Coat a new oil seal lip with multi purpose grease. Using special tool, drive in the oil seal.
   Oil seal installer : 5-8840-2169-0



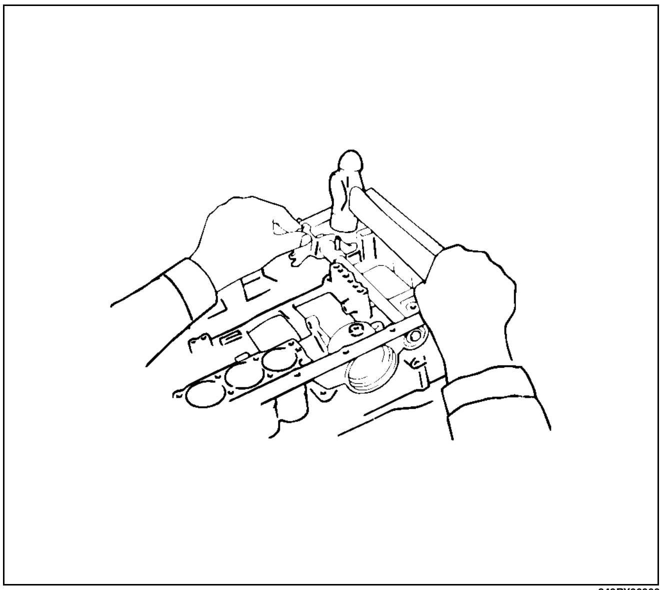
240RY00021

2. Assemble a new spacer to the manual valve lever.
3. Install the manual valve lever shaft to the transmission case through the manual valve lever by the threads.



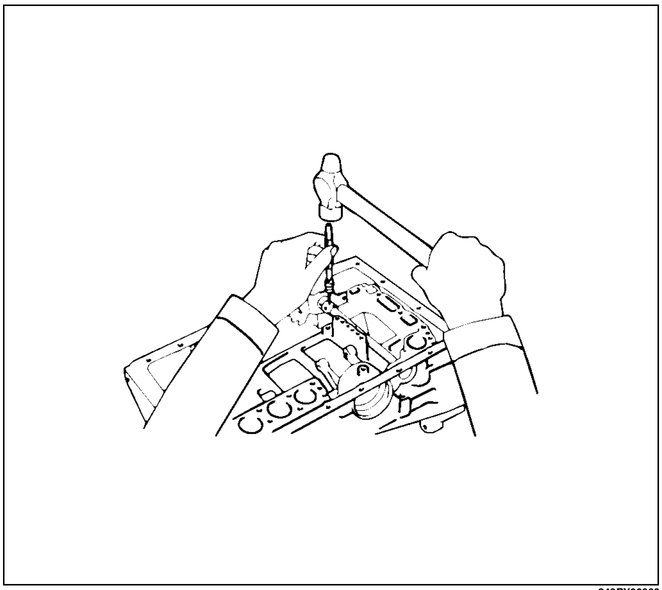
249RY00005

4. Drive in the pin with the slot at a right angle to the shaft.



249RY00006

5. Match the spacer hole to the lever staking hollow and stake the spacer to the lever.
   Make sure the manual valve lever shaft turns smoothly.

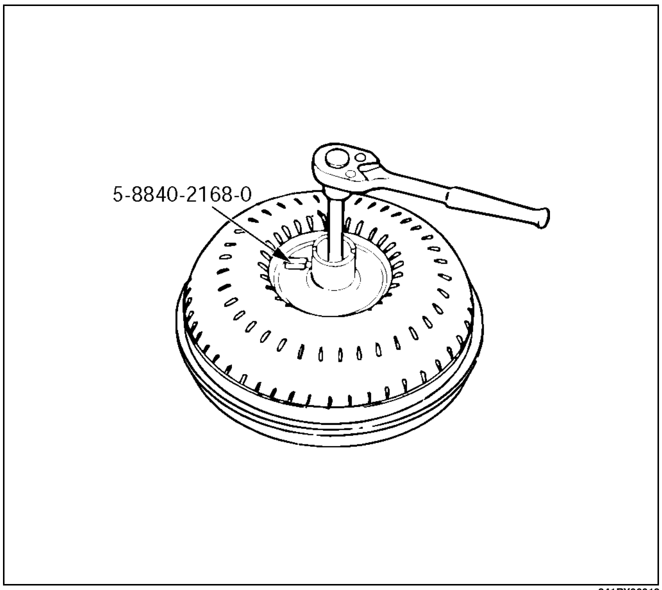


249RY00003

Torque Converter

Inspection and Repair

Insert special tool in end of torque converter.
Insert a turning tool into the inner race of the one-way clutch.
One-way clutch testing tool : 5-8840-2168-0
Insert the stopper so that it fits in the notch of the converter hub and outer race of the one-way clutch.



241RY00018

1. One-way clutch test.
   The clutch should lock when turned counterclockwise, and rotate freely and smoothly clockwise. Less than 2.5 N·m (0.25 kgf·m/22 lb·in) of torque should be required to rotate the clutch clockwise. If necessary, clean the converter and retest the clutch. Replace the converter if the clutch still fails the test.

Figure 1. Construction of Automatic Transmission

The JR405E automatic transmission is electrically controlled by a microcomputer transmission control module (TCM). There are four forward speeds and one reverse speed.
This JR405E automatic transmission employs a clutch pressure direct control system (Direct Electronic Shift Control: DESC) using duty cycle type solenoids, which ensure high shift quality.
This transmission also has a learning function and constantly checks the time of each clutch and brake required for the shift in order to match this time with the target value for the optimum shift.

The TCM will automatically select the most appropriate shift points and lock-up points depending on the Accelerator pedal opening, the vehicle speed and the vehicle load.
If any trouble arises in the speed sensor, APP sensor, solenoid, etc., the fail-safe control function is activated to keep the running performance.
Problems with the sensors or the solenoids can quickly be detected with the self diagnosis procedure described in this manual.

The JR405E automatic transmission consists of the torque converter, oil pump, input shaft, out put shaft, planetary gears and control valves.
The gear train consists of two planetary gear sets and three multiple plate clutches in combination with two multiple plate brakes and a one-way clutch.

STRUCTURE AND FUNCTION OF COMPONENT

TORQUE CONVERTER (WITH LOCK-UP FUNCTION)

- The torque converter is a device for transmitting the engine torque to the transmission. It transmits power by means of oil when the lock-up clutch is disengaged, and by means of a lock-up clutch when it is engaged.
- The torque converter is of the symmetrical, three-element, single-stage, two-phase type.
- As shown in the drawing, the symmetrical three-elements refer to three elements (components) consisting of impeller (1), turbine (2) and stator (3) that are arranged symmetrically (figure 5).
- "Single-stage" means that there is only one turbine as an output element; "two-phase" means that the pump impeller acts as a torque converter when the turbine speed is comparatively low, and as a fluid coupling when the speed is high.

Figure 6. Construction of Torque Converter

Lock-up mechanism

- "Lock-up" refers to a fixed state of the lock-up clutch inside the torque converter and thus connects the engine directly to the transmission.
- The hydraulic pressure for the lock-up control is supplied from two circuits.

When the lock-up clutch is disengaged (Figure 7)

- When the lock-up is disengaged, the torque converter operating pressure is supplied from the oil passage (A) to between the cover and the lock-up piston, and separates the lock-up piston clutch facing and converter cover.
- As a result, the engine drive power is transmitted from the converter cover to the pump impeller, to the ATF and to the turbine. The torque converter functions as a fluid connector in this condition.
- The torque converter operating pressure is supplied from oil passage (A), and passes through oil passage (B).

When the lock-up clutch is engaged (Figure 8)

- When the lock-up is engaged, the torque converter operating pressure is supplied from oil passage (B) to the oil pump impeller, the turbine, and then to the stator side. The oil between the lock-up piston and converter cover is drained.
- Since the force acting on the right side of the lock-up piston is greater than the force on the left side, it connects the lock-up piston clutch facing with the converter cover, thereby increasing the transmission efficiency.

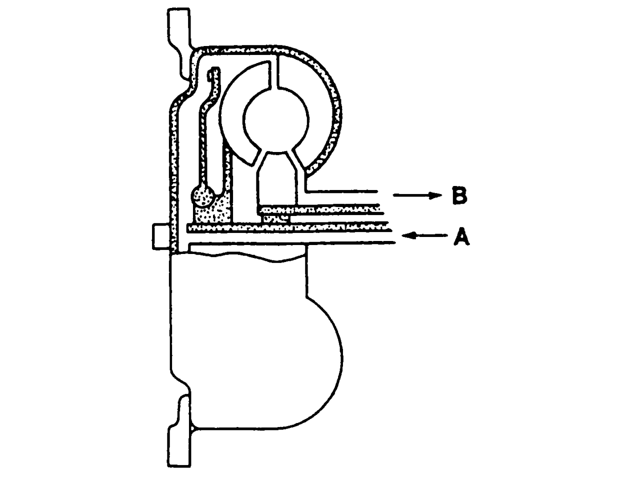

Figure 7. Lock-up Control (Disengaged)

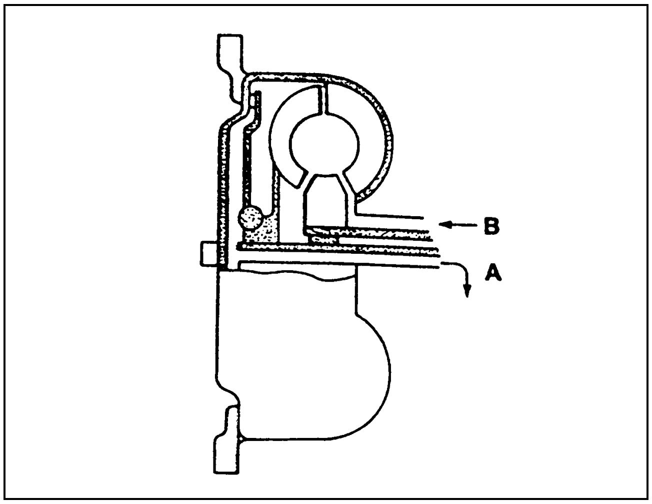

Figure 8. Lock-up Control (Engaged)

OIL PUMP

- The oil pump generating oil pressure is a small-size trochoid gear type oil pump. It feeds oil to the torque converter, lubricates the power train mechanism, and feeds the oil pressure to the oil pressure control unit under pressure.
- The oil pump is located behind the torque converter. Since the inner rotor in the oil pump is fitted with the drive sleeve of the torque converter, it works using power from the engine.

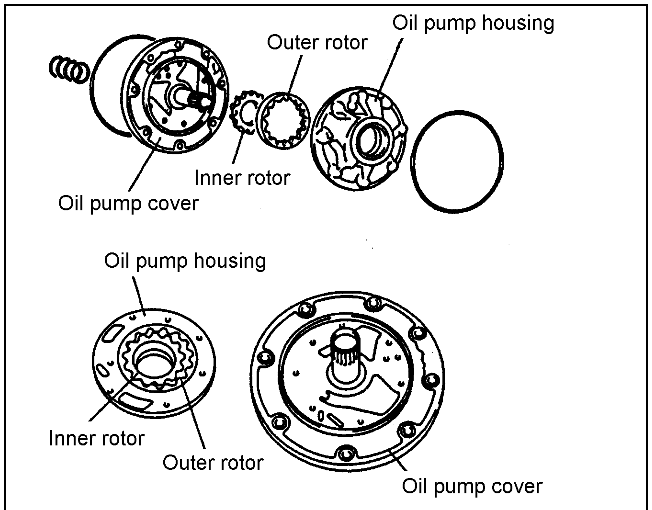

Figure 9. Construction of Oil Pump

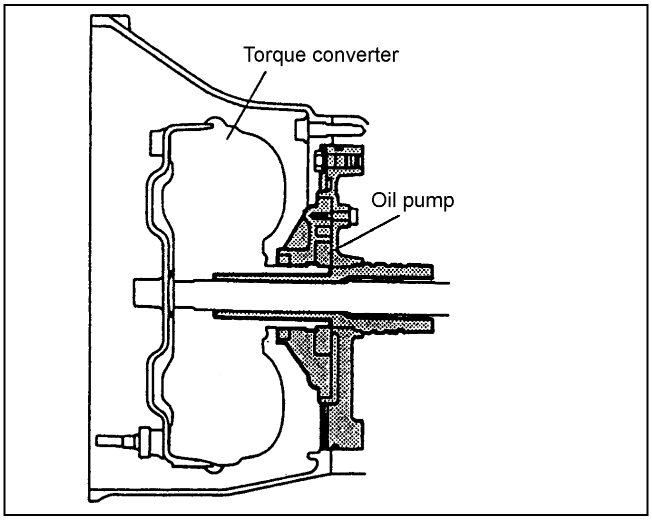

Figure 10. Location of Oil Pump

- When the inner rotor in the oil pump rotates, ATF is sucked in from the oil pan, passed between the inner rotor, outer rotor and crescent, and then discharged. This discharged pressure is sent to the pressure regulator valve in the control valve, and adjusted as required for operating the A/T. The flow rate under pressure increases or decreases in proportion to the number of rotations.

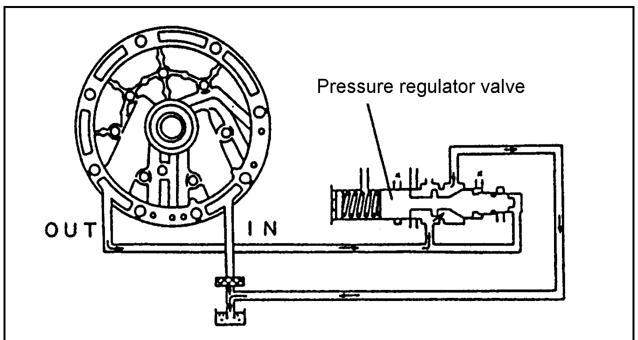

Figure 11. Operation of Oil Pump

INPUT SHAFT

- The input shaft has some oil holes, through which lubricating ATF is supplied to the torque converter, the bearings, etc.
- The input shaft is fitted to the turbine runner in the torque converter, the reverse & high clutch drum and the rear sun gear by means of the spline. Therefore, the engine driving force received by the torque converter is transmitted to the reverse & high clutch drum and rear sun gear.

OUTPUT SHAFT

- The output shaft has some oil holes, through which the lubricating ATF is supplied to the bearings, the planetary gear unit, etc.
- The output shaft transmits the engine driving force from the planetary gear to the propeller shaft.
- The front internal gear is fitted with the rear carrier assembly by spline. The parking gear is also fitted by spline. By fixing this gear mechanically, the output shaft is fixed as required when parking the vehicle.

GEAR SHIFTING MECHANISM

- The JR405E consists of two sets of planetary gears, three multiple plate clutches, two multiple plate brakes and a one-way clutch. They are activated in different combinations in any of four forward and one reverse gear positions.

Principle of gear shifting (Figure 12)

- Planetary gears have the advantage of a compact configuration because of the way they are constructed with a single central shaft.
- Also, unlike the manual transmission gears that require changing of the gear mesh, the gear ratio of the planetary gears can be changed more easily by locking, releasing or rotating only some of their parts.
- A planetary gear is made up of a sun gear (1) at its center, and pinion gears (2) each of which rotates about its own center and around the sun gear, as shown. They are all contained within the internal gear (3).
- Also, since the pinion gears are further supported by the planetary carrier (4), they rotate as a unit in the same direction, and at the same rate.
- As shown below, each planetary gear is constructed of three elements; a sun gear, pinion gears, an internal gear and a planetary carrier. Gear shifting is achieved by conditioning two of the three elements, namely the sun gear, the internal gear and planetary carrier.
- The planetary gears are locked by the clutch, brake and one-way clutch according to the gear shifting.

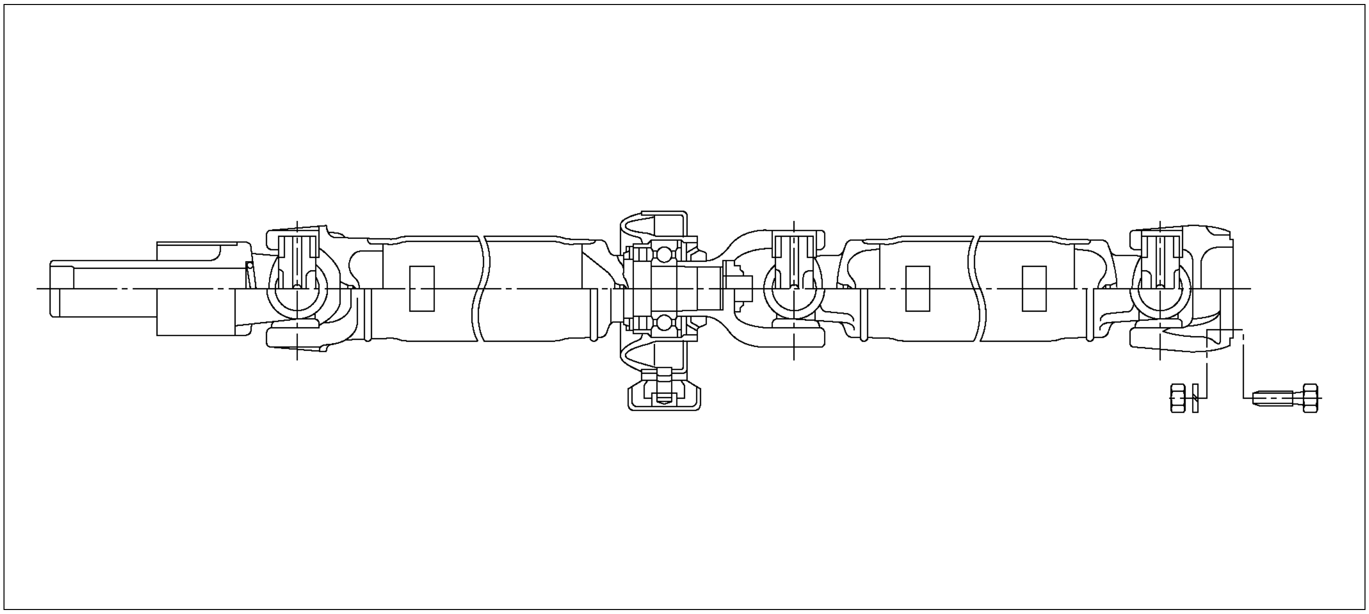
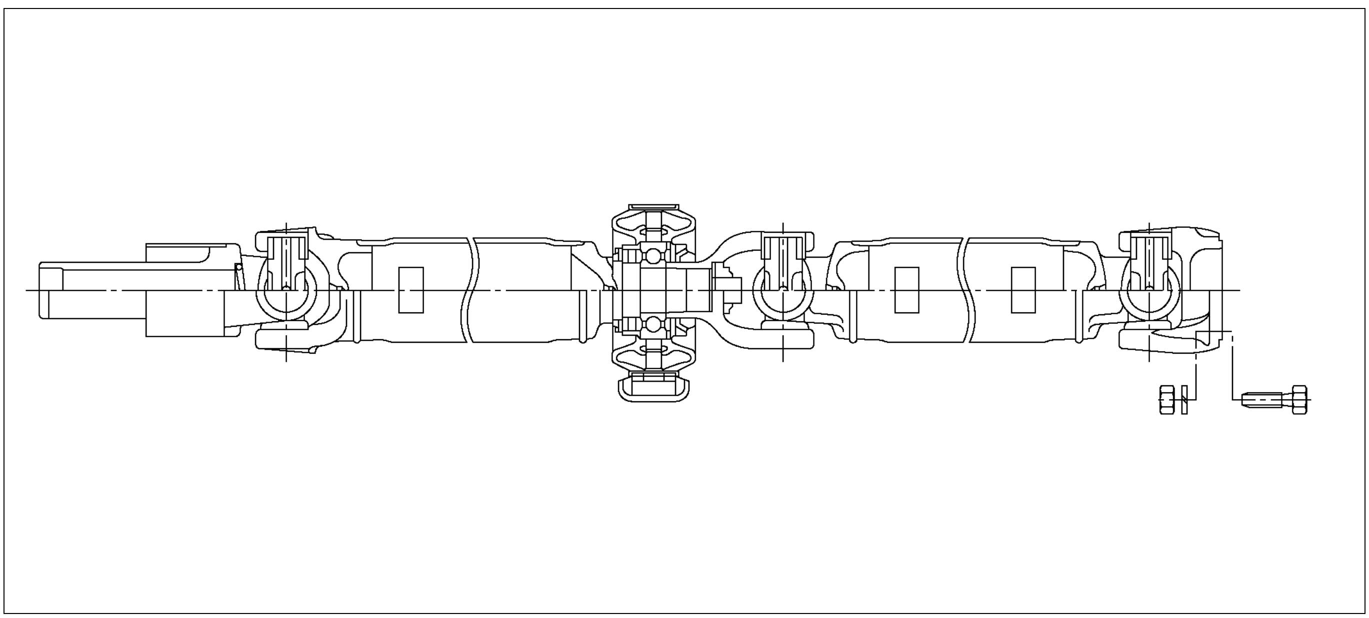
General Description

4×2 (Except High Ride Suspension) Model



F04R300001

4×2 (High Ride Suspension), 4×4 Model



401R300007

- The JR405E consists of two sets of planetary gears, which are called front planetary gear and rear planetary gear.
- The sun gear of the front planetary gear is fixed to the drive plates of 2-4 brake and reverse clutch.
- The planetary carrier of the front planetary gear is fixed to the drum of the low clutch, the drive plates of the low & reverse brake, and the hub of the high clutch.
- The internal gear of the front planetary gear, and the planetary carrier of the rear planetary gear, are connected as one and fixed to the output shaft.
- The sun gear of the rear planetary gear is fixed to the input shaft.
- The internal gear of the rear planetary gear is fixed to the hub of the low clutch.

Clutch and Brake

- Basic structure of the clutch and brake is shown in the figures below.
- In the figure A, the clutch plates (drive plate and driven plate) are released so that they slip against each other, transmitting no power.
- Figure B shows the condition where the oil pressure is acting on the piston. The clutch plates are fitted to each other under pressure, transmitting the rotations of the clutch drum to the clutch hub.
- When the oil pressure is removed from the piston, the clutch returns to the condition in figure A via the return spring.

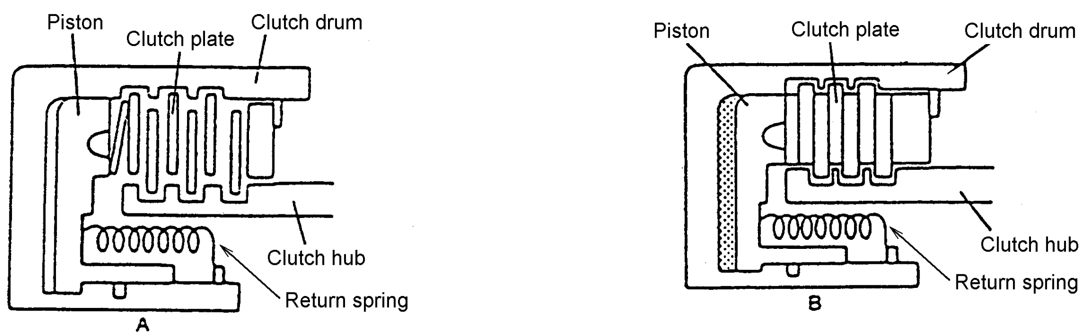


Figure 13. Basic Construction of Clutch and Brake

Low Clutch, High Clutch and Reverse Clutch (Multi-Plate Clutch)

- The multi-plate clutch is composed of drive plates and driven plates. By applying the oil pressure onto the end surface of the plates, the clutch is engaged. The oil pressure is adjusted with the control valve according to the signal from the TCM.
- All clutches use dish plates to prevent uncontrolled operation of the clutches when engaged, causing a shock.
- For the reverse clutch, a piston check ball is used to release the oil pressure. This prevents clutch drag caused by oil pressure generated by residual ATF due to the centrifugal force while the clutch is racing (under no oil pressure).
- For the low clutch and high clutch, a centrifugal balance chamber full of ATF is provided to offset the excessive oil pressure. This prevents clutch drag caused by oil pressure generated by residual ATF due to the centrifugal force while the clutch is racing (under no oil pressure).
- The solenoid in the control valve is driven based on the shift signal from TCM, it moves the shift valve, thereby engaging the drive plate and driven plate through the piston of each clutch.
- As a result, elements of the planetary gear unit are combined.
- When the oil pressure is removed, the piston returns to the original position via the force of the return spring.

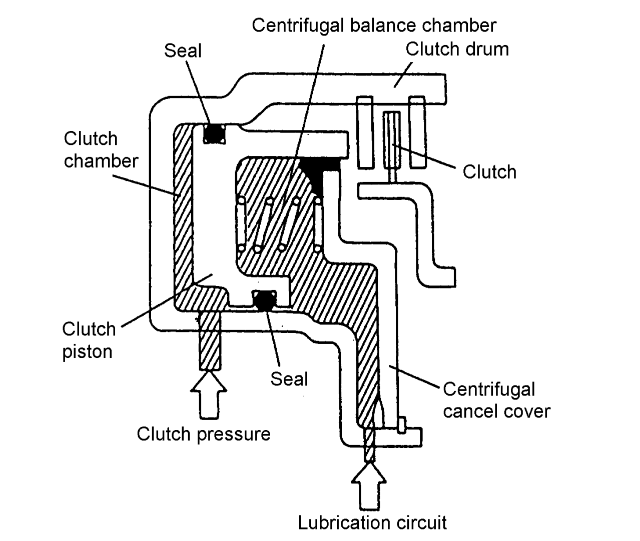

Figure 14. Basic Construction of Low Clutch and High Clutch

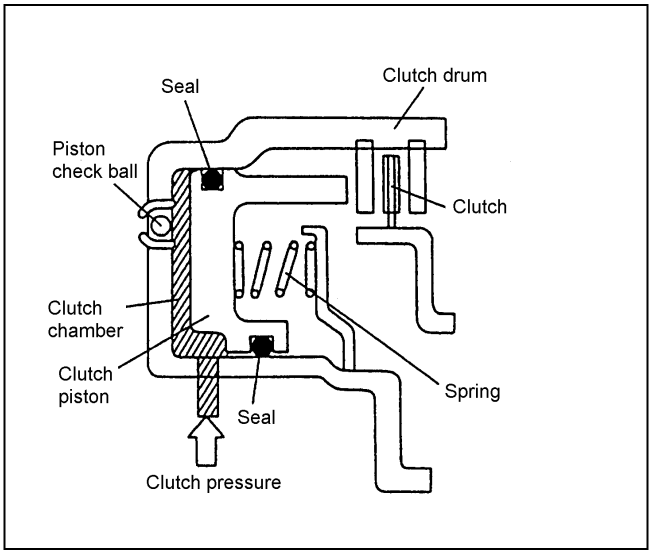

Figure 15. Basic Construction of Reverse Clutch

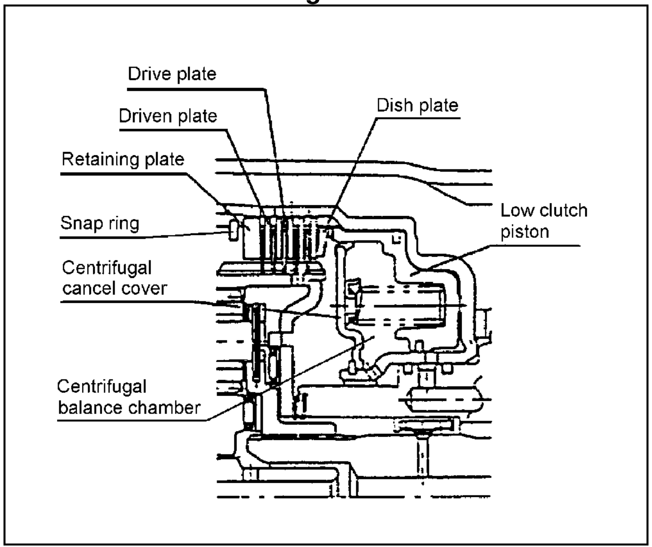

Figure 16. Construction of Low Clutch

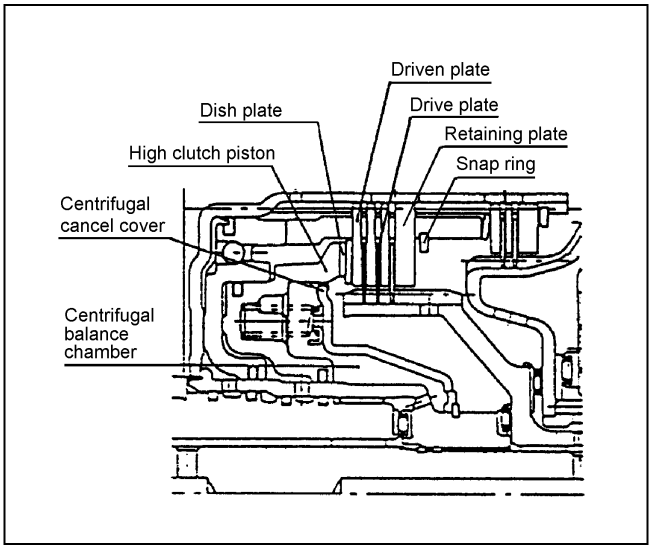

Figure 17. Construction of High Clutch

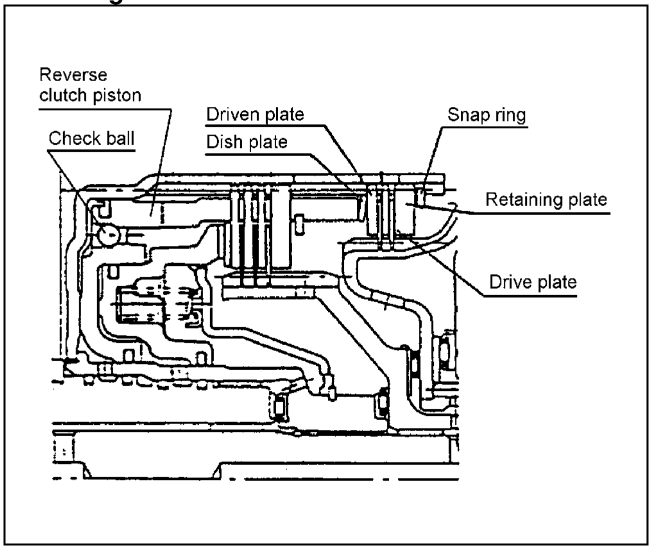

Figure 18. Construction of Reverse Clutch

2-4 Brake and Low & Reverse Brake (Multi-Plate Brake)

- The multi-plate brake is composed of drive plates and driven plates. By applying the oil pressure onto the end surface of the plates, the clutch is engaged. The oil pressure is adjusted with the control valve according to the signal from the TCM.
- All brakes use dish plates to prevent uncontrolled operation of the clutches when engaged, causing a shock.
- The solenoid in the control valve is driven based on the shift signal from TCM, it moves the shift valve, thereby engaging the drive plate and driven plate through the piston of each clutch.
- As a result, rotation of each element of the planetary gear unit is fixed.
- When the oil pressure is removed, the piston returns to the original position via the force of the return spring.

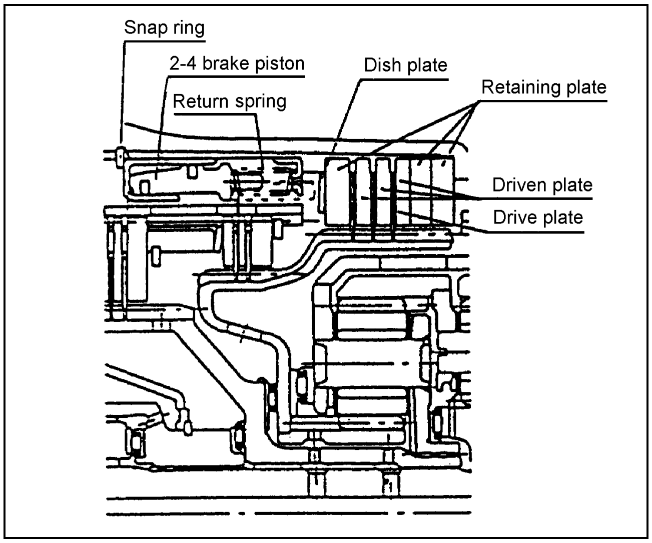

Figure 19. Construction of 2-4 Brake

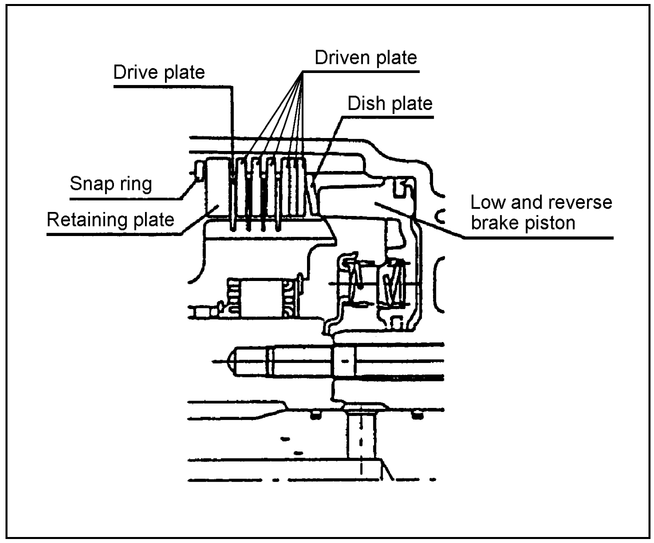

Figure 20. Construction of Low & Reverse Brake

Low One-way Clutch

- The low one-way clutch employs the sprag, which locks the counterclockwise rotation of the front planetary carrier and the rear internal gear.
- The one-way clutch outer race is fitted with the low clutch drum, and the inner race is fitted with the transmission case.
- The outer race rotates freely clockwise, but, when it attempts to rotate counterclockwise, the sprag locks the outer race.
- When the vehicle is traveling in 1st gear in the D, 3 or 2 position, the low one-way clutch locks the rear internal gear via the low clutch. It is left free in the 2nd, 3rd or 4th gear.

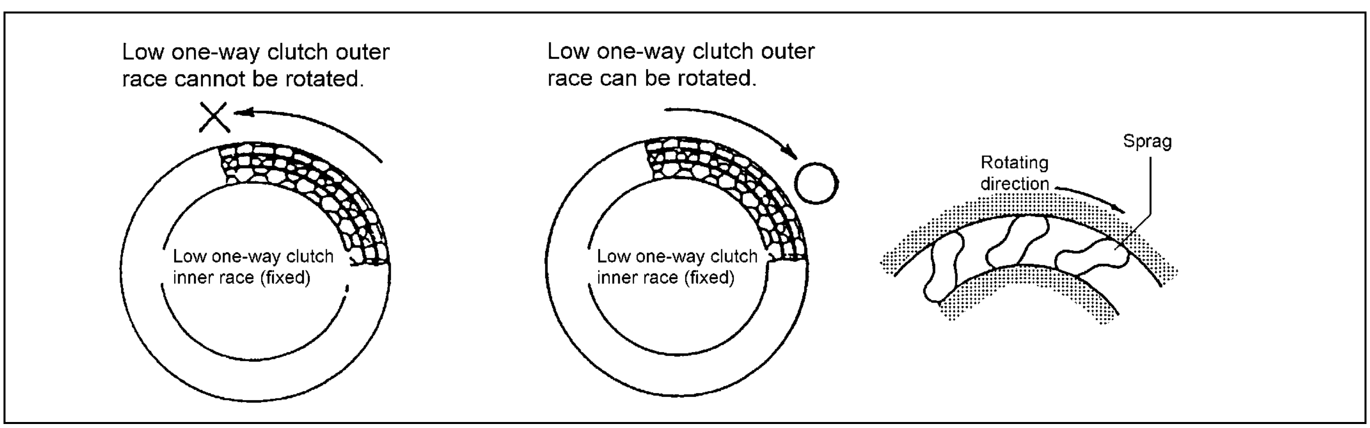

Figure 21. Construction of Low One-way Clutch

CONTROL VALVE

- Employing the direct electronic control (Direct Electronic Shift Control: DESC) for the clutch pressure has simplified the oil pressure circuit, reduced the number of functional components and made the control valve compact.
- The control valve body is divided into the upper body and the lower body. All solenoids, the oil pressure switch and the ATF thermo sensor are installed to the lower body.
- Three-way valve type solenoids providing high responsibility are employed. Some of the solenoids are switched between ON and OFF, and others repeat ON and OFF at 50Hz (duty cycle system). Functionally, some supply output pressure when power is not supplied, and others drain the output pressure.
- When the solenoid is driven based on the signal from the TCM, the oil pressure is changed.

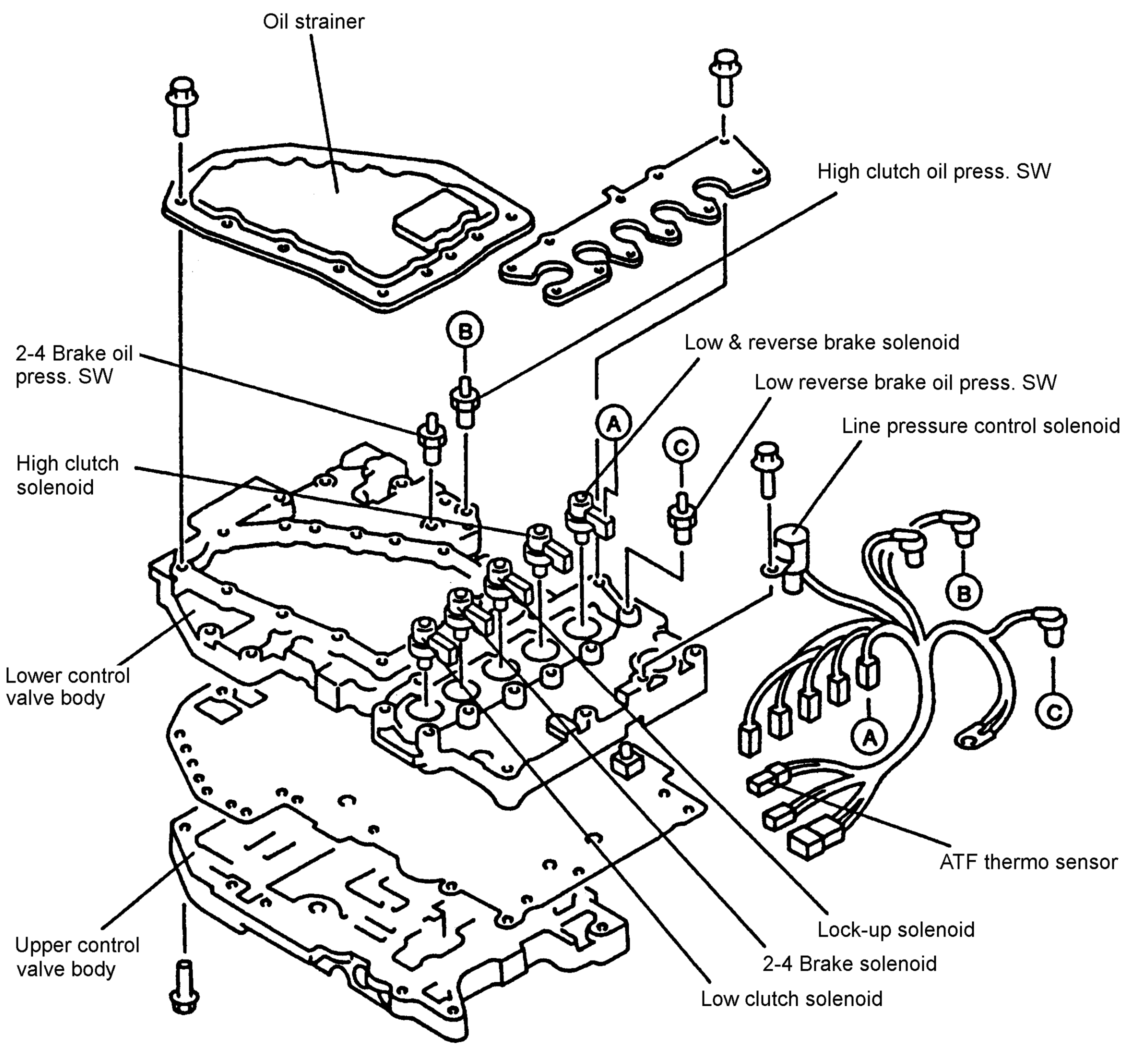

Figure 22. Construction of Valve Body

Line Pressure Solenoid

- The line pressure solenoid is turned ON or OFF according to the signal from the TCM. It switches the line pressure between high and low pressure.
- While no power is supplied, the solenoid supplies high pressure.

Shift Solenoid

- The shift solenoid is of the duty cycle type, which is turned ON or OFF at 50Hz. The ratio of the ON and OFF time can be freely controlled in the position of 0 - 100%.
- While no power is supplied, the solenoid supplies output pressure.
- The low clutch solenoid adjusts the low clutch pressure, the high clutch solenoid adjusts the high clutch pressure, the 2-4 brake solenoid adjusts the 2-4 brake pressure, and the low & reverse brake solenoid adjusts the low & reverse brake pressure respectively.

Lock-up Solenoid

- The lock-up solenoid is of the duty cycle type which is turned ON or OFF at 50Hz. The ratio of the ON and OFF time can be freely controlled in the position of 0 - 100%.
- While no power is supplied, the solenoid drains the output pressure.

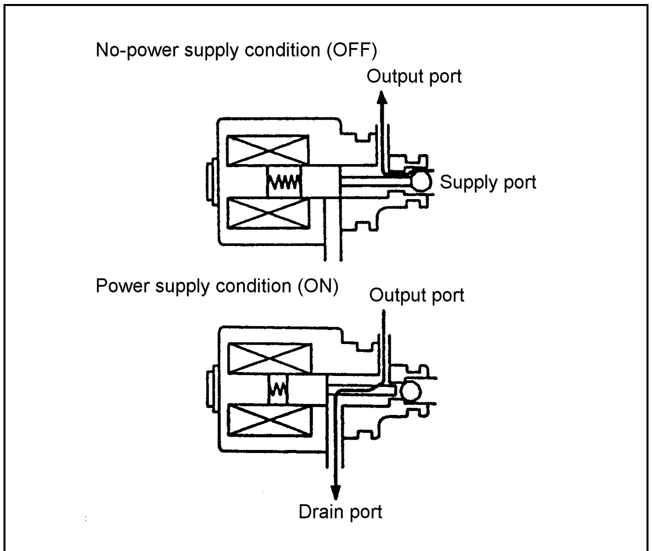

Figure 23. Shift Solenoid

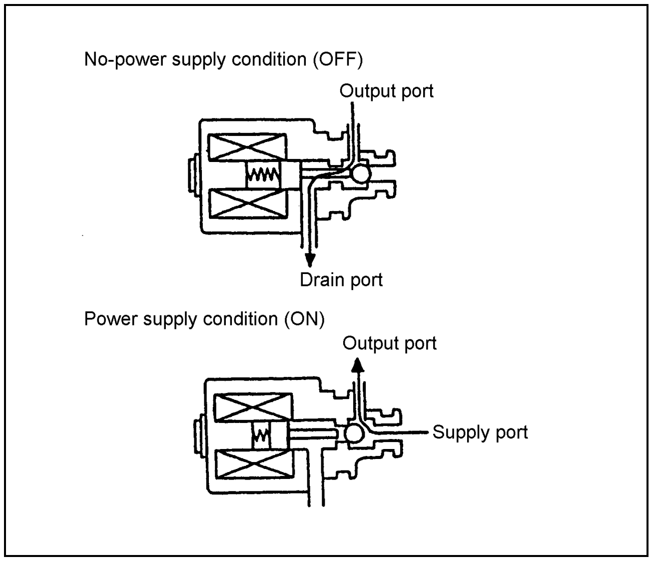

Figure 24. Lock-up Solenoid

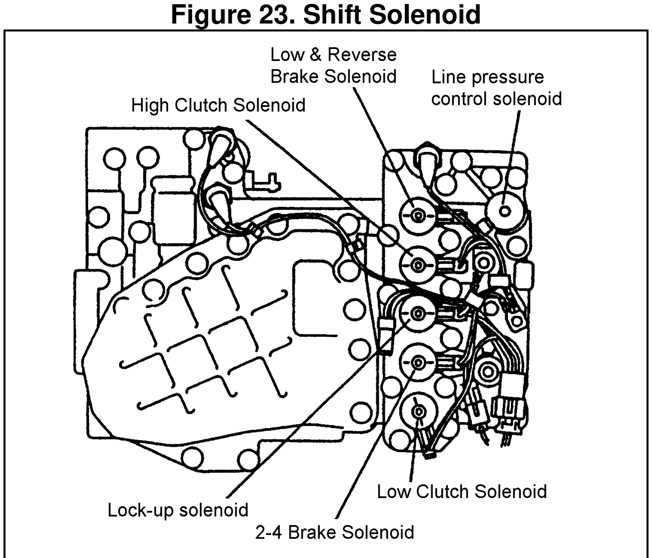

Figure 25. Location of Solenoid

Control Valve Fail-safe Function

- To prevent interlocking due to engagement of more than three clutches and brakes at the same time, the 2-4 brake fail-safe valve A and B, and the low & reverse brake fail-safe valve A and B are provided.
- When oil pressure is generated in the high clutch and the low clutch, the 2-4 brake solenoid is turned ON to drain the oil pressure applied to the 2-4 brake.
- When oil pressure is generated in the high clutch or 2-4 brake, the low & reverse brake solenoid is turned ON to drain the oil pressure applied to the low & reverse brake.

Oil Pressure Switch

- The oil pressure switch detects the condition of the oil pressure supply to the clutch and brake, and then sends the detection result to the TCM.
- The oil pressure switch is turned ON when the oil pressure reaches the switch working pressure, and turned OFF when the pressure decreases below the specified value.
- The high clutch oil pressure switch detects the high clutch oil pressure, the 2-4 brake oil pressure switch detects the 2-4 brake oil pressure, and the low & reverse brake oil pressure switch detects he low & reverse brake oil pressure respectively.

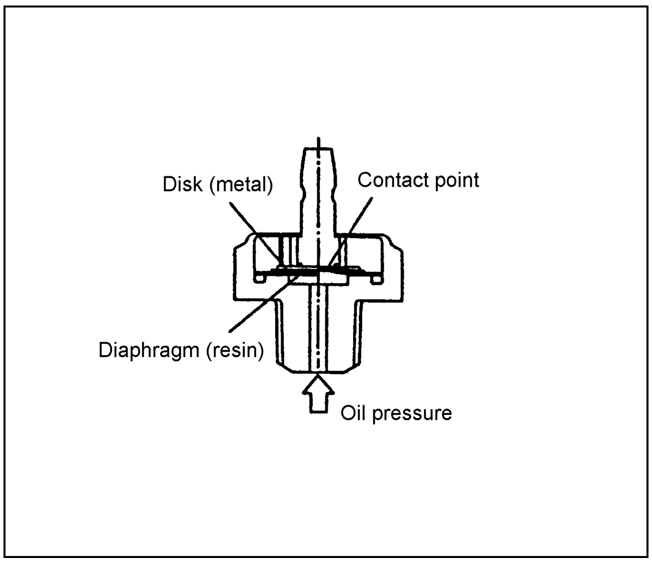

Figure 27. Oil Pressure Switch

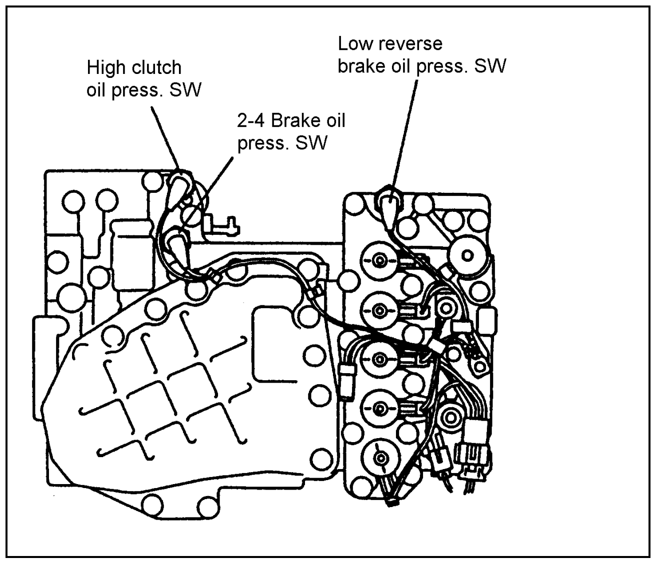

Figure 28. Location of Oil Pressure Switch

ATF Thermo Sensor

- The ATF thermo sensor detects the ATF temperature in the oil pan and sends a signal to the TCM.
- The ATF thermo sensor is of the thermister type and the resistance value changes according to the ATF oil temperature.
- When the ATF temperature is cold, the sensor resistance is high. When the ATF temperature increases, the sensor resistance decreases.
- When the ATF temperature increases to 135°C (275°F), the TCM lights up the ATF temperature warning lamp in the meter. When the ATF temperature decreases below 125°C (257°F), the ATF temperature warning lamp switches off.
- The ATF thermo sensor is installed to the lower control valve body and integrated with the harness assembly.

PARKING FUNCTION

- By setting the select lever to the P position, the parking pawl is engaged with the parking gear and fixes the output shaft.
- By moving the select lever, the manual shaft on the right side of the AT is moved. The manual plate and parking rod in the AT are interlocked with the manual shaft. When the manual shaft moves, the parking rod end pushes up the parking pawl.
- The parking pawl is engaged with the parking gear when pushed up, and fixes the output shaft.
- When the clutch is disengaged, it returns to the original position via the force of the return spring, fixed to the parking pawl.

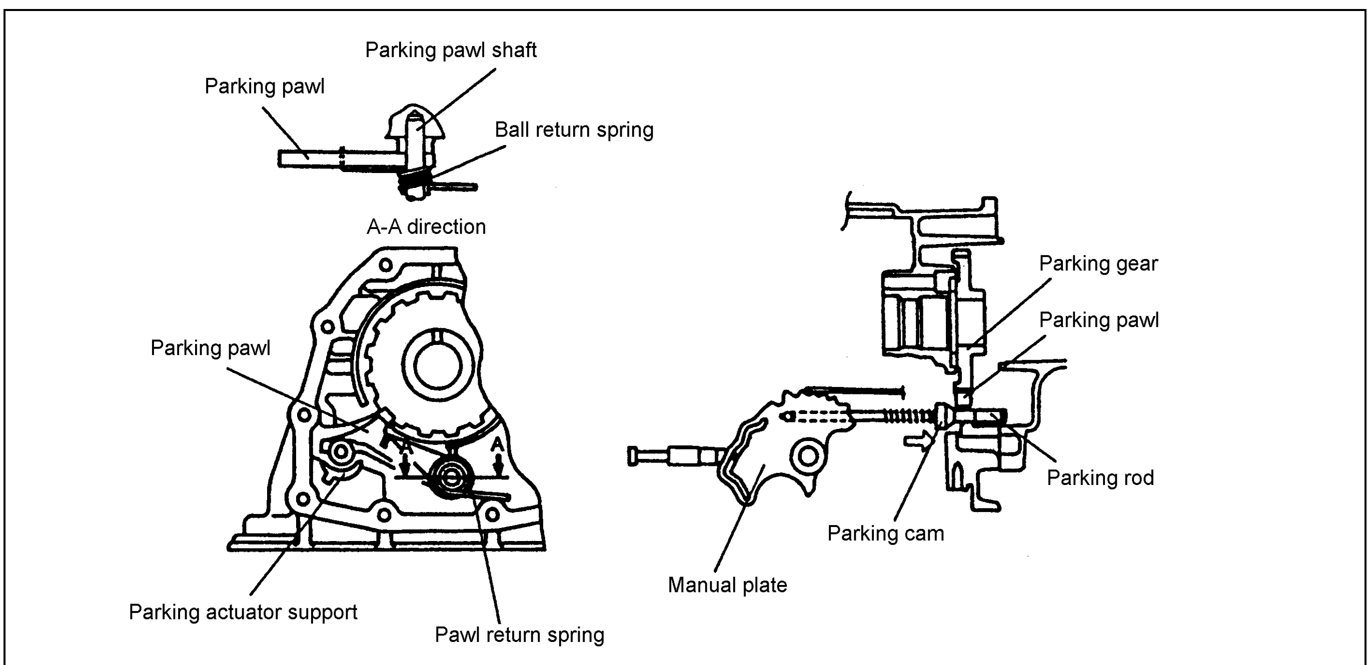

Figure 35. Parking Function

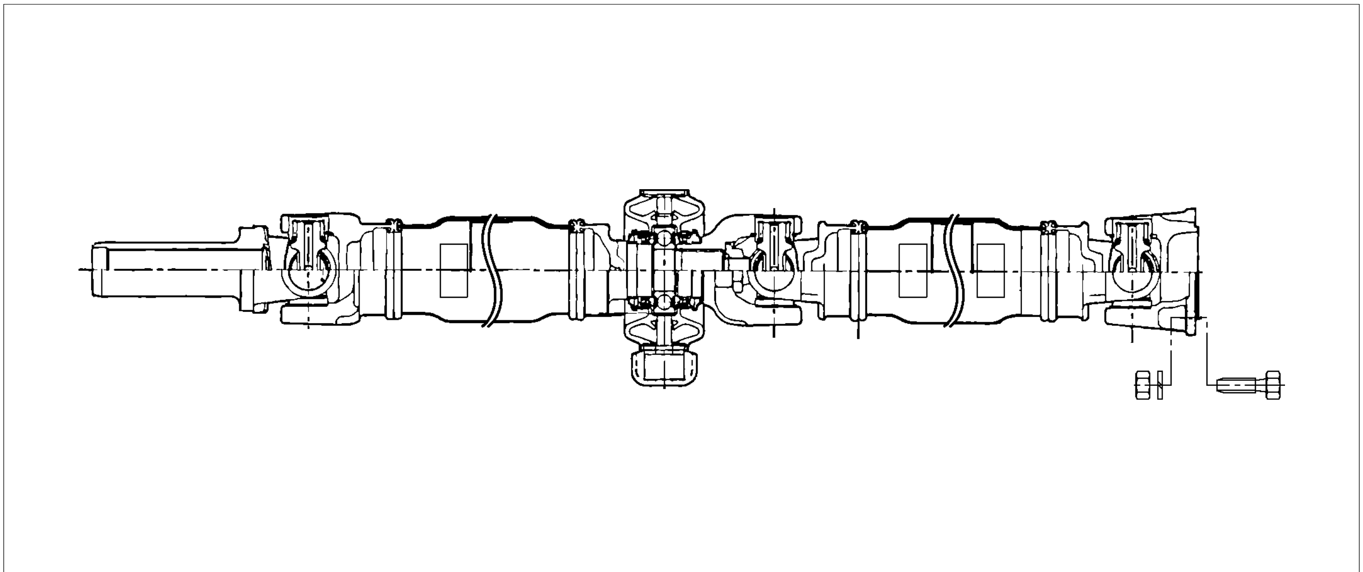
4×2 M/T AR-5, 4×2 A/T 4L60-E Model



RTW64ASF000101

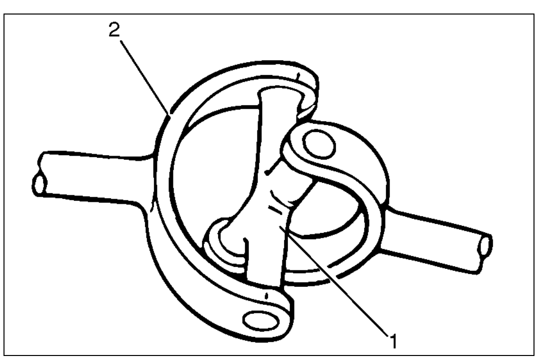
Torque is transmitted from the transmission to the axle through propeller shaft and universal joint assembles. All propeller shafts are the balanced tubular type. A splined slip joint is provided in some drivelines.

- Since the propeller shaft is total balanced carefully, welding or any other modification are not permitted.
- Alignment marks should be applied to each propeller shaft before removal.
- Be sure vehicle is stopped, engine is not running, brake is secured and vehicle is secured to prevent injury.
- Be careful not to grip the propeller shaft tube too tightly in the bise as this will be cause deformation.

Phasing

The propeller shaft is designer and built with the yoke lugs (ears) in line with each other. This design produces the smoothest running shaft possible, called phasing. Vibration can be caused by an out-of-phase propeller shaft. The propeller shaft down each time the universal joint goes around. This vibration would be the same as a person snapping rope and watching the “wave” reaction flow to the end. A propeller shaft working in phase would be similar to two persons snapping a rope at the same time, and watching the “waves” meet and cancel each other out. In comparison, this would be the same as the universal joints on a propeller shaft. A total cancellation of vibration produces a smooth flow of power in the driveline. It is very important to apply a reference mark to the propeller shaft before removal, to assure installation alignment.

Universal Joint



401RW015

A universal joint consists of two Y-shaped yokes (2) connected by a crossmember called a spider (1).
The spider is shaped like a cross. Universal joints are designed to handle the effects of various loadings and front or rear axle windup during acceleration. Within the designed angle variations, the universal joint will operate efficiently and safely. When the design angle is changed or exceeded the operational life of the joint may decrease.
The bearings used in universal joints are of the needle roller type. The needle rollers are held in place on the trunnions by round bearing cups. The bearing cups are held inside the yokes by snap rings.

INHIBITOR SWITCH

- The inhibitor switch is installed on the right side of the transmission main unit to detect the select lever position.
- The inhibitor switch is connected with the starter SW circuit. The engine cannot be started when the select lever is at any position other than the P and N position.
- By moving the select lever, the combination of the inhibitor switch pins is changed. The current position of TCM is detected based on the combination of the pins.

TURBINE SENSOR

- The turbine sensor is a hall element. It is installed to the front of the transmission case. The turbine sensor converts the rotations of the reverse & high clutch drum fitted with the input shaft by spline to pulse signal and sends the signal to the TCM.
- One turn of the reverse & high clutch drum generates 32-pulse signals, which are sent to the TCM.

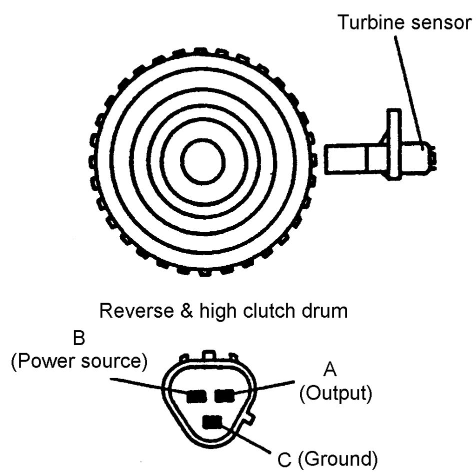

Figure 38. Turbine Sensor

SPEED SENSOR

- The speed sensor is a hall element. It is installed to the rear of the transmission case. The speed sensor converts the rotations of the parking gear, fitted with the output shaft by spline, to a pulse signal and sends the signal to the TCM.
- One turn of the parking gear generates 16-pulse signals, which are sent to the TCM.

CONTROL MECHANISM

CONTENT OF FUNCTION AND CONTROL

<table>
<tr><th>Item</th><th>Description</th></tr>
<tr><td>Line pressure control</td><td>TCM issues a signal according to vehicle travel, engine load and other conditions, which drives the ON/OFF type line pressure solenoid to switch the line pressure to high or low pressure.
The line pressure solenoid is switched to the low pressure side when the solenoid is turned ON (power supplied) and to the high pressure side when turned OFF (no power supplied).
In the forward travel position (D, 3, 2, L position), the line pressure decreases lower than that in the P, N, and R position through the oil pressure circuit.</td></tr>
<tr><td>Gear shift control</td><td>The TCM issues a shift solenoid drive signal based on the traveling mode switch, inhibitor switch, the vehicle speed, the APP opening and other input signals, to control the optimum gear position automatically.
Shift features have been set up to the TCM; the normal mode is suited to normal travel, and the power mode is used when the vehicle is loaded or the speed accelerated.
In addition, shift features used only for high oil temperature, hill climbing, and downward travel have been set up to the TCM. These are automatically switched depending on the travel conditions.
When the oil temperature is low (10°C or less), shifting up from the third speed to the fourth speed is prohibited by the gear shift control.</td></tr>
<tr><td>Shift pattern selection control</td><td>The TCM selects the following shift pattern according to a vehicle condition.

Increment of vehicle speed: More than 1km/h per second
Above conditions are all met at the same time.
<u>Down slope mode reset condition</u>
Accelerator pedal condition: Depressed
Select lever position: Other than D or 3 position
At least, one of above conditions is met.

- Power Mode -
When the power drive switch is On the shift pattern change is performed by 1 – 4 speed based on shift diagram set as power pattern.

- Up slope mode -
Up-slope reasoning value is calculated from the average APP angle and the average acceleration. Otherwise, up-slope reasoning value is calculated from the vehicle speed.
TCM chooses up-slope mode when the former is bigger than the latter.</td></tr>
<tr><td>Lock-up control</td><td>The lock-up solenoid adjusts the pressure to control the lock-up according to the signal from the TCM. This signal is based on the vehicle speed, APP opening and other input signals based on the pre-set lock-up point.
Smooth lock-up control engages and disengages the clutch smoothly at the time of lock-up.
When the oil temperature is low (20°C or less), lock-up is prohibited even when the vehicle is at a lock-up speed.
The lock-up is also disengaged when the APP is closed.</td></tr>
<tr><td>Direct electronic shift control (DESC)</td><td>The duty cycle type solenoid is used for each clutch and brake. The solenoid adjusts the clutch pressure to suit the engine load and vehicle traveling condition based on the signal from the TCM. The pressure switch provided in the control valve oil passage sends the oil pressure condition to the TCM, which controls the disengagement or engagement of the clutch and brake directly and finely.</td></tr>
</table>

Item	Description
Learning function	The learning function is provided to correct the oil pressure control timing to engage or disengage the clutch optimally in order to compensate changes of the engine performance and changes of the transmission with time. It is controlled to bring the shift time closer to the value pre-set to the TCM.
Fail-safe function	In the case of a malfunction of the vehicle speed sensor, APP sensor, all solenoids or the inhibitor switch, TCM automatically begins fail-safe control to minimize effects on driving. The gear is fixed in 3rd gear and the power supply to the solenoid is shut off so that the solenoid does not work. Lock up clutch is disengaged in this mode.
Self-diagnosis function	Parts required for controlling the automatic transmission are provided with a self-diagnosis function. When any trouble occurs, the check trans indicator lamp blinks to warn the driver. The trouble code is memorized in the TCM.

LINE PRESSURE CONTROL

- The TCM drives the ON/OFF type line pressure solenoid based on the APP opening, vehicle speed, turbine rotational speed, ATF temperature and shift position signal. The ON/OFF type line pressure solenoid is actuated, and switches the line pressure to a high or low pressure number appropriate to the situation.
- The line pressure generated by the oil pump acts on the point A of the pressure regulator valve. When the pressure control solenoid is turned ON by the signal from the TCM, the solenoid pressure does not act. The line pressure is adjusted to match the spring force acting on the right side of the pressure regulator valve.
- When the pressure control solenoid is turned OFF, the solenoid pressure acts so that the line pressure is adjusted to match the spring force acting on the right side of the pressure regulator valve.
- As a result, the line pressure is adjusted to be low when the pressure control solenoid is ON and to be high when the pressure control solenoid is OFF.
- In position D, 3, 2 and L, the line pressure through the oil pressure circuit acts onto the point B of the pressure regulator valve. The pressure regulator valve moves so as to increase the pressure to be drained, so that the line pressure is adjusted to be lower than the P, N, and R position by the difference of area at the point B.

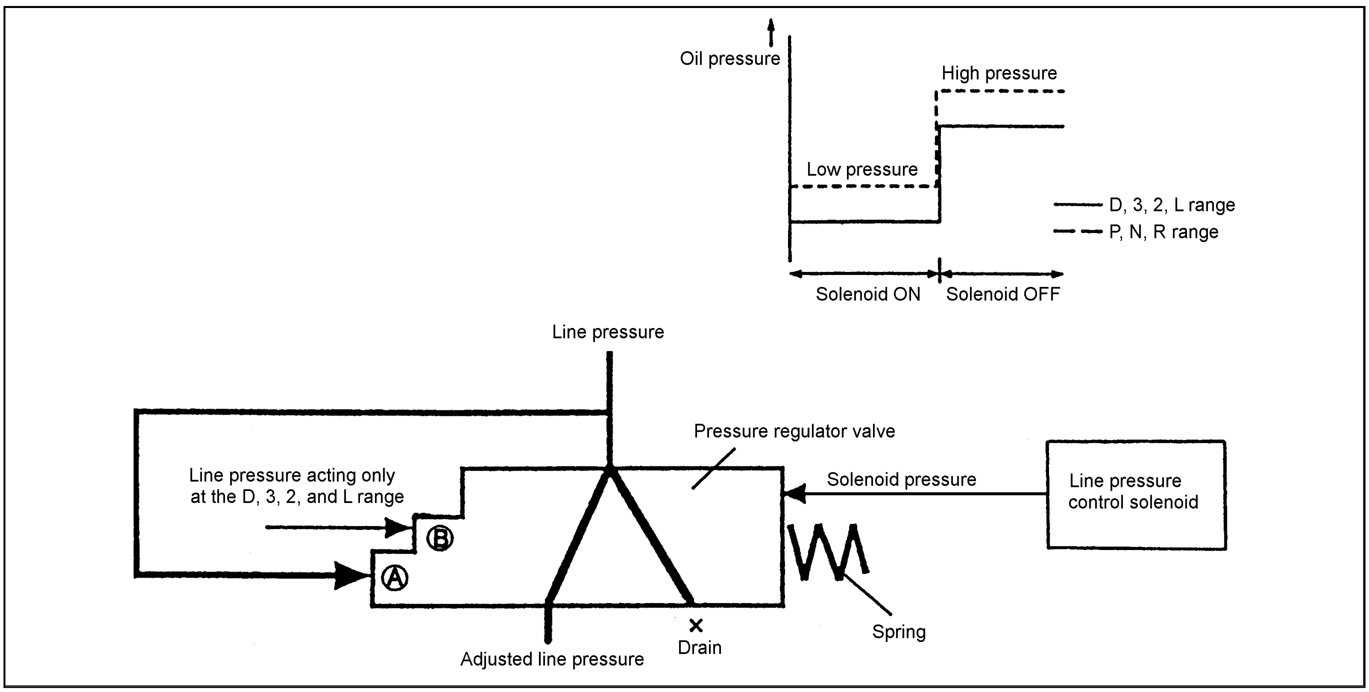

Figure 50. Line Pressure Control

LOCK-UP CONTROL

- The lock-up solenoid adjusts the pressure and controls the lock-up based on the pre-set lock-up point, according to the vehicle speed, APP opening, engine rotations, turbine rotations and ATF temperature input signal, based on the signal from the TCM.
- Smooth lock-up control is employed to engage or disengage the clutch smoothly at the time of lock-up on or off.
- When the oil temperature is low (20°C or less), lock-up is disengaged even though the vehicle is at the lock-up speed.
- The lock-up is disengaged also when the APP is closed.
- When the TCM determines the lock-up engagement, the DUTY ratio to supply power to the lock-up solenoid is gradually increased (5% to 95%) and the oil between the lock-up piston and converter cover is gradually drained.

Diagnosis of Propeller Shaft and Universal Joint

Condition	Possible cause	Correction
Leak at the Front Slip Yoke (An Occasional Drop of Lubricant Leaking from the Splined Yoke is Normal)	Rough surface on splined yoke; burred nicked or worn.	Replace the seal. Minor burrs can be Smoothed by careful use of crocus cloth or fine stone honing. Replace the yoke if badly burred.
	Defective transmission rear oil seal.	Replace the transmission rear oil seal and replenish the transmission oil.
Universal Joint Noise.	Worn universal joint bearings.	Replace.
	Improper lubrication.	Lubricate as directed.
	Loose flange bolts.	Tighten to specifications.
Ping, Snap, or Click in Drive Line (Usually Heard on Initial Load after the Transmission is in Forward or Reverse Gear)	Loose bushing bolts on the rear springs or upper and lower control arms.	Tighten the bolts to specified torque.
	Loose or out-of-phase end yoke.	Remove end yoke, turn 180 degrees from its original position, lubricate the splines and reinstall. Tighten the bolts and pinion nut to specified torque.
Squeak	Lack of lubricant.	Lubricate joints and splines. Also check for worn or brinelled parts.
Shudder on Acceleration (Low Speed)	Loose or missing bolts at the flanges.	Replace or tighten bolts to specified torque.
	Incorrectly set front joint angle.	Install shim under the transmission support mount to change the front joint angle.
	Worn universal joint.	Replace.
Vibration	Incorrect shaft runout.	Replace.
	Shaft out of balance.	Adjust.
	Transmission rear housing bushing, transfer case housing bushing worn.	Replace.
	Yoke spline jammed.	Replace.

As a result, the lock-up piston is fitted slowly to the converter cover under pressure securing smooth lock-up engagement.

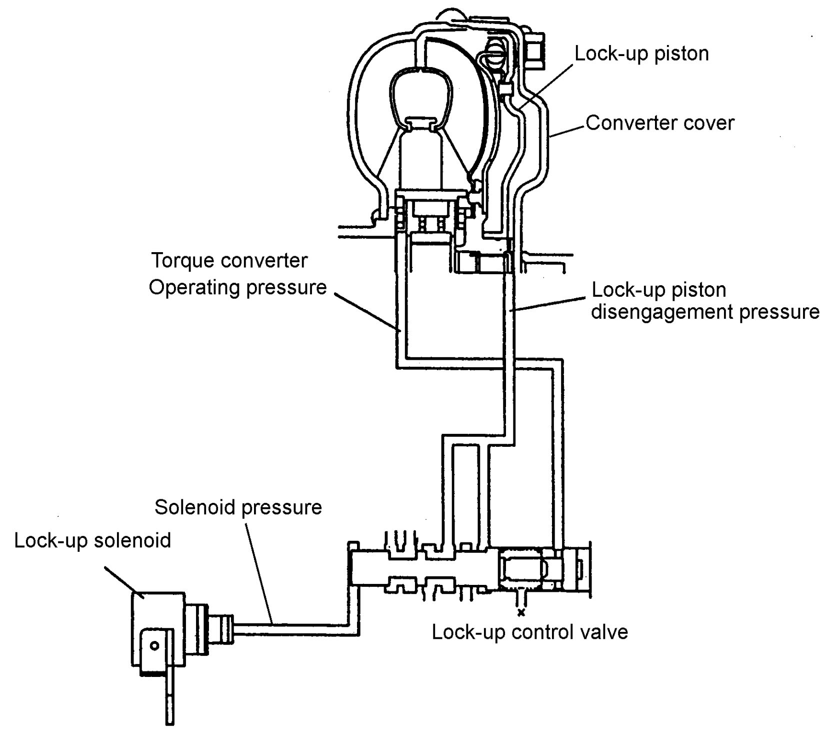

Figure 51. Lock-up Control

DIRECT ELECTRIC SHIFT CONTROL (DESC)

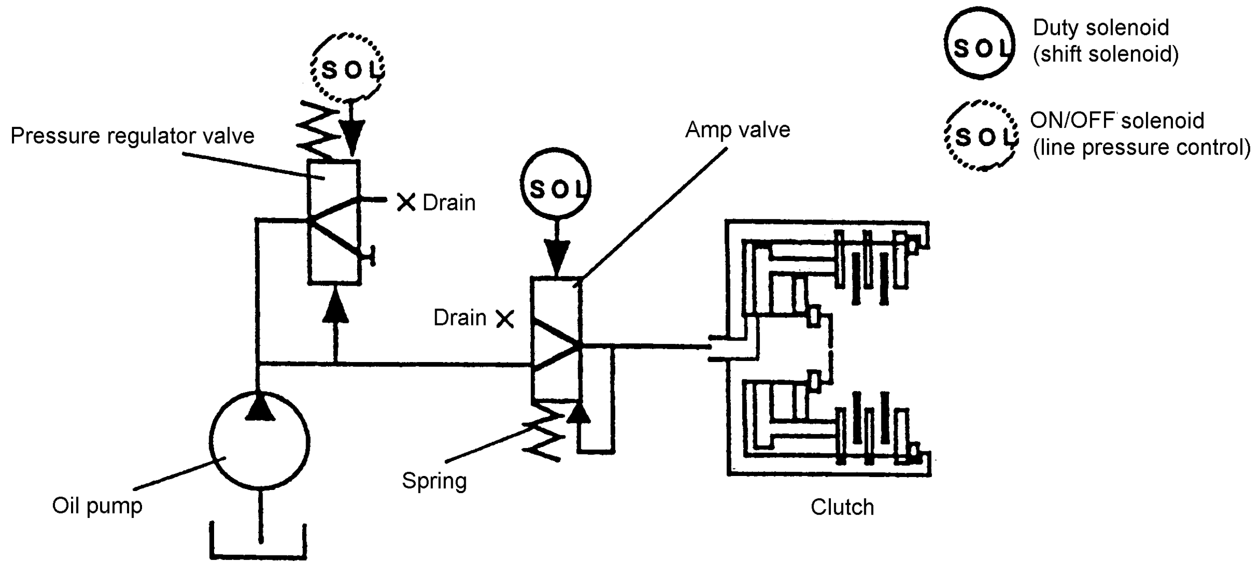
Feature

- Based on each switch signal (low & reverse brake pressure, 2-4 brake pressure & high clutch pressure) and each sensor signal (turbine sensor, speed sensor, engine speed signal & APP position signal), the duty cycle type solenoid adjusts the clutch pressure to match the engine load and vehicle travel conditions. Controlling the engagement and disengagement of the clutch and brake pressure is directly and accurately controlled via TCM, which is different to the previous accumulator type.

Operation

- Instead of the previous system (on/off type of shift solenoid and shift valve), the combination of the duty cycle type solenoid and the amplifier (Amp) valve are used to adjust the clutch pressure to match the engine load and vehicle travel conditions, based on the signal from the TCM. Also, the pressure switch provided in the oil passage of the control valve transmits the oil pressure condition (at that time) to TCM, enabling the engagement and disengagement control of the clutch and brake to be directly and finely carried out.
- When the gear is shifted from the 2nd to 3rd, 3rd to 4th (O/D), 4th (O/D) to 3rd and 3rd to 2nd, the clutch pressures on the engagement side and disengagement side are simultaneously controlled. As a result, engine racing or clutch drag is prevented which enables a smooth and quick shift response.

Direct Electric Shift Control



Previous Model

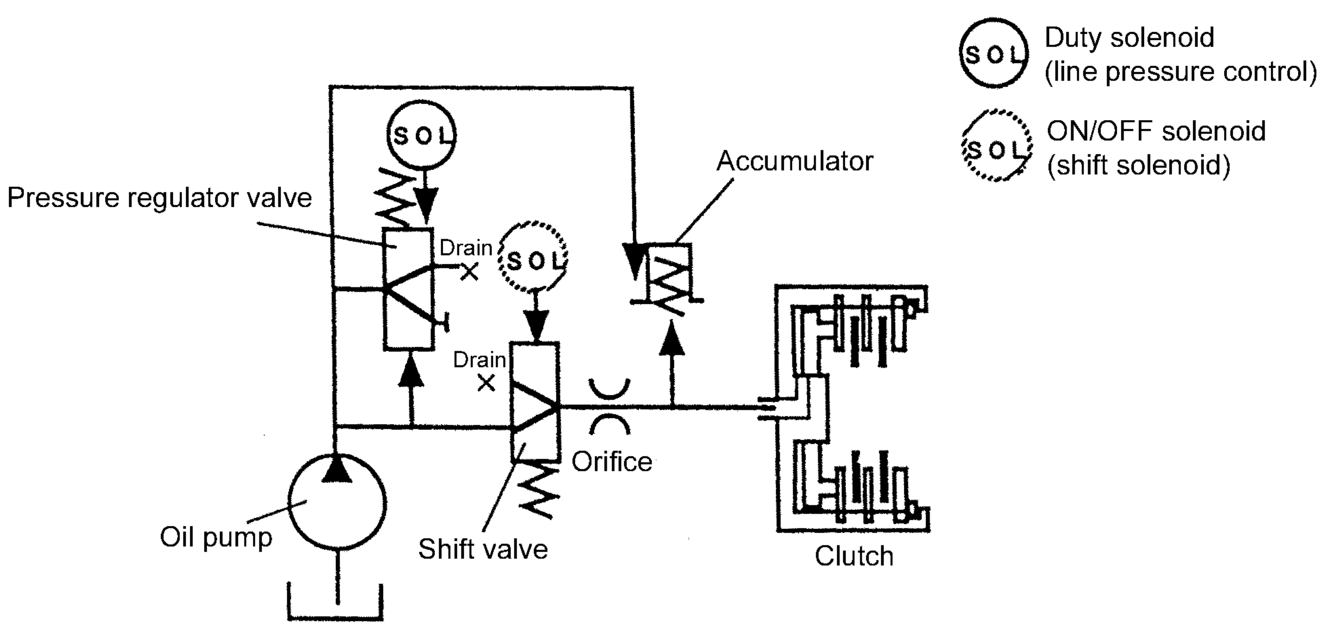


Figure 52. Direct Electric Shift Control (DESC)

LEARNING FUNCTION

- Oil pressure control timing is optimally corrected at the time of clutch engagement and disengagement. It is controlled to bring the shift time to the value preset to the TCM, and compensate for the changes in engine performance and transmission characteristics.
- When the gear is shifted, the clutch pressure ② is optimally corrected so that the shift time ① is as close to the target value preset to the TCM. The variation in the engine performance and changes to transmission characteristics which occur with time, can be compensated for based on the past shift results.
- When the clutch is operated to shift the gear, the time of the clutch oil pressure release ④ on the disengagement side is optimally corrected so that the change of the engine rpm ③ is optimum.

Note:

- When the battery terminal is disconnected, the contents of learning are cleared and as a result the shift shock may increase. After the vehicle has traveled, learning is repeated and the shock decreases gradually.

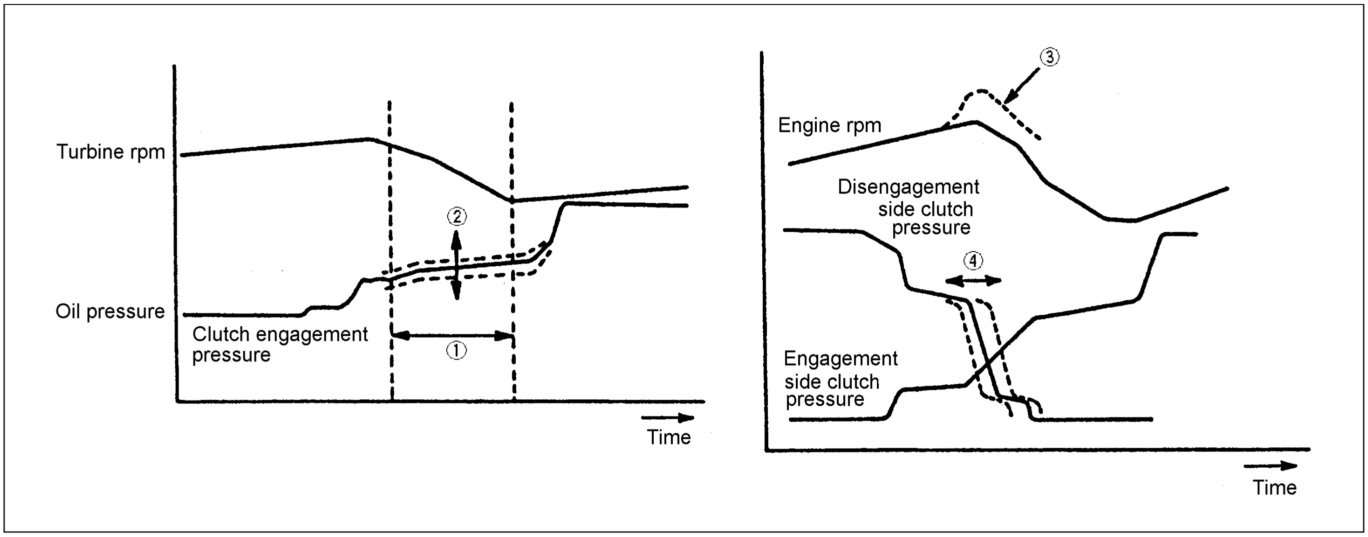

Figure 53. Learning Control

MAJOR INPUT/OUTPUT COMPONENT AND THEIR FUNCTIONS

Input	Speed sensor	Detects output shaft revolution and sends rpm signal to TCM.
	Turbine sensor	Detects input shaft revolution and sends rpm signal to TCM.
	Engine speed sensor	Inputs engine revolution from engine control computer.
	Brake switch	Detects brake pedal operation by the driver and sends signal to TCM.
	Inhibitor switch	Detects select lever position and sends signal to TCM.
	Mode select switch	Detects "Power Drive" or "3rd Start" selected by the driver and sends signal to TCM.
	4L switch (4WD Only)	Inputs 4L mode from transfer control computer.
	ATF thermo sensor	Detects ATF temperature and sends signal to TCM.
	High clutch oil pressure switch	Detects high clutch supply oil pressure and sends signal to TCM.
	2-4 brake oil pressure switch	Detects 2-4 brake supply oil pressure and sends signal to TCM.
	Low & Reverse brake oil pressure switch	Detects low & reverse brake supply oil pressure and sends signal to TCM.
	Accelerator Pedal position sensor	Inputs throttle opening angle from engine control computer.
	TCM	Judges necessary line pressure, gear shifting point and lock-up operation based on electrical signals from switches and sensors and sends appropriate signals to solenoids.
Output	Line pressure solenoid	Regulates oil pump delivery pressure to the appropriate line pressure for current driving conditions based on a signal from TCM.
	Low clutch solenoid	Selects appropriate gear shifting position for current driving conditions and regulates low clutch supply oil pressure based on a signal from TCM.
	High clutch solenoid	Selects appropriate gear shifting position for current driving conditions and regulates high clutch supply oil pressure based on a signal from TCM.
	2-4 brake solenoid	Selects appropriate gear shifting position for current driving conditions and regulates 2-4 brake supply oil pressure based on a signal from TCM.
	Low & Reverse brake solenoid	Selects appropriate gear shifting position for current driving conditions and regulates low & reverse brake supply oil pressure based on a signal from TCM.
	Lock-up solenoid	Regulates lock-up pressure to appropriate level for current driving conditions based on a signal from TCM.
	Mode indicator lamp	Indicates POWER DRIVE or 3rd START switch position.
	Speed meter signal (2WD Only)	Outputs vehicle speed to the speed meter.
	A/T OIL TEMP indicator lamp	Indicates A/T OIL TEMP indicator lamp in case of high temperature.
	CHECK TRANS indicator lamp	Indicates CHECK TRANS indicator lamp in case of malfunction.

CONTROL CIRCUIT BLOCK DIAGRAM

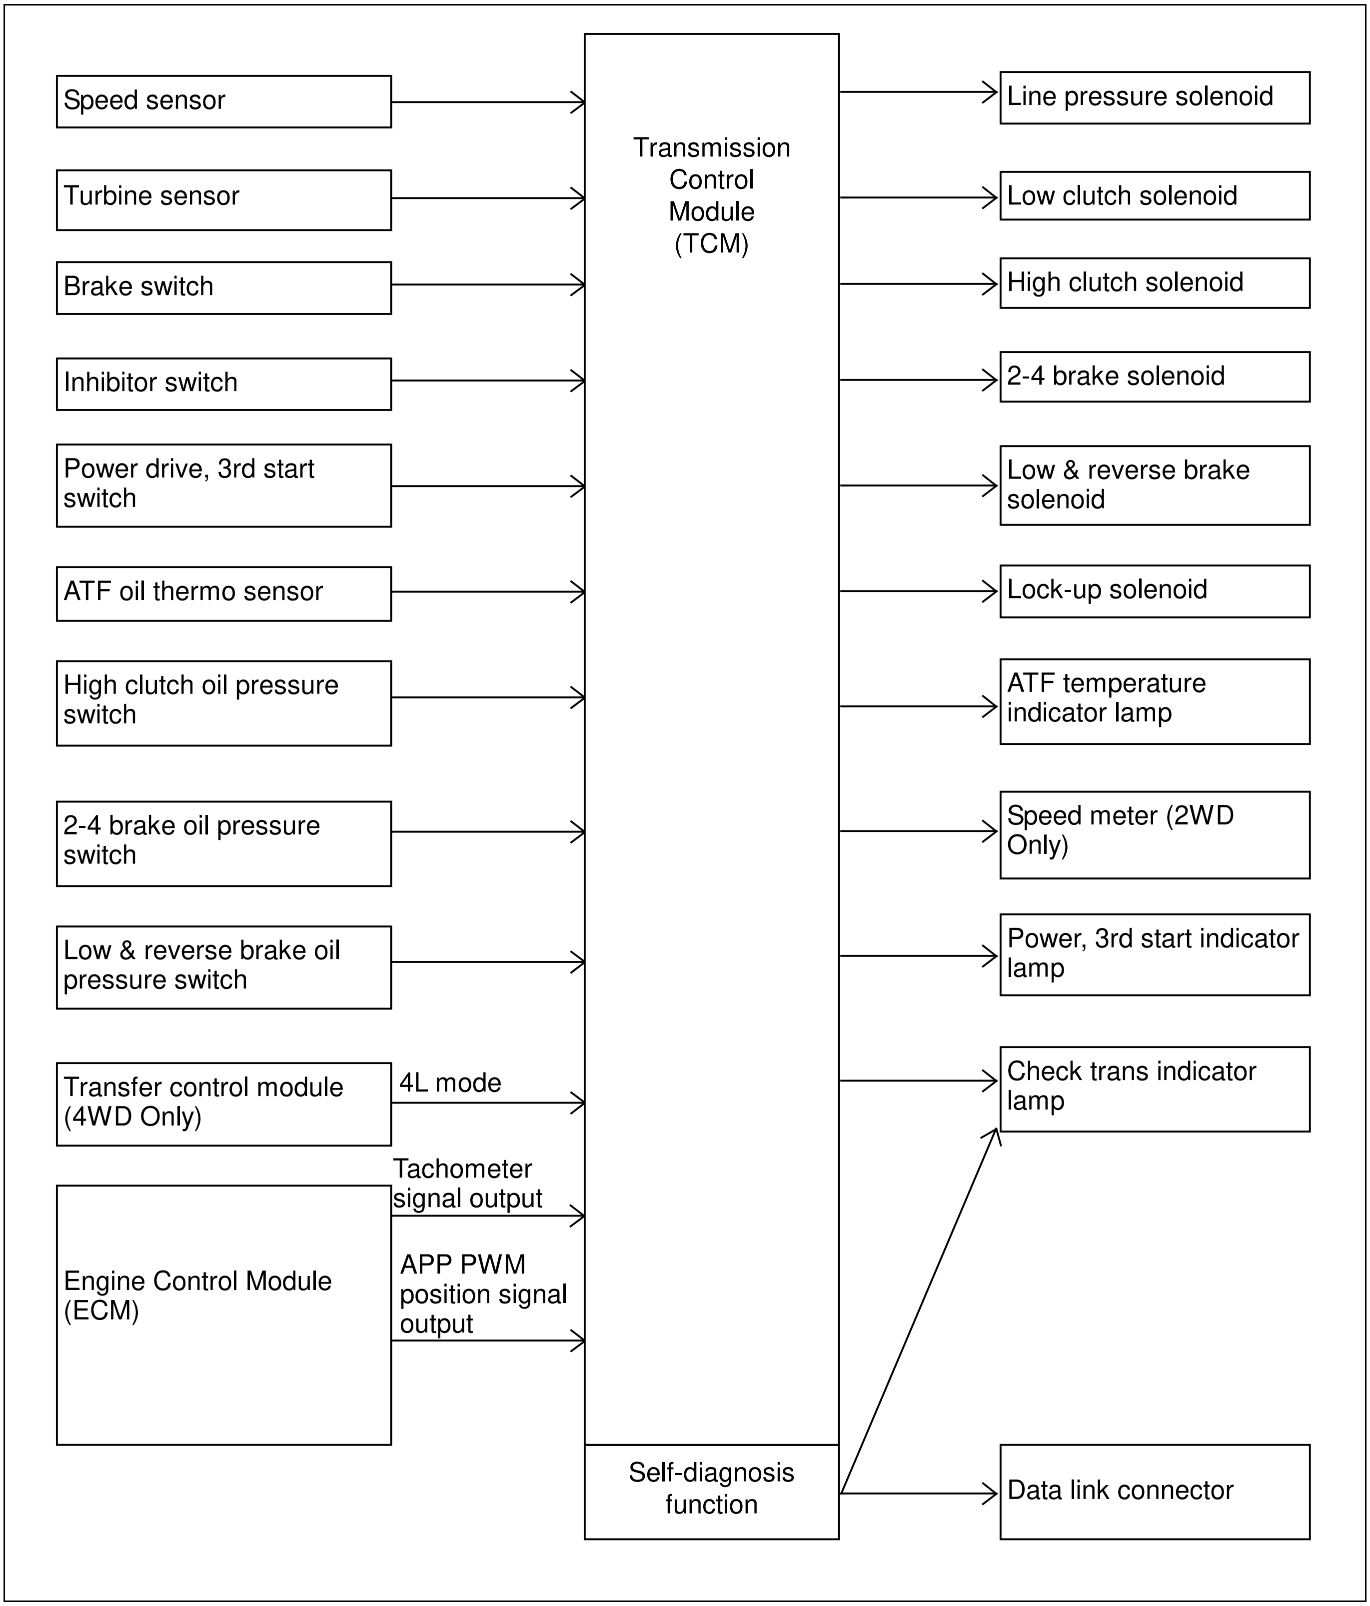

Figure 54. Control Circuit Block Diagram

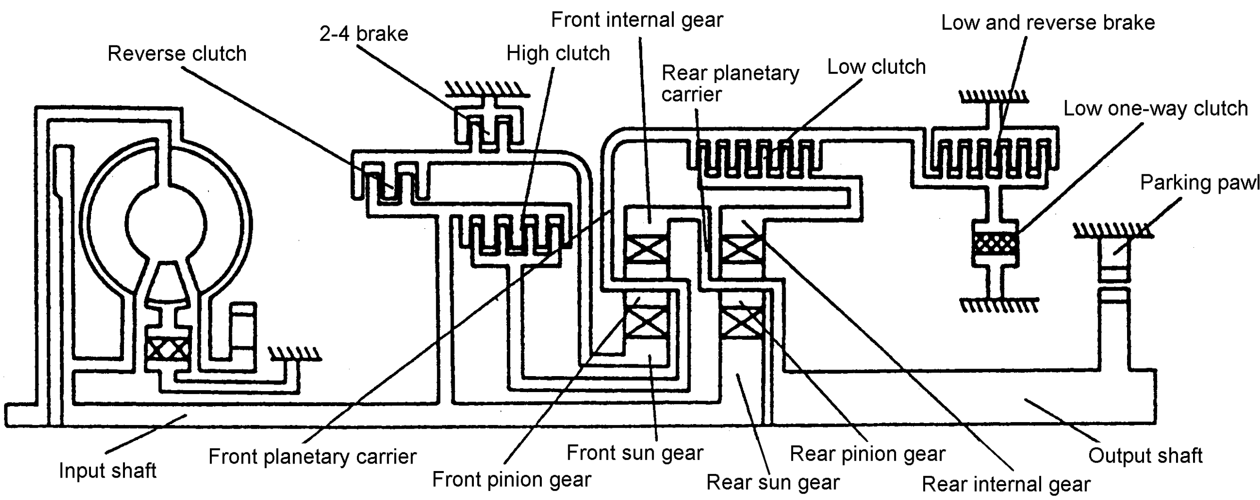
GEAR TRAIN (TRANSMISSION MECHANISM) OPERATION AND HYDRAULIC CIRCUIT

CONSTRUCTION AND OPERATION

The JR405E consists of two sets of planetary gears, three multiple plate clutches, two multiple plate brakes and one one-way clutch.



COMPONENT NAME AND FUNCTION

Component Name	Symbol	Function
Low Clutch	L/C	Connects the front planetary carrier to the rear internal gear. Engaged at 1st, 2nd and 3rd gear.
High Clutch	H/C	Connects the input shaft to the front planetary carrier. Engaged at 3rd and 4th (O/D) gear.
Reverse Clutch	R/C	Connects the input shaft to the front sun gear. Engaged at Reverse gear.
Low & Reverse Brake	L&R/B	Locks the front planetary carrier. Engaged at L position and Reverse gear.
2-4 Brake	2-4/B	Locks the front sun gear. Engaged at 2nd and 4th (O/D) gear.
Low One-way Clutch	L/O.C	Allows the front planetary carrier to turn forward (clockwise) but locks to opposite direction (counterclockwise). Operative when accelerating.
Low Clutch Solenoid	L/C.S	Regulates low clutch pressure.
High Clutch Solenoid	H/C.S	Regulates high clutch pressure.
Low & Reverse Brake Solenoid	L&R/B.S	Regulates low & reverse brake pressure.
2-4 Brake Solenoid	2-4/B.S	Regulates 2-4 brake pressure.
Lock-up Solenoid	L/U.S	Regulates lock-up clutch pressure.
High Clutch Oil Pressure SW	H/C.P/SW	Detects high clutch supply oil pressure.
Low & Reverse Brake Oil Pressure SW	L&R/B.P/SW	Detects low & reverse brake supply oil pressure.
2-4 Brake Oil Pressure SW	2-4/B.P/SW	Detects 2-4 brake supply oil pressure.

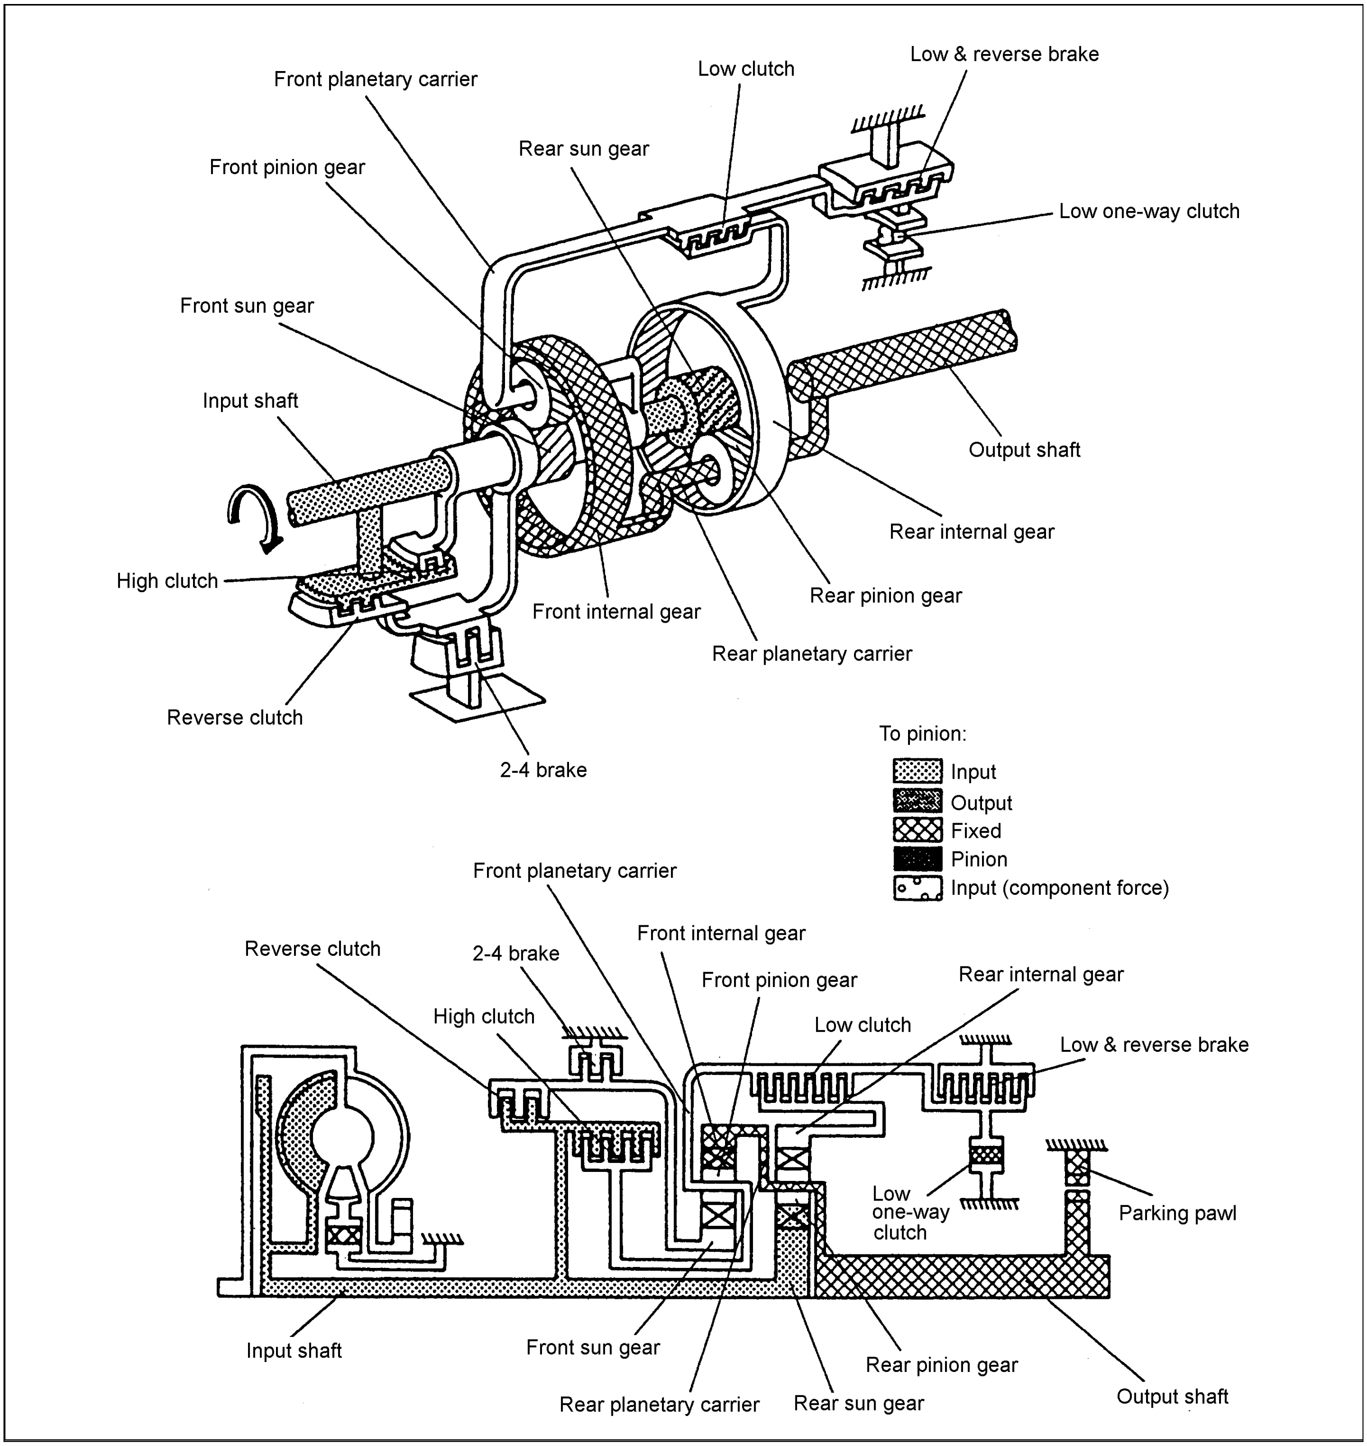
*1: Shifting the select lever to manual position at high speed, the transmission may hold the gear position until vehicle speed get down to certain speed to prevent engine overrun.

○ - Engaged or operated

△- Operative when accelerating

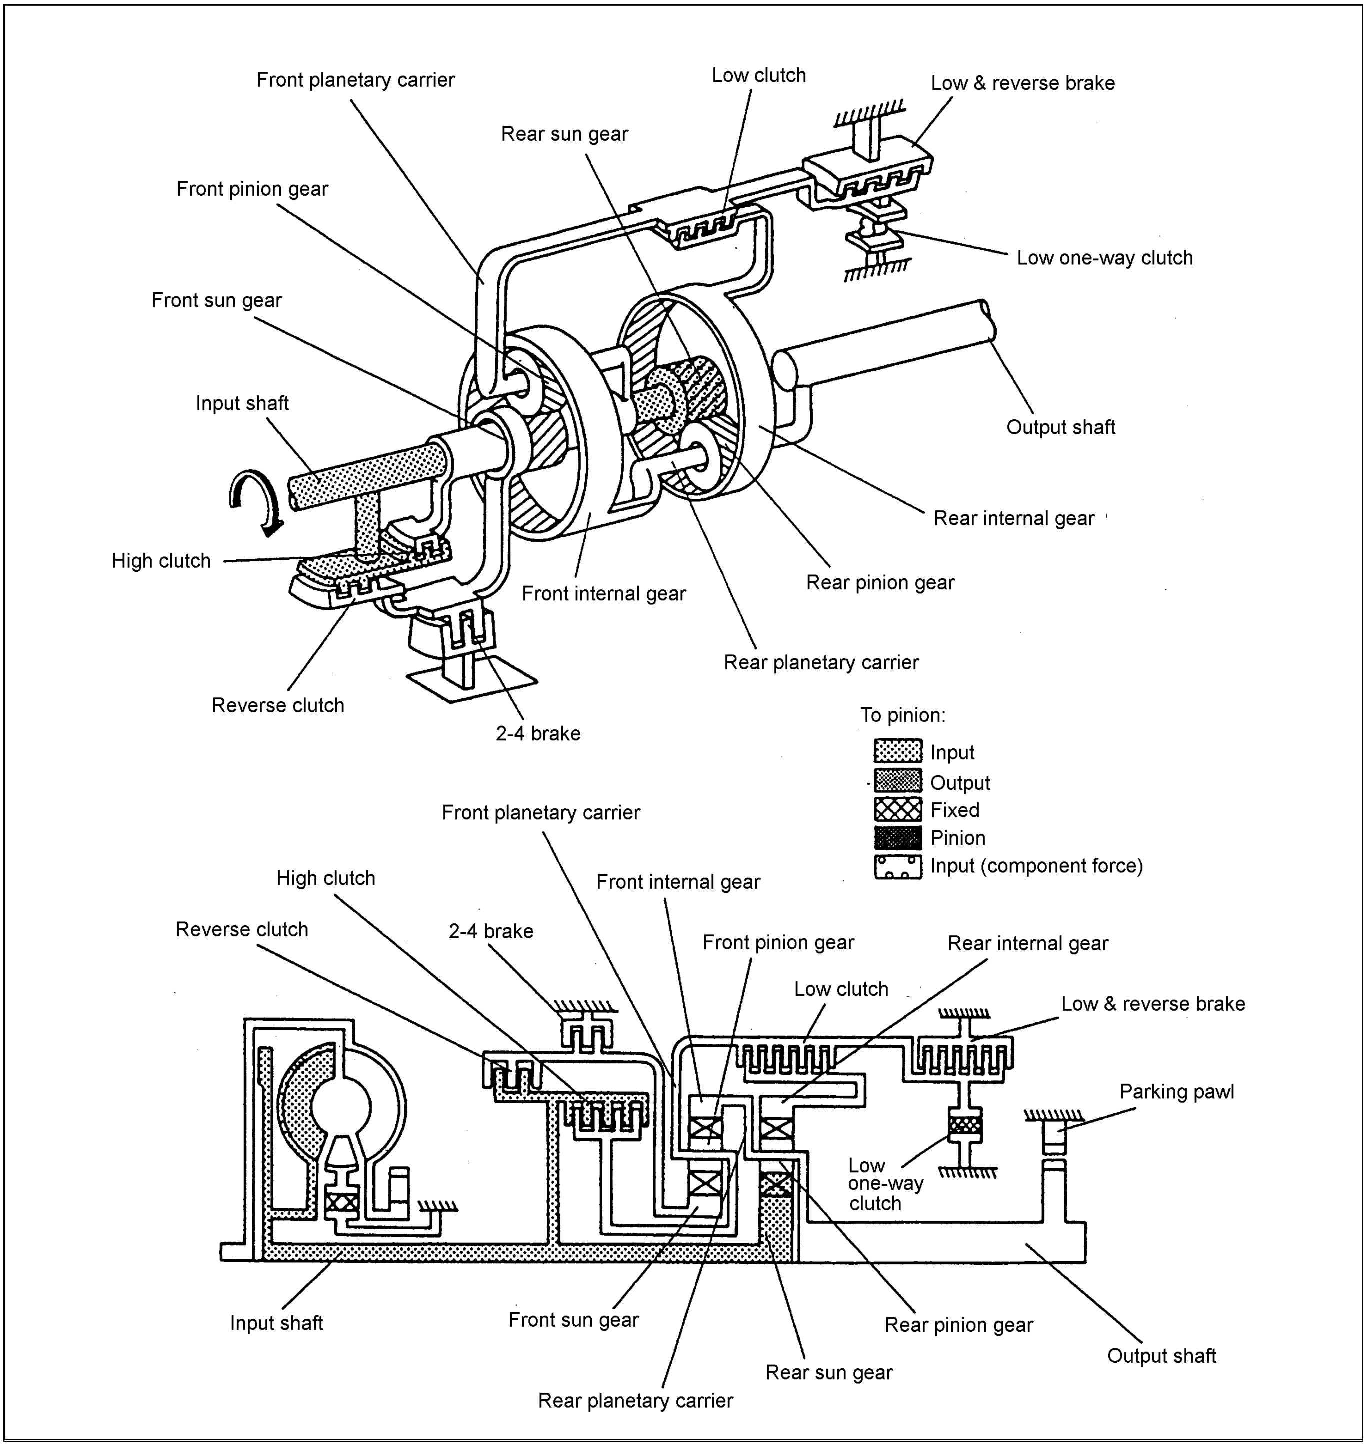
P Position

Although the driving force of the input shaft is transmitted to the rear sun gear and reverse & high clutch drum, the driving force is not transmitted to the output shaft since all of the clutches and brakes are not engaged. Therefore, the vehicle can move in this condition. However, since the output shaft is mechanically locked with the parking pawl, the rear planetary carrier and front internal gear are locked. For this reason, the vehicle does not move.



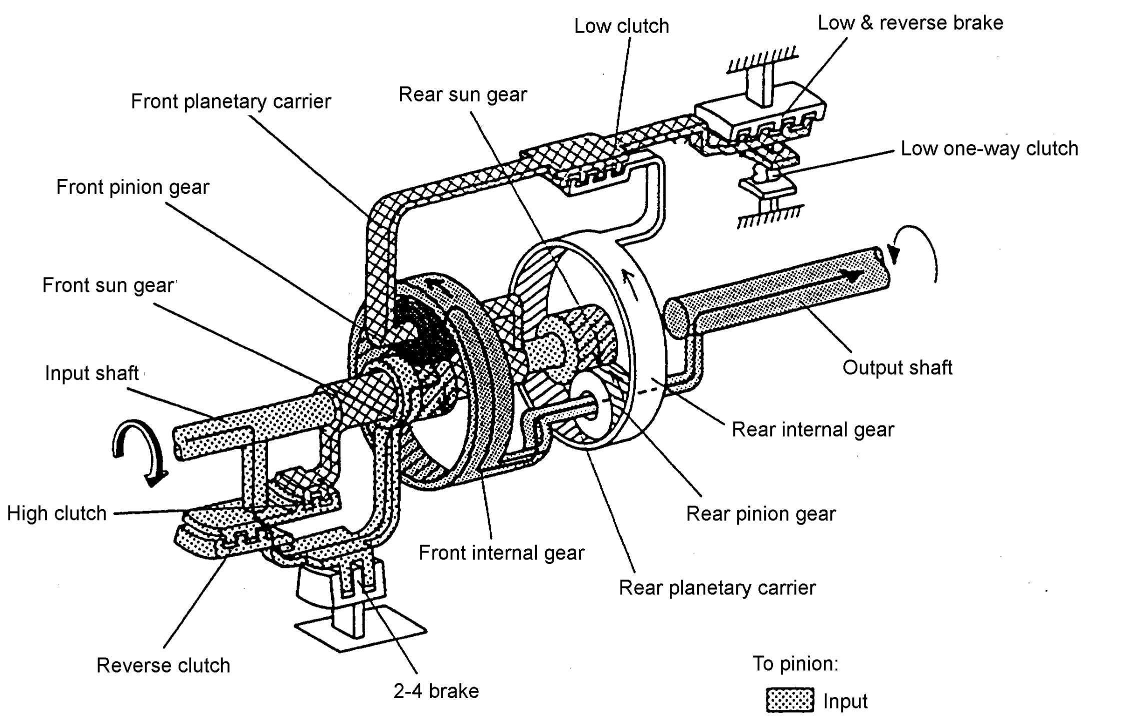
N Position

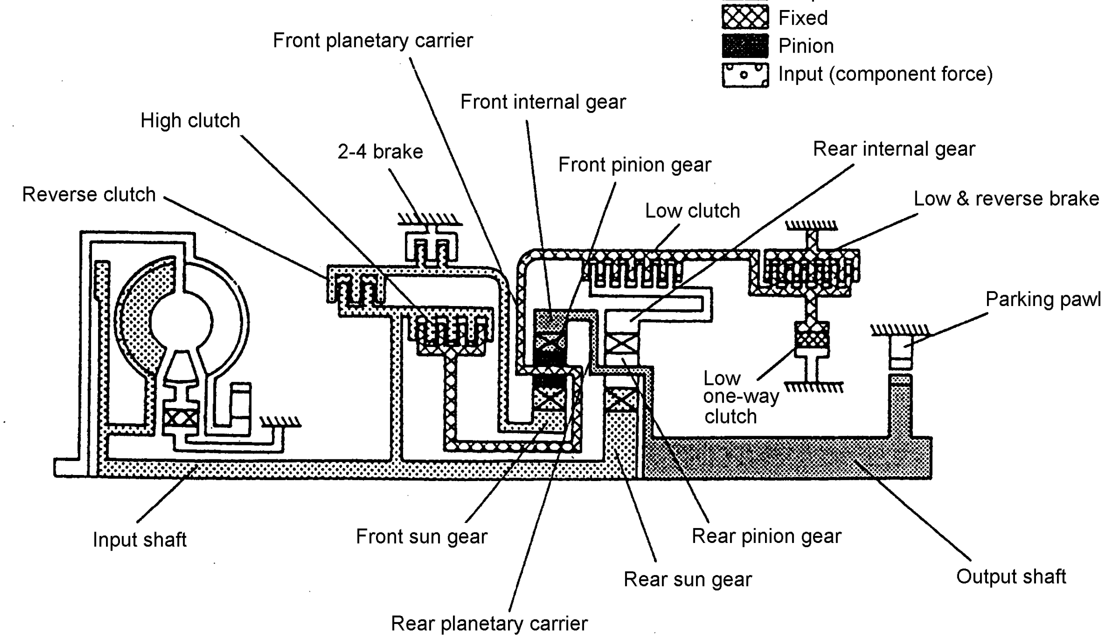
Although the driving force of the input shaft is transmitted to the rear sun gear and reverse & high clutch drum, the driving force is not transmitted to the output shaft, as all of the clutches and brakes are not engaged. Therefore, the vehicle can move at this condition.



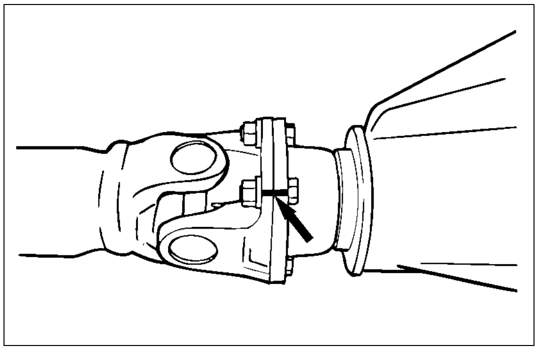
Reverse Gear in Position

The driving force from the input shaft is transmitted to the rear sun gear and reverse & high clutch drum. In the R position, the reverse clutch is engaged and the driving force is transmitted to the front sun gear and rotates it clockwise. The low & reverse brake is also engaged and the front planetary carrier is fixed so that the front pinion gear does not rotate clockwise, but can rotate counterclockwise. As a result, the output shaft rotates counterclockwise and the vehicle goes backwards.





Removal and Installation



401RS023

Removal

1. Raise the vehicle on a hoist.

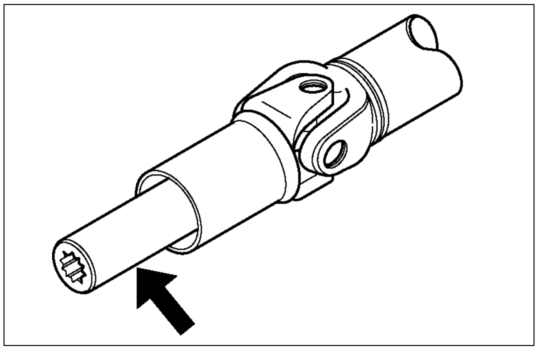
NOTE:

Apply alignment marks on the flange at the rear propeller shaft both front and rear side.

2. Remove center bearing fixing bolt.
3. Remove rear axle side bolt, nut and washer.
4. Remove rear propeller shaft.

NOTE:

Plug the hole of the transmission rear end to prevent oil leakage.



401L100007

Installation

NOTE:

Cover the slip yoke with cloth to avoid damage to the oil seal contact surface, when removing propeller shaft from transmission. Do not damage the oil seal contact surface of slip yoke with other parts at removal and installation.

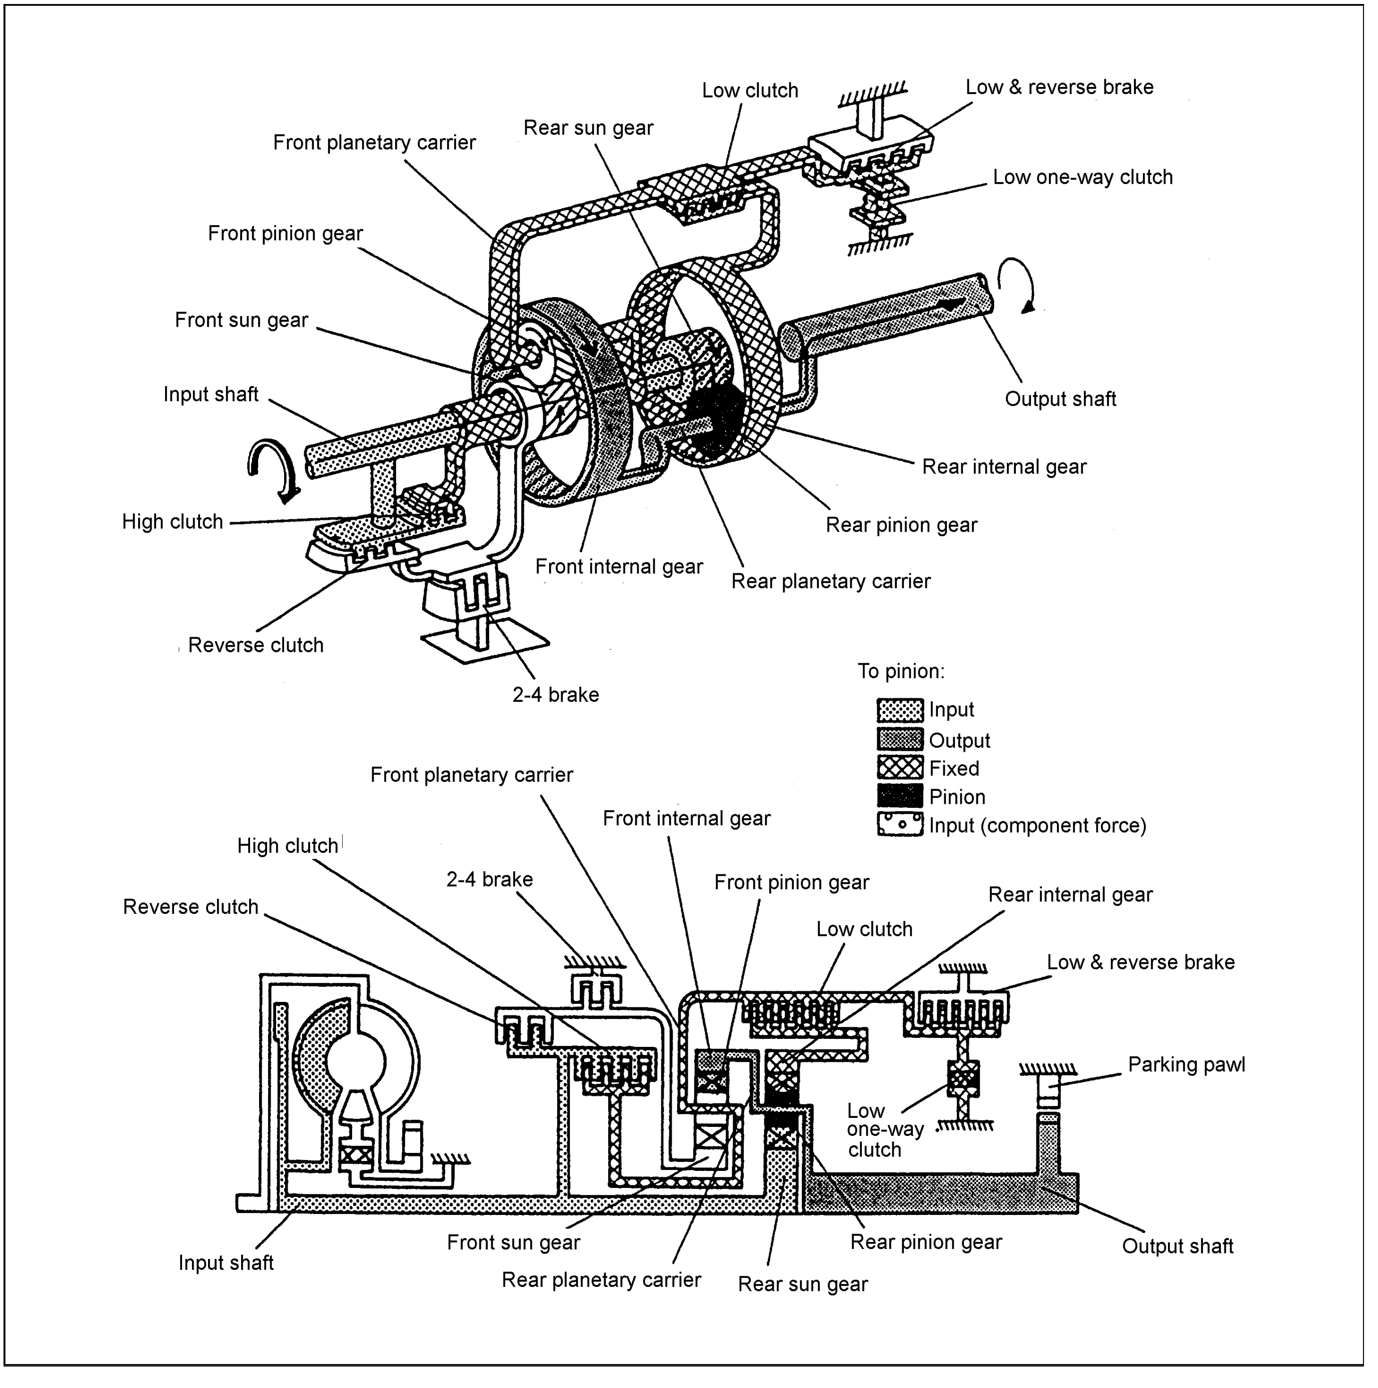
Completely remove the dust or foreign matter from the connecting surface of flange coupling on each end of the propeller shaft.

1. Align the mark which is applied at removal and insert the propeller shaft in the transmission.
2. Install rear propeller shaft and tighten the bolts to the specified torque.
   Torque: 59 N·m (6.0 kgf·m/43 lb·ft)
3. Install center bearing and tighten the bolts to the specified torque.
   Torque: 69 N·m (7.0 kgf·m/51 lb·ft)

1st Gear in D, 3, 2 Position

The driving force from the input shaft is transmitted to the rear sun gear and reverse & high clutch drum. As the low clutch is engaged, the movement of the rear internal gear is restricted. Since the low one-way clutch acts at the same time, counterclockwise rotations of the rear internal gear are locked. As a result, the driving force transmitted to the rear sun gear rotates the rear planetary carrier clockwise, then the rotation speed is decreased and multiple force is transmitted to the output shaft.

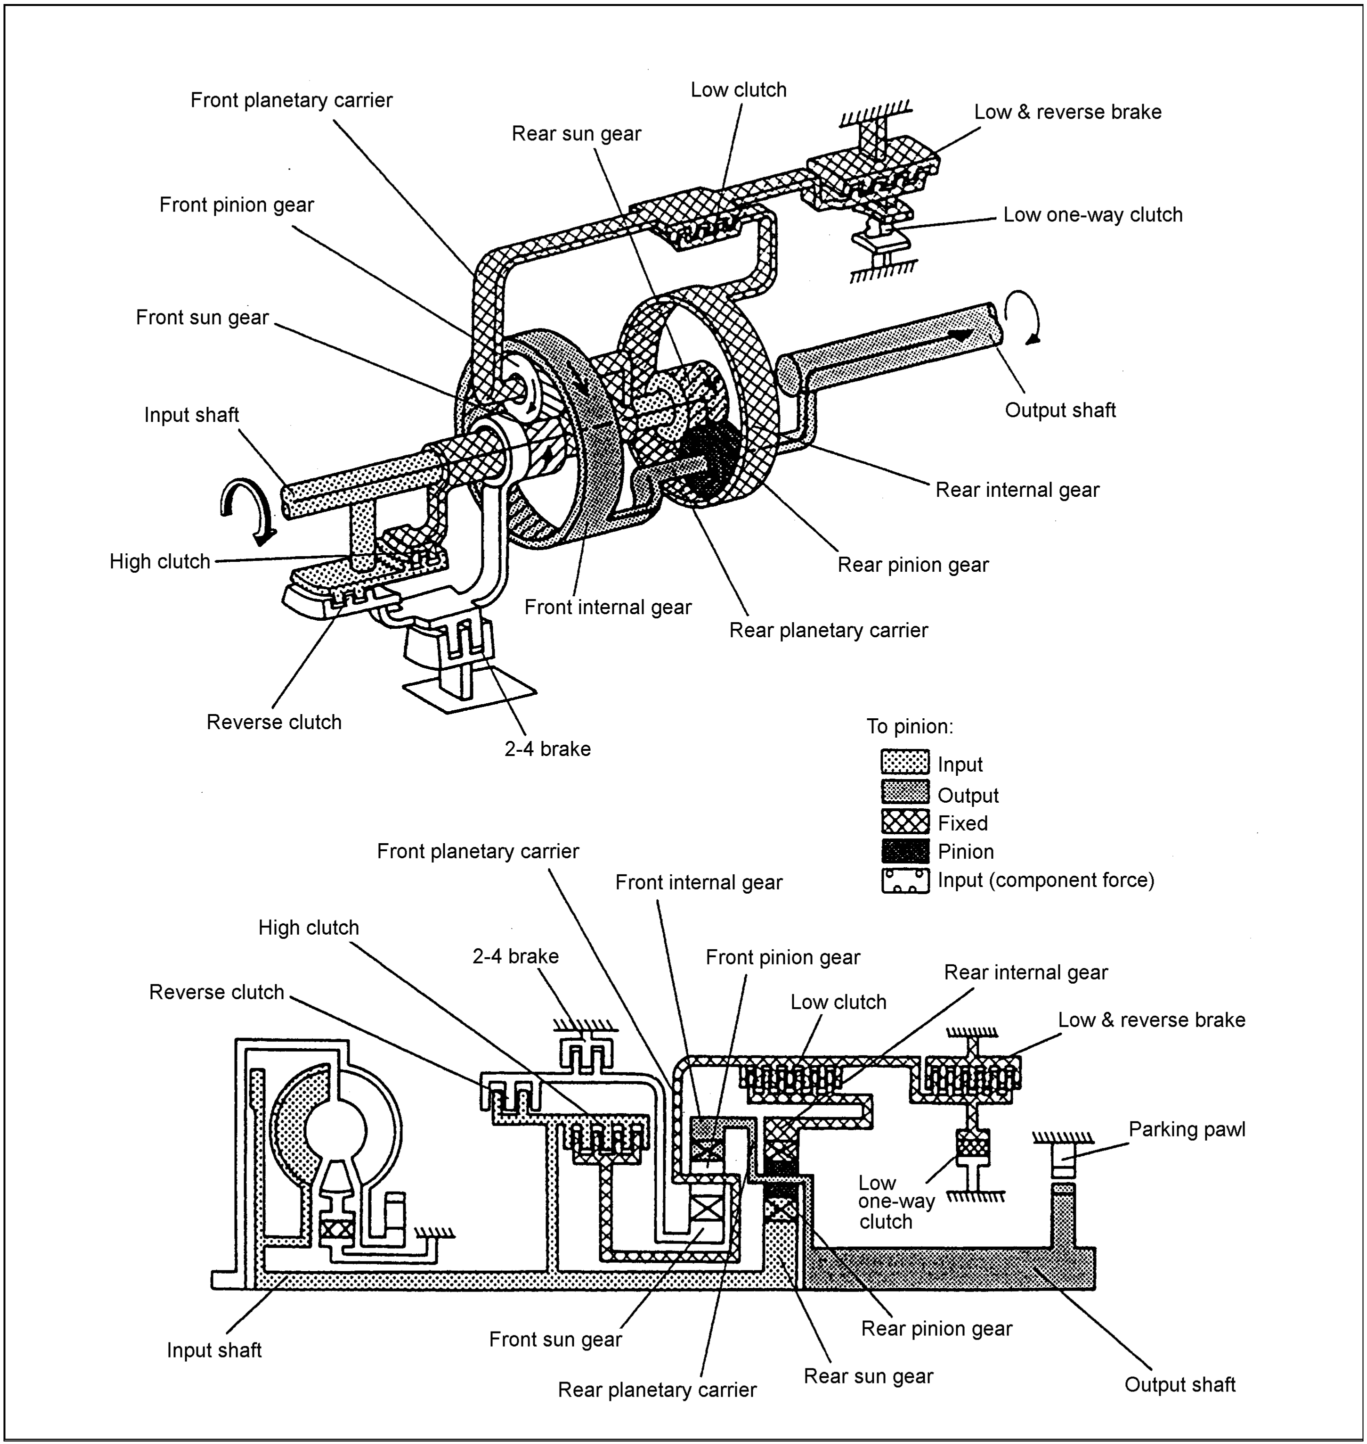
When decelerating, the rotating speed of the rear planetary carrier (rear pinion gear) is higher than that of the rear sun gear and the rear internal gear attempts to rotate clockwise. At this time, the low one-way clutch does not act but races, and therefore the rear internal gear rotates clockwise. The reverse torque from the driving shaft is not transmitted to the engine side and the engine brake does not act.



1st Gear in L Position

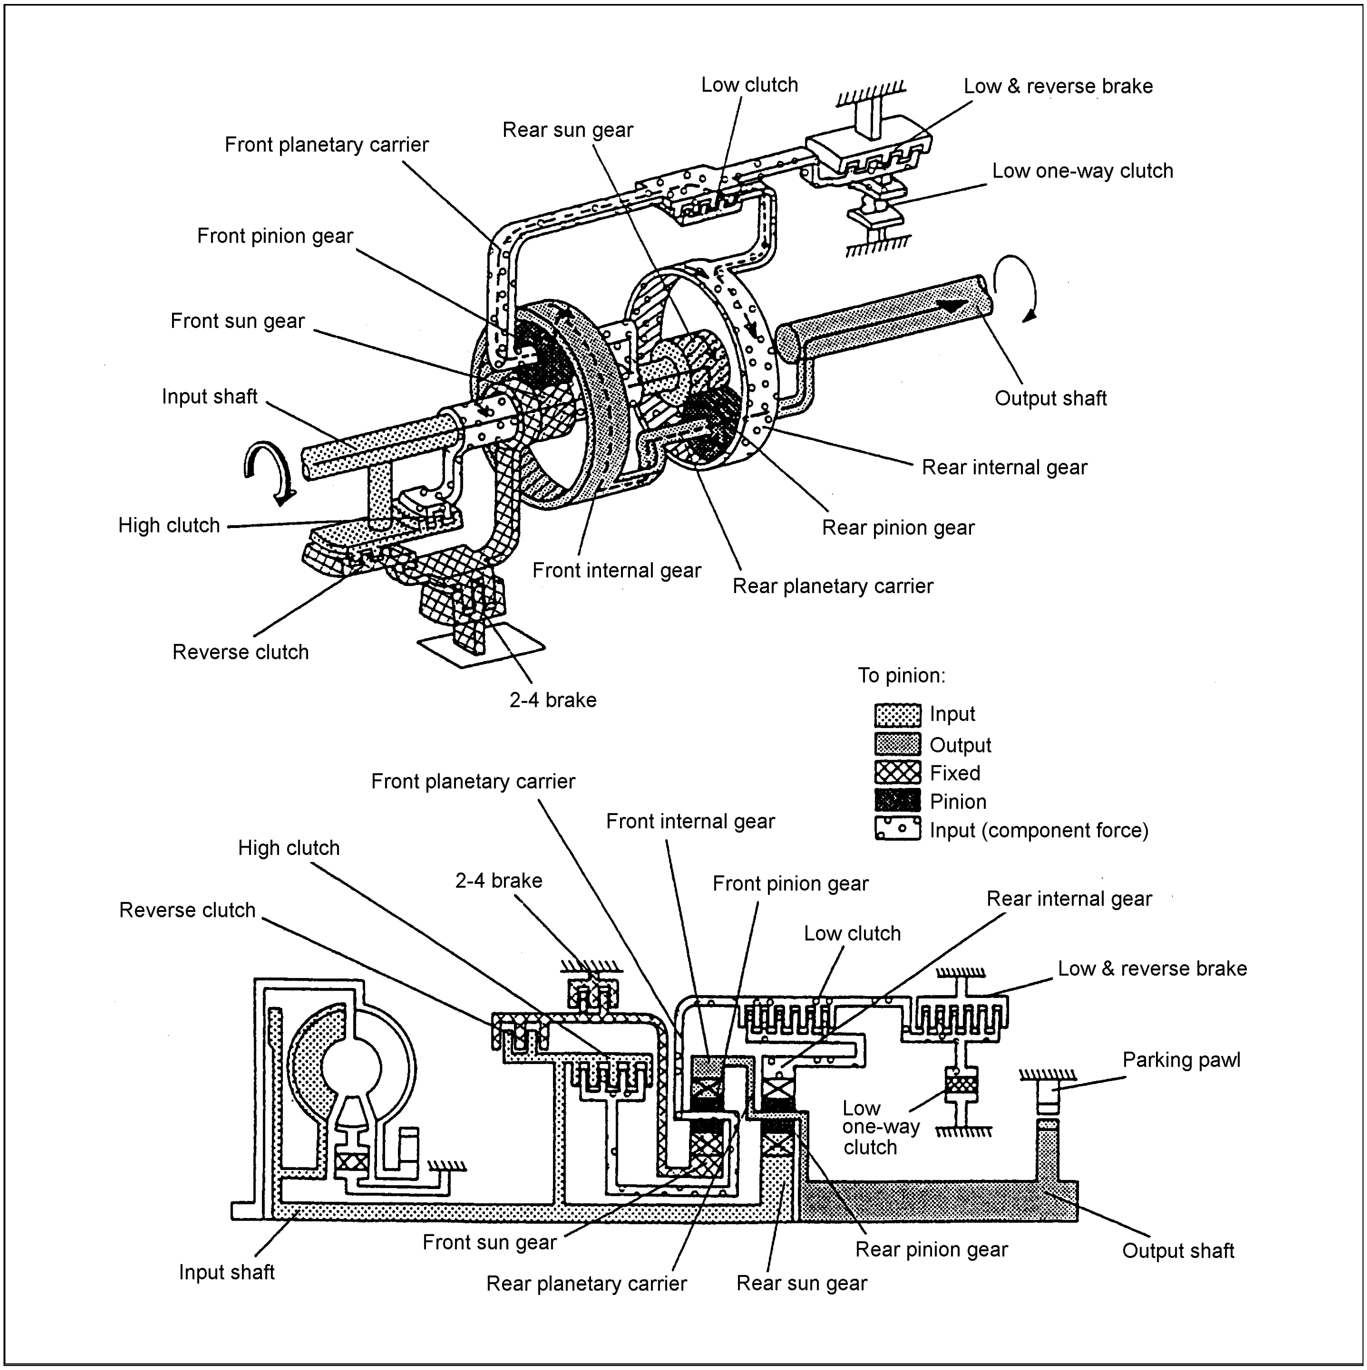
The basic mechanism is the same as in the D, 3, and 2 positions. To apply the engine brake, the low & reverse brake is engaged to restrict the movement of the low one-way clutch.

When decelerating, as the rear internal gear is fixed, reverse torque from the drive shaft is transmitted to the engine side so that the engine brake is applied.



2nd Gear in D, 3, 2 Position

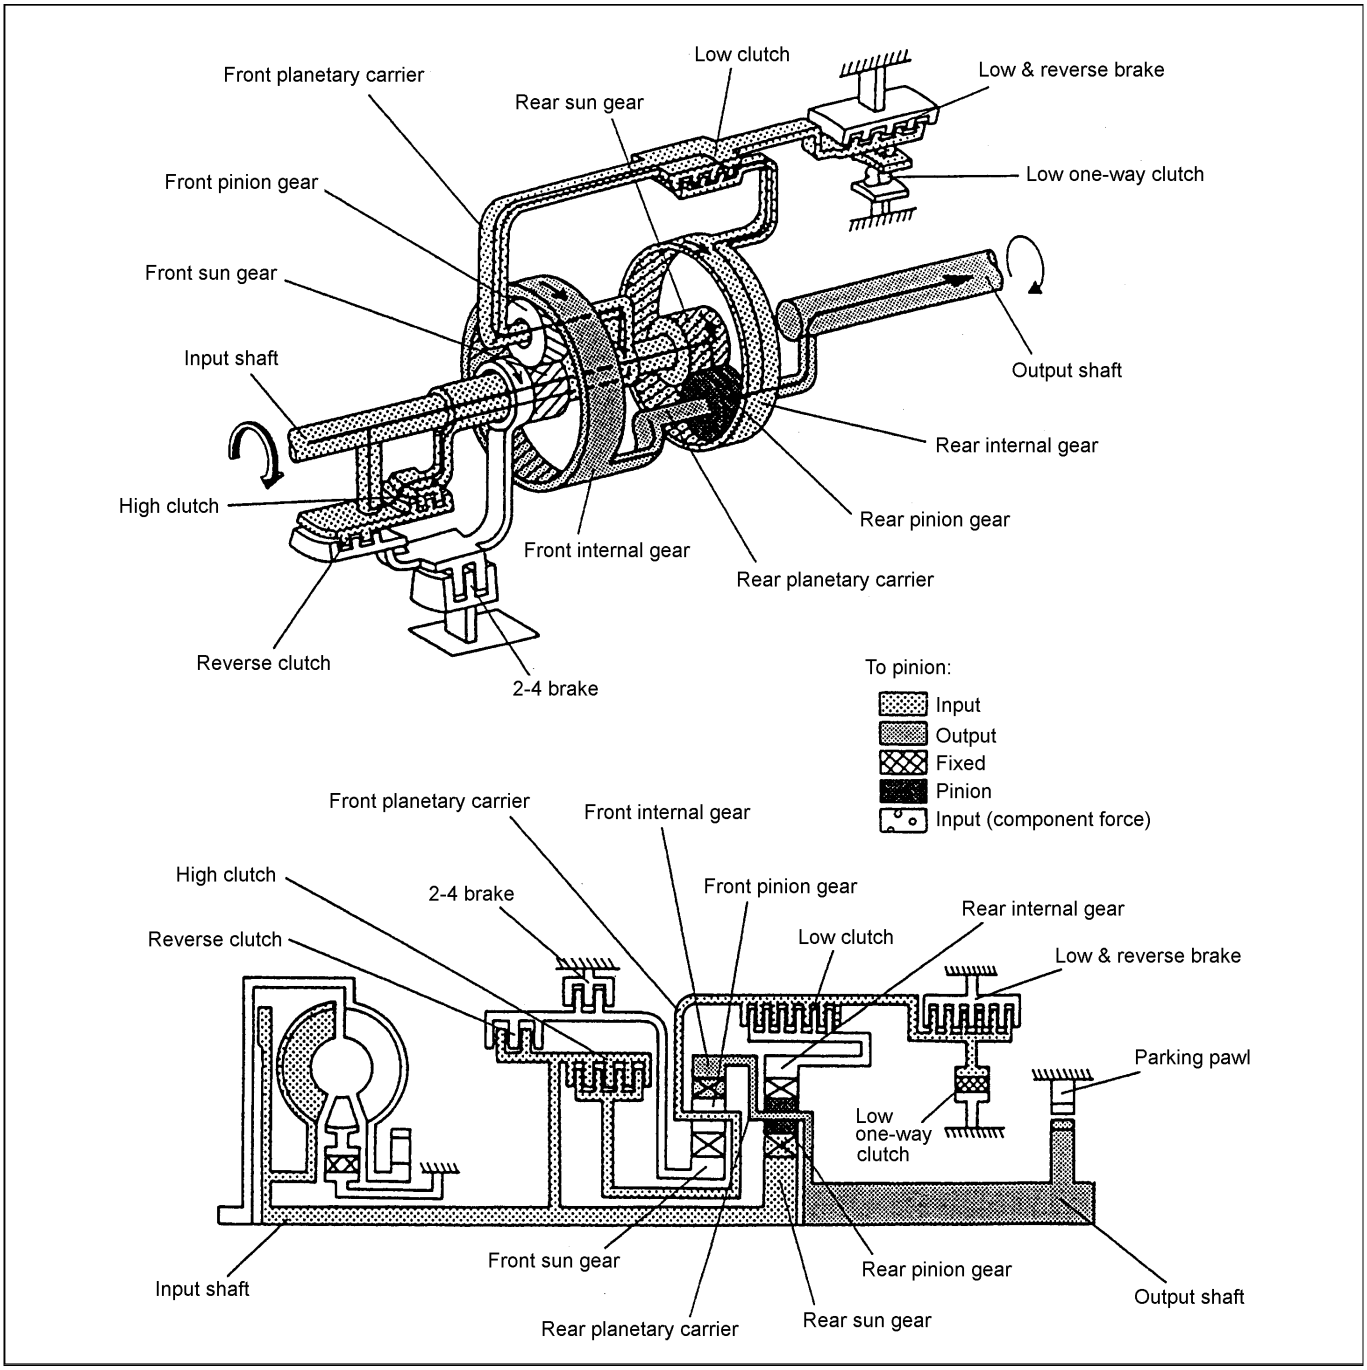
The driving force from the input shaft is transmitted to the rear sun gear and reverse & high clutch drum. As in the case of the 1st gear, the low clutch is engaged and the movement of the rear internal gear is restricted. Since the 2-4 brake is engaged, the front sun gear is fixed. As a result, movement of the rear internal gear is restricted, and the driving force transmitted to the rear sun gear rotates the rear planetary carrier clockwise. The rotating speed of the rear planetary carrier is higher than in 1st gear as the rear internal gear rotates. When decelerating, the engine brake is applied.



3rd Gear in D, 3 Position

The driving force from the input shaft is transmitted to the rear sun gear and reverse & high clutch drum. As in the case of the 1st gear and 2nd gear, the low clutch is engaged and the movement of the rear internal gear is restricted. Since the high clutch is engaged, the driving force from the input shaft is directly transmitted to the rear internal gear. As a result, the rpm of the rear sun gear and the rear internal gear becomes the same as that of the input shaft, so that the rear pinion gear rotates not independently but together with the rear sun gear and rear internal gear.

When decelerating, the engine brake is applied.



4th Gear (O/D) in D Position

The driving force from the input shaft is transmitted to the rear sun gear and reverse & high clutch drum. Since the 2-4 brake is engaged, the front sun gear is fixed. In addition to this the high clutch is engaged. As a result, the front pinion gear rotates itself together with other gears clockwise. This rotation increases the speed of rotation of the front internal gear and is transmitted to the output shaft.

Diagnostic Information and Procedures

Diagnostic Starting Point - Transmission Controls

Begin the system diagnosis with Diagnostic System Check - Transmission Controls. The Diagnostic System Check - Transmission Controls will provide the following information:

- The identification of the control modules which command the system.
- The ability of the control modules to communicate through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTCs) and the their statuses.

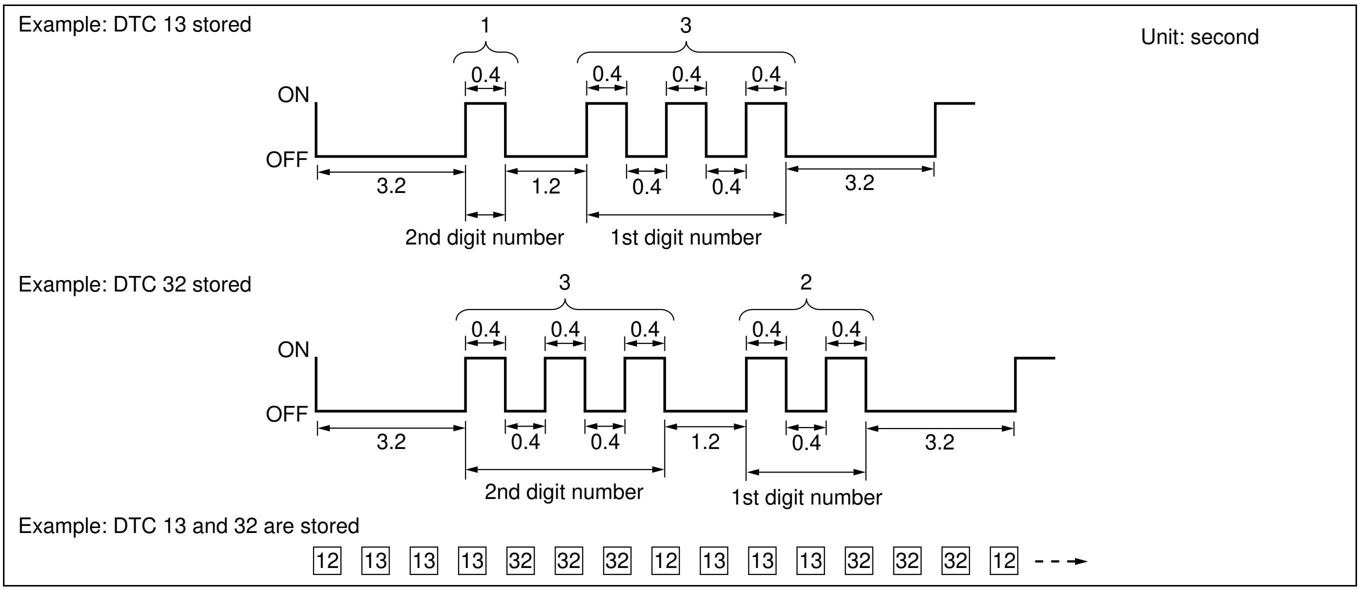
The use of the Diagnostic System Check - Transmission Controls will identify the correct procedure for diagnosing the system and where the procedure is located.

Reading Flash Diagnostic Trouble Codes (DTC)

The provision for communicating with the TCM is the Data Link Connector (DLC). The DTC(s) stored in the TCM memory can be read either through a hand-held diagnostic scanner such as Tech 2 plugged into the DLC or by counting the number of flashes of the CHECK TRANS lamp when the diagnostic test terminal of the DLC is grounded. The DLC terminal “11” (diagnostic request) is pulled “Low” (grounded) by jumped to DLC terminal “4”, which is a ground wire. Once terminals “11” and “4” have been connected, turn the ignition switch ON, with the engine OFF. The CHECK TRANS lamp initially flashes 12. If more than one DTC has been stored in the TCM's memory, the DTCs will be output numerical order with each DTC being displayed three times. All the stored DTCs are flashed, then return 12 and continue to flash the DTC. If no DTC exists, the CHECK TRANS flashes 12 continuously. The flash DTC display will continue as long as the DLC is shorted.

Diagnostic Trouble Codes (DTC) Clear Method

If there is no scan tool, history DTCs can be cleared by removing the ECM (B) (10A) fuse for at least 10 seconds with the ignition switch OFF.



Diagnostic System Check - Transmission Controls

Description

The Diagnostic System Check - Transmission Controls is an organized approach to identifying a condition that is created by a malfunction in the electronic transmission control system. The Diagnostic System Check must be the starting point for any driveability concern. The Diagnostic System Check directs the service technician to the next logical step in order to diagnose the concern. Understanding and correctly using the diagnostic table reduces diagnostic time, and prevents the replacement of good parts.

Test Description

The numbers below refer to the step numbers on the diagnostic table.
2. Lack of communication may be because of a partial or a total malfunction of the serial data circuit.
8. If there are other modules with DTCs set, refer to the DTC list. The DTC list directs you to the appropriate diagnostic procedure. If the control module stores multiple DTCs, diagnose the DTCs in the following order:

- Component level DTCs, such as sensor DTCs, solenoid DTCs, actuator DTCs, and relay DTCs. Diagnose the multiple DTCs within this category in numerical order. Begin with the lowest numbered DTC, unless the diagnostic table directs you otherwise.

Diagnostic System Check Transmission Controls

Important:

- DO NOT perform this diagnostic if there is not a driveability concern, unless another procedure directs you to this diagnostic.
- Before you proceed with diagnosis, search for applicable service bulletins.
- Unless a diagnostic procedure instructs you, DO NOT clear the DTCs.
- Ensure the battery has a full charge.
- Ensure the battery cables (+) (-) are clean and tight.
- Ensure the TCM grounds are clean, tight, and in the correct location.
- Ensure the TCM harness connectors are clean and correctly connected.
- Ensure the TCM terminals are clean and correctly mating.
- If there are gear ratio DTC's (P0731, P0732, P0733 or P0734), diagnose sensor DTCs and solenoid DTCs first.

Diagnostic System Check - Transmission Controls

Step	Action	Value(s)	Yes	No
1	Install a scan tool. Does the scan tool turn ON?	—	Go to Step 2	Go to Scan Tool Does Not Power Up
2	1. Turn ON the ignition, with the engine OFF. 2. Attempt to establish communication with the listed control modules. • TCM • Electronic hydraulic control unit (EHCU) [ABS module] (If so equipped) • Supplemental restraint system (SRS) control module (If so equipped) Does the scan tool communicate with all the listed control modules?	—	Go to Step 3	Go to Scan Tool Does Not Communicate with Keyword Device
3	Attempt to start the engine. Does the engine start and idle?	—	Go to Step 4	Go to Engine Cranks but Does Not Run in engine control section
4	Select the DTC display function for the following control modules: • TCM • Engine control module (ECM) Does the scan tool display any DTCs?	—	Go to Step 5	Go to Step 9
5	Does the scan tool other control module communication fault DTCs?	—	Go to Applicable DTC	Go to Step 6

Step	Action	Value(s)	Yes	No
6	Does the scan tool display TCM DTC P0602?	—	Go to Applicable DTC	Go to Step 7
7	Does the scan tool display TCM DTC P0560?	—	Go to Applicable DTC	Go to Step 8
8	Is there any other code in any controller that has not been diagnosed?	—	Go to Applicable DTC	Go to Step 9
9	Is the customer's concern with the engine system?	—	Go to Diagnostic System Check - Engine Controls	Go to Step 10
10	Drive vehicle and verify if any engine or transmission related driveability concern exist. Does an engine or transmission driveability concern exist?	—	Go to Symptoms - Engine Controls in engine control section or Symptoms Transmission Controls	System OK

Scan Tool Data List

The Transmission Scan Tool Data List contains all transmission related parameters that are available on the scan tool. Use the Transmission Scan Tool Data List only after the following is determined:

- The Transmission Controls - Diagnostic System Check is completed.
- On-board diagnostics are functioning properly.

Scan tool values from a properly running engine may be used for comparison with the transmission you are diagnosing. The Transmission Scan Tool Data List represents values that would be seen on a normal running engine. Only the parameters listed below are referenced in this service manual for use in diagnosis.

Scan Tool Parameter	Units Displayed	Typical Data
Operating Conditions: Engine idle/ Engine coolant temperature is between 75 to 85°C (167 to 185°F)/ Accelerator pedal is not pressed/ Park range/ Transfer case is 2H position/ Accessories OFF		
Accelerator Pedal Position	%	0%
Engine Speed	RPM	Nearly 700 RPM
AT Input Speed (Automatic Transmission)	RPM	600 to 700 RPM
TCC Slip Speed (Torque Converter Clutch)	RPM	Less than 100 RPM
AT Output Speed (Automatic Transmission)	RPM	0 RPM
Vehicle Speed	km/h/ MPH	0 km/h / MPH
Current Gear	1st/ 2nd/ 2nd L-Up/ 3rd/ 3rd L-Up/ 4th/ 4th L-Up	1st
Estimated Gear Ratio	: 1	32.77:1
Transmission Range (TR)	Park/ Neutral/ Reverse/ Drive/ Drive 3/ Drive 2/ Drive 1	Park
TR Switch P (Transmission Range)	On/ Off	On
TR Switch R (Transmission Range)	On/ Off	Off
TR Switch N (Transmission Range)	On/ Off	Off
TR Switch D (Transmission Range)	On/ Off	Off
TR Switch 3 (Transmission Range)	On/ Off	Off
TR Switch 2 (Transmission Range)	On/ Off	Off
TR Switch L (Transmission Range)	On/ Off	Off
PCS Command (Pressure Control Solenoid)	On/ Off	On
Low & Reverse Brake Solenoid Command	%	100%
Low & Reverse Brake Pressure Switch	On/ Off	Off
2-4 Brake Solenoid Command	%	100%
2-4 Brake Pressure Switch	On/ Off	Off
High Clutch Solenoid Command	%	100%
High Clutch Pressure Switch	On/ Off	Off
Low Clutch Solenoid Command	%	0%
TCC Solenoid (Torque Converter Clutch)	%	5%
Transmission Fluid Temperature	°C/ °F	Varies
Transmission Oil Temperature Lamp	On/ Off	Off
TCM Status Temp. (Temperature Transmission Control Module)	Low/ High	Low
4 Wheel Drive Low	On/ Off	Off
TCM Status Transfer (Transmission Control Module)	Low/ High	High
TCM Status Down Slope (Transmission Control Module)	On/ Off	Off

Scan Tool Parameter	Units Displayed	Typical Data
TCM Status Up Slope (Transmission Control Module)	On/ Off	Off
3rd Start Switch	On/ Off	Off
3rd Start Lamp	On/ Off	Off
Power Drive Switch	On/ Off	Off
Power Drive Lamp	On/ Off	Off
Brake Pedal Switch	On/ Off	Off
Diagnostic Switch	On/ Off	Off
Check Trans Lamp	On/ Off	Off

Scan Tool Data Definitions

This information will assist in driveability problems. The displays can be viewed while the vehicle is being driven. Always perform the Diagnostic System Check - Transmission Controls first. The Diagnostic System Check will confirm proper system operation.

Accelerator Pedal Position

This parameter displays the angle of the accelerator pedal as calculated by the engine control module (ECM) using the signals from the accelerator pedal position (APP) sensors. This data is sent over the pulse wave modulation (PWM) signal from the ECM to the TCM. The scan tool will display linearly from 0 to 100% according to the pedal operation.

Engine Speed

This parameter displays the rotational speed of the crankshaft as calculated by the engine control module (ECM) based on inputs from the crankshaft position sensor or camshaft position sensor. This data is sent over the pulse signal from the ECM to the TCM.

AT Input Speed (Automatic Transmission)

This parameter displays the rotational speed of the reverse & high clutch drum as calculated by the TCM based on inputs from the input shaft speed (ISS) sensor.

TCC Slip Speed (Torque Converter Clutch)

This parameter displays the difference between transmission input shaft speed and the engine speed (engine speed - input shaft speed). A negative value indicates that the engine speed is less than the input shaft speed, deceleration. A positive value indicates that the engine speed is greater than the input shaft speed, acceleration. A value of zero indicates that the engine speed is equal to the input shaft speed, torque converter clutch (TCC) is applied.

AT Output Speed (Automatic Transmission)

This parameter displays the rotational speed of the parking gear that is connected to the output shaft as calculated by the TCM based on inputs from the output shaft speed (OSS) sensor.

Vehicle Speed

This parameter indicates the vehicle speed calculated by the TCM using the signal from the output shaft speed sensor. The scan tool will display a low value at lower vehicle speeds, and a high value at higher vehicle speeds.

Current Gear

This parameter displays the current gear position based on the command from the TCM.

Estimated Gear Ratio

This parameter displays the current gear ratio calculated by the TCM using the signal from the input shaft speed (ISS) sensor and the output speed sensor (OSS) sensor.

Transmission Range (TR)

This parameter displays the selector lever position based on the transmission range (TR) switch inputs.

TR Switch P, R, N, D, 3, 2, L (Transmission Range)

This parameter displays the input state of the transmission range (TR) switch to the TCM. When the selector lever is moved to each range, the scan tool displays On.

PCS Command (Pressure Control Solenoid)

This parameter displays the commanded state of the pressure control (PC) solenoid valve control circuit. On indicates the solenoid valve is being energized by the TCM, allowing line pressure to be low.

Low & Reverse Brake Solenoid Command

This parameter displays the low & reverse brake solenoid valve control duty ratio based on the command for the TCM. The scan tool will display a lower percentage when the low & reverse brake is controlled to engage (fluid pressure is applied to the low & reverse brake hydraulic circuits). The scan tool will display higher percentage when the low & reverse brake is controlled to disengage (fluid pressure is drained from the low & reverse brake hydraulic circuits).

Inspection and Repair

Make all necessary adjustment, repairs, and part replacements if wear, damage, or other problems are discovered during inspection.

Visual Check

Inspect following parts for wear, damage, or other abnormal conditions.

Spider

Needle roller bearing

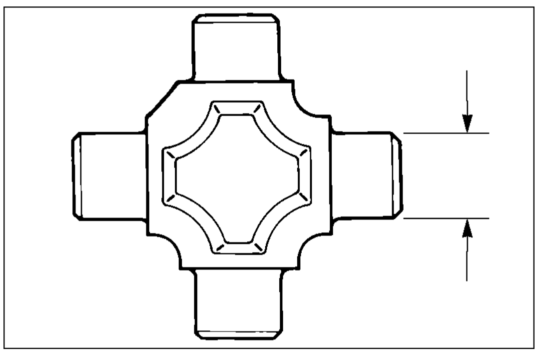
Yoke

Flange

Center bearing

Cushioning rubber

Bracket



401RS007

Outside Diameter of Spider Pins

mm(in)

Standard	Limit
17 (0.67)	16.99 (0.669)

Low & Reverse Brake Pressure Switch

This parameter displays the input state of the low & reverse brake transmission fluid pressure (TFP) switch to the TCM. When the low & reverse brake fluid pressure is generated, the scan tool displays On.

2-4 Brake Solenoid Command

This parameter displays the 2-4 brake solenoid valve control duty ratio based on the command from the TCM. The scan tool will display a lower percentage when the 2-4 brake is controlled to engage (fluid pressure is applied to the 2-4 brake hydraulic circuits). The scan tool will display higher percentage when the 2-4 brake is controlled to disengage (fluid pressure is drained from the 2-4 brake hydraulic circuits).

2-4 Brake Pressure Switch

This parameter displays the input state of the 2-4 brake transmission fluid pressure (TFP) switch to the TCM. When the 2-4 brake fluid pressure is generated, the scan tool displays On.

High Clutch Solenoid Command

This parameter displays the high clutch solenoid valve control duty ratio based on the command from the TCM. The scan tool will display a lower percentage when the high clutch is controlled to engage (fluid pressure is applied to the high clutch hydraulic circuits). The scan tool will display higher percentage when the high clutch is controlled to disengage (fluid pressure is drained from the high clutch hydraulic circuits).

High Clutch Pressure Switch

This parameter displays the input state of the high clutch transmission fluid pressure (TFP) switch to the TCM. When the high clutch fluid pressure is generated, the scan tool displays On.

Low Clutch Solenoid Command

This parameter displays the low clutch solenoid valve control duty ratio based on the command from the TCM. The scan tool will display a lower percentage when the low clutch is controlled to engage (fluid pressure is applied to the low clutch hydraulic circuits). The scan tool will display higher percentage when the low clutch is controlled to disengage (fluid pressure is drained from the low clutch hydraulic circuits).

TCC Solenoid (Torque Converter Clutch)

This parameter displays the torque converter clutch (TCC) control duty ratio based on the command from the TCM. The scan tool will display a lower percentage when the TCC is controlled to disengage (fluid pressure is drained from the TCC release hydraulic circuits). The scan tool will display higher percentage when the TCC is controlled to engage (fluid pressure is applied to the TCC apply hydraulic circuits).

Transmission Fluid Temperature

This parameter displays the temperature of the automatic transmission fluid (ATF) temperature as calculated by the TCM using the signal from the transmission fluid temperature (TFT) sensor. The scan tool will display a low temperature when the signal voltage is high, and a high temperature when the signal voltage is low.

Transmission Oil Temperature Lamp

This parameter displays the commanded state of the transmission oil temperature lamp control circuit. The lamp should be On when the scan tool indicates command On.

TCM Status Temp. (Temperature Transmission Control Module)

This parameter displays the commanded state of the high temperature mode shift map. On indicates the transmission fluid temperature is high and the high temperature mode is selected to prevent an overheating.

4 Wheel Drive Low

This parameter displays the input state of the 4WD low gear signal from the transfer case control module (TCCM). When the 4L mode is selected, the scan tool displays On.

TCM Status Transfer (Transmission Control Module)

This parameter displays the commanded state of the shift map that is based on the transfer case position. High indicates the high mode (2H or 4H) is inputted from the transfer case control module (TCCM). Low indicates the low mode (4L) is inputted from the TCCM.

TCM Status Down Slope (Transmission Control Module)

This parameter displays the commanded state of the down slope mode shift map. On indicates the down slope mode is selected under certain driving conditions.

TCM Status Up Slope (Transmission Control Module)

This parameter displays the commanded state of the up slope mode shift map. On indicates the up slope mode is selected under certin driving conditions.

3rd Start Switch

This parameter displays the input state of the 3rd start switch to the TCM. When the switch is pressed, the scan tool displays On.

3rd Start Lamp

This parameter displays the commanded state of the 3rd start lamp control circuit. The lamp should be On when the scan tool indicates command On.

Power Drive Switch

This parameter displays the input state of the power drive switch to the TCM. When the switch is pressed, the scan tool displays On.

Power Drive Lamp

This parameter displays the commanded state of the power drive lamp control circuit. The lamp should be On when the scan tool indicates command On.

Brake Pedal Switch

This parameter displays the input state of the brake pedal switch to the TCM. When the pedal is depressed, scan tool displays On.

Diagnostic Switch

This parameter displays the input state of the diagnostic request switch to the TCM. When the data link connector (DLC) terminal 11 is pulled low, the check trans lamp blinks to indicate flash code.

Check Trans Lamp

This parameter displays the commanded state of the check trans lamp control circuit. The lamp should be On when the scan tool indicates command On.

Scan Tool Output Controls

	Scan Tool Output Control	Descriptions
Lamp control	Power Lamp Test	The purpose of this test is for checking whether the power drive lamp is operating when commanded ON. Faulty circuit(s) or an open circuit could be considered when not operating when commanded ON.
Lamp control	3rd Start Lamp Test	The purpose of this test is for checking whether the 3rd start lamp is operating when commanded ON. Faulty circuit(s) or an open circuit could be considered when not operating when commanded ON.
Lamp control	AT Oil Temperature Lamp Test	The purpose of this test is for checking whether the AT oil temperature lamp is operating when commanded ON. Faulty circuit(s) or an open circuit could be considered when not operating when commanded ON.
Lamp control	Check Light Test	The purpose of this test is for checking whether the check trans lamp is operating when commanded ON. Faulty circuit(s) or an open circuit could be considered when not operating when commanded ON.
Solenoid valve control	Low & Reverse Brake Solenoid	The purpose of this test is for checking whether the low & reverse brake solenoid valve is operating when commanded ON. Faulty circuit(s) or a faulty solenoid valve could be considered if not energizing when commanded ON.
Solenoid valve control	2-4 Brake Solenoid Test	The purpose of this test is for checking whether the 2-4 brake solenoid valve is operating when commanded ON. Faulty circuit(s) or a faulty solenoid valve could be considered if not energizing when commanded ON.
Solenoid valve control	High Clutch Solenoid Test	The purpose of this test is for checking whether the high clutch solenoid valve is operating when commanded ON. Faulty circuit(s) or a faulty solenoid valve could be considered if not energizing when commanded ON.
Solenoid valve control	Low Clutch Solenoid Test	The purpose of this test is for checking whether the low clutch solenoid valve is operating when commanded ON. Faulty circuit(s) or a faulty solenoid valve could be considered if not energizing when commanded ON.
Solenoid valve control	Pressure Control Solenoid (PCS)	The purpose of this test is for checking whether the pressure control (PC) solenoid valve is operating when commanded ON. Faulty circuit(s) or a faulty solenoid valve could be considered if not energizing when commanded ON.
Solenoid valve control	TCC Solenoid Test	The purpose of this test is for checking whether the torque converter clutch (TCC) solenoid valve is operating when commanded ON. Faulty circuit(s) or a faulty solenoid valve could be considered if not energizing when commanded ON.

Scan Tool Does Not Power Up

Circuit Description

The data link connector (DLC) is a standardized 16-cavity connector. Connector design and location is dictated by an industry wide standard, and is required to provide the following:

- Scan tool power battery positive voltage at terminal 16
- Scan tool power ground at terminal 4
- Common signal ground at terminal 5

The scan tool will power up with the ignition OFF. Some modules however, will not communicate unless the ignition is ON.

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or TCM Connector End Views

Circuit/ System Testing Scan Tool Does Not Power Up

Step	Action	Value(s)	Yes	No
1	**Important:** Make sure the scan tool works properly on another vehicle before using this chart. 1. Turn OFF the ignition. 2. Inspect the Meter (+B) (10A) fuse in the cabin fuse block. Is the Meter (+B) (10A) fuse open?	—	Go to Step 2	Go to Step 3
2	Replace the Meter (+B) (10A) fuse. If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the Meter (+B) (10A) fuse or replace the shorted attached component. Did you complete the repair?	—	Go to Step 7	—
3	1. Check each circuit at the data link connector (DLC) (B-58) for a backed out, spread or missing terminal. 2. Repair the terminal as necessary. Did you find and complete the repair?	—	Go to Step 7	Go to Step 4
4	Connect a test lamp between the +B circuit (pin 16 of B-58) at the DLC and a known good ground. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 5
5	Repair the open in the battery voltage circuit to the DLC. Did you complete the repair?	—	Go to Step 7	—
6	1. Test each ground circuit at the DLC (pins 4 and 5 of B-58) for an open circuit or high resistance. 2. Repair the circuit(s), clean or tighten ground as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Intermittent Conditions
7	1. Connect the scan tool to the DLC. 2. Attempt to turn ON the scan tool. Does the scan tool ON?	—	System OK	Go to Step 1

Scan Tool Does Not Communicate with Keyword Device

Circuit Description

The TCM, electronic hydraulic control unit (EHCU) [ABS module] and supplemental restraint system (SRS) control module all communicate with the scan tool over the Keyword serial data link.

Diagnostic Aids

The following conditions will cause a loss of Keyword serial data communication between the scan tool and the TCM.

- A Keyword serial data circuit open
- A Keyword serial data circuit shorted to ground
- A Keyword serial data circuit shorted to voltage
- An internal condition within a module or connector on the Keyword serial data circuit, that causes a short to voltage or ground to the Keyword serial data circuit

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or TCM Connector End Views

Circuit/ System Testing Scan Tool Does Not Communicate with Keyward Device

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Attempt to establish communication with the listed control modules. • TCM • Electronic hydraulic control unit (EHCU) [ABS module] (If so equipped) • Supplemental restraint system (SRS) control module (If so equipped) Does the scan tool communicate with any of the listed control modules?	—	Go to Step 3	Go to Step 7
3	Does the scan tool communicate with the TCM?	—	Go to Step 4	Go to Lost Communication with The Transmission Control Module (TCM)
4	**Notice:** If no ABS is installed, skip to Step 5. Does the scan tool communicate with the EHCU?	—	Go to Step 5	Go to Diagnostic System Check - Anti-lock Brake Controls
5	**Notice:** If no SRS is installed, skip to Step 6. Does the scan tool communicate with the SRS control module?	—	Go to Step 6	Go to Diagnostic System Check -SRS Controls
6	Test the Keyword serial data circuit for an intermittently short to ground or intermittently short to voltage. Then, test the Keyword serial data circuit for an intermittently open (based on which control module did not communicate) at the connection in the circuit. Did you find and correct the condition?	—	Go to Step 15	System OK
7	1. Inspect for an intermittent, for a poor connection and for corrosion at the data link connector (DLC) (pin 7 of B-58). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 8

Step	Action	Value(s)	Yes	No
8	1. Turn OFF the ignition. 2. Disconnect the TCM C-94 and C-95 harness connectors. 3. Turn ON the ignition, with the engine OFF. 4. Attempt to communicate with the EHCU and SRS control module. Does the scan tool communicate with the EHCU and SRS control module?	—	Go to Step 12	Go to Step 9
9	**Notice:** If no ABS is installed, skip to Step 10. 1. Turn OFF the ignition. 2. Reconnect the TCM harness connectors. 3. Disconnect the EHCU harness connector. 4. Turn ON the ignition, with the engine OFF. 5. Attempt to communicate with the TCM and SRS control module. Does the scan tool communicate with the TCM and SRS control module?	—	Go to Step 13	Go to Step 10
10	**Notice:** If no SRS is installed, skip to Step 11. 1. Turn OFF the ignition. 2. Reconnect the TCM harness connectors if disconnected. 3. Reconnect the EHCU harness connector if disconnected. 4. Disconnect the SRS control module harness connector. 5. Turn ON the ignition, with the engine OFF. 6. Attempt to communicate with the TCM and EHCU. Does the scan tool communicate with the TCM and EHCU?	—	Go to Step 14	Go to Step 11
11	Repair the short to ground or short to voltage on the Keyword serial data circuit between the DLC and TCM, EHCU and SRS control module. Did you complete the repair?	—	Go to Step 15	—
12	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 15	—
13	Replace the EHCU. Refer to EHCU Replacement. Did you complete the replacement?	—	Go to Step 15	—
14	Replace the SRS control module. Refer to SRS Control Module Replacement. Did you complete the replacement?	—	Go to Step 15	—
15	Attempt to establish communication with the TCM, EHCU and SRS control module. Does the scan tool communicate with the TCM, EHCU and SRS control module?	—	System OK	Go to Step 2

Lost Communication with The Transmission Control Module (TCM)

Circuit Description

The TCM, electronic hydraulic control unit (EHCU) [ABS module] and supplemental restraint system (SRS) control module all communicate with the scan tool over the Keyword serial data link.

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or TCM Connector End Views

Circuit/ System Testing Lost Communication with The Transmission Control Module (TCM)

Step	Action	Action	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	Attempt to establish communication with the TCM. Does the scan tool communicate with the TCM?	—	Go to Intermittent Conditions	Go to Step 3
3	1. Inspect for an intermittent, for poor connections and for corrosion at the TCM C-94 and C-95 harness connectors. 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 4
4	1. Check the TCM (15A) in the cabin fuse block. Replace and retest if open. If any fuse continues to open, repair the short to ground on each circuit fed by that fuse. 2. Turn OFF the ignition. 3. Disconnect the TCM C-95 harness connector. 4. Turn ON the ignition, with the engine OFF. 5. Connect a test lamp to ground and check for voltage at the ignition voltage supply circuit at the TCM (pins 18 and 24 of C-95). Does the test lamp illuminate?	—	Go to Step 6	Go to Step 5
5	Repair the open in the ignition voltage circuit to the TCM. Did you complete the repair?	—	Go to Step 9	—
6	1. Turn OFF the ignition. 2. Disconnect the TCM C-94 harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the TCM (pin 5 of C-94). 4. Test the Keyword serial data circuit between the TCM (pin 5 of C-94) and the DLC (pin 7 of B-58) for an open circuit or high resistance. 5. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 7
7	1. Check TCM ground for corrosion and tightness. 2. Clean or tighten grounds as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 8

Step	Action	Action	Yes	No
8	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 9	—
9	1. Turn OFF the ignition. 2. Reconnect all previously disconnected fuse or harness connector(s). 3. Turn ON the ignition, with the engine OFF. 4. Attempt to establish communication with the TCM. Does the scan tool communicate with the TCM?	—	System OK	Go to Step 3

DTC P0560 (Flash Code 16)

Circuit Description

The TCM monitors the ignition voltage on the ignition feed terminal to make sure that the voltage stays within the proper range. If the TCM detects an excessively low ignition voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine speed is more than 1000 RPM.

Condition for Setting the DTC

- The TCM detects that the ignition voltage feed circuit is less than 10 volts for 1 second.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.

During the vehicle running;

- The TCM holds the last gear position when the diagnostic runs and fails.
- The TCM inhibits lock up control.

After the vehicle stopped;

- The TCM stops all shift solenoid valves and fixes to the 3rd gear. If a fail-safe valve problem is detected, the shift solenoid valves are not stopped but gear is fixed to the 3rd gear.
- The TCM stops PC solenoid valve.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- A charging system problem may set this DTC.
- The weakened battery may set this DTC.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle. 4. Load the electrical system by turning ON the headlights, A/C, etc. while observing the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	Test the charging system. Refer to Diagnosis of The Charging System in the Charging System Section. Did you find a charging system problem?	—	Go to Step 4	Go to Step 5
4	Repair the charging system. Refer to Diagnosis of The Charging System in the Charging System Section. Did you complete the repair?	—	Go to Step 6	—
5	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent, for poor connections and for corrosion at the harness connector of the TCM (pins 5, 18 and 24 of C-95). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Diagnostic Aids

Step	Action	Value(s)	Yes	No
6	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and let idle. 5. Load the electrical system by turning ON the headlights, A/C, etc. while observing the DTC Information with a scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 7
7	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0602

Description

The TCM has the ability to set a diagnostic trouble code (DTC) if it detects that there is no vehicle identification number (VIN) stored. In order for the software to be locked, the mechanization counter used at time of production must be set to zero. If the counter is anything other than zero AND there is no VIN stored, this DTC will set.

Condition for Setting the DTC

- VIN in TCM is not programmed (blank) and TCM is unlocked.

Action Taken When the DTC Sets

- The TCM does not blink the Check Trans lamp.

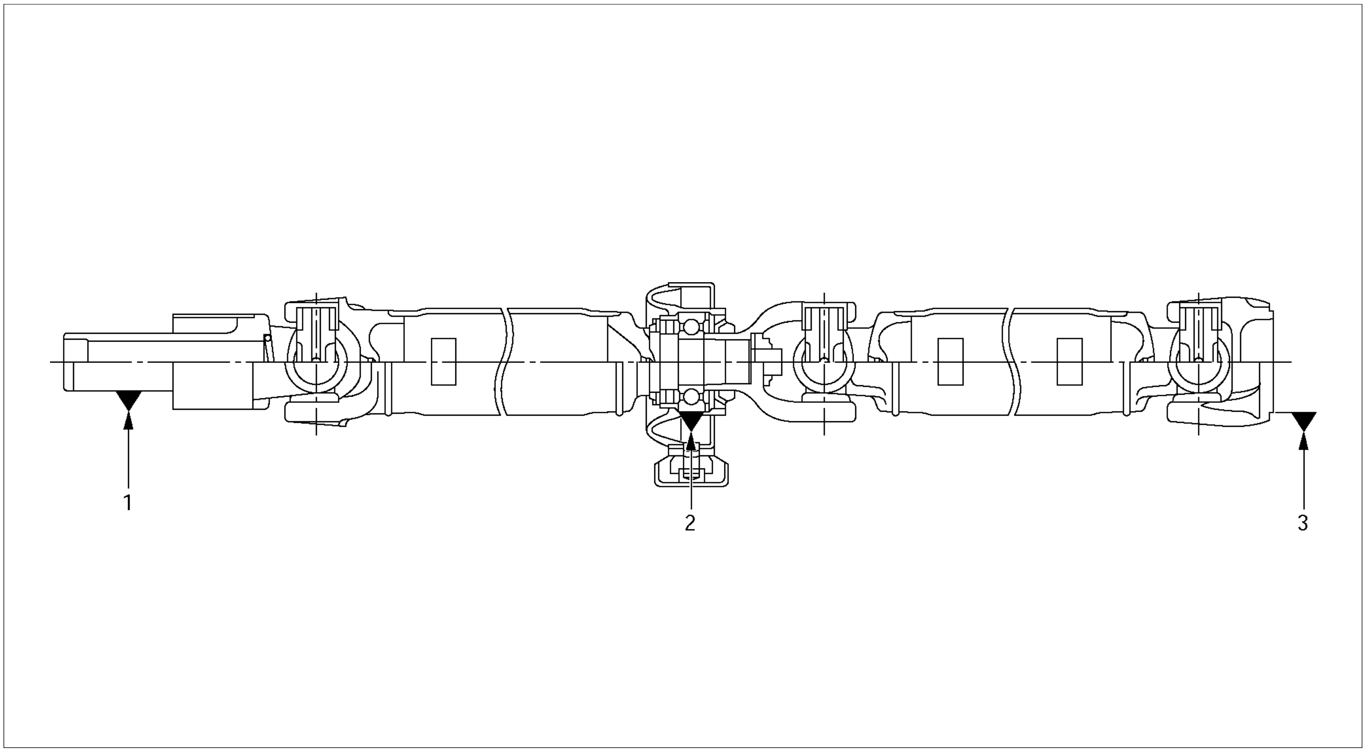
Notice:

- Clear the DTC with a scan tool after programming the VIN.

Circuit/ System Testing DTC P0602

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
3	1. Verify the correct VIN is entered into the TCM with a scan tool. Refer to TCM Replacement. If the VIN is correctly entered, clear the DTC with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. Does the DTC fail this ignition?	—	Go to Step 4	Go to Step 5
4	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 5	—
5	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Propeller Shaft Run-Out



401R300005

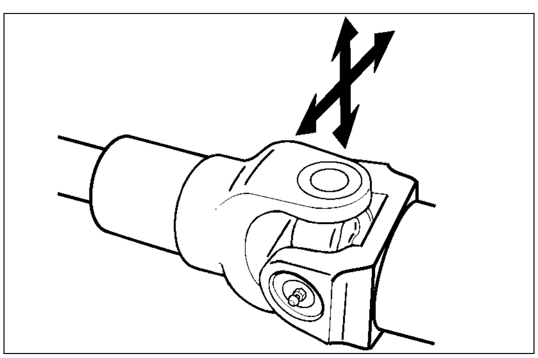
∗Grease fitting are installed to 4x4 vehicles only

Support 1 of splined yoke, 2 of center bearing and 3 of flange yoke and check for static run-out by holding the probe of a dial indicator in contact with the center part of the shaft and turning the propeller shaft.

If the amount of run-out is beyond the limit value, correct with a bench press or replace the shaft with a new one.

mm(in)

Limit	1.0 (0.04)



401R300008

Play in Spider Bearing

(1) Check the spider bearings for wear or damage.

(2) Check the amount of axial and radial play in spider bearing by moving the yoke back and forth on the spider axes and shaft axis.

mm(in)

Limit	0.1 (0.004)

If the limit is exceeded, replace the shaft assembly.

DTC P0705 (Flash Code 17)

Circuit Description

The transmission range (TR) switch is connected to the transmission manual shaft and installed externally to the transmission case. The TR switch relays a signal to the TCM indicating transmission range position by detecting ignition voltage through an internal switch. Only one of the seven internal switches will close for each P, R, N, D, 3, 2 and L position. Normally, the TCM expects to detect one high voltage input for each position. If the TCM detects more than one high voltage input at the same time or no input, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

Either of following condition is met:

- The TCM detects that the TR switch signals are all OFF for 2 seconds when the engine speed is more than 500 RPM.
- The TCM detects that multiple TR switch signals for 1 second.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.

During the vehicle running;

- The TCM holds the last gear position when the diagnostic runs and fails.
- The TCM inhibits lock up control.

After the vehicle stopped;

- The TCM stops all shift solenoid valves and fixes to the 3rd gear. If a fail-safe valve problem is detected, the shift solenoid valves are not stopped but gear is fixed to the 3rd gear.
- The TCM stops PC solenoid valve.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Schematic Reference: Transmission Controls Schematics

Circuit/ System Testing DTC P0705

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Observe the Transmission Range (TR) Switch P, R, N, D, 3, 2 and L parameter with a scan tool while selecting each transmission range. Does the scan tool indicate ON when its position and OFF when other positions?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Check to ensure the TR switch is adjusted correctly. 2. Adjust the TR switch as necessary. Refer to repair instructions (On-Vehicle Service). Did you find and correct the condition?	—	Go to Step 16	Go to Step 4
4	1. Turn OFF the ignition. 2. Disconnect the TR switch harness connector. 3. Turn ON the ignition, with the engine OFF. Does the scan tool indicate all TR Switch parameters OFF?	—	Go to Step 5	Go to Step 11

Step	Action	Value(s)	Yes	No
5	Connect a test lamp between the ignition voltage feed circuit to the TR switch (pin 3 of E-51) and a known good ground. Does the test lamp illuminate?	—	Go to Step 7	Go to Step 6
6	Repair the open circuit or high resistance between the Back Up (15A) fuse and the TR switch (pin 3 of E-51). Check the Back Up (15A) fuse first. Did you complete the repair?	—	Go to Step 16	—
7	Observe the ALL TR Switch parameter with a scan tool while momentarily jumping 3-amp fused jumper wire across the TR switch harness connector. • P range: Between 3 and 2 of E-51 • R range: Between 3 and 4 of E-51 • N range: Between 3 and 8 of E-51 • D range: Between 3 and 5 of E-51 • 3 range: Between 3 and 1 of E-51 • 2 range: Between 3 and 9 of E-51 • L range: Between 3 and 6 of E-51 Does the scan tool indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 8	Go to Step 9
8	Does the scan tool indicate multiple TR switch ON at Step 7?	—	Go to Step 10	Go to Step 12
9	1. Test the TR switch signal circuit (which ever parameter reading did not ON at Step 7) between the TCM and the TR switch for an open circuit or high resistance. • P range: Between 2 of C-94 and 2 of E-51 • R range: Between 19 of C-95 and 4 of E-51 • N range: Between 10 of C-95 and 8 of E-51 • D range: Between 11 of C-95 and 5 of E-51 • 3 range: Between 17 of C-94 and 1 of E-51 • 2 range: Between 2 of C-95 and 9 of E-51 • L range: Between 21 of C-95 and 6 of E-51 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 13

Step	Action	Value(s)	Yes	No
10	Repair the short circuit each other between the TCM and the TR switch (which ever parameter reading multiple TR switch ON at Step 7). • P range: Between 2 of C-94 and 2 of E-51 • R range: Between 19 of C-95 and 4 of E-51 • N range: Between 10 of C-95 and 8 of E-51 • D range: Between 11 of C-95 and 5 of E-51 • 3 range: Between 17 of C-94 and 1 of E-51 • 2 range: Between 2 of C-95 and 9 of E-51 • L range: Between 21 of C-95 and 6 of E-51 Did you complete the repair?	—	Go to Step 16	—
11	1. Test the TR switch signal circuit (which ever parameter reading did not OFF at Step 4) between the TCM and the TR switch for a short to battery or ignition voltage. • P range: Between 2 of C-94 and 2 of E-51 • R range: Between 19 of C-95 and 4 of E-51 • N range: Between 10 of C-95 and 8 of E-51 • D range: Between 11 of C-95 and 5 of E-51 • 3 range: Between 17 of C-94 and 1 of E-51 • 2 range: Between 2 of C-95 and 9 of E-51 • L range: Between 21 of C-95 and 6 of E-51 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15
12	1. Inspect for an intermittent and for poor connections at the harness connector of the TR switch (pins 1, 2, 3, 4, 5, 6, 8 and 9 of E-51). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 14
13	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the TCM (pins 2 and 17 of C-94 and pins 2, 10, 11, 19 and 21 of C-95). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15
14	Replace the TR switch. Refer to repair instructions (On-Vehicle Service). Did you complete the replacement?	—	Go to Step 16	—
15	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 16	—

Step	Action	Value(s)	Yes	No
16	1. Reconnect all previously disconnected fuse, components or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Observe the TR Switch P, R, N, D, 3, 2 and L parameter with a scan tool while selecting each transmission range. Does the scan tool indicate ON when its position and OFF when other positions?	—	Go to Step 17	Go to Step 3
17	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0710 (Flash Code 15)

Circuit Description

The transmission fluid temperature (TFT) sensor is attached to the lower part of the valve body assembly. The TFT sensor is a variable resistor and it measures the temperature of the transmission fluid. The sensor has a signal circuit and a low reference circuit. The TCM supplies 2.5 volts to the signal circuit and a ground for the low reference circuit. When the TFT sensor is cold, the sensor resistance is high. When the transmission fluid temperature increases, the sensor resistance decreases. With high sensor resistance, the TCM detects a high voltage on the signal circuit. With lower sensor resistance, the TCM detects a lower voltage on the signal circuit. If the TCM detects an excessively low or high signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

Either of following condition is met:

- The TCM detects that the TFT sensor signal voltage is less than 0.1 volts (more than 146°C [295°F]) when the selector lever is P or N range for longer than 5 minutes.
- The TCM detects that the TFT sensor signal voltage is more than 2.43 volts (less than -40°C [-40°F]) for 10 seconds when the vehicle speed is more than 20 km/h (12 MPH).

Action Taken When the DTC Sets

- The TCM does not blink the Check Trans lamp.
- The TCM inhibits 4th gear. (If the engine speed is more than 470 PRM for 10 minutes, shifting to 4th gear is allowed.)
- The TCM inhibits lock up control. (If the engine speed is more than 470 RPM for 10 minutes, lock up control is allowed.)
- The TCM uses a TFT substitution of 80°C (176°F) for transmission control.

Condition for Clearing the DTC

- current DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Temperature vs. Resistance table to test the TFT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability (poor shift quality) concerns.

Test Description

The numbers below refer to the step number on the Circuit/ System Testing.

5. If the TFT sensor signal circuit is shorted to ground, A/T Oil Temp lamp turns ON and the TCM switches shift map to the high temperature mode until this DTC is set.

Circuit/ System Testing DTC P0710

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Observe the Transmission Fluid Temperature (TFT) parameter with a scan tool within 5 minutes from the ignition switch is ON. Is the TFT parameter more than the specified value?	146°C (295°F)	Go to Step 4	Go to Step 3
3	Is the TFT parameter less than the specified value at Step 2?	-40°C (-40°F)	Go to Step 7	Go to Diagnostic Aids

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Disconnect the in-line harness connector (E-54) near the transmission range switch. 3. Turn ON the ignition, with the engine OFF. Is the TFT parameter less than the specified value?	-40°C (-40°F)	Go to Step 14	Go to Step 5
5	1. Test the signal circuit between the TCM (pin 4 of C-95) and the in-line harness connector (pin 2 of E-54) for the following conditions: • A short to ground • A short to the low reference circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 6
6	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect connections at the harness connector of the TCM (pins 4 and 14 of C-95) for corrosion. 4. Repair or clean the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17
7	1. Turn OFF the ignition. 2. Disconnect the in-line harness connector (E-54) near the transmission range switch. 3. Connect a DMM between the signal circuit (pin 2 of E-54) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	2.8 volts	Go to Step 8	Go to Step 9
8	**Important:** The TFT sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the TCM (pin 4 of C-95) and the in-line harness connector (pin 2 of E-54) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17
9	Connect a 3-amp fused jumper wire between the signal circuit and the low reference circuit (pins 2 and 8 of E-54). Is the TFT parameter more than the specified value?	146°C (295°F)	Go to Step 13	Go to Step 10
10	Connect a 3-amp fused jumper wire between the signal circuit (pin 2 of E-54) and a known good ground. Is the TFT parameter more than the specified value?	146°C (295°F)	Go to Step 12	Go to Step 11

Step	Action	Value(s)	Yes	No
11	1. Test the signal circuit between the TCM (pin 4 of C-95) and the in-line harness connector (pin 2 of E-54) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 15
12	1. Test the low reference circuit between the TCM (pin 14 of C-95) and the in-line harness connector (pin 8 of E-54) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 15
13	1. Inspect for an intermittent and for poor connections at the in-line harness connector (pins 2 and 8 of E-54). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 14
14	1. Remove the transmission oil pan. Refer to repair instructions (On-Vehicle Service). 2. Test the signal circuit between the TFT sensor and the in-line harness connector (pin 2 of E-54) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • A short to the solenoid valve circuit • High resistance 3. Test the low reference circuit between the TFT sensor and the in-line harness connector (pin 8 of E-54) for an open circuit or high resistance. 4. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 16
15	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the TCM (pins 4 and 14 of C-95). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17
16	Replace the TFT sensor. Refer to repair instructions (On-Vehicle Service). (TFT sensor is part of the harness assembly) Did you complete the replacement?	—	Go to Step 18	—
17	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 18	—

Step	Action	Value(s)	Yes	No
18	1. Reconnect all previously disconnected components or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 19
19	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0717 (Flash Code 14)

Circuit Description

The input shaft speed (ISS) sensor is located on right-hand of the transmission case. The ISS sensor is a hall effect element type sensor, which generates a square wave signal pulse based on the reverse & high clutch drum rotational speed (32 pulses per a rotation of the reverse & high clutch drum). The sensor has the following circuits.

- Ignition voltage feed circuit
- Low reference circuit
- ISS sensor signal circuit

The TCM calculates the turbine speed by the ISS sensor signal, and uses it to calculate torque converter slip speed and gear ratio. If the TCM detects excessively low input shaft speed during the vehicle running, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine speed is more than 1500 RPM.
- The vehicle speed is more than 40 km/h (24 MPH).
- The selector lever is forward range.

Condition for Setting the DTC

- The TCM detects that the input shaft speed is less than 300 RPM for 2 seconds.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.

During the vehicle running;

- The TCM holds the last gear position when the diagnostic runs and fails.
- The TCM inhibits lock up control.

After the vehicle stopped;

- The TCM stops all shift solenoid valves and fixes to the 3rd gear.
- The TCM stops PC solenoid valve.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electromagnetic interference in the ISS sensor circuits may set this DTC.
- An intermittent ISS sensor signal pulse may set this DTC.
- Ensure the ISS sensor is tight.

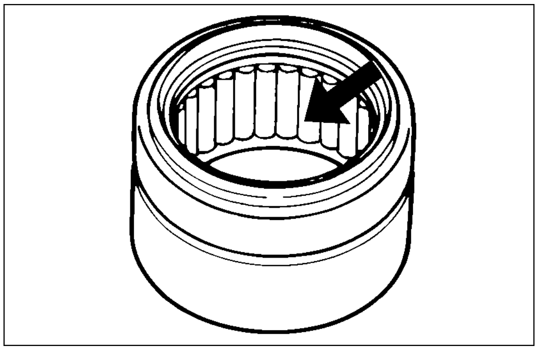
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Lift the driving wheels or drive the vehicle. 4. Operate the vehicle within the Conditions for Running the DTC. 5. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the input shaft speed (ISS) sensor harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the ignition voltage feed circuit (pin 2 of E-31) and a known good ground. Does the test lamp illuminate?	—	Go to Step 4	Go to Step 6

Step	Action	Value(s)	Yes	No
4	Intermittently jump the signal circuit (pin 1 of E-31) with a test lamp that is connected to a known good ground while observing the AT Input Speed parameter with a scan tool. Does the scan tool indicate any AT input speed when the circuit is intermittently pulled to ground?	—	Go to Step 5	Go to Step 8
5	Connect a test lamp between the ignition voltage feed circuit and the low reference circuit (pins 2 and 3 of E-31). Does the test lamp illuminate?	—	Go to Step 9	Go to Step 7
6	Repair the open circuit or high resistance between the Back Up (15A) fuse and the ISS sensor (pin 2 of E-31). Check the Back Up (15A) fuse first. Did you complete the repair?	—	Go to Step 14	—
7	Repair the open circuit or high resistance on the low reference circuit between the ISS sensor (pin 3 of E-31) and the engine ground terminal (E-10). Clean or tighten ground as necessary. Did you complete the repair?	—	Go to Step 14	—
8	1. Test the signal circuit between the TCM (pin 3 of C-95) and the ISS sensor (pin 1 of E-31) for the following conditions • An open circuit • A short to ground • A short to the low reference • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 10
9	1. Inspect for an intermittent and for poor connections at the harness connector of the ISS sensor (pin 1, 2 and 3 of E-31). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the TCM (pin 3 of C-95). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13



401RS011

Universal Joint Reassembly

1. Set the propeller shafts.

- Be sure to set the propeller shaft yoke by aligning the setting marks made during disassembly.

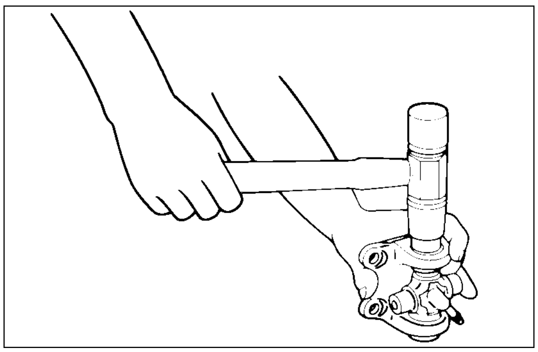
2. Spider

- Be sure to install the spider by aligning the setting marks made during disassembly.

3. Needle Roller Bearing

1) Apply a molybdenum-disulfide grease or a multi-purpose. type grease NLGI No.2 to inside of the bearing cap.

Grease Amount g(oz)
Approx. 1.2 (0.042)

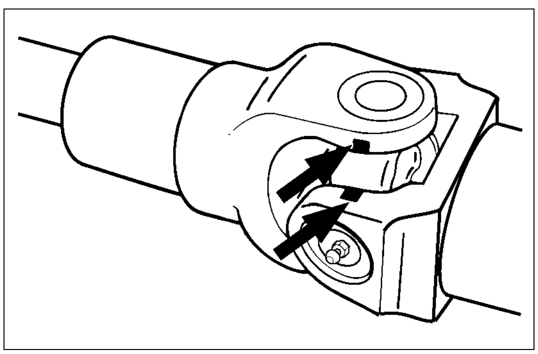


401RS012

2) Using either a mallet (or copper hammer) or a press, install the needle roller bearing into the yoke so that snap ring can be installed in its groove.

CAUTION:

- **The needle roller bearing cannot be installed smoothly if it is set at an incorrect angle with the flange.**
- **Excessive hammering will damage the needle roller bearing.**



401R300003

3) Align setting marks and join the yokes.

NOTE:
Assemble the spider and spline yoke so that their grease fittings are arranged on the same side.(4×4)

4. Snap ring

NOTE:
Discard used snap rings and install new ones.

When the bearing cap is in position, select and attach a snap ring of suitable thickness so that the end play of the spider pin is held within 0.1mm (0.004in).

mm(in)

Snap ring thickness	Identification color
1.50 (0.059)	Light Blue
1.53 (0.060)	White
1.56 (0.061)	Pink
1.59 (0.063)	Yellow
1.62 (0.064)	Green
1.65 (0.065)	Brown
1.68 (0.066)	Not colored

NOTE:
Be sure to use snap rings of the same thickness on both sides.

Step	Action	Value(s)	Yes	No
11	1. Inspect the ISS sensor and the reverse & high clutch drum for the following conditions: • Physical damage of sensor • Loose or improper installation of sensor • Excessive air gap • Foreign material passing between sensor and reverse & high clutch drum • Physical damage of reverse & high clutch drum 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 12
12	Replace the ISS sensor. Refer to repair instructions (On-Vehicle Service). Did you complete the replacement?	—	Go to Step 14	—
13	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 14	—
14	1. Reconnect all previously disconnected fuse, components or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 15
15	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0722 (Flash Code 11)

Circuit Description

The output shaft speed (OSS) sensor is located on right-hand of the transmission case near the transmission range switch. The OSS sensor is a hall effect element type sensor, which generates a square wave signal pulse based on the parking gear rotational speed that is connected to output shaft (16 pulses per a rotation of the parking gear). The sensor has the following circuits.

- Ignition voltage feed circuit
- Low reference circuit
- OSS sensor signal circuit

The TCM calculates the vehicle speed by the OSS sensor signal, and uses it to determine appropriate shift points and calculate gear ratio. The 2WD vehicle outputs the vehicle speed signal from the TCM to the engine control module (ECM) and the vehicle speed meter via output signal line. If the TCM detects excessively low output shaft speed during the vehicle running, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The input shaft speed is more than 1000 RPM.
- The selector lever is forward range for longer than 25 seconds.

Condition for Setting the DTC

- The TCM detects that the vehicle speed is less than 5 km/h (3 MPH) for 5 seconds.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.

During the vehicle running;

- The TCM holds the last gear position when the diagnostic runs and fails.
- The TCM inhibits lock up control.

After the vehicle stopped;

- The TCM stops all shift solenoid valves and fixes to the 3rd gear. If a fail-safe valve problem is detected, the shift solenoid valves are not stopped but gear is fixed to the 3rd gear.
- The TCM stops PC solenoid valve.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electromagnetic interference in the OSS sensor circuits may set this DTC.
- An intermittent OSS sensor signal pulse may set this DTC.
- Ensure the OSS sensor is tight.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	Drive the vehicle while observing the Vehicle Speed parameter with a scan tool. Does the scan tool indicate correct vehicle speed?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the output shaft speed (OSS) sensor harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the ignition voltage feed circuit (pin 2 of E-30) and a known good ground. Does the test lamp illuminate?	—	Go to Step 4	Go to Step 6

Step	Action	Value(s)	Yes	No
4	Intermittently jump the signal circuit (pin 1 of E-30) with a test lamp that is connected to a known good ground while observing the AT Output Speed or Vehicle Speed parameter with a scan tool. Does the scan tool indicate any AT output speed or vehicle speed when the circuit is intermittently pulled to ground?	—	Go to Step 5	Go to Step 8
5	Connect a test lamp between the ignition voltage feed circuit and the low reference circuit (pins 2 and 3 of E-30). Does the test lamp illuminate?	—	Go to Step 9	Go to Step 7
6	Repair the open circuit or high resistance between the TCM (15A) fuse and the OSS sensor (pin 2 of E-30). Did you complete the repair?	—	Go to Step 14	—
7	Repair the open circuit or high resistance on the low reference circuit between the OSS sensor (pin 3 of E-30) and the engine ground terminal (E-10). Clean or tighten ground as necessary. Did you complete the repair?	—	Go to Step 14	—
8	1. Test the signal circuit between the TCM (pin 13 of C-95) and the OSS sensor (pin 1 of E-30) for the following conditions: • An open circuit • A short to ground • A short to the low reference • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 10
9	1. Inspect for an intermittent and for poor connections at the harness connector of the OSS sensor (pin 1, 2 and 3 of E-30). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the TCM (pin 13 of C-95). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13

Step	Action	Value(s)	Yes	No
11	1. Inspect the OSS sensor and the parking gear for the following conditions: • Physical damage of sensor • Loose or improper installation of sensor • Excessive air gap • Foreign material passing between sensor and parking gear • Physical damage of parking gear 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 12
12	Replace the OSS sensor. Refer to repair instructions (On-Vehicle Service). Did you complete the replacement?	—	Go to Step 14	—
13	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 14	—
14	1. Reconnect all previously disconnected components or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Drive the vehicle while observing the Vehicle Speed parameter with a scan tool. Does the scan tool indicate correct vehicle speed?	—	Go to Step 15	Go to Step 3
15	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0727 (Flash Code 13)

Circuit Description

The engine speed signal to the TCM is sent from the engine control module (ECM) via a signal circuit based on inputs from the crankshaft position (CKP) sensor and camshaft position (CMP) sensor. If the TCM detects no engine speed signal from the ECM during the vehicle running, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The vehicle speed is more than 40 km/h (24 MPH).

Condition for Setting the DTC

- The TCM detects that the engine speed signal pulses from the ECM are not being received for 2 seconds.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.
- The TCM inhibits lock up control.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Circuit/ System Testing DTC P0727

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. If the engine does not start, crank over the engine for 10 seconds. 4. Monitor the ENGINE DTC Information with a scan tool. Is DTC P0335, P0336, P0340 or P0341 set?	—	Go to Applicable DTC in engine control section	Go to Step 3
3	Observe the Engine Speed parameter in the transmission data display with a scan tool. Does the scan tool indicate correct engine speed?	—	Go to Diagnostic Aids	Go to Step 4
4	1. Turn OFF the ignition. 2. Disconnect the engine control module (ECM) harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Intermittently jump the signal circuit (pin 33 of C-58) with a test lamp that is connected to a known good ground while observing the Engine Speed parameter with a scan tool. Does the scan tool indicate any engine speed when the circuit is intermittently pulled to ground?	—	Go to Step 7	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Test the signal circuit between the ECM (33 of C-58) and the TCM (7 of C-94) for the following conditions: • An open circuit • A short to ground • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 6
6	1. Turn OFF the ignition. 2. Inspect for an intermittent and for a poor connection at the harness connector of the TCM (pin 7 of C-94). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
7	1. Turn OFF the ignition. 2. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 33 of C-58). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 9
8	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 10	—
9	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 10	—
10	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Observe the Engine Speed parameter with a scan tool. Does the scan tool indicate correct engine speed?	—	Go to Step 11	Go to Step 4
11	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0731, P0732, P0733 or P0734 (Flash Code 41, 42, 43 or 44)

Circuit Description

The TCM calculates the gear ratio based on the input shaft speed signal from the input shaft speed (ISS) sensor and the output speed signal from the output shaft speed (OSS) sensor. The TCM compares the known transmission gear ratio to the calculated ratio for the selected gear ranges. If the TCM detects an unknown transmission gear ratio two consecutive driving cycles, this DTC will set.

Condition for Running the DTC

- Other than DTCs P0731, P0732, P0733 and P0734 are not set.
- The ignition switch is ON.
- The transmission fluid temperature is more than 60°C (140°F).
- The input shaft speed is more than 1000 RPM.
- The vehicle speed is more than 10 km/h (6 MPH).
- The selector lever is forward range for longer than 2 seconds.
- The TCM is not under gearshift control.

Condition for Setting the DTC

- The TCM detects that the output shaft speed is more than 500 RPM over the calculated speed (based on the input shaft speed and the gear ratio) for 7 seconds after each gearshift has completed.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp on the second consecutive driving cycle when the diagnostic runs and fails.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electromagnetic interference in the ISS sensor or OSS sensor circuits may set this DTC.
- An intermittent ISS sensor or OSS sensor signal pulse may set this DTC.
- Ensure the ISS sensor and OSS sensor is tight.
- Use the Clutch, Brake, Solenoid and Pressure Switch Logic table to verify each component works properly within the selected gear range.
- A transmission mechanical problem will cause this DTC to set.
- Sticking or contamination of shift valves may cause intermittent incorrect gear ratios.
- If multiple incorrect gear ratio codes are set, problem in fluid pressure, low ATF level, plugged filter or oil pump problem may exist.

Notice:

- Each DTC agrees with the following gear positions.
  - P0731: 1st gear
  - P0732: 2nd gear
  - P0733: 3rd gear
  - P0734: 4th gear

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or TCM Connector End Views

Circuit/ System Testing DTC P0731, P0732, P0733 or P0734

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	Perform the ATF level check. Refer to repair instructions (On-Vehicle Service). Did you perform the ATF level check?	—	Go to Step 3	Go to Transmission Fluid Checking Procedure
3	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Drive the vehicle while observing the DTC Information with a scan tool. Is there any DTCs set other than P0731, P0732, P0733 or P0734?	—	Refer to Applicable DTC	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Inspect all of the circuits going to the input shaft speed (ISS) sensor and the output shaft speed (OSS) sensor for the following conditions: • Routed too closely to fuel injection wiring or components • Routed too closely to after-market add-on electrical equipment • Routed too closely to solenoids and relays 2. If you find incorrect routing, correct the harness routing. Did you find and correct the condition?	—	Go to Step 13	Go to Step 5
5	1. Disconnect the ISS sensor and the OSS sensor harness connector. 2. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ISS sensor (pins 1, 2 and 3 of E-31) and the OSS sensor (pins 1,2 and 3 of E-30). 3. Disconnect the TCM harness connector. 4. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the TCM (pins 3 and 13 of C-95). 5. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 6
6	1. Inspect the ISS sensor and the OSS sensor for the following conditions: • Physical damage of sensor • Loose or improper installation of sensor • Excessive air gap • Foreign material passing between ISS sensor and reverse & high clutch drum • Foreign material passing between OSS sensor and parking gear • Physical damage of reverse & high clutch drum or parking gear 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 7
7	1. Place the selector lever in D range. 2. Observe the Low & Reverse Brake Pressure Switch, 2-4 Brake Pressure Switch and High Clutch Pressure Switch parameter with a scan tool. Refer to Clutch, Brake, Solenoid and Pressure Switch Logic table. Does the each transmission fluid pressure (TFP) switch display match each selected gear range?	—	Go to Step 8	Refer to DTC P1853, P1858 or P1863
8	Perform the line pressure test. Refer to Line Pressure Test. Is the line pressure within specifications for each selected gear range?	—	Go to Step 9	Refer to appropriate instructions in the Line Pressure Test

Step	Action	Value(s)	Yes	No
9	1. Remove the transmission oil pan. Refer to repair instruction (On-Vehicle Service). 2. Inspect the oil pan and the fluid for contamination. Was excessive contamination found?	—	Replace the transmission fluid and filter and Go to Step 10	Go to Step 11
10	Drive the vehicle while observing the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 11	Go to Step 13
11	1. Remove the all shift solenoid valve and all TFP switch from the valve body assembly and perform function check. Refer to repair instructions (On-Vehicle Service). 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
12	Repair or replace the valve body assembly/ clutches or brakes (On-Vehicle Service or Unit Repair). Did you complete the repair or replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected components or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Drive the vehicle while observing the DTC Information with a scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 14
14	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0748 (Flash Code 35)

Circuit Description

The pressure control (PC) solenoid valve is installed to the lower part of the valve body assembly. It controls the transmission fluid supply to the pressure regulator spool valve in the valve body. The TCM controls the solenoid valve by ON/ OFF signal based on the vehicle running conditions. The TCM turns ON the solenoid valve when a lower line pressure is required and turns OFF when a higher line pressure is required. With the operation of this solenoid valve, the operation and shift of the hydraulic circuit in the transmission can be performed smoothly. The PC solenoid valve is controlled according to the range position, speed sensor signals, transmission fluid temperature signal and the accelerator pedal position signal. The TCM monitors the PC solenoid valve operating status through the feedback circuit. If the TCM detects an improper voltage level on the control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The TCM detects an open circuit or short circuit on the PC solenoid valve control circuit.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.
- The TCM stops PC solenoid valve.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail at next ignition cycle.
- A current DTC clears when the diagnostic runs and does not fail at next ignition cycle.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

13	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0753 (Flash Code 31)

Circuit Description

The low & reverse brake solenoid valve controls fluid acting on spool valves in the low & reverse brake hydraulic circuits, which then controls low & reverse brake apply and release. The solenoid valve is installed to the lower part of the valve body assembly. The TCM controls the solenoid valve by a duty cycle (pulse width modulation [PWM]) signal based on the commanded gear position. The solenoid valve provides a smooth gearshift by operating on a duty cycle percentage of ON time. The TCM monitors the low & reverse brake solenoid valve operating status through the feedback circuit. If the TCM detects an improper voltage level on the control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The TCM detects an open circuit or short circuit on the low & reverse brake solenoid valve control circuit.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.

During the vehicle running;

- The TCM holds the last gear position when the diagnostic runs and fails.
- The TCM stops low & reverse brake solenoid valve.
- The TCM inhibits lock up control.

After the vehicle stopped;

- The TCM stops all shift solenoid valves and fixes to the 3rd gear. If a fail-safe valve problem is detected, the shift solenoid valves are not stopped but gear is fixed to the 3rd gear.
- The TCM stops PC solenoid valve.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail at next ignition cycle.
- A current DTC clears when the diagnostic runs and does not fail at next ignition cycle.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Clutch, Brake, Solenoid and Pressure Switch Logic table to verify each component works properly within the selected gear range.

2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Lift the driving wheels or drive the vehicle while observing the DTC Information with a scan tool. Is DTC P1875 also set?	—	Go to DTC P1875	Go to Step 3
3	1. Park the vehicle. 2. Turn ON the ignition, with the engine OFF. 3. Perform the Low & Reverse Brake Solenoid control with a scan tool. 4. Command the solenoid valve ON and OFF. Does the low & reverse brake solenoid valve click with each command?	—	Go to Diagnostic Aids	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Disconnect the in-line harness connector (E-54) near the transmission range switch. 3. Connect a test lamp between the control circuit (pin 5 of E-54 female side) and a known good ground. 4. Turn ON the ignition, with the engine OFF. 5. Perform the Low & Reverse Brake Solenoid control with a scan tool. 6. Command the solenoid valve ON and OFF. Does the test lamp turn ON and OFF with each command?	—	Go to Step 9	Go to Step 5
5	Does the test lamp remain illuminated with each command?	—	Go to Step 6	Go to Step 7
6	1. Test the control circuit between the TCM (pin 6 of C-95) and the in-line harness connector (pin 5 of E-54 female side) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
7	1. Test the control circuit between the TCM (pin 6 of C-95) and the in-line harness connector (pin 5 of E-54 female side) for the following conditions: • An open circuit • A short to ground • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 8
8	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the TCM (pin 6 of C-95). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
9	1. Inspect for an intermittent and for a poor connection at the in-line harness connector (pin 5 of E-54). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10

Step	Action	Value(s)	Yes	No
10	1. Remove the transmission oil pan. Refer to repair instructions (On-Vehicle Service). 2. Inspect the low & reverse brake solenoid valve for the following conditions: • Physical damage of solenoid valve • Loose or improper installation of solenoid valve 3. Inspect for an intermittent and for a poor connection at the harness connector of the low & reverse brake solenoid valve or in-line harness connector. 4. Inspect for an intermittent and for a poor connection of ground wire. 5. Test the control circuit between the low & reverse brake solenoid valve and the in-line harness connector (pin 5 of E-54 male side) for the following conditions: • An open circuit • A short to ground • A short to the other solenoid valve circuit • High resistance 6. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
11	Replace the low & reverse brake solenoid valve. Refer to repair instructions (On-Vehicle Service). Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected components or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Lift the driving wheels or drive the vehicle while observing the DTC Information with a scan tool. Did the DTC fail this ignition?	—	Go to Step 4	Go to Step 14
14	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0758 (Flash Code 32)

Circuit Description

The 2-4 brake solenoid valve controls fluid acting on spool valves in the 2-4 brake hydraulic circuits, which then controls 2-4 brake apply and release. The solenoid valve is installed to the lower part of the valve body assembly. The TCM controls the solenoid valve by a duty cycle (pulse width modulation [PWM]) signal based on the commanded gear position. The solenoid valve provides a smooth gearshift by operating on a duty cycle percentage of ON time. The TCM monitors the 2-4 brake solenoid valve operating status through the feedback circuit. If the TCM detects an improper voltage level on the control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The TCM detects an open circuit or short circuit on the 2-4 brake solenoid valve control circuit.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.

During the vehicle running;

- The TCM holds the last gear position when the diagnostic runs and fails.
- The TCM stops 2-4 brake solenoid valve.
- The TCM inhibits lock up control.

After the vehicle stopped;

- The TCM stops all shift solenoid valves and fixes to the 3rd gear. If a fail-safe valve problem is detected, the shift solenoid valves are not stopped but gear is fixed to the 3rd gear.
- The TCM stops PC solenoid valve.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail at next ignition cycle.
- A current DTC clears when the diagnostic runs and does not fail at next ignition cycle.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Clutch, Brake, Solenoid and Pressure Switch Logic table to verify each component works properly within the selected gear range.

Lift the driving wheels or drive the vehicle while observing the DTC Information with a scan tool. Did the DTC fail this ignition?	—	Go to Step 4	Go to Step 14
14	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0763 (Flash Code 33)

Circuit Description

The high clutch solenoid valve controls fluid acting on spool valves in the high clutch hydraulic circuits, which then controls high clutch apply and release. The solenoid valve is installed to the lower part of the valve body assembly. The TCM controls the solenoid valve by a duty cycle (pulse width modulation [PWM]) signal based on the commanded gear position. The solenoid valve provides a smooth gearshift by operating on a duty cycle percentage of ON time. The TCM monitors the high clutch solenoid valve operating status through the feedback circuit. If the TCM detects an improper voltage level on the control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The TCM detects an open circuit or short circuit on the high clutch solenoid valve control circuit.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.

During the vehicle running;

- The TCM holds the last gear position when the diagnostic runs and fails.
- The TCM stops high clutch solenoid valve.
- The TCM inhibits lock up control.

After the vehicle stopped;

- The TCM stops all shift solenoid valves and fixes to the 3rd gear. If a fail-safe valve problem is detected, the shift solenoid valves are not stopped but gear is fixed to the 3rd gear.
- The TCM stops PC solenoid valve.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail at next ignition cycle.
- A current DTC clears when the diagnostic runs and does not fail at next ignition cycle.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Clutch, Brake, Solenoid and Pressure Switch Logic table to verify each component works properly within the selected gear range.

Circuit/ System Testing DTC P0763

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Lift the driving wheels or drive the vehicle while observing the DTC Information with a scan tool. Is DTC P1875 also set?	—	Go to DTC P1875	Go to Step 3
3	1. Park the vehicle. 2. Turn ON the ignition, with the engine OFF. 3. Perform the High Clutch Solenoid control with a scan tool. 4. Command the solenoid valve ON and OFF. Does the high clutch solenoid valve click with each command?	—	Go to Diagnostic Aids	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Disconnect the in-line harness connector (E-54) near the transmission range switch. 3. Connect a test lamp between the control circuit (pin 10 of E-54 female side) and a known good ground. 4. Turn ON the ignition, with the engine OFF. 5. Perform the High Clutch Solenoid control with a scan tool. 6. Command the solenoid valve ON and OFF. Does the test lamp turn ON and OFF with each command?	—	Go to Step 9	Go to Step 5
5	Does the test lamp remain illuminated with each command?	—	Go to Step 6	Go to Step 7
6	1. Test the control circuit between the TCM (pin 8 of C-95) and the in-line harness connector (pin 10 of E-54 female side) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
7	1. Test the control circuit between the TCM (pin 8 of C-95) and the in-line harness connector (pin 10 of E-54 female side) for the following conditions: • An open circuit • A short to ground • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 8
8	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the TCM (pin 8 of C-95). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
9	1. Inspect for an intermittent and for a poor connection at the in-line harness connector (pin 10 of E-54). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10

Disassembly

1. Disassembly the three portions of the journal assemblies.
2. Remove the splined yoke, the 1st tube assembly with center bearing, the 2nd tube assembly and the flange yoke.
3. Remove the lock nut.
4. Remove the center yoke, the plain washer the center bearing and the 1st tube assembly.

Reassembly

1. Install the center bearing on the 1st tube assembly.

Clean the bearing fitting face.

Repack the grease.

Amount of grease required g(oz)	Approx. 12 (0.42)

2. Install the plain washer and the center yoke.
3. Install the lock nut and tighten it to the specified torque.
   Lock nut Torque : 118 N·m (12.0 kgf·m/87lb·ft)

(1) Discard the flange nut and install a new one.

(2) Stake the outer face of the flange nut against the slot in the shaft.

4. Install the splined yoke, the 1st tube assembly with center bearing, the 2nd tube assembly and the flange yoke by assembling the universal joint.

Step	Action	Value(s)	Yes	No
10	1. Remove the transmission oil pan. Refer to repair instructions (On-Vehicle Service). 2. Inspect the high clutch solenoid valve for the following conditions: • Physical damage of solenoid valve • Loose or improper installation of solenoid valve 3. Inspect for an intermittent and for a poor connection at the harness connector of the high clutch solenoid valve or in-line harness connector. 4. Inspect for an intermittent and for a poor connection of ground wire. 5. Test the control circuit between the high clutch solenoid valve and the in-line harness connector (pin 10 of E-54 male side) for the following conditions: • An open circuit • A short to ground • A short to the other solenoid valve circuit • High resistance 6. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
11	Replace the high clutch solenoid valve. Refer to repair instructions (On-Vehicle Service). Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected components or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Lift the driving wheels or drive the vehicle while observing the DTC Information with a scan tool. Did the DTC fail this ignition?	—	Go to Step 4	Go to Step 14
14	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0768 (Flash Code 34)

Circuit Description

The low clutch solenoid valve controls fluid acting on spool valves in the low clutch hydraulic circuits, which then controls low clutch apply and release. The solenoid valve is installed to the lower part of the valve body assembly. The TCM controls the solenoid valve by a duty cycle (pulse width modulation [PWM]) signal based on the commanded gear position. The solenoid valve provides a smooth gearshift by operating on a duty cycle percentage of ON time. The TCM monitors the low clutch solenoid valve operating status through the feedback circuit. If the TCM detects an improper voltage level on the control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The TCM detects an open circuit or short circuit on the low clutch solenoid valve control circuit.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.

During the vehicle running;

- The TCM holds the last gear position when the diagnostic runs and fails.
- The TCM stops low clutch solenoid valve.
- The TCM inhibits lock up control.

After the vehicle stopped;

- The TCM stops all shift solenoid valves and fixes to the 3rd gear. If a fail-safe valve problem is detected, the shift solenoid valves are not stopped but gear is fixed to the 3rd gear.
- The TCM stops PC solenoid valve.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail at next ignition cycle.
- A current DTC clears when the diagnostic runs and does not fail at next ignition cycle.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Clutch, Brake, Solenoid and Pressure Switch Logic table to verify each component works properly within the selected gear range.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Lift the driving wheels or drive the vehicle while observing the DTC Information with a scan tool. Is DTC P1875 also set?	—	Go to DTC P1875	Go to Step 3
3	1. Park the vehicle. 2. Turn ON the ignition, with the engine OFF. 3. Perform the Low Clutch Solenoid control with a scan tool. 4. Command the solenoid valve ON and OFF. Does the low clutch solenoid valve click with each command?	—	Go to Diagnostic Aids	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Disconnect the in-line harness connector (E-54) near the transmission range switch. 3. Connect a test lamp between the control circuit (pin 3 of E-54 female side) and a known good ground. 4. Turn ON the ignition, with the engine OFF. 5. Perform the Low Clutch Solenoid control with a scan tool. 6. Command the solenoid valve ON and OFF. Does the test lamp turn ON and OFF with each command?	—	Go to Step 9	Go to Step 5
5	Does the test lamp remain illuminated with each command?	—	Go to Step 6	Go to Step 7
6	1. Test the control circuit between the TCM (pin 9 of C-95) and the in-line harness connector (pin 3 of E-54 female side) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
7	1. Test the control circuit between the TCM (pin 9 of C-95) and the in-line harness connector (pin 3 of E-54 female side) for the following conditions: • An open circuit • A short to ground • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 8
8	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the TCM (pin 9 of C-95). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
9	1. Inspect for an intermittent and for a poor connection at the in-line harness connector (pin 3 of E-54). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10

Step	Action	Value(s)	Yes	No
10	1. Remove the transmission oil pan. Refer to repair instructions (On-Vehicle Service). 2. Inspect the low clutch solenoid valve for the following conditions: • Physical damage of solenoid valve • Loose or improper installation of solenoid valve 3. Inspect for an intermittent and for a poor connection at the harness connector of the low clutch solenoid valve or in-line harness connector. 4. Inspect for an intermittent and for a poor connection of ground wire. 5. Test the control circuit between the low clutch solenoid valve and the in-line harness connector (pin 3 of E-54 male side) for the following conditions: • An open circuit • A short to ground • A short to the other solenoid valve circuit • High resistance 6. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
11	Replace the low clutch solenoid valve. Refer to repair instructions (On-Vehicle Service). Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected components or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Lift the driving wheels or drive the vehicle while observing the DTC Information with a scan tool. Did the DTC fail this ignition?	—	Go to Step 4	Go to Step 14
14	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P1120 (Flash Code 22)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal control assembly. The analogue APP signals are converted by the engine control module (ECM) into a pulse width modulation (PWM) signal. This converted signal is continually sent from the ECM to the TCM to determine appropriate shift points depending on the accelerator pedal pressing amount. If the TCM fails to receive a PWM signal from the ECM, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The TCM detects that the APP PWM signal from the ECM is not being received.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.

During the vehicle running;

- The TCM holds the last gear position when the diagnostic runs and fails.
- The TCM inhibits lock up control.

After the vehicle stopped;

- The TCM stops all shift solenoid valves and fixes to the 3rd gear. If a fail-safe valve problem is detected, the shift solenoid valves are not stopped but gear is fixed to the 3rd gear.
- The TCM stops PC solenoid valve.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Circuit/ System Testing DTC P1120

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the ENGINE DTC Information with a scan tool. Is DTC P2621 or P2622 set?	—	Go to Applicable DTC in engine control section	Go to Diagnostic Aids

DTC P1750 (Flash Code 51)

Circuit Description

The low & reverse brake transmission fluid pressure (TFP) switch is installed to the lower part of the valve body assembly and it feedbacks fluid pressure in the low & reverse brake hydraulic circuit. The low & reverse brake fail-safe spool valves are installed to the control valve body assembly and it uses to prevent interlocking of clutches and brakes. When the solenoid valve is energized, fluid pressure is drained to disengage the low & reverse brake and the TFP switch is OFF. When the solenoid valve is not energized, fluid pressure is applied to engage the low & reverse brake and the TFP switch is ON. The TCM monitors the low & reverse brake TFP switch ON/ OFF status through the signal circuit. If the TCM detects an improper status on the signal circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The TCM detects that the low & reverse brake TFP switch signal repeats OFF/ ON twice when the selector lever in forward range with the 2nd, 3rd or 4th gear.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.

During the vehicle running;

- The TCM holds the last gear position when the diagnostic runs and fails.
- The TCM inhibits lock up control.

After the vehicle stopped;

- The TCM fixes to the 3rd gear.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail at next ignition cycle.
- A current DTC clears when the diagnostic runs and does not fail at next ignition cycle.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Clutch, Brake, Solenoid and Pressure Switch Logic table to verify each component works properly within the selected gear range.
- A sticking or intermittently sticking the low & reverse brake solenoid valve will cause this DTC to set.

1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Lift the driving wheels or drive the vehicle while observing the DTC Information with a scan tool. Is DTC P0753 or P1853 also set?	—	Go to Applicable DTC	Go to Step 3
3	Place the selector lever in forward range while observing the Low & Reverse Brake Pressure Switch parameter with a scan tool. Does the Low & Reverse Brake Pressure Switch parameter ever indicate ON when gear is shifted between 1st and 4th?	—	Go to Step 4	Go to Diagnostic Aids

Step	Action	Value(s)	Yes	No
4	1. Remove the transmission oil pan. Refer to repair instructions (On-Vehicle Service). 2. Inspect the low & reverse brake solenoid valve and transmission fluid pressure (TFP) switch for the following conditions: • Physical damage • Loose or improper installation 3. Test the signal circuit between the low & reverse brake TFP switch and the in-line harness connector (pin 12 of E-54 male side) for a short to ground. 4. Repair the circuit(s) or replace as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 5
5	1. Remove the low & reverse brake solenoid valve and TFP switch from the valve body assembly and perform function check. Refer to repair instructions (On-Vehicle Service). 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
6	Repair or replace the valve body assembly. Refer to repair instructions (On-Vehicle Service or Unit Repair). Did you complete the repair or replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected components or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Drive the vehicle while observing the DTC Information with a scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 8
8	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P1755 (Flash Code 52)

Circuit Description

The 2-4 brake transmission fluid pressure (TFP) switch is installed to the lower part of the valve body assembly and it feedbacks fluid pressure in the 2-4 brake hydraulic circuit. The low & reverse brake fail-safe spool valves are installed to the control valve body assembly and it uses to prevent interlocking of clutches and brakes. When the solenoid valve is energized, fluid pressure is drained to disengage the 2-4 brake and the TFP switch is OFF. When the solenoid valve is not energized, fluid pressure is applied to engage the 2-4 brake and the TFP switch is ON. The TCM monitors the 2-4 brake TFP switch ON/ OFF status through the signal circuit. If the TCM detects an improper status on the signal circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The TCM detects that the 2-4 brake TFP switch signal repeats OFF/ ON twice when the selector lever in forward range with the 3rd gear.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.

During the vehicle running;

- The TCM holds the last gear position when the diagnostic runs and fails.
- The TCM inhibits lock up control.

After the vehicle stopped;

- The TCM fixes to the 3rd gear.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail at next ignition cycle.
- A current DTC clears when the diagnostic runs and does not fail at next ignition cycle.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Clutch, Brake, Solenoid and Pressure Switch Logic table to verify each component works properly within the selected gear range.
- A sticking or intermittently sticking the 2-4 brake solenoid valve will cause this DTC to set.

Circuit/ System Testing DTC P1755

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Lift the driving wheels or drive the vehicle while observing the DTC Information with a scan tool. Is DTC P0758or P1858 also set?	—	Go to Applicable DTC	Go to Step 3
3	Place the selector lever in forward range while observing the 2-4 Brake Pressure Switch parameter with a scan tool. Does the 2-4 Brake Pressure Switch parameter ever indicate ON when gear is positioned 1st and 3rd?	—	Go to Step 4	Go to Diagnostic Aids

Step	Action	Value(s)	Yes	No
4	1. Remove the transmission oil pan. Refer to repair instructions (On-Vehicle Service). 2. Inspect the 2-4 brake solenoid valve and transmission fluid pressure (TFP) switch for the following conditions: • Physical damage • Loose or improper installation 3. Test the signal circuit between the 2-4 brake TFP switch and the in-line harness connector (pin 7 of E-54 male side) for a short to ground 4. Repair the circuit(s) or replace as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 5
5	1. Remove the 2-4 brake solenoid valve and TFP switch from the valve body assembly and perform function check. Refer to repair instructions (On-Vehicle Service). 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
6	Repair or replace the valve body assembly. Refer to repair instructions (On-Vehicle Service or Unit Repair). Did you complete the repair or replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected components or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Drive the vehicle while observing the DTC Information with a scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 8
8	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P1853 (Flash Code 26)

Circuit Description

The low & reverse brake transmission fluid pressure (TFP) switch is installed to the lower part of the valve body assembly and it feedbacks fluid pressure in the low & reverse brake hydraulic circuit. When the solenoid valve is energized, fluid pressure is drained to disengage the low & reverse brake and the TFP switch is OFF. When the solenoid valve is not energized, fluid pressure is applied to engage the low & reverse brake and the TFP switch is ON. The TCM monitors the low & reverse brake TFP switch ON/ OFF status through the signal circuit. If the TCM detects an improper status on the signal circuit, this DTC will set.

Condition for Running the DTC

- DTCs P0560, P0705, P0717, P0722, P0753, P0758, P0763, P0768, P1120, P1750, P1755 and P1875 are not set.

AND following conditions are met for longer than 2.5 seconds.

- The ignition switch is ON.
- The transmission fluid temperature is more than 60°C (140°F).
- The engine speed is more than 500 RPM.
- The TCM is not under gearshift control.

Condition for Setting the DTC

Either of following condition is met:

- The TCM detects that the low & reverse brake TFP switch signal is stuck at the ON for longer than 2 seconds when the selector lever in D range with 4th gear.
- The TCM detects that the low & reverse brake TFP switch signal is stuck at the OFF for longer than 2 second when the selector lever in R range.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Clutch, Brake, Solenoid and Pressure Switch Logic table to verify each component works properly within the selected gear range.
- A sticking or intermittently sticking the low & reverse brake solenoid valve will cause this DTC to set.

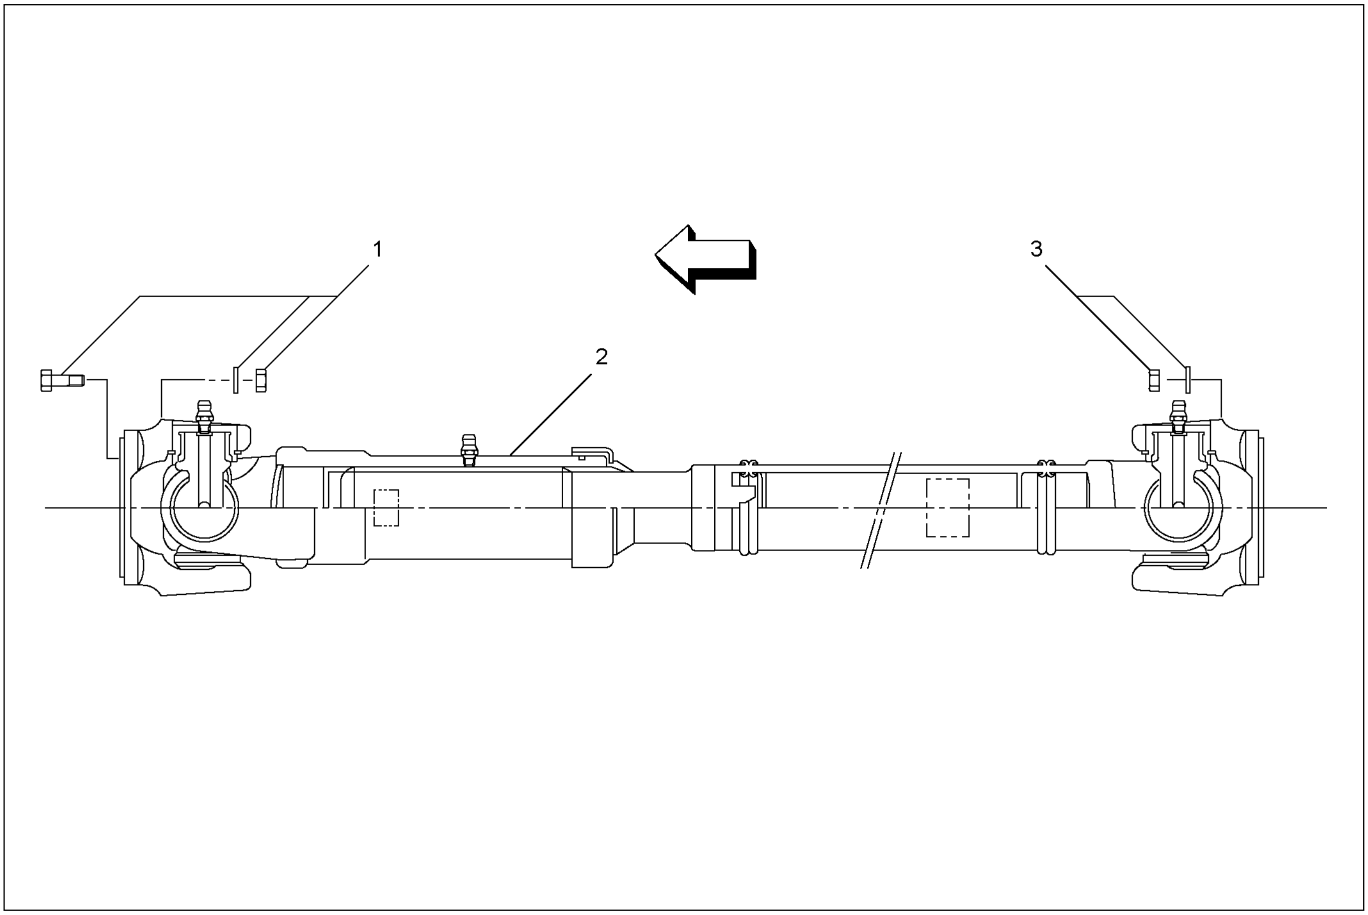
Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Lift the driving wheels or drive the vehicle while observing the DTC Information with a scan tool. Is DTC P0753 also set?	—	Go to DTC P0753	Go to Step 3
3	Place the selector lever in forward range while observing the Low & Reverse Brake Pressure Switch parameter with a scan tool. Does the Low & Reverse Brake Pressure Switch parameter ever indicate ON when gear is shifted between 1st and 4th?	—	Go to Step 5	Go to Step 4

Front Propeller Shaft

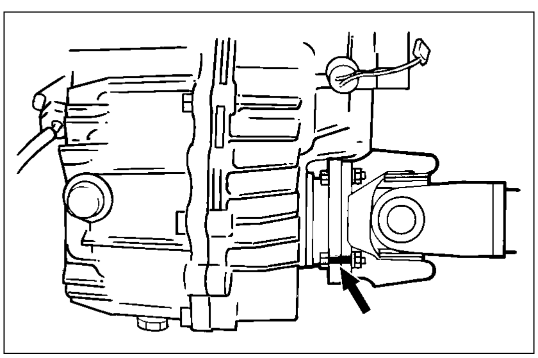
Removal and Installation



RUW54AMF000201

Legend

1. Bolt, Nut and Washer (Front Axle Side)
2. Front Propeller Shaft
3. Nut and Washer (Transfer Side)



401RS020

Removal

1. Jack up the vehicle and support it on the chassis stands.
2. Gear shift lever should be placed in neutral position and parking brake released.
3. Remove the exhaust and transfer protectors.

NOTE:
Apply alignment marks on the flange at the front propeller shaft both front and rear side.

4. Remove bolt, nut and washer (Front axle side).
5. Remove bolt, nut and washer (Transfer side).
6. Remove front propeller shaft.

Step	Action	Value(s)	Yes	No
4	Place the selector lever in R range while observing the Low & Reverse Brake Pressure Switch parameter with a scan tool. Does the Low & Reverse Brake Pressure Switch parameter indicate ON?	—	Go to Diagnostic Aids	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the in-line harness connector (E-54) near the transmission range switch. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Low & Reverse Brake Switch parameter with a scan tool while momentarily jumping 3-amp fused jumper wire between pin 12 of E-54 (female side) and a known good ground. Does the scan tool indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 8	Go to Step 6
6	1. Test the signal circuit between the TCM (pin 12 of C-95) and the in-line harness connector (pin 12 of E-54 female side) for the following conditions: • An open circuit • A short to ground • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 7
7	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the TCM (pin 12 of C-95). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	1. Inspect for an intermittent and for a poor connection at the in-line harness connector (pin 12 of E-54). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 9

Step	Action	Value(s)	Yes	No
9	1. Remove the transmission oil pan. Refer to repair instructions (On-Vehicle Service). 2. Inspect the low & reverse brake solenoid valve and transmission fluid pressure (TFP) switch for the following conditions: • Physical damage • Loose or improper installation 3. Inspect for an intermittent and for a poor connection at the harness connector of the low & reverse brake TFP switch or in-line harness connector. 4. Test the signal circuit between the low & reverse brake TFP switch and the in-line harness connector (pin 12 of E-54 male side) for the following conditions: • An open circuit • A short to ground • A short to the solenoid valve circuit • High resistance 5. Repair the connection(s), circuit(s) or replace as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
10	1. Remove the low & reverse brake solenoid valve and TFP switch from the valve body assembly and perform function check. Refer to repair instructions (On-Vehicle Service). 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
11	Repair or replace the valve body assembly. Refer to repair instructions (On-Vehicle Service or Unit Repair). Did you complete the repair or replacement?	—	Go to Step 13	—
12	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected components or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Drive the vehicle while observing the DTC Information with a scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 14
14	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P1858 (Flash Code 27)

Circuit Description

The 2-4 brake transmission fluid pressure (TFP) switch is installed to the lower part of the valve body assembly and it feedbacks fluid pressure in the 2-4 brake hydraulic circuit. When the solenoid valve is energized, fluid pressure is drained to disengage the 2-4 brake and the TFP switch is OFF. When the solenoid valve is not energized, fluid pressure is applied to engage the 2-4 brake and the TFP switch is ON. The TCM monitors the 2-4 brake pressure switch ON/ OFF status through the signal circuit. If the TCM detects an improper status on the signal circuit, this DTC will set.

Condition for Running the DTC

- DTCs P0560, P0705, P0717, P0722, P0753, P0758, P0763, P0768, P1120, P1750, P1755 and P1875 are not set.

AND following conditions are met for longer than 2.5 seconds.

- The ignition switch is ON.
- The transmission fluid temperature is more than 60°C (140°F).
- The engine speed is more than 500 RPM.
- The TCM is not under gearshift control.

Condition for Setting the DTC

Either of following condition is met:

- The TCM detects that the 2-4 brake TFP switch signal is stuck at the ON for longer than 2 seconds when the selector lever in P, R or N range.
- The TCM detects that the 2-4 brake TFP switch signal is stuck at the OFF for longer than 2 second when the selector lever in D range with 4th gear.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Clutch, Brake, Solenoid and Pressure Switch Logic table to verify each component works properly within the selected gear range.
- A sticking or intermittently sticking the 2-4 brake solenoid valve will cause this DTC to set.

14	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P1860 (Flash Code 36)

Circuit Description

The torque converter clutch (TCC) solenoid valve controls fluid acting on the lock up control spool valve, which then controls lock up clutch apply and release. The solenoid valve is installed to the lower part of the valve body assembly. The TCM controls the solenoid valve by a duty cycle (pulse width modulation [PWM]) signal based on the vehicle running conditions. The solenoid valve provides a smooth engagement of the torque converter clutch by operating on a duty cycle percentage of ON time. The TCM monitors the TCC solenoid valve operating status through the feedback circuit. If the TCM detects an improper voltage level on the control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The TCM detects an open circuit or short circuit on the TCC solenoid valve control circuit.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.
- The TCM inhibits lock up control.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail at next ignition cycle.
- A current DTC clears when the diagnostic runs and does not fail at next ignition cycle.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Circuit/ System Testing DTC P1860

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install a scan tool. 2. Perform the Torque Converter Clutch (TCC) Solenoid control with a scan tool. 3. Command the solenoid valve ON and OFF. Does the TCC solenoid valve click with each command?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the in-line harness connector (E-54) near the transmission range switch. 3. Connect a test lamp between the control circuit (pin 4 of E-54 female side) and a known good ground. 4. Turn ON the ignition, with the engine OFF. 5. Perform the TCC Solenoid control with a scan tool. 6. Command the solenoid valve ON and OFF. Does the test lamp turn ON and OFF with each command?	—	Go to Step 8	Go to Step 4
4	Does the test lamp remain illuminated with each command?	—	Go to Step 5	Go to Step 6

Step	Action	Value(s)	Yes	No
5	1. Test the control circuit between the TCM (pin 17 of C-95) and the in-line harness connector (pin 4 of E-54 female side) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
6	1. Test the control circuit between the TCM (pin 17 of C-95) and the in-line harness connector (pin 4 of E-54 female side) for the following conditions: • An open circuit • A short to ground • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 7
7	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the TCM (pin 17 of C-95). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
8	1. Inspect for an intermittent and for a poor connection at the in-line harness connector (pin 4 of E-54). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
9	1. Remove the transmission oil pan. Refer to repair instructions (On-Vehicle Service). 2. Inspect the TCC solenoid valve for the following conditions: • Physical damage of solenoid valve • Loose or improper installation of solenoid valve 3. Inspect for an intermittent and for a poor connection at the harness connector of the TCC solenoid valve or in-line harness connector. 4. Inspect for an intermittent and for a poor connection of ground wire. 5. Test the control circuit between the TCC solenoid valve and the in-line harness connector (pin 4 of E-54 male side) for the following conditions: • An open circuit • A short to ground • A short to the other solenoid valve circuit • High resistance 6. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10

Step	Action	Value(s)	Yes	No
10	Replace the TCC solenoid valve. Refer to repair instructions (On-Vehicle Service). Did you complete the replacement?	—	Go to Step 12	—
11	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 12	—
12	1. Reconnect all previously disconnected components or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Drive the vehicle while observing the DTC Information with a scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 13
13	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P1863 (Flash Code 28)

Circuit Description

The high clutch transmission fluid pressure (TFP) switch is installed to the lower part of the valve body assembly and it feedbacks fluid pressure in the high clutch hydraulic circuit. When the solenoid valve is energized, fluid pressure is drained to disengage the high clutch and the TFP switch is OFF. When the solenoid valve is not energized, fluid pressure is applied to engage the high clutch and the TFP switch is ON. The TCM monitors the high clutch TFP switch ON/ OFF status through the signal circuit. If the TCM detects an improper status on the signal circuit, this DTC will set.

Condition for Running the DTC

- DTCs P0560, P0705, P0717, P0722, P0753, P0758, P0763, P0768, P1120, P1750, P1755 and P1875 are not set.

AND following conditions are met for longer than 3 seconds.

- The ignition switch is ON.
- The transmission fluid temperature is more than 60°C (140°F).
- The engine speed is more than 500 RPM.
- The TCM is not under gearshift control.

Condition for Setting the DTC

Either of following condition is met:

- The TCM detects that the high clutch TFP switch signal is stuck at the ON for longer than 2 seconds when the selector lever in P, R or N range.
- The TCM detects that the high clutch TFP switch signal is stuck at the OFF for longer than 2 second when the selector lever in D range with 4th gear.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and does not fail.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Clutch, Brake, Solenoid and Pressure Switch Logic table to verify each component works properly within the selected gear range.
- A sticking or intermittently sticking the high clutch solenoid valve will cause this DTC to set.

Circuit/ System Testing DTC P1863

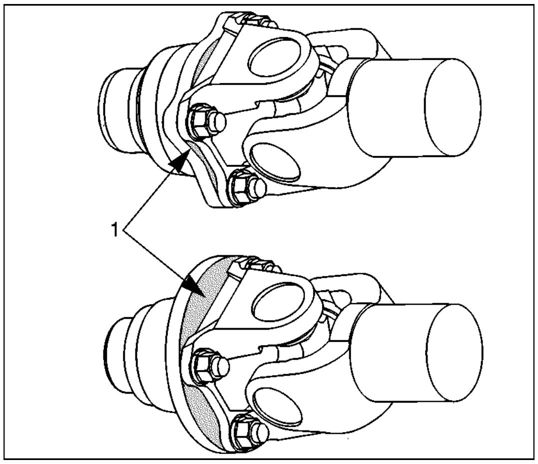
Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Lift the driving wheels or drive the vehicle while observing the DTC Information with a scan tool. Is DTC P0763 also set?	—	Go to DTC P0763	Go to Step 3
3	Place the selector lever in forward range while observing the High Clutch Pressure Switch parameter with a scan tool. Does the High Clutch Pressure Switch parameter ever indicate OFF when gear is positioned 3rd and 4th?	—	Go to Step 5	Go to Step 4

Step	Action	Value(s)	Yes	No
4	Place the selector lever in P, R and N range while observing the High Clutch Pressure Switch parameter with a scan tool. Does the High Clutch Pressure Switch parameter indicate OFF?	—	Go to Diagnostic Aids	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the in-line harness connector (E-54) near the transmission range switch. 3. Turn ON the ignition, with the engine OFF. 4. Observe the high clutch Switch parameter with a scan tool while momentarily jumping 3-amp fused jumper wire between pin 1 of E-54 (female side) and a known good ground. Does the scan tool indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 8	Go to Step 6
6	1. Test the signal circuit between the TCM (pin 20 of C-95) and the in-line harness connector (pin 1 of E-54 female side) for the following conditions: • An open circuit • A short to ground • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 7
7	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the TCM (pin 20 of C-95). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	1. Inspect for an intermittent and for a poor connection at the in-line harness connector (pin 1 of E-54). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 9

Installation

NOTE:

Never install the shaft assembly backwards. Completely remove the black paint from the connecting surface of flange coupling on each end of propeller shaft. Clean so that no foreign matter will be caught in between.



401RS019

1. Align the mark, which was applied at removal. Install front propeller shaft and tighten the bolts and nuts to the specified torque.

   Torque: 59 N·m (6.0 kgf·m/43 lb·ft)

2. Install the exhaust and transfer protectors.
3. After installing the propeller shaft, be sure to apply black paint (1) to exposed area (other than connecting surface) of the entire surface of flange coupling.

Step	Action	Value(s)	Yes	No
9	1. Remove the transmission oil pan. Refer to repair instructions (On-Vehicle Service). 2. Inspect the high clutch solenoid valve and transmission fluid pressure (TFP) switch for the following conditions: • Physical damage • Loose or improper installation 3. Inspect for an intermittent and for a poor connection at the harness connector of the high clutch TFP switch or in-line harness connector. 4. Test the signal circuit between the high clutch TFP switch and the in-line harness connector (pin 1 of E-54 male side) for the following conditions: • An open circuit • A short to ground • A short to the solenoid valve circuit • High resistance 5. Repair the connection(s), circuit(s) or replace as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
10	1. Remove the high clutch solenoid valve and TFP switch from the valve body assembly and perform function check. Refer to repair instructions (On-Vehicle Service). 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
11	Repair or replace the valve body assembly. Refer to repair instructions (On-Vehicle Service or Unit Repair). Did you complete the repair or replacement?	—	Go to Step 13	—
12	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected components or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Drive the vehicle while observing the DTC Information with a scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 14
14	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P1875 (Flash Code 25)

Circuit Description

The all shift solenoid valves feed drive voltage from the TCM and low side circuit is connected to the TCM through the ground return circuit. The TCM monitors the ground return circuit through the feedback circuit. If the TCM detects an improper status on the ground return circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The TCM detects an open circuit on the ground return circuit.

Action Taken When the DTC Sets

- The TCM blinks the Check Trans lamp when the diagnostic runs and fails.
- The TCM stops all shift solenoid valves and fixes to the 3rd gear. If a fail-safe valve problem is detected, the shift solenoid valves are not stopped but gear is fixed to the 3rd gear.
- The TCM stops PC solenoid valve.
- The TCM inhibits lock up control.

Condition for Clearing the DTC

- The TCM turns OFF the Check Trans lamp when the diagnostic runs and does not fail at next ignition cycle.
- A current DTC clears when the diagnostic runs and does not fail at next ignition cycle.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Schematic Reference: Transmission Controls Schematics

Circuit/ System Testing DTC P1875

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the in-line harness connector (E-54) near the transmission range switch. 3. Connect a test lamp between the ground return circuit (pin 11 of E-54 male side) and battery voltage. Does the test lamp illuminate?	—	Go to Step 4	Go to Step 7
4	1. Inspect for an intermittent and for a poor connection at the in-line harness connector (pin 11 of E-54). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 5
5	1. Test the circuit between the TCM (pin 22 of C-95) and the in-line harness connector (pin 11 of E-54 female side) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 6

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the TCM (pin 22 of C-95). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 8
7	1. Remove the transmission oil pan. Refer to repair instructions (On-Vehicle Service). 2. Inspect for an intermittent and for a poor connection at the ground terminal or in-line harness connector. Clean or tighten grounds as necessary. 3. Repair the open circuit or high between the ground terminal and the in-line harness connector (pin 11 of E-54 male side). Did you complete the repair?	—	Go to Step 9	—
8	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 9	—
9	1. Reconnect all previously disconnected components or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 10
10	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Check Trans Lamp Inoperative, Always On or Always Blinking

Circuit Description

The Check Trans Lamp is located on the instrument panel (IP) cluster. The Check Trans Lamp informs the driver that a transmission control system fault has occurred and that system requires service. The ignition voltage is supplied to the Check Trans Lamp via meter fuse. The TCM turns ON by grounding the lamp control circuit.

Check Trans Lamp Illumination

- The Check Trans Lamp illuminates for approximately 3 seconds when the ignition switch is turned ON, with the engine OFF.
- The Check Trans Lamp blinks if the TCM detects a fault.

Schematic Reference: Transmission Controls Schematics

Connector End View Reference: Transmission Controls Connector End Views or TCM Connector End Views

Circuit/ System Testing Check Trans Lamp Inoperative, Always On or Always Blinking

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Transmission Controls?	—	Go to Step 2	Go to Diagnostic System Check - Transmission Controls
2	1. Verify whether the instrument panel (IP) cluster is operational. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. Does the check trans lamp turn ON then turn OFF after 3 seconds passed?	—	Go to Intermittent Conditions	Go to Step 3
3	Does the check trans lamp blink?	—	Check for DTCs and if none exist Go to Step 4	Go to Step 6
4	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Observe the Diagnostic Switch parameter with a scan tool. Does the Diagnostic Switch parameter indicate ON?	—	Go to Step 5	Check for DTCs
5	Repair the short to ground between the TCM (pin 18 of C-94) and the data link connector (DLC) (pin 11 of B-58). Did you complete the repair?	—	Go to Step 21	—
6	1. Perform the Check Light control with a scan tool. 2. Command the lamp ON and OFF. Does the check trans lamp turn ON and OFF with each command?	—	Go to Intermittent Conditions	Go to Step 7
7	1. Turn OFF the ignition. 2. Inspect the Meter (10A) fuse in the cabin fuse block. Is the Meter (10A) fuse open?	—	Go to Step 8	Go to Step 9

Step	Action	Value(s)	Yes	No
8	Replace the Meter (10A) fuse. If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the Meter (10A) fuse or replace the shorted attached component. Did you complete the repair?	—	Go to Step 21	—
9	1. Turn OFF the ignition. 2. Disconnect the TCM C-94 harness connector. 3. Turn ON the ignition, with the engine OFF. Is the check trans lamp OFF?	—	Go to Step 10	Go to Step 16
10	1. Remove the Meter (10A) fuse that supplies voltage to the Check Trans Lamp. 2. Turn ON the ignition, with the engine OFF. 3. Measure the voltage from the check trans lamp control circuit in the TCM harness connector (pin 20 of C-94) to a known good ground. Is the voltage less than the specified value?	1 volt	Go to Step 11	Go to Step 17
11	1. Turn OFF the ignition. 2. Reinstall the Meter (10A) fuse. 3. Turn ON the ignition, with the engine OFF. 4. Connect a 3-amp fused jumper wire between the TCM harness connector (pin 20 of C-94) and a known good ground. Is the check trans lamp illuminated?	—	Go to Step 15	Go to Step 12
12	1. Turn OFF the ignition. 2. Remove the IP cluster. 3. Connect a test lamp between the ignition voltage feed circuit of the IP cluster harness connector (pin 8 of B-24) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 13	Go to Step 18
13	1. Test the control circuit between the TCM (pin 20 of C-94) and the IP cluster (pin 25 of B-23) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 21	Go to Step 14
14	1. Inspect for an intermittent and for poor connections at the harness connector of the IP cluster (pin 25 of B-23 and pin 8 of B-24). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 21	Go to Step 19
15	1. Inspect for an intermittent and for a poor connection at the harness connector of the TCM (pin 20 of C-94). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 21	Go to Step 20
16	Repair the short to ground between the TCM (pin 20 of C-94) and the IP cluster (pin 25 of B-23). Did you complete the repair?	—	Go to Step 21	—

Step	Action	Value(s)	Yes	No
17	Repair the short to battery or ignition voltage between the TCM (pin 20 of C-94) and the IP cluster (pin 25 of B-23). Did you complete the repair?	—	Go to Step 21	—
18	Repair the open circuit or high resistance on ignition the voltage feed circuit between the Meter (10A) fuse and the IP cluster (pin 8 of B-24). Did you complete the repair?	—	Go to Step 21	—
19	Repair or replace the IP cluster. Did you complete the repair or replacement?	—	Go to Step 21	—
20	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 21	—
21	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Perform the Check Light control with a scan tool. 3. Command the lamp ON and OFF. Does the check trans lamp turn ON and OFF with each command?	—	System OK	Go to Step 7

Symptoms - Transmission Controls

Symptoms - Transmission Controls

Important Preliminary Inspections Before Starting

Perform Diagnostic System Check - Transmission Controls before using the symptom tables, and verify that all of the following are true:

- The TCM and check trans lamp is operating correctly.
- The scan tool data is within the normal operating range. Refer to Scan Tool Data List in this section.
- Verify the customer concern and locate the correct symptom in the table of contents. Inspect the items indicated under that symptom.

Visual and Physical Inspection

Several of the symptom procedures ask for careful visual and physical inspection. This step is extremely important. The visual and physical inspection can lead to correcting a problem without further inspections, and can save valuable time. Ensure that:

- The TCM grounds are clean, tight, and in their proper location.
- The transmission harness wiring and terminals are properly connected and are not pinched or cut.

Intermittent

Important: Inspect for improper installation of electrical components if an intermittent condition exists. Inspect for aftermarket add-on electrical equipment devices, lights, and cellular phones. Verify that no aftermarket equipment is connected to the serial data circuit.

Important: The problem may or may not turn ON the check trans lamp or store a DTC. Faulty electrical connections or wiring cause most intermittent problems.

Perform a careful visual and physical inspection of the suspect connectors for the following conditions:

- Improperly mated connector halves
- Terminals that are not seated
- Terminals that are damaged or improperly formed

Reform or replace connector terminals in the problem circuit in order to ensure proper contact tension.

Remove the terminal from the connector body in order to inspect for poor terminal wire connection.

Road test the vehicle with the DMM connected to the suspected circuit. An abnormal reading that occurs when the malfunction occurs is a good indication that there is a malfunction in the circuit being monitored.

Use the scan tool in order to help detect intermittent conditions. Useful features of the Tech 2 includes the following:

- Trigger the Snapshot feature in order to capture and store transmission parameters when the malfunction occurs. Review this stored information in order to see the specific running conditions that caused the malfunction.
- Use the Plot Function on the scan tool in order to plot selected data parameters. Review this stored information to aid in locating an intermittent problem. Refer to the scan tool Users Guide for more information.

Important: If the intermittent condition exists as a start and then stall, test for DTCs relating to the vehicle theft deterrent system. Test for improper installation of electrical options such as lights, cellular phones, etc.

Any of the following may cause an intermittent check trans lamp with no stored DTC:

- The TCM grounds are loose or dirty. Refer to Transmission Controls Schematics.
- The check trans lamp circuit intermittently shorted to ground
- Electrical system interference caused by a malfunctioning relay, TCM driven solenoid, or switch. The electrical component can cause a sharp electrical surge. Normally, the problem will occur when the malfunctioning component is operating.
- There are any open diodes.

Important: The following symptom tables contain groups of possible causes for each symptom. The order of these procedures is not important. If the scan tool readings do not indicate the problems, then proceed in a logical order, easiest to check or most likely to cause first. In order to determine if a specific vehicle is using a particular system or component, refer to Transmission Controls Schematics for an application.

Use the following tables when diagnosing a symptom complaint:

- Intermittent Conditions
- Vehicle Does Not Run
- Trouble at Starting
- Faulty Gearshift
- Faulty Shift Pattern
- No or Error Gearshift
- Faulty Operation During Running
- Faulty Operation in Stopping
- Faulty Lock Up
- No Lock Up
- Transmission Fluid Leak
- Others

Intermittent Conditions

Checks	Action
Definition: The problem is not currently present but is indicated in DTC History. OR There is a customer complaint, but the symptom cannot currently be duplicated, if the problem is not DTC related.	
Preliminary Checks	• Refer to Symptoms - Transmission Controls before starting.
Harness/ Connector	Many intermittent open or shorted circuits are affected by harness/ connector movement that is caused by vibration, engine torque, bumps/ rough pavement, etc. Test for this type of condition by performing the applicable procedure from the following list: • Move related connectors and wiring while monitoring the appropriate scan tool data. • Move related connectors and wiring with the component commanded ON, and OFF, with the scan tool. Observe the component operation. • With the engine running, move related connectors and wiring while monitoring engine operation. If harness or connector movement affects the data displayed, component/ system operation, or engine operation, inspect and repair the harness/ connections as necessary.
Electrical Connections or Wiring	Poor electrical connections, terminal tension or wiring problems cause most intermittent. To perform the following inspections: • Poor mating of the connector halves, or terminals improperly seated in the connector body. • Improperly formed or damaged terminals. Test for poor terminal tension. • Poor terminal to wire connections including terminals crimped over insulation. This requires removing the terminal from the connector body. • Corrosion/ water intrusion. Pierced or damaged insulation can allow moisture to enter the wiring. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits. • Wires that are broken inside the insulation. • Harness for pinched, cut or rubbed through wiring. • Ensure that the wiring does not come in contact with hot exhaust components.
Control Module Power and Grounds Component Power and Grounds	Poor power or ground connections can cause widely varying symptoms. • Test all control module power supply circuits. Many vehicles have multiple circuits supplying power to the control module. Other components in the system may have separate power supply circuits that may also need to be tested. Inspect connections at the module/ component connectors, fuses, and any intermediate connections between the power source and the module/ component. A test lamp or a DMM may indicate that voltage is present, but neither tests the ability of the circuit to carry sufficient current. Ensure that the circuit can carry the current necessary to operate the component. • Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point. Inspect the connections at the component and in splice packs, where applicable. Ensure that the circuit can carry the current necessary to operate the component.

Checks	Action
Temperature Sensitivity	• An intermittent condition may occur when a component/ connection reaches normal operating temperature. The condition may occur only when the component/ connection is cold, or only when the component/ connection is hot. • If the intermittent is related to heat, review the data for a relationship with the following: - High ambient temperatures. - Underhood/ engine generated heat. - Circuit generated heat due to a poor connection, or high electrical load. - Higher than normal load conditions, towing, etc. • If the intermittent is related to cold, review the data for the following: - Low ambient temperatures-In extremely low temperatures, ice may form in a connection or component. Test for water intrusion. - The condition only occurs on a cold start. - The condition goes away when the vehicle warms up. • Information from the customer may help to determine if the trouble follows a pattern that is temperature related.
Electromagnetic Interference (EMI) and Electrical Noise	Some electrical components/ circuits are sensitive to EMI or other types of electrical noise. Inspect the following conditions: • A misrouted harness that is too close to high voltage/ high current devices such as injection components, motors, generator etc. These components may induce electrical noise on a circuit that could interfere with normal circuit operation. • Electrical system interference caused by a malfunctioning relay, or the TCM driven solenoid or switch. These conditions can cause a sharp electrical surge. Normally, the problem will occur when the malfunctioning component is operating. • Improper installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. These accessories may lead to an emission related failure while in use, but do not fail when the accessories are not in use. • Test for any open diodes. Some relays may contain a clamping diode. • Test the generator for a bad rectifier bridge that may be allowing AC noise into the electrical system.
Incorrect TCM Programming	• There are only a few situations where reprogramming a TCM is appropriate: - An ECM from another vehicle is installed. - Revised software/ calibration files have been released for this vehicle. **Important:** DO NOT reprogram the TCM with the SAME software/ calibration files that are already present in the TCM. This is not an effective repair for any type of driveability problem. • Verify that the TCM contains the correct software/ calibration. If incorrect programming is found, reprogram the TCM with the most current software/ calibration.
Duplicating Failure Conditions	• If none of the previous tests are successful, attempt to duplicate and/ or capture the failure conditions. • An alternate method is to drive the vehicle with the DMM connected to a suspected circuit. An abnormal reading on the DMM when the problem occurs, may help you locate the problem.
Scan Tool Snapshot	The scan tool can be set up to take a Snapshot of the parameters available via serial data. The Snapshot function records live data over a period of time. The recorded data can be played back and analyzed. The scan tool can also graph parameters singly or in combinations of parameters for comparison. The Snapshot can be triggered manually at the time the symptom is noticed, or set up in advance to trigger when a DTC sets. An abnormal value captured in the recorded data may point to a system or component that needs to be investigated further. Refer to the scan tool Users Guide for more information.

Vehicle Does Not Run
Trouble at Starting
Faulty Gearshift
Faulty Shift Pattern
No or Error Gearshift
Faulty Operation During Running
Faulty Operation in Stopping
Faulty Lock Up
No Lock Up
Transmission Fluid Leak
Others

Diagnostic Category		Category No.
This table consists of diagnostic categories that are located in the left column. Using this column, choose the appropriate category based on the operating conditions of the vehicle or transmission. After selecting a category, use the right column to locate the specific symptom diagnostic information.		
Vehicle Does Not Run	Vehicle does not run in D, 3, 2, L & L range	A1
	Vehicle does not run in R range	A2
	Vehicle does not run in D, 3, 2 and L range	A3
Trouble at Starting	Vehicle runs in N range	B1
	Poor acceleration at starting	B2
	Engine races up during starting (slip)	B3
	Large shock when selector lever is changed from N to D range or N to R range	B4
	Engine stalls when selector lever is changed from N to R, D, 3, 2 or L range	B5
	Engine does not crank in P or N range	B6
	Engine cranks in other than P or N range	B7
	Extended time lag when selector lever is changed from N to D	B8
	Extended time lag when selector lever is changed from N to R	B9
	Brake is applied in R range	B10
	Insufficient starting or shaking in D range	B11
	Noise or vibration occurs at starting	B12

2. Seal
3. Tube Assembly

Diagnostic Category		Category No.
Faulty Gearshift	Engine race up (slipping) when gearshift is up from 1st to 2nd	C1
	Engine race up (slipping) when gearshift is up from 2nd to 3rd	C2
	Engine race up (slipping) when gearshift is up from 3rd to 4th	C3
	Engine race up (slipping) when gearshift is down from 4th to 3rd	C4
	Engine race up (slipping) when gearshift is down (or kick-down) from 4th to 2nd	C5
	Engine race up (slipping) when gearshift is down (or kick-down) from 3rd to 2nd	C6
	Engine race up (slipping) when gearshift is down (or kick-down) from 4th or 3rd to 2nd	C7
	Engine race up (slipping) others	C8
	Braking feel when gearshift is up from 1st to 2nd	C9
	Braking feel when gearshift is up from 2nd to 3rd	C10
	Braking feel when gearshift is up from 3rd to 4th	C11
	Large shock when gearshift from 1st to 2nd or 2nd to 1st	C12
	Large shock when gearshift from 2nd to 3rd or 3rd to 2nd	C13
	Large shock when gearshift from 3rd to 4th or 4th to 3rd	C14
	Large shock when kick-down	C15
	Large shock when accelerator pedal is stepped ON or OFF without gearshift	C16
	Large shock when gearshift from 2nd to 1st in L range	C17
	Large shock others	C18
	Large shock when vehicle speed is reduced by no accelerator pedal or vehicle is stopped	C19
	Large shock at lock up	C20
	Shift down or engine overrun when accelerator pedal is stepped ON in 4th gear	C21
Faulty Shift Pattern	Faulty gearshift schedule (different from shift speed chart)	D1
	Gearshift frequently	D2
	Gearshift point is low or high at all points	D3
	Gearshift point is low or high at limited area	D4
	No kick-down	D5
No or Error Gearshift	No gearshift	E1
	Only 4th gear is not selectable	E2
	Gear is changed from 2nd to 3rd in 2 range	E3
	Gear is changed from 1st to 2nd in L range	E4
	Gear is changed from 3rd to 4th in 3 range	E5
Faulty Operation During Running	Low maximum speed or poor acceleration	F1
	Only 4th gear is not selectable	F2
	Noise or vibration occurs during in R, D, 3, 2 or L range	F3
	Engine brake does not apply in L range	F4
	Engine stalls before vehicle stops from running	F5

Diagnostic Category		Category No.
Faulty Operation in Stopping	Vehicle moves in P range or parking is not disengaged in other than P range	G1
	Large creeping force	G2
	Small creeping force	G3
	Large noise during idle with vehicle stop	G4
Faulty Lock Up	Judder Occurs at Lock Up	H1
	Large Shock at Lock Up	H2
	Lock Up Point is High or Low	H3
No Lock Up	No Lock Up	I1
Transmission Fluid Leak	Transmission fluid leaks from breather	J1
	Transmission fluid leaks between engine and converter housing	J2
	Transmission fluid leaks between converter housing and transmission case	J3
	Transmission fluid leaks between transmission case and extension housing	J4
	Transmission fluid leaks from oil pan	J5
	Transmission fluid leaks from manual shaft oil seal	J6
	Transmission fluid leaks from oil cooler pipe joint	J7
Others	Transmission overheat	Z1
	Mode lamp (power drive or 3rd start) does not turn On	Z2
	Mode lamp (power drive or 3rd start) does not turn Off	Z3
	A/T oil temperature lamp turns On	Z4
	Selector lever feeling is faulty	Z5
	Poor fuel consumption	Z6
	Shift indicator is faulty	Z7
	Abnormal smell	Z8
	Transmission fluid quantity is low or high	Z9
	Transmission fluid quantity is low or high	Z10
	Abnormal transmission fluid pressure	Z11

Diagnostic category

A1: Vehicle Does Not Run in D, 3, 2 L and R Range

Checks	Action
Definition: Vehicle does not run even though the accelerator pedal is being stepped on.	
Diagnosis Hints	Trouble in transmission main unit is suspected. The trouble in the transmission main unit may originate from the input circuits or output circuits; these circuits should also be checked to prevent a reoccurrence of the trouble.
Transmission Range Switch & Selector Lever Cable Checks	Inspect the transmission range switch and selector lever cable for misadjusting or disordering. Refer to On-Vehicle Service section.
Transmission Fluid Checks	Inspect the transmission fluid for the following conditions. If the transmission fluid is extremely blacked, contaminated or smells burnt, slipping of clutch is suspected. • Low quantity • Contamination • Smell
Line Pressure Checks	Inspect the line pressure in all ranges for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.
Stall Speed Checks	Inspect the stall speed in all ranges. Refer to Stall Test in Test Instruction section.
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking shift solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit
Torque Converter Checks	Inspect the torque converter for faulty operation or sticking.
Clutch and Brake Checks	Inspect the low clutch, reverse clutch, low one-way clutch and low & reverse brake for slipping.
Additional Checks	• Inspect the parking mechanism for faulty operation. • Inspect the engine for proper outputs.

A2: Vehicle Does Not Run in R Range

Checks	Action
Definition: Vehicle does not run in R range only. It runs correctly in forward range.	
Diagnosis Hints	Trouble in transmission main unit is suspected. The trouble in the transmission main unit may originate from the input circuits or output circuits; these circuits should also be checked to prevent a reoccurrence of the trouble.
Transmission Range Switch & Selector Lever Cable Checks	Inspect the transmission range switch and selector lever cable for misadjusting or disordering. Refer to On-Vehicle Service section.
Transmission Fluid Checks	Inspect the transmission fluid for the following conditions. If the transmission fluid is extremely blacked, contaminated or smells burnt, slipping of clutch is suspected. • Low quantity • Contamination • Smell
Line Pressure Checks	Inspect the line pressure in R range for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.
Stall Speed Checks	Inspect the stall speed in R range. Refer to Stall Test in Test Instruction section.

Checks	Action
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking shift solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit
Torque Converter Checks	Inspect the torque converter for faulty operation or sticking.
Clutch and Brake Checks	Inspect the reverse clutch and low & reverse brake for slipping.
Additional Checks	• Inspect the parking mechanism for faulty operation. • Inspect the engine for proper outputs.

A3: Vehicle Does Not Run in D, 3, 2 and L Range

Checks	Action
Definition: Vehicle does not run in D, 3, 2 and L range only. It runs correctly in R range.	
Diagnosis Hints	Trouble in transmission main unit is suspected. The trouble in the transmission main unit may originate from the input circuits or output circuits; these circuits should also be checked to prevent a reoccurrence of the trouble.
Transmission Range Switch & Selector Lever Cable Checks	Inspect the transmission range switch and selector lever cable for misadjusting or disordering. Refer to On-Vehicle Service section.
Transmission Fluid Checks	Inspect the transmission fluid for the following conditions. If the transmission fluid is extremely blacked, contaminated or smells burnt, slipping of clutch is suspected. • Low quantity • Contamination • Smell
Line Pressure Checks	Inspect the line pressure in forward ranges for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.
Stall Speed Checks	Inspect the stall speed in forward ranges. Refer to Stall Test in Test Instruction section.
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking shift solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit
Torque Converter Checks	Inspect the torque converter for faulty operation or sticking.
Clutch and Brake Checks	Inspect the low clutch and low one-way clutch for slipping.
Additional Checks	• Inspect the parking mechanism for faulty operation. • Inspect the engine for proper outputs.

B1: Vehicle Runs in N Range

Checks	Action
Definition: Creeping force appears in N range. Vehicle moves unless the brake pedal is stepped on in N range.	
Diagnosis Hints	Trouble in transmission main unit is suspected. The trouble in the transmission main unit may originate from the input circuits or output circuits; these circuits should also be checked to prevent a reoccurrence of the trouble.
Transmission Range Switch & Selector Lever Cable Checks	Inspect the transmission range switch and selector lever cable for misadjusting or disordering. Refer to On-Vehicle Service section.

Checks	Action
Transmission Fluid Checks	Inspect the transmission fluid for the following conditions. If the transmission fluid is extremely blacked, contaminated or smells burnt, slipping of clutch is suspected. • Low quantity • Contamination • Smell
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking shift solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit
Clutch and Brake Checks	Inspect the low clutch, reverse clutch, low one-way clutch and low & reverse brake for seizing.

B2: Poor Acceleration at Starting

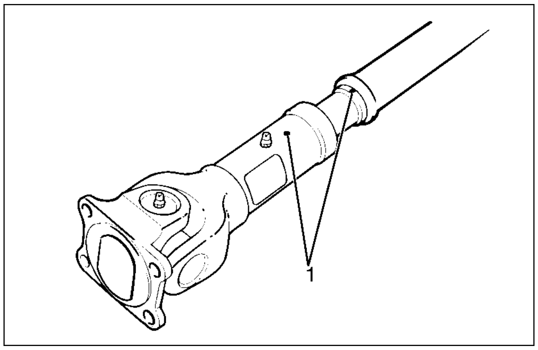
Checks	Action
Definition: Starting acceleration is poor.	
Diagnosis Hints	In addition to the low engine output, faulty gearshift of the transmission or fixing at the 3rd gear in the fail-safe operation may also be possible. Therefore, if “maximum speed is low, and acceleration is poor”, it should be cleared up whether the trouble originates from the engine system or transmission control system by a running test, inspection of stall speed, etc.
Transmission Range Switch & Selector Lever Cable Checks	Inspect the transmission range switch and selector lever cable for misadjusting or disordering. Refer to On-Vehicle Service section.
Transmission Fluid Checks	Inspect the transmission fluid for the following conditions. If the transmission fluid is extremely blacked, contaminated or smells burnt, slipping of clutch is suspected. • Low quantity • Contamination • Smell
Line Pressure Checks	Inspect the line pressure in forward ranges for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.
Stall Speed Checks	Inspect the stall speed in forward ranges. Refer to Stall Test in Test Instruction section.
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking shift solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit
Torque Converter Checks	Inspect the torque converter for faulty operation.
Clutch and Brake Checks	Inspect the low clutch and high clutch for slipping.
Additional Checks	• Inspect the engine for proper outputs. Refer to appropriate inspection chart in engine section. • Inspect the TCM grounds for being clean, tight, and in their proper locations. • Observe the Accelerator Pedal Position (APP). APP parameter should change linearly from 0 to 99 or 100% according to the accelerator pedal operation.

B3: Engine Races Up During Starting (Slip)

Checks	Action
Definition: The engine speeds up but the vehicle speed does not increase when the accelerator pedal is stepped on at starting.	
Diagnosis Hints	Slipping of the clutch is suspected. Gear ratio error DTC might be set.
Transmission Fluid Checks	Inspect the transmission fluid for the following conditions. If the transmission fluid is extremely blacked, contaminated or smells burnt, slipping of clutch is suspected. • Low quantity • Contamination • Smell
Line Pressure Checks	Inspect the line pressure in forward ranges for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.
Stall Speed Checks	Inspect the stall speed in forward ranges. Refer to Stall Test in Test Instruction section.
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking shift solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Faulty operation of transmission fluid pressure switch. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit
Clutch and Brake Checks	Inspect any clutch for slipping.
Additional Checks	• Inspect the engine for proper outputs. Refer to appropriate inspection chart in engine section. • Inspect the TCM grounds for being clean, tight, and in their proper locations. • Observe the Accelerator Pedal Position (APP). APP parameter should change linearly from 0 to 99 or 100% according to the accelerator pedal operation.

B4: Large Shock When Selector Lever is Changed from N to D Range or N to R Range

Checks	Action
Definition: A large shock is felt when the selector lever is changed from N to D or N to R during idle.	
Diagnosis Hints	• Check the vehicle side such as exhaust mounting and engine mounting. • With the fail-safe operation, garage shock may grow worth. If there is no DTC, faulty operation of the control valve or seized clutch might be suspected.
Transmission Range Switch & Selector Lever Cable Checks	Inspect the transmission range switch and selector lever cable for misadjusting or disordering. Refer to On-Vehicle Service section.
Line Pressure Test	Inspect the line pressure in D range or R range for a possible high or low pressure. Refer to Line Pressure Test in Test Instruction section.
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking shift solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit
Clutch and Brake Checks	Inspect any clutch for seizing.
Additional Checks	• Inspect the transmission input signals. • Inspect the engine for proper idle speed. • Inspect the suspension for play.



401RW056

1. Apply alignment marks (1) on the sleeve yoke and tube assembly then remove sleeve yoke.
2. Remove seal.
3. Remove tube assembly.

B5: Engine Stalls When Selector Lever is Changed from N to R, D, 3, 2 or L Range

Checks	Action
Definition: The engine stalls when selector lever is changed from N or P position to a run position during engine idling.	
Diagnosis Hints	• As the correct cause is attributable to the engine, faulty idle up, insufficient engine output, etc. are suspected. • As this is a cause of the transmission, faulty torque converter clutch (TCC) piston is suspected. • If the transmission fluid through resistance increases due to clogged oil cooler or some other reason, or if the transmission fluid level decreases, the TCC piston works causing the engine stall.
Transmission Fluid Checks	Inspect the transmission fluid for the following conditions. If the transmission fluid is extremely blacked, contaminated or smells burnt, slipping of clutch is suspected. • Low quantity • Contamination • Smell
Line Pressure Checks	Inspect the line pressure in forward ranges for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.
Stall Speed Checks	Inspect the stall speed in forward ranges. Refer to Stall Test in Test Instruction section.
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking lock up spool valve • Sticking TCC solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit
Additional Checks	• Inspect the engine for proper outputs. Refer to appropriate inspection chart in engine section. • Inspect the engine for proper idle speed.

B6: Engine Does Not Crank in P or N Range

B7: Engine Cranks in other than P or N Range

Checks	Action
Definition: • The engine starter does not run even though the P or N range. • The engine starter runs even though the R, D, 3, 2 or L range.	
Transmission Range Switch & Selector Lever Cable Checks	Inspect the transmission range switch and selector lever cable for misadjusting or disordering. Refer to On-Vehicle Service section.

B8: Extended Time Lag When Selector Lever is Changed from N to D

Checks	Action
Definition: The shift time lag is longer than the standard value when the selector lever is changed from N to D.	
Transmission Fluid Checks	Inspect the transmission fluid for low quantity.
Line Pressure Checks	Inspect the line pressure in D range for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.

Checks	Action
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Clogged hydraulic circuit
Clutch and Brake Checks	Inspect the low clutch and low one-way clutch for slipping.
Solenoid Valve Checks	• Inspect the low clutch solenoid valve for faulty operation.

B9: Extended Time Lag When Selector Lever is Changed from N to R

Checks	Action
Definition: The shift time lag is longer than the standard value when the selector lever is changed from N to R.	
Transmission Fluid Checks	Inspect the transmission fluid for low quantity.
Line Pressure Checks	Inspect the line pressure in R range for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Clogged hydraulic circuit
Clutch and Brake Checks	Inspect the low & reverse brake for slipping.
Solenoid Valve Checks	• Inspect the low & reverse brake solenoid valve for faulty operation.

B10: Brake is Applied in R Range

Checks	Action
Definition: Brake is applied suddenly in R range.	
Diagnosis Hints	Trouble in transmission main unit is suspected. The trouble in the transmission main unit may originate from the input circuits or output circuits; these circuits should also be checked to prevent a reoccurrence of the trouble.
Transmission Range Switch & Selector Lever Cable Checks	Inspect the transmission range switch and selector lever cable for misadjusting or disordering. Refer to On-Vehicle Service section.
Transmission Fluid Checks	Inspect the transmission fluid for low quantity.
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Clogged hydraulic circuit
Clutch and Brake Checks	Inspect the low clutch, high clutch or 2-4 brake for seizing.
Additional Checks	• Inspect the parking mechanism for faulty operation.

B11: Insufficient Starting or Shaking in D Range

Checks	Action
Definition: Insufficient starting or shaking in D range.	
Transmission Fluid Checks	Inspect the transmission fluid for low quantity.
Line Pressure Checks	Inspect the line pressure in D range for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.

Checks	Action
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Clogged hydraulic circuit
Clutch and Brake Checks	Inspect the low clutch, reverse clutch, low one-way clutch or low & reverse brake for slipping.

B12: Noise or Vibration Occurs at Starting

Checks	Action
Definition: Noise or vibration occurs in the vicinity of the transmission at starting.	
Diagnosis Hints	Cause other than transmission is suspected. Reproduce the running condition using a lift up, chassis dynamo, etc. to investigate the origin of the noise and vibration.
Additional Checks	• Inspect the differential gear noise. • Inspect the propeller shaft noise. • Inspect the tires for unbalanced or poor uniformity.

C1: Engine Race Up (Slipping) When Gearshift is Up from 1st to 2nd
C2: Engine Race Up (Slipping) When Gearshift is Up from 2nd to 3rd
C3: Engine Race Up (Slipping) When Gearshift is Up from 3rd to 4th
C4: Engine Race Up (Slipping) When Gearshift is Down from 4th to 3rd
C5: Engine Race Up (Slipping) When Gearshift is Down (or Kick-down) from 4th to 2nd
C6: Engine Race Up (Slipping) When Gearshift is Down (or Kick-down) from 3rd to 2nd
C7: Engine Race Up (Slipping) When Gearshift is Down (or Kick-down) from 4th or 3rd to 2nd
C8: Engine Race Up (Slipping) Others

Checks	Action
Definition: • Engine speed-up occurs when the accelerator pedal is stepped on for acceleration, and the gear is shifted up. • Engine speed-up occurs when the accelerator pedal is stepped on for acceleration, and the gear is shifted down or for kick-down during steady run. • Engine speed-up occurs when the accelerator pedal is stepped on for acceleration, and the gear is shifted down or for kick-down during steady run.	
Diagnosis Hints	Slipping of the clutch is suspected. Gear ratio error DTC might be set.
Transmission Fluid Checks	Inspect the transmission fluid for the following conditions. If the transmission fluid is extremely blacked, contaminated or smells burnt, slipping of clutch is suspected. • Low quantity • Contamination • Smell
Line Pressure Checks	Inspect the line pressure in forward ranges for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.
Stall Speed Checks	Inspect the stall speed in forward ranges. Refer to Stall Test in Test Instruction section.

Checks	Action
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking shift solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Faulty operation of transmission fluid pressure switch. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit
Clutch and Brake Checks	Inspect any clutch for slipping.
Additional Checks	• Inspect the engine for proper outputs. Refer to appropriate inspection chart in engine section. • Inspect the TCM grounds for being clean, tight, and in their proper locations. • Observe the Accelerator Pedal Position (APP). APP parameter should change linearly from 0 to 99 or 100% according to the accelerator pedal operation.

C9: Braking Feel When Gearshift is Up from 1st to 2nd

C10: Braking Feel When Gearshift is Up from 2nd to 3rd

C11: Braking Feel When Gearshift is Up from 3rd to 4th

Checks	Action
Definition: A braking feeling occurs when the accelerator pedal is stepped on for acceleration, and the gear is shifted up.	
Diagnosis Hints	Slipping of the clutch is suspected. Gear ratio error DTC might be set.
Transmission Fluid Checks	Inspect the transmission fluid for the following conditions. If the transmission fluid is extremely blacked, contaminated or smells burnt, slipping of clutch is suspected. • Low quantity • Contamination • Smell
Line Pressure Checks	Inspect the line pressure in forward ranges for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.
Stall Speed Checks	Inspect the stall speed in forward ranges. Refer to Stall Test in Test Instruction section.
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking shift solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Faulty operation of transmission fluid pressure switch. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit
Clutch and Brake Checks	Inspect any clutch for slipping.
Additional Checks	• Inspect the engine for proper outputs. Refer to appropriate inspection chart in engine section. • Inspect the TCM grounds for being clean, tight, and in their proper locations. • Observe the Accelerator Pedal Position (APP). APP parameter should change linearly from 0 to 99 or 100% according to the accelerator pedal operation.

C12: Large Shock When Gearshift from 1st to 2nd or 2nd to 1st
C13: Large Shock When Gearshift from 2nd to 3rd or 3rd to 2nd
C14: Large Shock When Gearshift from 3rd to 4th or 4th to 3rd
C15: Large Shock When Kick-down
C16: Large Shock When Accelerator Pedal is Stepped ON or OFF without Gearshift
C17: Large Shock When Gearshift from 2nd to 1st in L Range
C18: Large Shock Others
C19: Large Shock When Vehicle Speed is Reduced by No Accelerator Pedal or Vehicle is Stopped

Checks	Action
Definition: • A large shock is felt when the accelerator pedal is stepped on for acceleration and the gear is shifted up or down. • A large shock is felt when the accelerator pedal is stepped on for kick-down. • A large shock is felt when the accelerator pedal is not stepped on. • A large shock is felt when the selector lever is selected in L range.	
Diagnosis Hints	The same causes as in category No. “C1 - C8: Engine Race Up (Slipping)” are suspected.

C20: Large Shock at Lock Up

Checks	Action
Definition: A large shock is felt at lock up.	
Diagnosis Hints	Incorrect input signals or faulty operation of torque converter clutch is suspected. Refer to category No. “I1: No Lock Up.”

C21: Shift Down or Engine Overrun When Accelerator Pedal is Stepped ON in 4th Gear

Checks	Action
Definition: Shift down or engine overrun occurs above than kick-down area.	
Diagnosis Hints	The same causes as in category No. “C1 - C8: Engine Race Up (Slipping)” are suspected.

D1: Faulty Gearshift Schedule (Different from Shift Speed Chart)

Checks	Action
Definition: Faulty gearshift schedule, it is differ from the shift speed chart.	

Checks	Action
Diagnosis Hints	• When inspecting faulty gear shifting, it is important to distinguish between the fault of the electric system and transmission main unit. • Fault of electric system. - Monitor the output signal (each solenoid driving signal) using a scan tool. If a trouble signal is sent to the solenoid synchronously with the faulty gear shifting, the fault is originated in the electric system. - Monitor the input signal (signal from each sensor) using a scan tool and find an input signal which has an output signal (each solenoid driving signal) subjected to a fault. - Fault of the electric system may be derived from temperature or vibration. For instance, although the engine is normal while it is cold, fault may occur when the engine is warmed up or the vehicle is running. • Fault of mechanical system. - If the gear is incorrectly shifted, irrespective of the operating signal (On/Off) of each solenoid, the fault is originated from the transmission main unit. - If the clutch slips, or the transmission fluid smells burnt or is contaminated or black, or the stall speed increases. Gear ratio error DTC might be set.
Transmission Range Switch & Selector Lever Cable Checks	Inspect the transmission range switch and selector lever cable for misadjusting or disordering. Refer to On-Vehicle Service section.
Transmission Fluid Checks	Inspect the transmission fluid for the following conditions. If the transmission fluid is extremely blacked, contaminated or smells burnt, slipping of clutch is suspected. • Low quantity • Contamination • Smell
Line Pressure Checks	Inspect the line pressure in forward ranges for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.
Stall Speed Checks	Inspect the stall speed in forward ranges. Refer to Stall Test in Test Instruction section.
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking shift solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Faulty operation of transmission fluid pressure switch. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit

D2: Gearshift Frequently

Checks	Action
Definition: Shift down or engine overrun occurs above than kick-down area.	
Diagnosis Hints	The same causes as in category No. “C1 - C8: Engine Race Up (Slipping)” are suspected.

D3: Gearshift Point is Low or High at All Points

D4: Gearshift Point is Low or High at Limited Area

Checks	Action
Definition: • Gearshift point is deviated from the shift speed chart. • Gear is not shifted up properly, even though the vehicle is accelerating. • Gear is not shifted immediately and enough acceleration cannot be obtained, even though the accelerator pedal is being stepped on.	
Diagnosis Hints	• Inspect the output shaft speed (OSS) sensor for faulty operation. • Incorrect accelerator pedal position signal is suspected. Observe the Accelerator Pedal Position (APP). APP parameter should change linearly from 0 to 99 or 100% according to the accelerator pedal operation.

D5: No Kick-down

Checks	Action
Definition: The engine speeds up but the vehicle speed does not increase when the accelerator pedal is being stepped on at starting.	
Diagnosis Hints	Incorrect accelerator pedal position signal is suspected. Observe the Accelerator Pedal Position (APP). APP parameter should change linearly from 0 to 99 or 100% according to the accelerator pedal operation.

E1: No Gearshift

Checks	Action
Definition: • Gear is fixed, such as no gearshift from 1st to 2nd, 2nd to 3rd, and 3rd to 4th. • Sometimes the gear is shifted, and sometimes it is not possible.	
Diagnosis Hints	• Fixing at same gear speed, a signal error from the accelerator pedal position (APP) sensor or trouble in the transmission main unit are suspected. • Slipping of the clutch is suspected. Gear ratio error DTC might be set.
Transmission Range Switch & Selector Lever Cable Checks	Inspect the transmission range switch and selector lever cable for misadjusting or disordering. Refer to On-Vehicle Service section.
Transmission Fluid Checks	Inspect the transmission fluid for the following conditions. If the transmission fluid is extremely blacked, contaminated or smells burnt, slipping of clutch is suspected. • Low quantity • Contamination • Smell
Line Pressure Checks	Inspect the line pressure in forward ranges for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.
Stall Speed Checks	Inspect the stall speed in forward ranges. Refer to Stall Test in Test Instruction section.
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking shift solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit
Clutch and Brake Checks	Inspect the low clutch, high clutch or low & reverse brake for slipping.

Checks	Action
Sensor Checks	Inspect the input shaft speed (ISS) sensor and output shaft speed (OSS) sensor for faulty operation.
Additional Checks	• Inspect the TCM grounds for being clean, tight, and in their proper locations. • Observe the Accelerator Pedal Position (APP). APP parameter should change linearly from 0 to 99 or 100% according to the accelerator pedal operation.

E2: Only 4th Gear is Not Selectable

Checks	Action
Definition: Gearshift is not possible from 3rd to 4th even though the vehicle is accelerating.	
Diagnosis Hints	When the transmission fluid temperature is lower than 10°C (50°F), gearshift from the 3rd to the 4th is inhibited.
Transmission Range Switch & Selector Lever Cable Checks	Inspect the transmission range switch and selector lever cable for misadjusting or disordering. Refer to On-Vehicle Service section.
Transmission Fluid Checks	Inspect the transmission fluid for the following conditions. If the transmission fluid is extremely blacked, contaminated or smells burnt, slipping of clutch is suspected. • Low quantity • Contamination • Smell
Line Pressure Checks	Inspect the line pressure in forward ranges for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.
Stall Speed Checks	Inspect the stall speed in forward ranges. Refer to Stall Test in Test Instruction section.
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking shift solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit
Clutch and Brake Checks	Inspect the low clutch for seizing.
Sensor Checks	Inspect the transmission fluid temperature (TFT) sensor. Use the Temperature vs. Resistance table to test the TFT sensor at various temperature levels to evaluate the possibility of a skewed sensor.

E3: Gear is Changed from 2nd to 3rd in 2 Range

E4: Gear is Changed from 1st to 2nd in L Range

E5: Gear is Changed from 3rd to 4th in 3 Range

Checks	Action
Definition: • Gear is shifted from 2nd to 3rd in 2 range. • Gear is shifted from 1st to 2nd in L range. • Gear is shifted from 3rd to 4th in 3 range.	
Transmission Range Switch & Selector Lever Cable Checks	Inspect the transmission range switch and selector lever cable for misadjusting or disordering. Refer to On-Vehicle Service section.

Checks	Action
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking shift solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit

F1: Low Maximum Speed or Poor Acceleration

Checks	Action
Definition: • Starting acceleration is poor. • Acceleration is slow, even though the accelerator pedal is stepped on during the running.	
Diagnosis Hints	In addition to the low engine output, faulty gearshift of the transmission or fixing at the 3rd gear in the fail-safe operation may also be possible. Therefore, if “maximum speed is low, and acceleration is poor”, it should be cleared up whether the trouble originates from the engine system or transmission control system by a running test, inspection of stall speed, etc.
Transmission Range Switch & Selector Lever Cable Checks	Inspect the transmission range switch and selector lever cable for misadjusting or disordering. Refer to On-Vehicle Service section.
Transmission Fluid Checks	Inspect the transmission fluid for the following conditions. If the transmission fluid is extremely blacked, contaminated or smells burnt, slipping of clutch is suspected. • Low quantity • Contamination • Smell
Line Pressure Checks	Inspect the line pressure in forward ranges for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.
Stall Speed Checks	Inspect the stall speed in forward ranges. Refer to Stall Test in Test Instruction section.
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking shift solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit
Torque Converter Checks	Inspect the torque converter for faulty operation.
Clutch and Brake Checks	Inspect the low clutch and high clutch for slipping.
Additional Checks	• Inspect the engine for proper outputs. Refer to appropriate inspection chart in engine section. • Inspect the TCM grounds for being clean, tight, and in their proper locations. • Observe the Accelerator Pedal Position (APP). APP parameter should change linearly from 0 to 99 or 100% according to the accelerator pedal operation.

F2: Engine Race Up (Slipping) During Acceleration

Checks	Action
Definition: • Engine speed increases but the vehicle speed does not increase when the accelerator pedal is being stepped on.	

Checks	Action
Diagnosis Hints	The same causes as in category No. “C1 - C8: Engine Race Up (Slipping)” are suspected. When the condition of No. C1 - C8 grows worse, No. F2 results.

F3: Noise or Vibration Occurs During in R, D, 3, 2 or L Range

Checks	Action
Definition: Noise or vibration occurs in the vicinity of the transmission during running.	
Diagnosis Hints	Cause other than transmission is suspected. Reproduce the running condition using a lift up, chassis dynamo, etc. to investigate the origin of the noise and vibration.
Additional Checks	• Inspect the differential gear noise. • Inspect the propeller shaft noise. • Inspect the tires for unbalanced or poor uniformity.

F4: Engine Brake Does Not Apply in L Range

Checks	Action
Definition: The engine brake does not apply, allowing the vehicle to run freely when the accelerator pedal is released at low speed in L range.	
Diagnosis Hints	• Slipping of the clutch is suspected. Gear ratio error DTC might be set.
Line Pressure Checks	Inspect the line pressure in forward ranges for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking shift solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit
Clutch and Brake Checks	Inspect the low & reverse brake for slipping.
Sensor Checks	Inspect the input shaft speed (ISS) sensor and output shaft speed (OSS) sensor for faulty operation.

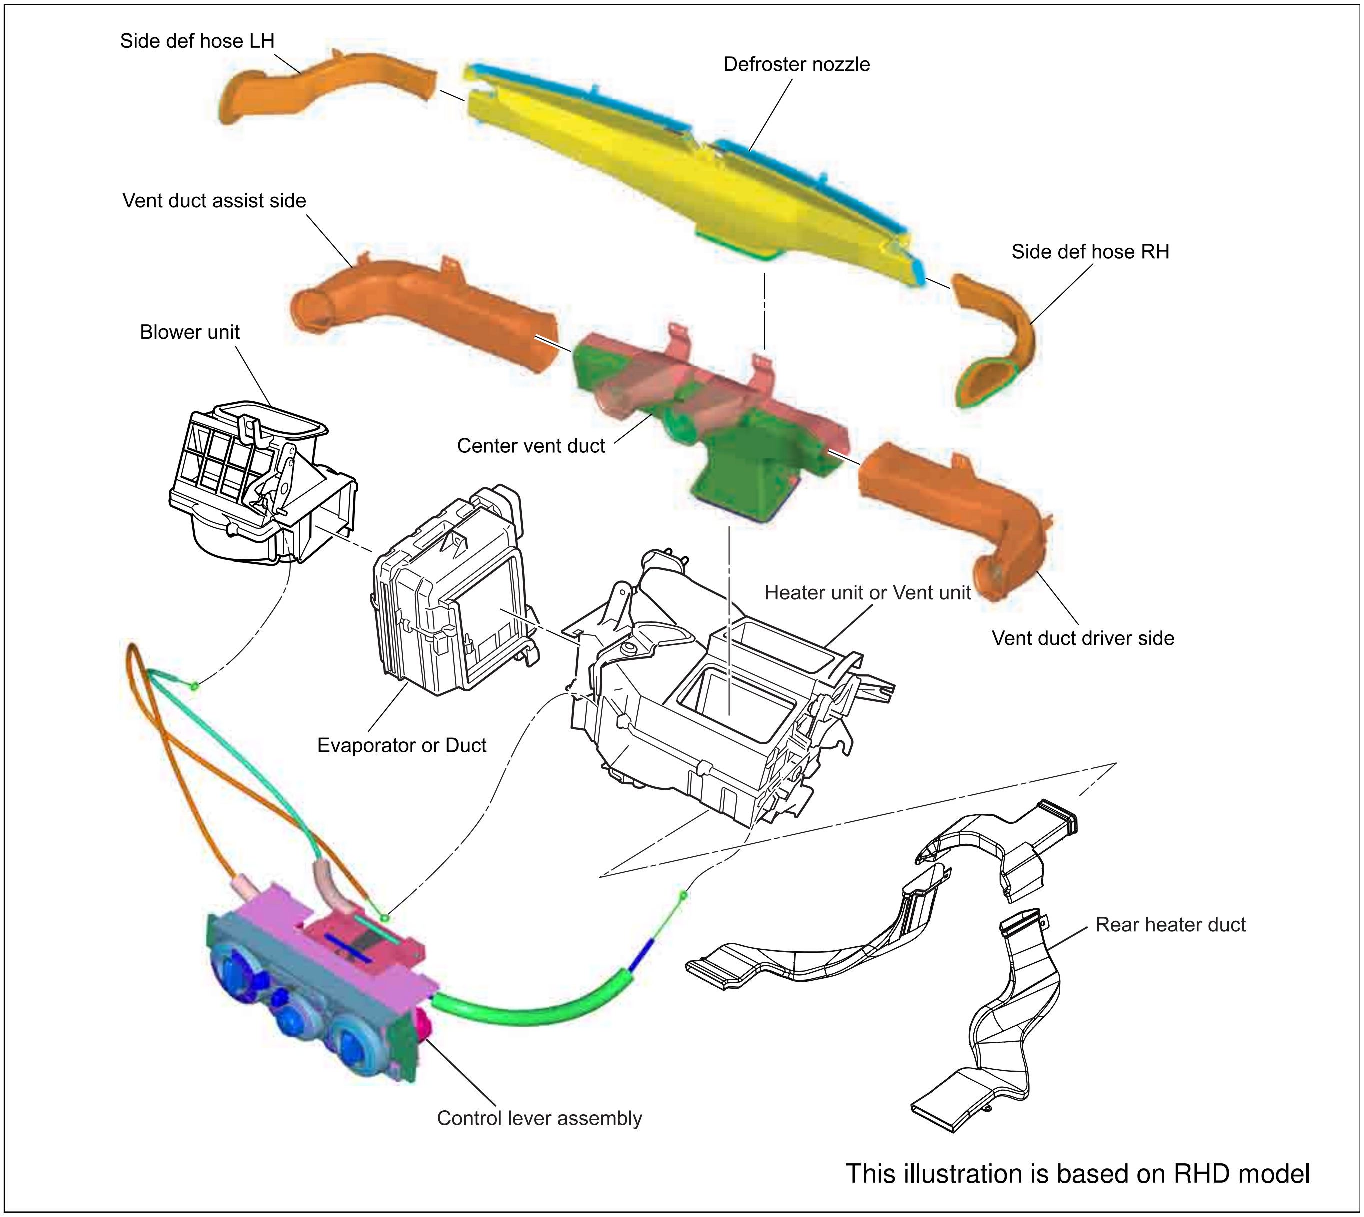
F5: Engine Stalls Before Vehicle Stops from Running

Checks	Action
Definition: The engine stalls simultaneously with the vehicle when the brake pedal is stepped on to stop the vehicle during running.	
Diagnosis Hints	The same causes as in category No. “B5: Engine Stalls When Selector Lever is Changed from N to R, D, 3, 2 or L Range” is suspected.

G1: Vehicle Moves in P Range or Parking is Not Disengaged in Other Than P Range

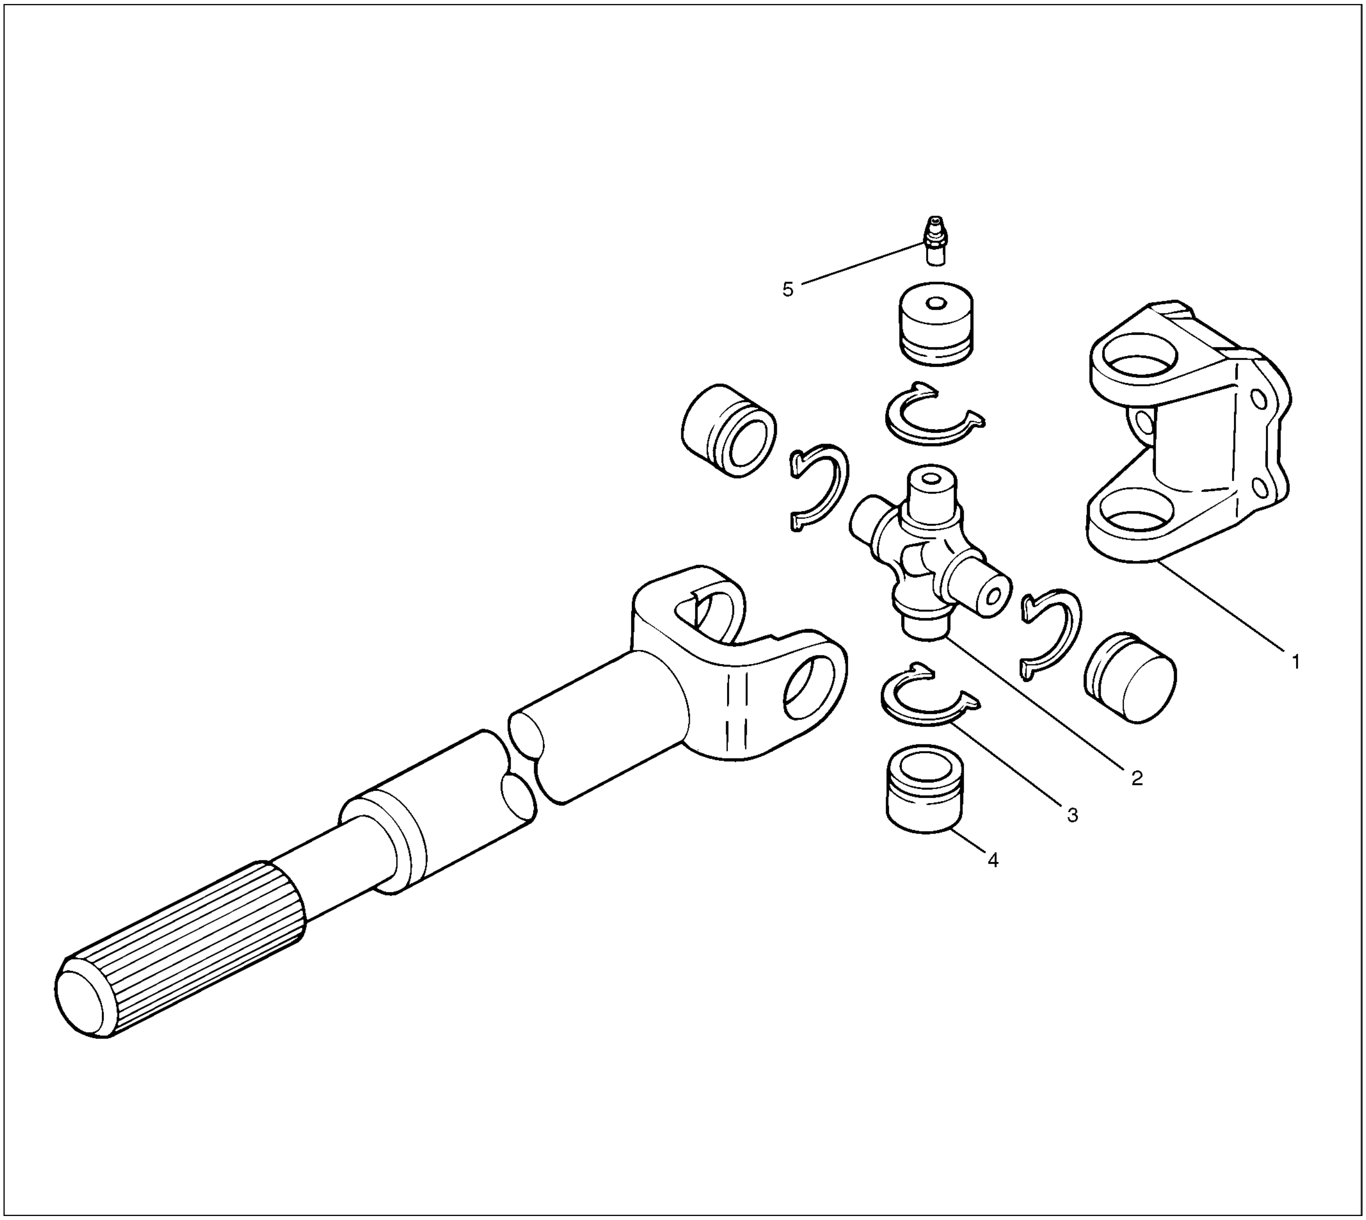
Checks	Action
Definition: Vehicle moves even though it stops on a slope and P range is selected. Vehicle does not move even though a position other than P range is selected, and the accelerator pedal is being stepped on.	
Diagnosis Hints	If the vehicle moves in N range, refer to category No. “B1: Vehicle Runs in N Range”.

COMPONENTS (INSIDE CAB)



RTW710LF001301

Universal Joint Disassembly and Reassembly



Legend

1. Flange Yoke
2. Spider
3. Snap Ring
4. Needle Roller Bearing
5. Grease Fitting

Checks	Action
Transmission Range Switch & Selector Lever Cable Checks	Inspect the transmission range switch and selector lever cable for misadjusting or disordering. Refer to On-Vehicle Service section.
Additional Checks	Inspect the parking mechanism for faulty operation.

G2: Large Creeping Force

Checks	Action
Definition: Vehicle accelerates in R, D, 3, 2 or L range, even though the accelerator pedal is not being stepped on.	
Diagnosis Hints	Too high idle speed is suspected. Inspect the engine for proper idle speed.

G3: Small Creeping Force

Checks	Action
Definition: Vehicle does not move, even though a run position is selected on a flat road during idling.	
Diagnosis Hints	When the creep force is small in all positions, low engine output is suspected. If the creep is normal only in the R position, operation of the fail-safe function due to trouble in the electrical system is suspected.
Transmission Fluid Checks	Inspect the transmission fluid for the following conditions. If the transmission fluid is extremely blacked, contaminated or smells burnt, slipping of clutch is suspected. • Low quantity • Contamination • Smell
Line Pressure Checks	Inspect the line pressure in forward ranges for a possible dropped pressure. Refer to Line Pressure Test in Test Instruction section.
Stall Speed Checks	Inspect the stall speed in forward ranges. Refer to Stall Test in Test Instruction section.
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking shift solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit
Torque Converter Checks	Inspect the torque converter for faulty operation.
Clutch and Brake Checks	Inspect the low clutch for slipping.
Additional Checks	• Inspect the engine for proper outputs. Refer to appropriate inspection chart in engine section. • Inspect the TCM grounds for being clean, tight, and in their proper locations. • Inspect the ground return circuit for being clean, tight, and in their proper locations.

G4: Large Noise During Idle with Vehicle Stop

Checks	Action
Definition: Transmission is noisy during idle in all range.	

Checks	Action
Diagnosis Hints	• Causes such as the solenoid operating sound or a faulty oil pump are suspected. • Distinguishing is possible by stopping the solenoid operation temporarily, checking the correlation for the former case and, changing the line pressure and confirming the correlation with noise. • As a matter of course, noise other than the transmission may be generated around the engine, and should be checked carefully. **Notice:** When the noise is generated only at the time of a gear shift, it may be the sound of transmission fluid flowing or gear noise. If the sound varies depending on the gear speed to be shifted, it may be the gear noise generated from the planetary gear and its components. If the sound varies depending on the vehicle speed, it may be the gear noise of the output system, or the gear noise of the input system or a faulty torque converter.

H1: Judder Occurs at Lock Up

Checks	Action
Definition: Judder occurs when lock up area.	
Diagnosis Hints	Slip due to burning of the torque converter clutch (TCC) facing or insufficient engagement due to dropped working pressure are suspected. Refer to category No. "I1: No Lock Up ". **Notice:** When the TCC facing has burnt, foreign material mixed in the oil cooler is suspected. In such a case, inspect the oil cooler circuit for clogging of the oil cooler.

H2: Large Shock at Lock Up
H3: Lock Up Point is High or Low

Checks	Action
Definition: • A large shock is felt at lock up. • Lock up point is excessively high or low.	
Diagnosis Hints	Incorrect input signals or faulty operation of torque converter clutch (TCC) is suspected. Refer to category No. "I1: No Lock Up".

I1: No Lock Up

Checks	Action
Definition: Lock up is not performed even though lock up control conditions being satisfied.	
Diagnosis Hints	• Monitor the signal to the torque converter clutch (TCC) solenoid valve while carrying out a running test. • When the transmission fluid temperature is lower than 20°C (68°F), lock up control is inhibited. • When the output signal to the TCC solenoid valve is sent correctly, causing no lock up, clogged hydraulic circuits or malfunction of the TCC piston may be suspected. • Even with the lock up area, the output signal to the TCC solenoid valve is not sent, a fault of the transmission fluid temperature (TFT) sensor controlling the lock up may be suspected. **Notice:** When the TCC facing has burnt, foreign material mixed in the oil cooler is suspected. In such a case, inspect the oil cooler circuit for clogging of the oil cooler.

Checks	Action
Transmission Fluid Checks	Inspect the transmission fluid for the following conditions. If the transmission fluid is extremely blacked, contaminated or smells burnt, slipping of clutch is suspected. • Low quantity • Contamination • Smell
Control Valve Body Checks	Inspect the valve body for the following conditions. • Faulty operation • Sticking spool valve • Sticking TCC solenoid valve. Perform function check. Refer to On-Vehicle Service section. • Clogged hydraulic circuit
Sensor Checks	Inspect the TFT sensor. Use the Temperature vs. Resistance table to test the TFT sensor at various temperature levels to evaluate the possibility of a skewed sensor.

J1: Transmission Fluid Leaks from Breather

Checks	Action
Definition: Transmission fluid leaks from breather.	
Diagnosis Hints	Transmission fluid quantity is excessively high.

J2: Transmission Fluid Leaks Between Engine and Converter Housing

J3: Transmission Fluid Leaks Between Converter Housing and Transmission Case

J4: Transmission Fluid Leaks Between Transmission Case and Extension Housing

J3: Transmission Fluid Leaks from Oil Pan

J3: Transmission Fluid Leaks from Manual Shaft Oil Seal

J3: Transmission Fluid Leaks from Oil Cooler Pipe Joint

Checks	Action
Definition: Transmission fluid leaks between engine and converter housing. Transmission fluid leaks between converter housing and transmission case. Transmission fluid leaks between transmission case and extension housing. Transmission fluid leaks from oil pan. Transmission fluid leaks from manual shaft oil seal. Transmission fluid leaks from oil cooler pipe joint.	
Diagnosis Hints	Faulty oil seal or contact surface is suspected.

Z1: Transmission Overheat

Checks	Action
Definition: Smells burnt or smoke from transmission.	
Diagnosis Hints	• Transmission fluid quantity is excessively high. • Slipping of the clutch is suspected. Gear ratio error DTC might be set. • Clogged oil cooler. • Faulty operation of oil pump. • Faulty torque converter clutch (TCC) piston.

Z2: Mode Lamp (Power Drive or 3rd Start) Does Not Turn On

Checks	Action
Definition: Mode lamp on the instrument panel (IP) cluster does not turn ON even though the switch is ON.	
Diagnosis Hints	• Faulty mode switch circuit. • Faulty mode switch. • Faulty lamp control circuit. • Faulty IP cluster.

Z3: Mode Lamp (Power Drive or 3rd Start) Does Not Turn Off

Checks	Action
Definition: Mode lamp on the instrument panel cluster does not turn OFF even though the switch is OFF.	
Diagnosis Hints	• Faulty mode switch circuit. • Faulty mode switch. • Faulty lamp control circuit. • Faulty IP cluster.

Z4: A/T Oil Temperature Lamp Turns On

Checks	Action
Definition: A/T oil temperature lamp turns On sometimes.	
Diagnosis Hints	• If the fluid temperature increases to 135°C (275°F), the TCM illuminates A/T Oil Temp lamp on the instrument panel cluster. When the fluid temperature deceases below 125°C (257°F), the lamp goes off. • When the vehicle is stuck in the mud or continues to accelerate under overload, transmission fluid temperature increases and lamp may be turned On. • If the lamp is On under usual conditions, following causes are suspected. - Transmission fluid level has increased for some fault. Refer to category No. “Z1: Transmission Overheat”. - Skewed transmission fluid temperature (TFT) sensor.

Z5: Selector Lever Feeling is Faulty

Checks	Action
Definition: Selector lever feeling is faulty.	
Diagnosis Hints	• Inspect the selector lever cable for misadjusting or disordering. • Faulty manual plate.

Z6: Poor Fuel Consumption

Checks	Action
Definition: Poor fuel consumption.	
Diagnosis Hints	The same causes as in category No. “C1 - C8: Engine Race Up (Slipping)” are suspected.

Z7: Shift Indicator is Faulty

Checks	Action
Definition: Shift indicator does not change even though the selector lever is moved.	
Diagnosis Hints	Inspect the transmission range switch and selector lever cable for misadjusting or disordering. Refer to On-Vehicle Service section.

Z8: Transmission Fluid is Splashed During Running

Checks	Action
Definition: Transmission Fluid is splashed during running.	
Diagnosis Hints	Transmission fluid quantity is excessively high.

Z9: Abnormal Smell

Checks	Action
Definition: Abnormal smell.	
Diagnosis Hints	A trouble in the transmission main unit.

Z10: Transmission Fluid Quantity is Low or High

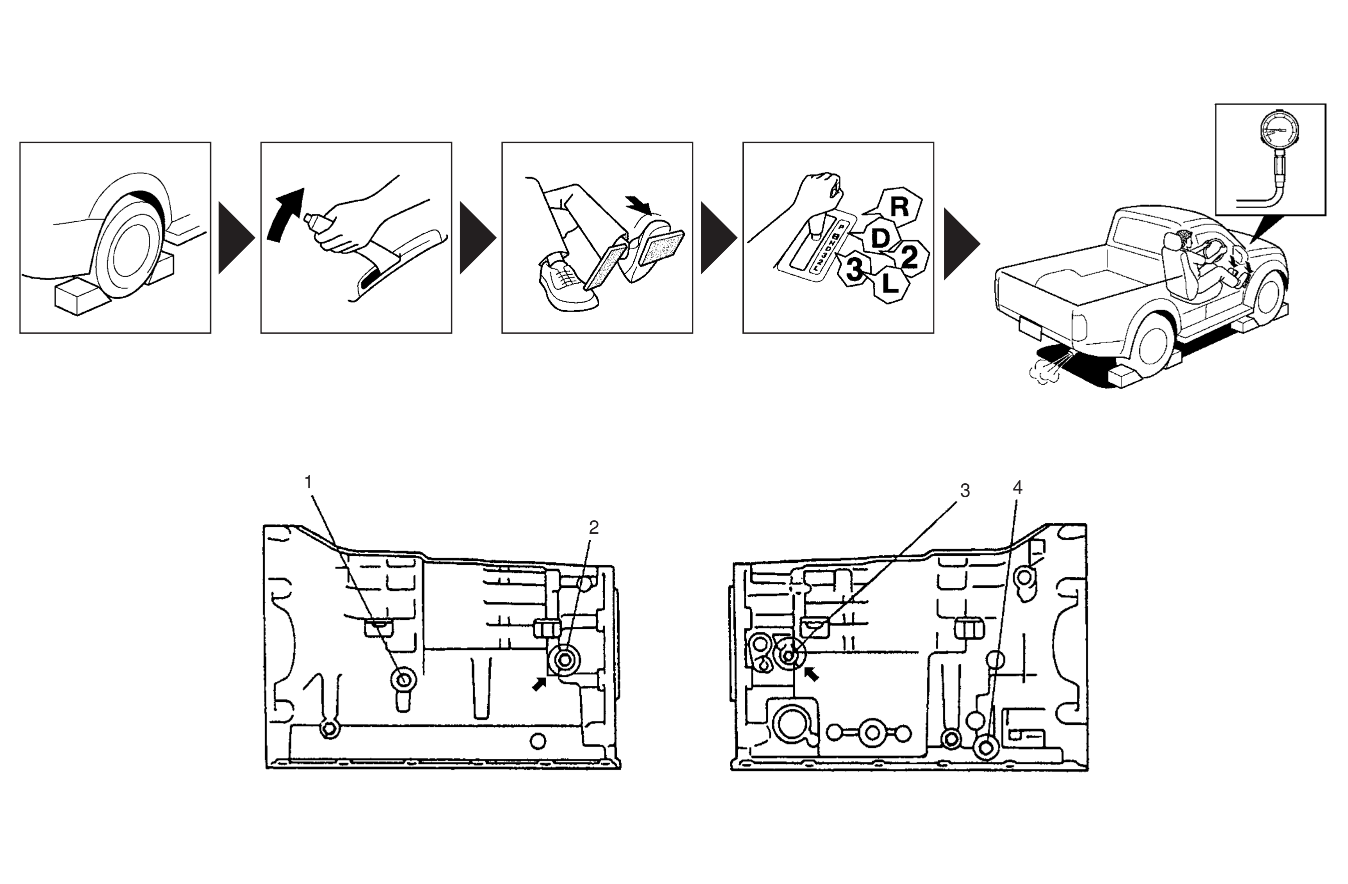
Checks	Action
Definition: Transmission fluid quantity is low or high.	
Diagnosis Hints	• If the fluid level is high, level check might be performed at low temperature. • If the fluid level is low, fluid leak is suspected.

Z11: Abnormal Transmission Fluid Pressure

Checks	Action
Definition: Transmission fluid pressure (TFP) is low or high.	
Diagnosis Hints	• Faulty pressure control (PC) solenoid valve or hydraulic circuits. • If pressure is low, faulty oil pump is suspected.

Test Instructions

Line Pressure Test



Legend
1. Oil cooler (outlet)
2. Low & reverse brake pressure detection port (R range line pressure detection port)
3. Low clutch pressure detection port (D, 3, 2, L range line pressure detection port)
4. Oil cooler (inlet)

Line Pressure Test Procedure

1. Fully apply the parking brake and chock all wheels.
2. Check the level of the engine oil, coolant and transmission fluid. Replenish as necessary.
3. Remove the plug from either of the line pressure detection port (low & reverse brake pressure detection port or low clutch pressure detection port).
4. Install a pressure gauge to the line pressure detection port.
5. Start the engine and warm up (allow engine coolant temperature to reach at least 70°C [158°F]).

Important: Keep the brakes applied at all times in order to prevent unexpected vehicle motion. Personal injury may result if the vehicle moves unexpectedly.

6. Let idle and record the line pressure when the selector lever is positioned R or D, 3, 2 and L range.

Important: Line pressure test at the stall speed must be finished within 5 seconds. Prolonged test time may break the transmission.

7. Fully depress the brake pedal with your left foot.
8. Move the selector lever to the R or D range and fully depress the accelerator pedal. Record the line pressure as soon as the stall speed.
9. Move the selector lever to the N range and let idle for at least 1 minute.
10. If the pressure gauge is connected to the low clutch pressure detection port, repeat the line pressure test (step 7 to 9) at the stall speed in 3, 2 and L range.
11. Turn OFF the ignition.
12. Disconnect a pressure gauge from the line pressure detection port.
13. Tighten the plug.

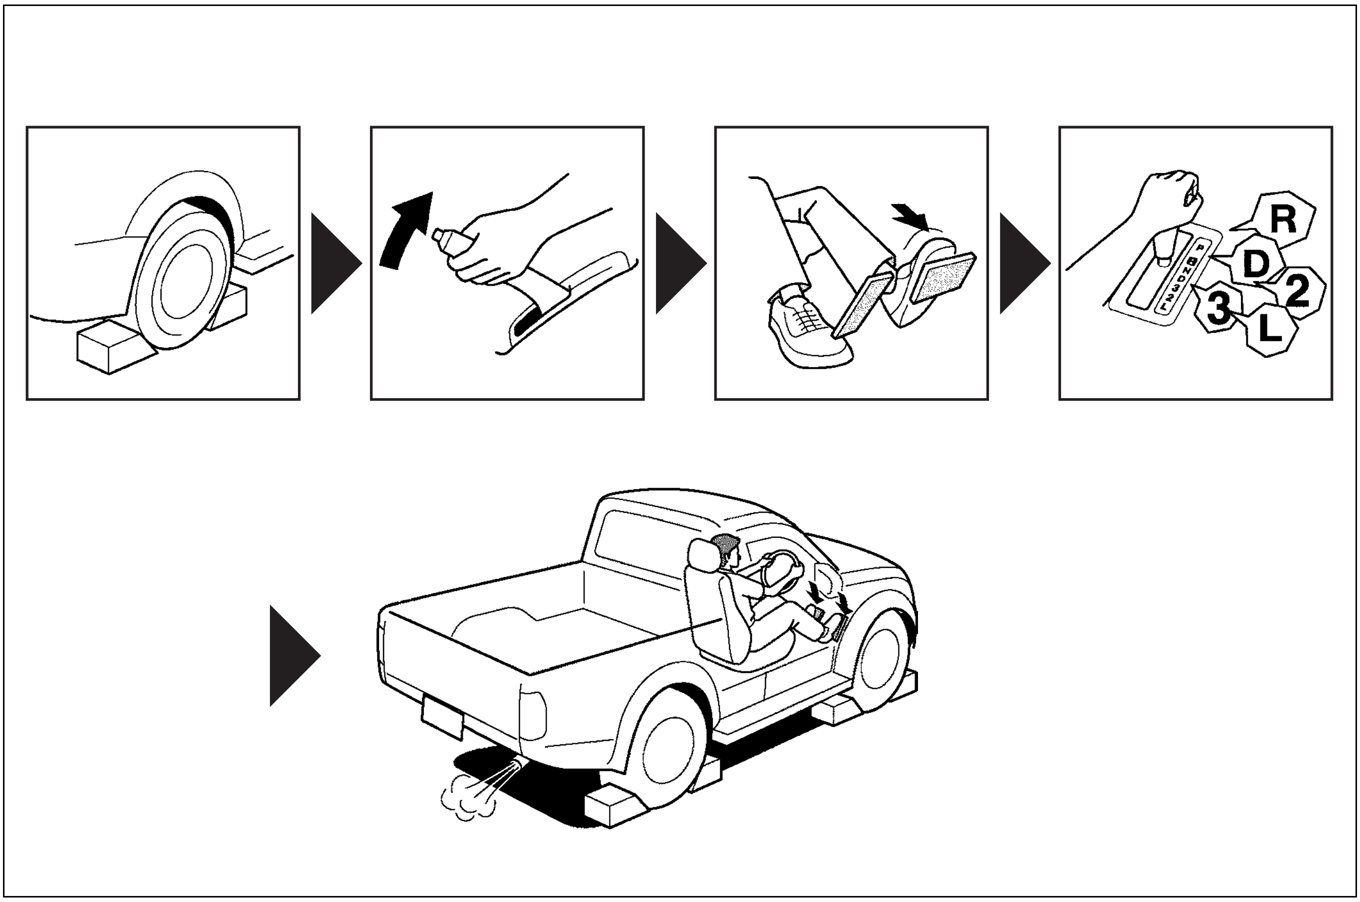
Standard Value

Selector lever position	Engine speed	Line pressure (kPa/ psi)
D, 3, 2 or D	Idle	350 - 480 / 51 - 70
	Stall	1050 - 1250 / 152 - 182
R	Idle	450 - 650 / 65 - 95
	Stall	1400 - 1630 / 203 - 237

Diagnosis

1. If the line pressure is lower than the standard value at idle in all ranges.
- Abraded oil pump.
- Faulty operation of each solenoid valve.
- Sticking of pressure regulator spool valve or pilot spool valve.
- Fatigued pressure regulator spool valve spring or pilot spool valve spring.
- Transmission fluid leaking from the oil strainer, oil pump, pressure regulator spool valve, torque converter relief spool valve or pressure relief valve.
2. If the line pressure is lower than the standard value at idle in D, 3, 2 and L range.
- Transmission fluid leaking from the low clutch hydraulic circuit.
3. If the line pressure is lower than the standard value at idle in R range.
- Transmission fluid leaking from the reverse clutch hydraulic circuit.
- Transmission fluid leaking from the low & reverse brake hydraulic circuit.
4. If the line pressure is lower that the standard value at idle in L or R range.
- Transmission fluid leaking from the low & reverse brake hydraulic circuit.
5. If the line pressure is higher than the standard value at idle in all ranges.
- Faulty accelerator pedal position signal.
- Faulty transmission fluid temperature (TFT) sensor.
- Faulty operation of low clutch solenoid valve.
- Sticking pilot spool valve.
- Sticking pressure regulator spool valve or plug.
6. If the line pressure is lower than the standard value at stall speed in all ranges.
- Faulty accelerator pedal position signal.
- Faulty operation of pressure control (PC) solenoid valve.
- Faulty operation of low clutch solenoid valve.
- Sticking pilot spool valve.
- Sticking pressure regulator spool valve or plug.

Stall Test



Stall Test Procedure

1. Fully apply the parking brake and chock all wheels.
2. Check the level of the engine oil, coolant and transmission fluid. Replenish as necessary.
3. Start the engine and warm up (allow engine coolant temperature to reach at least 70°C [158°F]).

Important: Stall test must be finished within 5 seconds. Prolonged test time may break the transmission.

4. Fully depress the brake pedal with your left foot.
5. Move the selector lever to the D range and fully depress the accelerator pedal. Record the engine speed as soon as the stall speed.
6. Move the selector lever to the N range and let idle for at least 1 minute.
7. Repeat the stall test (step 4 to 6) in R, 3, 2 and L range.

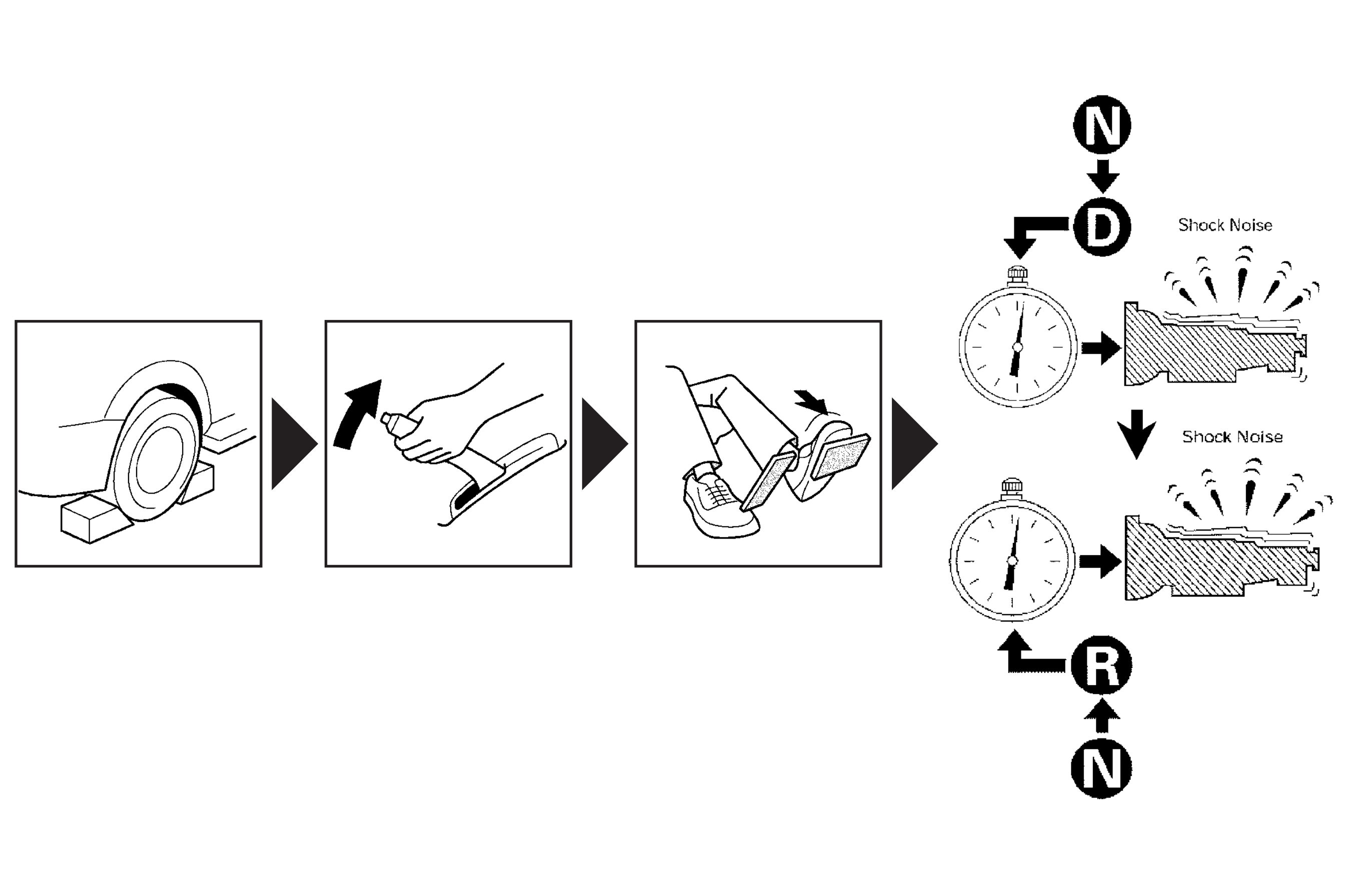
Standard Value

Stall speed	Pre condition
2050 ± 150 RPM	Ambient temperature between 10 and 40°C [50 and 104°F]

Diagnosis

1. If the stall speed is higher than the standard value in all ranges.
- Low line pressure.
- Abraded oil pump.
- Faulty operation of low clutch.
- Faulty transmission range switch.
- Transmission fluid leaking from the oil pump, valve body or transmission case.
- Sticking of pressure regulator spool valve or pilot spool valve.
2. If the stall speed is higher than the standard value in D, 3, 2 and L ranges.
- Slipping of low clutch
- Slipping of low one-way clutch
3. If the stall speed is higher than the standard value in R range.
- Slipping of low & reverse brake
- Slipping of reverse clutch
4. If the stall is lower than the standard value is all ranges.
- Slipping of torque converter one-way clutch
- Problem in engine

Time Lag Test



Time Lag Test Procedure

1. Fully apply the parking brake and chock all wheels.
2. Check the level of the engine oil, coolant and transmission fluid. Replenish as necessary.
3. Start the engine and warm up (allow engine coolant temperature to reach at least 70°C [158°F]).

Important: Keep the brakes applied at all times in order to prevent unexpected vehicle motion. Personal injury may result if the vehicle moves unexpectedly.

4. Let idle and record the time lag from when the selector lever is moved from N to D or N to R range until the shock has felt.

Standard Value

Selector lever position	Time lag
N to D range	Less than 0.7 seconds
N to R range	Less than 1.2 seconds

Diagnosis

1. If the time lag is out of the standard value when the selector lever is moved from N to D range.
   - Forward range line pressure is low.
   - Slipping of low clutch.
   - Slipping of low one-way clutch.
   - Problem in valve body (faulty operation, sticking or clogged hydraulic circuit).
   - Faulty operation of low clutch solenoid valve.
   - Shorter or faulty amount of transmission fluid.
2. If the time lag is out of the standard value when the selector lever is moved from N to R range.
   - Reverse range line pressure is low
   - Slipping of low & reverse brake
   - Slipping of reverse clutch
   - Problem in valve body (faulty operation, sticking or clogged hydraulic circuit).
   - Faulty operation of low & reverse brake solenoid valve.
   - Shorter or faulty amount of transmission fluid.

Road Test

Road Test Procedure

Selector lever position	Selected gear position	Gearshift
P	—	—

3	1st	
	2nd	
	3rd	
	4th(*1)	
2	1st	
	2nd	
	3rd(*1)	
	4th(*1)	
L	1st	
	2nd(*1)	
	3rd(*1)	
	4th(*1)	

*1: Shifting at high vehicle speed, the transmission may hold the gear position until vehicle speed gets down to prevent engine overruning.

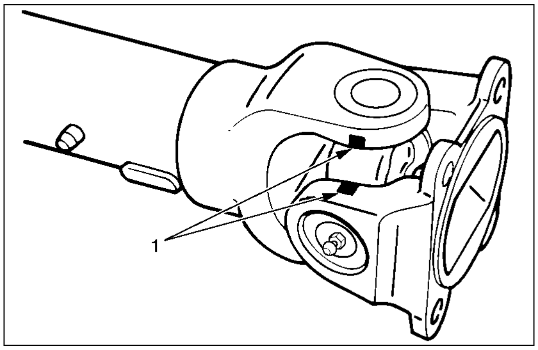
Notice: Perform this test at the normal transmission fluid temperature between 50 to 80°C (122 to 176°F). Drive the vehicle on level ground so as not to change to up slope mode and down slope mode.

1. D range road test in normal and power drive mode.
   - Select into the D range and hold the accelerator pedal constant at the 50% and 100% accelerator pedal position.
   - 1 to 2, 2 to 3, 3 to 4 upshift and lock up should take place, and shift points should match those shown in the shift speed chart.
   - Also check to see that downshift is made from 4 to 3, 3 to 2 and 2 to 1 point is within the limits shown in the shift speed chart.
2. 3 range road test in normal and power drive mode.
   - Select into the 3 range and hold the accelerator pedal constant at the 50% and 100% accelerator pedal position.
   - 1 to 2, 2 to 3 upshift and lock up should take place, and shift points should match those shown in the shift speed chart.
   - While running in the 3 range, does not upshift from 3 to 4.
3. 2 range road test in normal mode.
   - Select into the 2 range and hold the accelerator pedal constant at the 50% and 100% accelerator pedal position.
   - 1 to 2 upshift should take place, and shift points should match those shown in the shift speed chart.
   - While running in the 2 range, does not upshift from 2 to 3 or 3 to 4, and lock-up does not operate.
4. L range road test in normal mode.
   - While running in the L range, does not upshift from 1 to 2, 2 to 3 or 3 to 4, and lock-up does not operate.
5. R range road test.
   - Select into the R range and check for slipping.
6. P range road test.
   - Stop the vehicle on a grade and release the park brake after selecting into the P range. Then check to see that the parking lock pawl holds the vehicle in place.

Diagnosis

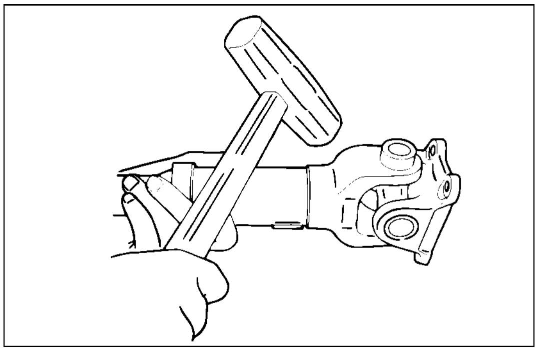
1. If there is no 1 to 2 upshift.
   - Faulty operation of 2-4 brake
   - Faulty operation of 2-4 brake hydraulic circuits
   - Sticking of 2-4 brake solenoid valve
   - Refer to symptom diagnosis No. D1: Faulty Gear Shifting or DTC P0731 - P0734 Incorrect Gear Ratio diagnosis.
2. If there is no 2 to 3 upshift.
   - Faulty operation of high clutch
   - Faulty operation of high clutch hydraulic circuits
   - Sticking of high clutch solenoid valve
   - Refer to symptom diagnosis No. D1: Faulty Gear Shifting or DTC P0731 - P0734 Incorrect Gear Ratio diagnosis.
3. If there is no 3 to 4 upshift.
   - Faulty operation of 2-4 brake
   - Faulty operation of 2-4 brake hydraulic circuits
   - Sticking of 2-4 brake solenoid valve
   - Refer to symptom diagnosis No. D1: Faulty Gear Shifting or DTC P0731 - P0734 Incorrect Gear Ratio diagnosis.
4. If there is no lock up in 2nd, 3rd and 4th.
   - Faulty operation of torque converter clutch (TCC) piston
   - Faulty operation of lock up hydraulic circuit
   - Sticking of TCC solenoid valve
   - Refer to symptom diagnosis No. I1: No Lock-up
5. If there is no reverse.
   - Faulty operation of reverse clutch
   - Faulty operation of reverse clutch hydraulic circuits
   - Faulty operation of low & reverse brake hydraulic circuits

Disassembly



401RS028

1. Apply alignment marks (1) on the yokes of the universal joint, then remove snap ring.



401RS006

2. Tap out the needle roller bearing by gently striking the shoulder of the yoke, using a mallet or a copper hammer.
3. Make sure of proper position for reinstallation by applying setting marks, then remove spider.

Inspection and Repair

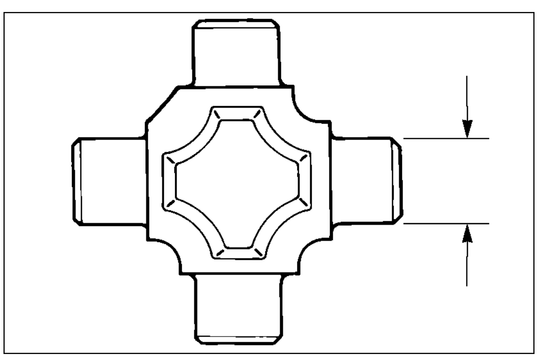
Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition is found through inspection.

NOTE:

When any part of the journal assembly (spider, needle roller bearing) requires replacement, be sure to replace the entire assembly.

Check the following parts for wear, damage, noise or any other abnormal conditions:

1. Spider
2. Needle roller bearing
3. Yoke
4. Flange
5. Constant velocity joint



401RS007

Outside Diameter of Spider Pin

Standard: 17.00 mm (0.6693 in)

Limit: 16.99 mm (0.6689 in)

- Sticking of low & reverse brake solenoid valve
- Refer to symptom diagnosis No. A2: Vehicle Dose Not Run in R Range

6. If there is no parking.

- Faulty parking pawl
- Refer to symptom diagnosis No. G1: Vehicle Moves in P Range or Parking Gear in Not Disengaged other than P Range.

Notice: The check for the cause of abnormal noise and vibration must be made with extreme care as it could also be due to loss of balance in the propeller shaft, differential, the torque converter, etc. Or insufficient bending, rigidity, etc. in the powertrain.

Shift Speed Chart

1. All upshifts have a solid green line with:

- 1-2 has black filled diamond plot points
- 2-3 has black filled squre plot points
- 2-4 has back filled circular plot posints

2. All donwshift have a sloid blue line with:

- 2-1 has white filled diamonf plot points
- 3-2 has white filled squre plot points
- 4-3 has white filled circular plot points

3. Torque converter clutch apply points have a dashed orange line with:

- 2nd apply has black filled diamond plot points
- 3rd apply has black filled squre plot points
- 4th apply has black filled circulat plot points

4. Torque converter clutch release points have a dashed pink line with:

- 2nd release has white filled diamond plot points
- 3rd release has white filled squre plot points
- 4th release has white filled circulat plot points

TCM Signal Test

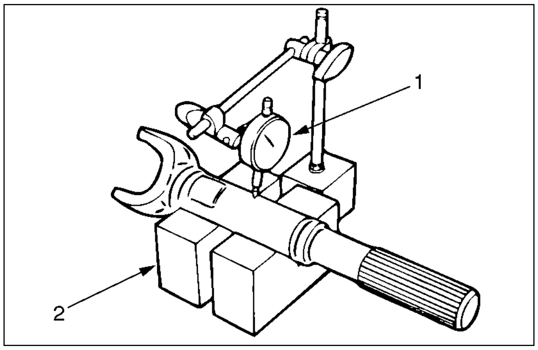
Inspection Tool

Use a DMM to measure voltage and circuit continuity. Also use an oscilloscope to measure waveform. Refer to the following table for the specified ranges or reference waveform.

Since the TCM terminals are extremely small, use appropriate test adapter from the test adapter kit. This will make measurement easier.

Pin No.	Wire color	Pin function	DMM (+)	DMM (-)	Test condition	Standard value
1 of C-94	RED/ WHT	Battery voltage	1 of C-94	Ground	Any time	Nearly 12 volts
2 of C-94	YEL/ VIO	P range switch signal	2 of C-94	Ground	P range	Nearly 12 volts
					Other than P range	Less than 2 volts
3 of C-94	RED	Brake pedal switch signal	3 of C-94	Ground	Pedal is released	Less than 2 volts
					Pedal is applied	Nearly 12 volts
4 of C-94	PNK/ WHT	3rd start lamp control	4 of C-94 (back probe)	Ground	Lamp OFF	Nearly 12 volts
					Lamp ON	Less than 2 volts
5 of C-94	VIO/ GRN	Keyword serial data communication	5 of C-94	7 of B-58	Ignition OFF	Continuity
6 of C-94	—	Not used	—	—	—	—
7 of C-94	BLK/ RED	Engine speed signal input	7 of C-94 (back probe)	5 of C-95 (back probe)	Engine run at 2000 RPM	Nearly 6.2 volts by AC range or waveform
8 of C-94	—	Not used	—	—	—	—
9 of C-94	—	Not used	—	—	—	—
10 of C-94	BLK/ YEL	Vehicle speed signal output (2WD)	10 of C-94 (back probe)	5 of C-95 (back probe)	Vehicle run at 20 km/h (12 MPH)	Nearly 6.5 volts by AC range or waveform
11 of C-94	GRN/ WHT	3rd start switch signal	11 of C-94 (back probe)	Ground	Switch is released	Nearly 12 volts
					Switch is pressed	Less than 2 volts
12 of C-94	BLU/ WHT	4WD low signal output	12 of C-94 (back probe)	Ground	4L mode	Less than 2 volts
					Other than 4L	Nearly 12 volts
13 of C-94	—	Not used	—	—	—	—
14 of C-94	—	Not used	—	—	—	—
15 of C-94	—	Not used	—	—	—	—
16 of C-94	RED/ WHT	Accelerator pedal position (APP) signal input	16 of C-94 (back probe)	5 of C-95	Pedal is released (0%)	Off duty ratio 10%
					Pedal is fully applied (100%)	Off duty ratio 90%
17 of C-94	BLK/GRN	3 range switch signal	17 of C-94	Ground	3 range	Nearly 12 volts
					Other than 3 range	Less than 2 volts
18 of C-94	YEL/ BLK	Diagnostic request switch	5 of C-94	11 of B-58	Ignition OFF	Continuity
19 of C-94	ORN/ BLU	Transmission oil temperature lamp control	19 of C-94 (back probe)	Ground	Lamp OFF	Nearly 12 volts
					Lamp ON	Less than 2 volts
20 of C-94	GRY/ YEL	Check trans lamp control	20 of C-94 (back probe)	Ground	Lamp OFF	Nearly 12 volts
					Lamp ON	Less than 2 volts
21 of C-94	PNK	Power drive lamp control	21 of C-94 (back probe)	Ground	Lamp OFF	Nearly 12 volts
					Lamp ON	Less than 2 volts

Pin No.	Wire color	Pin function	DMM (+)	DMM (-)	Test condition	Standard value
22 of C-94	—	Not used	—	—	—	—
23 of C-94	—	Not used	—	—	—	—
24 of C-94	GRN/ YEL	Power drive switch signal	24 of C-94 (back probe)	Ground	Switch is OFF	Nearly 12 volts
					Switch is ON	Less than 2 volts
1 of C-95	RED/ YEL	2-4 brake TFP switch signal	1 of C-95 (back probe)	Ground	2nd or 4th gear	Less than 2 volts
					Other than 2nd or 4th gear	Nearly 12 volts
2 of C-95	PNK/ BLK	2 range switch signal	2 of C-95	Ground	2 range	Nearly 12 volts
					Other than 2 range	Less than 2 volts
3 of C-95	BRN/ RED	ISS sensor signal	3 of C-95 (back probe)	5 of C-95 (back probe)	Vehicle run at 20 km/h (12 MPH) in L range with 1st gear	Nearly 6.5 volts by AC range or waveform
4 of C-95	BLU	TFT sensor signal	4 of C-95	14 of C-95	Ignition OFF	Refer to Temperature vs. Resistance table
5 of C-95	BLK	Ground	5 of C-95	Ground	Ignition OFF	Continuity
6 of C-95	BLU/ BLK	Low & reverse brake solenoid control	6 of C-95 (back probe)	22 of C-95 (back probe)	P or N range	Nearly 6.2 volts by AC range or waveform
7 of C-95	BLK/ YEL	2 & 4 brake solenoid control	7 of C-95 (back probe)	22 of C-95 (back probe)	P or N range	Nearly 6.2 volts by AC range or waveform
8 of C-95	RED	High clutch solenoid control	8 of C-95 (back probe)	22 of C-95 (back probe)	P or N range	Nearly 6.2 volts by AC range or waveform
9 of C-95	WHT/ BLU	Low clutch solenoid control	9 of C-95 (back probe)	22 of C-95 (back probe)	D range with 4th gear	Nearly 6.2 volts by AC range or waveform
10 of C-95	RED/ BLK	N range switch signal	10 of C-95	Ground	2 range	Nearly 12 volts
					Other than 2 range	Less than 2 volts
11 of C-95	BLU	D range switch signal	11 of C-95	Ground	D range	Nearly 12 volts
					Other than 2 range	Less than 2 volts
12 of C-95	YEL	Low & reverse brake TFP switch	12 of C-95 (back probe)	Ground	R range or L range	Less than 2 volts
					Other than R range or L range	Nearly 12 volts
13 of C-95	YEL/ RED	OSS sensor signal	13 of C-95 (back probe)	5 of C-95 (back probe)	Vehicle run at 20 km/h (12 MPH) in L range with 1st gear	Nearly 6.8 volts by AC range or waveform
14 of C-95	BLU/ BLK	TFT sensor low reference	4 of C-95	14 of C-95	Ignition OFF	Refer to Temperature vs. Resistance table
15 of C-95	—	Not used	—	—	—	—
16 of C-95	—	Not used	—	—	—	—
17 of C-95	BLK	TCC solenoid control	17 of C-95 (back probe)	5 of C-95 (back probe)	TCC is commanded OFF	Waveform
					TCC is commanded ON	Waveform
18 of C-95	WHT	Ignition voltage	18 of C-95	Ground	Ignition switch ON	Nearly 12 volts



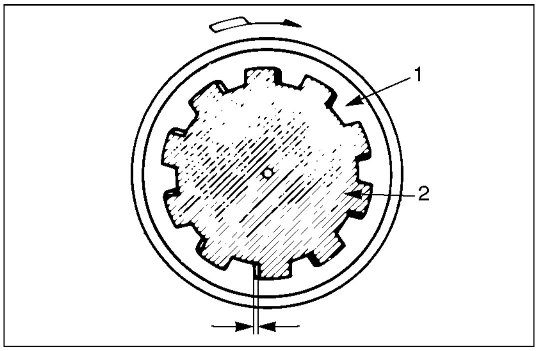
401RS027

Propeller Shaft Run-out

Support the ends of the propeller shaft on V-blocks (2) and check for run-out by holding the probe of a dial indicator (1) in contact with the center part of the shaft. If the amount of run-out is beyond the standard value for assembly, correct with a bench press or replace the shaft with a new propeller shaft assembly.

Standard: 0.3 mm (0.012 in)

Limit: 0.5 mm (0.02 in)



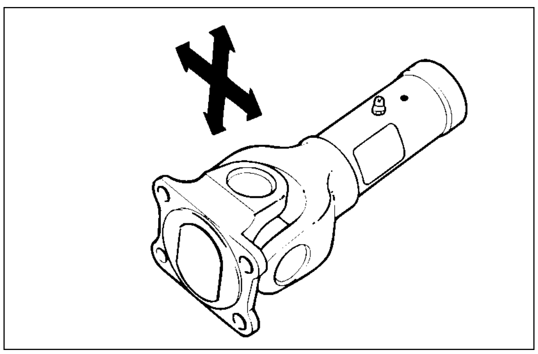
401RS009

Play in Splines in Normal Direction of Rotation

Check the amount of play between the sleeve yoke (1) and the propeller shaft spline (2) in the direction of rotation, using a pointed feeler gauge.

Standard: 0.073-0.156 mm (0.003-0.006 in)

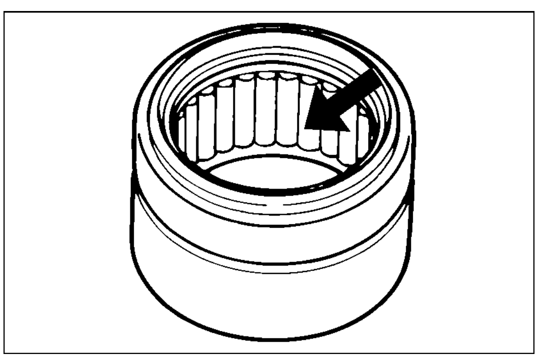
Limit: 0.3 mm (0.012 in)



401RS010

Play in Universal Joint

Limit: Less than 0.1 mm (0.004 in)



401RS011

Reassembly

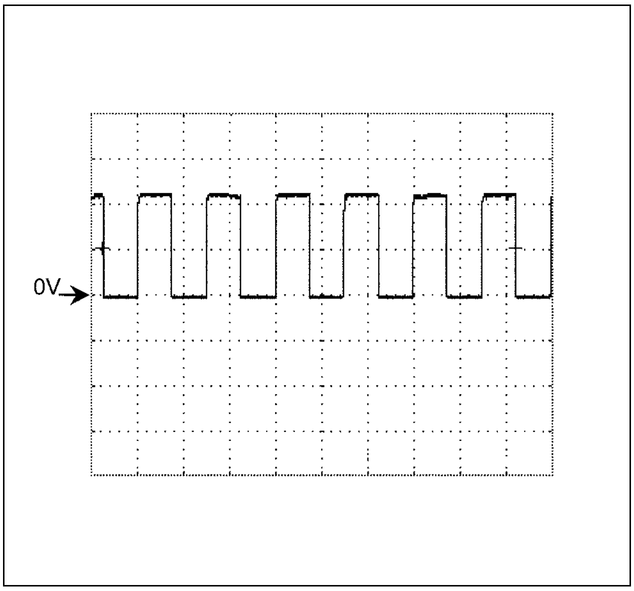
1. Install spider to flange yoke. Be sure to install the spider by aligning the setting marks made during disassembly.
2. Apply a molybdenum-disulfide grease or multi-purpose type grease NLGI No. 2 to inside of the bearing cap.

   Grease Amount: Approx. 1.2 g (0.042 oz)

Pin No.	Wire color	Pin function	DMM (+)	DMM (-)	Test condition	Standard value
19 of C-95	RED/ YEL	R range switch signal	19 of C-95	Ground	R range	Nearly 12 volts
					Other than R range	Less than 2 volts
20 of C-95	WHT/ BLK	High clutch TFP switch signal	20 of C-95 (back probe)	Ground	3rd or 4th gear	Less than 2 volts
					Other than 3rd to 4th gear	Nearly 12 volts
21 of C-95	PNK/ BLU	L range switch signal	21 of C-95	Ground	L range	Nearly 12 volts
					Other than L range	Less than 2 volts
22 of C-95	GRY/ RED	Ground return	22 of C-95	Ground	Ignition OFF	Continuity
23 of C-95	VIO	PC solenoid control	23 of C-95 (back probe)	5 of C-95 (back probe)	P or N rage	Nearly 12 volts
					D range	Less than 2 volts
24 of C-95	WHT	Ignition voltage	24 of C-95	Ground	Ignition switch ON	Nearly 12 volts

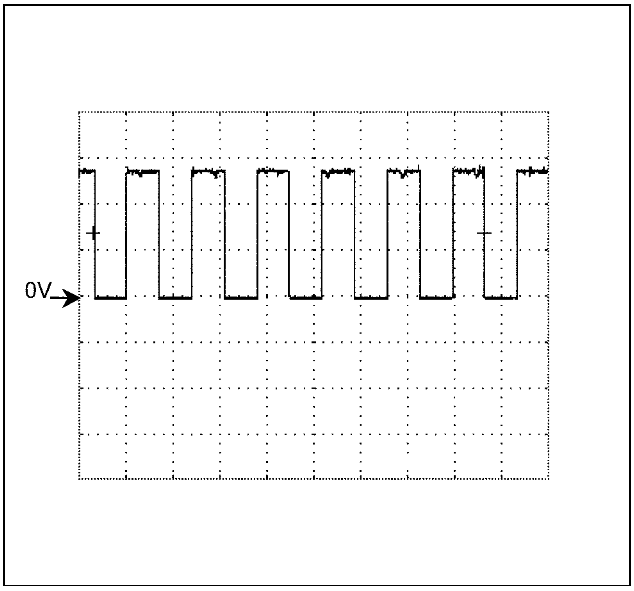
Reference Wave form

Engine speed signal



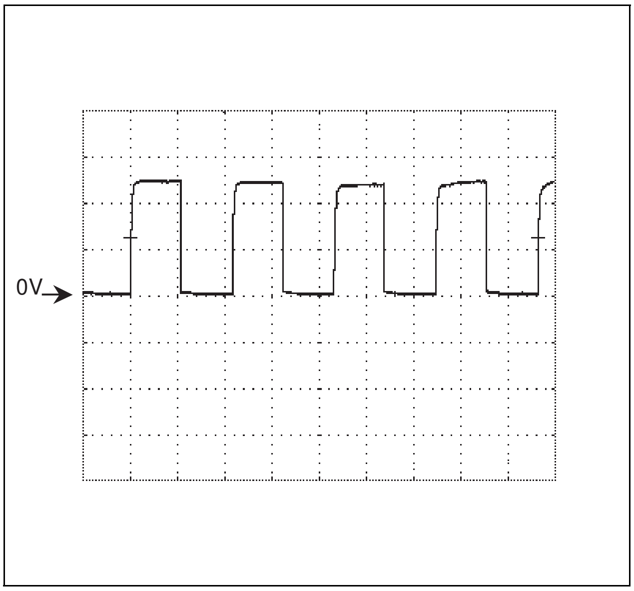
- Measurement terminal: 7 of C-94 (+) & 5 of C-95 (-)
- Measurement scale: 5 volts/div & 10 ms/div
- Measurement condition: Engine run at 2000 RPM

Vehicle speed signal



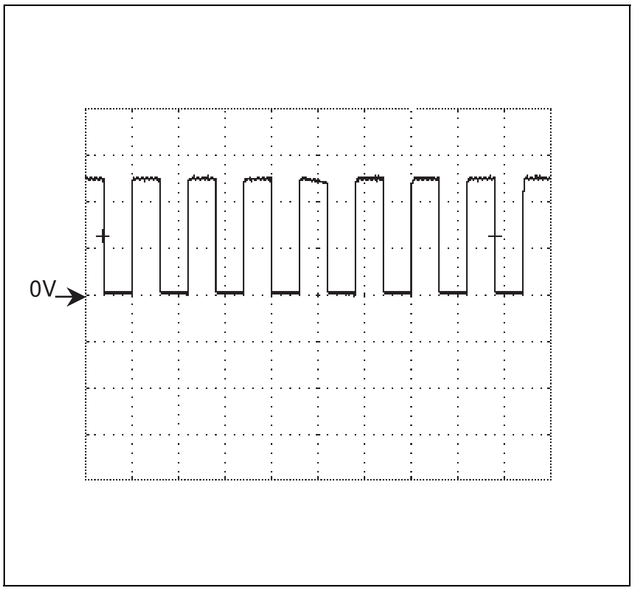
- Measurement terminal: 10 of C-94 (+) & 5 of C-95 (-)
- Measurement scale: 5 volts/div & 50 ms/div
- Measurement condition: Vehicle run at 20 km/h (12 MPH)

Input shaft speed (ISS) sensor signal



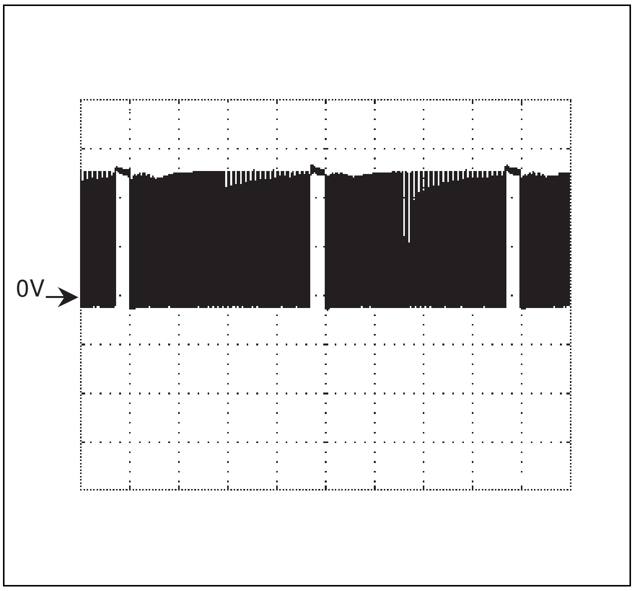
- Measurement terminal: 3 of C-95 (+) & 5 of C-95 (-)
- Measurement scale: 5 volts/div & 500 micro sec./div
- Measurement condition: Vehicle run at 20 km/h (12 MPH) in L range with 1st gear

Output shaft speed (OSS) sensor signal



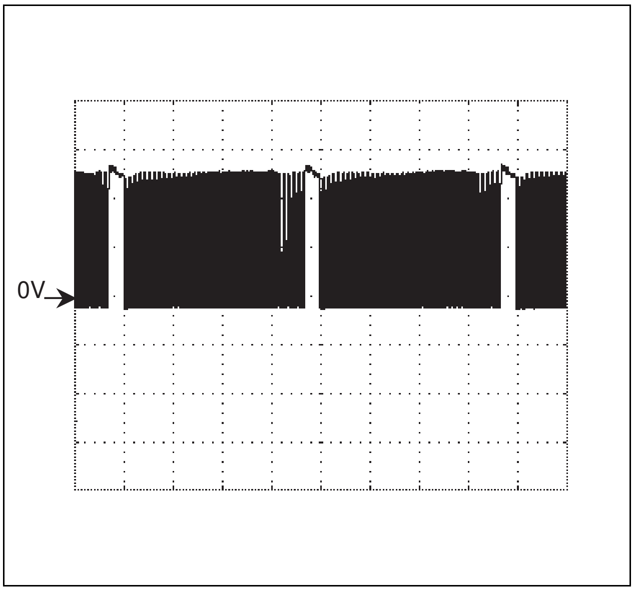
- Measurement terminal: 13 of C-95 (+) & 5 of C-95 (-)
- Measurement scale: 5 volts/div & 5 ms/div
- Measurement condition: Vehicle run at 20 km/h (12 MPH) in L range with 1st gear

Low & reverse brake solenoid valve control signal



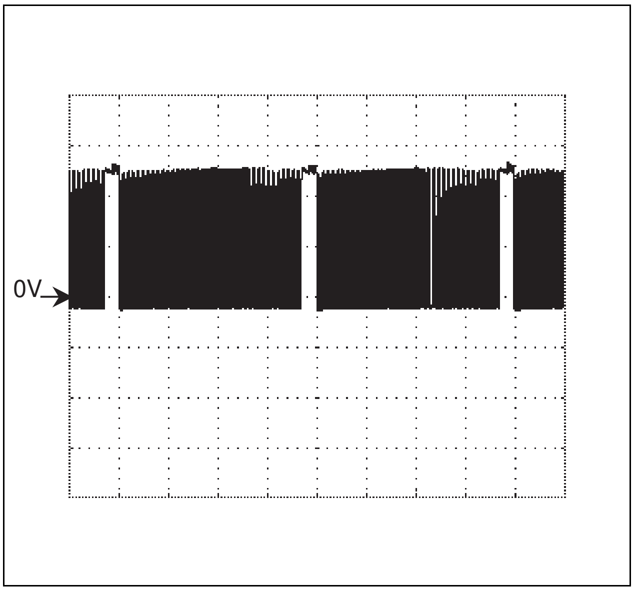
- Measurement terminal: 6 of C-95 (+) & 22 of C-95 (-)
- Measurement scale: 5 volts/div & 10 ms/div
- Measurement condition: P or N range

2-4 brake solenoid valve control signal



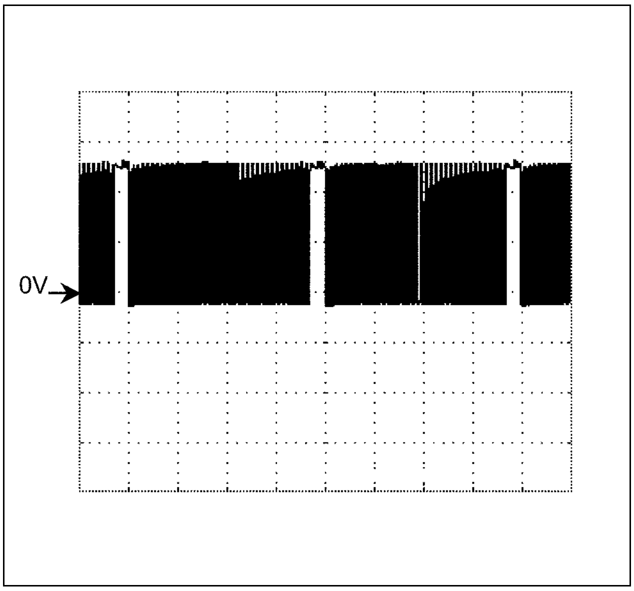
- Measurement terminal: 7 of C-95 (+) & 22 of C-95 (-)
- Measurement scale: 5 volts/div & 10 ms/div
- Measurement condition: P or N range

High clutch solenoid valve control signal



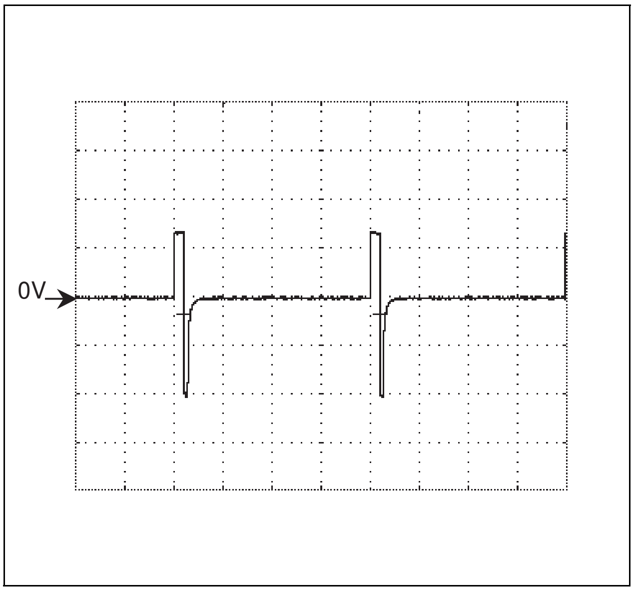
- Measurement terminal: 8 of C-95 (+) & 22 of C-95 (-)
- Measurement scale: 5 volts/div & 10 ms/div
- Measurement condition: P or N range

Low clutch solenoid valve control signal



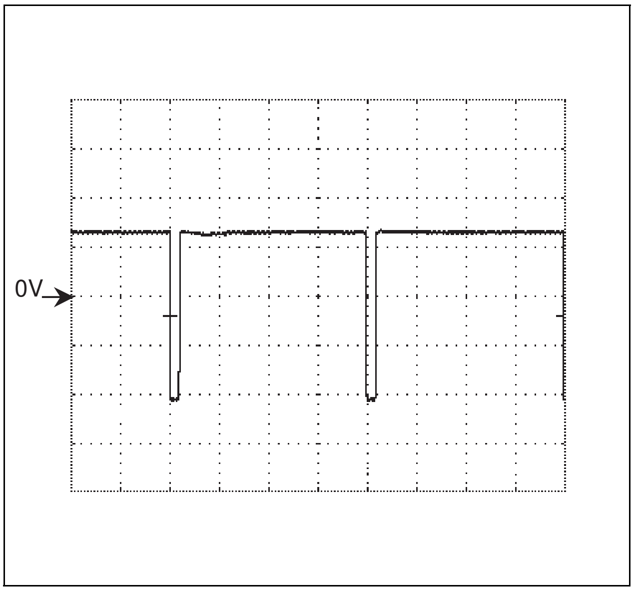
- Measurement terminal: 9 of C-95 (+) & 22 of C-95 (-)
- Measurement scale: 5 volts/div & 10 ms/div
- Measurement condition: D range with 4th gear

Torque converter clutch (TCC) solenoid valve control signal



- Measurement terminal: 17 of C-95 (+) & 5 of C-95 (-)
- Measurement scale: 10 volts/div & 5 ms/div
- Measurement condition: TCC is commanded OFF

Torque converter clutch (TCC) solenoid valve control signal



- Measurement terminal: 17 of C-95 (+) & 5 of C-95 (-)
- Measurement scale: 10 volts/div & 5 ms/div
- Measurement condition: TCC is commanded ON

Repair Instructions

Transmission Controls Module (TCM) Replacement

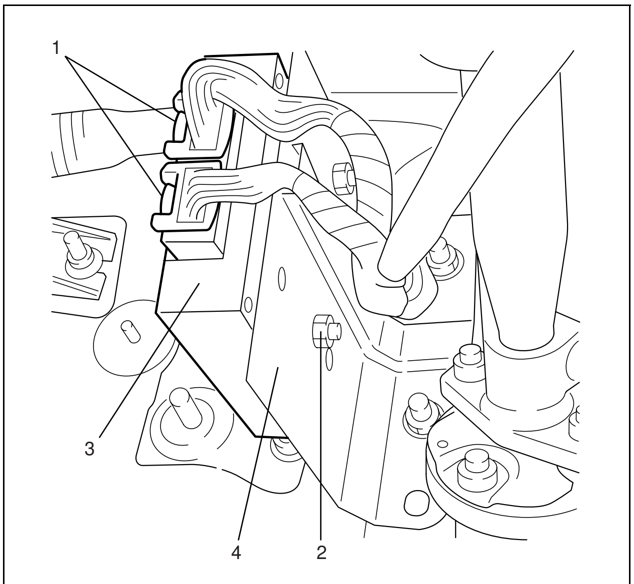
Description

The following A - C steps provide an overview procedure to replace and reprogram a TCM. Each A -C steps is explained further in this section.
A. Replace the old TCM with the new TCM.
B. Program the latest software and calibrations into the new TCM using the Service Programming System (SPS) if released. If not released, do not perform this and skip to Step C.
C. Program the vehicle identification number (VIN) into the TCM.

A. Removal and Installation

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the TCM harness connectors (1).
3. Loosen nuts (2) and remove the TCM (3) from the bracket (4).



Installation Procedure

Follow the removal steps in the reverse order. Be sure that the connectors are securely fastened.

B. Programming Software and Calibrations

Program the latest software/ calibrations if released. Refer to Service Programming System (SPS) Description and SPS (Remote Procedure) or SPS (Pass-Thru Procedure) in this section. If not released, do not perform this and skip to Step C.

C. Programming Vehicle Identification Number (VIN)

Notice: If you have performed SPS in the previous step, VIN has prgrommaned already. Programming VIN is not necessary in this step.

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > appropriate vehicle identification > AT JR405E > Programming > Program VIN.
4. If you installed a new, skip to step 8. If you installed a reused TCM from another vehicle or incorrect VIN is programmed before, the TCM might be locked already. In order to get programming approval, the on-screen displays a message to user. Get programming approval from the TIS 2000 using the following procedure:
   a. Connect a scan tool to the terminal that installed TIS 2000 with the latest software and the hardware key is plugged into port.
   b. Turn ON the scan tool and keep at title screen.
   c. Launch the TIS application.
   d. Select the Security Access at the main screen.
   e. Highlight the “Tech 2" on the Diagnostic Tool Selection screen and click “Next”.
   f. Click “Close” on the Security Access Enabled screen.
   g. Turn OFF the scan tool.
   h. Disconnect the scan tool from the terminal.
5. Install a scan tool to the vehicle.
6. Turn ON the ignition, with the engine OFF.
7. Select Diagnostics > appropriate vehicle identification > AT JR405E > Programming > Program VIN.
8. Input 17 digits of correct VIN.
9. After complete the programming, turn OFF/ ON the ignition.
10. Select Diagnostics > Lock ECU.
11. Follow the on-screen instructions and turn OFF/ ON the ignition.

Service Programming System (SPS) Description

The service programming system (SPS) allows a technician to program a control module through the data link connector (DLC). The information transfer circuit that is used at the DLC is the same serial data circuit used by the scan tool for retrieving DTCs, displaying data, clearing DTCs etc. This procedure offers the ability to install software/ calibrations matched to a particular vehicle.
Most control modules have two types of memory. The software/ calibrations reside in the flash memory. The two types of memory are listed below:

- Electrically Erasable Programmable Read Only Memory (EEPROM)
  This type of memory allows selected portions of memory to be programmed while other portions remain unchanged.
  Certain learned values reside in the EEPROM, such as:
  - The vehicle identification number (VIN)
  - The software/ calibrations identification numbers
  - The control module security information
- Flash Read Only Memory-Flash Memory

Flash memory has increased memory storage capacity. During programming, all information within this type of memory is erased, and then replaced with entirely new information.

Service Programming Methods

The two methods of programming a TCM are listed below:

- Remote Programming
- Pass Thru Programming

For information on programming a TCM using one of the methods listed above, refer to Service Programming System (SPS) (Remote Procedure) or Service Programming System (SPS) (Pass-Thru Procedure).

Before Programming a Control Module

Important: DO NOT program an existing TCM with the identical software/ calibration package. This procedure is not a short cut to correct the driveability condition. This is an ineffective repair. An TCM should only be programmed when the following occurs:

- When a service procedure instructs you to replace the TCM.
- An updated software/ calibrations is released.

Ensure that the following conditions are met before programming a TCM:

- The scan tool PCMCIA card is programmed with the latest software.
- The TIS 2000 is installed with the latest software.
- The hardware key is plugged into the computer port.
- Vehicle system voltage:
  - There are no charging system concerns. All charging system concerns must be repaired before programming the TCM.
  - The battery voltage is greater than 12 volts but less than 16 volts. The battery must be fully charged before programming the TCM.
  - A battery charger is NOT connected to the vehicles battery. Incorrect system voltage or voltage fluctuations from a battery charger may cause programming failure or TCM damage.
  - Turn OFF or disable any system that may put a load on the vehicles battery. Turn OFF or disable systems such as:
    - ◊ Heating, ventilation, and air conditioning (HVAC) systems
    - ◊ Headlights
    - ◊ Room lights
    - ◊ Accessory equipment
- The ignition switch is in the proper position. The scan tool prompts you to turn ON the ignition, with the engine OFF. DO NOT change the position of the ignition switch during the programming procedure unless instructed to do so.
- All tool connections are secure:
  - The RS-232 cable
  - The connection at the DLC
  - The voltage supply circuits
- DO NOT disturb the tool harnesses while programming. If an interruption occurs during the programming procedure, programming failure or TCM damage may occur.
- If you are performing the Pass-Thru programming procedure using a notebook computer without the power cord, ensure that the internal battery is fully charged.

Service Programming System (SPS) (Remote Procedure)

Notice: Some module will not accept SPS remote procedure using 10MB PCMCIA card. In such case, use 32MB PCMCIA card or SPS pass-thru procedure.

The Remote SPS method is a three-step process that involves the following procedures:

1. Connecting the scan tool to the vehicle and obtaining the information from the TCM.
2. Connecting the scan tool to the terminal and downloading a new calibration file from the terminal into the scan tool memory.
3. Reconnecting the scan tool to the vehicle and uploading the new calibration file into the TCM.

Performing the Remote Procedure

1. Connect a scan tool to the vehicle and obtain the TCM information using the following procedure:

Notice: Ensure the TCM is installed in the vehicle and the battery is fully charged before programming.

   a. Install a scan tool.
   b. Turn ON the ignition, with the engine OFF.
   c. Select Service Programming System (SPS) > Request Info.

d. If there is already stored in the scan tool, the existing data is displayed on the screen. The scan tool asks user to keep existing data "Keep Data" or "Continue" to request new vehicle information from the TCM. If there is no data in the scan tool, it will immediately start vehicle identification.
e. Select the vehicle description by following the on-screen instructions based on stamped VIN or affixed VIN plate on the vehicle.
f. During obtaining information, the scan tool is receiving information from all modules at the same time. But only ECM information is displayed on the screen.
g. Turn OFF all accessories and press "Okay".
h. Verify that the correct VIN is displayed on the scan tool. If the VIN is incorrect or no VIN, record the correct VIN.

2. Turn OFF the ignition.
3. Turn OFF the scan tool and disconnect from the vehicle.
4. Transfer the data from the terminal to the scan tool using the following procedure:

Notice: The TIS supports service programming with the Tech 2 scan tool only.

a. Connect the scan tool to the terminal.
b. Launch the TIS application.
c. Select the Service Programming System at the main screen.
d. Highlight the following information on the Select Diagnostic Tool and Programming Process screen, then click "Next".
   - Select Diagnostic Tool - Tech 2
   - Select Programming Process - Identify whether an existing TCM is being reprogrammed or a TCM is being replaced with a new one
   - Select ECU Location - Vehicle
e. Verify the connections on the Preparing for Communication screen, then click "Next".
f. Verify the VIN on the Validate Vehicle Identification Number (VIN) screen, then click "Next".

Notice: If the TCM is replaced to new one, VIN does not displayed. Input correct VIN reading from stamped VIN or affixed VIN plate on the vehicle. If the TCM from another vehicle is installed, input correct VIN by same way.

g. Highlight Transmission on the Select System Type screen, then click "Next", if on-screen instruction displayed.
h. Complete the following information based on the service ID plate on the Validate Vehicle Data screen until "Next" is highlighted, then click "Next".
   - Model
   - Model year
   - Engine type
   - Model designator
   - Destination code
   - Transmission type
i. Verify your selection on the Summary screen.

Notice: Refer to Service Bulletin and Description column before service programming is performed if the bulletins are listed along with the calibration files.

Notice: Select Cancel if you receive a message stating that the calibration selected is already the current calibration in the TCM and reprogramming with the same download is not allowed.

j. Click "Reprog".
k. The Transfer Data screen will appear until the progress bar reaches 100%.

5. Close the application and return to the TIS application selection screen after the download is completed.
6. Turn OFF the scan tool and disconnect from the terminal.
7. Transfer the data from the scan tool to the TCM using the following procedure:

a. Install a scan tool.
b. Turn ON the ignition, with the engine OFF.
c. Select Service Programming System (SPS) > Program ECU.
d. Turn OFF all accessories and press "Continue".
e. Programming in Process will appear until the progress bar reaches 100%.

Notice: Some warning lamp may turn ON or blink while programming the TCM since communication between the TCM and other modules are interrupted. Clear DTC in any module after programming.

f. Press "Continue" and exit the program after the scan tool displays "Programming Was Successful".

8. Turn OFF the ignition.
9. Turn OFF the scan tool and disconnect from the vehicle.

Service Programming System (SPS) (Pass-Thru Procedure)

Pass-Thru programming allows the scan tool to remain connected to the terminal and to the vehicle throughout the programming process. The vehicle must be in close proximity to the terminal while using Pass-Thru.

1. Launch the TIS application.
2. Select the Service Programming System at the main screen.
3. Highlight the following information on the Select Diagnostic Tool and Programming Process screen, then click "Next":
   - Select Diagnostic Tool-Select Pass - Thru

- Select Programming Process - Identify whether as existing TCM is being reprogrammed or an TCM is being replaced with a new one.
- Select ECU Location - Vehicle

4. Complete all vehicle data on the Preparing for Communication/ Determine Vehicle screen until “Next” is highlighted, then click “Next”.
5. Follow the instruction on the Preparing for Communication screen, then click “Next”.

Notice: In order to reduce the potential for signal loss, the RS-232 cable should not be more than 25 feet long.

6. Verify the VIN on the Validate Vehicle Identification Number (VIN) screen, then click “Next”.

Notice: If the TCM is replaced to new one, VIN does not displayed. Input correct VIN reading from stamped VIN or affixed VIN plate on the vehicle. If the TCM from another vehicle is installed, input correct VIN by same way.

7. Highlight Transmission on the Select System Type screen, then click “Next”, if on-screen instruction displayed.
8. Complete the following information based on the service ID plate on the Validate Vehicle Data screen until “Next” is highlighted, then click “Next”.
   - Model
   - Model year
   - Engine type
   - Model designator
   - Destination code
   - Transmission type
9. Verify your selection on the Summary screen.

Notice: Refer to Service Bulletin and Description column before service programming is performed if the bulletins are listed along with the calibration files.

Notice: Select Cancel if you receive a message stating that the calibration selected is already the current calibration in the TCM and reprogramming with the same download is not allowed.

10. Click “Reprog”.
11. The Transfer Data screen will appear until the progress bar reaches 100%.

Notice: Some warning lamp may turn ON or blink while programming the TCM since communication between the TCM and other modules are interrupted. Clear DTC in any module after programming.

12. Close the application and return to the TIS application selection screen after the download is completed.
13. Turn OFF the ignition.
14. Turn OFF the scan tool and disconnect from the vehicle.

Description and Operation

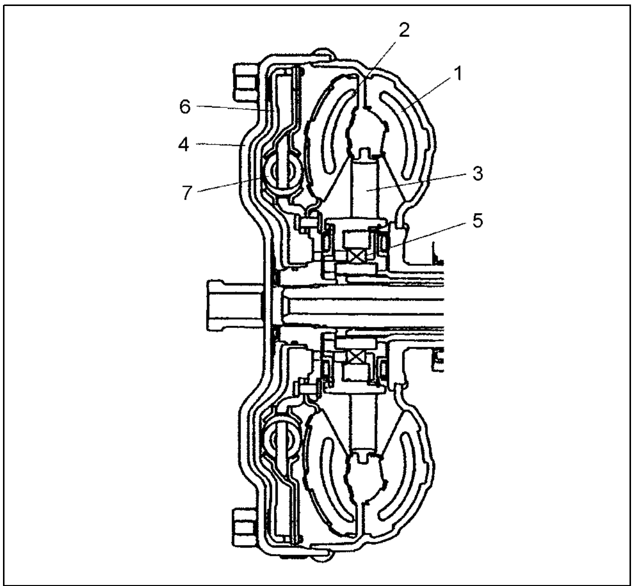
11. Oil pump
12. Valve body
13. Low one-way clutch
14. Parking gear

The JR405E automatic transmission is electrically controlled by a transmission control module (TCM). There are four forward speeds and one reverse speed. This JR405E automatic transmission employs a clutch pressure direct control system (Direct Electronic Shift Control: DESC) using duty cycle type solenoid valves, which ensure high shift quality. This transmission also has a learning function and constantly checks the time of each clutch and brake required for the shift in order to match this time with the target value for the optimum shift. The TCM will automatically select the most appropriate shift points and lock-up points depending on the accelerator pedal opening, the vehicle speed and the vehicle load. If any trouble arises in the speed sensor, solenoid valve, etc., the fail-safe control function is activated to keep the running performance.
The JR405E automatic transmission consists of the torque converter, oil pump, input shaft, out put shaft, planetary gears and valve body. The gear train consists of two planetary gear sets and three multiple plate clutches in combination with two multiple plate brakes and a one-way clutch.

Transmission Component Description

Torque Converter



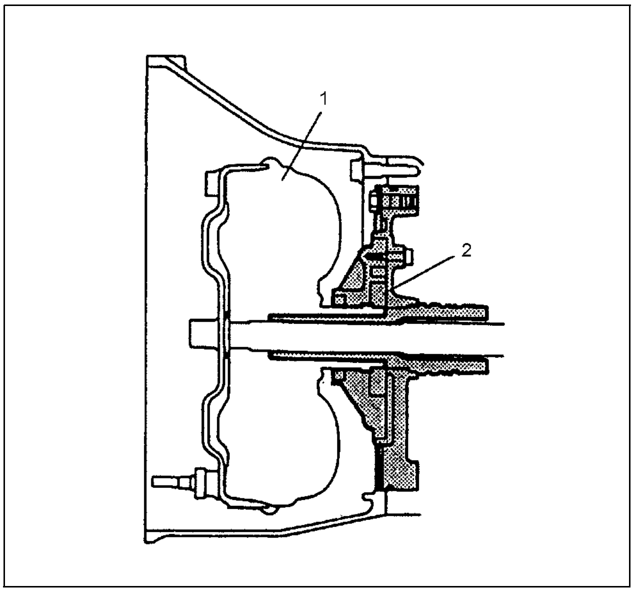
Legend

1. Pump impeller
2. Turbine runner
3. Stator
4. Converter front cover
5. One-way clutch
6. Torque converter clutch (TCC) piston
7. Torsion damper

The torque converter is a device for transmitting the engine torque to the transmission. It transmits power by means of oil when the lock up clutch is disengaged, and by means of a lock up clutch when it is engaged.

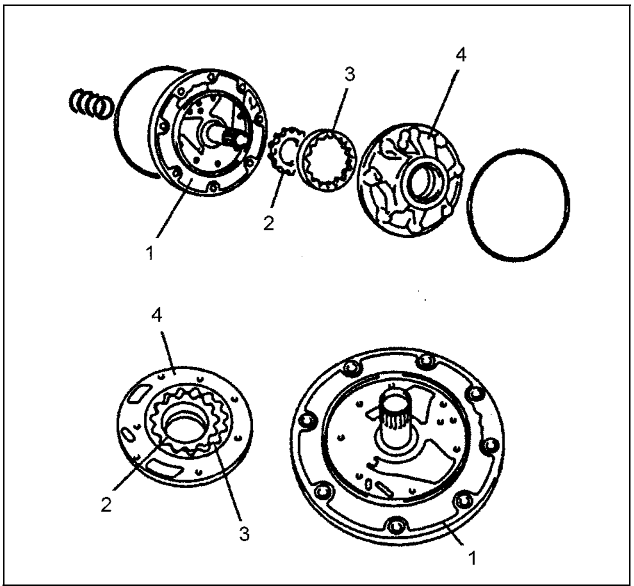
The torque converter is of the symmetrical, three-element, single-stage, two-phase type. As shown in the picture, the symmetrical three-elements refer to three elements (components) consisting of impeller (1), turbine (2) and stator (3) that are arranged symmetrically. Single-stage means that there is only one turbine as an output element; two-phase means that the pump impeller acts as a torque converter when the turbine speed is comparatively low, and as a fluid coupling when the speed is high. Lock up refers to a fixed state of the lock up clutch (=torque converter clutch (TCC) inside the torque converter and thus connects the engine directly to the transmission.

Oil Pump



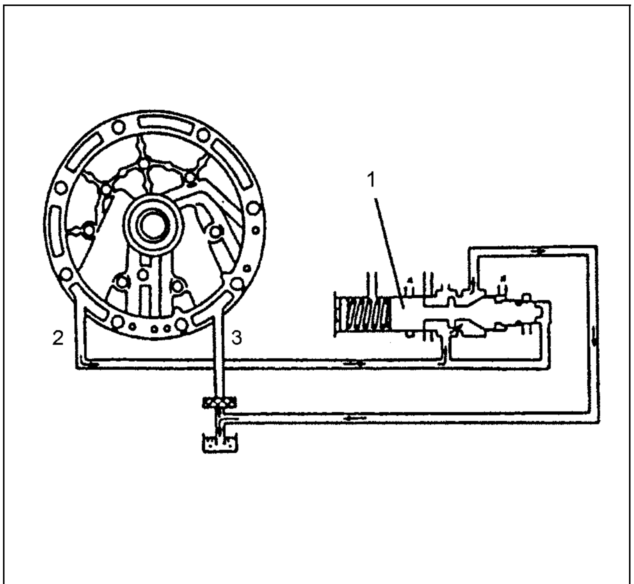
Legend

1. Torque converter
2. Oil pump



Legend
1. Oil pump cover
2. Inner rotor
3. Outer rotor
4. Oil pump housing

The oil pump generating oil pressure is a small sized trochoid gear type oil pump. It feeds oil to the torque converter, lubricates the power train mechanism, and feeds the oil pressure to the oil pressure control unit under pressure. The oil pump is located behind the torque converter. Since the inner rotor in the oil pump is fitted with the drive sleeve of the torque converter, it works using power from the engine.



Legend
1. Pressure regulator valve
2. Outlet
3. Inlet

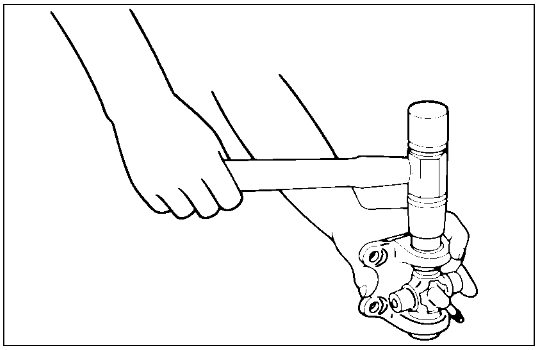
When the inner rotor in the oil pump rotates, transmission fluid is sucked in from the oil pan, passed between the inner rotor, outer rotor and crescent, and then discharged. This discharged pressure is sent to the pressure regulator valve in the valve body, and adjusted as required for operating the transmission. The flow rate under pressure increases or decreases in proportion to the number of rotations.

Input Shaft

The input shaft has some oil holes, through which lubricating transmission fluid is supplied to the torque converter, the bearings, etc. The input shaft is fitted to the turbine runner in the torque converter, the reverse & high clutch drum and the rear sun gear by means of the spline. Therefore, the engine driving force received by the torque converter is transmitted to the reverse & high clutch drum and rear sun gear.

Output Shaft

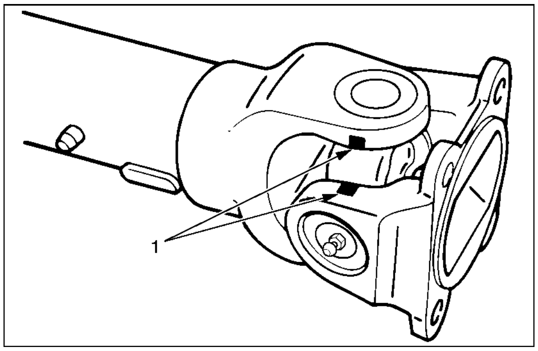
The output shaft has some oil holes, through which the lubricating transmission fluid is supplied to the bearings, the planetary gear unit, etc. The output shaft transmits the engine driving force from the planetary gear to the propeller shaft. The front internal gear is fitted with the rear carrier assembly by spline. The parking gear is also fitted by spline. By fixing this gear mechanically, the output shaft is fixed as required when parking the vehicle.



401RS012

3. Using either a mallet (or copper hammer) or a press, install the needle roller bearing into the yoke so that the snap ring can be installed in its groove.

CAUTION:
The needle roller bearing cannot be installed smoothly if it is set at an incorrect angle with the flange and excessive hammering will damage the needle roller bearing.



401RS028

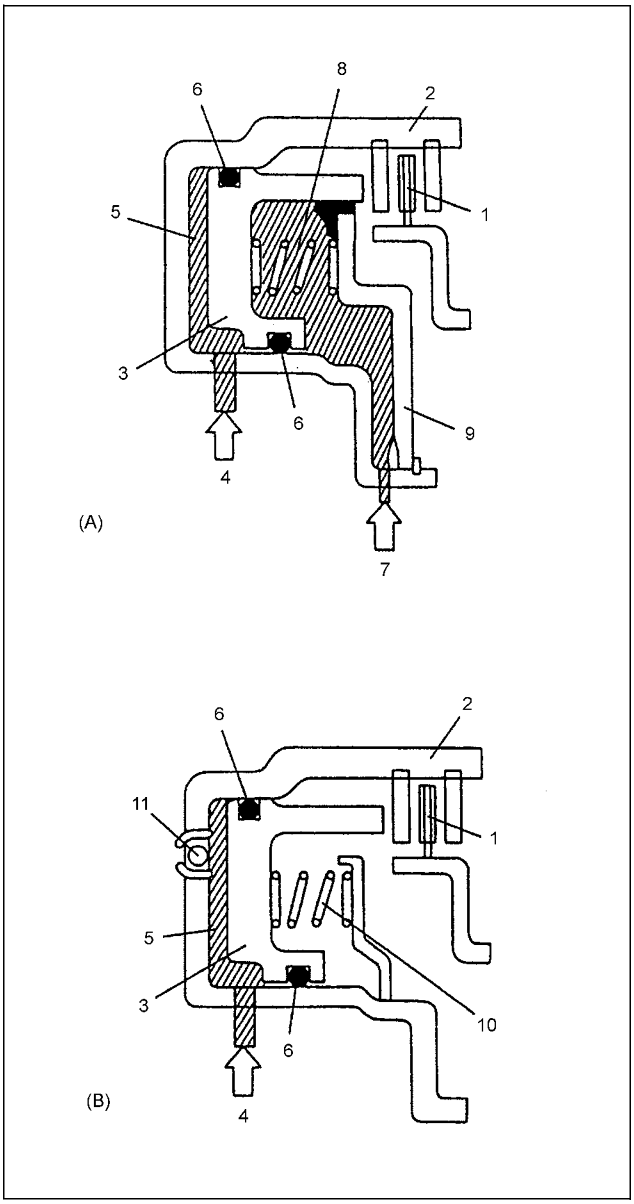
4. Align setting marks (1) and join the yokes.
5. Install snap ring.

NOTE:
Discard used snap rings and install new ones.
When the bearing cap is in position, select and attach a snap ring of suitable thickness so that the end play of the spider pin is held within 0.1 mm (0.004 in).

Snap ring thickness and Identification color
1.50 mm (0.059 in); Light Blue
1.53 mm (0.060 in); White
1.56 mm (0.061 in); Pink
1.59 mm (0.063 in); Yellow
1.62 mm (0.064 in); Green
1.65 mm (0.065 in); Brown
1.68 mm (0.066 in); Not colored

NOTE:
Be sure to use snap rings of the same thickness on both sides.

Low Clutch, High Clutch and Reverse Clutch



Legend

1. Clutch
2. Clutch drum
3. Clutch piston
4. Clutch fluid pressure
5. Clutch chamber
6. Oil seal
7. Lunrication circuit
8. Centrifugal balance chamber
9. Centrifugal cancel cover
10. Return spring
11. Piston check ball

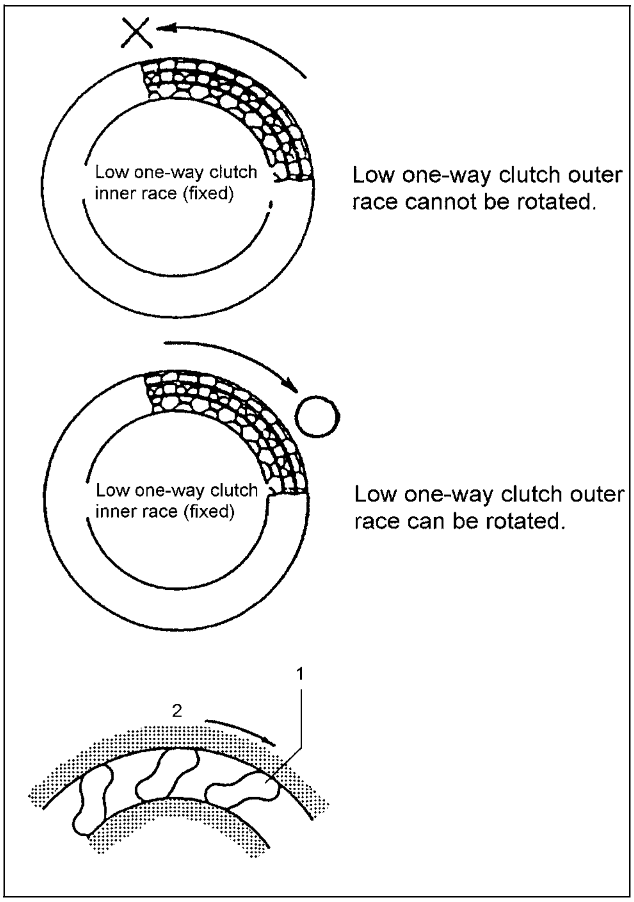
The multi-plate clutch is composed of drive plates and driven plates. By applying the oil pressure onto the end surface of the plates, the clutch is engaged. The oil pressure is adjusted with the spool valves according to the signal from the TCM. All clutches use dish plates to prevent uncontrolled operation of the clutches when engaged, causing a shock.

For the low clutch and high clutch (A), a centrifugal balance chamber full of transmission fluid is provided to offset the excessive oil pressure. This prevents clutch drag caused by oil pressure generated by residual transmission fluid due to the centrifugal force while the clutch is racing (under no oil pressure).
For the reverse clutch (B), a piston check ball is used to release the oil pressure. This prevents clutch drag caused by oil pressure generated by residual transmission fluid due to the centrifugal force while the clutch is racing (under no oil pressure).
The solenoid valve in the valve body is driven based on the shift signal from the TCM, it moves the shift valve, thereby engaging the drive plate and driven plate through the piston of each clutch. As a result, elements of the planetary gear unit are combined. When the oil pressure is removed, the piston returns to the original position via the force of the return spring.

2-4 Brake and Low & Reverse Brake

The multi-plate brake is composed of drive plates and driven plates. By applying the oil pressure onto the end surface of the plates, the brake is engaged. The oil pressure is adjusted with the spool valve according to the signal from the TCM. All brakes use dish plates to prevent uncontrolled operation of the clutches when engaged, causing a shock.
The solenoid valve in the valve body is driven based on the shift signal from the TCM, it moves the shift valve, thereby engaging the drive plate and driven plate through the piston of each brake. As a result, rotation of each element of the planetary gear unit is fixed. When the oil pressure is removed, the piston returns to the original position via the force of the return spring.

Low One-way Clutch

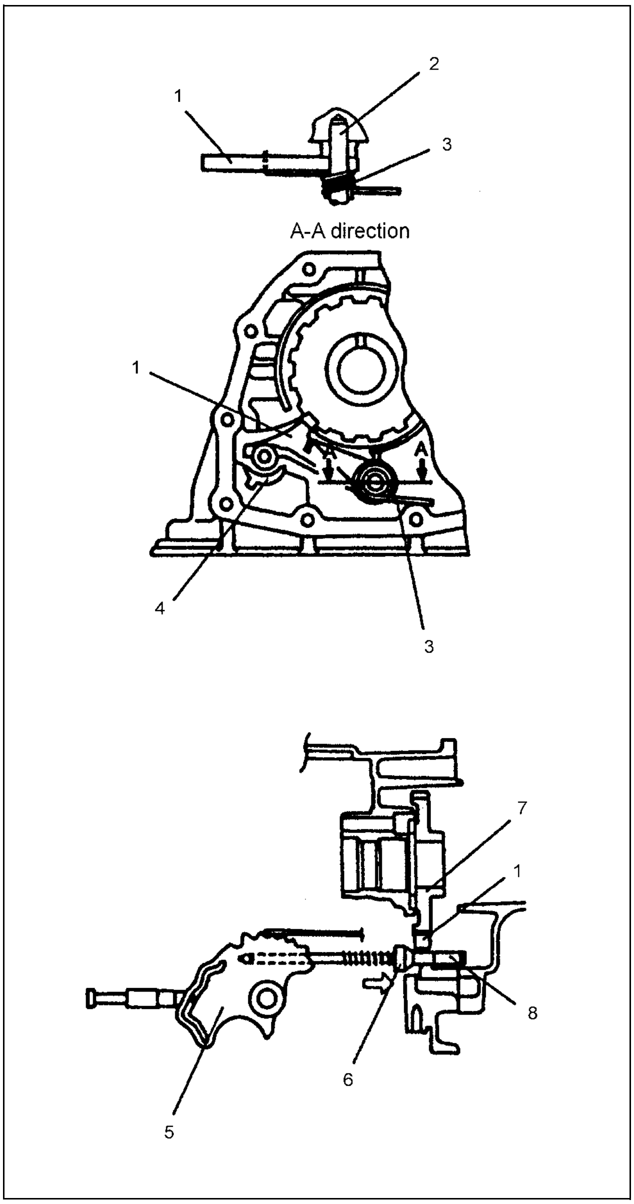


Legend

1. Sprag
2. Rotating direction

The low one-way clutch employs the sprag, which locks the counterclockwise rotation of the front planetary carrier and the rear internal gear. The one-way clutch outer race is fitted with the low clutch drum, and the inner race is fitted with the transmission case. The outer race rotates freely clockwise, but, when it attempts to rotate counterclockwise, the sprag locks the outer race. When the vehicle is traveling in 1st gear in the D, 3 or 2 position, the low one-way clutch locks the rear internal gear via the low clutch. It is left free in the 2nd, 3rd or 4th gear.

Parking Function

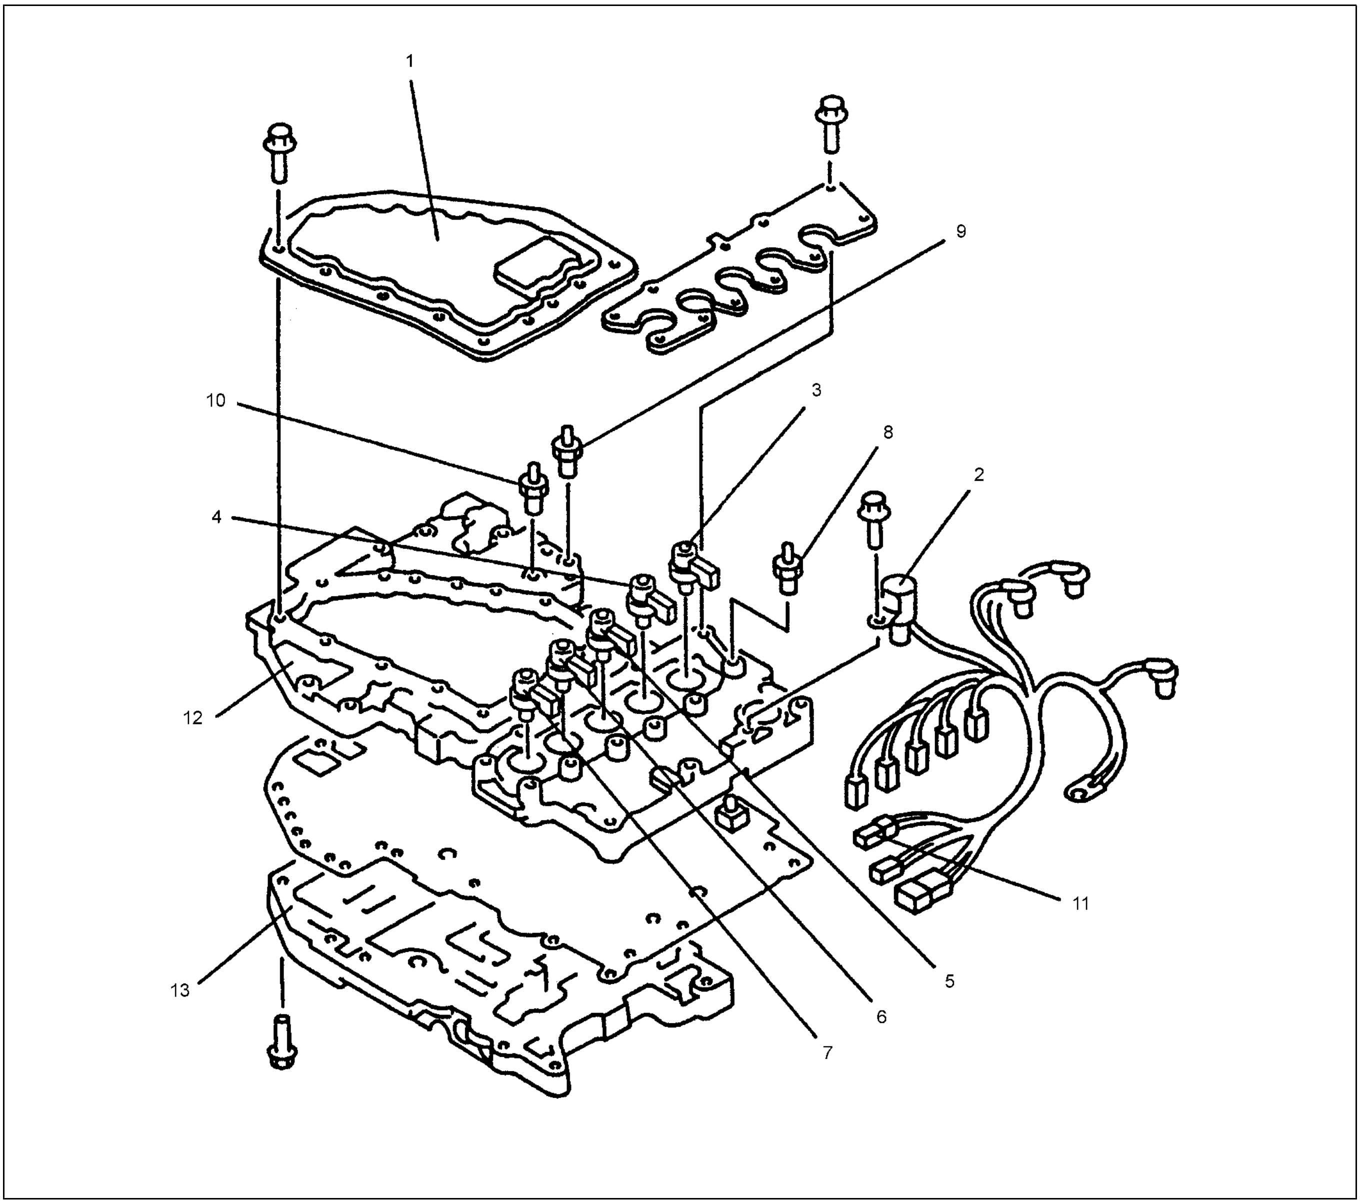


Legend

1. Parking pawl
2. Parking pawl shaft
3. Pawl return spring
4. Parking actuator support
5. Manual plate
6. Parking cam
7. Parking gear
8. Parking rod

By setting the selector lever to the P range, the parking pawl is engaged with the parking gear and fixes the output shaft. By moving the selector lever, the manual shaft on the right side of the transmission is moved. The manual plate and parking rod in the transmission is interlocked with the manual shaft. When the manual shaft moves, the parking rod end pushes up the parking pawl. The parking pawl is engaged with the parking gear when pushed up, and fixes the output shaft. When the parking is disengaged, it returns to the original position via the force of the return spring.

Valve Body Assembly



Legend

1. Oil filter
2. Pressure control (PC) solenoid valve
3. Low & reverse brake solenoid valve
4. High clutch solenoid valve
5. Torque converter clutch (TCC) solenoid valve
6. 2-4 brake solenoid valve
7. Low clutch solenoid valve

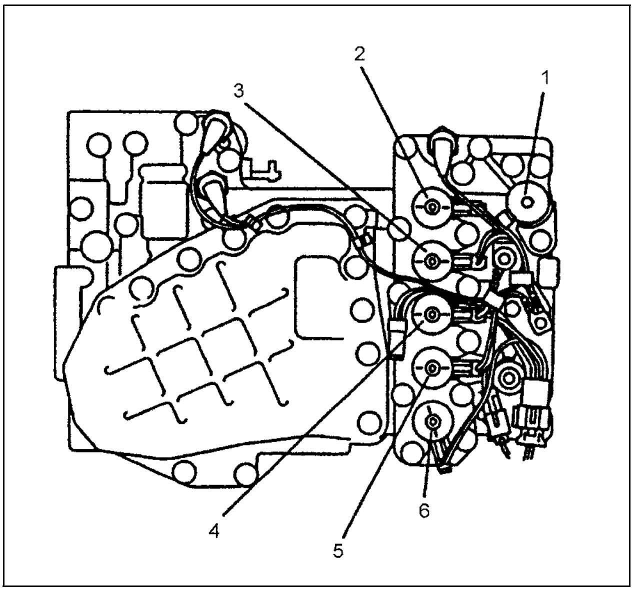
9. High clutch TFP switch
10. 2-4 brake TFP switch
11. Transmission fluid temperature (TFT) sensor
12. Lower body
13. Upper body

Employing the direct electronic control (Direct Electronic Shift Control: DESC) for the clutch pressure has simplified the oil pressure circuit, reduced the number of functional components and made the control valve compact. The control valve body is divided into the upper body and the lower body. All solenoid valves, the transmission fluid pressure (TFP) switch and the transmission fluid temperature (TFT) sensor are installed to the lower body. Three-way valve type solenoid valves providing high responsibility are employed. The pressure control (PC) solenoid valve is switched between ON and OFF, and other solenoid valves repeat ON and OFF at 50Hz (duty cycle). When the solenoid valve is driven based on the signal from the TCM, the fluid pressure is changed.



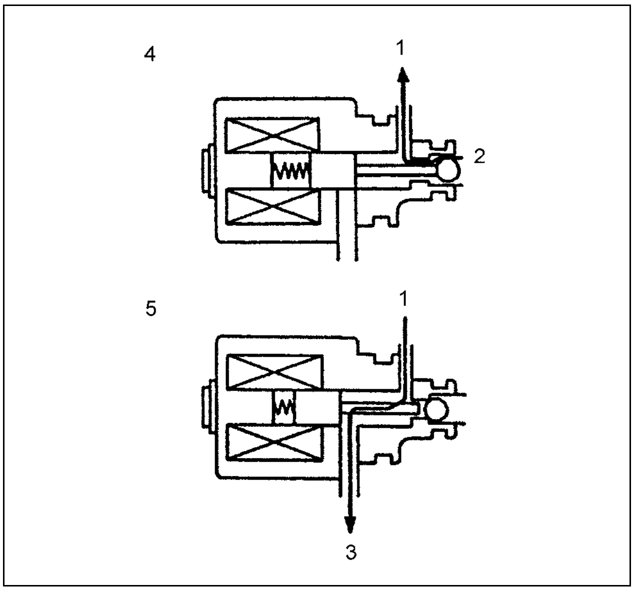
Legend

1. Pressure control (PC) solenoid valve
2. Low & reverse brake solenoid valve
3. High clutch solenoid valve
4. Torque converter clutch (TCC) solenoid valve
5. 2-4 brake solenoid valve
6. Low clutch solenoid valve

Pressure Control (PC) Solenoid Valve

The pressure control (PC) solenoid valve controls the transmission fluid supply to the pressure regulator spool valve in the valve body. The TCM controls the solenoid valve by ON/ OFF signal based on the vehicle running conditions. The TCM turns ON the solenoid valve when a lower line pressure is required and turns OFF when a higher line pressure is required. With the operation of this solenoid valve, the operation and shift of the hydraulic circuit in the transmission can be performed smoothly. The PC solenoid valve is controlled according to the range position, speed sensor signals, transmission fluid temperature signal and the accelerator pedal position signal.

Shift Solenoid Valve

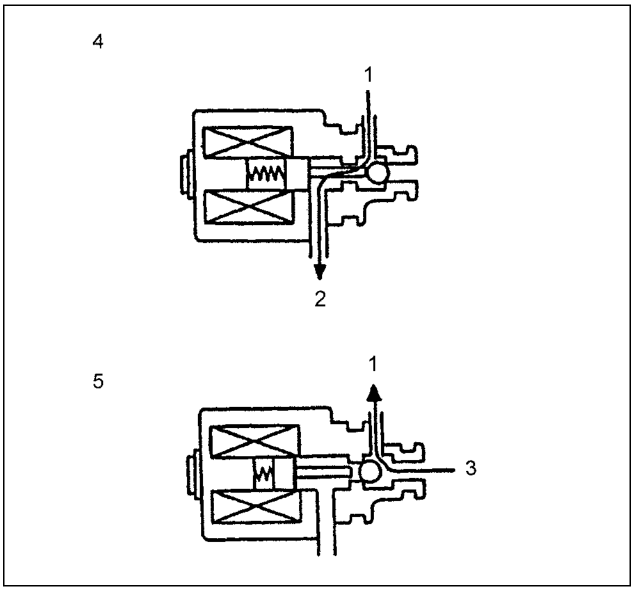


Legend

1. Output port
2. Supply port
3. Drain port
4. Deenergized (commanded OFF)
5. Energized (commanded ON)

All shift solenoid valve is a duty cycle type, which is turned ON and OFF at 50 Hz. The ration of ON and OFF time can be freely controlled within 0 to 100%. While no power is supplied, the solenoid valve supplies output pressure. The low clutch solenoid valve adjusts the low clutch pressure, the high clutch solenoid valve adjusts the high clutch pressure, the 2-4 brake solenoid valve adjusts the 2-4 brake pressure, and the low & reverse brake solenoid valve adjusts the low & reverse brake pressure respectively.

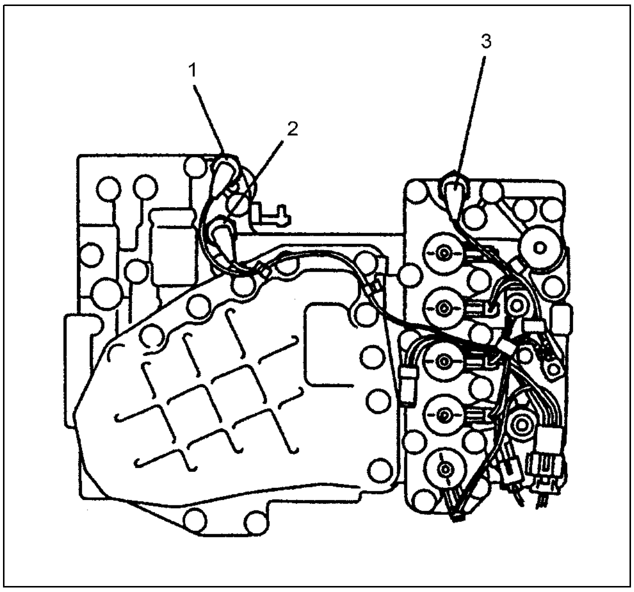
Torque Converter Clutch (TCC) Solenoid Valve



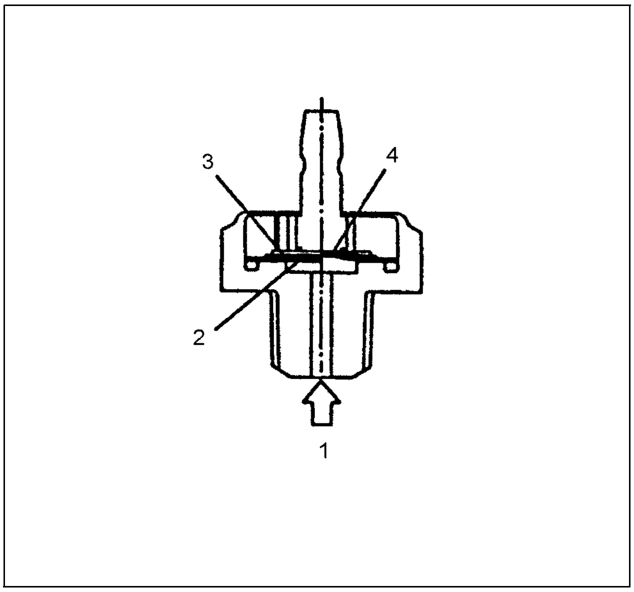
Legend
1. Output port
2. Drain port
3. Supply port
4. Deenergized (commanded OFF)
5. Energized (commanded ON)

The torque converter clutch (TCC) solenoid valve is a duty cycle type, which is turned ON and OFF at 50 Hz. The ration of ON and OFF time can be freely controlled within 5 to 95%. While no power is supplied, the solenoid valve drains the output pressure.

Transmission Fluid Pressure (TFP) Switch



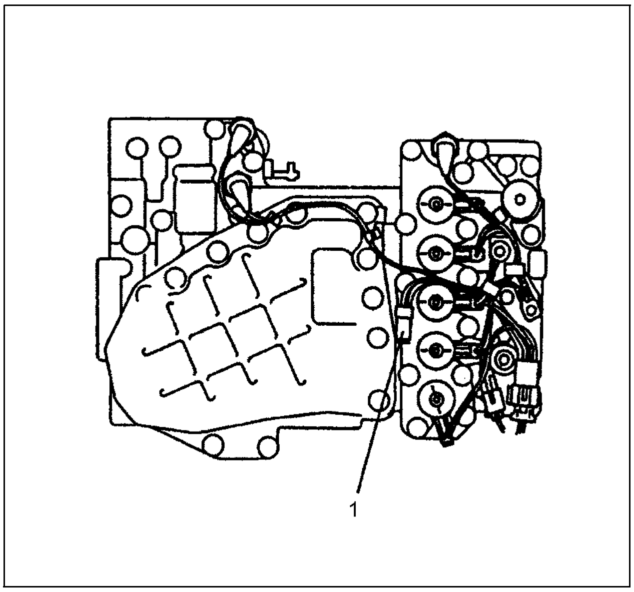
Legend
1. High clutch TFP switch
2. 2-4 brake TFP switch
3. Low & reverse brake TFP switch



Legend
1. Fluid pressure
2. Diaphram
3. Disc
4. Contact point

The transmission fluid pressure (TFP) switch detects the condition of the fluid pressure supply to the clutch and brake, and then sends the result to the TCM. The TFP switch is turned ON when the fluid pressure reaches the switch working pressure, and turned OFF when the fluid pressure decreases below the specified value. The high clutch TFP switch detects the high clutch fluid pressure, the 2-4 brake TFP switch detects the 2-4 brake fluid pressure, and the low & reverse brake TFP switch detects the low & reverse brake fluid pressure respectively.

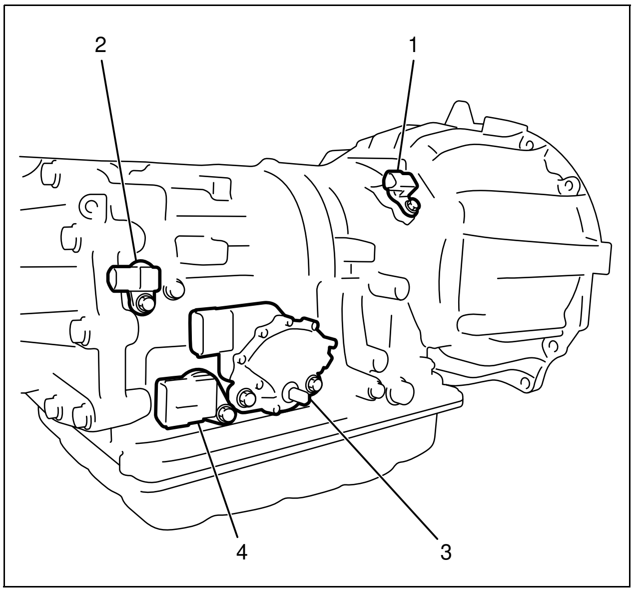
Transmission Fluid Temperature (TFT) Sensor



Legend
1. TFT sensor

The transmission fluid temperature (TFT) sensor is part of the harness assembly. The sensor is a variable resistor and it measures the temperature of the transmission fluid. When the TFT sensor is cold, the sensor resistance is high. When the transmission fluid temperature increases, the sensor resistance decreases. With high sensor resistance, the TCM detects a high voltage on the signal circuit. With lower sensor resistance, the TCM detects a lower voltage on the signal circuit.
If the fluid temperature increases to 135°C (275°F), the TCM illuminates A/T Oil Temp lamp on the instrument panel cluster. When the fluid temperature deceases below 125°C (257°F), the lamp goes off.

Transmission Range (TR) Switch



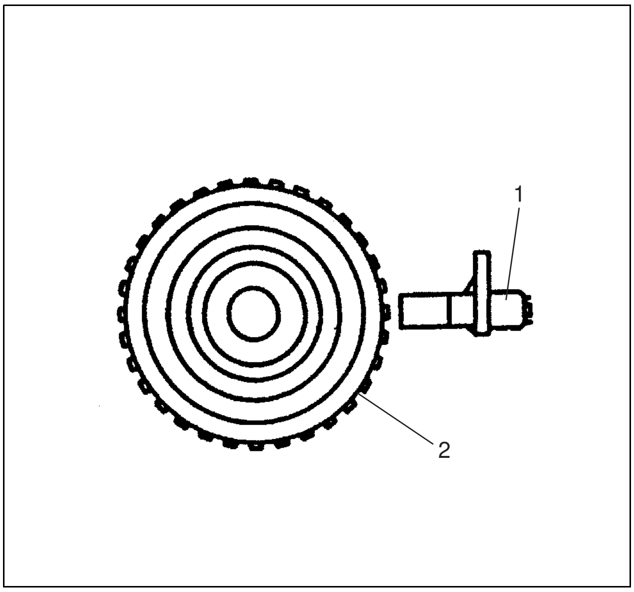
Legend

1. Input shaft speed (ISS) sensor
2. Output shaft speed (OSS) sensor
3. TR switch
4. In-line harness connector

	10	7	3	2	4	8	5	1	9	6
P	○	○	○	○						
R			○	—	○					
N	○	○	○	—	—	○				
D			○	—	—	—	○			
3			○	—	—	—	—	○		
2			○	—	—	—	—	—	○	
L			○	—	—	—	—	—	—	○

The transmission range (TR) switch is connected to the transmission manual shaft and installed externally to the transmission case. The selector lever moves the TR switch position via control cable. The TR switch relays a signal to the TCM indicating transmission range position by detecting ignition voltage through an internal switch. Only one of the seven internal switches will close for each P, R, N, D, 3, 2 and L position. Normally, the TCM expects to detect one high voltage input for each position.
The engine will not crank when the selector lever is at any position other than the P or N range.

Input Shaft Speed (ISS) Sensor

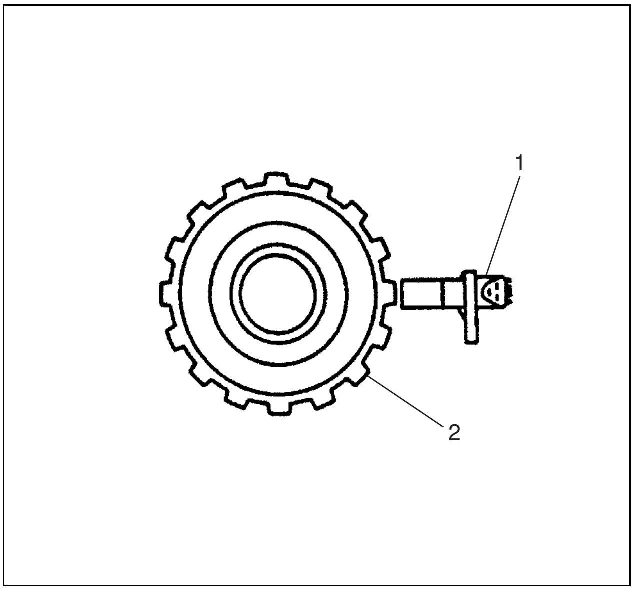


Legend

1. ISS sensor
2. Reverse & high clutch drum

The input shaft speed (ISS) sensor is located on right-hand of the transmission case. The ISS sensor is a hall effect element type sensor, which generates a square wave signal pulse based on the reverse & high clutch drum rotational speed (32 pulses per a rotation of the reverse & high clutch drum that is fitted with the input shaft by spline). The TCM calculates the turbine speed by the ISS sensor signal, and uses it to calculate torque converter slip speed and gear ratio.

Output Shaft Speed (OSS) Sensor



Legend

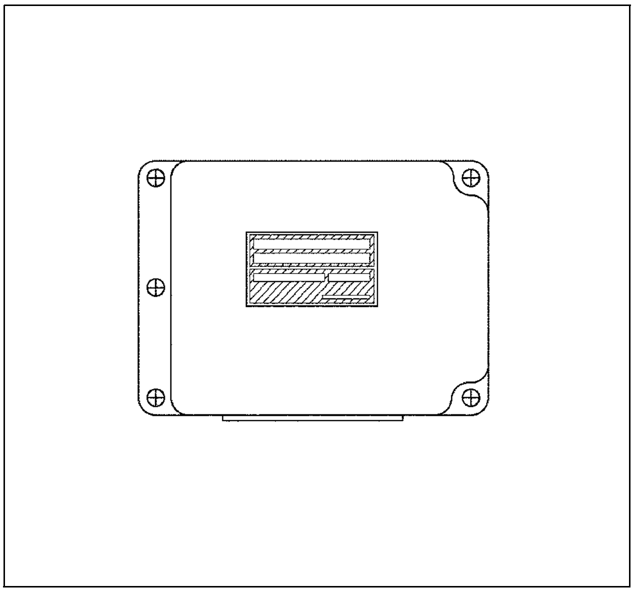
1. OSS sensor
2. Parking gear

The output shaft speed (OSS) sensor is located on right-hand of the transmission case near the transmission range switch. The OSS sensor is a hall effect element type sensor, which generates a square wave signal pulse based on the parking gear rotational speed that is connected to output shaft (16 pulses per a rotation of the parking gear that is fitted with the output shaft by spline). The TCM calculates the vehicle speed by the OSS sensor signal, and uses it to determine appropriate shift points and calculate gear ratio. The 2WD vehicle outputs the vehicle speed signal from the TCM to the engine control module (ECM) and the vehicle speed meter via output signal line.

Transmission Control System Description

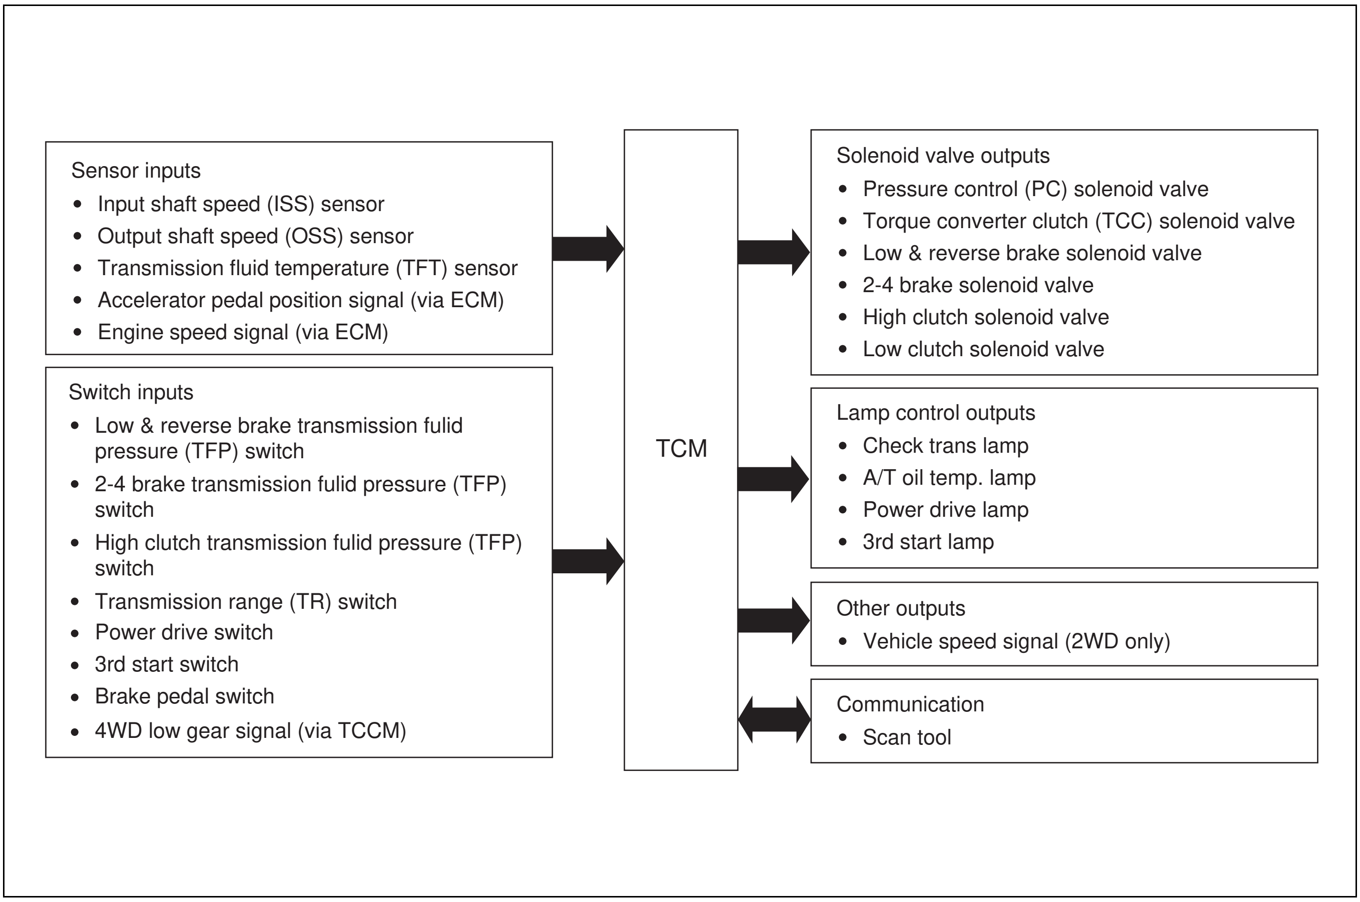
Transmission Control Module (TCM) Service Precautions

Important:
To avoid shock and possible serious injury, DO NOT touch the terminals. When disconnecting the harness connectors, always turn OFF the ignition switch or disconnect the battery cable.



The transmission control module (TCM) is designed to withstand normal current draws associated with vehicle operation. Avoid overloading any circuit. When testing for opens and shorts, do not ground or apply voltage to any of the TCM circuits unless instructed to do so. In some cases, these circuits should only be tested using a DMM. The TCM should remain connected to the TCM harness. The TCM is located next to brake pedal via mounting bracket. The TCM mainly controls the gearshift system control and on-board diagnostic for transmission control. The TCM constantly observes the information from various sensors. The TCM controls the systems that affect vehicle performance. The TCM performs the diagnostic function of the system. The TCM can recognize operational problems, alert the driver through the check trans lamp, and store diagnostic trouble codes (DTCs). DTCs identify the system faults to aid the technician in making repairs.

TCM Input & Output



TCM Voltage Description

The TCM supplies a buffered voltage to various switches and sensors. The TCM can do this because resistance in the TCM is so high in value that a test lamp may not illuminate when connected to the circuit. An ordinary shop voltmeter may not give an accurate reading because the voltmeter input impedance is too low. Use a 10-megaohm input impedance DMM, to ensure accurate voltage readings. The input and/ or output devices in the TCM include analog-to-digital converters, signal buffers, counters, and special drivers. The TCM controls most components with electronic switches which complete a ground circuit when turned ON.

Electrostatic Discharge Damage

Electronic components used in the TCM are often designed to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. By comparison, as much as 4,000 volts may be needed for a person to feel even the zap of a static discharge. There are several ways for a person to become statically charged. The most common methods of charging are by friction and induction.

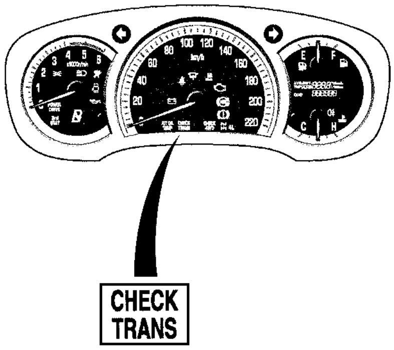
- An example of charging by friction is a person sliding across a vehicle seat.

Important: To prevent possible electrostatic discharge damage, follow these guidelines:

- Do not touch the TCM connector pins or soldered components on the TCM circuit board.
- Do not open the replacement part package until the part is ready to be installed.
- Before removing the part from the package, ground the package to a known good ground on the vehicle.
- If the part has been handled while sliding across the seat, while sitting down from a standing position, or while walking a distance, touch a known good ground before installing the part.
- Charge by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with opposite polarity.

Check Trans Lamp Operation

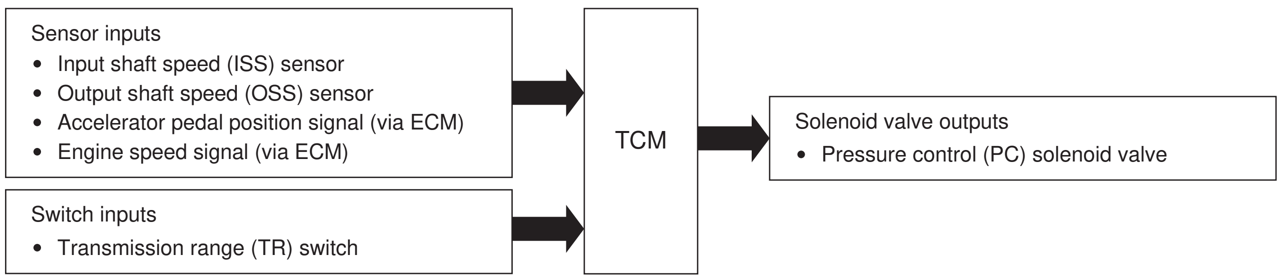
The check trans lamp is located in the instrument panel cluster.

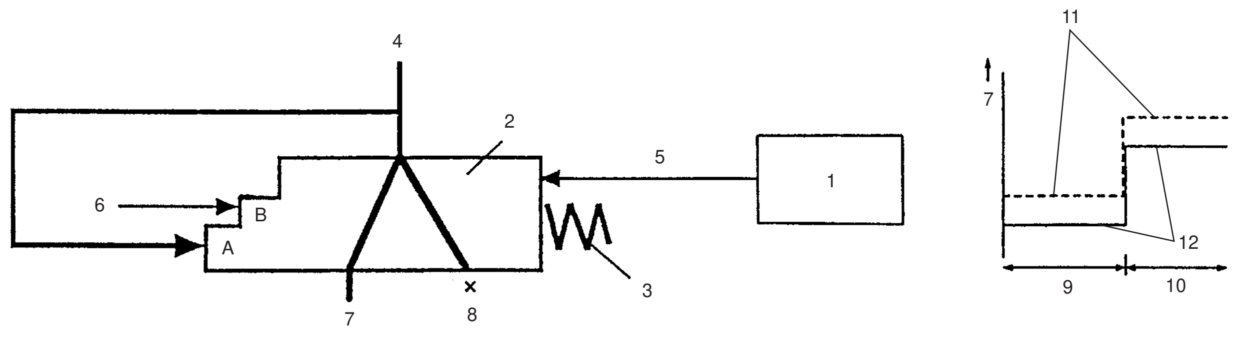


The check trans lamp indicates that a transmission related fault has occurred and vehicle service is required. The following is a list of the modes of operation for the check trans lamp:

- The check trans lamp illuminates for approximately 3 seconds when the ignition switch is turned ON, with the engine OFF. This is a bulb test to the check trans lamp is able to illuminate.
- The check trans lamp turns OFF after the engine is started if a diagnostic fault is not present.
- The check trans lamp remains blink after the engine is started if the TCM detects a fault. A DTC is stored any time the TCM blinks the check trans lamp due to a transmission related fault has occurred.

Line Pressure Control





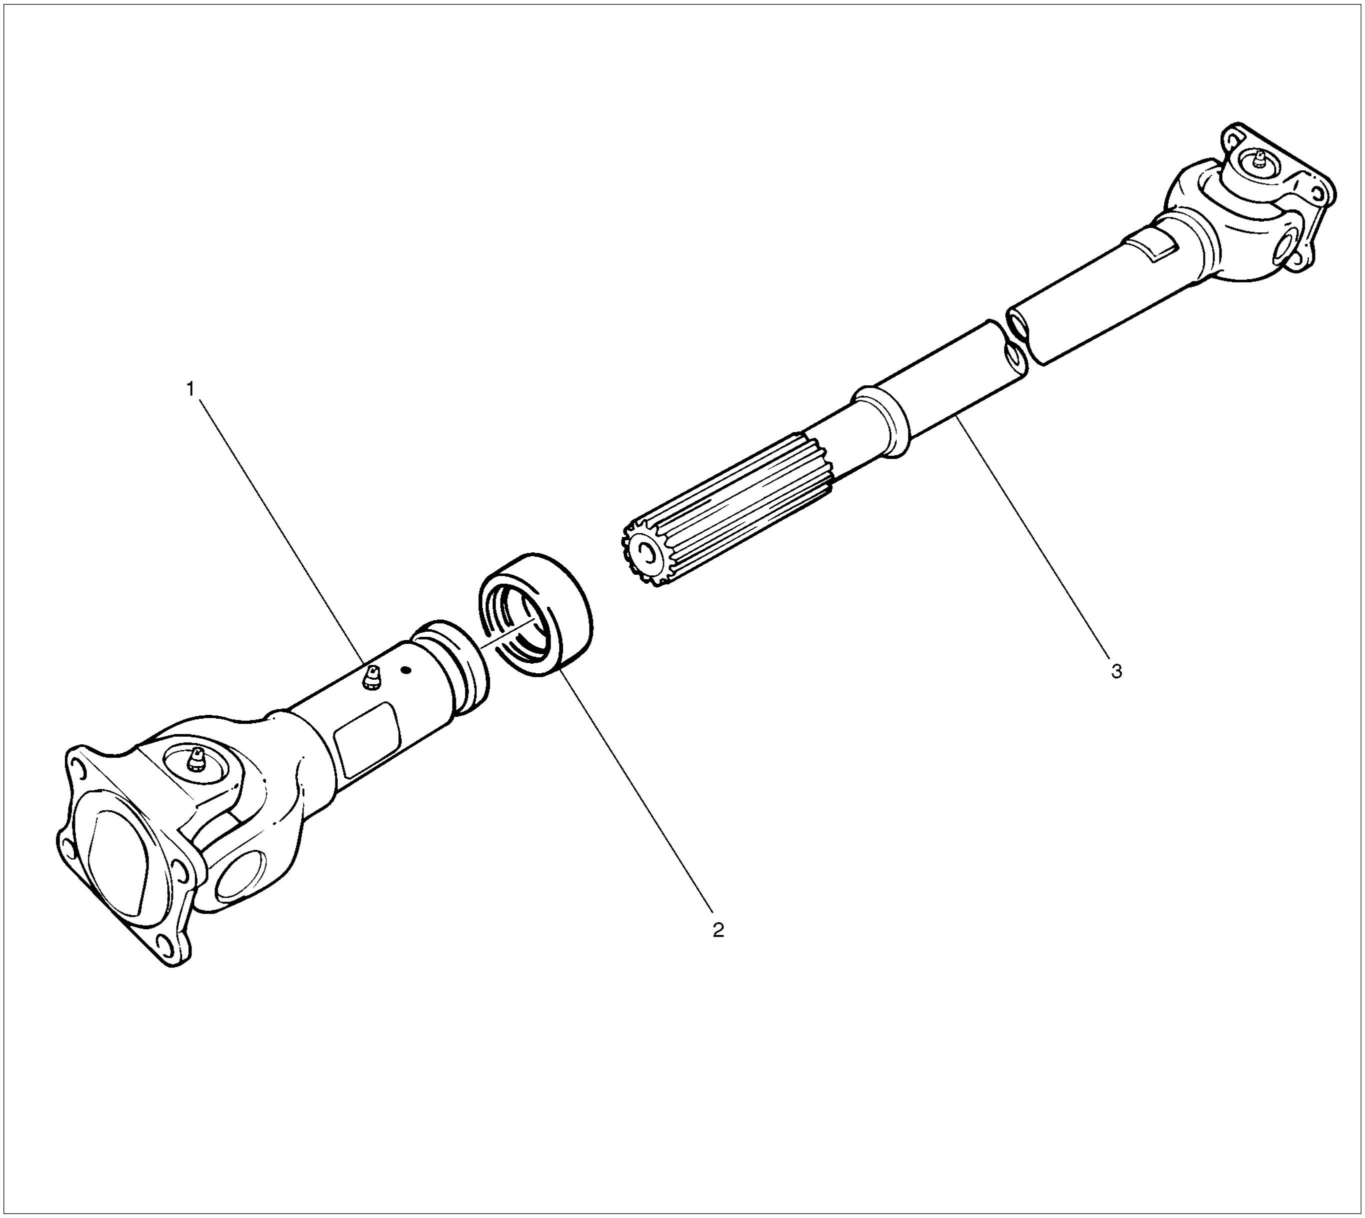
Legend

1. PC solenoid valve
2. Pressure regulator spool valve
3. Spring
4. Line pressure from oil pump
5. Solenoid fluid pressure
6. Line pressure in forward range
7. Adjusted line pressure
8. Drain
9. PC solenoid valve commanded ON
10. PC solenoid valve commanded OFF
11. Adjusted line pressure in P, N or R range
12. Adjusted line pressure in forward range

The TCM drives the ON/ OFF type pressure control (PC) solenoid valve based on the accelerator pedal angle, input shaft speed, output shaft speed, transmission fluid temperature and transmission range signal.

The line pressure generated by the oil pump acts on the point A of the pressure regulator spool valve. When the PC solenoid valve is turned ON by the signal from the TCM, the solenoid fluid pressure does not act. The line pressure is adjusted to match the spring force acting on the right side of the pressure regulator spool valve. When the PC solenoid valve is turned OFF, the solenoid fluid pressure acts so that the line pressure is adjusted to match the spring force acting on the right side of the pressure regulator spool valve. As a result, the line pressure is adjusted to be low when the PC solenoid valve is ON and to be high when the PC solenoid valve is OFF. In position D, 3, 2 and L, the line pressure through the oil pressure circuit acts onto the point B of the pressure regulator spool valve. The pressure regulator valve moves so as to increase the pressure to be drained, so that the line pressure is adjusted to be lower than the P, N, and R position by the difference of area at the point B.

Reassembly



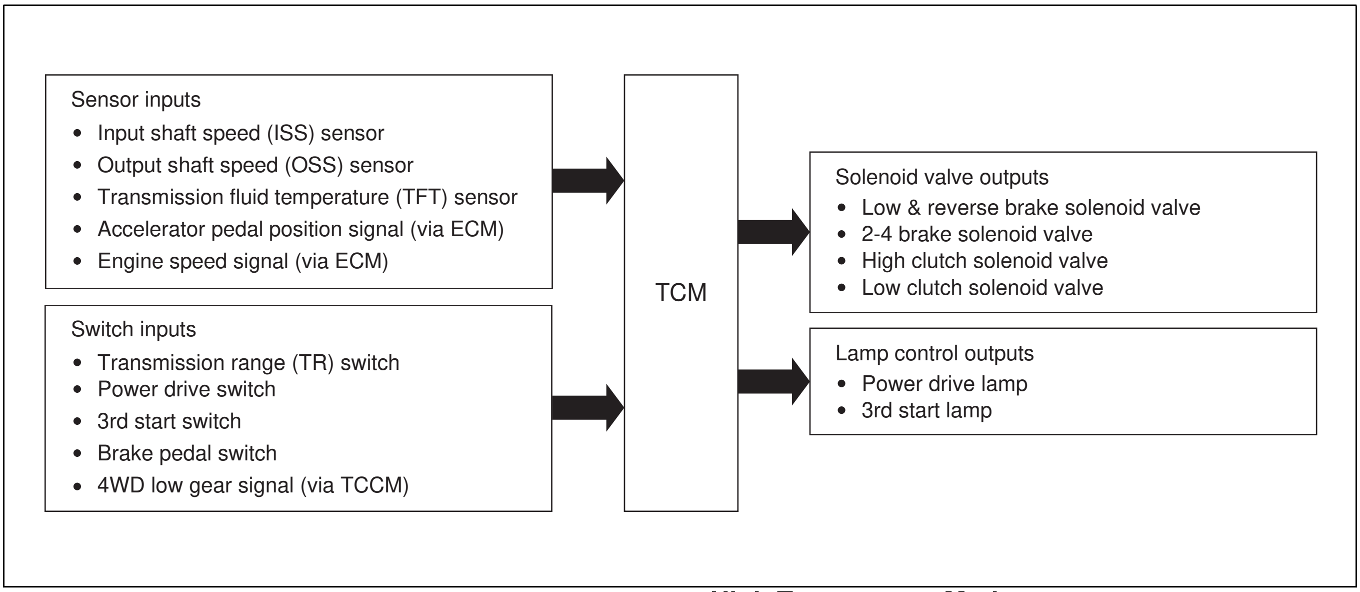
401RW057

Legend

1. Sleeve Yoke
2. Seal
3. Tube Assembly

1. Discard used seal and install new one.
2. Align the alignment marks and install tube assembly to sleeve yoke.

Gearshift Control & Shift Map Selection



The TCM commands each shift solenoid valve based on the traveling mode switch (power drive/ 3rd start), transmission range switch, the vehicle speed, the accelerator pedal angle and other input signals, to control the optimum gear position automatically. Shift features have been set up to the TCM as shift map; the normal mode is suited to normal travel, and the power mode is used when the vehicle is loaded or the speed accelerated. In addition, shift features used only for high transmission fluid temperature, hill climbing, and downward travel have been set up to the TCM. These are automatically switched depending on the driving conditions. When the transmission fluid temperature is lower than 10°C (50°F), gearshift from the 3rd to the 4th is inhibited.

Shift Map

The TCM selects either of the following shift map depending on the driving conditions.

Priority	Shift map	3rd start lamp	Power drive lamp
High	High temperature mode	OFF	OFF
	3rd start mode	ON	
	4L mode	OFF	
	Down slope mode when power drive SW Off		
	Down slope mode when power drive SW On		ON
	Power drive mode		
	Up slope mode		OFF
Low	Normal mode		

High Temperature Mode

Condition for setting the high temperature mode shift map;

- Transmission fluid temperature is more than 122°C (252°F) for 10 seconds.

Condition for canceling the high temperature mode shift map;

- Transmission fluid temperature is less than 115°C (239°F) for 10 seconds

Notice: High temperature mode may be set with driving conditions other than the setting condition met in order to protect from a thermal damage.

3rd Start Mode

Condition for setting the 3rd start mode shift map;
All of the following conditions are met:

- 3rd start switch is pressed
- Vehicle speed is less than 11 km/h (7 MPH)
- Transmission fluid is less than 115°C (239°F)
- Accelerator pedal position is less than 8%
- Selector lever is D range

Condition for canceling the 3rd start mode shift map;
Either of the following condition is met:

- 3rd start switch is pressed again
- Vehicle speed is more than 34 km/h (21 MPH)
- Selector lever is other than D range

4L Mode

Condition for setting the 4L mode shift map;
All of the following conditions are met:

- 4L switch is On
- Vehicle speed is more than 5 km/h (3 MPH)

Condition for canceling the 4L mode shift map;
Either of the following condition is met:

- 4L switch is On
- Vehicle speed is more than 5 km/h (3 MPH)

Down Slope Mode

Condition for setting the down slope mode shift map; All of the following conditions are met:

- Brake pedal switch is depressed
- Accelerator pedal is released
- Vehicle speed is more than 60 km/h (36 MPH)
- Increment of vehicle speed is more than 1 km/h (1 MPH) per second
- Selector lever is D or 3 range

Condition for canceling the down slope mode shift map; Either of the following condition is met:

- Accelerator pedal is depressed
- Selector lever is other than D or 3 range

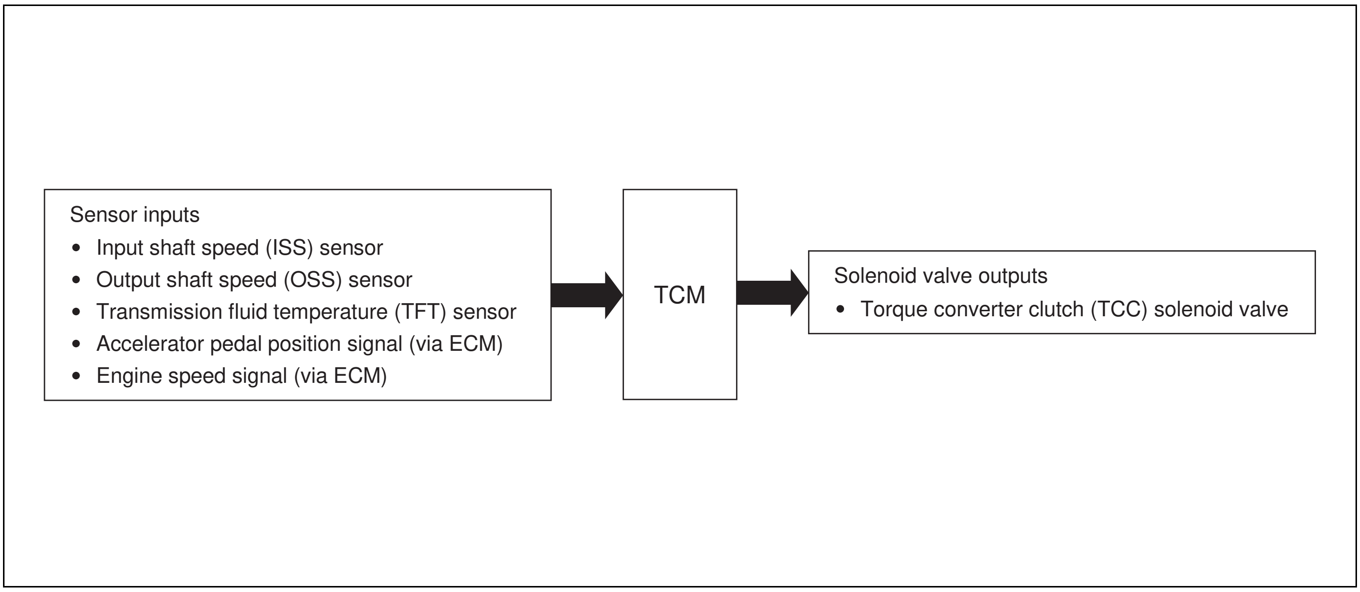
Power Drive Mode

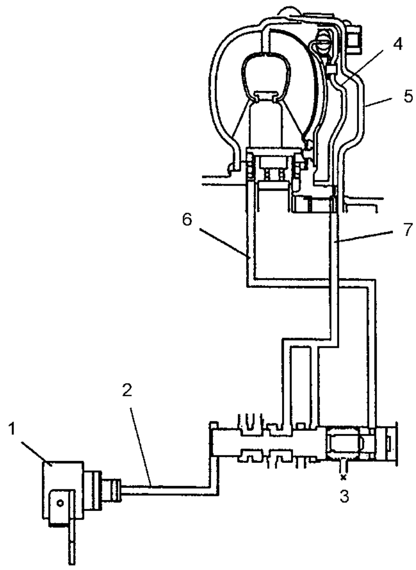
When the power drive switch is ON, the TCM switches shift map to the power drive mode map and performs gearshift control from 1st to 4th to gain more acceleration compared with normal mode.

Up Slope Mode

Up slope reasoning value is calculated from the averaged accelerator pedal angle and the averaged acceleration. Otherwise, up slope reasoning value is calculated from the vehicle speed. The TCM selects a up slope mode when the former is bigger than the latter.

Lock Up Control





Legend

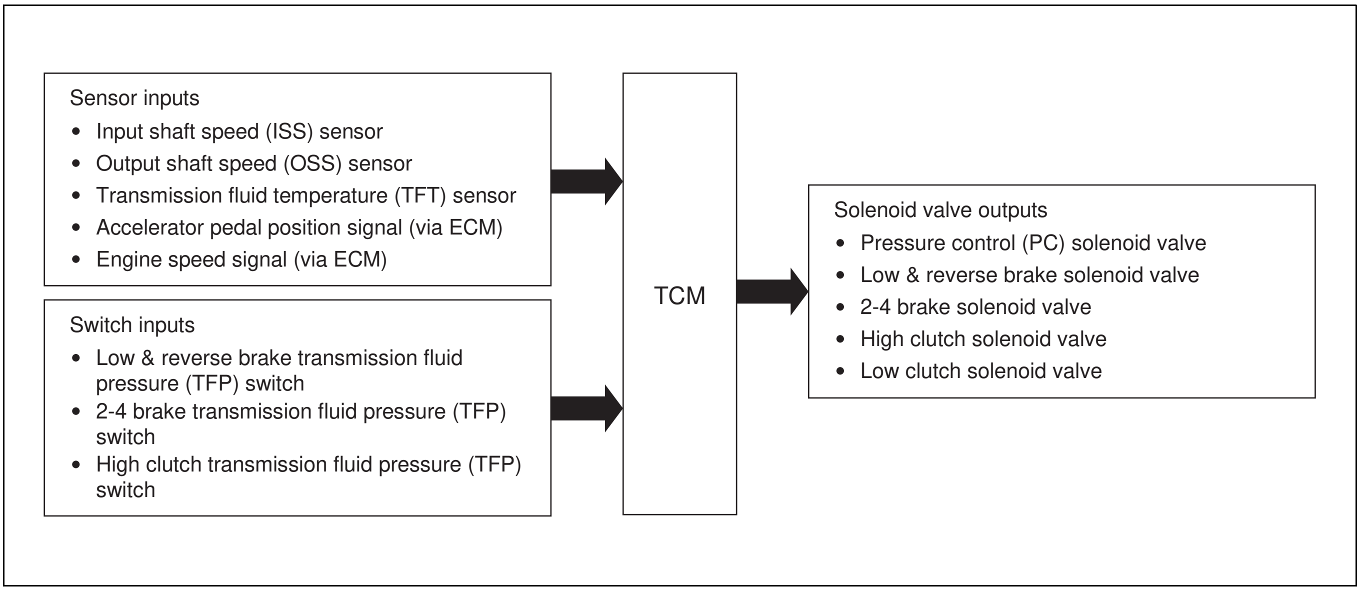
1. TCC solenoid valve
2. Solenoid fluid pressure
3. Lock up control spool valve
4. Torque converter clutch (TCC)
5. Torque converter front cover
6. TCC engagement fluid pressure
7. TCC disengagement fluid pressure

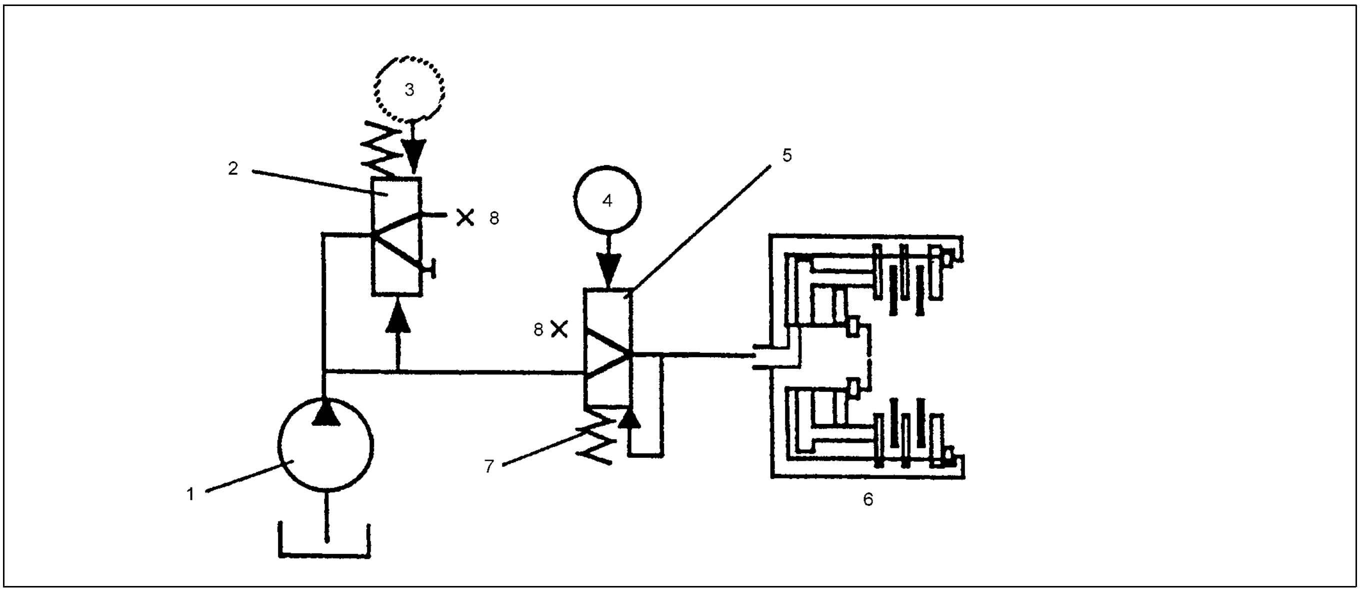
The TCM controls the torque converter clutch (TCC) solenoid valve based on the accelerator pedal angle, input shaft speed, output shaft speed and transmission fluid temperature.

Smooth lock up control is employed to engage or disengage the TCC smoothly at the time of lock up On or Off. When the TCM determines the TCC engagement, the solenoid valve control duty cycle (pulse width modulation [PWM]) signal is gradually increased (5% to 95%) and the transmission fluid between the TCC piston and torque converter front cover is gradually drained. As a result, the TCC piston is fitted slowly to the torque converter front cover under fluid pressure securing smooth lock up engagement.

The lock up control does not start when the transmission fluid temperature is less than 20°C (68°F) even though the vehicle is at the lock up control speed area. The lock up control disengages when the accelerator pedal angle is released.

Direct Electronic Shift Control (DECS)



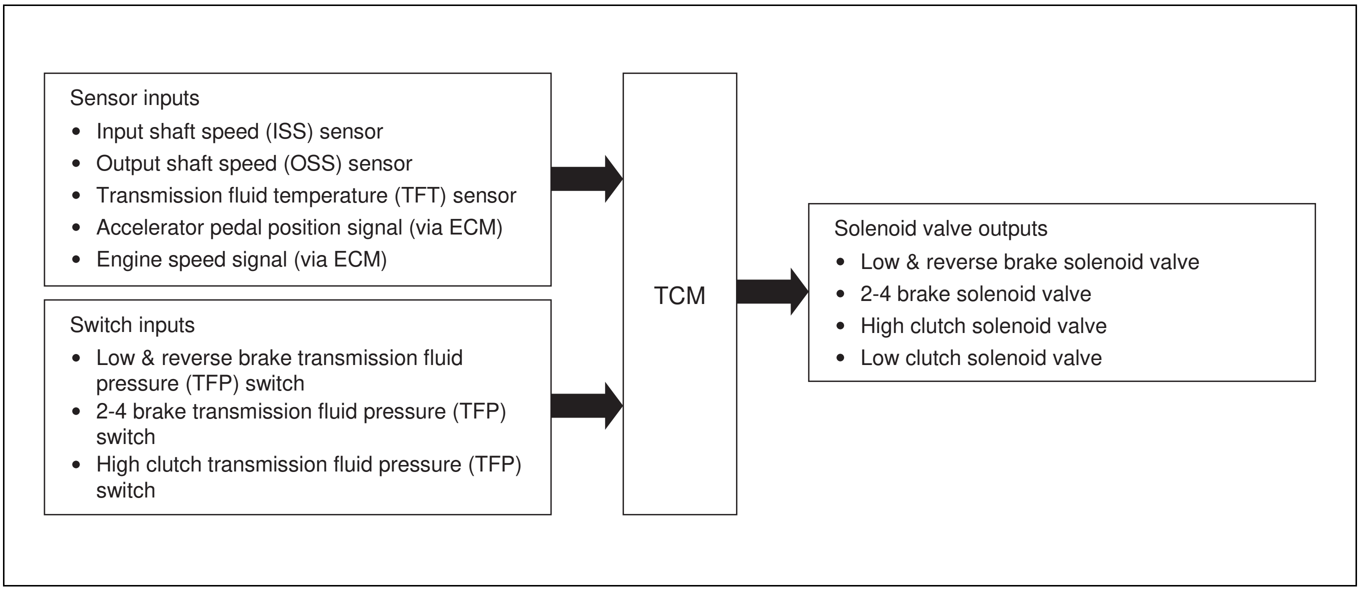


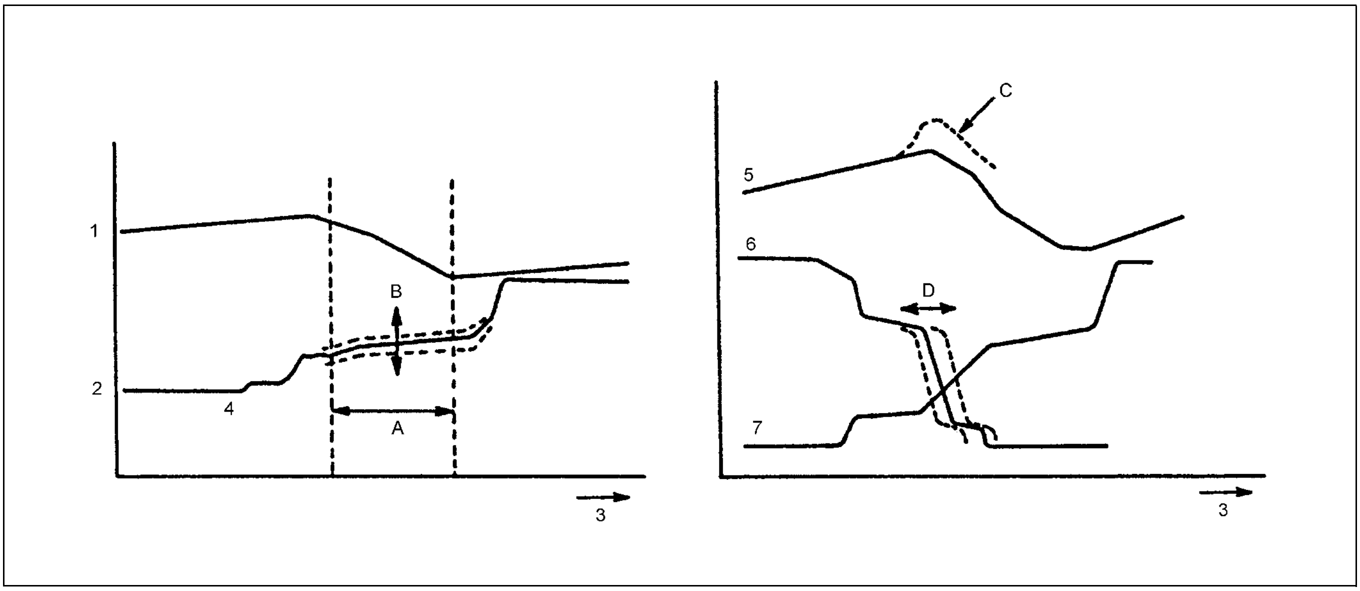
Legend

1. Oil pump
2. Pressure regulator spool valve
3. ON/ OFF type solenoid valve (pressure control [PC] solenoid valve
4. Duty cycle type solenoid valve (shift solenoid valve)
5. Amplifier (AMP) valve
6. Clutch

Based on each transmission fluid pressure (TFP) switch signal and each speed sensor signal and the accelerator pedal angle, the duty cycle type shift solenoid valve adjusts the clutch pressure to match the engine load and vehicle running conditions. Controlling the engagement and disengagement of the clutch and brake pressure is directly and accurately controlled via TCM, which is different to the conventional accumulator type. Instead of the conventional system (On/ Off type shift solenoid valve and shift valve), the combination of the duty cycle type solenoid valve and the amplifier (AMP) valve are used to adjust the clutch pressure to match the engine load and vehicle driving conditions, based on the signal from the TCM. Also, the TFP switch provided in the fluid passage of the control valve transmits to TCM, enabling the engagement and disengagement control of the clutch and brake to be directly and finely. When the gear is shifted from the 2nd to 3rd, 3rd to 4th, 4th to 3rd and 3rd to 2nd, the clutch pressures on the engagement side and disengagement side are simultaneously controlled. As a result, engine racing or clutch drag is prevented which enables a smooth and quick shift response.

Learning Control





Legend

1. Input shaft speed
2. Transmission fluid pressure
3. Time
4. Clutch engagement fluid pressure
5. Engine speed
6. Disengagement side clutch fluid pressure
7. Engagement side clutch fluid pressure

Transmission fluid pressure control timing is optimally corrected at the time of clutch engagement and disengagement. It is controlled to bring the shift time to the value preset to the TCM, and compensate for the changes in engine performance and transmission characteristics. When the gear is shifted, the clutch pressure (B) is optimally corrected so that the shift time (A) is as close to the target value preset to the TCM. The variation in the engine performance and changes to transmission characteristics which occur with time, can be compensated for based on the past shift results. When the clutch is operated to shift the gear, the time of the clutch fluid pressure release (D) on the disengagement side is optimally corrected so that the change of the engine speed (C) is optimum.

Notice: When the battery terminal is disconnected, the contents of learning are cleared and as a result the shift shock may increase. After the vehicle has traveled, learning is repeated and the shock decreases gradually.

Construction Parts

The JR405E consists of two sets of planetary gears, three multiple plate clutches, two multiple plate brakes and one one-way clutch.

High Clutch

High clutch (11) connects the input shaft (1) to the front planetary carrier (2). It is engaged at 3rd and 4th gear.

Low Clutch

Low clutch (14) connects the front planetary carrier (2) to the rear internal gear (7). It is engaged at 1st, 2nd and 3rd gear.

Reverse Clutch

Reverse clutch (9) connects the input shaft (1) to the front sun gear (4). It is engaged at reverse gear.

Low One-way Clutch

Low one-way clutch (16) allows the front planetary carrier (2) to turn forward (clockwise) but locks to opposite direction (counterclockwise). It is operative when accelerating.

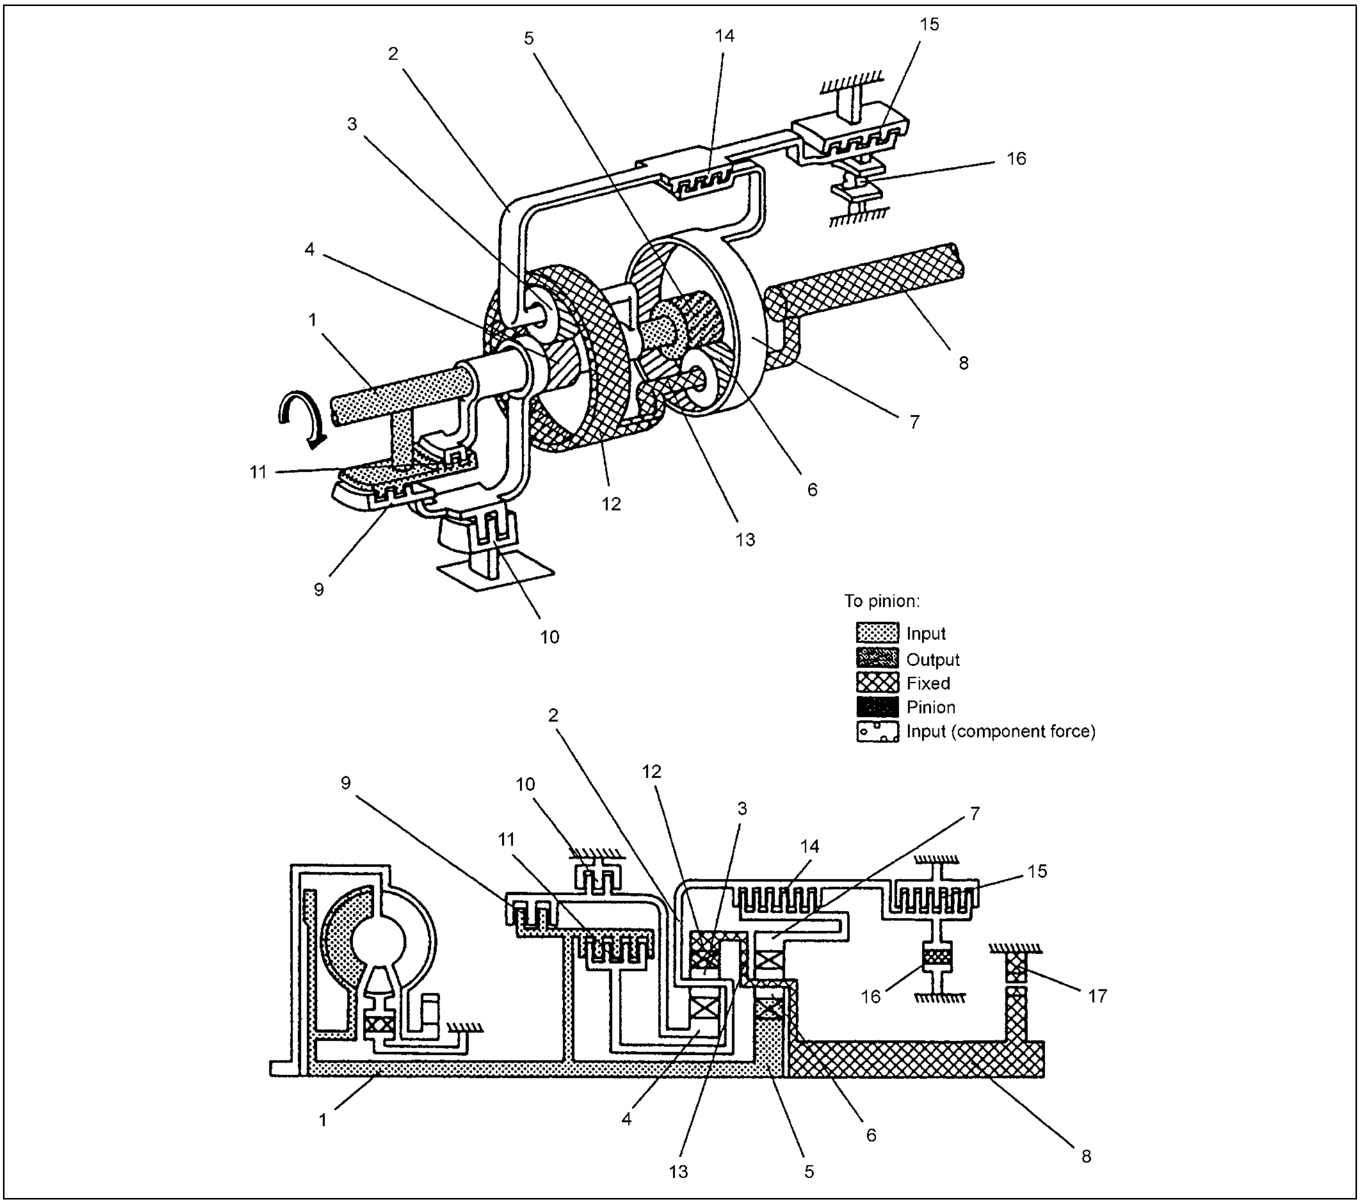
Low & Reverse Brake

Low & reverse brake (15) locks the front planetary carrier (2). It is engaged in L range and reverse gear.

2-4 Brake

2-4 brake (10) locks the front sun gear (4). It is engaged at 2nd and 4th (O/D) gear.

Parking



Legend

13. Rear planetary carrier
14. Low clutch
15. Low & reverse brake
16. Low one-way clutch
17. Parking pawl

Although the driving force of the input shaft (1) is transmitted to the rear sun gear (5) and reverse & high clutch drum, the driving force is not transmitted to the output shaft (8) since all of the clutches and brakes are not engaged. Therefore, the vehicle can move in this condition. However, since the output shaft (8) is mechanically locked with the parking pawl (17), the rear planetary carrier (13) and front internal gear (12) are locked. For this reason, the vehicle does not move.

Neutral

13. Rear planetary carrier
14. Low clutch
15. Low & reverse brake
16. Low one-way clutch
17. Parking pawl

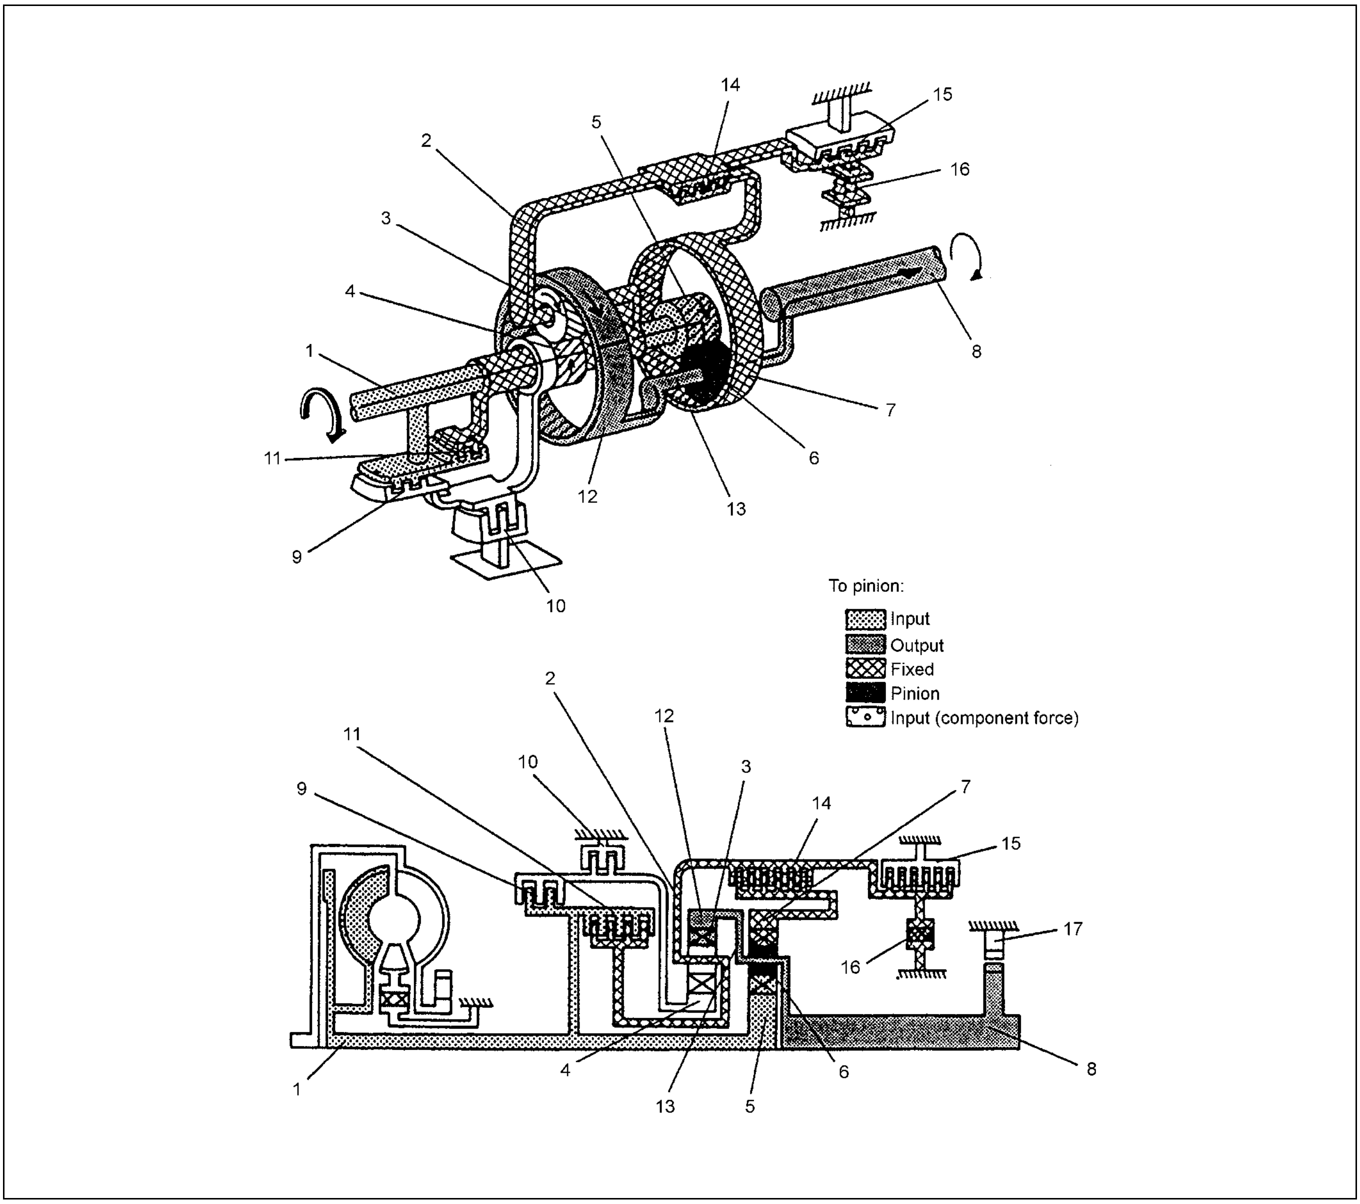
The driving force from the input shaft (1) is transmitted to the rear sun gear (5) and reverse & high clutch drum. In the R range, the reverse clutch (9) is engaged and the driving force is transmitted to the front sun gear (4) and rotates it clockwise. The low & reverse brake (15) is also engaged and the front planetary carrier (2) is fixed so that the front pinion gear (3) does not rotate clockwise, but can rotate counterclockwise. As a result, the output shaft (8) rotates counterclockwise and the vehicle goes backwards.

First Gear In D, 3, 2 Range



Legend

1. Input shaft
2. Front planetary carrier
3. Front pinion gear
4. Front sun gear
5. Rear sun gear
6. Rear pinion gear
7. Rear internal gear
8. Output shaft

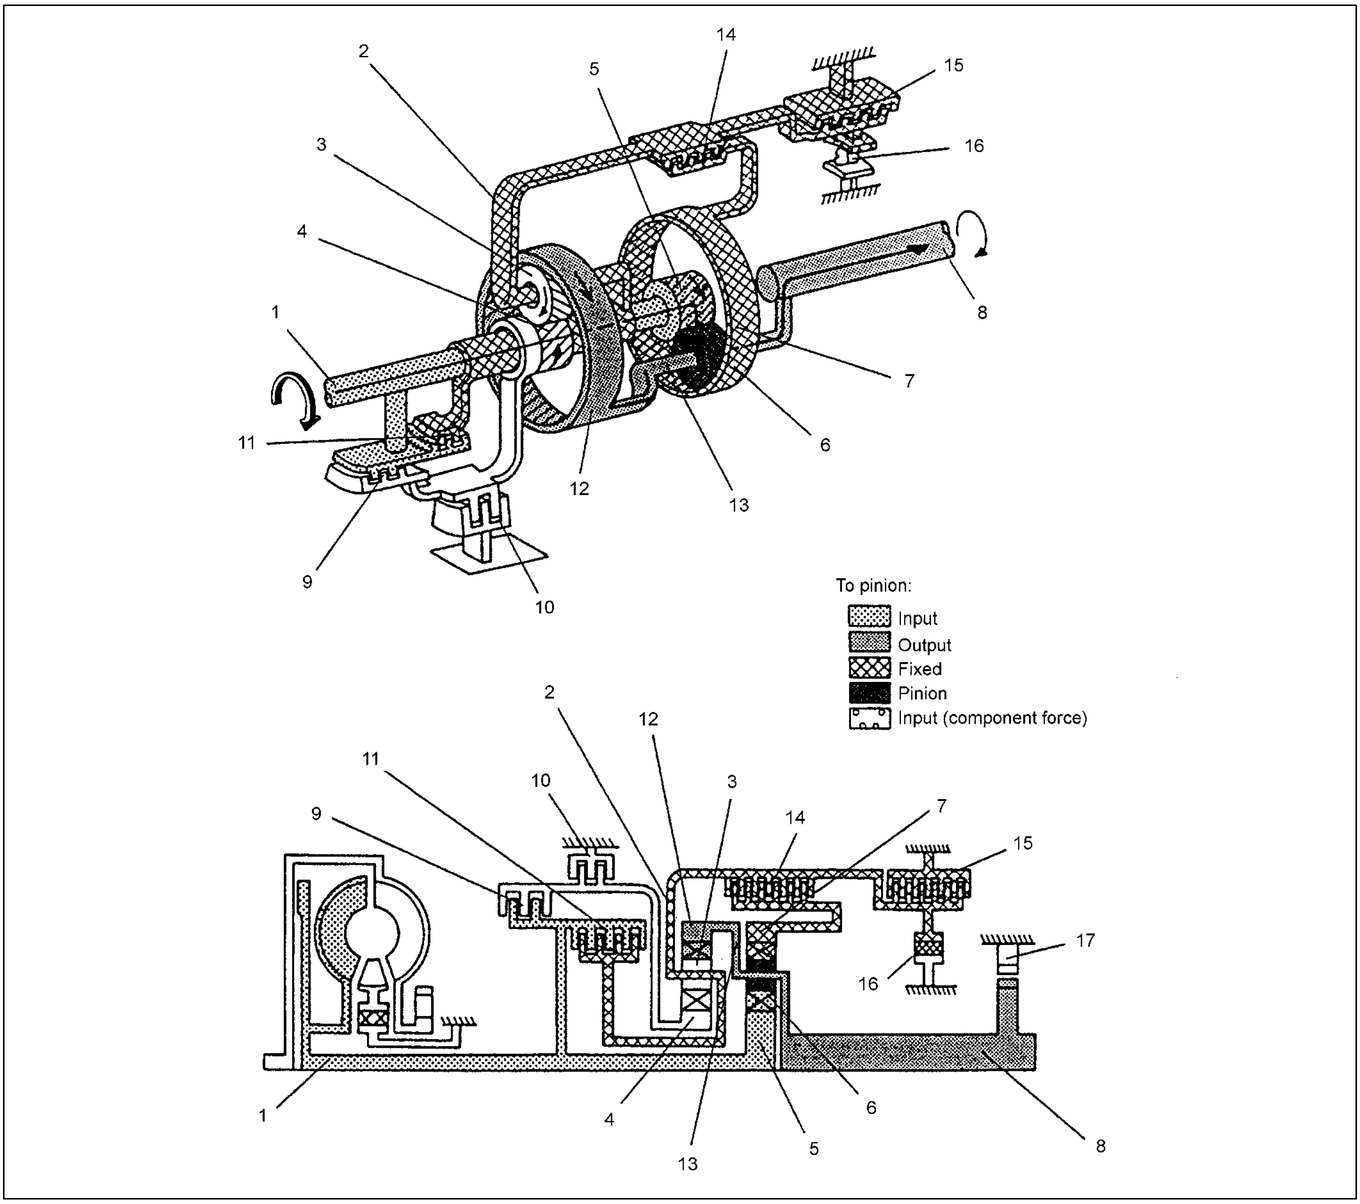
11. High clutch
12. Front internal gear
13. Rear planetary carrier
14. Low clutch
15. Low & reverse brake
16. Low one-way clutch
17. Parking pawl

The driving force from the input shaft (1) is transmitted to the rear sun gear (5) and reverse & high clutch drum. As the low clutch (14) is engaged, the movement of the rear internal gear (7) is restricted. Since the low one-way clutch (16) acts at the same time, counterclockwise rotations of the rear internal gear (7) are locked. As a result, the driving force transmitted to the rear sun gear (5) rotates the rear planetary carrier (13) clockwise, then the rotation speed is decreased and multiple forces is transmitted to the output shaft (8). When decelerating, the rotating speed of the rear planetary carrier (13) (rear pinion gear [6]) is higher than that of the rear sun gear (5) and the rear internal gear (7) attempts to rotate clockwise. At this time, the low one-way clutch (16) does not act but races, and therefore the rear internal gear (7) rotates clockwise. The reverse torque from the driving shaft is not transmitted to the engine side and the engine brake does not act.

SECTION 4B
REAR AXLE

TABLE OF CONTENTS

First Gear In L Range



Legend

1. Input shaft
2. Front planetary carrier
3. Front pinion gear

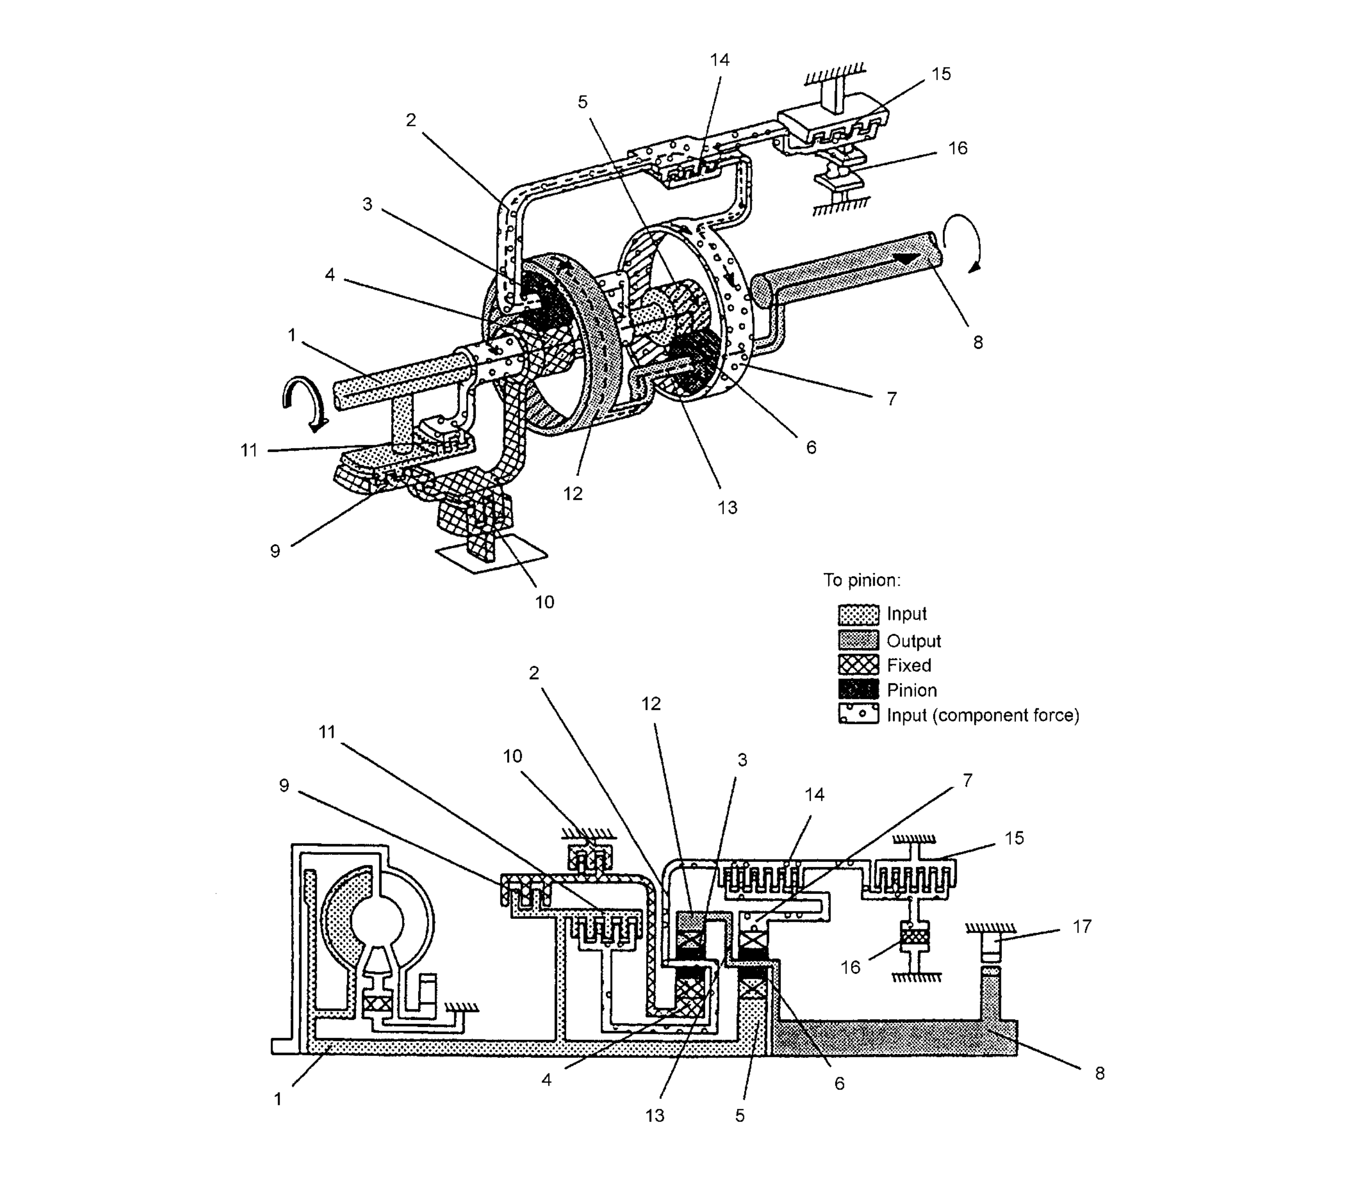
10. 2-4 brake
11. High clutch
12. Front internal gear
13. Rear planetary carrier
14. Low clutch
15. Low & reverse brake
16. Low one-way clutch
17. Parking pawl

The basic mechanism is the same as in the D, 3, and 2 ranges. To apply the engine brake, the low & reverse brake (15) is engaged to restrict the movement of the low one-way clutch (16).
When decelerating, as the rear internal gear (7) is fixed, reverse torque from the propeller shaft is transmitted to the engine side so that the engine brake is applied.

Second Gear



Legend

1. Input shaft
2. Front planetary carrier
3. Front pinion gear
4. Front sun gear
5. Rear sun gear
6. Rear pinion gear
7. Rear internal gear
8. Output shaft

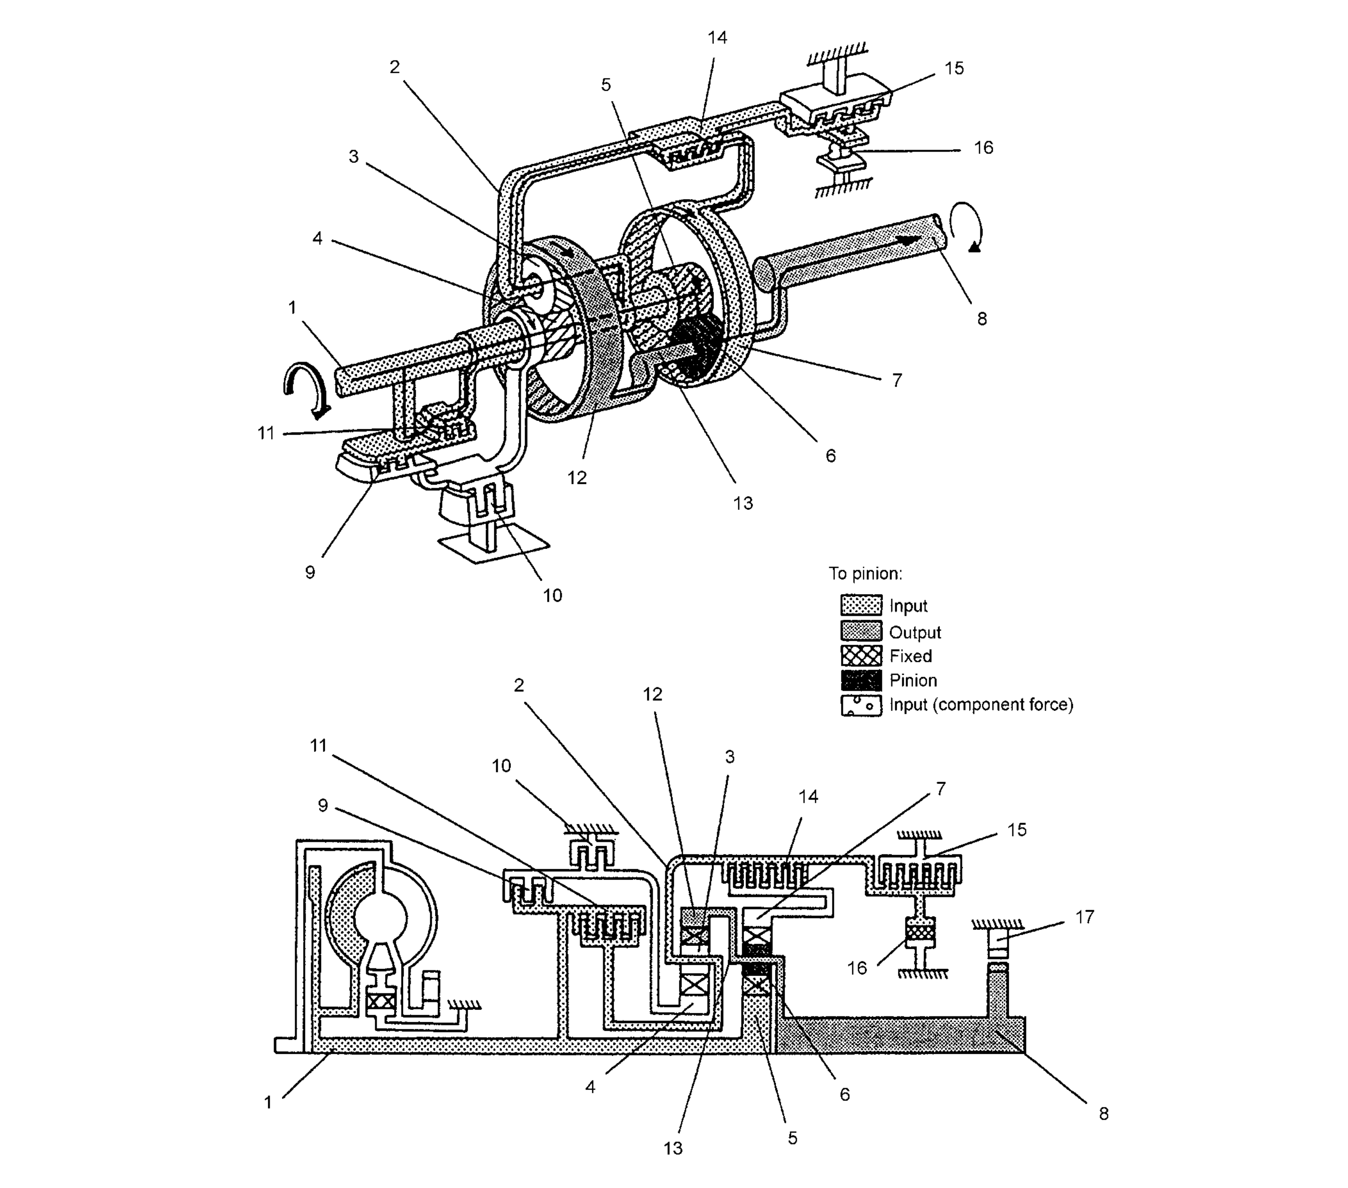
11. High clutch
12. Front internal gear
13. Rear planetary carrier
14. Low clutch
15. Low & reverse brake
16. Low one-way clutch
17. Parking pawl

The driving force from the input shaft (1) is transmitted to the rear sun gear (5) and reverse & high clutch drum. As in the case of the 1st gear, the low clutch (14) is engaged and the movement of the rear internal gear (7) is restricted. Since the 2-4 brake is engaged (10), the front sun gear (4) is fixed. As a result, movement of the rear internal gear (7) is restricted, and the driving force transmitted to the rear sun gear (5) rotates the rear planetary carrier (13) clockwise. The rotating speed of the rear planetary carrier (13) is higher than in 1st gear as the rear internal gear (7) rotates. When decelerating, the engine brake is applied.

Third Gear

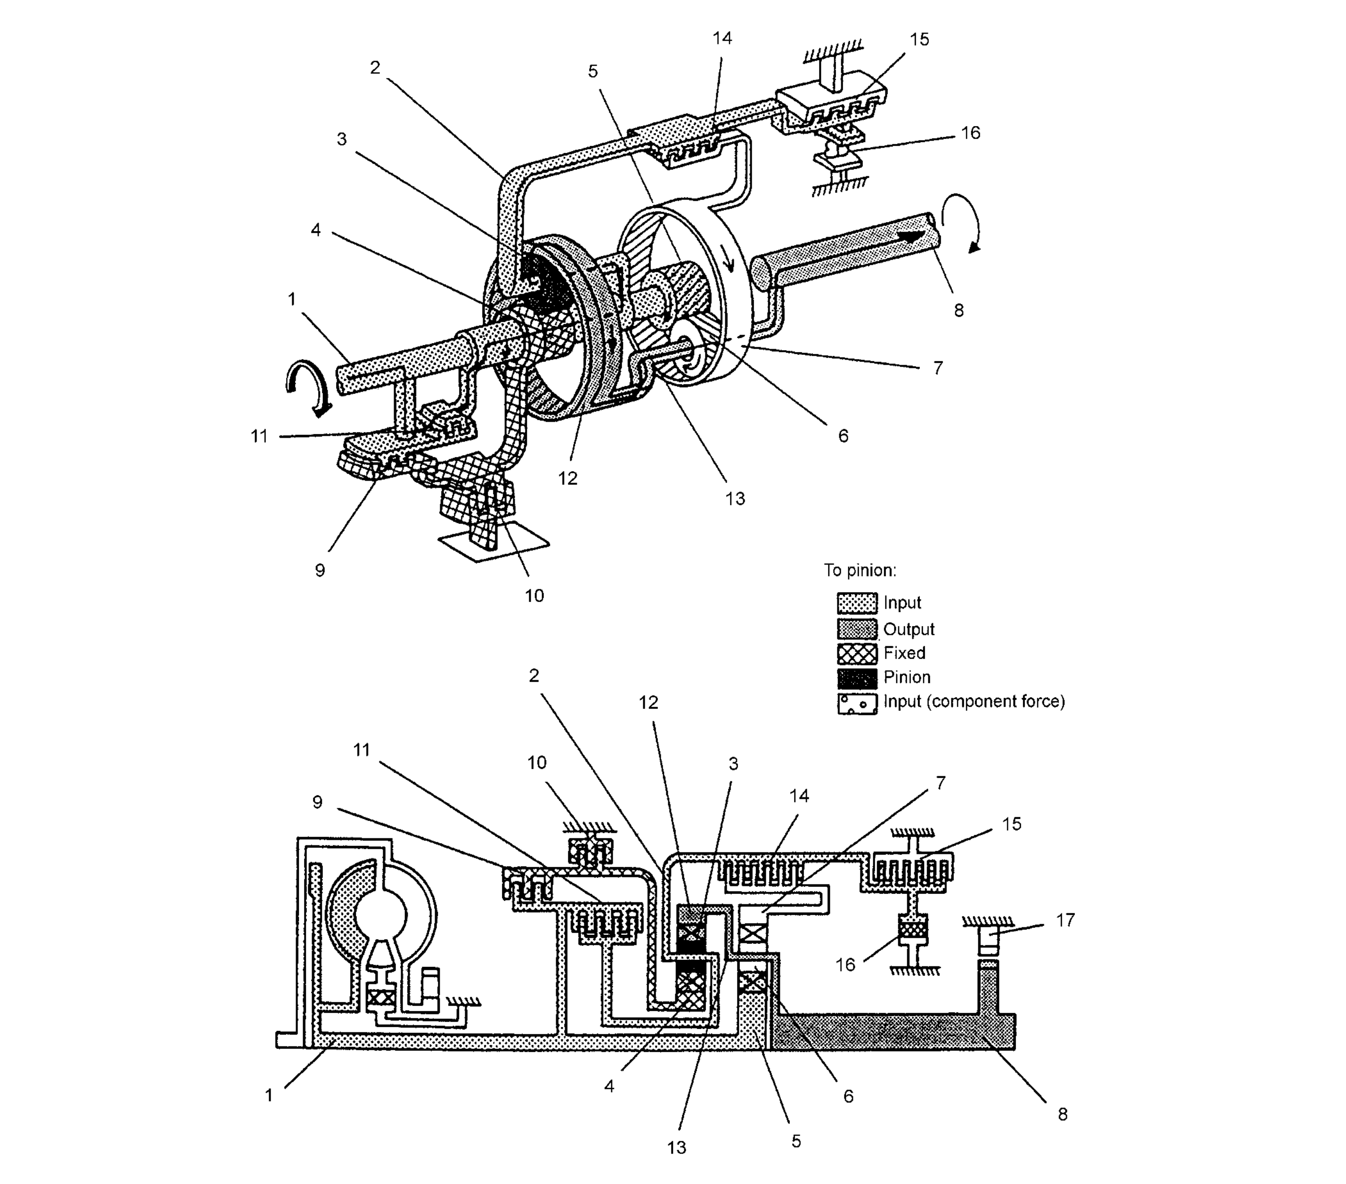


Legend

1. Input shaft
2. Front planetary carrier
3. Front pinion gear
4. Front sun gear
5. Rear sun gear
6. Rear pinion gear
7. Rear internal gear
8. Output shaft
9. Reverse clutch
10. 2-4 brake
11. High clutch
12. Front internal gear
13. Rear planetary carrier
14. Low clutch
15. Low & reverse brake
16. Low one-way clutch
17. Parking pawl

The driving force from the input shaft (1) is transmitted to the rear sun gear (5) and reverse & high clutch drum. As in the case of the 1st gear and 2nd gear, the low clutch (14) is engaged and the movement of the rear internal gear (7) is restricted. Since the high clutch (11) is engaged, the driving force from the input shaft (1) is directly transmitted to the rear internal gear (7). As a result, the speed of the rear sun gear (5) and the rear internal gear (7) becomes the same as that of the input shaft (1), so that the rear pinion gear rotates (6) not independently but together with the rear sun gear (5) and rear internal gear (7). When decelerating, the engine brake is applied.

Fourth Gear



Legend

1. Input shaft
2. Front planetary carrier
3. Front pinion gear
4. Front sun gear
5. Rear sun gear
6. Rear pinion gear
7. Rear internal gear
8. Output shaft
9. Reverse clutch
10. 2-4 brake
11. High clutch
12. Front internal gear
13. Rear planetary carrier
14. Low clutch
15. Low & reverse brake
16. Low one-way clutch
17. Parking pawl

The driving force from the input shaft (1) is transmitted to the rear sun gear (5) and reverse & high clutch drum. Since the 2-4 brake (10) is engaged, the front sun gear (4) is fixed. In addition to this the high clutch (11) is engaged. As a result, the front pinion gear (6) rotates itself together with other gears clockwise. This rotation increases the speed of rotation of the front internal gear (12) and is transmitted to the output shaft (8).

SECTION 7A3

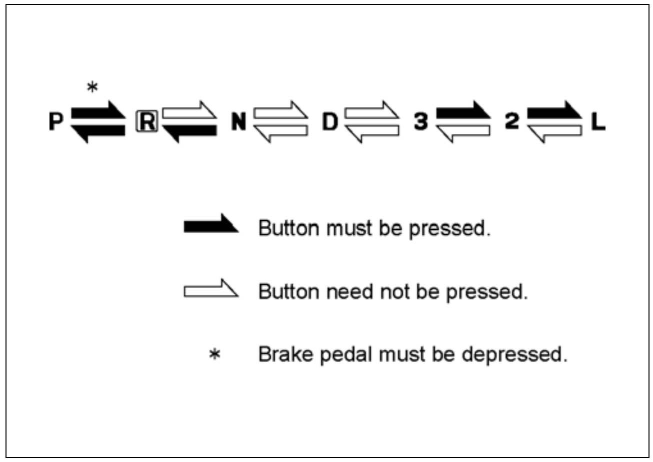
ON-VEHICLE SERVICE (JR405E)

TABLE OF CONTENTS

DESCRIPTION

Before performing on-vehicle service on the automatic transmission, check that the engine idling speed and general engine condition are normal.

For shift interlock function, if the ignition key is out of "LOCK" position, the shift lever select button can not be pushed. (shift lever can not be operated.)



RTW77ASH000901

AUTOMATIC TRANSMISSION FLUID (ATF)

Inspect

Remove the transmission dipstick to check the condition of the ATF.

Check the color and smell of the ATF.

If the ATF is abnormal color or smells burnt, replace it and investigate the cause of trouble.

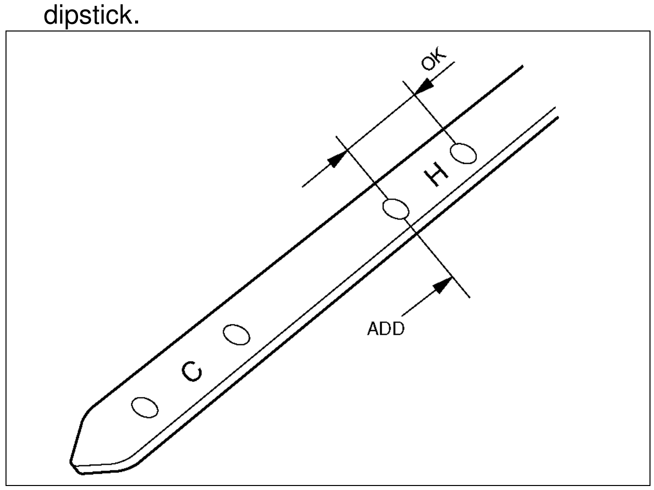
Coloor of ATF	Condition
Clear red	Normality
Blackish discoloration	Defects of power train parts (clutches)
White turbidity	Include water
Discoloration of red brown	Deterioration of ATF

ATF LEVEL

Inspect

Hot Level

1. Warm up the engine and the transmission by driving the vehicle on the road so that the temperature reaches around 80°C (176°F).
   Do not turn the engine off.
2. Park the vehicle on a level surface.
3. Apply the parking brake firmly.
4. Let the engine run at idle.
   Move the select lever slowly through all the gear positions.
   Stop in each gear position just long enough for the transmission to engage.
5. Return the select lever to either "P" or "N".
6. Remove the ATF level dipstick.
7. Wipe the dipstick clean with a paper towel.
8. Reinsert the dipstick and wait several seconds.
9. Remove the dipstick.
   The ATF level should be inside the "H" range on the dipstick.



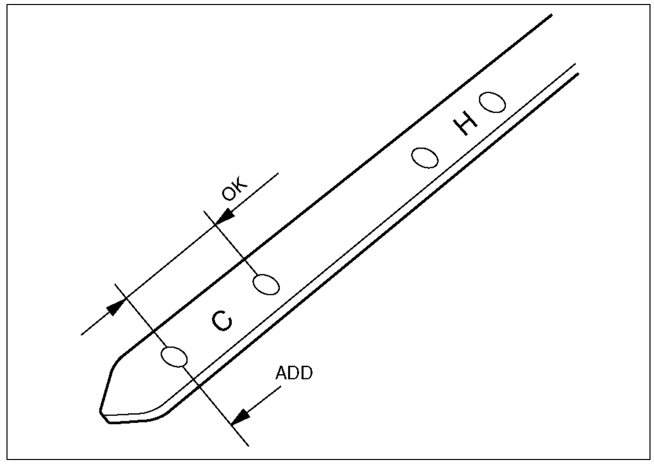
242R300001

If the ATF level is below the "H" range, ATF must be added.

Cold Level

The vehicle must not have been driven so that the temperature reaches around 20°C (68°F) before the cold level check is made.

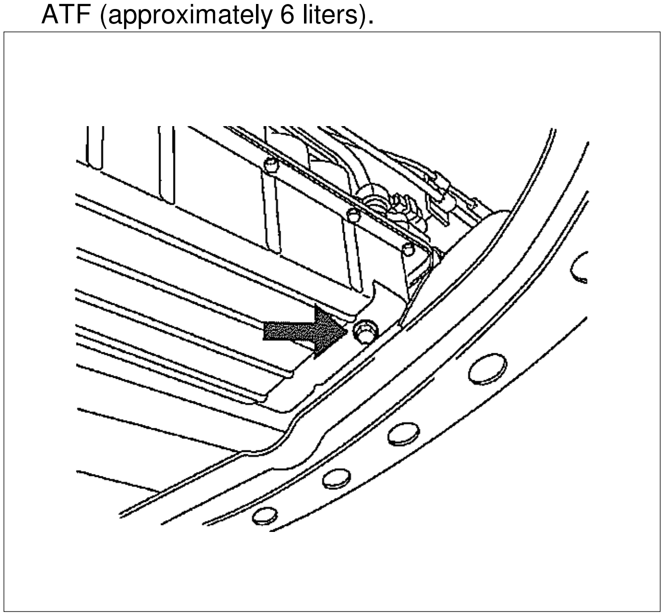
1. Park the vehicle on a level surface.
2. Apply the parking brake firmly.
3. Start the engine and allow it to warm up.
   The engine coolant temperature gauge needle should be midway between the "C" mark and "H" mark.
4. Let the engine run at idle.
   Move the select lever slowly through all the gear ranges.
   Stop in each range just long enough for the transmission to engage.
5. Return the select lever either "P" or "N".
6. Remove the ATF level dipstick.
7. Wipe the dipstick clean with a paper towel.
8. Reinsert the dipstick and wait several seconds.
9. Remove the dipstick.
   The ATF level should be inside the "C" range on the dipstick.
   If the ATF level is below the "C" range, ATF must be added.



242R300002

ATF CHANGE

1. Park the vehicle on level ground and block the rear wheels.
2. Start the engine and allow it to idle until the ATF reaches a temperature of 40-50°C (104-122°F).
3. Stop the engine.
4. Raise the front to the vehicle and support with suitable safety stands.
5. Remove the drain plug from the oil pan and drain the ATF (approximately 6 liters).



6. Remove the oil pan.
7. Inspect the oil pan (details written below).
8. Install the oil pan.

Note:

Use a new gasket. Clean the oil pan and magnet.

Oil pan bolt torque : 8 N·m (0.8 kgf·m/69 lb·in)

9. Replace the gasket and install the drain plug.
   Drain plug torque : 35 N·m (3.6 kgf·m/26 lb·ft)

Note:

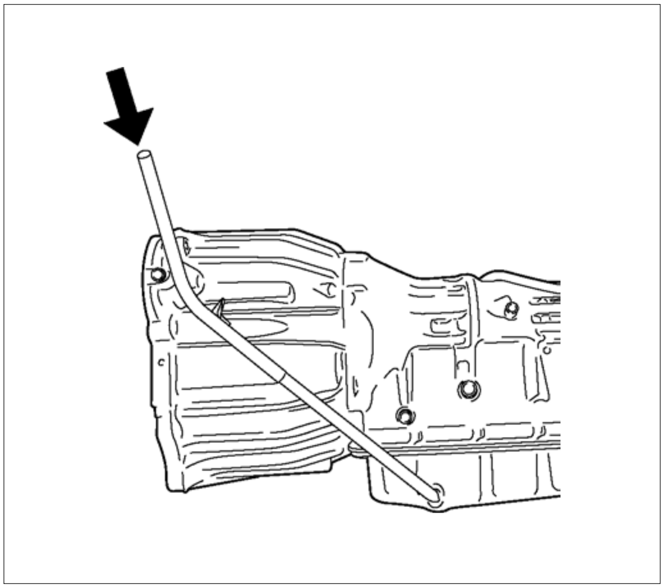
Do not reuse the old washer (gasket).

Clean the drain plug (especially the threaded section).

10. Remove the safety stands and wheel blocks.
11. Pour about 5 liters of new ATF.
12. Start the engine. With your foot on the brake, move the shift lever through each gear range, and shift to "P" range.
13. Check the ATF level. Add more ATF carefully as necessary using the dipstick. Refer to "ATF LEVEL" preciously in this section.

Note:

Keep the engine idle (do not stop it) during the ATF level adjustment.



RTW07ASH000101

Inspect

1. Check the drain plug tip for adhesion of foreign substances.
2. Check the drained ATF for color, smell and inclusion of foreign substances.
3. Check the oil pan bottom and magnet for adhesion of foreign substances.

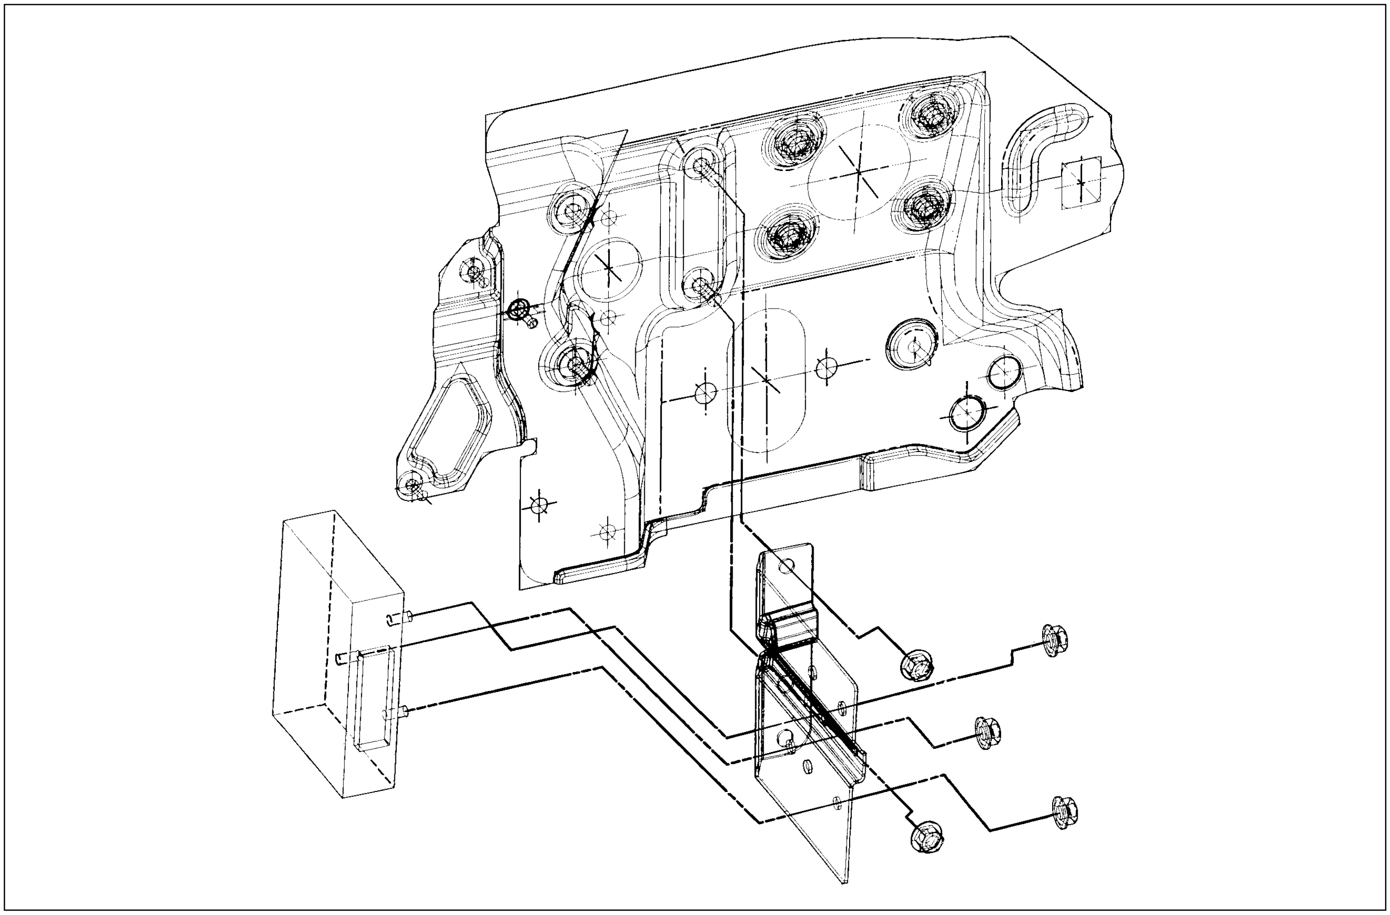
   If a problem is discovered during those checks, the Automatic transmission must be overhauled.

Note:

The torque converter and the oil strainer need replacing with new ones if the drained ATF contains large amounts of metallic or facing flakes.

In addition, flush the ATF cooler circuit.

TRANSMISSION CONTROL MODULE (TCM)



RTW37ALF001901

Remove and Disconnect

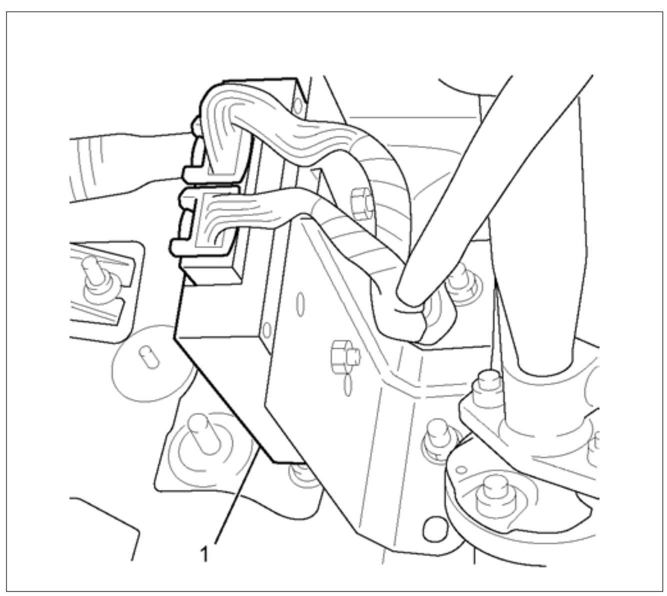
1. Disconnect the negative battery cable.
2. Remove the connectors.
3. Remove the fixing nuts and remove the TCM (1) from the bracket.

Note:

The TCM is fitted under the instrument panel of the driver's compartment via three stud bolts.

Install or Connect

Follow the removal steps in the reverse order. Be absolutely sure that the connectors are securely fastened.



RTW77ASH000801

Service Precaution

WARNING:
THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE REFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION:
Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU/GM will call out those fasteners that require a replacement after removal. ISUZU/GM will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specification. Following these instructions can help you avoid damage to parts and systems.

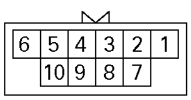
INHIBITOR SWITCH

The inhibitor switch is attached to the right side of the transmission.

Inspect

1. Block the wheels.
2. Disconnect the negative battery cable.
3. Disconnect the harness connectors.
4. Use an ohmmeter to check the inhibitor switch continuity between the following terminals as shown in the figure.
5. Place the select lever in the “N” position.

Terminal / Position	10	7	3	2	4	8	5	1	9	6
P	○	○	○	○						
R			○	—	○					
N	○	○	○	—	—	○				
D			○	—	—	—	○			
3			○	—	—	—	—	○		
2			○	—	—	—	—	—	○	
L			○	—	—	—	—	—	—	○



249R300001

6. Move the select lever to either side.
   Check the inhibitor switch continuity between the terminals shown in Step 4.
   The continuity readings should remain fairly steady as the select lever is moved.
   If there is no continuity or the continuity is intermittent, the inhibitor switch must be adjusted.

Adjust

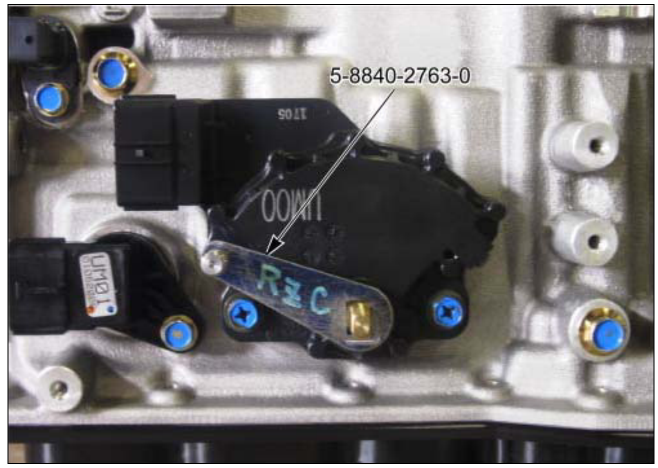
1. Disconnect the shift cable from the lever.
2. Loosen the inhibitor switch bolts.
3. Use the inhibitor switch set plate to align the neutral holes (manual shaft and inhibitor switch).
   Turn the inhibitor switch to adjust it.
   Inibitor switch set plate: 5-8840-2763-0

Note:

Inhibitor switch adjustment is very important.

If the inibitor switch is not correctly adjusted, the automatic transmission will not function normally.

4. Tighten the 2 inhibitor switch bolts to the specified touque.
   Torque: 6 N·m (0.6 kgf·m/52 lb·in)

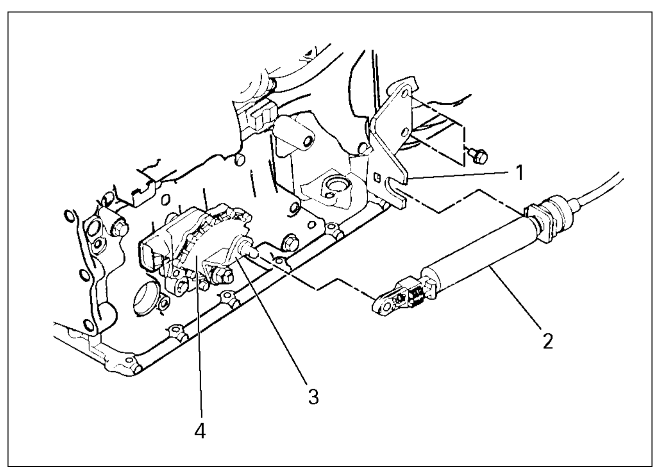


47INH-SW01

5. Remove the inhibitor switch set plate.
6. Connect the shift cable to the lever.
7. Connect the harness connector.

Remove or Disconnect

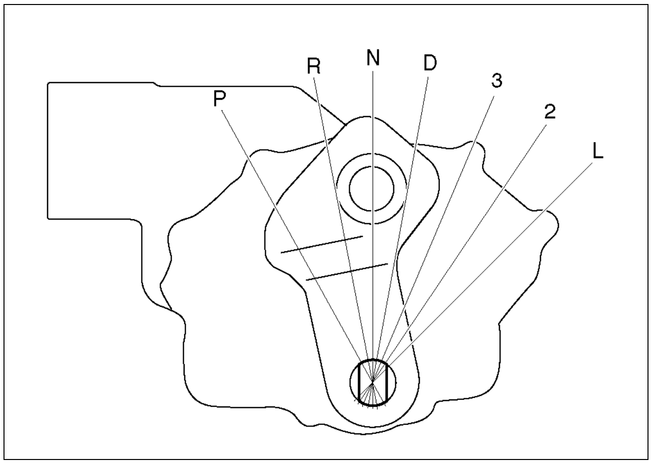
1. Remove the cable bracket (1) from the transmission.
2. Disconnect the shift cable (2) from the lever (3).
3. Disconnect the harness connectors.
4. Remove the inhibitor switch bolts.
5. Remove the inhibitor switch (4) from the transmission.



238R300001

Install or Connect

1. Install the inhibitor switch to the transmission.
   Temporarily tighten the inhibitor switch bolts.
2. Move the manual shaft select lever to the “N” position.



249R300002

3. Use the inhibitor switch set plate to align the neutral holes (manual shaft and inhibitor switch).
   Turn the inhibitor switch to adjust it.
   Inhibitor switch set plate: 5-8840-2763-0

Note:

Inhibitor switch adjustment is very important.

If the inhibitor switch is not correctly adjusted, the automatic transmission will not function normally.

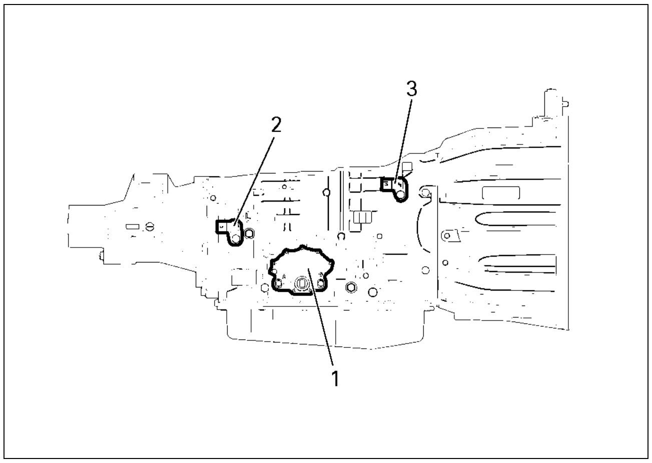
4. Tighten the 2 inhibitor switch bolts to the specified torque.
   Torque: 6 N·m (0.6 kgf·m/52 lb·in)

47INH-SW01

5. Remove the inhibitor switch set plate.
6. Install the cable bracket to the transmission.
7. Connect the shift cable to the lever.
8. Connect the harness connector.
9. Connect the negative battery cable.
10. Remove the wheel blocks.

SPEED SENSOR

The speed sensor is attached to the right side of the transmission.



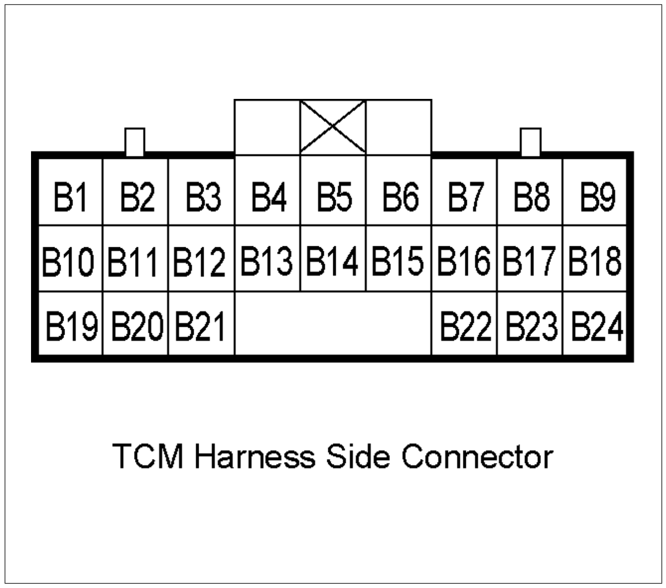
240L300001

Legend

1. Inhibitor switch
2. Speed sensor
3. Turbine sensor

Inspect

1. During driving at a speed of 20km/h (12mph) with “L” range in low gear, measure the voltage between the TCM connector terminals (B13) and (B5) with a digital voltmeter.
   Standard voltage : approx. 7V (AC range)



RTW47ASH000801

2. If the voltage is outside of the standard value, check the speed sensor pole piece for the presence of foreign materials and the speeed sensor cable for a short or open circuit.
   If the result of the inspection is normal, replace the speed sensor.
   Torque: 6 N·m (0.6 kgf·m/52 lb·in)

TURBINE SENSOR

The turbine sensor is attached to the right side of the transmission.

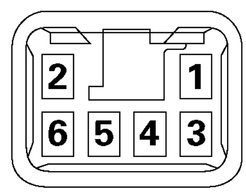
Inspect

1. During driving at a speed of 20km/h (12mph) with “L” range in low gear, measure the voltage between the TCM connector terminals (B3) and (B5) with a digital voltmeter.
   Standard voltage : approx. 7V (AC range)
2. If the voltage is outside of the standard value, check the turbine sensor pole piece for presence of foreign materials and the turbine sensor cable for a short or open circuit.
   If the result of the inspection is abnormal, replace the turbine sensor.
   Torque: 6 N·m (0.6 kgf·m/52 lb·in)

POWER AND 3RD START SWITCH

Inspect

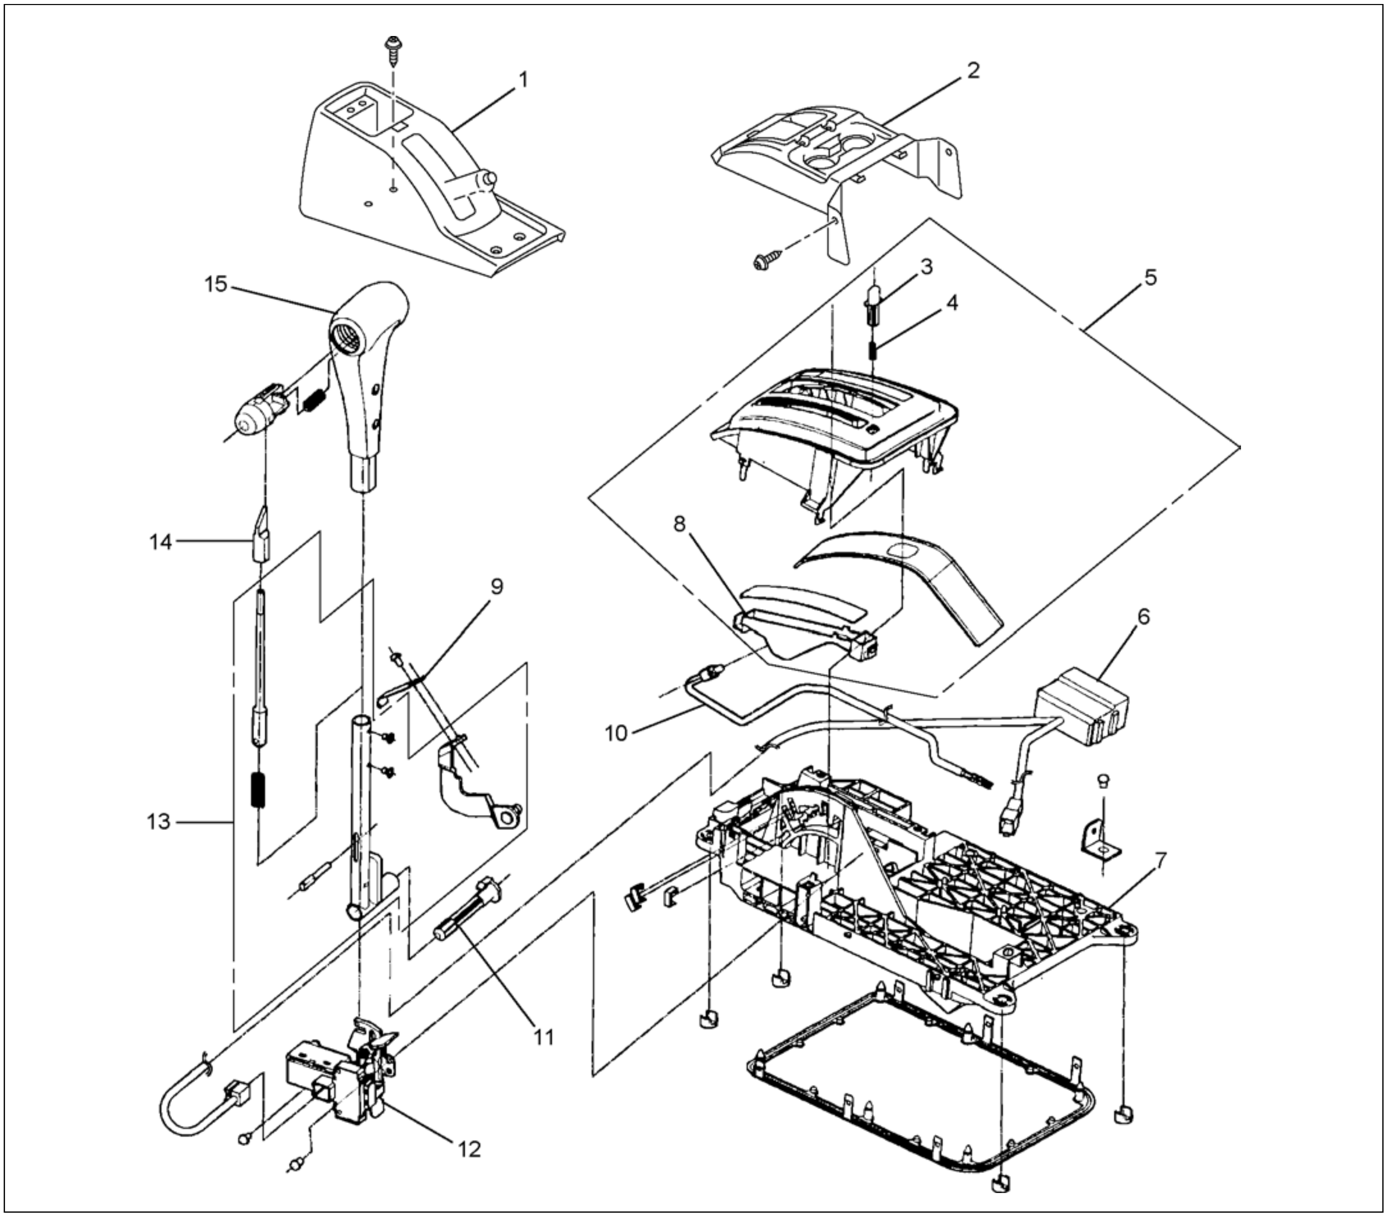
1. Block the wheels.
2. Disconnect the negative battery cable.
3. Pry out the switch from the floor console.
4. Disconnect the harness connector.
5. Check continuity between terminals (5) and (6) at third (3rd) position.
6. Check continuity between terminals (3) and (6) at power (PWR) position.
7. Replace the power and 3rd start switch if the result of inspection is abnormal.
8. Connect the harness connector.
9. Connect the negative battery cable.
10. Remove the wheel blocks.



Switch Position	Terminal		
	3	6	5
PWR	○	○	
3rd		○	○

238R300003

SELECT LEVER



RTW77ALF000201

Legend

1. Rear console
2. Front console
3. Shift lock release button
4. Shift lock button spring
5. Upper housing
6. Interlock controller
7. Base plate
8. Position indicator housing
9. Spring plate
10. Lamp assembly
11. Grooved pin
12. Shift lock unit
13. Lever assembly
14. Sleeve
15. Select lever knob

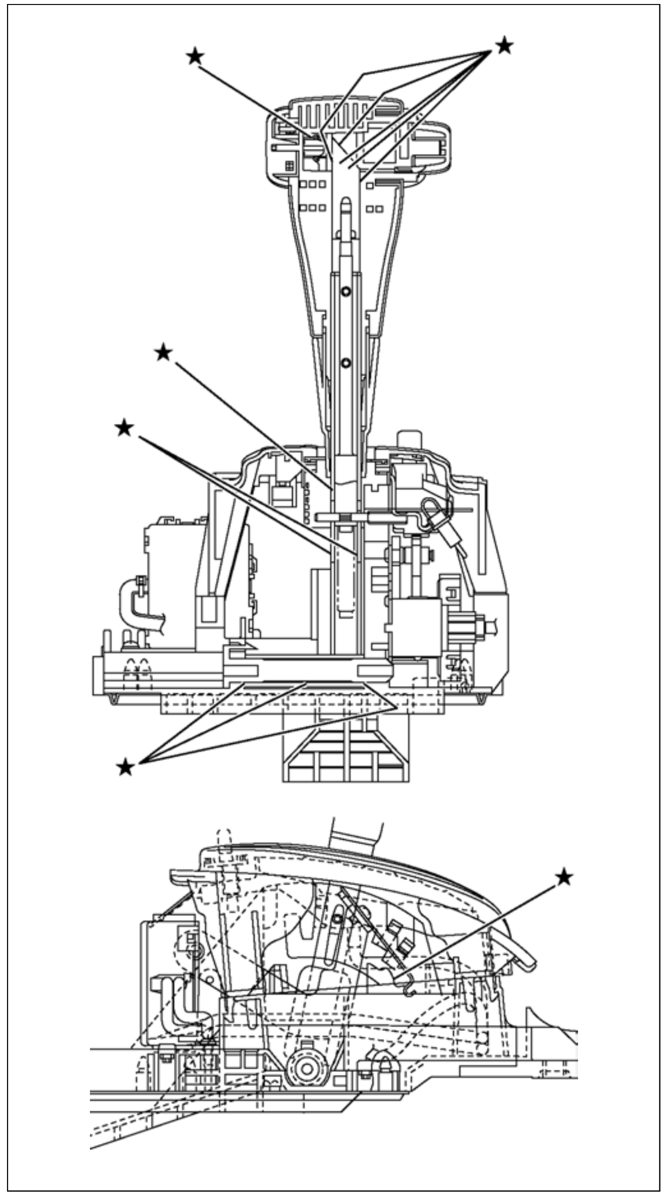
Remove or Disconnect

1. Block the wheels.
2. Disconnect the negative battery cable.
3. Remove the rear console and the front console.
4. Remove the 2 screws fixing the select lever knob.
5. Remove the knob together with the knob button and spring from the lever.
6. Turn the sleeve counterclockwise to remove it. Make a note of the number of turns required to free the sleeve.
7. Remove the harness connectors from the base plate.
8. Remove the upper housing (held in place by 4 latched fasteners).
9. Remove the lamp assembly by turning it counterclockwise.
10. Remove the spring plate.
11. Remove the grooved pin.
12. Disconnect the shift cable from the select lever.
13. Remove the lever assembly by pressing the rod down (lever in N position).
14. Remove the harness connectors from the shift lock unit, then remove the shift lock unit.
15. Remove the interlock controller.
16. If the replacement of shift lock release button or shift lock button spring is required, remove the position indicator housing, the shift lock button spring and shift lock release button can be removed.

Install or Connect

NOTE

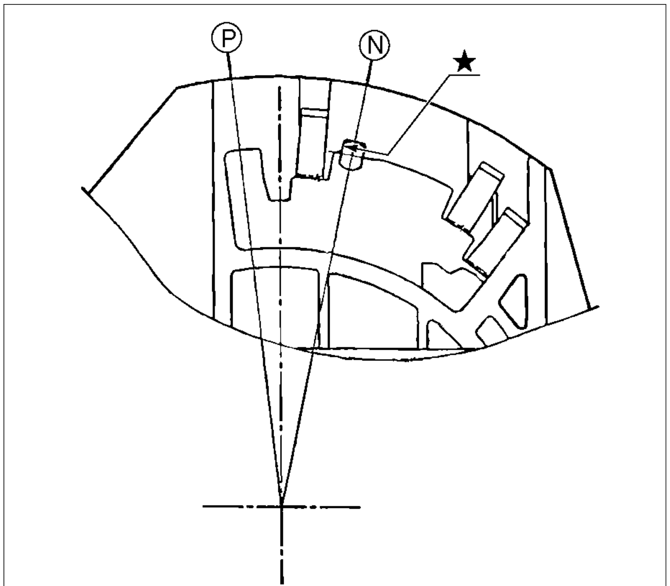
Apply MULTEMP No. 2 grease (or equivalent) to the select lever. Refer to the illustration.



RTW77ALH000201

1. Install the interlock controller.
2. Install the shift lock unit and connect the harness to the shift lock unit.
3. Install the lever assembly to the base plate.
   a. Insert and secure the shaft and connect the cable.
   b. Insert pawled end of the shaft into the base plate hole.
   c. Insert the detent pin of the shaft into detent aperture (lever assembly in N position).
   d. Install the grooved pin.

4. Install the spring plate.
   a. Insert the detent pin into the base plate detent groove until it touches the front wall (lever assembly in N position).



DETAIL DETENT

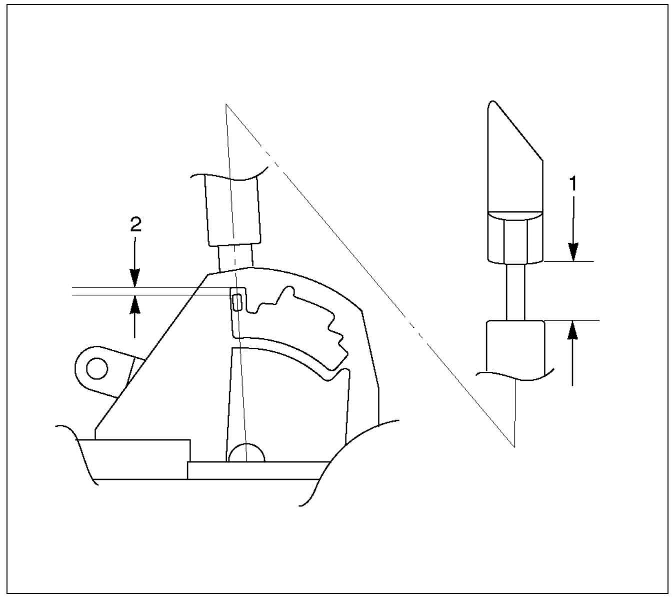
RTW37ASH001001

   b. Stack the short spring plate and tighten the screws to the specified torque.

Screw torque	2 N·m (0.2kgf·m/17 lb·in)

   c. Check that the detent pin moves smoothly in the detent groove (shift knob temporarily installed).
5. Temporarily install the sleeve.
6. Move the lever to the “P” position.
7. Adjust the clearance (2) between the detent plate and the pin by moving the select lever knob sleeve (1).

Detent plate and pin clearance	mm(in)
0.2 - 1.0 (0.01 - 0.04)	

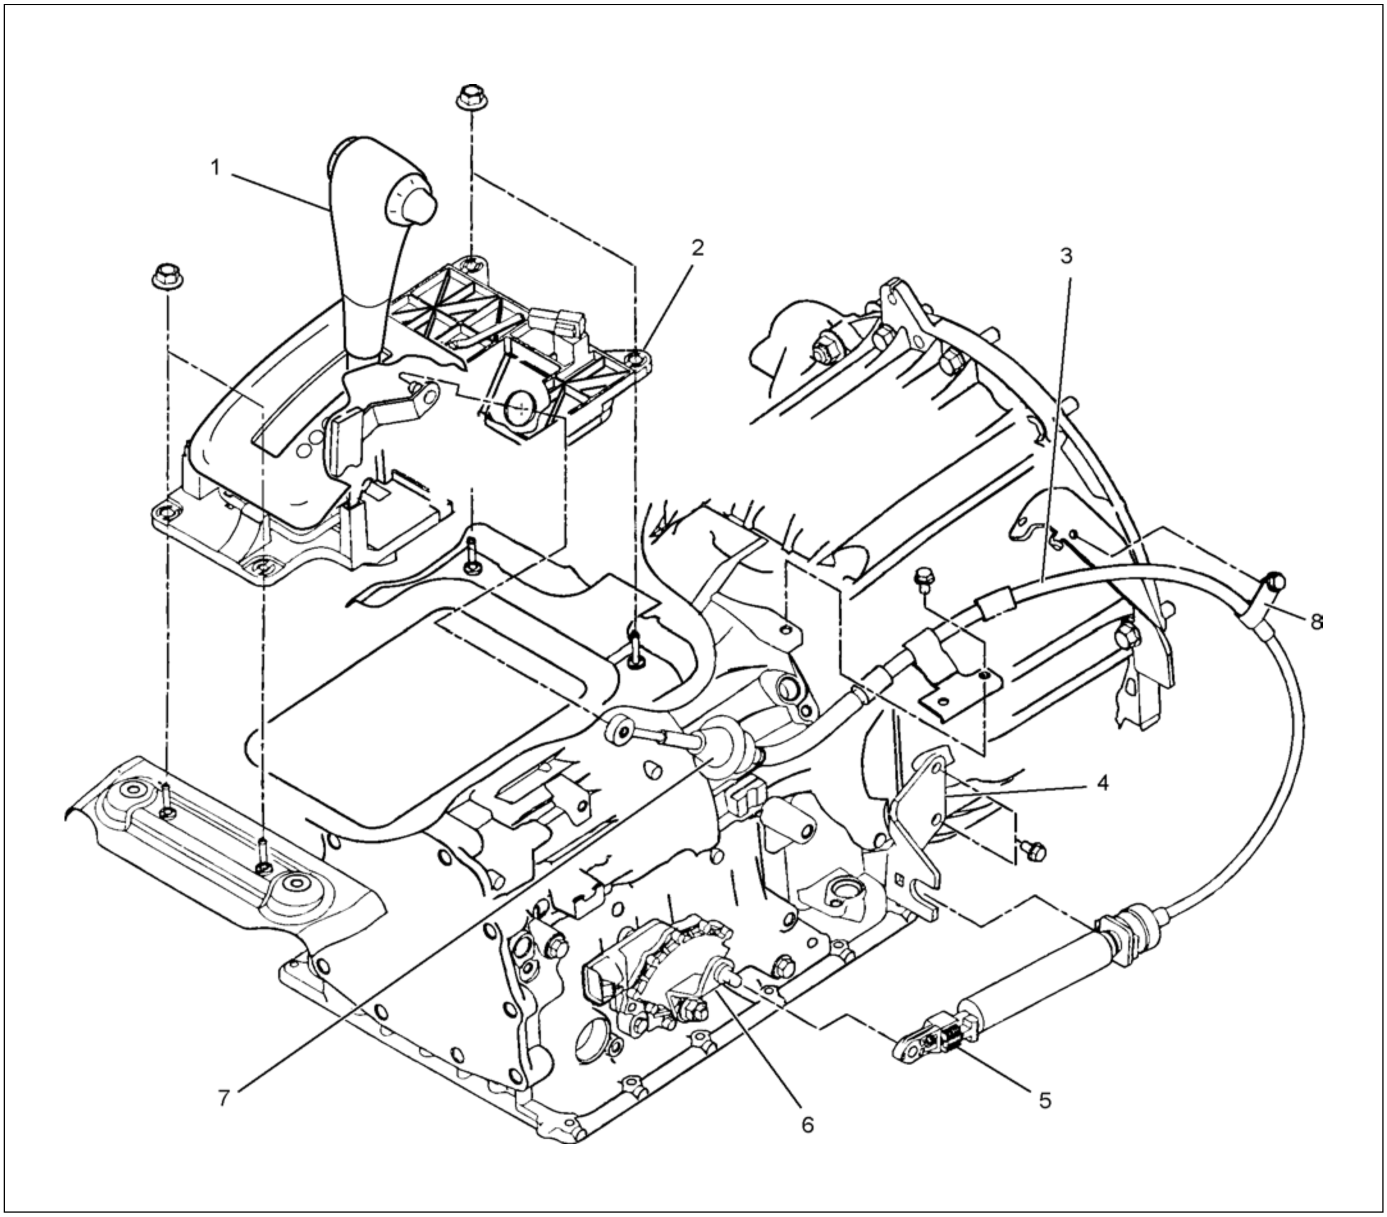


255R300002

8. Install the lamp assembly to the lamp socket.
   a. Align the recessed portion of the lamp socket with the protruding portion of the lamp assembly.
   b. Insert the lamp assembly into the lamp socket and rotate it 90 degrees clockwise.
9. Remove the sleeve and move the lever to the “N” position.
10. Install the upper housing. Make sure that the 4 latched fasteners are securely closed.
11. Attach the harness connectors to the base plate.
12. Install the sleeve (rotate the sleeve clockwise the same number of turns it was rotated counterclockwise at disassembly).
13. Install the knob, the knob button, and the knob spring.
14. Install the 2 screws securing the knob and tighten them to the specified torque.

    Screw torque: 2 N·m (0.2kgf·m/17 lb·in)

SHIFT CABLE



Legend

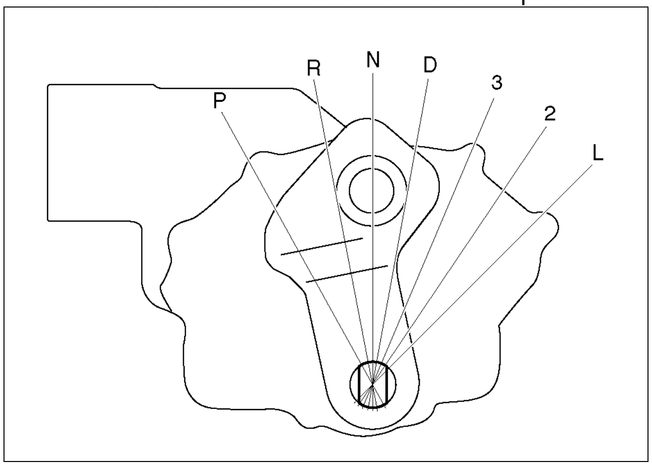
1. Select lever
2. Select lever base
3. Shift cable
4. Bracket
5. Adjuster
6. Manual shaft select lever
7. Shift cable retaining pawl
8. Clip

Remove or Disconnect

1. Block the wheels.
2. Disconnect the negative battery cable.
3. Move the select lever to the “N” position.
4. Remove the rear console and front console.
5. Disconnect the shift cable from the select lever.
6. Press on the shift cable retaining pawl to remove the cable from the select lever base.
7. Disconnect the shift cable from the transmission side.
8. Remove the shift cable from the bracket.
9. Pull the shift cable free from the bottom of the vehicle.

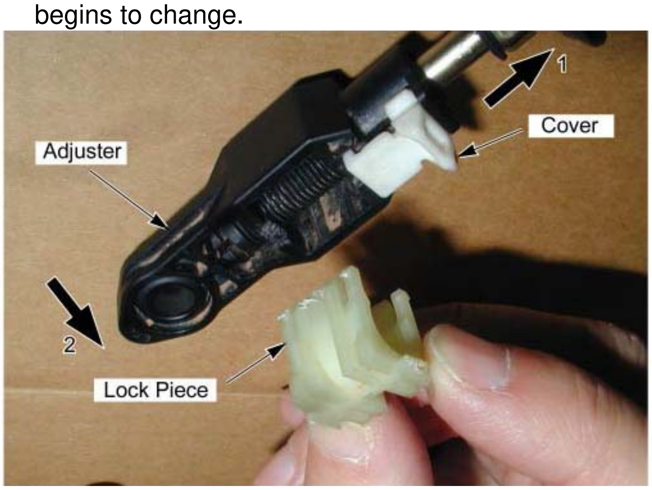
Install or Connect

1. Install the shift cable toward the inside of the cabin from the bottom of the vehicle.
2. Push the shift cable into the select lever base.
3. Connect the shift cable to the select lever.
4. Fix the shift cable to the bracket.
   Install the clip on the marking on the shift cable.
5. Check that the select lever is in the “N” position.
6. Check that the transmission is in the “N” position.



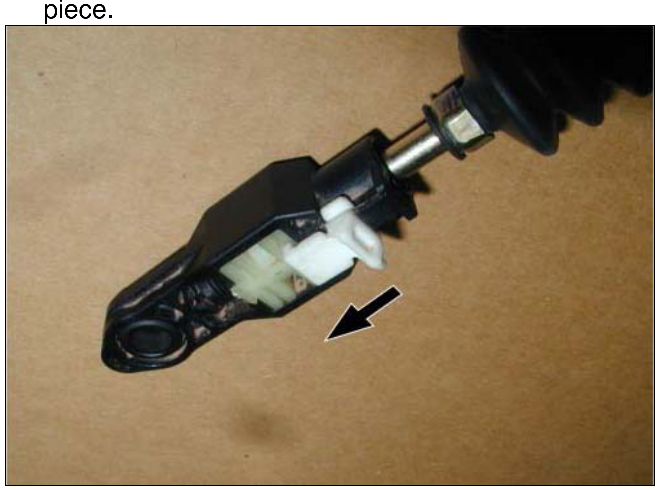
249R300002

7. Slide the cover in the direction shown by the arrow (1).
8. Use an ordinary screwdriver to move the lock piece from the position indicated by the arrow (2). Continue to move the lock piece until the adjuster position begins to change.



P1010012

9. Connect the shift cable to the manual shaft select lever at the transmission side.
10. Insert the lock piece to the adjuster (cable length adjustment).
11. Slide the cover on the adjuster and secure the lock piece.



P1010016-2

12. Press the select lever knob button 5 times at “P” position.
    Then check that the select lever moves smoothly to each of its positions.
13. Check that the shift position indicated by the select lever and the actual shift position are the same.
14. Install the front console and rear console.
15. Connect the negative battery cable.
16. Remove the wheel blocks.

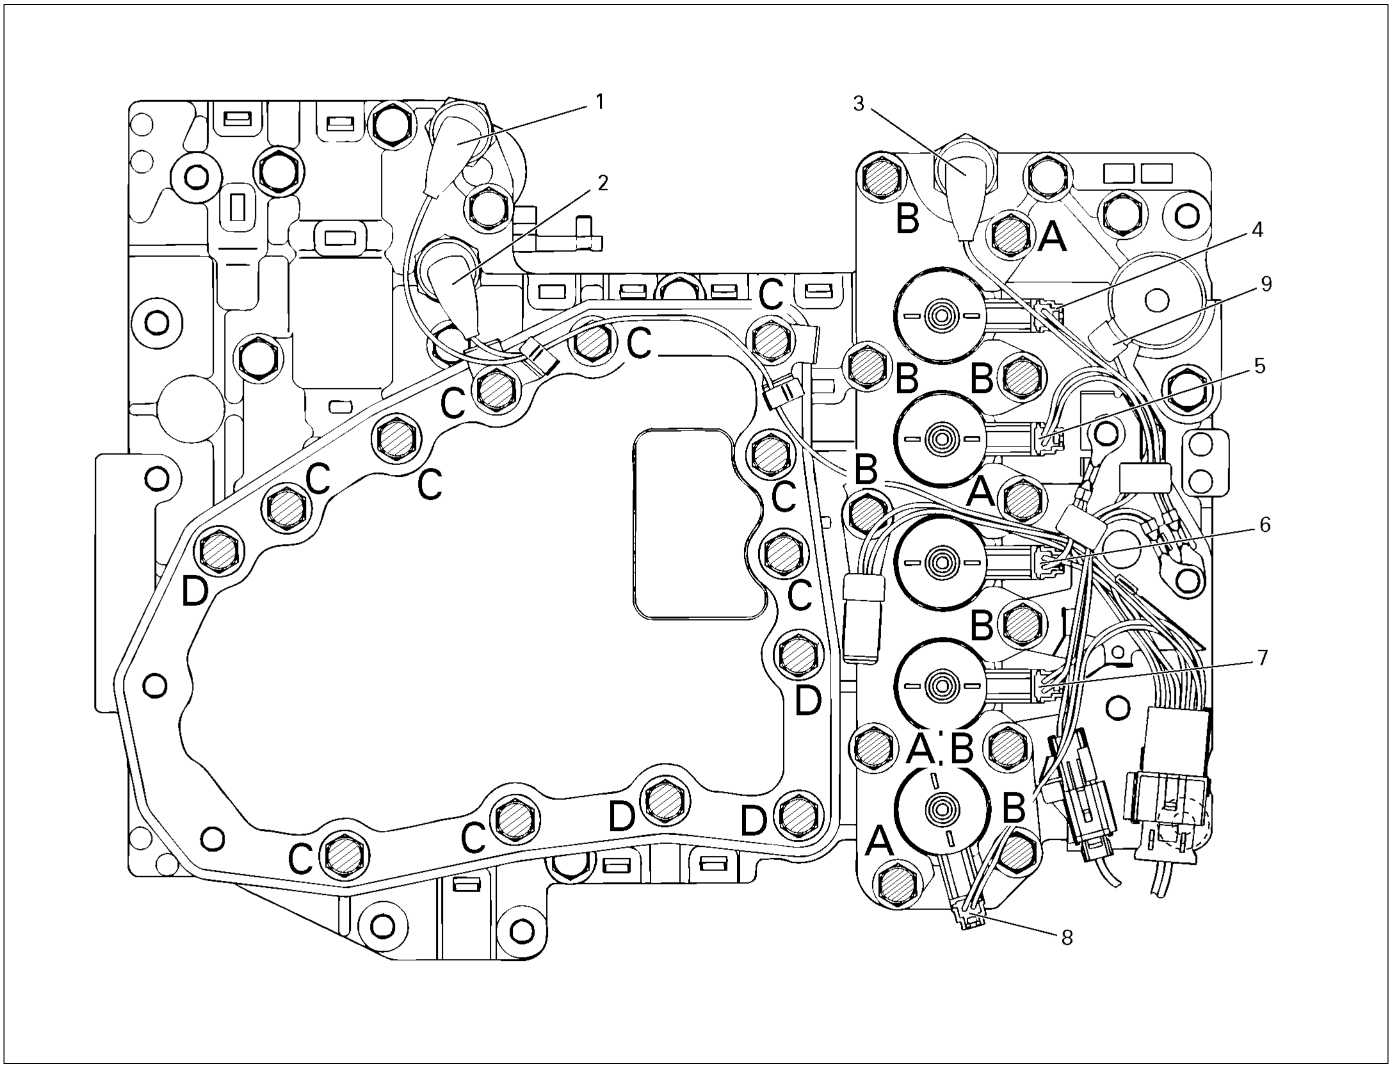
SOLENOIDS, OIL PRESSURE SWITCH AND OIL TEMPERATURE SENSOR



244L300003

Legend

1. High clutch oil pressure switch connector (wire color: Gray)
2. 2-4 brake oil pressure switch connector (wire color: Brown)
3. Low and reverse brake oil pressure switch connector (wire color: White)
4. Low and reverse brake duty solenoid connector (wire color: Pink and White)
5. High clutch duty solenoid connector (wire color: Green and Gray)
6. Lock-up duty solenoid connector (wire color: Yellow and Black)
7. 2-4 brake duty solenoid connector (wire color: Blue and Brown)
8. Low clutch duty solenoid connector (wire color: Orange and Black)
9. Line pressure solenoid connector (wire color: Pink)

Remove or Disconnect

1. Block the wheels.
2. Disconnect the negative battery cable.
3. Drain the fluid.
   Refer to “ATF CHANGE” in this section.
4. Remove the 19 bolts and oil pan.
5. Inspect the bottom of the oil pan and strainer netting for foreign material (clutch facing and metal shavings).
   If there is an excessive accumulation of foreign material, the oil strainer must be replaced.
   Further inspection is required to determine the source of the foreign material.
6. Remove the harness assembly (including the oil temperature sensor).
7. Remove the 11 bolts and the solenoid fixing plate.
8. Remove the 6 solenoids and 3 oil pressure switches.

Inspect

Oil pressure switch

Apply compressed air (390 kPa/4.0 kgf/cm^2/57 psi) to the oil pressure switch to check the oil pressure switch continuity between the connector and screw.

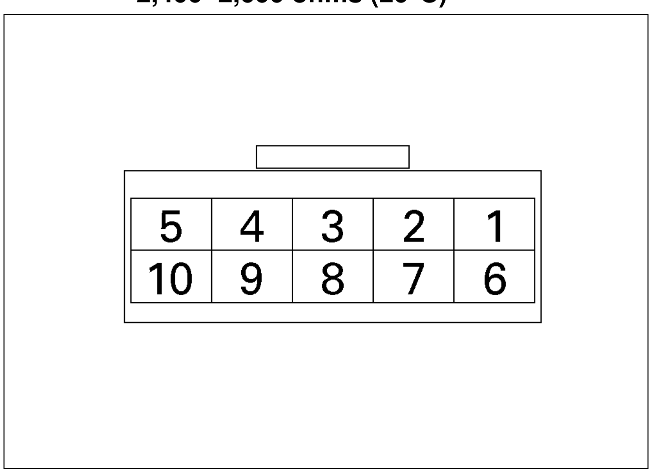
Replace the oil pressure switch if the result of inspection is abnormal.

Oil temperature sensor (harness assembly)

Check the oil temperature sensor resistance between harness terminals 7 and 6 (ground).

Oil temperature sensor resistance:

2,400~2,600 ohms (20°C)



244L300011

Solenoid

Measure the resistance of each solenoid.

Resistance:

Brown connector – 3.0~3.4 ohms (20°C)

Gray connector – 12.0~13.2 ohms (20°C)

White connector – 12.2~13.4 ohms (20°C)

Replace the solenoid if the result of inspection is abnormal.

Install or connect

1. Install the O-rings to each of the solenoids.
2. Install the 6 solenoids and 3 oil pressure switches.
   Line pressure solenoid bolt torque:
   8 N·m (0.8 kgf·m/69 lb·in)
   Oil pressure switch bolt torque:
   4 N·m (0.4 kgf·m/35 lb·in)
3. Install the solenoid fixing plate together with the harness brackets.

	Number	Length (Color)
Solenoid fixing plate bolt		
(A)	4	16 mm (0.63 in) (Gold)
(B)	7	45 mm (1.77 in) (Silver)

Bolt torque : 8 N·m (0.8 kgf·m/69 lb·in)

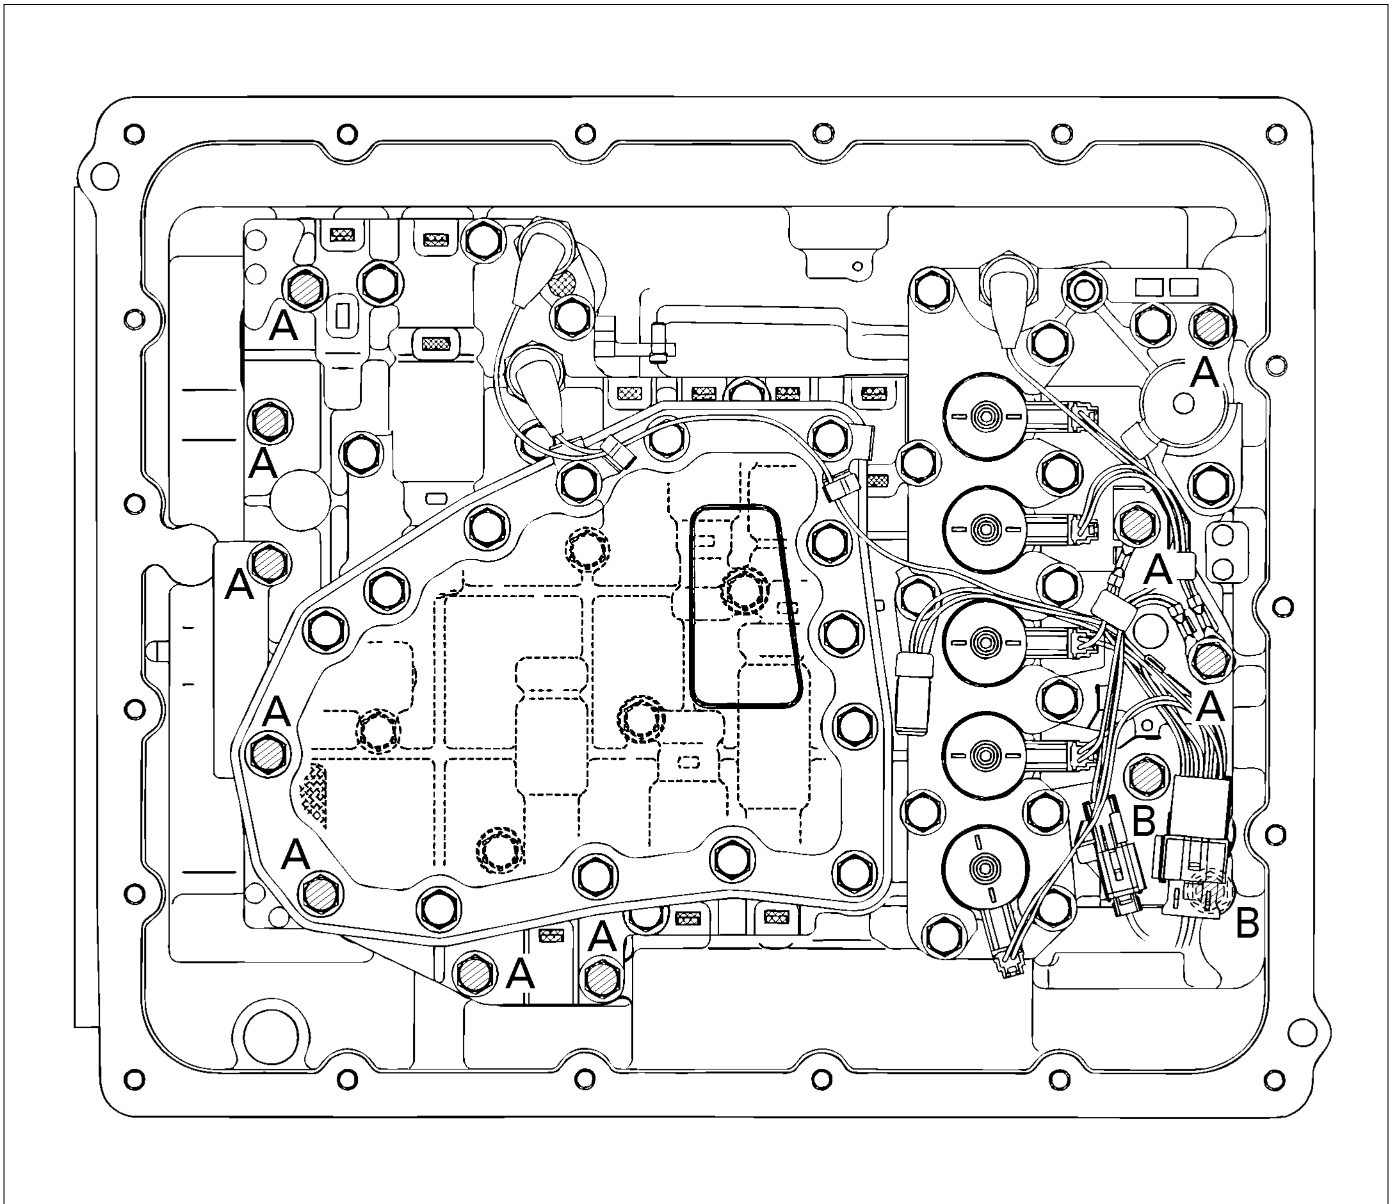
4. Install the harness assembly.
5. If removed, install the oil strainer.

	Number	Length (Color)
Oil strainer bolt		
(C)	9	13 mm (0.51 in) (Silver)
(D)	4	45 mm (1.77 in) (Silver)

Bolt torque : 8 N·m (0.8 kgf·m/69 lb·in)

6. Install the new gasket and oil pan.
   Bolt torque : 8 N·m (0.8 kgf·m/69 lb·in)
7. Fill the fluid.
   Refer to “ATF CHANGE” in this section.
8. Connect the negative battery cable.
9. Remove the wheel blocks.

CONTROL VALVE ASSEMBLY



244L300001

Remove or Disconnect

1. Block the wheels.
2. Disconnect the negative battery cable.
3. Drain the fluid.
   Refer to “ATF CHANGE” in this section.
4. Remove the 19 bolts and oil pan.
5. Inspect the bottom of the oil pan and strainer netting for foreign material (clutch facing and metal shavings).
   If there is an excessive accumulation of foreign material, the oil strainer must be replaced.
   Further inspection is required to determine the source of the foreign material.
6. Disconnect the 2 harness connectors leading to the control valve.
7. Remove the 12 bolts and the control valve assembly.

Number of bolts	Length
10 (A) 2 (B)	40 mm (1.57 in) 30 mm (1.18 in)

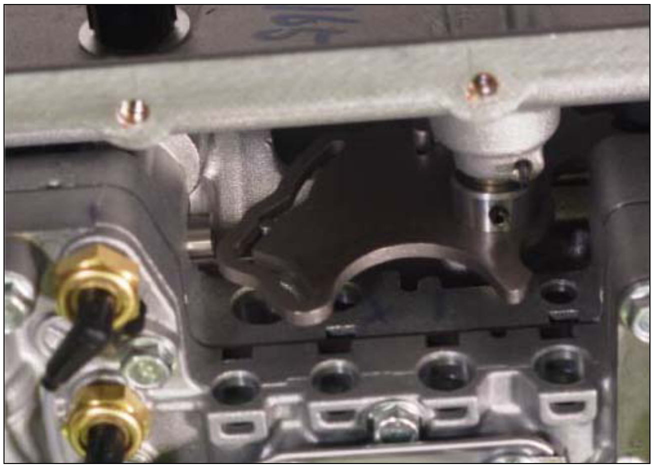
Note:

Take care not to disturb the manual valve (inside the control valve assembly).

Do not allow the pin to fall free (the pin prevents the valve from turning).

Install or Connect

1. Align the manual valve and the manual plate of the transmission case.



43ASSY119

2. Install the control valve assembly and tighten the 12 fixing bolts to the specified torque.

Number of bolts	Length	Color
10 (A)	40 mm (1.57 in)	Gold
2 (B)	30 mm (1.18 in)	Gold

Bolt torque : 8 N·m (0.8 kgf·m/69 lb·in)

3. Connect the 2 harness connectors.
4. If removed, install the oil strainer.
   Refer to “Solenoids, Oil Pressure Switch and Oil Temperature Sensor” previously in this section.
5. Install the new gasket and oil pan.
   Bolt torque : 8 N·m (0.8 kgf·m/69 lb·in)
6. Fill with the fluid.
   Refer to “ATF CHANGE” in this section.
7. Connect the negative battery cable.
8. Remove the wheel blocks.

FLUSHING THE TRANSMISSION FLUID COOLER AND LINE

The fluid cooler and lines may be flushed under the following condition. This will help prevent more trouble after the transmission is repaired.

1. When an abnormal amount of debris is found.
2. When an abnormal wear or chips on gears and shafts is found while overhauling.
3. When there is abnormal clutch facing wear and oil contamination found.

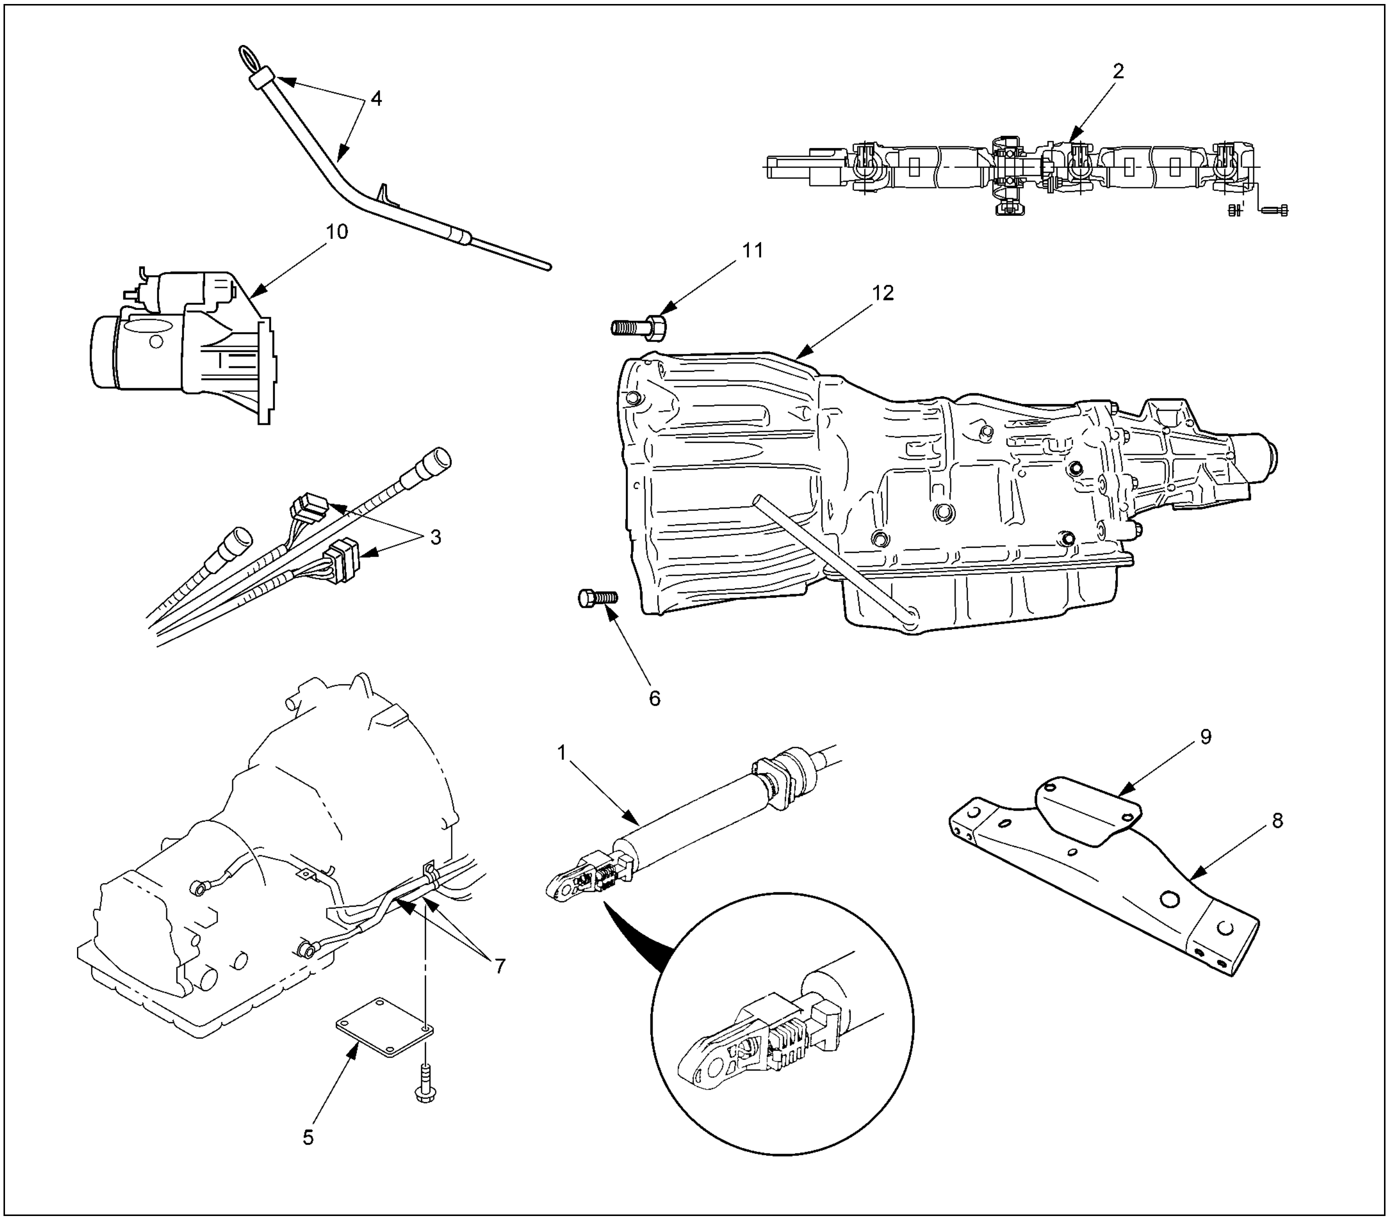
Procedures

1. Block the wheels.
2. Disconnect the negative battery cable.
3. Raise the vehicle and support it with suitable safety stands.
4. Disconnect the fluid cooler lines at the transmission case and fluid cooler.
5. Flush and back-flush the fluid cooler and lines using solvent and compressed air.

Note:
DO NOT exceed (200 kPa/2.0 kgf/cm^2/28 psi) air pressure, or damage may result to oil cooler.

6. Remove all remaining solvent from the system with compressed air.
7. Flush the cooling system again with Automatic Transmission Fluid (ATF).
   After the final flush, connect all lines.
   Cooler line joint connector torque :
   44 N·m (4.5 kgf·m/33 lb·ft)
8. Replenish the ATF.
9. Start the engine to test the system for the free flow of fluid. If the flow is restricted, the cooler assembly or lines must be replaced.
   Repeated cleaning and flushing may not remove all the debris from the fluid cooler circuit.
   Move the select lever through the various ranges and return to neutral.
   Check for fluid level.
   If the fluid level is below the specified range, ATF must be added.
10. Connect the negative battery cable.
11. Remove the safety stands.
12. Remove the wheel blocks.

TRANSMISSION ASSEMBLY



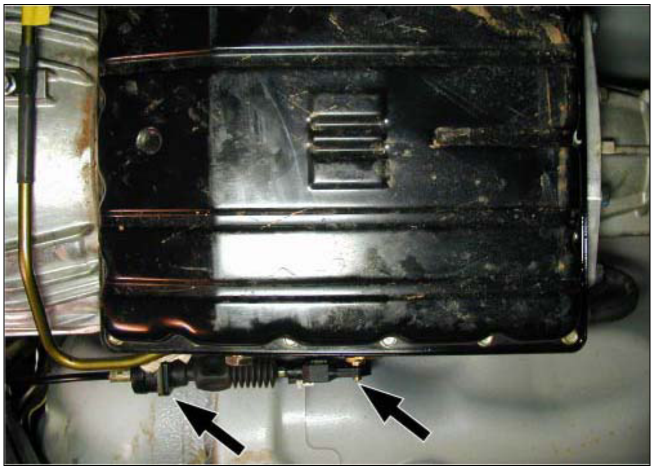
Legend

1. Shift Cable
2. Propeller Shaft
3. Engine Harness
4. ATF Level Dipstick & Filler Tube
5. Under Cover
6. Bolt
7. ATF Pipe
8. Crossmember
9. Transmission Mount
10. Starter Motor
11. Bolt
12. Automatic Transmission

Remove or Disconnect

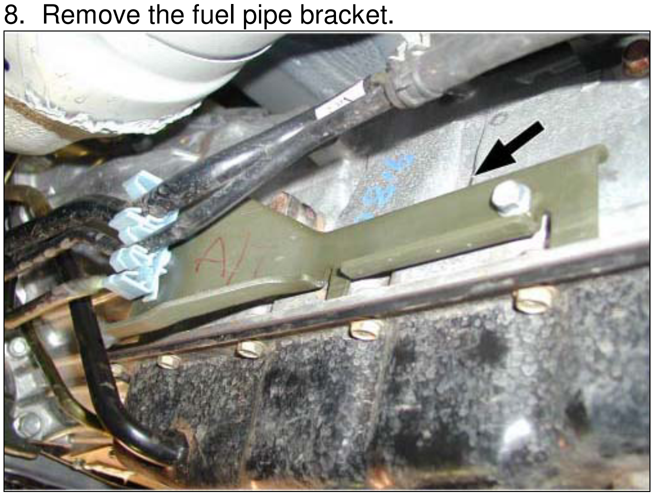
1. Block the wheels.
2. Disconnect the negative battery cable.
3. Raise the vehicle and support it with the suitable safety stands.

4. Remove the shift cable from the transmission.

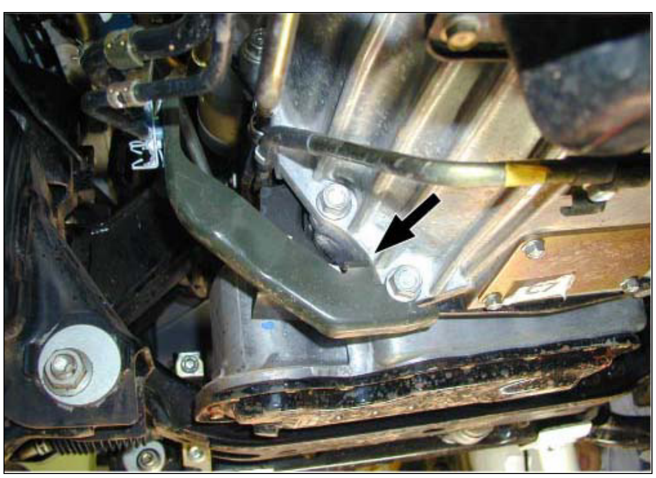


P1010068

5. Remove the rear propeller shaft assembly.
6. Loosen (do not remove) the nuts securing the exhaust manifold and the exhaust pipe.
7. Disconnect the harness connectors from the transmission.
8. Remove the fuel pipe bracket.



P1010013

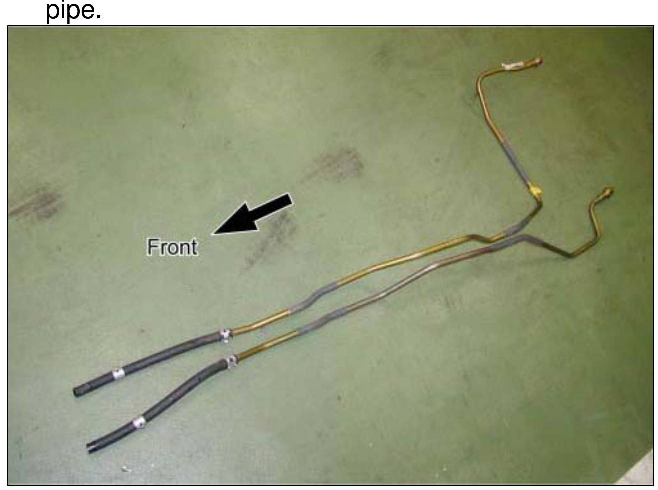


P1010014

9. Remove the ATF level dipstick and tube.
10. Remove the undercover.
11. Rotate the ring gear and remove the 6 torque converter bolts.

P1010016

12. Remove the automatic transmission fluid cooling pipe.



P1010060

13. Place a jack beneath the engine to support it.
14. Remove the 3rd crossmember.
15. Remove the transmission mount.
16. Lower the jack beneath the engine slightly to tilt the engine and transmission. Do not allow the radiator and air conditioner hoses to stretch.
17. Remove the bolts attaching the transmission to the engine.
18. Lower the transmission from beneath the vehicle. Take care not to damage the breathers.

Install or Connect

1. Install the transmission to the engine and tighten the bolts.

   Bolt torque : M10 40 N·m (4.1 kgf·m/30 lb·ft)
   M12 76 N·m (7.7 kgf·m/56 lb·ft)

2. Install the cable bracket to the transmission.
3. Connect the engine harness connectors.

4. Install the transmission mount.
   Bolt torque (rubber to transmission) :
   50N·m (5.1 kgf·m/37 lb·ft)
   Nut torque (rubber to crossmember) :
   52N·m (5.3 kgf·m/38 lb·ft)
5. Install the 3rd crossmember.
   Bolt and Nut torque : 67 N·m (6.8 kgf·m/49 lb·ft)
   Bolt torque : 50 N·m (5.1 kgf·m/37 lb·ft)
6. Install the automatic transmission fluid cooling pipe.
7. Install the torque converter bolts.
   Bolt torque : 29 N·m (3.0 kgf·m/22 lb·ft)
8. Install the undercover.
   Bolt torque : 9 N·m (0.9 kgf·m/78 lb·in)
9. Install the ATF level dipstick and tube.
10. Install the fuel hose bracket.
    Bolt torque : 10 N·m (1.0 kgf·m/87 lb·in)
11. Tighten the nuts securing the exhaust manifold and the exhaust pipe.
    Bolt torque : 43 N·m (4.4 kgf·m/32 lb·ft)
12. Install the rear propeller shaft assembly.
    Flange bolt torque : 59 N·m (6.0 kgf·m/43 lb·ft)
    Center bearing bracket bolt torque :
    69 N·m (7.0 kgf·m/51 lb·ft)
13. Install the shift cable.
14. Connect the negative battery cable.
15. Remove the safety stands.
16. Remove the wheels blocks.

SECTION 7A4

UNIT REPAIR (JR405E)

TABLE OF CONTENTS

AUTOMATIC TRANSMISSION DISASSEMBLY

Cleaning the automatic transmission

1. Use compressed steam and /or cleaning oil to thoroughly clean the outside of the transmission before disassembly.

CAUTION:
Steam under high pressure may cause dirt particles adhering to the transmission to fly through the air at great speed. These particles can cause serious eye injury. Wear protective goggles when steam-cleaning the outside of the transmission.

2. During disassembly, clean the removed parts with cleaning oil. Dry the parts with compressed air.
   Use Compressed air to clean the transmission oil holes and oil passages.

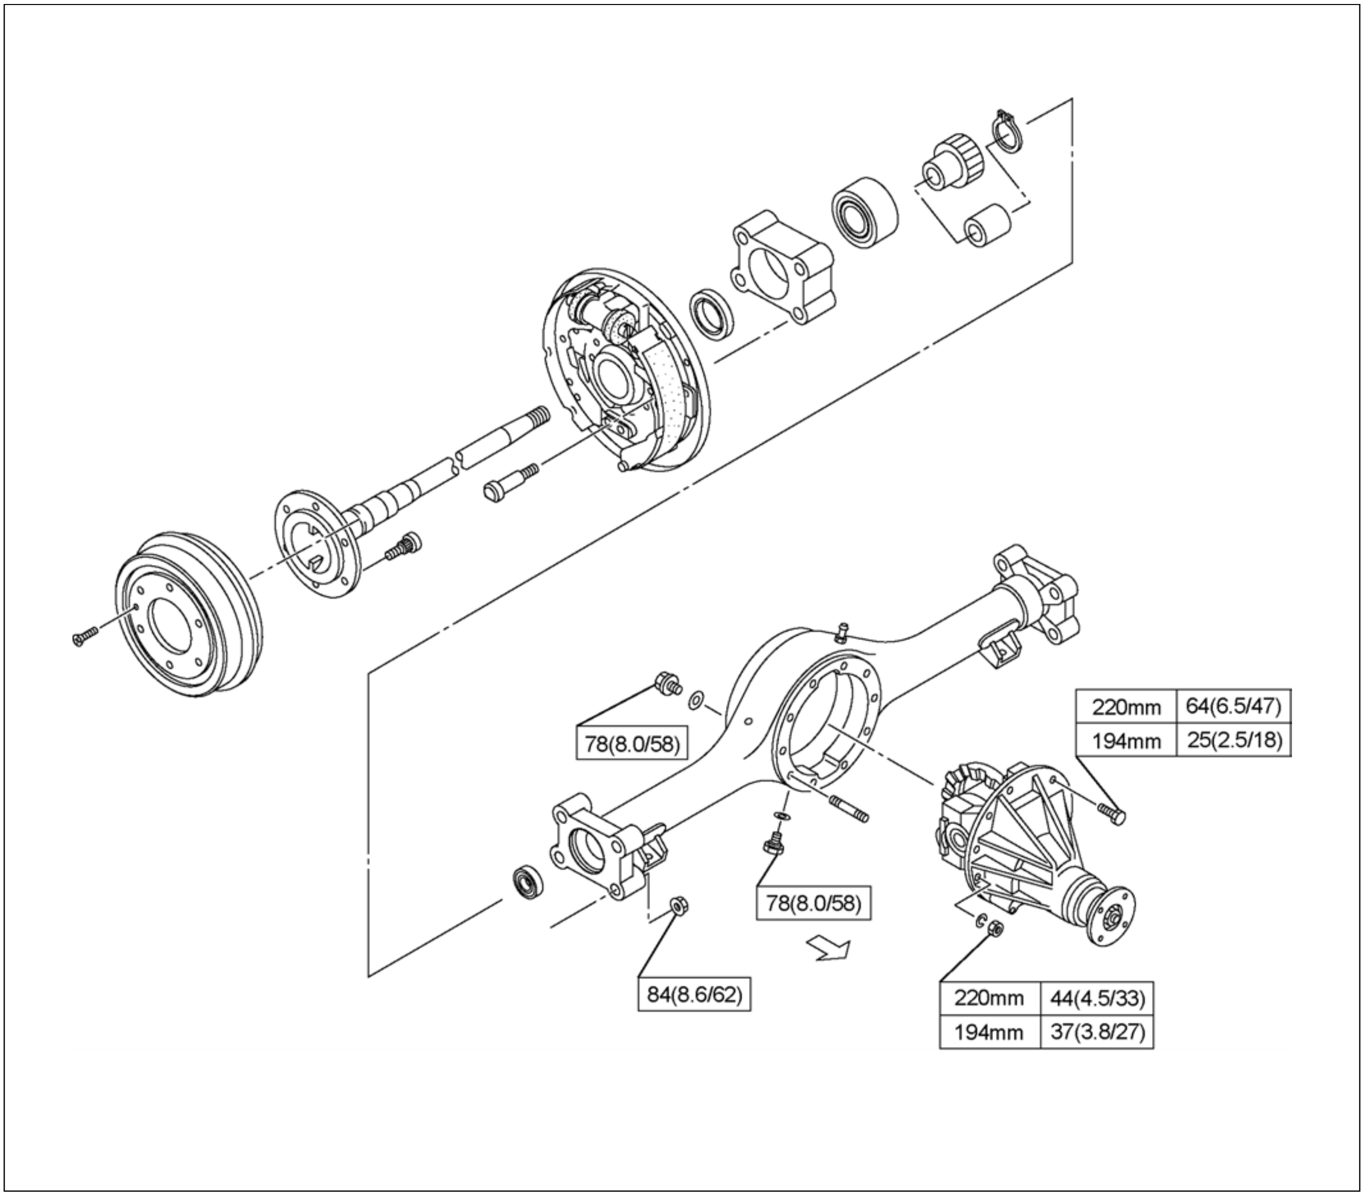
Automatic transmission disassembly cautions

- Perform the disassembly procedure in a dust-free environment to prevent the entry of foreign material into the transmission.
- Inspect each transmission part as you remove it.
- Carefully check the oil pan and the magnet for foreign material. This is a good way to estimate the transmission condition.
- Use your bare hands or vinyl gloves to disassemble the transmission. Do not use ordinary work gloves (loose threads from the gloves may fall into the transmission and cause problems).
- Use a plastic hammer to loosen the transmission case and other aluminum parts during disassembly. Strike around the parts lightly with the hammer. Do not pry aluminum parts away from each other with a screwdriver or similar object.
- Arrange the disassembled parts neatly in the order they were removed. Cover the parts with a plastic sheet or similar object to protect them from dust.

Torque Specifications

Rear Axle

N·m (kgf·m/lb·ft)



RTW74BLF000101

Disassembly steps

1. Torque converter

- Pull the torque converter free.

NOTE:
Place a pan beneath the torque converter to catch automatic transmission fluid (ATF) spillage.

- Drain the ATF from the torque converter.

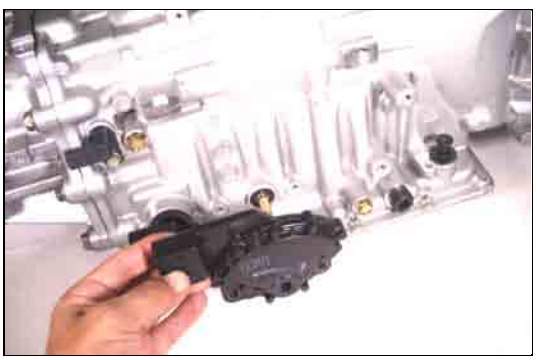
01ASSY101

2. Turbine sensor and speed sensor

- Remove the turbine sensor from the transmission case.

02ASSY103

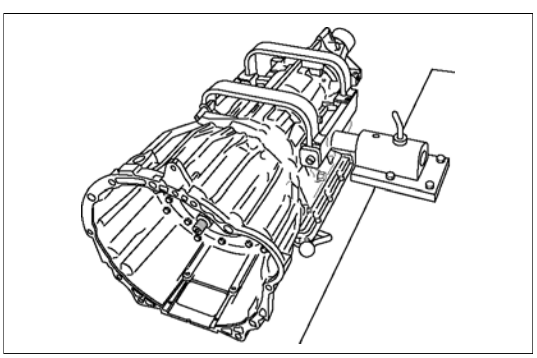
- Remove the speed sensor from the transmission case.



03ASSY106

3. Inhibitor switch

Remove the 2 bolts and the inhibitor switch from the transmission case.



240L300002

4. Oil pan

- Lift and support the transmission with the holding fixture and holding fixture base.
  Holding fixture: 5-8841-0841-0
  Holding fixture base: 5-8840-0003-0
- Remove the drain plug from the oil pan and drain the ATF from the oil pan.
- Rotate the automatic transmission so that the converter housing is facing up and drain the ATF.
- Rotate the automatic transmission so that the oil pan is facing up.
- Remove the 19 bolts and the oil pan.

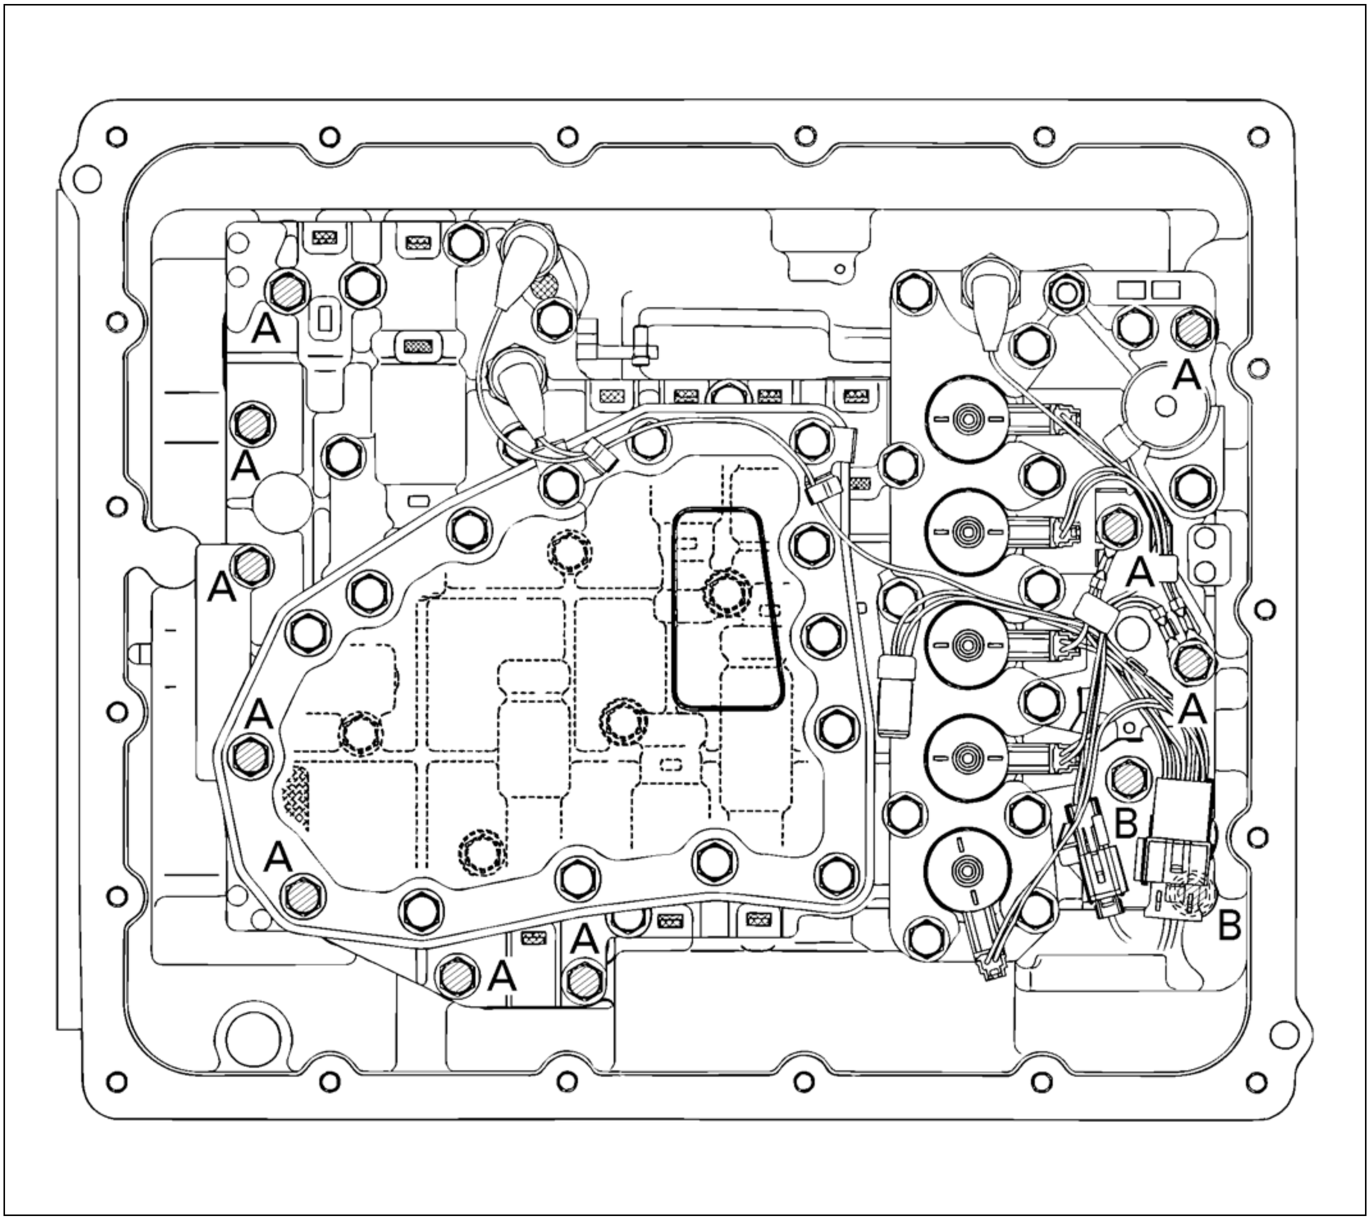
04CV37

- Inspect the bottom of the oil pan and strainer netting for foreign material (clutch facing and metal shavings).
  If there is an excessive accumulation of foreign material, the oil strainer must be replaced.
  Further inspection is required to determine the source of the foreign material.

45CV29

5. Control valve assembly

- Disconnect the 2 harness connectors leading to the control valve.



244L300001

- Remove the 12 bolts and the control valve assembly.

Number of bolts	Length
10 (A) 2 (B)	40 mm (1.57 in) 30 mm (1.18 in)

42ASSY118

NOTE:
Take care not to disturb the manual valve (inside the control valve assembly).
Do not allow the pin to fall free (the pin prevents the valve from turning).

10ASSY116

6. Converter housing

- Position the automatic transmission so that the converter housing is facing up.
- Remove the 8 bolts and the converter housing.

11ASSY068

7. O-ring

Remove the O-ring from the input shaft.

12ASSY067

8. Oil pump assembly and bearing race

- Remove the 8 bolts.
- Use a slide hammer to remove the oil pump assembly from the transmission case.

NOTE:
To prevent damage to the oil pump bolt hole threads, hand-tighten the slide hammer as far as possible.

- Remove the bearing race from the oil pump assembly.
- Inspect the bearing race surfaces for damage.

14ASSY057

9. Input shaft

Pull the input shaft free.

15ASSY049

10. Clutch pack (Reverse and high clutch assembly) and bearing

- Pull the clutch pack free.
- Remove the bearing from the clutch pack.

16ASSY047

11.High clutch hub, bearing, and bearing race
- Remove the clutch hub, bearing (with bearing race), and the bearing race.
- Remove the bearing (with bearing race) and the bearing race from the high clutch hub.
- Inspect the bearing race surfaces for damage.

17ASSY040

12.Front sun gear, bearing, and bearing race
- Remove the bearing, the front sun gear, and the bearing race.
- Remove the bearing and the bearing race from the front sun gear.
- Inspect the bearing race surfaces for damage.

19ASSY113

13.2-4 brake retainer
- Remove the brake seal ring and the sleeve.

23ASSY030

- Attach the spring compressor to the transmission case.
  Spring compressor: 5-8840-2764-0

24ASSY029

- Force out the 2-4 brake retainer and remove the snap ring.

NOTE:
Overturning the spring compressor will damage the 2-4 brake retainer.
- Remove the spring compressor.

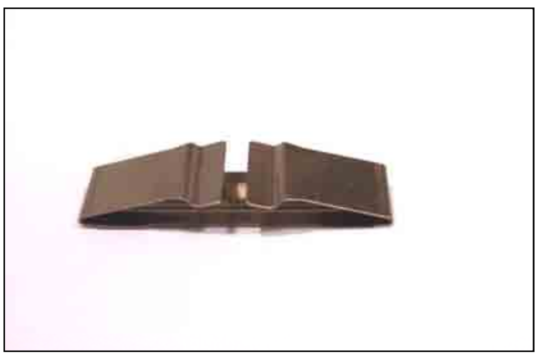
25ASSY019

- Remove the 2-4 brake retainer and return spring.

26ASSY026

14.Carrier assembly (Carrier and low clutch assembly), bearing, bearing race, and 2 – 4 brake assembly

- Pull the carrier assembly, the bearing, the bearing race and the 2-4 brake assembly (Dish plate, retaining plate, drive plate, and driven plate) from the transmission case at the same time.
- Remove the bearing, the bearing race, and the 2-4 brake assembly from the carrier assembly.



27U-SPG02

- Remove the 3 brake springs from the transmission case.

28L&R06

15.Low and reverse brake

- Remove the snap ring.
- Pull the low and reverse brake free.

16.Rear extension (2WD) or Adapter case (4WD)

- Rotate the transmission case so that the oil pan opening is facing up.
- Remove the 10 bolts and the rear extension (2WD) or the adapter case (4WD).

29ASSY091

17.Output shaft

- Pull the output shaft from the transmission case.

30ASSY089

- Remove the bearing (with bearing race) from the transmission case.

31ASSY124

18.Parking pawl, shaft, spring, and spacer

Remove the parking pawl, shaft, spring and spacer from the transmission case.

36ASSY075

19.Actuator support

Remove the actuator support from the transmission case.

37ASSY074

20.Low one-way clutch inner race and bearing

- Loosen the 7 bolts securing the low one-way clutch inner race.

NOTE:

Loosen the bolts a little at a time as uniformly as possible to prevent the inner race from tilting and becoming jammed.

- Remove the 6 bolts. Support the low one-way clutch inner race with your hand and remove the final bolt.

39ASSY006

- Remove the bearing and the low one-way clutch inner race from the transmission case.
- Remove the bearing from the low one-way clutch inner race.

40ASSY005

21.Low and reverse brake return spring

Remove the low and reverse brake return spring from the transmission case.

41L&R02

22.Low and reverse brake piston

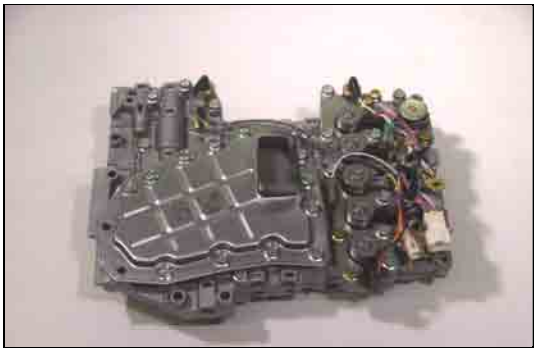
- Force compressed air (390 kPa/4.0 kgf/cm^2/57 psi) through the transmission case oil passages.

42ASSY004

- Remove the low and reverse brake piston from the transmission case.

CONTROL VALVE ASSEMBLY

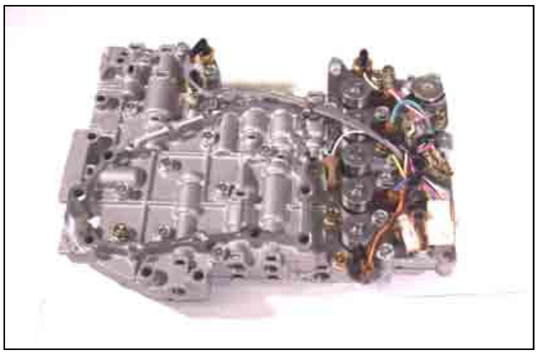
Disassembly steps



01CV40

1. **Oil strainer**

   Remove the 13 bolts and the oil strainer from the control valve assembly.

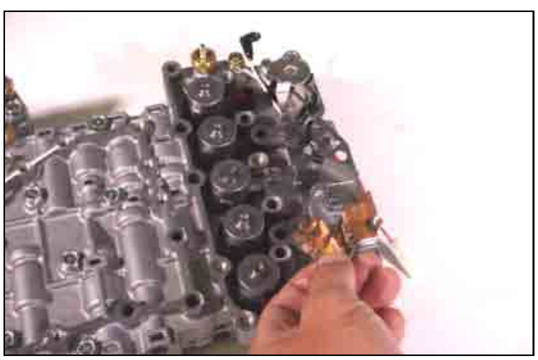


02CV26

2. **Harness assembly**

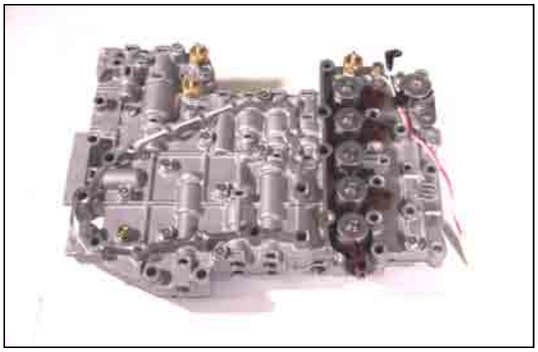
   Remove the harness assembly.

04CV21



05CV20

3. **Solenoid fixing plate**
4. **Harness bracket**
   - Remove the 11 bolts and the solenoid fixing plate together with the harness bracket.



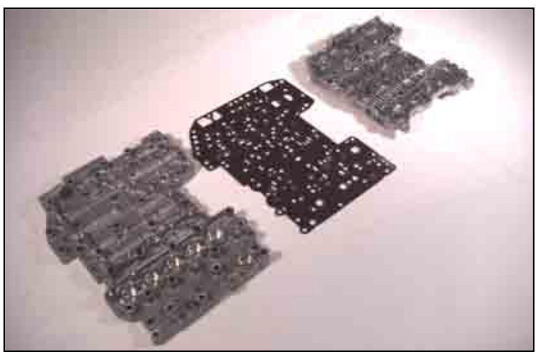
06CV19

5. **Solenoid**
6. **Oil pressure switch**

   Remove the 6 solenoids together and the 3 oil pressure switches.

07CV17

7. **Control valve upper body**
8. **Control valve lower body**
9. **Separation plate**
   - Remove the 17 bolts securing the control valve upper body, the control valve lower body, and the separation plate.



08CV16

- Separate the upper body, the lower body, and the separation plate.

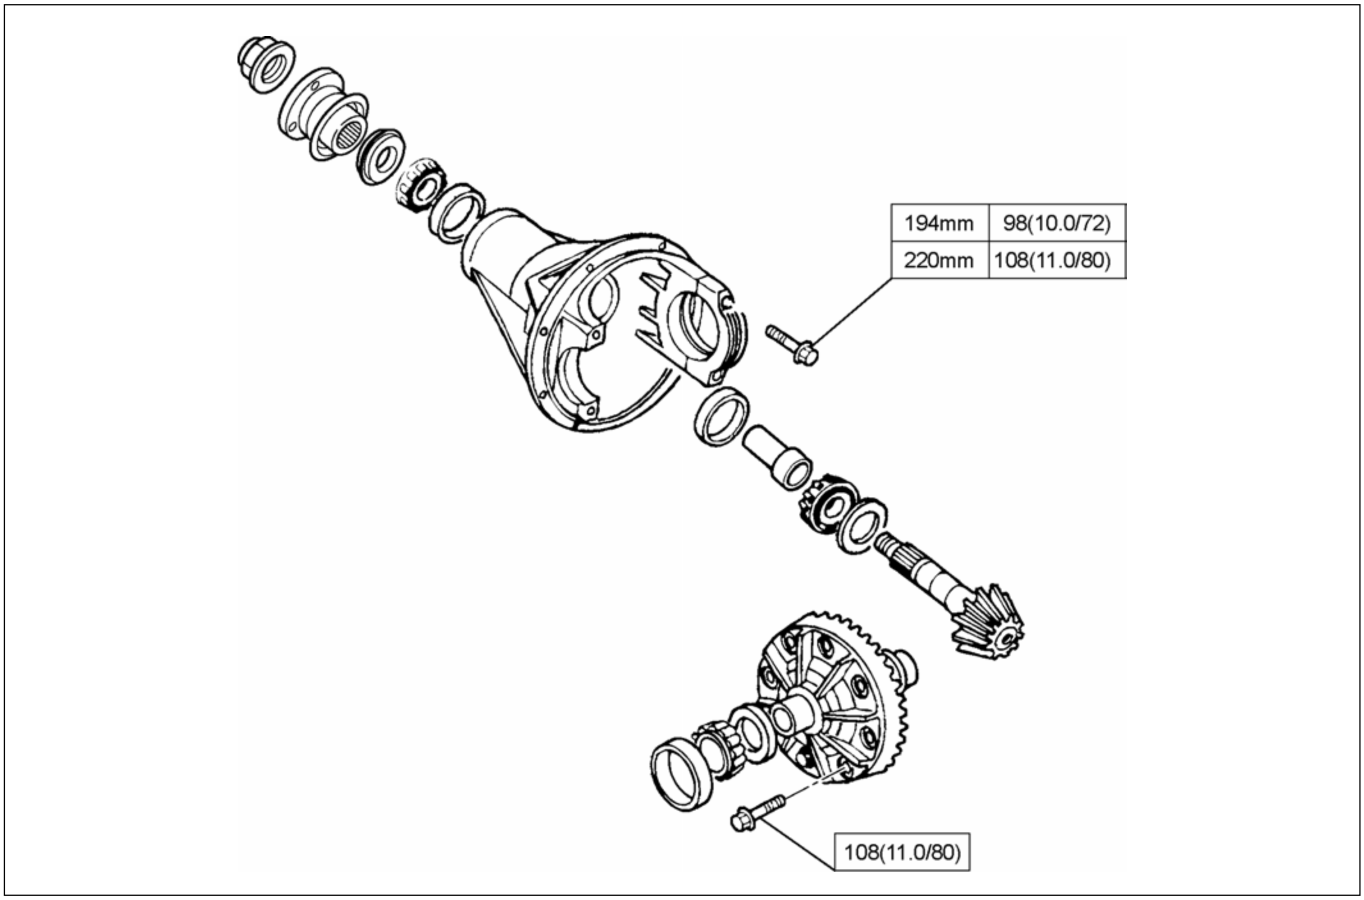
NOTE:
Take care not to drop or lose the parts at the inside of the control valve.

Inspection

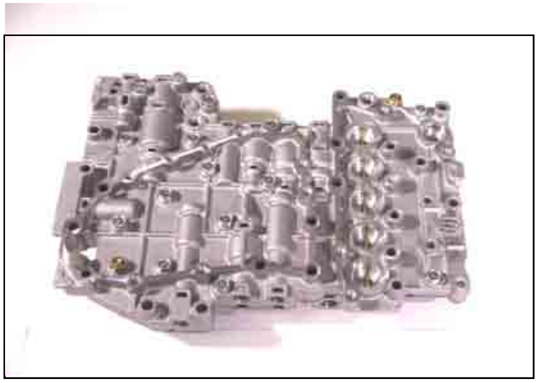
- Inspect the separation plate for wear and other damage.

Differential

N·m (kgf·m/lb·ft)



RTW74BMF000101



11CV18

Reassembly steps

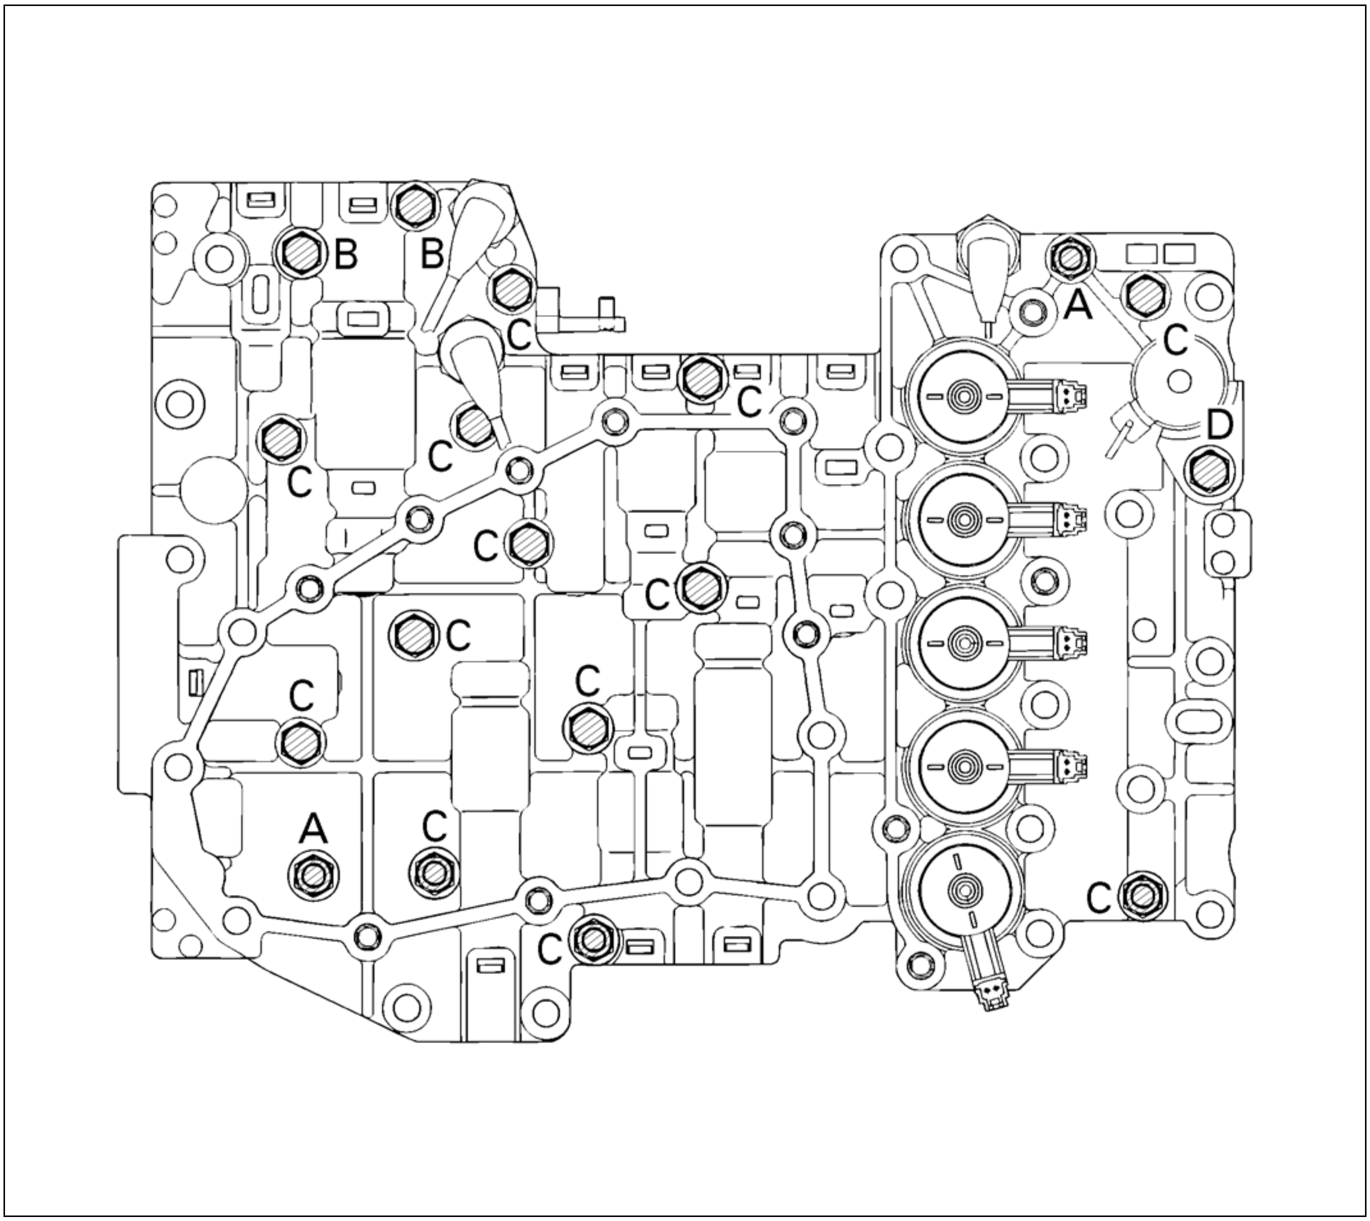
Coat the parts with ATF before installing them.

1. **Control valve upper body**
2. **Control valve lower body**
3. **Separation plate**

   Assemble the control valve upper body, the lower body, and the separation plate.

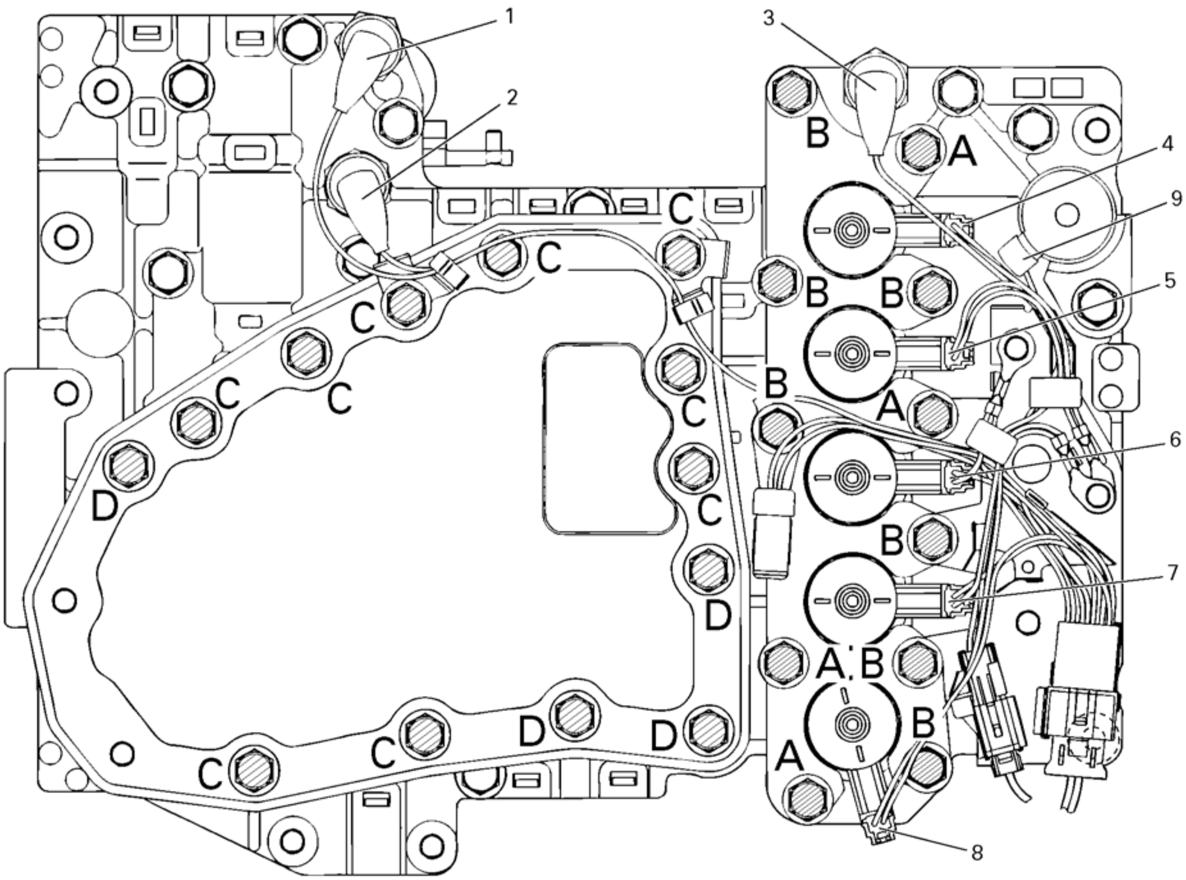
   Tighten the bolts to the specified torque.

Torque: 8 N·m (0.8 kgf·m/69 lb·in)



244L300002

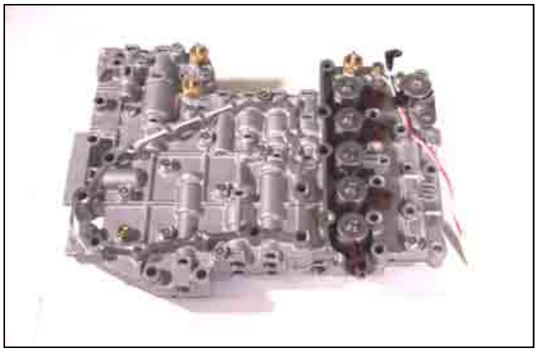
	Number	Length (Color)
Control valve rocket bolts and nuts (A)	2 (Plus 2 nuts)	50 mm (1.97 in) (Gold)
Upper body and lower body fixing bolts		
(B)	2	45 mm (1.77 in) (Silver)
(C)	13	35 mm (1.38 in) (Silver)
Line pressure solenoid fixing bolt (D)	1	16 mm (0.63 in) (Gold)



244L300003

Legend

1. High clutch oil pressure switch connector (wire color: Gray)
2. 2-4 brake oil pressure switch connector (wire color: Brown)
3. Low and reverse brake oil pressure switch connector (wire color: White)
4. Low and reverse brake duty solenoid connector (wire color: Pink and White)
5. High clutch duty solenoid connector (wire color: Green and Gray)
6. Lock-up duty solenoid connector (wire color: Yellow and Black)
7. 2-4 brake duty solenoid connector (wire color: Blue and Brown)
8. Low clutch duty solenoid connector (wire color: Orange and Black)
9. Line pressure solenoid connector (wire color: Pink)



12CV19

4. Solenoid

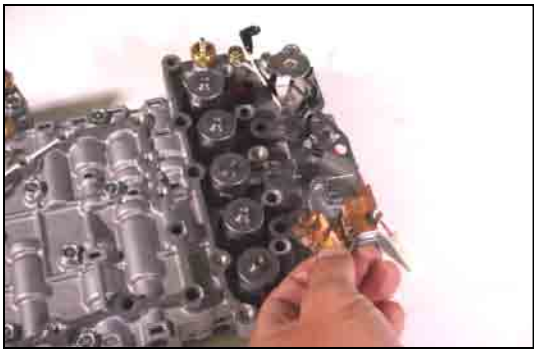
5. Oil pressure switch

- Install the O-rings to each of the solenoids.
- Install the 6 solenoids together and the 3 oil pressure switches.

NOTE:
Be sure the high clutch oil pressure switch is marked.

- Tighten the bolts to the specified torque.

Torque:
Oil pressure switch bolts – 4 N·m (0.4 kgf·m/35 lb·in)
Line pressure solenoid bolt (Single gold-colored bolt 16 mm) – 8 N·m (0.8 kgf·m/69 lb·in)



13CV20

6. Solenoid fixing plate

7. Harness bracket

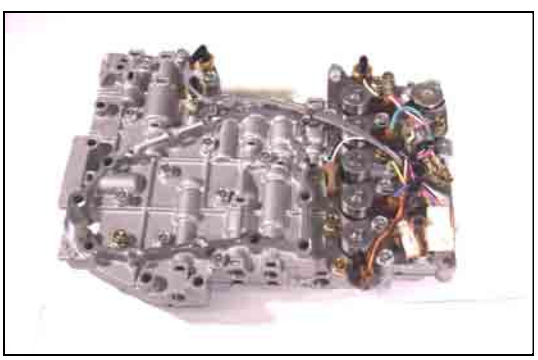
Install the solenoid fixing plate together with the harness bracket.

Tighten the bolts to the specified torque.

Torque: 8 N·m (0.8 kgf·m/69 lb·in)

	Number	Length (Color)
Solenoid fixing plate bolt		
(A)	4	16 mm (0.63 in) (Gold)
(B)	7	45 mm (1.77 in) (Silver)

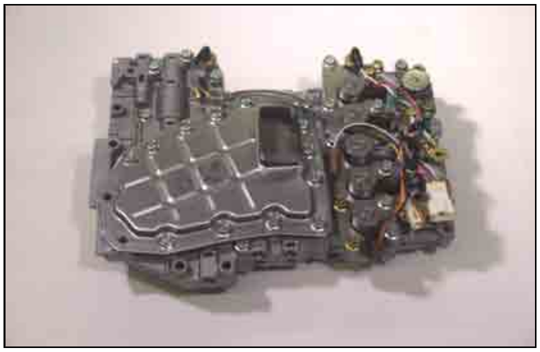
14CV21



15CV26

8. Harness assembly

Install the harness assembly.



16CV40

9. Oil strainer

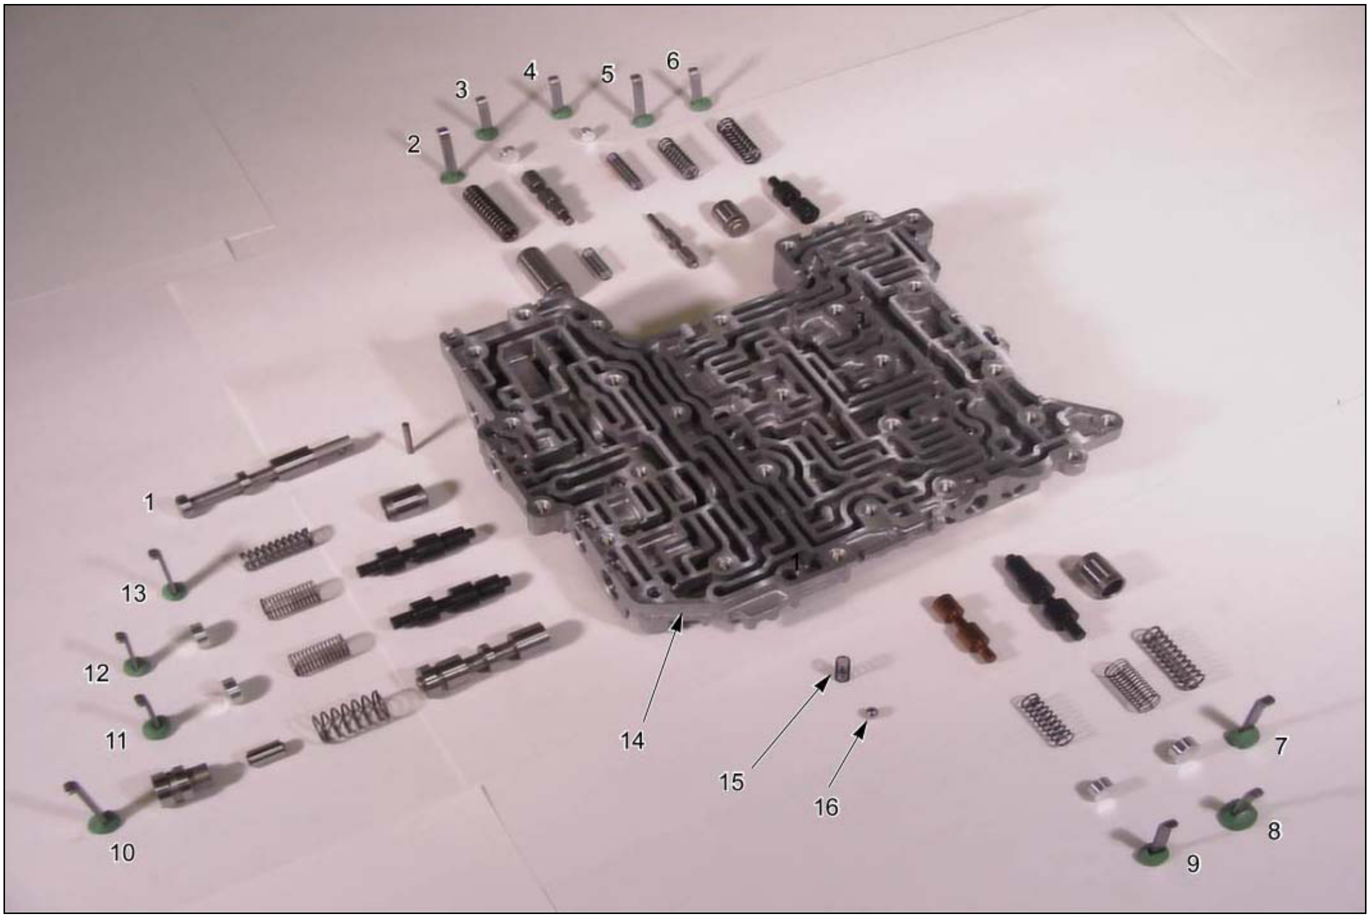
Install the oil strainer.

Tighten the bolts to the specified torque.

Torque: 8 N·m (0.8 kgf·m/69 lb·in)

	Number	Length (Color)
Oil strainer bolt		
(C)	9	13 mm (0.51 in) (Silver)
(D)	4	45 mm (1.77 in) (Silver)

CONTROL VALVE UPPER BODY



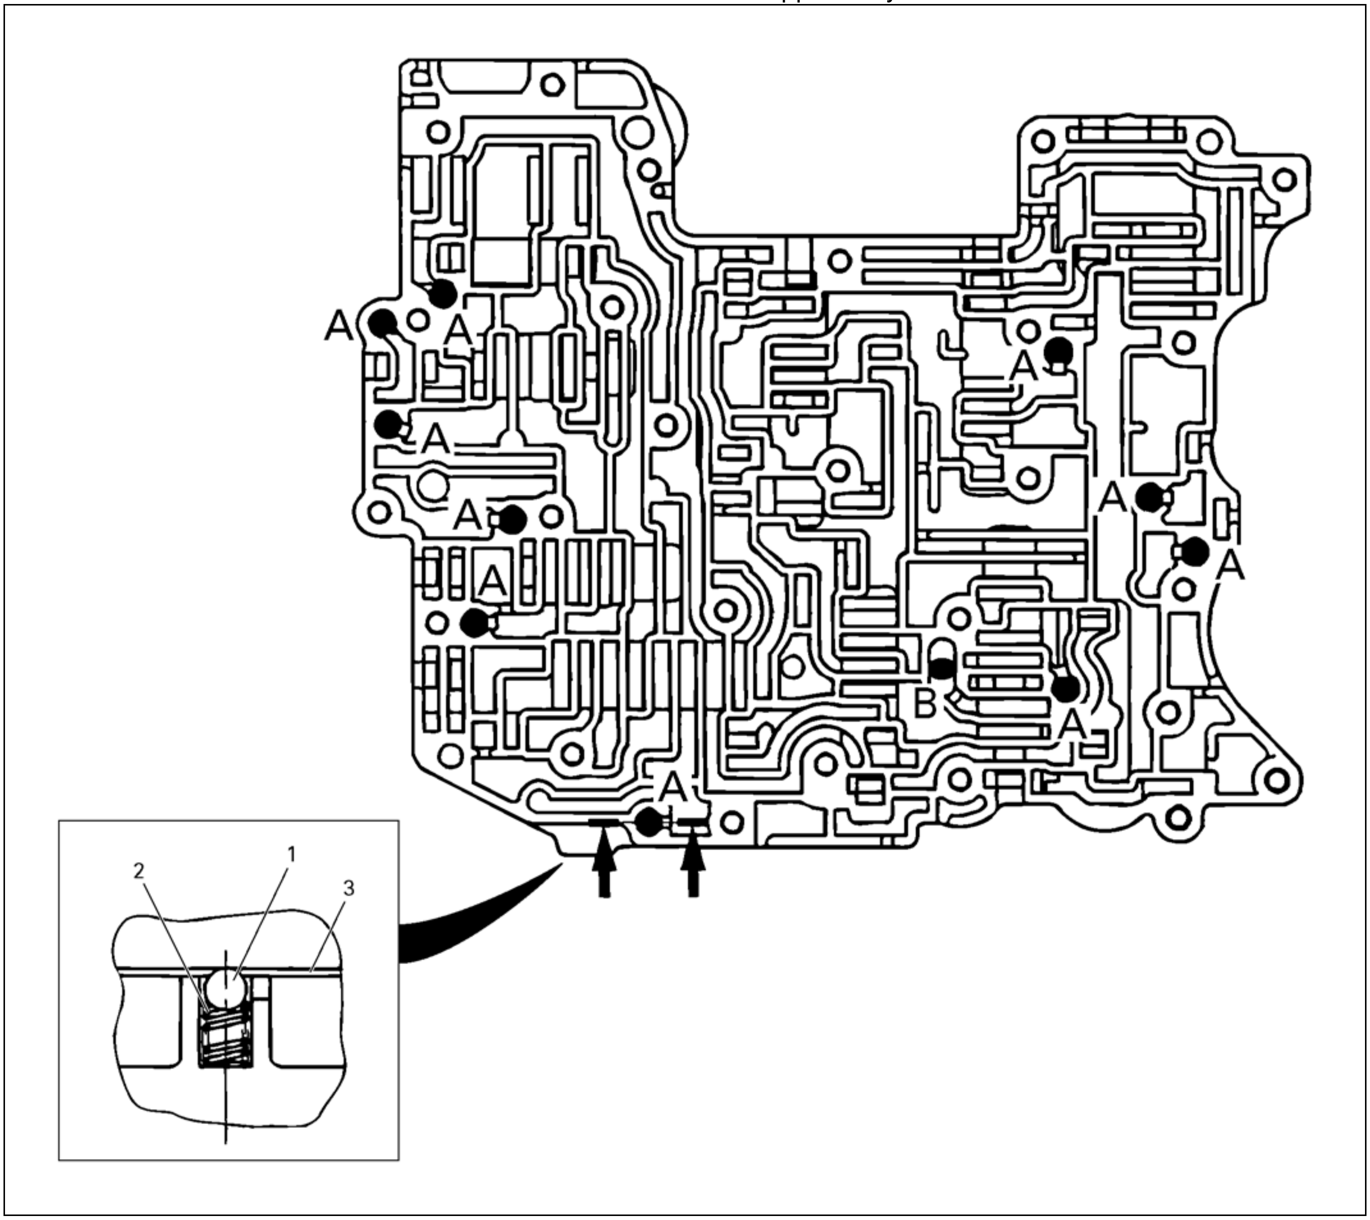
09CV02

Legend

1. Manual valve, and pin
2. Retainer plate, spring, and 2-4 brake accumulator
3. Retainer plate, plug, and low and reverse brake fail valve B
4. Retainer plate, plug, spring, and reverse stall valve
5. Retainer plate, spring, and low and reverse brake solenoid accumulator
6. Retainer plate, spring, and pilot valve
7. Retainer plate, spring, and low clutch solenoid accumulator
8. Retainer plate, plug, spring, and low clutch amp valve A
9. Retainer plate, plug, spring, and 2-4 brake fail valve B
10. Retainer plate, sleeve, plug, spring, and lock-up control valve
11. Retainer plate, plug, spring, and 2-4 brake amp valve
12. Retainer plate, plug, spring, and high clutch amp valve
13. Retainer plate, spring, and high clutch solenoid accumulator
14. Control valve upper body
15. Spring
16. Steel ball

Disassembly steps

- Remove the 11 steel balls and springs from the control valve upper body.



244L300005

Legend

1. Steel ball: A – 10 (Silver)
   B – 1 (Black)
2. Spring
3. Separation plate

- Remove the control valves from the control valve upper body.

NOTE:
Place the control valve where it will not get mixed up with the other parts.

Inspection

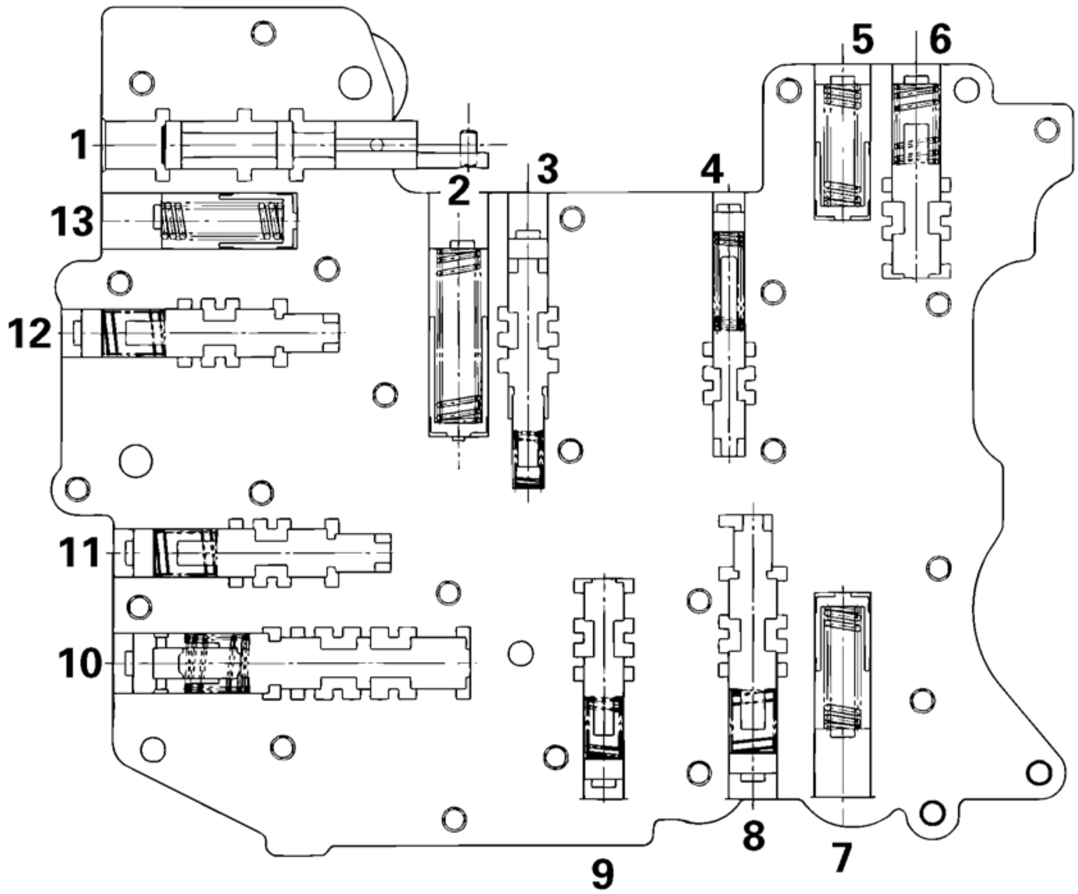
Valve

Inspect each of the valves for denting and other damage.

Spring

Inspect each of the springs for wear and fatigue.

Valve specifications



244L300006
