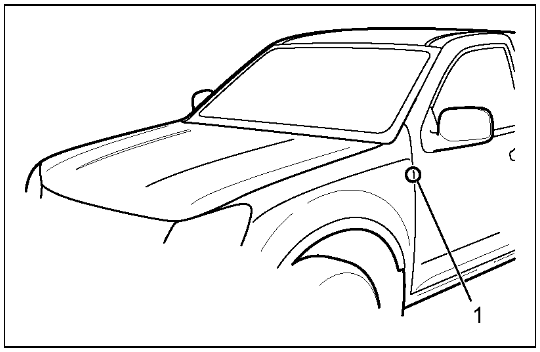
There are six battery fluid caps on top of the battery. These are covered by a paper label.
The battery is completely sealed except for the six small vent holes on the side. These vent holes permit the escape of small amounts of gas generated by the battery.
This type of battery has the following advantages over conventional batteries:

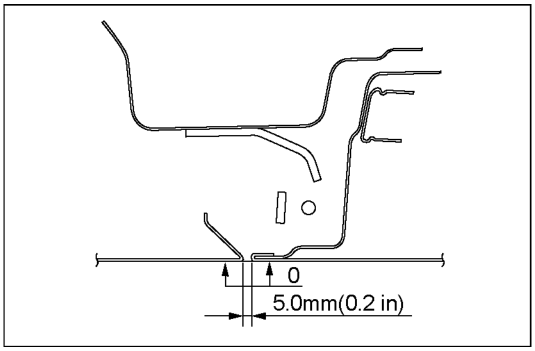
1. There is no need to add water during the entire service life of the battery.
2. The battery protects itself against overcharging. The battery will refuse to accept an extensive charge. (A conventional battery will accept an excessive charge, resulting in gassing and loss of battery fluid.)
3. The battery is much less vulnerable to self discharge than a conventional type battery.

Service Precaution

CAUTION:
Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.



RTW72BSH000601



RTW32BSH000301

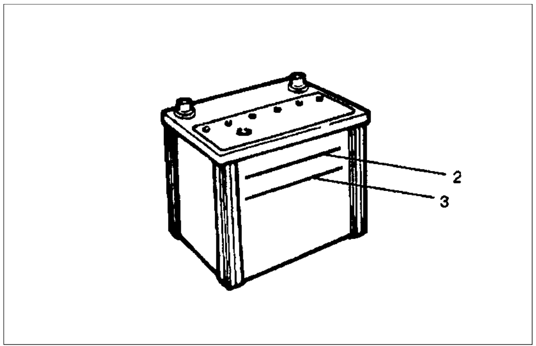
2) Check the fender and front door (1).

- Clearance : 5.0 mm (0.2 in)
- Height (step) : Flushness

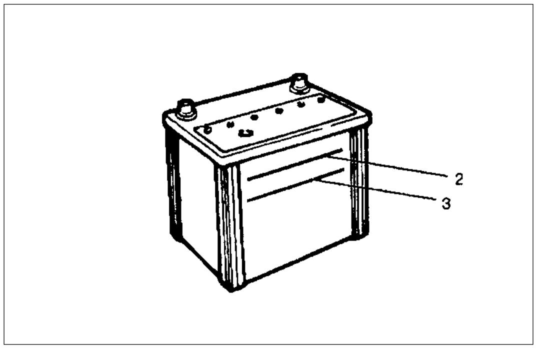
Diagnosis

1. Visual Inspection

Inspect the battery for obvious physical damage, such as a cracked or broken case, which would permit electrolyte loss. Replace the battery if obvious physical damage is discovered during inspection.
Check for any other physical damage and correct it as necessary.



2. Hydrometer Check



3. Fluid Level Check

The fluid level should be between the upper level line (2) and lower lever line (3) on side of battery.

a. CORRECT FLUID LEVEL - Charge the battery.
b. BELOW LOWER LEVEL - Replace battery.

4. Voltage Check

1. Put voltmeter test leads to battery terminals.
   a. VOLTAGE IS 12.4V OR ABOVE - Go to Step 5.
   b. VOLTAGE IS UNDER 12.4V - Go to procedure (2) below.
2. Determine fast charge amperage from specification. (See Main Data and Specifications in this section).
   Fast charge battery for 30 minutes at amperage rate no higher than specified value.
   Take voltage and amperage readings after charge.
   a. VOLTAGE IS ABOVE 16V AT BELOW 1/3 OF AMPERAGE RATE - Replace battery.
   b. VOLTAGE IS ABOVE 16V AT ABOVE 1/3 OF AMPERAGE RATE - Drop charging voltage to 15V and charge for 10 - 15 hours. Then go to Step 5.
   c. VOLTAGE IS BETWEEN 12V AND 16V - Continue charging at the same rate for an additional 3-1/2 hours. Then go to Step 5.
   d. VOLTAGE BELOW 12V - Replace Battery.

Battery Charging

Observe the following safety precautions when charging the battery:

1. Never attempt to charge the battery when the fluid level is below the lower level line on the side of the battery. In this case, the battery must be replaced.
2. Pay close attention to the battery during charging procedure.
   Battery charging should be discontinued or the rate of charge reduced if the battery feels hot to the touch.
   Battery charging should be discontinued or the rate of charge reduced if the battery begins to gas or spew electrolyte from the vent holes.
3. In order to more easily view the hydrometer blue dot or ring, it may be necessary to jiggle or tilt the battery.
4. Battery temperature can have a great effect on battery charging capacity.
5. The sealed battery used on this vehicle may be either quick charged or slow charged in the same manner as other batteries.
   Whichever method you decide to use, be sure that you completely charge the battery. Never partially charge the battery.

Jump Starting

Jump Starting with an Auxiliary (Booster) Battery

CAUTION: Never push or tow the vehicle in an attempt to start it. Serious damage to the emission system as well as other vehicle parts will result.
Treat both the discharged battery and the booster battery with great care when using jumper cables.
Carefully follow the jump starting procedure, being careful at all times to avoid sparking.
WARNING: FAILURE TO CAREFULLY FOLLOW THE JUMP STARTING PROCEDURE COULD RESULT IN THE FOLLOWING:

1. Serous personal injury, particularly to your eyes.
2. Property damage from a battery explosion, battery acid, or an electrical fire.
3. Damage to the electronic components of one or both vehicles particularly.

Never expose the battery to an open flame or electrical spark. Gas generated by the battery may catch fire or explode.
Remove any rings, watches, or other jewelry before working around the battery. Protect your eyes by wearing an approved set of goggles.
Never allow battery fluid to come in contact with your eyes or skin.
Never allow battery fluid to come in contact with fabrics or painted surfaces.

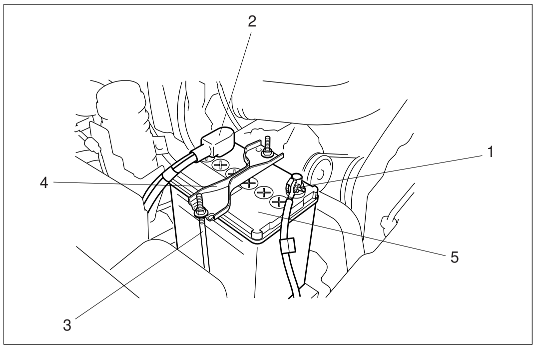
Battery fluid is a highly corrosive acid.
Should battery fluid come in contact with your eyes, skin, fabric, or a painted surface, immediately and thoroughly rinse the affected area with clean tap water.
Never allow metal tools or jumper cables to come in contact with the positive battery terminal, or any other metal surface of the vahicle. This will protect against a short circuit.
Always keep batteries out of reach of young children.

Jump Starting Procedure

1. Set the vehicle parking brake and place the shift lever in the "NEUTRAL" position.
   Turn "OFF" the ignition.
   Turn "OFF" all lights and any other accessory requiring electrical power.
2. Look at the built-in hydrometer.
   If the indication area of the built-in hydrometer is completely clear, do not try to jump start.
3. Attach the end of one jumper cable to the positive terminal of the booster battery.
   Attach the other end of the same cable to the positive terminal of the discharged battery.
   Do not allow the vehicles to touch each other. This will cause a ground connection, effectively neutralizing the charging procedure.
   Be sure that the booster battery has a 12 volt rating.
4. Attach one end of the remaining cable to the negative terminal of the booster battery.
   Attach the other end of the same cable to a solid engine ground (such as the air conditioning compressor bracket or the generator mounting bracket) of the vehicle with the discharged battery.
   The ground connection must be at least 450 mm (18 in.) from the battery of the vehicle whose battery is being charged.

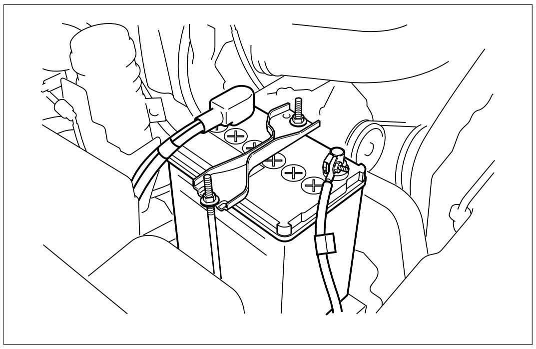
WARNING: NEVER ATTACH THE END OF THE JUMPER CABLE DIRECTLY TO THE NEGATIVE TERMINAL OF THE DEAD BATTERY.

5. Start the engine of the vehicle with the good battery.
   Make sure that all unnecessary electrical accessories have been turned "OFF".
6. Start the engine of the vehicle with the dead battery.
7. To remove the jumper cables, follow the above directions in reverse order.
   Be sure to first disconnect the negative cable from the vehicle with the discharged battery.



Removal

1. Remove negative cable (1).
2. Remove positive cable (2).
3. Remove retainer screw and rods (3).
4. Remove retainer (4).
5. Remove battery (5).



Installation

1. Install battery.
2. Install retainer.
3. Instal retainer screw and rods.

NOTE: Make sure that the rod is hooked on the body side.

4. Install positive cable.
5. Install negative cable.

Main Data and Specifications

General Specifications

Model (JIS)	34B19L	50D20L
Voltage (V)	12	12
Cold Cranking Performance (Amp)	272	306
Reserve Capacity (Min)	49	78

SECTION 6D2

IGNITION SYSTEM

TABLE OF CONTENTS

General Description

Ignition is done by the Ignition Module that fires.
Since the cylinder on exhaust stroke requires less energy to fire its spark plug, energy from the ignition coils can be utilized to fire the mating cylinder on compression stroke.
A notch in the timing disc on the crankshaft activates the crank angle sensor which then sends information such as firing order and starting timing of ignition coil to the ECM.
By receiving signals such as crank position, engine speed, water temperature and Manifold Absolute Pressure (MAP), the ECM controls the ignition timing.

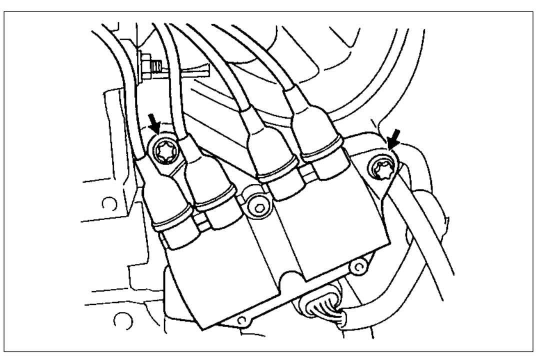
Service Precaution

CAUTION:
Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Diagnosis

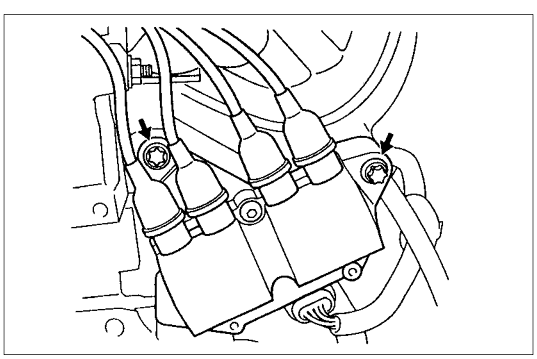
Refer to Section Drivability and Emissions for the diagnosis to electronic ignition system (EI system).

Ignition Coil



Removal

1. Disconnect battery ground cable.
2. Disconnect the Ignition coil connector.
3. Remove the ignition coil.



Installation

1. Install the ignition coil.
   Connect ignition coil connector and ignition coil, then tighten bolt to the specified torque.
   Torque: 20 N·m (2.0 kgf·m)
2. Connect battery ground cable.

Spark Plug

Removal

1. Remove spark plugs.

Inspection and Repair

The spark plug affects entire engine performance and therefore its inspection is very important.

- Check electrode and insulator for presence of cracks, and replace if any.
- Check electrode for wear, and replace if necessary.
- Check gasket for damage, and replace if necessary.
- Measure insulation resistance with an ohmmeter, and replace if faulty.
- Adjust spark plug gap to 1.0 - 1.1 mm (0.027 in) - 0.8 mm (0.031 in).
- Check fuel and electrical systems if spark plug is extremely dirty.
- Use spark plugs having low heat value (hot type plug) if fuel and electrical systems are normal.
- Use spark plugs having high heat value (cold type plug) if insulator and electrode are extremely burned.

Sooty Spark Plugs

Much deposit of carbon or oil on the electrode and insulator of spark plug reduces the engine performance.

Possible causes:

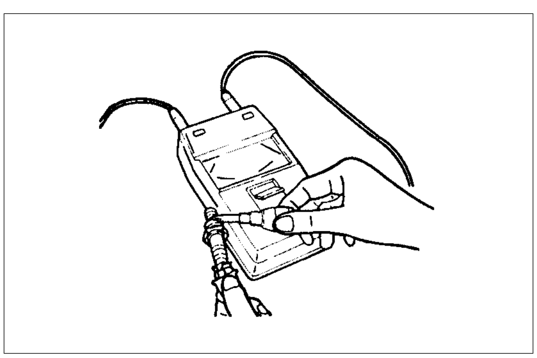
- Too rich mixture
- Presence of oil in combustion chamber
- Incorrectly adjusted spark plug gap

Burning Electrodes

This fault is characterized by scorched or heavily oxidized electrode or blistered insulator nose.

Possible causes:

- Too lean mixture
- Improper heat value



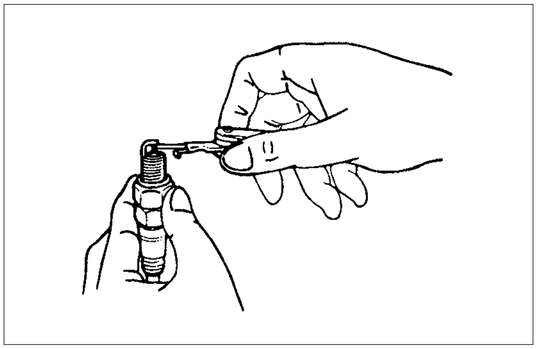
Measuring Insulation Resistance

- Measure insulation resistance using a 500 volt megaohm meter.
- Replace spark plugs if measured value is out of standard.

  Insulation resistance: 50 MΩ or more

Cleaning Spark Plugs

- Clean spark plugs with a spark plug cleaner.
- Raise the ground electrode to an angle of 45 to 60 degrees. if electrode is wet, dry it gefore cleaning.
- After spark plug is thoroughly cleaned, check insulator for presence of cracks.

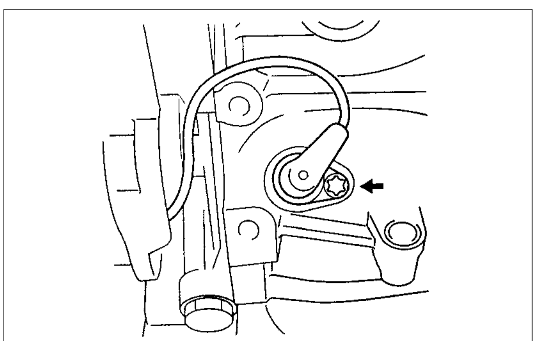


- Clean threads and metal body with a wire brush.
- File the electrode tip if electrode is extremely worn.
- Bend the ground electrode to adjust the spark plug gap.

Installation

1. Spark plugs
   - Tighten spark plugs to the specified torque.

   Torque: 20 N·m (2.0 kgf·m)



Crankshaft Angle Sensor

Removal

1. Disconnect battery ground cable
2. Disconnect the wiring connector from crankshaft angle sensor.
3. Remove crankshaft angle sensor from cylinder block.

Installation

1. Install crankshaft angle sensor into the cylinder block. Before installation, apply small amount of engine oil to the O-ring.

   Torque: 6 N·m (0.6 kgf·m)
2. Reconnect wiring connector to crankshaft angle sensor.

Starting System

General Description

Cranking Circuit

The cranking system consists of a battery, starter, starter switch, starter relay, etc. These main components are connected.

Starter

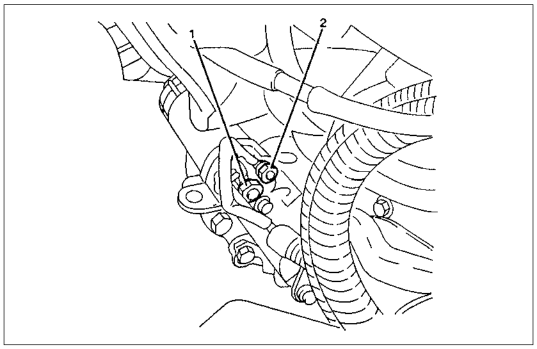
The cranking system employs a magnetic type reduction starter in which the motor shaft is also used as a pinion shaft. When the starter switch is turned on, the contacts of magnetic switch are closed, and the armature rotates. At the same time, the plunger is attracted, and the pinion is pushed forward by the shift lever to mesh with the ring gear.
Then, the ring gear runs to start the engine. When the engine starts and the starter switch is turned off, the plunger returns, the pinion is disengaged from the ring gear, and the armature stops rotation. When the engine speed is higher than the pinion, the pinion idles, so that the armature is not driven.

Service Precaution

CAUTION:
Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Diagnosis

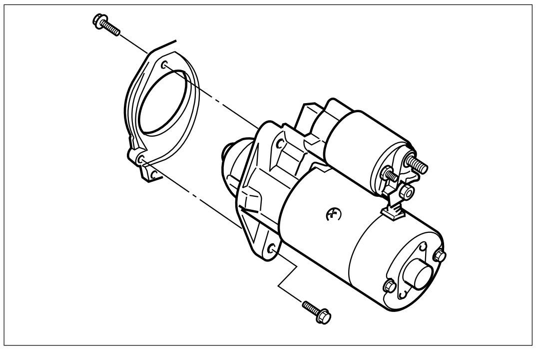
Condition	Possible cause	Correction
Starter does not run	Charging failure	Repair charging system
	Battery Failure	Replace Battery
	Terminal connection failure	Repair or replace terminal connector and/or wiring harness
	Starter switch failure	Repair or replace starter switch
	Starter failure	Repair or replace starter



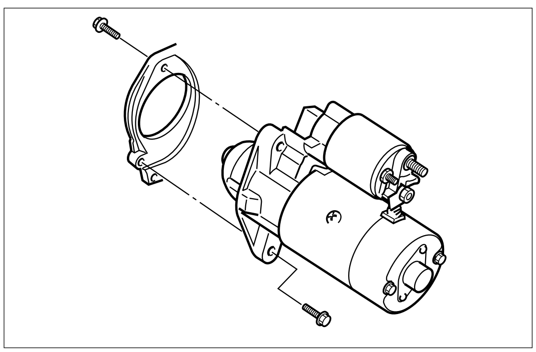
Starter

Removal

1. Remove the battery ground cable.
2. Remove harness connectors (1) and (2).



3. Remove bolts from starter.



Installation

1. Install starter assembly.
2. Install mounting bolts and tighten bolts to specified torque.

   Torque: 51 N·m (5.2 kgf·m)
3. Connect harness.
4. Reconnect the battery ground cable.

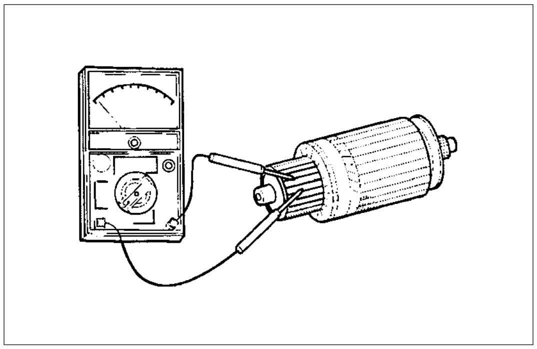
12 Through Bolt

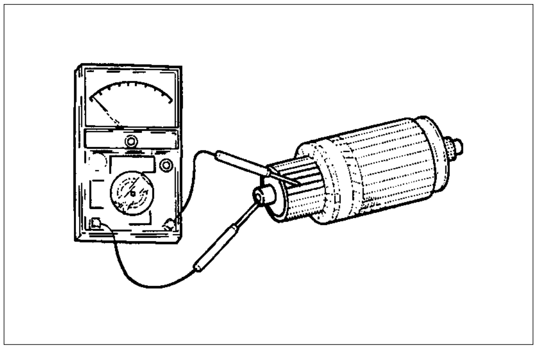
Inspection and Repair

Repair or replace necessary parts if extreme wear or damage is found during inspection.

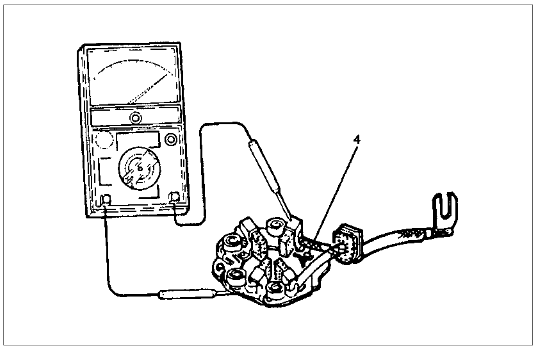


Armature

Check for continuity between commutator and segment.
Replace commutator if there is no continuity (i.e., disconnected).



Check for continuity between commutator and shaft.
Also, check for continuity between commutator and armature core, armature core and shaft. Replace commutator if there is continuity (i.e., internally grounded).

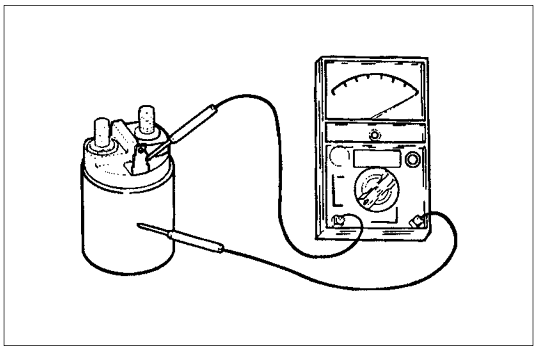


Brush

Measure the length of brush.
Replace with a new one, if it is below the limit.

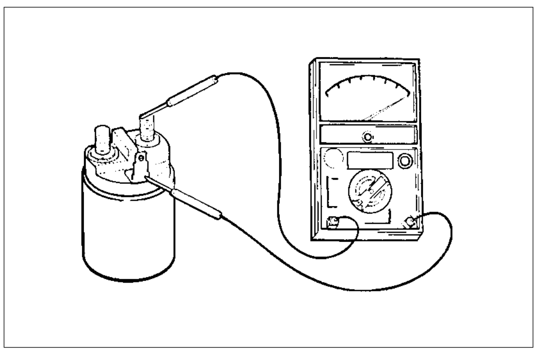
Brush Holder

Check for continuity between brush holder (+) (4) and base (-).
Replace, if there is continuity (i.e., insulation is broken).



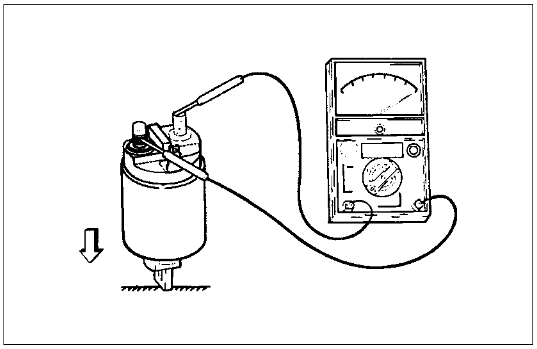
Magnetic Switch

Check for continuity of shunt coil between terminals S and M.
Replace, if there is no continuity (i.e., coil is disconnected).



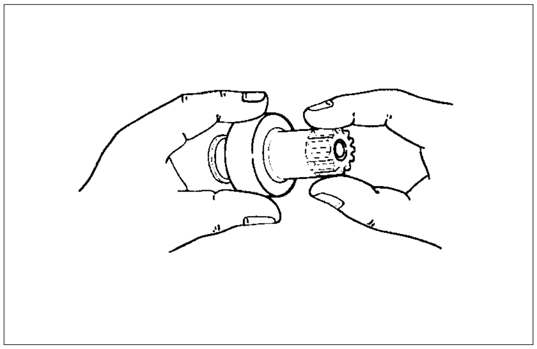
Continuity of Series Coil

Check for continuity between terminals S and M.
Replace, if there is no continuity (i.e., coil is disconnected).



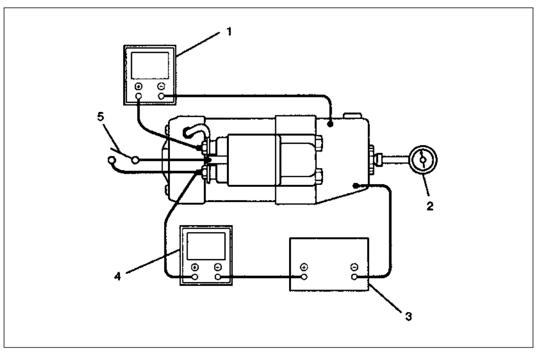
Continuity of Contacts

With the plunger faced downward, push down the magnetic switch. In this state, check for continuity between terminals B and M. Replace, if there is no continuity (i.e., contacts are faulty).



Pinion

Check if the pinion rotates smoothly in drive direction by hand, or if it is locked when it is rotated in reverse. If not, replace the pinion.



Characteristic Test

For easily confirming the characteristics, conduct the noload test as follows:
Rating as short as 30 seconds requires rapid testing.
Fix the starter on the test bench, and wire as shown in illustration. When the switch is closed, the current flows and the starter runs under no load. At this time, measure current, voltage and speed to check if they satisfy the standard.

Charging System

General Description

The charging system is an IC integral regulator charging system and its main components are connected as shown in illustration.
The regulator is a solid state type and it is mounted along with the brush holder assembly inside the generator installed on the rear end cover.
The generator does not require particular maintenance such as voltage adjustment. The rectifier connected to the stator coil has eight diodes to transform AC voltage into DC voltage.
This DC voltage is connected to the output terminal of generator.

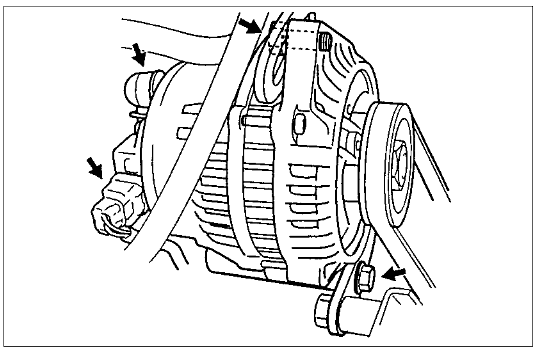
11 Rotor assembly
12 Ball bearing

General On-Vehicle Inspection

The operating condition of charging system is indicated by the charge warning lamp. The warning lamp comes on when the starter switch is turned to "ON" position. The charging system operates normally if the lamp goes off when the engine starts. If the warning lamp shows abnormality or if undercharged or overcharged battery condition is suspected, perform diagnosis by checking the charging system as follows:

1. Check visually the belt and wiring connector.
2. With the engine stopped, turn the stator switch to "ON" position and observe the warning lamp.
   If lamp does not come on:
   Disconnect wiring connector from generator, and ground the terminal "L" on connector side.
   If lamp comes on:
   Repair or replace the generator.

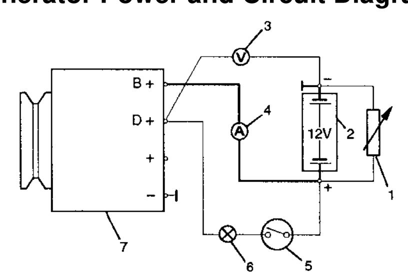
Generator



Removal

1. Disconnect battery ground cable.
2. Move drive belt tensioner to loose side using wrench then remove drive belt.
3. Disconnect terminal "B" wiring connector and connector.
4. Remove generator assembly.

Generator Power and Circuit Diagram

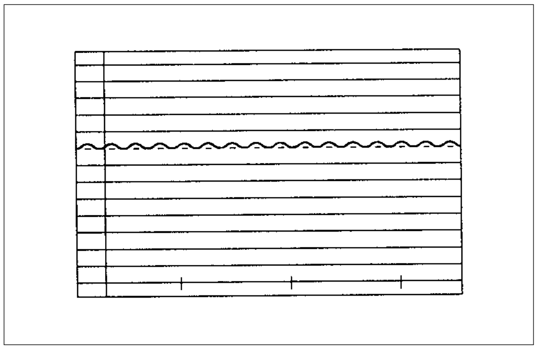


Inspection

Legend

1 Load resistor, set parallel to battery
2 Battery
3 Voltmeter
4 Ammeter
5 Ignition Lock
6 Charge Telltale
7 Generator

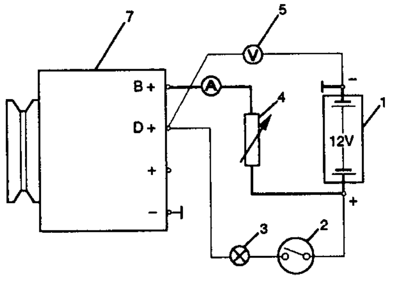
1. Disconnect battery.
2. Close off connecting cable from alternator terminal "B+".
3. Set ammeter (measuring range 100A) in disconnected line.
4. Connect controllable load resistor to battery terminal.
5. Set resistor in front of connection to "O"; connect first to battery, then to resistor.
6. Connect tachometer.
7. Connect oscilloscope according to manufacturer's instructions.
8. Connect battery.
9. Start engine and read off resulting current at various engine speeds.



Generator Power

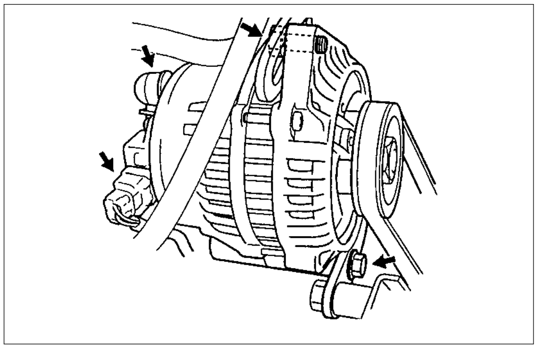
1. Adjust load resistor, if the required load currents are not attained.
2. The shape of the voltage curves on oscilloscope curve should be regular.
3. Test value: 5 to 7A.
4. If the required minimum current intensity is not attained, or if the oscilloscope picture shows variations, the alternator should be overhauled.

Regulated Voltage Circuit Diagram



Legend

1 Battery
2 Ignition Lock
3 Charge Telltale
4 Resistor, for attainment of load current with the battery set in series
5 Voltmeter
6 Ammeter
7 Generator



Installation

1. Install generator assembly and bring generator assembly to the position to be installed.
2. Install generator assembly and tighten to the specified torque.

   Torque:

   Long bolt: 35 N·m (3.6 kgf·m)

   Short bolt: 20 N·m (2.0 kgf·m)
3. Connect wiring harness connector.
4. Move drive belt tensioner to loose side using a wrench, then install drive belt to normal position.
5. Reconnect battery ground cable.

The generator has four external connections; the "B+" lead to battery positive, "L" lead to the warning lamp circuit(max. 2 watts), "S" lead to battery positive terminal for battery sensing and an earth connection.

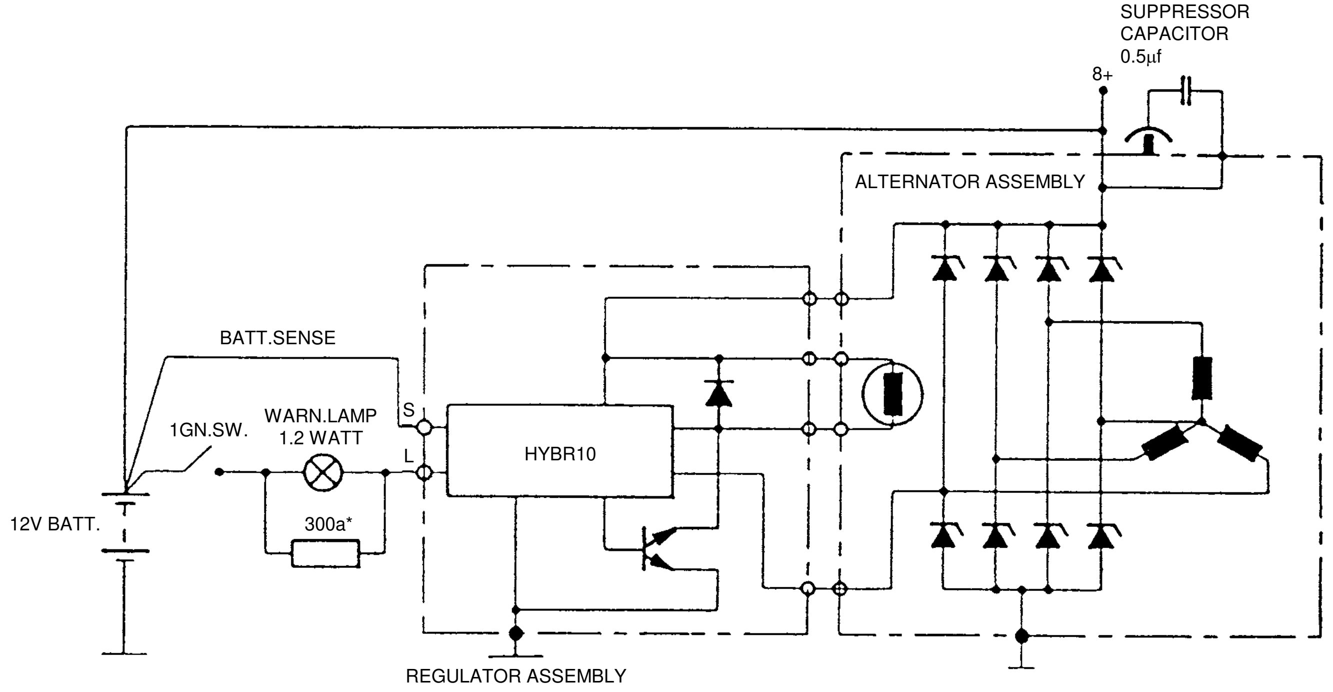
Explanation of type inscripiton

Example:KC-A--> 14V 50-90A.

K = Code for Stator OD(126mm OD).
C = Compact Generator.
A = Ausland (countries other than Germany)
> = Direction of rotation(clockwise).
14V = Generator Operating Voltage.
50A = Stabilised output at 25 C at 1800 RPM./13.5 Volts.
90A = Stabilised output at 25 C at 1800 RPM./13.5 Volts.

Generator Connetions.

B+ : Battery Main Connection (battery positive)
S : Battery Sense Connection(battery positive)
L : Waring lamp(via warning lamp to Ignition switch)



NOTE: * RESISTOR IS RECOMMENDED TO ENSURE THAT THE GENERATOR REMAINS FUNCTIONAL IN CASE OF WARNING LAMP FAILURE

Warning

Do not reverse S and L connections as this will destroy the warning lamp circuit of the regulator.
Ensure good electrical contact beween generator earth and battery negative,

Operation

With the Iginiton switch turnded "ON", current is supplied via the warning lamp to the "L" terminal of the regulator. Base current is fed to T15 causing it to turn on, current then flows from B+ through the rotor winding via the regulator brushes and the collector emitter junction of T15 to earth completing the circuit. The current in the rotor causes a magnetic field between adjacent poles to be created, this field is rotated and cuts the windings of the stator at right angles inducing a voltage into them.
As the speed is increased this induced voltage increases and results in curent being rectified in the 3 phase diode bridge and supplied as DC to the B+ output and hence to the battery.
When the voltage at the B+ terminal of the battery reaches around 14.2 volts, this voltage is monitored by the "S" lead and turns the regulator Hybrid base current to T15 OFF removing rotor current, resulting in a decrease in output voltage to below the regulating voltage, T15 base current turns ON and the whole cycle is repeated very rapidly.
D38 protects T15 and the regulator against the back voltage developed across the rotor winding when T15 turns OFF.
The new generated EP regulators incorporate current limiting in the warning lamp circuit.

Backup Regulation

The EP regulator will limit the output voltage to a safe level should either the main B+ cable or the battery sense wire become decoupled, the output voltage will be slightly above the normal setting(1-3 volts).

Start up phase

When the Iginition switch is turned on and the engine is not running, the current to the rotor is reduced by switching it on and off at a 50% duty cycle, the frequency is approximately 4 KHz and may be audible at times.
This is quite normal, once the engine is started normal regulation commences.

Warning lamp failure

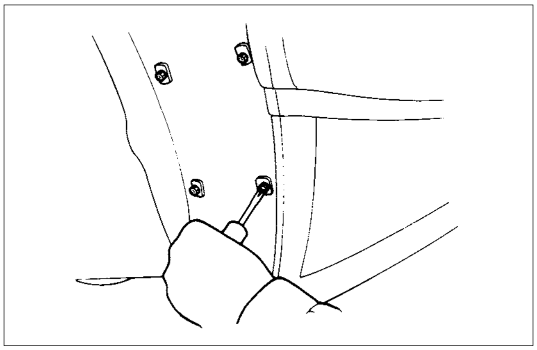
Should the warning lamp fail, the generator will self excite by deriving a small current from the phase connecion allowing the voltage to build up to regulating level.
Note: no filed current will flow when the engine is cranking.

Important Operations - Removal

1. Front Combi Lamp Assembly

2. Radiator Grille

Refer to the Radiator Grille in this section.

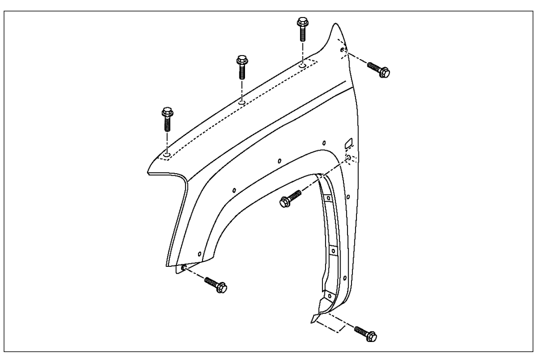


5. Inner Liner

Remove the inner liner fixing screws.

6. Front Bumper Fascia

Refer to the Front Bumper in this section.



RTW52BSH000401

8. Front Fender Panel

Remove the 8 fixing bolts.

Important Operation - Installation

8. Front Fender Panel

1) Tighten the front fender panel fixing bolts to the specified torque.

Torque	N·m(kgf·m/lb·in)
10 (1.0 / 87)	

Diagnosis

The EP regulator incorporates diagnostics which will illuminate the warning lamp as a result of fault conditions in the generator and external circuitry.

These conditions include:

1. An open circuit in the regulator battery sensing wire (S Terninal)
2. An open circuit or excessive voltage drop in the B+ cable.
3. An open circuit in the generator phase connection.
4. Overcharging of the battery.
5. Regulator output stage short circuit.
6. Open circuit rotor.

The regulator compares the voltage at B+ with the voltage at the "S" terminal connceted to battery positive. If the voltage differential exceeds a predetermined threshold, the regulator will operate in backup mode to limit the output voltage to a safe level. The warning lamp; will remain illuminated as along as these conditions prevail.
Sources of high resistance which will trigger the warning lamp are:

a. Poor contact in wiring harness connectors.
b. Poor contact between rectifier and regulator.
c. High resistance in fusible link assembly.

Caution:
When bench testing the generator it is important that the warning lamp wattage of 2 watts is not exceeded.
Reversal of the "S" and "L" on the regulator will damage the regulator.
The correct plug for the regulator is a 9 122 067 011 for the Bosch tye and for the Shinagawa connector the number is X02FW.

See appendix 1 for daignostic matrix.
Before testing or disassembling the generator please observe the following points.

1. When testing the diodes with AC type testers the RMS. Vlotage output must not exceed 12.0 volts, it is recommended that the stator should be disconnected during this test.
2. Where zener power diodes are used, the breakdown voltage should be tested to ensure all diodes have the same zener voltage.
3. Insulation tests on the rotor and stator should use a voltage not exceeding 110v for a series test lamp. The rectifier must be disconnected from the stator prior to testing.
4. When carrying out repairs to the charging system always disconnected the battery negative first, and reconnect it last.

5. During current output tests please make sure that the ammeter is securely connceted into the charge circuit.
6. Some battery powered timing lights can produce high transient voltages when connected or disconnected. Only disconnect or connect timing lights when the engine is switched off.
7. Make sure the warning lamp circuit is functioning normally before commencing tests.
8. Battery isolation switches must only be operated when the engine is stopped.
9. To protect the charging system when using 240 volt chargers it is recommeneded that the battery is disconnected whilst charging.
10. Due to the very low resistance value of the stator winding it may not be possible to obtain accurate readings without special equipment.
11. 12 volts must never be connected to the "L" terminal of the regulator as this will damage the lamp driver circuit.
12. No loads apart from the warning lamp can be connected to the "L" termainal. The "W" terminal is provided for this purpose.

Disassembly

1. Mark the relative positions of the end housings in relation to the stator assembly to aid reassembly. Use a permanent marking pen do not use centre punched as this can cause misalignmnet of the housings.
2. Remove the EP regulator from the slipring end housing by removing the two screws. Tilt the regulator slightly from the plug connection until the regulator clears the housing, then lift clear.
3. Remove the four through bolts.
4. Carefully remove the stator assembly along with the slipring end housing taking care not to put strain on the stator wires.
5. To disconnect the stator from the rectifier assembly, grasp the stator wires close to the wire loop with a pair of long nosed pliers, heat the joint with a soldering iron, when the point becomes plastic apply a slight twisting motion to the wires, then pull upwards to release the wires. Remove the stator.

   This procedure opens the wire loop to release the stator connections easily.
6. To remove the rectifier remove the three retaining screw and the B+ terminal nut and washers.

Note: the B+ bolt and the positive heatsink retaining screw are fitted with mica insulating washers.
These must be discarded and replaced with new washers and heatsink compound.

7. To remove the pulley, mount an 8mm Allen key in the vice with the short end upwards, place a 24mm ring spanner on the puley nut, position the internal hexagon of the rotor shaft onto the Allen ken, loosen the nut and remove the pulley.

Note: the pulley has an integral boss which locks up against the bearing,
therefore no thrust collar is provided.

8. Removing the rotor assembly. Remove the four retaining screws from the drive end housing, withdraw the rotor complete with the bearing.

Note: the rotor must not be pressed from the drive end housing using a press as the bearing retaining plate and drive end housing will be damaged or distorted. Parts removed in this way must be replaced if the integrity of the generator is to be maintained.

9. Remove the drive end bearing from the rotor shaft using a chuck type puler, take care not to distort the fan assembly during this process.
10. Remove the slipring end bearing using the same meghod as in 9.

Clean

Thoroughly clean all components except the rotor and stator with an approved cleaning agent. Ensure that all traced of oil and dirt are removed. If an abrasive cleaner is used to remove scale and paint from the housings take care not to abrade the bearing and mounting spigot surfaces. The rotor and stator must be cleaned with compressed air only, the use of solvents could cause damage to the insulating materials.

Inspection

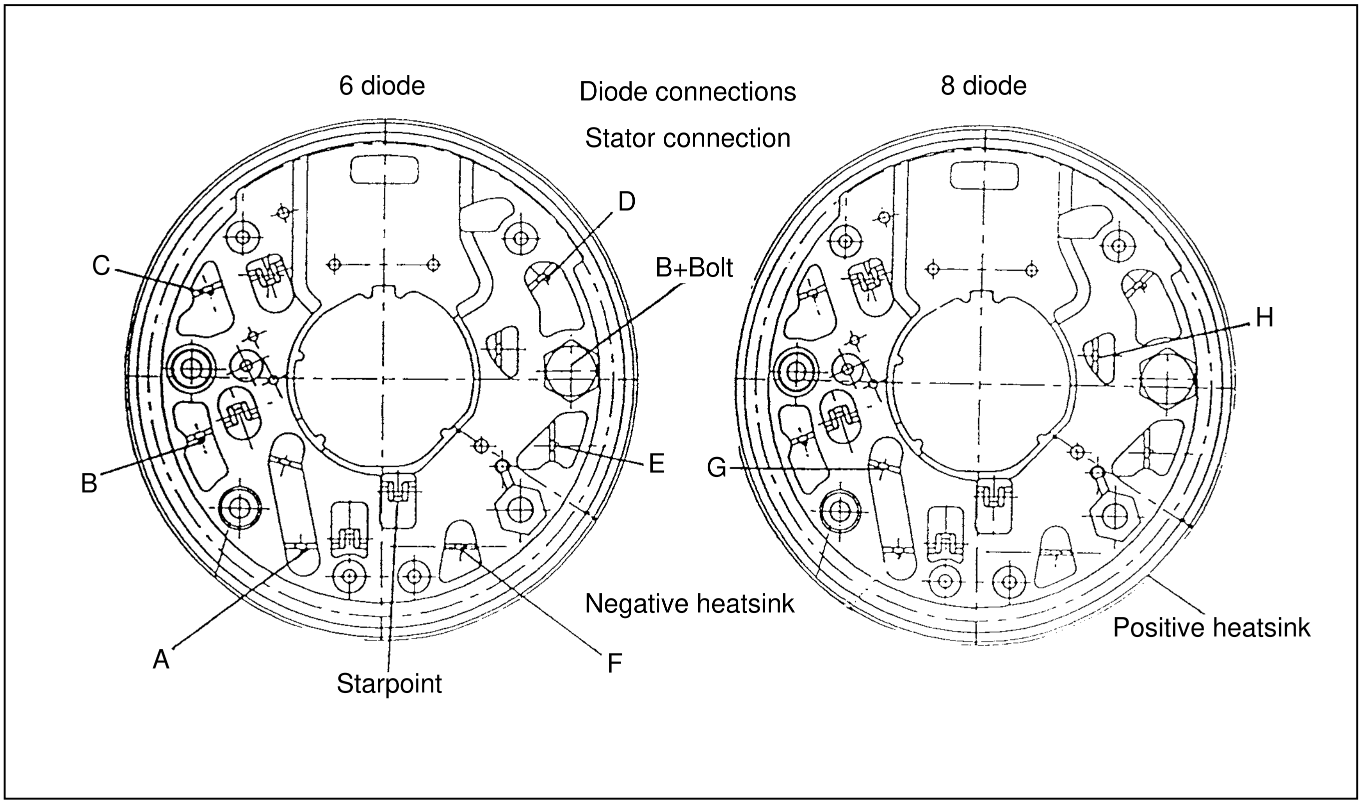
1. Rectifier assembly

The following test equipment is required.
The recitifier assembly is not repairable and must be replaced if a faulty diode is detected during inspection.

(a) Adiode tester where the DC output at the test probes does not exceed 14 volts or in the case of AC testers 12 volts RMS. This is to ensue that when inspection rectifiers fitted with zener power diodes the forward and reverse checks are completer and are not masked by the diode turning on due to the zener breakdown voltage.

(b) A zenere diode tester with a DC output in excess of 30 volts, the tester should also incorporate internal current limiting set to 5 Ma. to prevent high currents during inspection.

(c) Diodes can be destroyed during service due to high temperature and overload, open circuits are usually a result of excessive voltage.

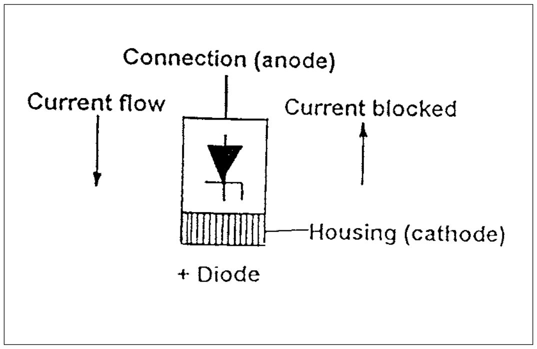


1.1 Power Diodes.

Apply the negative test probe of the diode tester or a multimeter with a diode test feature to the positive heatsink and the positive probe alternately to A,B,C, a low resistance reading, or the forward voltage drop across the diode shoud be obtained. Reverse the test probes, a high resistance reading or a higher reverse voltage should be obtained.

Now connect the positive test probe to the negative heatsink and the negative alternatively to D,E,F, a low resistance or forward voltage drop across the diode should be obtained. Reverse the test probes, a high resistance reading or a higher reverse voltage should be obtained.

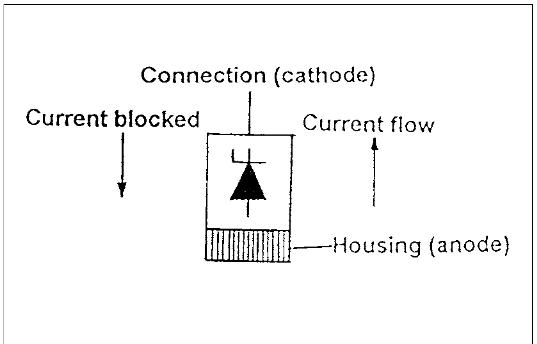
For 8 diode rectifier plates tests for G and H should be included. When the reverse voltage test is done the applied voltage should be less than 14 volts DC or 12 volts RMS for AC testers.



1.2 Zener Diode

The basic tests in 1.1 should be undertaken first before the diode zener voltage is tested. Diodes are grouped together according to their zener voltag i.e. all diodes within a rectifier must have the same zener voltage.

Connect the test probes as for the reverese test listed above i.e. reverse biased apply the test voltage form the zener diode tester (current limited to 5ma) and read to zener breakdown voltage this should be a steady reading and not increase with increased voltage from the tester.



Readings for Zener diode groups 011 to 042

Zener voltage at 5Ma.	Positive diode	Negative diode	Fordward current Rating
17.8v-19.2v	011	012	25A
18.8v-20.2v	013	014	25A

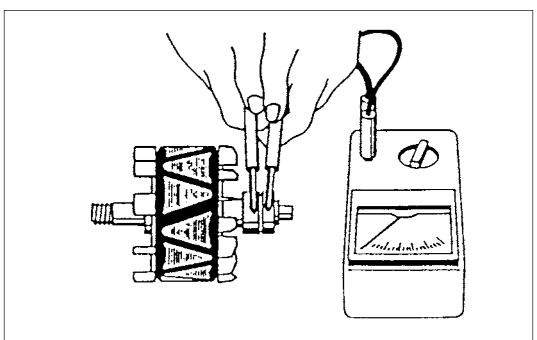
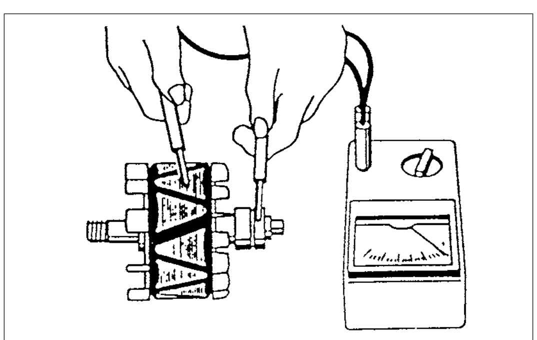
19.8v-21.2v	035	036	35A
20.8v-22.2v	037	038	35A
21.8v-23.2v	039	040	35A
22.8v-24.2v	041	042	35A

Note: Diode number is stamped on the rear of the diode.



2. Stator

Inspect the stator insulation resistance to ground with an insuation tester or a series test lamp up to 110 volts.
The insulation resistance must be greater than 1 megohm.
The winding reisistance is measured between phases using a low reading ohmmeter designed for this purpose, the values are given at the rear of this instruction.



3. Rotor

Inspect the rotor for insulation resistance to ground using an insulation tester or a series test lamp up to 110 volts.
The insulation resistance must be grater than 1 megohm.
Measure the rotor resistance between the sliprings using an ohmmeter or apply 12 volts across the sliprings and measure the rotor current flow, then divide 12 by the measured current, the results is the rotor resistance in ohms. values are given at the rear of this instruction.

If the sliprings are worn or out of round they must be re-machined to a minimum diameter or 26.7 mm and should have a runout not exceeding 0.060mm. If the slipring is below these limits it must be replaced with a new one.

Warning; extreme care must be exercised when machining the slipring as it is possible for the turning tool to foul the

fan.

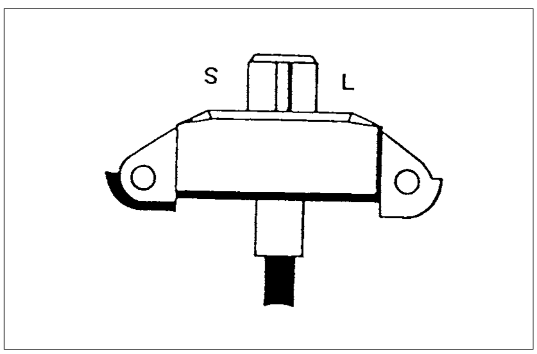
4. Replacing the brushes (inbuilt regulator)

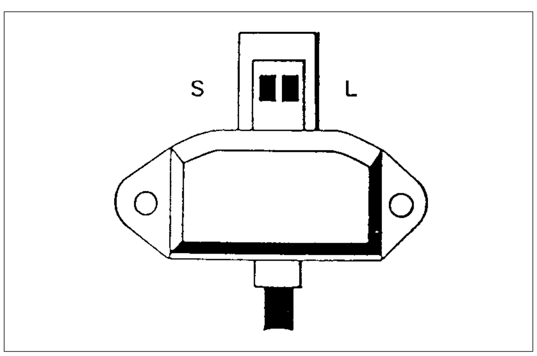
Check the brushes for length, this is measured from the brush holder to the end of the brush along it's centre line. Also inspect for any sideways wear. If worn replace both brushes. The minimum length is 3.8mm. Inspect the brush springs for signs of corrosion or loss of tension or uneven tension.

Replacing the brushes, using a soldering iron apply heat to the soldered joints on the rear of the brush holder of the regulator, using a small lever prise up the retaining tabs to release the brush lead and spring. Thread the new brush lead up the brush holder along with the spring, pull the lead through the tabs until the brush is protruding 12mm from the holder. Bend down the tabs and solder the brush lead taking care not to allow the solder to run up the lead which will reduce flexibility. Use 60/40 resin cored solder.

5. Ball bearing

Please note the bearings used in this KCA generator are a high
tolerance type, only fully sealed bearings of the same specification are to be used as replacements. It is recommended that the bearings be replaced during the reconditioning process to restore the unit to original specification.





6. Regulator

The regulator can only be tested when fitted into an altenator.

Warning: do not reverse"S" and "L" connections or put 12 volt supply to "L" terminal, this connection must not be used as a supply source other than to supply the requirements of the warning lamp 2(watts).
Such action will destroy the regulator warning lamp circuit.

For test voltages refer to Generator output testing section. See also additional information on regulator function earlier in this instruction.

Reassembly

Generator

(a) Press new bearing onto slipring end of the rotor taking care to aplly the force to the bearing inner race only, otherwise the bearing will be noisy and it's life will be shortened.

(b) Fit a new bearing to the drive end housing, fit the bearing plate, and four retaining screws, press the rotor into the bearing, using a support tool to take the thrust against the bearing inner.
The support is fitted from the pulley side of the bearing. In this way the thrust is not taken by the drive end housing.

(c) To fit pulley, mount an 8mm Allen key in the vice with the short end upwards, place a 24mm ring spanner on the shaft nut, position the internal hexagon of the rotor shaft onto the Allen key, tighten the nut to the required torque(See torque chart)

(d) Inspect the bearing support ring for signs of damage, if in doubt replace the ring by pressing it into the housing by hand, do not use excessive force.

(e) To refit the rectifier, fit new mica washers to the positive heatsink B+ bolt and retaining screw each washer must have heatsink compound applied to both surfaces before fitting.
Fit the three retaining screws to the rectifier then install into slipring end housing. Tighten the B+ bolt to the reuired torque.

(f) To refit the stator, make sure the spigot surface are clean and free from damage, fit the stator into the slipring end housing noting the correct lead connection positioning. Fit the stator leads into the wire loops in the recrifier. Using a pair of pliers squeeze the loop to retain the stator lead prior to soldering. Repeat for each lead in turn, solder the leads into position using 60/40 resin cored solder. Make sure the leads will be clear of the internal fan when the rotor is assmebled into the stator.

(g) Carefully install the rotor into the stator/slipring end housing assembly, noting the alignment of the housings and through bolt holes. Fit the through bolts making sure the stator is seated correctly, tighten the through bolts to the correct torque setting (uneven torque can produce magnetic noise levels above normal).

(h) Fitting the regulator. Compress the brushes into the brush holder by hand, slip the regulator through the opening in the rear of the slipring end housing until the brushes come in contact with the slipring. Press the regulator towards the slipring until the holes are aligned then fit the retaining screws and tighten.

Inspection

Generator

Before any in field testing can be undertaken it is important that the battery's conditions is established and the terminals are clean and tight.

Check the condition of the generator drive belt and ensure that it is adjusted in accordance with the engine manufacturer's recommnedations.

Battery conditions:
Note: This assessment may be difficult with maintenance free assemblies.

Test the specific gravity of the individual cells the readings should be within 10 points of each other, it is recommended that the average SG should be 1.260 or higher.
A load test should be carried out to determine the ability of the battery to supply and accept current. This is a good indicator as to the general condition of the battery.
A load equal to the normal starting current should be placed across the battery, the duration of this load test should not exceed 10 seconds, during this time the terminal voltage across the battery should not drop below 9.6 volts. Observe each cell for signs of excessive gas liberation, usuall an indication of cell failure.
If the battery test is clear proceed with the Generator tests as follows.

Care should be taken when making the following connections. It is recommended that the battery negative terminal be disconnected before the test meters are connected, and reconnecting the negative terminal when the meters are inserted into the circuit under test. The warning lamp in the D+ circuit should not exceed 2 watts.

Regulating voltage test on the vehicle.

Connect a voltmeter to the generator, the positive lead to the B+ terminal and the nagative lead to the generator casing. Select the voltage range to suit the system, i.e. 20v for 12 volt sysytems or 40v for 24 volt systems. Connect an ammeter in series with the main output cable from the B+ terminal on the generator, the range selected must be capable of reading the maximum output from the generator.

Note the voltmeter reading before starting the engine. This reading should increase when the engine is running indicating generator output, start the engine and increase the engine speed until the generator is running at 4000 rpm, switch on vehicle loads of 5-10 A is indcated on the ammeter, the voltmeter shoud read 14.0-14.2 v for a 12 volt system, for a 24 volt system the readings should be 5-10 A and 27.7-28.5 volts.

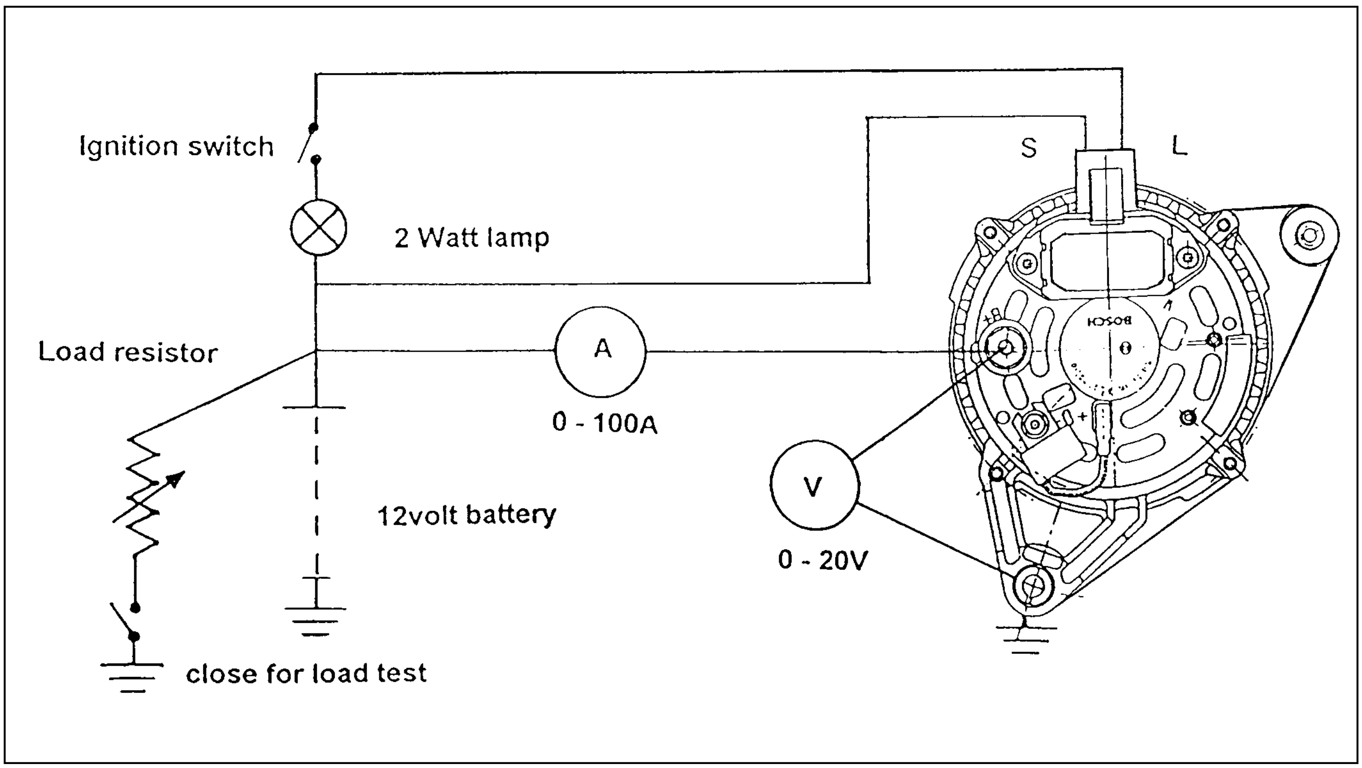
Load regulation test

Increase the engine speed until the generator is running at 6000 rpm, increase the load to 90% of full output a decrease in the regulating voltage should not exceed 0.50 volts for 12 v and 0.70 v for 24 v regulators of the readings obtained in the previous test. If so, the regulator is defective.

Generator output test at full load

Increase engine speed until the altenator is running at 6000 rpm, switch on electrical loads until the generator voltage drops to 13.5 volts for 12 v systems and 26 volts for 24 v systems, full outut should be obtained under these conditions. It may be necessary to adjust engine speed to maintain altenator speed. If sufficient electrical loads are not available a carbon pile resistance can be connected across the battery and adjusted until maximum output is obtained.

Keep the time for this test to a minimum to avoid undue heating and high engine speeds.



Technical Data

(mm)

Brush wear	-	Minimum Length	3.8

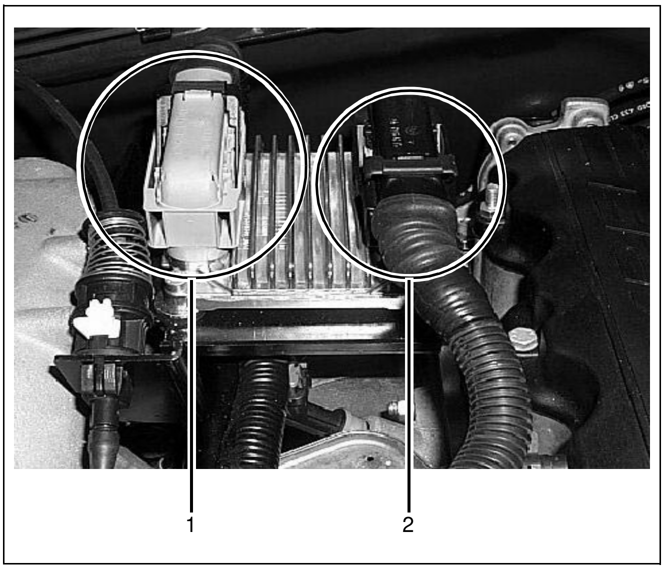
GENERAL DESCRIPTION FOR ECM AND SENSORS

Engine Control Module (ECM)



(1) J1 Port
(2) J2 Port

The engine control module (ECM) is located on the intake manifold. The ECM controls the following.

- Fuel metering system
- Ignition timing
- On-board diagnostics for electrical functions.

The ECM constantly observes the information from various sensors. The ECM controls the systems that affect vehicle performance. And it performs the diagnostic function of the system.
The function can recognize operational problems, and warn to the driver through the check engine lamp, and store diagnostic trouble code (DTC). DTCs identify the problem areas to aid the technician in marking repairs.

The input / output devices in the ECM include analog to digital converts, signal buffers, counters and drivers. The ECM controls most components with electronic switches which complete a ground circuit when turned on.

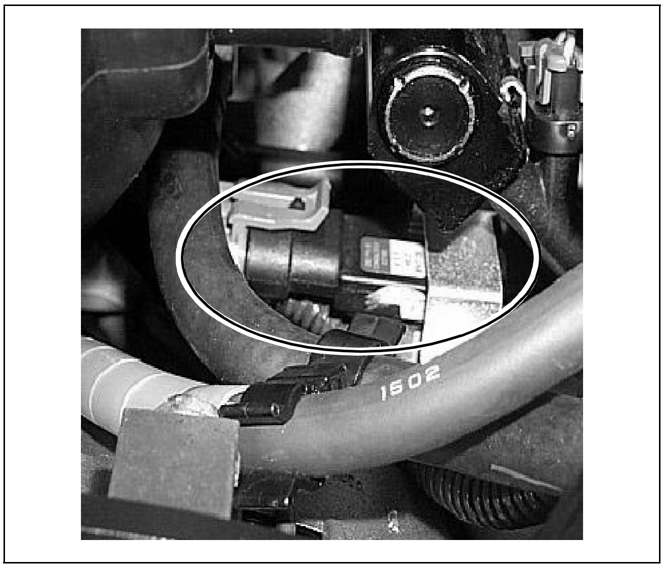
Inputs (Operating condition read):

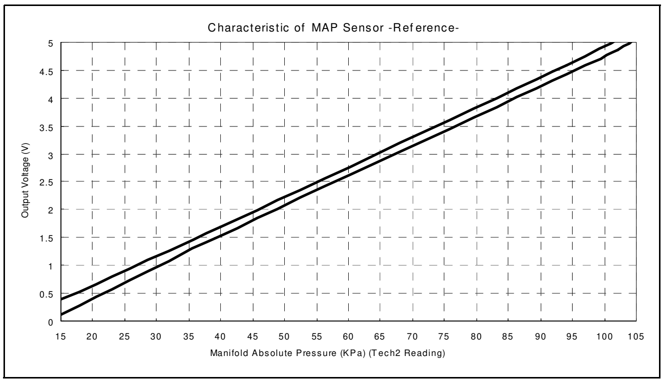
- Battery voltage
- Electrical ignition
- Exhaust oxygen content
- Intake manifold pressure
- Intake air temperature
- Engine coolant temperature
- Crankshaft position
- Knock signal
- Throttle position
- Vehicle speed
- Power steering pressure
- Air conditioning request on or off

Outputs (Systems controlled):

- Ignition control
- Fuel control
- Idle air control
- Fuel pump
- EVAP canister purge
- Air conditioning
- Diagnostics functions

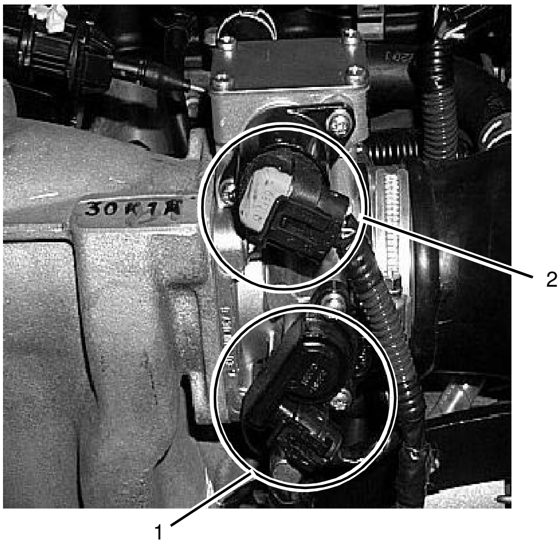
Manifold Absolute Pressure (MAP) Sensor



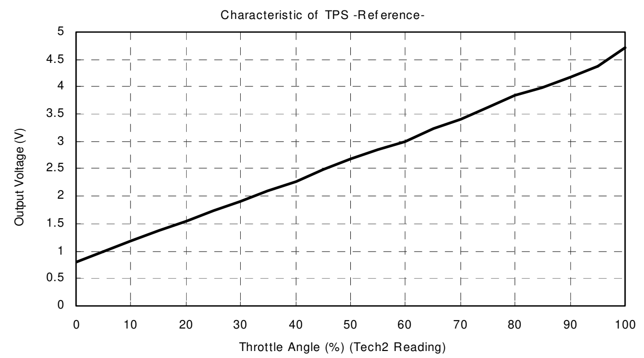


The MAP sensor is a strain gage. A pressure strains the resistance on the silicon base. At that time the resistance value changes. And it changes voltage. In other words it measures a pressure value. It is installed to the intake manifold. Output voltage of the MAP sensor is low as pressure is low.

Throttle Position Sensor (TPS)



(1) Throttle Position Sensor
(2) Idle Air Control (IAC) Valve



The TPS is a potentiometer connected to throttle shaft on the throttle body.
The engine control module (ECM) monitors the voltage on the signal line and calculates throttle position. As the throttle valve angle is changed when accelerator pedal moved. The TPS signal also changed at a moved throttle valve. As the throttle valve opens, the output increases so that the output voltage should be high.
The throttle body has a throttle plate to control the amount of the air delivered to the engine.
Engine coolant is directed through a coolant cavity in the throttle body to warm the throttle valve and to prevent icing.

Idle Air Control (IAC) Valve

Step / Coil	A	B	C	D
Coil A High (ECM J1-28)	On			On
Coil A Low (ECM J1-30)		On	On	
Coil B High (ECM J1-13)	On	On		
Coil B Low (ECM J1-29)			On	On

← (IAC Valve Close Direction)

(IAC Valve Open Direction) →

The idle air control valve (IAC) valve is two directional and gives 2-way control. With power supply to the coils controlled steps by the engine control module (ECM), the IAC valve's pintle is moved to adjust idle speed, raising it for fast idle when cold or there is extra load from the air conditioning or power steering.
By moving the pintle in (to decrease air flow) or out (to increase air flow), a controlled amount of the air can move around the throttle plate. If the engine speed is too low, the engine control module (ECM) will retract the IAC pintle, resulting in more air moving past the throttle plate to increase the engine speed.
If the engine speed is too high, the engine control module (ECM) will extend the IAC pintle, allowing less air to move past the throttle plate, decreasing the engine speed.

The IAC pintle valve moves in small step called counts. During idle, the proper position of the IAC pintle is calculated by the engine control module (ECM) based on battery voltage, coolant temperature, engine load, and engine speed.
If the engine speed drops below a specified value, and the throttle plate is closed, the engine control module (ECM) senses a near-stall condition. The engine control module (ECM) will then calculate a new IAC pintle valve position to prevent stalls.
If the IAC valve is disconnected and reconnected with the engine running, the idle speed will be wrong. In this case, the IAC must be reset. The IAC resets when the key is cycled “On” then “Off”. When servicing the IAC, it should only be disconnected or connected with the ignition “Off”.
The position of the IAC pintle valve affects engine start-up and the idle characteristic of the vehicle.
If the IAC pintle is fully open, too much air will be allowed into the manifold. This results in high idle speed, along with possible hard starting and lean air/ fuel ratio.

Important Operations - Removal

5. Fuel Filler Pipe and Evaporator Hose

7. Rear Body Assembly
Attach lifting wires to the rear body hooks and raise the rear body.

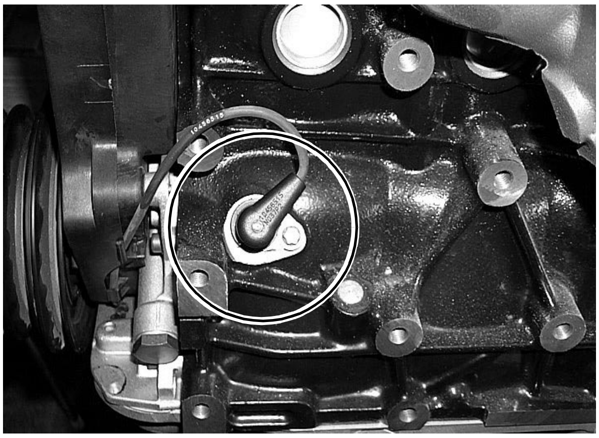
Note:
In lifting up rear body, take care not to strike it against cab body.

Important Operation – Installation

6. Bolt; Frame to Body

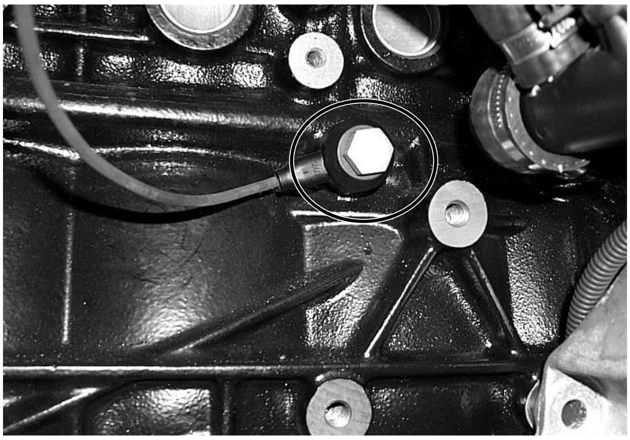
Torque	N·m(kgf·m/lb·ft)
54 (5.5 / 40)	

Crankshaft Position (CKP) Sensor



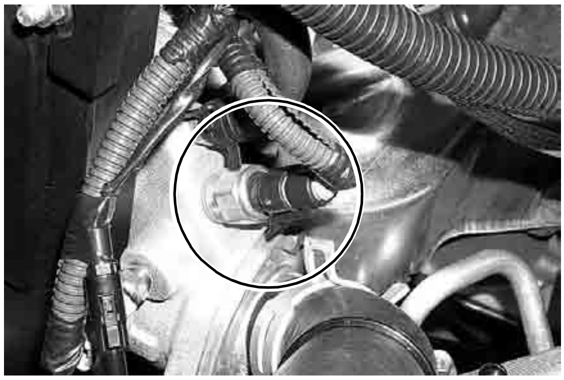
The crankshaft position (CKP) sensor, which sends a signal necessary for deciding on injection timing to the ECM, is mounted on the left-hand side of the cylinder block just back of the A/C compressor.
The crankshaft has a 58 teeth press-fit timing disc, from which the CKP sensor reads the position of the crankshaft at all the times. It converts this to an electrical signal, which it sends to the ECM.
Using the 58 X signals per rotation and the timing-mark signal sent by the CKP sensor, the ECM is able to accurately calculate engine speed and crank position.
The ECM converts the 58 X signals into square signals. This converted signal is sent from the ECM terminal J2-25 to the tachometer.

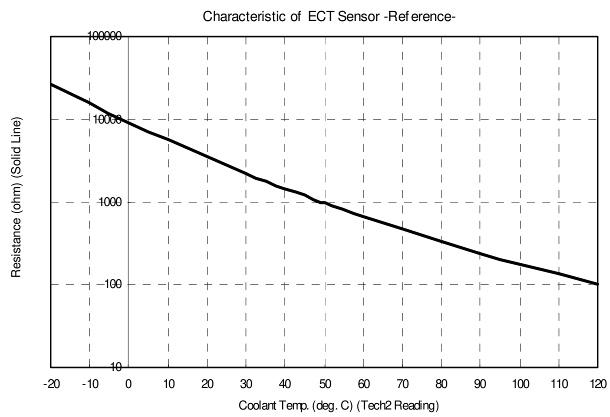
Knock Sensor (KS)



The knock sensor (KS) contains an element that converts detection of knock into an electrical signal, and is mounted on cylinder block wall.
When the ECM receives a signal that indicates knock, the ECM orders ignition timing to be adjusted to compensate.

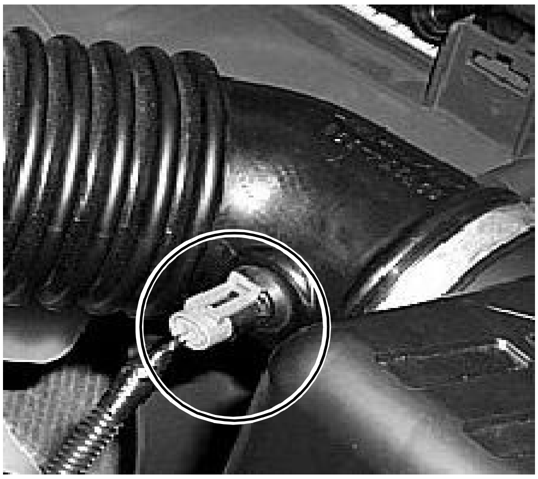
Engine Coolant Temperature (ECT) Sensor

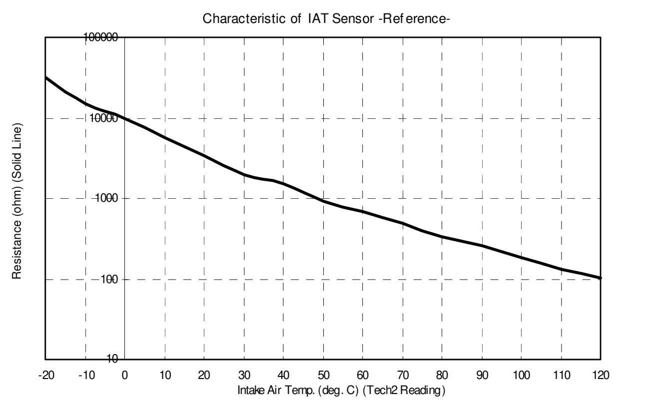




The ECT sensor is a thermistor. A temperature changes the resistance value. And it changes voltage. In other words it measures a temperature value. It is installed on the coolant stream. Low coolant temperature produces a high resistance.
The ECM supplies 5 volts signal to the ECT sensor through resisters in the ECM and measures the voltage. The signal voltage will be high when the engine temperature is cold, and it will be low when the engine temperature is hot.

Intake Air Temperature (IAT) Sensor



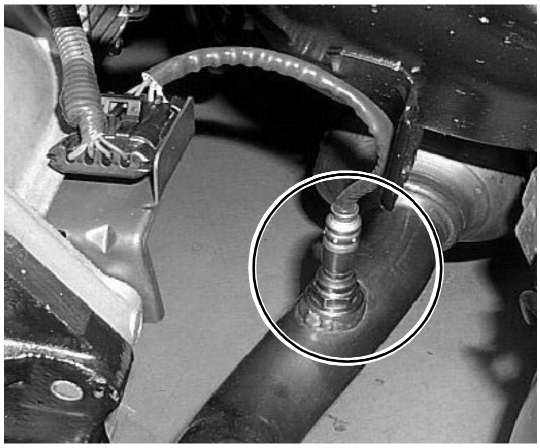


The IAT sensor is a thermistor. A temperature changes the resistance value. And it changes voltage. In other words it measures a temperature value. Low air temperature produces a high resistance.
The ECM supplies 5 volts signal to the IAT sensor through resisters in the ECM and measures the voltage. The signal voltage will be high when the air temperature is cold, and it will be low when the air temperature is hot.

Vehicle Speed Sensor (VSS)

The VSS is a magnet rotated by the transmission output shaft. The VSS uses a hall element. It interacts with the magnetic field treated by the rotating magnet. It outputs pulse signal. The 12 volts operating supply from the meter fuse.

Heated Oxygen (O_2) Sensor



The heated oxygen sensor consists of a 4-wire low temperature activated zirconia oxygen analyzer element with heater for operating temperature of 315°C, and there is one mounted on each exhaust pipe.
A constant 450millivolt is supplied by the ECM between the two supply terminals, and oxygen concentration in the exhaust gas is reported to the ECM as returned signal voltage.
The oxygen present in the exhaust gas reacts with the sensor to produce a voltage output. This voltage should constantly fluctuate from approximately 100mV to 1000mV and the ECM calculates the pulse width commanded for the injectors to produce the proper combustion chamber mixture.
Low oxygen sensor output voltage is a lean mixture which will result in a rich commanded to compensate.
High oxygen sensor output voltage is a rich mixture which result in a lean commanded to compensate.
When the engine is first started the system is in “Open Loop” operation. In “Open Loop”, the ECM ignores the signal from the oxygen sensors. When various conditions (ECT, time from start, engine speed & oxygen sensor output) are met, the system enters “Closed Loop” operation. In “Closed Loop”, the ECM calculates the air fuel ratio based on the signal from the oxygen sensors.
Heated oxygen sensors are used to minimize the amount of time required for closed loop fuel control to begin operation and allow accurate catalyst monitoring.
The oxygen sensor heater greatly decreases the amount of time required for fuel control sensors to become active.
Oxygen sensor heaters are required by catalyst monitor and sensors to maintain a sufficiently high temperature which allows accurate exhaust oxygen content readings further away from the engine.

GENERAL DESCRIPTION FOR FUEL METERING

The fuel metering system starts with the fuel in the fuel tank. An electric fuel pump, located in the fuel tank, pumps fuel to the fuel rail through an in-line fuel filter.
The pump is designed to provide fuel at a pressure above the pressure needed by the injectors.
A fuel pressure regulator in the fuel rail keeps fuel available to the fuel injectors at a constant pressure.
A return line delivers unused fuel back to the fuel tank.
The basic function of the air/fuel metering system is to control the air/fuel delivery to the engine. Fuel is delivered to the engine by individual fuel injectors mounted in the intake manifold.
The main control sensor is the heated oxygen sensor located in the exhaust system. The heated oxygen sensor reports to the ECM how much oxygen is in the exhaust gas. The ECM changes the air/fuel ratio to the engine by controlling the amount of time that fuel injector is “On”.
The best mixture to minimize exhaust emissions is 14.7 parts of air to 1 part of gasoline by weight, which allows the catalytic converter to operate most efficiently.
Because of the constant measuring and adjusting of the air/fuel ratio, the fuel injection system is called a “closed loop” system.
The ECM monitors signals from several sensors in order to determine the fuel needs of the engine. Fuel is delivered under one of several conditions called “mode”.
All modes are controlled by the ECM.

Battery Voltage Correction Mode

When battery voltage is low, the ECM will compensate for the weak spark by increasing the following:

- The amount of fuel delivered.
- The idle RPM.

Clear Flood Mode

Clear a flooded engine by pushing the accelerator pedal down all the way. The ECM then de-energizes the fuel injectors. The ECM holds the fuel injectors de-energized as long as the throttle remains above 75% and the engine speed is below 800 RPM. If the throttle position becomes less than 75%, the ECM again begins to pulse the injectors ON and OFF, allowing fuel into the cylinders.

Deceleration Fuel Cutoff (DFCO) Mode

The ECM reduces the amount of fuel injected when it detects a decrease in the throttle position and the air flow. When deceleration is very fast, the ECM may cut off fuel completely. Until enable conditions meet the engine revolution less 1000 rpm or manifold absolute pressure less than 10 kPa.

Engine Speed/ Vehicle Speed/ Fuel Disable Mode

The ECM monitors engine speed. It turns off the fuel injectors when the engine speed increases above 6000 RPM. The fuel injectors are turned back on when engine speed decreases below 3500 RPM.

Acceleration Mode

The ECM provides extra fuel when it detects a rapid increase in the throttle position and the air flow.

Fuel Cutoff Mode

No fuel is delivered by the fuel injectors when the ignition is OFF. This prevents engine run-on. In addition, the ECM suspends fuel delivery if no reference pulses are detected (engine not running) to prevent engine flooding.

Starting Mode

When the ignition is first turned ON, the ECM energizes the fuel pump relay for two seconds to allow the fuel pump to build up pressure. The ECM then checks the engine coolant temperature (ECT) sensor and the throttle position sensor to determine the proper air/fuel ratio for starting.
The ECM controls the amount of fuel delivered in the starting mode by adjusting how long the fuel injectors are energized by pulsing the injectors for very short times.

Run Mode

The run mode has the following two conditions:

- Open loop
- Closed loop

When the engine is first started, the system is in “open loop” operation. In “Open Loop,” the ECM ignores the signal from the heated oxygen sensor (HO2S). It calculates the air/fuel ratio based on inputs from the TP, ECT, and MAP sensors.
The system remains in “Open Loop” until the following conditions are met:

- The HO2S has a varying voltage output showing that it is hot enough to operate properly (this depends on temperature).
- The ECT has reached a specified temperature.
- A specific amount of time has elapsed since starting the engine.
- Engine speed has been greater than a specified RPM since start-up.

The specific values for the above conditions vary with different engines and are stored in the programmable read only memory (PROM). When these conditions are met, the system enters “closed loop” operation. In “closed loop,” the ECM calculates the air/fuel ratio (injector on-time) based on the signal from the HO2S. This allows the air/fuel ratio to stay very close to 14.7:1.

Fuel Metering System Components

The fuel metering system is made up of the following parts.

- Fuel injector
- Throttle body
- Fuel rail
- Fuel pressure regulator
- ECM
- Crankshaft position (CKP) sensor
- Idle air control (IAC) valve
- Fuel pump

Fuel Injector

The group fuel injection fuel injector is a solenoid operated device controlled by the ECM. The ECM energizes the solenoid, which opens a valve to allow fuel delivery.

The fuel is injected under pressure in a conical spray pattern at the opening of the intake valve. Excess fuel not used by the injectors passes through the fuel pressure regulator before being returned to the fuel tank.

Fuel Pressure Regulator

The fuel pressure regulator is a diaphragm-operated relief valve mounted on the fuel rail with fuel pump pressure on one side and manifold pressure on the other side. The fuel pressure regulator maintains the fuel pressure available to the injector at three times barometric pressure adjusted for engine load. It may be serviced separately.

If the pressure is too low or poor performance, DTC P0131 or P1171 will be the result. If the pressure is too high, DTC P0132 or P1167 will be the result. Refer to *Fuel System Diagnosis* for information on diagnosing fuel pressure conditions.

Fuel Rail

The fuel rail is mounted to the top of the engine and distributes fuel to the individual injectors. Fuel is delivered to the fuel inlet tube of the fuel rail by the fuel lines. The fuel goes through the fuel rail to the fuel pressure regulator. The fuel pressure regulator maintains a constant fuel pressure at the injectors. Remaining fuel is then returned to the fuel tank.

Fuel Pump Electrical Circuit

When the key is first turned ON, the ECM energizes the fuel pump relay for two seconds to build up the fuel pressure quickly. If the engine is not started within two seconds, the ECM shuts the fuel pump off and waits until the engine is cranked. When the engine is cranked and the 58X crankshaft position signal has been detected by the ECM, the ECM supplies 12 volts to the fuel pump relay to energize the electric in-tank fuel pump.

An inoperative fuel pump will cause a “no-start” condition. A fuel pump which does not provide enough pressure will result in poor performance.

Thottle Body Unit

The throttle body has a throttle plate to control the amount of air delivered to the engine. The Thottle position sensor and IAC valve are also mounted on the throttle body.

Vacuum ports located behind the throttle plate provide the vacuum signals needed by various components. Engine coolant is directed through a coolant cavity in the throttle body to warm the throttle valve and to prevent icing.

GENERAL DESCRIPTION FOR ELECTRIC IGNITION SYSTEM

The engine use two ignition coils, one per two cylinders. A two wire connector provides a battery voltage primary supply through the ignition fuse.

The ignition control spark timing is the ECM's method of controlling the spark advance and the ignition dwell.

The ignition control spark advance and the ignition dwell are calculated by the ECM using the following inputs.

- Engine speed
- Crankshaft position (CKP) sensor
- Engine coolant temperature (ECT) sensor
- Throttle position sensor
- Vehicle speed sensor
- ECM and ignition system supply voltage

Ignition coil works to generate only the secondary voltage be receiving the primary voltage from ECM.

The primary voltage is generated at the coil driver located in the ECM. The coil driver generate the primary voltage based on the crankshaft position signal. In accordance with the crankshaft position signal, ignition coil driver determines the adequate ignition timing and also cylinder number to ignite.

Ignition timing is determined the coolant temperature, intake air temperature, engine speed, engine load, knock sensor signal, etc.

Spark Plug

Although worn or dirty spark plugs may give satisfactory operation at idling speed, they frequently fail at higher engine speeds. Faulty spark plugs may cause poor fuel economy, power loss, loss of speed, hard starting and generally poor engine performance. Follow the scheduled maintenance service recommendations to ensure satisfactory spark plug performance. Refer to *Maintenance and Lubrication*.

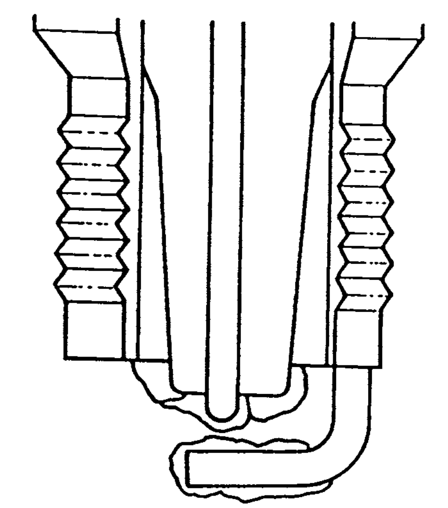
Normal spark plug operation will result in brown to grayish-tan deposits appearing on the insulator portion of the spark plug. A small amount of red-brown, yellow, and white powdery material may also be present on the insulator tip around the center electrode. These deposits are normal combustion by-products of fuels and lubricating oils with additives. Some electrode wear will also occur. Engines which are not running properly are often referred to as "misfiring." This means the ignition spark is not igniting the air/fuel mixture at the proper time. While other ignition and fuel system causes must also be considered, possible causes include ignition system conditions which allow the spark voltage to reach ground in some other manner than by jumping across the air gap at the tip of the spark plug, leaving the air/fuel mixture unburned. Misfiring may also occur when the tip of the spark plug becomes overheated and ignites the mixture before the spark jumps. This is referred to as "pre-ignition."

Spark plugs may also misfire due to fouling, excessive gap, or a cracked or broken insulator. If misfiring occurs before the recommended replacement interval, locate and correct the cause.

Carbon fouling of the spark plug is indicated by dry, black carbon (soot) deposits on the portion of the spark plug in the cylinder. Excessive idling and slow speeds under light engine loads can keep the spark plug temperatures so low that these deposits are not burned off. Very rich fuel mixtures or poor ignition system output may also be the cause. Refer to *DTC P1167*.

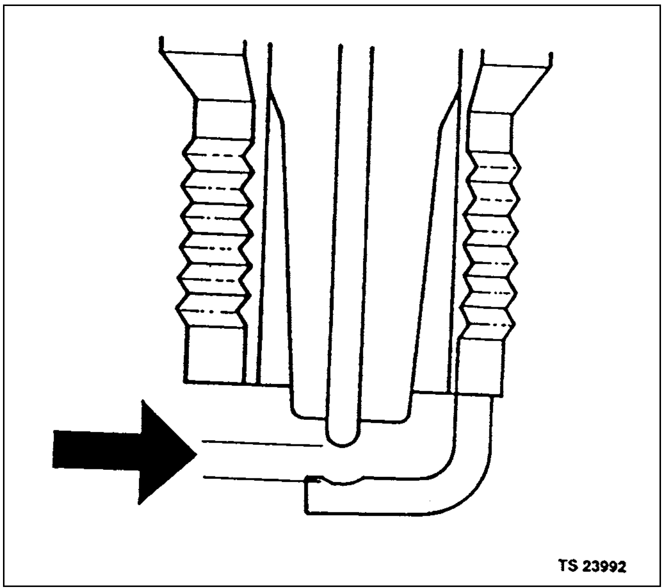
Oil fouling of the spark plug is indicated by wet oily deposits on the portion of the spark plug in the cylinder, usually with little electrode wear. This may be caused by oil during break-in of new or newly overhauled engines.

Deposit fouling of the spark plug occurs when the normal red-brown, yellow or white deposits of combustion by-products become sufficient to cause misfiring. In some cases, these deposits may melt and form a shiny glaze on the insulator around the center electrode. If the fouling is found in only one or two cylinders, valve stem clearances or intake valve seals may be allowing excess lubricating oil to enter the cylinder, particularly if the deposits are heavier on the side of the spark plug facing the intake valve.



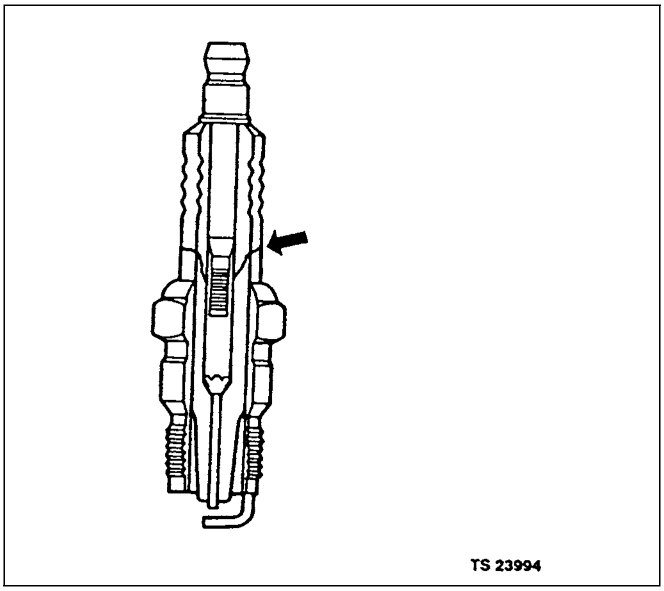
TS 23995

Excessive gap means that the air space between the center and the side electrodes at the bottom of the spark plug is too wide for consistent firing. This may be due to improper gap adjustment or to excessive wear of the electrode during use. A check of the gap size and comparison to the gap specified for the vehicle in Maintenance and Lubrication will tell if the gap is too wide. A spark plug gap that is too small may cause an unstable idle condition. Excessive gap wear can be an indication of continuous operation at high speeds or with engine loads, causing the spark to run too hot. Another possible cause is an excessively lean fuel mixture.



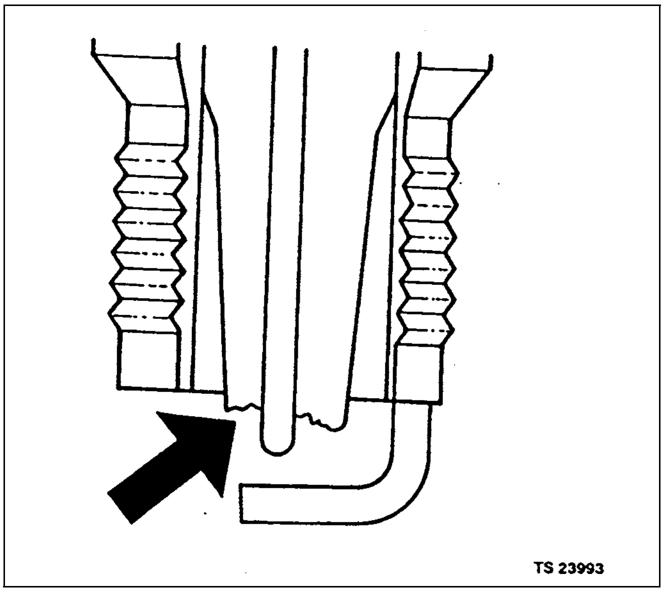
Low or high spark plug installation torque or improper seating can result in the spark plug running too hot and can cause excessive center electrode wear. The plug and the cylinder head seats must be in good contact for proper heat transfer and spark plug cooling. Dirty or damaged threads in the head or on the spark plug can keep it from seating even though the proper torque is applied. Once spark plugs are properly seated, tighten them to the torque shown in the Specifications Table. Low torque may result in poor contact of the seats due to a loose spark plug. Over tightening may cause the spark plug shell to be stretched and will result in poor contact between the seats. In extreme cases, exhaust blow-by and damage beyond simple gap wear may occur.

Cracked or broken insulators may be the result of improper installation, damage during spark plug re-gapping, or heat shock to the insulator material. Upper insulators can be broken when a poorly fitting tool is used during installation or removal, when the spark plug is hit from the outside, or is dropped on a hard surface. Cracks in the upper insulator may be inside the shell and not visible. Also, the breakage may not cause problems until oil or moisture penetrates the crack later.



A broken or cracked lower insulator tip (around the center electrode) may result from damage during re-gapping or from "heat shock" (spark plug suddenly operating too hot).

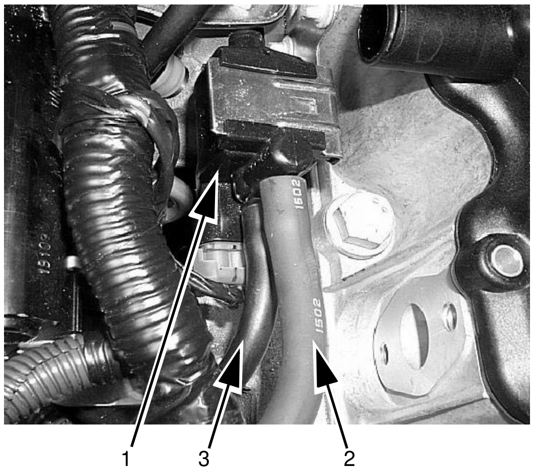
- Damage during re-gapping can happen if the gapping tool is pushed against the center electrode or the insulator around it, causing the insulator to crack. When re-gapping a spark plug, make the adjustment by bending only the ground side terminal, keeping the tool clear of other parts.



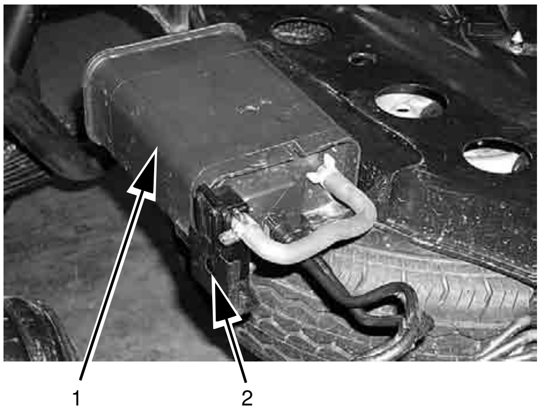
- "Heat shock" breakage in the lower insulator tip generally occurs during several engine operating conditions (high speeds or heavy loading) and may be caused by over-advanced timing or low grade fuels. Heat shock refers to a rapid increase in the tip temperature that causes the insulator material to crack.

Spark plugs with less than the recommended amount of service can sometimes be cleaned and re-gapped, then returned to service. However, if there is any doubt about the serviceability of a spark plug, replace it. Spark plugs with cracked or broken insulators should always be replaced.

GENERAL DESCRIPTION FOR EVAPORATIVE EMISSION SYSTEM



(1) Purge Solenoid Valve
(2) From Canistor to Purge Solenoid
(3) From Purge Solenoid to Intake



(1) Canistor
(2) Air Separator

EVAP Emission Control System Purpose

The basic evaporative emission control system used on the charcoal canister storage method. The method transfers fuel vapor from the fuel tank to an activated carbon (charcoal) storage devise to hold the vapors when the vehicle is not operating.
The canister is located on the rear axle housing by the frame cross-member.
When the engine is running, the fuel vapor is purged from the carbon element by intake air flow and consumed in the normal combustion process.

EVAP Emission Control System Operation

The EVAP canister purge is controlled by a solenoid valve that allows the manifold vacuum to purge the canister. The engine control module (ECM) supplies a ground to energize the solenoid valve (purge on). The EVAP purge solenoid control is pulse-width modulated (PWM) (turned on and off several times a second). The duty cycle (pulse width) is determined by engine operating conditions including load, throttle position, coolant temperature and ambient temperature. The duty cycle is calculated by the ECM. the output is commanded when the appropriate conditions have been met. These conditions are:

- The engine is fully warmed up.
- The engine has been running for a specified time.
- The IAT reading is above 10°C (50°F).
- Purge/Vacuum Hoses. Made of rubber compounds, these hoses route the gasoline fumes from their sources to the canister and from the canister to the intake air flow.
- EVAP Canister. Mounted on a bracket ahead of the fuel tank, the canister stores fuel vapors until the ECM determined that engine conditions are right for them to be removed and burned.

Poor idle, stalling and Poor driveability can be caused by:

- A malfunctioning purge solenoid.
- A damaged canister.
- Hoses that are split, cracked, or not connected properly.

System Fault Detection

The EVAP leak detection strategy is based on applying vacuum to the EVAP system and monitoring vacuum decay. At an appropriate time, the EVAP purge solenoid is turned "ON," allowing the engine vacuum to draw a small vacuum on the entire evaporative emission system.
After the desired vacuum level has been achieved, the EVAP purge solenoid is turned "OFF," sealing the system. A leak is detected by monitoring for a decrease in vacuum level over a given time period, all other variables remaining constant.
If the desired vacuum level cannot be achieved in the test described above, a large leak or a faulty EVAP purge control solenoid valve is indicated.
Leaks can be caused by the following conditions:

- Missing or faulty fuel cap
- Disconnected, damaged, pinched, or blocked EVAP purge line
- Disconnected, damaged, pinched, or blocked fuel tank vapor line
- Disconnected or faulty EVAP purge control solenoid valve
- Open ignition feed circuit to the purge solenoid

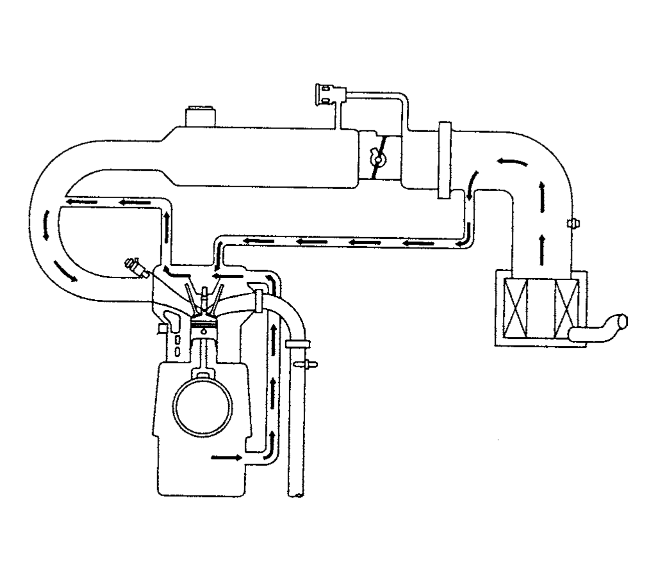
- Damaged EVAP canister
- Leaking fuel sender assembly O-ring
- Leaking fuel tank or fuel filler neck

The ECM supplies a ground to energize the purge control solenoid valve (purge "ON"). The EVAP purge control is turned "ON" and "OFF," several times a second. The duty cycle (pulse width) is determined by engine operating conditions including load, throttle position, coolant temperature and ambient temperature. The duty cycle is calculated by the ECM and the output is commanded when the appropriate conditions have been met.

The system checks for conditions that cause the EVAP system to purge continuously by commanding the EVAP purge solenoid "OFF", EVAP purge solenoid duty ratio "0%". If fuel tank vacuum level increases during the test, a continuous purge flow condition is indicated. This can be caused by the following conditions:

- EVAP purge solenoid leaking
- EVAP purge and engine vacuum lines switched at the EVAP purge control solenoid valve
- EVAP purge control solenoid valve driver circuit grounded

POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM



Crankcase Ventilation System Purpose

The crankcase ventilation system is used to consume crankcase vapors in the combustion process instead of venting them to the atmosphere. Fresh air from the throttle body is supplied to the crankcase and mixed with blow-by gases. This mixture is then passed through the positive crankcase ventilation (PCV) port into the intake manifold.
While the engine is running, exhaust gases and small amounts of the fuel/air mixture escape past the piston rings and enter the crankcase. these gases are mixed with clean air entering through a tube from the air intake duct.

During normal, part-throttle operation, the system is designed to allow crankcase gases to flow through the PCV hose into the intake manifold to be consumed by normal combustion.
A plugged positive crankcase ventilation port or PCV hose may cause the following conditions:

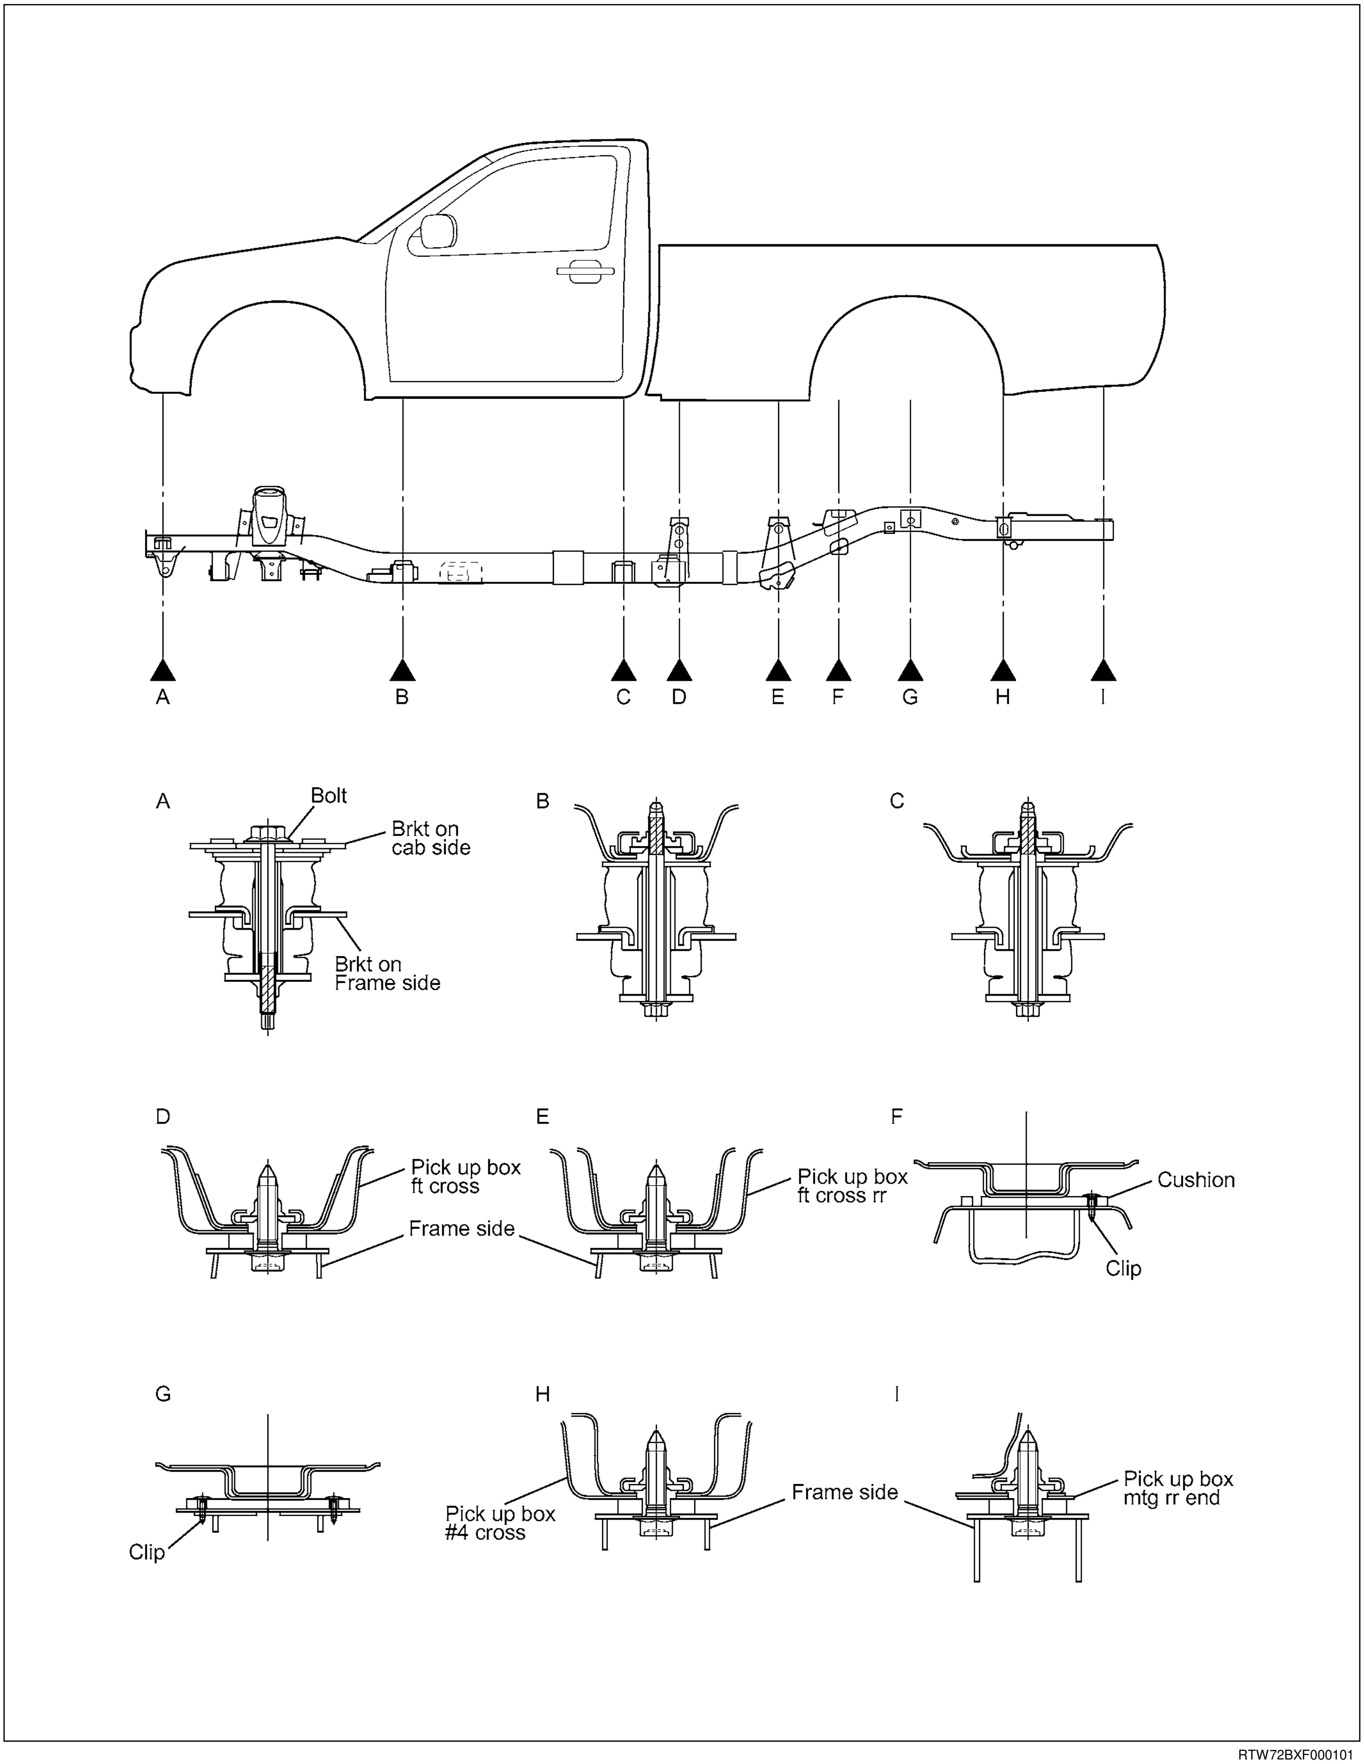
- Rough idle.
- Stalling or slow idle speed.
- Oil leaks.
- Sludge in the engine.

A leaking PCV hose would cause:

- Rough idle.
- Stalling.
- High idle speed.

BODY MOUNTING

REGULAR CAB Model



A/C CLUTCH DIAGNOSIS

A/C Clutch Circuit Operation

A 12-volt signal is supplied to the A/C request input of the ECM when the A/C is selected through the A/C control switch.

The A/C compressor clutch relay is controlled through the ECM. This allows the ECM to modify the idle air control position prior to the A/C clutch engagement for better idle quality. If the engine operating conditions are within their specified calibrated acceptable ranges, the ECM will enable the A/C compressor relay. This is done by providing a ground path for the A/C relay coil within the ECM. When the A/C compressor relay is enabled, battery voltage is supplied to the compressor relay is enabled, battery voltage is supplied to the compressor clutch coil.

The ECM will enable the A/C compressor clutch whenever the engine is running and the A/C has been requested. The ECM will not enable the A/C compressor clutch if any of the following conditions are met:

- The engine speed is greater than 6000 RPM.
- The ECT is greater than 122°C (251°F).
- The throttle is more than 95% open.

A/C Clutch Circuit Purpose

The A/C compressor operation is controlled by the engine control module (ECM) for the following reasons:

- It improves idle quality during compressor clutch engagement.
- It improves wide open throttle (WOT) performance.
- It provides A/C compressor protection from operation with incorrect refrigerant pressures.

The A/C electrical system consists of the following components:

- The A/C control switch.
- The A/C refrigerant pressure switches.
- The A/C compressor clutch.
- The A/C compressor clutch relay.
- The ECM.

A/C Request Signal

This signal tells the ECM when the A/C mode is selected at the A/C control switch. The ECM uses this input to adjust the idle speed before turning on the A/C clutch. The A/C compressor will be inoperative if this signal is not available to the ECM.

Refer to *A/C Clutch Circuit Diagnosis* for A/C wiring diagrams and diagnosis for the A/C electrical system.

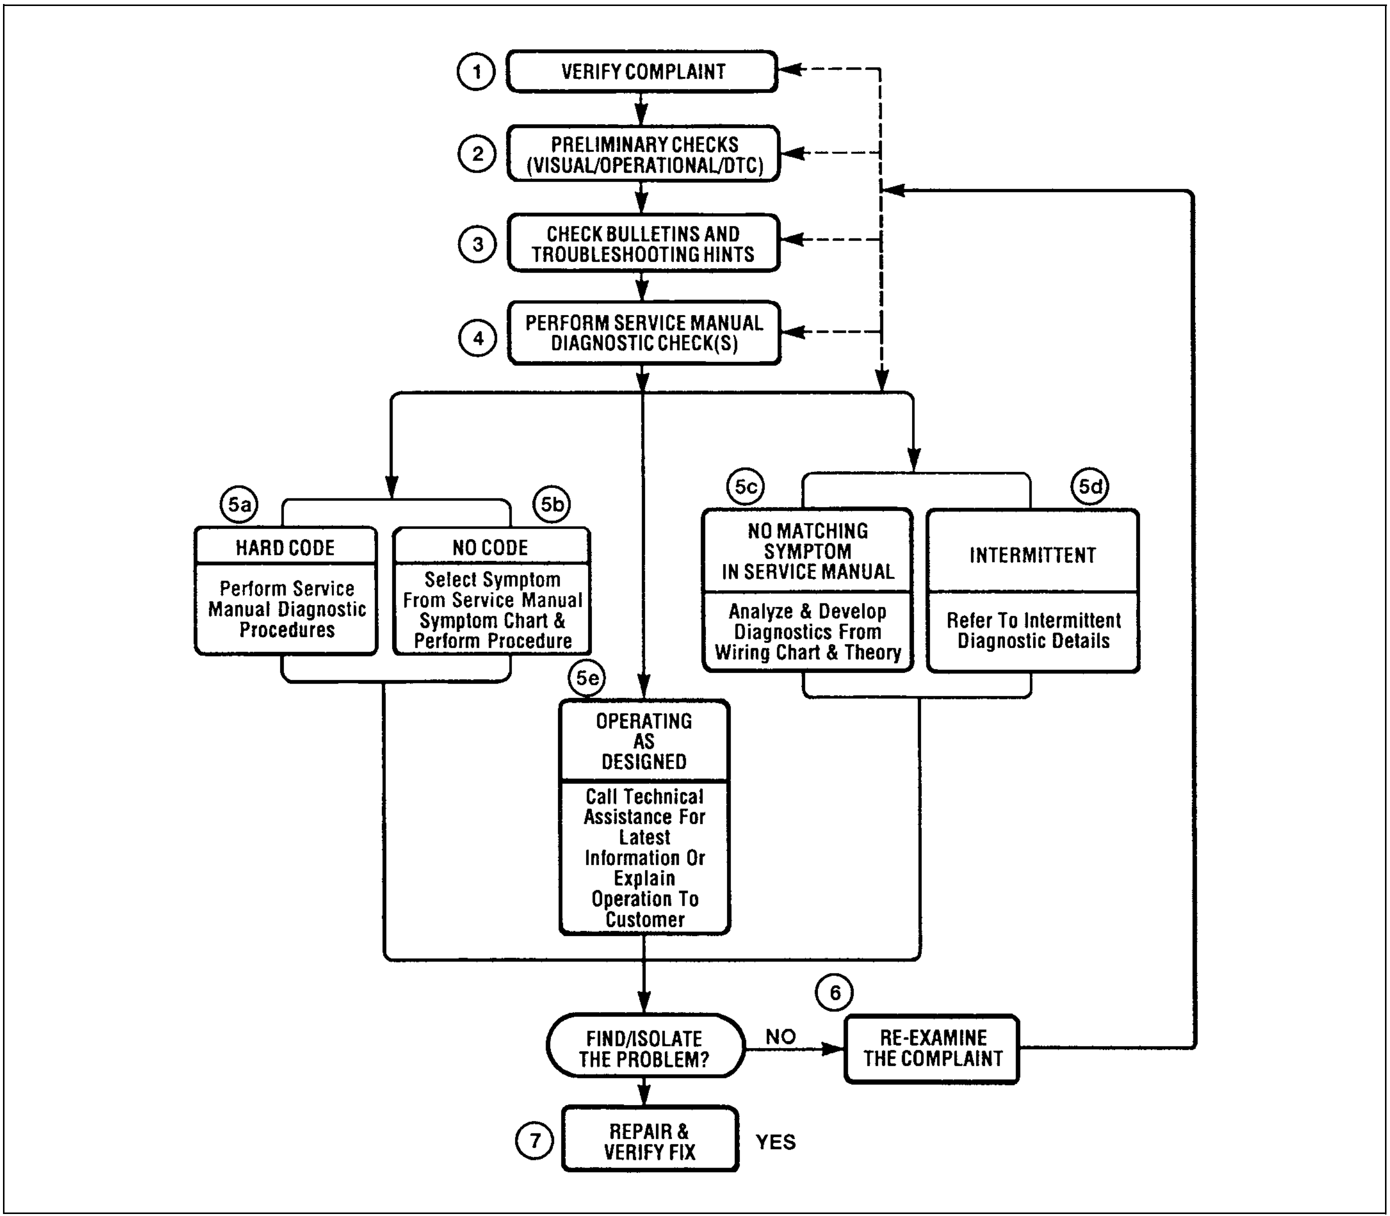
ISUZU STRATEGY BASED DIAGNOSTICS

Overview

As a retail service technician, you are part of the ISUZU service team. The team goal is FIX IT RIGHT THE FIRST TIME for the satisfaction of every customer. You are a very important member of the team as you diagnose and repair customer vehicles.

You have maximum efficiency in diagnosis when you have an effective, organized plan for your work. Strategy Based Diagnostics (refer to Figure 1) provides you with guidance as you create and follow a plan of action for each specific diagnostic situation.

STRATEGY BASED DIAGNOSTICS CHART



Diagnostic Thought Process

As you follow a diagnostic plan, every box on the Strategy Based Diagnostics chart requires you to use the diagnostic thought process. This method of thinking optimizes your diagnosis in the following ways:

- Improves your understanding and definition of the customer complaint
- Saves time by avoiding testing and/or replacing good parts
- Allows you to look at the problem from different perspectives
- Guides you to determine what level of understanding about system operation is needed:
  - Owner's manual level
  - Service manual level
  - In-depth (engineering) level
    - Owner's manual level
    - Service manual level
    - In-depth (engineering) level

1. Verify the Complaint

What you should do

To verify the customer complaint, you need to know the correct (normal) operating behavior of the system and verify that the customer complaint is a valid failure of the system.
The following information will help you verify the complaint:

- WHAT the vehicle model/options are
- WHAT aftermarket and dealer-installed accessories exist
- WHAT related system(s) operate properly
- WHEN the problem occurs
- WHERE the problem occurs
- HOW the problem occurs
- HOW LONG the condition has existed (and if the system ever worked correctly)
- HOW OFTEN the problem occurs
- Whether the severity of the problem has increased, decreased or stayed the same

What resources you should use

Whenever possible, you should use the following resources to assist you in verifying the complaint:

- Service manual Theory or Circuit Description sections
- Service manual "System Performance Check"
- Owner manual operational description
- Technician experience
- Identical vehicle for comparison
- Circuit testing tools
- Vehicle road tests
- Complaint check sheet
- Contact with the customer

2. Perform Preliminary Checks

NOTE: An estimated 10 percent of successful vehicle repairs are diagnosed with this step!

What you should do

You perform preliminary checks for several reasons:

- To detect if the cause of the complaint is VISUALLY OBVIOUS
- To identify parts of the system that work correctly
- To accumulate enough data to correctly and accurately search for a ISUZU Service Bulletin on ISUZU Web site.

The initial checks may vary depending on the complexity of the system and may include the following actions:

- Operate the suspect system
- Make a visual inspection of harness routing and accessible/visible power and ground circuits
- Check for blown fuses
- Make a visual inspection for separated connectors
- Make a visual inspection of connectors (includes checking terminals for damage and tightness)
- Check for any DTCs stored by the on-board computers
- Sense unusual noises, smells, vibrations or movements
- Investigate the vehicle service history (call other dealerships, if appropriate)

What resources you should use

Whenever appropriate, you should use the following resources for assistance in performing preliminary checks:

- Tech II or other technical equipment for viewing DTCs
- Service manual information:
  - Component locations
  - Harness routing
  - Wiring schematics
  - Procedures for viewing DTCs
- Dealership service history file
- Vehicle road test
- Identical vehicle or system for comparison

3. Check Bulletins and Troubleshooting Hints

NOTE: As estimated 30 percent of successful vehicle repairs are diagnosed with this step!

What you should do

You should have enough information gained from preliminary checks to accurately search for a bulletin and other related service information. Some service manual sections provide troubleshooting hints that match symptoms with specific complaints.

What resources you should use

You should use the following resources for assistance in checking for bulletins and troubleshooting hints:

- Printed bulletins
- Access ISUZU Bulletin Web site.
- Videotapes
- Service manual

4. Perform Service Manual Diagnostic Checks

What you should do

The “System Checks” in most service manual sections and in most cells of section 8A (electrical) provide you with:

- A systematic approach to narrowing down the possible causes of a system fault
- Direction to specific diagnostic procedures in the service manual
- Assistance to identify what systems work correctly

What resources you should use

Whenever possible, you should use the following resources to perform service manual checks:

- Service manual
- Technical equipment (for viewing DTCs and analyzing data)
- Digital multimeter and circuit testing tools
- Other tools as needed

5a and 5b. Perform Service Manual Diagnostic Procedures

NOTE: An estimated 40 percent of successful vehicle repairs are diagnosed with these steps!

What you should do

When directed by service manual diagnostic checks, you must then carefully and accurately perform the steps of diagnostic procedures to locate the fault related to the customer complaint.

What resources you should use

Whenever appropriate, you should use the following resources to perform service manual diagnostic procedures:

- Service manual
- Technical equipment (for analyzing diagnostic data)
- Digital multimeter and circuit testing tools
- Essential and special tools

5c. Technician Self Diagnoses

When there is no DTC stored and no matching symptom for the condition identified in the service manual, you must begin with a thorough understanding of how the system(s) operates. Efficient use of the service manual combined with you experience and a good process of elimination will result in accurate diagnosis of the condition.

What you should do

Step 1: Identify and understand the suspect circuit(s)

Having completed steps 1 through 4 of the Strategy Based Diagnostics chart, you should have enough information to identify the system(s) or sub-system(s) involved. Using the service manual, you should determine and investigate the following circuit characteristics:

- Electrical:
  - How is the circuit powered (power distribution charts and/or fuse block details)?
  - How is the circuit grounded (ground distribution charts)?
  - How is the circuit controlled or sensed (theory of operation):
    - If it is a switched circuit, is it normally open or normally closed?
    - Is the power switched or is the ground switched?
    - Is it a variable resistance circuit (ECT sensor or TP sensor, for example)?
    - Is it a signal generating device (MAF sensor of VSS, for example)?
    - Does it rely on some mechanical/vacuum device to operate?
- Physical:
  - Where are the circuit components (component locators and wire harness routing diagrams):
    - Are there areas where wires could be chafed or pinched (brackets or frames)?
    - Are there areas subjected to extreme temperatures?

  - Are there areas subjected to vibration or movement (engine, transmission or suspension)?
  - Are there areas exposed to moisture, road salt or other corrosives (battery acid, oil or other fluids)?
  - Are there common mounting areas with other systems/components?
- Have previous repairs been performed to wiring, connectors, components or mounting areas (causing pinched wires between panels and drivetrain or suspension components without causing and immediate problem)?
- Does the vehicle have aftermarket or dealer-installed equipment (radios, telephone, etc.)

Step 2: Isolate the problem

At this point, you should have a good idea of what could cause the present condition, as well as could not cause the condition. Actions to take include the following:

- Divide (and separate, where possible) the system or circuit into smaller sections
- Confine the problem to a smaller area of the vehicle (start with main harness connections while removing panels and trim as necessary in order to eliminate large vehicle sections from further investigation)
- For two or more circuits that do not share a common power or ground, concentrate on areas where harnesses are routed together or connectors are shared (refer to the following hints)

Hints

Though the symptoms may vary, basic electrical failures are generally caused by:

- Loose connections:
  - Open/high resistance in terminals, splices, connectors or grounds
- Incorrect connector/harness routing (usually in new vehicles or after a repair has been made):
  - Open/high resistance in terminals, splices, connectors of grounds
- Corrosion and wire damage:
  - Open/high resistance in terminals, splices, connectors of grounds
- Component failure:
  - Opens/short and high resistance in relays, modules, switches or loads
- Aftermarket equipment affecting normal operation of other systems

You may isolate circuits by:

- Unplugging connectors or removing a fuse to separate one part of the circuit from another part
- Operating shared circuits and eliminating those that function normally from the suspect circuit
- If only one component fails to operate, begin testing at the component
- If a number of components do no operate, begin tests at the area of commonality (such as power sources, ground circuits, switches or major connectors)

What resources you should use

Whenever appropriate, you should use the following resources to assist in the diagnostic process:

- Service manual
- Technical equipment (for data analysis)
- Experience
- Technical Assistance
- Circuit testing tools

5d. Intermittent Diagnosis

By definition, an intermittent problem is one that does not occur continuously and will occur when certain conditions are met. All these conditions, however, may not be obvious or currently known. Generally, intermittents are caused by:

- Faulty electrical connections and wiring
- Malfunctioning components (such as sticking relays, solenoids, etc.)
- EMI/RFI (Electromagnetic/radio frequency interference)
- Aftermarket equipment

Intermittent diagnosis requires careful analysis of suspected systems to help prevent replacing good parts. This may involve using creativity and ingenuity to interpret customer complaints and simulating all external and internal system conditions to duplicate the problem.

What you should do

Step 1: Acquire information

A thorough and comprehensive customer check sheet is critical to intermittent problem diagnosis. You should require this, since it will dictate the diagnostic starting point. The **vehicle service history** file is another source for accumulating information about the complaint.

Step 2: Analyze the intermittent problem

Analyze the customer check sheet and service history file to determine conditions relevant to the suspect system(s).

Using service manual information, you must identify, trace and locate all electrical circuits related to the malfunctioning system(s). If there is more than one system failure, you should identify, trace and locate areas of commonality shared by the suspect circuits.

Step 3: Simulate the symptom and isolate the problem

Simulate the symptom and isolate the system by reproducing all possible conditions suggested in Step 1 while monitoring suspected circuits/components/ systems to isolate the problem symptom. Begin with the most logical circuit/component.

Isolate the circuit by dividing the suspect system into simpler circuits. Next, confine the problem into a smaller area of the system. Begin at the most logical point (or point of easiest access) and thoroughly check the isolated circuit for the fault, using basic circuit tests.

Hints

You can isolate a circuit by:

- Unplugging connectors or removing a fuse to separate one part of the circuit from another
- If only component fails to operate, begin testing the component
- If a number of components do not operate, begin test at areas of commonality (such as power sources, ground circuits, switches, main connectors or major components)
- Substitute a known good part from the parts department or the vehicle system
- Try the suspect part in a known good vehicle

See **Symptom Simulation Tests** on the next page for problem simulation procedures. Refer to service manual sections 6E and 8A for information about intermittent diagnosis. Follow procedures for basic circuit testing in service manual section 8A.

What resources you should use

Whenever appropriate, you should use the following resources to assist in the diagnostic process:

- Service manual
- Bulletins
- Digital multimeter (with a MIN/MAX feature)
- Tech II and Tech II upload function
- Circuit testing tools (including connector kits/ harnesses and jumper wires)
- Experience
- Intermittent problem solving simulation methods
- Customer complaint check sheet

Symptom Simulation Tests

1. Vibration

This method is useful when the customer complaint analysis indicates that the problem occurs when the vehicle/system undergoes some form of vibration.

For connectors and wire harness, slightly shake vertically and horizontally. Inspect the connector joint and body for damage. Also, tapping lightly along a suspected circuit may be helpful.

For parts and sensors, apply slight vibration to the part with a light tap of the finger while monitoring the system for a malfunction.

2. Heat

This method is important when the complaint suggests that the problem occurs in a heated environment. Apply moderate heat to the component with a hair drier or similar tool while monitoring the system for a malfunction.

CAUTION: Care must be take to avoid overheating the component.

3. Water and Moisture

This method may be used when the complaint suggests that the malfunction occurs on a rainy day or under conditions of high humidity. In this case, apply water in a light spray on the vehicle to duplicate the problem.

CAUTION: Care must be take to avoid directly exposing electrical connections to water.

4. Electrical loads

This method involves turning systems ON (such as the blower, lights or rear window defogger) to create a load on the vehicle electrical system at the same time you are monitoring the suspect circuit/component.

5e. Vehicle Operates as Designed

This condition refers to instances where a system operating as designed is perceived to be unsatisfactory or undesirable. In general, this is due to:

- A lack of understanding by the customer
- A conflict between customer expectations and vehicle design intent
- A system performance that is unacceptable to the customer

What you should do

You can verify that a system is operating as designed by:

- Reviewing service manual functional/diagnostic checks
- Examining bulletins and other service information for supplementary information
- Compare system operation to an identical vehicle

If the condition is due to a customer misunderstanding or a conflict between customer expectation and system operation, you should explain the system operation to the customer.

If the complaint is due to a case of unsatisfactory system performance, you should contact Technical Assistance for the latest information.

What resources you should use

Whenever possible, you should use the following resources to facilitate the diagnostic process:

- Vehicle service information (service manual, etc.)
- ISUZU field support
- Experience
- Identical vehicle or system for comparison

6. Re-examine the complaint

When you do not successfully find/isolate the problem after executing a diagnostic path, you should re-examine the complaint.

What you should do

In this case, you will need to backtrack and review information accumulated from step 1 through 4 of Strategy Based Diagnostics. You also should repeat any procedures that require additional attention.
A previous path may be eliminated from consideration only if you are certain that all steps were executed as directed. You must then select another diagnostic path (step 5a, 5b, 5c or 5d). If all possible options have been explored, you may call or seek ISUZU field support.

What resources you should use

Whenever possible, you should use the following resources to facilitate the diagnostic process:

- Service manual
- Accumulated information form a previous diagnostic path
- Service information and publications
- ISUZU field support

7. Repair and Verify Fix

What you should do

After you have located the cause of the problem, you must execute a repair by following recommended service manual procedures.
When the repair is completed, you should verify the fix by performing the system checks under the conditions listed in the customer complaint.
If applicable, you should carry out preventive measures to avoid a repeat complaint.

What resources you should use

Whenever possible, you should use the following resources to facilitate the repair process:

- Electrical repair procedures
- Service manual information and publications

GENERAL SERVICE INFORMATION

Aftermarket Electrical and Vacuum Equipment

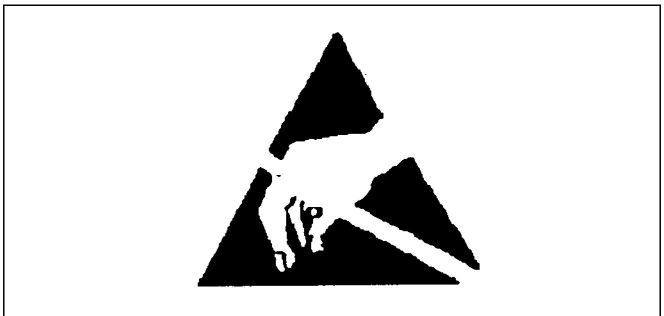
Aftermarket (add-on) electrical and vacuum equipment is defined as any equipment which connects to the vehicle's electrical or vacuum systems that is installed on a vehicle after it leaves the factory. No allowances have been made in the vehicle design for this type of equipment.

NOTE: No add-on vacuum equipment should be added to this vehicle.

NOTE: Add-on electrical equipment must only be connected to the vehicle's electrical system at the battery (power and ground).

Add-on electrical equipment, even when installed to these guidelines, may still cause the electric system to malfunction. This may also include equipment not connected to the vehicle electrical system such as portable telephones and radios. Therefore, the first step in diagnosing any electric problem is to eliminate all aftermarket electrical equipment from the vehicle. After this is done, if the problem still exists, it may be diagnosed in the normal manner.

Electrostatic Discharge Damage



Electronic components used in the ECM are often designed to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. Less than 100 volts of static electricity can cause damage to some electronic components. By comparison, it takes as much as 4000 volts for a person to feel even the zap of a static discharge.

There are several ways for a person to become statically charged. The most common methods of charging are by friction and induction.

- An example of charging by friction is a person sliding across a vehicle seat.
- Charge by induction occurs when a person with well-insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with the opposite polarity. Static charges can cause damage, therefore it is important to use care when handling and testing electronic components.

Non-OEM Parts

All of the OBD diagnostics have been calibrated to run with OEM parts. Accordingly, if commercially sold sensor or switch is installed, it makes a wrong diagnosis and turns on the check engine lamp.

Aftermarket electronics, such as cellular phones, stereos, and anti-theft devices, may radiate EMI into the control system if they are improperly installed. This may cause a false sensor reading and turn on the check engine lamp.

Poor Vehicle Maintenance

The sensitivity of OBD diagnostics will cause the check engine lamp to turn on if the vehicle is not maintained properly. Restricted oil filters, fuel filters, and crankcase deposits due to lack of oil changes or improper oil viscosity can trigger actual vehicle faults that were not previously monitored prior to OBD. Poor vehicle maintenance can not be classified as a “non-vehicle fault”, but with the sensitivity of OBD diagnostics, vehicle maintenance schedules must be more closely followed.

Related System Faults

Many of the OBD system diagnostics will not run if the ECM detects a fault on a related system or component.

Visual/Physical Engine Compartment Inspection

Perform a careful visual and physical engine compartment inspection when performing any diagnostic procedure or diagnosing the cause of an emission test failure. This can often lead to repairing a problem without further steps. Use the following guidelines when performing a visual/physical inspection:

- Inspect all vacuum hoses for punches, cuts, disconnects, and correct routing.
- Inspect hoses that are difficult to see behind other components.
- Inspect all wires in the engine compartment for proper connections, burned or chafed spots, pinched wires, contact with sharp edges or contact with hot exhaust manifolds or pipes.

Basic Knowledge of Tools Required

NOTE: Lack of basic knowledge of this powertrain when performing diagnostic procedures could result in an incorrect diagnosis or damage to powertrain components. Do not attempt to diagnose a powertrain problem without this basic knowledge.

A basic understanding of hand tools is necessary to effectively use this section of the Service Manual.

On-Board Diagnostic (OBD)

On-Board Diagnostic Tests

A diagnostic test is a series of steps, the result of which is a pass or fail reported to the diagnostic executive. When a diagnostic test reports a pass result, the diagnostic executive records the following data:

- The diagnostic test has been completed since the last ignition cycle.
- The diagnostic test has passed during the current ignition cycle.
- The fault identified by the diagnostic test is not currently active.

When a diagnostic test reports a fail result, the diagnostic executive records the following data:

- The diagnostic test has been completed since the last ignition cycle.
- The fault identified by the diagnostic test is currently active.
- The fault has been active during this ignition cycle.
- The operating conditions at the time of the failure.

The Diagnostic Executive

The Diagnostic Executive is a unique segment of software which is designed to coordinate and prioritize the diagnostic procedures as well as define the protocol for recording and displaying their results. The main responsibilities of the Diagnostic Executive are listed as follows:

- Commanding the check engine lamp on and off
- DTC logging and clearing
- Current status information on each diagnostic

Diagnostic Information

The diagnostic charts and functional checks are designed to locate a faulty circuit or component through a process of logical decisions. The charts are prepared with the requirement that the vehicle functioned correctly at the time of assembly and that there are not multiple faults present.

There is a continuous self-diagnosis on certain control functions. This diagnostic capability is complemented by the diagnostic procedures contained in this manual. The language of communicating the source of the malfunction is a system of diagnostic trouble codes. When a malfunction is detected by the control module, a diagnostic trouble code is set and the check engine lamp is illuminated.

Check Engine Lamp

The check engine lamp looks the same as the check engine lamp you are already familiar with, the “Check Engine” lamp.

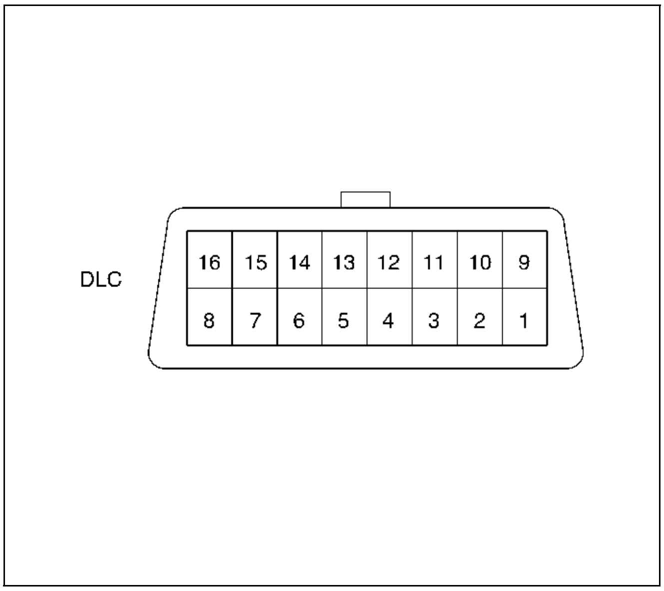
Basically, the check engine lamp is turned on when the ECM detects a DTC that will impact the vehicle emissions.

- When the check engine lamp remains “ON” while the engine is running, or when a malfunction is suspected due to a driveability or emissions problem, a Powertrain On-Board Diagnostic (OBD) System Check must be performed. The procedures for these checks are given in On-Board Diagnostic (OBD) System Check. These checks will expose faults which may not be detected if other diagnostics are performed first.

Data Link Connector (DLC)

The provision for communication with the contorl module is the Data Link Connector (DLC). It is located behind the lower front instrument panel. The DLC is used to connect to a Tech2. Some common uses of the Tech2 are listed below:

- Identifying stored Diagnostic Trouble Codes (DTCs).
- Clearing DTCs.
- Reading serial data.



Verifying Vehicle Repair

Verification of vehicle repair will be more comprehensive for vehicles with OBD system diagnostic. Following a repair, the technician should perform the following steps:

1. Review and record the Fail Records for the DTC which has been diagnosed.
2. Clear DTC(s).
3. Operate the vehicle within conditions noted in the Fail Records.
4. Monitor the DTC status information for the specific DTC which has been diagnosed until the diagnostic test associated with that DTC runs.

Following these steps is very important in verifying repairs on OBD systems. Failure to follow these steps could result in unnecessary repairs.

Reading Diagnostic Trouble Codes Using a Tech 2

The procedure for reading diagnostic trouble code(s) is to used a diagnostic Tech2. When reading DTC(s), follow instructions supplied by Tech2 manufacturer.

Clearing Diagnostic Trouble Codes

To clear Diagnostic Trouble Codes (DTCs), use the Tech2 “clear DTCs” or “clear information” function. When clearing DTCs follow instructions supplied by the Tech2 manufacturer.

Diagnosis With Tech 2

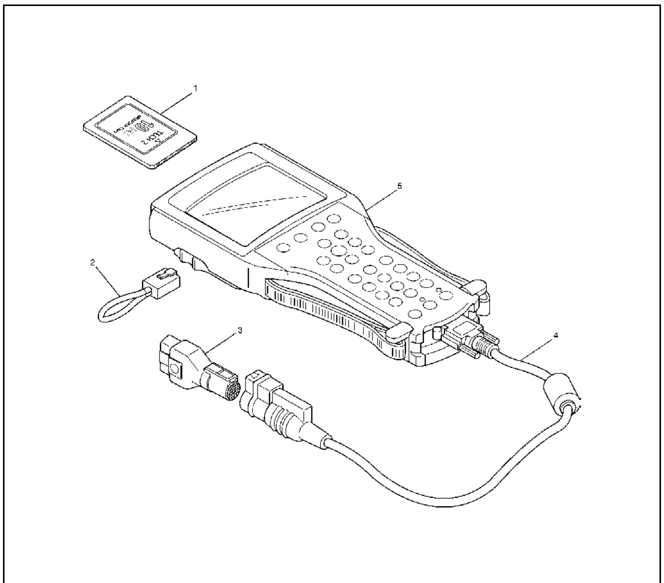
If no codes are set:

- Refer to **F1: Data Display** and identify the electrical faults that are not indicated by trouble code.
- Refer to “**SYMPTOM DIAGNOSIS**”.

If codes are set:

1. Record all trouble codes displayed by Tech 2 and check id the codes are intermittent.
2. Clear the codes.
3. Drive the vehicle for a test to reproduce the faulty status.
4. Check trouble codes again using the Tech 2.
5. If no codes is displayed by test driving, the fault is intermittent. In this case, refer to “DIAGNOSIS AIDS”.
6. If a code is present, refer to DTC Chart for diagnosis.
7. Check trouble codes again using the Tech 2.

Tech 2 CONNECTION



Tech 2 scan tool is used to electrically diagnose the automatic transmission system and to check the system. The Tech 2 enhances the diagnosis efficiency though all the troubleshooting can be done without the Tech 2.

1. Configuration of Tech 2
   - Tech 2 scan tool kit (No. 7000086), Tech 2 scan tool (No. 7000057) and DLC cable (No. 3000095).
   - SAE 16/19 adapter (No. 3000098) (3), RS232 loop back connector (No. 3000112) (2) and PCMCIA card (No. 3000117) (1).
2. Tech 2 Connection
   - Check the key switch is turn OFF.
   - Insert the PCMCIA card (1) into the Tech 2 (5).
   - Connect the SAE 16/19 adapter (3) to the DLC cable (4).
   - Connect the DLC cable (4) to the Tech 2 (5).
   - Connect the SAE 16/19 adapter (3) to the data link connector of the vehicle.

   - Turn the key switch of the vehicle ON and press the “PWR” key of the Tech 2.
   - Check the display of the Tech 2.

NOTE: Be sure to check that the power is not supplied to the Tech 2 when attaching or removing the PCMCIA card.

- F4: Injector Balance Test

F0: Diagnostic Trouble Code
The purpose of the “Diagnostic Trouble Codes” mode is to display stored trouble code in the ECM.
When “Clear DTC Information” is selected, a “Clear DTC Information”, warning screen appears.
This screen informs you that by cleaning DTC's “all stored DTC information in the ECM will be erased”.
After clearing codes, confirm system operation by test driving the vehicle.
Use the “DTC Information” mode to search for a specific type of stored DTC information.

History
This selection will display only DTCs that are stored in the ECM's history memory. It will not display Type B DTCs that have not requested the MIL (“Check Engine Lamp”). It will display all type A and B DTCs that requested the MIL and have failed within the last 40 warm-up cycles. In addition, it will display all type C and D DTCs that have failed within the last 40 warm-up cycles.

MIL SVC or Message Request
This selection will display only DTCs that are requesting the MIL. Type C and Type D DTCs cannot be displayed using the MIL. Type C and D DTCs cannot be displayed using this option.
This selection will report type B DTCs only after the MIL has been requested.

Last Test Failed
This selection will display only DTCs that have failed the last time the test run. The last test may have run during a previous ignition cycle of a type A or type B DTC is displayed. For type C and type D DTCs, the last failure must have occurred during the current ignition cycle to appear as last test fail.

Test Failed Since Code Cleared
The selection will display all active and history DTCs that have reported a test failure since the last time DTCs were cleared. DTCs that last failed more that 40 warm-up cycles before this option is selected will not be displayed.

No Run Since Code Cleared
This selection will display up to DTCs that have not run since the DTCs were last cleared. Since any displayed DTCs have not run, their condition (passing or failing) is unknown.

Failed This Ignition
This selection will display all DTCs that have failed during the present ignition cycle.

F1: Data Display
The purpose of the “Data Display” mode is to continuously monitor data parameters.
The current actual values of all important sensors and signals in the system are display through F1 mode.
See the “Typical Scan Data” section.

F2: Snapshot
“Snapshot” allows you to focus on making the condition occur, rather than trying to view all of the data in anticipation of the fault.
The snapshot will collect parameter information around a trigger point that you select.

F3: Miscellaneous Test:
The purpose of “Miscellaneous Test” mode is to check for correct operation of electronic system actuators.

TYPICAL SCAN DATA & DEFINITIONS (ENGINE DATA)

Use the Typical Values Table only after the On-Board Diagnostic System Check has been completed, no DTC(s) were noted, and you have determined that the on-board diagnostics are functioning properly. Tech 2 values from a properly-running engine may be used for comparison with the engine you are diagnosing.
Condition : Vehicle stopping, engine running, air conditioning off & after warm-up (Coolant temperature approximately 80 deg.)

	Tech 2 Parameter	Units	Idle	2000rpm	Description
1	Engine Speed	rpm	775 - 875	1950 - 2050	The actual engine speed is measured by ECM from the CKP sensor 58X signal.
2	Desired Idle Speed	rpm	825	800 - 850	The desired engine idle speed that the ECM commanding. The ECM compensates for various engine loads.
3	Engine Coolant Temperature	°C or °F	80 - 90	80 - 90	The ECT is measured by ECM from ECT sensor output voltage. When the engine is normally warm upped, this data displays approximately 80 °C or more.
4	Start Up ECT (Engine Coolant Temperature)	°C or °F	Depends on ECT at start-up	Depends on ECT at start-up	Start-up ECT is measured by ECM from ECT sensor output voltage when engine is started.
5	Intake Air Temperature	°C or °F	Depends on ambient temp	Depends on ambient temp	The IAT is measured by ECM from IAT sensor output voltage. This data is changing by intake air temperature.
6	Start Up IAT (Intake Air Temperature)	°C or °F	Depends on IAT at start-up	Depends on IAT at start-up	Start-up IAT is measured by ECM from IAT sensor output voltage when engine is started.
7	Manifold Absolute Pressure	kPa	31 - 36	25 - 30	The MAP (kPa) is measured by ECM from MAP output voltage. This data is changing by inlet manifold pressure.
8	Barometric Pressure	kPa	Depends on altitude	Depends on altitude	The barometric pressure is measured by ECM from the MAP sensor output voltage monitored during key up and wide open throttle. This data is changing by altitude.
9	Throttle Position	%	0	2-4	Throttle position operating angle is measured by the ECM from throttle position output voltage. This should display 0% at idle and 99 - 100% at full throttle.
10	Calculated Air Flow	g/s	3.5 -4.50	8.0 - 10.0	This displays calculated air mount from MAP sensor output. This data is changing by inlet manifold pressure.
11	Air Fuel Ratio		14.6:1	14.6:1	This displays the ECM commanded value. In closed loop, this should normally be displayed around 14.2:1 - 14.7:1.
12	Spark Advance	°CA	8 - 15	25 - 32	This displays the amount of spark advance being commanded by the ECM.
13	Engine Load	%	2 - 5	5 - 10	This displays is calculated by the ECM form engine speed and MAF sensor reading. Engine load should increase with an increase in engine speed or air flow amount.
14	Injection Pulse Width	ms	1.0 - 3.0	3.0 - 4.0	This displays the amount of time the ECM is commanding each injector On during each engine cycle. A longer injector pulse width will cause more fuel to be delivered. Injector pulse width should increase with increased engine load.
15	Fuel System Status	Open Loop/ Close Loop	Close Loop	Close Loop	When the engine is first started the system is in “Open Loop” operation. In “Open Loop”, the ECM ignores the signal from the oxygen sensors. When various conditions (ECT, time from start, engine speed & oxygen sensor output) are met, the system enters “Closed Loop” operation. In “Closed Loop”, the ECM calculates the air fuel ratio based on the signal from the oxygen sensors.
16	Knock Present	Yes/No	No	No	This displays knock sensor detection status. When engine knock is occurred, displays "Yes".
17	Knock Counter		-	-	This displays the number of knock during a ignition cycle.
18	Knock Retard	°CA	0	0	This displays the commanded ignition spark timing retard timing based on the signal from the knock sensor.
19	A/C Clutch Relay	On/Off	Off	Off	This displays whether the ECM has commanded the A/C compressor clutch “On” or “Off”.

	Tech 2 Parameter	Units	Idle	2000rpm	Description
20	A/C Request	Yes/No	Off	Off	This displays the air conditioner request signal. This should display “On” when the air conditioner switch is switched on.
21	EVAP Purge Solenoid (Evaporative Emission)	%	0 - 10	0 - 10	This displays the duty signal from the ECM to control the canister purge solenoid valve.
22	Fuel Pump	On/Off	On	On	This displays operating status for the fuel pump main relay. This should display “On” when the key switch is turned on and while engine is running.
23	Idle Air Control	Steps	20 - 30	65 - 75	This displays the ECM commanded position of the idle air control valve pintle. A larger number means that more air is being commanded through the idle air passage.
24	Idle Speed Variation	rpm	-25 - 0	1125 - 1225	This displays variation of actual engine speed & desired idle speed.
25	Vehicle Speed	km/h or mph	0	0	This displays vehicle speed. The vehicle speed is measured by ECM from the vehicle speed sensor.
26	Ignition Voltage	V	10.0 - 14.5	10.0 - 14.5	This displays the system voltage measured by the ECM at ignition feed.
27	Reference Voltage	V	5.00	5.00	
28	Malfunction Indicator Lamp	On/Off	Off	Off	This displays operating status for the Check Engine Lamp. This should display “On” when the Check Engine Lamp is turned on.
29	Time From Start		-	-	This displays the engine time elapsed since the engine was started. If the engine is stopped, engine run time will be reset to 00:00:00

TYPICAL SCAN DATA & DEFINITIONS (O_2 SENSOR DATA)

Use the Typical Values Table only after the On-Board Diagnostic System Check has been completed, no DTC(s) were noted, and you have determined that the on-board diagnostics are functioning properly. Tech 2 values from a properly-running engine may be used for comparison with the engine you are diagnosing.
Condition : Vehicle stopping, engine running, air conditioning off & after warm-up (Coolant temperature approximately 80 deg.)

	Tech 2 Parameter	Units	Idle	2000rpm	Description
1	Engine Speed	rpm	710 - 875	1950 - 2050	The actual engine speed is measured by ECM from the CKP sensor 58X signal.
2	Desired Idle Speed	rpm	825	800 - 850	The desired engine idle speed that the ECM commanding. The ECM compensates for various engine loads.
3	Engine Coolant Temperature	°C or °F	80 - 90	80 - 90	The ECT is measured by ECM from ECT sensor output voltage. When the engine is normally warm upped, this data displays approximately 80 °C or more.
4	Start Up ECT (Engine Coolant Temperature)	°C or °F	Depends on ECT at start-up	Depends on ECT at start-up	Start-up ECT is measured by ECM from ECT sensor output voltage when engine is started.
5	Intake Air Temperature	°C or °F	Depends on ambient temp	Depends on ambient temp	The IAT is measured by ECM from IAT sensor output voltage. This data is changing by intake air temperature.
6	Start Up IAT (Intake Air Temperature)	°C or °F	Depends on IAT at start-up	Depends on IAT at start-up	Start-up IAT is measured by ECM from IAT sensor output voltage when engine is started.
7	Manifold Absolute Pressure	kPa	31 - 36	25 - 30	The MAP (kPa) is measured by ECM from MAP output voltage. This data is changing by inlet manifold pressure.
8	Barometric Pressure	kPa	Depends on altitude	Depends on altitude	The barometric pressure is measured by ECM from the MAP sensor output voltage monitored during key up and wide open throttle. This data is changing by altitude.
9	Throttle Position	%	0	2 - 4	Throttle position operating angle is measured by the ECM from throttle position output voltage. This should display 0% at idle and 99 - 100% at full throttle.
10	Calculated Air Flow	g/s	3.5 -4.50	8.0 - 10.0	This displays intake air amount. The mass air flow is measured by ECM from the MAF sensor output voltage.
11	Air Fuel Ratio		14.6:1	14.6:1	This displays the ECM commanded value. In closed loop, this should normally be displayed around 14.2:1 - 14.7:1.
12	Fuel System Status	Open Loop/ Close Loop	Close Loop	Close Loop	When the engine is first started the system is in "Open Loop" operation. In "Open Loop", the ECM ignores the signal from the oxygen sensors. When various conditions (ECT, time from start, engine speed & oxygen sensor output) are met, the system enters "Closed Loop" operation. In "Closed Loop", the ECM calculates the air fuel ratio based on the signal from the oxygen sensors.
13	Engine Load	%	2 - 5	5 - 10	This displays is calculated by the ECM form engine speed and MAF sensor reading. Engine load should increase with an increase in engine speed or air flow amount.
14	B1 O_2 Sensor Ready (Bank 1)	Yes/No	Yes	Yes	This displays the status of the exhaust oxygen sensor. This display will indicate "Yes" when the ECM detects a fluctuating oxygen sensor output voltage sufficient to allow closed loop operation. This will not occur unless the oxygen sensor is warmed up.
15	B1S1 Status (Bank 1 Sensor 1)	Rich / Lean	Rich / Lean	Rich / Lean	This displays dependent on the exhaust oxygen sensor output voltage. Should fluctuate constantly "Rich" and "Lean" in closed loop.
16	Fuel Trim Learned	Yes/No	Yes	Yes	When conditions are appropriate for enabling long term fuel trim corrections, fuel trim learn will display "Yes". This indicates that the long term fuel trim is responding to the short term fuel trim. If the fuel trim lean displays "No", then long term fuel trim will not respond to changes in short term fuel trim.

	Tech 2 Parameter	Units	Idle	2000rpm	Description
17	Fuel Trim Cell		15 - 20	1 - 2	This displays dependent on engine speed and calculated intake air flow reading. A plot of engine speed versus intake air flow amount is divided into the cells. Fuel trim cell indicates which cell is currently active.
18	B1S1 O_2 Sensor (Bank1 Sensor 1)	mV	50 - 950	50 -950	This displays the exhaust oxygen sensor output voltage. Should fluctuate constantly within a range between 10mV (lean exhaust) and 1000mV (rich exhaust) while operating in closed loop.
19	B1 Short Term Fuel Trim (Bank 1)	%	-6 - 0	-6 - 0	The short term fuel trim to a bank represents a short term correction to the bank fuel delivery by the ECM in response to the amount of time the bank fuel control oxygen sensor voltage spends above or below the 450mV threshold. If the oxygen sensor voltage has mainly remained less than 450mV, indicating a lean air/ fuel, short term fuel trim will increase into the positive range above 0% and the ECM will pass fuel. If the oxygen sensor voltage stays mainly above the threshold, short term fuel trim will decrease below 0% into the negative range while the ECM reduces fuel delivery to compensate for the indicated rich condition. Under certain conditions such as extended idle and high ambient temperatures, canister purge may cause short term fuel trim to read in the negative range during normal operation. Fuel trim values at maximum authority may indicate an excessively rich or lean system.
20	B1 Long Term Fuel Trim (Bank 1)	%	-10 - 0	-5 - 0	The long term fuel trim is delivered from the short term fuel term values and represents a long term correction of fuel delivery for bank in question. A value of 0% indicates that fuel delivery requires no compensation to maintain the ECM commanded air fuel ratio. A negative value indicates that the fuel system is rich and fuel delivery is being reduced (decreased injector pulse width). A positive value indicates that a lean condition exists and the ECM is compensating by add fuel (increased injector pulse width). Because long term fuel trim tends to follow short term fuel trim, a value in the negative range due to canister purge at idle should not be considered unusual. Fuel trim values at maximum authority may indicate an excessively rich or lean system.
21	Injection Pulse Width	ms	3.0 - 1.0	3.0 - 4.0	This displays the amount of time the ECM is commanding each injector On during each engine cycle. A longer injector pulse width will cause more fuel to be delivered. Injector pulse width should increase with increased engine load.
22	Power Enrichment	Yes/No	No	No	The ECM provides the extra amount of fuel when it detects a rapid increase in the throttle position and air flow (Power Enrichment). Under this condition the ECM should detect a “rich condition (high oxygen sensor voltage).
23	Deceleration Fuel Cutoff	Active/ Inactive	Inactive	Inactive	The ECM reduces the amount of fuel injected when it detects a decrease in the throttle position and the air flow. When deceleration is very fast, the ECM may cut off fuel completely. Until enable conditions meet the engine revolution less than 1000rpm or MAP less than 10kPa.
24	Time From Start		-	-	This displays the engine time elapsed since the engine was started. If the engine is stopped, engine run time will be reset to 00:00:00

MISCELLANEOUS TEST

The state of each circuit can be tested by using miscellaneous test menus. Especially when DTC cannot be detected, a faulty circuit can be diagnosed by testing each circuit by means of these menus.
Even DTC has been detected, the circuit tests using these menus could help discriminate between a mechanical trouble and an electrical trouble.
Connect Tech 2 and select "Powertrain", "2.XL L4 HV240" & "Miscellaneous Test".

F0: Lamps
F0: Malfunction Indicator Lamp
When the Tech 2 is operated, "Malfunction Indicator Lamp (Check Engine Lamp)" is turned on or off.
The circuit is normal if the "Malfunction Indicator Lamp (Check Engine Lamp)" in the instrument panel is turned on or off in accordance with this operation.

F1: Relays
F0: Fuel Pump Relay
When the Tech 2 is operated, fuel pump relay signal turns ON or OFF.
The circuit is normal if fuel pump sound is generated in accordance with this operation when key switch is turned ON.

F1: A/C Clutch Relay
When the Tech 2 is operated, A/C clutch relay signal turns ON or OFF.
The circuit is normal if A/C compressor clutch is energized in accordance with this operation when the engine is running.

F2: EVAP
F0: Purge Solenoid
When the Tech 2 is operated, duty ratio of EVAP purge solenoid is changed 10%-by-10%.

Purge Solenoid	
Engine Speed	800 RPM
Desired Idle Speed	762 RPM
Engine Coolant Temperature	80 °C
Start Up ECT	50 °C
Intake Air Temperature	30 °C
Start Up IAT	25 °C
Manifold Absolute Pressure	35kPa
EVAP Purge Solenoid	30%

- Press "Increase" key.
  Then, EVAP Purge Solenoid is increases 10%-by-10%.
- Press "Quit" Key.

F3: IAC System
F0: IAC Control
When the Tech 2 is operated, "Idle Air Control" increases or decreases 5steps-by-5steps up to 150steps.
The circuit is normal if idle engine speed is changed in accordance with this operation.

IAC Control	
Engine Speed	800 RPM
Desired Idle Speed	762 RPM
Engine Coolant Temperature	80 °C
Start Up ECT	50 °C
Intake Air Temperature	30 °C
Start Up IAT	25 °C
Manifold Absolute Pressure	35kPa
Idle Air Control	30 Steps

- Press "Increase" key.
  Then, Idle Air Control is increases 1osteps-by-10steps up to 160steps. Engine speed is also changed by this operation.
- Press "Quit" Key.

F1: IAC Reset
When the Tech 2 is operated, "Idle Air Control" resets.
The circuit is normal if idle engine speed is droped in accordance with this operation.

IAC Reset	
Engine Speed	800 RPM
Desired Idle Speed	762 RPM
Engine Coolant Temperature	80 °C
Start Up ECT	50 °C
Intake Air Temperature	30 °C
Start Up IAT	25 °C
Manifold Absolute Pressure	35kPa
Idle Air Control	30 Steps

- Press "Increase" key.
  Then, Desired Idle speed is increases 50rpm-by-50rpm up to 1550rpm. Engine speed is also changed by this operation.
- Press "Quit" Key.

F4: Injector Balance Test

When the Tech 2 is operated, selected injector turns ON or OFF.

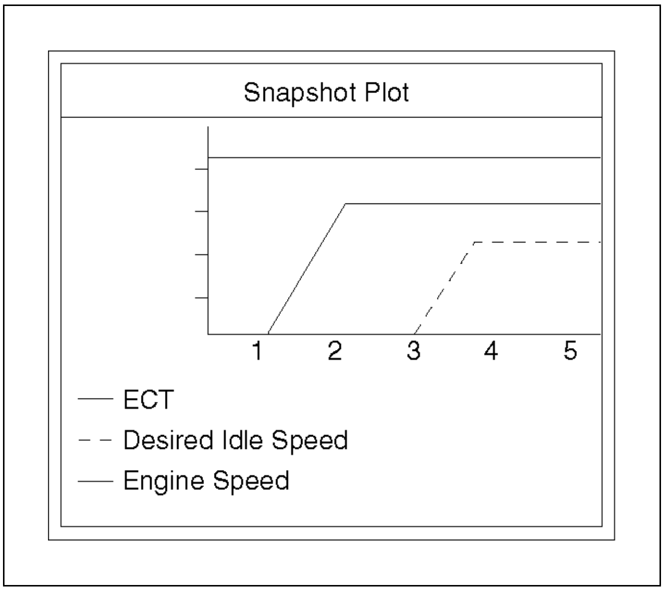
The circuit is normal if engine vibration is changed at selected cylinder in accordance with this operation when engine is idling.

Injector Balance Test	
Engine Speed	800 RPM
Desired Idle Speed	762 RPM
Engine Coolant Temperature	80
Start Up ECT	50
Intake Air Temperature	30
Start Up IAT	25
Manifold Absolute Pressure	35kPa
Injector 1	On

- Press “Injector Off” key.
  Then, engine speed drops and vibration occurs when a cylinder is selected.
- Press “Quit” Key.

PLOTTING SNAPSHOT GRAPH

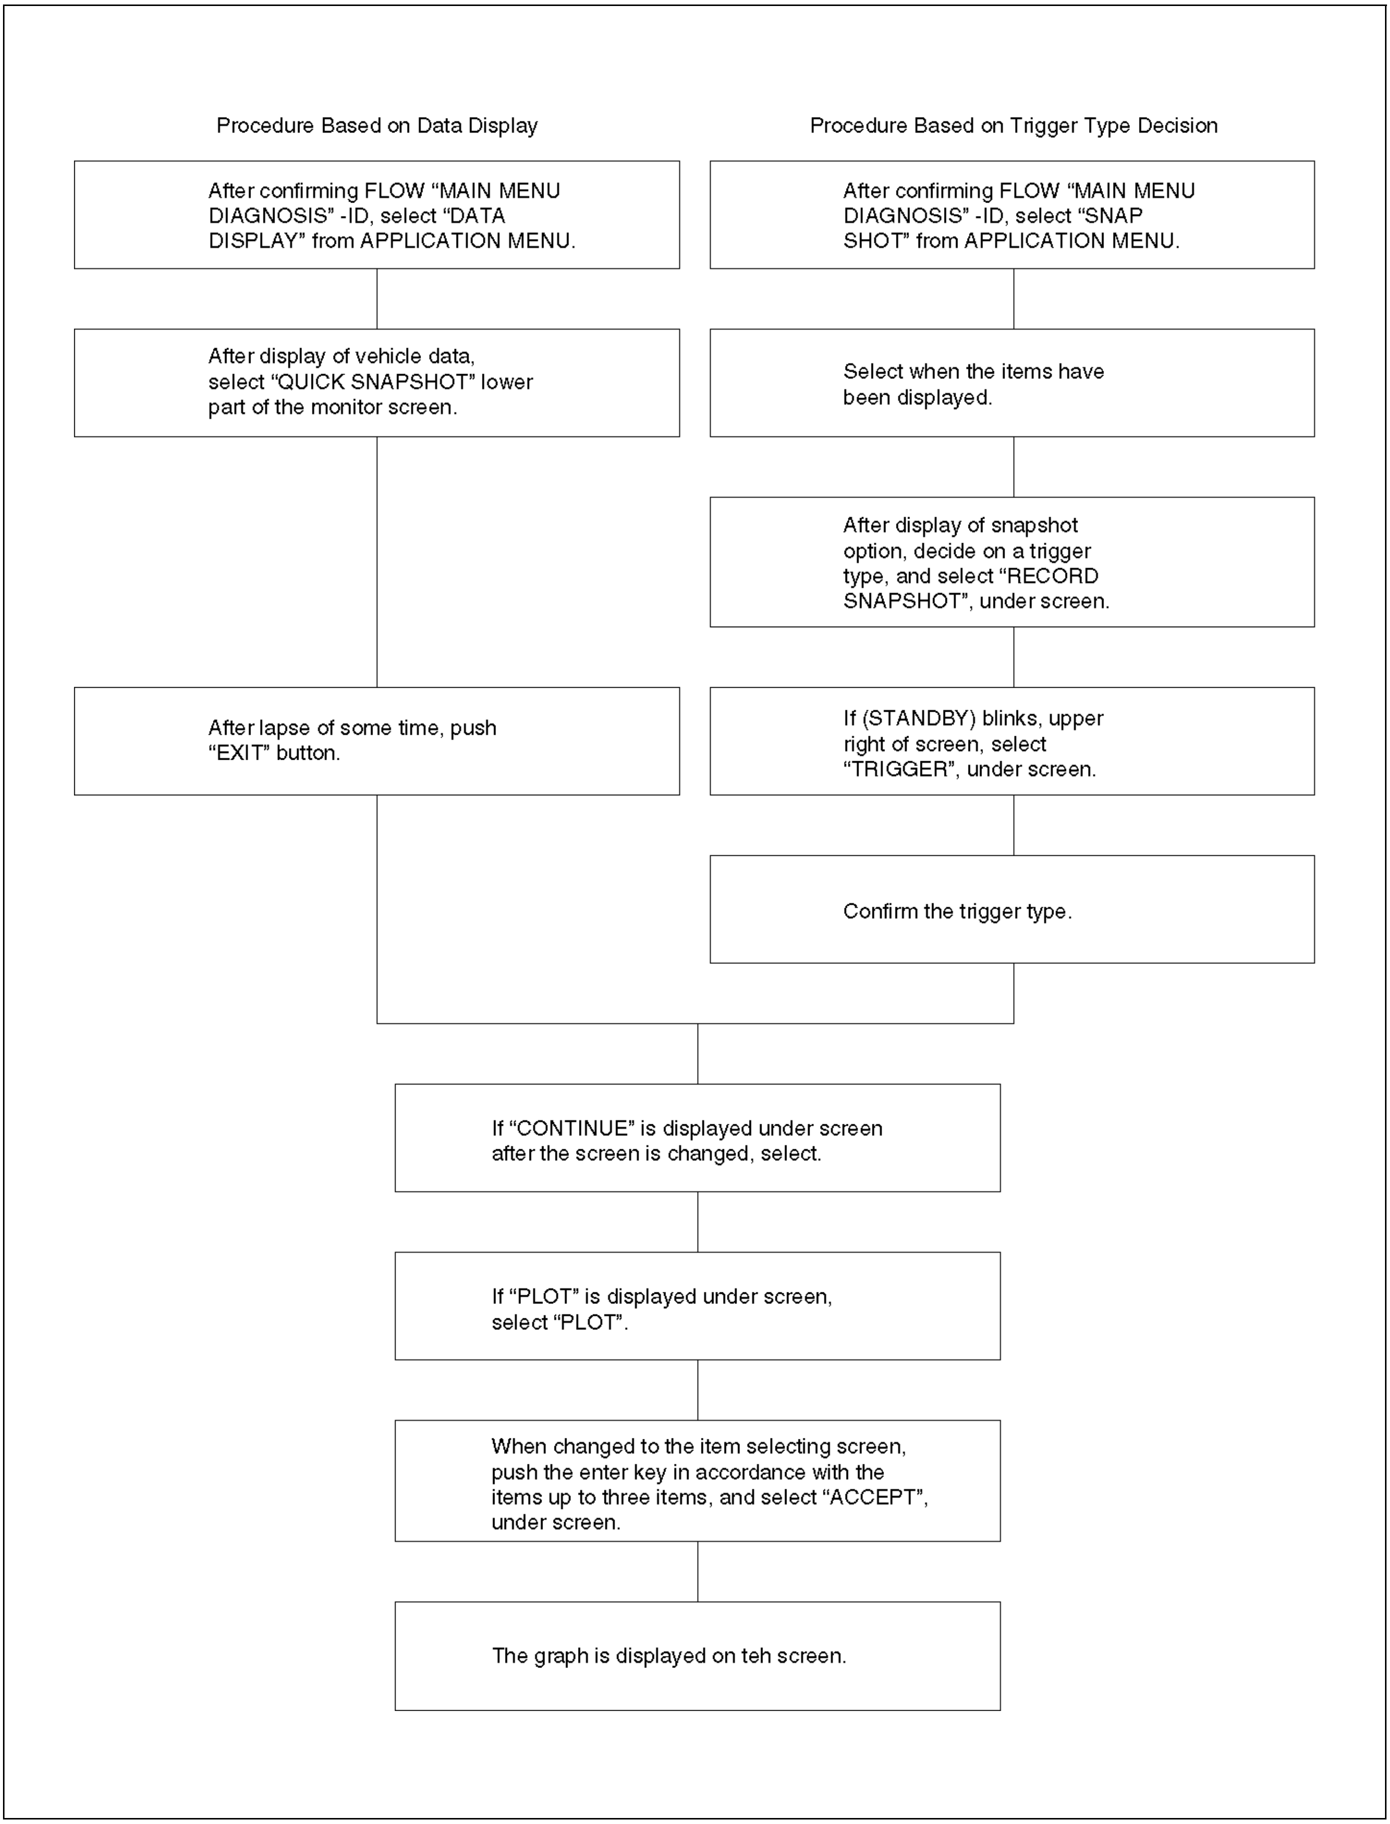
This test selects several necessary items from the data list to plot graphs and makes data comparison on a long term basis. It is an effective test particularly in emission related evaluations.



060RX037

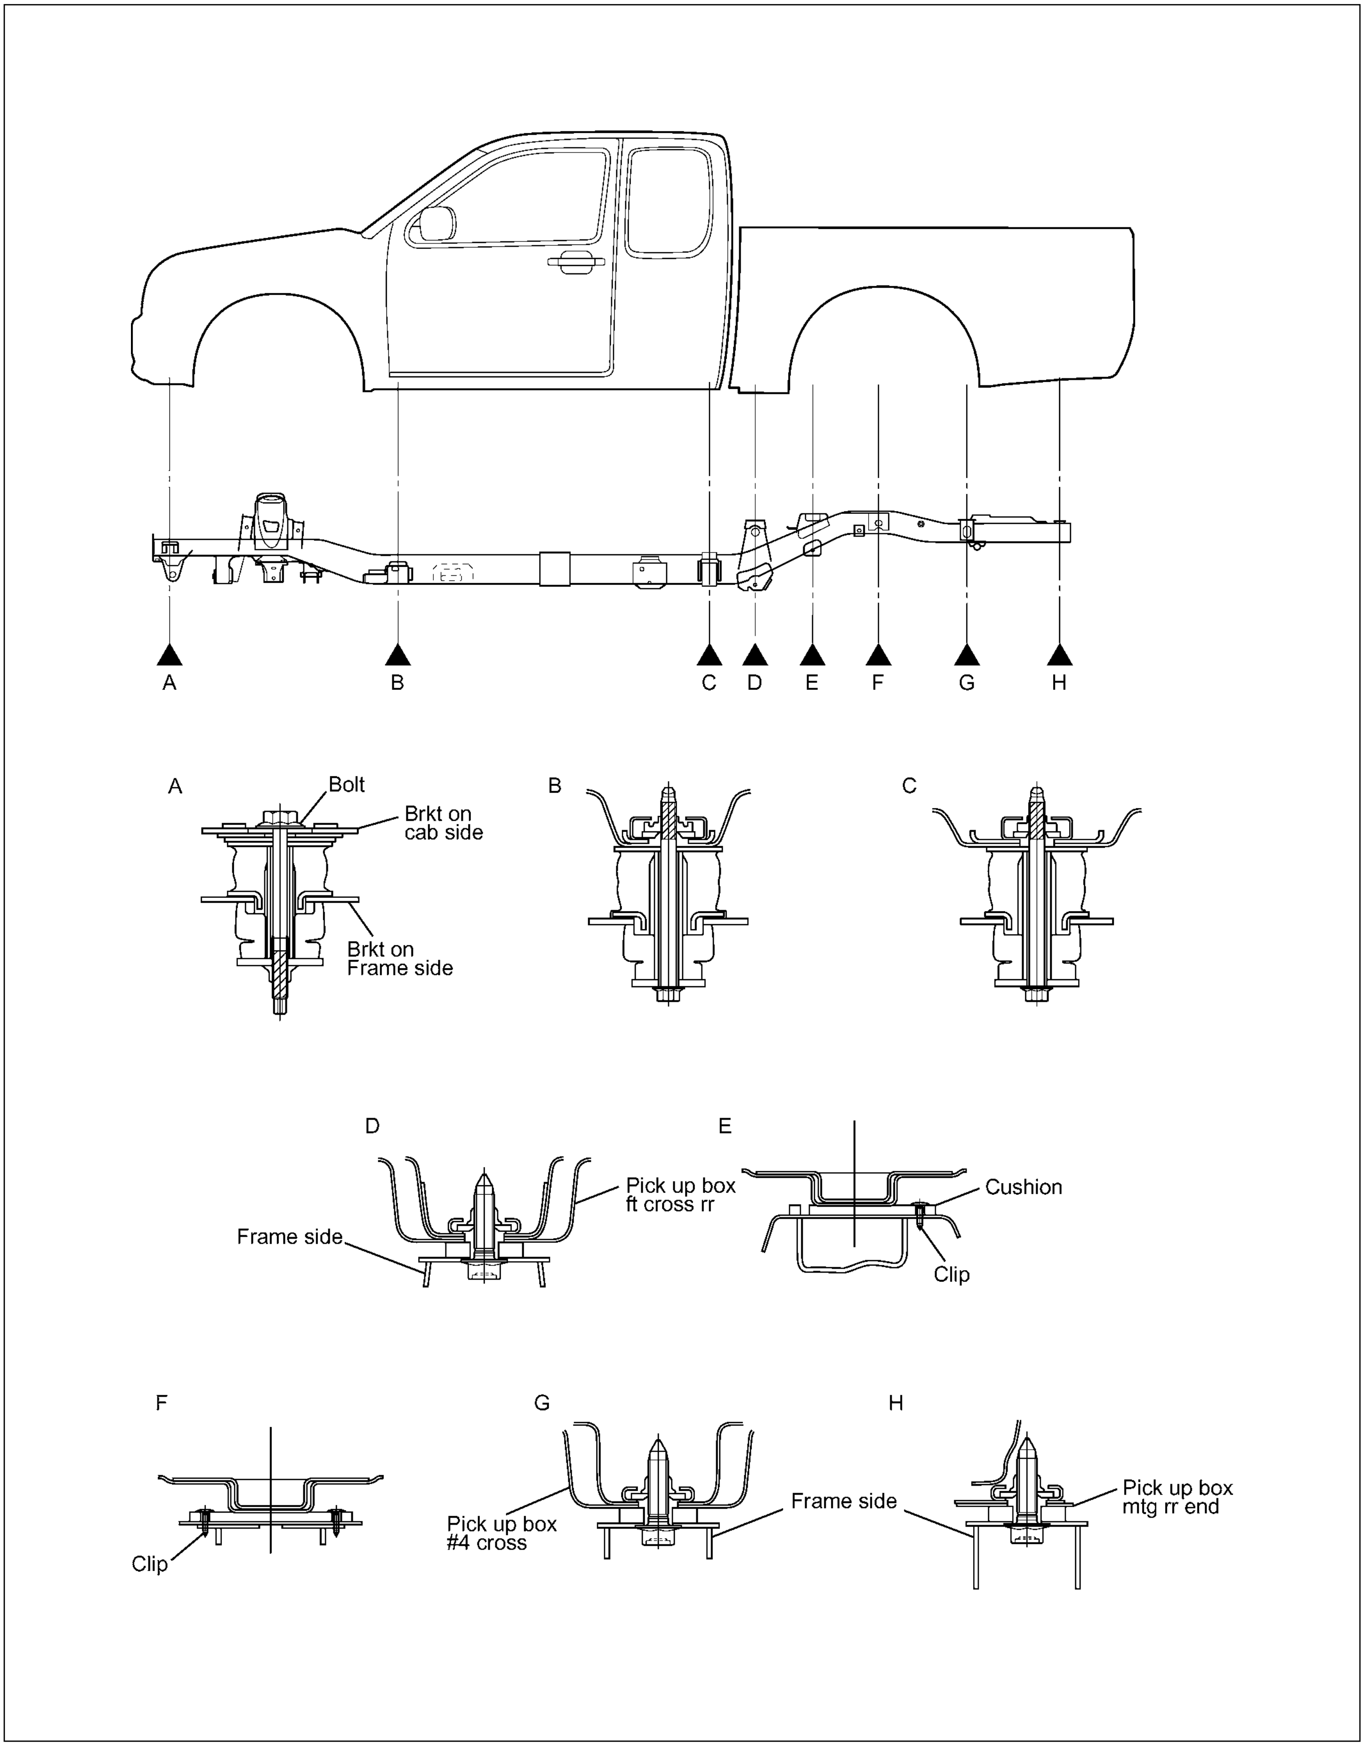
For trouble diagnosis, you can collect graphic data (snap shot) directly from the vehicle.
You can replay the snapshot data as needed. Therefore, accurate diagnosis is possible, even though the vehicle is not available.

Plotting Graph Flow Chart (Plotting graph after obtaining vehicle information)



D06RY00167

EXTEND CAB Model



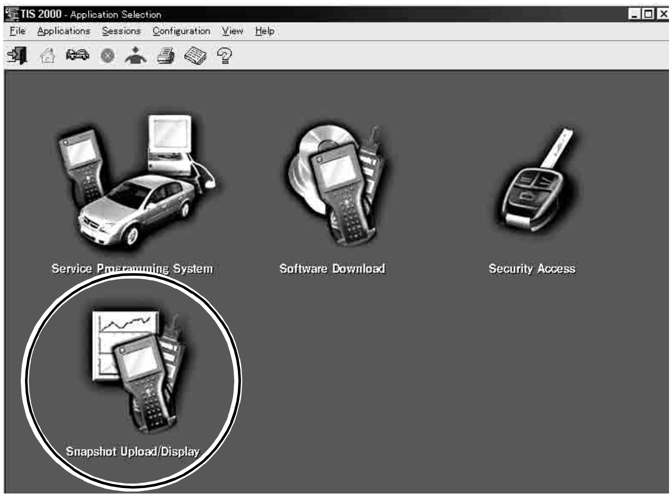
RTW72BXF000201

Flow Chart for Snapshot Replay (Plotting Graph)

1. Press the enter-key in initial display.
2. Select "VIEW CAPTURE DATA"
3. If snapshot option is displayed, decide on a trigger type, and slect "REVIEW DATA" under screen.
4. When the data triggered by vehicle is displayed, select the data.
   (Plural display of data depending on the number of times of triggering.)
5. data is displayed on the screen.
   To see the graph, select "PLOT" under screen.
6. Changed to the item selection screen, push the enter key up to three times, and select "ACCEPT" under screen.
7. The graph is displayed on the screen.

060RX0-40

SNAPSHOT DISPLAY WITH TIS2000

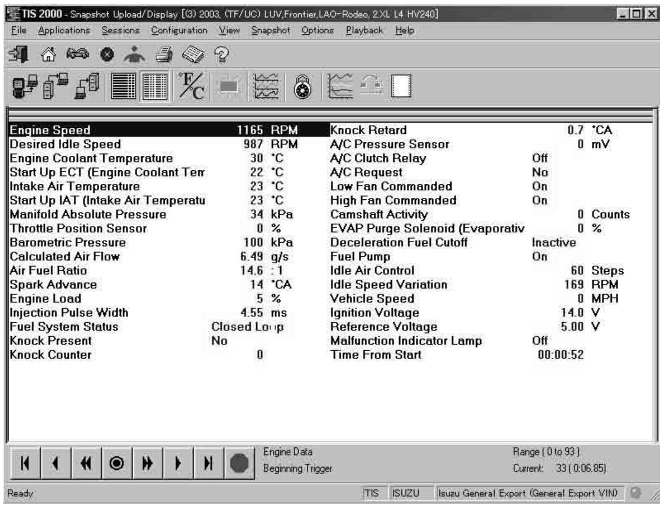


Procedures for transferring and displaying Tech2 snapshot data by using TIS2000 [Snapshot Upload] function is described below.
Snapshot data can be displayed with [Snapshot Upload] function included in TIS2000.

By analyzing these data in various methods, trouble conditions can be checked.
Snapshot data is displayed by executing the three steps below shown:

1. Record the snapshot data, in Tech2.

2. Transfer the snapshot data to PC.



After recording the snapshot in Tech2, transfer the data from Tech2 to PC by the below procedures.

1. Start TIS2000.
2. Select [Snapshot Upload] on the TIS2000 start screen.
3. Select [Upload from trouble diagnosis tool (transfer from diagnosis tester)] or click the corresponding icon of the tool bar.
4. Select Tech2, and transfer the recorded snapshot information.
5. Select the transferred snapshot.
6. After ending transfer of the snapshot, data parameter list is displayed on the screen.

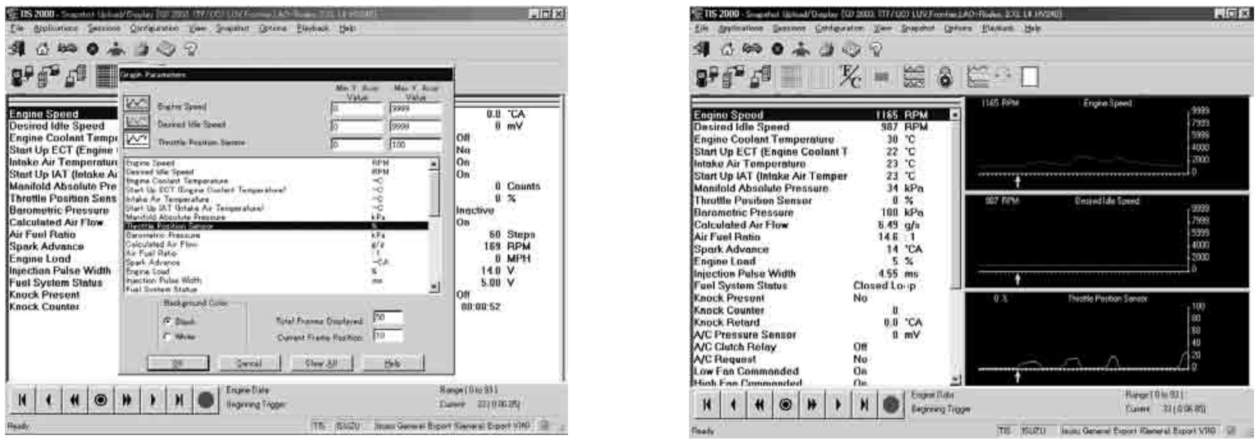
3. Snapshot data is displayed with TIS2000 [Snapshot Upload] function.

Snapshot is stored in the PC hard disk or floppy disk, and can be displayed any time.

Stored snapshot can be displayed by the below procedures.

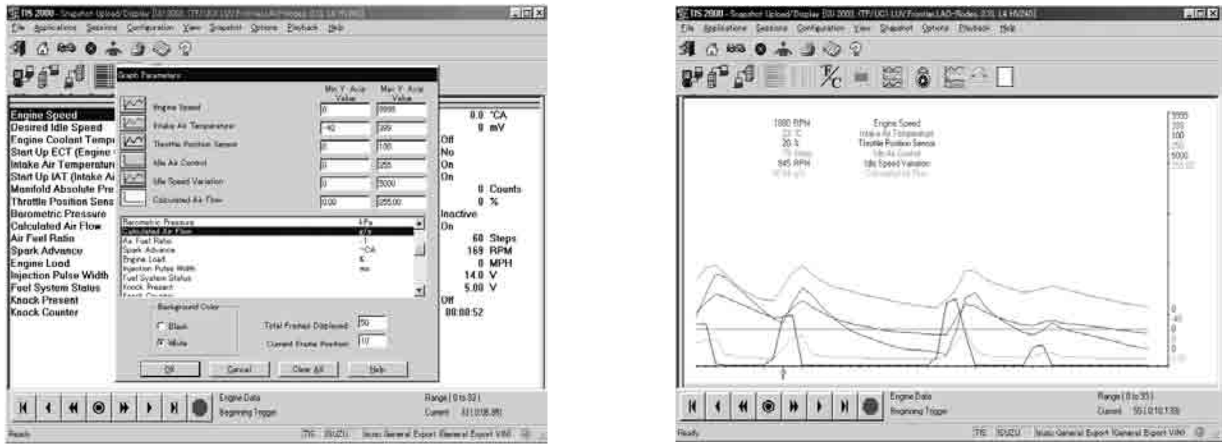
1. Start TIS2000.
2. Select [Snapshot Upload] on the TIS2000 start screen.
3. Select [Open the existing files] or click the corresponding icon of the tool bar.
4. Select the transferred snapshot.
5. Open the snapshot, to display the data parameter list on the screen.

Graph display Values and graphs (Max. 3 graphs):



1. Click the icon for graph display. [Graph Parameter] window opens.
2. Click the first graph icon of the window upper part, and select one parameter from the list of the window lower part. Selected parameter is displayed nest to the graph icon. Graph division can be selected in the field on the parameter right side.
3. Repeat the same procedures with the 2nd and 3rd icons.
4. After selecting all parameters to be displayed (Max. 3 parameters), click [OK] button.
5. Parameter selected is displayed in graph form on the right of the data parameter on the screen.
6. Graph display can be moved with the navigation icon.
7. For displaying another parameter by graph, click the parameter of the list, drug the mouse to the display screen while pressing the mouse button and release the mouse button. New parameter is displayed at the position of the previous parameter. For displaying the graph display screen in full size, move the cursor upward on the screen. When the cursor is changed to the magnifying glass form, click the screen. Graph screen is displayed on the whole screen.

Display of graphs on one screen (Max. 6 graphs):



1. Click the 6 graph icon. [Graph Parameter] window opens.
2. Click the graph icon, select the parameter to be displayed from the list and change divisions according to necessity.
3. Repeat the same procedures with the graph icons, from the 2nd to 6th.
4. Click the [OK] button to display.
5. In this case, parameters are displayed only in graph form. All parameters are displayed in one graph.
6. The graph display screen can be moved with the navigation icon.

SERVICE PROGRAMMING SYSTEM (SPS)

The procedure to program the control unit by using the Service Programming System (SPS) software contained in TIS2000 is explained below.

NOTE:

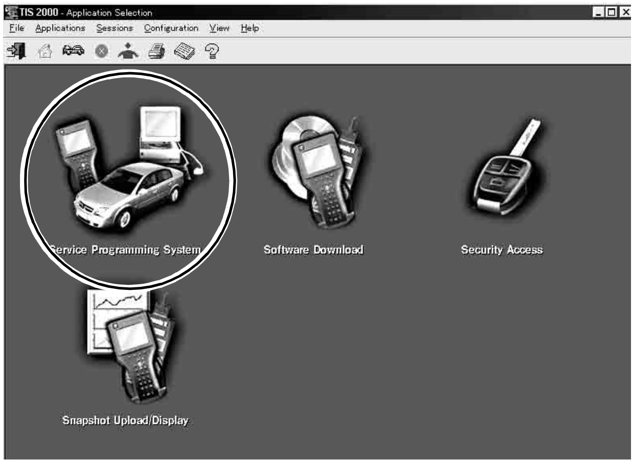
- **If the Engine Control Module (ECM) was programmed, the Immobilizer System must be linked to the ECM: Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.**
- **Should Tech2 display "SPS Procedure was not successful", engine will not start, but no DTCs are present, low battery voltage or poor electrical connections should be the primary suspects. Perform the SPS procedure again after rectifying the fault/s.**

IMPORTANT:
Perform the following checks before attempting to program the control unit:

- **The Tech2 PCMCIA card is programmed with The latest software release.**
- **The latest release of TIS2000 is loaded on the PC.**
- **The vehicle battery is fully charged.**
- **The control unit to be programmed is connected to the vehicle.**

1. Preparations of TIS 2000

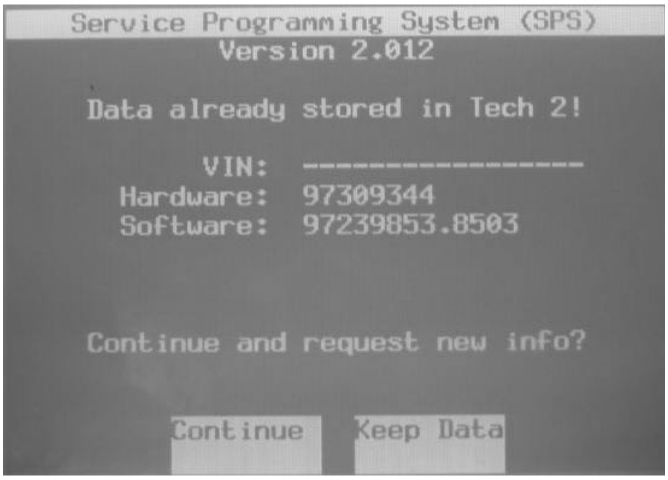
1. Connect Tech 2 to P/C.
2. Check to see if Hardware Key is plugged into Port.
3. Activate TIS 2000 by P/C.
4. On the activating screen of TIS2000, choose "Service Programming System"



5. On the screen of "Diagnostic Tester and Processing Program Selection", choose the one that will comply with the following.
   - Tech-2 in use
   - New programming by the existing module or new programming by the replaced/new module.
   - Fixing position of the control unit.
6. Upon completion of the selection, push the button of "Next".

2. Demand of Data

1. Connect Tech-2 to the vehicle. When activated by turning on the power of Tech-2, push the “Enter” switch.
2. Turn on the ignition switch (without starting the engine)
3. In the main menu of Diagnostic Tester, push “F1: Service Programming System (SPS)”.
4. Push “F0: Request Info” of Tech-2.
5. Where vehicle data has been already saved in Tech 2, the existing data come on display. In this instance, as Tech-2 starts asking whether to keep the data or to continue obtaining anew data from the control unit, choose either of them



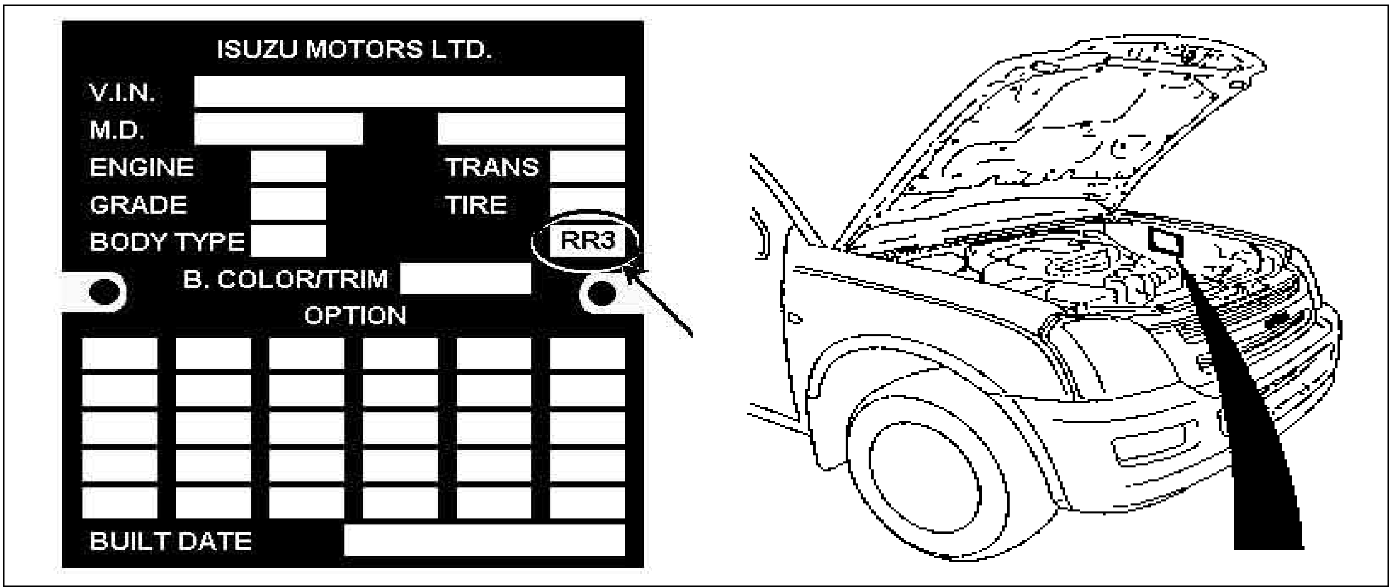
6. If you select “continue”, you have to select “Model Year”, “Vehicle Type”.
7. After that. then push button and turn Ignition switch tuned on, off, on following Tech-2 display. Tech-2 will read information from controller after this procedure.
8. During obtaining information, Tech-2 is receiving information from the control unit ECM and TCM (A/T only) at the same time. With VIN not being programmed into the new control unit at the time of shipment, "obtaining information" is not complete (because the vehicle model, engine model and model year are specified from VIN). For the procedure get additional information on vehicles, instruction will be provided in dialog form, when TIS2000 is in operation.
9. Following instructions by Tech-2, push the “Exit” switch of Tech-2, turn off the ignition of the vehicle and turn off the power of Tech-2, thereby removing from the vehicle.

3. Data Exchange

1. Connect Tech-2 to P/C, turn on the power and click the “Next” button of P/C.
2. Check VIN of the vehicle and choose “Next”.
3. Select “System Type” for required control unit.
   - Engine (Programming for ECM or PCM)
   - Transmission (Programming for TCM)
4. When a lack of data is asked from among the following menu, enter accordingly.
   Select following Menu
   - Model Year
   - Model
   - Engine type
   - Transmission type
   - Destination code (vehicles for general export)*1
   - Immobilizer

   Etc.

* 1: How to read the destination code
Destination code can be read from ID Plate affixed on vehicles, while on VIN plate the destination code is described at the right-hand edge of Body Type line. In the figure, the destination code can be read as "RR3" (Australia).

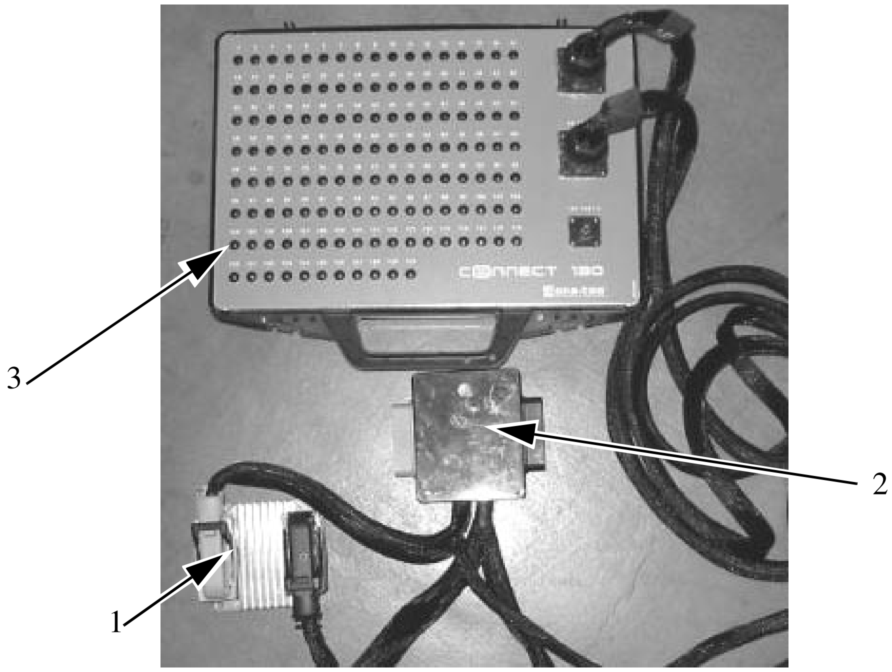


5. After choosing the data, click the “Next” button.
6. When all the necessary information is entered, the “details” of software within the database that match the entered data will appear for confirmation. Click the “Program” switch and then download the new software onto Tech-2.
7. “Data Transfer” comes on display. The progress of downloading will be displayed on the screen in the form of bar graph.
8. Upon finishing the data transfer, turn off the power of Tech-2, removing from P/C.

4. Programming of ECM

1. Check to see if batteries are fully charged, while ABS connectors shall be removed from the vehicle.
2. Connect Tech-2 to Vehicle Diagnostic Connectors.
3. Turn on the power of Tech-2 and the title screen comes on display.
4. Turn on the ignition (without allowing the engine to start)
5. On the title screen of Tech-2, push the “Enter” button.
6. Choose “F1: Service Programming System” on the main screen and then choose “FI: Program ECU”.
7. While data is being transferred, “Programming in Progress” will be displayed on the Tech-2 screen.
8. Upon finishing the data transfer, Tech-2 will display “Reprogramming Was Successful”. Push the “Exit” button to bring program to completion
9. Following “Procedure 2: Demand of Data”, try over again “Information Obtaining” and check to confirm if the data has been correctly re-loaded.
10. Upon finishing confirmation, turn off the ignition of the vehicle and then turn off the power of Tech-2, removing from the vehicle.

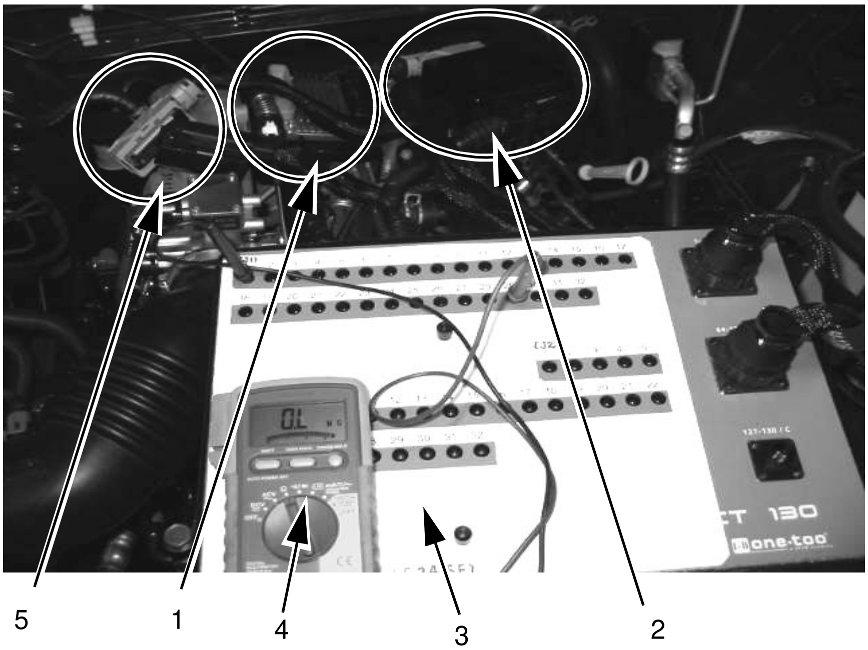
HOW TO USE BREAKER BOX



(1) Engine Control Module (ECM)
(2) Harness Adapter
(3) Breaker Box

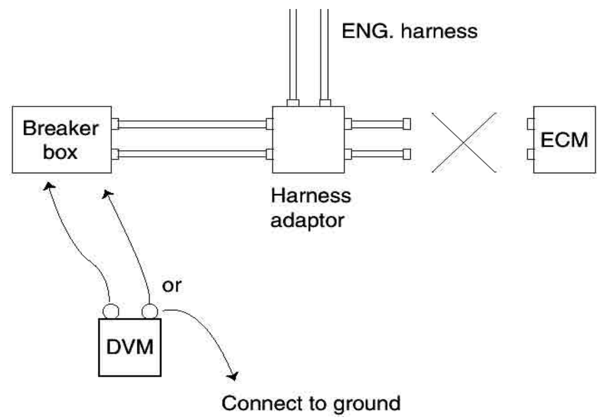
The engine control module (ECM) and other connectors have water proof connector and special terminal. Water proof terminal does not allow to use back prove. In addition, the engine control module (ECM) special terminal can not let regular digital voltage meter prove to access, because terminal shape is very fin pin type.
In order to prevent damage of female terminal and connector itself, the breaker box and adapter is the most suitable special tool.

Breaker Box Connection Type A

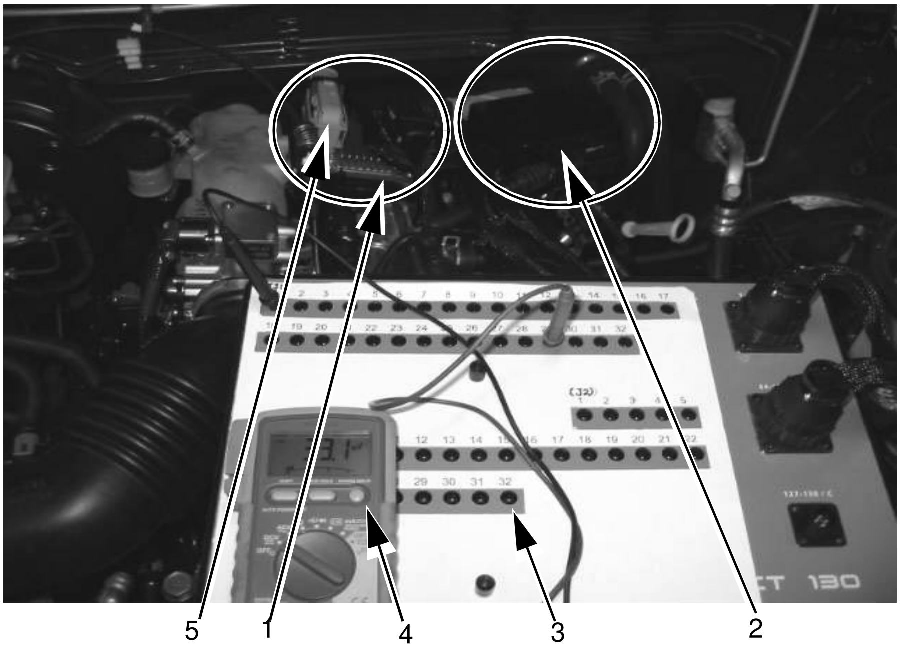


(1) Engine Control Module (ECM)
(2) Harness Adapter
(3) Breaker Box
(4) Digital Voltage Meter
(5) ECM - Harness Adapter Disconnection

Breaker box connection type A, check for “open circuit” and “short to ground circuit”.

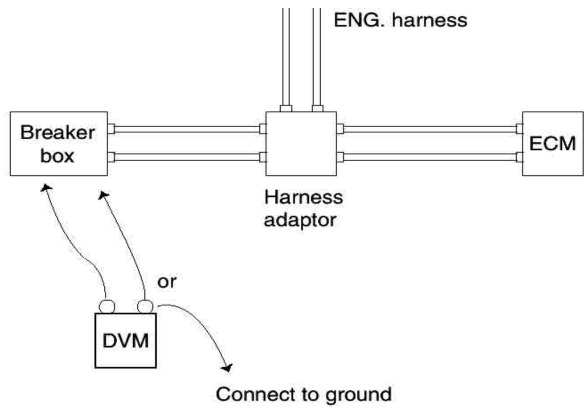


Breaker Box Connection Type B



(1) Engine Control Module (ECM)
(2) Harness Adapter
(3) Breaker Box
(4) Digital Voltage Meter
(5) ECM - Harness Adapter Connection

Breaker box connection type B, check for "short to power supply circuit" and "power, signal voltage check" between the engine control module (ECM) and electrical components.



Important Operations – Installation

Bolt : A

Torque	N·m(kgf·m/lb·ft)
50 (5.1 / 37)	

Bolt : B,C

Torque	N·m(kgf·m/lb·ft)
72 (7.3 / 53)	

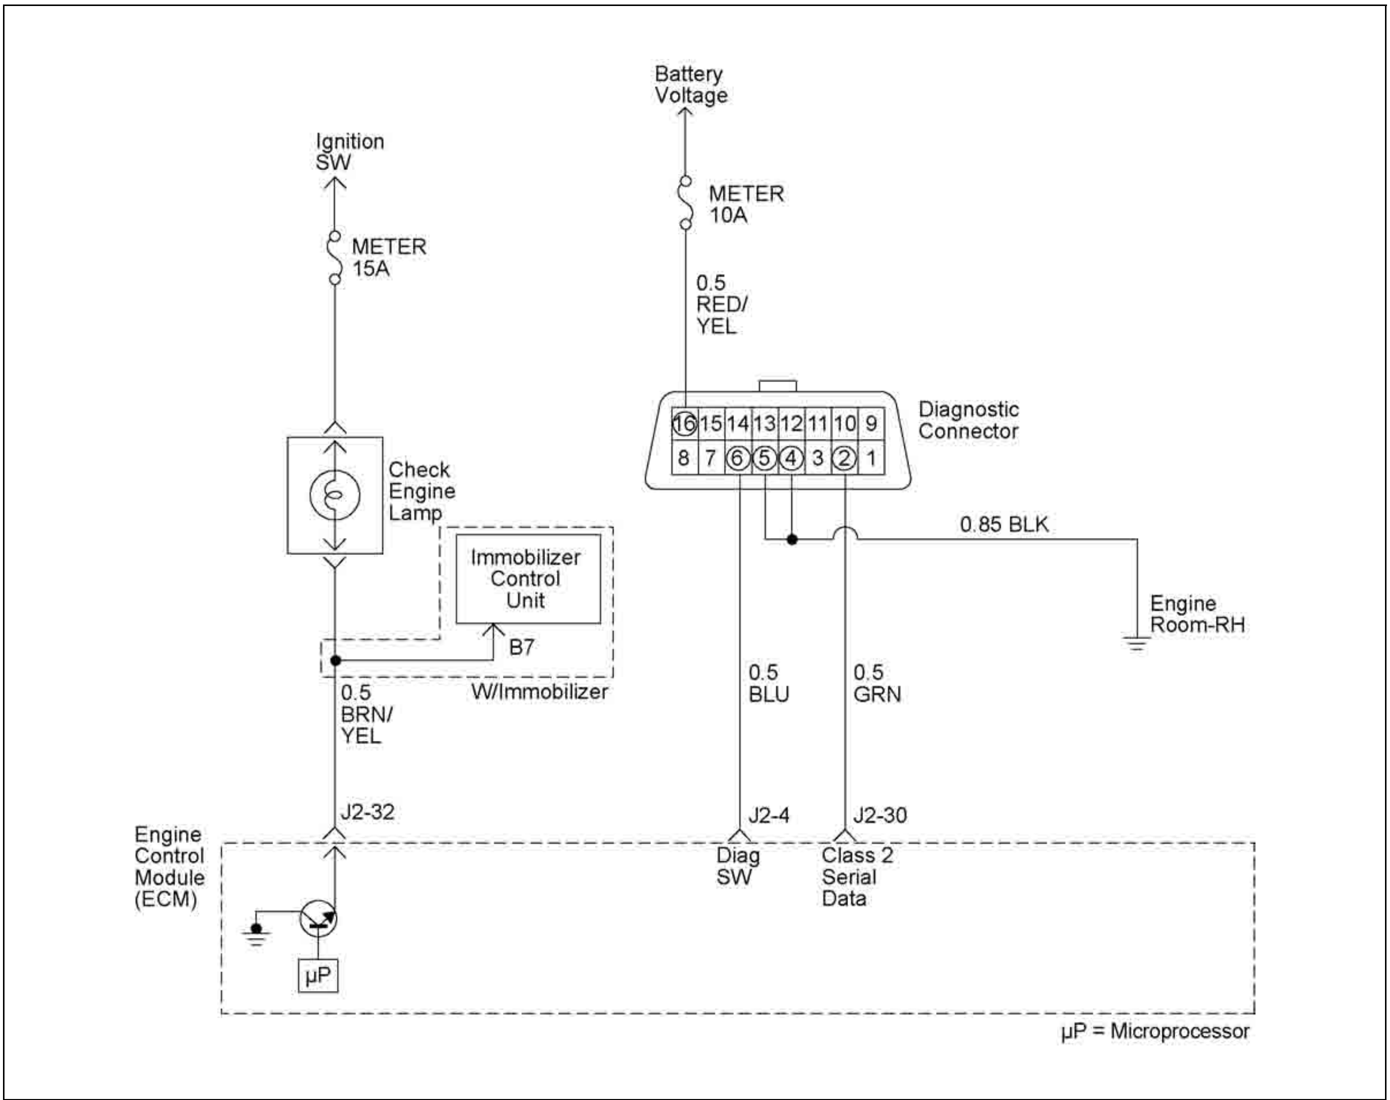
Bolt : D,G,H

Torque	N·m(kgf·m/lb·ft)
54 (5.5 / 40)	

NOTE :

Discard the used mounting bolts D,G,H shown in the figure and install new ones.

ON-BOARD DIAGNOSTIC (OBD) SYSTEM CHECK



Circuit Description

The on-board diagnostic system check is the starting point for any driveability complaint diagnosis. Before using this procedure, perform a careful visual/physical check of the ECM and engine grounds for cleanliness and tightness.

The on-board diagnostic system check is an organized approach to identifying a problem created by an electronic engine control system malfunction.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for poor connections or a damaged harness. Inspect the ECM harness and connector for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.

Test Description

Number(s) below refer the step number(s) on the Diagnostic Chart:

1. The Check Engine Lamp (MIL) should be ON steady with the ignition “On”, engine “Off”. If not, “No Check Engine Lamp (MIL)” chart should be used to isolate the malfunction.
2. Checks the Class 2 data circuit and ensures that the ECM is able to transmit serial data.
3. This test ensures that the ECM is capable of controlling the Check Engine Lamp (MIL) and the Check Engine Lamp (MIL) driver circuit is not shorted to ground circuit.
4. If the engine will not start, “Engine Cranks But Will Not Run” chart should be used to diagnose the fault.
6. The Tech2 parameters which is not within the typical range may help to isolate the area which is causing the problem.
12. This vehicle is equipped with ECM which utilizes an electrically erasable programmable read only memory (EEPROM).

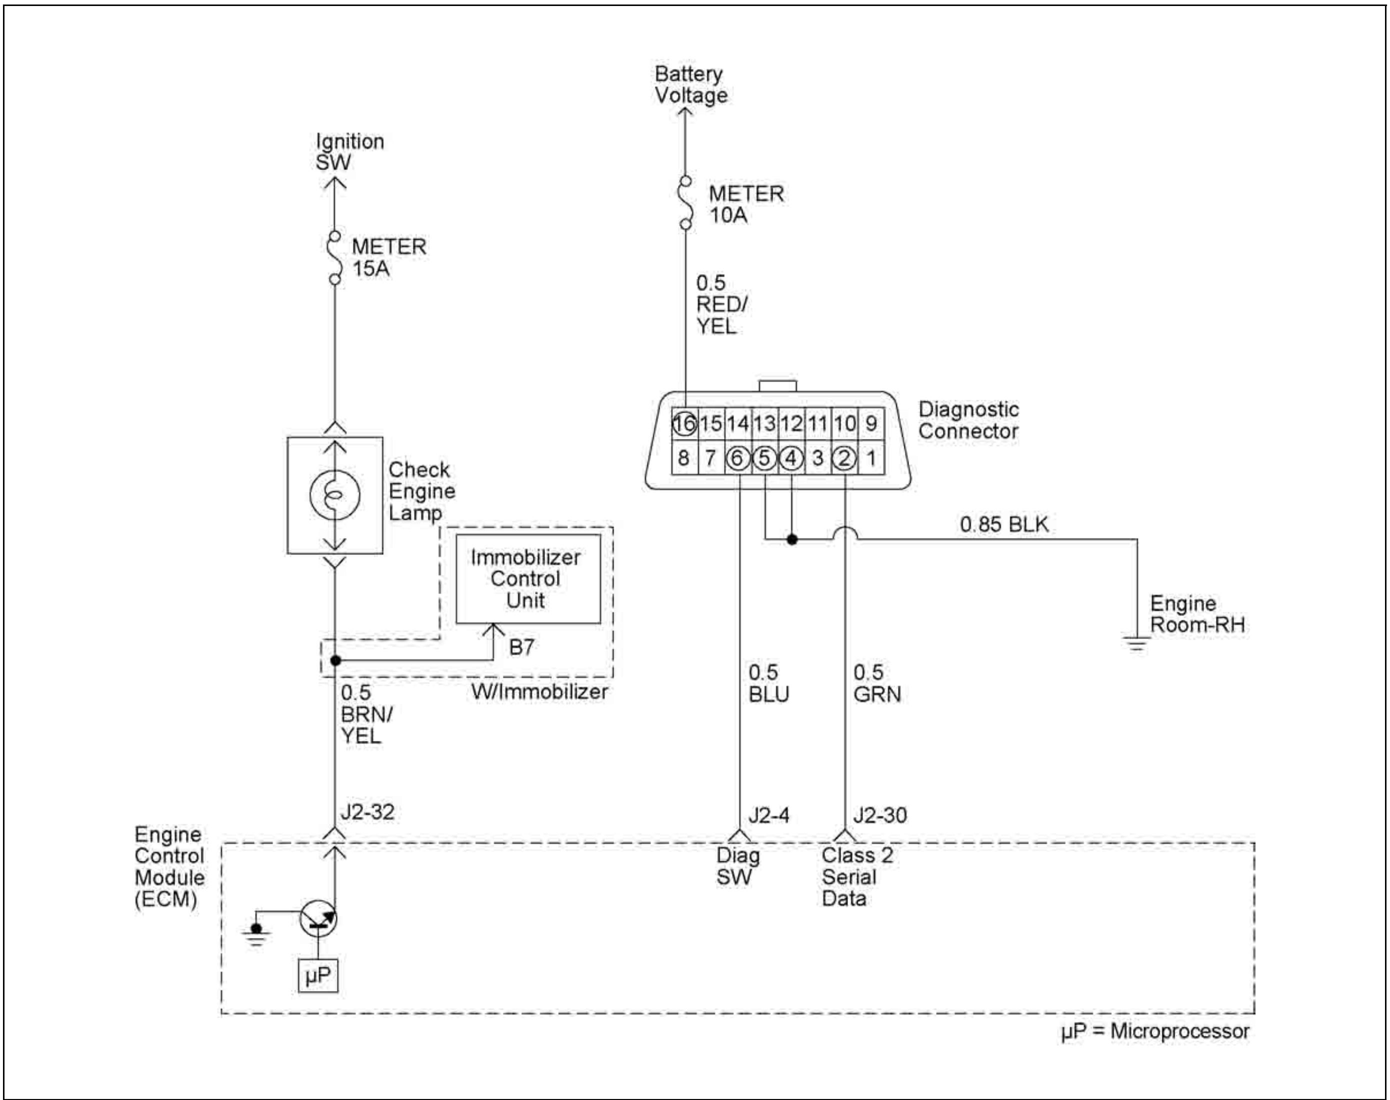
ON-BOARD DIAGNOSTIC (OBD) SYSTEM CHECK

Step	Action	Value(s)	Yes	No
1	1. Ignition “On”, engine “Off”. 2. Check the “CHECK ENGINE” lamp (MIL). Does the “CHECK ENGINE” lamp turn “On”?	—	Go to *Step 2*	Go to *No CHECK ENGINE Lamp*
2	1. Using the Tech 2, ignition “On” and engine “Off”. 2. Attempt to display “Engine Data” with the Tech 2. Does the Tech 2 display “Engine Data” and “O_2 Sensor Data”?	—	Go to *Step 3*	Go to *Step 7*
3	1. Using the Tech 2, ignition “On” and engine “Off”. 2. Select the “Miscellaneous Test” and perform the “Malfunction Indicator Lamp” in “Lamps”. 3. Operate the Tech 2 in accordance with the Tech 2 instructions. Does the “CHECK ENGINE” lamp turn “Off”?	—	Go to *Step 4*	Go to *CHECK ENGINE LAMP On Steady*
4	Attempt to start the engine. Does the engine start and continue to “Run”?	—	Go to *Step 5*	Go to *Engine Cranks But Will Not Run*
5	1. Using the Tech 2, ignition “On” and engine “Off”. 2. Select the “Read DTC Infor By Priority” in “Diagnostic Trouble Code”. 3. Are any DTCs stored?	—	Go to *DTC Chart*	Go to *Step 6*
6	Compare typical scan data values displayed on the Tech 2 “Engine Data” and “O_2 Sensor Data”. Are the displayed values within the range?	—	Refer to *SYMPTOM DIAGNOSIS*	Refer to *TYPICAL SCAN DATA*
7	Using the DVM and check the data link connector power supply circuit. 1. Ignition “Off”, engine “Off”. 2. Check the circuit for open circuit. Was the problem found? 	—	Repair faulty harness and verify repair	Go to *Step 8*
8	Using the DVM and check the data link connector ground circuit. 1. Ignition “Off”, engine “Off”. 2. Check the circuit for open circuit. Was the problem found? 	—	Repair faulty harness and verify repair	Go to *Step 9*

Step	Action	Value(s)	Yes	No
9	Using the DVM and check the data link connector ground circuit. 1. Ignition “On”, engine “Off”. 2. Check the circuit for short to power supply circuit. Was the DVM indicated specified value? 	Less than 1V	Go to *Step 10*	Repair faulty harness and verify repair
10	Using the DVM and check the data link connector communication circuit. 1. Ignition “On”, engine “Off”. 2. Check the circuit for short to power supply circuit. Was the DVM indicated battery voltage? 	—	Repair faulty harness and verify repair	Go to *Step 11*
11	Using the DVM and check the data link connector communication circuit. 1. Ignition “Off”, engine “Off”. 2. Disconnect the ECM connector. 3. Check the circuit for open or short to ground circuit. Was the problem found? 	—	Repair faulty harness and verify repair	Go to *Step 12*
12	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 13*

Step	Action	Value(s)	Yes	No
13	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

NO CHECK ENGINE LAMP (MIL)



Circuit Description

The check engine lamp should be illuminated and steady for about five seconds with the ignition "ON" and the engine stopped. Ignition feed voltage is supplied to the check engine lamp bulb through the meter fuse. The Engine Control Module (ECM) turns the check engine lamp "ON" by grounding the check engine lamp driver circuit.

Diagnostic Aids

An intermittent check engine lamp may be cased by a poor connection, rubbed-through wire insulation, or a wire broken inside the insulation. Check for the following items:

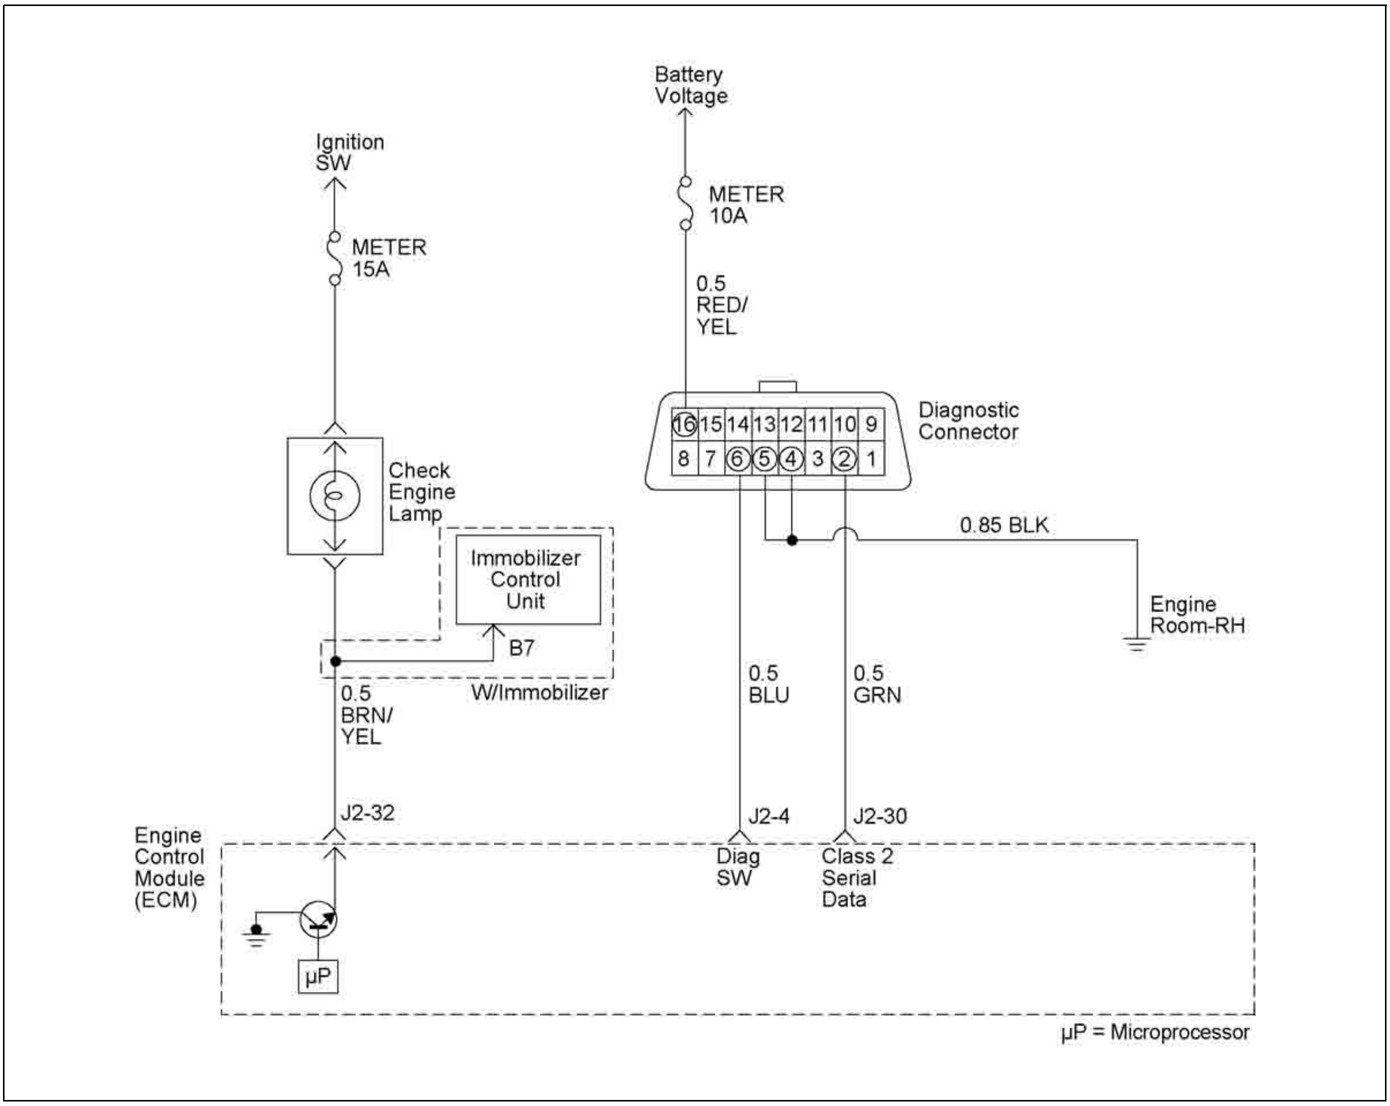
- Inspect the ECM harness and connections for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.
- If the engine runs OK, check for a faulty light bulb, an open in the check engine lamp driver circuit, or an open in the instrument cluster ignition feed.
- If the engine cranks but will not run, check for an open ECM ignition or battery feed, or a poor ECM to engine ground.

No Check Engine Lamp (MIL)

Step	Action	Value(s)	Yes	No
1	Check the "Meter" fuse (15A). If the fuse is burnt out, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 2*

Step	Action	Value(s)	Yes	No
2	Using the DVM and check the “CHECK ENGINE” lamp circuit. 1. Ignition “Off”, engine “Off”. 2. Disconnect the ECM connector. 3. Ignition “On”. 4. Check the circuit for open circuit. Was the DVM indicated specified value? 	10 - 14.5V	Go to *Step 5*	Go to *Step 3*
3	Check the “CHECK ENGINE” lamp bulb. If the bulb is burnt out, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 4*
4	Using the DVM and check the “CHECK ENGINE” lamp circuit. 1. Ignition “Off”, engine “Off”. 2. Disconnect the meter connector and ECM connector. 3. Check the circuit for open circuit. Was the problem found? 	—	Verify repair	Go to *Step 5*
5	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 6*
6	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

CHECK ENGINE LAMP (MIL) "ON" STEADY



Circuit description

The check engine lamp should always be illuminated and steady for about five seconds with ignition "ON" and the engine stopped. Ignition feed voltage is supplied directly to the check engine lamp indicator. The Engine Control Module (ECM) turns the check engine lamp "ON" by grounding the check engine lamp driver circuit. The check engine lamp should not remain "ON" with the engine running and no DTC(s) set. A steady check engine lamp with the engine running and no DTC(s) suggests a short to ground in the check engine lamp driver circuit.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation, or a wire broken inside the insulation. Check for the following items:

- Poor connection or damaged harness - Inspect the ECM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.

Check Engine Lamp (MIL) "ON" Steady

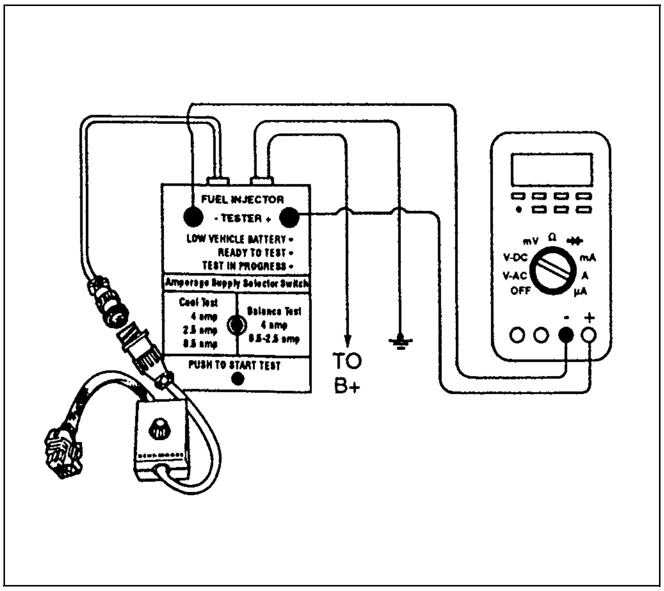
Step	Action	Value(s)	Yes	No
1	1. Ignition "Off", engine "Off". 2. Disconnect the ECM connector. 3. Ignition "On". Was the "CHECK ENGINE" lamp turned on?	—	Go to *Step 2*	Go to *Step 4*

Step	Action	Value(s)	Yes	No
2	Using the DVM and check the “CHECK ENGINE” lamp circuit. 1. Ignition “Off”, engine “Off”. 2. Disconnect the meter connector and ECM connector. 3. Check the circuit for short to ground circuit. Was the problem found? 	—	Verify repair	Go to *Step 3*
3	Replace the meter assembly. Is the action complete?	—	Verify repair	—
4	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 5*
5	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

FUEL METERING SYSTEM CHECK

Some failures of the fuel metering system will result in an "Engine Cranks But Will Not Run" symptom. If this condition exists, refer to *the Cranks But Will Not Run* chart. This chart will determine if the problem is caused by the ignition system, the ECM, or the fuel pump electrical circuit.
Refer to *Fuel System Electrical Test* for the fuel system wiring schematic.
If there is a fuel delivery problem, refer to *Fuel System Diagnosis*, which diagnoses the fuel injectors, the fuel pressure regulator, and the fuel pump.
Followings are applicable to the vehicles with closed Loop System:
If a malfunction occurs in the fuel metering system, it usually results in either a rich HO2S signal or a lean HO2S signal. This condition is indicated by the HO2S voltage, which causes the ECM to change the fuel calculation (fuel injector pulse width) based on the HO2S reading. Changes made to the fuel calculation will be indicated by a change in the long term fuel trim values which can be monitored with a Scan Tool. Ideal long term fuel trim values are around 0%; for a lean HO2S signal, the ECM will add fuel, resulting in a fuel trim value above 0%. Some variations in fuel trim values are normal because all engines are not exactly the same. If the evaporative emission canister purge is 02 status may be rich condition. 02 status indicates the lean condition, refer *to DTC P1171* for items which can cause a lean HO2S signal.

FUEL INJECTOR COIL TEST PROCEDURE AND FUEL INJECTOR BALANCE TEST PROCEDURE



Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart:

2. Relieve the fuel pressure by connecting 5-8840-0378-0 T-Joint to the fuel pressure connection on the fuel rail.

   Caution: In order to reduce the risk of fire and personal injury, wrap a shop towel around the fuel pressure connection. The towel will absorb any fuel leakage that occurs during the connection of the fuel pressure gauge. Place the towel in an approved container when the connection of the fuel pressure gauge is complete.
   Place the fuel pressure gauge bleed hose in an approved gasoline container.
   With the ignition switch OFF open the valve on the fuel pressure gauge.

3. Record the lowest voltage displayed by the DVM after the first second of the test. (During the first second, voltage displayed by the DVM may be inaccurate due to the initial current surge.)
   Injector Specifications:

Resistance Ohms	Voltage Specification at 10°C-35°C (50°F-95°F)
11.8-12.6	5.7-6.6

- The voltage displayed by the DVM should be within the specified range.
- The voltage displayed by the DVM may increase throughout the test as the fuel injector windings warm and the resistance of the fuel injector windings changes.

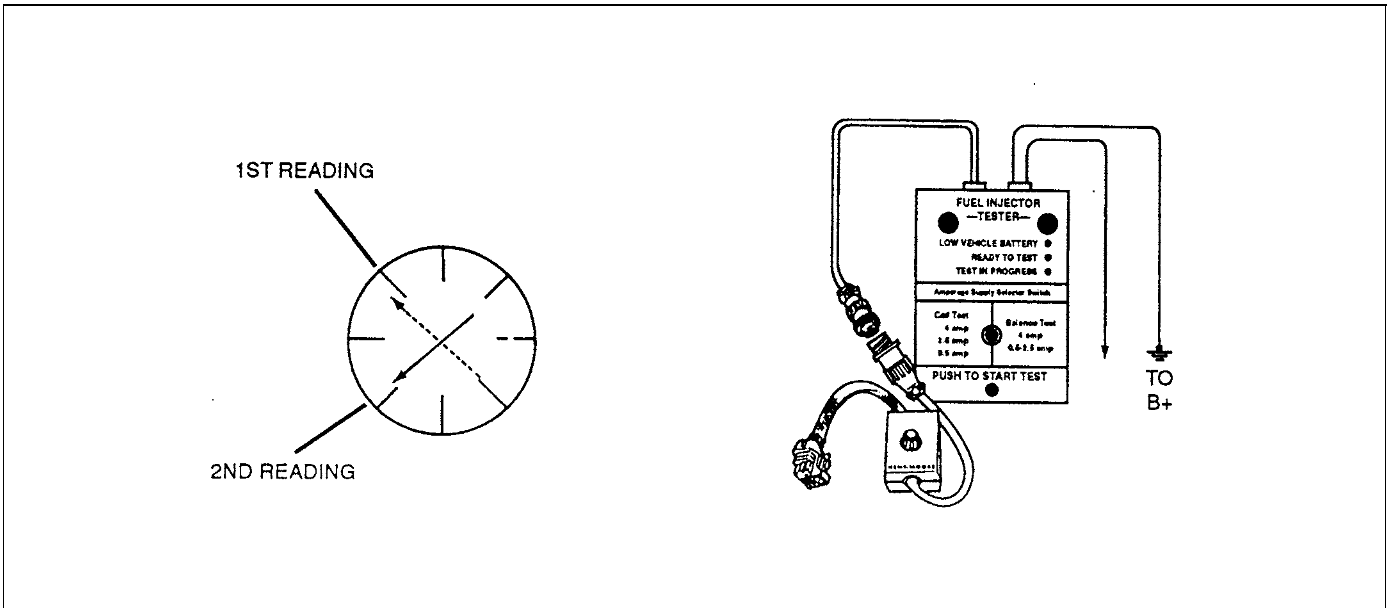
- An erratic voltage reading (large fluctuations in voltage that do not stabilize) indicates an intermittent connection within the fuel injector.

5. Injector Specifications:

Highest Acceptable Voltage Reading Above/Below 35°C/10°C (95°F/50°F)	Acceptable Subtracted Value
9.5Volts	0.6Volt

7. The Fuel Injector Balance Test portion of this chart (Step 7 through Step 11) checks the mechanical (fuel delivery) portion of the fuel injector. An engine cooldown period of 10 minutes is necessary in order to avoid irregular fuel pressure readings due to "Hot Soak" fuel boiling.

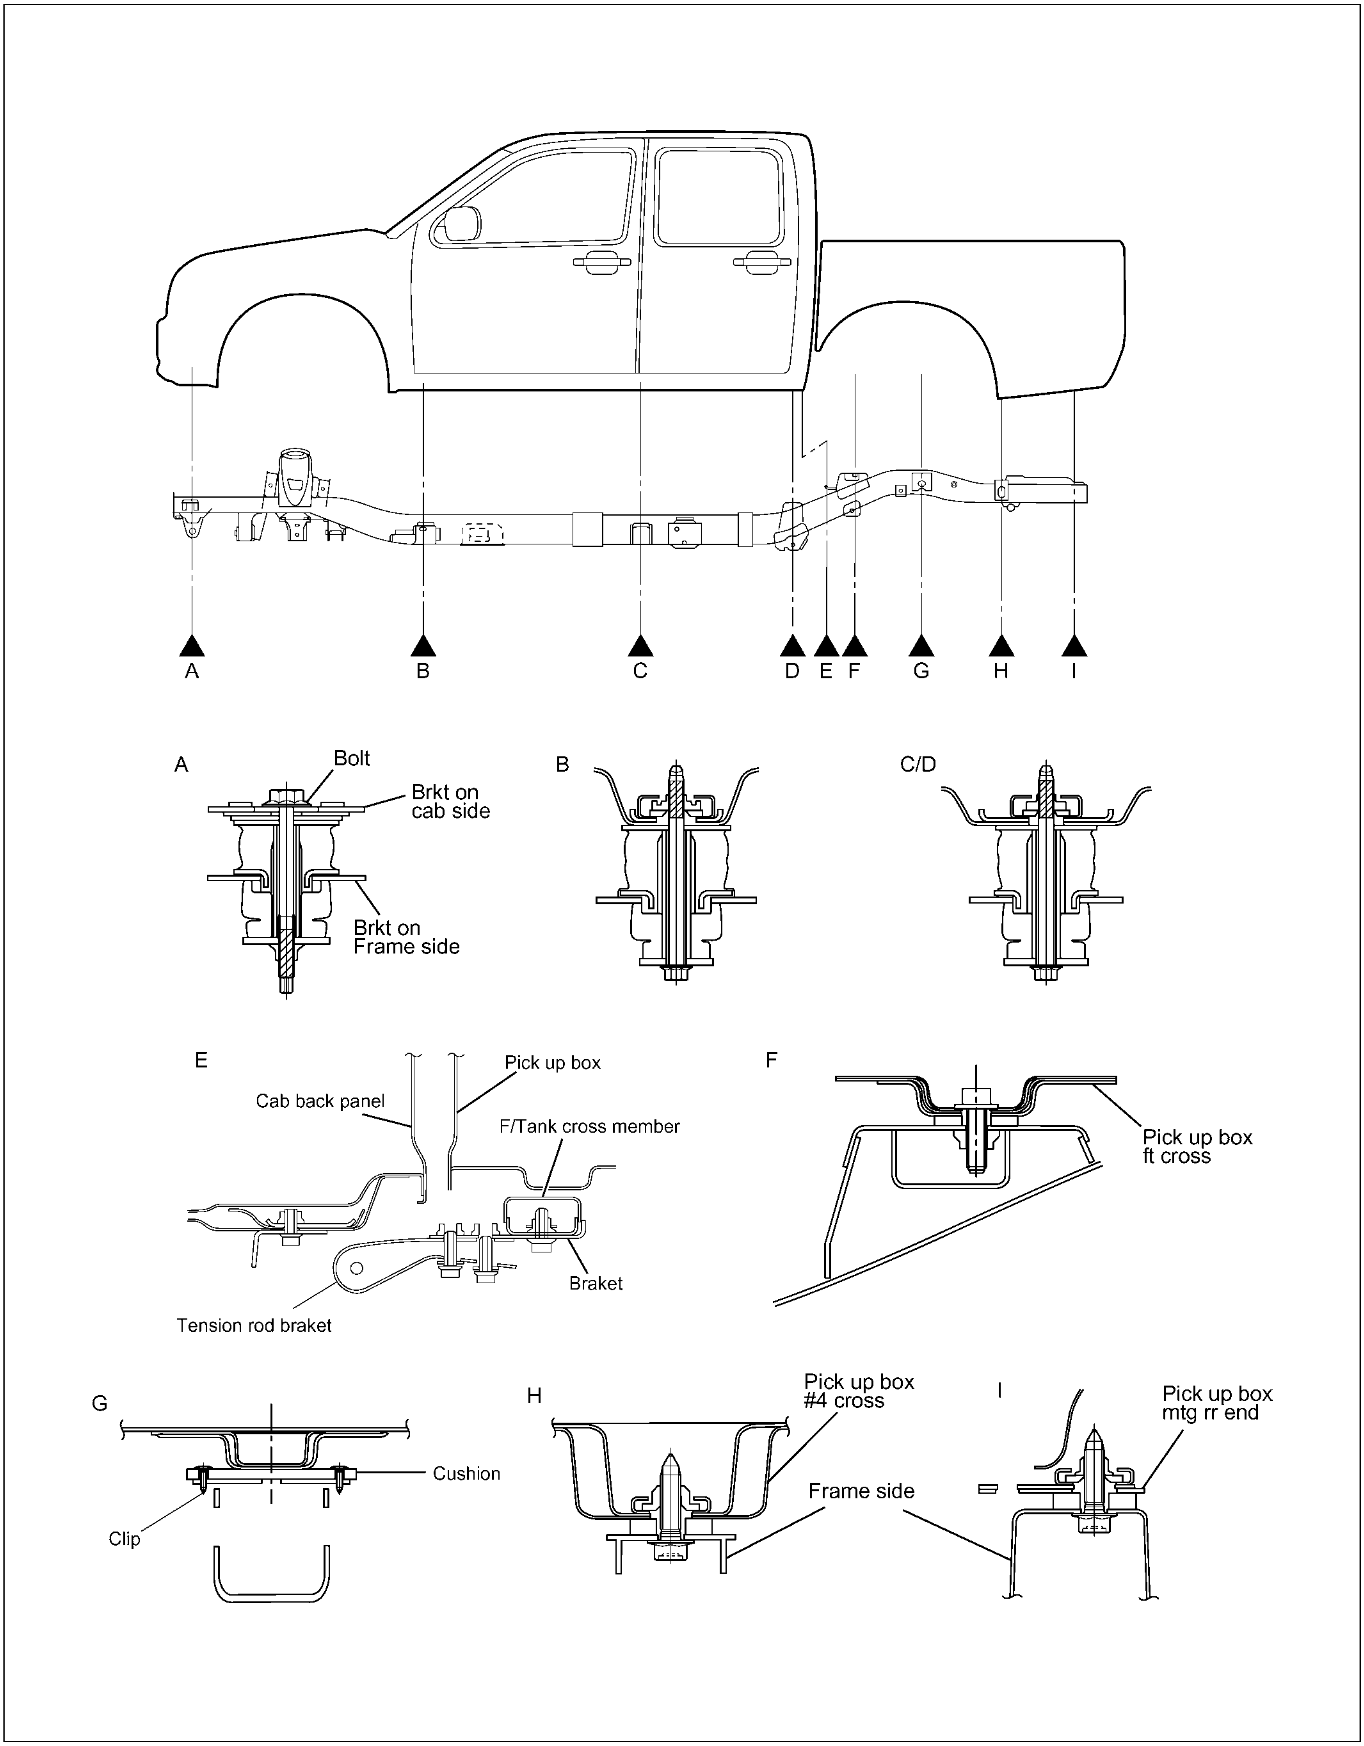
Injector Coil Test Procedure (Steps 1-6) and Injector Balance Test Procedure (Steps 7-11)



CYLINDER				
	1	2	3	4
1st Reading (1)	296kPa (43psi)	296kPa (43psi)	296kPa (43psi)	296kPa (43psi)
2nd Reading (2)	205kPa (29psi)	205kPa (29psi)	196kPa (28psi)	274kPa (39psi)
Amount of Drop (1st Reading-2nd Reading)	91kPa (14psi)	91kPa (14psi)	100kPa (15psi)	22kPa (4psi)
Av. Drop = 166kPa/24psi ±10kPa/1.5psi = 156 - 176kPa or 22.5 - 25.5psi	Faulty, Lean (Too Little Fuel Drop)	Faulty, Lean (Too Little Fuel Drop)	Faulty, Lean (Too Little Fuel Drop)	Faulty, Lean (Too Little Fuel Drop)

NOTE: These figures are examples only.

CREW CAB Model



RTW72BXF000301

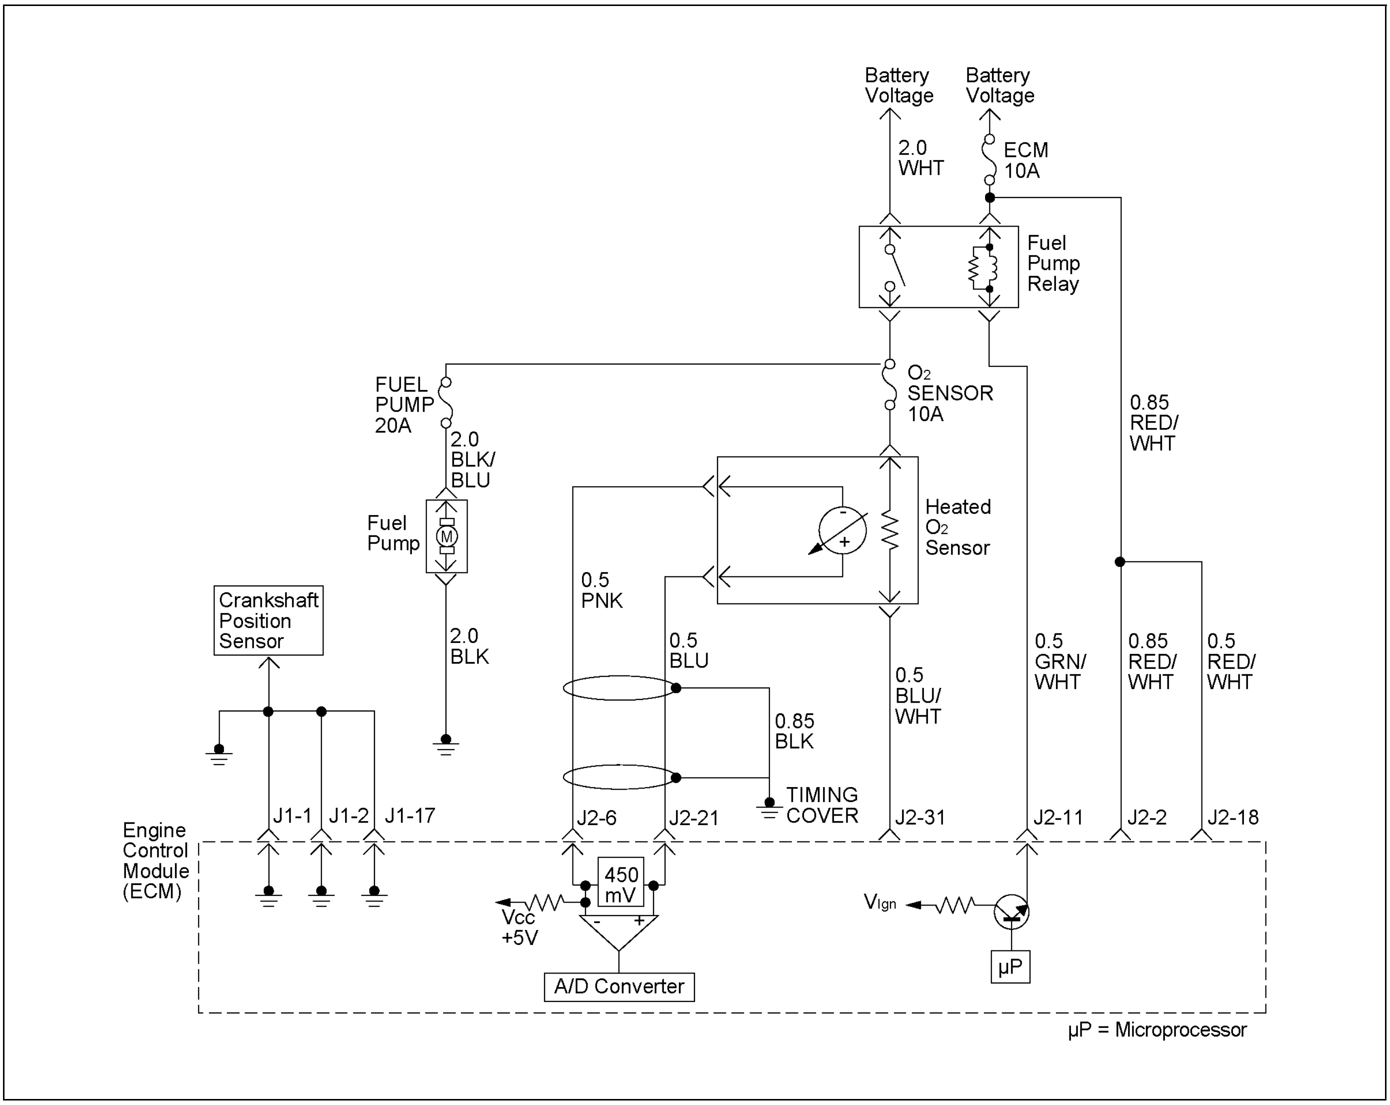
Injector Coil Test Procedure (Steps 1-6) and Injector Balance Test Procedure (Steps 7-11)

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Turn the engine OFF. **NOTE:** In order to prevent flooding of a single cylinder and possible engine damage, relieve the fuel pressure before performing the fuel injector coil test procedure. 2. Relieve the fuel pressure. Refer to Test Description Number 2. 3. Connect the 5-8840-2618-0 Fuel Injector Tester to B+ and ground, and to the 5-8840-2589-0 Injector Adapter Cable. 4. Remove the harness connector of the Fuel Injector and connect the 5-8840-2589-0 Injector Adapter Cable for F/I check. 5. Set the amperage supply selector switch on the fuel injector tester to the "Coil Test" 0.5 amp position. 6. Connect the leads from the 5-8840-2392-0 Digital Voltmeter (DVM) to the fuel injector tester. Refer to the illustrations associated with the test description. 7. Set the DVM to the tenths scale (0.0). 8. Observe the engine coolant temperature. Is the engine coolant temperature within the specified values?	10°C (50°F) to 35°C (95°F)	Go to *Step 3*	Go to *Step 5*
3	1. Set the injector adapter cable to injector #1. 2. Press the "Push to Start Test" button on the fuel injector tester. 3. Observe the voltage reading on the DVM. **Important:** The voltage reading may rise during the test. 4. Record the lowest voltage observed after the first second of the test. 5. Set the injector adapter cable to the next injector and repeat steps 2, 3, and 4. Did any fuel injector have an erratic voltage reading (large fluctuations in voltage that did not stabilize) or a voltage reading outside of the specified values?	5.7-6.6V	Go to *Step 4*	Go to *Step 7*
4	Replace the faulty fuel injector(S). Refer to *Fuel Injector*. Is the action complete?	—	Go to *Step 7*	—

Step	Action	Value(s)	Yes	No
5	1. Set the Injector Adapter Cable to injector #1. 2. Press the "Push to Start Test" button on the fuel injector tester. 3. Observe the voltage reading on the DVM. **Important:** The voltage reading may rise during the test. 4. Record the lowest voltage observed after the first second of the test. 5. Set the Injector Adapter Cable to the next injector and repeat steps 2, 3, and 4. Did any fuel injector have an erratic voltage reading (large fluctuations in voltage that did not stabilize) or a voltage reading above the specified value?	9.5V	Go to *Step 4*	Go to *Step 6*
6	1. Identify the highest voltage reading recorded (other than those above 9.5V). 2. Subtract the voltage reading of each injector from the highest voltage selected in step 1. Repeat until you have a subtracted value for each injector. For any injector, is the subtracted value in step 2 greater than the specified value?	0.6V	Go to *Step 4*	Go to *Step 7*
7	***Caution: In order to reduce the risk of fire and personal injury, wrap a shop towel around the fuel pressure connection. The towel will absorb any fuel leakage that occurs during the connection of the fuel pressure gauge. Place the Towel in an approved container when the connection of the fuel pressure gauge is complete.*** 1. Connect the 5-8840-0378-0 Fuel Pressure Gauge to the fuel pressure test port. 2. Energize the fuel pump using the Scan Tool. 3. Place the bleed hose of the fuel pressure gauge into an approved gasoline container. 4. Bleed the air out of the fuel pressure gauge. 5. With the fuel pump running, observe the reading on the fuel pressure gauge. Is the fuel pressure within the specified values?	296kPa-376kPa (43-55psi)	Go to *Step 8*	Go to *Fuel System Diagnosis*
8	Turn the fuel pump OFF. Does the fuel pressure remain constant?	—	Go to *Step 9*	Go to *Fuel System Diagnosis*

Step	Action	Value(s)	Yes	No
9	1. Connect the 5-8840-0378-0 Fuel Injector Tester and 5-8840-2589-0 Injector Adapter Cable to the fuel injector harness connector. 2. Set the amperage supply selector switch on the fuel injector tester to the “Balance Test” 0.5-2.5 amp position. 3. Using the Scan Tool turn the fuel pump ON then OFF in order to pressurize the fuel system. 4. Record the fuel pressure indicated by the fuel pressure gauge after the fuel pressure stabilizes. This is the first pressure reading. 5. Energize the fuel injector by depressing the “Push to Start Test” button on the fuel injector tester. 6. Record the fuel pressure indicated by the fuel pressure gauge after the fuel pressure gauge needle has stopped moving. This is the second pressure reading. 7. Repeat steps 1 through 6 for each fuel injector. 8. Subtract the second pressure reading from the first pressure reading for one fuel injector. The result is the pressure drop value. 9. Obtain a pressure drop value for each fuel injector. 10. Add all of the individual pressure drop values. This is the total pressure drop. 11. Divide the total pressure drop by the number of fuel injectors. This is the average pressure drop. Does any fuel injector have a pressure drop value that is either higher than the average pressure drop or lower than the average pressure drop by the specified value?	10kPa (1.5psi)	Go to *Step 10*	Go to *OBD System Check*
10	Re-test any fuel injector that does not meet the specification. Refer to the procedure in Step 11. **NOTE:** Do not repeat any portion of this test before running the engine in order to prevent the engine from flooding. Does any fuel injector still have a pressure drop value that is either higher than the average pressure drop or lower than the average pressure drop by the specified value?	10kPa (1.5psi)	Go to *Step 11*	Go to *Symptoms*
11	1. Replace the faulty fuel injector(s). Refer to *Fuel Injector*. 2. Disconnect the 5-8840-2589-0 Injector Adapter Cable for F/I check and re-connect the original F/I check connector. Is the action complete?	—	Verify repair	—

FUEL SYSTEM ELECTRICAL TEST



Circuit Description

When the ignition switch is first turned ON, the engine control module (ECM) energizes the fuel pump relay which applies power to the in-tank fuel pump. The fuel pump relay will remain ON as long as the engine is running or cranking and the ECM is receiving 58X crankshaft position pulses. If no 58X crankshaft position pulses are present, the ECM de-energizes the fuel pump relay within 2 seconds after the ignition is turned ON or the engine is stopped.

The fuel pump delivers fuel to the fuel rail and injectors, then to the fuel pressure regulator. The fuel pressure regulator controls fuel pressure by allowing excess fuel to be returned to the fuel tank. With the engine stopped and ignition ON, the fuel pump can be turned ON by using a command by the scan tool.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation, or a wire broken inside the insulation. Check for the following items:

- Poor connection or damaged harness - Inspect the ECM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.

  Caution: To reduce the risk of fire and personal injury:

  - ***It is necessary to relieve fuel system pressure before connecting a fuel pressure gauge. Refer to Fuel Pressure Relief Procedure, below.***
  - ***A small amount of fuel may be released when disconnecting the fuel lines. Cover fuel line fittings with a shop towel before disconnecting, to catch any fuel that may leak out. Place the towel in an approved container when the disconnect is completed.***

Fuel Pressure Relief Procedure

1. Remove the fuel cap.
2. Remove the fuel pump relay from the underhood relay center.
3. Start the engine and alow it to stall.
4. Crank the engine for an additional 3 seconds.

Fuel Pressure Gauge Installation

1. Remove the fuel pressure fitting cap.
2. Install fuel pressure gauge 5-8840-0378-0 to the fuel feed line located in front of and above the right side valve cover.
3. Reinstall the fuel pump relay.

Fuel System Electrical Test

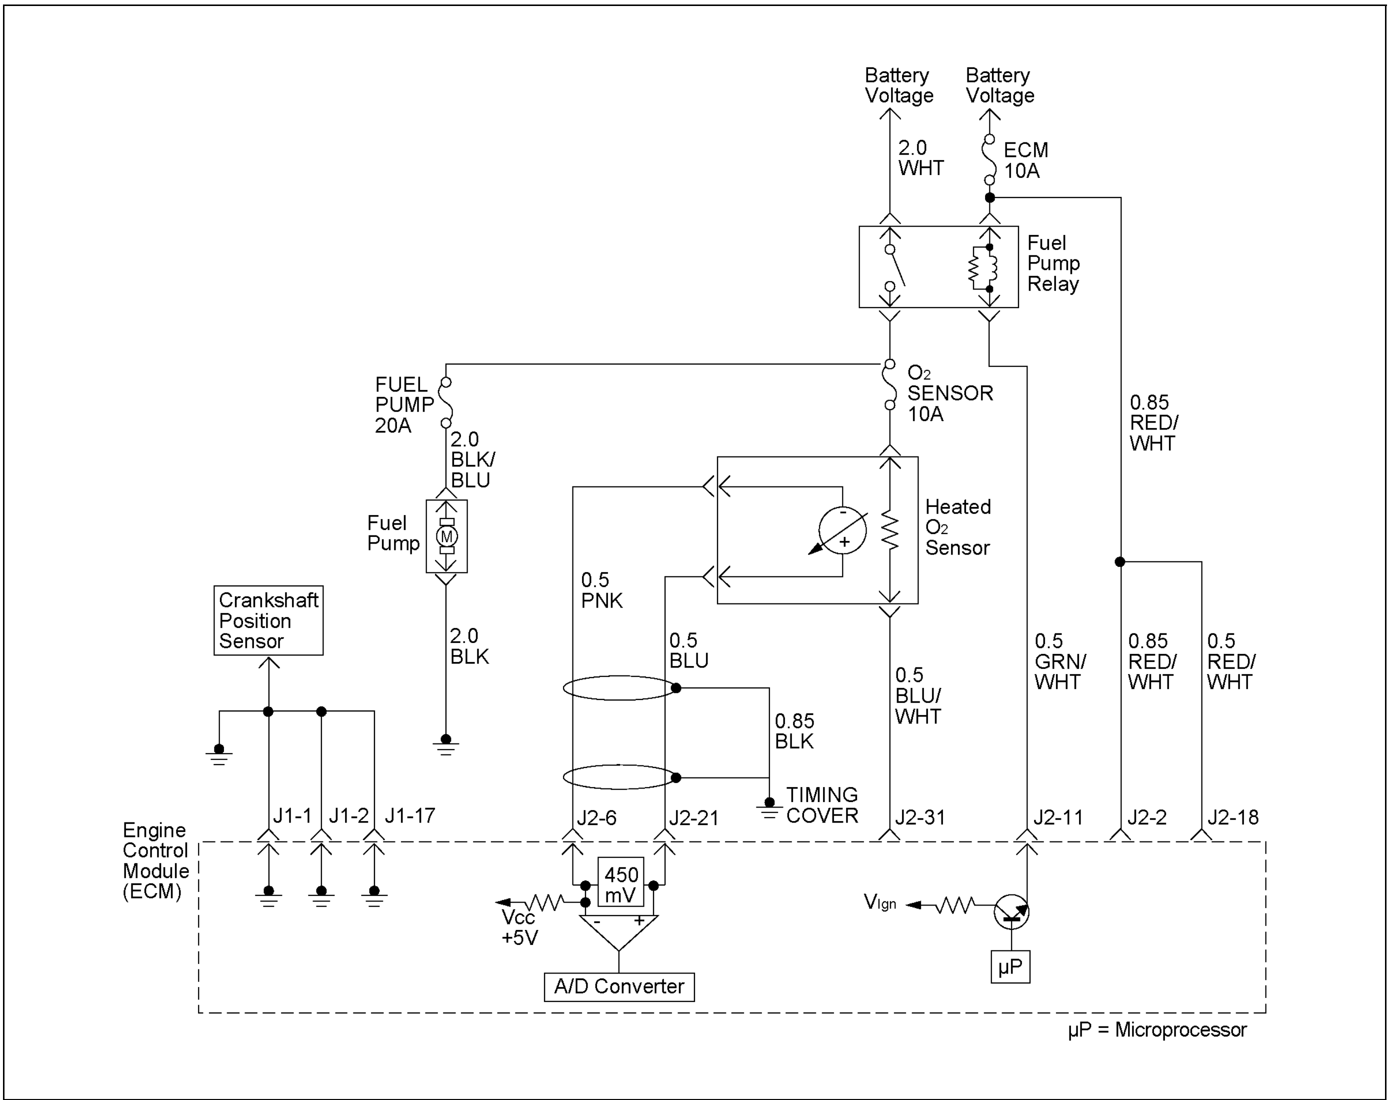
Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Using the Tech 2, ignition “On” and engine “On”. 2. Select the “Miscellaneous Test” and perform the “Fuel Pump Relay” in the “Relays”. 3. Operate the Tech 2 in accordance with procedure. Was the fuel pump operated, when the Tech 2 is operated?	—	Go to *Fuel System Diagnosis*	Go to *Step 3*
3	Check the “Fuel Pump” fuse (20A). If the fuse is burnt out, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 4*
4	Check for poor/faulty connection at the fuel pump, fuel pump relay or ECM connector. If a poor/faulty connection is found, repair as necessary. Was the problem found?  	—	Verify repair	Go to *Step 5*
5	Using the DVM and check the fuel pump relay. 1. Ignition “Off”, engine “Off”. 2. Remove the fuel pump relay from the relay box. 3. Check the relay coil. Was the DVM indicated specified value? Fuel Pump Relay  	120 - 150 Ω	Go to *Step 6*	Replace fuel pump relay and verify repair

Step	Action	Value(s)	Yes	No
6	Using the DVM and check the fuel pump relay power supply circuit. 1. Ignition “On”, engine “Off”. 2. Remove the fuel pump relay from the relay box. 3. Check the circuit for open or short to ground circuit. Was the DVM indicated specified value?  	10 - 14.5V	Go to *Step 8*	Go to *Step 7*
7	Repair the open or short to ground circuit between the “ECM” fuse (15A) and fuel pump relay. Is the action complete?	—	Verify repair	—
8	Using the DVM and check the fuel pump relay ground circuit. 1. Ignition “Off”, engine “Off”. 2. Disconnect the ECM connector. 3. Remove the fuel pump relay from the relay box. 4. Check the circuit for open or short to ground circuit. Was the problem found?  	—	Repair faulty harness and verify repair	Go to *Step 9*
9	Using the DVM and check the fuel pump relay power supply circuit. 1. Ignition “Off”, engine “Off”. 2. Remove the fuel pump relay from the relay box. 3. Check the circuit for open circuit. Was the DVM indicated specified value?  	10 - 14.5V	Go to *Step 11*	Go to *Step 10*

Step	Action	Value(s)	Yes	No
10	Repair the open circuit between the fuel pump relay and battery. Is the action complete?	—	Verify repair	—
11	Using the DVM and check the fuel pump power supply circuit. 1. Ignition "On", engine "Off". 2. Disconnect the fuel pump connector. 3. Check the circuit for open or short to ground circuit. Was the DVM indicated specified value? 	10 - 14.5V	Go to *Step 13*	Go to *Step 12*
12	Repair the open or short to ground circuit between the fuel pump relay and fuel pump. Is the action complete?	—	Verify repair	—
13	Using the DVM and check the fuel pump ground circuit. 1. Ignition "Off", engine "Off". 2. Disconnect the fuel pump connector. 3. Check the circuit for open circuit. Was the DVM indicated specified value? 	Continuity	Go to *Step 15*	Go to *Step 14*
14	Repair the open circuit between the fuel pump and body ground. Is the action complete?	—	Verify repair	—
15	Replace the fuel pump. Was the problem solved?	—	Verify repair	Go to *Step 16*
16	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***"SPS (Service Programming System)".*** Was the problem solved?	—	Verify repair	Go to *Step 17*

Step	Action	Value(s)	Yes	No
17	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

FUEL SYSTEM DIAGNOSIS



Circuit Description

When the ignition switch is turned ON, the engine control module (ECM) will turn ON the in-tank fuel pump. The in-tank fuel pump will remain ON as long as the engine is cranking or running and the ECM is receiving 58X crankshaft position pulses. If there are no 58X crankshaft position pulses, the ECM will turn the in-tank fuel pump OFF 2 seconds after the ignition switch is turned ON or 2 seconds after the engine stops running.

The in-tank fuel pump is an electric pump within an integral reservoir. The in-tank fuel pump supplies fuel through an in-line fuel filter to the fuel rail assembly. The fuel pump is designed to provide fuel at a pressure above the pressure needed by the fuel injectors. A fuel pressure regulator, attached to the fuel rail, keeps the fuel available to the fuel injectors at a regulated pressure. Unused fuel is returned to the fuel tank by a separate fuel return line.

Test Description

Number(s) below refer to the step number(s) on the Diagnostic Chart.

2. Connect the fuel pressure gauge to the fuel feed line as shown in the fuel system illustration. Wrap a shop towel around the fuel pressure connection in order to absorb any duel leakage that may occur when installing the fuel pressure gauge. With the ignition switch ON and the fuel pump running, the fuel pressure indicated by the fuel pressure gauge should be 283-376 kPa (41-55 psi). This pressure is controlled by the amount of pressure the spring inside the fuel pressure regulator can provide.
3. A fuel system that cannot maintain a constant fuel pressure has a leak in one or more of the following areas:
   - The fuel pump check valve.
   - The fuel pump flex line.
   - The valve or valve seat within the fuel pressure regulator.

- The fuel injector(s).

4. Fuel pressure that drops off during acceleration, cruise, or hard cornering may case a lean condition. A lean condition can cause a loss of power, surging, or misfire. A lean condition can be diagnosed using a Tech 2 Scan Tool.

Following are applicable to the vehicle with closed Loop System:

If an extremely lean condition occurs, the oxygen sensor(s) will stop toggling. The oxygen sensor output voltage(s) will drop below 500 mV. Also, the fuel injector pulse width will increase.

Important: Make sure the fuel system is not operating in the "Fuel Cut-Off Mode."

When the engine is at idle, the manifold pressure is low (high vacuum). This low pressure (high vacuum) is applied to the fuel pressure regulator diaphragm. The low pressure (high vacuum) will offset the pressure being applied to the fuel pressure regulator diaphragm by the spring inside the fuel pressure regulator. When this happens, the result is lower fuel pressure. The fuel pressure at idle will vary slightly as the barometric pressure changes, but the fuel pressure at idle should always be less than the fuel pressure noted in step 2 with the engine OFF.

16. Check the spark plug associated with a particular fuel injector for fouling or saturation in order to determine if that particular fuel injector is leaking. If checking the spark plug associated with a particular fuel injector for fouling or saturation does not determine that a particular fuel injector is leaking, use the following procedure:
    - Remove the fuel rail, but leave the fuel lines and injectors connected to the fuel rail. Refer to *Fuel Rail Assembly in On-Vehicle Service.*
    - Lift the fuel rail just enough to leave the fuel injector nozzles in the fuel injector ports.

    Caution: In order to reduce the risk of fire and personal injury that may result from fuel spraying on the engine, verify that the fuel rail is positioned over the fuel injector ports and verify that the fuel injector retaining clips are intact.

    - ***Pressurize the fuel system by connecting a 20 amp fused jumper between B+ and the fuel pump relay connector.***
    - ***Visually and physically inspect the fuel injector nozzles for leaks.***

17. A rich condition may result from the fuel pressure being above 376 kPa (55 psi). A rich condition may cause a 45 to set. Driveability conditions associated with rich conditions can include hard starting (followed by black smoke) and a strong sulfur smell in the exhaust.

20. This test determines if the high fuel pressure is due to a restricted fuel return line or if the high fuel pressure is due to a faulty fuel pressure regulator.

21. A lean condition may result from fuel pressure below 333 kPa (48 psi). A lean condition may cause a 44 to set. Driveability conditions associated with lean conditions can include hard starting (when the engine is cold), hesitation, poor driveability, lack of power, surging, and misfiring.

22. Restricting the fuel return line causes the fuel pressure to rise above the regulated fuel pressure. Command the fuel pump ON with the scan tool. The fuel pressure should rise above 376 kPa (55 psi) as the fuel return line becomes partially closed.

NOTE: Do not allow the fuel pressure to exceed 414 kPa (60 psi). Fuel pressure in excess of 414 kPa (60 psi) may damage the fuel pressure regulator.

Caution: To reduce the risk of fire and personal injury:

- ***It is necessary to relieve fuel system pressure before connecting a fuel pressure gauge. Refer to Fuel Pressure Relief Procedure, below.***
- ***A small amount of fuel may be released when disconnecting the fuel lines. Cover fuel line fittings with a shop towel before disconnecting, to catch any fuel that may leak out. Place the towel in an approved container when the disconnect is completed.***

Fuel Pressure Relief Procedure

1. Remove the fuel cap.
2. Located on the intake manifold which is at the top right part of the engine.
3. Start the engine and allow it to stall.
4. Crank the engine for an additional 3 seconds.

Fuel Pressure Gauge Installation

1. Remove the fuel pressure fitting cap.
2. Install fuel pressure gauge 5-8840-0378-0 to the fuel feed line located on the upper right side of the engine.
3. Reinstall the fuel pump relay.

Important Operations – Installation

Fuel System Diagnosis

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Turn the ignition OFF. 2. Turn the air conditioning system OFF. 3. Relieve fuel system pressure and install the fuel pressure gauge. 4. Turn the ignition ON. NOTE: The fuel pump will run for approximately 2 seconds. Use the Scan Tool to command the fuel pump ON. 5. Observe the fuel pressure indicated by the fuel pressure gauge with the fuel pump running. Is the fuel pressure within the specified limits?	283-376 kPa (41-55 psi)	Go to *Step 3*	Go to *Step 17*
3	Does the fuel pressure indicated by the fuel pressure gauge remain constant? NOTE: The fuel pressure will drop when the fuel pump stops running, then it should stabilize and remain constant.	—	Go to *Step 4*	Go to *Step 12*
4	1. When the vehicle is at normal operating temperature, turn the ignition ON to build fuel pressure and observe the measurement on the gauge. 2. Start the engine and observe the fuel pressure gauge. Did the reading drop by the amount specified after the engine was started?	21-105 kPa (3-15 psi)	Go to *Step 5*	Go to *Step 9*
5	Is fuel pressure dropping off during acceleration, cruise, or hard cornering?	—	Go to *Step 6*	Check for improper fuel
6	Visually and physically inspect the following items for a restriction: • The in-line fuel filter. • The fuel feed line. Was a restriction found?	—	Verify repair	Go to *Step 7*
7	Remove the fuel tank and visually and physically inspect the following items: • The fuel pump strainer for a restriction. • The fuel line for a leak. • Verify that the correct fuel pump is in the vehicle. Was a problem found in any of these areas?	—	Verify repair	Go to *Step 8*
8	Replace the fuel pump. Is the action complete?	—	Verify repair	—
9	1. Disconnect the vacuum hose from the fuel pressure regulator. 2. With the engine idling, apply 12-14 inches of vacuum to the fuel pressure regulator. Does the fuel pressure indicated by the fuel pressure gauge drop by the amount specified?	21-105 kPa (3-15 psi)	Go to *Step 10*	Go to *Step 11*

Step	Action	Value(s)	Yes	No
10	Locate and repair the loss of vacuum to the fuel pressure regulator. Is the action complete?	—	Verify repair	—
11	Replace the fuel pressure regulator. Is the action complete?	—	Verify repair	—
12	1. Run the fuel pump with the Scan Tool. 2. After pressure has built up, turn off the pump and clamp the supply hose shut with suitable locking pliers. Does the fuel pressure indicated by the fuel pressure gauge remain constant?	—	Go to *Step 13*	Go to *Step 15*
13	Visually inspect the fuel supply line and repair any leaks. Was a problem found?	—	Verify repair	Go to *Step 14*
14	Remove the fuel tank and inspect for leaky hose or in-tank fuel line. Was a problem found?	—	Verify repair	Go to *Step 8*
15	1. If the pliers are still clamped to the fuel supply hose, remove the locking pliers. 2. With suitable locking pliers, clamp the fuel return line to prevent fuel from returning to the fuel tank. 3. Run the fuel pump with the Scan Tool. 4. After pressure has built up, remove power to the pump. Does the fuel pressure indicated by the fuel pressure gauge remain constant?	—	Go to *Step 11*	Go to *Step 16*
16	Locate and replace any leaking fuel injector(s). Is the action complete?	—	Verify repair	—
17	Is the fuel pressure indicated by the fuel pressure gauge above the specified limit?	376 kPa (55 psi)	Go to *Step 18*	Go to *Step 21*
18	1. Relieve the fuel pressure. Refer to the *Fuel Pressure Relief*. 2. Disconnect the fuel return line from the fuel rail. 3. Attach a length of flexible hose to the fuel rail return outlet passage. 4. Place the open end of the flexible hose into an approved gasoline container. 5. Run the fuel pump with the Scan Tool. 6. Observe the fuel pressure indicated by the fuel pressure gauge with the fuel pump running. Is the fuel pressure within the specified limits?	290-376 kPa (42-55 psi)	Go to *Step 19*	Go to *Step 20*
19	Locate and correct the restriction in the fuel return line. Is the action complete?	—	Verify repair	—
20	Visually and physically inspect the fuel rail outlet passages for a restriction. Was a restriction found?	—	Verify repair	Go to *Step 11*
21	Is the fuel pressure indicated by the fuel pressure gauge above the specified value?	0 kPa (0 psi)	Go to *Step 22*	Go to *Step 23*

Step	Action	Value(s)	Yes	No
22	1. Command the fuel pump ON with the Scan Tool. 2. Using suitable pliers which will not damage the fuel hose, gradually apply pressure with the pliers to pinch the flexible fuel return hose closed. Does the fuel pressure indicated by the fuel pressure gauge rise above the first specified value? ***Caution: Do not let the fuel pressure exceed the second specified value.***	376 kPa (55 psi) 414 kPa (60 psi)	Go to *Step 11*	Go to *Step 7*
23	1. Command the fuel pump ON with the Scan Tool. 2. Remove the fuel filler cap and listen for the sound of the fuel pump running. 3. Turn the pump off. Was the fuel pump running?	—	Go to *Step 7*	Go to *Fuel System Electrical Test Chart*

ECM DIAGNOSTIC TROUBLE CODES (DTC)

Type A

- Emission related.
- Requests illumination of the MIL (Malfunction Indicator Lamp = Check Engine Lamp) of the first trip with a fail.
- Stores a history DTC on the first trip.
- Stores a freeze frame (If empty).
- Stores a fail record.
- Updates the fail record each time the diagnostic test fails.

Type B

- Emission related.
- “Armed” after one trip with fail.
- “Disarmed” after one trip with a pass.
- Requests illumination of the MIL on the second consecutive trip with a fail.
- Store a history DTC on the second consecutive trip with a fail. (The DTC will be armed after the first fail.)
- Stores a freeze frame on the second consecutive trip with a fail (If empty).
- Stores a fail record when the first test fails (not dependent on consecutive trip).
- Updates the fail record each time the diagnostic test fails.

Type D

- Non emission related.
- Does not request illumination of any lamp.
- Stores a history DTC on the first trip.
- Does not store a freeze frame.
- Stores fail record when test fails.
- Updates the fail record each time the diagnostic test fails.

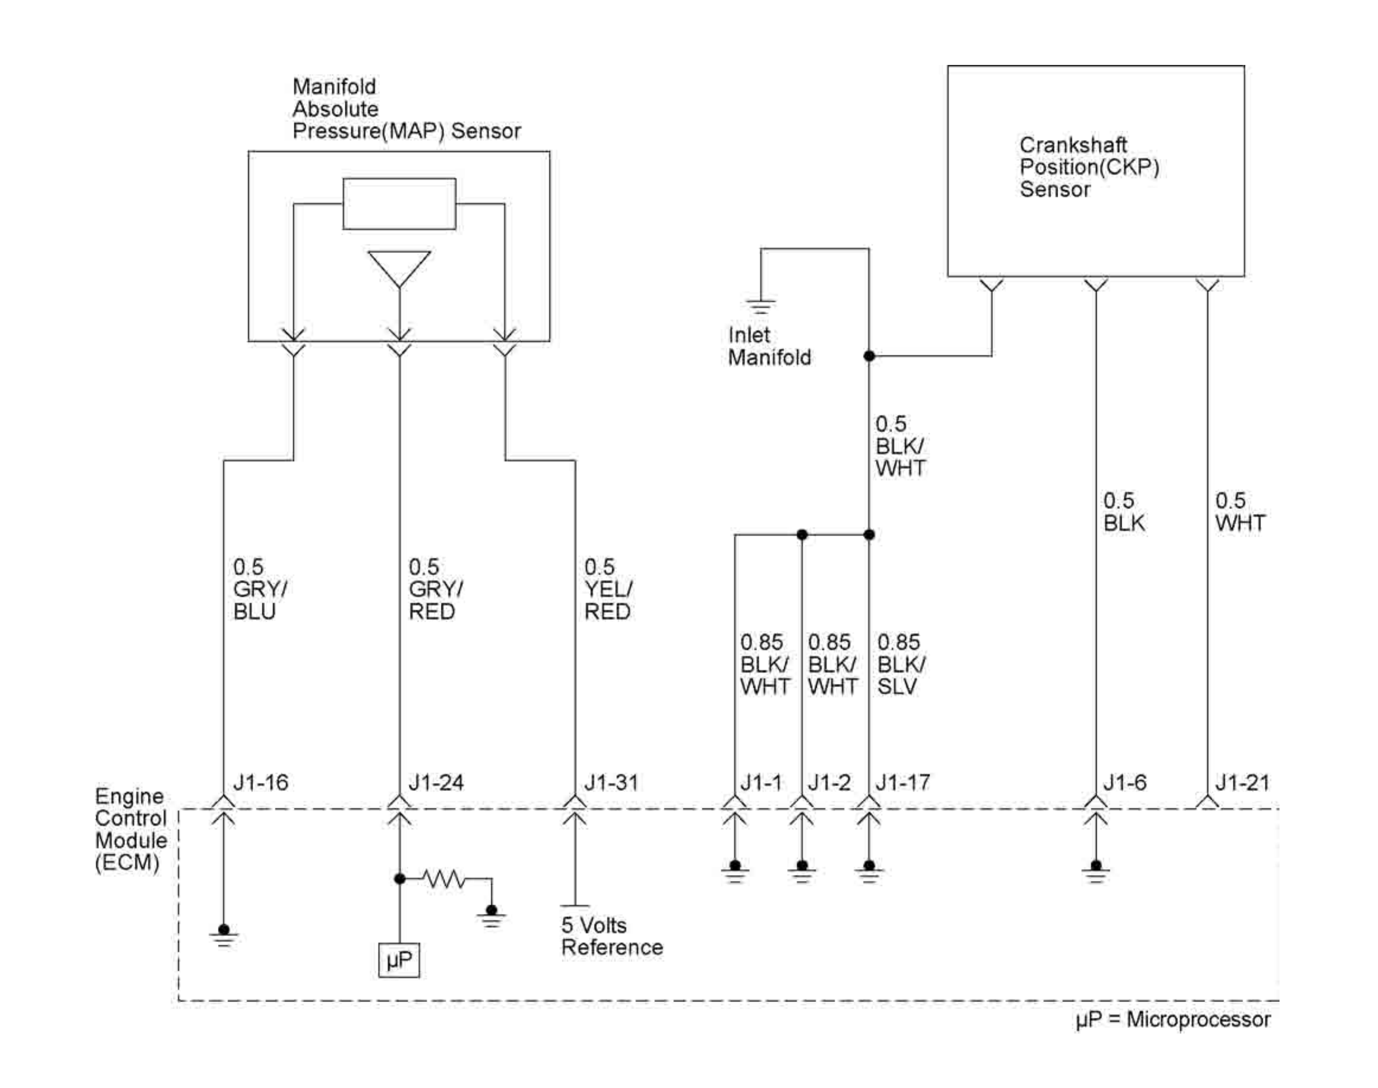
P1693	B	Tachometer Output Low Voltage	Tacho output circuit short to ground circuit.	No fail-safe function.	Tacho output circuit is correct condition.	1. Tacho output circuit short to ground circuit. 2. Poor connector connection. 3. ECM malfunction.	J2-25

DIAGNOSTIC TROUBLE CODE (DTC) P0107 MANIFOLD ABSOLUTE PRESSURE CIRCUIT LOW INPUT



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0107	A	Manifold Absolute Pressure Circuit Low Input	1. No DTC relating to TPS. 2. Throttle position is more than 0% if engine speed is below 1000rpm, or throttle position more than 5% if engine speed is more than 1000rpm. 3. MAP sensor output is below 12kPa.	The ECM uses default manifold absolute pressure value based on engine speed and throttle position.

Circuit Description

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure. The MAP sensor signal voltage to the engine control module (ECM) varies from below 2 volts at idle (low manifold pressure) to above 4 volts with the ignition ON, engine not running or at wide-open throttle (high manifold pressure).

A “speed density” method of determining engine load is used on the 2.4L engine. This is calculated using inputs from the MAP sensor, the CKP Sensor, and the Intake Air Temperature (IAT) sensor. The MAP sensor is the main sensor used in this calculation, and measuring engine load is its main function.

The ECM monitors the MAP signals for voltages outside the normal range (10-104 kPa) of the MAP sensor. If the ECM detects a MAP signal voltage that is excessively low, Diagnostic Trouble Code P0107 will be set.

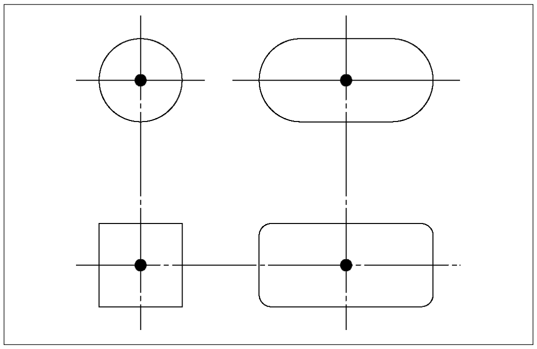
Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM - Inspect harness

BODY DIMENSIONS

Service Precaution



RUW52BSH003301

Note : Be sure to measure from the center of one hole to the center of the other hole.

connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.

- If these codes are also set, it could indicate a problem with the 5 Volt reference circuit.
- Damaged harness - Inspect the wiring harness for damage, short to ground, short to battery positive, and open circuit. If the harness appears to be OK, observe the MAP display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

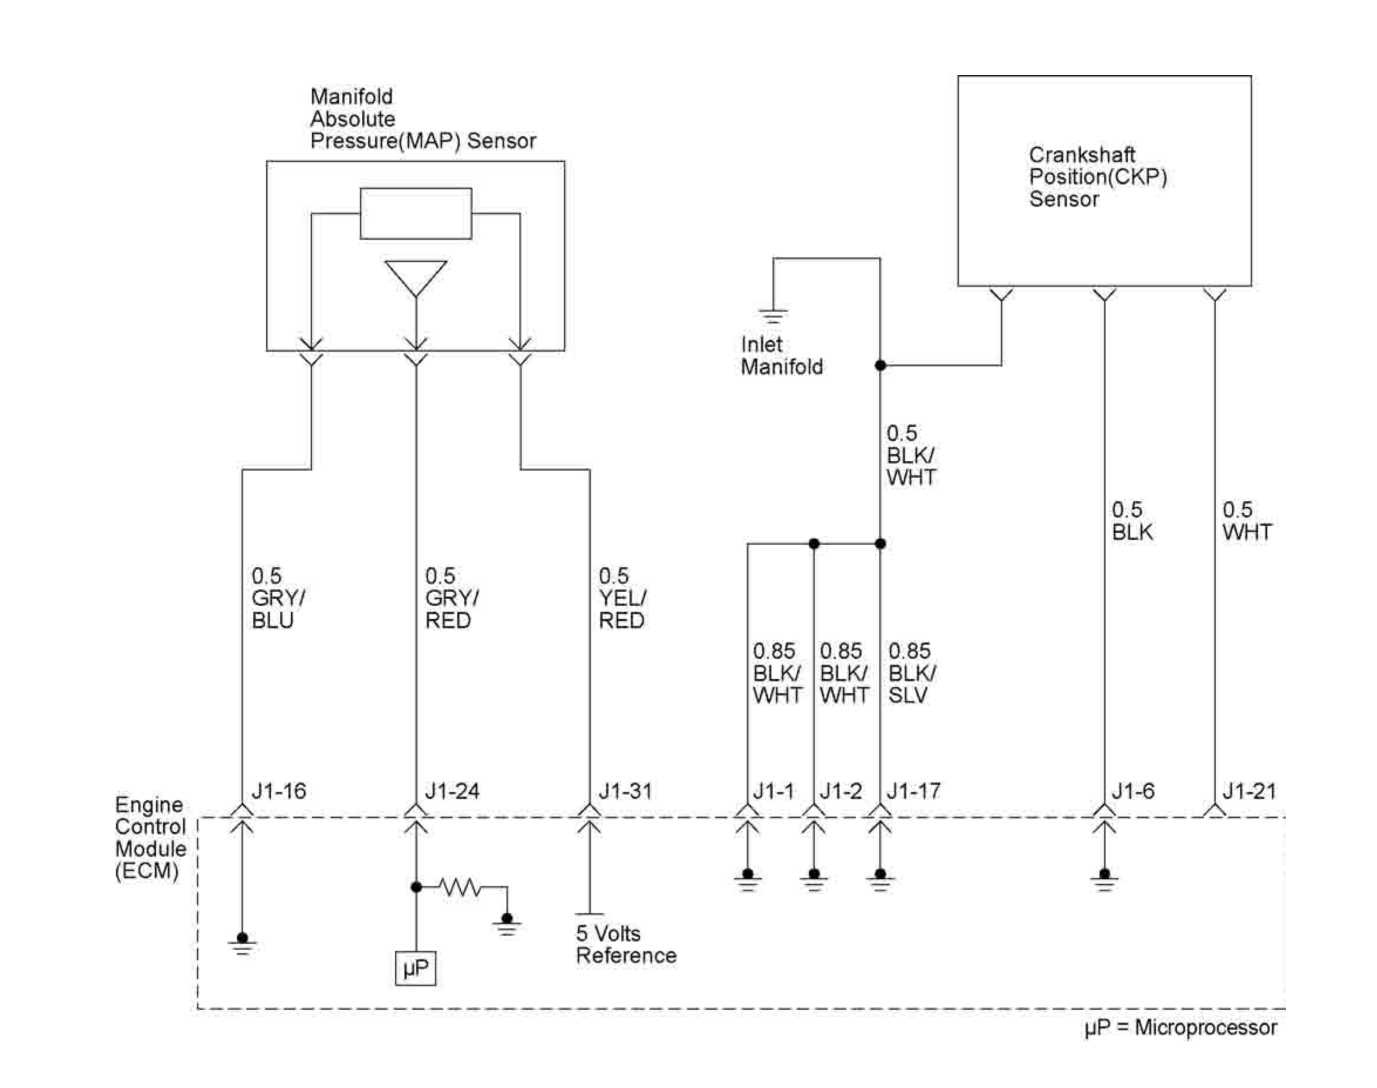
Diagnostic Trouble Code (DTC) P0107
Manifold Absolute Pressure Circuit Low Input

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select “F0: Read DTC Infor By Priority” in “F0: Diagnostic Trouble Code”. Is the DTC P0107 stored as “Present Failure”?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition “On” and engine “Off”. 2. Select “Clear DTC Information” with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the “F5: Failed This Ignition” in “F2: DTC Information”. Was the DTC P0107 stored in this ignition cycle?	—	Go to *Step 4*	Refer to *Diagnostic Aids* and Go to *Step 4*
4	Check for poor/faulty connection at the MAP sensor or ECM connector. If a poor/faulty connection is found, repair as necessary. Was the problem found? 	—	Verify repair	Go to *Step 5*
5	Visually check the MAP. Was the problem found?	—	Go to Step 9	Go to *Step 6*
6	Using the DVM and check the MAP sensor power supply circuit. 1. Ignition “On”, engine “Off”. 2. Disconnect the MAP sensor connector. 3. Check the circuit for open or short to ground circuit. Was the DVM indicated specified value? 	Approximately 5.0V	Go to *Step 8*	Go to *Step 7*

Step	Action	Value(s)	Yes	No
7	Repair the open or short to ground circuit between the ECM and MAP sensor Was the problem solved?  	—	Verify repair	Go to *Step 11*
8	Using the DVM and check the MAP sensor signal circuit. **Breaker box is available:** 1. Ignition “Off”, engine “Off”. 2. Install the breaker box as type A. (ECM disconnected) Refer to 6E-88 page. 3. Disconnect MAP sensor connector. 4. Check the circuit for open, short to sensor ground or short to ground circuit. Was the problem found?  **Breaker box is not available:** 1. Ignition “Off”, engine “Off”. 2. Disconnect the MAP sensor connector and ECM connector. 3. Check the circuit for open, short to sensor ground or short to ground circuit. Was the problem found?  	—	Repair faulty harness and verify repair	Go to *Step 9*
9	Substitute a known good MAP sensor and recheck. Was the problem solved?	—	Go to *Step 10*	Go to *Step 11*
10	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
11	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 12*

Step	Action	Value(s)	Yes	No
12	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0108 MANIFOLD ABSOLUTE PRESSURE CIRCUIT HIGH INPUT



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0108	A	Manifold Absolute Pressure Circuit High Input	1. No DTC relating to TPS. 2. Throttle position is below 15% if engine speed is below 2500rpm, or throttle position is below 35% if engine speed is more than 2500rpm. 3. Engine run time is longer than 10 seconds. 4. MAP sensor output is more than 103kPa.	The ECM uses default manifold absolute pressure value based on engine speed and throttle position.

Circuit Description

The manifold absolute pressure (MAP) sensor responds to changes in intake manifold pressure. The MAP sensor signal voltage to the engine control module (ECM) varies from below 2 volts at idle (low manifold pressure) to above 4 volts with the ignition ON, engine not running or at wide-open throttle (high manifold pressure).

A "speed density" method of determining engine load is used on the 2.4L engine. This is calculated using inputs from the MAP sensor, RPM, CKP Sensor, and the Intake Air Temperature (IAT) sensor. The MAP sensor is the main sensor used in this calculation, and measuring engine load is its main function.

The ECM monitors the MAP signals for voltages outside the normal range (10-104 kPa) of the MAP sensor. If the ECM detects a MAP signal voltage that is excessively high, Diagnostic Trouble Code P0108 will be set.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM - Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- If these codes are also set, it could indicate a problem with the 5 Volt reference circuit.
- Damaged harness - Inspect the wiring harness for damage; an open circuit, a short to ground, or a short to voltage. If the harness appears to be OK, observe the MAP display on the Tech 2 while moving connectors and wiring harnesses related to the sensor. A change in the display will indicate the location of the fault.

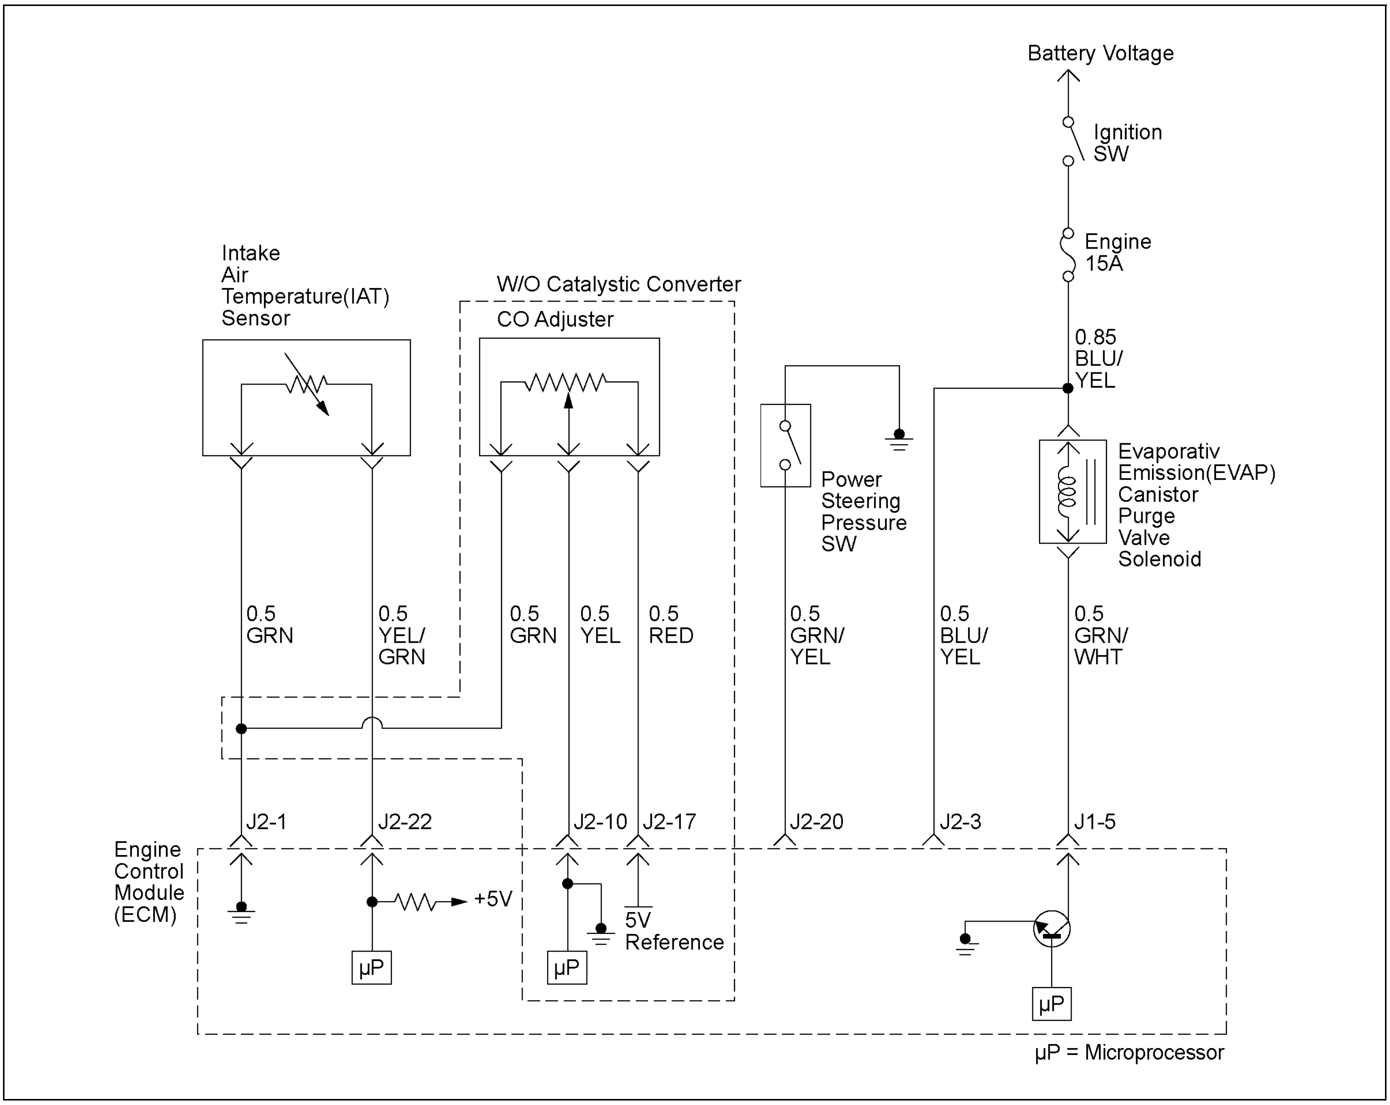
Diagnostic Trouble Code (DTC) P0108 Manifold Absolute Pressure Circuit High Input

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select “F0: Read DTC Infor By Priority” in “F0: Diagnostic Trouble Code”. Is the DTC P0108 stored as “Present Failure”?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition “On” and engine “Off”. 2. Select “Clear DTC Information” with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the “F5: Failed This Ignition” in “F2: DTC Information”. Was the DTC P0108 stored in this ignition cycle?	—	Go to *Step 4*	Refer to *Diagnostic Aids* and Go to *Step 4*
4	Check for poor/faulty connection at the MAP sensor or ECM connector. If a poor/faulty connection is found, repair as necessary. Was the problem found?  	—	Verify repair	Go to *Step 5*
5	Visually check the MAP sensor. Was the problem found?	—	Go to *Step 11*	Go to *Step 6*

Step	Action	Value(s)	Yes	No
6	Using the DVM and check the MAP sensor power supply circuit. 1. Ignition “On”, engine “Off”. 2. Disconnect the MAP sensor connector. 3. Check the circuit for short to voltage circuit. Was the DVM indicated specified value?  	Approximately 5.0V	Go to *Step 8*	Go to *Step 7*
7	Repair the short to voltage circuit between the ECM and MAP sensor. Was the problem solved?  	—	Verify repair	Go to *Step 13*
8	Using the DVM and check the MAP sensor signal circuit. 1. Ignition “On”, engine “Off”. 2. Disconnect the MAP sensor connector. 3. Check the circuit for short to power supply circuit. Was the DVM indicated specified value?  	Less than 1V	Go to *Step 9*	Repair faulty harness and verify repair
9	Using the DVM and check the MAP sensor ground circuit. 1. Ignition “On”, engine “Off”. 2. Disconnect the MAP sensor connector . 3. Check the circuit for short to power supply circuit. Was the DVM indicated specified value?  	Less than 1V	Go to *Step 10*	Repair faulty harness and verify repair

Step	Action	Value(s)	Yes	No
10	Using the DVM and check the MAP sensor ground circuit. **Breaker box is available:** 1. Ignition "Off", engine "Off". 2. Install the breaker box as type A. (ECM disconnected) Refer to 6E-88 page. 3. Disconnect the MAP sensor connector. 4. Check the circuit for open circuit. Was the problem found?  **Breaker box is not available:** 1. Ignition "Off", engine "Off". 2. Disconnect the MAP sensor connector and ECM connector. 3. Check the circuit for open circuit. Was the problem found? 	—	Repair faulty harness and verify repair	Go to *Step 11*
11	Substitute a known good MAP sensor and recheck. Was the problem solved?	—	Go to Step 12	Go to *Step 13*
12	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
13	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***"SPS (Service Programming System)".*** Was the problem solved?	—	Verify repair	Go to *Step 14*
14	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0112 INTAKE AIR TEMPERATURE SENSOR LOW INPUT



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0112	A	Intake Air Temperature Sensor Low Input	1. No DTC relating to VSS. 2. Vehicle speed is more than 25km/h. 3. Engine run time is longer than 120 seconds. 4. IAT sensor output is more than 149 deg. C.	The ECM uses 20 deg. C condition as substitute.

Circuit Description

The intake air temperature (IAT) sensor is a thermistor which measures the temperature of the air entering the engine. The engine control module (ECM) applies 5 volts through a pull-up resistor to the IAT sensor. When the intake air is cold, the sensor resistance is high and the ECM will monitor a high signal voltage on the IAT signal circuit. If the intake air is warm, the sensor resistance is lower, causing the ECM to monitor a lower voltage. Diagnostic Trouble Code P0112 will set when the ECM detects an excessively low signal voltage (short to ground) on the intake air temperature sensor signal circuit.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM - Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness - Inspect the wiring harness for damage, short to ground, short to battery and open

circuit. If the harness appears to be OK, observe the IAT display on the Tech 2 while moving connectors and wiring harnesses related to the IAT sensor. A change in the IAT display will indicate the location of the fault.

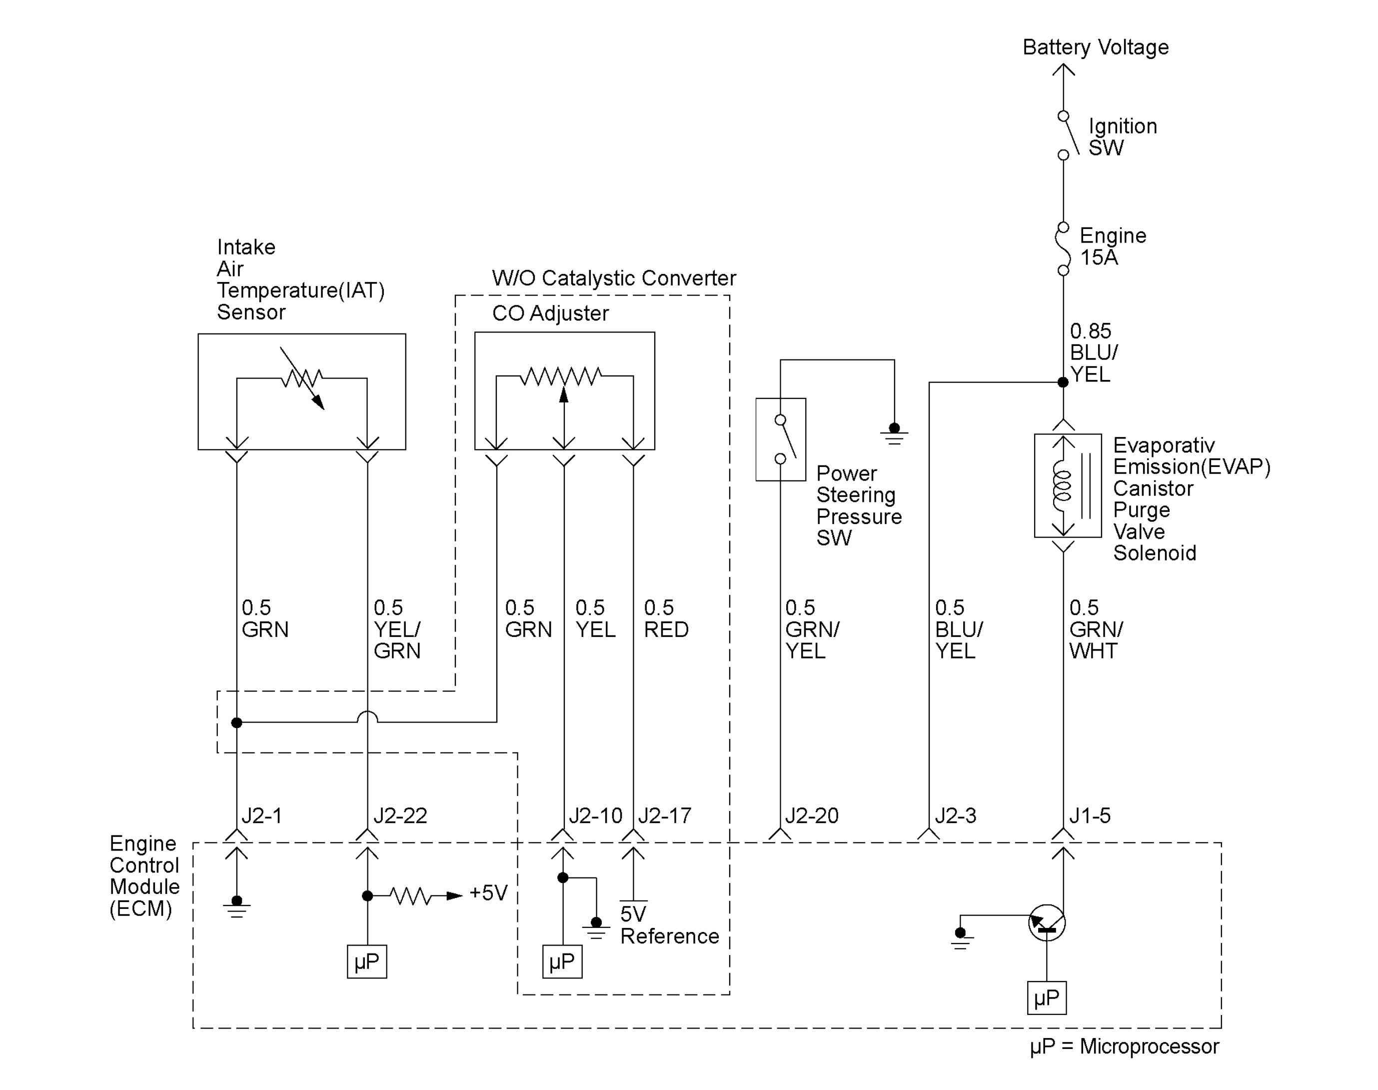
DIAGNOSTIC TROUBLE CODE (DTC) P0113 INTAKE AIR TEMPERATURE SENSOR HIGH INPUT



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0113	A	Intake Air Temperature Sensor High Input	1. No DTC relating to VSS & ECT sensor. 2. Vehicle speed is below 70km/h. 3. 3Engine coolant temperature is more than -8 deg. C. 4. Engine run time is longer than 120 seconds. 5. Mass air flow is below 30g/s. 6. IAT sensor output is below -38 deg. C.	The ECM uses 20 deg. C condition as substitute.

Circuit Description

The intake air temperature (IAT) sensor is a thermistor which measures the temperature of the air entering the engine. The engine control module (ECM) applies 5 volts through a pull-up resistor to the IAT sensor. When the intake air is cold, the sensor resistance is high and the ECM will monitor a high signal voltage on the IAT signal circuit. If the intake air is warm, the sensor resistance is lower causing the ECM to monitor a lower voltage. Diagnostic Trouble Code P0113 will set when the ECM detects an excessively high signal voltage on the intake air temperature sensor signal circuit.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM - Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.

- Damaged harness - Inspect the wiring harness for damage, short to ground, short to battery positive, and open circuit. If the harness appears to be OK, observe the IAT display on the Tech 2 while moving connectors and wiring harnesses related to the IAT sensor. A change in the IAT display will indicate the location of the fault.

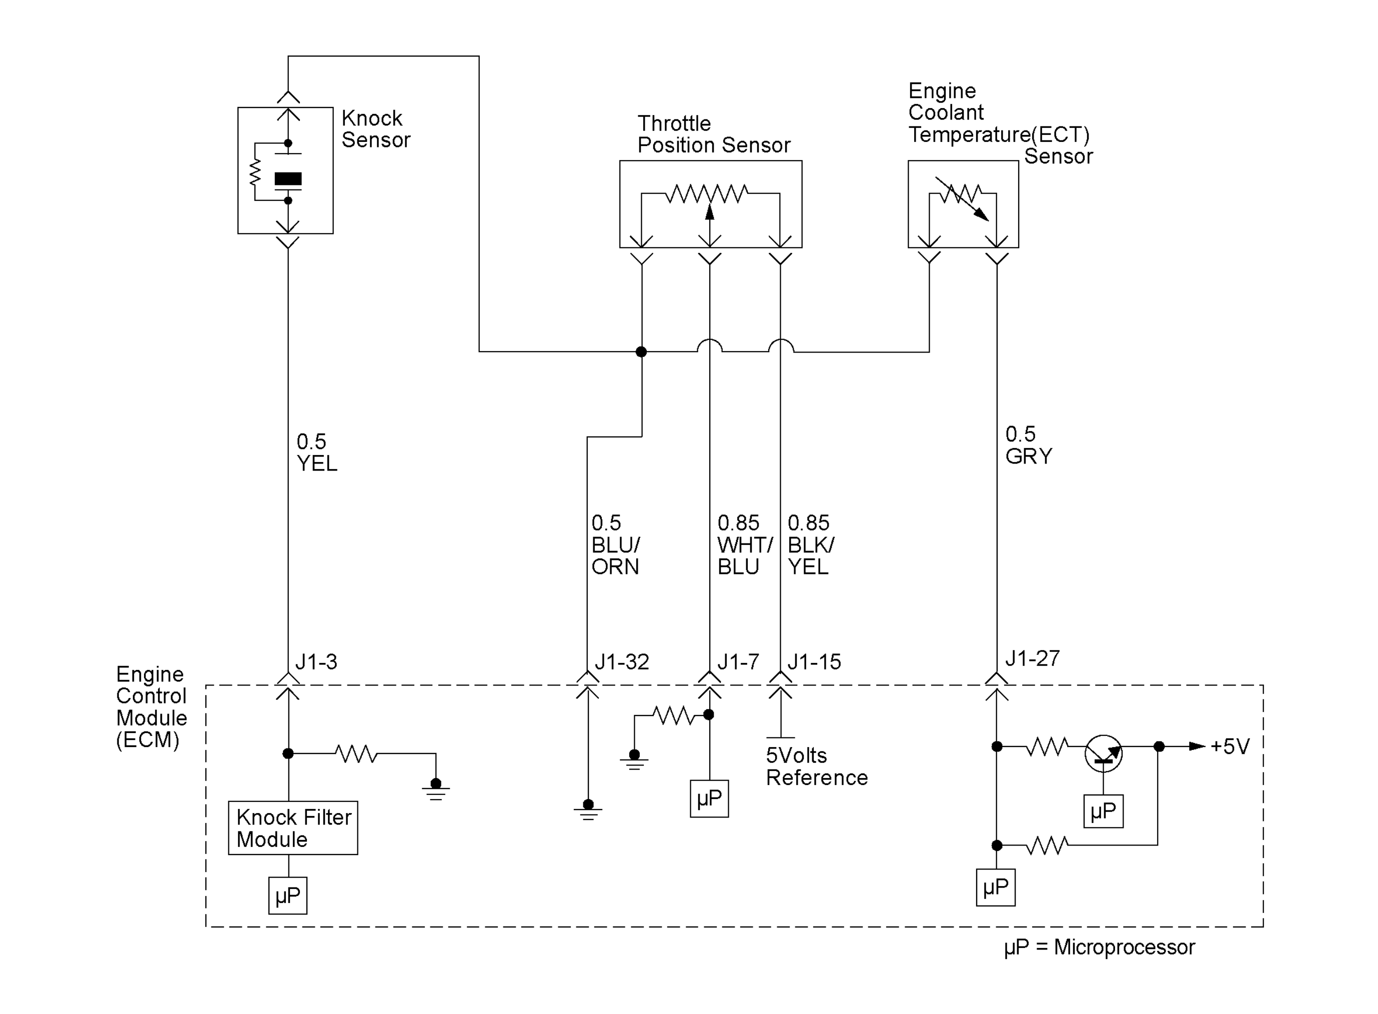
DIAGNOSTIC TROUBLE CODE (DTC) P0117 ENGINE COOLANT TEMPERATURE SENSOR LOW INPUT



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0117	A	Engine Coolant Temperature Sensor Low Input	1. Engine run time is longer than 120 seconds. 2. ECT sensor output is more than 149 deg. C.	The ECM uses default engine coolant temperature value based on intake air temperature and engine run time.

Circuit Description

The engine coolant temperature (ECT) sensor is a thermistor mounted in the engine coolant stream. The engine control module (ECM) applies a voltage (about 5 volts) through a pull-up resistor to the ECT signal circuit. When the engine coolant is cold, the sensor (thermistor) resistance is high, therefore the ECM will measure a high signal voltage. As the engine coolant warms, the sensor resistance becomes lower, and the ECT signal voltage measured at the ECM drops. Diagnostic Trouble code P0117 set when the ECM detects an excessively low signal voltage on the engine coolant temperature sensor signal circuit.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM - Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness - Inspect the wiring harness for damage, short to ground, short to battery positive, and open circuit. If the harness appears to be OK, observe the ECT display on the Tech 2 while moving connectors and wiring harnesses related to the ECT sensor. A change in the ECT display will indicate the location of the fault.

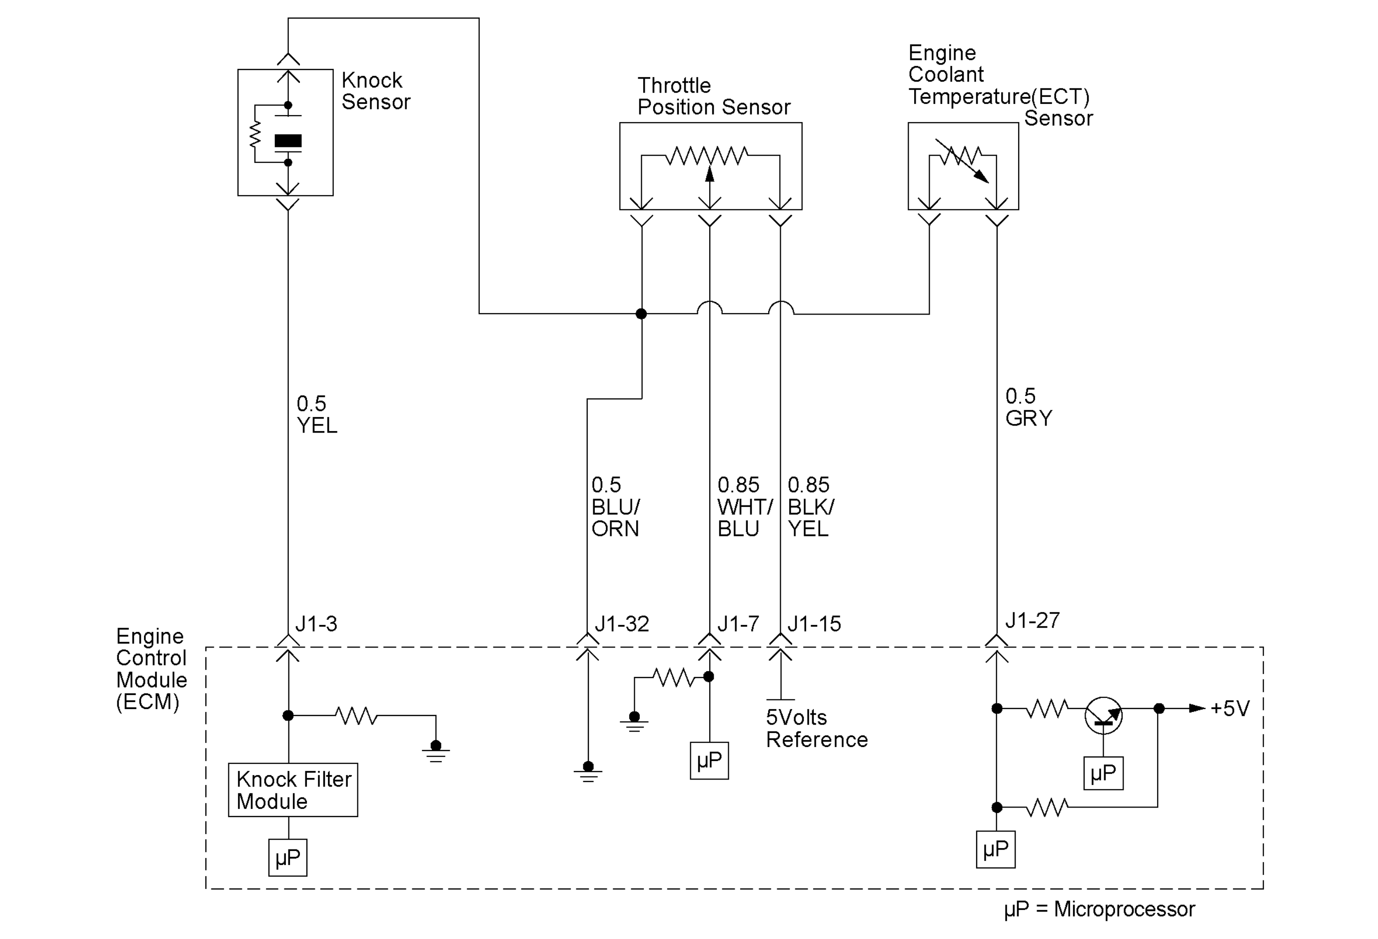
15	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0122 THROTTLE POSITION SENSOR LOW INPUT



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0122	A	Throttle Position Sensor Low Input	TPS output voltage is below 0.14V.	The ECM uses 0% condition as substitute.

Circuit Description

The throttle position sensor circuit provides a signal voltage that changes relative to throttle blade angle. The signal voltage will vary from below 1 volt at closed throttle to about 4 volts at wide open throttle (WOT).
The TPS signal is used by the engine control module (ECM) for fuel control and most of the ECM-controlled outputs. If the ECM detect a continuous short to ground in the TPS or circuit, then a code P0122 will set.

Diagnostic Aids

- Poor connection at ECM - Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness - Inspect the wiring harness for damage, short to ground, short to battery positive, and open circuit. If the harness appears to be OK, observe the throttle position display on the Tech 2 while moving connectors and wiring harnesses related to the TPS. A change in the display will indicate the location of the fault.

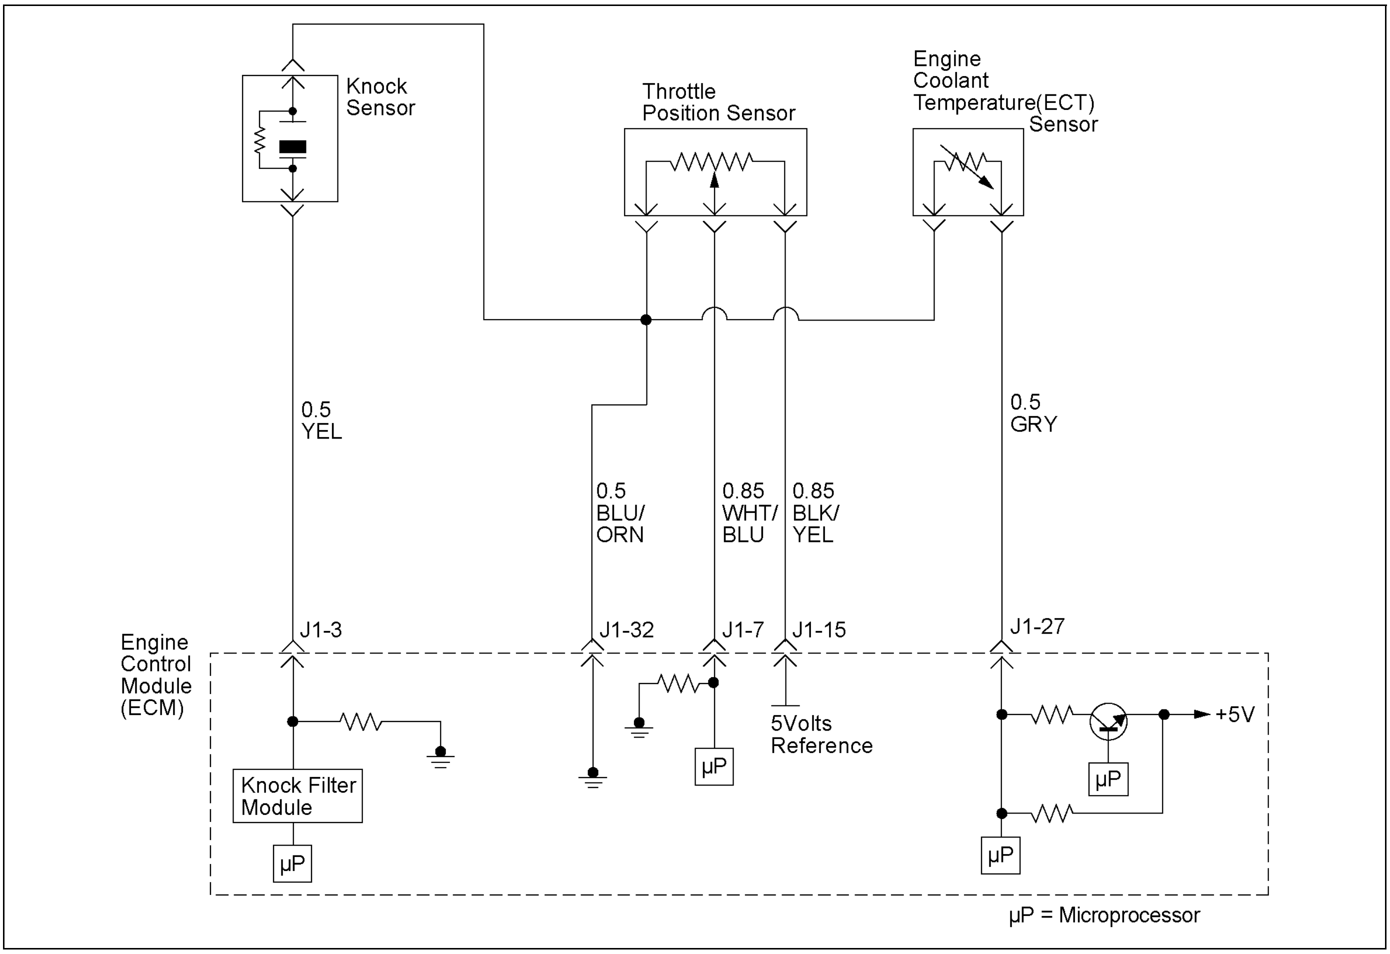
Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0123 THROTTLE POSITION SENSOR HIGH INPUT



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0123	A	Throttle Position Sensor High Input	TPS output voltage is more than 4.9V.	The ECM uses 0% condition as substitute.

Circuit Description

The throttle position sensor circuit provides a voltage signal that changes relative to throttle blade angle. The signal voltage will vary from below 1 volt at closed throttle to about 4 volts at wide open throttle (WOT).
The TPS is used by the engine control module (ECM) for fuel control and most of the ECM-controlled outputs.
If the ECM detect a continuous short voltage in the TPS or circuit, then a code P0123 will set.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM - Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- If these codes are also set, it could indicate a problem with the 5 Volt reference circuit or components itself.
- Damaged harness - Inspect the wiring harness for damage, short to ground, short to battery positive and open circuit. If the harness appears to be OK, observe the Throttle Position sensor display on the Tech 2 while moving connectors and wiring harnesses related to the TP sensor. A change in the display will indicate the location of the fault.

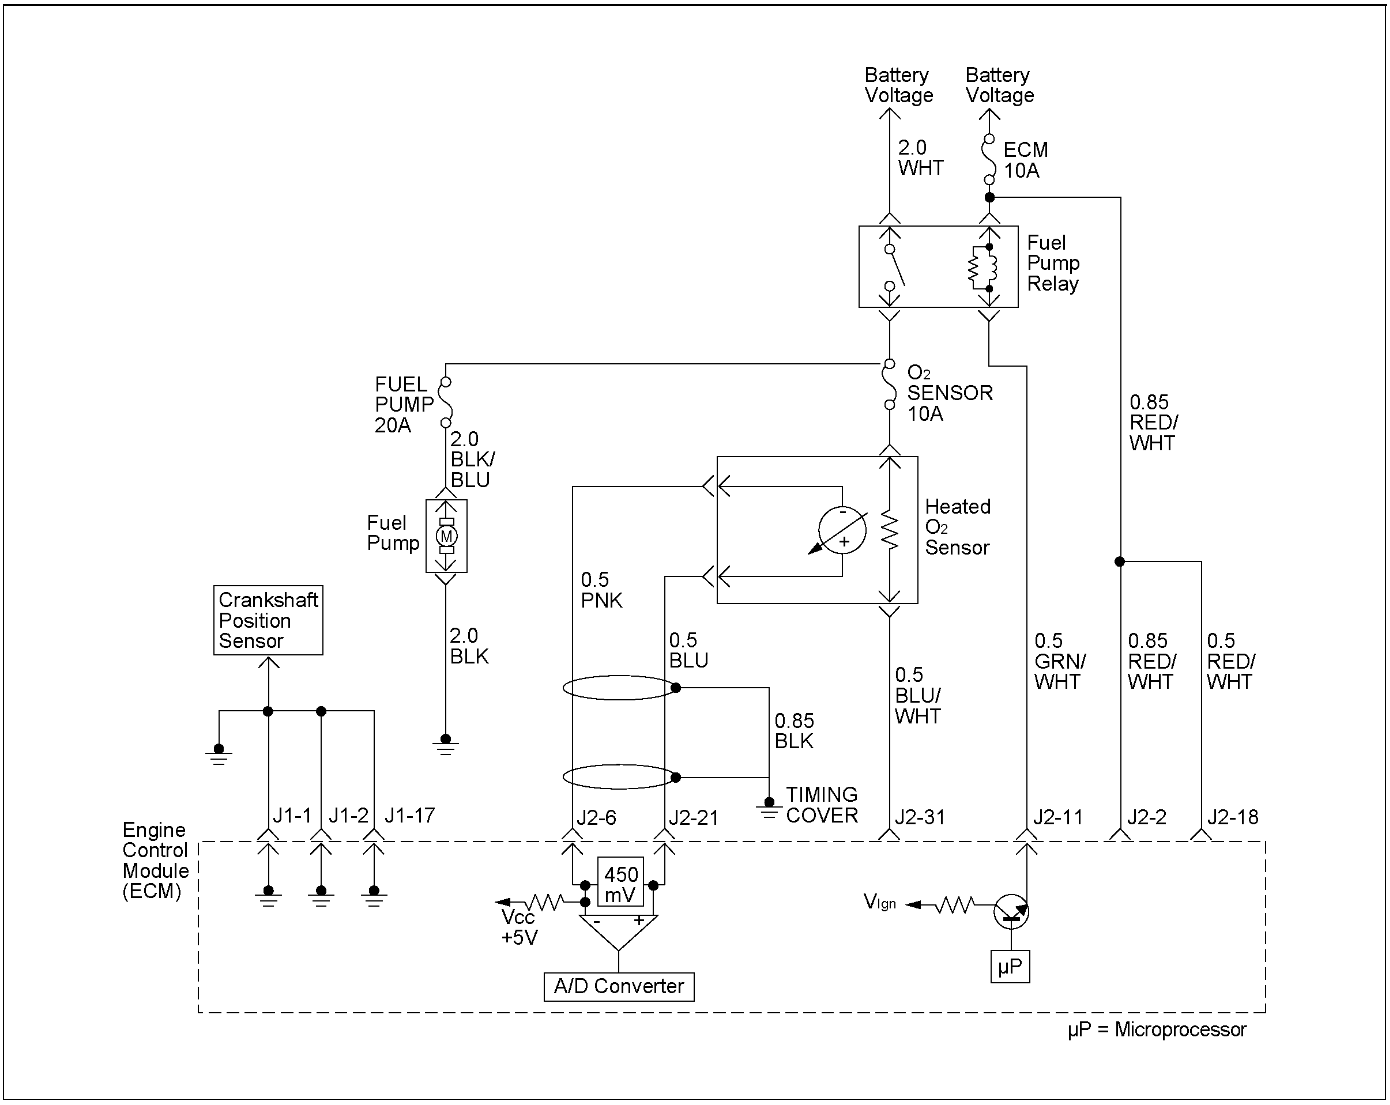
DIAGNOSTIC TROUBLE CODE (DTC) P0131 O_2 SENSOR CIRCUIT LOW VOLTAGE (BANK 1 SENSOR 1)



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0131	A	O_2 SensorCircuit Low Voltage (Bank 1 Sensor 1)	1. No DTC relating to MAP sensor, TPS, EVAP purge, ECT sensor, CKP sensor, VSS, injector control circuit and ignition control circuit. 2. Engine coolant temperature is more than 60 deg. C. 3. O_2 sensor bank 1 output voltage is below 50mV in "Closed Loop" condition.	"Open Loop" fuel control.

Circuit Description

The engine control module (ECM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO2S) signal and low circuits. The oxygen sensor varies the voltage within a range of about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean. The ECM constantly monitors the HO2S signal during "Closed Loop" operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary. If the Bank 1 HO2S 1 voltage remains excessively low for an extended period of time, Diagnostic Trouble Code P0131 will be set.

Diagnostic Aids

Check for the following conditions:

- Heated oxygen sensor wiring - The sensor pigtail may be routed incorrectly and/or contacting the exhaust system. Also, check for shorts to ground, shorts to battery positive and open circuits.

- Poor ECM to engine block grounds.
- Fuel pressure - The system will go lean if pressure is too low. The ECM can compensate for some decrease. However, if fuel pressure is too low, a Diagnostic Trouble Code P0131 may be set. Refer to Fuel System Diagnosis.
- Lean injector(s) - Perform “Injector Balance Test.”
- Vacuum leaks - Check for disconnected or damaged vacuum hoses and for vacuum leaks at the intake manifold, throttle body, EGR system, and PCV system.
- Exhaust leaks - An exhaust leak may cause outside air to be pulled into the exhaust gas stream past the HO2S, causing the system to appear lean. Check for exhaust leaks that may cause a false lean condition to be indicated.
- Fuel contamination - Water, even in small amounts, can be delivered to the fuel injectors. The water can cause a lean exhaust to be indicated. Excessive alcohol in the fuel can also cause this condition. For the procedure to check for fuel contamination, Refer to Fuel System Diagnosis.

Diagnostic Trouble Code (DTC) P0131
O_2 Sensor Circuit Low Voltage (Bank 1 Sensor 1)

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select “F0: Read DTC Infor By Priority” in “F0: Diagnostic Trouble Code”. Is the DTC P0131 stored as “Present Failure”?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*

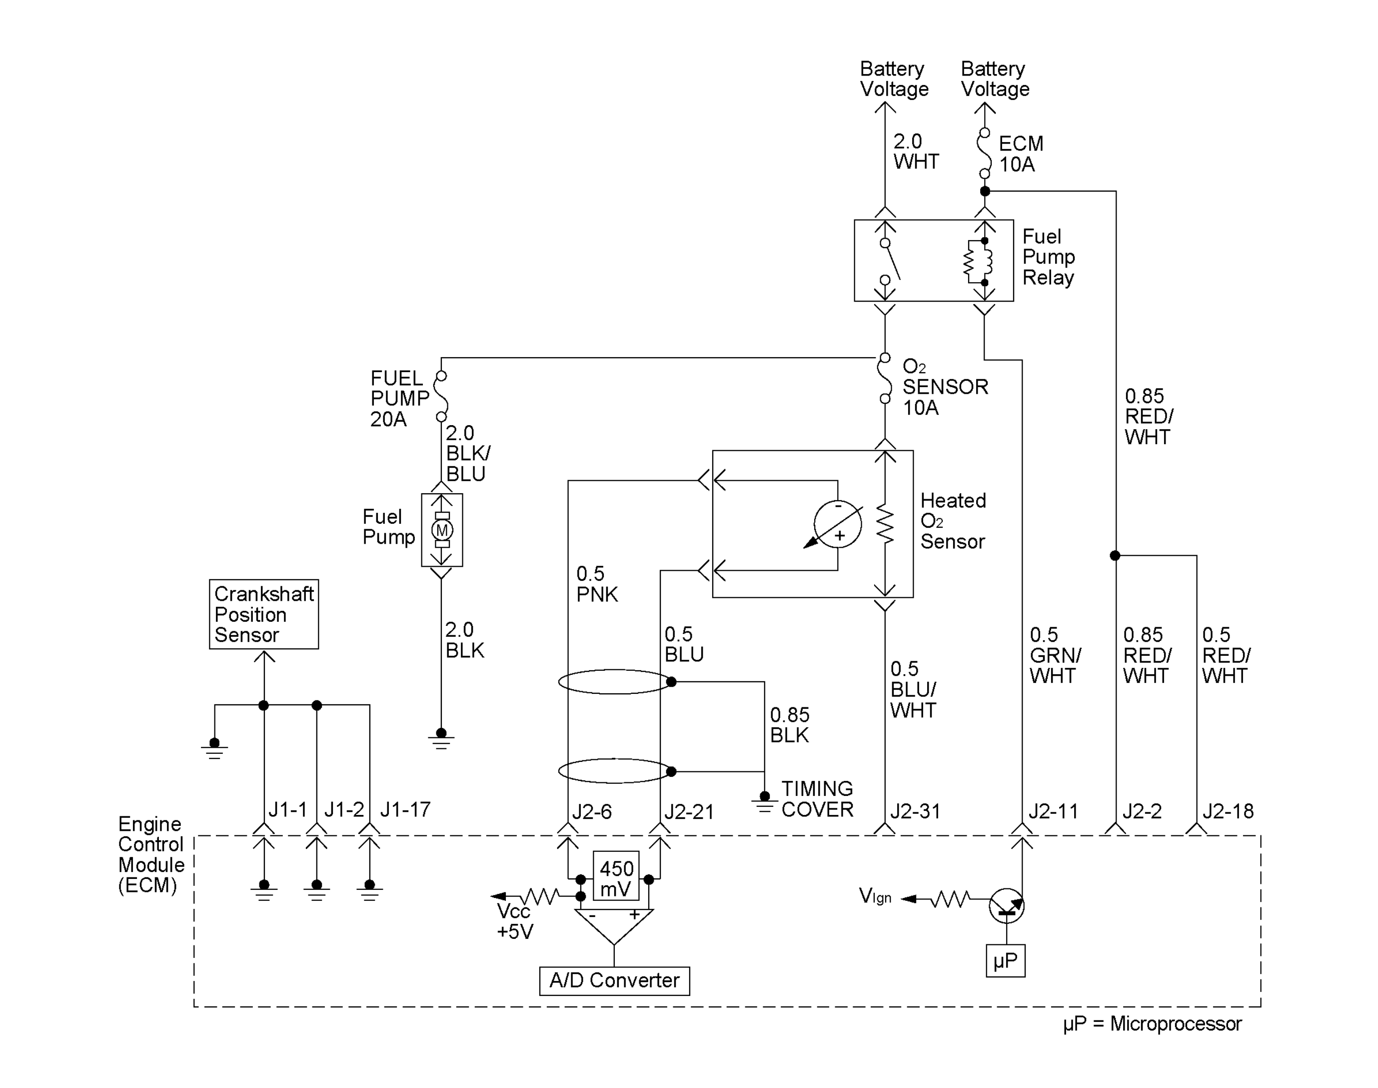
16	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 17*
17	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0132 O_2 SENSOR CIRCUIT HIGH VOLTAGE (BANK 1 SENSOR 1)



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0132	A	O_2 Sensor Circuit High Voltage (Bank 1 Sensor 1)	1. No DTC relating to MAP sensor, TPS, EVAP purge, ECT sensor, CKP sensor, VSS, injector control circuit and ignition control circuit. 2. Engine coolant temperature is more than 60 deg. C. 3. O_2 sensor bank 1 output voltage is more than 952mV in “Closed Loop” condition.	“Open Loop” fuel control.

Circuit Description

The engine control module (ECM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO2S) signal and low circuits. The oxygen sensor varies the voltage within a range of about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean. The ECM constantly monitors the HO2S signal during “Closed Loop” operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary. If the Bank 1 HO2S 1 voltage remains excessively high for an extended period of time, Diagnostic Trouble Code P0132 will be set.

Diagnostic Aids

Check the following items:

- Fuel pressure - The system will go rich if pressure is too high. The ECM can compensate for some increase. However, if fuel pressure is too high, a Diagnostic Trouble Code P0132 may be set. Refer to

BACK TO CHAPTER INDEX

ISUZU KB P190 2007
TO MODEL INDEX

Fuel System Diagnosis.

- Perform "Injector Balance Test" - Refer to Fuel System Diagnosis.
- Check the EVAP canister for fuel saturation - If full of fuel, check canister control and hoses. Refer to Evaporative (EVAP) Emission Control System.
- Check for a leak in the fuel pressure regulator diaphragm by checking the vacuum line to the regulator for the presence of fuel.
- An intermittent TPS output will cause the system to go rich due to a false indication of the engine accelerating.
- Silicon contamination of the HO2S can also cause a high HO2S voltage to be indicated. This condition is indicated by a powdery white deposit on the portion of the HO2S exposed to the exhaust stream. If contamination is noticed, replace the affected HO2S.

Diagnostic Trouble Code (DTC) P0132
O_2 Sensor Circuit High Voltage (Bank 1 Sensor 1)

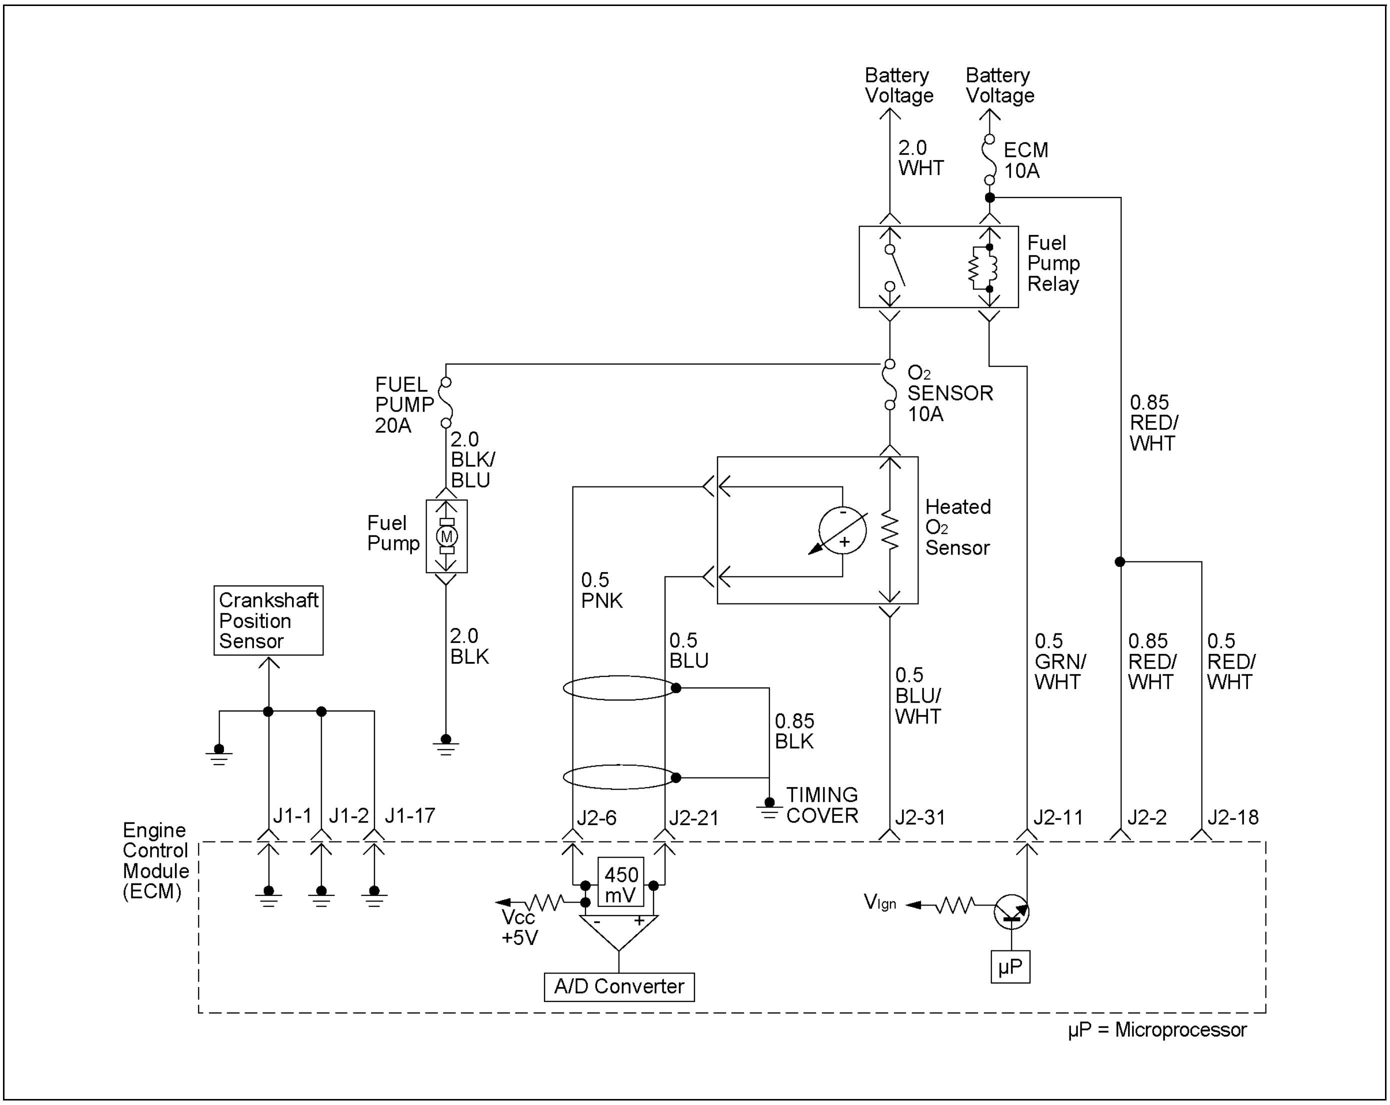
14	Check for fuel pressure. Refer to *"Fuel System Diagnosis"* 6E-108 page. Was the fuel pressure correct?	—	Go to *Step 15*	Refer to *Fuel System Diagnosis*
15	Replace the O_2 sensor. Was the problem solved?	—	Verify repair	Go to *Step 16*
16	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***"SPS (Service Programming System)".*** Was the problem solved?	—	Verify repair	Go to *Step 17*
17	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0134 O_2 SENSOR NO ACTIVITY DEFECTED (BANK 1 SENSOR 1)



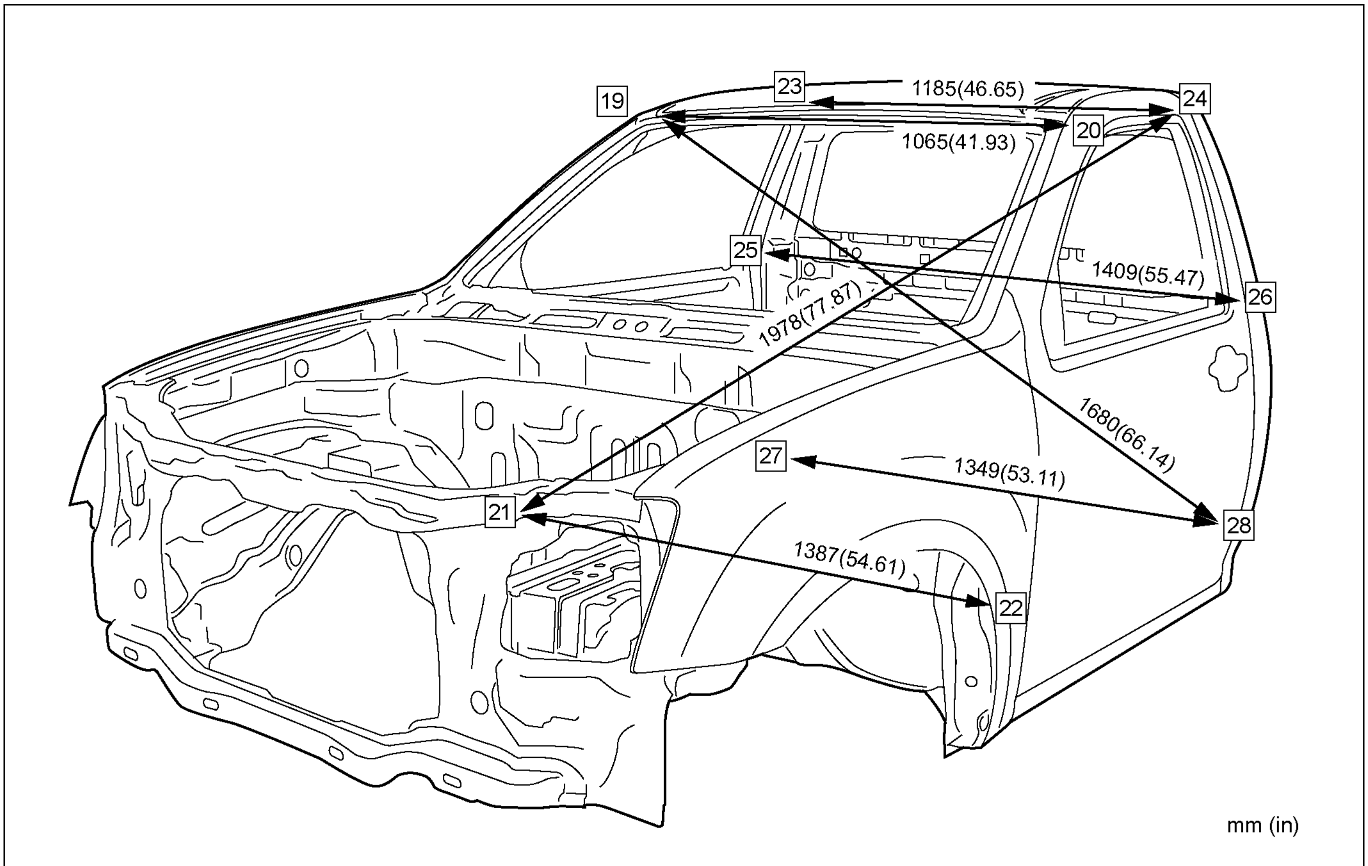
Condition for setting the DTC and action taken when the DTC sets

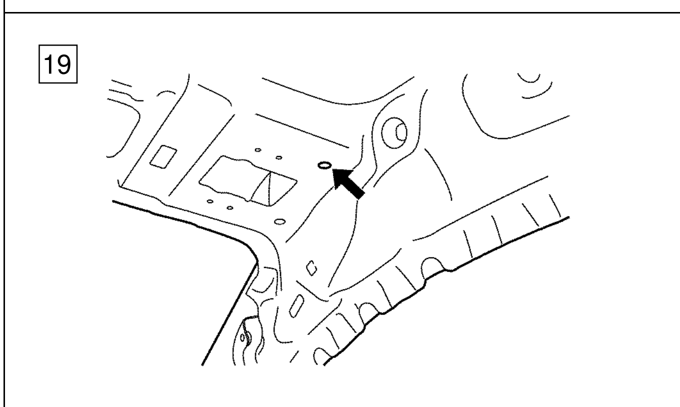
Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0134	A	O_2 Sensor Circuit No Activity Detected (Bank 1 Sensor 1)	1. No DTC relating to MAP sensor, TPS, EVAP purge, ECT sensor, CKP sensor, VSS, injector control circuit and ignition control circuit. 2. Engine coolant temperature is more than 60 deg.C. 3. Engine run time is longer than 40 seconds. 4. Mass air flow is more than 7g/s. 5. O_2 sensor bank 1 output voltage is between 300mV and 600mV.	“Open Loop” fuel control.

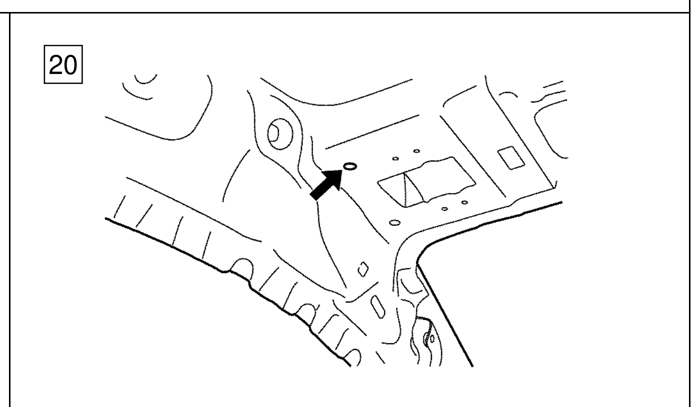
Circuit Description

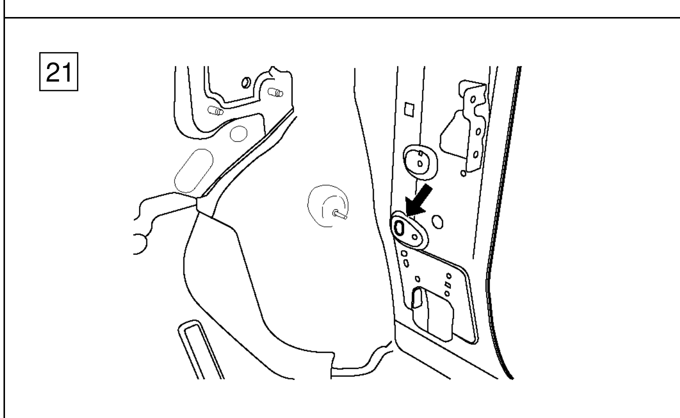
The engine control module (ECM) supplies a bias voltage of about 450 mV between the heated oxygen sensor (HO2S) high and low circuits. The oxygen sensor varies the voltage within a range of about 1000 mV when the exhaust is rich, down through about 10 mV when exhaust is lean. The ECM constantly monitors the HO2S signal during “Closed Loop” operation and compensates for a rich or lean condition by decreasing or increasing injector pulse width as necessary. If the Bank 1 HO2S 1 voltage remains at or near the 450 mV bias for an extended period of time, Diagnostic Trouble Code P0134 will be set, indicating an open sensor signal or sensor low circuit.

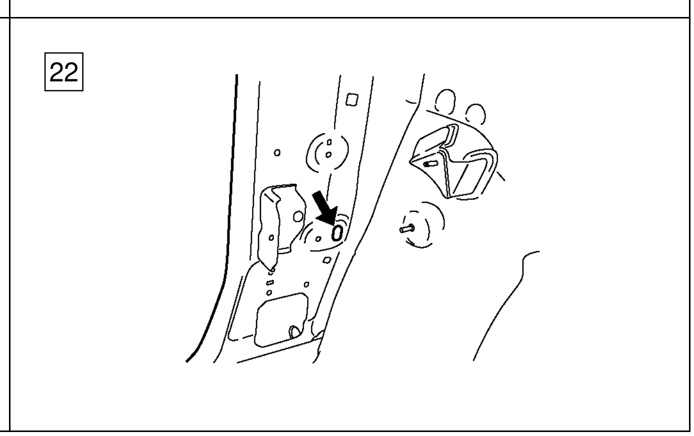
ROOM SECTION (REGULAR CAB)











Diagnostic Aids

Check for the following conditions:

- Poor connection or damaged harness - Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.

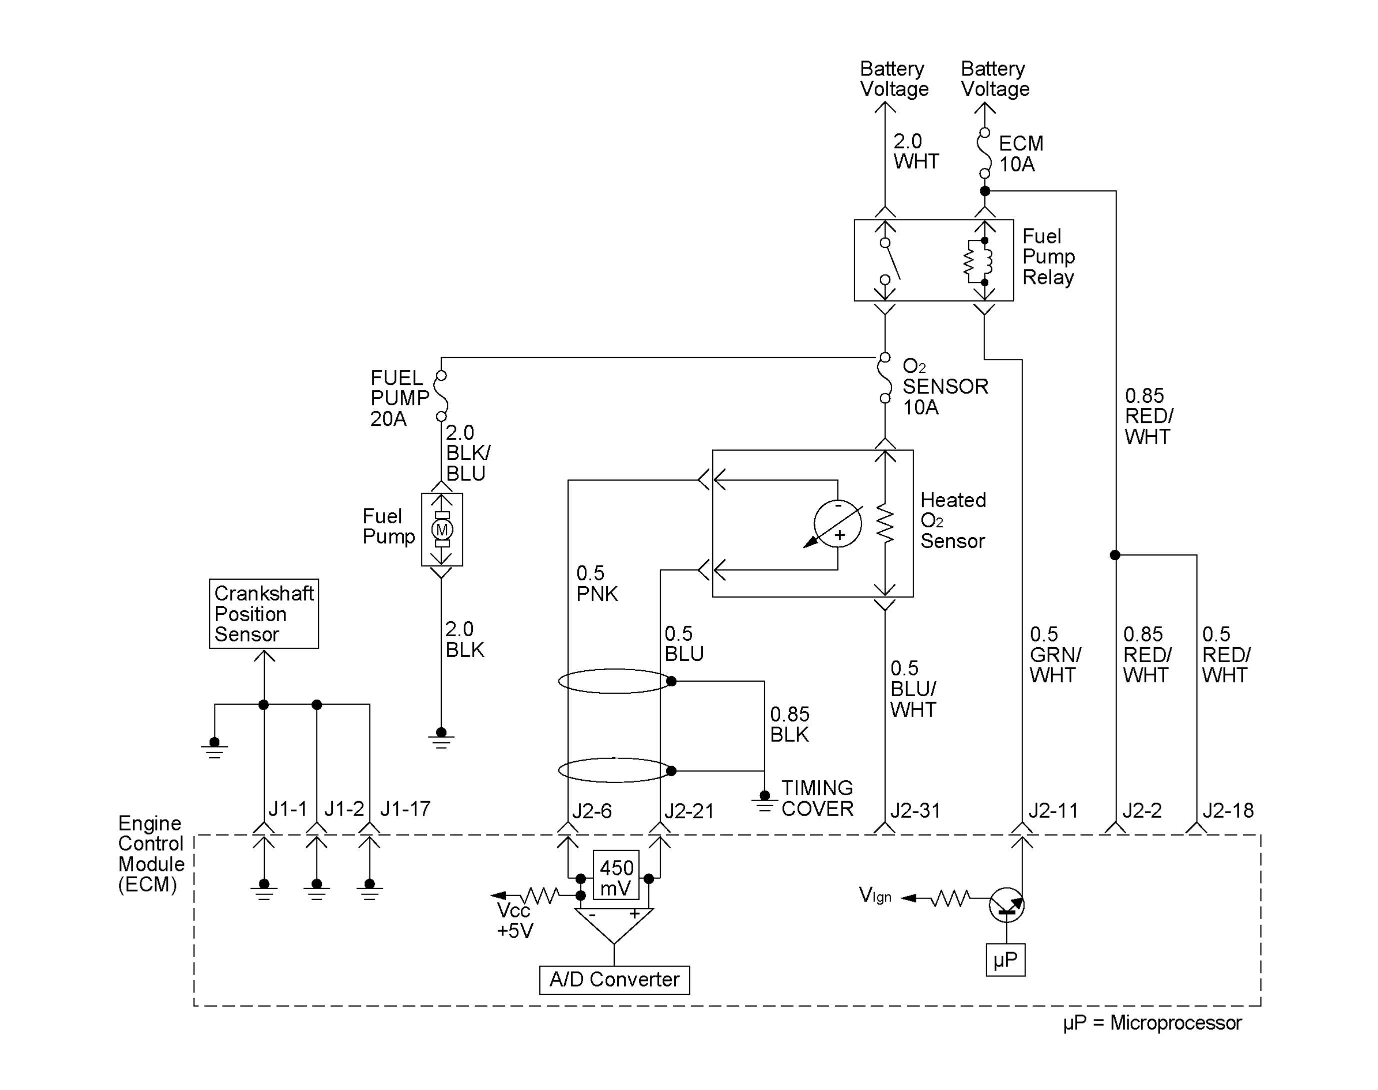
Diagnostic Trouble Code (DTC) P0134
O_2 Sensor Circuit No Activity Detected (Bank 1 Sensor 1)

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select “F0: Read DTC Infor By Priority” in “F0: Diagnostic Trouble Code”. Is the DTC P0134 stored as “Present Failure”?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition “On” and engine “Off”. 2. Select “Clear DTC Information” with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the “F5: Failed This Ignition” in “F2: DTC Information”. Was the DTC P0134 stored in this ignition cycle?	—	Go to *Step 4*	Refer to *Diagnostic Aids* and Go to *Step 4*
4	Check for poor/faulty connection at the O_2 sensor or ECM connector. If a poor/faulty connection is found, repair as necessary. Was the problem found? 	—	Verify repair	Go to *Step 5*
5	Using the DVM and check the O_2 sensor circuit. 1. Ignition “On”, engine “Off”. 2. Disconnect the O_2 sensor connector. 3. Check the circuit for open circuit. Was the DVM indicated specified value? 	Approximatly 450mV	Go to *Step 7*	Go to *Step 6*

Step	Action	Value(s)	Yes	No
6	Using the DVM and check the O_2 sensor circuit. **Breaker box is available:** 1. Ignition “Off”, engine “Off”. 2. Install the breaker box as type A. (ECM disconnected) Refer to 6E-88 page. 3. Disconnect the O_2 sensor. 4. Check the circuit for open circuit. Was the problem found?  **Breaker box is not available:** 1. Ignition “Off”, engine “Off”. 2. Disconnect the O_2 sensor connector and ECM connector. 3. Check the circuit for open circuit. Was the problem found? 	—	Repair faulty harness and verify repair	Go to *Step 13*
7	1. Using the Tech 2, ignition “On” and engine “On”. 2. Monitor the “Manifold Absolute Pressure” in the data display. Does the Tech 2 indicate correct “Manifold Absolute Pressure” in accordance with engine speed or acceleration?	—	Go to *Step 9*	Go to *Step 8*
8	Remove the MAP sensor and check for the following conditions. • Objects blocking the air cleaner. • Objects blocking the MAP sensor. • Objects blocking the throttle valve. • Vacuum leaking at intake duct. • Vacuum leaking at throttle body. If a problem is found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 9*
9	1. Using the Tech 2, ignition “On” and engine “On”. 2. Select the “Miscellaneous Test” and perform the “IAC Control” in the “IAC System”. 3. Operate the Tech 2 in accordance with procedure. Was the engine speed changed, when the IAC valve is operating step by step?	—	Go to *Step 11*	Go to *Step 10*

Step	Action	Value(s)	Yes	No
10	Check for the following conditions. • Objects blocking the IAC valve. • Objects blocking the throttle valve. • Vacuum leaking at throttle body. If a problem is found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 11*
11	Check for injector for the affected bank. Refer to *"Injector Coil Test & Injector Balance Test Procedure"* 6E-98 page. Was the injector operation correct?	—	Go to *Step 12*	Refer to *Injector Coil Test & Injector Balance Test Procedure*
12	Check for fuel pressure. Refer to *"Fuel System Diagnosis"* 6E-108 page. Was the fuel pressure correct?	—	Go to *Step 13*	Refer to *Fuel System Diagnosis*
13	Replace the O_2 sensor. Was the problem solved?	—	Verify repair	Go to *Step 14*
14	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***"SPS (Service Programming System)".*** Was the problem solved?	—	Verify repair	Go to *Step 15*
15	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0135 O_2 SENSOR HEATER CIRCUIT (BANK 1 SENSOR 1)



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0135	A	O_2 SensorHeater Circuit (Bank 1 Sensor 1)	1. No DTC relating to MAP sensor and ECT sensor. 2. Engine coolant temperature is more than 60 deg. C. 3. Engine run time is longer than 20 seconds. 4. MAP sensor output is more than 70kPa. 5. O_2 sensor bank 1 heater current more than 10mA.	No fail-safe function.

Circuit Description

Heated oxygen sensors are used to minimize the amount of time required for “Closed Loop” fuel control operation and to allow accurate catalyst monitoring. The oxygen sensor heater greatly decreases the amount of time required for fuel control sensors Bank 1 HO2S 1 1 to become active. Oxygen sensor heaters are required by catalyst monitor sensors Bank 1 HO2S 2 to maintain a sufficiently high temperature which allows accurate exhaust oxygen content readings further from the engine.

The engine control module (ECM) will run the heater test only after a cold start (determined by engine coolant and intake air temperature at the time of start-up) and only once during an ignition cycle. When the engine is started the ECM will monitor the HO2S voltage. When the HO2S voltage indicates a sufficiently active sensor, the ECM looks at how much time has elapsed since start-up. If the ECM determines that too much time was required for the Bank 1 HO2S 1 to become active, a Diagnostic Trouble Code P0135 will set.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM - Inspect harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness - Inspect the wiring harness for damage; shorts to ground, shorts to battery positive and open circuits.

Diagnostic Trouble Code (DTC) P0135
O_2 Sensor Heater Circuit (Bank 1 Sensor 1)

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select "F0: Read DTC Infor By Priority" in "F0: Diagnostic Trouble Code". Is the DTC P0135 stored as "Present Failure"?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition "On" and engine "Off". 2. Select "Clear DTC Information" with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the "F5: Failed This Ignition" in "F2: DTC Information". Was the DTC P0135 stored in this ignition cycle?	—	Go to *Step 4*	Refer to *Diagnostic Aids* and Go to *Step 4*
4	Check for poor/faulty connection at the O_2 sensor or ECM connector. If a poor/faulty connection is found, repair as necessary. Was the problem found? C56(J2)  E77 	—	Verify repair	Go to *Step 5*
5	Visually check the O_2 sensor. Was the problem found?	—	Go to *Step 11*	Go to *Step 6*
6	Using the DVM and check the O_2 sensor. 1. Ignition "Off", engine "Off". 2. Disconnect O_2 sensor connector 3. Measure the resistance of heater. Was the tester indicated specified value? O2 Sensor 	Approximately 12.5Ω at 20°C	Go to *Step 7*	Go to *Step 11*

Step	Action	Value(s)	Yes	No
7	Using the DVM and check the heater power supply circuit for the affected cylinder. 1. Ignition “On”, engine “Off”. 2. Disconnect the O_2 sensor connector. 3. Check the circuit for open circuit. Was the DVM indicated specified value? 	10 - 14.5V	Go to *Step 9*	Go to *Step 8*
8	Repair the open or short to ground circuit between the “O_2 Sensor” fuse (10A) and O_2 sensor. Is the action complete?	—	Verify repair	—
9	Using the DVM and check the heater ground circuit. **Breaker box is available:** 1. Ignition “Off”, engine “Off”. 2. Install the breaker box as type A. (ECM disconnected) Refer to 6E-88 page. 3. Disconnect the O_2 sensor connector. 4. Check the circuit for open or short to ground circuit. Was the problem found?  **Breaker box is not available:** 1. Ignition “Off”, engine “Off”. 2. Disconnect the O_2 sensor connector and ECM connector. 3. Check the circuit for open or short to ground circuit. Was the problem found? 	—	Repair faulty harness and verify repair	Go to *Step 10*

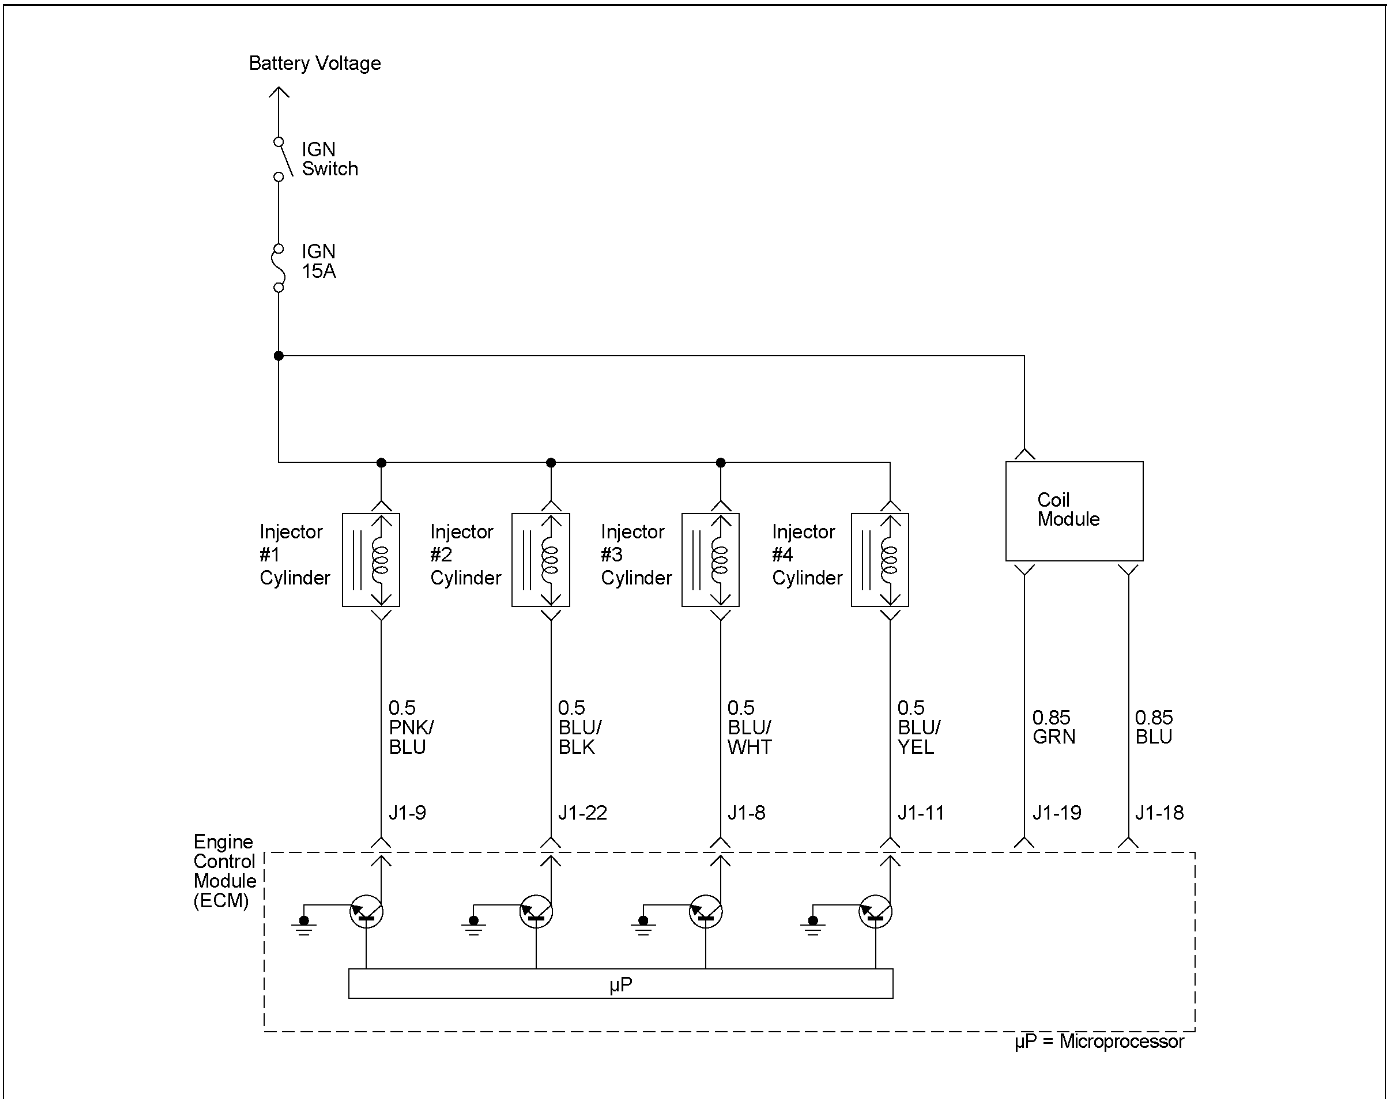
Step	Action	Value(s)	Yes	No
10	Using the DVM and check the heater ground circuit. 1. Ignition “On”, engine “Off”. 2. Disconnect the O_2 sensor connector. 3. Check the circuit for short to voltage circuit. Was the DVM indicated voltage?  	—	Repair faulty harness and verify repair	Go to *Step 12*
11	Replace the O_2 sensor. Was the problem solved?	—	Verify repair	Go to *Step 12*
12	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 13*
13	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0201 INJECTOR 1 CONTROL CIRCUIT

DIAGNOSTIC TROUBLE CODE (DTC) P0202 INJECTOR 2 CONTROL CIRCUIT

DIAGNOSTIC TROUBLE CODE (DTC) P0203 INJECTOR 3 CONTROL CIRCUIT

DIAGNOSTIC TROUBLE CODE (DTC) P0204 INJECTOR 4 CONTROL CIRCUIT



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0201	A	Injector 1 Control Circuit	1. Engine is running. 2. Engine speed is more than 1000rpm. 3. Injector voltage does not meet to the battery voltage when the injector is commanded Off or does not meet to the 0V when the injector is commanded On.	No fail-safe function.
P0202	A	Injector 2 Control Circuit		
P0203	A	Injector 3 Control Circuit		
P0204	A	Injector 4 Control Circuit		

Circuit Description

The engine control module (ECM) has four individual injector driver circuits. Each controls an injector. When a driver circuit is grounded by the ECM, the injector is activated. The ECM monitors the current in each driver circuit. The ECM measures a voltage drop through a fixed resistor and controls it. The voltage on each driver is monitored to detect a fault. If the voltage is not what the ECM expects to monitor on the circuit, a Diagnostic

Trouble Code is set. This Diagnostic Trouble Code is also set if an injector driver is shorted to voltage.

Diagnostic Aids

An injector driver circuit that is open or shorted to voltage will cause a Diagnostic Trouble Code P0201 to set. It will also cause a misfire due to an inoperative injector. A misfire Diagnostic Trouble Code will also be set indicating which cylinder is inoperative.

Long term and short term fuel trims that are excessively high or low are a good indication that an injector is faulty.

Use Fuel Injector Coil Test Procedure to check for faulty injectors.

Diagnostic Trouble Code (DTC) P0201 Injector 1 Control Circuit

Diagnostic Trouble Code (DTC) P0202 Injector 2 Control Circuit

Diagnostic Trouble Code (DTC) P0203 Injector 3 Control Circuit

Diagnostic Trouble Code (DTC) P0204 Injector 4 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select "F0: Read DTC Infor By Priority" in "F0: Diagnostic Trouble Code". Is the DTC P0201, P0202, P0203 or P0204 stored as "Present Failure"?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition "On" and engine "Off". 2. Select "Clear DTC Information" with the Tech2 and clear the DTC information. 3. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

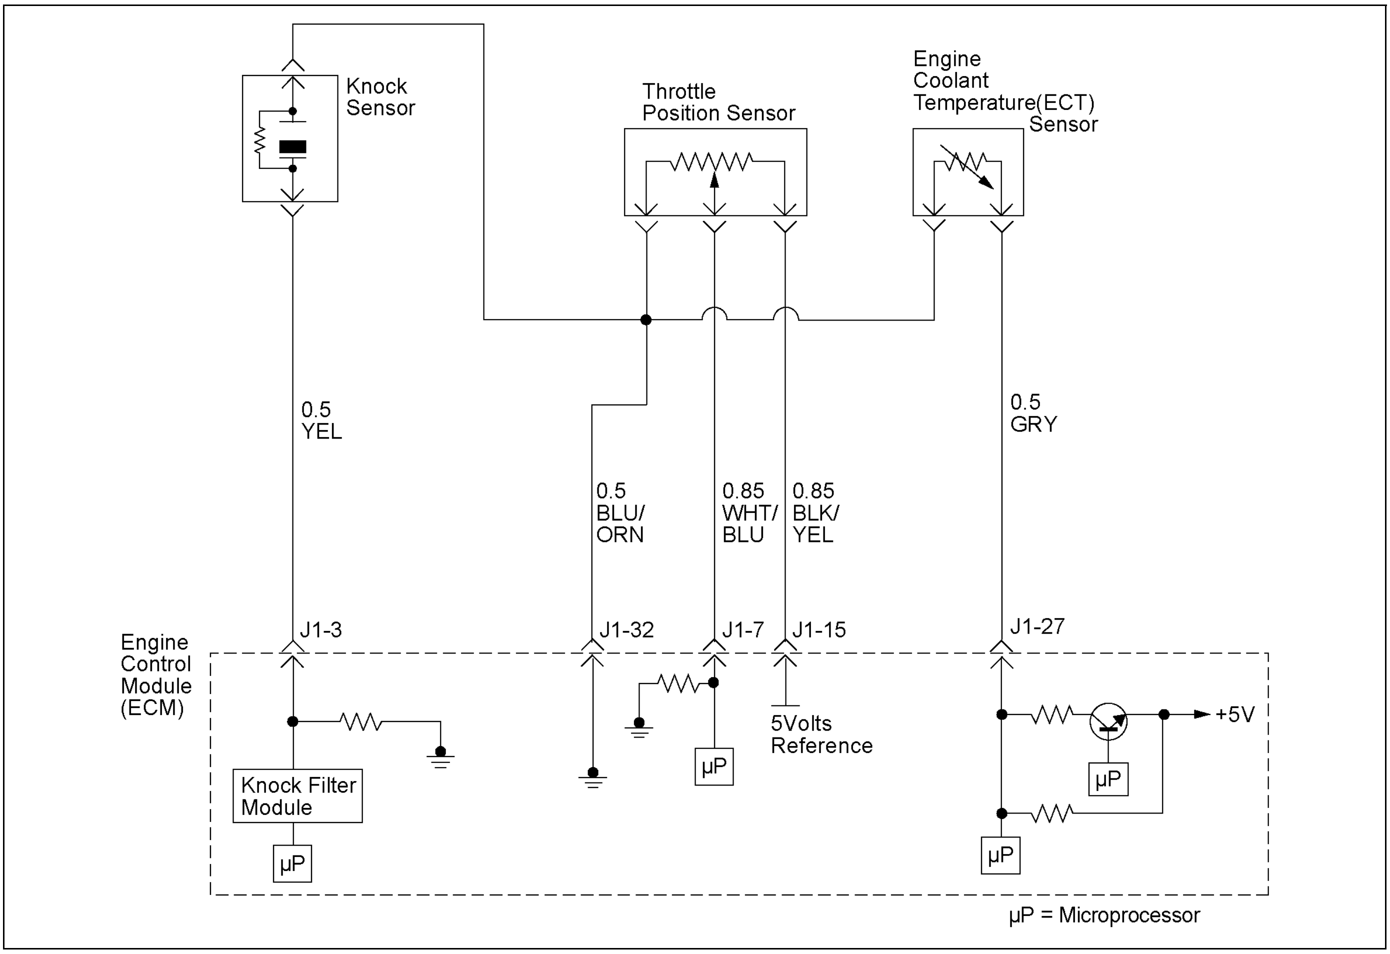
DIAGNOSTIC TROUBLE CODE (DTC) P0325 KNOCK SENSOR (KS) MODULE CIRCUIT



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0325	B	Knock Sensor Module Circuit	1. No DTC relating to MAP sensor. 2. Engine coolant temperature is more than 50 deg. C. 3. Engine speed is more than 1600rpm. 4. Knock sensor filter module integrated circuit malfunction.	ECM retards ignition timing 4 deg. C.

Circuit Description

The knock sensor (KS) system is used to detect engine detonation. The knock sensor produced an AC voltage signal. The knock sensor sends this signal to the ECM. The amplitude and the frequency of the AC voltage signal depends upon the knock level being detected. The ECM will then retard the spark timing based on the signals from the Knock Sensor.

Diagnostic Aids

Correct any abnormal engine noise before using the diagnostic table.
Check for an open circuit.

Diagnostic Trouble Code (DTC) P0325 Knock Sensor Module Circuit

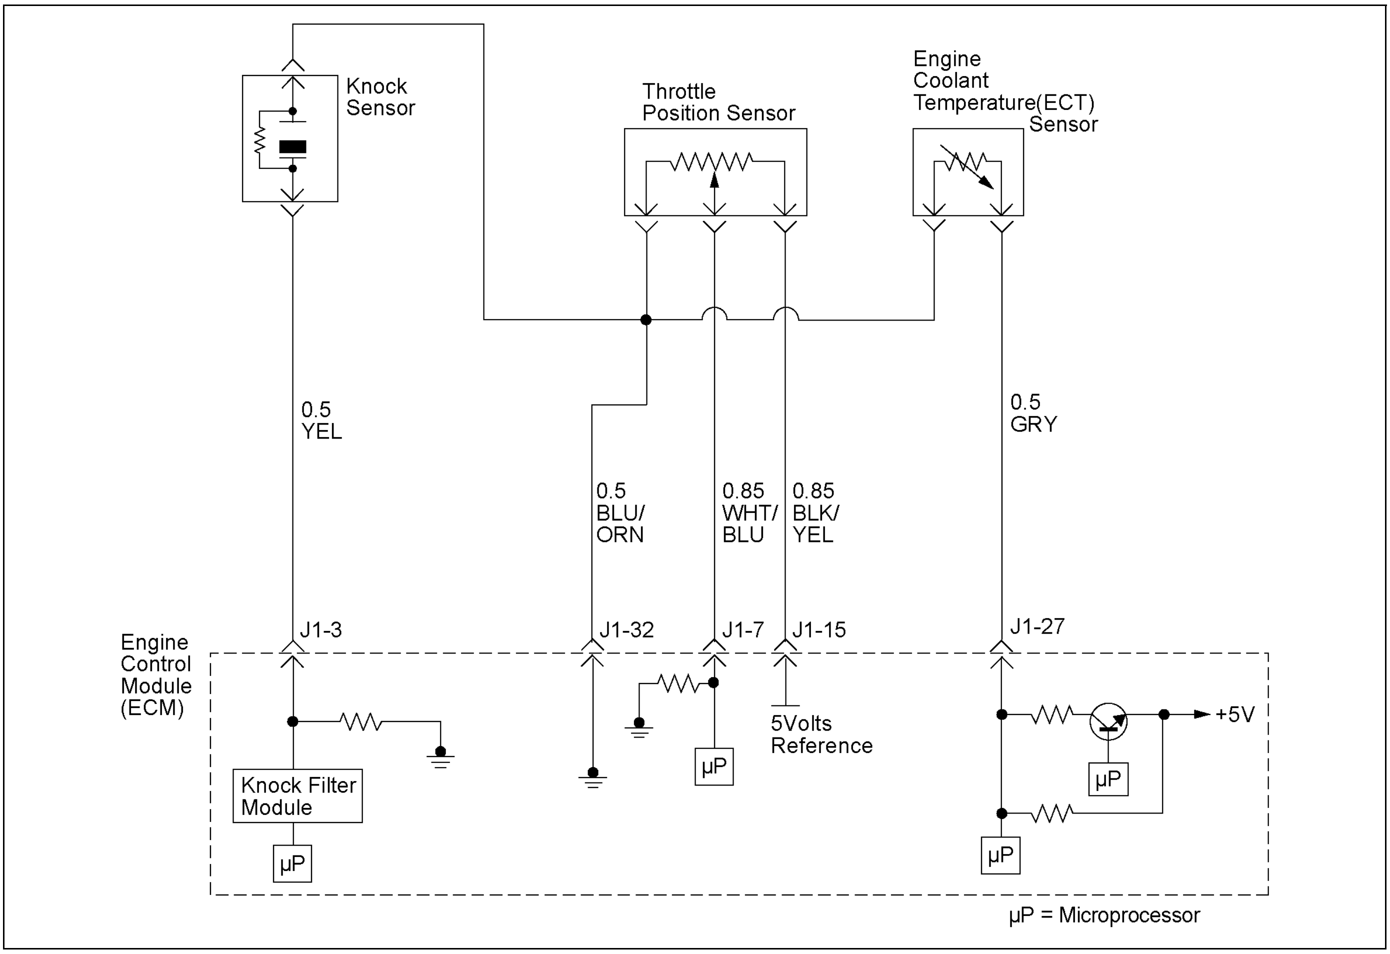
Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*

Step	Action	Value(s)	Yes	No
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select “F0: Read DTC Infor By Priority” in “F0: Diagnostic Trouble Code”. Is the DTC P0325 stored as “Present Failure”?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition “On” and engine “Off”. 2. Select “Clear DTC Information” with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the “F5: Failed This Ignition” in “F2: DTC Information”. Was the DTC P0325 stored in this ignition cycle?	—	Go to *Step 4*	Refer to *Diagnostic Aids* and Go to *Step 4*
4	Check for poor/faulty connection at the knock sensor or ECM connector. If a poor/faulty connection is found, repair as necessary. Was the problem found?  	—	Verify repair	Go to *Step 5*
5	Visually check the knock sensor. Was the problem found?	—	Go to *Step 10*	Go to *Step 6*
6	Listen to the engine noise while raising and lowering the engine speed. Is a knock or audible noise present?	—	Go to *Step 7*	Go to *Step 8*
7	Repair the mechanical engine problem or a loose bracket or component. Is the action complete?	—	Verify repair	—

Step	Action	Value(s)	Yes	No

Disconnect the knock sensor. 4. Check the circuit for open circuit. Was the problem found?  **Breaker box is not available:** 1. Ignition “Off”, engine “Off”. 2. Disconnect the knock sensor connector and ECM connector. 3. Check the circuit for open circuit. Was the problem found? 	—	Repair faulty harness and verify repair	Go to *Step 9*
9	Substitute a known good knock sensor and recheck. Was the problem solved?	—	Go to Step 10	Go to *Step 11*
10	Replace the knock sensor. Was the problem solved?	—	Verify repair	Go to *Step 11*
11	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 12*
12	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0327 KNOCK SENSOR (KS) CIRCUIT



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0327	A	Knock Sensor Circuit	1. No DTC relating to MAP sensor. 2. Engine coolant temperature is more than 50 deg. C. 3. Engine speed is more than 1600rpm. 4. Knock sensor harness short to ground or short to voltage circuit.	ECM retards ignition timing 4 deg. C.

Circuit Description

The ECM uses the Knock Sensor (KS) in order to detect engine detonation. This allows the ECM to retard the Ignition Control (IC) spark timing based on the KS signal the ECM receives. The knock sensors produce an AC signal that rides on the 1.3 volts DC. The signal's amplitude and frequency are dependent upon the amount of the knock being experienced.
The ECM determines whether the knock is occurring by comparing the signal level on the KS circuit with a voltage level on the noise channel. The normal engine noise varies depending on the engine speed and load. Then the ECM determines that an abnormally high noise channel voltage level is being experienced, a Diagnostic Trouble Code P0327 sets.

Diagnostic Aids

Check for the following conditions:
A poor connection at the ECM. Inspect the knock sensor and the ECM connectors for: , broken locks, improperly formed or damaged terminals.

- Backed out terminals
- Broken locks
- Improperly formed or damaged terminals

Also, check the wiring harness for: shorts to ground, shorts to battery positive, and open circuits.

- A misrouted harness. Inspect the knock sensor harness in order to ensure that it is not routed too close to high voltage wires such as spark plug leads.

Diagnostic Trouble Code (DTC) P0327 Knock Sensor Circuit

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select “F0: Read DTC Infor By Priority” in “F0: Diagnostic Trouble Code”. Is the DTC P0327 stored as “Present Failure”?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition “On” and engine “Off”. 2. Select “Clear DTC Information” with the Tech2 and clear the DTC information. 3. 10	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***"SPS (Service Programming System)".*** Was the problem solved?	—	Verify repair	Go to *Step 11*
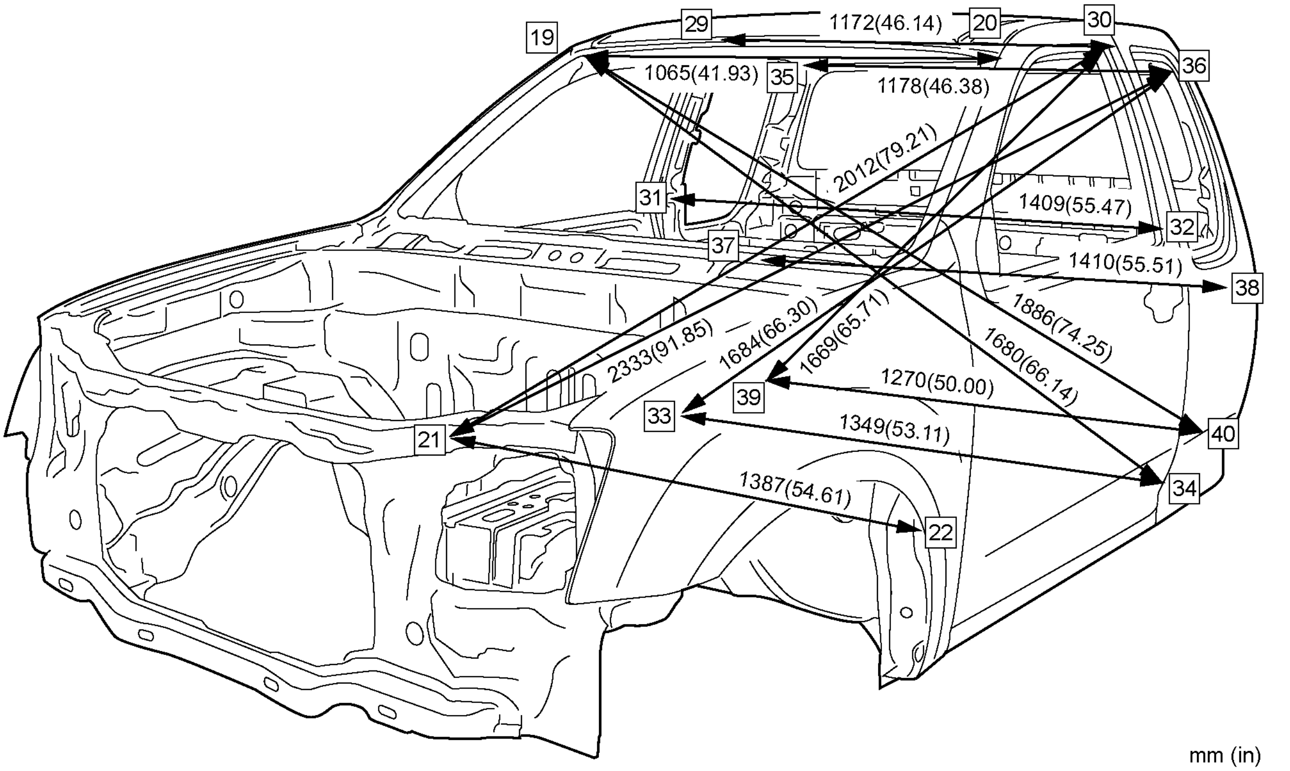
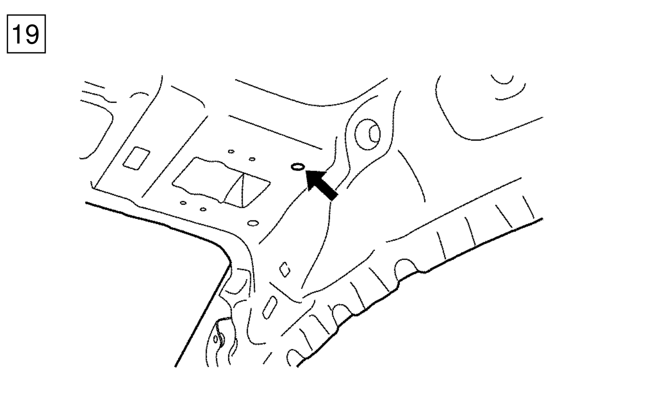
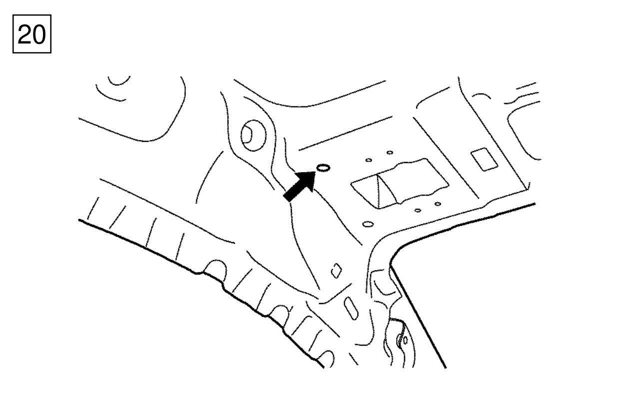
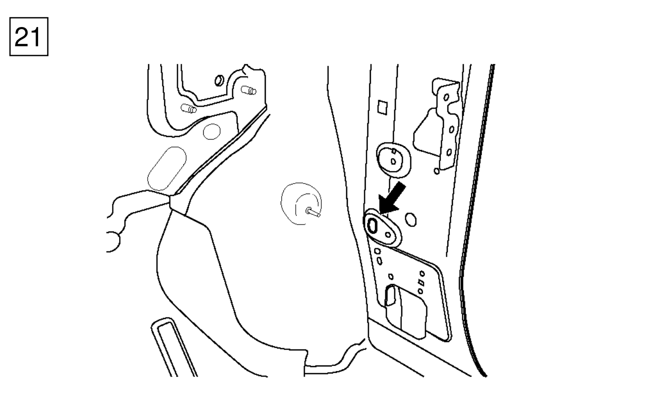
11	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.	—	Verify repair	—

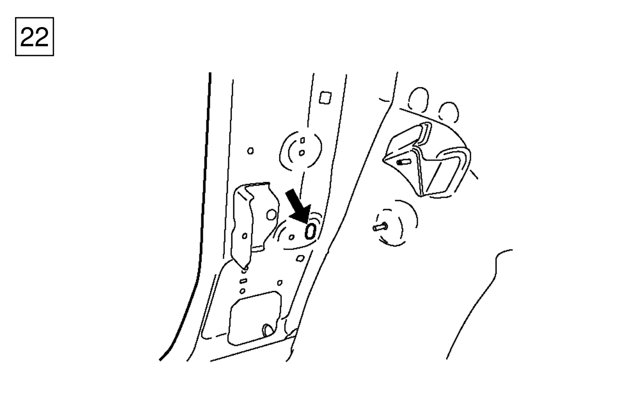
ROOM SECTION (EXTEND CAB)





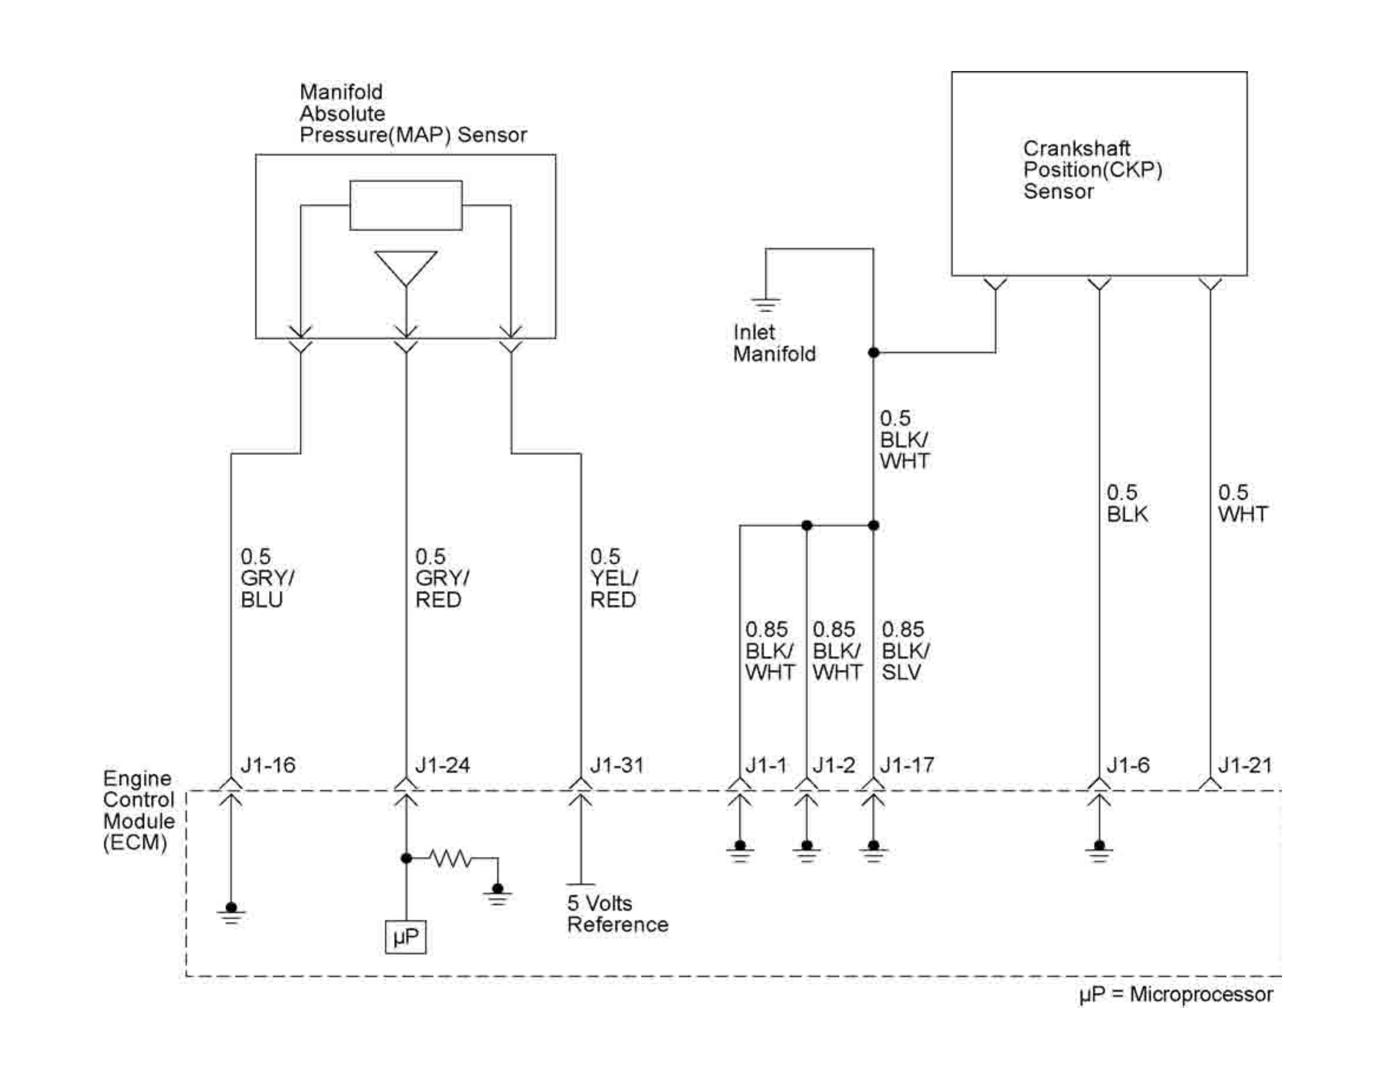






DIAGNOSTIC TROUBLE CODE (DTC) P0336 CRANKSHAFT POSITION (CKP) SENSOR CIRCUIT RANGE/PERFORMANCE (58X)

DIAGNOSTIC TROUBLE CODE (DTC) P0337 CRANKSHAFT POSITION (CKP) SENSOR CIRCUIT LOW INPUT (58X)



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0336	B	Crankshaft Position Sensor Circuit Range/Performance (58X)	1. Engine is running. 2. Extra or missing pulse is detected consecutively.	No fail-safe function.
P0337	B	Crankshaft Position Sensor Circuit Low Input (58X)	No pulse is detected during engine cranking.	

Circuit Description

The 58X reference signal is produced by the crankshaft position (CKP) sensor. During one crankshaft revolution, 58 crankshaft pulses will be produced. The engine control module (ECM) uses the 58X reference signal to calculate engine RPM and crankshaft position. The ECM constantly monitors the number of pulses on the 58X reference circuit. If the ECM receives an incorrect number of pulses on the 58X reference circuit, Diagnostic Trouble Code P0336 will set. If the ECM does not receive pluses on the 58X reference circuit, Diagnostic Trouble Code P0337 will set.

Diagnostic Aids

An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for:

- Poor connection - Inspect the ECM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connection.
- Damaged harness - Inspect the wiring harness for damage; shorts to ground, shorts to battery positive and open circuits. If the harness appears to be OK, disconnect the ECM, turn the ignition on and observe a voltmeter connected to the 58X reference circuit at the ECM harness connector while moving connectors and wiring harnesses related to the ECM. A change in voltage will indicate the location of the fault.

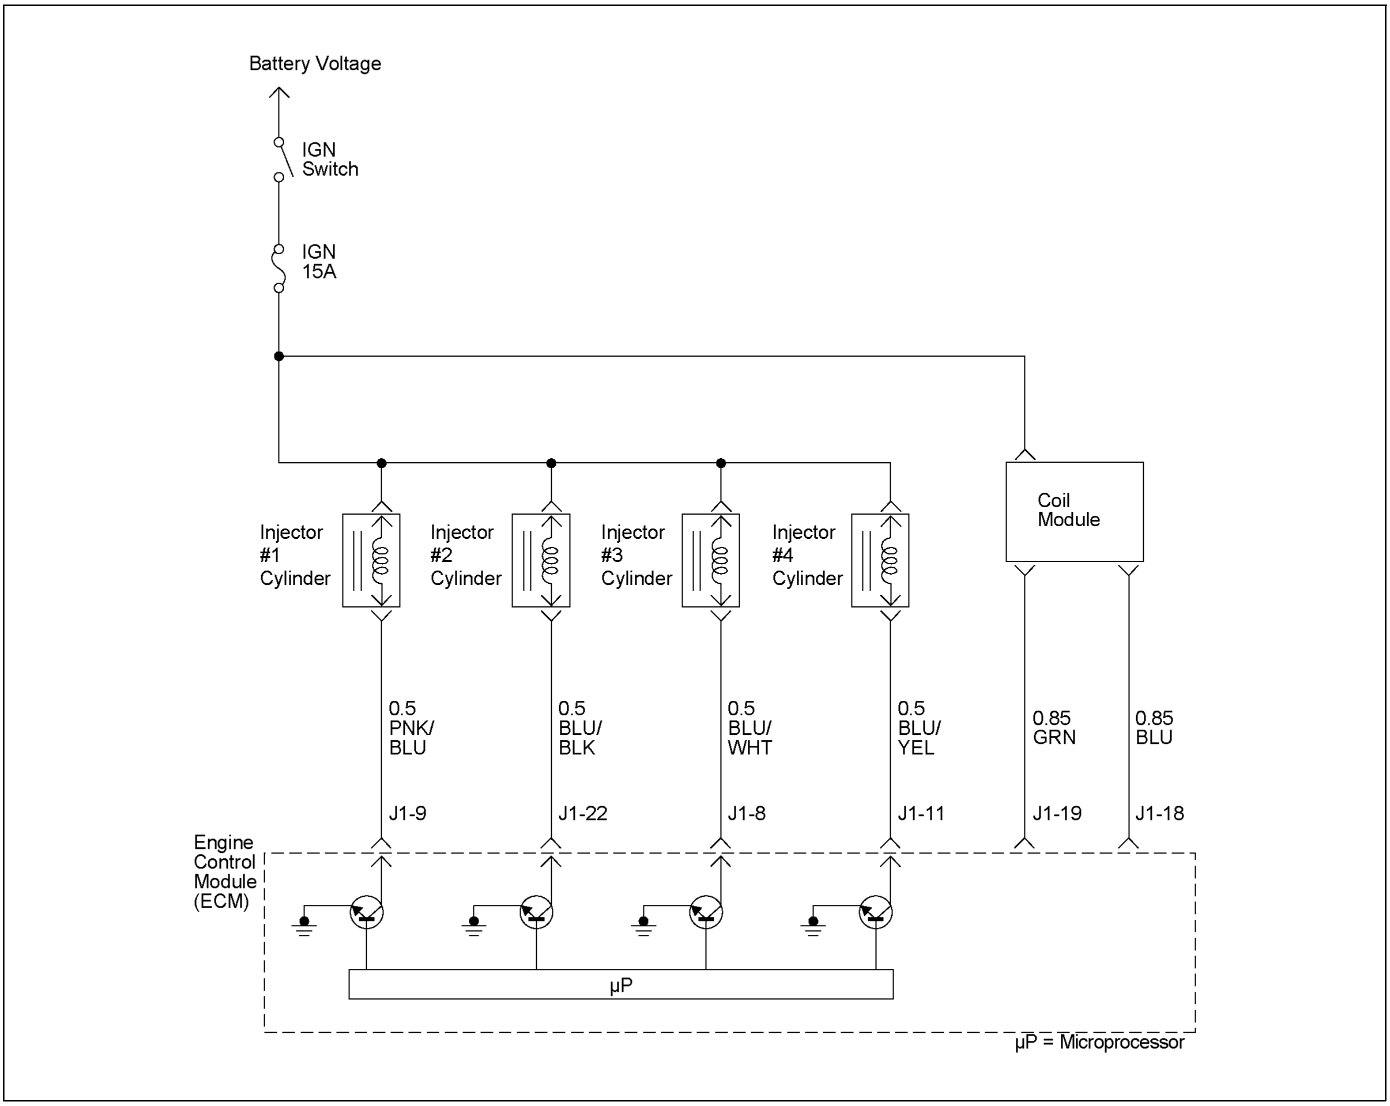
17	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0351 IGNITION 1 CONTROL CIRCUIT

DIAGNOSTIC TROUBLE CODE (DTC) P0352 IGNITION 2 CONTROL CIRCUIT



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0351	A	Ignition 1 Control Circuit	#1 or #4cylinder ignition signals are not detected consecutively.	No fail-safe function.
P0352	A	Ignition 2 Control Circuit	#2 or #3 cylinder ignition signals are not detected consecutively.	

Circuit Description

The ignition control circuit provides a zero volt or a 5 volt signal to the ignition control module. The normal circuit voltage is zero volts. When the module receives the 5 volt signal from the ECM, it provides a ground path for the B+ voltage supplied to the ignition primary coil. When the ECM turns off the 5 volts to the module, the module will remove the ground path of the ignition primary coils; causing the magnetic field produces a voltage in the secondary coils which fires the spark plug.

The circuit between the ECM and the ignition control module is monitored for an open circuit, short to voltage, and short to ground. When the ECM detects a problem in the ignition control circuit, it will set DTC P0351 or P0352.

Diagnostic Aids

Check for the following conditions:

- Poor connection at the ECM - Inspect the harness connectors for backed-out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal-to-wire connections.

- Damaged harness - Inspect the wiring harness for damage; Open circuits, shorts to ground, or shorts to Voltage. If the harness appears to be OK, observe the Tech 2 display related to DTC P0351 or P0352 while moving the connector and wiring related to the ignition system. A change in the display will indicate the location of the fault.

Diagnostic Trouble Code (DTC) P0351 Ignition 1 Control Circuit

Diagnostic Trouble Code (DTC) P0352 Ignition 2 Control Circuit

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select “F0: Read DTC Infor By Priority” in “F0: Diagnostic Trouble Code”. Is the DTC P0351 or P0352 stored as “Present Failure”?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition “On” and engine “Off”. 2. Select “Clear DTC Information” with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the “F5: Failed This Ignition” in “F2: DTC Information”. Was the DTC P0351 or P0352 stored in this ignition cycle?	—	Go to *Step 4*	Refer to *Diagnostic Aids* and Go to *Step 4*
4	Check for poor/faulty connection at the ignition coil module or ECM connector. If a poor/faulty connection is found, repair as necessary. Was the problem found? 	—	Verify repair	Go to *Step 5*
5	Visually check the ignition coil module. Was the problem found?	—	Go to *Step 12*	Go to *Step 6*

Step	Action	Value(s)	Yes	No
6	Using the DVM and check the ignition coil module signal circuit for the affected coil. 1. Ignition “On”, engine “Off”. 2. Disconnect the ignition coil module connector. 3. Check the circuit for short to battery voltage circuit for the affected coil. Was the DVM indicated battery voltage? 	—	Repair faulty harness and verify repair	Go to *Step 7*

Step	Action	Value(s)	Yes	No
7	Using the DVM and check the ignition coil signal circuit for the affected coil. **Breaker box is available:** 1. Ignition “Off”, engine “Off”. 2. Install the breaker box as type A. (ECM disconnected) Refer to 6E-88 page. 3. Disconnect the ignition coil module connector. 4. Check the circuit for open or short to ground circuit for the affected coil. Was the problem found? Coil 2  Coil 1  **Breaker box is not available:** 1. Ignition “Off”, engine “Off”. 2. Disconnect the ignition coil module connector and ECM connector. 3. Check the circuit for open or short to ground circuit for the affected coil. Was the problem found? Coil 1  Coil 2  	—	Repair faulty harness and verify repair	Go to *Step 8*

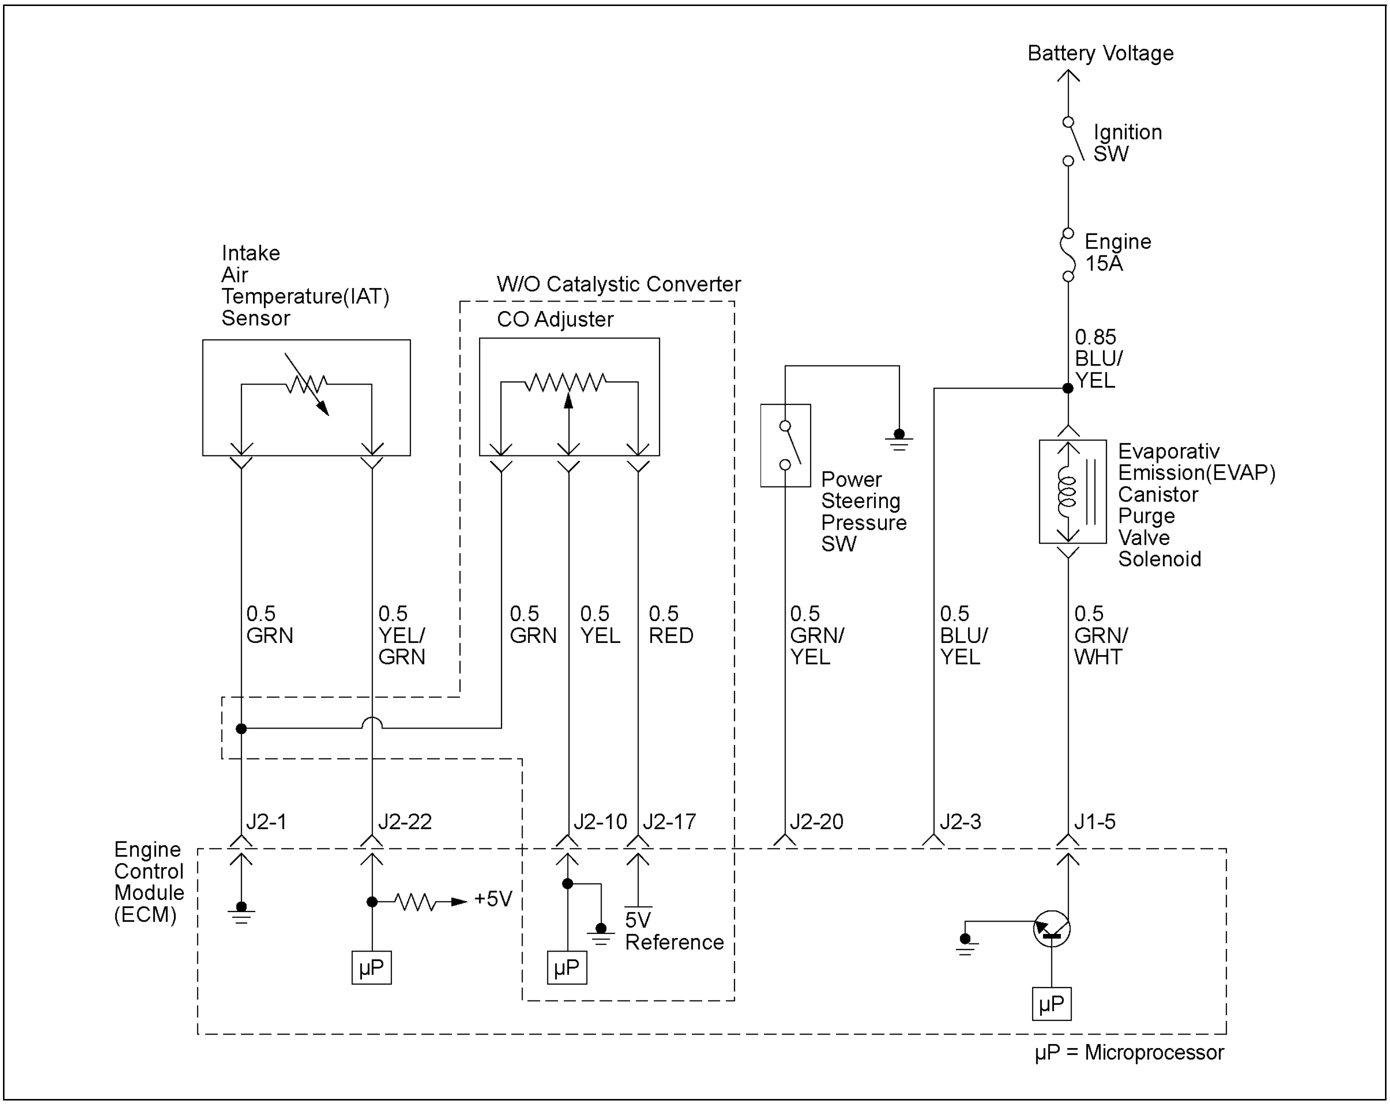
9	Repair the open or short to ground circuit between the “IGN. Coil” fuse (15A) and ignition coil module. Is the action complete?	—	Verify repair	—
10	Replace the ignition coil module. Was the problem solved?	—	Verify repair	Go to *Step 11*
11	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 12*
12	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0443 EVAPORATIVE (EVAP) EMISSION CONTROL SYSTEM PURGE CONTROL CIRCUIT



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0443	B	EVAP Emission Control System Purge Control Circuit	EVAP purge solenoid circuit open, short to ground or short to voltage circuit.	No fail-safe function.

Circuit Description

The Engine Control Module (ECM) controls the Evaporative Emission (EVAP) Canister Purge Solenoid Valve through the use of a control (ground) circuit. If the ECM commands the Purge solenoid to maximum duty cycle (100%) but the voltage remains High (12 Volts); or, if the ECM commands the Purge solenoid to minimum duty cycle (0%) but the voltage remains Low (0 volts), then DTC P0443 will set.

Diagnostic Aids

- Poor connections, or a damaged harness - Inspect the harness connectors for: backed-out terminals, improper mating or damaged terminals. Also check for open circuits, shorts to ground, and shorts to voltage.

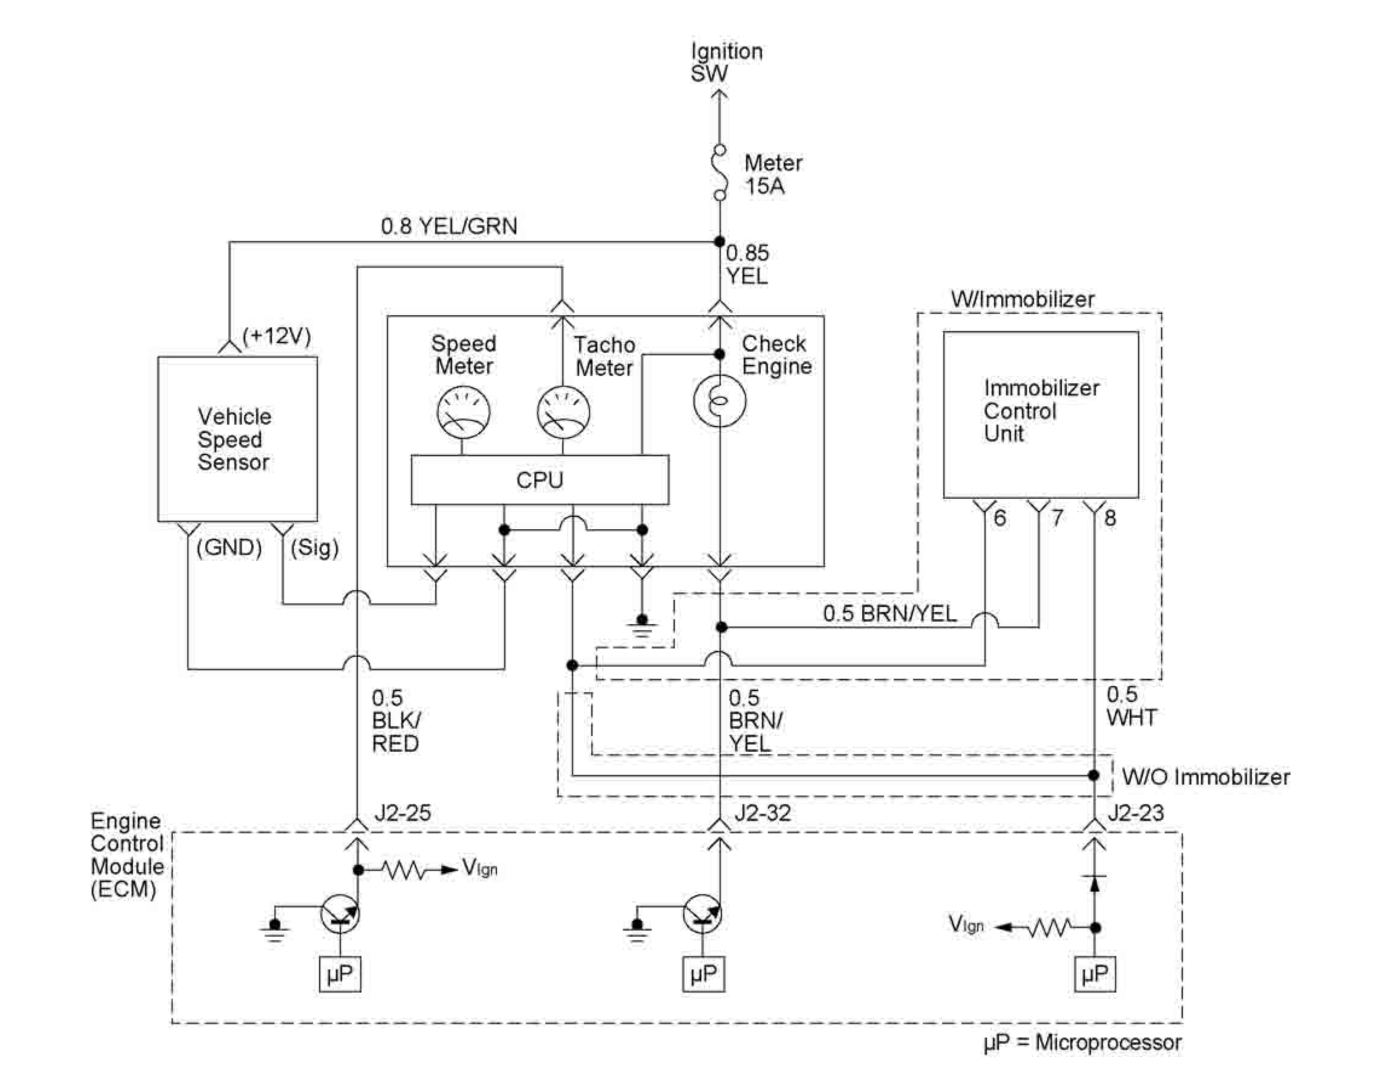
13	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0502 VEHICLE SPEED SENSOR (VSS) CIRCUIT LOW INPUT



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0502	B	Vehicle Speed Sensor Circuit Low Input	1. No DTC relating to MAP sensor, TPS, ECT sensor, injector control circuit and ignition control circuit. 2. Engine is running. 3. Vehicle speed is below 3km/h in power condition or 2km/h in deceleration condition.	ECM uses 0km/h condition as substitute.

Circuit Description

The vehicle speed sensor has a magnet rotated by the transmission output shaft. Attached to the sensor is a hall effect circuit that interacts with the magnetic field created by the rotating magnet. A 12-volt operating supply for the speed sensor hall circuit is supplied from the meter fuse.

Diagnostic Aids

- Poor connection at ECM: Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.

Diagnostic Trouble Code (DTC) P0502 Vehicle Speed Sensor Circuit Low Input

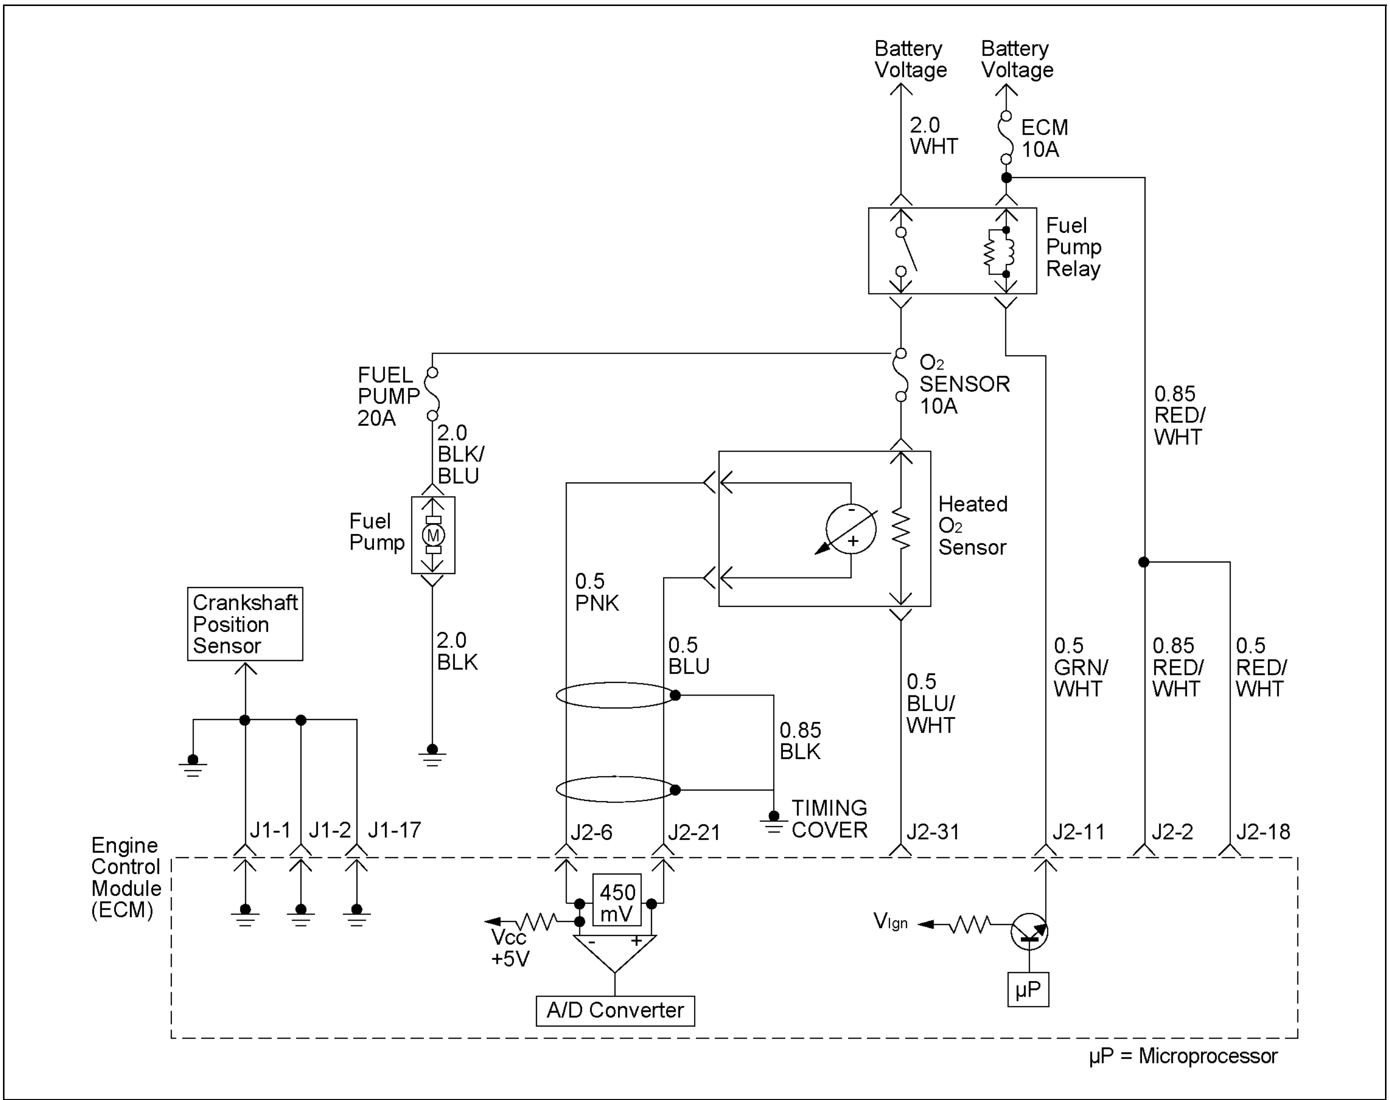
DIAGNOSTIC TROUBLE CODE (DTC) P0562 SYSTEM VOLTAGE LOW



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0562	D	System Voltage Low	Battery voltage is below 11V.	No fail-safe function.

Circuit Description

The engine control module (ECM) monitors the system voltage on the ignition feed terminal to the ECM. A system voltage Diagnostic Trouble Code will set whenever the voltage is below a calibrated value.

Diagnostic Aids

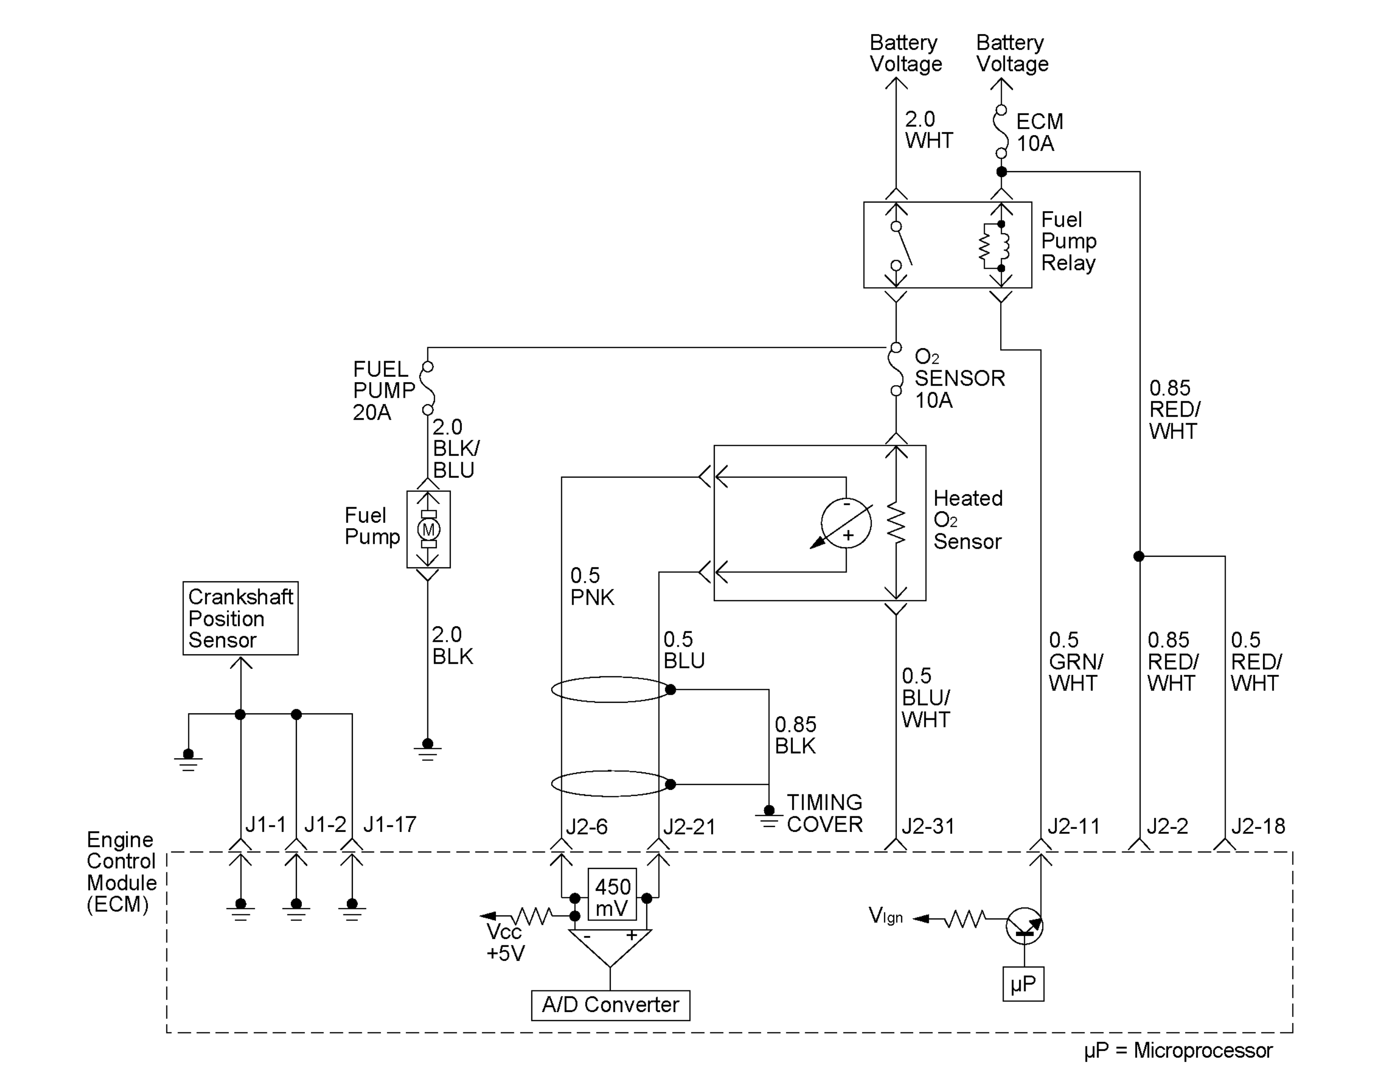
- If the Diagnostic Trouble Code sets when an accessory is operated, check for a poor connection or excessive current draw.
- Check for open circuits or shorts to ground on the ECM's battery or ignition inputs.

Diagnostic Trouble Code (DTC) P0562 System Voltage Low

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*

Step	Action	Value(s)	Yes	No
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select “F0: Read DTC Infor By Priority” in “F0: Diagnostic Trouble Code”. Is the DTC P0562 stored as “Present Failure”?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition “On” and engine “Off”. 2. Select “Clear DTC Information” with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the “F5: Failed This Ignition” in “F2: DTC Information”. Was the DTC P0562 stored in this ignition cycle?	—	Go to *Step 4*	Refer to *Diagnostic Aids* and Go to *Step 4*
4	1. Using the Tech 2, ignition “On” and engine “On”. 2. Monitor the “Ignition Voltage” in the data display. 3. Load the electrical system by turning on the headlights, etc.. Does the Tech 2 indicate enough ignition voltage?	10 - 14.5V	Go to *Step 6*	Go to *Step 5*
5	Using the DVM and check the battery voltage at the battery terminal. Does the tester indicate enough battery voltage?	10 - 14.5V	Go to *Step 6*	Check the charging system, charge or replace the battery
6	Check for poor/faulty connection at the ECM connector. If a poor/faulty connection is found, repair as necessary. Was the problem found? 	—	Verify repair	Go to *Step 7*
7	Check for poor/faulty connection of the ECM ground at the inlet manifold. If a poor/faulty connection is found, repair as necessary. Was the problem found? 	—	Verify repair	Go to *Step 8*
8	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 9*
9	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0563 SYSTEM VOLTAGE HIGH



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0563	A	System Voltage High	Battery voltage is above 16V.	No fail-safe function.

Circuit Description

The engine control module (ECM) monitors the system voltage on the ignition feed terminals to the ECM. A system voltage Diagnostic Trouble Code will set whenever the voltage is above a calibrated value.

Diagnostic Aids

Check for a faulty charging system components.

Diagnostic Trouble Code (DTC) P0563 System Voltage High

Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0601	A	ECM Memory Checksum	ECM memory area error.	Engine control disabled.

Circuit Description

The engine control module (ECM) used in this vehicle utilizes an electrically erasable programmable read-only memory (EEPROM). The EEPROM contains program information and the calibrations required for engine, transmission, and powertrain diagnostics operation.
Unlike the PROM used in past applications, the EEPROM is not replaceable. When the ECM is replaced or a calibration update is required, the ECM must be programmed using a Tech 2.

Diagnostic Aids

- Diagnostic Trouble Code P0601 indicates that the contents of the EEPROM have changed since the ECM was programmed. The only possible repair is ECM reprogramming or replacement. Check service bulletins to program the replacement ECM with the correct software and calibration for the vehicle.

Diagnostic Trouble Code (DTC) P0601 ECM Memory Checksum

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select “F0: Read DTC Infor By Priority” in “F0: Diagnostic Trouble Code”. Is the DTC P0601 stored as “Present Failure”?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition “On” and engine “Off”. 2. Select “Clear DTC Information” with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the “F5: Failed This Ignition” in “F2: DTC Information”. Was the DTC P0601 stored in this ignition cycle?	—	Go to *Step 4*	Refer to *Diagnostic Aids*
4	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 5*
5	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P0602 ECU PROGRAMMING ERROR

Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0602	-	ECU Programming Error	ECM memory area error.	Engine control disabled.

Circuit Description

The engine control module (ECM) used in this vehicle utilizes an electrically erasable programmable read-only memory (EEPROM). The EEPROM contains program information and the calibrations required for engine, transmission, and powertrain diagnostics operation.

Unlike the PROM used in past applications, the EEPROM is not replaceable. When the ECM is replaced or a calibration update is required, the ECM must be programmed using a Tech 2.

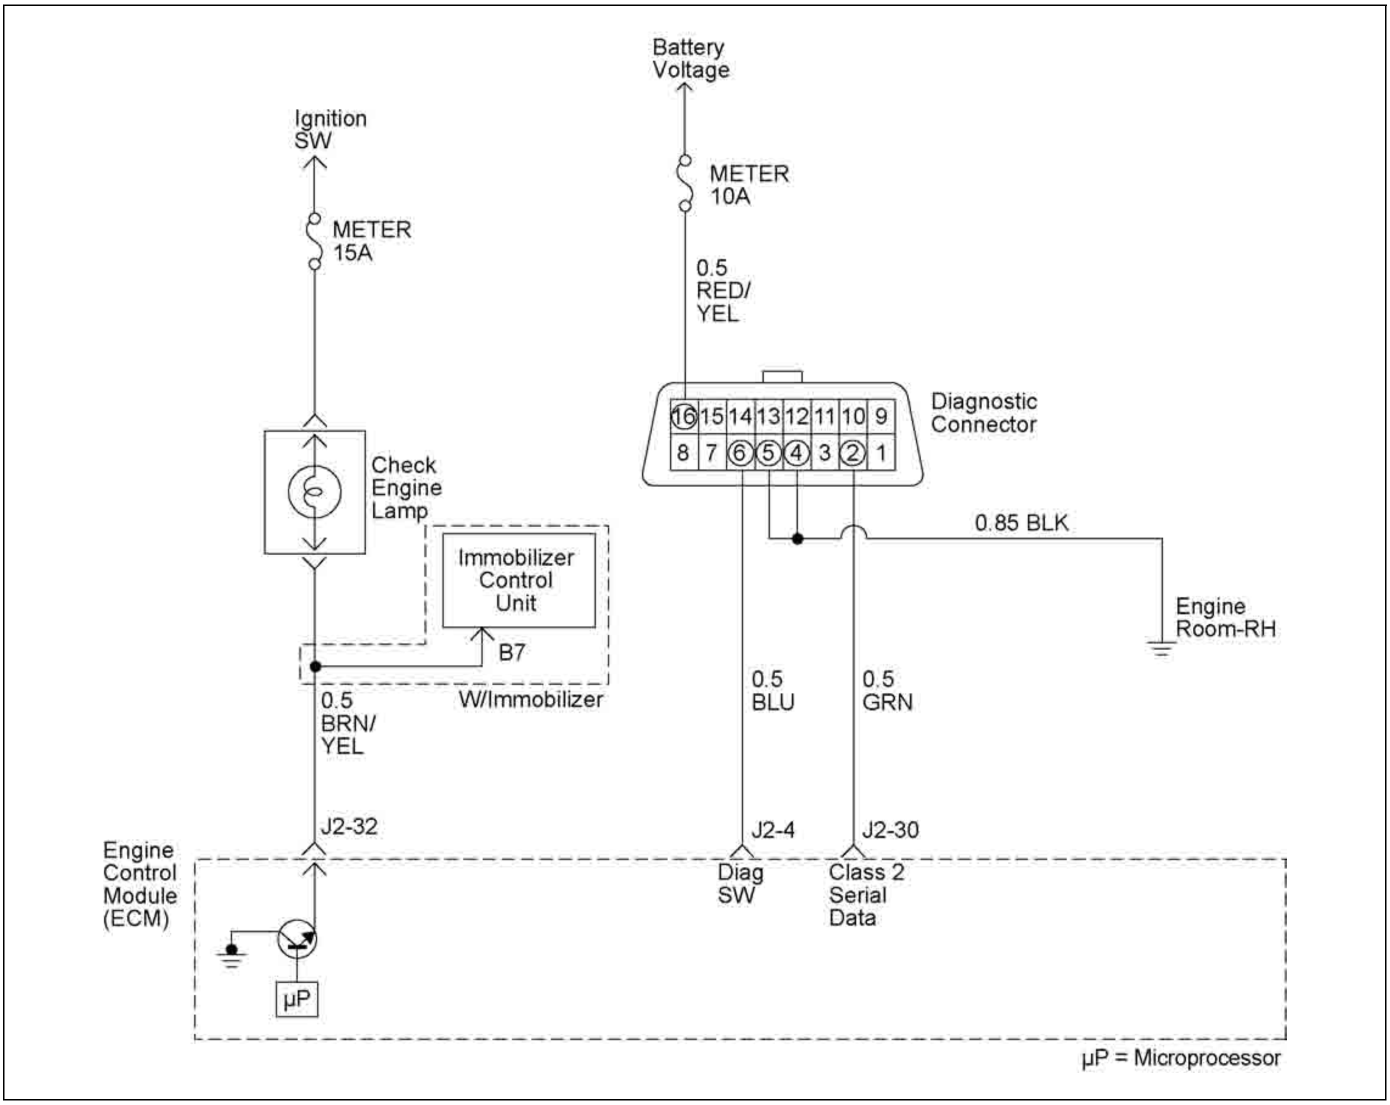
Diagnostic Aids

- Diagnostic Trouble Code P0602 indicates when non programmed ECM is used without service programming system (SPS). The replacement ECM must be programmed.

Diagnostic Trouble Code (DTC) P0602 ECU Programming Error

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select “F0: Read DTC Infor By Priority” in “F0: Diagnostic Trouble Code”. Is the DTC P0602 stored as “Present Failure”?	—	Go to Step 3	Refer to *Diagnostic Aids*
3	Download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Is the action complete?	—	Verify repair	—

DTC P0650 MALFUNCTION INDICATOR LAMP (MIL) CONTOROL CIRCUIT MALFUNCTION



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P0650	A	Malfunction Indicator Lamp (MIL) Control Circuit Malfunction	Check engine lamp circuit open, short to ground or short to voltage circuit.	No fail-safe function.

Circuit Description

The check engine lamp should always be illuminated and steady with ignition “ON” and the engine stopped. Ignition feed voltage is supplied directly to the check engine lamp indicator. The Engine Control Module (ECM) turns the check engine lamp “ON” by grounding the check engine lamp driver circuit. The check engine lamp should not remain “ON” with the engine running and no DTC(s) set. A steady check engine lamp with the engine running and no DTC(s) suggests a short to ground in the check engine lamp driver circuit.

Diagnostic Aids

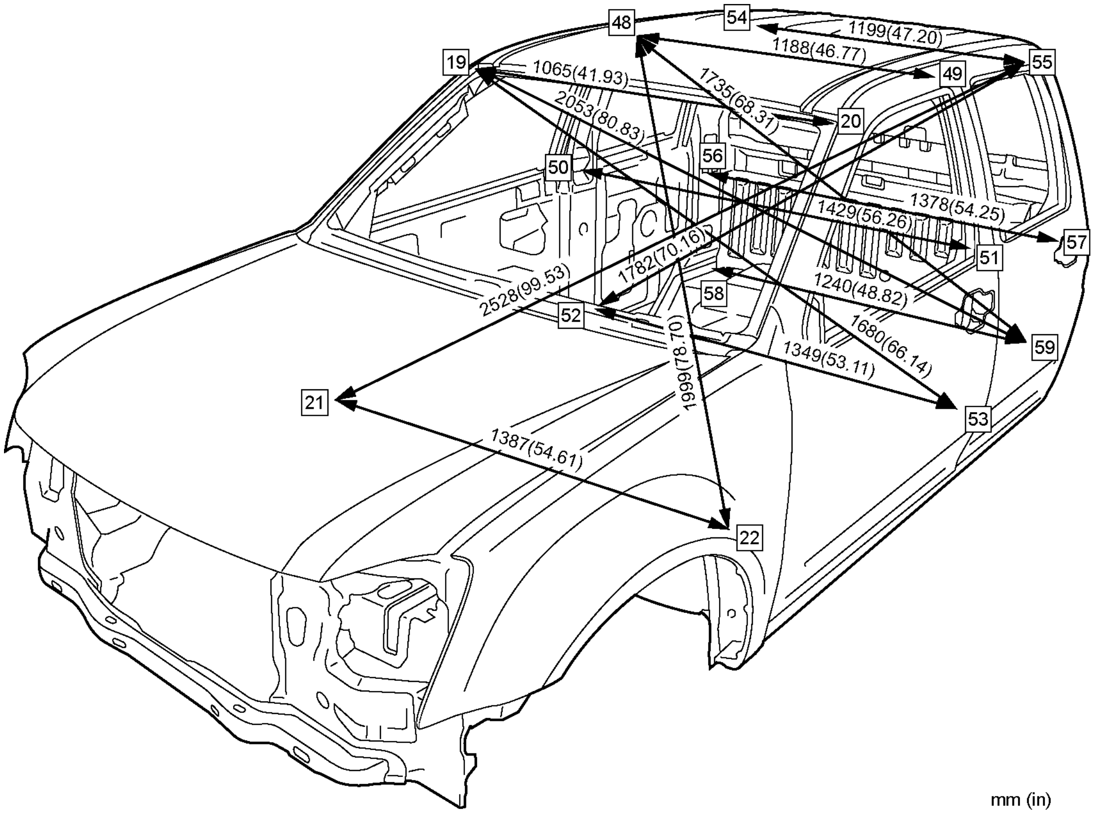
An intermittent may be caused by a poor connection, rubbed-through wire insulation, or a wire broken inside the insulation. Check for the following items:

- Poor connection or damaged harness - Inspect the ECM harness and connectors for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.

Diagnostic Trouble Code (DTC) P0650
Malfunction Indicator Lamp (MIL) Control Circuit Malfunction

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select “F0: Read DTC Infor By Priority” in “F0: Diagnostic Trouble Code”. Is the DTC P0650 stored as “Present Failure”?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition “On” and engine “Off”. 2. Select “Clear DTC Information” with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the “F5: Failed This Ignition” in “F2: DTC Information”. Was the DTC P0650 stored in this ignition cycle?	—	Go to *Step 4*	Refer to *Diagnostic Aids* and Go to *Step 4*
4	1. Ignition “On”, engine “Off”. 2. Check the “Check Engine” lamp. Does the lamp turn “On”?	—	Go to *Step 5*	Go to *Step 6*
5	1. Ignition “On”, engine “Off”. 2. Check the “Check Engine” lamp. Does the lamp turn “Off”?	—	Go to *Step 9*	Go to *Step 7*
6	Check the “Check Engine” lamp bulb. If the bulb is burnt out, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 7*
7	Check for poor/faulty connection at the meter connector and ECM connector. If a poor/faulty connection is found, repair as necessary. Was the problem found? 	—	Verify repair	Go to *Step 8*

ROOM SECTION (CREW CAB)



19

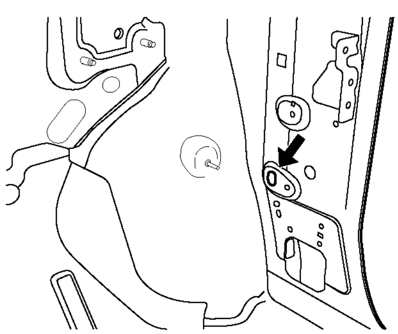
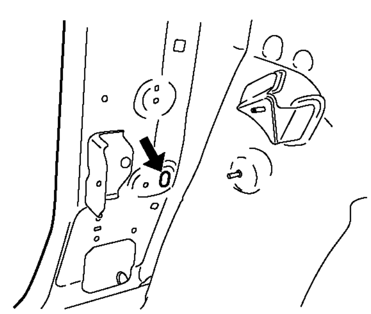
21

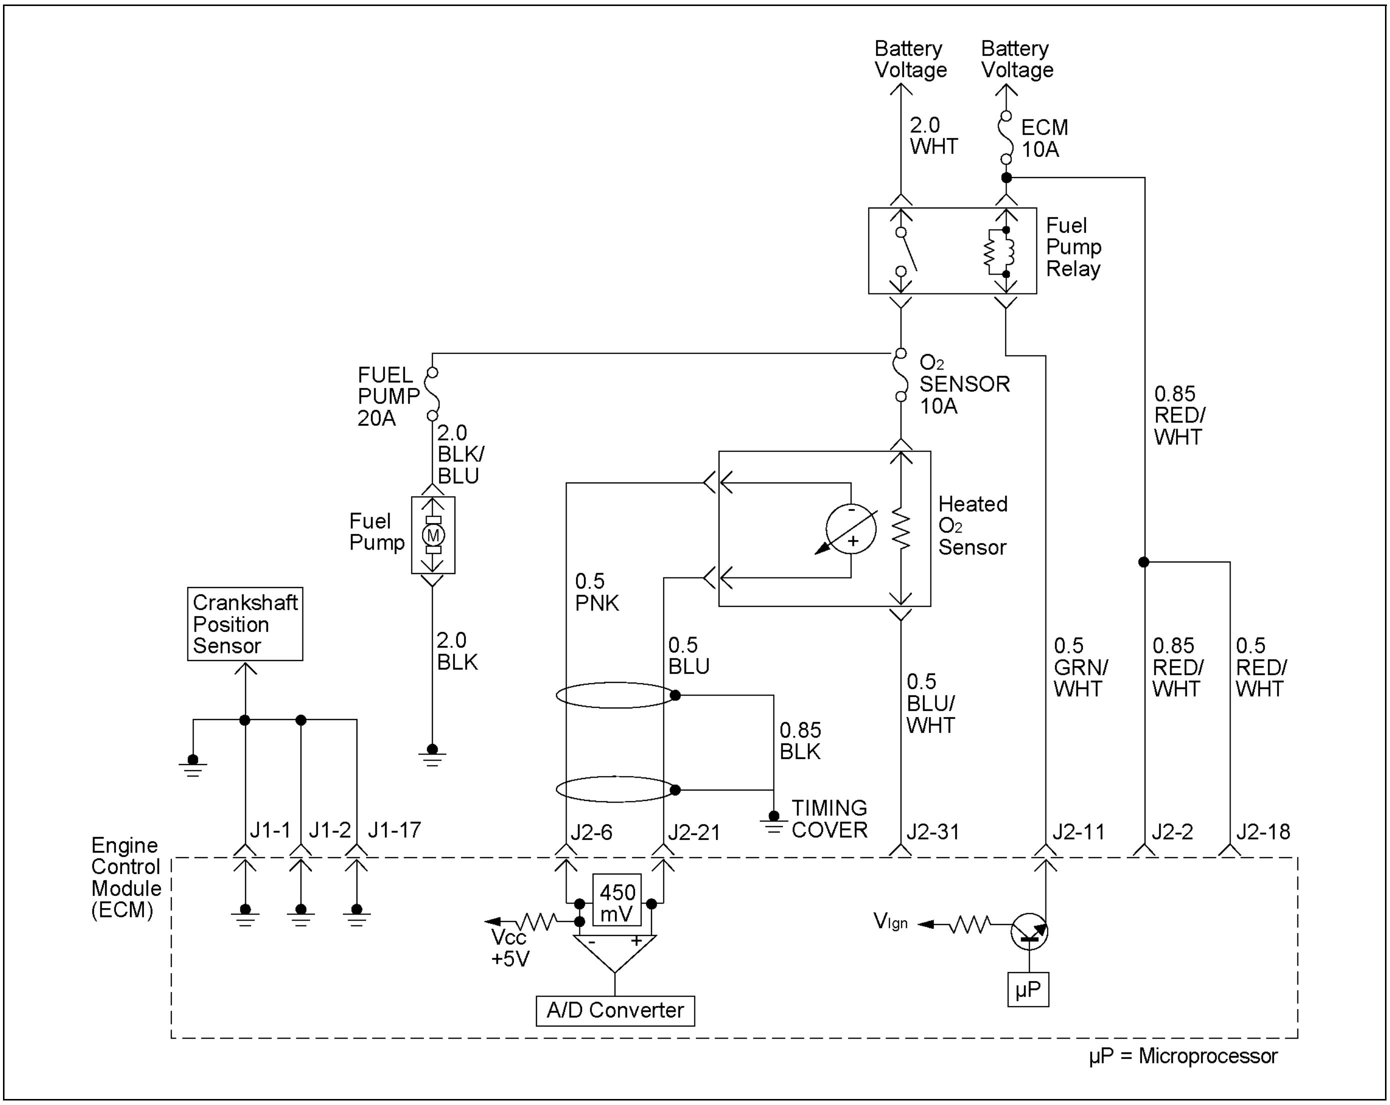


22



Step	Action	Value(s)	Yes	No
8	Using the DVM and check the “Check Engine” lamp circuit. **Breaker box is available:** 1. Ignition “Off”, engine “Off”. 2. Install the breaker box as type A. (ECM disconnected) Refer to 6E-88 page. 3. Remove the meter connector. 4. Check the circuit for open or short to ground circuit. Was the problem found?  **Breaker box is not available:** 1. Ignition “Off”, engine “Off”. 2. Disconnect the ECM connector. 3. Remove the meter connector. 4. Check the circuit for open or short to ground circuit. Was the problem found? 	—	Repair faulty harness and verify repair	Go to *Step 9*
9	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 10*
10	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P1167 FUEL SUPPLY SYSTEM RICH DURING DECELERATION FUEL CUT OFF



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P1167	D	Fuel Supply System Rich During Deceleration Fuel Cutoff	1. No DTC relating to MAP sensor, TPS, EVAP purge, ECT sensor, CKP sensor, VSS, injector control circuit and ignition control circuit. 2. O_2 sensor bank 1 output voltage is more than 550mV in deceleration fuel cutoff mode.	No fail-safe function.

Circuit Description

The engine control module (ECM) internal circuitry can identify if the vehicle fuel system is capable of supplying adequate amounts of fuel during deceleration (fuel cut off). The ECM monitors the voltage of the oxygen sensor during fuel cut off. When a fuel cut off mode of operation is requested during “Closed Loop” operation (by deceleration), the ECM will provide more fuel to the engine. Under these conditions the ECM should detect a “lean” condition (low oxygen sensor voltage). If this “lean” exhaust is not detected at this time, a Diagnostic Trouble Code P1167 will set.

Diagnostic Aids

Check the following items:

- Fuel pressure - The system will go rich if pressure is too high. The ECM can compensate for some increase. However, if fuel pressure is too high, a Diagnostic Trouble Code P1167 may be set. Refer to *Fuel System Diagnosis*.

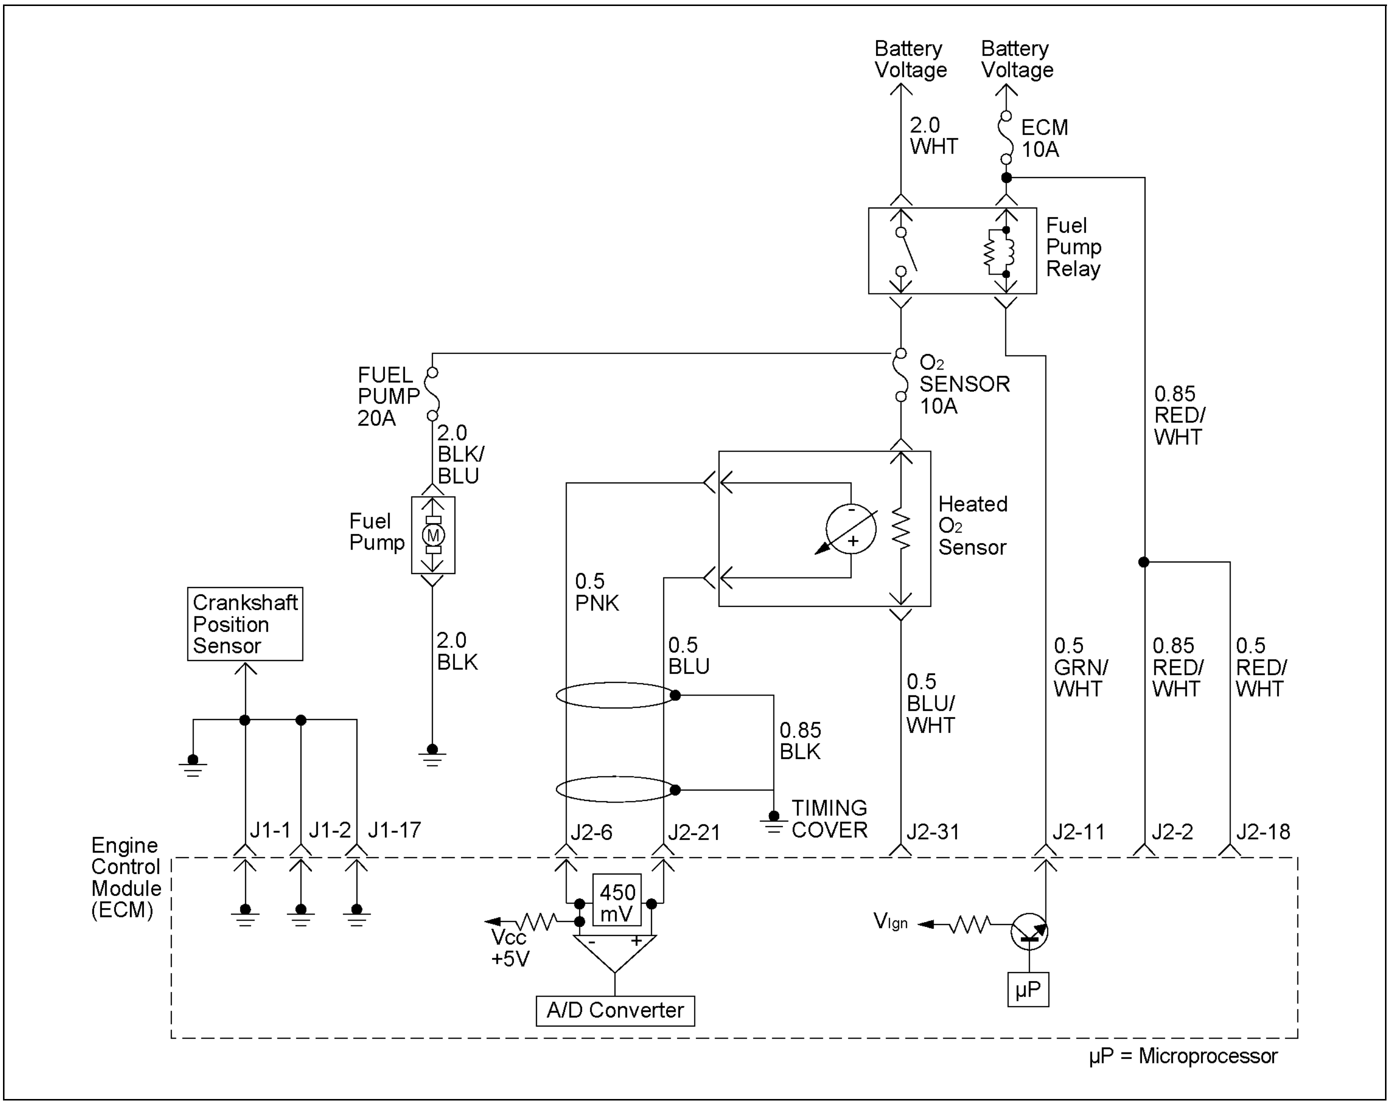
- Perform "Injector Balance Test" - Refer to *Fuel System Diagnosis*.
- Check the EVAP canister for fuel saturation - If full of fuel, check canister control and hoses. Refer to *Evaporative (EVAP) Emission Control System*.
- Check for a leak in the fuel pressure regulator diaphragm by checking the vacuum line to toe regulator for the presence of fuel.
- An intermittent TP sensor output will cause the system to go rich due to a false indication of the engine accelerating.
- Silicon contamination of the HO2S can also cause a high HO2S voltage to be indicated. This condition is indicated by a powdery white deposit on the portion of the HO2S exposed to the exhaust stream. If contamination is noticed, replace the affected HO2S.

Diagnostic Trouble Code (DTC) P1167
Fuel Supply System Rich During Deceleration Fuel Cutoff

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select "F0: Read DTC Infor By Priority" in "F0: Diagnostic Trouble Code". Is the DTC P1167 stored as "Present Failure"?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition "On" and engine "Off". 2. Select "Clear DTC Information" with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the "F5: Failed This Ignition" in "F2: DTC Information". Was the DTC P1167 stored in this ignition cycle?	—	Go to *Step 4*	Refer to *Diagnostic Aids* and Go to *Step 4*
4	1. Using the Tech 2, ignition "On" and engine "Off". 2. Monitor the "Throttle Position" in the data display. Does the Tech 2 indicate correct "Throttle Position" in accordance with accelerator pedal operation?	—	Go to *Step 6*	Go to *Step 5*
5	Check for the following conditions. • Objects blocking the throttle valve. • Incorrectly installed. If a problem is found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 12*
6	1. Using the Tech 2, ignition "On" and engine "On". 2. Monitor the "Manifold Absolute Pressure" in the data display. Does the Tech 2 indicate correct "Manifold Absolute Pressure" in accordance with engine speed or acceleration?	—	Go to *Step 8*	Go to *Step 7*
7	Remove the MAP sensor and check for the following conditions. • Objects blocking the air cleaner. • Objects blocking the MAP sensor. • Objects blocking the throttle valve. • Vacuum leaking at intake duct. • Vacuum leaking at throttle body. If a problem is found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 13*

Step	Action	Value(s)	Yes	No
8	1. Using the Tech 2, ignition “On” and engine “On”. 2. Select the “Miscellaneous Test” and perform the “IAC Control” in the “IAC System”. 3. Operate the Tech 2 in accordance with procedure. Was the engine speed changed, when the IAC valve is operating step by step?	—	Go to *Step 10*	Go to *Step 9*
9	Check for the following conditions. • Objects blocking the IAC valve. • Objects blocking the throttle valve. • Vacuum leaking at throttle body. If a problem is found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 14*
10	Check for injector for the affected bank. Refer to *“Injector Coil Test & Injector Balance Test Procedure”* 6E-98 page. Was the injector operation correct?	—	Go to *Step 11*	Refer to *Injector Coil Test & Injector Balance Test Procedure*
11	Check for fuel pressure. Refer to *“Fuel System Diagnosis”* 6E-108 page. Was the fuel pressure correct?	—	Go to *Step 15*	Refer to *Fuel System Diagnosis*
12	Replace the TPS. Is the action complete?	—	Verify repair	—
13	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
14	Replace the IAC valve. Is the action complete?	—	Verify repair	—
15	Replace the O_2 sensor. Was the problem solved?	—	Verify repair	Go to *Step 16*
16	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 17*
17	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P1171 FUEL SUPPLY SYSTEM LEAN DURING POWER ENRICHMENT



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P1171	D	Fuel Supply System Lean During Power Enrichment	1. No DTC relating to MAP sensor, TPS, EVAP purge, ECT sensor, CKP sensor, VSS, injector control circuit and ignition control circuit. 2. Engine coolant temperature is more than 60 deg. C. 3. Mass air flow is below 13.5m/s. 4. O_2 sensor bank 1 output voltage is below 350mV in power enrichment mode.	No fail-safe function.

Circuit Description

The engine control module (ECM) internal circuitry can identify if the vehicle fuel system is capable of supplying adequate amounts of fuel during heavy acceleration (power enrichment). The ECM monitors the voltage of the oxygen sensor during power enrichment. When a power enrichment mode of operation is requested during “Closed Loop” operation (by heavy acceleration), the ECM will provide more fuel to the engine. Under these conditions the ECM should detect a “rich” condition (high oxygen sensor voltage). If this “rich” exhaust is not detected at this time, a Diagnostic Trouble Code P1171 will set. A plugged fuel filter or restricted fuel line can prevent adequate amounts of fuel from being supplied during power enrichment mode.

Diagnostic Aids

Check for the following conditions:

- Heated oxygen sensor wiring - The sensor pigtail may be routed incorrectly and contacting the exhaust system.
- Poor ECM to engine block ground.
- Fuel pressure - The system will go lean if pressure is too low. The ECM can compensate for some decrease. However, if fuel pressure is too low, a diagnostic Trouble Code P1171 may be set. Refer to *Fuel System Diagnosis*.
- Lean injector(s) - Perform "Injector Balance Test."
- Vacuum leaks - Check for disconnected or damaged vacuum hoses and for vacuum leaks at the intake manifold, throttle body, and PCV system.
- Exhaust leaks - An exhaust leak may cause outside air to be pulled into the exhaust gas stream past the HO2S, causing the system to appear lean. Check for exhaust leaks that may cause a false lean condition to be indicated.
- Fuel contamination - Water, even in small amounts, can be delivered to the fuel injectors. The water can cause a lean exhaust to be indicated, Excessive alcohol in the fuel can also cause this condition. Refer to *Fuel System Diagnosis* for the procedure to check for fuel contamination.

Diagnostic Trouble Code (DTC) P1171
Fuel Supply System Lean During Power Enrichment

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select "F0: Read DTC Infor By Priority" in "F0: Diagnostic Trouble Code". Is the DTC P1171 stored as "Present Failure"?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition "On" and engine "Off". 2. Select "Clear DTC Information" with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the "F5: Failed This Ignition" in "F2: DTC Information". Was the DTC P1171 stored in this ignition cycle?	—	Go to *Step 4*	Refer to *Diagnostic Aids* and Go to *Step 4*
4	1. Using the Tech 2, ignition "On" and engine "Off". 2. Monitor the "Throttle Position" in the data display. Does the Tech 2 indicate correct "Throttle Position" in accordance with accelerator pedal operation?	—	Go to *Step 6*	Go to *Step 5*
5	Check for the following conditions. • Objects blocking the throttle valve. • Incorrectly installed. If a problem is found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 12*
6	1. Using the Tech 2, ignition "On" and engine "On". 2. Monitor the "Manifold Absolute Pressure" in the data display. Does the Tech 2 indicate correct "Manifold Absolute Pressure" in accordance with engine speed or acceleration?	—	Go to *Step 8*	Go to *Step 7*

Step	Action	Value(s)	Yes	No
7	Remove the MAP sensor and check for the following conditions. • Objects blocking the air cleaner. • Objects blocking the MAP sensor. • Objects blocking the throttle valve. • Vacuum leaking at intake duct. • Vacuum leaking at throttle body. If a problem is found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 13*
8	1. Using the Tech 2, ignition “On” and engine “On”. 2. Select the “Miscellaneous Test” and perform the “IAC Control” in the “IAC System”. 3. Operate the Tech 2 in accordance with procedure. Was the engine speed changed, when the IAC valve is operating step by step?	—	Go to *Step 10*	Go to *Step 9*
9	Check for the following conditions. • Objects blocking the IAC valve. • Objects blocking the throttle valve. • Vacuum leaking at throttle body. If a problem is found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 14*
10	Check for injector for the affected bank. Refer to *“Injector Coil Test & Injector Balance Test Procedure”* 6E-98 page. Was the injector operation correct?	—	Go to *Step 11*	Refer to *Injector Coil Test & Injector Balance Test Procedure*
11	Check for fuel pressure. Refer to *“Fuel System Diagnosis”* 6E-108 page. Was the fuel pressure correct?	—	Go to *Step 15*	Refer to *Fuel System Diagnosis*
12	Replace the TPS. Is the action complete?	—	Verify repair	—
13	Replace the MAP sensor. Is the action complete?	—	Verify repair	—
14	Replace the IAC valve. Is the action complete?	—	Verify repair	—
15	Replace the O_2 sensor. Was the problem solved?	—	Verify repair	Go to *Step 16*
16	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 17*
17	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P1625 ECM SYSTEM RESET

Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P1625	B	ECM System Reset	ECM reset has occurred other than “On”.	Engine control disabled.

Circuit Description

The engine control module (ECM) monitors unexpected ECM reset. This will not turn on MIL light on, only records code DTC P1625.

Diagnostic Aids

Check for the follwing conditions:

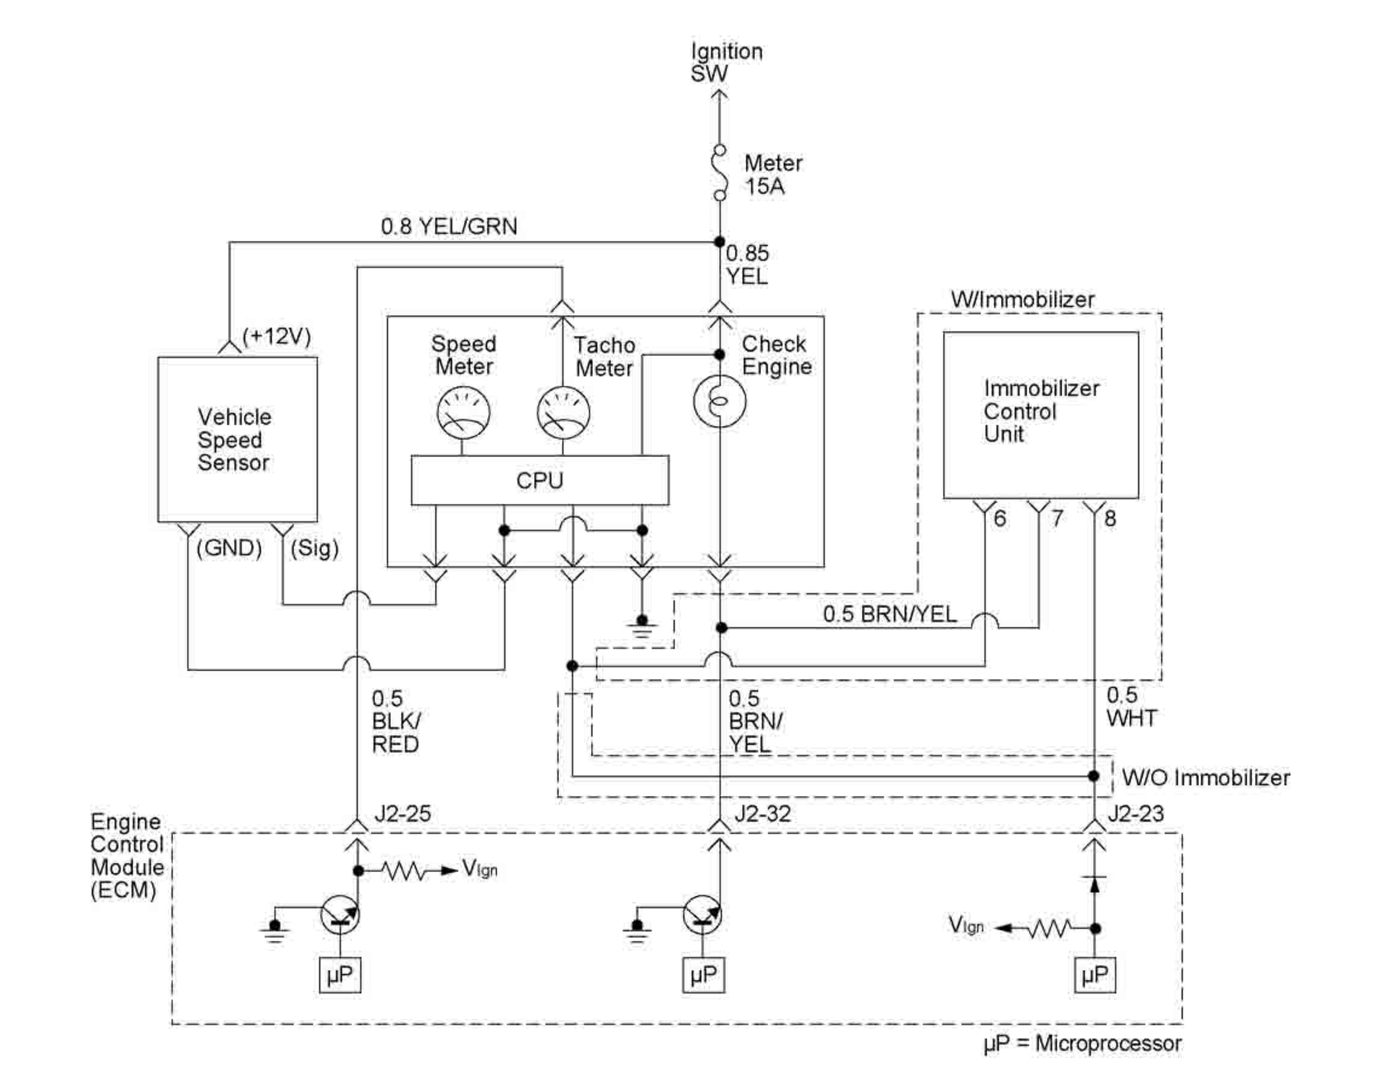
- P1625 alone stored does not need diagnosis. Clear DTC code.

NOTE: DTC P1625 is a DTC to record a ECM reset history. If DTC P1625 is not reset and no engine abnormality occurs after learing the DTC, no farther diagnostic procedures are required.

Diagnostic Trouble Code (DTC) P1625 ECM System Reset

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select “F0: Read DTC Infor By Priority” in “F0: Diagnostic Trouble Code”. Is the DTC P1625 stored as “Present Failure”?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition “On” and engine “Off”. 2. Select “Clear DTC Information” with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the “F5: Failed This Ignition” in “F2: DTC Information”. Was the DTC P1625 stored in this ignition cycle?	—	Go to *Step 4*	Refer to *Diagnostic Aids* and Go to *Step 4*
4	Is the Immobilizer function programmed in the ECM?	—	Verify repair	Go to *Step 5*
5	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 6*
6	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P1626 IMMOBILIZER NO SIGNAL



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P1626	-	Immobilizer No Signal	No response from immobilizer control unit.	1. Engine does not start. 2. Check engine lamp flash.

Circuit Description

The ECM decides whether that is an abnomality in the immobilizer control system. DTC P1626 is recorded by the ECM when no response from immobiliser.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM and Immobilizer-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness Inspect the wiring harness for damage, If the harness appears to be OK, disconnect the ECM and Immobilizer, turn the ignition “ON” and observe a voltmeter connected to the suspect driver circuit at the ECM and Immobilizer harnass connector while moving connectors and wiring harnesses relates to the MIL. A change in voltage will indicate the location of the fault.

Diagnostic Trouble Code (DTC) P1626 Immobilizer No Signal

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select “F0: Read DTC Infor By Priority” in “F0: Diagnostic Trouble Code”. Is the DTC P1626 stored as “Present Failure”?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition “On” and engine “Off”. 2. Select “Clear DTC Information” with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the “F5: Failed This Ignition” in “F2: DTC Information”. Was the DTC P1626 stored in this ignition cycle?	—	Go to *Step 4*	Refer to *Diagnostic Aids* and Go to *Step 4*
4	1. Using the Tech 2, ignition “On” and engine “Off”. 2. Select “Immobilizer” in the system selection menu “Body”. 3. Select “Read DTC Info Ordered By Priority” in the “Diagnositic Trouble Code”. Was the DTC B0007 stored in this ignition cycle?	—	Refer to *“Immobilizer Workshop Manual” & Go to DTC Chart B0007*	Go to *Step 5*
5	Check for poor/faulty connection at the immobilizer control unit connector or ECM connector. If a poor/ faulty connection is found, repair as necessary. Was the problem found? C-56(J2)  B-68 	—	Verify repair	Go to *Step 6*
6	Using the DVM and check the “CHECK ENGINE” lamp circuit. 1. Ignition “Off”, engine “Off”. 2. Disconnect the meter connector and immobilizer control unit connector. 3. Ignition “On”. 4. Check the circuit for short to power supply circuit. Was the problem found? B-68  B-24 	—	Repair faulty harness and verify repair	Go to *Step 7*

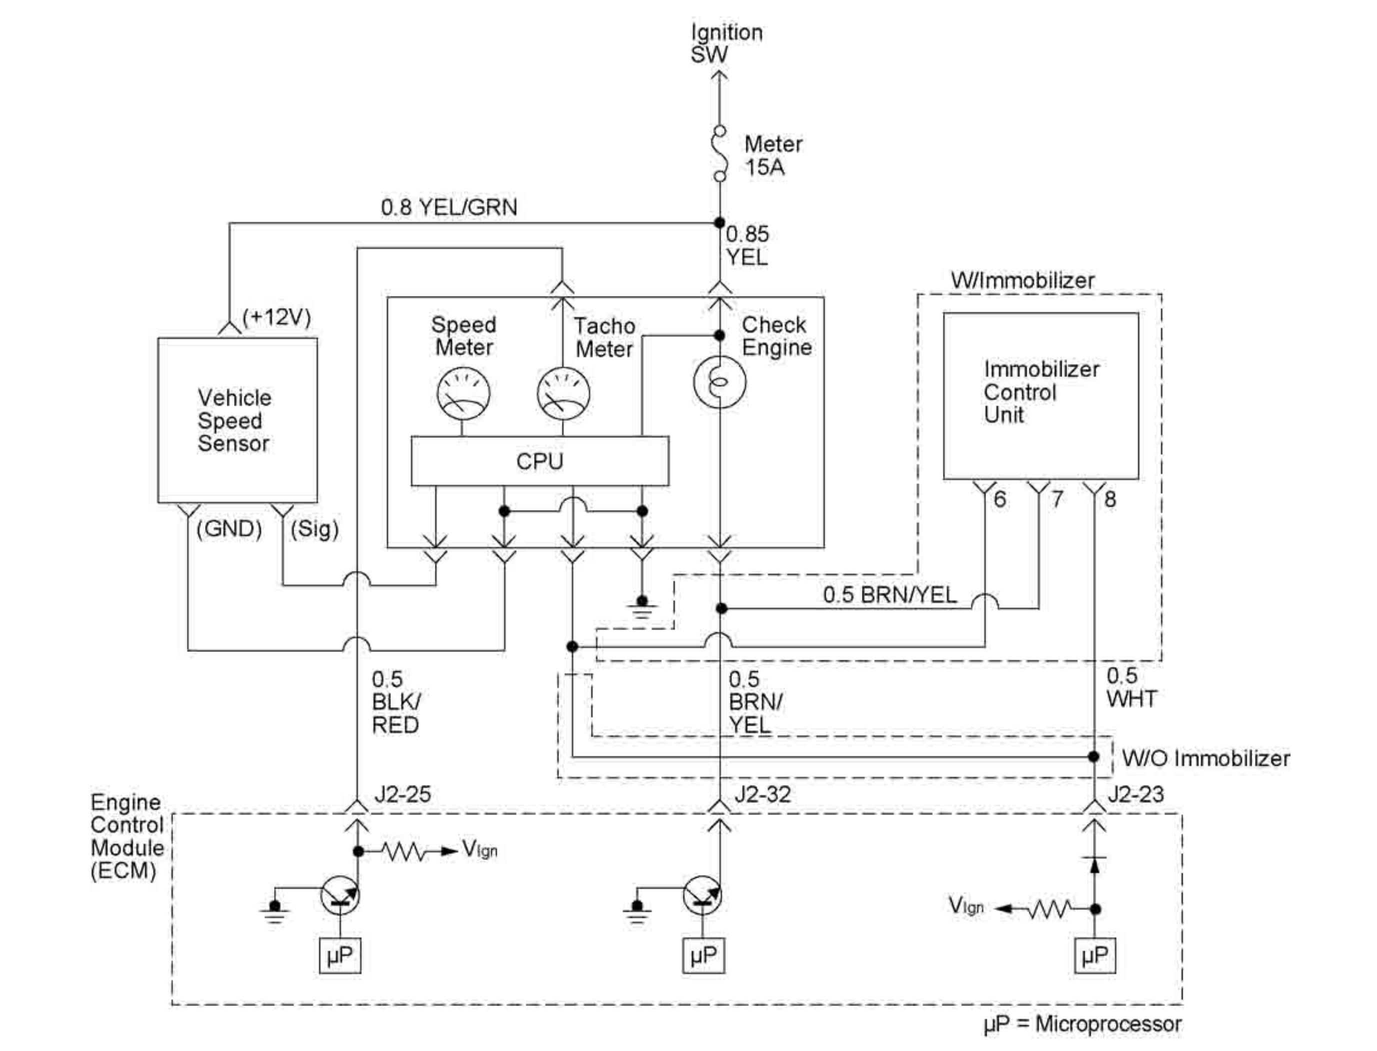
11	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P1631
IMMOBILIZER WRONG SIGNAL



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P1631	-	Immobilizer Wrong Signal	Received response is not correct.	1. Engine does not start. 2. Check engine lamp flash.

Circuit Description

The ECM decides whether that is an abnomality in the immobilizer control system. DTC P1631 is recorded by the ECM when received response was not correct.

Diagnostic Aids

Check for the following conditions:

- Poor connection at ECM and Immobilizer-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage, If the harness appears to be OK, disconnect the ECM and Immobilizer, turn the ignition “ON” and observe a voltmeter connected to the suspect driver circuit at the ECM and Immobilizer harnass connector while moving connectors and wiring harnesses relates to the MIL. A change in voltage will indicate the location of the fault.

Diagnostic Trouble Code (DTC) P1631 Immobilizer Wrong Signal

Step	Action	Value(s)	Yes	No
1	Was the "On-Board Diagnostic (OBD) System Check" performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select "F0: Read DTC Infor By Priority" in "F0: Diagnostic Trouble Code". Is the DTC P1631 stored as "Present Failure"?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition "On" and engine "Off". 2. Select "Clear DTC Information" with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the "F5: Failed This Ignition" in "F2: DTC Information". 4	1. Using the Tech 2, ignition "On" and engine "Off". 2. Select "Immobilizer" in the system selection menu "Body". 3. Select "Read DTC Info Ordered By Priority" in the "Diagnositic Trouble Code". Was the DTC B0007 stored in this ignition cycle?	—	Refer to *"Immobilizer Workshop Manual" & Go to DTC Chart B0007*	Go to *Step 5*
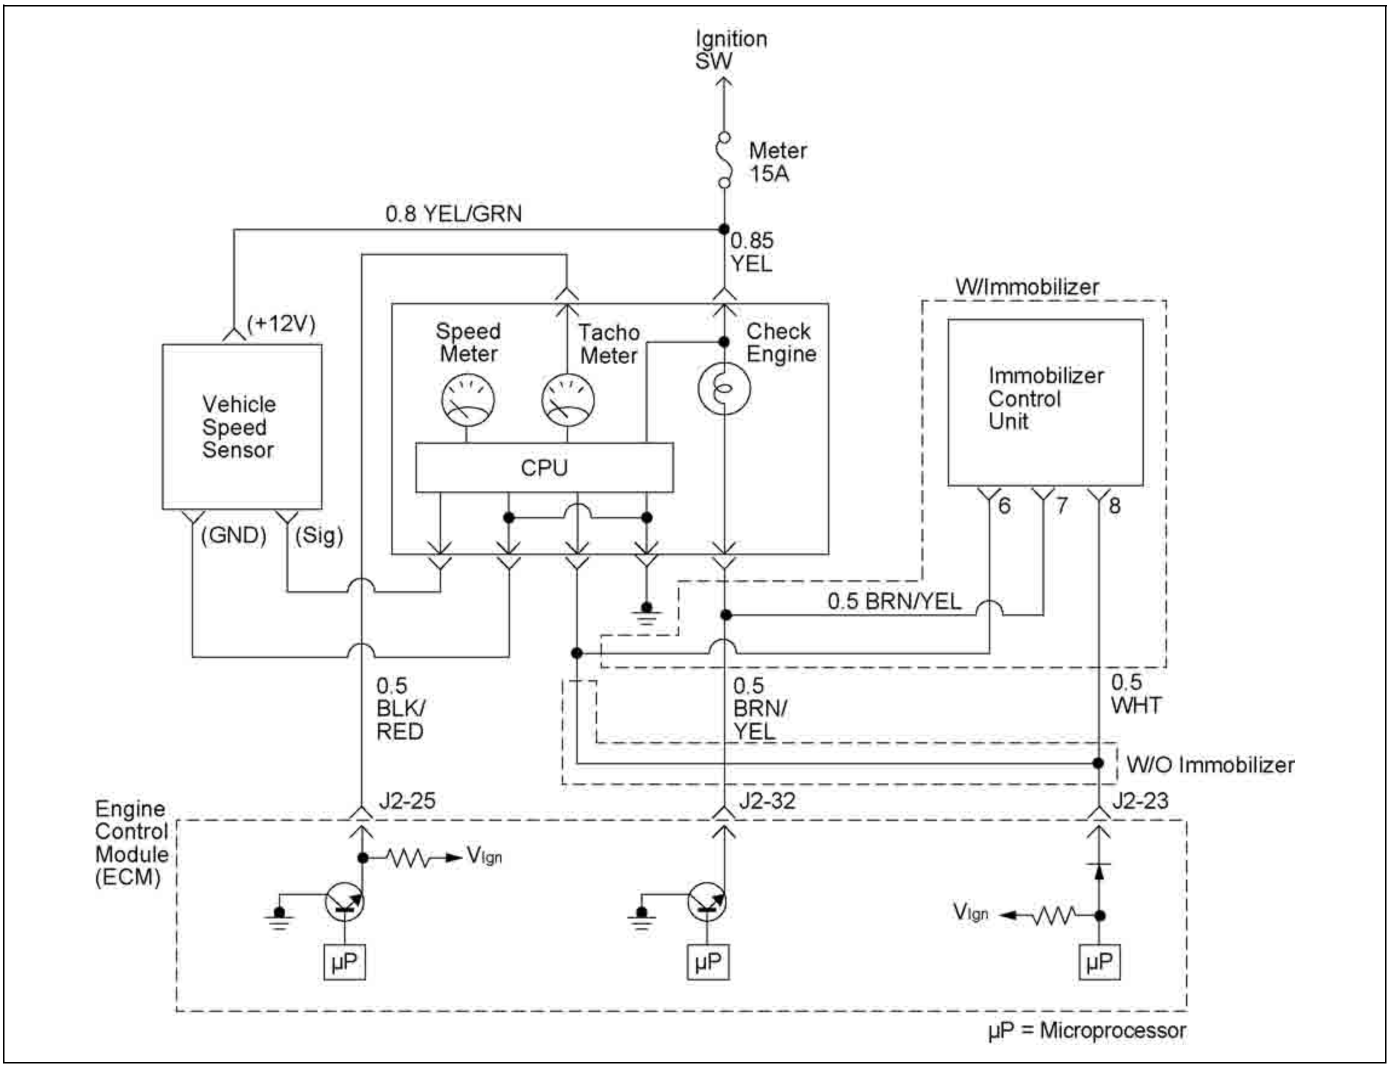
5	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***"SPS (Service Programming System)".*** Was the problem solved?	—	Verify repair	Go to *Step 6*
6	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P1648
WRONG SECURITY CODE ENTERED



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P1648	-	Wrong Security Code Entered	Received incorrect security code.	1. Engine does not start. 2. Check engine lamp flash.

Circuit Description

The ECM decides whether that is an abnomality in the immobilizer control system. DTC P1648 is recorded by the ECM when received incorrect security code.

Diagnostic Aids

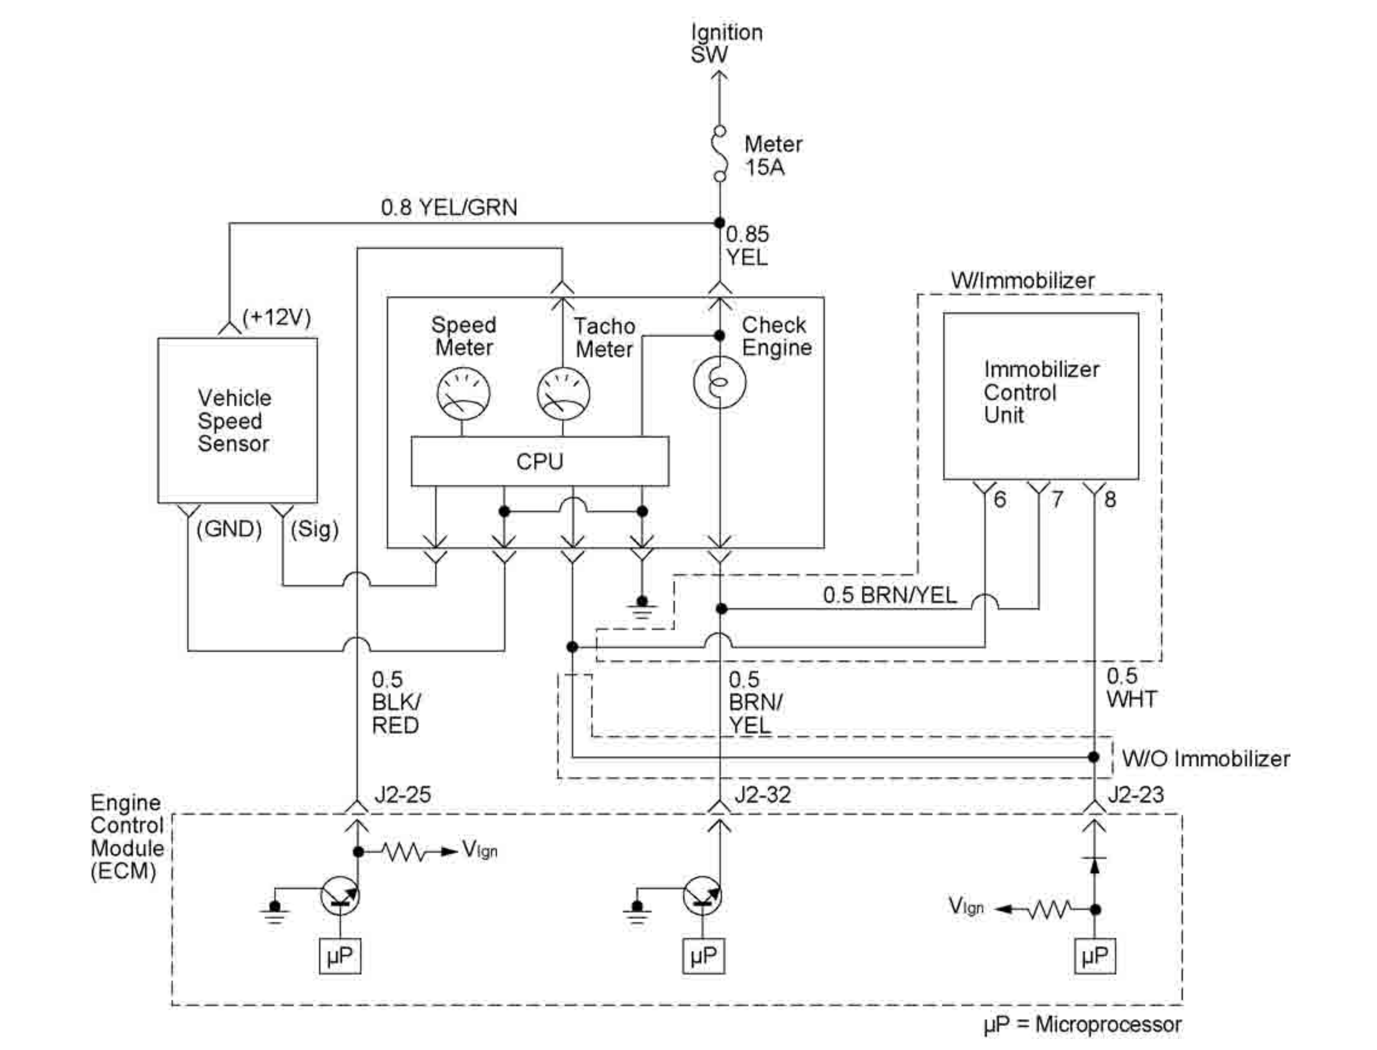
Check for the following conditions:

- Poor connection at ECM and Immobilizer-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness Inspect the wiring harness for damage, If the harness appears to be OK, disconnect the ECM and Immobilizer, turn the ignition "ON" and observe a voltmeter connected to the suspect driver circuit at the ECM and Immobilizer harnass connector while moving connectors and wiring harnesses relates to the MIL. A change in voltage will indicate the location of the fault.

Diagnostic Trouble Code (DTC) P1648 Wrong Security Code Entered

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select “F0: Read DTC Infor By Priority” in “F0: Diagnostic Trouble Code”. Is the DTC P1648 stored as “Present Failure”?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition “On” and engine “Off”. 2. Select “Clear DTC Information” with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the “F5: Failed This Ignition” in “F2: DTC Information”. Was the DTC P1648 stored in this ignition cycle?	—	Go to *Step 4*	Refer to *Diagnostic Aids* and Go to *Step 4*
4	1. Using the Tech 2, ignition “On” and engine “Off”. 2. Select “Immobilizer” in the system selection menu “Body”. 3. Select “Read DTC Info Ordered By Priority” in the “Diagnositic Trouble Code”. Was the DTC B0007 stored in this ignition cycle?	—	Refer to *“Immobilizer Workshop Manual” & Go to DTC Chart B0007*	Go to *Step 5*
5	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 6*
6	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P1649 IMMOBILIZER FUNCTION NOT PROGRAMMED



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P1649	-	Immobilizer Function Not Programmed	Immobilizer function is not programmed in the ECM.	1. Engine does not start. 2. Check engine lamp flash.

Circuit Description

The ECM decides whether that is an abnomality in the immobilizer control system. DTC P1649 is recorded by the ECM when security code & secret key not programmed.

Diagnostic Aids

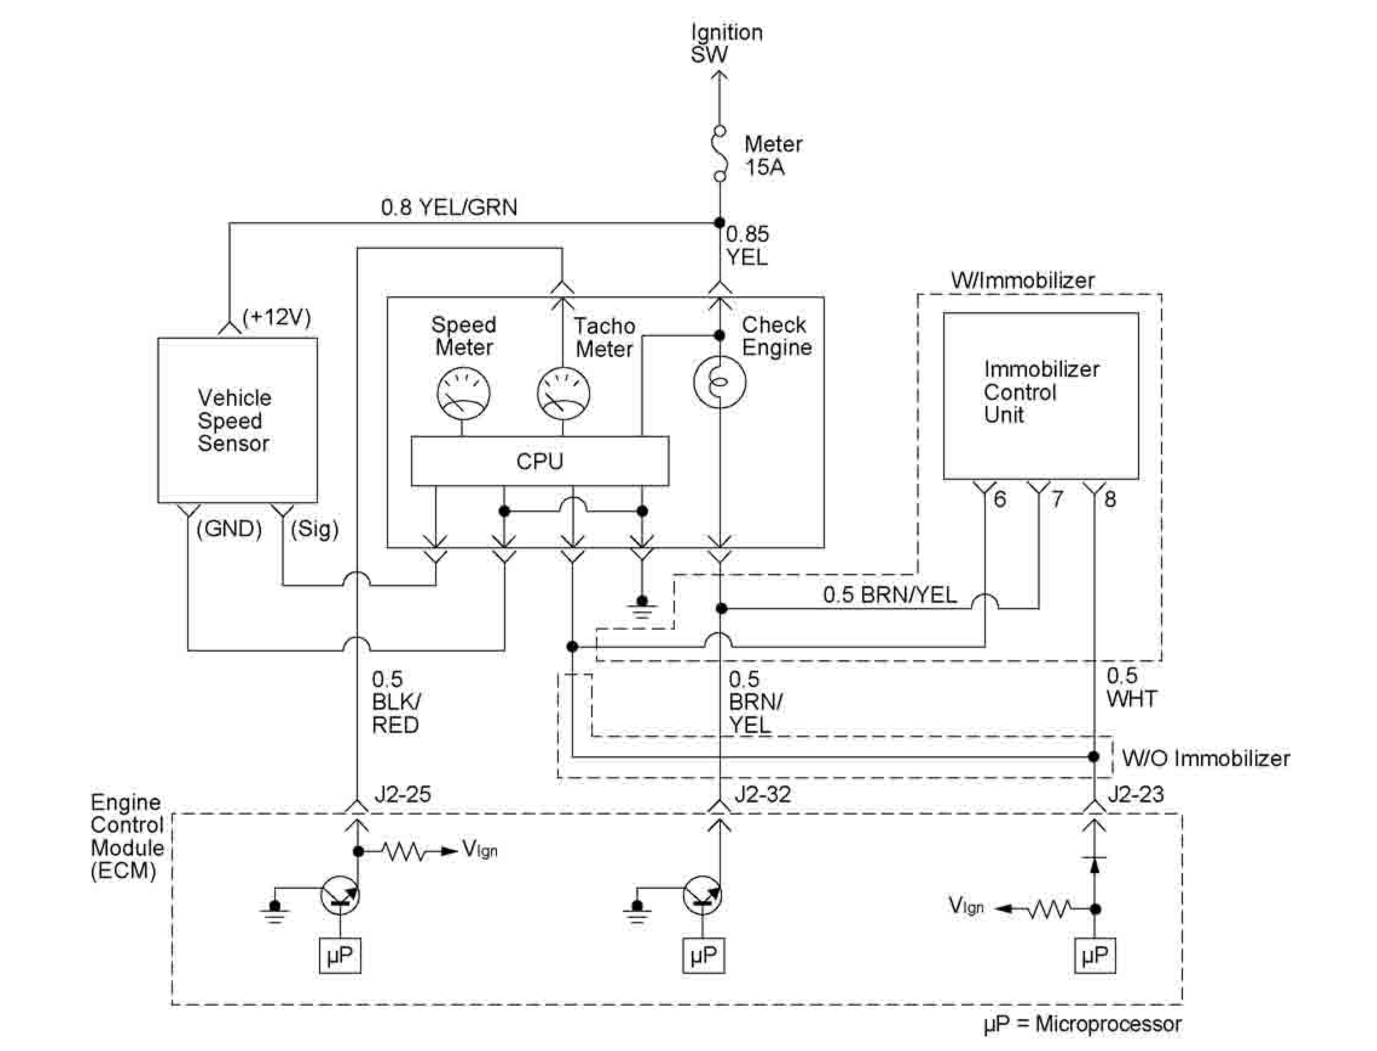
Check for the following conditions:

- Poor connection at ECM and Immobilizer-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness Inspect the wiring harness for damage, If the harness appears to be OK, disconnect the ECM and Immobilizer, turn the ignition “ON” and observe a voltmeter connected to the suspect driver circuit at the ECM and Immobilizer harnass connector while moving connectors and wiring harnesses relates to the MIL. A change in voltage will indicate the location of the fault.

Diagnostic Trouble Code (DTC) P1649 Immobilizer Function Not Programmed

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select “F0: Read DTC Infor By Priority” in “F0: Diagnostic Trouble Code”. Is the DTC P1649 stored as “Present Failure”?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition “On” and engine “Off”. 2. Select “Clear DTC Information” with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the “F5: Failed This Ignition” in “F2: DTC Information”. Was the DTC P1649 stored in this ignition cycle?	—	Go to *Step 4*	Refer to *Diagnostic Aids* and Go to *Step 4*
4	1. Using the Tech 2, ignition “On” and engine “Off”. 2. Select “Immobilizer” in the system selection menu “Body”. 3. Select “Read DTC Info Ordered By Priority” in the “Diagnositic Trouble Code”. Were the any DTC's B0002 or B0009 stored in this ignition cycle?	—	Refer to *“Immobilizer Workshop Manual” & Go to DTC Chart B0002 or B0009*	Go to *Step 5*
5	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 6*
6	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

DIAGNOSTIC TROUBLE CODE (DTC) P1693 TACHOMETER OUTPUT LOW VOLTAGE



Condition for setting the DTC and action taken when the DTC sets

Code	Type	DTC Name	DTC Setting Condition	Fail-Safe (Back Up)
P1693	B	Tachometer Output Low Voltage	Tacho output circuit short to ground circuit.	No fail-safe function.

Circuit Description

Based on the information from the Crank Position Sensor (CKP), X58 reference signal is generated at each rotation of the crankshaft.
Engine Control Module (ECM) converts X58 reference signal into the square wave signal which is used to drive the pulse generator of the tachometer.
When the wave length of the output signal is long, the tacho meter indicates the engine speed is low, and vise versa.
This malfunction detects a low impedance short to ground or open contact on the Tacho output, the Diagnostic Trouble Code P1693 will be set.

Diagnostic Aids

- Poor connections or a damaged harness - Inspect the harness connections for: backed out terminals, imprope, mating or damaged terminals. Also check for open circuit, short to ground, and short to voltage.
- This malfunction detects a low impedance short to ground or open contact on the ECM out put circuit.

Diagnostic Trouble Code (DTC) P1693 Tachometer Output Low Voltage

Step	Action	Value(s)	Yes	No
1	Was the “On-Board Diagnostic (OBD) System Check” performed?	—	Go to *Step 2*	Go to *On Board Diagnostic (OBD) System Check*
2	1. Connect the Tech 2. 2. Review and record the failure information. 3. Select “F0: Read DTC Infor By Priority” in “F0: Diagnostic Trouble Code”. Is the DTC P1693 stored as “Present Failure”?	—	Go to *Step 3*	Refer to *Diagnostic Aids* and Go to *Step 3*
3	1. Using the Tech2, ignition “On” and engine “Off”. 2. Select “Clear DTC Information” with the Tech2 and clear the DTC information. 3. Operate the vehicle and monitor the “F5: Failed This Ignition” in “F2: DTC Information”. Was the DTC P1693 stored in this ignition cycle?	—	Go to *Step 4*	Refer to *Diagnostic Aids* and Go to *Step 4*
4	Check for poor/faulty connection at the ECM or meter connector. If a poor/faulty connection is found, repair the faulty terminal. Was the problem found?  	—	Verify repair	Go to *Step 5*
5	If a oscilloscope is available, monitor the Tachometer output signal. Does the oscilloscope indicate correct wave form? Crankshaft Position (CKP) Sensor & Tacho Output Signal Reference Wave Form  Measurement Terminal: CH1: J1-21(+) / CH2: J2-25(+) GND(-) Measurement Scale: CH1: 2V/div / CH2: 10V/div 5ms/div Measurement Condition: Approximately 2000rpm	—	Go to *Step 10*	Not available: Go to *Step 6* Fixed at low: Go to *Step 6* Fixed at High: Go to *Step 7*

I : Inspect and correct or replace as necessary A : Adjust
R : Replace or change T : Tighten to specified torque L : Lubricate

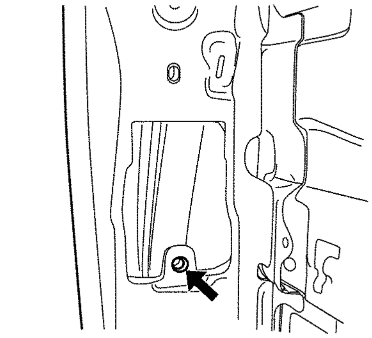
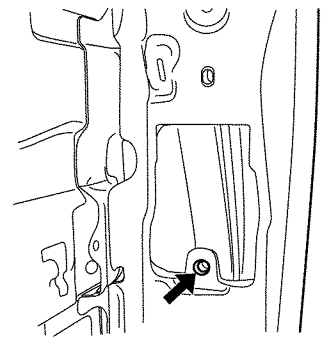
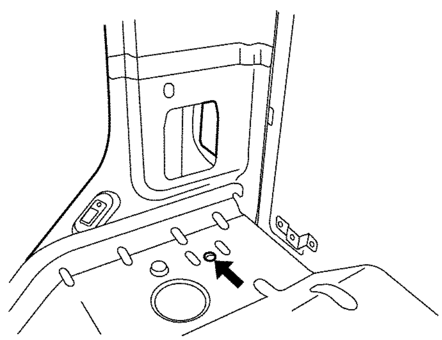
56



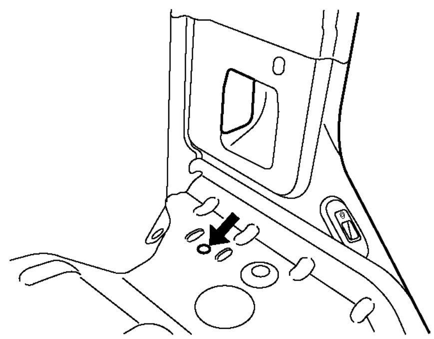
57



58



59



Step	Action	Value(s)	Yes	No
6	Using the DVM and check the Tacho output circuit. **Breaker box is available:** 1. Ignition “Off”, engine “Off”. 2. Install the breaker box as type A. (ECM disconnected) Refer to 6E-88 page. 3. Disconnect the meter connector. 4. Check the circuit for open or short to ground circuit. Was the problem found?  **Breaker box is not available:** 1. Ignition “Off”, engine “Off”. 2. Disconnect the ECM connector. 3. Disconnect the meter connector. 4. Check the circuit for open or short to ground circuit. Was the problem found? 	—	Repair faulty harness and verify repair	Go to *Step 7*
7	Using the DVM and check the Tacho output circuit. 1. Ignition “On”, engine “Off”. 2. Disconnect the meter connector. 3. Check the circuit for short to power supply circuit. Was the DVM indicated specified value? 	Less than 1V	Go to *Step 8*	Repair faulty harness and verify repair
8	Check any accessory parts which may cause electric interference or magnetic interference. Was the problem found?	—	Remove the accessory parts and verify repair	Go to *Step 9*

Step	Action	Value(s)	Yes	No
9	Replace the Tacho meter. Was the problem solved?	—	Verify repair	Go to *Step 10*
10	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 11*
11	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

SYMPTOM DIAGNOSIS

PRELIMINARY CHECKS

Before using this section, perform the "On-Board Diagnostic (OBD) System Check" and verify all of the following items:

- The engine control module (ECM) and malfunction indicator lamp (MIL = Check Engine Lamp) are operating correctly.
- There are no Diagnostic Trouble Code(s) stored.
- Tech 2 data is within normal operating range. Refer to Typical Scan Data Values.
- Verify the customer complaint and locate the correct symptom in the table of contents. Perform the procedure included in the symptom chart.

VISUAL/PHYSICAL CHECK

Several of the symptom procedures call for a careful visual/physical check. This can lead to correcting a problem without further checks and can save valuable time. This check should include the following items:

- ECM grounds for cleanliness, tightness and proper location.
- Vacuum hoses for splits, kinks, and proper connection, shown on the "Emission Control System Schematics". Check thoroughly for any type of leak or restriction.
- Air intake ducts for collapsed or damaged areas.
- Air leaks at throttle body mounting area, manifold absolute pressure (MAP) sensor and intake manifold sealing surfaces.
- Ignition wires for cracking, harness, and carbon tracking.
- Wiring for proper connections, pinches and cuts.

INTERMITTENT

Important: An intermittent problem may or may not turn on the malfunction indicator lamp (MIL) or store a Diagnostic Trouble Code. Do NOT use the Diagnostic Trouble Code (DTC) charts for intermittent problems.
The fault must be present to locate the problem.
Most intermittent problems are cased by faulty electrical connections or wiring. Perform a careful visual/physical check for the following conditions.

- Poor mating of the connector halves or a terminal not fully seated in the connector (backed out).
- Improperly formed or damaged terminal.
- All connector terminals in the problem circuit should be carefully checked for proper contact tension.
- Poor terminal-to-wire connection. This requires removing the terminal form the connector body to check.
- Ignition coils shorted to ground and arcing at ignition wires or plugs.
- MIL (Check Engine Lamp) wire to ECM shorted to ground.
- Poor ECM grounds. Refer to the ECM wiring diagrams.

Road test the vehicle with a Digital Multimeter connected to a suspected circuit. An abnormal voltage when the malfunction occurs is a good indication that there is a fault in the circuit being monitored.
Using Tech 2 to help detect intermittent conditions. The Tech 2 has several features that can be used to located an intermittent condition.

An intermittent MIL (Check Engine Lamp) with no stored Diagnostic Trouble Code may be caused by the following:

- Ignition coil shorted to ground and arcing at ignition wires or plugs.
- MIL (Check Engine Lamp) wire to ECM short to ground.
- Poor ECM grounds. Refer to the ECM wiring diagrams.

Check for improper installation of electrical options such as light, cellular phones, etc. Check all wires from ECM to the ignition control module for poor connections.
Check for an open diode across the A/C compressor clutch and check for other open diodes (refer to wiring diagrams in Electrical Diagnosis).

If problem has not been found, refer to ECM connector symptom tables.

- Check the "Broadcast Code" of the ECM, and compare it with the latest Isuzu service bulletins and/ or Isuzu EEPROM reprogramming equipment to determine if an update to the ECM's reprogrammable memory has been released.

To check the "Broadcast Code", connect the Tech 2, then look for "ID info." then select "Broadcast Code". This should display a 4 character code, such as "XBYA" (example only).
This identifies the contents of the reprogrammable software and calibration contained in the ECM.
If the "Broadcast Code" is not the most current available, it is advisable to reprogram the ECM's EEPROM memory, which may either help identify a hard-to find problem or may fix the problem.
The Service Programming System (SPS) will not allow incorrect software programming or incorrect calibration changes.

ENGINE CRANKS BUT WILL NOT RUN

DEFINITIONS: Engine cranks, but will not run. (The engine never start.)
NOTE: The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM.
Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.
NOTE: The vehicle with immobilizer system, this system may be activated. Check the immobilizer system diagosis.

Step	Action	Value(s)	Yes	No
1	Was the "*On-Board Diagnostic (OBD) System Check*" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visually/physical check performed?	—	Go to *Step 4*	Go to *Visual / physical Check.*
4	Check the "Ignition coil" fuse (15A) and "ECM" fuse (15A). Was a fuse blown?	—	Verify repair	Go to *Step 5*
5	1. Ignition ON 2. Use a DVM to verify that battery voltage at the ignition coil fuse, and the ECM fuse. Was battery voltage presented at the fuses?	—	Go to *Step 6*	Verify & repair
6	1. Visually/physically inspect for the following conditions: • Restriction of air intake system. Check for a restricted air filter element, or foreign objects blocking the air intake system. • Check for objects blocking the IAC passage or throttle bore, excessive deposits in the throttle bore and on the throttle plate. • Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty crankcase ventilation hose/brake booster hose. Was a problem found?	—	Verify repair	Go to *Step 7*
7	1. Using a Tech 2, display the IAC value. 2. Check for a faulty, plugged, or sticking IAC operation. Was the problem found?	—	Verify repair	Go to *Step 8*
8	1. Using a Tech 2, display the MAP sensor value. 2. Check for a faulty, plugged, or incorrectly installed MAP sensor. Was the problem found?	—	Verify repair	Go to *Step 9*
9	If oscilloscope is available, check the wave form of the CKP signal. Was the correct wave form found?	—	Go to *Step 12*	Go to *Step 10*
10	Check the CKP sensor wire for open or short circuit. Was a problem found?	—	Verify repair	Go to *Step 11*
11	Replace CKP sensor. Is there still problem?	—	Replace pulsar ring.	Verify repair

Step	Action	Value(s)	Yes	No
12	Visually/physically inspect the secondary ignition wires. Check for the following conditions: • Verify that all ignition wire resistance are less than the specified value. • Verify that ignition wires are correctly routed to eliminate cross-fitting. • Verify that ignition wires are not arcing to ground. Spraying the secondary ignition wires with a light mist of water may help locate an intermittent problem. Was a problem found?	#1 cyl. 4.4kΩ #2 cyl. 3.6kΩ #3 cyl. 3.1kΩ #4 cyl. 2.8kΩ	Verify repair	Go to *Step 13*
13	1. Disconnect the spark plug high tension cable from No.1 spark plug. 2. Install a spark tester at the end of the disconnected ignition coil. 3. Clip the spark tester to a good ground. 4. Observe the spark tester while the engine is cranking. Was a crisp blue spark observed? (Only one or two sparks followed by no result is considered the same as “No Spark”.)	—	Go to *Step 21*	Go to *Step 14*
14	1. Disconnect the ignition coil harness connector. 2. Check for an open or short circuit between the ignition coil and the ECM. Was a problem found?	—	Verify repair	Go to *Step 15*
15	1. Ignition “On”. 2. Using a Digital Voltmeter (DVM) check the ignition wire coil at the ignition coil harness connector. Was the voltage equal to the specified value?	Battery voltage	Go to *Step 16*	Verify repair
16	1. Ignition “Off”. 2. With DVM, check for an open in the ground wire at the ignition coil harness connector. Was the ground wire OK?	—	Go to *Step 17*	Verify repair
17	Replace the ignition coil, verify the repair. Attempt to start the engine. Is there still a problem?	—	Go to *Step 18*	Verify repair
18	Use an ohmmeter to check the ignition coil primary winding resistance. Was the primary winding resistance approximately equal to the specified value?	0.8-18kΩ	Go to *Step 19*	Go to *Step 20*
19	Use an ohmmeter to check the ignition coil secondary winding resistance. Was the primary winding resistance hear around the to the specified value?	2.5kΩ	Go to *Step 21*	Go to *Step 20*
20	Replace the ignition coil.	—	Verify repair	—
21	1. Remove the spark plugs from all cylinders. 2. Visually inspect the spark plug electrodes. 3. Replace any spark plugs with loose or missing electrodes or cracked insulators. Did your inspection reveal any spark plugs exhibiting excessive fouling?	—	Correct the fouling condition	Go to *Step 22*

Step	Action	Value(s)	Yes	No
22	Perform the procedure in Fuel System Pressure Test (Refer to 6E-108 "*Fuel System Diagnosis*") to determine if there is a problem with fuel delivery. Was a problem found?	—	Verify repair	Go to *Step 23*
23	Refer to 6E-108 page "*Fuel System Diagnosis*" to determine if there is a problem with fuel delivery. Was a problem found?	—	Verify repair	Go to *Step 24*
24	Check for the following engine mechanical problems (refer to *Engine Mechanical*): • Low compression • Leaking cylinder head gaskets • Worn camshaft • Camshaft drive belt slipped or stripped Was a problem found?	—	Verify repair	Go to *Step 25*
25	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Go to *Step 26*
26	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***"SPS (Service Programming System)".*** Was the problem solved?	—	Verify repair	Go to *Step 27*
27	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.	—	Verify Repair	—

HARD START SYMPTOM

DEFINITIONS: Engine cranks, but does not start for a long time. Does eventually start, of may start and then immediately stall.

Step	Action	Value(s)	Yes	No
1	Was the "*On-Board Diagnostic (OBD) System Check*" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visually/physical check performed?	—	Go to *Step 4*	Go to *Visual / physical Check.*
4	1. Visually/physically inspect for the following conditions: • Restriction of air intake system. Check for a restricted air filter element, or foreign objects blocking the air intake system • Check for objects blocking the IAC passage or throttle bore, excessive deposits in the throttle bore and on the throttle plate • Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty crankcase ventilation hose/brake booster hose. Was a problem found?	—	Verify repair	Go to *Step 5*
5	1. Using a Tech 2, display the IAC value. 2. Check for a faulty, plugged, or sticking IAC operation. Was the problem found?	—	Verify repair	Go to *Step 6*
6	Check engine coolant temperature (ECT) sensor for shift in value. 1. After 8 hours with hood up and the engine not running, connect the Tech 2. 2. Ignition On, engine not running. 3. Using Tech 2, compare Engine Coolant Temperature to Intake Air Temperature. Are ECT and IAT within the specified value of each other?	±5°C	Go to *Step 8*	Go to *Step 7*

<table>
<tr><th>Step</th><th>Action</th><th>Value(s)</th><th>Yes</th><th>No</th></tr>
<tr><td>7</td><td>1. Using a Tech 2, display the engine coolant temperature and note the value.
2. Check the resistance of the engine coolant temperature sensor.
Is the actual resistance near the resistance value in the chart for the temperature that was noted?
<table>

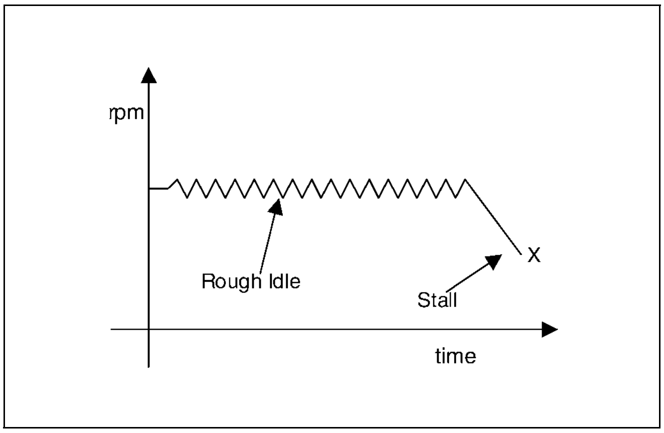
</table>

Step	Action	Value(s)	Yes	No
14	Drain sample fuel, visual inspection. Any suspecion about the fuel, such as discoloration, particle, contamination, water, unusual smell, then drain the fuel from fuel tank. Replace the fuel from know vehicle source. If any suspicion of alcohol contamination, completely drain the fuel, replace by fuel from known vehicle source.	—	Verify repair	Go to *Step 15*
15	Perform the procedure in Fuel System Pressure Test (Refer to 6E-108 "*Fuel System Diagnosis*") to determine if there is a problem with fuel delivery. Was a problem found?	—	Verify repair	Go to *Step 16*
16	1. Check the injector connectors. 2. If any of the connectors are connected at an improper cylinder, connect as necessary. Was a problem found?	—	Verify repair	Go to *Step 17*
17	Check for the following engine mechanical problems (refer to *Engine Mechanical*): • Low compression • Leaking cylinder head gaskets • Worn camshaft • Camshaft drive belt slipped or stripped Was a problem found?	—	Verify repair	Go to *Step 18*
18	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Go to *Step 19*
19	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***"SPS (Service Programming System)".*** Was the problem solved?	—	Verify repair	Go to *Step 20*
20	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.	—	Verify Repair	—

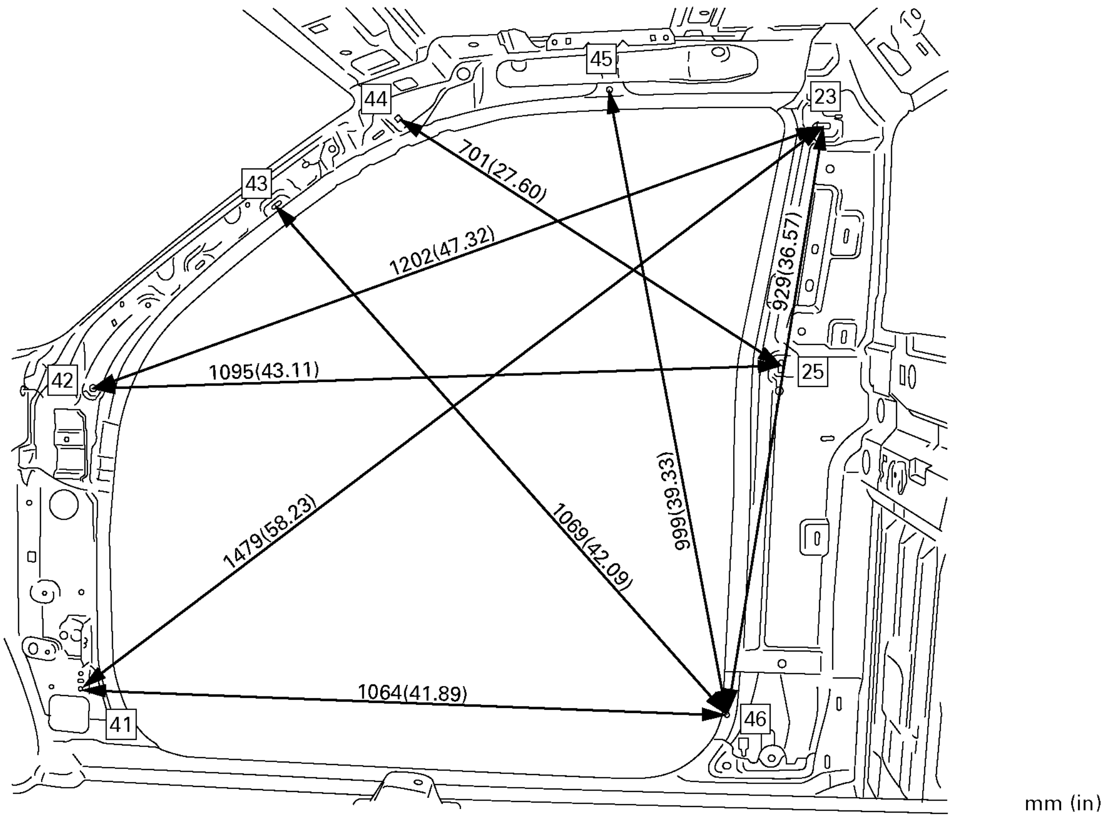
ROUGH, UNSTABLE, OR INCORRECT IDLE, STALLING SYMPTOM

DEFINITIONS: Engine runs unevenly at idle. If severe, the engine or vehicle may shake. Engine idle speed may vary in RPM. Either condition may be severe enough to stall the engine.

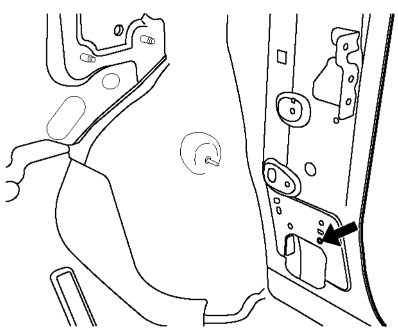


Step	Action	Value(s)	Yes	No
1	Was the "*On-Board Diagnostic (OBD) System Check*" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual / physical Check.*
4	1. Check for faulty, plugged or incorrectly installed PCV valve. 2. Verify that the PCV system is not plugged. Was a problem found?	—	Verify repair	Go to *Step 5*
5	1. Check for incorrect idle speed. Ensure that the following conditions are present. • Engine fully warm • Accessories are "Off" 2. Using a Tech 2, monitor IAC position. Is the IAC position within the specified values?	20-30 Steps	Go to *Step 7*	Go to *Step 6*
6	1. Visually/physically inspect for the following conditions: • Restriction of the air intake system. Check for a restricted air filter element, or foreign objects blocking the air intake system. • Check for objects blocking the IAC passage or throttle bore, excessive deposits in the throttle bore and on the throttle plate. • Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty crankcase ventilation hose/brake booster hose. Was a problem found?	—	Verify repair	Go to *Step 7*

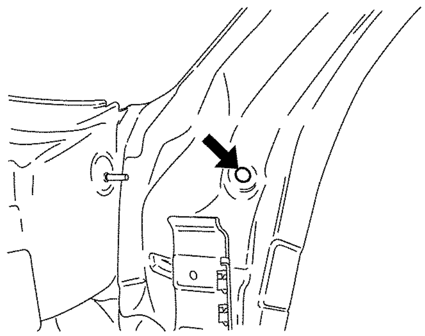
SIDE BODY SECTION (REGULAR CAB)



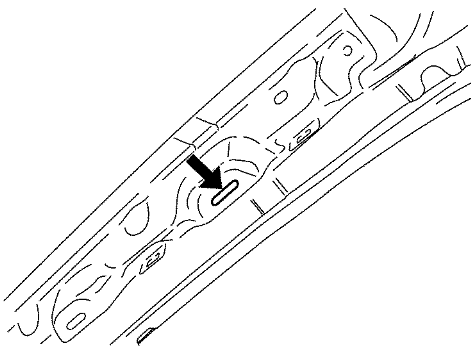
41



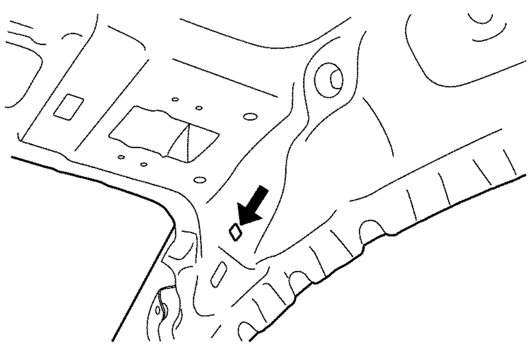
42



43



44

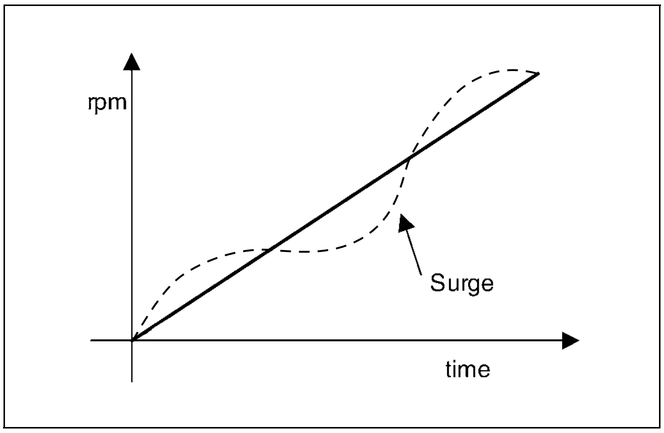


Step	Action	Value(s)	Yes	No
7	1. Using a Tech 2, display the engine coolant temperature and note the value. 2. Check the resistance of the engine coolant temperature sensor. Is the actual resistance near the resistance value in the chart for the temperature that was noted? Temperature (°C) / Resistance (Ω) (Approximately): -20 / 26740 0 / 9120 20 / 3500 40 / 1464 60 / 664 80 / 333 100 / 175 120 / 102	—	Go to *Step 8*	Replace the ECT sensor. Verify repair
8	1. Using a Tech 2, display the MAP sensor value in comparison with atmosphere temperature. 2. Check for a faulty, plugged, or incorrectly installed MAP sensor. Was the problem found?	—	Verify repair	Go to *Step 9*
9	Using Tech 2, monitor throttle position with the engine idling. Is the throttle position at the specified value and steady?	0%	Go to *Step 10*	Refer to *Diagnostic Trouble Code P0123 for further diagnosis*
10	Check for proper ignition voltage output with the spark tester. Was a problem found?	—	Verify repair	Go to *Step 11*
11	1. Remove the spark plugs and check for gas or oil fouling cracks, wear, improper gap, burned electrodes, heavy deposits, or improper heat range. 2. If spark plugs are fouled, the cause of fouling must be determined before replacing the spark plugs. Was a problem found?	—	Verify repair	Go to *Step 12*
12	Check for a loose ignition control module ground. Was a problem found?	—	Verify repair	Go to *Step 13*
13	Check items that can cause the engine to run rich. Refer to DTC P1167 “Fuel Supply System Rich During Deceleration Fuel Cut Off”. Was a problem found?	—	Verify repair	Go to *Step 14*
14	Check items that can cause the engine to run lean. Refer to DTC P1171 “Fuel Supply System Lean During Power Enrichment”. Was a problem found?	—	Verify repair	Go to *Step 15*
15	Check the injector connectors, if any of the injectors are connected any incorrect cylinder, correct as necessary. Was a problem found?	—	Verify repair	Go to *Step 16*
16	1. Check for faulty engine mounts. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 17*

Step	Action	Value(s)	Yes	No
17	Perform the procedure in Fuel System Pressure Test (Refer to 6E-108 "*Fuel System Diagnosis*") to determine if there is a problem with fuel delivery. Was a problem found?	—	Verify repair	Go to *Step 18*
18	Check for the following engine mechanical problems (refer to *Engine Mechanical*): • Low compression • Leaking cylinder head gaskets • Worn camshaft • Sticking or leaking valves • Valve timing • Broken valve springs • Camshaft drive belt slipped or stripped Was a problem found?	—	Verify repair	Go to *Step 19*
19	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Go to *Step 20*
20	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***"SPS (Service Programming System)".*** Was the problem solved?	—	Verify repair	Go to *Step 21*
21	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.	—	Verify Repair	—

SURGES AND/OR CHUGS SYMPTOM

DEFINITIONS: See the illustration below. Feels like the vehicle speeds up and slows down with no charge in the accelerator pedal.



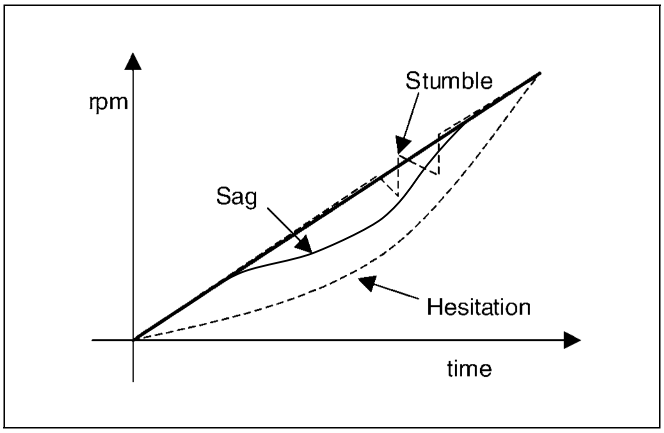
Step	Action	Value(s)	Yes	No
1	Was the "*On-Board Diagnostic (OBD) System Check*" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual / physical Check.*
4	Be sure that the driver understands A/C compressor operation as explained in the owner's manual. Inform the customer how the A/C clutch operate. Is the customer experiencing a normal condition?	—	System OK	Go to *Step 5*
5	1. Using a Tech 2, display the MAP sensor value in comparison with atmosphere temperature. 2. Check for a faulty, plugged, or incorrectly installed MAP sensor. Was the problem found?	—	Verify repair	Go to *Step 6*
6	Observe the throttle position display on the Tech 2 while slowly increasing throttle pedal. Is the throttle position at the specified value and steady in any position?	—	Go to *Step 7*	Refer to *Diagnostic Trouble Code P0123 for further diagnosis*
7	Check the knock sensor wire, shield wire, or installation condition. Was a problem found?	—	Verify repair	Go to *Step 8*
8	Run Engine. Check the fuel control Heated Oxygen Sensor (HO2S). When monitored on the Tech 2, the HO2S should respond quickly to different throttle positions. If it doesn't check for silicon or other contaminates from fuel or use of improper sealant. The sensors may have a white powdery coating. Silicon contamination sends a rich exhaust signal which causes the ECM to command an excessively lean air/fuel mixture. Was a problem found?	—	Verify repair	Go to *Step 9*

Step	Action	Value(s)	Yes	No
9	Check the fuel pressure. Refer to 6E-108 page "*Fuel System Diagnosis*". Was a problem found?	—	Verify repair	Go to *Step 10*
10	Monitor "*B1S1 (Bank 1 Sensor 1) Status*" on the Tech 2. Is the "*B1S1 (Bank 1 Sensor 1) Status*" in the rich condition?	—	Verify repair	Go to *Step 11*
11	Check items that can cause the engine to run rich. Refer to DTC P1167 "Fuel Supply System Rich During Deceleration Fuel Cut Off". Was a problem found?	—	Verify repair	Go to *Step 12*
12	Check items that can cause the engine to run lean. Refer to DTC P1171 "Fuel Supply System Lean During Power Enrichment". Was a problem found?	—	Verify repair	Go to *Step 13*
13	Check for proper ignition voltage output with the spark tester. Was a problem found?	—	Verify repair	Go to *Step 14*
14	Check for a loose ignition control module ground. Was a problem found?	—	Verify repair	Go to *Step 15*
15	Visually/physically inspect all spark plug high-tension cables. Check for the following conditions: • Verify that the resistance of all spark plug high-tension cables are less than the specified value. • Verify that the all spark plug high-tension cables are correctly fitted to eliminate cross-fitting. • Verify that the all spark plug high-tension cables are not arcing to ground. Spraying the spark plug high-tension cables with a light mist of water may help locate an intermittent problem. Was a problem found?	#1 cyl. 4.4kΩ #2 cyl. 3.6kΩ #3 cyl. 3.1kΩ #4 cyl. 2.8kΩ	Verify repair	Go to *Step 16*
16	1. Check the ignition coil secondary resistance. 2. Replace the coil if it is greater than the specified resistance. Did the coil require replacement?	2.5kΩ	Verify repair	Go to *Step 17*
17	1. Remove the spark plugs and check for gas or oil fouling cracks, wear, improper gap, burned electrodes, heavy deposits, or improper heat range. 2. If spark plugs are fouled, the cause of fouling must be determined before replacing the spark plugs. Was a problem found?	—	Verify repair	Go to *Step 18*
18	1. Check the injector connectors. 2. If any of the connectors are connected at an improper cylinder, connect as necessary. Was a problem found?	—	Verify repair	Go to *Step 19*
19	Check the ECM grounds to verify that they are clean and tight. Refer to the *ECM wiring diagrams*. Was a problem found?	—	Verify repair	Go to *Step 20*
20	Visually/physically check the vacuum hose for splits, kinks and proper connections and routing. Was a problem found?	—	Verify repair	Go to *Step 21*

Step	Action	Value(s)	Yes	No
21	Check the exhaust system for a possible restriction: • Damaged or collapsed pipes • Internal muffler failure Was a problem found?	—	Verify repair	Go to *Step 22*
22	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Go to *Step 23*
23	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***"SPS (Service Programming System)".*** Was the problem solved?	—	Verify repair	Go to *Step 24*
24	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.	—	Verify Repair	—

HESITATION, SAG, STUMBLE SYMPTOM

DEFINITIONS: Momentary lack of response as the accelerator is pushed down. Can occur at any vehicle speed. Usually most pronounced when first trying to make the vehicle move, as from a stop sign. May cause the engine to stall if severe enough.



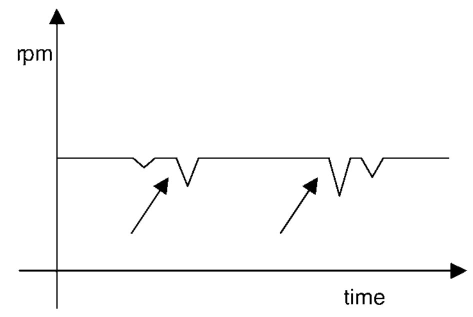
Step	Action	Value(s)	Yes	No
1	Was the "*On-Board Diagnostic (OBD) System Check*" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual / physical Check*.
4	Check the fuel quality. Is the customer using improper fuel or degraded fuel?	—	Replace fuel	Go to *Step 5*
5	1. Using a Tech 2, display the MAP sensor value in comparison with atmosphere temperature. 2. Check for a faulty, plugged, or incorrectly installed MAP sensor. Was the problem found?	—	Verify repair	Go to *Step 6*
6	Observe the throttle position display on the Tech 2 while slowly increasing throttle pedal. Does the throttle position increase steady with increasing smoothly?	—	Go to *Step 7*	Refer to *Diagnostic Trouble Code P0123 for further diagnosis*
7	Check the knock sensor wire, shield wire, or installation condition. Was a problem found?	—	Verify repair	Go to *Step 8*
8	Run Engine. Check the fuel control Heated Oxygen Sensor (HO2S). When monitored on the Tech 2, the HO2S should respond quickly to different throttle positions. If it doesn't check for silicon or other contaminates from fuel or use of improper sealant. The sensors may have a white powdery coating. Silicon contamination sends a rich exhaust signal which causes the ECM to command and excessively lean air/fuel mixture. Was a problem found?	—	Verify repair	Go to *Step 9*
9	Check the fuel pressure. Refer to 6E-108 "*Fuel System Diagnosis*". Was a problem found?	—	Verify repair	Go to *Step 10*

Step	Action	Value(s)	Yes	No
10	Monitor "*B1S1 (Bank 1 Sensor 1) Status*" on the Tech 2. Is the "*B1S1 (Bank 1 Sensor 1) Status*" in the rich condition?	—	Go to *Step 11*	Go to *Step 12*
11	Check items that can cause the engine to run rich. Refer to DTC P1167 "Fuel Supply System Rich During Deceleration Fuel Cut Off". Was a problem found?	—	Verify repair	Go to *Step 12*
12	Check items that can cause the engine to run lean. Refer to DTC P1171 "Fuel Supply System Lean During Power Enrichment". Was a problem found?	—	Verify repair	Go to *Step 13*
13	Check for proper ignition voltage output with the spark tester. Was a problem found?	—	Verify repair	Go to *Step 14*
14	Check for a loose ignition control module ground. Was a problem found?	—	Verify repair	Go to *Step 15*
15	Visually/physically inspect all spark plug high-tension cables. Check for the following conditions: • Verify that the resistance of all spark plug high-tension cables are less than the specified value. • Verify that the all spark plug high-tension cables are correctly fitted to eliminate cross-fitting. • Verify that the all spark plug high-tension cables are not arcing to ground. Spraying the spark plug high-tension cables with a light mist of water may help locate an intermittent problem. Was a problem found?	#1 cyl. 4.4kΩ #2 cyl. 3.6kΩ #3 cyl. 3.1kΩ #4 cyl. 2.8kΩ	Verify repair	Go to *Step 16*
16	1. Check the ignition coil secondary resistance. 2. Replace the coil if it is greater than the specified resistance. Did the coil require replacement?	2.5kΩ	Verify repair	Go to *Step 17*
17	1. Remove the spark plugs and check for gas or oil fouling cracks, wear, improper gap, burned electrodes, heavy deposits, or improper heat range. 2. If spark plugs are fouled, the cause of fouling must be determined before replacing the spark plugs. Was a problem found?	—	Verify repair	Go to *Step 18*
18	Check the ECM grounds to verify that they are clean and tight. Refer to the ECM wiring diagrams. Was a problem found?	—	Verify repair	Go to *Step 19*
19	Visually/physically check the vacuum hose for splits, kinks and proper connections and routing. Was a problem found?	—	Verify repair	Go to *Step 20*

Step	Action	Value(s)	Yes	No
20	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Go to *Step 21*
21	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***"SPS (Service Programming System)".*** Was the problem solved?	—	Verify repair	Go to *Step 22*
22	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.	—	Verify Repair	—

CUTS OUT, MISSES SYMPTOM

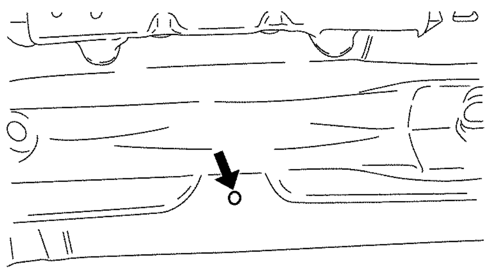
DEFINITIONS: Steady pulsation or jerking that follows engine speed; usually more pronounced as engine load increases.



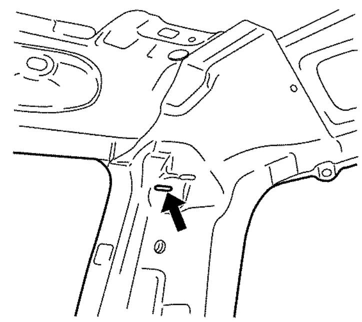
Step	Action	Value(s)	Yes	No
1	Was the "*On-Board Diagnostic (OBD) System Check*" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual / physical Check*.
4	Check the ECM grounds to verify that they are clean and tight. Refer to the ECM wiring diagrams in *Electrical Diagnosis*. Was a problem found?	—	Verify repair	Go to *Step 5*
5	Check for a loose or short circuit of ignition coil module voltage feed. Was a problem found?	—	Verify repair	Go to *Step 6*
6	Check for a loose or short circuit of ignition coil module ground. Was a problem found?	—	Verify repair	Go to *Step 7*
7	Visually/physically inspect all spark plug high-tension cables. Check for the following conditions: • Verify that the resistance of all spark plug high-tension cables are less than the specified value. • Verify that the all spark plug high-tension cables are correctly fitted to eliminate cross-fitting. • Verify that the all spark plug high-tension cables are not arcing to ground. Spraying the spark plug high-tension cables with a light mist of water may help locate an intermittent problem. Was a problem found?	#1 cyl. 4.4kΩ #2 cyl. 3.6kΩ #3 cyl. 3.1kΩ #4 cyl. 2.8kΩ	Verify repair	Go to *Step 7*
8	Check the CKP sensor wire, shield wire, or installation condition. Was a problem found?	—	Verify repair	Go to *Step 9*
9	Monitor "*B1S1 (Bank 1 Sensor 1) Status*" on the Tech 2. Is the "*B1S1 (Bank 1 Sensor 1) Status*" in the rich condition?	—	Go to *Step 10*	Go to *Step 11*

Step	Action	Value(s)	Yes	No
10	Check items that can cause the engine to run rich. Refer to *DTC P1167 "Fuel Supply System Rich During Deceleration Fuel Cut Off"*. Was a problem found?	—	Verify repair	Go to *Step 11*
11	Monitor "*B1S1 (Bank 1 Sensor 1) Status*" on the Tech 2. Is the "*B1S1 (Bank 1 Sensor 1) Status*" in the lean condition?	—	Go to *Step 12*	Go to *Step 13*
12	Check items that can cause the engine to run lean. Refer to *DTC P1171 "Fuel Supply System Lean During Power Enrichment"*. Was a problem found?	—	Verify repair	Go to *Step 13*
13	1. Visually/physically inspect for the following conditions: • Restriction of air intake system. Check for a restricted air filter element, or foreign objects blocking the air intake system. • Check for objects blocking the IAC passage or throttle bore, excessive deposits in the throttle bore and on the throttle plate. • Check for a condition that causes a large vacuum leak, such as an incorrectly installed or faulty crankcase ventilation hose/brake booster hose. Was a problem found?	—	Verify repair	Go to *Step 14*
14	Check the injector connectors, if any of the injectors are connected an incorrect cylinder, correct as necessary. Was a problem found?	—	Verify repair	Go to *Step 15*
15	Perform the "*Injector Coil/Balance Test*" (Refer to 6E-98 page). Was a problem found.	—	Verify repair	Go to *Step 16*
16	1. Check for fuel in the pressure regulator vacuum hose. 2. If fuel is present, replace the fuel pressure regulator assembly. Was a problem found?	—	Verify repair	Go to *Step 17*
17	Check for proper ignition voltage output with the spark tester. Was a problem found?	—	Verify repair	Go to *Step 18*
18	1. Remove the spark plugs and check for gas or oil fouling cracks, wear, improper gap, burned electrodes, heavy deposits, or improper heat range. 2. If spark plugs are fouled, the cause of fouling must be determined before replacing the spark plugs. Was a problem found?	—	Verify repair	Go to *Step 19*

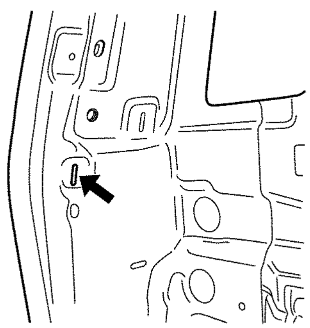
45



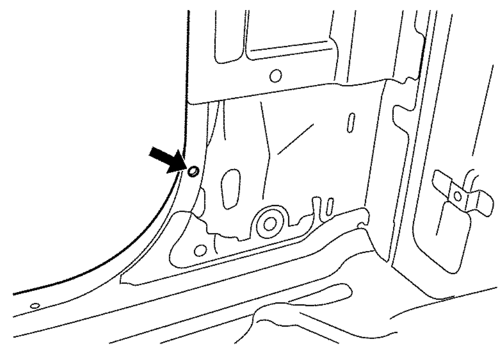
23



25



46



Step	Action	Value(s)	Yes	No
19	Check for the following engine mechanical problems (refer to *Engine Mechanical*): • Low compression • Leaking cylinder head gaskets • Worn camshaft • Sticking or leaking valves • Valve timing • Broken valve springs • Camshaft drive belt slipped or stripped Was a problem found?	—	Verify repair	Go to *Step 20*
20	1. Check for faulty engine mounts. 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 21*
21	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Go to *Step 22*
22	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 23*
23	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify Repair	—

LACK OF POWER, SLUGGISH OR SPONGY SYMPTOM

DEFINITIONS: Engine delivers less than expected power. Attempting part-throttle acceleration results in little or no increase in vehicle speed.

Step	Action	Value(s)	Yes	No
1	Was the "*On-Board Diagnostic (OBD) System Check*" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual / physical Check*.
4	1. Remove and check the air filter element for dirt or restrictions. 2. Replace the air filter element if necessary. Was a repair required?	—	Verify repair	Go to *Step 5*
5	Check the ECM grounds to verify that they are clean and tight. Refer to the ECM wiring diagrams. Was a problem found?	—	Verify repair	Go to *Step 6*
6	1. Using a Tech 2, display the MAP sensor value in comparison with atmosphere temperature. 2. Check for a faulty, plugged, or incorrectly installed MAP sensor. Was the problem found?	—	Verify repair	Go to *Step 7*
7	1. Using a Tech 2, display the ECT sensor and IAT sensor value and warm up condition compared with the typical data. 2. Check the specified value or wire. Was the problem found?	—	Verify repair	Go to *Step 8*
8	Observe the throttle position display on the Tech 2 while slowly increasing throttle pedal. Does the throttle position increase steady with increasing smoothly?	—	Go to *Step 9*	Refer to *Diagnostic Trouble Code P0123 for further diagnosis*
9	Check the knock sensor wire, shield wire, or installation condition. Was a problem found?	—	Verify repair	Go to *Step 10*
10	Run Engine. Check the fuel control Heated Oxygen Sensor (HO2S). When monitored on the Tech 2, the HO2S should respond quickly to different throttle positions. If it doesn't check for silicon or other contaminates from fuel or use of improper sealant. The sensors may have a white powdery coating. Silicon contamination sends a rich exhaust signal which causes the ECM to command and excessively lean air/fuel mixture. Was a problem found?	—	Verify repair	Go to *Step 11*
11	Check the fuel pressure. Refer to "*Fuel System Diagnosis*" 6E-108. Was a problem found?	—	Verify repair	Go to *Step 12*

Step	Action	Value(s)	Yes	No
12	Monitor "*B1S1 (Bank 1 Sensor 1) Status*" on the Tech 2. Is the "*B1S1 (Bank 1 Sensor 1) Status*" in the rich condition?	—	Verify repair	Go to *Step 13*
13	Check items that can cause the engine to run rich. Refer to DTC P1167 "Fuel Supply System Rich During Deceleration Fuel Cut Off". Was a problem found?	—	Verify repair	Go to *Step 14*
14	Check items that can cause the engine to run lean. Refer to DTC P1171 "Fuel Supply System Lean During Power Enrichment". Was a problem found?	—	Verify repair	Go to *Step 15*
15	Check for proper ignition voltage output with a spark tester. Was the problem found?	—	Verify repair	Go to *Step 16*
16	1. Remove the spark plugs and check for gas or oil fouling cracks, wear, improper gap, burned electrodes, heavy deposits, or improper heat range. 2. If spark plugs are fouled, the cause of fouling must be determined before replacing the spark plugs. Was a problem found?	—	Verify repair	Go to *Step 17*
17	Drain sample fuel, visual inspection. Any suspecion about the fuel, such as discoloration, particle, contamination, water, unusual smell, then drain the fuel from fuel tank. Replace the fuel from know vehicle source. If any suspencion of alcohol contamination, completely drain the fuel, replace by fuel from known vehicle source.	—	Verify repair	Go to *Step 18*
18	Check the exhaust system for a possible restriction: • Damaged or collapsed pipes • Internal muffler failure Was a problem found?	—	Verify repair	Go to *Step 19*
19	Check for the following engine mechanical problems (refer to *Engine Mechanical*): • Low compression • Leaking cylinder head gaskets • Worn camshaft • Loose timing belt Was a problem found?	—	Verify repair	Go to *Step 20*
20	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Go to *Step 21*

Step	Action	Value(s)	Yes	No
21	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***"SPS (Service Programming System)".*** Was the problem solved?	—	Verify repair	Go to *Step 22*
22	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.	—	Verify Repair	—

DETONATION/SPARK KNOCK SYMPTOM

DEFINITIONS: A mild to severe ping, usually worse under acceleration. The engine makes a sharp metallic knocking sound that changes with throttle opening. Prolonged detonation may lead to complete engine tailure.

Step	Action	Value(s)	Yes	No
1	Was the "*On-Board Diagnostic (OBD) System Check*" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual / physical Check*.
4	1. If Tech 2 readings are normal (refer to Typical Scan Data Values) and there are no engine mechanical faults, fill the fuel tank with a known quality gasoline. 2. Re-evaluate the vehicle performance. Is detonation present?	—	Go to *Step 5*	Verify repair
5	1. Check for obvious overheating problems: • Low engine coolant • Restricted air flow to radiator • Incorrect coolant solution 2. If a problem is found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 6*
6	Check the fuel pressure. Refer to 6E-108 page "*Fuel System Diagnosis*". Was a problem found?	—	Verify repair	Go to *Step 7*
7	1. Using a Tech 2, display the MAP sensor value in comparison with atmosphere temperature. 2. Check for a faulty, plugged, or incorrectly installed MAP sensor. Was the problem found?	—	Verify repair	Go to *Step 8*
8	1. Using a Tech 2, display the ECT sensor and IAT sensor value and warm up condition compared with the typical data. 2. Check the specified value or wire. Was the problem found?	—	Verify repair	Go to *Step 9*
9	Observe the throttle position display on the Tech 2 while slowly increasing throttle pedal. Does the throttle position increase steady with increasing smoothly?	—	Go to *Step 10*	Refer to *Diagnostic Trouble Code P0123 for further diagnosis*
10	Check the knock sensor wire, shield wire, or installation condition. Was a problem found?	—	Verify repair	Go to *Step 11*
11	Check items that can cause the engine to run lean. Refer to DTC P1171 "Fuel Supply System Lean During Power Enrichment". Was a problem found?	—	Verify repair	Go to *Step 12*

Step	Action	Value(s)	Yes	No
12	Check spark plugs for proper heat range. Were incorrect spark plugs installed?	—	Verify repair	Go to *Step 13*
13	1. Remove excessive carbon buildup with a top engine cleaner. 2. Re-evaluate vehicle performance. Is detonation still present?	—	Verify repair	Go to *Step 14*
14	Check for an engine mechanical problem. Perform a cylinder compression check. Refer to *Engine Mechanical*. Was a problem found?	—	Verify repair	Go to *Step 15*
15	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Go to *Step 16*
16	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***"SPS (Service Programming System)".*** Was the problem solved?	—	Verify repair	Go to *Step 17*
17	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.	—	Verify Repair	—

POOR FUEL ECONOMY SYMPTOM

DEFINITIONS: Fuel economy, as measured by an actual road test, is noticeably lower than expected. Also, economy is noticeably lower than it was on this vehicle at one time, as previously shown by an actual road test.

Step	Action	Value(s)	Yes	No
1	Was the "*On-Board Diagnostic (OBD) System Check*" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to Visual / physical Check.
4	Check owner's driving habits. • Is the A/C On full time (defroster mode On)? • Are tires at the correct pressure? • Are excessively heavy loads being carried? • Is acceleration too much, too often?	—	Go to *Step 5*	Go to *Step 6*
5	Review the items in Step 4 with the customer and advise as necessary. Is the action complete?	—	System OK	—
6	Visually/physically check: Vacuum hoses for splits, kinks, and improper connections and routing as shown on the "Emission Control System Schematics". Was a problem found?	—	Verify repair	Go to *Step 7*
7	Check for low engine coolant level. Was a problem found?	—	Verify repair	Go to *Step 8*
8	Check for incorrect or faulty engine thermostat. Refer to *Engine Cooling*. Was a problem found?	—	Verify repair	Go to *Step 9*
9	Remove and check the air filter element for dirt or for restrictions. Was a problem found?	—	Verify repair	Go to *Step 10*
10	1. Using a Tech 2, display the MAP sensor value in comparison with atmosphere temperature. 2. Check for a faulty, plugged, or incorrectly installed MAP sensor. Was the problem found?	—	Verify repair	Go to *Step 11*
11	1. Using a Tech 2, display the ECT sensor and IAT sensor value and warm up condition compared with the typical data. 2. Check the specified value or wire. Was the problem found?	—	Verify repair	Go to *Step 12*
12	Check the knock sensor wire, shield wire, or installation condition. Was a problem found?	—	Verify repair	Go to *Step 13*
13	Check the fuel pressure. Refer to 6E-108 page "*Fuel System Diagnosis*". Was a problem found?	—	Verify repair	Go to *Step 14*

Step	Action	Value(s)	Yes	No
14	Monitor "*B1S1 (Bank 1 Sensor 1) Status*" on the Tech 2. Is the "*B1S1 (Bank 1 Sensor 1) Status*" in the rich condition?	—	Verify repair	Go to *Step 15*
15	Check items that can cause the engine to run rich. Refer to DTC P1167 "Fuel Supply System Rich During Deceleration Fuel Cut Off". Was a problem found?	—	Verify repair	Go to *Step 16*
16	1. Remove the spark plugs and check for gas or oil fouling cracks, wear, improper gap, burned electrodes, heavy deposits, or improper heat range. 2. If spark plugs are fouled, the cause of fouling must be determined before replacing the spark plugs. Was a problem found?	—	Verify repair	Go to *Step 17*
17	Check for proper calibration of the speedometer. Does the speed indicated on the speed meter closely match the vehicle speed displayed on the Tech 2?	—	Go to *Step 19*	Go to *Step 18*
18	Diagnose and repair the inaccurate speedometer condition as necessary. Refer to *Vehicle Speed Sensor in Electrical Diagnosis*.	—	Verify Repair	—
19	Check for proper calibration of the fuel gauge. Was a problem found?	—	Verify repair	Go to *Step 20*
20	Check for the following engine mechanical problems (refer to *Engine Mechanical*): • Low compression • Worn camshaft • Sticking or leaking valves • Valve timing Was a problem found?	—	Verify repair	Go to *Step 21*
21	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Go to *Step 22*
22	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***"SPS (Service Programming System)".*** Was the problem solved?	—	Verify repair	Go to *Step 23*
23	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.	—	Verify Repair	—

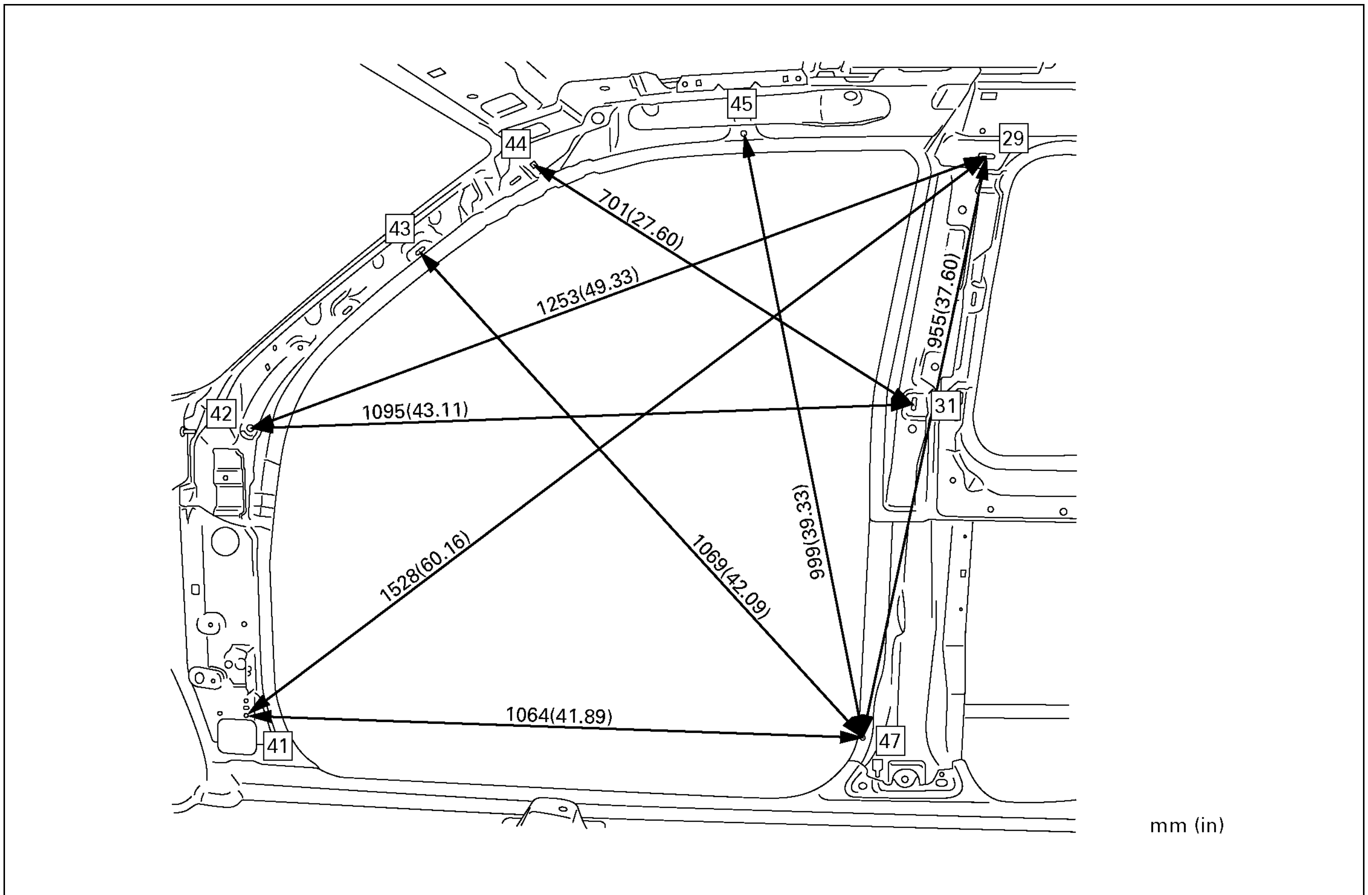
EXCESSIVE EXHAUST EMISSIONS OR ODORS SYMPTOM

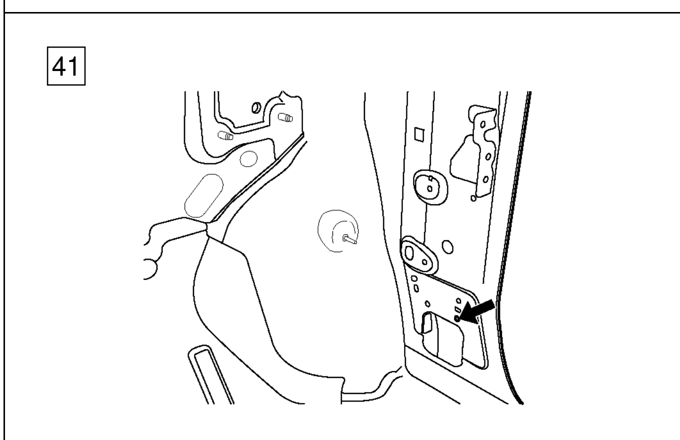
DEFINITIONS: Vehicle fails an emission test. There is excessive “rotten egg” smell. (Excessive odors do not necessarily indicate excessive emissions.)

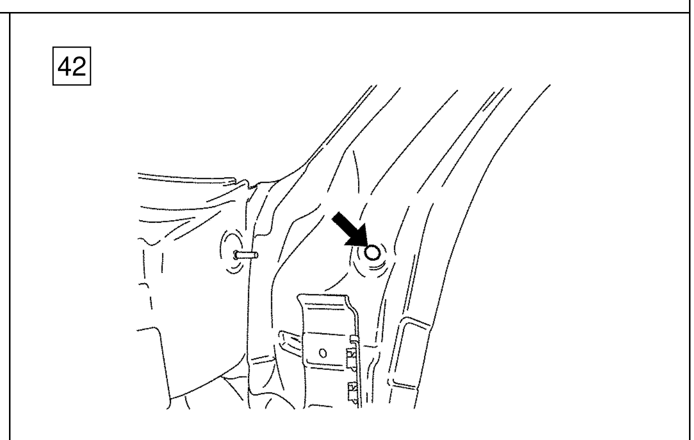
Step	Action	Value(s)	Yes	No
1	Was the “*On-Board Diagnostic (OBD) System Check*” performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual / physical Check*.
4	Does the customer continual accelerate On/Off during cold condition?	—	System OK	Go to *Step 5*
5	Is the customer using the incorrect fuel type?	—	Replace with unleaded fuel	Go to *Step 6*
6	Check for vacuum leaks (vacuum lines, intake manifold, throttle body, etc.) Were any vacuum leaks found?	—	Go to *Step 17*	Go to *Step 7*
7	1. Check fuel cap for proper installation. 2. Secure the fuel cap if necessary. Was a problem found?	—	Go to *Step 17*	Go to *Step 8*
8	Check the fuel pressure. Refer to 6E-108 page *“Fuel System Diagnosis”* . Was a problem found?	—	Go to *Step 17*	Go to *Step 9*
9	1. Check for faulty, plugged or incorrectly installed PCV valve. 2. Verify that the PCV system is not plugged. Was a problem found?	—	Go to *Step 17*	Go to *Step 10*
10	Check the injector connectors, if any of the injectors are connected to an incorrect cylinder, correct as necessary. Was a problem found?	—	Go to *Step 17*	Go to *Step 11*
11	Perform the *“Injector Coil/Balance Test”* (Refer to 6E-98 page). Was a problem found.	—	Go to *Step 17*	Go to *Step 12*
12	Check for a problem with the engine cooling system. Was a problem found?	—	Go to *Step 17*	Go to *Step 13*
13	Check EVAP canister for fuel loading. Refer to Evaporative Emission Control System. Was a problem found?	—	Go to *Step 17*	Go to *Step 14*
14	Check the EVAP purge solenoid valve operation. Is the valve operated normally?	—	Go to *Step 17*	Verify repair & Go to *Step 15*
15	Check the exhaust system for a possible restriction: • Damaged or collapsed pipes • Internal catalytic converter failure Was a problem found?	—	Verify repair & Go to *Step 16*	Go to *Step 17*

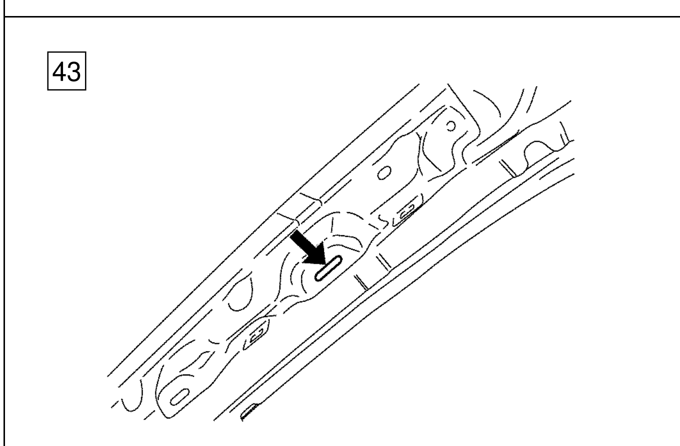
Step	Action	Value(s)	Yes	No
16	1. Remove excessive carbon buildup with a top engine cleaner. Refer to the instructions on the top engine cleaner can. 2. Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to *Step 18*
17	Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to *Step 18*
18	Run Engine. Check the fuel control Heated Oxygen Sensor (HO2S). When monitored on the Tech 2, the HO2S should respond quickly to different throttle positions. If it doesn't check for silicon or other contaminates from fuel or use of improper sealant. The sensors may have a white powdery coating. Silicon contamination sends a rich exhaust signal which causes the ECM to command and excessively lean air/fuel mixture. Was a problem found?	—	Verify repair	Go to *Step 19*
19	Monitor "*B1S1 (Bank 1 Sensor 1) Status*" on the Tech 2. Is the "*B1S1 (Bank 1 Sensor 1) Status*" in the rich condition?	—	Go to *Step 20*	Go to *Step 21*
20	1. Check items that can cause the engine to run rich. Refer to *Diagnostic Aids in DTC P1167 "Fuel Supply System Rich During Deceleration Fuel Cut Off"*. Make any necessary repairs. 2. Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to *Step 22*
21	1. Check items that can cause the engine to run lean. Refer to Diagnostic Aids in *DTC P1171 "Fuel Supply System Lean During Power Enrichment"*. Make any necessary repairs. 2. Perform the exhaust emission test. Does the vehicle pass the test?	—	System OK	Go to *Step 22*
22	Check for the following engine mechanical problems (refer to *Engine Mechanical*): • Low compression • Leaking cylinder head gaskets • Worn camshaft • Sticking or leaking valves • Valve timing • Broken valve springs Was a problem found?	—	Verify repair	Go to *Step 23*
23	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Go to *Step 24*

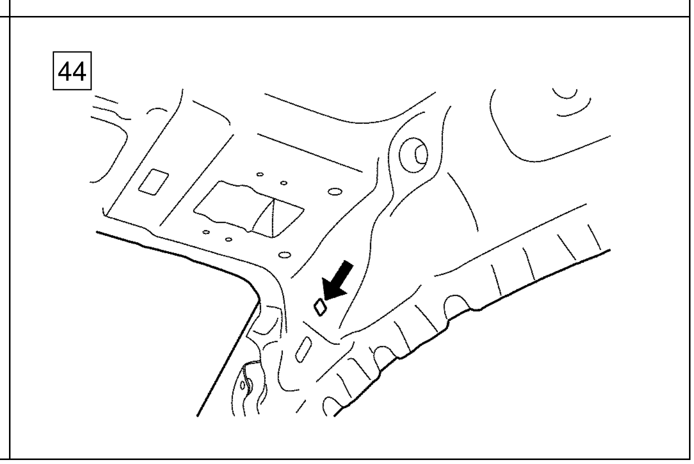
SIDE BODY SECTION (EXTEND CAB)











Step	Action	Value(s)	Yes	No
24	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 25*
25	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify Repair	—

DIESELING, RUN-ON SYMPTOM

DEFINITIONS: Engine continues to run after key is turned OFF, but runs very rough. If engine runs smoothly, check the ignition switch and adjustment.

Step	Action	Value(s)	Yes	No
1	Was the "*On-Board Diagnostic (OBD) System Check*" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual / physical Check*.
4	Check for a short between battery voltage and the ignition feed circuit. Was a problem found?	—	Verify repair	Go to *Step 5*
5	Check the fuel leaking from injector. Refer to Fuel System Diagnostic. Was the problem found?	—	Verify repair	Go to *Step 6*
6	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Go to *Step 7*
7	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***"SPS (Service Programming System)".*** Was the problem solved?	—	Verify repair	Go to *Step 8*
8	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 "Immobilizer System-ECM replacement" for the ECM/Immobilizer linking procedure.	—	Verify repair	—

BACKFIRE SYMPTOM

DEFINITIONS: Fuel ignites in the intake manifold, or in the exhaust system, making a loud popping noise.

Step	Action	Value(s)	Yes	No
1	Was the "*On-Board Diagnostic (OBD) System Check*" performed?	—	Go to *Step 2*	Go to *OBD System Check*
2	1. Perform a bulletin search. 2. If a bulletin that addresses the symptom is found, correct the condition as instructed in the bulletin. Was a bulletin found that addresses the symptom?	—	Verify repair	Go to *Step 3*
3	Was a visual/physical check performed?	—	Go to *Step 4*	Go to *Visual / physical Check*.
4	Check for proper ignition voltage output with the spark tester. Was a problem found?	—	Verify repair	Go to *Step 5*
5	1. Remove the spark plugs and check for gas or oil fouling cracks, wear, improper gap, burned electrodes, heavy deposits, or improper heat range. 2. If spark plugs are fouled, the cause of fouling must be determined before replacing the spark plugs. Was a problem found?	—	Verify repair	Go to *Step 6*
6	Visually/physically inspect all spark plug high-tension cables. Check for the following conditions: • Verify that the resistance of all spark plug high-tension cables are less than the specified value. • Verify that the all spark plug high-tension cables are correctly fitted to eliminate cross-fitting. • Verify that the all spark plug high-tension cables are not arcing to ground. Spraying the spark plug high-tension cables with a light mist of water may help locate an intermittent problem. Was a problem found?	#1 cyl. 4.4kΩ #2 cyl. 3.6kΩ #3 cyl. 3.1kΩ #4 cyl. 2.8kΩ	Verify repair	Go to *Step 7*
7	Check the fuel pressure. Refer to 6E-108 page *"Fuel System Diagnosis"*. Was a problem found?	—	Verify repair	Go to *Step 8*
8	Check for an intermittent ignition system malfunction: • Intermittent CKP 58X signal • Intermittent ignition feed circuit or sensor ground circuit to the crankshaft position sensor. Was a problem found?	—	Verify repair	Go to *Step 9*
9	Refer to 6E-108 page *"Fuel System Diagnosis"* to determine if there is a problem with fuel delivery. Was a problem found?	—	Verify repair	Go to *Step 10*

Step	Action	Value(s)	Yes	No
10	Check for the following engine mechanical problems (refer to *Engine Mechanical*): • Low compression • Leaking cylinder head gaskets • Worn camshaft • Sticking or leaking valves • Valve timing • Broken valve springs • Camshaft drive belt slipped or stripped Was a problem found?	—	Verify repair	Go to *Step 11*
11	Check leakage at exhaust system. Check the intake and exhaust manifold for casting flash. Refer to *Engine Mechanical*. Was a problem found?	—	Verify repair	Go to *Step 12*
12	1. Review all diagnostic procedures within this table. 2. If all procedures have been completed and no malfunctions have been found, review/inspect the following: • Visual/physical inspection • Tech 2 data • All electrical connections within a suspected circuit and/or system Was a problem found?	—	Verify repair	Go to *Step 13*
13	Is the ECM programmed with the latest software release? If not, download the latest software to the ECM using the ***“SPS (Service Programming System)”.*** Was the problem solved?	—	Verify repair	Go to *Step 14*
14	Replace the ECM. Is the action complete? **IMPORTANT:** The replacement ECM must be programmed. Refer to section of the Service Programming System (SPS) in this manual. Following ECM programming, the immobilizer system (if equipped) must be linked to the ECM. Refer to section 11 “Immobilizer System-ECM replacement” for the ECM/Immobilizer linking procedure.	—	Verify repair	—

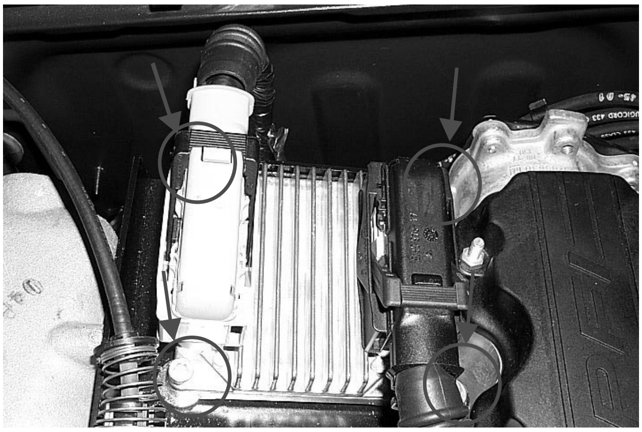
ON-VEHICLE SERVICE PROCEDURE

ENGINE CONTROL MODULE (ECM)

Location
On the intake manifold.

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the two connectors from the ECM.
3. Remove four bolts.
4. Remove the ECM from bracket.



Installation Procedure

1. Put on the ECM to the bracket.
2. Tighten the ECM by four bolts with specified tightening torque.

Tightening torque

- Bolts: 8.0 - 12.0 N·m (0.8 - 1.2 kgf·m)

3. Connect the two connectors to the ECM.
4. Connect the negative battery cable.

NOTE: Verify any DTCs (diagnosis Trouble Code) are not stored after replacement.

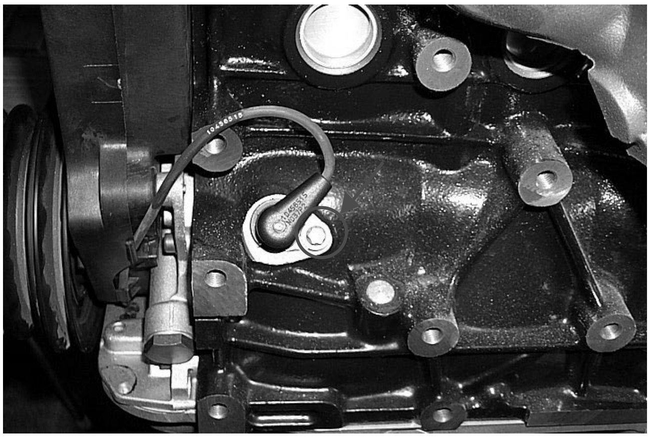
CRANKSHAFT POSITION (CKP) SENSOR

Location
Left-hand side of the cylinder block. (Back of the A/C compressor)

Removal Procedure

1. Disconnect the negative battery cable.
2. Remove the drive belt. Refer to Engine Mechanical Section.
3. Remove the A/C compressor from engine. Refer to Engine Mechanical Section.
4. Disconnect connector from the CKP sensor.
5. Loosen a bolt and remove the CKP sensor from the cylinder block.

NOTE: Use caution to avoid any hot oil that might drip out.



Installation Procedure

1. Install the CKP sensor to the cylinder block.
2. Tighten CKP sensor by a bolt with specified tightening torque.

Tightening Torque

- Bolt: 6N·m (0.6kgf·m)

3. Reinstall the A/C compressor to the engine.
4. Reinstall the accessory drive belt.
5. Connect the negative battery cable.

NOTE: Verify any DTCs (diagnosis Trouble Code) are not stored after replacement.

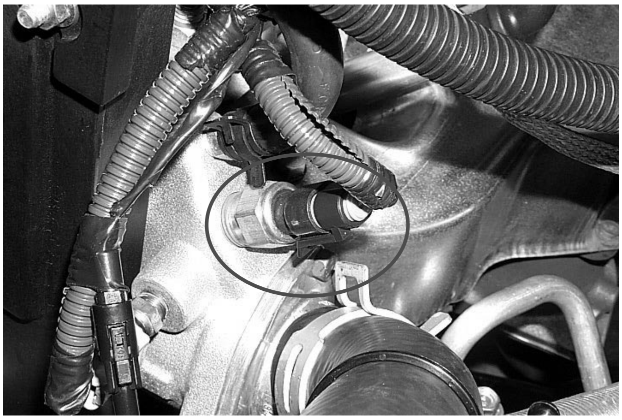
ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Location
Installed to the thermostat housing.

Removal Procedure

1. Disconnect the negative battery cable.
2. Drain enough engine coolant so that the coolant level will be below the ECT sensor.
3. Disconnect connector from the ECT sensor.
4. Loosen and remove the ECT sensor from the thermostat housing.

NOTE: Cool down the engine before above procedures are carried out.



Installation Procedure

1. Apply sealer to threads of screw at the ECT sensor.
2. Tighten the ECT sensor with specified tightening torque.

Tightening Torque

- Bolt: 13N·m (1.3kgf·m)

3. Connect a ECT sensor connector to the ECT sensor.
4. Fill the engine coolant.
5. Connect the negative battery cable.

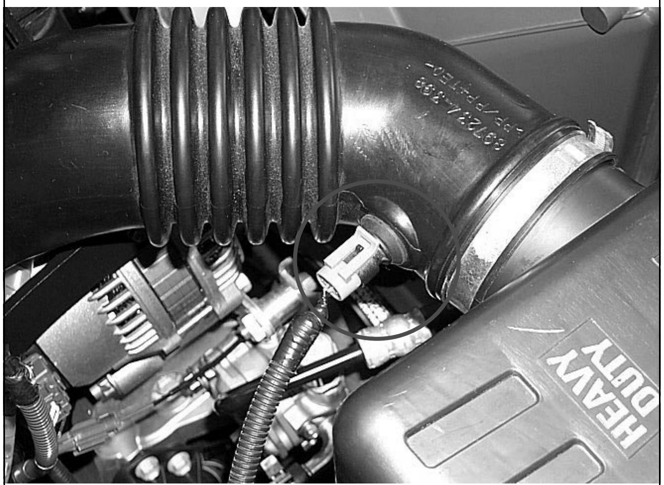
NOTE: Verify any DTCs (diagnosis Trouble Code) are not stored after replacement.
Verify no engine coolant leaking from the sensor threads after replacement.

INTAKE AIR TEMPERATURE (IAT) SENSOR

Location
Installed to the intake duct housing.

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect a IAT sensor connector from the IAT sensor.
3. Remove the IAT sensor from the intake duct.



Installation Procedure

1. Install the IAT sensor into intake air duct.
2. Connect a IAT sensor connector to the IAT sensor.
3. Connect the negative battery cable.

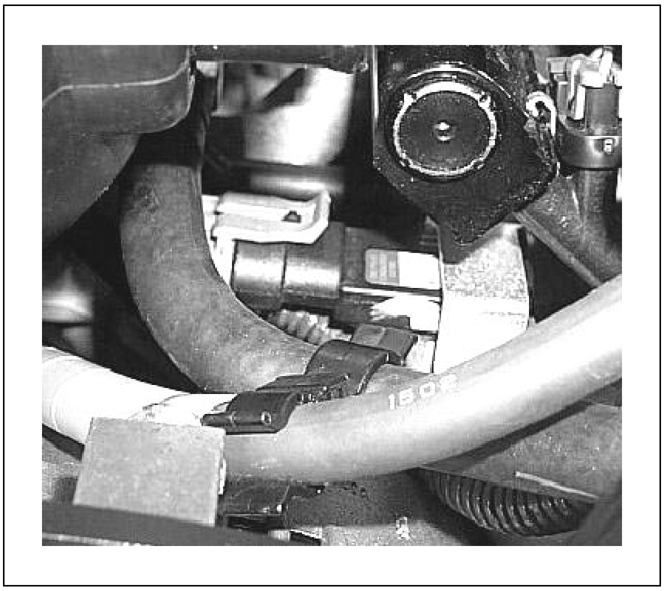
NOTE: Verify any DTCs (diagnosis Trouble Code) are not stored after replacement.

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

Location
Installed on the intake manifold.

Removal Procedure

1. Disconenct the negative battery cable.
2. Disconnect a MAP sensor connector from the MAP sensor.
3. Loosen a bolt and remove the MAP sensor from the intake manifold.
4. Remove the MAP sensor from the bracket.



Installation Procedure

1. Tighten the MAP sensor by a bolt with specified tightening torque.

Tightening Torque

- Bolt: 8N·m (0.8kgf·m)

2. Connect a MAP sensor connector to the MAP sensor.
3. Connect the negative battery cable.

NOTE: Verify any DTCs (diagnosis Trouble Code) are not stored after replacement.

THROTTLE POSITION SENSOR (TPS)

Location
Installed on the throttle body.

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the TPS connector.
3. Loosen two screws and remove TPS from the throttle body.

Installation Procedure

1. Temporary tighten the TPS by two screws.
2. Connect a TPS connectors to the TPS.
3. Connect the Tech2 to the vehicle.
4. Connect the negative battery cable.
5. Select "Data Display" with the Tech2.
6. Check the throttle position data and adjust the TPS position.
7. Tighten two screws.

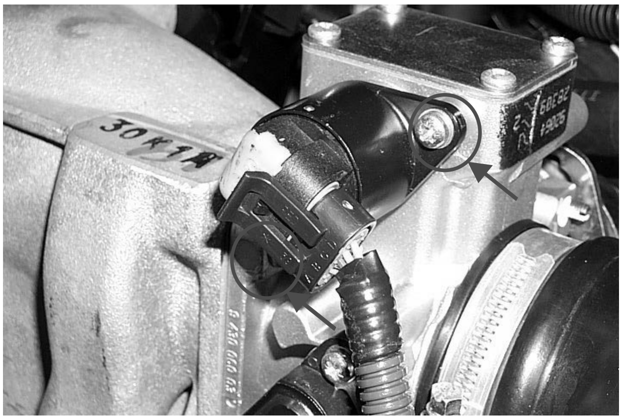
NOTE: Verify any DTCs (diagnosis Trouble Code) are not stored after replacement.

IDLE AIR CONTROL (IAC) VALVE

Location
Installed on the throttle body.

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the IAC valve connector.
3. Loosen two screws and remove IAC valve from the throttle body.

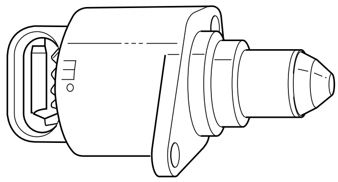


Cleaning and Inspection

1. Clean the IAC valve O-ring sealing surface, pintle valve seat and air passage.
2. Use carburetor cleaner and a parts cleaning brush to remove carbon deposit.
   Do not use a cleaner that contain methyl ethyl ketone. This is an extremely strong solvent and not necessary for this type of deposit.
3. Shiny spots on the pintle are normal and do not indicate misalignment or a bent pintle shaft.
4. Inspect the IAC valve O-ring for cuts, cracks or distortion.

Measurement

- Clean the IAC valve O-ring sealing surface, pintle valve seat and air passage.
- Use carburetor cleaner and a parts cleaning brush to remove carbon deposit. Do not use a cleaner that contain methyl ethyl ketone. This is an extremely strong solvent and not necessary for this type of deposit.
- Shiny spots on the pintle are normal and do not indicate misalignment or a bent pintle shaft.
- Inspect the IAC valve O-ring for cuts, cracks or distortion. Replace the O-ring if damaged.



Installation Procedure

1. Tighten the IAC valve by two screws.
2. Connect a IAC valve connector to the MAP sensor.
3. Connect the negative battery cable.

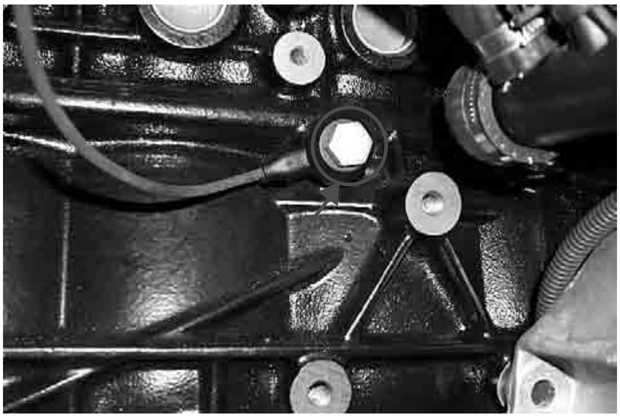
NOTE: Verify any DTCs (diagnosis Trouble Code) are not stored after replacement.

KNOCK SENSOR

Location
Right-hand side of the cylinder block.

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the knock sensor connector.
3. Loosen a bolt and remove knock sensor from the cylinder block.



Installation Procedure

1. Tighten the knock sensor by a bolt with specified tightening torque.

Tightening Torque

- Bolt: 20N·m (2.0kgf·m)

2. Connect a knock sensor connector to the knock sensor.
3. Connect the negative battery cable.

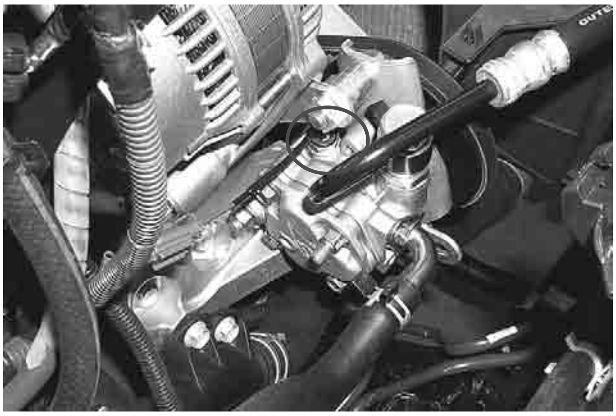
NOTE: Verify any DTCs (diagnosis Trouble Code) are not stored after replacement.

POWER STEERING PRESSURE (PSP) SWITCH

Location
Installed on the power steering pump assembly.

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the power steering pressure switch connector.
3. Loosen and remove the power steering pressure switch from the power steering pump.



Installation Procedure

1. Install the power steering pressure switch to the power steering pump.
2. Tighten the power steering pressure switch.
3. Connect a connector to the power steering pressure switch.
4. Connect the negative battery cable.

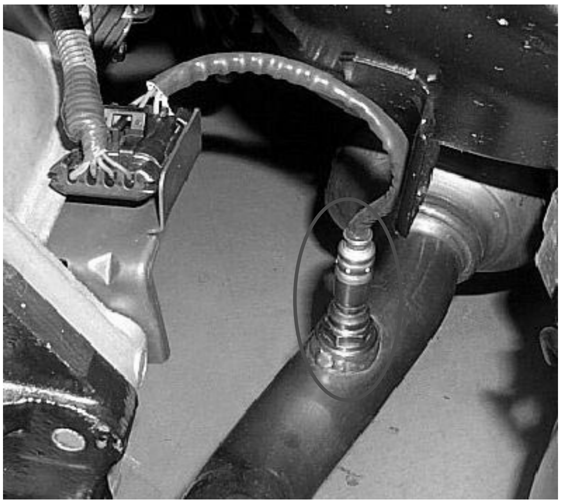
NOTE: Verify any DTCs (diagnosis Trouble Code) are not stored after replacement.
Verify no power steering fluid leaking from the sensor threads after replacement.

HEATED OXYGEN SENSOR (HO2S)

Location
Installed on the exhaust pipe.

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the O_2 sensor connector.
3. Loosen and remove the O_2 sensor from the exhaust pipe.



Inspection
Inspect the louvered end of the sensor for grease, dirt, excessive carbon build up or other contamination.

Installation Procedure

1. Install the O_2 sensor to the exhaust pipe.
2. Tighten the O_2 sensor with specified tightening torque.

Tightening Torque

- Bolt: 42N·m (4.3kgf·m)

3. Connect a O_2 sensor connector to the O_2 sensor.
4. Connect the negative battery cable.

NOTE: Verify any DTCs (diagnosis Trouble Code) are not stored after replacement.
Verify no exhaust gas leaking from the sensor threads after replacement.

EVAP CANISTER PURGE VALVE SOLENOID

Location
On the intake manifold.

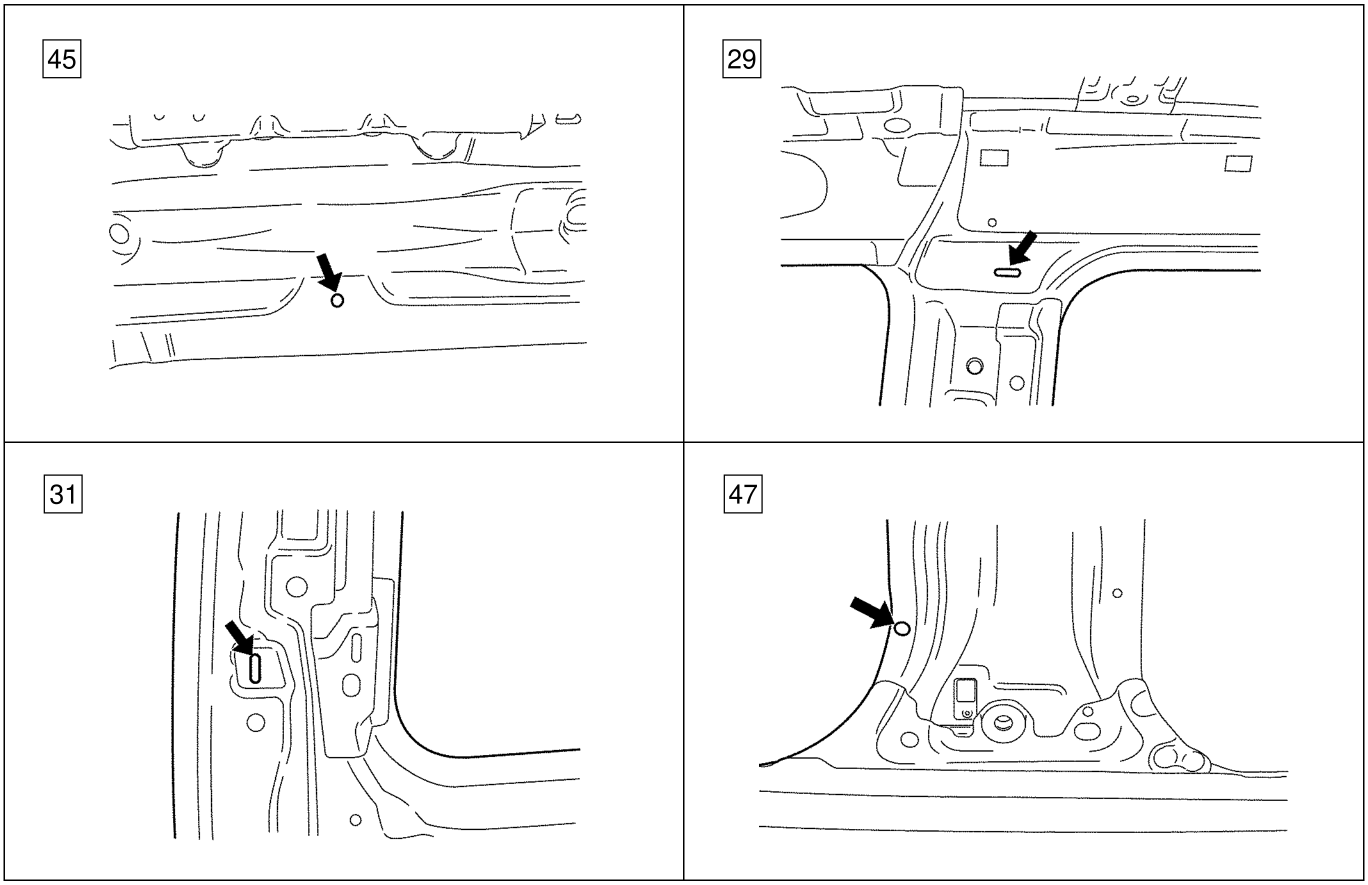
Removal Procedure

1. Disconenct the negative battery cable.
2. Disconnect a purge solenoid connector from the purge solenoid.
3. Disconnect two hoses from the purge solenoid valve.
4. Slide from the bracket and remove the purge solenoid.

Installation Procedure

1. Insert EVAP purge solenoid valve onto the bracket.
2. Connect two hoses to the purge solenoid valve.
3. Connect a purge solenoid connector to the purge solenoid.
4. Connect the negative battery cable.

NOTE: Verify any DTCs (diagnosis Trouble Code) are not stored after replacement.
Verify proper connection of two hoses.



45
29
31
47

FUEL PRESSURE RELIEF

Caution: To reduce the risk of fire and personal injury, it is necessary to relieve the fuel system pressure before servicing the fuel system components.

Caution: After relieving the fuel system pressure, a small amount of fuel may be released when servicing fuel lines or connections. Reduce the chance of personal injury by covering the fuel line fitting with a short towel before disconnecting the fittings. The towel will absorb any fuel that may leak out. When the disconnect is completed, place the towel in an approved container.

1. Remove the fuel filler cap.
2. Remove the fuel pump relay from the underhood relay box.
3. Start the engine and allow it to stall.
4. Crank the engine for about 30 seconds.
5. Disconnect the negative battery cable.

FUEL RAIL ASSEMBLY

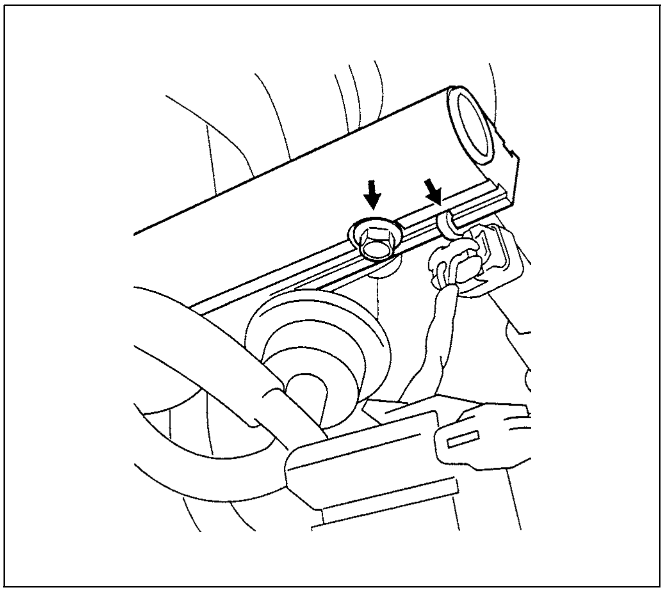
Removal Procedure

NOTE:

- Use care when removing the fuel rail assembly in order to prevent damage to the injector al connector terminal and the injector spray tips.
- Fitting should be capped and holes plugged during servicing to prevent dirt and other contaminants from entering open lines and passage.

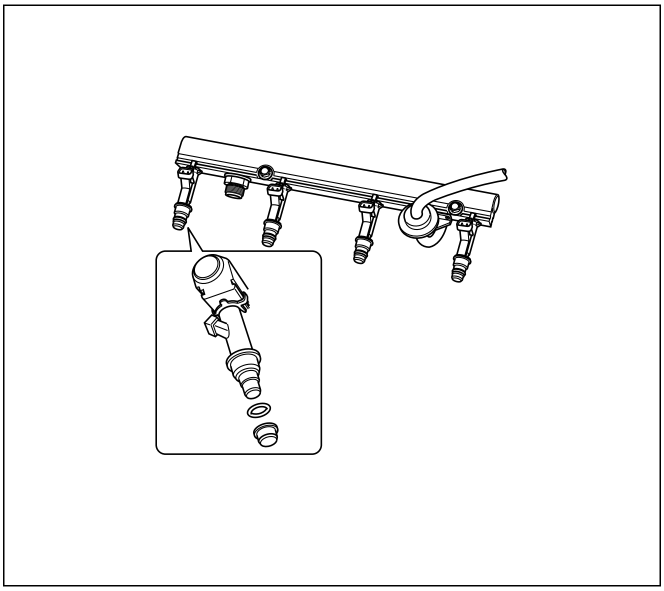
Important: An eight-digit identification number is stamped on side of the fuel injector. Refer to this number when you service the fuel rail or when a replacement part is required.

1. Disconnect 4 injector connectors.
2. Lift side-clip up on the fuel rail.
3. Disconnect fuel pressure regulator hose.
4. Disconnect wiring harness from the bands on the fuel rail.
5. Remove the intake pipe.
6. Loosen flare nut.
   A. Lift up the injectors carefully to separate them from intake manifold.
   B. Lift up the fuel rail with injectors as assembly. Do not separate the fuel injectors from fuel rail.
   C. If an injector become separated from fuel rail, injector backup O-ring and injector retainer clip must be replaced.
   D. Drain residual fuel from fuel rail into an approved container.



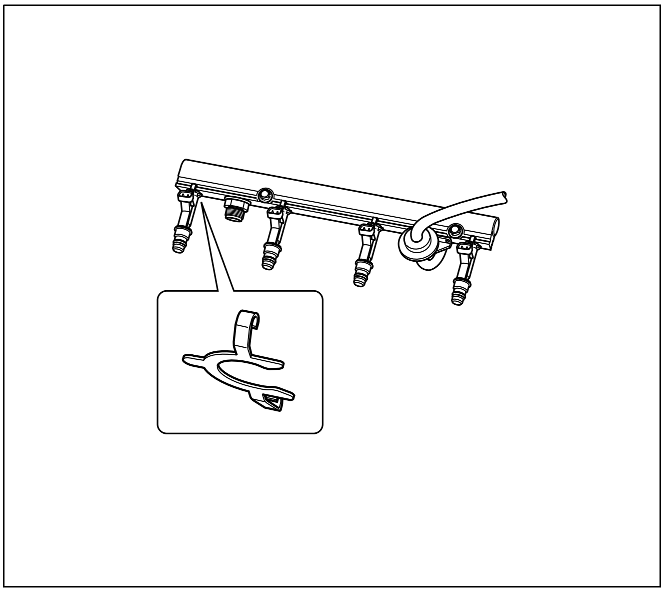
7. If removal of fuel pressure regulator is necessary, Refer to *Fuel Pressure Regulator Removal Procedure*.

8. If removal of fuel injector is necessary, Refer to *Fuel Injectors Removal Procedure*.

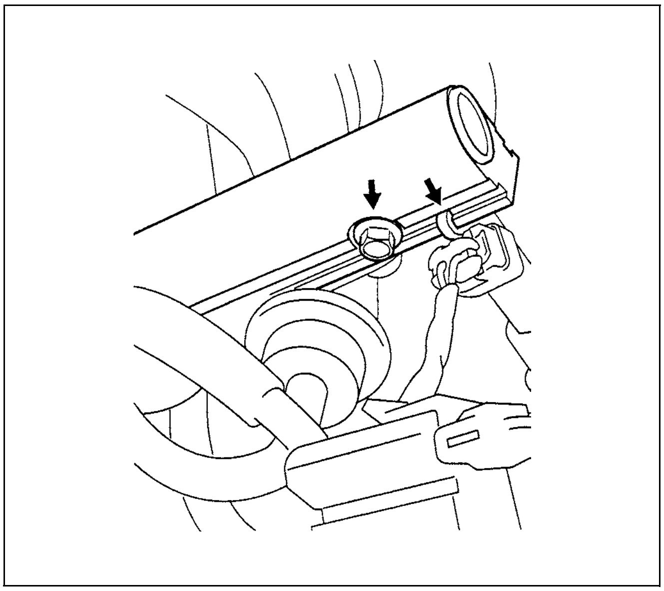


Installation Procedure

1. Install the fuel injectors if necessary. Refer to Fuel Injector Installation Procedure.
2. Install the fuel pressure regulator if necessary. Refer to *Fuel Pressure Regulator Installation Procedure*.
3. Place the fuel injector rail assembly on the manifold and insert the injectors into each port by pushing fuel rail.



4. Install two fuel rail retaining bolts. Tighten fuel rail retaining bolt to 19 N·m (1.9kgf·m)
5. Place wiring harness in its place and secure it with two nuts.
6. Connect all connector to each fuel injector.
7. Connect the fuel supply line securely. Do not over tighten.
8. Connect the fuel return line securely. Do not over tighten.
9. Connect the negative battery cable.
10. Crank the engine until it starts. Cranking the engine may take longer than usual due to trapped air in the fuel system. Check for leak. If fuel leak is observed, stop engine immediately. Before correcting fuel leak, be sure to depressurize system again.

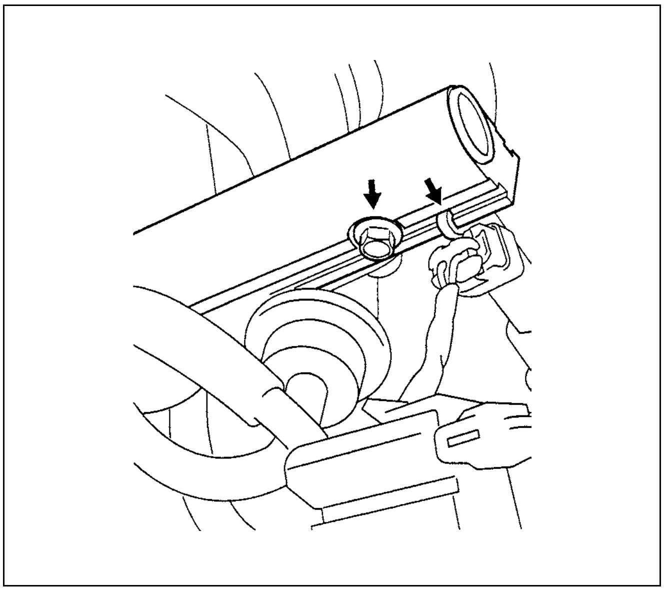


FUEL INJECTOR

Removal Procedure

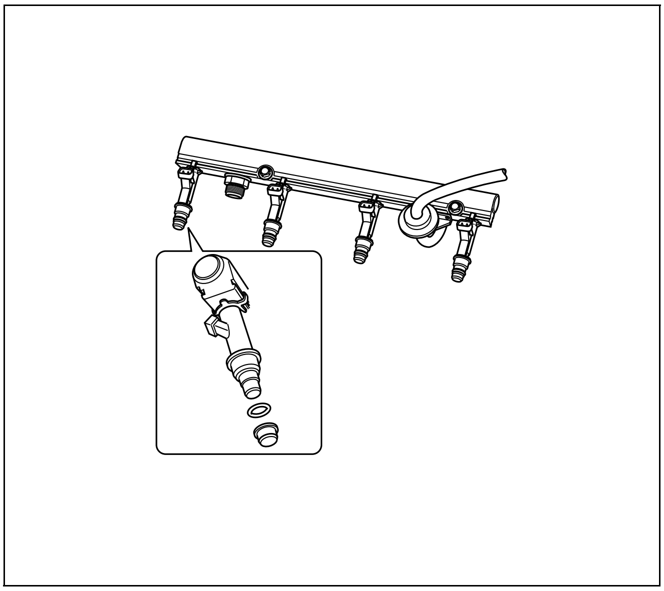
NOTE: If the fuel injectors are leaking, the engine oil may be contaminated with fuel. Check the oil for signs of contamination and change the oil and filter if necessary.

NOTE: Use care in removing the fuel injector in order to prevent damage to the fuel injector al connector pins or fuel injector nozzles. The fuel injector is an al component and should not be immersed in any type of cleaner as this may damage the fuel injector.



Important: Fuel injectors are serviced as complete assembly only.

1. Disconnect the negative battery cable.
2. Disconnect al connector from fuel injector.
3. Remove the fuel rail. Refer to *Fuel Rail Removal Procedure*.
4. Remove the fuel injector retainer clip.
5. Remove the fuel injector assembly from fuel rail.
6. Remove O-ring from the fuel injector.
7. Remove O-ring backup from fuel injector.

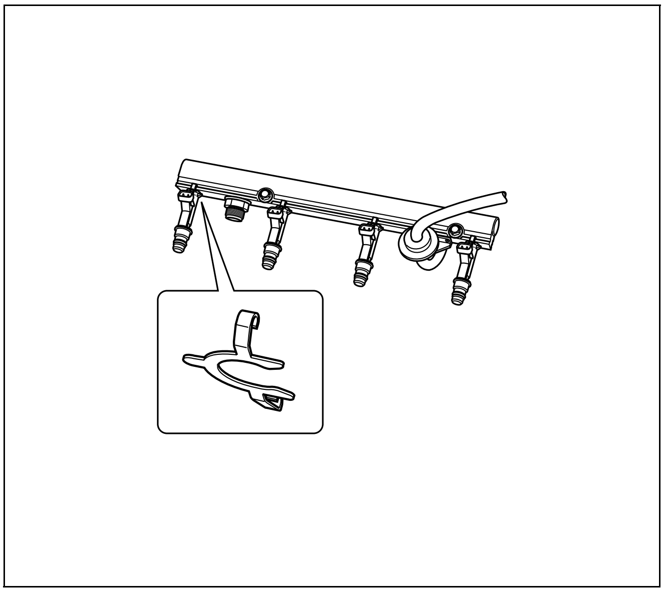


Inspection

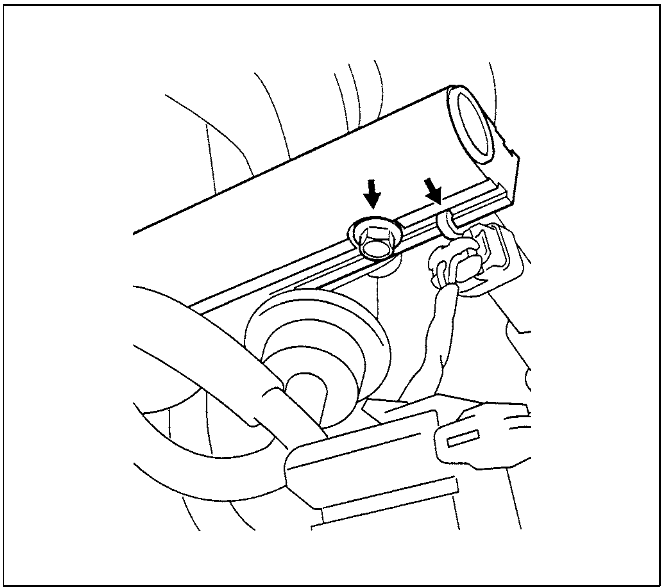
1. Inspect O-ring for crack, damage or leaks.
2. Replace worn or damaged O-ring.
3. Lubricate the new O-rings with engine oil before installation.

Installation Procedure

1. Lubricate the new O-ring with engine oil.
2. Install the O-ring backup on the fuel injector.
3. Install new O-ring on the fuel injector.
4. Install all four injector on the fuel rail.
5. Use new injector retainer clip to retain the injetor to the fuel rail.
6. Coat the end of the fuel injector with engine oil.



7. Install fuel rail assembly. Tighten the nuts to 19 N·m (1.9 kgf·m). Refer to *Fuel Rail Installation Procedure*.
   Tighten the flare nut to 27 - 33 N·m (2.8 - 3.4 kgf·m).
8. Connect the negative battery cable.



FUEL PRESSURE REGULATOR

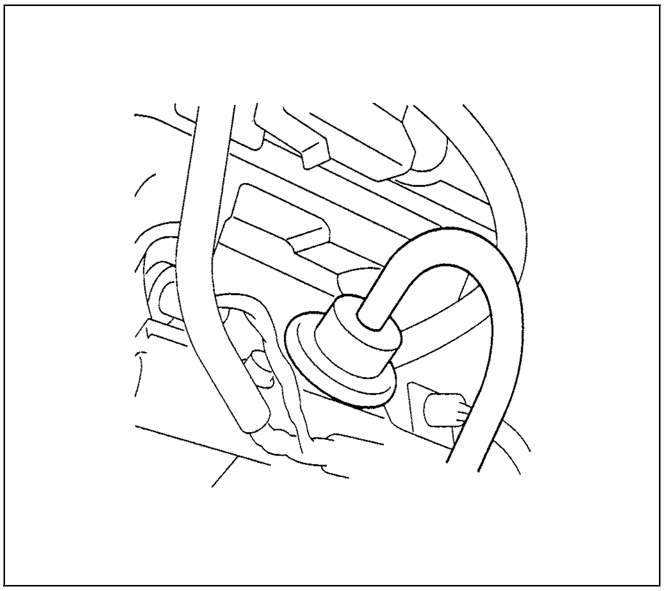
Removal Procedure

Caution: To reduce the risk of fire and personal injury, it is necessary to relieve the fuel system pressure before servicing the fuel system components.

Caution: After relieving the fuel system pressure, a small amount of fuel may be released when servicing fuel lines or connections. Reduce the chance of personal injury by covering the fuel line fitting with a shop towel before disconnecting the fittings. The towel will absorb any fuel that may leak out. When the disconnect is completed, place the towel in an approved container.

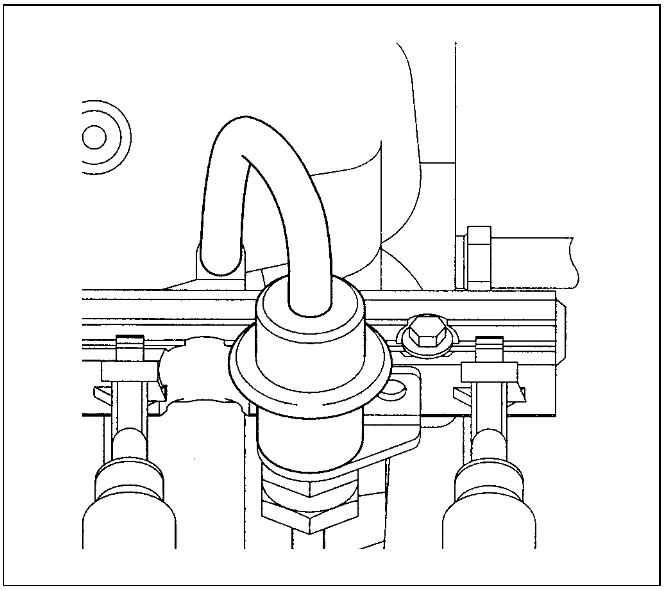
NOTE: Compressed air must never be used to test or clean a fuel pressure regulator, as damage to the fuel pressure regulator may occur.

NOTE: To prevent damage to the fuel pressure regulator, do not immerse the pressure regulator in solvent.

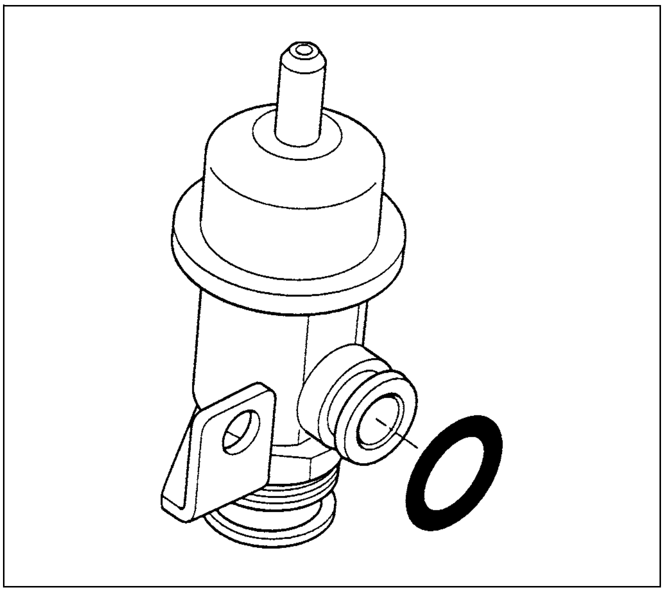


Removal Procedure

1. Depressurize the fuel system. Refer to *Fuel Pressure Relief Procedure.*
2. Disconnect the negative battery cable.
3. Remove the fuel pump relay.
4. Disconnect the vacuum line form fuel pressure regulator.

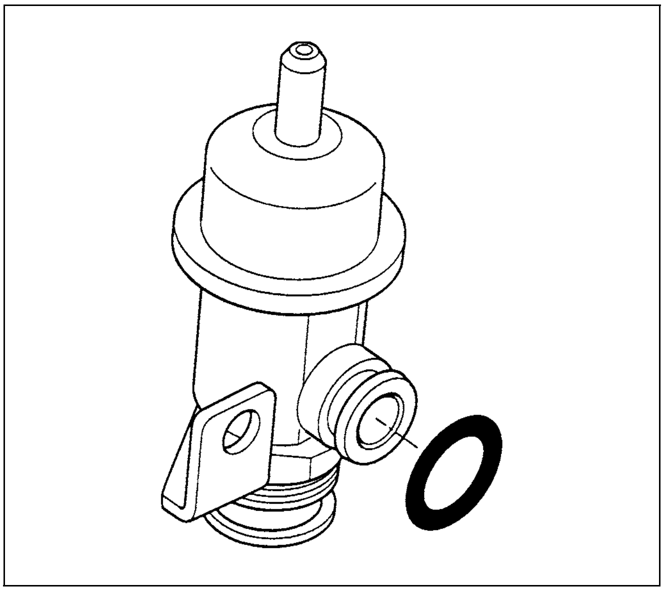


5. Remove the fuel pressure regulator retaining screw.
6. Remove the fuel pressure regulator from fuel rail.

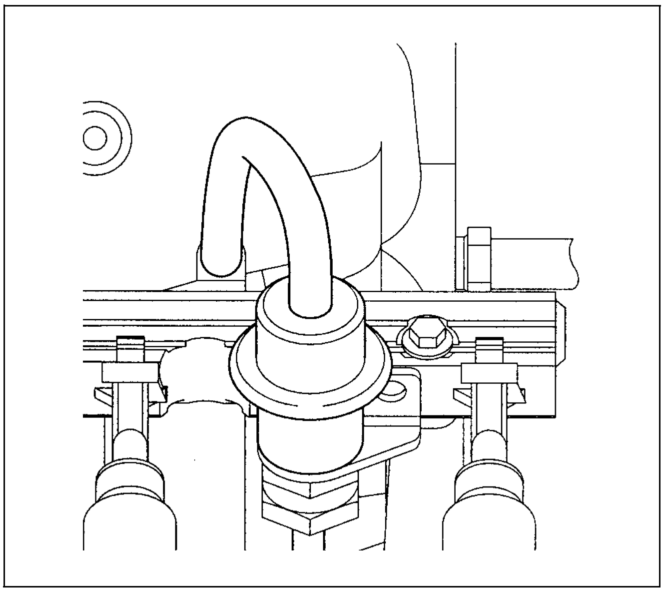


Installation Procedure

1. Insert the fuel pressure regulator into the fuel rail.



2. Install the fuel pressure regulator retaining bracket and tighten with a screw.
3. Connect vacuum line onto the fuel pressure regulator.



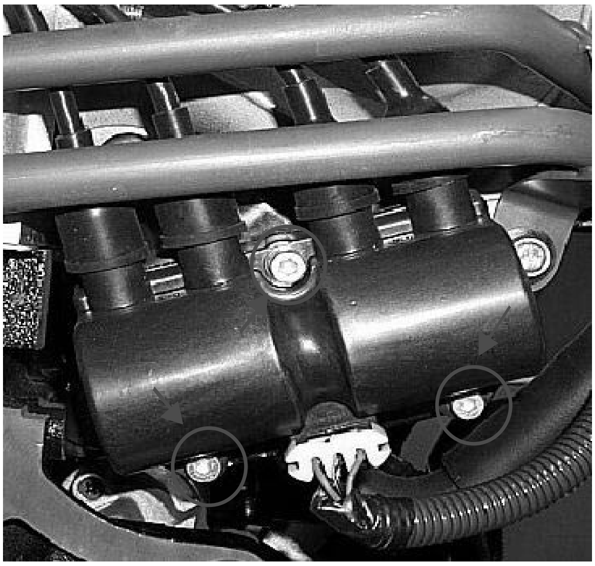
4. Install the fuel pump relay.
5. Connect the negative battery cable.
6. Crank the engine until it starts. Cranking the engine may take longer than usual due to trapped air in the fuel line.
7. Tighten the flare nut to 27 - 33 N·m (2.8 - 3.4 kgf·m).

IGNITION COIL

Location
Back of the engine right-hand side.

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the ignition coil connector.
3. Disconnect four spark plug cables from the ignition coil.
4. Loosen three bolts and remove ignition coil from the bracket.



Installation Procedure

1. Tighten the ignition coil by three bolts.
2. Connect four spark plug cables to the ignition coil.
3. Connect a ignition coil connector to the ignition coil.
4. Connect the negative battery cable.

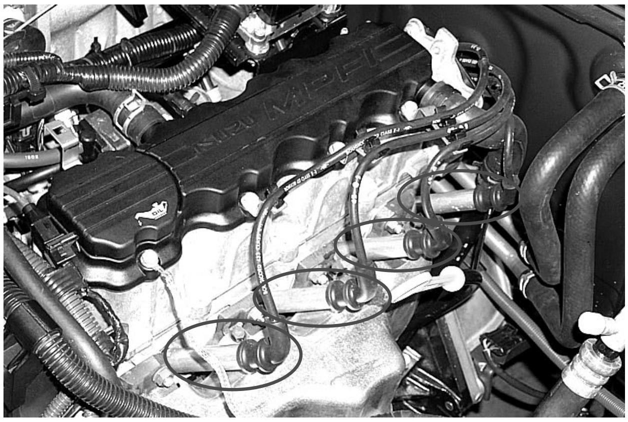
NOTE: Verify any DTCs (diagnosis Trouble Code) are not stored after replacement.
Verify proper connection of spark plug cables for each cylinders.

SPARK PLUGS

Location
Installed on the left-hand side of cylinder head.

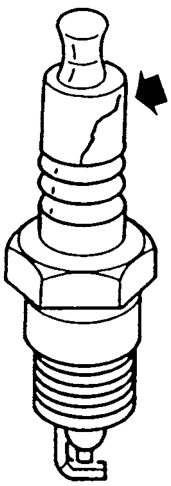
Removal Procedure

1. Disconnect the negative battery cable
2. Remove the spark plug cable.
3. Remove the spark plug.



Inspection

1. Check the insulator for cracks. Replace the spark plug if cracks are present.
2. Check the electrode condition and replace the spark plug if necessary.



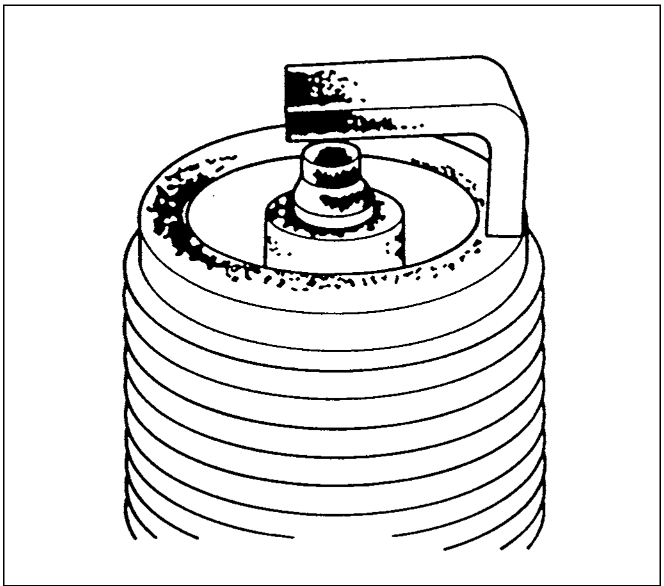
If the spark plug electrodes and insulators are fouled with carbon or oil, the engine will not operate efficiently. There are a number of possible causes:

- Fuel mixture is too rich.

- Oil in the combustion chamber.
- The spark plug gap is not set correctly.

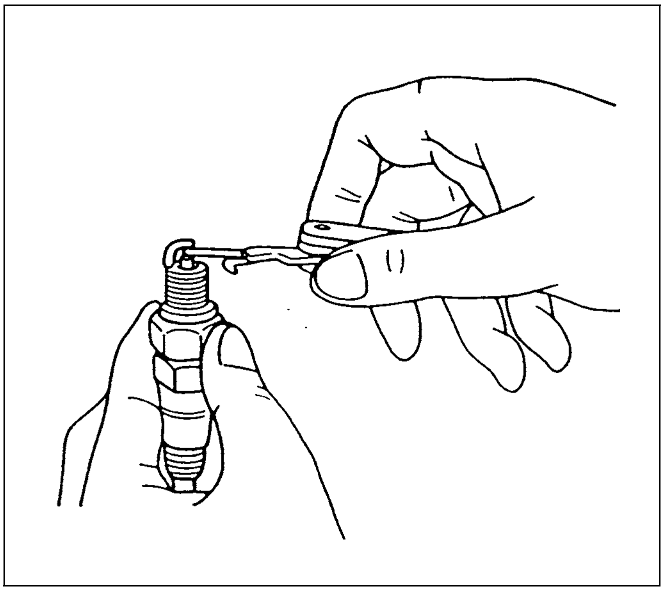
If spark plug fouling is excessive, check the fuel and al system for possible causes of trouble. If fuel and al system are normal, install spark plugs of a higher heat range which have the same physical dimensions as the original equipment spark plugs.
The following symptoms are characteristics of spark plugs that are running too hot:

- Fuel mixture is too lean.
- Heat range is incorrect.



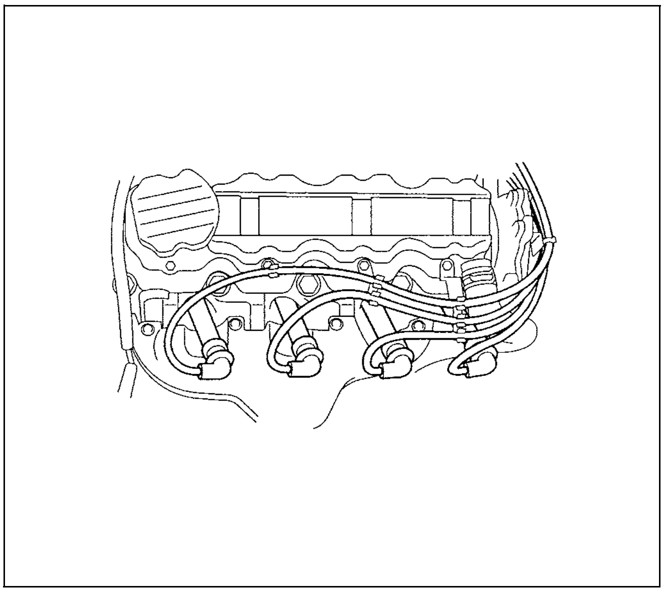
If vehicle usage does not conform to normal driving conditions, a more suitable spark plug may be substituted.
If fuel and al system are normal, in most cases of this sort, the problem can be corrected by using a colder type spark plug with the same physical dimensions as the original equipment spark plug.

3. Check the gaskets for damage and replace if necessary.
4. Measure the spark plug gap. The specification is 1.0 to 1.1mm (0.039 to 0.043").
5. Adjust the spark gap by bending the grounded electrode.



Installation

1. Tighten the spark plug to the 25N·m (2.5kgf·m).
2. Push the spark plug cable in until it snaps in.



Installation Procedure

1. Install the spark plug to the cylinder head.
2. Tighten the spark plug with specified tightening torque.

Tightening Torque

- Bolt: 25N·m (2.5kgf·m)

3. Connect the spark plug cable to the spark plug.
4. Connect the negative battery cable.

NOTE: Verify any DTCs (diagnosis Trouble Code) are not stored after replacement.
Verify proper connection of spark plug cables for each cylinders.

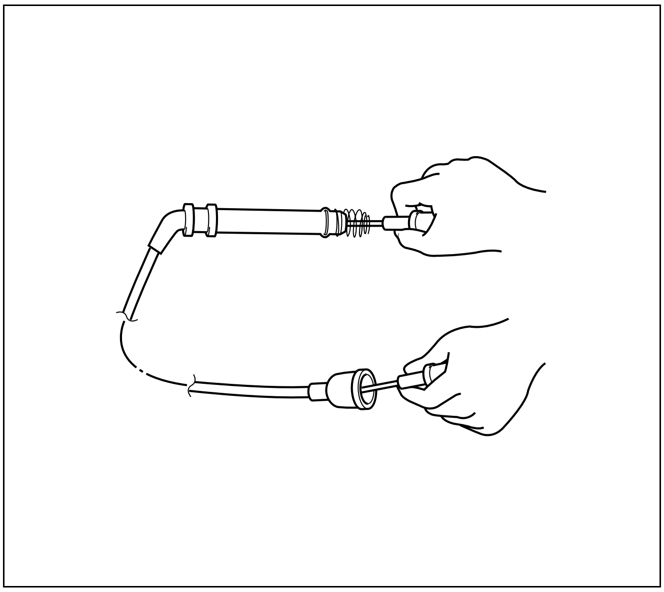
SPARK PLUG CABLES

The cable contains a synthetic conductor which is easily damaged. Never stretch or kink the cable. Disconnect the cable from spark plug and the ignition coil.
The original equipment cables and the ignition coil are marked to show correct location of the cables. If spark plug cables or the ignition coil are replaced previously, before cables are removed from the ignition coil, mark the cables and the coil so they can be reconnected in the same position.

Inspection

NOTE: Never puncture the spark plug cable's insulation with a needle or the pointed end of a probe into the cable. An increase in resistance would be created which would cause the cable to become defective.

1. If the cable has broken or cracked insulation, it must be replaced.
2. If the terminals are corroded or loose, the cable must be replaced.
3. Check that the cable resistance does not exceed specified value.
   #1 cylinder: 3.50kΩ - 5.24kΩ
   #2 cylinder: 2.89kΩ - 4.33kΩ
   #3 cylinder: 2.49kΩ - 3.73kΩ
   #4 cylinder: 2.22kΩ - 3.32kΩ



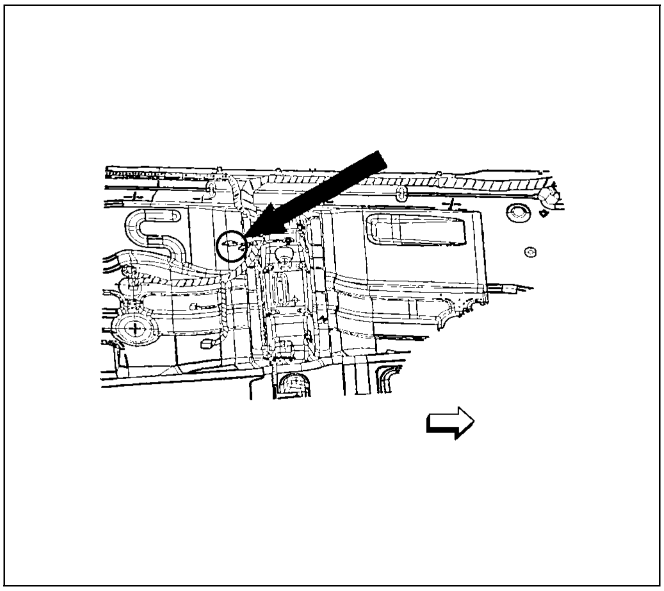
EMISSION CONTROL ; *CO ADJUSTER (W/O CATALYSTIC CONVERTER)

*CO : Carbon monoxide

Location
Under the leht-hand side of the front sheet.

Removal Procedure

1. Remove the left-hand side of the front sheet. Refer to Sec.10 CAB “Front Sheet”.
2. Disconnect the CO adjuster connector.



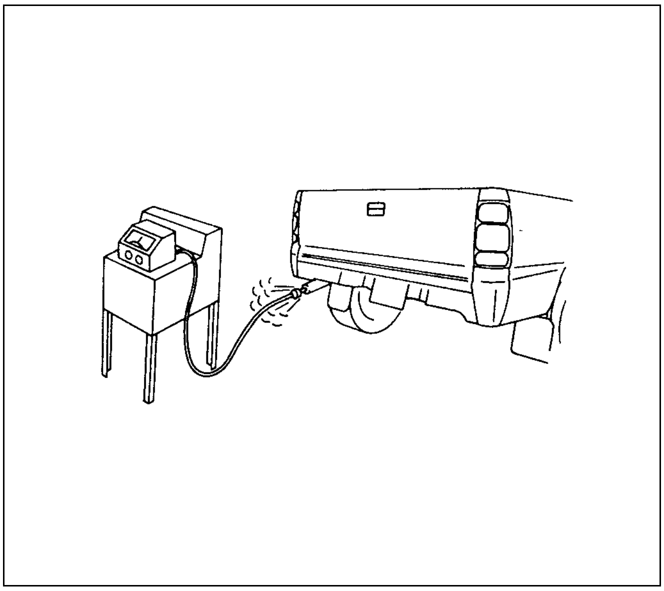
3. Remove the CO adjuster.

Installation Procedure

1. Connect the CO adjuster connector.
2. Install the left-hand side of the front sheet. Refer to Sec.10 CAB “Front Sheet”.
3. Check and adjust CO concentration.

Checking procedure

1. Operate the engine at normal temperature.
2. Turn all accessories switch OFF.
3. Place the select lever in the “N” range.
4. Start the engine at idle.

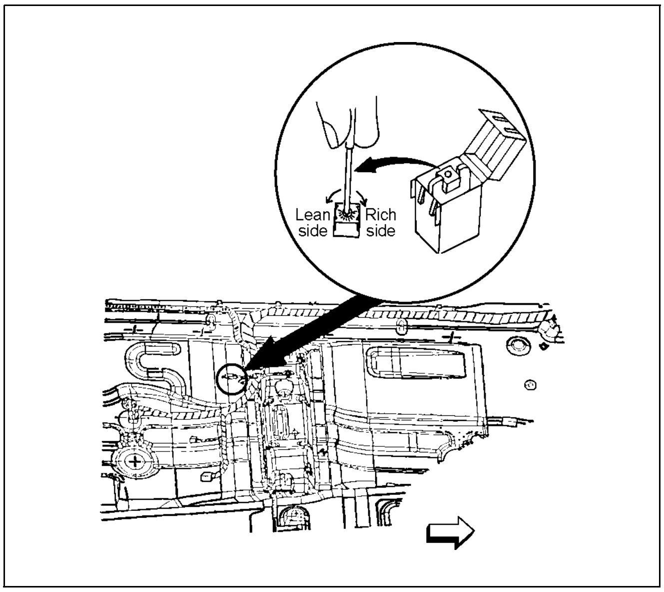


5. Measure the CO concentration for 1-3 minutes, after idlling the engine to allow the CO concentration to stabilize.
6. Check the CO concentration.
7. If the value is not within specification, adjust the CO concentration.

Adjustment Procedure

1. Warm-up the engine.
2. Turn OFF switches of all electrical equipment.
3. Open the CO adjuster cap.
4. Turn the CO adjuster screw checking the CO concentration

.



5. Adjust the CO concentration within specification.

Specification:
CO concentration : 0.6 — 1.0 %

NOTE: Apply the liquid gasket to the CO adjuster screw after the adjustment.

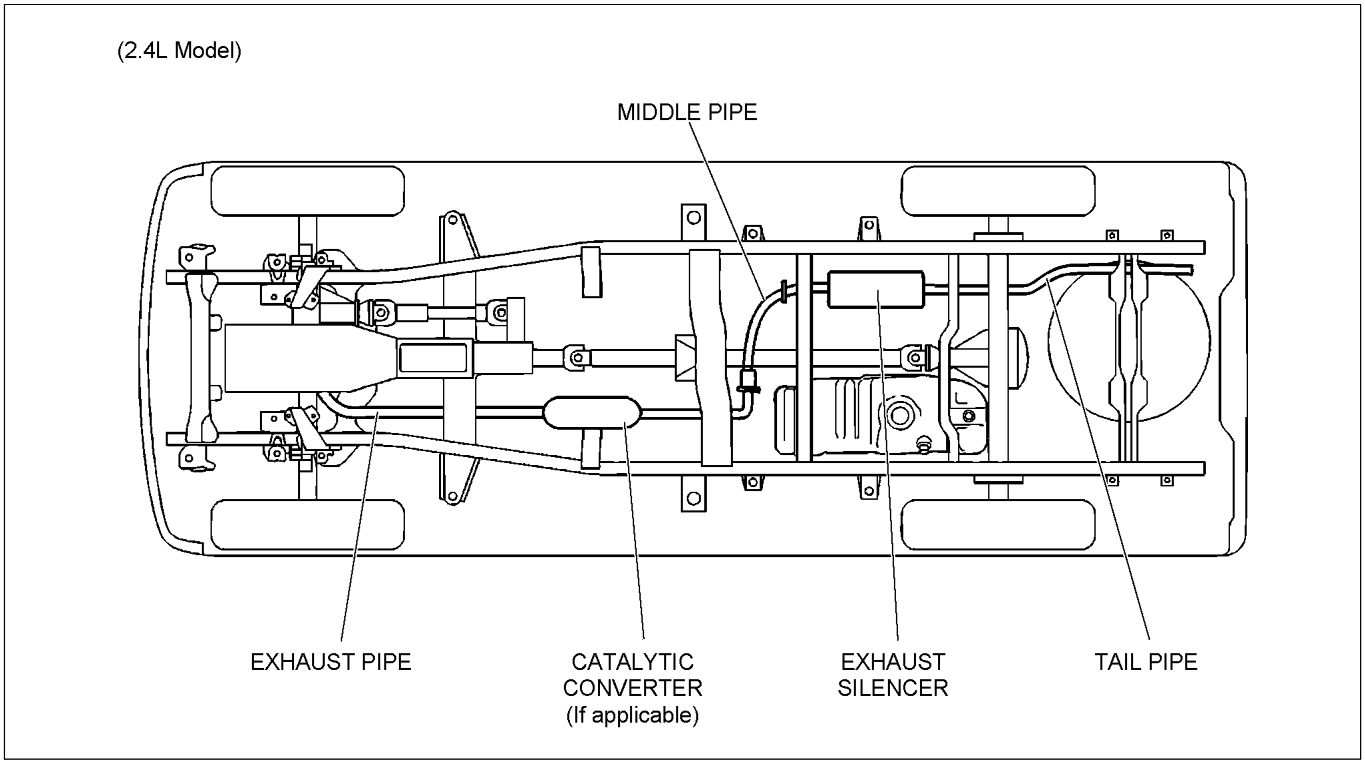
SECTION 6F

ENGINE EXHAUST

TABLE OF CONTENTS

PAGE

General Description



RTW46AMF000501

When inspecting or replacing exhaust system components, make sure there is adequate clearance from all points on the underbody to prevent overheating the floor pan and possible damage to the passenger compartment insulation and trim materials.
Check complete exhaust system and nearby body areas and rear compartment lid for broken, damaged, missing or mispositioned parts, open seams, holes, loose connections or other deterioration which could permit exhaust fumes to seep into the rear compartment or passenger compartment. Dust or water in the rear compartment may be an indication of a problem in one of these areas. Any faulty areas should be corrected immediately.

Hangers

Various types of hangers are used to support exhaust system(s). These include conventional rubber straps, rubber rings, and rubber blocks.
The installation of exhaust system supports is very important, as improperly installed supports can cause annoying vibrations which can be difficult to diagnose.

Three Way Catalytic Converter (If applicable)

The three way catalytic converter is an emission control device added to the exhaust system to reduce pollutants from the exhaust gas stream.

CAUTION: The catalytic converter requires the use of unleaded fuel only.
Periodic maintenance of the exhaust system is not required. If the vehicle is raised for other service, it is advisable to check the condition of the complete exhaust system.
A dual bed monolith catalytic converter is used in combination with three way catalytic converter.
Catalytic Types:
Three way (Reduction/Oxidation) catalyst
The catalyst coating on the three way (reduction) converter contains platinum and rhodium which lowers the levels of nitrous oxide (NOx) as well as hydrocarbons (HC) and carbon monoxide (Co).

Gasket

The gasket must be replaced whenever a new exhaust pipe, muffler or catalytic converter is installed.

Service Precaution

CAUTION:
Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Exhaust Pipe

Exhaust Pipe and Associated parts

Removal

(2.4L)

1. Disconnect battery ground cable.
2. Raise the vehicle and support with suitable safety stands.
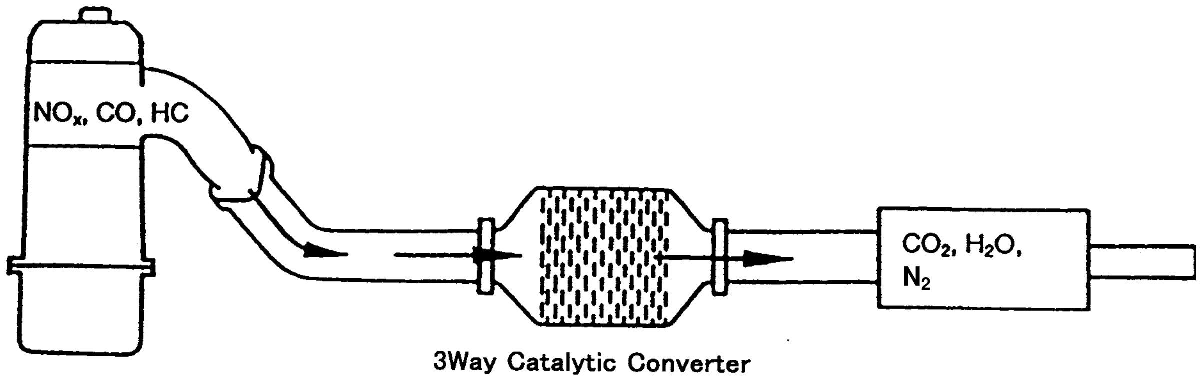
3. Remove front pipe fixing nuts (3).
4. Remove mid pipe fixing nuts (4).
5. Remove the O_2 sensor connector (2).
6. Remove the front exhaust pipe with catalytic converter (1).

Installation

1. Install Catalytic Converter (1) and tighten four to the specified torque:
   Torque:
   Fixing nuts: 28 N·m (2.9 kgf·m)
2. Tight two nuts (4)
   Torque:
   Nuts: 43 N·m (4.4 kgf·m)
3. Connect the O_2 sensor connector (2).

3 WAY CATALYTIC CONVERTER SYSTEM (If applicable)



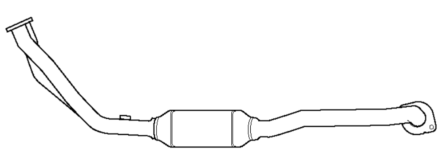
Inspection

Make the necessary adjustments, and part replacements if excessive or damage is discovered during inspection.

Exhaust Pipe Assembly

1. Check connections for looseness or damage.
2. Check clamps for weakness, crack, or damage.

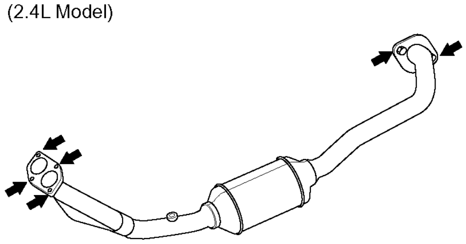
(2.4L Model)



Catalytic Converter

Check for dents or damage.
If any part of the converter is damaged or dented, repair or replace it.

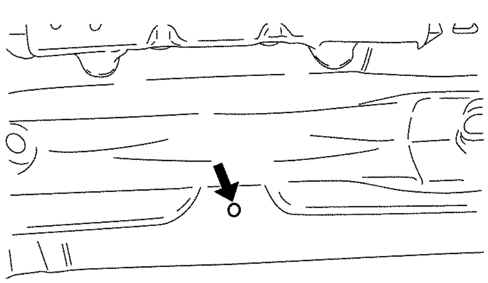
(2.4L Model)



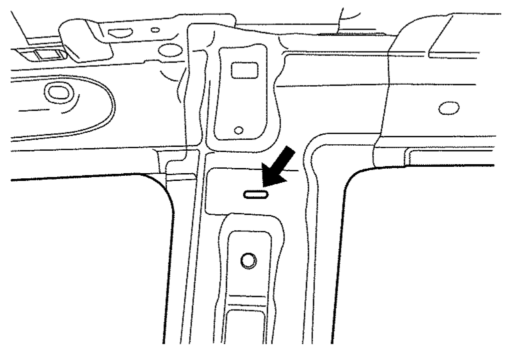
Removal

1. Jack up the vehicle.
2. Check that the converter is cool.
3. Remove the bolts at the front and rear of the converter.
4. Remove the converter and gaskets.

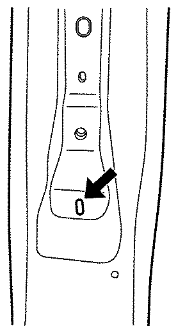
45



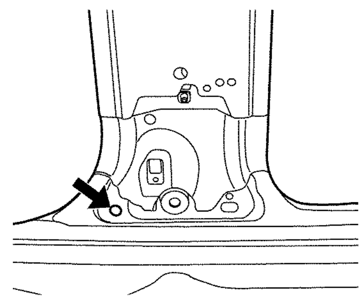
48

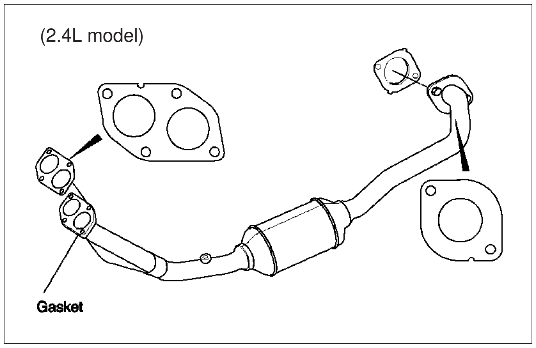


50



60



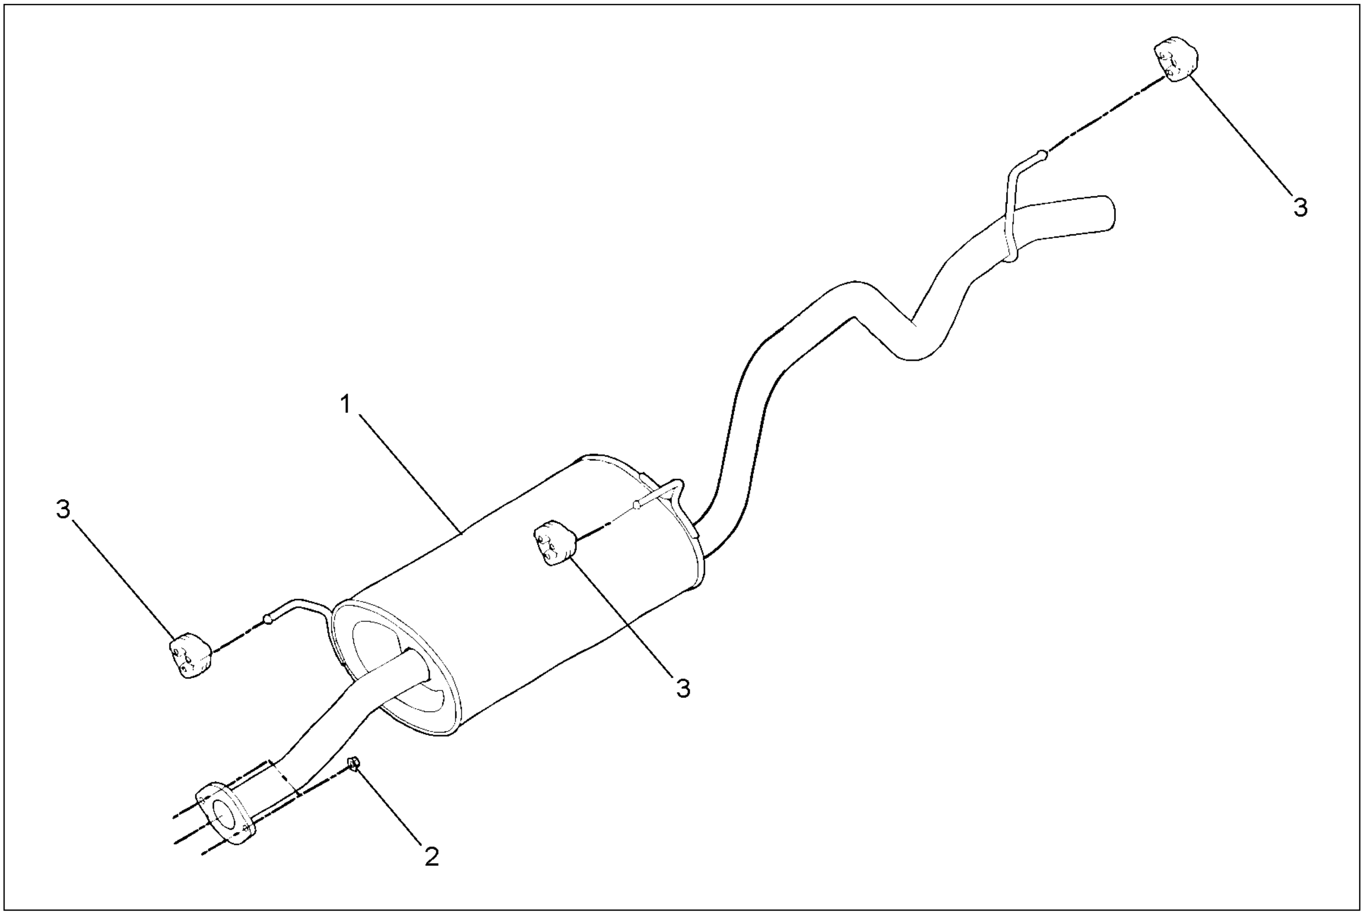


Installation

1. Place new gaskets on the converter front and rear pipes, and connect the converter to the exhaust pipes.
2. Tighten the bolts with the specified torque.
3. Reinstall the bracket bolts and tighten them.

Exhaust Silencer

Exhaust Silencer and Associated Parts



RTW46FMF000701

Legend

1. Exhaust Silencer
2. Exhaust Silencer Fixing Nuts
3. Rubber

Removal

(2.4L)

1. Disconnect battery ground cable.
2. Raise the vehicle and support with suitable safety stands.
3. Remove the damper rubber and nut (2)(3).
4. Remove exhaust silencer (1).

Installation

(2.4L)

1. Install the exhaust silencer and tighten two nuts and the damper rubbers.

Torque:
Bolts: 43 N·m (4.4 kgf·m)

Main Data and Specifications

Exhaust system

14 Camshaft Journal
15 HLV
16 Check relief valve
17 Oil Pan

A gear-type oil pump is directly driven by the crankshaft and draws oil from the oil pan, via the suction pipe. If then passes the pressured oil through a full-flow disposable oil filter, to the main oil gallery in the cylinder Block. An oil pump pressure relief valve and oil filter bypass valve are incorporated in the system.

From the main oil gallery in the cylinder block, the cylinder head and crankshaft main bearings are supplied with oil.

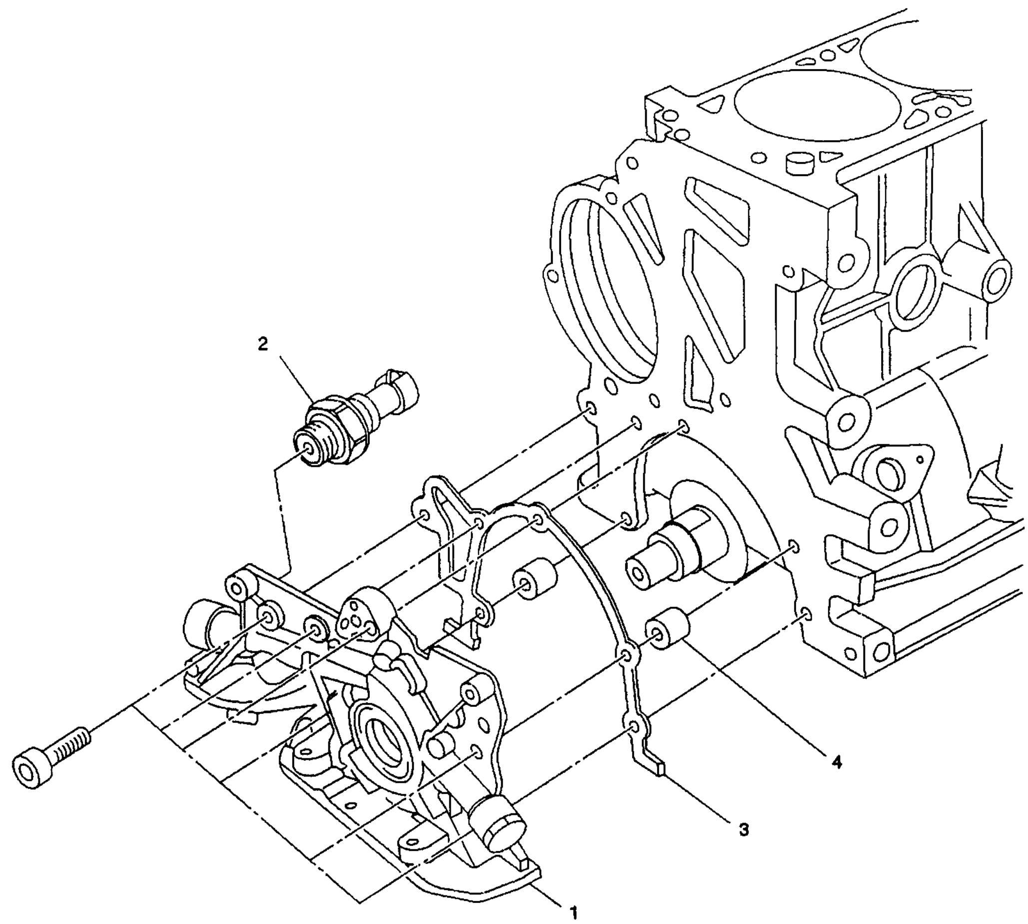
The camshaft bearings and hydraulic tappets are supplied through the main feed galleries in the cylinder head. Vent valves allow air to be expelled from the oil galleries in the cylinder head. The balance shaft journals are directly fed from the crankshaft main bearings. The connecting rod bearings are fed via passages in the crankshaft. The oil returns to the oil pan via passages in the cylinder block.

Service Precaution

CAUTION:
Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

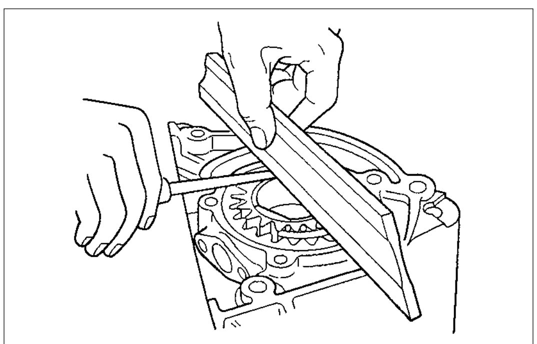
Oil Pump

Oil Pump and Associated Parts



Legend

1 Oil Pump Assembly
2 Oil Pressure Switch
3 Gasket
4 Sleeve



Disassembly

1. Remove crankshaft timing pulley.
2. Remove oil pan.
3. Remove oil strainer.
4. Remove oil pump assembly.
5. Remove oil pressure switch.
6. Remove gasket.
7. Remove sleeve.

Inspection and Repair

CAUTION: Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

Body and Gears

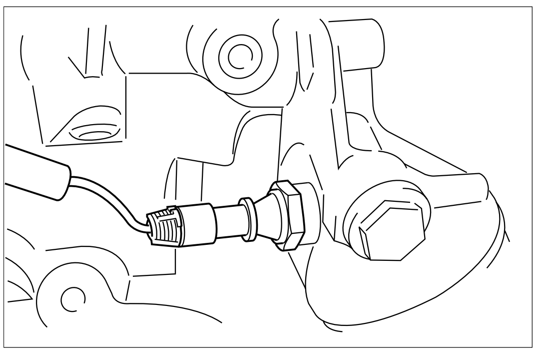
The pump assembly must be replaced if one or more of the conditions below is discovered during inspection:
Indentation of gear pair - Use feeler strip and straight edge.

Dimension: 0.03 mm to 0.10 mm

(0.0012 to 0.0039 in)

Oil Strainer

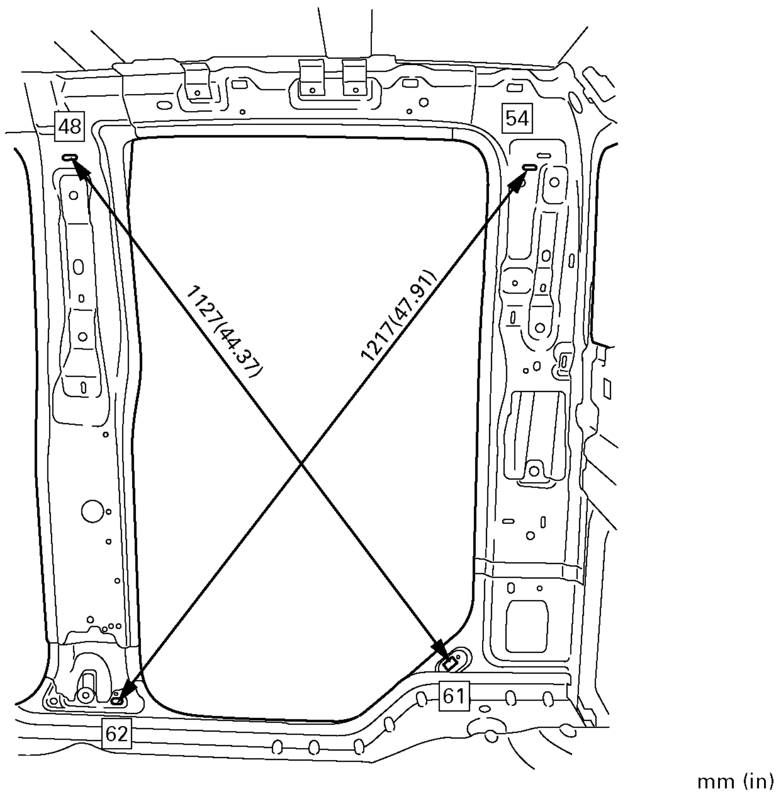
Check the oil strainer for cracking and scoring. If cracking and scoring are found, the oil strainer must be replaced.

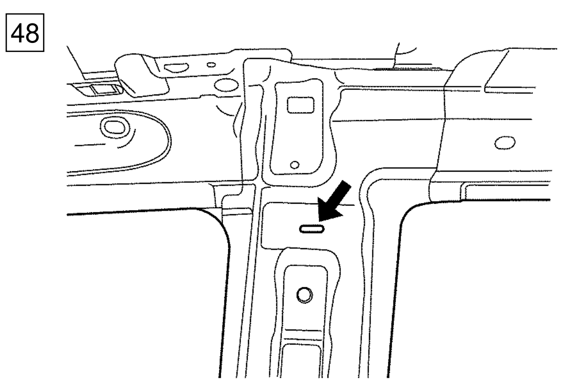


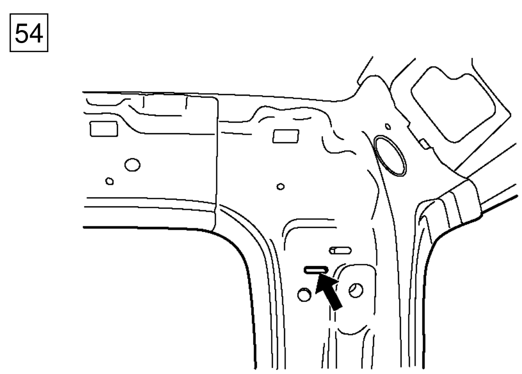
Reassembly

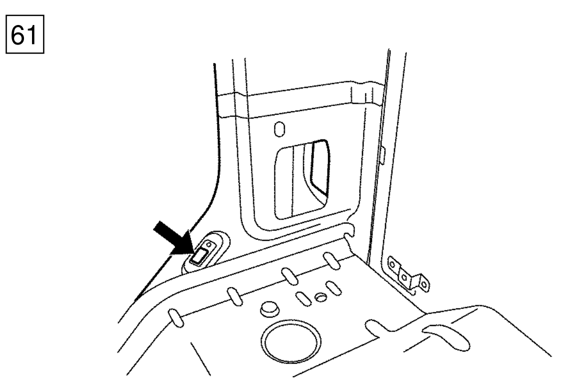
1. Install oil pressure switch to the oil pump.
   Torque: 40 N·m (4.1 kgf·m)
2. Install the oil pump with the sleeve and the gasket.
   Torque: 6 N·m (0.6 kgf·m)
3. Install oil strainer.
   Torque: 8 N·m (0.8 kgf·m)
4. Install the oil pan.
   Tighten the bolts:
   15 N·m (1.5 kgf·m)
5. Install crankshaft timing pulley.
   Tighten the bolts:
   20 N·m (2.0 kgf·m)

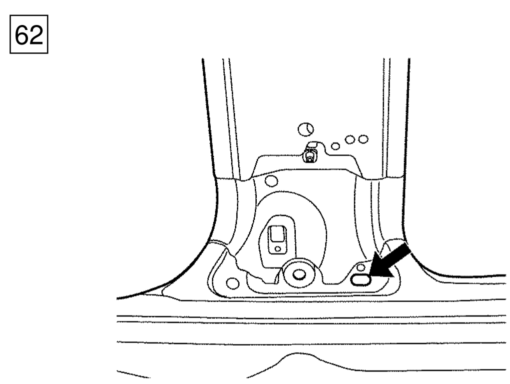
SIDE BODY SECTION; REAR SIDE (CREW CAB)





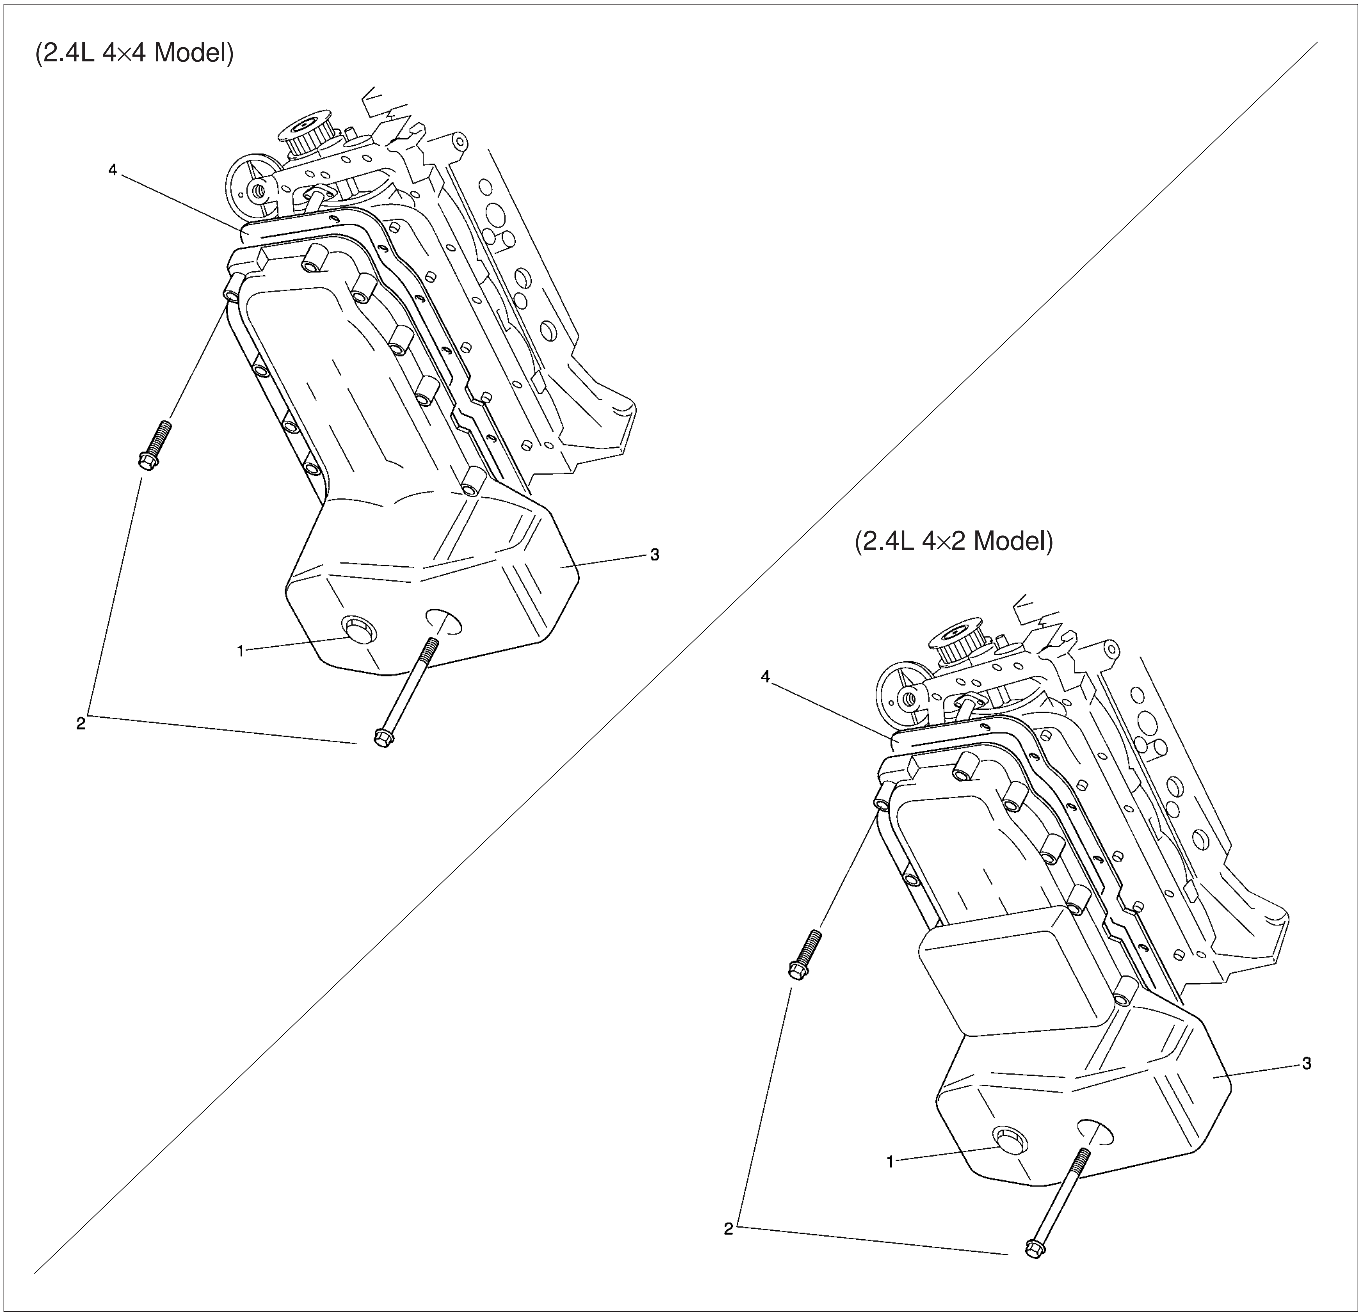






Oil Pan

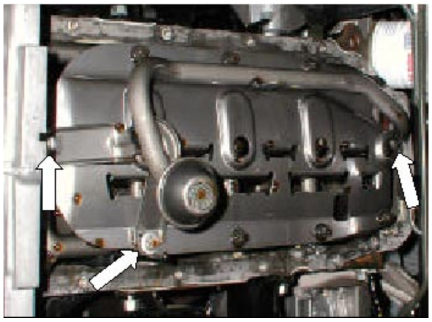
Oil Pan and Associated Parts



Important

Disassembly

1. Loosen a drain plug to drain oil.
2. Remove engine hood.
3. Remove engine rear mounting.
4. Remove transmission assembly.
5. Remove engine front mounting.
6. Raise the vehicle and support with switch stands, and then remove engine.
7. Remove oil pan.



Inspection and Repair

CAUTION: Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

Reassembly

To install, follows the disassembly steps in the reverse order.

Important

Sealer - Apply silicon into groove in oil pan lugs prior to fitment of oil pan to block, remove excess sealer after oil pan is bolted to block.

(2.4L 4×4 Model)

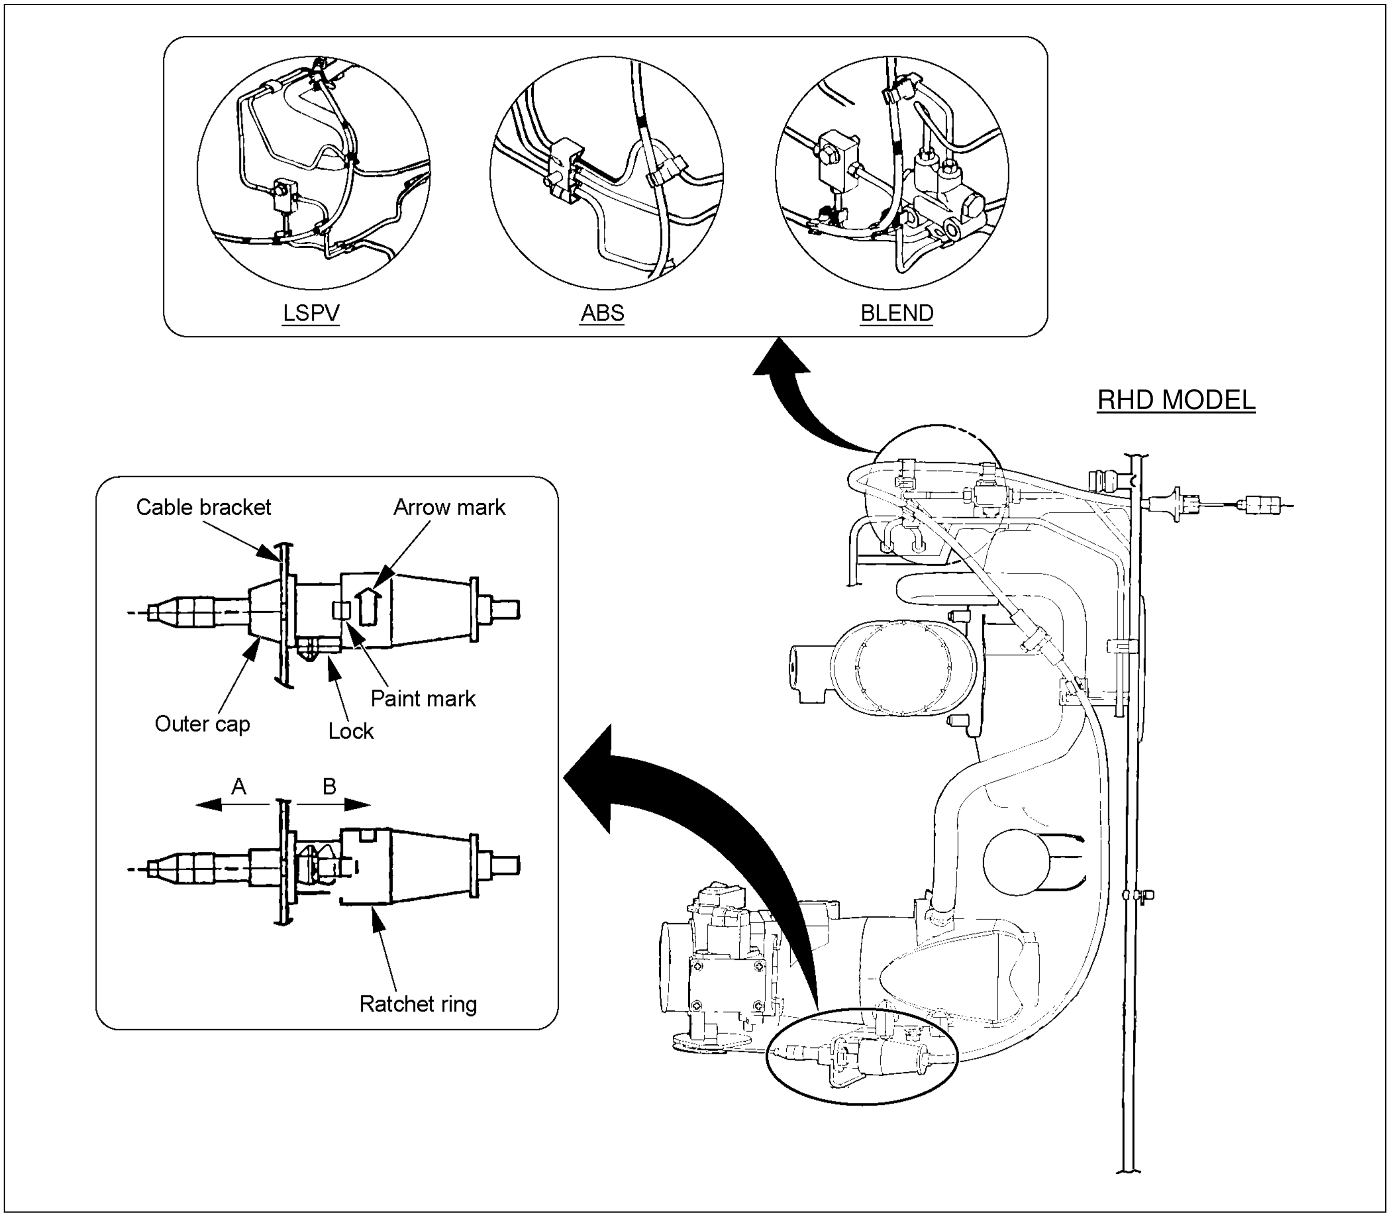
Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Accelerator Pedal Control Cable

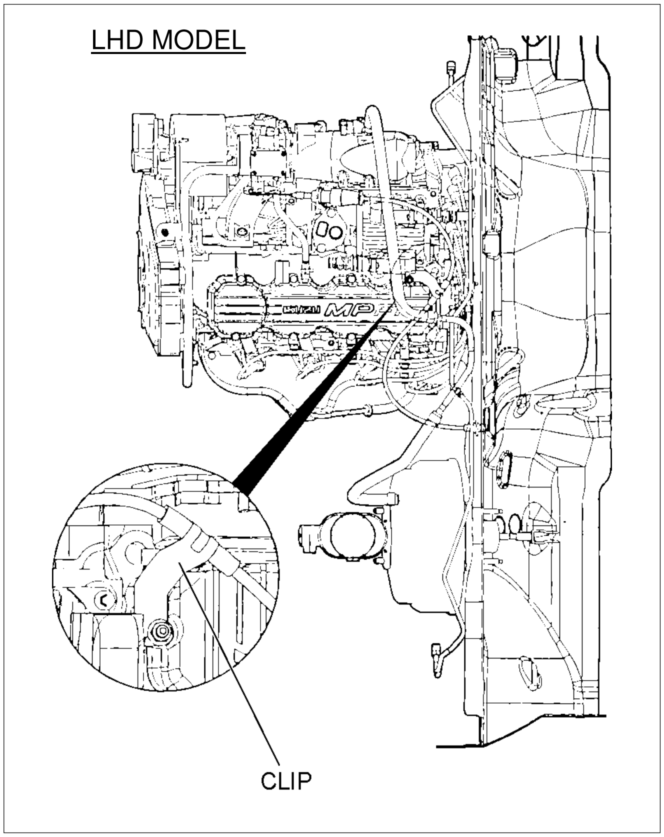


RTW46HLF000501

Removal

1. Disconnect the accelerator control cable from the accelerator pedal and dash panel.
2. Remove the cable clips.
3. Remove the accelerator control cable from accelerator control cable bracket.
   1) Slide the lock in direction A
   2) Rotate the ratchet ring in indirection an arrow 90°.

4. Remove the accelerator control cable from the throttle.



RTW46AMH000101

Inspection

Check the following items and replace the control cable if any abnormality is found.

- The control cable should move smoothly.
- The control cable should not be bent or kinked.
- The control cable should not be damage or corrosion.

Installation

1. Install the accelerator control cable to accelerator control pedal dash panel.
2. Install the accelerator control cable to throttle. Attach T-END and inner cable to throttle cam of engine.
3. Install accelerator control cable to accelerator bracket.
   1) Rotate the ratchet ring in direction an arrow 90° until both white marking are aligned.
   2) Confirm marking of outer cap must be upper side.
   3) Slider the lock in direction B.
   4) Confirm ratchet ring is locked.

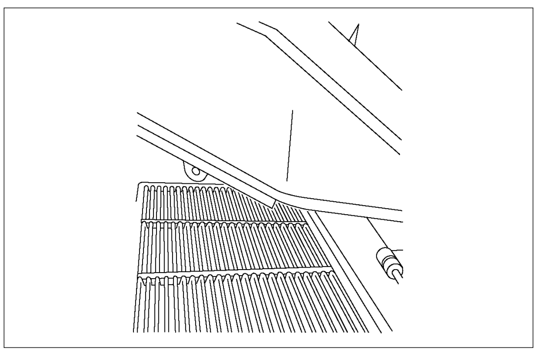
UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Air Cleaner Filter

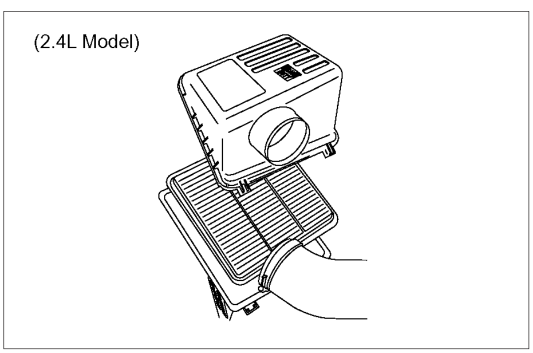


RTW46JSH000101

NOTE:
The air cleaner filter is not damaged with the edge of the air cleaner housing.

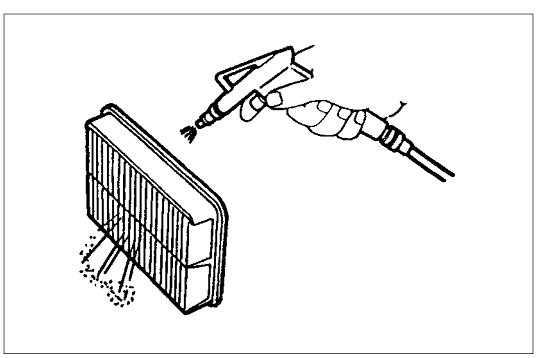
Removal

1. Remove positive ventilation hose connector.
2. Remove intake air temperature sensor.
3. Remove mass air flow sensor.
4. Remove air cleaner duct assembly.
5. Remove air cleaner element.



Inspection

Check the air cleaner filter for damage or dust clogging. Replace if it is damaged, or clean if it is clogged.



Cleaning Method

Tap the air cleaner filter gently so as not to damage the paper filter, or clean the element by blowing with compressed air of about 490 kPa (71 psi) from the clean side if it is extremely dirty.

Installation

1. Install air cleaner element.
2. Attach the air cleaner duct cover to the body completely, then clamp it with the clip.
3. Install mass air flow sensor.
4. Install mass air temperature sensor.
5. Install positive crankcase ventilation hose connector.

TABLE OF CONTENTS

6A1
Engine Mechanical – V6

ATTENTION

Before performing any service operation or other procedure described in this Section, refer to 1.1 WARNING, CAUTION and NOTES for correct workshop practices with regard to safety and/or property damage.

1 General Information

The HFV6 engine features a closed vee, deep skirt die cast aluminium cylinder block with cast iron cylinder liners, internally balanced crankcase, full length water jackets and six bolt main bearing caps.

The cylinders are arranged in two banks of three with a 60 degree included angle between the two banks.

The right-hand bank of cylinders consists of number 1-3-5 cylinders and the left-hand bank of cylinders consists of number 2-4-6.

The engine firing order is 1-2-3-4-5-6.

Each aluminium cylinder head is fitted with hardened valve seats and four valves per cylinder: two intake and two exhaust.

The valves are operated by two camshafts (DOHC) per cylinder bank, one each for intake and exhaust valves.

The crankshaft is manufactured from forged steel. A reluctor wheel is pressed in place onto the rear of the crankshaft for the crankshaft position sensor.

The connecting rods are manufactured from powdered metal and the rod cap is separated during the manufacturing process using the fractured method. This creates a stronger, visually seamless rod to cap union.

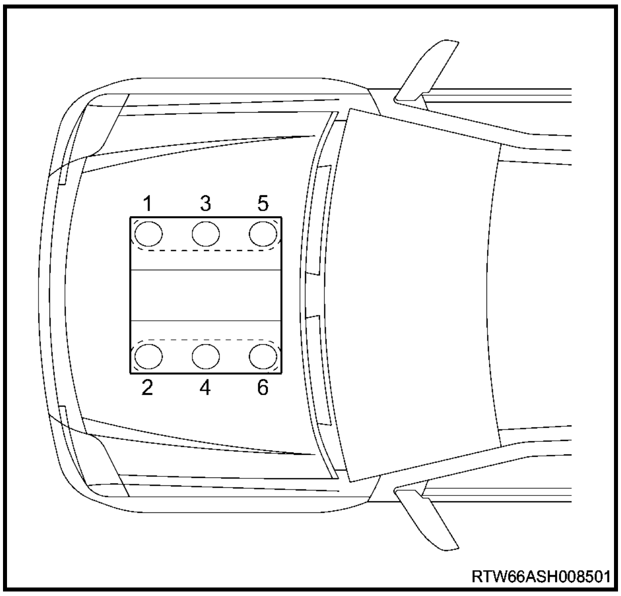

Figure 6A1 – 1

1.1 WARNING, CAUTION and NOTES

This Section contains various WARNINGS, CAUTIONS and NOTE statements that you must observe carefully to reduce the risk of death or injury during service, repair procedures or vehicle operation. Incorrect service or repair procedures may damage the vehicle or cause operational faults. WARNINGS, CAUTION and NOTE statements are not exhaustive. HOLDEN LTD can not possibly warn of all the potentially hazardous consequences of failure to follow these instructions.

Definition of WARNING, CAUTION and NOTE Statements

Diagnosis and repair procedures in this Section contain both general and specific WARNING, CAUTION and NOTE statements. HOLDEN LTD is dedicated to the presentation of service information that helps the technician to diagnose and repair the systems necessary for proper operation of the vehicle. Certain procedures may present a hazard to the technician if they are not followed in the recommended manner. WARNING, CAUTION and NOTE statements are designed to help prevent these hazards from occurring, but not all hazards can be foreseen.

WARNING defined

A WARNING statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in death or injury. A WARNING statement alerts you to take necessary action or not to take a prohibited action. If a WARNING statement is ignored, the following consequences may occur:

- Death or injury to the technician or other personnel working on the vehicle,
- Death or injury to other people in or near the workplace area, and / or
- Death or injury to the driver / or passenger(s) of the vehicle or other people, if the vehicle has been improperly repaired.

CAUTION defined

A CAUTION statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in damage to or destruction of equipment, or corruption of data. If a CAUTION statement is ignored, the following consequences may occur:

- Damage to the vehicle,
- Unnecessary vehicle repairs or component replacement,
- Faulty operation or performance of any system or component being repaired,
- Damage to any system or components which depend on the proper operation of the system or component being repaired,

- Faulty operation or performance of any systems or components which depend on the proper operation or performance of the system or component under repair,
- Damage to fasteners, basic tools or special tools and / or
- Leakage of coolant, lubricant or other vital fluids.

NOTE defined

A NOTE statement immediately precedes or follows an operating procedure, maintenance practice or condition that requires highlighting. A NOTE statement also emphasises necessary characteristics of a diagnostic or repair procedure. A NOTE statement is designed to:

- Clarify a procedure,
- Present additional information for accomplishing a procedure,
- Give insight into the reasons for performing a procedure in the recommended manner, and / or

Present information that gives the technician the benefit of past experience in accomplishing a procedure with greater ease.

1.3 Engine Serial Number

The engine serial number is located on the machined pad (1) at the left-hand rear of the cylinder block.

The following is a breakdown of the engine serial number, using an example of 10H7E H051230001:

- 10 = Component ID (i.e. 10 = Assembly)
- H7E = Engine Broadcast Code
- H = Assembly Plant Code
- 05 = Build Year
- 123 = Julian Date
- 0001 = Four Digit Daily Sequence Number

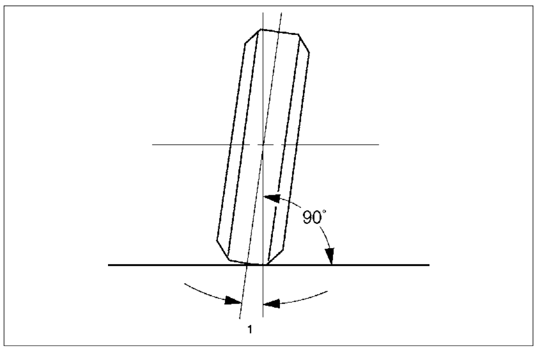
Front End Alignment Inspection and Adjustment

General Description

“Front End Alignment” refers to the angular relationship between the front wheels, the front suspension attaching parts and the ground.

Proper front end alignment must be maintained in order to insure efficient steering, good directional stability and to prevent abnormal tire wear.

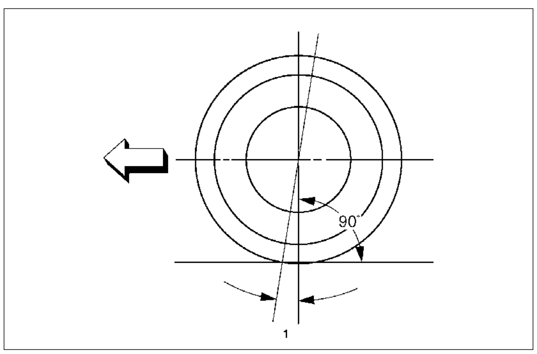
The most important factors of front end alignment are wheel toe-in, wheel camber and axle caster.



Camber:

This illustration shows a view from the front of the vehicle.

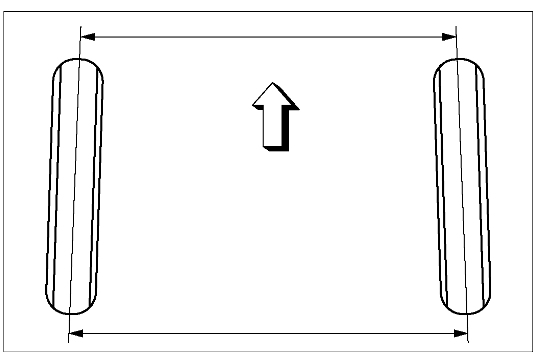
Camber is the vertical tilting inward or outward of the front wheels. When the wheels tilt outward at the top, the camber is positive (+). When the wheels tilt inward at the top, the camber is negative (-). The amount of tilt measured in degrees from the vertical is called the camber angle (1). If camber is extreme or unequal between the wheels, improper steering and excessive tire wear will result. Negative camber causes wear on the inside of the tire, while positive camber causes wear to the outside.



Caster:

This illustration shows a view from the side of the vehicle.

Caster (1) is the vertical tilting of the wheel axis either forward or backward (when viewed from the side of the vehicle). A backward tilt is positive (+) and a forward tilt is negative (-). On the short and long arm type suspension you cannot see a caster angle without a special instrument, but if you look straight down from the top of the upper control arm to the ground, the ball joints do not line up (fore and aft) when a caster angle other than 0 degrees is present. With a positive angle, the lower ball joint would be slightly ahead (toward the front of the vehicle) of the upper ball joint center line.



Toe-in:

This illustration shows a view from the top of the vehicle.

Toe-in is the measured amount the front wheels are turned in. The actual amount of toe-in is normally a fraction of a degree. Toe-in is measured from the center of the tire treads or from the inside of the tires. The purpose of toe-in is to insure parallel rolling of the front wheels and to offset any small deflections of the wheel support system which occurs when the vehicle is rolling forward. Incorrect toe-in results in excessive toe-in and unstable steering. Toe-in is the last alignment to be set in the front end alignment procedure.

1.4 Engine Construction

Cylinder Block

The cylinder block (1) is constructed from aluminium alloy with cast-in-place iron cylinder bore liners.

Each of the four copper-infiltrated sintered steel main bearing caps are attached to the cylinder block by six bolts. Along with two outer and two inner bolts, two side bolts are used in the deep skirt block for increased block stiffness.

The crankshaft thrust bearing is mounted in the third main bearing cap.

To prevent aeration, oil return from the valve train and cylinder heads is channelled away from the reciprocating components through oil drain back passages incorporated into the cylinder heads and engine block. Pressure actuated piston oil cooling jets are mounted between opposing cylinders.

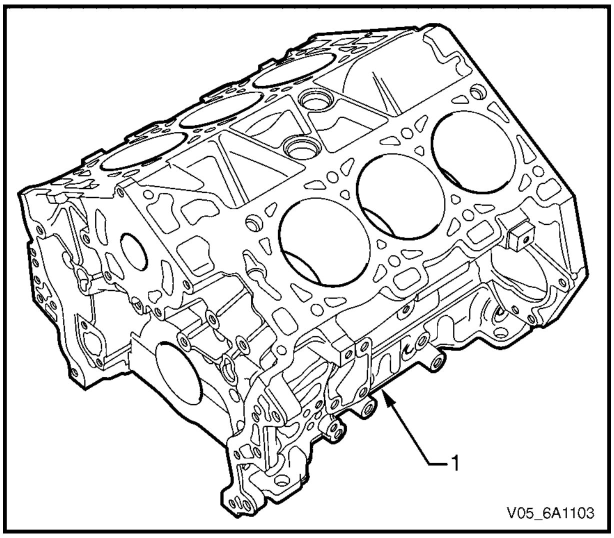


Figure 6A1 – 14

Cylinder Heads

The cylinder heads (1) are semi-permanent mould cast aluminium with powdered metal valve seat inserts and valve guides.

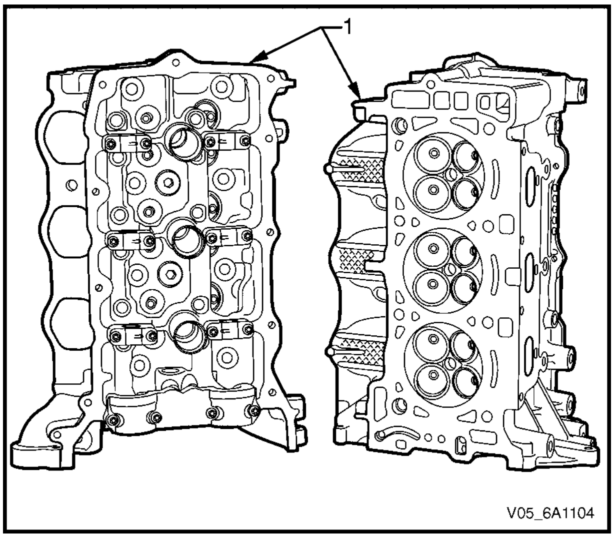

Figure 6A1 – 15

Each cylinder head contains four valves per cylinder. The valves (1) are actuated by the rocker arms (2) that pivot on stationary hydraulic lash adjusters (3), which are oil-fed to maintain valve / rocker lash.

The separate exhaust and intake camshafts are supported by four bearings machined into the cylinder head. The front camshaft bearing cap is used as a thrust control surface for each camshaft.

A tube (4) is pressed into each cylinder head in three places that shields each spark plug. An ignition coil assembly is mounted directly on each spark plug, through each spark plug tube.

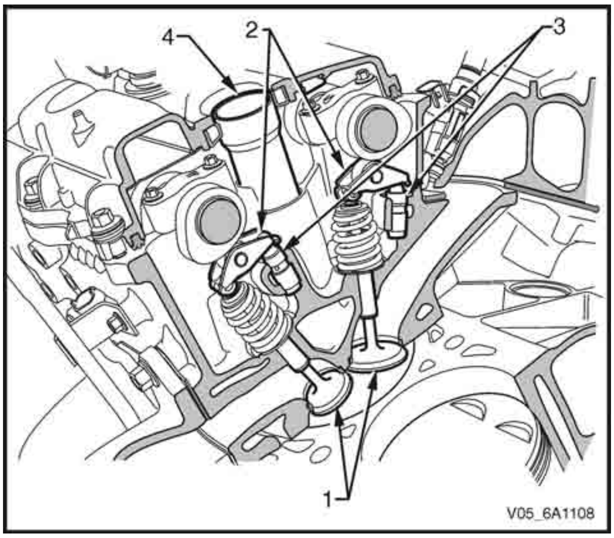

Figure 6A1 – 16

Crankshaft

The crankshaft is a forged steel design with four main bearings. The number three main bearing controls crankshaft thrust. A crankshaft position reluctor wheel is pressed onto the rear of the crankshaft, in front of the rear main journal. The crankshaft is internally balanced with an integral oil pump drive machined into the nose in front of the front main journal.

Pistons, Pins and Connecting Rods

The piston assembly (1) is fitted with two low tension compression rings and one multi-piece oil control ring. The top compression ring is plasma sprayed, while the second compression ring is cast iron Napier.

The oil control ring incorporates a steel expander and two chrome plated steel rails.

The connecting rods are sinter forged steel and have full floating piston pins. The piston pins are a slip-fit type, into the bronze bushed connecting rods. Round wire retainers are used to retain the piston pin into the piston.

The cast aluminium pistons incorporate a polymer coated skirt to reduce friction.

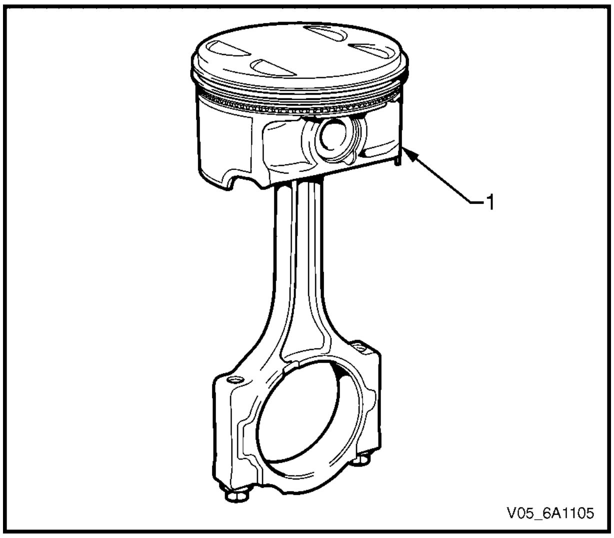

Figure 6A1 – 17

Camshaft Drive System

Three timing chains are fitted:

- primary (1),
- right-hand secondary (2), and
- left-hand secondary (3), refer to Figure 6A1 – 18 for the HFV6 engine.

The primary timing chain connects the crankshaft sprocket (4) with the left-hand and right-hand intermediate drive shaft sprockets (5).

Each oil pressure fed intermediate sprocket drives the secondary timing chains, which subsequently drive the respective cylinder head camshaft position actuators (6).

Two stationary timing chain guides (7) and movable timing chain shoes (8) control secondary timing chain backlash.

Each secondary timing chain shoe is under tension from an oil pressure hydraulically operated tensioner (9). To control backlash on the primary chain, two stationary timing chain guides (10) and an oil pressure hydraulically actuated tensioner with built in shoe (11) are fitted.

The tensioners minimise timing chain noise and provide accurate valve action by keeping slack out of the timing chains, while continuously adjusting for timing chain wear. The tensioners incorporate a plunger that adjusts outward with wear, minimising backlash. The tensioners are equipped with oiling jets to spray oil onto the timing components during engine operation. Each tensioner is sealed to the head or block using a rubber coated steel gasket. The gasket traps an adequate oil reserve to ensure quiet start-up.

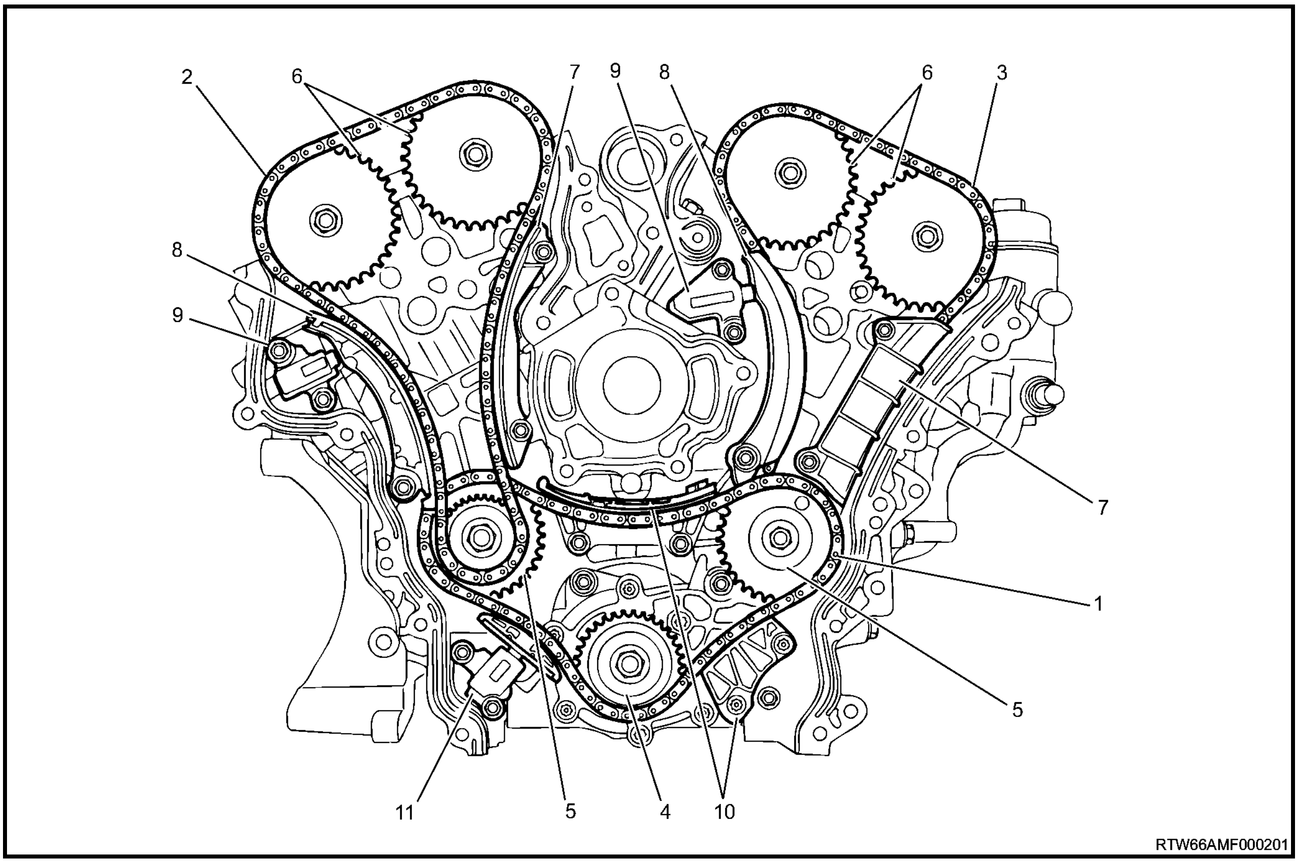

Figure 6A1 – 18

1.5 Engine Lubrication System

Lubrication Description

A structural diecast aluminium oil pan is fitted that incorporates an oil suction pipe, an oil deflector and an oil level sensor. The oil suction pipe is bolted into the oil pan and seals to the bottom of the cylinder block with a gasket. The oil deflector is bolted to the upper portion of the oil pan and ensures oil supply is maintained under all conditions. The oil level sensor is mounted through the bottom of the oil pan.

A crankshaft driven gerotor oil pump is mounted to the front of the cylinder block. The pump, which incorporates an internal pressure-relief valve, draws oil from the oil suction tube through the lower passage in the cylinder block. Oil is then directed through an upper passage to the left-hand side of the cylinder block where the oil filter adapter is mounted.

The oil filter adapter incorporates a top-access, cartridge style oil filter. The filter is accessed through a screw-on cap that incorporates an oil bypass valve. The oil filter adapter housing incorporates a drain back control valve and a threaded oil pressure sender. Oil flows through a lower passage within the oil filter adapter and through the oil filter cartridge. Filtered oil travels back through the upper passage of the adapter and into the engine block.

Oil is then directed up and across the front of the cylinder block, through several drilled passages. These front passages feed oil to each cylinder head, the passage for the main bearings and piston oil jets, the right-hand and left-hand secondary idler sprockets and to the primary timing chain tensioner.

Each cylinder head passage directs oil into oiling circuits for the stationary hydraulic lash adjusters (SHLAs) and the camshaft bearing journals. An additional passage in the cylinder head also directs oil to the secondary timing chain tensioner.

The oil passage that supplies oil to the main bearings also supplies oil to pressure actuated piston cooling oil jets. Each oil jet is mounted between opposing cylinder bores and directs oil to the two bores to provide extra cooling and control piston temperatures.

From the front passages, oil is directed to the front of the block where the right-hand and left-hand intermediate drive shaft sprockets and the primary timing chain tensioner are mounted. Each camshaft timing chain tensioner relies on a gasket to maintain an oil reserve after the engine is turned off. All camshaft timing chain tensioners incorporate a small oil jet to supply an oil spray onto the camshaft timing chain components.

Oil returns to the oil pan, either through the camshaft timing chain area or through the drain back passages on the outboard walls of the cylinder heads and cylinder block.

1.6 Service Notes

Cleanliness and Care

Throughout this Section, correct cleaning and protection of machined surfaces and friction areas is a part of the repair procedure. This is considered standard workshop practice, even if not specifically stated.

When any internal engine part is serviced, care and cleanliness is extremely important.

When components are removed for service, they should be marked, organised or retained in a specific order for reassembly.

At the time of installation, components should be installed in the same location and with the same mating surface as when removed.

Any engine is a combination of many machined, honed, polished and lapped surfaces with tolerances that are measured in thousandths of a millimetre. These surfaces should be covered or protected to avoid component damage.

A liberal coating of clean engine oil should be applied to friction areas during assembly, as the lubrication will protect and lubricate friction surfaces during the initial engine start-up.

Replacing Engine Gaskets

Re-Using Gaskets and Applying Sealants

- do not reuse any gasket unless specified,
- gaskets that can be reused will be identified in the service procedure, and
- do not apply sealant to any gasket or sealing surface unless specified in the service information.

Separating Components

- Use a rubber mallet to separate components.
- Bump the part sideways to loosen the components.
- Bumping should be done at bends or reinforced areas to prevent distortion of parts.

Cleaning Gasket Surfaces

- Where required, remove all gasket and sealing material from the part using a plastic or wood scraper.
- Care must be used to avoid gouging or scraping the sealing surfaces.

- Do not use any other method or technique to remove sealant or gasket material from a part.
- Do not use abrasive pads, sand paper, or power tools to clean the gasket surfaces as these methods of cleaning can cause damage to the component sealing surfaces. Abrasive pads also produce fine grit that the oil filter cannot remove from the oil. This grit is abrasive and has been known to cause internal engine damage.

Assembling Components

- When assembling components, use only the sealant specified or equivalent in the service procedure.
- Sealing surfaces should be clean and free of debris or oil.
- Specific components such as crankshaft oil seals or valve stem oil seals may require lubrication during assembly.
- Components requiring lubrication will be identified in the service procedure.
- When applying sealant to a component, apply the amount specified in the service procedure.
- Do not allow the sealant to enter into any blind threaded holes as it may prevent the bolt from clamping correctly or cause component damage when tightened.
- Only ever tighten bolts to the correct torque specification. Do not over-tighten.

Use of Room Temperature Vulcanising and Anaerobic Sealer

CAUTION

A number of sealant types are commonly used in engines. Examples are; room temperature vulcanising (RTV) sealer, anaerobic gasket eliminator sealer, and anaerobic thread sealant and pipe joint compound. The correct type of sealant and amount must be used in the specified location to prevent oil leaks. Do not interchange the different types of sealers.

Room Temperature Vulcanising Sealer

- Room temperature vulcanising (RTV) sealant hardens when exposed to air. This type of sealer is used where two non-rigid parts (such as the intake manifold and the engine block) are assembled together.
- Do not use RTV sealant in areas where extreme temperatures are experienced. These areas include the exhaust manifold, head gasket, or other surfaces where a gasket eliminator is specified.
- Follow all safety recommendations and directions that are on the container.
- To remove the sealant or the gasket material, refer to Replacing Engine Gaskets.
- Apply RTV to a clean surface. Use a bead size as specified in the service procedure. Run the bead to the inside of any bolt holes. Do not allow the sealer to enter any blind threaded holes, as it may prevent the bolt from clamping correctly or cause damage when the bolt is tightened.
- Assemble components while RTV is still wet (within 3 minutes). Do not wait for RTV to skin over.
- Tighten the bolts to the correct torque specification. Do not over-tighten.

Anaerobic Sealer

- Anaerobic gasket eliminator or thread sealant, hardens in the absence of air. This type sealer is used where two rigid parts (such as castings) are assembled together, where fasteners are subjected to vibration, or where the holes are not blind. When two rigid parts are disassembled and no sealer or gasket is readily noticeable, the parts were probably assembled using a gasket eliminator.
- Follow all safety recommendations and directions that are on the container.
- To remove the sealant or the gasket material, refer to Replacing Engine Gaskets.
- Apply a continuous bead of gasket eliminator to one flange or on the bolt/stud thread. All surfaces must be clean and dry.
- Spread the sealer evenly to achieve a uniform coating on the sealing surface.
- Do not allow the sealer to enter any blind threaded holes as it may prevent the bolt from clamping correctly or cause damage when tightened.

CAUTION

Anaerobic sealed joints that are partially tightened and allowed to cure more than five minutes may result in incorrect shimming and sealing of the joint.

- Tighten the bolts to the correct torque specification. Do not over-tighten.
- After correctly tightening the fasteners, remove the excess sealer from the outside of the joint.

Pipe Joint Compound

- Pipe joint compound is a pliable sealer that does not completely harden. This type of sealer is used where two non-rigid parts (such as pressed steel and machined surfaces) are assembled together.
- Do not use pipe joint compound in areas where extreme temperatures are expected. These areas include the exhaust manifold, head gasket, or other surfaces where gasket eliminator is specified.
- Follow all safety recommendations and directions that are on the container.
- To remove the sealant or the gasket material, refer to Replacing Engine Gaskets.
- Apply the pipe joint compound to a clean surface. Use a bead size or quantity as specified in the procedure. Run the bead to the inside of any bolt holes. Do not allow the sealer to enter any blind threaded holes as it may prevent the bolt from clamping correctly or cause component damage when the bolt is tightened.
- Apply a continuous bead of pipe joint compound to one sealing surface. Sealing surfaces to be resealed must be clean and dry.
- Tighten the bolts to the correct torque specification. Do not over-tighten.

Separating Parts

CAUTION

Many internal engine components will develop specific wear patterns on their friction surfaces. When disassembling the engine, internal components must be separated, marked and organised in a way to ensure reinstallation in their original location and position.

Separate, mark, or organise the following components:

- Piston and the piston pin.
- Piston to the specific cylinder bore.
- Piston rings to the specific piston.
- Connecting rod to the crankshaft journal.
- Connecting rod to the bearing cap.
- Crankshaft main and connecting rod bearings.
- Camshaft and rocker arms.
- Rocker arms and stationary hydraulic lash adjusters to cylinder head location.
- Valve to the valve guide.
- Valve spring and shim to the cylinder head location.
- Engine block main bearing cap location and direction.
- Oil pump drive and driven gears.

Tools and Equipment

Special tools are listed and illustrated throughout this Section with a complete listing at the end, refer to 7 Special Tools. These tools (or their equivalents) are specially designed to quickly and safely accomplish the operations for which they are intended. The use of these special tools will also minimise possible damage to engine components. Some precision measuring tools are required for inspection of certain critical components. A commercially available torque wrench and torque angle wrench, Tool No. EN-7115 are required for the correct tightening of various fasteners.

To correctly service the engine assembly, the following items should be readily available:

- Approved eye protection and safety gloves.

- A clean, well-lit, work area.
- A suitable parts cleaning tank.
- A compressed air supply.
- Trays or storage containers to keep parts and fasteners organised.
- An adequate set of hand tools.
- Approved engine repair stand.
- An approved engine lifting device that will adequately support the weight of the components.

Fasteners

Fasteners are central to the reliable operation of an engine. Whenever any bolt or any other threaded component is removed, allow the engine to cool (inset A) before attempting fastener removal.

Because of the greater thermal expansion of aluminium, bolt threads will change dimension to a greater extent when hot with this material (inset B) when compared to cast iron.

If a bolt or other threaded component is removed before the engine is allowed to cool to at least 50° C, threads could be pulled from the cylinder block or cylinder head.

Do not use impact tools to remove bolts during engine disassembly. While this may be common practice with cast iron engine components, use of these tools is more likely to pull the aluminium threads in the cylinder block or head of this engine.

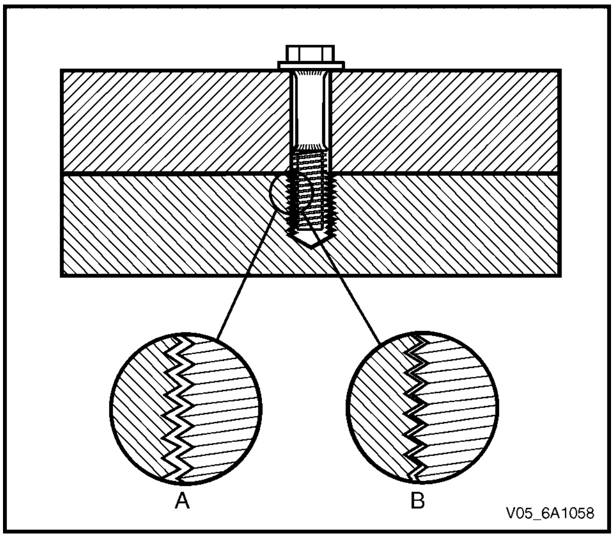

Figure 6A1 – 19

Clamp Load

When torque is applied to a fastener, the fastener stretches and the joint compresses. The force developed in the fastener due to its stretch is called tension (C), while the force applied to the joint is called clamp load (B).

As shown, only a small portion of the applied torque (A) is transferred to the clamp load (inset 1). Friction under the bolt head (inset 3) and in the threads (inset 2) absorbs much of the applied torque (A). Typically, only 10% (inset 1) of the torque is available to develop stretch (or tension) in the fastener and clamp load in the joint.

Therefore, a slight variation in friction in the thread or under the bolt head, results in a wide variation in the clamp load applied to the joint.

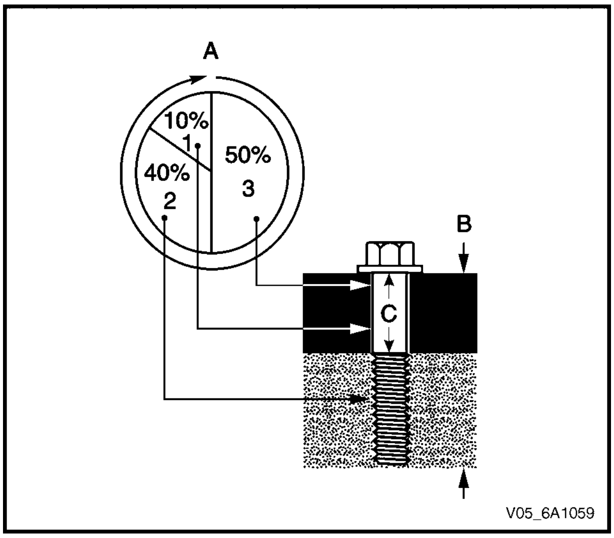

Figure 6A1 – 20

Torque Angle and Torque to Yield Fasteners

The torque angle method of applying torque to a fastener has been developed to overcome the effects of friction variation in fastener applications.

The application of the torque angle method does not always mean the fastener has to be replaced after loosening. It is only when the fastener has been angle tightened to the extent the yield point has been exceeded, that the fastener must be replaced.

Examples are the main bearing caps that are angle tightened but the bolts can be re-used, whereas the M11 cylinder head bolts that are torque to yield fasteners, must be replaced after loosening.

2 Diagnosis

2.1 Engine Diagnosis

Begin engine mechanical system diagnosis by reviewing the disassembled views provided in 1.2 Engine Components and 1.4 Engine Construction. Reviewing the description and operation information provided will assist in determining whether the condition described by the customer is a fault or normal engine operation.

2.2 Symptoms

Strategy Based Diagnosis

1 Review the system operations to familiarise yourself with the system functions, refer to 1 General Information and 6C1-1 Engine Management General Information.

2 Perform an engine management Diagnostic System Check, refer to 6C1-2 Engine Management – V6 – Diagnostics.

All diagnosis on a vehicle should follow a logical process. Strategy based diagnosis is a uniform approach for repairing all vehicle systems. The strategy based diagnostic flow chart may always be used to resolve a system problem. The diagnostic flow chart is the place to start when repairs are required. For a detailed explanation of strategy based diagnosis and the flow chart, refer to 6C1-2 Engine Management – V6 – Diagnostics.

Visual / Physical Inspection

1 Inspect the vehicle for aftermarket accessories which may adversely affect engine operation.

2 Inspect the easily accessible or visible system components for obvious signs of damage or conditions that may cause the symptom.

3 Check the engine lubrication system for the following:

- correct oil level,
- correct lubricant viscosity,
- correct oil filter application, and
- contaminated or burnt oil.

4 Confirm the exact operating conditions under which the fault occurs. Note factors such as:

- engine speed (r.p.m.),
- ambient temperature,
- engine temperature,
- engine warm-up time, and
- vehicle road speed.

5 Compare the engine sounds, if applicable, to a known good engine, and ensure you are not trying to diagnose a normal operating condition.

Intermittent

For intermittent faults, test the vehicle under the same conditions the customer reported in order to confirm whether the system is operating correctly.

2.3 Engine Misfire without Internal Engine Noises

Cause	Correction
Abnormalities, severe cracking, bumps or missing areas in the accessory drive belt. Abnormalities in the accessory drive system and/or components may cause engine speed variations that result in a misfire diagnostic trouble code (DTC). A misfire code may be present without an actual misfire condition.	Replace the accessory drive belt, refer to 3.5Accessory Drive Belt. Refer to 6C1-2 Engine Management – V6 – Diagnostics to check for DTCs.
Worn, damaged or misaligned accessory drive components and excessive pulley run-out may lead to a misfire DTC. A misfire code may be present without an actual misfire condition.	Inspect the components and repair or replace as required. Refer to 6C1-2 Engine Management – V6 – Diagnostics to check for DTCs.
Loose or incorrectly fitted flexplate or crankshaft balancer assembly. A misfire DTC may be present without an actual misfire condition.	Repair or replace the flexplate or crankshaft balancer as required, refer to 3.13 Crankshaft Balancer Assembly or 4.3 Flexplate Assembly. Refer to 6C1-2 Engine Management – V6 – Diagnostics to check for DTCs
Restricted exhaust system. A severe restriction in the exhaust flow can cause significant loss of engine performance and may set a DTC. Possible causes of restrictions in the exhaust system include collapsed/dented pipes and blocked mufflers and/or catalytic converters.	Repair or replace exhaust system components as required, refer to 8B Exhaust System. Refer to 6C1-2 Engine Management – V6 – Diagnostics to check for DTCs
Incorrectly installed or damaged vacuum hoses.	Repair or replace vacuum hoses as required.
Incorrect sealing between the intake manifold and cylinder heads, upper intake manifold and lower intake manifold, throttle body and intake manifold.	Repair or replace the intake manifold, throttle body gaskets, cylinder heads, throttle body as required.
Incorrectly installed or damaged barometric pressure(BARO) sensor and/or seal. The seal should not be torn or damaged.	Repair or replace the BARO sensor and/or seal as required, refer to 6C1-3 Engine Management – V6 – Service Operations.
Incorrectly installed or damaged EVAP purge solenoid and/or O-ring seal.	Repair or replace the EVAP purge solenoid and/or seal as required, refer to 6C1-3 Engine Management – V6 – Service Operations
Worn or loose stationary hydraulic lash adjusters (SHLA) and/or rocker arms. The SHLAs, rocker arms and roller bearings should be intact and in the correct position.	Replace the SHLAs and/or rocker arms as required, refer to 3.21 Stationary Hydraulic Lash Adjuster or 3.20 Rocker Arm.
Stuck valves. Carbon build up on the valve stems can result in the valves not closing correctly.	Repair or replace as required, refer to 3.22 Cylinder Head Assembly.
Excessively worn or misaligned timing chain/s.	Replace the timing chain/s and components as required, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.
Worn camshaft lobes.	Replace the camshaft/s and SHLAs as required, refer to 3.19 Camshaft or 3.21 Stationary Hydraulic Lash Adjuster.
Excessive oil pressure. A lubrication system with excessive oil pressure may lead to excessive lash adjuster pump-up and loss of compression.	1 Perform an oil pressure test, refer to 3.1 Engine Oil. 2 Repair or replace the engine oil pump as required, refer to 3.17Oil Pump Assembly.

Cause	Correction
Faulty cylinder head gasket and/or cracking or other damage to the cylinder head and cylinder block coolant passages. Coolant consumption may or may not cause the engine to overheat.	1 Inspect the spark plugs for coolant saturation, refer to 6C1-3 Engine Management – V6 – Service Operations. 2 Inspect the cylinder heads, cylinder block and/or head gaskets, refer to 3.22Cylinder Head Assembly and/or 4.7Cylinder Block. 3 Repair or replace components as required.
Worn piston rings. Oil consumption may or may not cause the engine to misfire.	1 Inspect the spark plugs for oil deposits, refer to 6C1-3 Engine Management – V6 – Service Operations. 2 Check the cylinders for a loss of compression, refer to 2.15 Engine Compression Test. 3 Perform compression testing to identify the cause of low compression. 4 Repair or replace components as required.
A damaged crankshaft reluctor wheel. A damaged crankshaft reluctor wheel can result in different symptoms depending on the severity and location of the damage. Systems with severe reluctor ring damage may exhibit periodic loss of crankshaft position, stop delivering a signal, and then re-sync the crankshaft position. Systems with slight reluctor ring damage may exhibit no loss of crankshaft position and no misfire may occur, however, a DTC may set.	Replace the crankshaft as required, refer to 4.6 Crankshaft and Main Bearings. Refer to 6C1-2 Engine Management – V6 – Diagnostics to check for DTCs

2.4 Engine Misfire with Abnormal Internal Lower Engine Noises

Cause	Correction
Abnormalities, severe cracking, bumps or missing areas in the accessory drive belt. Abnormalities in the accessory drive system and/or components may cause engine speed variations that result in a misfire diagnostic trouble code (DTC). A misfire code may be present without an actual misfire condition.	Replace the accessory drive belt, refer to 3.5Accessory Drive Belt. Refer to 6C1-2 Engine Management – V6 – Diagnostics to check for DTCs
Worn, damaged or misaligned accessory drive components and excessive pulley run-out may lead to a misfire DTC. A misfire code may be present without an actual misfire condition.	Inspect the components and repair or replace as required. Refer to 6C1-2 Engine Management – V6 – Diagnostics to check for DTCs
Loose or Incorrectly fitted flexplate or crankshaft balancer assembly. A misfire code may be present without an actual misfire condition.	Repair or replace the flexplate or crankshaft balancer as required, refer to 3.13 Crankshaft Balancer Assembly or 4.3 Flexplate Assembly.
Worn or broken piston rings. Oil consumption may or may not cause an actual misfire.	1 Inspect the spark plugs for oil deposits, refer to 6C1-3 Engine Management – V6 – Service Operations. 2 Check the cylinders for a loss of compression, refer to 2.15 Engine Compression Test. 3 Perform compression testing to identify the cause of low compression. 4 Repair or replace components as required.
Worn crankshaft thrust bearing. Severely worn thrust surfaces on the crankshaft and/or thrust bearing may permit fore and aft movement of the crankshaft and create a DTC without an actual misfire condition being present.	Replace the crankshaft and/or bearings as required, refer to 4.6 Crankshaft and Main Bearings. Refer to 6C1-2 Engine Management – V6 – Diagnostics to check for DTCs

Inspection

Before making any adjustments affecting caster, camber or toe-in, the following front end inspection should be made.

1. Inspect the tires for proper inflation pressure. Refer to Main Data and Specifications in Wheel and Tire System section.
2. Make sure that the vehicle is in an unladen condition (With no passengers or loading).
3. Make sure that the spare tire is installed at the normal position.
4. Inspect the front wheel bearings for proper adjustment. Refer to Front Hub and Disc Overhaul in Suspension section.
5. Inspect the ball joints and tie rod ends. If excessive looseness is noted, correct before adjusting. Refer to Steering Linkage in this section.
6. Inspect the wheel and tires for run-out. Refer to Wheel Replacement in Wheel and Tire System section.
7. Inspect the trim height. If not within specifications, the correction must be made before adjusting caster.
8. Inspect the steering unit for looseness at the frame.
9. Inspect shock absorbers for leaks or any noticeable noise. Refer to Shock Absorber in Suspension section.
10. Inspect the control arms or stabilizer bar attachment for looseness. Refer to Suspension section.
11. Inspect the front end alignment using alignment equipment. Follow the manufacturer's instructions.
12. Park the vehicle on a level surface.

2.5 Engine Misfire with Abnormal Valve Train Noise

Cause	Correction
Worn or loose stationary hydraulic lash adjusters (SHLA) and/or valve rocker arms. The SHLAs, rocker arm and roller bearings should be intact and in the correct position.	Replace the SHLAs and/or rocker arms as required, refer to 3.21 Stationary Hydraulic Lash Adjuster or 3.20 Rocker Arm.
Stuck valves. Carbon build up on the valve stems can result in the valves not closing correctly.	Repair or replace as required, refer to 3.22 Cylinder Head Assembly.
Excessively worn or misaligned timing chain/s.	Replace the timing chain/s and components as required, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.
Worn camshaft lobes.	Replace the camshaft/s and SHLAs as required, refer to 3.19 Camshaft or 3.21 Stationary Hydraulic Lash Adjuster.
Sticking camshaft lash adjusters.	Replace the lash adjusters as required, refer to 3.21 Stationary Hydraulic Lash Adjuster.

2.6 Engine Misfire with Coolant Consumption

Cause	Correction
Faulty cylinder head gasket and/or cracking or other damage to the cylinder heads and cylinder block coolant passages. Coolant consumption may or may not cause the engine to overheat.	1 Inspect the spark plugs for coolant saturation, refer to 6C1-3 Engine Management – V6 – Service Operations. 2 Inspect the cylinder heads, cylinder block and/or head gaskets, refer to 3.22Cylinder Head Assembly and/or 4.7Cylinder Block. 3 Repair or replace components as required.

2.7 Engine Misfire with Excessive Oil Consumption

Cause	Correction
Worn valves, valve guides and/or valve stem oil seals.	1 Inspect the spark plugs for coolant saturation, refer to 6C1-3 Engine Management – V6 – Service Operations. 2 Repair or replace components as required, refer to 3.22 Cylinder Head Assembly.
Worn or broken piston rings. Oil consumption may or may not cause an actual misfire.	1 Inspect the spark plugs for oil deposits, refer to 6C1-3 Engine Management – V6 – Service Operations. 2 Check the cylinders for a loss of compression, refer to 2.15 Engine Compression Test. 3 Perform compression testing to identify the cause of low compression. 4 Repair or replace components as required.

2.8 Engine Noise on Start-up, but only Lasting a Few Seconds

NOTE

A cold piston knock, which disappears in approximately 1.5 minutes from start up, should be considered acceptable. A cold engine knock usually disappears when the specific cylinder's secondary ignition circuit is grounded out during diagnosis.

A light rattle/tapping noise may indicate a valve train/upper engine concern, while a low rumble/knocking may indicate a crankshaft, piston or lower engine concern.

Cause	Correction
Oil filter anti-drain back valve faulty.	Replace the oil filter adaptor, refer to 3.3 Oil Filter Adaptor.
Incorrect oil viscosity.	Drain the engine oil and replace with the correct viscosity oil, refer to 3.1 Engine Oil.
High camshaft stationary hydraulic lash adjuster (SHLA) leak down rate.	Replace the SHLA as required, refer to 3.21 Stationary Hydraulic Lash Adjuster.
Worn crankshaft thrust bearing.	Inspect and replace the crankshaft and/or bearings as required, refer to 4.6 Crankshaft and Main Bearings.
Damaged or faulty oil filter by-pass valve.	1 Inspect the oil filter by-pass valve for correct operation. 2 Repair or replace the oil filter adaptor/by-pass valve as required.

BACK TO CHAPTER INDEX
ISUZU KB P190 2007
TO MODEL INDEX

2.9 Upper Engine Noise, Regardless of Engine Speed

NOTE

A cold piston knock, which disappears in approximately 1.5 minutes from start up, should be considered acceptable. A cold engine knock usually disappears when the specific cylinder's secondary ignition circuit is grounded out during diagnosis.

A light rattle/tapping noise may indicate a valve train/upper engine concern, while a low rumble/knocking may indicate a crankshaft, piston or lower engine concern.

Cause	Correction
Low oil pressure.	1 Perform an oil pressure test, refer to 2.19 Engine Oil Pressure Diagnosis. 2 Repair or replace the engine oil pump as required, refer to 3.17 Oil Pump Assembly.
Worn or loose stationary hydraulic lash adjusters (SHLA) and/or valve rocker arms. The SHLAs, rocker arm and roller bearings should be intact and in the correct position.	1 Clean, inspect and replace the camshaft lash adjusters as required, refer to 3.21 Stationary Hydraulic Lash Adjuster. 2 Replace the SHLAs and/or rocker arms as required, refer to 3.21 Stationary Hydraulic Lash Adjuster or 3.20 Rocker Arm.
Incorrect lubrication to the stationary hydraulic lash adjusters and valve rocker arm.	Inspect the following components and repair or replace as required: • valve rocker arms, refer to 3.20 Rocker Arm. • stationary hydraulic lash adjusters, refer to 3.21 Stationary Hydraulic Lash Adjuster. • oil filter by-pass valve, refer to 3.3 Oil Filter Adaptor. • oil pump and suction pipe, refer to 3.17 Oil Pump Assembly. • cylinder head oil galleries, refer to 3.22 Cylinder Head Assembly. • cylinder block oil galleries, refer to 4.7 Cylinder Block.
Broken Valve Spring.	Replace the valve spring, refer to 3.22 Cylinder Head Assembly.
Stretched or broken timing chain/s and/or damaged timing chain sprocket teeth.	Replace the timing chains or sprockets as required, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.
Worn or faulty timing chain tensioner or guide.	Replace the timing chains or sprockets as required, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.
Worn camshaft lobes.	Replace the camshaft/s and SHLAs as required, refer to 3.19 Camshaft or 3.21 Stationary Hydraulic Lash Adjuster.
Worn valve guides and/or valve stems.	Inspect and repair or replace valves and valve guides as required, refer to 3.22 Cylinder Head Assembly.
Stuck valves. Carbon on the valve stem or valve seat may cause the valve to stay open.	Inspect and repair or replace valves and valve guides as required, refer to 3.22 Cylinder Head Assembly.

2.10 Lower Engine Noise, Regardless of Engine Speed

NOTE

A cold piston knock which disappears in approximately 1.5 minutes from start up should be considered acceptable. A cold engine knock usually disappears when the specific cylinder's secondary ignition circuit is grounded out during diagnosis.

A light rattle/tapping noise may indicate a valve train/upper engine concern, while a low rumble/knocking may indicate a crankshaft, piston or lower engine concern.

Cause	Correction
Low oil pressure.	1 Perform an oil pressure test, refer to 2.19 Engine Oil Pressure Diagnosis. 2 Repair or replace the engine oil pump as required, refer to 3.17Oil Pump Assembly.
Worn accessory drive components. Abnormalities such as severe cracking, bumps, stretching or missing areas on an accessory drive belt and/or misalignment of accessory drive system components.	Inspect the accessory drive system, repair or replace components as required, refer to 3.5 Accessory Drive Belt.
Loose or damaged crankshaft balancer and pulley assembly.	Repair or replace the crankshaft balancer and pulley assembly as required, refer to 3.13 Crankshaft Balancer Assembly.
Detonation or spark knock.	Confirm the correct operation of the ignition system, refer to 6C1-2 Engine Management – V6 – Diagnostics.
Loose torque converter bolts.	Inspect and tighten the torque converter bolts to the correct torque specification, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing.
Loose or damaged flexplate.	Repair or replace the flexplate as required, refer to 4.3 Flexplate Assembly.
Oil pump suction pipe loose, damaged or restricted.	Clean, inspect and repair/replace the oil pump suction pipe as required, refer to 4.2 Oil Pan and Oil Pump Suction Pipe Assembly.
Excessive piston-to-cylinder bore clearance.	Inspect the piston and cylinder bore and repair/replace components as required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings and 4.7 Cylinder Block.
Excessive connecting rod bearing clearance.	Inspect the connecting rod, crankshaft and bearings and repair/replace components as required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings and 4.6 Crankshaft and Main Bearings.
Excessive piston pin to bore clearance.	Inspect the pistons and pins and repair/replace components as required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings.
Excessive crankshaft main bearing clearance.	Inspect the crankshaft, cylinder block journals, main bearings and main bearing caps and repair/replace components as required, refer to 4.6 Crankshaft and Main Bearings and 4.7Cylinder Block.
Incorrect piston, pin and connecting rod installation. Pistons must be installed with the mark or dimple facing the front of the engine. Piston pins must be centred in the piston pin bore.	Confirm the pistons, pins and connecting rods are installed correctly and repair if required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings.

2.11 Engine Noise Under Load

NOTE

A cold piston knock which disappears in approximately 1.5 minutes from start up, should be considered acceptable. A cold engine knock usually disappears when the specific cylinder's secondary ignition circuit is grounded out during diagnosis.

A light rattle/tapping noise may indicate a valve train/upper engine concern, while a low rumble/knocking may indicate a crankshaft, piston or lower engine concern.

Cause	Correction
Low oil pressure.	1 Perform an oil pressure test, refer to 2.19 Engine Oil Pressure Diagnosis. 2 Repair or replace the engine oil pump as required, refer to 3.17Oil Pump Assembly.
Detonation or spark knock.	Confirm the correct operation of the ignition system, refer to 6C1-2 Engine Management – V6 – Diagnostics.
Loose torque converter bolts.	Inspect and tighten the torque converter bolts to the correct torque specification, refer to 7C1 Automatic – 4L60E – General Information – 4L60E – General Information.
Cracked flexplate.	Replace the flywheel/flex-plate as required, refer to 4.3 Flexplate Assembly.
Excessive connecting rod bearing clearance.	Inspect the connecting rod, crankshaft and bearings and repair/replace components as required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings and 4.6 Crankshaft and Main Bearings.
Excessive crankshaft bearing clearance	Inspect the crankshaft, cylinder block journals, main bearings and main bearing caps and repair/replace components as required, refer to 4.6 Crankshaft and Main Bearings and 4.7Cylinder Block.

2.12 Engine Will Not Crank – Crankshaft Will Not Rotate

Cause	Correction
Seized accessory drive system component.	1 Remove the accessory drive belt, refer to 3.5 Accessory Drive Belt. 2 Rotate the crankshaft by hand at the balancer pulley or flywheel. 3 Repair or replace accessory drive system components as required.
Hydraulically locked cylinder caused by: • coolant in cylinder, • oil in cylinder, or • fuel in cylinder.	1 Remove the spark plugs and check for fluid, refer to 6C1-3 Engine Management – V6 – Service Operations. 2 Inspect for broken head gasket/s. 3 Inspect for cracked engine block or cylinder head. 4 Inspect for sticking fuel injector. 5 Repair or replace components as required.
Seized torque converter.	1 Remove the torque converter bolts, refer to 7C1 Automatic – 4L60E – General Information – 4L60E – General Information. 2 Rotate the crankshaft by hand at the balancer pulley or flywheel. 3 Repair or replace torque converter as required.

Cause	Correction
Material in cylinder bore, caused by: • broken valve, • broken piston or ring, or • dirt or foreign matter entry during engine assembly procedure.	1 Clean and inspect the cylinder for damaged components and or foreign matter, refer to 4.7 Cylinder Block. 2 Repair or replace components as required.
Seized crankshaft or connecting rod bearings.	Inspect and repair or replace crankshaft, connecting rod and bearings as required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings and 4.6 Crankshaft and Main Bearings.
Bent or broken connecting rod.	Inspect and repair or replace connecting rod and bearings as required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings.
Bent or broken crankshaft.	Inspect and repair or replace crankshaft and bearings as required, refer to 4.6 Crankshaft and Main Bearings.
Seized or broken camshaft.	1 Inspect and replace camshafts as required, refer to 3.19 Camshaft. 2 Inspect camshaft journals and cam caps on cylinder head and repair or replace components as required, refer to 3.22 Cylinder Head Assembly.
Seized or broken camshaft timing components.	1 Inspect the crankshaft, idler, intake camshaft and exhaust camshaft sprockets. 2 Inspect the timing chains. 3 Inspect the guides. 4 Inspect the tensioners. 5 Repair or replace components as required, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.
Seized or broken valve train components.	1 Inspect the stationary hydraulic lash adjusters, refer to 3.21 Stationary Hydraulic Lash Adjuster. 2 Inspect the rocker arms, refer to 3.20 Rocker Arm. 3 Inspect the Valves Refer to 3.22 Cylinder Head Assembly. 4 Inspect the valve springs, refer to 3.22 Cylinder Head Assembly. 5 Repair or replace components as required.

2.13 Coolant in Combustion Chamber

Definition

Excessive white smoke and/or coolant type odour emitted from the exhaust pipe may indicate coolant in the combustion chamber. Low coolant levels, an inoperative engine cooling fan or a faulty thermostat may lead to an over-temperature condition which may cause internal engine component damage. A slower than normal cranking speed may indicate coolant entering the combustion chamber.

1 Remove the spark plugs and inspect for spark plugs saturated by coolant and coolant in the cylinder bore.

2 Inspect by performing a cylinder leakage test, refer to 2.16 Cylinder Leakage Test. During this test, excessive air bubbles in the coolant may indicate a faulty head gasket, cracked cylinder head or cracked cylinder block.

3 Inspect by performing a cylinder compression test. Two cylinders side-by-side on the cylinder block, with low compression, may indicate a failed cylinder head gasket, refer to 2.15 Engine Compression Test.

Cause	Correction
Cracked intake manifold or faulty gasket.	Replace components as required, refer to 3.10 Intake Manifold Assembly – Complete.
Faulty cylinder head gasket.	Replace the cylinder head gasket, refer to 3.22 Cylinder Head Assembly.
Warped cylinder head.	Repair or replace the cylinder heads as required, refer to 3.22 Cylinder Head Assembly.
Cracked cylinder liner or block	Repair or replace the cylinder block and components as required, refer to 4.7 Cylinder Block.
Cylinder head or cylinder block porosity.	Repair or replace the cylinder block or cylinder heads as required, refer to 4.7 Cylinder Block or 3.22 Cylinder Head Assembly.

2.14 Coolant in Engine Oil

Definition

Foamy or discoloured oil or an engine oil overfill condition may indicate coolant entering the engine crankcase. Low coolant levels, an inoperative engine cooling fan or a faulty thermostat may lead to an over-temperature condition which may result in engine component damage. Contaminated engine oil and oil filters must be replaced.

1 Inspect the oil for excessive foaming or an overfill condition. Oil diluted by coolant may not correctly lubricate the crankshaft bearings, resulting in component damage, refer to 2.10Lower Engine Noise, Regardless of Engine Speed.

2 Perform a cylinder leakage test, refer to 2.16 Cylinder Leakage Test. During this procedure, excessive air bubbles in the engine coolant may indicate a faulty gasket or damaged component.

3 Perform a cylinder compression test. Two cylinders side-by-side on the cylinder block, with low compression, may indicate a failed cylinder head gasket, refer to 2.15 Engine Compression Test.

Cause	Correction
Faulty cylinder head gasket.	Replace the cylinder head gasket, refer to 3.22 Cylinder Head Assembly.
Warped cylinder head.	Repair or replace the cylinder heads as required, refer to 3.22 Cylinder Head Assembly.
Cracked cylinder liner or block	Repair or replace the cylinder block and components as required, refer to 4.7 Cylinder Block.
Cylinder head, cylinder block or intake manifold porosity.	Repair or replace the cylinder block, cylinder heads or intake manifold components as required, refer to 4.7 Cylinder Block, 3.22 Cylinder Head Assembly or 3.10 Intake Manifold Assembly – Complete.

2.15 Engine Compression Test

A compression pressure test of the engine cylinders determines the condition of the rings, the valves and the head gasket.

Preliminary Steps

1 Ensure the battery is fully charged.

2 Remove the spark plugs from all cylinders, refer to 6C1-3 Engine Management – V6 – Service Operations.

NOTE

DTCs will set when the fuel system or the ignition system is disabled and the engine is cranked. Disregard DTCs that set under this condition.

3 Disable the fuel system by removing the fuel pump relay, refer to 8A Electrical Body & Chassis.

4 Start the engine to use any residual fuel from the fuel lines.

4 Disable the ignition coils by removing fuses 34 and 35, refer to 8A Electrical Body & Chassis .

5 Using Tech 2, command the throttle plate to wide open throttle.

Engine Cylinder Compression Test

1 Install the compression tester to cylinder number 1.

2 While observing the compression tester reading, turn the ignition to the START position for several seconds and then allow the ignition to return to the ON position.

3 Record the highest compression reading obtained.

4 Repeat the engine compression test for each cylinder.

Test Result Evaluation

Normal engine compression pressure builds quickly and evenly to over 965 kPa. In addition, the lowest reading of an engine cylinder should not be less than 70 percent of the highest reading. If any cylinder fails the compression test, adding 15 ml of engine oil to the suspected cylinder may help isolate the following fault condition.

1 A fault condition in the piston rings will produce the following result:

- A low compression on the first engine cycle
- The compression tends to build-up with the succeeding engine rotation.
- The compression improves with the addition of engine oil.

2 A fault condition in an intake or exhaust valve will produce the following result:

- A low compression on the first engine cycle
- The compression does not build with the succeeding engine rotation.
- The compression does not improve with the addition of engine oil.

3 A fault condition in the cylinder head gasket will produce the following result:

- A low compression on the first engine cycle
- The compression does not build with the succeeding engine rotation.
- The compression does not improve with the addition of engine oil.
- The suspected cylinders are positioned adjacent to each other.
- The engine oil may be contaminated with engine coolant.
- The engine coolant may be contaminated with engine oil.

Once the fault has been identified, refer to the relevant service procedure and reinstall the removed components.

Using Tech 2, clear DTCs.

2.16 Cylinder Leakage Test

A leakage test may be performed to measure cylinder/combustion chamber leakage. High cylinder leakage may indicate one or more of the following:

- worn or burnt valves,
- broken valve springs,
- stuck valve lifters,
- incorrect valve lash/adjustment,
- damaged piston,
- worn piston rings,
- worn or scored cylinder bore,
- damaged cylinder head gasket,
- cracked or damaged cylinder head, or
- cracked or damaged engine block.

1 Disconnect the battery ground negative cable.
2 Remove the spark plugs from all cylinders, refer to 6C1-3 Engine Management – V6 – Service Operations.
3 Rotate the crankshaft to place the piston in the cylinder being tested at top dead centre (TDC) of the compression stroke.
4 Install a commercially available cylinder head leak down tester into the spark plug hole.

NOTE

If required, hold the crankshaft balancer bolt to prevent the engine from rotating.

5 Apply shop air pressure to the cylinder head leak down tester and adjust according to the manufacturers instructions.
6 Record the cylinder leakage value. Cylinder leakage that exceeds 25 percent is considered excessive and may require component service. In excessive leakage situations, inspect for the following conditions:
   - air leakage sounds at the throttle body or air inlet duct that may indicate a worn or burnt intake valve or a broken valve spring,
   - air leakage sounds at the exhaust system tailpipe that may indicate a worn or burnt exhaust valve or a broken valve spring,
   - air leakage sounds from the crankcase, oil level indicator tube, or oil fill tube that may indicate worn piston rings, a damaged piston, a worn or scored cylinder bore, a damaged engine block or a damaged cylinder head, or
   - air bubbles in the cooling system may indicate a damaged cylinder head or a damaged cylinder head gasket.
7 Perform the leakage test on the remaining cylinders and record the values.

2.17 Engine Oil Consumption Diagnosis

Definition

Excessive oil consumption (not due to leaks) is the use of 3 litres or more of engine oil within 10,000 kilometres. Prior to performing oil pressure testing, a preliminary inspection of the vehicle should be performed. During the preliminary visual inspection, the following likely causes of excessive oil usage should be investigated.

Cause	Correction
External oil leaks.	Refer to 2.18 Engine Oil Leak Diagnosis.
Incorrect oil level or reading of the oil level indicator.	Check for the correct oil level, refer to 3.1 Engine Oil.
Incorrect oil viscosity.	Replace the engine oil, using the recommended SAE grade of engine oil, refer to 3.1 Engine Oil.
Continuous high-speed driving or severe usage.	Service vehicle more frequently, refer to 0B Lubrication and Service.
Crankcase ventilation system restricted or malfunctioning.	Repair or replace crankcase ventilation system components as required, refer to 6C1-3 Engine Management – V6 – Service Operations.

Cause	Correction
Worn valve guides and or valve stems.	Inspect and repair valves and valve guides as required, refer to 3.22 Cylinder Head Assembly.
Worn or damaged valve stem oil seal.	Replace valve stem oil seals as required, refer to 3.22 Cylinder Head Assembly.
Piston rings broken, worn or not seated correctly.	Allowing adequate time for the piston rings to seat correctly, replace piston rings as required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings.
Piston rings incorrectly installed or not matched to cylinder bore oversize.	Replace piston rings as required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings.

2.18 Engine Oil Leak Diagnosis

Introduction

It is important to correctly identify the source of an engine oil leak. For example, a power steering fluid leak or spillage during servicing can travel across the valley area of the engine and run-out the weep hole, which is located at the back of the cylinder block. Failure to correctly identify the source of an engine oil leak can lead to unnecessary replacement of engine components.

Most fluid leaks can be repaired by repairing or replacing the faulty component or resealing the gasket surface. However, once a leak is identified it is important to determine and repair the cause as well as the leak itself.

Locating and Identifying the Leak

Inspect the leaking fluid and determine whether it is engine oil, transmission fluid, power steering fluid, brake fluid or some other fluid. If unsure of the source of the leaking lubricant, a quick check of fluid levels should indicate where the fluid is coming from, as one or more fluid level should be low.

Visual Inspection

Once the type of leaking fluid has been determined, a visual inspection of the affected system should be performed. When performing the visual inspection:

1 Bring the vehicle to the normal operating temperature.
2 Park the vehicle over a large sheet of paper or other clean surface.
3 Leave the vehicle idling for 2-3 minutes, then check for dripping fluid.
4 If required, identify the type of fluid leaking and the approximate location of the leak.
5 Visually inspect the suspected area. A small mirror may assist viewing areas that are difficult to see normally.
6 Check for leaks at all sealing surfaces and fittings.
7 Check for any cracked or damaged components.
8 If the leak cannot be located, completely clean the entire engine and surrounding components, drive the vehicle at normal operating temperature for several kilometres and then repeat Steps 3 to 8.
9 If the leak still cannot be located, proceed with either the Powder Method or Black Light and Dye Method as outlined below.

Powder Method

1 Completely clean the entire engine and surrounding components.
2 Apply an aerosol type powder (e.g. foot powder) to the suspected area.
3 Operate the vehicle at normal operating temperature and at varying speeds for several kilometres.
4 Identify the source of the leak from the discoloration of the powder around the suspect components.
5 If required, use a small mirror to assist in viewing areas that are difficult to see normally.
6 Refer to Possible Causes for Engine Oil Leaks in this Section, and repair or replace components as required.

Black Light and Dye Method

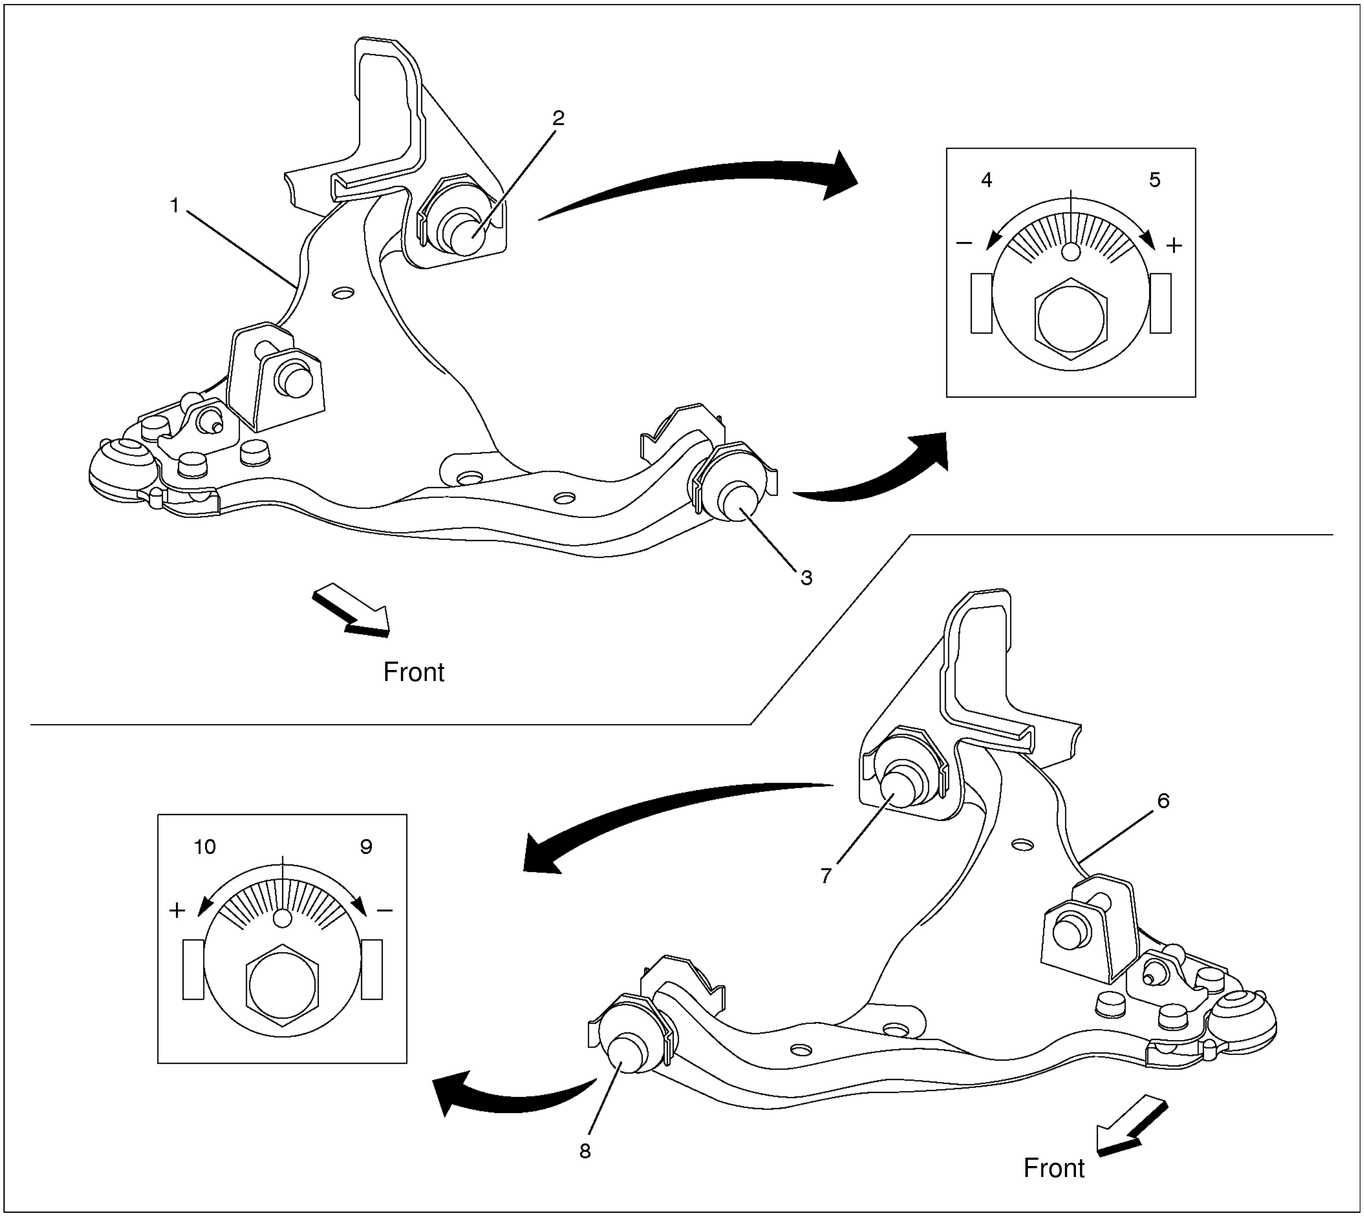
A black light and die kit Tool No. J28428-E or a commercially available equivalent is available to technicians to aid in engine oil leak diagnosis. When using a black light and die kit for the first time, it is recommended the technician read the manufacturers instructions prior to using the kit.

1 Add the specified amount of dye, as per manufacturers instructions, into the engine or suspected source of the oil leak.
2 Operate the vehicle at normal operating temperature and at varying speeds for several kilometres.

Alignment for 4×2 (except High Ride Suspension)

Caster and camber adjustment

The lower links of the 4 X2 vehicle front suspension have an adjusting cam at either end (front and rear). This permits simultaneous adjustment of camber and caster angle.



RTW340LF000301

Legend

1. Lower link ASM RH
2. Adjusting cam RR
3. Adjusting cam FRT
4. -direction The lower link ASM moves toward the inside
5. +direction The lower link ASM moves toward the outside
6. Lower link ASM LH
7. Adjusting cam RR
8. Adjusting cam FRT
9. -direction The lower link ASM moves toward the inside
10. +direction The lower link ASM moves toward the outside

3 With the vehicle parked on a flat level surface, aim the black light at the suspected component/s. The dyed fluid will appear as a yellow path leading to the oil leak source

4 Refer to Possible Causes for Engine Oil Leaks in this Section, and repair or replace components as required.

Possible Causes for Engine Oil Leaks

Common possible causes for engine oil leaks are:

- higher than recommended fluid levels,
- higher than recommended fluid pressures,
- blocked or faulty fluid filters or pressure relief valve,
- blocked or faulty engine ventilation system,
- incorrectly tightened or damaged fasteners,
- cracked or porous components,
- incorrect gaskets or sealants used,
- incorrect gaskets or sealant installation,
- damaged or worn gaskets or seals, and
- damaged or worn sealing surfaces.

2.19 Engine Oil Pressure Diagnosis

If the engine oil pressure is below the specified value, inspect the engine and components for the following:

- loose oil filter adaptor bolts,
- faulty oil filter adaptor seals,
- worn or faulty oil pump,
- loose oil pump bolts,
- loose, blocked or damaged oil pump suction pipe,
- faulty oil pump suction pipe seal,
- faulty oil pump pressure relief valve,
- faulty or incorrectly installed oil gallery plugs,
- excessive bearing clearance in one of the following:
- connecting rods big end/s,
- crankshaft main journal/s,
- camshaft/s,
- camshaft sprocket/s, and
- cracked, porous or restricted oil galleries, or broken lash adjuster/s.

2.20 Accessory Drive Belt Diagnosis

Tension Check

NOTE

An accessory drive belt that squeaks when the engine is started or stopped is considered normal and has no effect on drive belt durability.

1 Start the engine and switch off the air-conditioning system. Allow engine to run until normal operating temperature has been reached.

2 Turn the engine off and inspect the markings on the drive belt tensioner to confirm the drive belt tension is within the operating limits.

3 If the markings on the drive belt tensioner were outside the acceptable operating limits, replace the accessory drive belt, refer to 3.5 Accessory Drive Belt.

NOTE

The operating limits for acceptable drive belt tension are when the drive belt tensioner pointer (1) is aligned between the outer edge of the minimum and maximum tension marks (2).

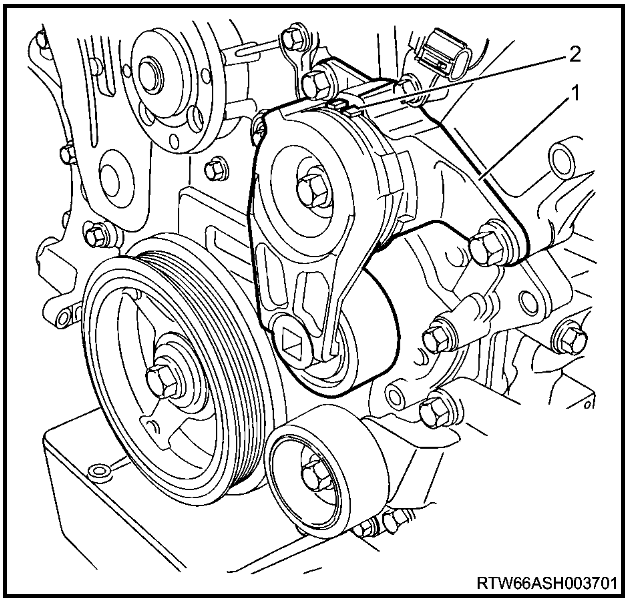


Figure 6A1 – 21

Inspect

Figure 6A1 – 22 illustrates the various stages of belt wear to aid in belt replacement decisions. Condition of the belt ribs is best judged where the belt is bent over one of the larger accessory drive system pulleys.

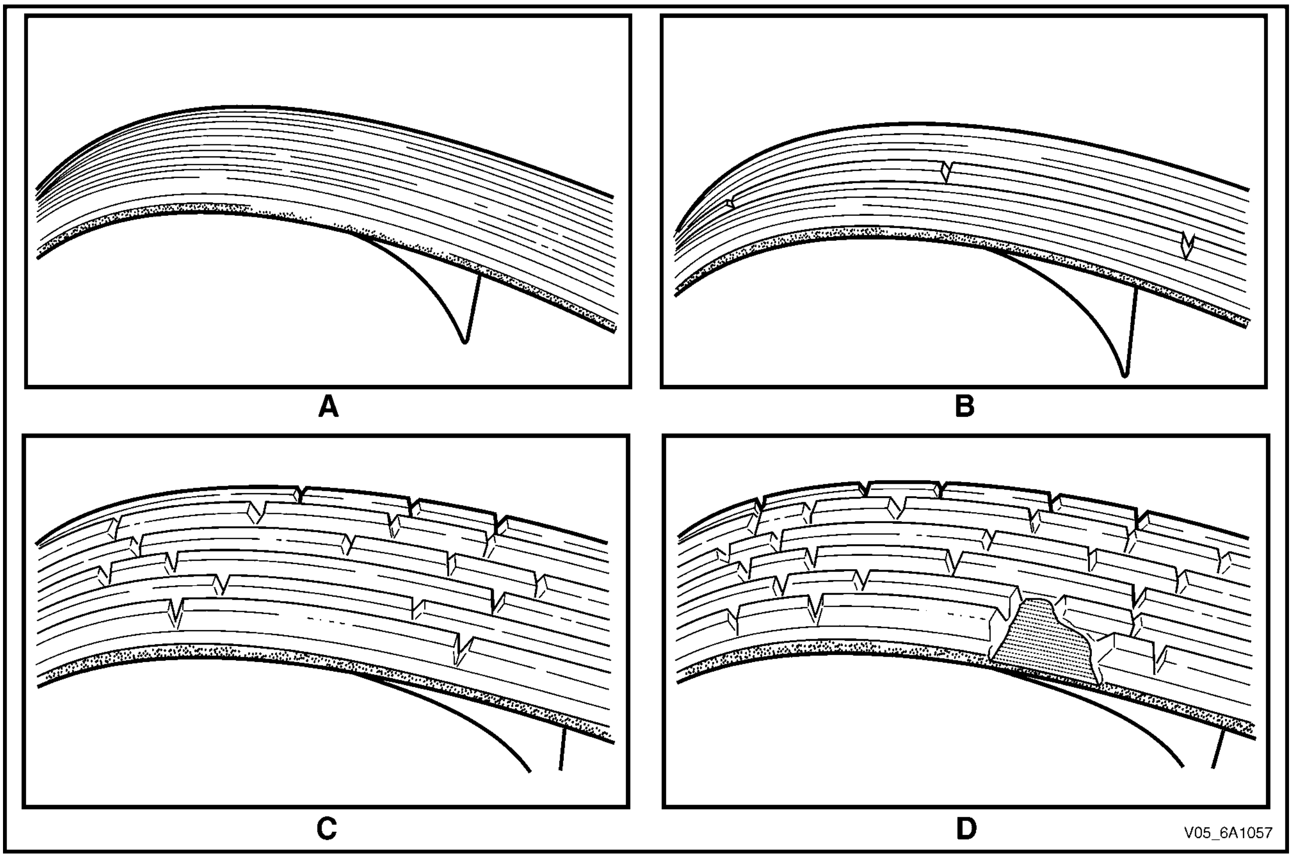

Figure 6A1 – 22

Legend

A New belt

B Moderately used belt – few cracks, some wear on ribs and in grooves. replacement is not required

C Severely used belt – several cracks per 30 mm. Should be replaced before chunking occurs.

D Failed belt – separation of rib material from the backing (chunking). Replace belt immediately.

Drive Belt Chirp

Definition

Accessory drive belt chirping can be defined as a high-pitched noise that is heard once per revolution of the drive belt or a pulley.

NOTE

Chirping during start-up in cold damp conditions that abates once the engine reaches operating temperature is considered normal.

Diagnostic Aids

The symptom may be intermittent due to moisture on the drive belts or pulleys. It may be necessary to spray a small amount of water on the drive belt to duplicate and confirm a customers concern. If spraying water onto the drive belt system duplicates the symptom, cleaning the belt pulleys may be the solution.

A loose or incorrectly installed body component, suspension component or other item may be the cause of the noise.

Test Description

The numbers below refer to steps in the diagnostic table.

2 The noise may not be engine related. This step is to confirm the engine is making the noise. If the engine is not making the noise, do not proceed further with this diagnostic procedure.

3 The noise may be an internal engine noise. Removing the drive belt and operating the engine briefly will confirm whether or not the noise is related to the drive belt.

CAUTION

When running the engine with the accessory drive belt removed, the coolant pump will not be operating and the engine may overheat if left unsupervised even for a short period.

NOTE

There may also be a number of DTCs set when running the engine with the accessory drive belt removed.

4 Inspect all drive pump pulleys for pilling.

NOTE

Pilling is the small balls (pills) or strings of rubber in the belt grooves caused by the accumulation of rubber dust.

6 Misalignment of the accessory drive system pulleys may be caused by incorrect mounting of an accessory drive component (A/C compressor, generator etc.) or pulley. Misalignment may also be caused by incorrect installation of a pulley during a previous repair. Test for a misaligned pulley using a straight edge in the pulley grooves across two or three pulleys. If a misaligned pulley is found, refer to the relevant component service information for the correct installation and removal procedures.

10 Inspecting the fasteners can eliminate the possibility that an incorrect fastener has been installed.

12 Inspecting the pulleys for being bent should include inspecting for a dent or other damage that would prevent the drive belt from not seating correctly in all of the pulley grooves or on the smooth surface when the back end of the belt is used as the driving surface.

14 Replacing the drive belt when it is not damaged and there is no excessive pilling will only be a temporary repair.

Diagnostic Table

Step	Action	Yes	No
1	Did you review the information provided in 2.2 Symptoms, and perform the required inspections.	Go to Step 2	Go to 2.2 Symptoms
2	Confirm the customer complaint. Is there a chirping noise?	Go to Step 3	Refer to Diagnostic Aids in this Section
3	1 Remove the drive belt, refer to 3.5 Accessory Drive Belt. 2 Operate the engine for no more than 40 seconds. Does the chirping noise still exist?	Accessory drive system OK. Go to 2.2 Symptoms, and restart the diagnosis of the noise	Go to Step 4
4	Inspect for severe pilling, i.e. in excess of 33% of the belt groove depth. Do the belt grooves have pilling?	Go to Step 5	Go to Step 6
5	Clean the drive belt pulleys with a wire brush. Are the belt pulleys clean?	Go to Step 15	Go to Step 6
6	Inspect for misalignment of the pulleys. Are the pulleys misaligned?	Go to Step 7	Go to Step 8
7	Replace or repair misaligned pulleys. Did you complete the repair?	Go to Step 15	—
8	Inspect for any bent or damaged accessory drive component mounting brackets. Did you find any bent or damaged brackets?	Go to Step 9	Go to Step 10
9	Replace or repair any bent or damaged Brackets. Did you complete the repairs?	Go to Step 15	—

Step	Action	Yes	No
10	Inspect for missing, loose or incorrect fasteners. Did you find any missing, loose or incorrect fasteners?	Go to Step 11	Go to Step 12
11	Tighten any loose fasteners to the torque specification as provided in provided in 6. Torque Wrench Specifications. Replace any incorrect or missing fasteners. Did you complete the repairs?	Go to Step 15	—
12	Inspect for a bent pulley. Did you find any bent pulleys?	Go to Step 13	Go to Step 14
13	Replace bent pulleys as required. Did you complete the repair?	Go to Step 15	—
14	Replace the accessory drive belt, refer to 3.5Accessory Drive Belt. Did you complete the repair?	Go to Step 15	—
15	Reinstall the accessory drive belt and operate the system to confirm the repair. Did you correct the chirp noise?	Accessory drive system OK	Go to 2.2 Symptoms, and restart the diagnosis

Drive Belt Squeal

Definition

Accessory drive belt squealing can be defined as a loud screeching noise caused by a slipping drive belt. Belt squeal is unusual in multi-rib belts. Drive belt squeal generally occurs when a heavy load is applied to the drive belt, such as an air-conditioning compressor engagement, snapping the throttle, seized pulley or a faulty accessory drive component.

Diagnostic Aids

If the noise is intermittent, confirm the accessory drive components by varying their loads, making sure they are operated to their maximum capacity. An overcharged A/C system, restrictions in the power steering pressure circuit or a faulty generator or coolant pump are likely causes of accessory drive belt squeal.

A loose or incorrectly installed body component, suspension component or other item may be the cause of the noise.

Test Description

The numbers below refer to steps in the diagnostic table.

2 The noise may not be engine related. This step is to confirm the engine is making the noise. If the engine is not making the noise, do not proceed further with this diagnostic procedure.

3 The noise may be an internal engine noise. Removing the drive belt and operating the engine briefly will confirm whether or not the noise is related to the drive belt.

CAUTION

When running the engine with the accessory drive belt removed, the coolant pump will not be operating and the engine may overheat if left unsupervised even for a short period.

NOTE

There may also be a number of DTCs set when running the engine with the accessory drive belt removed.

4 Confirms an accessory drive component does not have a seized bearing. With the belt removed, test the bearings in the accessory drive components spin free and smooth.

5 Confirms the drive belt tensioner is operating correctly. If the drive belt tensioner is not operating correctly, drive belt tension will not be maintained, resulting in a belt squealing noise

6 Confirms the belt is not too long, which would prevent the tensioner from working as intended. Also, if an excessively long belt has been fitted, it may also be routed incorrectly and may be turning an accessory drive component in the wrong direction.

7 Misalignment of the pulleys may be caused by one of the following:

- Incorrect mounting of an accessory drive component,
- Incorrect installation of an accessory drive pulley or,
- Bent or damaged pulley.

Test for a misaligned pulley using a straight edge in the pulley grooves across 2 or 3 pulleys. If a misaligned pulley is found, refer to the relevant component service information for the correct installation and removal procedures.

8 This test is to confirm the pulleys are the correct diameter and/or width. Using a known good vehicle, compare the pulley sizes.

Diagnostic Table

Step	Action	Yes	No
1	Did you review the information provided in 2.2 Symptoms, and perform the required inspections.	Go to Step 2	Go to 2.2 Symptoms
2	Confirm the customer complaint. Is there a squealing noise?	Go to Step 3	Refer to Diagnostic Aids in this Section
3	1 Remove the drive belt, refer to 3.5 Accessory Drive Belt. 2 Operate the engine for no more than 40 seconds. Does the squealing noise still exist?	Accessory drive system OK. Go to 2.2 Symptoms, and restart the diagnosis of the noise	Go to Step 4
4	Inspect the accessory drive components for a seized bearing and general malfunctions. Did you find and correct any seized bearings or general malfunctions in the accessory drive system?	Go to Step 9	Go to Step 5
5	Test the accessory drive belt tensioner for correct operation, refer to Accessory Drive Belt Tensioner Diagnosis. Did you find and repair any problems with the tensioner?	Go to Step 9	Go to Step 6
6	Inspect the accessory drive belt is the correct length, refer to 3.5 Accessory Drive Belt. Did you find and repair any problems with the drive belt length?	Go to Step 9	Go to Step 7
7	Inspect the accessory drive pulleys for misalignment. Did you find and correct any misaligned accessory drive pulleys?	Go to Step 9	Go to Step 8
8	Check the accessory drive pulleys are the correct size. Did you find and replace any incorrect pulleys?	Go to Step 9	Refer to Diagnostic Aids in this Section
9	Reinstall the accessory drive belt and operate the system to confirm the repair. Did you correct the squeal noise?	Accessory drive system OK	Go to 2.2 Symptoms, and restart the diagnosis

Drive Belt Whine

Definition

Accessory drive belt whine can be defined as a high-pitched continuous noise that is most likely to be caused by a failed bearing in one of the accessory drive components.

Diagnostic Aids

The drive belts themselves will not cause a whine. If the noise is intermittent, confirm the accessory drive components by varying their loads, making sure they are operated to their maximum capacity. An overcharged A/C system, restrictions in the power steering pressure circuit or a faulty generator or coolant pump are likely causes of accessory drive belt whine.

Test Description

The numbers below refer to steps in the diagnostic table.

3 The noise may be an internal engine noise. Removing the drive belt and operating the engine briefly will confirm whether or not the noise is related to the drive belt.

CAUTION

When running the engine with the accessory drive belt removed, the coolant pump will not be operating and the engine may overheat if left unsupervised even for a short period.

NOTE

There may also be a number of DTCs set when running the engine with the accessory drive belt removed.

4 The inspection of bearings should include the following accessory drive components:

- drive belt tensioners,
- drive belt idlers,
- generator,
- power steering pump,
- coolant pump, and
- A/C compressor.

The drive belt may need to be installed and the accessory drive components operated separately, at varying loads to confirm the location of the faulty bearing, refer to the relevant Sections for component inspection and repair procedures.

Diagnostic Table

Step	Action	Yes	No
1	Did you review the information provided in 2.2 Symptoms, and perform the required inspections.	Go to Step 2	Go to 2.2 Symptoms
2	Confirm the customer complaint. Is there a whining noise?	Go to Step 3	Refer to Diagnostic Aids in this Section
3	1 Remove the drive belt, refer to 3.5 Accessory Drive Belt. 2 Operate the engine for no more than 40 seconds. Does the whining noise still exist?	Accessory drive system OK Go to 2.2 Symptoms, and restart the diagnosis	Go to Step 4
4	Inspect the accessory drive components for a faulty or seized bearings and general malfunctions. Did you find and correct any faulty/seized bearings or general malfunctions in the accessory drive system?	Go to Step 5	Refer to Diagnostic Aids in this Section
5	Reinstall the accessory drive belt and operate the system to confirm the repair. Did you correct the whine?	Accessory drive system OK	Go to 2.2 Symptoms, and restart the diagnosis

Drive Belt Rumble

Definition

Accessory drive belt rumble can be defined as a low pitch tapping, knocking or thumping noise heard at or just above idle, once per rotation of the drive belt or a specific component. Drive belt rumble is generally caused by one of the following:

- pilling or strings in the drive belt grooves,
- separation of the drive belt, or
- a damaged or faulty drive belt.

NOTE

Pilling is the small balls (pills) or strings of rubber in the belt grooves caused by the accumulation of rubber dust.

Diagnostic Aids

Vibration from the engine may cause a body component or other parts to emit a rumbling noise.

The drive belt may have a condition that cannot be seen or felt. Sometimes the replacement of the belt may be the only way to confirm the belt is faulty.

If the drive belt has been replaced and the diagnostic table completed, but the rumble is still present only when the drive belt is installed, an accessory drive component such as the A/C compressor may be the cause. Varying the load to each accessory drive component in turn, should help isolate which component is causing the noise.

Test Description

The numbers below refer to steps in the diagnostic table.

2 Confirms the symptom exists at the time of diagnosis. Other vehicle components may be causing the noise.

3 Confirms the accessory drive belt is the cause of the noise. Drive belt rumbling is often confused with an internal engine noise due to the similarity in the description. Removing the drive belt and operating the engine briefly will confirm whether or not the noise is related to the drive belt.

CAUTION

When running the engine with the accessory drive belt removed, the coolant pump will not be operating and the engine may overheat if left unsupervised even for a short period.

NOTE

There may also be a number of DTCs set when running the engine with the accessory drive belt removed.

4 Inspecting the drive belt is to ensure that it is not causing the noise. Small cracks across the ribs of the drive belt will not cause the noise and are not justification alone to replace the belt. Belt separation can be identified by the ply of the belt separating and may be seen at the edge of the belt or felt as lumps under the belt.

5 Small amounts of pilling is a normal condition and is deemed acceptable. When the pilling is severe (33% of the belt groove depth), the belt does not have a smooth surface to run on and should be replaced.

Diagnostic Table

Step	Action	Yes	No
1	Did you review the information provided in 2.2 Symptoms, and perform the required inspections.	Go to Step 2	Go to 2.2 Symptoms
2	Confirm the customer complaint. Is there a rumbling noise?	Go to Step 3	Refer to Diagnostic Aids in this Section
3	1 Remove the drive belt, refer to 3.5 Accessory Drive Belt. 2 Operate the engine for no more than 40 seconds. Does the rumbling noise still exist?	Accessory drive system OK Go to 2.2 Symptoms, and restart the diagnosis	Go to Step 4
4	Inspect the accessory drive belt for damage, separation or sections of missing ribs. Did you find any damaged, separated or missing ribs?	Go to Step 7	Go to Step 5
5	Inspect the accessory drive belt for severe pilling (exceeding 33% of the belt groove depth). Did you find sever pilling?	Go to Step 6	Go to Step 5

Step	Action	Yes	No
6	Clean the drive belt using a suitable wire brush and reinstall to the engine, refer to 3.5 Accessory Drive Belt. Did you complete the repairs?	Go to Step 8	—
7	Install a new accessory drive belt, refer to 3.5 Accessory Drive Belt. Did you replace the accessory drive belt?	Go to Step 8	—
8	If required, reinstall the accessory drive belt and operate the system to confirm the repair. Did you correct the rumbling noise?	Accessory drive system OK	Refer to Diagnostic Aids in this Section

Drive Belt Vibration

Definition

Accessory drive belt vibration can be defined as a drive belt that jumps, shakes or rattles. Accessory drive belt vibration is usually indicated by one of the following:

- the vibration is engine speed related, or
- the vibration is sensitive to accessory drive system load.

Diagnostic Aids

The accessory drive components such as the A/C compressor or generator can have an affect on engine vibration.

To aid in locating which component is causing the vibration, vary the load to each accessory drive component in turn and note the effect it has on the vibration if any.

Test Description

The numbers below refer to steps in the diagnostic table.

2 Confirms the symptom exists at the time of diagnosis. Other vehicle components may be causing the noise.

3 Confirms the accessory drive belt is the cause of the noise. Drive belt rumbling is often confused with an internal engine noise due to the similarity in the description. Removing the drive belt and operating the engine briefly will confirm whether or not the noise is related to the drive belt.

CAUTION

When running the engine with the accessory drive belt removed, the coolant pump will not be operating and the engine may overheat if left unsupervised even for a short period.

NOTE

There may also be a number of DTCs set when running the engine with the accessory drive belt removed.

4 The drive belt may cause a vibration. Inspecting the drive belt is considerably easier while the drive belt is removed.

6 Inspecting the fasteners can eliminate the possibility that an incorrect fastener has been installed.

8 This step should only be performed if the coolant pump is driven by the drive belt. Inspect the coolant pump for a bent shaft. Also inspect the coolant pump bearings for smooth operation and excessive play. Compare the coolant pump with a known good pump.

9 Accessory drive component brackets that are bent, cracked or loose may put extra strain on the accessory component causing it to vibrate.

Diagnostic Table

Step	Action	Yes	No
1	Did you review the information provided in 2.2 Symptoms, and perform the required inspections.	Go to Step 2	Go to 2.2 Symptoms
2	Confirm the customer complaint. Is there a rumbling noise?	Go to Step 3	Refer to Diagnostic Aids in this Section
3	1 Remove the drive belt, refer to 3.5 Accessory Drive Belt. 2 Operate the engine for no more than 40 seconds. Does the vibration noise still exist?	Accessory drive system OK. Go to 4.2 Symptoms, and restart the diagnosis	Go to Step 4
4	Inspect the accessory drive belt for damage, wear, debris build-up or sections of missing ribs. Did you find any damage, wear, debris build-up or missing ribs?	Go to Step 5	Go to Step 6
5	Install a new accessory drive belt, refer to 3.5 Accessory Drive Belt. Did you replace the accessory drive belt?	Go to Step 10	—
6	Inspect for incorrect, loose, missing or damaged fasteners. Did you find any incorrect, loose, missing or damaged fasteners?	Go to Step 7	Go to Step 8
7	Tighten any loose fasteners to the correct torque specification, refer to 6 Torque Wrench Specifications. Replace any incorrect or missing fasteners. Did you complete the repairs?	Go to Step 10	—
8	Inspect the coolant pump for a bent shaft, refer to 6B1 Engine Cooling – V6. Did you find and repair a bent coolant pump shaft?	Go to Step 10	Go to Step 9
9	Inspect for bent, cracked or damaged accessory drive component mounting brackets. Did you find and repair any bent brackets?	Go to Step 10	Refer to Diagnostic Aids in this Section
10	If required, reinstall the accessory drive belt and operate the system to confirm the repair. Did you correct the vibration?	Accessory drive system OK	Refer to Diagnostic Aids in this Section

Drive Belt Falls Off

Definition

The drive belt falls off during normal operation or does not ride correctly on the accessory drive pulleys.

Diagnostic Aids

If the accessory drive belt repeatedly falls off the drive pulleys, this is most likely due to pulley misalignment.

An extra load that is quickly applied and released by an accessory drive component (e.g. A/C compressor) may cause the accessory drive belt to fall off. In this circumstance, confirm the fault by operating the accessory drive components in turn, noting which one caused the belt to fall off.

Lack of drive belt tension may also cause the belt to fall off the pulleys. Low drive belt tension could be caused by one of the following:

- an incorrect drive belt length,
- a faulty drive belt tensioner, or
- a stretched or faulty drive belt.

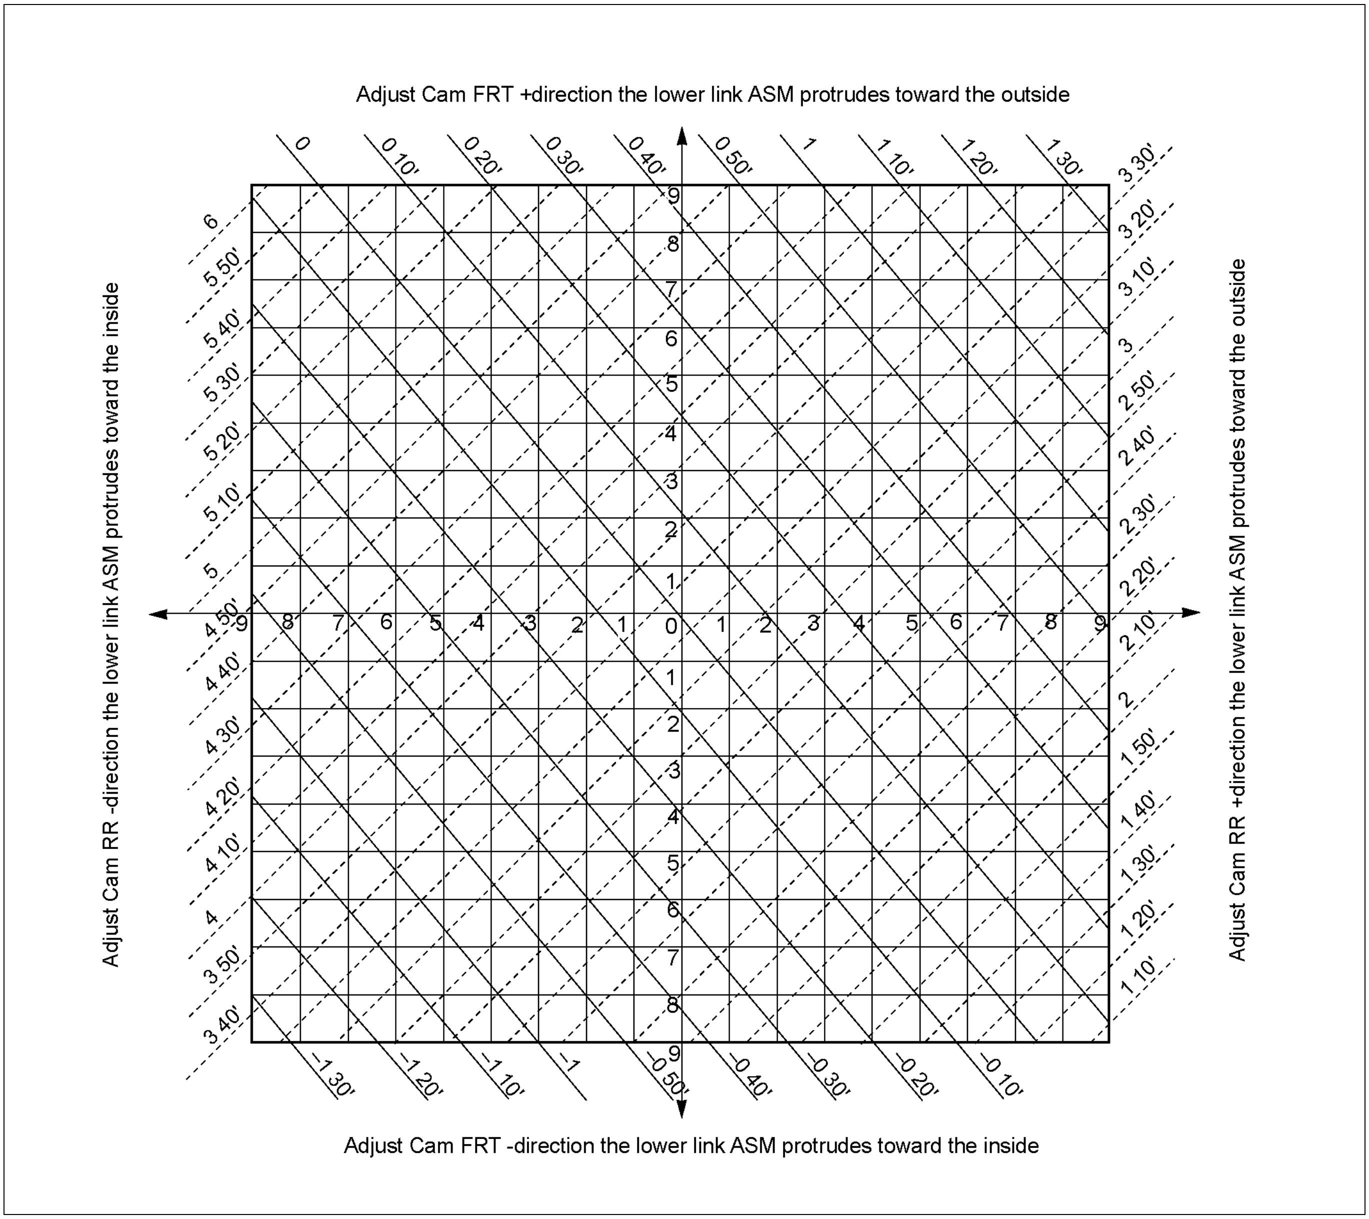
Test Description

The numbers below refer to steps in the diagnostic table.

2 Confirms the condition of the drive belt. Damage may have occurred to the drive belt when it first fell off or it may have been damaged which caused the belt to fall off.

4 Misalignment of the pulleys may be caused by:

The following illustration shows the alignment procedure.



RTW340LF000401

- the incorrect installation or mounting of an accessory drive component,
- the incorrect installation of an accessory drive component pulley, or
- a damaged or bent accessory drive pulley.

Test for a misaligned pulley using a suitable straight edge in the pulley grooves across two or more pulleys. If a misaligned pulley is found, refer to the service information for the particular component, for the correct pulley replacement procedures.

5 Inspecting the pulleys should include an inspection for dents or other damage that would prevent the drive belt from seating correctly in all of the pulley grooves or on the smooth surface of a pulley when the back side of the belt is used.

6 Accessory drive component mounting brackets that are bent will cause the drive belt to fall off.

7 Inspection of the fasteners can eliminate the possibility that an incorrect fastener was installed. Missing, loose or incorrect fasteners may cause pulley misalignment from the fasteners moving under load. Over-tightening of the fasteners may cause deflection of mounting brackets and result in misaligned accessory drive pulleys.

Diagnostic Table

Step	Action	Yes	No
1	Did you review the information provided in 2.2 Symptoms, and perform the required inspections.	Go to Step 2	Go to 2.2 Symptoms
2	Inspect for a damaged accessory drive belt. Did you find any damage on the drive belt?	Go to Step 3	Go to Step 4
3	Install a new accessory drive belt, refer to 3.5 Accessory Drive Belt. Does the drive belt continue to fall off?	Go to Step 4	Go to Step 12
4	Inspect the accessory drive system pulleys for misalignment Did you find and repair any misaligned drive system pulleys?	Go to Step 12	Go to Step 5
5	Inspect for a dented or cracked accessory drive system pulley. Did you find and repair any dented or cracked drive system?	Go to Step 12	Go to Step 6
6	Inspect for bent accessory drive component mounting brackets. Did you find and repair any bent mounting brackets?	Go to Step 12	Go to Step 7
7	Inspect for incorrect, loose, missing or damaged fasteners. Did you find any incorrect, loose, missing or damaged fasteners?	Go to Step 8	Go to Step 9
8	Tighten any loose fasteners to the correct torque specification, refer to 6 Torque Wrench Specifications. Replace any incorrect or missing fasteners. Does the drive belt continue to fall off?	Go to Step 9	Go to Step 12
9	Test the accessory drive belt tensioner for correct operation, refer to Accessory Drive Belt Tensioner Diagnosis in this Section. Did you accessory drive belt tensioner operate correctly?	Go to Step 11	Go to Step 10
10	Replace the drive belt tensioner, refer to 3.7 Accessory Drive Belt Tensioner Assembly. Does the drive belt continue to fall off?	Go to Step 11	Go to Step 12
11	Inspect for a failed drive belt idler and drive belt tensioner bearings. Did you find and repair any failed bearings?	Go to Step 12	Refer to Diagnostic Aids in this Section
12	If required, reinstall the accessory drive belt and operate the system to confirm the repair. Does the drive belt continue to fall off?	Go to Step 2	Accessory drive system OK

Drive Belt Excessive Wear

Definition

Excessive wear can be defined as wear at the outside ribs of the drive belt (frayed edges), usually caused by an incorrectly installed drive belt

Diagnostic Aids

Excessive wear of a drive belt is usually caused by an incorrect installation or an incorrect drive belt fitted. Minor pulley misalignment will not cause excessive wear, but will cause the drive belt to fall off. Major pulley misalignment may cause excessive wear, but would also result in the drive belt falling off.

Test Description

The numbers below refer to steps in the diagnostic table.

2 Confirms the drive belt is correctly installed onto all of the accessory drive system pulleys. Wear on the drive belt may be caused by incorrectly positioning the drive belt by one or more grooves to a particular pulley.

3 The installation of the drive belt that is the incorrect width will cause wear on the drive belt. The drive belt ribs should match all the grooves on all the pulleys in the accessory drive system.

4 Confirms the drive belt is not contacting any parts of the engine or body while the engine is running. There should be sufficient clearance when the accessory drive component loads varies. The drive belt should not come into contact with any engine or body parts.

Diagnostic Table

Step	Action	Yes	No
1	Did you review the information provided in 2.2 Symptoms, and perform the required inspections.	Go to Step 2	Go to 2.2 Symptoms
2	Inspect the accessory drive belt for correct installation. Is the drive belt installed correctly?	Go to Step 5	Go to Step 3
3	Ensure that the drive belt is the correct one for the application. Is the correct drive belt installed?	Go to Step 5	Go to Step 4
4	Is the drive belt contacting any engine or body components with the engine running?	Go to Step 6	Refer to Diagnostic Aids in this Section
5	Install a new accessory drive belt, refer to 3.5 Accessory Drive Belt. Did you replace the accessory drive belt?	Go to Step 6	—
6	If required, reinstall the accessory drive belt and operate the system to confirm the repair. Did you correct the excessive wear?	Accessory drive system OK	Go to Step 2

Accessory Drive Belt Tensioner Diagnosis

Diagnostic Table

Step	Action	Yes	No
1	1 Remove the accessory drive belt. 2 Inspect the drive belt tensioner pulley. Is the drive belt tensioner pulley loose or misaligned?	Go to Step 4	Go to Step 2
2	Rotate the drive belt tensioner. Does the drive belt tensioner rotate freely, without any unusual resistance or binding?	Go to Step 3	Go to Step 4
3	1 Using a suitable torque wrench, measure the torque required to lift the drive belt tensioner off the stop. 2 Using a known good tensioner, measure the torque required to lift the drive belt tensioner off the stop. Is the first torque reading within 10% of the second reading?	Accessory drive belt tensioner OK	Go to Step 4
4	Replace the drive belt tensioner, refer to 3.7 Accessory Drive Belt Tensioner Assembly. Is the repair complete?	Accessory drive belt tensioner OK	—

3 Minor Service Operations

ATTENTION

The V6 engine is a combination of numerous components, containing machined, honed, polished and lapped surfaces manufactured on the latest, high technology production equipment. Many of the components contain tolerances measured in thousandths of a millimetre. Consequently, when any engine component is to be serviced, care and cleanliness are extremely important.

Prior to re-assembly of the engine, all components must be cleaned and inspected in accordance with the relevant clean and inspect procedures throughout this Section, and replaced or repaired where required.

In addition to cleaning and inspecting components, a liberal coating of engine oil should be applied to friction surfaces during assembly to protect and lubricate the surfaces on initial operation.

When performing any service operation, it should be understood that correct cleaning and protection of machined surfaces and friction areas is part of the repair procedure. This is considered standard workshop practice, even if not specifically stated. Torque values must be used as specified during reassembly to ensure correct retention of all components.

Through out this section, fastener torque wrench specifications may be accompanied with the following identification marks:

- ■ **Fasteners must be replaced after loosening.**
- ♦ **Fasteners either have micro encapsulated sealant applied or incorporate a mechanical thread lock and should only be re-used once. If in doubt, replacement is recommended.**

If one of these identification marks is present alongside a fastener torque wrench specification, the recommendation regarding that fastener must be adhered to.

3.1 Engine Oil

The procedure outlined below is typically the same for both rear wheel drive and all wheel drive vehicles.

Check

The following procedure is applicable to both rear wheel and all wheel drive vehicles

1 Run the engine to bring it to normal operating temperature.

2 Park the vehicle on a level surface. A vehicle that is not level will affect the accuracy of the level reading.

3 Stop the engine and wait 5 to 10 minutes to allow the oil to drain back into the oil pan.

4 Remove the oil level indicator (1) and wipe clean.

5 Insert the indicator, ensuring it is fully seated.

6 Slowly remove the indicator to avoid smearing. Hold it horizontally or with lower end slightly down to avoid oil running along indicator.

7 Observe the oil level where it passes over the centre line of the indicator.

8 If the level is lower than the Add mark (2), add enough oil to the engine to reach the Upper mark (3). Do not add too much oil as the reading should never be above the Upper mark.

NOTE

When topping up the oil, allow approximately 5 to 10 minutes for the added oil to fully drain into the oil pan.

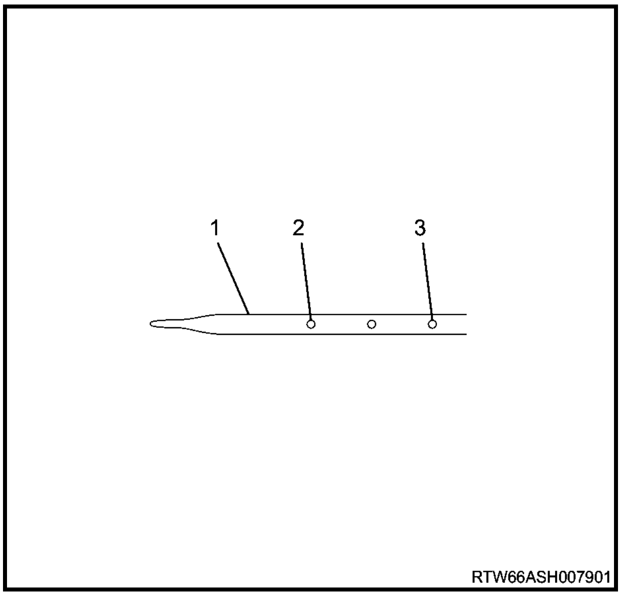


Figure 6A1 – 23

Replace

NOTE

- Quicker and more complete draining will occur if the engine oil is at normal operating temperature. However, care must be taken to avoid scalding from the hot oil.
- It recommended the oil filter be changed at each engine oil change, refer to 3.2 Oil Filter.

1 Remove the oil fill cap.

2 To ensure complete draining of the oil pan, raise the front and rear of the vehicle to maintain a level attitude. If not using a hoist, support the vehicle with safety stands, refer to 0A General Information.

3 Clean any foreign material from around the oil drain plug and place a suitable, clean drain tray under the engine.

WARNING

The oil may be hot. Avoid contact with the oil.
Ensure that eyes and skin are protected.

4 Remove the drain plug (1), taking care to avoid scalding from the hot oil. Allow the oil to drain.

5 Clean and inspect the drain plug threads. If damaged, replace the drain plug.

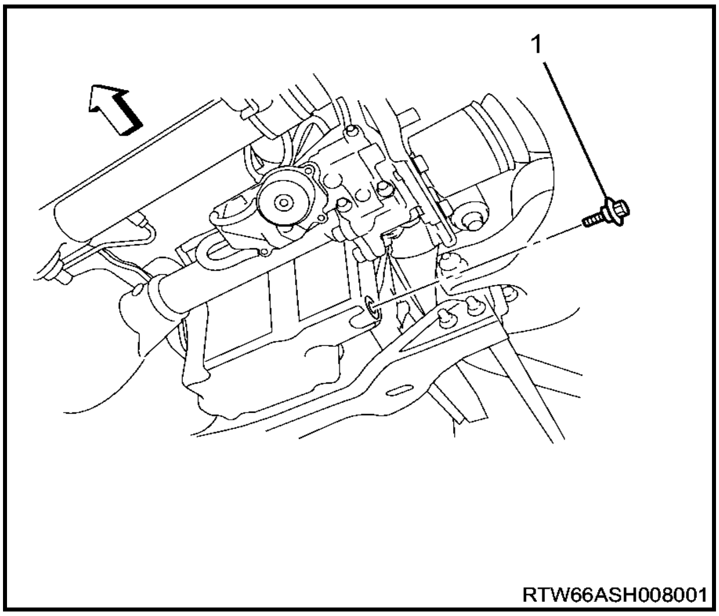

Figure 6A1 – 24

6 Once the oil has completely drained, reinstall the drain plug and tighten to the correct torque specification.

Oil pan drain plug torque specification ....25.0 Nm

7 Replace the oil filter, refer to 3.2 Oil Filter.

8 Lower the vehicle to the ground and fill with the specified amount of SAE 5W30 lubricant.

Engine Oil Capacity: With Oil Filter Change.......................................6.5 litres

9 Install the oil fill cap.

10 Start the engine and check for leaks.

Pressure Check

1 Run the engine to bring it to normal operating temperature.

2 Park the vehicle on a level surface. A vehicle not level will affect the accuracy of the level reading.

3 Stop the engine and wait 5 to 10 minutes to allow the oil to drain back into the oil pan.

4 Check the oil level and top up with the recommended engine oil as required, refer to Check, in this Section.

5 Remove the engine oil pressure sensor (1), refer to 6C1-3 Engine Management – V6 – Service Operations.

6 Install the oil pressure gauge adaptor, Tool No. J36648-A into the oil pressure sender hole in the oil filter housing.

7 Install a suitable oil pressure gauge into the adaptor.

8 Start the engine.

9 Measure and record the pressure reading on the gauge at idle and 2000 r.p.m. Compare the results with the specification.

Minimum engine oil pressure @ idle...	69 kPa
@ 2000 r.p.m.	138 kPa

10 If the engine oil pressure is not to specification, refer to 2.19 Engine Oil Pressure Diagnosis.

11 After completing the engine oil pressure check, stop the engine and remove the oil pressure gauge.

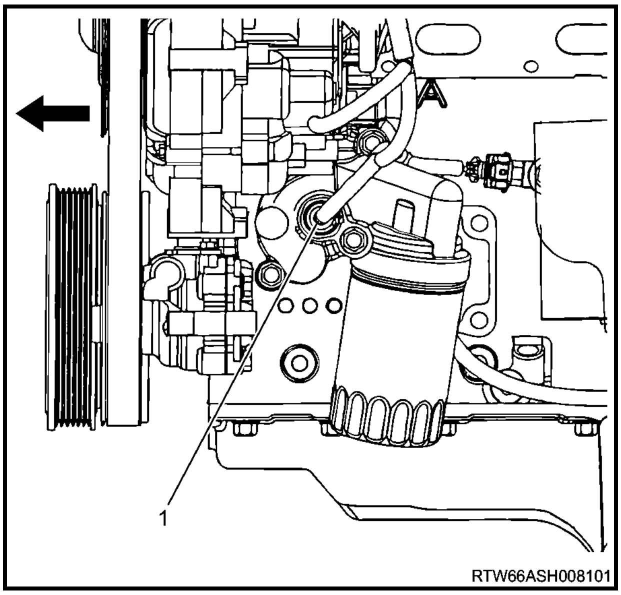

Figure 6A1 – 25

12 Reinstall the oil pressure sensor, refer to 6C1-3 Engine Management – V6 – Service Operations.

13 Start the engine and check for leaks.

3.2 Oil Filter Cartridge

Replace

NOTE

- The oil filter cartridge should be replaced at the correct time or distance intervals, refer to 0B Lubrication and Service.
- The oil filter cartridge should also be replaced whenever the engine oil is suspected to have been contaminated by foreign material.

1 Remove and discard the oil filter cartridge (1).

2 Install the new oil filter cartridge.

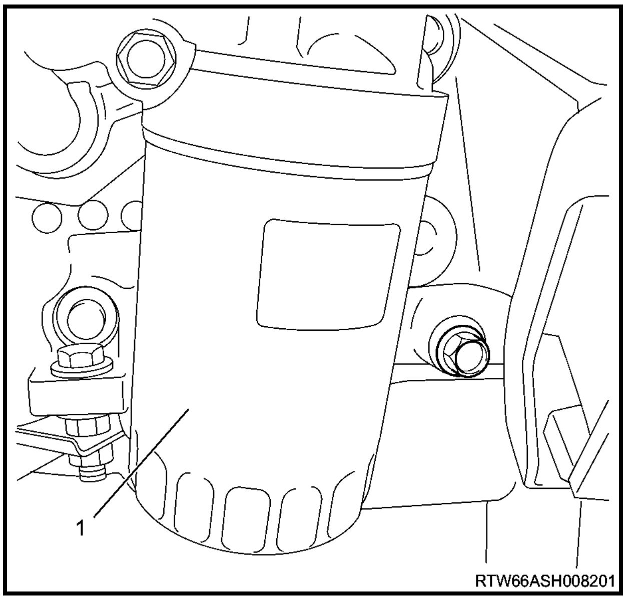

Figure 6A1 – 26

3.3 Oil Filter Adaptor

Remove

CAUTION

Disconnection of the battery affects certain vehicle electronic systems, refer to 1.1 WARNING, CAUTION and NOTES before disconnecting the battery.

1 Disconnect the battery negative terminal.

2 Disconnect the wiring harness connector from the oil pressure sender.

3 Remove the oil filter adaptor attaching bolts (2), four places.

4 Remove the oil filter adaptor and discard the gasket (3).

5 Clean the surfaces of the adaptor and cylinder block.

CAUTION

- **Do not use a screwdriver or similar to prise the oil filter adapter from the engine as damage to the sealing surface may occur.**
- **If required, use a rubber mallet to tap the oil filter adapter to loosen the components prior to separating. Tapping should be done at bends, corners or reinforced areas to prevent distortion of parts.**

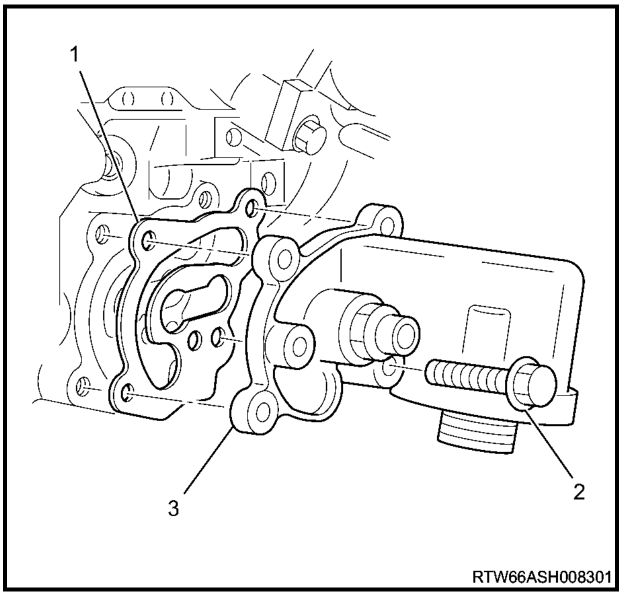

Figure 6A1 – 27

Reinstall

Reinstallation of the oil filter adaptor is the reverse of the removal procedure, noting the following:

1 A new gasket must be used.

2 Loosely install the oil filter adaptor attaching bolts, then tighten all fasteners to the correct torque specification.

Oil filter adaptor attaching bolt torque specification	20.0- 26.0 Nm

3.4 Oil Level Indicator Tube

Remove

1 Remove the oil level indicator from the oil level indicator tube.

2 Remove the bolt (2) attaching the oil level indicator tube (1) and engine wiring harness retaining bracket.

3 Withdraw the oil level indicator tube from the oil pan.

4 Remove and discard the o-ring at the bottom of the oil level indicator tube.

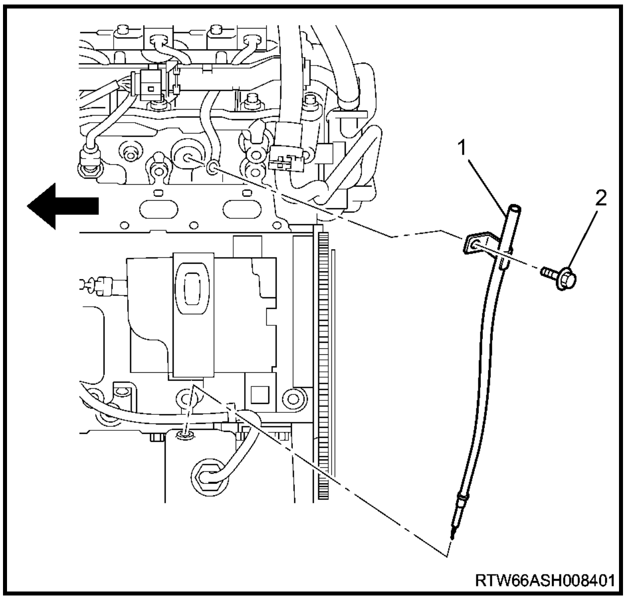

Figure 6A1 – 28

Reinstall

Reinstallation of the oil level indicator tube is the reverse of the removal procedure, noting the following:

1 Install a new oil level indicator o-ring.

2 Ensure the attaching bolt passes through the engine wiring harness retaining bracket.

3 Tighten bolt to the correct torque specification.

Oil level indicator tube attaching bolt torque specification ....8.0 – 12.0 Nm

3.5 Accessory Drive Belt

RWD Vehicle

Remove

1 Remove the air intake duct from between the air flow meter and the throttle body, refer to 6C1-3 Engine Management – V6 – Service Operations.

2 Note the accessory drive belt (1) routing.

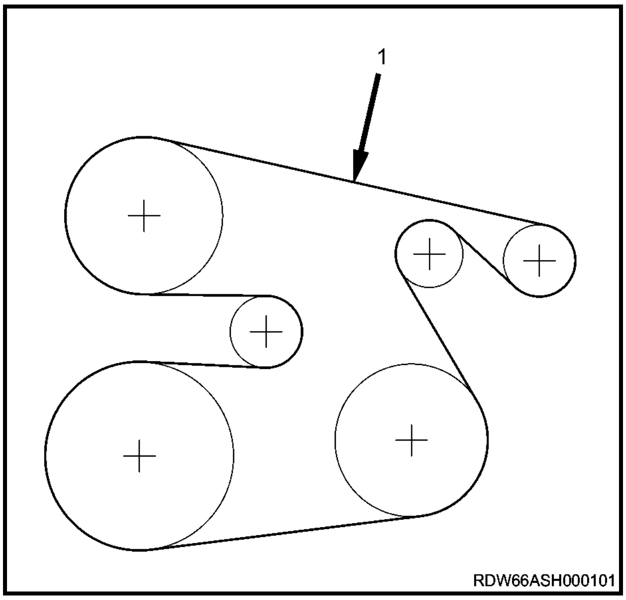

Figure 6A1 – 29

3 Using a suitable ½" drive socket bar (1), rotate the drive belt tensioner (2) clockwise, to reduce belt tension.

4 While holding the tensioner in the reduced tension position, remove the accessory drive belt (3).

NOTE

If required use an assistant to maintain the tensioner in the required position.

CAUTION

If running the engine with the accessory drive belt removed, the coolant pump will not be operating and the engine may overheat if left unsupervised even for a short period.

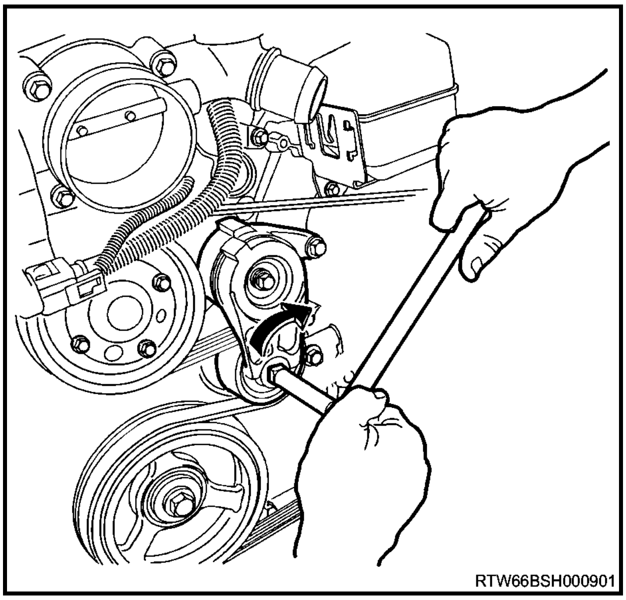

Figure 6A1 – 30

Reinstall

1 Install the drive belt over the A/C compressor, idler pulley, power steering pump, coolant pump, generator and tensioner pulleys.

2 Using a suitable ½" drive socket bar (1), rotate the drive belt tensioner (2) clockwise, refer to Figure 6A1 – 30.

3 With an assistant holding the tensioner in the required position, feed the accessory drive belt (3) over the crankshaft pulley.

4 Slowly release the drive belt tensioner mechanism.

NOTE

Ensure the drive belt ribs are correctly aligned with the grooves in the accessory drive pulleys or damage to the drive belt and accessory drive components and pulleys may occur.

5 Reinstall the air intake duct to the air flow meter and the throttle body, refer to 6C1-3 Engine Management – V6 – Service Operations.

6 Run the engine to ensure correct operation.

3.6 Accessory Drive Belt Idler Pulley

Remove

1 Remove the accessory drive belt, refer to 3.5 Accessory Drive Belt.

2 Remove the accessory drive belt idler pulley attaching bolt (1).

3 Remove the dished washer (2) and accessory drive belt idler pulley (3).

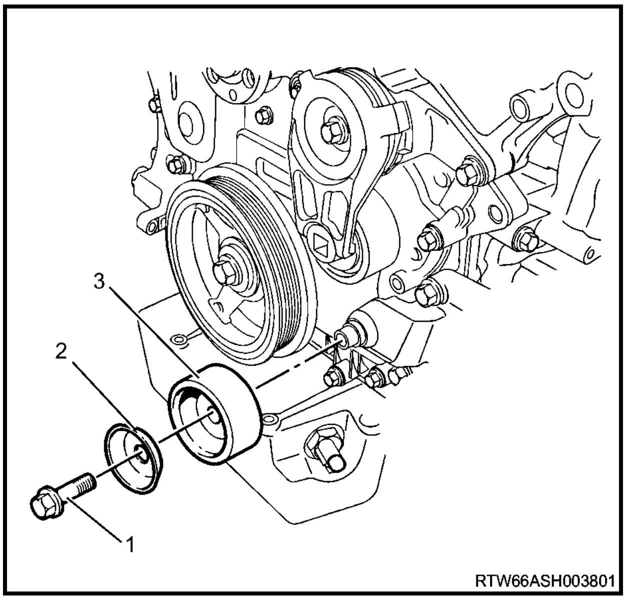

Figure 6A1 – 31

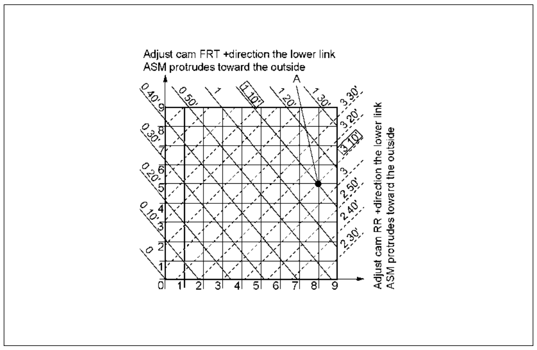
Reinstall

Reinstallation of the accessory drive belt idler pulley is the reverse of the removal procedure. Tighten the bolt to the correct torque specification.

Accessory drive belt idler pulley attaching bolt torque specification......................50.0 Nm

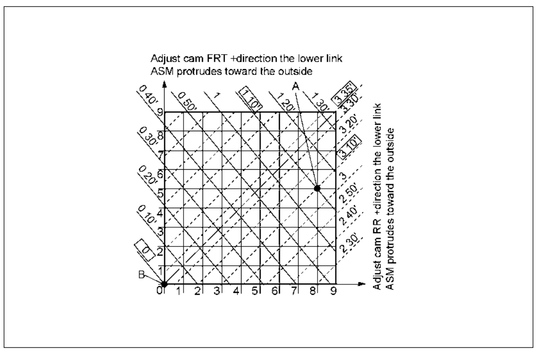
Example

Measured value			
Camber angle	1°10'	Caster angle	3°10'
Standard value			
Camber angle	0°±30'	Caster angle	3°35'±45'



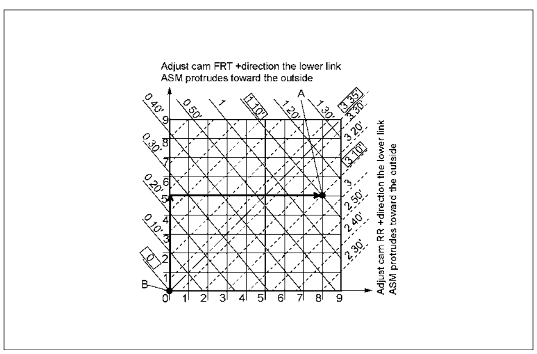
RTW340SH001001

1. Mark an ‘A’ at the intersection point of the measured camber angle value (solid line) and the measured caster angle value (dotted line).



RTW340SH001101

2. Mark a ‘B’ at the intersection point of the standard camber angle value (solid line) and the standard caster angle value (dotted line).



RTW340SH001201

3. The vertical distance between points ‘A’ and ‘B’ represents the adjustment required at the front cam. The horizontal distance between points ‘A’ and ‘B’ represents the adjustment required at the rear cam.
   In this example, the front cam would be moved 5 increments to the positive and the rear cam would be moved 8 increments to the positive.

CAUTION:

Maximum possible adjustment from the center point of the cams is 9 increments to either side.

3.7 Accessory Drive Belt Tensioner Assembly

Remove

1 Remove the accessory drive belt, refer to 3.5 Accessory Drive Belt.

2 Remove the three bolts (2) attaching accessory drive belt tensioner assembly (1).

3 Remove the accessory drive belt tensioner assembly.

NOTE

The accessory drive belt tensioner pulley is not serviced separately. If the pulley is found to be faulty, the entire tensioner assembly must be replaced.

CAUTION

Repairing a damaged accessory drive belt pulley should not be attempted under any circumstances.

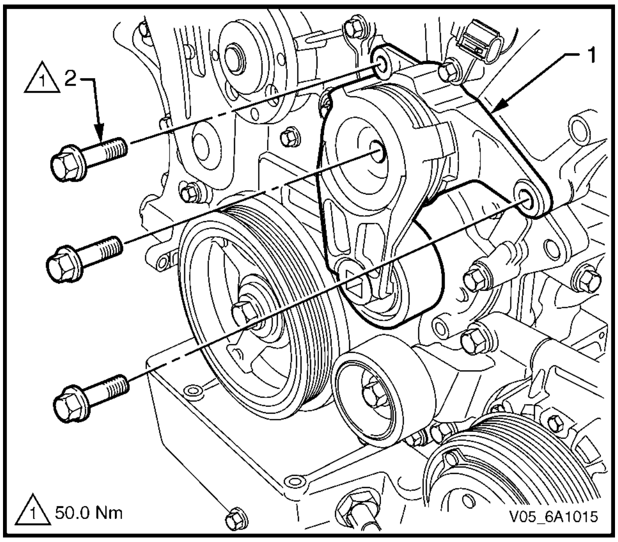


Figure 6A1 – 32

Reinstall

Reinstallation of the accessory drive belt tensioner assembly is the reverse of the removal procedure. Tighten the bolts to the correct torque specification.

Accessory drive belt tensioner attaching bolt torque specification......................50.0 Nm

3.8 Power Steering Pump Bracket

Remove

1 Remove the power steering pump and reservoir, refer to 3B_Steering.

2 Remove the three bolts (1), (3) and (4) attaching the power steering pump bracket (5) to the engine block.

3 Remove the power steering pump bracket.

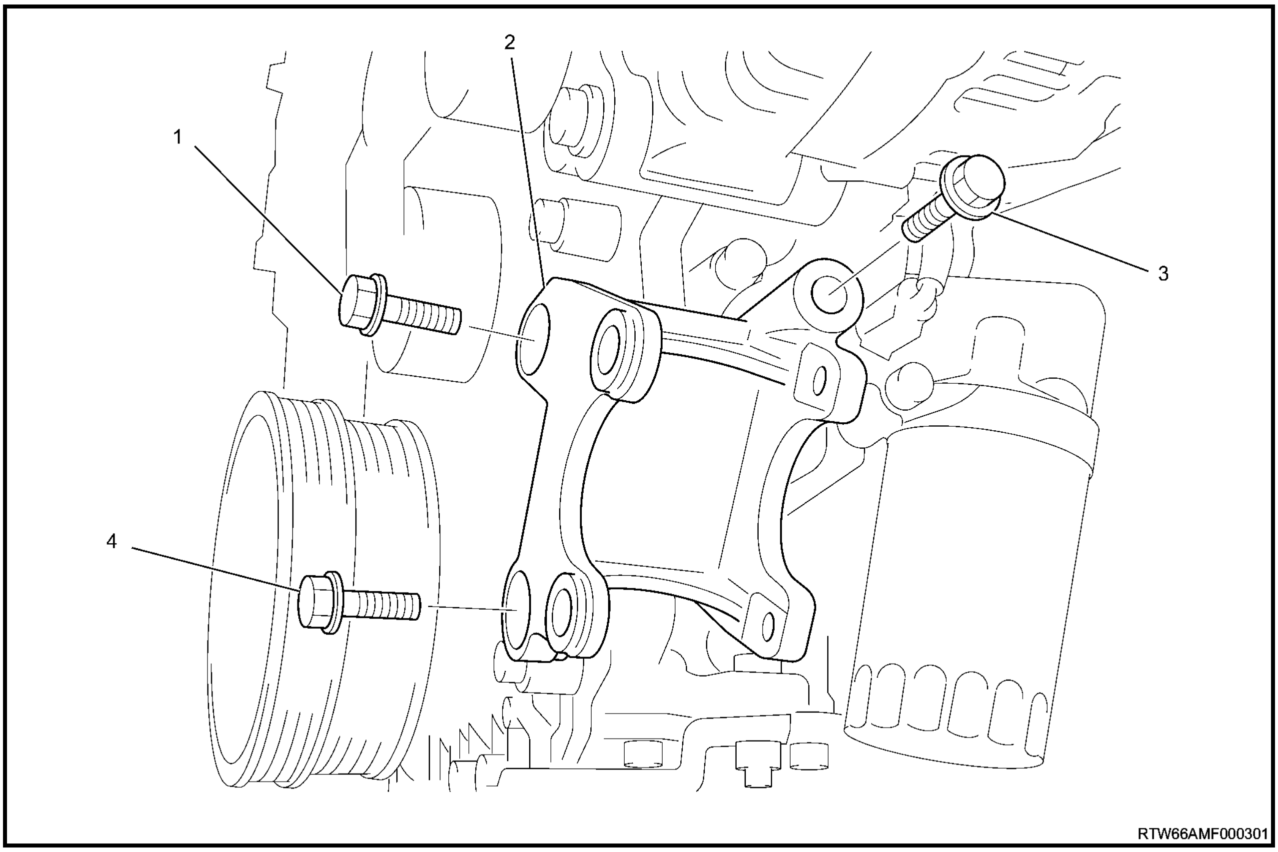

Figure 6A1 – 33

Reinstall

Reinstallation of the power steering pump and pump bracket is the reverse of the removal procedure, noting the following:

1 Hand start the bolts before tightening.

2 Tighten the bolts to the correct torque specification.

Power steering pump bracket attaching bolt torque specification.....................22.0 Nm

3.9 Upper Intake Manifold

The intake manifold comprises of an upper and lower section. Some service procedures only require the removal of the upper intake manifold (e.g. fuel injector/spark plug servicing), while other service procedures require the removal of both the upper and lower manifold as a complete assembly (e.g. cylinder head/s). If the complete assembly needs to be removed, refer to 3.10 Intake Manifold Assembly – Complete.

Remove

CAUTION

Disconnection of the battery affects certain vehicle electronic systems. Refer to 1.1 WARNING, CAUTION and NOTES before disconnecting the battery.

1 Disconnect the battery negative terminal.

2 Remove the air intake duct (1) and hose (2), refer to 6C1-3 Engine Management – V6 – Service Operations.

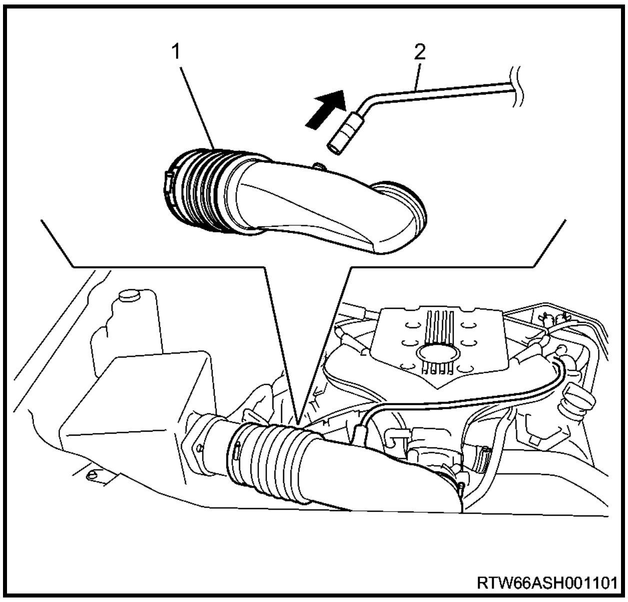

Figure 6A1 – 34

3 Retract the throttle body wiring connector lock (3).

4 While pressing the connector latch in the direction of the arrow (4), disconnect the throttle body wiring connector.

5 Disconnect the throttle body connector wiring harness from its retaining clip (5).

6 Remove the main wiring harness retainer pin (6) from the intake manifold by pushing from the front to the rear using a suitable piece of 5 mm steel rod (or an Allen key).

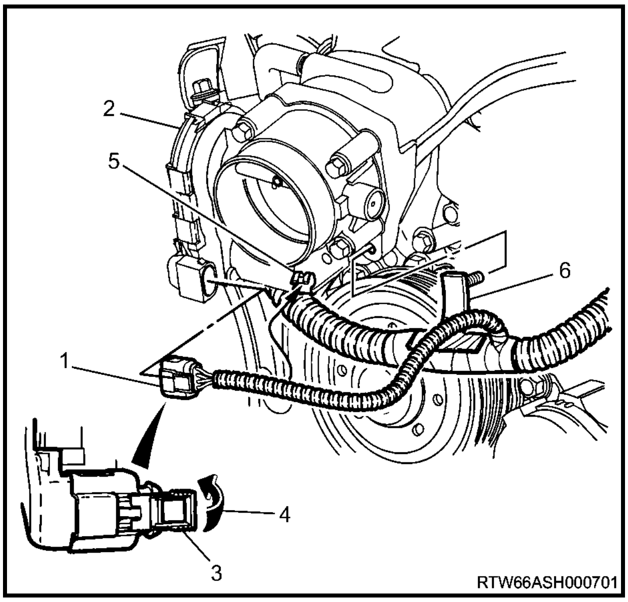

Figure 6A1 – 35

CAUTION

The following precautions must be followed when disconnecting the throttle body wiring connector:

- **Do not use any mechanical device such as a screwdriver to disengage the harness connector (1) from the throttle body (2).**
- **When retracting the throttle wiring connector lock (3), take care not to disengage the lock from the connector.**
- **Do not pull on the connector wires.**
- **Take care not to break the barbed harness retainer pin (6) while removing the harness retainer from the intake manifold.**
- **Should the pin be broken, then it is vital that a new harness retainer is fitted to the wiring harness shield. If not, the harness will foul the engine drive belt.**

7 Disconnect the brake booster hoses from the upper intake manifold:

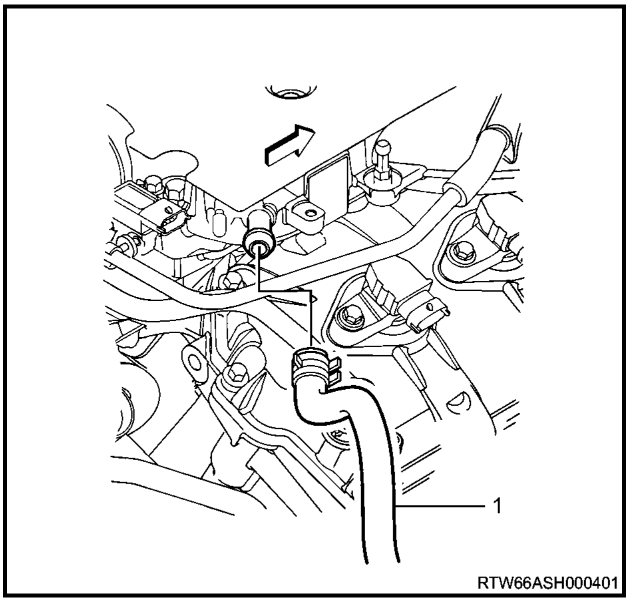

Figure 6A1 – 36

8 Disconnect the wiring harness connector from the barometric (BARO) pressure sensor (1).

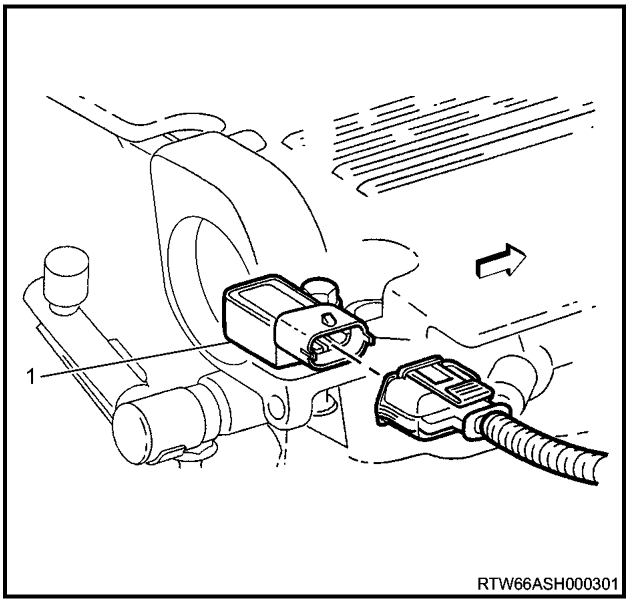

Figure 6A1 – 37

9 Disconnect the PCV tube connector (1) from the upper intake manifold assembly.

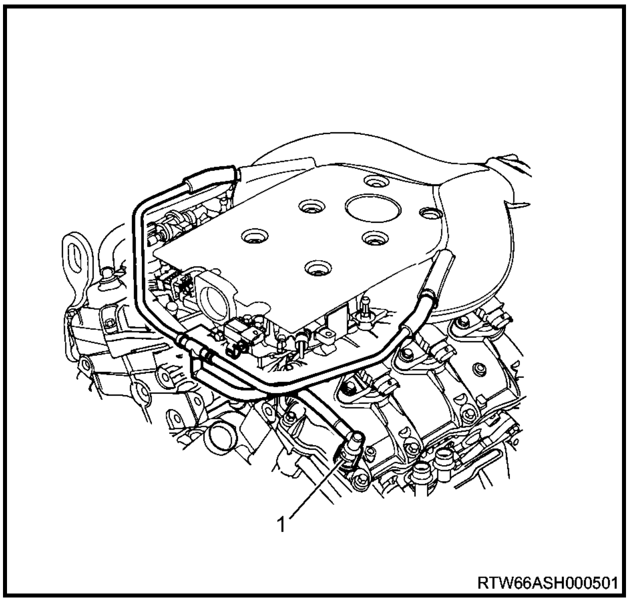

Figure 6A1 – 38

10 Remove the bolt (3) attaching the EVAP valve and the fuel injector wiring harness connector mounting bracket to the upper intake manifold assembly.

11 Move the EVAP valve and the fuel injector wiring harness connector mounting bracket clear of the upper intake manifold assembly.

12 Disconnect the PCV fresh air tube (1) from its upper intake manifold mounting clip (2).

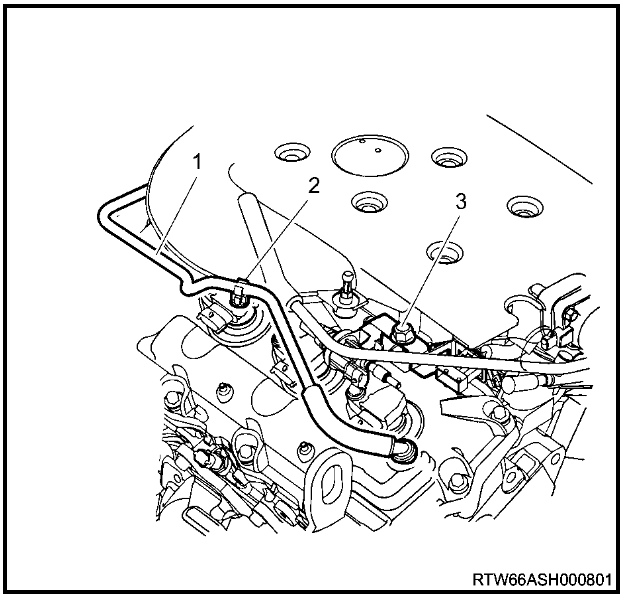

Figure 6A1 – 39

13 Disconnect the EVAP valve outlet tube (1) from the intake manifold (2).

14 Remove the four long (3) (165 mm long) and two short bolts (4) (70 mm long) attaching the upper intake manifold (2) to the cylinder heads and lower intake manifold.

15 Lift the upper intake manifold (2) clear from the lower half and then remove the upper intake manifold from the engine.

16 Remove and discard the upper to lower intake manifold gaskets (5).

CAUTION

- **When the upper intake manifold is removed, plug each of the lower intake runner openings with lint free cloth, to stop the entry of foreign material into the engine.**
- **Do not reuse the upper to lower intake manifold gaskets (5).**

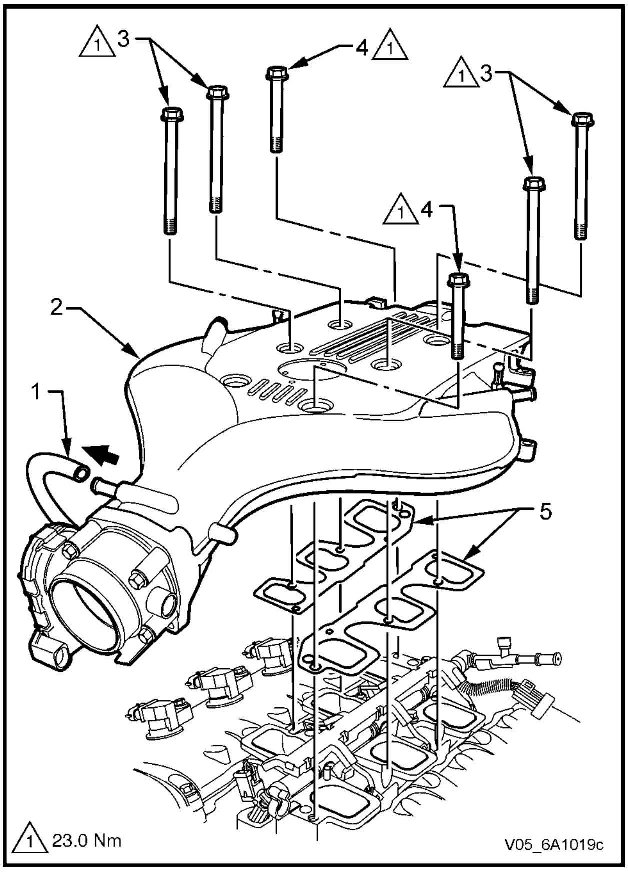

Figure 6A1 – 40

17 Remove the upper and lower intake manifold assembly from the engine.

18 Remove lower intake manifold to cylinder head gasket.

Disassemble

Remove the following from the upper intake manifold, refer to 6C1-3 Engine Management – V6 – Service Operations:

- BARO sensor and
- Throttle body assembly.

Clean

CAUTION

Due to the aluminium alloy construction of the intake manifold, wire brushes and steel scrapers must not be used during the cleaning process, as damage to sealing surfaces may occur. Use of a wooden or plastic scraper is preferred.

1 Clean mating surfaces ensuring any gasket material is removed.

2 Clean the manifold using a suitable solvent.

WARNING

Safety glasses must be worn when using compressed air.

3 Dry the timing components with compressed air.

Inspect

1 Inspect the intake manifold for the following fault conditions:

- Damaged sealing and mating surfaces.
- Damaged lower intake manifold gasket.
- Damage or excessive debris on the threaded and through holes.
- Cracks or damage to the intake manifold body.

NOTE

If the lower intake manifold is cracked or damaged, it must be replaced. No welding or patching of the intake manifold should be performed.

2 Place a straight edge (1) across the upper intake manifold sealing surface (2).

3 Using a feeler gauge (3), measure the clearance between the manifold and the straight edge.

4 If the clearance between the upper intake manifold sealing surface and the straight edge exceeds the specified maximum warpage, replace the manifold.

Upper manifold maximum warpage	0.05 mm

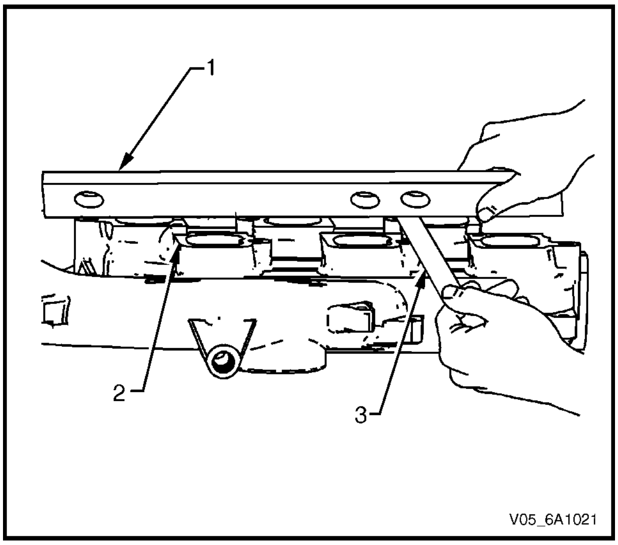

Figure 6A1 – 41

5 Place a straight edge (1) across the lower intake manifold sealing surface (2).

6 Using a feeler gauge (3), measure the clearance between the manifold and the straight edge.

7 If the clearance between the lower intake manifold sealing surface and the straight edge exceeds the specified maximum warpage, replace the manifold.

Lower manifold maximum warpage	0.05 mm

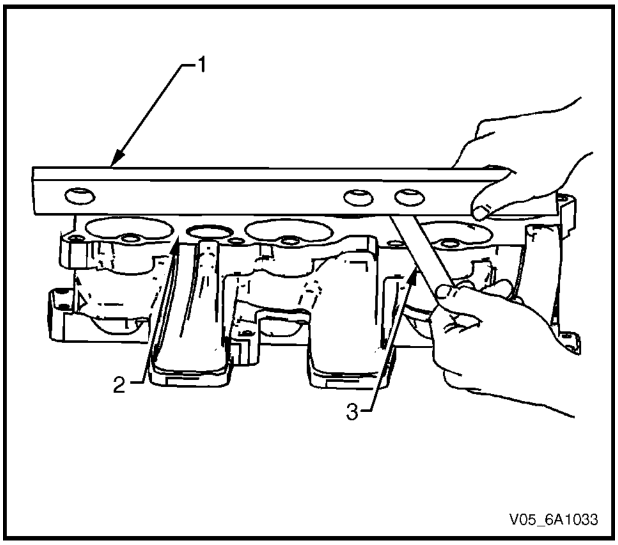

Figure 6A1 – 42

Reassemble

Reassembly of the upper manifold is the reverse of the disassembly procedure .

Reinstall

Reinstallation of the upper intake manifold and the upper and lower intake manifold assembly is the reverse of the removal procedure, noting the following:

1 Only new gaskets are to be fitted between the upper and lower intake manifolds.

CAUTION

Tighten the intake manifold bolts in a circular pattern starting at the centre bolt and moving outward.

2 Ensure that all fasteners are tightened to the correct torque specification.

Upper intake manifold to lower intake manifold attaching bolt torque specification ....23.0 Nm
Upper intake manifold to cylinder head attaching bolt torque specification ....23.0 Nm

CAUTION

Incorrect wiring connector installation may cause component malfunction or component damage.

3 Ensure all wiring connectors are fully engaged and if applicable, locked in place.

4 Ensure all wiring harnesses are correctly routed and attached securely in their retaining clips.

5 Ensure that all hoses and pipes are routed correctly and that any retaining clips are correctly installed.

6 Start and run the engine to check for correct operation.

3.10 Intake Manifold Assembly – Complete

The intake manifold comprises of an upper and lower section. Some service procedures only require the removal of the upper intake manifold (e.g. fuel injector/spark plug servicing), while other service procedures require the removal of both the upper and lower manifold as a complete assembly (e.g. cylinder head/s). If only the upper intake manifold needs to be removed, refer to 3.9 Upper Intake Manifold.

Remove

CAUTION

Disconnection of the battery affects certain vehicle electronic systems. Refer to 1.1 WARNING, CAUTION and NOTES before disconnecting the battery.

1 Depressurise the fuel system.

2 Disconnect the battery negative terminal.

3 Remove the air intake duct (1) and hose (2), refer to 6C1-3 Engine Management – V6 – Service Operations.

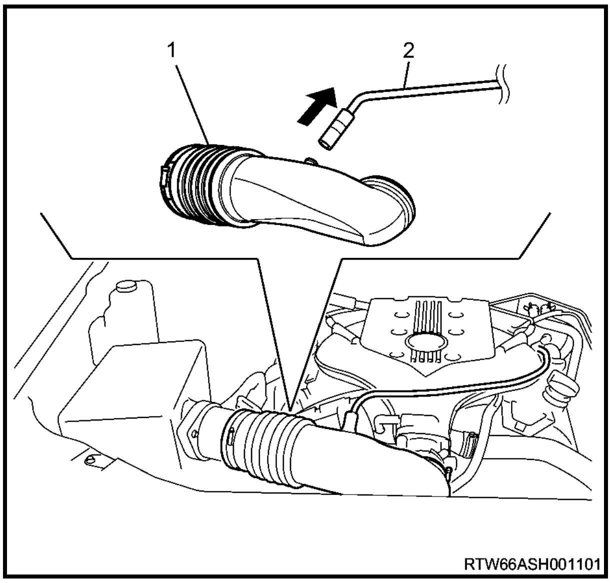

Figure 6A1 – 43

4 Retract the throttle body wiring connector lock (3).

5 While pressing the connector latch in the direction of the arrow (4), disconnect the throttle body wiring connector.

6 Disconnect the throttle body connector wiring harness from its retaining clip (5).

7 Remove the main wiring harness retainer pin (6) from the intake manifold by pushing from the front to the rear using a suitable piece of 5 mm steel rod (or an Allen key).

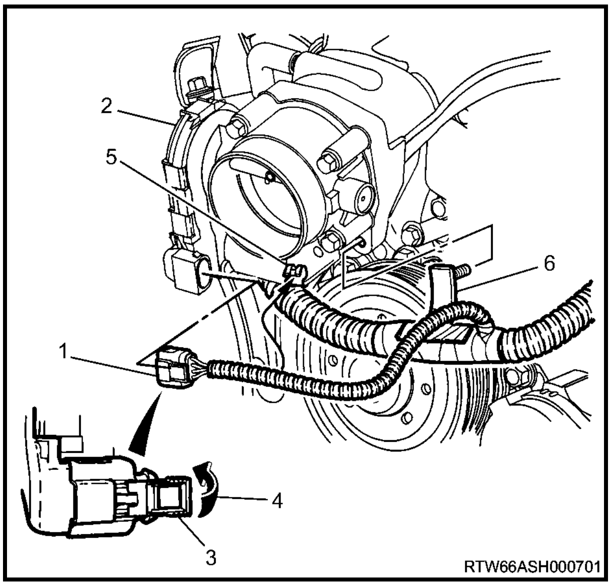

Figure 6A1 – 44

CAUTION

The following precautions must be followed when disconnecting the throttle body wiring connector:

- **Do not use any mechanical device such as a screwdriver to disengage the harness connector (1) from the throttle body (2).**
- **When retracting the throttle wiring connector lock (3), take care not to disengage the lock from the connector.**
- **Do not pull on the connector wires.**
- **Take care not to break the barbed harness retainer pin (6) while removing the harness retainer from the intake manifold.**
- **Should the pin be broken, then it is vital that a new harness retainer is fitted to the wiring harness shield. If not, the harness will foul the engine drive belt.**

8 Disconnect the brake booster hose (1), from the upper intake manifold:

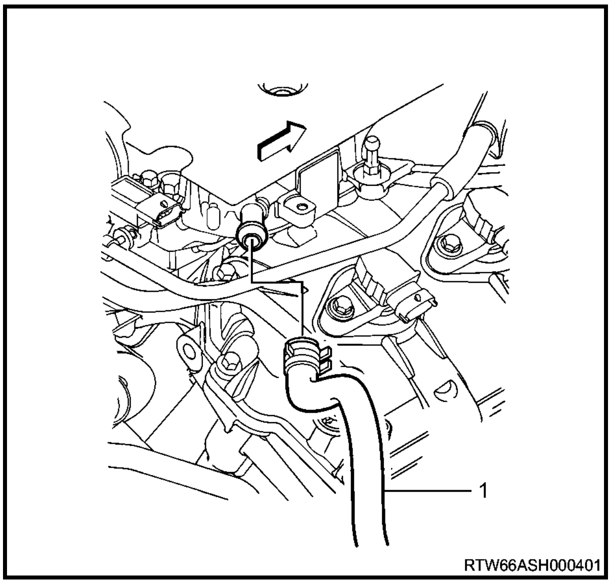

Figure 6A1 – 45

9 Disconnect the wiring harness connector from the barometric (BARO) pressure sensor (1).

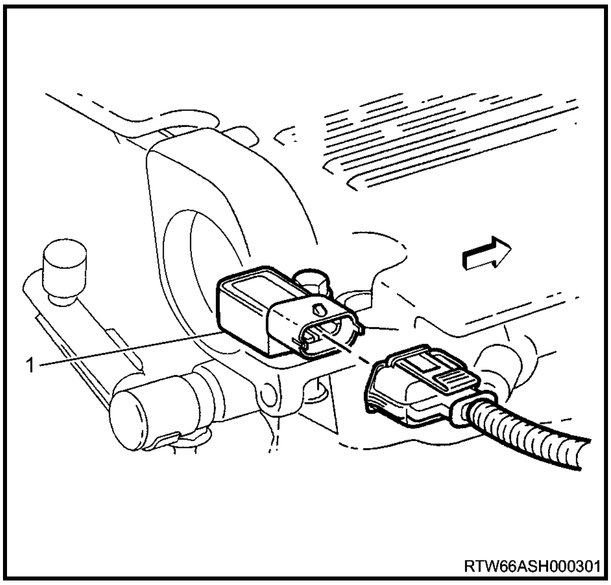

Figure 6A1 – 46

10 Disconnect the PCV tube connector (1) from the upper intake manifold assembly.

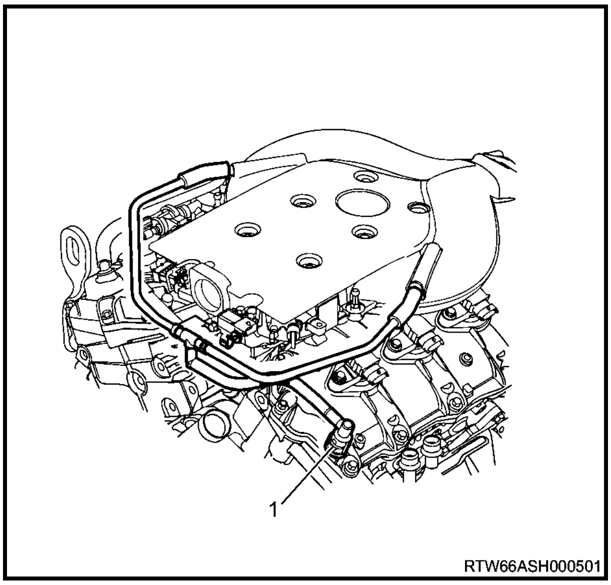

Figure 6A1 – 47

CASTER

3°35'±45'

Note:
Left and right side to be equal within 30'

CAMBER

0°±30'

Note:
Left and right side to be equal within 30'

KING PIN INCLINATION

12°30'±30'

11 Disconnect the fuel feed hose from the fuel rail (1).

12 Pull out the release bar (2) (broad arrow) of the fuel injector harness wiring connector (3).

13 Disconnect the fuel injector harness wiring connector from the fuel injector wiring harness (4).

CAUTION

Plug the fuel feed hose opening after removal to prevent dirt and other contaminants from entering the fuel system.

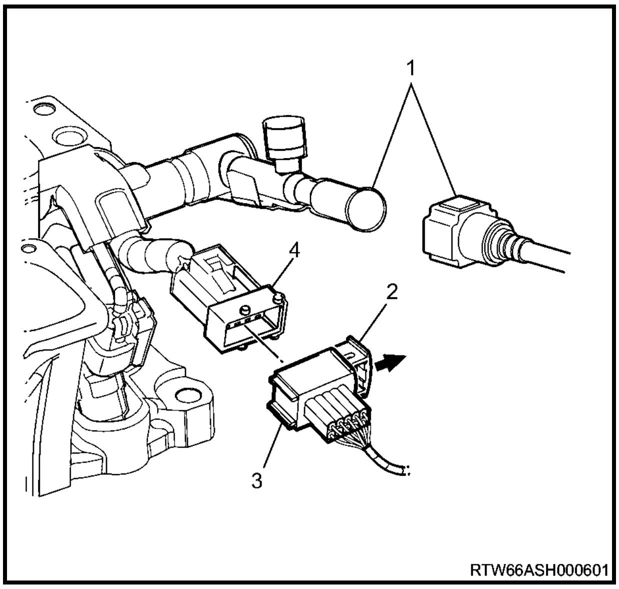

Figure 6A1 – 48

14 Remove the wiring harness connector (2) from the EVAP valve (1).

15 Disconnect the quick connect (3) from the rear of the EVAP valve, as follows:

a Squeeze the two barbed lugs together, push the quick connect into the valve, then pull out to separate the connection.

b Plug both open ends to prevent the entry of foreign matter.

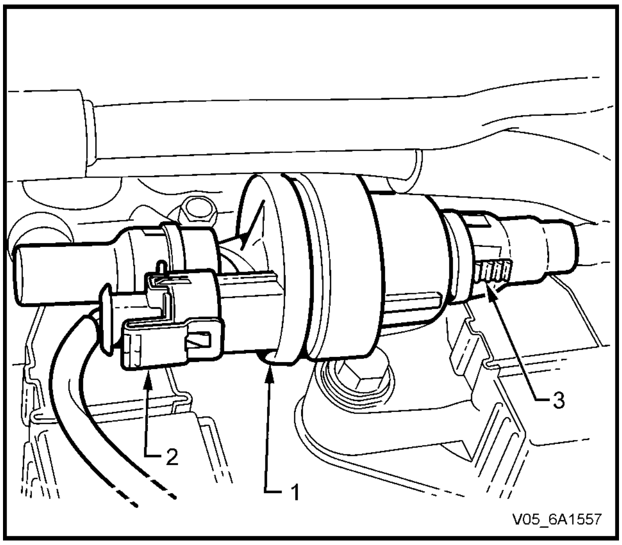

Figure 6A1 – 49

16 Remove the bolt (3) attaching the EVAP valve and the fuel injector wiring harness connector mounting bracket to the upper intake manifold assembly.

17 Move the EVAP valve and the fuel injector wiring harness connector mounting bracket clear of the upper intake manifold assembly.

18 Disconnect the PCV fresh air tube (1) from its upper intake manifold mounting clip (2).

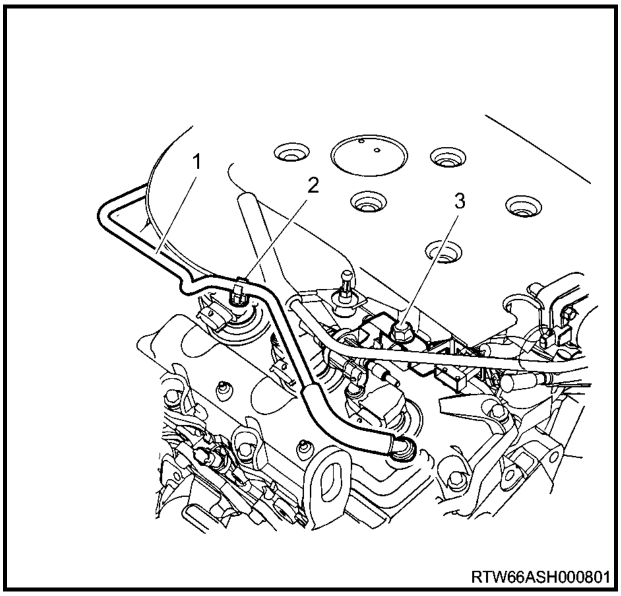

Figure 6A1 – 50

19 Remove the four long (1) bolts (165 mm) securing the complete intake manifold to the cylinder heads.

20 Remove the two short (2) bolts (45 mm) securing the lower intake manifold to the cylinder heads.

CAUTION

Do not loosen nor remove the short bolts (×) (70 mm) holding the upper intake manifold to the lower. These bolts are at the front left and rear right of the upper intake manifold.

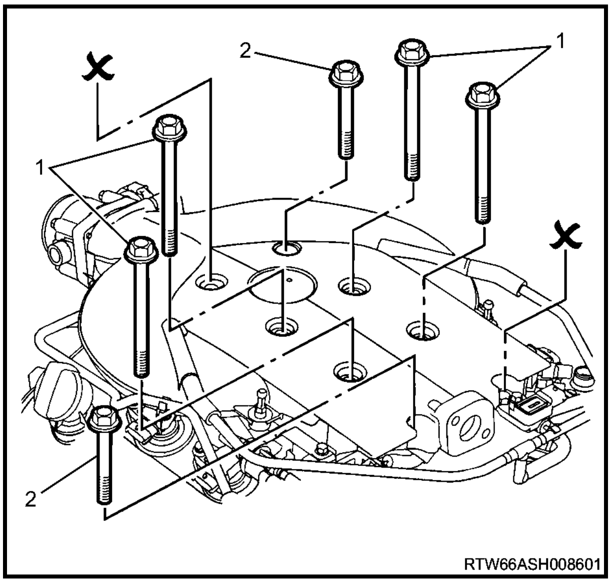

Figure 6A1 – 51

CAUTION

When the intake manifold is removed, plug each of the cylinder head intake openings with lint free cloth, to stop the entry of foreign material into the intake ports.

21 Remove the upper and lower intake manifold assembly from the engine.

22 Remove lower intake manifold to cylinder head gasket.

Disassemble

1 Disconnect the EVAP hose (1) from the upper intake manifold (2).

2 Remove the bolts (3) (70 mm long) attaching the upper intake manifold to the lower intake manifold (4).

NOTE

These bolts are located at the front left and rear right of the upper intake manifold, as shown.

3 Remove the upper intake manifold from the lower intake manifold.

4 Remove and discard the upper to lower intake manifold gaskets.

CAUTION

Do not reuse the upper to lower intake manifold gaskets (5).

5 Remove the EVAP hose from the retaining clip (6) attached to the lower intake manifold.

6 Remove the following from the upper intake manifold, refer to 6C1-3 Engine Management – V6 – Service Operations:

- BARO Sensor and
- Throttle Body assembly

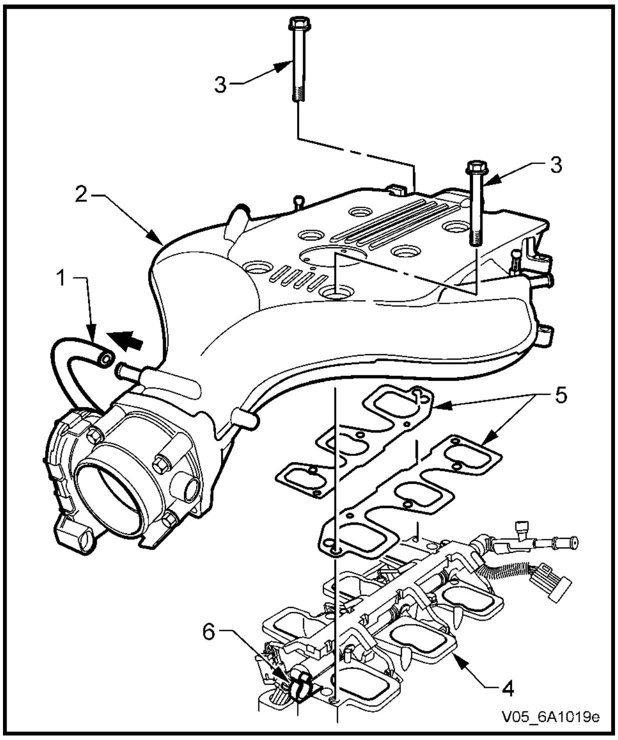

Figure 6A1 – 52

7 Remove the fuel rail and injector assembly. Refer to 6C1-3 Engine Management – V6 – Service Operations.

CAUTION

The following precautions must be followed when removing the fuel rail and injector assembly:

- **Care must be taken when removing the fuel rail and injector assembly to prevent damage to the injector spray tips and injector harness connector terminals.**
- **Support the fuel rail and injector assembly after removal.**
- **Plug all fuel line and manifold openings after removal to prevent dirt and other contaminants from entering the fuel system.**

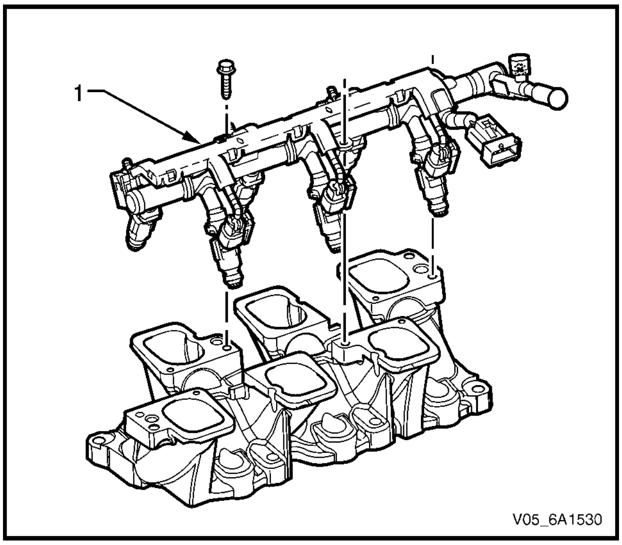

Figure 6A1 – 53

Clean

CAUTION

Due to the aluminium alloy construction of the intake manifold, wire brushes and steel scrapers must not be used during the cleaning process, as damage to sealing surfaces may occur. Use of a wooden or plastic scraper is preferred.

1 Clean mating surfaces ensuring any gasket material is removed.

2 Clean the manifold using a suitable solvent

WARNING

Safety glasses must be worn when using compressed air.

3 Dry the timing components with compressed air.

Inspect

1 Inspect the intake manifold for the following fault conditions:

- Damaged sealing and mating surfaces.
- Damaged lower intake manifold gasket.
- Damage or excessive debris on the threaded and through holes.
- Cracks or damage to the intake manifold body.

NOTE

If the lower intake manifold is cracked or damaged, it must be replaced. No welding or patching of the intake manifold should be performed.

2 Place a straight edge (1) across the upper intake manifold sealing surface (2).

3 Using a feeler gauge (3), measure the clearance between the manifold and the straight edge.

4 If the clearance between the upper intake manifold sealing surface and the straight edge exceeds the specified maximum warpage, replace the manifold.

Upper manifold maximum warpage .... 0.05 mm

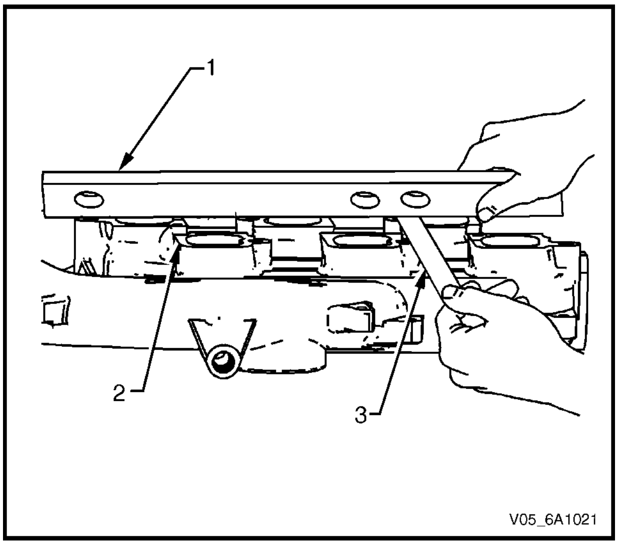

Figure 6A1 – 54

5 Place a straight edge (1) across the lower intake manifold sealing surface (2).

6 Using a feeler gauge (3), measure the clearance between the manifold and the straight edge.

7 If the clearance between the lower intake manifold sealing surface and the straight edge exceeds the specified maximum warpage, replace the manifold.

Lower manifold maximum warpage .... 0.05 mm

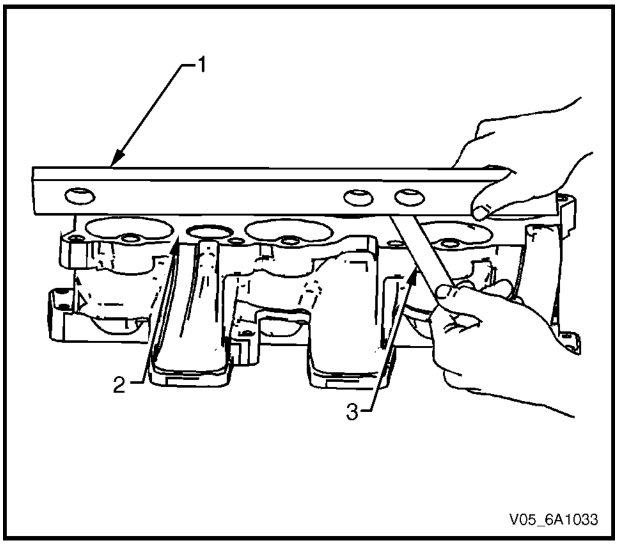

Figure 6A1 – 55

Reassemble

Reassembly of the upper to lower intake manifold is the reverse of the disassembly procedure noting the following:

1 Ensure that both the manifolds have been cleaned and inspected.

2 Ensure that the warpage of the mating surfaces is within tolerances.

3 New upper to lower intake manifold gaskets must be used.

4 Do not tighten the intake manifold to lower intake manifold attaching bolt at this stage. The intake manifold attaching bolts must be tightened at the specified sequence during the reinstallation procedure.

Reinstall

Reinstallation of the upper intake manifold and the upper and lower intake manifold assembly is the reverse of the removal procedure, noting the following:

1 Install the EVAP hose to the clip attached to the lower intake manifold.

2 Only new gaskets are to be fitted between the upper and lower intake manifolds.

3 If undamaged, the lower intake manifold to cylinder head gasket may be re-used, however its replacement is strongly recommended.

CAUTION

Tighten the intake manifold bolts in a circular pattern starting at the centre bolt and moving outward.

4 Ensure that all fasteners are tightened to the correct torque specification.

Upper intake manifold to lower intake manifold attaching bolt torque specification	23.0 Nm
Upper intake manifold to cylinder head attaching bolt torque specification	23.0 Nm
Lower intake manifold to cylinder head attaching bolt torque specification	23.0 Nm
Fuel injector wiring harness bracket attaching bolt torque specification	9.0 Nm

CAUTION

Incorrect wiring connector installation may cause component malfunction or component damage.

5 Ensure all wiring connectors are fully engaged and if applicable, locked in place.

6 Ensure all wiring harnesses are correctly routed and attached securely in their retaining clips.

7 Ensure that all hoses and pipes are routed correctly and that any retaining clips are correctly installed.

8 After installation pull on any quick connect fittings to check that each is correctly installed.

9 Start and run the engine to check for correct operation.

3.11 Exhaust Manifold Assembly

Remove

WARNING

Allow the engine to cool before commencing.

CAUTION

Disconnection of the battery affects certain vehicle electronic systems, refer to 1.1 WARNING, CAUTION and NOTES before disconnecting the battery.

1 Disconnect the battery negative terminal.

2 Remove the oxygen sensor harness connector (1) from the retaining bracket.

3 Disconnect the oxygen sensor wiring harness connector from the engine wiring harness connector (2).

4 Unclip the oxygen sensor wiring harness retaining clip and move aside.

5 For the left-hand side:

Remove the oil level indicator tube.

6 Raise the front of the vehicle and place on stands, refer to 0A General Information.

7 Working from under the vehicle, remove the two exhaust manifold to exhaust pipe flange nuts, refer to 6F Exhaust System - V6 - V6.

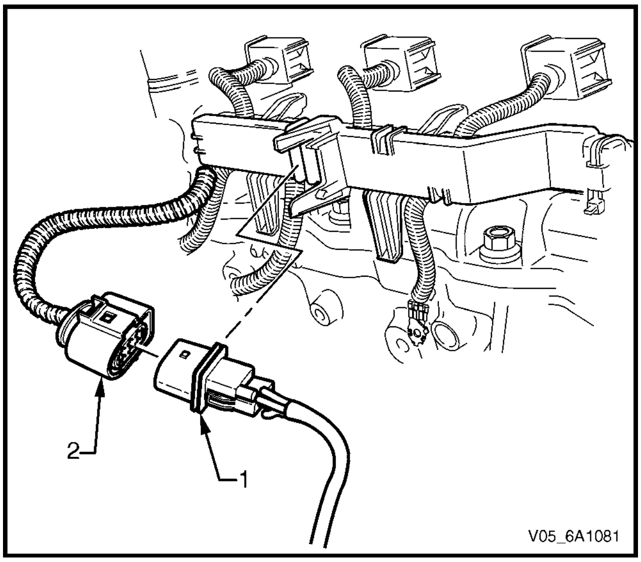

Figure 6A1 – 56

8 Remove the three bolts attaching the exhaust manifold outer heat shield (1) to the exhaust manifold (2).

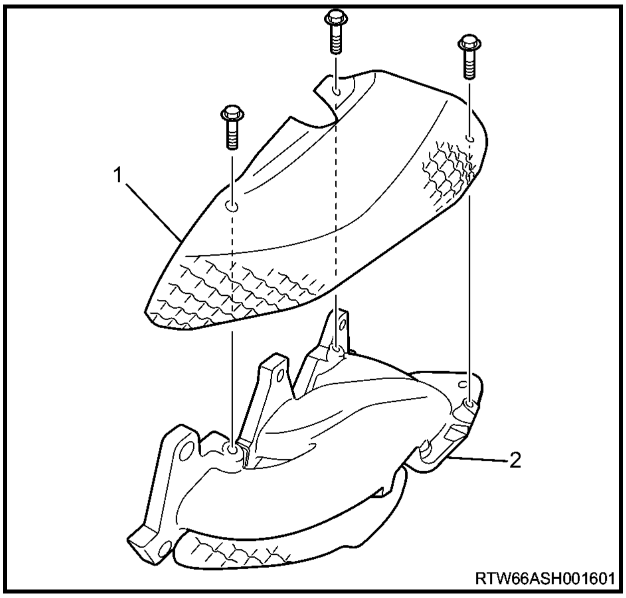

Figure 6A1 – 57

9 Progressively loosen the seven exhaust manifold attaching bolts (2), working from the outside to the centre and then remove the bolts.

10 Manoeuvre the exhaust manifold (3), away from the cylinder head.

11 Remove and discard the exhaust manifold to cylinder head gasket.

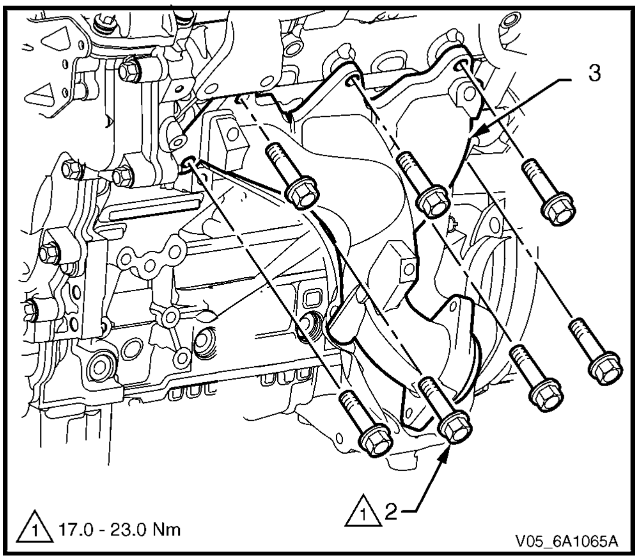

Figure 6A1 – 58

12 Remove the three bolts (1), attaching the exhaust manifold inner heat shield to the exhaust manifold.

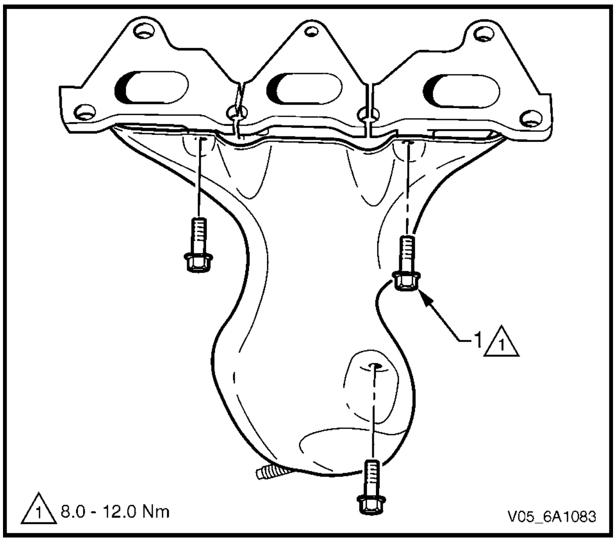

Figure 6A1 – 59

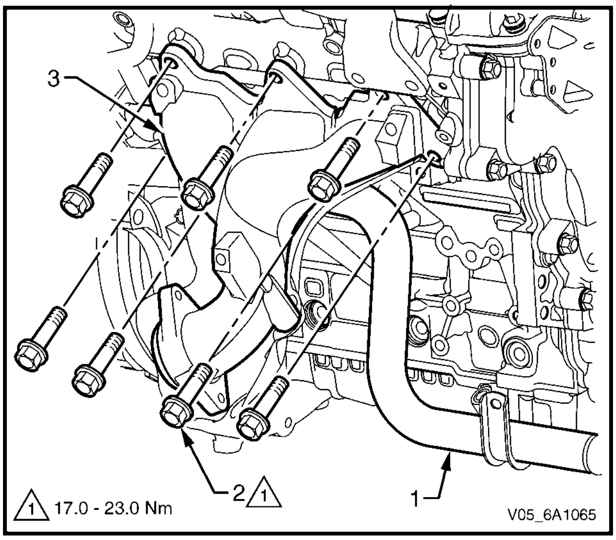
13 Using a suitable commercially available non-corrosive cleaning solvent and a soft bristled parts cleaning brush, thoroughly clean the exhaust manifold.

14 Dry the exhaust manifold using compressed air.

WARNING

Safety glasses must be worn when using compressed air.



NOTE

- The same procedure applies to the Right-hand exhaust manifold.
- To gain access to the lower rear exhaust manifold attaching bolts (2), apply a slight downward movement to the coolant inlet pipe (1).

Inspect

Inspect the exhaust manifold (1) for the following:

- Damage to the threaded holes for the heat shield mounting.
- Damage to the exhaust manifold mounting holes.
- Damage to the threads of the exhaust manifold to exhaust pipe flange studs.
- Damage to the gasket sealing surfaces.
- Using a straight edge (2) and feeler gauges (3), check the cylinder head mounting face of the exhaust manifold does not exceed the maximum distortion specification of 0.25mm.

NOTE

If the surface flatness is not within specifications, the exhaust manifold is warped and must be replaced.

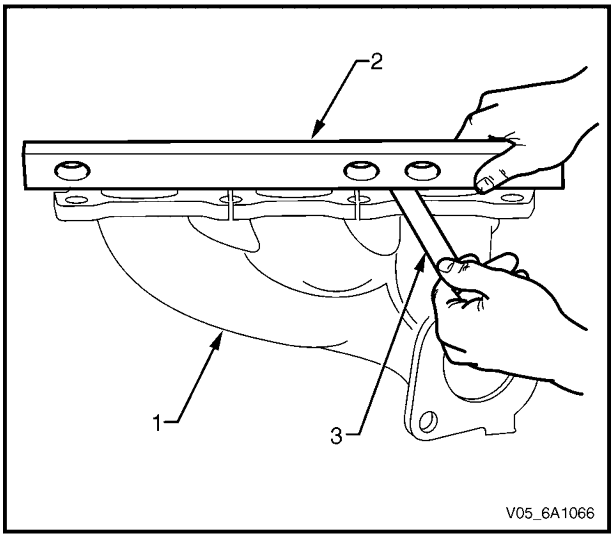


Figure 6A1 – 60

Reinstall

Reinstallation of the exhaust manifold assembly is the reverse of the removal procedure, noting the following:

1 Ensure the exhaust manifold, cylinder head and exhaust pipe flange surfaces are clean.

2 Position a new exhaust manifold gasket onto the exhaust manifold.

3 Apply a 5 mm bead of Loctite 272 thread sealant (or equivalent) to the threads of the exhaust manifold attaching bolts.

4 Install the bolts into the exhaust manifold. This will prevent the gasket from falling off the manifold.

5 Manoeuvre the exhaust manifold into position and install the exhaust manifold attaching bolts.

6 From underneath the vehicle install the exhaust manifold to exhaust pipe flange nuts.

7 Tighten the exhaust manifold attaching bolts to the correct torque specification.

NOTE

When tightening the exhaust manifold to cylinder head attaching bolts, begin with the centre bolts, then alternate from side to side to the outer bolts.

Exhaust manifold to cylinder head attaching bolt torque specification...........17.0 – 23.0 Nm

8 Apply an anti seize compound such as Caltex Kopr-Kote (or equivalent) to the cleaned heat shield bolt threads. Install the heat shield attaching bolts and tighten to the correct torque specification.

Exhaust manifold heat shield attaching bolt torque specification ....8.0 – 12.0 Nm

9 For the right-hand side, install the battery harness ground cable attaching nut through the ground terminal and lower coolant tube mounting lug, and tighten to the correct torque specification.

Battery harness ground terminal attaching nut torque specification.......................13.0 Nm

3.12 Camshaft Cover

Remove

1 Remove the intake manifold assembly, refer to 3.10 Intake Manifold Assembly – Complete.

2 For the left-hand side, remove the evaporative (EVAP) emission canister purge solenoid, refer to 6C1-3 Engine Management – V6 – Service Operations.

3 Remove the two bolts (1) attaching the engine wiring harness former to the rear of the cylinder heads.

4 Unclip the transmission vent tube (2) from the engine wiring harness.

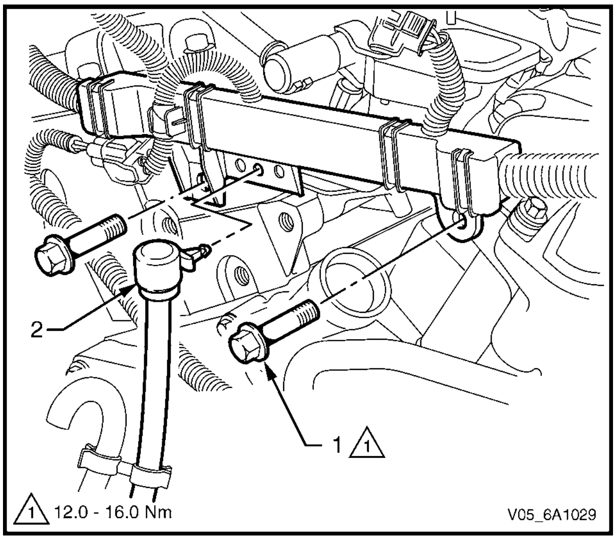

Figure 6A1 – 61

5 Disconnect the oxygen sensor wiring harness connector (1) from the engine wiring harness (2), left-hand shown, right-hand similar.

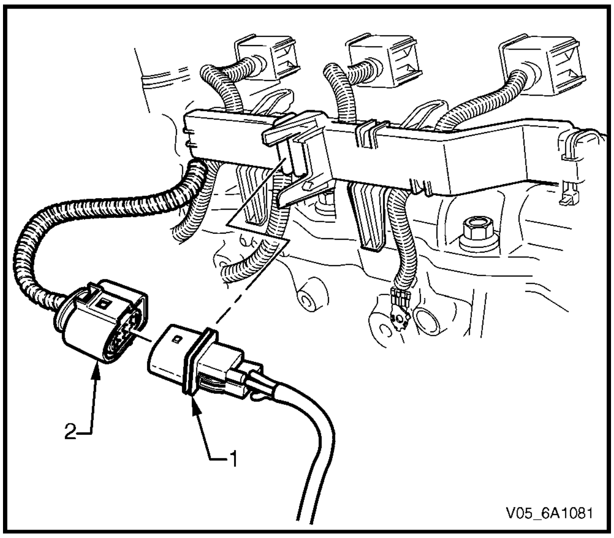

Figure 6A1 – 62

6 Remove the bolt (1) attaching the ground connector (2) to the cylinder head.

7 Fro the left-hand side, disconnect the engine coolant temperature (ECT) sensor wiring connector (3).

8 Unclip the engine wiring harness retaining lugs from the side of the camshaft cover.

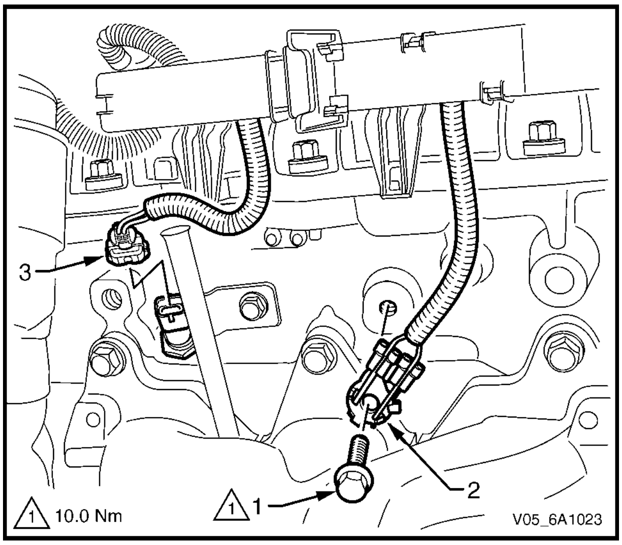

Figure 6A1 – 63

9 For the right-hand side, remove the engine wiring harness retaining clip (1) from the engine control module (ECM) bracket (2).

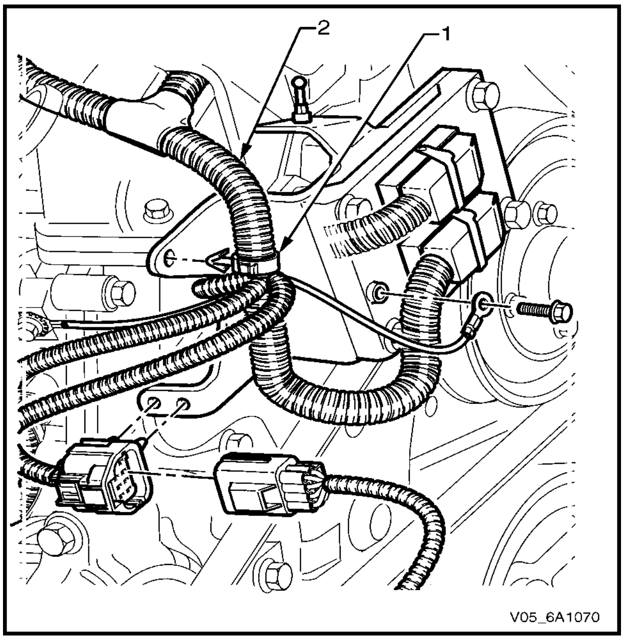

Figure 6A1 – 64

10 Disconnect the camshaft position (CMP) sensor wiring connector (1).

11 Unclip the engine wiring harness retaining lug (3) from the front of the camshaft cover.

12 Remove the ignition coil assemblies; refer to 6C1-3 Engine Management – V6 – Service Operations.

13 Move the engine wiring harness clear of the camshaft cover.

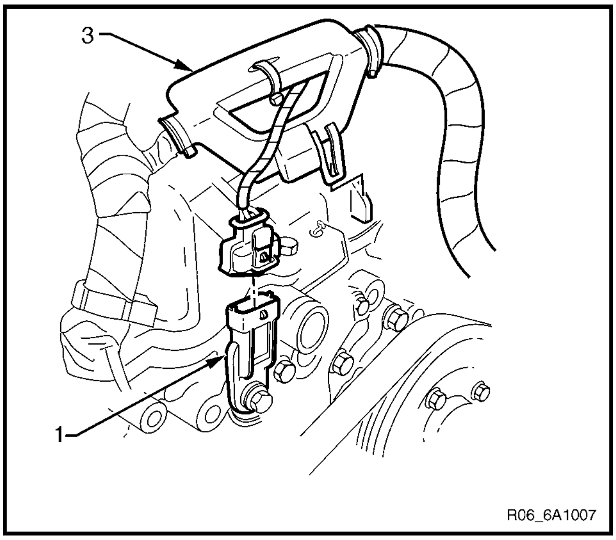

Figure 6A1 – 65

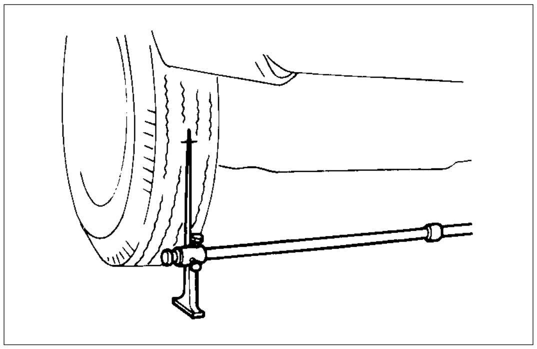
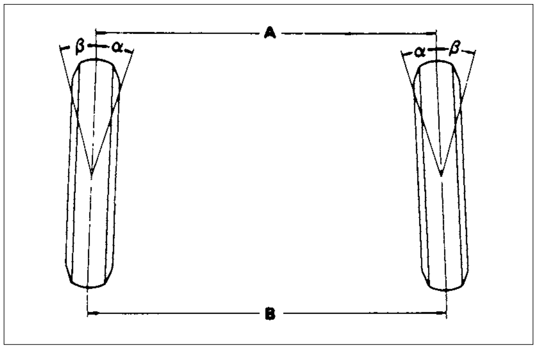


Toe-in Adjustment

Measurement should be taken with the vehicle on a surface plate.
If a surface plate is not available, toe-in should be checked with the vehicle parked on a level floor.

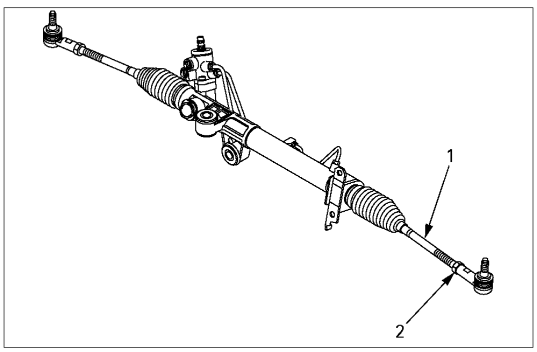
1. Set front wheels to straight ahead position.
2. Align the toe-in gauge with center height of each wheel at front end.
3. Apply center marks to each wheel, then take measurement of distance A between the center marks on each wheel.
4. Slowly move the vehicle rearward until the center marks reach the rear end position.
5. Take measurement of distance B between the center marks at rear end.



The toe-in can be calculated with the following formula.
Toe-in = B - A

Toe-in mm (in)

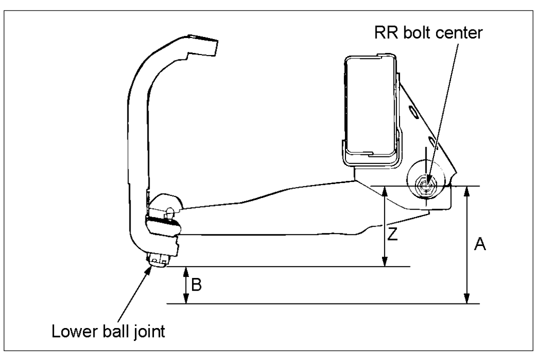
4×2 (Except high ride suspension)	0±2 (0±0.08)



To adjust the toe-in angle, loosen the lock nuts (2) on the tie rod (1) and turn the tie rod. Turn both rods the same amount, to keep the steering wheel centered.

Lock Nut Torque N·m (kgf·m/lb·ft)

98±6.0 (10.0±0.6 / 72.3±4.3)



RTW53ASH000101

Trim Height

Trim Height : at Curb Weight (Reference Data)

Trim height (Z) = A - B

Front mm (in)

Z
105(4.13)

14 Remove the bolt (1), 13 places, attaching the camshaft cover (2) to the cylinder head (3).

15 Remove the cover and discard the seal.

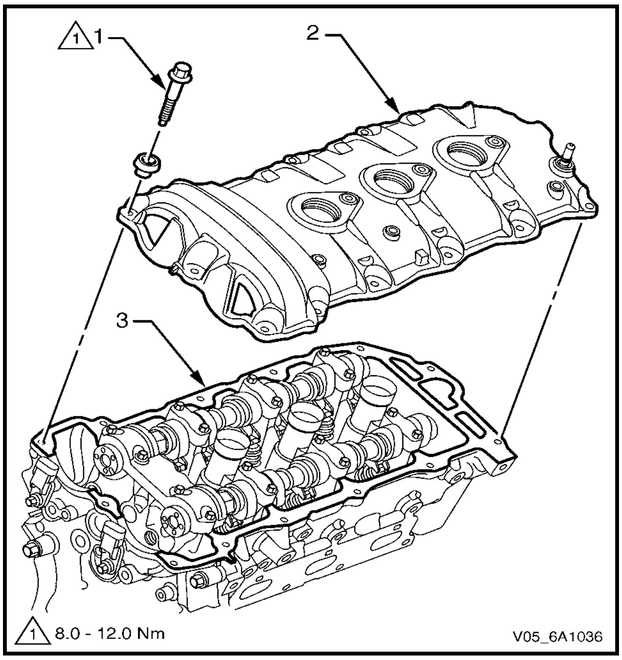


Figure 6A1 – 66

16 Install Tool No. EN-46101 (1) to the spark plug tubes of the cylinder head to prevent entry of dirt into the combustion chamber.

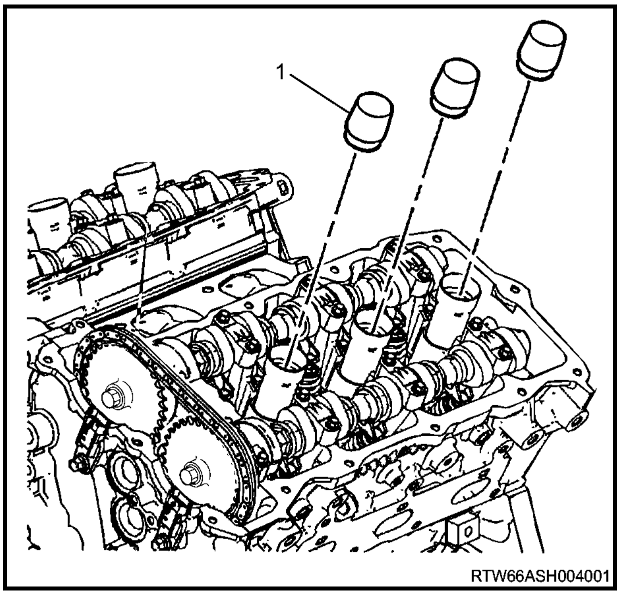

Figure 6A1 – 67

Clean and Inspect

WARNING

Safety glasses must be worn when using compressed air.

1 Clean the camshaft cover with suitable cleaning solvent and blow dry with compressed air.

2 Inspect the cover for cracking and distortion.

3 Check the spark plug tube seals for damage.

4 If the camshaft cover is damaged in any way that will affect it's performance to seal and stop the ingress of dirt, replace the camshaft cover.

Reinstall

Reinstallation of the camshaft cover assembly is the reverse of the removal procedure, noting the following:

1 If not already fitted, install Tool No. EN-46101 (1) to the spark plug tubes of the cylinder head.

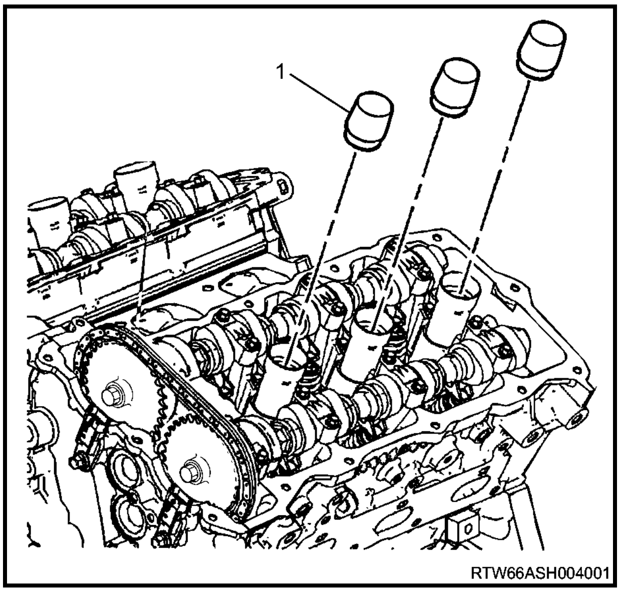

Figure 6A1 – 68

2 Ensure that the grommet (1), 13 places, is correctly seated in its hole.

3 Wipe the camshaft cover sealing surface on the cylinder head with a clean lint free cloth.

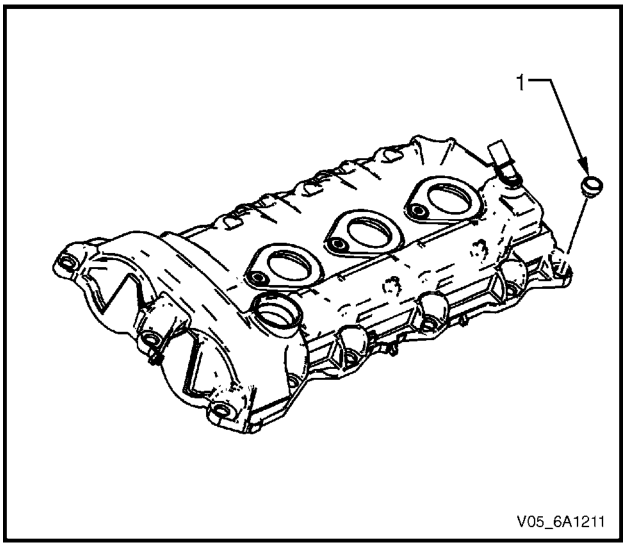

Figure 6A1 – 69

4 Ensure that a new seal is correctly fitted to the camshaft cover. Place a 3 mm bead of RTV sealant on the join line of the engine front cover (1).

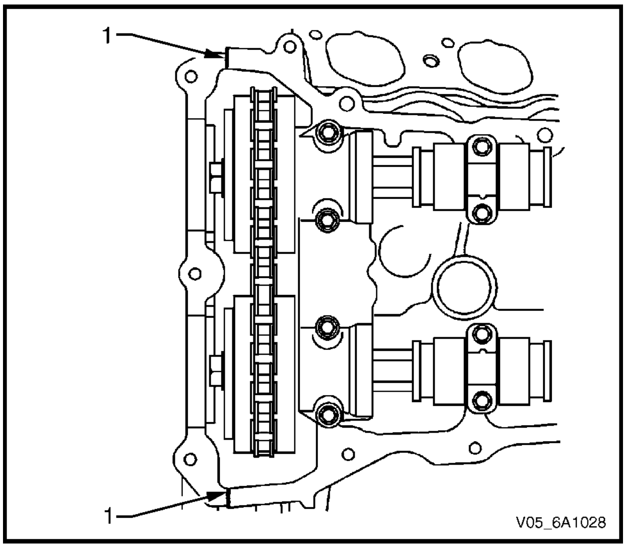

Figure 6A1 – 70

5 Place the camshaft cover (1) into position onto the cylinder head (2).

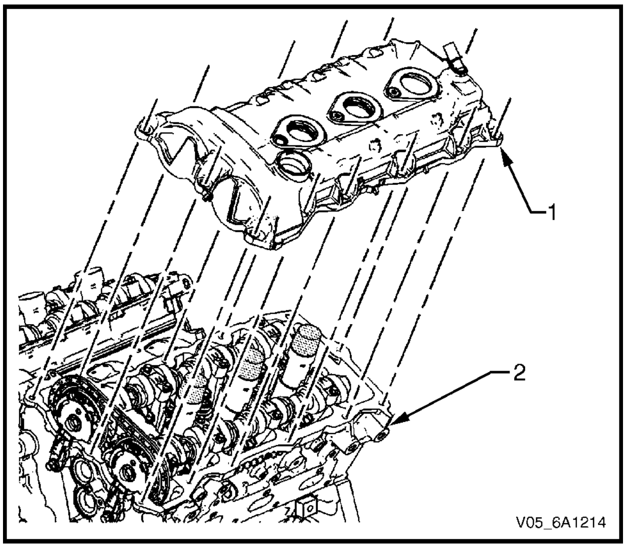

Figure 6A1 – 71

6 Loosely install the camshaft cover bolt (1), 13 places.

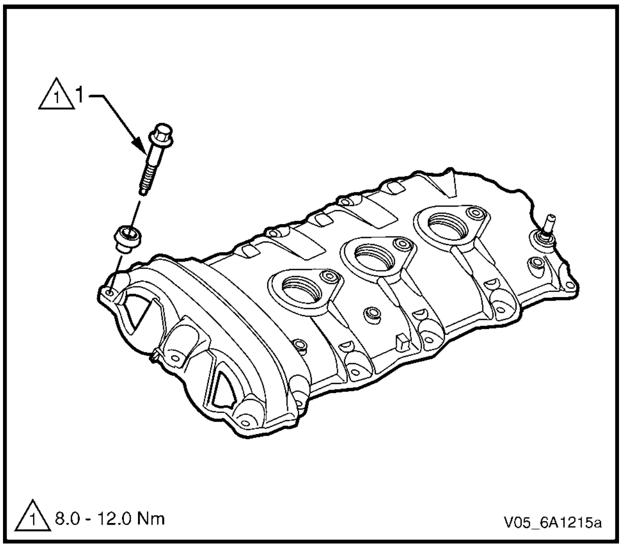

Figure 6A1 – 72

7 Tighten the camshaft cover bolts to the correct torque specification, in the sequence shown.

Camshaft cover attaching bolt torque specification	8.0 – 12.0 Nm

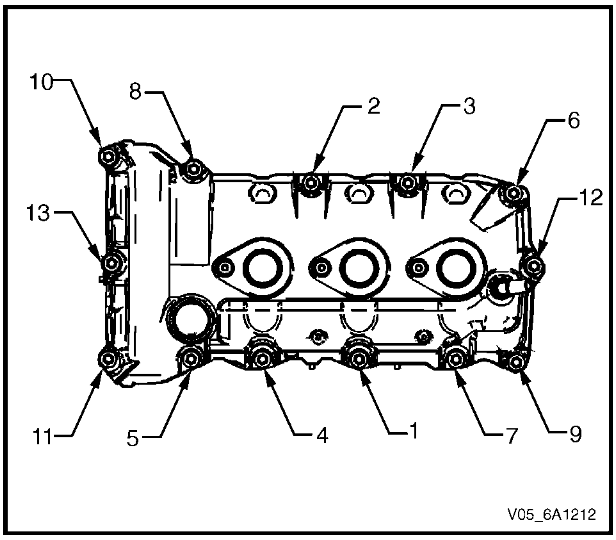

Figure 6A1 – 73

8 Remove Tool No. EN-46101 (1).

9 Tighten all remaining fasteners to the correct torque specification.

Engine ground connector bolt torque specification	10.0 Nm
Engine wiring harness former attaching bolt torque specification	12.0 – 16.0 Nm

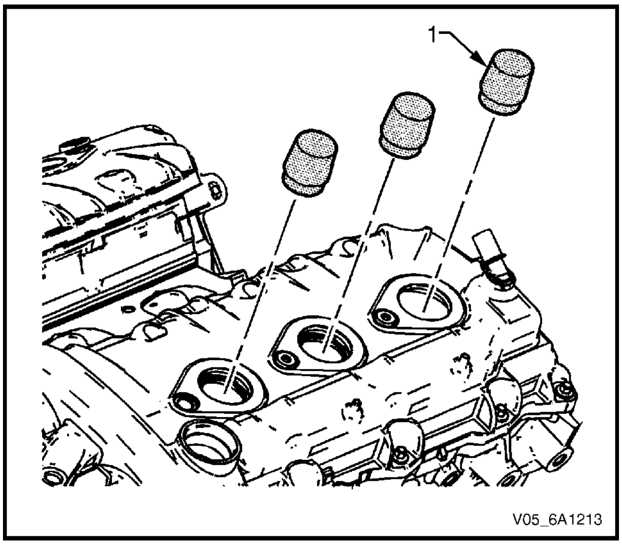

Figure 6A1 – 74

3.13 Crankshaft Balancer Assembly

Remove

1 Remove the accessory drive belt, refer to 3.5 Accessory Drive Belt.

2 Remove the starter motor, refer to 6D1-2_ Starting System.

3 Install Tool No. EN-46106 (1) into the starter motor opening to stop the camshaft from rotating.

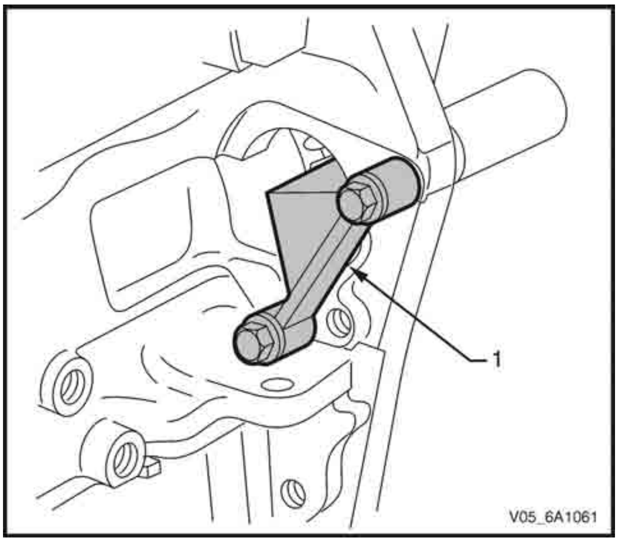

Figure 6A1 – 75

4 Remove the bolt (1) attaching the crankshaft balancer assembly (2) to the crankshaft.

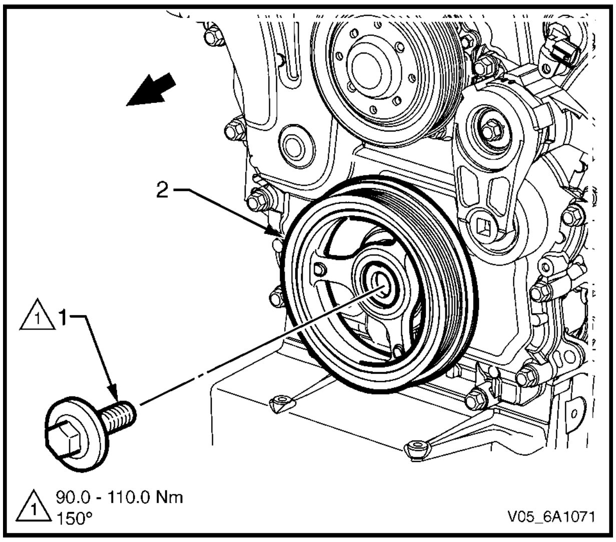

Figure 6A1 – 76

5 Remove the crankshaft balancer assembly (1) from the crankshaft using the appropriate tool:

Tool No. J-41816 (2) or equivalent.

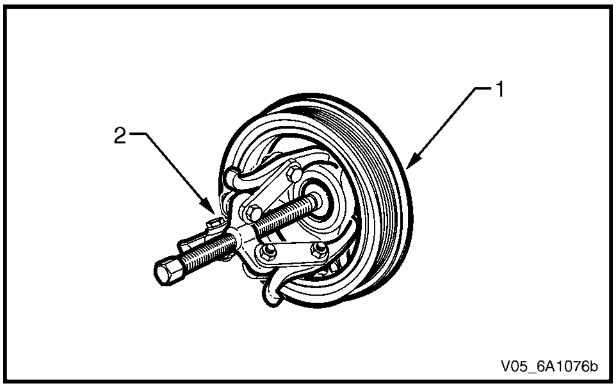

Figure 6A1 – 77

Clean and Inspect

1 Using a suitable non-corrosive cleaning solvent and a soft bristled parts cleaning brush, clean the crankshaft balancer assembly.

WARNING

Safety glasses must be worn when using compressed air.

2 Dry the crankshaft balancer assembly using compressed air.

3 Inspect the crankshaft balancer assembly for the following fault conditions:

- Hub to crankshaft inner surface for wear or damage,
- Sealing surface for wear, grooving or scoring,
- Rubber ring between the hub and the pulley for wear, chunking and general deterioration, and
- Drive belt ribs of the pulley for damage.

Reinstall

CAUTION

Do not lubricate the crankshaft front oil seal or crankshaft balancer sealing surfaces. The crankshaft balancer must be installed onto a dry seal.

1 Lubricate the crankshaft balancer assembly hub bore.

2 Partially install the crankshaft balancer assembly onto the crankshaft.

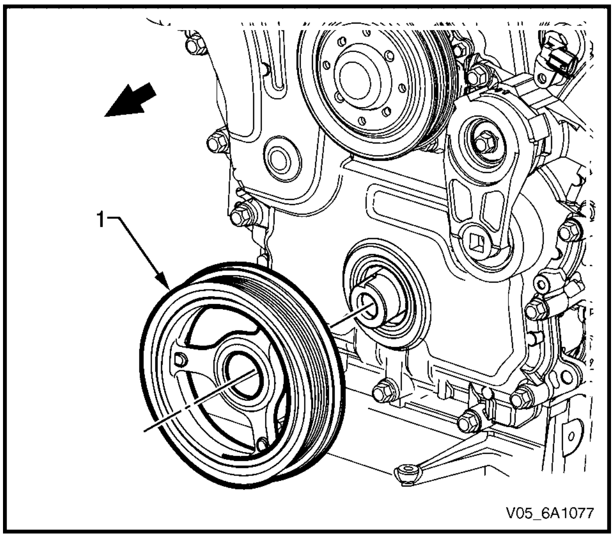

Figure 6A1 – 78

3 Using crankshaft balancer installer, Tool No. J-41998-B (1), fully install the crankshaft balancer assembly into the crankshaft.

CAUTION

To prevent damage to the crankshaft threads, fully install crankshaft balancer installer, Tool No. J-41998-B (1) into the crankshaft before pressing the pulley and balancer assembly.

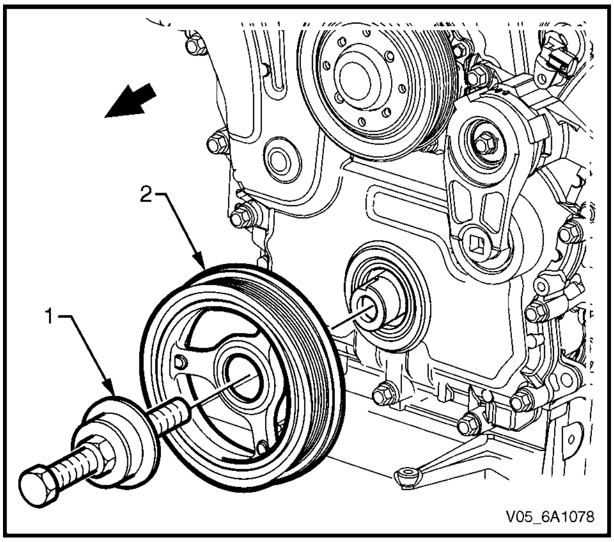

Figure 6A1 – 79

4 Apply Loctite 272 or equivalent to the thread of a new crankshaft balancer assembly retaining bolt (1).

5 Install the crankshaft balancer assembly retaining bolt and tighten to the correct torque specification.

■ ♦ Crankshaft balancer retaining bolt torque specification:
Stage 1 ....90.0 – 110.0 Nm
Stage 2 ....150°

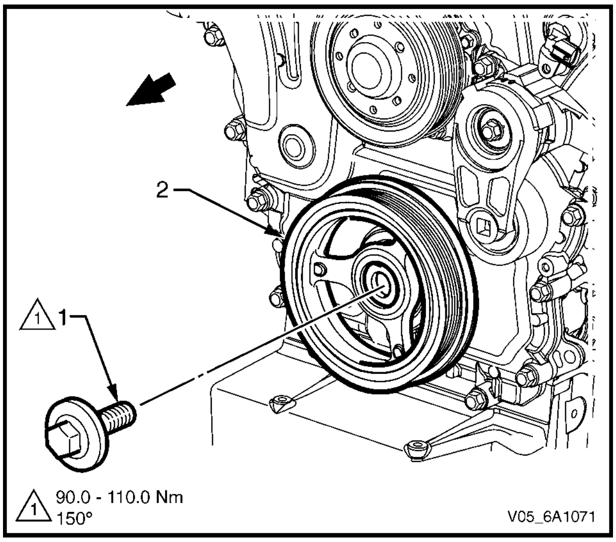

Figure 6A1 – 80

3.14 Crankshaft Front Seal

Replace

1 Remove the crankshaft balancer assembly, refer to 3.13 Crankshaft Balancer Assembly.

2 Using a flat bladed tool (2) or seal remover, Tool No. E-308, carefully remove the crankshaft front seal (1) from the front cover.

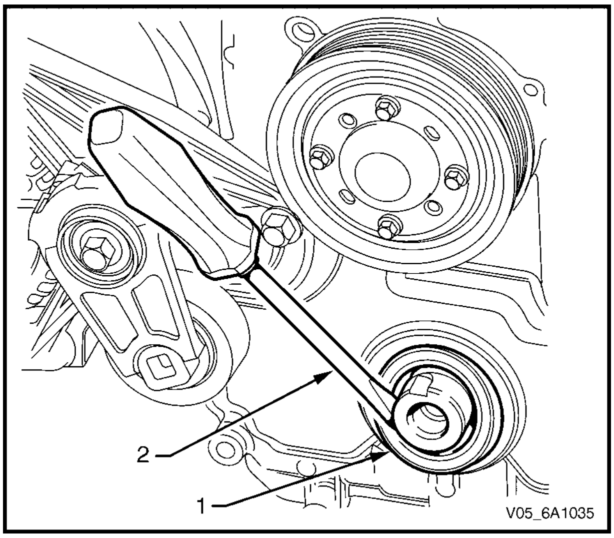

Figure 6A1 – 81

3 Using crankshaft front seal installer, Tool No. J-29184 (2) and a suitable hammer, install a new crankshaft front seal (1) until fully seated against the front cover housing.

4 Install the crankshaft balancer assembly, refer to 3.13 Crankshaft Balancer Assembly.

CAUTION

Do not lubricate the crankshaft front oil seal or crankshaft balancer sealing surfaces. The crankshaft balancer is installed into a dry seal.

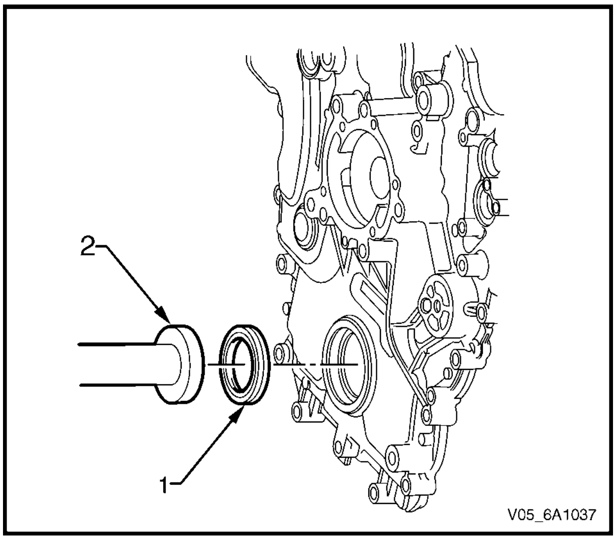

Figure 6A1 – 82

3.15 Front Cover Assembly

Remove

1 Drain the engine coolant, refer to 6B1_Engine Cooling.

2 Remove the water outlet pipe and coolant pump assembly, refer to 6B1_ Engine Cooling:

3 Remove the camshaft covers, refer to 3.12 Camshaft Cover.

4 Remove the crankshaft balancer assembly, refer to 3.13 Crankshaft Balancer Assembly.

5 Disconnect the purge vent hose from the water outlet pipe.

NOTE

Do not disconnect the power steering pipes or drain the power steering fluid.

6 Remove the power steering pump reservoir mounting bracket, refer to 3.8 Power Steering Pump Bracket.

7 Remove the camshaft position sensor, refer to 6C1-3 Engine Management – V6 – Service Operations.

NOTE

Do not disconnect the A/C compressor pipes.

8 Remove the bolt (2), 22 places, attaching the front cover assembly (1).

CAUTION

Only use the prise points and a bolt in the jackscrew hole to remove the engine front cover.

9 Loosely install a 10 x 1.5 mm bolt in the jackscrew hole (1).

10 Using the prise points (2) located at the edge of the front cover and the jackscrew, shear the RTV sealant.

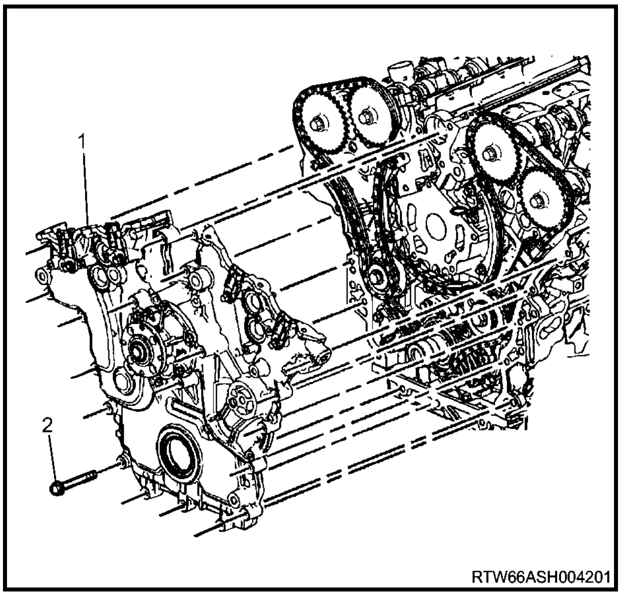

Figure 6A1 – 83

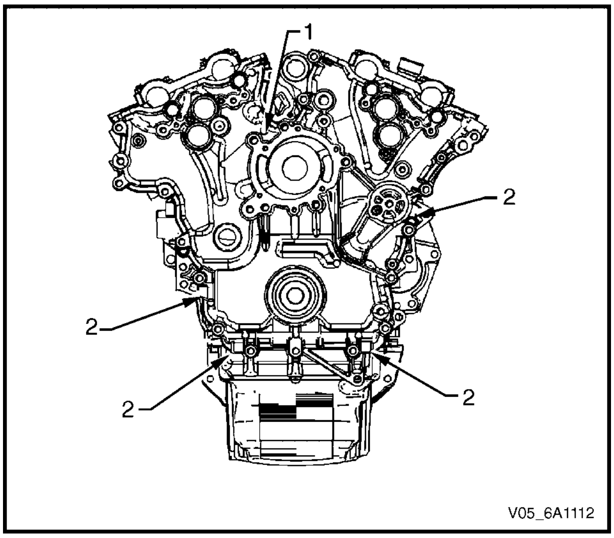

Figure 6A1 – 84

11 Remove the front cover assembly (1).

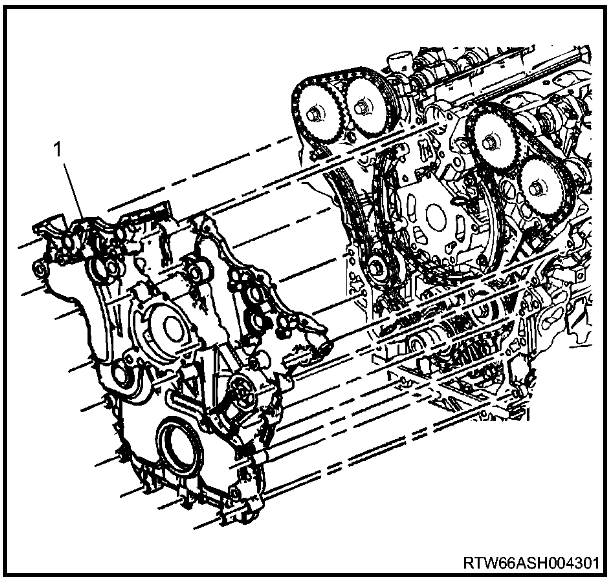

Figure 6A1 – 85

Disassemble

1 Remove the crankshaft front oil seal (1) from the engine front cover (2) using a flat bladed tool or seal remover, Tool No. E-308. Discard the seal.

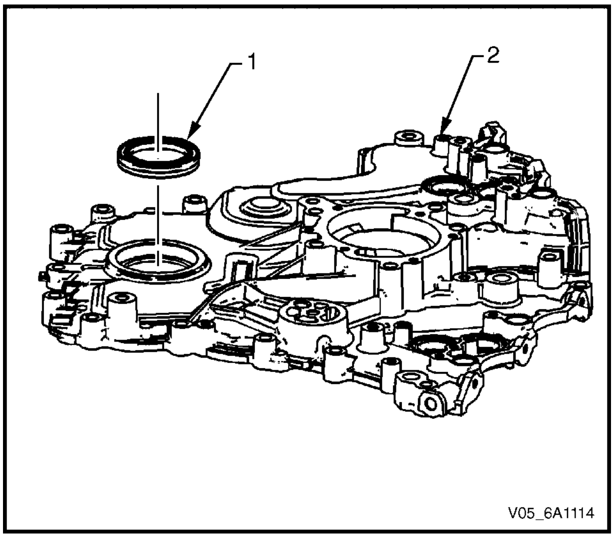

Figure 6A1 – 86

2 Remove the camshaft position actuator valve oil seals (1) from the engine front cover (2). Discard the seals.

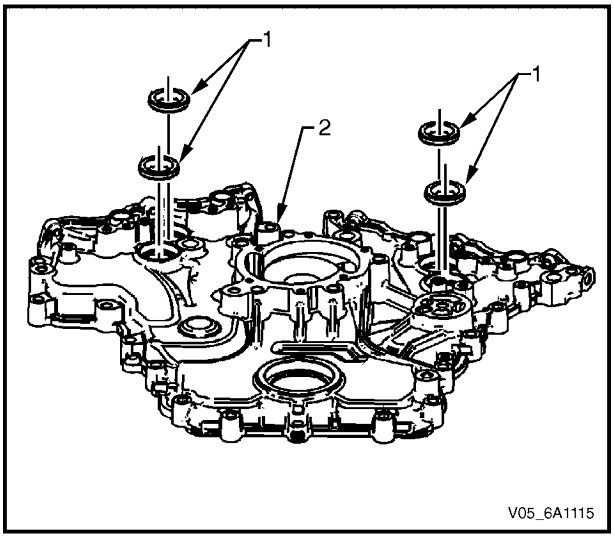

Figure 6A1 – 87

3 Remove the coolant pump seal (1) from the engine front cover (2). Discard the seal.

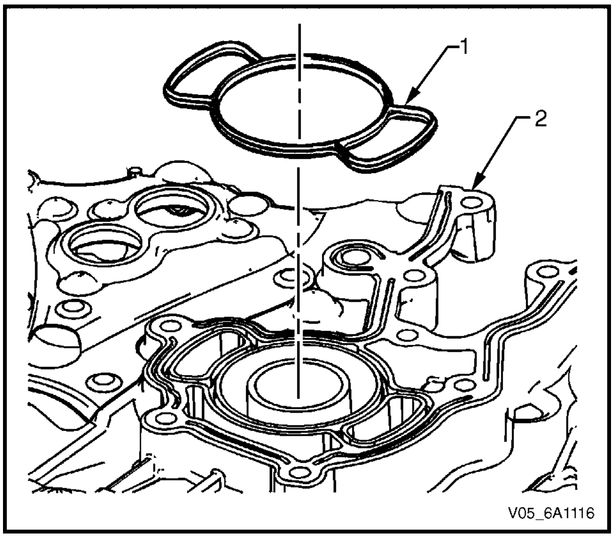

Figure 6A1 – 88

Clean

4 Remove any RTV sealant (1) from the engine front cover using a plastic or wood scraper.

CAUTION

- **Insert a piece of cardboard between the front of the oil pan and oil pump to prevent any contaminants from falling into the oil pan.**
- **Do not use a sharp or metal gasket scraper to clean the sealing surfaces.**

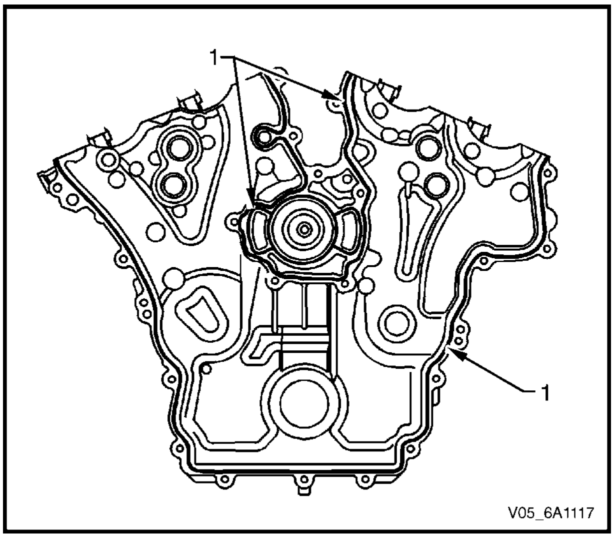

Figure 6A1 – 89

5 Clean out any debris from the bolt holes.

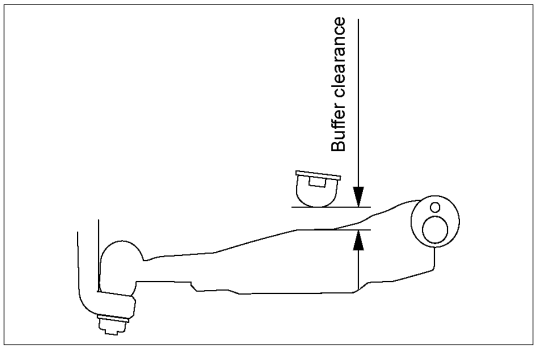
6 Clean the front cover with a suitable cleaning solvent.

7 Dry the front cover with compressed air.

WARNING

Safety glasses must be worn when using compressed air.

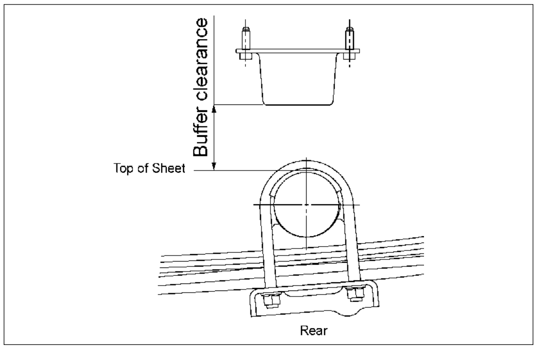
8 Use compressed air to remove any engine coolant from the engine cooling passages and from the top of the oil pan oil deflector.



RTW53ASH000201

FRT Buffer clearance (Reference Data) mm(in)

4×2 (Except high ride suspension)
25.9(1.02)



RTW340SH000101-X

4×2 (Except high ride suspension)
82 (3.23)

MAXIMUM STEERING ANGLE

	4×2 (Except high ride suspension)
Outside wheel	33.5°
Inside wheel	37.1°

Inspect

1 Inspect both sides of the engine front cover for the following conditions:

- damage to the camshaft position actuator valve oil seal bores (1),
- damage to the bolt holes (2),
- damage and/or corrosion to the engine coolant passage (3),
- dents or damage to the exterior (4),
- damage to the crankshaft front oil seal bore (5),
- gouges or damage to the coolant pump sealing surfaces (6), and
- damage to the coolant pump bolt hole threads (7).

2 Repair or replace the front cover as required.

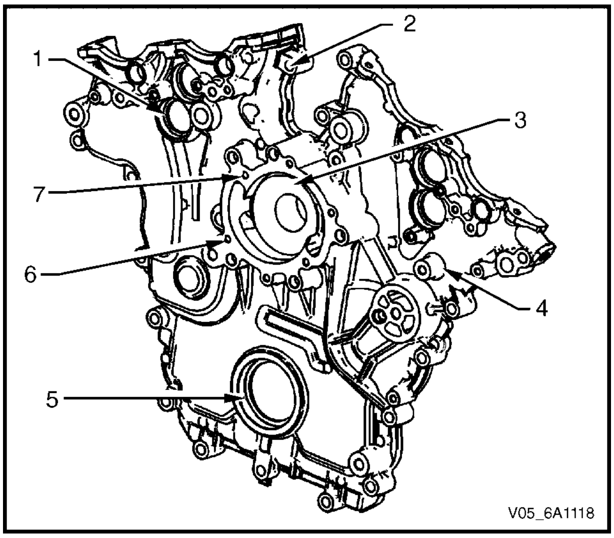

Figure 6A1 – 90

Reassemble

1 Install a new crankshaft front oil seal (1) into the front cover (2) using crankshaft front seal installer, Tool No. J-29184 (3) and a suitable hammer.

CAUTION

Do not lubricate the crankshaft front oil seal or crankshaft balancer sealing surfaces. The crankshaft balancer is installed into a dry seal.

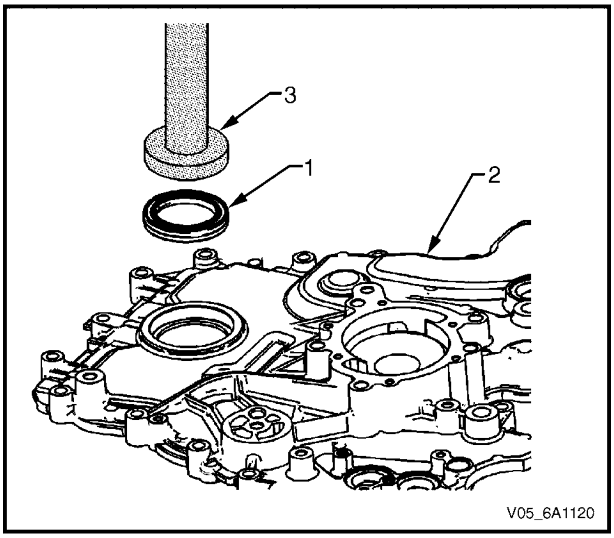

Figure 6A1 – 91

2 Install a new camshaft position actuator valve oil seal (1) into the front cover (2) using Tool No. EN-46103 (3) and a suitable hammer.

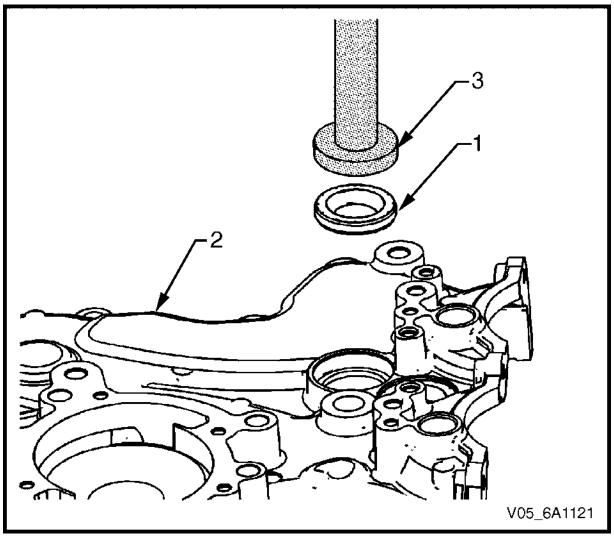

Figure 6A1 – 92

Reinstall

Reinstallation of the front cover is the reverse of the removal procedure, noting the following:

1 Install the guide pins, Tool No. EN-46109 (1) into the engine block, two places.

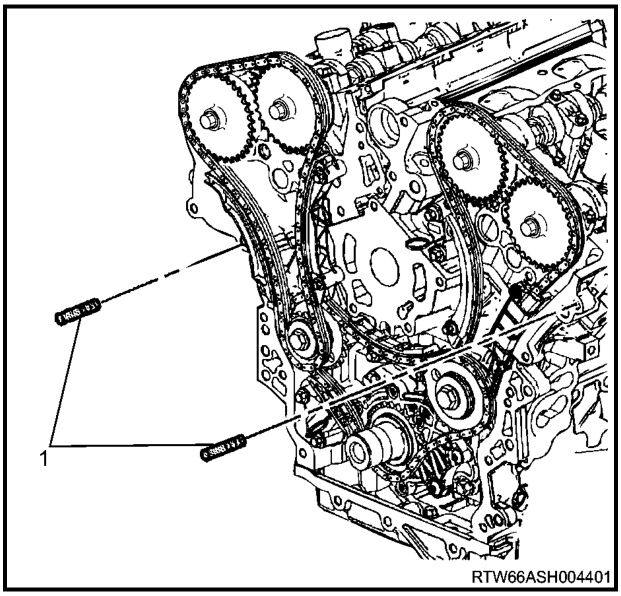

Figure 6A1 – 93

2 Install a new engine front cover to cylinder block seal (1).

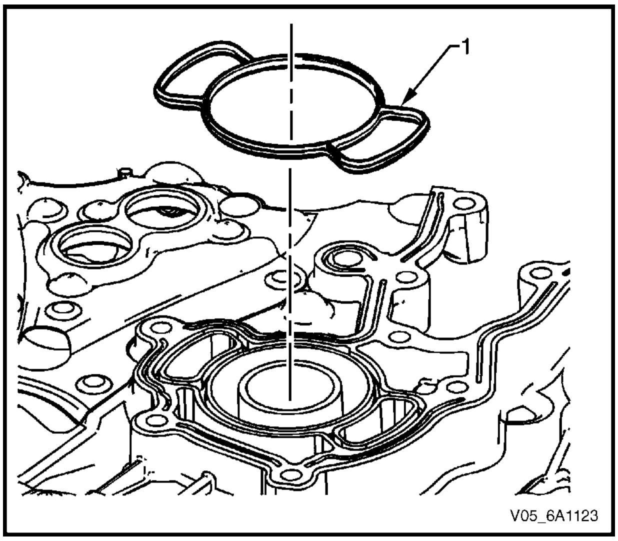

Figure 6A1 – 94

3 Apply a 3 mm bead of RTV sealant (1) to the front cover.

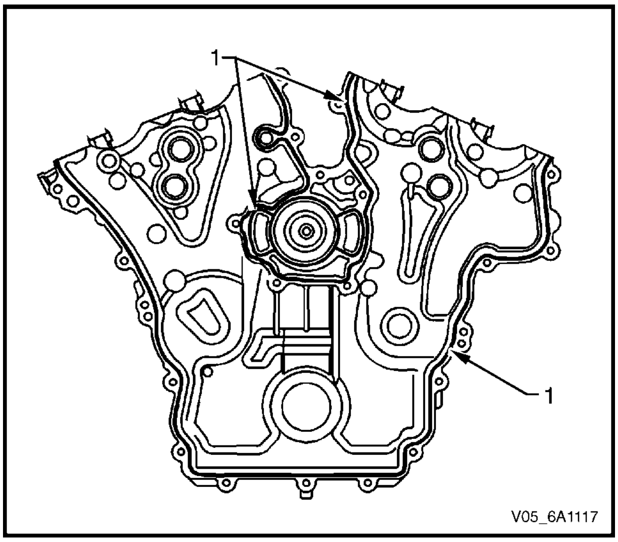

Figure 6A1 – 95

4 Place the front cover onto the special tools and slide into position.

5 Remove the special tools from the cylinder block.

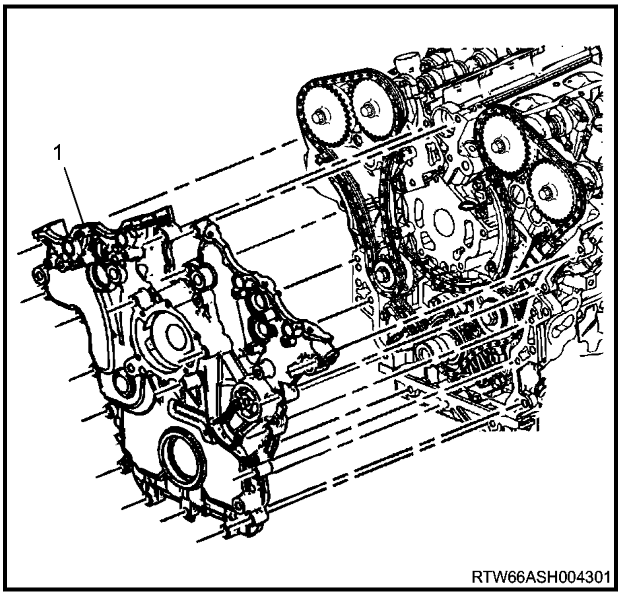

Figure 6A1 – 96

6 Hand start the front cover bolts (1).

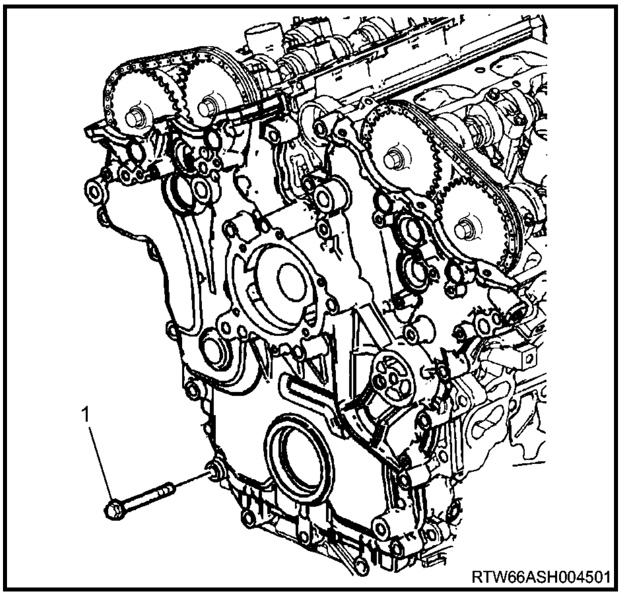

Figure 6A1 – 97

7 Tighten the engine front cover bolts to the correct torque specification, in the sequence shown.

Engine front cover assembly attaching bolt torque specification ....20.0 – 26.0 Nm

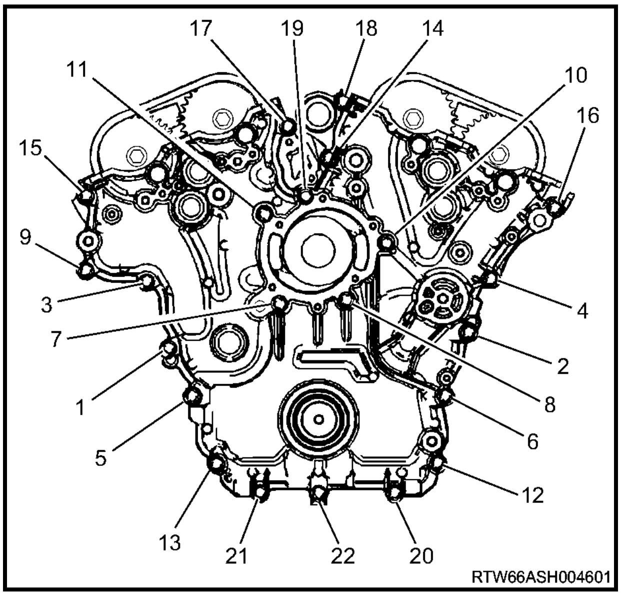

Figure 6A1 – 98

8 Fill the cooling system, refer to 6B1 Engine Cooling – V6.

9 Change the engine oil, refer to 3.1 Engine Oil.

3.16 Timing Chains, Tensioners, Shoes and Guides

CAUTION

Setting the camshaft timing is required whenever the camshaft drive system has been disturbed and the relationship between any chain and sprocket has been lost. If required, follow the left-hand secondary timing chain reinstallation procedure to reset the camshaft timing.

Primary and Left-hand Secondary Timing Chain Installation

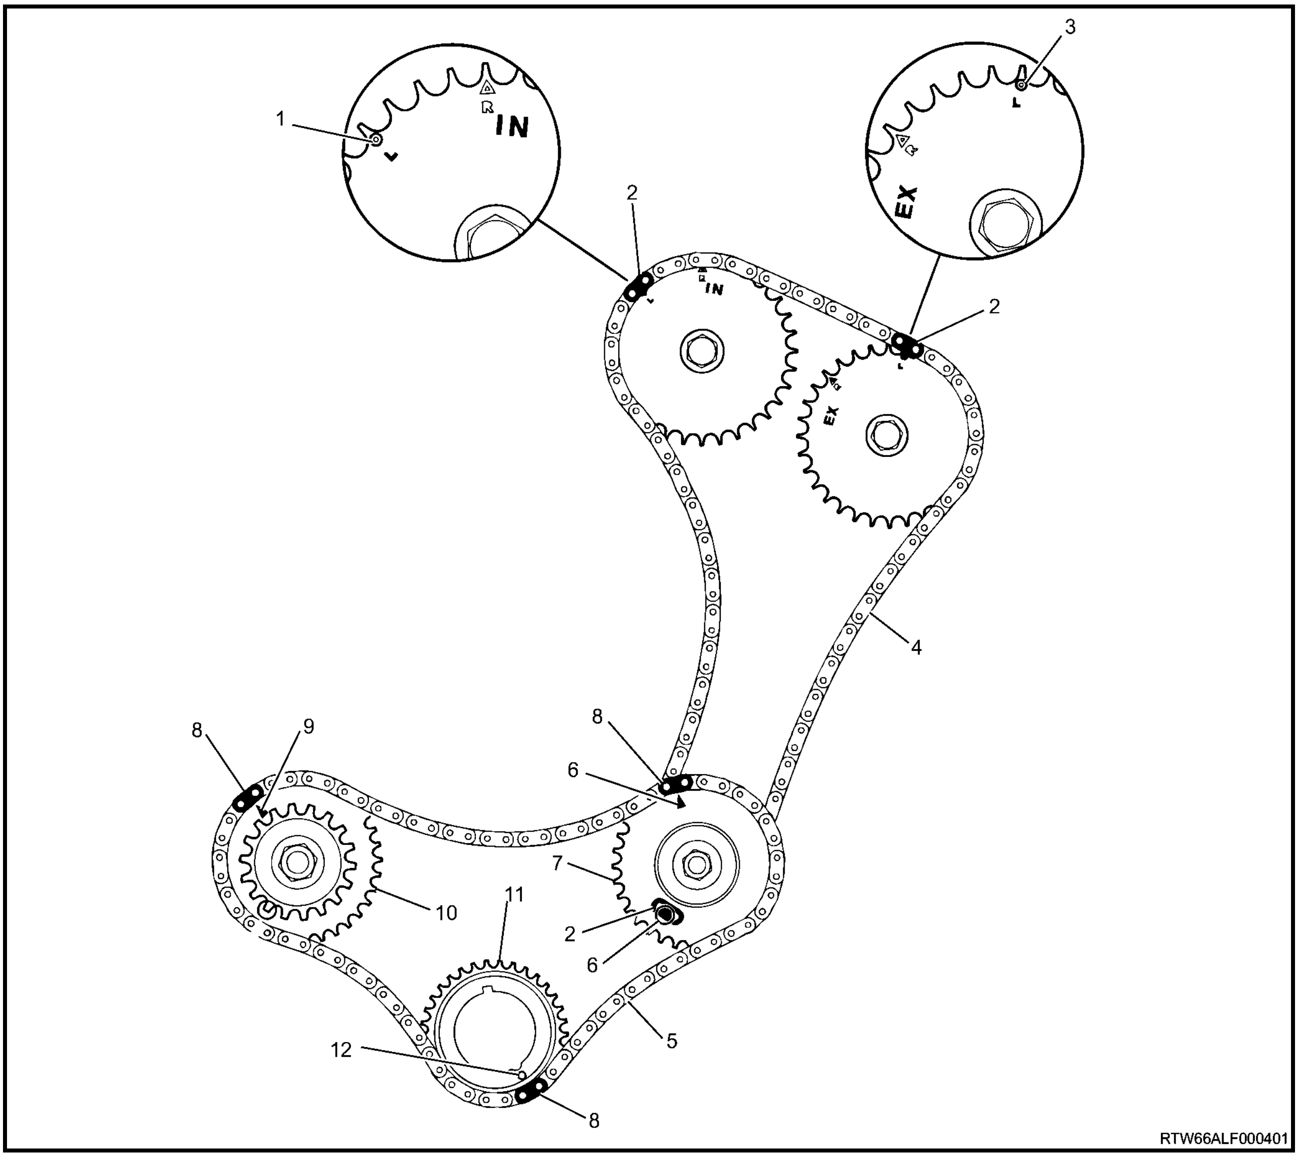

Figure 6A1 – 99

Remove

Right-hand Secondary Timing Chain

CAUTION

After removing the upper intake manifold, and spark plugs, plug any openings to prevent dirt and other contaminants from entering.

1 Remove the engine front cover assembly, refer to 3.15 Front Cover Assembly.

2 Remove the spark plugs to aid crankshaft/engine rotation, refer to 6C1-3 Engine Management – V6 – Service Operations.

3 Install Tool No. EN46111 (1) onto the crankshaft (2).

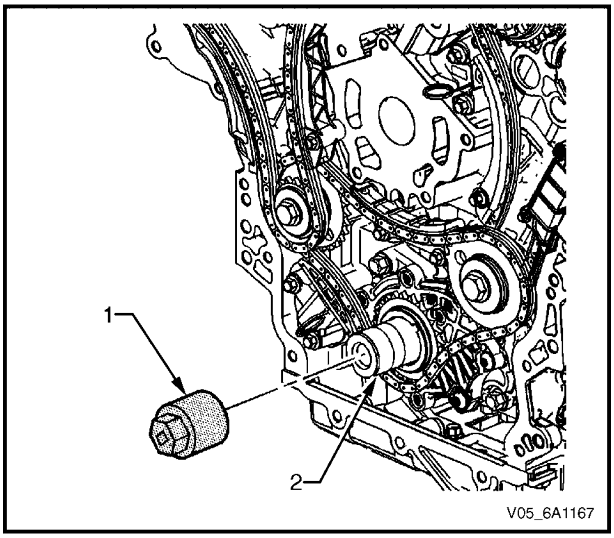

Figure 6A1 – 101

4 Using Tool No. EN46111 (1), rotate the crankshaft in a clockwise direction until the crankshaft sprocket timing mark (2) is aligned with the indexing mark (3) on the oil pump housing.

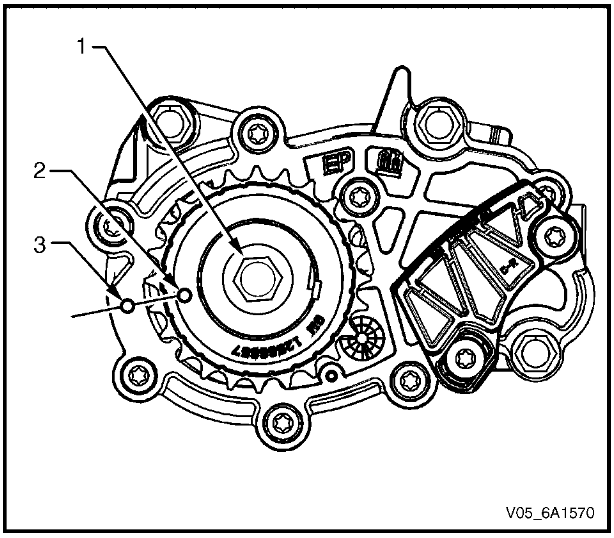

Figure 6A1 – 102

5 After aligning the crankshaft sprocket timing mark, check that the camshaft flats (1) at the rear of the right-hand cylinder head are parallel with the camshaft cover rail (2).

6 If the camshaft flats are not as shown, rotate the crankshaft 360 °.

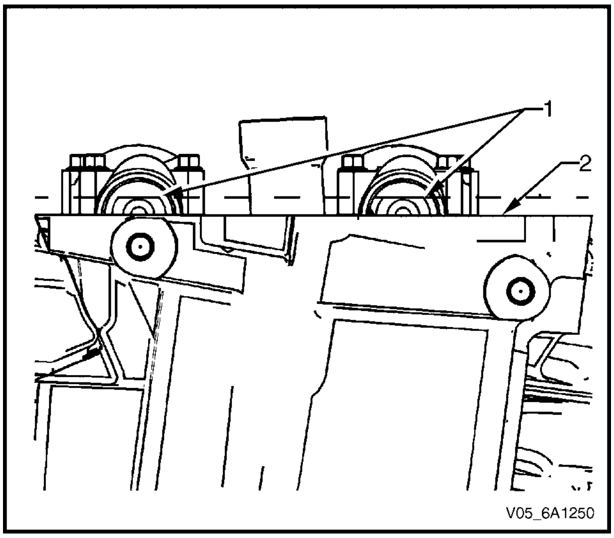

Figure 6A1 – 103

7 Install Tool No. EN 46105-1 (1) onto the rear of the right-hand cylinder head camshafts (2).

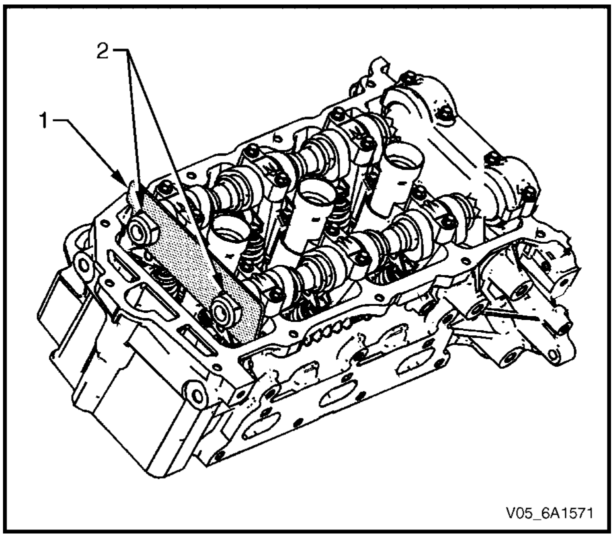

Figure 6A1 – 104

8 Install Tool No. EN 46105-2 (1) onto the rear of the left-hand cylinder head camshafts (2), and tool No

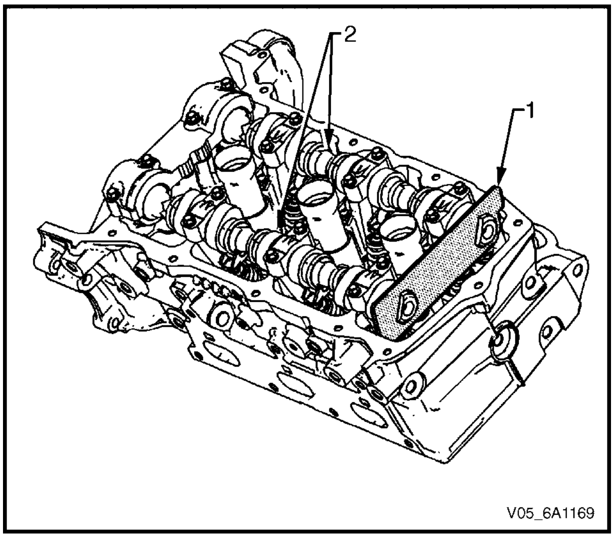

Figure 6A1 – 105

9 Remove the right-hand secondary timing chain tensioner bolts (1) and remove the tensioner (2).

NOTE

Take care when removing the tensioner bolts. The tensioner plunger is subjected to spring tension and may spring apart during tensioner removal.

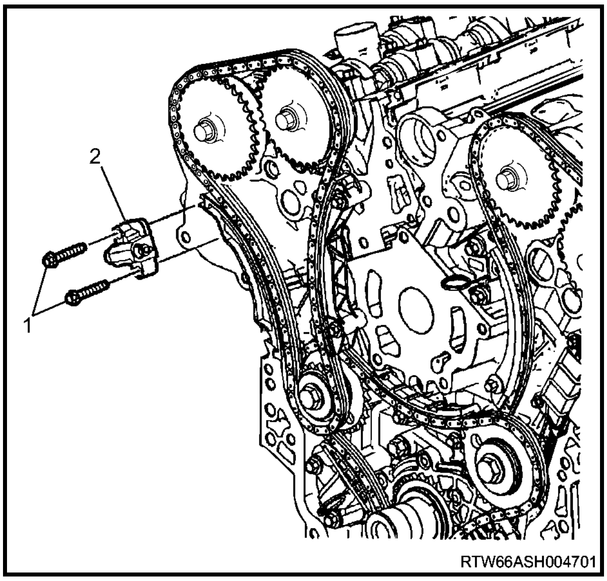

Figure 6A1 – 106

10 Remove the tensioner gasket (1) from the tensioner (2) and discard the gasket.

11 Inspect the tensioner mounting surface on the right-hand cylinder head for burrs or any defects that would affect the sealing of a new tensioner gasket.

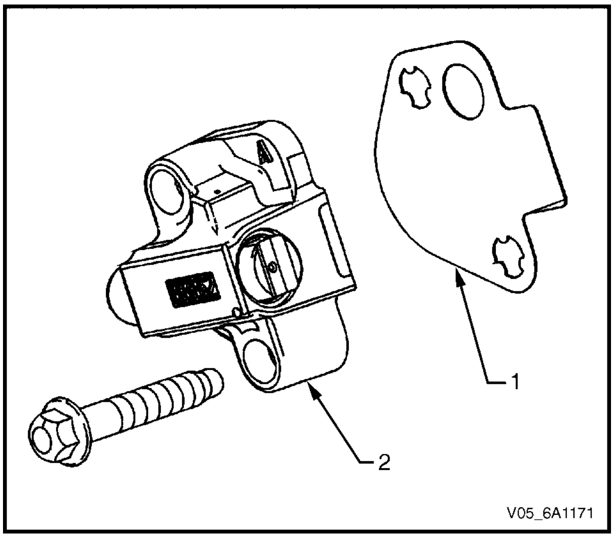

Figure 6A1 – 107

12 Remove the right-hand secondary timing chain shoe bolt (1).

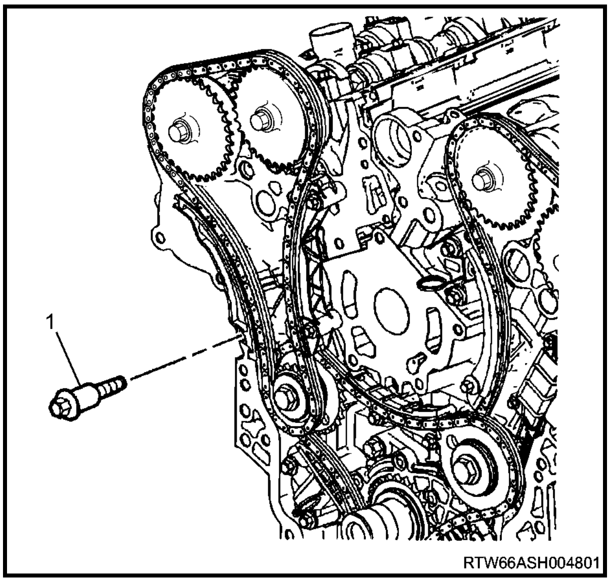

Figure 6A1 – 108

13 Remove the right-hand secondary timing chain shoe (1).

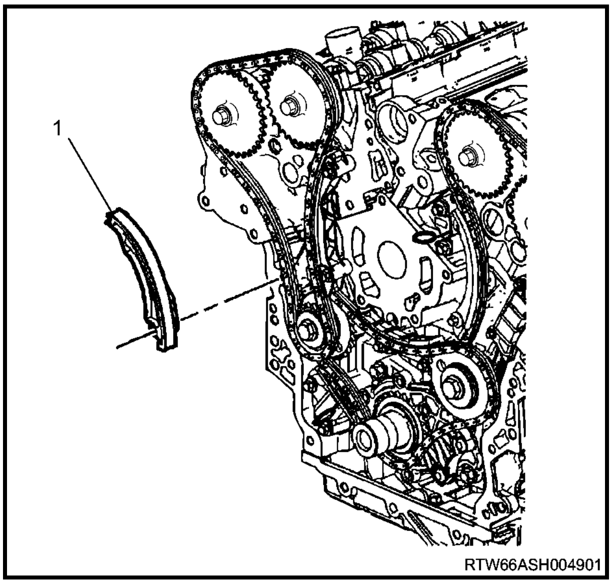

Figure 6A1 – 109

14 Remove the two right-hand secondary timing chain guide bolts (1) and remove the guide (2).

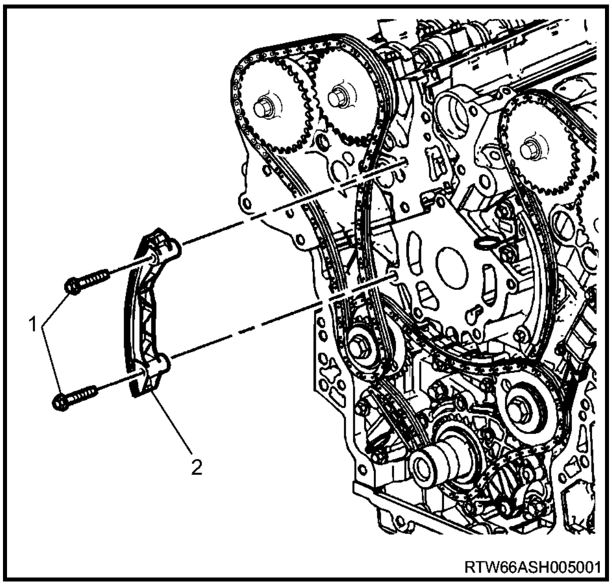

Figure 6A1 – 110

15 Remove the right-hand secondary timing chain (1) from the camshaft position actuators (2) and the camshaft intermediate driveshaft sprocket (3).

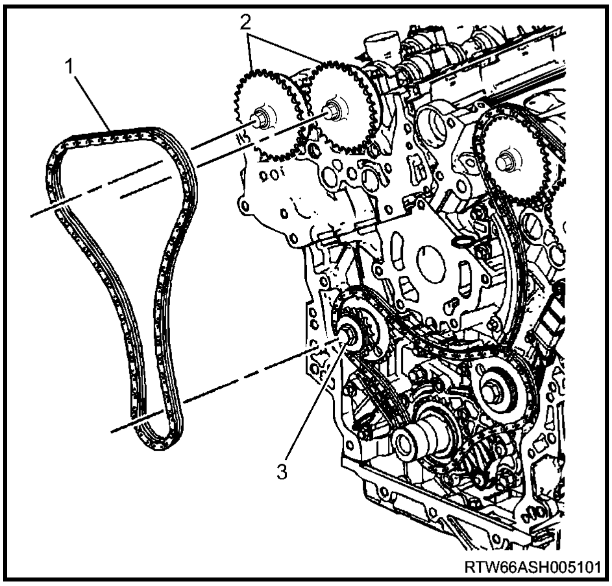

Figure 6A1 – 111

Primary Timing Chain

1 Remove the right-hand secondary timing chain, refer to Right-hand Secondary Timing Chain in this Section.

2 Remove the two primary timing chain tensioner bolts (1), and remove the tensioner (2).

NOTE

Take care when removing the tensioner bolts. The tensioner plunger is subjected to spring tension and may spring apart during tensioner removal.

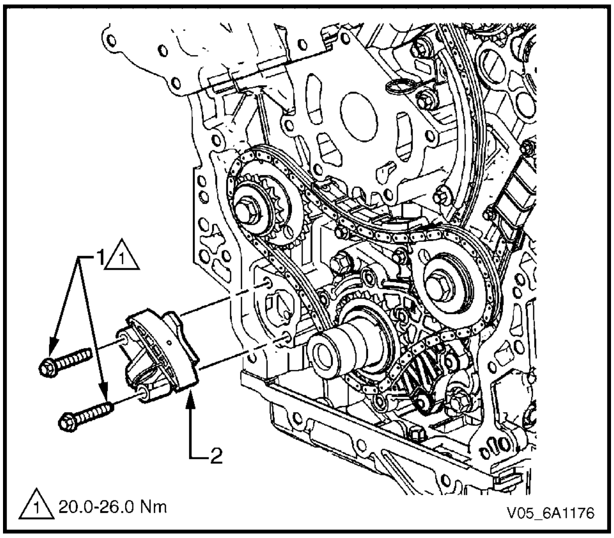

Figure 6A1 – 112

3 Remove the gasket (1) from the tensioner (2) and discard the gasket.

4 Inspect the primary timing chain tensioner mounting surface on the engine block for burrs or any defects that would affect the sealing of a new tensioner gasket.

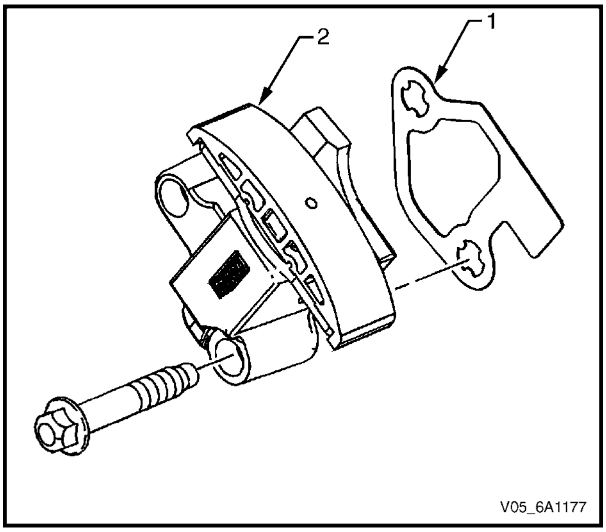

Figure 6A1 – 113

5 Remove the two primary timing chain upper guide bolts (1) and remove the guide (2).

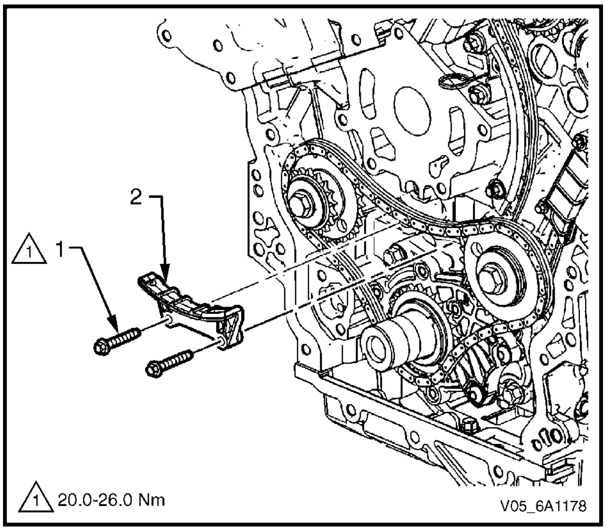

Figure 6A1 – 114

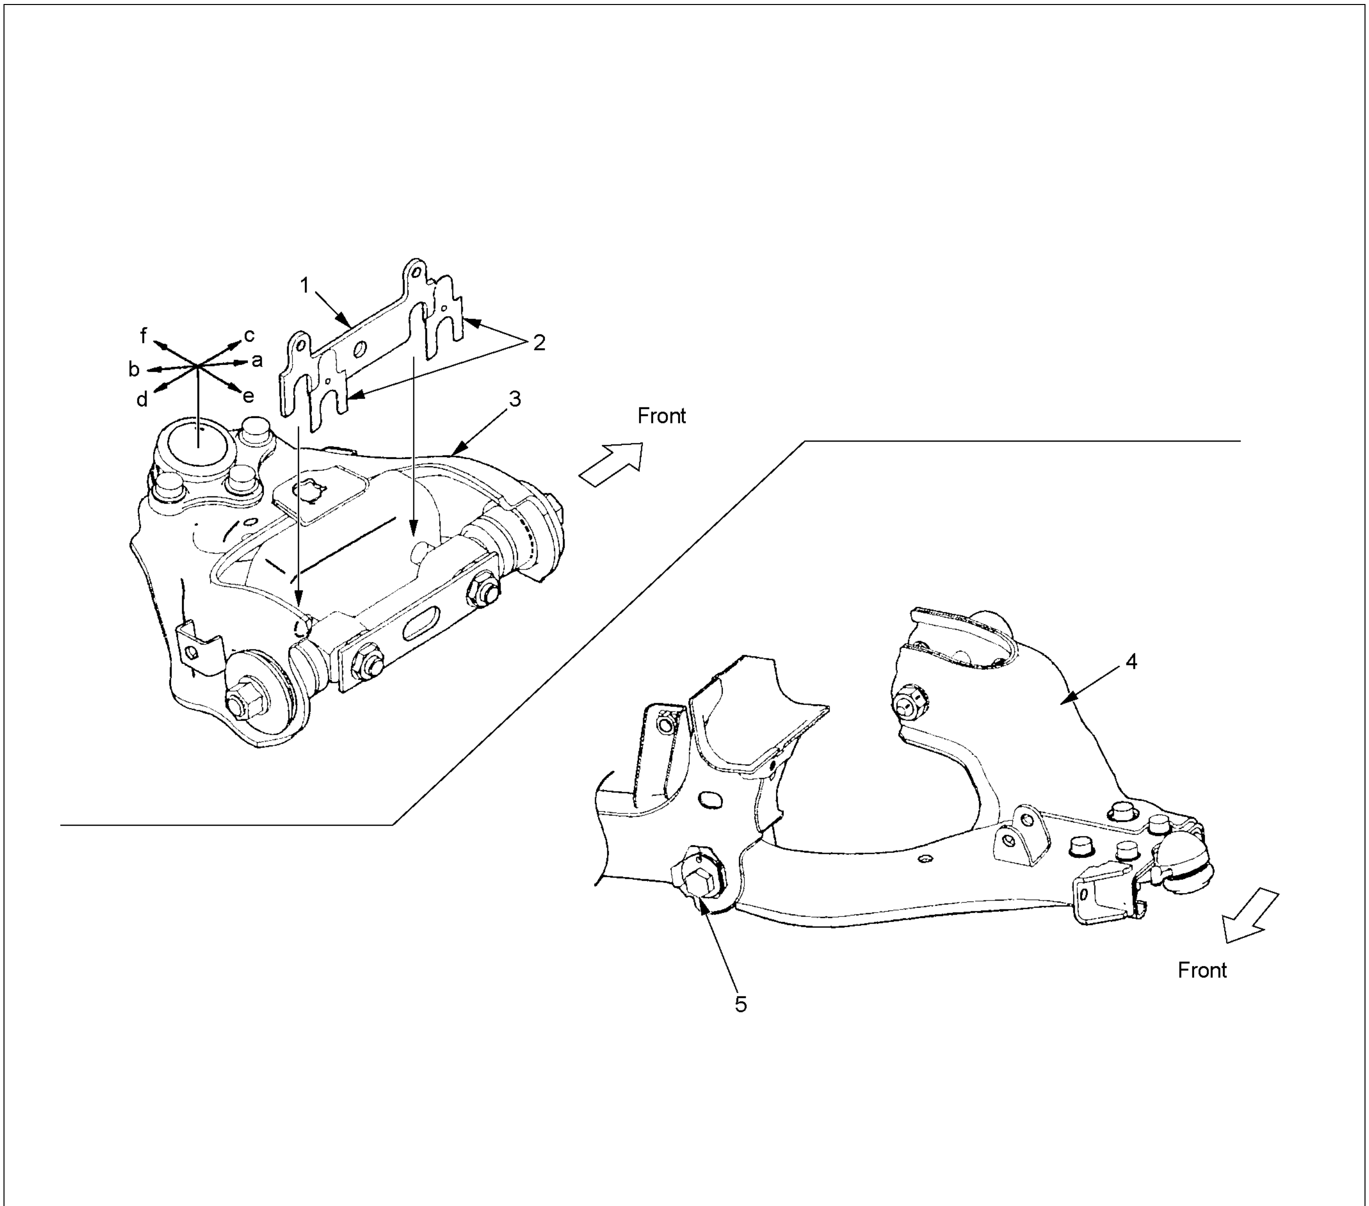
Alignment for 4×2 (High Ride Suspension) and 4×4

Caster and camber adjustment

The camber angle and caster angle can be adjusted by means of the camber shims and caster shims installed in position between the chassis frame and fulcrum pins.



RTW340LF001901

Legend

1. Camber shim
2. Caster shim
3. Upper link ASM LH
4. Lower link ASM LH
5. Adjusting cam

NOTE

Do not remove the primary timing chain lower guide (1). The primary timing chain lower guide is not serviced separately. If the primary timing chain lower guide requires replacement, the oil pump assembly (2) must be replaced.

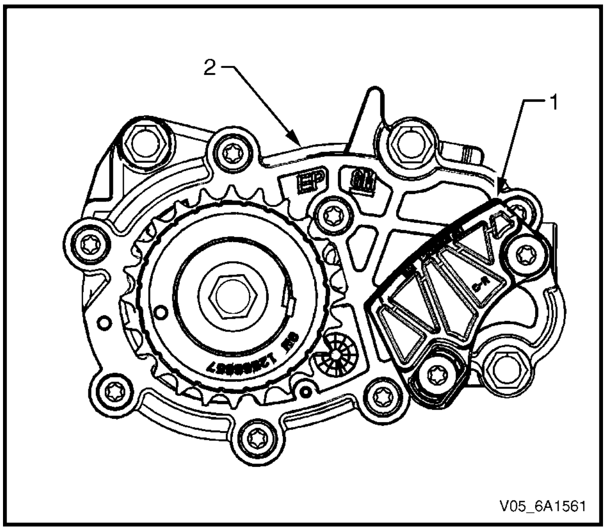


Figure 6A1 – 115

6 Remove the primary timing chain (1).

NOTE

For ease of removal, remove the chain from the crankshaft sprocket, before attempting to remove from the camshaft intermediate driveshaft sprockets.

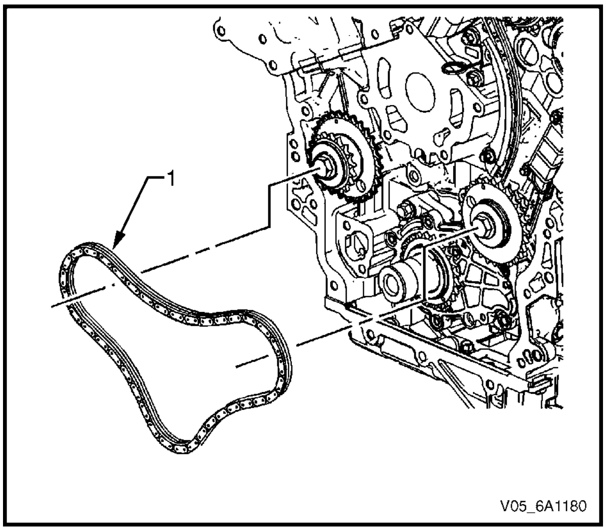

Figure 6A1 – 116

7 If required, remove the right-hand camshaft intermediate driveshaft sprocket bolt (1) and remove the sprocket (2).

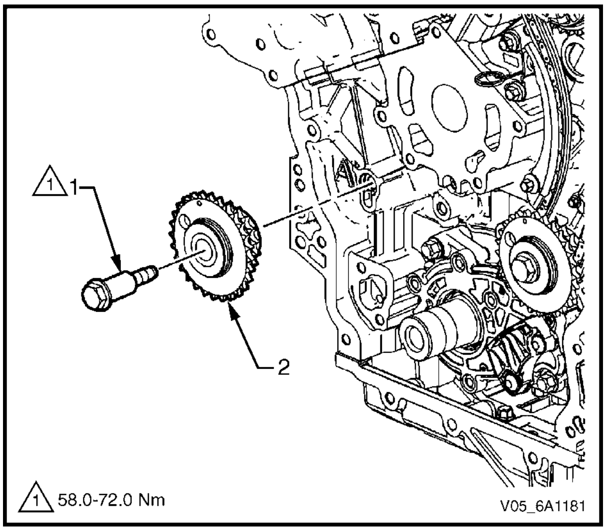

Figure 6A1 – 117

8 If required, remove the crankshaft sprocket (1) from the crankshaft (2).

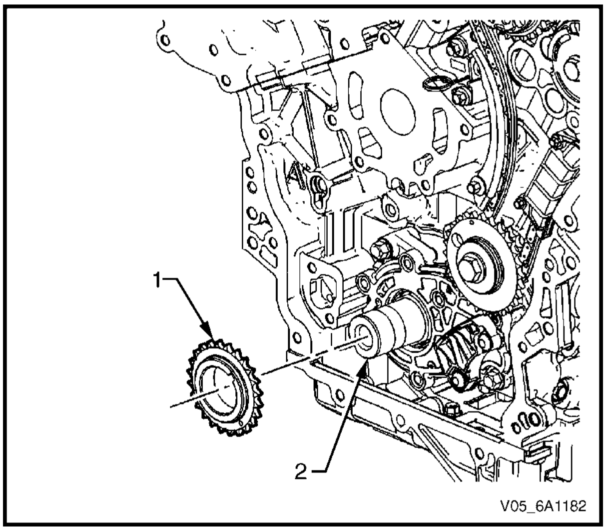

Figure 6A1 – 118

Left-hand Secondary Timing Chain

1 Remove the primary timing chain, refer to Primary Timing Chain in this Section.

2 Remove the two left-hand secondary timing chain tensioner bolts (1) and remove the tensioner (2).

NOTE

Take care when removing the tensioner bolts. The tensioner plunger is subjected to spring tension and may spring apart during tensioner removal.

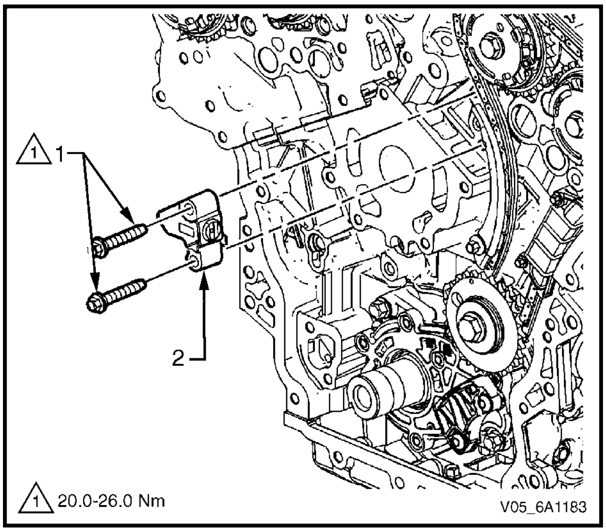

Figure 6A1 – 119

3 Remove the gasket (1) from the tensioner (2) and discard the gasket.

4 Inspect the tensioner mounting surface on the left-hand cylinder head for burrs or any defects that would affect the sealing of a new tensioner gasket.

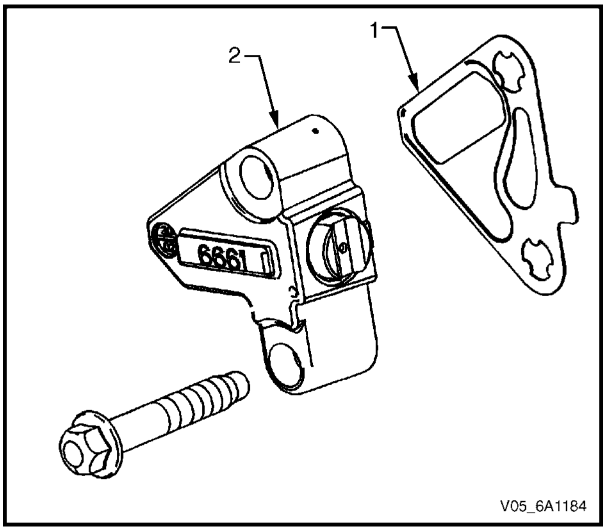

Figure 6A1 – 120

5 Remove the left-hand secondary timing chain shoe bolt (1).

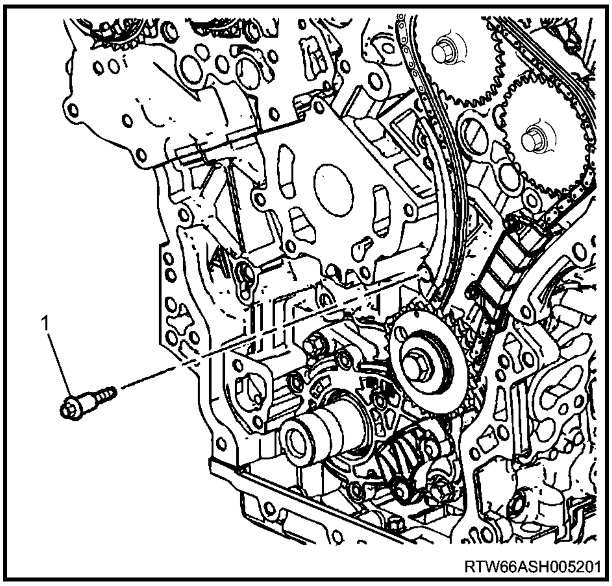

Figure 6A1 – 121

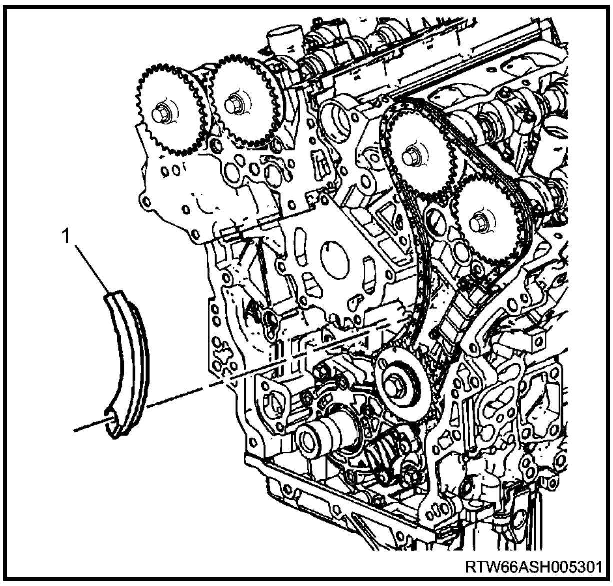

Figure 6A1 – 122

7 Remove the left-hand secondary timing chain guide bolt (1), two places, and remove the guide (2).

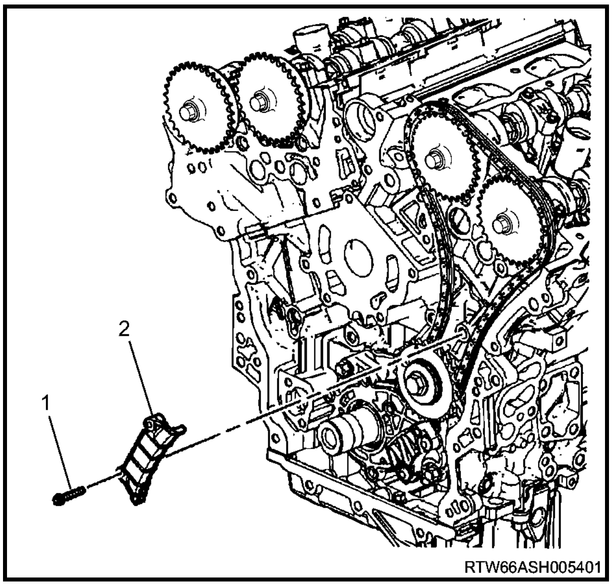

Figure 6A1 – 123

8 Remove the left-hand secondary timing chain (1) from the camshaft position actuators (2) and the camshaft intermediate driveshaft sprocket.

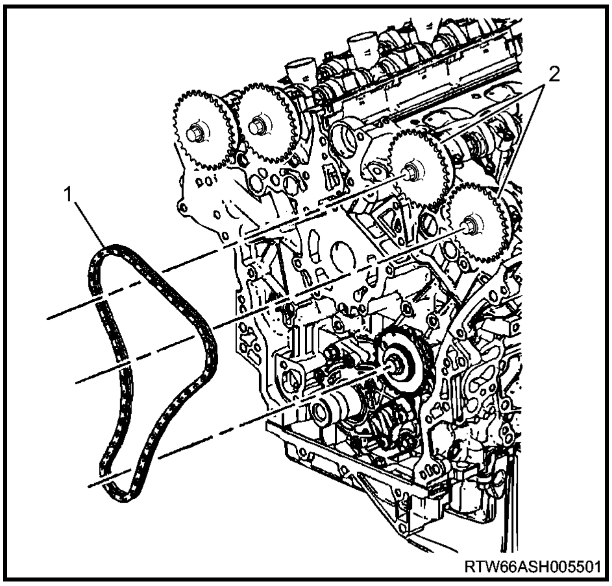

Figure 6A1 – 124

9 If required, remove the left-hand camshaft intermediate driveshaft sprocket bolt (1) and remove the sprocket (2).

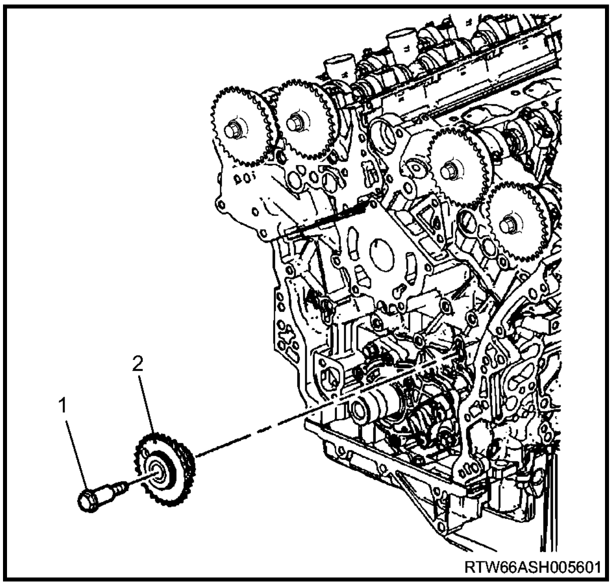

Figure 6A1 – 125

10 Remove Tool No. EN 46105-2 (1) from the left-hand cylinder head camshafts (2).

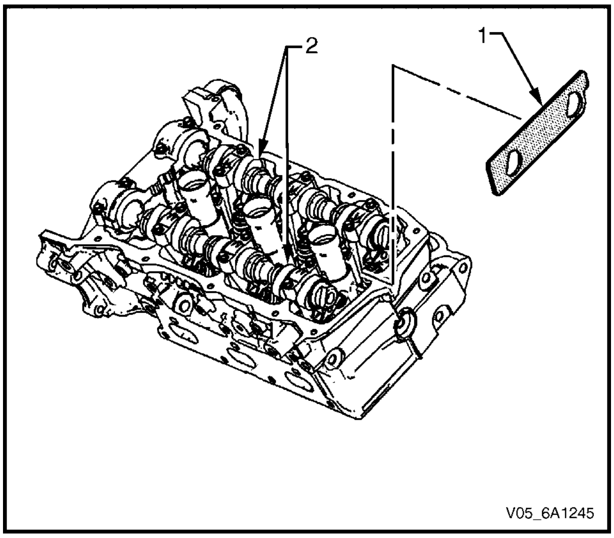

Figure 6A1 – 126

11 Remove Tool No. EN 46105-1 (1) from the right-hand cylinder head camshafts (2).

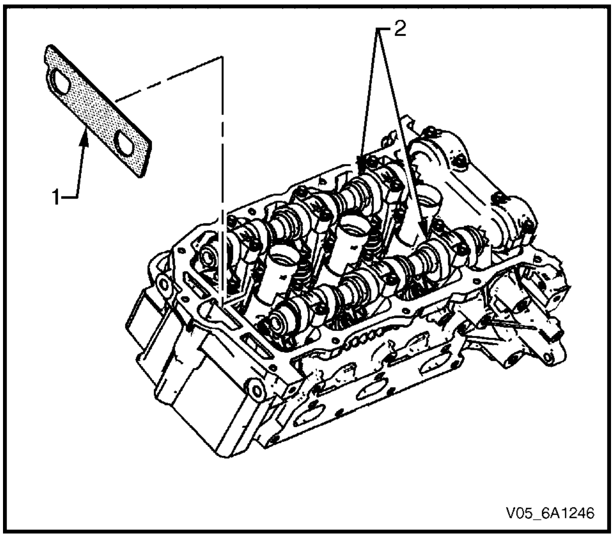

Figure 6A1 – 127

Clean

1 Clean all the following components with a suitable solvent:

- crankshaft sprocket,
- primary timing chain,
- primary timing chain guide,
- primary timing chain tensioner,
- secondary timing chains,
- secondary timing chain shoes,
- secondary timing chain guides,
- secondary timing chain tensioners, and
- bolts.

WARNING

Safety glasses must be worn when using compressed air.

2 Dry all the components with compressed air.

Inspect

Timing Chains

1 Inspect the primary and/or secondary timing chains for the following:
   - binding or worn rollers (1),
   - loose links (2), and
   - loose pins (3).

2 Replace a damaged timing chain as required.

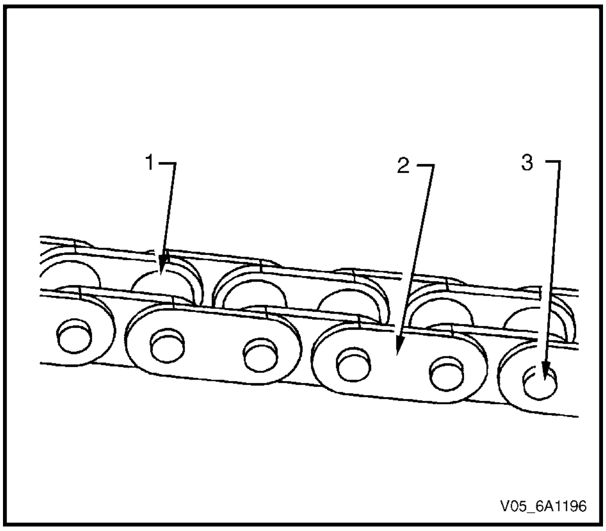

Figure 6A1 – 128

Camshaft Intermediate Driveshaft Sprockets

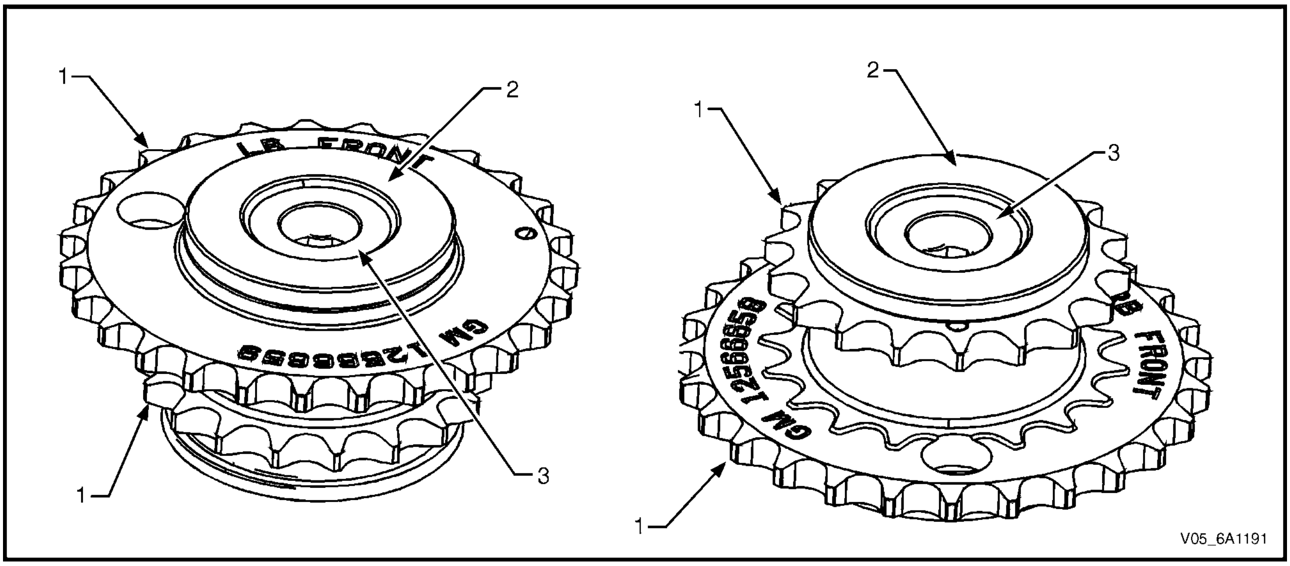

Figure 6A1 – 129

1 Inspect the camshaft intermediate driveshaft sprockets for the following:
   - Damage to the primary and secondary timing chain sprocket (1), refer to Figure 6A1 – 129.
   - Damage to the hub bearing (2). Ensure the hub bearing spins freely. If the hub bearing wobbles, is noisy or feels rough when rotated replace the camshaft intermediate sprocket, and
   - Damage to the bolt flange seating / sealing surface (3).
   - Damage to the bearing hub-to-engine block sealing surface.

Inlet and Exhaust Camshaft Sprocket

Inspect the camshaft sprocket assemblies, refer to 3.18 Camshaft Sprocket.

Crankshaft Sprocket

1 Inspect the crankshaft sprocket for the following:
- sprocket damage (1),
- bore damage (2),
- keyway damage (3), and
- damage to the cushion material (4).

2 Replace a damaged sprocket as required.

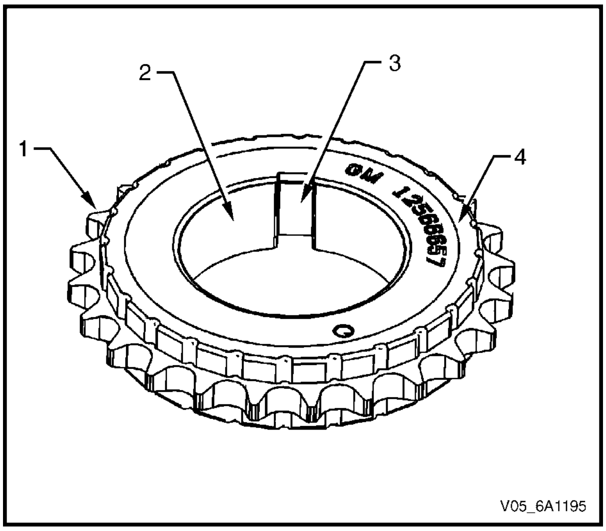

Figure 6A1 – 130

Primary Timing Chain Upper Guide

1 Inspect the primary timing chain upper guide for the following:
- worn guide surface (1),
- cracked or broken guide surface (2), and
- cracked or damaged guide base (3).

2 Replace a damaged guide as required.

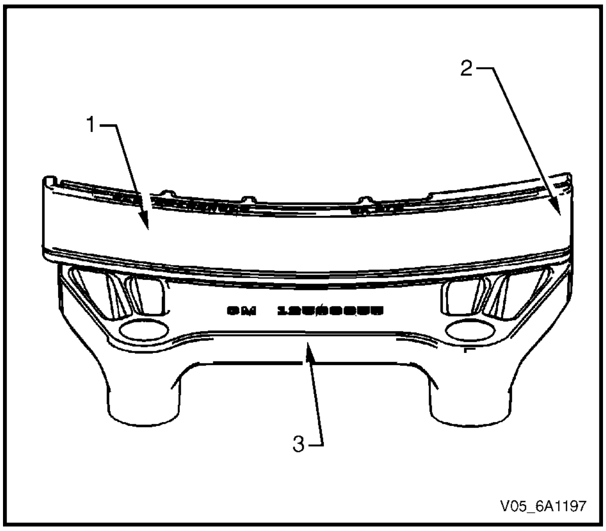

Figure 6A1 – 131

Primary Timing Chain Lower Guide

1 Inspect the primary timing chain lower guide for the following:
- worn guide surface (1),
- cracked or broken guide surface (2), and
- cracked or damaged guide base (3).

2 Replace the primary timing chain lower guide by replacing the oil pump assembly, refer to 3.17 Oil Pump Assembly.

NOTE

The primary timing chain lower guide is not serviced separately and is part of the oil pump assembly.

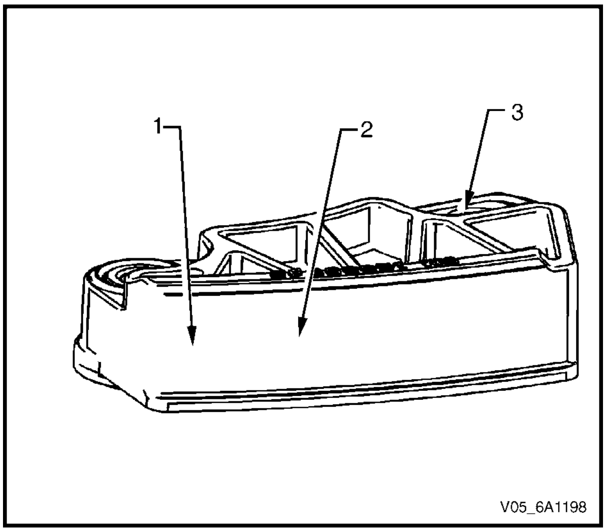

Figure 6A1 – 132

Primary Timing Chain Tensioner

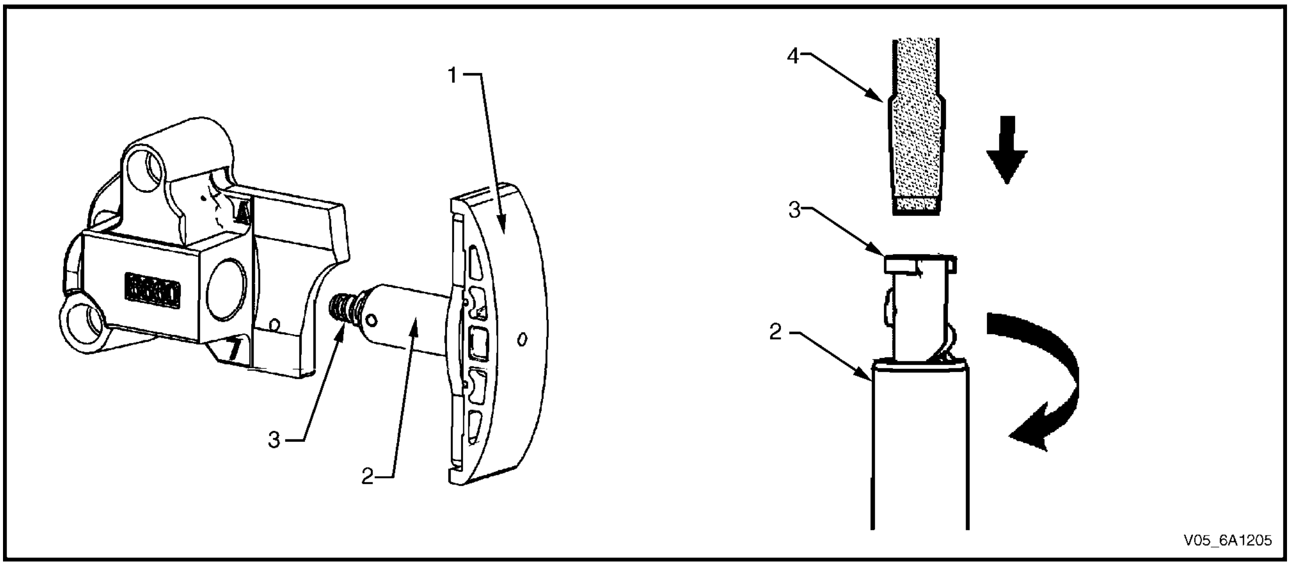

Figure 6A1 – 133

1 Inspect the primary timing chain tensioner for worn shoe surface (1), refer to Figure 6A1 – 133.

2 Inspect the tensioner for a locked or binding tensioner shaft (2). Reset the plunger (3) and ensure the tensioner shaft moves freely in and out of the body of the tensioner.

NOTE

To reset the tensioner, use a suitably sized flat blade screwdriver or Tool No. J 45027 (4) to wind the plunger in a clockwise direction, into the tensioner shaft.

3 Replace a damaged tensioner as required.

Left-hand Secondary Timing Chain Guide

1 Inspect the left-hand secondary timing chain guide for the following:
- worn guide surface (1),
- cracked or broken guide surface (2), and
- cracked or damaged guide base (3).

2 Replace a damaged guide as required.

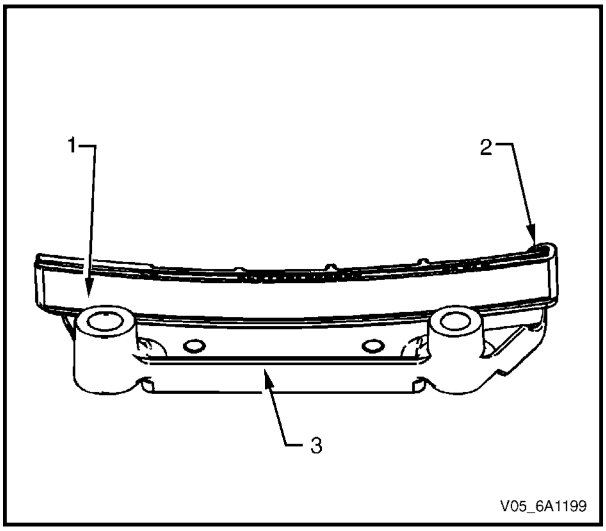

Figure 6A1 – 134

Left-hand Secondary Timing Chain Shoe

1 Inspect the front of the left-hand secondary timing chain shoe for the following:
- worn shoe surface (1),
- cracked or broken shoe surface (2), and
- cracked or damaged shoe (3).

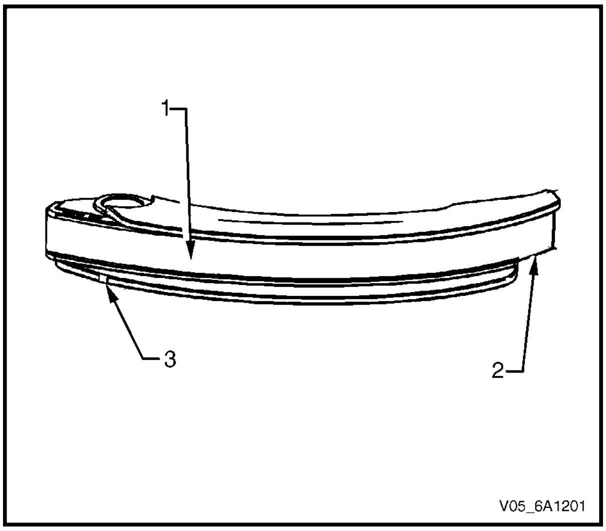

Figure 6A1 – 135

2 Inspect the back of the shoe for a damaged, worn or missing timing chain tensioner contact pad (1).

3 Replace a damaged shoe as required.

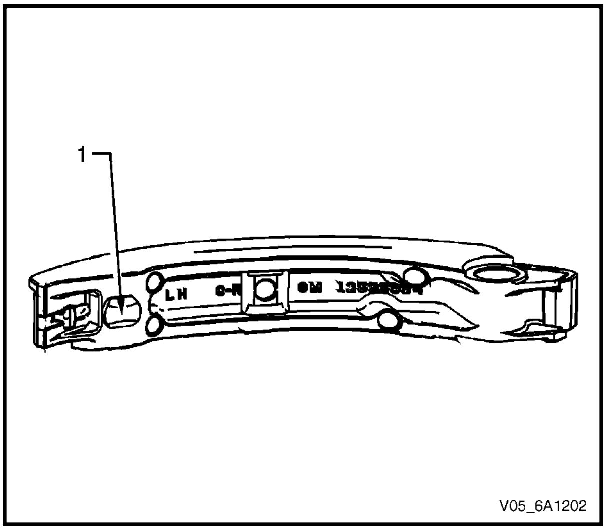

Figure 6A1 – 136

Left-hand Secondary Timing Chain Tensioner

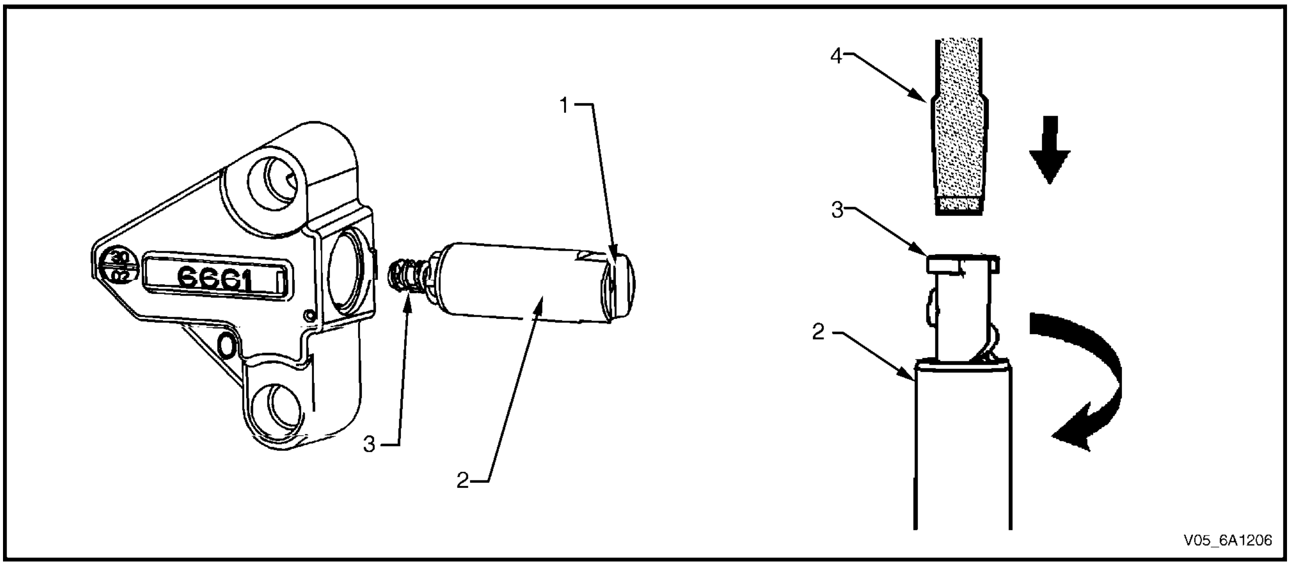

Figure 6A1 – 137

1 Inspect the left-hand secondary timing chain tensioner for damaged plunger-to-shoe contact surface (1), refer to Figure 6A1 – 137.

2 Inspect the tensioner for locked or binding tensioner shaft (2). Reset the plunger (3) and ensure the tensioner shaft moves freely in and out of the body of the tensioner.

NOTE

To reset the tensioner, use a suitably sized flat blade screwdriver or Tool No. J 45027 (4) to wind the plunger in a clockwise direction, into the tensioner shaft.

3 Replace a damaged tensioner as required.

Right-hand Secondary Timing Chain Guide

1 Inspect the right-hand secondary timing chain guide for the following:
- worn guide surface (1),
- cracked or broken guide surface (2), and
- cracked or damaged guide base (3).

2 Replace a damaged guide as required.

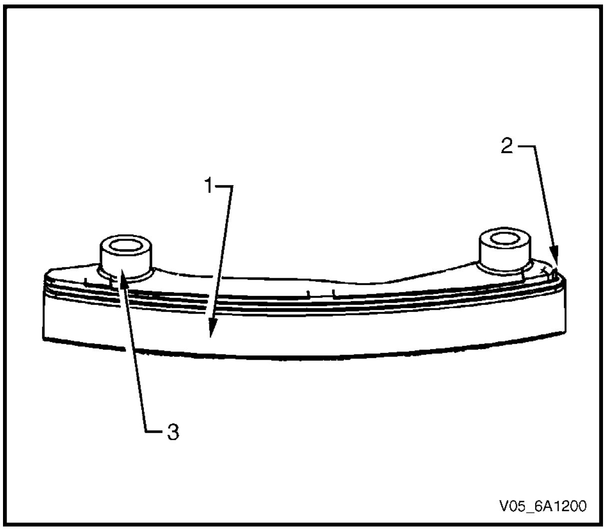

Figure 6A1 – 138

Right-hand Secondary Timing Chain Shoe

1 Inspect the front of the right-hand secondary timing chain shoe for the following:
- worn shoe surface (1),
- cracked or broken shoe surface (2), and
- cracked or damaged shoe (3).

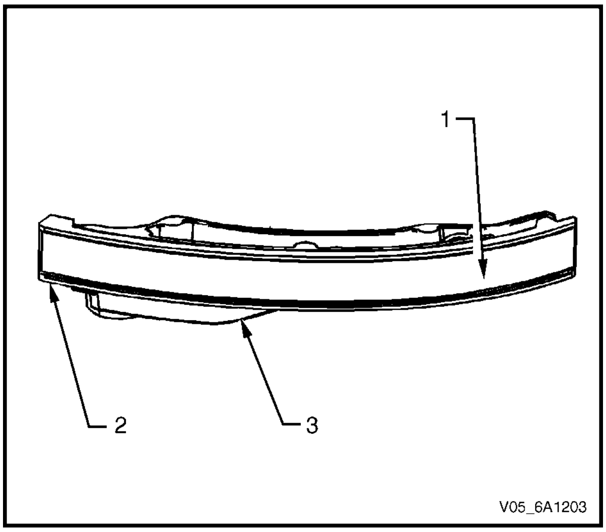

Figure 6A1 – 139

Adjustment Method

	addition / subtraction of shim		move direction of upper b/j	caster angle alteration	camber angle alteration
	front side	rear side			
caster adjustment	addition	subtraction	a	decrease	decrease (toward negative direction)
	subtraction	addition	b	increase	increase (toward positive direction)
	no change	subtraction	c	decrease	no alteration
	no change	addition	d	increase	no alteration
camber adjustment	addition		e	no alteration	decrease (toward negative direction)
	subtraction		f	no alteration	increase (toward positive direction)

Notes:

1. **Adjusting cam is at initial position (the hole & projection are upward as shown in a illustration) before a shim adjustment.**
2. **Difference of caster shim front/rear thickness should be 3.6mm(0.142in) or less.**
   Overall thickness of caster shim and camber shim should be 10.8mm(0.426in) or less.
3. **Make a combination in a such a way that the number of shims is at a minimum.**

Fulcrum Pin Bolt Torque	N·m (kgf·m/lb·ft)
152.0±15 (15.5±1.5 / 112.1±10.8)	

CASTER

3°10'±45'

Note:

CAMBER

0°±30'

Note:
Left and right side to be equal within 30'.

KING PIN INCLINATION

12°30'±30'

2 Inspect the back of the shoe for a damaged, worn or missing timing chain tensioner contact pad (1).

Replace a damaged shoe as required.

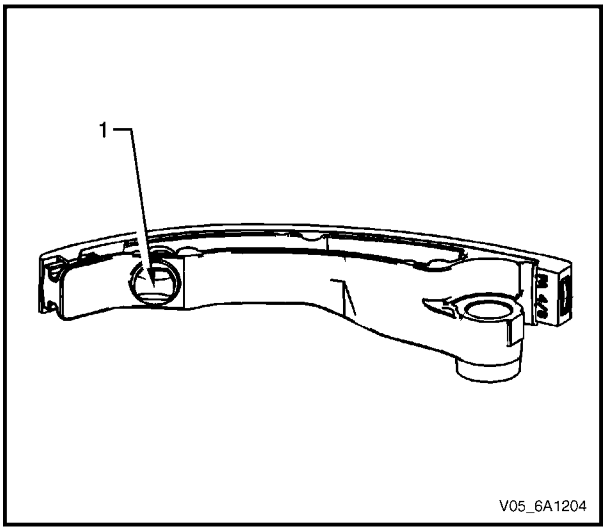

Figure 6A1 – 140

Right-hand Secondary Timing Chain Tensioner

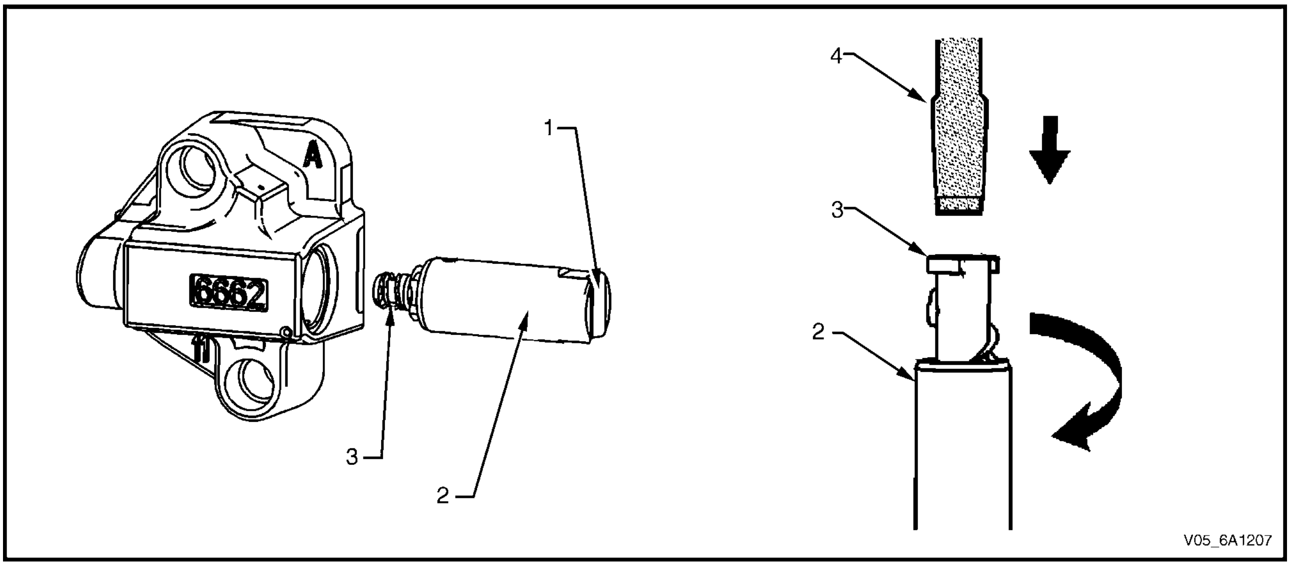

Figure 6A1 – 141

1 Inspect the right-hand secondary timing chain tensioner for damaged plunger-to-shoe contact surface (1), refer to Figure 6A1 – 141.

NOTE

To reset the tensioner, use a suitably sized flat blade screwdriver or Tool No. J 45027 (4) to wind the plunger in a clockwise direction, into the tensioner shaft.

2 Inspect the tensioner for a locked or binding tensioner shaft (2). Reset the plunger (3) and ensure the tensioner shaft moves freely in and out of the body of the tensioner.

3 Replace a damaged tensioner as required.

Reinstall

Left-hand Secondary Timing Chain Components

1 Install the crankshaft sprocket (1) onto the crankshaft (2) by aligning the keyway to the key on the crankshaft.

2 Slide the crankshaft sprocket on the crankshaft until the crankshaft sprocket contacts the step in the crankshaft.

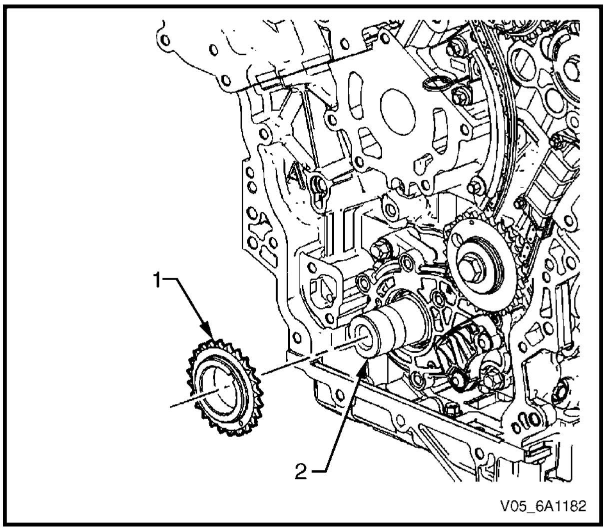

Figure 6A1 – 142

NOTE

Ensure that the crankshaft sprocket is installed with the timing mark (1) visible.

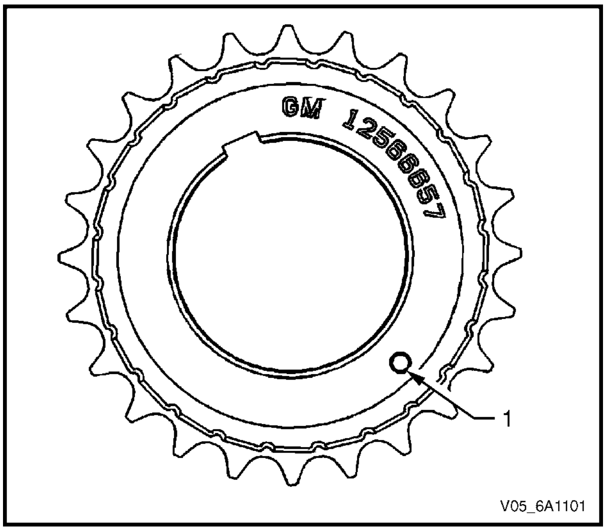

Figure 6A1 – 143

CAUTION

In order to install Tool No. EN 46105 onto the camshafts, rotate the camshafts in an anti-clockwise direction. There should be no need to rotate the camshaft more than 45 degrees.

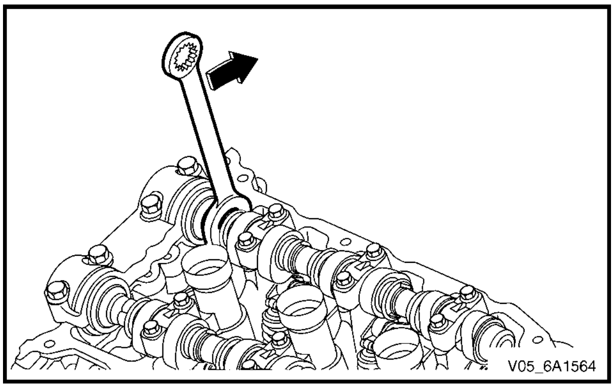

Figure 6A1 – 144

3 Install Tool No. EN 46105-1 (1) onto the rear of the left-hand cylinder head camshafts (2), and Tool No. EN 46105-2 onto the rear of the right-hand cylinder head camshafts.

4 Ensure that Tool No. EN 46105 is fully seated onto the camshafts.

CAUTION

All camshafts must be locked in place before installation of any timing chains.

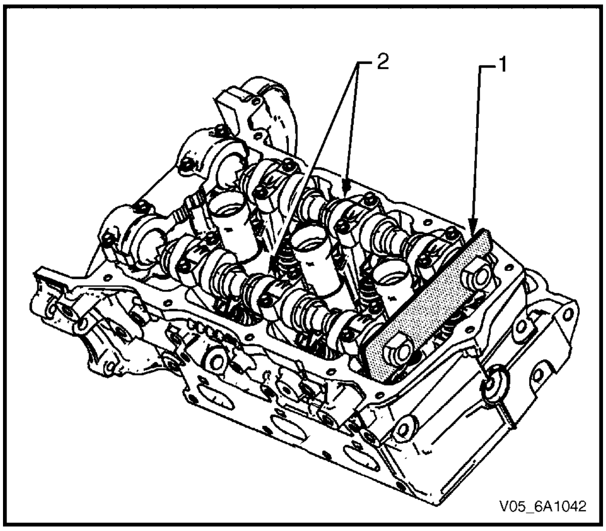

Figure 6A1 – 145

5 Using Tool No. EN46111 (1), rotate the crankshaft in a clockwise direction until the crankshaft sprocket timing mark (2) is aligned with the indexing mark (3) on the oil pump housing.

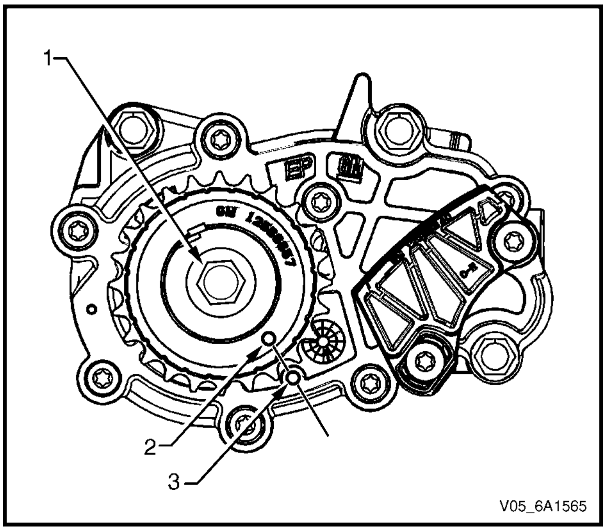

Figure 6A1 – 146

6 Install the left-hand secondary timing chain (1) aligning the chain in the following manner:

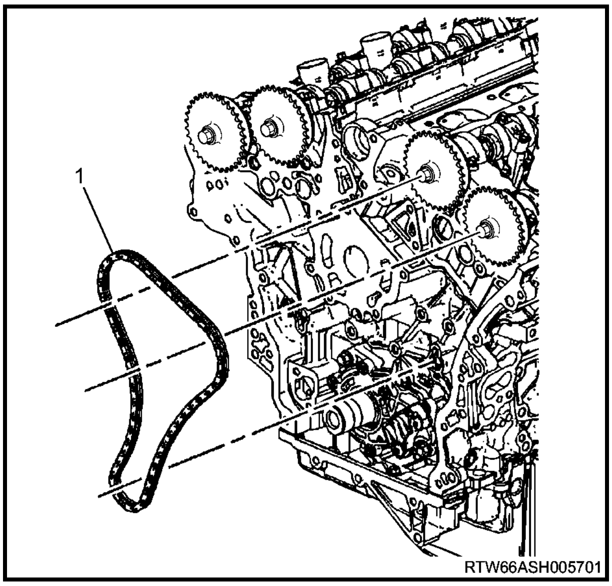

Figure 6A1 – 147

7 Wrap the secondary timing chain around both left-hand camshaft drive sprockets.

8 Ensure there are two bright links located on top of each of the camshaft actuator sprockets.

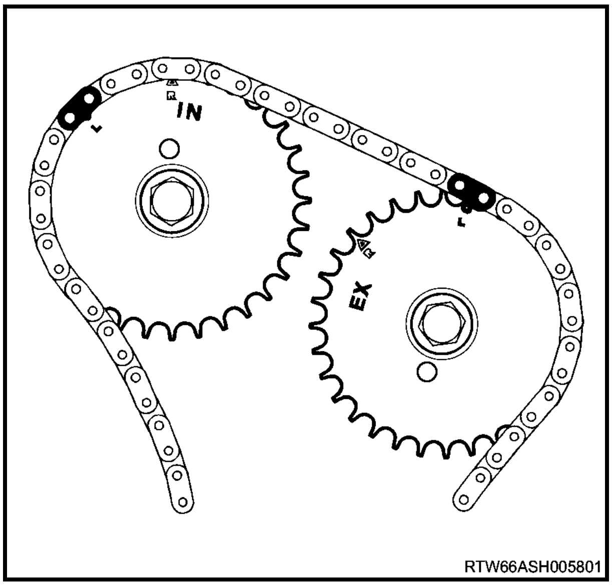

Figure 6A1 – 148

CAUTION

When aligning the left-hand secondary timing chain to the camshaft actuator sprockets, ensure the circular timing marks on the sprocket are used, NOT the triangular mark.

9 Align the bright plated timing chain link (1) with the left-hand exhaust camshaft position actuator sprocket alignment circle mark (2).

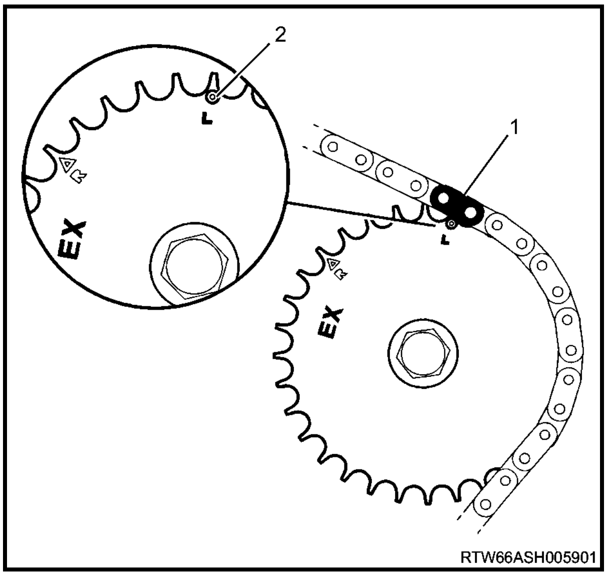

Figure 6A1– 153

10 Align the bright plated timing chain link (1) with the intake camshaft position actuator sprocket alignment circle mark (2).

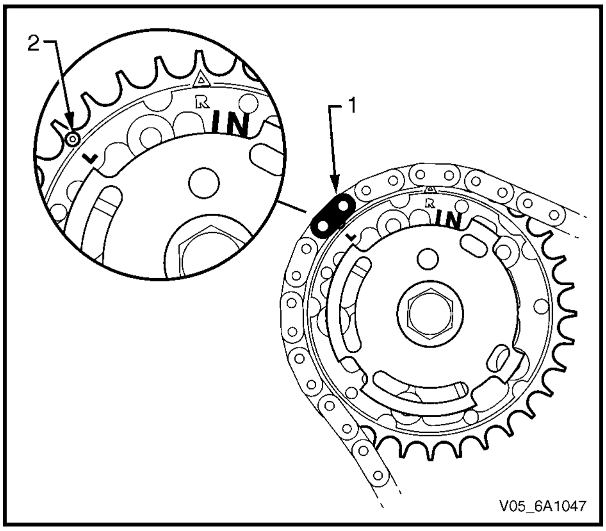

Figure 6A1 – 149

11 Ensure the left-hand camshaft intermediate driveshaft sprocket is selected and orientated correctly.

CAUTION

The left-hand camshaft intermediate driveshaft sprocket (1) is marked with the letters LB and 'FRONT', and the right-hand sprocket (2) is marked with the letters RB and 'FRONT' Ensure the correct sprocket is used and the 'FRONT' text is facing forwards when installed.

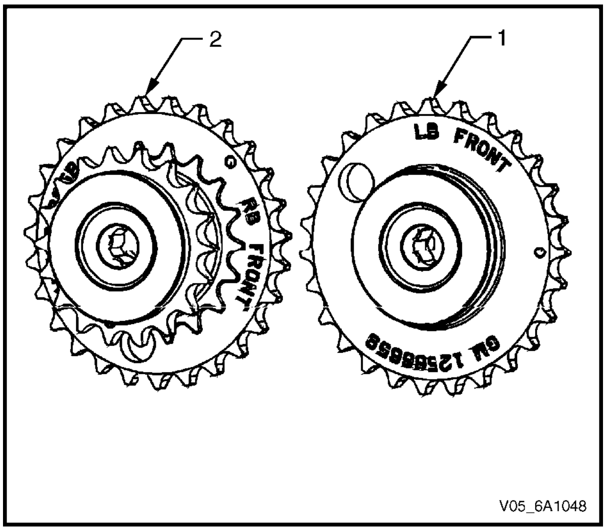

Figure 6A1 – 150

12 Place the left-hand secondary timing chain around the left-hand camshaft intermediate driveshaft inner sprocket, with the bright plated timing chain link (1) aligned with the access hole (2) in the outer sprocket.

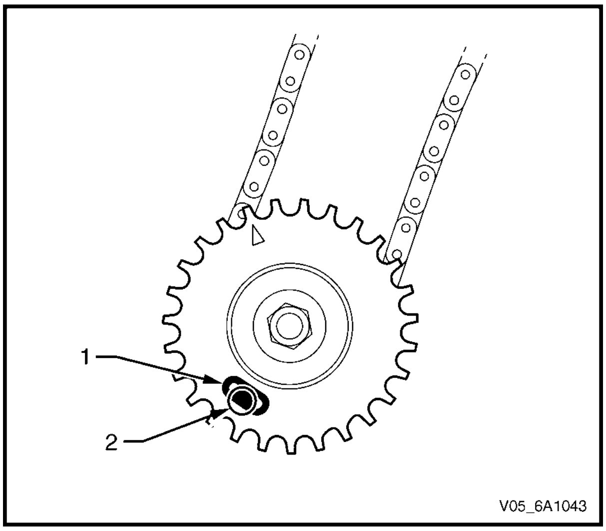

Figure 6A1 – 151

13 Install the left-hand camshaft intermediate driveshaft sprocket to the cylinder block.

14 Install the driveshaft sprocket bolt (1) and tighten to the correct torque specification.

Camshaft intermediate driveshaft sprocket attaching bolt torque specification...........58.0 – 72.0 Nm

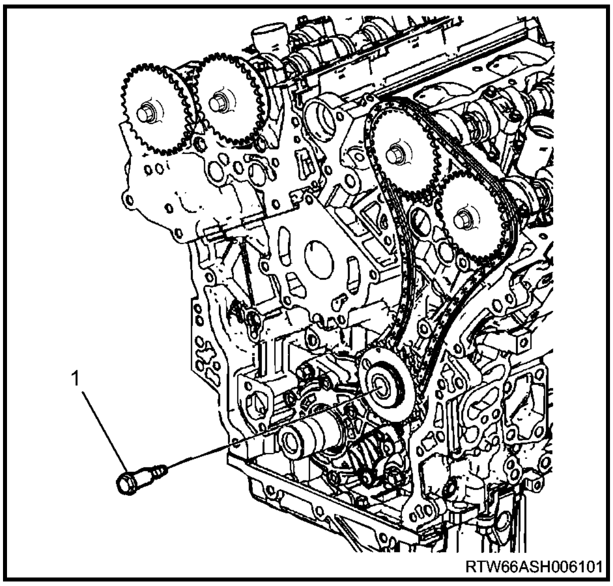

Figure 6A1 – 152

15 Verify the left-hand secondary timing chain timing mark alignments (1 to 6)

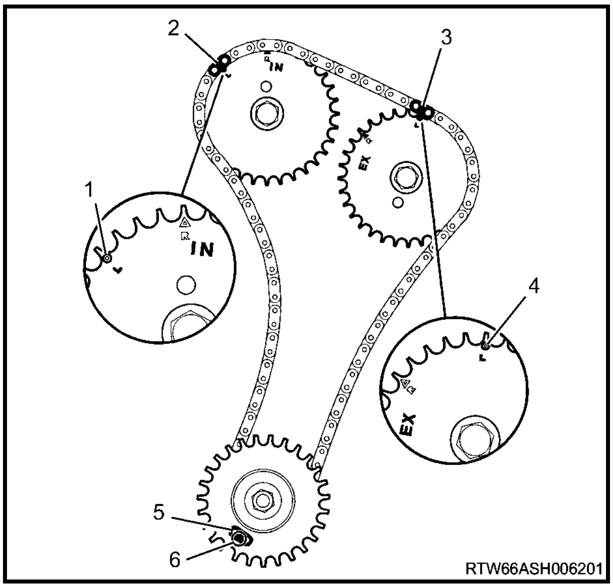

Figure 6A1 – 153

16 Ensure the left-hand secondary timing chain guide is selected and orientated correctly.

CAUTION

The left-hand secondary timing chain guide is marked with the letters LH. Ensure the correct shoe is used when installing to the left-hand side in this procedure and that the letters 'LH" are facing the front of the vehicle when installed.

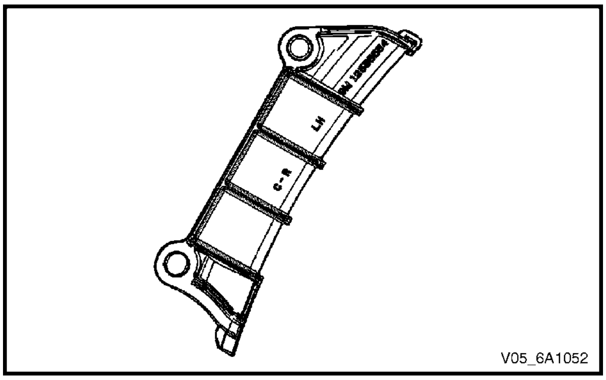

Figure 6A1 – 154

17 Install the left-hand secondary timing chain guide (1).

18 Install the secondary timing chain guide bolts (2) and tighten to the correct torque specification.

Secondary timing chain guide attaching bolt torque specification...........20.0 – 26.0 Nm

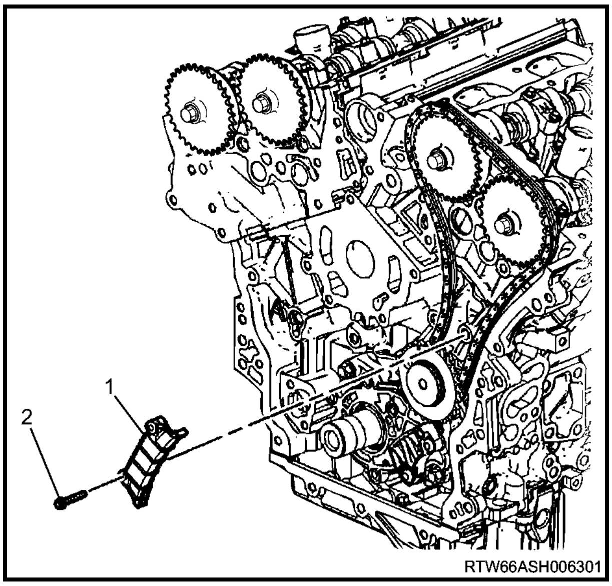

Figure 6A1 – 155

19 Ensure the left-hand secondary timing chain shoe is selected and orientated correctly.

CAUTION

The left-hand secondary timing chain shoe is marked with the letters LH on the back face of the timing chain shoe. Ensure the correct shoe is used when installing to the left-hand side.

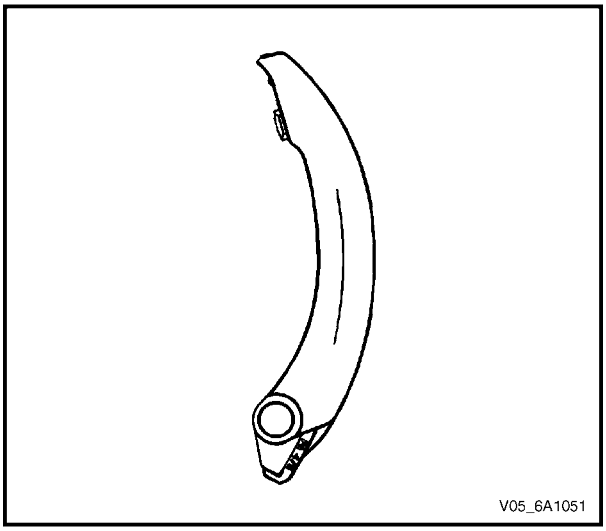

Figure 6A1 – 156

20 Install the left-hand secondary timing chain shoe (1).

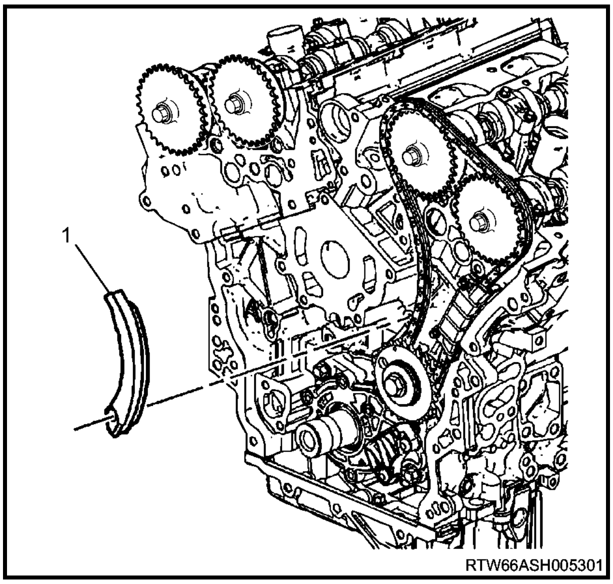

Figure 6A1 – 157

21 Install the left-hand secondary timing chain shoe bolt (1) and tighten to the correct torque specification.

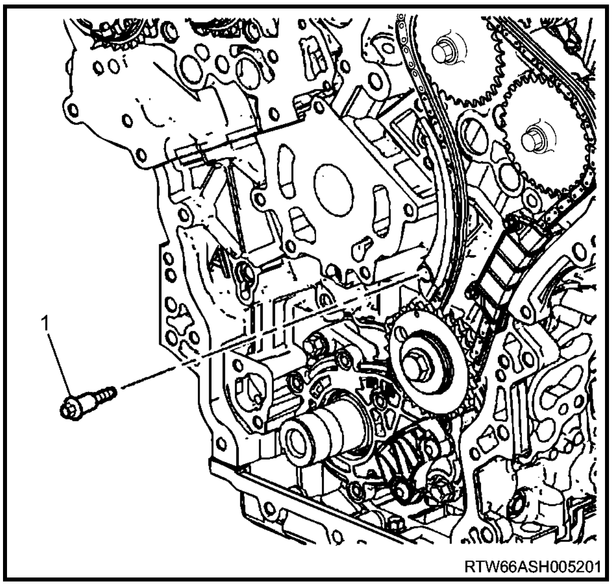

Figure 6A1 – 158

NOTE

Ensure secondary timing chain shoe is clear of the left-hand secondary timing chain tensioner mounting pad, before tightening the attaching bolt.

Secondary timing chain shoe attaching bolt torque specification ....20.0 – 26.0 Nm

22 Ensure the left-hand secondary timing chain tensioner is selected and orientated correctly.

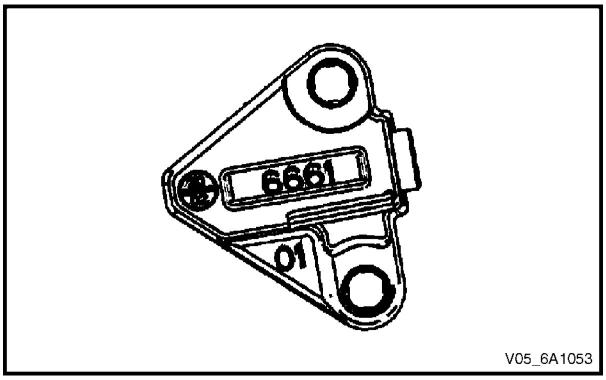

Figure 6A1 – 159

23 Reset the left-hand secondary timing chain tensioner.

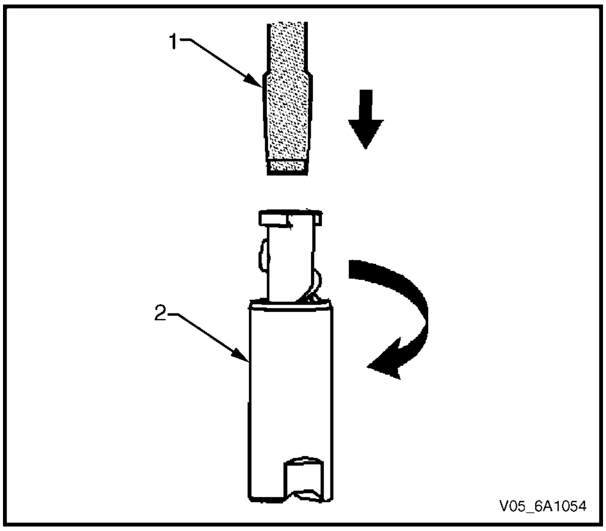

Figure 6A1 – 160

NOTE

To reset the tensioner, use a suitably sized flat blade screwdriver (1) or Tool No. J 45027 (4) to wind the plunger in a clockwise direction, into the tensioner shaft (2).

24 Install the tensioner shaft (1) into the left-hand secondary timing chain tensioner body (2).

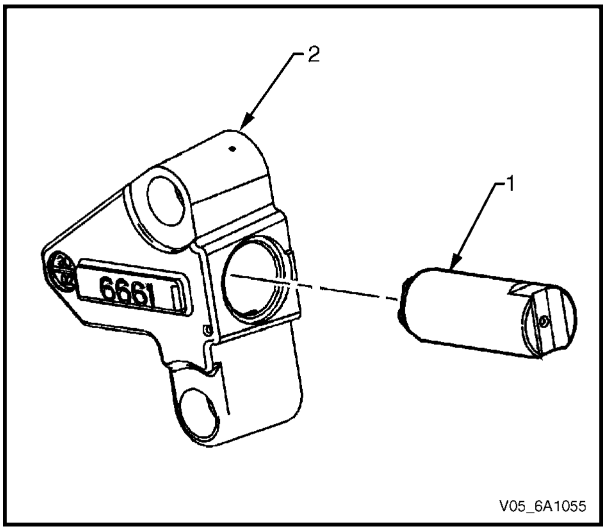

Figure 6A1 – 161

25 Compress the tensioner shaft into the body and lock the left-hand secondary timing chain tensioner by inserting Tool No. EN 46112 into the access hole in the side of the tensioner body.

26 Slowly release pressure on the left-hand secondary timing chain tensioner. The tensioner should remain compressed.

CAUTION

If Tool No. EN 46112 (1) is not removed from the tensioner body (2), the tensioner shaft (3) will remain in the locked position and no tension will be placed on the timing chain, this will cause damage to the engine.

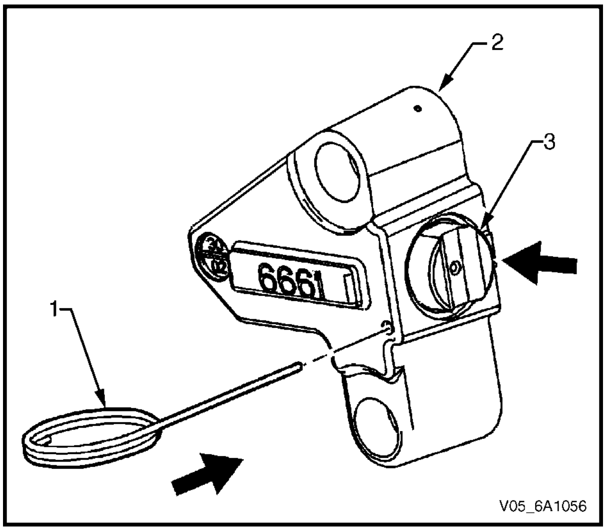

Figure 6A1 – 162

27 Install a new left-hand secondary timing chain tensioner gasket (1) to the tensioner (2).

28 Install the left-hand secondary timing chain tensioner bolts through tensioner and gasket.

29 Ensure the left-hand secondary timing chain tensioner mounting surface on the left-hand cylinder head does not have any burrs or defects that would affect the sealing of the new gasket.

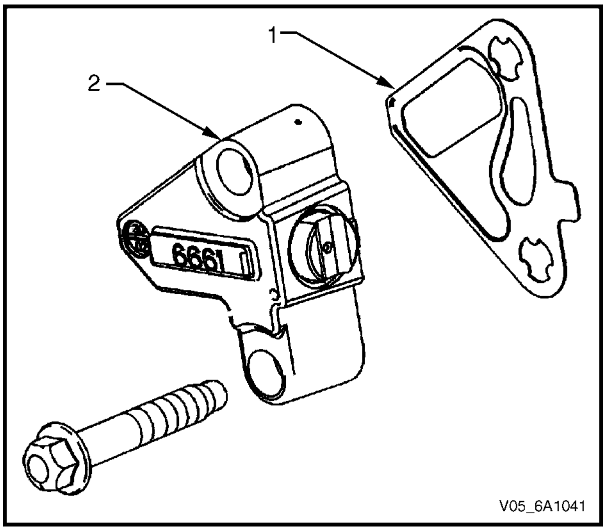

Figure 6A1 – 163

30 Place the left-hand secondary timing chain tensioner (2) into position and loosely install the bolts (1) to the cylinder head.

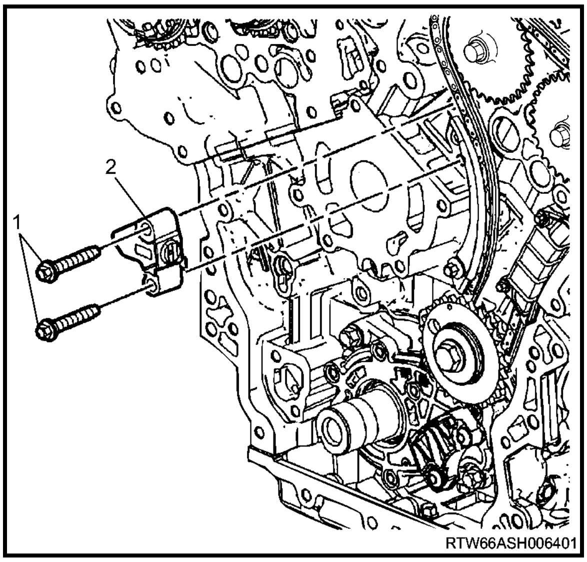

Figure 6A1 – 164

31 Verify the proper placement of the left-hand secondary timing chain tensioner gasket tab (1).

32 Tighten the left-hand secondary timing chain tensioner bolts (2) to the correct torque specification.

Secondary timing chain tensioner attaching bolt torque specification...........20.0 – 26.0 Nm

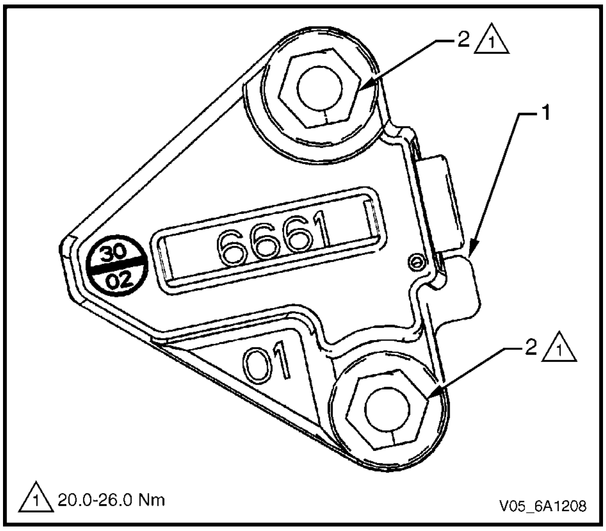

Figure 6A1 – 165

33 Release the left-hand secondary timing chain tensioner (1) by pulling out Tools No. EN 46112 (2) and unlocking the tensioner shaft.

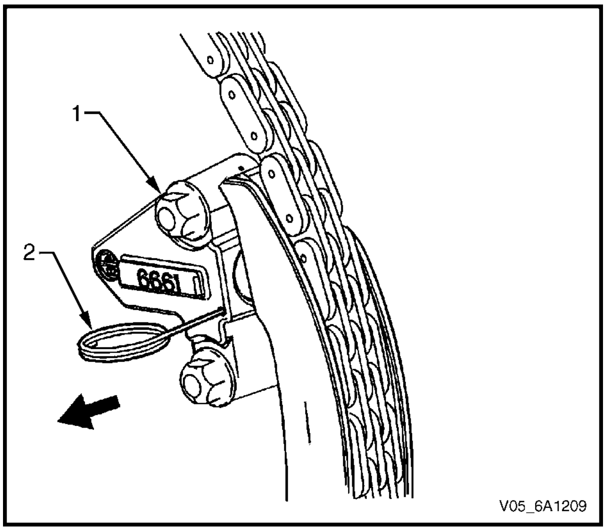

Figure 6A1 – 166

I : Inspect and correct or replace as necessary   A : Adjust

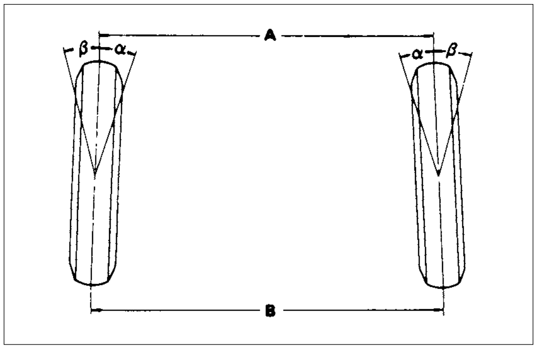
Toe-in Adjustment

Measurement should be taken with the vehicle on a surface plate.
If a surface plate is not available, toe-in should be checked with the vehicle parked on a level floor.

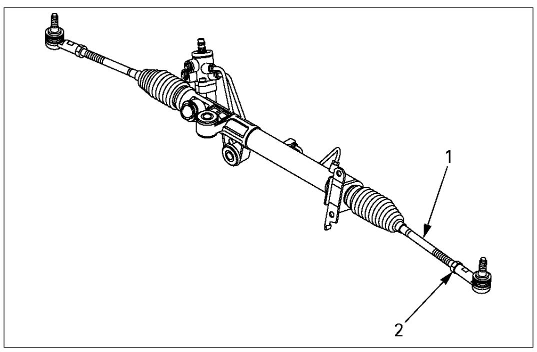
1. Set front wheels to straight ahead position.
2. Align the toe-in gauge with center height of each wheel at front end.
3. Apply center marks to each wheel, then take measurement of distance A between the center marks on each wheel.
4. Slowly move the vehicle rearward until the center marks reach the rear end position.
5. Take measurement of distance B between the center marks at rear end.



The toe-in can be calculated with the following formula.
Toe-in = B - A

Toe-in mm (in)

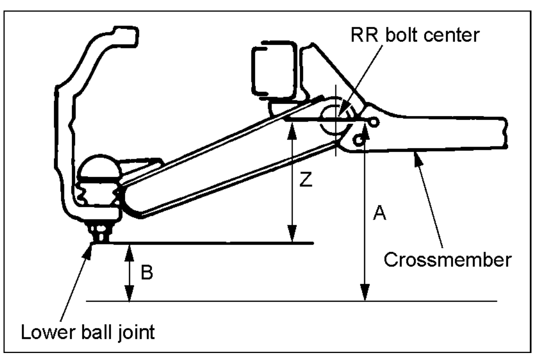
4×2 (High ride suspension) 4×4	0±2 (0±0.08)



To adjust the toe-in angle, loosen the lock nuts (2) on the tie rod (1) and turn the tie rod. Turn both rods the same amount, to keep the steering wheel centered.

Lock Nut Torque N·m (kgf·m/lb·ft)

98±6.0 (10.0±0.6 / 72.3±4.3)



RTW330SH000201

Trim Height

Trim Height : at Curb Weight
Trim height (Z) = A - B

mm (in)

Z
165±5 (6.5±0.20) (Philippine only)
140±5 (5.5±0.20) (Except Philippine)

MAXIMUM STEERING ANGLE

	4×2 (High ride suspension), 4×4
Outside wheel	32.8° (Philippine only)
Inside wheel	35.0° (Philippine only)
Outside wheel	32.1° (Except Philippine)
Inside wheel	34.4° (Except Philippine)

34 Verify the left-hand secondary timing chain timing mark alignments (1 to 6).

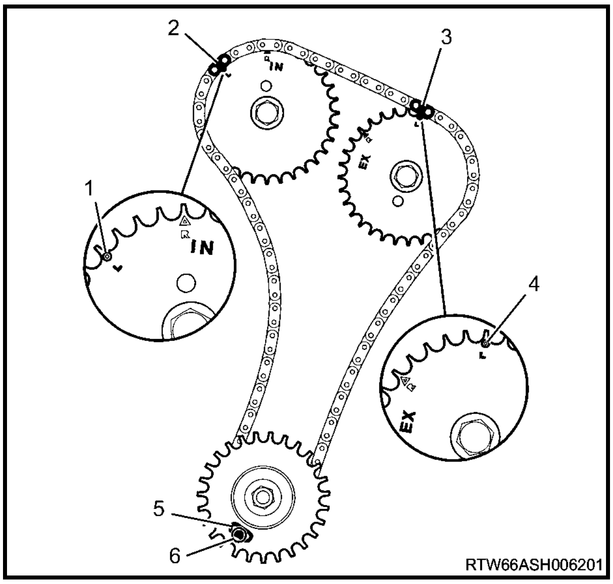


Figure 6A1 – 167

Primary Timing chain Components

1 If previously removed, install the left-hand secondary timing chain components, refer to Left-hand Secondary Timing Chain Components in this Section.

2 Ensure the right-hand camshaft intermediate driveshaft sprocket (2) is selected and orientated correctly.

CAUTION

The right-hand camshaft intermediate driveshaft sprocket (2) is marked with the letters RB and 'FRONT', and the left-hand sprocket (1) is marked with the letters LB and 'FRONT' Ensure the correct sprocket is used and the FRONT text is facing forwards when installed.

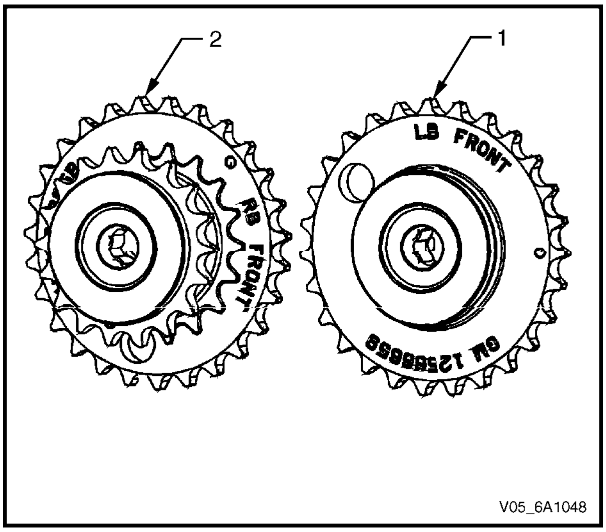

Figure 6A1 – 168

3 Install the right-hand camshaft intermediate driveshaft sprocket (2).

4 Install the driveshaft sprocket bolt (1) and tighten to the correct torque specification.

Camshaft intermediate driveshaft sprocket attaching bolt torque specification...........58.0 – 72.0 Nm

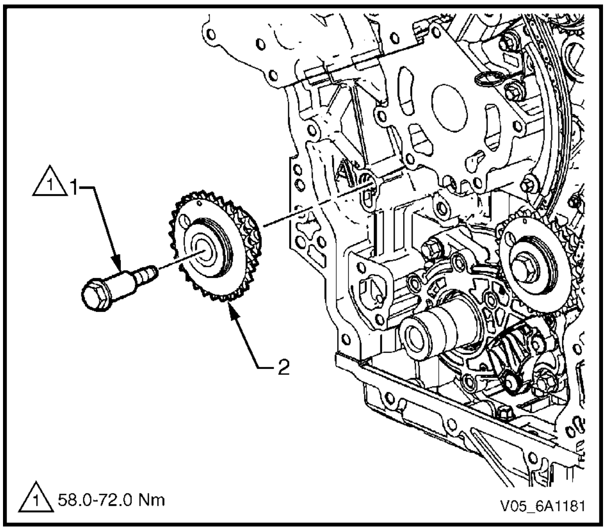

Figure 6A1 – 169

5 Ensure that the crankshaft sprocket timing mark (1) is aligned with the indexing mark (2) on the oil pump housing.

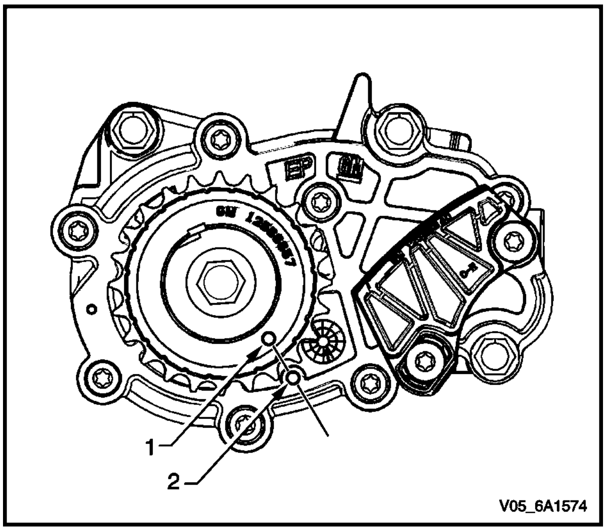

Figure 6A1 – 170

6 Install the primary timing chain (1).

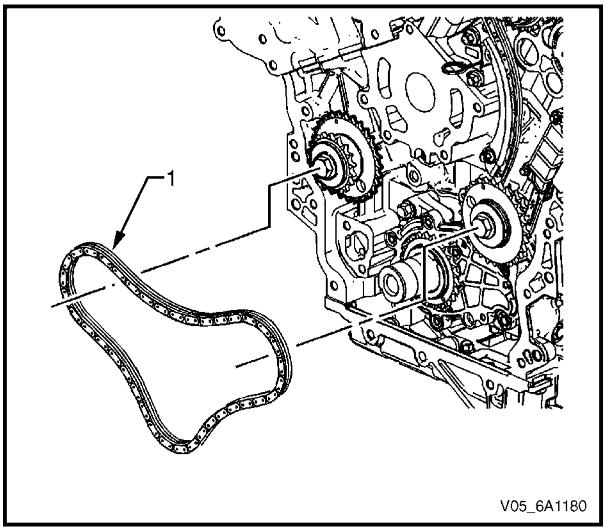

Figure 6A1 – 171

7 Wrap the primary timing chain around the large sprockets of each camshaft intermediate driveshaft sprocket and the crankshaft sprocket aligning the bright plated chain links as follows:

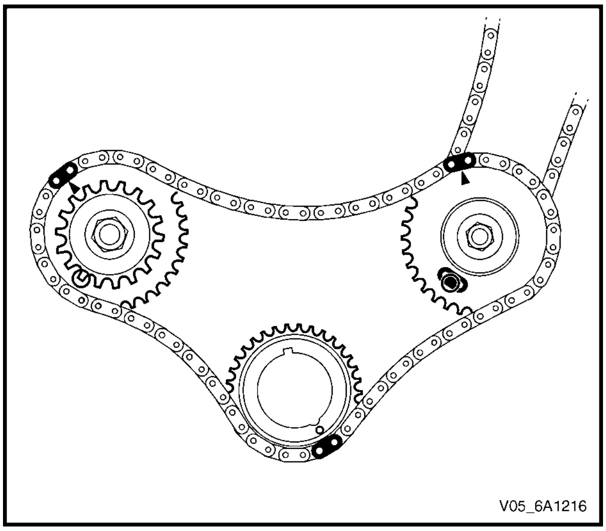

Figure 6A1 – 172

8 The left-hand camshaft intermediate driveshaft sprocket timing mark (1) will align with a bright plated primary timing chain link (2).

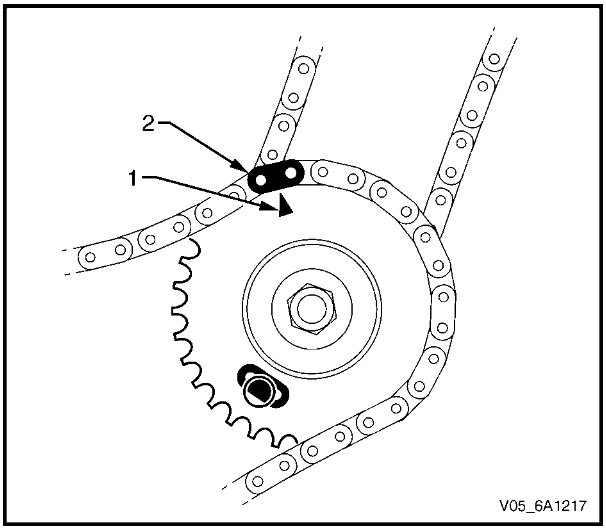

Figure 6A1 – 173

9 The right-hand camshaft intermediate driveshaft sprocket timing mark (1) will align with a bright plated primary timing chain link (2).

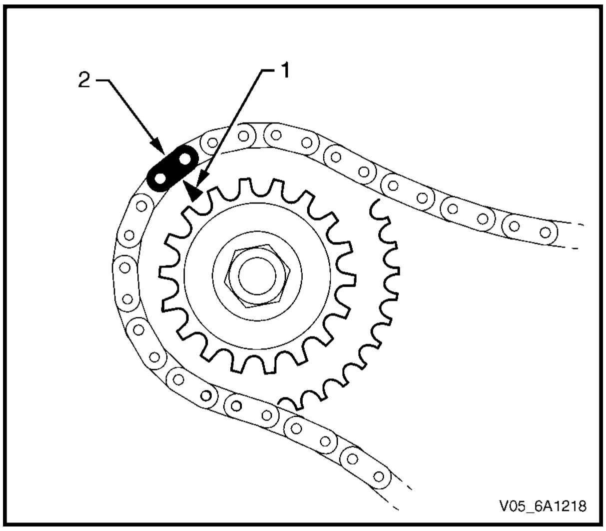

Figure 6A1 – 174

10 The crankshaft sprocket timing mark (1) will align with a bright plated timing chain link (2).

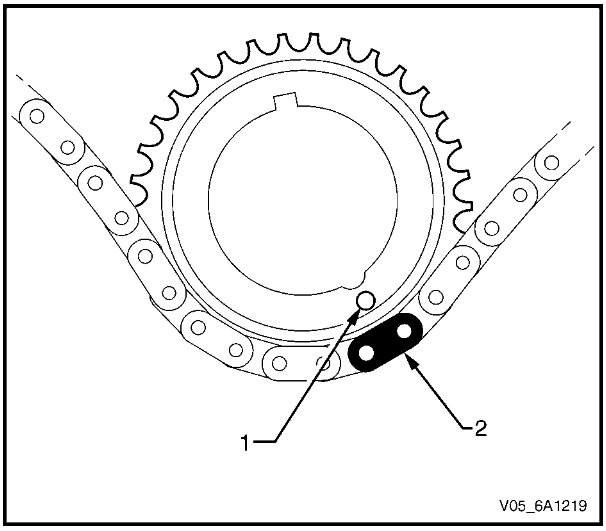

Figure 6A1 – 175

11 Ensure all the timing marks (1, 2 and 3) are properly aligned with the bright plated timing chain links (4, 5 and 6).

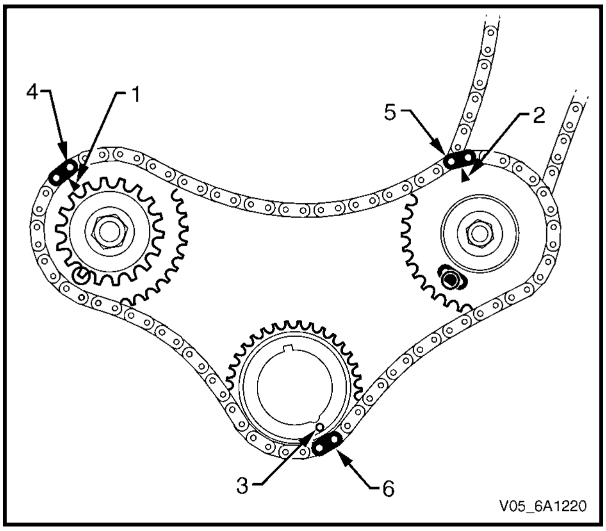

Figure 6A1 – 176

NOTE

Do not remove the primary timing chain lower guide (1). The primary timing chain lower guide is not serviced separately. If the primary timing chain lower guide must be replaced, the oil pump assembly (2) must be replaced.

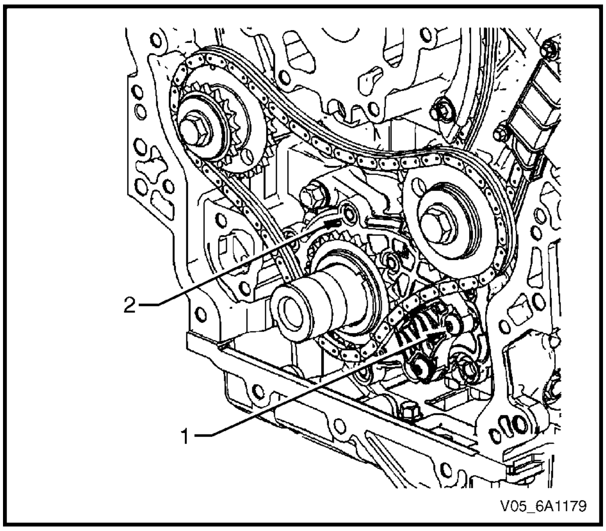

Figure 6A1 – 177

12 Ensure the primary timing chain upper guide is selected and orientated correctly.

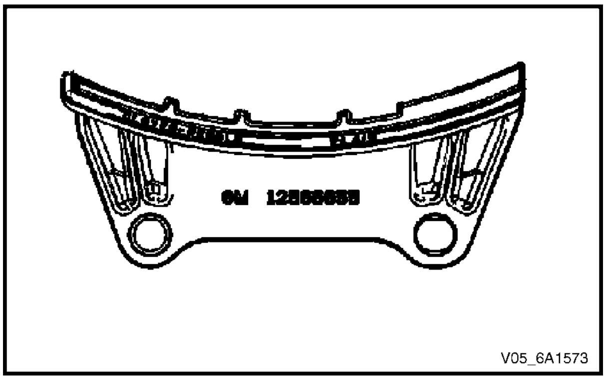

Figure 6A1 – 178

13 Install the primary timing chain upper guide (1).

14 Install the primary timing chain upper guide bolts (2) and tighten to the correct torque specification.

Primary timing chain upper guide attaching bolt torque specification...........20.0 – 26.0 Nm

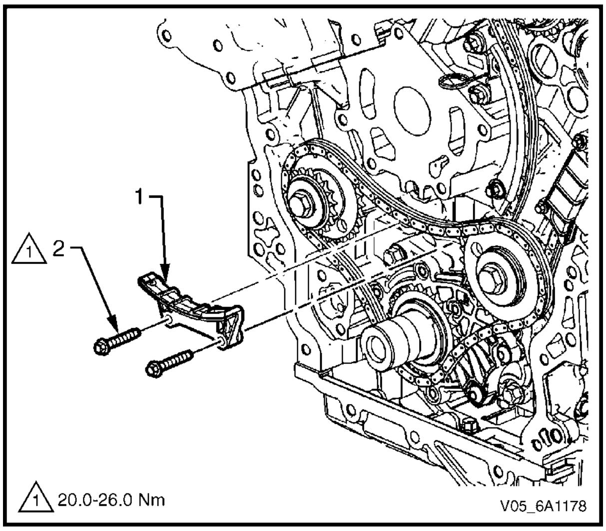

Figure 6A1 – 179

15 Ensure that the primary timing chain tensioner is being installed.

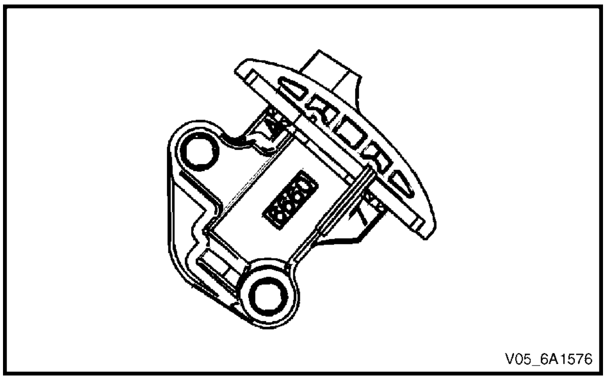

Figure 6A1 – 180

16 Reset the primary timing chain tensioner.

NOTE

To reset the tensioner, use a suitably sized flat blade screwdriver (1) or Tool No. J 45027 (4) to wind the plunger in a clockwise direction, into the tensioner shaft (2).

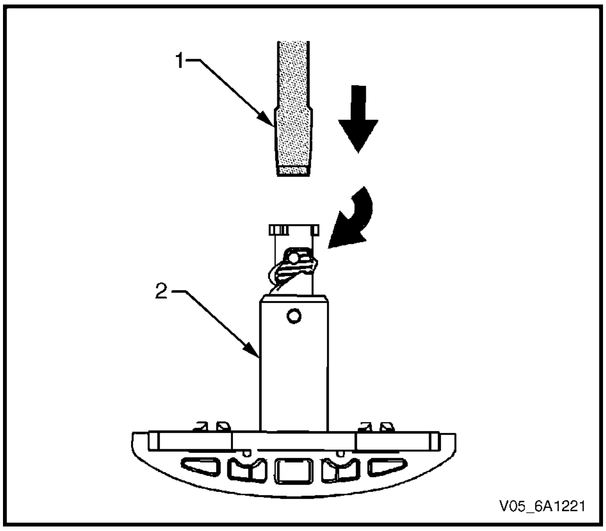

Figure 6A1 – 181

17 Install the tensioner shoe assembly (1) into the primary timing chain tensioner body (2).

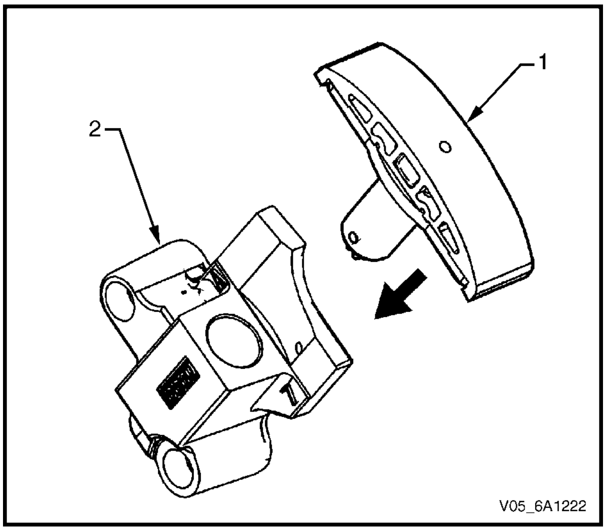

Figure 6A1 – 182

18 Compress the shoe assembly into the body (2) and lock the primary timing chain tensioner by inserting Tool No. EN 46112 into the access hole in the side of the body.

CAUTION

If Tool No. EN 46112 (1) is not inserted into the tensioner body, the plunger will remain in the locked position and no tension will be placed on the timing chain.

19 Slowly release pressure on the primary timing chain tensioner. The primary timing chain tensioner should remain compressed.

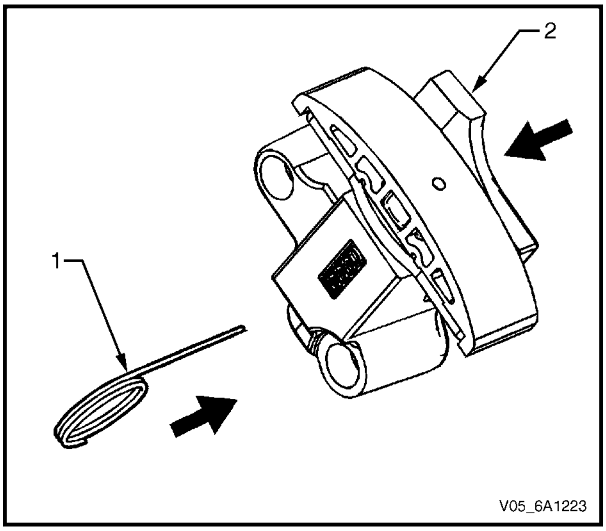

Figure 6A1 – 183

20 Install a new primary timing chain tensioner gasket (1) to the tensioner (2).

21 Install the primary timing chain tensioner bolts (3) through tensioner and gasket.

22 Ensure the primary timing chain tensioner mounting surface on the engine block does not have any burrs or defects that would affect the sealing of the new gasket.

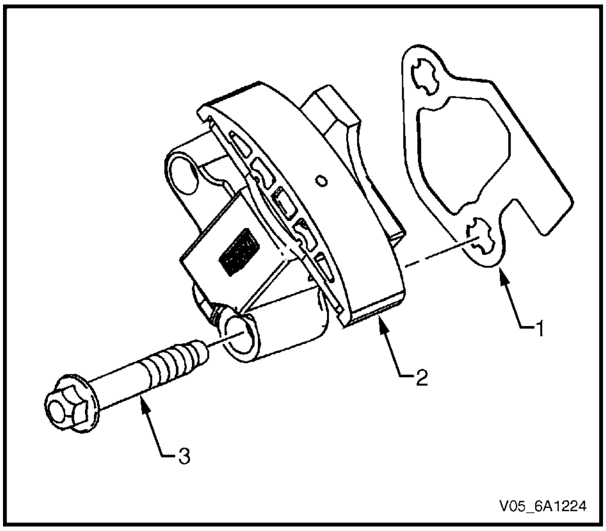

Figure 6A1 – 184

23 Place the primary timing chain tensioner (2) into position and loosely install the bolts (1) to the engine block.

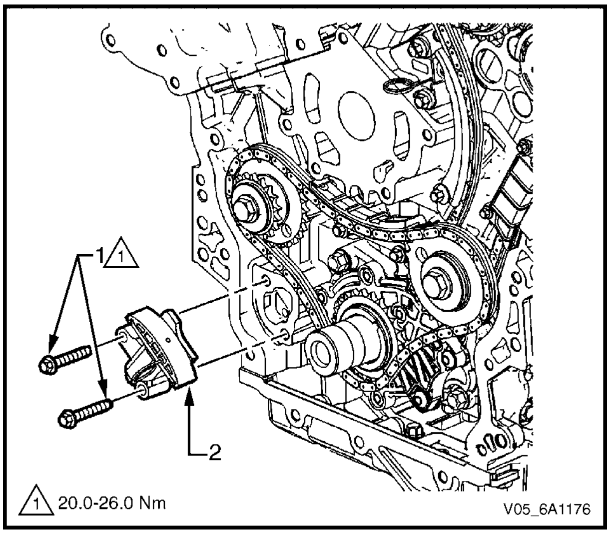

Figure 6A1 – 185

24 Verify the proper placement of the primary timing chain tensioner gasket tab (1).

25 Tighten the primary timing chain tensioner bolts (2) to the correct torque specification.

Primary timing chain tensioner attaching bolt torque specification	20.0 – 26.0 Nm

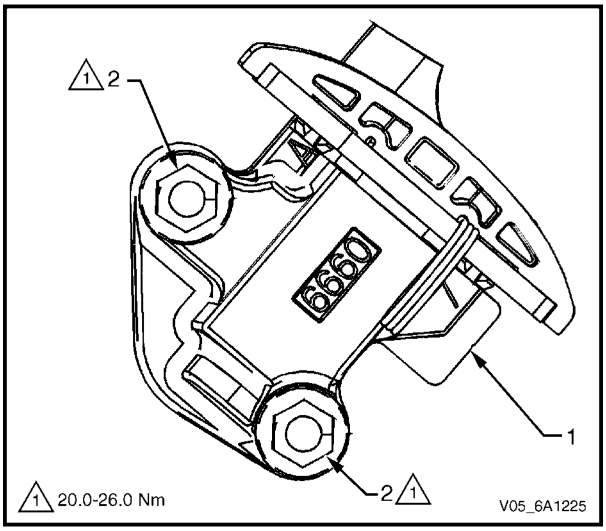

Figure 6A1 – 186

26 Release the primary timing chain tensioner (1) by pulling out Tool No. EN 46112 (2) and unlocking the tensioner shaft.

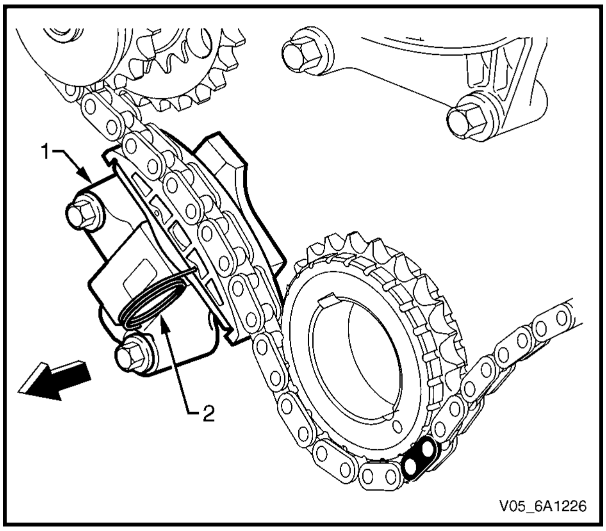

Figure 6A1 – 187

27 Verify the primary and left-hand secondary timing chain timing mark alignments (1 to 12).

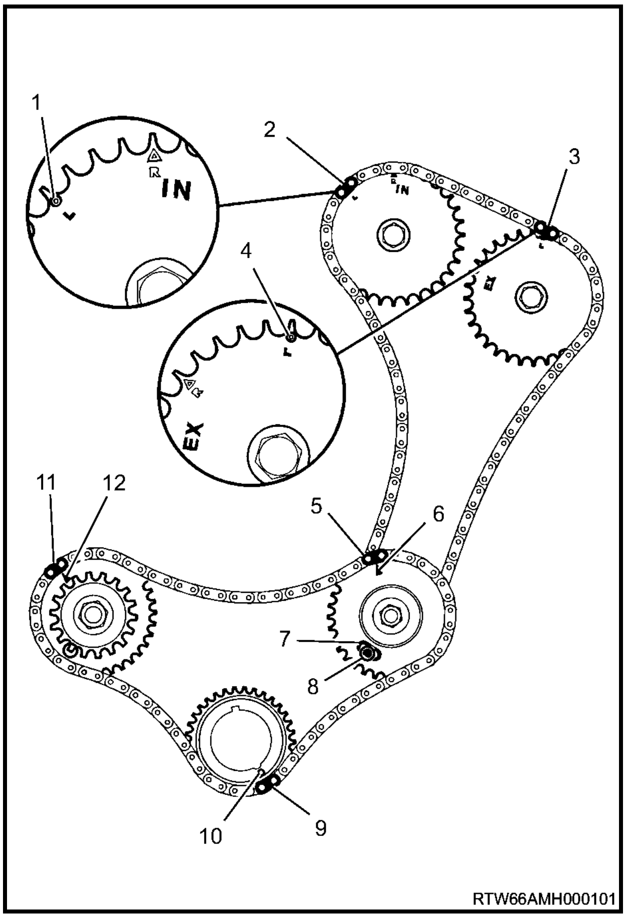

Figure 6A1 – 188

28 Remove Tool No. EN 46105 from the left-hand and right-hand cylinder head camshafts.

Right-hand Secondary Timing Chain Components

1 Install the primary timing chain components, refer to Primary Timing chain Components in this Section.

2 Using Tool No. EN46111 (1), rotate the crankshaft in a clockwise direction until the crankshaft sprocket timing mark (2) is aligned with the indexing mark (3) on the oil pump housing.

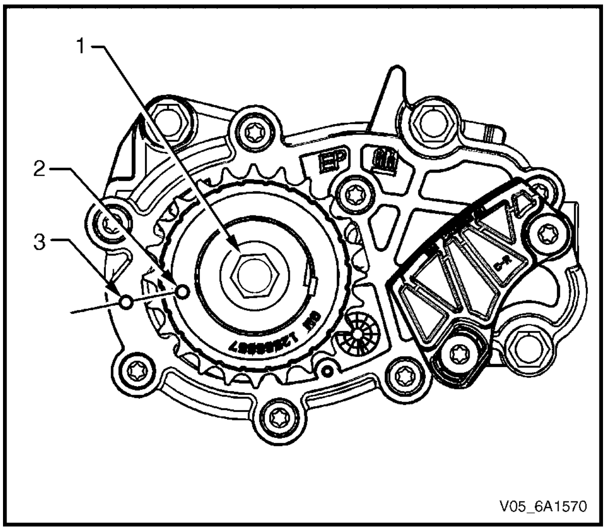

Figure 6A1 – 189

CAUTION

In order to install Tool No. EN 46105 onto the camshafts, rotate the camshafts. There should be no need to rotate the camshaft more than 45 degrees.

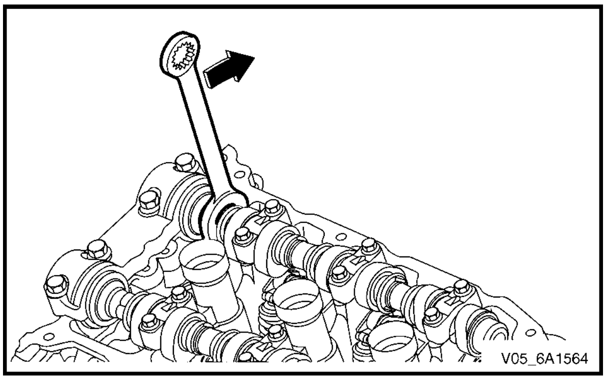

Figure 6A1 – 190

3 Install Tool No. EN 46105-1 (1) onto the rear of the right-hand cylinder head camshafts (2).

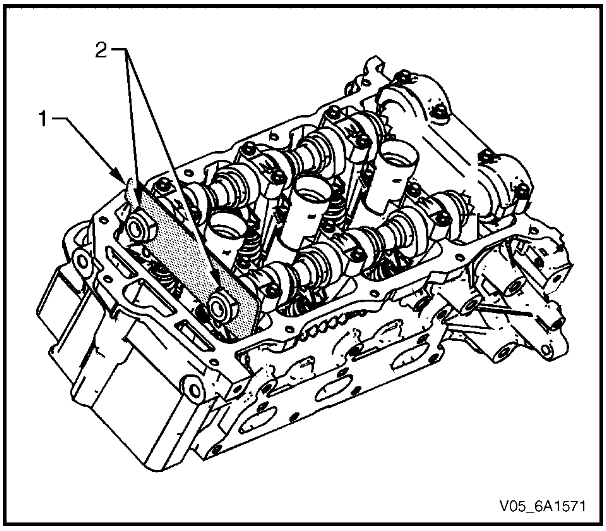

Figure 6A1 – 191

4 Install Tool No. EN 46105-2 (1) onto the rear of the left-hand cylinder head camshafts (2).

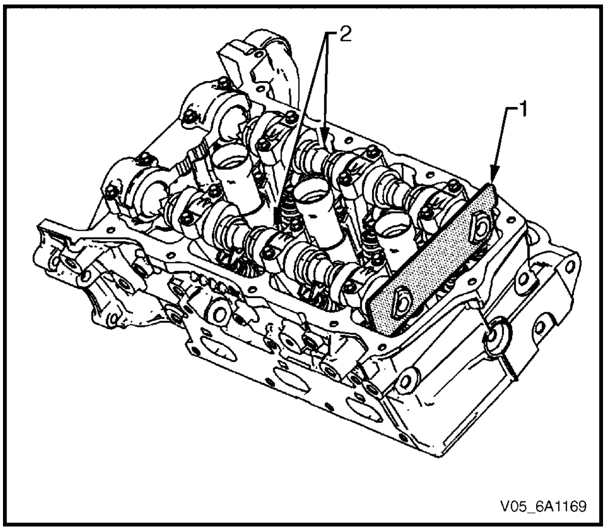

Figure 6A1 – 192

5 Install the right-hand secondary timing chain (1) onto the camshaft actuators (2) and the right hand camshaft intermediate driveshaft sprocket (3) aligning the chain in the following manner:

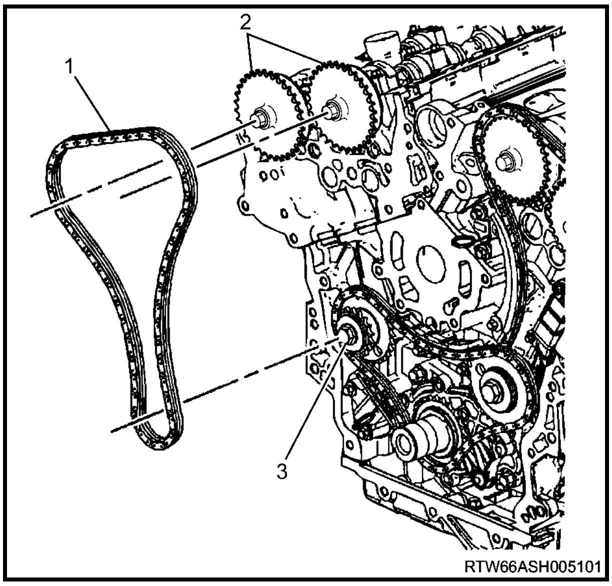

Figure 6A1 – 193

6 Place the secondary timing chain around the right-hand camshaft intermediate driveshaft outer sprocket, aligning the bright plated timing chain link (1) with the alignment access hole (2) in the inner sprocket.

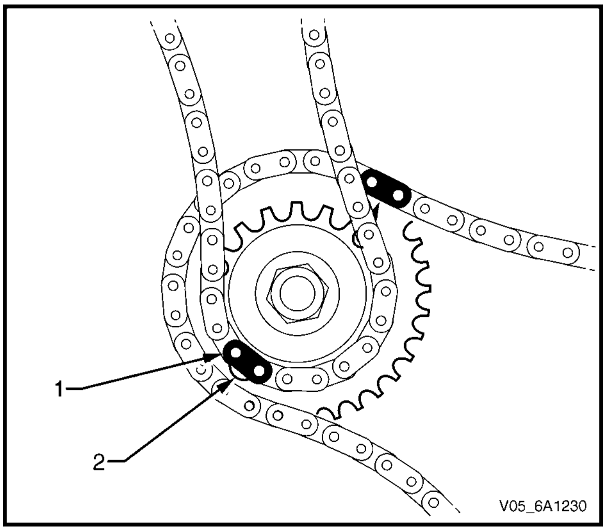

Figure 6A1 – 194

7 Wrap the secondary timing chain around both right-hand actuator drive sprockets.

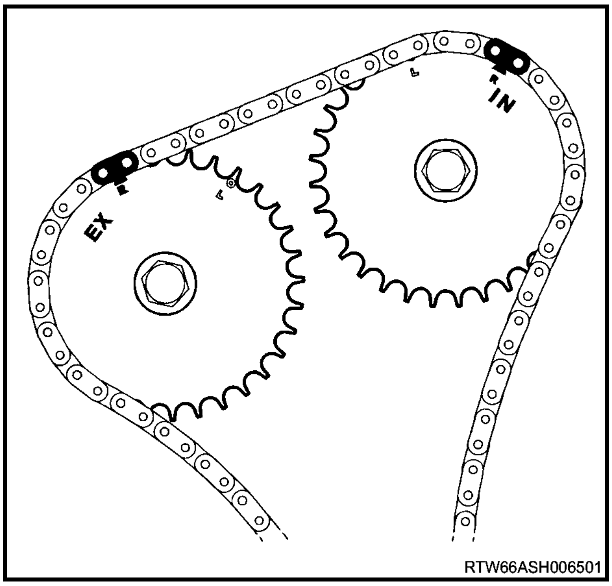

Figure 6A1 – 195

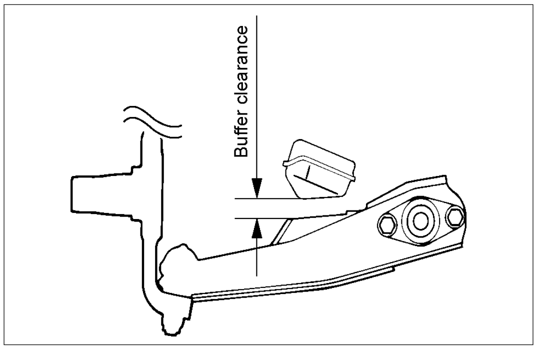


RTW53ASH000301

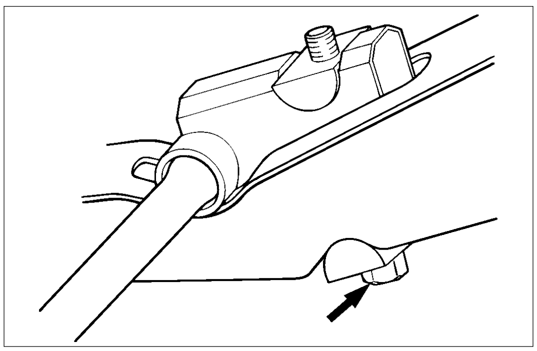
FRT Buffer clearance (Reference Data) mm(in)

4×2 (High ride suspension), 4×4
29.7(1.17)

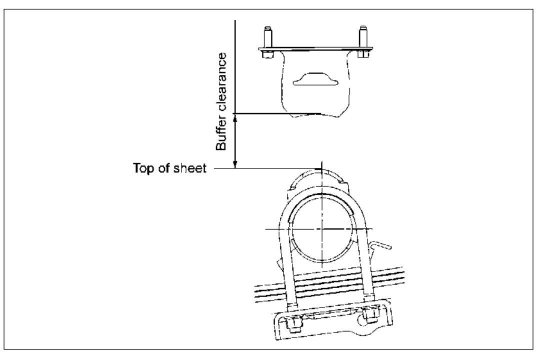
Adjustment

Adjust the trim height by means of the adjusting bolt on the height control arms.

1. Check and adjust the tire inflation pressures.
2. Park the vehicle on level ground and move the front of the vehicle up and down several times to settle the suspension.
3. Make necessary adjustments with the adjusting bolt on the height control arms.



410RS001



RTW63ASH000101

RR Buffer clearance (Reference Data) mm(in)

4×2 (High ride suspension), 4×4
80.0 (3.15)

8 Align the bright plated timing chain link (2) with the exhaust actuator sprocket alignment triangle mark or circular mark .

CAUTION

Ensure that when aligning the right-hand secondary timing chain to the right-hand camshaft actuator sprockets, that the triangular timing marks (1) on the sprocket are used, NOT the circular mark.

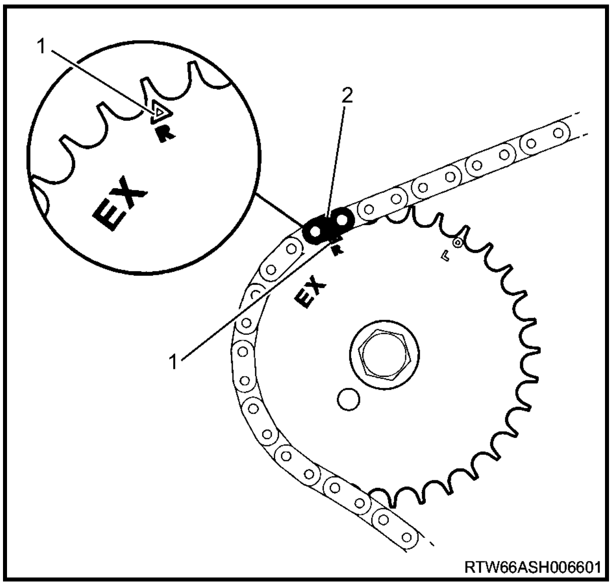


Figure 6A1 – 196

9 Align the bright plated timing chain link (1) with the intake actuator sprocket alignment triangle mark (2).

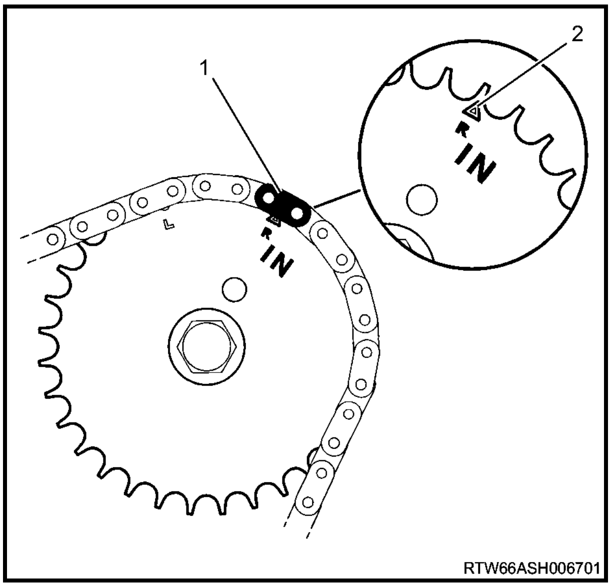

Figure 6A1 – 197

10 Ensure that the right-hand secondary timing chain guide is selected and orientated correctly.

CAUTION

Ensure that the right-hand secondary timing chain guide is used when installing to the right-hand side in this procedure.

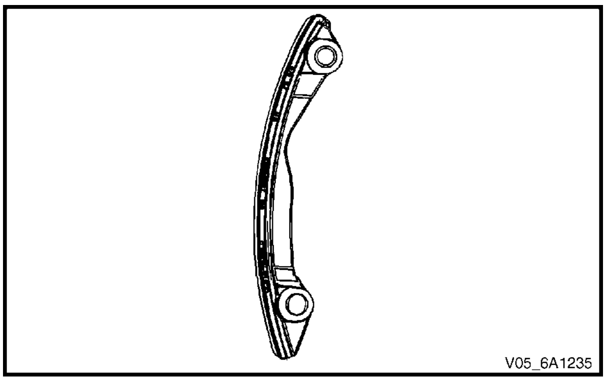

Figure 6A1 – 198

11 Position the chain guide (2).

12 Install the secondary timing chain guide bolts (1) and tighten to the correct torque specification.

Secondary timing chain guide attaching bolt torque specification...........20.0 – 26.0 Nm

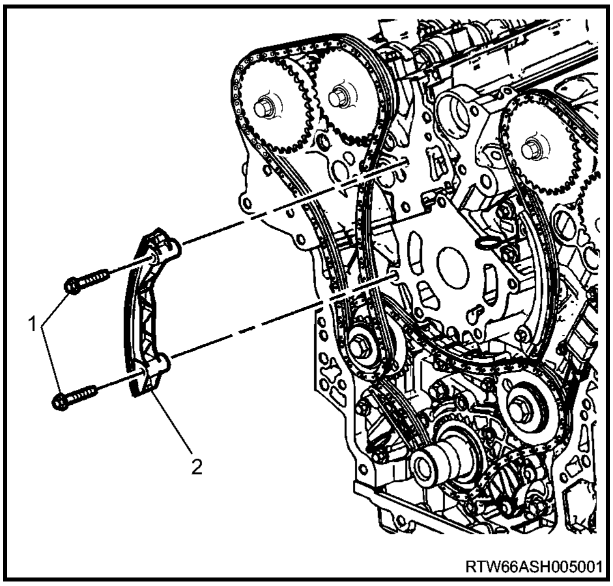

Figure 6A1 – 199

13 Ensure the right-hand secondary timing chain shoe is selected and orientated correctly.

CAUTION

The right-hand secondary camshaft drive shoe is marked with the letters ‘RH’. Ensure that the right-hand drive shoe is used when installing to the right-hand side in this procedure and that the letters ‘RH” are facing the front of the vehicle when installed.

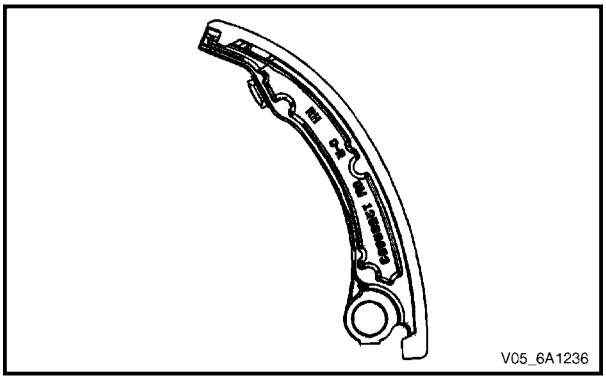

Figure 6A1 – 200

14 Position the right-hand secondary timing chain shoe (1).

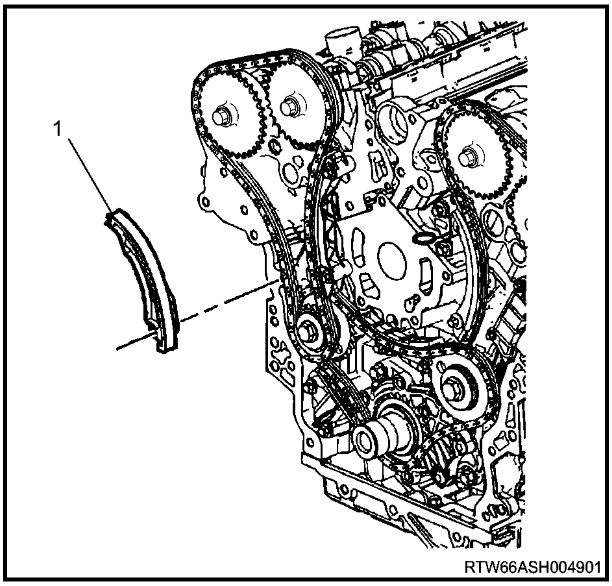

Figure 6A1 – 201

15 Install the secondary timing chain shoe bolt (1) and tighten to the correct torque specification.

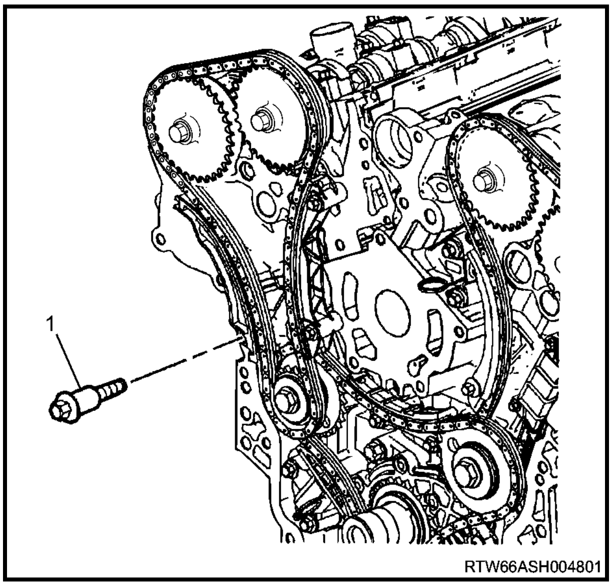

Figure 6A1 – 202

Secondary timing chain shoe attaching bolt torque specification...........20.0 – 26.0 Nm

16 Ensure the right-hand secondary timing chain tensioner is selected and orientated correctly.

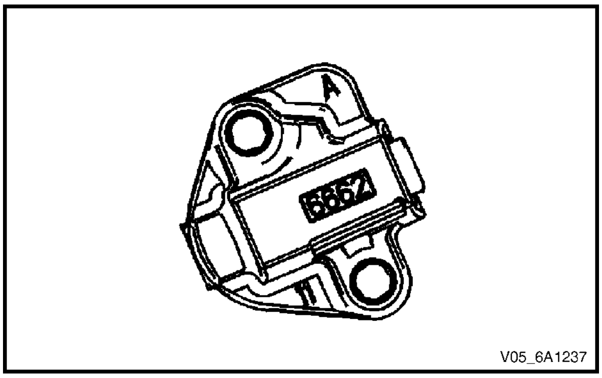

Figure 6A1 – 203

17 Reset the right-hand secondary timing chain tensioner.

NOTE

To reset the tensioner, use a suitably sized flat blade screwdriver (1) or Tool No. J 45027 to wind the plunger in a clockwise direction, into the tensioner shaft (2).

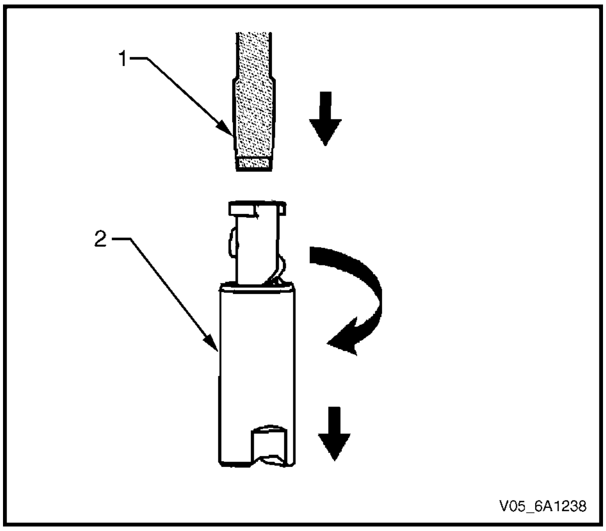

Figure 6A1 – 204

18 Install the tensioner shaft (1) into the right-hand secondary timing chain tensioner body (2).

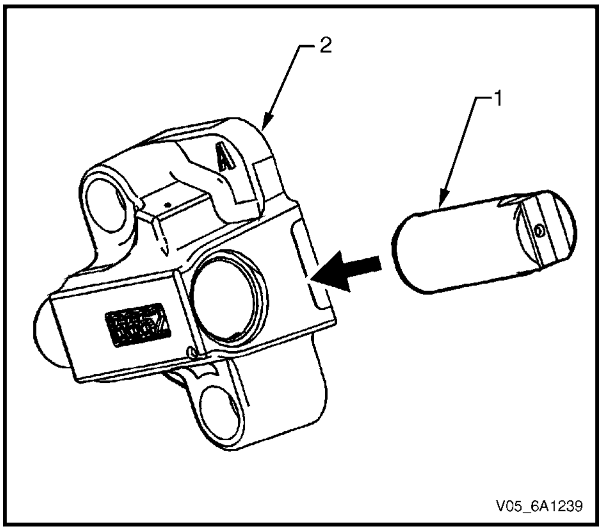

Figure 6A1 – 205

19 Compress the tensioner shaft into the body and lock the tensioner by inserting Tool No. EN 46112 into the access hole in the side of the tensioner body.

20 Slowly release pressure on the right-hand secondary timing chain tensioner. The tensioner should remain compressed.

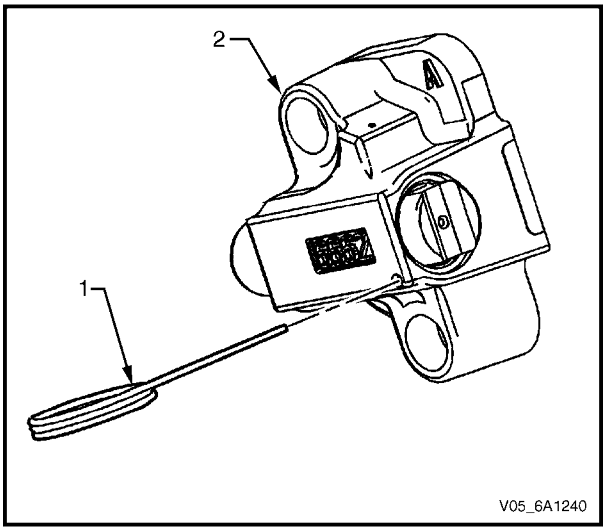

Figure 6A1 – 206

21 Install a new right-hand secondary timing chain tensioner gasket (1) to the tensioner (2).

22 Install the right-hand secondary timing chain tensioner bolts (3) through the tensioner and gasket.

23 Ensure the right-hand secondary timing chain tensioner mounting surface on the right-hand cylinder head does not have any burrs or defects that would affect the sealing of the new tensioner gasket.

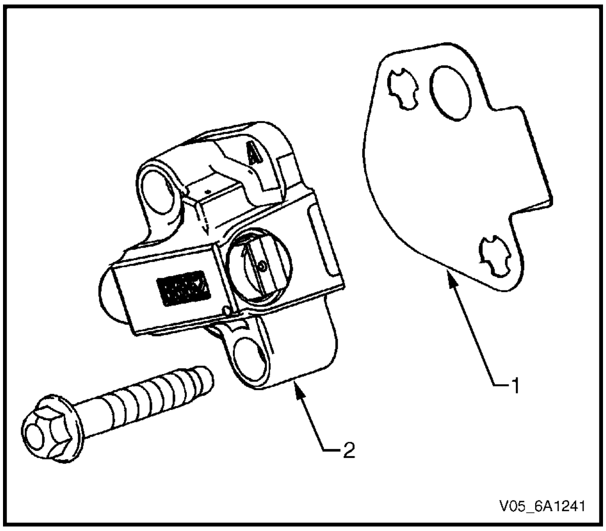

Figure 6A1 – 207

24 Place the right-hand secondary timing chain tensioner (2) into position and loosely install the bolts (1) to the engine block.

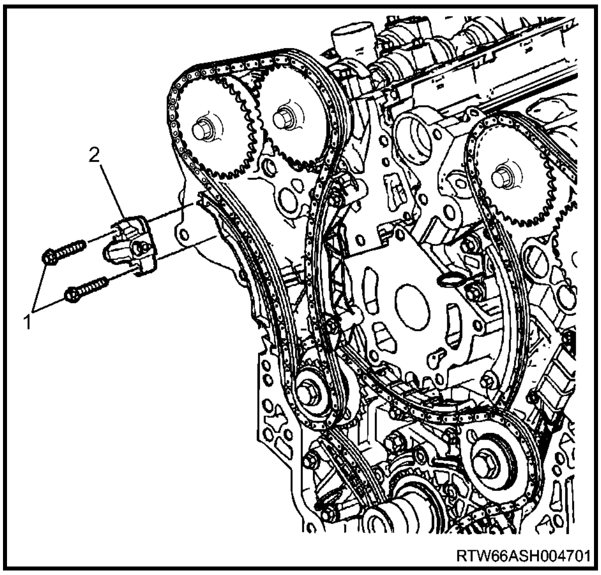

Figure 6A1 – 208

25 Verify the proper placement of the right-hand secondary timing chain tensioner gasket tab (1).

26 Tighten the right-hand secondary timing chain tensioner bolts (2) to the correct torque specification.

Secondary timing chain tensioner attaching bolt torque specification...........20.0 – 26.0 Nm

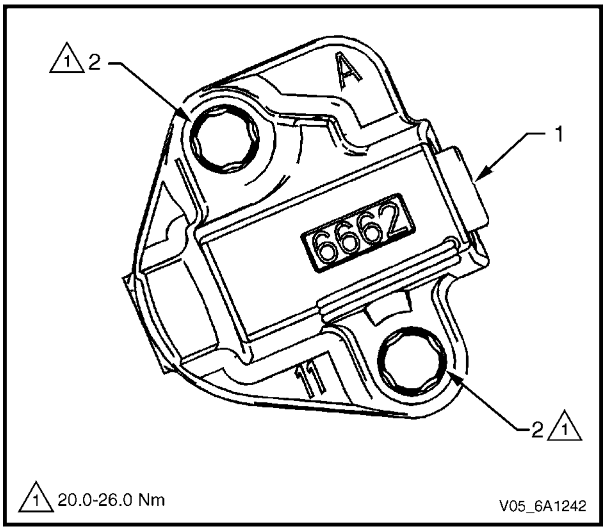

Figure 6A1 – 209

27 Release the right-hand timing chain tensioner (1) by pulling out Tool No. EN 46112 (2) and unlocking the tensioner plunger.

CAUTION

If Tool No. EN 46112 (1) is not removed from the tensioner body (2), the plunger will remain in the locked position and no tension will be placed on the timing chain, this will cause damage to the engine.

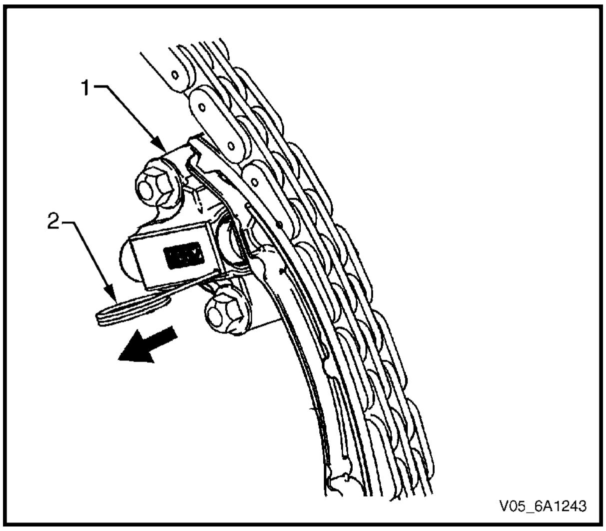

Figure 6A1 – 210

28 Verify all primary and secondary timing chain timing mark alignments (1 to 18).

29 Remove Tool No. EN 46105 and EN 46105-2 from the left and right-hand cylinder head camshafts.

30 Reinstall the spark plugs. Refer to 6C1-3 Engine Management – V6 – Service Operations.

31 Reinstall the engine front cover assembly, refer to 3.15 Front Cover Assembly.

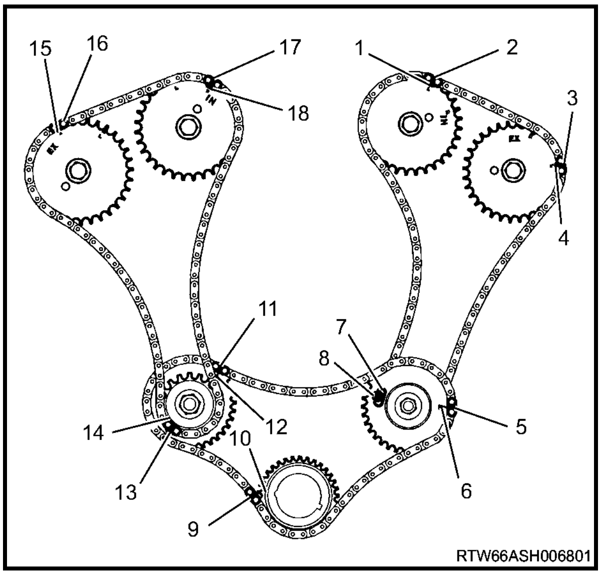

Figure 6A1 – 211

3.17 Oil Pump Assembly

Remove

NOTE

Do not remove the left-hand bank idler sprocket.

1 Remove the primary timing chain and crankshaft sprocket, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.

2 Remove the three bolts (1) attaching the oil pump (2).

3 Remove the oil pump assembly.

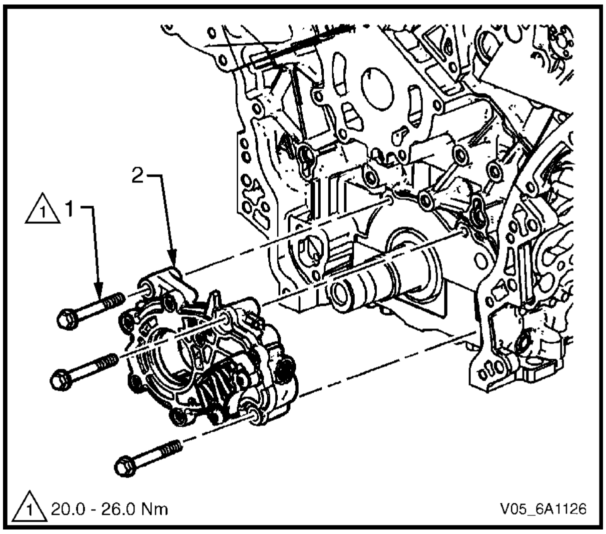

Figure 6A1 – 212

Disassemble

CAUTION

There are no serviceable components within the oil pump. Disassemble the pump only to diagnose an oil related concern. A disassembled oil pump must not be reused: it must be replaced.

1 Remove the two bolts (1) attaching the primary timing chain lower guide (2) and remove the guide.

CAUTION

The primary timing chain lower guide is not serviced separately and is part of the oil pump assembly. If it is removed from the pump assembly, the guide and the pump must be replaced.

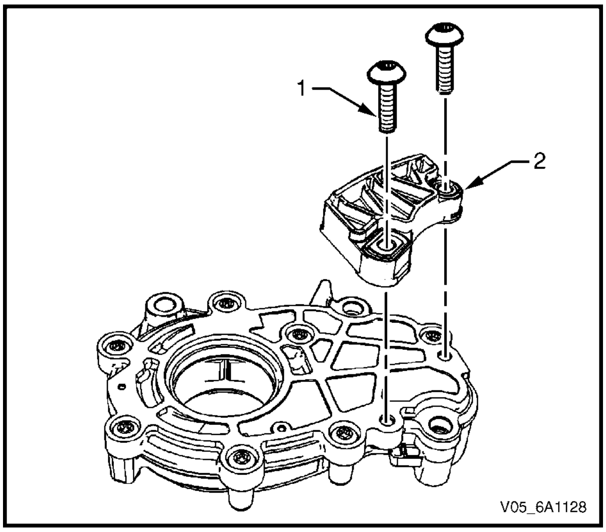

Figure 6A1 – 213

2 Remove the seven bolts (2) attaching the oil pump cover to the oil pump housing (1) and remove the cover from the housing.

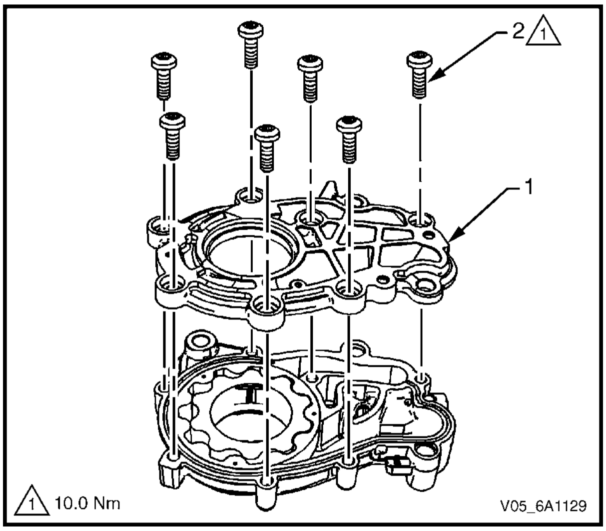

Figure 6A1 – 214

3 Remove the inner gerotor ring (1).

4 Remove the outer gerotor ring (2).

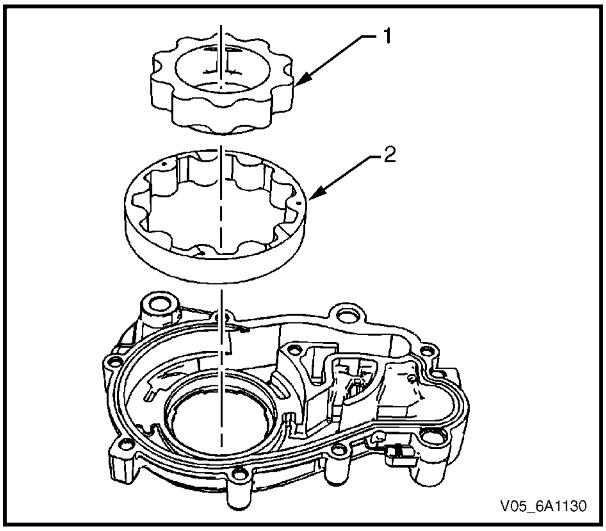

Figure 6A1 – 215

5 Remove the clip (1), retaining the oil relief valve cap (2).

6 Remove the cap, spring (3) and plunger (4) from the oil pump housing.

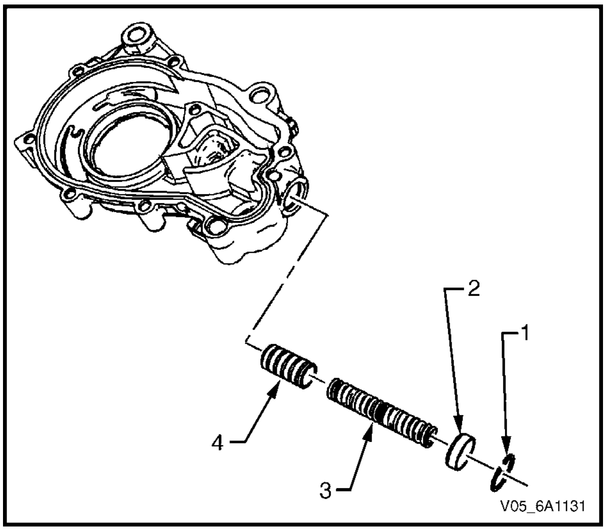

Figure 6A1 – 216

Clean

1 Clean the oil pump components with non-corrosive solvent.

WARNING

Safety glasses must be worn when using compressed air.

2 Dry the oil pump components with compressed air.

Inspect

1 Inspect the oil pump housing for damage.

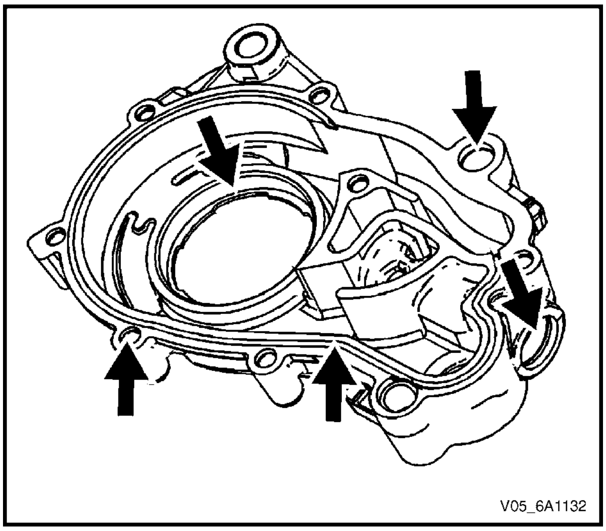

Figure 6A1 – 217

2 Inspect the oil pump cover for damage.

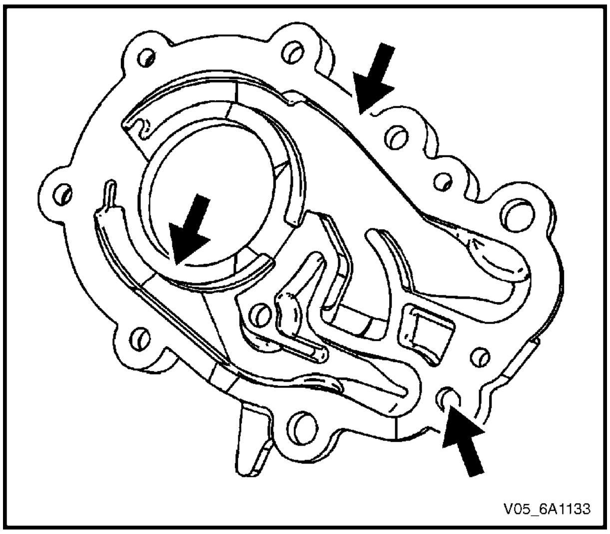

Figure 6A1 – 218

3 Inspect the inner drive gear for damage. If inner surface damage is found, ensure the crankshaft is also inspected.

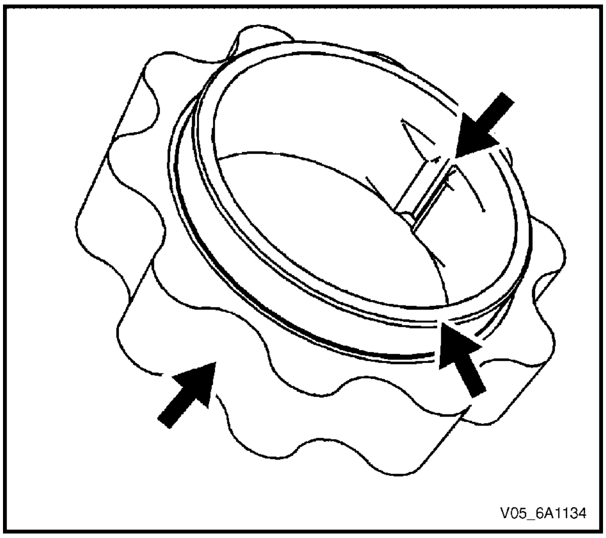

Figure 6A1 – 219

4 Inspect the outer driven gear for damage.

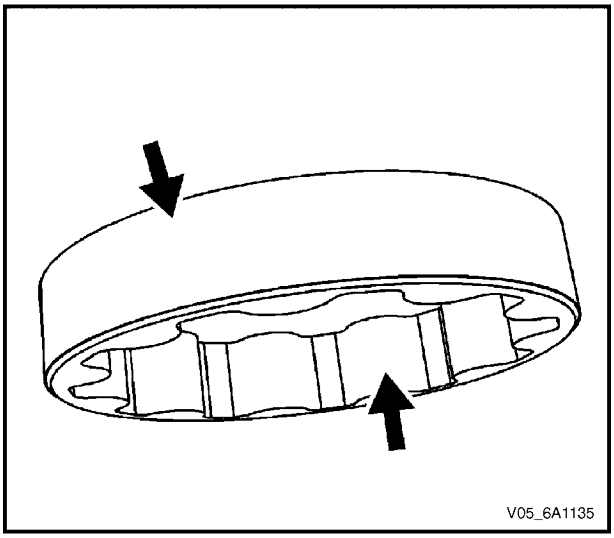

Figure 6A1 – 220

5 Inspect the oil pump relief valve components for debris or damage.

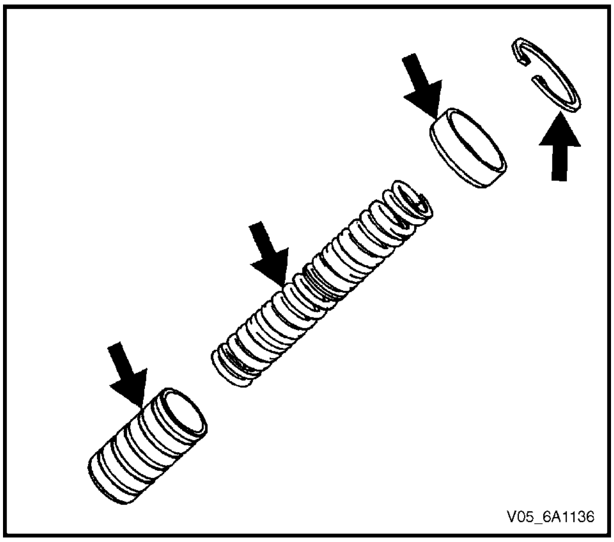

Figure 6A1 – 221

6 Inspect the primary camshaft chain lower guide for damage. If replacement of the primary camshaft chain lower guide is required, replace the entire oil pump assembly as the primary camshaft chain lower guide is not serviceable separately.

7 If debris or damage is present within the oil pump, further inspection of all of the engine components is required.

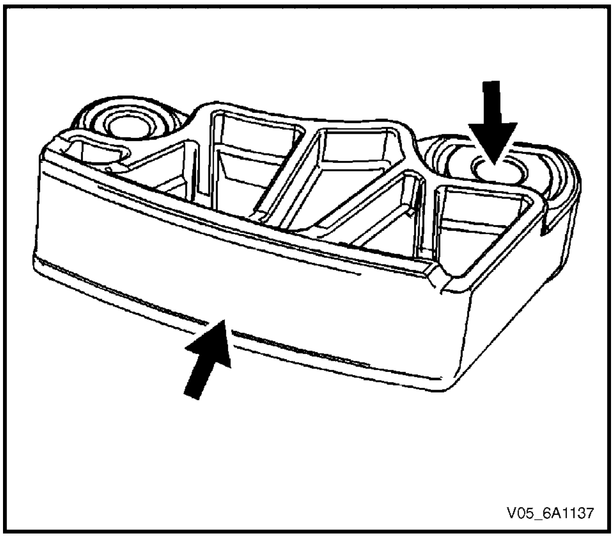

Figure 6A1 – 222

SECTION 3B

POWER-ASSISTED STEERING SYSTEM

TABLE OF CONTENTS

Reassemble

CAUTION

As there are no serviceable components within the oil pump, a disassembled oil pump must be replaced.

Reinstall

1 Align the oil pump gerotor with the crankshaft flats and fit the oil pump assembly to the engine block.

2 Align the pump body (2) with the mounting holes in the cylinder block.

3 Install the oil pump bolt (1), three places, and tighten to the correct torque specification.

4 Install the primary timing chain, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.

Oil pump attaching bolt torque specification ....20.0 – 26.0 Nm

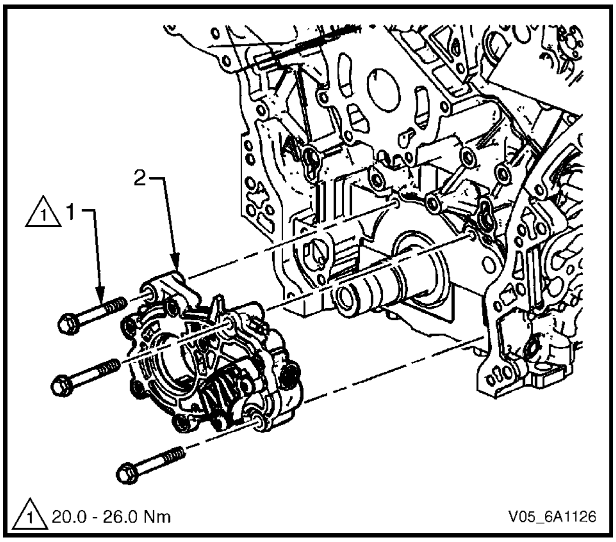

Figure 6A1 – 223

3.18 Camshaft Sprocket

CAUTION

Setting the camshaft timing is required whenever the camshaft drive system is disturbed to ensure the relationship between any chain and sprocket is not lost. Even when only one sprocket is involved, multiple crankshaft rotations will not produce conditions where correct timing can be confirmed.

If required, follow the Left-hand Secondary Camshaft Chain Components reinstallation procedure to reset the camshaft timing.

Remove

Right-hand Side

1 Remove the right-hand camshaft cover, refer to 3.12 Camshaft Cover.

2 Remove the camshaft position sensors, refer to 6C1-3 Engine Management – Service Operations.

3 Remove the camshaft position actuator solenoids, refer to 6C1-3 Engine Management – V6 – Service Operations.

4 Remove the crankshaft balancer assembly, refer to 3.13 Crankshaft Balancer Assembly.

5 Install the crankshaft rotation socket Tool No. EN-46111 onto the crankshaft.

6 Rotate the crankshaft until the camshafts are in a neutral low tension position. The camshaft flats will be parallel with the camshaft cover rail (1).

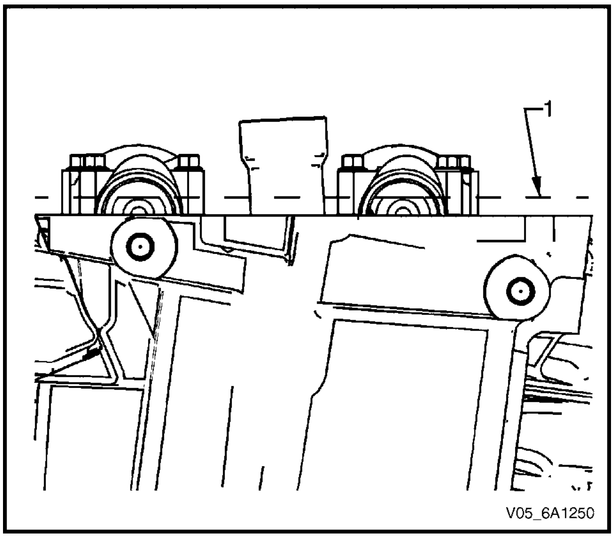

Figure 6A1 – 224

7 Install Tool No. EN-46105 – 1 (1) onto the rear of the right-hand cylinder head (3) camshafts (2).

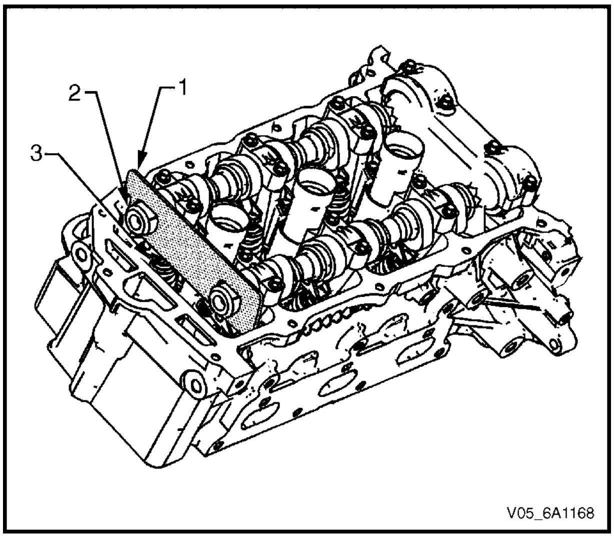

Figure 6A1 – 225

8 Loosen the camshaft sprocket bolt.

NOTE

- Use an open-end spanner (1) at the camshaft hex (2) to prevent camshaft/engine rotation.
- Do not remove the camshaft sprocket bolt at this time.
- If you have already removed the camshaft timing chain proceed to step 12

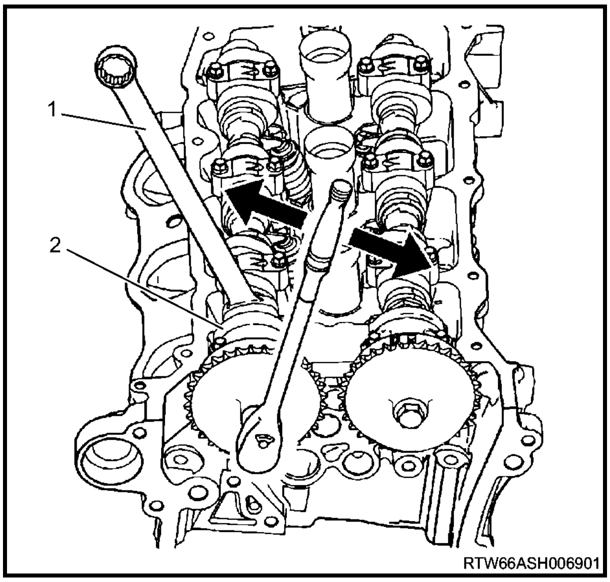

Figure 6A1 – 226

9 Install Tool No. EN-46108 (1 and 2) to retain the timing chain (3 and 4).

10 Firmly tighten the wing nuts of Tool No. EN-46108.

11 Mark the timing chain and the respective location on both camshaft sprocket.

NOTE

Ensure the camshaft timing chain and the camshaft sprocket are marked for correct reassembly.

CAUTION

Ensure the tips of Tool No. EN-46108 are fully engaged into the timing chain and the wing nuts are tight and the timing chain is taught.

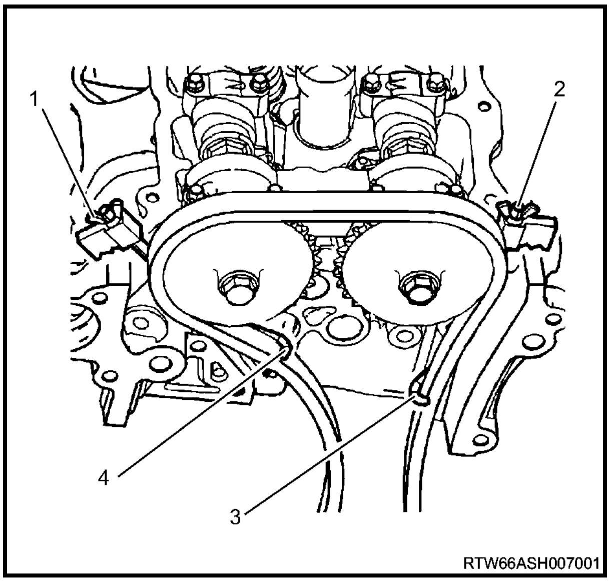

Figure 6A1 – 227

12 Remove the bolt (1) attaching the right-hand exhaust camshaft sprocket (2) and remove the sprocket.

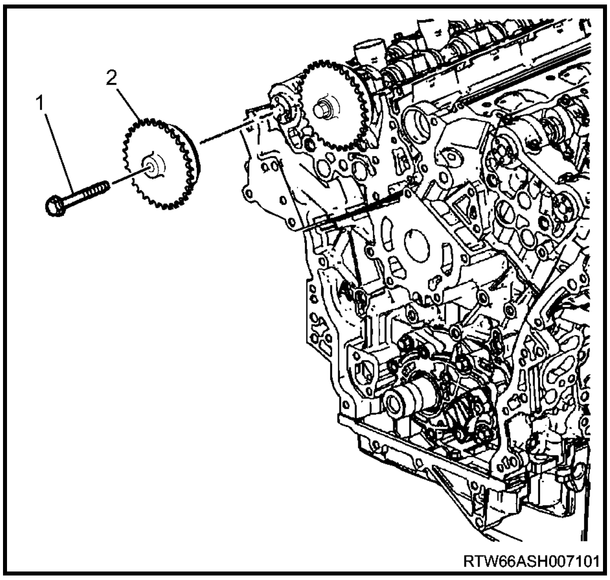

Figure 6A1 – 228

13 Remove the bolt (1) attaching right-hand intake camshaft sprocket (2) and remove the sprocket.

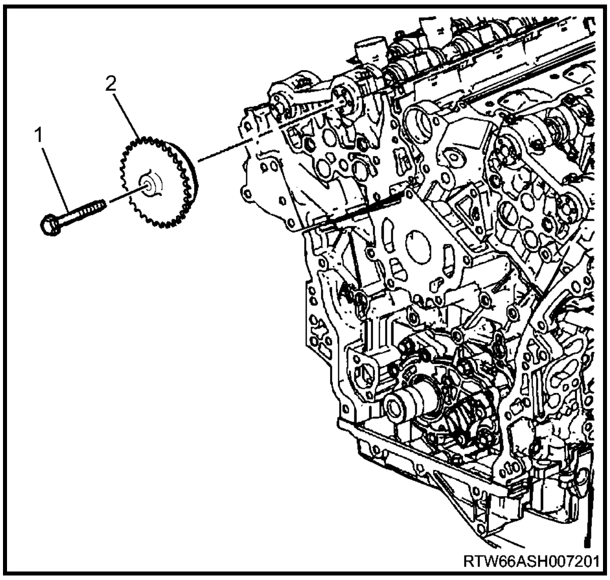

Figure 6A1 – 229

Left-hand Side

1 Remove the left-hand camshaft cover, refer to 3.12 Camshaft Cover.

2 Remove the camshaft position sensors, refer to 6C1-3 Engine Management – V6 – Service Operations.

3 Remove the camshaft position actuator solenoids, refer to 6C1-3 Engine Management – V6 – Service Operations.

4 Remove the crankshaft balancer assembly, refer to 3.13 Crankshaft Balancer Assembly.

5 Install the crankshaft rotation socket Tool No. EN-46111 onto the crankshaft.

6 Rotate the crankshaft until the camshafts are in a neutral low tension position. The camshaft flats will be parallel with the camshaft cover rail (1).

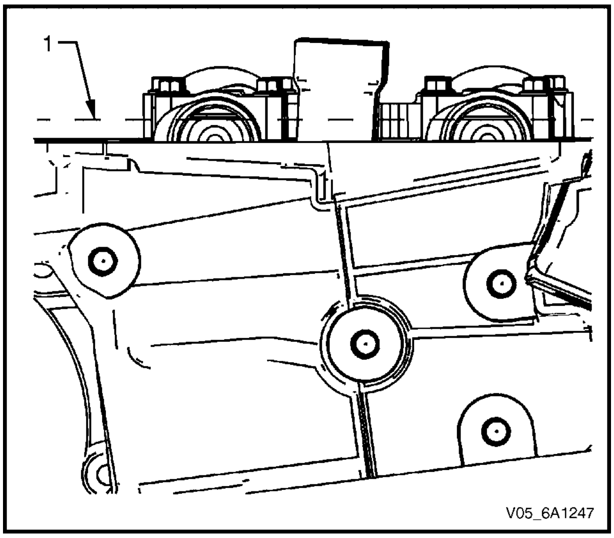

Figure 6A1 – 230

7 Install Tool No. EN-46105 – 1 (1) onto the rear of the left-hand cylinder head camshafts (2).

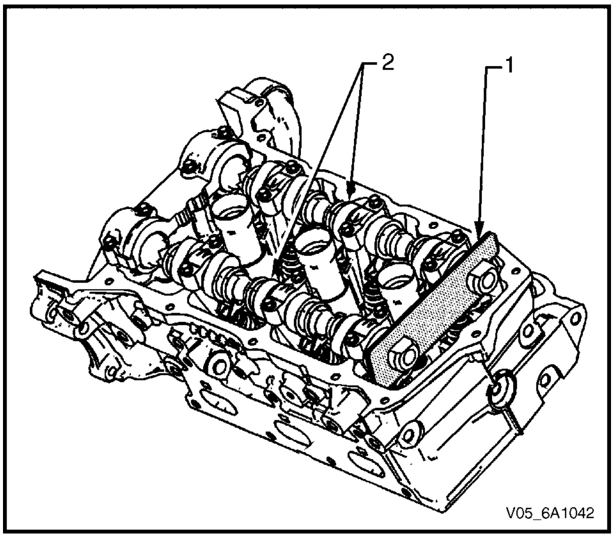

Figure 6A1 – 231

8 Loosen the camshaft sprocket bolt.

NOTE

- Use an open-end wrench (1) at the camshaft hex (2) to prevent camshaft/engine rotation.
- Do not remove the camshaft sprocket bolt at this time.
- If the camshaft timing chain has already been removed proceed to step 12.

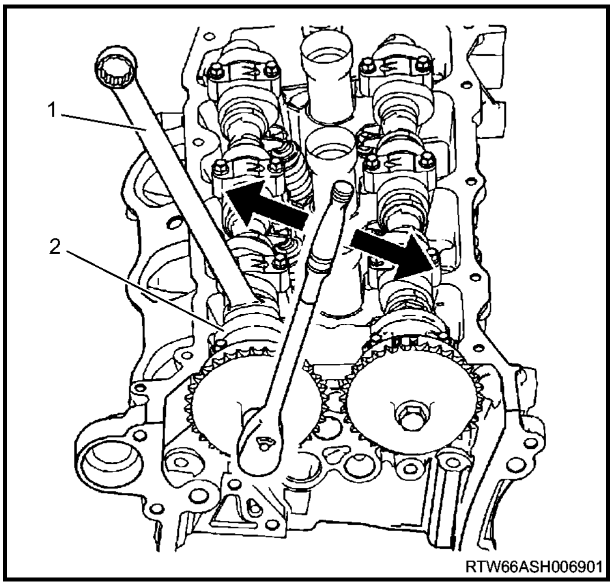

Figure 6A1 – 232

9 Install Tool No. EN-46108 (1 and 2) to retain the timing chain (3 and 4).

10 Firmly tighten the wing nuts of Tool No. EN-46108.

CAUTION

Ensure the tips of Tool No. EN-46108 are fully engaged into the timing chain and the wing nuts are tight and the timing chain is taught.

11 Mark the timing chain and the respective location on both camshaft sprocket.

NOTE

Ensure the camshaft timing chain and the camshaft sprocket are marked for correct reassembly.

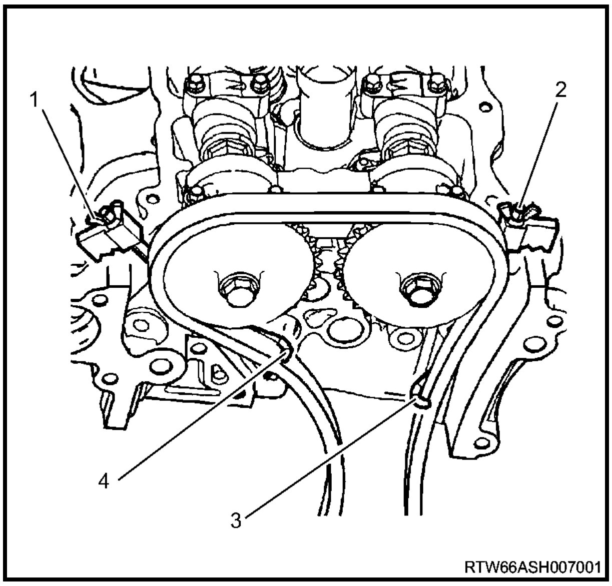

Figure 6A1 – 233

12 Remove the bolt (1) attaching the left-hand exhaust camshaft sprocket (2) and remove the sprocket.

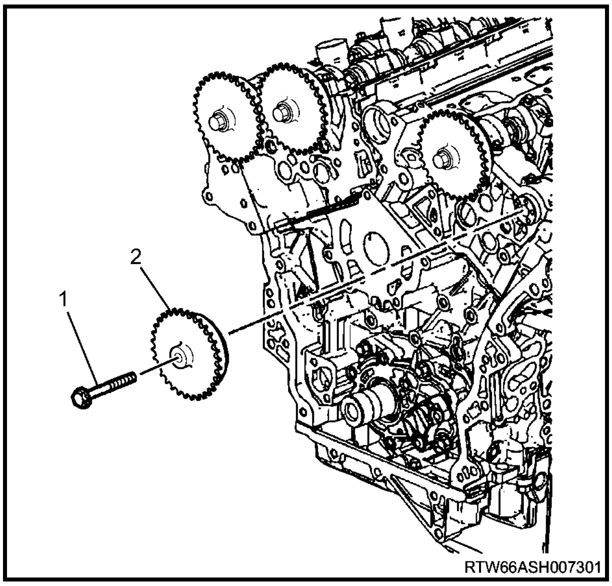

Figure 6A1 – 234

13 Remove the bolt (1) attaching left-hand intake camshaft sprocket (2) and remove the sprocket.

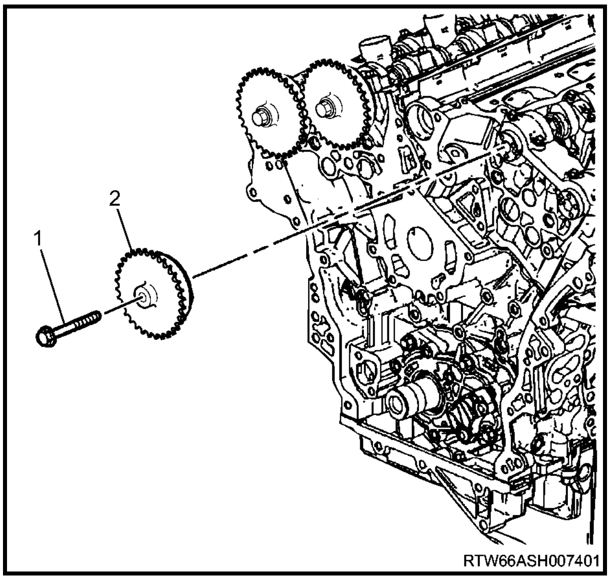

Figure 6A1 – 235

Clean

1 Clean the exterior of each camshaft sprocket with solvent.

WARNING

Safety glasses must be worn when using compressed air.

2 Dry the timing components with compressed air.

Inspect

1 Inspect the front of each sprocket for the following:

- Sprocket damage (1), and
- Sprocket bolt seating inner hub damage (2).

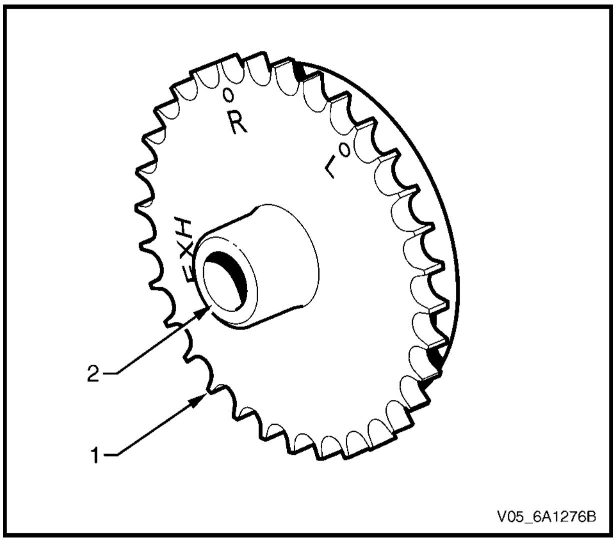

Figure 6A1 – 236

2 Inspect the back of each sprocket for the following:

- Sprocket damage (1),
- Camshaft locating pin damage (2) and,
- Camshaft seating/sealing inner hub flange damage (3),

NOTE

These checks apply to both the inlet and exhaust camshaft sprockets.

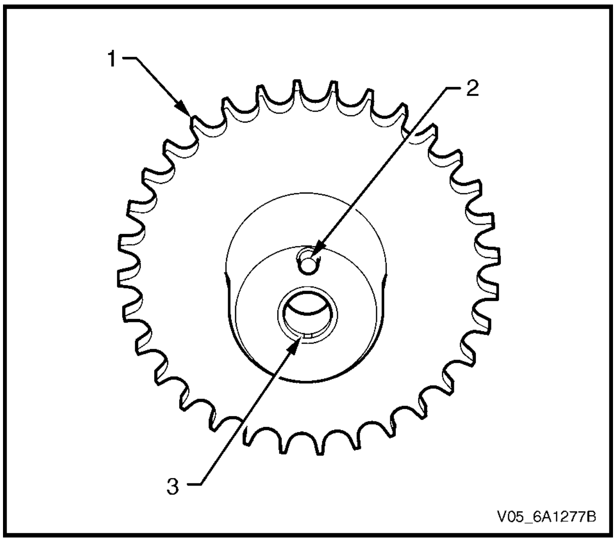

Figure 6A1 – 237

Reinstall

Reinstallation of the camshaft sprockets is the reverse of the removal procedure, noting the following:

1 Align the sprockets and timing chain with the marks made during removal.

2 Tighten the camshaft sprocket bolts to the correct torque specification.

Camshaft sprocket attaching bolt torque specification ....49.0 – 67.0 Nm

3 Remove the timing chain retention tools.

3.19 Camshaft

Remove

Right-hand Side

1 Remove the right-hand cylinder head camshaft sprockets, refer to 3.18 Camshaft Sprocket.

2 Remove the Tool No. EN-46105 – 1 (1) from the right-hand cylinder head camshafts (2).

NOTE

Tool No. EN-46105 was installed as part of the right-hand cylinder head camshaft sprocket removal procedure.

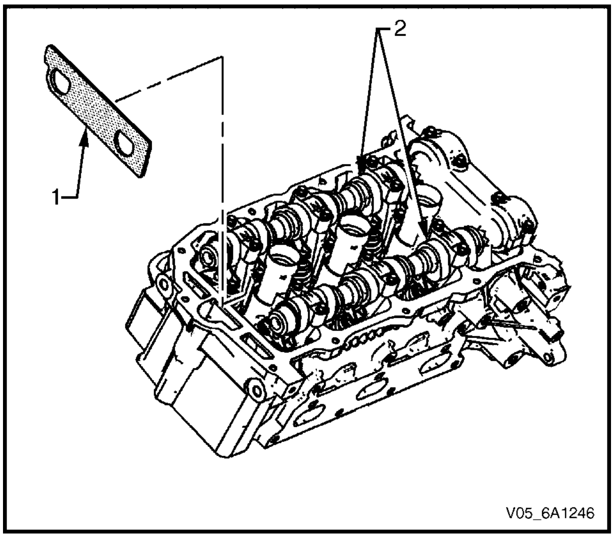

Figure 6A1 – 238

3 Observe the markings (1) on the bearing caps. Each bearing cap is marked to identify its location. The markings have the following meanings:

- The raised feature must always be oriented toward the centre of the cylinder head.
- An I indicates the intake camshaft.
- An E indicates the exhaust camshaft.
- The number indicates the journal position from the front of the engine.

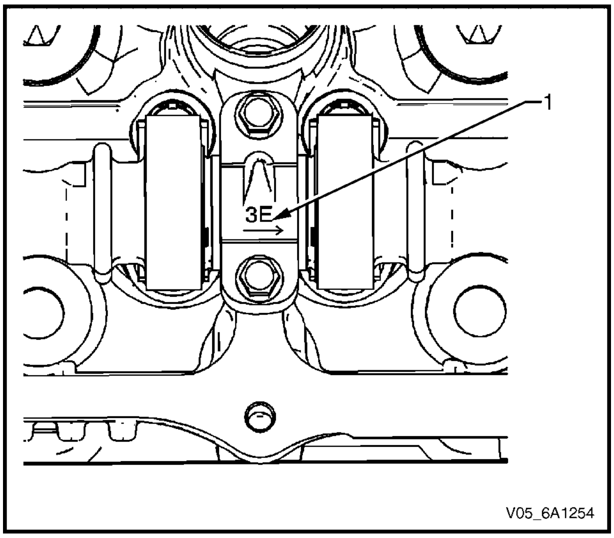

Figure 6A1 – 239

4 Remove the camshaft bearing cap bolts (1) and caps (2).

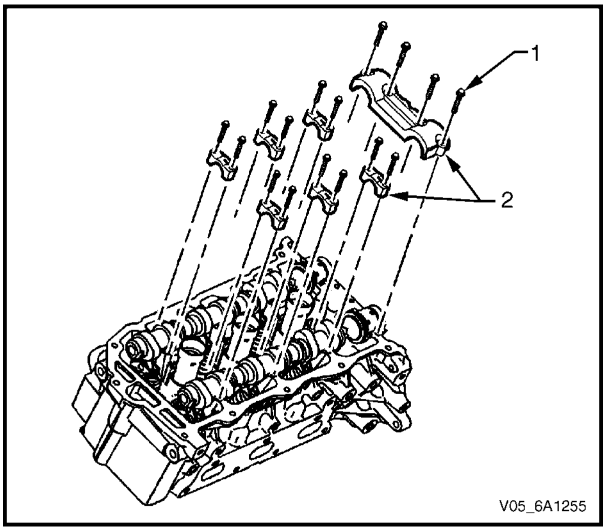

Figure 6A1 – 240

5 Remove the camshafts (1).

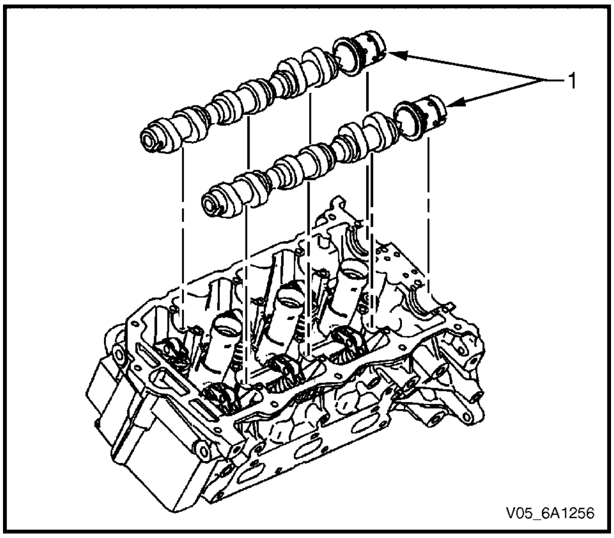

Figure 6A1 – 241

Left-hand Side

1 Remove the left-hand cylinder head camshaft position actuators, refer to 3.18 Camshaft Sprocket.

2 Remove Tool No. EN-46105 – 1 (1) from the left-hand camshafts.

NOTE

Tool No. EN-46105 was installed as part of the left-hand cylinder head camshaft position actuator removal procedure.

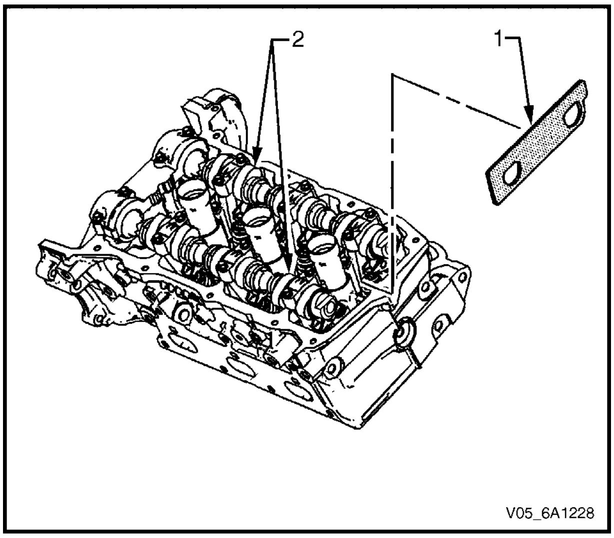

Figure 6A1 – 242

3 Observe the markings (1) on the bearing caps. Each bearing cap is marked in order to identify its location. The markings have the following meanings:

- The raised feature must always be oriented toward the centre of the cylinder head.
- An I indicates the intake camshaft.
- An E indicates the exhaust camshaft.
- The number indicates the journal position from the front of the engine.

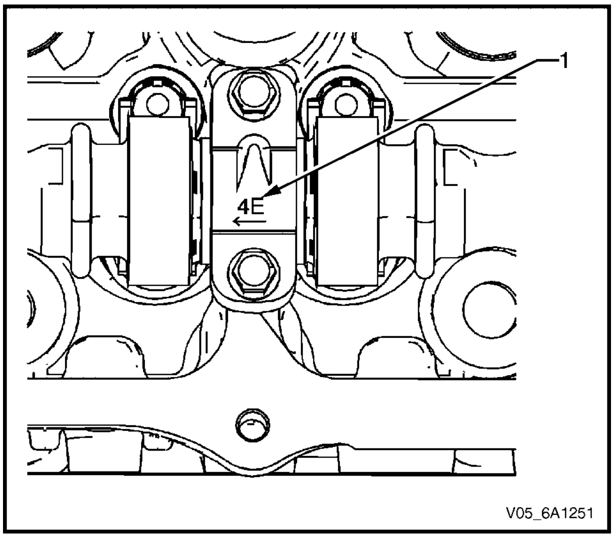

Figure 6A1 – 243

4 Remove the camshaft bearing cap bolts (1) and caps (2).

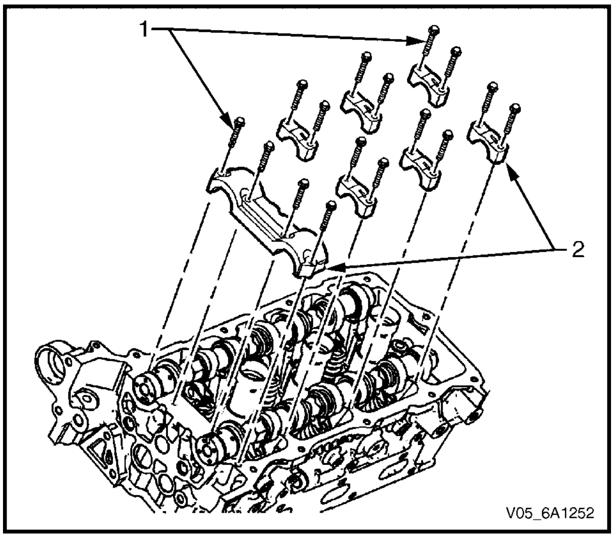

Figure 6A1 – 244

5 Remove the camshafts (1).

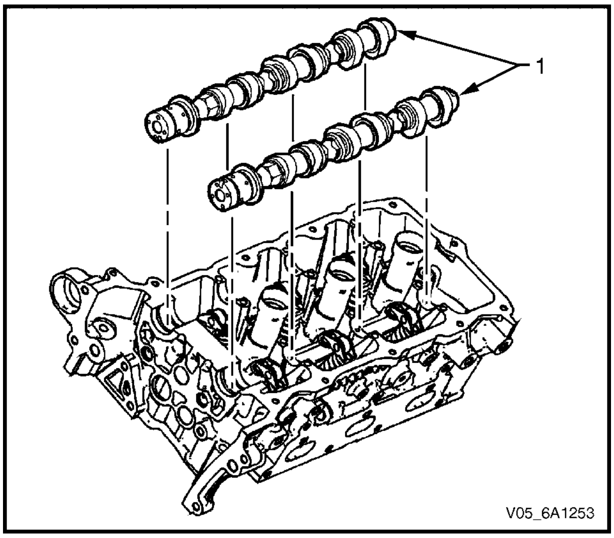

Figure 6A1 – 245

Clean

1 Clean the camshaft in solvent.

WARNING

Safety glasses must be worn when using compressed air.

2 Dry the camshaft with compressed air.

Inspect

Camshaft Visual Inspection

1 Inspect the threaded hole (2) for damage.
2 Inspect the camshaft sprocket locating notch (3) for damage or wear.
3 Inspect the camshaft sealing grooves (4) for damage.
4 Inspect the camshaft thrust surface (5) for damage.
5 Inspect the camshaft lobes (6) and journals (7) for the following conditions:
- Excessive scoring or pitting
- Discoloration from overheating
- Deformation from excessive wear, especially the camshaft lobes

6 If any of the above conditions exist on the camshaft, replace the camshaft.

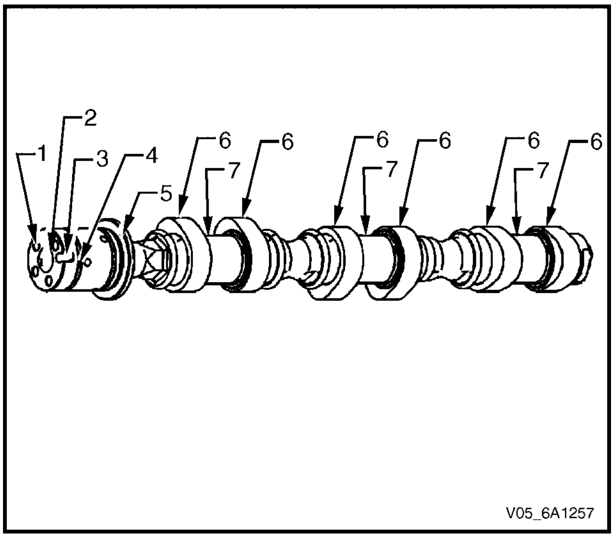

Figure 6A1 – 246

Camshaft Measurement

1 With the camshaft (1) in a suitable fixture (2), measure the camshaft for wear.

2 For camshaft measurement, refer to the following specifications, 5 Specifications.

NOTE

If the camshaft measures outside the specified range, replace the camshaft.

CAUTION

No machining of the camshaft is allowed.

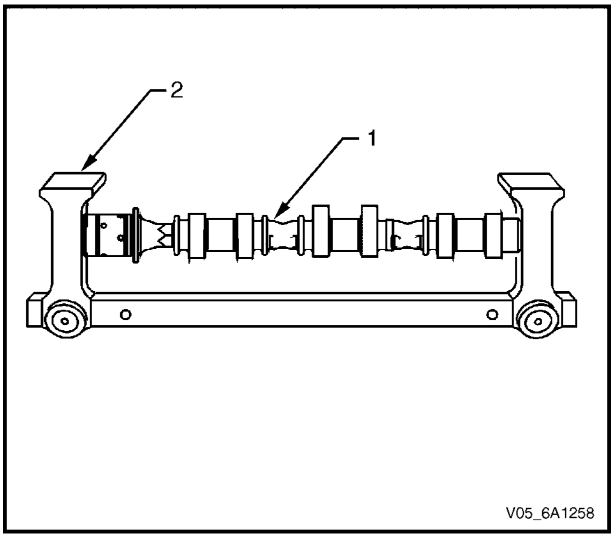

Figure 6A1 – 247

3 Measure the camshaft (2) journals for diameter and out-of-round using an outside micrometer (1).

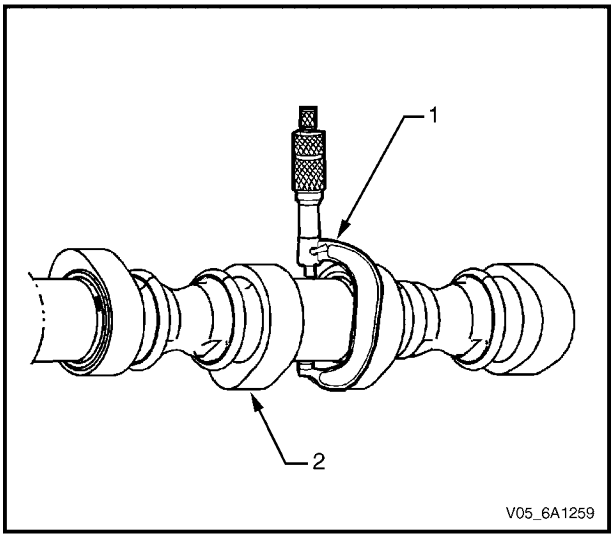

Figure 6A1 – 248

4 Measure the camshaft runout using a dial indicator (1).

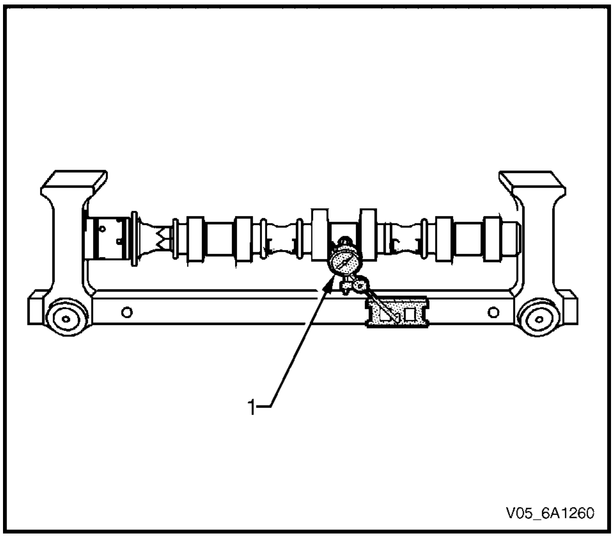

Figure 6A1 – 249

5 Measure the camshaft thrust width for wear using a depth micrometer (A).

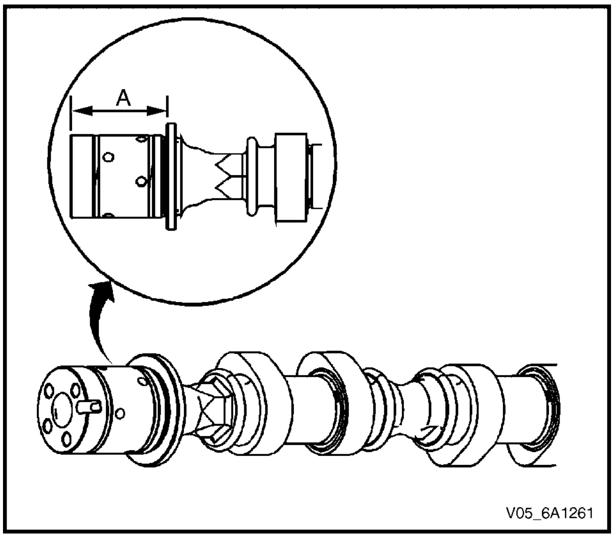

Figure 6A1 – 250

6 Measure the camshaft thrust wall surface for runout using a dial indicator (1).

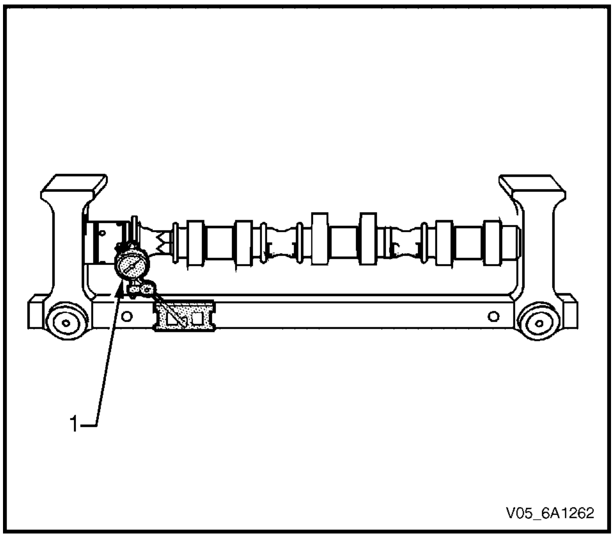

Figure 6A1 – 251

7 Measure the camshaft lobes for wear using a dial indicator (1).

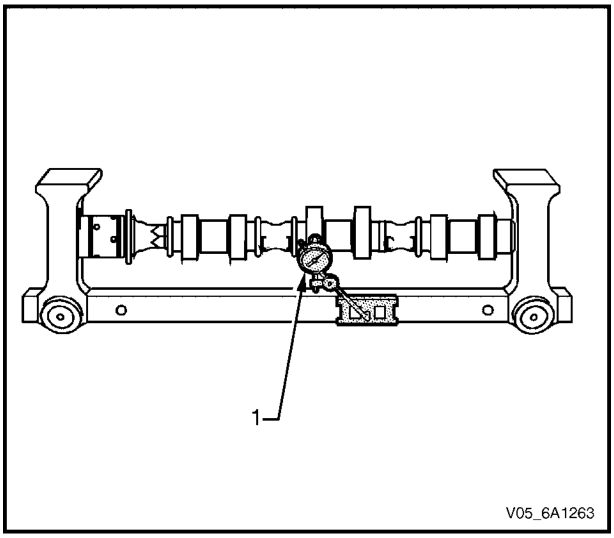

Figure 6A1 – 252

8 Place the dial indicator tip on the base circle (1) of the camshaft lobe.

9 Set the dial indicator at zero.

10 Rotate the camshaft until the indicator tip is at the highest point (2) on the lobe. This reading is the lift of the camshaft lobe.

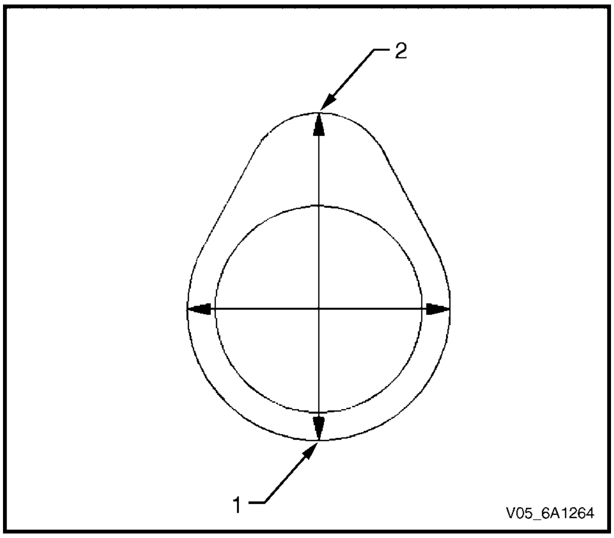

Figure 6A1 – 253

Reinstall

Right-hand Side

1 Select the correct camshaft for the particular installation location. ID markings are on the rear end of each camshaft. The ID markings are defined as follows:

- The first five digits refer to the date and time of production.
  - Example = 3L18H.
- Digits six through nine refer to engine production code.
  - LY7 = Alloytec 190 engine.
- The last two digits refer to position:
  - LI = left-hand intake.
  - LE = left-hand exhaust.
  - RI = right-hand intake.
  - RE = right-hand exhaust.

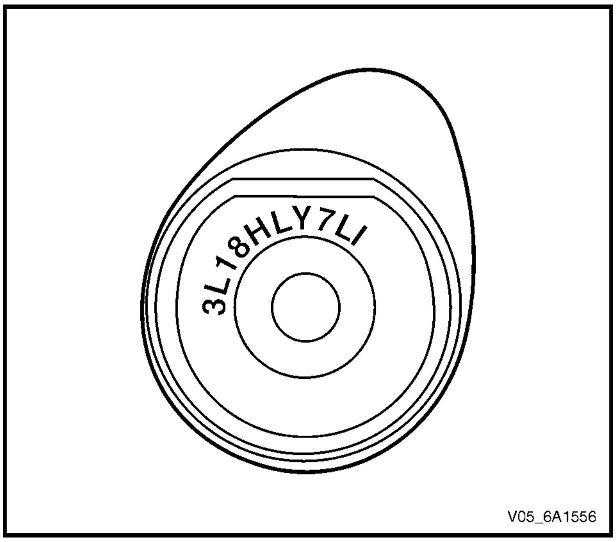

Figure 6A1 – 254

2 Apply a liberal amount of engine oil to the camshaft (1) journals and the right-hand cylinder head camshaft carriers (2).

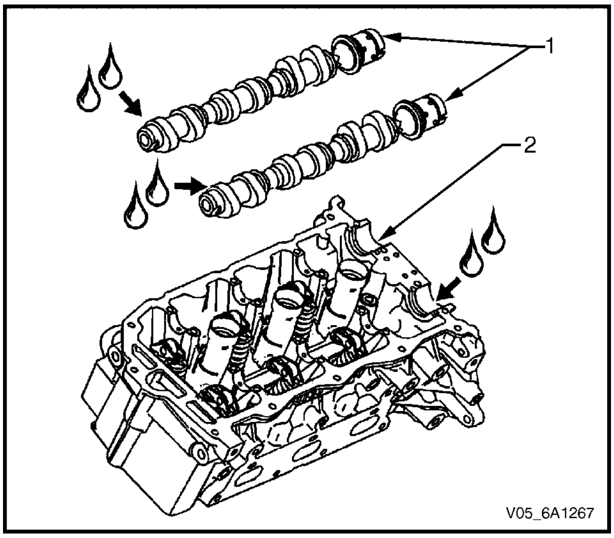

Figure 6A1 – 255

3 Position the camshafts (1) on the cylinder head and assemble the camshaft sprockets to the camshafts.

NOTE

Install the camshaft sprocket bolts but do not tighten at this stage.

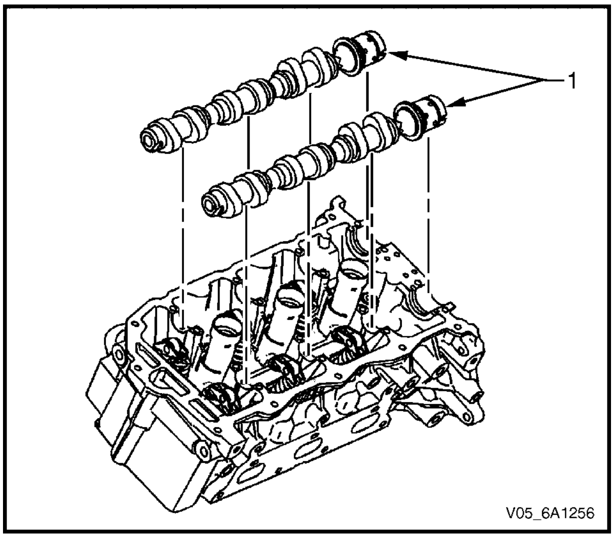

Figure 6A1 – 256

4 Ensure the camshaft lobes are in the neutral position with the flats on the back of the camshafts up and parallel (1) with the right-hand cylinder head camshaft cover rail.

5 Ensure the marks on the right-hand exhaust camshaft position actuator and timing chain, made prior to the disassemble operation are aligned.

6 Ensure the marks on the right-hand intake camshaft position actuator and timing chain, made prior to the disassemble operation are aligned.

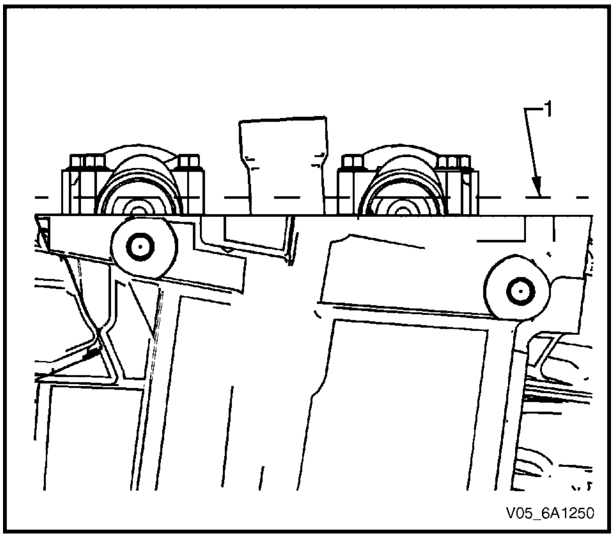

Figure 6A1 – 257

7 Observe the markings on the right-hand cylinder head camshaft bearing caps. Each bearing cap is marked (1) to identify its location. The markings have the following meanings:

- The raised feature must always be oriented toward the centre of the cylinder head.
- The I indicates the intake camshaft.
- The E indicates the exhaust camshaft.
- The number 1, 3, 5 indicates the cylinder position from the front of the engine.

8 Apply a liberal amount of engine oil to the camshaft bearing caps.

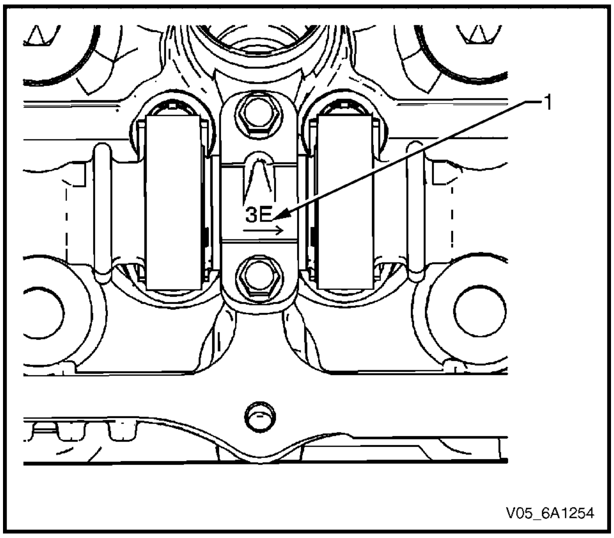

Figure 6A1 – 258

9 Install the camshaft bearing thrust cap (1) in the first journal of the right-hand cylinder head.

10 Install the remaining bearing caps (2) with their orientation mark toward the centre of the cylinder head.

11 Hand start all the camshaft bearing cap bolts (3).

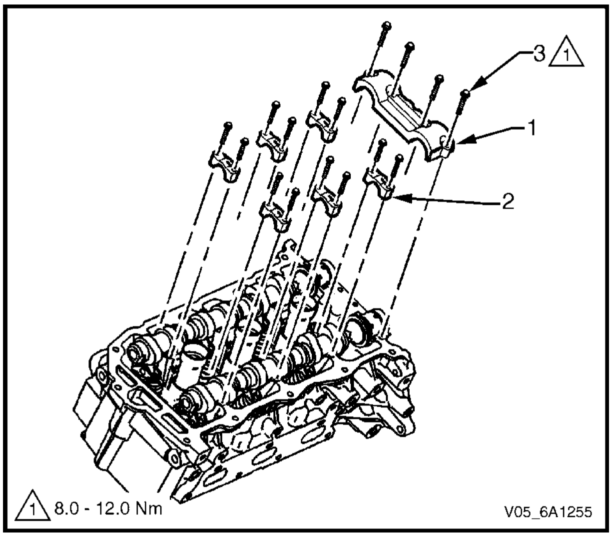

Figure 6A1 – 259

12 Tighten the camshaft bearing cap bolts to the correct torque specification and in the sequence shown.

Camshaft bearing cap attaching bolt torque specification:
Stage 1:..8.0 – 12.0 Nm

13 Loosen the centre intake camshaft bearing cap bolts 1 and 2, and the centre exhaust camshaft bearing cap bolts 3 and 4.

14 Retighten the centre camshaft bearing cap bolts 1, 2, 3 and 4 to the correct torque specification.

Camshaft bearing cap attaching bolt torque specification:
Stage 2:..8.0 – 12.0 Nm

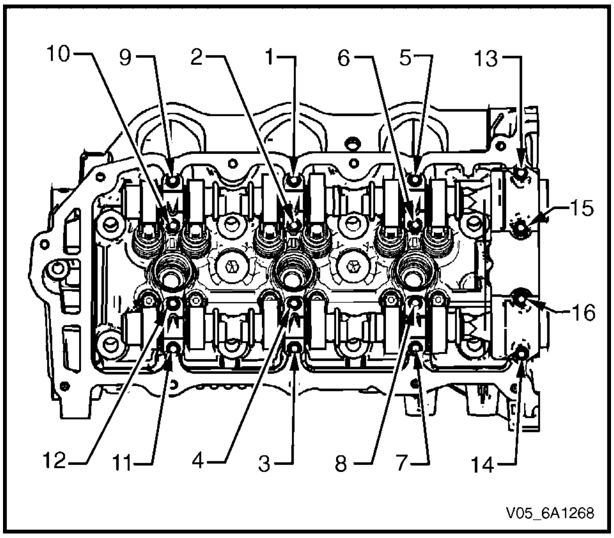

Figure 6A1 – 260

Left-hand Side

1 Select the correct camshaft for the particular installation location. ID markings can be found on the rear end of each camshaft. The ID markings are defined as follows:

- The first five digits refer to the date and time of production.
  - Example = 3L18H.
- Digits six through nine refer to engine production code.
  - LY7 = Alloytec 190 engine.
- The last two digits refer to position:
  - LI = left-hand intake.
  - LE = left-hand exhaust.
  - RI = right-hand intake.
  - RE = right-hand exhaust.

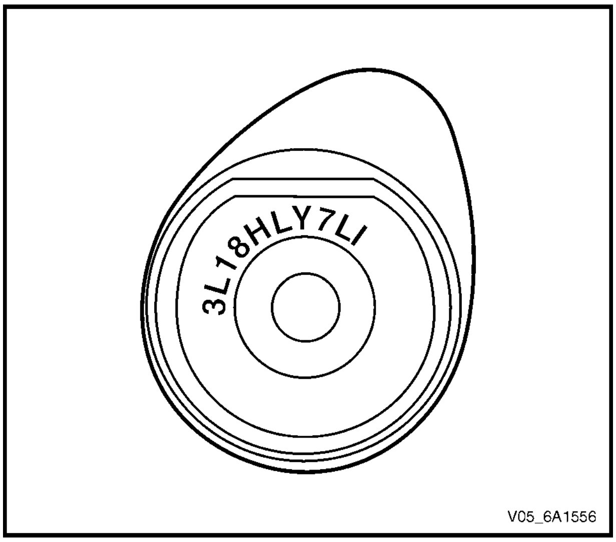

Figure 6A1 – 261

2 Apply a liberal amount of engine oil to the camshaft journals and the left-hand cylinder head camshaft carriers.

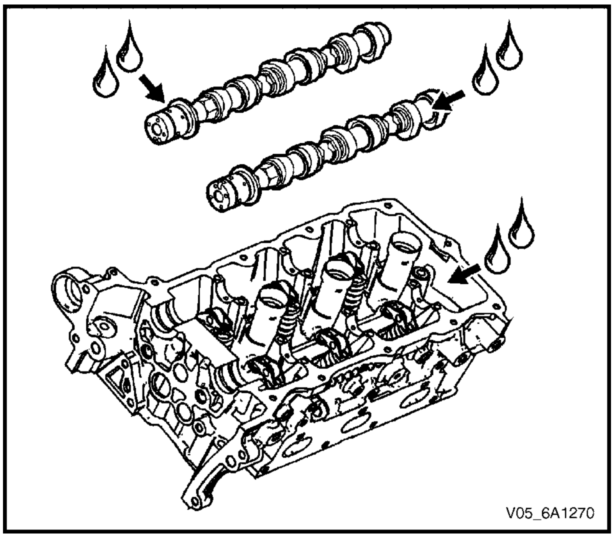

Figure 6A1 – 262

3 Position the camshafts (1) on the cylinder head and assemble the camshaft sprockets to the camshafts.

NOTE

Install the camshaft sprocket bolts but do not tighten at this stage.

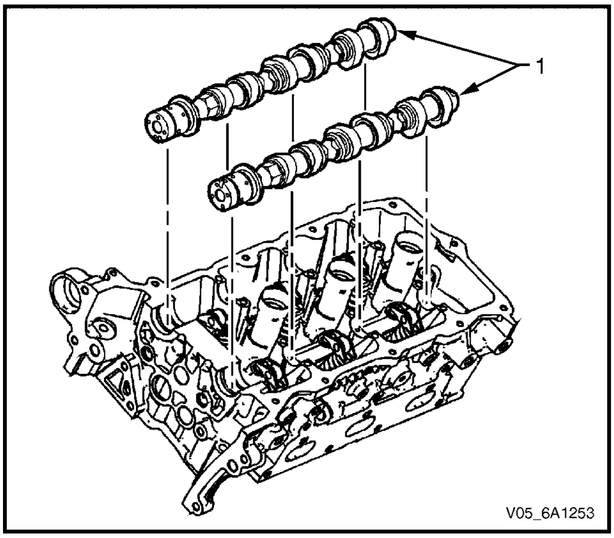

Figure 6A1 – 263

4 Ensure the camshaft lobes are in the neutral position with the flats on the back of the camshafts up and parallel (1) with the left-hand cylinder head camshaft cover rail.

5 Ensure the marks on the left-hand exhaust camshaft position actuator and timing chain, made prior to the disassemble operation are aligned.

6 Ensure the marks on the left-hand intake camshaft position actuator and timing chain, made prior to the disassemble operation are aligned.

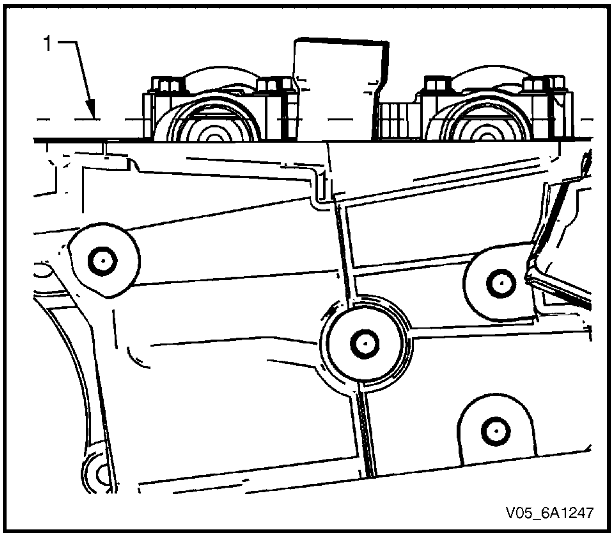

Figure 6A1 – 264

7 Observe the markings on the left-hand cylinder head camshaft bearing caps. Each bearing cap is marked (1) to identify its location. The markings have the following meanings:

- The raised feature must always be oriented toward the centre of the cylinder head.
- The I indicates the intake camshaft.
- The E indicates the exhaust camshaft.
- The number 2, 4, 6 indicates the cylinder position from the front of the engine.

8 Apply a liberal amount of engine oil to the camshaft bearing caps.

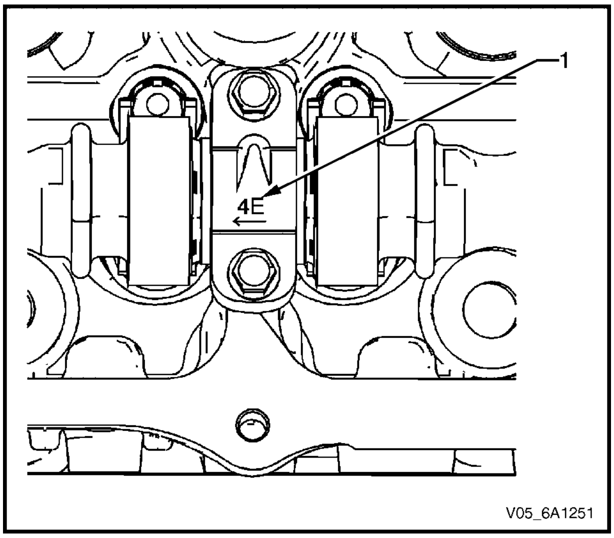

Figure 6A1 – 265

9 Install the camshaft bearing thrust cap (1) in the first journal of the left-hand cylinder head.

10 Install the remaining bearing caps (2) with their orientation mark toward the centre of the cylinder head.

11 Hand start all the camshaft bearing cap bolts (3).

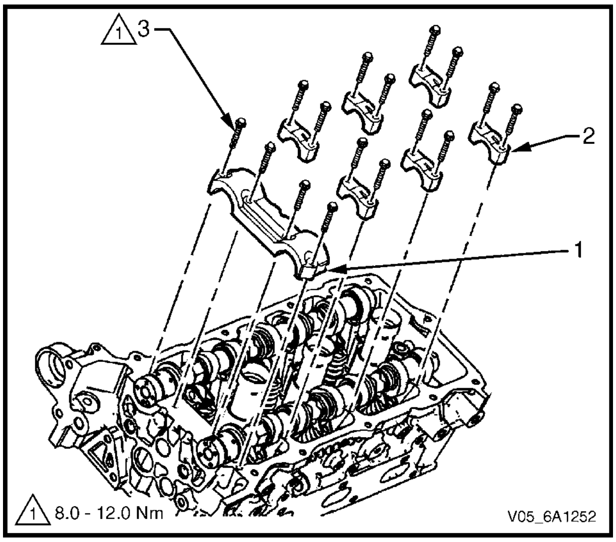

Figure 6A1 – 266

12 Tighten the camshaft bearing cap bolts to the correct torque specification and in the sequence shown.

Camshaft bearing cap bolt torque specification:
Stage 1:..8.0 – 12.0 Nm

13 Loosen the centre intake camshaft bearing cap bolts 1, and 2, and the centre exhaust camshaft bearing cap bolts 3 and 4.

14 Retighten the centre camshaft bearing cap bolts 1, 2, 3 and 4 to the correct torque specification.

Camshaft bearing cap bolt torque specification:
Stage 2:..8.0 – 12.0 Nm

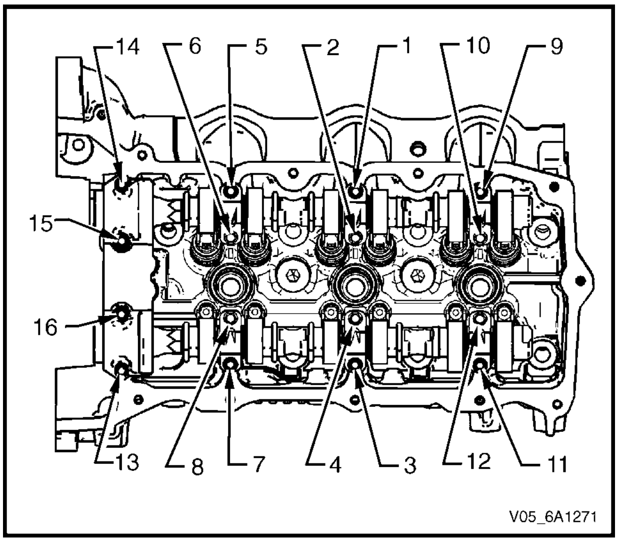

Figure 6A1 – 267

3.20 Rocker Arm

Remove

1. Remove the camshafts from the appropriate cylinder head, refer to 3.19 Camshaft.
2. Remove the rocker arm (1) from the cylinder head (2).

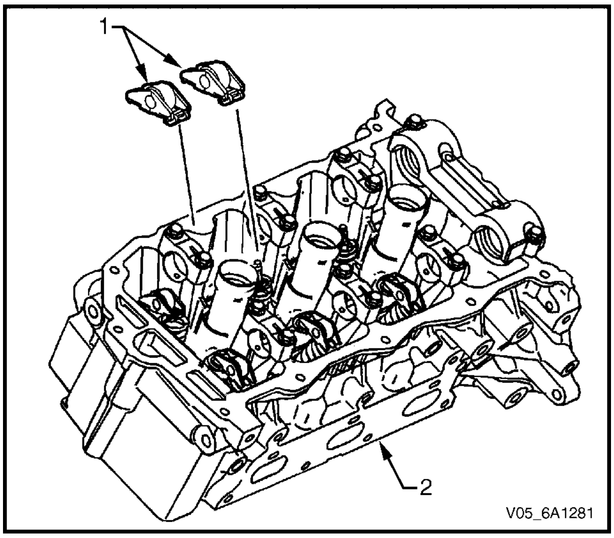

Figure 6A1 – 268

NOTE

Record the rocker arm positions during removal.

CAUTION

If the rocker arms are being reused, they must be reinstalled in their original location.

Clean and Inspect

1. Inspect the rocker arm roller (1) for the following:
   - flat spots,
   - excessive scoring and pitting, and
   - ensure the roller spins freely
2. Inspect the rocker arm valve tip area (2).
3. Inspect the rocker arm stationary hydraulic lash adjuster (SHLA) pivot area (3).
4. Replace the rocker arm as required.

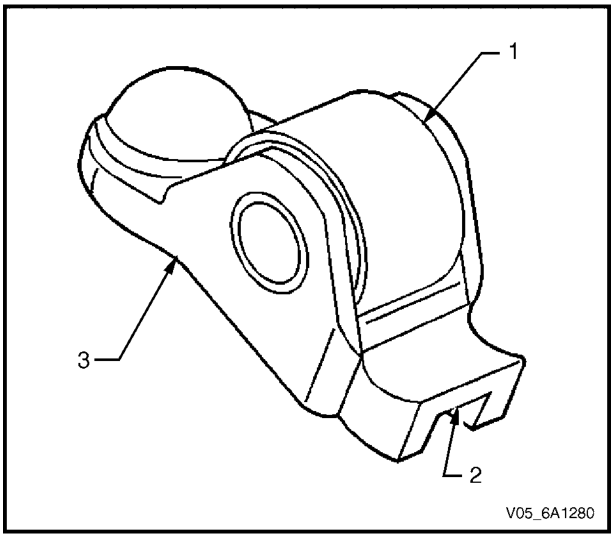

Figure 6A1 – 269

Reinstall

1 Apply a liberal amount of commercially available camshaft / lifter prelube or equivalent to the pivot pocket (1), roller (2) and valve slot (3) areas of the camshaft followers.

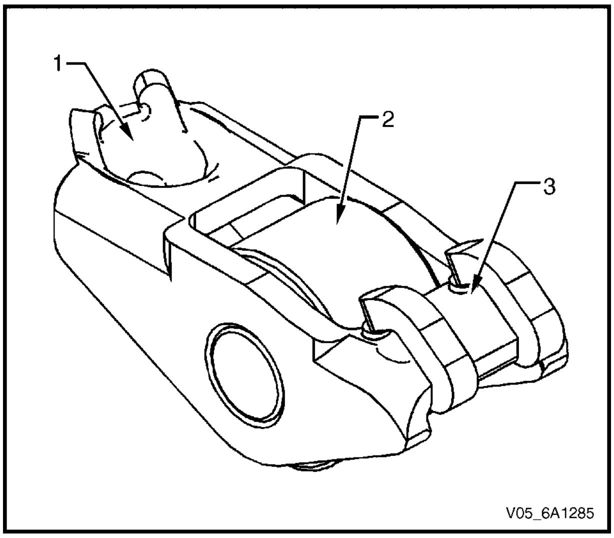

Figure 6A1 – 270

2 Place the rocker arm in position on the valve tip and stationary hydraulic lash adjuster (SHLA). The rounded head end of the arm seats on the SHLA while the flat end seats on the valve tip.

CAUTION

- **The rocker arm (1) must be positioned squarely on the valve tip so the full width of the roller will completely contact the camshaft lobe.**
- **If the rocker arms are being reused, they must be reinstalled in their original location.**

3 Clean the camshaft journals and carriers with a clean, lint-free cloth.

4 Reinstall the camshafts, refer to 3.19 Camshaft.

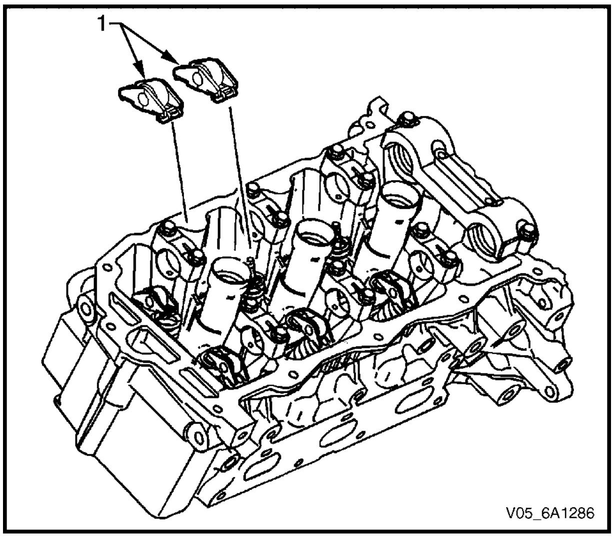

Figure 6A1 – 271

3.21 Stationary Hydraulic Lash Adjuster

Remove

1 Remove the rocker arms from the appropriate cylinder head, refer to 3.20 Rocker Arm.

2 Remove the stationary hydraulic lash adjuster (SHLA) from the cylinder head (2).

CAUTION

- **Do not stroke/cycle the stationary hydraulic lash adjuster (1) plunger without oil in the lower pressure chamber.**
- **Do not allow the stationary hydraulic lash adjuster to tip over, plunger down, after the oil fill.**

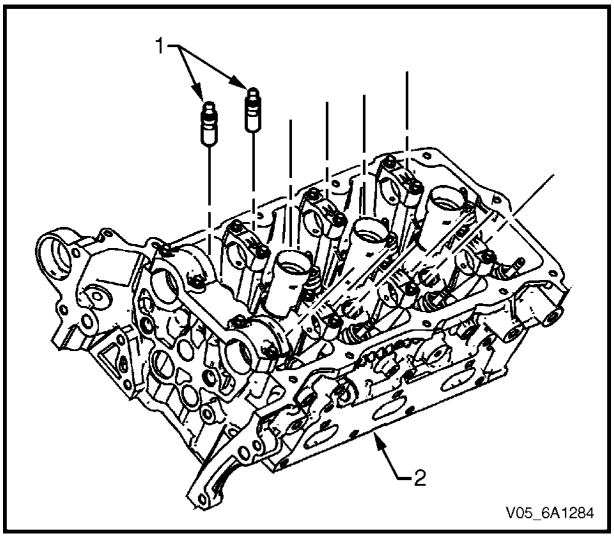

Figure 6A1 – 272

Clean and Inspect

1 Inspect the stationary hydraulic lash adjuster (SHLA) in the following areas:

- a plugged oil passage (1),
- a scored or worn camshaft follower pivot area (2),
- a damaged or broken retainer (3), and
- a severely scuffed or worn SHLA body (4).

2 Replace the SHLA as required.

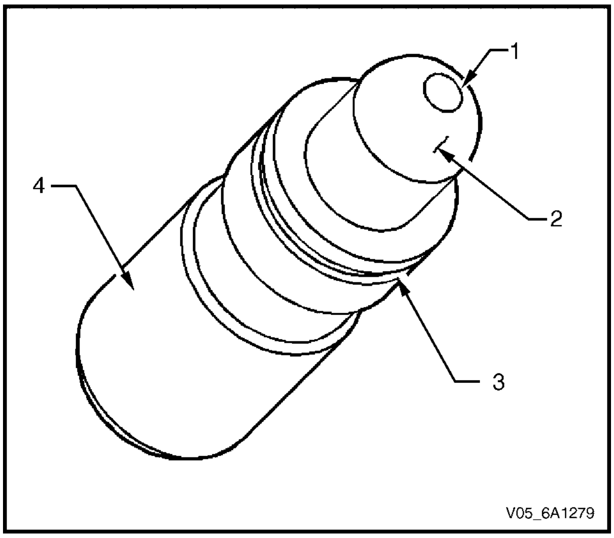

Figure 6A1 – 273

Reinstall

1 Fill the stationary hydraulic lash adjuster (SHLA) with clean engine oil. Take precautions to prevent scratching the pivot sphere area of the SHLA.

2 Lubricate the SHLA bores in the cylinder head with clean engine oil.

3 Install the SHLA in the cylinder head (2).

4 Apply a liberal amount of commercially available camshaft/lifter prelube to the SHLA pivot spheres.

5 Install the rocker arms, refer to 3.20 Rocker Arm.

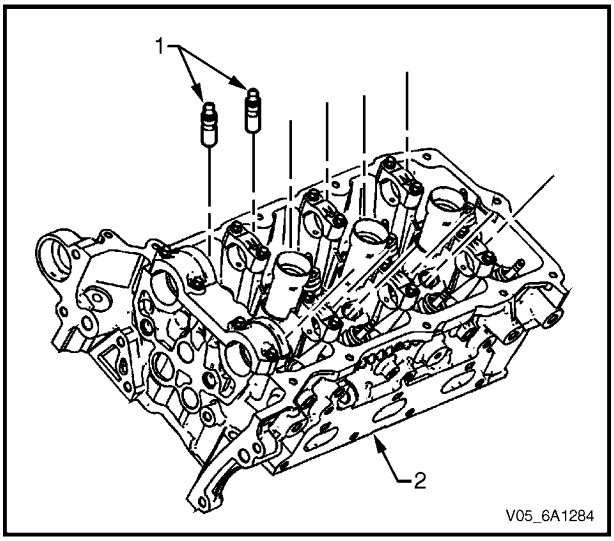

Figure 6A1 – 274

CAUTION

Ensure each lash adjuster (1) is filled with clean engine oil and the adjuster does not tip over, plunger down, before the installation. The loss of oil in the adjuster lower pressure chamber, or the dry stroking/cycling of the adjuster plunger, will allow air to enter the high pressure chamber of the valve lifter. Air in the high pressure chamber of the adjuster may not be purged causing cavitation and extensive engine component damage.

3.22 Cylinder Head Assembly

Remove

Right-hand Side (Bank 1) Cylinder Head

1 Remove the heater hoses and heater pipe assembly, refer to 6B1 Engine Cooling – V6.

2 Remove the intake manifold assembly, refer to 3.10 Intake Manifold Assembly – Complete.

3 Remove the exhaust manifold, refer to 3.11 Exhaust Manifold Assembly.

4 Remove engine harness ground terminal attaching bolts from the cylinder head, refer to 8A Electrical Body and Chassis.

5 Remove the right-hand side secondary timing chain, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.

6 Remove the camshaft sprockets, refer to 3.18 Camshaft Sprocket.

7 Remove the cylinder head attaching bolt (1), eight places.

8 Remove the cylinder head.

NOTE

There is no bolt fitted to the hole in the rear of the right-hand-hand cylinder head.

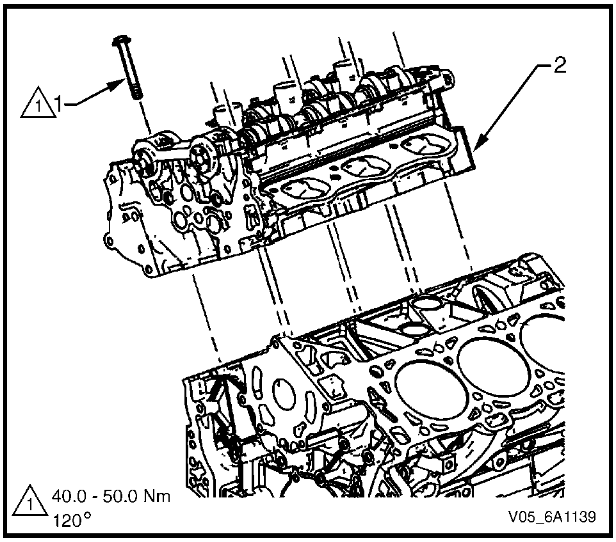

Figure 6A1 – 275

9 Remove and discard the cylinder head gasket (1).

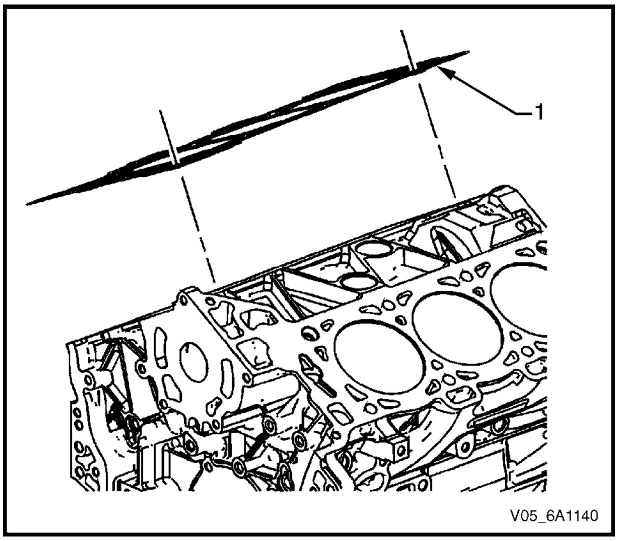

Figure 6A1 – 276

Left-hand Side (Bank 2) Cylinder Head

1 Remove the intake manifold assembly, refer to 3.10 Intake Manifold Assembly – Complete.

2 Remove the exhaust manifold, refer to 3.11 Exhaust Manifold Assembly.

3 Remove the power steering reservoir and pump mounting brackets, refer to 3.8 Power Steering Pump Bracket.

NOTE

Do not disconnect the power steering pipes and/or hoses.

4 Remove the oil filter adapter upper bolt.

NOTE

Do not remove the oil filter adapter.

5 Remove the engine coolant temperature (ECT) sensor, refer to 6C1-3 Engine Management – V6 – Service Operations.

6 Remove engine harness ground terminal attaching bolt from cylinder head, refer to 8A Electrical Body & Chassis.

7 Remove the left-hand bank secondary timing chain, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.

8 Remove the camshaft position actuators, refer to 3.18 Camshaft Sprocket.

9 Remove the front M8 (1) cylinder head attaching bolt, two places.

10 Remove the cylinder head attaching bolt (2), eight places.

11 Remove the cylinder head (3).

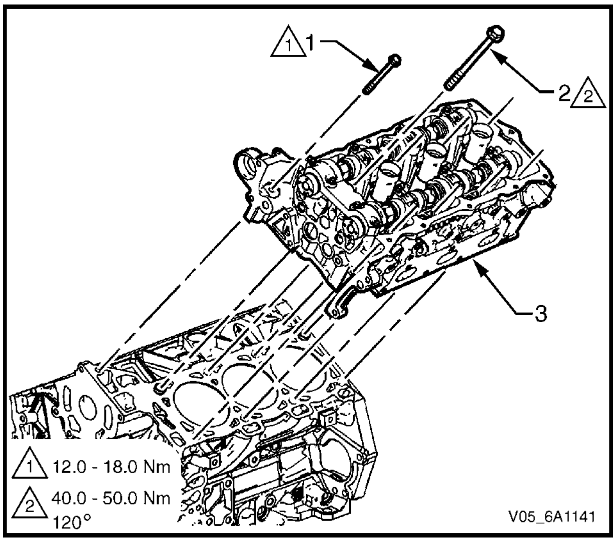

Figure 6A1 – 277

12 Remove and discard the cylinder head gasket (1).

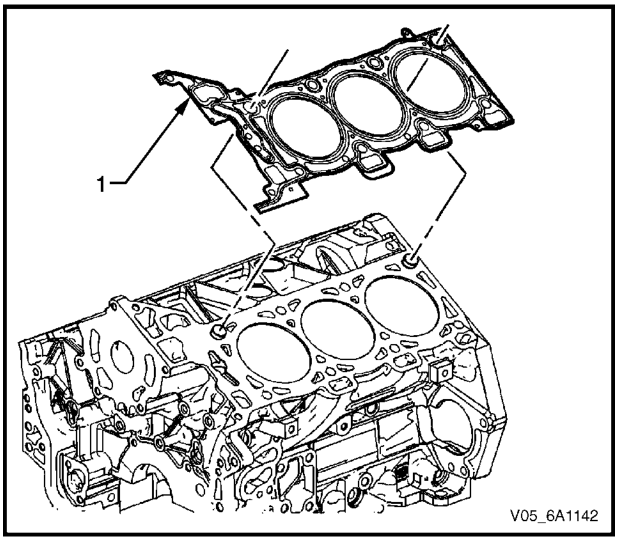

Figure 6A1 – 278

Disassemble

1 Using an appropriately sized deep socket (1) and a plastic hammer (2), lightly tap on the valve spring retainer to loosen the valve collets.

CAUTION

Ensure valve heads will not contact anything during this step in order to avoid bending or damage.

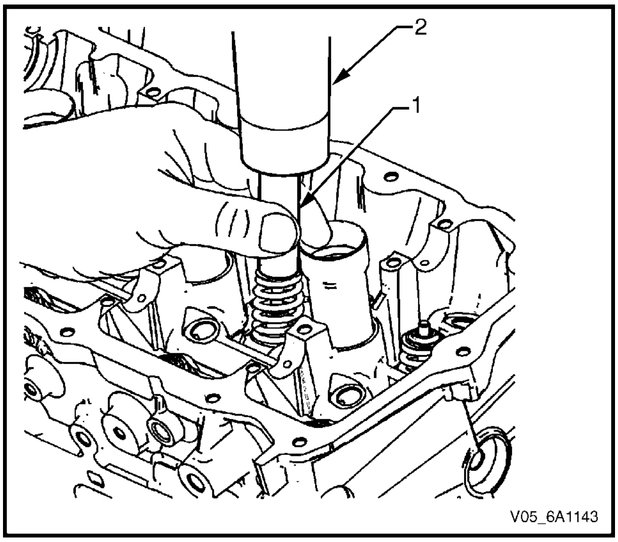

Figure 6A1 – 279

CAUTION

Do not compress the valve springs less than 24.0 mm. Contact between the valve spring retainer and the valve stem oil seal can cause potential valve stem oil seal damage.

WARNING

Compressed valve springs (1) have high tension against the valve spring compressor (2). Valve springs that are not correctly compressed by, or are released from the valve spring compressor can be ejected from the valve spring compressor with intense force. Use care when compressing or releasing the valve spring with the valve spring compressor and when removing or installing the valve stem keys. Failing to use care may cause personal injury.

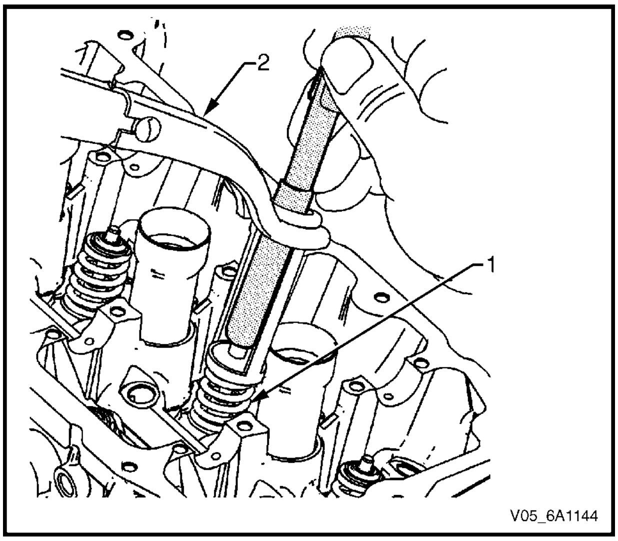

Figure 6A1 – 280

2 Compress the valve spring (1) using valve spring compressor Tool No. J-8062 (2) and adaptor Tool No. EN-46119.

3 Remove the valve collets using Tool EN-46117 (1).

4 Remove the valve spring compressor (2) and the adapter (3).

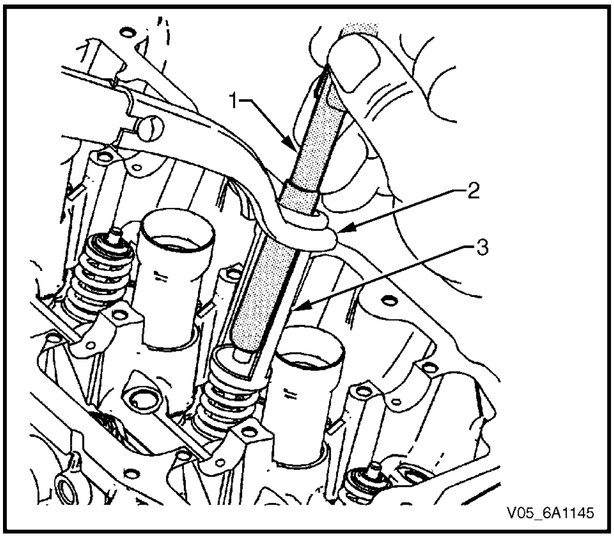

Figure 6A1 – 281

5 Remove the valve spring retainer (1).

6 Remove the valve spring (2).

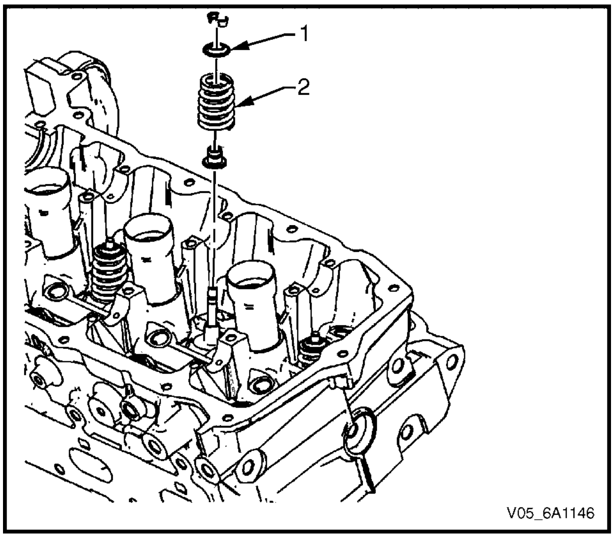

Figure 6A1 – 282

7 Remove the valves (1).

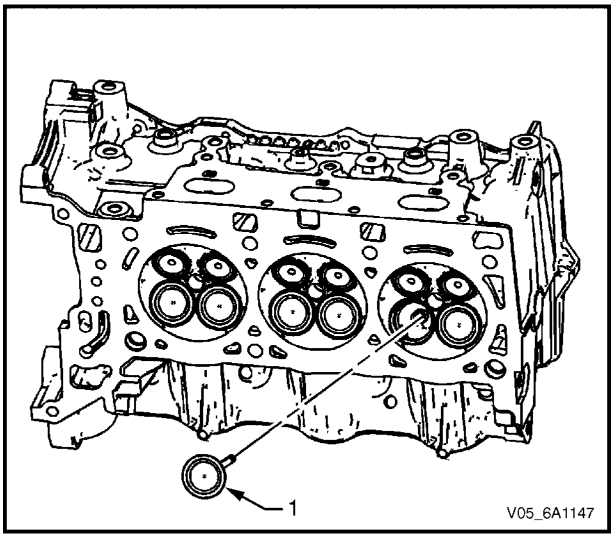

Figure 6A1 – 283

CAUTION

Never reuse a valve stem oil seal.

8 Remove the valve stem oil seal using Tool No. EN-46116 and discard.

9 Repeat these procedures for the remaining valves.

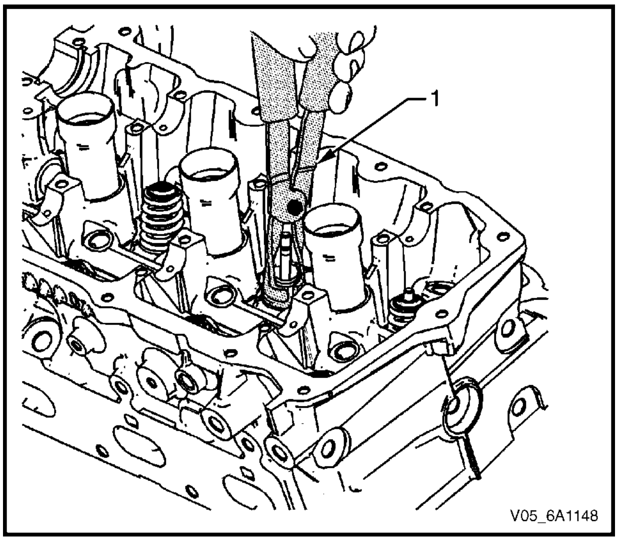

Figure 6A1 – 284

10 Remove the cylinder head oil gallery expansion plugs (1).

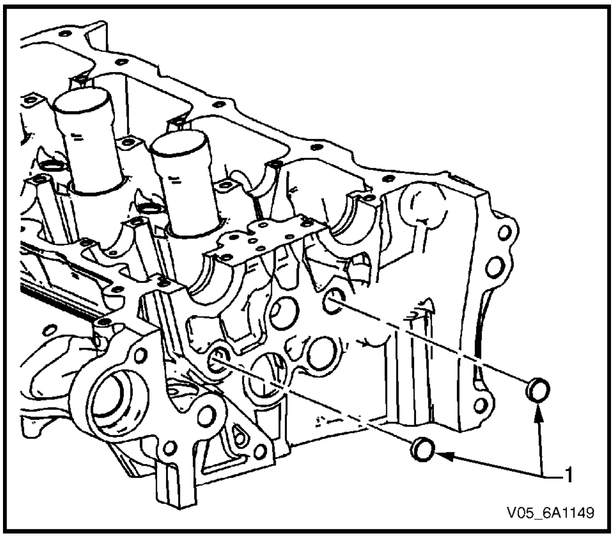

Figure 6A1 – 285

11 Remove the cylinder head coolant threaded plugs (1).

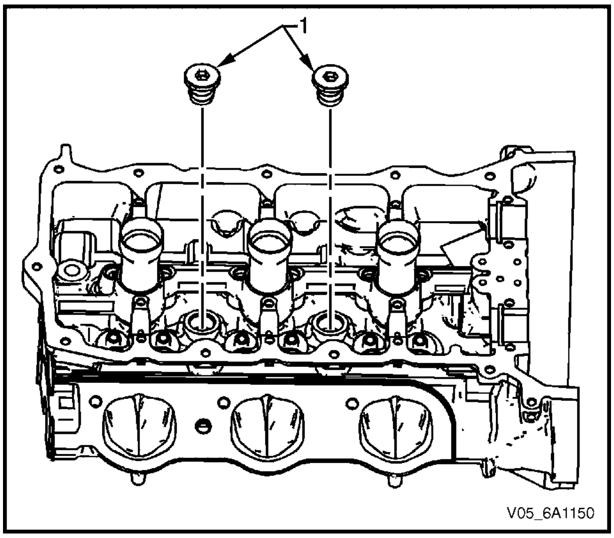

Figure 6A1 – 286

Clean

CAUTION

Due to the aluminium alloy construction of the cylinder head, wire brushes and steel scrapers must not be used during the cleaning process, as damage to sealing surfaces may occur. Use a wood or plastic scraper as an alternative.

1 Remove any old thread sealant, gasket material or sealant using commercially available plastic or wooden scraper.
2 Clean all cylinder head surfaces with non-corrosive solvent.

WARNING

Safety glasses must be worn when using compressed air.

3 Blow out all the oil galleries using compressed air.
4 Remove any carbon deposits from the combustion chambers.
5 Clean any debris or build-up from the lifter pockets.

Inspect

Visual Inspection

1 Inspect the cylinder head (1) camshaft bearing surfaces for the following conditions:
- excessive scoring or pitting,
- discoloration from overheating, and
- deformation from excessive wear.

2 If any of the above conditions exist on the camshaft bearing surfaces, replace the cylinder head. Do not machine the camshaft bearing journals.

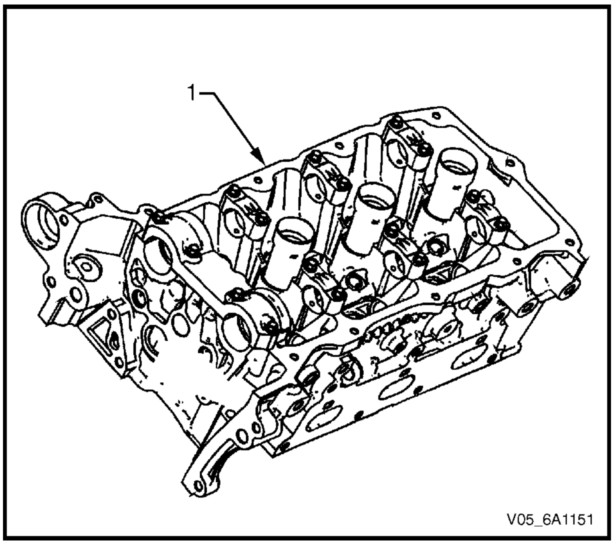

Figure 6A1 – 287

3 Inspect the cylinder head for the following:
- Cracks, damage or pitting in the combustion chambers.
- Debris in the oil galleries. continue to clean the galleries until all debris is removed.
- Coolant leaks or damage to the deck face sealing surface. if coolant leaks are present, measure the surface warpage as described under Cylinder Head Measurement within this Section.
- Burrs or any defects that would degrade the sealing of a new secondary camshaft chain tensioner gasket.
- Damage to any gasket surfaces.
- Damage to any threaded bolt holes.
- Burnt or eroded areas in the combustion chamber.
- Cracks in the exhaust ports and combustion chambers.
- External cracks in the water passages.
- Restrictions in the intake or exhaust passages.
- Restrictions in the cooling system passages.
- Rusted, damaged or leaking core plugs.

4 If the cylinder head is cracked or damaged, it must be replaced. No welding or patching of the cylinder head is recommended.

Cylinder Head Measurement

NOTE

For all cylinder head and associated component specifications, refer to 5 Specifications.

Camshaft Journal Clearance

1 Install the camshaft bearing cap in the cylinder head without the camshaft.

2 Install the camshaft cap bolts and tighten to the correct torque specification

Camshaft bearing cap attaching bolt........8.0 – 12.0 Nm.

3 Measure the camshaft bearings using an inside micrometer.

4 Subtract the camshaft journal diameter from the camshaft bearing diameter. This will provide the running clearance. If the running clearance exceeds specifications and the camshaft journals are within specification, replace the cylinder head.

Camshaft Journal Alignment

1 Ensure the camshafts are serviceable, refer to 3.19 Camshaft for measuring procedures.

2 Inspect the cylinder head camshaft bearing surfaces for any imperfections or scratches that could inhibit correct camshaft clearances. Repair minor imperfections or scratches.

3 Install the camshafts in the cylinder head.

4 Install the camshaft bearing caps.

5 Install the camshaft cap bolts and tighten to the correct torque specification.

Camshaft bearing cap attaching bolt........8.0 – 12.0 Nm.

6 Ensure the camshafts spin freely in the cylinder head. If the camshaft does not run freely, replace the cylinder head.

Deck Flatness Inspection

1 Ensure the cylinder head decks are clean and free of gasket material.

2 Inspect the surface for any imperfections or scratches that could inhibit correct cylinder head gasket sealing.

3 Place a straight-edge (1) diagonally across the cylinder head (2) deck face surface.

4 Measure the clearance between the straight-edge and the cylinder head deck face using a feeler gauge at four points along the straight-edge.

5 If the warpage is less than 0.05 mm, the cylinder head deck surface does not require resurfacing.

6 If the warpage is between 0.05±0.20 mm or any imperfections or scratches that could inhibit correct cylinder head gasket sealing are present, the cylinder head deck surface requires resurfacing.

7 If resurfacing is required the maximum amount that can be removed is 0.25 mm.

8 If the cylinder head deck surface requires more than 0.25 mm material removal the head must be replaced.

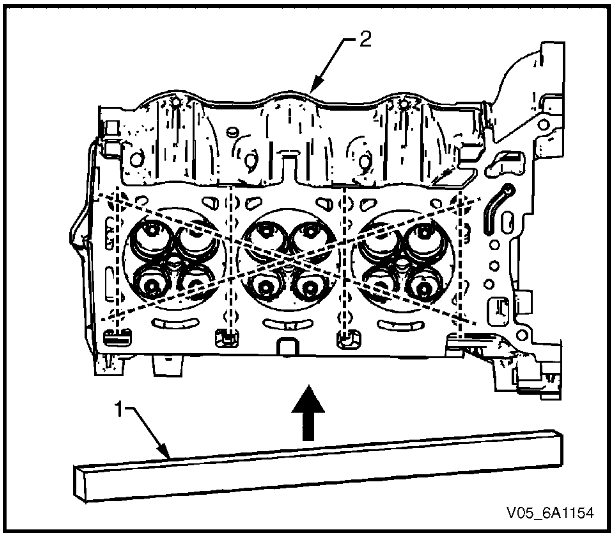

Figure 6A1 – 288

Valve Guide Measurement

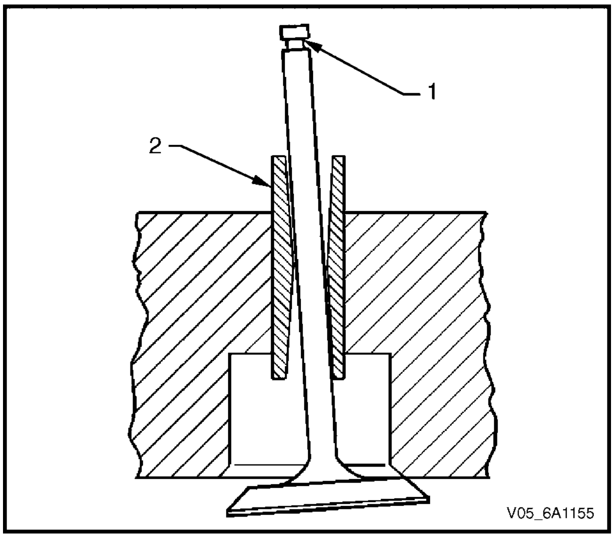

Figure 6A1 – 289

1 Measure the valve stem (1) to-guide (2) clearance. Excessive valve stem-to-guide clearance may cause excessive oil consumption and may also cause a valve to break. Insufficient clearance will result in noisy and sticky functioning of the valve and will disturb the engine assembly smoothness.

2 Clamp a dial indicator to the cylinder head at the camshaft cover rail.

3 Locate the dial indicator so the movement of the valve stem from side to side, crossways to the cylinder head, will cause a direct movement of the indicator stem. The dial indicator stem must contact the side of the valve stem just above the valve guide.

4 Drop the valve head about 0.064 mm off the valve seat.

5 Use light pressure when moving the valve stem from side to side to obtain a clearance reading, refer to 5 Specifications.

- If the clearance for the valve is greater than specified and a new standard diameter valve stem will not bring the clearance within specifications, the valve guide may be oversized by 0.075 mm using the valve guide reamer, Tool No. J 42096 or by 0.375 mm using the valve guide reamer, Tool No. EN-46120. Two sizes of oversized valve stems are available for service.
- Valve guide wear at the bottom 10 mm of the valve guide is not significant enough to affect normal operation.
- If over sizing the guide does not bring the clearance within specifications, replace the cylinder head.

Valve Spring Inspection and Measurement

Inspection Procedure

1 Clean the valve springs in solvent.

WARNING

Safety glasses must be worn when using compressed air

2 Dry the valve springs with compressed air.

3 Inspect the valve springs for broken coils or coil ends.

Measurement Procedure

1 Use a commercially available valve spring tester to measure the valve spring tension, refer to 5 Specifications.

CAUTION

Do not use shims to increase spring load. The use of shims can cause the valve spring to bottom out before the camshaft lobe is at peak lift.

2 If low valve spring load is found, replace the valve springs.

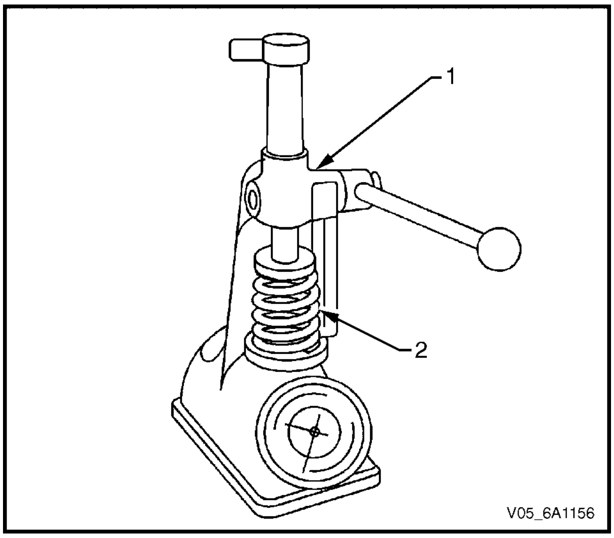

Figure 6A1 – 290

Valve and Seat Grinding

Valve Cleaning Procedure

CAUTION

Do not use a wire brush on any part of the valve stem. The valve stem is chrome plated to provide enhanced wear characteristics. Wire brushing the stem could remove the chrome plating.

1 Use soft bristle brush to clean any carbon build-up from the valve head.

2 Thoroughly clean the valve with solvent and wipe dry.

Valve Visual Inspection Procedure

1 Inspect the valve for damage from the head to tip for the following conditions:
- pitting in the valve seat area (1),
- lack of valve margin (2),
- bending in the valve stem (3),
- pitting or excessive wear in the stem (4),
- worn valve key grooves (5), and
- worn valve tip (6).

2 Replace the valve if any of these conditions exist.

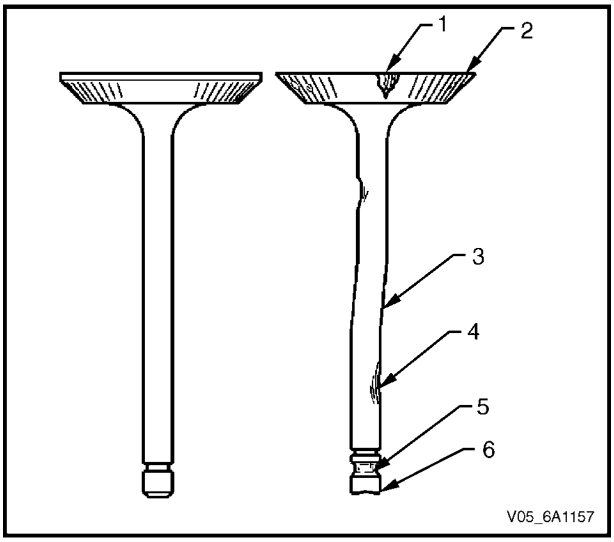

Figure 6A1 – 291

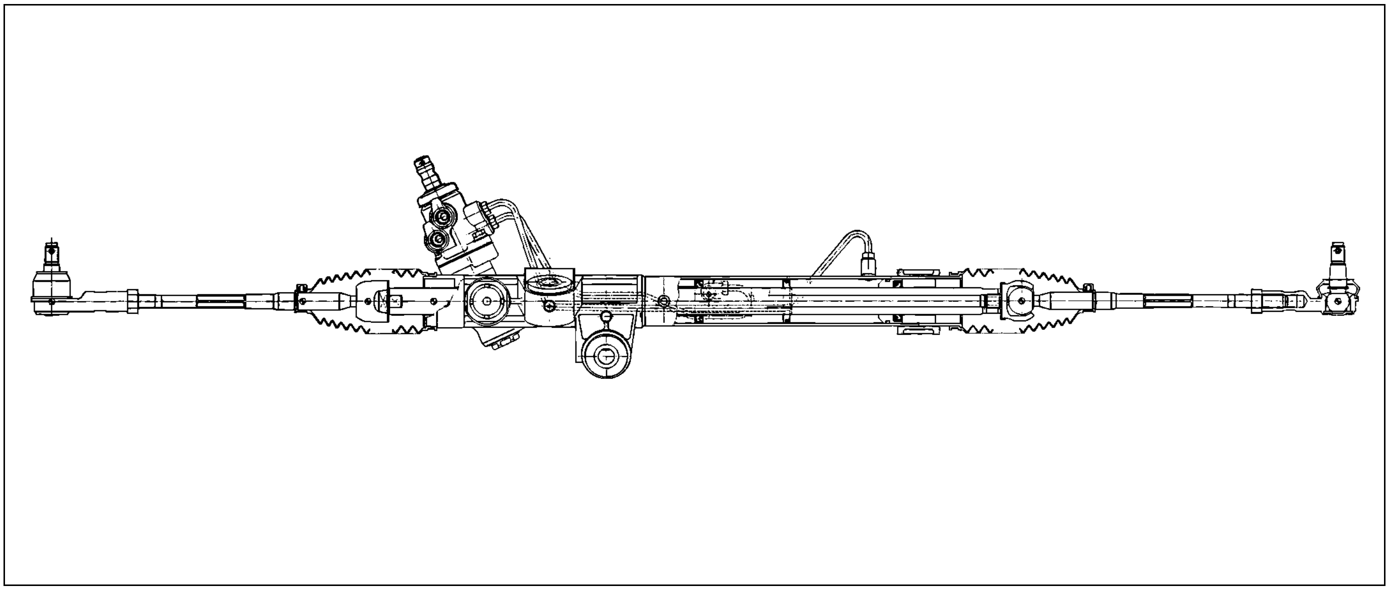
Valve Measurement and Reconditioning Overview

Correct valve service is critical to engine performance. Therefore, all detailed measurement procedures must be followed to identify components that are out of specification. If the measurement procedures reveal the valve or valve seat must be reconditioned, it is critical to perform the measurement procedures after reconditioning.

General Description

The hydraulic power steering system consists of a pump, an oil reservoir, a steering unit, a pressure hose and a return hose.

Power Steering Unit



440R300001

The power steering unit is a rack and pinion type.
The toe-in angle can be adjusted by turning the rod on each side.
The steering housing cannot be disassembled.

Valve Seat Width Measurement Procedure

1 Measure the valve seat (1) width in the cylinder head using a scale (2).

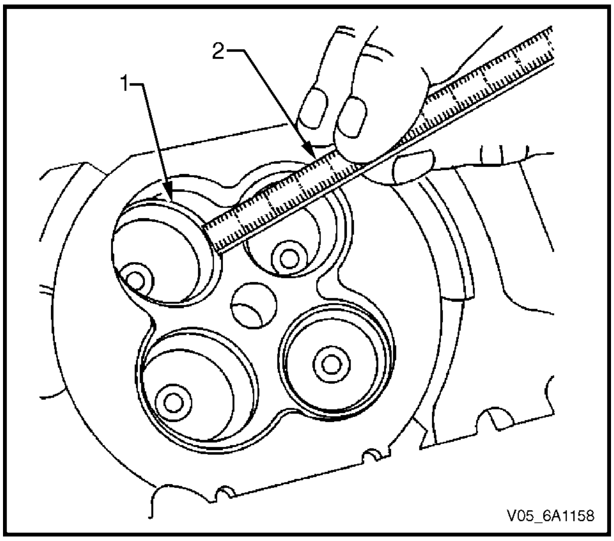


Figure 6A1 – 292

2 Measure the seat width on the valve face (1) using a correct scale.

CAUTION

The seat contact area must be at least 0.5 mm from the outer diameter (margin) of the valve. If the contact area is too close to the margins, the seat must be reconditioned to move the contact area away from the margin.

3 Compare the measurements with the specifications, refer to 5 Specifications.

4 If the seat widths are acceptable, check the valve seat roundness, refer to Valve Seat Roundness Measurement Procedure in this Section.

5 If the seat width is not acceptable, grind the valve seat to bring the width back to specification. Correct valve seat width is critical to providing the correct amount of valve heat dissipation, refer to Valve and Seat Reconditioning Procedure in this Section.

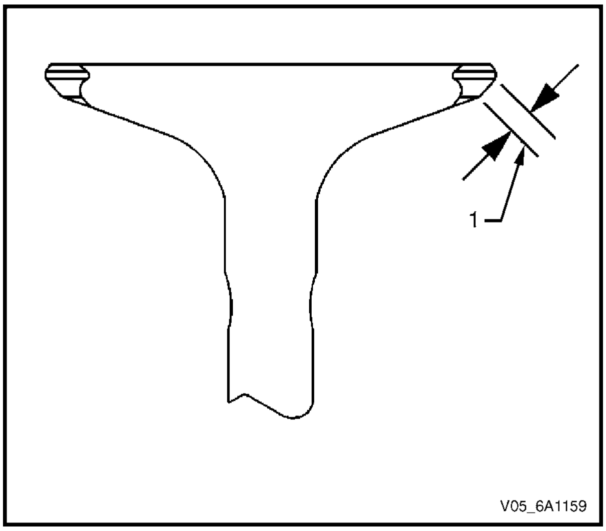

Figure 6A1 – 293

Valve Seat Roundness Measurement Procedure

1 Measure the valve seat roundness using a dial indicator attached to a tapered pilot installed in the guide. The pilot should have a slight bind when installed in the guide.

CAUTION

The correct size pilot must be used. Do not use adjustable diameter pilots. Adjustable pilots may damage the valve guides.

2 Compare your measurements with the specifications, refer to 5 Specifications.

3 If the valve seat exceeds the roundness specification, grind the valve and valve seat, refer to Valve and Seat Reconditioning Procedure in this Section.

4 If new valves are being used, the valve seat roundness must be within 0.05 mm.

Valve Margin Measurement Procedure

1 Measure the valve margin using an appropriate scale.
2 Refer to 5 Specifications for minimum valve margin and compare them to your measurements.
3 If the valve margins are beyond specification, replace the valves.
4 If the valve margins are within specification and do not require refacing, test the valve for seat concentricity, refer to Valve-to-Seat Concentricity Measurement Procedure in this Section.

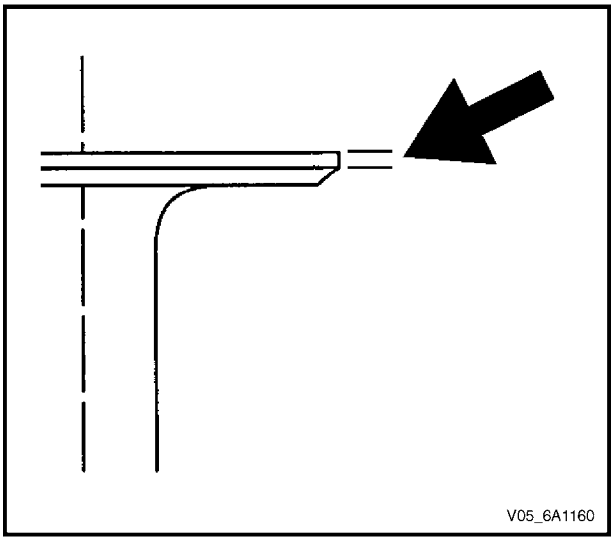

Figure 6A1 – 294

Valve-to-Seat Concentricity Measurement Procedure

Checking the valve-to-seat concentricity determines whether the valve and seat are sealing correctly.

Measure the valve face and the valve seat to ensure correct valve sealing.

1 Coat the valve face lightly with blue dye (3).
2 Install the valve in the cylinder head.
3 Turn the valve against the seat with enough pressure to wear off the dye.
4 Remove the valve from the cylinder head.
5 Inspect the valve face.

NOTE

- If the valve face is concentric, providing a correct seal, with the valve stem, a continuous mark (1) will be made around the entire face (2).
- The wear mark must be at least 0.5 mm from the margin of the valve. If the wear mark is too close to the margin, the seat must be reconditioned to move the contact area away from the margin.
- If the face is not concentric with the stem, the mark will not be continuous around the valve face. The valve should be refaced or replaced and the seat must be reconditioned, refer to Valve and Seat Reconditioning Procedure in this Section.

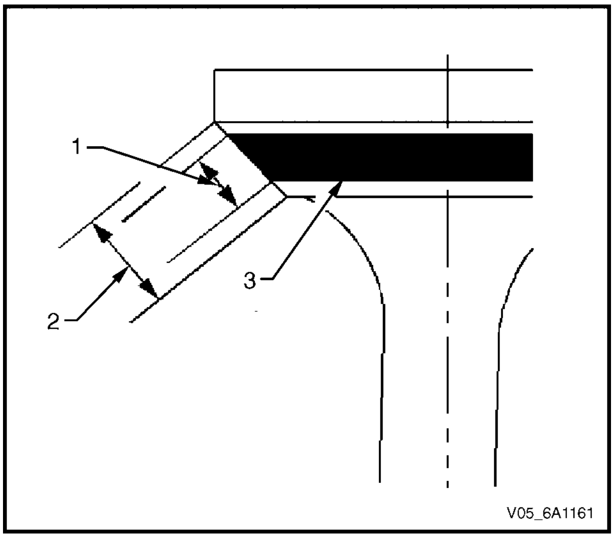

Figure 6A1 – 295

Valve and Seat Reconditioning Procedure

If the valve seat width, roundness or concentricity are beyond specifications, grind the seats in order to ensure correct heat dissipation and prevent the build up of carbon on the seats.

If valve seat reconditioning is required, reface the valve face, unless a new valve is used.

1 Grind the valve seats (2) to the correct angle specification, refer to 5 Specifications.

2 Using the correct angle specification, grind and relieve the valve seats (1) to correctly position the valve seating surface (2) to the valve.

3 Using the correct angle specification, grind and undercut the valve seats (3) to narrow the valve seat widths to the specifications, refer to 5 Specifications.

4 If the original valve is being used, grind the valve to the specifications, refer to 5 Specifications. Measure the valve margin again after grinding, refer to Valve Margin Measurement Procedure in this Section. Replace the valve if the margin is out of specification. New valves do not require grinding.

5 When grinding the valves and seats, grind off as little material as possible. Cutting valve seat results in lowering the valve spring pressure.

6 Install the valve in the cylinder head.

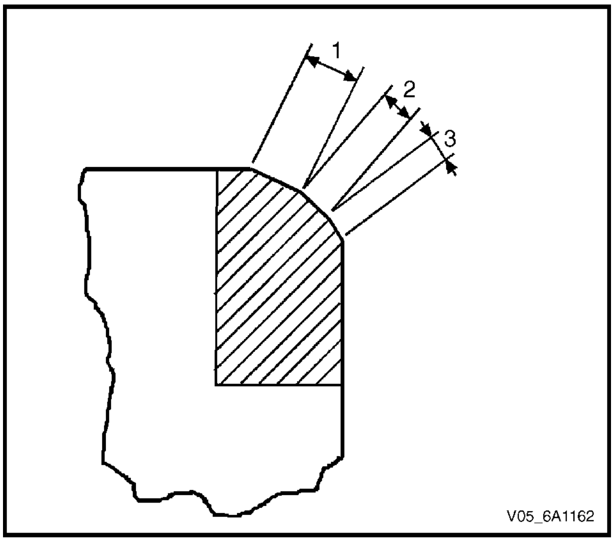

Figure 6A1 – 296

CAUTION

If using refaced valves, lap the valves into the seats with a fine grinding compound. The refacing and reseating operations should leave the refinished surfaces smooth and true so that minimal lapping is required. Excessive lapping will groove the valve face and prevent a good seat when hot.

NOTE

- Clean any remaining lapping compound from the valve and seat with solvent and compressed air prior to final assembly.
- If fitting new valves, do not lap the valves under any condition.

7 After obtaining the correct valve seat width in the cylinder head, measure the valve stem height, refer to Valve Stem Height Measurement Procedure in this Section.

8 If the valve stem height is acceptable, test the seats for concentricity, refer to Valve-to-Seat Concentricity Measurement Procedure in this Section.

Valve Stem Height Measurement Procedure

CAUTION

To determine the valve stem height measurement, measure from the valve spring seat to the valve spring retainer.

1 Install the valve into the valve guide.
2 Ensure the valve is seated to the valve seat.
3 Install the valve stem oil seal.
4 Install the valve spring retainer and valve stem keys.
5 Measure the distance (1) between the cylinder head to the bottom of the valve spring retainer, refer to 5 Specifications.
6 If the maximum height specification is exceeded, a new valve should be installed and the valve stem height re-measured.

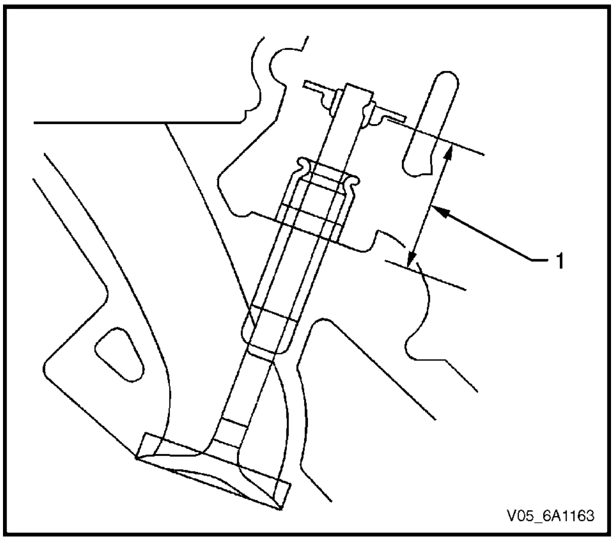

Figure 6A1 – 297

CAUTION

Do not grind the valve stem tip. The tip of the valve is hardened and grinding the tip will eliminate the hardened surface causing premature wear and possible engine damage.

CAUTION

Do not use shims to adjust valve stem height. The use of shims will cause the valve spring to bottom out before the camshaft lobe is at peak lift and engine damage could result.

7 If the valve stem height still exceeds the maximum height specification, the cylinder head must be replaced.

Assemble

1 Install the cylinder head coolant threaded plugs (1) and tighten to the correct torque specification.

Cylinder head threaded plug ....31.0 Nm

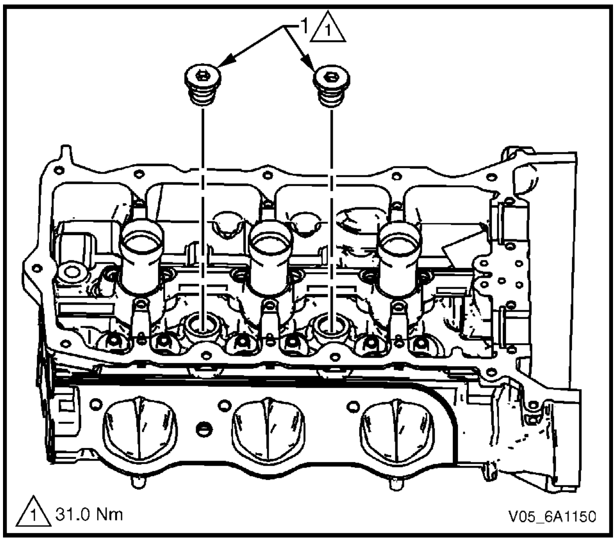

Figure 6A1 – 298

2 Install the cylinder head oil gallery expansion plugs (1).

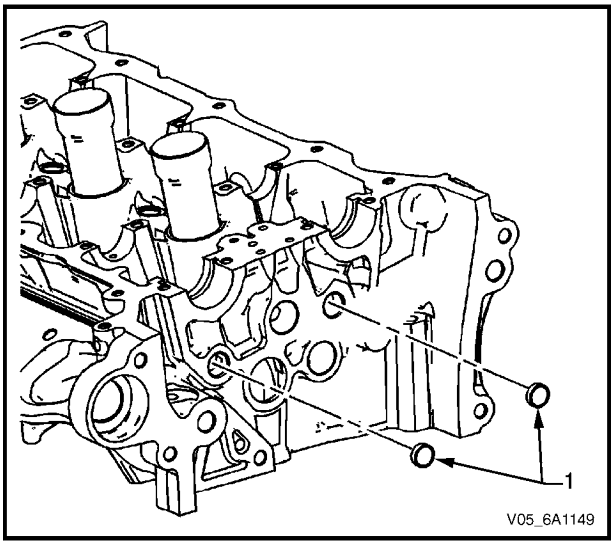

Figure 6A1 – 299

CAUTION

- **Never reuse a valve stem oil seal. Always use new seals when assembling the cylinder head.**
- **Force should only be applied to the valve spring contact area of the new valve stem oil seal during installation.**

3 Fit the valve stem oil seals onto the guides using Tool No. EN-46116 (1).

4 Push and twist the valve stem oil seal into position on the valve guide until the seal positively locks on the guide using Tool No. EN-46116.

5 Lubricate the valve stem and valve guide ID with clean engine oil.

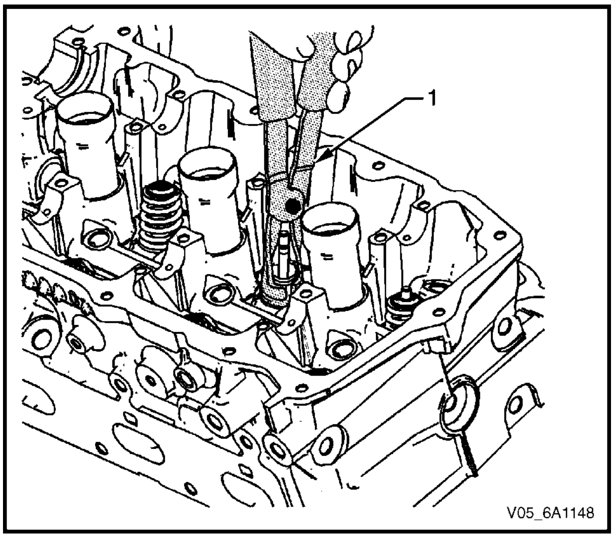

Figure 6A1 – 300

CAUTION

The valve stem oil seal must not come loose from the valve guide when the valve (1) is installed.

6 Insert the valve into the valve guide until it bottoms on the valve seat.

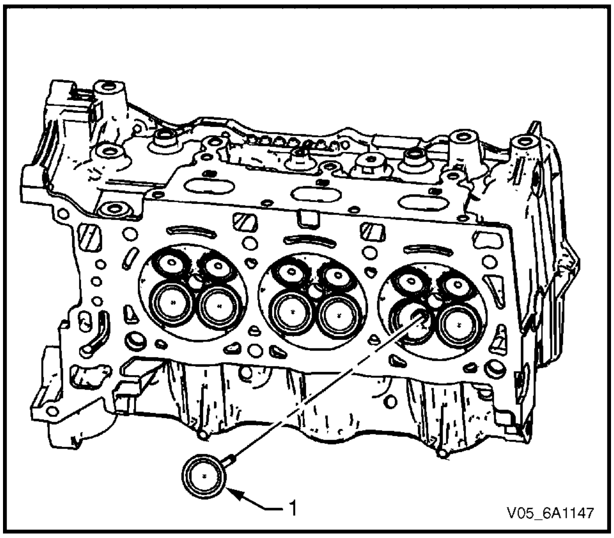

Figure 6A1 – 301

7 Position the valve spring (2) on the spring seat (1).

8 Place the valve spring retainer onto the valve spring.

CAUTION

Do not compress the valve springs less than 24.0 mm. Contact between the valve spring retainer and the valve stem oil seal can cause potential valve stem oil seal damage.

WARNING

Compressed valve springs (1) have high tension against the valve spring compressor (2). Valve springs that are not correctly compressed by, or are released from, the valve spring compressor can be ejected from the valve spring compressor with intense force. Use care when compressing or releasing the valve spring with the valve spring compressor and when removing or installing the valve stem keys. Failing to use care may cause personal injury.

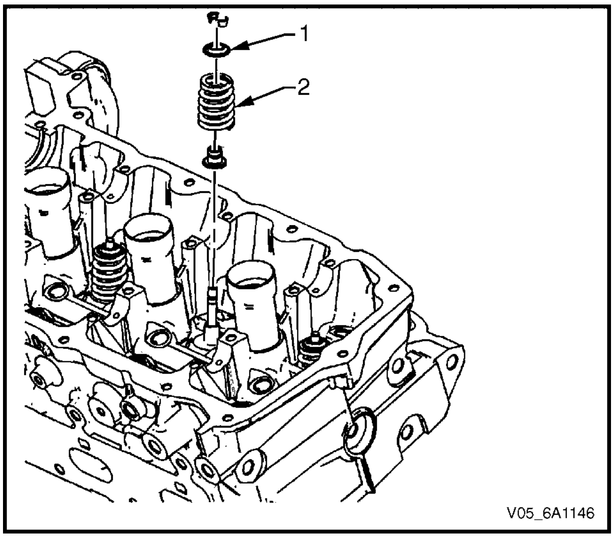

Figure 6A1 – 302

9 Compress the valve spring using valve spring compressor Tool No. J-8062 and adaptor Tool No. EN-46119.

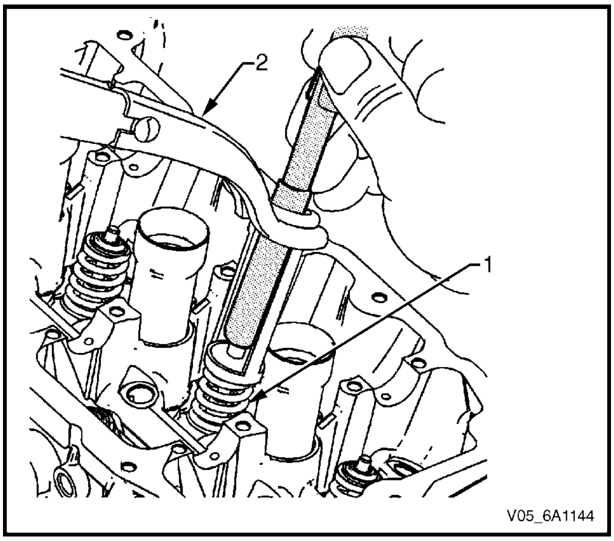

Figure 6A1 – 303

CAUTION

Ensure correct directional placement of valve collets (1) in Tool No. EN-46117 (2). The valve collets must be installed with the tapered end towards the valve stem seal.

10 With the spring compressed, install the valve collets into Tool No. EN 46117.

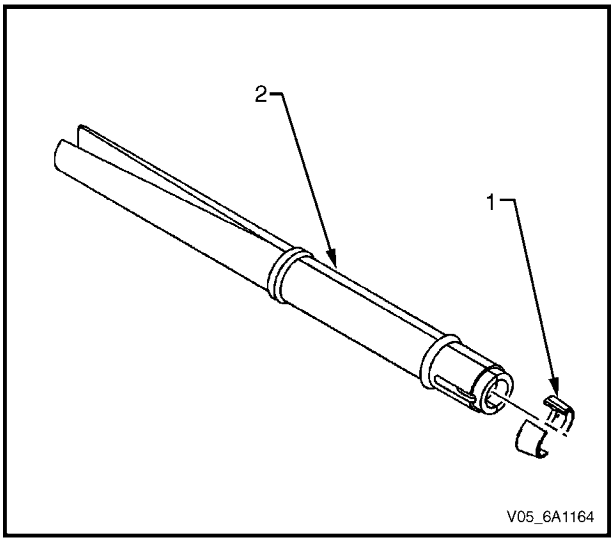

Figure 6A1 – 304

11 Place the collets into position by pushing the tool (1) downward and releasing tension on the valve spring compressor (2).

12 Verify the valve collets are installed by placing a rag over the valve tip and tapping with a dead-blow hammer. The valve collets and the spring should remain in place.

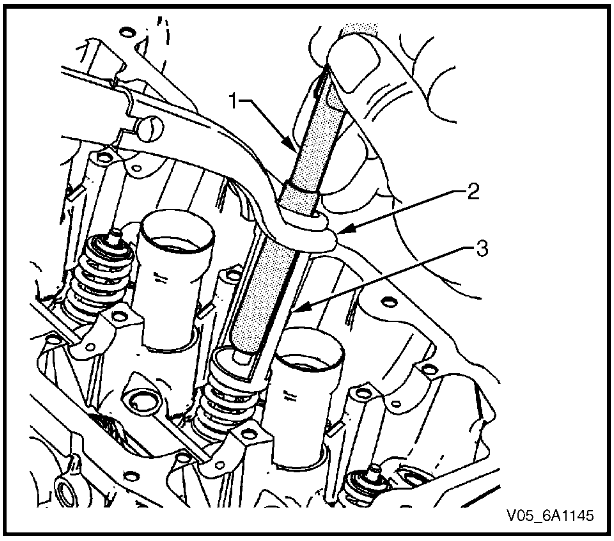

Figure 6A1 – 305

Reinstall

Right-hand Side (Bank 1) Cylinder Head

The reinstallation procedure for the right-hand side cylinder head assembly is the reverse of the removal procedure, noting the following:

1 Ensure all fasteners are tightened to the correct torque specification.

2 Using crankshaft rotation Tool No. EN-46111 (1), align the crankshaft sprocket timing mark (2) with the indexing mark (3) on the oil pump housing.

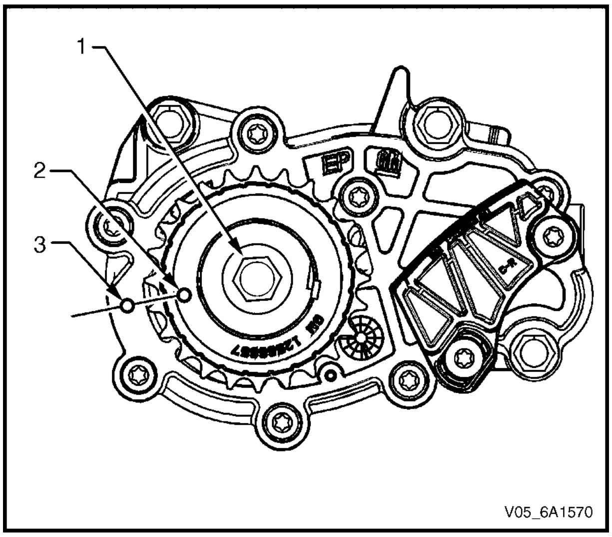

Figure 6A1 – 306

3 Ensure the deck face is clean and the cylinder head locating pins are securely mounted in the cylinder block deck face.

4 Install a new right-hand cylinder head gasket (1) using the deck face locating pins for retention.

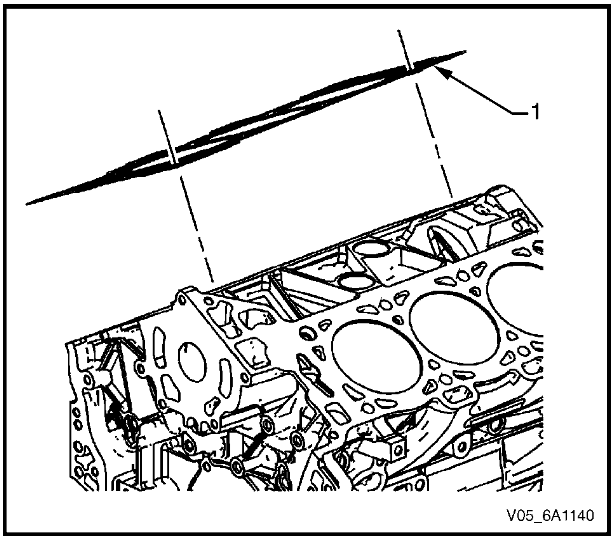

Figure 6A1 – 307

5 Align the cylinder head with the locating pins.

6 Place the cylinder head in position on the deck face.

NOTE

Do not allow oil on the cylinder head bolt bosses.

CAUTION

Do not reuse the old M11 cylinder head bolts (1 to 8 inclusive).

7 Install new M11 cylinder head bolts (1) eight places and tighten in the sequence shown and to the correct torque specification.

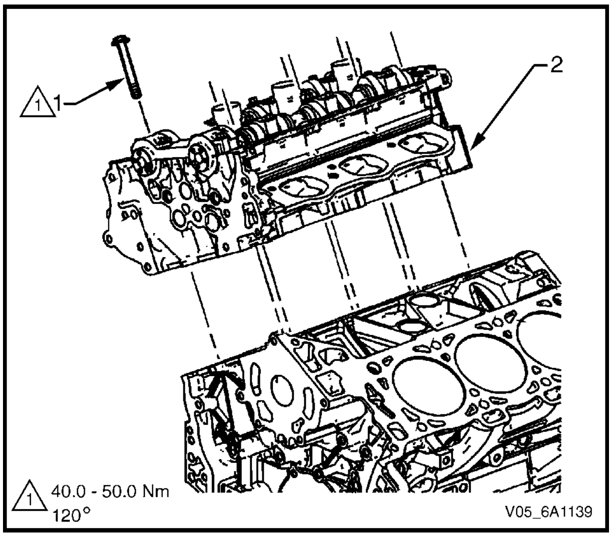

Figure 6A1 – 308

■ Cylinder head M11 attaching bolt torque specification: Stage 1: ....40.0 – 50.0 Nm Stage 2: ....120°

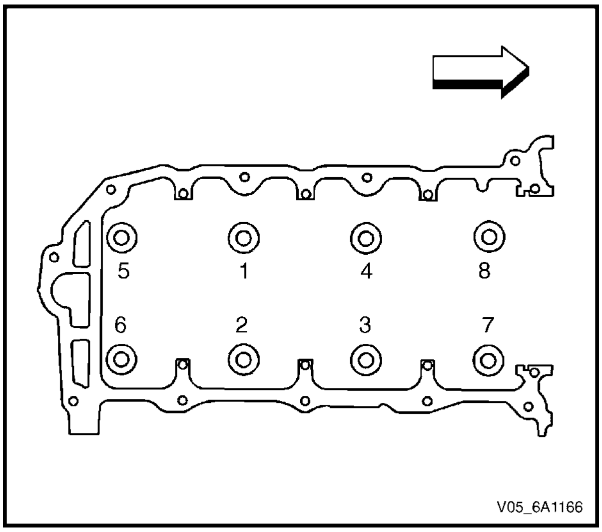

Figure 6A1 – 309

Left-hand Side (Bank 2) Cylinder Head

The reinstallation procedure for the left-hand side cylinder head assembly is the reverse of the removal procedure, noting the following:

1 Ensure all fasteners are tightened to the correct torque specification.

2 Using crankshaft rotation Tool No. EN-46111 (1), align the crankshaft sprocket timing mark (2) with the indexing mark (3) on the oil pump housing.

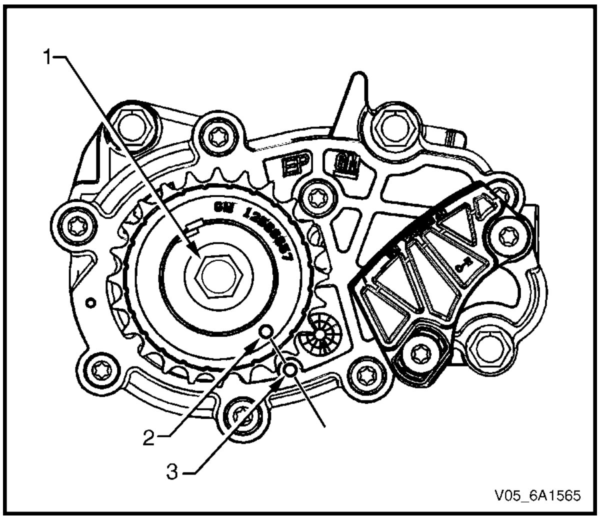

Figure 6A1 – 310

3 Ensure the deck face is clean and the cylinder head locating pins are securely mounted in the cylinder block deck face.

4 Install a new cylinder head gasket (1) using the deck face locating pins for retention.

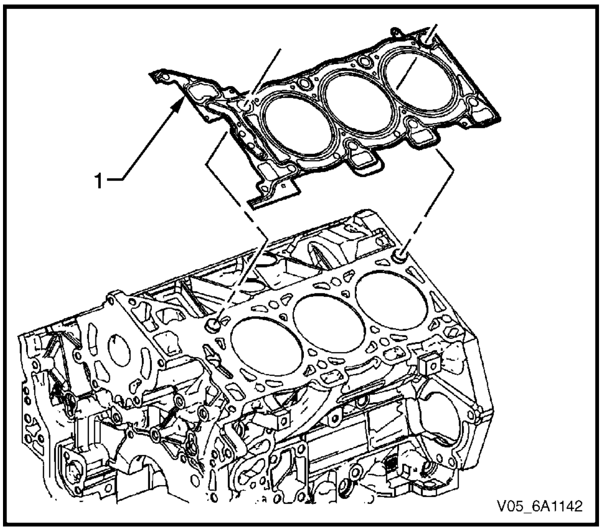

Figure 6A1 – 311

5 Align the cylinder head with the locating pins.

6 Place the cylinder head in position on the deck face.

NOTE

Do not allow oil on the cylinder head bolt bosses.

CAUTION

Do not reuse the old M11 cylinder head bolts (1 to 8 inclusive).

7 Install new M11 cylinder head bolt (1), eight places, and tighten in the sequence shown and to the correct torque specification.

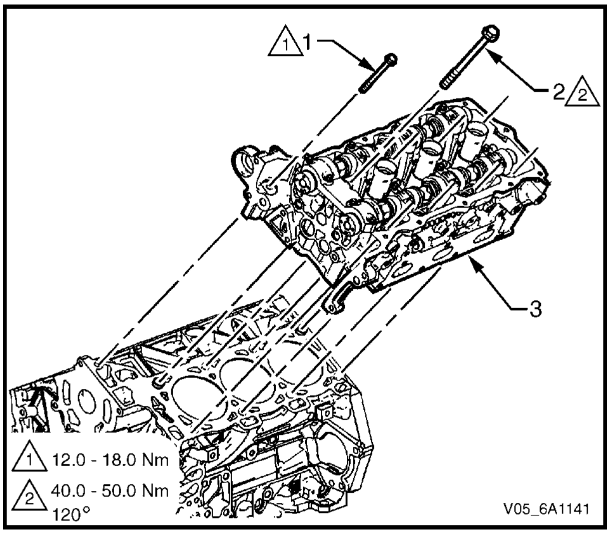

Figure 6A1 – 312

8 Install the front M8 cylinder head bolt (2), two places, and tighten in the sequence (9 and 10) and to the correct torque.

■ Cylinder head M11 attaching bolt torque specification:
Stage 1: ....40.0 – 50.0 Nm
Stage 2: ....120°

■ M8 cylinder head bolt torque specification
Stage 1: ....12.0 – 18.0 Nm
Stage 2: ....60°

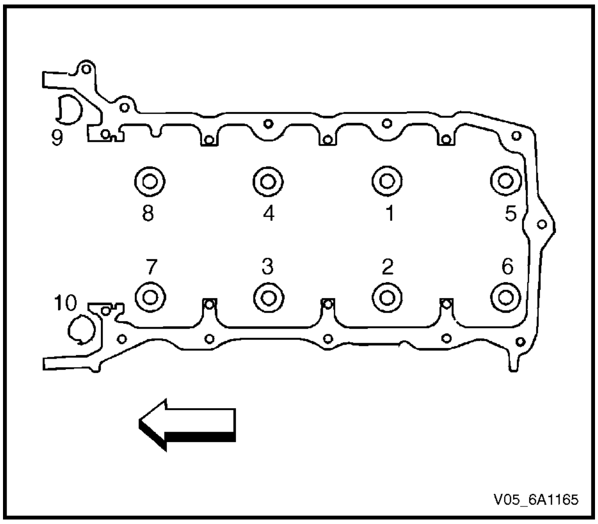

Figure 6A1 – 313

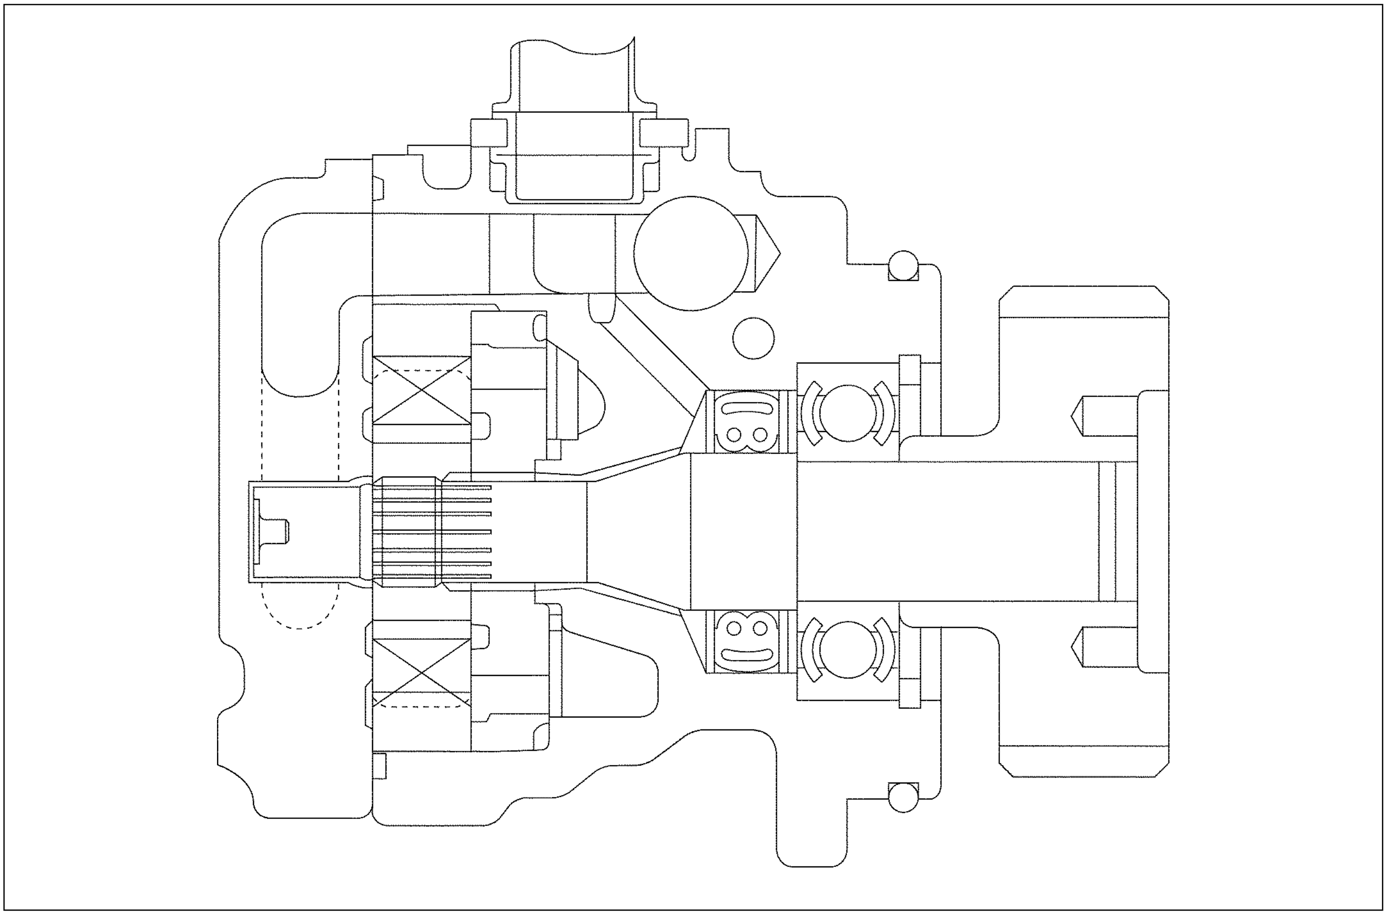
Hydraulic Pump

4JJ1-TC, 4JK1-TC



RTW53BMF0003

The hydraulic pump is vane-type design. The submerged pump has a housing and internal parts that are inside the reservoir and operate submerged in oil. There are two bore openings at the rear of the pump housing. The larger opening contains the cam ring, pressure plate, thrust plate, rotor and vane assembly, and end plate. The smaller opening contains the pressure line union, flow control valve and spring.

The flow control orifice is part of the pressure line union. The pressure relief valve inside the flow control valve limits the pump pressure.

3.23 Engine Mounts and Brackets

Remove

1 Remove the exhaust manifold assembly from the side of the engine where the engine mount is to be removed, refer to 3.11 Exhaust Manifold Assembly.

2 Fit the engine lift brackets, Tool No. EN-46114 (1) to the cylinder heads.

CAUTION

Only lift the engine far enough to take the weight off the engine mount, or damage to the mount and lifting equipment failure may occur.

3 Using an engine lifting crane, raise the side of the engine where the mount is to be removed enough to remove the weight from the engine mounts, and create a slight tension in the lifting equipment.

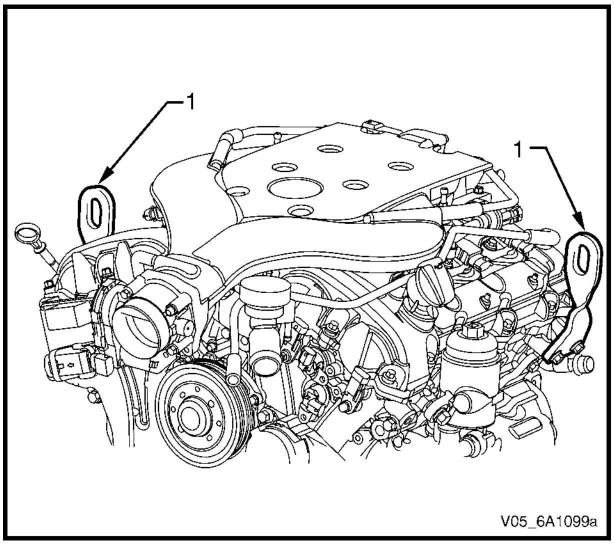


Figure 6A1 – 314

4 Remove the left-hand or right-hand side engine mount and bracket as required.

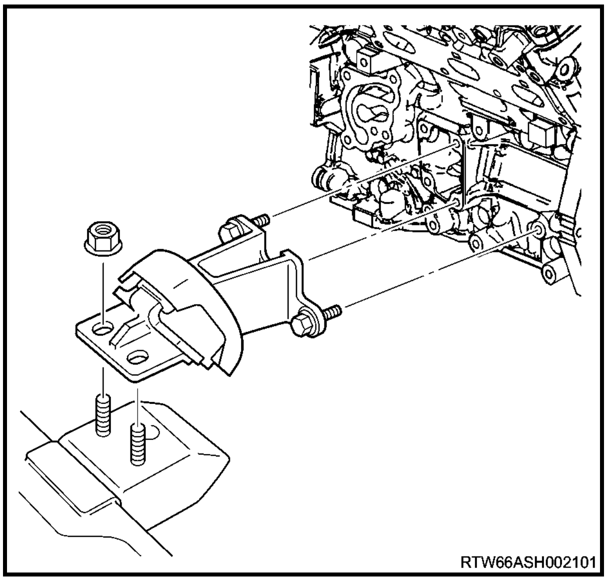

Figure 6A1 – 315

Engine Mount Location

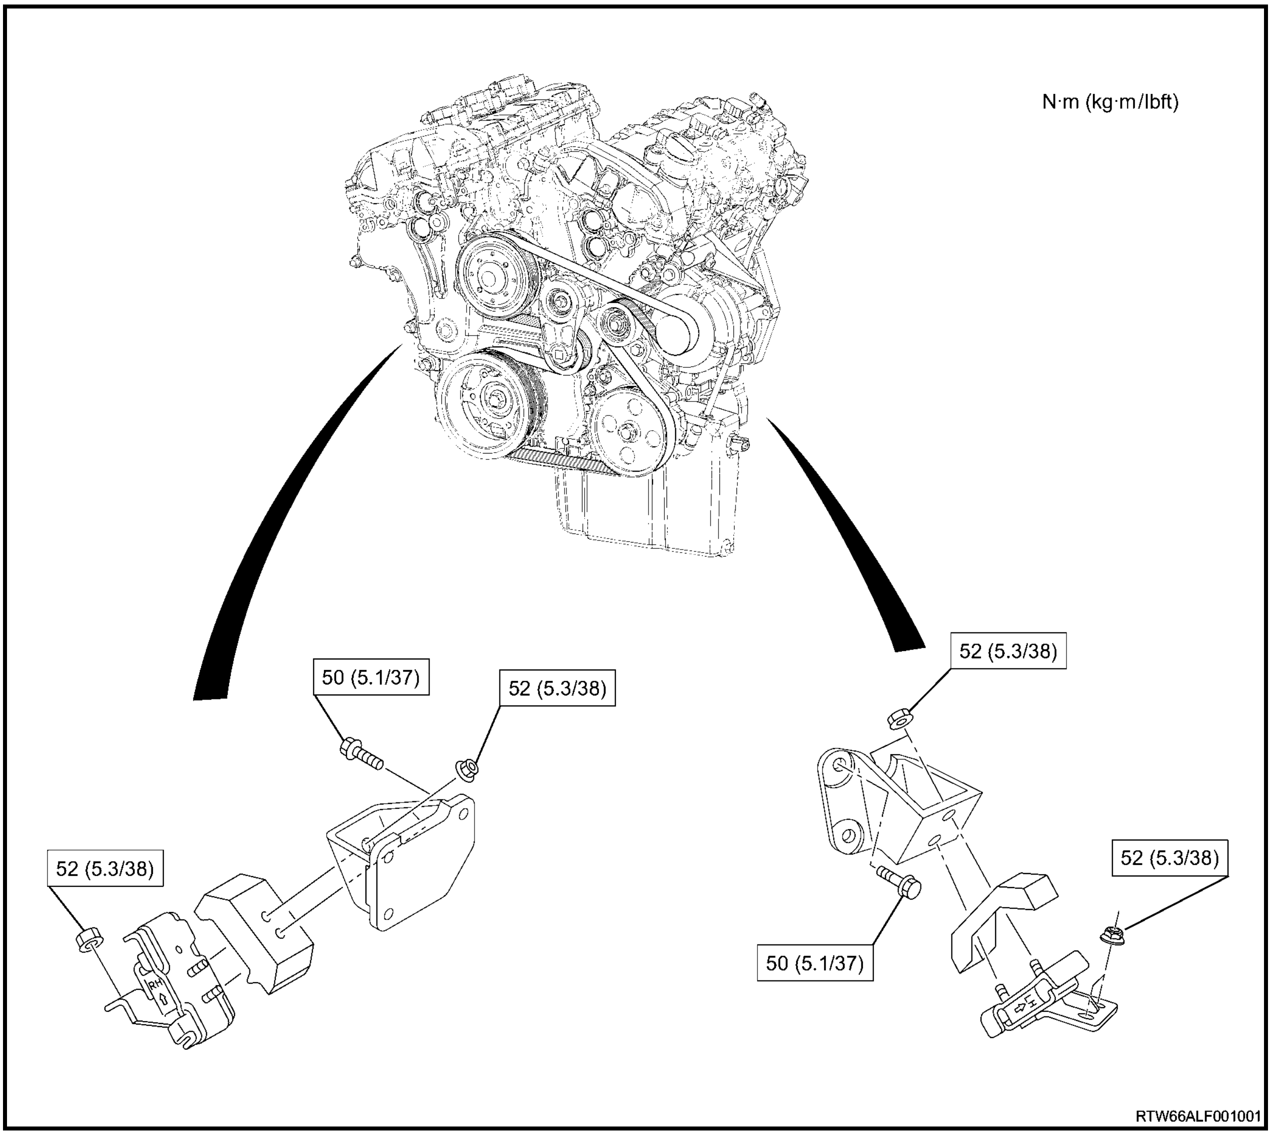

Figure 6A1 – 316

Inspect

NOTE

Although the following procedure provides information regarding on-vehicle engine mount inspections, it is preferable to inspect the engine mounts once removed from the vehicle.

1 Fit the engine lift brackets, Tool No. EN-4611 to the cylinder heads.

WARNING

Only lift the engine enough to take the weight off the engine mounts, or damage to the mounts and lifting equipment failure may occur.

2 Using a commercially available engine lifting crane, have an assistant raise the engine far enough to remove the weight on the engine mounts and create a slight tension in the rubber.

3 Observe the engine mount while raising the engine.

4 Replace the engine mount if any of the following conditions are found:

- The hard rubber surface is covered with heat check cracks,
- The rubber is split through the centre of the engine mount, or
- The rubber is separated from the metal plate portion of the engine mount.

5 Remove the engine lift brackets, Tool No. EN-46114 from the engine.

Reinstall

The reinstallation procedure for the engine mounts is the reverse of the removal procedure, noting the following:

Ensure all fasteners are tightened to the correct torque specification.

Engine mount bracket to
cylinder block attaching bolt
torque specification
....43.0 – 57.0 Nm

Engine mount to bracket attaching nut
torque specification
....70.0 – 90.0 Nm

Engine mount to frame attaching nut
torque specification
....44.0 – 60.0 Nm

4 Major Service Operations

ATTENTION

The V6 engine is a combination of numerous components, containing machined, honed, polished and lapped surfaces manufactured on the latest, high technology production equipment. Many of the components contain tolerances measured in thousandths of a millimetre. Consequently, when any engine component is to be serviced, care and cleanliness are extremely important.

Prior to re-assembly of the V6 engine, all components must be cleaned and inspected in accordance with the relevant procedures throughout this section, and replaced or repaired where required.

In addition to cleaning and inspecting components, a liberal coating of engine oil should be applied to friction surfaces during assembly to protect and lubricate the surfaces on initial operation.

When performing any service operation contained in this Section, it should be understood that correct cleaning and protection of machined surfaces and friction areas is part of the repair procedure. This is considered standard workshop practice, even if not specifically stated. Torque values must be used as specified during reassembly to ensure correct retention of all components.

Through out this section, fastener torque wrench specifications may be accompanied with the following identification marks:

■ Fasteners must be replaced after loosening.

♦ Fasteners either have micro encapsulated sealant applied or incorporate a mechanical thread lock and should only be re-used once. If in doubt, replacement is recommended.

If one of these identification marks is present alongside a fastener torque wrench specification, the recommendation regarding that fastener must be adhered to.

4.1 Engine Removal

CAUTION

- **Allow the engine to cool to at least 50° C, before attempting fastener removal.**
- **As aluminium has a greater rate of thermal expansion than that of cast iron, aluminium bolt hole threads will change dimension to a larger extent than cast iron bolt threads.**
- **If a bolt or other threaded component is removed before the engine is allowed to cool to at least 50° C, threads could be pulled from the cylinder block or cylinder head.**
- **Do not use impact tools to remove bolts during engine disassembly. While this may be common practice with cast iron engine components, use of these tools is likely to pull the aluminium threads in the cylinder block or head of this engine.**

Remove

1 Remove the skid plate.
2 Drain the radiator coolant, refer to 6B1 Engine Cooling – V6.
3 Disconnect the battery negative and positive terminal, refer to 8A Electrical Body & Chassis.
4 Remove the battery from the vehicle.
5 Depressurise the fuel system pressure, refer to 6C Fuel System – V6.
6 Make alignment marks on the bonnet and hinges in order to return the bonnet to the exact original position.
7 Remove the bonnet, refer to 2B Sheet Metal.
8 Remove the rubber hose (2) and air duct (1).

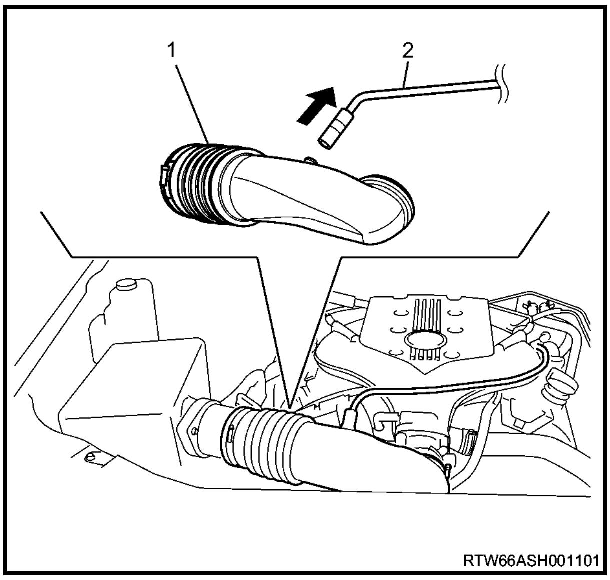

Figure 6A1 – 317

9 Disconnect the barometric sensor connector (1).

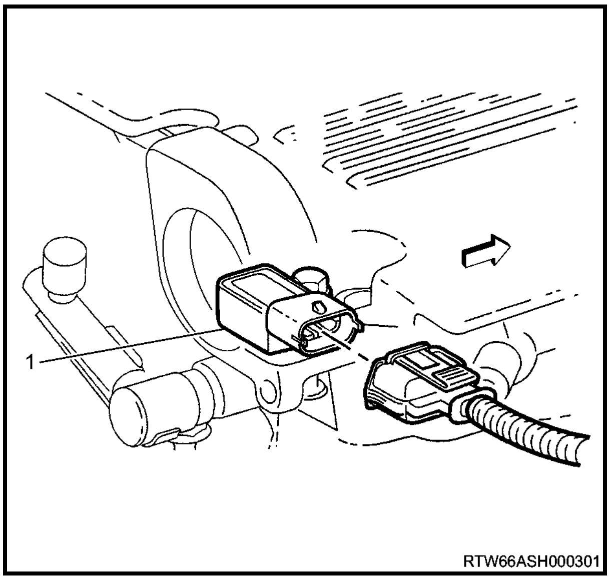

Figure 6A1 – 318

10 Disconnect the vacuum booster hose (1).

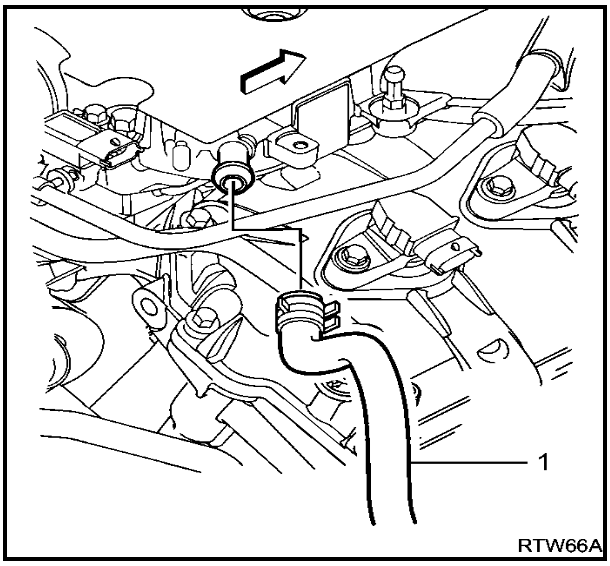

Figure 6A1 – 319

11 Disconnect the EVAP purge solenoid connector (1).

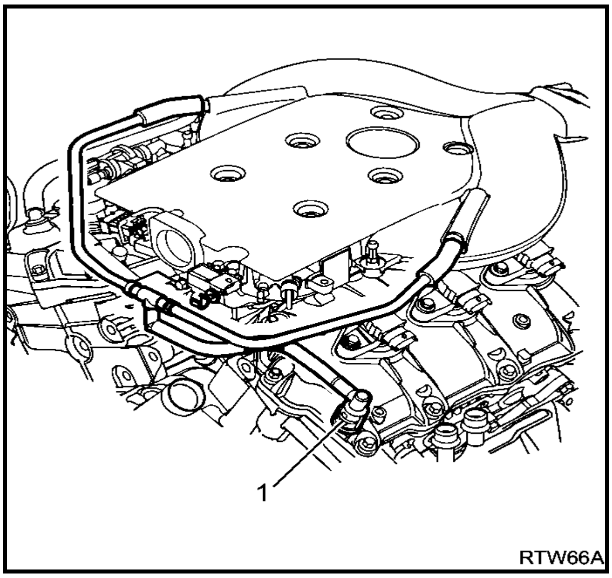

Figure 6A1 – 320

CAUTION

Plug the fuel feed hose after removal to prevent dirt entering the pipe.

12 Disconnect the fuel pipe connector and injector harness connector.

13 Disconnect the fuel feed hose from the fuel rail (1), refer to 6C Fuel system.

14 Pull out release bar (2) of the fuel injector harness wiring connector (3).

15 Disconnect the fuel injector harness wiring connector from the fuel injector wiring harness (4).

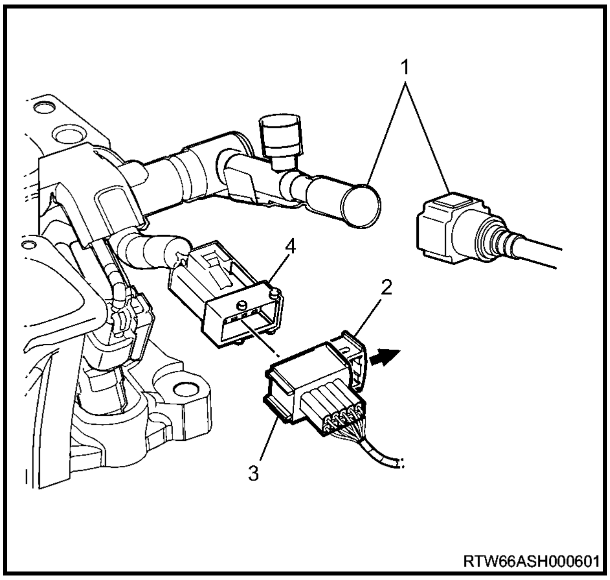

Figure 6A1 – 321

16 To disconnect the throttle body connector (1) the following procedure must be followed.

17 Retract the throttle body wiring connector lock (3) while pressing the connector latch in the direction of the arrow (4).

18 Disconnect the throttle body wiring connector (1).

19 Release the throttle body connector wiring harness from its retaining clip (5).

CAUTION

Take care not to break the barbed retainer pin (6), when removing the harness. Should the pin be damaged it is vital that a new harness retainer be fitted.

20 Remove the main wiring harness retainer pin (6) from the intake manifold by pushing from the front to the rear using a suitable length of 5mm steel rod or an allen key.

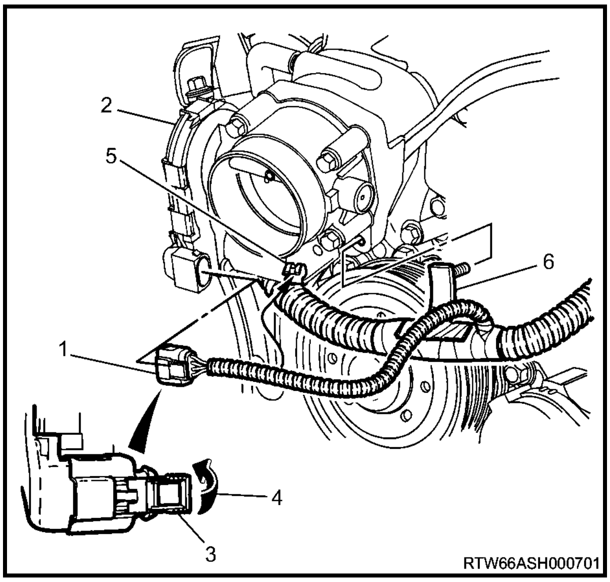

Figure 6A1 – 322

21 Disconnect the PCV fresh air tube (1) from the upper intake manifold mounting clip (2) and remove the fixing bolt (3).

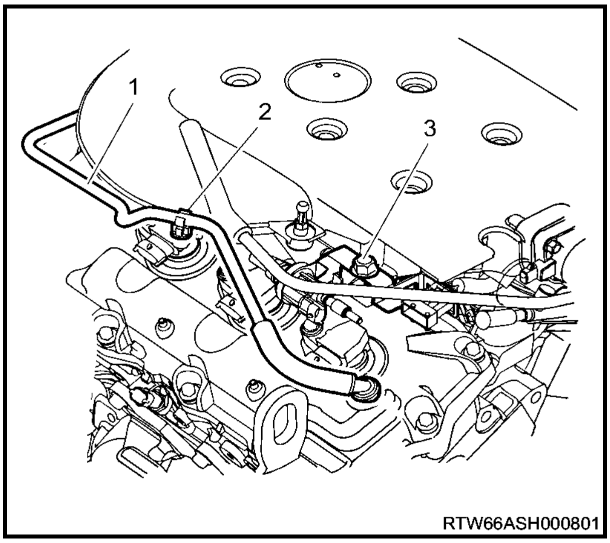

Figure 6A1 – 323

22 Disconnect the EVAP valve outlet tube, (1) from the upper intake manifold (2).

23 Remove the four long bolts, (3) attaching the upper intake manifold, (2) to the cylinder heads and lower intake manifold.

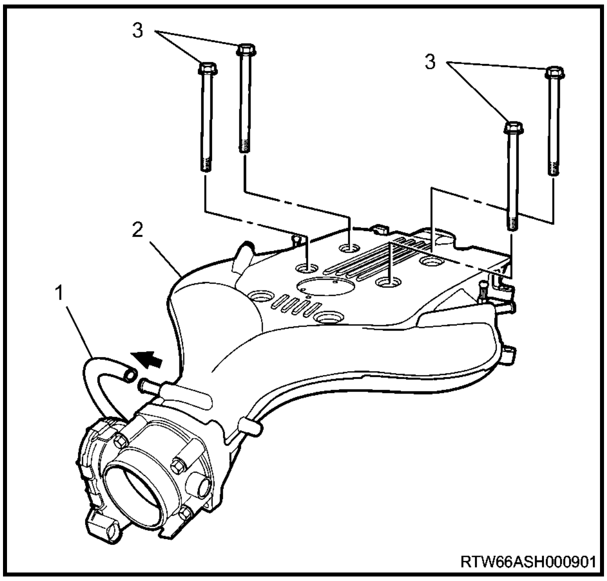

Figure 6A1 – 324

23 Remove the six bolts, (1) attaching the lower intake manifold (2), then remove the manifold from the engine.

24 Remove the following from the engine and engine compartment :

- Lower intake manifold to cylinder head gasket
- The Heater hose
- The Air Cleaner assembly

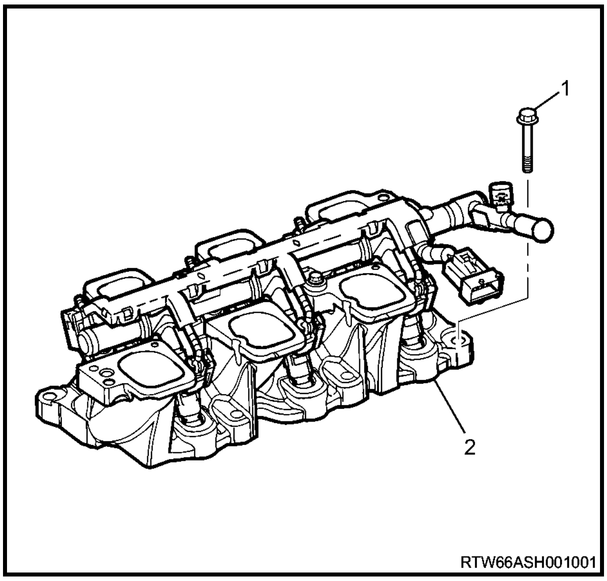

Figure 6A1 – 325

25 Remove the transmission support (1).

26 Remove the front and rear propeller shafts, (4WD Only), refer to 4C1 Front Wheel Drive and 4C2 Drive Line (For 4WD Vehicles).

27 Remove the front torsion bar springs, refer to 3C Suspension.

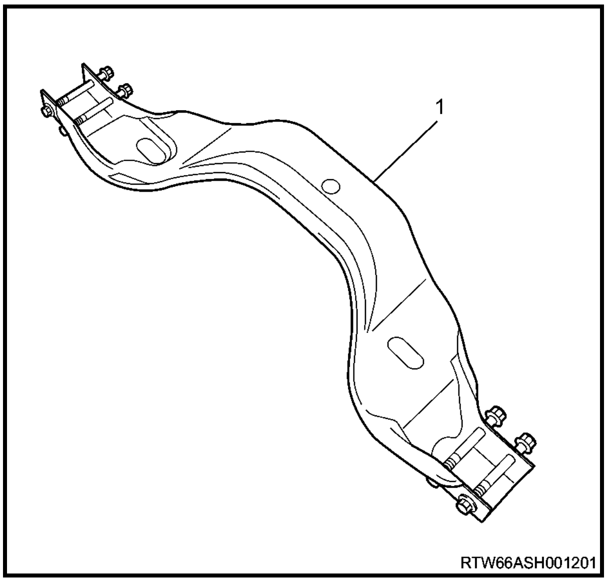

Figure 6A1 – 326

28 Remove the centre exhaust pipe (1), refer to 6F Exhaust System - V6 - V6.

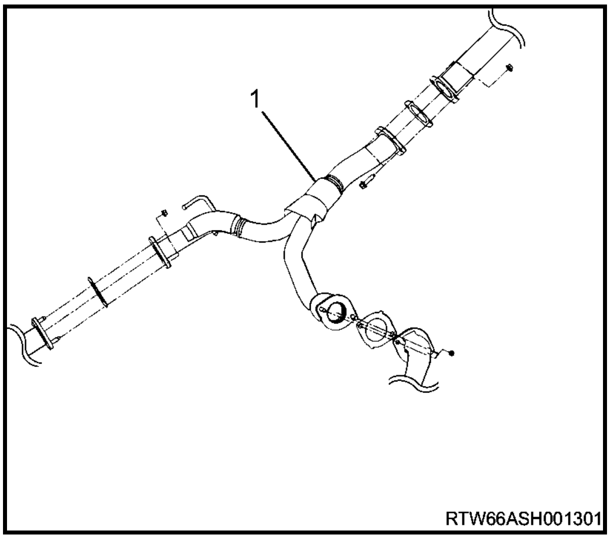

Figure 6A1 – 327

29 Disconnect the two post-catalytic converter oxygen sensor wiring harness connectors, 1 each bank.

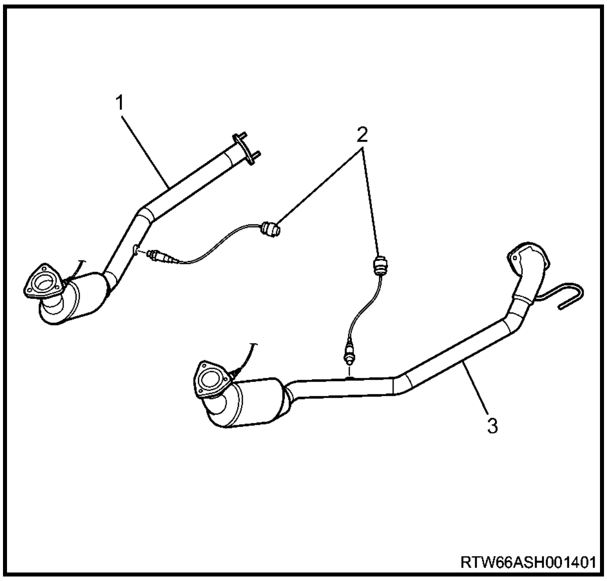

Figure 6A1 – 328

30 Disconnect the two pre-catalytic converter oxygen sensor wiring harness connectors, 1 each bank.

31 Remove the front exhaust flange nuts, three each bank.

32 Remove the front left-hand exhaust pipe from the rubber mount.

33 Remove the front exhaust pipes from the vehicle, for further information, refer to 6F Exhaust System - V6.

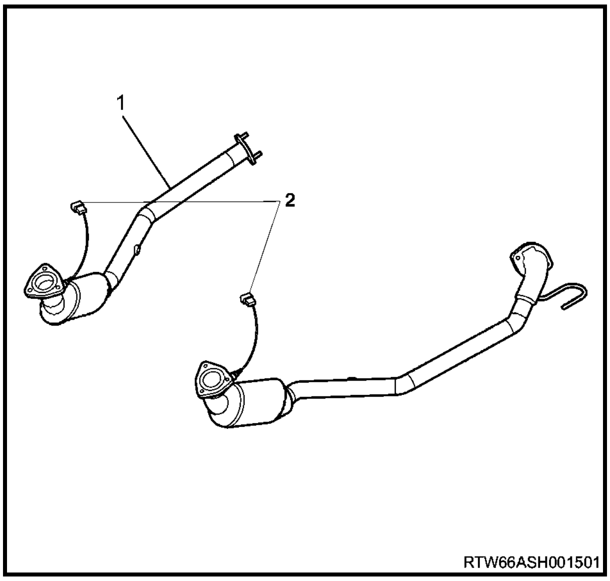

Figure 6A1 – 329

34 Remove the transfer case from the vehicle (4WD Only), refer to 7D Transfer Case and Adaptor Housing.

35 Disconnect the harness connector from the transmission, refer to 7B1 Manual Transmission – V6 or 7C1, 2, 3 or 4 for automatic transmission.

36 Remove the left-hand side exhaust manifold upper heat shield (1), (Automatic transmission only).

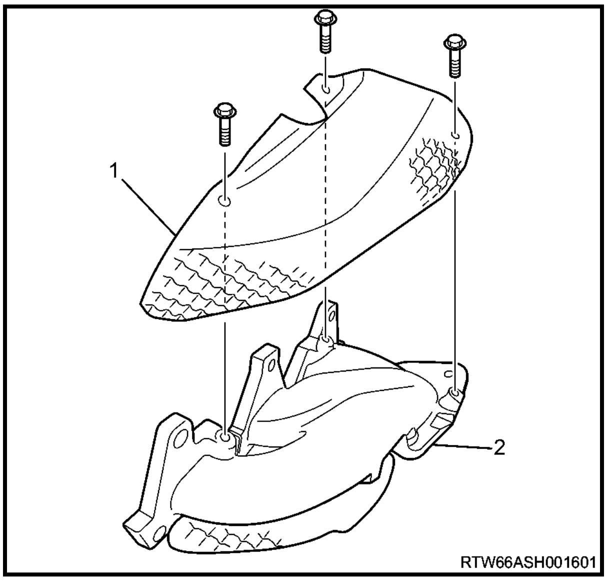

Figure 6A1 – 330

37 Progressively loosen the seven exhaust manifold attaching bolts (2), working from the outside to the centre and then remove the bolts.

38 Manoeuvre the exhaust manifold (3), away from the cylinder head.

39 Remove and discard the exhaust manifold to cylinder head gasket.

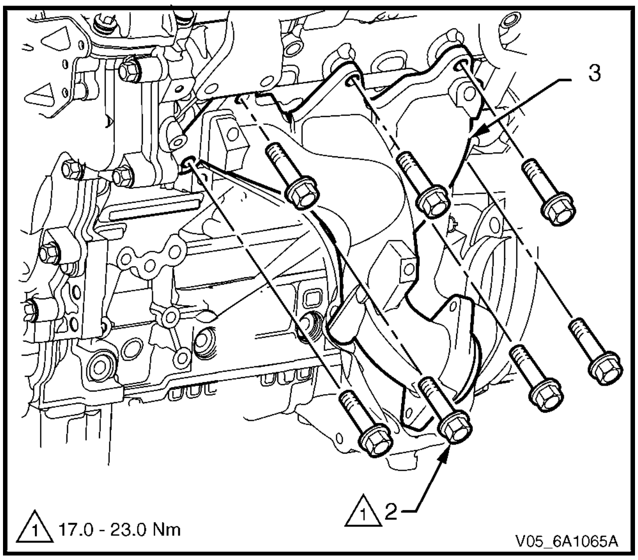

Figure 6A1 – 331

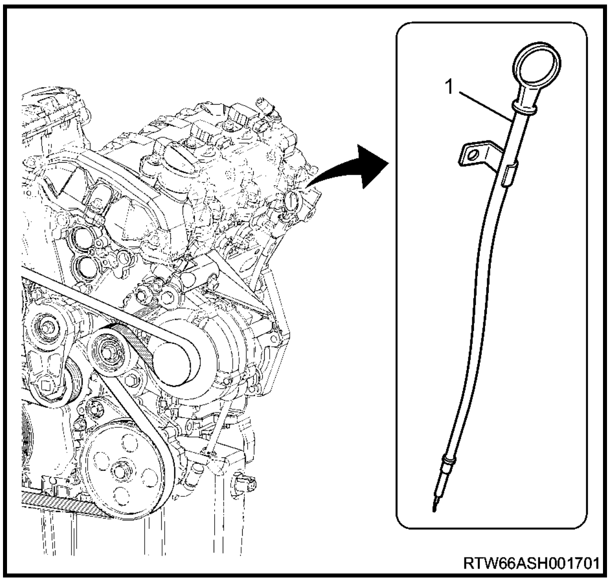
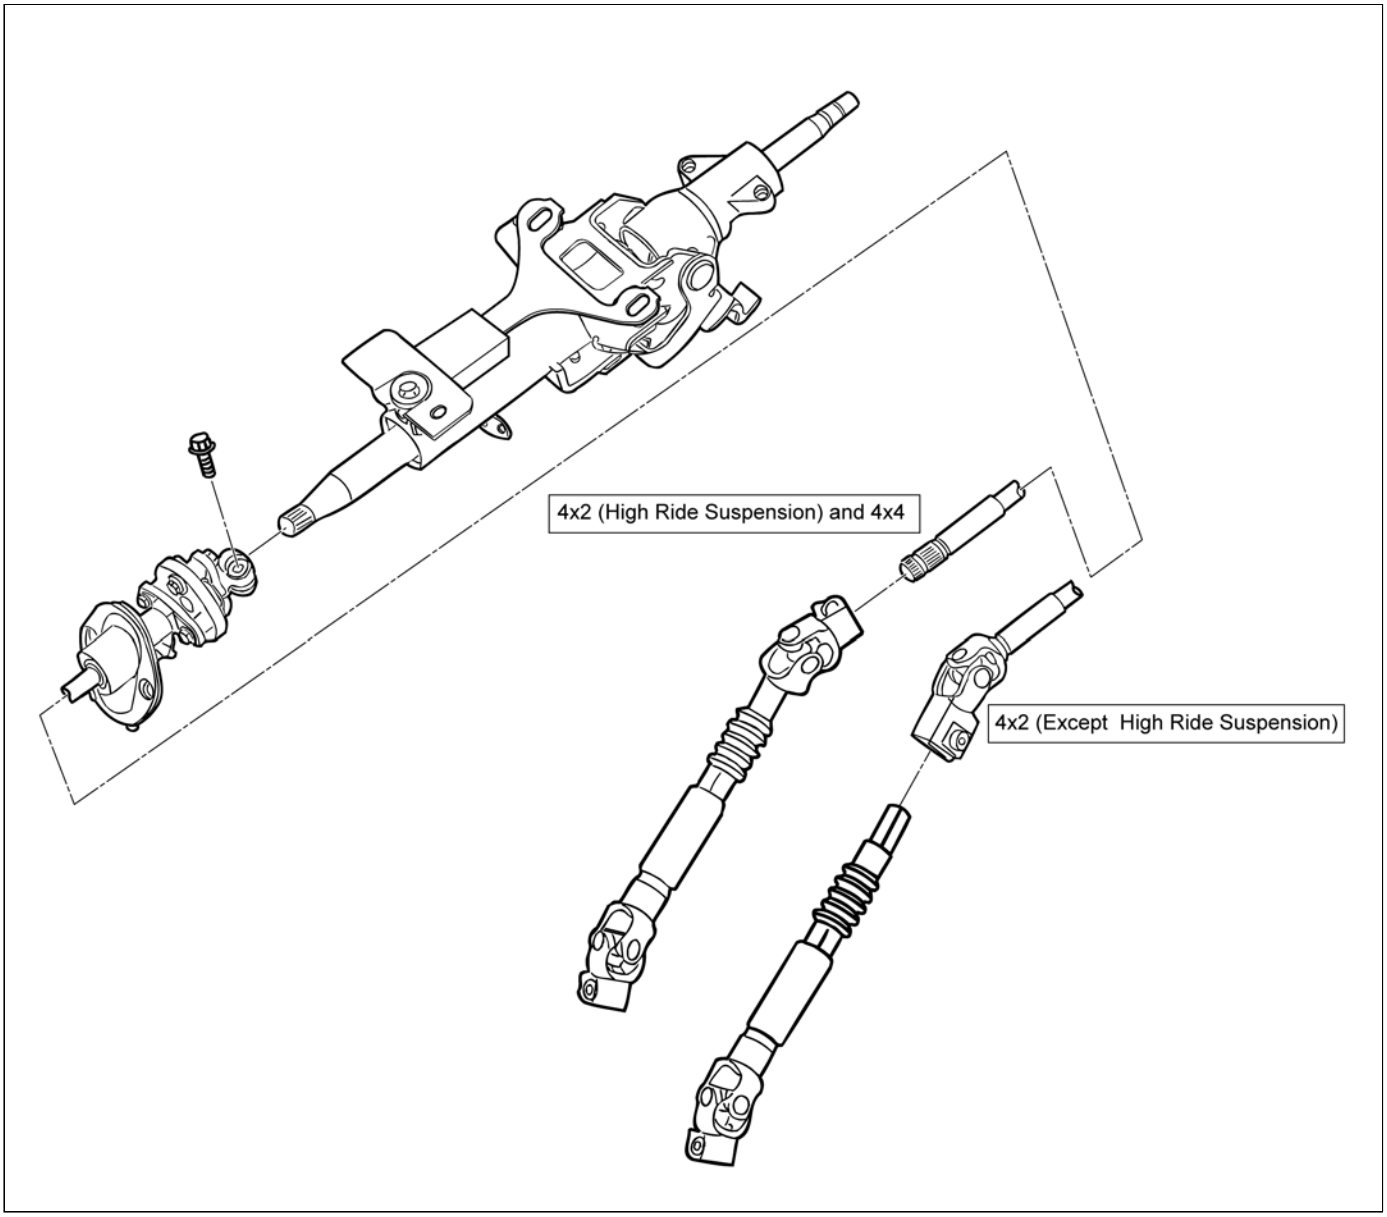
40 Remove the engine oil level indicator assembly (1), (automatic transmission only).

41 Remove the left-hand side exhaust manifold, (automatic transmission only).



Steering Column



WARNING: TO AVOID DEPLOYMENT WHEN TROUBLE-SHOOTING THE SRS SYSTEM, DO NOT USE ELECTRICAL TEST EQUIPMENT, SUCH AS A BATTERY-POWERED OR A/C-POWERED VOLTMETER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN SPECIFIED IN THIS MANUAL. DO NOT USE A NON-POWERED PROBE-TYPE TESTER.

INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

When servicing a vehicle equipped with a Supplemental Restraint System, pay close attention to all WARNINGS and CAUTIONS.

For detailed explanations about SRS, refer to Restraints section.

The steering column has three important features in addition to the steering function:

1. The column is energy absorbing, designed to compress in a front-end collision to minimize the possibility of injury to the driver of the vehicle.
2. The ignition switch and lock are mounted conveniently on the column.
3. With the column mounted lock, the ignition and steering operation can be locked to prevent theft of the vehicle.

The column can be disassembled and reassembled. However, to insure the energy absorbing action, use only the specified screws, bolts and nuts as designated, and tighten them to the specified torque.

Handle the column with care when it is removed from the vehicle. A sharp blow on the end of the steering shaft or shift lever, or dropping the assembly could shear or loosen the fasteners that maintain column rigidity.

Figure 6A1 – 332

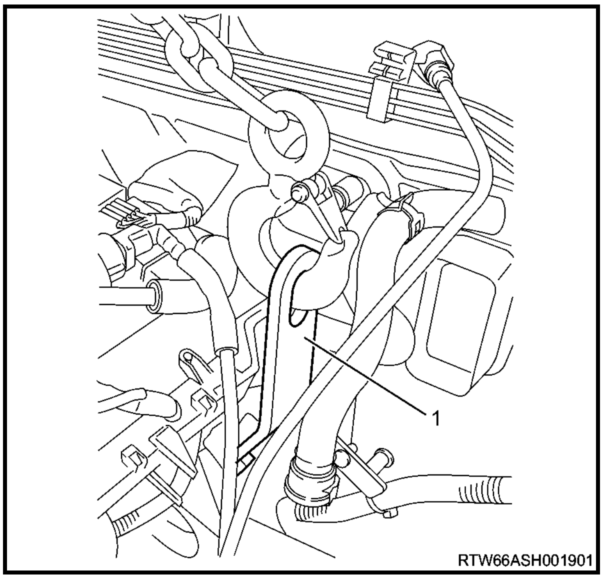


Figure 6A1 – 333

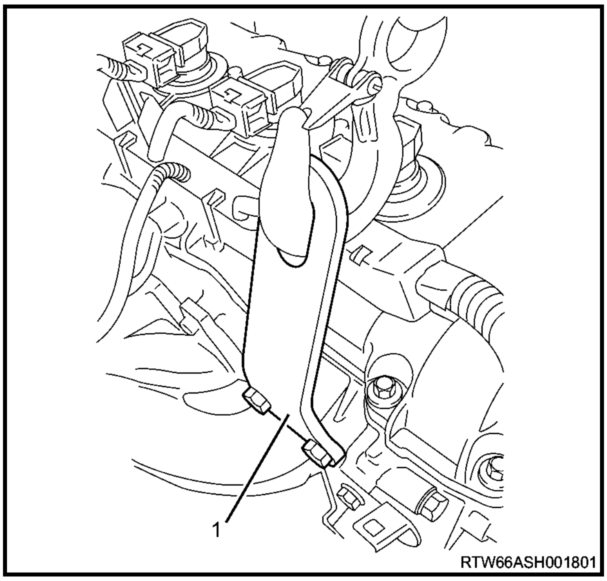

Figure 6A1 – 334

42 Fit the engine lifting brackets (1), (EN–46114) and attach the engine hoist, raise the engine to take the weight off the engine mounts.

Engine Lift Bracket Attaching Bolt torque specification ....58.0 – 72.0.0 Nm

43 Remove the left-hand side knock sensor (1).

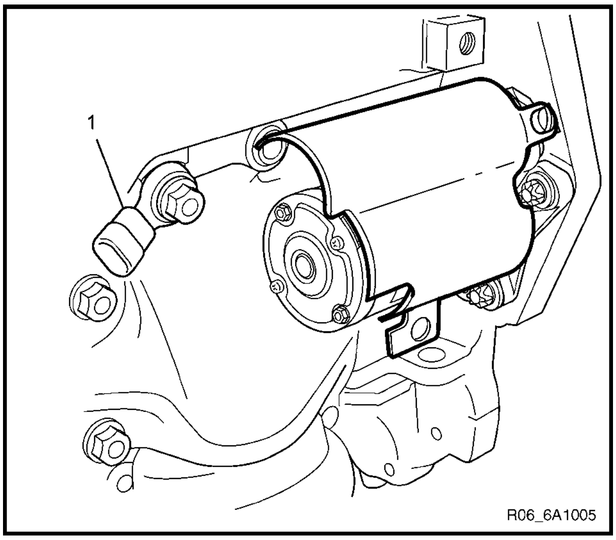

Figure 6A1 – 335

NOTE

Removal or the starter motor is only required for vehicles with an Automatic Transmission.

44 Remove the left-hand side engine mount (1), (automatic transmission only).

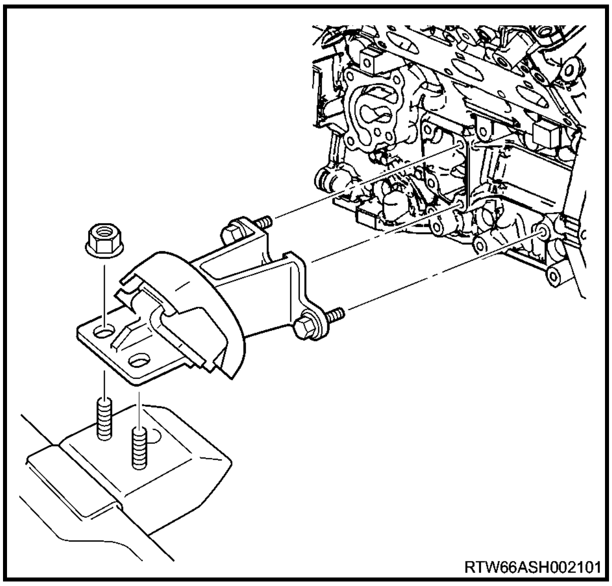

Figure 6A1 – 336

45 Unclip the oil level sensor harness from the heat shield (1).

a Remove the heat shield retaining screw (2).

b Remove the lower starter motor attaching bolt (3).

c Remove the heat shield.

d Remove the upper starter motor retaining bolt (3).

46 Remove the starter motor from the engine block and lower the starter motor as far as possible to gain access to the wiring harness connections.

47 Remove the starter motor, (automatic transmission only).

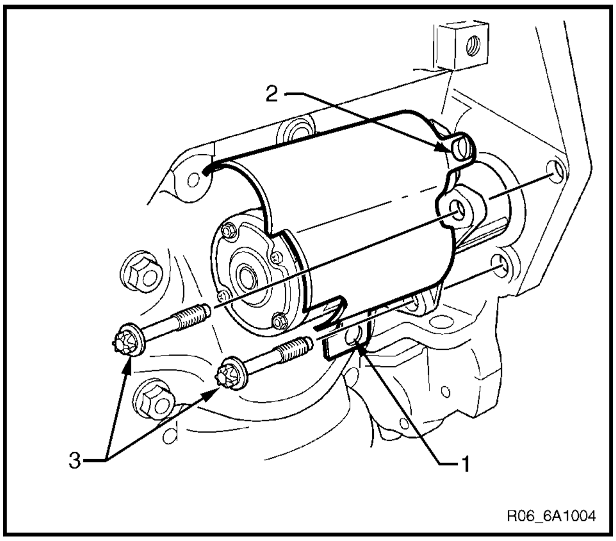

Figure 6A1 – 337

48 Reinstall the left-hand side engine mount (1), (automatic transmission only).

49 Remove the transmission assembly, refer to 7C1 Automatic – 4L60E – General Information.

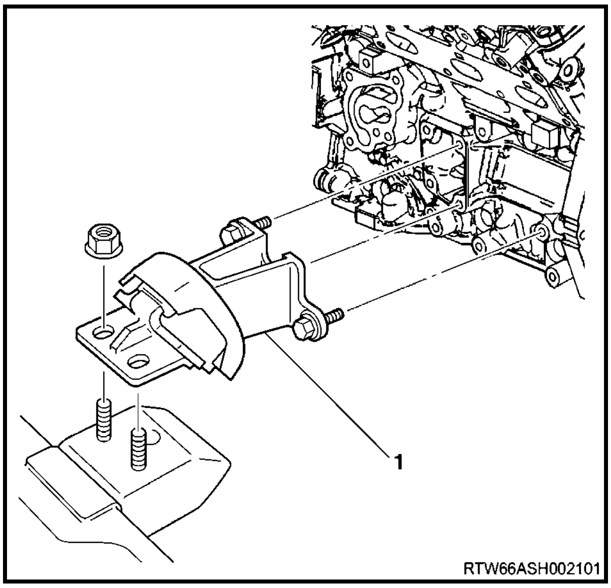

Figure 6A1 – 338

50 Unplug the connector from the oil level sensor (1).

51 Remove the attaching bolt (2) holding the ground cable to the engine block.

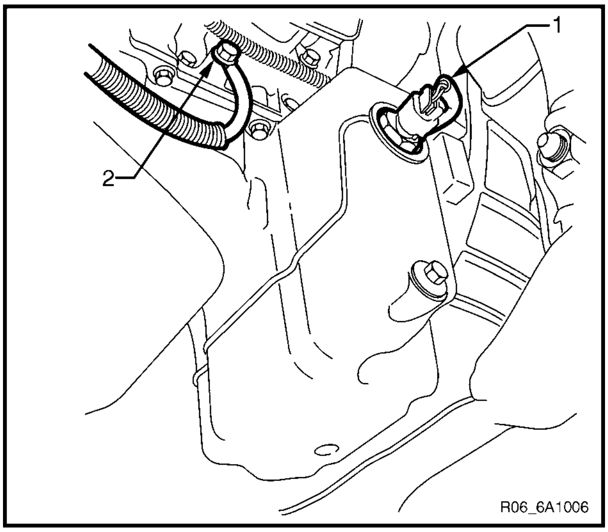

Figure 6A1 – 339

52 Remove the accessory drive belt using a socket wrench (1), to reduce tension rotate the drive belt tensioner (2) clockwise, then while holding the tensioner in the reduced tension position, remove the accessory drive belt (3).

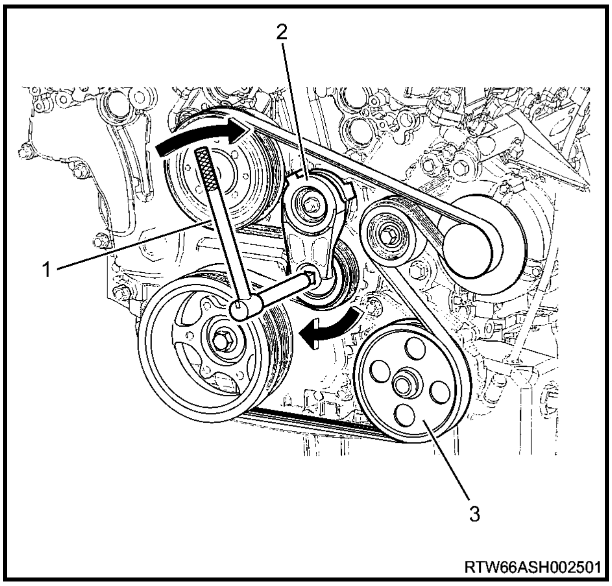

Figure 6A1 – 340

53 Remove the power steering pump bolts (two places), remove the pump (1) from the mounting bracket and disconnect the power steering hoses (two places) from the pump body.

NOTE

Plug the open ends of the power steering hoses to prevent the ingress of contaminants.

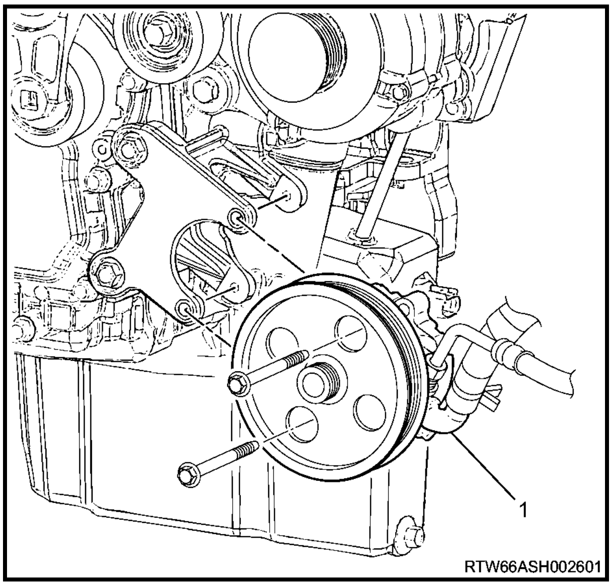

Figure 6A1 – 341

54 Remove the power steering pump bracket mounting bolts (three places) then remove the pump bracket (1).

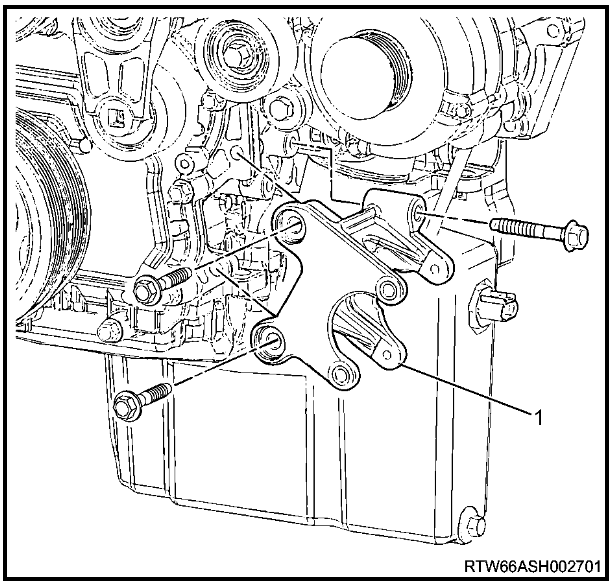

Figure 6A1 – 342

55 Release the lower radiator hose clamp (1) and remove the lower hose from the coolant pipe (2).

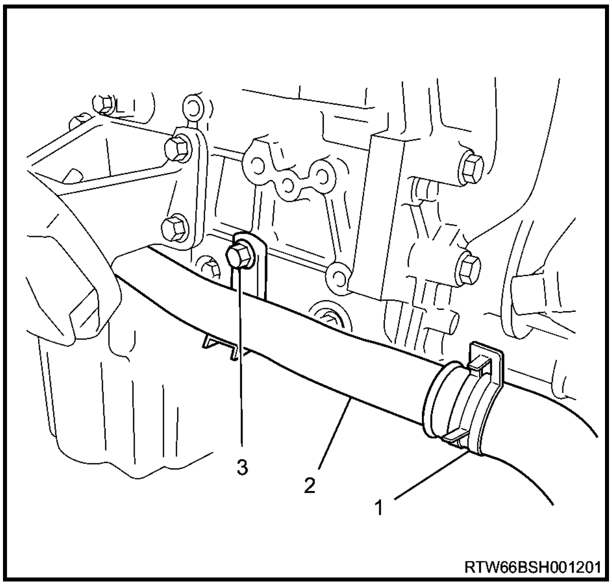

Figure 6A1 – 343

56 Release the upper radiator hose clamp (1) and remove the upper hose from the coolant pipe (2).

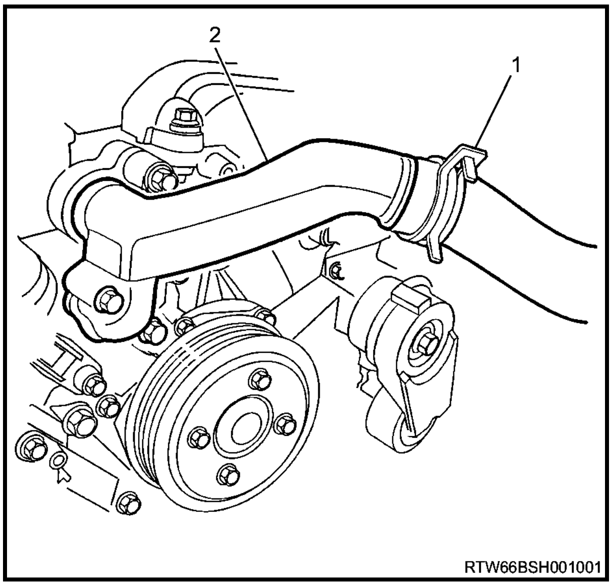

Figure 6A1 – 344

57 Unclip and remove the generator wiring harness connector (1), Remove battery connection attaching nut (4), and remove the battery harness cable (2) from the connection stud.

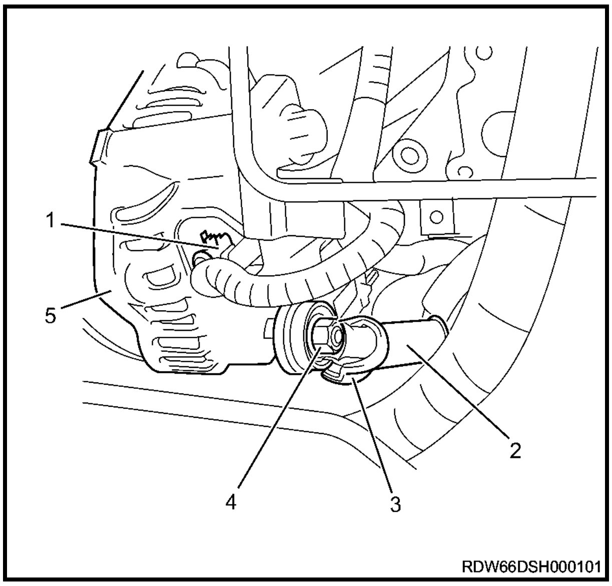

Figure 6A1 – 345

58 Remove the generator attaching bolts (1, 2, and 4) three places, then remove the generator (3) from the mounting bracket.

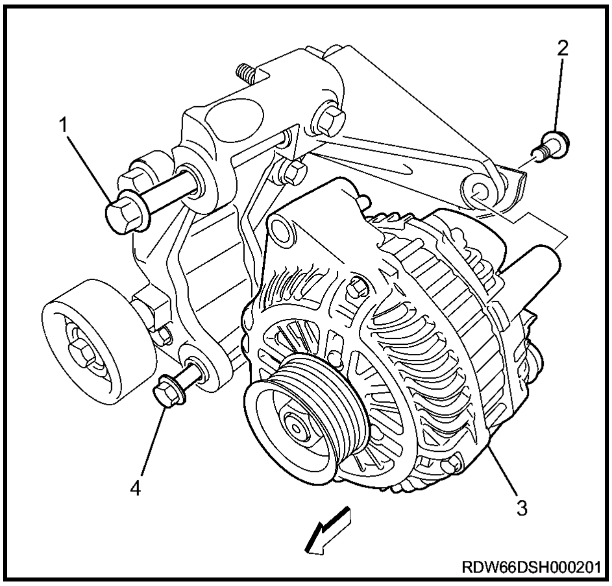

Figure 6A1 – 346

59 Remove the idler pulley attaching bolt and remove the idler pulley (1).

60 Remove the generator bracket attaching bolts, five places, and remove the generator mounting bracket (2).

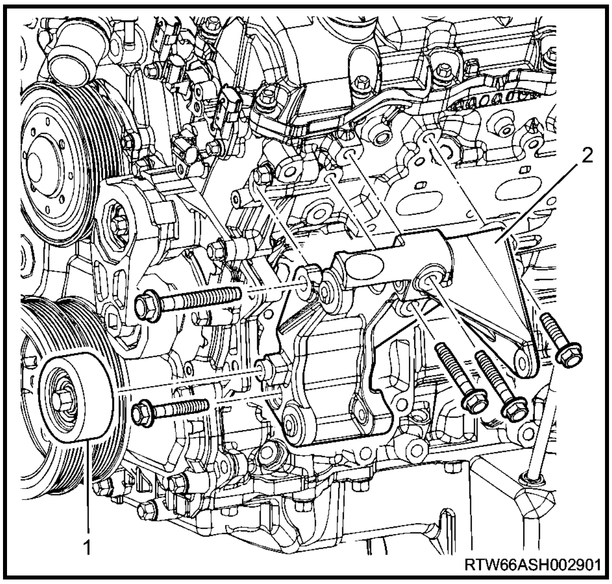

Figure 6A1 – 347

61 Remove the air cleaner cover assembly including the MAF sensor assembly (1).

62 Remove the air cleaner filter (2) from the air cleaner body assembly (3).

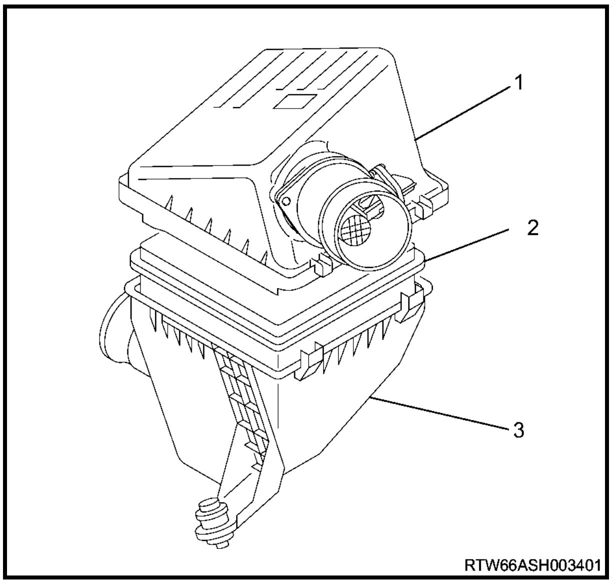

Figure 6A1 – 348

63 Disconnect the ECM connectors (1).

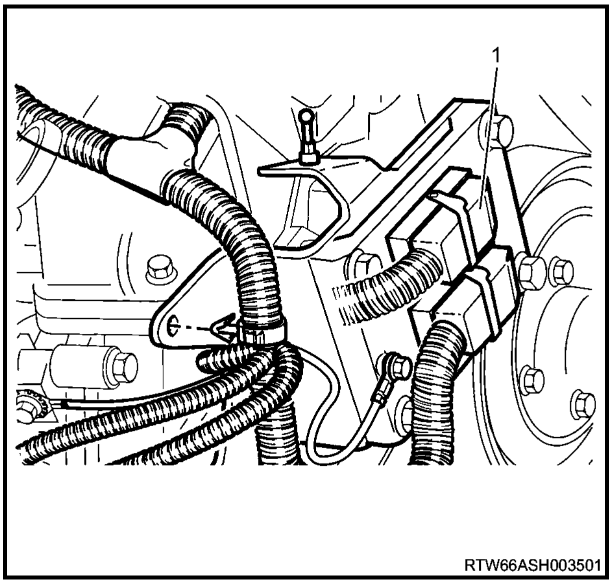

Figure 6A1 – 349

64 Disconnect the canister hose (1).

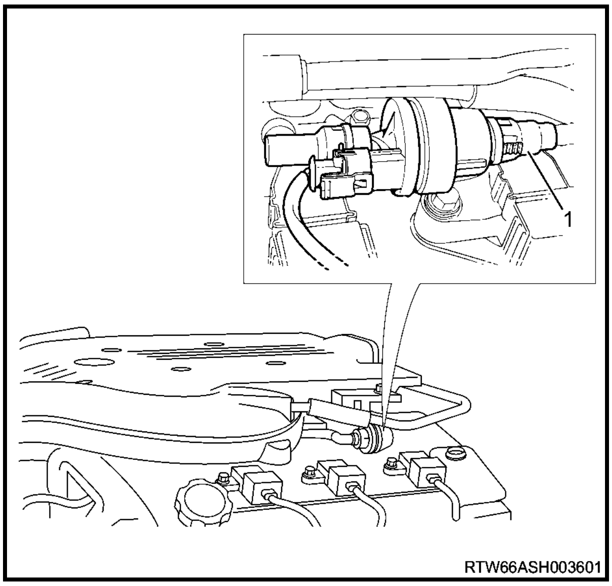

Figure 6A1 – 350

65 Remove the engine mount attaching nuts (1), (two places) on the chassis side of the left-hand and right-hand engine mounts.

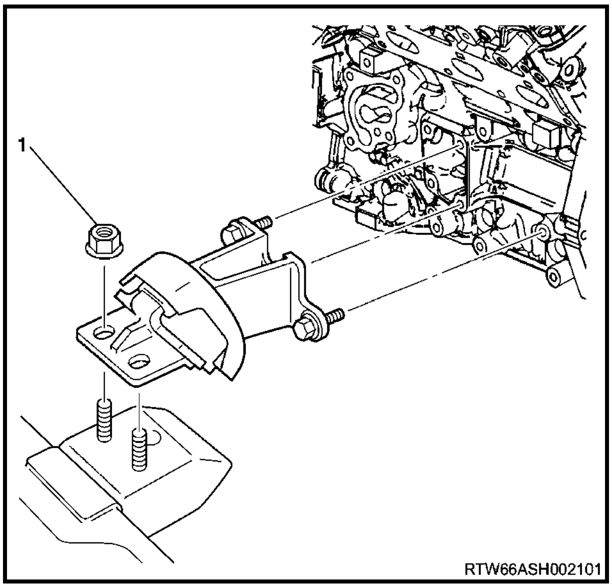

Figure 6A1 – 351

66 Slowly raise the engine using the engine hoist continue to lift and manoeuvre the engine assembly clear of the engine compartment.

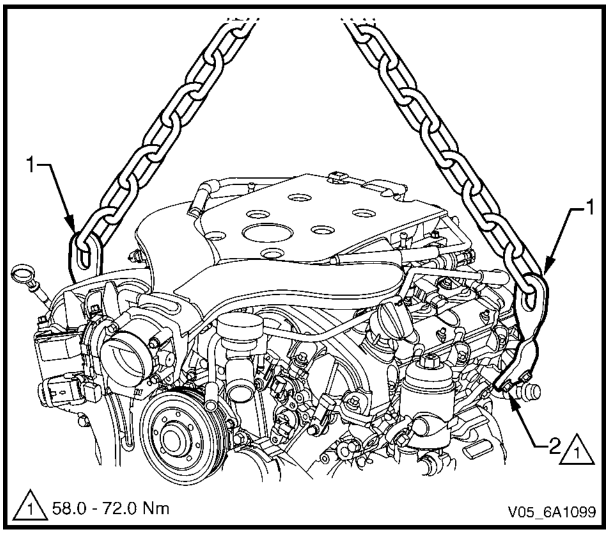

Figure 6A1 – 352

Disassemble

1 Remove the wiring harness connectors and ground connections from the engine and transmission assembly and carefully set the wiring harness to one side, refer to 8A Electrical Body & Chassis.

2 Remove the engine control module (ECM) and mounting bracket, refer to 6C1-3 Engine Management – V6 – Service Operations.

3 Mount the engine assembly on a suitable engine stand.

5 Drain the engine oil into a suitable, clean container.

6 Remove the following components:

a Oil filter adaptor, refer to 3.3 Oil Filter Adaptor.

b Engine coolant inlet pipe, refer to 6B1 Engine Cooling – V6.

c Heater pipe assembly, refer to 6B1 Engine Cooling – V6.

d Thermostat assembly, refer to 6B1 Engine Cooling – V6.

e Exhaust manifold assemblies, refer to 3.11 Exhaust Manifold Assembly.

f Engine coolant outlet pipe, refer to 6B1 Engine Cooling – V6.

g Crankshaft position sensor, refer to 6C1-3 Engine Management – V6 – Service Operations.

h Knock sensors, refer to 6C1-3 Engine Management – V6 – Service Operations.

i Engine mounts and brackets, refer to 3.23 Engine Mounts and Brackets.

j Flexplate assemblies, refer to 4.3 Flexplate Assembly.

k Timing chains, tensioners, shoes, guides & sprockets, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.

l Cylinder head assemblies, refer to 3.22 Cylinder Head Assembly.

m Oil pan assembly, refer to 4.2 Oil Pan and Oil Pump Suction Pipe Assembly.

n Piston and connecting rod assemblies, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings.

o Crankshaft assembly, refer to 4.6 Crankshaft and Main Bearings.

p Piston oil nozzles, refer 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings.

Reassemble

Reassembly of the engine assembly is the reverse of the disassembly procedure.

Reinstall

Reinstallation of the engine assembly is the reverse to the removal procedure, noting the following:

NOTE

Refer to 6 Torque Wrench Specifications for the correct torque specifications.

1 Tighten the fasteners to the correct torque specification.

Engine ground connector bolt torque specification	10.0 Nm
Power steering high pressure line attaching bolt torque specification	8.0 – 12.0 Nm
Power steering high pressure line flare nut torque specification	25.0 – 35.0 Nm
Engine mount to frame attaching bolt torque specification	44.0 – 60.0 Nm
Knock Sensor Attaching Nut torque specification	23.0 Nm

2 Use only the specified engine lubricant type and quantity. It is recommended that a fluorescent oil dye, such as that contained in J 28481-B, be added to assist in any future oil leak diagnosis.

3 Fill the cooling system with the correct quantity and grade of coolant, refer to 6B1 Engine Cooling – V6.

4 Check transmission fluid level, replenishing as required, using the specified lubricant for the transmission fitted, refer to 7C1 Automatic – 4L60E – General Information.

5 Disable the ignition system, refer to 6C1-3 Engine Management – V6 – Service Operations.

6 Crank the engine several times. Listen for any unusual noises or evidence that parts are binding.

7 Enable the ignition system. Start the engine and listen for any unusual noises.

8 Check the vehicle oil pressure gauge or warning indicator and confirm the engine has acceptable oil pressure. If required, install an oil pressure gauge and measure the engine oil pressure, refer to 2.19 Engine Oil Pressure Diagnosis.

9 Run the engine at about 1,000 r.p.m. until the engine has reached normal operating temperature.

10 Listen for any unusual noises.

11 Check for oil, fuel, coolant and exhaust leaks while the engine is running, correcting as required.

12 Perform a final inspection for correct engine oil and coolant levels.

4.2 Oil Pan and Oil Pump Suction Pipe Assembly

Remove

1 Remove the engine assembly from the vehicle, refer to 4.1 Engine .

2 Separate the engine and transmission assemblies, refer to 7C1 Automatic – 4L60E – General Information.

3 Mount the engine assembly on a suitable engine stand.

4 Remove the engine front cover, refer to 3.15 Front Cover Assembly.

5 Remove the two long bolts (1) attaching the rear of the oil pan to the crankshaft rear oil seal housing.

6 Remove the remaining eleven bolts attaching the oil pan to the cylinder block.

7 Using the shear points located at the edge of the oil pan shear the RTV sealant.

8 Remove the oil pan from the cylinder block.

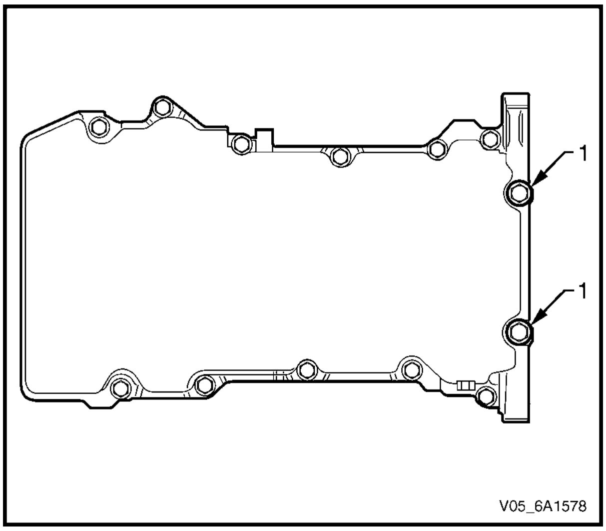

Figure 6A1 – 353

Disassemble

1 Remove the following:
2 Oil pan drain plug (7) and sleeve (8).
3 Oil level sensor (9).
4 Crankshaft oil deflector bolts (6) and remove the deflector.
5 Oil pump suction pipe bolts (5) and the suction pipe (3).
6 Oil pump suction pipe gasket (4) from the suction pipe and discard.

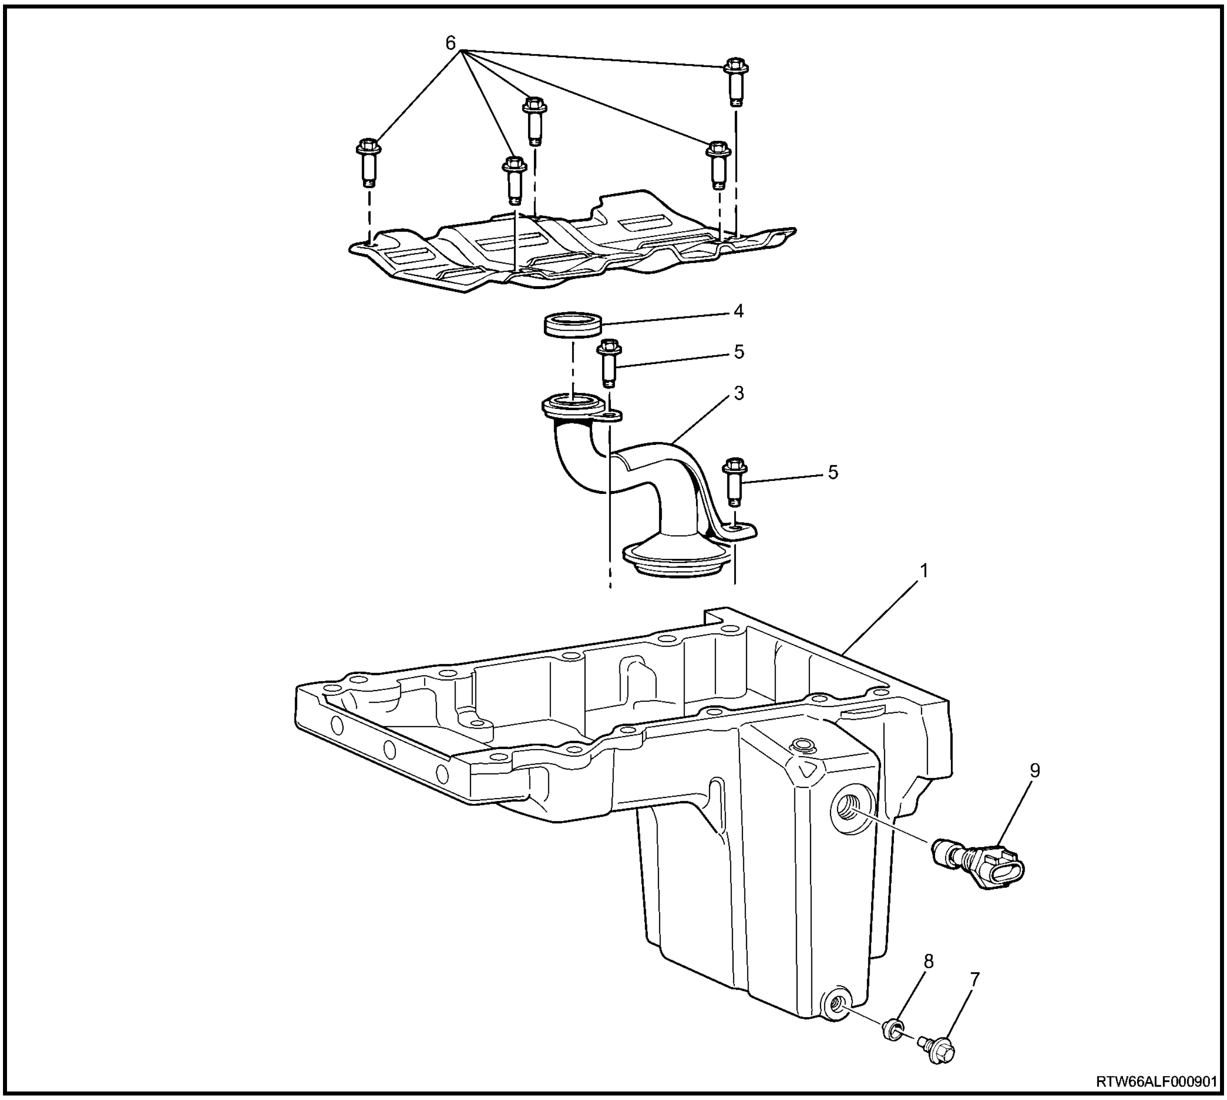

Figure 6A1 – 354

Clean

1 Remove any remaining thread sealant, gasket material or sealant using a commercially available wooden or plastic scraper.
2 Clean the oil pan and oil pan components in solvent.
3 Clean out debris from the bolt holes.

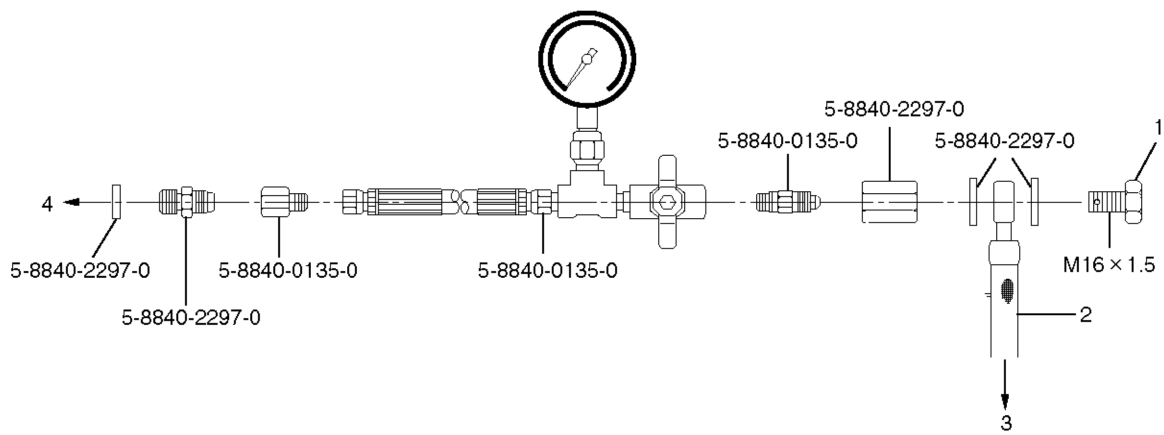
WARNING

Safety glasses must be worn when using compressed air.

4 Dry the oil pan and oil pan components with compressed air.

Power Steering System Test

Test Procedure



F02RX002

Legend

(1) Bolt
(2) Hose
(3) Power Steering Unit
(4) Power Steering Pump

The fluid pressure test in the power steering system is performed to determine whether or not the oil pump and power steering unit are functioning normally.
The power steering system test is used to identify and isolate hydraulic circuit difficulties. Prior to performing this test, the following inspections and corrections, if necessary, must be made.

- Inspect pump reservoir for proper fluid level.
- Inspect pump driver gear condition.

1. Place a container under the pump to catch the fluid when disconnecting or connecting the hoses.
2. With the engine NOT running, disconnect the pressure hose at the power steering pump and install power steering tester 5-8840-0135-0 and power steering tester adapter 5-8840-2297-0 as shown in the illustration. The gage must be between the shutoff valve and pump. Open the shutoff valve.
3. Check the fluid level. Fill the reservoir with power steering fluid, to the "Full" mark. Start the engine, then turn the steering wheel and momentarily hold it against a stop (right or left). Turn the engine off and check the connections at tester for leakage.
4. Bleed the system. Refer to Bleeding the Power Steering System in this section.
5. Start the engine and check the fluid level. Add power steering fluid if required. When the engine is at normal operating temperature, increase engine speed to 1500 rpm.

CAUTION: Do not leave shutoff valve fully closed for more than 5 seconds, as the pump could become damaged internally.

Inspect

1 Inspect the exterior of the oil pan for the following conditions:
   - Damage to the drain plug or drain plug hole,
   - Damage to the transmission mounting bosses,
   - Damage to the oil level sensor threads, and
   - Dents or damage to the exterior.
2 Inspect the interior of the oil pan for the following conditions:
   - Gouges or damage to the oil pan sealing surfaces,
   - Damage to the crankshaft oil deflector,
   - Damage to the bolt holes,
   - Damage to the oil suction tube mounting bosses, and
   - Damage to the crankshaft oil deflector mounting bosses.

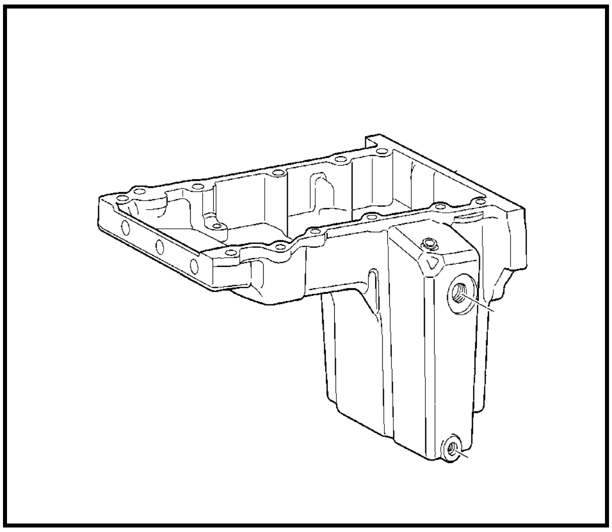


Figure 6A1 – 355

3 Inspect the oil pan deflector for damage.
4 Repair or replace the oil pan deflector and/or oil pan as required.

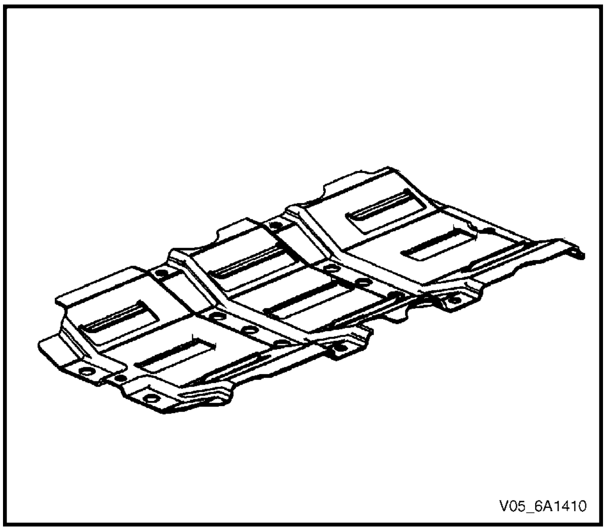

Figure 6A1 – 356

5 Inspect the following:
6 The mounting face (1) of the oil pump suction pipe for possible leakage paths.
7 The oil pump pipe support bracket (2) for cracks or damage.
8 The oil pump suction pipe tube (3) for cracks, imperfections and/or damage.
9 The oil pump screen (4) for blockage, foreign material, tears, cracks and/or damage.
10 Repair or replace the oil pan and/or oil pan components as required.

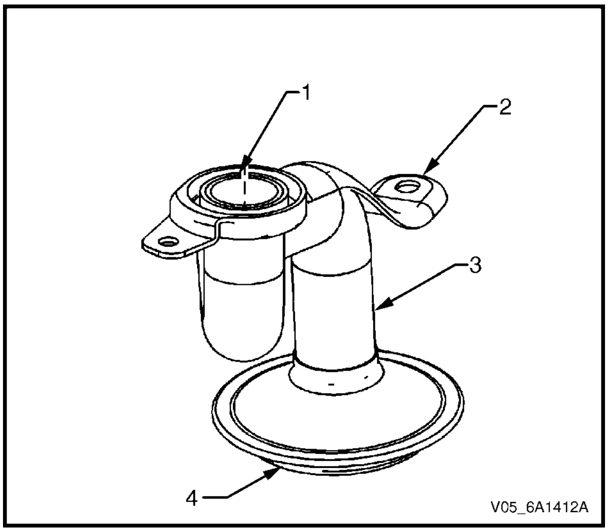

Figure 6A1 – 357

Reassemble

Reassembly of the oil pan and oil suction pipe assembly is the reverse of the disassembly procedure, noting the following:

1 Install a new oil suction tube seal onto the oil suction tube.

2 Install the oil suction pipe and tighten the attaching bolts to the correct torque specification.

Oil suction pipe attaching bolt torque specification ....10.0 Nm

3 Install the crankshaft oil deflector into the oil pan assembly and tighten the attaching bolts to the correct torque specification.

Crankshaft oil deflector attaching bolt torque specification......................10.0 Nm

4 Install the oil level sensor into the oil pan assembly and tighten to the correct torque specification.

Oil level sensor torque specification...................20.0 Nm

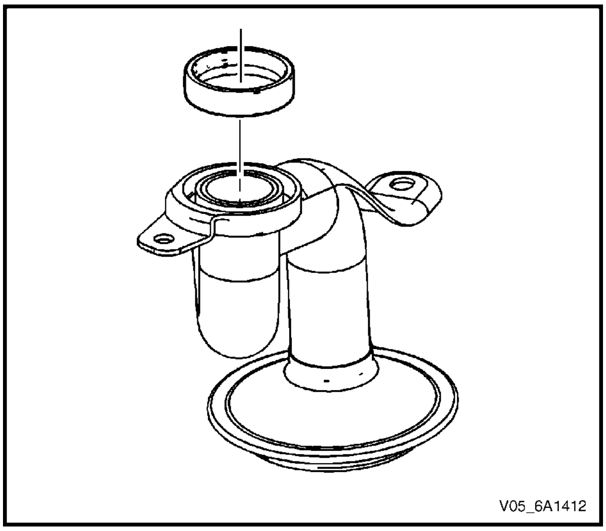

Figure 6A1 – 358

5 Install the oil pan drain plug into the oil pan assembly and tighten to the correct torque specification.

Oil pan drain plug torque specification ....25.0 Nm

Reinstall

1 Install the guide pins, Tool No. EN-46109 (1) into the oil pan rail bolt hole on each side of the engine block.

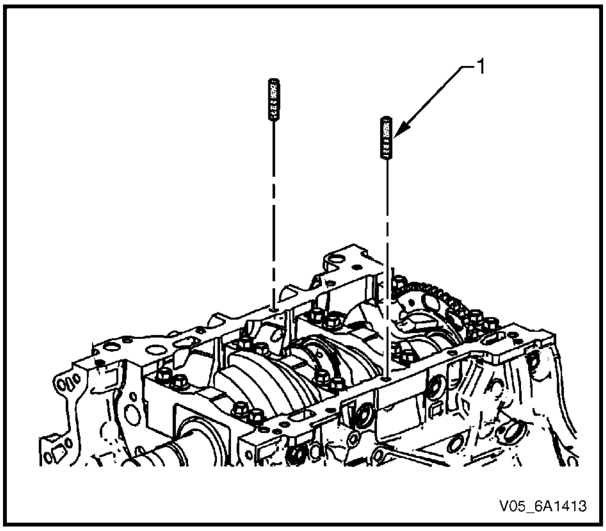

Figure 6A1 – 359

2 Place a 3mm bead (1) of RTV sealant on the cylinder block pan rail and crankshaft rear oil seal housing to oil pan mating surfaces.

3 Position the oil pan onto the cylinder block.

4 Remove the guide pins, Tool No. EN-46109 from the cylinder block.

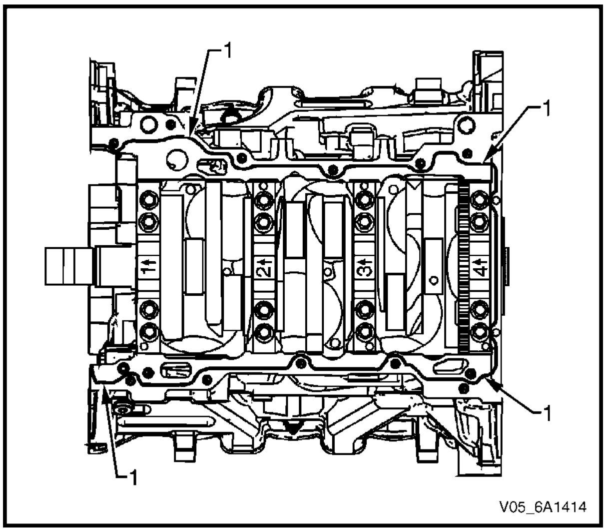

Figure 6A1 – 360

5 Loosely install the oil pan bolts.

6 Tighten the oil pan attaching bolts to the correct torque specification and in the sequence shown.

Oil pan to cylinder block attaching bolt (1 – 11) torque specification ....20.0 – 26.0 Nm
Oil pan to crankshaft rear oil seal housing attaching bolt (12 – 13) torque specification ....8.0 – 12.0 Nm

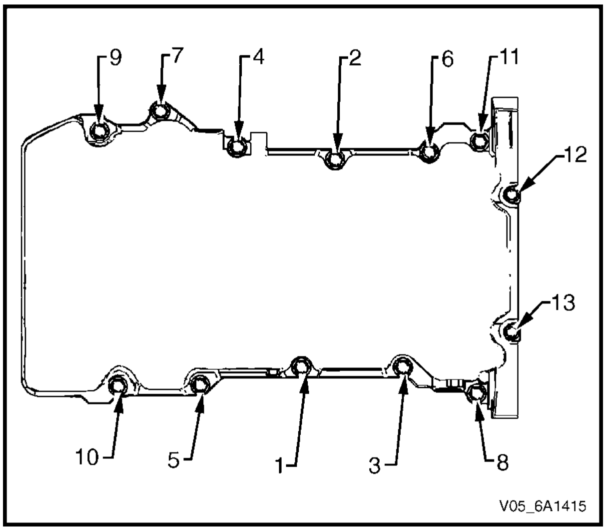

Figure 6A1 – 361

4.3 Flexplate Assembly

Remove

1 Remove the transmission, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing.

2 Remove the starter motor, refer to 6D1-2 Starting System – V6.

3 Install the flexplate holding tool, Tool No. EN-46106 (1) into the starter motor mounting location.

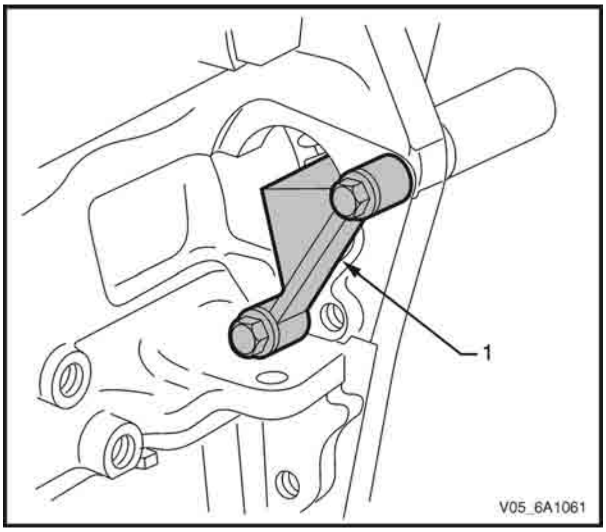

Figure 6A1 – 362

4 Loosen the eight flexplate attaching bolts (1).

5 Remove the flexplate holding tool.

6 Using a suitable permanent marker or paint pen, mark the flexplate assembly (2) to crankshaft relationship.

7 Remove the eight flexplate attaching bolts and discard.

8 Remove the flexplate assembly.

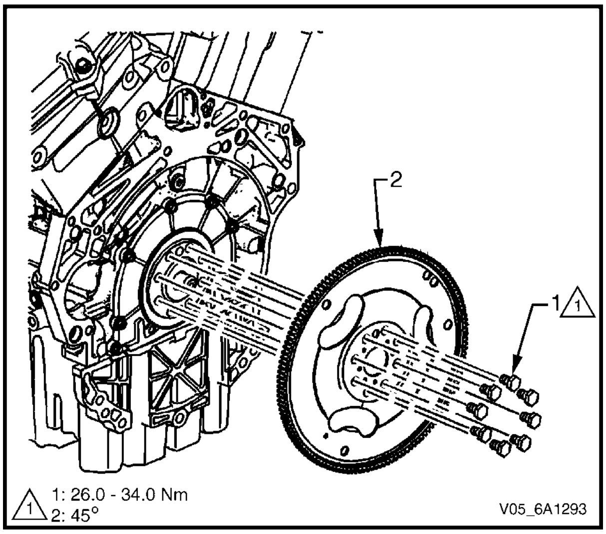

Figure 6A1 – 363

Clean

1 Clean the flexplate assembly in a suitable solvent.

WARNING

Safety glasses must be worn when using compressed air.

2 Dry the flexplate assembly with compressed air.

Inspect

1 Inspect the flexplate assembly for the following conditions:

- Stress cracks around the flexplate to torque converter mounting bolt hole locations (1).
- Stress cracks around the flexplate to crankshaft mounting bolt hole locations (2 and 4).
- Cracks at welded areas that retain the ring gear onto the flexplate (3).
- Damaged or missing ring gear teeth (5).

2 Replace the flexplate assembly as required.

NOTE

The flexplate ring gear is not serviced separately and cannot be repaired. If found to be faulty or damaged, the flexplate assembly must be replaced.

CAUTION

Do not repair the welded areas that retain the ring gear to the flexplate. The flexplate must be replaced.

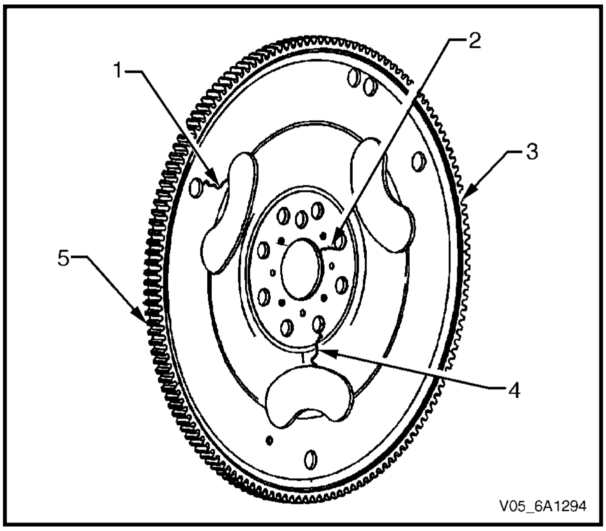

Figure 6A1 – 364

Reinstall

NOTE

The bolt holes are unevenly spaced to enable flexplate fitment in the one position only.

1 Place the flexplate assembly (2) in position on the crankshaft.

2 Install new flexplate attaching bolts (1) and hand tighten.

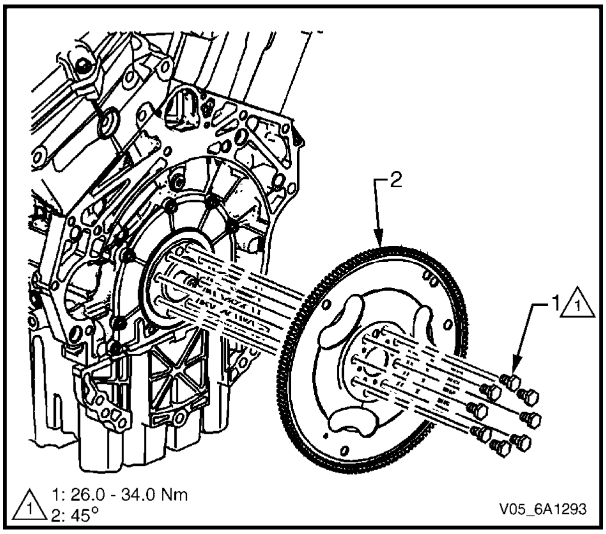

Figure 6A1 – 365

3 Install the flexplate holding tool, Tool No. EN-46106 (1) into the starter motor mounting location.

4 Tighten the eight flexplate attaching bolts to the correct torque specification.

■ ♦ Flexplate attaching bolt torque specification: Stage 1 ....26.0 – 34.0 Nm Stage 2 ....45°

5 Remove the flexplate holding tool.

6 Install the starter motor, refer to 6D1-2 Starting System – V6.

7 Install the transmission, refer to 7E4 Automatic Transmission – 4L60E – On-vehicle Servicing.

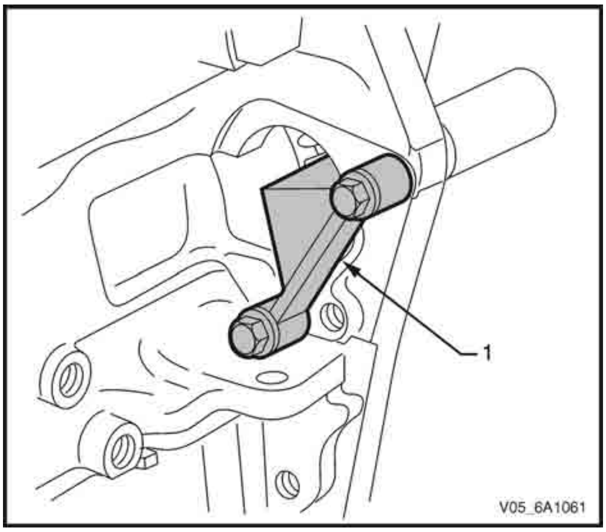

Figure 6A1 – 366

4.4 Crankshaft Rear Seal and Plate Assembly

Remove

1 Remove the engine assembly, refer to 4.1 Engine .

2 Remove the flexplate assembly, refer to 4.3 Flexplate Assembly.

3 Remove the engine oil pan assembly, refer to 4.2 Oil Pan and Oil Pump Suction Pipe Assembly.

4 Remove the five bolts (1) attaching the crankshaft rear seal housing to the rear of the cylinder block (2).

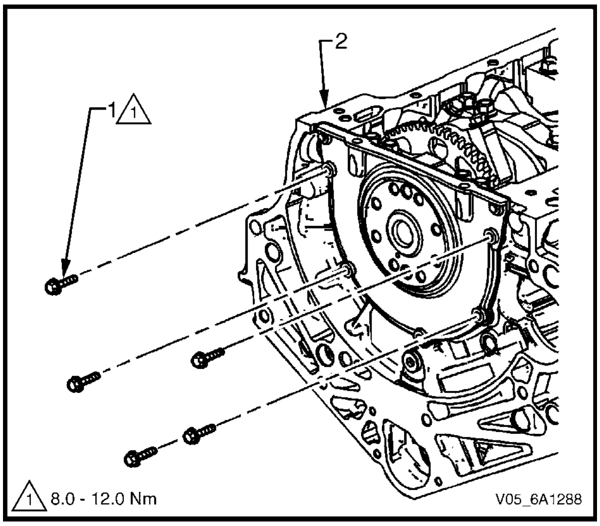

Figure 6A1 – 367

5 Shear the RTV sealant using the prise points located at the edge of the crankshaft rear oil seal housing,

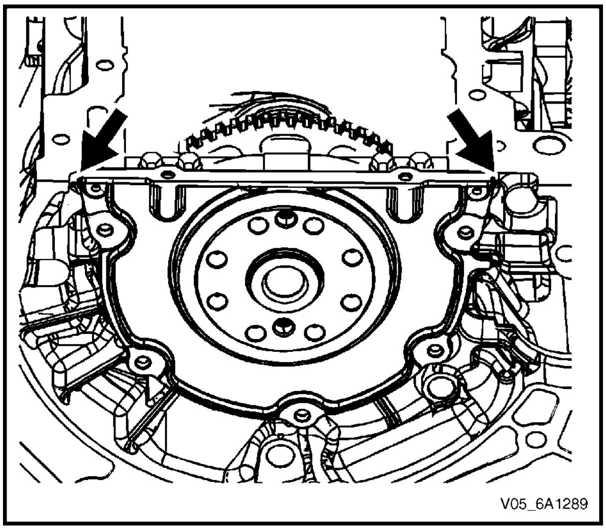

Figure 6A1 – 368

6 Remove the crankshaft rear oil seal housing (1) from the cylinder block (2).

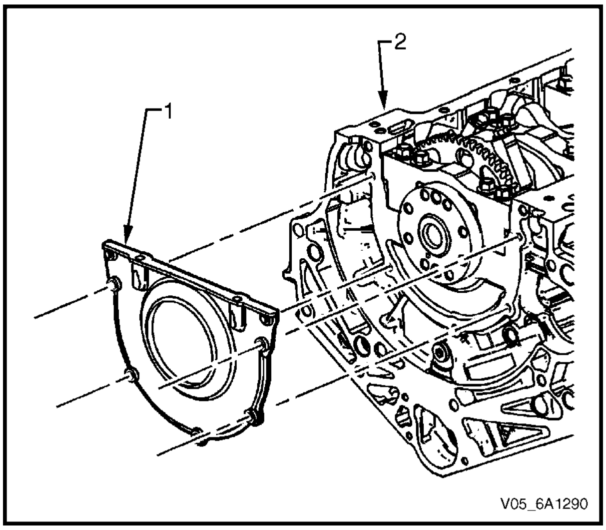

Figure 6A1 – 369

Reinstall

1 Install the guide pins, Tool No. EN-46109 (1) into the two crankshaft rear oil seal housing bolt holes of the cylinder block (2).

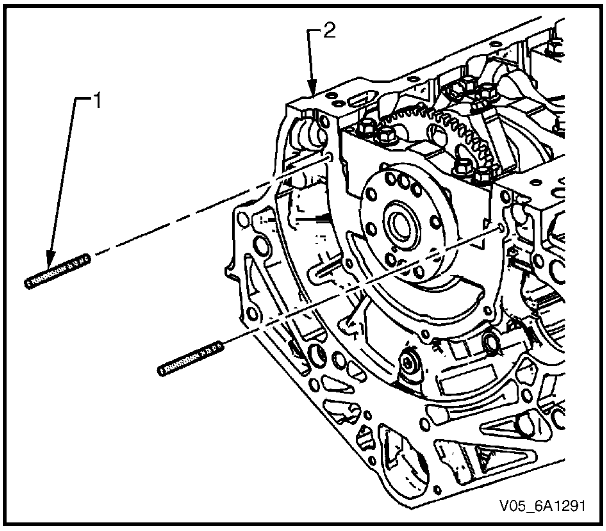

Figure 6A1 – 370

2 Apply a 3mm bead (1) of RTV sealant to the crankshaft rear oil seal housing.

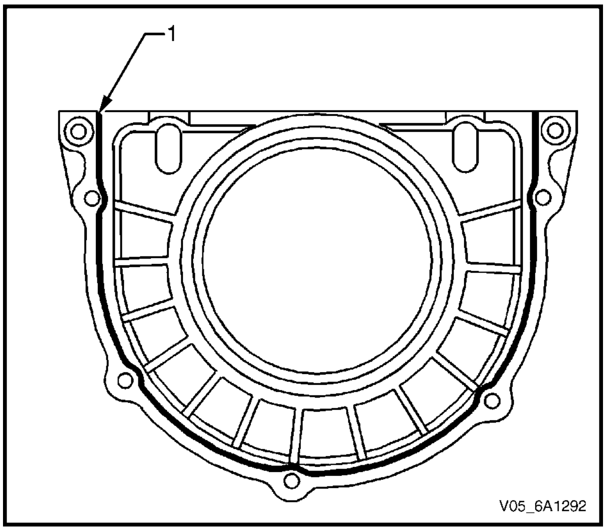

Figure 6A1 – 371

3 Install the crankshaft rear oil seal housing (1) to the cylinder block (2).

NOTE

- Do not allow any engine oil onto the cylinder block mating surface, where the crankshaft rear oil seal housing is to be installed.
- A seal-protector is provided with the new crankshaft rear seal and housing assembly. Do not remove the seal protector from the crankshaft rear oil seal housing until the crankshaft rear oil seal housing is fully in position.

4 Remove the guide pins from the cylinder block.

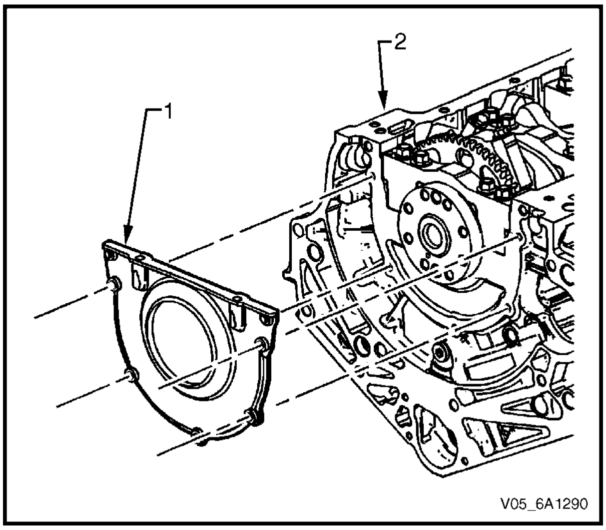

Figure 6A1 – 372

5 Install the crankshaft rear oil seal housing attaching bolts (1) to the cylinder block (2) and tighten to the correct torque specification.

Crankshaft rear oil seal housing attaching bolt torque specification.............8.0 – 12.0 Nm

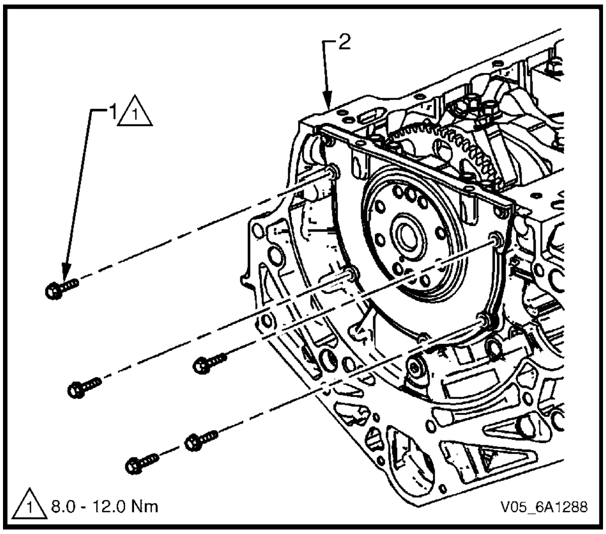

Figure 6A1 – 373

4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings

Remove

1 Remove the engine assembly, refer to 4.1 Engine .

2 Remove both cylinder head assemblies, refer to 3.22 Cylinder Head Assembly.

3 Remove the oil pan assembly, refer to 4.2 Oil Pan and Oil Pump Suction Pipe Assembly.

4 Mark the top of the piston being removed to identify its specific bore.

5 Install Tool No. EN-46111 (1) onto the crankshaft (2).

6 Rotate the crankshaft until the piston being removed is at the bottom of its stroke; bottom dead centre (BDC).

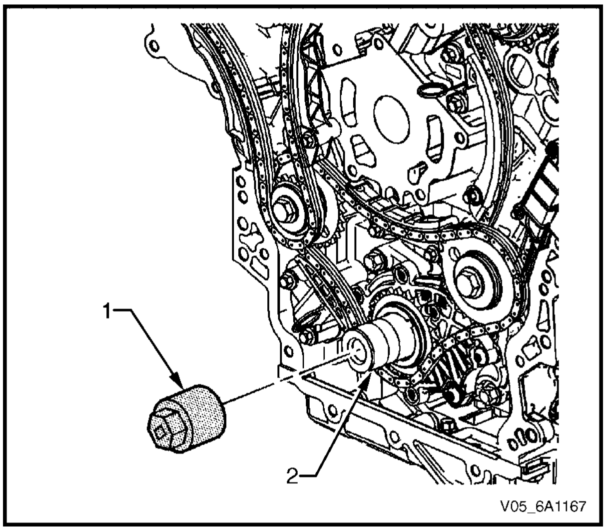

Figure 6A1 – 374

CAUTION

If the connecting rod bearings have been used in a running engine, they must be replaced with new connecting rod bearings for reassembly.

7 Before removing the connecting rods, check the connecting rod side clearance using the following procedure:

a Tap the connecting rod to one end of the crankshaft journal with a dead blow or wooden hammer.

b Using feeler gauges, measure the clearance between the crankshaft counterweight and the connecting rod.

c The connecting rod side clearance should not exceed specifications, refer to 5 Specifications.

d If the endplay exceeds the specified limits, measure the width of the crankpin end of the connecting rod, refer to 5 Specifications.

e If the connecting rod width is significantly smaller than specified and severe wear is present on the side of the connecting rod, replace the connecting rod.

f If the connecting rod width is within specification and excessive scoring is present on the crankshaft journals, replace the crankshaft.

CAUTION

Do not use a stamp, punch or any other method that may distort or stress the connecting rod and cap. Extensive engine damage may result from a connecting rod that is distorted or stressed.

8 Mark the cylinder number on the connecting rod and the connecting rod cap with a paint stick or permanent marker.

CAUTION

Powdered metal connecting rods have rod bolts which yield when tighten to the specified torque. If the bolts are loosened or removed they must be replaced. Rod bolts that are not replaced will not torque to the correct clamp load and can lead to serious engine damage.

9 Remove the connecting rod bolts (1), loosening progressively from side to side.

CAUTION

The connecting rod caps must remain with the original connecting rod.

10 Remove the connecting rod cap (2).

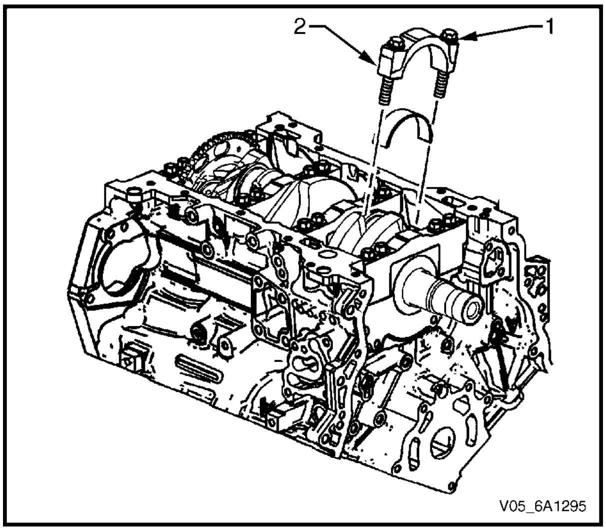

Figure 6A1 – 375

11 Install connecting rod guide pin set, Tool No. EN-46121 (1) to the connecting rod bolt holes.

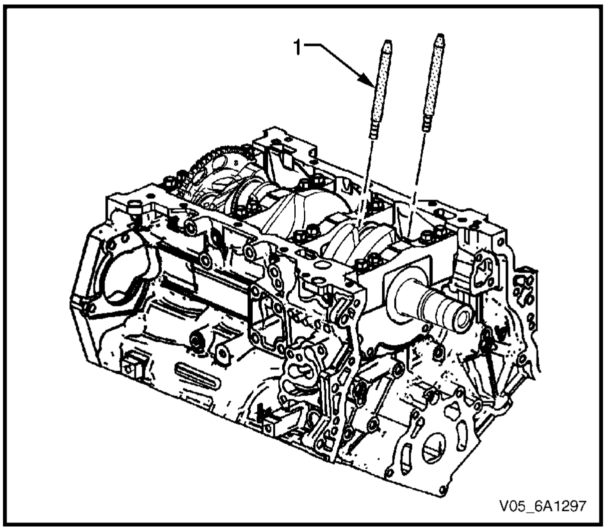

Figure 6A1 – 376

CAUTION

Do not damage the crankshaft journal, cylinder wall and piston cooling jets when removing the connecting rod and piston assembly.

12 Using connecting rod guide pin set, Tool No. EN-46121 (1), push the connecting rod and piston assembly (2) through the top of the cylinder.

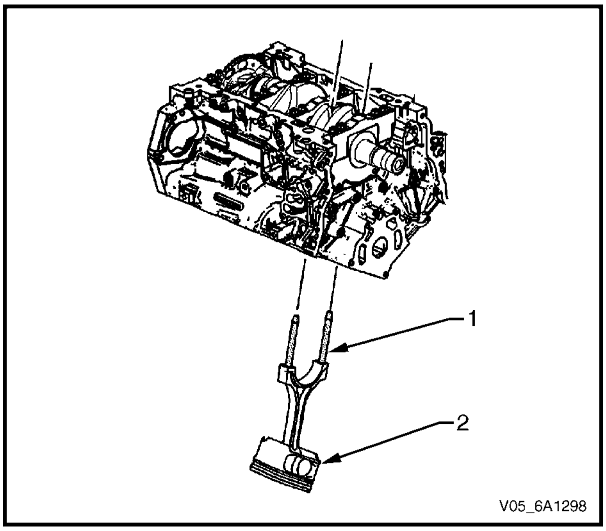

Figure 6A1 – 377

CAUTION

When dismantled, ensure the connecting rod, connecting rod cap, piston and bearings are organised in their original position and location. This will also aid engine mechanical diagnosis.

13 Remove connecting rod guide pin set, Tool No. EN-46121 (1) from the connecting rod bolt holes.

14 Remove the upper connecting rod bearing from the connecting rod (2).

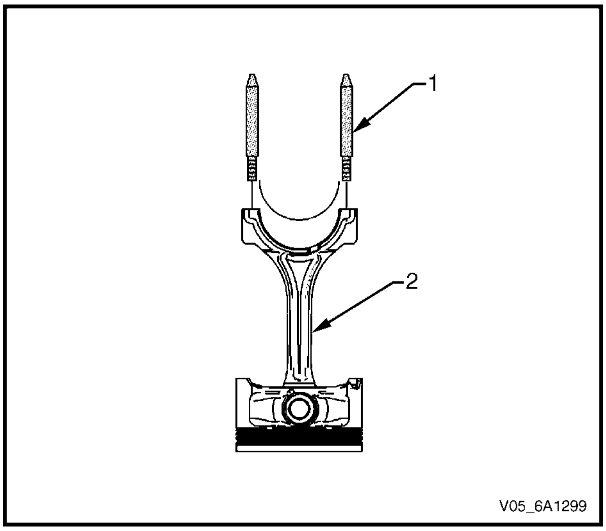

Figure 6A1 – 378

6. Fully close the shutoff valve. Record the highest pressures.
- If the pressure recorded is within 9800-10300 kPa (100-105 kg/cm^2/1422-1493psi), the pump is functioning within its specifications.
- If the pressure recorded is higher than 10300 kPa (105 kg/cm^2/1493psi), the valve in the pump is defective.
- If the pressure recorded is lower than 9800 kPa (100 kg/cm^2/1422psi), the valve or the rotating assembly in the pump is defective.
7. If the pump pressures are within specifications, leave the valve open and turn (or have someone else turn) the steering wheel fully in both directions. Record the highest pressures and compare with the maximum pump pressure recorded in step 6. If this pressure cannot be built up at either side of the power steering unit, the power steering unit is leaking internally and must be replaced.
8. Shut the engine off, remove the testing gauge.
9. Reconnect the pressure hose, check the fluid level and make the needed repairs.
10. If the problem still exists, the steering and front suspension must be thoroughly examined.

Maintenance

The hydraulic system should be kept clean, the fluid level in the reservoir should be checked at regular intervals and fluid added when required. Refer to Recommended Fluids and Lubricants in General Information section for the type of fluid to be used and the intervals for filling.

If the system contains some dirt, flush it as described in this section. If it is exceptionally dirty, the pump must be completely disassembled before further usage. (The steering unit cannot be disassembled.)

All tubes, hoses, and fittings should be inspected for leakage at regular intervals. Fittings must be tight. Make sure the clips, clamps and supporting tubes and hoses are in place and properly secured.

Power steering hoses and lines must not be twisted, kinked or tightly bent. Air in the system will cause spongy action and noisy operation. When a hose is disconnected or when fluid is lost, for any reason, the system must be bled after refilling. Refer to Bleeding the Power Steering System in this section.

- Inspect gear for looseness or damage.
- Inspect hoses to insure they are not touching any other parts of the vehicle.
- Inspect fluid level and fill to the proper level.

Fluid Level

1. Run the engine until the power steering fluid reaches normal operating temperature, about 55° C (130° F), then shut the engine off.
2. Check the level of fluid in the reservoir.
3. If the fluid level is low, add power steering fluid as specified in General Information to the proper level and install the receiver cap.
4. When checking the fluid level after the steering system has been serviced, air must be bled from the system. Refer to Bleeding the Power Steering System in this section.

Bleeding the Power Steering System

When a power steering pump or unit has been installed, or an oil line has been disconnected, the air that has entered the system must be bled out before the vehicle is operated. If air is allowed to remain in the power steering fluid system, noisy and unsatisfactory operation of the system may result.

Bleeding Procedure

When bleeding the system, and any time fluid is added to the power steering system, be sure to use only power steering fluid as specified in General Information.

1. Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two minutes.
2. Start the engine and let it run for a few seconds. Do not turn the steering wheel. Then turn the engine off.
3. Add fluid if necessary.
4. Repeat the above procedure until the fluid level remains constant after running the engine.
5. Raise and support the front end of the vehicle so that the wheels are off the ground.
6. Start the engine. Slowly turn the steering wheel right and left, lightly contacting the wheel stops.
7. Add power steering fluid if necessary.
8. Lower the vehicle, set the steering wheel at the straight forward position after turning it to its full steer positions 2 or 3 times, and stop the engine.
9. Check the fluid level and refill as required.
10. If the fluid is extremely foamy, allow the vehicle to settle for a few minutes, then repeat the above procedure.

Flushing the Power Steering System

1. Raise and support the front end of the vehicle off the ground until the wheels are free to turn.
2. Remove the fluid return line at the pump inlet connector and plug the connector port on the pump. Direct the line toward a large container to catch the draining fluid.
3. While running the engine at idle, fill the reservoir with new power steering fluid. Turn the steering wheel in both directions. Do not contact or hold the steering wheel to the wheel stops. This will cause the pump to go to pressure relief mode, which may cause a sudden fluid overflow at the reservoir.

15 Remove the lower connecting rod bearing (1) from the connecting rod cap (2).

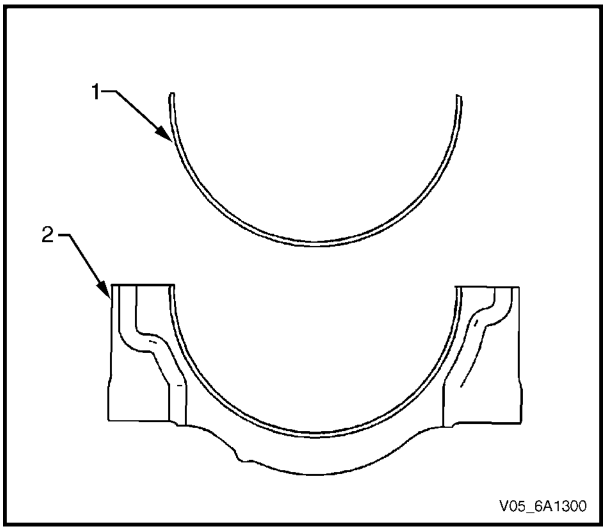

Figure 6A1 – 379

NOTE

The cap and rod are a matched set and must be kept together.

16 Reattach the connecting rod cap (1) to the connecting rod (2) to prevent damage to their mating surfaces.

17 Repeat steps 4 to 16 for the remaining piston and connecting rod assemblies.

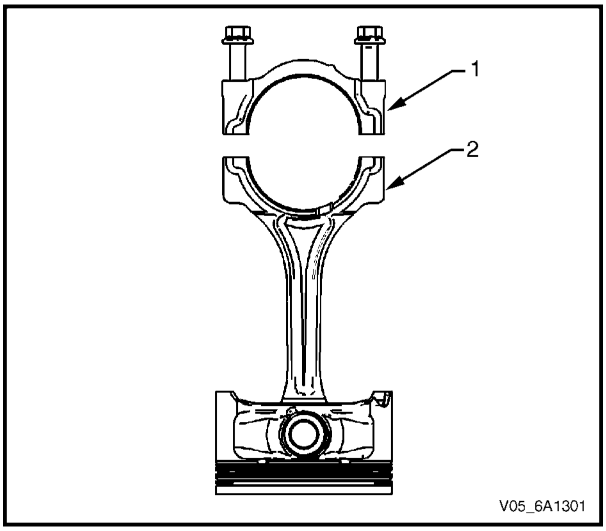

Figure 6A1 – 380

Disassemble

CAUTION

A piston ring expander must be used to remove and install the piston rings. Only expand the rings far enough to fit over the piston lands. If the rings are overexpanded, the top ring will shatter and the others will distort.

1 Remove the piston rings (2) using a piston ring expander (1). Place each ring in a clean shop towel for storage.

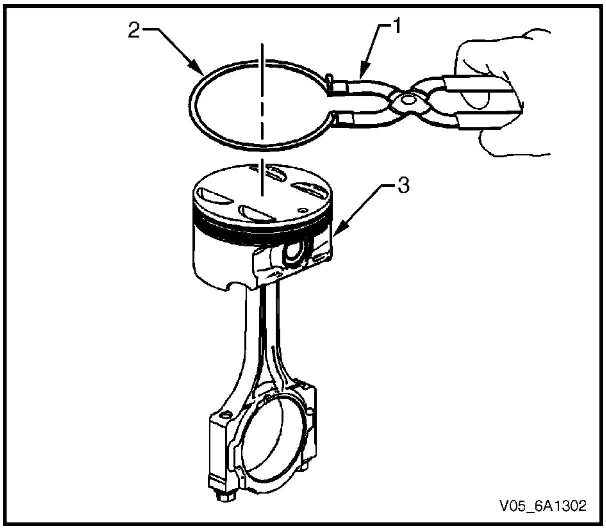

Figure 6A1 – 381

CAUTION

Do not reuse the piston pin retainers.

2 Remove the piston pin retainers by using the removal access notch (1) in the side of the piston. Discard the piston pin retainers.

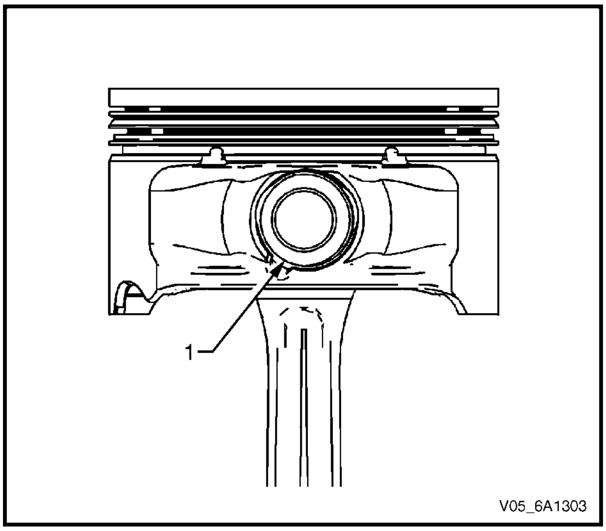

Figure 6A1 – 382

3 Slide the piston pin (1) out of the piston (2). The piston will disconnect from the connecting rod.

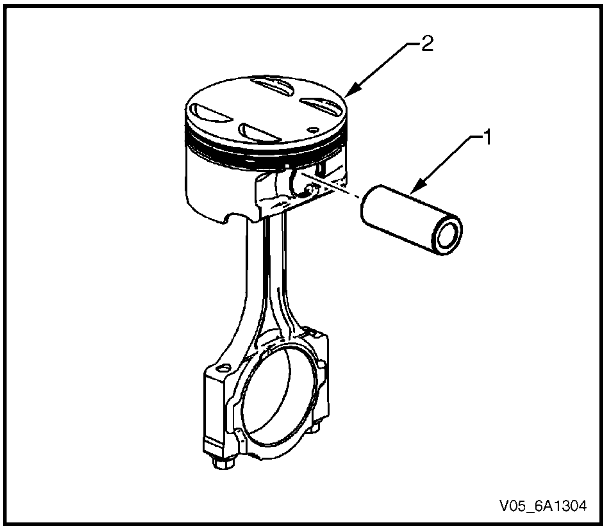

Figure 6A1 – 383

Clean and Inspect

Piston Cleaning Procedure

CAUTION

Do not use a wire brush to clean any part of the piston.

1 Clean the piston skirts and the pins with a suitable solvent.

2 Clean the piston ring grooves with a groove cleaner. Ensure the oil ring holes and slots are clean.

WARNING

Safety glasses must be worn when using compressed air.

3 Dry the piston with compressed air.

Piston Inspection Procedure

1 Inspect the pistons for the following conditions:
- eroded areas at the top of the piston (1),
- piston pin retainer grooves for burrs (2),
- worn piston pin bores or worn piston pins (3),
- scuffed or damaged skirt coating (4),
- ring grooves for cracks, nicks or burrs that may cause binding (5), and
- warped or worn ring lands.

2 Replace pistons that show any signs of damage or excessive wear.

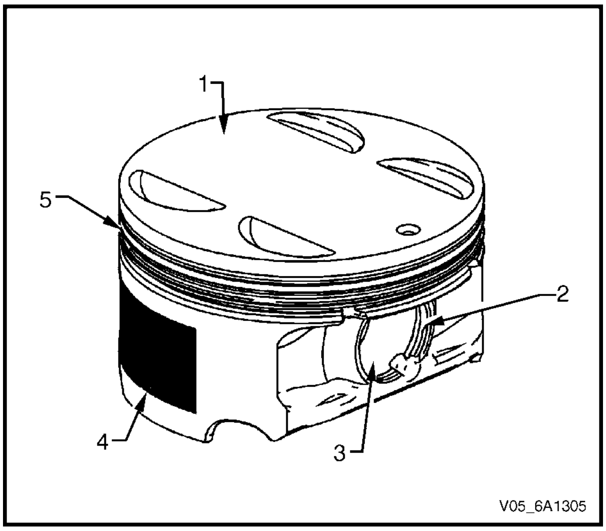

Figure 6A1 – 384

Piston Measurement

1 Measure piston width using the following procedure:

a Using an outside micrometer, measure the width of the piston at 30 mm below the crown top (1), at the thrust surfaces of the piston, perpendicular to the piston pin centreline.

b Compare the measurement of the piston to its original cylinder by subtracting the piston width from the cylinder diameter.

c Check your measurements with specifications, refer to 5 Specifications.

d If the clearance obtained through measurement is greater than the provided specifications and the cylinder bores are within specification, replace the piston.

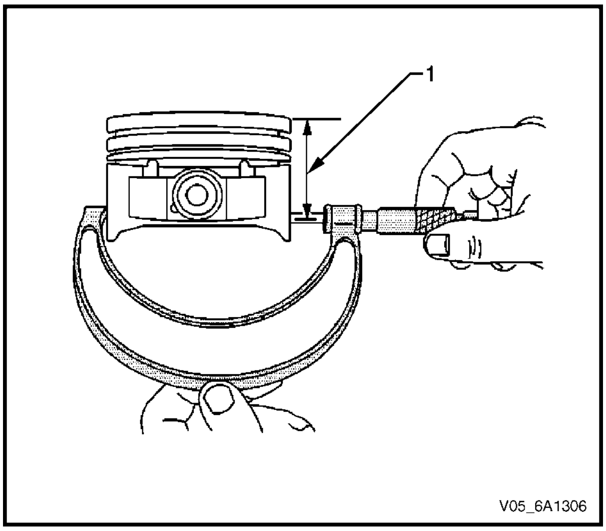

Figure 6A1 – 385

2 Measure the piston pin bore to piston pin (2) clearances using the following procedure:

a Piston pin bores and pins must be free of varnish or scuffing.

b Use an outside micrometer (1) to measure the piston pin in the piston contact areas.

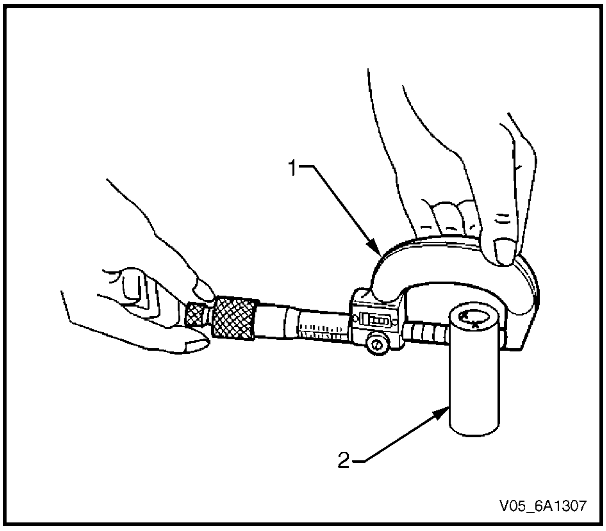

Figure 6A1 – 386

3 Using an inside micrometer, measure the piston pin bore (1). Compare the result with the piston pin diameter and piston pin to piston pin bore clearance listed in the specifications, refer to 5 Specifications.

4 If the clearance is excessive, determine which piece is out of specification and replace as required.

5 Replace the piston if any of its dimensions are out of specification.

6 If the new piston does not meet clearance specifications, the cylinder block may need to be oversized to 0.25 mm. There is only one size of oversized pistons and rings available for service.

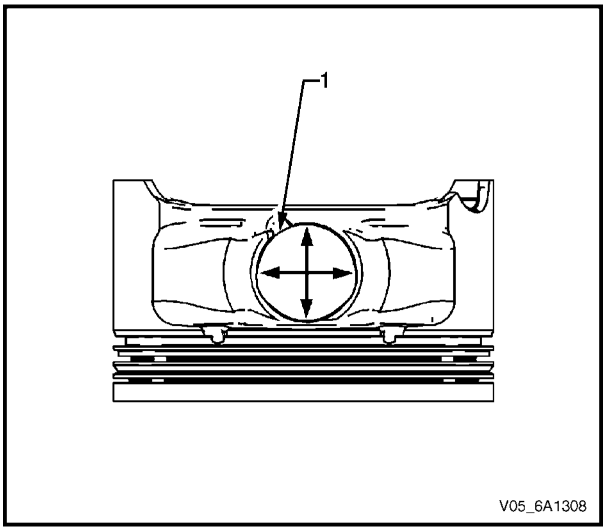

Figure 6A1 – 387

Piston Ring Measurement

1 Measure the piston ring end gap using the following procedure:

a Place the piston ring (1) in the area of the bore where the piston ring will travel, approximately 25 mm below the deck surface. Ensure the ring is square with the cylinder bore by positioning the ring with the piston head.

b Measure the end gap of the piston ring with feeler gauges (2), refer to 5 Specifications.

c If the clearance exceeds the provided specifications, the piston rings must be replaced.

d Repeat the procedure for all piston rings.

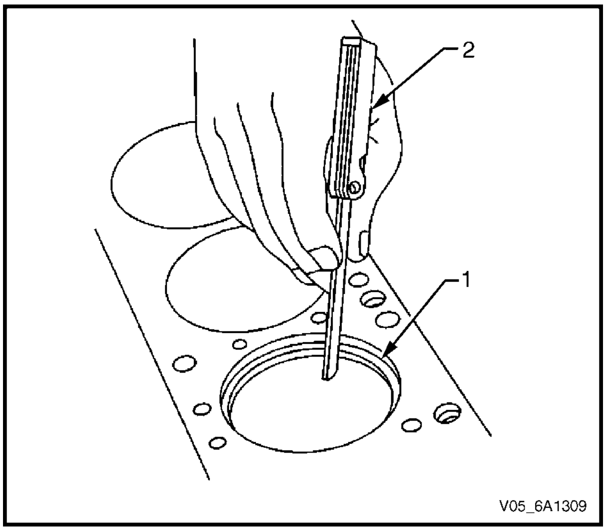

Figure 6A1 – 388

2 Measure the piston ring side clearance using the following procedure:

a Roll the piston ring (1) entirely around the piston ring groove. If any binding is caused by the ring groove, dress the groove with a fine file. If any binding is caused by a distorted piston ring, replace the ring.

b With the piston ring on the piston, use feeler gauges (2) to check clearance at multiple locations.

c Compare the measurements with piston ring side clearance listed in the specifications, refer to 5 Specifications.

d If the clearance is greater than specifications, replace the piston rings.

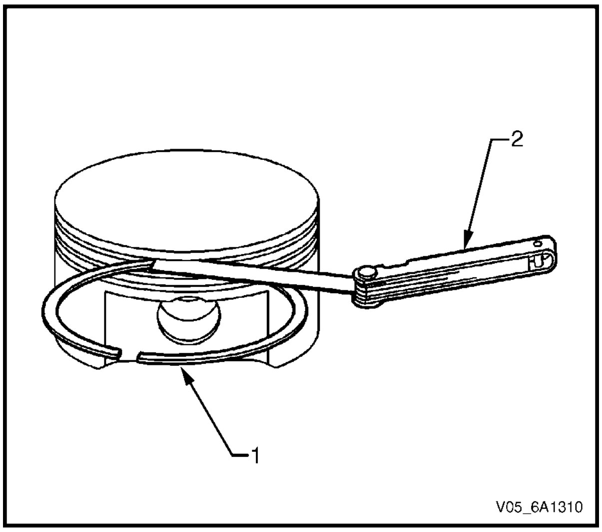

Figure 6A1 – 389

3 There is a locating dimple (1) on the compression rings. Install the compression rings with the dimple facing up.

4 If the new ring does not reduce the clearance to the correct specification, install a new piston.

5 If the new piston does not meet clearance specifications, the cylinder block may need to be oversized to 0.25 mm. There is only one size of oversized pistons and rings available for service.

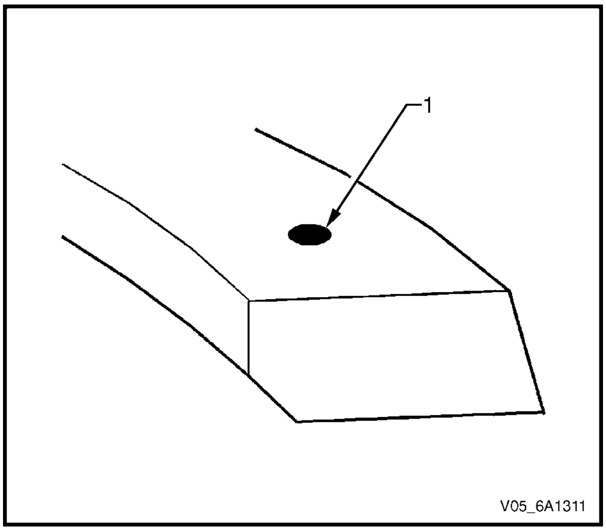

Figure 6A1 – 390

Connecting Rod Cleaning Procedure

1 Clean the connecting rods in solvent.

WARNING

Safety glasses must be worn when using compressed air.

2 Dry the connecting rod using compressed air.

3 Remove the connecting rod cap and clean the threads.

4 Remove the connecting rod bearing and discard. Never reuse a connecting rod bearing that has been used in a running engine.

Connecting Rod Visual Inspection Procedure

1 Inspect the piston pin bushing (4) for scoring or damage.

2 Inspect the connecting rod beam (1) for twisting or bending.

3 Inspect the rod cap (2) for any nicks or damage caused by possible interference.

4 Inspect for scratches or abrasion on the rod bearing seating surface.

5 If the connecting rod bores contain minor scratches or abrasions, clean the bores in a circular direction with a light emery paper.

6 Retain the original bolts (3) for preliminary assembly. They must be replaced for final assembly.

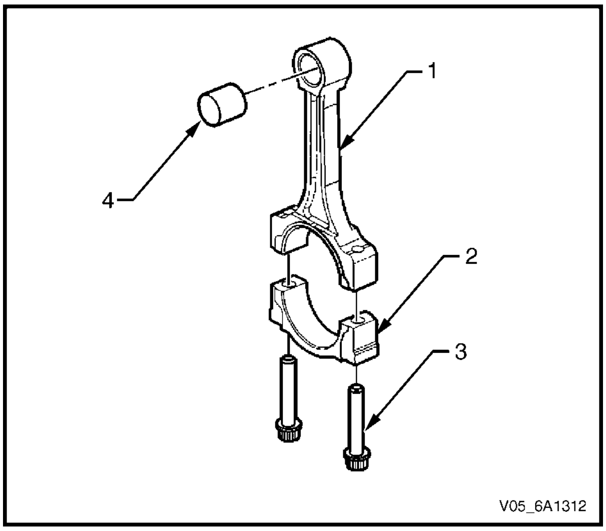

Figure 6A1 – 391

Connecting Rod Measurement Procedure

Piston Pin End

NOTE

Measurements of all components should be taken with the components at normal room temperature.

1 Using an outside micrometer (1), take two measurements of the piston pin (2) in the area of the connecting rod contact.

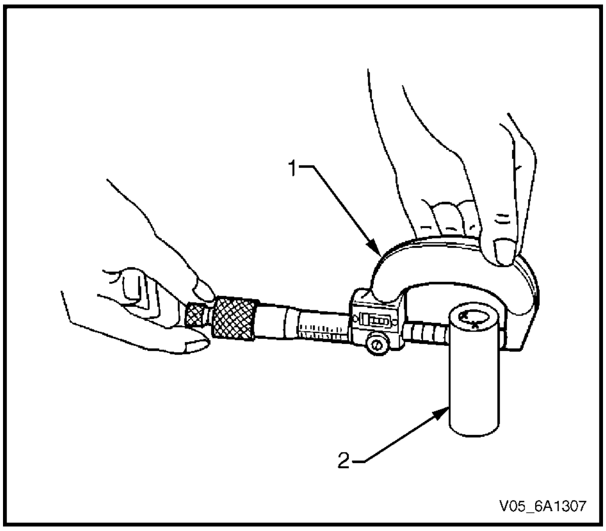

Figure 6A1 – 392

2 Using an inside micrometer, measure the connecting rod piston pin bore (1).

3 Subtract the piston pin diameter from the piston pin bore.

4 Compare the clearance measurements listed in the specifications, refer to 5 Specifications.

5 If the clearance is excessive, replace the piston pin. If a new pin does not resolve the clearance problem, replace the connecting rod.

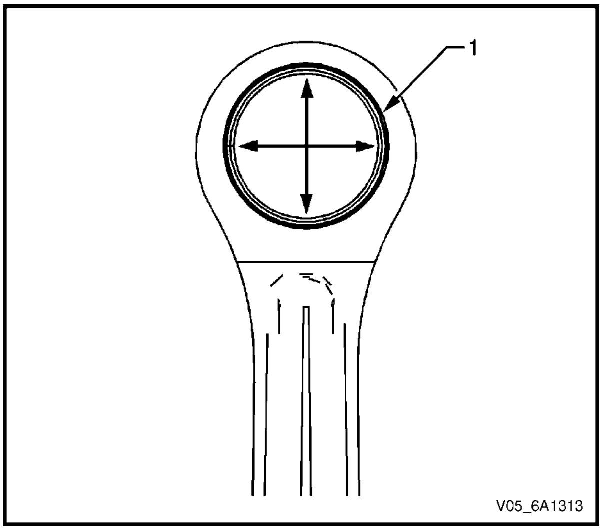

Figure 6A1 – 393

Crankshaft Bearing End

NOTE

Measurements of all components should be taken with the components at normal room temperature.

1 Using an inside micrometer, measure the connecting rod crankshaft bearing bore (1).

2 Compare the bore measurements listed in the specifications, refer to 5 Specifications.

3 Replace the connecting rod if the bore is out of specification. Do not recondition the connecting rod.

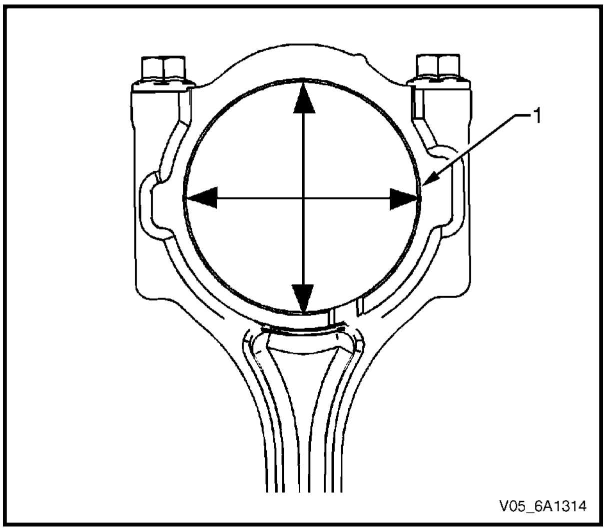

Figure 6A1 – 394

Reassemble

Piston and Piston Pin

CAUTION

The arrow located on top of the piston must point toward the front of the engine.

NOTE

The connecting rod is non-directional and may be assembled/reassembled to the piston in either direction.

1. Lubricate the piston pin (1) bores in the piston (2) and the connecting rod with clean engine oil.
2. Assemble the piston and piston pin to the connecting rod. Correctly orient the piston when reusing a marked connecting rod.
3. Align the piston pin bore with the connecting rod pin bore.
4. Slide the piston pin into the piston and the connecting rod.

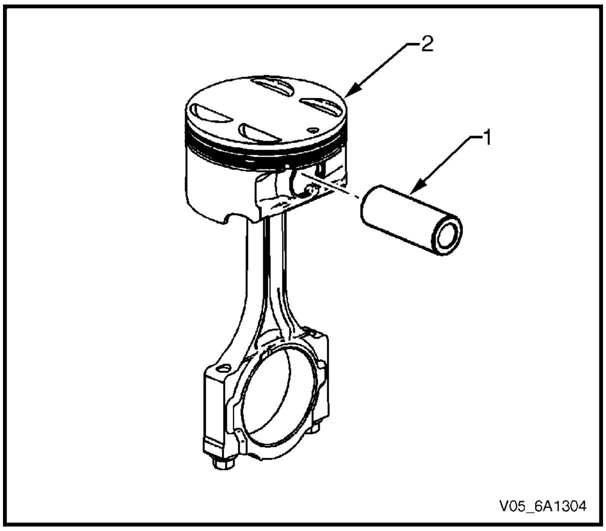

Figure 6A1 – 395

CAUTION

New piston pin retainers must be used. Never reuse the piston pin retainers.

5. Install new piston pin retainers (1).
6. Ensure the piston pin retainers are fully seated in their grooves.
7. Repeat steps 1 to 6 for the remaining pistons.

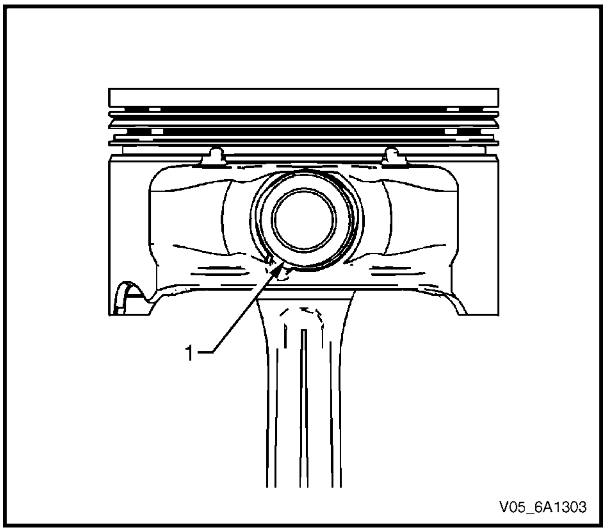

Figure 6A1 – 396

Piston Ring

NOTE

The ends of the expander must be facing toward the top of the piston.

1 Correctly orient the oil control ring expander (1) before installation.

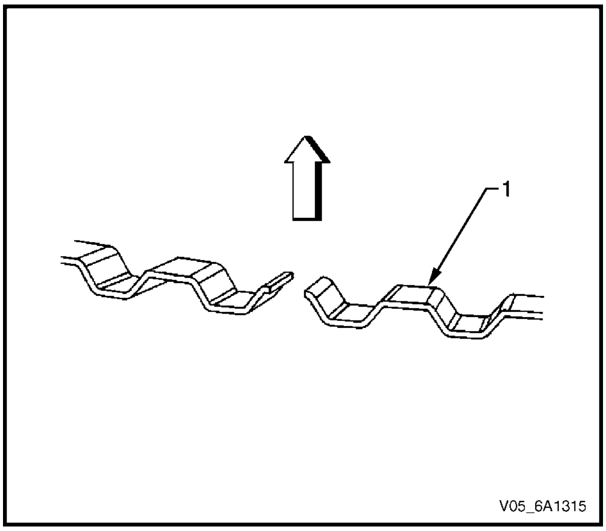

Figure 6A1 – 397

2 Using a piston ring expander, install the oil control ring assembly using the following procedure:

3 Install the expander ring (3).

4 Install the two oil scraper rings (4). Expand the rings only enough to clear the piston diameter. Over-expanding the piston rings will distort or crack the rings.

5 Install the second (2) and top (1) piston rings as follows.

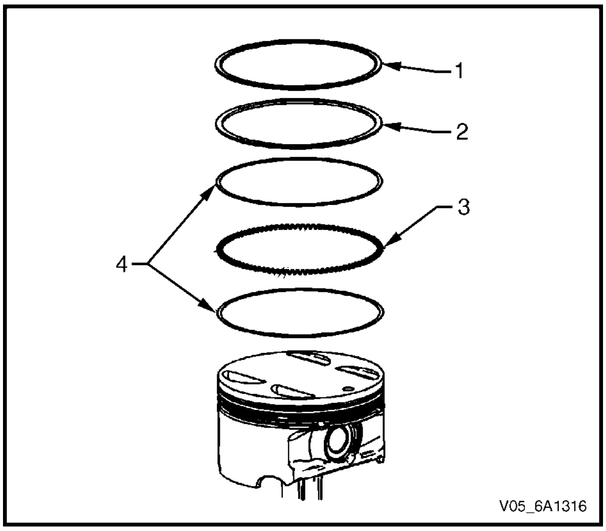

Figure 6A1 – 398

6 Using the ring expander (1), install the second piston ring (2) onto the piston (3). Do not over-expand the ring. Repeat for the top ring.

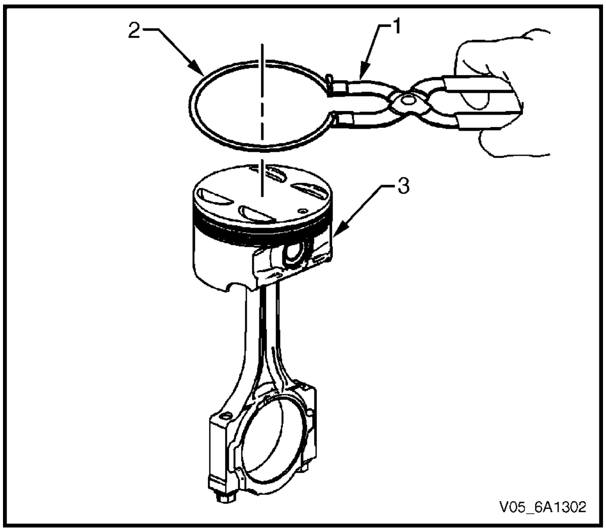

Figure 6A1 – 399

7 Once the rings are installed, set the ring gaps for the oil control, second and top ring as follows. Use the piston location arrow for reference.

- Lower oil control ring position (1).
- Upper oil control ring position (2).
- Top ring position (3).
- Oil control ring expander position (4).
- Second ring position (5).

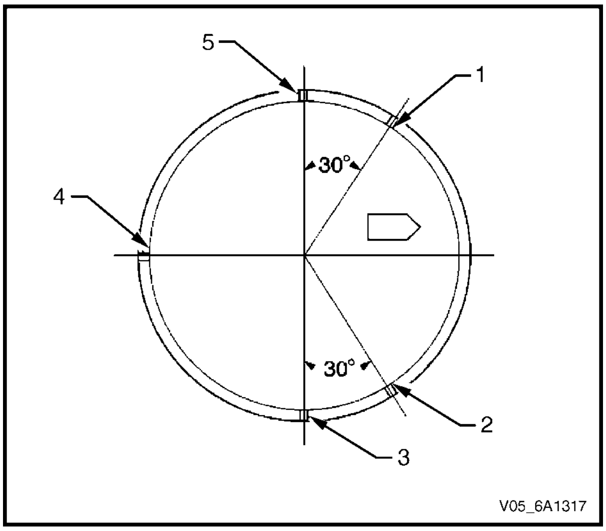

Figure 6A1 – 400

Connecting Rod Bearing

CAUTION

If the connecting rod bearings have been used in a running engine, they must be replaced with new connecting rod bearings for reassembly.

1 Clean the connecting rod (2) and the connecting rod cap bearing bore with a lint-free cloth.

2 Clean the oil from behind the connecting rod bearing halves.

3 Install a new upper connecting rod bearing (1) into position. Roll the bearing into position so the lock tang engages the alignment slot. The bearing must fit flush in the connecting rod.

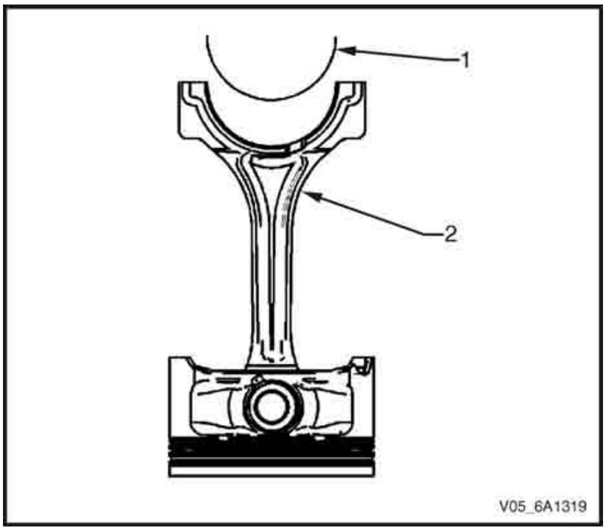

Figure 6A1 – 401

4 Install the lower connecting rod bearing (1) into position in the connecting rod cap (2).

5 Roll the bearing into position so the lock tang engages the alignment slot. The bearing must fit flush with the connecting rod cap.

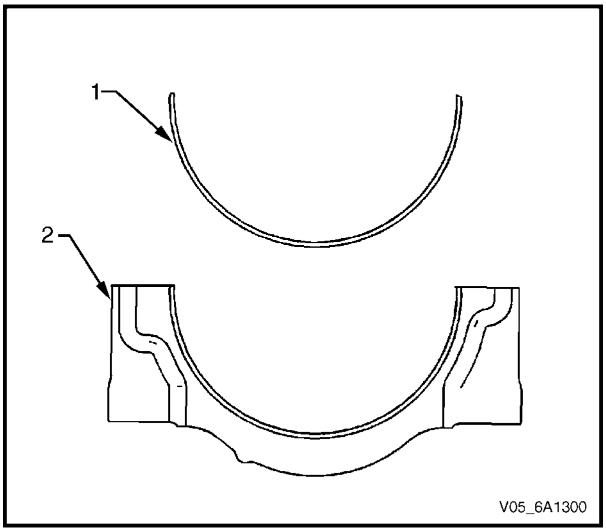

Figure 6A1 – 402

Reinstall

Piston Connecting Rod and Connecting Rod Bearing Installation

CAUTION

The piston is directional and must be installed in the engine block in the correct direction. The locating arrow on the top of each piston must be pointing toward the front of the engine.

1 Liberally lubricate the cylinder walls, piston rings and piston skirts with engine oil.

2 Select the correctly numbered piston/connecting rod assembly for the cylinder. A dot (1) showing correct piston orientation is located on the top of the piston.

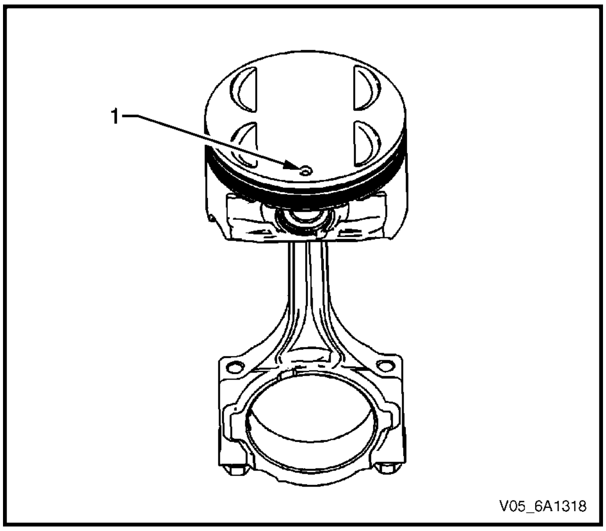

Figure 6A1 – 403

3 Install connecting rod guide pin set, Tool No. EN-46121 (1) into the connecting rod bolt holes.

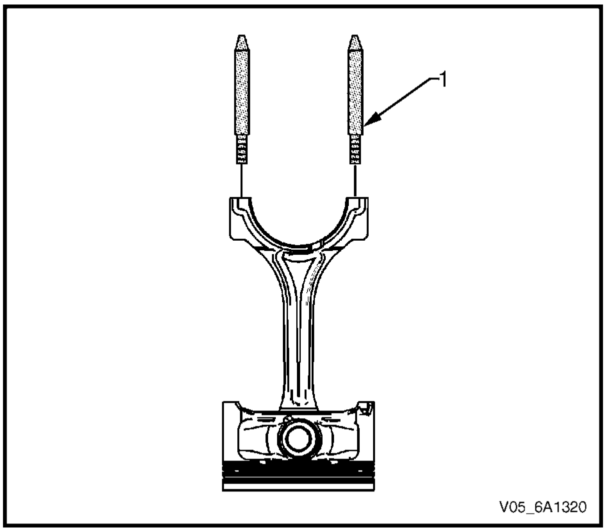

Figure 6A1 – 404

4 Compress the piston rings using a commercially available ring compressor.

CAUTION

Extreme care must be used when installing the piston and connecting rod to ensure the rod does not scrape or nick the cylinder bore, oil jets, or crankshaft surfaces.

5 Using both hands from the top and bottom of the cylinder, slowly guide the piston (2) and connecting rod assembly into the cylinder. Do not allow the connecting rod to contact the cylinder wall.

6 When the ring compressor contacts the deck surface, gently tap the piston into the cylinder using the handle end of a dead-blow hammer. Guide the connecting rod onto the crankshaft bearing journal using connecting rod guide pin set, Tool No. EN-46121 (1) while gently tapping the piston into the cylinder with a soft-blow hammer.

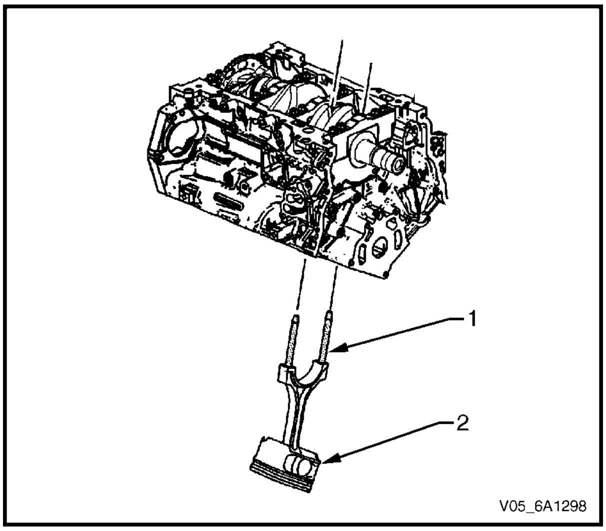

Figure 6A1 – 405

SEVERE CONDITIONS MAINTENANCE SCHEDULE (For GENERAL EXPORT)

Severe driving conditions

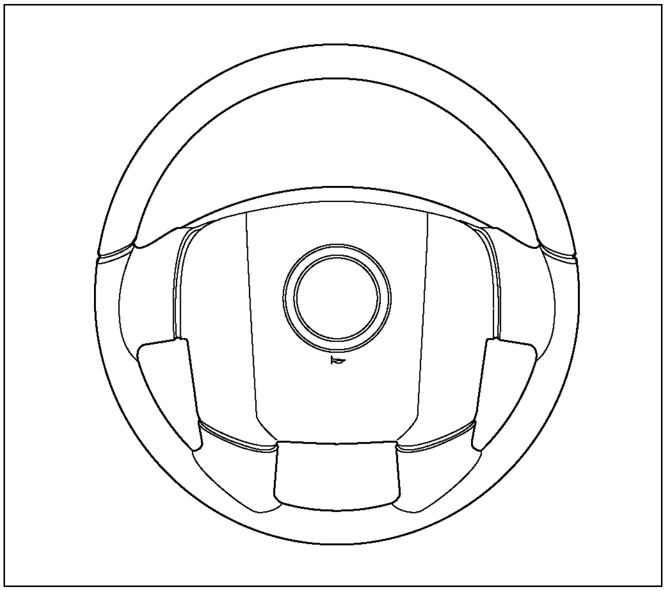
- A : Repeated short trips
- B : Driving on rough roads
- C : Driving on dusty roads
- D : Driving in extremely cold weather and/or on salted roads
- E : Towing trailer or climbing mountain frequently
- F : Operation in high ambient temperature conditions

- [C24SE] : C24SE Gasoline engine
- [HFV6] : HFV6 Gasoline engine
- [G] : Gasoline engine
- [4JA1-T] : 4JA1-T Diesel engine
- [4JH1-TC] : 4JH1-TC Diesel engine
- [4JJ1 (Standard Output)] : 4JJ1 Standard Output Diesel engine
- [4JJ1 (High Output)] : 4JJ1 High Output Diesel engine
- [D] : Diesel engine
- [MT] : Manual transmission
- [AT] : Automatic transmission
- [4WD] : Four wheel drive

Item	Interval		Condition					
		A	B	C	D	E	F	A+D
Engine oil	[G] : Change every 5,000 km (3,000 miles) or 3 month [4JA1-T] : Change every 2,500 km (1,500 miles) [4JH1-TC] [4JJ1 (Standard Output)] [4JJ1 (High Output)] : Change every 5,000 km (3,000 miles)			●				●
Engine oil filter	[G] : Replace every 5,000 km (3,000 miles) or 3 month [D] : Replace every 5,000 km (3,000 miles)			●				●
Exhaust pipes and mounting	Inspect every 5,000 km (3,000 miles)	●	●		●			
Air cleaner element	Replace every 20,000 km (12,000 miles) [D] : Inspect every 2,500 km (1,500 miles)			●				
Steering system for looseness or damage	Inspect every 5,000 km (3,000 miles)		●					
Universal joints and sleeves	Inspect for wear and lubricate every 5,000 km (3,000 miles)		●	●				
Transmission or transmission with transfer case oil	[MT] [C24SE] [D] Change every 20,000 km (12,000 miles) after changing at initial 10,000 km (6,000 miles)		●					
	[MT] [HFV6] Change every 40,000 km (24,000 miles)						●	
	[AT] Transmission: Change every 20,000 km (12,000 miles)	●	●	●		●		●
	[4WD] Transfer: Change every 20,000 km (12,000 miles)		●					
Differential oil	Change every 20,000 km (12,000 miles) after changing at initial 10,000 km (6,000 miles)		●					
Front brake pads and discs wear	Inspect every 5,000 km (3,000 miles)	●	●	●				
Rear brake lining and drum wear	Inspect every 5,000 km (3,000 miles)	●	●	●				

4. Install all the lines and hoses. Fill the system with new power steering fluid and bleed the system as described in Bleeding the Power Steering System. Operate the engine for about 15 minutes.
   Remove the pump return line at the pump inlet and plug the connection on the pump. While refilling the reservoir, check the draining fluid for contamination. If foreign matter is still evident, replace all lines, disassemble and clean or replace the power steering system components. Do not re-use any drained power steering fluid.

Steering Wheel Free Play Inspection



RTW73BSH000901

1. With the tires in the straight-ahead position, check the amount of steering wheel play by turning the wheel in both directions until the tires begin to move.

NOTE: The wheel free play should be checked with the engine running.

Free play: 0 - 30 mm (0 - 1.18 in)

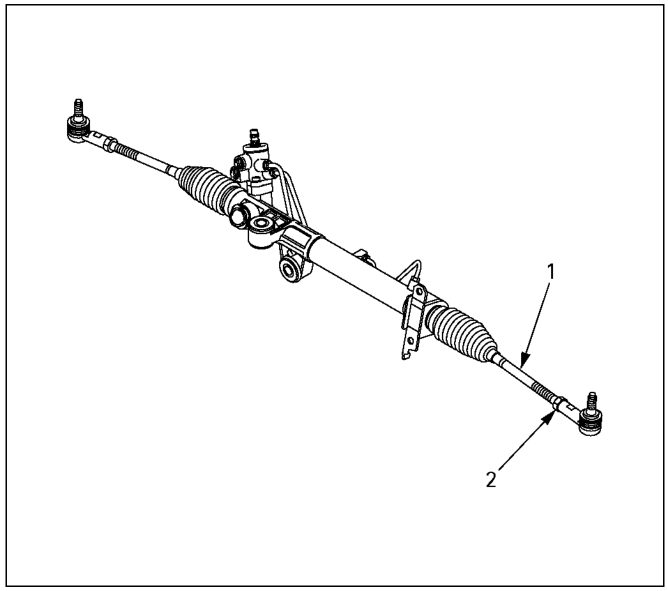
2. Also check the steering wheel for play and looseness in the mount by moving it back and forth and sideways. When test driving, check for hard steering, steering shimmy and tendency to pull to one side.

Front End Alignment Inspection and Adjustment

Toe-in Adjustment

Toe-in: Refer to Section 3A FRONT ALIGNMENT

1. To adjust the toe-in angle, loosen the lock nuts (2) on the tie rod (1) and turn the tie rod. Turn both rods the same amount, to keep the steering wheel centered .



431R30006

2. Tighten the lock nut to the specified torque.

Torque:
98 N·m (10 kgf·m/72 lb·ft)

7 Remove connecting rod guide pin set, Tool No. EN-46121 (1) from the connecting rod bolt holes.

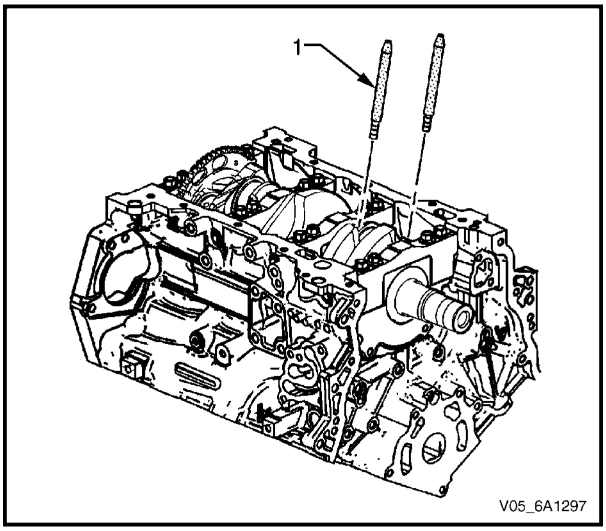


Figure 6A1 – 406

Connecting Rod Bearing Clearance Measurement Procedure

NOTE

Before final assembly, check the clearance of the new connecting rod bearings.

1 Place a length of fresh, room temperature plastic gauging material all the way across the connecting rod bearing journal.
2 Install the connecting rod bearing into the connecting rod cap.
3 Install the connecting rod end cap (1) on its original connecting rod and ensure the bearing lock tangs are aligned on the same side of the rod.

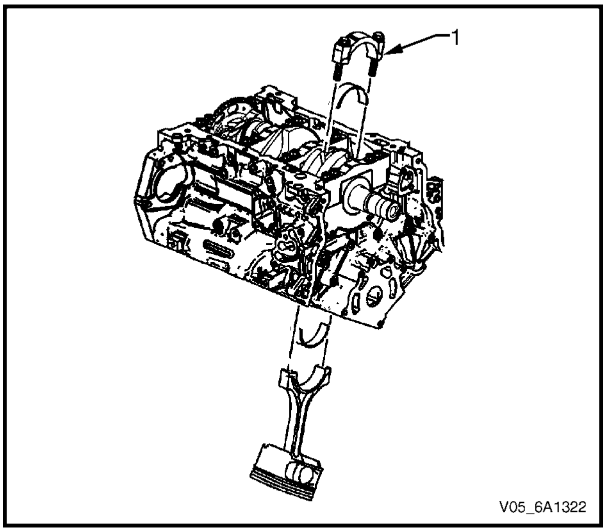

Figure 6A1 – 407

NOTE

Reuse the old connecting rod bolts only for measuring the connecting rod bearing clearance.

4 Install the connecting rod cap bolts into the connecting rod cap and tighten to the correct torque specification using torque angle wrench, Tool No. EN-7115.

Connecting rod cap attaching bolt torque specification:	
Stage 1	30.0 Nm
Stage 2	Loosen completely
Stage 3	25.0 Nm
Stage 4	110 degrees

5 Allow the assembly to sit for at least 2 minutes.
6 Remove the connecting rod cap bolts and discard.
7 Remove the connecting rod cap.

8 Determine the connecting rod bearing clearance by comparing the width of the flattened plastic gauging (1) material at its widest point with the graduation on the gauging material container (2).

9 Compare the measurements with the specifications, refer to 5 Specifications.

10 If the new bearings do not provide the correct crankshaft to connecting rod bearing clearance, inspect the following:

11 Measure the crankshaft connecting rod journals for the correct specified size and ensure the correct new bearings are being installed. If the crankshaft connecting rod journals are incorrectly sized, replace or regrind the crankshaft. Crankshaft machining is permitted and undersized bearings are available.

12 Measure the connecting rod bearing bore diameter to ensure correct size. The connecting rod is not machineable and the connecting rod must be replaced if out of specification.

13 Clean the plastic gauging material from the connecting rod bearing journals using a soft lint-free cloth.

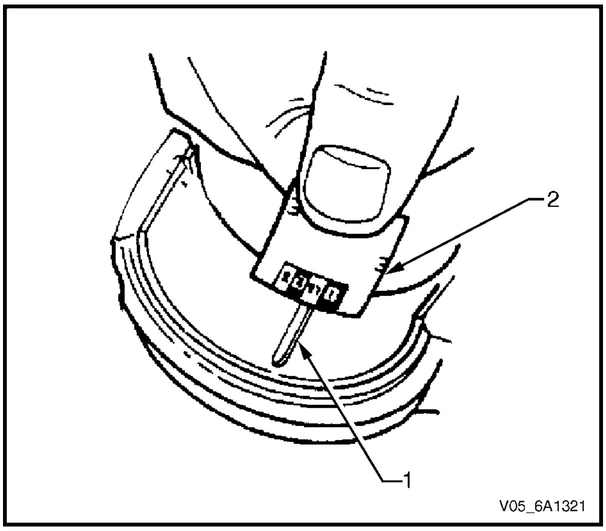

Figure 6A1 – 408

Connecting Rod Final Assembly Procedure

1 Carefully guide the connecting rod away from the crankshaft connecting rod journal slightly to lubricate the crankshaft connecting rod bearing journal.

2 Apply a liberal amount of clean engine oil to the crankshaft connecting rod bearing journal.

3 Guide the connecting rod to the crankshaft connecting rod journal.

4 Install the connecting rod end cap (1) on its original connecting rod and ensure the bearing lock tangs are aligned on the same side of the rod.

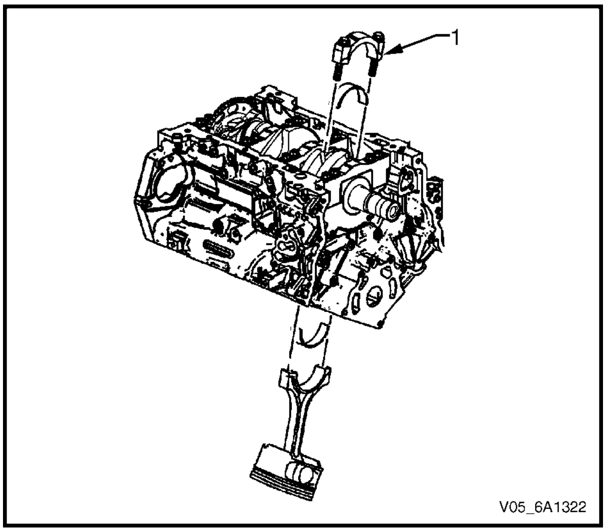

Figure 6A1 – 409

CAUTION

- **Do not lubricate the new connecting rod bolts. The new bolts have a pre-applied graphite lubricant. Applying lubricant to the connecting rod bolts will effect the clamp load when the connecting rod bolts are tightened to the specified torque. Incorrect clamp load can lead to component failure and extensive engine damage.**
- **Do not reuse the old connecting rod bolts.**

5 Install new connecting rod bolts into the connecting rod cap and tighten to the correct torque specification.

■ Connecting rod cap attaching bolt torque specification:
Stage 1 ....30.0 Nm
Stage 2 .... Loosen completely
Stage 3 ....25.0 Nm
Stage 4 .... 110 degrees

NOTE

During and after installation, ensure each piston is positioned correctly in the correct cylinder. The locating arrow on the top of each piston must be pointing toward the front of the engine.

6 Repeat these procedures for the remaining piston/connecting rod assemblies.
7 Reinstall the oil pan and oil pump pick up assembly, refer to 4.2 Oil Pan and Oil Pump Suction Pipe Assembly.
8 Reinstall the cylinder heads, refer to 3.22 Cylinder Head Assembly.
9 Reinstall the engine assembly, refer to 4.1 Engine .

4.6 Crankshaft and Main Bearings

1 Remove the engine assembly, refer to 4.1 Engine .
2 Remove both cylinder head assemblies, refer to 3.22 Cylinder Head Assembly.
3 Remove the oil pan assembly, refer to 4.2 Oil Pan and Oil Pump Suction Pipe Assembly.
4 Remove the piston and connecting rod assemblies, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings.
5 Remove the oil pump assembly, refer to 3.17 Oil Pump Assembly.
6 Remove the crankshaft rear oil seal and plate assembly, refer to 4.4 Crankshaft Rear Seal and Plate Assembly.
7 Remove the crankshaft position sensor, refer to 6C1-3 Engine Management – V6 – Service Operations.

Crankshaft End Play Measurement

1 Place a dial indicator at the end of the crankshaft nose.
2 Gently force the crankshaft towards the front and rear of the cylinder block with a lever while monitoring the movement of the dial indicator.
3 The crankshaft endplay should not exceed specifications, refer to 5 Specifications.
4 If the specifications are exceeded, inspect the thrust bearing thrust outer diameter and the crankshaft thrust wall for wear and/or excessive runout. Compare the values with the specifications, refer to 5 Specifications.
5 Replace the thrust bearing or crankshaft as required.

Remove

1 Remove the crankshaft bearing cap side bolts (3).

CAUTION

The crankshaft bearing cap outer bolts are yield tightened during assembly and must be replaced prior to reassembly. Crankshaft bearing cap outer bolts that are not replaced will not torque to the correct clamp load and can lead to serious engine damage.

2 Remove the crankshaft bearing cap outer bolts (1).
3 Remove the crankshaft bearing cap inner bolts (2).

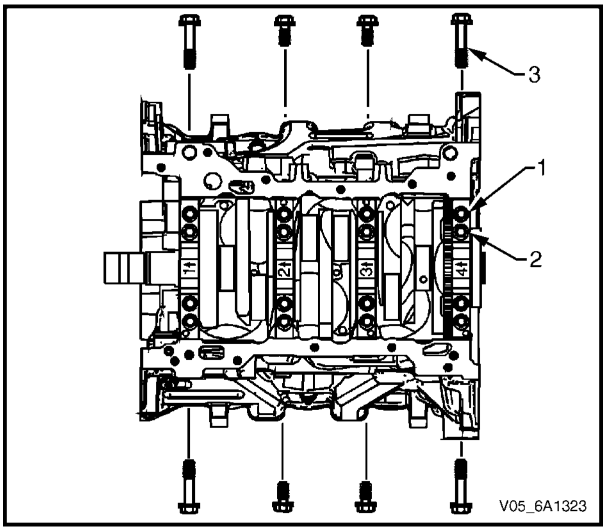

Figure 6A1 – 410

4 Loosen the nuts (1) of the crankshaft main bearing cap remover, Tool No. J-41818 (2) to separate the chamfered collets. Install the collets into the inner bolt holes of the front main bearing cap (3).

5 Tighten the remover nuts to the correct torque specification.

Crankshaft bearing cap remover nut.................11.0 Nm.

6 Install a slide hammer, Tool No. J-6125-1B (4) onto the crankshaft bearing cap remover and remove the crankshaft bearing cap.

7 Repeat steps 9 to 14 for the remaining crankshaft bearing caps.

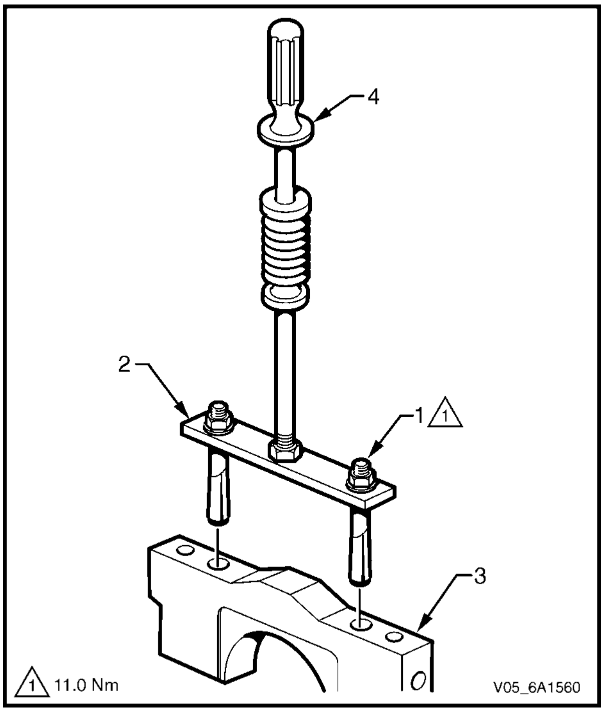

Figure 6A1 – 411

8 Remove the crankshaft (1) from the engine block (2), lifting evenly to avoid jamming against the main thrust bearing.

9 Place the crankshaft in a secure place.

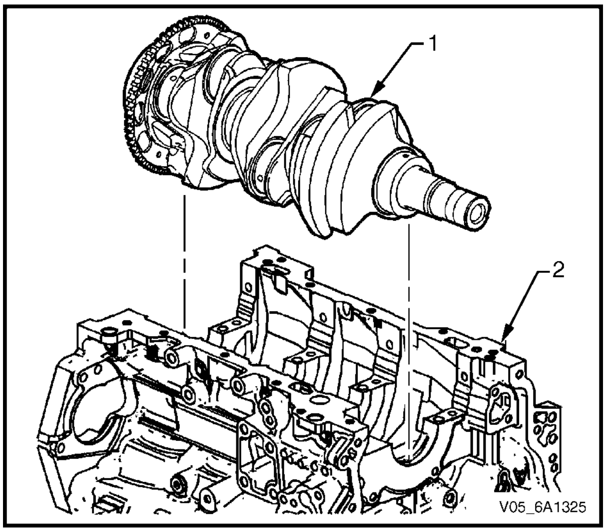

Figure 6A1 – 412

10 If required, remove the crankshaft sprocket drive pin (1) from the crankshaft (2),

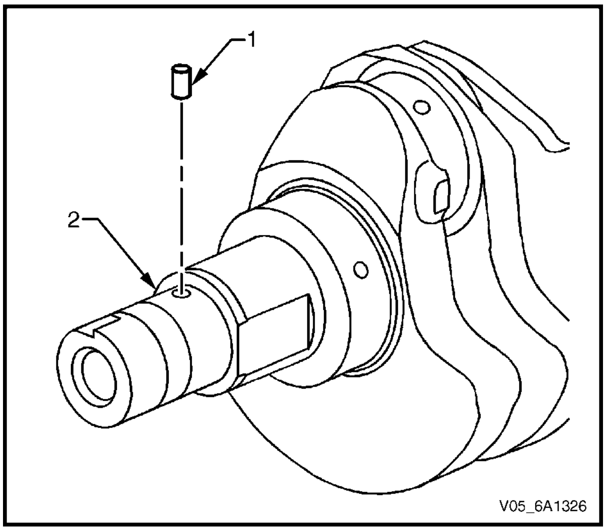

Figure 6A1 – 413

Crankshaft Bearing

1 Prepare a piece of cardboard or similar, numbered 1 – 4 for bearing identification.

NOTE

Main bearing journals are numbered from the front of the engine.

2 Remove the crankshaft upper bearing halves from the cylinder block. Note the position of the thrust bearing (1) at the number 3 journal (2).

3 Place the crankshaft upper bearing halves on the cardboard in the correct positions.

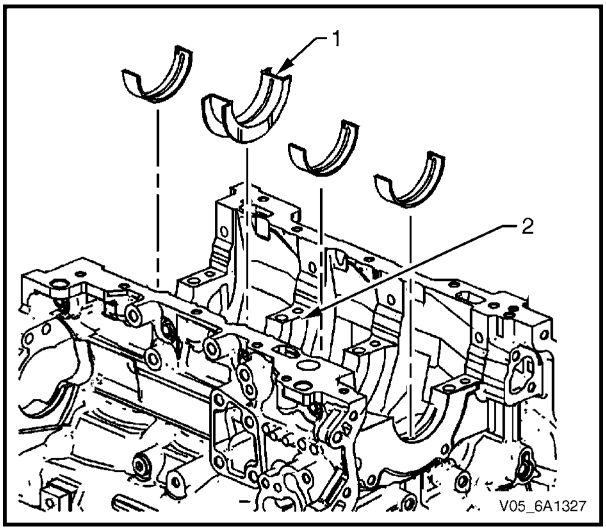

Figure 6A1 – 414

4 Remove the crankshaft lower bearing halves (2) from the crankshaft bearing caps (1).

5 Place the crankshaft lower bearing halves in the correct positions on the cardboard.

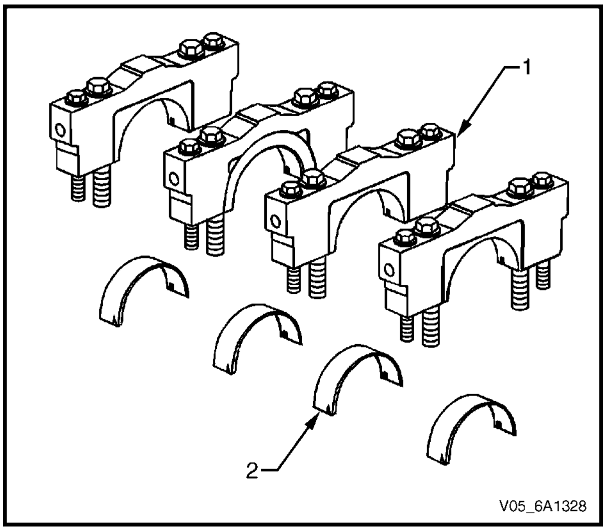

Figure 6A1 – 415

Clean and Inspect

Crankshaft and Main Bearing Cleaning

WARNING

Safety glasses must be worn when using compressed air.

Clean the following components in solvent and then dry with compressed air:

- crankshaft bearings,
- connecting rod bearings,
- crankshaft journals,
- crankpin journals,
- crankshaft oil passages, and
- crankshaft threaded holes.

Crankshaft and Main Bearing Visual Inspection

1 Perform the following visual inspections:

- Inspect the crankshaft balancer bolt hole (1) for thread damage.
- Inspect the crankshaft balancer mounting area (2) for damage.
- Inspect the crankshaft sprocket pin hole (3) for damage.
- Inspect the oil pump drive flats (4) for damage.
- Inspect the crankshaft main journals (5) for damage.
- Inspect the crankshaft connecting rod journals (6) for damage.
- Inspect the crankshaft oil passages (7) for obstructions.
- Inspect the crankshaft main bearing thrust wall surfaces (8) for damage.
- Inspect the crankshaft counterweights (9) for damage.
- Inspect the crankshaft reluctor ring teeth (10) for damage.
- Inspect the crankshaft rear main oil seal surface (11) for damage.
- Inspect the crankshaft engine flexplate mounting surface (12) for damage.
- Inspect the crankshaft pilot hole (13) for damage.
- Inspect the crankshaft engine flywheel bolt holes (14) for thread damage.

2 Repair or replace the crankshaft as required.

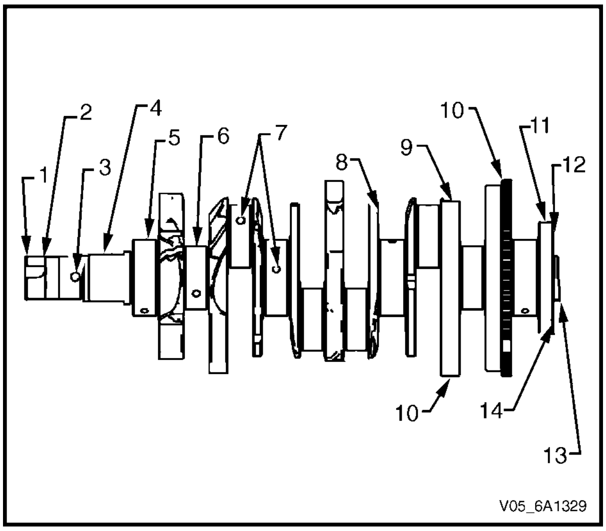

Figure 6A1 – 416

Crankshaft Main Bearing Inspection

CAUTION

All connecting rod and main journal bearings that have been used in a running engine must be replaced. Never re-use the crankshaft or connecting rod bearings.

NOTE

The following bearing wear conditions should be used to diagnose engine operating conditions or root cause of a condition.

1 Inspect for fatigue indicated by craters or pockets (2). Flattened sections on the bearing halves (1) also indicate fatigue.

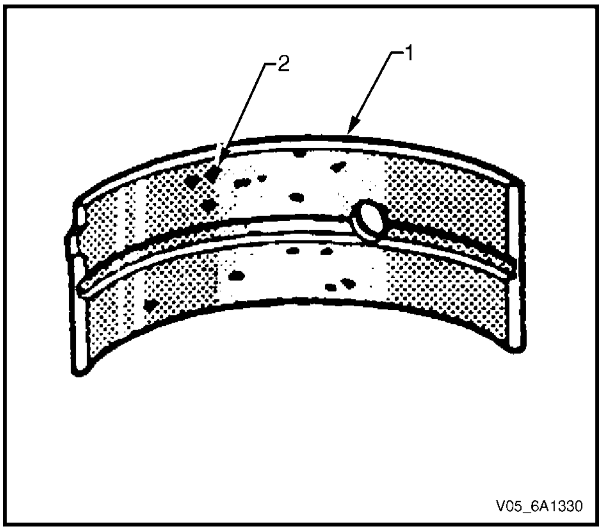

Figure 6A1 – 417

2 Inspect for excessive scoring or discoloration (2) on both front and back of the bearing halves (1).

3 Inspect the main bearings for dirt embedded into the bearing material.

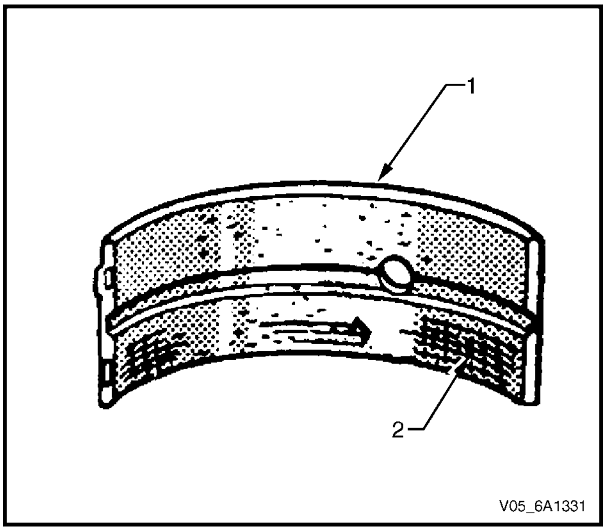

Figure 6A1 – 418

4 Inspect for incorrect seating indicated by bright, polished sections (1).

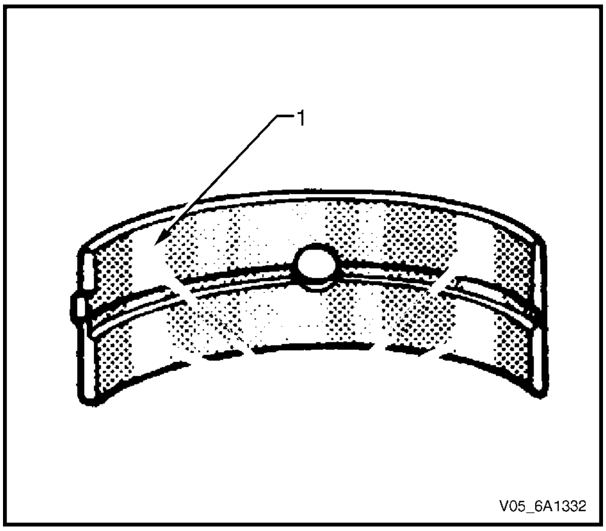

Figure 6A1 – 419

Crankshaft Measurement

1 Using a suitable fixture (1), support the crankshaft (2).

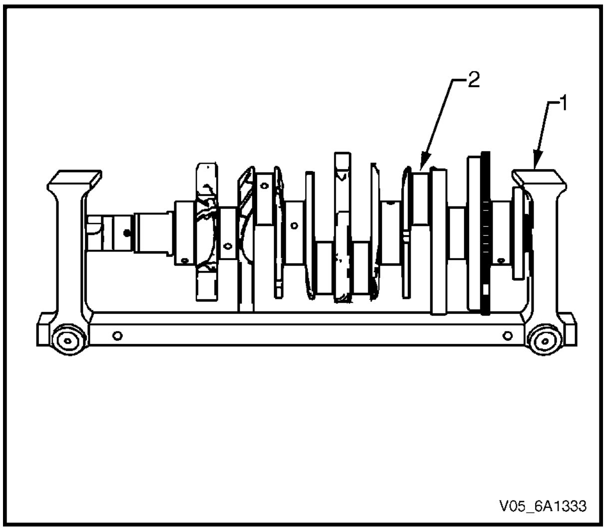

Figure 6A1 – 420

2 Using a dial indicator (1) and magnetic base (2), rotate the crankshaft (3) carefully by hand. Measure the crankshaft main journals for runout and compare with the engine specifications, refer to 5 Specifications.

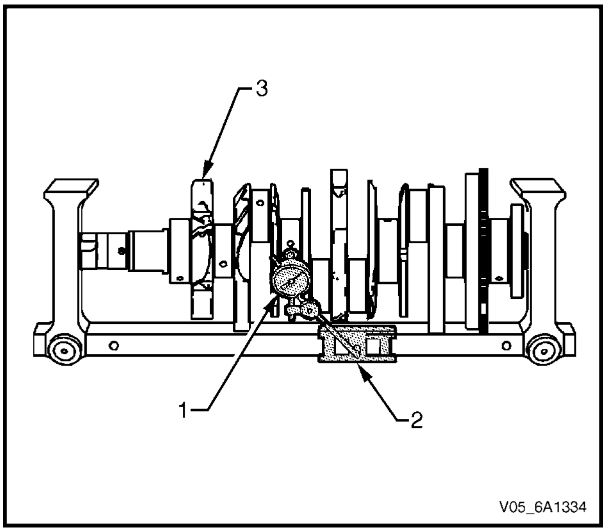

Figure 6A1 – 421

3 Measure the crankshaft thrust wall width (1) for wear using an inside micrometer and compare with the engine specifications, refer to 5 Specifications.

4 Measure the crankshaft thrust wall surface (2) for runout using a dial indicator, mounted to a magnetic stand and compare with the engine specifications, refer to 5 Specifications.

5 If the crankshaft journals are damaged or worn beyond specifications, the crankshaft may be ground 0.25 mm. There is only one size of oversized main bearings available for service.

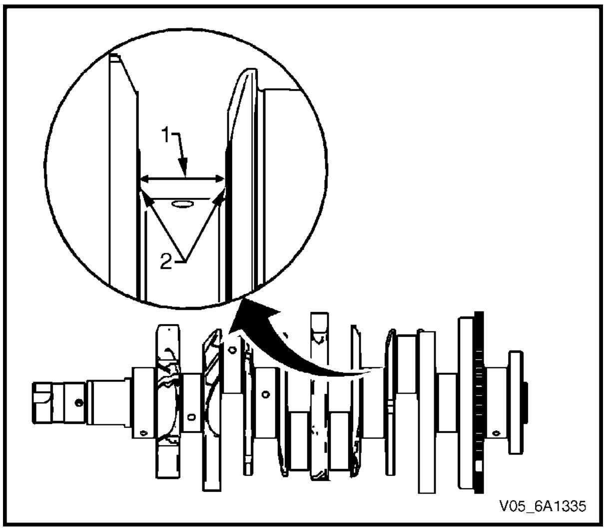

Figure 6A1 – 422

6 Inspect the crankshaft main journals (1) for undersize, using an outside micrometer (2).

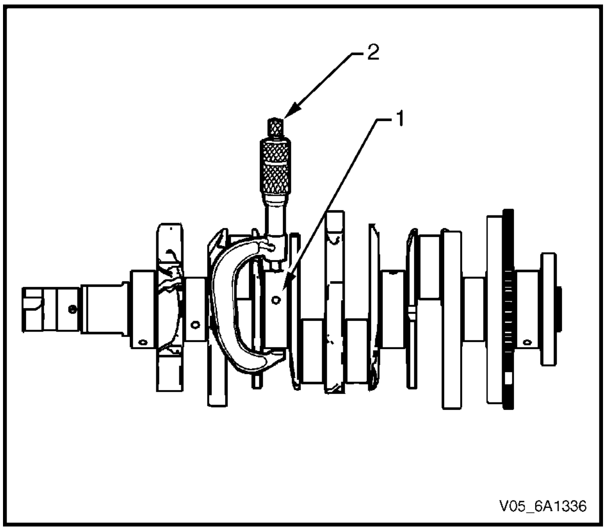

Figure 6A1 – 423

7 Inspect the crankpins (1) for undersize using an outside micrometer (2).

8 Compare your measurements with those listed in the engine specifications, refer to 5 Specifications. If the crankpin journals are worn beyond the specifications, the crankshaft may be ground 0.25 mm. Only one size of oversized connecting rod bearings available for service.

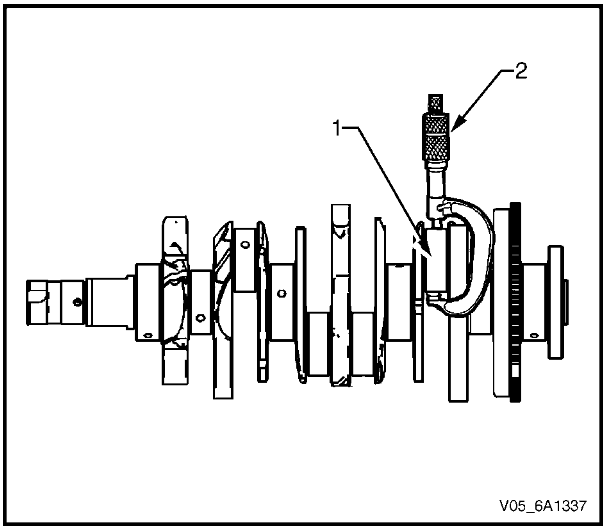

Figure 6A1 – 424

9 Measure the main bearing and crankpin journals for out-of-round using the following procedure:

a Using an outside micrometer, measure the journal at the extreme front and rear locations on the journal. Call these points A and B.

b Measure the journal in two new locations exactly 90 degrees from the first points. Call these points C and D.

c Subtract A from C and B from D. The differences will indicate journal out-of-round.

d The out-of-round should not exceed 0.004 mm maximum.

e If the journals are worn beyond the specifications, the crankshaft may be ground 0.25 mm. There is only one size of oversized crankshaft and connecting rod bearings available for service.

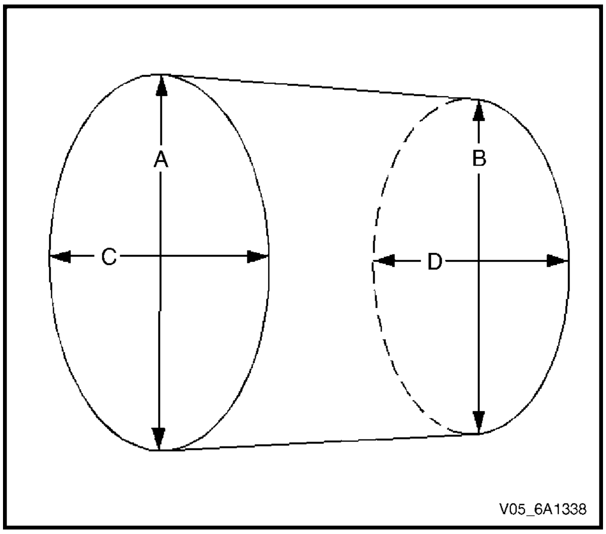

Figure 6A1 – 425

10 Measure the main bearing and crankpin journals for taper using the following procedure:

a Using an outside micrometer, measure the journal at the extreme front (A) and rear (B) of the journal parallel to the crankshaft centreline.

b Subtract the smallest from the largest measurement. The result will be the journal taper.

c If the main bearing journal taper exceeds 0.004 mm, replace the crankshaft.

d If the journals are worn beyond the specifications, the crankshaft may be ground 0.25 mm. There is only one size of oversized crankshaft and connecting rod bearings available for service.

Reinstall

Crankshaft Bearing Installation Procedure

CAUTION

If the crankshaft bearings have been used in a running engine, replace them with new crankshaft bearings for reassembly.

1 Clean the crankcase crank bore with a lint-free cloth.

2 Clean all the oil from the backside of new bearing halves.

3 Install the new upper crankshaft bearings into position. The thrust bearing (1) belongs in the number 3 journal(2). Ensure the upper bearing insert contains the oil transfer hole and groove. Roll the bearing into position so the lock tang engages the crank slot. The bearing must fit flush with the upper crankcase.

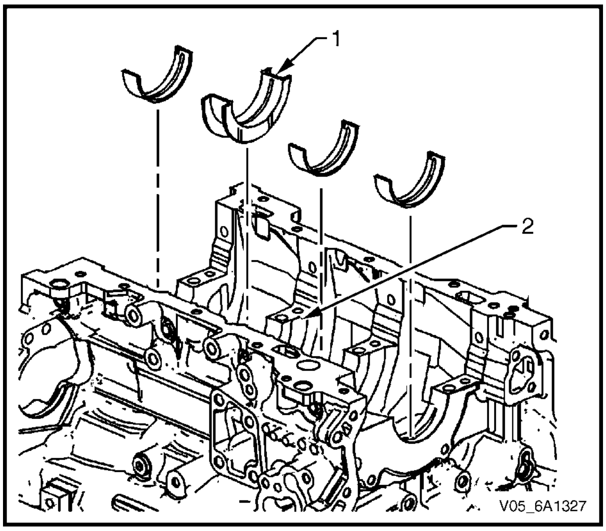

Figure 6A1 – 426

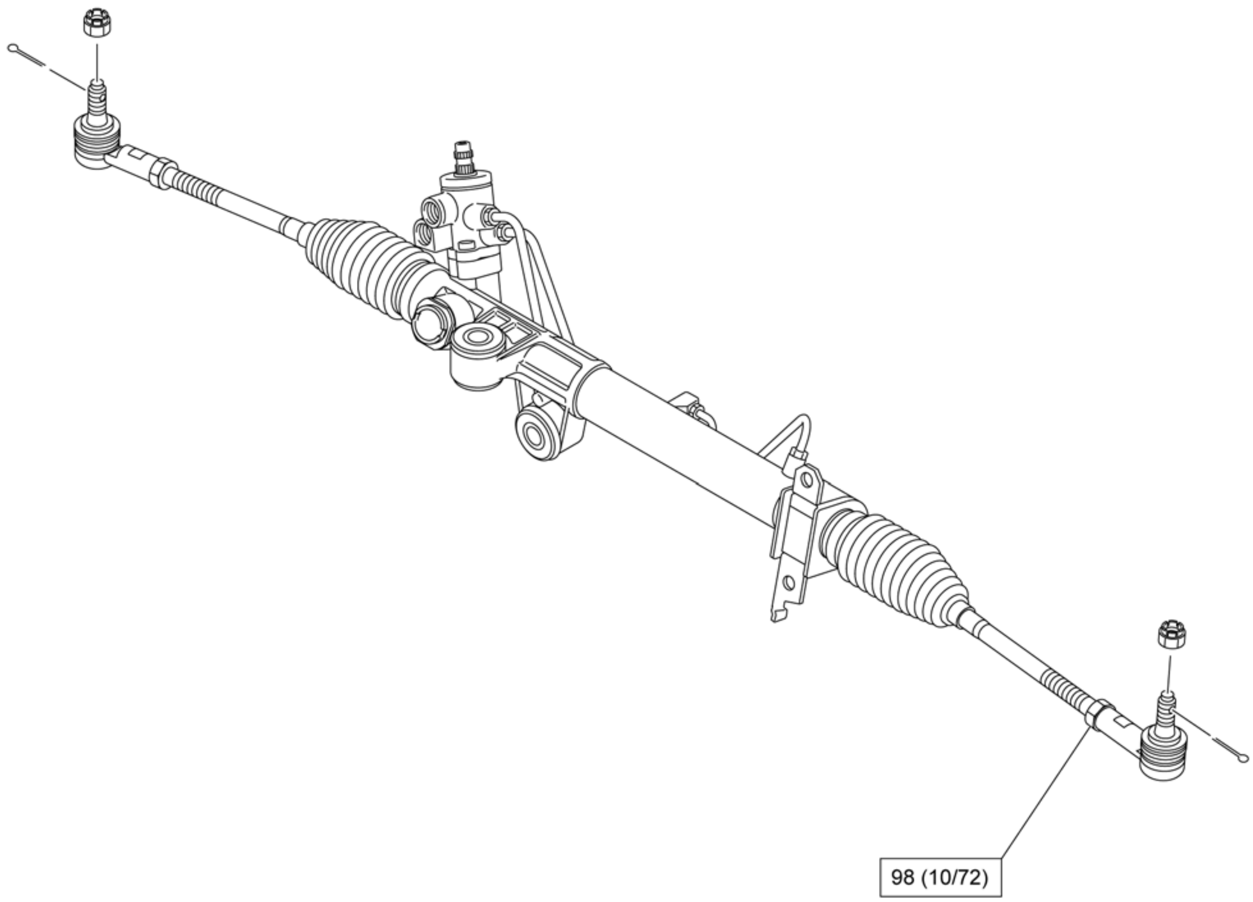
Torque Specification

N·m (kgf·m/lb·ft)



RTW53BLF001001

Special Tools

ILLUSTRATION	TOOL NO. TOOL NAME	ILLUSTRATION	TOOL NO. TOOL NAME
 901RS276	**5-8840-0135-0** **(J-29877-A)** Tester; Power steering	 901RS278	**5-8840-2297-0** **(J-39213)** Adapter; Power steering tester

4 Install the new lower crankshaft bearings (2) into position in the main bearing caps (1). The lower crankshaft bearings are identified by no grooves or holes. The bearings must fit flush with the crankshaft bearing caps.

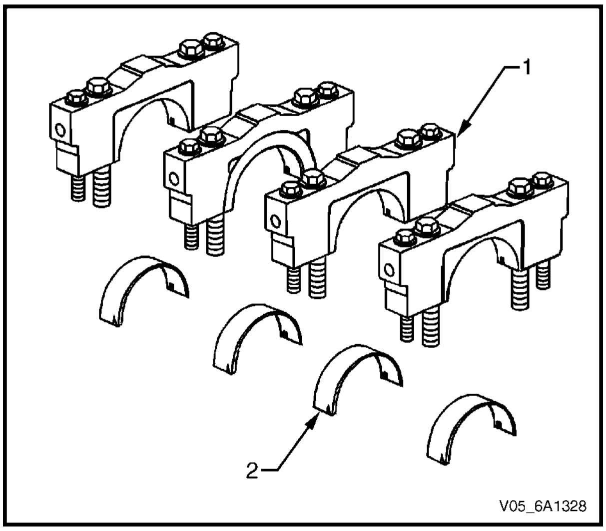


Figure 6A1 – 427

Crankshaft Main Bearing Clearance Measurement

1 Place a length of fresh, room temperature plastic gauging material all the way across all the crankshaft bearing journals.

2 Install the crankshaft main bearing caps.

3 Loosely install the original inner main cap bolts (1).

4 Loosely install the original outer main cap bolts (2).

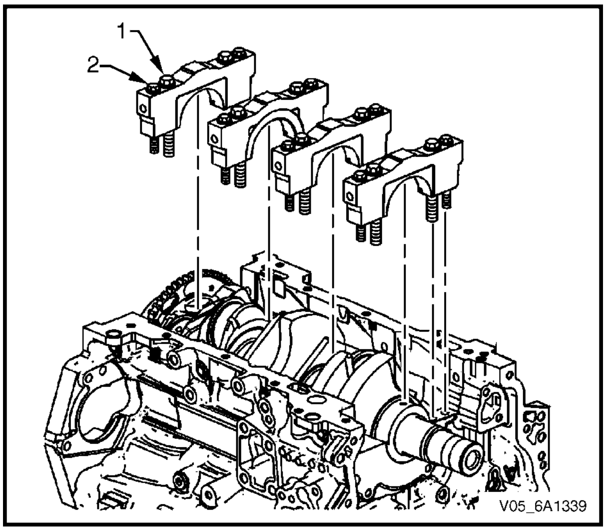

Figure 6A1 – 428

5 Loosely install the original short/inner side main cap bolts.

6 Loosely install the original long/outer side main cap bolts (3).

7 Gently tap the crankshaft main bearing caps with a soft-faced hammer to help seat the caps.

8 Tighten the main caps bolts to the correct torque specification, and in the following sequence.

Crankshaft main bearing cap inboard attaching bolt torque specification: Stage 1 ....20.0 Nm Stage 2 ....80°
Crankshaft main bearing cap outboard attaching bolt torque specification: Stage 1 ....15.0 Nm Stage 2 ....110°
Crankshaft main bearing cap side attaching bolt torque specification: Stage 1 ....30.0 Nm Stage 2 ....60°

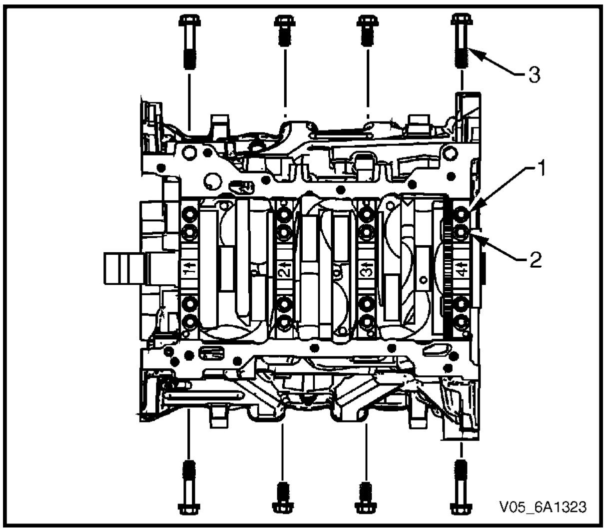

Figure 6A1 – 429

NOTE

Do not rotate the crankshaft.

9 Allow the assembly to sit for 2 minutes.

10 Remove the crankshaft bearing cap side bolts.

11 Remove the crankshaft bearing cap outer bolts (2).

12 Remove the crankshaft bearing cap inner bolts (1).

13 Install the crankshaft main bearing cap remover Tool No. J-41818 as previously described and remove the crankshaft bearing cap.

14 Repeat steps 10 to 13 for the remaining crankshaft bearing caps.

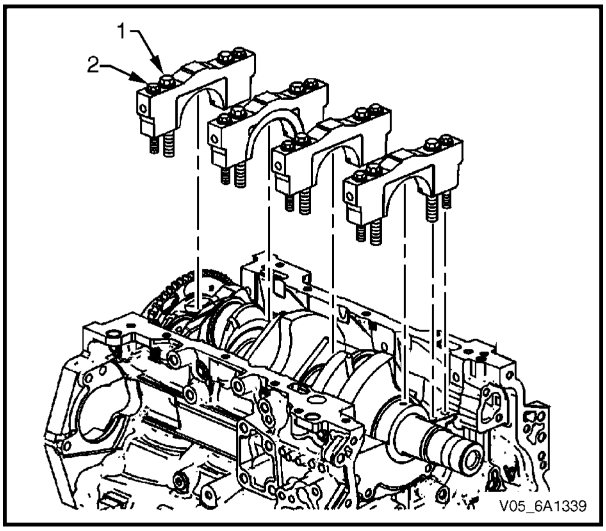

Figure 6A1 – 430

15 Determine the crankshaft bearing clearance by comparing the width of the flattened plastic gauging material (1) at its widest point with the graduation on the gauging material scale (2).

16 Compare the measurements listed in the specifications, refer to 5 Specifications. If the new bearings do not provide the correct crankshaft to bearing clearance, inspect the following:

17 Measure the crankshaft journals for the correct specified size and ensure new bearings are being installed. If the crankshaft journals are incorrectly sized, replace or regrind the crankshaft. Crankshaft machining is permitted and undersized bearings are available.

18 Measure the engine block crankshaft bearing bore diameter to ensure correct size. The engine block crankshaft bearing bore is not machineable and the block must be replaced if out of specification.

19 Clean the plastic gauging material from the crankshaft bearing journals with a soft, lint-free cloth.

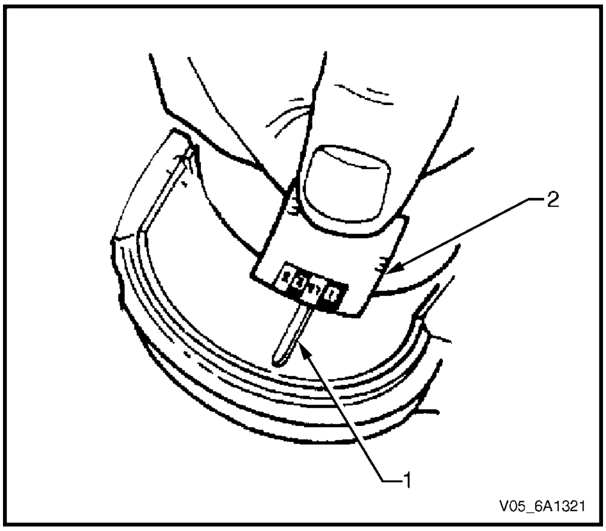

Figure 6A1 – 431

Crankshaft Final Installation Procedure

1 If removed, install the crankshaft sprocket drive pin (1). Lightly tap the pin in place with a small soft face, bronze/plastic, hammer until it bottoms in the hole.

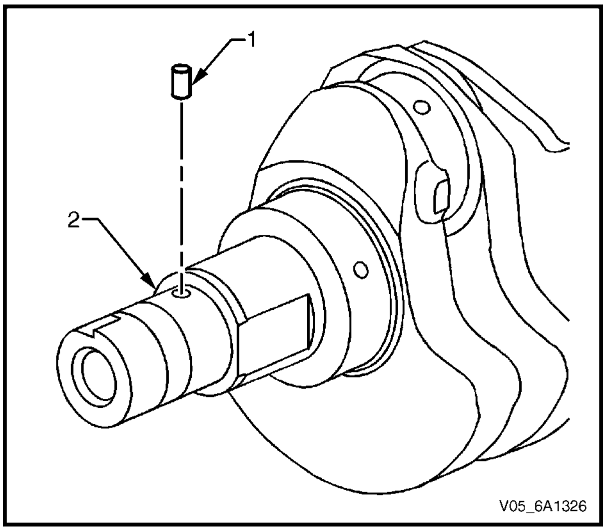

Figure 6A1 – 432

CAUTION

Ensure the crankshaft position sensor has been removed from the cylinder block prior to loading the crankshaft, as damage to the sensor may occur.

2 Apply a liberal amount of clean engine oil to the upper and lower bearing surfaces.

3 Gently lower the crankshaft (1) into position in the cylinder block (2).

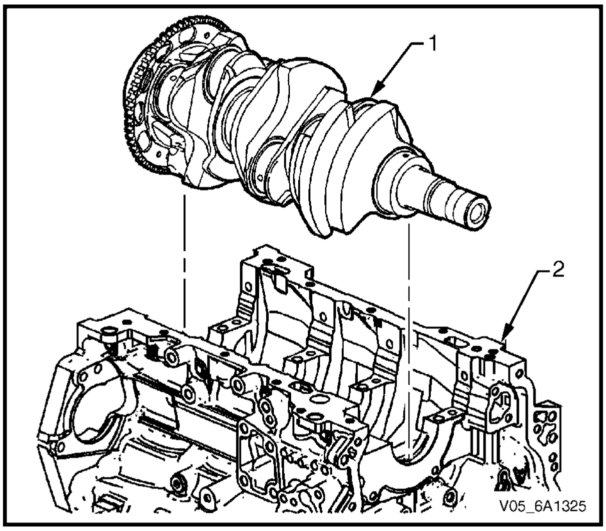

Figure 6A1 – 433

4 Install the crankshaft main bearing caps.

5 Loosely install the original inner main cap bolts (1).

CAUTION

The outer crankshaft bearing cap bolts (2) are yield tightened during assembly and must be replaced prior to reassembly. Outer crankshaft bearing cap bolts that are not replaced will not torque to the correct clamp load and can lead to serious engine damage.

6 Loosely install the new outer main bearing cap bolts (2).

7 Gently tap the crankshaft main bearing caps with a soft-faced hammer to help seat the caps.

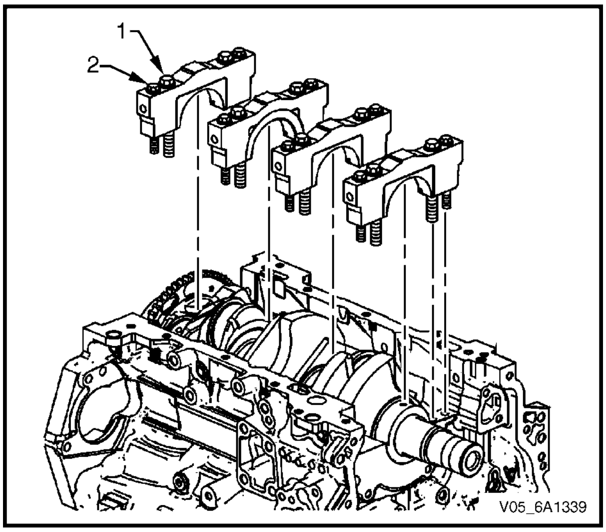

Figure 6A1 – 434

8 Loosely install new short / inner side main cap bolts (4).

CAUTION

- **The short / inner side main cap bolts originally have a sealant on the flange of the bolt head. New bolts must be used. If new bolts are not used, oil can leak from the crankcase past the bolts.**
- **The long / outer side main cap bolts originally have a sealant on the flange of the bolt head. New bolts must be used. If new bolts are not used, oil can leak from the crankcase past the bolts.**

9 Loosely install the new long / outer side main cap bolts (3).

10 Tighten the main caps bolts to the correct torque specification, and in the following sequence.

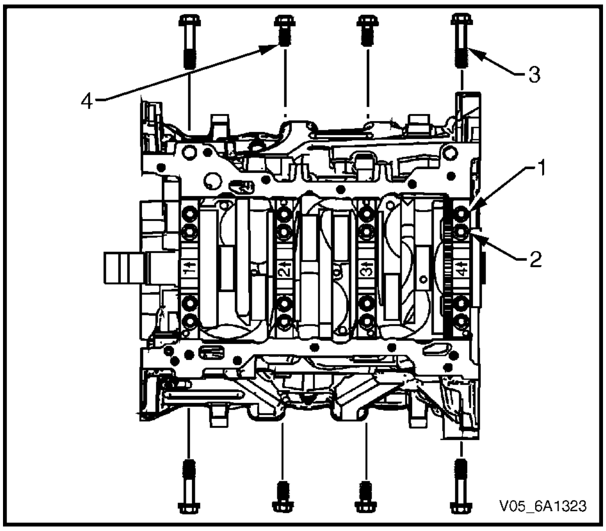

Figure 6A1 – 435

■ Crankshaft main bearing cap inboard attaching bolt torque specification:
Stage 1 ....20.0 Nm
Stage 2 ....80°

■ Crankshaft main bearing cap outboard attaching bolt torque specification:
Stage 1 ....15.0 Nm
Stage 2 ....110°

■ ♦ Crankshaft main bearing cap side attaching bolt torque specification:
Stage 1 ....30.0 Nm
Stage 2 ....60°

11 Ensure the crankshaft turns without binding or noise.

12 Install the remaining components in the reverse order to removal, refer to the appropriate Section.

4.7 Cylinder Block

Disassemble

1 Remove oil jet bolt (1) attaching the oil jet (2), three places.

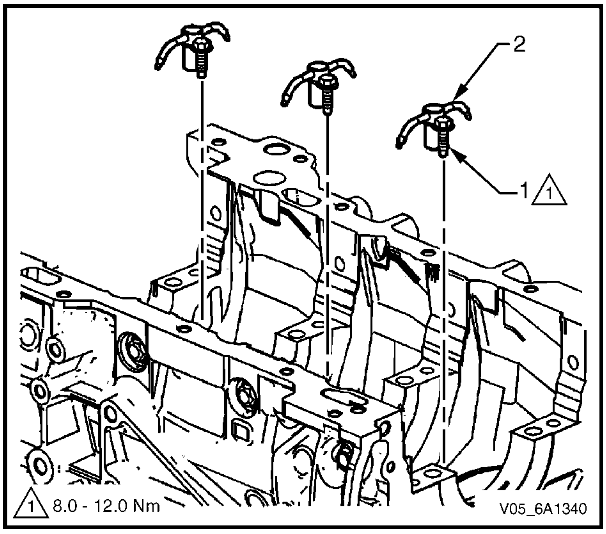

Figure 6A1 – 436

2 Remove the right-hand front oil pan rail oil gallery expansion plug (1).

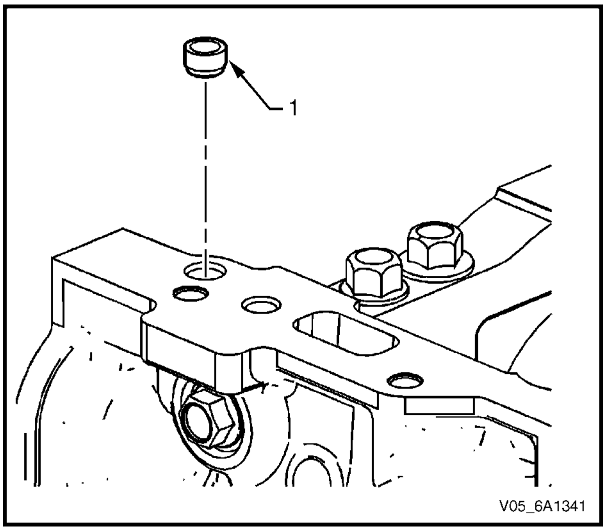

Figure 6A1 – 437

3 Remove the cylinder block-to-oil pan alignment dowels (1).

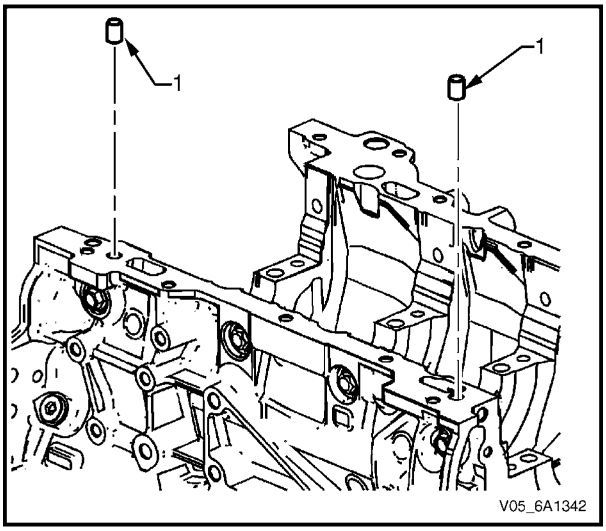

Figure 6A1 – 438

4 Remove the right-hand side M14 oil gallery threaded plug (1).

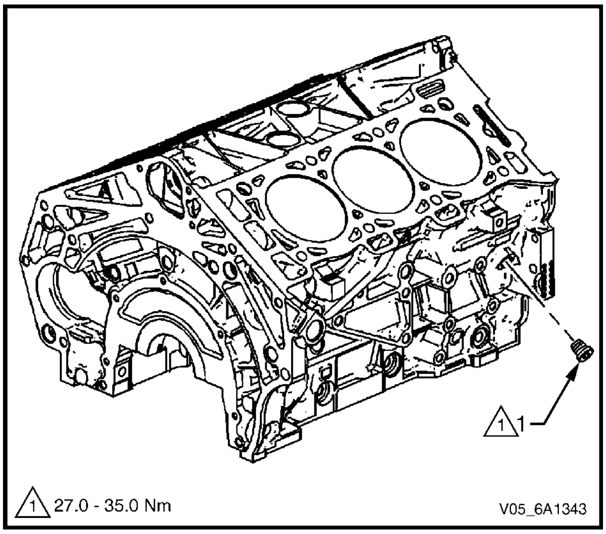

Figure 6A1 – 439

5 Remove the right-hand side M14 coolant drain threaded plug (1).

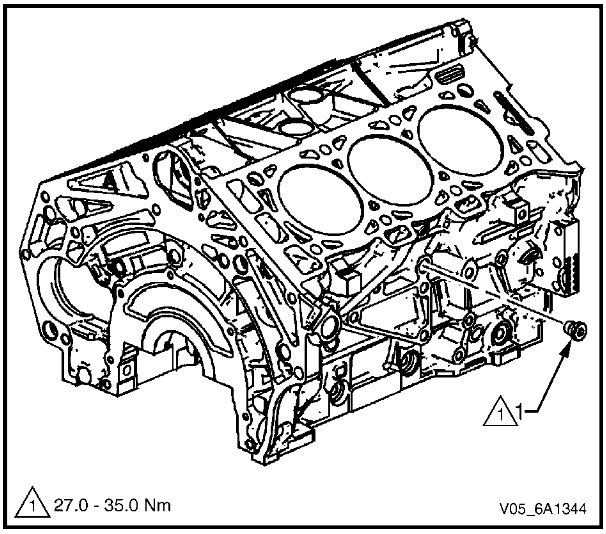

Figure 6A1 – 440

6 Remove the rear M14 oil gallery threaded plug (1).

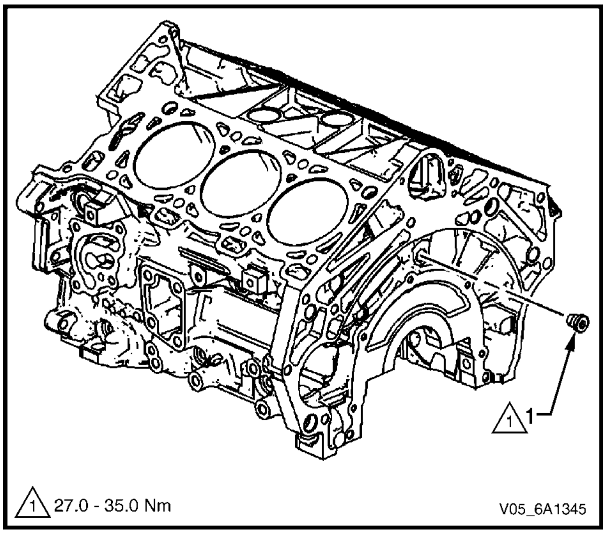

Figure 6A1 – 441

7 Remove the left-hand side M14 coolant drain threaded plug (1).

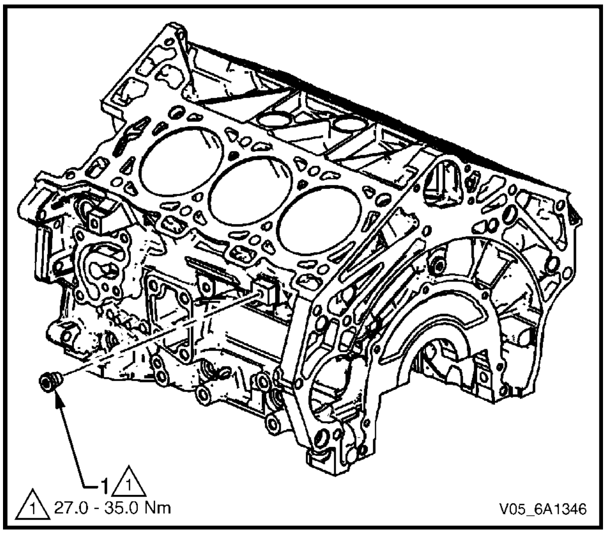

Figure 6A1 – 442

8 Remove the left-hand side M20 oil gallery threaded plug (1).

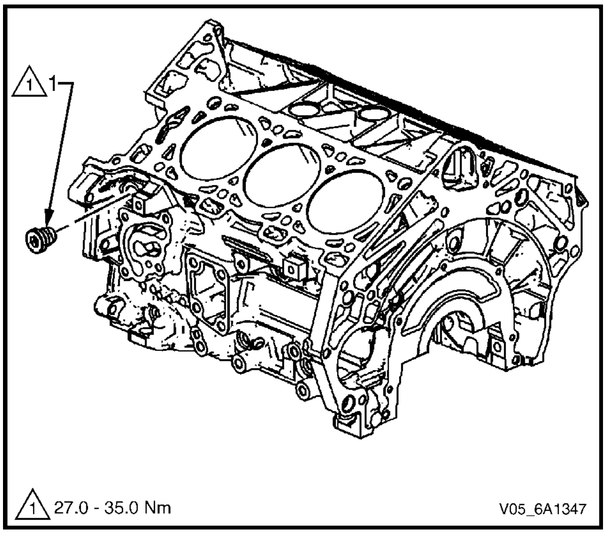

Figure 6A1 – 443

CAUTION

Do not force coolant expansion plugs downwards during removal procedure as the cylinder block will be damaged.

9 Remove the coolant expansion plugs (1).

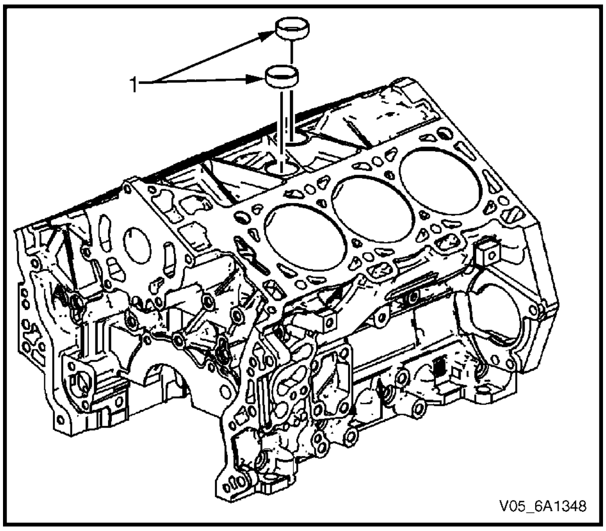

Figure 6A1 – 444

10 Remove the cylinder block-to-transmission alignment dowels (1).

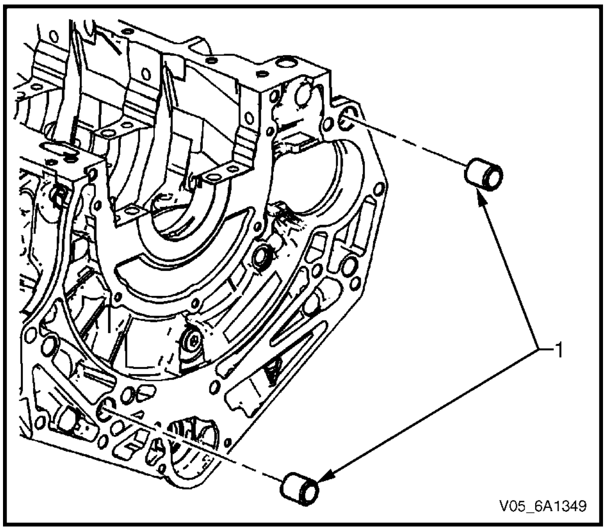

Figure 6A1 – 445

11 Remove the front oil gallery expansion plug (1).

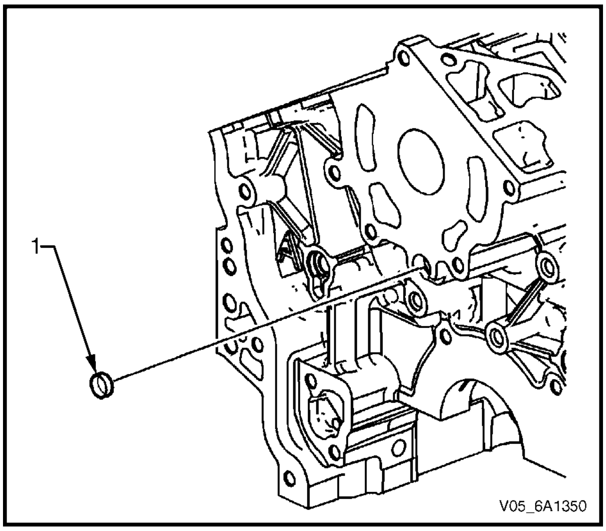

Figure 6A1 – 446

12 Remove the cylinder block-to-cylinder head alignment dowels (1).

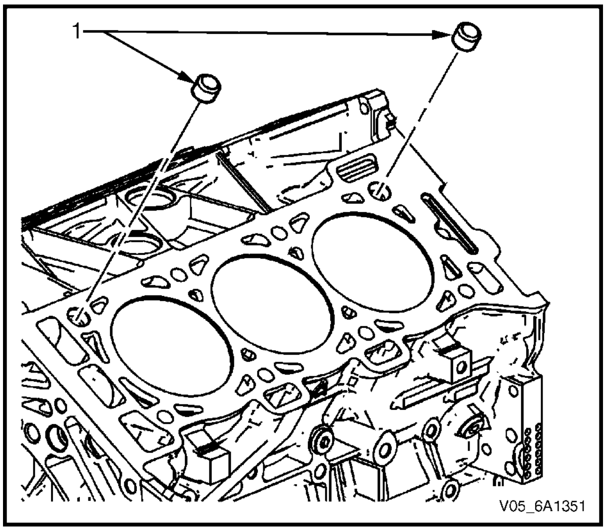

Figure 6A1 – 447

Clean

1 Remove all thread sealant, gasket material or sealant using a commercially available plastic or wood scraper.

2 Clean all the following areas with a suitable solvent:

- sealing surfaces,
- cooling passages,
- oil passages, and
- bearing journals.

3 Clean all threaded and through holes with a suitable solvent.

WARNING

Safety glasses must be worn when using compressed air.

4 Dry the engine block with compressed air.

Inspect

Visual Inspection

NOTE

The following procedure assumes the engine has been disassembled and cleaned, as described above.

1 Inspect the crankshaft bearing journals for damage or spun bearings. The crankshaft bearing journals are not repairable and if damage is found, the cylinder block assembly must be replaced.
2 Inspect the primary camshaft chain tensioner mounting surface on the engine block for burrs or any defects that would affect the sealing of the new primary camshaft chain tensioner gasket.
3 Inspect all sealing and mating surfaces for damage, repair or replace the cylinder block assembly if required.
4 Inspect all threaded and through holes for damage or excessive debris.
5 Inspect all bolts for damage, if damaged replace with new bolts only.
6 Inspect the cylinder walls for cracks or damage. The cylinder sleeves are not serviced separately, if the cylinders are damaged the cylinder block assembly must be replaced.
7 Inspect the engine block for cracks. Do not repair any cracks. If cracks are found, the cylinder block assembly must be replaced. Repair any damaged threaded holes, refer to 4.9 Thread Repair Specifications.

Measuring Cylinder Bore Diameter

1 Measure the cylinder bore diameter 37 mm from the deck face (1) using a commercially available bore gauge or Tool No. J-8087 (2).
2 Record the results and compare with the dimensions listed in the specifications, refer to 5 Specifications.

NOTE

If the cylinder diameter exceeds the specifications, the cylinder block may be oversized to 0.25 mm. Only one size of oversized pistons and rings are available for service. If the cylinder bore diameter exceeds specification by more than 0.25 mm, the cylinder block must be replaced.

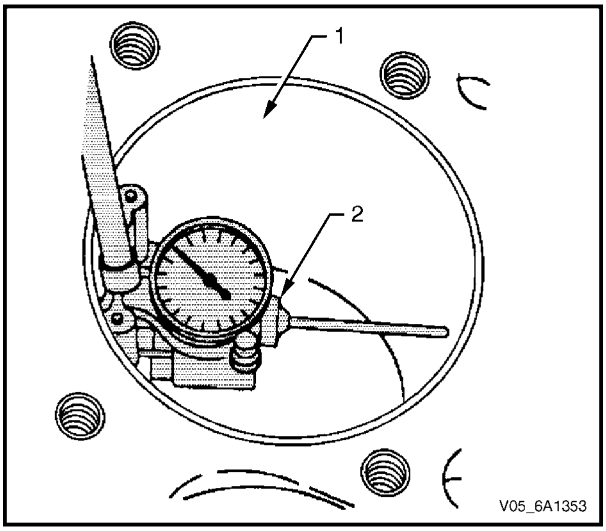

Figure 6A1 – 448

Measuring Cylinder Bore Taper

1 Measure the cylinder bore along the thrust surfaces, perpendicular to the crankshaft centreline, at 10 mm below the deck surface and record the measurement.
2 Measure the cylinder bore along the thrust surfaces, perpendicular to the crankshaft centreline, at 100 mm below the deck surface and record the measurement.
3 Calculate the difference between the two measurements. The result will be the cylinder taper.
4 Compare the results with the dimensions listed in the specifications, refer to 5 Specifications.

NOTE

If the cylinder diameter exceeds the specifications, the cylinder block may be oversized to 0.25 mm. Only one size of oversized pistons and rings are available for service. If the cylinder bore diameter exceeds specification by more than 0.25 mm, the cylinder block must be replaced.

Measuring Cylinder Bore Out-of-Round

1 Measure both the thrust and non-thrust cylinder diameter at 10 mm below the deck. Record your measurements.

2 Calculate the difference between the two measurements. The result will indicate out-of-round at the upper end of the cylinder.

3 Measure both the thrust and non-thrust cylinder diameter at 100 mm below the deck surface. Record your measurements.

4 Calculate the difference between the two measurements. The result will indicate out-of-round at the lower end of the cylinder.

5 Compare your results with the dimensions listed in the specifications, refer to 5 Specifications.

NOTE

If the cylinder diameter exceeds the specifications, the cylinder block may be oversized to 0.25 mm. Only one size of oversized pistons and rings are available for service. If the cylinder bore diameter exceeds specification by more than 0.25 mm, the cylinder block must be replaced.

Deck Flatness Inspection

1 Ensure the engine block decks are clean and free of gasket material.

2 Inspect the surface for any imperfections or scratches that could inhibit correct cylinder head gasket sealing.

3 Place a straight-edge diagonally across the cylinder block deck face surface.

4 Measure the clearance between the straight-edge and the cylinder block deck face using a feeler gauge at 4 points along the straight-edge.

5 If the warpage is less than 0.05 mm, the cylinder block deck surface does not require resurfacing.

6 If the warpage is between 0.05 ±0.20 mm or any imperfections or scratches that could inhibit correct cylinder head gasket sealing are present, the cylinder block deck surface requires resurfacing.

7 If resurfacing is required the maximum amount that can be removed is 0.25 mm.

8 If the cylinder block deck surface requires more than 0.25 mm material removal the block must be replaced.

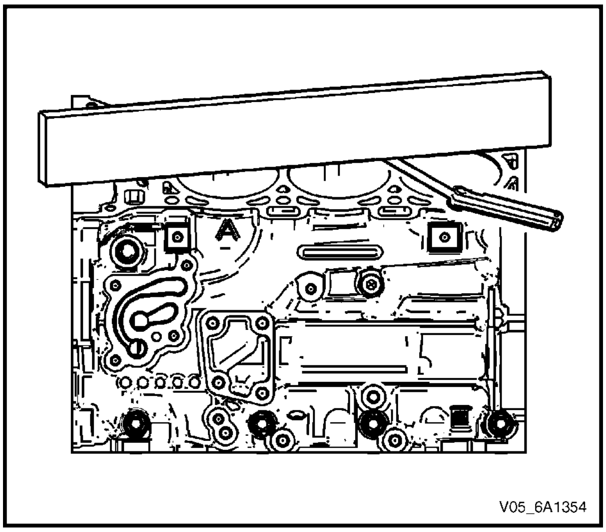

Figure 6A1 – 449

Reassemble

1 Install the cylinder block-to-cylinder head alignment dowels (1).

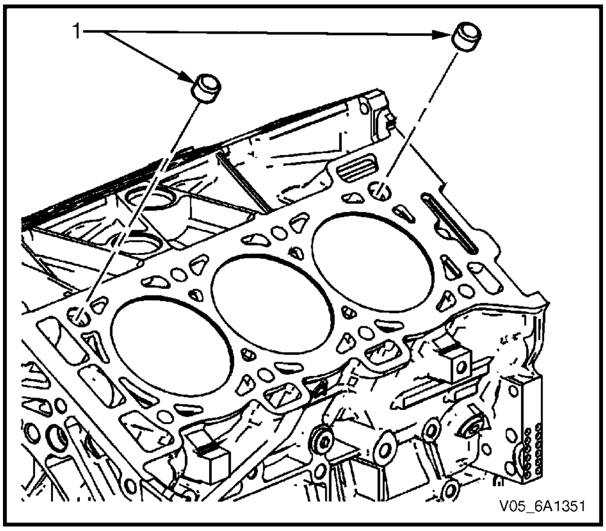

Figure 6A1 – 450

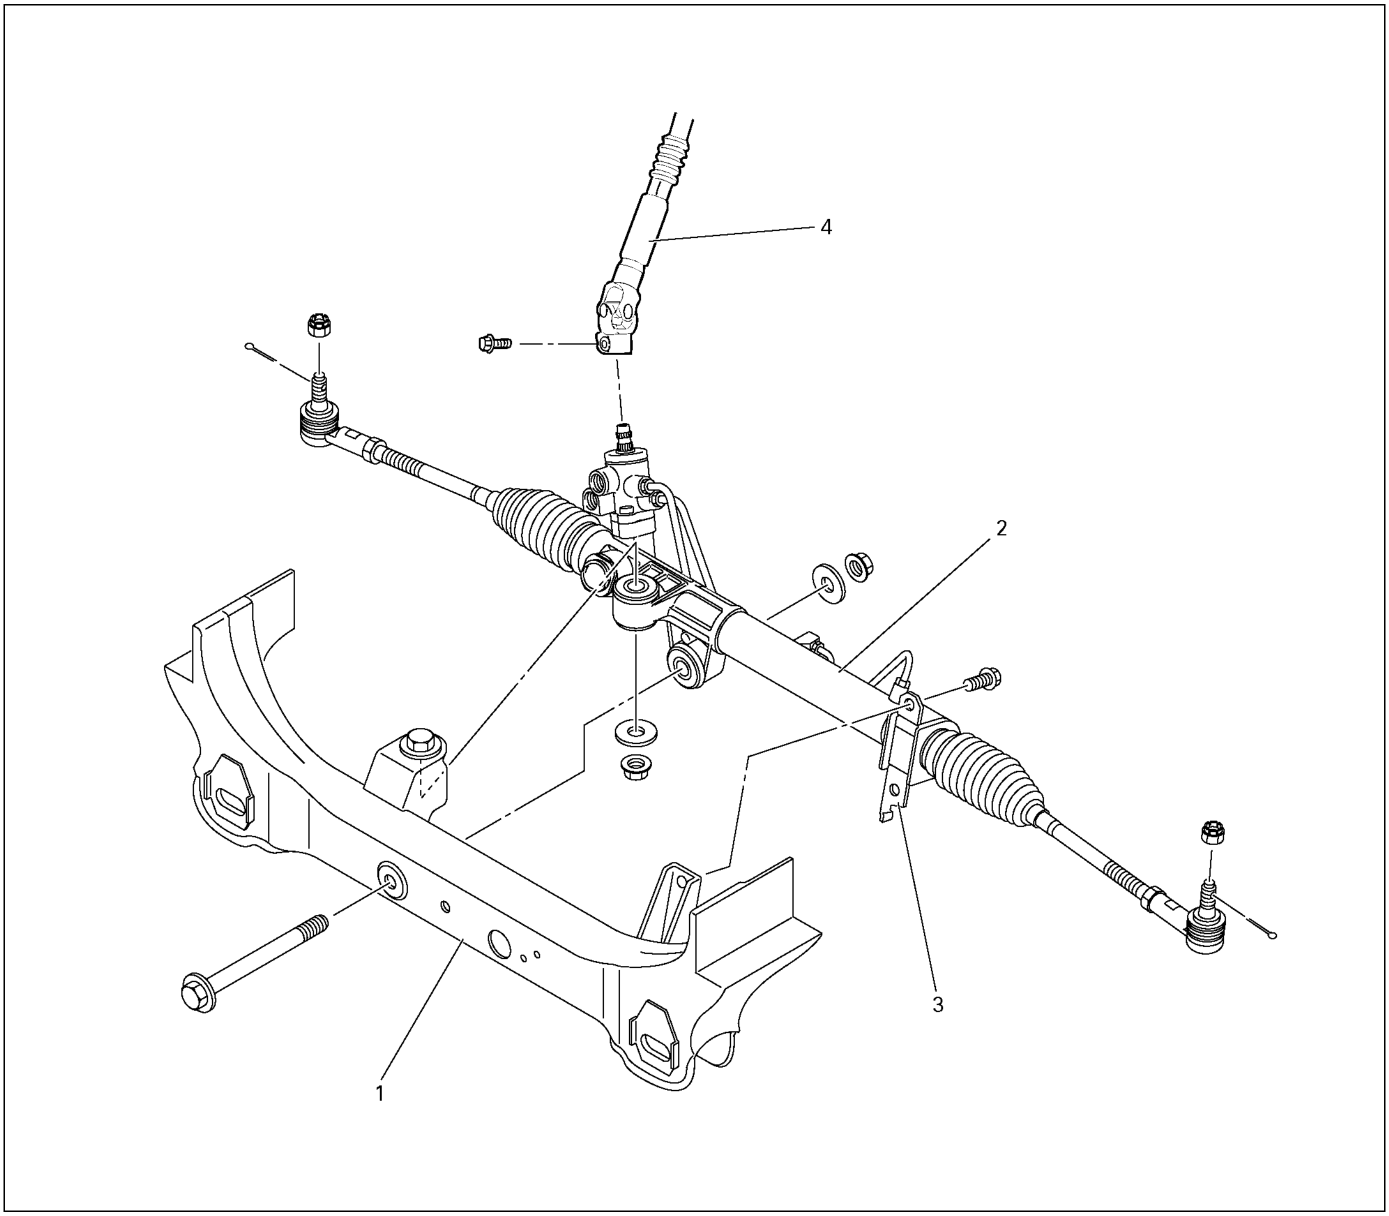
Power Steering Unit

Power Steering Unit and Associated Parts



431R300016

Legend

(1) Crossmember
(2) Power Steering Unit Assembly
(3) Bracket
(4) Universal joint (Steering shaft)

Removal

1. Remove the universal joint assembly.
   Make a setting mark across the coupling flange and steering unit to insure reassembly of the parts in the original position.
2. Drain power steering fluid.
3. Remove the tie rod end assembly from knuckle.
   Use tie rod end remover 5-8840-2005-0.

2 Install a new front oil gallery expansion plug (1).

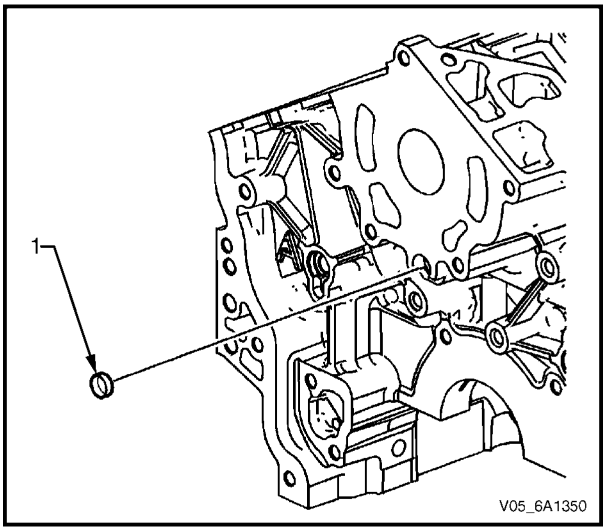


Figure 6A1 – 451

3 Install the cylinder block-to-transmission alignment dowels (1).

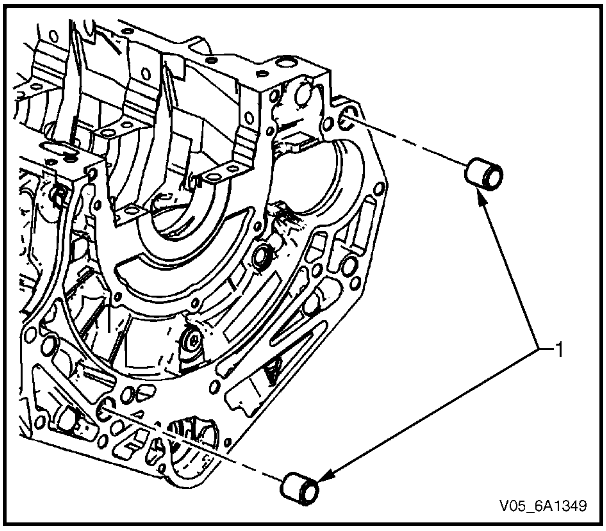

Figure 6A1 – 452

4 Place RTV sealant on new coolant expansion plugs (1) and install the new coolant expansion plugs.

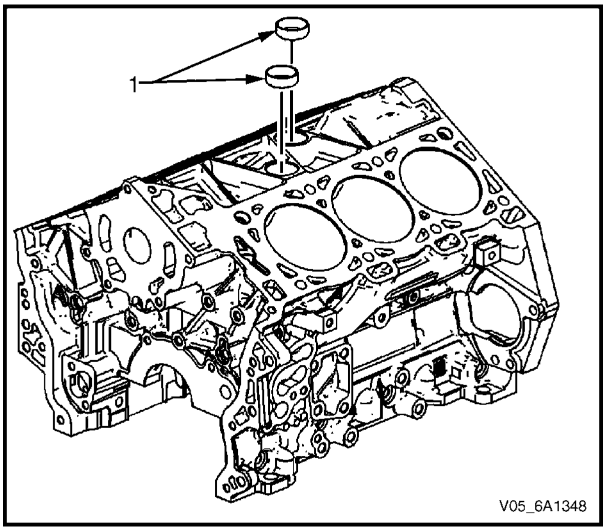

Figure 6A1 – 453

5 Install the left-hand side M20 oil gallery threaded plug (1) and tighten to the correct torque specification.

Left-hand side M20 cylinder block oil gallery threaded plug torque specification ....27.0 – 35.0 Nm

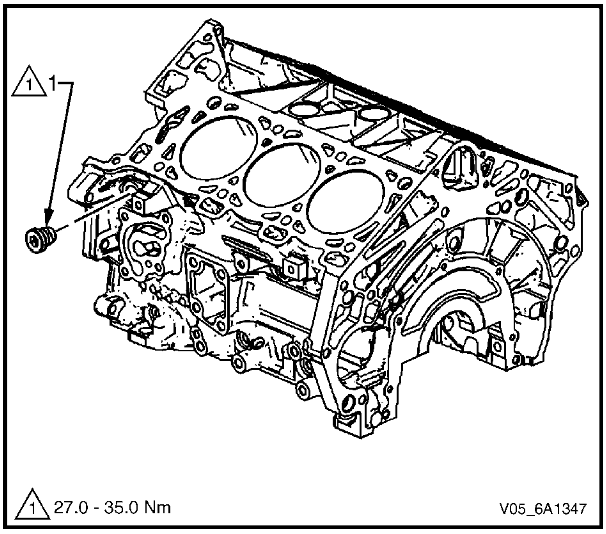

Figure 6A1 – 454

6 Install the left-hand side M14 coolant drain threaded plug (1) and tighten to the correct torque specification.

Left-hand side M14 cylinder block coolant drain threaded plug torque specification ....27.0 – 35.0 Nm

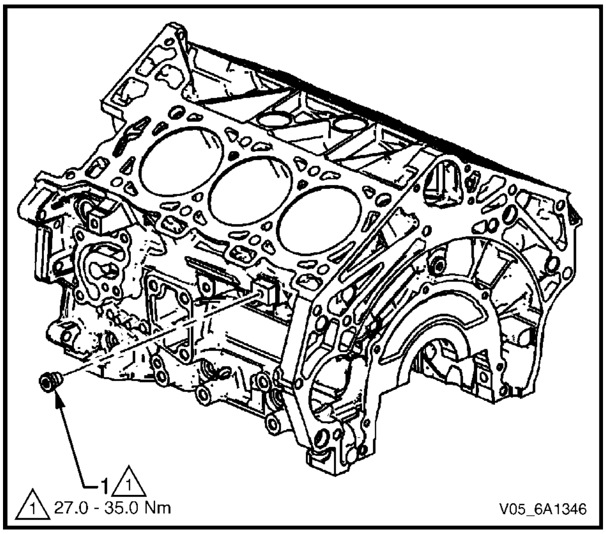

Figure 6A1 – 455

7 Install the M14 rear oil gallery threaded plug (1) and tighten to the correct torque specification.

M14 cylinder block rear oil gallery threaded plug torque specification ....27.0 – 35.0 Nm

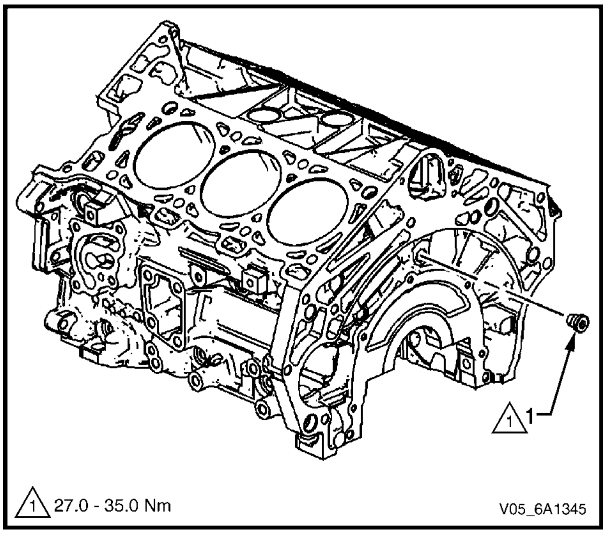

Figure 6A1 – 456

8 Install the right-hand side M14 coolant drain threaded plug (1) and tighten to the correct torque specification.

Right-hand side M14 cylinder block coolant drain threaded plug torque specification ....27.0 – 35.0 Nm

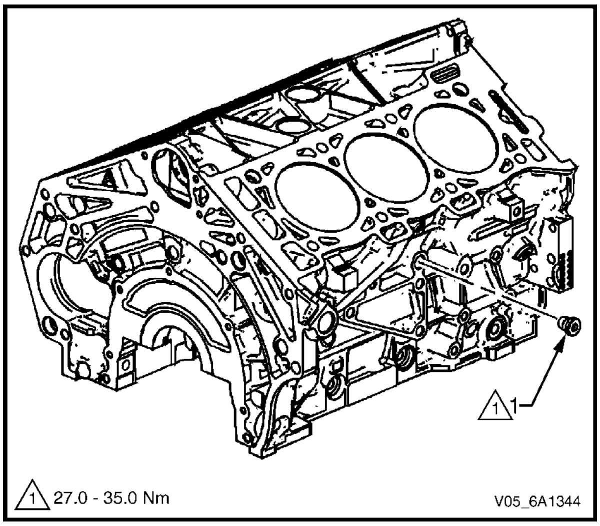

Figure 6A1 – 457

9 Install the right-hand side M14 oil gallery threaded plug (1) and tighten to the correct torque specification.

Right-hand side M14 cylinder block oil gallery threaded plug torque specification ....27.0 – 35.0 Nm

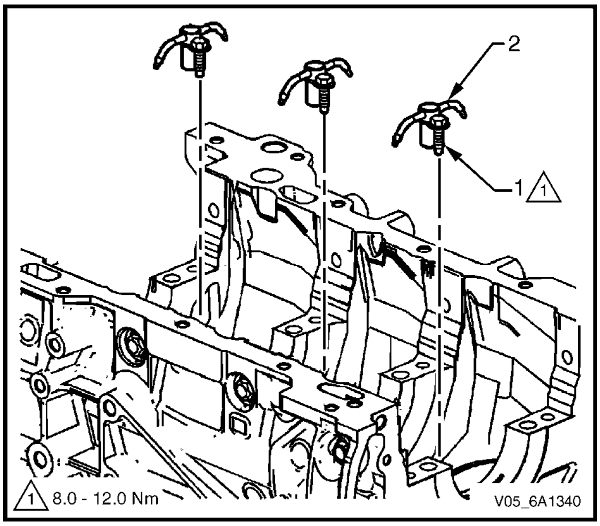

Figure 6A1 – 461

4.8 Thread Repairs

General Information

The thread repair process involves a solid, thin walled, self-locking, carbon steel, bushing type insert. During the insert installation process, the installation driver tool cold-rolls the bottom internal threads and expands the bottom external threads of the insert into the base material. This action mechanically locks the insert into place.

This Section describes the recommended method of repairing threads in three specific areas of the engine.

- general thread repair,
- cylinder block main bearing cap bolt hole thread repair, and
- cylinder head bolt hole thread repair.

For detailed descriptions of all thread specifications used refer to 4.9 Thread Repair Specifications.

The drill-bit and counter-bore tool from the thread repair kit, Tool No. J-42385-700 and J-42385-2000 are designed for use with either a suitable tap wrench or drill motor. Limited access and larger hole repair may process better using a tap wrench. An extension from Tool J 43965 may also be required to drive the thread repair tooling dependent on access to the hole being repaired. Use only a tap wrench when tapping the hole and during installation of the insert.

1 It is critical the drilling, counter boring and tapping of the hole to be repaired follows the same centreline (1) as the original hole.

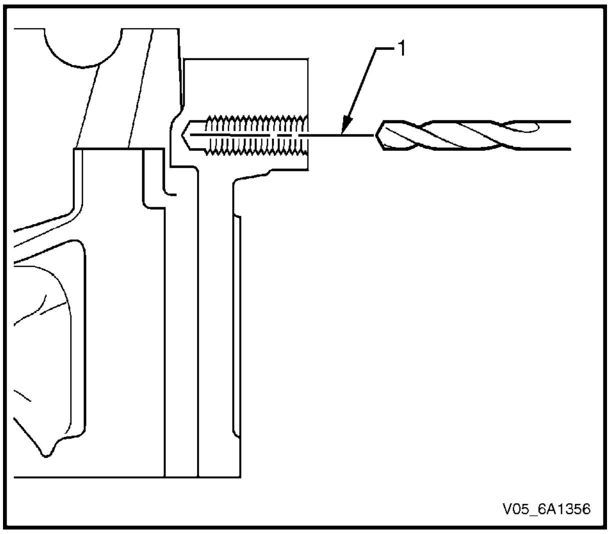

Figure 6A1 – 462

2 During the drilling and tapping of the hole being repaired, ensure the tooling is consistently machining perpendicular to the surface of the base material.

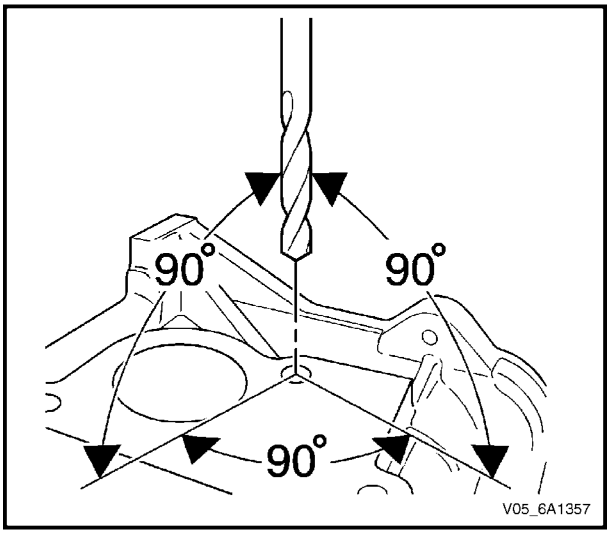

Figure 6A1 – 463

3 If the threaded hole being repaired has a base surface perpendicular to the hole centreline, tapping guides are available to aid in tapping the hole.

Tap Size	Tap Guide	Tap Size	Tap Guide	Tap Size	Tap Guide
-	J 42385	-	J 42385	-	J 42385
6 x 1.0	729	10 x 1.5	731	14 x 1.5	736
8 x 1.25	730	12 x 1.5	732	20 x 1.5	737

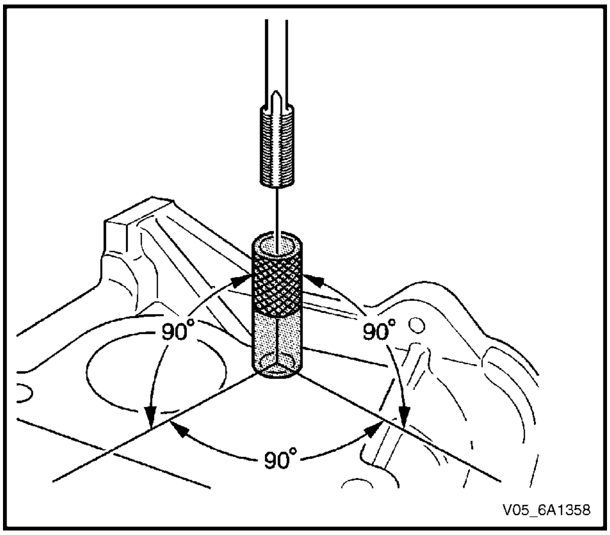

Figure 6A1 – 464

General Thread Repair

NOTE

The use of a cutting type fluid such as WD 40® or equivalent is recommended when performing the drilling, counter boring and tapping procedures

1 When installed to the correct depth, the flange (1) of the insert will be seated against the counter bore of the drilled/tapped hole and just below the surface (2) of the base material.

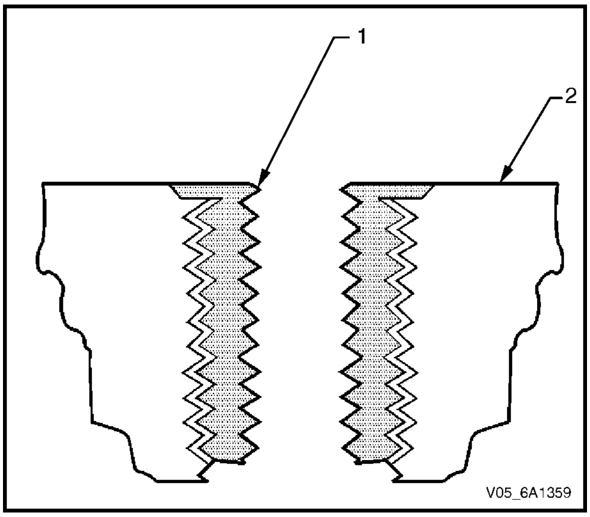

Figure 6A1 – 465

NOTE

During the drilling process, repeatedly remove the drill and clean the swarf from the hole and the flutes of the drill.

CAUTION

Do not drill any further than the original hole depth.

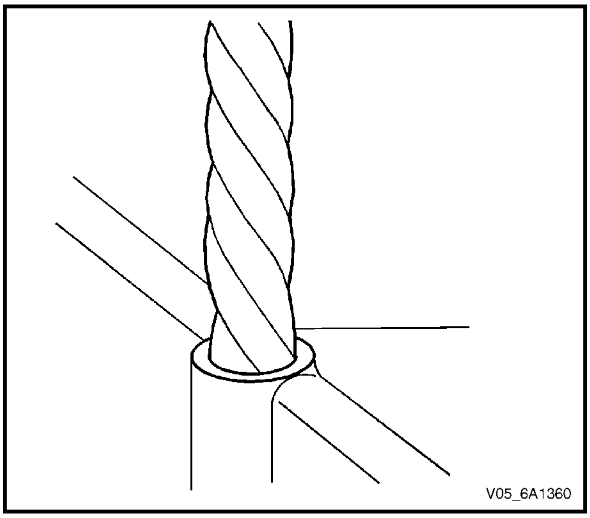

Figure 6A1 – 466

2 Drill out the threads of the damaged hole to the correct depth for the thread being repaired:

- M6 inserts require a minimum drill depth of 15 mm.
- M8 inserts require a minimum drill depth of 20 mm.
- M10 inserts require a minimum drill depth of 23.5 mm.

NOTE

All swarf must be removed from the drilled hole prior to tapping.

WARNING

Safety glasses must be worn when using compressed air.

3 Using compressed air, clean out any swarf.

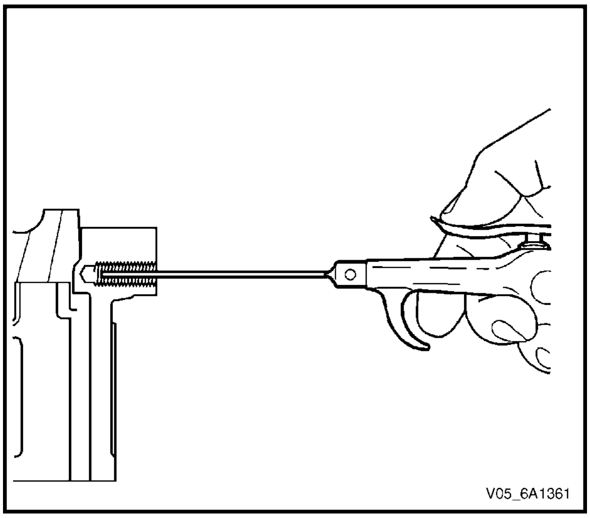

Figure 6A1 – 467

NOTE

A correctly counter bored hole will show a slight burnishing on the surface of the base material for 360 degrees around the drilled hole.

4 Counter bore the drilled hole to the full depth permitted by the tool (1).

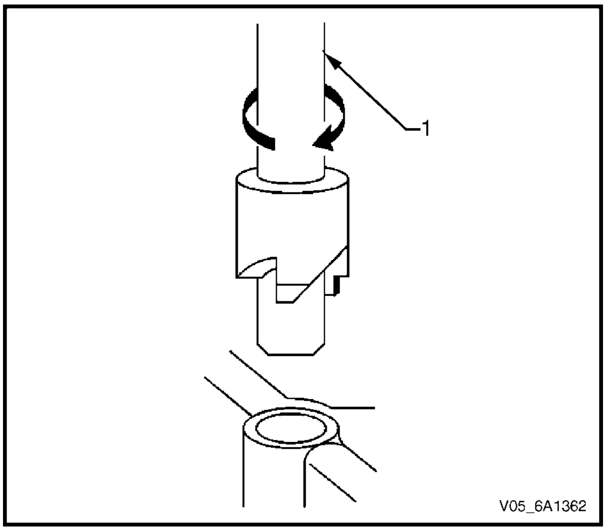

Figure 6A1 – 468

NOTE

All swarf must be removed from the drilled hole prior to tapping.

WARNING

Safety glasses must be worn when using compressed air.

5 Using compressed air, clean out any swarf.

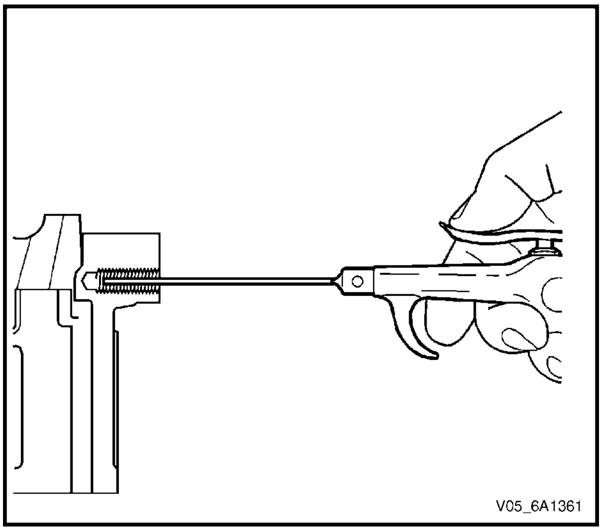

Figure 6A1 – 469

NOTE

- During the tapping process, repeatedly remove the tap and clean the swarf from the hole and the flutes of the tap.
- Ensure the tap has created full threads at least to the depth equal to the insert length.

6 Using a suitable tapping wrench, tap the threads of the drilled hole by hand only.

- M6 inserts require a minimum drill depth of 15 mm.
- M8 inserts require a minimum drill depth of 20 mm.
- M10 inserts require a minimum drill depth of 23.5 mm.

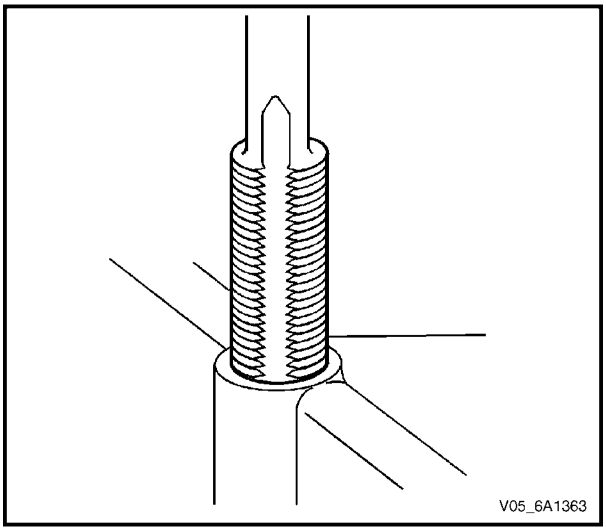

Figure 6A1 – 470

NOTE

All swarf must be removed from the tapped hole prior to insert installation.

WARNING

Safety glasses must be worn when using compressed air.

7 Using compressed air, clean out any swarf.

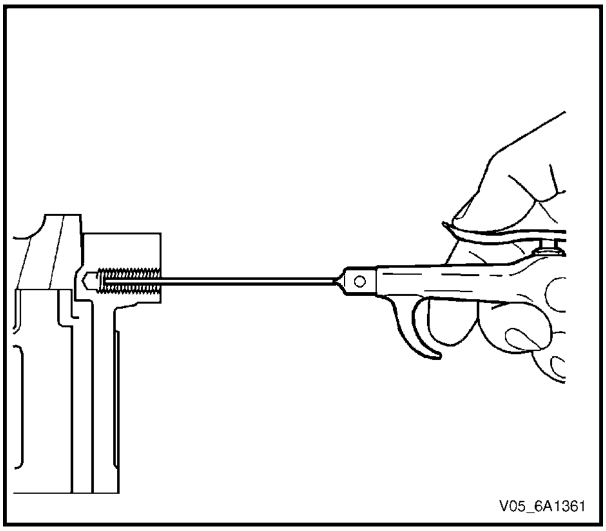

Figure 6A1 – 471

8 Spray a commercially available thread cleaner into the tapped hole.

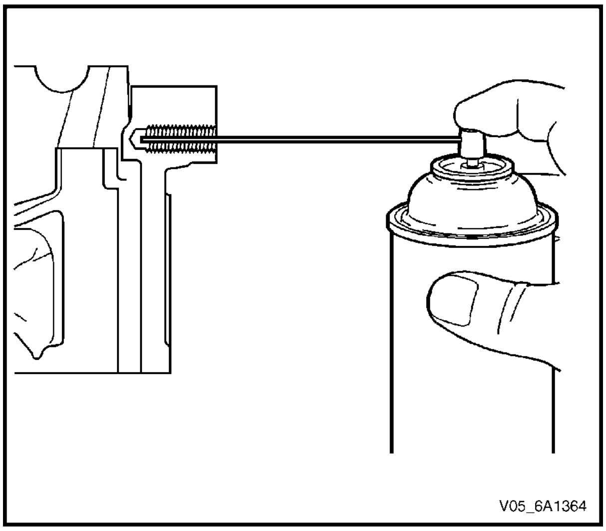

Figure 6A1 – 472

NOTE

All swarf must be removed from the tapped hole prior to insert installation.

WARNING

Safety glasses must be worn when using compressed air.

9 Using compressed air, clean out any swarf.

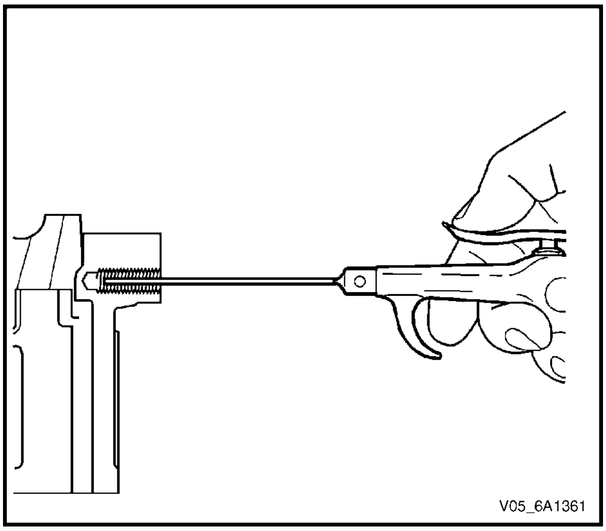

Figure 6A1 – 473

NOTE

Do not allow oil or other foreign material to contact the outside diameter (OD) of the insert.

10 Lubricate the threads of the driver installation tool (2) with the driver oil (1).

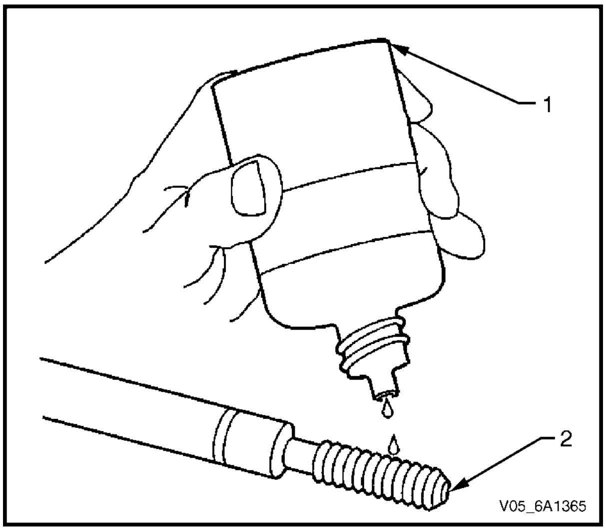

Figure 6A1 – 474

11 Install the insert (2) onto the driver installation tool (1).

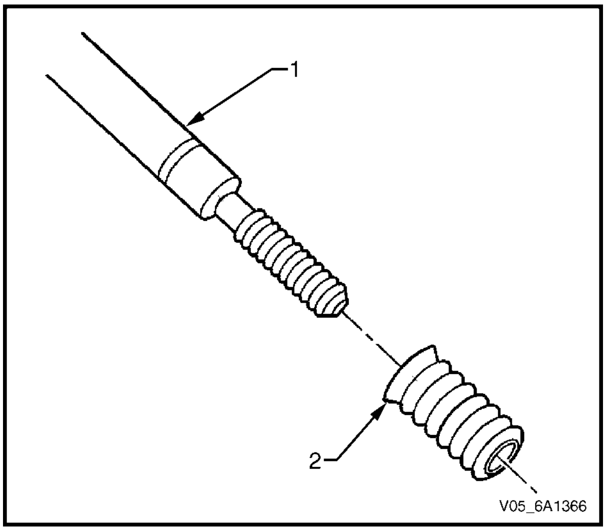

Figure 6A1 – 475

12 Apply thread lock sealant (1) such as Loctite 277® or equivalent to the insert OD threads (2).

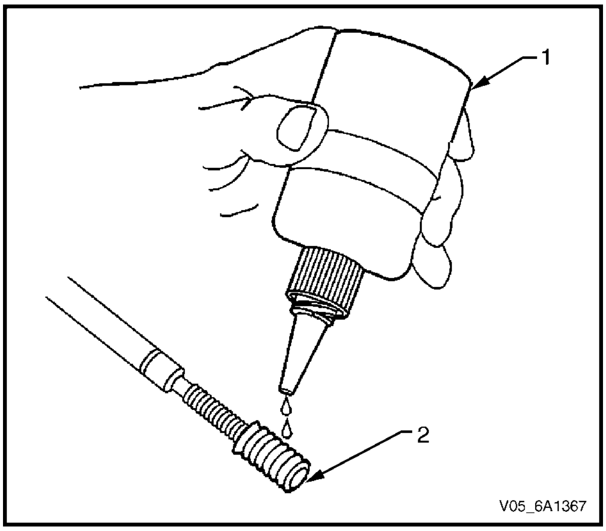

Figure 6A1 – 476

13 Install the insert (2) into the tapped hole by hand only.

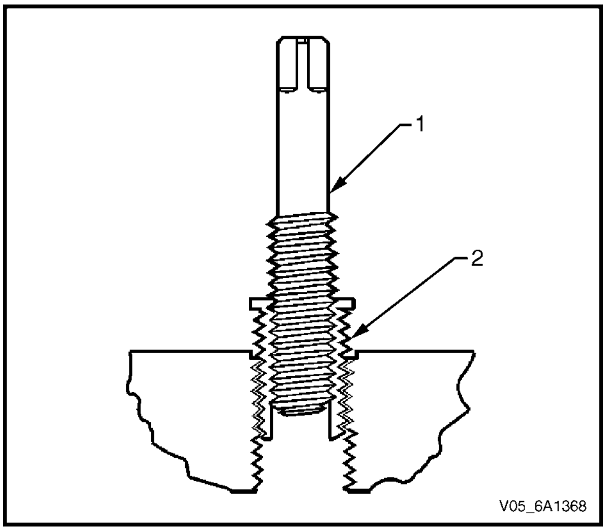

Figure 6A1 – 477

CAUTION

If the insert will not thread down until the flange contacts the counter bore surface, remove the insert immediately with a screw extracting tool and inspect the tapped hole for any remaining swarf and/or incorrect tapping.

14 Install the insert until the flange (2) of the insert contacts the counter bore surface.

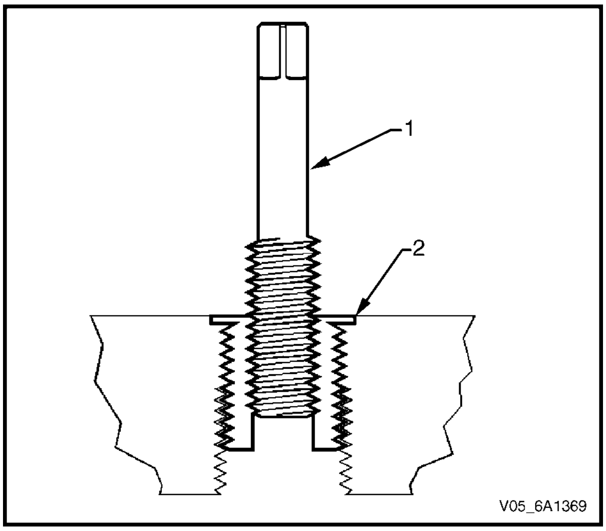

Figure 6A1 – 478

NOTE

The driver installation tool will tighten up before cutting completely through the insert. This is acceptable. The threads at the bottom of the insert are being formed and the insert is mechanically locking the insert into the base material threads.

15 Continue to rotate the driver installation tool (1) through the insert (2)

16 Remove the driver installation tool.

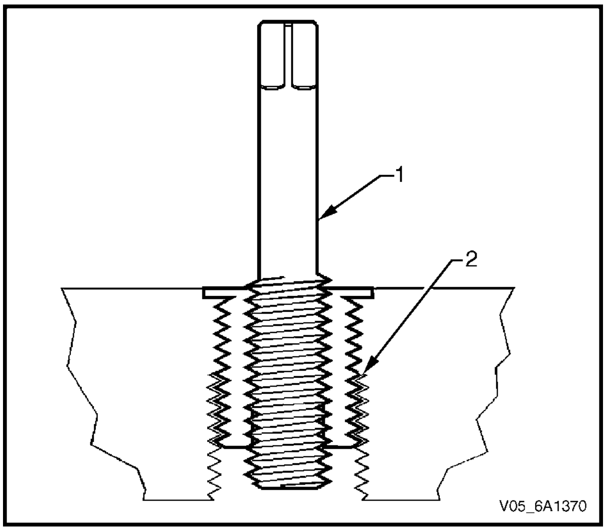

Figure 6A1 – 479

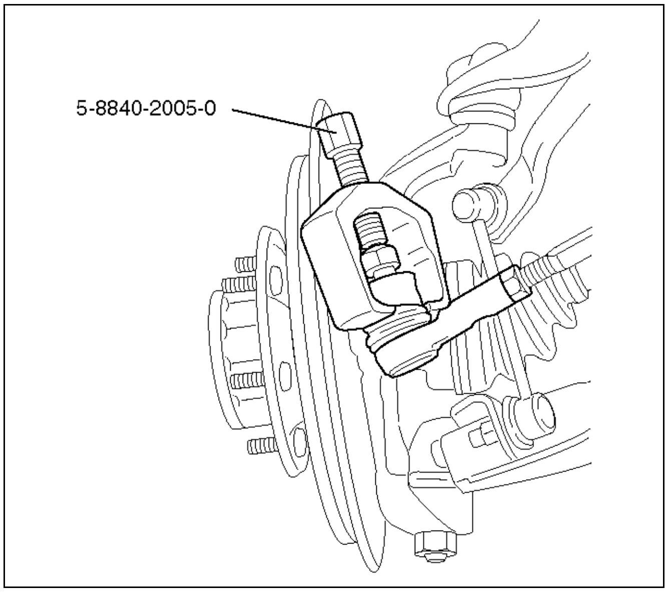

901RW270

4. Disconnect the feed line and return line from steering unit.
   Remove the clips on the crossmember and frame.
   Wire the power steering line to frame.

NOTE: Take care to prevent foreign matter from entering when disconnecting the power steering line.

5. Remove the power steering unit from the crossmember.

Installation

1. Install power steering unit on crossmember.
   Tighten fixing bolt and nut to specified torque.
   Torque:
   116 N·m (11.8 kgf·m/85 lb·ft)
   Torque:
   220 N·m (22.4 kgf·m/162 lb·ft)
2. Connect the feed line and return line.
   Torque:
   25 N·m (2.5 kgf·m/18 lb·ft)
3. Install tie-rod end assembly on knuckle.
   Torque:
   98 N·m (10 kgf·m/72 lb·ft)
4. Align the setting marks on the universal joint (applied at disassembly) with the setting marks on the power steering unit. Connect the universal joint assembly to the power steering unit.
5. Tighten the universal joint bolt to the specified torque.
   Torque:
   31 N·m (3.2 kgf·m/23 lb·ft)
6. Install the stone guard.
7. Bleed the system.
   Refer to Bleeding the Power Steering System in this section.

17 Inspect the insert for correct installation into the tapped hole. A correctly installed insert (1) will be either flush or slightly below flush with the surface of the base material (2).

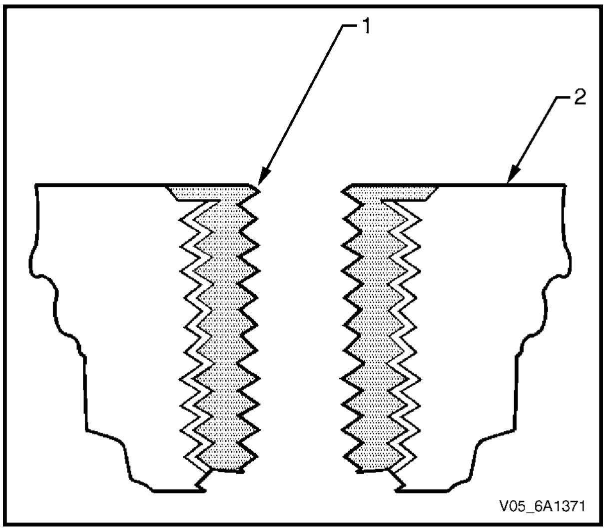

Figure 6A1 – 480

18 Any installed insert that restricts or blocks an oil or engine coolant passage (3) will need to have the oil or engine coolant passage drilled out (4) to the original size of the oil or engine coolant passage. After drilling the restriction or blockage, clean out any swarf and thread the installation driver tool through the insert again to remove any burrs caused by the drilling of the oil or engine coolant passage.

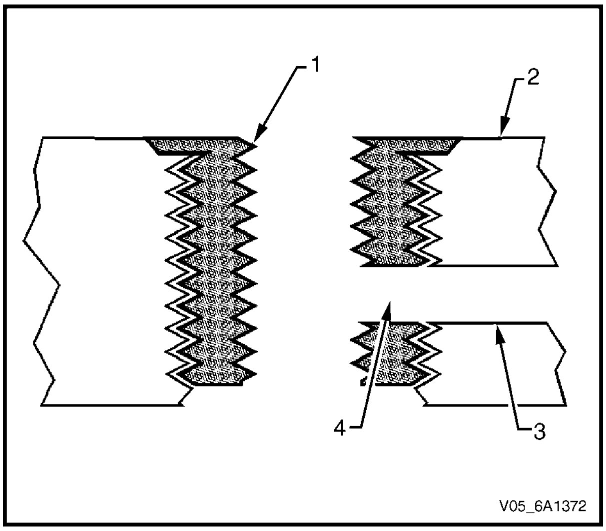

Figure 6A1 – 481

Main Bearing Cap Bolt Hole Thread Repair

The crankshaft main bearing bolt hole thread repair tools are in Tool No. J 42385-2000 and J 42385-700 which consist of the following:

- Drill (1) for outboard holes J 42385-702
- Tap (2) for outboard holes J 42385-703
- Installation driver (3) for outboard holes J 42385-704
- Bushing (4) for outboard holes J 42385-726
- Alignment pin (5) for outboard holes J 42385-727
- Bolts (6) for outboard holes J 42385-728
- Drill (7) for inboard holes J 42385-720
- Tap (8) for inboard holes J 42385-721
- Installation driver (9) for inboard holes J 42385-722
- Bushing (10) J 42385-713
- Alignment pin (11) J 42385-308
- Bolts (12) J 42385-734
- Fixture plate (13) J 42385-712

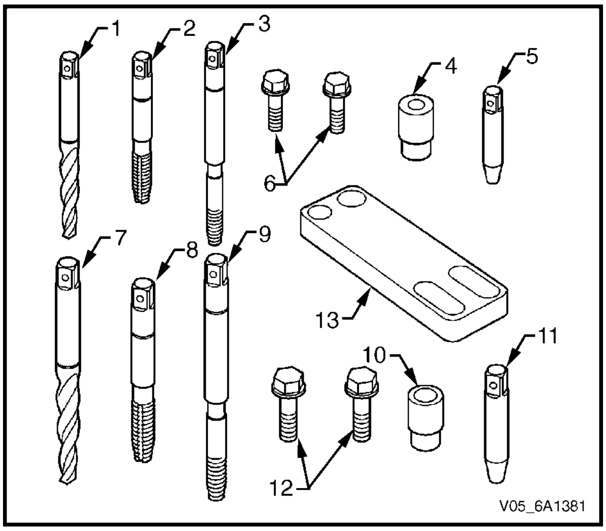

Figure 6A1 – 482

NOTE

- Ensure the fixture plate is installed during the machining and installation processes of the insert.
- The use of a cutting type fluid such as WD 40® or equivalent is recommended when performing the drilling, counter boring and tapping procedures.
- When installed to the correct depth, the flange of the insert will be seated against the counter bore of the drilled/tapped hole.

1 Position the fixture plate (3) with the bushing (2) installed over the crankshaft main cap bolt hole to be repaired.

2 Loosely install the fixture plate bolts (1) into the remaining crankshaft main cap bolt holes.

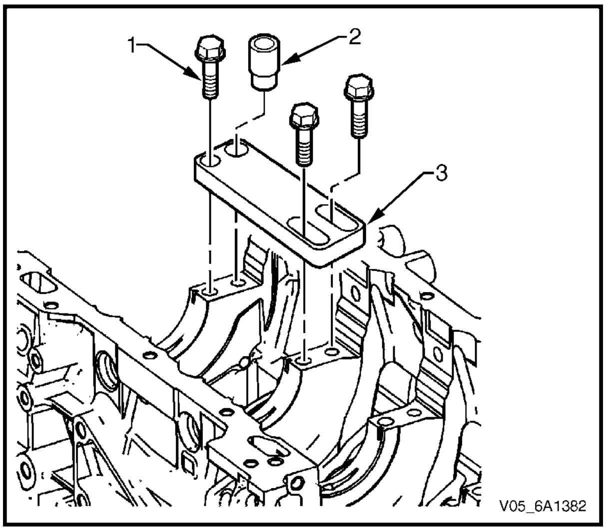

Figure 6A1 – 483

3 Position the alignment pin (1) through the bushing and into the crankshaft main cap bolt hole.

4 With the alignment pin in the desired crankshaft main cap bolt hole, tighten the fixture retaining bolts (2).

5 Remove the alignment pin.

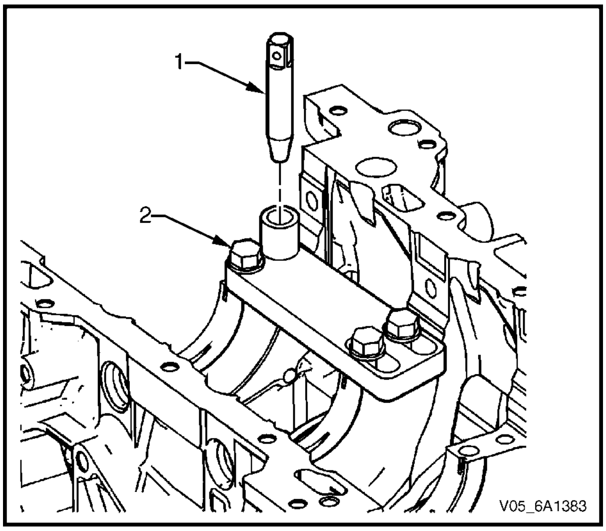

Figure 6A1 – 484

6 Drill the crankshaft main bolt hole until the mark (1) on the drill aligns with the top of the drill bushing (2).

NOTE

During the drilling process, repeatedly remove the drill and clean the swarf from the hole and the flutes of the drill.

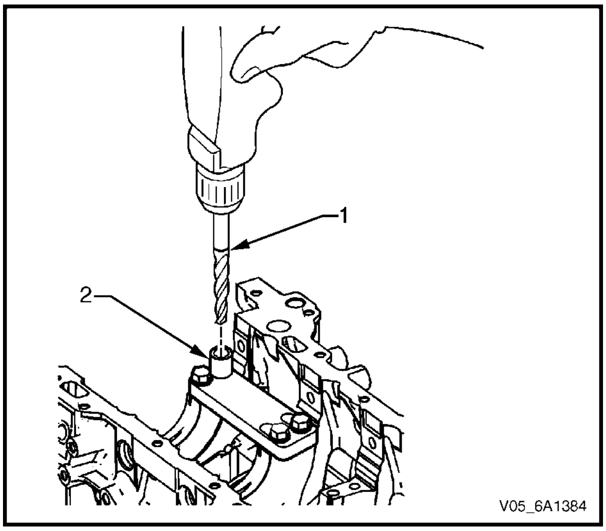

Figure 6A1 – 485

NOTE

All swarf must be removed from the drilled hole prior to tapping.

WARNING

Safety glasses must be worn when using compressed air.

7 Using compressed air, clean out any swarf.

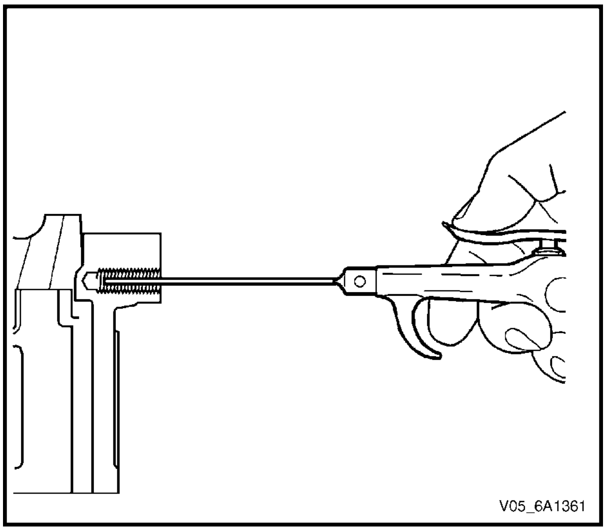

Figure 6A1 – 486

NOTE

- During the tapping process, repeatedly remove the tap and clean the swarf from the hole and the flutes of the tap.
- Ensure the tap has created full threads at least to the depth equal to the insert length.

CAUTION

Do not remove the fixture plate during the machining and installation processes of the insert.

8 Using a suitable tapping wrench, tap the threads of the drilled hole by hand only.

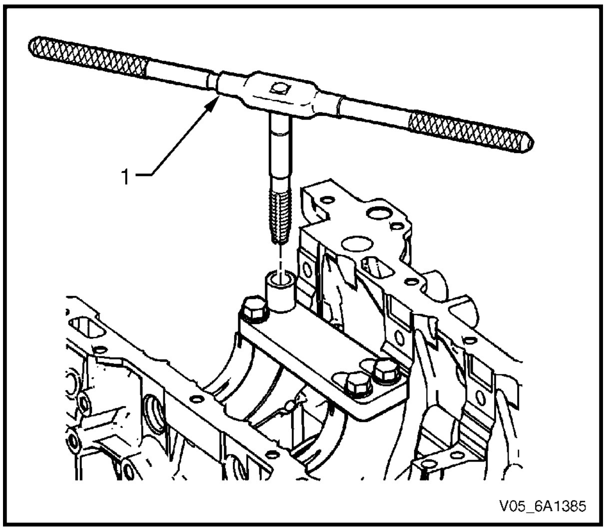

Figure 6A1 – 487

9 In order to tap the new threads for the insert to the correct depth, rotate the tap into the crankshaft main cap bolt hole until the mark (1) on the tap aligns with the top of the drill bushing (2).

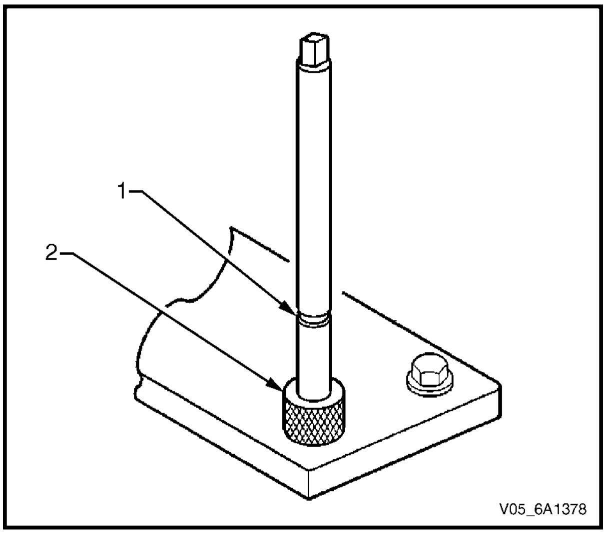

Figure 6A1 – 488

NOTE

All swarf must be removed from the tapped hole prior to insert installation.

WARNING

Safety glasses must be worn when using compressed air.

10 Using compressed air, clean out any swarf.

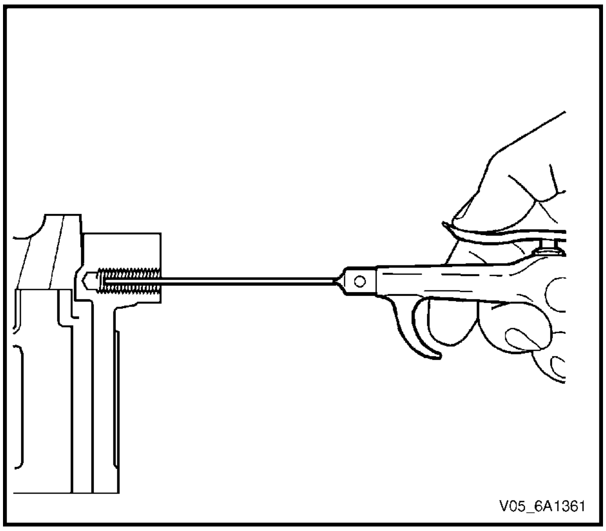

Figure 6A1 – 489

11 Spray a commercially available thread cleaner into the tapped hole.

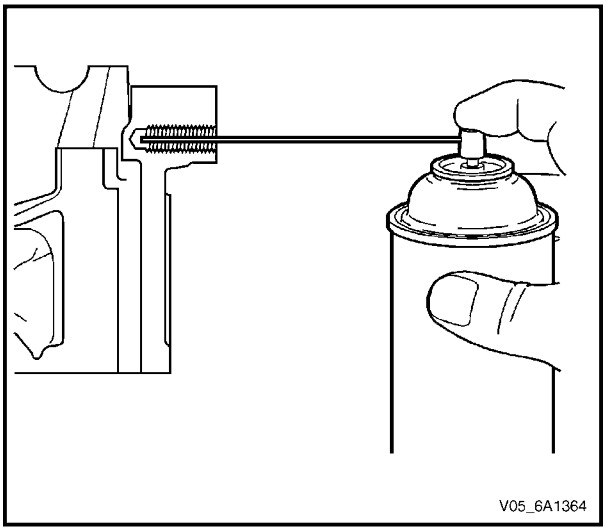

Figure 6A1 – 490

NOTE

All swarf must be removed from the tapped hole prior to insert installation.

WARNING

Safety glasses must be worn when using compressed air.

12 Using compressed air, clean out any swarf.

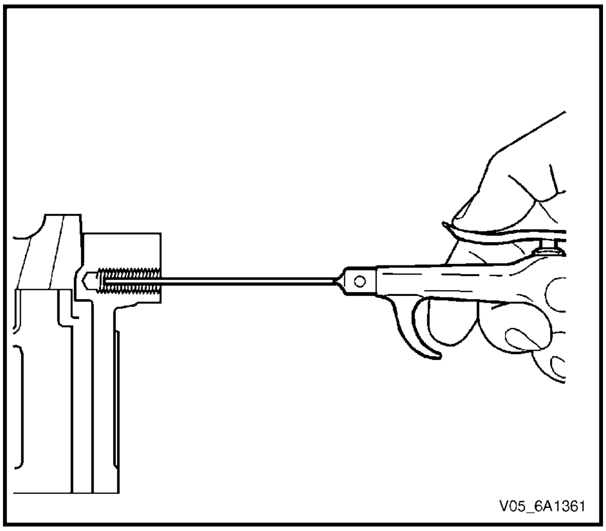

Figure 6A1 – 491

NOTE

- Do not remove the fixture plate, ensure the fixture plate is installed during the installation process of the insert.
- Do not allow oil or other foreign material to contact the outside diameter (OD) of the insert.

13 Lubricate the threads of the driver installation tool (2) with the driver oil (1).

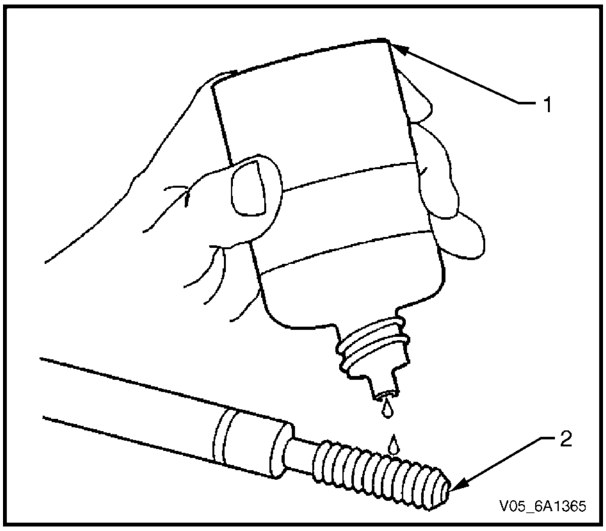

Figure 6A1 – 492

14 Install the insert (2) onto the driver installation tool (1).

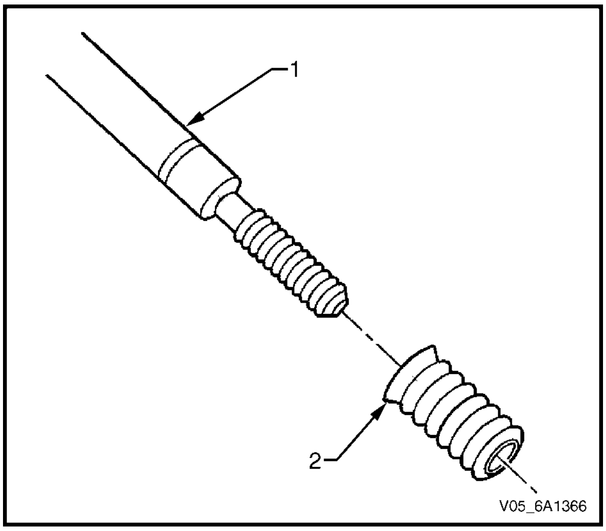

Figure 6A1 – 493

15 Apply thread lock sealant (1) such as Loctite 277® or equivalent to the insert OD threads (2).

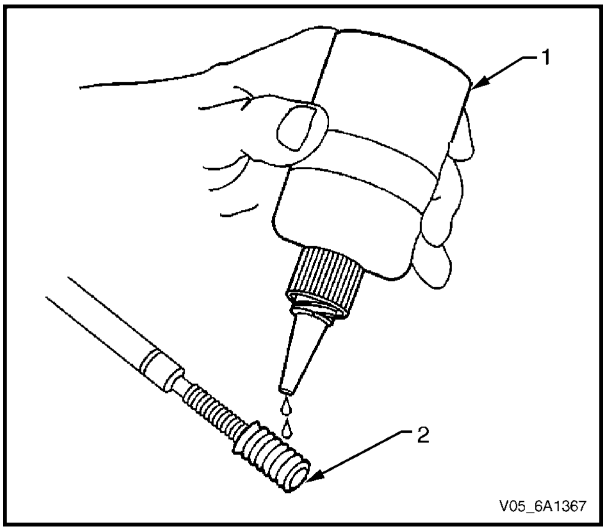

Figure 6A1 – 494

16 Install the insert and installation driver (1) to the tapped hole by hand only.

17 Start the insert into the threaded hole.

CAUTION

If the insert will not thread down until the flange contacts the counter-bored surface, remove the insert immediately with a screw extracting tool and inspect the tapped hole for any remaining swarf and/or incorrect tapping.

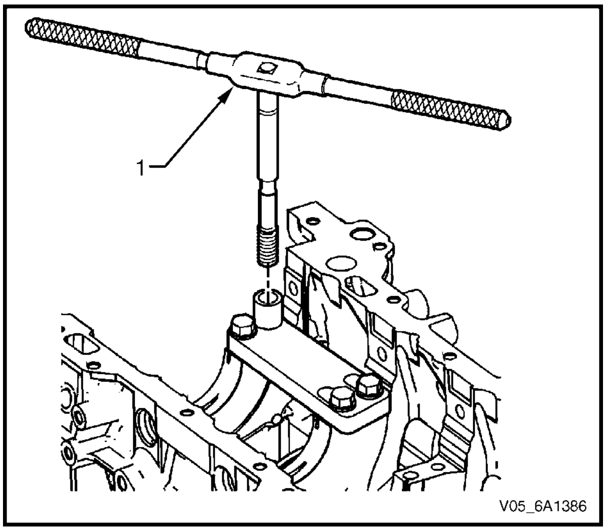

Figure 6A1 – 495

18 Install the insert until the flange of the insert contacts the counter-bored surface.

NOTE

The driver installation tool will tighten up before cutting completely through the insert. This is acceptable. The threads at the bottom of the insert are being formed and the insert is mechanically locking the insert into the base material threads.

19 Continue to rotate the driver installation tool through the insert.

20 Rotate the driver installation tool until the mark (1) on the driver installation tool aligns with the top of the drill bushing (2).

21 Inspect the insert for correct installation into the tapped hole.

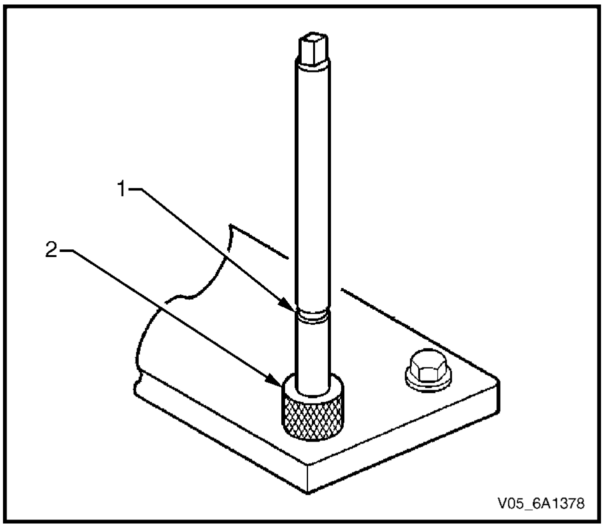

Figure 6A1 – 496

22 Remove the fixture plate bolts (1), bushing (2) and fixture plate (3).

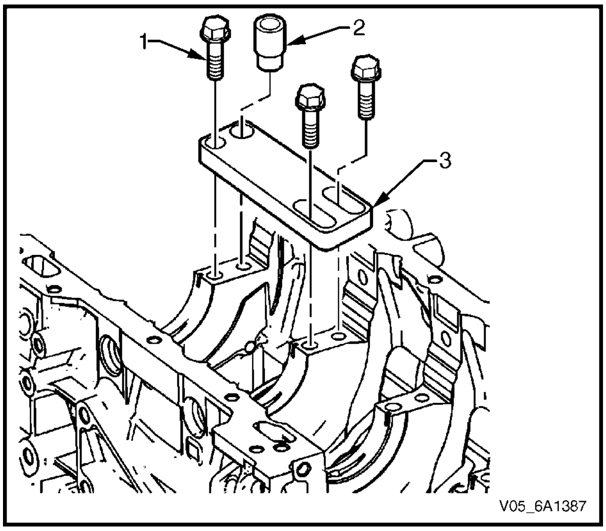

Figure 6A1 – 497

Cylinder Head Bolt Hole Thread Repair

The cylinder head bolt hole thread repair tools are in Tool No. J 42385-2000 and J 42385-700 which consist of the following:

- Drill (1) J 42385-723
- Tap (2) J 42385-724
- Installation driver (3) J 42385-725
- Alignment pin (4) J 42385-303
- Bushing (5) J 42385-302
- Bolts (6) J 42385-733
- Fixture plate (7) J 42385-401

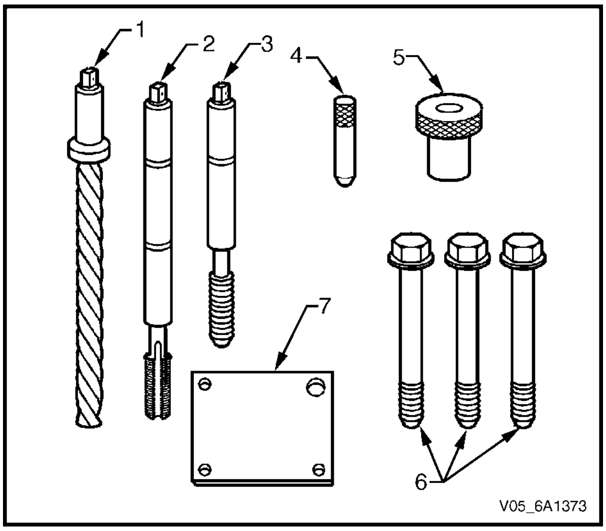

Figure 6A1 – 498

NOTE

- Ensure the fixture plate is installed during the machining and installation processes of the insert.
- The use of a cutting type fluid such as WD 40® or equivalent is recommended when performing the drilling, counter boring and tapping procedures.
- When installed to the correct depth, the flange of the insert will be seated against the counter bore of the drilled/tapped hole.

1 Position the fixture plate (3) with the bushing (1) installed over the cylinder head bolt hole to be repaired (4).

2 Loosely install the fixture plate bolts (2) into the remaining cylinder head bolt holes.

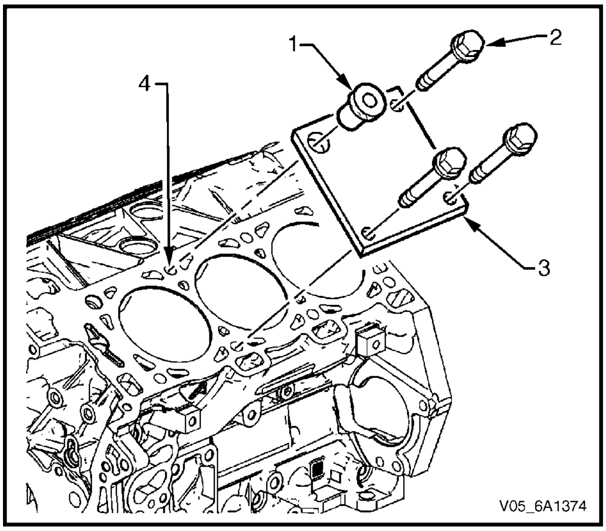

Figure 6A1 – 499

3 Position the alignment pin (1) through the bushing and into the cylinder head bolt hole.

4 With the alignment pin in the desired cylinder head bolt hole, tighten the fixture retaining bolts (2).

5 Remove the alignment pin.

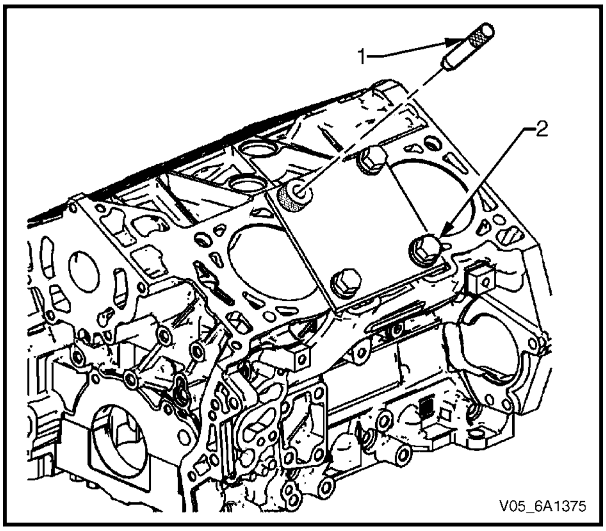

Figure 6A1 – 500

NOTE

During the drilling process, repeatedly remove the drill and clean swarf from the hole and the flutes of the drill.

6 Drill the hole until the stop collar contacts the top of the drill bushing.

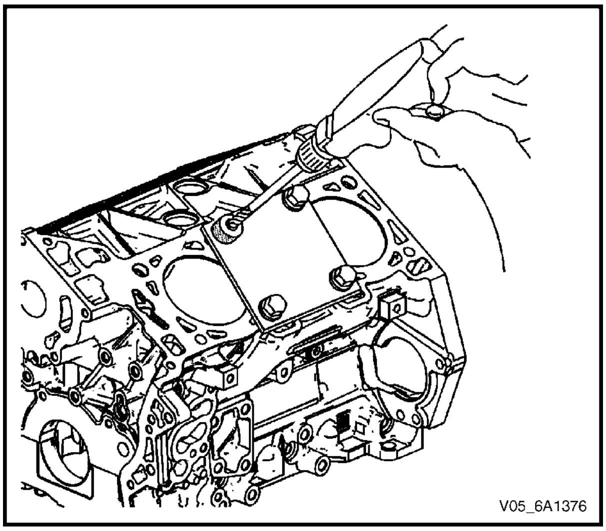

Figure 6A1 – 501

NOTE

All swarf must be removed from the drilled hole prior to tapping.

WARNING

Safety glasses must be worn when using compressed air.

7 Using compressed air, clean out any swarf.

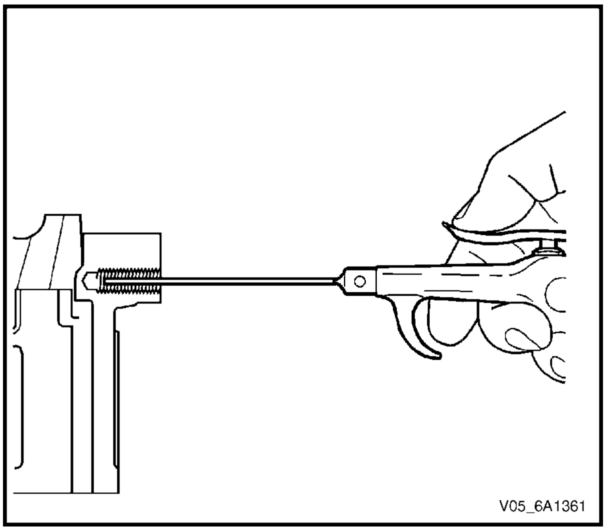

Figure 6A1 – 502

CAUTION

Do not remove the fixture plate during the machining and installation processes of the insert.

NOTE

- During the tapping process, repeatedly remove the tap and clean swarf from the hole and the flutes of the tap.
- Ensure the tap has created full threads at least to the depth equal to the insert length.

8 Using a suitable tapping wrench, tap the threads of the drilled hole by hand only.

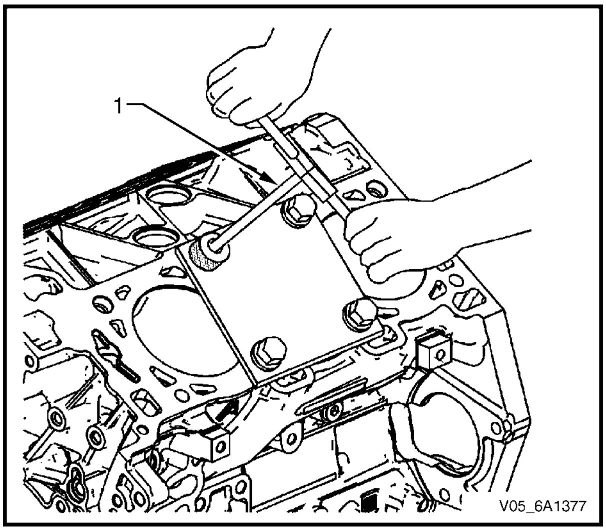

Figure 6A1 – 503

9 In order to tap the new threads for the insert to the correct depth, rotate the tap into the cylinder head bolt hole until the mark (1) on the tap aligns with the top of the drill bushing (2).

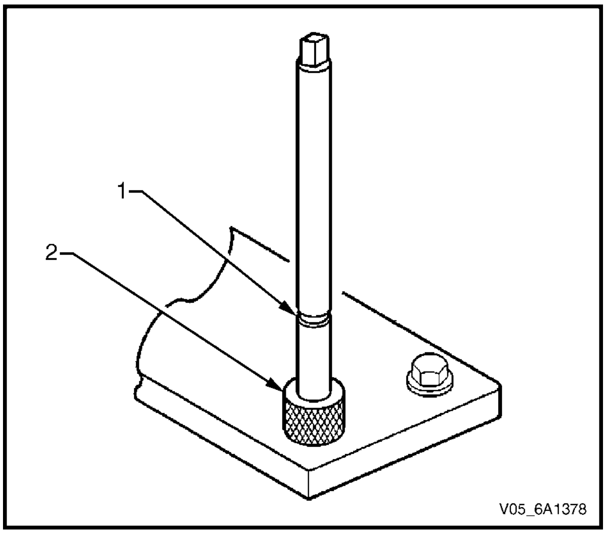

Figure 6A1 – 504

NOTE

Remove the fixture plate prior to installing the insert with the installer tool.

10 Remove the bushing (1) and fixture plate bolts (2) from the cylinder block (4) and remove the fixture plate (3).

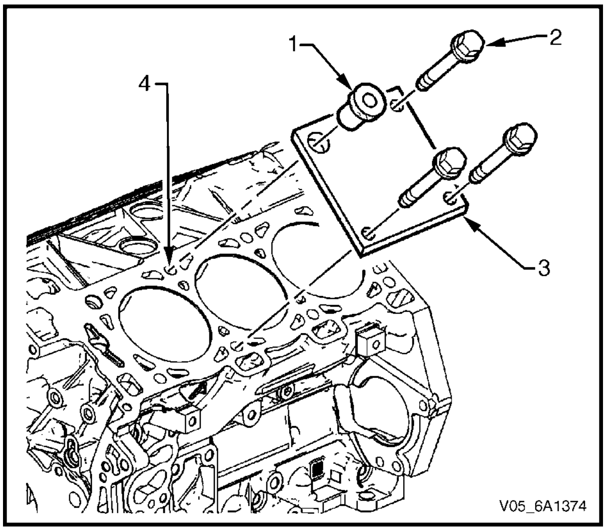

Figure 6A1 – 505

NOTE

All swarf must be removed from the tapped hole prior to insert installation.

WARNING

Safety glasses must be worn when using compressed air.

11 Using compressed air, clean out any swarf.

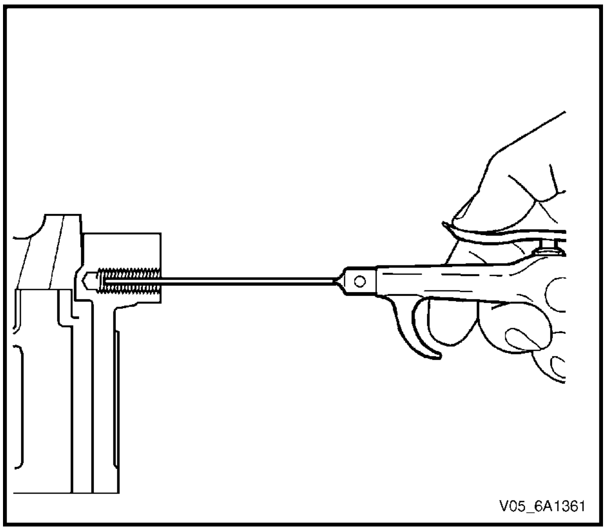

Figure 6A1 – 506

12 Spray a commercially available thread cleaner into the tapped hole.

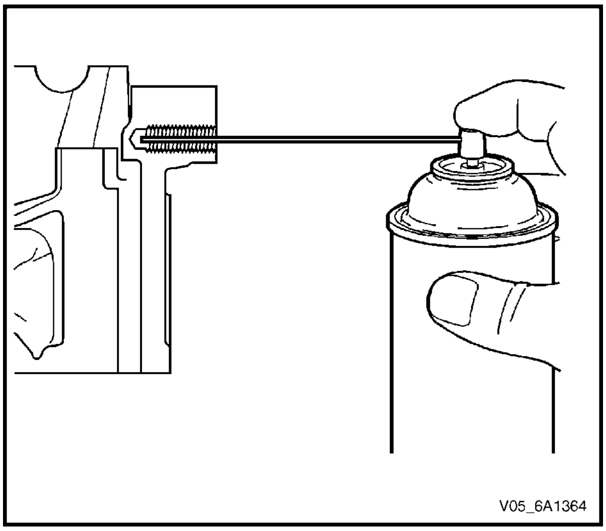

Figure 6A1 – 507

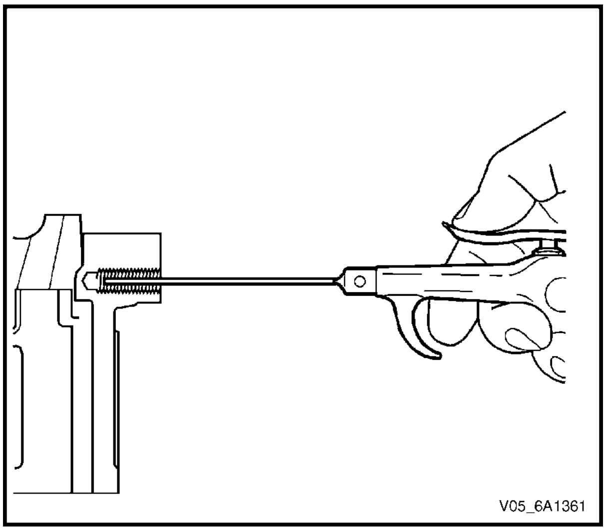

Figure 6A1 – 508

NOTE

Do not allow oil or other foreign material to contact the outside diameter (OD) of the insert.

14 Lubricate the threads of the driver installation tool (2) with the driver oil (1).

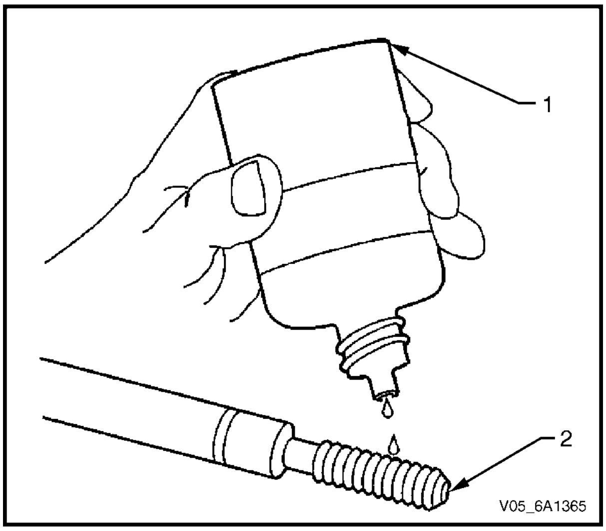

Figure 6A1 – 509

15 Install the insert (2) onto the driver installation tool (1).

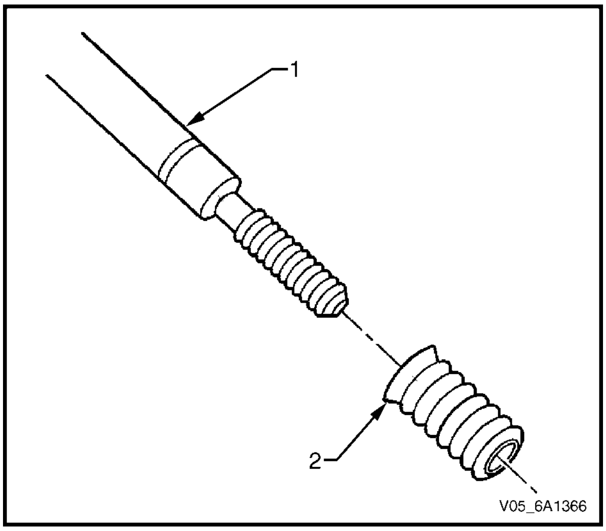

Figure 6A1 – 510

16 Apply thread lock sealant (1) such as Loctite 277® or equivalent to the insert OD threads (2).

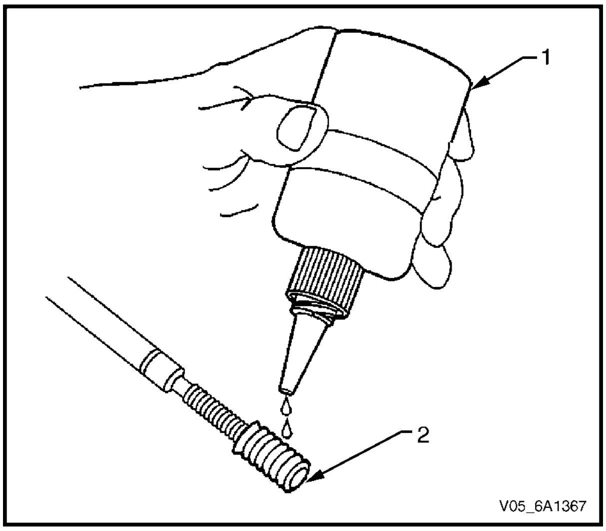

Figure 6A1 – 511

17 Install the insert and installation driver (1) into the tapped hole by hand only.

18 Start the insert into the threaded hole.

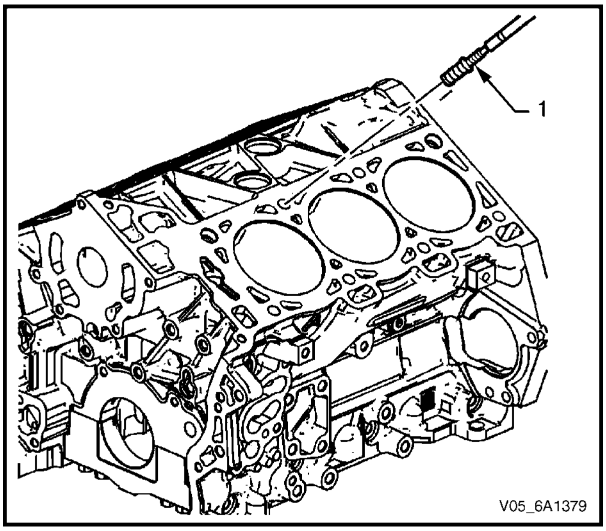

Figure 6A1 – 512

CAUTION

If the insert will not thread down until the flange contacts the counter-bored surface, remove the insert immediately with a screw extracting tool and inspect the tapped hole for any remaining swarf and/or incorrect tapping.

19 Install the insert until the flange of the insert contacts the counter-bored surface.

NOTE

The driver installation tool will tighten up before cutting completely through the insert. This is acceptable. The threads at the bottom of the insert are being formed and the insert is mechanically locking the insert into the base material threads.

20 Continue to rotate the driver installation tool through the insert.

21 In order to completely form the new threads in the insert, rotate the driver installation tool through the insert until the mark on the driver installation tool (1) aligns with the surface of the engine block deck (2).

22 Inspect the insert for correct installation into the tapped hole.

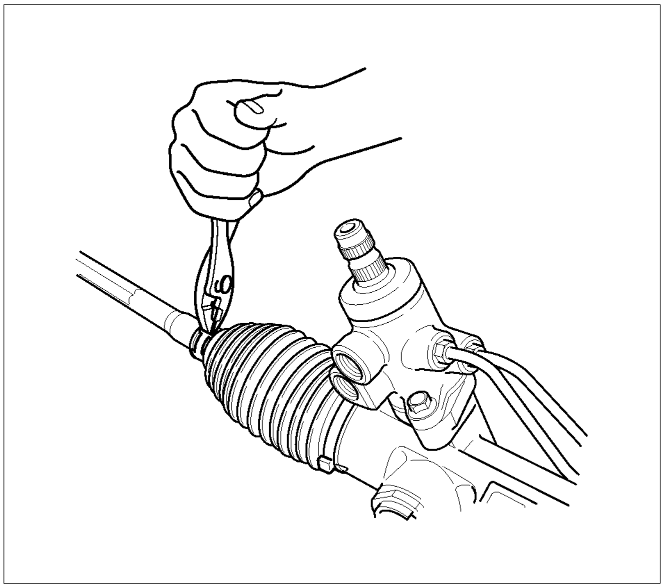
Disassembly

NOTE : The valve hosing is made of aluminum and care should be exercised when clamping in a vise, etc.

to prevent distortion or damage.

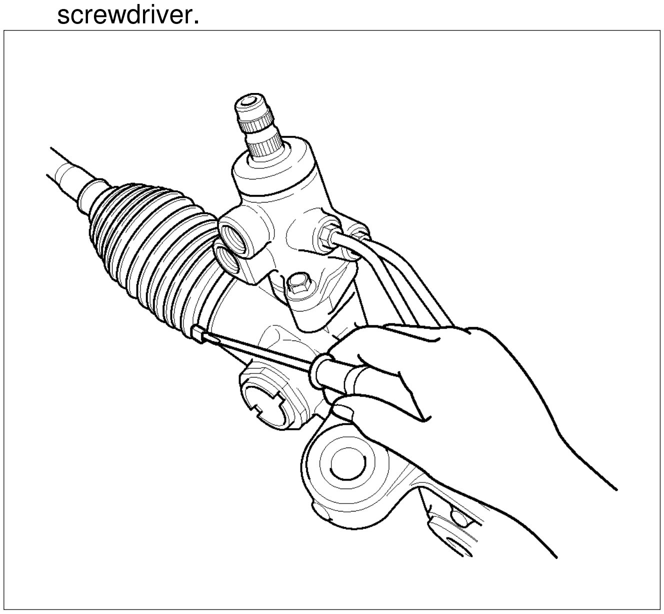
For the left side, follow the same steps as right side.

1. Loosen lock nut and remove tie-rod end.
2. Remove clip and band, then remove bellows.
   - Use a pair of pliers to open the clip. Slide the clip toward the tie-rod end.



RUW53BSH000401

   - Remove band from the bellows by using screwdriver.



RUW53BSH000501

CAUTION :

For 4×2 except High ride suspension models;

The band is not reusable. If removed, it must be replaced with a new one.

Take care not to damage the bellows during band removal.

For 4×4 and 4×2 High ride suspension models;

The band and bellows are not reusable. If removed, they must be replaced with a new one.

3. Remove tie-rod assembly.
   To remove, move the boot toward the tie-rod end, then remove tab washer.
4. Remove oil line, mounting rubber and dust cover.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found during inspection.

Check the following parts.

1. Tie-rod end
2. Lock nut
3. Clip
4. Bellows
5. Band

Tie-Rod End

If looseness or play is found when checked by moving the end of ball joint at tie-rod end, replace tie-rod end.

Tie-Rod Assembly

If the resistance is insufficient or play is felt when checked by moving the ball on the tie-rod, replace the tie-rod assembly.

Rubber Parts

For 4×2 except High ride suspension models;

If wear or damage is found during inspection, replace with new ones.

For 4×4 and 4×2 High ride suspension models;

Even if wear or damage is not found after removal, replace with new ones.

Reassembly

1. Install mounting rubber and dust cover (If removed).
2. Install oil line.
   Torque: 12 N·m (1.2 kgf·m/104 lb·in)

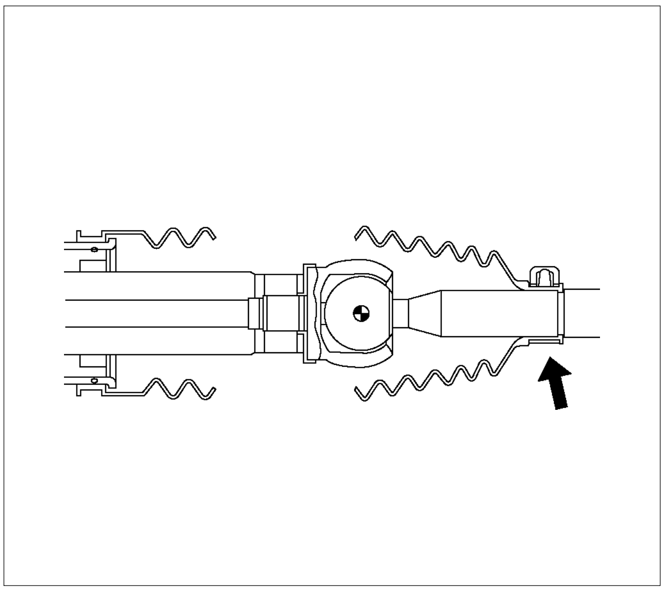
5	M10 x 1.5	211	212	213	214	420	32.5	27.0

3. Install tie-rod assembly with tab washer, then tighten to specified torque.
   For 4×2 except High ride suspension models;
   Torque: 83 N·m (8.5 kgf·m/61 lb·ft)
   For 4×4 and 4×2 High ride suspension models;
   Torque: 108 N·m (11.0 kgf·m/80 lb·ft)
   After tightening, bend tab washer against width across flat of inner ball joint.
4. Apply grease to the tie-rod groove. Install bellows on housing assembly.

CAUTION :

Make sure that there are no bulges or dents in the bellows.

After installation, confirm the small end of the bellows is inserted into the tie-rod groove.

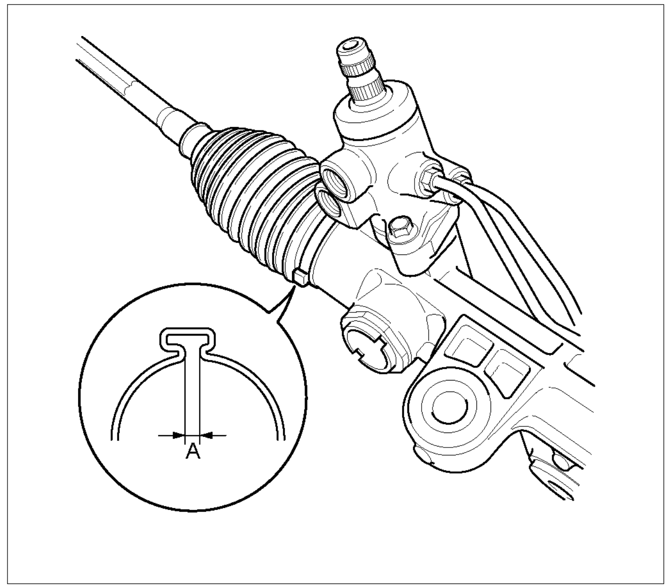


RUW53BSH000301

5. Caulk the band using clamp pliers 5-8840-2745-0.
   For 4×2 except High ride suspension models;
   Caulk gap(A): less than 2.0mm(0.08in).
   For 4×4 and 4×2 High ride suspension models;
   Caulk gap(A): 2.6 – 3.3mm(0.10 – 0.13in).

CAUTION :

Be sure to use a new band.



RUW53BSH000601

6. Install clip.
7. Install tie-rod end and tighten lock nut.

Torque:

98 N·m (10 kgf·m/72 lb·ft)

5 Specifications

General

Engine Type	V6
Bank Angle	60°
Displacement	3.6 litre (3,565 cm3)
Bore	94 mm
Stroke	85.6 mm
Compression Ratio	10.2:1
Cranking Speed at 40°C	80 r.p.m.
Spark Plug Gap	1.1 mm
Firing Order	1-2-3-4-5-6

Cylinder Block

Cylinder Bore Diameter	93.992 – 94.008 mm
Cylinder Out-of-Round – Production Maximum	0.013 mm
Crankshaft Main bearing bore Diameter	72.867 – 72.881 mm
Cylinder Head Deck Surface Flatness	0.05 mm

Crankshaft

Connecting Rod Journal Diameter	55.992 – 56.008 mm
Connecting Rod Journal Out-of-Round	0.005 mm
Connecting Rod Journal Taper	0.005 mm
Connecting Rod Journal Width (Production)	22.000 mm
Connecting Rod Journal Width (Service limit)	21.920 – 22.080 mm
Crankshaft End Play	0.100 – 0.330 mm
Crankshaft Main Bearing Clearance	0.010 – 0.060 mm
Crankshaft Main Journal Diameter	67.992 – 68.008 mm
Crankshaft Main Journal Out-of-Round	0.005 mm
Crankshaft Main Journal Taper	0.005 mm
Crankshaft Main Journal Width, #2, 4 (Production)	24 mm
Crankshaft Main Journal Width, #2, 4 (Service)	23.900 – 24.100 mm
Crankshaft Main Journal Width, #3 (Production)	24.400 mm
Crankshaft Main Journal Width, #3 (Service)	24.360 – 24.440 mm
Crankshaft Main Journal Thrust Wall Runout	0.000 – 0.040 mm
Crankshaft Main Journal Thrust Wall Square	0.000 – 0.010 mm
Crankshaft Rear Flange Runout	0.025 mm
Crankshaft Reluctor Ring Runout - Maximum	1.500 mm
Crankshaft Thrust Bearing Clearance	0.076 – 0.305 mm
Crankshaft Thrust Surface Runout	0.040 mm
Crankshaft Thrust Surface – Height Diameter	95.000 mm

Connecting Rod

Connecting Rod Length - Bore Centre-to-Centre	150.400 mm
Connecting Rod Bore Diameter - Bearing End	59.620 – 59.636 mm
Connecting Rod Bore Diameter - Pin End	24.007 – 24.021 mm
Connecting Rod Width	21.775 mm
Connecting Rod Side Clearance	0.095 – 0.355 mm
Connecting Rod Bearing Clearance	0.010 – 0.070 mm

Piston

Piston Diameter	93.956 – 93.974 mm
Piston Pin Bore Diameter	24.005 – 24.009 mm
Piston Ring Groove Width - First (Top) Compression Ring	1.220 – 1.240 mm
Piston Ring Groove Width - Second Compression Ring	1.510 – 1.530 mm

Piston Ring Groove Width - Oil Control Ring ....2.510 – 2.530 mm

Piston to Bore Clearance ....0.026 – 0.052 mm

Piston Pin

Piston Pin Diameter ....23.997 - 24.000 mm

Piston Pin Length....................60.600 – 61.100 mm

Piston Pin Clearance to Connecting Rod Bore ....0.007 – 0.024mm

Piston Pin Clearance to Piston Pin Bore....................0.004 – 0.012mm

Piston Rings

Piston Ring to Groove Clearance:

- First (Top) Compression Ring....................0.030 – 0.065 mm
- Second Compression Ring ....0.015 – 0.060 mm
- Oil Control Ring ....0.030 – 0.170 mm

Piston Ring End Gap:

- First (Top) Compression Ring....................0.150 – 0.300 mm
- Second Compression Ring ....0.280 – 0.480 mm
- Oil Control Ring ....0.150 – 0.600 mm

Cylinder Head

Combustion Chamber Volume.................... 53.600 cc

Valve Guide Bore Diameter – Intake ....6.000 – 6.020 mm

Valve Guide Bore Diameter – Exhaust ....6.000 – 6.020 mm

Valve Guide Installed Height....................14.050 – 14.550 mm

Stationary Hydraulic Lash Adjuster (SHLA) Bore Diameter ....12.008 – 12.030 mm

Valve Seat Angle – Seating Surface.................... 45°

Valve Seat Angle – Relief Surface.................... 30°

Valve Seat Angle – Undercut Surface .... 60°

Valve Seat Runout – Maximum ....0.050 mm

Valve Seat Width – Exhaust Seating Surface....................1.400 – 1.800 mm

Valve Seat Width – Exhaust Relief Surface....................0.700 – 0.900 mm

Valve Seat Width – Intake Seating Surface ....1.000 – 1.400 mm

Valve Seat Width – Intake Relief Surface ....0.500 – 0.700 mm

Engine Block Deck Surface Flatness....................0.05 mm

Exhaust Manifold Deck Surface Flatness ....0.25 mm

Intake Manifold Deck Surface Flatness ....0.05 mm

Valve System

Face Angle.................... 44.25°

Face Runout ....0.038 mm

Valve Face Width – Exhaust....................2.750 mm

Valve Face Width – Intake ....2.180 mm

Valve Head Diameter – Exhaust....................30.470 – 30.730 mm

Valve Head Diameter – Intake ....36.830 – 37.090 mm

Valve Installed Height ....35.26 – 36.69 mm

Valve Length – Exhaust....................97.110 mm

Valve Length – Intake ....101.230 mm

Valve Stem Diameter (standard)....................5.955 – 5.975 mm

Valve Stem Diameter (oversize) ....6.013 – 6.033 mm

Valve Stem to Guide Clearance....................0.025 – 0.065 mm

Hydraulic Lash Adjuster Diameter ....11.986 – 12.000 mm

Hydraulic Lash Adjuster to Bore Clearance ....0.037 – 0.041 mm

Rocker Arm/Camshaft Follower Ratio....................1.68:1

Rocker Arm/Camshaft Follower Roller Diameter ....17.740 – 17.800 mm

Valve Spring Free Length ....42.500 – 45.500 mm

Valve Spring Installed Height – Closed....................35.000 mm
Valve Spring Installed Height – Open....................24.000 mm
Valve Spring Load – Closed....................247 – 273 N
Valve Spring Load – Open....................598 – 662 N
Valve Spring Diameter – Inside Top....................12.200 – 12.700 mm
Valve Spring Diameter – Outside Top....................18.000 – 20.500 mm
Valve Spring Diameter – Inside Bottom....................17.950 – 18.450 mm
Valve Spring Diameter – Outside Bottom....................26.000 mm
Valve Spring Coil Thickness....................3.250 – 3.900 mm
Valve Spring Total Number of Coils....................7.1

Camshaft

Camshaft Bearing Inside Diameter – Front Number 1....................35.000 – 35.020 mm
Camshaft Bearing Inside Diameter – Middle & Rear Number 2 - 4....................27.000 – 27.020 mm
Camshaft End Play....................0.045 – 0.215 mm
Camshaft Journal Diameter – Front Number 1....................34.936 – 34.960 mm
Camshaft Journal Diameter – Middle & Rear Number 2 - 4....................26.936 – 26.960 mm
Camshaft Journal Out-of-round....................0.006 mm
Camshaft Journal to Bore Clearance....................0.040 – 0.084 mm
Camshaft Runout – Front & Rear Number 1 and 4....................0.025 mm
Camshaft Runout – Middle Number 2 and 3....................0.050 mm
Camshaft Lobe Duration – Exhaust (@ 0.150 mm Lift)....................238°
Camshaft Lobe Duration – Intake (@ 0.150 mm Lift)....................237°
Camshaft Lobe Height – Exhaust....................6.6 mm
Camshaft Lobe Height – Intake....................6.5 mm
Camshaft Lobe Overlap (@ 0.150 mm Lift)....................-5° (no overlap)
Valve Opens – Exhaust....................229° BTDC
Valve Opens – Intake....................14° ATDC
Centre-line – Exhaust....................111° BTDC
Centre-line – Intake....................132° ATDC
Valve Closes – Exhaust....................9° ATDC
Valve Closes – Intake....................252° ATDC
Valve Lift – Exhaust....................10.8 mm
Valve Lift – Intake....................10.8 mm

Oil Pump

Type....................Gerotor
Gear Diameter – Outer....................87.095 – 87.175 mm
Gear Bore Depth....................15.565 – 15.600 mm
Gear Bore Diameter....................87.275 – 87.325 mm
Gear Thickness....................15.511 – 15.536 mm
Gear to Cover Clearance....................0.030 – 0.085 mm
Gear to Housing Clearance....................0.100 – 0.230 mm
Inner Gear Tip Clearance....................0.075 – 0.180 mm
Crankshaft Clearance to Housing....................0.040 – 0.130 mm
Inner Gerotor Hub Diameter....................53.310 – 53.335 mm
Housing Hub Diameter....................53.380 – 53.420 mm
Inner Gerotor Hub Clearance to Housing....................0.045 – 0.110 mm

Lubrication System

Oil Type....................SAE 5W30
Oil Capacity – with Filter....................6.5 L
Oil Pressure – Minimum at idle....................69 kPa
Oil Pressure – Minimum at 2000 r.p.m.....................138 kPa

ATTENTION

- ■ **Fasteners must be replaced after loosening.**
- ♦ **Fasteners either have micro encapsulated sealant applied or incorporate a mechanical thread lock and should only be re-used once. If in doubt, replacement is recommended.**

Oil Pan Drain Plug .... 25.0 Nm
Oil Filter Adaptor Attaching Bolt .... 20.0 – 26.0 Nm
Oil Level Indicator Tube Attaching Bolt .... 8.0 – 12.0 Nm
Accessory Drive Belt Idler Pulley Attaching Bolt .... 50.0 Nm
Accessory Drive Belt Tensioner Attaching Bolt .... 50.0 Nm
Power Steering Reservoir Bracket Attaching Screw .... 9.0 Nm
Power Steering Pump Bracket Attaching Bolt .... 49.0 – 67.0 Nm
Upper Intake Manifold to Lower Intake Manifold Attaching Bolt .... 23.0 Nm
Upper Intake Manifold to Cylinder Head Attaching Bolt .... 23.0 Nm
Lower Intake Manifold to Cylinder Head Attaching Bolt .... 23.0 Nm
Fuel Injector Wiring Harness Bracket Attaching bolt .... 9.0 Nm
Exhaust Manifold to Cylinder Head Attaching Bolt .... 17.0 - 23.0 Nm
Exhaust Manifold Heat Shield Attaching Bolt .... 8.0 - 12.0 Nm
Battery Harness Ground Terminal Attaching Nut .... 13.0 Nm
Camshaft Cover Attaching Bolt .... 8.0 – 12.0 Nm
Engine Ground Connector Bolt .... 10.0 Nm
Engine Wiring Harness Former Attaching Bolt .... 12.0 – 16.0 Nm
■ ♦ Crankshaft Balancer Assembly Attaching Bolt:
Stage 1 .... 90.0 –110.0 Nm
Stage 2 .... 150°
Engine Front Cover Assembly Attaching Bolt .... 20.0 – 26.0 Nm
Camshaft Intermediate Driveshaft Sprocket Attaching Bolt .... 58.0 – 72.0 Nm
Secondary Timing Chain Guide Attaching Bolt .... 20.0 – 26.0 Nm
Secondary Timing Chain Shoe Attaching Bolt .... 20.0 – 26.0 Nm
Secondary Timing Chain Tensioner Attaching Bolt .... 20.0 – 26.0 Nm
Primary Timing Chain Upper Guide Attaching Bolt .... 20.0 – 26.0 Nm
Primary Timing Chain Tensioner Attaching Bolt .... 20.0 – 26.0 Nm
Oil Pump Assembly Attaching Bolt .... 20.0 – 26.0 Nm
Camshaft Sprocket Attaching Bolt .... 49.0 – 67.0 Nm
Exhaust Camshaft Sprocket Attaching Bolt .... 49.0 – 67.0 Nm
Camshaft Bearing Cap Attaching Bolt .... 8.0 – 12.0 Nm
Cylinder Head Threaded Plug .... 31.0 Nm
■ Cylinder Head M11 Attaching Bolt:
Stage 1 .... 40.0 – 50.0 Nm
Stage 2 .... 120°
■ Cylinder Head M8 Attaching Bolt:
Stage 1 .... 12.0 – 18.0 Nm
Stage 2 .... 60°
Engine Mount Bracket to Cylinder Block Attaching Bolt .... 43.0 – 57.0 Nm
Engine Mount to Bracket Attaching Nut .... 70.0 – 90.0 Nm
Engine Mount to Frame Attaching Nut .... 44.0 – 60.0 Nm
Engine Lift Bracket Attaching Bolt .... 58.0 – 72.0.0 Nm
Knock Sensor Attaching Nut .... 23.0 Nm

Power Steering High Pressure Line Attaching Bolt ....8.0 – 12.0 Nm

Power Steering High Pressure Line Flare Nut..........................25.0 – 35.0 Nm

Steering Gear Housing Mounting Nut:
Stage 1 ....60.0 Nm
Stage 2 ....40° – 50°

Oil Suction Pipe Attaching Bolt...10.0 Nm

Crankshaft Oil Deflector Attaching bolt...10.0 Nm

Oil Level Sensor ....20.0 Nm

Oil Pan to Cylinder Block Attaching Bolt..................................20.0 – 26.0 Nm

Oil Pan to Crankshaft Rear Oil Seal Housing Attaching Bolt........8.0 - 12.0 Nm

■ ♦ Flexplate Attaching Bolt:

Stage 1 ....26.0 – 34.0 Nm

Stage 2 .... 45°

Crankshaft Rear Oil Seal Housing Attaching Bolt.......................8.0 – 12.0 Nm

■ Connecting Rod Cap Attaching Bolt:

Stage 1 ....30.0 Nm

Stage 2 ....Loosen Completely

Stage 3 ....25.0 Nm

Stage 4 ....110°

Crankshaft Bearing Cap Remover Nut ....11.0 Nm

■ Crankshaft Main Bearing Cap Inboard Attaching Bolt:

Stage 1 ....20.0 Nm

Stage 2 .... 80°

■ Crankshaft Main Bearing Cap Outboard Attaching Bolt:

Stage 1 ....15.0 Nm

Stage 2 ....110°

■ ♦ Crankshaft main Bearing Cap Side Attaching Bolt:

Stage 1 ....30.0 Nm

Stage 2 .... 60°

Cylinder Block Threaded Plug ....27.0 - 35.0 Nm

Oil Jet Attaching Bolt ....8.0 – 12.0 Nm

7 Special Tools

Tool Number	Illustration	Description
E-308		Seal Remover Previously released.
EN-46101		Spark Plug Tube Seal Guide Set Used to protect the spark plug lip seals when installing the camshaft cover to the cylinder head.
EN-46103		Camshaft Actuator Valve Seal Installer Used to install the camshaft actuator valve seals into the front cover.
EN-46105 – 1 and 2		Camshaft Locking Tool Set Used to retain camshaft position during timing chain or camshaft actuator replacement.
EN-46106		Flexplate Holding Tool Used to retain crankshaft position during valve-train overhaul and harmonic balancer removal.
EN-46108		Timing Chain Retention Tool Set Used to retain timing chain tension during camshaft and sprocket removal.

Tool Number	Illustration	Description
EN-46109		Engine Front Cover / Oil Pan / Crankshaft Rear Oil Seal Housing Installation Guide Pins Used to align the engine front cover/oil pan/crankshaft rear oil seal housing during engine assembly.
EN-46110		On-vehicle Valve Spring Compressor Used to remove valve springs with the cylinder heads assembled to the cylinder block.
EN-46111		Crankshaft Rotation Socket Used to rotate the crankshaft during engine overhaul.
EN-46112		Timing Chain Tensioner Retraction Springs Used to retain the timing chain tensioner plunger within the tensioner bore during assembly of timing chains to engine.
EN-46114		Engine Lift Brackets Used in conjunction with commercially available lifting equipment to lift engine.
EN-46116		Valve Stem Seal Remover / Installer Used to remove/install the valve stem seals.

Tool Number	Illustration	Description
EN-46117		Valve Stem Key Remover / Installer Used in conjunction with J-8062 or EN-46110 to remove and reinstall the valve stem keys.
EN-46119		Off-vehicle Valve Spring Compressor Adaptor Used in conjunction with J-8062 to remove valve springs with the engine disassembled.
EN-46120 and J-42096		Valve Guide Reamer Used to oversize valve guides prior to the installation of new oversized valves.
EN-46121		Connecting Rod Guide Pin Set Used to guide connecting rods onto the crankshaft journals and prevent damage to the cylinder bores, journal faces and piston cooling jets during engine assembly procedures.
EN-46122		Oil Control Valve Check Ball Remover / Installer
EN-7115		Torque Angle Wrench Used to accurately tighten fasteners when an angle torque is required.

Tool Number	Illustration	Description
J-29184		Crankshaft Front Oil Seal Installer
J-36648-A		Oil Pressure Gauge Adaptor
j-41816		three legged puller
J-41818		Main Bearing Cap Removal Tool Used in conjunction with J-6125-1B to remove the main bearing caps from the cylinder block during engine disassembly procedures.
J-41998-B		Crankshaft Balancer Installer
J-42385-2000		Thread Insert Kit Used to repair damaged threads during engine overhaul.
J-42385-700		High Feature Thread Repair Kit Used to repair damaged threads during engine overhaul.

Tool Number	Illustration	Description
J-45027		Tensioner Tool Used to reset the timing chain tensioner plunger.
J-6125-1B		Slide Hammer Used in conjunction with J-41818 to remove the main bearing caps from the cylinder block during engine disassembly.
J-8062		Valve Spring Compressor Used in conjunction with EN-46119 to remove valve springs with the engine disassembled.
J-8087		Cylinder Bore Gauge Commercial equivalent also available

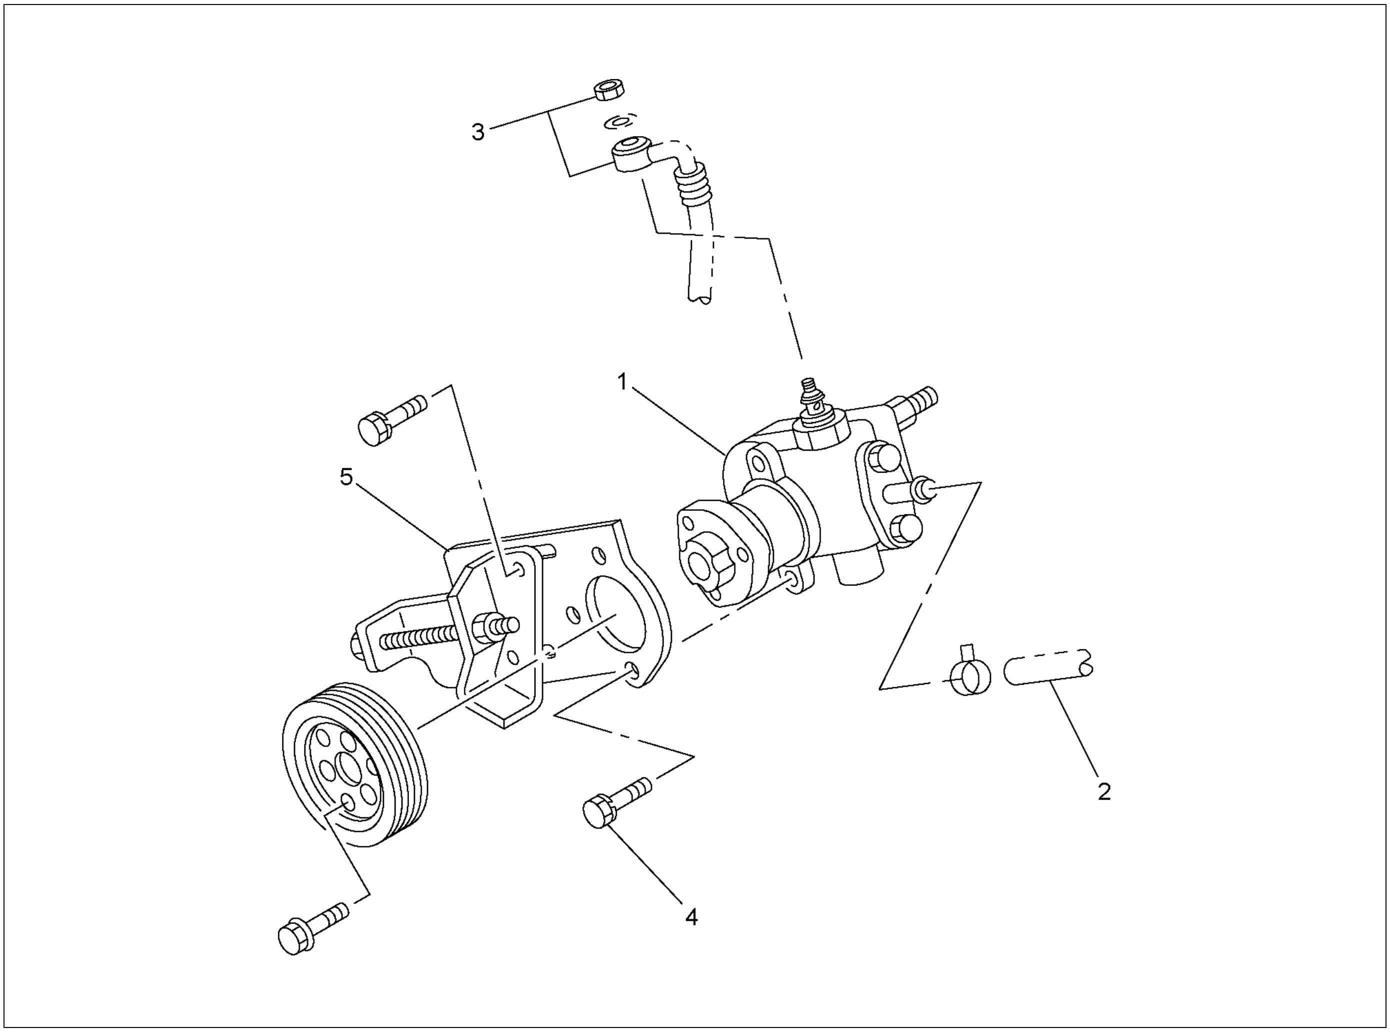
Section 6A1
Engine Mechanical – V6

ATTENTION

Before performing any service operation or other procedure described in this Section, refer to 1.1 WARNING, CAUTION and NOTES for correct workshop practices with regard to safety and/or property damage.

Power Steering Pump (4JH1-TC, 4JA1-T)

Power Steering Pump and Associated Parts



RTW53BMF000401

Legend

(1) Pump Assembly
(2) Suction Hose
(3) Flexible Hose
(4) Bolt
(5) Bracket

Removal

1. Remove the drive belt.
2. Remove the pulley
3. Place a drain pan below the pump.
4. Disconnect the suction hose.
5. Disconnect the flexible hose.
6. Remove the power steering fixing bolt and remove the pump assembly.

Installation

1. Install the pump assembly to the pump braket, tighten the fixing bolt to the specified torque.
   Torque: 40 N·m (4.1 kgf·m/30 lb·ft)
2. Install the flexible hose.
   Tighten the nut to specified torque.
   Torque: 20 N·m (2.0 kgf·m/14 lb·ft)
3. Install the pulley and tighten the bolt to the specified torque.
   Torque: 28 N·m (2.9 kgf·m/21 lb·ft)
4. Install the drive belt.
5. Connect the suction hose, then fill and bleed system.
   Refer to Bleeding the Power Steering System in this section.

1 General Information

The HFV6 engine features a closed vee, deep skirt die cast aluminium cylinder block with cast iron cylinder liners, internally balanced crankcase, full length water jackets and six bolt main bearing caps.

The cylinders are arranged in two banks of three with a 60 degree included angle between the two banks.

The right-hand bank of cylinders consists of number 1-3-5 cylinders and the left-hand bank of cylinders consists of number 2-4-6.

The engine firing order is 1-2-3-4-5-6.

Each aluminium cylinder head is fitted with hardened valve seats and four valves per cylinder: two intake and two exhaust.

The valves are operated by two camshafts (DOHC) per cylinder bank, one each for intake and exhaust valves.

The crankshaft is manufactured from forged steel. A reluctor wheel is pressed in place onto the rear of the crankshaft for the crankshaft position sensor.

The connecting rods are manufactured from powdered metal and the rod cap is separated during the manufacturing process using the fractured method. This creates a stronger, visually seamless rod to cap union.

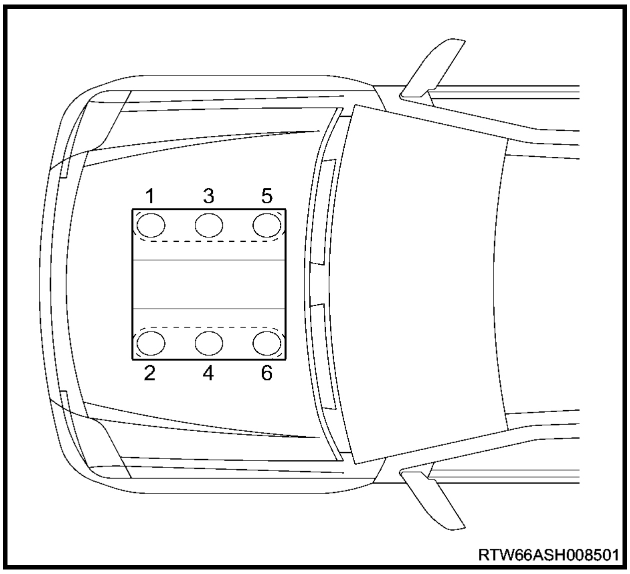


Figure 6A1 – 1

MY06 Update

Throughout this Section, reference is made to 'MY06 Update' or 'Excluding MY06 Update'.

Vehicles manufactured post 14th March 2007 are fitted with an updated version of the HFV6 engine. This engine features a different timing chain, and as a result different sprocket teeth. This change also introduces the use of a new special tool to assist in the serviceability of replacing the engine timing components.

All service procedures and descriptions specific to this update variation are qualified as 'MY06 Update'.

1.1 WARNING, CAUTION and NOTES

This Section contains various WARNINGS, CAUTIONS and NOTE statements that you must observe carefully to reduce the risk of death or injury during service, repair procedures or vehicle operation. Incorrect service or repair procedures may damage the vehicle or cause operational faults. WARNINGS, CAUTION and NOTE statements are not exhaustive. HOLDEN LTD can not possibly warn of all the potentially hazardous consequences of failure to follow these instructions.

Definition of WARNING, CAUTION and NOTE Statements

Diagnosis and repair procedures in this Section contain both general and specific WARNING, CAUTION and NOTE statements. HOLDEN LTD is dedicated to the presentation of service information that helps the technician to diagnose and repair the systems necessary for proper operation of the vehicle. Certain procedures may present a hazard to the technician if they are not followed in the recommended manner. WARNING, CAUTION and NOTE statements are designed to help prevent these hazards from occurring, but not all hazards can be foreseen.

WARNING defined

A WARNING statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in death or injury. A WARNING statement alerts you to take necessary action or not to take a prohibited action. If a WARNING statement is ignored, the following consequences may occur:

- Death or injury to the technician or other personnel working on the vehicle,
- Death or injury to other people in or near the workplace area, and / or
- Death or injury to the driver / or passenger(s) of the vehicle or other people, if the vehicle has been improperly repaired.

CAUTION defined

A CAUTION statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in damage to or destruction of equipment, or corruption of data. If a CAUTION statement is ignored, the following consequences may occur:

- Damage to the vehicle,
- Unnecessary vehicle repairs or component replacement,

- Faulty operation or performance of any system or component being repaired,
- Damage to any system or components which depend on the proper operation of the system or component being repaired,
- Faulty operation or performance of any systems or components which depend on the proper operation or performance of the system or component under repair,
- Damage to fasteners, basic tools or special tools and / or
- Leakage of coolant, lubricant or other vital fluids.

NOTE defined

A NOTE statement immediately precedes or follows an operating procedure, maintenance practice or condition that requires highlighting. A NOTE statement also emphasises necessary characteristics of a diagnostic or repair procedure. A NOTE statement is designed to:

- Clarify a procedure,
- Present additional information for accomplishing a procedure,
- Give insight into the reasons for performing a procedure in the recommended manner, and / or

Present information that gives the technician the benefit of past experience in accomplishing a procedure with greater ease.

1.3 Engine Serial Number

The engine serial number is located on the machined pad (1) at the left-hand rear of the cylinder block.

The following is a breakdown of the engine serial number, using an example of 10H7E H051230001:

- 10 = Component ID (i.e. 10 = Assembly)
- H7E = Engine Broadcast Code
- H = Assembly Plant Code
- 05 = Build Year
- 123 = Julian Date
- 0001 = Four Digit Daily Sequence Number

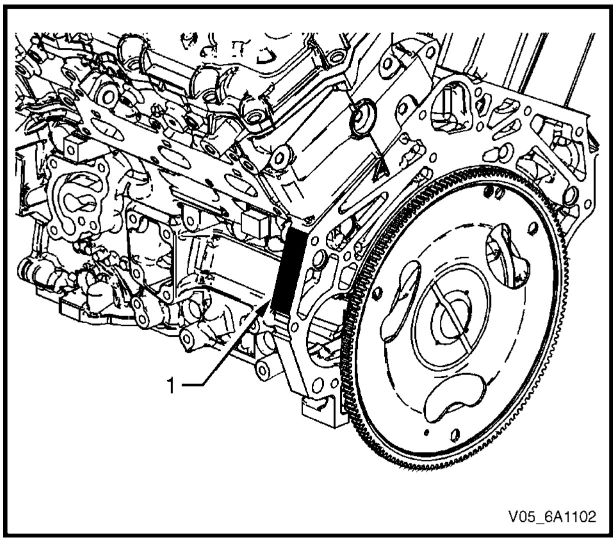

Figure 6A1 – 13

1.4 Engine Construction

Cylinder Block

The cylinder block (1) is constructed from aluminium alloy with cast-in-place iron cylinder bore liners.

Each of the four copper-infiltrated sintered steel main bearing caps are attached to the cylinder block by six bolts. Along with two outer and two inner bolts, two side bolts are used in the deep skirt block for increased block stiffness.

The crankshaft thrust bearing is mounted in the third main bearing cap.

To prevent aeration, oil return from the valve train and cylinder heads is channelled away from the reciprocating components through oil drain back passages incorporated into the cylinder heads and engine block. Pressure actuated piston oil cooling jets are mounted between opposing cylinders.

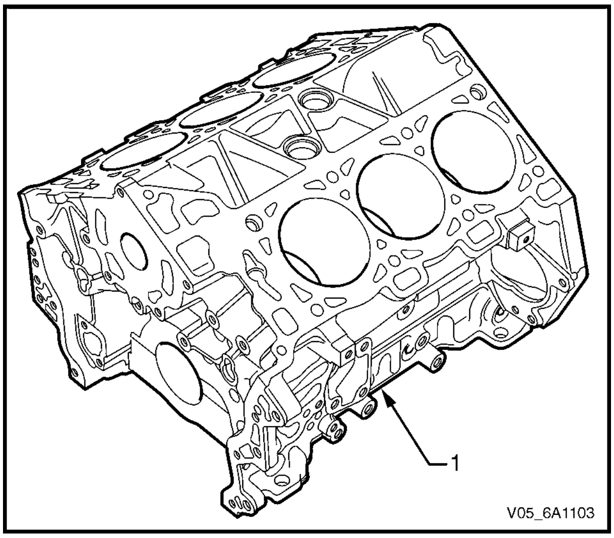

Figure 6A1 – 14

Cylinder Heads

The cylinder heads (1) are semi-permanent mould cast aluminium with powdered metal valve seat inserts and valve guides.

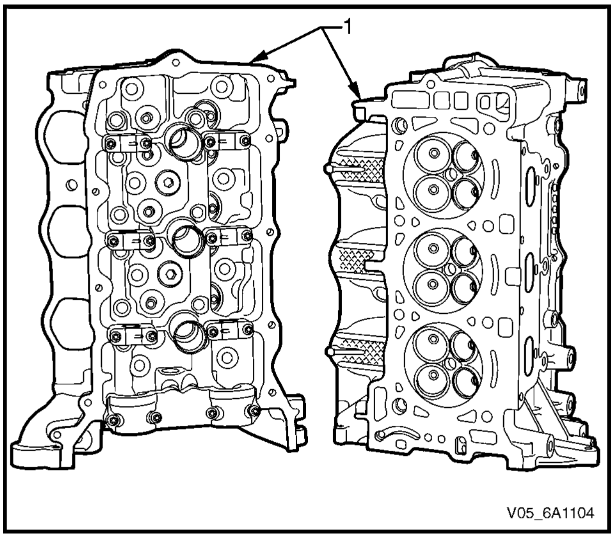

Figure 6A1 – 15

Each cylinder head contains four valves per cylinder. The valves (1) are actuated by the rocker arms (2) that pivot on stationary hydraulic lash adjusters (3), which are oil-fed to maintain valve / rocker lash.

The separate exhaust and intake camshafts are supported by four bearings machined into the cylinder head. The front camshaft bearing cap is used as a thrust control surface for each camshaft.

A tube (4) is pressed into each cylinder head in three places that shields each spark plug. An ignition coil assembly is mounted directly on each spark plug, through each spark plug tube.

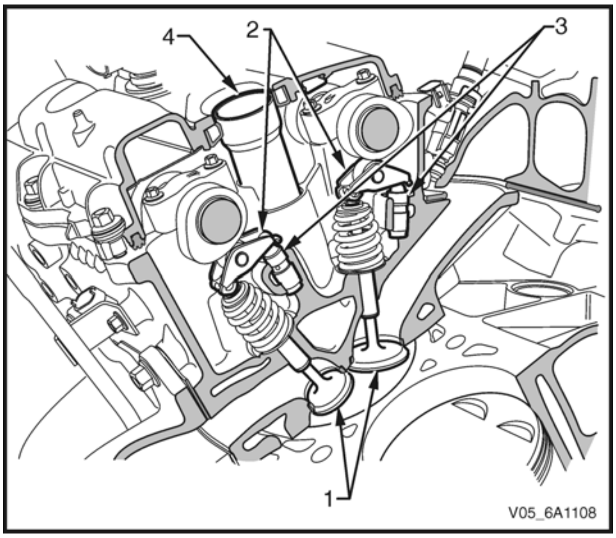

Figure 6A1 – 16

SEVERE CONDITIONS MAINTENANCE SCHEDULE (For EUROPE)

Severe driving conditions
- A: Repeated short trips
- B: Driving on rough roads
- C: Driving on dusty roads
- D: Driving in extremely cold weather and/or on salted roads
- E: Towing trailer or climbing mountein frequently

MT : Manual transmission
AT : Automatic transmission
4WD : Four wheel drive

Item	Interval		Condition					
			A	B	C	D	E	A+D
Engine oil	Change every 5,000 km (3,000 miles)				●			●
Engine oil filter	Replace every 5,000 km (3,000 miles)				●			●
Exhaust pipes and mounting	Inspect every 10,000 km (6,000 miles)		●	●		●		
Air cleaner element	Replace every 20,000 km (12,000 miles)				●			
Steering system for looseness or damage	Inspect every 5,000 km (3,000 miles)			●				
Universal joints and sleeves	Inspect for wear and lubricate every 10,000 km (6,000 miles)			●	●			
Transmission or transmission with transfer case oil	MT	Change every 30,000 km (18,000 miles) after changing at initial 10,000 km (6,000 miles)		●				
	AT	Transmission: Inspection every 20,000 km (12,000 miles)	●	●	●		●	●
	4WD	Transfer: Change every 30,000 km (18,000 miles) After changing at initial 10,000 km (6,000 miles)		●				
Differential oil	Change every 20,000 km (12,000 miles) after changing at initial 10,000 km (6,000 miles)			●				
Front brake pads and discs wear	Inspect every 5,000 km (3,000 miles)		●	●	●			
Rear brake lining and drum wear	Inspect every 5,000 km (3,000 miles)		●	●	●			

Disassembly

1. Clean the oil pump with solvent (plug the discharge and suction ports to prevent the entry of solvent).
   Be careful not to expose the oil seal of shaft assembly to solvent.
2. Remove the bolt, suction pipe and O-ring.
3. Remove the connector, O-ring, relief valve and spring.
4. Remove the bolt, rear housing and O-ring.
5. Remove the snap ring.
6. Remove the shaft assembly.
7. Remove the oil seal.

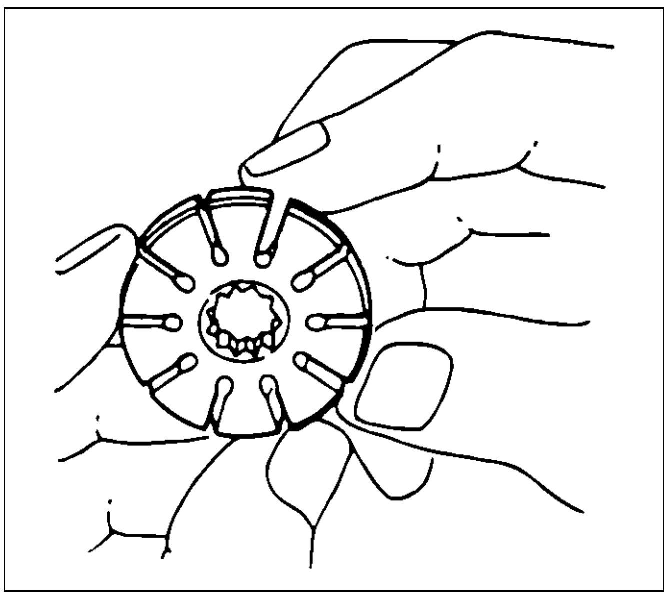
CAUTION: When removing the oil seal, be careful not to damage the housing.

8. Remove the pump cartridge assembly from the front housing.
9. Remove two O-rings.

Inspection and Repair

Make all necessary adjustments, repairs, and part replacements if wear, damage, or other problems are discovered during inspection.

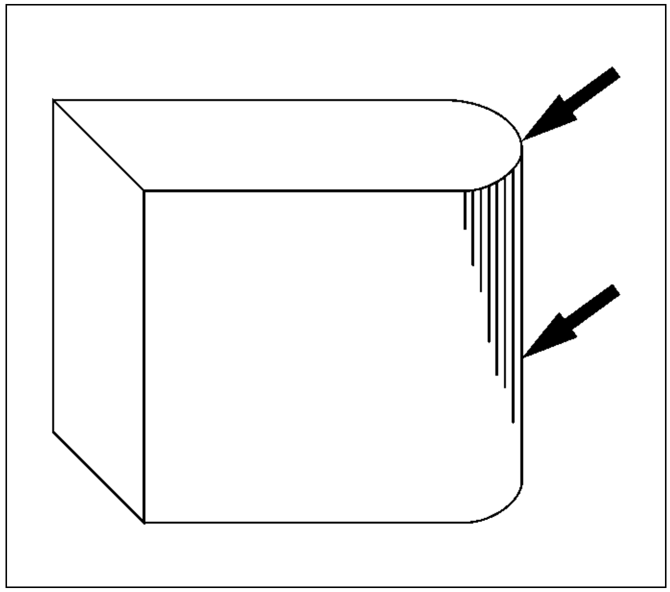
Rotor



442RS002

Check that the groove in the vane is free from excessive wear and that the vane slides smoothly. When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Vane



442RS003

Sliding faces of the vane should be free from wear. (Particularly the curved face at the tip that contact with the cam should be free from wear and distortion). When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Cam

The inner face of the cam should have a uniform contact pattern without a sign of step wear. When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Side Plate

The sliding faces of parts must be free from step wear (more than 0.01 mm (0.0004 in)), which can be felt by the finger nail.
The parts with minor scores may be reused after lapping the face.

Relief Valve

The sliding face of the valve must be free from burrs and damage. The parts with minor scores may be reused after smoothing with emery cloth (#800 or finer).

Shaft

Oil seal sliding faces must be free from a step wear which can be felt by the finger nail. Bushing fitting face must be free from damage and wear.

O-ring, Oil Seal, Snap Ring

Be sure to discard used parts, and always use new parts for installation. Prior to installation, lubricate all seals and rings with power steering fluid.

Crankshaft

The crankshaft is a forged steel design with four main bearings. The number three main bearing controls crankshaft thrust. A crankshaft position reluctor wheel is pressed onto the rear of the crankshaft, in front of the rear main journal. The crankshaft is internally balanced with an integral oil pump drive machined into the nose in front of the front main journal.

Pistons, Pins and Connecting Rods

The piston assembly (1) is fitted with two low tension compression rings and one multi-piece oil control ring. The top compression ring is plasma sprayed, while the second compression ring is cast iron Napier.

The oil control ring incorporates a steel expander and two chrome plated steel rails.

The connecting rods are sinter forged steel and have full floating piston pins. The piston pins are a slip-fit type, into the bronze bushed connecting rods. Round wire retainers are used to retain the piston pin into the piston.

The cast aluminium pistons incorporate a polymer coated skirt to reduce friction.

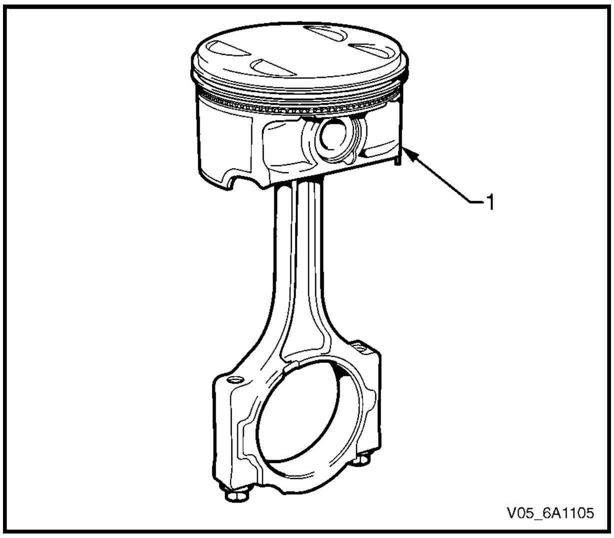


Figure 6A1 – 17

Camshaft Drive System

Three timing chains are fitted:

- primary (1),
- right-hand secondary (2), and
- left-hand secondary (3), refer to Figure 6A1 – 18 for the HFV6 engine.

The primary timing chain connects the crankshaft sprocket (4) with the left-hand and right-hand intermediate drive shaft sprockets (5).

Each oil pressure fed intermediate sprocket drives the secondary timing chains, which subsequently drive the respective cylinder head camshaft position actuators (6).

Two stationary timing chain guides (7) and movable timing chain shoes (8) control secondary timing chain backlash.

Each secondary timing chain shoe is under tension from an oil pressure hydraulically operated tensioner (9). To control backlash on the primary chain, two stationary timing chain guides (10) and an oil pressure hydraulically actuated tensioner with built in shoe (11) are fitted.

The tensioners minimise timing chain noise and provide accurate valve action by keeping slack out of the timing chains, while continuously adjusting for timing chain wear. The tensioners incorporate a plunger that adjusts outward with wear, minimising backlash. The tensioners are equipped with oiling jets to spray oil onto the timing components during engine operation. Each tensioner is sealed to the head or block using a rubber coated steel gasket. The gasket traps an adequate oil reserve to ensure quiet start-up.

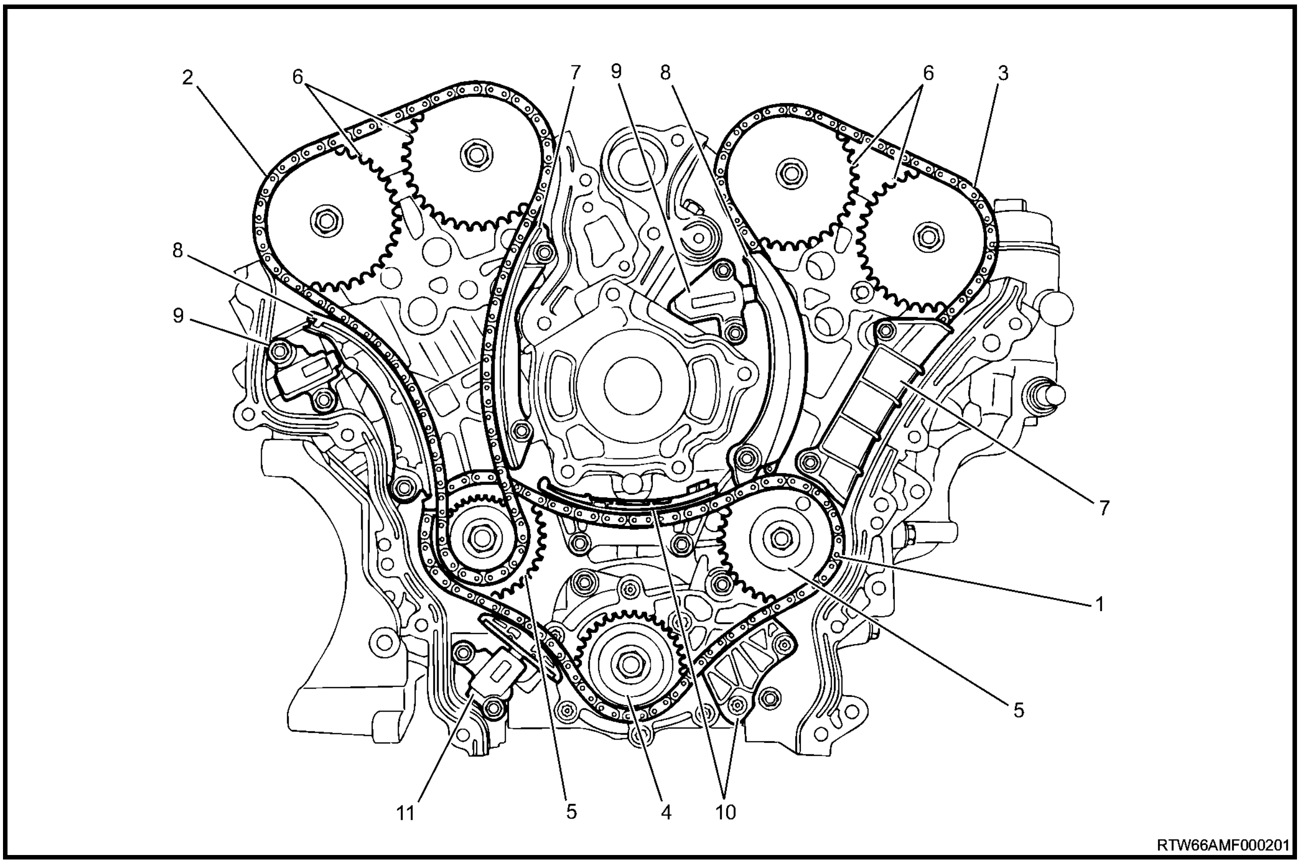

Figure 6A1 – 18

5	Intermediate Sprocket	11	Primary Timing Chain Tensioner
6	Camshaft Sprocket		

1.5 Engine Lubrication System

Lubrication Description

A structural diecast aluminium oil pan is fitted that incorporates an oil suction pipe, an oil deflector and an oil level sensor. The oil suction pipe is bolted into the oil pan and seals to the bottom of the cylinder block with a gasket. The oil deflector is bolted to the upper portion of the oil pan and ensures oil supply is maintained under all conditions. The oil level sensor is mounted through the bottom of the oil pan.

A crankshaft driven gerotor oil pump is mounted to the front of the cylinder block. The pump, which incorporates an internal pressure-relief valve, draws oil from the oil suction tube through the lower passage in the cylinder block. Oil is then directed through an upper passage to the left-hand side of the cylinder block where the oil filter adapter is mounted.

The oil filter adapter incorporates a top-access, cartridge style oil filter. The filter is accessed through a screw-on cap that incorporates an oil bypass valve. The oil filter adapter housing incorporates a drain back control valve and a threaded oil pressure sender. Oil flows through a lower passage within the oil filter adapter and through the oil filter cartridge. Filtered oil travels back through the upper passage of the adapter and into the engine block.

Oil is then directed up and across the front of the cylinder block, through several drilled passages. These front passages feed oil to each cylinder head, the passage for the main bearings and piston oil jets, the right-hand and left-hand secondary idler sprockets and to the primary timing chain tensioner.

Each cylinder head passage directs oil into oiling circuits for the stationary hydraulic lash adjusters (SHLAs) and the camshaft bearing journals. An additional passage in the cylinder head also directs oil to the secondary timing chain tensioner.

The oil passage that supplies oil to the main bearings also supplies oil to pressure actuated piston cooling oil jets. Each oil jet is mounted between opposing cylinder bores and directs oil to the two bores to provide extra cooling and control piston temperatures.

From the front passages, oil is directed to the front of the block where the right-hand and left-hand intermediate drive shaft sprockets and the primary timing chain tensioner are mounted. Each camshaft timing chain tensioner relies on a gasket to maintain an oil reserve after the engine is turned off. All camshaft timing chain tensioners incorporate a small oil jet to supply an oil spray onto the camshaft timing chain components.

Oil returns to the oil pan, either through the camshaft timing chain area or through the drain back passages on the outboard walls of the cylinder heads and cylinder block.

1.6 Service Notes

Cleanliness and Care

Throughout this Section, correct cleaning and protection of machined surfaces and friction areas is a part of the repair procedure. This is considered standard workshop practice, even if not specifically stated.

When any internal engine part is serviced, care and cleanliness is extremely important.

When components are removed for service, they should be marked, organised or retained in a specific order for reassembly.

At the time of installation, components should be installed in the same location and with the same mating surface as when removed.

Any engine is a combination of many machined, honed, polished and lapped surfaces with tolerances that are measured in thousandths of a millimetre. These surfaces should be covered or protected to avoid component damage.

A liberal coating of clean engine oil should be applied to friction areas during assembly, as the lubrication will protect and lubricate friction surfaces during the initial engine start-up.

Replacing Engine Gaskets

Re-Using Gaskets and Applying Sealants

- do not reuse any gasket unless specified,
- gaskets that can be reused will be identified in the service procedure, and
- do not apply sealant to any gasket or sealing surface unless specified in the service information.

Separating Components

- Use a rubber mallet to separate components.
- Bump the part sideways to loosen the components.
- Bumping should be done at bends or reinforced areas to prevent distortion of parts.

Cleaning Gasket Surfaces

- Where required, remove all gasket and sealing material from the part using a plastic or wood scraper.
- Care must be used to avoid gouging or scraping the sealing surfaces.
- Do not use any other method or technique to remove sealant or gasket material from a part.
- Do not use abrasive pads, sand paper, or power tools to clean the gasket surfaces as these methods of cleaning can cause damage to the component sealing surfaces. Abrasive pads also produce fine grit that the oil filter cannot remove from the oil. This grit is abrasive and has been known to cause internal engine damage.

Assembling Components

- When assembling components, use only the sealant specified or equivalent in the service procedure.
- Sealing surfaces should be clean and free of debris or oil.
- Specific components such as crankshaft oil seals or valve stem oil seals may require lubrication during assembly.
- Components requiring lubrication will be identified in the service procedure.
- When applying sealant to a component, apply the amount specified in the service procedure.
- Do not allow the sealant to enter into any blind threaded holes as it may prevent the bolt from clamping correctly or cause component damage when tightened.
- Only ever tighten bolts to the correct torque specification. Do not over-tighten.

Use of Room Temperature Vulcanising and Anaerobic Sealer

CAUTION

A number of sealant types are commonly used in engines. Examples are; room temperature vulcanising (RTV) sealer, anaerobic gasket eliminator sealer, and anaerobic thread sealant and pipe joint compound. The correct type of sealant and amount must be used in the specified location to prevent oil leaks. Do not interchange the different types of sealers.

Room Temperature Vulcanising Sealer

- Room temperature vulcanising (RTV) sealant hardens when exposed to air. This type of sealer is used where two non-rigid parts (such as the intake manifold and the engine block) are assembled together.
- Do not use RTV sealant in areas where extreme temperatures are experienced. These areas include the exhaust manifold, head gasket, or other surfaces where a gasket eliminator is specified.
- Follow all safety recommendations and directions that are on the container.
- To remove the sealant or the gasket material, refer to Replacing Engine Gaskets.
- Apply RTV to a clean surface. Use a bead size as specified in the service procedure. Run the bead to the inside of any bolt holes. Do not allow the sealer to enter any blind threaded holes, as it may prevent the bolt from clamping correctly or cause damage when the bolt is tightened.
- Assemble components while RTV is still wet (within 3 minutes). Do not wait for RTV to skin over.
- Tighten the bolts to the correct torque specification. Do not over-tighten.

Anaerobic Sealer

- Anaerobic gasket eliminator or thread sealant, hardens in the absence of air. This type sealer is used where two rigid parts (such as castings) are assembled together, where fasteners are subjected to vibration, or where the holes are not blind. When two rigid parts are disassembled and no sealer or gasket is readily noticeable, the parts were probably assembled using a gasket eliminator.
- Follow all safety recommendations and directions that are on the container.
- To remove the sealant or the gasket material, refer to Replacing Engine Gaskets.
- Apply a continuous bead of gasket eliminator to one flange or on the bolt/stud thread. All surfaces must be clean and dry.
- Spread the sealer evenly to achieve a uniform coating on the sealing surface.
- Do not allow the sealer to enter any blind threaded holes as it may prevent the bolt from clamping correctly or cause damage when tightened.

CAUTION

Anaerobic sealed joints that are partially tightened and allowed to cure more than five minutes may result in incorrect shimming and sealing of the joint.

- Tighten the bolts to the correct torque specification. Do not over-tighten.
- After correctly tightening the fasteners, remove the excess sealer from the outside of the joint.

Pipe Joint Compound

- Pipe joint compound is a pliable sealer that does not completely harden. This type of sealer is used where two non-rigid parts (such as pressed steel and machined surfaces) are assembled together.
- Do not use pipe joint compound in areas where extreme temperatures are expected. These areas include the exhaust manifold, head gasket, or other surfaces where gasket eliminator is specified.
- Follow all safety recommendations and directions that are on the container.
- To remove the sealant or the gasket material, refer to Replacing Engine Gaskets.
- Apply the pipe joint compound to a clean surface. Use a bead size or quantity as specified in the procedure. Run the bead to the inside of any bolt holes. Do not allow the sealer to enter any blind threaded holes as it may prevent the bolt from clamping correctly or cause component damage when the bolt is tightened.
- Apply a continuous bead of pipe joint compound to one sealing surface. Sealing surfaces to be resealed must be clean and dry.
- Tighten the bolts to the correct torque specification. Do not over-tighten.

Separating Parts

CAUTION

Many internal engine components will develop specific wear patterns on their friction surfaces. When disassembling the engine, internal components must be separated, marked and organised in a way to ensure reinstallation in their original location and position.

Separate, mark, or organise the following components:

- Piston and the piston pin.
- Piston to the specific cylinder bore.
- Piston rings to the specific piston.
- Connecting rod to the crankshaft journal.
- Connecting rod to the bearing cap.
- Crankshaft main and connecting rod bearings.
- Camshaft and rocker arms.
- Rocker arms and stationary hydraulic lash adjusters to cylinder head location.
- Valve to the valve guide.
- Valve spring and shim to the cylinder head location.
- Engine block main bearing cap location and direction.
- Oil pump drive and driven gears.

Tools and Equipment

Special tools are listed and illustrated throughout this Section with a complete listing at the end, refer to 7 Special Tools. These tools (or their equivalents) are specially designed to quickly and safely accomplish the operations for which they are intended. The use of these special tools will also minimise possible damage to engine components. Some precision measuring tools are required for inspection of certain critical components. A commercially available torque wrench and torque angle wrench, Tool No. EN-7115 are required for the correct tightening of various fasteners.

To correctly service the engine assembly, the following items should be readily available:

- Approved eye protection and safety gloves.
- A clean, well-lit, work area.
- A suitable parts cleaning tank.
- A compressed air supply.
- Trays or storage containers to keep parts and fasteners organised.
- An adequate set of hand tools.
- Approved engine repair stand.
- An approved engine lifting device that will adequately support the weight of the components.

Fasteners

Fasteners are central to the reliable operation of an engine. Whenever any bolt or any other threaded component is removed, allow the engine to cool (inset A) before attempting fastener removal.

Because of the greater thermal expansion of aluminium, bolt threads will change dimension to a greater extent when hot with this material (inset B) when compared to cast iron.

If a bolt or other threaded component is removed before the engine is allowed to cool to at least 50° C, threads could be pulled from the cylinder block or cylinder head.

Do not use impact tools to remove bolts during engine disassembly. While this may be common practice with cast iron engine components, use of these tools is more likely to pull the aluminium threads in the cylinder block or head of this engine.

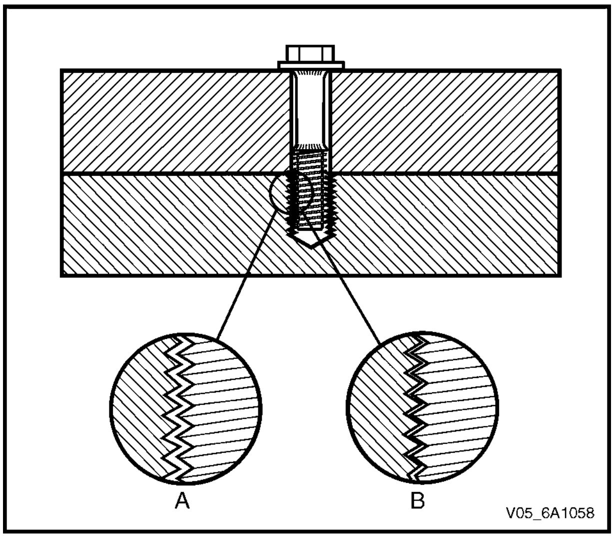

Figure 6A1 – 19

Clamp Load

When torque is applied to a fastener, the fastener stretches and the joint compresses. The force developed in the fastener due to its stretch is called tension (C), while the force applied to the joint is called clamp load (B).

As shown, only a small portion of the applied torque (A) is transferred to the clamp load (inset 1). Friction under the bolt head (inset 3) and in the threads (inset 2) absorbs much of the applied torque (A). Typically, only 10% (inset 1) of the torque is available to develop stretch (or tension) in the fastener and clamp load in the joint.

Therefore, a slight variation in friction in the thread or under the bolt head, results in a wide variation in the clamp load applied to the joint.

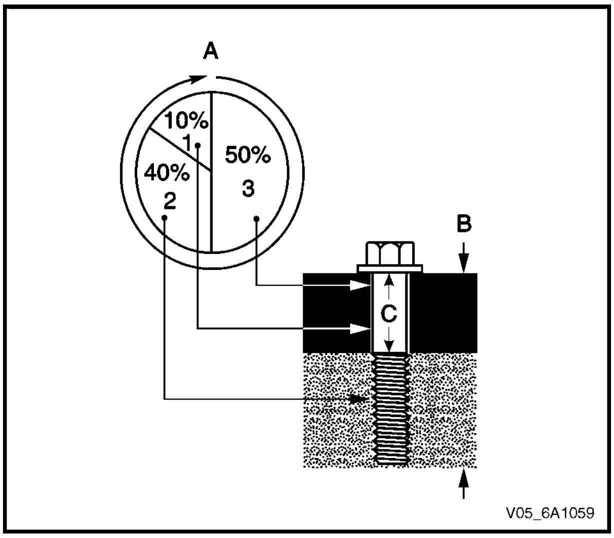

Figure 6A1 – 20

Torque Angle and Torque to Yield Fasteners

The torque angle method of applying torque to a fastener has been developed to overcome the effects of friction variation in fastener applications.

The application of the torque angle method does not always mean the fastener has to be replaced after loosening. It is only when the fastener has been angle tightened to the extent the yield point has been exceeded, that the fastener must be replaced.

Examples are the main bearing caps that are angle tightened but the bolts can be re-used, whereas the M11 cylinder head bolts that are torque to yield fasteners, must be replaced after loosening.

2 Diagnosis

2.1 Engine Diagnosis

Begin engine mechanical system diagnosis by reviewing the disassembled views provided in 1.2 Engine Components and 1.4 Engine Construction. Reviewing the description and operation information provided will assist in determining whether the condition described by the customer is a fault or normal engine operation.

2.2 Symptoms

Strategy Based Diagnosis

1 Review the system operations to familiarise yourself with the system functions, refer to 1 General Information and 6C1-1 Engine Management General Information.

2 Perform an engine management Diagnostic System Check, refer to Section 6C1-2 Engine Management – V6 – Diagnostics.

All diagnosis on a vehicle should follow a logical process. Strategy based diagnosis is a uniform approach for repairing all vehicle systems. The strategy based diagnostic flow chart may always be used to resolve a system problem. The diagnostic flow chart is the place to start when repairs are required. For a detailed explanation of strategy based diagnosis and the flow chart, refer to Section 6C1-2 Engine Management – V6 – Diagnostics.

Visual / Physical Inspection

1 Inspect the vehicle for aftermarket accessories which may adversely affect engine operation.

2 Inspect the easily accessible or visible system components for obvious signs of damage or conditions that may cause the symptom.

3 Check the engine lubrication system for the following:

- correct oil level,
- correct lubricant viscosity,
- correct oil filter application, and
- contaminated or burnt oil.

4 Confirm the exact operating conditions under which the fault occurs. Note factors such as:

- engine speed (r.p.m.),
- ambient temperature,
- engine temperature,
- engine warm-up time, and
- vehicle road speed.

5 Compare the engine sounds, if applicable, to a known good engine, and ensure you are not trying to diagnose a normal operating condition.

Intermittent

For intermittent faults, test the vehicle under the same conditions the customer reported in order to confirm whether the system is operating correctly.

2.3 Engine Misfire without Internal Engine Noises

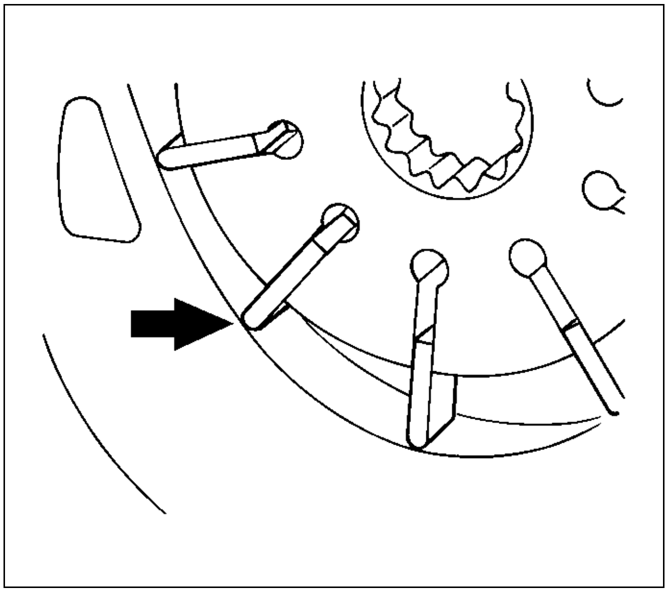
Cause	Correction
Abnormalities, severe cracking, bumps or missing areas in the accessory drive belt. Abnormalities in the accessory drive system and/or components may cause engine speed variations that result in a misfire diagnostic trouble code (DTC). A misfire code may be present without an actual misfire condition.	Replace the accessory drive belt, refer to 3.5 Accessory Drive Belt. Refer to 6C1-2 Engine Management – V6 – Diagnostics to check for DTCs.
Worn, damaged or misaligned accessory drive components and excessive pulley run-out may lead to a misfire DTC. A misfire code may be present without an actual misfire condition.	Inspect the components and repair or replace as required. Refer to 6C1-2 Engine Management – V6 – Diagnostics to check for DTCs.
Loose or incorrectly fitted flexplate or crankshaft balancer assembly. A misfire DTC may be present without an actual misfire condition.	Repair or replace the flexplate or crankshaft balancer as required, refer to 3.13 Crankshaft Balancer Assembly or 4.3 Flexplate Assembly. Refer to 6C1-2 Engine Management – V6 – Diagnostics to check for DTCs
Restricted exhaust system. A severe restriction in the exhaust flow can cause significant loss of engine performance and may set a DTC. Possible causes of restrictions in the exhaust system include collapsed/dented pipes and blocked mufflers and/or catalytic converters.	Repair or replace exhaust system components as required, refer to 8B Exhaust System. Refer to 6C1-2 Engine Management – V6 – Diagnostics to check for DTCs
Incorrectly installed or damaged vacuum hoses.	Repair or replace vacuum hoses as required.
Incorrect sealing between the intake manifold and cylinder heads, upper intake manifold and lower intake manifold, throttle body and intake manifold.	Repair or replace the intake manifold, throttle body gaskets, cylinder heads, throttle body as required.
Incorrectly installed or damaged barometric pressure(BARO) sensor and/or seal. The seal should not be torn or damaged.	Repair or replace the BARO sensor and/or seal as required, refer to 6C1-3 Engine Management – V6 – Service Operations.
Incorrectly installed or damaged EVAP purge solenoid and/or O-ring seal.	Repair or replace the EVAP purge solenoid and/or seal as required, refer to 6C1-3 Engine Management – V6 – Service Operations
Worn or loose stationary hydraulic lash adjusters (SHLA) and/or rocker arms. The SHLAs, rocker arms and roller bearings should be intact and in the correct position.	Replace the SHLAs and/or rocker arms as required, refer to 3.21 Stationary Hydraulic Lash Adjuster or 3.20 Rocker Arm.
Stuck valves. Carbon build up on the valve stems can result in the valves not closing correctly.	Repair or replace as required, refer to 3.22 Cylinder Head Assembly.
Excessively worn or misaligned timing chain/s.	Replace the timing chain/s and components as required, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.
Worn camshaft lobes.	Replace the camshaft/s and SHLAs as required, refer to 3.19 Camshaft or 3.21 Stationary Hydraulic Lash Adjuster.
Excessive oil pressure. A lubrication system with excessive oil pressure may lead to excessive lash adjuster pump-up and loss of compression.	1 Perform an oil pressure test, refer to 3.1 Engine Oil. 2 Repair or replace the engine oil pump as required, refer to 3.17 Oil Pump Assembly.

Reassembly

1. Install oil seal to front housing. Be sure to discard used oil seal, and always use new parts for installation.

CAUTION: When installing the oil seal, be careful not to damage the oil seal contacting surface of the housing.

2. Install shaft assembly.
3. Install the vanes to roter with curved face in contact with the inner wall of cam.



442RS005

4. Install roter and vanes to cam.
5. Install pin to front housing.
6. Install two new O-rings to front housing. Be sure to discard used O-ring.
7. Install side plate.

CAUTION: When installing side plate, be careful not to damage its inner surface. Damaged side plate may cause poor pump performance, pump seizure or oil leakage.

8. Install pump cartridge assembly to front housing.
9. Install snap ring to shaft end.
10. Install rear housing with a new O-ring. Be sure to discard used O-ring. Then install bolt and tighten it to specified torque.

    Torque: 25 N·m (2.5 kgf·m/18 lb·ft)
11. Install suction pipe with a new O-ring. Be sure to discard used O-ring. Then install bolt and tighten it to specified torque.

    Torque: 10 N·m (1.0 kgf·m/87 lb·in)
12. Install relief valve and spring.
13. Install connector with a new O-ring. Be sure to discard used O-ring. Tighten the connector to specified torque.

    Torque: 59 N·m (6.0 kgf·m/43 lb·ft)

Main Data and Specifications

General Specifications

Oil pump	Type	Vane
	Operating fluid	ATF DEXRON®—III

Cause	Correction
Faulty cylinder head gasket and/or cracking or other damage to the cylinder head and cylinder block coolant passages. Coolant consumption may or may not cause the engine to overheat.	1 Inspect the spark plugs for coolant saturation, refer to 6C1-3 Engine Management – V6 – Service Operations. 2 Inspect the cylinder heads, cylinder block and/or head gaskets, refer to 3.22 Cylinder Head Assembly and/or 4.7 Cylinder Block. 3 Repair or replace components as required.
Worn piston rings. Oil consumption may or may not cause the engine to misfire.	1 Inspect the spark plugs for oil deposits, refer to 6C1-3 Engine Management – V6 – Service Operations. 2 Check the cylinders for a loss of compression, refer to 2.15 Engine Compression Test. 3 Perform compression testing to identify the cause of low compression. 4 Repair or replace components as required.
A damaged crankshaft reluctor wheel. A damaged crankshaft reluctor wheel can result in different symptoms depending on the severity and location of the damage. Systems with severe reluctor ring damage may exhibit periodic loss of crankshaft position, stop delivering a signal, and then re-sync the crankshaft position. Systems with slight reluctor ring damage may exhibit no loss of crankshaft position and no misfire may occur, however, a DTC may set.	Replace the crankshaft as required, refer to 4.6 Crankshaft and Main Bearings. Refer to 6C1-2 Engine Management – V6 – Diagnostics to check for DTCs

2.4 Engine Misfire with Abnormal Internal Lower Engine Noises

Cause	Correction
Abnormalities, severe cracking, bumps or missing areas in the accessory drive belt. Abnormalities in the accessory drive system and/or components may cause engine speed variations that result in a misfire diagnostic trouble code (DTC). A misfire code may be present without an actual misfire condition.	Replace the accessory drive belt, refer to 3.5 Accessory Drive Belt. Refer to 6C1-2 Engine Management – V6 – Diagnostics to check for DTCs
Worn, damaged or misaligned accessory drive components and excessive pulley run-out may lead to a misfire DTC. A misfire code may be present without an actual misfire condition.	Inspect the components and repair or replace as required. Refer to 6C1-2 Engine Management – V6 – Diagnostics to check for DTCs
Loose or Incorrectly fitted flexplate or crankshaft balancer assembly. A misfire code may be present without an actual misfire condition.	Repair or replace the flexplate or crankshaft balancer as required, refer to 3.13 Crankshaft Balancer Assembly or 4.3 Flexplate Assembly.
Worn or broken piston rings. Oil consumption may or may not cause an actual misfire.	1 Inspect the spark plugs for oil deposits, refer to 6C1-3 Engine Management – V6 – Service Operations. 2 Check the cylinders for a loss of compression, refer to 2.15 Engine Compression Test. 3 Perform compression testing to identify the cause of low compression. 4 Repair or replace components as required.
Worn crankshaft thrust bearing. Severely worn thrust surfaces on the crankshaft and/or thrust bearing may permit fore and aft movement of the crankshaft and create a DTC without an actual misfire condition being present.	Replace the crankshaft and/or bearings as required, refer to 4.6 Crankshaft and Main Bearings. Refer to 6C1-2 Engine Management – V6 – Diagnostics to check for DTCs

2.5 Engine Misfire with Abnormal Valve Train Noise

Cause	Correction
Worn or loose stationary hydraulic lash adjusters (SHLA) and/or valve rocker arms. The SHLAs, rocker arm and roller bearings should be intact and in the correct position.	Replace the SHLAs and/or rocker arms as required, refer to 3.21 Stationary Hydraulic Lash Adjuster or 3.20 Rocker Arm.
Stuck valves. Carbon build up on the valve stems can result in the valves not closing correctly.	Repair or replace as required, refer to 3.22 Cylinder Head Assembly.
Excessively worn or misaligned timing chain/s.	Replace the timing chain/s and components as required, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.
Worn camshaft lobes.	Replace the camshaft/s and SHLAs as required, refer to 3.19 Camshaft or 3.21 Stationary Hydraulic Lash Adjuster.
Sticking camshaft lash adjusters.	Replace the lash adjusters as required, refer to 3.21 Stationary Hydraulic Lash Adjuster.

2.6 Engine Misfire with Coolant Consumption

Cause	Correction
Faulty cylinder head gasket and/or cracking or other damage to the cylinder heads and cylinder block coolant passages. Coolant consumption may or may not cause the engine to overheat.	1 Inspect the spark plugs for coolant saturation, refer to 6C1-3 Engine Management – V6 – Service Operations. 2 Inspect the cylinder heads, cylinder block and/or head gaskets, refer to 3.22 Cylinder Head Assembly and/or 4.7 Cylinder Block. 3 Repair or replace components as required.

2.7 Engine Misfire with Excessive Oil Consumption

Cause	Correction
Worn valves, valve guides and/or valve stem oil seals.	1 Inspect the spark plugs for coolant saturation, refer to 6C1-3 Engine Management – V6 – Service Operations. 2 Repair or replace components as required, refer to 3.22 Cylinder Head Assembly.
Worn or broken piston rings. Oil consumption may or may not cause an actual misfire.	1 Inspect the spark plugs for oil deposits, refer to 6C1-3 Engine Management – V6 – Service Operations. 2 Check the cylinders for a loss of compression, refer to 2.15 Engine Compression Test. 3 Perform compression testing to identify the cause of low compression. 4 Repair or replace components as required.

2.8 Engine Noise on Start-up, but only Lasting a Few Seconds

NOTE

A cold piston knock, which disappears in approximately 1.5 minutes from start up, should be considered acceptable. A cold engine knock usually disappears when the specific cylinder's secondary ignition circuit is grounded out during diagnosis.

A light rattle/tapping noise may indicate a valve train/upper engine concern, while a low rumble/knocking may indicate a crankshaft, piston or lower engine concern.

Cause	Correction
Oil filter anti-drain back valve faulty.	Replace the oil filter adaptor, refer to 3.3 Oil Filter Adaptor.
Incorrect oil viscosity.	Drain the engine oil and replace with the correct viscosity oil, refer to 3.1 Engine Oil.
High camshaft stationary hydraulic lash adjuster (SHLA) leak down rate.	Replace the SHLA as required, refer to 3.21 Stationary Hydraulic Lash Adjuster.
Worn crankshaft thrust bearing.	Inspect and replace the crankshaft and/or bearings as required, refer to 4.6 Crankshaft and Main Bearings.
Damaged or faulty oil filter by-pass valve.	1 Inspect the oil filter by-pass valve for correct operation. 2 Repair or replace the oil filter adaptor/by-pass valve as required.

2.9 Upper Engine Noise, Regardless of Engine Speed

NOTE

A cold piston knock, which disappears in approximately 1.5 minutes from start up, should be considered acceptable. A cold engine knock usually disappears when the specific cylinder's secondary ignition circuit is grounded out during diagnosis.

A light rattle/tapping noise may indicate a valve train/upper engine concern, while a low rumble/knocking may indicate a crankshaft, piston or lower engine concern.

Cause	Correction
Low oil pressure.	1 Perform an oil pressure test, refer to 2.19 Engine Oil Pressure Diagnosis. 2 Repair or replace the engine oil pump as required, refer to 3.17 Oil Pump Assembly.
Worn or loose stationary hydraulic lash adjusters (SHLA) and/or valve rocker arms. The SHLAs, rocker arm and roller bearings should be intact and in the correct position.	1 Clean, inspect and replace the camshaft lash adjusters as required, refer to 3.21 Stationary Hydraulic Lash Adjuster. 2 Replace the SHLAs and/or rocker arms as required, refer to 3.21 Stationary Hydraulic Lash Adjuster or 3.20 Rocker Arm.
Incorrect lubrication to the stationary hydraulic lash adjusters and valve rocker arm.	Inspect the following components and repair or replace as required: • valve rocker arms, refer to 3.20 Rocker Arm. • stationary hydraulic lash adjusters, refer to 3.21 Stationary Hydraulic Lash Adjuster. • oil filter by-pass valve, refer to 3.3 Oil Filter Adaptor. • oil pump and suction pipe, refer to 3.17 Oil Pump Assembly. • cylinder head oil galleries, refer to 3.22 Cylinder Head Assembly. • cylinder block oil galleries, refer to 4.7 Cylinder Block.
Broken Valve Spring.	Replace the valve spring, refer to 3.22 Cylinder Head Assembly.
Stretched or broken timing chain/s and/or damaged timing chain sprocket teeth.	Replace the timing chains or sprockets as required, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.
Worn or faulty timing chain tensioner or guide.	Replace the timing chains or sprockets as required, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.
Worn camshaft lobes.	Replace the camshaft/s and SHLAs as required, refer to 3.19 Camshaft or 3.21 Stationary Hydraulic Lash Adjuster.
Worn valve guides and/or valve stems.	Inspect and repair or replace valves and valve guides as required, refer to 3.22 Cylinder Head Assembly.
Stuck valves. Carbon on the valve stem or valve seat may cause the valve to stay open.	Inspect and repair or replace valves and valve guides as required, refer to 3.22 Cylinder Head Assembly.

2.10 Lower Engine Noise, Regardless of Engine Speed

NOTE

A cold piston knock which disappears in approximately 1.5 minutes from start up should be considered acceptable. A cold engine knock usually disappears when the specific cylinder's secondary ignition circuit is grounded out during diagnosis.

A light rattle/tapping noise may indicate a valve train/upper engine concern, while a low rumble/knocking may indicate a crankshaft, piston or lower engine concern.

Cause	Correction
Low oil pressure.	1 Perform an oil pressure test, refer to 2.19 Engine Oil Pressure Diagnosis. 2 Repair or replace the engine oil pump as required, refer to 3.17 Oil Pump Assembly.
Worn accessory drive components. Abnormalities such as severe cracking, bumps, stretching or missing areas on an accessory drive belt and/or misalignment of accessory drive system components.	Inspect the accessory drive system, repair or replace components as required, refer to 3.5 Accessory Drive Belt.
Loose or damaged crankshaft balancer and pulley assembly.	Repair or replace the crankshaft balancer and pulley assembly as required, refer to 3.13 Crankshaft Balancer Assembly.
Detonation or spark knock.	Confirm the correct operation of the ignition system, refer to 6C1-2 Engine Management – V6 – Diagnostics.
Loose torque converter bolts.	Inspect and tighten the torque converter bolts to the correct torque specification, refer to 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing.
Loose or damaged flexplate.	Repair or replace the flexplate as required, refer to 4.3 Flexplate Assembly.
Oil pump suction pipe loose, damaged or restricted.	Clean, inspect and repair/replace the oil pump suction pipe as required, refer to 4.2 Oil Pan and Oil Pump Suction Pipe Assembly.
Excessive piston-to-cylinder bore clearance.	Inspect the piston and cylinder bore and repair/replace components as required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings and 4.7 Cylinder Block.
Excessive connecting rod bearing clearance.	Inspect the connecting rod, crankshaft and bearings and repair/replace components as required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings and 4.6 Crankshaft and Main Bearings.
Excessive piston pin to bore clearance.	Inspect the pistons and pins and repair/replace components as required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings.
Excessive crankshaft main bearing clearance.	Inspect the crankshaft, cylinder block journals, main bearings and main bearing caps and repair/replace components as required, refer to 4.6 Crankshaft and Main Bearings and 4.7 Cylinder Block.
Incorrect piston, pin and connecting rod installation. Pistons must be installed with the mark or dimple facing the front of the engine. Piston pins must be centred in the piston pin bore.	Confirm the pistons, pins and connecting rods are installed correctly and repair if required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings.

2.11 Engine Noise Under Load

NOTE

A cold piston knock which disappears in approximately 1.5 minutes from start up, should be considered acceptable. A cold engine knock usually disappears when the specific cylinder's secondary ignition circuit is grounded out during diagnosis.

A light rattle/tapping noise may indicate a valve train/upper engine concern, while a low rumble/knocking may indicate a crankshaft, piston or lower engine concern.

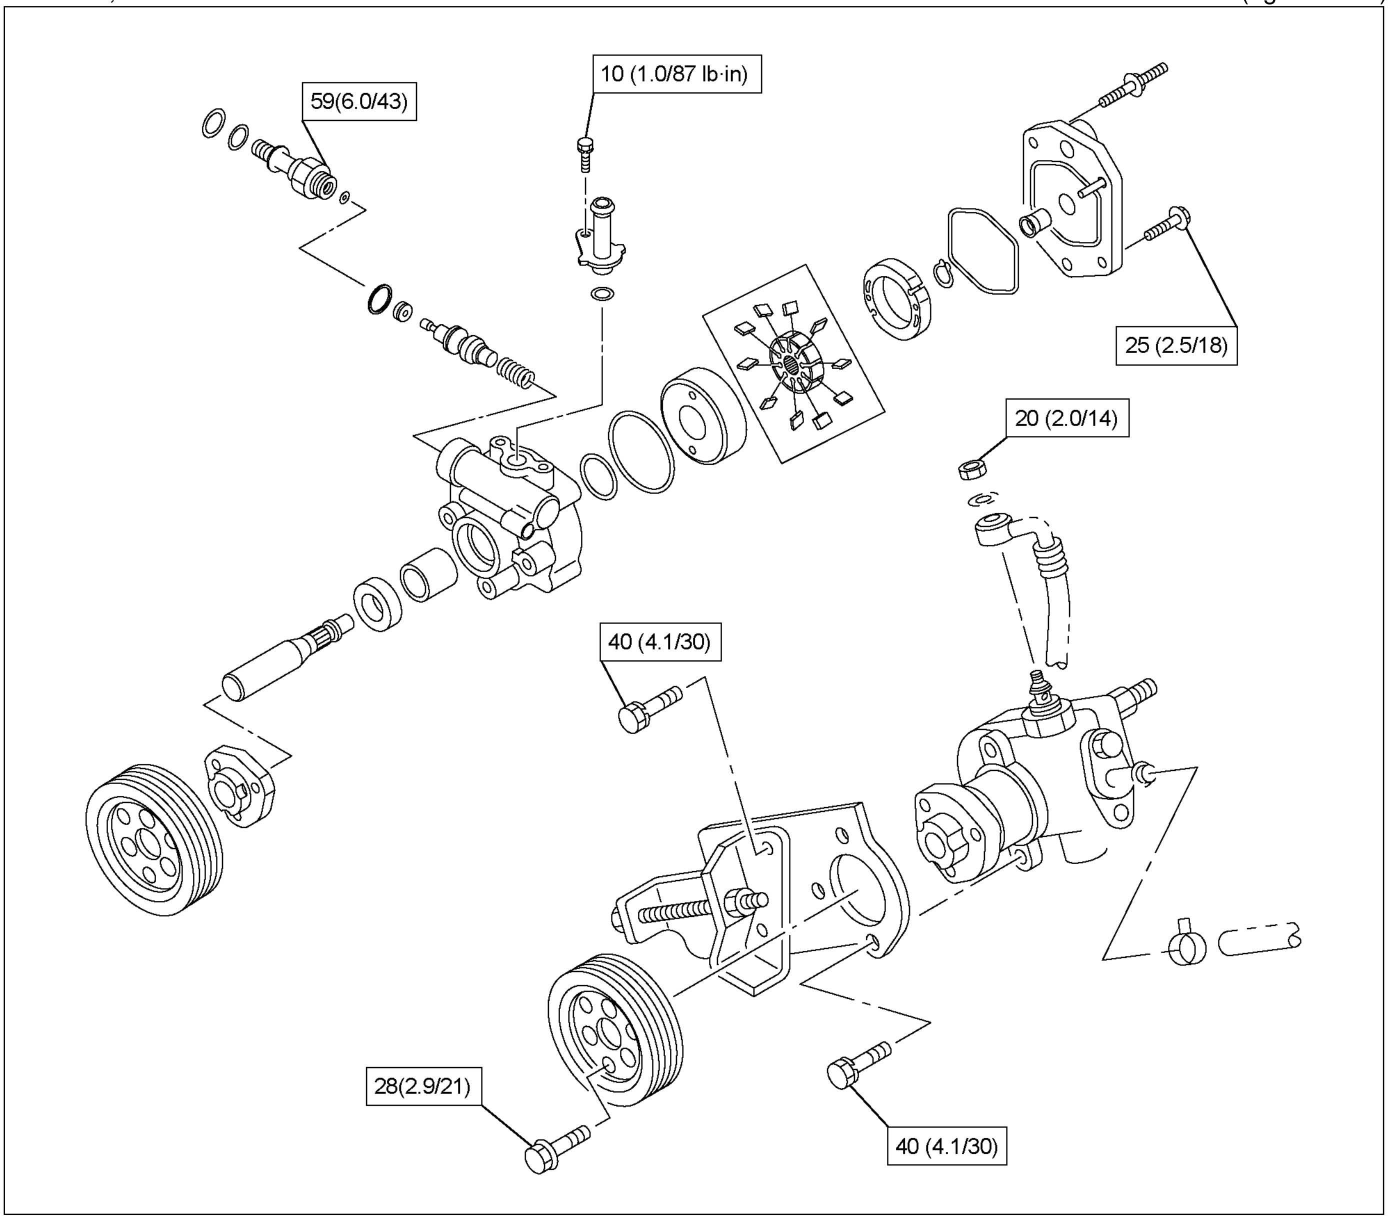
Cause	Correction
Low oil pressure.	1 Perform an oil pressure test, refer to 2.19 Engine Oil Pressure Diagnosis. 2 Repair or replace the engine oil pump as required, refer to 3.17 Oil Pump Assembly.
Detonation or spark knock.	Confirm the correct operation of the ignition system, refer to 6C1-2 Engine Management – V6 – Diagnostics.
Loose torque converter bolts.	Inspect and tighten the torque converter bolts to the correct torque specification, refer to 7C1 Automatic – 4L60E – General Information – 4L60E – General Information.
Cracked flexplate.	Replace the flywheel/flex-plate as required, refer to 4.3 Flexplate Assembly.
Excessive connecting rod bearing clearance.	Inspect the connecting rod, crankshaft and bearings and repair/replace components as required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings and 4.6 Crankshaft and Main Bearings.
Excessive crankshaft bearing clearance	Inspect the crankshaft, cylinder block journals, main bearings and main bearing caps and repair/replace components as required, refer to 4.6 Crankshaft and Main Bearings and 4.7 Cylinder Block.

2.12 Engine Will Not Crank – Crankshaft Will Not Rotate

Cause	Correction
Seized accessory drive system component.	1 Remove the accessory drive belt, refer to 3.5 Accessory Drive Belt. 2 Rotate the crankshaft by hand at the balancer pulley or flywheel. 3 Repair or replace accessory drive system components as required.
Hydraulically locked cylinder caused by: • coolant in cylinder, • oil in cylinder, or • fuel in cylinder.	1 Remove the spark plugs and check for fluid, refer to 6C1-3 Engine Management – V6 – Service Operations. 2 Inspect for broken head gasket/s. 3 Inspect for cracked engine block or cylinder head. 4 Inspect for sticking fuel injector. 5 Repair or replace components as required.
Seized torque converter.	1 Remove the torque converter bolts, refer to 7C1 Automatic – 4L60E – General Information – 4L60E – General Information. 2 Rotate the crankshaft by hand at the balancer pulley or flywheel. 3 Repair or replace torque converter as required.
Material in cylinder bore, caused by: • broken valve, • broken piston or ring, or • dirt or foreign matter entry during engine assembly procedure.	1 Clean and inspect the cylinder for damaged components and or foreign matter, refer to 4.7 Cylinder Block. 2 Repair or replace components as required.
Seized crankshaft or connecting rod bearings.	Inspect and repair or replace crankshaft, connecting rod and bearings as required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings and 4.6 Crankshaft and Main Bearings.
Bent or broken connecting rod.	Inspect and repair or replace connecting rod and bearings as required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings.
Bent or broken crankshaft.	Inspect and repair or replace crankshaft and bearings as required, refer to 4.6 Crankshaft and Main Bearings.
Seized or broken camshaft.	1 Inspect and replace camshafts as required, refer to 3.19 Camshaft. 2 Inspect camshaft journals and cam caps on cylinder head and repair or replace components as required, refer to 3.22 Cylinder Head Assembly.
Seized or broken camshaft timing components.	1 Inspect the crankshaft, idler, intake camshaft and exhaust camshaft sprockets. 2 Inspect the timing chains. 3 Inspect the guides. 4 Inspect the tensioners. 5 Repair or replace components as required, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.
Seized or broken valve train components.	1 Inspect the stationary hydraulic lash adjusters, refer to 3.21 Stationary Hydraulic Lash Adjuster. 2 Inspect the rocker arms, refer to 3.20 Rocker Arm. 3 Inspect the Valves Refer to 3.22 Cylinder Head Assembly. 4 Inspect the valve springs, refer to 3.22 Cylinder Head Assembly. 5 Repair or replace components as required.

Torque Specifications

4JH1-TC, 4JA1-T N・m (kgf・m/lb・ft)



RTW73BLF000901

2.13 Coolant in Combustion Chamber

Definition

Excessive white smoke and/or coolant type odour emitted from the exhaust pipe may indicate coolant in the combustion chamber. Low coolant levels, an inoperative engine cooling fan or a faulty thermostat may lead to an over-temperature condition which may cause internal engine component damage. A slower than normal cranking speed may indicate coolant entering the combustion chamber.

1 Remove the spark plugs and inspect for spark plugs saturated by coolant and coolant in the cylinder bore.

2 Inspect by performing a cylinder leakage test, refer to 2.16 Cylinder Leakage Test. During this test, excessive air bubbles in the coolant may indicate a faulty head gasket, cracked cylinder head or cracked cylinder block.

3 Inspect by performing a cylinder compression test. Two cylinders side-by-side on the cylinder block, with low compression, may indicate a failed cylinder head gasket, refer to 2.15 Engine Compression Test.

Cause	Correction
Cracked intake manifold or faulty gasket.	Replace components as required, refer to 3.10 Intake Manifold Assembly – Complete.
Faulty cylinder head gasket.	Replace the cylinder head gasket, refer to 3.22 Cylinder Head Assembly.
Warped cylinder head.	Repair or replace the cylinder heads as required, refer to 3.22 Cylinder Head Assembly.
Cracked cylinder liner or block	Repair or replace the cylinder block and components as required, refer to 4.7 Cylinder Block.
Cylinder head or cylinder block porosity.	Repair or replace the cylinder block or cylinder heads as required, refer to 4.7 Cylinder Block or 3.22 Cylinder Head Assembly.

2.14 Coolant in Engine Oil

Definition

Foamy or discoloured oil or an engine oil overfill condition may indicate coolant entering the engine crankcase. Low coolant levels, an inoperative engine cooling fan or a faulty thermostat may lead to an over-temperature condition which may result in engine component damage. Contaminated engine oil and oil filters must be replaced.

1 Inspect the oil for excessive foaming or an overfill condition. Oil diluted by coolant may not correctly lubricate the crankshaft bearings, resulting in component damage, refer to 2.10 Lower Engine Noise, Regardless of Engine Speed.

2 Perform a cylinder leakage test, refer to 2.16 Cylinder Leakage Test. During this procedure, excessive air bubbles in the engine coolant may indicate a faulty gasket or damaged component.

3 Perform a cylinder compression test. Two cylinders side-by-side on the cylinder block, with low compression, may indicate a failed cylinder head gasket, refer to 2.15 Engine Compression Test.

Cause	Correction
Faulty cylinder head gasket.	Replace the cylinder head gasket, refer to 3.22 Cylinder Head Assembly.
Warped cylinder head.	Repair or replace the cylinder heads as required, refer to 3.22 Cylinder Head Assembly.
Cracked cylinder liner or block	Repair or replace the cylinder block and components as required, refer to 4.7 Cylinder Block.
Cylinder head, cylinder block or intake manifold porosity.	Repair or replace the cylinder block, cylinder heads or intake manifold components as required, refer to 4.7 Cylinder Block, 3.22 Cylinder Head Assembly or 3.10 Intake Manifold Assembly – Complete.

2.15 Engine Compression Test

A compression pressure test of the engine cylinders determines the condition of the rings, the valves and the head gasket.

Preliminary Steps

1 Ensure the battery is fully charged.

2 Remove the spark plugs from all cylinders, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

NOTE

DTCs will set when the fuel system or the ignition system is disabled and the engine is cranked. Disregard DTCs that set under this condition.

3 Disable the fuel system by removing the fuel pump relay, refer to Section 8A Electrical Body & Chassis.

4 Start the engine to use any residual fuel from the fuel lines.

4 Disable the ignition coils by removing fuses 34 and 35, refer to Section 8A Electrical Body & Chassis .

5 Using Tech 2, command the throttle plate to wide open throttle.

Engine Cylinder Compression Test

1 Install the compression tester to cylinder number 1.

2 While observing the compression tester reading, turn the ignition to the START position for several seconds and then allow the ignition to return to the ON position.

3 Record the highest compression reading obtained.

4 Repeat the engine compression test for each cylinder.

Test Result Evaluation

Normal engine compression pressure builds quickly and evenly to over 965 kPa. In addition, the lowest reading of an engine cylinder should not be less than 70 percent of the highest reading. If any cylinder fails the compression test, adding 15 ml of engine oil to the suspected cylinder may help isolate the following fault condition.

1 A fault condition in the piston rings will produce the following result:

- A low compression on the first engine cycle
- The compression tends to build-up with the succeeding engine rotation.
- The compression improves with the addition of engine oil.

2 A fault condition in an intake or exhaust valve will produce the following result:

- A low compression on the first engine cycle
- The compression does not build with the succeeding engine rotation.
- The compression does not improve with the addition of engine oil.

3 A fault condition in the cylinder head gasket will produce the following result:

- A low compression on the first engine cycle
- The compression does not build with the succeeding engine rotation.
- The compression does not improve with the addition of engine oil.
- The suspected cylinders are positioned adjacent to each other.
- The engine oil may be contaminated with engine coolant.
- The engine coolant may be contaminated with engine oil.

Once the fault has been identified, refer to the relevant service procedure and reinstall the removed components.

Using Tech 2, clear DTCs.

2.16 Cylinder Leakage Test

A leakage test may be performed to measure cylinder/combustion chamber leakage. High cylinder leakage may indicate one or more of the following:

- worn or burnt valves,
- broken valve springs,
- stuck valve lifters,
- incorrect valve lash/adjustment,
- damaged piston,
- worn piston rings,
- worn or scored cylinder bore,
- damaged cylinder head gasket,
- cracked or damaged cylinder head, or
- cracked or damaged engine block.

1 Disconnect the battery ground negative cable.
2 Remove the spark plugs from all cylinders, refer to Section 6C1-3 Engine Management – V6 – Service Operations.
3 Rotate the crankshaft to place the piston in the cylinder being tested at top dead centre (TDC) of the compression stroke.
4 Install a commercially available cylinder head leak down tester into the spark plug hole.

NOTE

If required, hold the crankshaft balancer bolt to prevent the engine from rotating.

5 Apply shop air pressure to the cylinder head leak down tester and adjust according to the manufacturers instructions.
6 Record the cylinder leakage value. Cylinder leakage that exceeds 25 percent is considered excessive and may require component service. In excessive leakage situations, inspect for the following conditions:
   - air leakage sounds at the throttle body or air inlet duct that may indicate a worn or burnt intake valve or a broken valve spring,
   - air leakage sounds at the exhaust system tailpipe that may indicate a worn or burnt exhaust valve or a broken valve spring,
   - air leakage sounds from the crankcase, oil level indicator tube, or oil fill tube that may indicate worn piston rings, a damaged piston, a worn or scored cylinder bore, a damaged engine block or a damaged cylinder head, or
   - air bubbles in the cooling system may indicate a damaged cylinder head or a damaged cylinder head gasket.
7 Perform the leakage test on the remaining cylinders and record the values.

2.17 Engine Oil Consumption Diagnosis

Definition

Excessive oil consumption (not due to leaks) is the use of 3 litres or more of engine oil within 10,000 kilometres. Prior to performing oil pressure testing, a preliminary inspection of the vehicle should be performed. During the preliminary visual inspection, the following likely causes of excessive oil usage should be investigated.

Cause	Correction
External oil leaks.	Refer to 2.18 Engine Oil Leak Diagnosis.
Incorrect oil level or reading of the oil level indicator.	Check for the correct oil level, refer to 3.1 Engine Oil.
Incorrect oil viscosity.	Replace the engine oil, using the recommended SAE grade of engine oil, refer to 3.1 Engine Oil.
Continuous high-speed driving or severe usage.	Service vehicle more frequently, refer to 0B Lubrication and Service.
Crankcase ventilation system restricted or malfunctioning.	Repair or replace crankcase ventilation system components as required, refer to 6C1-3 Engine Management – V6 – Service Operations.
Worn valve guides and or valve stems.	Inspect and repair valves and valve guides as required, refer to 3.22 Cylinder Head Assembly.
Worn or damaged valve stem oil seal.	Replace valve stem oil seals as required, refer to 3.22 Cylinder Head Assembly.
Piston rings broken, worn or not seated correctly.	Allowing adequate time for the piston rings to seat correctly, replace piston rings as required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings.
Piston rings incorrectly installed or not matched to cylinder bore oversize.	Replace piston rings as required, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings.

2.18 Engine Oil Leak Diagnosis

Introduction

It is important to correctly identify the source of an engine oil leak. For example, a power steering fluid leak or spillage during servicing can travel across the valley area of the engine and run-out the weep hole, which is located at the back of the cylinder block. Failure to correctly identify the source of an engine oil leak can lead to unnecessary replacement of engine components.

Most fluid leaks can be repaired by repairing or replacing the faulty component or resealing the gasket surface. However, once a leak is identified it is important to determine and repair the cause as well as the leak itself.

Locating and Identifying the Leak

Inspect the leaking fluid and determine whether it is engine oil, transmission fluid, power steering fluid, brake fluid or some other fluid. If unsure of the source of the leaking lubricant, a quick check of fluid levels should indicate where the fluid is coming from, as one or more fluid level should be low.

Visual Inspection

Once the type of leaking fluid has been determined, a visual inspection of the affected system should be performed. When performing the visual inspection:

1 Bring the vehicle to the normal operating temperature.

2 Park the vehicle over a large sheet of paper or other clean surface.

3 Leave the vehicle idling for 2-3 minutes, then check for dripping fluid.

4 If required, identify the type of fluid leaking and the approximate location of the leak.

5 Visually inspect the suspected area. A small mirror may assist viewing areas that are difficult to see normally.

6 Check for leaks at all sealing surfaces and fittings.

7 Check for any cracked or damaged components.

8 If the leak cannot be located, completely clean the entire engine and surrounding components, drive the vehicle at normal operating temperature for several kilometres and then repeat Steps 3 to 8.

9 If the leak still cannot be located, proceed with either the Powder Method or Black Light and Dye Method as outlined below.

Powder Method

1 Completely clean the entire engine and surrounding components.

2 Apply an aerosol type powder (e.g. foot powder) to the suspected area.

3 Operate the vehicle at normal operating temperature and at varying speeds for several kilometres.

4 Identify the source of the leak from the discoloration of the powder around the suspect components.

5 If required, use a small mirror to assist in viewing areas that are difficult to see normally.

6 Refer to Possible Causes for Engine Oil Leaks in this Section, and repair or replace components as required.

Black Light and Dye Method

A black light and die kit Tool No. J28428-E or a commercially available equivalent is available to technicians to aid in engine oil leak diagnosis. When using a black light and die kit for the first time, it is recommended the technician read the manufacturers instructions prior to using the kit.

1 Add the specified amount of dye, as per manufacturers instructions, into the engine or suspected source of the oil leak.

2 Operate the vehicle at normal operating temperature and at varying speeds for several kilometres.

3 With the vehicle parked on a flat level surface, aim the black light at the suspected component/s. The dyed fluid will appear as a yellow path leading to the oil leak source

4 Refer to Possible Causes for Engine Oil Leaks in this Section, and repair or replace components as required.

Possible Causes for Engine Oil Leaks

Common possible causes for engine oil leaks are:

- higher than recommended fluid levels,
- higher than recommended fluid pressures,
- blocked or faulty fluid filters or pressure relief valve,
- blocked or faulty engine ventilation system,
- incorrectly tightened or damaged fasteners,
- cracked or porous components,
- incorrect gaskets or sealants used,
- incorrect gaskets or sealant installation,
- damaged or worn gaskets or seals, and
- damaged or worn sealing surfaces.

2.19 Engine Oil Pressure Diagnosis

If the engine oil pressure is below the specified value, inspect the engine and components for the following:

- loose oil filter adaptor bolts,
- faulty oil filter adaptor seals,
- worn or faulty oil pump,
- loose oil pump bolts,
- loose, blocked or damaged oil pump suction pipe,
- faulty oil pump suction pipe seal,
- faulty oil pump pressure relief valve,
- faulty or incorrectly installed oil gallery plugs,
- excessive bearing clearance in one of the following:
- connecting rods big end/s,
- crankshaft main journal/s,
- camshaft/s,
- camshaft sprocket/s, and
- cracked, porous or restricted oil galleries, or broken lash adjuster/s.

2.20 Accessory Drive Belt Diagnosis

Tension Check

NOTE

An accessory drive belt that squeaks when the engine is started or stopped is considered normal and has no effect on drive belt durability.

1 Start the engine and switch off the air-conditioning system. Allow engine to run until normal operating temperature has been reached.

2 Turn the engine off and inspect the markings on the drive belt tensioner to confirm the drive belt tension is within the operating limits.

3 If the markings on the drive belt tensioner were outside the acceptable operating limits, replace the accessory drive belt, refer to 3.5 Accessory Drive Belt.

NOTE

The operating limits for acceptable drive belt tension are when the drive belt tensioner pointer (1) is aligned between the outer edge of the minimum and maximum tension marks (2).

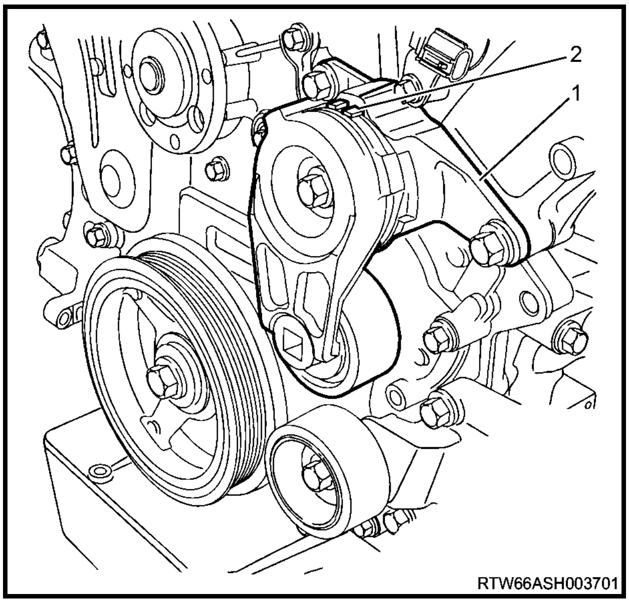


Figure 6A1 – 21

Inspect

Figure 6A1 – 22 illustrates the various stages of belt wear to aid in belt replacement decisions. Condition of the belt ribs is best judged where the belt is bent over one of the larger accessory drive system pulleys.

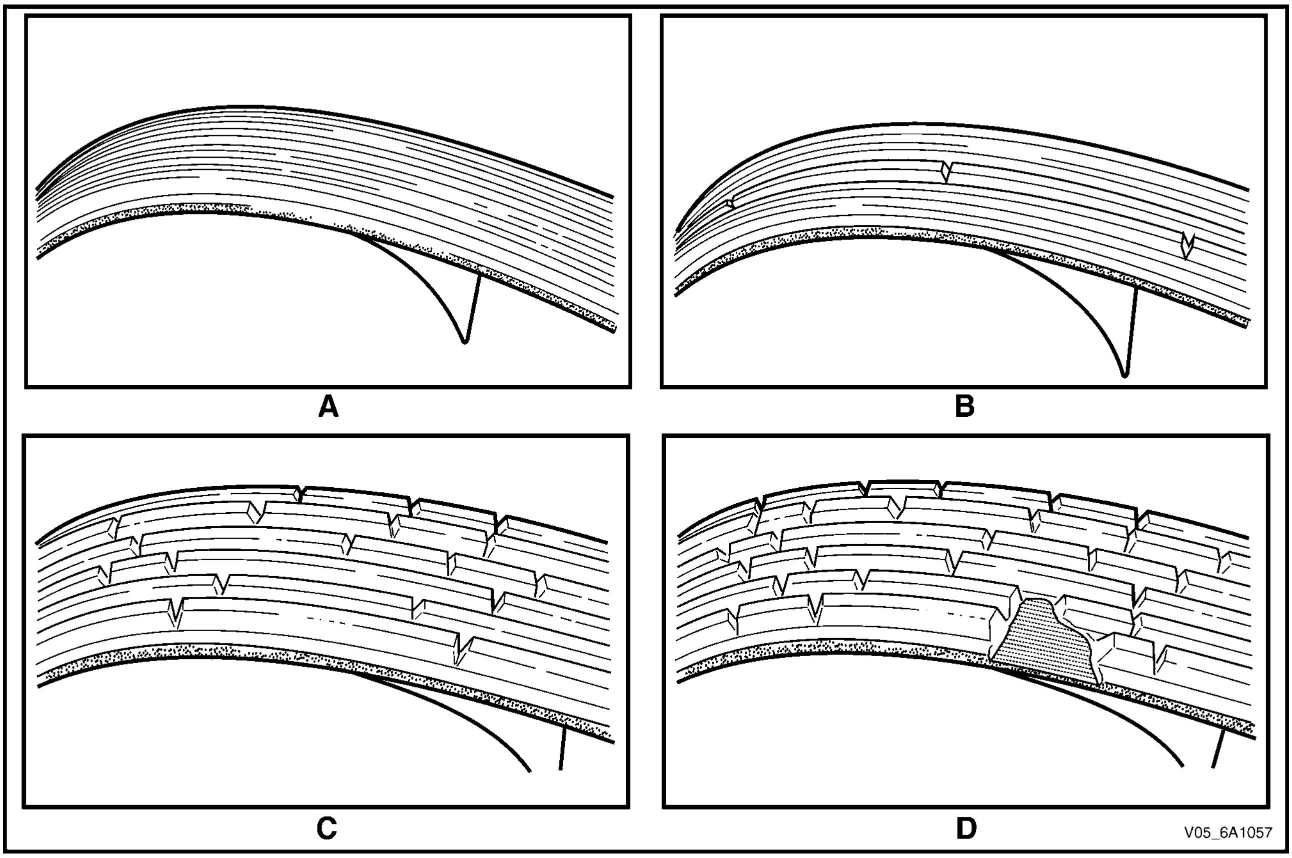

Figure 6A1 – 22

Legend

A New belt

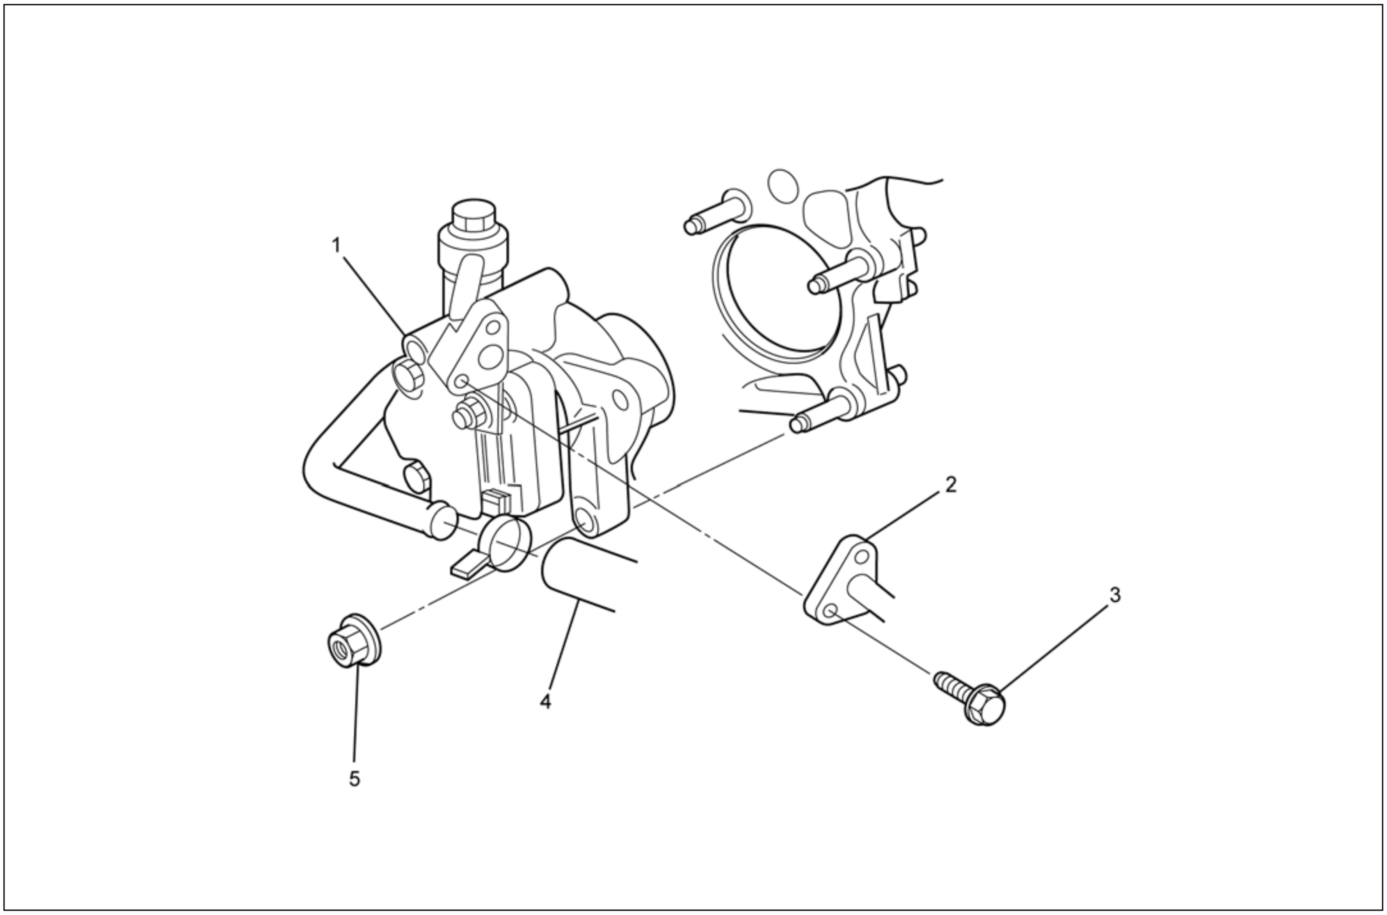
B Moderately used belt – few cracks, some wear on ribs and in grooves. replacement is not required

C Severely used belt – several cracks per 30 mm. Should be replaced before chunking occurs.

D Failed belt – separation of rib material from the backing (chunking). Replace belt immediately.

Power Steering Pump (4JJ1-TC, 4JK1-TC)

Power Steering Pump and Associated Parts



RTW53BMF000201

Legend

(1) Pump Assembly
(2) Flexible Hose
(3) Bolt
(4) Suction Hose
(5) Nut

Removal

1. Remove the cooler compressor drive belt.
2. Place a drain pan below the pump.
3. Disconnect the suction hose.
4. Disconnect the flexible hose.
5. Remove the power steering fixing nut, and remove the pump assembly.

Installation

1. Install the pump assembly. Tighten the fixing nut to the specified torque.
   Torque:
   25 N·m (2.5 kgf·m/18 lb·ft)
2. Install the flexible hose.
   Tighten the bolts to the specified torque.
   Torque: 8 N·m (0.8 kgf·m/69 lb·in)
3. Install the cooler compressor drive belt.
4. Connect the suction hose, then fill the power steering fluid and bleed the power steering system.
   Refer to Bleeding the Power Steering System in this section.

Drive Belt Chirp

Definition

Accessory drive belt chirping can be defined as a high-pitched noise that is heard once per revolution of the drive belt or a pulley.

NOTE

Chirping during start-up in cold damp conditions that abates once the engine reaches operating temperature is considered normal.

Diagnostic Aids

The symptom may be intermittent due to moisture on the drive belts or pulleys. It may be necessary to spray a small amount of water on the drive belt to duplicate and confirm a customers concern. If spraying water onto the drive belt system duplicates the symptom, cleaning the belt pulleys may be the solution.

A loose or incorrectly installed body component, suspension component or other item may be the cause of the noise.

Test Description

The numbers below refer to steps in the diagnostic table.

2 The noise may not be engine related. This step is to confirm the engine is making the noise. If the engine is not making the noise, do not proceed further with this diagnostic procedure.

3 The noise may be an internal engine noise. Removing the drive belt and operating the engine briefly will confirm whether or not the noise is related to the drive belt.

CAUTION

When running the engine with the accessory drive belt removed, the coolant pump will not be operating and the engine may overheat if left unsupervised even for a short period.

NOTE

There may also be a number of DTCs set when running the engine with the accessory drive belt removed.

4 Inspect all drive pump pulleys for pilling.

NOTE

Pilling is the small balls (pills) or strings of rubber in the belt grooves caused by the accumulation of rubber dust.

6 Misalignment of the accessory drive system pulleys may be caused by incorrect mounting of an accessory drive component (A/C compressor, generator etc.) or pulley. Misalignment may also be caused by incorrect installation of a pulley during a previous repair. Test for a misaligned pulley using a straight edge in the pulley grooves across two or three pulleys. If a misaligned pulley is found, refer to the relevant component service information for the correct installation and removal procedures.

10 Inspecting the fasteners can eliminate the possibility that an incorrect fastener has been installed.

12 Inspecting the pulleys for being bent should include inspecting for a dent or other damage that would prevent the drive belt from not seating correctly in all of the pulley grooves or on the smooth surface when the back end of the belt is used as the driving surface.

14 Replacing the drive belt when it is not damaged and there is no excessive pilling will only be a temporary repair.

Diagnostic Table

Step	Action	Yes	No
1	Did you review the information provided in 2.2 Symptoms, and perform the required inspections.	Go to Step 2	Go to 2.2 Symptoms
2	Confirm the customer complaint. Is there a chirping noise?	Go to Step 3	Refer to Diagnostic Aids in this Section
3	1 Remove the drive belt, refer to 3.5 Accessory Drive Belt. 2 Operate the engine for no more than 40 seconds. Does the chirping noise still exist?	Accessory drive system OK. Go to 2.2 Symptoms, and restart the diagnosis of the noise	Go to Step 4
4	Inspect for severe pilling, i.e. in excess of 33% of the belt groove depth. Do the belt grooves have pilling?	Go to Step 5	Go to Step 6
5	Clean the drive belt pulleys with a wire brush. Are the belt pulleys clean?	Go to Step 15	Go to Step 6
6	Inspect for misalignment of the pulleys. Are the pulleys misaligned?	Go to Step 7	Go to Step 8
7	Replace or repair misaligned pulleys. Did you complete the repair?	Go to Step 15	—
8	Inspect for any bent or damaged accessory drive component mounting brackets. Did you find any bent or damaged brackets?	Go to Step 9	Go to Step 10
9	Replace or repair any bent or damaged Brackets. Did you complete the repairs?	Go to Step 15	—
10	Inspect for missing, loose or incorrect fasteners. Did you find any missing, loose or incorrect fasteners?	Go to Step 11	Go to Step 12
11	Tighten any loose fasteners to the torque specification as provided in provided in 6. Torque Wrench Specifications. Replace any incorrect or missing fasteners. Did you complete the repairs?	Go to Step 15	—
12	Inspect for a bent pulley. Did you find any bent pulleys?	Go to Step 13	Go to Step 14
13	Replace bent pulleys as required. Did you complete the repair?	Go to Step 15	—
14	Replace the accessory drive belt, refer to 3.5 Accessory Drive Belt. Did you complete the repair?	Go to Step 15	—
15	Reinstall the accessory drive belt and operate the system to confirm the repair. Did you correct the chirp noise?	Accessory drive system OK	Go to 2.2 Symptoms, and restart the diagnosis

Drive Belt Squeal

Definition

Accessory drive belt squealing can be defined as a loud screeching noise caused by a slipping drive belt. Belt squeal is unusual in multi-rib belts. Drive belt squeal generally occurs when a heavy load is applied to the drive belt, such as an air-conditioning compressor engagement, snapping the throttle, seized pulley or a faulty accessory drive component.

Diagnostic Aids

If the noise is intermittent, confirm the accessory drive components by varying their loads, making sure they are operated to their maximum capacity. An overcharged A/C system, restrictions in the power steering pressure circuit or a faulty generator or coolant pump are likely causes of accessory drive belt squeal.

A loose or incorrectly installed body component, suspension component or other item may be the cause of the noise.

Test Description

The numbers below refer to steps in the diagnostic table.

2 The noise may not be engine related. This step is to confirm the engine is making the noise. If the engine is not making the noise, do not proceed further with this diagnostic procedure.

3 The noise may be an internal engine noise. Removing the drive belt and operating the engine briefly will confirm whether or not the noise is related to the drive belt.

CAUTION

When running the engine with the accessory drive belt removed, the coolant pump will not be operating and the engine may overheat if left unsupervised even for a short period.

NOTE

There may also be a number of DTCs set when running the engine with the accessory drive belt removed.

4 Confirms an accessory drive component does not have a seized bearing. With the belt removed, test the bearings in the accessory drive components spin free and smooth.

5 Confirms the drive belt tensioner is operating correctly. If the drive belt tensioner is not operating correctly, drive belt tension will not be maintained, resulting in a belt squealing noise

6 Confirms the belt is not too long, which would prevent the tensioner from working as intended. Also, if an excessively long belt has been fitted, it may also be routed incorrectly and may be turning an accessory drive component in the wrong direction.

7 Misalignment of the pulleys may be caused by one of the following:

- Incorrect mounting of an accessory drive component,
- Incorrect installation of an accessory drive pulley or,
- Bent or damaged pulley.

Test for a misaligned pulley using a straight edge in the pulley grooves across 2 or 3 pulleys. If a misaligned pulley is found, refer to the relevant component service information for the correct installation and removal procedures.

8 This test is to confirm the pulleys are the correct diameter and/or width. Using a known good vehicle, compare the pulley sizes.

Diagnostic Table

Step	Action	Yes	No
1	Did you review the information provided in 2.2 Symptoms, and perform the required inspections.	Go to Step 2	Go to 2.2 Symptoms
2	Confirm the customer complaint. Is there a squealing noise?	Go to Step 3	Refer to Diagnostic Aids in this Section

Step	Action	Yes	No
3	1 Remove the drive belt, refer to 3.5 Accessory Drive Belt. 2 Operate the engine for no more than 40 seconds. Does the squealing noise still exist?	Accessory drive system OK. Go to 2.2 Symptoms, and restart the diagnosis of the noise	Go to Step 4
4	Inspect the accessory drive components for a seized bearing and general malfunctions. Did you find and correct any seized bearings or general malfunctions in the accessory drive system?	Go to Step 9	Go to Step 5
5	Test the accessory drive belt tensioner for correct operation, refer to Accessory Drive Belt Tensioner Diagnosis. Did you find and repair any problems with the tensioner?	Go to Step 9	Go to Step 6
6	Inspect the accessory drive belt is the correct length, refer to 3.5 Accessory Drive Belt. Did you find and repair any problems with the drive belt length?	Go to Step 9	Go to Step 7
7	Inspect the accessory drive pulleys for misalignment. Did you find and correct any misaligned accessory drive pulleys?	Go to Step 9	Go to Step 8
8	Check the accessory drive pulleys are the correct size. Did you find and replace any incorrect pulleys?	Go to Step 9	Refer to Diagnostic Aids in this Section
9	Reinstall the accessory drive belt and operate the system to confirm the repair. Did you correct the squeal noise?	Accessory drive system OK	Go to 2.2 Symptoms, and restart the diagnosis

Drive Belt Whine

Definition

Accessory drive belt whine can be defined as a high-pitched continuous noise that is most likely to be caused by a failed bearing in one of the accessory drive components.

Diagnostic Aids

The drive belts themselves will not cause a whine. If the noise is intermittent, confirm the accessory drive components by varying their loads, making sure they are operated to their maximum capacity. An overcharged A/C system, restrictions in the power steering pressure circuit or a faulty generator or coolant pump are likely causes of accessory drive belt whine.

Test Description

The numbers below refer to steps in the diagnostic table.

3 The noise may be an internal engine noise. Removing the drive belt and operating the engine briefly will confirm whether or not the noise is related to the drive belt.

CAUTION

When running the engine with the accessory drive belt removed, the coolant pump will not be operating and the engine may overheat if left unsupervised even for a short period.

NOTE

There may also be a number of DTCs set when running the engine with the accessory drive belt removed.

4 The inspection of bearings should include the following accessory drive components:

- drive belt tensioners,
- drive belt idlers,
- generator,
- power steering pump,
- coolant pump, and
- A/C compressor.

The drive belt may need to be installed and the accessory drive components operated separately, at varying loads to confirm the location of the faulty bearing, refer to the relevant Sections for component inspection and repair procedures.

Diagnostic Table

Step	Action	Yes	No
1	Did you review the information provided in 2.2 Symptoms, and perform the required inspections.	Go to Step 2	Go to 2.2 Symptoms
2	Confirm the customer complaint. Is there a whining noise?	Go to Step 3	Refer to Diagnostic Aids in this Section
3	1 Remove the drive belt, refer to 3.5 Accessory Drive Belt. 2 Operate the engine for no more than 40 seconds. Does the whining noise still exist?	Accessory drive system OK Go to 2.2 Symptoms, and restart the diagnosis	Go to Step 4
4	Inspect the accessory drive components for a faulty or seized bearings and general malfunctions. Did you find and correct any faulty/seized bearings or general malfunctions in the accessory drive system?	Go to Step 5	Refer to Diagnostic Aids in this Section
5	Reinstall the accessory drive belt and operate the system to confirm the repair. Did you correct the whine?	Accessory drive system OK	Go to 2.2 Symptoms, and restart the diagnosis

Drive Belt Rumble

Definition

Accessory drive belt rumble can be defined as a low pitch tapping, knocking or thumping noise heard at or just above idle, once per rotation of the drive belt or a specific component. Drive belt rumble is generally caused by one of the following:

- pilling or strings in the drive belt grooves,
- separation of the drive belt, or
- a damaged or faulty drive belt.

NOTE

Pilling is the small balls (pills) or strings of rubber in the belt grooves caused by the accumulation of rubber dust.

Diagnostic Aids

Vibration from the engine may cause a body component or other parts to emit a rumbling noise.

The drive belt may have a condition that cannot be seen or felt. Sometimes the replacement of the belt may be the only way to confirm the belt is faulty.

If the drive belt has been replaced and the diagnostic table completed, but the rumble is still present only when the drive belt is installed, an accessory drive component such as the A/C compressor may be the cause. Varying the load to each accessory drive component in turn, should help isolate which component is causing the noise.

Test Description

The numbers below refer to steps in the diagnostic table.

2 Confirms the symptom exists at the time of diagnosis. Other vehicle components may be causing the noise.

3 Confirms the accessory drive belt is the cause of the noise. Drive belt rumbling is often confused with an internal engine noise due to the similarity in the description. Removing the drive belt and operating the engine briefly will confirm whether or not the noise is related to the drive belt.

CAUTION

When running the engine with the accessory drive belt removed, the coolant pump will not be operating and the engine may overheat if left unsupervised even for a short period.

NOTE

There may also be a number of DTCs set when running the engine with the accessory drive belt removed.

4 Inspecting the drive belt is to ensure that it is not causing the noise. Small cracks across the ribs of the drive belt will not cause the noise and are not justification alone to replace the belt. Belt separation can be identified by the ply of the belt separating and may be seen at the edge of the belt or felt as lumps under the belt.

5 Small amounts of pilling is a normal condition and is deemed acceptable. When the pilling is severe (33% of the belt groove depth), the belt does not have a smooth surface to run on and should be replaced.

Diagnostic Table

Step	Action	Yes	No
1	Did you review the information provided in 2.2 Symptoms, and perform the required inspections.	Go to Step 2	Go to 2.2 Symptoms
2	Confirm the customer complaint. Is there a rumbling noise?	Go to Step 3	Refer to Diagnostic Aids in this Section
3	1 Remove the drive belt, refer to 3.5 Accessory Drive Belt. 2 Operate the engine for no more than 40 seconds. Does the rumbling noise still exist?	Accessory drive system OK Go to 2.2 Symptoms, and restart the diagnosis	Go to Step 4

Step	Action	Yes	No
4	Inspect the accessory drive belt for damage, separation or sections of missing ribs. Did you find any damaged, separated or missing ribs?	Go to Step 7	Go to Step 5
5	Inspect the accessory drive belt for severe pilling (exceeding 33% of the belt groove depth). Did you find sever pilling?	Go to Step 6	Go to Step 5
6	Clean the drive belt using a suitable wire brush and reinstall to the engine, refer to 3.5 Accessory Drive Belt. Did you complete the repairs?	Go to Step 8	—
7	Install a new accessory drive belt, refer to 3.5 Accessory Drive Belt. Did you replace the accessory drive belt?	Go to Step 8	—
8	If required, reinstall the accessory drive belt and operate the system to confirm the repair. Did you correct the rumbling noise?	Accessory drive system OK	Refer to Diagnostic Aids in this Section

Drive Belt Vibration

Definition

Accessory drive belt vibration can be defined as a drive belt that jumps, shakes or rattles. Accessory drive belt vibration is usually indicated by one of the following:

- the vibration is engine speed related, or
- the vibration is sensitive to accessory drive system load.

Diagnostic Aids

The accessory drive components such as the A/C compressor or generator can have an affect on engine vibration.

To aid in locating which component is causing the vibration, vary the load to each accessory drive component in turn and note the effect it has on the vibration if any.

Test Description

The numbers below refer to steps in the diagnostic table.

2 Confirms the symptom exists at the time of diagnosis. Other vehicle components may be causing the noise.

3 Confirms the accessory drive belt is the cause of the noise. Drive belt rumbling is often confused with an internal engine noise due to the similarity in the description. Removing the drive belt and operating the engine briefly will confirm whether or not the noise is related to the drive belt.

CAUTION

When running the engine with the accessory drive belt removed, the coolant pump will not be operating and the engine may overheat if left unsupervised even for a short period.

NOTE

There may also be a number of DTCs set when running the engine with the accessory drive belt removed.

4 The drive belt may cause a vibration. Inspecting the drive belt is considerably easier while the drive belt is removed.

6 Inspecting the fasteners can eliminate the possibility that an incorrect fastener has been installed.

8 This step should only be performed if the coolant pump is driven by the drive belt. Inspect the coolant pump for a bent shaft. Also inspect the coolant pump bearings for smooth operation and excessive play. Compare the coolant pump with a known good pump.

9 Accessory drive component brackets that are bent, cracked or loose may put extra strain on the accessory component causing it to vibrate.

Diagnostic Table

Step	Action	Yes	No
1	Did you review the information provided in 2.2 Symptoms, and perform the required inspections.	Go to Step 2	Go to 2.2 Symptoms
2	Confirm the customer complaint. Is there a rumbling noise?	Go to Step 3	Refer to Diagnostic Aids in this Section
3	1 Remove the drive belt, refer to 3.5 Accessory Drive Belt. 2 Operate the engine for no more than 40 seconds. Does the vibration noise still exist?	Accessory drive system OK. Go to 4.2 Symptoms, and restart the diagnosis	Go to Step 4
4	Inspect the accessory drive belt for damage, wear, debris build-up or sections of missing ribs. Did you find any damage, wear, debris build-up or missing ribs?	Go to Step 5	Go to Step 6
5	Install a new accessory drive belt, refer to 3.5 Accessory Drive Belt. Did you replace the accessory drive belt?	Go to Step 10	—

Step	Action	Yes	No
6	Inspect for incorrect, loose, missing or damaged fasteners. Did you find any incorrect, loose, missing or damaged fasteners?	Go to Step 7	Go to Step 8
7	Tighten any loose fasteners to the correct torque specification, refer to 6 Torque Wrench Specifications. Replace any incorrect or missing fasteners. Did you complete the repairs?	Go to Step 10	—
8	Inspect the coolant pump for a bent shaft, refer to 6B1 Engine Cooling – V6. Did you find and repair a bent coolant pump shaft?	Go to Step 10	Go to Step 9
9	Inspect for bent, cracked or damaged accessory drive component mounting brackets. Did you find and repair any bent brackets?	Go to Step 10	Refer to Diagnostic Aids in this Section
10	If required, reinstall the accessory drive belt and operate the system to confirm the repair. Did you correct the vibration?	Accessory drive system OK	Refer to Diagnostic Aids in this Section

Drive Belt Falls Off

Definition

The drive belt falls off during normal operation or does not ride correctly on the accessory drive pulleys.

Diagnostic Aids

If the accessory drive belt repeatedly falls off the drive pulleys, this is most likely due to pulley misalignment.

An extra load that is quickly applied and released by an accessory drive component (e.g. A/C compressor) may cause the accessory drive belt to fall off. In this circumstance, confirm the fault by operating the accessory drive components in turn, noting which one caused the belt to fall off.

Lack of drive belt tension may also cause the belt to fall off the pulleys. Low drive belt tension could be caused by one of the following:

- an incorrect drive belt length,
- a faulty drive belt tensioner, or
- a stretched or faulty drive belt.

Test Description

The numbers below refer to steps in the diagnostic table.

2 Confirms the condition of the drive belt. Damage may have occurred to the drive belt when it first fell off or it may have been damaged which caused the belt to fall off.

4 Misalignment of the pulleys may be caused by:

- the incorrect installation or mounting of an accessory drive component,
- the incorrect installation of an accessory drive component pulley, or
- a damaged or bent accessory drive pulley.

Test for a misaligned pulley using a suitable straight edge in the pulley grooves across two or more pulleys. If a misaligned pulley is found, refer to the service information for the particular component, for the correct pulley replacement procedures.

5 Inspecting the pulleys should include an inspection for dents or other damage that would prevent the drive belt from seating correctly in all of the pulley grooves or on the smooth surface of a pulley when the back side of the belt is used.

6 Accessory drive component mounting brackets that are bent will cause the drive belt to fall off.

7 Inspection of the fasteners can eliminate the possibility that an incorrect fastener was installed. Missing, loose or incorrect fasteners may cause pulley misalignment from the fasteners moving under load. Over-tightening of the fasteners may cause deflection of mounting brackets and result in misaligned accessory drive pulleys.

Diagnostic Table

Step	Action	Yes	No
1	Did you review the information provided in 2.2 Symptoms, and perform the required inspections.	Go to Step 2	Go to 2.2 Symptoms
2	Inspect for a damaged accessory drive belt. Did you find any damage on the drive belt?	Go to Step 3	Go to Step 4
3	Install a new accessory drive belt, refer to 3.5 Accessory Drive Belt. Does the drive belt continue to fall off?	Go to Step 4	Go to Step 12
4	Inspect the accessory drive system pulleys for misalignment Did you find and repair any misaligned drive system pulleys?	Go to Step 12	Go to Step 5
5	Inspect for a dented or cracked accessory drive system pulley. Did you find and repair any dented or cracked drive system?	Go to Step 12	Go to Step 6
6	Inspect for bent accessory drive component mounting brackets. Did you find and repair any bent mounting brackets?	Go to Step 12	Go to Step 7
7	Inspect for incorrect, loose, missing or damaged fasteners. Did you find any incorrect, loose, missing or damaged fasteners?	Go to Step 8	Go to Step 9

9	Test the accessory drive belt tensioner for correct operation, refer to Accessory Drive Belt Tensioner Diagnosis in this Section. Did you accessory drive belt tensioner operate correctly?	Go to Step 11	Go to Step 10
10	Replace the drive belt tensioner, refer to 3.7 Accessory Drive Belt Tensioner Assembly. Does the drive belt continue to fall off?	Go to Step 11	Go to Step 12
11	Inspect for a failed drive belt idler and drive belt tensioner bearings. Did you find and repair any failed bearings?	Go to Step 12	Refer to Diagnostic Aids in this Section
12	If required, reinstall the accessory drive belt and operate the system to confirm the repair. Does the drive belt continue to fall off?	Go to Step 2	Accessory drive system OK

Drive Belt Excessive Wear

Definition

Excessive wear can be defined as wear at the outside ribs of the drive belt (frayed edges), usually caused by an incorrectly installed drive belt

Diagnostic Aids

Excessive wear of a drive belt is usually caused by an incorrect installation or an incorrect drive belt fitted. Minor pulley misalignment will not cause excessive wear, but will cause the drive belt to fall off. Major pulley misalignment may cause excessive wear, but would also result in the drive belt falling off.

Test Description

The numbers below refer to steps in the diagnostic table.

2 Confirms the drive belt is correctly installed onto all of the accessory drive system pulleys. Wear on the drive belt may be caused by incorrectly positioning the drive belt by one or more grooves to a particular pulley.

3 The installation of the drive belt that is the incorrect width will cause wear on the drive belt. The drive belt ribs should match all the grooves on all the pulleys in the accessory drive system.

4 Confirms the drive belt is not contacting any parts of the engine or body while the engine is running. There should be sufficient clearance when the accessory drive component loads varies. The drive belt should not come into contact with any engine or body parts.

Diagnostic Table

Step	Action	Yes	No
1	Did you review the information provided in 2.2 Symptoms, and perform the required inspections.	Go to Step 2	Go to 2.2 Symptoms
2	Inspect the accessory drive belt for correct installation. Is the drive belt installed correctly?	Go to Step 5	Go to Step 3
3	Ensure that the drive belt is the correct one for the application. Is the correct drive belt installed?	Go to Step 5	Go to Step 4
4	Is the drive belt contacting any engine or body components with the engine running?	Go to Step 6	Refer to Diagnostic Aids in this Section
5	Install a new accessory drive belt, refer to 3.5 Accessory Drive Belt. Did you replace the accessory drive belt?	Go to Step 6	—
6	If required, reinstall the accessory drive belt and operate the system to confirm the repair. Did you correct the excessive wear?	Accessory drive system OK	Go to Step 2

Accessory Drive Belt Tensioner Diagnosis

Diagnostic Table

Step	Action	Yes	No
1	1 Remove the accessory drive belt. 2 Inspect the drive belt tensioner pulley. Is the drive belt tensioner pulley loose or misaligned?	Go to Step 4	Go to Step 2
2	Rotate the drive belt tensioner. Does the drive belt tensioner rotate freely, without any unusual resistance or binding?	Go to Step 3	Go to Step 4
3	1 Using a suitable torque wrench, measure the torque required to lift the drive belt tensioner off the stop. 2 Using a known good tensioner, measure the torque required to lift the drive belt tensioner off the stop. Is the first torque reading within 10% of the second reading?	Accessory drive belt tensioner OK	Go to Step 4
4	Replace the drive belt tensioner, refer to 3.7 Accessory Drive Belt Tensioner Assembly. Is the repair complete?	Accessory drive belt tensioner OK	—

3 Minor Service Operations

ATTENTION

The V6 engine is a combination of numerous components, containing machined, honed, polished and lapped surfaces manufactured on the latest, high technology production equipment. Many of the components contain tolerances measured in thousandths of a millimetre. Consequently, when any engine component is to be serviced, care and cleanliness are extremely important.

Prior to re-assembly of the engine, all components must be cleaned and inspected in accordance with the relevant clean and inspect procedures throughout this Section, and replaced or repaired where required.

In addition to cleaning and inspecting components, a liberal coating of engine oil should be applied to friction surfaces during assembly to protect and lubricate the surfaces on initial operation.

When performing any service operation, it should be understood that correct cleaning and protection of machined surfaces and friction areas is part of the repair procedure. This is considered standard workshop practice, even if not specifically stated. Torque values must be used as specified during reassembly to ensure correct retention of all components.

Through out this section, fastener torque wrench specifications may be accompanied with the following identification marks:

- ■ **Fasteners must be replaced after loosening.**
- ♦ **Fasteners either have micro encapsulated sealant applied or incorporate a mechanical thread lock and should only be re-used once. If in doubt, replacement is recommended.**

If one of these identification marks is present alongside a fastener torque wrench specification, the recommendation regarding that fastener must be adhered to.

3.1 Engine Oil

The procedure outlined below is typically the same for both rear wheel drive and all wheel drive vehicles.

Check

The following procedure is applicable to both rear wheel and all wheel drive vehicles

1. Run the engine to bring it to normal operating temperature.
2. Park the vehicle on a level surface. A vehicle that is not level will affect the accuracy of the level reading.
3. Stop the engine and wait 5 to 10 minutes to allow the oil to drain back into the oil pan.
4. Remove the oil level indicator (1) and wipe clean.
5. Insert the indicator, ensuring it is fully seated.
6. Slowly remove the indicator to avoid smearing. Hold it horizontally or with lower end slightly down to avoid oil running along indicator.
7. Observe the oil level where it passes over the centre line of the indicator.
8. If the level is lower than the Add mark (2), add enough oil to the engine to reach the Upper mark (3). Do not add too much oil as the reading should never be above the Upper mark.

NOTE

When topping up the oil, allow approximately 5 to 10 minutes for the added oil to fully drain into the oil pan.

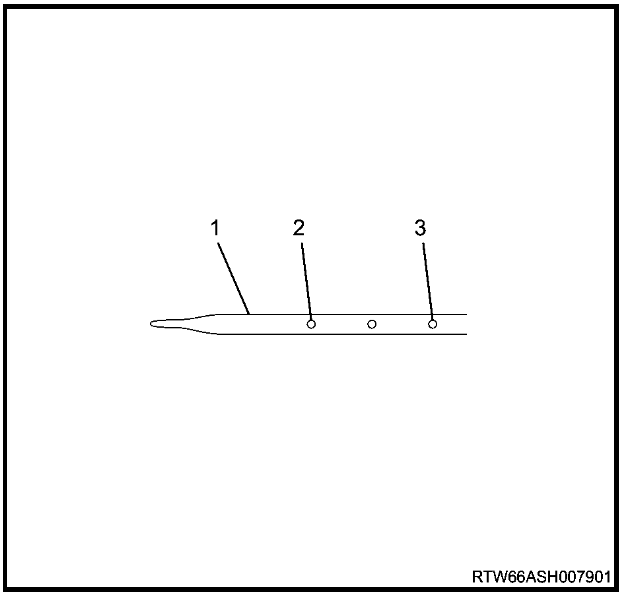

Figure 6A1 – 23

Replace

NOTE

- Quicker and more complete draining will occur if the engine oil is at normal operating temperature. However, care must be taken to avoid scalding from the hot oil.
- It recommended the oil filter be changed at each engine oil change, refer to 3.2 Oil Filter.

1 Remove the oil fill cap.

2 To ensure complete draining of the oil pan, raise the front and rear of the vehicle to maintain a level attitude. If not using a hoist, support the vehicle with safety stands, refer to Section 0A General Information.

3 Clean any foreign material from around the oil drain plug and place a suitable, clean drain tray under the engine.

WARNING

The oil may be hot. Avoid contact with the oil.
Ensure that eyes and skin are protected.

4 Remove the drain plug (1), taking care to avoid scalding from the hot oil. Allow the oil to drain.

5 Clean and inspect the drain plug threads. If damaged, replace the drain plug.

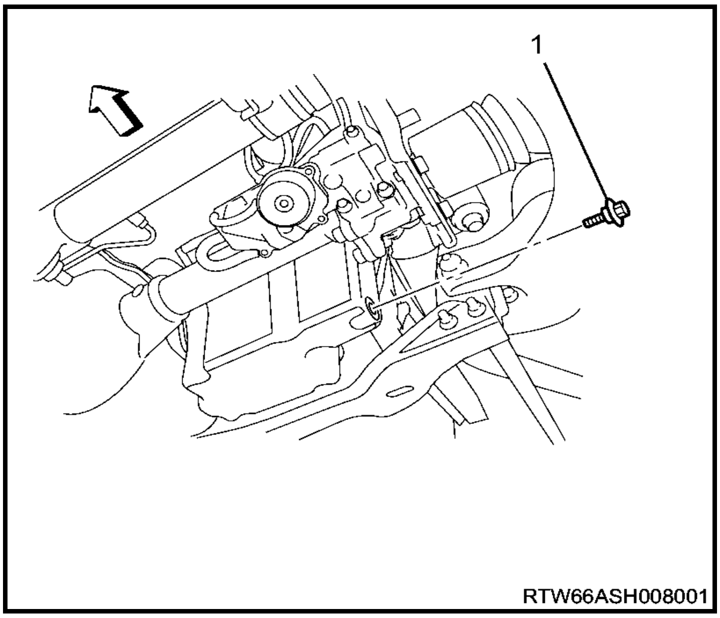

Figure 6A1 – 24

6 Once the oil has completely drained, reinstall the drain plug and tighten to the correct torque specification.

Oil pan drain plug torque specification ....25.0 Nm

7 Replace the oil filter, refer to 3.2 Oil Filter.

8 Lower the vehicle to the ground and fill with the specified amount of SAE 5W30 lubricant.

Engine Oil Capacity: With Oil Filter Change.......................................6.5 litres

9 Install the oil fill cap.

10 Start the engine and check for leaks.

Pressure Check

1 Run the engine to bring it to normal operating temperature.
2 Park the vehicle on a level surface. A vehicle not level will affect the accuracy of the level reading.
3 Stop the engine and wait 5 to 10 minutes to allow the oil to drain back into the oil pan.
4 Check the oil level and top up with the recommended engine oil as required, refer to Check, in this Section.
5 Remove the engine oil pressure sensor (1), refer to Section 6C1-3 Engine Management – V6 – Service Operations.
6 Install the oil pressure gauge adaptor, Tool No. J36648-A into the oil pressure sender hole in the oil filter housing.
7 Install a suitable oil pressure gauge into the adaptor.
8 Start the engine.
9 Measure and record the pressure reading on the gauge at idle and 2000 r.p.m. Compare the results with the specification.

Minimum engine oil pressure	
@ idle	69 kPa
@ 2000 r.p.m.	138 kPa

10 If the engine oil pressure is not to specification, refer to 2.19 Engine Oil Pressure Diagnosis.
11 After completing the engine oil pressure check, stop the engine and remove the oil pressure gauge.

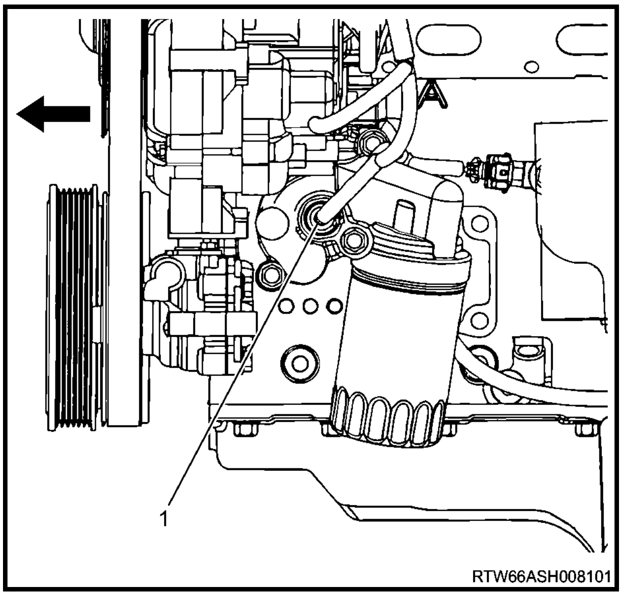

Figure 6A1 – 25

12 Reinstall the oil pressure sensor, refer to Section 6C1-3 Engine Management – V6 – Service Operations.
13 Start the engine and check for leaks.

3.2 Oil Filter Cartridge

Replace

NOTE

- The oil filter cartridge should be replaced at the correct time or distance intervals, refer to Section 0B Lubrication and Service.
- The oil filter cartridge should also be replaced whenever the engine oil is suspected to have been contaminated by foreign material.

1 Remove and discard the oil filter cartridge (1).

2 Install the new oil filter cartridge.

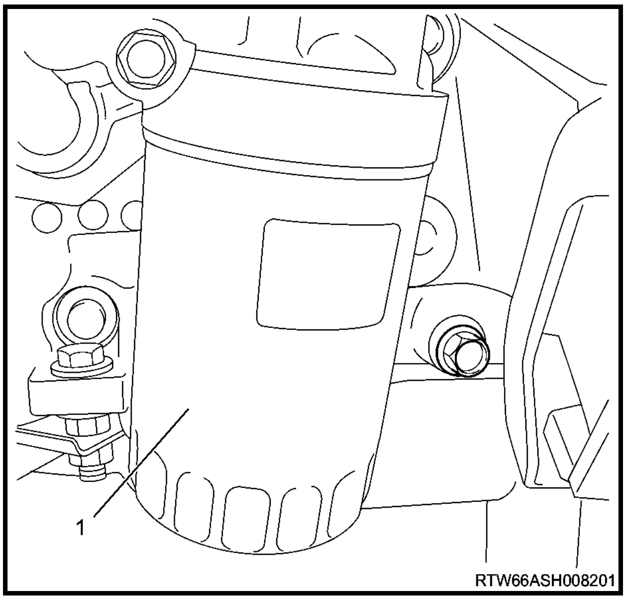

Figure 6A1 – 26

3.3 Oil Filter Adaptor

Remove

CAUTION

Disconnection of the battery affects certain vehicle electronic systems, refer to 1.1 WARNING, CAUTION and NOTES before disconnecting the battery.

1 Disconnect the battery negative terminal.

2 Disconnect the wiring harness connector from the oil pressure sender.

3 Remove the oil filter adaptor attaching bolts (2), four places.

4 Remove the oil filter adaptor and discard the gasket (3).

5 Clean the surfaces of the adaptor and cylinder block.

CAUTION

- **Do not use a screwdriver or similar to prise the oil filter adapter from the engine as damage to the sealing surface may occur.**
- **If required, use a rubber mallet to tap the oil filter adapter to loosen the components prior to separating. Tapping should be done at bends, corners or reinforced areas to prevent distortion of parts.**

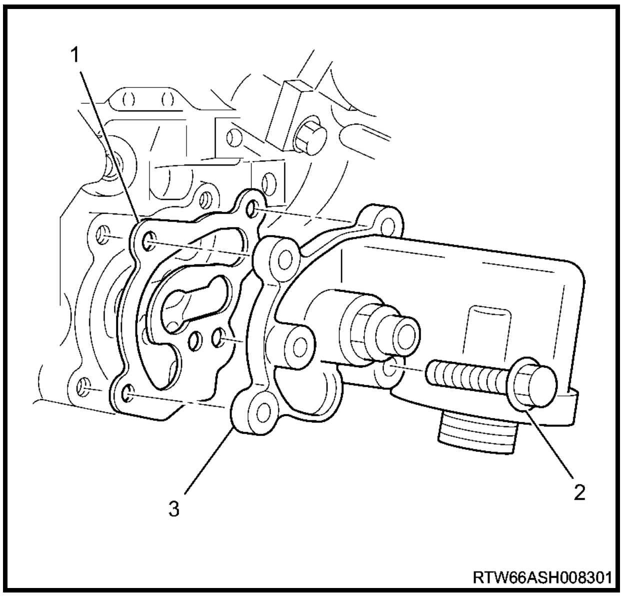

Figure 6A1 – 27

Reinstall

Reinstallation of the oil filter adaptor is the reverse of the removal procedure, noting the following:

1 A new gasket must be used.

2 Loosely install the oil filter adaptor attaching bolts, then tighten all fasteners to the correct torque specification.

Oil filter adaptor attaching bolt torque specification ....20.0- 26.0 Nm

3.4 Oil Level Indicator Tube

Remove

1 Remove the oil level indicator from the oil level indicator tube.

2 Remove the bolt (2) attaching the oil level indicator tube (1) and engine wiring harness retaining bracket.

3 Withdraw the oil level indicator tube from the oil pan.

4 Remove and discard the o-ring at the bottom of the oil level indicator tube.

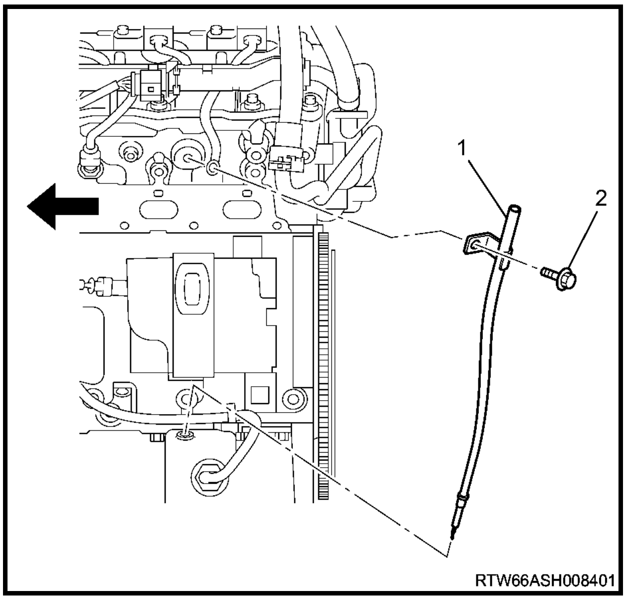

Figure 6A1 – 28

Reinstall

Reinstallation of the oil level indicator tube is the reverse of the removal procedure, noting the following:

1 Install a new oil level indicator o-ring.

2 Ensure the attaching bolt passes through the engine wiring harness retaining bracket.

3 Tighten bolt to the correct torque specification.

Oil level indicator tube attaching bolt torque specification ....8.0 – 12.0 Nm

3.5 Accessory Drive Belt

RWD Vehicle

Remove

1 Remove the air intake duct from between the air flow meter and the throttle body, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

2 Note the accessory drive belt (1) routing.

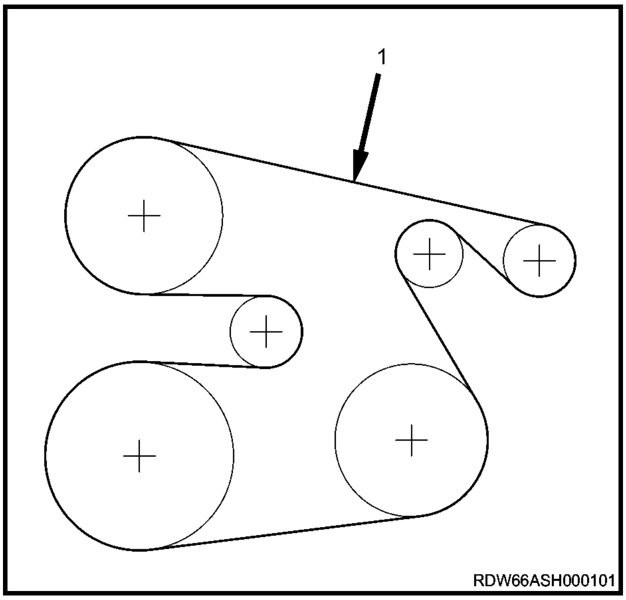

Figure 6A1 – 29

3 Using a suitable ½” drive socket bar (1), rotate the drive belt tensioner (2) clockwise, to reduce belt tension.

4 While holding the tensioner in the reduced tension position, remove the accessory drive belt (3).

NOTE

If required use an assistant to maintain the tensioner in the required position.

CAUTION

If running the engine with the accessory drive belt removed, the coolant pump will not be operating and the engine may overheat if left unsupervised even for a short period.

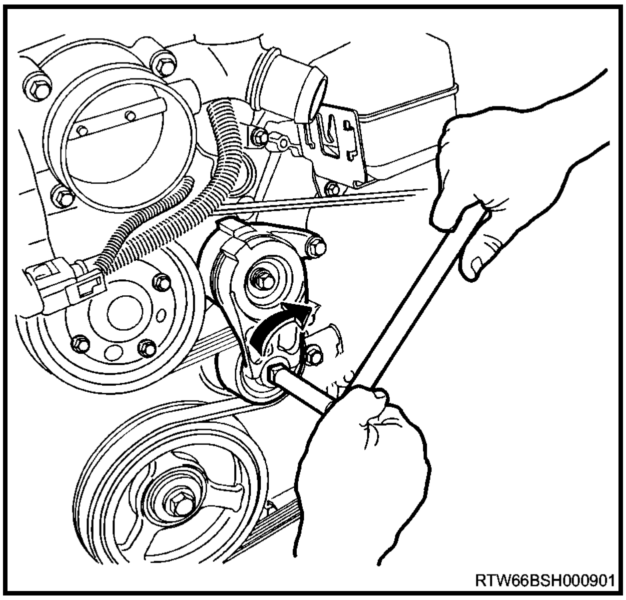

Figure 6A1 – 30

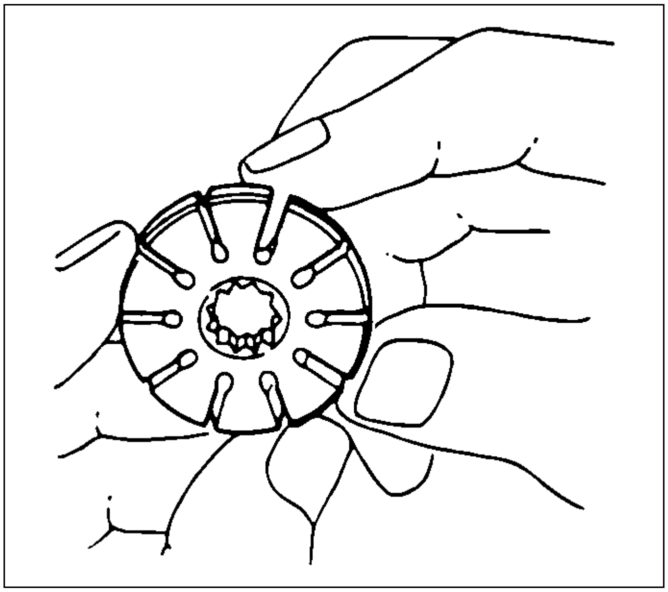
Disassembly

1. Clean the oil pump with solvent (plug the discharge and suction ports to prevent the entry of solvent).
   Be careful not to expose the oil seal of the shaft assembly to solvent.
2. Remove the bolt, suction pipe and O-ring.
3. Remove the nut and bracket.
4. Remove the nut, washer and joint.
5. Remove the connector, O-ring, relief valve and spring.
6. Remove the bolt, rear housing and O-ring.
7. Remove the pump cartridge assembly and the side plate from the shaft. Remove two O-rings.

Inspection and Repair

Make all necessary adjustments, repairs, and part replacements if wear, damage, or other problems are discovered during inspection.

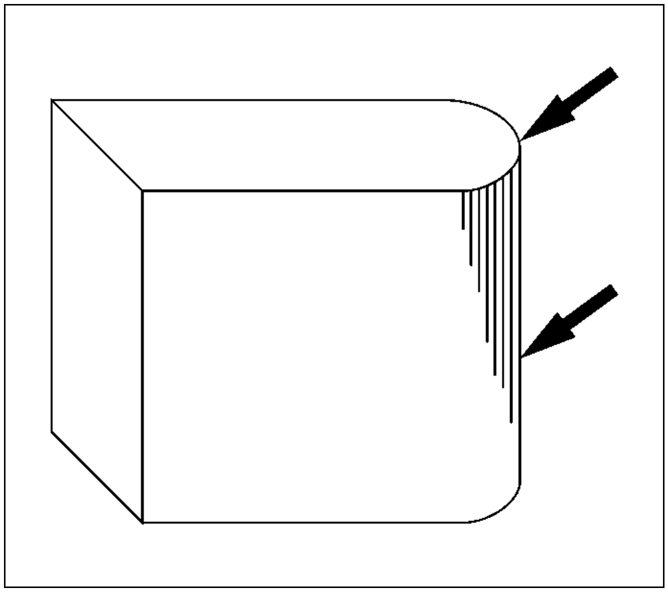
Rotor



442RS002

Check that the groove in the vane is free from excessive wear and that the vane slides smoothly. When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Vane



442RS003

Sliding faces of the vane should be free from wear. (In particular the curved face at the tip that makes contact with the cam should be free from wear and distortion). When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Cam

The inner face of the cam should have a uniform contact pattern without a sign of step wear. When part replacement becomes necessary, the pump cartridge should be replaced as a subassembly.

Side Plate

The sliding faces of parts must be free from step wear (more than 0.01 mm (0.0004 in)), which can be felt by a finger nail.
Parts with minor scores may be reused after lapping the face.

Relief Valve

The sliding face of the valve must be free from burrs and damage. Parts with minor scores may be reused after smoothing with emery cloth (#800 or finer).

Shaft and Housing Assembly

The bushing fitting face on the shaft must be free from damage and wear.

O-ring

Be sure to discard used parts, and always use new parts for installation. Prior to installation, lubricate all seals and rings with power steering fluid.

Reinstall

1 Install the drive belt over the A/C compressor, idler pulley, power steering pump, coolant pump, generator and tensioner pulleys.

2 Using a suitable ½" drive socket bar (1), rotate the drive belt tensioner (2) clockwise, refer to Figure 6A1 – 30.

3 With an assistant holding the tensioner in the required position, feed the accessory drive belt (3) over the crankshaft pulley.

4 Slowly release the drive belt tensioner mechanism.

NOTE

Ensure the drive belt ribs are correctly aligned with the grooves in the accessory drive pulleys or damage to the drive belt and accessory drive components and pulleys may occur.

5 Reinstall the air intake duct to the air flow meter and the throttle body, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

6 Run the engine to ensure correct operation.

3.6 Accessory Drive Belt Idler Pulley

Remove

1 Remove the accessory drive belt, refer to 3.5 Accessory Drive Belt.

2 Remove the accessory drive belt idler pulley attaching bolt (1).

3 Remove the dished washer (2) and accessory drive belt idler pulley (3).

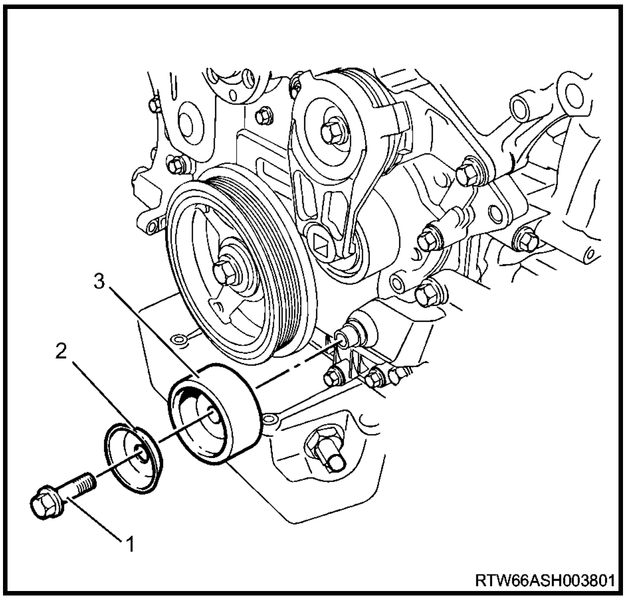


Figure 6A1 – 31

Reinstall

Reinstallation of the accessory drive belt idler pulley is the reverse of the removal procedure. Tighten the bolt to the correct torque specification.

Accessory drive belt idler pulley attaching bolt torque specification......................50.0 Nm

3.7 Accessory Drive Belt Tensioner Assembly

Remove

1 Remove the accessory drive belt, refer to 3.5 Accessory Drive Belt.

2 Remove the three bolts (2) attaching accessory drive belt tensioner assembly (1).

3 Remove the accessory drive belt tensioner assembly.

NOTE

The accessory drive belt tensioner pulley is not serviced separately. If the pulley is found to be faulty, the entire tensioner assembly must be replaced.

CAUTION

Repairing a damaged accessory drive belt pulley should not be attempted under any circumstances.

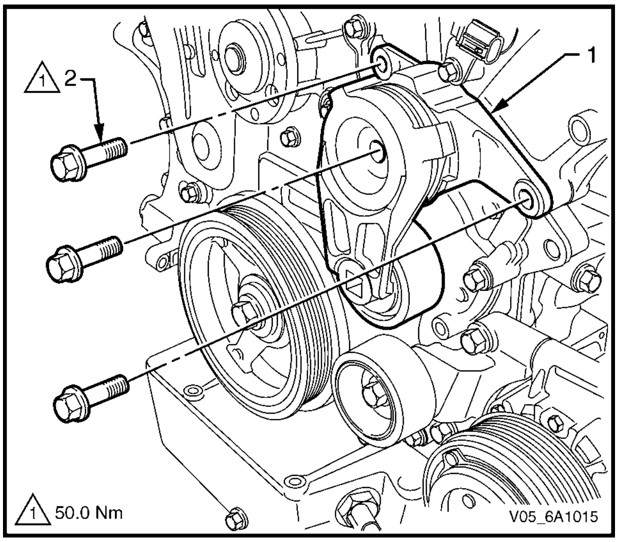

Figure 6A1 – 32

Reinstall

Reinstallation of the accessory drive belt tensioner assembly is the reverse of the removal procedure. Tighten the bolts to the correct torque specification.

Accessory drive belt tensioner attaching bolt torque specification......................50.0 Nm

3.8 Power Steering Pump Bracket

Remove

1 Remove the power steering pump and reservoir, refer to Section 3B Steering.

2 Remove the three bolts (1), (3) and (4) attaching the power steering pump bracket (5) to the engine block.

3 Remove the power steering pump bracket.

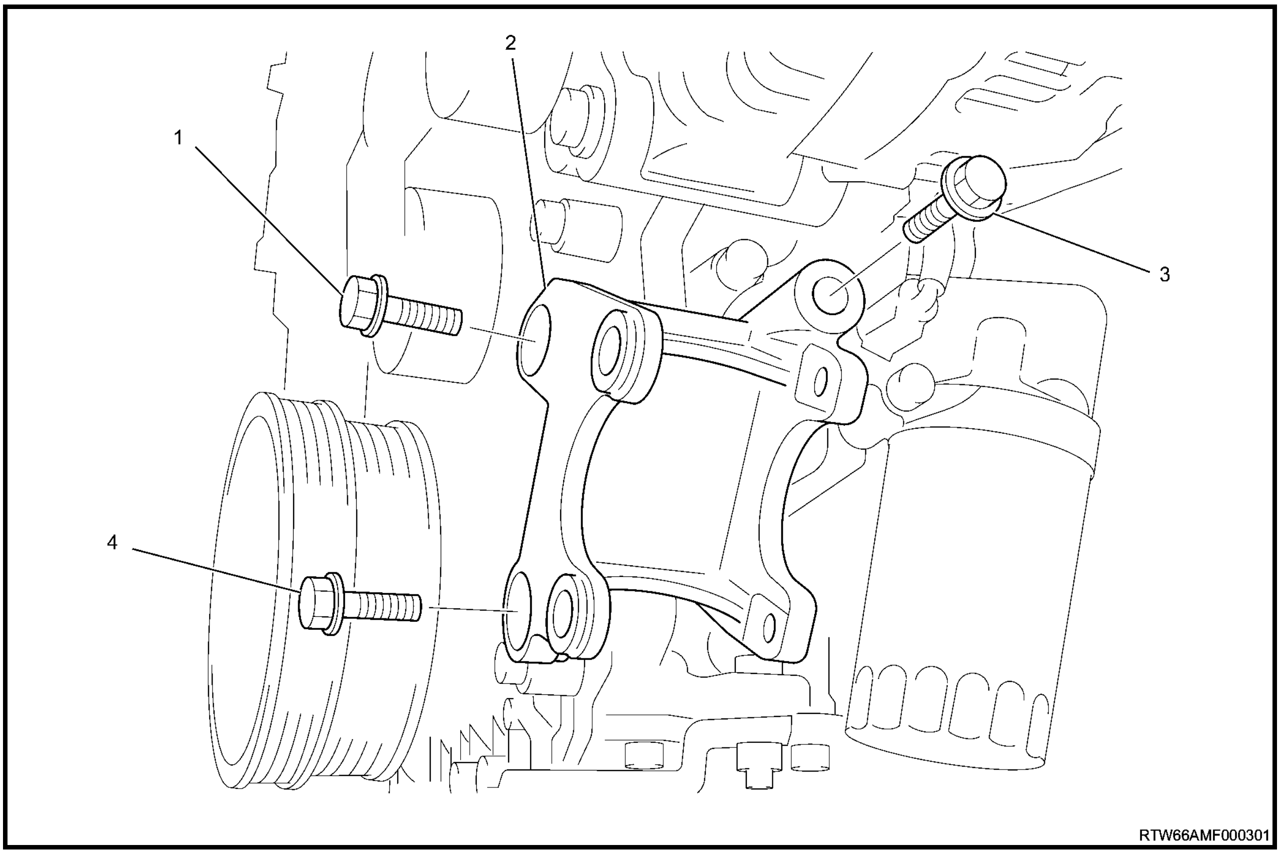

Figure 6A1 – 33

Reinstall

Reinstallation of the power steering pump and pump bracket is the reverse of the removal procedure, noting the following:

1 Hand start the bolts before tightening.

2 Tighten the bolts to the correct torque specification.

Power steering pump bracket attaching bolt torque specification......................22.0 Nm

3.9 Upper Intake Manifold

The intake manifold comprises of an upper and lower section. Some service procedures only require the removal of the upper intake manifold (e.g. fuel injector/spark plug servicing), while other service procedures require the removal of both the upper and lower manifold as a complete assembly (e.g. cylinder head/s). If the complete assembly needs to be removed, refer to 3.10 Intake Manifold Assembly – Complete.

Remove

CAUTION

Disconnection of the battery affects certain vehicle electronic systems. Refer to 1.1 WARNING, CAUTION and NOTES before disconnecting the battery.

1 Disconnect the battery negative terminal.

2 Remove the air intake duct (1) and hose (2), refer to Section 6C1-3 Engine Management – V6 – Service Operations.

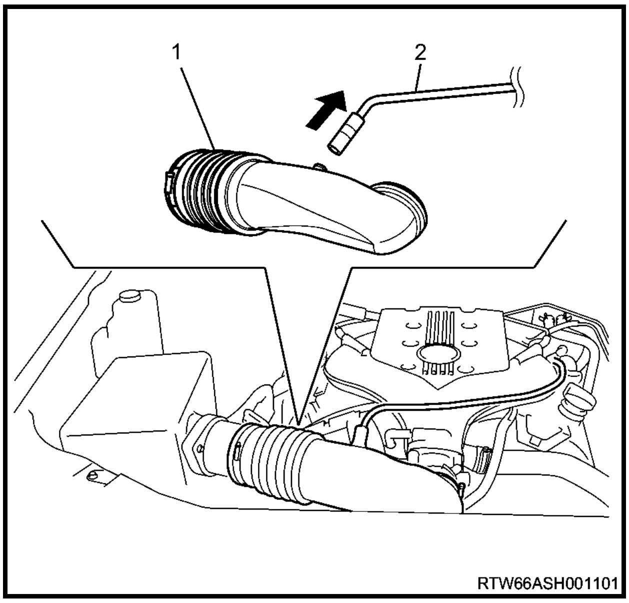

Figure 6A1 – 34

3 Retract the throttle body wiring connector lock (3).

4 While pressing the connector latch in the direction of the arrow (4), disconnect the throttle body wiring connector.

5 Disconnect the throttle body connector wiring harness from its retaining clip (5).

6 Remove the main wiring harness retainer pin (6) from the intake manifold by pushing from the front to the rear using a suitable piece of 5 mm steel rod (or an Allen key).

CAUTION

The following precautions must be followed when disconnecting the throttle body wiring connector:

- **Do not use any mechanical device such as a screwdriver to disengage the harness connector (1) from the throttle body (2).**
- **When retracting the throttle wiring connector lock (3), take care not to disengage the lock from the connector.**
- **Do not pull on the connector wires.**
- **Take care not to break the barbed harness retainer pin (6) while removing the harness retainer from the intake manifold.**
- **Should the pin be broken, then it is vital that a new harness retainer is fitted to the wiring harness shield. If not, the harness will foul the engine drive belt.**

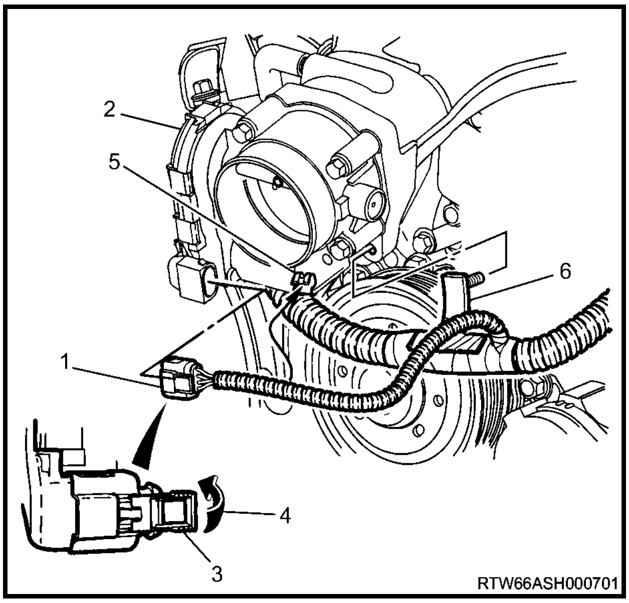

Figure 6A1 – 35

7 Disconnect the brake booster hoses from the upper intake manifold:

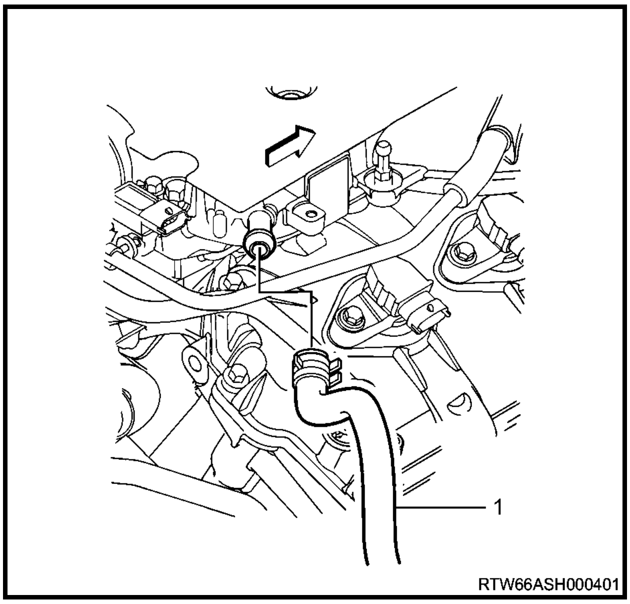

Figure 6A1 – 36

8 Disconnect the wiring harness connector from the barometric (BARO) pressure sensor (1).

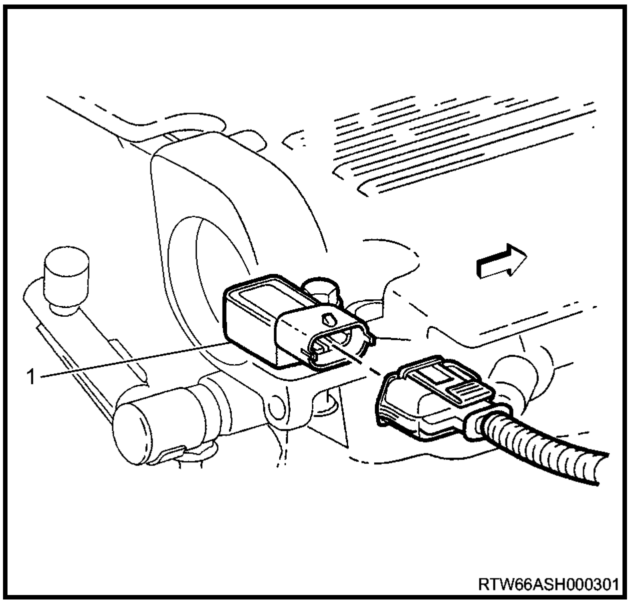

Figure 6A1 – 37

9 Disconnect the PCV tube connector (1) from the upper intake manifold assembly.

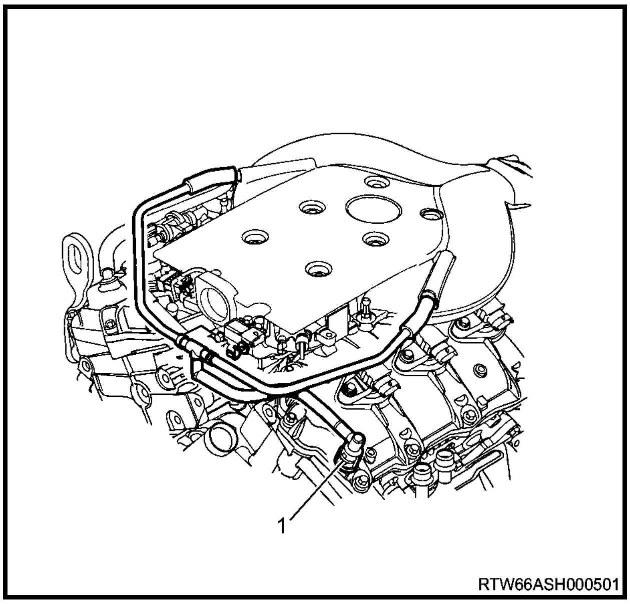

Figure 6A1 – 38

10 Remove the bolt (3) attaching the EVAP valve and the fuel injector wiring harness connector mounting bracket to the upper intake manifold assembly.

11 Move the EVAP valve and the fuel injector wiring harness connector mounting bracket clear of the upper intake manifold assembly.

12 Disconnect the PCV fresh air tube (1) from its upper intake manifold mounting clip (2).

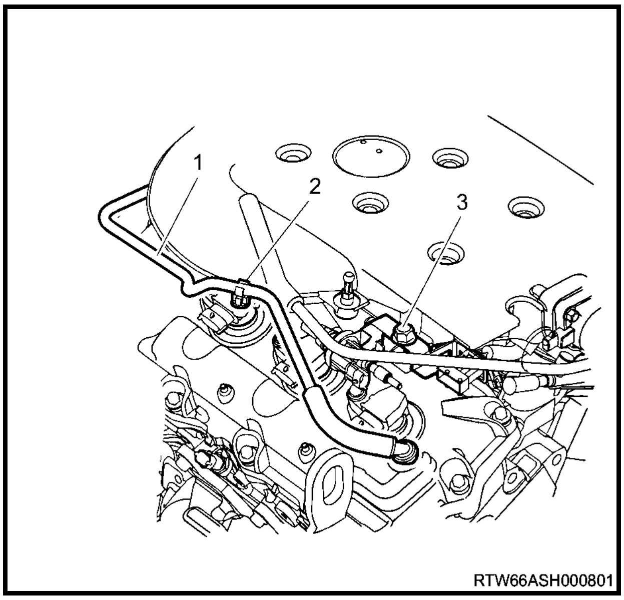

Figure 6A1 – 39

13 Disconnect the EVAP valve outlet tube (1) from the intake manifold (2).

14 Remove the four long (3) (165 mm long) and two short bolts (4) (70 mm long) attaching the upper intake manifold (2) to the cylinder heads and lower intake manifold.

15 Lift the upper intake manifold (2) clear from the lower half and then remove the upper intake manifold from the engine.

16 Remove and discard the upper to lower intake manifold gaskets (5).

CAUTION

- **When the upper intake manifold is removed, plug each of the lower intake runner openings with lint free cloth, to stop the entry of foreign material into the engine.**
- **Do not reuse the upper to lower intake manifold gaskets (5).**

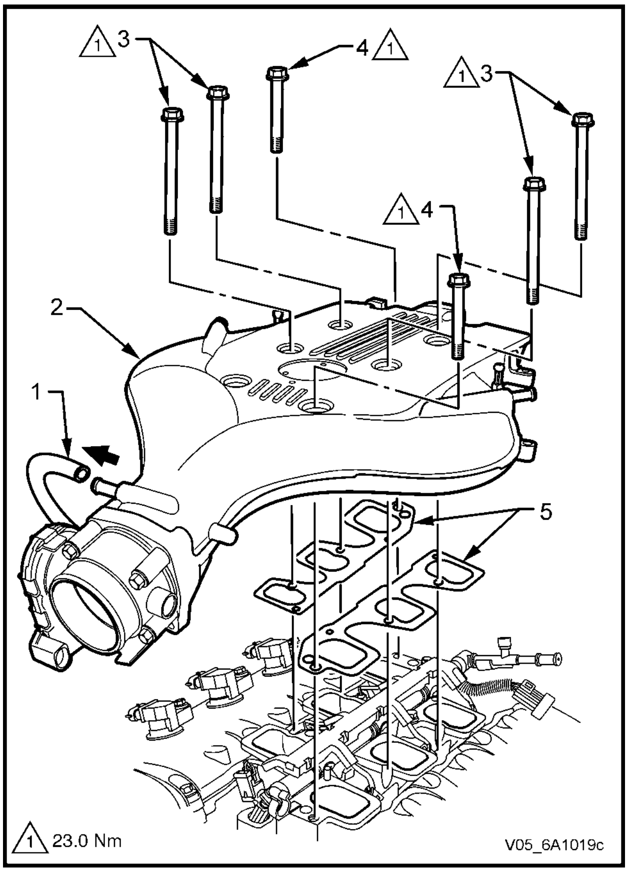

Figure 6A1 – 40

17 Remove the upper and lower intake manifold assembly from the engine.

18 Remove lower intake manifold to cylinder head gasket.

Disassemble

Remove the following from the upper intake manifold, refer to Section 6C1-3 Engine Management – V6 – Service Operations:

- BARO sensor and
- Throttle body assembly.

Clean

CAUTION

Due to the aluminium alloy construction of the intake manifold, wire brushes and steel scrapers must not be used during the cleaning process, as damage to sealing surfaces may occur. Use of a wooden or plastic scraper is preferred.

1 Clean mating surfaces ensuring any gasket material is removed.

2 Clean the manifold using a suitable solvent.

WARNING

Safety glasses must be worn when using compressed air.

3 Dry the timing components with compressed air.

Inspect

1 Inspect the intake manifold for the following fault conditions:

- Damaged sealing and mating surfaces.
- Damaged lower intake manifold gasket.
- Damage or excessive debris on the threaded and through holes.
- Cracks or damage to the intake manifold body.

NOTE

If the lower intake manifold is cracked or damaged, it must be replaced. No welding or patching of the intake manifold should be performed.

2 Place a straight edge (1) across the upper intake manifold sealing surface (2).

3 Using a feeler gauge (3), measure the clearance between the manifold and the straight edge.

4 If the clearance between the upper intake manifold sealing surface and the straight edge exceeds the specified maximum warpage, replace the manifold.

Upper manifold maximum warpage	0.05 mm

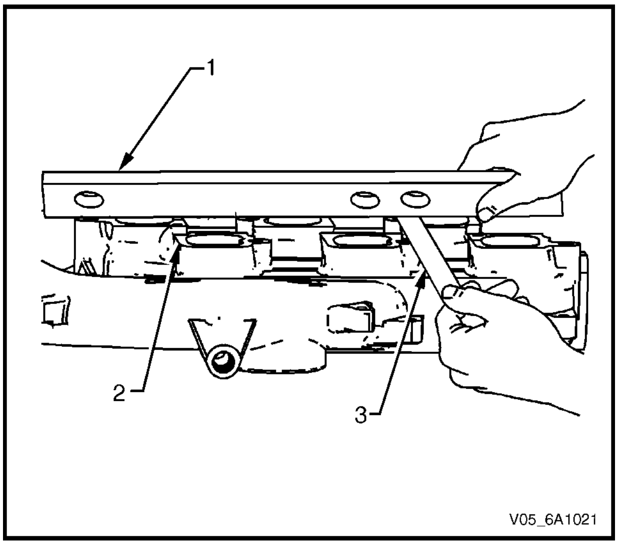

Figure 6A1 – 41

5 Place a straight edge (1) across the lower intake manifold sealing surface (2).

6 Using a feeler gauge (3), measure the clearance between the manifold and the straight edge.

7 If the clearance between the lower intake manifold sealing surface and the straight edge exceeds the specified maximum warpage, replace the manifold.

Lower manifold maximum warpage	0.05 mm

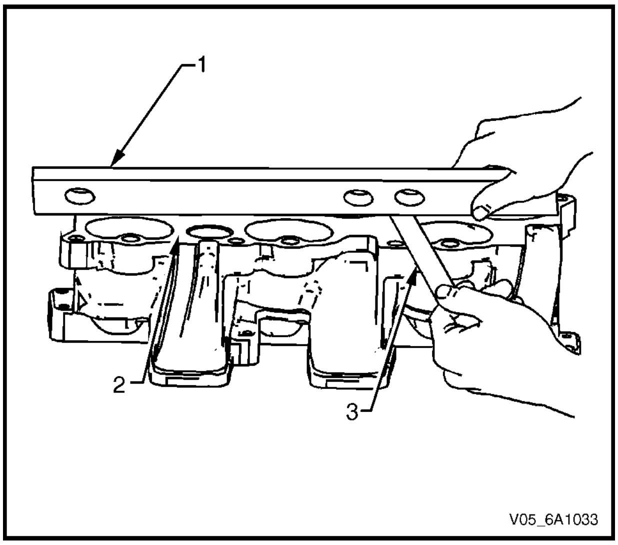

Figure 6A1 – 42

Reassemble

Reassembly of the upper manifold is the reverse of the disassembly procedure .

Reinstall

Reinstallation of the upper intake manifold and the upper and lower intake manifold assembly is the reverse of the removal procedure, noting the following:

1 Only new gaskets are to be fitted between the upper and lower intake manifolds.

CAUTION

Tighten the intake manifold bolts in a circular pattern starting at the centre bolt and moving outward.

2 Ensure that all fasteners are tightened to the correct torque specification.

Upper intake manifold to lower intake manifold attaching bolt torque specification	23.0 Nm
Upper intake manifold to cylinder head attaching bolt torque specification	23.0 Nm

CAUTION

Incorrect wiring connector installation may cause component malfunction or component damage.

3 Ensure all wiring connectors are fully engaged and if applicable, locked in place.

4 Ensure all wiring harnesses are correctly routed and attached securely in their retaining clips.

5 Ensure that all hoses and pipes are routed correctly and that any retaining clips are correctly installed.

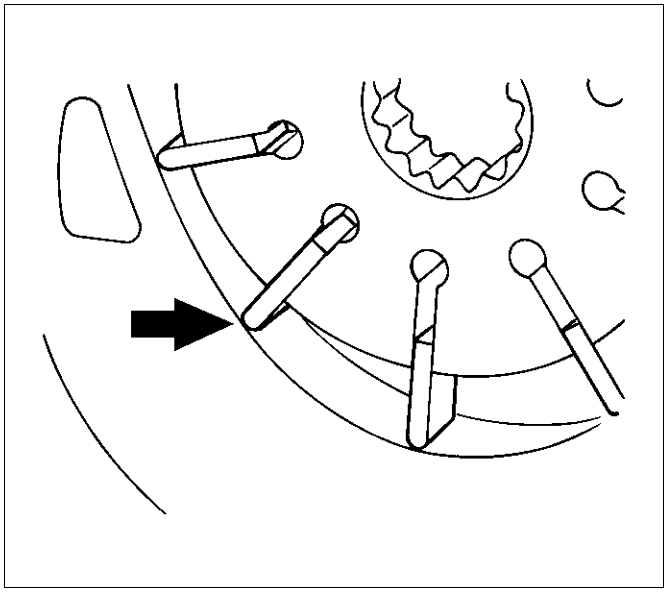
6 Start and run the engine to check for correct operation.

Reassembly

1. Install two new O-rings on shaft and housing assembly. Be sure to discard used O-ring.
2. Install side plate.

CAUTION: When installing side plate, be careful not to damage its inner surface. A damaged side plate may cause poor pump performance, pump seizure or oil leakage.

3. Install the vanes on rotor with curved face in contact with the inner wall of cam.



442RS005

4. Install rotor and vanes on cam.
5. Install pump cartridge assembly on shaft and housing assembly.
6. Install a new O-ring on rear housing. Be sure to discard used O-ring. Then install bolt and tighten it to specified torque.
   Torque: 25 N·m (2.5 kgf·m/18 lb·ft)
7. Install a new O-ring on suction pipe. Be sure to discard used O-ring. Then install bolt and tighten it to specified torque.
   Torque: 10 N·m (1.0 kgf·m/87 lb·in)
8. Install relief valve and spring.
9. Install a new O-ring on connector. Be sure to discard used O-ring. Tighten the connector to specified torque.
   Torque: 59 N·m (6.0 kgf·m/43 lb·ft)
10. Install new O-rings on joint. Be sure to discard used O-rings. Temporarily tighten the nut with washer.
11. Install bracket. Then install nut and tighten it to specified torque.
    Torque: 12 N·m (1.2 kgf·m/104 lb·in)
12. Tighten the nut to the specified torque (This nut was temporarily tightened in step 10).
    Torque: 20 N·m (2.0 kgf·m/14 lb·ft)

Main Data and Specifications

General Specifications

Oil pump	Type	Vane
	Operating fluid	ATF DEXRON®—III

3.10 Intake Manifold Assembly – Complete

The intake manifold comprises of an upper and lower section. Some service procedures only require the removal of the upper intake manifold (e.g. fuel injector/spark plug servicing), while other service procedures require the removal of both the upper and lower manifold as a complete assembly (e.g. cylinder head/s). If only the upper intake manifold needs to be removed, refer to 3.9 Upper Intake Manifold.

Remove

CAUTION

Disconnection of the battery affects certain vehicle electronic systems. Refer to 1.1 WARNING, CAUTION and NOTES before disconnecting the battery.

1 Depressurise the fuel system.
2 Disconnect the battery negative terminal.
3 Remove the air intake duct (1) and hose (2), refer to Section 6C1-3 Engine Management – V6 – Service Operations.

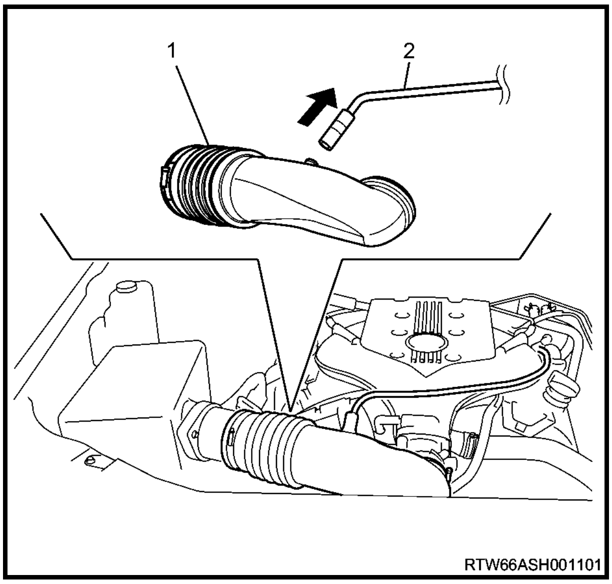


Figure 6A1 – 43

4 Retract the throttle body wiring connector lock (3).

5 While pressing the connector latch in the direction of the arrow (4), disconnect the throttle body wiring connector.

6 Disconnect the throttle body connector wiring harness from its retaining clip (5).

7 Remove the main wiring harness retainer pin (6) from the intake manifold by pushing from the front to the rear using a suitable piece of 5 mm steel rod (or an Allen key).

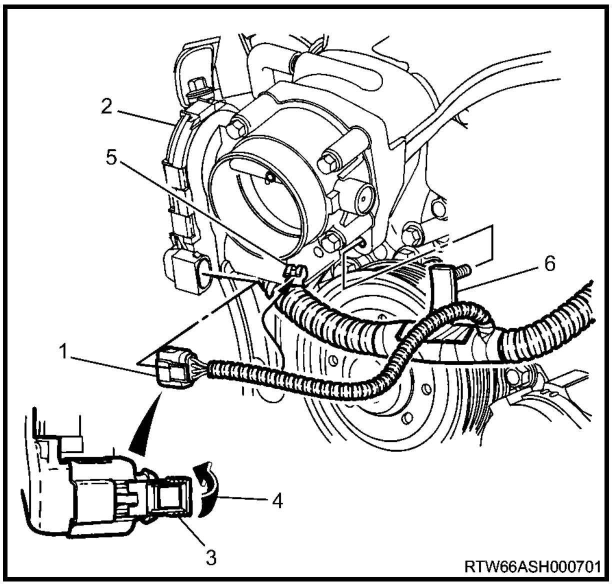

Figure 6A1 – 44

CAUTION

The following precautions must be followed when disconnecting the throttle body wiring connector:

- **Do not use any mechanical device such as a screwdriver to disengage the harness connector (1) from the throttle body (2).**
- **When retracting the throttle wiring connector lock (3), take care not to disengage the lock from the connector.**
- **Do not pull on the connector wires.**
- **Take care not to break the barbed harness retainer pin (6) while removing the harness retainer from the intake manifold.**
- **Should the pin be broken, then it is vital that a new harness retainer is fitted to the wiring harness shield. If not, the harness will foul the engine drive belt.**

8 Disconnect the brake booster hose (1), from the upper intake manifold:

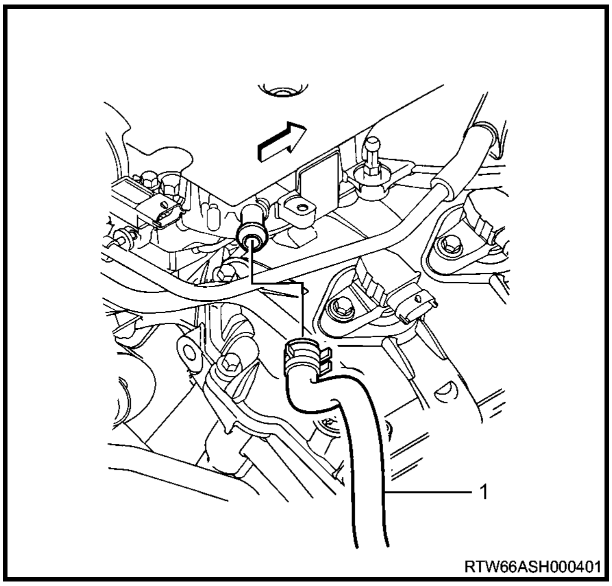

Figure 6A1 – 45

9 Disconnect the wiring harness connector from the barometric (BARO) pressure sensor (1).

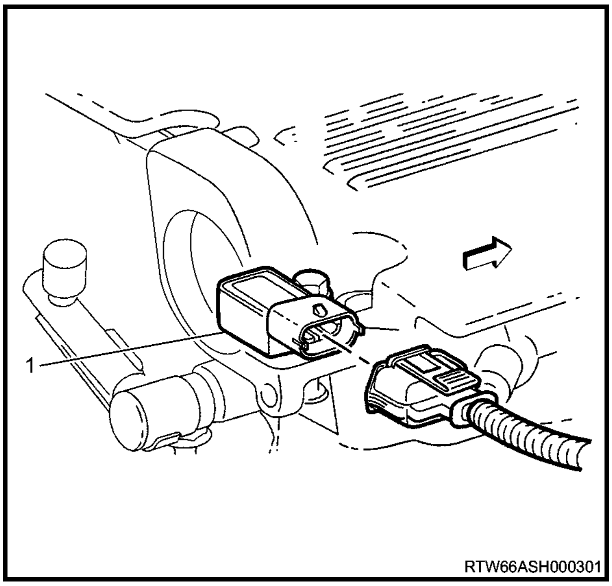

Figure 6A1 – 46

10 Disconnect the PCV tube connector (1) from the upper intake manifold assembly.

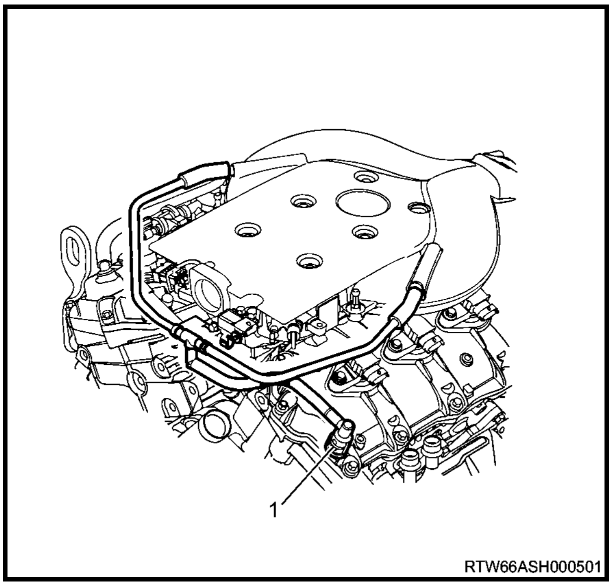

Figure 6A1 – 47

11 Disconnect the fuel feed hose from the fuel rail (1).

12 Pull out the release bar (2) (broad arrow) of the fuel injector harness wiring connector (3).

13 Disconnect the fuel injector harness wiring connector from the fuel injector wiring harness (4).

CAUTION

Plug the fuel feed hose opening after removal to prevent dirt and other contaminants from entering the fuel system.

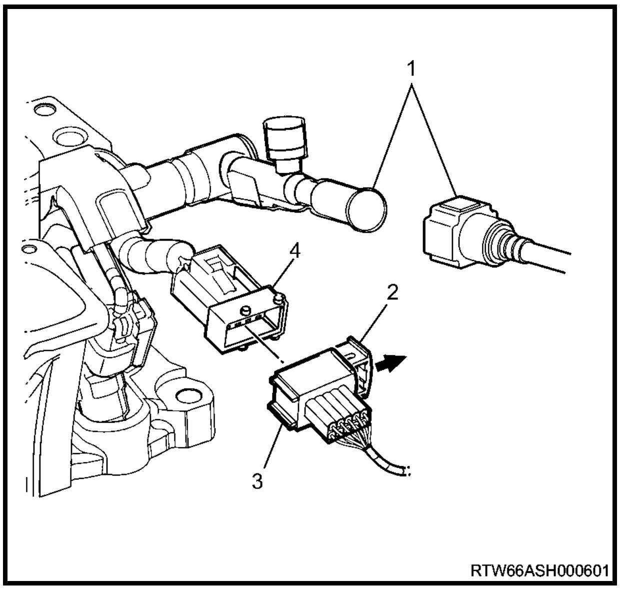

Figure 6A1 – 48

14 Remove the wiring harness connector (2) from the EVAP valve (1).

15 Disconnect the quick connect (3) from the rear of the EVAP valve, as follows:

a Squeeze the two barbed lugs together, push the quick connect into the valve, then pull out to separate the connection.

b Plug both open ends to prevent the entry of foreign matter.

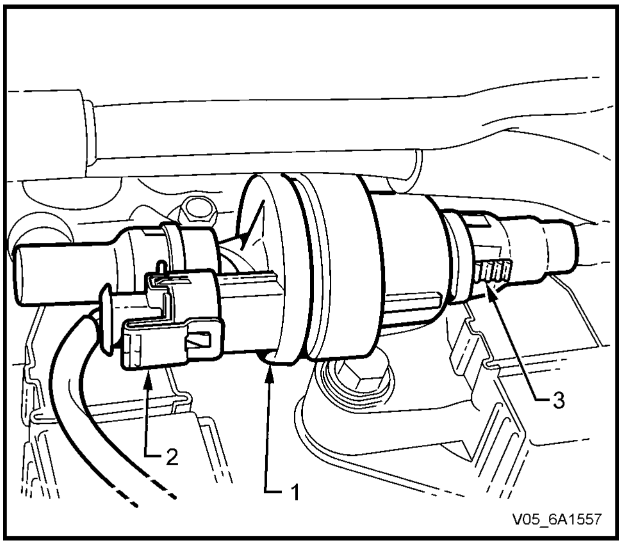

Figure 6A1 – 49

16 Remove the bolt (3) attaching the EVAP valve and the fuel injector wiring harness connector mounting bracket to the upper intake manifold assembly.

17 Move the EVAP valve and the fuel injector wiring harness connector mounting bracket clear of the upper intake manifold assembly.

18 Disconnect the PCV fresh air tube (1) from its upper intake manifold mounting clip (2).

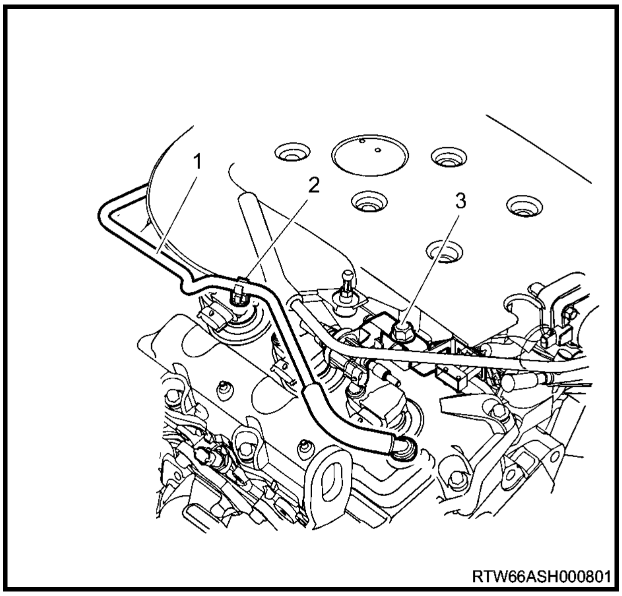

Figure 6A1 – 50

19 Remove the four long (1) bolts (165 mm) securing the complete intake manifold to the cylinder heads.

20 Remove the two short (2) bolts (45 mm) securing the lower intake manifold to the cylinder heads.

CAUTION

Do not loosen nor remove the short bolts (×) (70 mm) holding the upper intake manifold to the lower. These bolts are at the front left and rear right of the upper intake manifold.

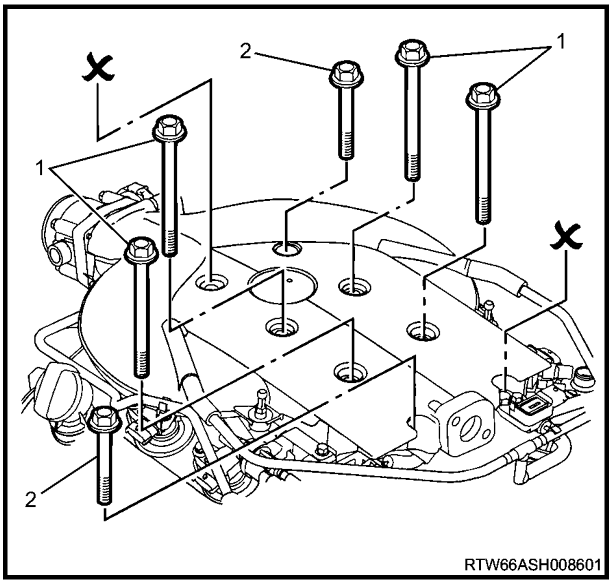

Figure 6A1 – 51

CAUTION

When the intake manifold is removed, plug each of the cylinder head intake openings with lint free cloth, to stop the entry of foreign material into the intake ports.

21 Remove the upper and lower intake manifold assembly from the engine.

22 Remove lower intake manifold to cylinder head gasket.

Disassemble

1 Disconnect the EVAP hose (1) from the upper intake manifold (2).

2 Remove the bolts (3) (70 mm long) attaching the upper intake manifold to the lower intake manifold (4).

NOTE

These bolts are located at the front left and rear right of the upper intake manifold, as shown.

3 Remove the upper intake manifold from the lower intake manifold.

4 Remove and discard the upper to lower intake manifold gaskets.

CAUTION

Do not reuse the upper to lower intake manifold gaskets (5).

5 Remove the EVAP hose from the retaining clip (6) attached to the lower intake manifold.

6 Remove the following from the upper intake manifold, refer to Section 6C1-3 Engine Management – V6 – Service Operations:

- BARO Sensor and
- Throttle Body assembly

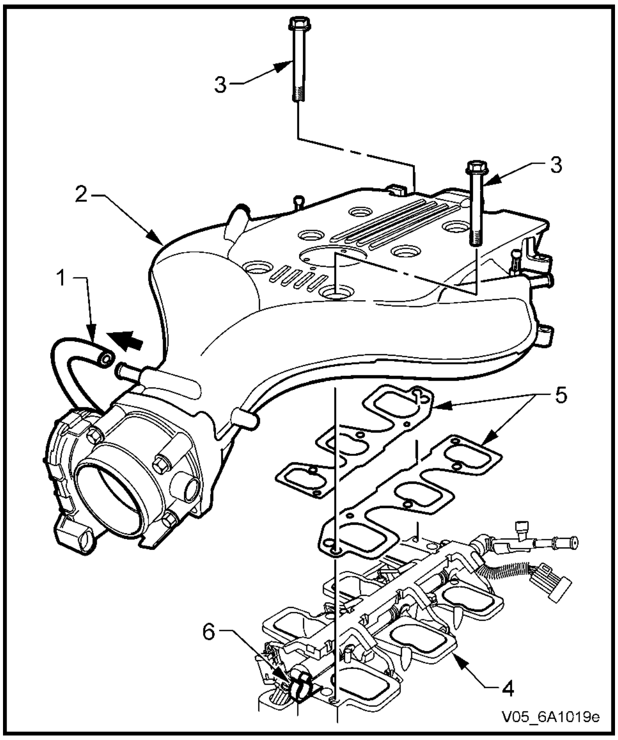

Figure 6A1 – 52

7 Remove the fuel rail and injector assembly. Refer to Section 6C1-3 Engine Management – V6 – Service Operations.

CAUTION

The following precautions must be followed when removing the fuel rail and injector assembly:

- **Care must be taken when removing the fuel rail and injector assembly to prevent damage to the injector spray tips and injector harness connector terminals.**
- **Support the fuel rail and injector assembly after removal.**
- **Plug all fuel line and manifold openings after removal to prevent dirt and other contaminants from entering the fuel system.**

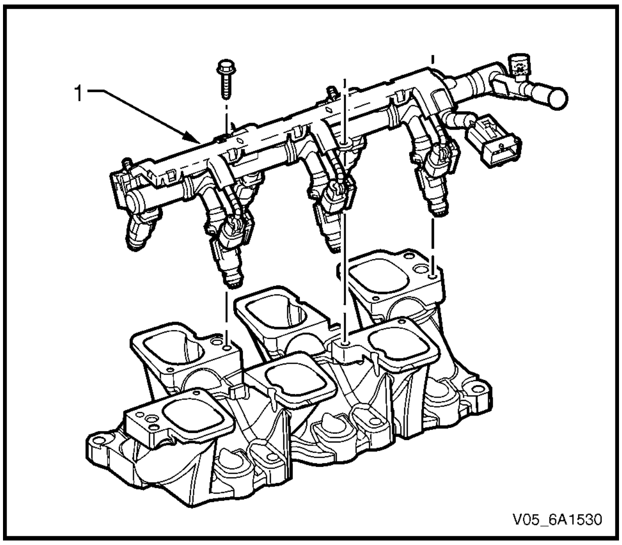

Figure 6A1 – 53

Clean

CAUTION

Due to the aluminium alloy construction of the intake manifold, wire brushes and steel scrapers must not be used during the cleaning process, as damage to sealing surfaces may occur. Use of a wooden or plastic scraper is preferred.

1 Clean mating surfaces ensuring any gasket material is removed.

2 Clean the manifold using a suitable solvent

WARNING

Safety glasses must be worn when using compressed air.

3 Dry the timing components with compressed air.

Inspect

1 Inspect the intake manifold for the following fault conditions:

- Damaged sealing and mating surfaces.
- Damaged lower intake manifold gasket.
- Damage or excessive debris on the threaded and through holes.
- Cracks or damage to the intake manifold body.

NOTE

If the lower intake manifold is cracked or damaged, it must be replaced. No welding or patching of the intake manifold should be performed.

2 Place a straight edge (1) across the upper intake manifold sealing surface (2).

3 Using a feeler gauge (3), measure the clearance between the manifold and the straight edge.

4 If the clearance between the upper intake manifold sealing surface and the straight edge exceeds the specified maximum warpage, replace the manifold.

Upper manifold maximum warpage .... 0.05 mm

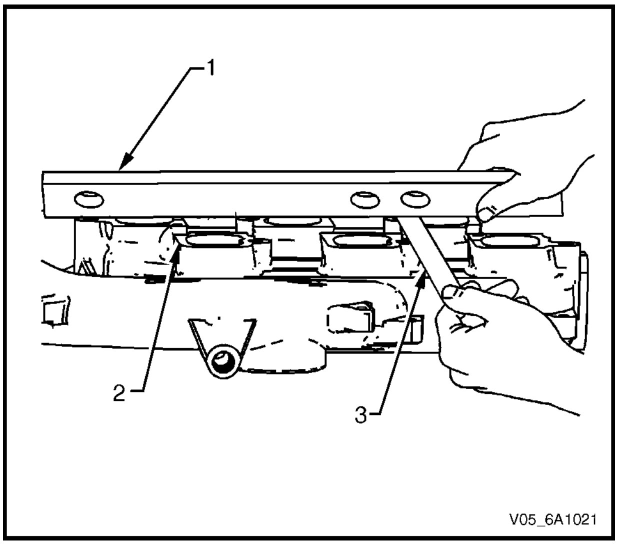

Figure 6A1 – 54

5 Place a straight edge (1) across the lower intake manifold sealing surface (2).

6 Using a feeler gauge (3), measure the clearance between the manifold and the straight edge.

7 If the clearance between the lower intake manifold sealing surface and the straight edge exceeds the specified maximum warpage, replace the manifold.

Lower manifold maximum warpage	0.05 mm

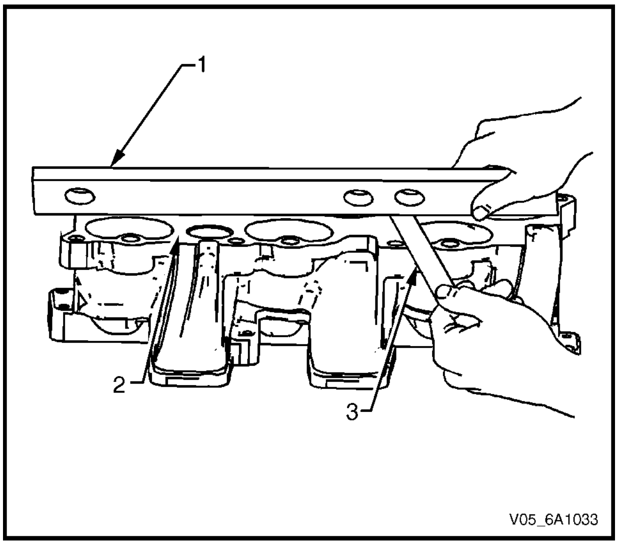

Figure 6A1 – 55

Reassemble

Reassembly of the upper to lower intake manifold is the reverse of the disassembly procedure noting the following:

1 Ensure that both the manifolds have been cleaned and inspected.

2 Ensure that the warpage of the mating surfaces is within tolerances.

3 New upper to lower intake manifold gaskets must be used.

4 Do not tighten the intake manifold to lower intake manifold attaching bolt at this stage. The intake manifold attaching bolts must be tightened at the specified sequence during the reinstallation procedure.

Reinstall

Reinstallation of the upper intake manifold and the upper and lower intake manifold assembly is the reverse of the removal procedure, noting the following:

1 Install the EVAP hose to the clip attached to the lower intake manifold.

2 Only new gaskets are to be fitted between the upper and lower intake manifolds.

3 If undamaged, the lower intake manifold to cylinder head gasket may be re-used, however its replacement is strongly recommended.

CAUTION

Tighten the intake manifold bolts in a circular pattern starting at the centre bolt and moving outward.

4 Ensure that all fasteners are tightened to the correct torque specification.

Upper intake manifold to lower intake manifold attaching bolt torque specification	23.0 Nm
Upper intake manifold to cylinder head attaching bolt torque specification	23.0 Nm
Lower intake manifold to cylinder head attaching bolt torque specification	23.0 Nm
Fuel injector wiring harness bracket attaching bolt torque specification	9.0 Nm

CAUTION

Incorrect wiring connector installation may cause component malfunction or component damage.

5 Ensure all wiring connectors are fully engaged and if applicable, locked in place.

6 Ensure all wiring harnesses are correctly routed and attached securely in their retaining clips.

7 Ensure that all hoses and pipes are routed correctly and that any retaining clips are correctly installed.

8 After installation pull on any quick connect fittings to check that each is correctly installed.

9 Start and run the engine to check for correct operation.

3.11 Exhaust Manifold Assembly

Remove

WARNING

Allow the engine to cool before commencing.

CAUTION

Disconnection of the battery affects certain vehicle electronic systems, refer to 1.1 WARNING, CAUTION and NOTES before disconnecting the battery.

1 Disconnect the battery negative terminal.

2 Remove the oxygen sensor harness connector (1) from the retaining bracket.

3 Disconnect the oxygen sensor wiring harness connector from the engine wiring harness connector (2).

4 Unclip the oxygen sensor wiring harness retaining clip and move aside.

5 For the left-hand side:

Remove the oil level indicator tube.

6 Raise the front of the vehicle and place on stands, refer to Section 0A General Information.

7 Working from under the vehicle, remove the two exhaust manifold to exhaust pipe flange nuts, refer to Section 6F Exhaust System - V6.

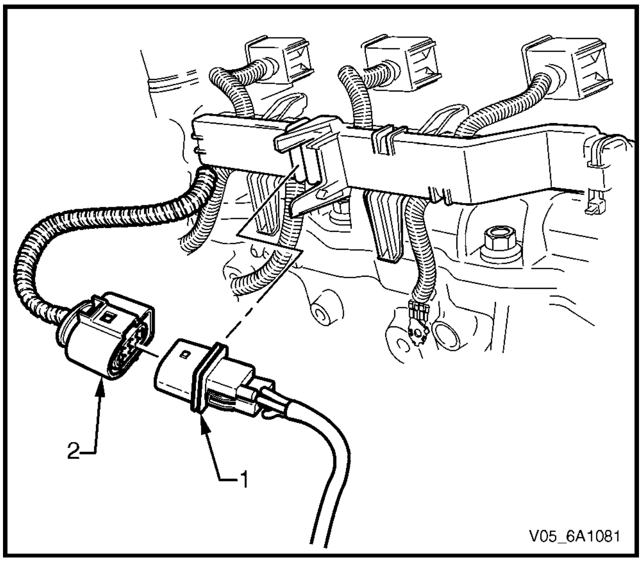

Figure 6A1 – 56

8 Remove the three bolts attaching the exhaust manifold outer heat shield (1) to the exhaust manifold (2).

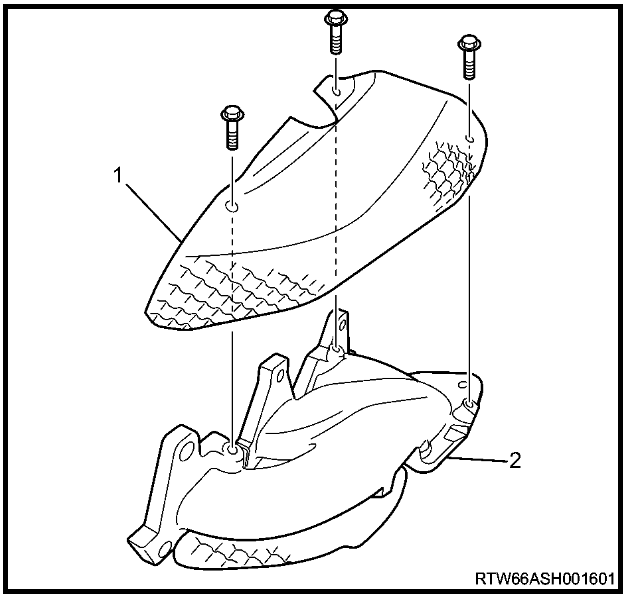

Figure 6A1 – 57

9 Progressively loosen the seven exhaust manifold attaching bolts (2), working from the outside to the centre and then remove the bolts.

10 Manoeuvre the exhaust manifold (3), away from the cylinder head.

11 Remove and discard the exhaust manifold to cylinder head gasket.

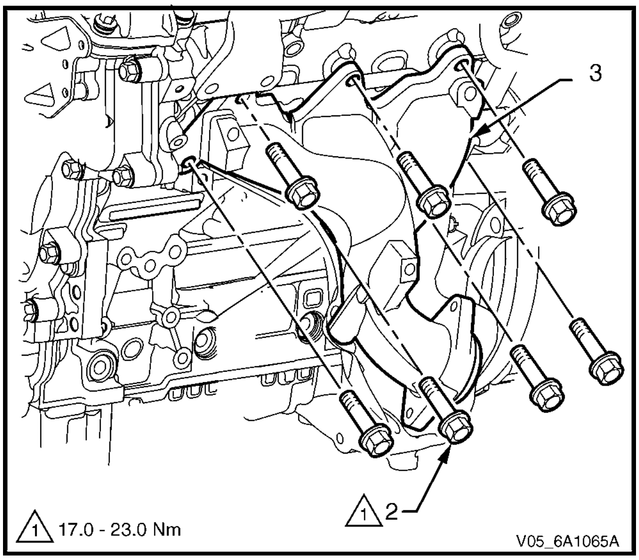

Figure 6A1 – 58

12 Remove the three bolts (1), attaching the exhaust manifold inner heat shield to the exhaust manifold.

13 Using a suitable commercially available non-corrosive cleaning solvent and a soft bristled parts cleaning brush, thoroughly clean the exhaust manifold.

14 Dry the exhaust manifold using compressed air.

WARNING

Safety glasses must be worn when using compressed air.

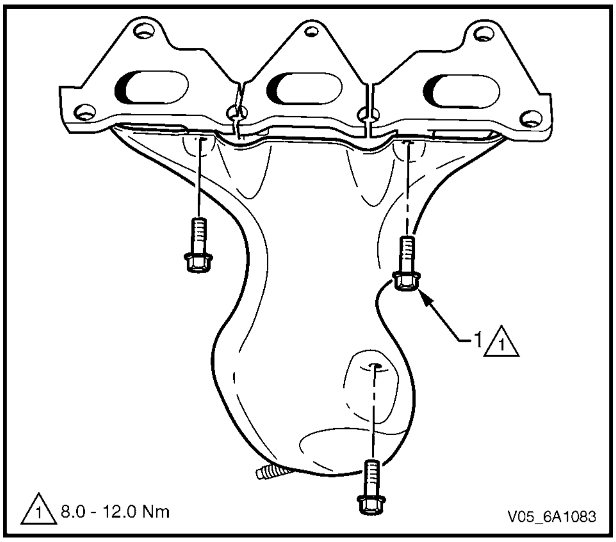

Figure 6A1 – 59

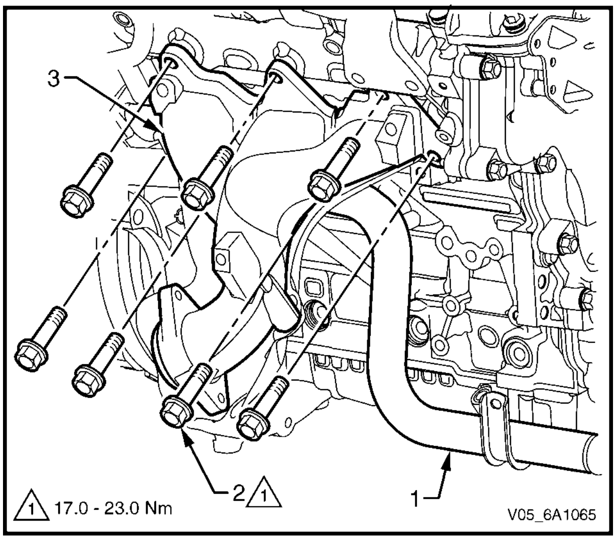
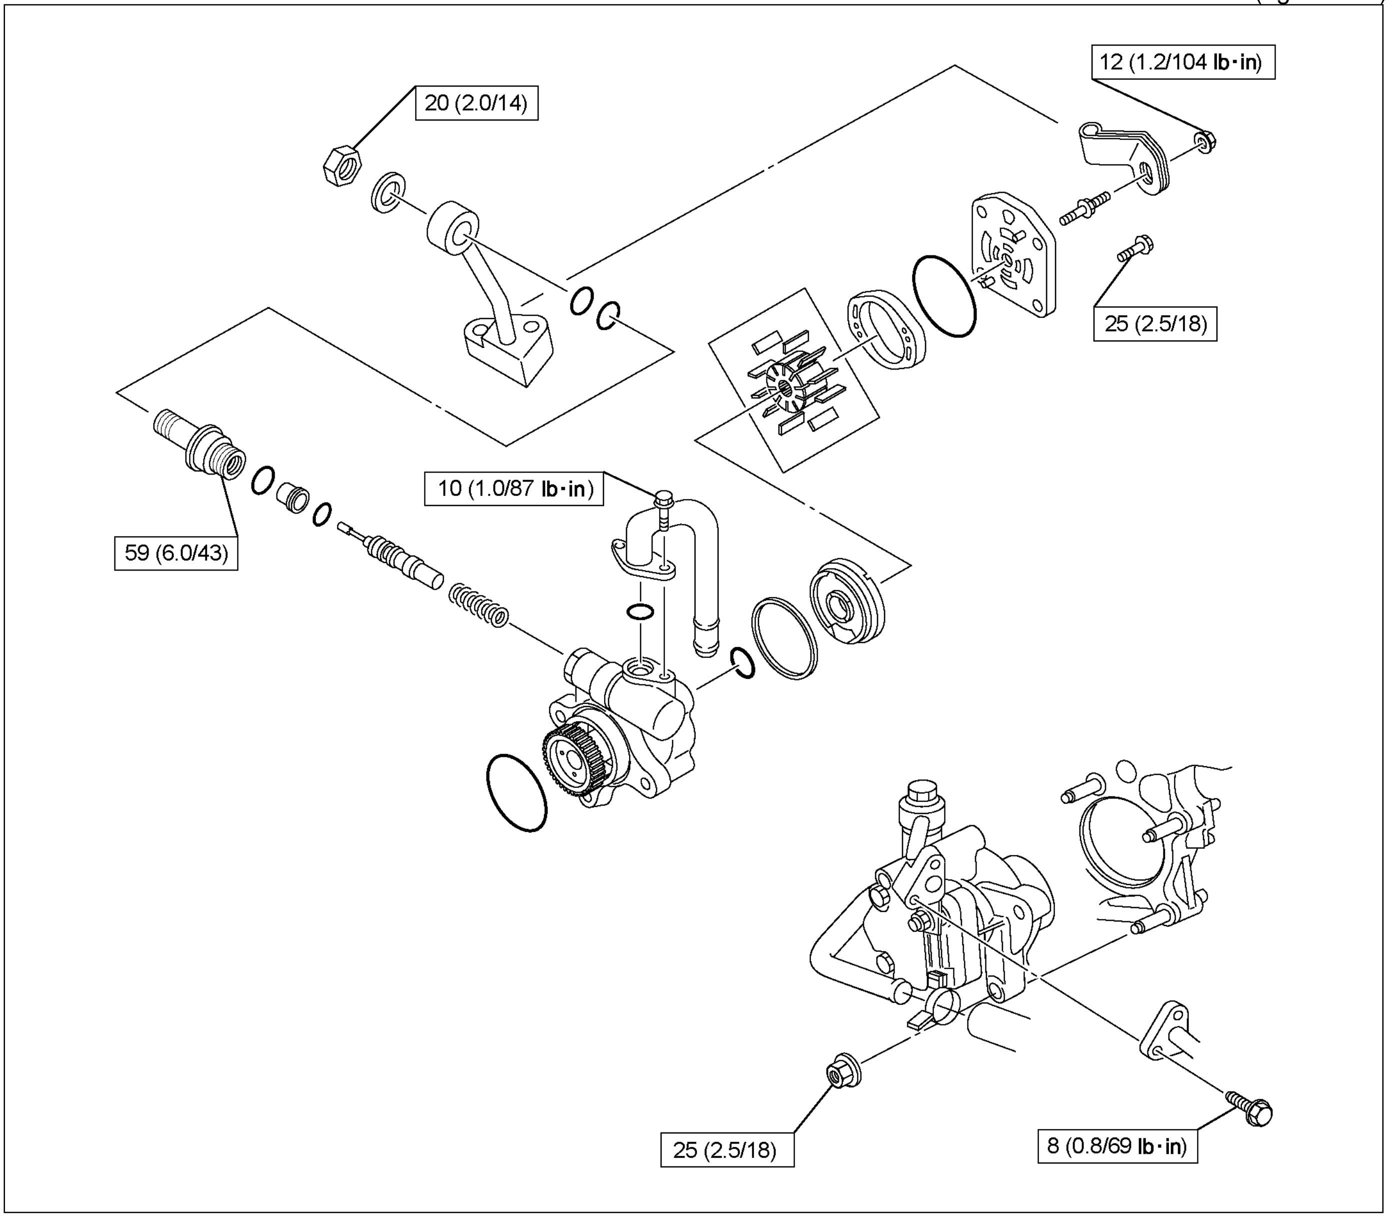
NOTE

- The same procedure applies to the Right-hand exhaust manifold.
- To gain access to the lower rear exhaust manifold attaching bolts (2), apply a slight downward movement to the coolant inlet pipe (1).



Torque Specifications

N·m (kgf·m/lb·ft)



RTW73BLF000701

Inspect

Inspect the exhaust manifold (1) for the following:

- Damage to the threaded holes for the heat shield mounting.
- Damage to the exhaust manifold mounting holes.
- Damage to the threads of the exhaust manifold to exhaust pipe flange studs.
- Damage to the gasket sealing surfaces.
- Using a straight edge (2) and feeler gauges (3), check the cylinder head mounting face of the exhaust manifold does not exceed the maximum distortion specification of 0.25mm.

NOTE

If the surface flatness is not within specifications, the exhaust manifold is warped and must be replaced.

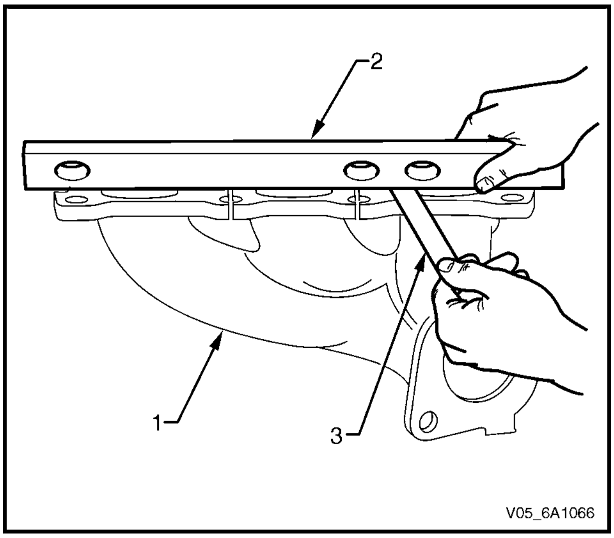


Figure 6A1 – 60

Reinstall

Reinstallation of the exhaust manifold assembly is the reverse of the removal procedure, noting the following:

1. Ensure the exhaust manifold, cylinder head and exhaust pipe flange surfaces are clean.
2. Position a new exhaust manifold gasket onto the exhaust manifold.
3. Apply a 5 mm bead of Loctite 272 thread sealant (or equivalent) to the threads of the exhaust manifold attaching bolts.
4. Install the bolts into the exhaust manifold. This will prevent the gasket from falling off the manifold.
5. Manoeuvre the exhaust manifold into position and install the exhaust manifold attaching bolts.
6. From underneath the vehicle install the exhaust manifold to exhaust pipe flange nuts.
7. Tighten the exhaust manifold attaching bolts to the correct torque specification.

NOTE

When tightening the exhaust manifold to cylinder head attaching bolts, begin with the centre bolts, then alternate from side to side to the outer bolts.

Exhaust manifold to cylinder head attaching bolt torque specification...........17.0 – 23.0 Nm

8. Apply an anti seize compound such as Caltex Kopr-Kote (or equivalent) to the cleaned heat shield bolt threads. Install the heat shield attaching bolts and tighten to the correct torque specification.

Exhaust manifold heat shield attaching bolt torque specification ....8.0 – 12.0 Nm

9. For the right-hand side, install the battery harness ground cable attaching nut through the ground terminal and lower coolant tube mounting lug, and tighten to the correct torque specification.

Battery harness ground terminal attaching nut torque specification.......................13.0 Nm

3.12 Camshaft Cover

Remove

1 Remove the intake manifold assembly, refer to 3.10 Intake Manifold Assembly – Complete.

2 For the left-hand side, remove the evaporative (EVAP) emission canister purge solenoid, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

3 Remove the two bolts (1) attaching the engine wiring harness former to the rear of the cylinder heads.

4 Unclip the transmission vent tube (2) from the engine wiring harness.

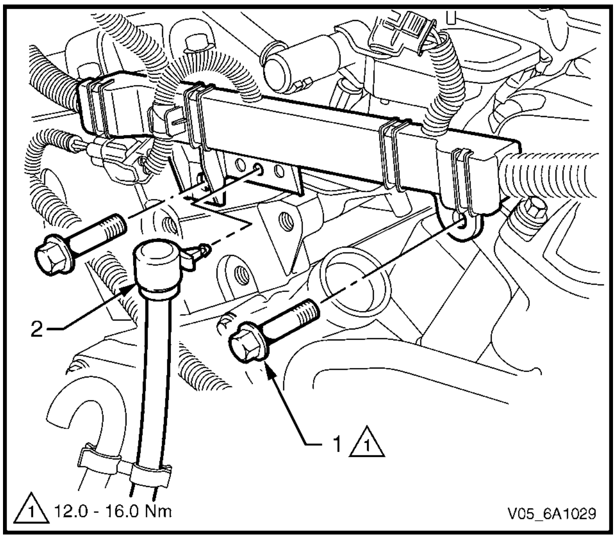

Figure 6A1 – 61

5 Disconnect the oxygen sensor wiring harness connector (1) from the engine wiring harness (2), left-hand shown, right-hand similar.

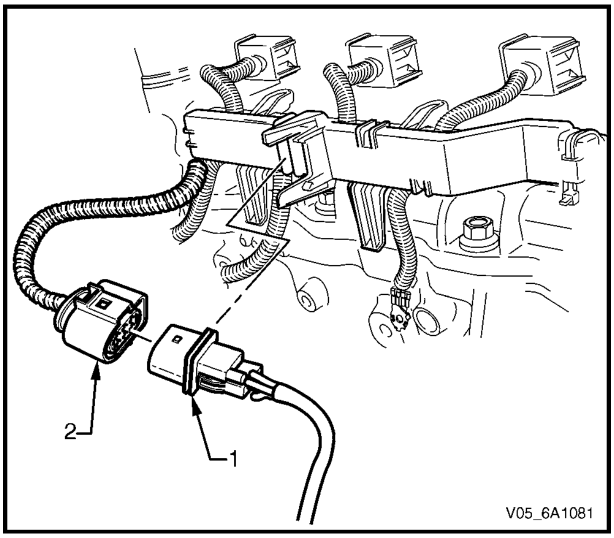

Figure 6A1 – 62

6 Remove the bolt (1) attaching the ground connector (2) to the cylinder head.

7 Fro the left-hand side, disconnect the engine coolant temperature (ECT) sensor wiring connector (3).

8 Unclip the engine wiring harness retaining lugs from the side of the camshaft cover.

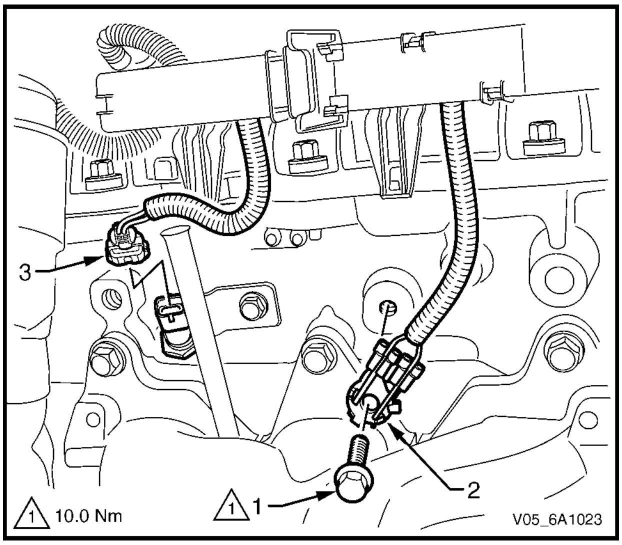

Figure 6A1 – 63

9 For the right-hand side, remove the engine wiring harness retaining clip (1) from the engine control module (ECM) bracket (2).

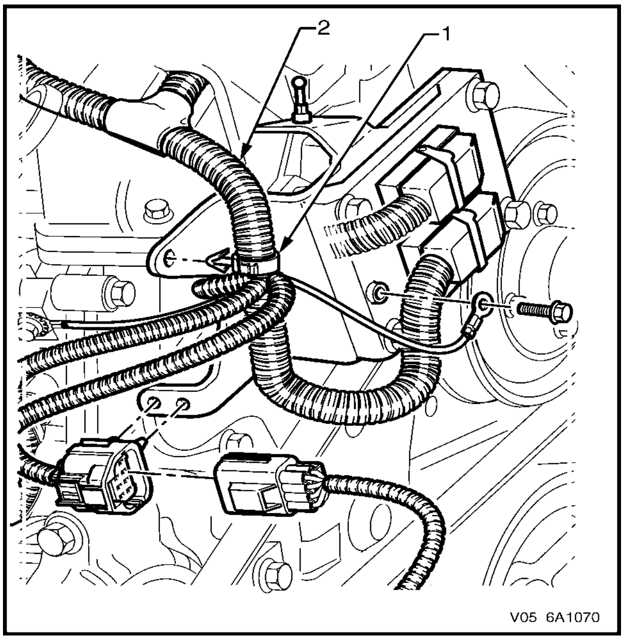

Figure 6A1 – 64

10 Disconnect the camshaft position (CMP) sensor wiring connector (1).

11 Unclip the engine wiring harness retaining lug (3) from the front of the camshaft cover.

12 Remove the ignition coil assemblies; refer to Section 6C1-3 Engine Management – V6 – Service Operations.

13 Move the engine wiring harness clear of the camshaft cover.

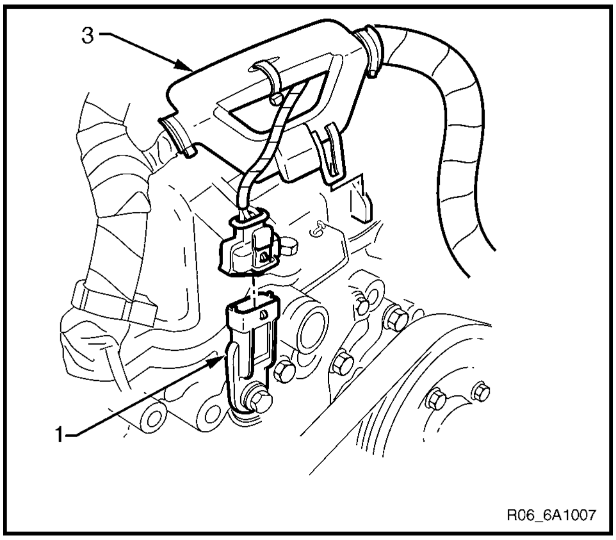

Figure 6A1 – 65

14 Remove the bolt (1), 13 places, attaching the camshaft cover (2) to the cylinder head (3).

15 Remove the cover and discard the seal.

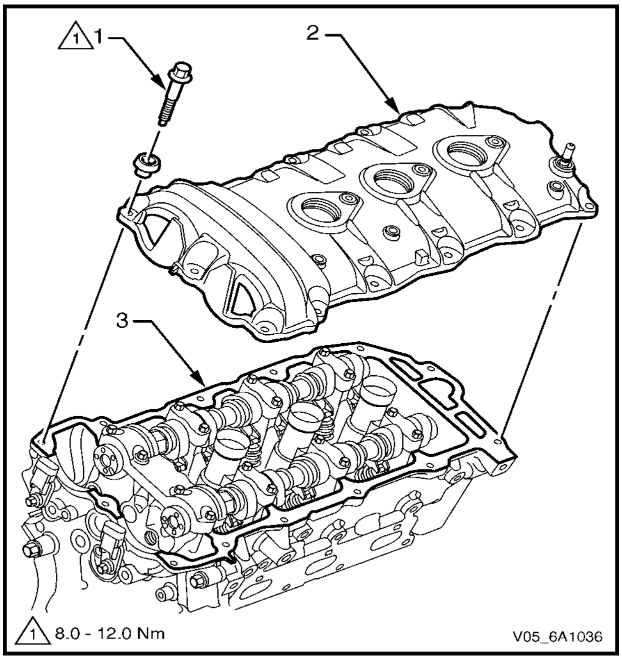

Figure 6A1 – 66

16 Install Tool No. EN-46101 (1) to the spark plug tubes of the cylinder head to prevent entry of dirt into the combustion chamber.

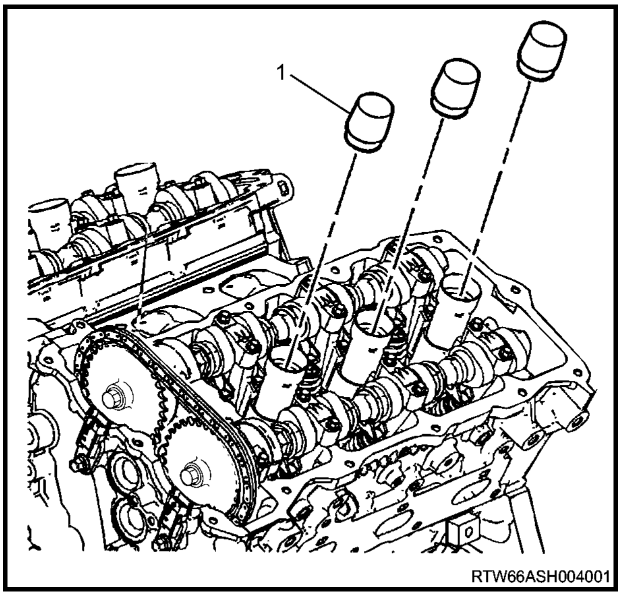

Figure 6A1 – 67

Clean and Inspect

WARNING

Safety glasses must be worn when using compressed air.

1 Clean the camshaft cover with suitable cleaning solvent and blow dry with compressed air.

2 Inspect the cover for cracking and distortion.

3 Check the spark plug tube seals for damage.

4 If the camshaft cover is damaged in any way that will affect it’s performance to seal and stop the ingress of dirt, replace the camshaft cover.

Reinstall

Reinstallation of the camshaft cover assembly is the reverse of the removal procedure, noting the following:

1 If not already fitted, install Tool No. EN-46101 (1) to the spark plug tubes of the cylinder head.

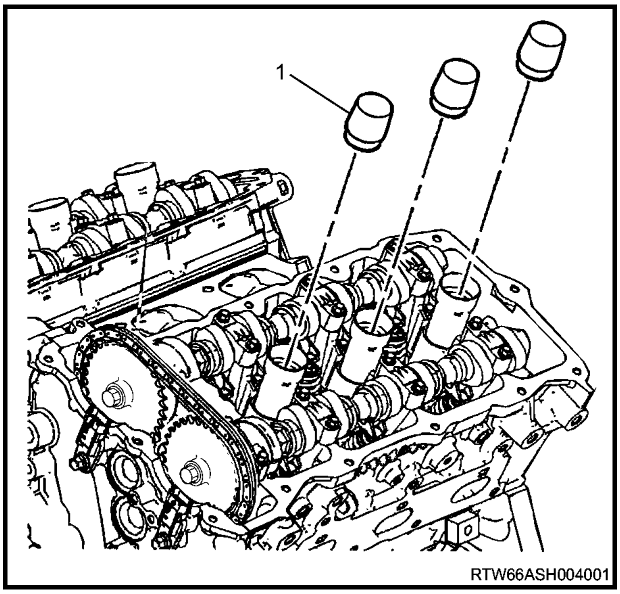

Figure 6A1 – 68

2 Ensure that the grommet (1), 13 places, is correctly seated in its hole.

3 Wipe the camshaft cover sealing surface on the cylinder head with a clean lint free cloth.

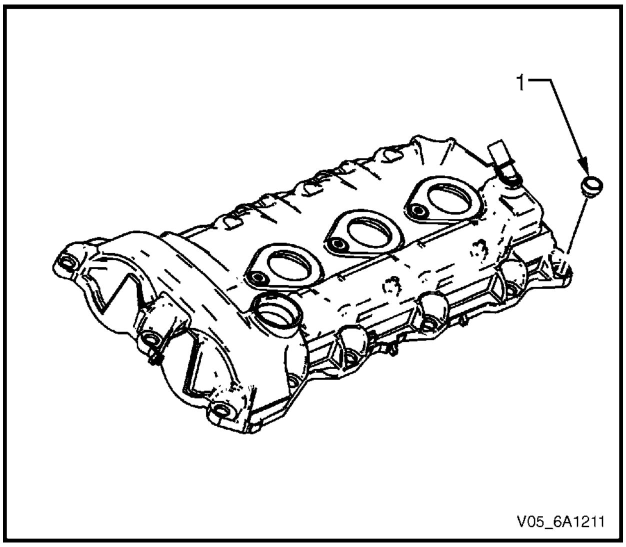

Figure 6A1 – 69

4 Ensure that a new seal is correctly fitted to the camshaft cover. Place a 3 mm bead of RTV sealant on the join line of the engine front cover (1).

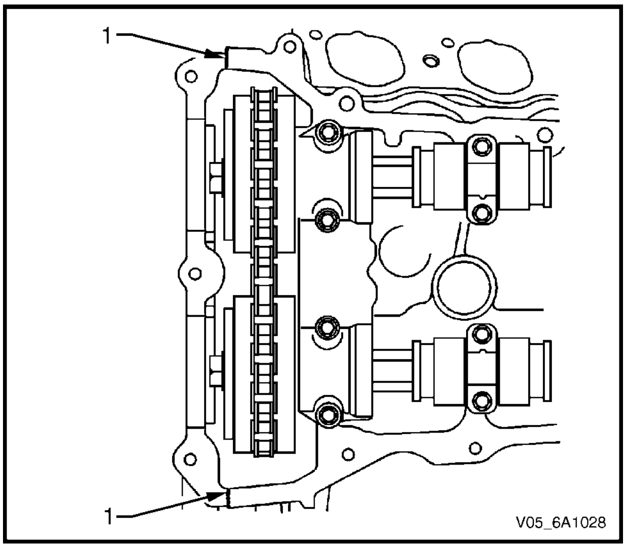

Figure 6A1 – 70

5 Place the camshaft cover (1) into position onto the cylinder head (2).

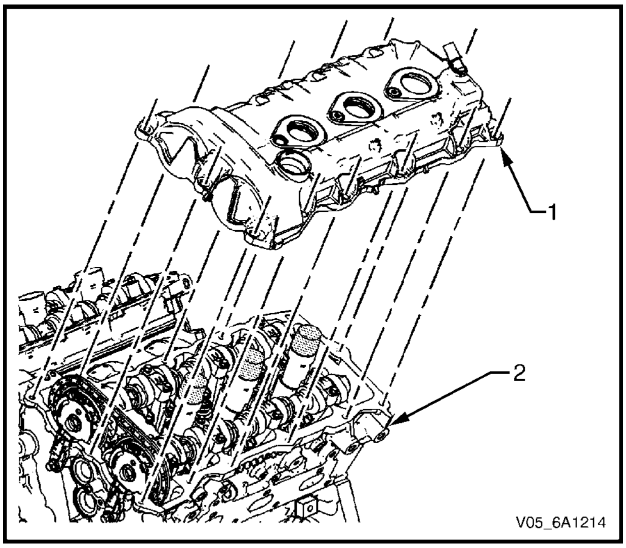

Figure 6A1 – 71

6 Loosely install the camshaft cover bolt (1), 13 places.

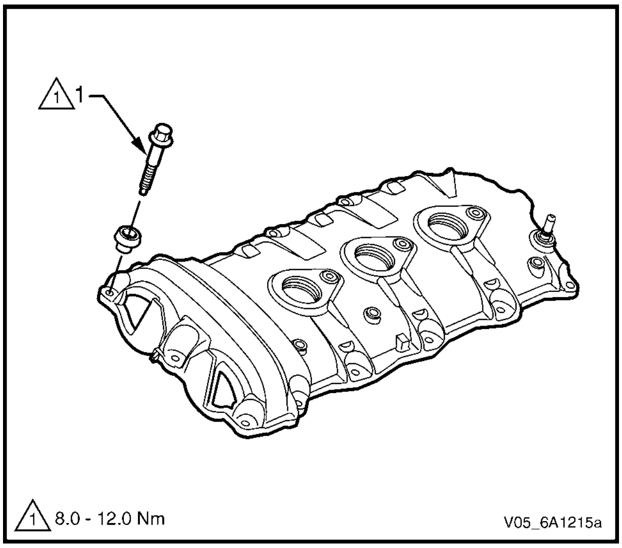

Figure 6A1 – 72

7 Tighten the camshaft cover bolts to the correct torque specification, in the sequence shown.

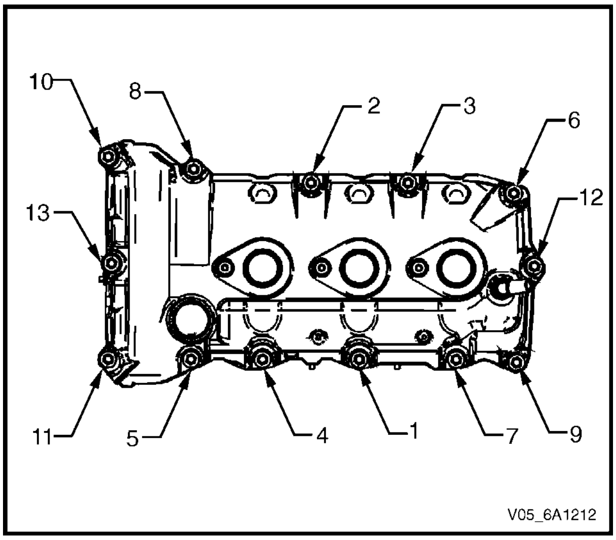

Figure 6A1 – 73

Camshaft cover attaching bolt torque specification	8.0 – 12.0 Nm

8 Remove Tool No. EN-46101 (1).

9 Tighten all remaining fasteners to the correct torque specification.

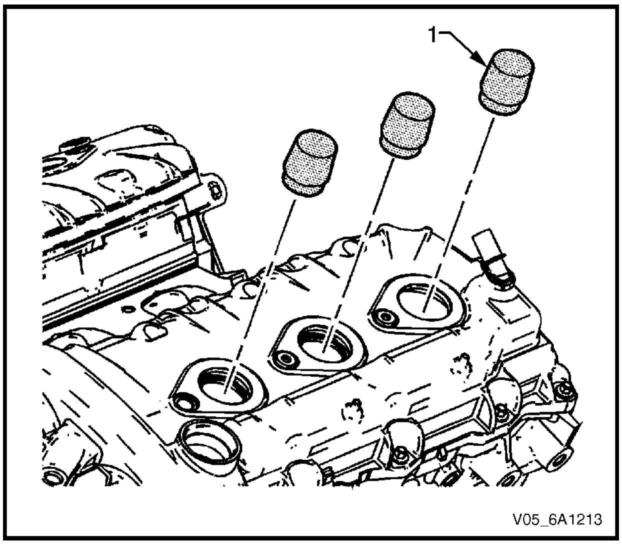

Figure 6A1 – 74

Engine ground connector bolt torque specification	10.0 Nm
Engine wiring harness former attaching bolt torque specification	12.0 – 16.0 Nm

3.13 Crankshaft Balancer Assembly

Remove

1 Remove the accessory drive belt, refer to 3.5 Accessory Drive Belt.

2 Remove the starter motor, refer to Section 6D1-2 Starting System.

3 Install Tool No. EN-46106 (1) into the starter motor opening to stop the camshaft from rotating.

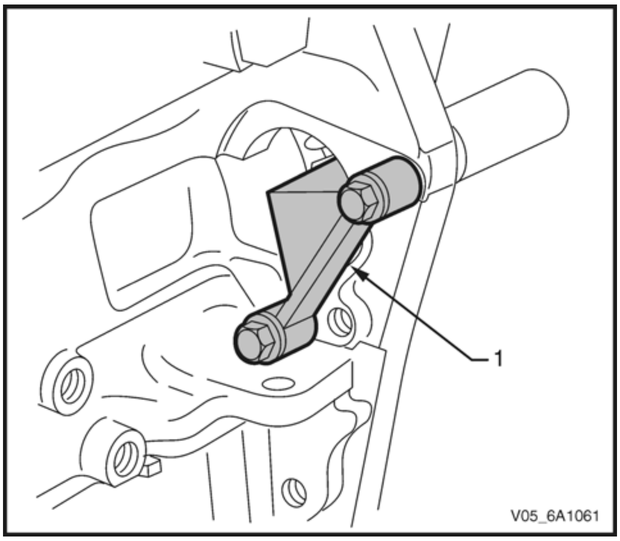

Figure 6A1 – 75

4 Remove the bolt (1) attaching the crankshaft balancer assembly (2) to the crankshaft.

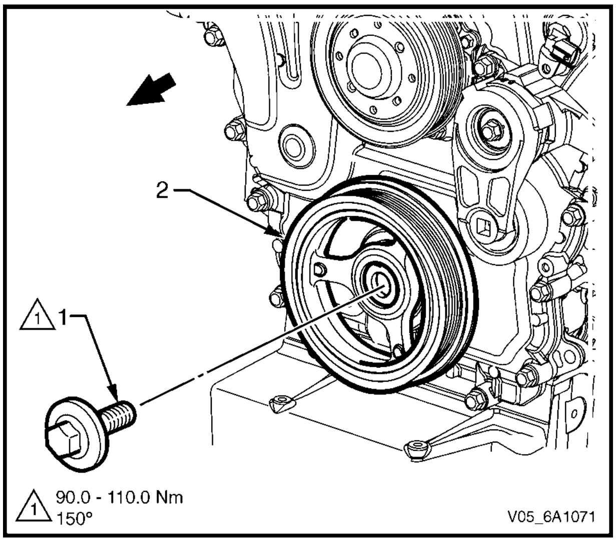

Figure 6A1 – 76

5 Remove the crankshaft balancer assembly (1) from the crankshaft using the appropriate tool:

Tool No. J-41816 (2) or equivalent.

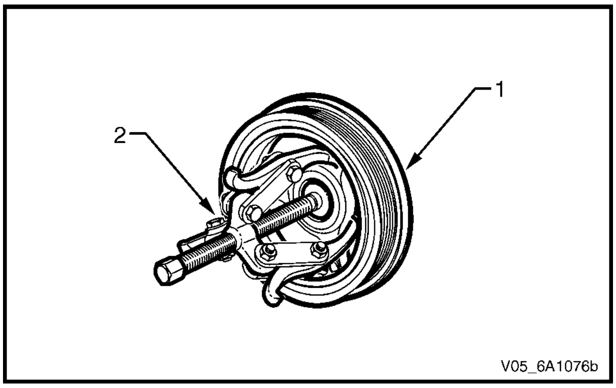

Figure 6A1 – 77

Clean and Inspect

1 Using a suitable non-corrosive cleaning solvent and a soft bristled parts cleaning brush, clean the crankshaft balancer assembly.

WARNING

Safety glasses must be worn when using compressed air.

2 Dry the crankshaft balancer assembly using compressed air.

3 Inspect the crankshaft balancer assembly for the following fault conditions:

- Hub to crankshaft inner surface for wear or damage,
- Sealing surface for wear, grooving or scoring,
- Rubber ring between the hub and the pulley for wear, chunking and general deterioration, and
- Drive belt ribs of the pulley for damage.

Reinstall

CAUTION

Do not lubricate the crankshaft front oil seal or crankshaft balancer sealing surfaces. The crankshaft balancer must be installed onto a dry seal.

1 Lubricate the crankshaft balancer assembly hub bore.

2 Partially install the crankshaft balancer assembly onto the crankshaft.

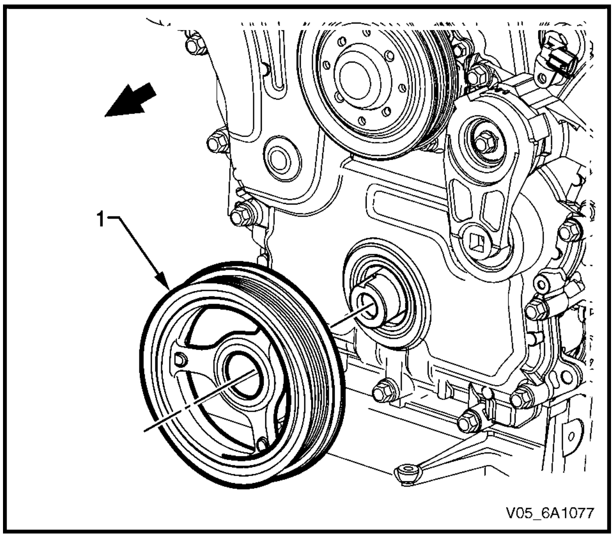

Figure 6A1 – 78

3 Using crankshaft balancer installer, Tool No. J-41998-B (1), fully install the crankshaft balancer assembly into the crankshaft.

CAUTION

To prevent damage to the crankshaft threads, fully install crankshaft balancer installer, Tool No. J-41998-B (1) into the crankshaft before pressing the pulley and balancer assembly.

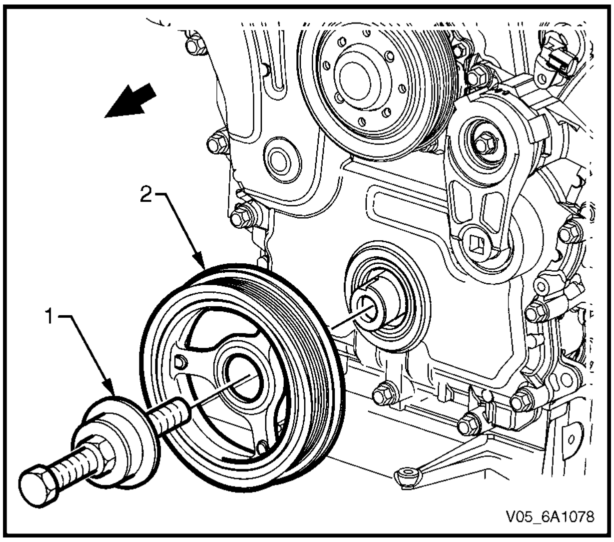

Figure 6A1 – 79

4 Apply Loctite 272 or equivalent to the thread of a new crankshaft balancer assembly retaining bolt (1).

5 Install the crankshaft balancer assembly retaining bolt and tighten to the correct torque specification.

■ ♦ Crankshaft balancer retaining bolt torque specification:	
Stage 1	90.0 – 110.0 Nm
Stage 2	150°

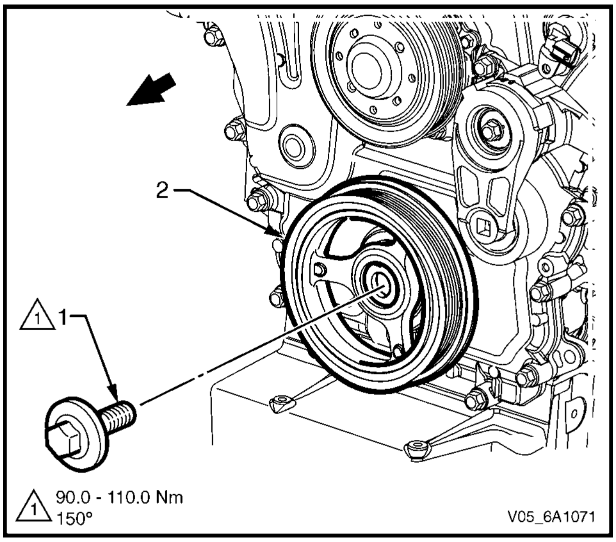

Figure 6A1 – 80

Supplemental Restraint System Steering Wheel & Column

Service Precaution

This steering wheel and column repair section covers the Supplemental Restraint System (SRS) steering column. The following repair procedures are specific to SRS components. When servicing a vehicle equipped with Supplemental Restraint System, pay close attention to all WARNINGS and CAUTIONS.

For detailed explanation about SRS, refer to Restraints section.

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNECESSARY SRS SYSTEM REPAIRS.

SAFE HANDLING OF INFLATOR MODULES REQUIRES THE PROCEDURES DESCRIBED BELOW TO BE FOLLOWED FOR BOTH LIVE AND DEPLOYED MODULES.

SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY (AIR BAG). AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY (AIR BAG) SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY-PRODUCT OF THE DEPLOYMENT REACTION, THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY (AIR BAG) IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AN AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY.

WHEN PLACING A LIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE.

NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS SYSTEM, DO NOT USE ELECTRICAL TEST EQUIPMENT, SUCH AS A BATTERY-POWERED OR A/C-POWERED VOLT-METER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN SPECIFIED IN THIS MANUAL. DO NOT USE A NON-POWERED PROBE-TYPE TESTER.

INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

SRS Connectors

CAUTION: The special yellow color connectors are used for the supplemental restraint system-air bag circuit.

When removing the cable harness, do not pull the cables. Otherwise, cable disconnection may occur.

When connecting the SRS connector, insert the connector completely. Imperfect locking may cause malfunction of the SRS circuit.

3.14 Crankshaft Front Seal

Replace

1 Remove the crankshaft balancer assembly, refer to 3.13 Crankshaft Balancer Assembly.

2 Using a flat bladed tool (2) or seal remover, Tool No. E-308, carefully remove the crankshaft front seal (1) from the front cover.

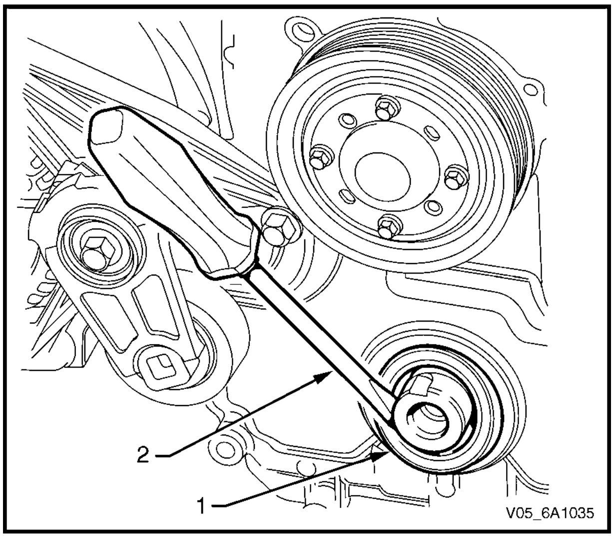

Figure 6A1 – 81

3 Using crankshaft front seal installer, Tool No. J-29184 (2) and a suitable hammer, install a new crankshaft front seal (1) until fully seated against the front cover housing.

4 Install the crankshaft balancer assembly, refer to 3.13 Crankshaft Balancer Assembly.

CAUTION

Do not lubricate the crankshaft front oil seal or crankshaft balancer sealing surfaces. The crankshaft balancer is installed into a dry seal.

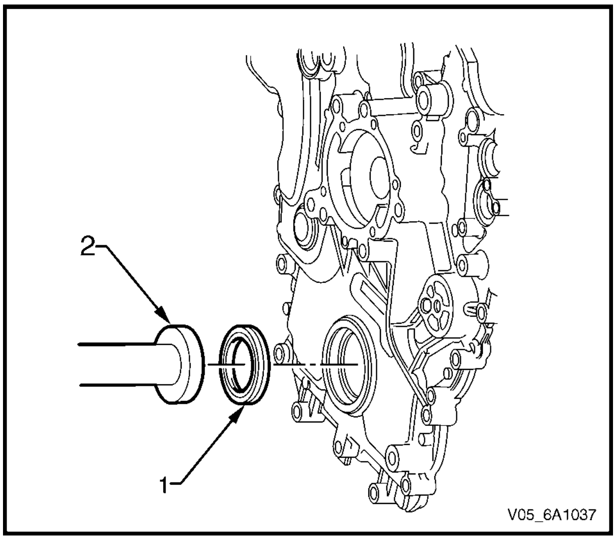

Figure 6A1 – 82

3.15 Front Cover Assembly

Remove

1 Drain the engine coolant, refer to Section 6B1 Engine Cooling.

2 Remove the water outlet pipe and coolant pump assembly, refer to Section 6B1 Engine Cooling:

3 Remove the camshaft covers, refer to 3.12 Camshaft Cover.

4 Remove the crankshaft balancer assembly, refer to 3.13 Crankshaft Balancer Assembly.

5 Disconnect the purge vent hose from the water outlet pipe.

NOTE

Do not disconnect the power steering pipes or drain the power steering fluid.

6 Remove the power steering pump reservoir mounting bracket, refer to 3.8 Power Steering Pump Bracket.

7 Remove the camshaft position sensor, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

NOTE

Do not disconnect the A/C compressor pipes.

8 Remove the bolt (2), 22 places, attaching the front cover assembly (1).

CAUTION

Only use the prise points and a bolt in the jackscrew hole to remove the engine front cover.

9 Loosely install a 10 x 1.5 mm bolt in the jackscrew hole (1).

10 Using the prise points (2) located at the edge of the front cover and the jackscrew, shear the RTV sealant.

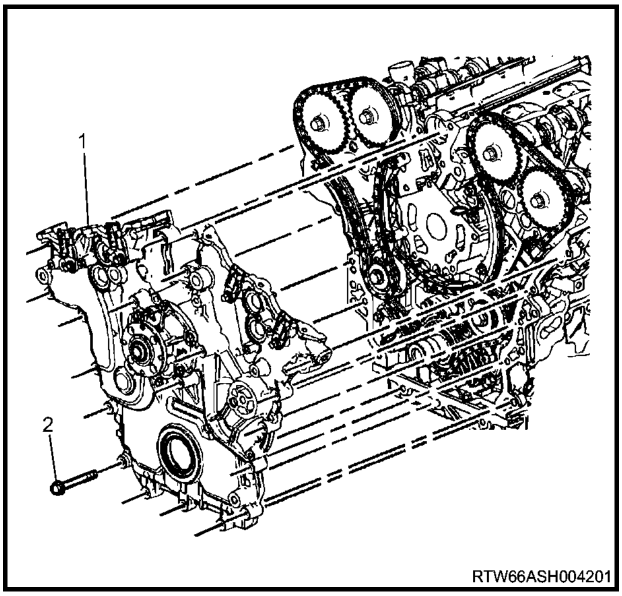

Figure 6A1 – 83

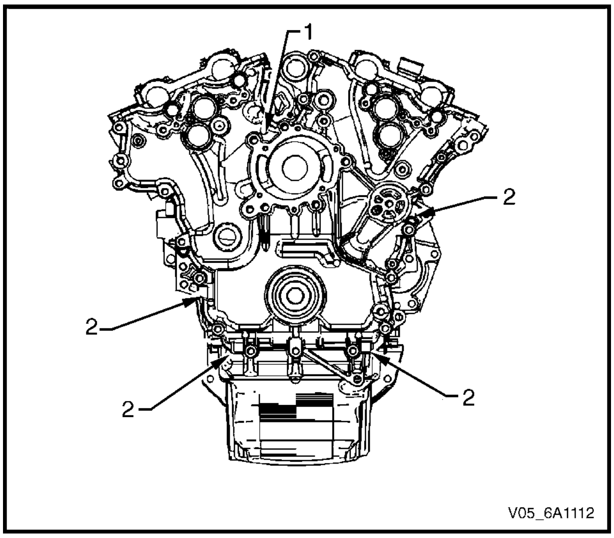

Figure 6A1 – 84

11 Remove the front cover assembly (1).

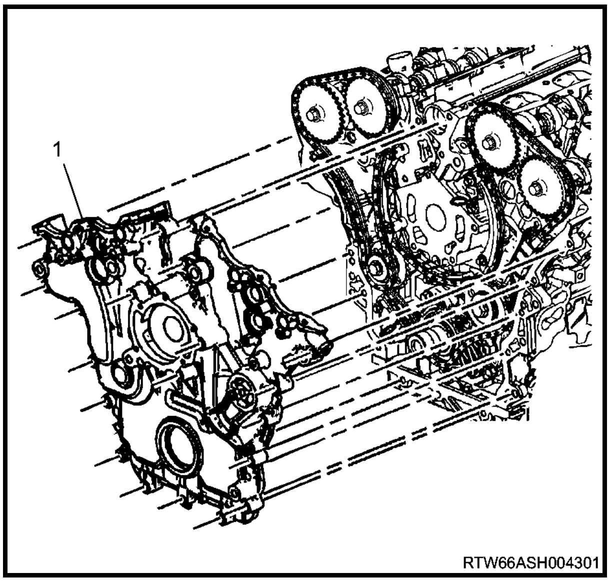

Figure 6A1 – 85

Disassemble

1 Remove the crankshaft front oil seal (1) from the engine front cover (2) using a flat bladed tool or seal remover, Tool No. E-308. Discard the seal.

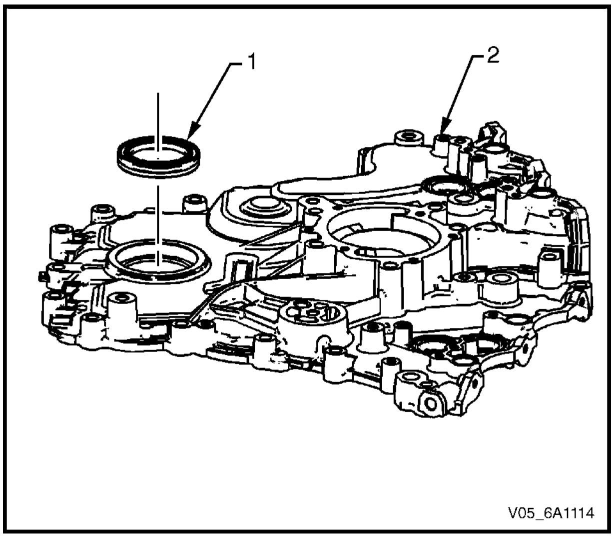

Figure 6A1 – 86

2 Remove the camshaft position actuator valve oil seals (1) from the engine front cover (2). Discard the seals.

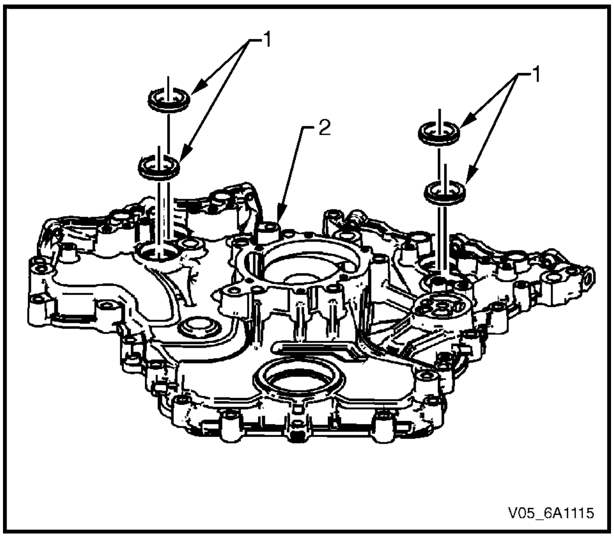

Figure 6A1 – 87

3 Remove the coolant pump seal (1) from the engine front cover (2). Discard the seal.

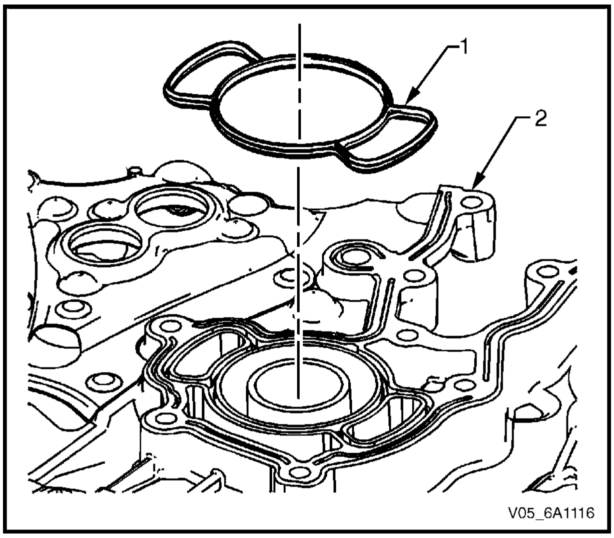

Figure 6A1 – 88

Clean

4 Remove any RTV sealant (1) from the engine front cover using a plastic or wood scraper.

CAUTION

- **Insert a piece of cardboard between the front of the oil pan and oil pump to prevent any contaminants from falling into the oil pan.**
- **Do not use a sharp or metal gasket scraper to clean the sealing surfaces.**

5 Clean out any debris from the bolt holes.

6 Clean the front cover with a suitable cleaning solvent.

7 Dry the front cover with compressed air.

WARNING

Safety glasses must be worn when using compressed air.

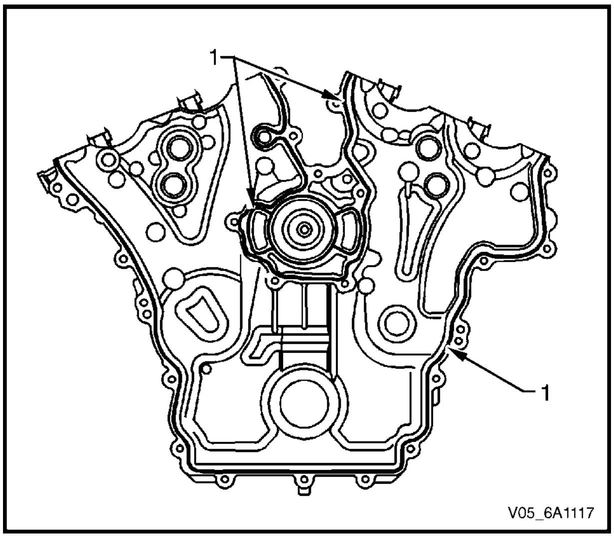

Figure 6A1 – 89

8 Use compressed air to remove any engine coolant from the engine cooling passages and from the top of the oil pan oil deflector.

Inspect

1 Inspect both sides of the engine front cover for the following conditions:

- damage to the camshaft position actuator valve oil seal bores (1),
- damage to the bolt holes (2),
- damage and/or corrosion to the engine coolant passage (3),
- dents or damage to the exterior (4),
- damage to the crankshaft front oil seal bore (5),
- gouges or damage to the coolant pump sealing surfaces (6), and
- damage to the coolant pump bolt hole threads (7).

2 Repair or replace the front cover as required.

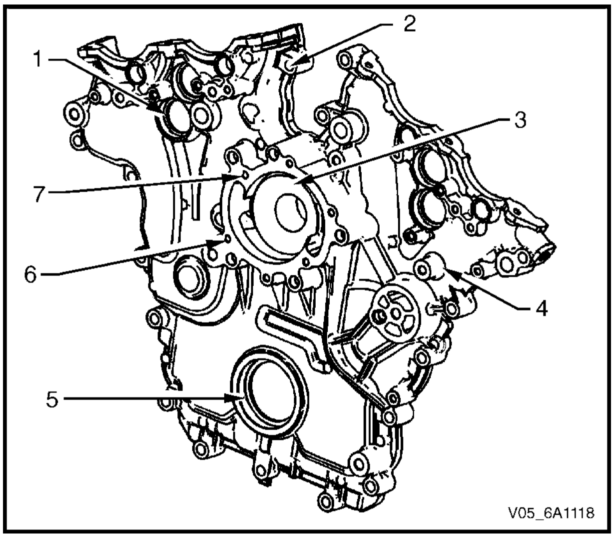

Figure 6A1 – 90

Reassemble

1 Install a new crankshaft front oil seal (1) into the front cover (2) using crankshaft front seal installer, Tool No. J-29184 (3) and a suitable hammer.

CAUTION

Do not lubricate the crankshaft front oil seal or crankshaft balancer sealing surfaces. The crankshaft balancer is installed into a dry seal.

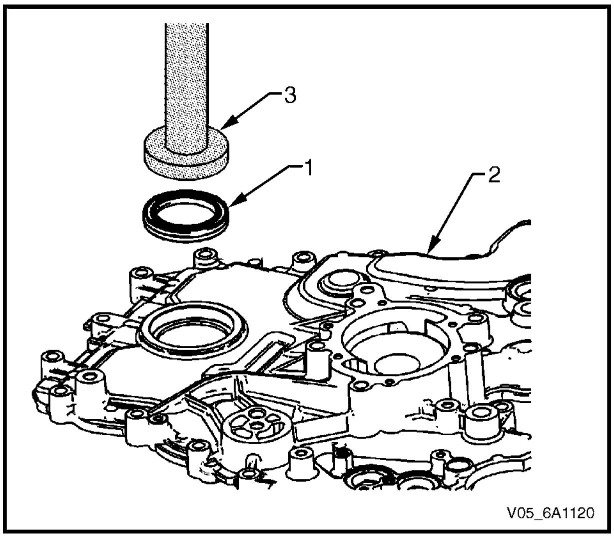

Figure 6A1 – 91

2 Install a new camshaft position actuator valve oil seal (1) into the front cover (2) using Tool No. EN-46103 (3) and a suitable hammer.

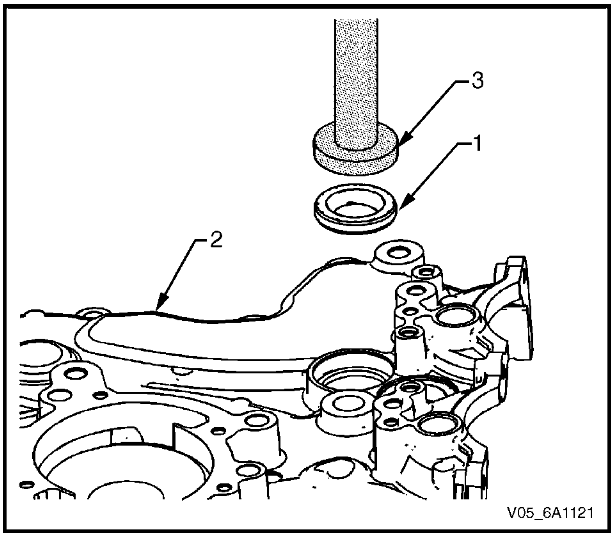

Figure 6A1 – 92

Reinstall

Reinstallation of the front cover is the reverse of the removal procedure, noting the following:

1 Install the guide pins, Tool No. EN-46109 (1) into the engine block, two places.

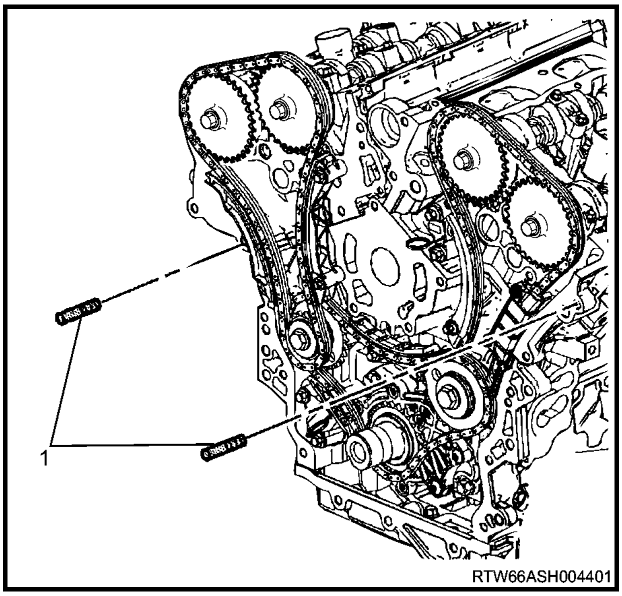

Figure 6A1 – 93

2 Install a new engine front cover to cylinder block seal (1).

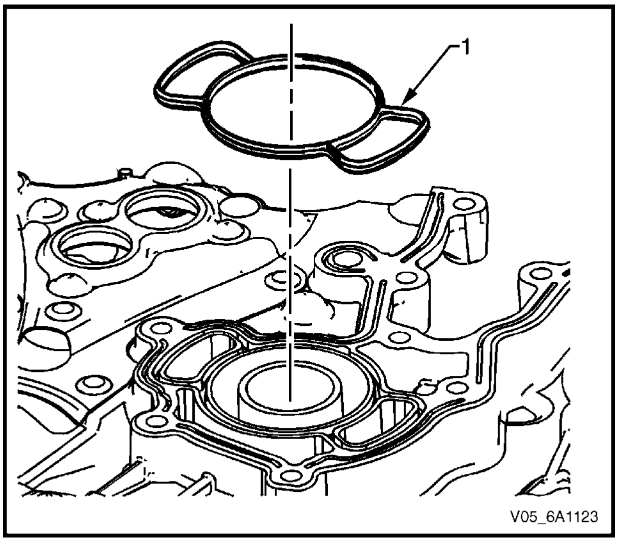

Figure 6A1 – 94

3 Apply a 3 mm bead of RTV sealant (1) to the front cover.

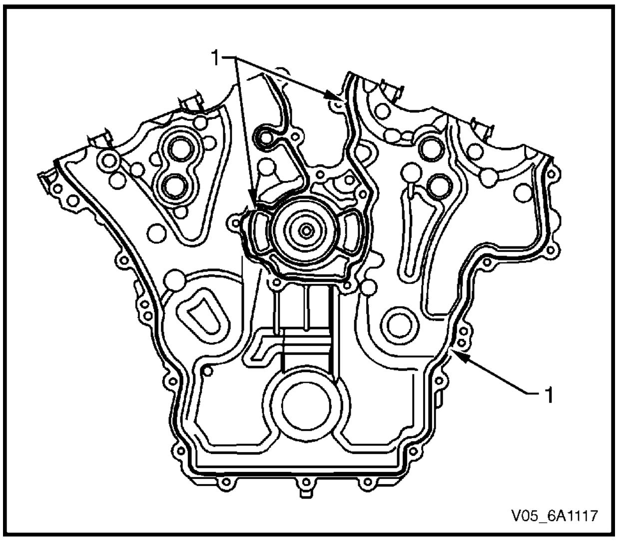

Figure 6A1 – 95

4 Place the front cover onto the special tools and slide into position.

5 Remove the special tools from the cylinder block.

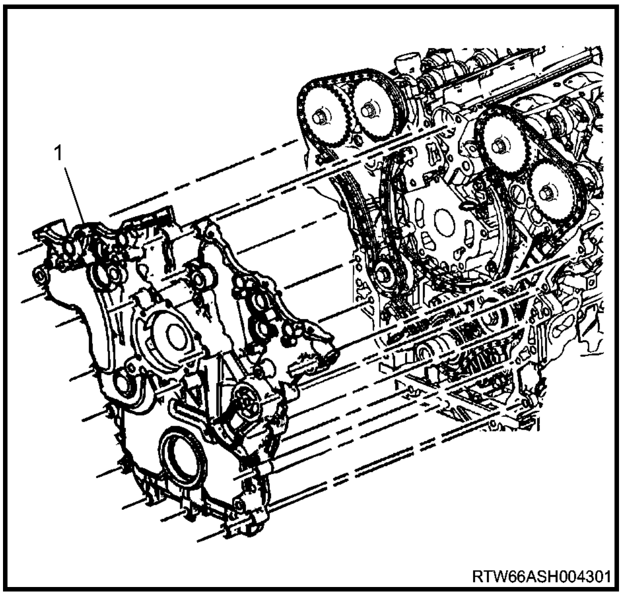

Figure 6A1 – 96

6 Hand start the front cover bolts (1).

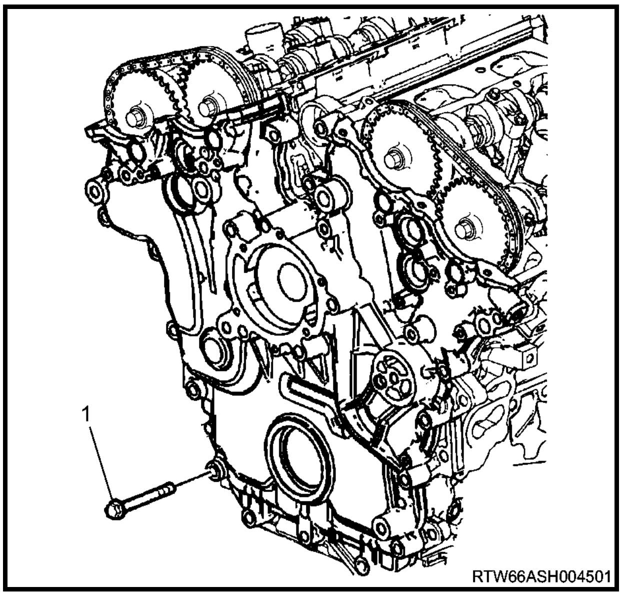

Figure 6A1 – 97

7 Tighten the engine front cover bolts to the correct torque specification, in the sequence shown.

Engine front cover assembly attaching bolt torque specification ....20.0 – 26.0 Nm

8 Fill the cooling system, refer to Section 6B1 Engine Cooling – V6.

9 Change the engine oil, refer to 3.1 Engine Oil.

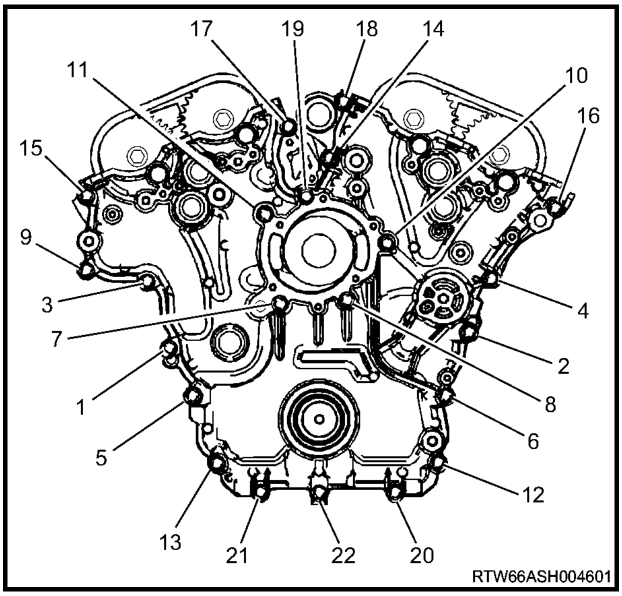

Figure 6A1 – 98

3.16 Timing Chains, Tensioners, Shoes and Guides

CAUTION

Setting the camshaft timing is required whenever the camshaft drive system has been disturbed and the relationship between any chain and sprocket has been lost. If required, follow the left-hand secondary timing chain reinstallation procedure to reset the camshaft timing.

Remove

Right-hand Secondary Timing Chain

CAUTION

After removing the upper intake manifold, and spark plugs, plug any openings to prevent dirt and other contaminants from entering.

1 Remove the engine front cover assembly, refer to 3.15 Front Cover Assembly.

2 Remove the spark plugs to aid crankshaft/engine rotation, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

3 Install Tool No. EN46111 (1) onto the crankshaft (2).

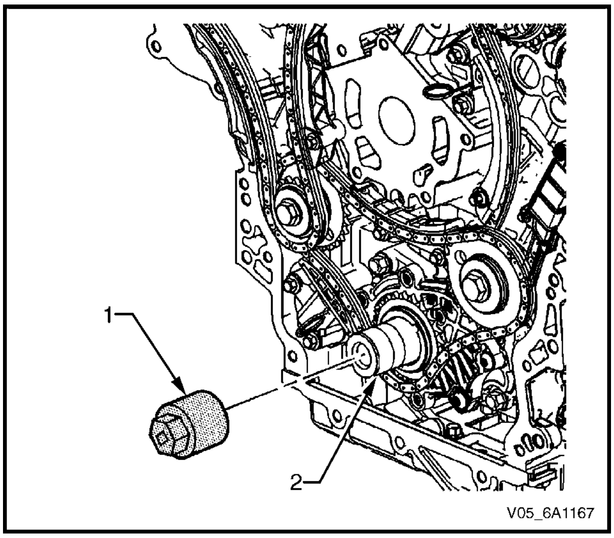

Figure 6A1 – 103

4 Using Tool No. EN46111 (1), rotate the crankshaft in a clockwise direction until the crankshaft sprocket timing mark (2) is aligned with the indexing mark (3) on the oil pump housing.

NOTE

Graphic shows 'Early Type' crankshaft sprocket, 'Late Type' similar.

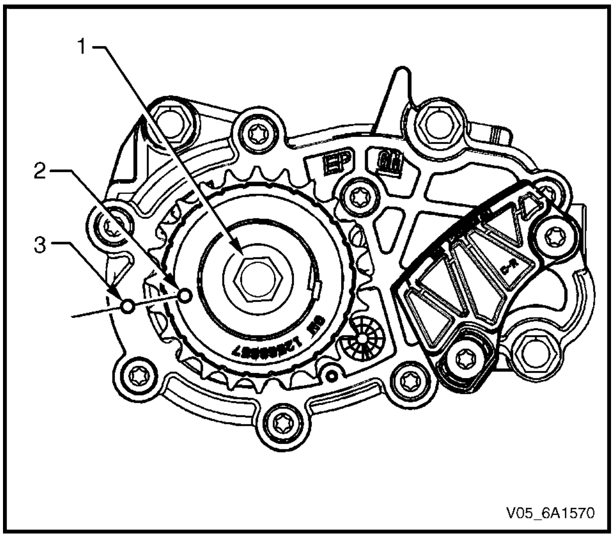

Figure 6A1 – 104

5 After aligning the crankshaft sprocket timing mark, check that the camshaft flats (1) at the rear of the right-hand cylinder head are parallel with the camshaft cover rail (2).

6 If the camshaft flats are not as shown, rotate the crankshaft 360 °.

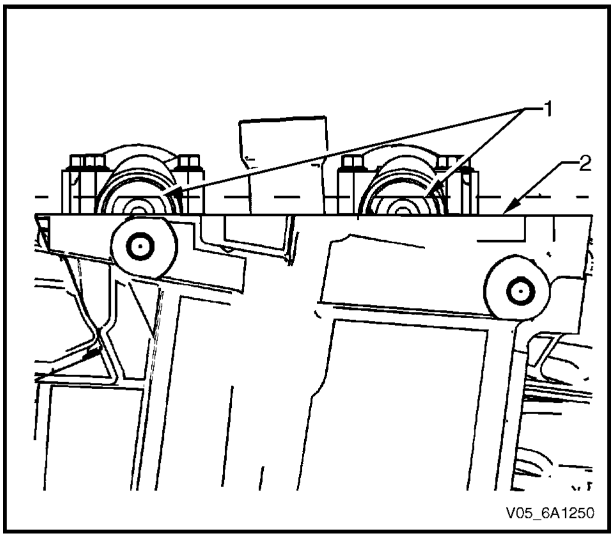

Figure 6A1 – 105

7 Install Tool No. EN 46105–1 (1) onto the rear of the right-hand cylinder head camshafts (2).

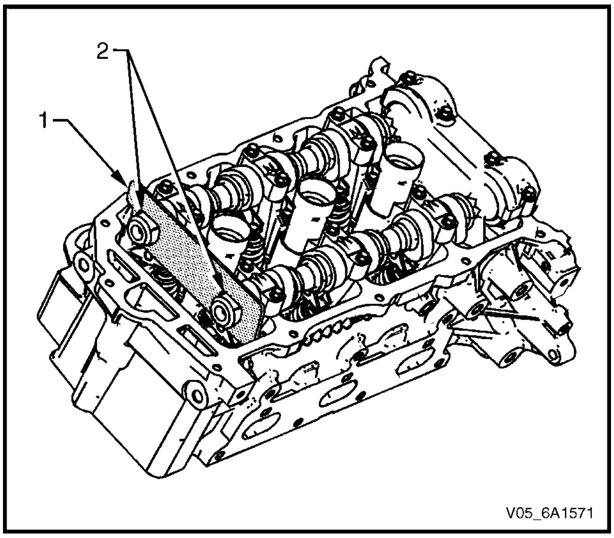

Figure 6A1 – 106

8 Install Tool No. EN 46105–2 (1) onto the rear of the left-hand cylinder head camshafts (2).

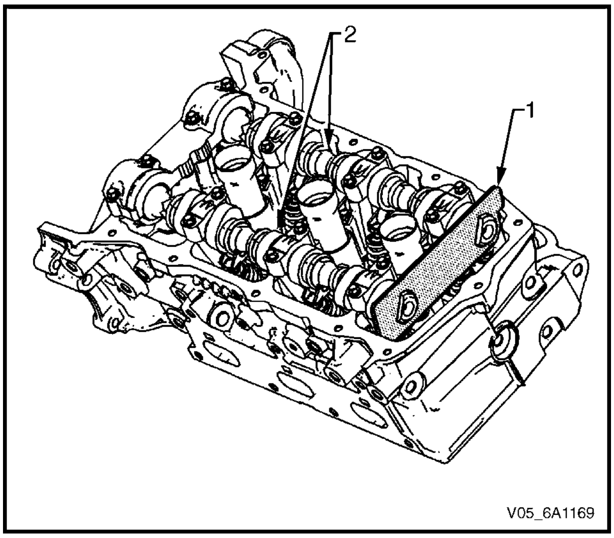

Figure 6A1 – 107

9 Remove the right-hand secondary timing chain tensioner bolts (1) and remove the tensioner (2).

NOTE

Take care when removing the tensioner bolts. The tensioner plunger is subjected to spring tension and may spring apart during tensioner removal.

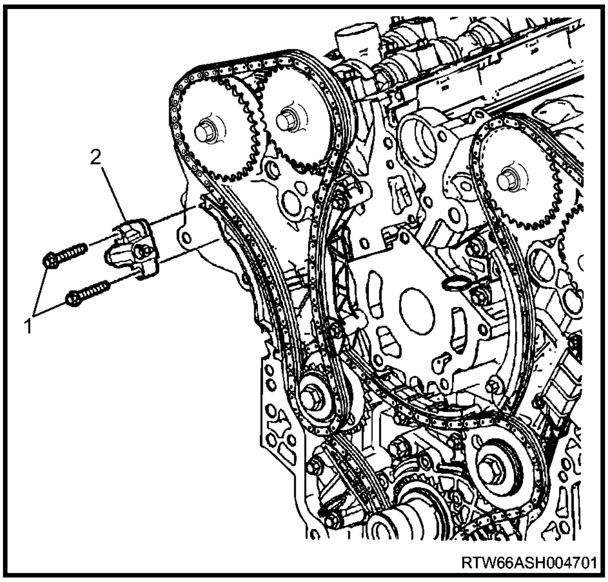

Figure 6A1 – 108

10 Remove the tensioner gasket (1) from the tensioner (2) and discard the gasket.

11 Inspect the tensioner mounting surface on the right-hand cylinder head for burrs or any defects that would affect the sealing of a new tensioner gasket.

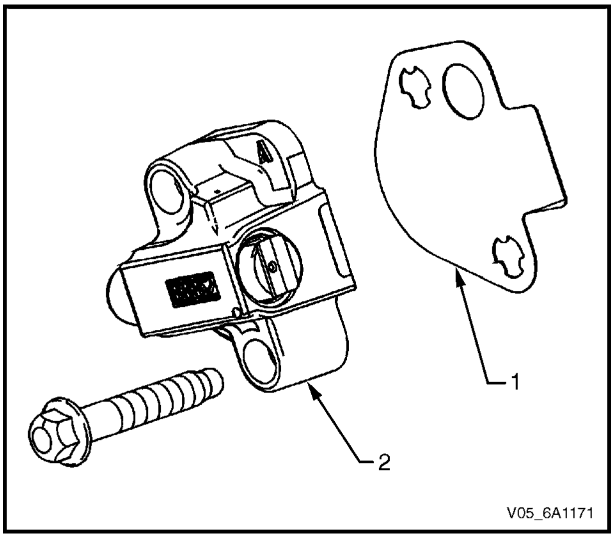

Figure 6A1 – 109

12 Remove the right-hand secondary timing chain shoe bolt (1).

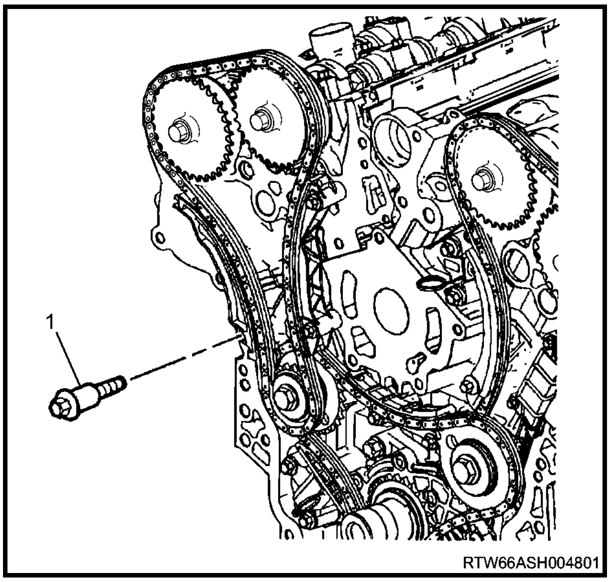

Figure 6A1 – 110

13 Remove the right-hand secondary timing chain shoe (1).

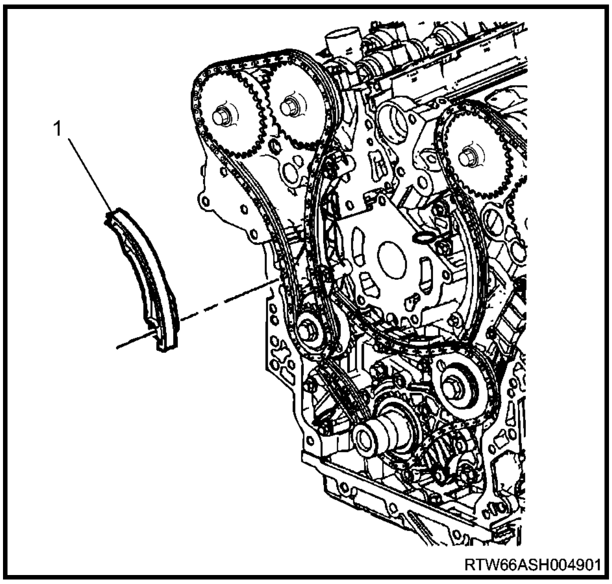

Figure 6A1 – 111

14 Remove the two right-hand secondary timing chain guide bolts (1) and remove the guide (2).

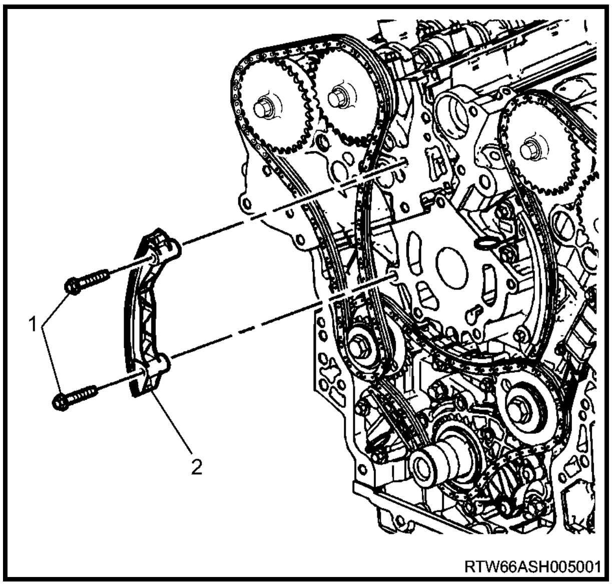

Figure 6A1 – 112

15 Remove the right-hand secondary timing chain (1) from the camshaft position actuators (2) and the camshaft intermediate sprocket (3).

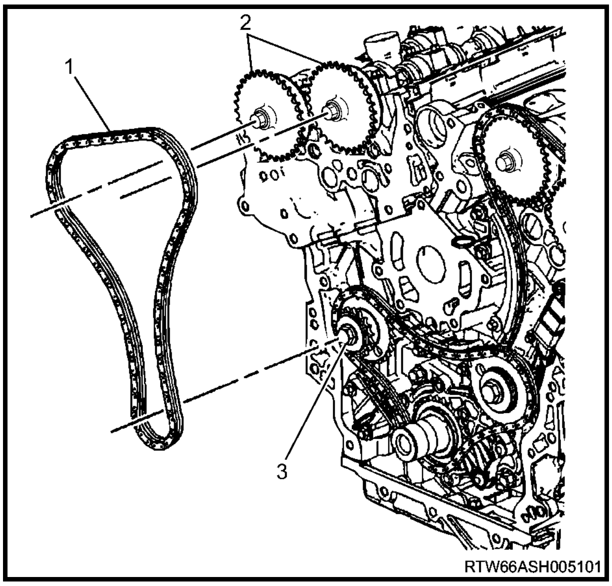

Figure 6A1 – 113

Primary Timing Chain

1 Remove the right-hand secondary timing chain, refer to Right-hand Secondary Timing Chain in this Section.

2 Remove the two primary timing chain tensioner bolts (1), and remove the tensioner (2).

NOTE

Take care when removing the tensioner bolts. The tensioner plunger is subjected to spring tension and may spring apart during tensioner removal.

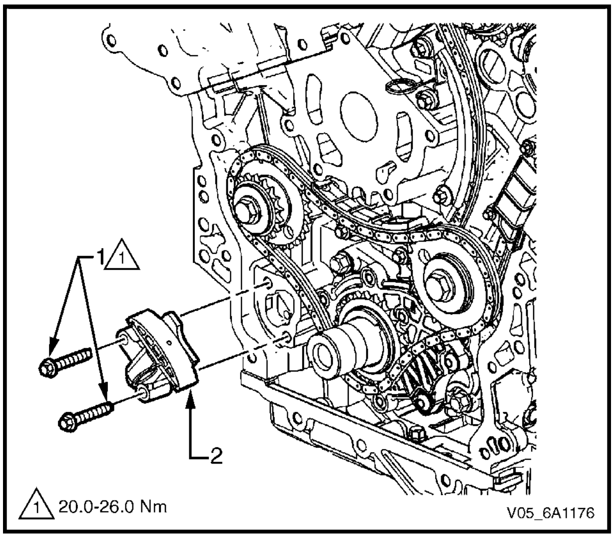

Figure 6A1 – 114

3 Remove the gasket (1) from the tensioner (2) and discard the gasket.

4 Inspect the primary timing chain tensioner mounting surface on the engine block for burrs or any defects that would affect the sealing of a new tensioner gasket.

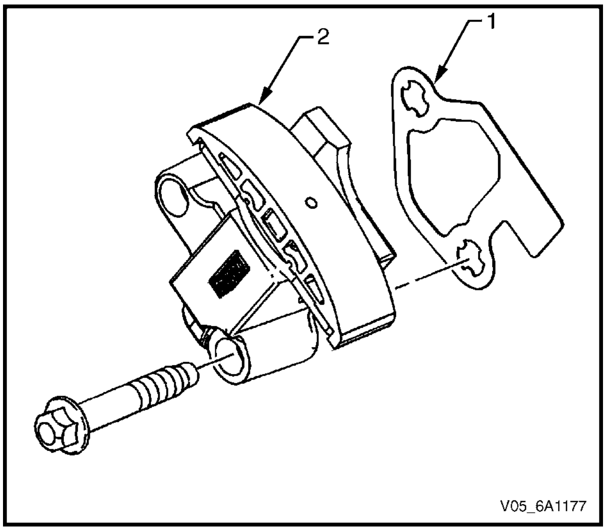

Figure 6A1 – 115

5 Remove the two primary timing chain upper guide bolts (1) and remove the guide (2).

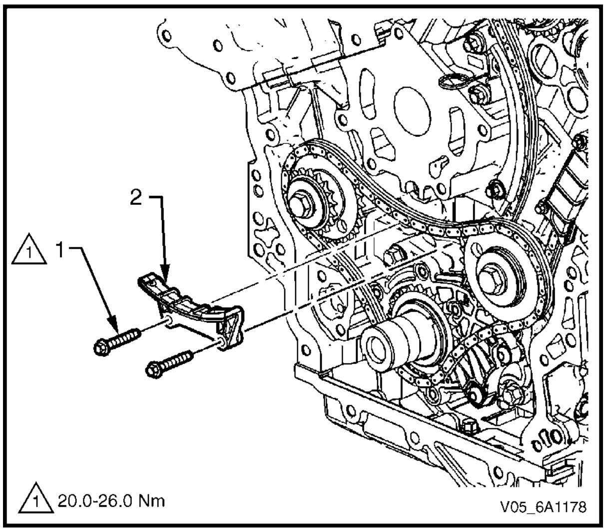

Figure 6A1 – 116

NOTE

Do not remove the primary timing chain lower guide (1). The primary timing chain lower guide is not serviced separately. If the primary timing chain lower guide requires replacement, the oil pump assembly (2) must be replaced.

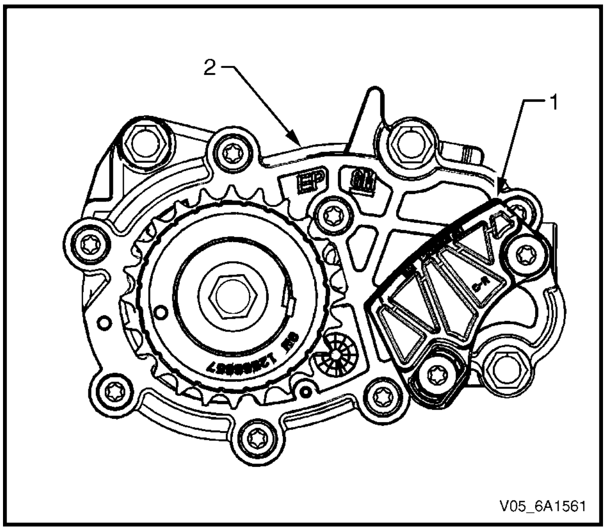

Figure 6A1 – 117

6 Remove the primary timing chain (1).

NOTE

For ease of removal, remove the chain from the crankshaft sprocket, before attempting to remove from the camshaft intermediate sprockets.

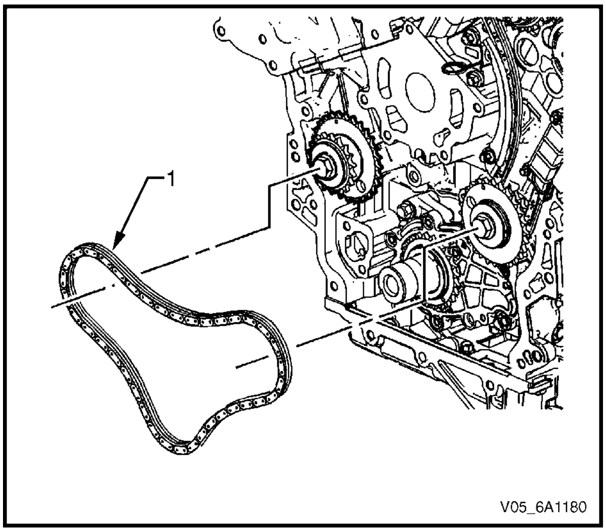

Figure 6A1 – 118

7 If required, remove the right-hand camshaft intermediate sprocket bolt (1) and remove the sprocket (2).

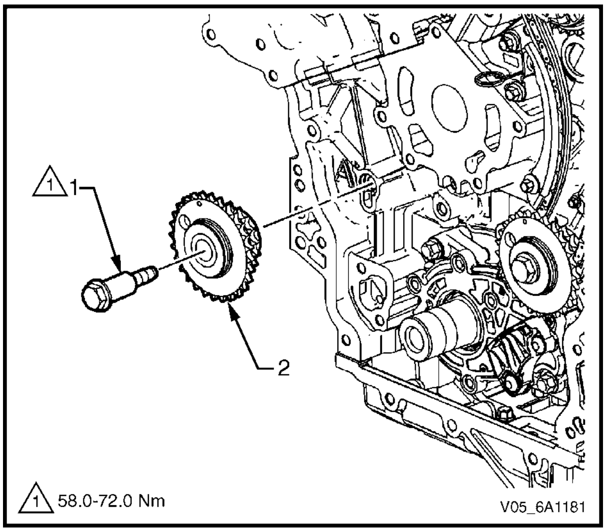

Figure 6A1 – 119

8 If required, remove the crankshaft sprocket (1) from the crankshaft (2).

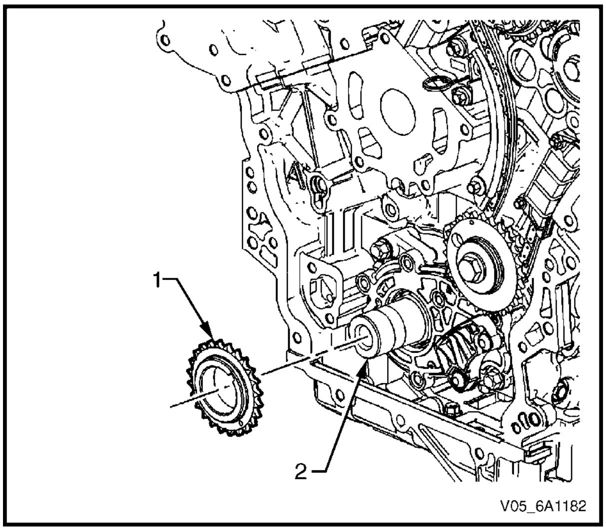

Figure 6A1 – 120

Left-hand Secondary Timing Chain

1 Remove the primary timing chain, refer to Primary Timing Chain in this Section.

2 Remove the two left-hand secondary timing chain tensioner bolts (1) and remove the tensioner (2).

NOTE

Take care when removing the tensioner bolts. The tensioner plunger is subjected to spring tension and may spring apart during tensioner removal.

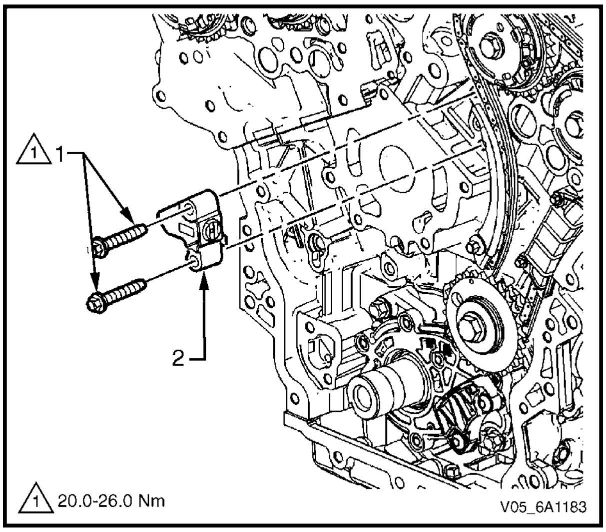

Figure 6A1 – 121

3 Remove the gasket (1) from the tensioner (2) and discard the gasket.

4 Inspect the tensioner mounting surface on the left-hand cylinder head for burrs or any defects that would affect the sealing of a new tensioner gasket.

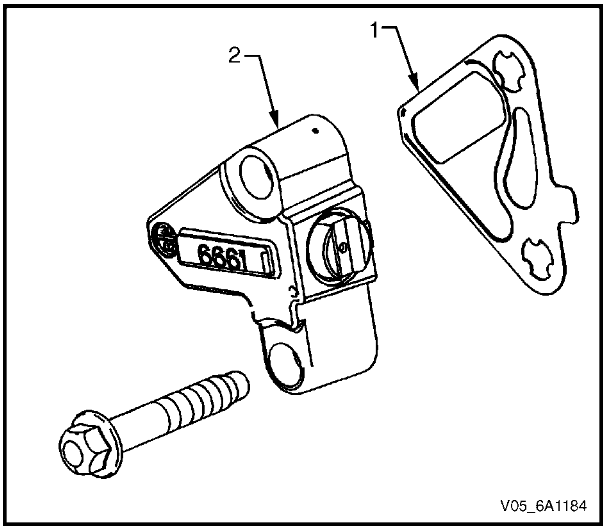

Figure 6A1 – 122

5 Remove the left-hand secondary timing chain shoe bolt (1).

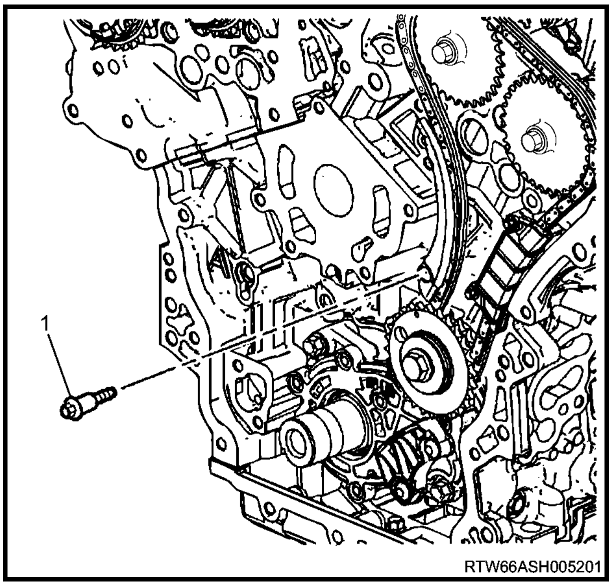

Figure 6A1 – 123

6 Remove the left-hand secondary timing chain shoe (1).

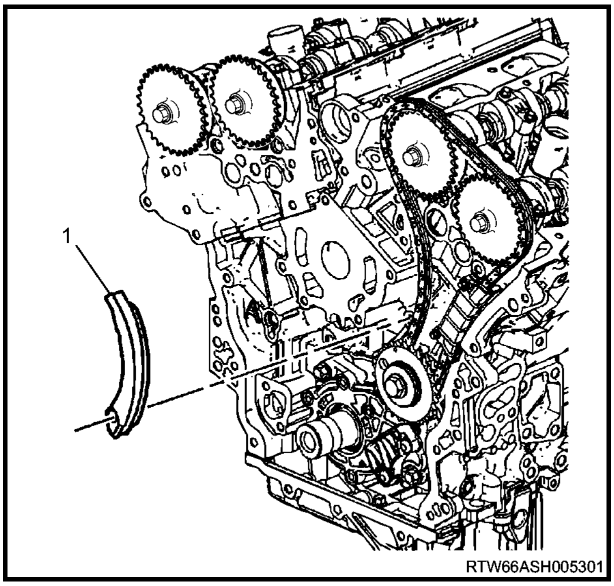

Figure 6A1 – 124

7 Remove the left-hand secondary timing chain guide bolt (1), two places, and remove the guide (2).

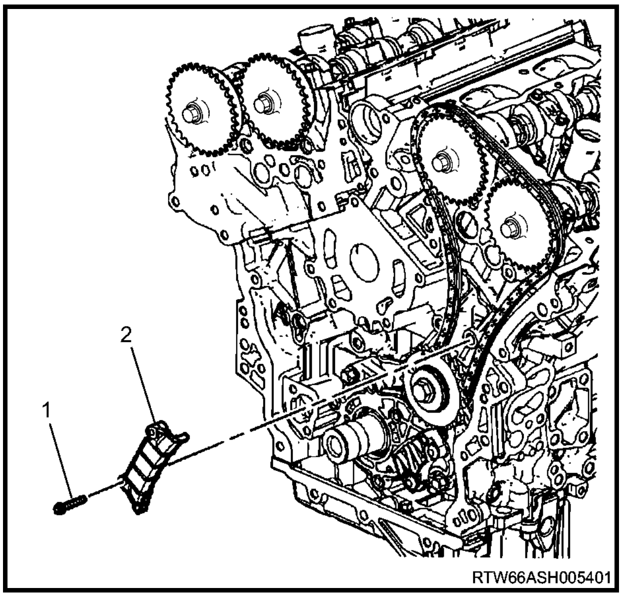

Figure 6A1 – 125

8 Remove the left-hand secondary timing chain (1) from the camshaft position actuators (2) and the camshaft intermediate sprocket.

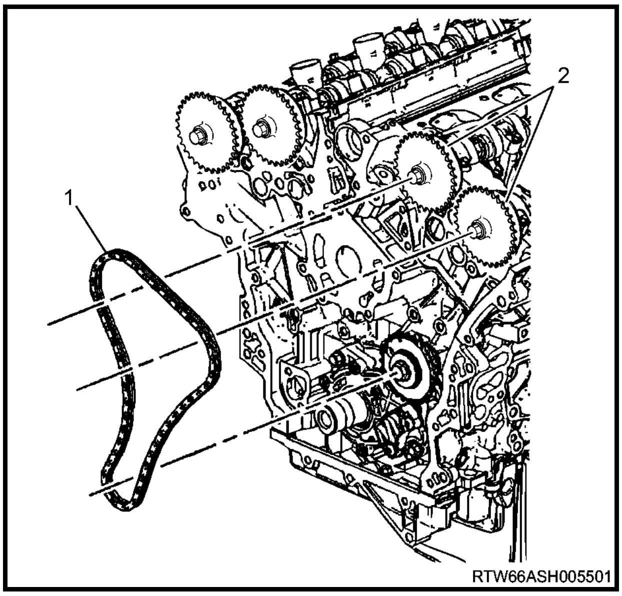

Figure 6A1 – 126

9 If required, remove the left-hand camshaft intermediate sprocket bolt (1) and remove the sprocket (2).

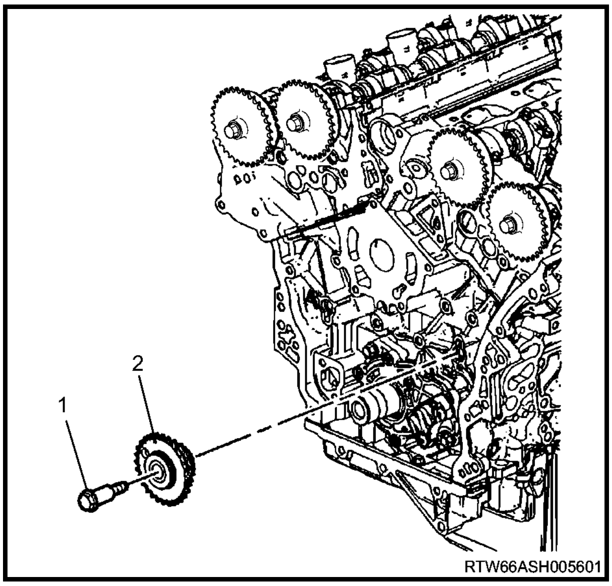

Figure 6A1 – 127

10 Remove Tool No. EN 46105–2 (1) from the left-hand cylinder head camshafts (2).

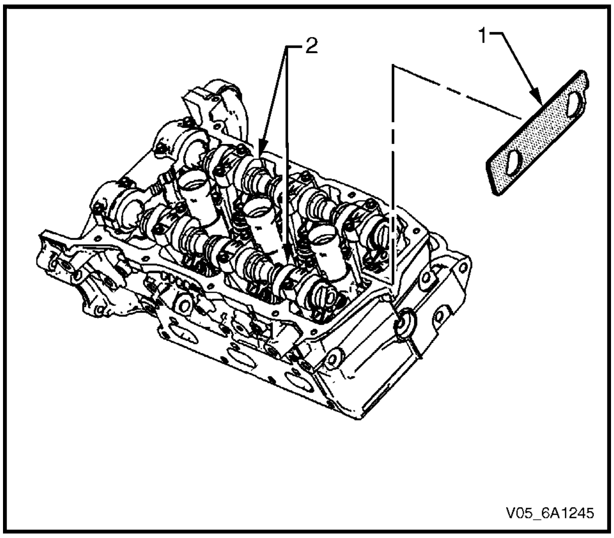

Figure 6A1 – 128

Recommended Fluids and Lubricants (For GENERAL EXPORT)

In order to obtain maximum performance and longest service life from your ISUZU vehicles, it is very important to select and use correctly the best lubricants and diesel fuels.
When lubricating, be sure to use ISUZU genuine lubricants or recommended lubricants listed below, according to the maintenance schedule for each vehicle model.
The lubrication intervals in the maintenance schedule and coverage and period of new vehicle warranty are based on the use of ISUZU genuine lubricants or recommended lubricants listed in the chart, which will serve as a guide for selecting lubricants of the correct brand name.

LUBRICATION	MAKE	BRAND/TYPE	GRADE		
			API	ACEA	JASO
Gasoline engine crankcase C24SE	**ISUZU GENUINE**	**BESCO RACING ACE TYPE SJ (5W-30)**	**SJ**		
	ISUZU GENUINE	**BESCO MULTI ACE (7.5W-30)**	**SG**		
	CALTEX	HAVOLINE FORMULA (15W-40, 10W-30, 20W-50)	SL		
	SHELL	HELIX PLUS (15W-50)	SJ/CF	A3/B3	
	ELF	SUPER SPORTI S (15W-40)	SG		
	TOTAL	QUARTZ 5000 (15W-40, 20W-50)	SJ/CF	A2/B2	
	CASTROL	GTX-7 (15W-40)	SG/SH		
	BP	VISCO 3000 (15W-40)	SG/SH		
Gasoline engine crankcase HFV6		10W-30	SL		
	CALTEX	HAVOLINE FORMULA (10W-30)	SL		
Diesel engine crankcase	**ISUZU GENUINE**	**BESCO MULTI-Z TYPE CF-4 (10W-30)**	**CF-4**		
	ISUZU GENUINE	**BESCO MULTI-Z SUV (5W-30)**	**CD**		
	ISUZU GENUINE	**BESCO S-3 (10W, 20W, 30, 40)**	**CD**		
	CALTEX/CHEVRON	DELO CXJ (15W-40, 20W-50, 40)	CD/CF		DH-1

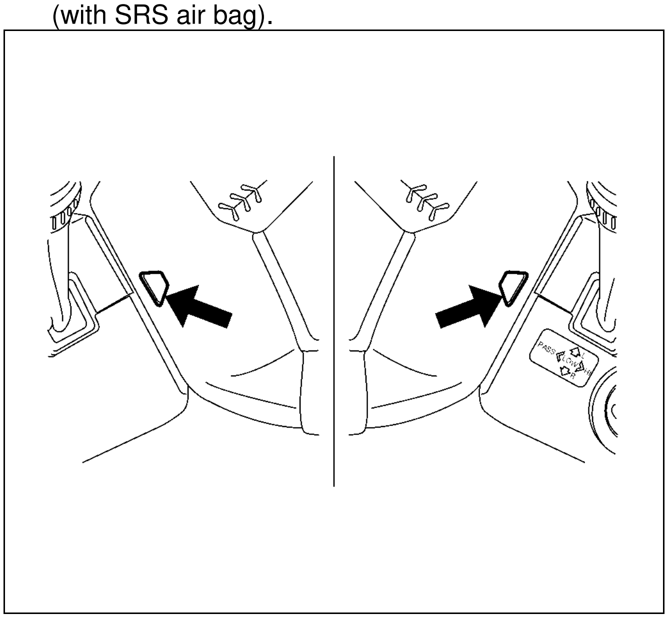
Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "-" terminal cable, and wait at least 5 minutes (with SRS air bag).
4. Disconnect the yellow 2-way SRS connector located under the steering column (with SRS air bag).

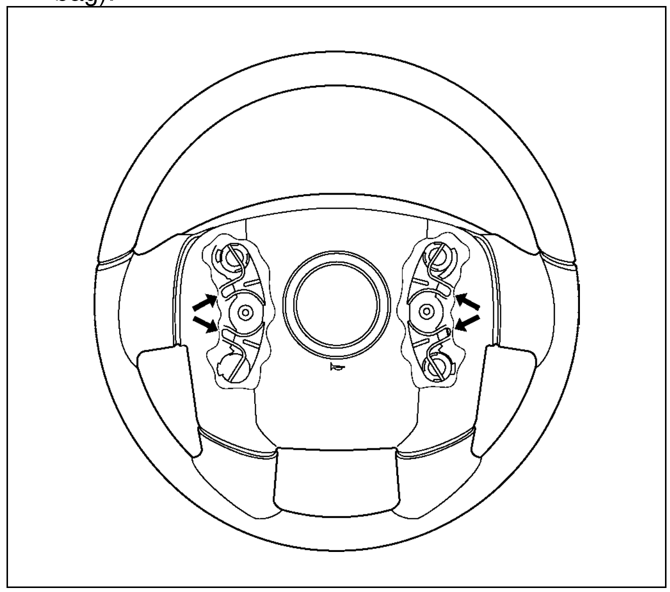
CAUTION: The wheels of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering wheel. Failure to do so will cause the coil assembly to lose its centering which will cause damage to the coil assembly (with SRS air bag).

5. Disable the SRS (Refer to "Disabling the SRS" in this section) (with SRS air bag).
6. Check the holes on both sides of the steering cover (with SRS air bag).



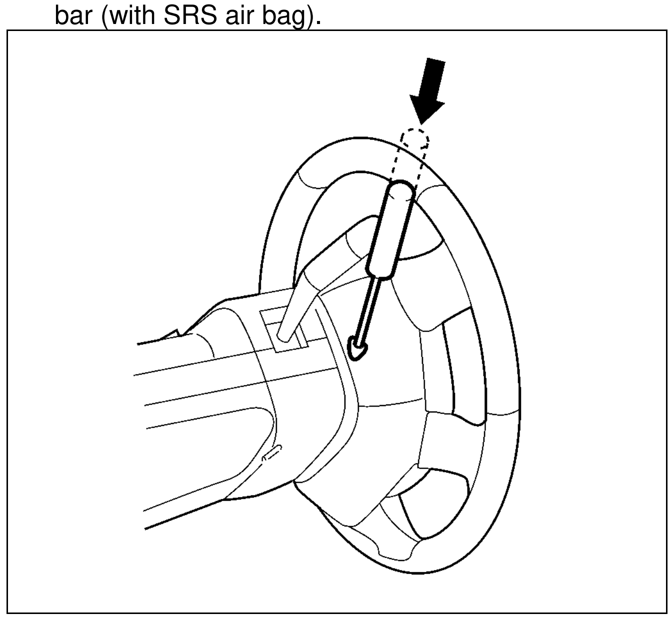
060R300025

7. Check the position of the pins in their holes. Push the pin in the direction of the arrow (with SRS air bag).



RTW73BSH000101

8. Push the four pins with a ϕ 5~6 mm (0.20~0.24 in) bar (with SRS air bag).



060R300031

9. Cancel the lock to release the four pins (with SRS air bag).

11 Remove Tool No. EN 46105–1 (1) from the right-hand cylinder head camshafts (2).

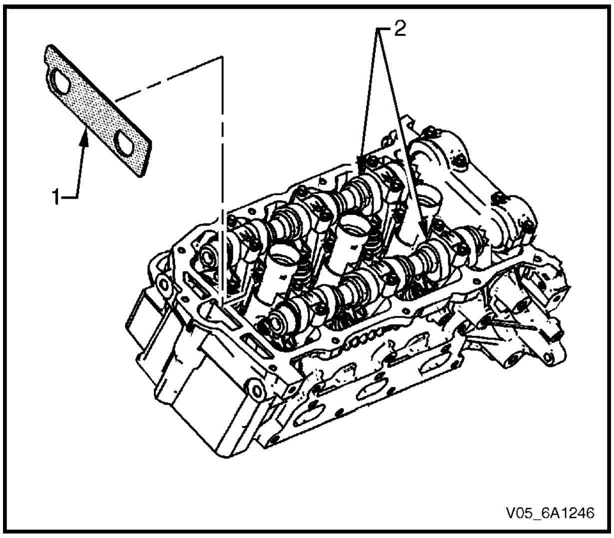


Figure 6A1 – 129

Clean

1 Clean all the following components with a suitable solvent:

- crankshaft sprocket,
- primary timing chain,
- primary timing chain guide,
- primary timing chain tensioner,
- secondary timing chains,
- secondary timing chain shoes,
- secondary timing chain guides,
- secondary timing chain tensioners, and
- bolts.

WARNING

Safety glasses must be worn when using compressed air.

2 Dry all the components with compressed air.

Inspect

Timing Chains

1 Inspect the primary and/or secondary timing chains for the following:
- binding or worn rollers (1),
- loose links (2), and
- loose pins (3).

2 Replace a damaged timing chain as required.

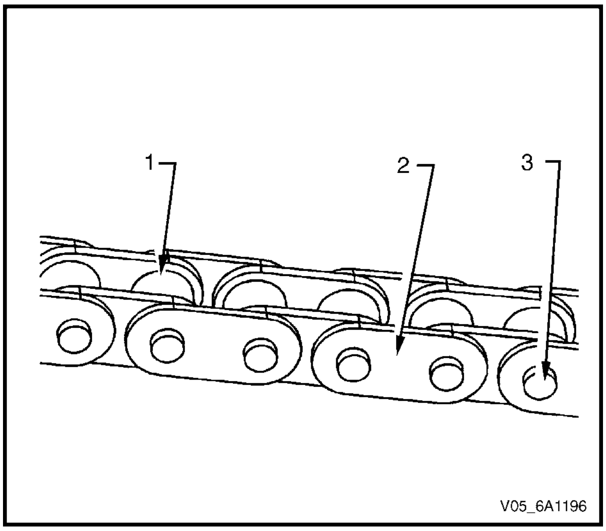

Figure 6A1 – 130

Camshaft Intermediate Sprockets

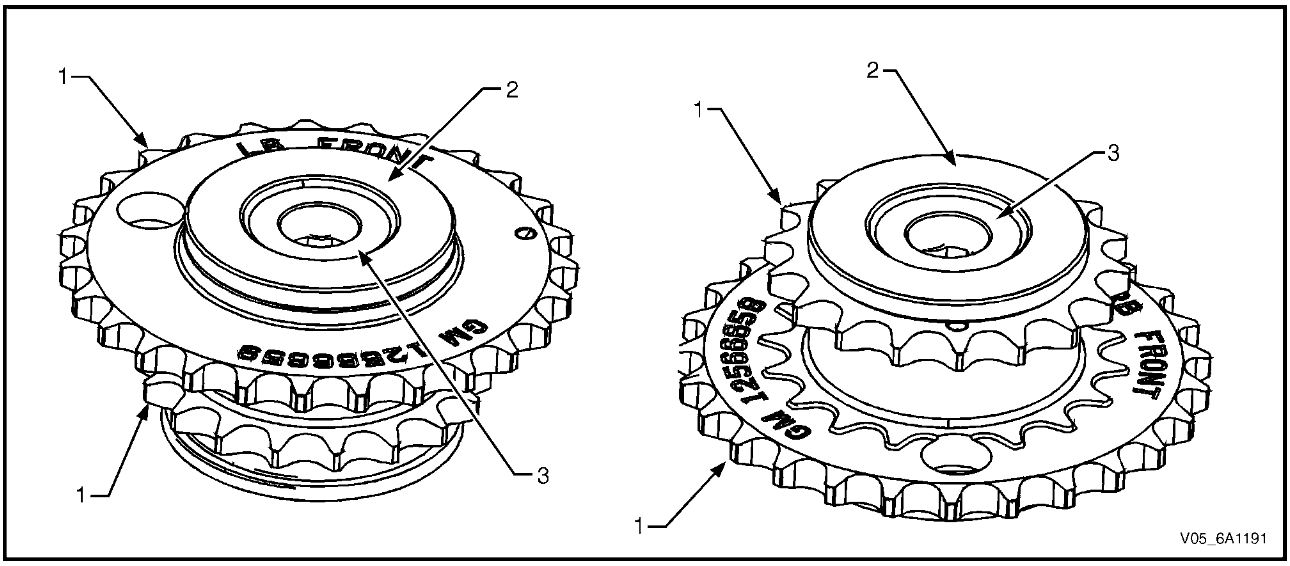

Figure 6A1 – 131

1 Inspect the camshaft intermediate sprockets for the following:
- Damage to the primary and secondary timing chain sprocket (1), refer to Figure 6A1 – 129.
- Damage to the hub bearing (2). Ensure the hub bearing spins freely. If the hub bearing wobbles, is noisy or feels rough when rotated replace the camshaft intermediate sprocket, and
- Damage to the bolt flange seating / sealing surface (3).
- Damage to the bearing hub-to-engine block sealing surface.

Inlet and Exhaust Camshaft Sprocket

Inspect the camshaft sprocket assemblies, refer to 3.18 Camshaft Sprocket.

Crankshaft Sprocket

1 Inspect the crankshaft sprocket for the following:
- sprocket damage (1),
- bore damage (2),
- keyway damage (3), and
- damage to the cushion material (4).

2 Replace a damaged sprocket as required.

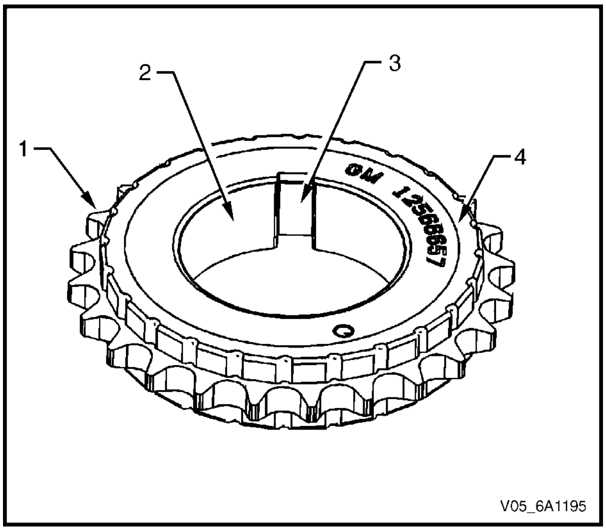

Figure 6A1 – 132

Primary Timing Chain Upper Guide

1 Inspect the primary timing chain upper guide for the following:
- worn guide surface (1),
- cracked or broken guide surface (2), and
- cracked or damaged guide base (3).

2 Replace a damaged guide as required.

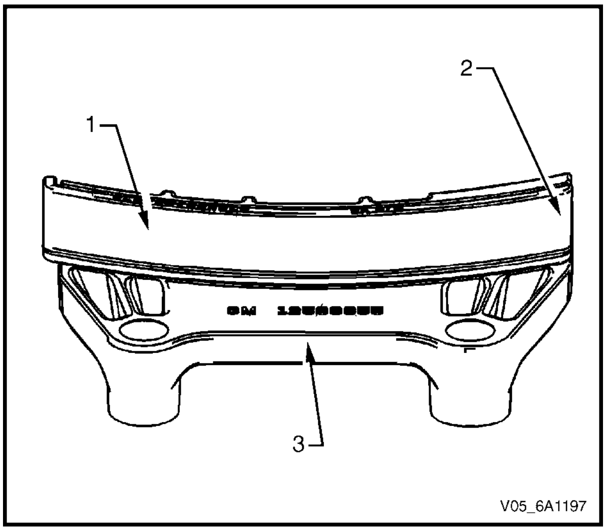

Figure 6A1 – 133

Primary Timing Chain Lower Guide

1 Inspect the primary timing chain lower guide for the following:
- worn guide surface (1),
- cracked or broken guide surface (2), and
- cracked or damaged guide base (3).

2 Replace the primary timing chain lower guide by replacing the oil pump assembly, refer to 3.17 Oil Pump Assembly.

NOTE

The primary timing chain lower guide is not serviced separately and is part of the oil pump assembly.

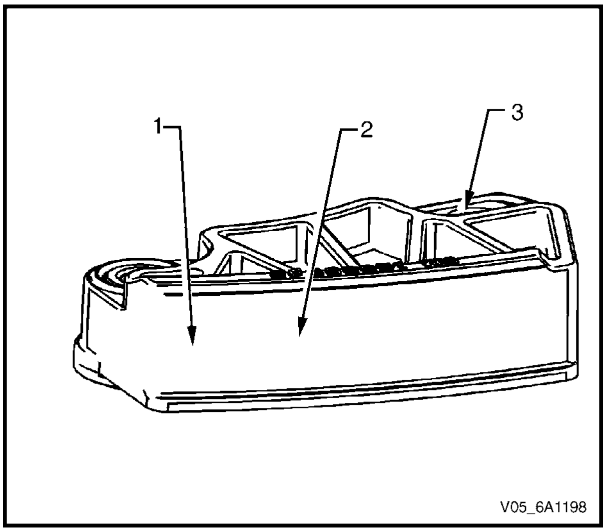

Figure 6A1 – 134

Primary Timing Chain Tensioner

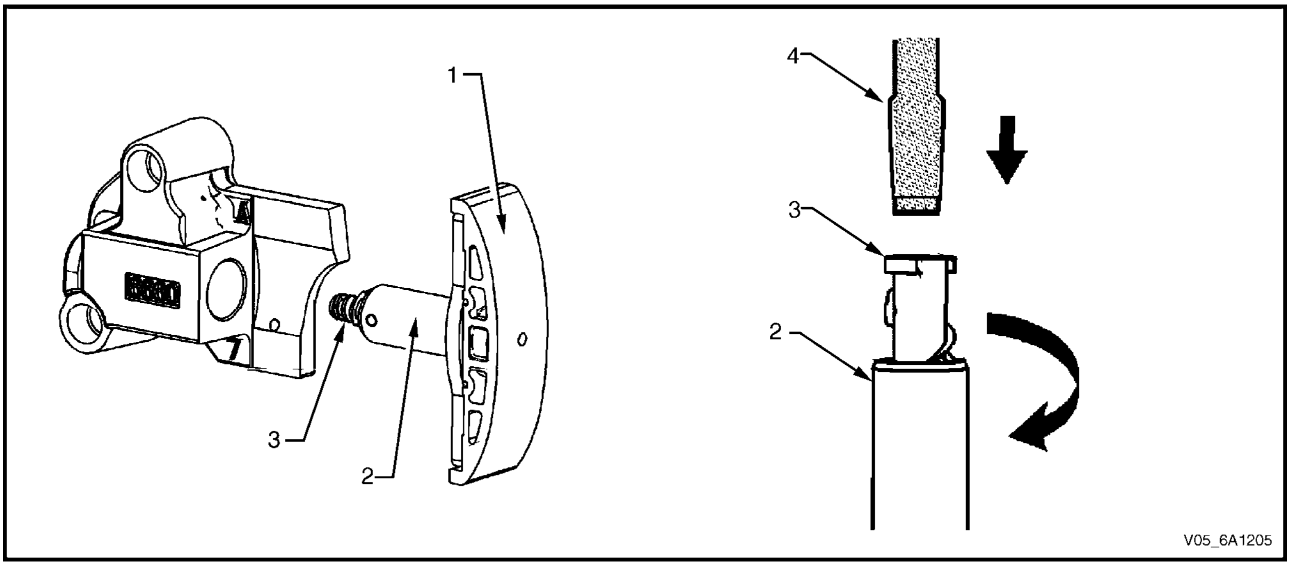

Figure 6A1 – 135

1 Inspect the primary timing chain tensioner for worn shoe surface (1), refer to Figure 6A1 – 133.

2 Inspect the tensioner for a locked or binding tensioner shaft (2). Reset the plunger (3) and ensure the tensioner shaft moves freely in and out of the body of the tensioner.

NOTE

To reset the tensioner, use a suitably sized flat blade screwdriver or Tool No. J 45027 (4) to wind the plunger in a clockwise direction, into the tensioner shaft.

3 Replace a damaged tensioner as required.

Left-hand Secondary Timing Chain Guide

1 Inspect the left-hand secondary timing chain guide for the following:

- worn guide surface (1),
- cracked or broken guide surface (2), and
- cracked or damaged guide base (3).

2 Replace a damaged guide as required.

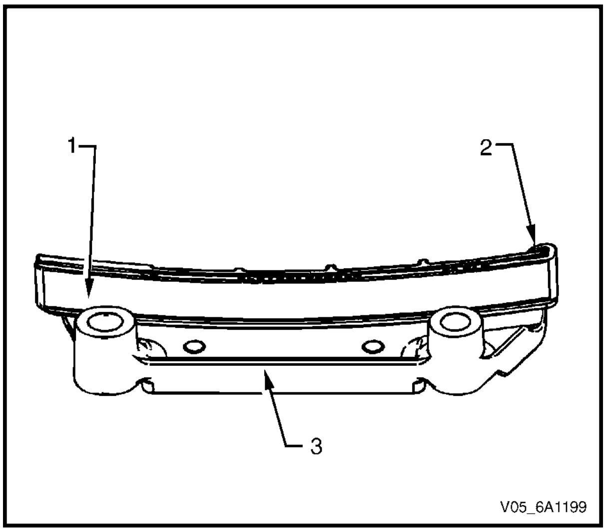

Figure 6A1 – 136

Left-hand Secondary Timing Chain Shoe

1 Inspect the front of the left-hand secondary timing chain shoe for the following:
- worn shoe surface (1),
- cracked or broken shoe surface (2), and
- cracked or damaged shoe (3).

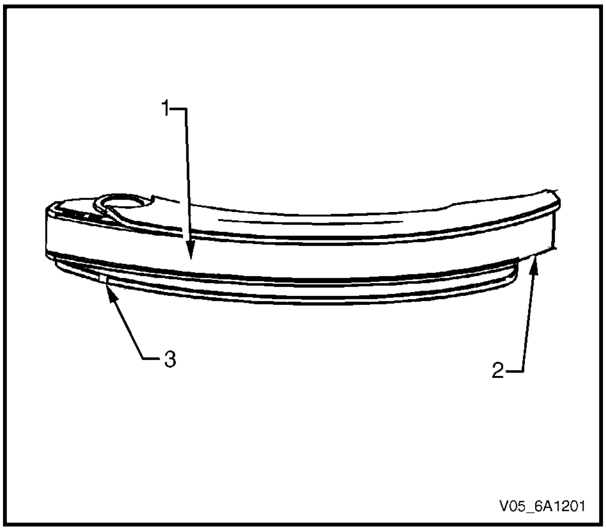

Figure 6A1 – 137

2 Inspect the back of the shoe for a damaged, worn or missing timing chain tensioner contact pad (1).

3 Replace a damaged shoe as required.

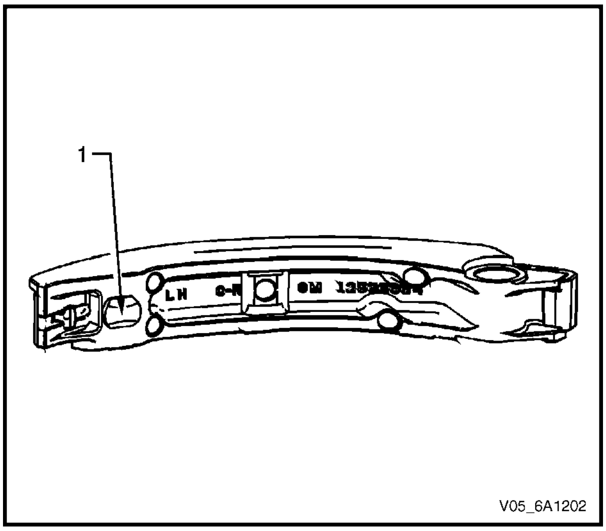

Figure 6A1 – 138

Left-hand Secondary Timing Chain Tensioner

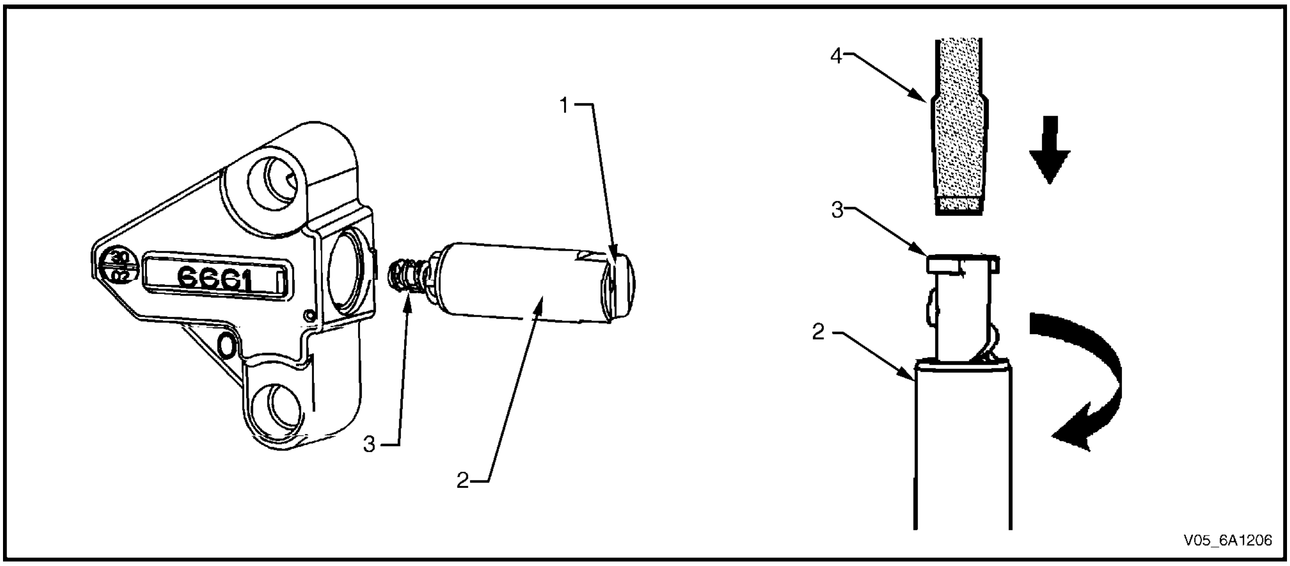

Figure 6A1 – 139

1 Inspect the left-hand secondary timing chain tensioner for damaged plunger-to-shoe contact surface (1), refer to Figure 6A1 – 137.

2 Inspect the tensioner for locked or binding tensioner shaft (2). Reset the plunger (3) and ensure the tensioner shaft moves freely in and out of the body of the tensioner.

NOTE

To reset the tensioner, use a suitably sized flat blade screwdriver or Tool No. J 45027 (4) to wind the plunger in a clockwise direction, into the tensioner shaft.

3 Replace a damaged tensioner as required.

Right-hand Secondary Timing Chain Guide

1 Inspect the right-hand secondary timing chain guide for the following:

- worn guide surface (1),
- cracked or broken guide surface (2), and
- cracked or damaged guide base (3).

2 Replace a damaged guide as required.

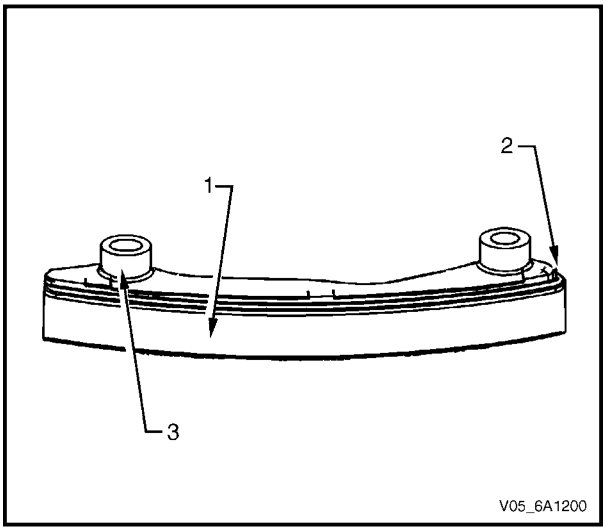

Figure 6A1 – 140

Right-hand Secondary Timing Chain Shoe

1 Inspect the front of the right-hand secondary timing chain shoe for the following:

- worn shoe surface (1),
- cracked or broken shoe surface (2), and
- cracked or damaged shoe (3).

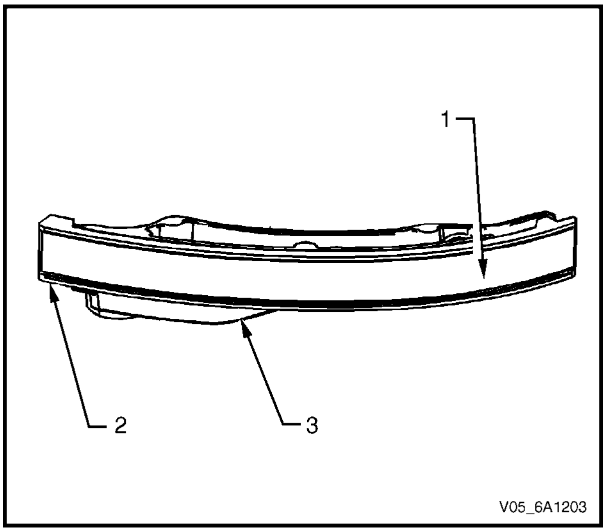

Figure 6A1 – 141

2 Inspect the back of the shoe for a damaged, worn or missing timing chain tensioner contact pad (1).

Replace a damaged shoe as required.

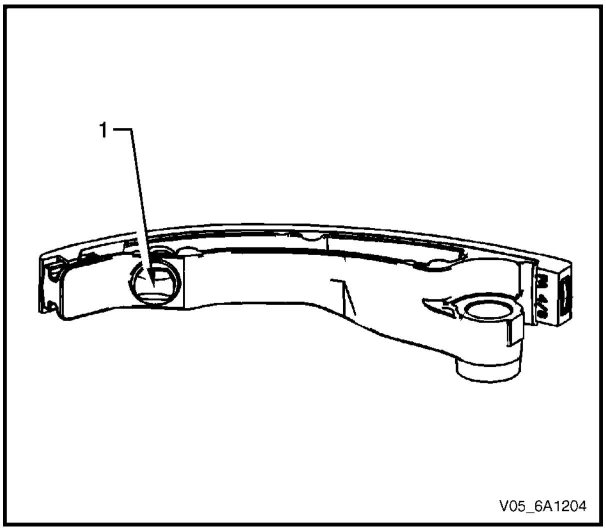

Figure 6A1 – 142

Right-hand Secondary Timing Chain Tensioner

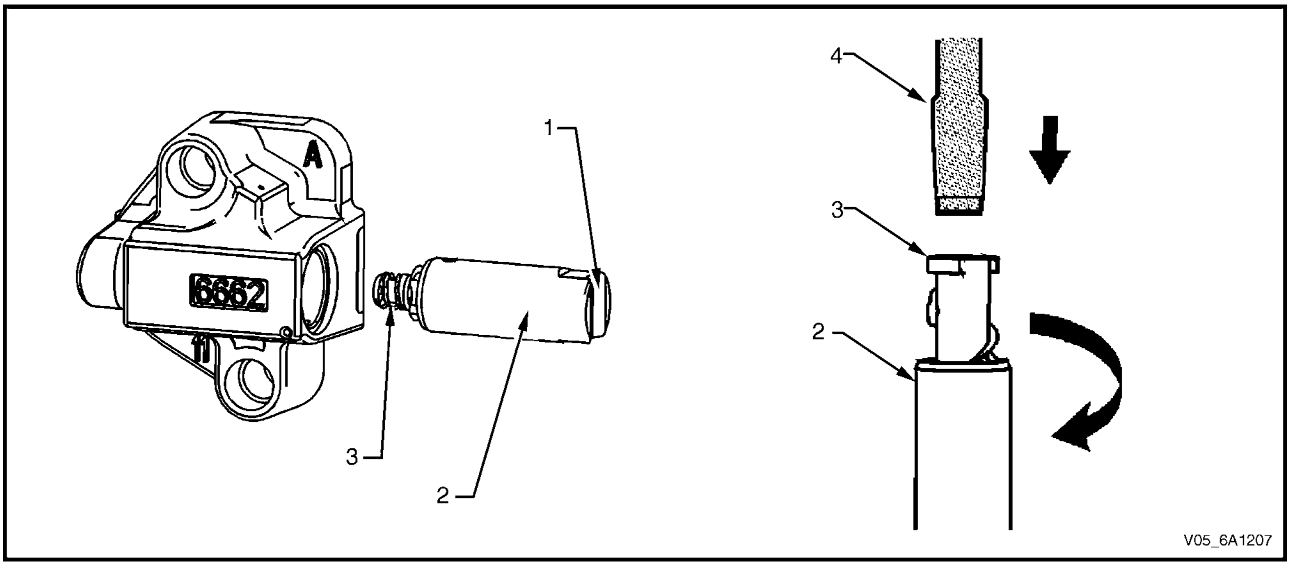

Figure 6A1 – 143

1 Inspect the right-hand secondary timing chain tensioner for damaged plunger-to-shoe contact surface (1), refer to Figure 6A1 – 141.

NOTE

To reset the tensioner, use a suitably sized flat blade screwdriver or Tool No. J 45027 (4) to wind the plunger in a clockwise direction, into the tensioner shaft.

2 Inspect the tensioner for a locked or binding tensioner shaft (2). Reset the plunger (3) and ensure the tensioner shaft moves freely in and out of the body of the tensioner.

3 Replace a damaged tensioner as required.

Reinstall

Left-hand Secondary Timing Chain Components – Excluding MY06 Update

1 Install the crankshaft sprocket (1) onto the crankshaft (2) by aligning the keyway to the key on the crankshaft.

2 Slide the crankshaft sprocket on the crankshaft until the crankshaft sprocket contacts the step in the crankshaft.

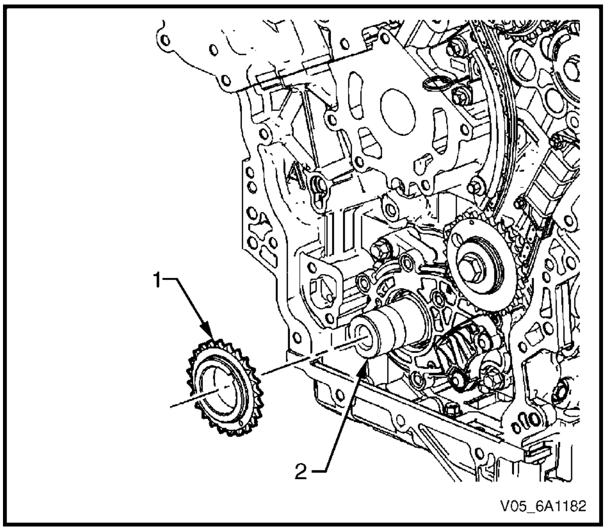

Figure 6A1 – 144

NOTE

Ensure that the crankshaft sprocket is installed with the timing mark (1) visible.

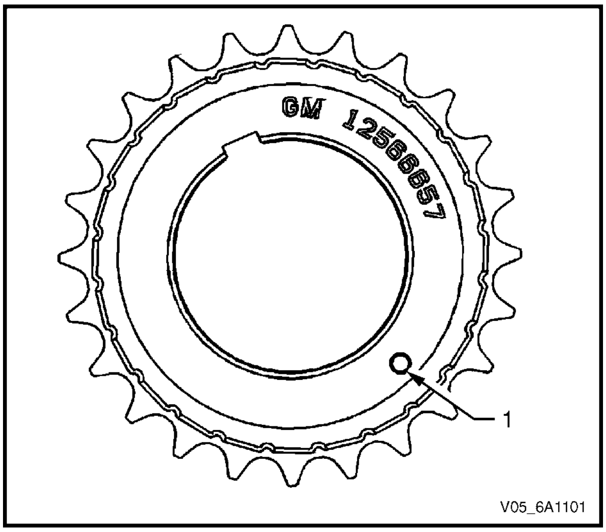

Figure 6A1 – 145

CAUTION

In order to install Tool No. EN 46105 onto the camshafts, rotate the camshafts in an anti-clockwise direction. There should be no need to rotate the camshaft more than 45 degrees.

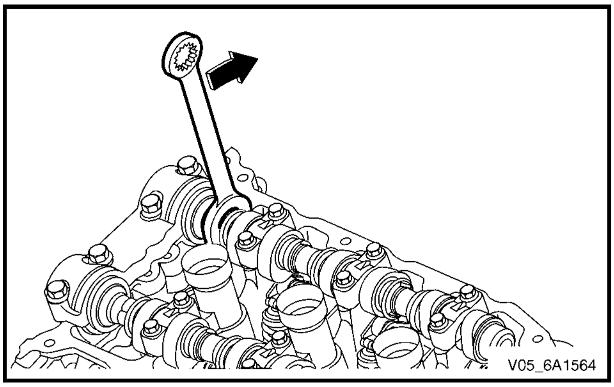

Figure 6A1 – 146

3 Install Tool No. EN 46105-1 (1) onto the rear of the left-hand cylinder head camshafts (2), and Tool No. EN 46105-2 onto the rear of the right-hand cylinder head camshafts.

4 Ensure that Tool No. EN 46105 is fully seated onto the camshafts.

CAUTION

All camshafts must be locked in place before installation of any timing chains.

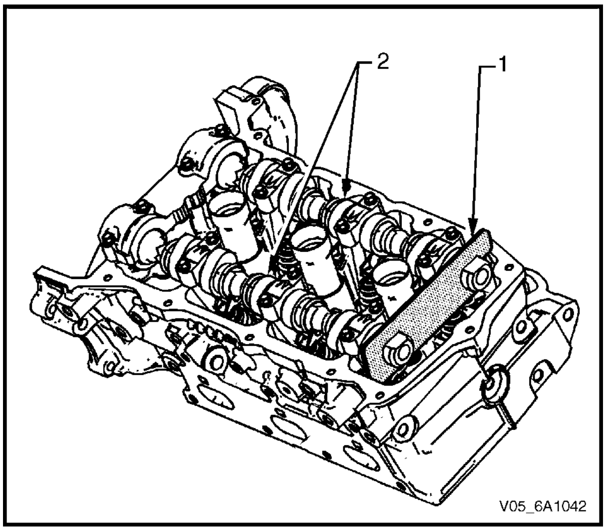

Figure 6A1 – 147

5 Using Tool No. EN46111 (1), rotate the crankshaft in a clockwise direction until the crankshaft sprocket timing mark (2) is aligned with the indexing mark (3) on the oil pump housing.

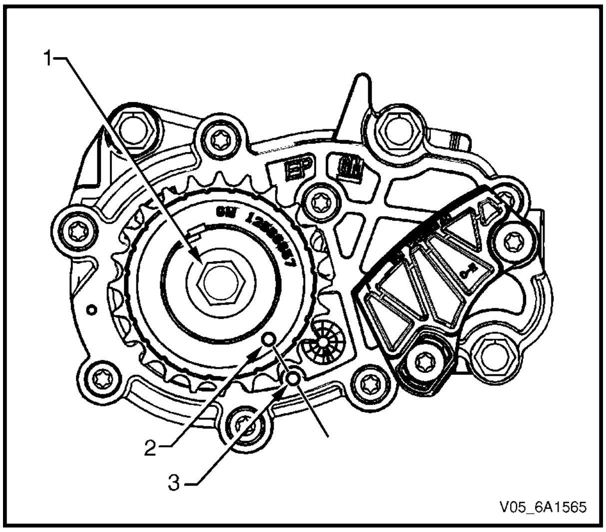

Figure 6A1 – 148

6 Install the left-hand secondary timing chain (1) aligning the chain in the following manner:

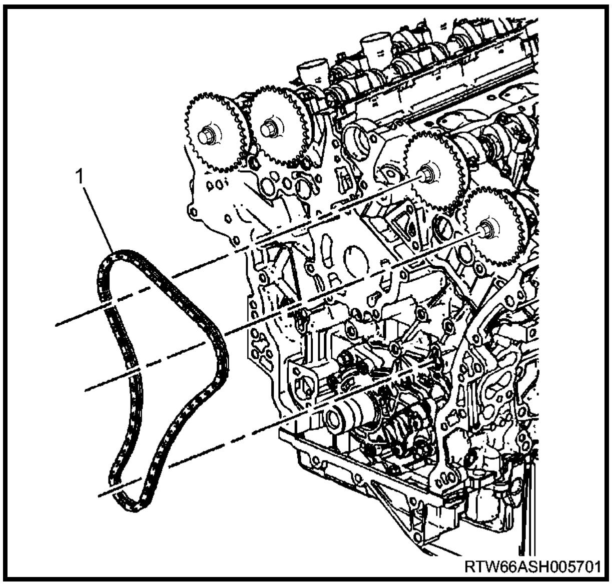

Figure 6A1 – 149

7 Wrap the secondary timing chain around both left-hand camshaft drive sprockets.

8 Ensure there are two bright links located on top of each of the camshaft sprockets.

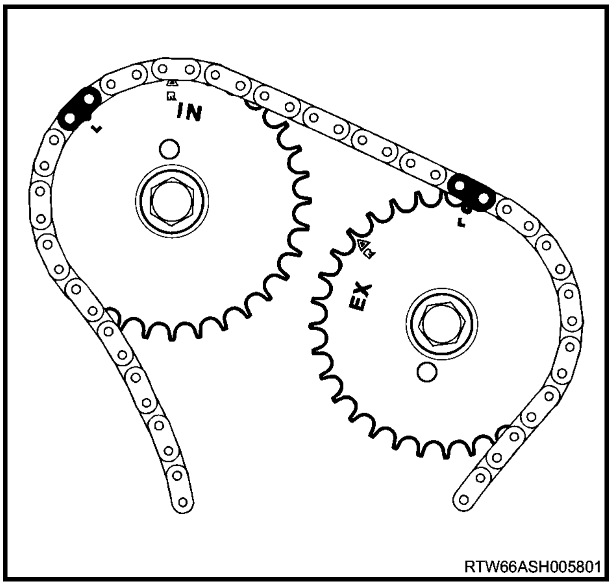

Figure 6A1 – 150

CAUTION

When aligning the left-hand secondary timing chain to the camshaft sprockets, ensure the circular timing marks on the sprocket are used, NOT the triangular mark.

9 Align the bright plated timing chain link (1) with the left-hand exhaust camshaft position sprocket alignment circle mark (2).

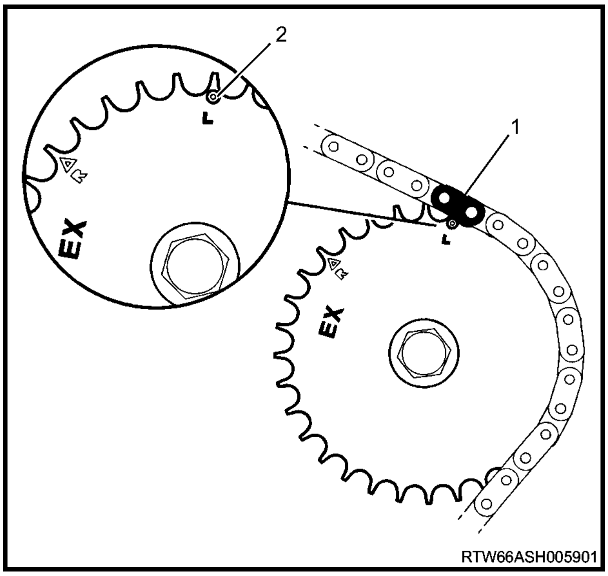

Figure 6A1 – 151

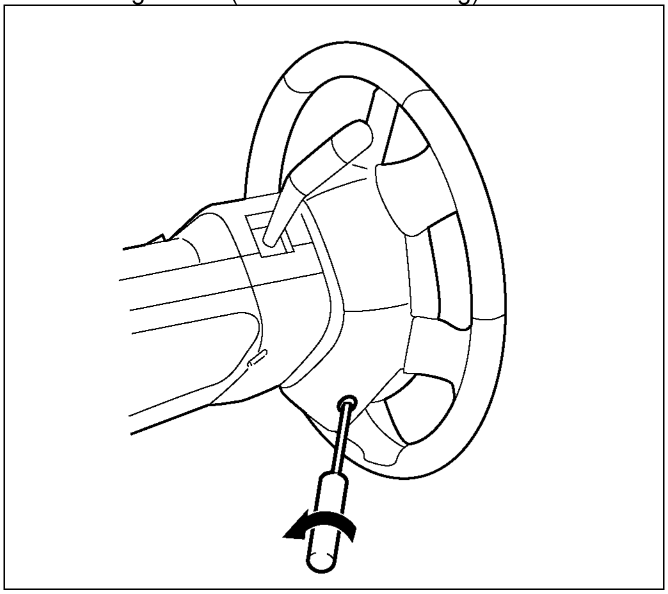
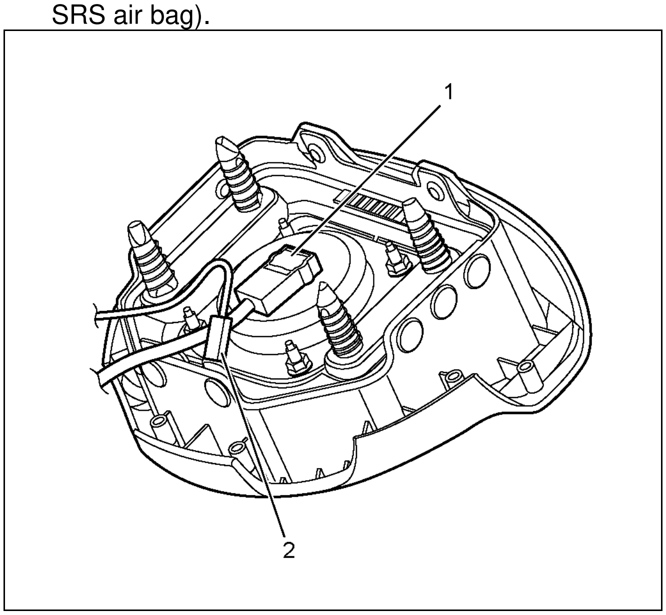
10. Loosen the horn pad fixing screw at the rear of the steering wheel (without SRS air bag).



430R300009

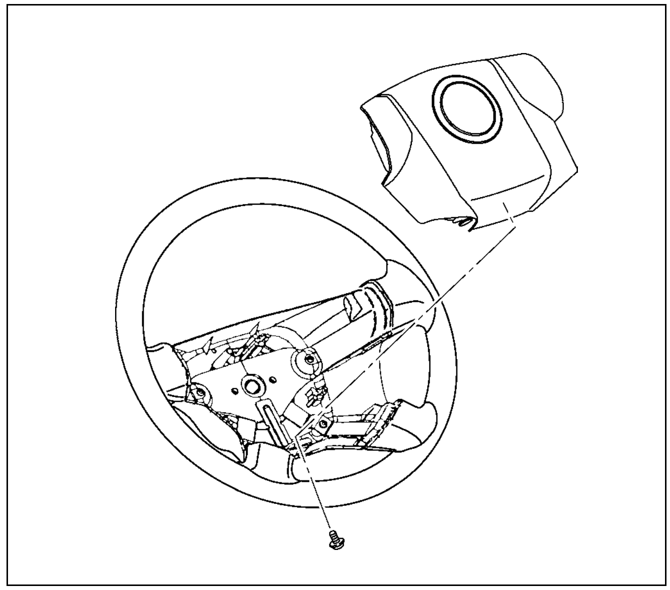
11. Disconnect the SRS air bag connector (1) and horn lead connector (2) located behind the air bag assembly and remove the air bag assembly (with SRS air bag).



RTW73BSH001101

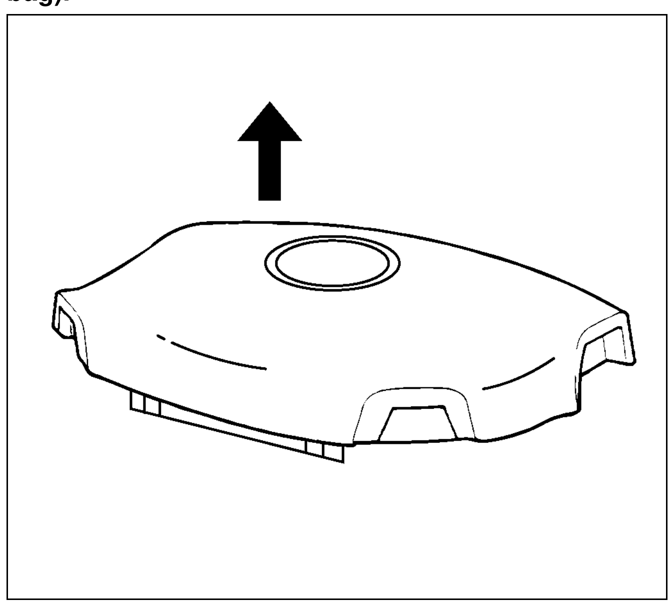
12. Remove the horn pad and the horn leads at the center of the wheel (without SRS air bag).

NOTE: It should be removed first from the bottom spokes.



RTW73BSH000601

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE COVER SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT (with SRS air bag).



430R300007

10 Align the bright plated timing chain link (1) with the intake camshaft position sprocket alignment circle mark (2).

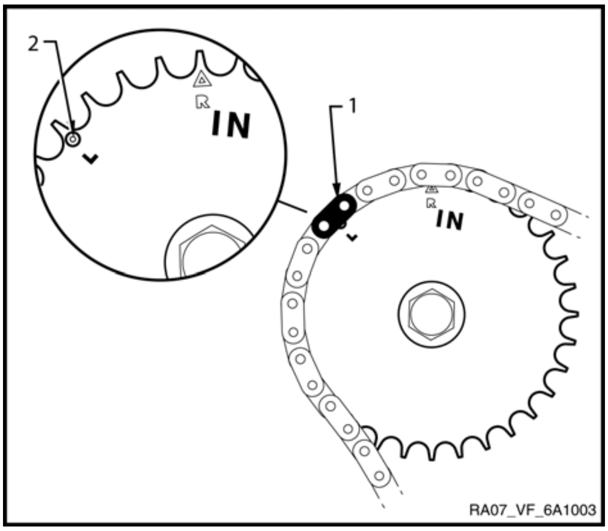


Figure 6A1 – 152

11 Ensure the left-hand camshaft intermediate sprocket is selected and orientated correctly.

CAUTION

The left-hand camshaft intermediate sprocket (1) is marked with the letters LB and 'FRONT', and the right-hand sprocket (2) is marked with the letters RB and 'FRONT' Ensure the correct sprocket is used and the 'FRONT' text is facing forwards when installed.

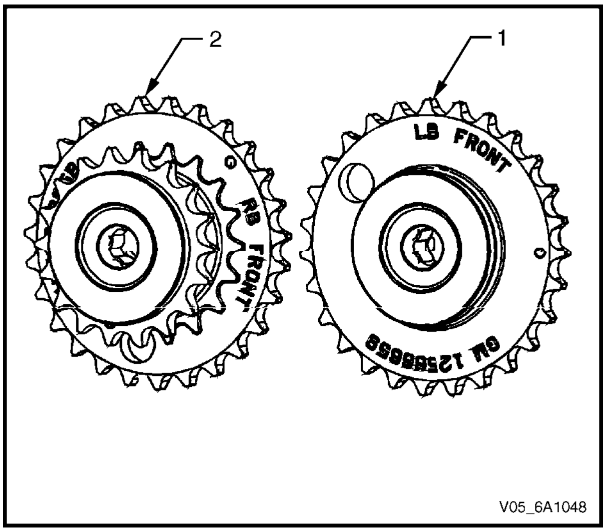

Figure 6A1 – 153

12 Place the left-hand secondary timing chain around the left-hand camshaft intermediate inner sprocket, with the bright plated timing chain link (1) aligned with the access hole (2) in the outer sprocket.

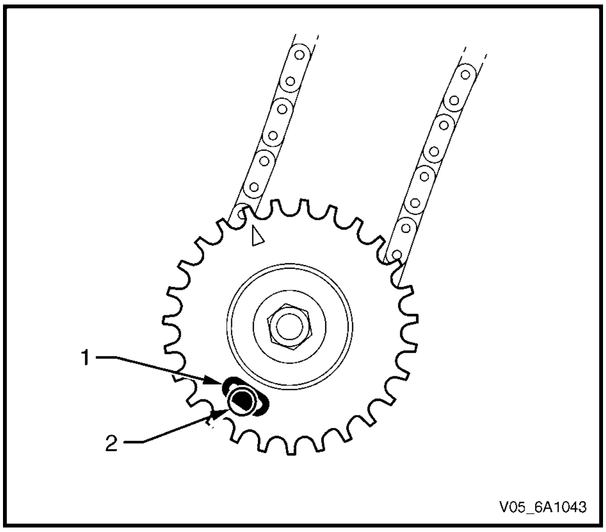

Figure 6A1 – 154

13 Install the left-hand camshaft intermediate sprocket to the cylinder block.

14 Install the sprocket bolt (1) and tighten to the correct torque specification.

Camshaft intermediate sprocket attaching bolt torque specification...........58.0 – 72.0 Nm

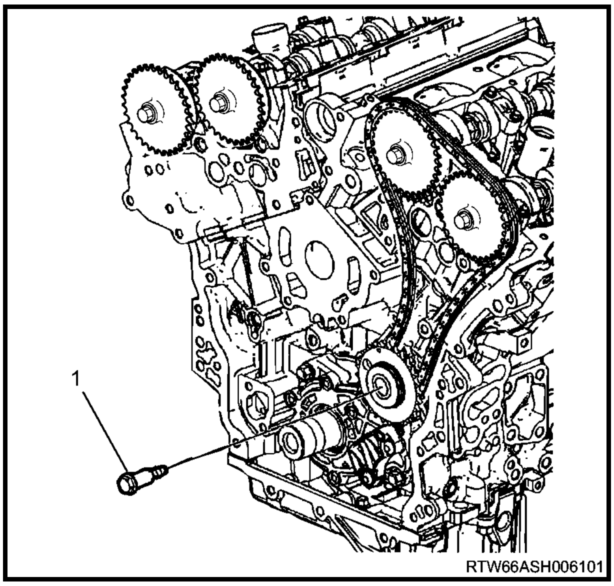

Figure 6A1 – 155

15 Verify the left-hand secondary timing chain timing mark alignments (1 to 6)

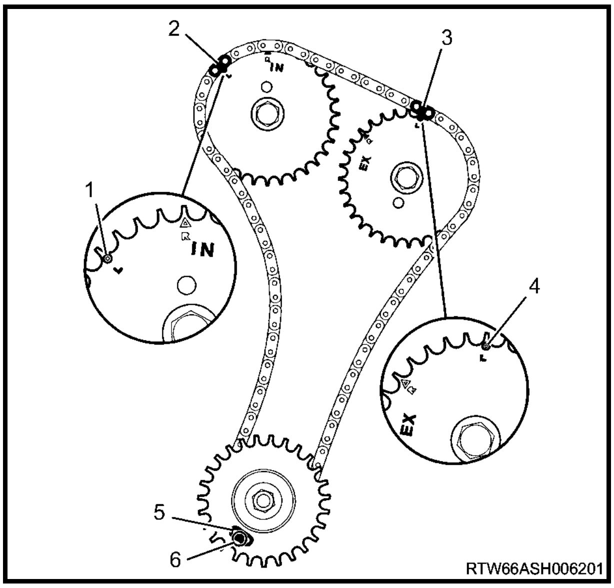

Figure 6A1 – 156

16 Ensure the left-hand secondary timing chain guide is selected and orientated correctly.

CAUTION

The left-hand secondary timing chain guide is marked with the letters LH. Ensure the correct shoe is used when installing to the left-hand side in this procedure and that the letters 'LH" are facing the front of the vehicle when installed.

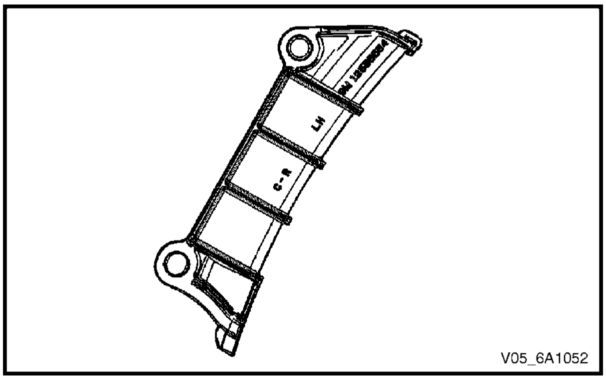

Figure 6A1 – 157

17 Install the left-hand secondary timing chain guide (1).

18 Install the secondary timing chain guide bolts (2) and tighten to the correct torque specification.

Secondary timing chain guide attaching bolt torque specification...........20.0 – 26.0 Nm

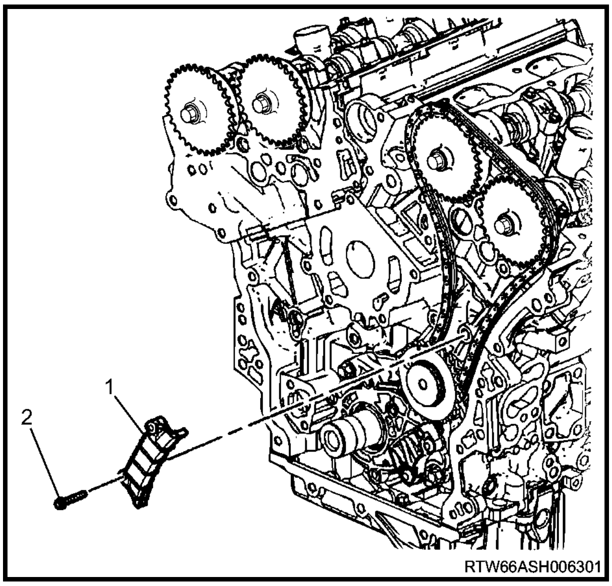

Figure 6A1 – 158

19 Ensure the left-hand secondary timing chain shoe is selected and orientated correctly.

CAUTION

The left-hand secondary timing chain shoe is marked with the letters LH on the back face of the timing chain shoe. Ensure the correct shoe is used when installing to the left-hand side.

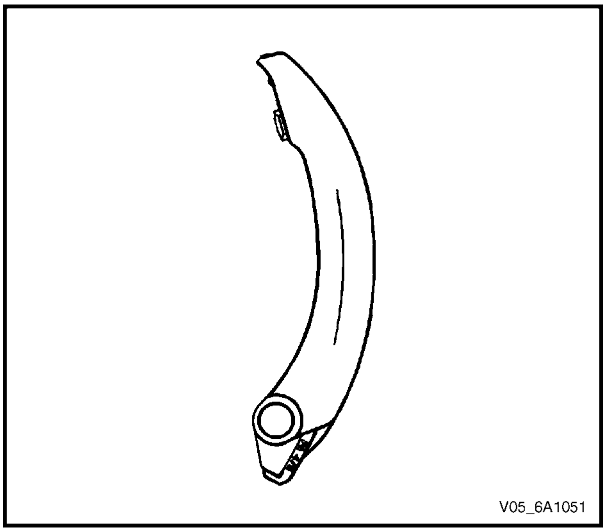

Figure 6A1 – 159

20 Install the left-hand secondary timing chain shoe (1).

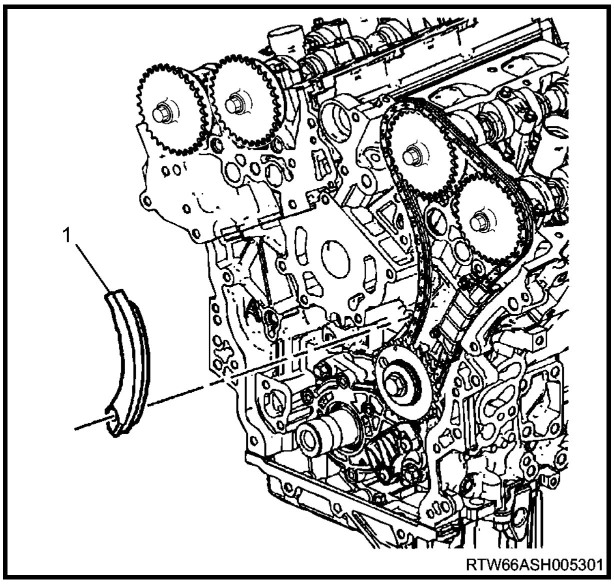

Figure 6A1 – 160

21 Install the left-hand secondary timing chain shoe bolt (1) and tighten to the correct torque specification.

NOTE

Ensure secondary timing chain shoe is clear of the left-hand secondary timing chain tensioner mounting pad, before tightening the attaching bolt.

Secondary timing chain shoe attaching bolt torque specification ....20.0 – 26.0 Nm

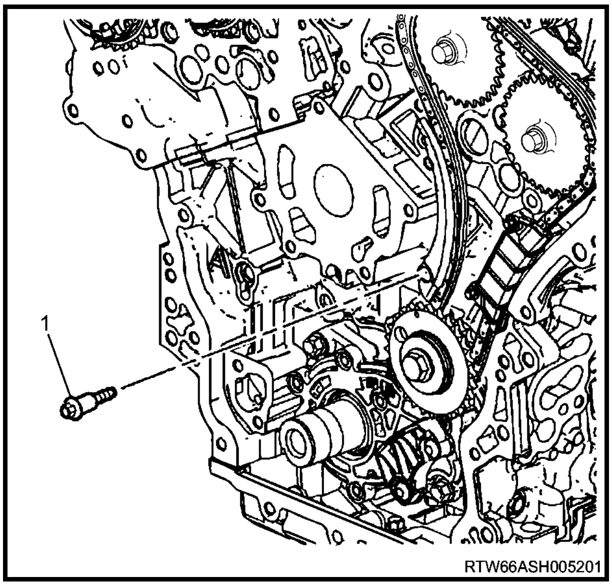

Figure 6A1 – 161

22 Ensure the left-hand secondary timing chain tensioner is selected and orientated correctly.

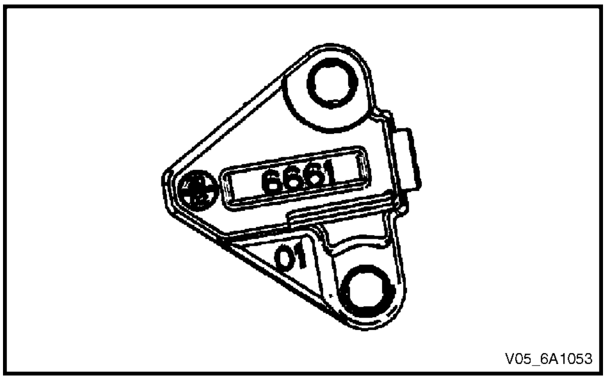

Figure 6A1 – 162

23 Reset the left-hand secondary timing chain tensioner.

NOTE

To reset the tensioner, use a suitably sized flat blade screwdriver (1) or Tool No. J 45027 (4) to wind the plunger in a clockwise direction, into the tensioner shaft (2).

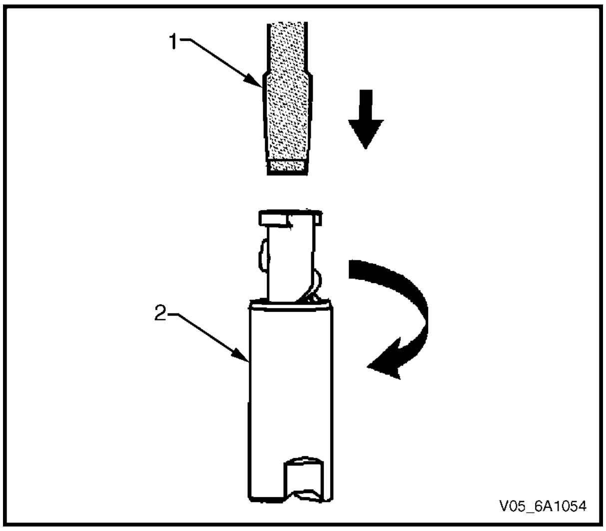

Figure 6A1 – 163

24 Install the tensioner shaft (1) into the left-hand secondary timing chain tensioner body (2).

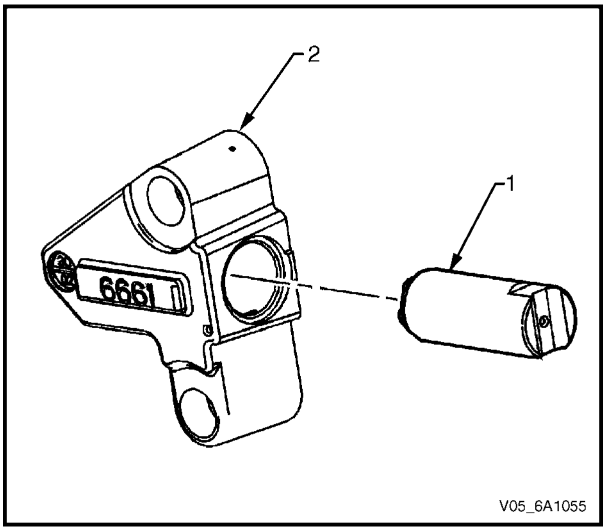

Figure 6A1 – 164

25 Compress the tensioner shaft into the body and lock the left-hand secondary timing chain tensioner by inserting Tool No. EN 46112 into the access hole in the side of the tensioner body.

26 Slowly release pressure on the left-hand secondary timing chain tensioner. The tensioner should remain compressed.

CAUTION

If Tool No. EN 46112 (1) is not removed from the tensioner body (2), the tensioner shaft (3) will remain in the locked position and no tension will be placed on the timing chain, this will cause damage to the engine.

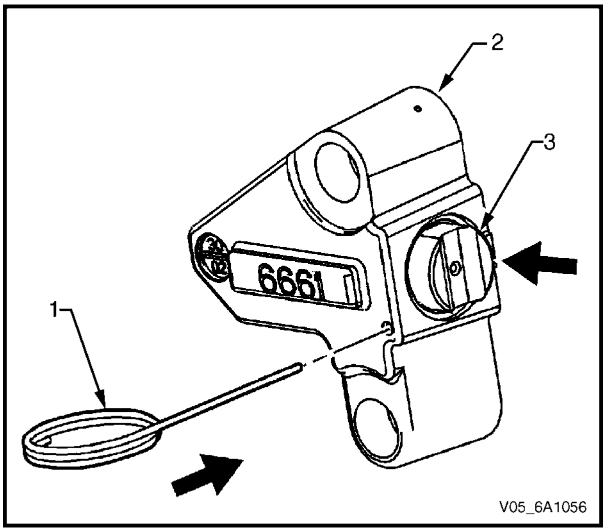

Figure 6A1 – 165

27 Install a new left-hand secondary timing chain tensioner gasket (1) to the tensioner (2).

28 Install the left-hand secondary timing chain tensioner bolts through tensioner and gasket.

29 Ensure the left-hand secondary timing chain tensioner mounting surface on the left-hand cylinder head does not have any burrs or defects that would affect the sealing of the new gasket.

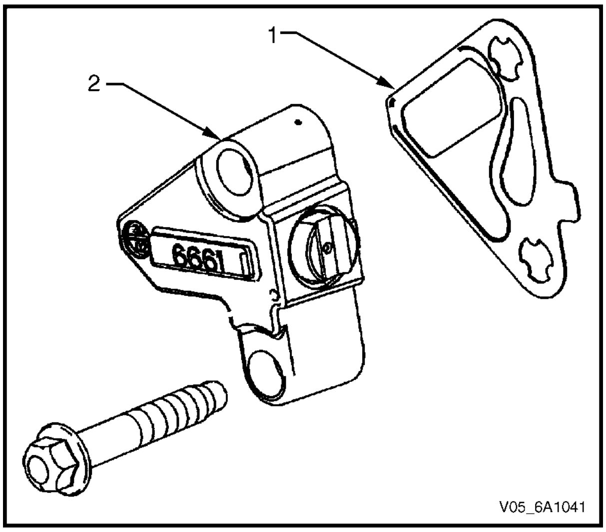

Figure 6A1 – 166

30 Place the left-hand secondary timing chain tensioner (2) into position and loosely install the bolts (1) to the cylinder head.

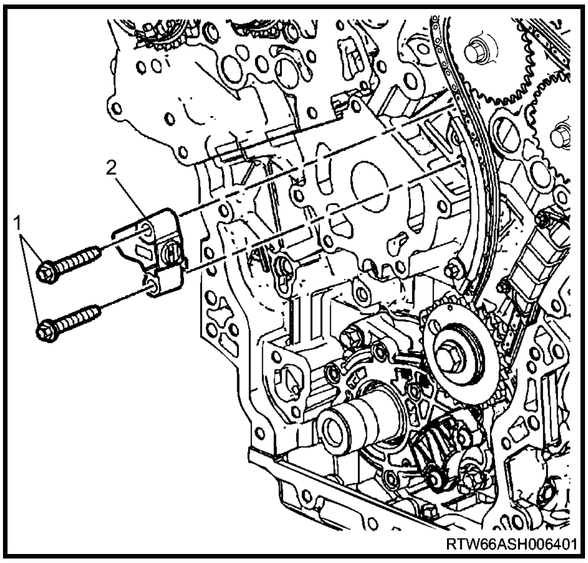

Figure 6A1 – 167

31 Verify the proper placement of the left-hand secondary timing chain tensioner gasket tab (1).

32 Tighten the left-hand secondary timing chain tensioner bolts (2) to the correct torque specification.

Secondary timing chain tensioner attaching bolt torque specification	20.0 – 26.0 Nm

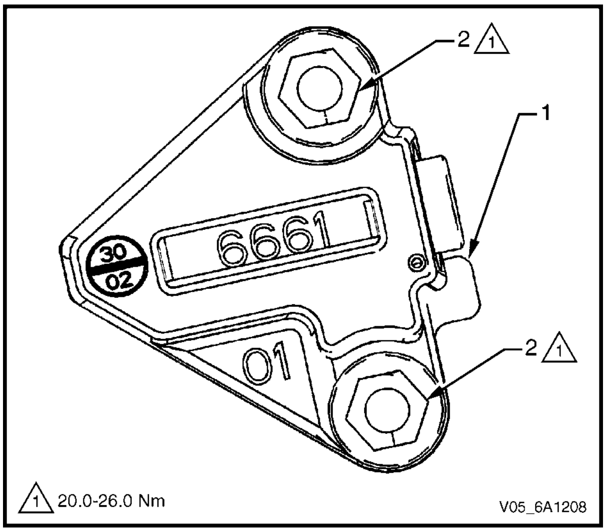

Figure 6A1 – 168

33 Release the left-hand secondary timing chain tensioner (1) by pulling out Tools No. EN 46112 (2) and unlocking the tensioner shaft.

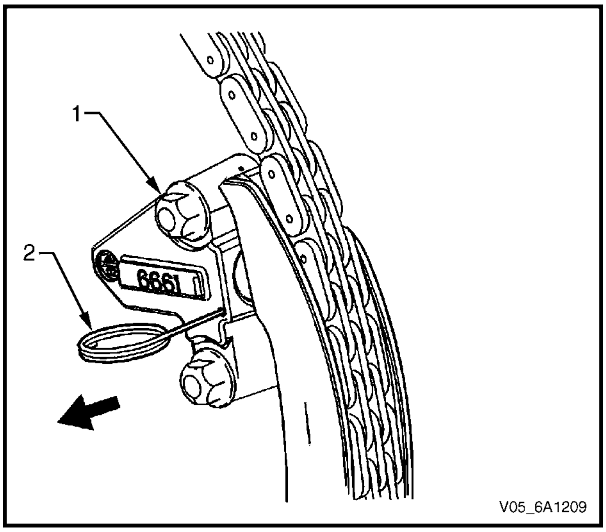

Figure 6A1 – 169

34 Verify the left-hand secondary timing chain timing mark alignments (1 to 6).

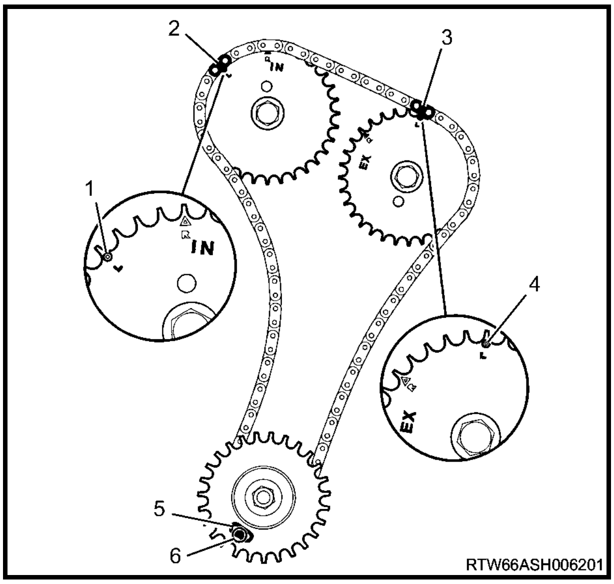

Figure 6A1 – 170

Left-hand Secondary Timing Chain Components – MY06 Update

1 Install the crankshaft sprocket (1) onto the crankshaft (2) by aligning the keyway to the key on the crankshaft.

2 Slide the crankshaft sprocket on the crankshaft until the crankshaft sprocket contacts the step in the crankshaft.

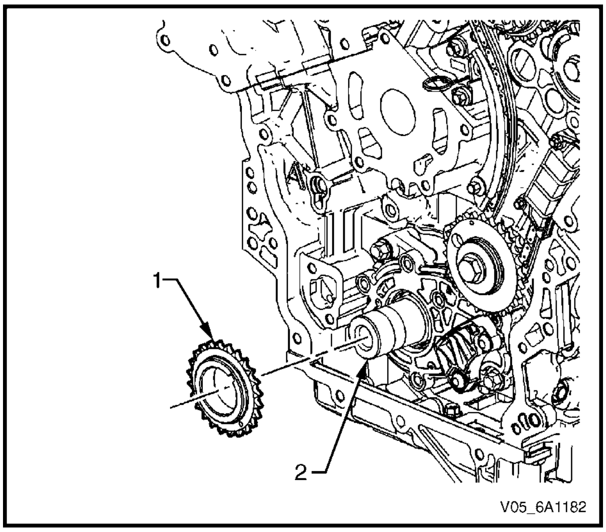

Figure 6A1 – 171

NOTE

Ensure that the crankshaft sprocket is installed with the timing mark (1) visible.

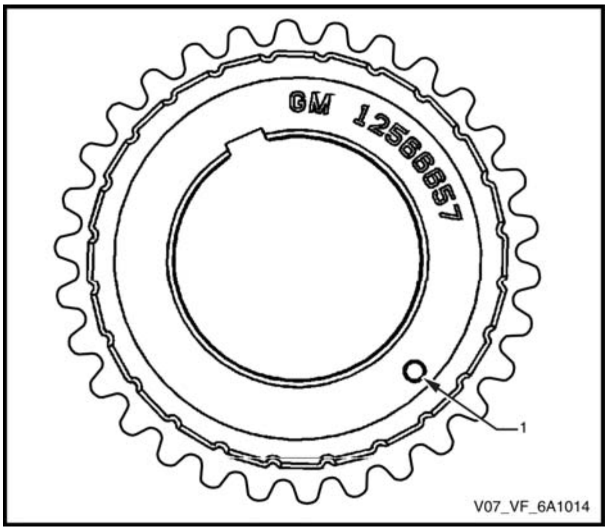

Figure 6A1 – 172

CAUTION

In order to install Tool No. EN 46105 onto the camshafts, rotate the camshafts in an anti-clockwise direction. There should be no need to rotate the camshaft more than 45 degrees.

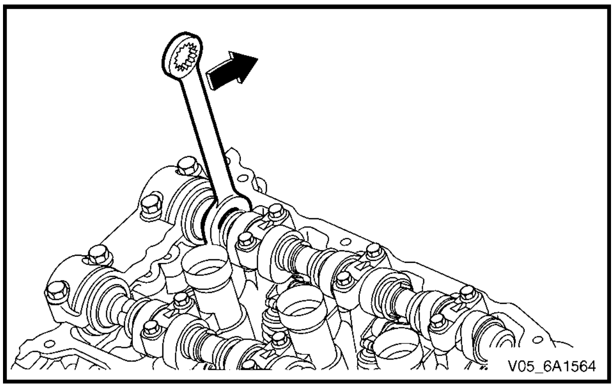

Figure 6A1 – 173

3 Install Tool No. EN 46105-1 (1) onto the rear of the left-hand cylinder head camshafts (2).

CAUTION

All camshafts must be locked in place before installation of any timing chains.

4 Ensure that Tool No. EN 46105 is fully seated onto the camshafts.

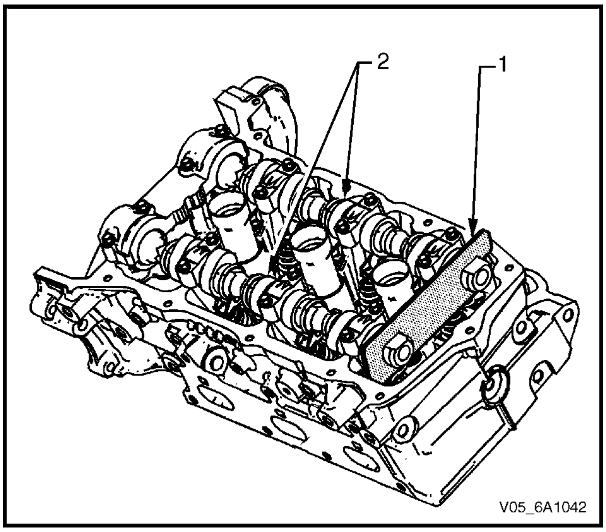

Figure 6A1 – 174

5 Using Tool No. EN46111 (1), rotate the crankshaft in a clockwise direction until the crankshaft sprocket timing mark (2) is aligned with the indexing mark (3) on the oil pump housing.

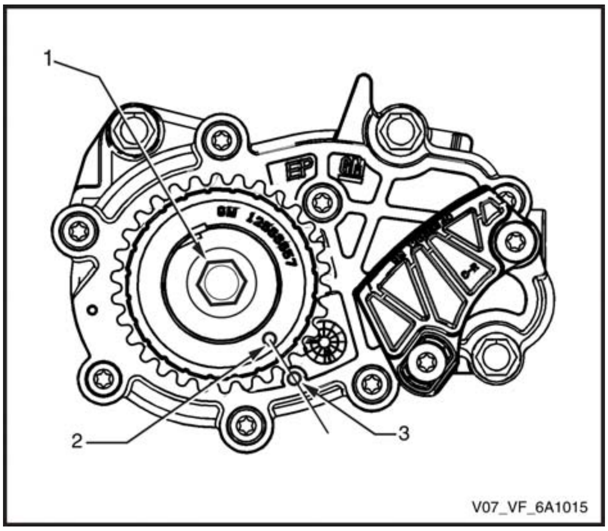

Figure 6A1 – 175

6 Install the left-hand secondary timing chain (1) aligning the chain in the following manner:

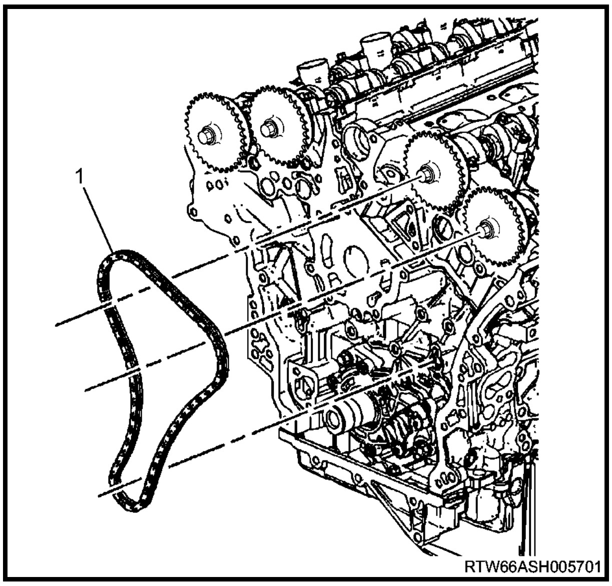

Figure 6A1 – 176

7 Wrap the secondary timing chain around both left-hand camshaft drive sprockets.

8 Ensure there are two bright links located on top of each of the camshaft sprockets.

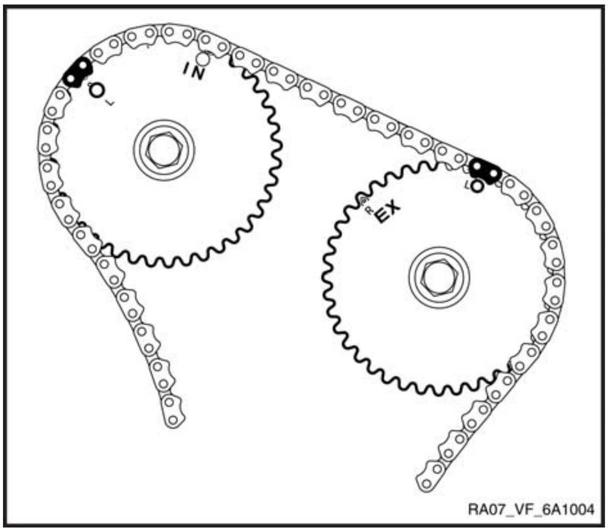

Figure 6A1 – 177

CAUTION

When aligning the left-hand secondary timing chain to the camshaft sprockets, ensure the circular timing marks on the sprocket are used, NOT the triangular mark.

9 Align the bright plated timing chain link (1) with the left-hand exhaust camshaft position sprocket alignment circle mark (2).

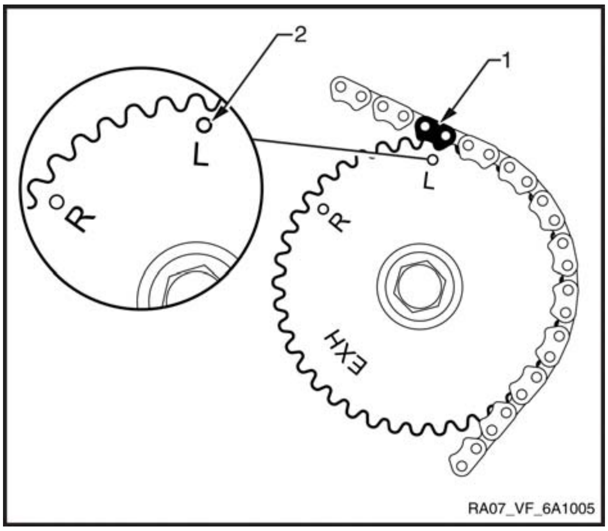

Figure 6A1 – 178

10 Align the bright plated timing chain link (1) with the intake camshaft position sprocket alignment circle mark (2).

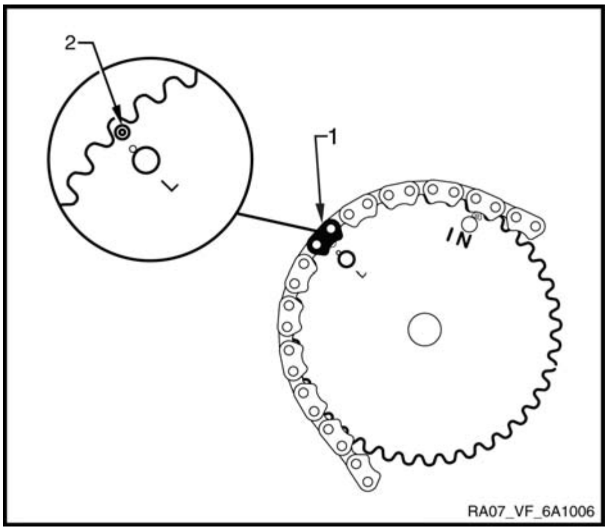

Figure 6A1 – 179

CAUTION

The left-hand camshaft intermediate sprocket (1) is marked with the letters LB and 'FRONT', and the right-hand sprocket (2) is marked with the letters RB and 'FRONT' Ensure the correct sprocket is used and the 'FRONT' text is facing forwards when installed.

11 Ensure the left-hand camshaft intermediate sprocket is selected and orientated correctly.

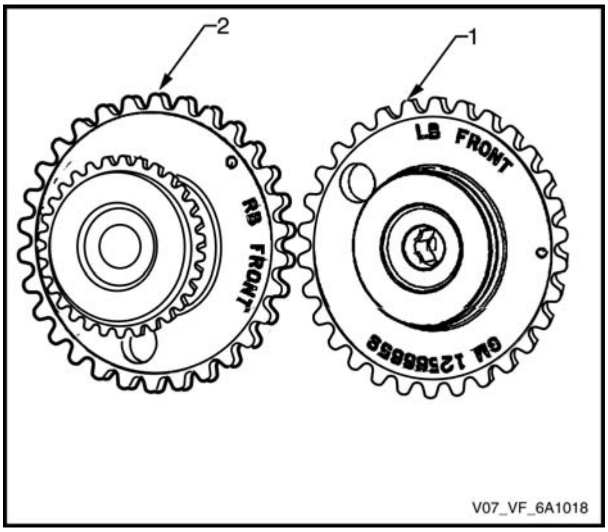

Figure 6A1 – 180

Inspection and Repair (with SRS air bag)

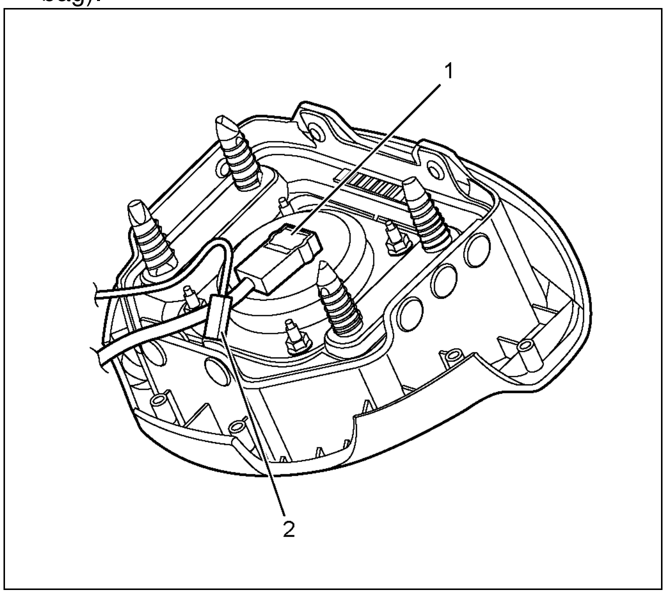
The inflator module consists of a cover, air bag, inflator, and retainer. Inspect the inflator module mainly for the following:

- Check for holes, cracks, severe blemishes and deformation on the cover.
- Check that the retainer is not deformed.
- Check for defects such as damage and breakage in the lead wire for the igniter.

If an abnormality is found as a result of the inspection, replace the inflator module with a new one.

Installation

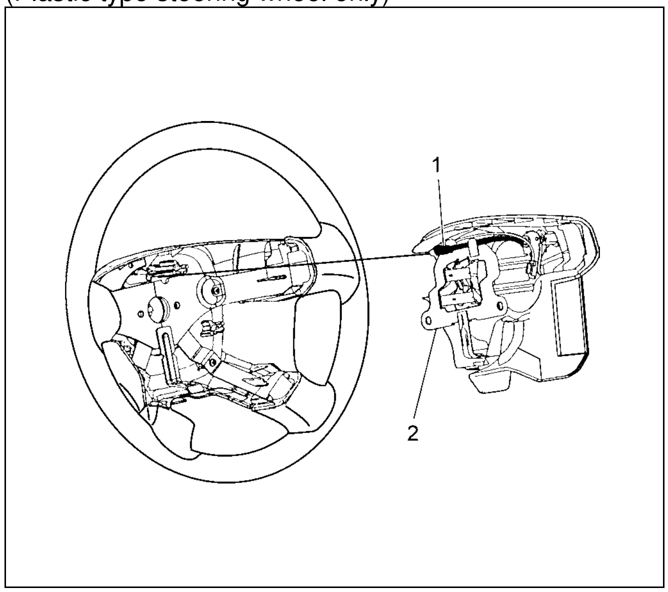
1. Support the inflator module and carefully connect the SRS connector (1) and horn lead (2) (with SRS air bag).



RTW73BSH001101

2. Connect the horn leads at center of wheel (without SRS air bag).

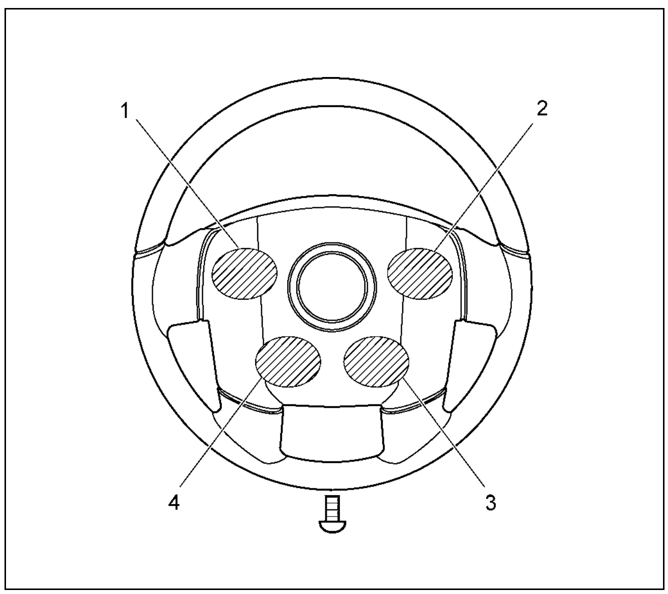
NOTE: The horn leads (1) are passed along the top of the bracket (2).
(Plastic type steering wheel only)



RTW73BSH000801

3. Push the horn pad at areas 1-4.
   Tighten the horn pad fixing screw to the specifed torque (without SRS air bag)
   Torque: 3 N·m (0.3 kgf·m/26 lb·in)

NOTE: A horn pad should not be struck during attachment.



RTW73BSH000201

12 Place the left-hand secondary timing chain around the left-hand camshaft intermediate inner sprocket, with the bright plated timing chain link (1) aligned with the access hole (2) in the outer sprocket.

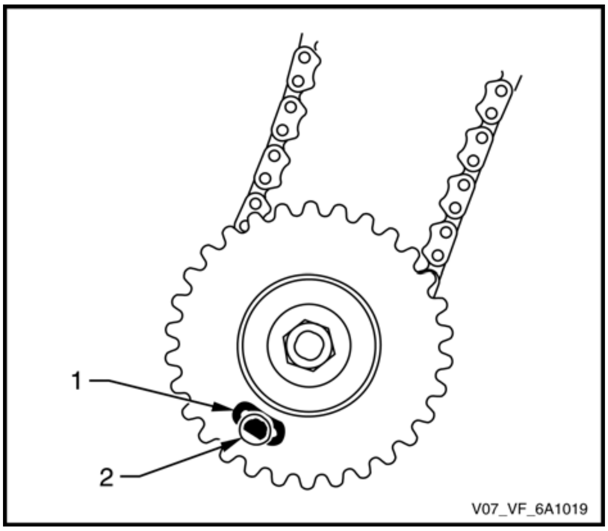


Figure 6A1 – 181

13 Install the left-hand camshaft intermediate sprocket to the cylinder block.

14 Install the sprocket bolt (1) and tighten to the correct torque specification.

Camshaft intermediate sprocket attaching bolt torque specification...........58.0 – 72.0 Nm

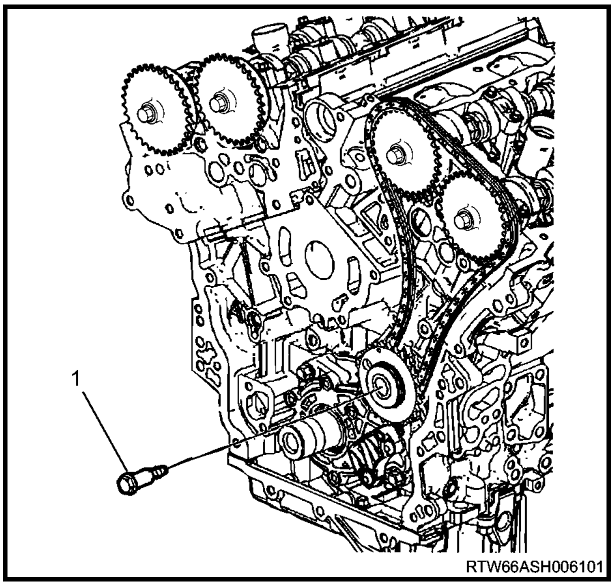

Figure 6A1 – 182

15 Verify the left-hand secondary timing chain timing mark alignments (1 to 6)

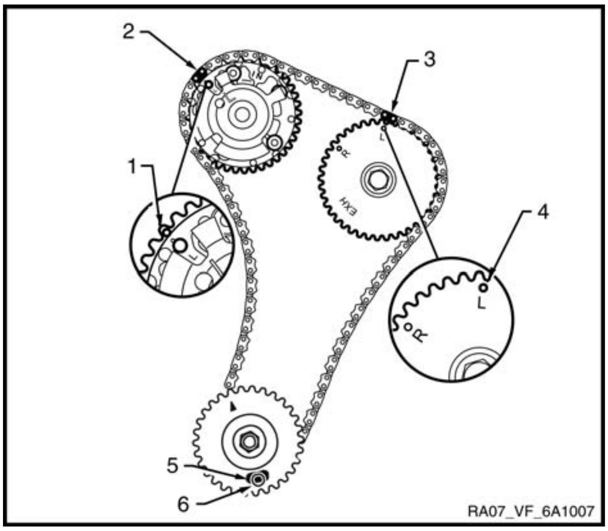

Figure 6A1 – 183

CAUTION

The left-hand secondary timing chain guide is marked with the letters LH. Ensure the correct shoe is used when installing to the left-hand side in this procedure and that the letters 'LH" are facing the front of the vehicle when installed.

16 Ensure the left-hand secondary timing chain guide is selected and orientated correctly.

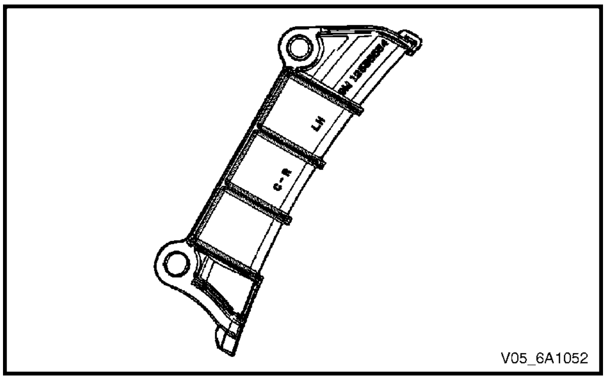

Figure 6A1 – 184

17 Install the left-hand secondary timing chain guide (1).

18 Install the secondary timing chain guide bolts (2) and tighten to the correct torque specification.

Secondary timing chain guide attaching bolt torque specification...........20.0 – 26.0 Nm

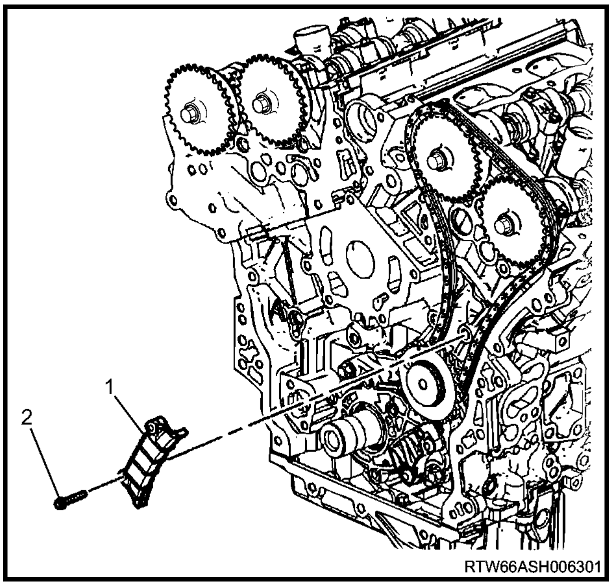

Figure 6A1 – 185

CAUTION

The left-hand secondary timing chain shoe (2) is marked with the letters LH on the back face of the timing chain shoe. Ensure the correct shoe is used when installing to the left-hand side.

19 Ensure the left-hand secondary timing chain shoe is selected and orientated correctly.

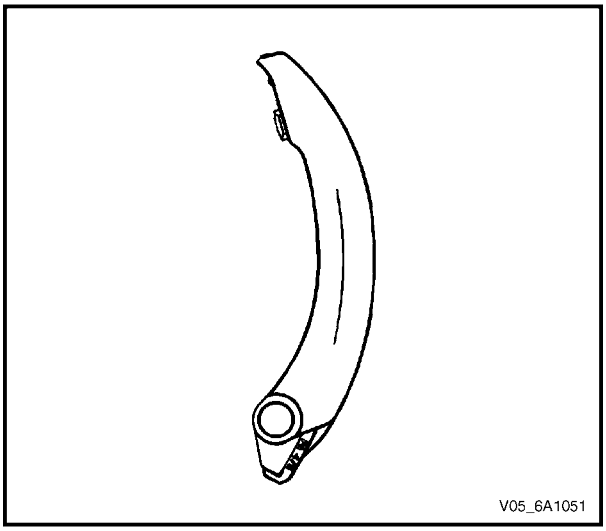

Figure 6A1 – 186

20 Install the left-hand secondary timing chain shoe (1).

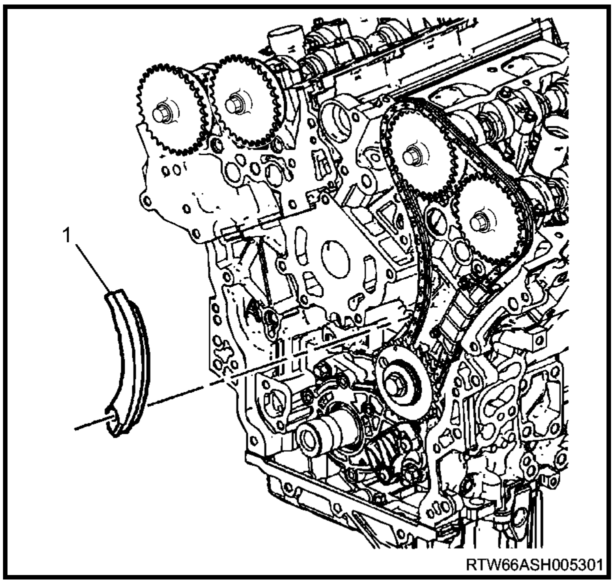

Figure 6A1 – 187

21 Install the left-hand secondary timing chain shoe bolt (1) and tighten to the correct torque specification.

NOTE

Ensure secondary timing chain shoe is clear of the left-hand secondary timing chain tensioner mounting pad, before tightening the attaching bolt.

Secondary timing chain shoe attaching bolt torque specification ....20.0 – 26.0 Nm

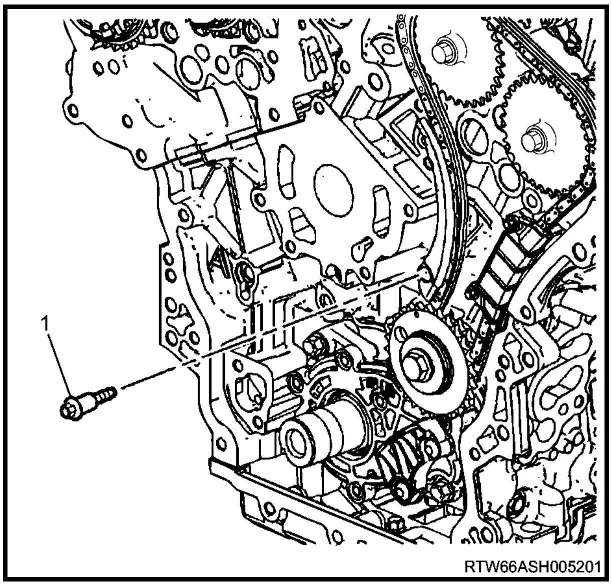

Figure 6A1 – 188

22 Ensure the left-hand secondary timing chain tensioner is selected and orientated correctly.

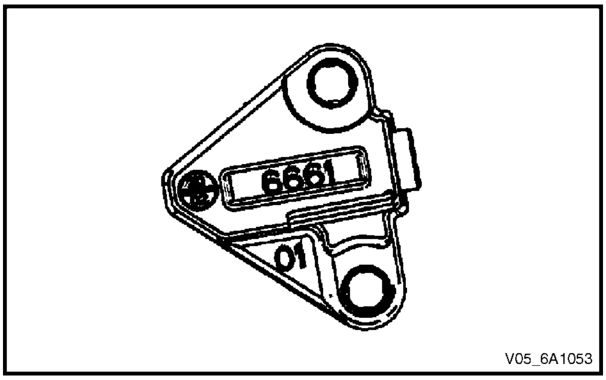

Figure 6A1 – 189

23 Reset the left-hand secondary timing chain tensioner.

NOTE

To reset the tensioner, use a suitably sized flat blade screwdriver (1) or Tool No. J 45027 (4) to wind the plunger in a clockwise direction, into the tensioner shaft (2).

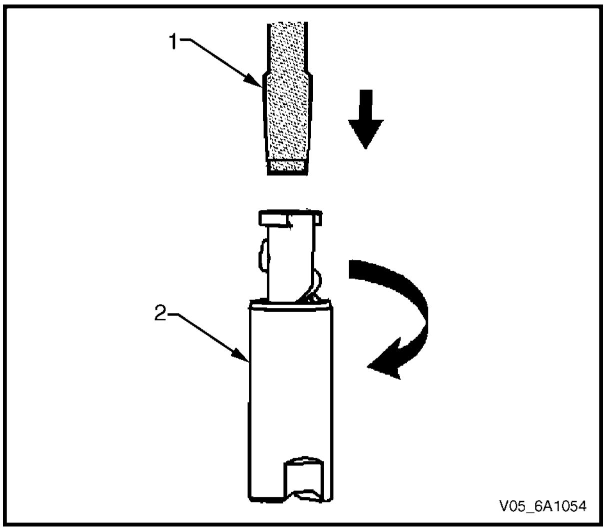

Figure 6A1 – 190

24 Install the tensioner shaft (1) into the left-hand secondary timing chain tensioner body (2).

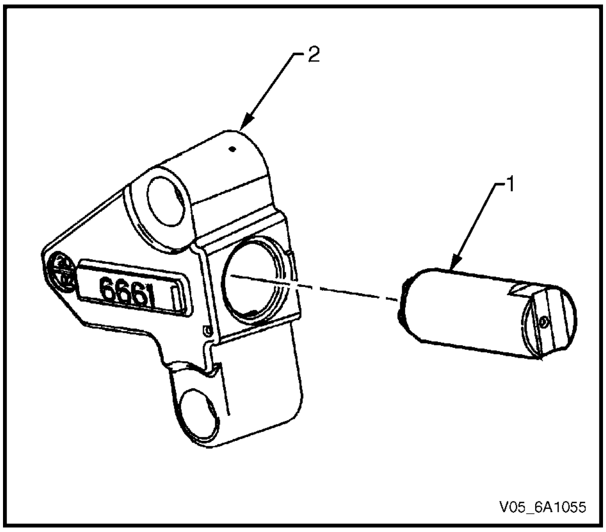

Figure 6A1 – 191

CAUTION

If Tool No. EN 46112 (1) is not removed from the tensioner body (2), the tensioner shaft (3) will remain in the locked position and no tension will be placed on the timing chain, this will cause damage to the engine.

25 Compress the tensioner shaft into the body and lock the left-hand secondary timing chain tensioner by inserting Tool No. EN 46112 into the access hole in the side of the tensioner body.

26 Slowly release pressure on the left-hand secondary timing chain tensioner. The tensioner should remain compressed.

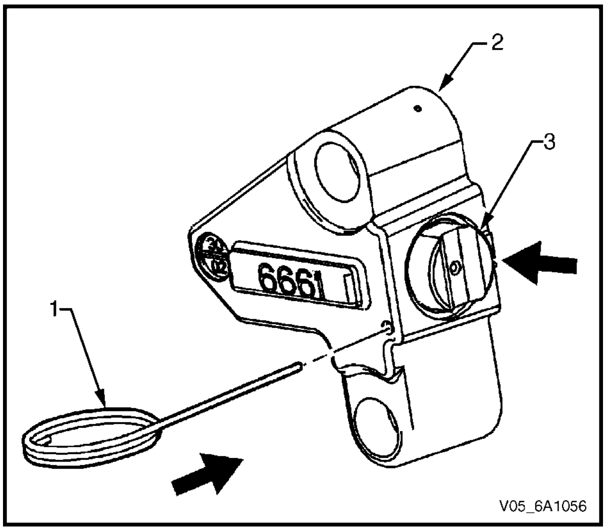

Figure 6A1 – 192

27 Install a new left-hand secondary timing chain tensioner gasket (1) to the tensioner (2).

28 Install the left-hand secondary timing chain tensioner bolts through tensioner and gasket.

29 Ensure the left-hand secondary timing chain tensioner mounting surface on the left-hand cylinder head does not have any burrs or defects that would affect the sealing of the new gasket.

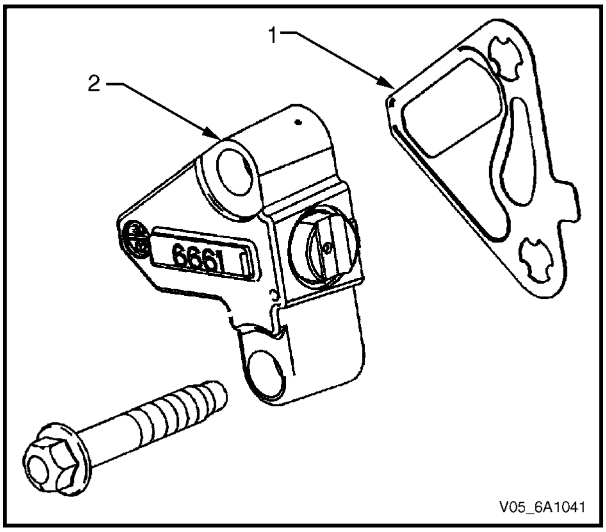

Figure 6A1 – 193

30 Place the left-hand secondary timing chain tensioner (2) into position and loosely install the bolts (1) to the cylinder head.

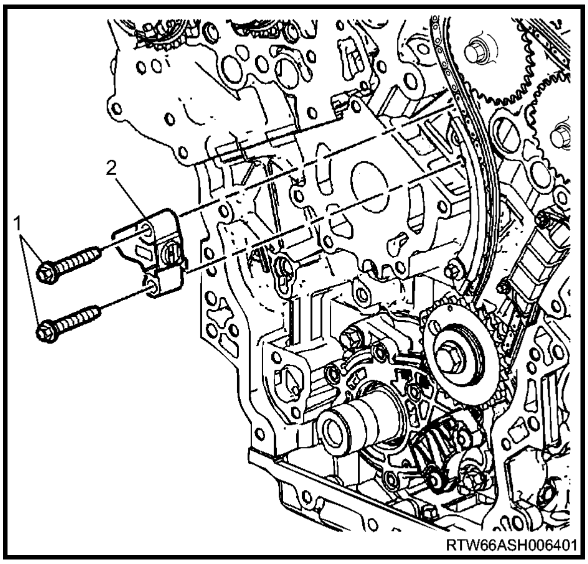

Figure 6A1 – 194

31 Verify the proper placement of the left-hand secondary timing chain tensioner gasket tab (1).

32 Tighten the left-hand secondary timing chain tensioner bolts (2) to the correct torque specification.

Secondary timing chain tensioner attaching bolt torque specification...........20.0 – 26.0 Nm

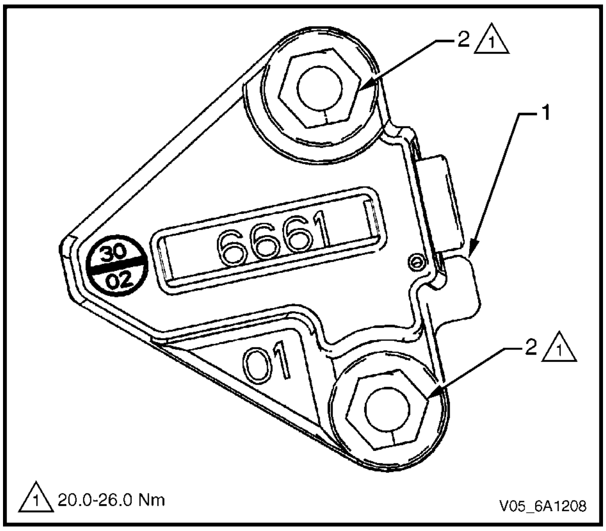

Figure 6A1 – 195

33 Release the left-hand secondary timing chain tensioner (1) by pulling out Tools No. EN 46112 (2) and unlocking the tensioner shaft.

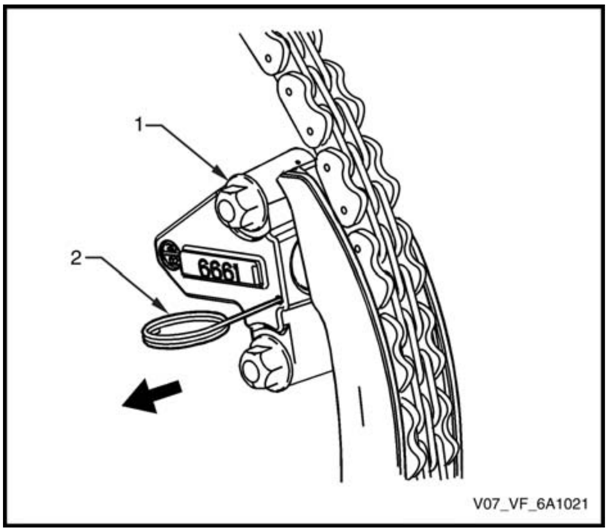

Figure 6A1 – 196

34 Verify the left-hand secondary timing chain timing mark alignments (1 to 6).

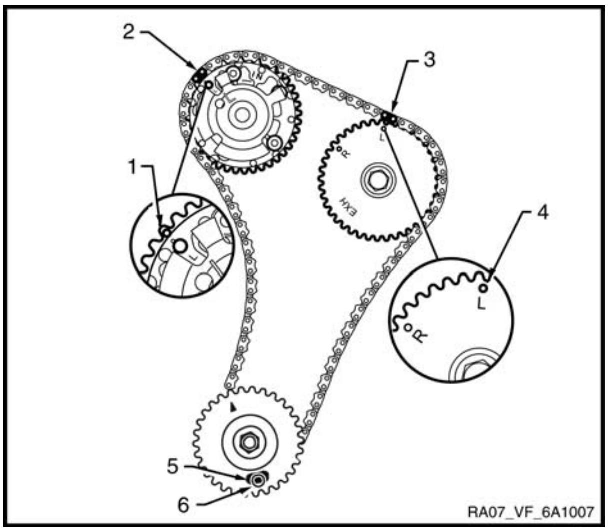

Figure 6A1 – 197

Primary Timing Chain Components – Excluding MY06 Update

1 If previously removed, install the left-hand secondary timing chain components, refer to Left-hand Secondary Timing Chain Components in this Section.

CAUTION

The right-hand camshaft intermediate sprocket (2) is marked with the letters RB and 'FRONT', and the left-hand sprocket (1) is marked with the letters LB and 'FRONT' Ensure the correct sprocket is used and the FRONT text is facing forwards when installed.

2 Ensure the right-hand camshaft intermediate sprocket (2) is selected and orientated correctly.

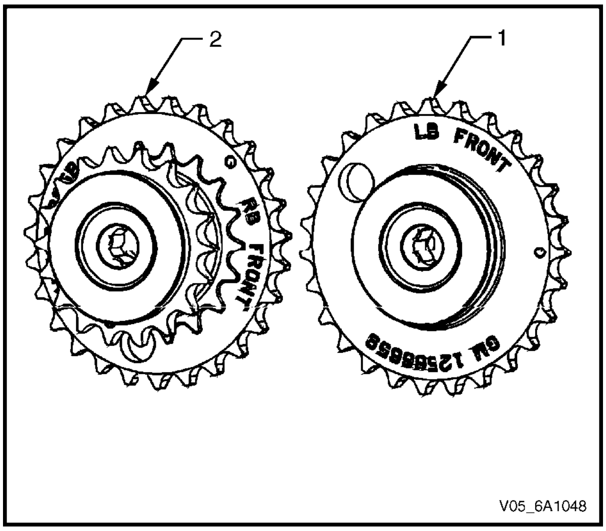

Figure 6A1 – 198

3 Install the right-hand camshaft intermediate sprocket (2).

4 Install the sprocket bolt (1) and tighten to the correct torque specification.

Camshaft intermediate sprocket attaching bolt torque specification...........58.0 – 72.0 Nm

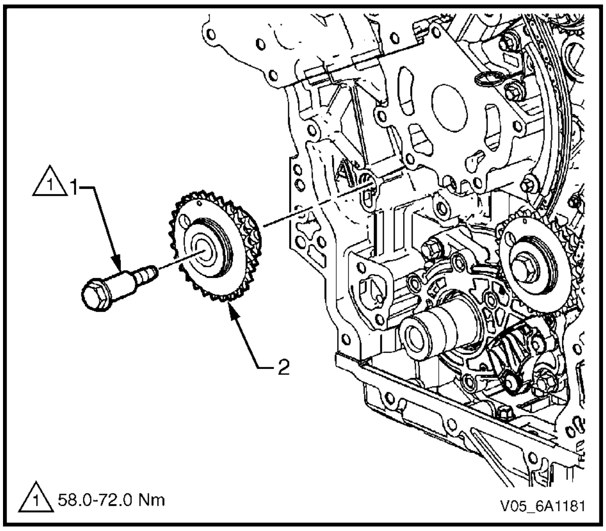

Figure 6A1 – 199

5 Ensure that the crankshaft sprocket timing mark (1) is aligned with the indexing mark (2) on the oil pump housing.

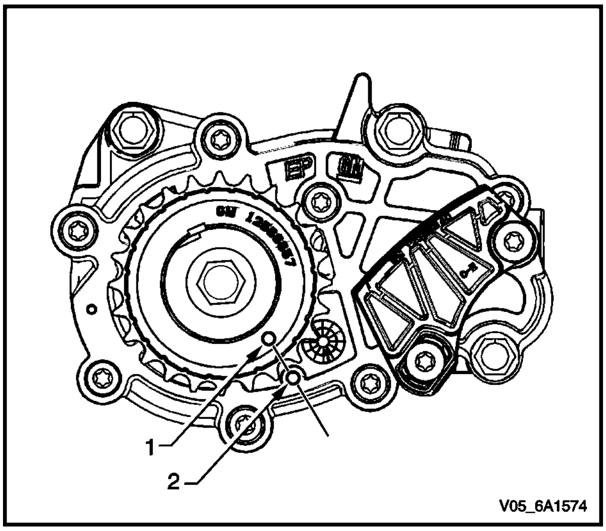

Figure 6A1 – 200

6 Install the primary timing chain (1).

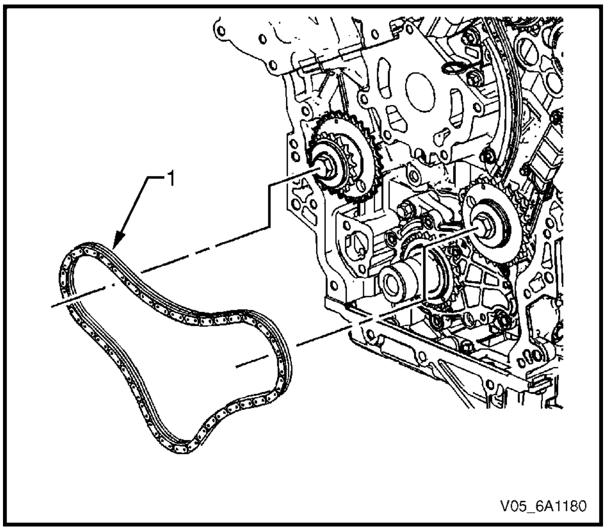

Figure 6A1 – 201

7 Wrap the primary timing chain around the large sprockets of each camshaft intermediate sprocket and the crankshaft sprocket aligning the bright plated chain links as follows:

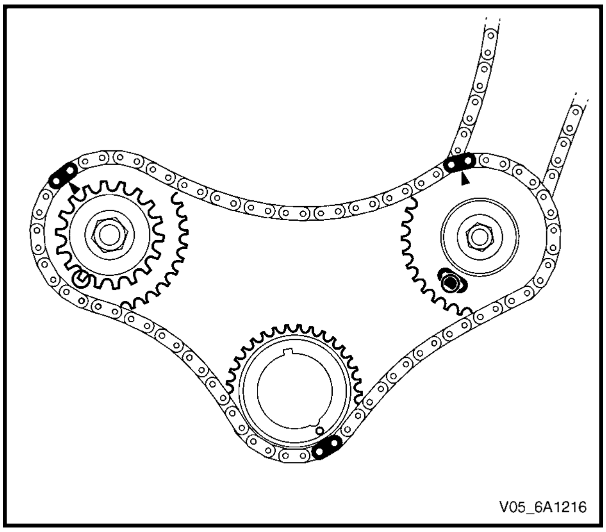

Figure 6A1 – 202

8 The left-hand camshaft intermediate sprocket timing mark (1) will align with a bright plated primary timing chain link (2).

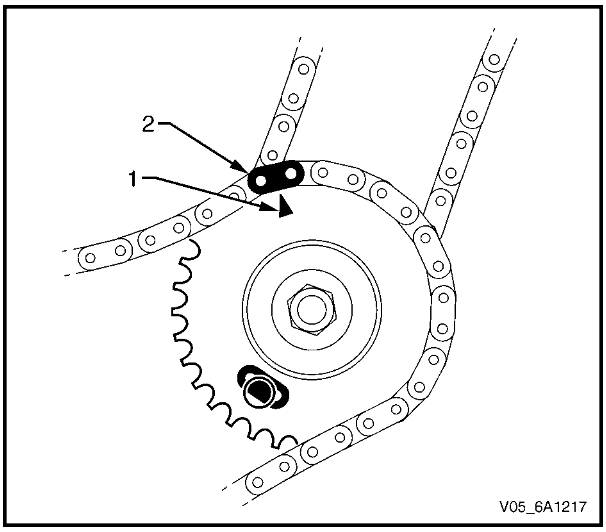

Figure 6A1 – 203

9 The right-hand camshaft intermediate sprocket timing mark (1) will align with a bright plated primary timing chain link (2).

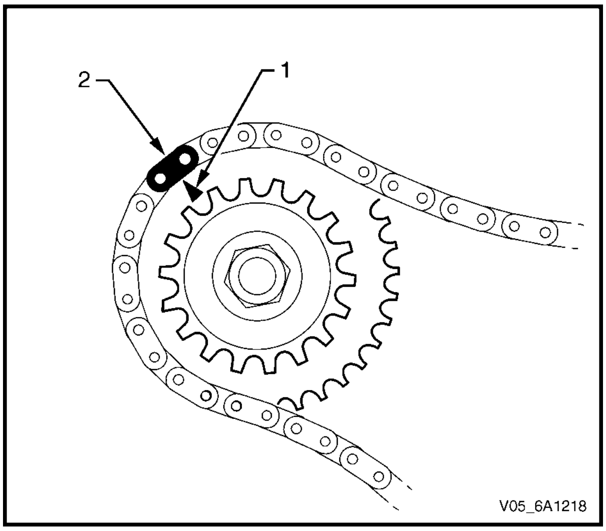

Figure 6A1 – 204

10 The crankshaft sprocket timing mark (1) will align with a bright plated timing chain link (2).

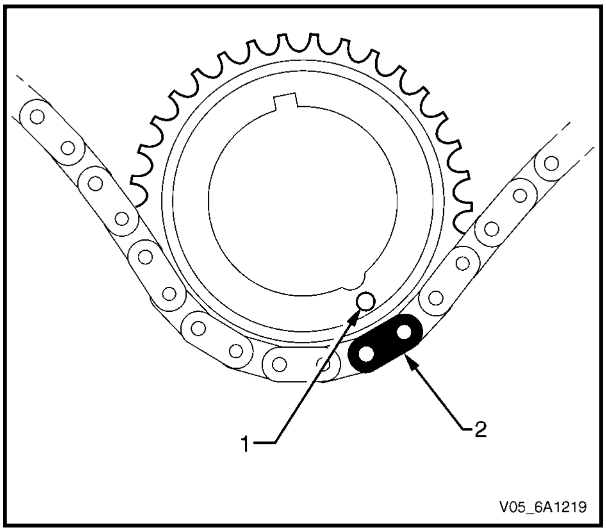

Figure 6A1 – 205

11 Ensure all the timing marks (1, 2 and 3) are properly aligned with the bright plated timing chain links (4, 5 and 6).

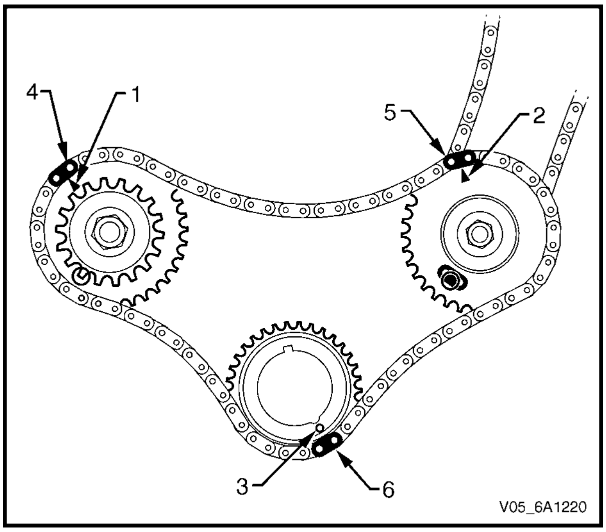

Figure 6A1 – 206

NOTE

Do not remove the primary timing chain lower guide (1). The primary timing chain lower guide is not serviced separately. If the primary timing chain lower guide must be replaced, the oil pump assembly (2) must be replaced.

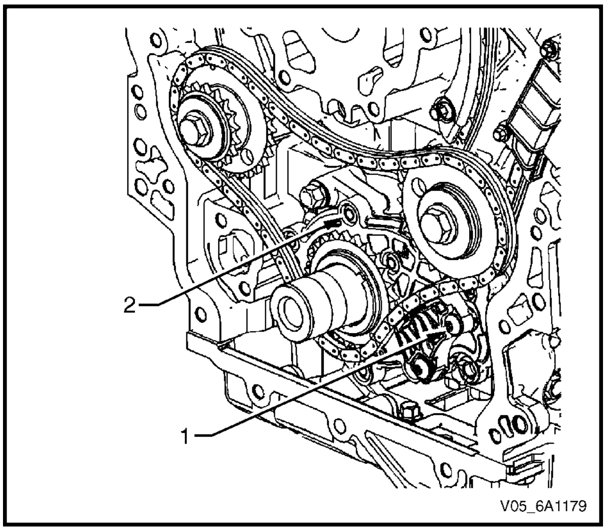

Figure 6A1 – 207

12 Ensure the primary timing chain upper guide is selected and orientated correctly.

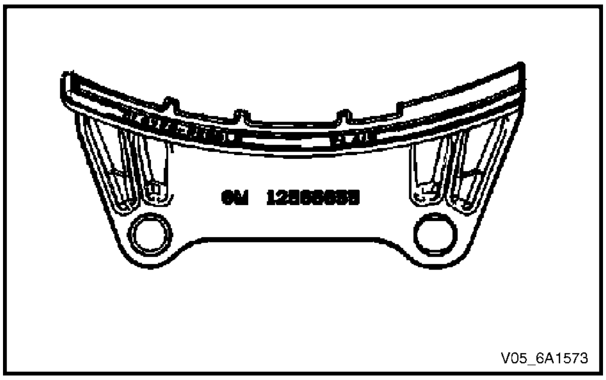

Figure 6A1 – 208

13 Install the primary timing chain upper guide (1).

14 Install the primary timing chain upper guide bolts (2) and tighten to the correct torque specification.

Primary timing chain upper guide attaching bolt torque specification...........20.0 – 26.0 Nm

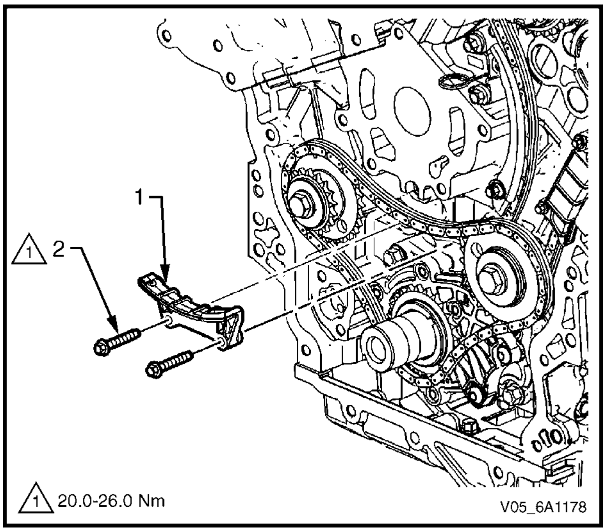

Figure 6A1 – 209

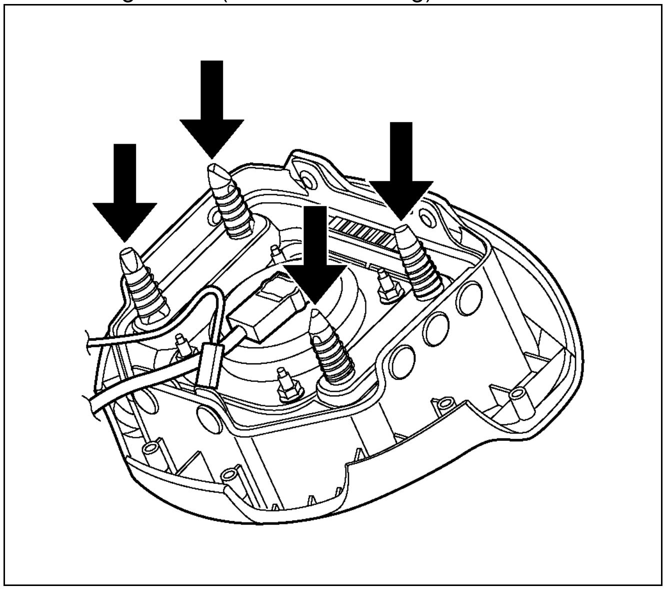
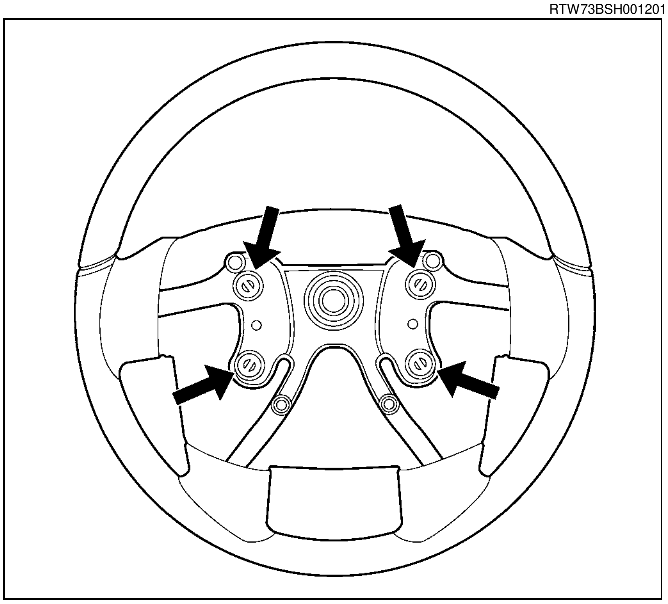
3. Align each snap stud of driver air bag to the holes on steering wheel (with SRS air bag).

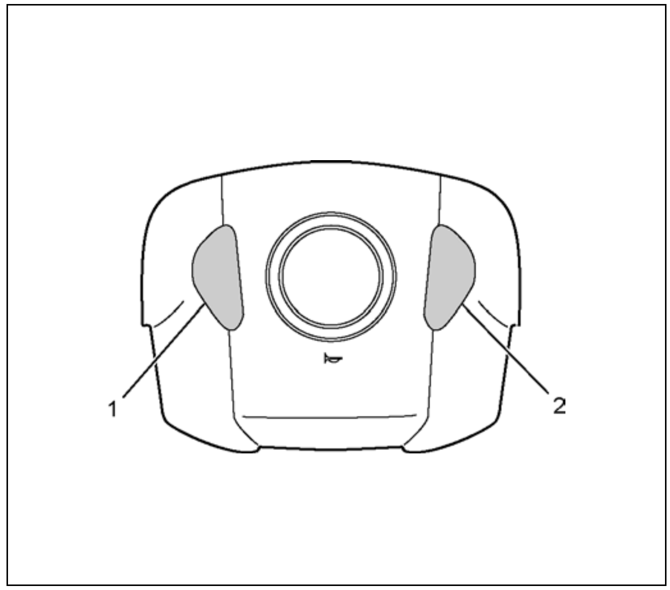


RTW73BSH001201



RTW73BSH000401

4. Push the SRS air bag at area-1 (1) and area-2 (2). At that time confirm the audible noise of each stud.



RTW73BSH000301

5. Enable the SRS (Refer to "Enabling the SRS" in this section) (with SRS air bag).
6. Connect the SRS connector (with SRS air bag).
7. Connect the battery "-" terminal cable (with SRS air bag).
8. Turn the ignition switch to "ON" while watching warning light and check - the light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

15 Ensure that the primary timing chain tensioner is being installed.

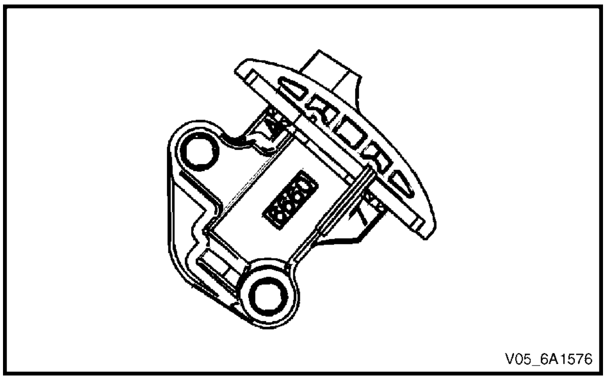


Figure 6A1 – 210

16 Reset the primary timing chain tensioner.

NOTE

To reset the tensioner, use a suitably sized flat blade screwdriver (1) or Tool No. J 45027 (4) to wind the plunger in a clockwise direction, into the tensioner shaft (2).

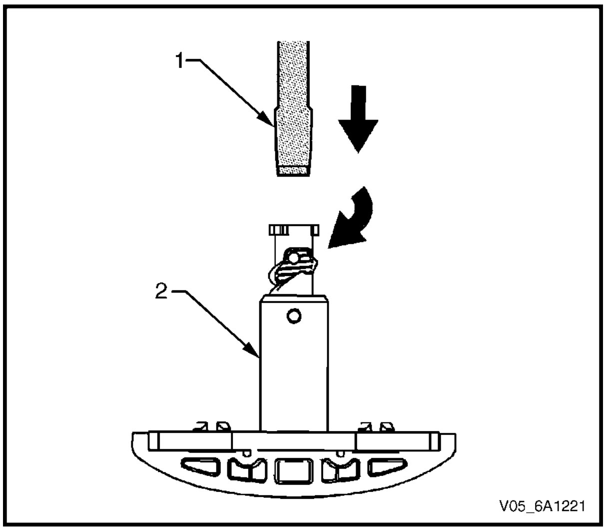

Figure 6A1 – 211

17 Install the tensioner shoe assembly (1) into the primary timing chain tensioner body (2).

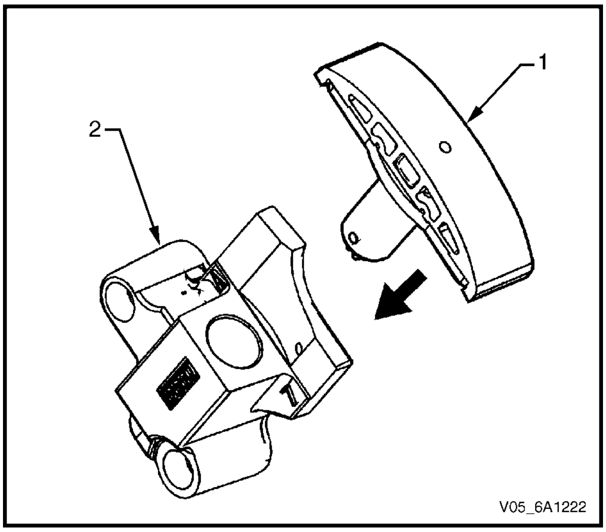

Figure 6A1 – 212

18 Compress the shoe assembly into the body (2) and lock the primary timing chain tensioner by inserting Tool No. EN 46112 into the access hole in the side of the body.

CAUTION

If Tool No. EN 46112 (1) is not inserted into the tensioner body, the plunger will remain in the locked position and no tension will be placed on the timing chain.

19 Slowly release pressure on the primary timing chain tensioner. The primary timing chain tensioner should remain compressed.

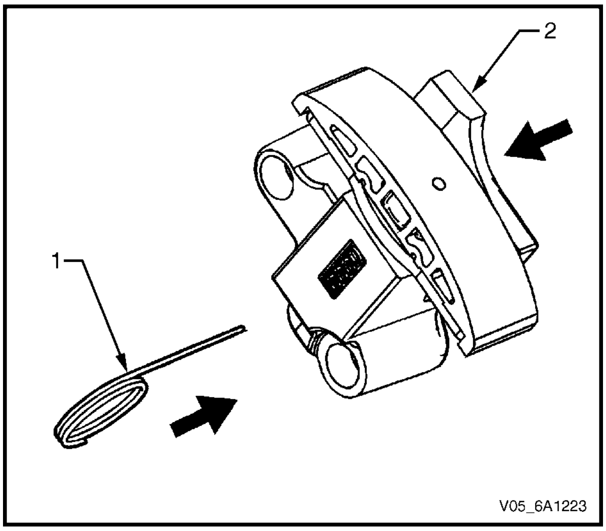

Figure 6A1 – 213

20 Install a new primary timing chain tensioner gasket (1) to the tensioner (2).

21 Install the primary timing chain tensioner bolts (3) through tensioner and gasket.

22 Ensure the primary timing chain tensioner mounting surface on the engine block does not have any burrs or defects that would affect the sealing of the new gasket.

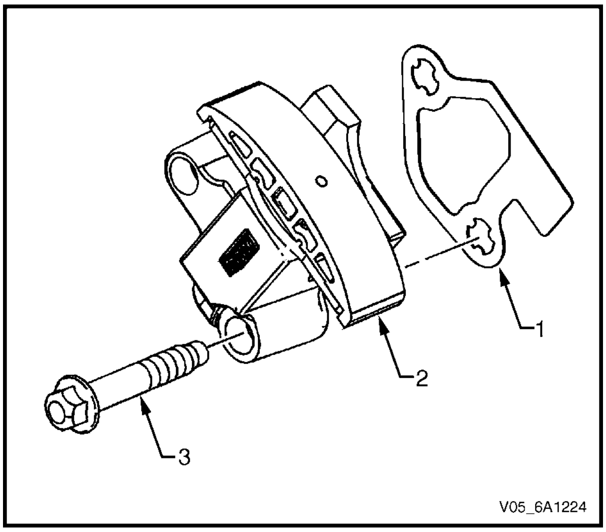

Figure 6A1 – 214

23 Place the primary timing chain tensioner (2) into position and loosely install the bolts (1) to the engine block.

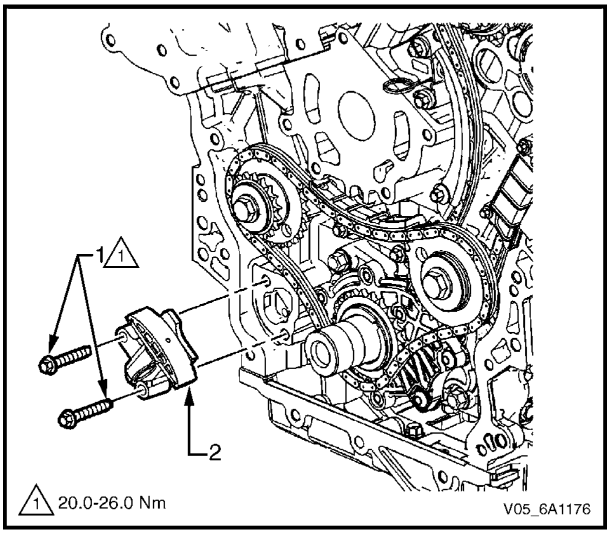

Figure 6A1 – 215

24 Verify the proper placement of the primary timing chain tensioner gasket tab (1).

25 Tighten the primary timing chain tensioner bolts (2) to the correct torque specification.

Primary timing chain tensioner attaching bolt torque specification	20.0 – 26.0 Nm

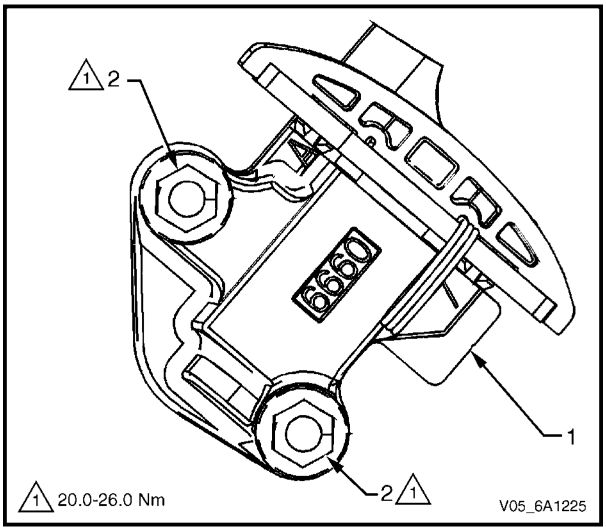

Figure 6A1 – 216

26 Release the primary timing chain tensioner (1) by pulling out Tool No. EN 46112 (2) and unlocking the tensioner shaft.

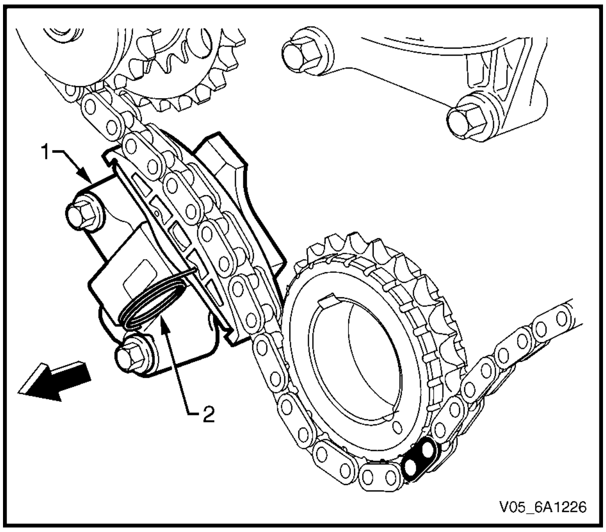

Figure 6A1 – 217

27 Verify the primary and left-hand secondary timing chain timing mark alignments (1 to 12).

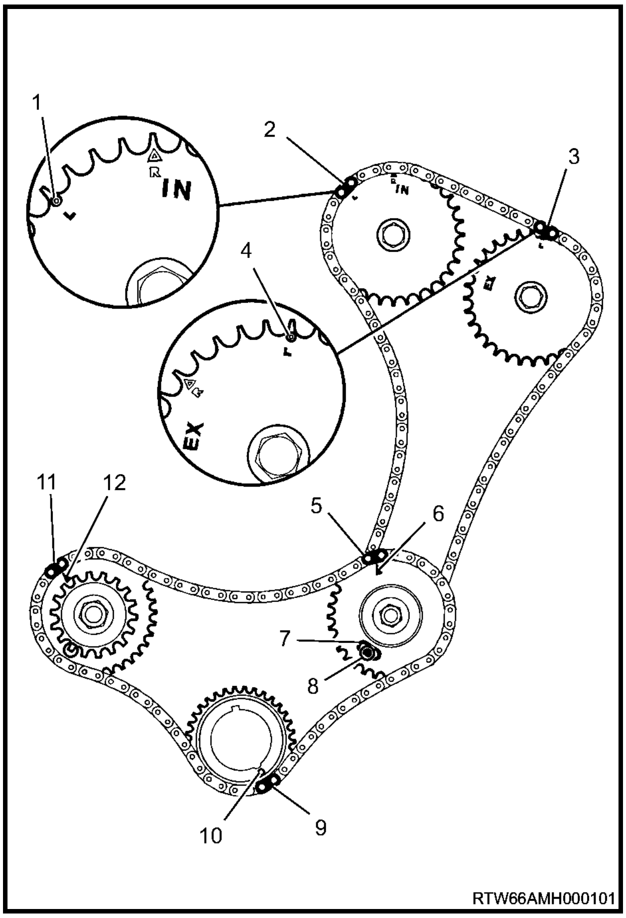

Figure 6A1 – 218

28 Remove Tool No. EN 46105 from the left-hand and right-hand cylinder head camshafts.

Primary Timing Chain Components – MY06 Update

1 If previously removed, install the left-hand secondary timing chain components, refer to Left-hand Secondary Timing Chain Components in this Section.

CAUTION

The right-hand camshaft intermediate sprocket (2) is marked with the letters RB and 'FRONT', and the left-hand sprocket (1) is marked with the letters LB and 'FRONT' Ensure the correct sprocket is used and the FRONT text is facing forwards when installed.

2 Ensure the right-hand camshaft intermediate sprocket (2) is selected and orientated correctly.

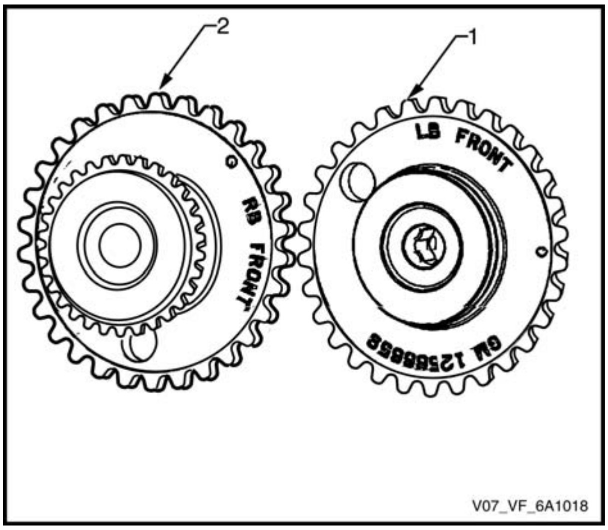

Figure 6A1 – 219

3 Install the right-hand camshaft intermediate sprocket (2).

4 Install the sprocket bolt (1) and tighten to the correct torque specification.

Camshaft intermediate sprocket attaching bolt torque specification...........58.0 – 72.0 Nm

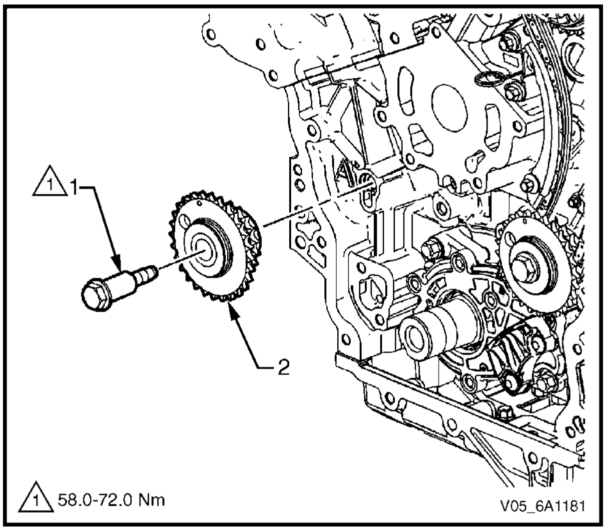

Figure 6A1 – 220

5 Ensure that the crankshaft sprocket timing mark (1) is aligned with the indexing mark (2) on the oil pump housing.

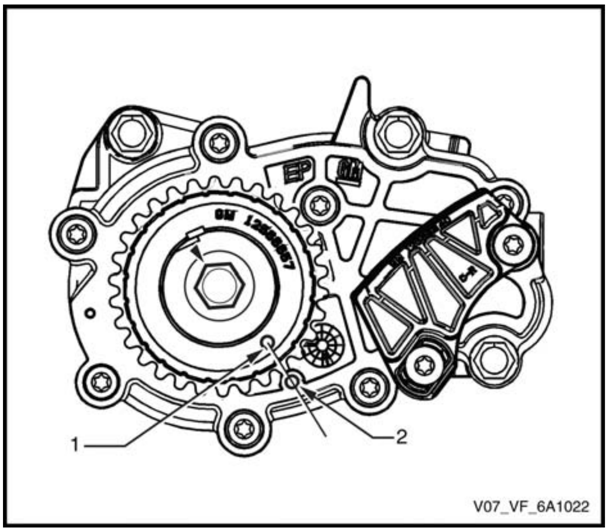

Figure 6A1 – 221

6 Install the primary timing chain (1).

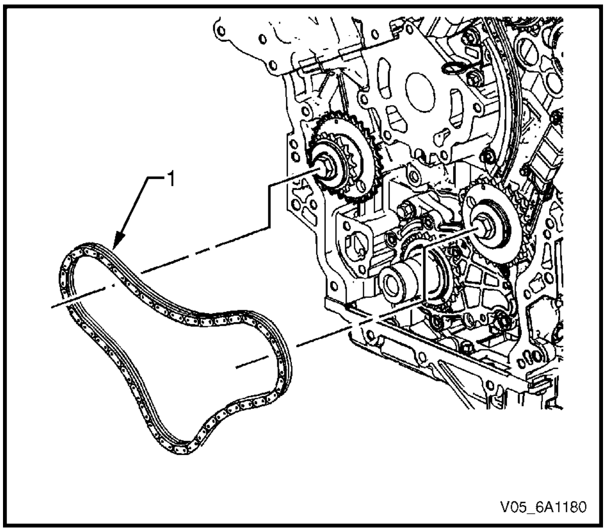

Figure 6A1 – 222

7 Wrap the primary timing chain around the large sprockets of each camshaft intermediate sprocket and the crankshaft sprocket, aligning the bright plated chain links as follows:

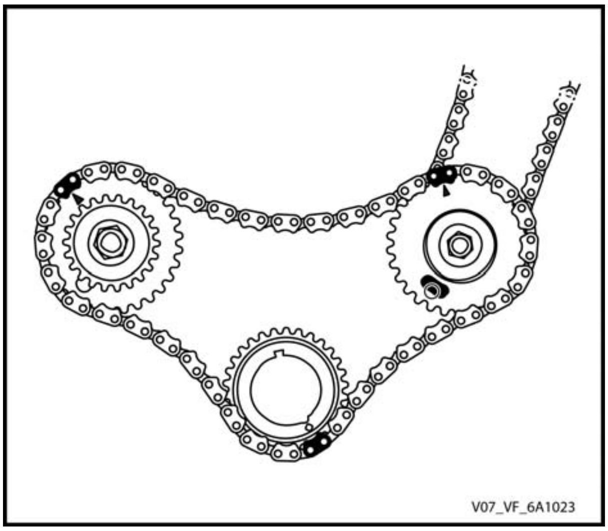

Figure 6A1 – 223

8 The left-hand camshaft intermediate sprocket timing mark (1) will align with a bright plated primary timing chain link (2).

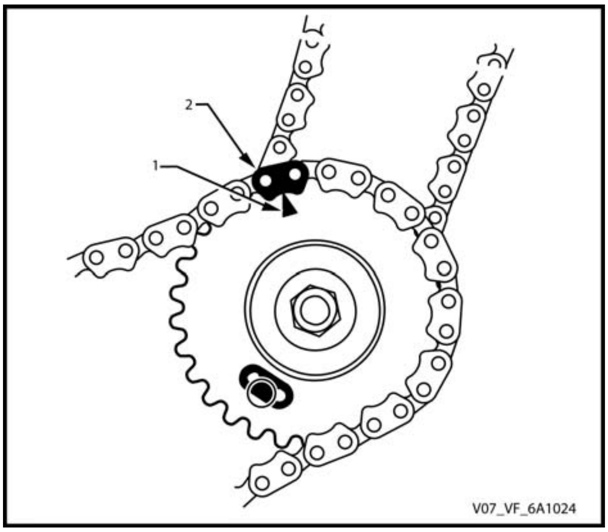

Figure 6A1 – 224

9 The right-hand camshaft intermediate sprocket timing mark (1) will align with a bright plated primary timing chain link (2).

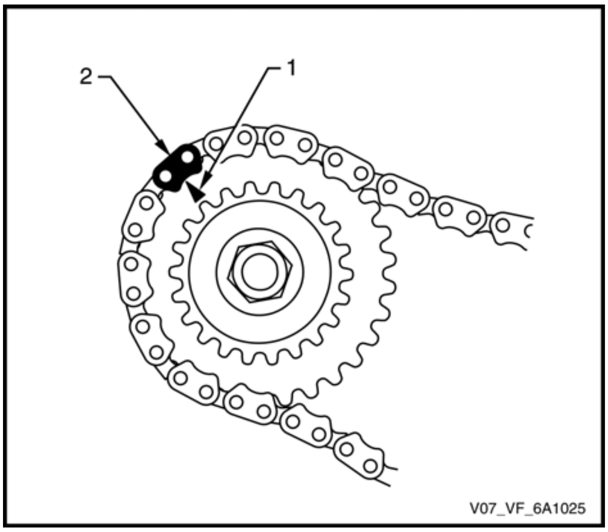

Figure 6A1 – 225

10 The crankshaft sprocket timing mark (1) will align with a bright plated timing chain link (2).

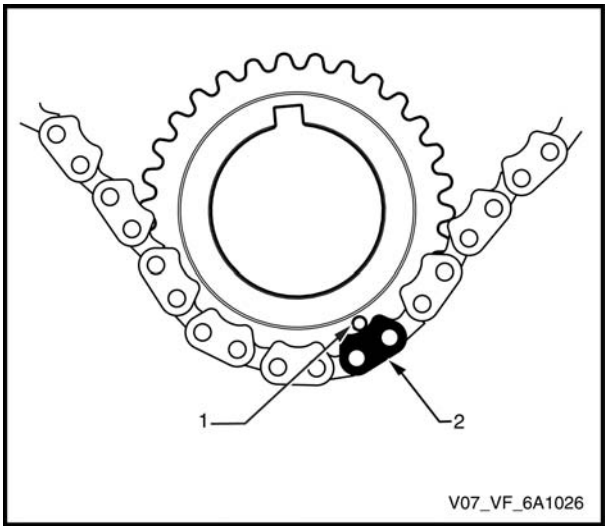

Figure 6A1 – 226

11 Ensure all the timing marks (1, 2 and 3) are properly aligned with the bright plated timing chain links (4, 5 and 6).

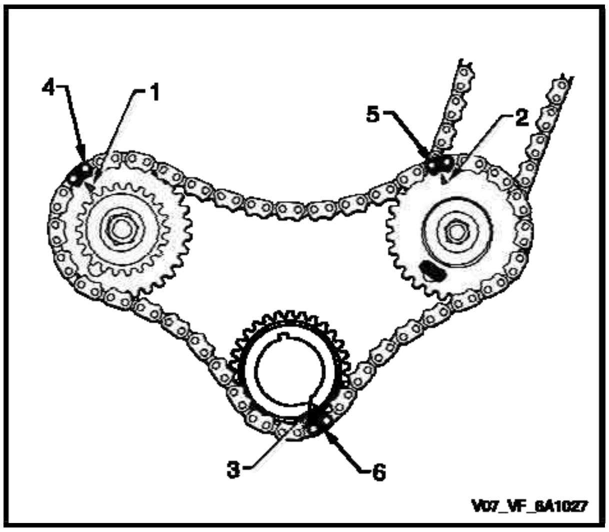

Figure 6A1 – 227

NOTE

Do not remove the primary timing chain lower guide (1). The primary timing chain lower guide is not serviced separately. If the primary timing chain lower guide must be replaced, the oil pump assembly (2) must be replaced.

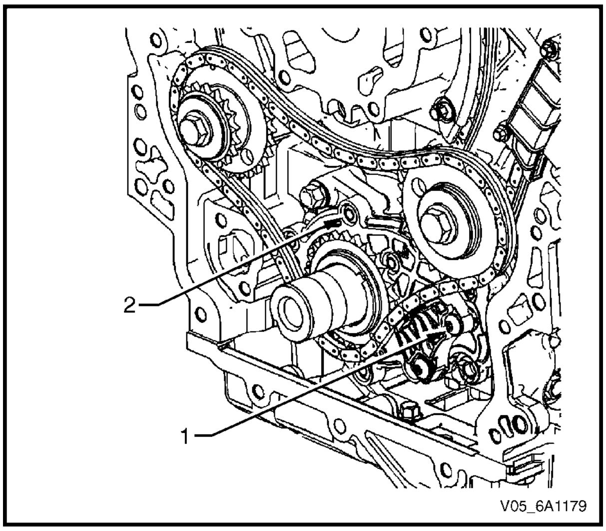

Figure 6A1 – 228

12 Ensure the primary timing chain upper guide is selected and orientated correctly.

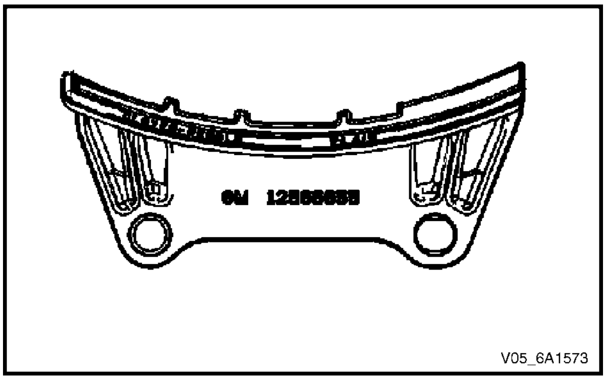

Figure 6A1 – 229

13 Install the primary timing chain upper guide (1).

14 Install the primary timing chain upper guide bolts (2) and tighten to the correct torque specification.

Primary timing chain upper guide attaching bolt torque specification	20.0 – 26.0 Nm

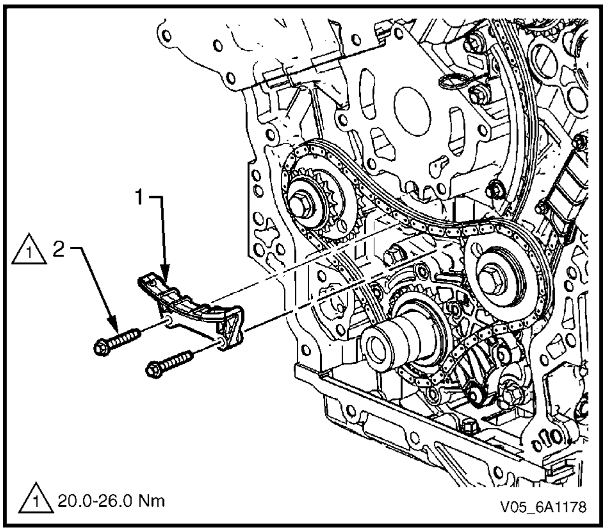

Figure 6A1 – 230

15 Ensure that the primary timing chain tensioner is being installed.

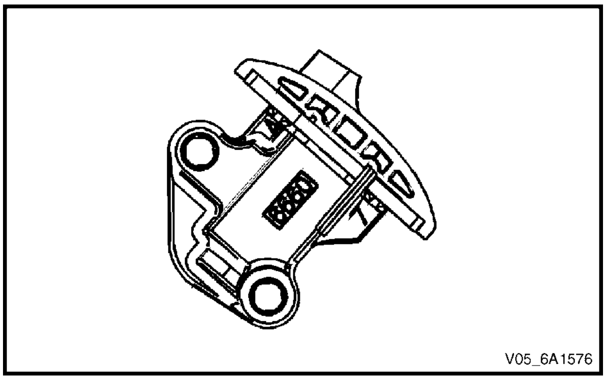

Figure 6A1 – 231

16 Reset the primary timing chain tensioner.

NOTE

To reset the tensioner, use a suitably sized flat blade screwdriver (1) or Tool No. J 45027 (4) to wind the plunger in a clockwise direction, into the tensioner shaft (2).

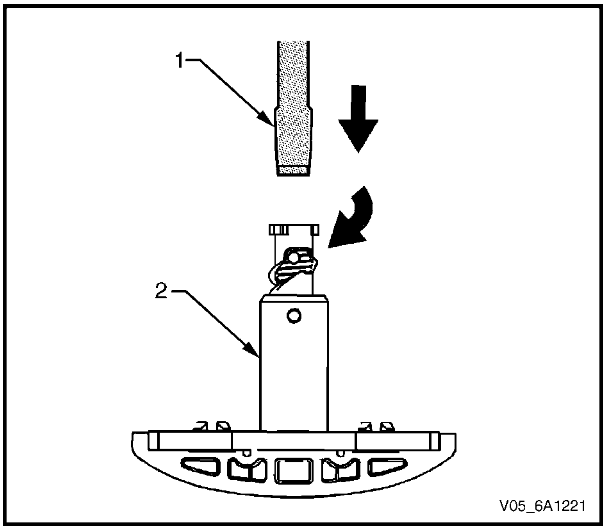

Figure 6A1 – 232

17 Install the tensioner shoe assembly (1) into the primary timing chain tensioner body (2).

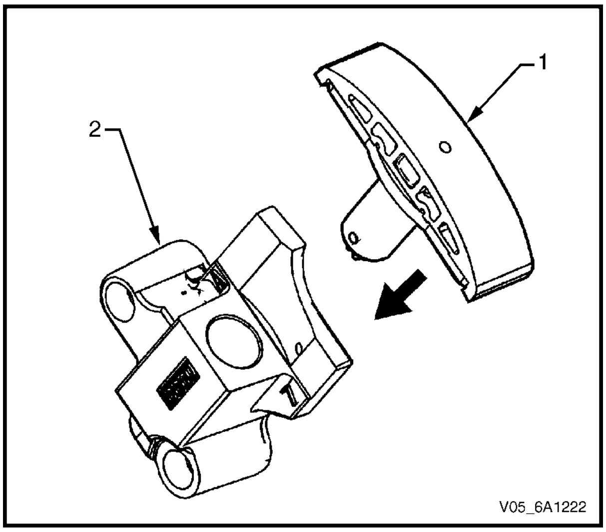

Figure 6A1 – 233

CAUTION

If Tool No. EN 46112 (1) is not inserted into the tensioner body, the plunger will remain in the locked position and no tension will be placed on the timing chain.

18 Compress the shoe assembly into the body (2) and lock the primary timing chain tensioner by inserting Tool No. EN 46112 into the access hole in the side of the body.

19 Slowly release pressure on the primary timing chain tensioner. The primary timing chain tensioner should remain compressed.

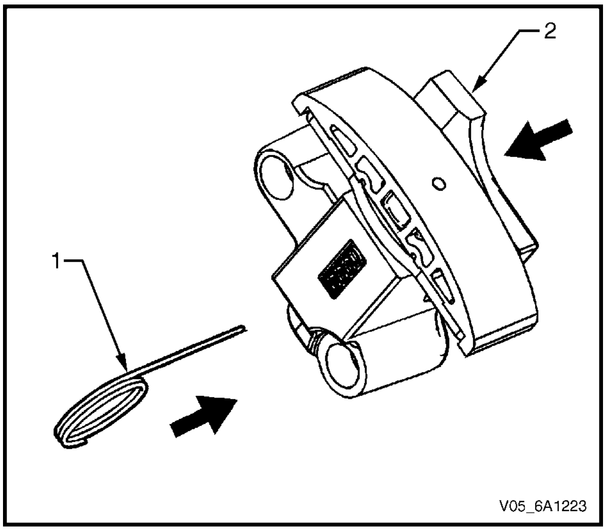

Figure 6A1 – 234

20 Install a new primary timing chain tensioner gasket (1) to the tensioner (2).

21 Install the primary timing chain tensioner bolts (3) through tensioner and gasket.

22 Ensure the primary timing chain tensioner mounting surface on the engine block does not have any burrs or defects that would affect the sealing of the new gasket.

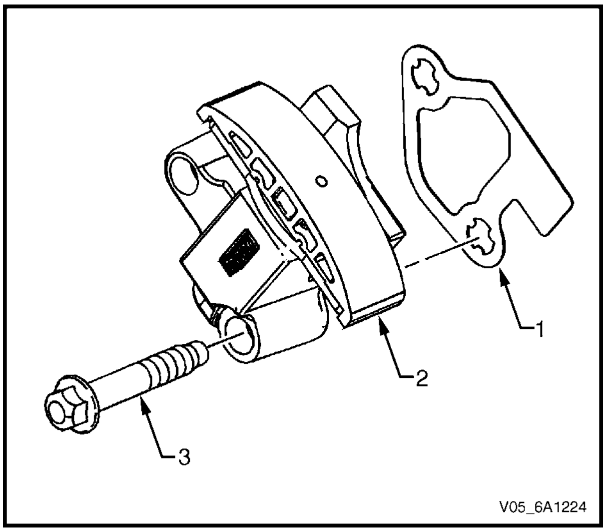

Figure 6A1 – 235

23 Place the primary timing chain tensioner (2) into position and loosely install the bolts (1) to the engine block.

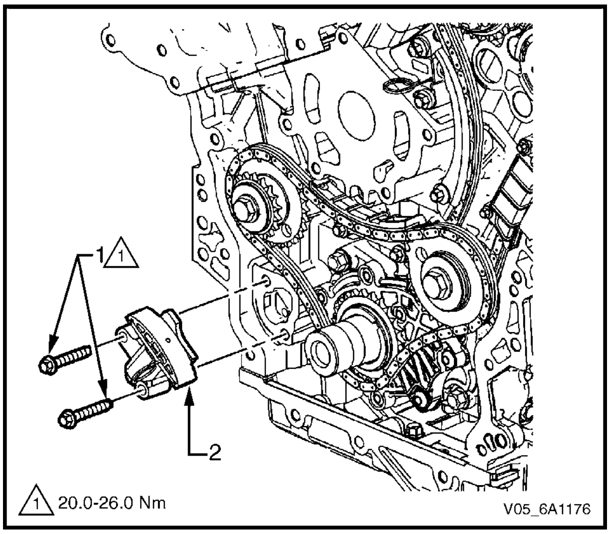

Figure 6A1 – 236

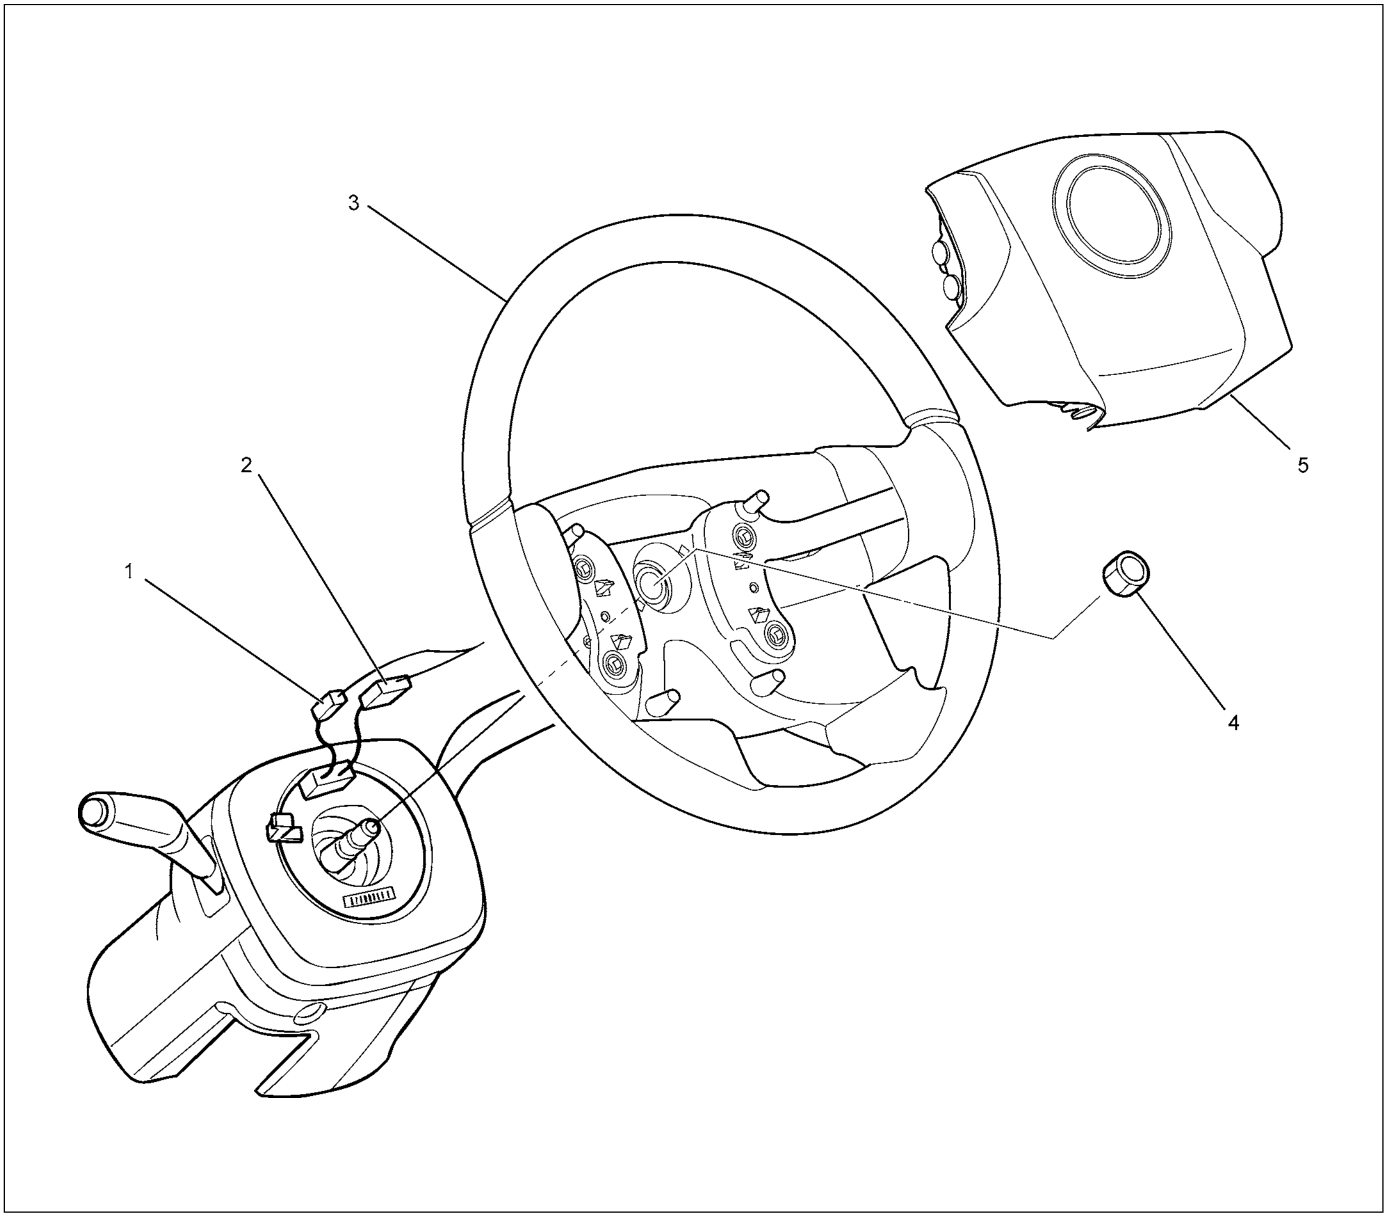
Steering Wheel

Steering Wheel and Associated Parts



RTW73BLF000101

Legend

(1) Horn Lead
(2) SRS Connector
(3) Steering Wheel
(4) Steering Wheel Fixing Nut
(5) Inflator Module or Horn Pad

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "-" terminal cable, and wait at least 5 minutes (with SRS air bag).
4. Disconnect the yellow 2-way SRS connector located under the steering column (with SRS air bag).

CAUTION: The wheels of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering wheel. Failure to do so will cause the coil assembly to lose its centering which will cause damage to the coil assembly (with SRS air bag).

5. Disable the SRS (Refer to "Disabling the SRS" in this section) (with SRS air bag).

24 Verify the proper placement of the primary timing chain tensioner gasket tab (1).

25 Tighten the primary timing chain tensioner bolts (2) to the correct torque specification.

Primary timing chain tensioner attaching bolt torque specification...........20.0 – 26.0 Nm

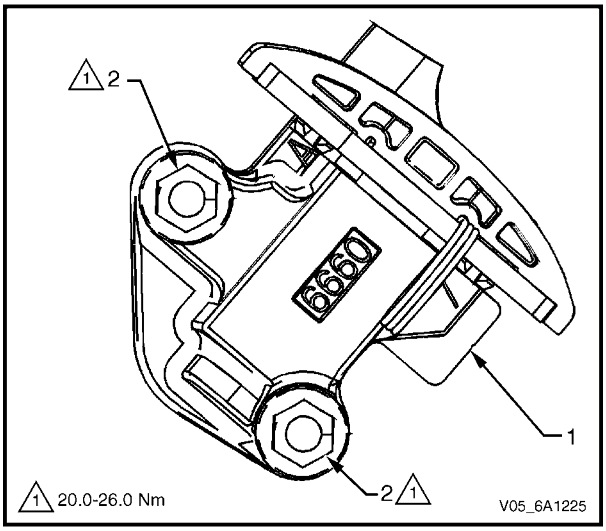


Figure 6A1 – 237

26 Release the primary timing chain tensioner (1) by pulling out Tool No. EN 46112 (2) and unlocking the tensioner shaft.

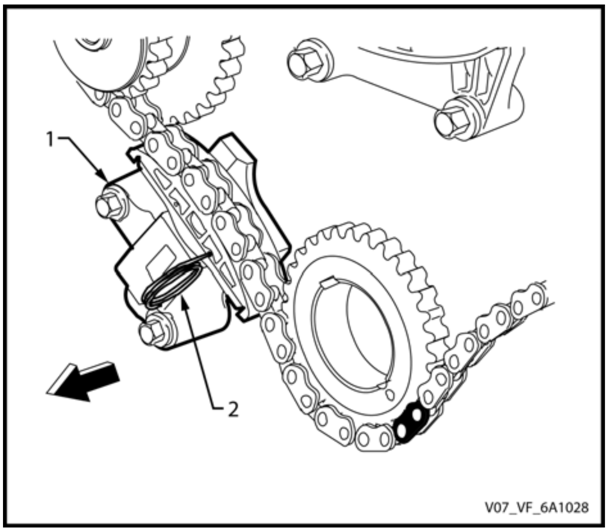

Figure 6A1 – 238

27 Verify the primary and left-hand secondary timing chain timing mark alignments (1 to 12).

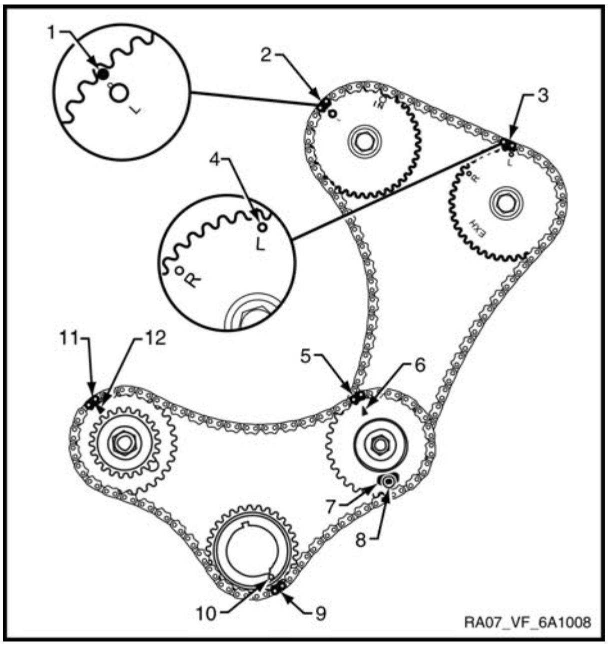

Figure 6A1 – 239

28 Remove Tool No. EN 46105–1 from the left-hand cylinder head camshafts.

Right-hand Secondary Timing Chain Components – Excluding MY06 Update

1 Install the primary timing chain components, refer to Primary Timing chain Components in this Section.

2 Using Tool No. EN46111 (1), rotate the crankshaft in a clockwise direction until the crankshaft sprocket timing mark (2) is aligned with the indexing mark (3) on the oil pump housing.

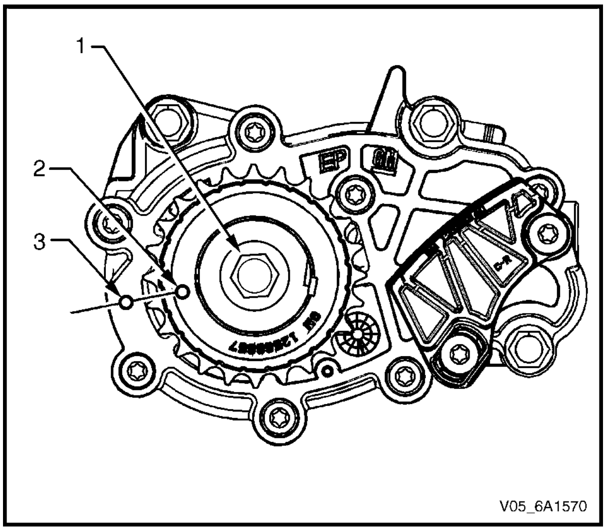

Figure 6A1 – 240

CAUTION

In order to install Tool No. EN 46105 onto the camshafts, rotate the camshafts. There should be no need to rotate the camshaft more than 45 degrees.

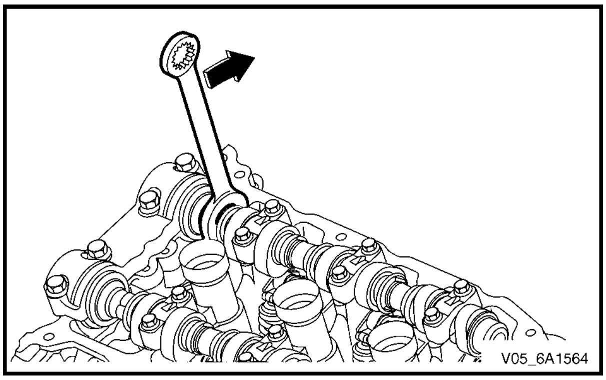

Figure 6A1 – 241

3 Install Tool No. EN 46105–1 (1) onto the rear of the right-hand cylinder head camshafts (2).

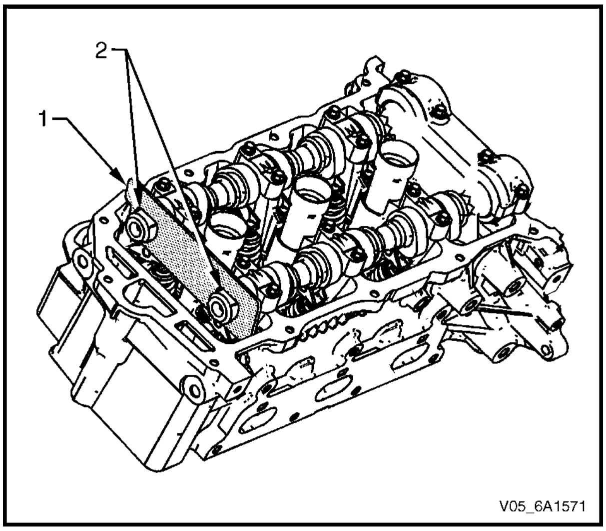

Figure 6A1 – 242

4 Install Tool No. EN 46105–2 (1) onto the rear of the left-hand cylinder head camshafts (2).

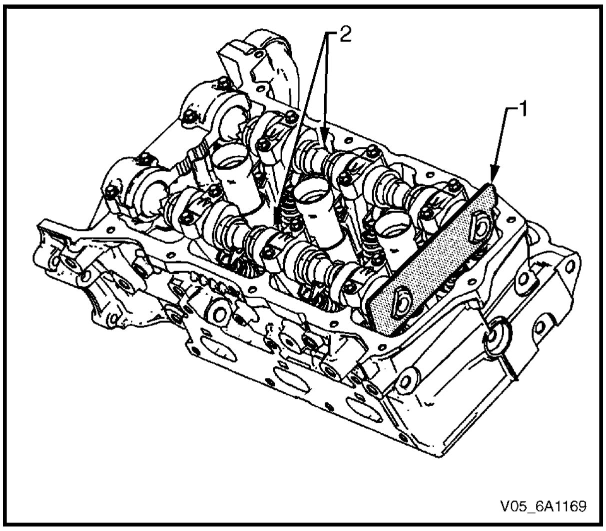

Figure 6A1 – 243

5 Install the right-hand secondary timing chain (1) onto the camshaft sprockets (2) and the right hand camshaft intermediate sprocket (3) aligning the chain in the following manner:

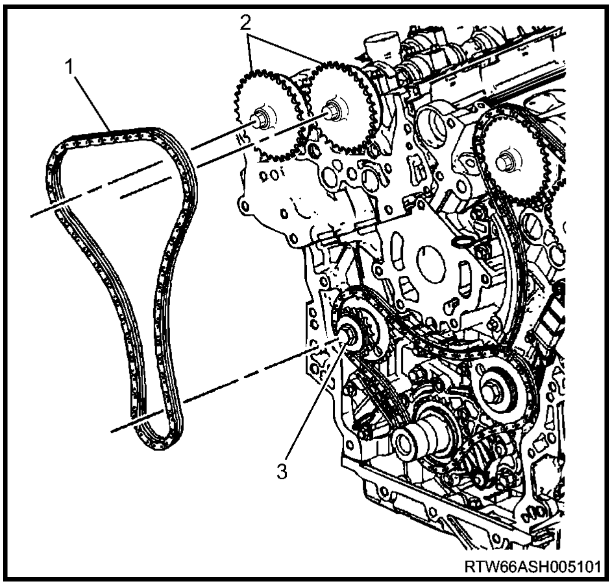

Figure 6A1 – 244

6 Place the secondary timing chain around the right-hand camshaft intermediate outer sprocket, aligning the bright plated timing chain link (1) with the alignment access hole (2) in the inner sprocket.

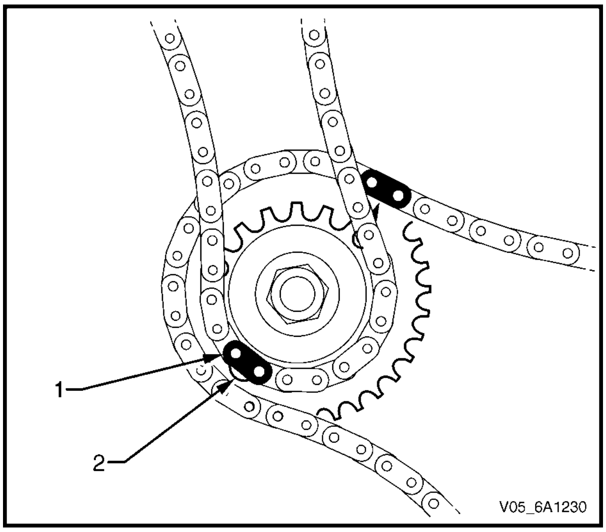

Figure 6A1 – 245

7 Wrap the secondary timing chain around both right-hand camshaft sprockets.

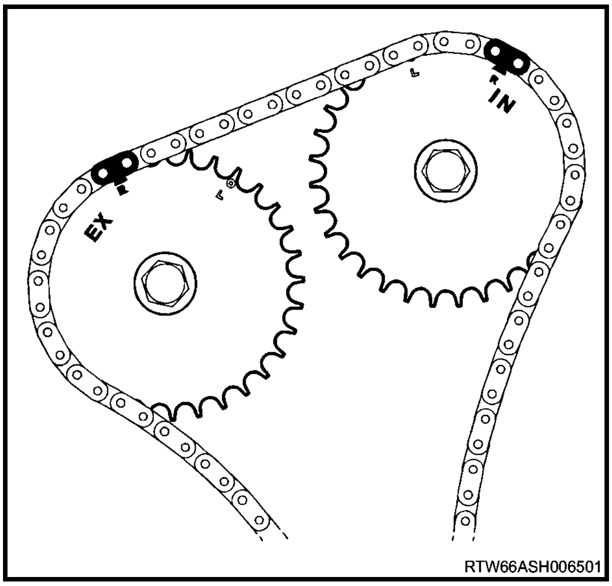

Figure 6A1 – 246

CAUTION

Ensure that when aligning the right-hand secondary timing chain to the right-hand camshaft sprockets, that the triangular timing marks (1) on the sprocket are used, NOT the circular mark.

8 Align the bright plated timing chain link (2) with the exhaust sprocket alignment triangle mark or circular mark.

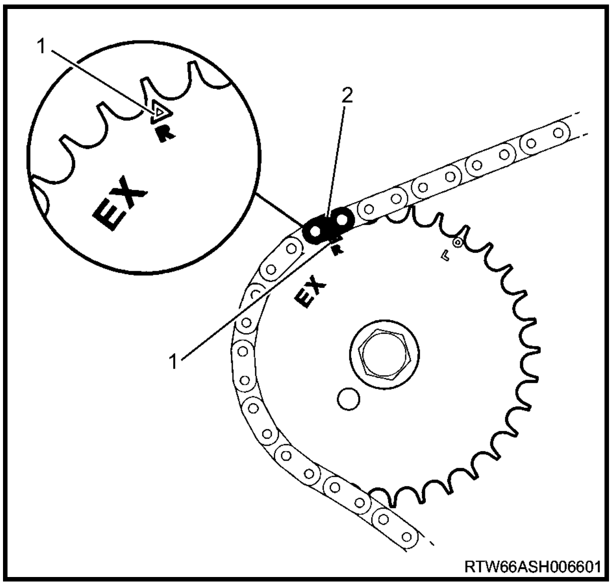

Figure 6A1 – 247

9 Align the bright plated timing chain link (1) with the intake sprocket alignment triangle mark (2).

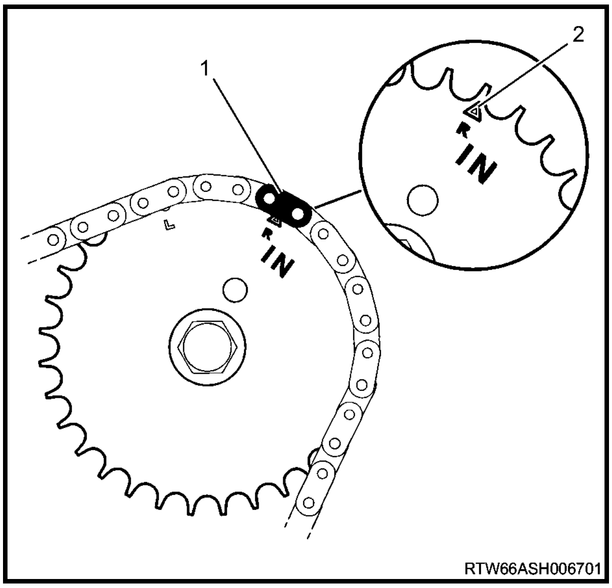

Figure 6A1 – 248

CAUTION

Ensure that the right-hand secondary timing chain guide is used when installing to the right-hand side in this procedure.

10 Ensure that the right-hand secondary timing chain guide is selected and orientated correctly.

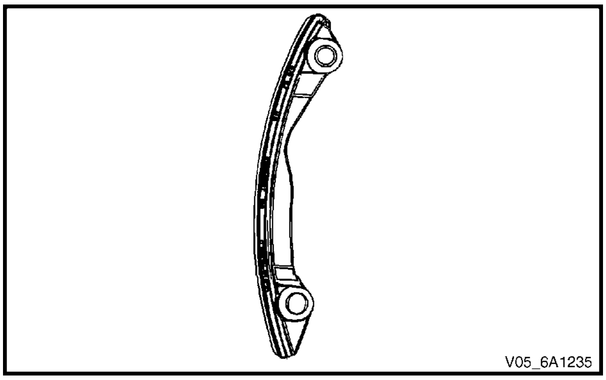

Figure 6A1 – 249

11 Position the chain guide (2).

12 Install the secondary timing chain guide bolts (1) and tighten to the correct torque specification.

Secondary timing chain guide attaching bolt torque specification...........20.0 – 26.0 Nm

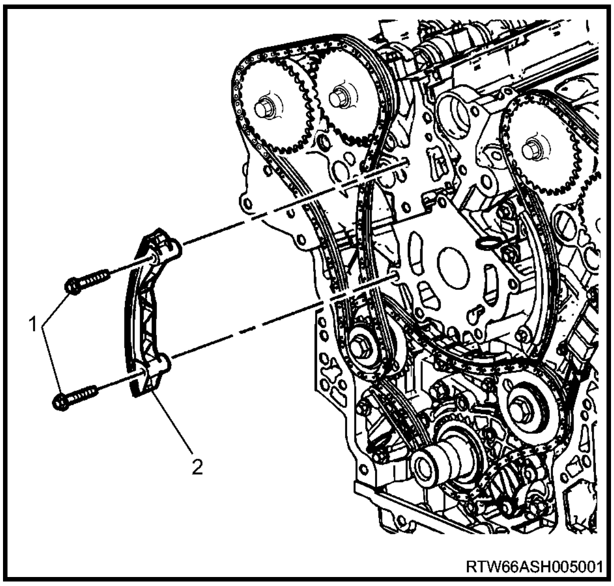

Figure 6A1 – 250

CAUTION

The right-hand secondary camshaft drive shoe is marked with the letters 'RH'. Ensure that the right-hand drive shoe is used when installing to the right-hand side in this procedure and that the letters 'RH" are facing the front of the vehicle when installed.

13 Ensure the right-hand secondary timing chain shoe is selected and orientated correctly.

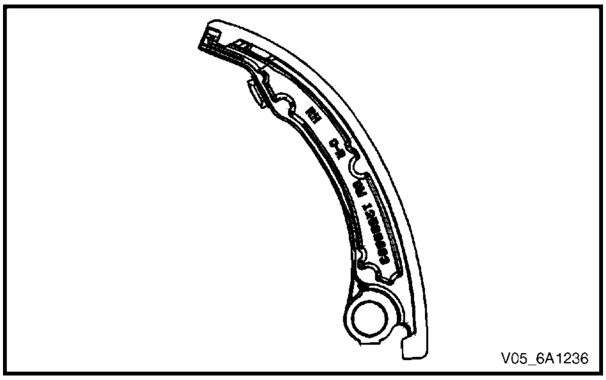

Figure 6A1 – 251

14 Position the right-hand secondary timing chain shoe (1).

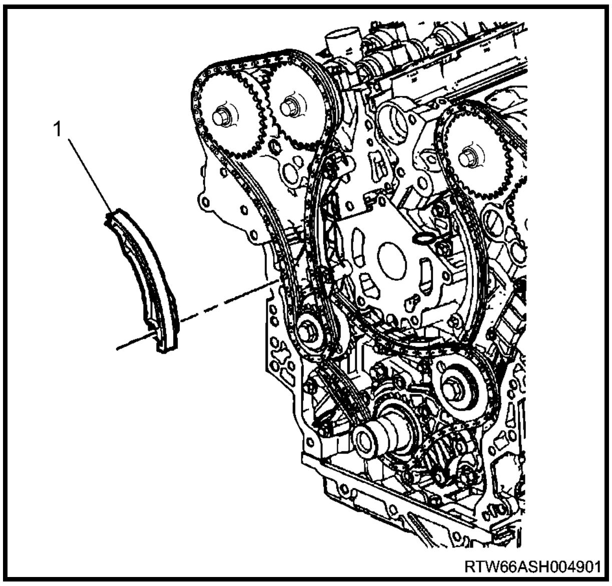

Figure 6A1 – 252

15 Install the secondary timing chain shoe bolt (1) and tighten to the correct torque specification.

Secondary timing chain shoe attaching bolt torque specification...........20.0 – 26.0 Nm

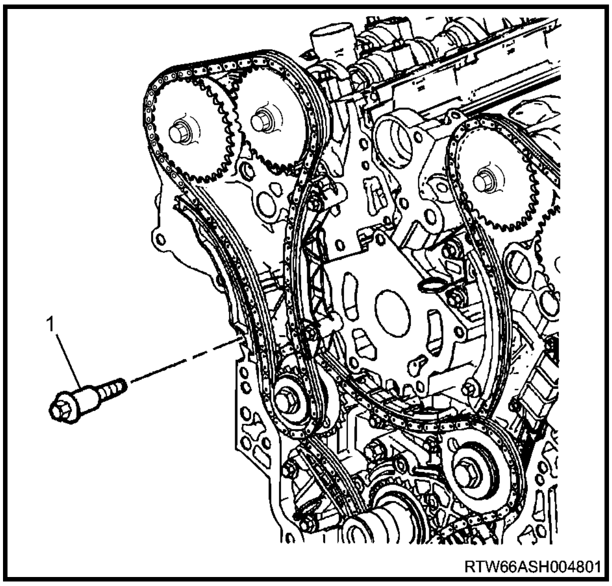

Figure 6A1 – 253

16 Ensure the right-hand secondary timing chain tensioner is selected and orientated correctly.

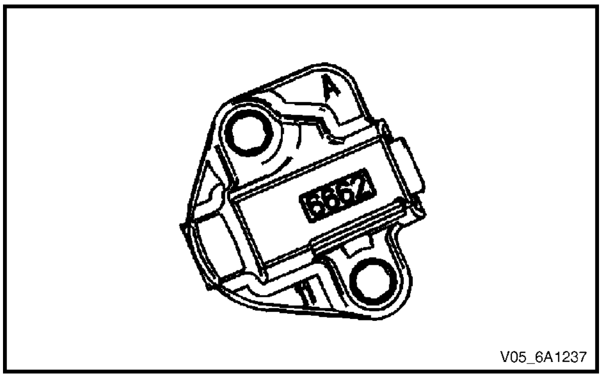

Figure 6A1 – 254

17 Reset the right-hand secondary timing chain tensioner.

NOTE

To reset the tensioner, use a suitably sized flat blade screwdriver (1) or Tool No. J 45027 to wind the plunger in a clockwise direction, into the tensioner shaft (2).

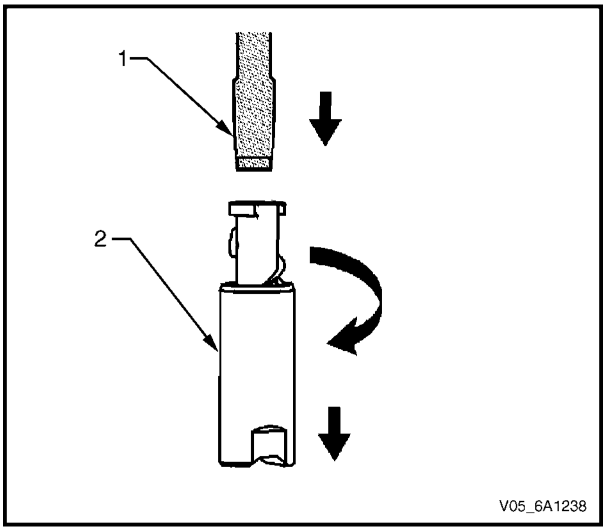

Figure 6A1 – 255

18 Install the tensioner shaft (1) into the right-hand secondary timing chain tensioner body (2).

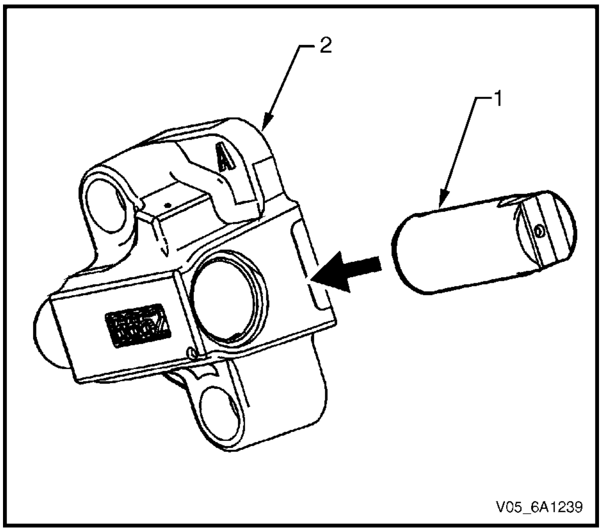

Figure 6A1 – 256

19 Compress the tensioner shaft into the body and lock the tensioner by inserting Tool No. EN 46112 into the access hole in the side of the tensioner body.

20 Slowly release pressure on the right-hand secondary timing chain tensioner. The tensioner should remain compressed.

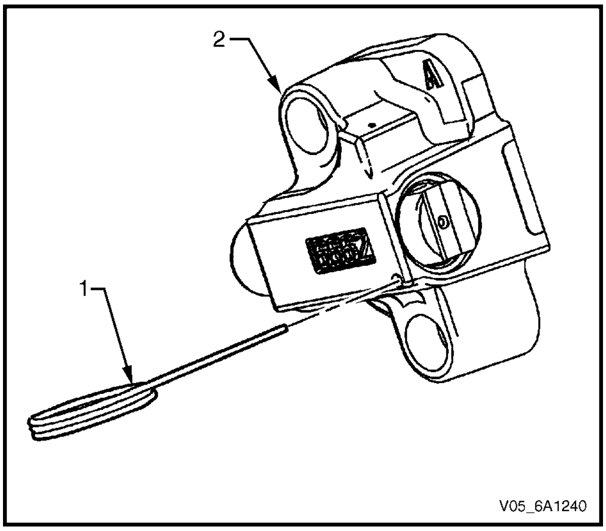

Figure 6A1 – 257

21 Install a new right-hand secondary timing chain tensioner gasket (1) to the tensioner (2).

22 Install the right-hand secondary timing chain tensioner bolts (3) through the tensioner and gasket.

23 Ensure the right-hand secondary timing chain tensioner mounting surface on the right-hand cylinder head does not have any burrs or defects that would affect the sealing of the new tensioner gasket.

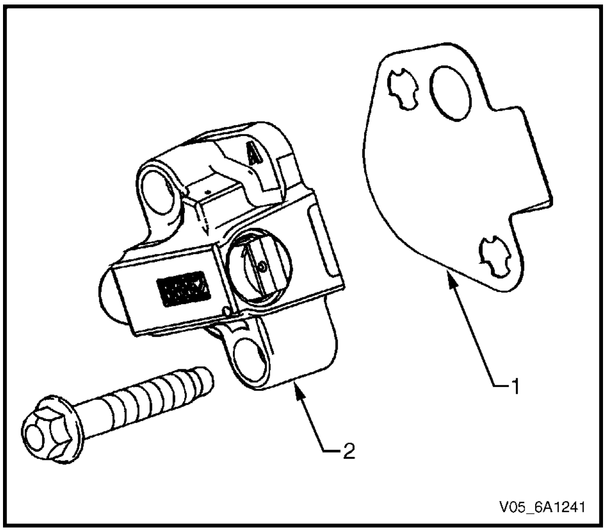

Figure 6A1 – 258

24 Place the right-hand secondary timing chain tensioner (2) into position and loosely install the bolts (1) to the engine block.

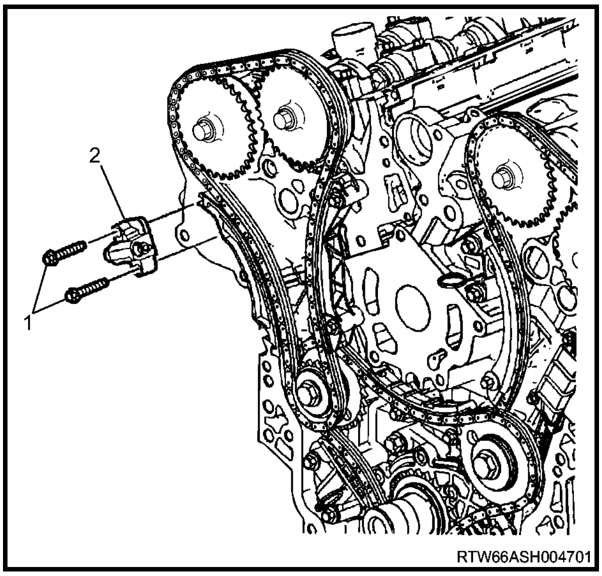

Figure 6A1 – 259

25 Verify the proper placement of the right-hand secondary timing chain tensioner gasket tab (1).

26 Tighten the right-hand secondary timing chain tensioner bolts (2) to the correct torque specification.

Secondary timing chain tensioner attaching bolt torque specification...........20.0 – 26.0 Nm

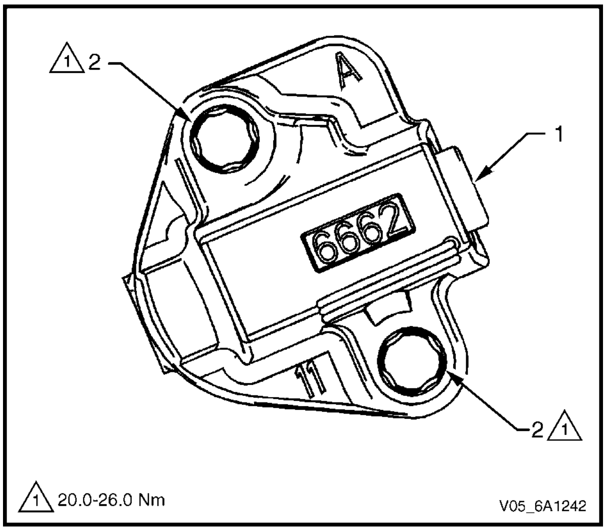

Figure 6A1 – 260

27 Release the right-hand timing chain tensioner (1) by pulling out Tool No. EN 46112 (2) and unlocking the tensioner plunger.

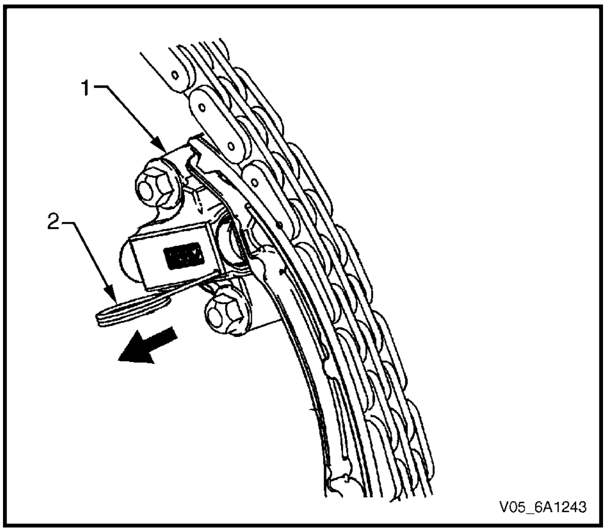

Figure 6A1 – 261

28 Verify all primary and secondary timing chain timing mark alignments (1 to 18).

29 Remove Tool No. EN 46105 and EN 46105-2 from the left and right-hand cylinder head camshafts.

30 Reinstall the spark plugs. Refer to Section 6C1-3 Engine Management – V6 – Service Operations.

31 Reinstall the engine front cover assembly, refer to 3.15 Front Cover Assembly.

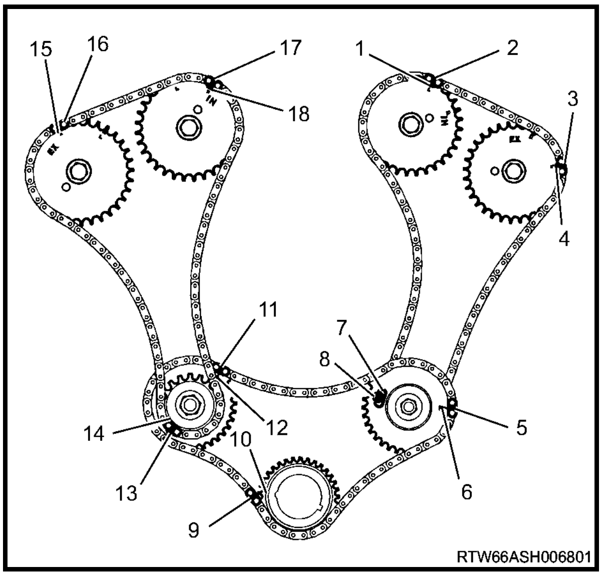

Figure 6A1 – 262

Right-hand Secondary Timing Chain Components – MY06 Update

1 Install the primary timing chain components, refer to Primary Timing chain Components in this Section.

2 Using Tool No. EN46111 (1), rotate the crankshaft in a clockwise direction until the crankshaft sprocket timing mark (2) is aligned with the indexing mark (3) on the oil pump housing.

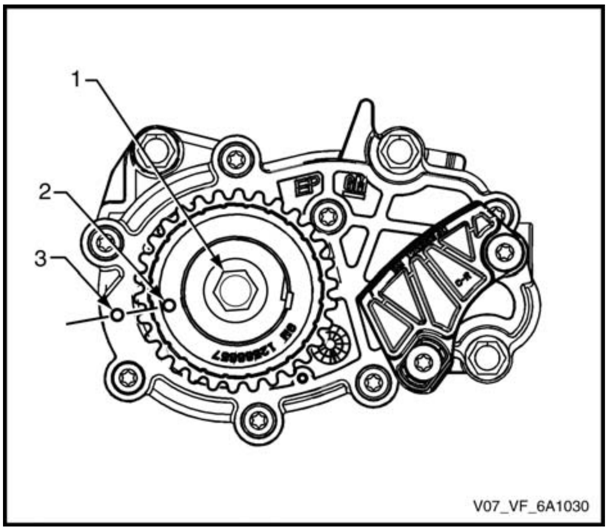

Figure 6A1 – 263

CAUTION

In order to install Tool No. EN 46105 onto the camshafts, rotate the camshafts. There should be no need to rotate the camshaft more than 45 degrees.

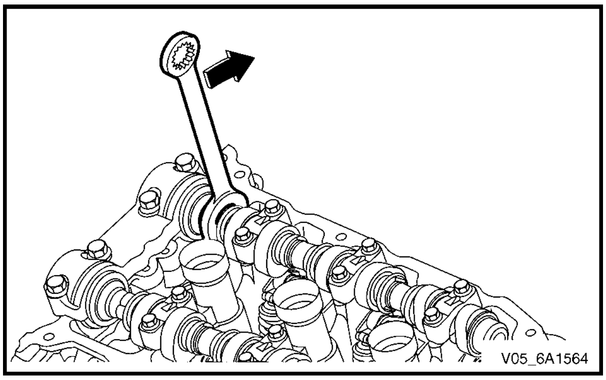

Figure 6A1 – 264

3 Install Tool No. EN 46105–1 (1) onto the rear of the right-hand cylinder head camshafts (2).

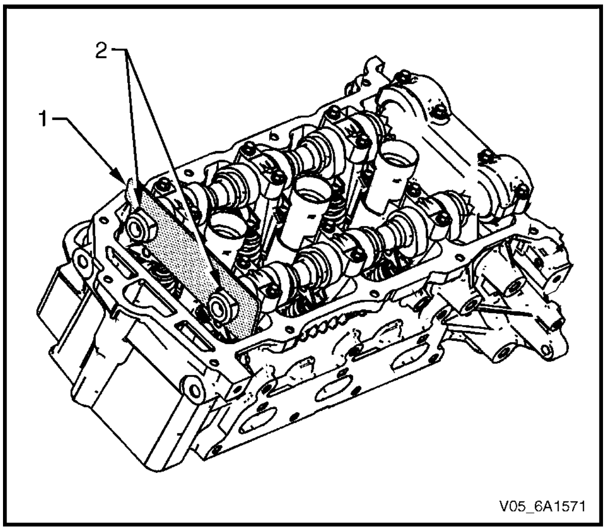

Figure 6A1 – 265

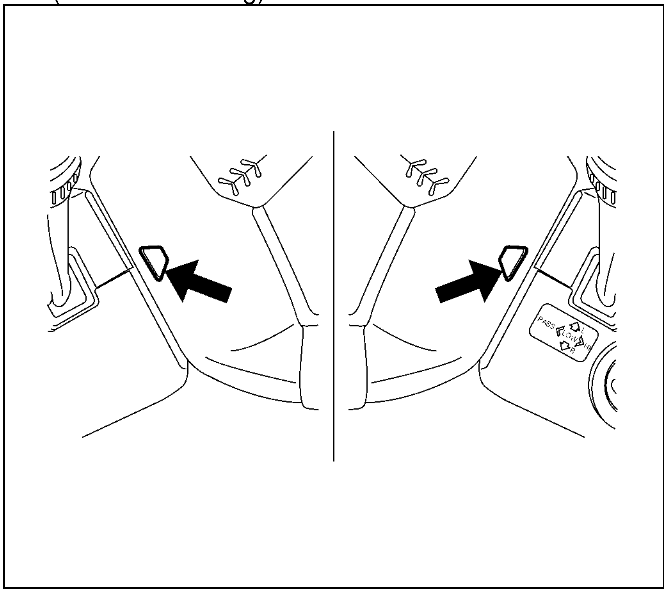
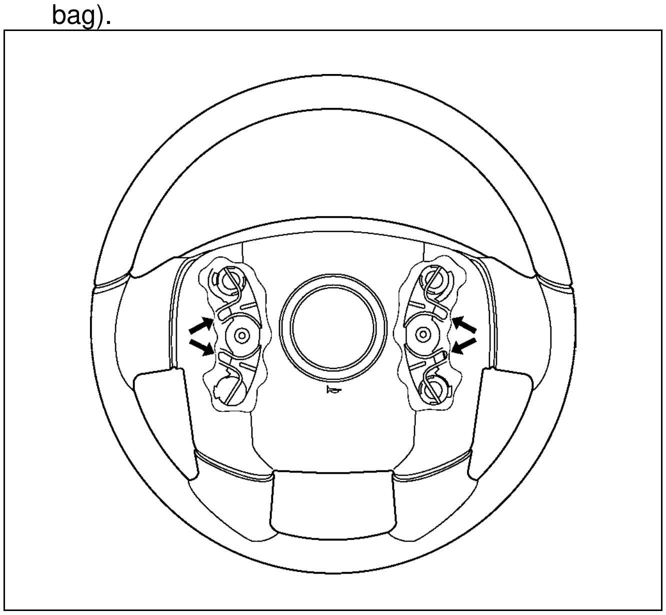
6. Check the holes on both sides of the steering cover (with SRS air bag).



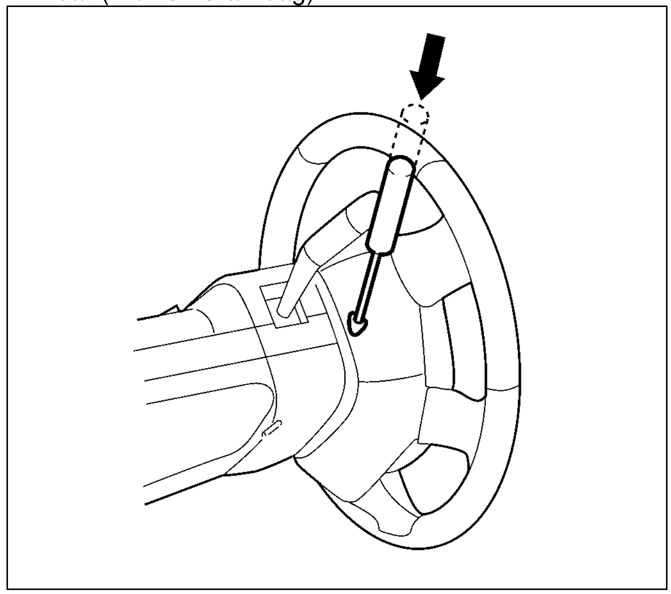
060R300025

7. Check the position of the pins in their holes. Push the pin in the direction of the arrow (with SRS air bag).



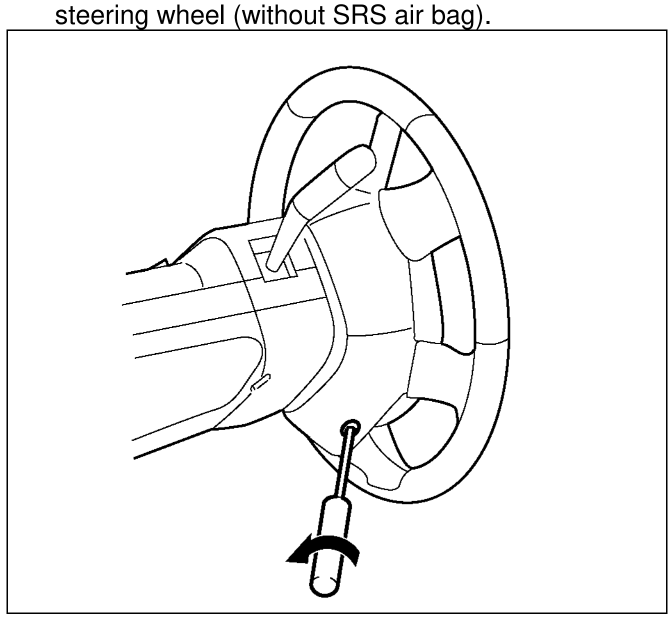
RTW73BSH000101

8. Push the four pins with a ϕ 5~6 mm (0.20~0.24 in) bar (with SRS air bag).



060R300031

9. Cancel the lock to release the four pins (with SRS air bag).
10. Loosen the horn pad fixing screw at the rear of the steering wheel (without SRS air bag).



430R300009

4 Install Tool No. EN 46105–2 (1) onto the rear of the left-hand cylinder head camshafts (2).

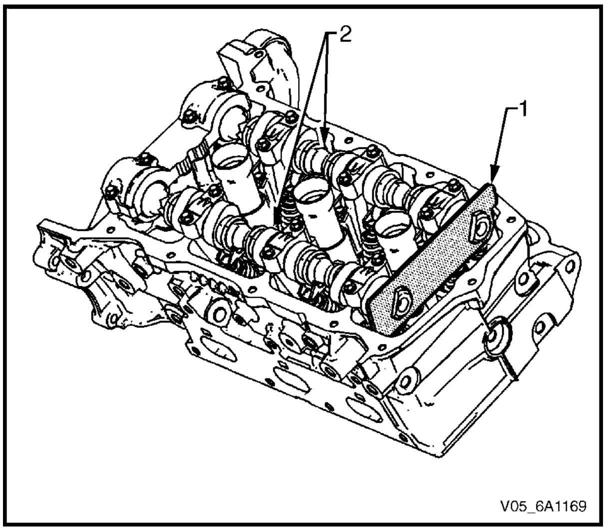


Figure 6A1 – 266

5 Install the right-hand secondary timing chain (1) onto the camshaft sprockets (2) and the right hand camshaft intermediate sprocket (3) aligning the chain in the following manner:

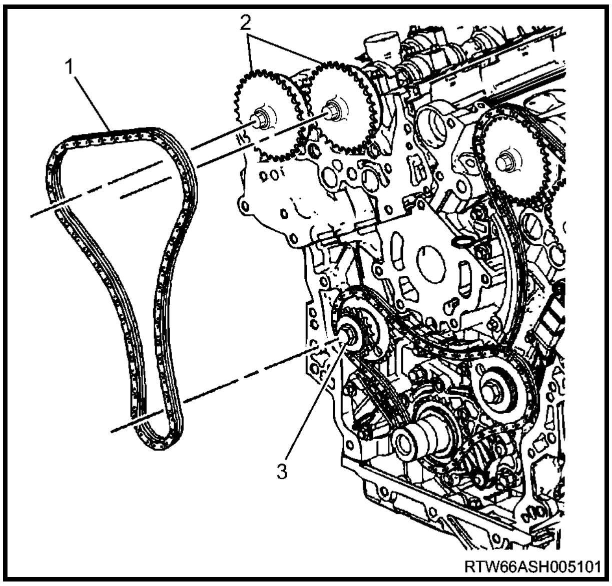

Figure 6A1 – 267

6 Place the secondary timing chain around the right-hand camshaft intermediate outer sprocket, aligning the bright plated timing chain link (1) with the alignment access hole (2) in the inner sprocket.

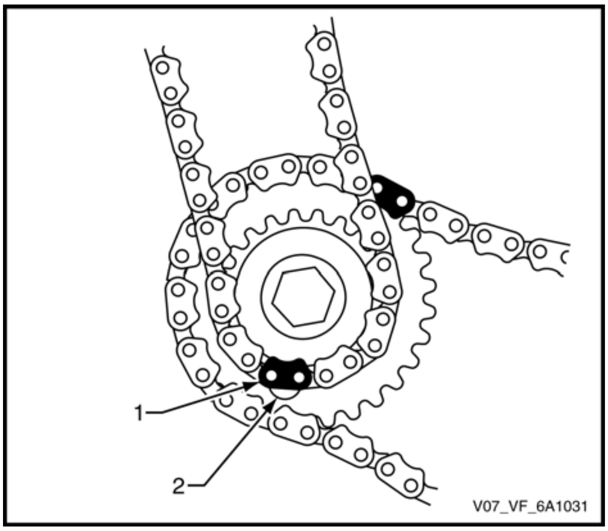

Figure 6A1 – 268

7 Wrap the secondary timing chain around both right-hand camshaft drive sprockets.

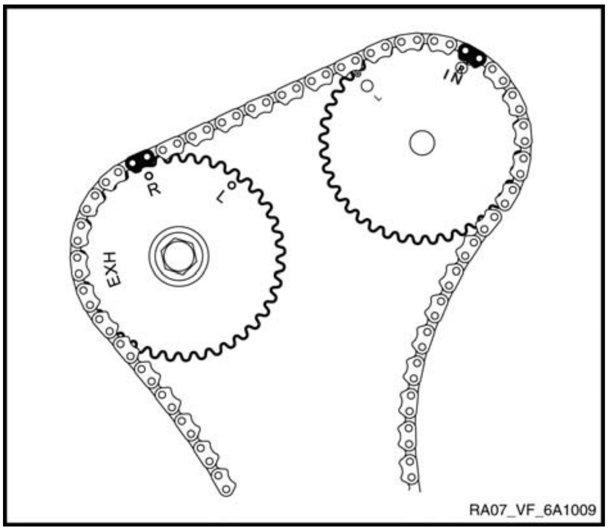

Figure 6A1 – 269

CAUTION

Ensure that when aligning the right-hand secondary timing chain to the right-hand camshaft sprockets, that the triangular timing marks (1) on the sprocket are used, NOT the circular mark.

8 Align the bright plated timing chain link (2) with the exhaust sprocket alignment triangle mark or circular mark.

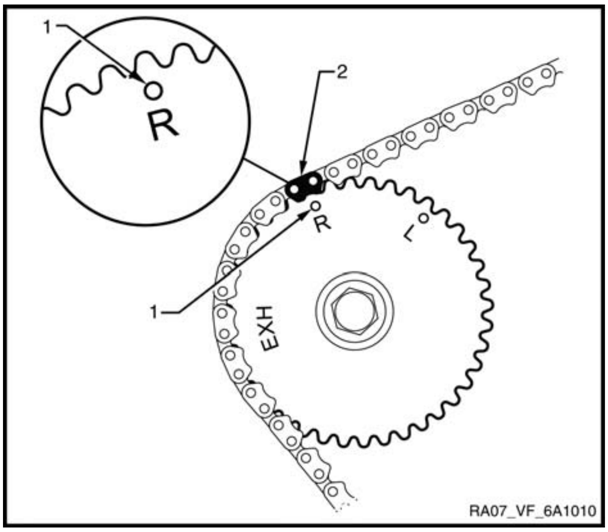

Figure 6A1 – 270

9 Align the bright plated timing chain link (1) with the intake sprocket alignment triangle mark (2).

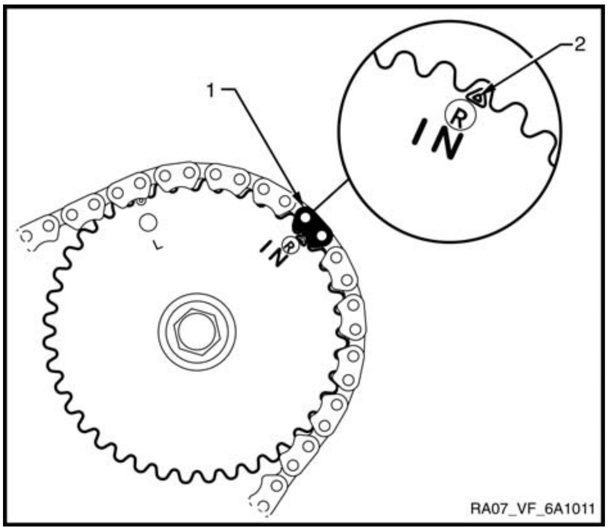

Figure 6A1 – 271

CAUTION

Ensure that the right-hand secondary timing chain guide is used when installing to the right-hand side in this procedure.

10 Ensure that the right-hand secondary timing chain guide is selected and orientated correctly.

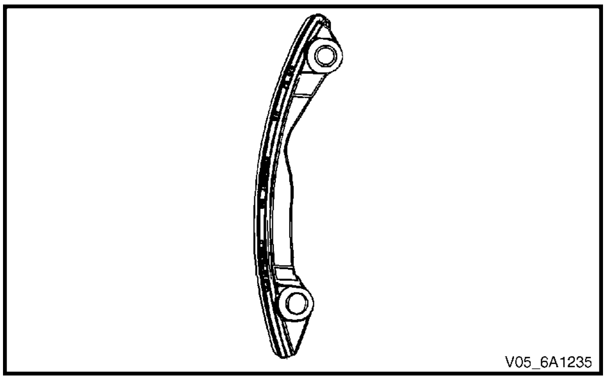

Figure 6A1 – 272

11 Position the chain guide (2).

12 Install the secondary timing chain guide bolts (1) and tighten to the correct torque specification.

Secondary timing chain guide attaching bolt torque specification	20.0 – 26.0 Nm

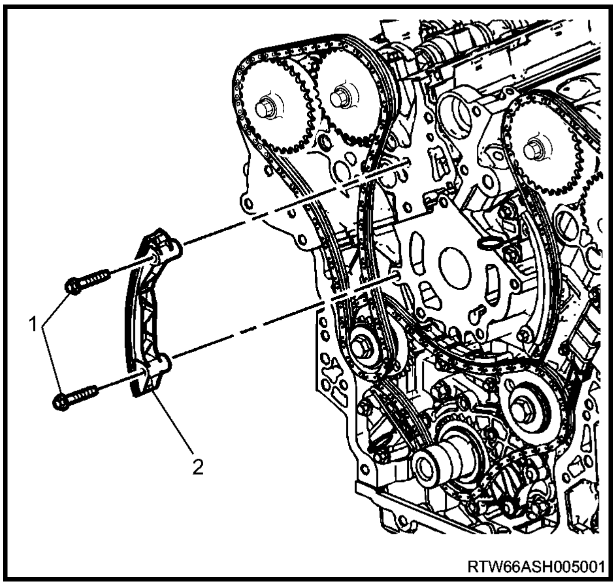

Figure 6A1 – 273

13 Ensure the right-hand secondary timing chain shoe is selected and orientated correctly.

CAUTION

The right-hand secondary camshaft drive shoe is marked with the letters 'RH'. Ensure that the right-hand drive shoe is used when installing to the right-hand side in this procedure and that the letters 'RH" are facing the front of the vehicle when installed.

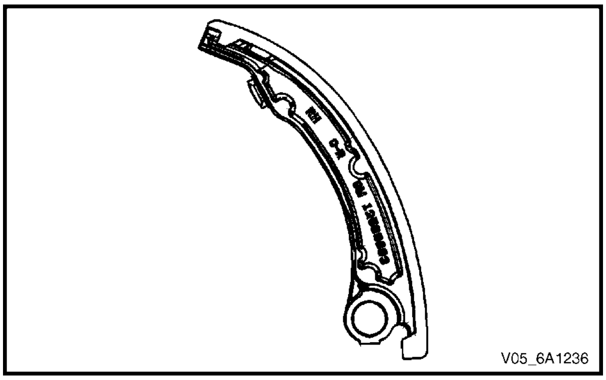

Figure 6A1 – 274

14 Position the right-hand secondary timing chain shoe (1).

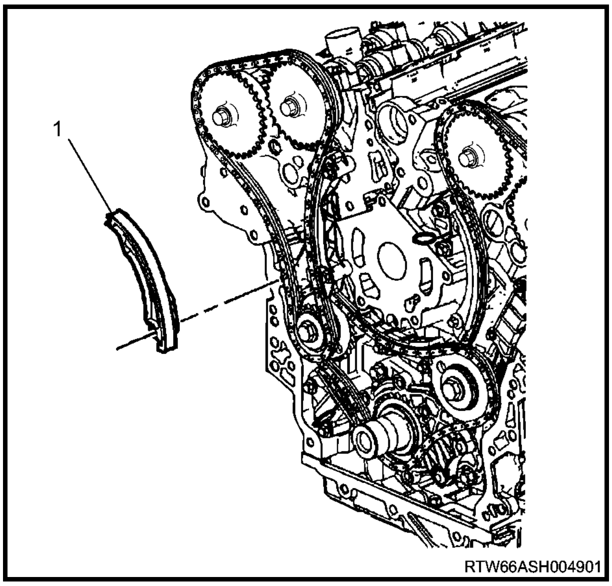

Figure 6A1 – 275

15 Install the secondary timing chain shoe bolt (1) and tighten to the correct torque specification.

Secondary timing chain shoe attaching bolt torque specification...........20.0 – 26.0 Nm

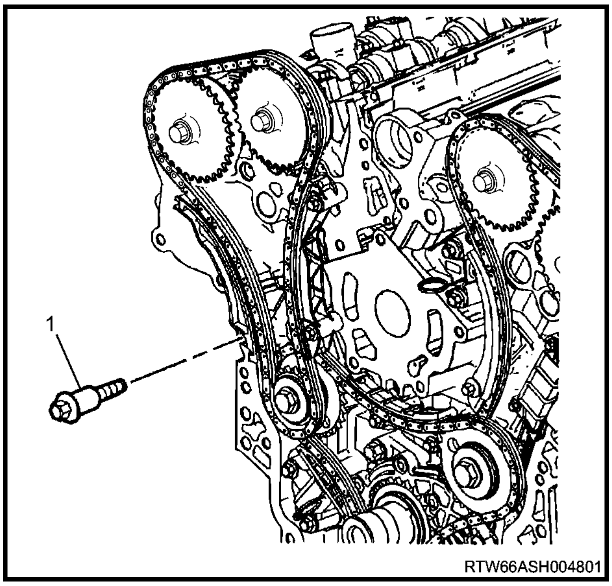

Figure 6A1 – 276

16 Ensure the right-hand secondary timing chain tensioner is selected and orientated correctly.

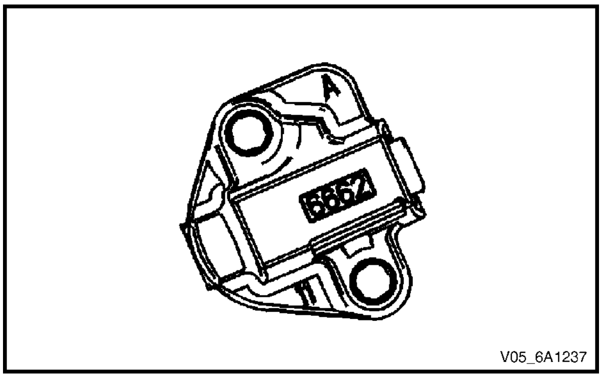

Figure 6A1 – 277

17 Reset the right-hand secondary timing chain tensioner.

NOTE

To reset the tensioner, use a suitably sized flat blade screwdriver (1) or Tool No. J 45027 to wind the plunger in a clockwise direction, into the tensioner shaft (2).

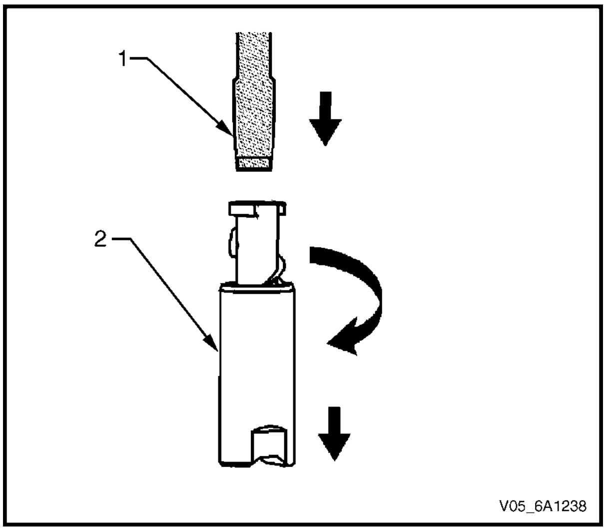

Figure 6A1 – 278

18 Install the tensioner shaft (1) into the right-hand secondary timing chain tensioner body (2).

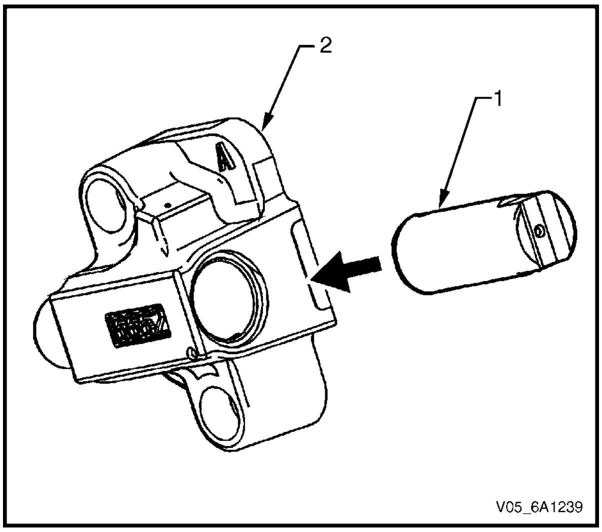

Figure 6A1 – 279

19 Compress the tensioner shaft into the body and lock the tensioner by inserting Tool No. EN 46112 into the access hole in the side of the tensioner body.

20 Slowly release pressure on the right-hand secondary timing chain tensioner. The tensioner should remain compressed.

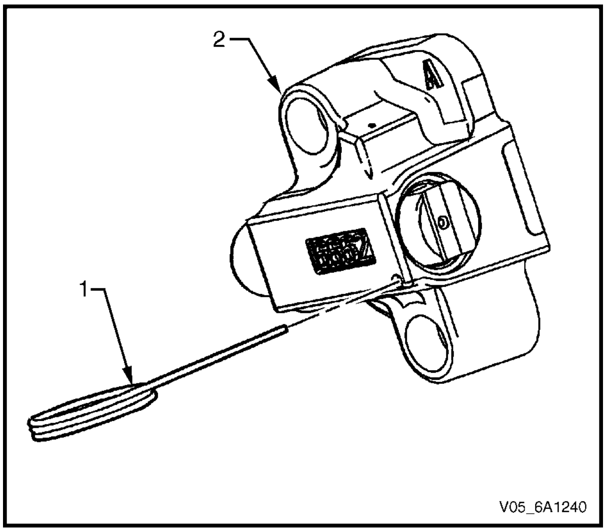

Figure 6A1 – 280

21 Install a new right-hand secondary timing chain tensioner gasket (1) to the tensioner (2).

22 Install the right-hand secondary timing chain tensioner bolts (3) through the tensioner and gasket.

23 Ensure the right-hand secondary timing chain tensioner mounting surface on the right-hand cylinder head does not have any burrs or defects that would affect the sealing of the new tensioner gasket.

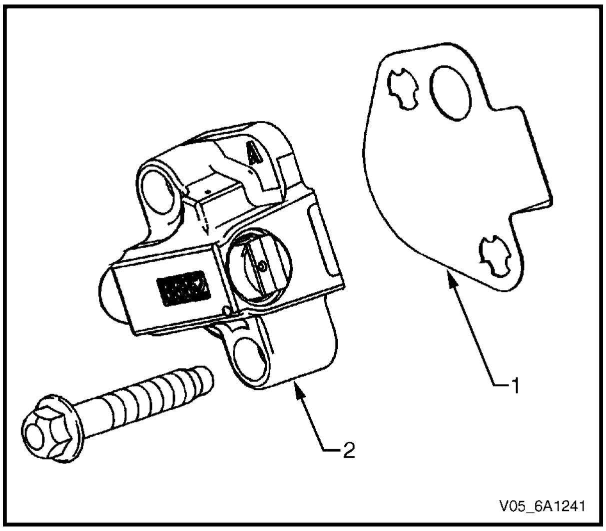

Figure 6A1 – 281

24 Place the right-hand secondary timing chain tensioner (2) into position and loosely install the bolts (1) to the engine block.

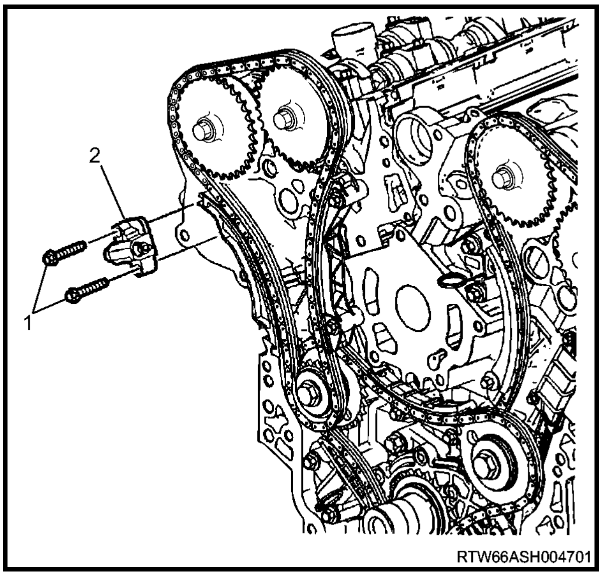

Figure 6A1 – 282

25 Verify the proper placement of the right-hand secondary timing chain tensioner gasket tab (1).

26 Tighten the right-hand secondary timing chain tensioner bolts (2) to the correct torque specification.

Secondary timing chain tensioner attaching bolt torque specification...........20.0 – 26.0 Nm

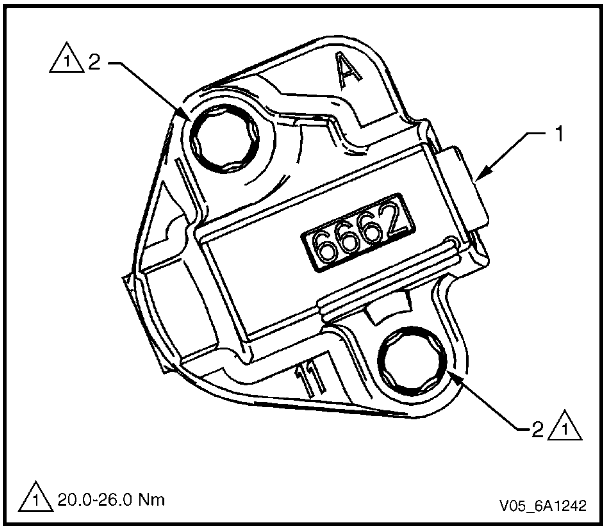

Figure 6A1 – 283

27 Release the right-hand timing chain tensioner (1) by pulling out Tool No. EN 46112 (2) and unlocking the tensioner plunger.

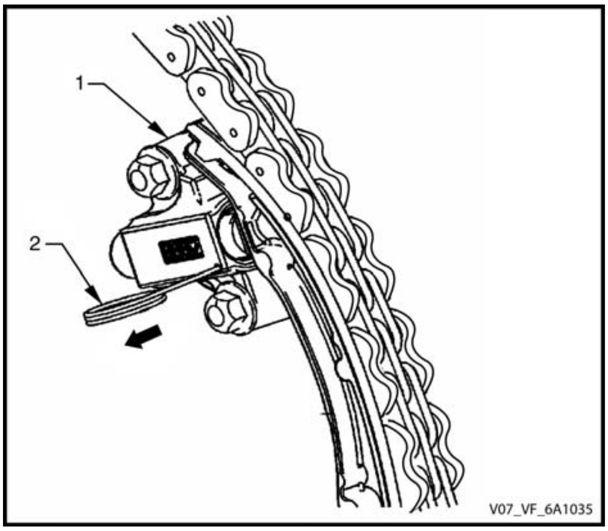

Figure 6A1 – 284

28 Verify all primary and secondary timing chain timing mark alignments (1 to 18).

29 Remove Tool No. EN 46105–1 and EN 46105-2 from the left and right-hand cylinder head camshafts.

30 Reinstall the spark plugs. Refer to Section 6C1-3 Engine Management – V6 – Service Operations.

31 Reinstall the engine front cover assembly, refer to 3.15 Front Cover Assembly.

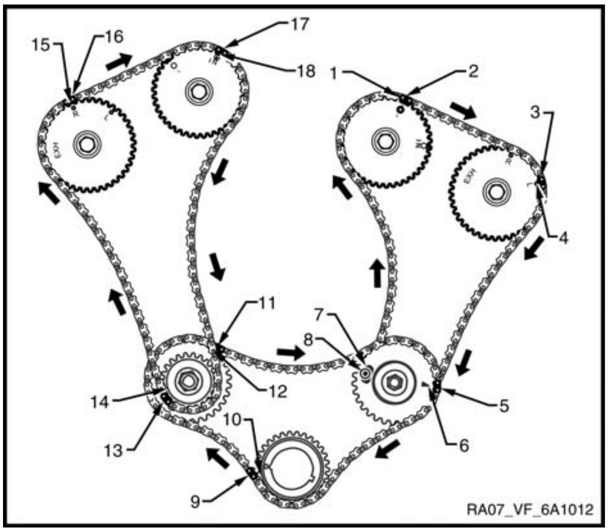

Figure 6A1 – 285

3.17 Oil Pump Assembly

Remove

NOTE

Do not remove the left-hand bank idler sprocket.

1 Remove the primary timing chain and crankshaft sprocket, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.

2 Remove the three bolts (1) attaching the oil pump (2).

3 Remove the oil pump assembly.

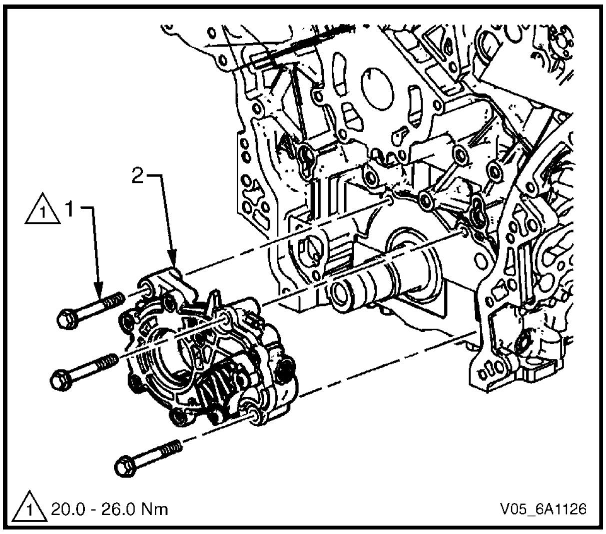

Figure 6A1 – 286

Disassemble

CAUTION

There are no serviceable components within the oil pump. Disassemble the pump only to diagnose an oil related concern. A disassembled oil pump must not be reused: it must be replaced.

1 Remove the two bolts (1) attaching the primary timing chain lower guide (2) and remove the guide.

CAUTION

The primary timing chain lower guide is not serviced separately and is part of the oil pump assembly. If it is removed from the pump assembly, the guide and the pump must be replaced.

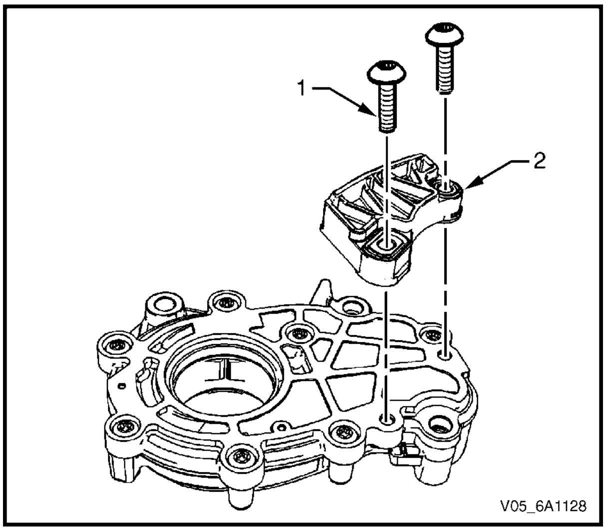

Figure 6A1 – 287

2 Remove the seven bolts (2) attaching the oil pump cover to the oil pump housing (1) and remove the cover from the housing.

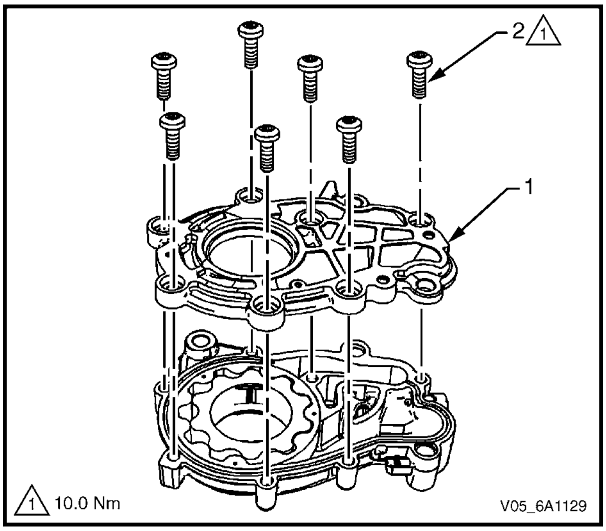

Figure 6A1 – 288

3 Remove the inner gerotor ring (1).

4 Remove the outer gerotor ring (2).

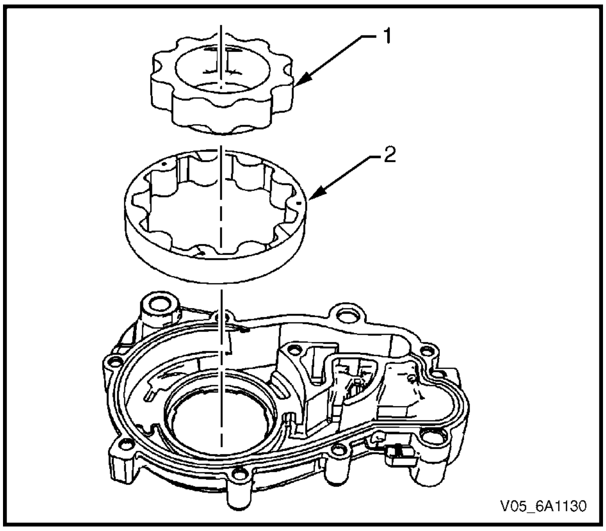

Figure 6A1 – 289

5 Remove the clip (1), retaining the oil relief valve cap (2).

6 Remove the cap, spring (3) and plunger (4) from the oil pump housing.

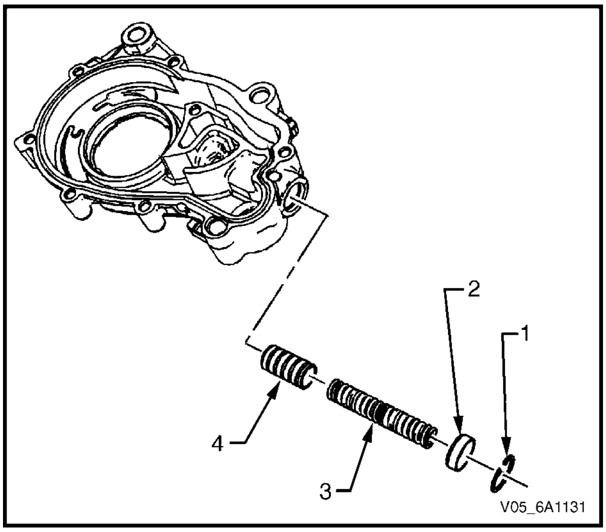

Figure 6A1 – 290

Clean

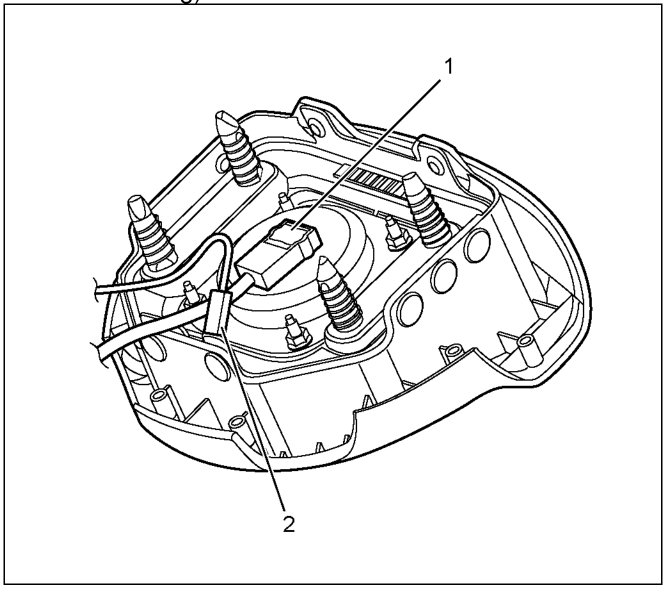
1 Clean the oil pump components with non-corrosive solvent.

WARNING

Safety glasses must be worn when using compressed air.

2 Dry the oil pump components with compressed air.

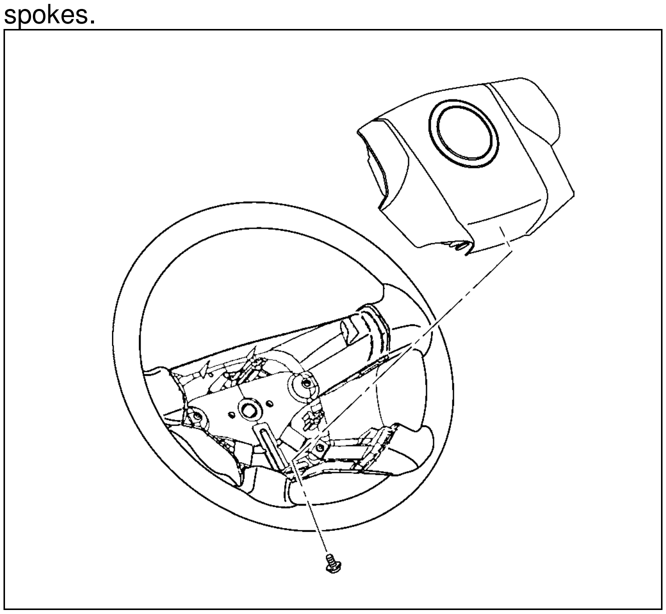
11. Disconnect the SRS air bag connector (1) and horn lead connector (2) located behind the air bag assembly and remove the air bag assembly (with SRS air bag).



RTW73BSH001101

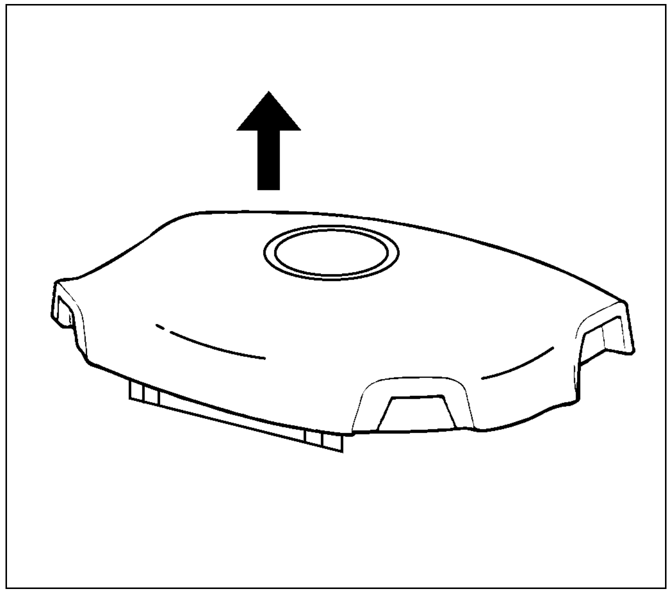
12. Remove the horn pad and the horn leads at the center of the wheel (without SRS air bag).

NOTE: It should be removed first from the bottom spokes.



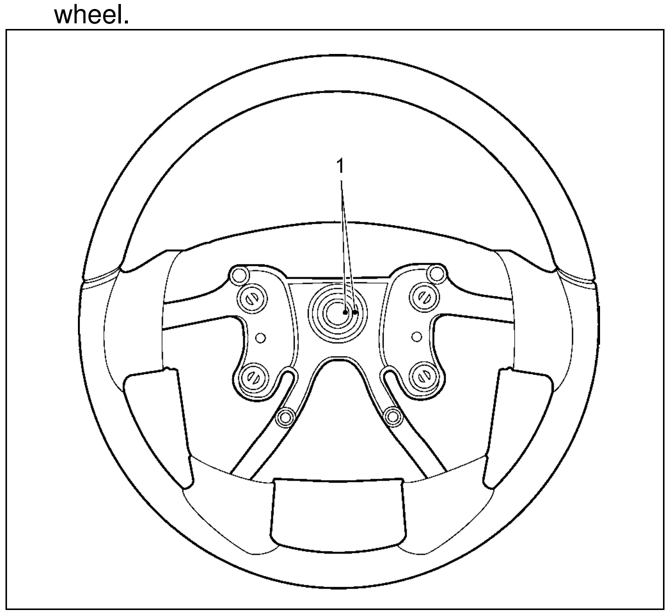
RTW73BSH000601

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE COVER SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT (with SRS air bag).



430R300007

13. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position. Move the front wheels to the straight ahead position, then use steering wheel remover 5-8521-0016-0 (2) to remove the steering wheel.



RTW73BSH000501

CAUTION: Never apply force to the steering wheel in the direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

Inspect

1 Inspect the oil pump housing for damage.

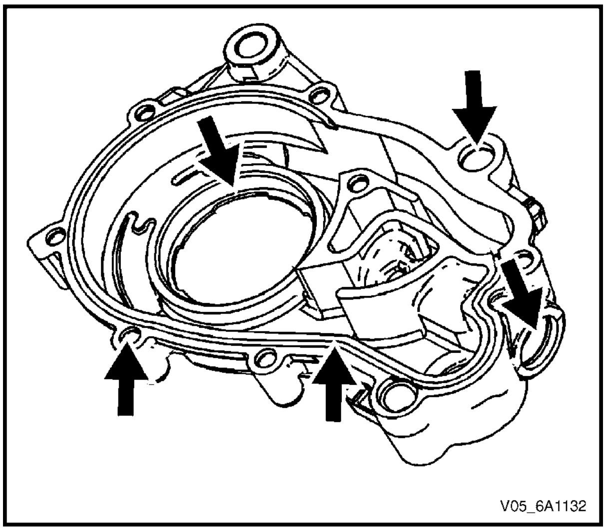


Figure 6A1 – 291

2 Inspect the oil pump cover for damage.

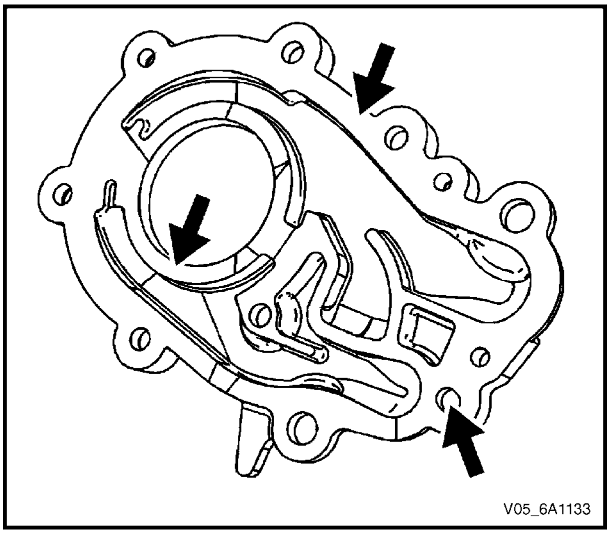

Figure 6A1 – 292

3 Inspect the inner drive gear for damage. If inner surface damage is found, ensure the crankshaft is also inspected.

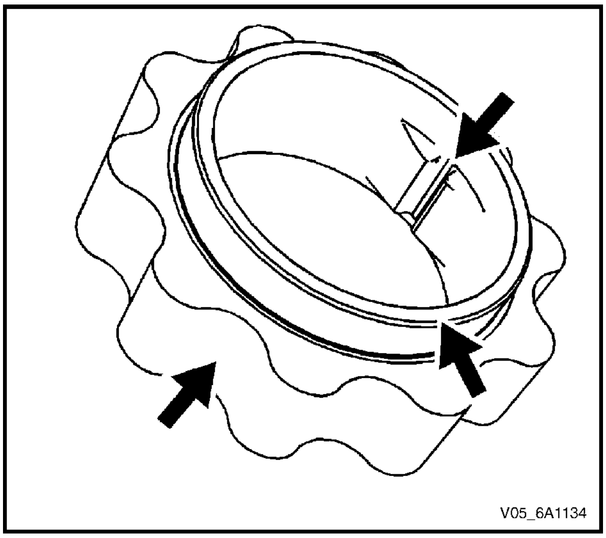

Figure 6A1 – 293

4 Inspect the outer driven gear for damage.

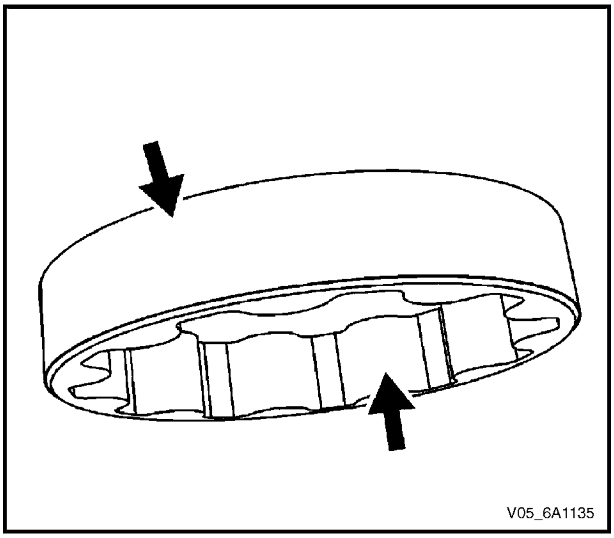

Figure 6A1 – 294

5 Inspect the oil pump relief valve components for debris or damage.

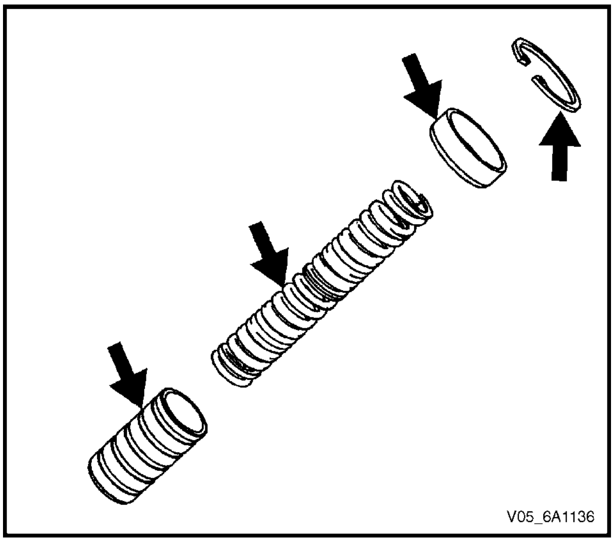

Figure 6A1 – 295

6 Inspect the primary camshaft chain lower guide for damage. If replacement of the primary camshaft chain lower guide is required, replace the entire oil pump assembly as the primary camshaft chain lower guide is not serviceable separately.

7 If debris or damage is present within the oil pump, further inspection of all of the engine components is required.

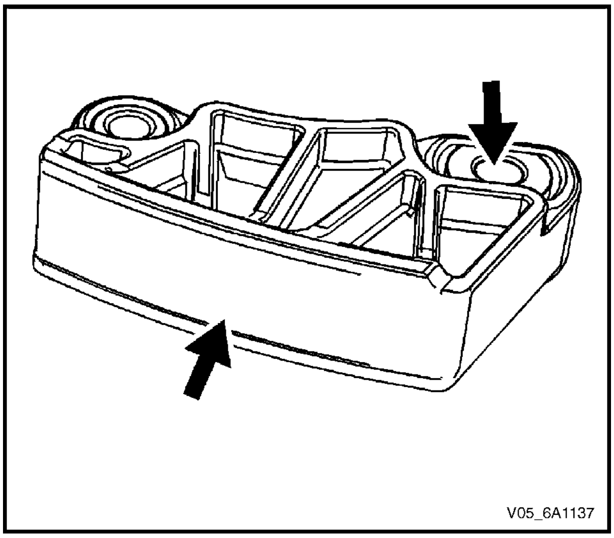

Figure 6A1 – 296

Reassemble

CAUTION

As there are no serviceable components within the oil pump, a disassembled oil pump must be replaced.

Reinstall

1. Align the oil pump gerotor with the crankshaft flats and fit the oil pump assembly to the engine block.
2. Align the pump body (2) with the mounting holes in the cylinder block.
3. Install the oil pump bolt (1), three places, and tighten to the correct torque specification.
4. Install the primary timing chain, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.

Oil pump attaching bolt torque specification	20.0 – 26.0 Nm

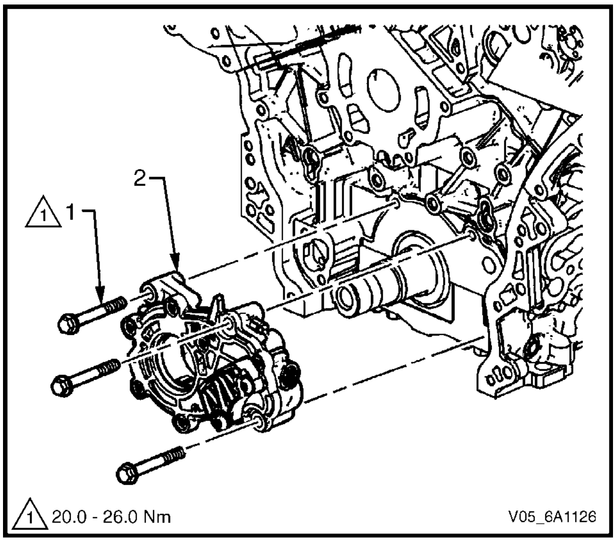

Figure 6A1 – 297

3.18 Camshaft Sprocket – Excluding MY06 Update

CAUTION

Setting the camshaft timing is required whenever the camshaft drive system is disturbed to ensure the relationship between any chain and sprocket is not lost. Even when only one sprocket is involved, multiple crankshaft rotations will not produce conditions where correct timing can be confirmed.
If required, follow the Left-hand Secondary Camshaft Chain Components reinstallation procedure to reset the camshaft timing.

Remove

Right-hand Side

1 Remove the right-hand camshaft cover, refer to 3.12 Camshaft Cover.

2 Remove the camshaft position sensors, refer to Section 6C1-3 Engine Management – Service Operations.

3 Remove the camshaft position actuator solenoids, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

4 Remove the crankshaft balancer assembly, refer to 3.13 Crankshaft Balancer Assembly.

5 Install the crankshaft rotation socket Tool No. EN-46111 onto the crankshaft.

6 Rotate the crankshaft until the camshafts are in a neutral low tension position. The camshaft flats will be parallel with the camshaft cover rail (1).

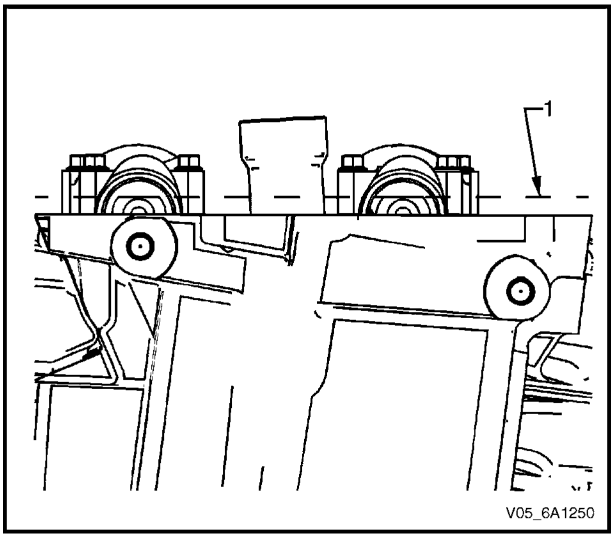

Figure 6A1 – 298

7 Install Tool No. EN-46105 – 1 (1) onto the rear of the right-hand cylinder head (3) camshafts (2).

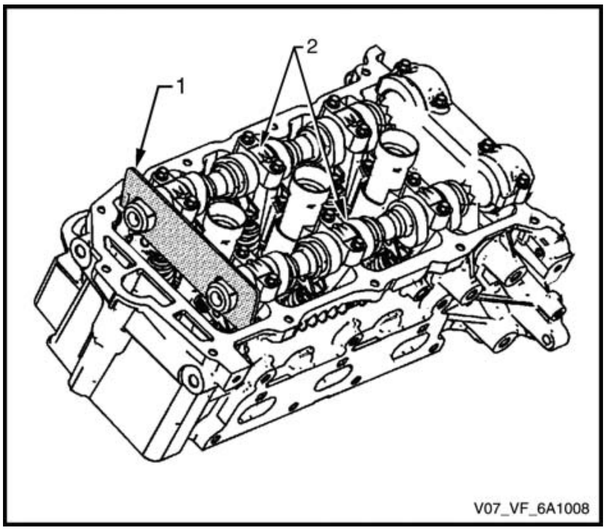

Figure 6A1 – 299

NOTE

Use an open-end spanner (1) at the camshaft hex (2) to prevent camshaft/engine rotation.

NOTE

Do not remove the camshaft sprocket bolt (3) at this time.

8 Loosen the camshaft sprocket bolt (3).

NOTE

If you have already removed the camshaft timing chain proceed to step 12

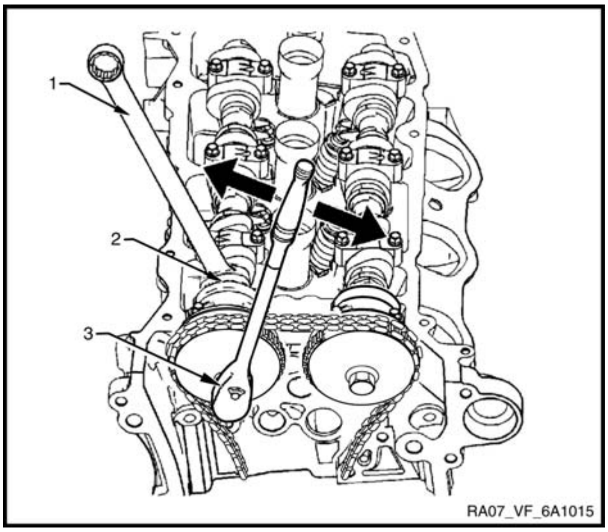

Figure 6A1 – 300

CAUTION

Ensure the tips of Tool No. EN-46108 are fully engaged into the timing chain and the wing nuts are tight and the timing chain is taught.

9 Install Tool No. EN-46108 (1 and 2) to retain the timing chain (3 and 4).

10 Firmly tighten the wing nuts of Tool No. EN-46108.

11 Mark the timing chain and the respective location on both camshaft sprocket.

NOTE

Ensure the camshaft timing chain and the camshaft sprocket are marked for correct reassembly.

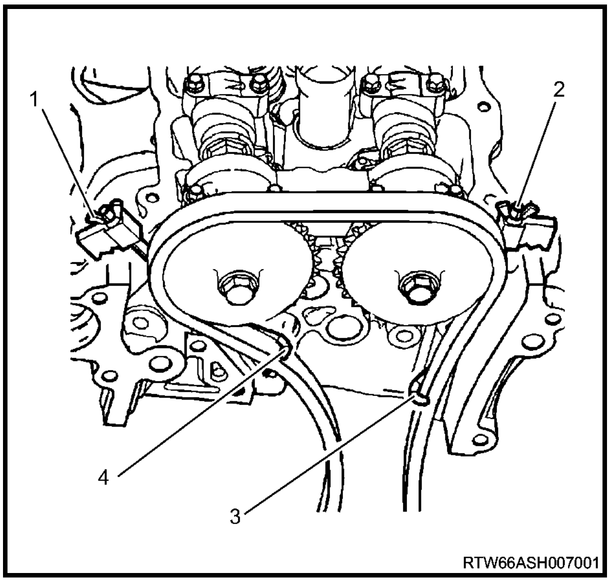

Figure 6A1 – 301

12 Remove the bolt (1) attaching the right-hand exhaust camshaft sprocket (2) and remove the sprocket.

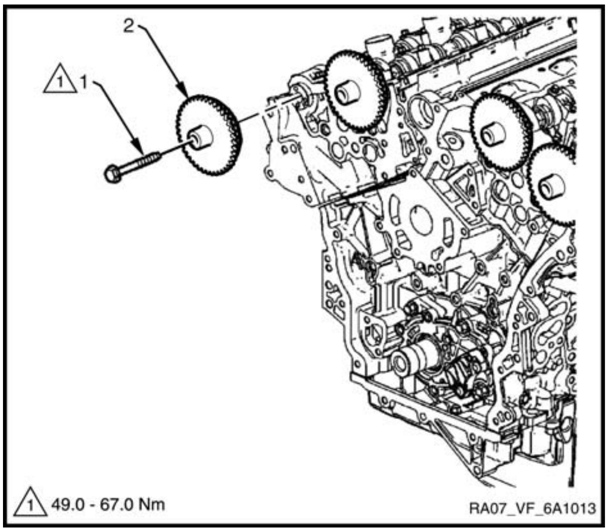

Figure 6A1 – 302

13 Remove the bolt (1) attaching right-hand intake camshaft sprocket (2) and remove the sprocket.

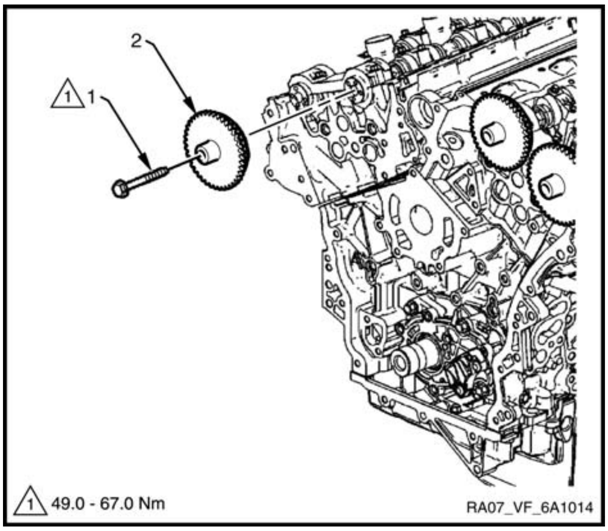

Figure 6A1 – 303

Left-hand Side

1 Remove the left-hand camshaft cover, refer to 3.12 Camshaft Cover.

2 Remove the camshaft position sensors, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

3 Remove the camshaft position actuator solenoids, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

4 Remove the crankshaft balancer assembly, refer to 3.13 Crankshaft Balancer Assembly.

5 Install the crankshaft rotation socket Tool No. EN-46111 onto the crankshaft.

6 Rotate the crankshaft until the camshafts are in a neutral low tension position. The camshaft flats will be parallel with the camshaft cover rail (1).

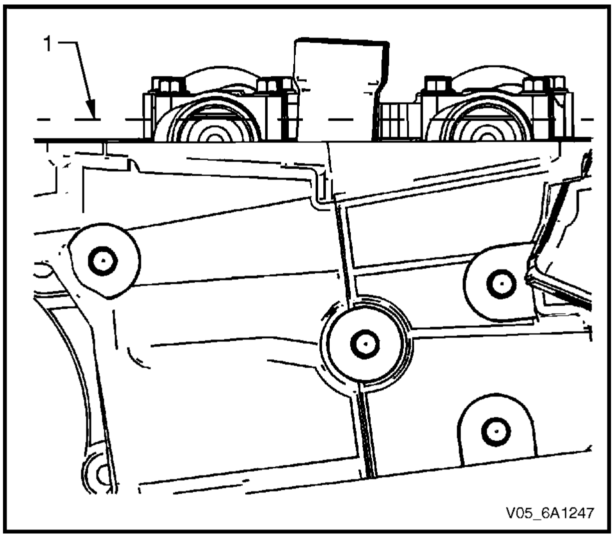

Figure 6A1 – 304

7 Install Tool No. EN-46105 – 1 (1) onto the rear of the left-hand cylinder head camshafts (2).

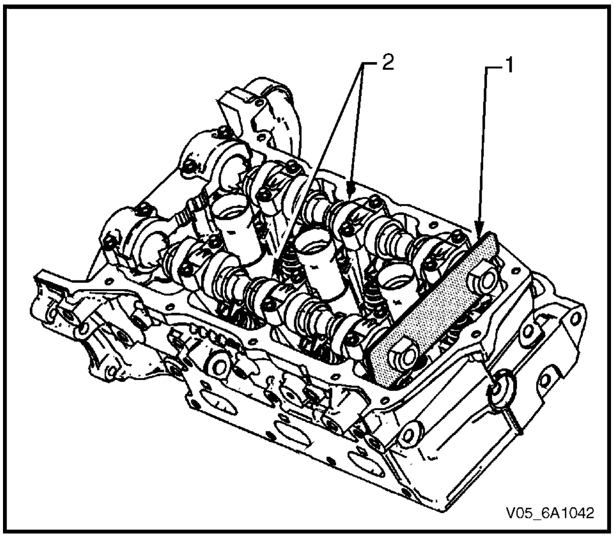

Figure 6A1 – 305

NOTE

Use an open-end wrench (1) at the camshaft hex (2) to prevent camshaft/engine rotation.

NOTE

Do not remove the camshaft sprocket bolt (3) at this time.

8 Loosen the camshaft sprocket bolt (3).

NOTE

If the camshaft timing chain has already been removed proceed to Step 12.

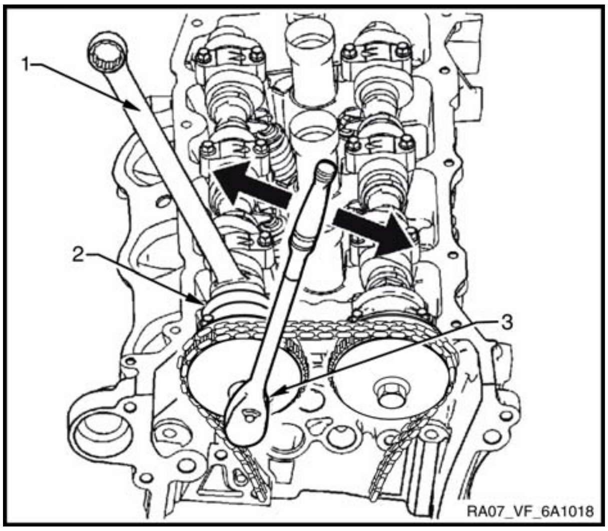

Figure 6A1 – 306

CAUTION

Ensure the tips of Tool No. EN-46108 are fully engaged into the timing chain and the wing nuts are tight and the timing chain is taught.

9 Install Tool No. EN-46108 (1 and 2) to retain the timing chain (3 and 4).

10 Firmly tighten the wing nuts of Tool No. EN-46108.

NOTE

Ensure the camshaft timing chain and the camshaft sprocket are marked for correct reassembly.

11 Mark the timing chain and the respective location on both camshaft sprocket.

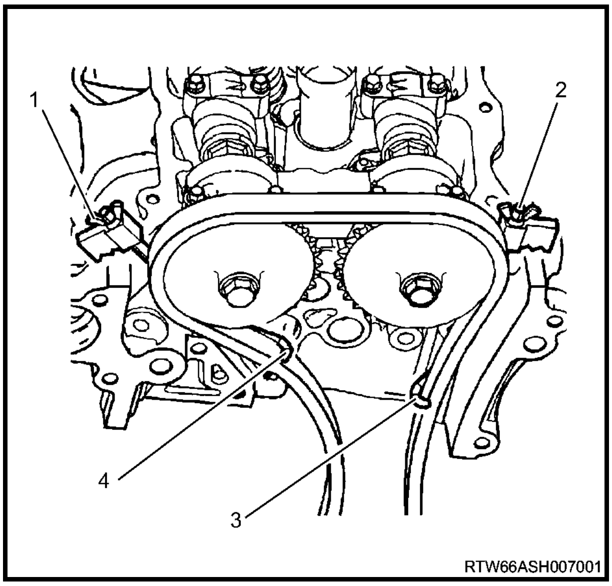

Figure 6A1 – 307

12 Remove the bolt (1) attaching the left-hand exhaust camshaft sprocket (2) and remove the sprocket.

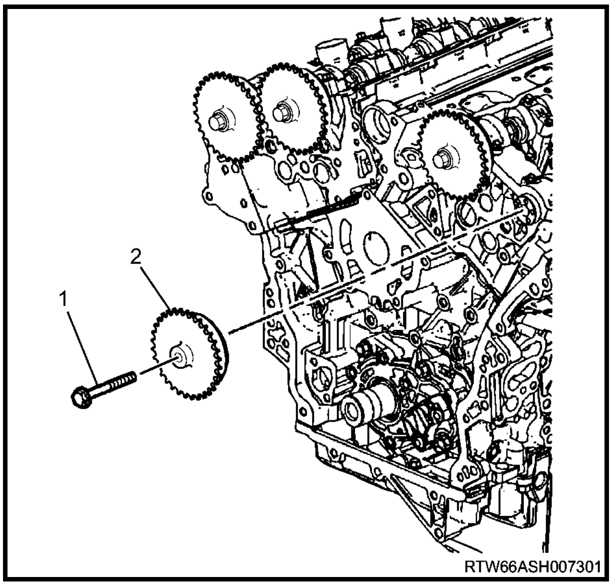

Figure 6A1 – 308

13 Remove the bolt (1) attaching left-hand intake camshaft sprocket (2) and remove the sprocket.

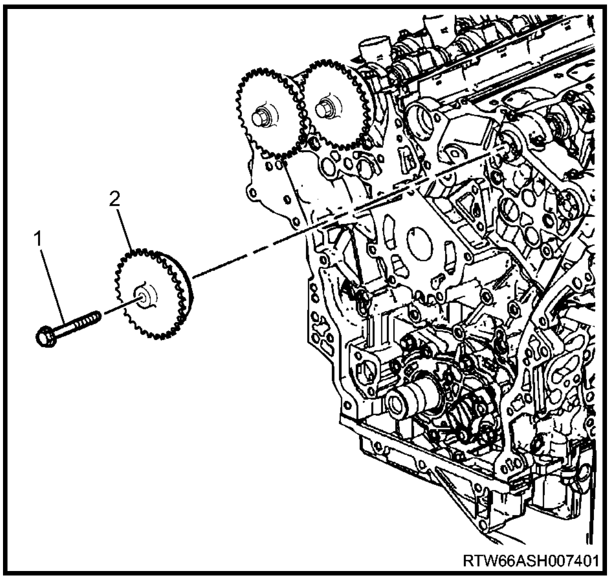

Figure 6A1 – 309

Clean

1 Clean the exterior of each camshaft sprocket with solvent.

WARNING

Safety glasses must be worn when using compressed air.

2 Dry the timing components with compressed air.

Inspect

1 Inspect the front of each sprocket for the following:

- Sprocket damage (1), and
- Sprocket bolt seating inner hub damage (2).

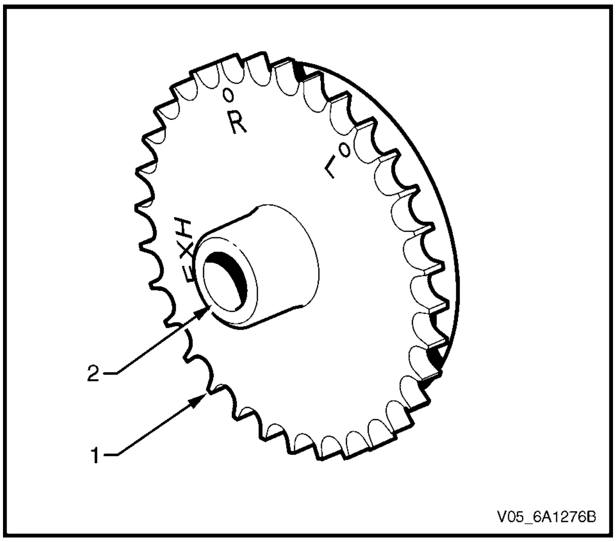

Figure 6A1 – 310

2 Inspect the back of each sprocket for the following:

- Sprocket damage (1),
- Camshaft locating pin damage (2) and,
- Camshaft seating/sealing inner hub flange damage (3),

NOTE

These checks apply to both the inlet and exhaust camshaft sprockets.

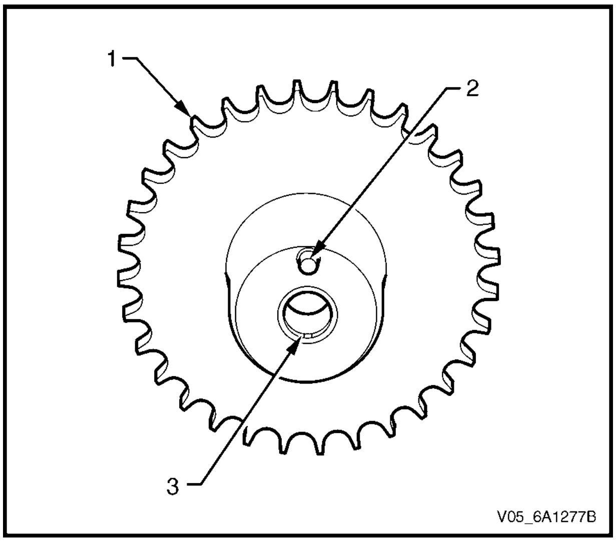

Figure 6A1 – 311

Reinstall

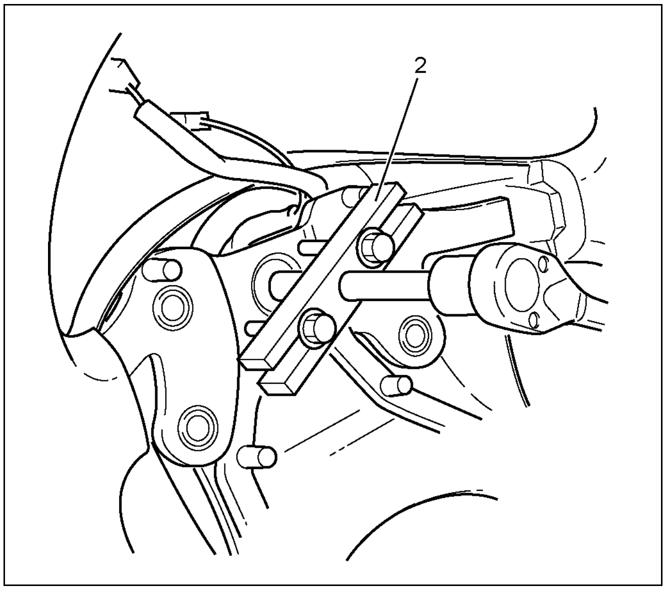
Reinstallation of the camshaft sprockets is the reverse of the removal procedure, noting the following:

1 Align the sprockets and timing chain with the marks made during removal.

2 Tighten the camshaft sprocket bolts to the correct torque specification.

Camshaft sprocket attaching bolt torque specification ....49.0 – 67.0 Nm

3 Remove the timing chain retention tools.



RTW73BSH001301

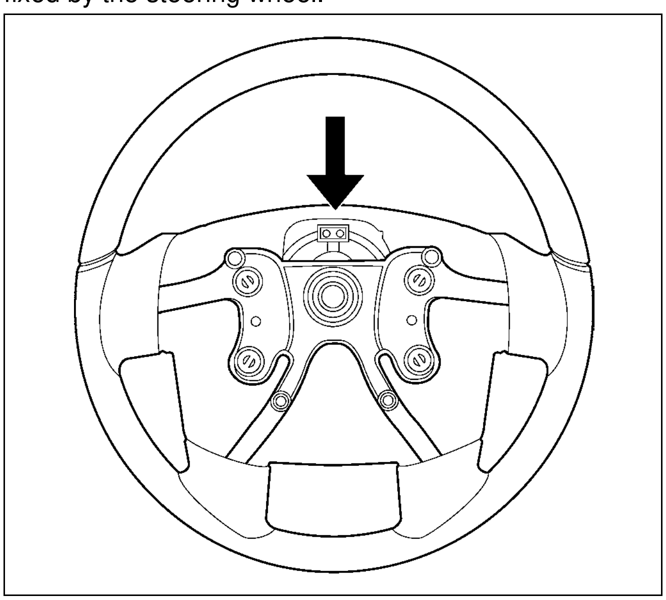
14. Remove steering column cover.
15. Disconnect the wiring harness connectors located under the steering column then remove combination switch and SRS coil assembly.

Installation

1. Align the setting marks made when removing, then install steering wheel.

   Refer to the adjustment method in case a mark has not been applied in this section.

NOTE: Confirm SRS and horn harness connector is fixed by the steering wheel.

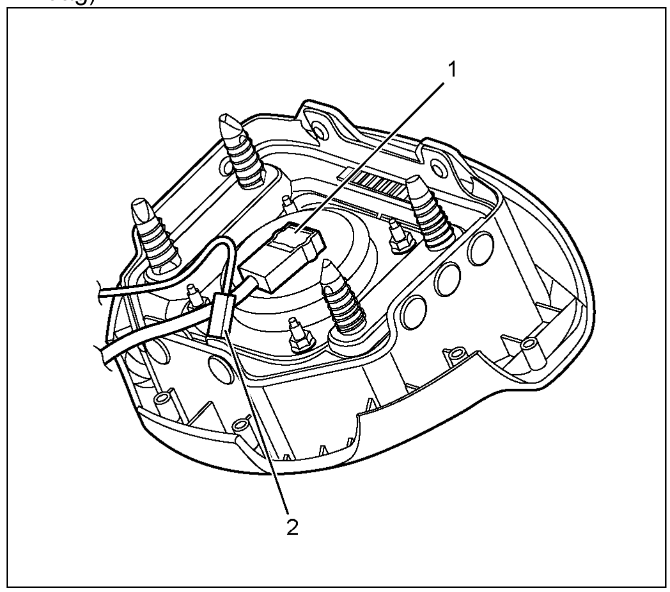


RTW73BSH000701

CAUTION: Never apply force to the steering wheel in the direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

2. Tighten the steering wheel fixing nut to the specified torque.

   Torque: 35 N·m (3.6 kgf·m/26 lb·ft)
3. Support the inflator module and carefully connect the SRS connector (1) and horn lead (2) (with SRS air bag).

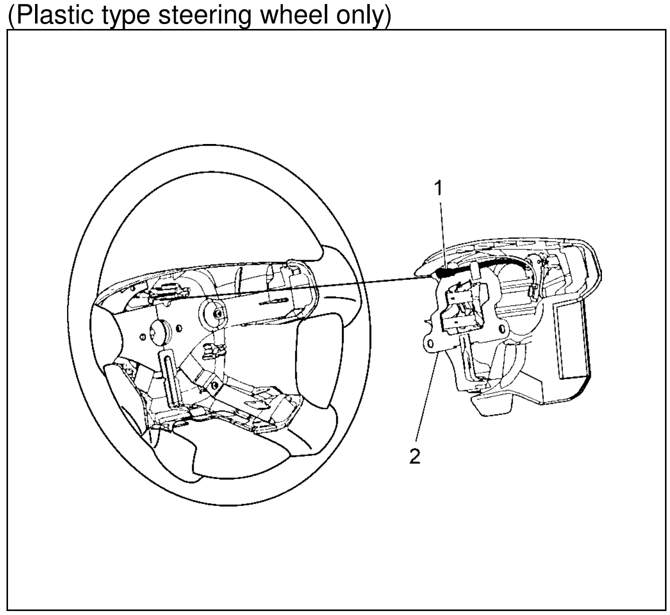


RTW73BSH001101

4. Connect the horn leads at center of wheel (without SRS air bag).

NOTE: The horn leads (1) are passed along the top of the bracket (2).

(Plastic type steering wheel only)



RTW73BSH000801

3.19 Camshaft Sprocket – MY06 Update

CAUTION

Setting the camshaft timing is required whenever the camshaft drive system is disturbed to ensure the relationship between any chain and sprocket is not lost. Even when only one sprocket is involved, multiple crankshaft rotations will not produce conditions where correct timing can be confirmed.
If required, follow the Left-hand Secondary Camshaft Chain Components reinstallation procedure to reset the camshaft timing.

Remove

Right-hand Side

1 Remove the right-hand camshaft cover, refer to 3.12 Camshaft Cover.
2 Remove the camshaft position sensors, refer to Section 6C1-3 Engine Management – Service Operations.
3 Remove the camshaft position actuator solenoids, refer to Section 6C1-3 Engine Management – V6 – Service Operations.
4 Remove the crankshaft balancer assembly, refer to 3.13 Crankshaft Balancer Assembly.
5 Install the crankshaft rotation socket Tool No. EN-46111 onto the crankshaft.
6 Rotate the crankshaft until the camshafts are in a neutral low tension position. The camshaft flats will be parallel with the camshaft cover rail (1).

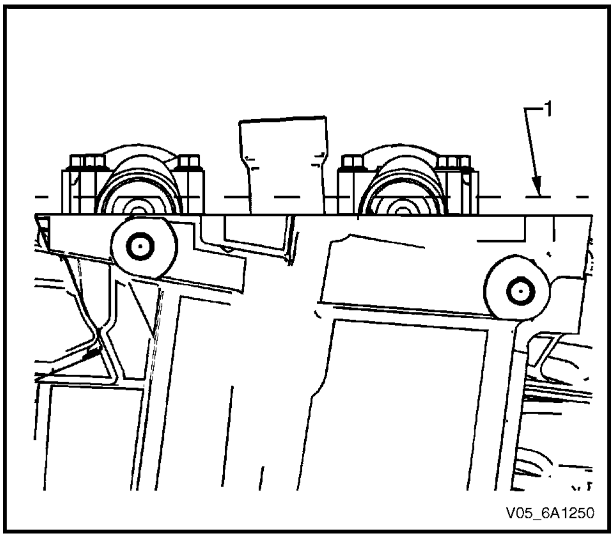


Figure 6A1 – 312

7 Install Tool No. EN-46105–1 (1) onto the rear of the right-hand cylinder head (3) camshafts (2).

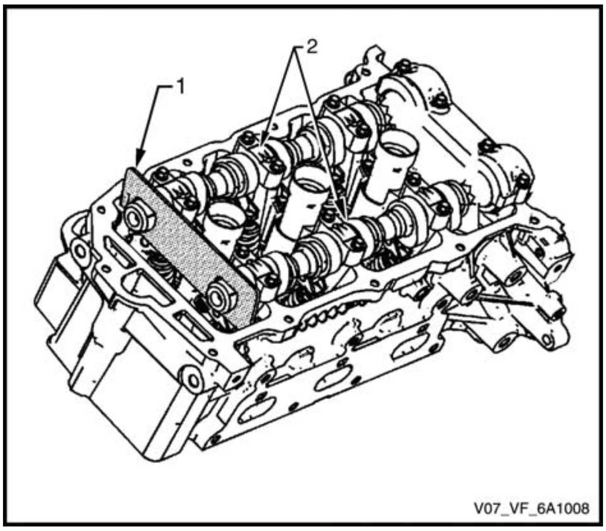

Figure 6A1 – 313

NOTE

Use an open-end spanner (1) at the camshaft hex (2) to prevent camshaft/engine rotation.

NOTE

Do not remove the camshaft sprocket bolt (3) at this time.

8 Loosen the camshaft sprocket bolt (3).

NOTE

If you have already removed the camshaft timing chain proceed to Step 12

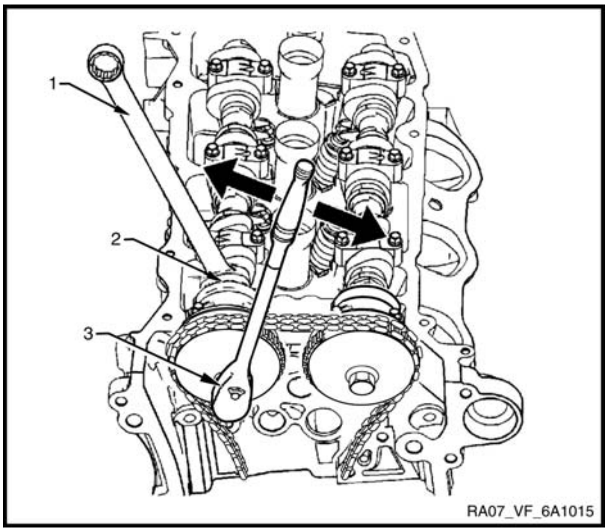

Figure 6A1 – 314

NOTE

The front engine cover is removed in the following graphic for illustration purposes and is not required to be removed to perform this procedure.

9 Loosen the timing chain retention Tool No. EN 48313 so that the legs are retracted.

10 Insert the Tool No. EN 48313 between the camshaft actuators, rearward of the timing chain until the top line that is scribed into the body of the tool (1) is adjacent to the top surface of the cylinder head (2). This is the approximate installed position.

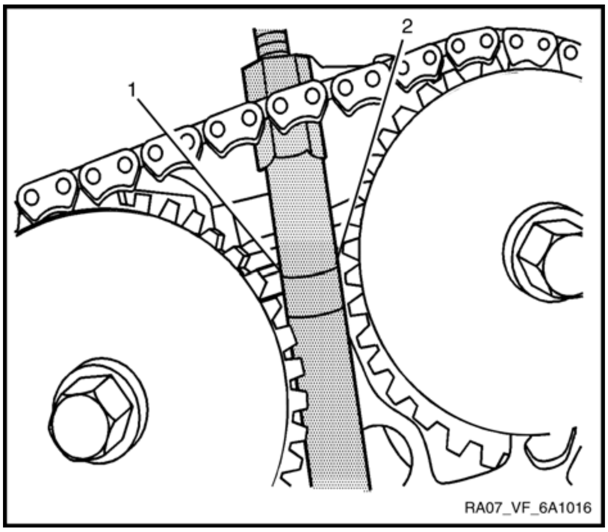

Figure 6A1 – 315

11 Ensure that the feet (2) of the Tool No. EN 48313 are facing the front of the engine.

CAUTION

DO NOT tighten the Tool No. EN 48313 at this stage.

12 Partially expand the legs (1) on the Tool No. EN 48313 by turning the T-shaped handle clockwise.

CAUTION

Ensure the feet (2) of the Tool No. EN 48313 are correctly engaged into one of the link pockets to prevent the chain from slipping during tightening.

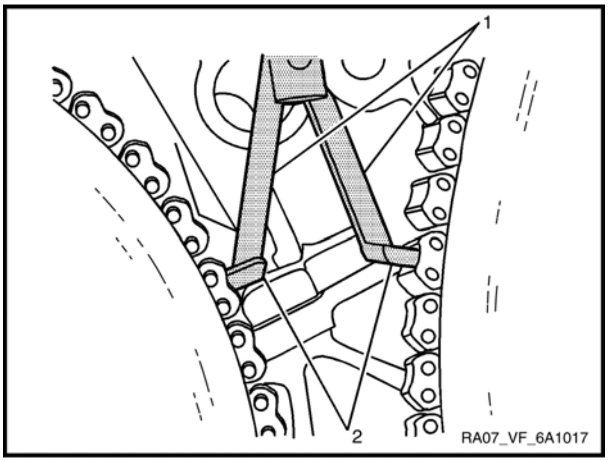

Figure 6A1 – 316

13 Continue expanding the Tool No. EN 48313 until the feet (2) contact the timing chain.

14 Hand tighten the Tool No. EN 48313. DO NOT allow the body of the Tool No. EN 48313 to rotate when tightening the T-handle.

15 Use an open-end spanner on the hex cast into both the right intake and exhaust camshafts and rotate the camshafts towards each other in order to create slack in the chain between the actuators.

16 The Tool No. EN 48313 is now correctly installed to hold the timing chain in position.

NOTE

Ensure the camshaft timing chain and the camshaft position actuators are marked for correct reassembly.

17 Mark the timing chain and the respective location on both camshaft position actuators.

18 Remove the bolt (1) attaching the right-hand exhaust camshaft sprocket (2) and remove the sprocket.

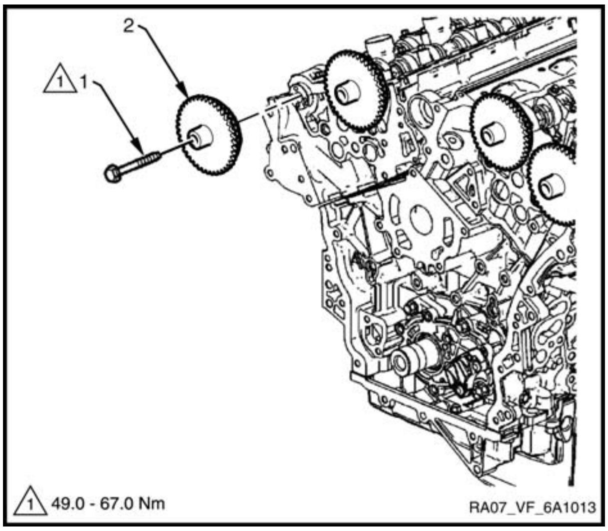

Figure 6A1 – 317

19 Remove the bolt (1) attaching right-hand intake camshaft sprocket (2) and remove the sprocket.

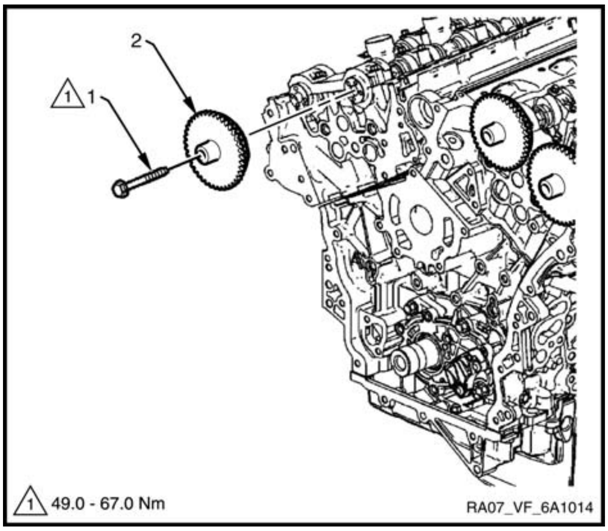

Figure 6A1 – 318

Left-hand Side

1 Remove the left-hand camshaft cover, refer to 3.12 Camshaft Cover.

2 Remove the camshaft position sensors, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

3 Remove the camshaft position actuator solenoids, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

4 Remove the crankshaft balancer assembly, refer to 3.13 Crankshaft Balancer Assembly.

5 Install the crankshaft rotation socket Tool No. EN-46111 onto the crankshaft.

6 Rotate the crankshaft until the camshafts are in a neutral low tension position. The camshaft flats will be parallel with the camshaft cover rail (1).

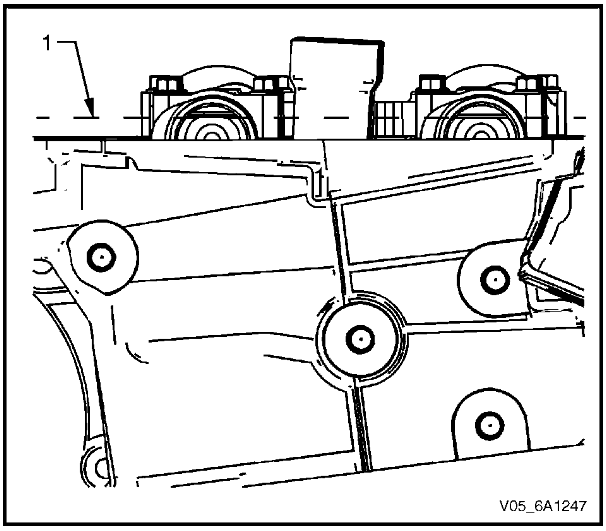

Figure 6A1 – 319

7 Install Tool No. EN-46105–1 (1) onto the rear of the left-hand cylinder head camshafts (2).

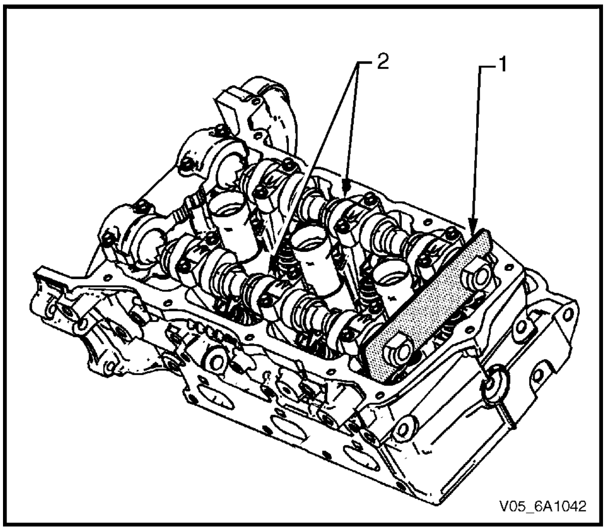

Figure 6A1 – 320

NOTE

Use an open-end wrench (1) at the camshaft hex (2) to prevent camshaft/engine rotation.

NOTE

Do not remove the camshaft sprocket bolt (3) at this time.

8 Loosen the camshaft sprocket bolt (3).

NOTE

If the camshaft timing chain has already been removed proceed to Step 12.

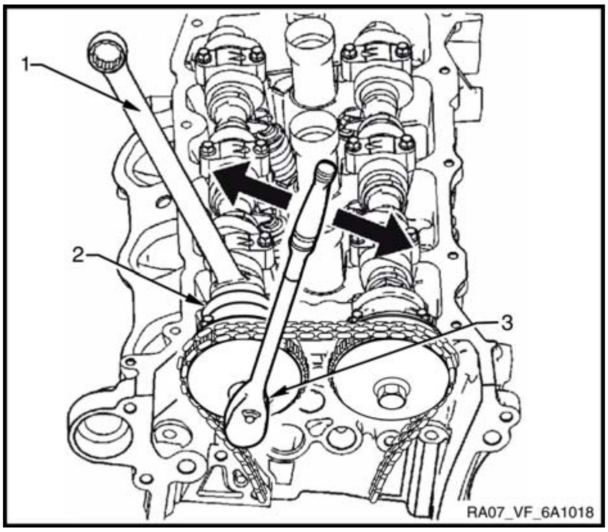

Figure 6A1 – 321

NOTE

The front engine cover is removed in the following graphic for illustration purposes and is not required to be removed to perform this procedure.

9 Loosen the timing chain retention Tool No. EN 48313 so that the legs are retracted.

10 Insert the Tool No. EN 48313 between the camshaft actuators, rearward of the timing chain until the top line that is scribed into the body of the tool (1) is adjacent to the top surface of the cylinder head (2). This is the approximate installed position.

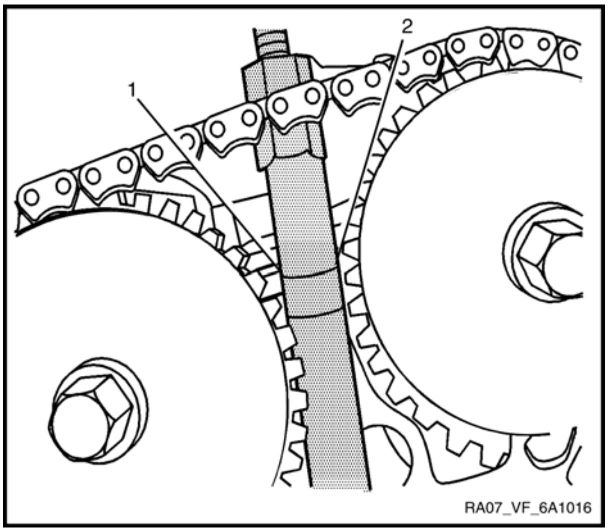

Figure 6A1 – 322

11 Ensure that the feet (2) of the Tool No. EN 48313 are facing the front of the engine.

CAUTION

DO NOT tighten the Tool No. EN 48313 at this stage.

12 Partially expand the legs (1) on the Tool No. EN 48313 by turning the T-shaped handle clockwise.

CAUTION

Ensure the feet (2) of the Tool No. EN 48313 are correctly engaged into one of the link pockets to prevent the chain from slipping during tightening.

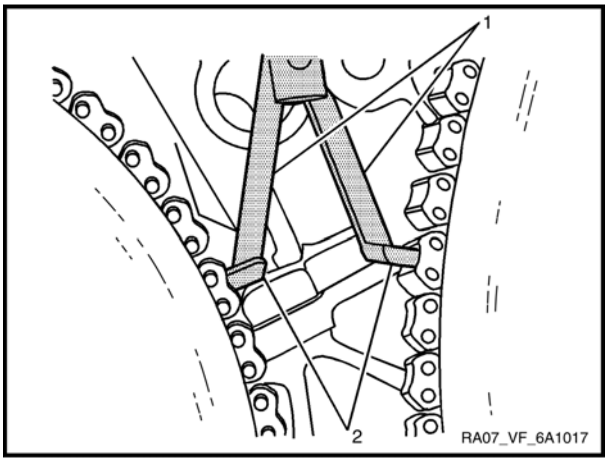

Figure 6A1 – 323

13 Continue expanding the Tool No. EN 48313 until the feet (2) contact the timing chain.

14 Hand tighten the Tool No. EN 48313. DO NOT allow the body of the Tool No. EN 48313 to rotate when tightening the T-handle.

15 Use an open-end spanner on the hex cast into both the left intake and exhaust camshafts and rotate the camshafts towards each other in order create slack in the chain between the actuators.

16 The Tool No. EN 48313 is now correctly installed to hold the timing chain in position.

NOTE

Ensure the camshaft timing chain and the camshaft position actuators are marked for correct reassembly.

17 Mark the timing chain and the respective location on both camshaft position actuators.

18 Remove the bolt (1) attaching the left-hand exhaust camshaft sprocket (2) and remove the sprocket.

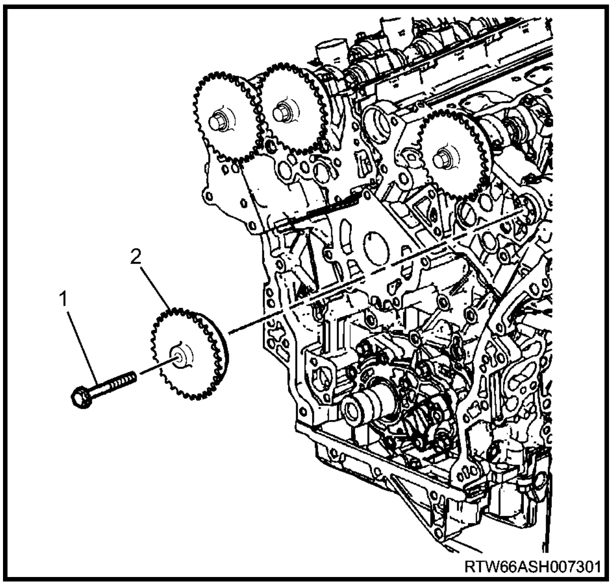

Figure 6A1 – 324

13 Remove the bolt (1) attaching left-hand intake camshaft sprocket (2) and remove the sprocket.

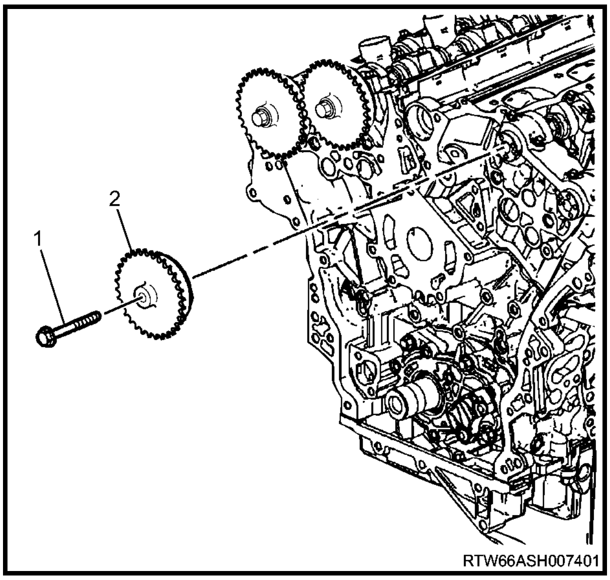

Figure 6A1 – 325

Clean

1 Clean the exterior of each camshaft sprocket with solvent.

WARNING

Safety glasses must be worn when using compressed air.

2 Dry the timing components with compressed air.

Inspect

1 Inspect the front of each sprocket for the following:

- Sprocket damage (1), and
- Sprocket bolt seating inner hub damage (2).

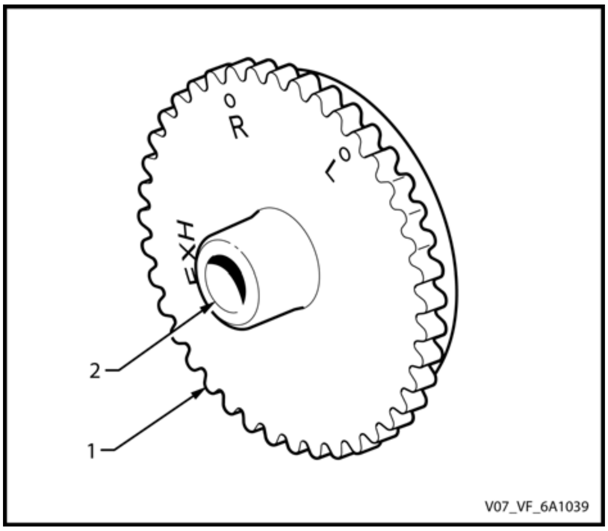

Figure 6A1 – 326

2 Inspect the back of each sprocket for the following:

- Sprocket damage (1),
- Camshaft locating pin damage (2) and,
- Camshaft seating/sealing inner hub flange damage (3),

NOTE

These checks apply to both the inlet and exhaust camshaft sprockets.

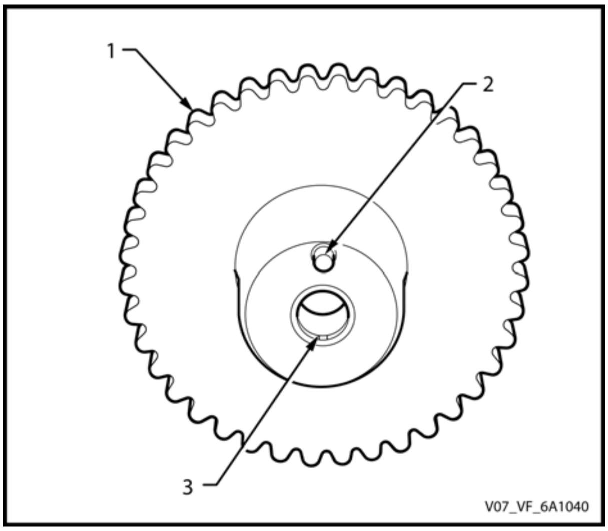

Figure 6A1 – 327

Reinstall

Reinstallation of the camshaft sprockets is the reverse of the removal procedure, noting the following:

1 Align the sprockets and timing chain with the marks made during removal.

2 Tighten the camshaft sprocket bolts to the correct torque specification.

Camshaft sprocket attaching bolt torque specification ....49.0 – 67.0 Nm

3 Remove the timing chain retention tools.

3.20 Camshaft

Remove

Right-hand Side

1 Remove the right-hand cylinder head camshaft sprockets, refer to 3.18 Camshaft Sprocket.

NOTE

Tool No. EN-46105–1 was installed as part of the right-hand cylinder head camshaft sprocket removal procedure.

2 Remove the Tool No. EN-46105–1 (1) from the right-hand cylinder head camshafts (2).

NOTE

Tool No. EN-46105 was installed as part of the right-hand cylinder head camshaft sprocket removal procedure.

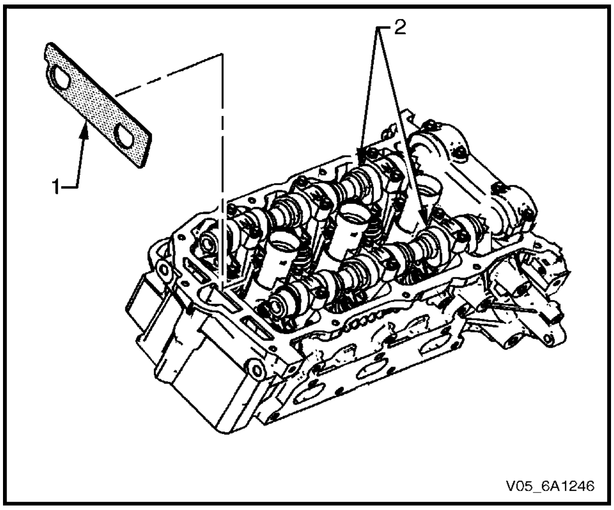

Figure 6A1 – 328

3 Observe the markings (1) on the bearing caps. Each bearing cap is marked to identify its location. The markings have the following meanings:

- The raised feature must always be oriented toward the centre of the cylinder head.
- An I indicates the intake camshaft.
- An E indicates the exhaust camshaft.
- The number indicates the journal position from the front of the engine.

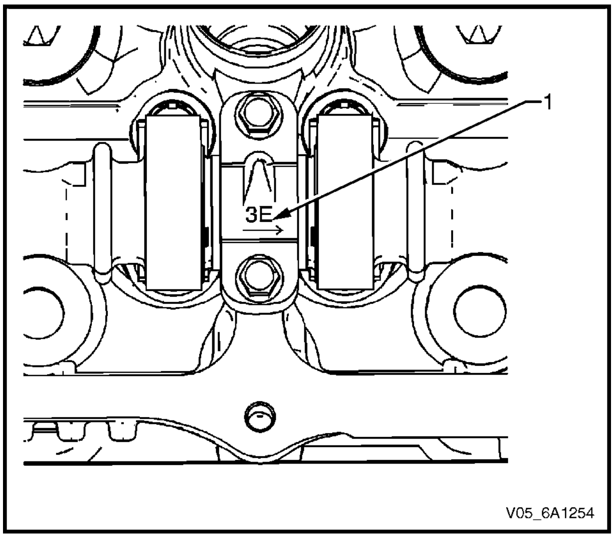

Figure 6A1 – 329

4 Remove the camshaft bearing cap bolts (1) and caps (2).

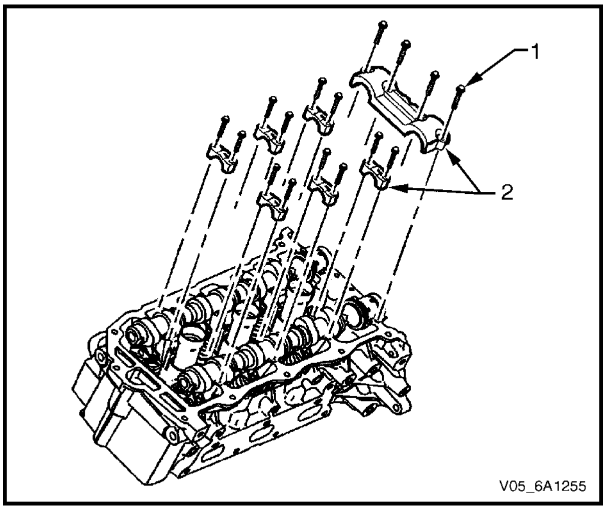

Figure 6A1 – 330

5 Remove the camshafts (1).

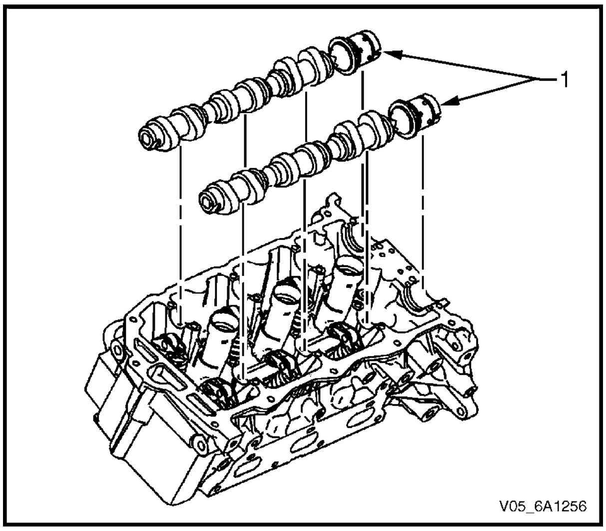

Figure 6A1 – 331

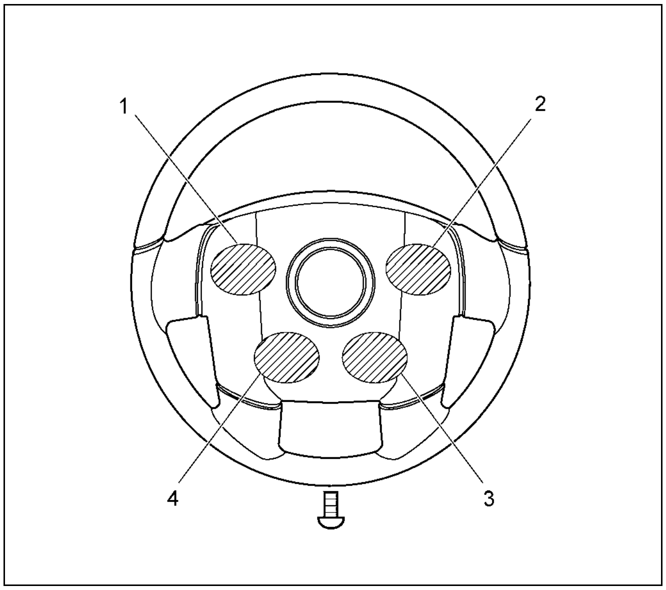
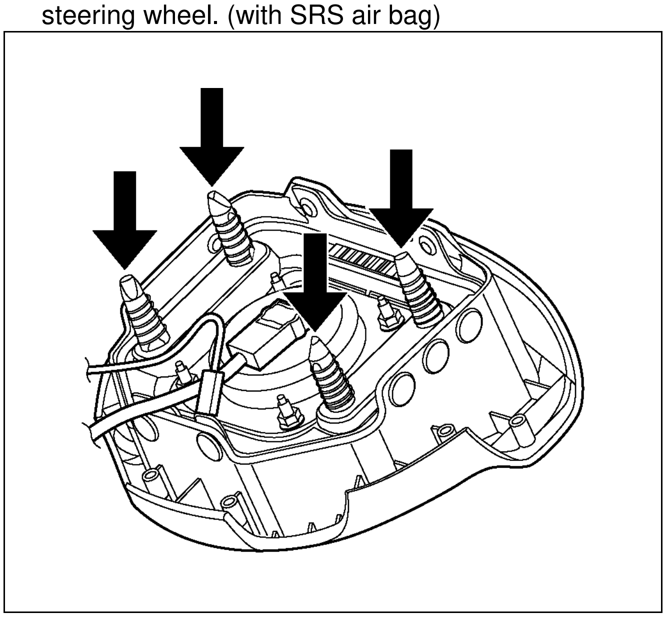
5. Push the horn pad at areas 1-4.
   Tighten the horn pad fixing screw to the specifed torque (without SRS air bag)
   Torque: 3 N·m (0.3 kgf·m/26 lb·in)

NOTE: A horn pad should not be struk during attachment.

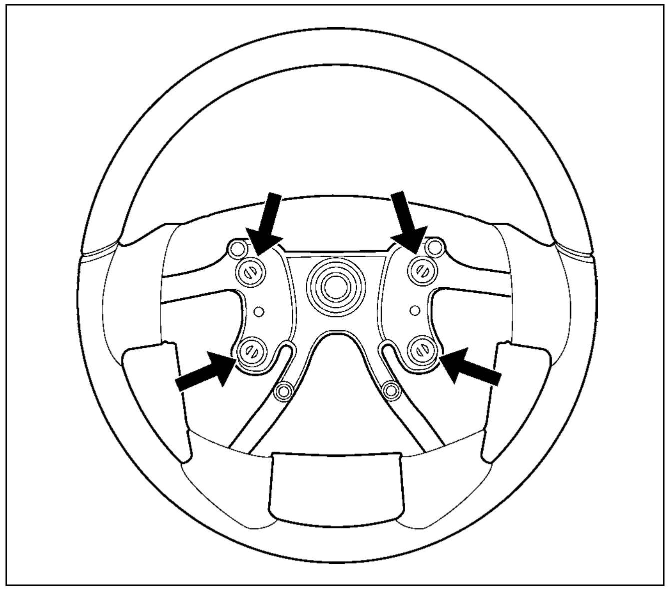


RTW73BSH000201

6. Align each snap stud of driver air bag to the holes on steering wheel. (with SRS air bag)

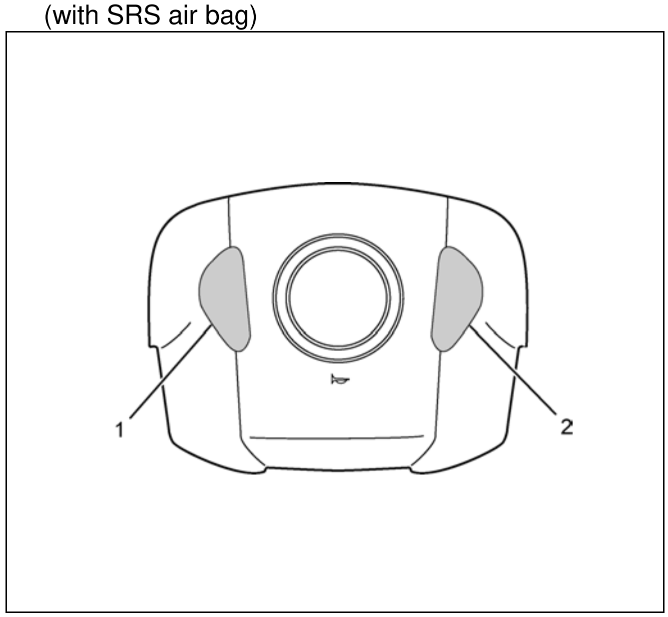


RTW73BSH001201



RTW73BSH000401

7. Push the SRS air at bag at area-1 (1) and area-2 (2). At that time confirm the audible noise of each stud. (with SRS air bag)



RTW73BSH000301

8. Enable the SRS (Refer to "Enabling the SRS" in this section) (with SRS air bag).
9. Connect the SRS connector (with SRS air bag).
10. Connect the battery "-" terminal cable (with SRS air bag).
11. Turn the ignition switch to "ON" while watching warning light and check - the light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

Left-hand Side

1 Remove the left-hand cylinder head camshaft sprockets, refer to 3.18 Camshaft Sprocket.

NOTE

Tool No. EN-46105–1 was installed as part of the left-hand cylinder head camshaft sprocket removal procedure.

2 Remove Tool No. EN-46105–1 (1) from the left-hand camshafts.

NOTE

Tool No. EN-46105 was installed as part of the left-hand cylinder head camshaft position actuator removal procedure.

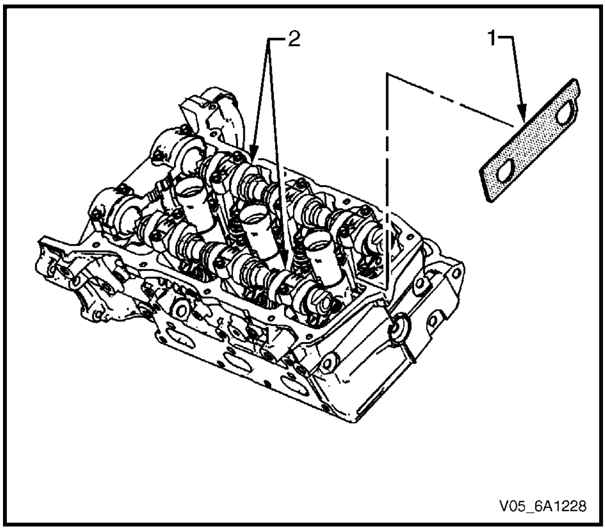


Figure 6A1 – 332

3 Observe the markings (1) on the bearing caps. Each bearing cap is marked in order to identify its location. The markings have the following meanings:

- The raised feature must always be oriented toward the centre of the cylinder head.
- An I indicates the intake camshaft.
- An E indicates the exhaust camshaft.
- The number indicates the journal position from the front of the engine.

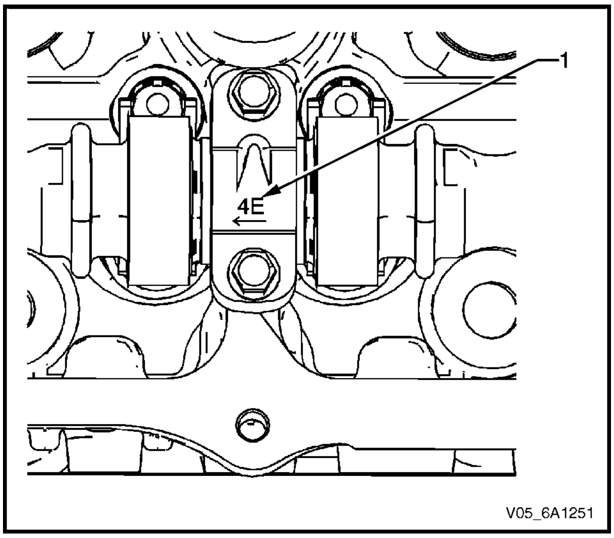

Figure 6A1 – 333

4 Remove the camshaft bearing cap bolts (1) and caps (2).

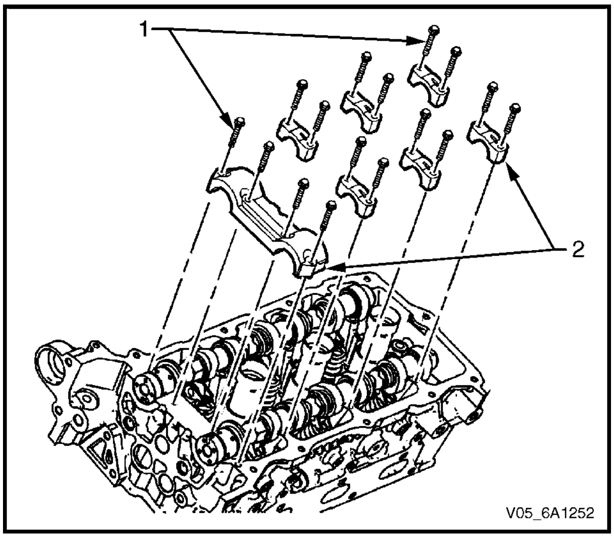

Figure 6A1 – 334

5 Remove the camshafts (1).

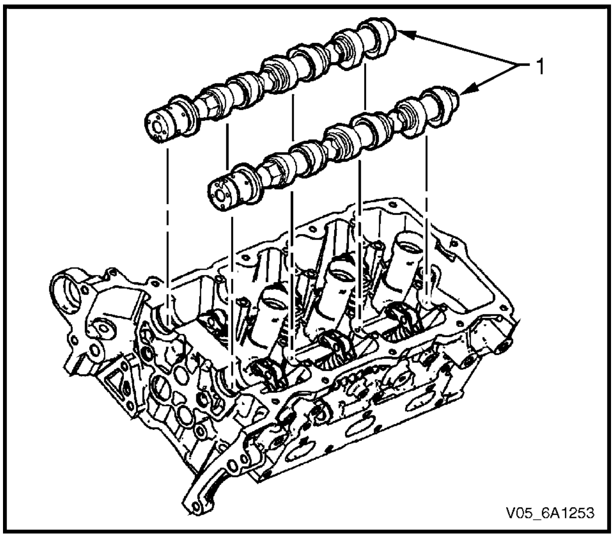

Figure 6A1 – 335

Clean

1 Clean the camshaft in solvent.

WARNING

Safety glasses must be worn when using compressed air.

2 Dry the camshaft with compressed air.

Inspect

Camshaft Visual Inspection

1. Inspect the threaded hole (2) for damage.
2. Inspect the camshaft sprocket locating notch (3) for damage or wear.
3. Inspect the camshaft sealing grooves (4) for damage.
4. Inspect the camshaft thrust surface (5) for damage.
5. Inspect the camshaft lobes (6) and journals (7) for the following conditions:
   - Excessive scoring or pitting
   - Discoloration from overheating
   - Deformation from excessive wear, especially the camshaft lobes
6. If any of the above conditions exist on the camshaft, replace the camshaft.

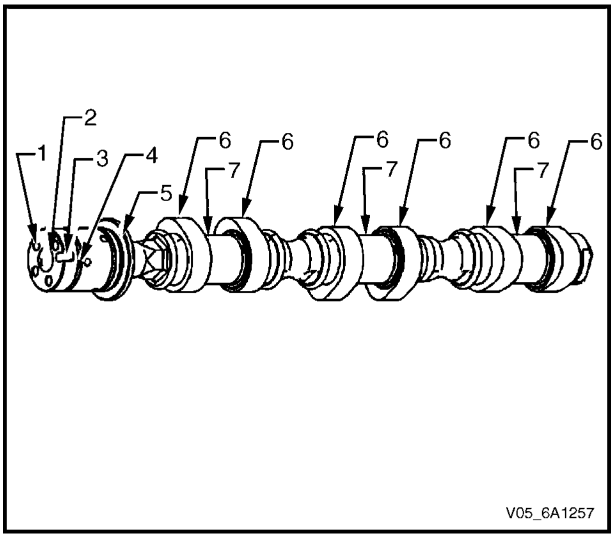

Figure 6A1 – 336

Camshaft Measurement

1. With the camshaft (1) in a suitable fixture (2), measure the camshaft for wear.
2. For camshaft measurement, refer to the following specifications, 5 Specifications.

NOTE

If the camshaft measures outside the specified range, replace the camshaft.

CAUTION

No machining of the camshaft is allowed.

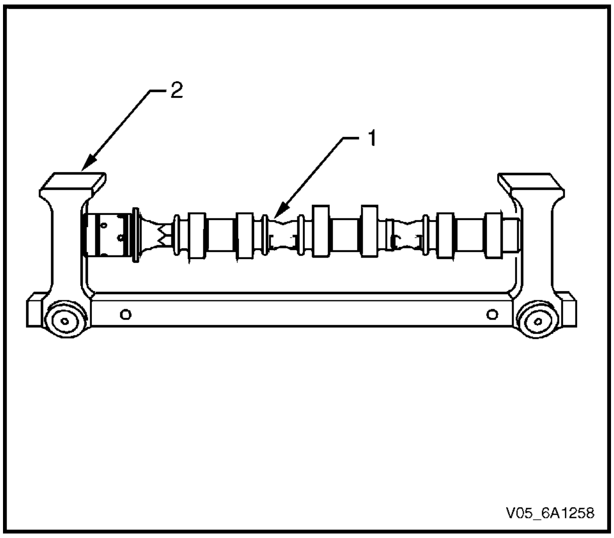

Figure 6A1 – 337

3. Measure the camshaft (2) journals for diameter and out-of-round using an outside micrometer (1).

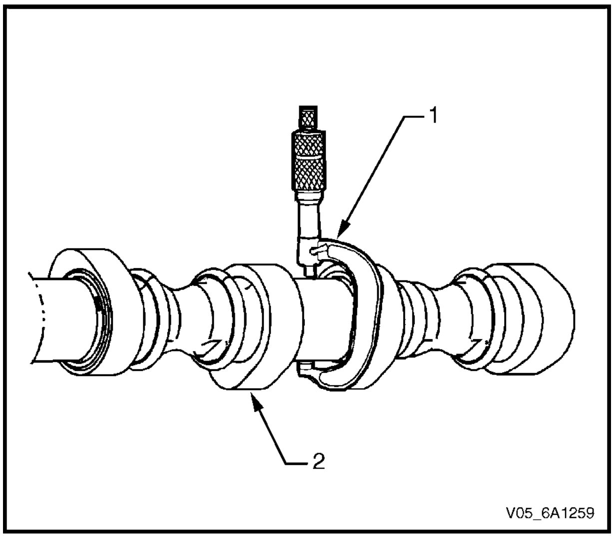

Figure 6A1 – 338

4 Measure the camshaft runout using a dial indicator (1).

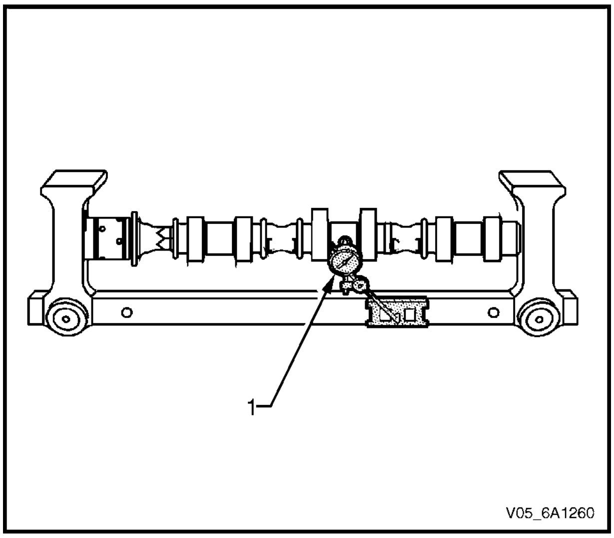

Figure 6A1 – 339

5 Measure the camshaft thrust width for wear using a depth micrometer (A).

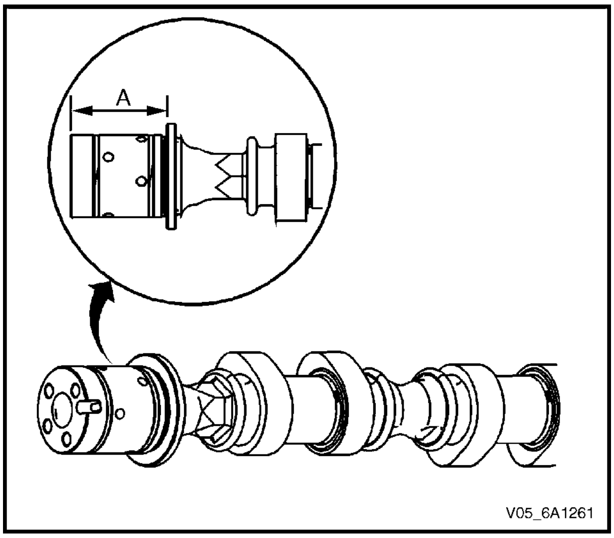

Figure 6A1 – 340

6 Measure the camshaft thrust wall surface for runout using a dial indicator (1).

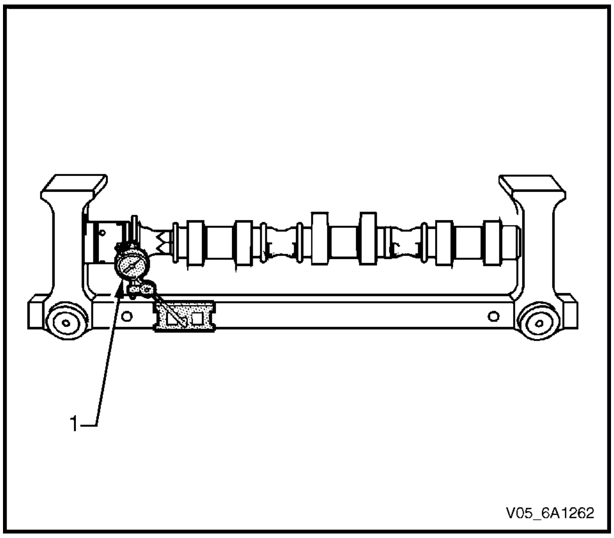

Figure 6A1 – 341

7 Measure the camshaft lobes for wear using a dial indicator (1).

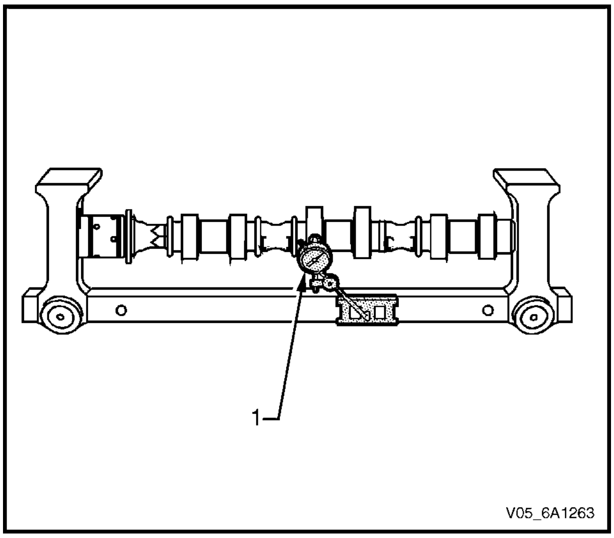

Figure 6A1 – 342

8 Place the dial indicator tip on the base circle (1) of the camshaft lobe.

9 Set the dial indicator at zero.

10 Rotate the camshaft until the indicator tip is at the highest point (2) on the lobe. This reading is the lift of the camshaft lobe.

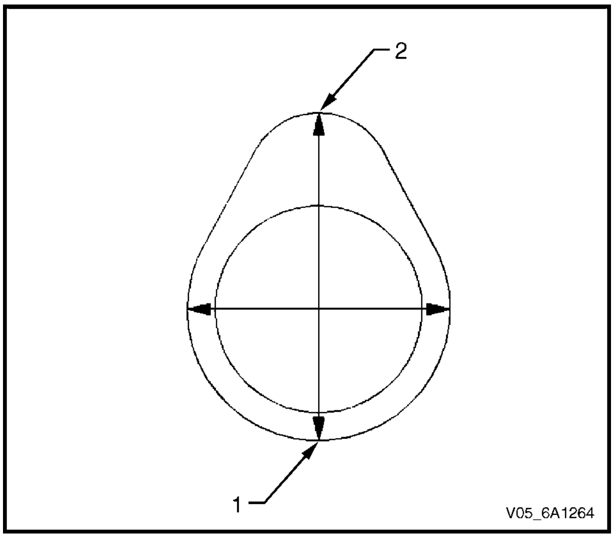

Figure 6A1 – 343

Reinstall

Right-hand Side

1 Select the correct camshaft for the particular installation location. ID markings are on the rear end of each camshaft. The ID markings are defined as follows:

- The first five digits refer to the date and time of production.
  - Example = 3L18H.
- Digits six through nine refer to engine production code.
  - LY7 = Alloytec 190 engine.
- The last two digits refer to position:
  - LI = left-hand intake.
  - LE = left-hand exhaust.
  - RI = right-hand intake.
  - RE = right-hand exhaust.

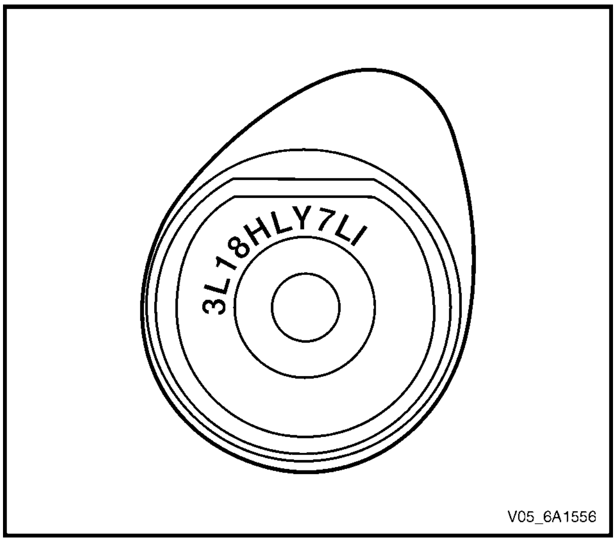

Figure 6A1 – 344

2 Apply a liberal amount of engine oil to the camshaft (1) journals and the right-hand cylinder head camshaft carriers (2).

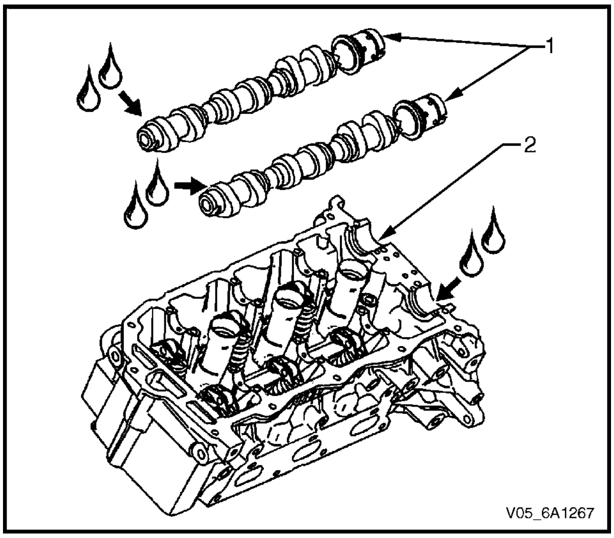

Figure 6A1 – 345

3 Position the camshafts (1) on the cylinder head and assemble the camshaft sprockets to the camshafts.

NOTE

Install the camshaft sprocket bolts but do not tighten at this stage.

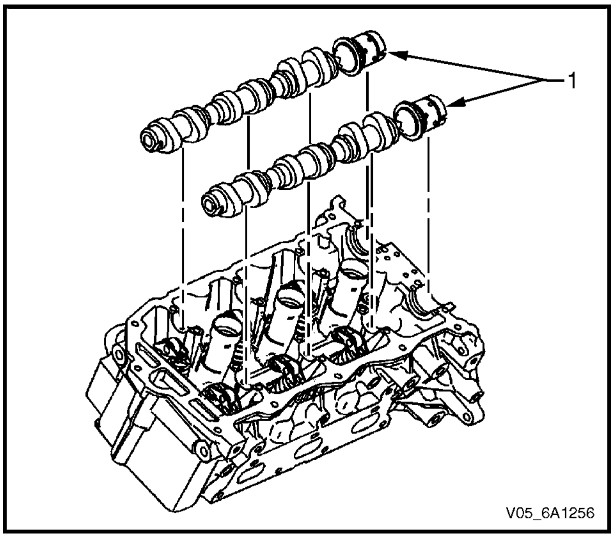

Figure 6A1 – 346

4 Ensure the camshaft lobes are in the neutral position with the flats on the back of the camshafts up and parallel (1) with the right-hand cylinder head camshaft cover rail.

5 Ensure the marks on the right-hand exhaust camshaft position actuator and timing chain, made prior to the disassemble operation are aligned.

6 Ensure the marks on the right-hand intake camshaft position actuator and timing chain, made prior to the disassemble operation are aligned.

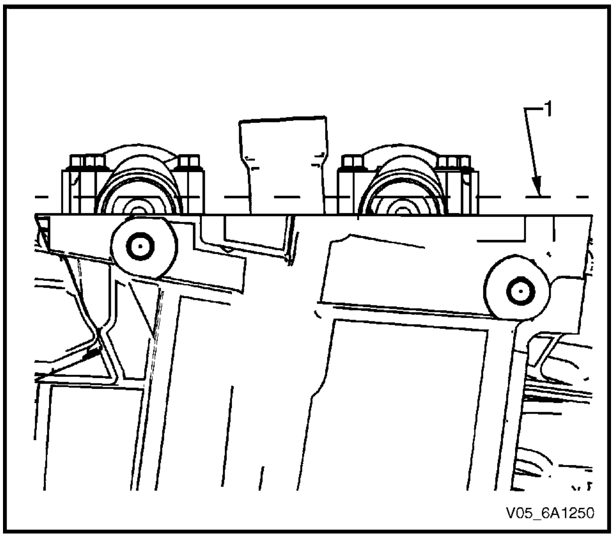

Figure 6A1 – 347

7 Observe the markings on the right-hand cylinder head camshaft bearing caps. Each bearing cap is marked (1) to identify its location. The markings have the following meanings:

- The raised feature must always be oriented toward the centre of the cylinder head.
- The I indicates the intake camshaft.
- The E indicates the exhaust camshaft.
- The number 1, 3, 5 indicates the cylinder position from the front of the engine.

8 Apply a liberal amount of engine oil to the camshaft bearing caps.

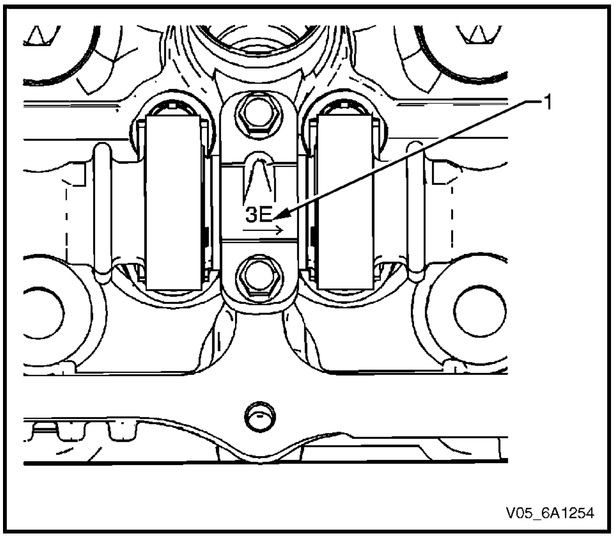

Figure 6A1 – 348

9 Install the camshaft bearing thrust cap (1) in the first journal of the right-hand cylinder head.

10 Install the remaining bearing caps (2) with their orientation mark toward the centre of the cylinder head.

11 Hand start all the camshaft bearing cap bolts (3).

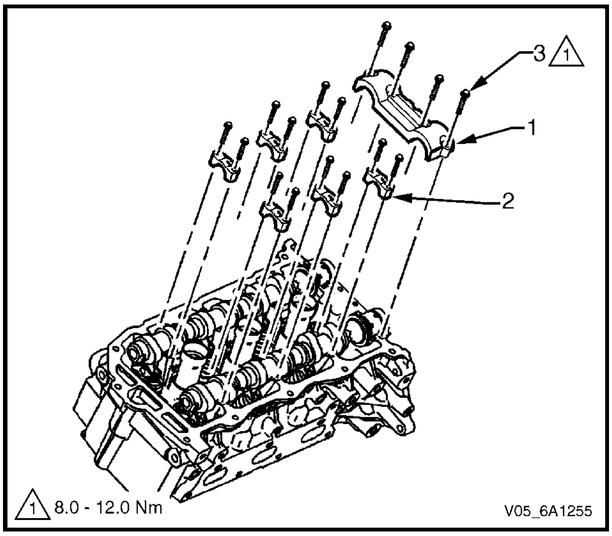

Figure 6A1 – 349

12 Tighten the camshaft bearing cap bolts to the correct torque specification and in the sequence shown.

Camshaft bearing cap attaching bolt torque specification:
Stage 1: ....8.0 – 12.0 Nm

13 Loosen the centre intake camshaft bearing cap bolts 1 and 2, and the centre exhaust camshaft bearing cap bolts 3 and 4.

14 Retighten the centre camshaft bearing cap bolts 1, 2, 3 and 4 to the correct torque specification.

Camshaft bearing cap attaching bolt torque specification:
Stage 2: ....8.0 – 12.0 Nm

15 Install the right-hand cylinder head camshaft sprocket, refer to 3.18 Camshaft Sprocket.

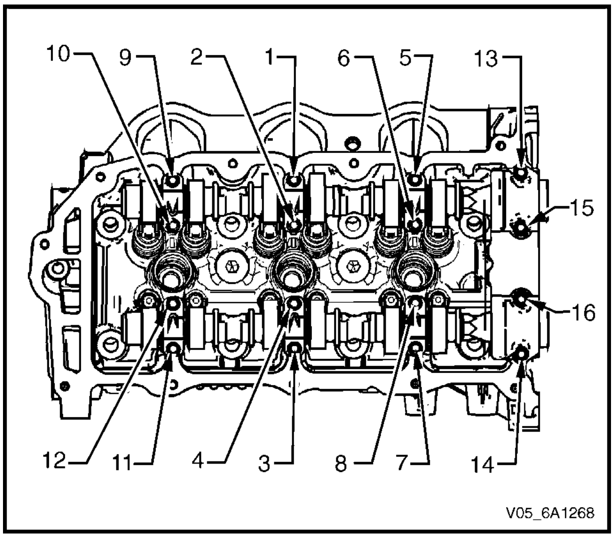

Figure 6A1 – 350

Left-hand Side

1 Select the correct camshaft for the particular installation location. ID markings can be found on the rear end of each camshaft. The ID markings are defined as follows:

- The first five digits refer to the date and time of production.
  - Example = 3L18H.
- Digits six through nine refer to engine production code.
  - LY7 = Alloytec 190 engine.
- The last two digits refer to position:
  - LI = left-hand intake.
  - LE = left-hand exhaust.
  - RI = right-hand intake.
  - RE = right-hand exhaust.

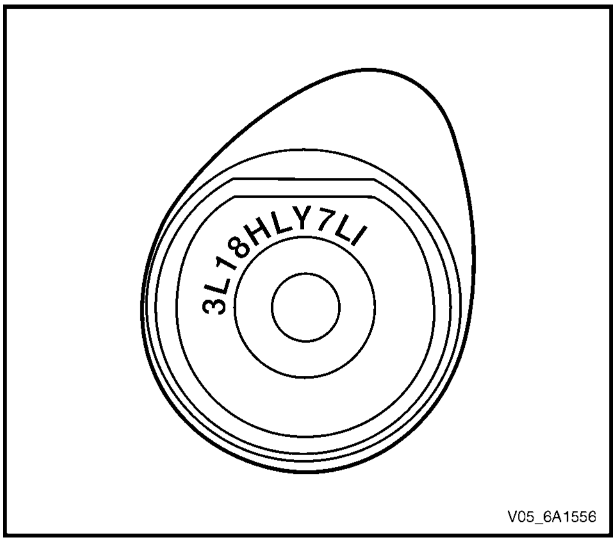

Figure 6A1 – 351

2 Apply a liberal amount of engine oil to the camshaft journals and the left-hand cylinder head camshaft carriers.

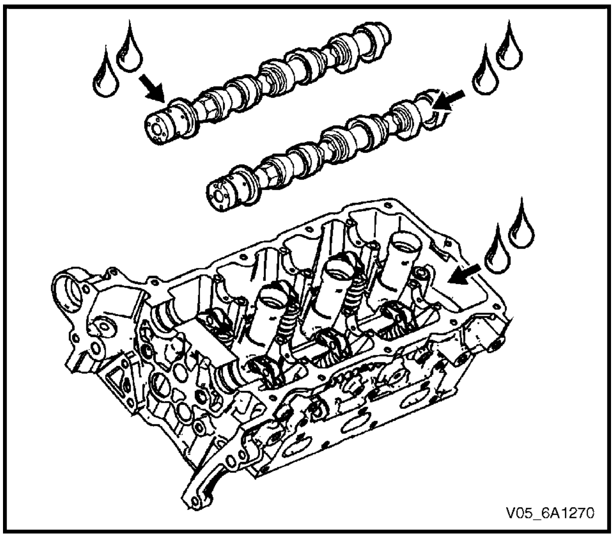

Figure 6A1 – 352

3 Position the camshafts (1) on the cylinder head and assemble the camshaft sprockets to the camshafts.

NOTE

Install the camshaft sprocket bolts but do not tighten at this stage.

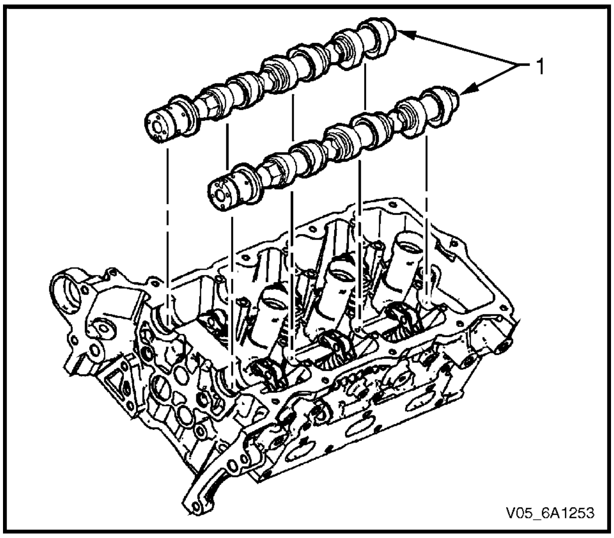

Figure 6A1 – 353

4 Ensure the camshaft lobes are in the neutral position with the flats on the back of the camshafts up and parallel (1) with the left-hand cylinder head camshaft cover rail.

5 Ensure the marks on the left-hand exhaust camshaft position actuator and timing chain, made prior to the disassemble operation are aligned.

6 Ensure the marks on the left-hand intake camshaft position actuator and timing chain, made prior to the disassemble operation are aligned.

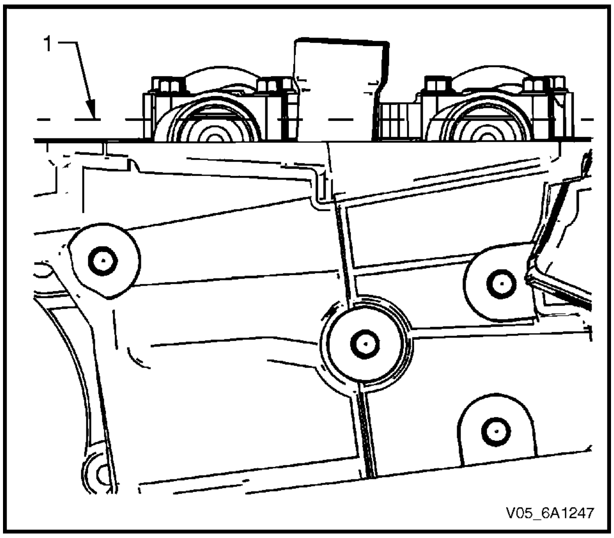

Figure 6A1 – 354

7 Observe the markings on the left-hand cylinder head camshaft bearing caps. Each bearing cap is marked (1) to identify its location. The markings have the following meanings:

- The raised feature must always be oriented toward the centre of the cylinder head.
- The I indicates the intake camshaft.
- The E indicates the exhaust camshaft.
- The number 2, 4, 6 indicates the cylinder position from the front of the engine.

8 Apply a liberal amount of engine oil to the camshaft bearing caps.

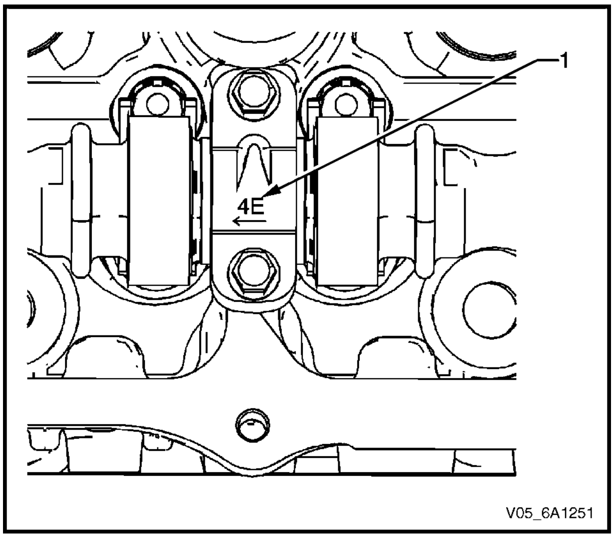

Figure 6A1 – 355

9 Install the camshaft bearing thrust cap (1) in the first journal of the left-hand cylinder head.

10 Install the remaining bearing caps (2) with their orientation mark toward the centre of the cylinder head.

11 Hand start all the camshaft bearing cap bolts (3).

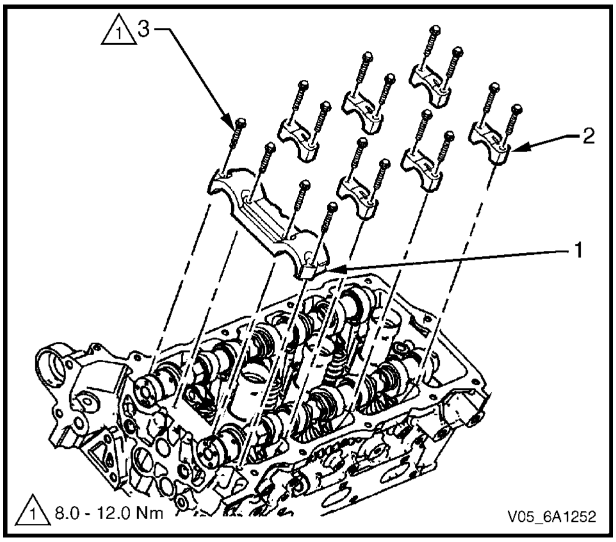

Figure 6A1 – 356

12 Tighten the camshaft bearing cap bolts to the correct torque specification and in the sequence shown.

Camshaft bearing cap bolt torque specification: Stage 1: ....8.0 – 12.0 Nm

13 Loosen the centre intake camshaft bearing cap bolts 1, and 2, and the centre exhaust camshaft bearing cap bolts 3 and 4.

14 Retighten the centre camshaft bearing cap bolts 1, 2, 3 and 4 to the correct torque specification.

Camshaft bearing cap bolt torque specification: Stage 2: ....8.0 – 12.0 Nm

15 Install the right-hand cylinder head camshaft sprocket, refer to 3.18 Camshaft Sprocket.

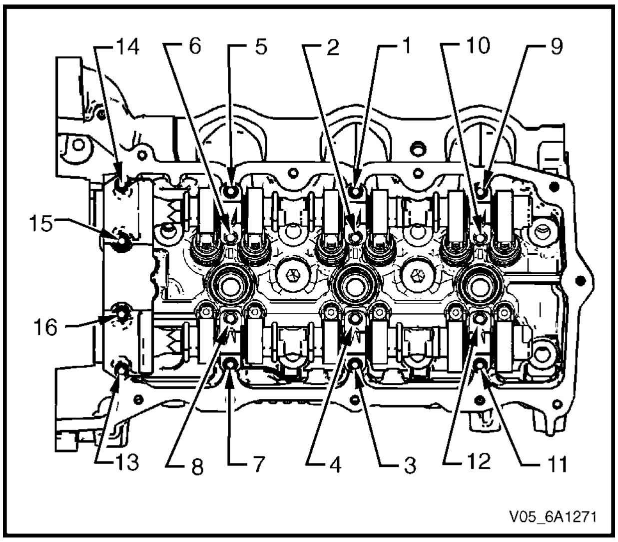

Figure 6A1 – 357

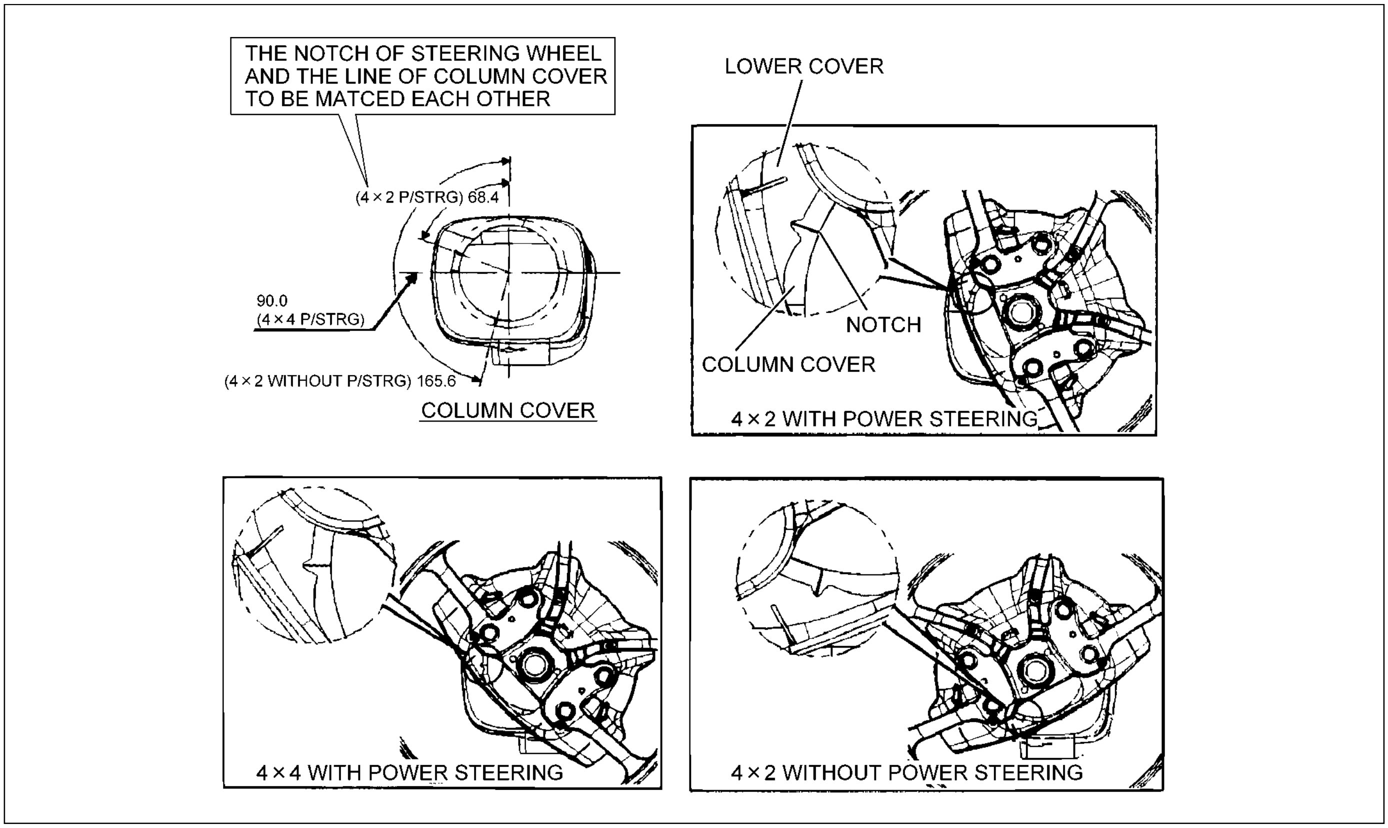
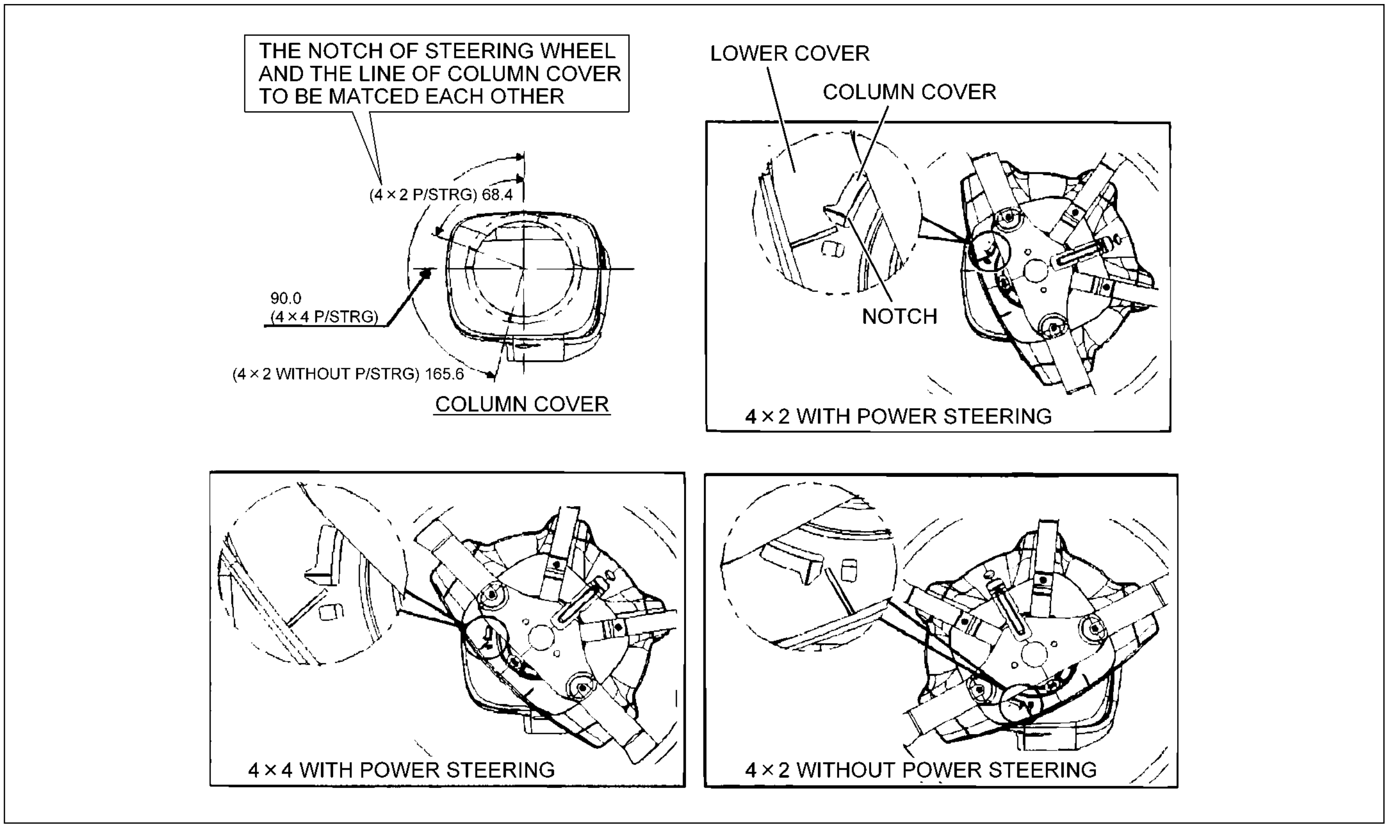
The adjustment method in case a mark has not been applied

with SRS air bag



RTW63BMF000201

without SRS air bag



RTW63BMF000301

3.21 Rocker Arm

Remove

1 Remove the camshafts from the appropriate cylinder head, refer to 3.19 Camshaft.

2 Remove the rocker arm (1) from the cylinder head (2).

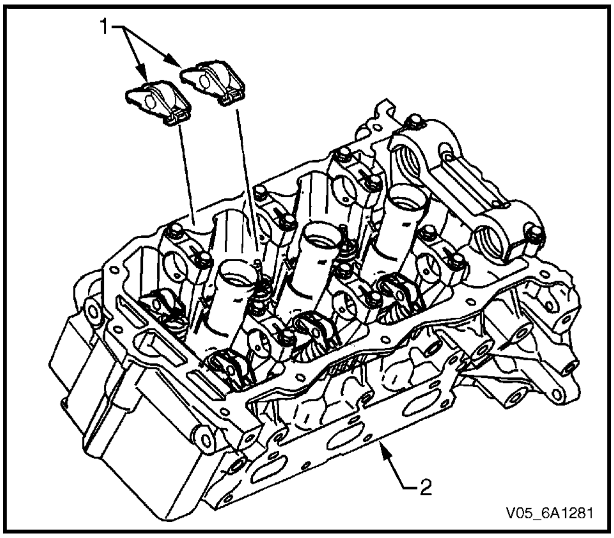


Figure 6A1 – 358

NOTE

Record the rocker arm positions during removal.

CAUTION

If the rocker arms are being reused, they must be reinstalled in their original location.

Clean and Inspect

1 Inspect the rocker arm roller (1) for the following:
- flat spots,
- excessive scoring and pitting, and
- ensure the roller spins freely

2 Inspect the rocker arm valve tip area (2).

3 Inspect the rocker arm stationary hydraulic lash adjuster (SHLA) pivot area (3).

4 Replace the rocker arm as required.

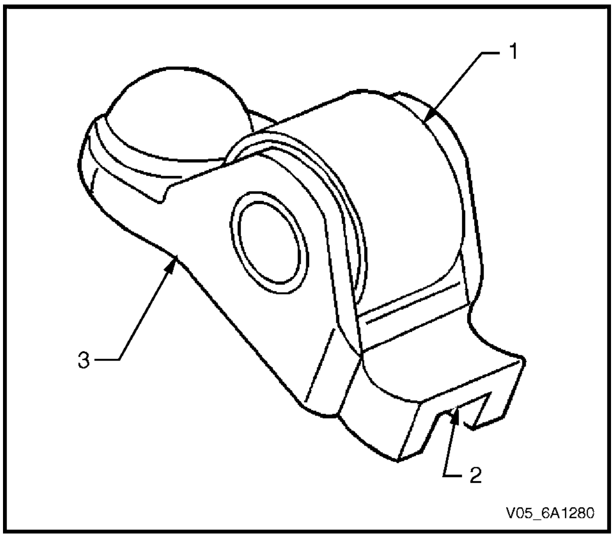

Figure 6A1 – 359

Reinstall

1 Apply a liberal amount of commercially available camshaft / lifter prelube or equivalent to the pivot pocket (1), roller (2) and valve slot (3) areas of the camshaft followers.

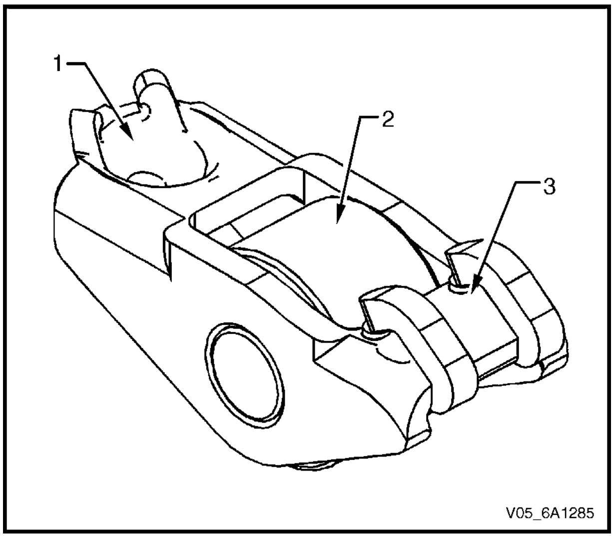

Figure 6A1 – 360

2 Place the rocker arm in position on the valve tip and stationary hydraulic lash adjuster (SHLA). The rounded head end of the arm seats on the SHLA while the flat end seats on the valve tip.

CAUTION

- **The rocker arm (1) must be positioned squarely on the valve tip so the full width of the roller will completely contact the camshaft lobe.**
- **If the rocker arms are being reused, they must be reinstalled in their original location.**

3 Clean the camshaft journals and carriers with a clean, lint-free cloth.

4 Reinstall the camshafts, refer to 3.19 Camshaft.

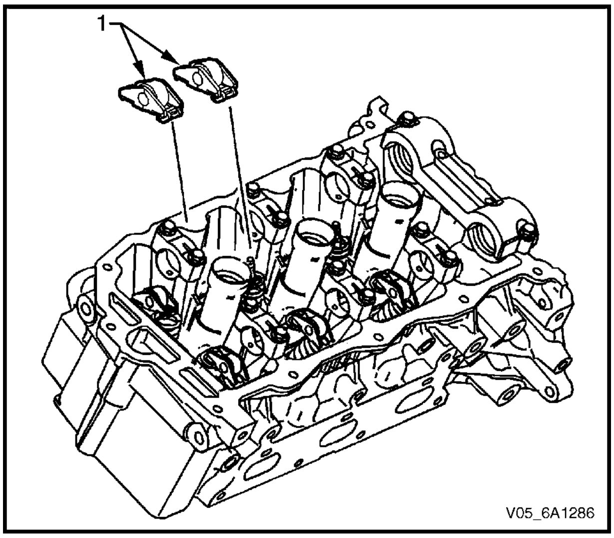

Figure 6A1 – 361

3.22 Stationary Hydraulic Lash Adjuster

Remove

1 Remove the rocker arms from the appropriate cylinder head, refer to 3.20 Rocker Arm.

2 Remove the stationary hydraulic lash adjuster (SHLA) from the cylinder head (2).

CAUTION

- **Do not stroke/cycle the stationary hydraulic lash adjuster (1) plunger without oil in the lower pressure chamber.**
- **Do not allow the stationary hydraulic lash adjuster to tip over, plunger down, after the oil fill.**

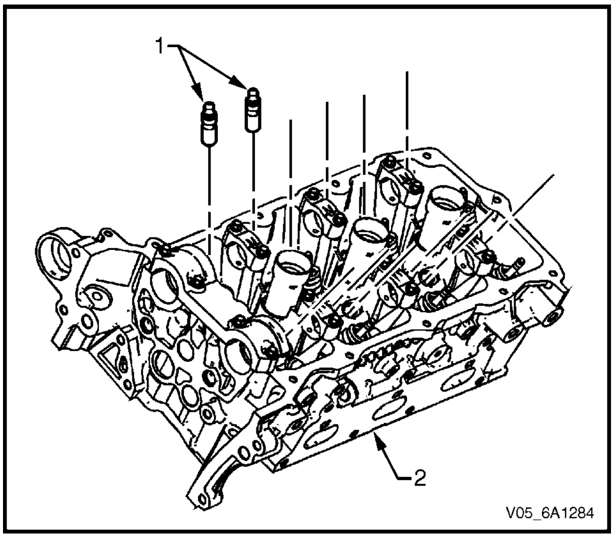

Figure 6A1 – 362

Clean and Inspect

1 Inspect the stationary hydraulic lash adjuster (SHLA) in the following areas:

- a plugged oil passage (1),
- a scored or worn camshaft follower pivot area (2),
- a damaged or broken retainer (3), and
- a severely scuffed or worn SHLA body (4).

2 Replace the SHLA as required.

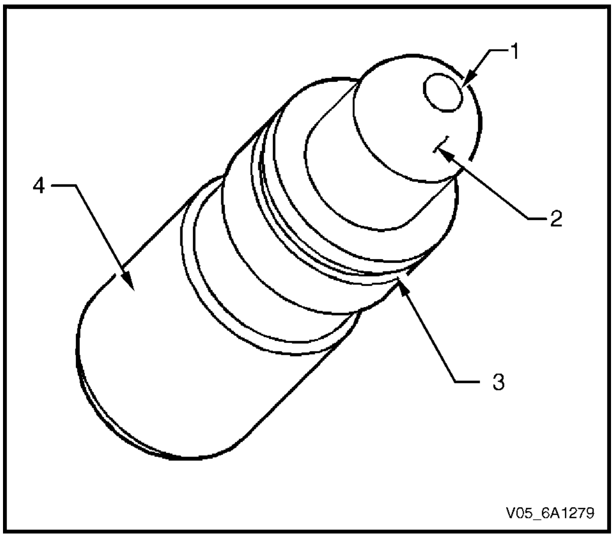

Figure 6A1 – 363

Reinstall

1 Fill the stationary hydraulic lash adjuster (SHLA) with clean engine oil. Take precautions to prevent scratching the pivot sphere area of the SHLA.

2 Lubricate the SHLA bores in the cylinder head with clean engine oil.

3 Install the SHLA in the cylinder head (2).

4 Apply a liberal amount of commercially available camshaft/lifter prelube to the SHLA pivot spheres.

5 Install the rocker arms, refer to 3.20 Rocker Arm.

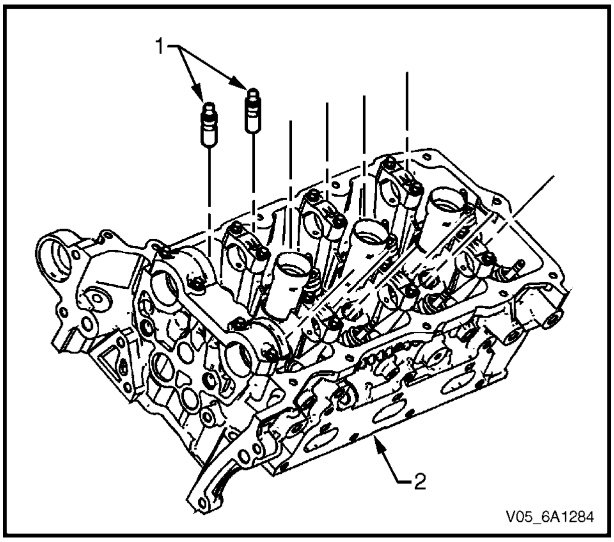

Figure 6A1 – 364

CAUTION

Ensure each lash adjuster (1) is filled with clean engine oil and the adjuster does not tip over, plunger down, before the installation. The loss of oil in the adjuster lower pressure chamber, or the dry stroking/cycling of the adjuster plunger, will allow air to enter the high pressure chamber of the valve lifter. Air in the high pressure chamber of the adjuster may not be purged causing cavitation and extensive engine component damage.

3.23 Cylinder Head Assembly

Remove

Right-hand Side (Bank 1) Cylinder Head

1 Remove the heater hoses and heater pipe assembly, refer to Section 6B1 Engine Cooling – V6.

2 Remove the intake manifold assembly, refer to 3.10 Intake Manifold Assembly – Complete.

3 Remove the exhaust manifold, refer to 3.11 Exhaust Manifold Assembly.

4 Remove engine harness ground terminal attaching bolts from the cylinder head, refer to Section 8A Electrical Body and Chassis.

5 Remove the right-hand side secondary timing chain, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.

6 Remove the camshaft sprockets, refer to 3.18 Camshaft Sprocket.

7 Remove the cylinder head attaching bolt (1), eight places.

8 Remove the cylinder head.

NOTE

There is no bolt fitted to the hole in the rear of the right-hand-hand cylinder head.

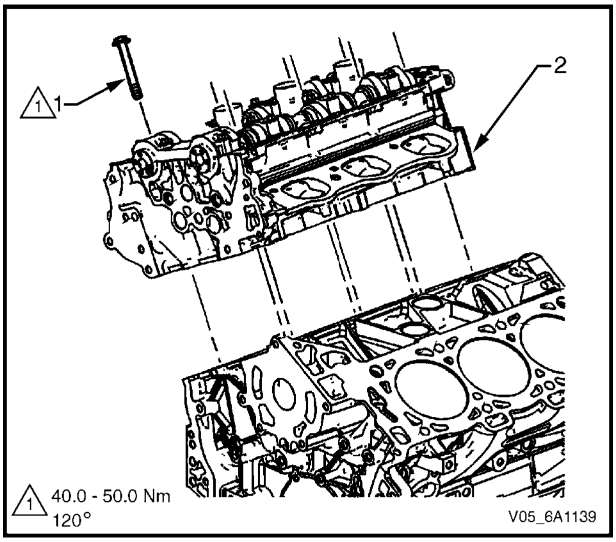

Figure 6A1 – 365

9 Remove and discard the cylinder head gasket (1).

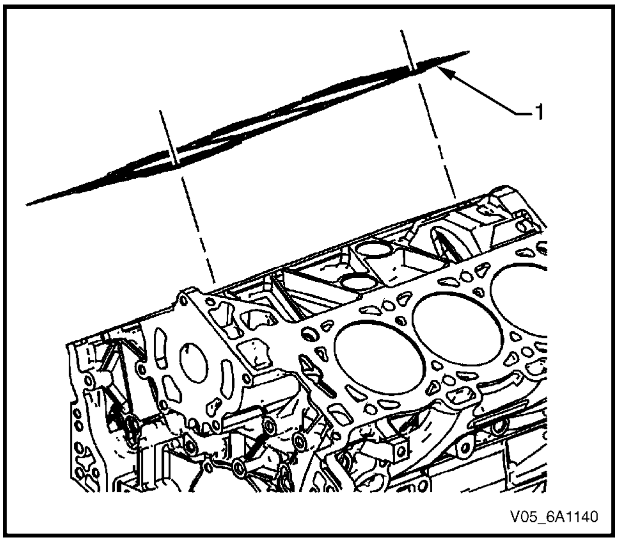

Figure 6A1 – 366

Left-hand Side (Bank 2) Cylinder Head

1 Remove the intake manifold assembly, refer to 3.10 Intake Manifold Assembly – Complete.

2 Remove the exhaust manifold, refer to 3.11 Exhaust Manifold Assembly.

3 Remove the power steering reservoir and pump mounting brackets, refer to 3.8 Power Steering Pump Bracket.

NOTE

Do not disconnect the power steering pipes and/or hoses.

4 Remove the oil filter adapter upper bolt.

NOTE

Do not remove the oil filter adapter.

5 Remove the engine coolant temperature (ECT) sensor, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

6 Remove engine harness ground terminal attaching bolt from cylinder head, refer to Section 8A Electrical Body & Chassis.

7 Remove the left-hand bank secondary timing chain, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.

8 Remove the camshaft position actuators, refer to 3.18 Camshaft Sprocket.

9 Remove the front M8 (1) cylinder head attaching bolt, two places.

10 Remove the cylinder head attaching bolt (2), eight places.

11 Remove the cylinder head (3).

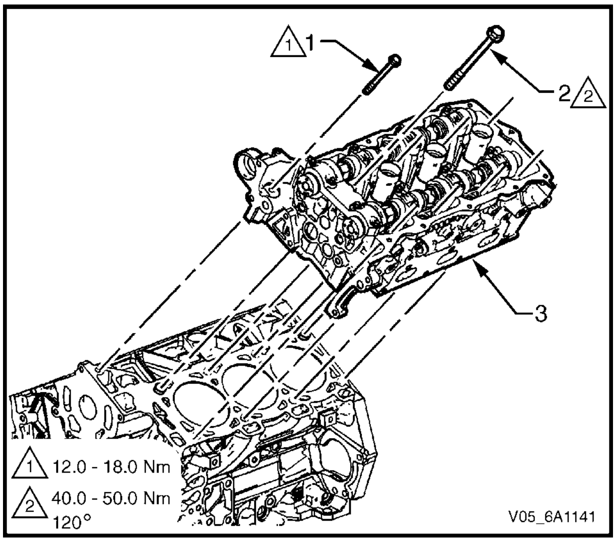

Figure 6A1 – 367

12 Remove and discard the cylinder head gasket (1).

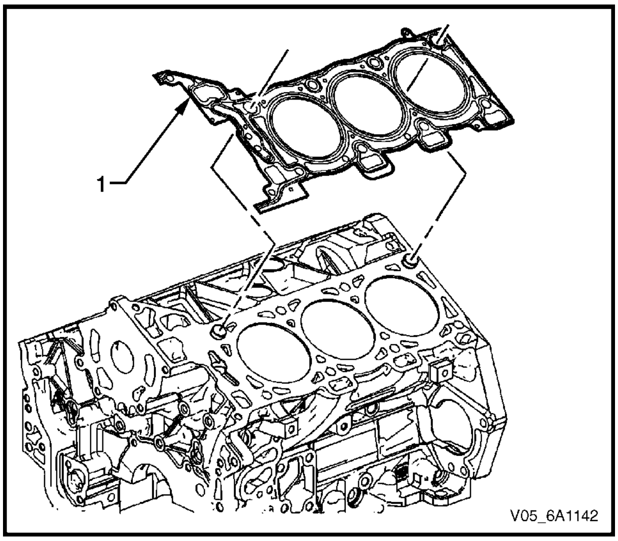

Figure 6A1 – 368

Disassemble

1 Using an appropriately sized deep socket (1) and a plastic hammer (2), lightly tap on the valve spring retainer to loosen the valve collets.

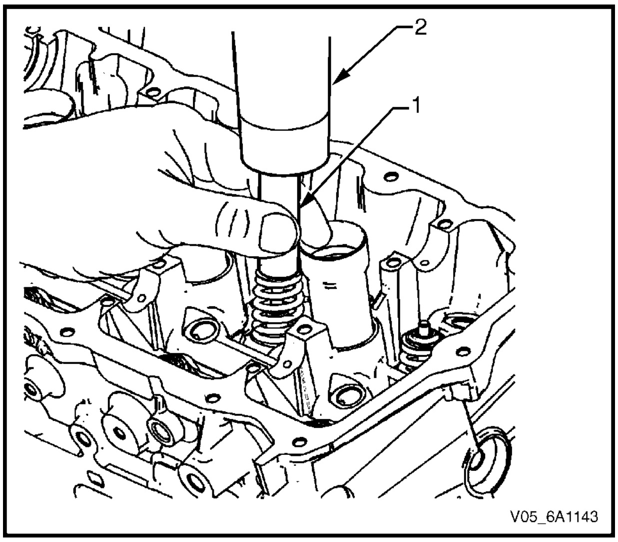

Figure 6A1 – 369

CAUTION

Ensure valve heads will not contact anything during this step in order to avoid bending or damage.

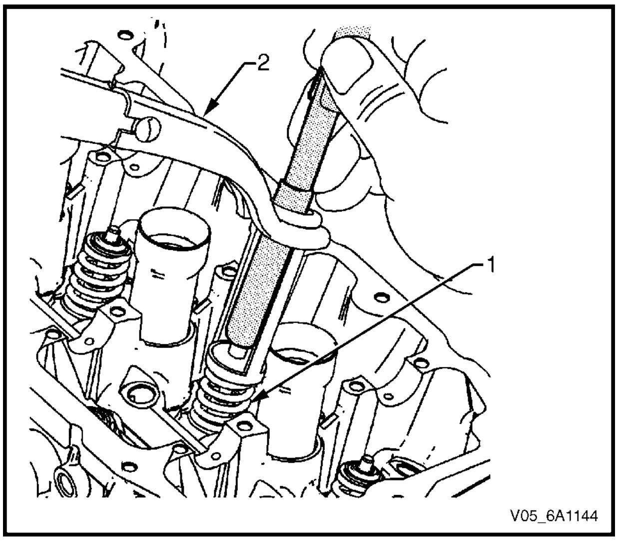

Figure 6A1 – 370

CAUTION

Do not compress the valve springs less than 24.0 mm. Contact between the valve spring retainer and the valve stem oil seal can cause potential valve stem oil seal damage.

WARNING

Compressed valve springs (1) have high tension against the valve spring compressor (2). Valve springs that are not correctly compressed by, or are released from the valve spring compressor can be ejected from the valve spring compressor with intense force. Use care when compressing or releasing the valve spring with the valve spring compressor and when removing or installing the valve stem keys. Failing to use care may cause personal injury.

2 Compress the valve spring (1) using valve spring compressor Tool No. J-8062 (2) and adaptor Tool No. EN-46119.

3 Remove the valve collets using Tool EN-46117 (1).

4 Remove the valve spring compressor (2) and the adapter (3).

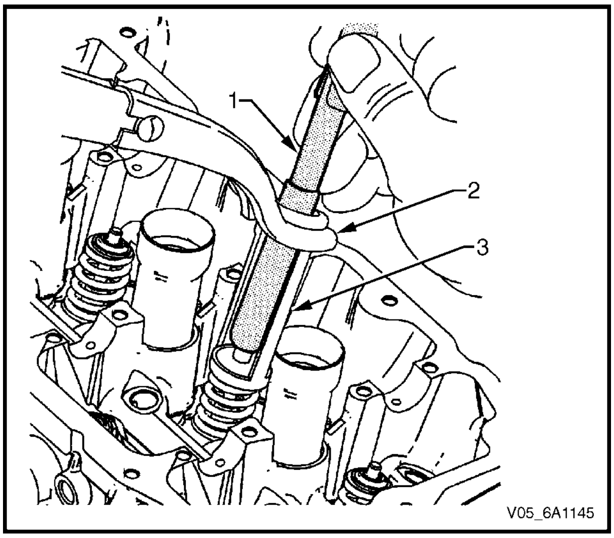

Figure 6A1 – 371

5 Remove the valve spring retainer (1).

6 Remove the valve spring (2).

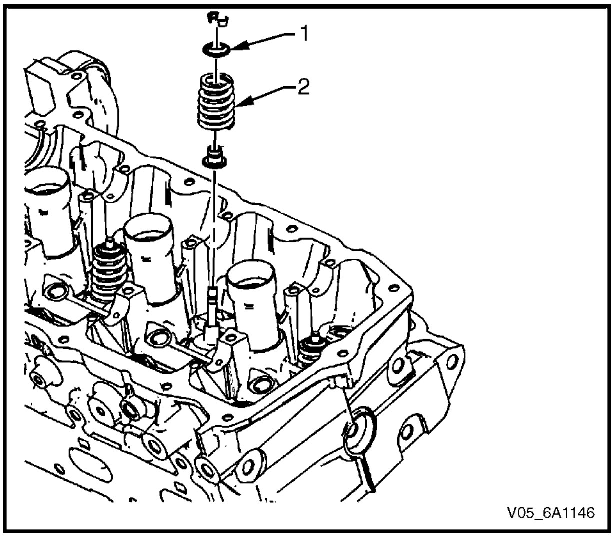

Figure 6A1 – 372

7 Remove the valves (1).

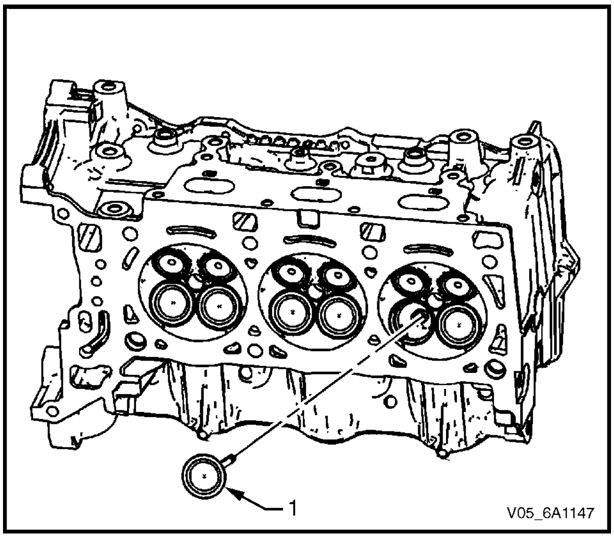

Figure 6A1 – 373

CAUTION

Never reuse a valve stem oil seal.

8 Remove the valve stem oil seal using Tool No. EN-46116 and discard.

9 Repeat these procedures for the remaining valves.

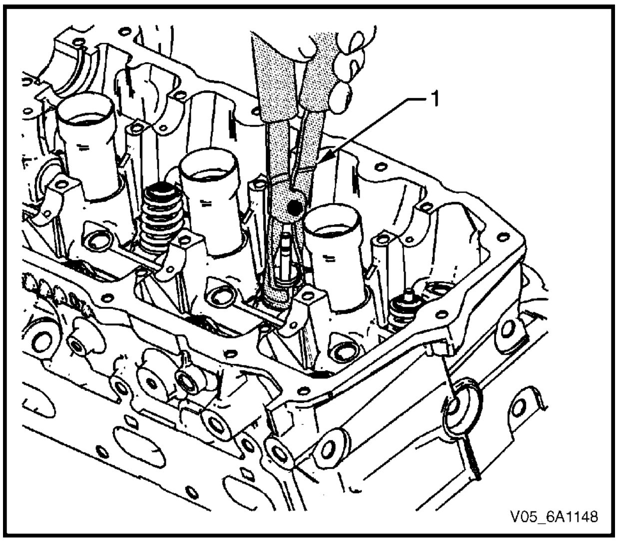

Figure 6A1 – 374

10 Remove the cylinder head oil gallery expansion plugs (1).

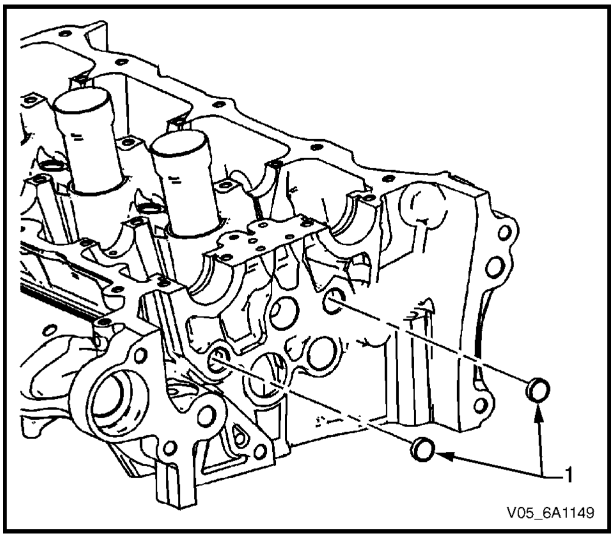

Figure 6A1 – 375

11 Remove the cylinder head coolant threaded plugs (1).

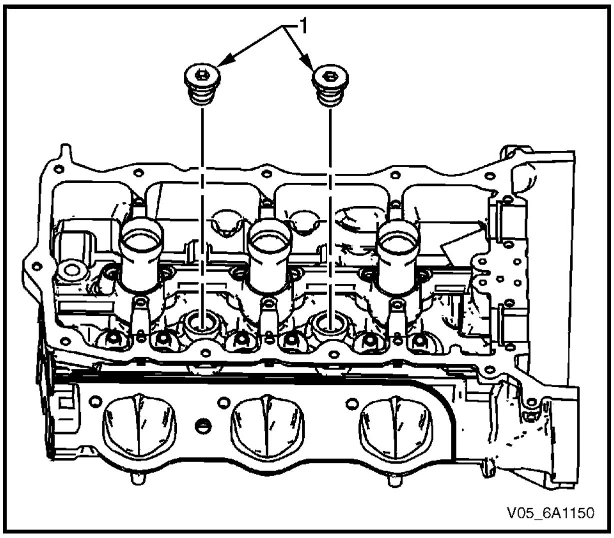

Figure 6A1 – 376

Clean

CAUTION

Due to the aluminium alloy construction of the cylinder head, wire brushes and steel scrapers must not be used during the cleaning process, as damage to sealing surfaces may occur. Use a wood or plastic scraper as an alternative.

1 Remove any old thread sealant, gasket material or sealant using commercially available plastic or wooden scraper.
2 Clean all cylinder head surfaces with non-corrosive solvent.

WARNING

Safety glasses must be worn when using compressed air.

3 Blow out all the oil galleries using compressed air.
4 Remove any carbon deposits from the combustion chambers.
5 Clean any debris or build-up from the lifter pockets.

Inspect

Visual Inspection

1 Inspect the cylinder head (1) camshaft bearing surfaces for the following conditions:
- excessive scoring or pitting,
- discoloration from overheating, and
- deformation from excessive wear.

2 If any of the above conditions exist on the camshaft bearing surfaces, replace the cylinder head. Do not machine the camshaft bearing journals.

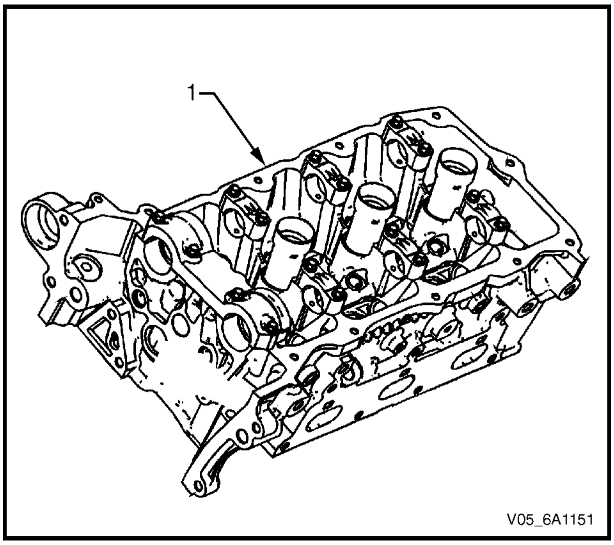

Figure 6A1 – 377

3 Inspect the cylinder head for the following:
- Cracks, damage or pitting in the combustion chambers.
- Debris in the oil galleries. continue to clean the galleries until all debris is removed.
- Coolant leaks or damage to the deck face sealing surface. if coolant leaks are present, measure the surface warpage as described under Cylinder Head Measurement within this Section.
- Burrs or any defects that would degrade the sealing of a new secondary camshaft chain tensioner gasket.
- Damage to any gasket surfaces.
- Damage to any threaded bolt holes.
- Burnt or eroded areas in the combustion chamber.
- Cracks in the exhaust ports and combustion chambers.
- External cracks in the water passages.
- Restrictions in the intake or exhaust passages.
- Restrictions in the cooling system passages.
- Rusted, damaged or leaking core plugs.

4 If the cylinder head is cracked or damaged, it must be replaced. No welding or patching of the cylinder head is recommended.

SECTION 0A

GENERAL INFORMATION

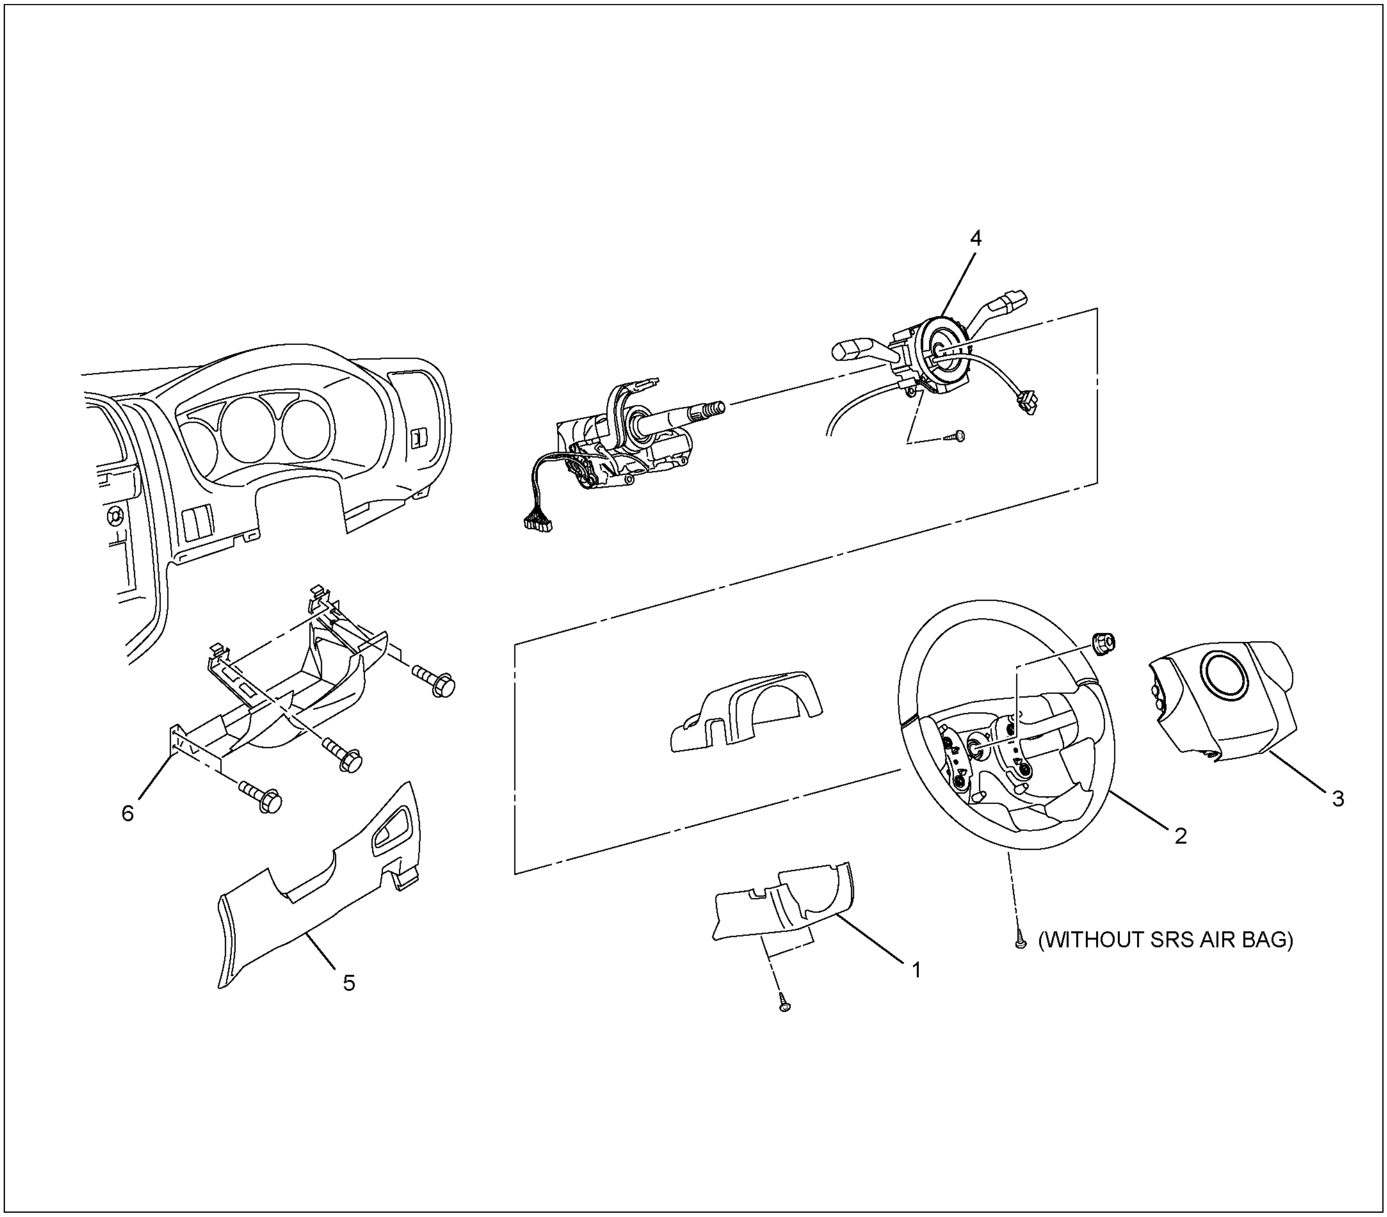
Use the applicable standard or equivalent for diesel fuels.

Combination Switch

Combination Switch and Associated Parts



RTW73BLF000201

Legend

(1) Steering Column Cover
(2) Steering Wheel
(3) Inflator Module or Horn Pad
(4) Combination Switch and SRS Coil Assembly
(5) Instrument Panel Lower Cover
(6) Driver Knee Bolster (reinforcement)

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "-" terminal cable, and wait at least 5 minutes (with SRS air bag).
4. Disconnect the yellow 2-way SRS connector located under the steering column (with SRS air bag).

CAUTION: The wheels of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering wheel. Failure to do so will cause the coil assembly to lose its centering which will cause damage to the coil assembly. (with SRS air bag)

5. Remove the engine hood opening lever, then remove instrument panel lower cover.
6. Remove the driver knee bolster (reinforcement).

Cylinder Head Measurement

NOTE

For all cylinder head and associated component specifications, refer to 5 Specifications.

Camshaft Journal Clearance

1 Install the camshaft bearing cap in the cylinder head without the camshaft.

2 Install the camshaft cap bolts and tighten to the correct torque specification

Camshaft bearing cap attaching bolt........8.0 – 12.0 Nm.

3 Measure the camshaft bearings using an inside micrometer.

4 Subtract the camshaft journal diameter from the camshaft bearing diameter. This will provide the running clearance. If the running clearance exceeds specifications and the camshaft journals are within specification, replace the cylinder head.

Camshaft Journal Alignment

1 Ensure the camshafts are serviceable, refer to 3.19 Camshaft for measuring procedures.

2 Inspect the cylinder head camshaft bearing surfaces for any imperfections or scratches that could inhibit correct camshaft clearances. Repair minor imperfections or scratches.

3 Install the camshafts in the cylinder head.

4 Install the camshaft bearing caps.

5 Install the camshaft cap bolts and tighten to the correct torque specification.

Camshaft bearing cap attaching bolt........8.0 – 12.0 Nm.

6 Ensure the camshafts spin freely in the cylinder head. If the camshaft does not run freely, replace the cylinder head.

Deck Flatness Inspection

1 Ensure the cylinder head decks are clean and free of gasket material.

2 Inspect the surface for any imperfections or scratches that could inhibit correct cylinder head gasket sealing.

3 Place a straight-edge (1) diagonally across the cylinder head (2) deck face surface.

4 Measure the clearance between the straight-edge and the cylinder head deck face using a feeler gauge at four points along the straight-edge.

5 If the warpage is less than 0.05 mm, the cylinder head deck surface does not require resurfacing.

6 If the warpage is between 0.05±0.20 mm or any imperfections or scratches that could inhibit correct cylinder head gasket sealing are present, the cylinder head deck surface requires resurfacing.

7 If resurfacing is required the maximum amount that can be removed is 0.25 mm.

8 If the cylinder head deck surface requires more than 0.25 mm material removal the head must be replaced.

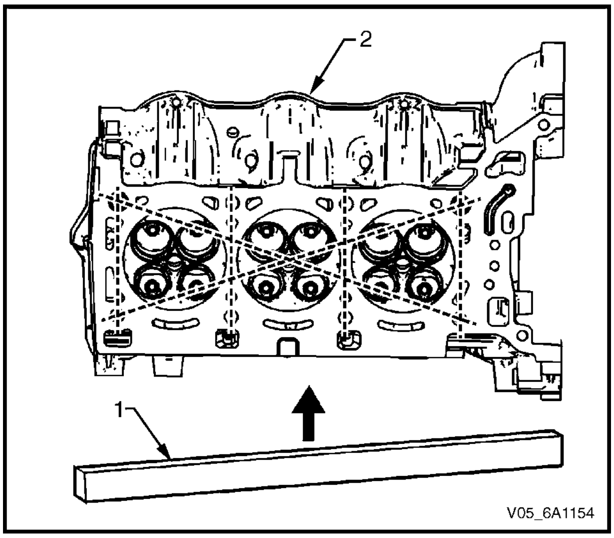


Figure 6A1 – 378

Valve Guide Measurement

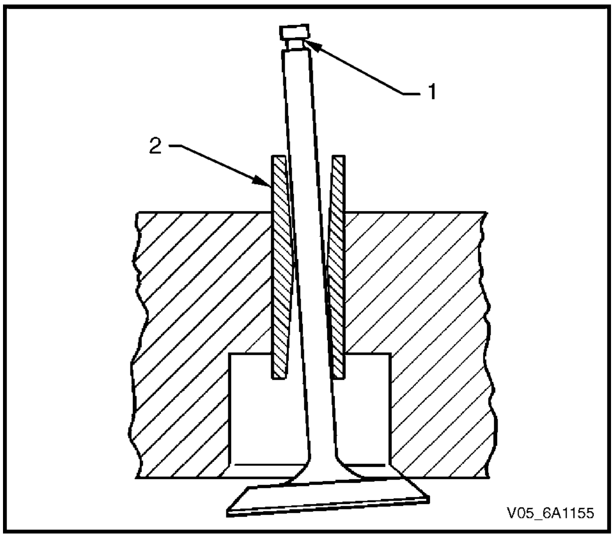

Figure 6A1 – 379

1 Measure the valve stem (1) to-guide (2) clearance. Excessive valve stem-to-guide clearance may cause excessive oil consumption and may also cause a valve to break. Insufficient clearance will result in noisy and sticky functioning of the valve and will disturb the engine assembly smoothness.

2 Clamp a dial indicator to the cylinder head at the camshaft cover rail.

3 Locate the dial indicator so the movement of the valve stem from side to side, crossways to the cylinder head, will cause a direct movement of the indicator stem. The dial indicator stem must contact the side of the valve stem just above the valve guide.

4 Drop the valve head about 0.064 mm off the valve seat.

5 Use light pressure when moving the valve stem from side to side to obtain a clearance reading, refer to 5 Specifications.

- If the clearance for the valve is greater than specified and a new standard diameter valve stem will not bring the clearance within specifications, the valve guide may be oversized by 0.075 mm using the valve guide reamer, Tool No. J 42096 or by 0.375 mm using the valve guide reamer, Tool No. EN-46120. Two sizes of oversized valve stems are available for service.
- Valve guide wear at the bottom 10 mm of the valve guide is not significant enough to affect normal operation.
- If over sizing the guide does not bring the clearance within specifications, replace the cylinder head.

Valve Spring Inspection and Measurement

Inspection Procedure

1 Clean the valve springs in solvent.

WARNING

Safety glasses must be worn when using compressed air

2 Dry the valve springs with compressed air.

3 Inspect the valve springs for broken coils or coil ends.

Measurement Procedure

1 Use a commercially available valve spring tester to measure the valve spring tension, refer to 5 Specifications.

CAUTION

Do not use shims to increase spring load. The use of shims can cause the valve spring to bottom out before the camshaft lobe is at peak lift.

2 If low valve spring load is found, replace the valve springs.

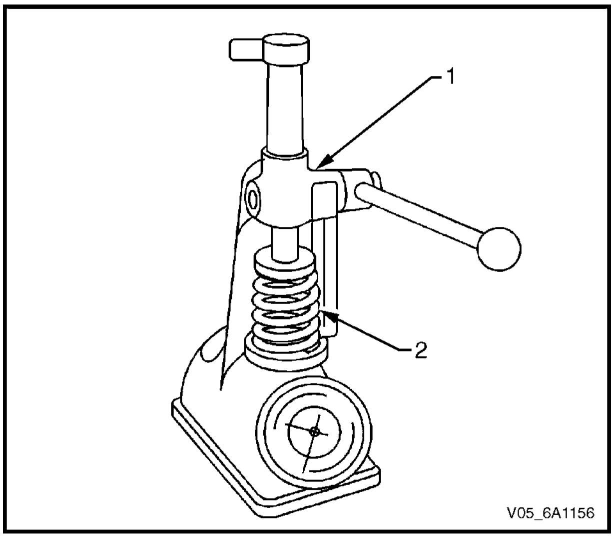

Figure 6A1 – 380

Valve and Seat Grinding

Valve Cleaning Procedure

CAUTION

Do not use a wire brush on any part of the valve stem. The valve stem is chrome plated to provide enhanced wear characteristics. Wire brushing the stem could remove the chrome plating.

1 Use soft bristle brush to clean any carbon build-up from the valve head.

2 Thoroughly clean the valve with solvent and wipe dry.

Valve Visual Inspection Procedure

1 Inspect the valve for damage from the head to tip for the following conditions:
- pitting in the valve seat area (1),
- lack of valve margin (2),
- bending in the valve stem (3),
- pitting or excessive wear in the stem (4),
- worn valve key grooves (5), and
- worn valve tip (6).

2 Replace the valve if any of these conditions exist.

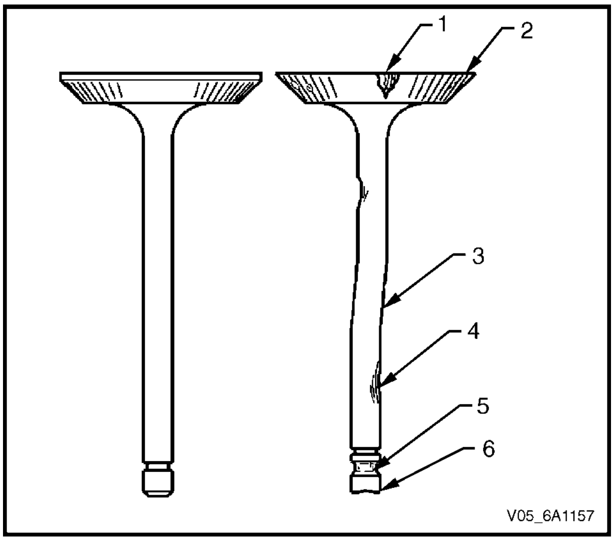

Figure 6A1 – 381

Valve Measurement and Reconditioning Overview

Correct valve service is critical to engine performance. Therefore, all detailed measurement procedures must be followed to identify components that are out of specification. If the measurement procedures reveal the valve or valve seat must be reconditioned, it is critical to perform the measurement procedures after reconditioning.

Valve Seat Width Measurement Procedure

1 Measure the valve seat (1) width in the cylinder head using a scale (2).

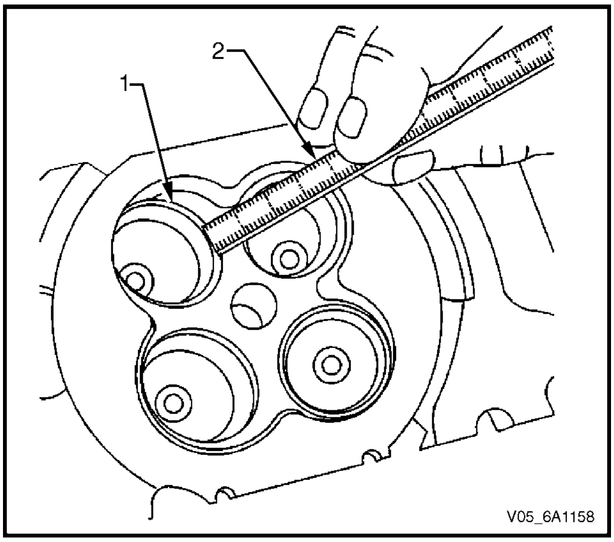

Figure 6A1 – 382

2 Measure the seat width on the valve face (1) using a correct scale.

CAUTION

The seat contact area must be at least 0.5 mm from the outer diameter (margin) of the valve. If the contact area is too close to the margins, the seat must be reconditioned to move the contact area away from the margin.

3 Compare the measurements with the specifications, refer to 5 Specifications.

4 If the seat widths are acceptable, check the valve seat roundness, refer to Valve Seat Roundness Measurement Procedure in this Section.

5 If the seat width is not acceptable, grind the valve seat to bring the width back to specification. Correct valve seat width is critical to providing the correct amount of valve heat dissipation, refer to Valve and Seat Reconditioning Procedure in this Section.

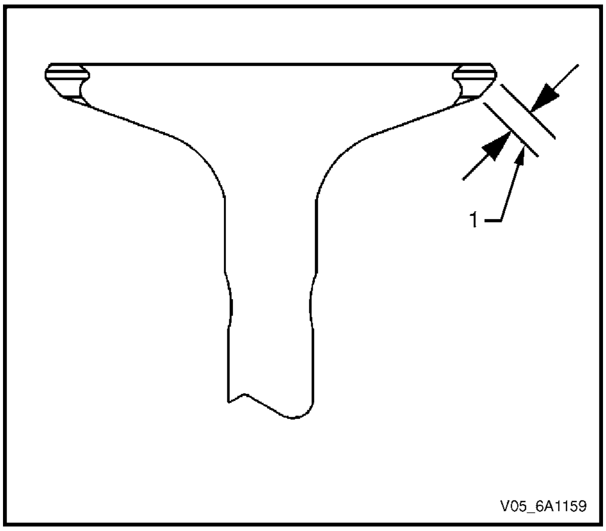

Figure 6A1 – 383

Valve Seat Roundness Measurement Procedure

1 Measure the valve seat roundness using a dial indicator attached to a tapered pilot installed in the guide. The pilot should have a slight bind when installed in the guide.

CAUTION

The correct size pilot must be used. Do not use adjustable diameter pilots. Adjustable pilots may damage the valve guides.

2 Compare your measurements with the specifications, refer to 5 Specifications.

3 If the valve seat exceeds the roundness specification, grind the valve and valve seat, refer to Valve and Seat Reconditioning Procedure in this Section.

4 If new valves are being used, the valve seat roundness must be within 0.05 mm.

Valve Margin Measurement Procedure

1 Measure the valve margin using an appropriate scale.

2 Refer to 5 Specifications for minimum valve margin and compare them to your measurements.

3 If the valve margins are beyond specification, replace the valves.

4 If the valve margins are within specification and do not require refacing, test the valve for seat concentricity, refer to Valve-to-Seat Concentricity Measurement Procedure in this Section.

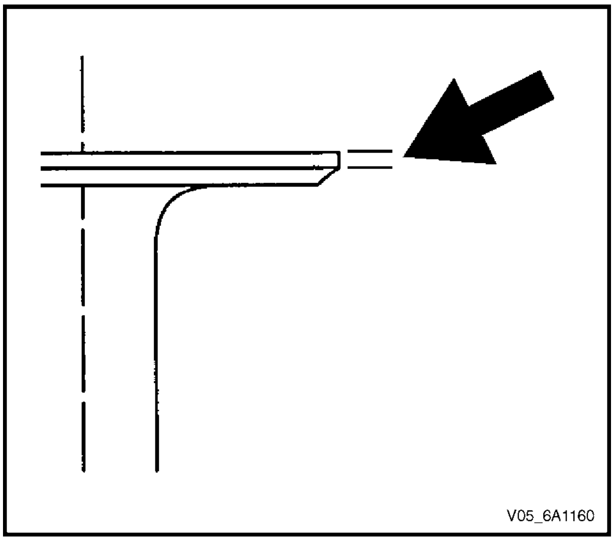

Figure 6A1 – 384

Valve-to-Seat Concentricity Measurement Procedure

Checking the valve-to-seat concentricity determines whether the valve and seat are sealing correctly.

Measure the valve face and the valve seat to ensure correct valve sealing.

1 Coat the valve face lightly with blue dye (3).
2 Install the valve in the cylinder head.
3 Turn the valve against the seat with enough pressure to wear off the dye.
4 Remove the valve from the cylinder head.
5 Inspect the valve face.

NOTE

- If the valve face is concentric, providing a correct seal, with the valve stem, a continuous mark (1) will be made around the entire face (2).
- The wear mark must be at least 0.5 mm from the margin of the valve. If the wear mark is too close to the margin, the seat must be reconditioned to move the contact area away from the margin.
- If the face is not concentric with the stem, the mark will not be continuous around the valve face. The valve should be refaced or replaced and the seat must be reconditioned, refer to Valve and Seat Reconditioning Procedure in this Section.

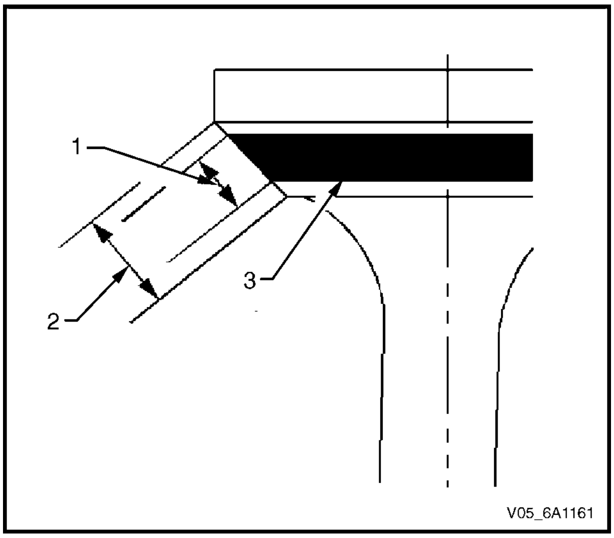

Figure 6A1 – 385

Valve and Seat Reconditioning Procedure

If the valve seat width, roundness or concentricity are beyond specifications, grind the seats in order to ensure correct heat dissipation and prevent the build up of carbon on the seats.

If valve seat reconditioning is required, reface the valve face, unless a new valve is used.

1 Grind the valve seats (2) to the correct angle specification, refer to 5 Specifications.
2 Using the correct angle specification, grind and relieve the valve seats (1) to correctly position the valve seating surface (2) to the valve.
3 Using the correct angle specification, grind and undercut the valve seats (3) to narrow the valve seat widths to the specifications, refer to 5 Specifications.
4 If the original valve is being used, grind the valve to the specifications, refer to 5 Specifications. Measure the valve margin again after grinding, refer to Valve Margin Measurement Procedure in this Section. Replace the valve if the margin is out of specification. New valves do not require grinding.
5 When grinding the valves and seats, grind off as little material as possible. Cutting valve seat results in lowering the valve spring pressure.
6 Install the valve in the cylinder head.

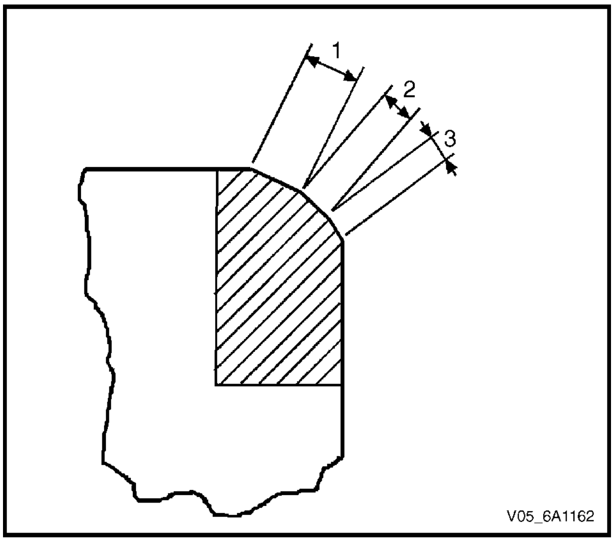

Figure 6A1 – 386

CAUTION

If using refaced valves, lap the valves into the seats with a fine grinding compound. The refacing and reseating operations should leave the refinished surfaces smooth and true so that minimal lapping is required. Excessive lapping will groove the valve face and prevent a good seat when hot.

NOTE

- Clean any remaining lapping compound from the valve and seat with solvent and compressed air prior to final assembly.
- If fitting new valves, do not lap the valves under any condition.

7 After obtaining the correct valve seat width in the cylinder head, measure the valve stem height, refer to Valve Stem Height Measurement Procedure in this Section.

8 If the valve stem height is acceptable, test the seats for concentricity, refer to Valve-to-Seat Concentricity Measurement Procedure in this Section.

Valve Stem Height Measurement Procedure

CAUTION

To determine the valve stem height measurement, measure from the valve spring seat to the valve spring retainer.

1 Install the valve into the valve guide.

2 Ensure the valve is seated to the valve seat.

3 Install the valve stem oil seal.

4 Install the valve spring retainer and valve stem keys.

5 Measure the distance (1) between the cylinder head to the bottom of the valve spring retainer, refer to 5 Specifications.

6 If the maximum height specification is exceeded, a new valve should be installed and the valve stem height re-measured.

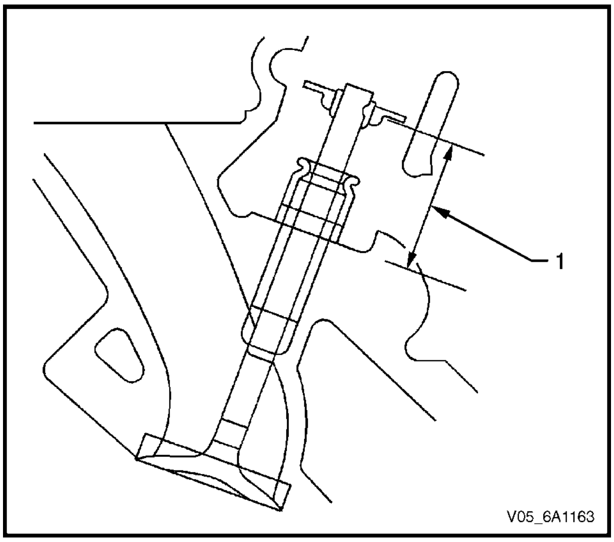

Figure 6A1 – 387

CAUTION

Do not grind the valve stem tip. The tip of the valve is hardened and grinding the tip will eliminate the hardened surface causing premature wear and possible engine damage.

CAUTION

Do not use shims to adjust valve stem height. The use of shims will cause the valve spring to bottom out before the camshaft lobe is at peak lift and engine damage could result.

7 If the valve stem height still exceeds the maximum height specification, the cylinder head must be replaced.

Assemble

1 Install the cylinder head coolant threaded plugs (1) and tighten to the correct torque specification.

Cylinder head threaded plug	31.0 Nm

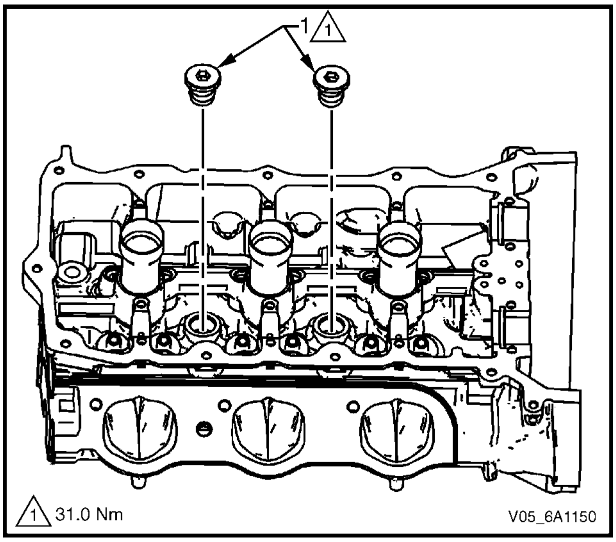

Figure 6A1 – 388

2 Install the cylinder head oil gallery expansion plugs (1).

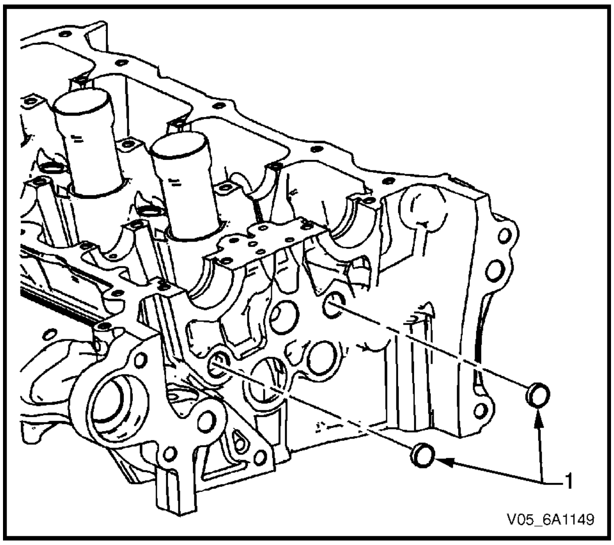

Figure 6A1 – 389

CAUTION

- **Never reuse a valve stem oil seal. Always use new seals when assembling the cylinder head.**
- **Force should only be applied to the valve spring contact area of the new valve stem oil seal during installation.**

3 Fit the valve stem oil seals onto the guides using Tool No. EN-46116 (1).

4 Push and twist the valve stem oil seal into position on the valve guide until the seal positively locks on the guide using Tool No. EN-46116.

5 Lubricate the valve stem and valve guide ID with clean engine oil.

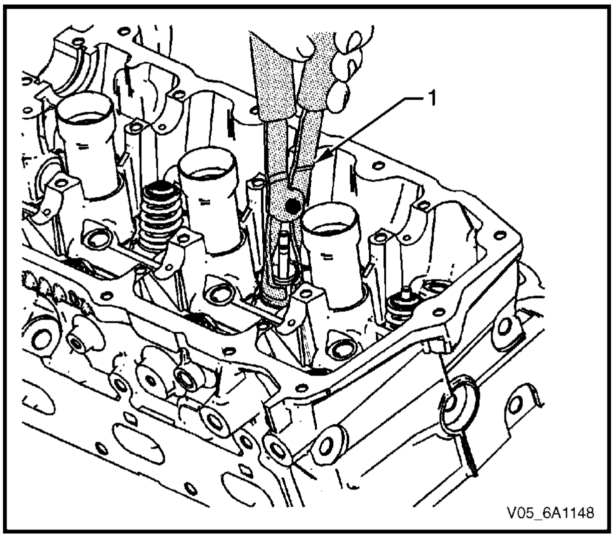

Figure 6A1 – 390

CAUTION

The valve stem oil seal must not come loose from the valve guide when the valve (1) is installed.

6 Insert the valve into the valve guide until it bottoms on the valve seat.

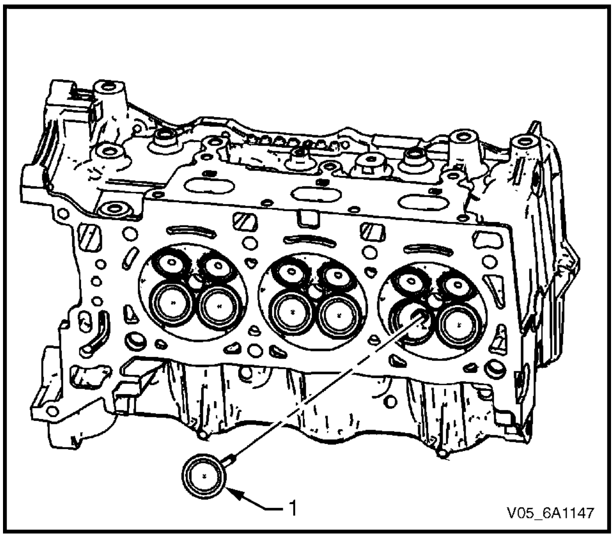

Figure 6A1 – 391

7 Position the valve spring (2) on the spring seat (1).

8 Place the valve spring retainer onto the valve spring.

CAUTION

Do not compress the valve springs less than 24.0 mm. Contact between the valve spring retainer and the valve stem oil seal can cause potential valve stem oil seal damage.

WARNING

Compressed valve springs (1) have high tension against the valve spring compressor (2). Valve springs that are not correctly compressed by, or are released from, the valve spring compressor can be ejected from the valve spring compressor with intense force. Use care when compressing or releasing the valve spring with the valve spring compressor and when removing or installing the valve stem keys. Failing to use care may cause personal injury.

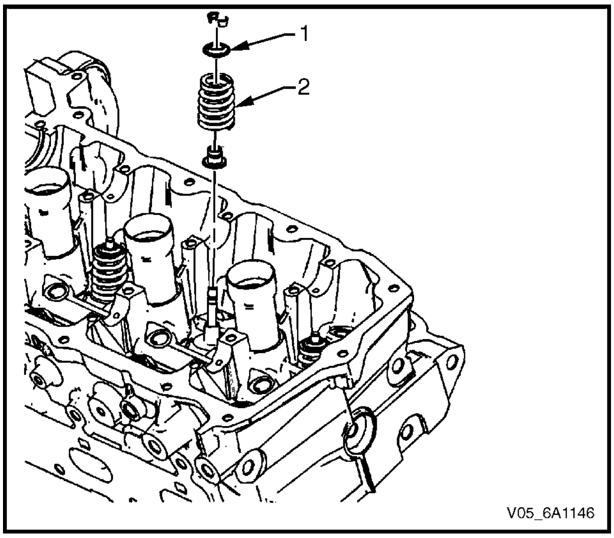

Figure 6A1 – 392

9 Compress the valve spring using valve spring compressor Tool No. J-8062 and adaptor Tool No. EN-46119.

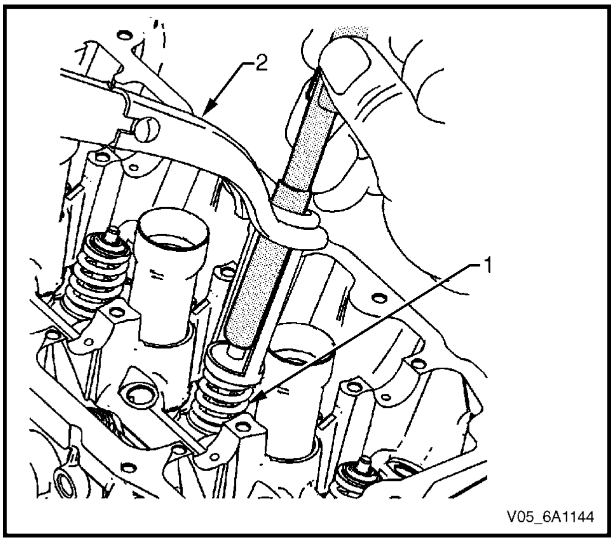

Figure 6A1 – 393

CAUTION

Ensure correct directional placement of valve collets (1) in Tool No. EN-46117 (2). The valve collets must be installed with the tapered end towards the valve stem seal.

10 With the spring compressed, install the valve collets into Tool No. EN 46117.

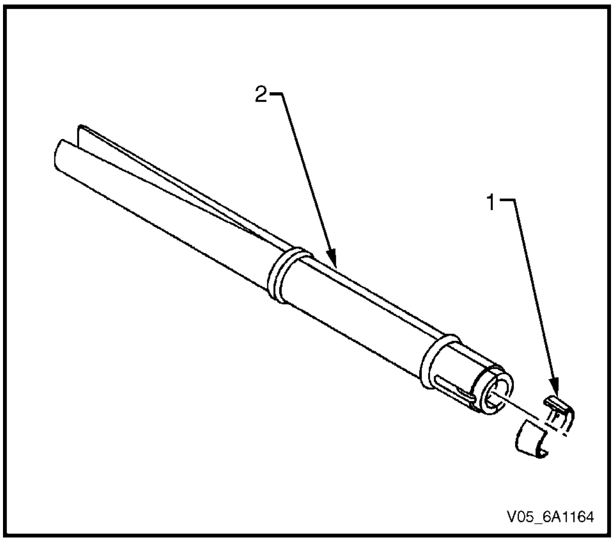

Figure 6A1 – 394

11 Place the collets into position by pushing the tool (1) downward and releasing tension on the valve spring compressor (2).

12 Verify the valve collets are installed by placing a rag over the valve tip and tapping with a dead-blow hammer. The valve collets and the spring should remain in place.

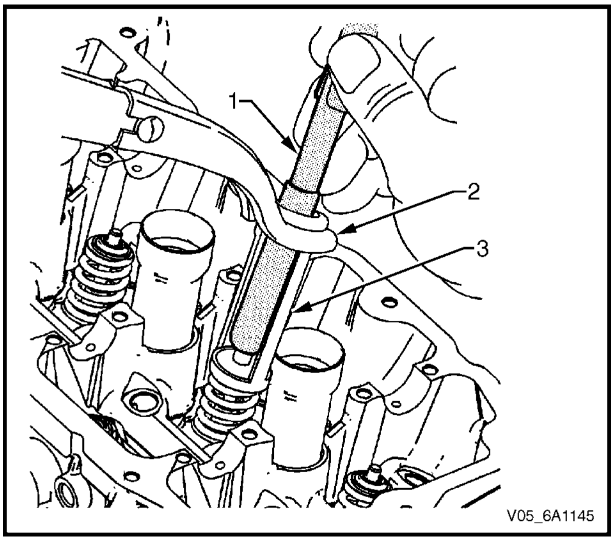

Figure 6A1 – 395

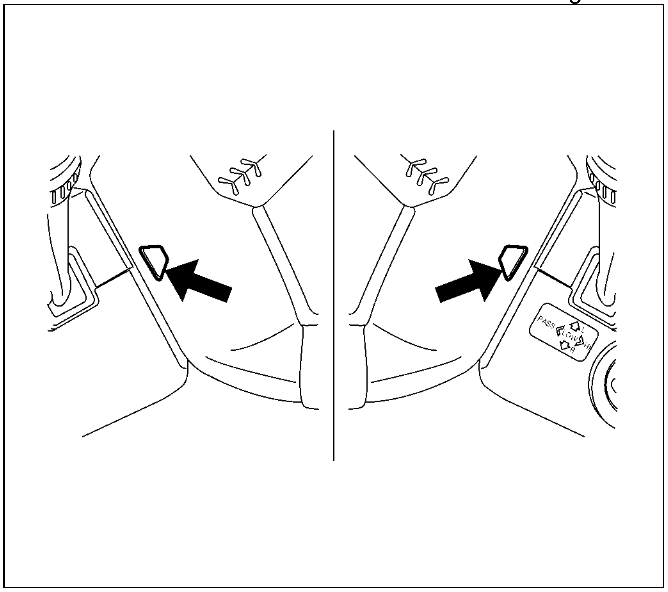
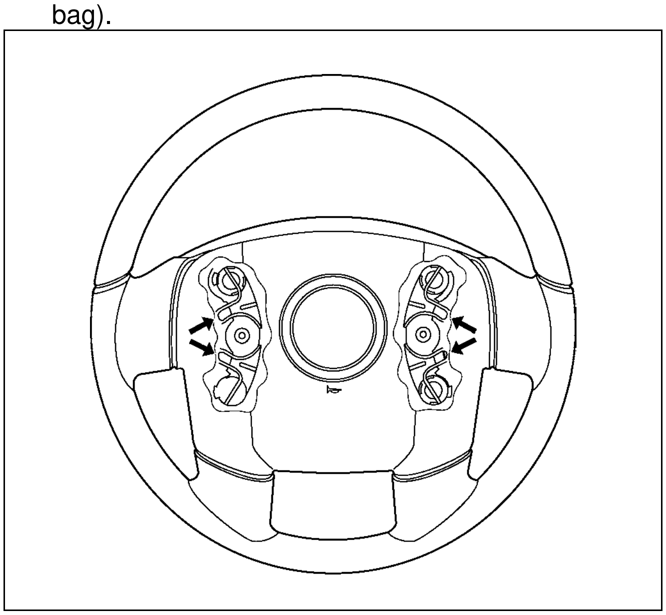
7. Disable the SRS (Refer to "Disabling the SRS" in this section) (with SRS air bag).
8. Check the holes on both sides of the steering cover.



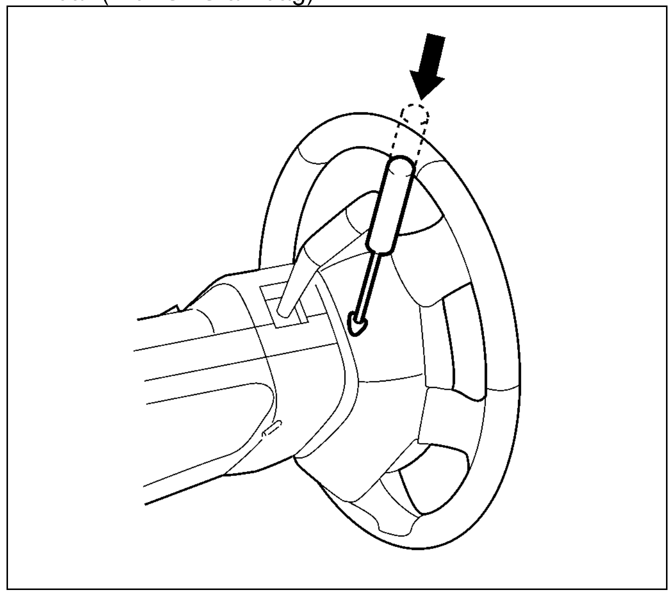
060R300025

9. Check the position of the pins in their holes. Push the pin in the direction of the arrow (with SRS air bag).



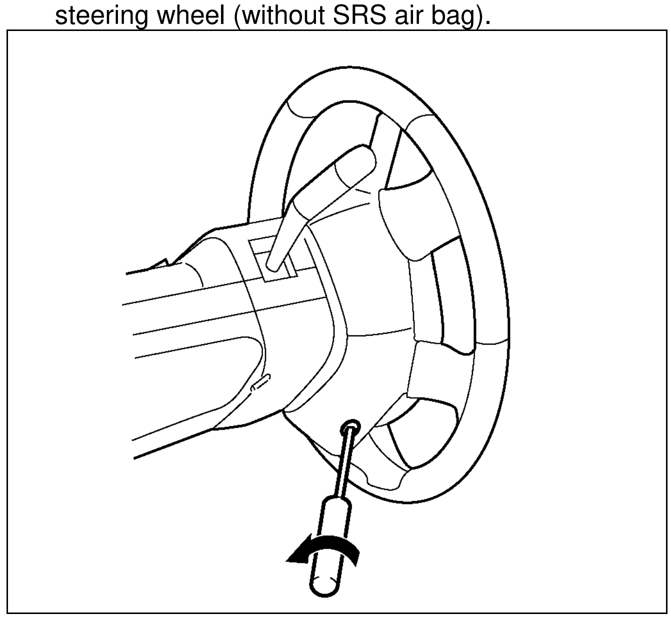
RTW73BSH000101

10. Push the four pins with a ϕ 5~6 mm (0.20~0.24 in) bar (with SRS air bag).



060R300031

11. Cancel the lock to release the four pins (with SRS air bag).
12. Loosen the horn pad fixing screw at the rear of the steering wheel (without SRS air bag).



430R300009

Reinstall

Right-hand Side (Bank 1) Cylinder Head

The reinstallation procedure for the right-hand side cylinder head assembly is the reverse of the removal procedure, noting the following:

1 Ensure all fasteners are tightened to the correct torque specification.

2 Using crankshaft rotation Tool No. EN-46111 (1), align the crankshaft sprocket timing mark (2) with the indexing mark (3) on the oil pump housing.

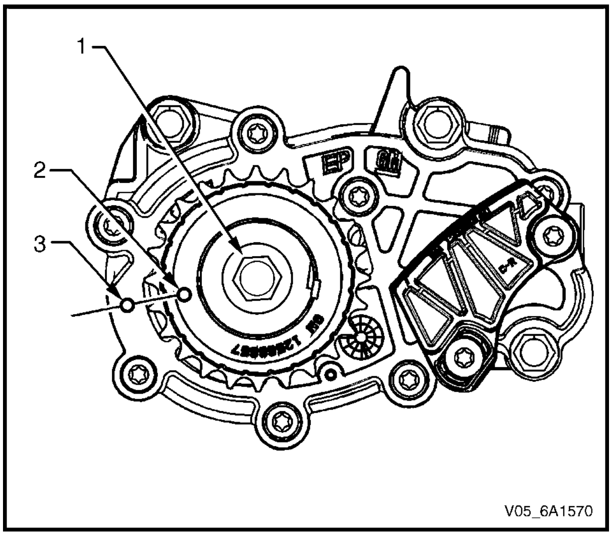


Figure 6A1 – 396

3 Ensure the deck face is clean and the cylinder head locating pins are securely mounted in the cylinder block deck face.

4 Install a new right-hand cylinder head gasket (1) using the deck face locating pins for retention.

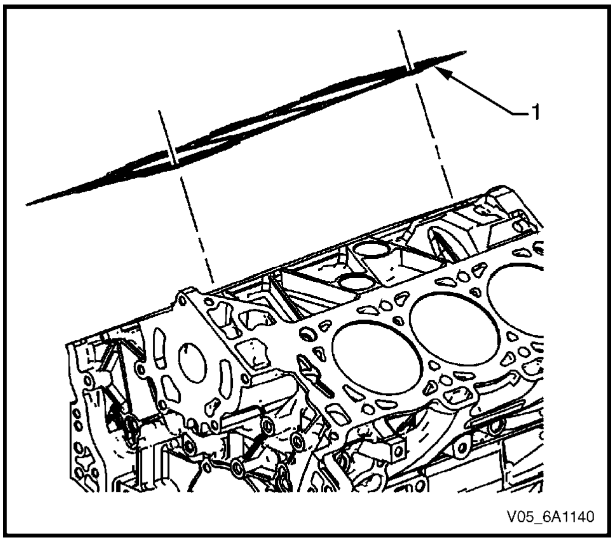

Figure 6A1 – 397

5 Align the cylinder head with the locating pins.

6 Place the cylinder head in position on the deck face.

NOTE

Do not allow oil on the cylinder head bolt bosses.

CAUTION

Do not reuse the old M11 cylinder head bolts (1 to 8 inclusive).

7 Install new M11 cylinder head bolts (1) eight places and tighten in the sequence shown and to the correct torque specification.

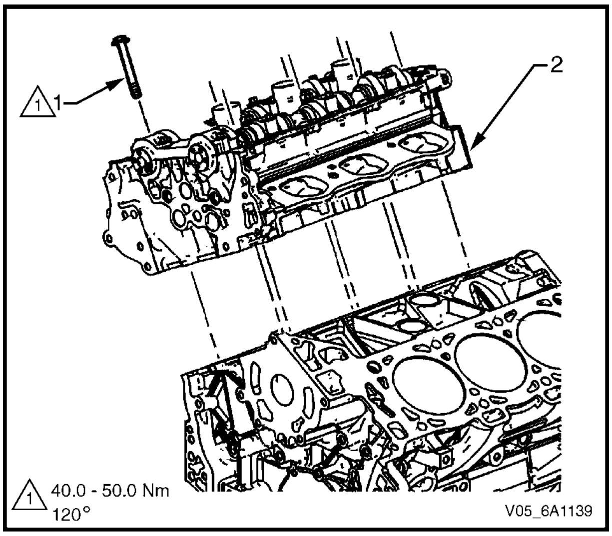

Figure 6A1 – 398

■ Cylinder head M11 attaching bolt torque specification:

Stage 1: ....40.0 – 50.0 Nm
Stage 2: ....120°

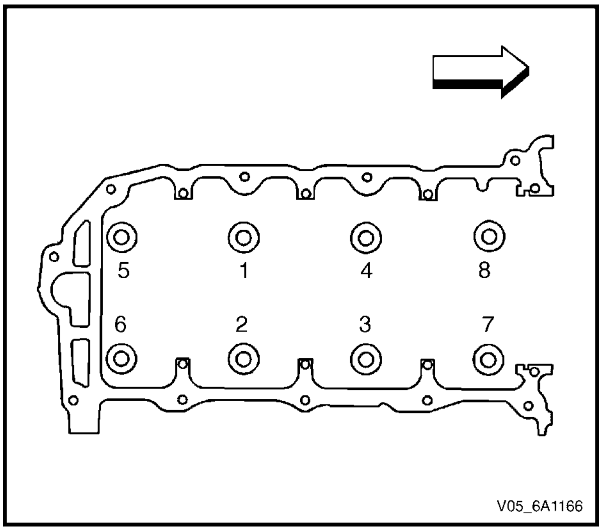

Figure 6A1 – 399

Left-hand Side (Bank 2) Cylinder Head

The reinstallation procedure for the left-hand side cylinder head assembly is the reverse of the removal procedure, noting the following:

1 Ensure all fasteners are tightened to the correct torque specification.

2 Using crankshaft rotation Tool No. EN-46111 (1), align the crankshaft sprocket timing mark (2) with the indexing mark (3) on the oil pump housing.

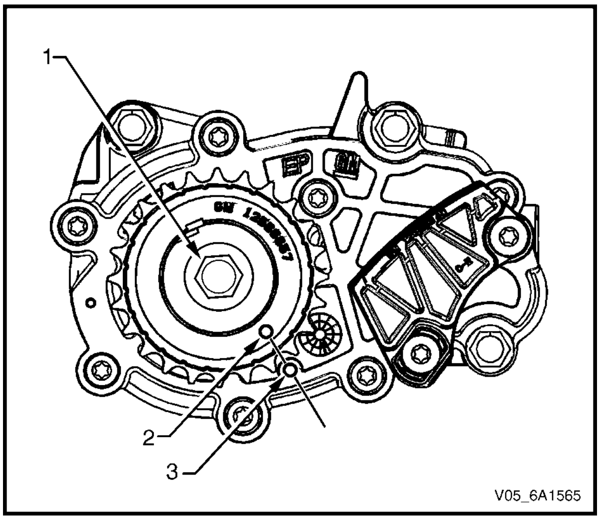

Figure 6A1 – 400

3 Ensure the deck face is clean and the cylinder head locating pins are securely mounted in the cylinder block deck face.

4 Install a new cylinder head gasket (1) using the deck face locating pins for retention.

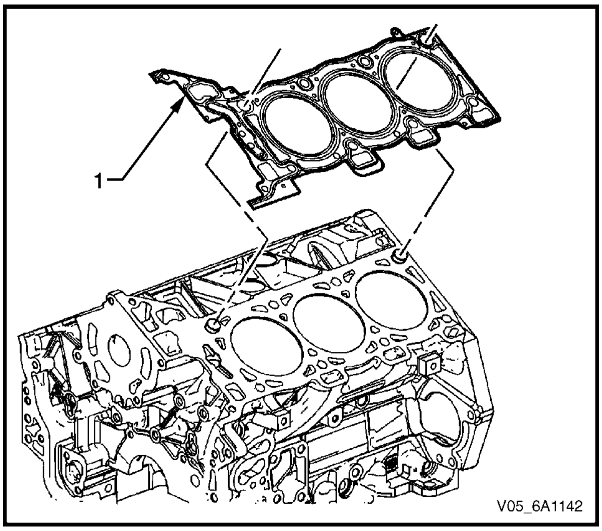

Figure 6A1 – 401

5 Align the cylinder head with the locating pins.

6 Place the cylinder head in position on the deck face.

NOTE

Do not allow oil on the cylinder head bolt bosses.

CAUTION

Do not reuse the old M11 cylinder head bolts (1 to 8 inclusive).

7 Install new M11 cylinder head bolt (1), eight places, and tighten in the sequence shown and to the correct torque specification.

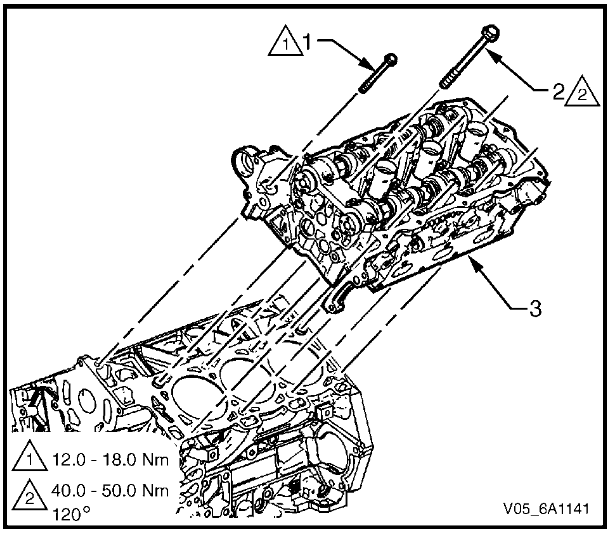

Figure 6A1 – 402

8 Install the front M8 cylinder head bolt (2), two places, and tighten in the sequence (9 and 10) and to the correct torque.

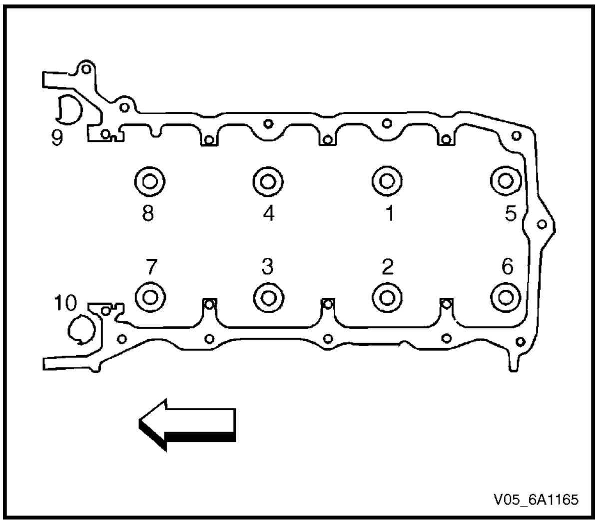

Figure 6A1 – 403

■ Cylinder head M11 attaching bolt torque specification:

Stage 1: ....40.0 – 50.0 Nm
Stage 2: ....120°

■ M8 cylinder head bolt torque specification

Stage 1: ....12.0 – 18.0 Nm
Stage 2: ....60°

3.24 Engine Mounts and Brackets

Remove

1 Remove the exhaust manifold assembly from the side of the engine where the engine mount is to be removed, refer to 3.11 Exhaust Manifold Assembly.

2 Fit the engine lift brackets, Tool No. EN-46114 (1) to the cylinder heads.

CAUTION

Only lift the engine far enough to take the weight off the engine mount, or damage to the mount and lifting equipment failure may occur.

3 Using an engine lifting crane, raise the side of the engine where the mount is to be removed enough to remove the weight from the engine mounts, and create a slight tension in the lifting equipment.

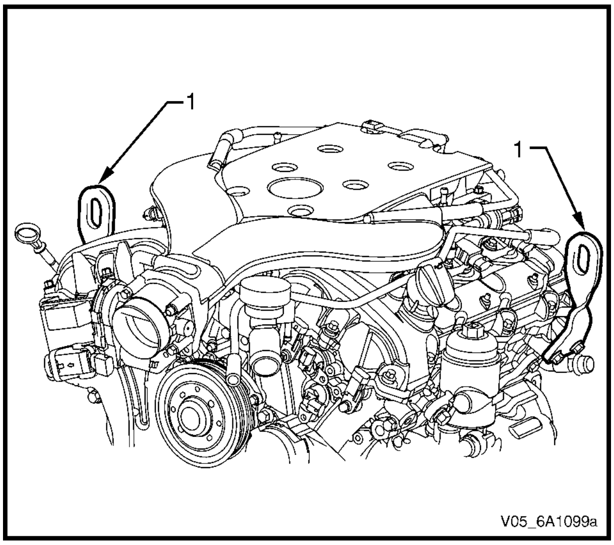

Figure 6A1 – 404

4 Remove the left-hand or right-hand side engine mount and bracket as required.

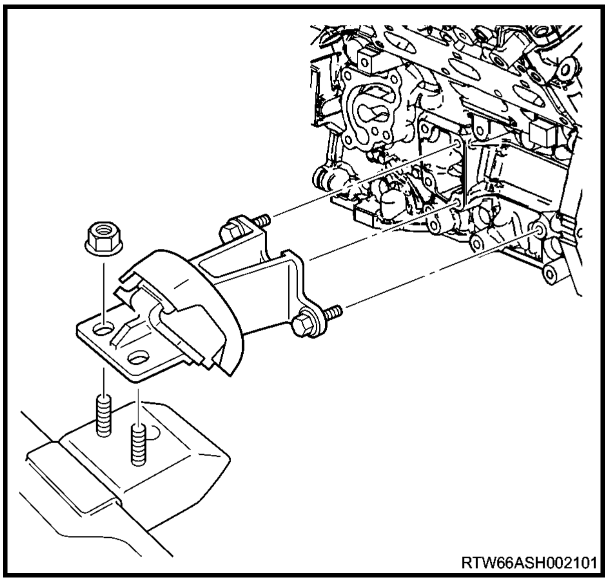

Figure 6A1 – 405

Engine Mount Location

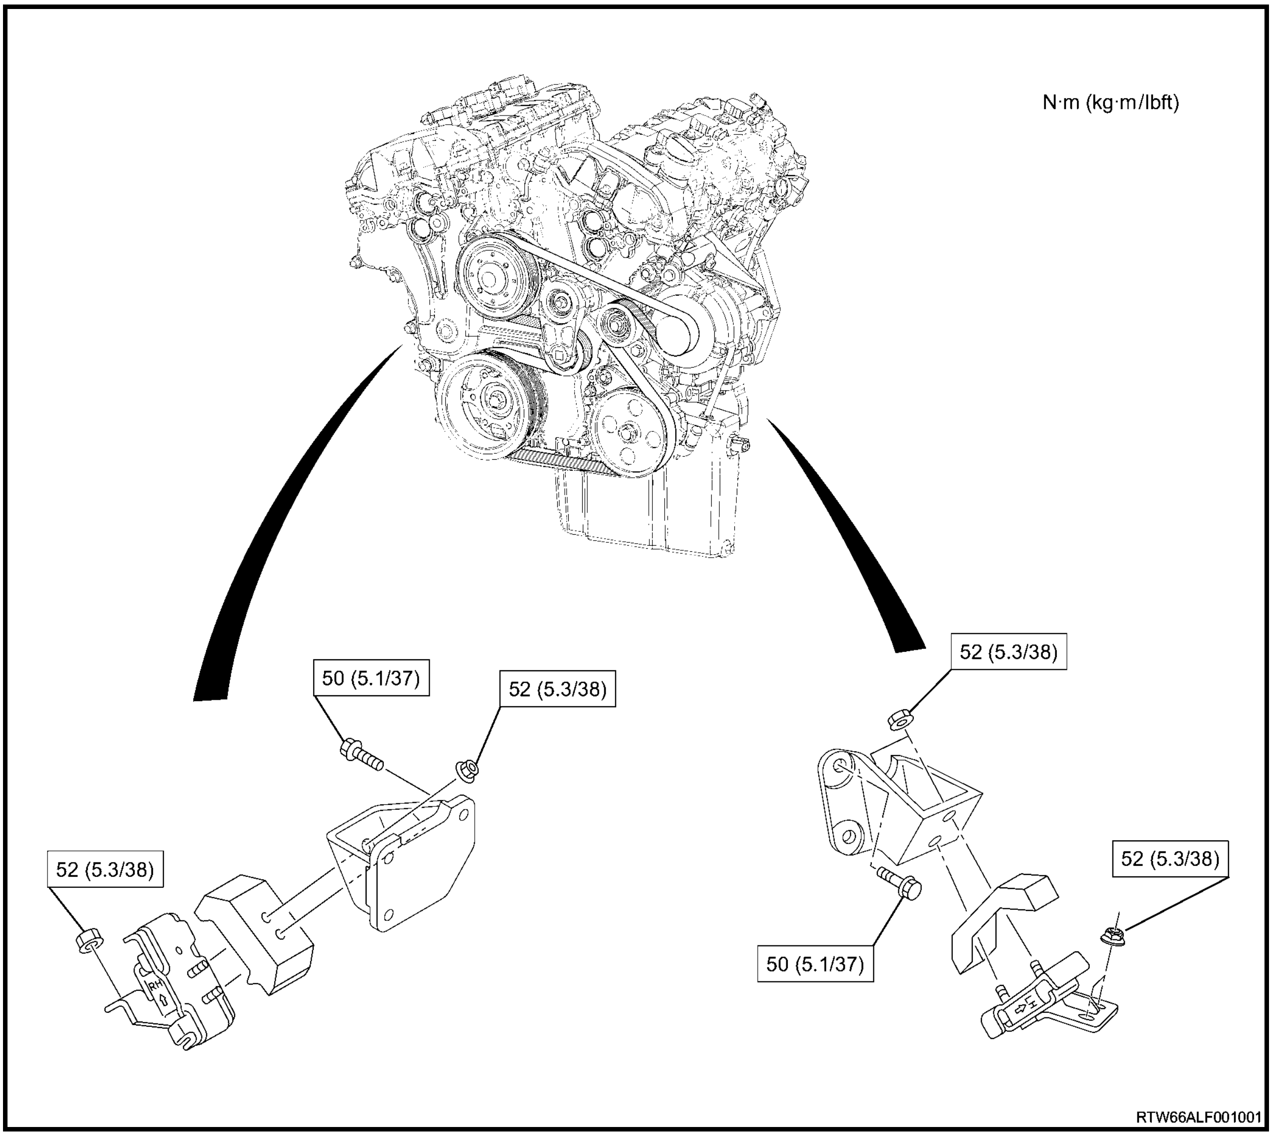

Figure 6A1 – 406

Inspect

NOTE

Although the following procedure provides information regarding on-vehicle engine mount inspections, it is preferable to inspect the engine mounts once removed from the vehicle.

1 Fit the engine lift brackets, Tool No. EN-4611 to the cylinder heads.

WARNING

Only lift the engine enough to take the weight off the engine mounts, or damage to the mounts and lifting equipment failure may occur.

2 Using a commercially available engine lifting crane, have an assistant raise the engine far enough to remove the weight on the engine mounts and create a slight tension in the rubber.

3 Observe the engine mount while raising the engine.

4 Replace the engine mount if any of the following conditions are found:

- The hard rubber surface is covered with heat check cracks,
- The rubber is split through the centre of the engine mount, or
- The rubber is separated from the metal plate portion of the engine mount.

5 Remove the engine lift brackets, Tool No. EN-46114 from the engine.

Reinstall

The reinstallation procedure for the engine mounts is the reverse of the removal procedure, noting the following:

Ensure all fasteners are tightened to the correct torque specification.

Engine mount bracket to
cylinder block attaching bolt
torque specification
....43.0 – 57.0 Nm

Engine mount to bracket attaching nut
torque specification
....70.0 – 90.0 Nm

Engine mount to frame attaching nut
torque specification
....44.0 – 60.0 Nm

4 Major Service Operations

ATTENTION

The V6 engine is a combination of numerous components, containing machined, honed, polished and lapped surfaces manufactured on the latest, high technology production equipment. Many of the components contain tolerances measured in thousandths of a millimetre. Consequently, when any engine component is to be serviced, care and cleanliness are extremely important.

Prior to re-assembly of the V6 engine, all components must be cleaned and inspected in accordance with the relevant procedures throughout this section, and replaced or repaired where required.

In addition to cleaning and inspecting components, a liberal coating of engine oil should be applied to friction surfaces during assembly to protect and lubricate the surfaces on initial operation.

When performing any service operation contained in this Section, it should be understood that correct cleaning and protection of machined surfaces and friction areas is part of the repair procedure. This is considered standard workshop practice, even if not specifically stated. Torque values must be used as specified during reassembly to ensure correct retention of all components.

Through out this section, fastener torque wrench specifications may be accompanied with the following identification marks:

■ Fasteners must be replaced after loosening.

♦ Fasteners either have micro encapsulated sealant applied or incorporate a mechanical thread lock and should only be re-used once. If in doubt, replacement is recommended.

If one of these identification marks is present alongside a fastener torque wrench specification, the recommendation regarding that fastener must be adhered to.

4.1 Engine Removal

CAUTION

- **Allow the engine to cool to at least 50° C, before attempting fastener removal.**
- **As aluminium has a greater rate of thermal expansion than that of cast iron, aluminium bolt hole threads will change dimension to a larger extent than cast iron bolt threads.**
- **If a bolt or other threaded component is removed before the engine is allowed to cool to at least 50° C, threads could be pulled from the cylinder block or cylinder head.**
- **Do not use impact tools to remove bolts during engine disassembly. While this may be common practice with cast iron engine components, use of these tools is likely to pull the aluminium threads in the cylinder block or head of this engine.**

Remove

1 Remove the skid plate.
2 Drain the radiator coolant, refer to Section 6B1 Engine Cooling – V6.
3 Disconnect the battery negative and positive terminal, refer to Section 8A Electrical Body & Chassis.
4 Remove the battery from the vehicle.
5 Depressurise the fuel system pressure, refer to Section 6C Fuel System – V6.
6 Make alignment marks on the bonnet and hinges in order to return the bonnet to the exact original position.
7 Remove the bonnet, refer to Section 2B Sheet Metal.
8 Remove the rubber hose (2) and air duct (1).

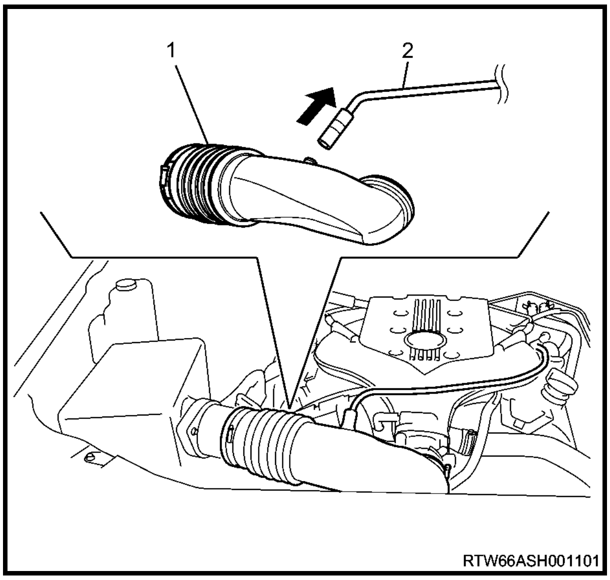

Figure 6A1 – 407

9 Disconnect the barometric sensor connector (1).

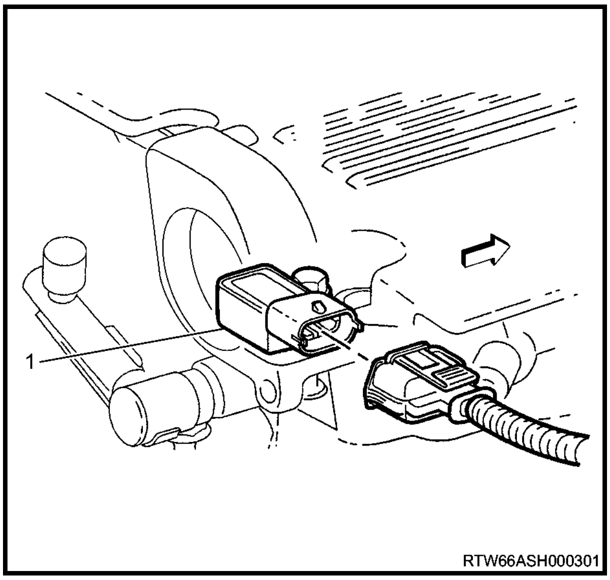

Figure 6A1 – 408

10 Disconnect the vacuum booster hose (1).

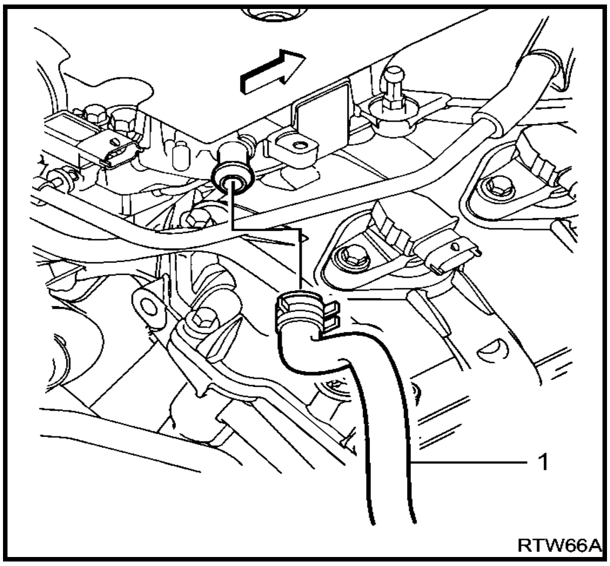

Figure 6A1 – 409

11 Disconnect the EVAP purge solenoid connector (1).

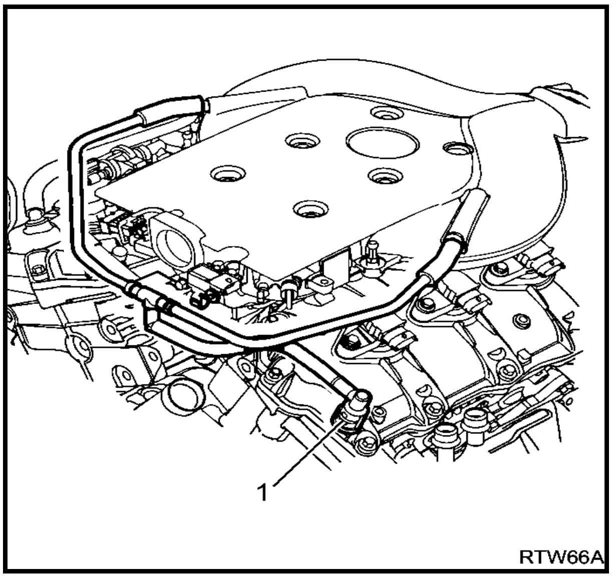

Figure 6A1 – 410

CAUTION

Plug the fuel feed hose after removal to prevent dirt entering the pipe.

12 Disconnect the fuel pipe connector and injector harness connector.

13 Disconnect the fuel feed hose from the fuel rail (1), refer to Section 6C Fuel system.

14 Pull out release bar (2) of the fuel injector harness wiring connector (3).

15 Disconnect the fuel injector harness wiring connector from the fuel injector wiring harness (4).

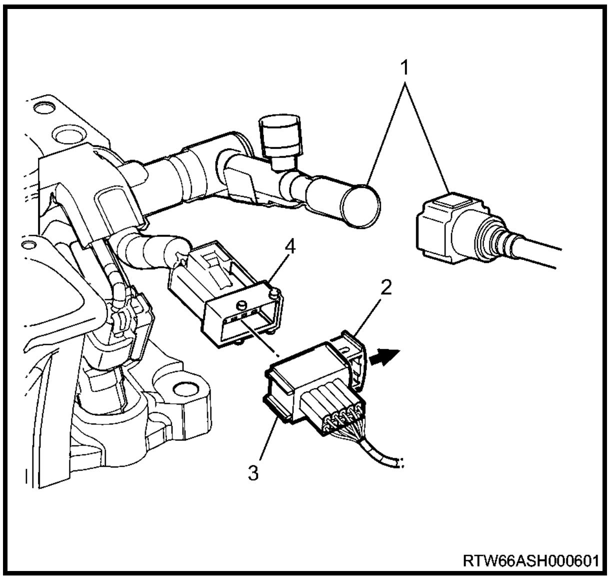

Figure 6A1 – 411

16 To disconnect the throttle body connector (1) the following procedure must be followed.

17 Retract the throttle body wiring connector lock (3) while pressing the connector latch in the direction of the arrow (4).

18 Disconnect the throttle body wiring connector (1).

19 Release the throttle body connector wiring harness from its retaining clip (5).

CAUTION

Take care not to break the barbed retainer pin (6), when removing the harness. Should the pin be damaged it is vital that a new harness retainer be fitted.

20 Remove the main wiring harness retainer pin (6) from the intake manifold by pushing from the front to the rear using a suitable length of 5mm steel rod or an allen key.

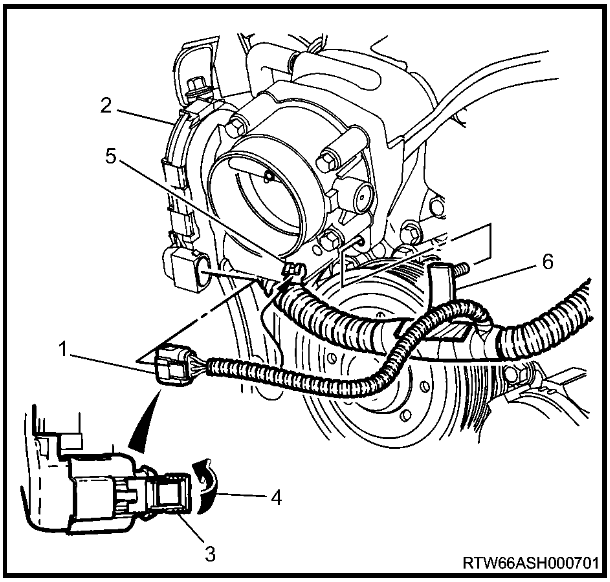

Figure 6A1 – 412

21 Disconnect the PCV fresh air tube (1) from the upper intake manifold mounting clip (2) and remove the fixing bolt (3).

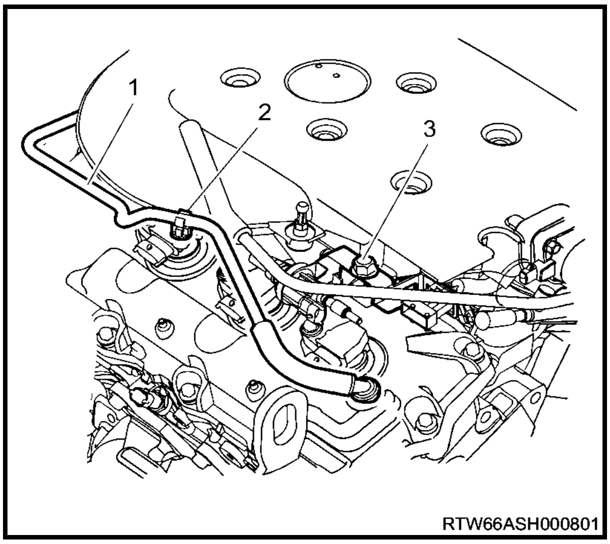

Figure 6A1 – 413

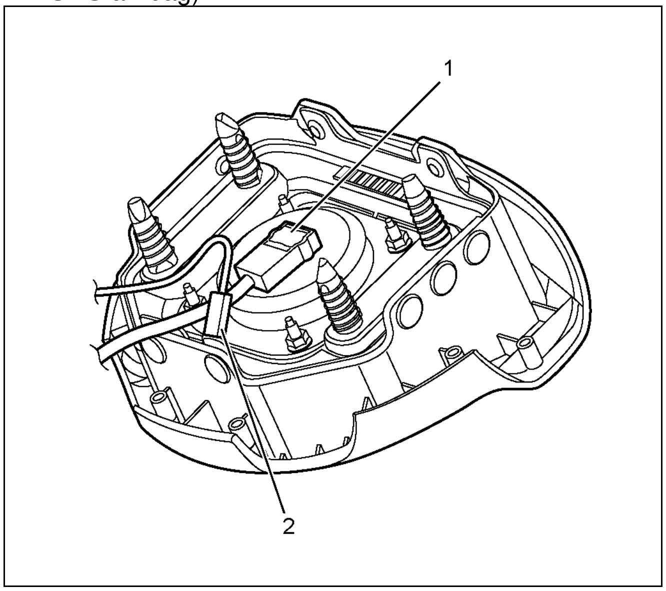
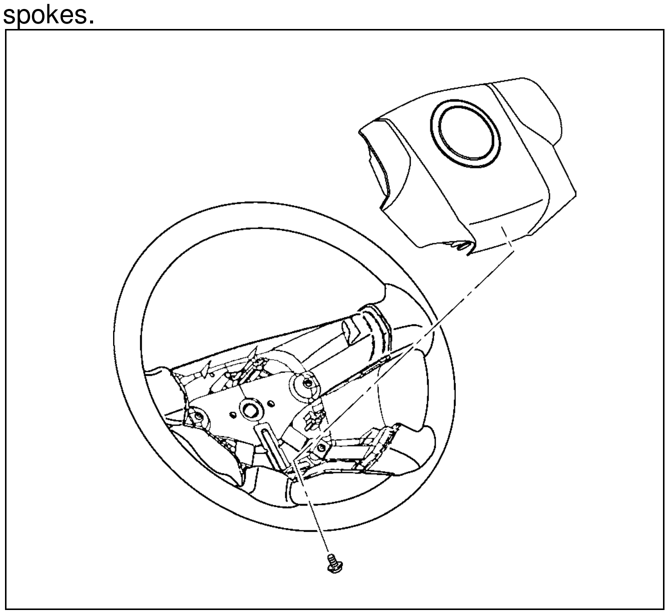
13. Disconnect the SRS air bag connector (1) and horn lead connector (2) located behind the air bag assembly and remove the air bag assembly (with SRS air bag).



RTW73BSH001101

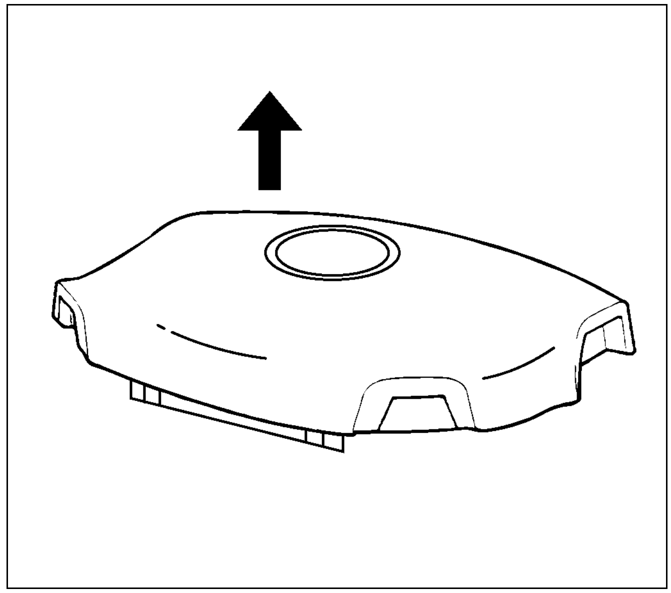
14. Remove the horn pad and the horn leads at the center of the wheel (without SRS air bag).

NOTE: It should be removed first from the bottom spokes.



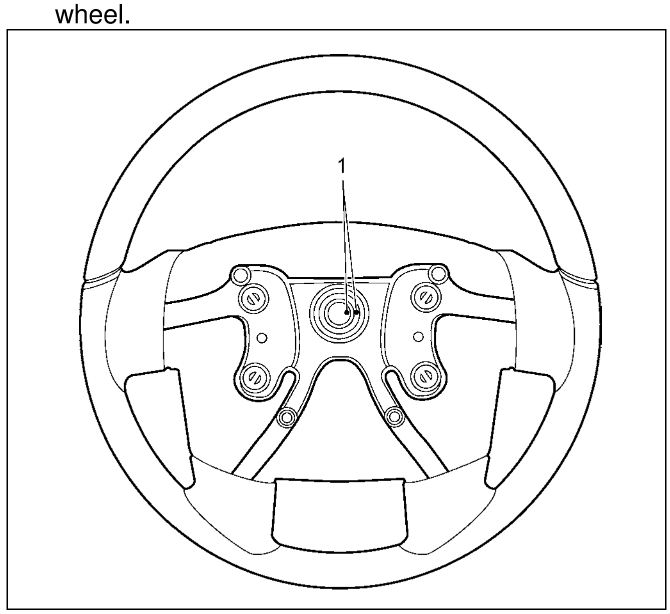
RTW73BSH000601

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE COVER SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT (with SRS air bag).



430R300007

15. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position. Move the front wheels to the straight ahead position, then use steering wheel remover 5-8521-0016-0 (2) to remove the steering wheel.



RTW73BSH000501

CAUTION: Never apply force to the steering wheel in the direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

22 Disconnect the EVAP valve outlet tube, (1) from the upper intake manifold (2).

23 Remove the four long bolts, (3) attaching the upper intake manifold, (2) to the cylinder heads and lower intake manifold.

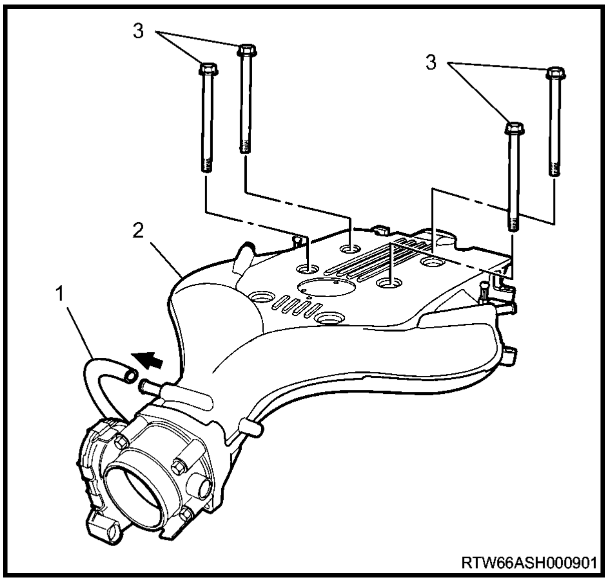


Figure 6A1 – 414

23 Remove the six bolts, (1) attaching the lower intake manifold (2), then remove the manifold from the engine.

24 Remove the following from the engine and engine compartment :

- Lower intake manifold to cylinder head gasket
- The Heater hose
- The Air Cleaner assembly

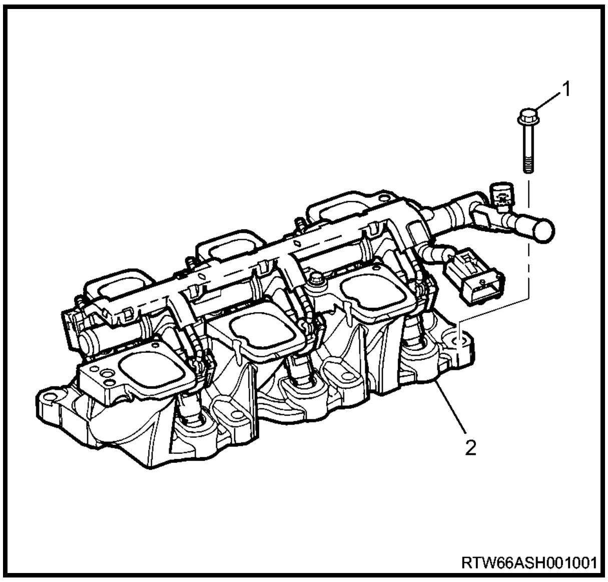

Figure 6A1 – 415

25 Remove the transmission support (1).

26 Remove the front and rear propeller shafts, (4WD Only), refer to Section 4C1 Front Wheel Drive and Section 4C2 Drive Line (For 4WD Vehicles).

27 Remove the front torsion bar springs, refer to Section 3C Suspension.

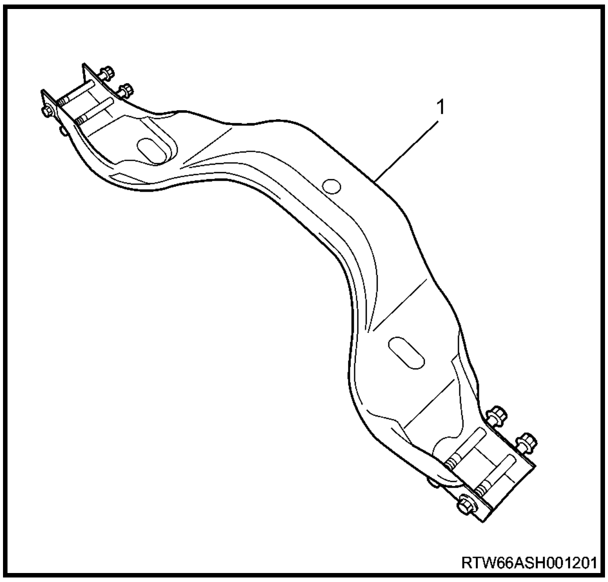

Figure 6A1 – 416

28 Remove the centre exhaust pipe (1), refer to Section 6F Exhaust System - V6.

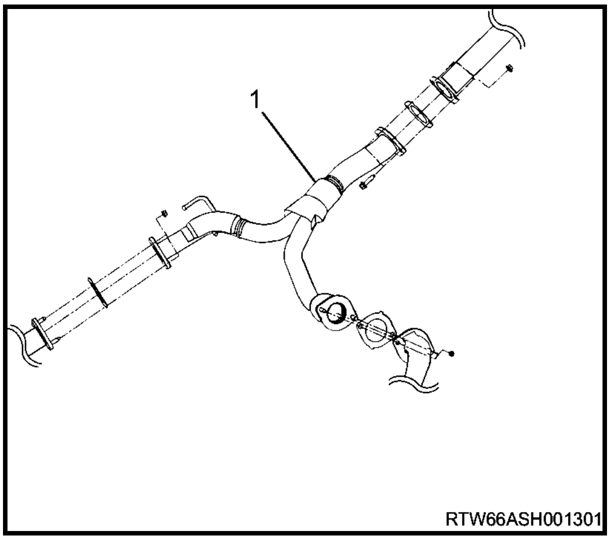

Figure 6A1 – 417

29 Disconnect the two post-catalytic converter oxygen sensor wiring harness connectors, 1 each bank.

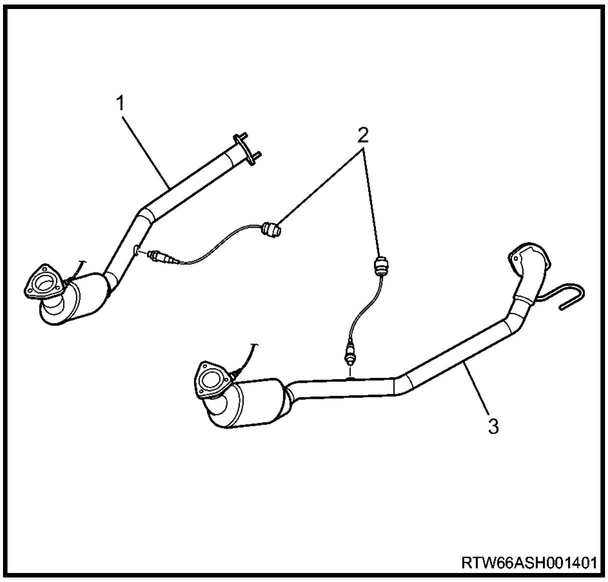

Figure 6A1 – 418

30 Disconnect the two pre-catalytic converter oxygen sensor wiring harness connectors, 1 each bank.

31 Remove the front exhaust flange nuts, three each bank.

32 Remove the front left-hand exhaust pipe from the rubber mount.

33 Remove the front exhaust pipes from the vehicle, for further information, refer to Section 6F Exhaust System - V6.

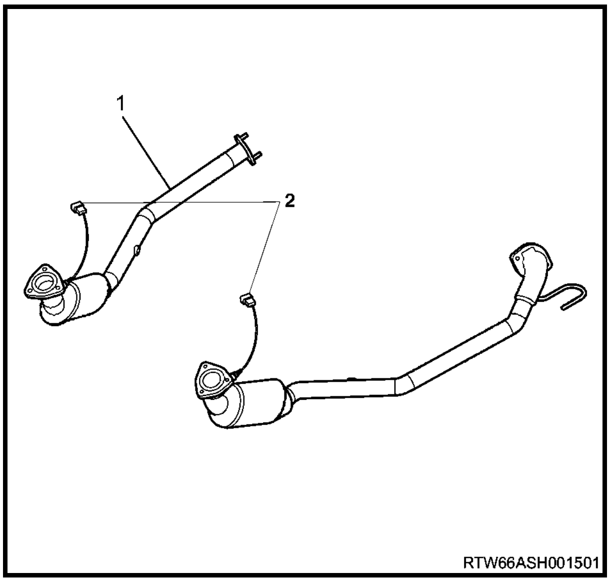

Figure 6A1 – 419

34 Remove the transfer case from the vehicle (4WD Only), refer to Section 7D Transfer Case and Adaptor Housing.

35 Disconnect the harness connector from the transmission, refer to Section 7B1 Manual Transmission – V6 or Section 7C1, Section 7C2, Section 7C3 or Section 7C4 for automatic transmission.

36 Remove the left-hand side exhaust manifold upper heat shield (1), (Automatic transmission only).

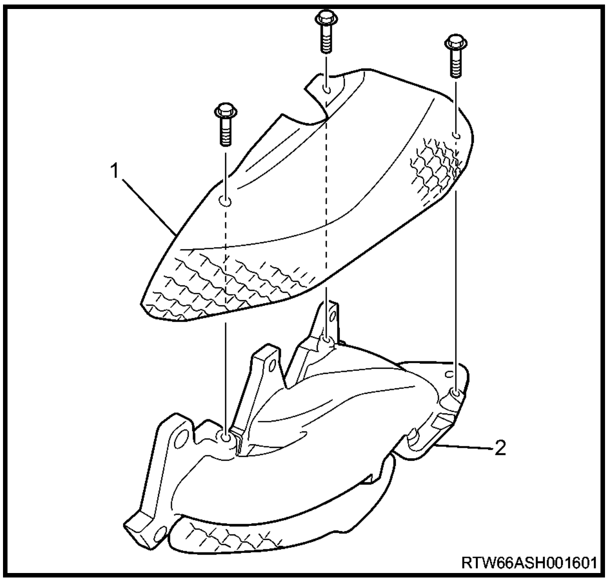

Figure 6A1 – 420

37 Progressively loosen the seven exhaust manifold attaching bolts (2), working from the outside to the centre and then remove the bolts.

38 Manoeuvre the exhaust manifold (3), away from the cylinder head.

39 Remove and discard the exhaust manifold to cylinder head gasket.

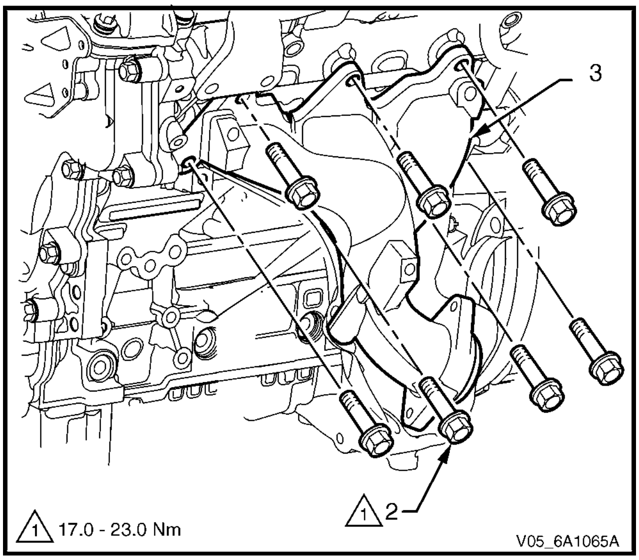

Figure 6A1 – 421

40 Remove the engine oil level indicator assembly (1), (automatic transmission only).

41 Remove the left-hand side exhaust manifold, (automatic transmission only).

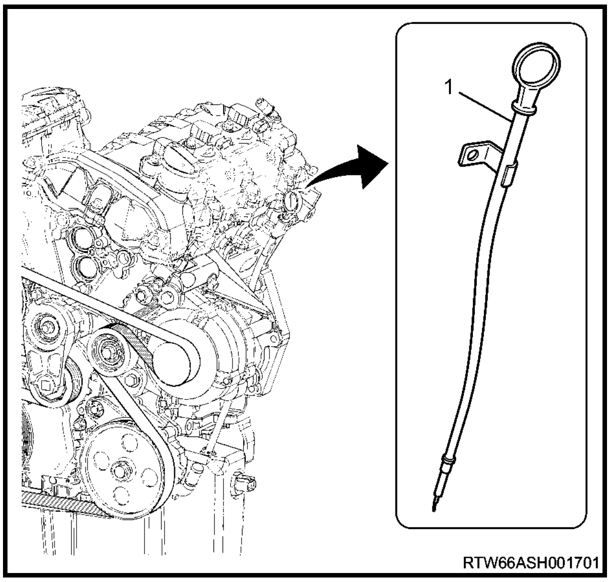

Figure 6A1 – 422

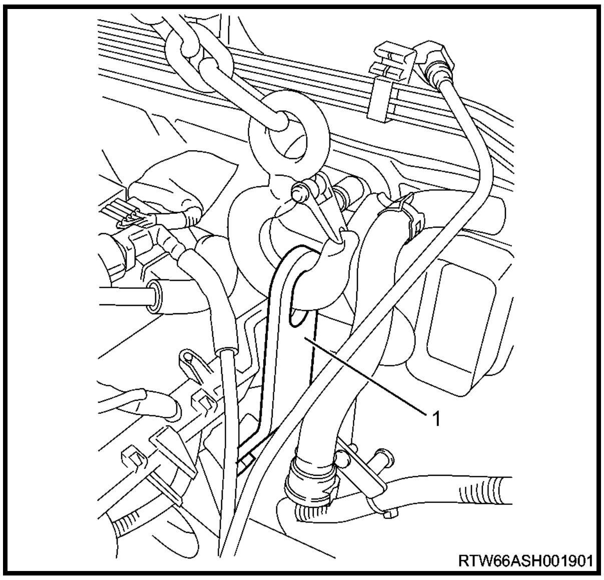

Figure 6A1 – 423

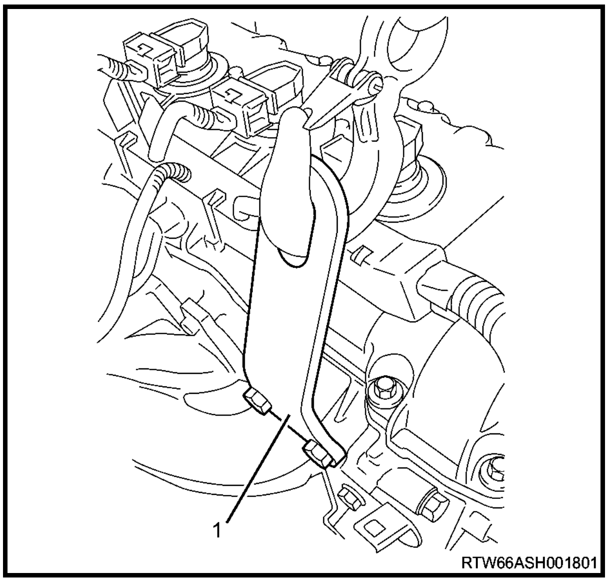

Figure 6A1 – 424

42 Fit the engine lifting brackets (1), (EN–46114) and attach the engine hoist, raise the engine to take the weight off the engine mounts.

Engine Lift Bracket Attaching Bolt torque specification ....58.0 – 72.0.0 Nm

43 Remove the left-hand side knock sensor (1).

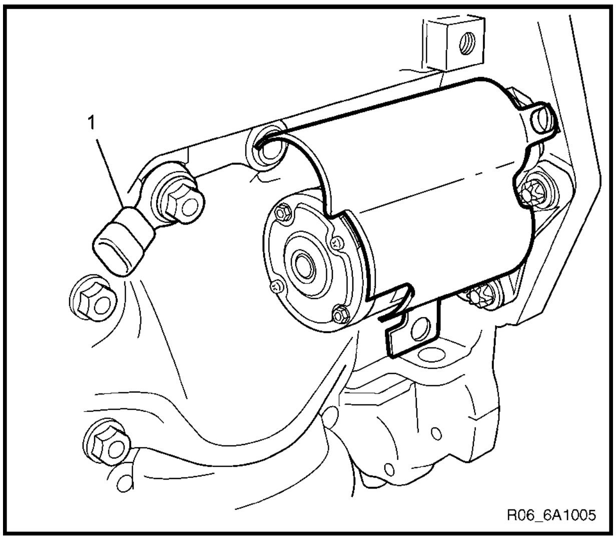

Figure 6A1 – 425

NOTE

Removal or the starter motor is only required for vehicles with an Automatic Transmission.

44 Remove the left-hand side engine mount (1), (automatic transmission only).

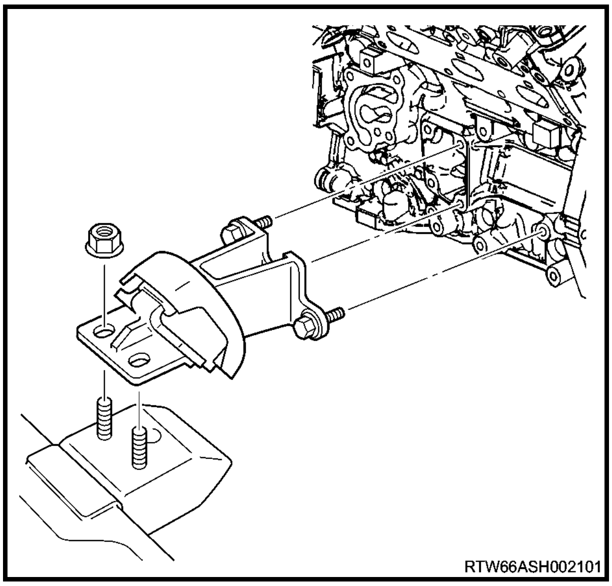

Figure 6A1 – 426

45 Unclip the oil level sensor harness from the heat shield (1).

a Remove the heat shield retaining screw (2).

b Remove the lower starter motor attaching bolt (3).

c Remove the heat shield.

d Remove the upper starter motor retaining bolt (3).

46 Remove the starter motor from the engine block and lower the starter motor as far as possible to gain access to the wiring harness connections.

47 Remove the starter motor, (automatic transmission only).

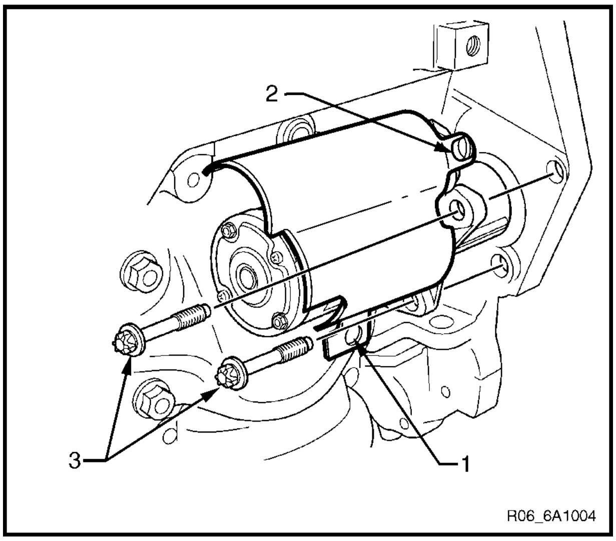

Figure 6A1 – 427

48 Reinstall the left-hand side engine mount (1), (automatic transmission only).

49 Remove the transmission assembly, refer to Section 7C1 Automatic – 4L60E – General Information.

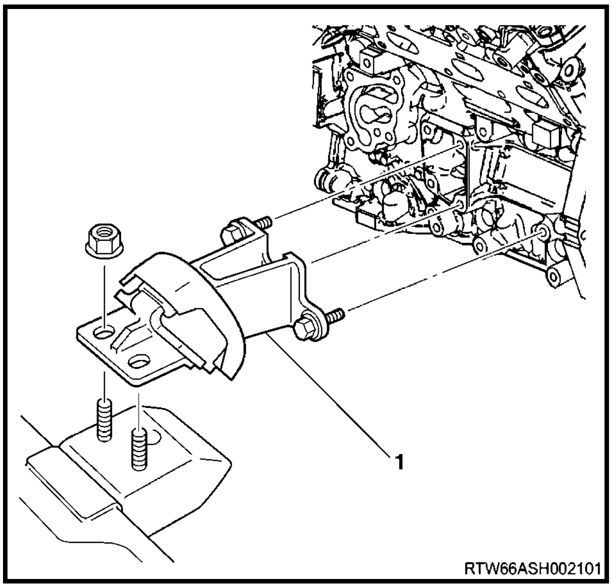

Figure 6A1 – 428

50 Unplug the connector from the oil level sensor (1).

51 Remove the attaching bolt (2) holding the ground cable to the engine block.

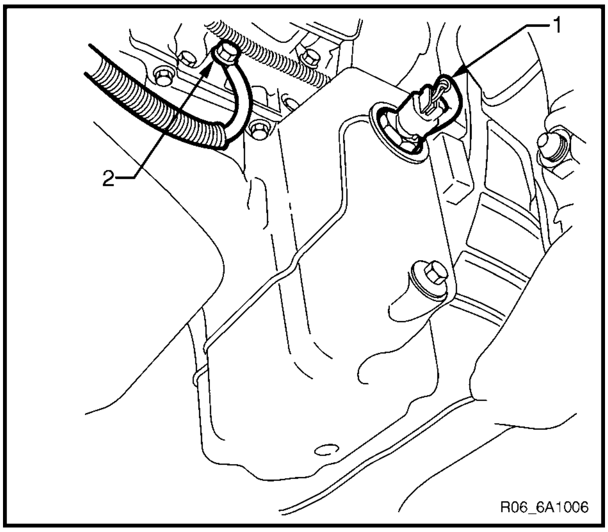

Figure 6A1 – 429

52 Remove the accessory drive belt using a socket wrench (1), to reduce tension rotate the drive belt tensioner (2) clockwise, then while holding the tensioner in the reduced tension position, remove the accessory drive belt (3).

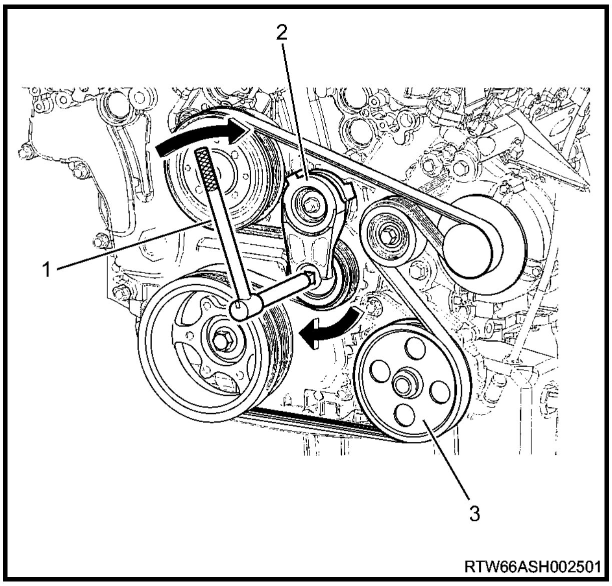

Figure 6A1 – 430

53 Remove the power steering pump bolts (two places), remove the pump (1) from the mounting bracket and disconnect the power steering hoses (two places) from the pump body.

NOTE

Plug the open ends of the power steering hoses to prevent the ingress of contaminants.

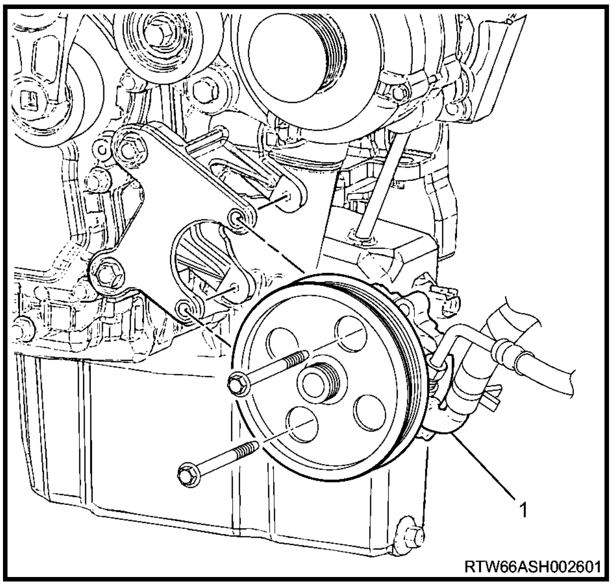

Figure 6A1 – 431

54 Remove the power steering pump bracket mounting bolts (three places) then remove the pump bracket (1).

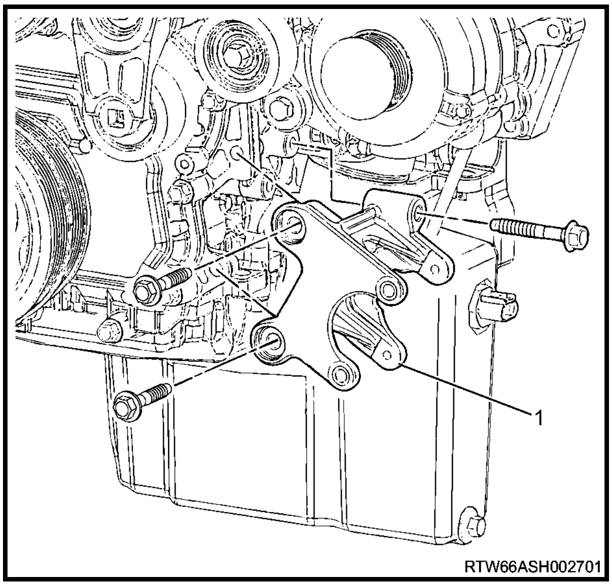

Figure 6A1 – 432

55 Release the lower radiator hose clamp (1) and remove the lower hose from the coolant pipe (2).

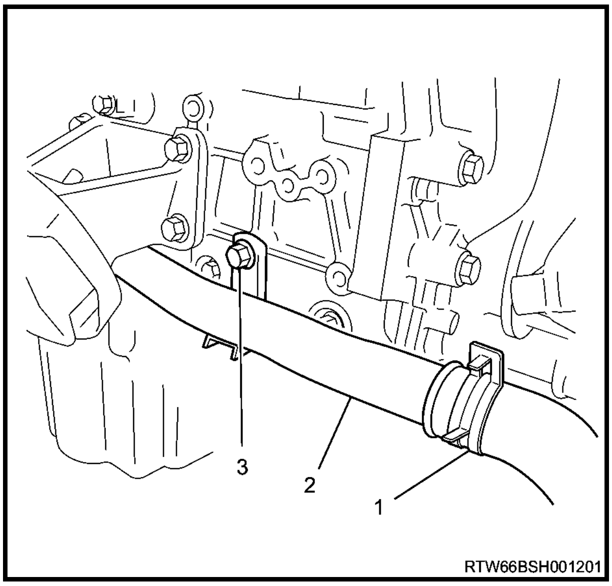

Figure 6A1 – 433

56 Release the upper radiator hose clamp (1) and remove the upper hose from the coolant pipe (2).

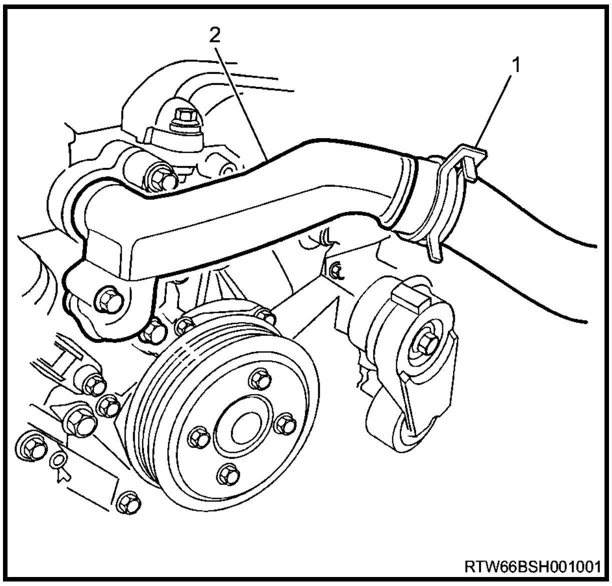

Figure 6A1 – 434

57 Unclip and remove the generator wiring harness connector (1), Remove battery connection attaching nut (4), and remove the battery harness cable (2) from the connection stud.

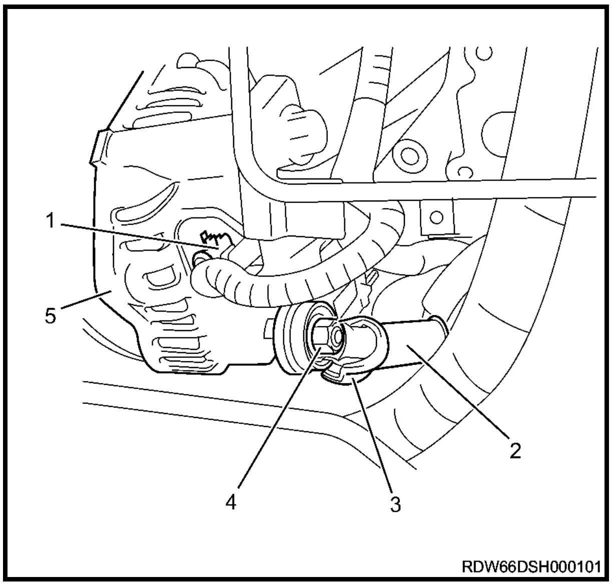

Figure 6A1 – 435

58 Remove the generator attaching bolts (1, 2, and 4) three places, then remove the generator (3) from the mounting bracket.

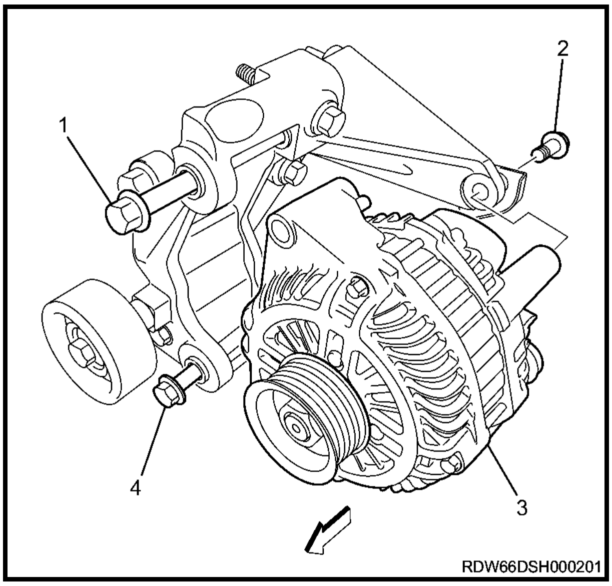

Figure 6A1 – 436

59 Remove the idler pulley attaching bolt and remove the idler pulley (1).

60 Remove the generator bracket attaching bolts, five places, and remove the generator mounting bracket (2).

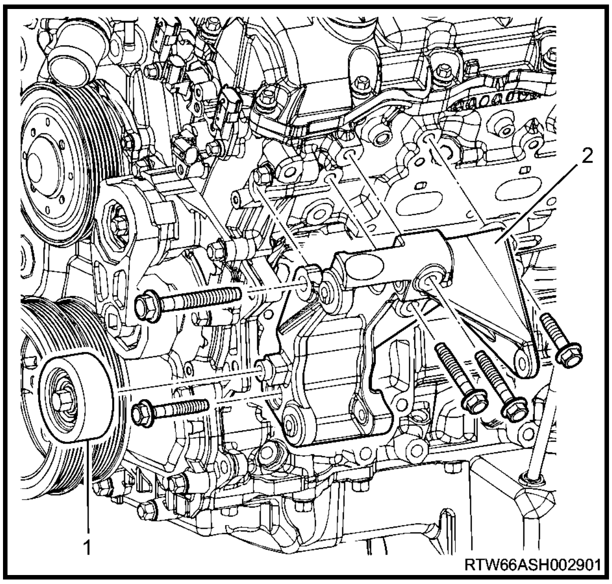

Figure 6A1 – 437

61 Remove the air cleaner cover assembly including the MAF sensor assembly (1).

62 Remove the air cleaner filter (2) from the air cleaner body assembly (3).

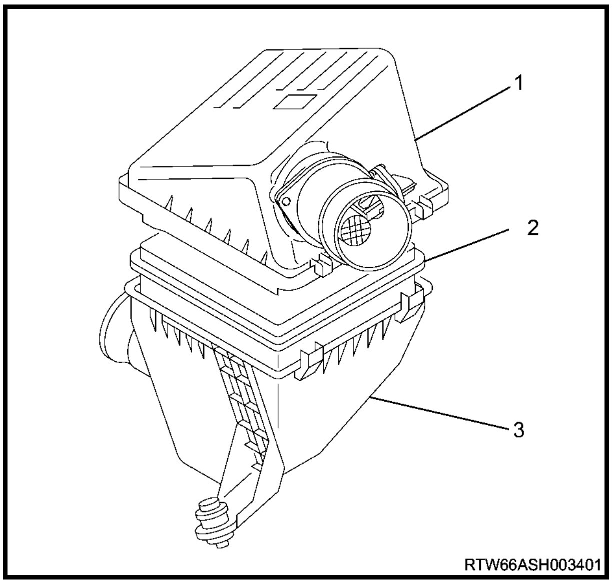

Figure 6A1 – 438

63 Disconnect the ECM connectors (1).

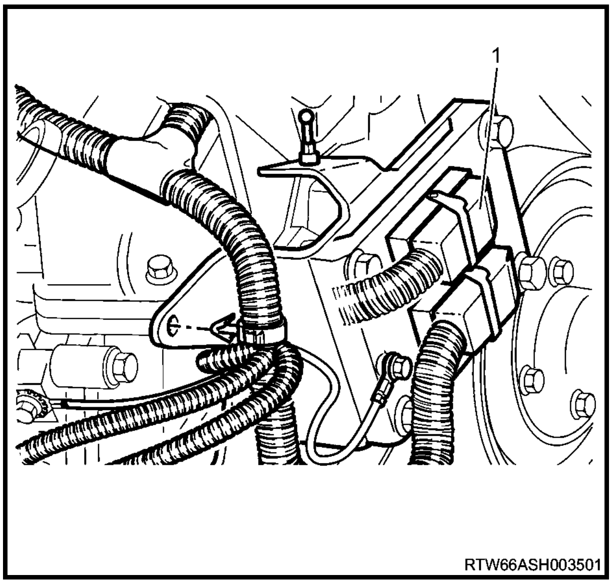

Figure 6A1 – 439

64 Disconnect the canister hose (1).

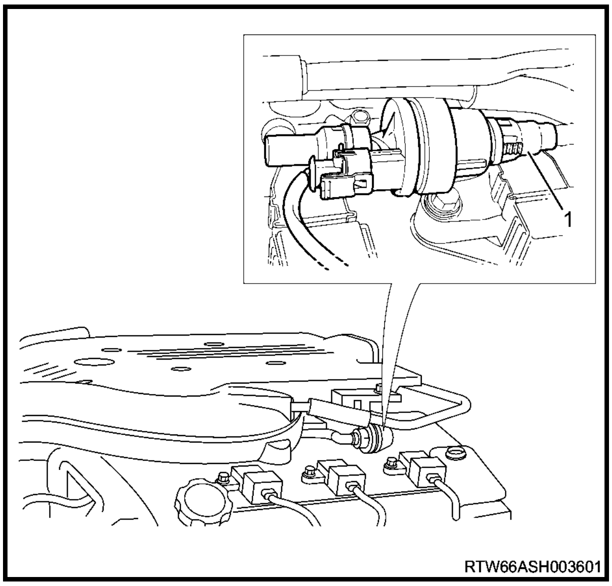

Figure 6A1 – 440

65 Remove the engine mount attaching nuts (1), (two places) on the chassis side of the left-hand and right-hand engine mounts.

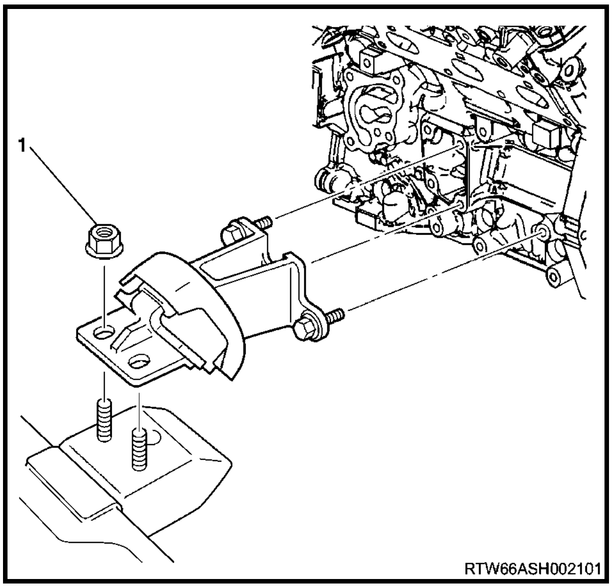

Figure 6A1 – 441

66 Slowly raise the engine using the engine hoist continue to lift and manoeuvre the engine assembly clear of the engine compartment.

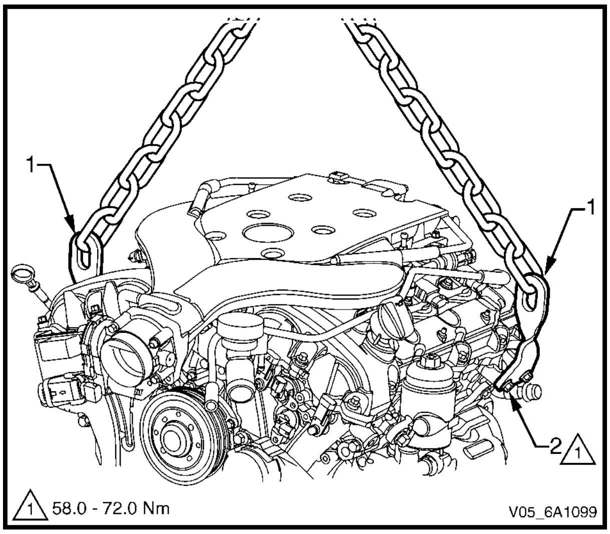

Figure 6A1 – 442

Disassemble

1 Remove the wiring harness connectors and ground connections from the engine and transmission assembly and carefully set the wiring harness to one side, refer to Section 8A Electrical Body & Chassis.

2 Remove the engine control module (ECM) and mounting bracket, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

3 Mount the engine assembly on a suitable engine stand.

5 Drain the engine oil into a suitable, clean container.

6 Remove the following components:

a Oil filter adaptor, refer to 3.3 Oil Filter Adaptor.

b Engine coolant inlet pipe, refer to Section 6B1 Engine Cooling – V6.

c Heater pipe assembly, refer to Section 6B1 Engine Cooling – V6.

d Thermostat assembly, refer to Section 6B1 Engine Cooling – V6.

e Exhaust manifold assemblies, refer to 3.11 Exhaust Manifold Assembly.

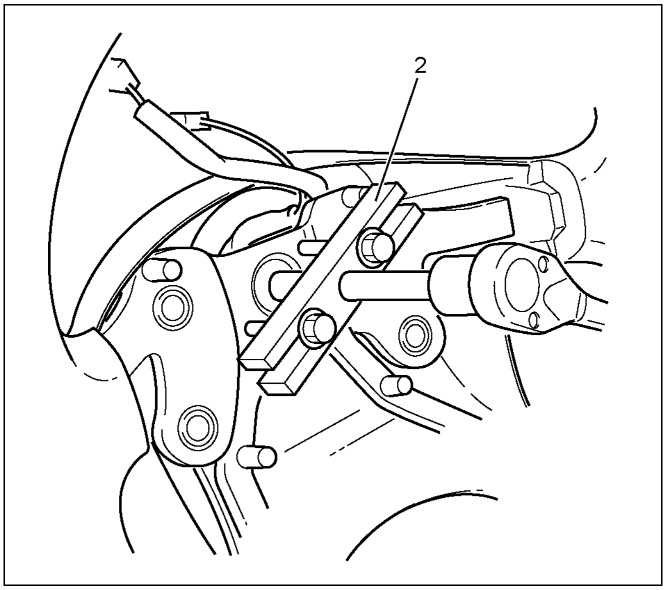
f Engine coolant outlet pipe, refer to Section 6B1 Engine Cooling – V6.

g Crankshaft position sensor, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

h Knock sensors, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

i Engine mounts and brackets, refer to 3.23 Engine Mounts and Brackets.

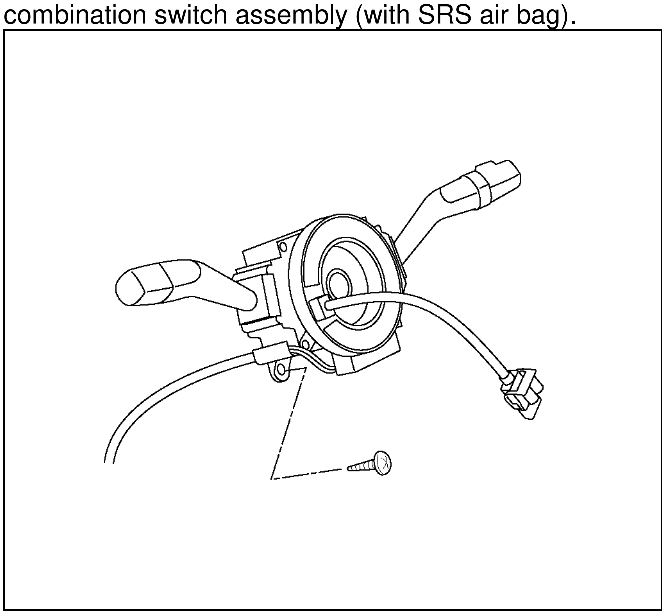
j Flexplate assemblies, refer to 4.3 Flexplate Assembly.



RTW73BSH001301

16. Remove steering column cover.
17. Disconnect the wiring harness connectors located under the steering column then remove combination switch and SRS coil assembly (with SRS air bag).

NOTE: The SRS coil is a part of the combination switch assembly, which cannot be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly (with SRS air bag).

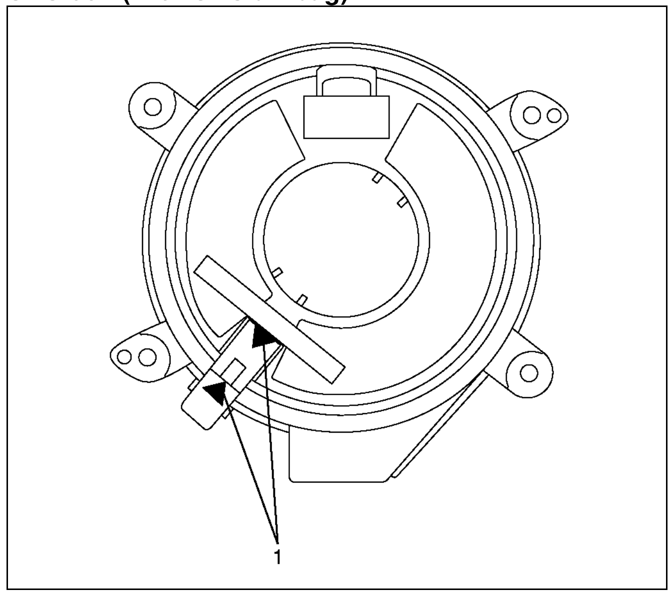


RTW73BSH001001

Installation

1. Install the combination switch assembly with SRS coil (with SRS air bag).
2. Turn the SRS coil fully counterclockwise, return about 3 turns and align the neutral mark (with SRS air bag).

CAUTION: When turning the SRS coil fully counterclockwise, stop turning if resistance is felt. Further forced turning may damage the cable in the SRS coil (with SRS air bag).



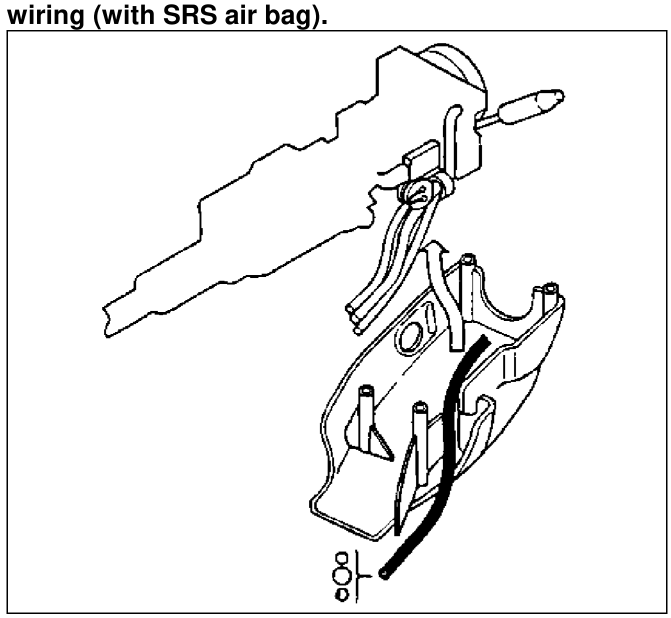
826RW014

Legend

(1) Neutral mark

3. Connect the wiring harness connectors located at the base of steering column.
4. Install the air conditioning lower duct.
5. Install the steering column cover.

CAUTION: When installing the steering column cover, be sure to wire (through each harness) as illustrated so that the harness starter switch, combination switch and SRS coil will not catch wiring (with SRS air bag).



825RS048

k Timing chains, tensioners, shoes, guides & sprockets, refer to 3.16 Timing Chains, Tensioners, Shoes and Guides.

l Cylinder head assemblies, refer to 3.22 Cylinder Head Assembly.

m Oil pan assembly, refer to 4.2 Oil Pan and Oil Pump Suction Pipe Assembly.

n Piston and connecting rod assemblies, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings.

o Crankshaft assembly, refer to 4.6 Crankshaft and Main Bearings.

p Piston oil nozzles, refer 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings.

Reassemble

Reassembly of the engine assembly is the reverse of the disassembly procedure.

Reinstall

Reinstallation of the engine assembly is the reverse to the removal procedure, noting the following:

NOTE

Refer to 6 Torque Wrench Specifications for the correct torque specifications.

1 Tighten the fasteners to the correct torque specification.

Engine ground connector bolt torque specification	10.0 Nm
Power steering high pressure line attaching bolt torque specification	8.0 – 12.0 Nm
Power steering high pressure line flare nut torque specification	25.0 – 35.0 Nm
Engine mount to frame attaching bolt torque specification	44.0 – 60.0 Nm
Knock Sensor Attaching Nut torque specification	23.0 Nm

2 Use only the specified engine lubricant type and quantity. It is recommended that a fluorescent oil dye, such as that contained in J 28481-B, be added to assist in any future oil leak diagnosis.

3 Fill the cooling system with the correct quantity and grade of coolant, refer to Section 6B1 Engine Cooling – V6.

4 Check transmission fluid level, replenishing as required, using the specified lubricant for the transmission fitted, refer to Section 7C1 Automatic – 4L60E – General Information.

5 Disable the ignition system, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

6 Crank the engine several times. Listen for any unusual noises or evidence that parts are binding.

7 Enable the ignition system. Start the engine and listen for any unusual noises.

8 Check the vehicle oil pressure gauge or warning indicator and confirm the engine has acceptable oil pressure. If required, install an oil pressure gauge and measure the engine oil pressure, refer to 2.19 Engine Oil Pressure Diagnosis.

9 Run the engine at about 1,000 r.p.m. until the engine has reached normal operating temperature.

10 Listen for any unusual noises.

11 Check for oil, fuel, coolant and exhaust leaks while the engine is running, correcting as required.

12 Perform a final inspection for correct engine oil and coolant levels.

4.2 Oil Pan and Oil Pump Suction Pipe Assembly

Remove

1 Remove the engine assembly from the vehicle, refer to 4.1 Engine .
2 Separate the engine and transmission assemblies, refer to Section 7C1 Automatic – 4L60E – General Information.
3 Mount the engine assembly on a suitable engine stand.
4 Remove the engine front cover, refer to 3.15 Front Cover Assembly.
5 Remove the two long bolts (1) attaching the rear of the oil pan to the crankshaft rear oil seal housing.
6 Remove the remaining eleven bolts attaching the oil pan to the cylinder block.
7 Using the shear points located at the edge of the oil pan shear the RTV sealant.
8 Remove the oil pan from the cylinder block.

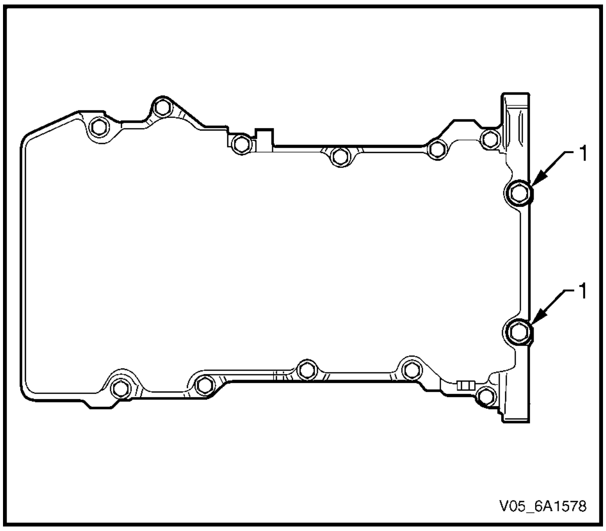


Figure 6A1 – 443

Disassemble

1 Remove the following:
2 Oil pan drain plug (7) and sleeve (8).
3 Oil level sensor (9).
4 Crankshaft oil deflector bolts (6) and remove the deflector.
5 Oil pump suction pipe bolts (5) and the suction pipe (3).
6 Oil pump suction pipe gasket (4) from the suction pipe and discard.

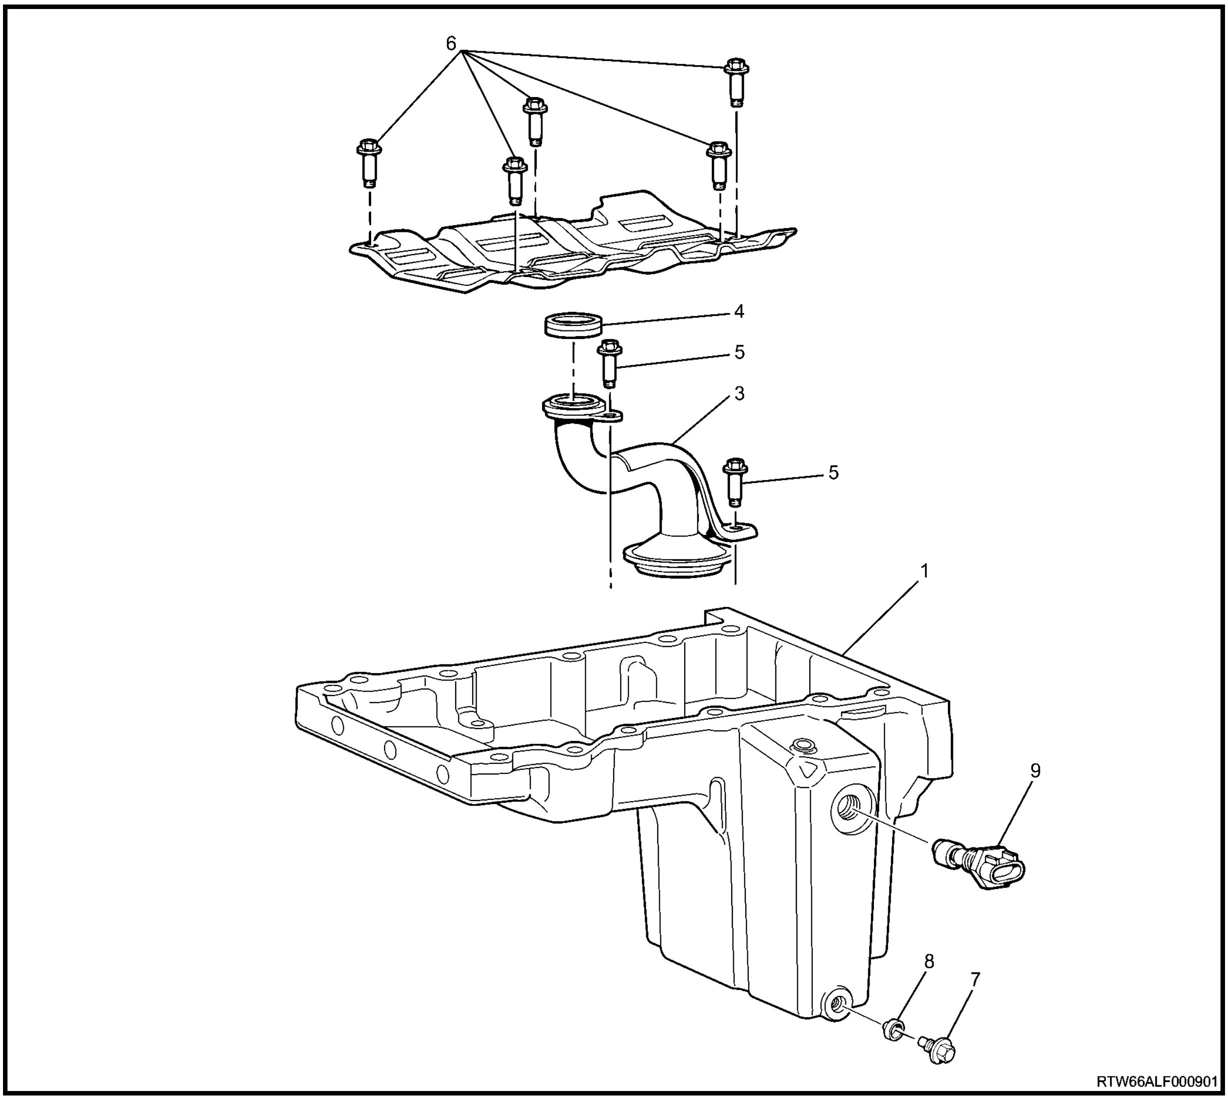

Figure 6A1 – 444

Clean

1 Remove any remaining thread sealant, gasket material or sealant using a commercially available wooden or plastic scraper.
2 Clean the oil pan and oil pan components in solvent.
3 Clean out debris from the bolt holes.

WARNING

Safety glasses must be worn when using compressed air.

4 Dry the oil pan and oil pan components with compressed air.

Inspect

1 Inspect the exterior of the oil pan for the following conditions:
   - Damage to the drain plug or drain plug hole,
   - Damage to the transmission mounting bosses,
   - Damage to the oil level sensor threads, and
   - Dents or damage to the exterior.
2 Inspect the interior of the oil pan for the following conditions:
   - Gouges or damage to the oil pan sealing surfaces,
   - Damage to the crankshaft oil deflector,
   - Damage to the bolt holes,
   - Damage to the oil suction tube mounting bosses, and
   - Damage to the crankshaft oil deflector mounting bosses.

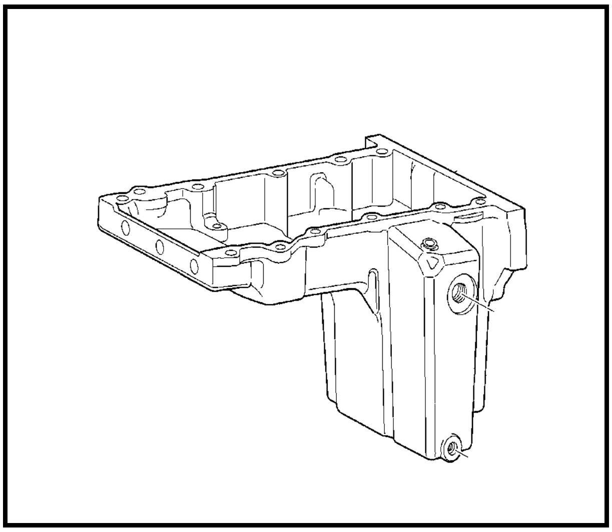

Figure 6A1 – 445

3 Inspect the oil pan deflector for damage.
4 Repair or replace the oil pan deflector and/or oil pan as required.

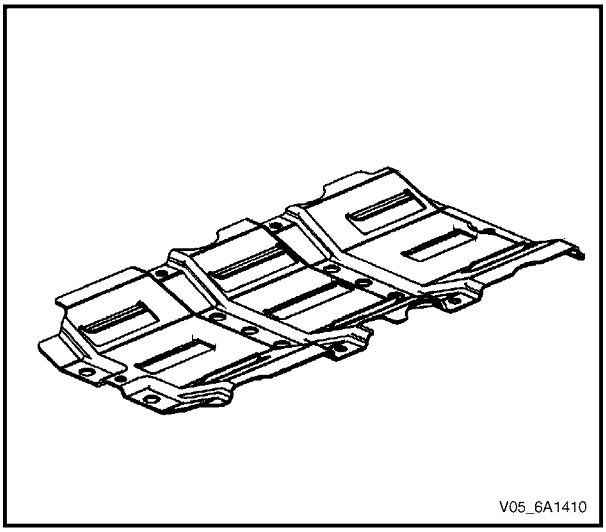

Figure 6A1 – 446

5 Inspect the following:
6 The mounting face (1) of the oil pump suction pipe for possible leakage paths.
7 The oil pump pipe support bracket (2) for cracks or damage.
8 The oil pump suction pipe tube (3) for cracks, imperfections and/or damage.
9 The oil pump screen (4) for blockage, foreign material, tears, cracks and/or damage.
10 Repair or replace the oil pan and/or oil pan components as required.

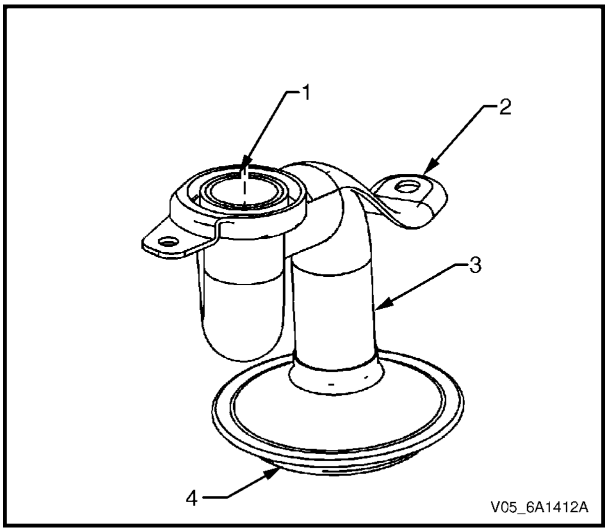

Figure 6A1 – 447

Reassemble

Reassembly of the oil pan and oil suction pipe assembly is the reverse of the disassembly procedure, noting the following:

1 Install a new oil suction tube seal onto the oil suction tube.

2 Install the oil suction pipe and tighten the attaching bolts to the correct torque specification.

Oil suction pipe attaching bolt torque specification	10.0 Nm

3 Install the crankshaft oil deflector into the oil pan assembly and tighten the attaching bolts to the correct torque specification.

Crankshaft oil deflector attaching bolt torque specification	10.0 Nm

4 Install the oil level sensor into the oil pan assembly and tighten to the correct torque specification.

Oil level sensor torque specification	20.0 Nm

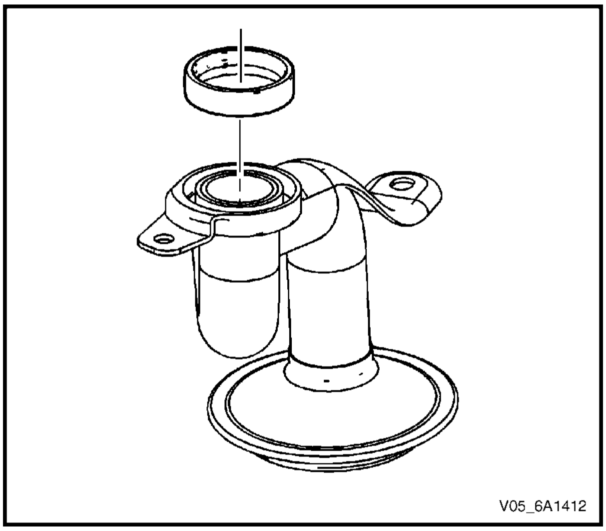

Figure 6A1 – 448

5 Install the oil pan drain plug into the oil pan assembly and tighten to the correct torque specification.

Oil pan drain plug torque specification	25.0 Nm

Reinstall

1 Install the guide pins, Tool No. EN-46109 (1) into the oil pan rail bolt hole on each side of the engine block.

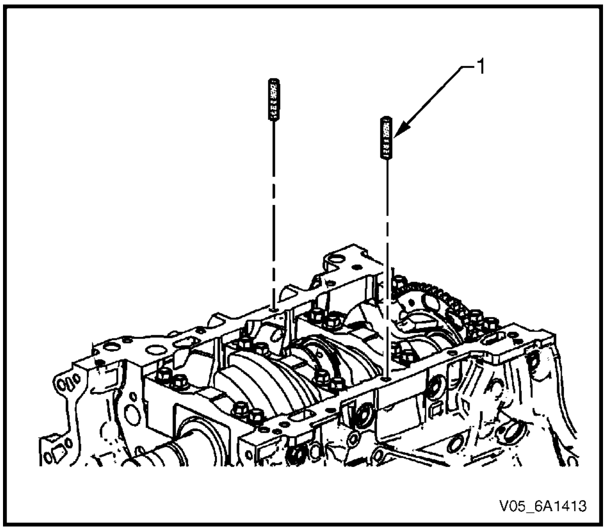

Figure 6A1 – 449

2 Place a 3mm bead (1) of RTV sealant on the cylinder block pan rail and crankshaft rear oil seal housing to oil pan mating surfaces.

3 Position the oil pan onto the cylinder block.

4 Remove the guide pins, Tool No. EN-46109 from the cylinder block.

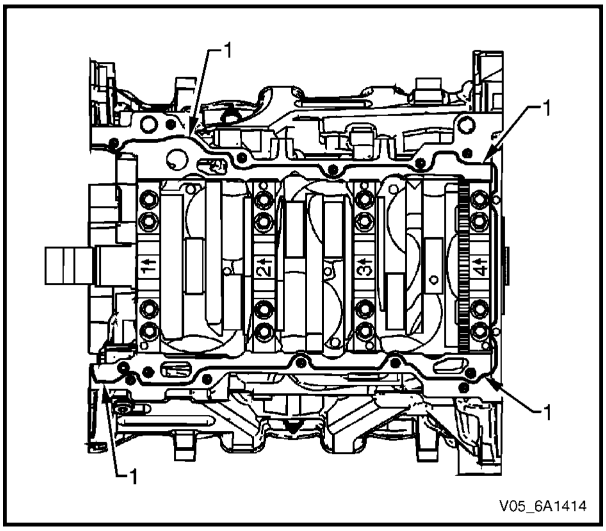

Figure 6A1 – 450

5 Loosely install the oil pan bolts.

6 Tighten the oil pan attaching bolts to the correct torque specification and in the sequence shown.

Oil pan to cylinder block attaching bolt (1 – 11) torque specification	20.0 – 26.0 Nm
Oil pan to crankshaft rear oil seal housing attaching bolt (12 – 13) torque specification	8.0 – 12.0 Nm

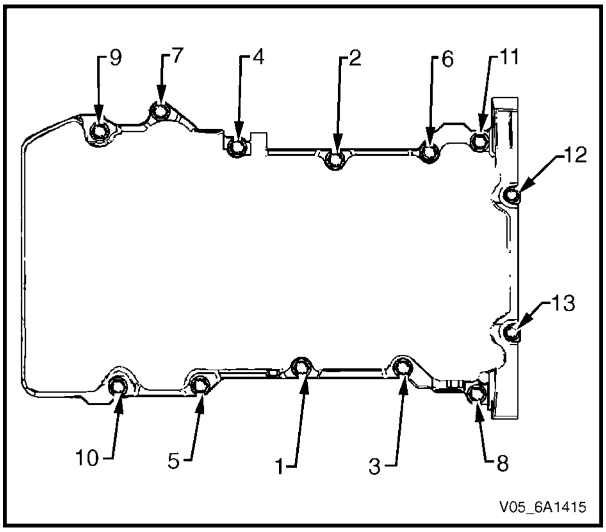

Figure 6A1 – 451

4.3 Flexplate Assembly

Remove

1 Remove the transmission, refer to Section 7C4 Automatic Transmission – 4L60E – On-vehicle Servicing.

2 Remove the starter motor, refer to Section 6D1-2 Starting System – V6.

3 Install the flexplate holding tool, Tool No. EN-46106 (1) into the starter motor mounting location.

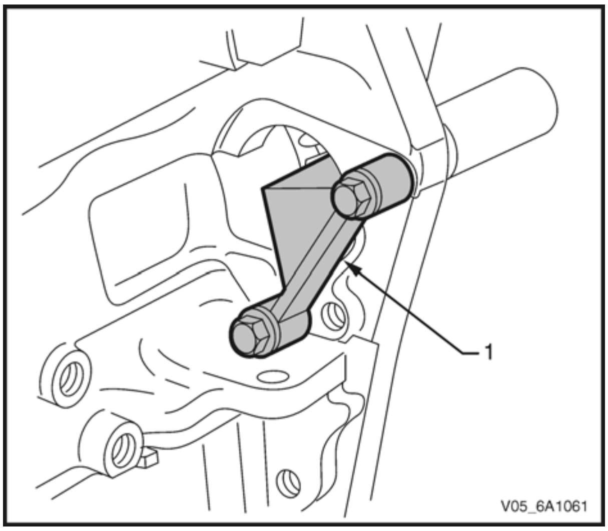

Figure 6A1 – 452

4 Loosen the eight flexplate attaching bolts (1).

5 Remove the flexplate holding tool.

6 Using a suitable permanent marker or paint pen, mark the flexplate assembly (2) to crankshaft relationship.

7 Remove the eight flexplate attaching bolts and discard.

8 Remove the flexplate assembly.

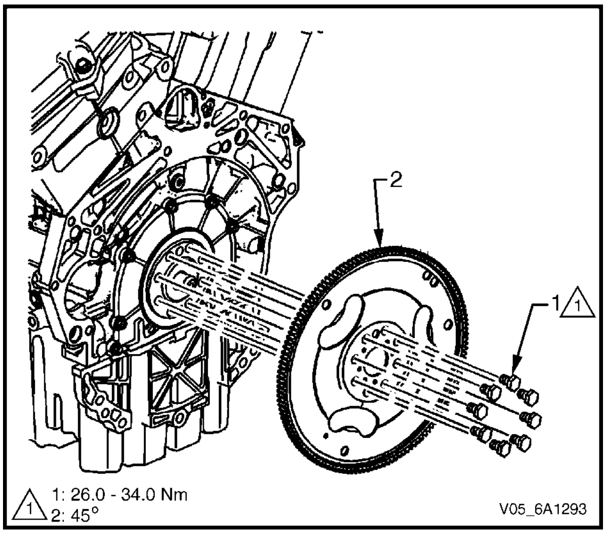

Figure 6A1 – 453

Clean

1 Clean the flexplate assembly in a suitable solvent.

WARNING

Safety glasses must be worn when using compressed air.

2 Dry the flexplate assembly with compressed air.

Inspect

1 Inspect the flexplate assembly for the following conditions:

- Stress cracks around the flexplate to torque converter mounting bolt hole locations (1).
- Stress cracks around the flexplate to crankshaft mounting bolt hole locations (2 and 4).
- Cracks at welded areas that retain the ring gear onto the flexplate (3).
- Damaged or missing ring gear teeth (5).

2 Replace the flexplate assembly as required.

NOTE

The flexplate ring gear is not serviced separately and cannot be repaired. If found to be faulty or damaged, the flexplate assembly must be replaced.

CAUTION

Do not repair the welded areas that retain the ring gear to the flexplate. The flexplate must be replaced.

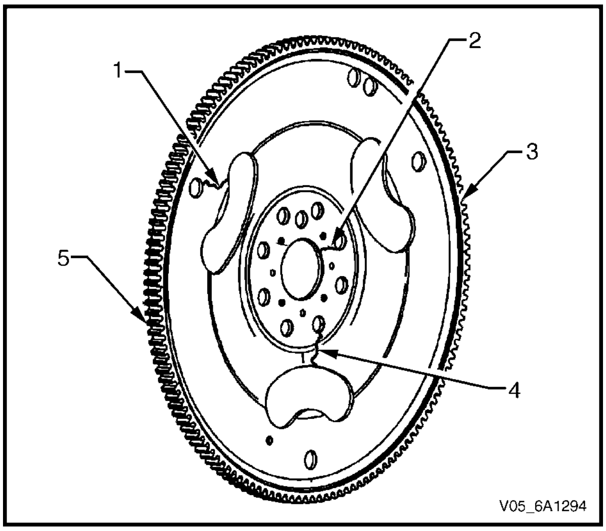

Figure 6A1 – 454

Reinstall

NOTE

The bolt holes are unevenly spaced to enable flexplate fitment in the one position only.

1 Place the flexplate assembly (2) in position on the crankshaft.

2 Install new flexplate attaching bolts (1) and hand tighten.

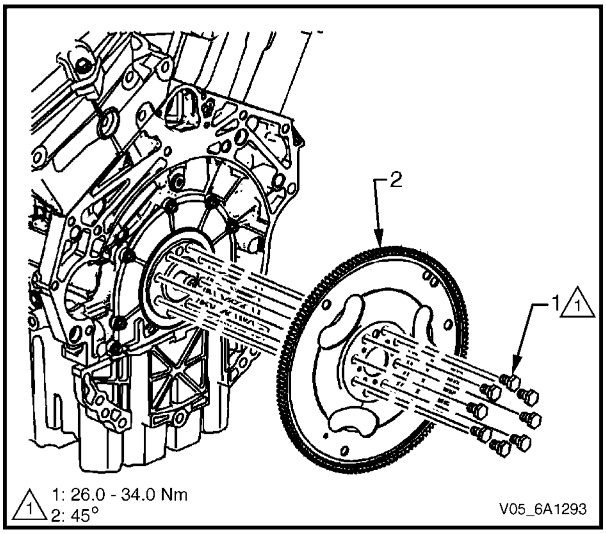

Figure 6A1 – 455

3 Install the flexplate holding tool, Tool No. EN-46106 (1) into the starter motor mounting location.

4 Tighten the eight flexplate attaching bolts to the correct torque specification.

■ ♦ Flexplate attaching bolt torque specification:	
Stage 1	26.0 – 34.0 Nm
Stage 2	45°

5 Remove the flexplate holding tool.

6 Install the starter motor, refer to Section 6D1-2 Starting System – V6.

7 Install the transmission, refer to Section 7E4 Automatic Transmission – 4L60E – On-vehicle Servicing.

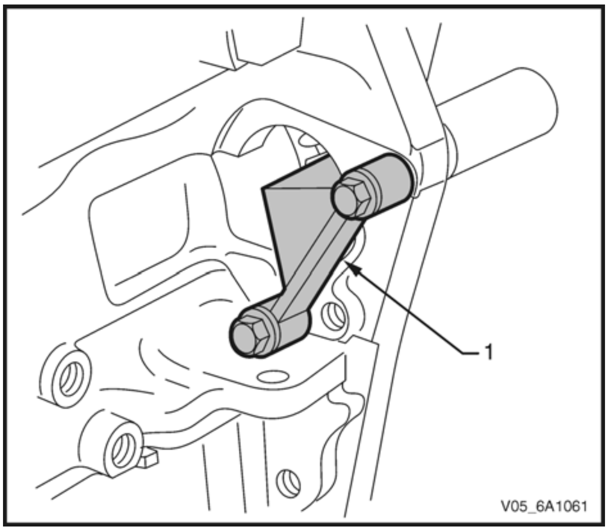

Figure 6A1 – 456

4.4 Crankshaft Rear Seal and Plate Assembly

Remove

1 Remove the engine assembly, refer to 4.1 Engine .

2 Remove the flexplate assembly, refer to 4.3 Flexplate Assembly.

3 Remove the engine oil pan assembly, refer to 4.2 Oil Pan and Oil Pump Suction Pipe Assembly.

4 Remove the five bolts (1) attaching the crankshaft rear seal housing to the rear of the cylinder block (2).

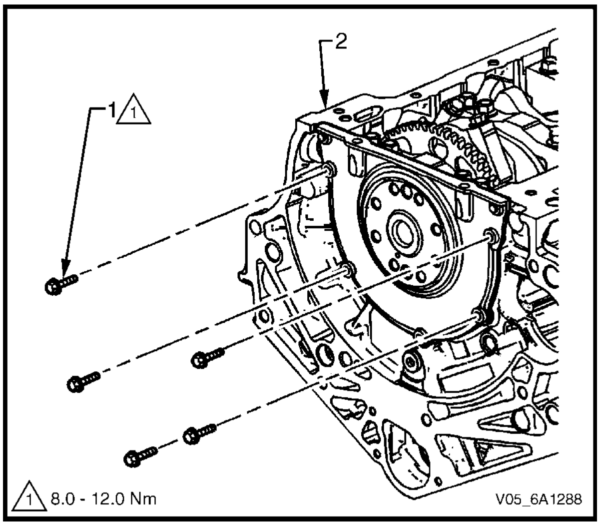

Figure 6A1 – 457

5 Shear the RTV sealant using the prise points located at the edge of the crankshaft rear oil seal housing,

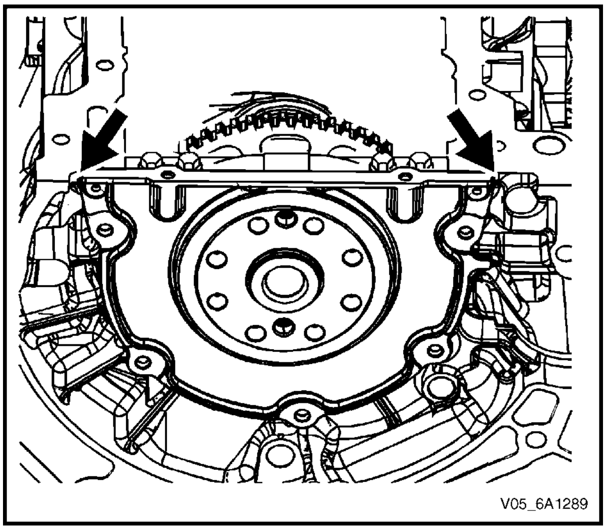

Figure 6A1 – 458

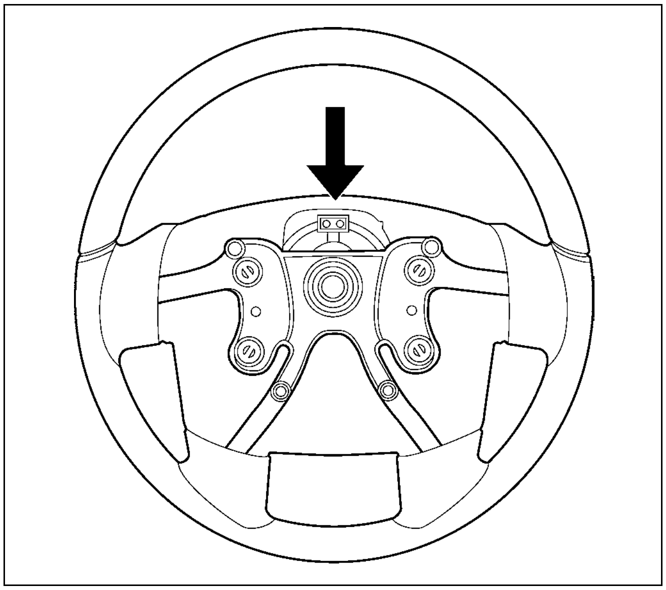
6. Install the driver knee bolster assembly.
7. Install the steering lower cover and engine hood opening lever.
8. Install the steering wheel and align the setting marks.

   Refer to the adjustment method in case a mark has not been applied in this section.

NOTE: Confirm SRS and horn harness connector is fixed by the steering wheel.

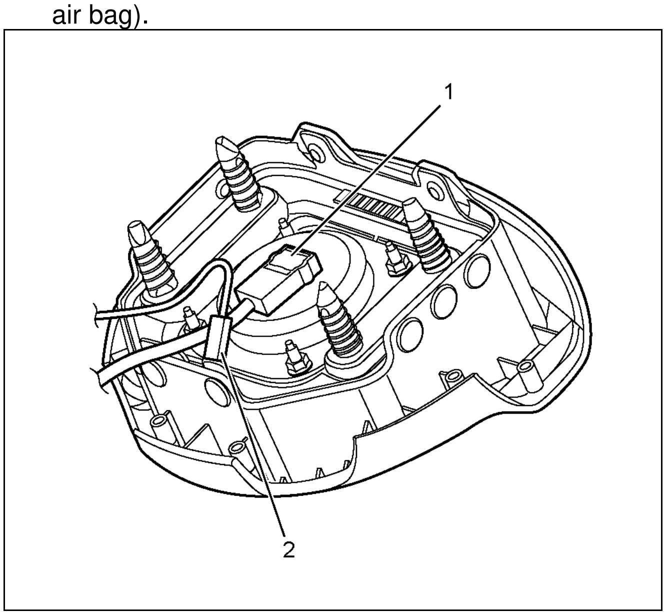


RTW73BSH000701

CAUTION: Never apply force to the steering wheel in the direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

9. Tighten the steering wheel fixing nut to the specified torque.

   Torque: 35 N·m (3.6 kgf·m/26 lb·ft)
10. Support the inflator module and carefully connect the SRS connector (1) and horn lead (2) (with SRS air bag).

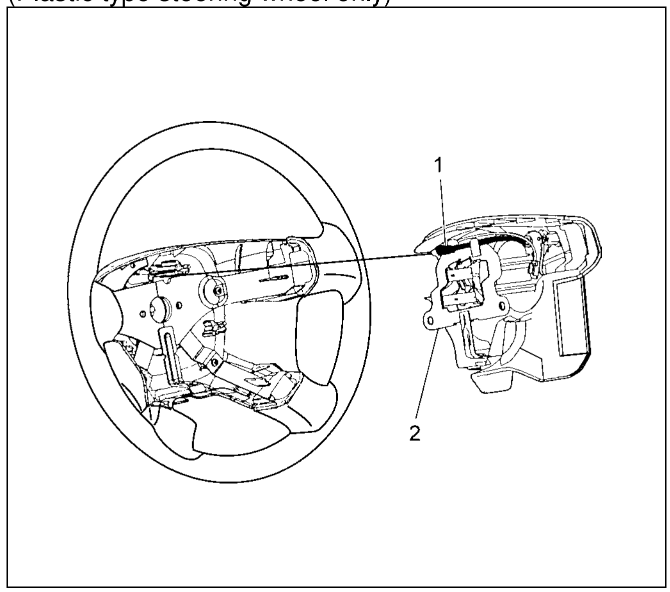


RTW73BSH001101

11. Connect the horn leads at center of wheel (without SRS air bag).

NOTE: The horn leads (1) are passed along the top of the bracket (2).

(Plastic type steering wheel only)



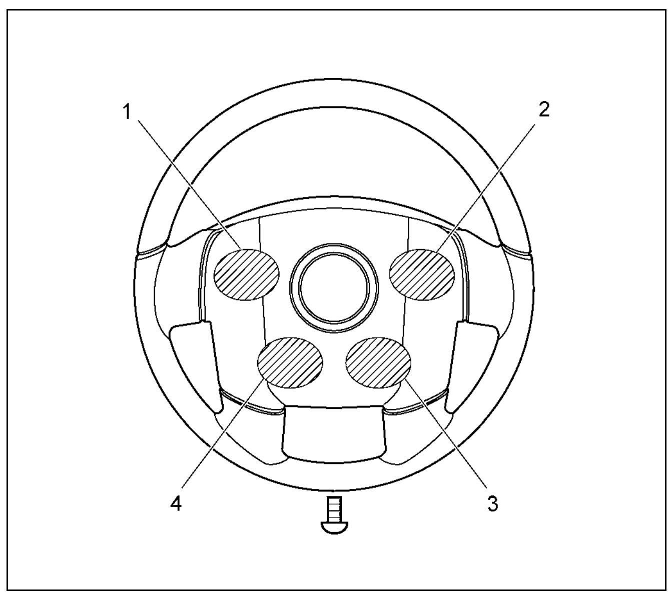
RTW73BSH000801

12. Push the horn pad at areas 1-4.

    Tighten the horn pad fixing screw to the specifed torque (without SRS air bag)

    Torque: 3 N·m (0.3 kgf·m/26 lb·in)

NOTE: A horn pad should not be struck during attachment.



RTW73BSH000201

6 Remove the crankshaft rear oil seal housing (1) from the cylinder block (2).

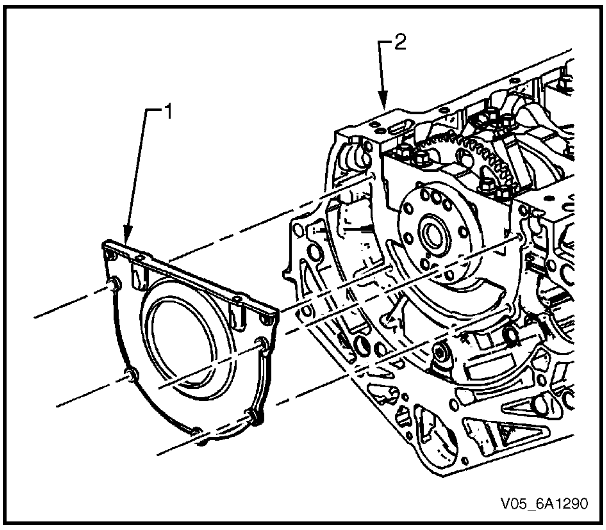


Figure 6A1 – 459

Reinstall

1 Install the guide pins, Tool No. EN-46109 (1) into the two crankshaft rear oil seal housing bolt holes of the cylinder block (2).

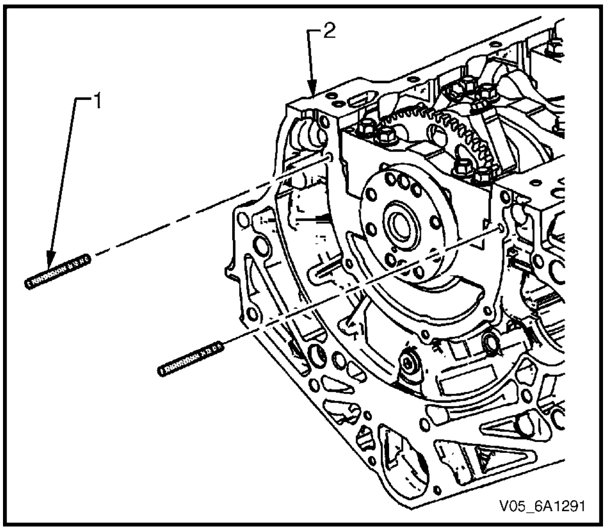

Figure 6A1 – 460

2 Apply a 3mm bead (1) of RTV sealant to the crankshaft rear oil seal housing.

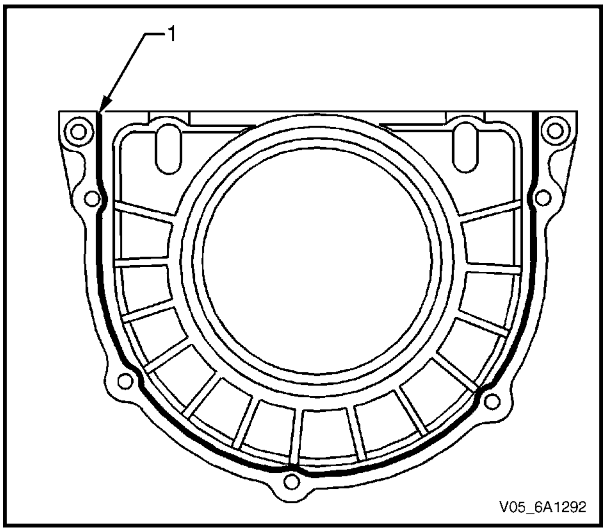

Figure 6A1 – 461

3 Install the crankshaft rear oil seal housing (1) to the cylinder block (2).

NOTE

- Do not allow any engine oil onto the cylinder block mating surface, where the crankshaft rear oil seal housing is to be installed.
- A seal-protector is provided with the new crankshaft rear seal and housing assembly. Do not remove the seal protector from the crankshaft rear oil seal housing until the crankshaft rear oil seal housing is fully in position.

4 Remove the guide pins from the cylinder block.

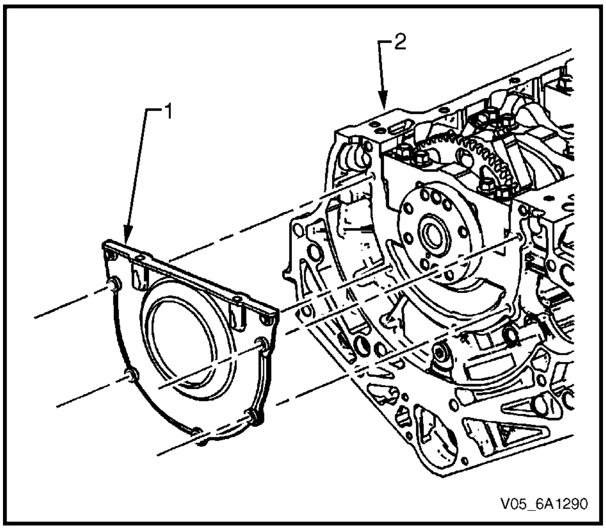

Figure 6A1 – 462

5 Install the crankshaft rear oil seal housing attaching bolts (1) to the cylinder block (2) and tighten to the correct torque specification.

Crankshaft rear oil seal housing attaching bolt torque specification.............8.0 – 12.0 Nm

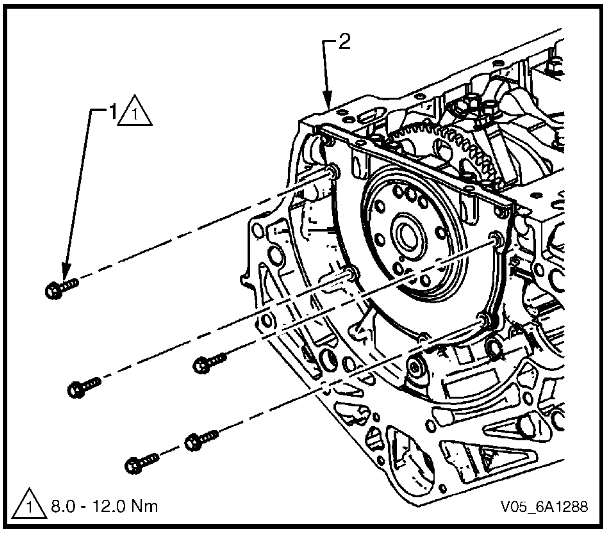

Figure 6A1 – 463

4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings

Remove

1. Remove the engine assembly, refer to 4.1 Engine .
2. Remove both cylinder head assemblies, refer to 3.22 Cylinder Head Assembly.
3. Remove the oil pan assembly, refer to 4.2 Oil Pan and Oil Pump Suction Pipe Assembly.
4. Mark the top of the piston being removed to identify its specific bore.
5. Install Tool No. EN-46111 (1) onto the crankshaft (2).
6. Rotate the crankshaft until the piston being removed is at the bottom of its stroke; bottom dead centre (BDC).

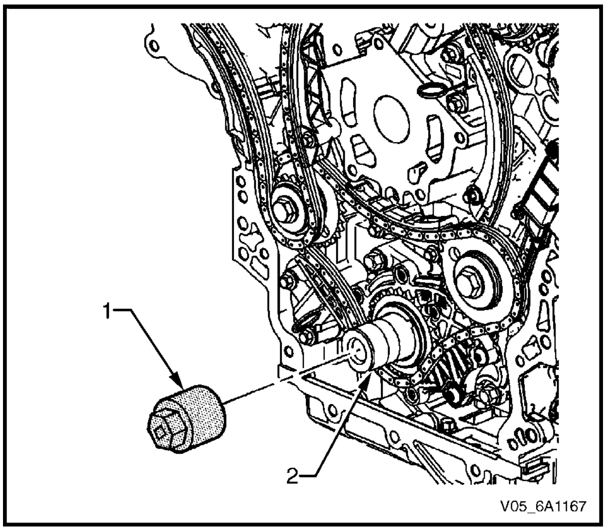

Figure 6A1 – 464

CAUTION

If the connecting rod bearings have been used in a running engine, they must be replaced with new connecting rod bearings for reassembly.

7. Before removing the connecting rods, check the connecting rod side clearance using the following procedure:
   a. Tap the connecting rod to one end of the crankshaft journal with a dead blow or wooden hammer.
   b. Using feeler gauges, measure the clearance between the crankshaft counterweight and the connecting rod.
   c. The connecting rod side clearance should not exceed specifications, refer to 5 Specifications.
   d. If the endplay exceeds the specified limits, measure the width of the crankpin end of the connecting rod, refer to 5 Specifications.
   e. If the connecting rod width is significantly smaller than specified and severe wear is present on the side of the connecting rod, replace the connecting rod.
   f. If the connecting rod width is within specification and excessive scoring is present on the crankshaft journals, replace the crankshaft.

CAUTION

Do not use a stamp, punch or any other method that may distort or stress the connecting rod and cap. Extensive engine damage may result from a connecting rod that is distorted or stressed.

8. Mark the cylinder number on the connecting rod and the connecting rod cap with a paint stick or permanent marker.

CAUTION

Powdered metal connecting rods have rod bolts which yield when tighten to the specified torque. If the bolts are loosened or removed they must be replaced. Rod bolts that are not replaced will not torque to the correct clamp load and can lead to serious engine damage.

9 Remove the connecting rod bolts (1), loosening progressively from side to side.

CAUTION

The connecting rod caps must remain with the original connecting rod.

10 Remove the connecting rod cap (2).

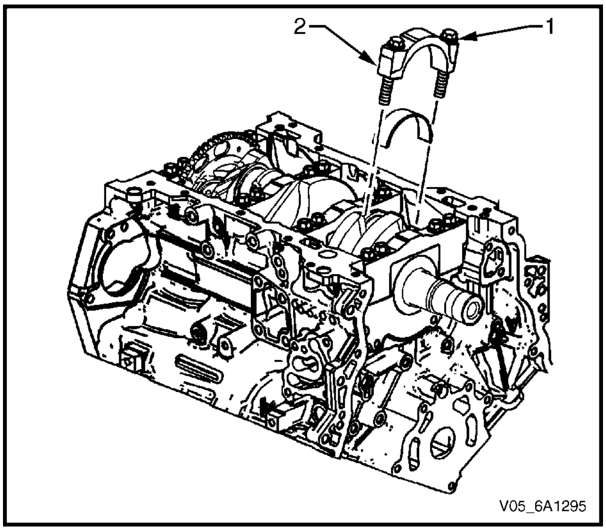

Figure 6A1 – 465

11 Install connecting rod guide pin set, Tool No. EN-46121 (1) to the connecting rod bolt holes.

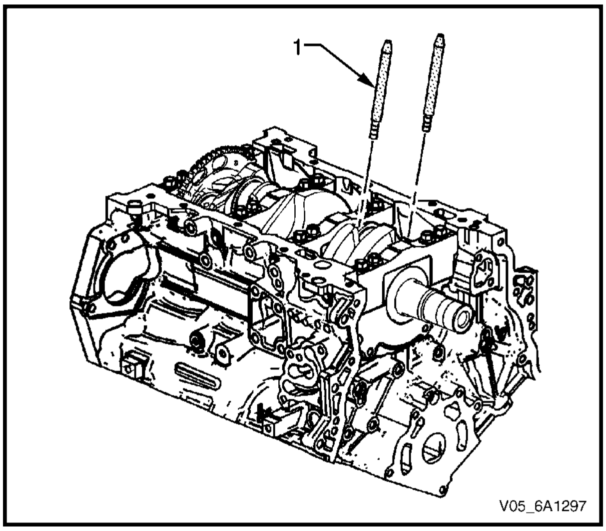

Figure 6A1 – 466

CAUTION

Do not damage the crankshaft journal, cylinder wall and piston cooling jets when removing the connecting rod and piston assembly.

12 Using connecting rod guide pin set, Tool No. EN-46121 (1), push the connecting rod and piston assembly (2) through the top of the cylinder.

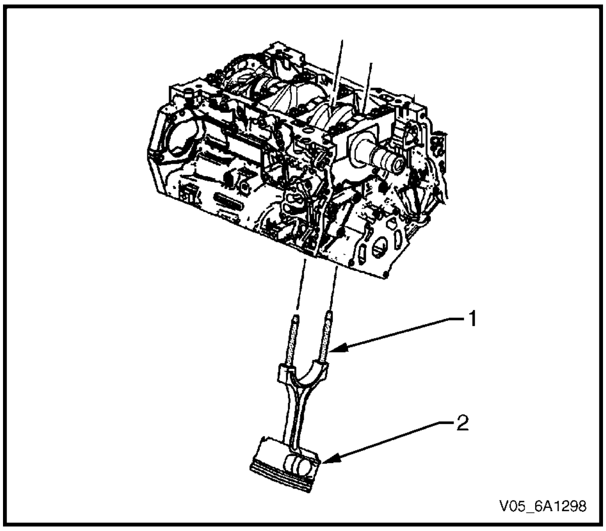

Figure 6A1 – 467

CAUTION

When dismantled, ensure the connecting rod, connecting rod cap, piston and bearings are organised in their original position and location. This will also aid engine mechanical diagnosis.

13 Remove connecting rod guide pin set, Tool No. EN-46121 (1) from the connecting rod bolt holes.

14 Remove the upper connecting rod bearing from the connecting rod (2).

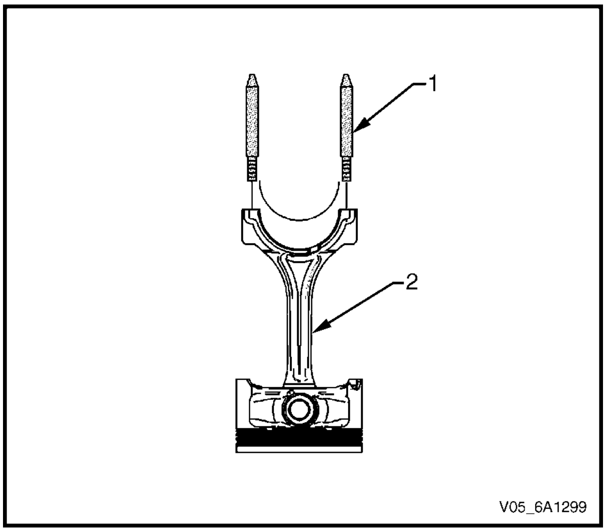

Figure 6A1 – 468

15 Remove the lower connecting rod bearing (1) from the connecting rod cap (2).

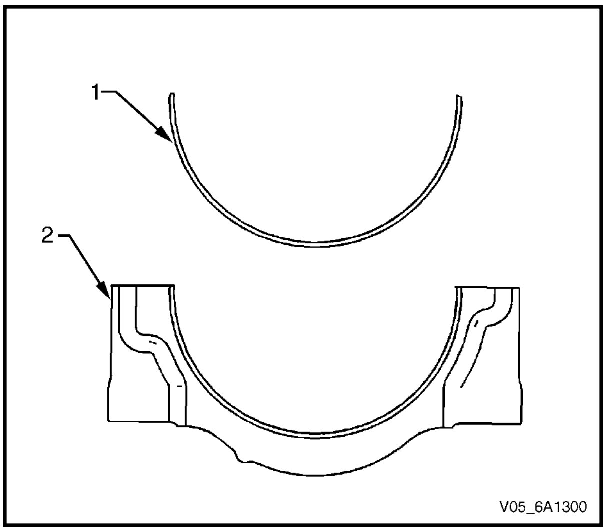

Figure 6A1 – 469

NOTE

The cap and rod are a matched set and must be kept together.

16 Reattach the connecting rod cap (1) to the connecting rod (2) to prevent damage to their mating surfaces.

17 Repeat steps 4 to 16 for the remaining piston and connecting rod assemblies.

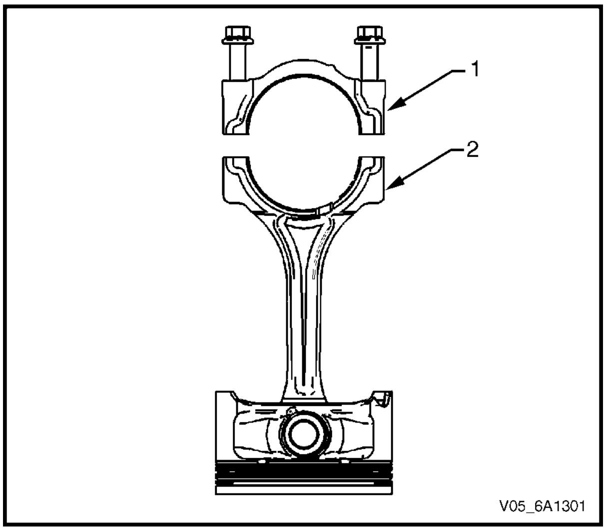

Figure 6A1 – 470

Disassemble

CAUTION

A piston ring expander must be used to remove and install the piston rings. Only expand the rings far enough to fit over the piston lands. If the rings are overexpanded, the top ring will shatter and the others will distort.

1 Remove the piston rings (2) using a piston ring expander (1). Place each ring in a clean shop towel for storage.

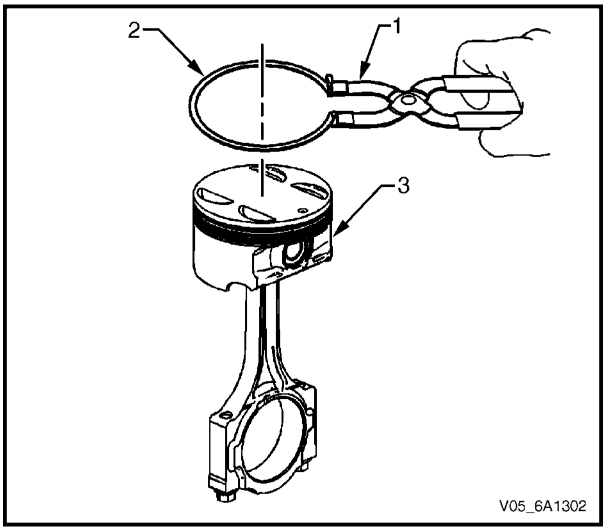

Figure 6A1 – 471

CAUTION

Do not reuse the piston pin retainers.

2 Remove the piston pin retainers by using the removal access notch (1) in the side of the piston. Discard the piston pin retainers.

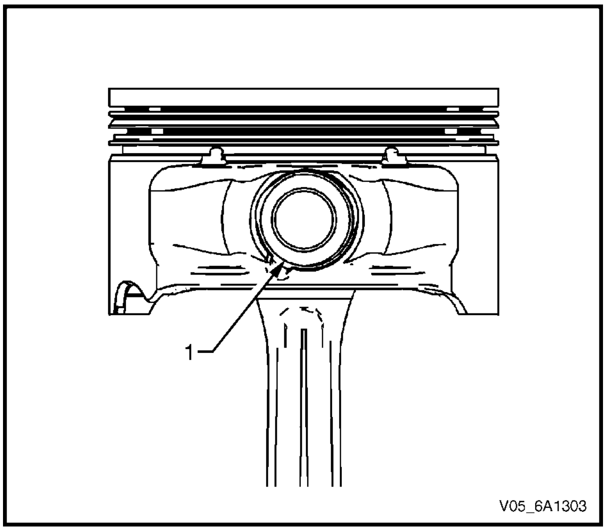

Figure 6A1 – 472

3 Slide the piston pin (1) out of the piston (2). The piston will disconnect from the connecting rod.

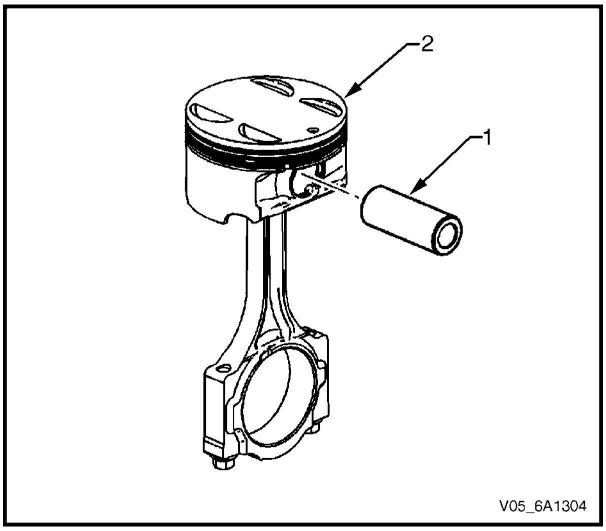

Figure 6A1 – 473

Clean and Inspect

Piston Cleaning Procedure

CAUTION

Do not use a wire brush to clean any part of the piston.

1 Clean the piston skirts and the pins with a suitable solvent.

2 Clean the piston ring grooves with a groove cleaner. Ensure the oil ring holes and slots are clean.

WARNING

Safety glasses must be worn when using compressed air.

3 Dry the piston with compressed air.

Piston Inspection Procedure

1 Inspect the pistons for the following conditions:

- eroded areas at the top of the piston (1),
- piston pin retainer grooves for burrs (2),
- worn piston pin bores or worn piston pins (3),
- scuffed or damaged skirt coating (4),
- ring grooves for cracks, nicks or burrs that may cause binding (5), and
- warped or worn ring lands.

2 Replace pistons that show any signs of damage or excessive wear.

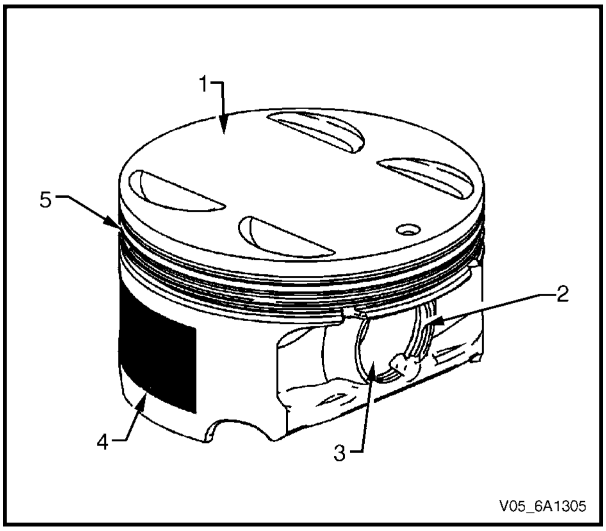

Figure 6A1 – 474

Piston Measurement

1 Measure piston width using the following procedure:

a Using an outside micrometer, measure the width of the piston at 30 mm below the crown top (1), at the thrust surfaces of the piston, perpendicular to the piston pin centreline.

b Compare the measurement of the piston to its original cylinder by subtracting the piston width from the cylinder diameter.

c Check your measurements with specifications, refer to 5 Specifications.

d If the clearance obtained through measurement is greater than the provided specifications and the cylinder bores are within specification, replace the piston.

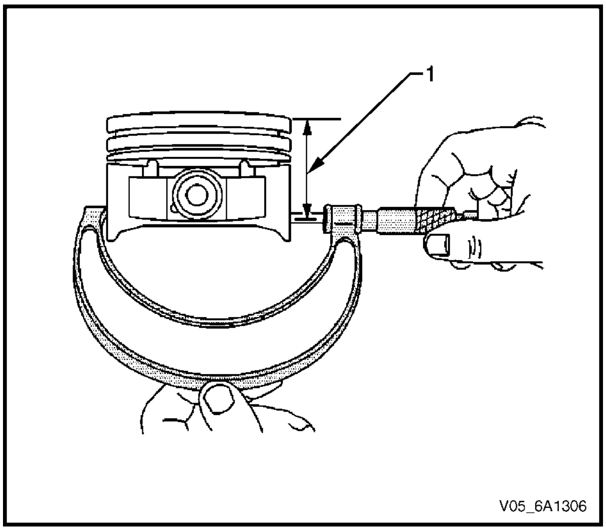

Figure 6A1 – 475

2 Measure the piston pin bore to piston pin (2) clearances using the following procedure:

a Piston pin bores and pins must be free of varnish or scuffing.

b Use an outside micrometer (1) to measure the piston pin in the piston contact areas.

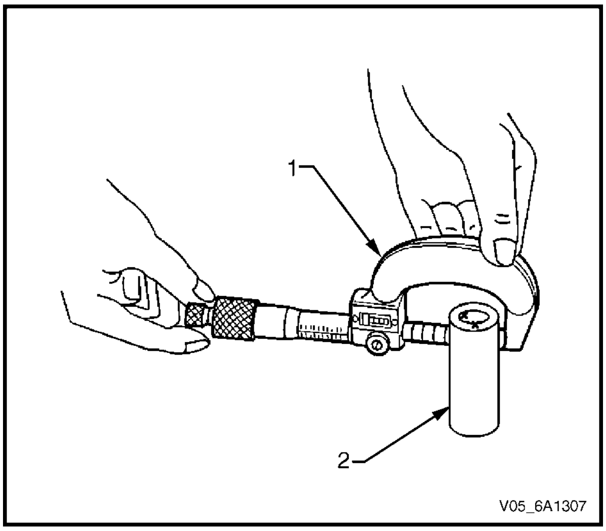

Figure 6A1 – 476

3 Using an inside micrometer, measure the piston pin bore (1). Compare the result with the piston pin diameter and piston pin to piston pin bore clearance listed in the specifications, refer to 5 Specifications.

4 If the clearance is excessive, determine which piece is out of specification and replace as required.

5 Replace the piston if any of its dimensions are out of specification.

6 If the new piston does not meet clearance specifications, the cylinder block may need to be oversized to 0.25 mm. There is only one size of oversized pistons and rings available for service.

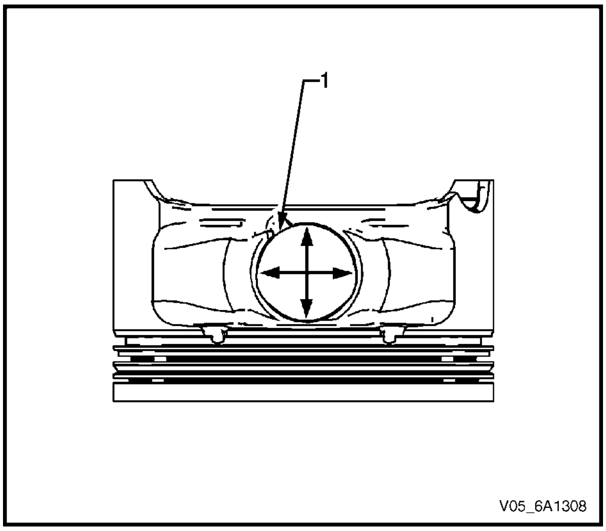

Figure 6A1 – 477

Piston Ring Measurement

1 Measure the piston ring end gap using the following procedure:

a Place the piston ring (1) in the area of the bore where the piston ring will travel, approximately 25 mm below the deck surface. Ensure the ring is square with the cylinder bore by positioning the ring with the piston head.

b Measure the end gap of the piston ring with feeler gauges (2), refer to 5 Specifications.

c If the clearance exceeds the provided specifications, the piston rings must be replaced.

d Repeat the procedure for all piston rings.

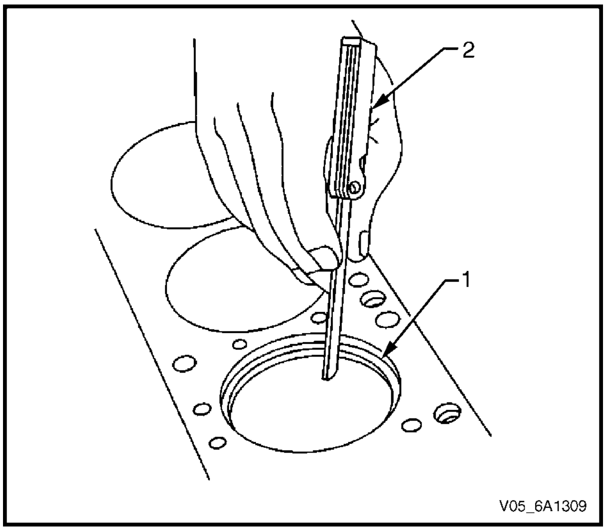

Figure 6A1 – 478

2 Measure the piston ring side clearance using the following procedure:

a Roll the piston ring (1) entirely around the piston ring groove. If any binding is caused by the ring groove, dress the groove with a fine file. If any binding is caused by a distorted piston ring, replace the ring.

b With the piston ring on the piston, use feeler gauges (2) to check clearance at multiple locations.

c Compare the measurements with piston ring side clearance listed in the specifications, refer to 5 Specifications.

d If the clearance is greater than specifications, replace the piston rings.

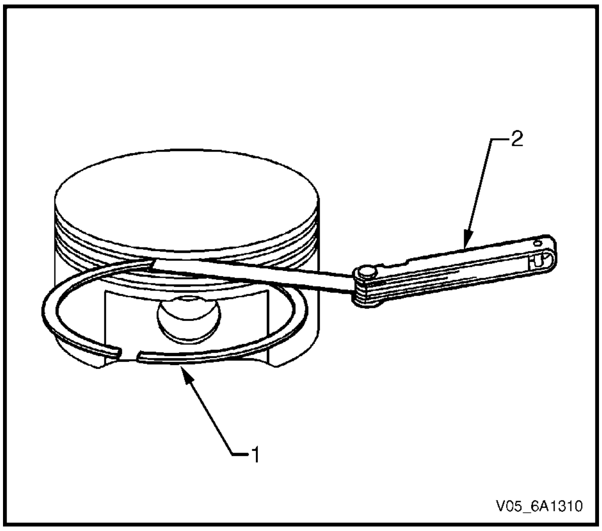

Figure 6A1 – 479

3 There is a locating dimple (1) on the compression rings. Install the compression rings with the dimple facing up.

4 If the new ring does not reduce the clearance to the correct specification, install a new piston.

5 If the new piston does not meet clearance specifications, the cylinder block may need to be oversized to 0.25 mm. There is only one size of oversized pistons and rings available for service.

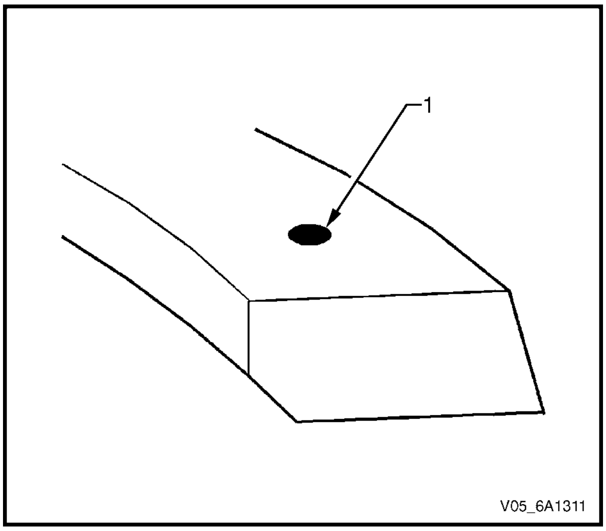

Figure 6A1 – 480

Connecting Rod Cleaning Procedure

1 Clean the connecting rods in solvent.

WARNING

Safety glasses must be worn when using compressed air.

2 Dry the connecting rod using compressed air.

3 Remove the connecting rod cap and clean the threads.

4 Remove the connecting rod bearing and discard. Never reuse a connecting rod bearing that has been used in a running engine.

Connecting Rod Visual Inspection Procedure

1 Inspect the piston pin bushing (4) for scoring or damage.

2 Inspect the connecting rod beam (1) for twisting or bending.

3 Inspect the rod cap (2) for any nicks or damage caused by possible interference.

4 Inspect for scratches or abrasion on the rod bearing seating surface.

5 If the connecting rod bores contain minor scratches or abrasions, clean the bores in a circular direction with a light emery paper.

6 Retain the original bolts (3) for preliminary assembly. They must be replaced for final assembly.

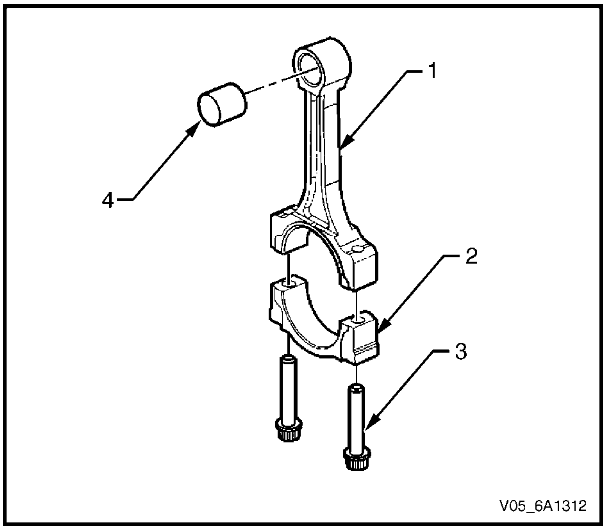

Figure 6A1 – 481

Connecting Rod Measurement Procedure

Piston Pin End

NOTE

Measurements of all components should be taken with the components at normal room temperature.

1 Using an outside micrometer (1), take two measurements of the piston pin (2) in the area of the connecting rod contact.

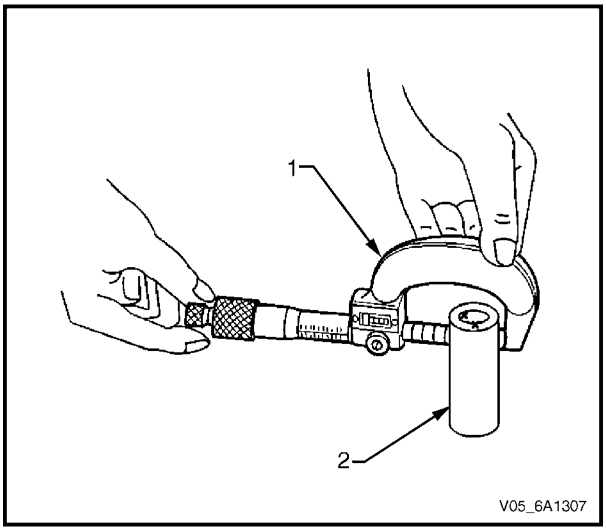

Figure 6A1 – 482

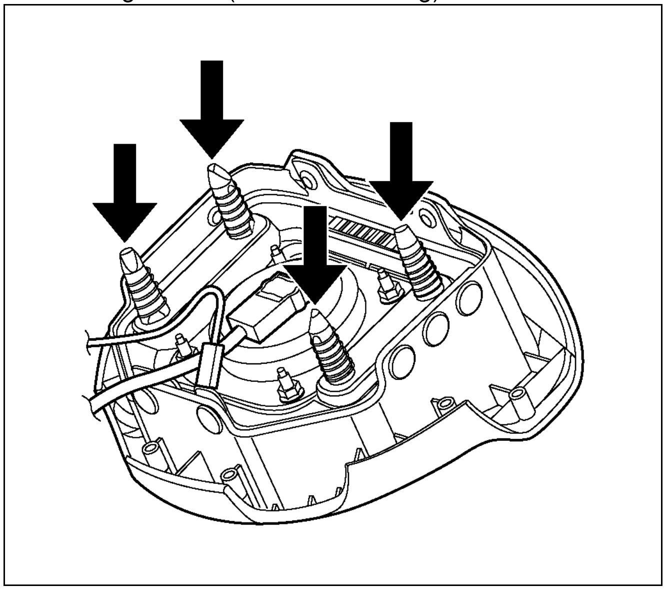
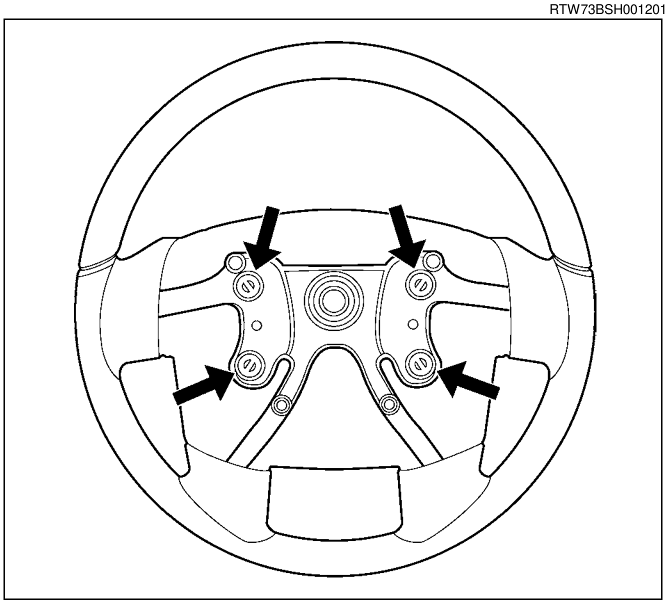
13.Align each snap stud of driver air bag to the holes on steering wheel. (with SRS air bag)

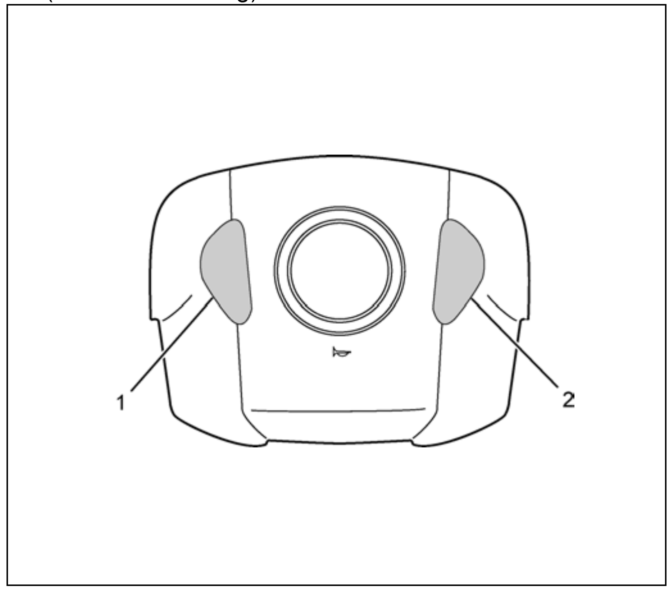


RTW73BSH001201



RTW73BSH000401

14.Push the SRS air bag at area-1 (1) and area-2 (2). At that time confirm the audible noise of each stud. (with SRS air bag)



RTW73BSH000301

15.Enable the SRS (Refer to "Enabling the SRS" in this section). (with SRS air bag)
16.Install driver knee bolster (reinforcement).
17.Install instrument panel lower cover then install the engine hood opening lever.
18.Connect the SRS connector (with SRS air bag).
19.Connect the battery "-" terminal cable. (with SRS air bag)
20.Turn the ignition switch to "ON" while watching warning light and check - the light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

2 Using an inside micrometer, measure the connecting rod piston pin bore (1).
3 Subtract the piston pin diameter from the piston pin bore.
4 Compare the clearance measurements listed in the specifications, refer to 5 Specifications.
5 If the clearance is excessive, replace the piston pin. If a new pin does not resolve the clearance problem, replace the connecting rod.

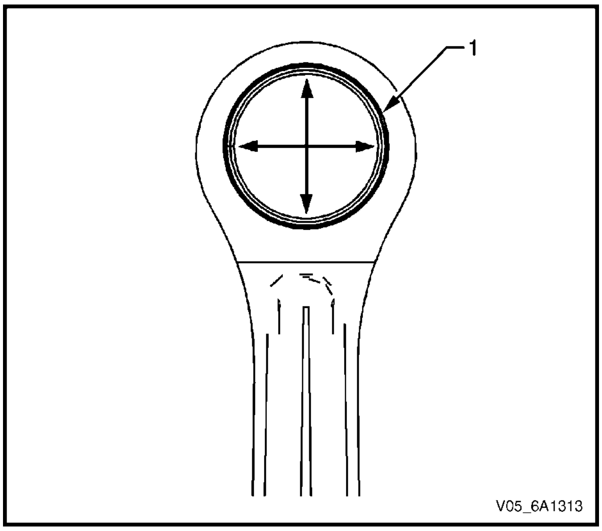


Figure 6A1 – 483

Crankshaft Bearing End

NOTE

Measurements of all components should be taken with the components at normal room temperature.

1 Using an inside micrometer, measure the connecting rod crankshaft bearing bore (1).
2 Compare the bore measurements listed in the specifications, refer to 5 Specifications.
3 Replace the connecting rod if the bore is out of specification. Do not recondition the connecting rod.

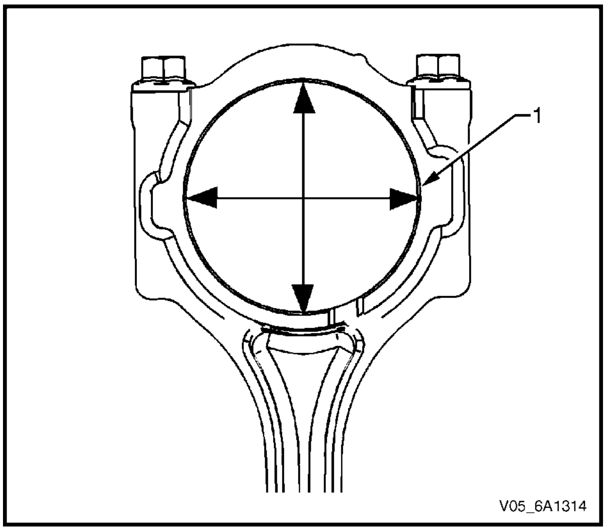

Figure 6A1 – 484

Reassemble

Piston and Piston Pin

CAUTION

The arrow located on top of the piston must point toward the front of the engine.

NOTE

The connecting rod is non-directional and may be assembled/reassembled to the piston in either direction.

1 Lubricate the piston pin (1) bores in the piston (2) and the connecting rod with clean engine oil.

2 Assemble the piston and piston pin to the connecting rod. Correctly orient the piston when reusing a marked connecting rod.

3 Align the piston pin bore with the connecting rod pin bore.

4 Slide the piston pin into the piston and the connecting rod.

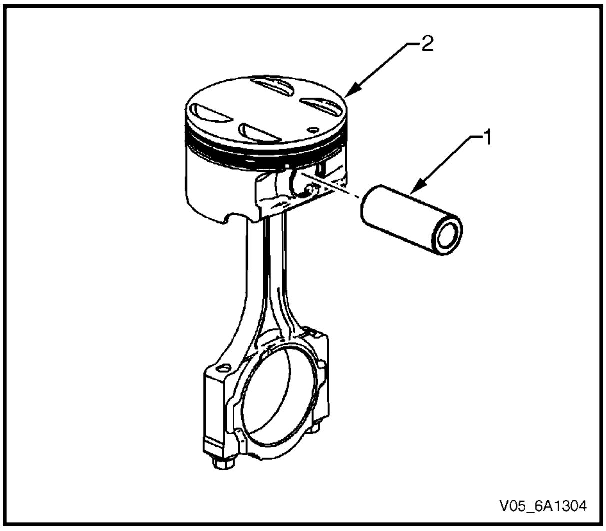

Figure 6A1 – 485

CAUTION

New piston pin retainers must be used. Never reuse the piston pin retainers.

5 Install new piston pin retainers (1).

6 Ensure the piston pin retainers are fully seated in their grooves.

7 Repeat steps 1 to 6 for the remaining pistons.

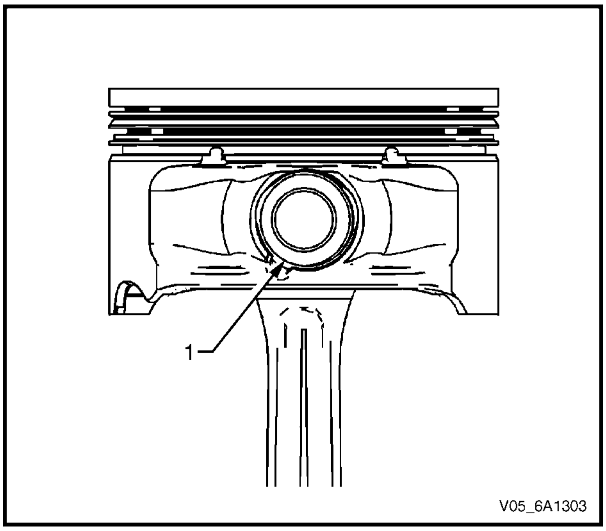

Figure 6A1 – 486

Piston Ring

NOTE

The ends of the expander must be facing toward the top of the piston.

1 Correctly orient the oil control ring expander (1) before installation.

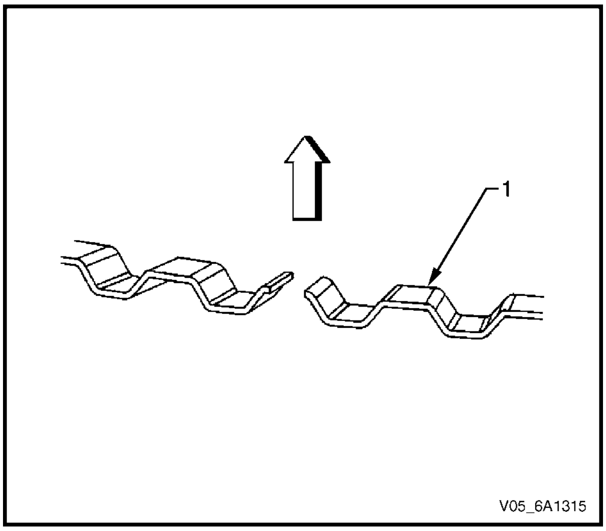

Figure 6A1 – 487

2 Using a piston ring expander, install the oil control ring assembly using the following procedure:

3 Install the expander ring (3).

4 Install the two oil scraper rings (4). Expand the rings only enough to clear the piston diameter. Over-expanding the piston rings will distort or crack the rings.

5 Install the second (2) and top (1) piston rings as follows.

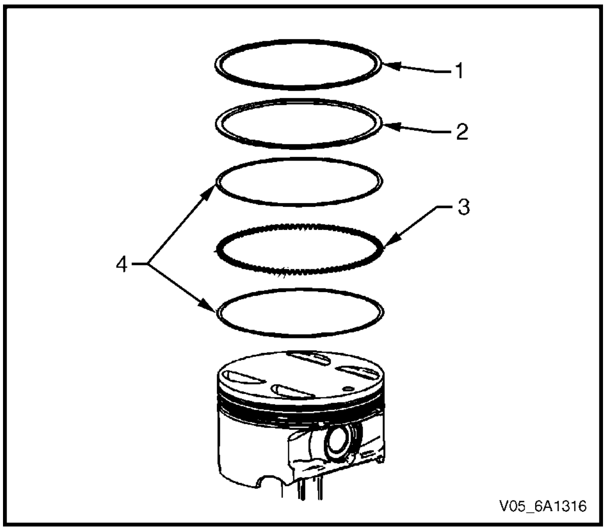

Figure 6A1 – 488

6 Using the ring expander (1), install the second piston ring (2) onto the piston (3). Do not over-expand the ring. Repeat for the top ring.

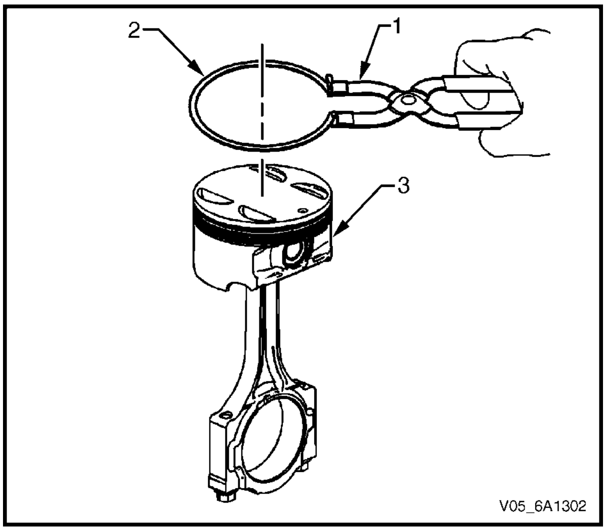

Figure 6A1 – 489

7 Once the rings are installed, set the ring gaps for the oil control, second and top ring as follows. Use the piston location arrow for reference.

- Lower oil control ring position (1).
- Upper oil control ring position (2).
- Top ring position (3).
- Oil control ring expander position (4).
- Second ring position (5).

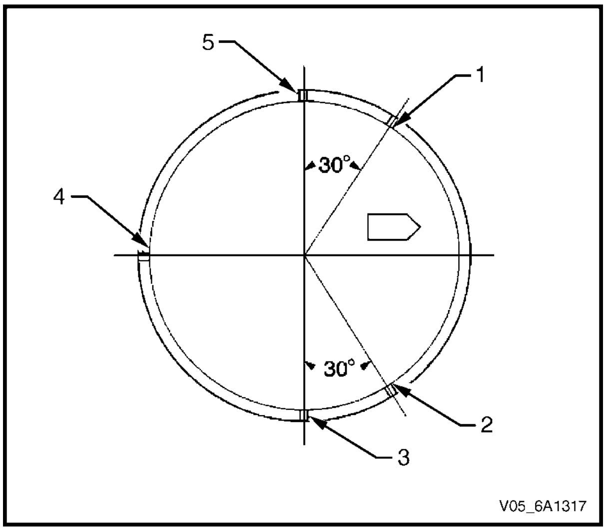

Figure 6A1 – 490

Connecting Rod Bearing

CAUTION

If the connecting rod bearings have been used in a running engine, they must be replaced with new connecting rod bearings for reassembly.

1 Clean the connecting rod (2) and the connecting rod cap bearing bore with a lint-free cloth.

2 Clean the oil from behind the connecting rod bearing halves.

3 Install a new upper connecting rod bearing (1) into position. Roll the bearing into position so the lock tang engages the alignment slot. The bearing must fit flush in the connecting rod.

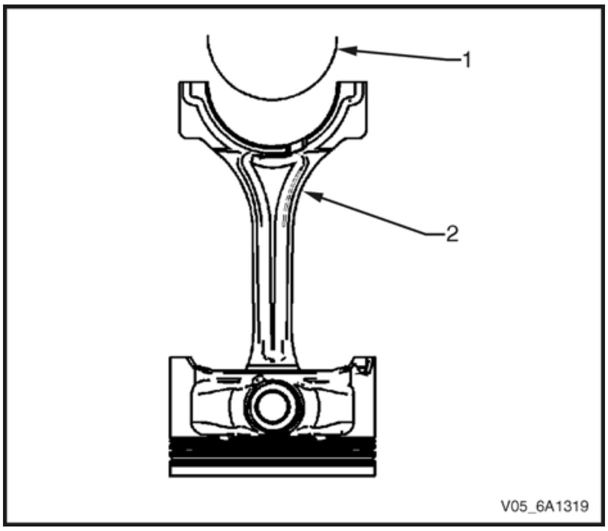

Figure 6A1 – 491

4 Install the lower connecting rod bearing (1) into position in the connecting rod cap (2).

5 Roll the bearing into position so the lock tang engages the alignment slot. The bearing must fit flush with the connecting rod cap.

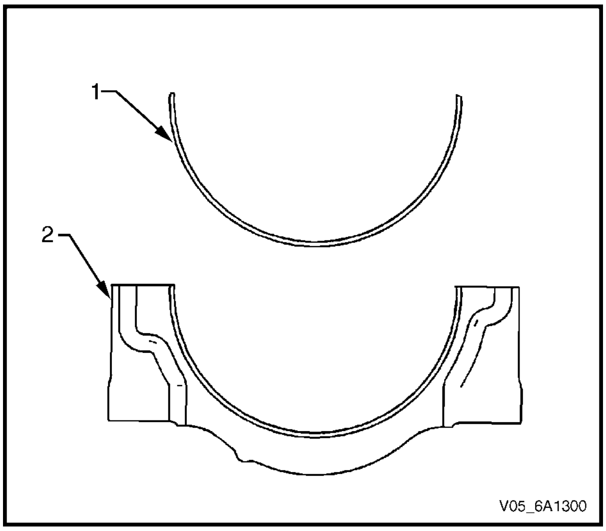

Figure 6A1 – 492

Reinstall

Piston Connecting Rod and Connecting Rod Bearing Installation

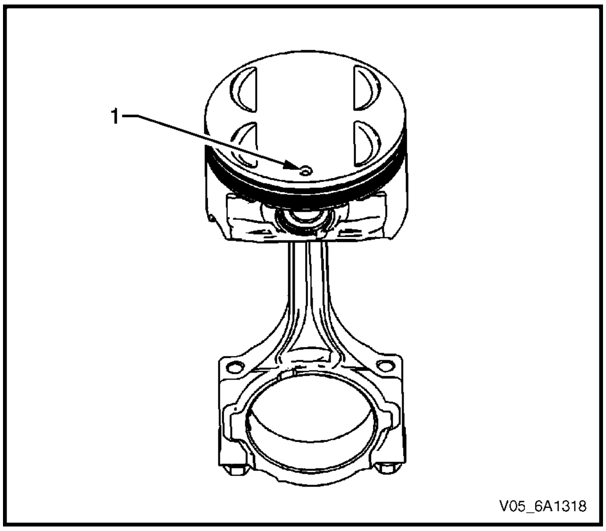

Figure 6A1 – 493

CAUTION

The piston is directional and must be installed in the engine block in the correct direction. The locating arrow on the top of each piston must be pointing toward the front of the engine.

1 Liberally lubricate the cylinder walls, piston rings and piston skirts with engine oil.

2 Select the correctly numbered piston/connecting rod assembly for the cylinder. A dot (1) showing correct piston orientation is located on the top of the piston.

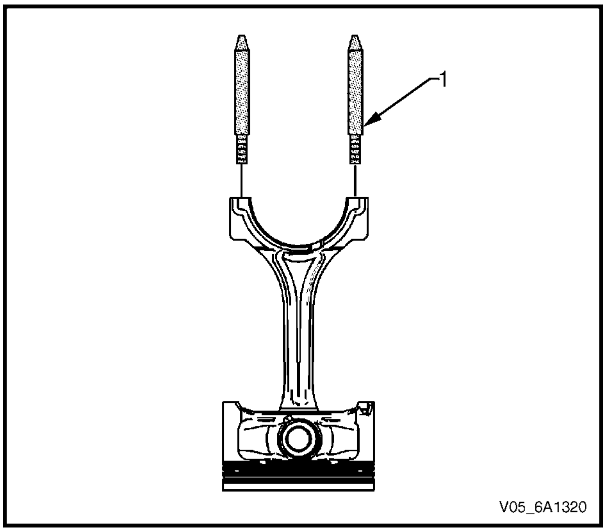

Figure 6A1 – 494

3 Install connecting rod guide pin set, Tool No. EN-46121 (1) into the connecting rod bolt holes.

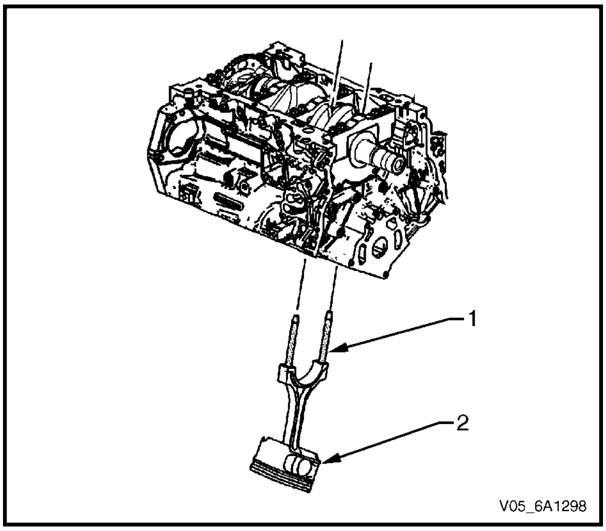

Figure 6A1 – 495

4 Compress the piston rings using a commercially available ring compressor.

CAUTION

Extreme care must be used when installing the piston and connecting rod to ensure the rod does not scrape or nick the cylinder bore, oil jets, or crankshaft surfaces.

5 Using both hands from the top and bottom of the cylinder, slowly guide the piston (2) and connecting rod assembly into the cylinder. Do not allow the connecting rod to contact the cylinder wall.

6 When the ring compressor contacts the deck surface, gently tap the piston into the cylinder using the handle end of a dead-blow hammer. Guide the connecting rod onto the crankshaft bearing journal using connecting rod guide pin set, Tool No. EN-46121 (1) while gently tapping the piston into the cylinder with a soft-blow hammer.

7 Remove connecting rod guide pin set, Tool No. EN-46121 (1) from the connecting rod bolt holes.

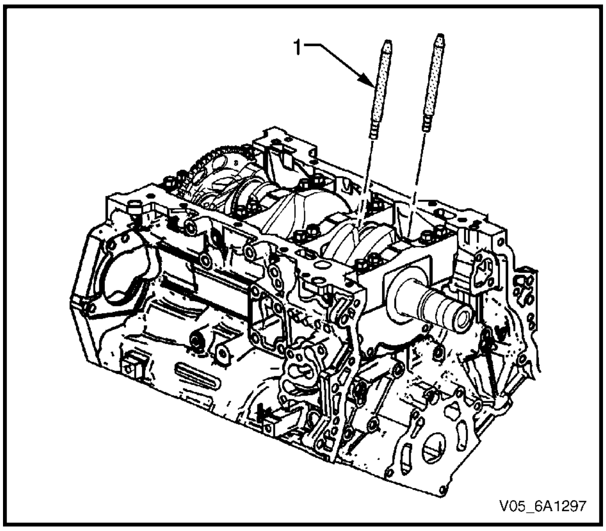

Figure 6A1 – 496

Connecting Rod Bearing Clearance Measurement Procedure

NOTE

Before final assembly, check the clearance of the new connecting rod bearings.

1 Place a length of fresh, room temperature plastic gauging material all the way across the connecting rod bearing journal.

2 Install the connecting rod bearing into the connecting rod cap.

3 Install the connecting rod end cap (1) on its original connecting rod and ensure the bearing lock tangs are aligned on the same side of the rod.

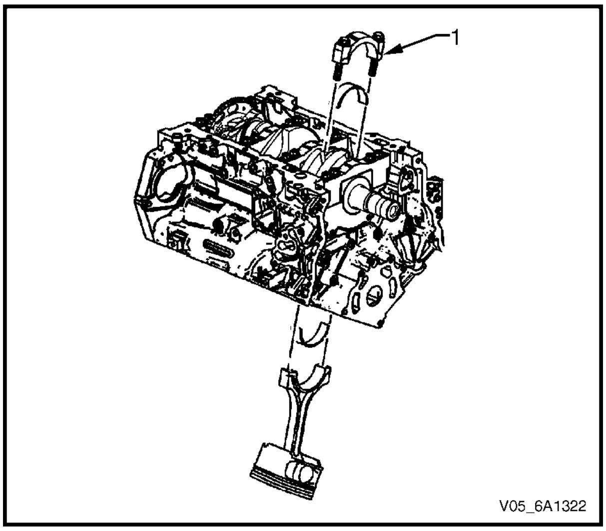

Figure 6A1 – 497

NOTE

Reuse the old connecting rod bolts only for measuring the connecting rod bearing clearance.

4 Install the connecting rod cap bolts into the connecting rod cap and tighten to the correct torque specification using torque angle wrench, Tool No. EN-7115.

Connecting rod cap attaching bolt torque specification: Stage 1 ....30.0 Nm Stage 2 .... Loosen completely Stage 3 ....25.0 Nm Stage 4 .... 110 degrees

5 Allow the assembly to sit for at least 2 minutes.

6 Remove the connecting rod cap bolts and discard.

7 Remove the connecting rod cap.

8 Determine the connecting rod bearing clearance by comparing the width of the flattened plastic gauging (1) material at its widest point with the graduation on the gauging material container (2).

9 Compare the measurements with the specifications, refer to 5 Specifications.

10 If the new bearings do not provide the correct crankshaft to connecting rod bearing clearance, inspect the following:

11 Measure the crankshaft connecting rod journals for the correct specified size and ensure the correct new bearings are being installed. If the crankshaft connecting rod journals are incorrectly sized, replace or regrind the crankshaft. Crankshaft machining is permitted and undersized bearings are available.

12 Measure the connecting rod bearing bore diameter to ensure correct size. The connecting rod is not machineable and the connecting rod must be replaced if out of specification.

13 Clean the plastic gauging material from the connecting rod bearing journals using a soft lint-free cloth.

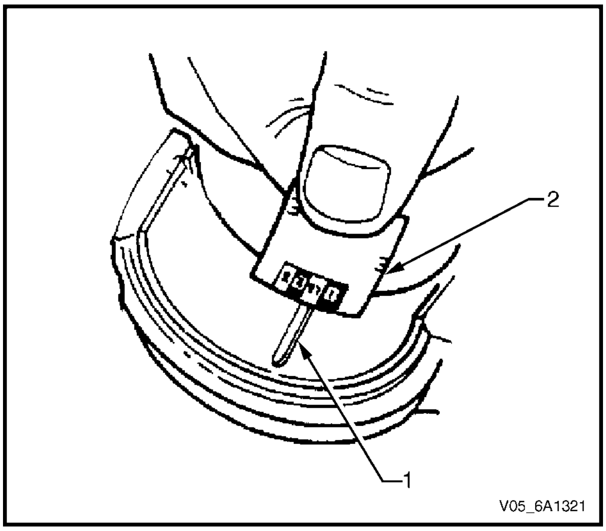

Figure 6A1 – 498

Connecting Rod Final Assembly Procedure

1 Carefully guide the connecting rod away from the crankshaft connecting rod journal slightly to lubricate the crankshaft connecting rod bearing journal.

2 Apply a liberal amount of clean engine oil to the crankshaft connecting rod bearing journal.

3 Guide the connecting rod to the crankshaft connecting rod journal.

4 Install the connecting rod end cap (1) on its original connecting rod and ensure the bearing lock tangs are aligned on the same side of the rod.

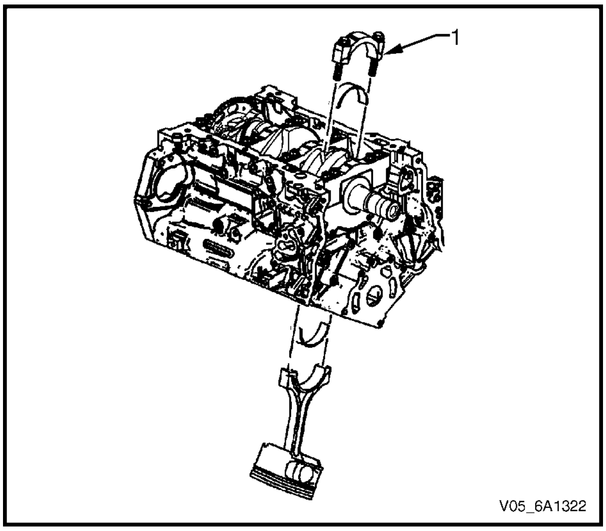

Figure 6A1 – 499

CAUTION

- **Do not lubricate the new connecting rod bolts. The new bolts have a pre-applied graphite lubricant. Applying lubricant to the connecting rod bolts will effect the clamp load when the connecting rod bolts are tightened to the specified torque. Incorrect clamp load can lead to component failure and extensive engine damage.**
- **Do not reuse the old connecting rod bolts.**

5 Install new connecting rod bolts into the connecting rod cap and tighten to the correct torque specification.

■ Connecting rod cap attaching bolt torque specification:	
	Stage 1 ....30.0 Nm
	Stage 2 .... Loosen completely
	Stage 3 ....25.0 Nm
	Stage 4 .... 110 degrees

NOTE

During and after installation, ensure each piston is positioned correctly in the correct cylinder. The locating arrow on the top of each piston must be pointing toward the front of the engine.

6 Repeat these procedures for the remaining piston/connecting rod assemblies.

7 Reinstall the oil pan and oil pump pick up assembly, refer to 4.2 Oil Pan and Oil Pump Suction Pipe Assembly.

8 Reinstall the cylinder heads, refer to 3.22 Cylinder Head Assembly.

9 Reinstall the engine assembly, refer to 4.1 Engine .

4.6 Crankshaft and Main Bearings

1 Remove the engine assembly, refer to 4.1 Engine .
2 Remove both cylinder head assemblies, refer to 3.22 Cylinder Head Assembly.
3 Remove the oil pan assembly, refer to 4.2 Oil Pan and Oil Pump Suction Pipe Assembly.
4 Remove the piston and connecting rod assemblies, refer to 4.5 Pistons, Pins, Rings, Connecting Rods and Big-end Bearings.
5 Remove the oil pump assembly, refer to 3.17 Oil Pump Assembly.
6 Remove the crankshaft rear oil seal and plate assembly, refer to 4.4 Crankshaft Rear Seal and Plate Assembly.
7 Remove the crankshaft position sensor, refer to Section 6C1-3 Engine Management – V6 – Service Operations.

Crankshaft End Play Measurement

1 Place a dial indicator at the end of the crankshaft nose.
2 Gently force the crankshaft towards the front and rear of the cylinder block with a lever while monitoring the movement of the dial indicator.
3 The crankshaft endplay should not exceed specifications, refer to 5 Specifications.
4 If the specifications are exceeded, inspect the thrust bearing thrust outer diameter and the crankshaft thrust wall for wear and/or excessive runout. Compare the values with the specifications, refer to 5 Specifications.
5 Replace the thrust bearing or crankshaft as required.

Remove

1 Remove the crankshaft bearing cap side bolts (3).

CAUTION

The crankshaft bearing cap outer bolts are yield tightened during assembly and must be replaced prior to reassembly. Crankshaft bearing cap outer bolts that are not replaced will not torque to the correct clamp load and can lead to serious engine damage.

2 Remove the crankshaft bearing cap outer bolts (1).
3 Remove the crankshaft bearing cap inner bolts (2).

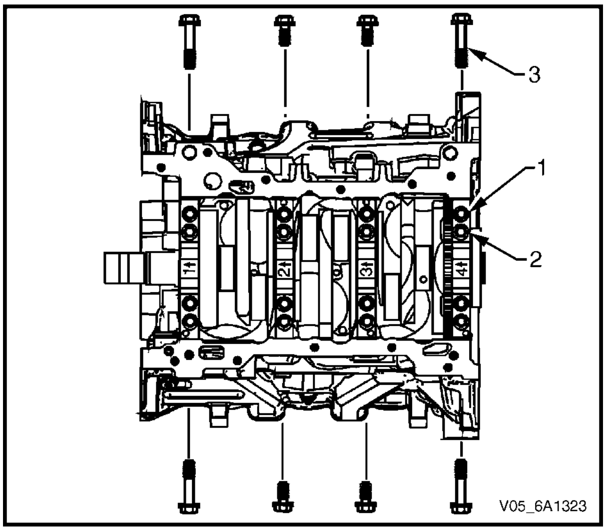

Figure 6A1 – 500

4 Loosen the nuts (1) of the crankshaft main bearing cap remover, Tool No. J-41818 (2) to separate the chamfered collets. Install the collets into the inner bolt holes of the front main bearing cap (3).

5 Tighten the remover nuts to the correct torque specification.

Crankshaft bearing cap remover nut.................11.0 Nm.

6 Install a slide hammer, Tool No. J-6125-1B (4) onto the crankshaft bearing cap remover and remove the crankshaft bearing cap.

7 Repeat steps 9 to 14 for the remaining crankshaft bearing caps.

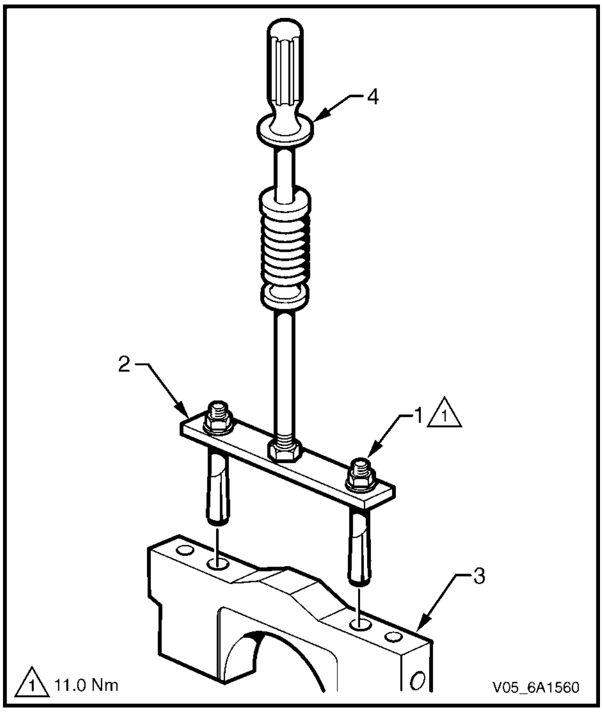

Figure 6A1 – 501

8 Remove the crankshaft (1) from the engine block (2), lifting evenly to avoid jamming against the main thrust bearing.

9 Place the crankshaft in a secure place.

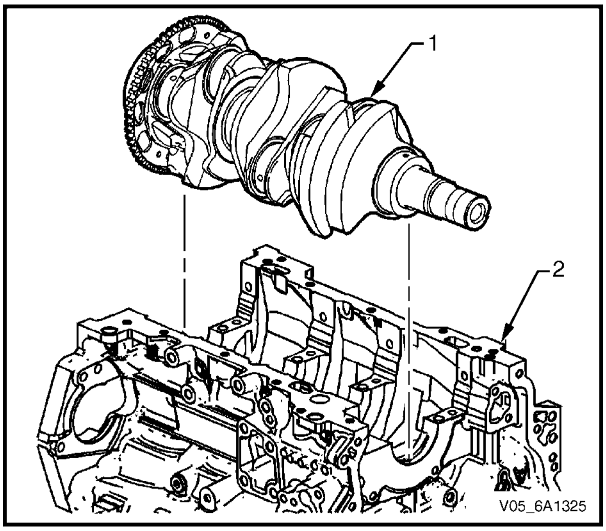

Figure 6A1 – 502

10 If required, remove the crankshaft sprocket drive pin (1) from the crankshaft (2),

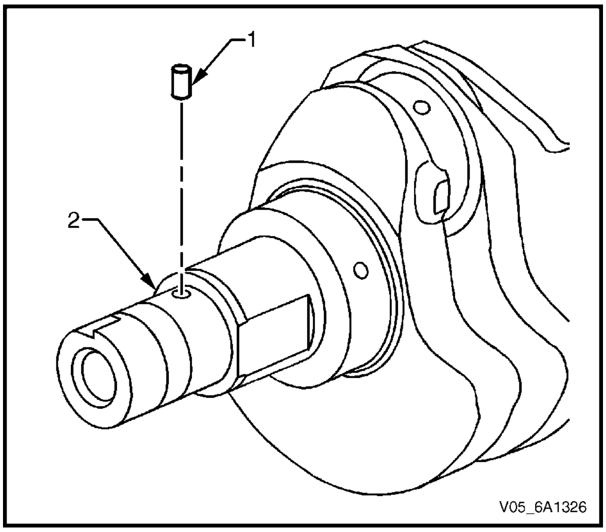

Figure 6A1 – 503

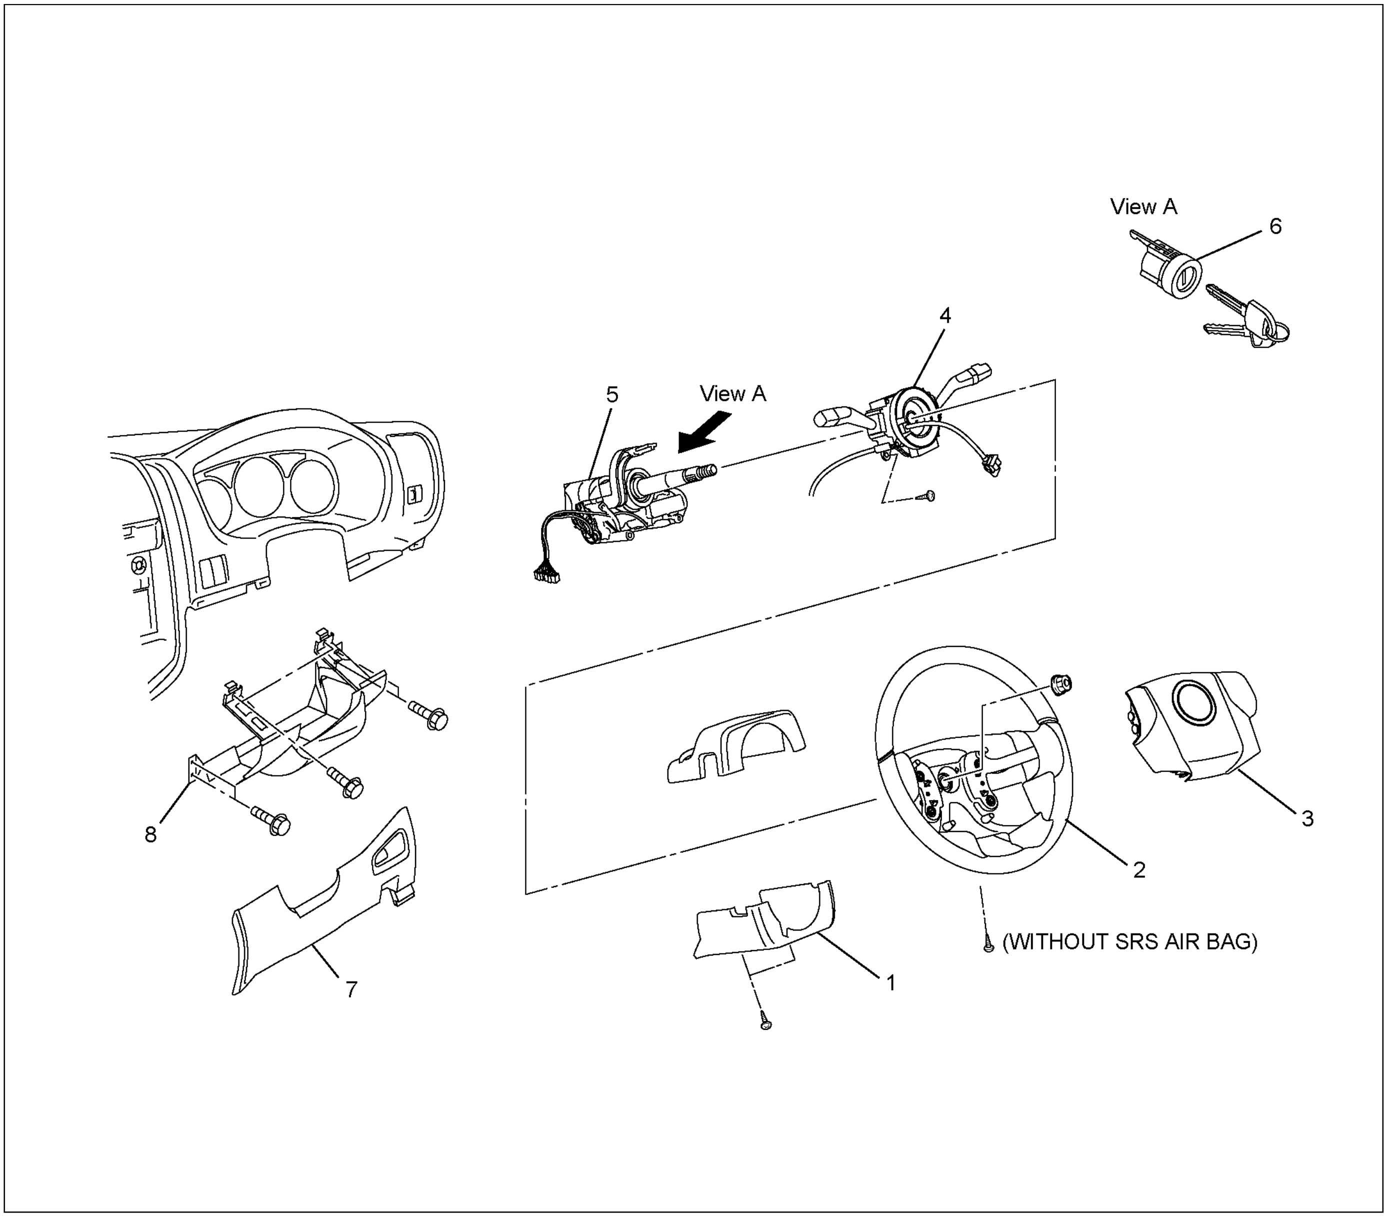
Lock Cylinder

Lock Cylinder and Associated Parts



Legend

(1) Steering Column Cover
(2) Steering Wheel
(3) Inflator Module or Horn pad
(4) Combination Switch and SRS Coil Assembly
(5) Steering Column Assembly
(6) Lock Cylinder Assembly
(7) Instrument Panel Lower Cover
(8) Driver Knee Bolster (reinforcement)

Removal

1. Turn the steering wheel so that the vehicle's wheels are pointing straight ahead.
2. Turn the ignition switch to "LOCK".
3. Disconnect the battery "-" terminal cable, and wait at least 5 minutes (with SRS air bag).
4. Disconnect the yellow 2-way SRS connector located under the steering column (with SRS air bag).

Crankshaft Bearing

1 Prepare a piece of cardboard or similar, numbered 1 – 4 for bearing identification.

NOTE

Main bearing journals are numbered from the front of the engine.

2 Remove the crankshaft upper bearing halves from the cylinder block. Note the position of the thrust bearing (1) at the number 3 journal (2).

3 Place the crankshaft upper bearing halves on the cardboard in the correct positions.

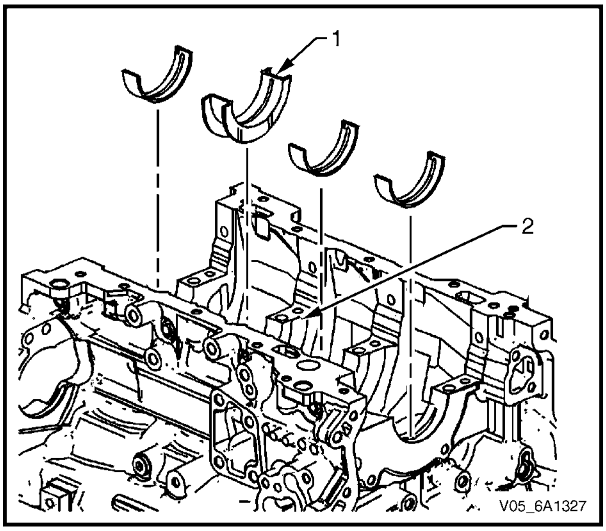


Figure 6A1 – 504

4 Remove the crankshaft lower bearing halves (2) from the crankshaft bearing caps (1).

5 Place the crankshaft lower bearing halves in the correct positions on the cardboard.

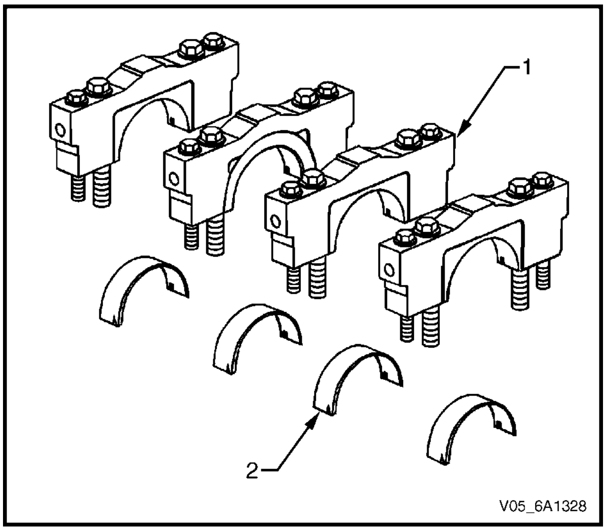

Figure 6A1 – 505

Clean and Inspect

Crankshaft and Main Bearing Cleaning

WARNING

Safety glasses must be worn when using compressed air.

Clean the following components in solvent and then dry with compressed air:

- crankshaft bearings,
- connecting rod bearings,
- crankshaft journals,
- crankpin journals,
- crankshaft oil passages, and
- crankshaft threaded holes.

Crankshaft and Main Bearing Visual Inspection

1 Perform the following visual inspections:

- Inspect the crankshaft balancer bolt hole (1) for thread damage.
- Inspect the crankshaft balancer mounting area (2) for damage.
- Inspect the crankshaft sprocket pin hole (3) for damage.
- Inspect the oil pump drive flats (4) for damage.
- Inspect the crankshaft main journals (5) for damage.
- Inspect the crankshaft connecting rod journals (6) for damage.
- Inspect the crankshaft oil passages (7) for obstructions.
- Inspect the crankshaft main bearing thrust wall surfaces (8) for damage.
- Inspect the crankshaft counterweights (9) for damage.
- Inspect the crankshaft reluctor ring teeth (10) for damage.
- Inspect the crankshaft rear main oil seal surface (11) for damage.
- Inspect the crankshaft engine flexplate mounting surface (12) for damage.
- Inspect the crankshaft pilot hole (13) for damage.
- Inspect the crankshaft engine flywheel bolt holes (14) for thread damage.

2 Repair or replace the crankshaft as required.

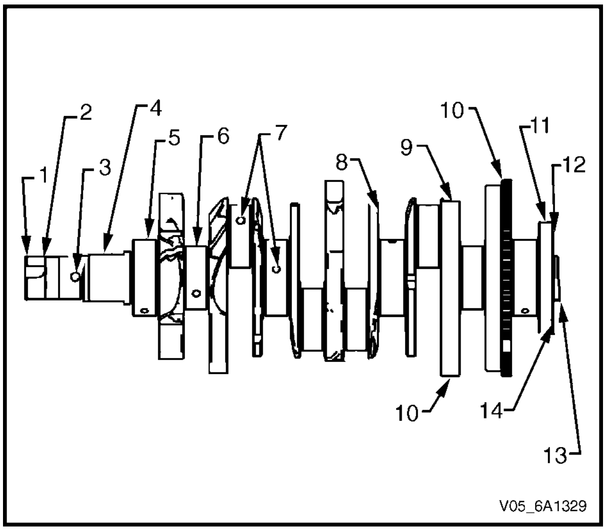

Figure 6A1 – 506

Crankshaft Main Bearing Inspection

CAUTION

All connecting rod and main journal bearings that have been used in a running engine must be replaced. Never re-use the crankshaft or connecting rod bearings.

NOTE

The following bearing wear conditions should be used to diagnose engine operating conditions or root cause of a condition.

1 Inspect for fatigue indicated by craters or pockets (2). Flattened sections on the bearing halves (1) also indicate fatigue.

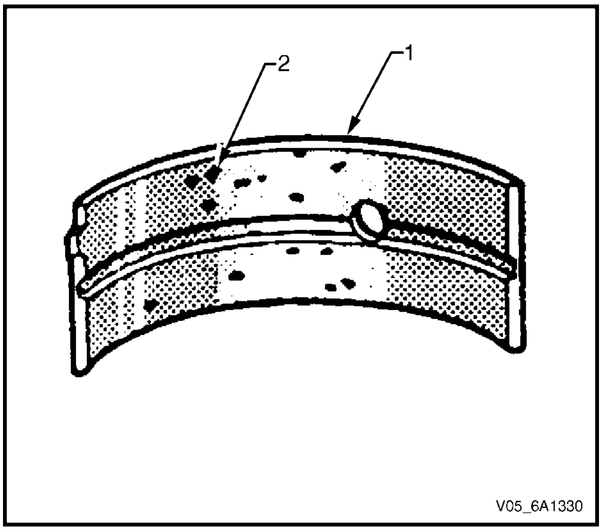

Figure 6A1 – 507

2 Inspect for excessive scoring or discoloration (2) on both front and back of the bearing halves (1).

3 Inspect the main bearings for dirt embedded into the bearing material.

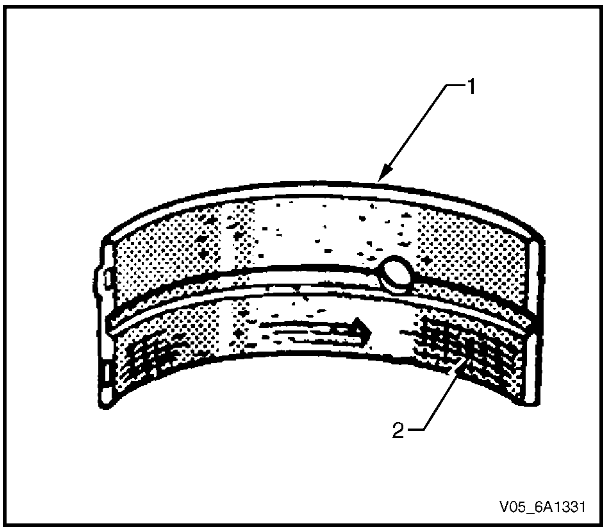

Figure 6A1 – 508

4 Inspect for incorrect seating indicated by bright, polished sections (1).

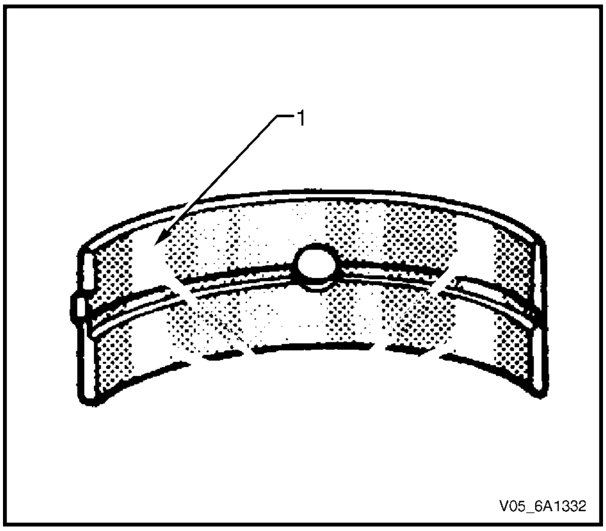

Figure 6A1 – 509

Crankshaft Measurement

1 Using a suitable fixture (1), support the crankshaft (2).

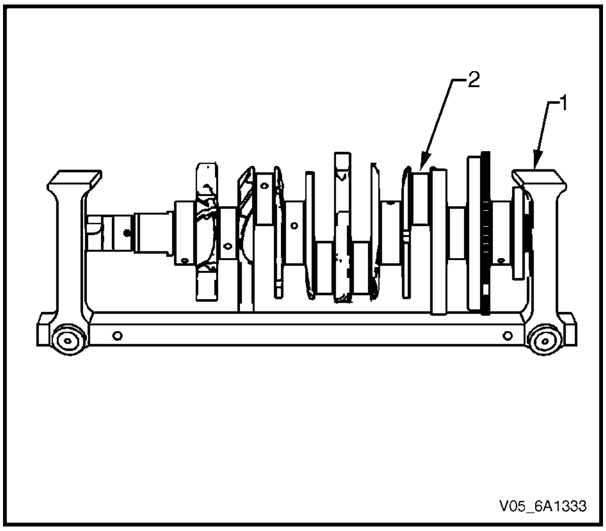

Figure 6A1 – 510

2 Using a dial indicator (1) and magnetic base (2), rotate the crankshaft (3) carefully by hand. Measure the crankshaft main journals for runout and compare with the engine specifications, refer to 5 Specifications.

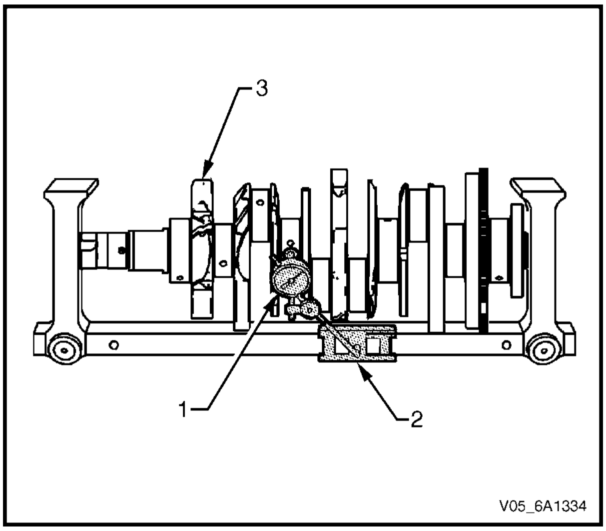

Figure 6A1 – 511

3 Measure the crankshaft thrust wall width (1) for wear using an inside micrometer and compare with the engine specifications, refer to 5 Specifications.

4 Measure the crankshaft thrust wall surface (2) for runout using a dial indicator, mounted to a magnetic stand and compare with the engine specifications, refer to 5 Specifications.

5 If the crankshaft journals are damaged or worn beyond specifications, the crankshaft may be ground 0.25 mm. There is only one size of oversized main bearings available for service.

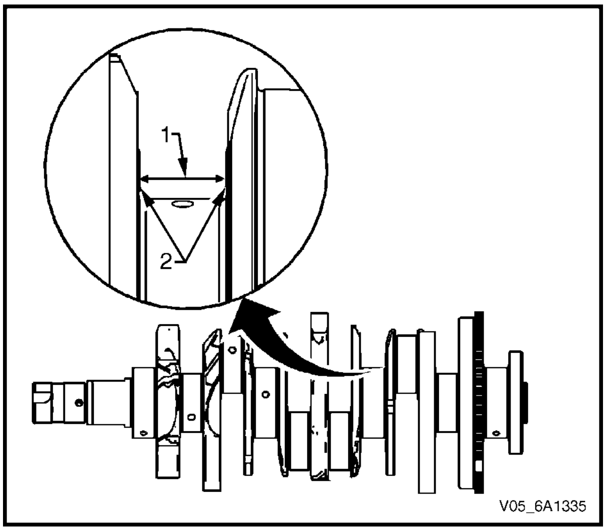

Figure 6A1 – 512

6 Inspect the crankshaft main journals (1) for undersize, using an outside micrometer (2).

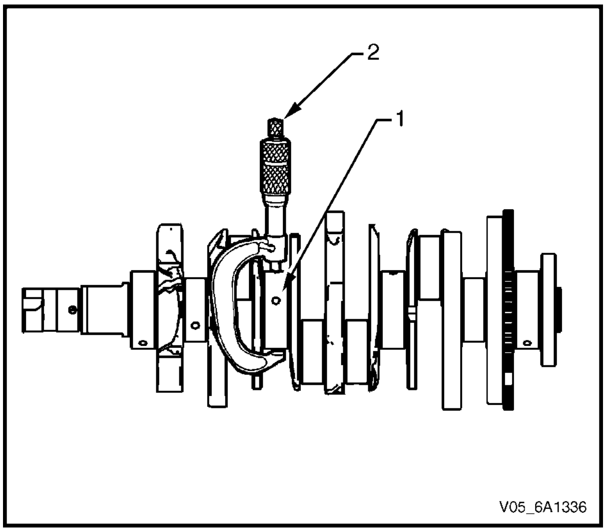

Figure 6A1 – 513

7 Inspect the crankpins (1) for undersize using an outside micrometer (2).

8 Compare your measurements with those listed in the engine specifications, refer to 5 Specifications. If the crankpin journals are worn beyond the specifications, the crankshaft may be ground 0.25 mm. Only one size of oversized connecting rod bearings available for service.

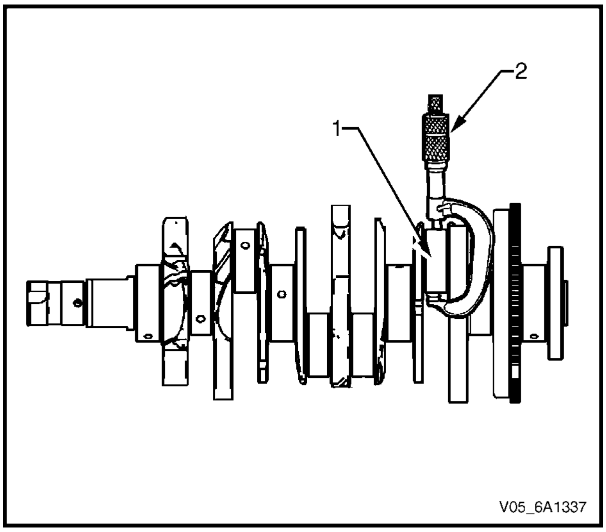

Figure 6A1 – 514

9 Measure the main bearing and crankpin journals for out-of-round using the following procedure:

   a Using an outside micrometer, measure the journal at the extreme front and rear locations on the journal. Call these points A and B.

   b Measure the journal in two new locations exactly 90 degrees from the first points. Call these points C and D.

   c Subtract A from C and B from D. The differences will indicate journal out-of-round.

   d The out-of-round should not exceed 0.004 mm maximum.

   e If the journals are worn beyond the specifications, the crankshaft may be ground 0.25 mm. There is only one size of oversized crankshaft and connecting rod bearings available for service.

10 Measure the main bearing and crankpin journals for taper using the following procedure:

   a Using an outside micrometer, measure the journal at the extreme front (A) and rear (B) of the journal parallel to the crankshaft centreline.

   b Subtract the smallest from the largest measurement. The result will be the journal taper.

   c If the main bearing journal taper exceeds 0.004 mm, replace the crankshaft.

   d If the journals are worn beyond the specifications, the crankshaft may be ground 0.25 mm. There is only one size of oversized crankshaft and connecting rod bearings available for service.

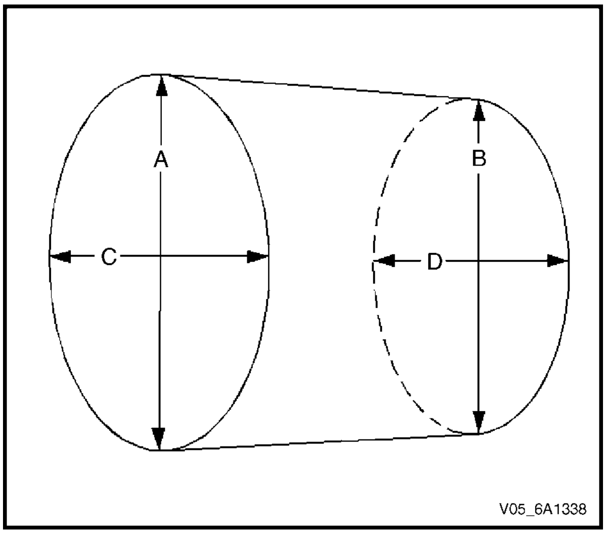

Figure 6A1 – 515

Reinstall

Crankshaft Bearing Installation Procedure

CAUTION

If the crankshaft bearings have been used in a running engine, replace them with new crankshaft bearings for reassembly.

1 Clean the crankcase crank bore with a lint-free cloth.

2 Clean all the oil from the backside of new bearing halves.

3 Install the new upper crankshaft bearings into position. The thrust bearing (1) belongs in the number 3 journal(2). Ensure the upper bearing insert contains the oil transfer hole and groove. Roll the bearing into position so the lock tang engages the crank slot. The bearing must fit flush with the upper crankcase.

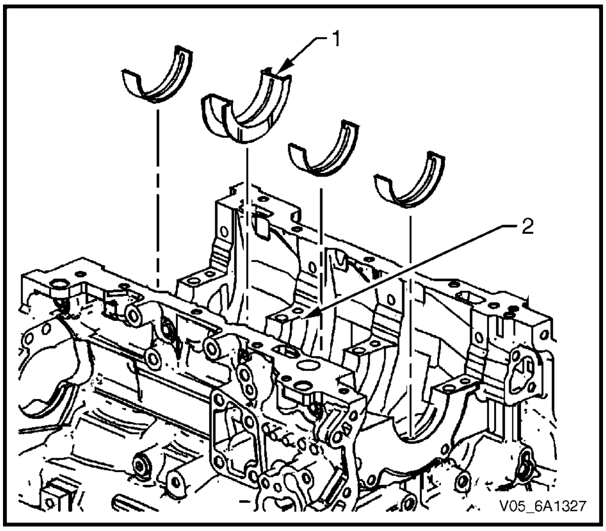

Figure 6A1 – 516

4 Install the new lower crankshaft bearings (2) into position in the main bearing caps (1). The lower crankshaft bearings are identified by no grooves or holes. The bearings must fit flush with the crankshaft bearing caps.

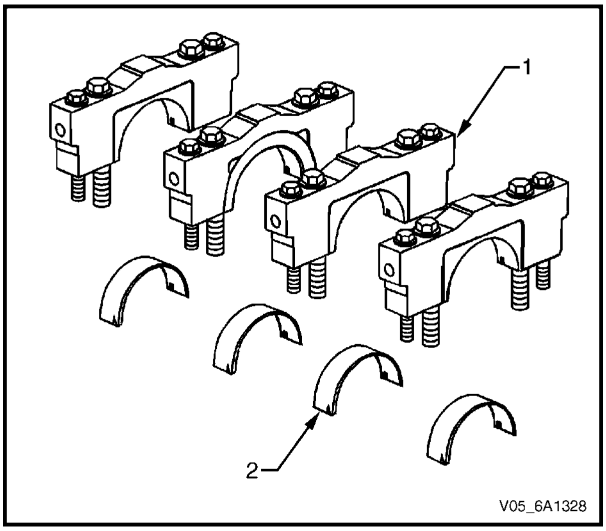

Figure 6A1 – 517

Crankshaft Main Bearing Clearance Measurement

1 Place a length of fresh, room temperature plastic gauging material all the way across all the crankshaft bearing journals.

2 Install the crankshaft main bearing caps.

3 Loosely install the original inner main cap bolts (1).

4 Loosely install the original outer main cap bolts (2).

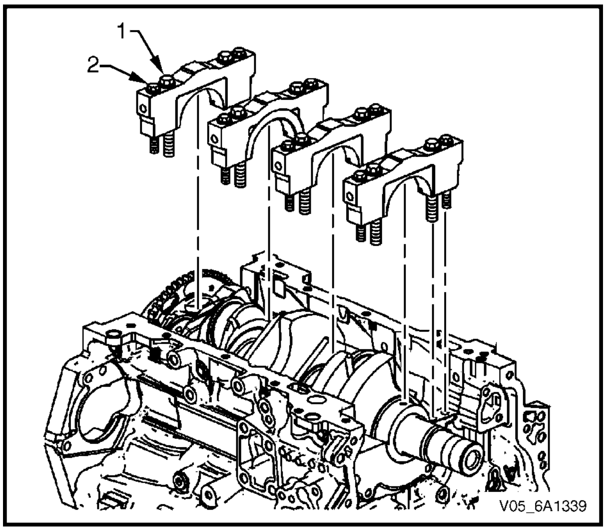

Figure 6A1 – 518

5 Loosely install the original short/inner side main cap bolts.

6 Loosely install the original long/outer side main cap bolts (3).

7 Gently tap the crankshaft main bearing caps with a soft-faced hammer to help seat the caps.

8 Tighten the main caps bolts to the correct torque specification, and in the following sequence.

Crankshaft main bearing cap inboard attaching bolt torque specification:	
Stage 1	20.0 Nm
Stage 2	80°
Crankshaft main bearing cap outboard attaching bolt torque specification:	
Stage 1	15.0 Nm
Stage 2	110°
Crankshaft main bearing cap side attaching bolt torque specification:	
Stage 1	30.0 Nm
Stage 2	60°

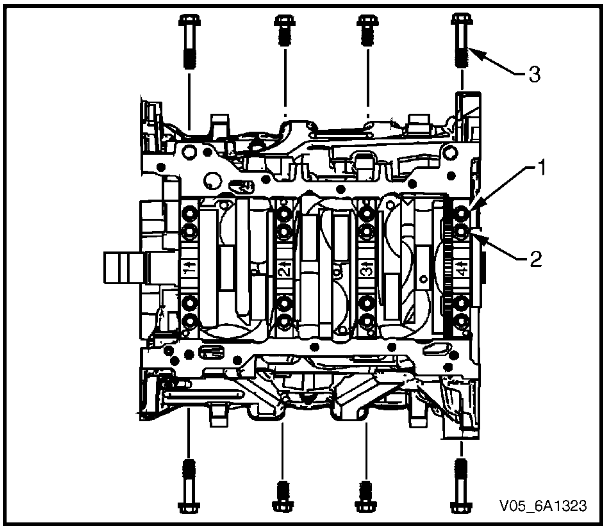

Figure 6A1 – 519

NOTE

Do not rotate the crankshaft.

9 Allow the assembly to sit for 2 minutes.

10 Remove the crankshaft bearing cap side bolts.

11 Remove the crankshaft bearing cap outer bolts (2).

12 Remove the crankshaft bearing cap inner bolts (1).

13 Install the crankshaft main bearing cap remover Tool No. J-41818 as previously described and remove the crankshaft bearing cap.

14 Repeat steps 10 to 13 for the remaining crankshaft bearing caps.

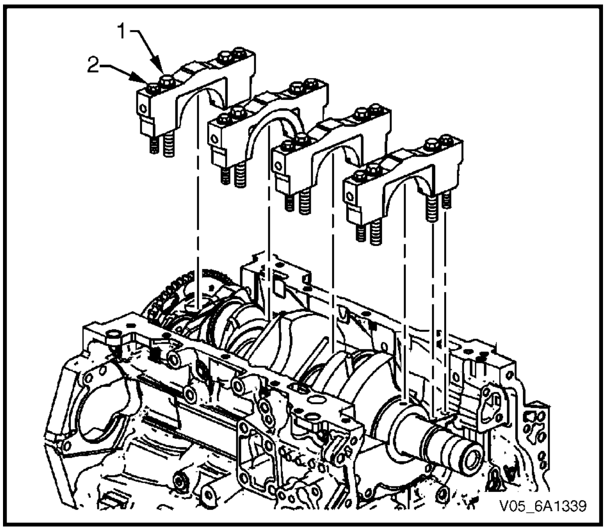

Figure 6A1 – 520

15 Determine the crankshaft bearing clearance by comparing the width of the flattened plastic gauging material (1) at its widest point with the graduation on the gauging material scale (2).

16 Compare the measurements listed in the specifications, refer to 5 Specifications. If the new bearings do not provide the correct crankshaft to bearing clearance, inspect the following:

17 Measure the crankshaft journals for the correct specified size and ensure new bearings are being installed. If the crankshaft journals are incorrectly sized, replace or regrind the crankshaft. Crankshaft machining is permitted and undersized bearings are available.

18 Measure the engine block crankshaft bearing bore diameter to ensure correct size. The engine block crankshaft bearing bore is not machineable and the block must be replaced if out of specification.

19 Clean the plastic gauging material from the crankshaft bearing journals with a soft, lint-free cloth.

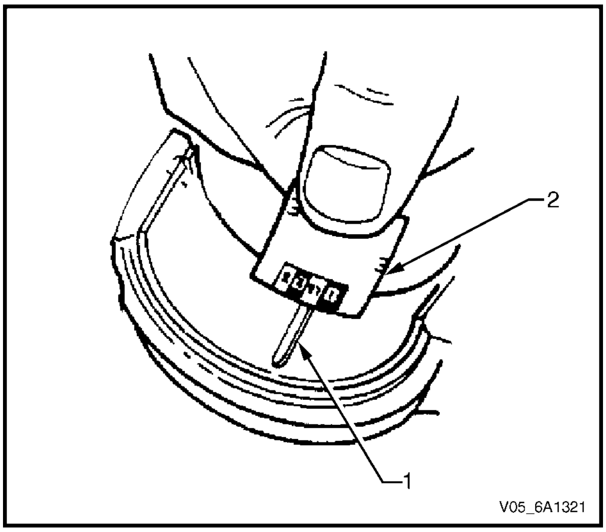

Figure 6A1 – 521

Crankshaft Final Installation Procedure

1 If removed, install the crankshaft sprocket drive pin (1). Lightly tap the pin in place with a small soft face, bronze/plastic, hammer until it bottoms in the hole.

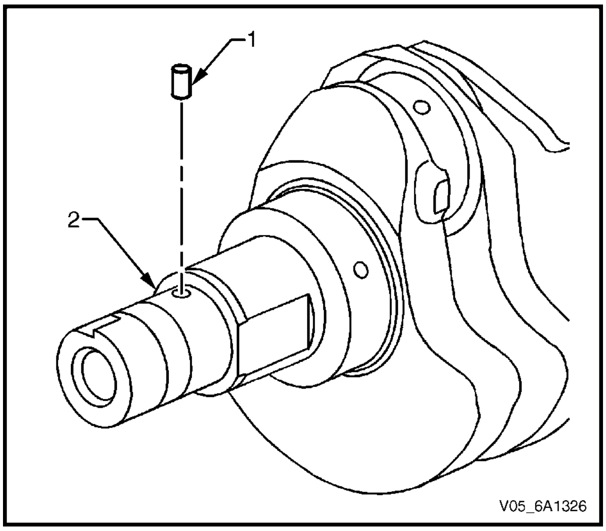

Figure 6A1 – 522

CAUTION

Ensure the crankshaft position sensor has been removed from the cylinder block prior to loading the crankshaft, as damage to the sensor may occur.

2 Apply a liberal amount of clean engine oil to the upper and lower bearing surfaces.

3 Gently lower the crankshaft (1) into position in the cylinder block (2).

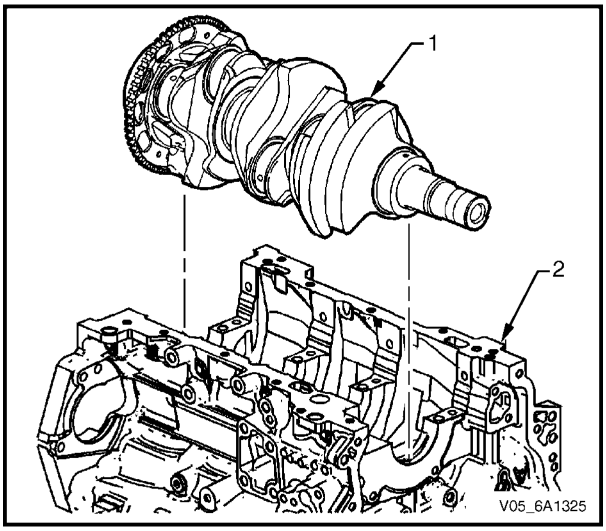

Figure 6A1 – 523

4 Install the crankshaft main bearing caps.

5 Loosely install the original inner main cap bolts (1).

CAUTION

The outer crankshaft bearing cap bolts (2) are yield tightened during assembly and must be replaced prior to reassembly. Outer crankshaft bearing cap bolts that are not replaced will not torque to the correct clamp load and can lead to serious engine damage.

6 Loosely install the new outer main bearing cap bolts (2).

7 Gently tap the crankshaft main bearing caps with a soft-faced hammer to help seat the caps.

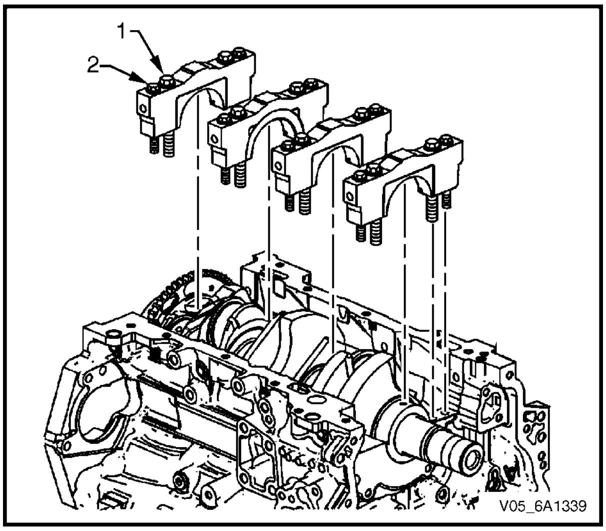

Figure 6A1 – 524

8 Loosely install new short / inner side main cap bolts (4).

CAUTION

- **The short / inner side main cap bolts originally have a sealant on the flange of the bolt head. New bolts must be used. If new bolts are not used, oil can leak from the crankcase past the bolts.**
- **The long / outer side main cap bolts originally have a sealant on the flange of the bolt head. New bolts must be used. If new bolts are not used, oil can leak from the crankcase past the bolts.**

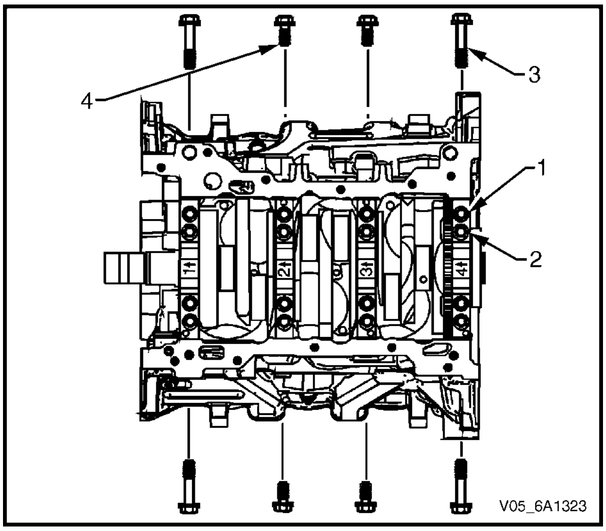

Figure 6A1 – 525

9 Loosely install the new long / outer side main cap bolts (3).

10 Tighten the main caps bolts to the correct torque specification, and in the following sequence.

■ Crankshaft main bearing cap inboard attaching bolt torque specification:
Stage 1 ....20.0 Nm
Stage 2 ....80°

■ Crankshaft main bearing cap outboard attaching bolt torque specification:
Stage 1 ....15.0 Nm
Stage 2 ....110°

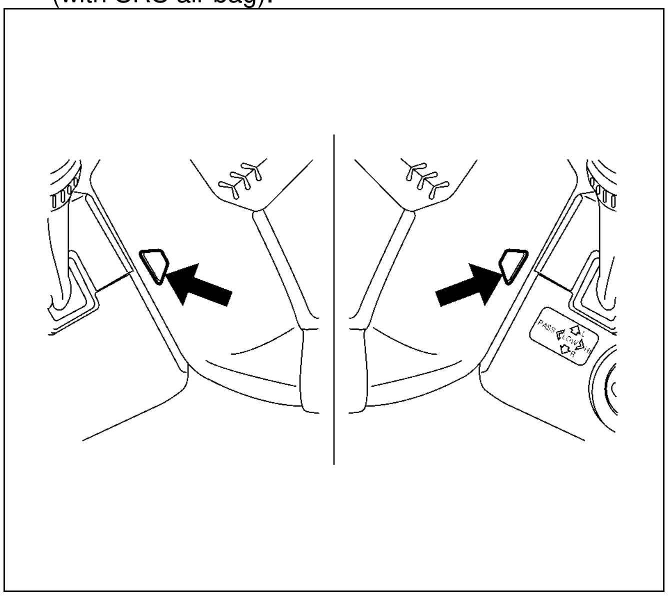
■ ♦ Crankshaft main bearing cap side attaching bolt torque specification:
Stage 1 ....30.0 Nm
Stage 2 ....60°

11 Ensure the crankshaft turns without binding or noise.

12 Install the remaining components in the reverse order to removal, refer to the appropriate Section.

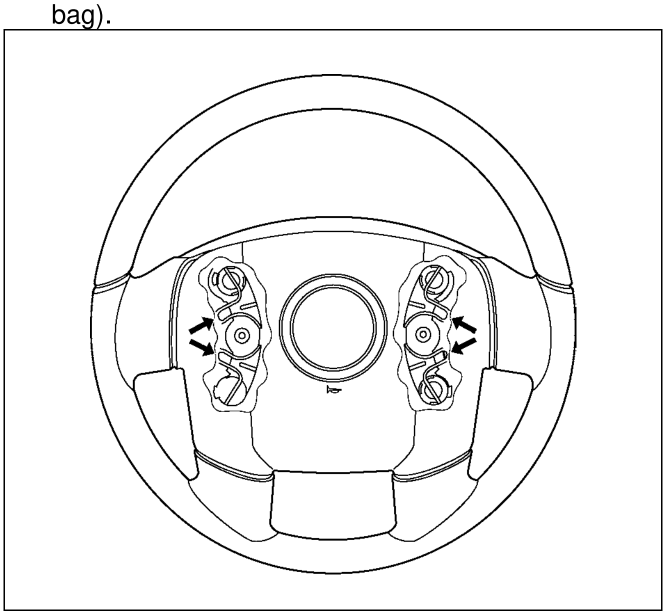
CAUTION: The wheels of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering wheel. Failure to do so will cause the coil assembly to lose its centering which will cause damage to the coil assembly (with SRS air bag).

5. Remove the engine hood opening lever and steering lower cover.
6. Remove driver knee bolster (reinforcement).
7. Disable the SRS (Refer to "Disabling the SRS" in this section) (with SRS air bag).
8. Check the holes on both sides of the steering cover (with SRS air bag).



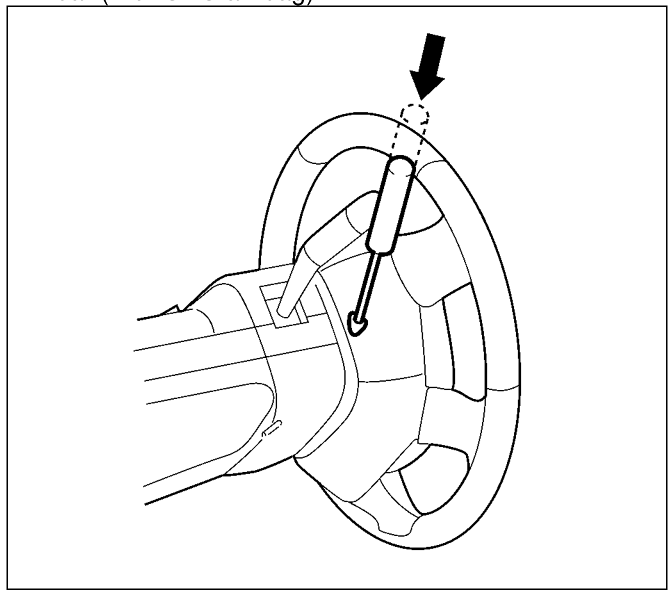
060R300025

9. Check the position of the pins in thier holes. Push the pin in the direction of the arrow (with SRS air bag).



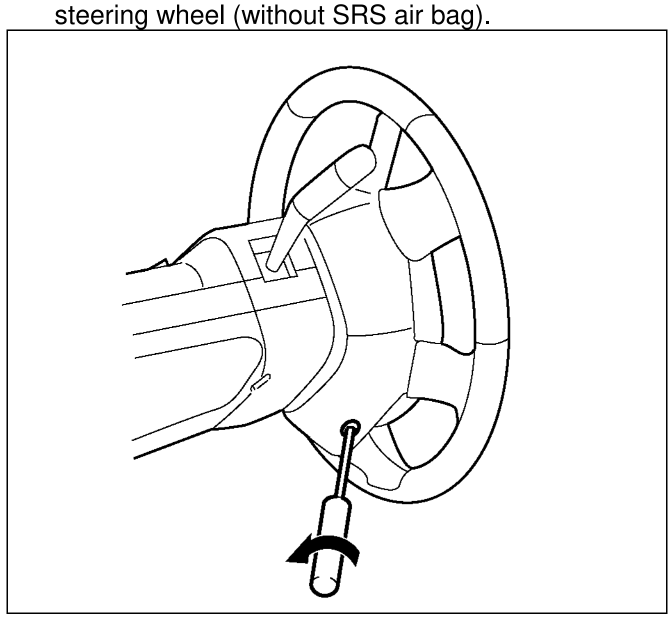
RTW73BSH000101

10. Push the four pins with a ϕ 5~6 mm (0.20~0.24 in) bar (with SRS air bag).



060R300031

11. Cancel the lock to release the four pins (with SRS air bag).
12. Loosen the horn pad fixing screw at the rear of the steering wheel (without SRS air bag).



430R300009

4.7 Cylinder Block

Disassemble

1 Remove oil jet bolt (1) attaching the oil jet (2), three places.

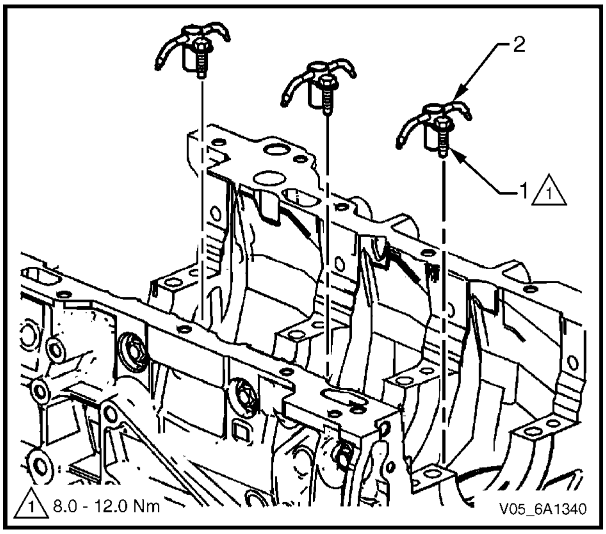


Figure 6A1 – 526

2 Remove the right-hand front oil pan rail oil gallery expansion plug (1).

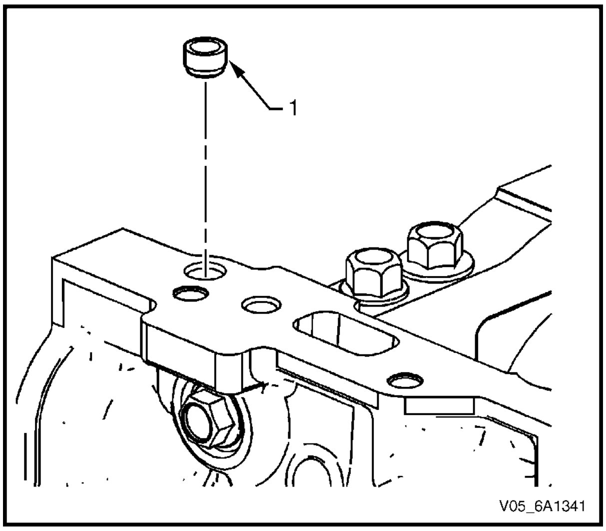

Figure 6A1 – 527

3 Remove the cylinder block-to-oil pan alignment dowels (1).

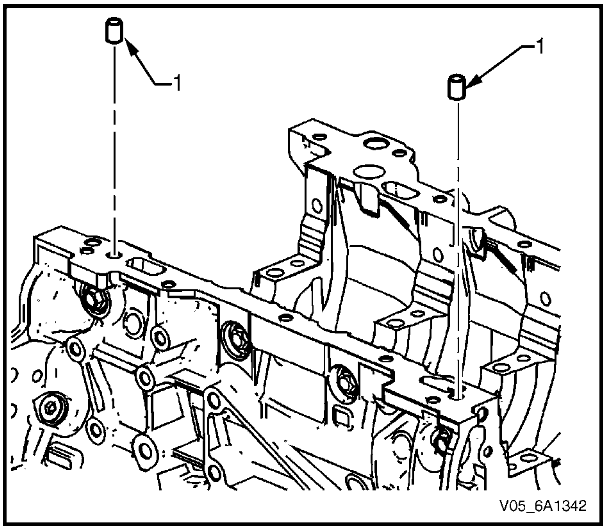

Figure 6A1 – 528

4 Remove the right-hand side M14 oil gallery threaded plug (1).

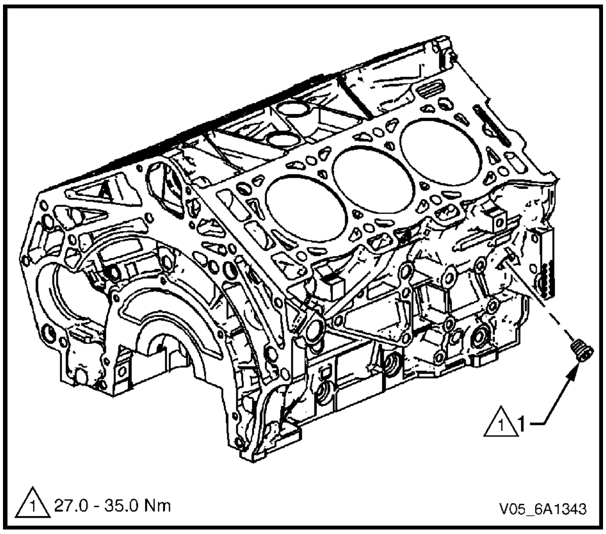

Figure 6A1 – 529

5 Remove the right-hand side M14 coolant drain threaded plug (1).

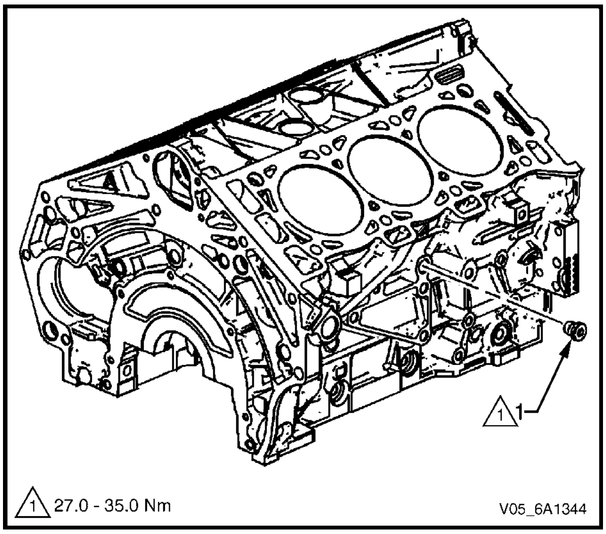

Figure 6A1 – 530

6 Remove the rear M14 oil gallery threaded plug (1).

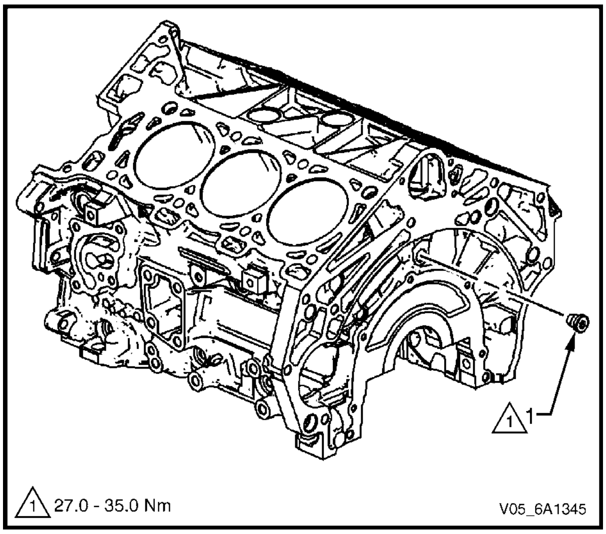

Figure 6A1 – 531

7 Remove the left-hand side M14 coolant drain threaded plug (1).

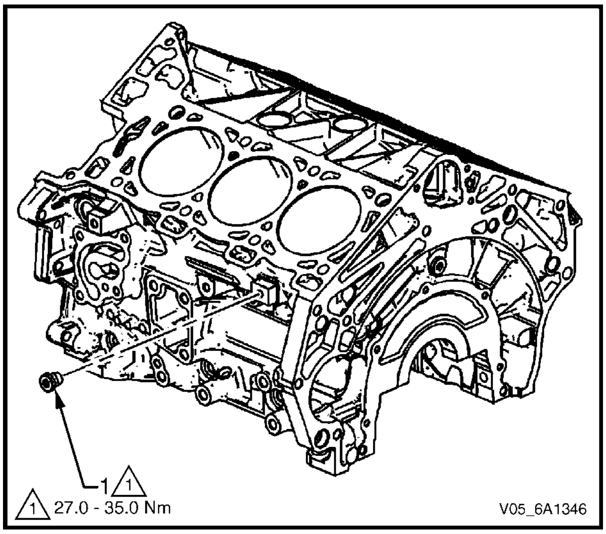

Figure 6A1 – 532

8 Remove the left-hand side M20 oil gallery threaded plug (1).

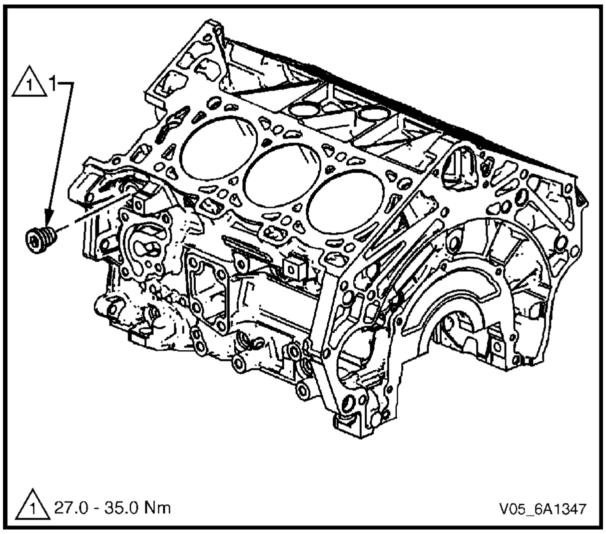

Figure 6A1 – 533

CAUTION

Do not force coolant expansion plugs downwards during removal procedure as the cylinder block will be damaged.

9 Remove the coolant expansion plugs (1).

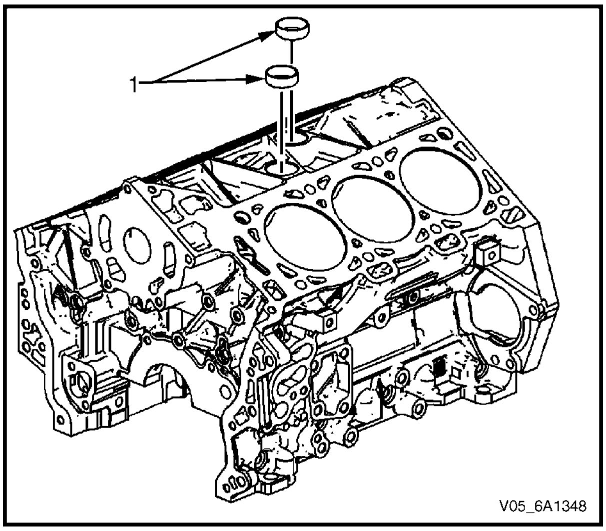

Figure 6A1 – 534

10 Remove the cylinder block-to-transmission alignment dowels (1).

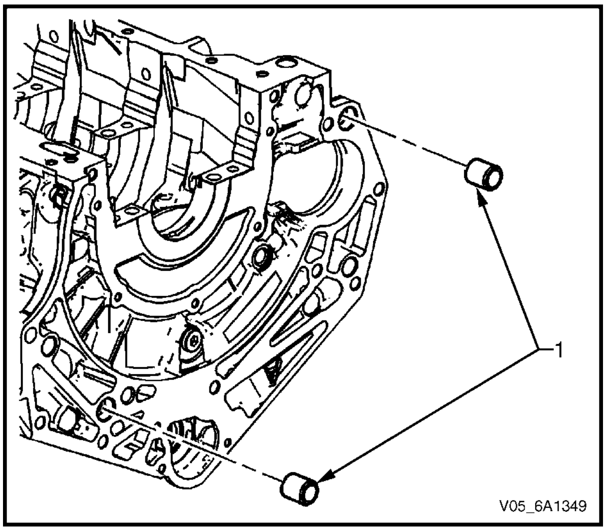

Figure 6A1 – 535

11 Remove the front oil gallery expansion plug (1).

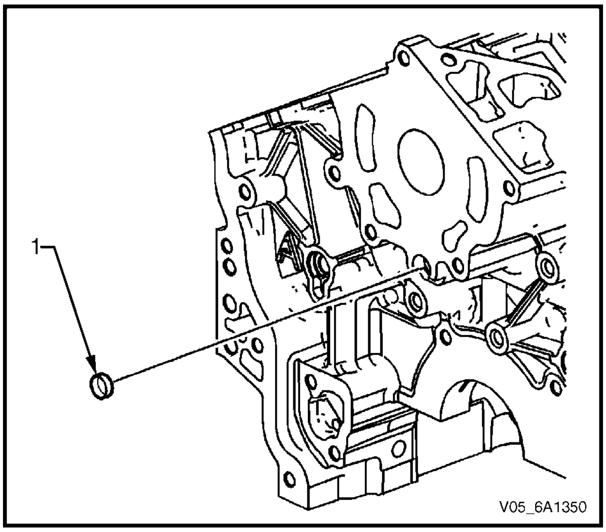

Figure 6A1 – 536

12 Remove the cylinder block-to-cylinder head alignment dowels (1).

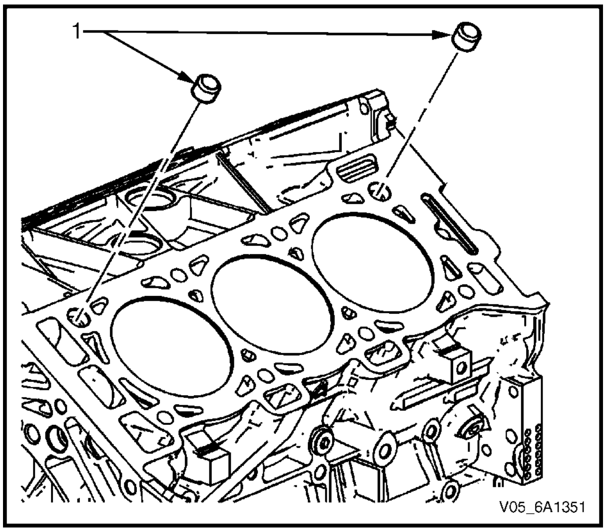

Figure 6A1 – 537

Clean

1 Remove all thread sealant, gasket material or sealant using a commercially available plastic or wood scraper.
2 Clean all the following areas with a suitable solvent:
   - sealing surfaces,
   - cooling passages,
   - oil passages, and
   - bearing journals.
3 Clean all threaded and through holes with a suitable solvent.

WARNING

Safety glasses must be worn when using compressed air.

4 Dry the engine block with compressed air.

Inspect

Visual Inspection

NOTE

The following procedure assumes the engine has been disassembled and cleaned, as described above.

1 Inspect the crankshaft bearing journals for damage or spun bearings. The crankshaft bearing journals are not repairable and if damage is found, the cylinder block assembly must be replaced.
2 Inspect the primary camshaft chain tensioner mounting surface on the engine block for burrs or any defects that would affect the sealing of the new primary camshaft chain tensioner gasket.
3 Inspect all sealing and mating surfaces for damage, repair or replace the cylinder block assembly if required.
4 Inspect all threaded and through holes for damage or excessive debris.
5 Inspect all bolts for damage, if damaged replace with new bolts only.
6 Inspect the cylinder walls for cracks or damage. The cylinder sleeves are not serviced separately, if the cylinders are damaged the cylinder block assembly must be replaced.
7 Inspect the engine block for cracks. Do not repair any cracks. If cracks are found, the cylinder block assembly must be replaced. Repair any damaged threaded holes, refer to 4.9 Thread Repair Specifications.

Measuring Cylinder Bore Diameter

1 Measure the cylinder bore diameter 37 mm from the deck face (1) using a commercially available bore gauge or Tool No. J-8087 (2).
2 Record the results and compare with the dimensions listed in the specifications, refer to 5 Specifications.

NOTE

If the cylinder diameter exceeds the specifications, the cylinder block may be oversized to 0.25 mm. Only one size of oversized pistons and rings are available for service. If the cylinder bore diameter exceeds specification by more than 0.25 mm, the cylinder block must be replaced.

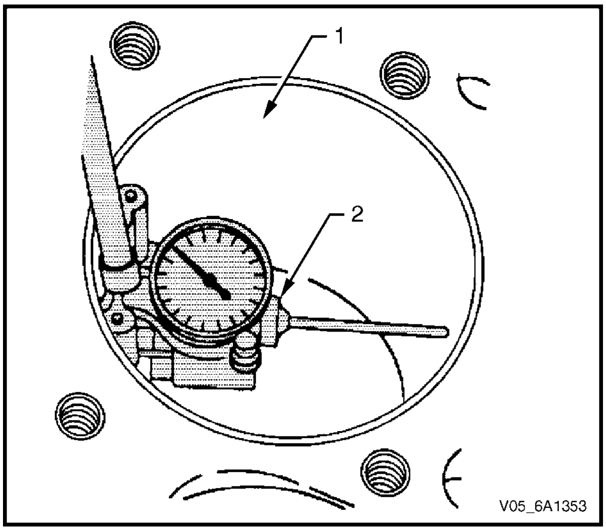

Figure 6A1 – 538

Measuring Cylinder Bore Taper

1. Measure the cylinder bore along the thrust surfaces, perpendicular to the crankshaft centreline, at 10 mm below the deck surface and record the measurement.
2. Measure the cylinder bore along the thrust surfaces, perpendicular to the crankshaft centreline, at 100 mm below the deck surface and record the measurement.
3. Calculate the difference between the two measurements. The result will be the cylinder taper.
4. Compare the results with the dimensions listed in the specifications, refer to 5 Specifications.

NOTE

If the cylinder diameter exceeds the specifications, the cylinder block may be oversized to 0.25 mm. Only one size of oversized pistons and rings are available for service. If the cylinder bore diameter exceeds specification by more than 0.25 mm, the cylinder block must be replaced.

Measuring Cylinder Bore Out-of-Round

1. Measure both the thrust and non-thrust cylinder diameter at 10 mm below the deck. Record your measurements.
2. Calculate the difference between the two measurements. The result will indicate out-of-round at the upper end of the cylinder.
3. Measure both the thrust and non-thrust cylinder diameter at 100 mm below the deck surface. Record your measurements.
4. Calculate the difference between the two measurements. The result will indicate out-of-round at the lower end of the cylinder.
5. Compare your results with the dimensions listed in the specifications, refer to 5 Specifications.

NOTE

If the cylinder diameter exceeds the specifications, the cylinder block may be oversized to 0.25 mm. Only one size of oversized pistons and rings are available for service. If the cylinder bore diameter exceeds specification by more than 0.25 mm, the cylinder block must be replaced.

Deck Flatness Inspection

1. Ensure the engine block decks are clean and free of gasket material.
2. Inspect the surface for any imperfections or scratches that could inhibit correct cylinder head gasket sealing.
3. Place a straight-edge diagonally across the cylinder block deck face surface.
4. Measure the clearance between the straight-edge and the cylinder block deck face using a feeler gauge at 4 points along the straight-edge.
5. If the warpage is less than 0.05 mm, the cylinder block deck surface does not require resurfacing.
6. If the warpage is between 0.05 ±0.20 mm or any imperfections or scratches that could inhibit correct cylinder head gasket sealing are present, the cylinder block deck surface requires resurfacing.
7. If resurfacing is required the maximum amount that can be removed is 0.25 mm.
8. If the cylinder block deck surface requires more than 0.25 mm material removal the block must be replaced.

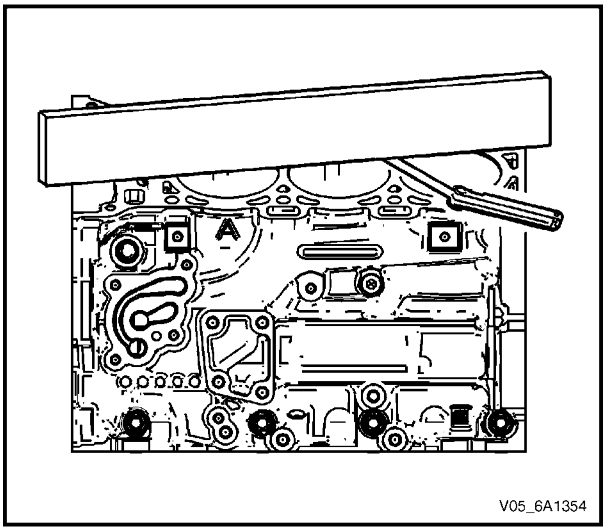

Figure 6A1 – 539

Reassemble

1 Install the cylinder block-to-cylinder head alignment dowels (1).

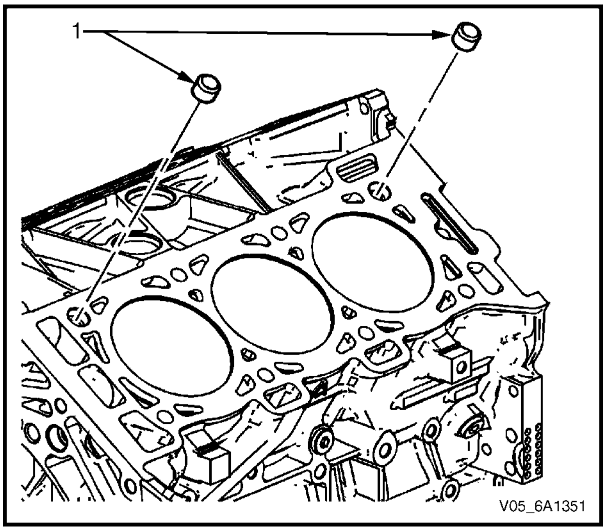

Figure 6A1 – 540

2 Install a new front oil gallery expansion plug (1).

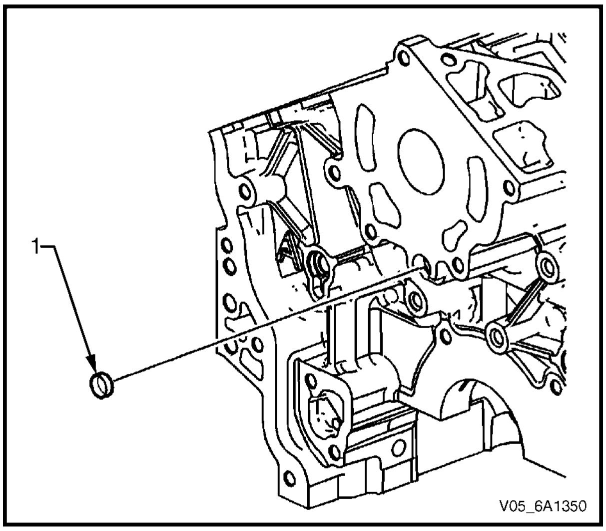

Figure 6A1 – 541

3 Install the cylinder block-to-transmission alignment dowels (1).

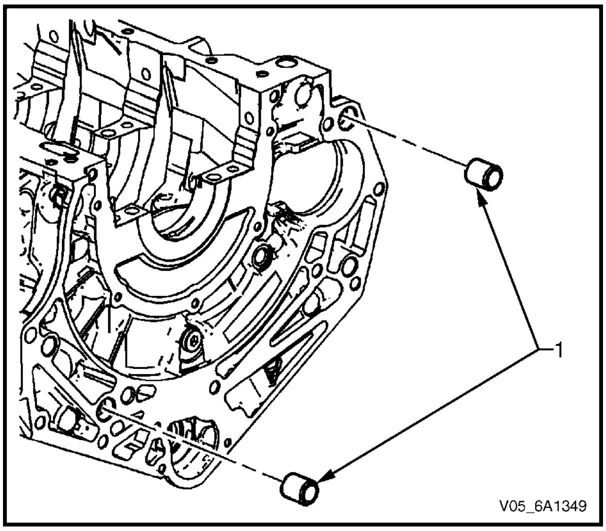

Figure 6A1 – 542

4 Place RTV sealant on new coolant expansion plugs (1) and install the new coolant expansion plugs.

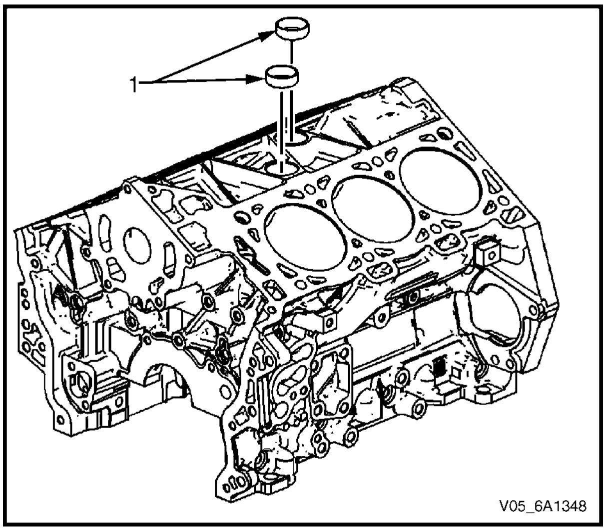

Figure 6A1 – 543

5 Install the left-hand side M20 oil gallery threaded plug (1) and tighten to the correct torque specification.

Left-hand side M20 cylinder block oil gallery threaded plug torque specification ....27.0 – 35.0 Nm

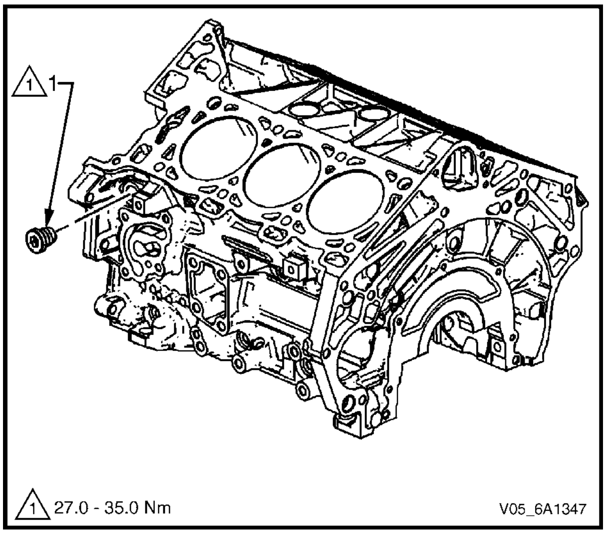

Figure 6A1 – 544

6 Install the left-hand side M14 coolant drain threaded plug (1) and tighten to the correct torque specification.

Left-hand side M14 cylinder block coolant drain threaded plug torque specification ....27.0 – 35.0 Nm

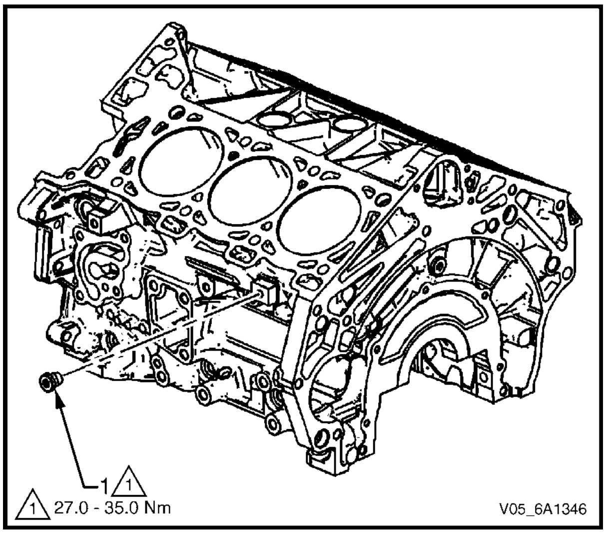

Figure 6A1 – 545

7 Install the M14 rear oil gallery threaded plug (1) and tighten to the correct torque specification.

M14 cylinder block rear oil gallery threaded plug torque specification ....27.0 – 35.0 Nm

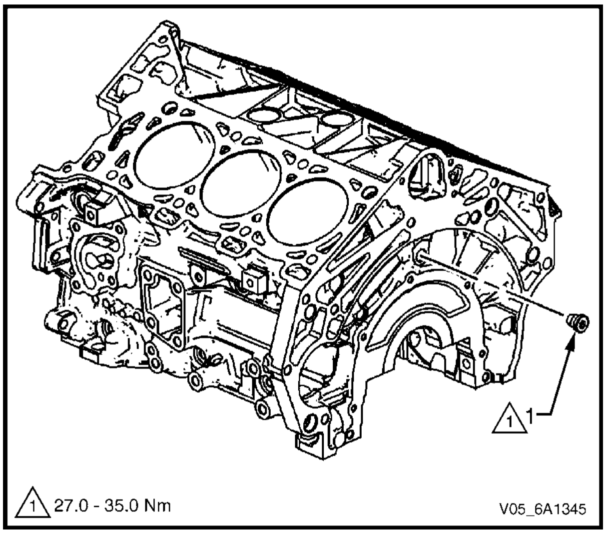

Figure 6A1 – 546

8 Install the right-hand side M14 coolant drain threaded plug (1) and tighten to the correct torque specification.

Right-hand side M14 cylinder block coolant drain threaded plug torque specification ....27.0 – 35.0 Nm

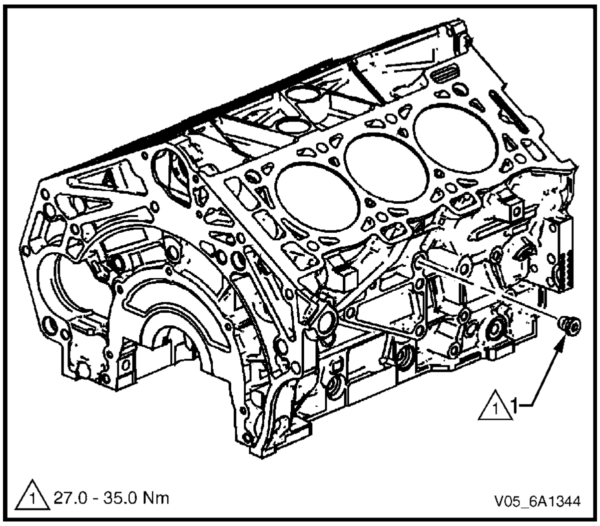

Figure 6A1 – 547

9 Install the right-hand side M14 oil gallery threaded plug (1) and tighten to the correct torque specification.

Right-hand side M14 cylinder block oil gallery threaded plug torque specification ....27.0 – 35.0 Nm

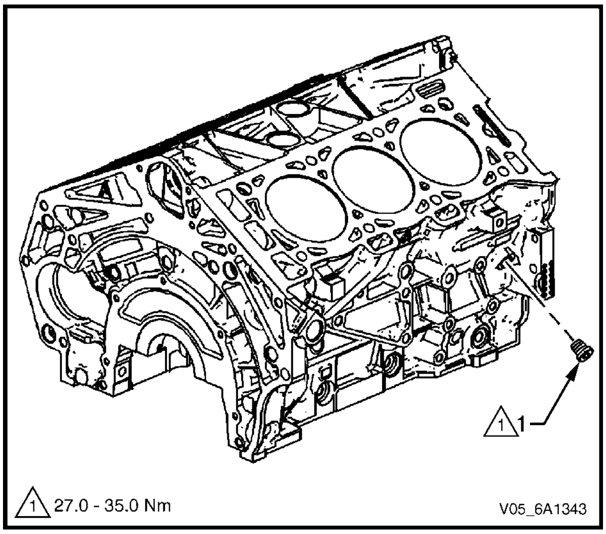

Figure 6A1 – 548

10 Install the cylinder block-to-oil pan alignment dowels (1).

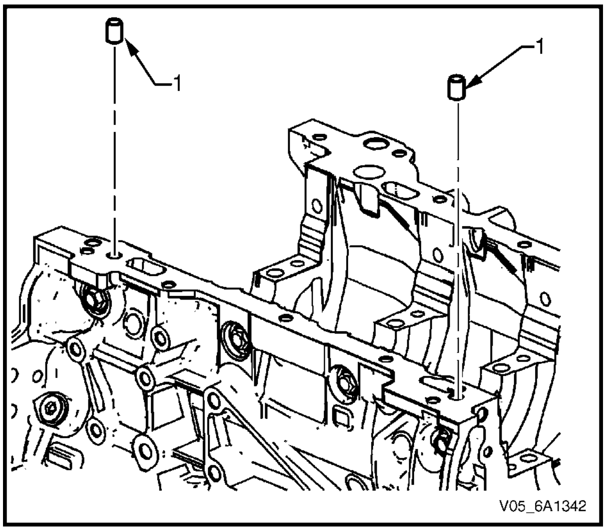

Figure 6A1 – 549

11 Install the new right-hand front oil pan rail oil gallery expansion plug (1).

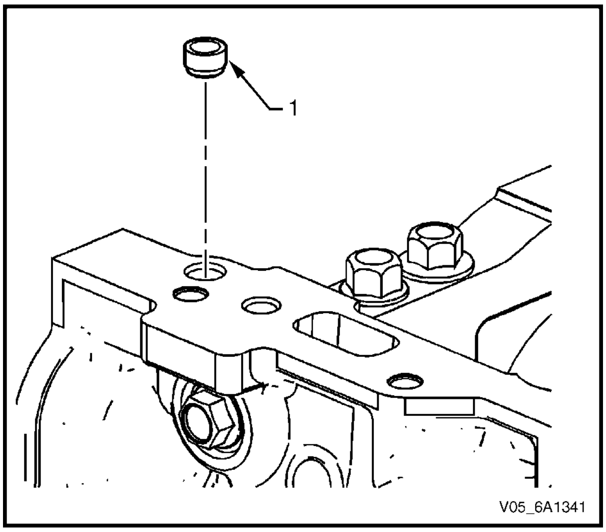

Figure 6A1 – 550

12 Install the oil jet (2), three places.

13 Install the oil jet attaching bolt (1), three places and tighten to the correct torque specification.

Oil jet attaching bolt torque specification ....8.0 – 12.0 Nm

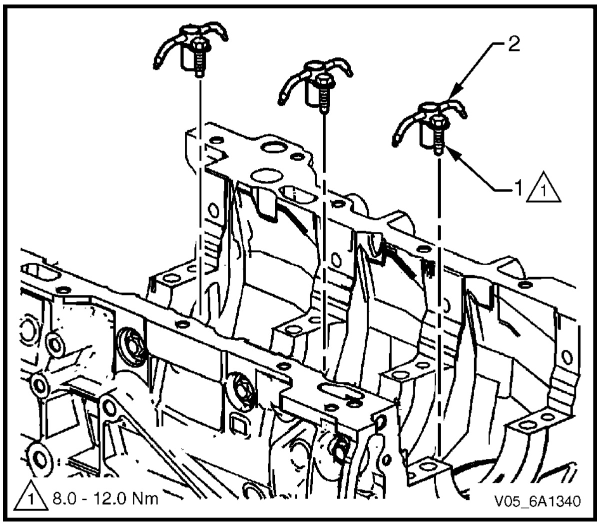

Figure 6A1 – 551

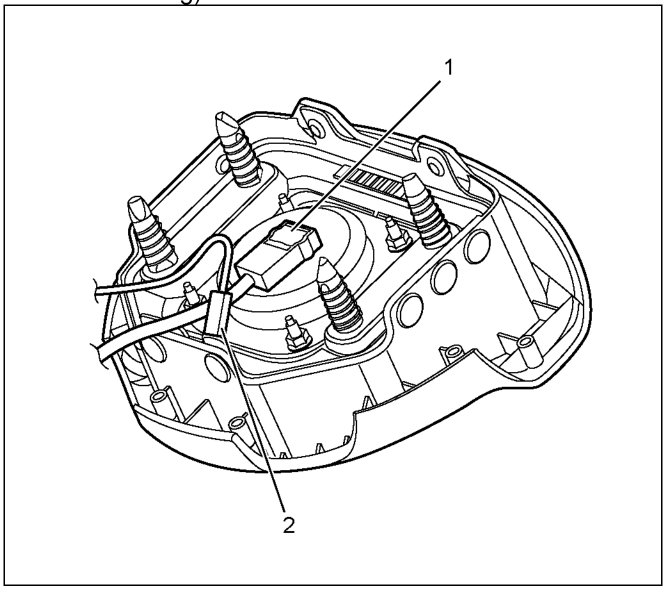
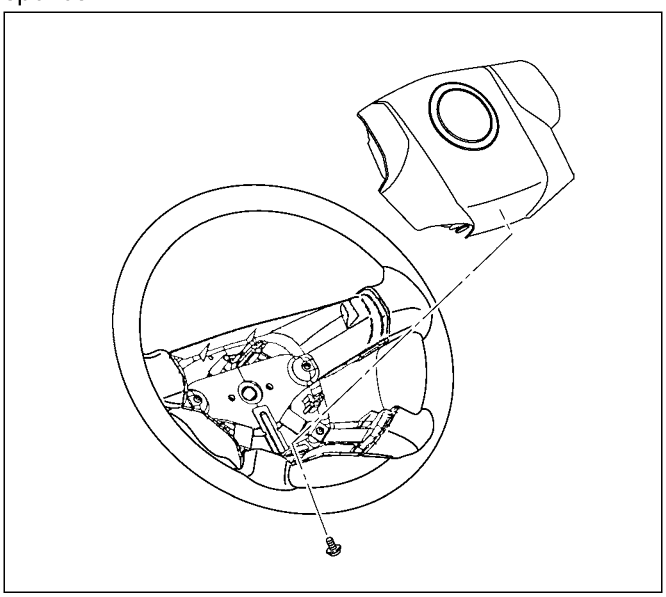
13. Disconnect the SRS air bag connector (1) and horn lead connector (2) located behind the air bag assembly and remove the air bag assembly (with SRS air bag).



RTW73BSH001101

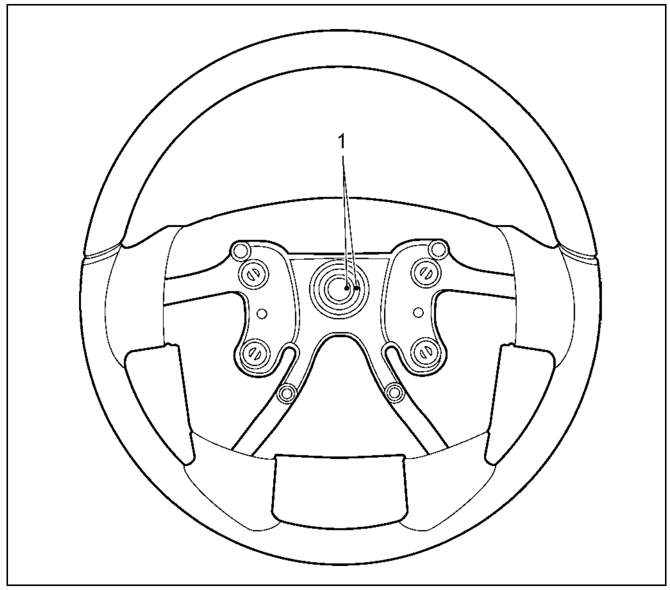
14. Remove the horn pad and the horn leads at the center of the wheel (without SRS air bag).

NOTE: It should be removed first from the bottom spokes.



RTW73BSH000601

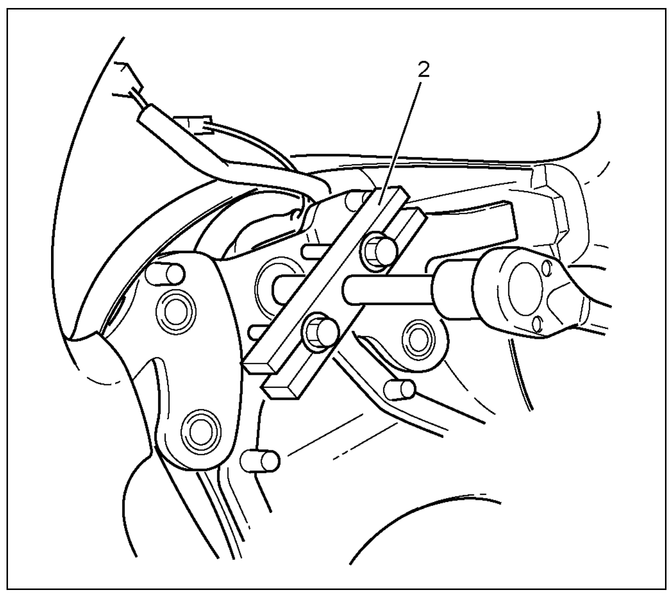
15. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position.



RTW73BSH000501

16. Move the front wheels to the straight ahead position, then use steering wheel remover 5-8521-0016-0 (2) to remove the steering wheel.

CAUTION: Never apply force to the steering wheel in the direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.



RTW73BSH001301

WARNING: THE INFLATOR MODULE SHOULD ALWAYS BE CARRIED WITH THE COVER AWAY FROM YOUR BODY AND SHOULD ALWAYS BE LAID ON A FLAT SURFACE WITH THE COVER SIDE UP. THIS IS NECESSARY BECAUSE A FREE SPACE IS PROVIDED TO ALLOW THE AIR CUSHION TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY MAY RESULT (with SRS air bag).

4.8 Thread Repairs

General Information

The thread repair process involves a solid, thin walled, self-locking, carbon steel, bushing type insert. During the insert installation process, the installation driver tool cold-rolls the bottom internal threads and expands the bottom external threads of the insert into the base material. This action mechanically locks the insert into place.

This Section describes the recommended method of repairing threads in three specific areas of the engine.

- general thread repair,
- cylinder block main bearing cap bolt hole thread repair, and
- cylinder head bolt hole thread repair.

For detailed descriptions of all thread specifications used refer to 4.9 Thread Repair Specifications.

The drill-bit and counter-bore tool from the thread repair kit, Tool No. J-42385-700 and J-42385-2000 are designed for use with either a suitable tap wrench or drill motor. Limited access and larger hole repair may process better using a tap wrench. An extension from Tool J 43965 may also be required to drive the thread repair tooling dependent on access to the hole being repaired. Use only a tap wrench when tapping the hole and during installation of the insert.

1 It is critical the drilling, counter boring and tapping of the hole to be repaired follows the same centreline (1) as the original hole.

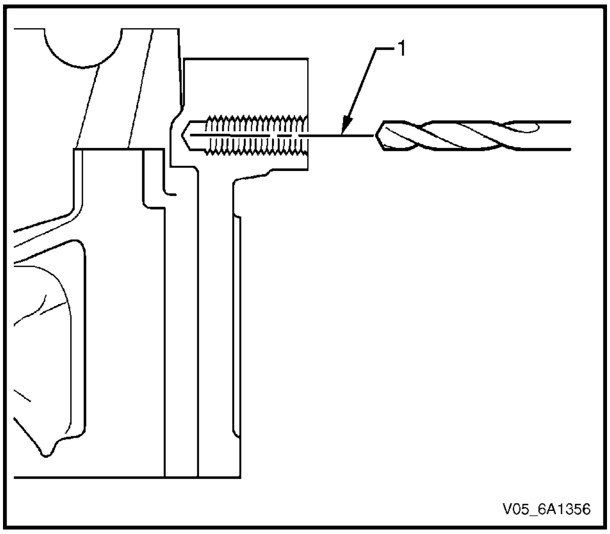


Figure 6A1 – 552

2 During the drilling and tapping of the hole being repaired, ensure the tooling is consistently machining perpendicular to the surface of the base material.

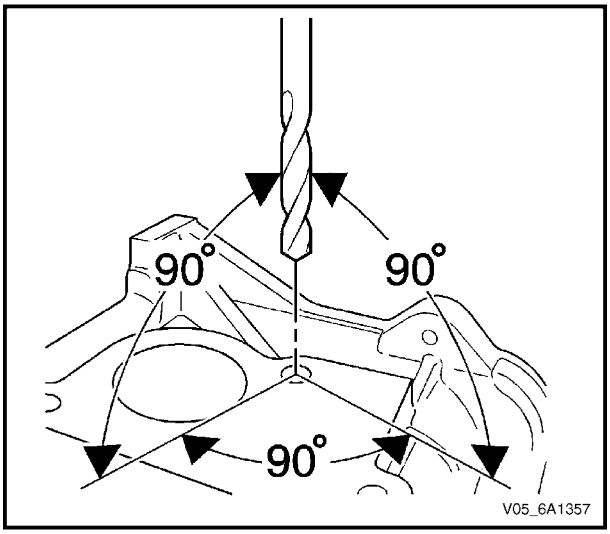

Figure 6A1 – 553

3 If the threaded hole being repaired has a base surface perpendicular to the hole centreline, tapping guides are available to aid in tapping the hole.

Tap Size	Tap Guide	Tap Size	Tap Guide	Tap Size	Tap Guide
-	J 42385	-	J 42385	-	J 42385
6 x 1.0	729	10 x 1.5	731	14 x 1.5	736
8 x 1.25	730	12 x 1.5	732	20 x 1.5	737

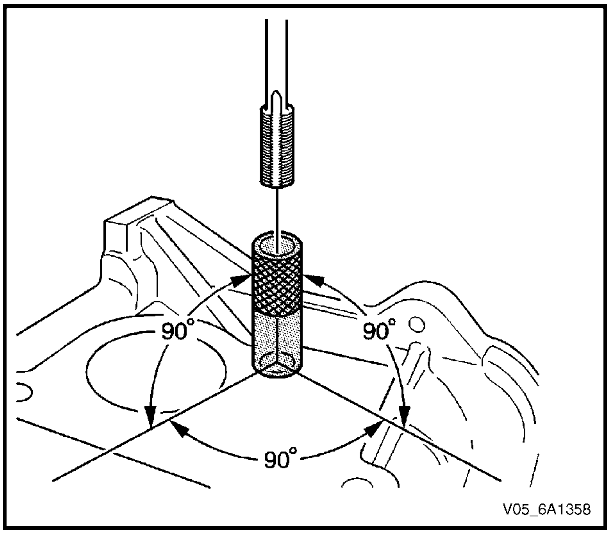

Figure 6A1 – 554

General Thread Repair

NOTE

The use of a cutting type fluid such as WD 40® or equivalent is recommended when performing the drilling, counter boring and tapping procedures

1 When installed to the correct depth, the flange (1) of the insert will be seated against the counter bore of the drilled/tapped hole and just below the surface (2) of the base material.

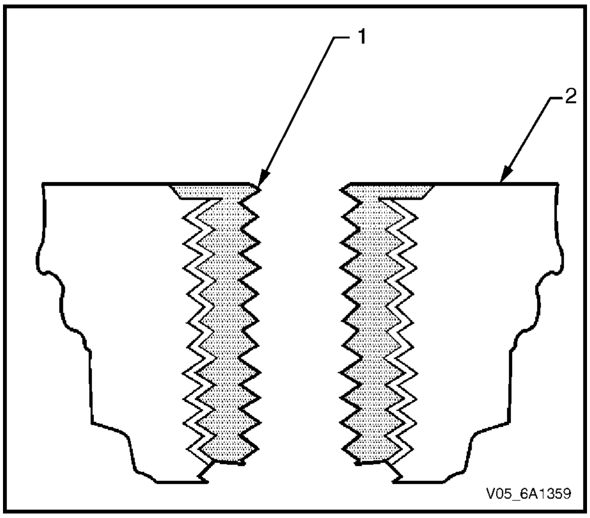

Figure 6A1 – 555

NOTE

During the drilling process, repeatedly remove the drill and clean the swarf from the hole and the flutes of the drill.

CAUTION

Do not drill any further than the original hole depth.

2 Drill out the threads of the damaged hole to the correct depth for the thread being repaired:

- M6 inserts require a minimum drill depth of 15 mm.
- M8 inserts require a minimum drill depth of 20 mm.
- M10 inserts require a minimum drill depth of 23.5 mm.

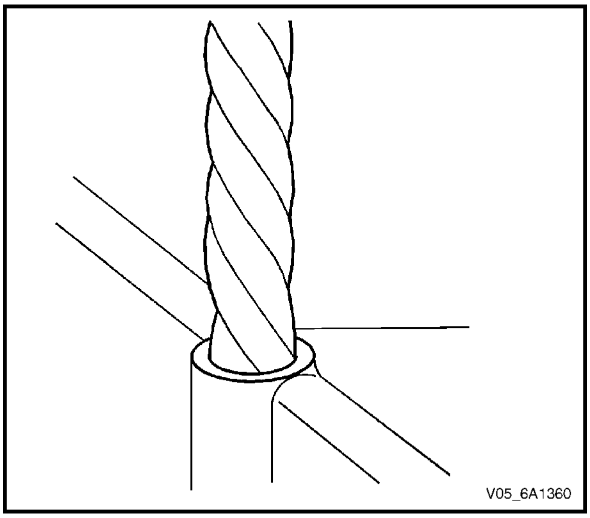

Figure 6A1 – 556

NOTE

All swarf must be removed from the drilled hole prior to tapping.

WARNING

Safety glasses must be worn when using compressed air.

3 Using compressed air, clean out any swarf.

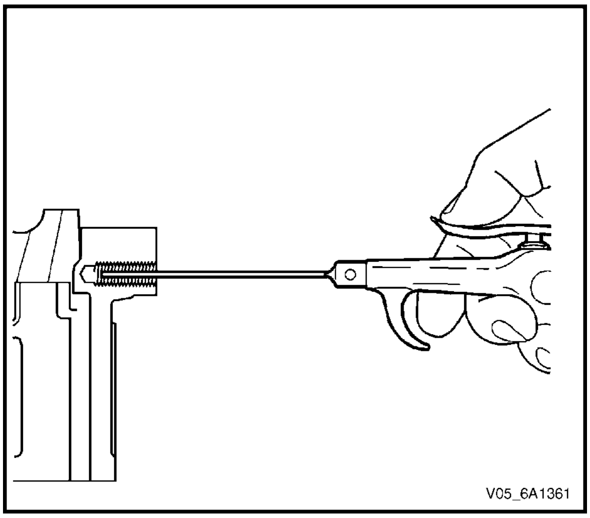

Figure 6A1 – 557

NOTE

A correctly counter bored hole will show a slight burnishing on the surface of the base material for 360 degrees around the drilled hole.

4 Counter bore the drilled hole to the full depth permitted by the tool (1).

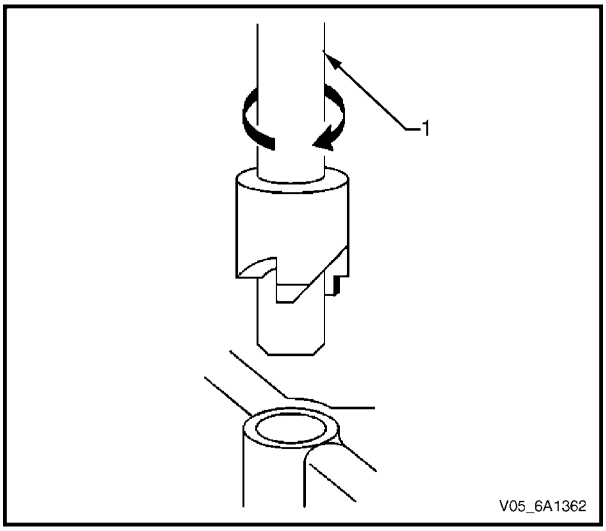

Figure 6A1 – 558

NOTE

All swarf must be removed from the drilled hole prior to tapping.

WARNING

Safety glasses must be worn when using compressed air.

5 Using compressed air, clean out any swarf.

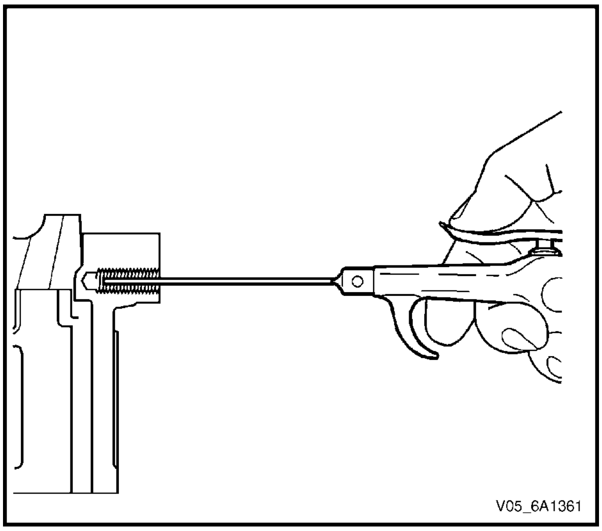

Figure 6A1 – 559

NOTE

- During the tapping process, repeatedly remove the tap and clean the swarf from the hole and the flutes of the tap.
- Ensure the tap has created full threads at least to the depth equal to the insert length.

6 Using a suitable tapping wrench, tap the threads of the drilled hole by hand only.

- M6 inserts require a minimum drill depth of 15 mm.
- M8 inserts require a minimum drill depth of 20 mm.
- M10 inserts require a minimum drill depth of 23.5 mm.

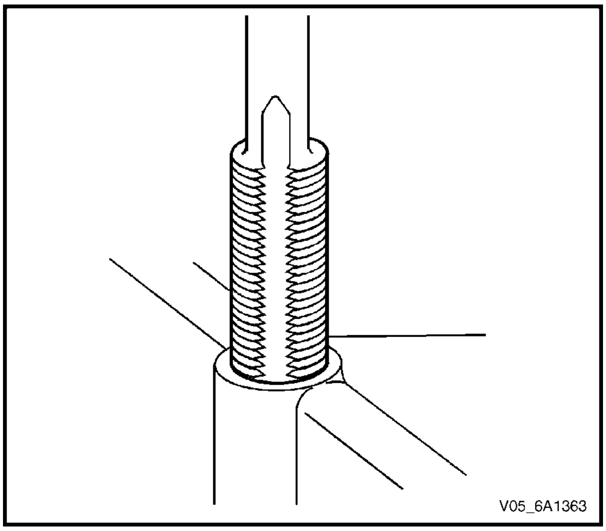

Figure 6A1 – 560

NOTE

All swarf must be removed from the tapped hole prior to insert installation.

WARNING

Safety glasses must be worn when using compressed air.

7 Using compressed air, clean out any swarf.

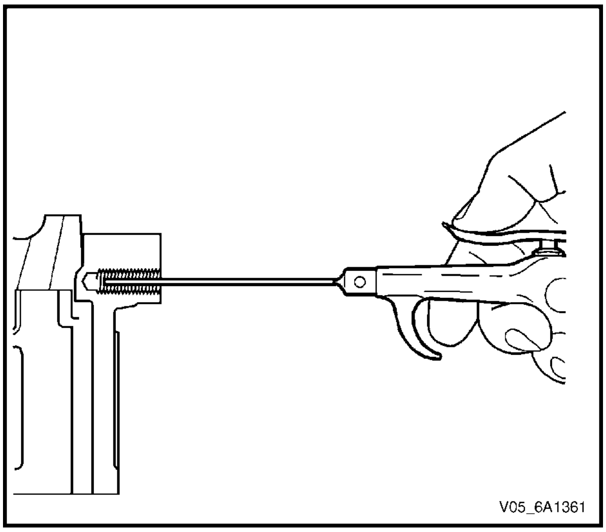

Figure 6A1 – 561

8 Spray a commercially available thread cleaner into the tapped hole.

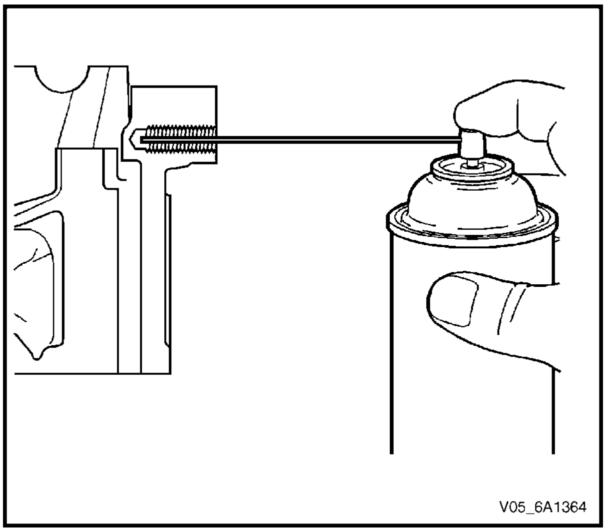

Figure 6A1 – 562

NOTE

All swarf must be removed from the tapped hole prior to insert installation.

WARNING

Safety glasses must be worn when using compressed air.

9 Using compressed air, clean out any swarf.

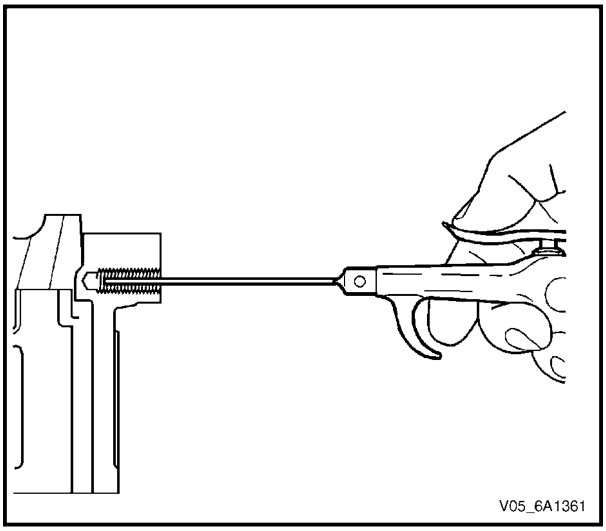

Figure 6A1 – 563

NOTE

Do not allow oil or other foreign material to contact the outside diameter (OD) of the insert.

10 Lubricate the threads of the driver installation tool (2) with the driver oil (1).

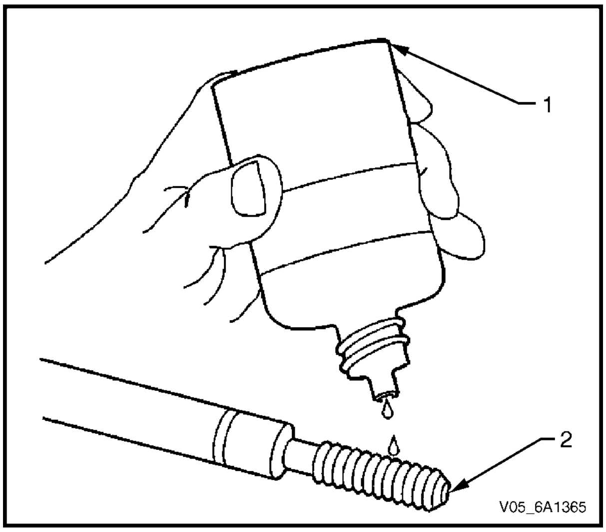

Figure 6A1 – 564

11 Install the insert (2) onto the driver installation tool (1).

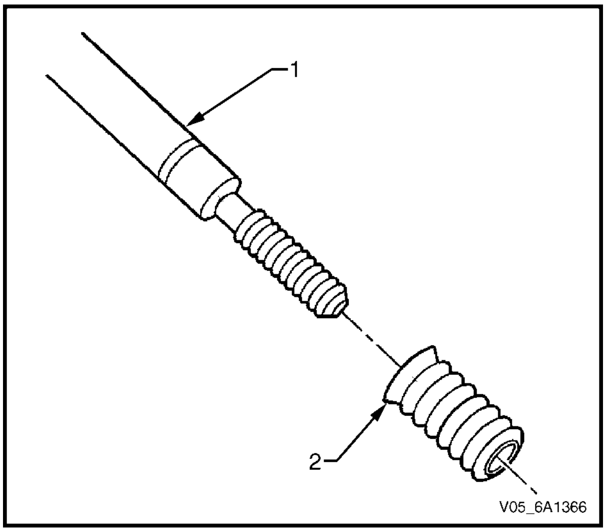

Figure 6A1 – 565

12 Apply thread lock sealant (1) such as Loctite 277® or equivalent to the insert OD threads (2).

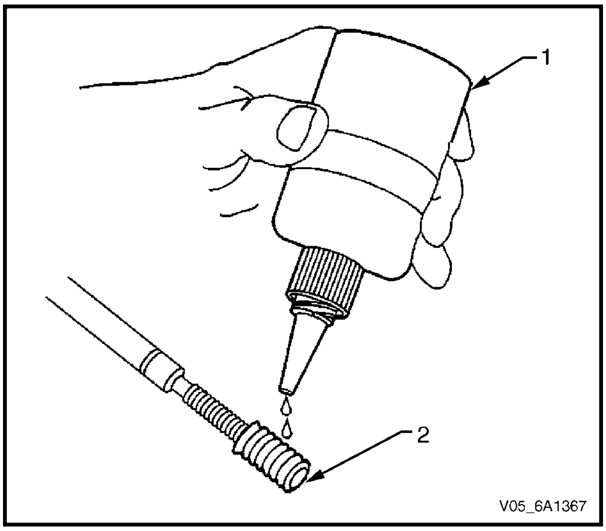

Figure 6A1 – 566

13 Install the insert (2) into the tapped hole by hand only.

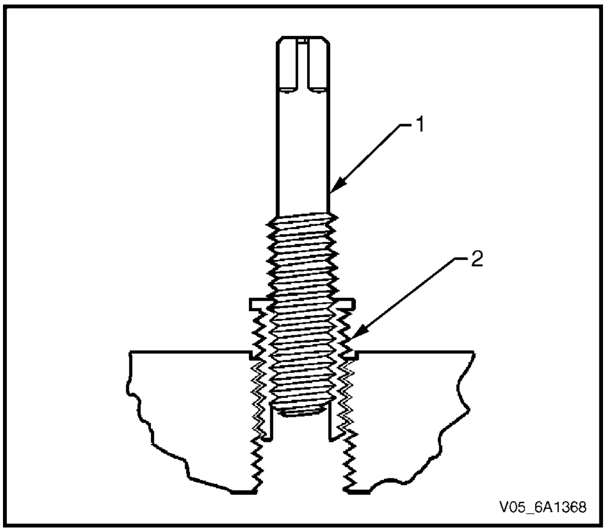

Figure 6A1 – 567

CAUTION

If the insert will not thread down until the flange contacts the counter bore surface, remove the insert immediately with a screw extracting tool and inspect the tapped hole for any remaining swarf and/or incorrect tapping.

14 Install the insert until the flange (2) of the insert contacts the counter bore surface.

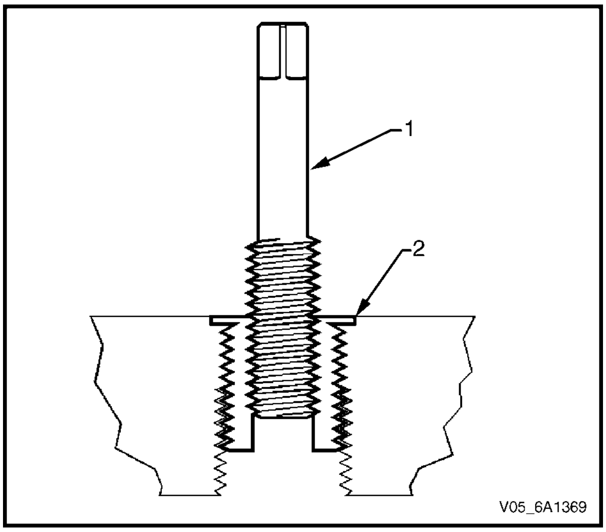

Figure 6A1 – 568

NOTE

The driver installation tool will tighten up before cutting completely through the insert. This is acceptable. The threads at the bottom of the insert are being formed and the insert is mechanically locking the insert into the base material threads.

15 Continue to rotate the driver installation tool (1) through the insert (2)

16 Remove the driver installation tool.

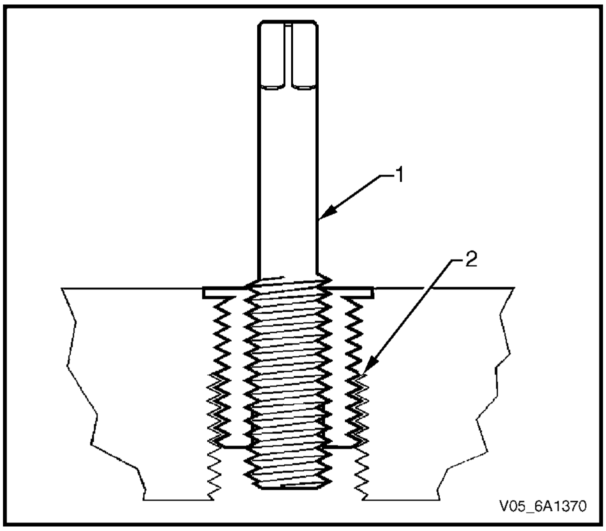

Figure 6A1 – 569

17 Inspect the insert for correct installation into the tapped hole. A correctly installed insert (1) will be either flush or slightly below flush with the surface of the base material (2).

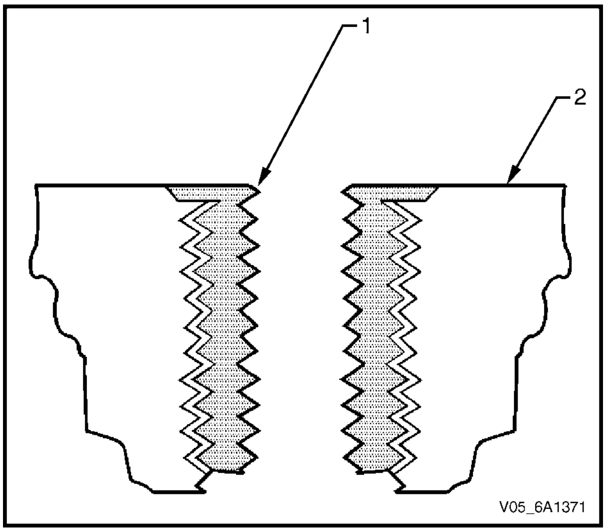

Figure 6A1 – 570

18 Any installed insert that restricts or blocks an oil or engine coolant passage (3) will need to have the oil or engine coolant passage drilled out (4) to the original size of the oil or engine coolant passage. After drilling the restriction or blockage, clean out any swarf and thread the installation driver tool through the insert again to remove any burrs caused by the drilling of the oil or engine coolant passage.

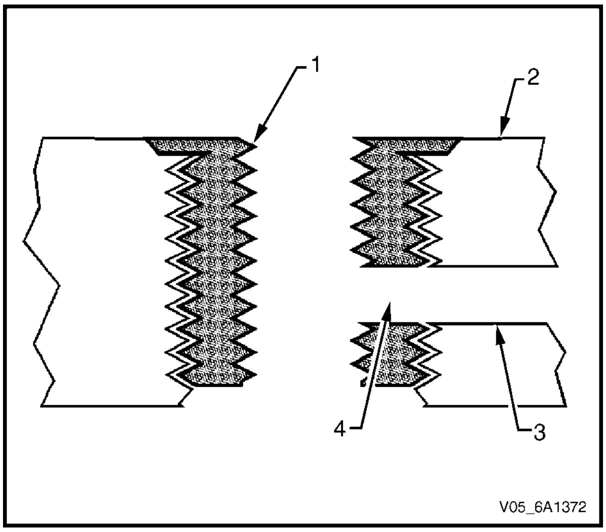

Figure 6A1 – 571

Main Bearing Cap Bolt Hole Thread Repair

The crankshaft main bearing bolt hole thread repair tools are in Tool No. J 42385-2000 and J 42385-700 which consist of the following:

- Drill (1) for outboard holes J 42385-702
- Tap (2) for outboard holes J 42385-703
- Installation driver (3) for outboard holes J 42385-704
- Bushing (4) for outboard holes J 42385-726
- Alignment pin (5) for outboard holes J 42385-727
- Bolts (6) for outboard holes J 42385-728
- Drill (7) for inboard holes J 42385-720
- Tap (8) for inboard holes J 42385-721
- Installation driver (9) for inboard holes J 42385-722
- Bushing (10) J 42385-713
- Alignment pin (11) J 42385-308
- Bolts (12) J 42385-734
- Fixture plate (13) J 42385-712

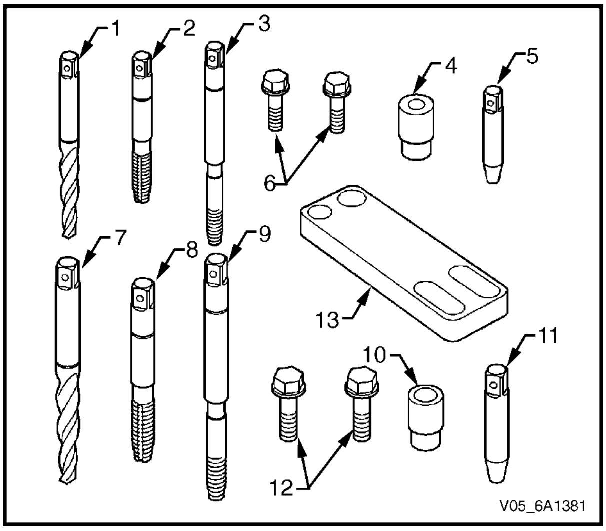

Figure 6A1 – 572

NOTE

- Ensure the fixture plate is installed during the machining and installation processes of the insert.
- The use of a cutting type fluid such as WD 40® or equivalent is recommended when performing the drilling, counter boring and tapping procedures.
- When installed to the correct depth, the flange of the insert will be seated against the counter bore of the drilled/tapped hole.

1. Position the fixture plate (3) with the bushing (2) installed over the crankshaft main cap bolt hole to be repaired.
2. Loosely install the fixture plate bolts (1) into the remaining crankshaft main cap bolt holes.

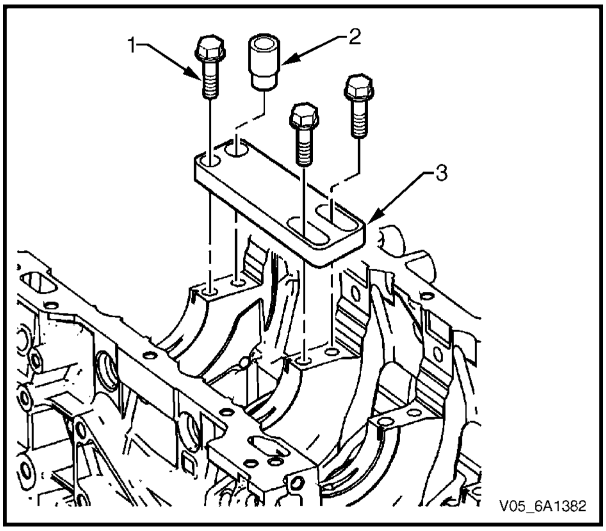

Figure 6A1 – 573

3 Position the alignment pin (1) through the bushing and into the crankshaft main cap bolt hole.

4 With the alignment pin in the desired crankshaft main cap bolt hole, tighten the fixture retaining bolts (2).

5 Remove the alignment pin.

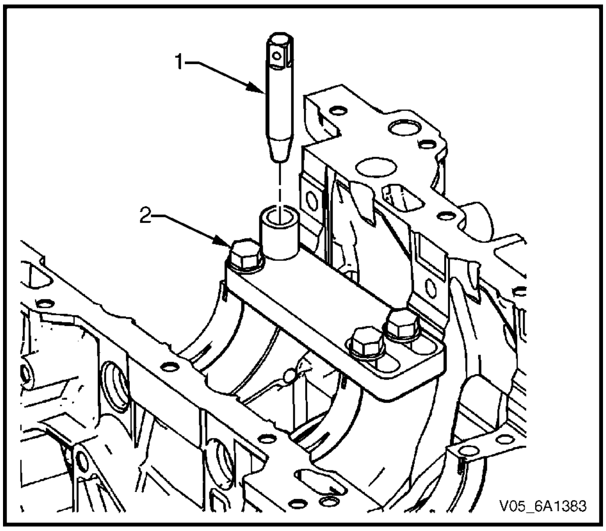

Figure 6A1 – 574

6 Drill the crankshaft main bolt hole until the mark (1) on the drill aligns with the top of the drill bushing (2).

NOTE

During the drilling process, repeatedly remove the drill and clean the swarf from the hole and the flutes of the drill.

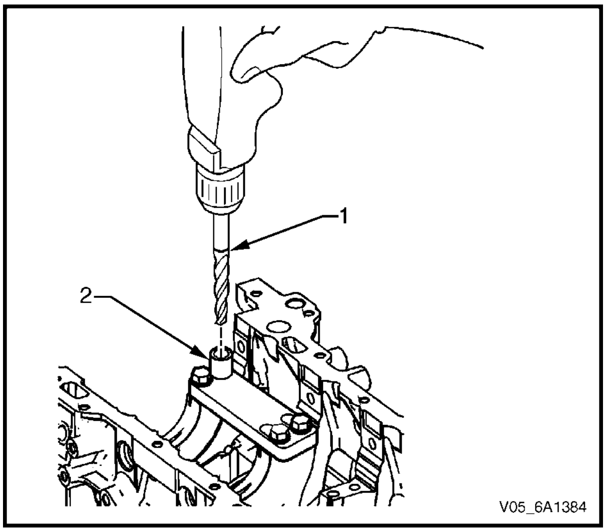

Figure 6A1 – 575

NOTE

All swarf must be removed from the drilled hole prior to tapping.

WARNING

Safety glasses must be worn when using compressed air.

7 Using compressed air, clean out any swarf.

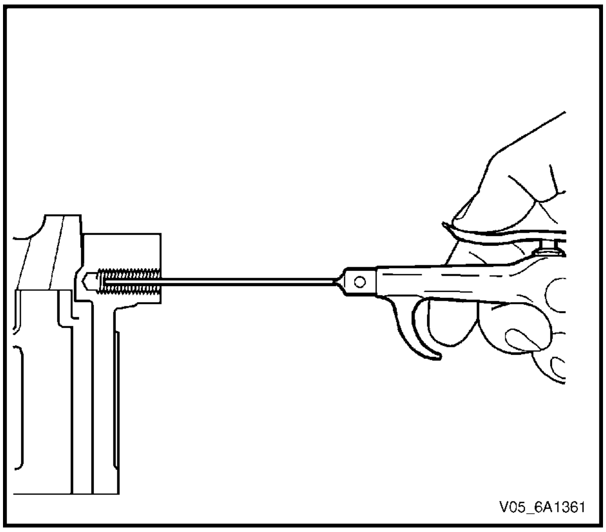

Figure 6A1 – 576

NOTE

- During the tapping process, repeatedly remove the tap and clean the swarf from the hole and the flutes of the tap.
- Ensure the tap has created full threads at least to the depth equal to the insert length.

CAUTION

Do not remove the fixture plate during the machining and installation processes of the insert.

8 Using a suitable tapping wrench, tap the threads of the drilled hole by hand only.

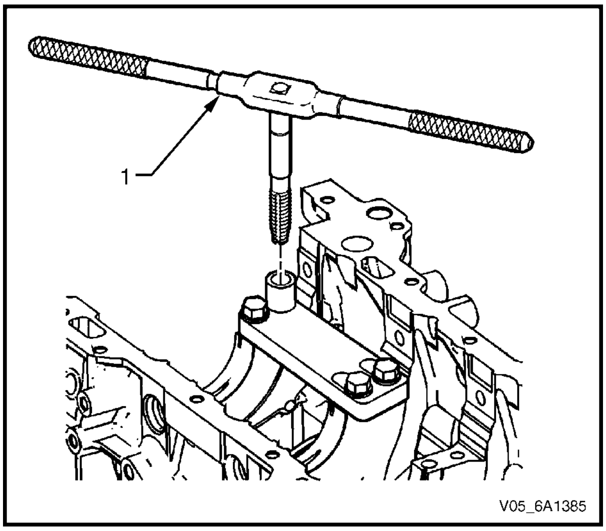

Figure 6A1 – 577

9 In order to tap the new threads for the insert to the correct depth, rotate the tap into the crankshaft main cap bolt hole until the mark (1) on the tap aligns with the top of the drill bushing (2).

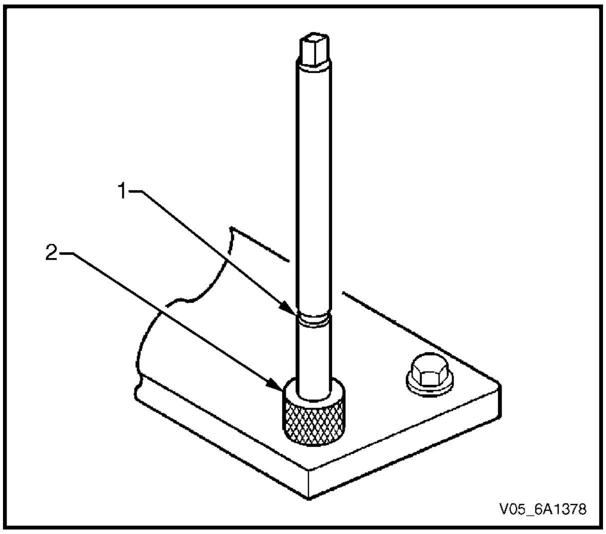

Figure 6A1 – 578

NOTE

All swarf must be removed from the tapped hole prior to insert installation.

WARNING

Safety glasses must be worn when using compressed air.

10 Using compressed air, clean out any swarf.

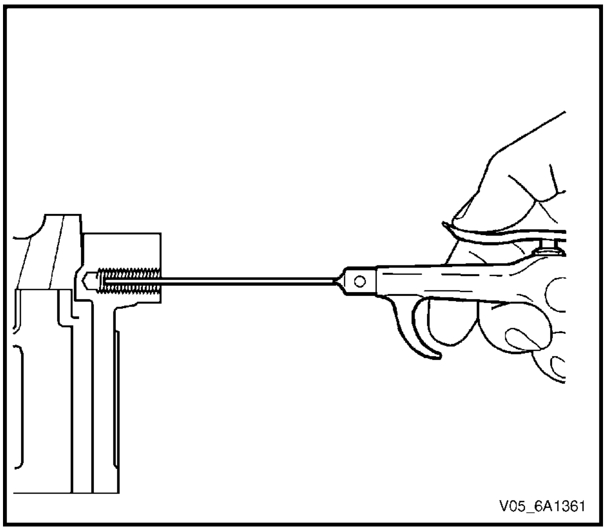

Figure 6A1 – 579

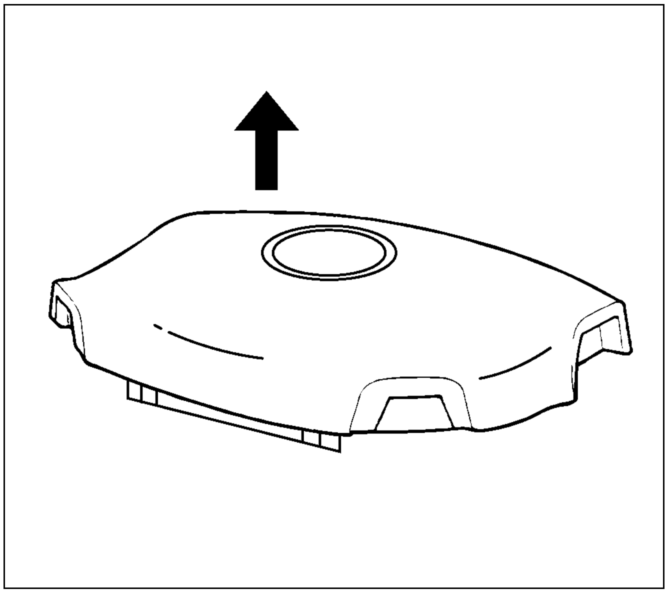
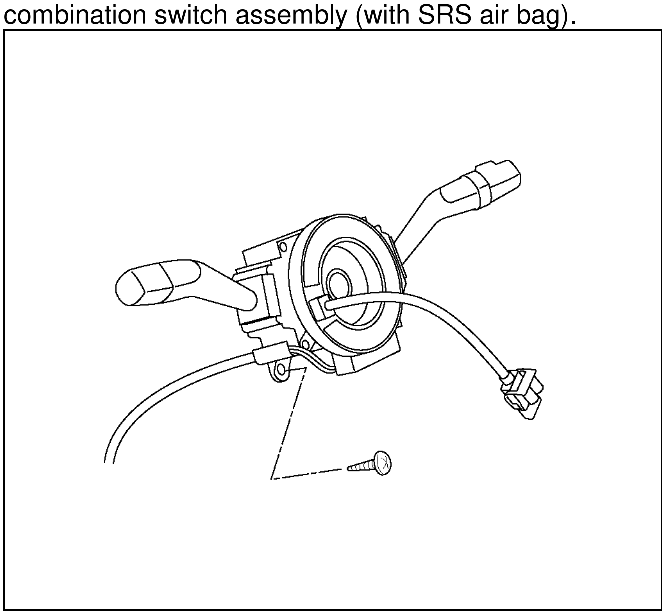


430R300007

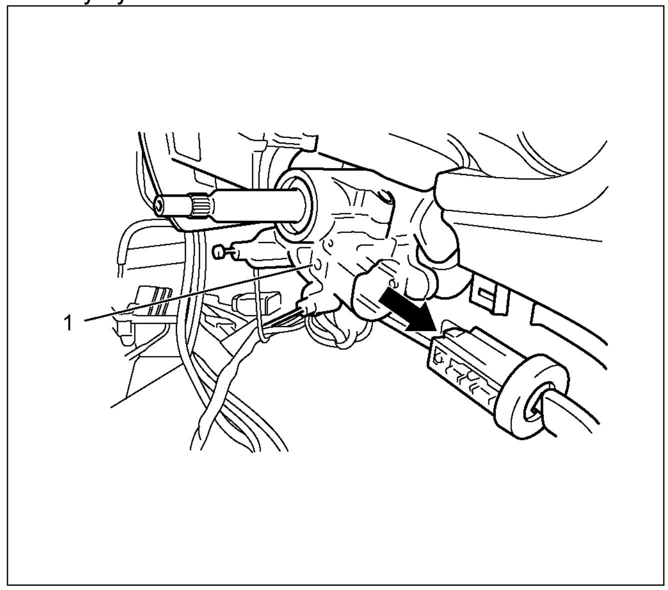
17. Remove steering column cover.
18. Disconnect the wiring harness connectors located under the steering column.
19. Remove the combination switch assembly with SRS coil.

NOTE: The SRS coil is a part of the combination switch assembly, which cannot be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly (with SRS air bag).



RTW73BSH001001

20. Turn the ignition switch to the ACC position.
21. Insert a pin (1) into the hole and push on it. Pull the key cylinder free.

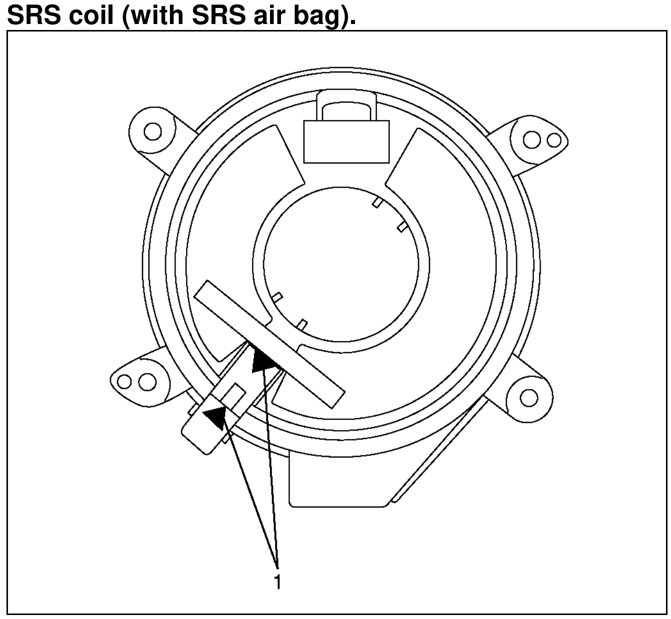


RUW53BSH000101

Installation

1. Install lock cylinder assembly.
2. Install the combination switch assembly with SRS coil (with SRS air bag).
3. Turn the SRS coil fully counterclockwise, return about 3 turns and align the neutral mark (with SRS air bag).

CAUTION: When turning the SRS coil fully counterclockwise, stop turning if resistance is felt. Further forced turning may damage the cable in the SRS coil (with SRS air bag).



826RW014

Legend

(1) Neutral mark

11 Spray a commercially available thread cleaner into the tapped hole.

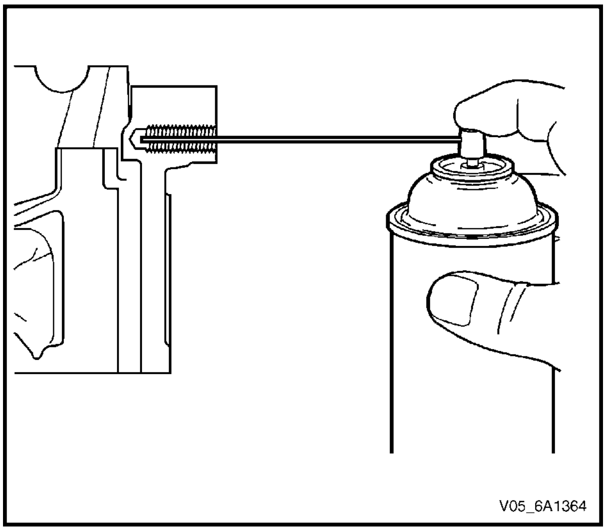


Figure 6A1 – 580

NOTE

All swarf must be removed from the tapped hole prior to insert installation.

WARNING

Safety glasses must be worn when using compressed air.

12 Using compressed air, clean out any swarf.

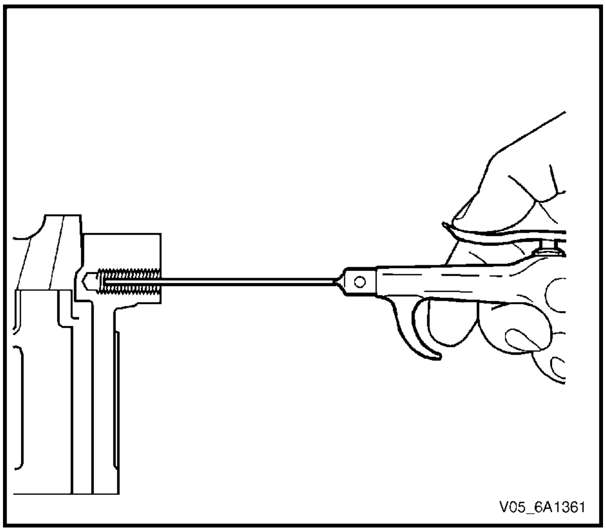

Figure 6A1 – 581

NOTE

- Do not remove the fixture plate, ensure the fixture plate is installed during the installation process of the insert.
- Do not allow oil or other foreign material to contact the outside diameter (OD) of the insert.

13 Lubricate the threads of the driver installation tool (2) with the driver oil (1).

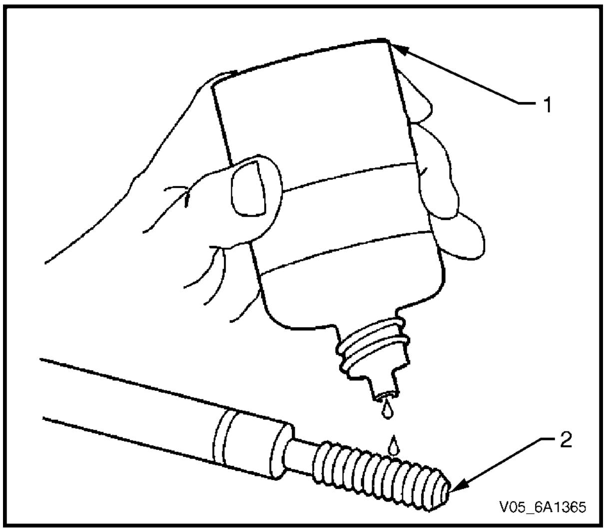

Figure 6A1 – 582

14 Install the insert (2) onto the driver installation tool (1).

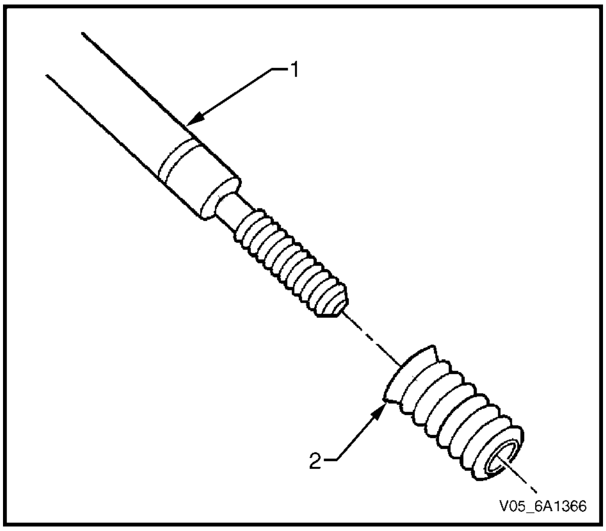

Figure 6A1 – 583

15 Apply thread lock sealant (1) such as Loctite 277® or equivalent to the insert OD threads (2).

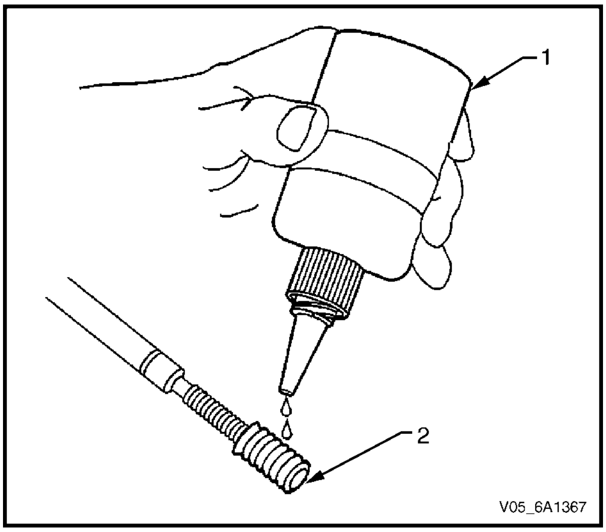

Figure 6A1 – 584

16 Install the insert and installation driver (1) to the tapped hole by hand only.

17 Start the insert into the threaded hole.

CAUTION

If the insert will not thread down until the flange contacts the counter-bored surface, remove the insert immediately with a screw extracting tool and inspect the tapped hole for any remaining swarf and/or incorrect tapping.

18 Install the insert until the flange of the insert contacts the counter-bored surface.

NOTE

The driver installation tool will tighten up before cutting completely through the insert. This is acceptable. The threads at the bottom of the insert are being formed and the insert is mechanically locking the insert into the base material threads.

19 Continue to rotate the driver installation tool through the insert.

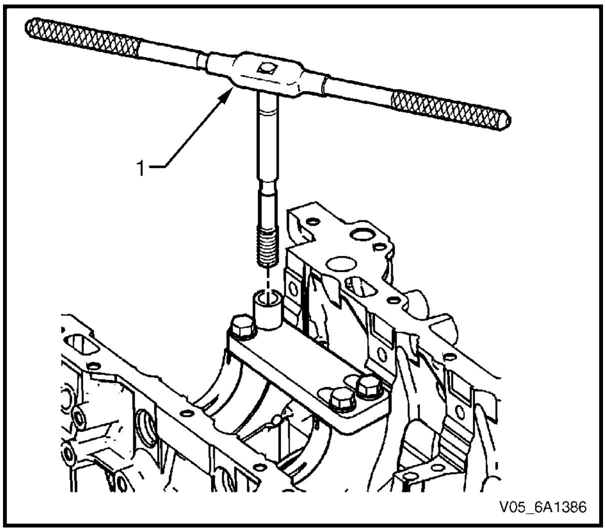

Figure 6A1 – 585

20 Rotate the driver installation tool until the mark (1) on the driver installation tool aligns with the top of the drill bushing (2).

21 Inspect the insert for correct installation into the tapped hole.

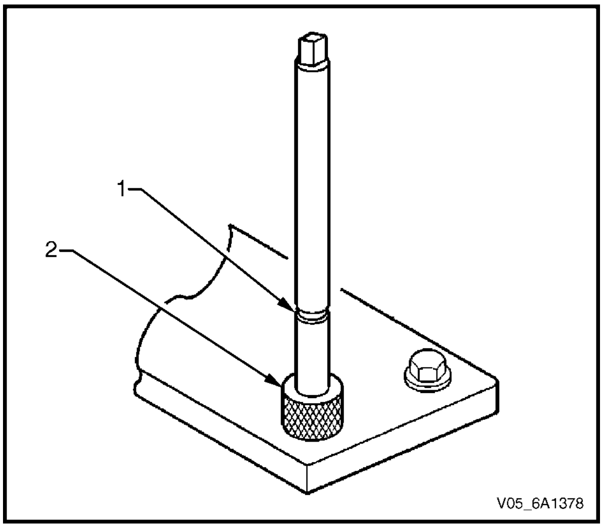

Figure 6A1 – 586

22 Remove the fixture plate bolts (1), bushing (2) and fixture plate (3).

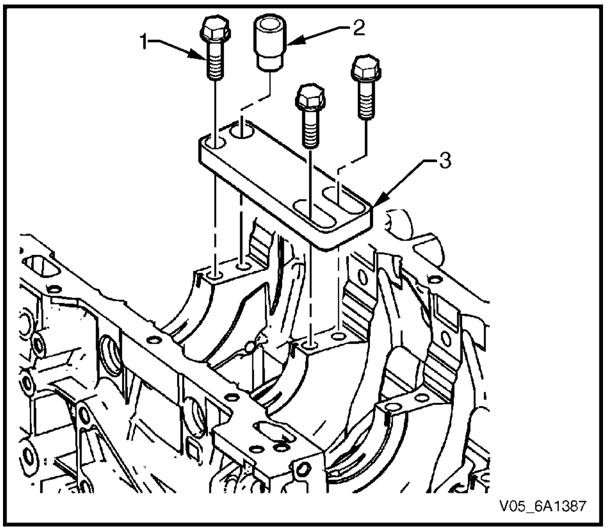

Figure 6A1 – 587

Cylinder Head Bolt Hole Thread Repair

The cylinder head bolt hole thread repair tools are in Tool No. J 42385-2000 and J 42385-700 which consist of the following:

- Drill (1) J 42385-723
- Tap (2) J 42385-724
- Installation driver (3) J 42385-725
- Alignment pin (4) J 42385-303
- Bushing (5) J 42385-302
- Bolts (6) J 42385-733
- Fixture plate (7) J 42385-401

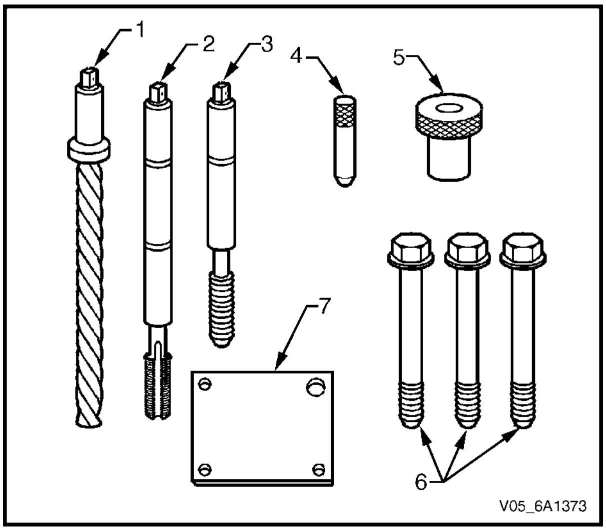

Figure 6A1 – 588

NOTE

- Ensure the fixture plate is installed during the machining and installation processes of the insert.
- The use of a cutting type fluid such as WD 40® or equivalent is recommended when performing the drilling, counter boring and tapping procedures.
- When installed to the correct depth, the flange of the insert will be seated against the counter bore of the drilled/tapped hole.

1 Position the fixture plate (3) with the bushing (1) installed over the cylinder head bolt hole to be repaired (4).

2 Loosely install the fixture plate bolts (2) into the remaining cylinder head bolt holes.

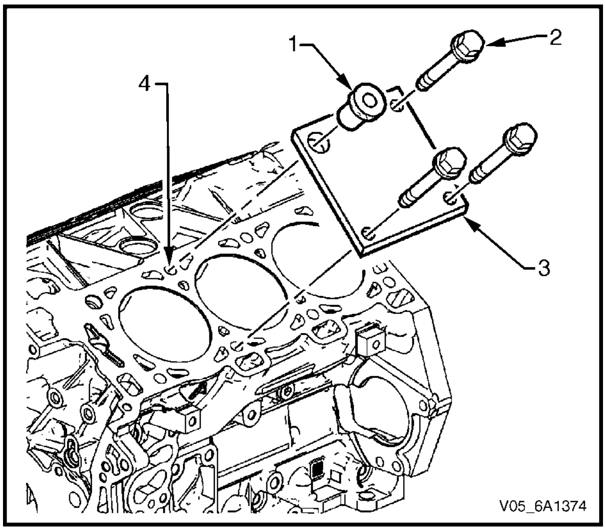

Figure 6A1 – 589

3 Position the alignment pin (1) through the bushing and into the cylinder head bolt hole.

4 With the alignment pin in the desired cylinder head bolt hole, tighten the fixture retaining bolts (2).

5 Remove the alignment pin.

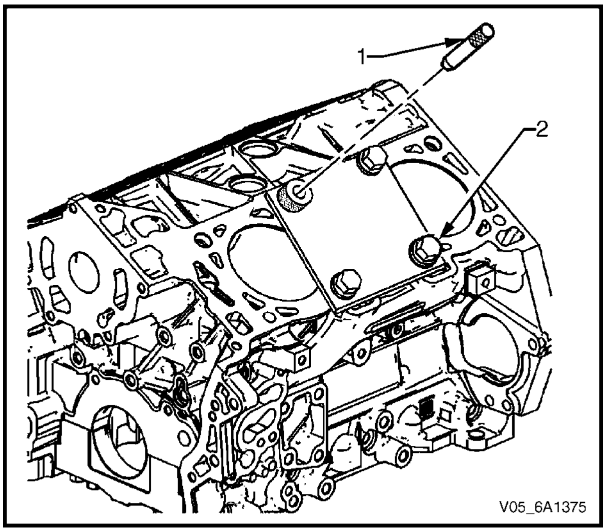

Figure 6A1 – 590

NOTE

During the drilling process, repeatedly remove the drill and clean swarf from the hole and the flutes of the drill.

6 Drill the hole until the stop collar contacts the top of the drill bushing.

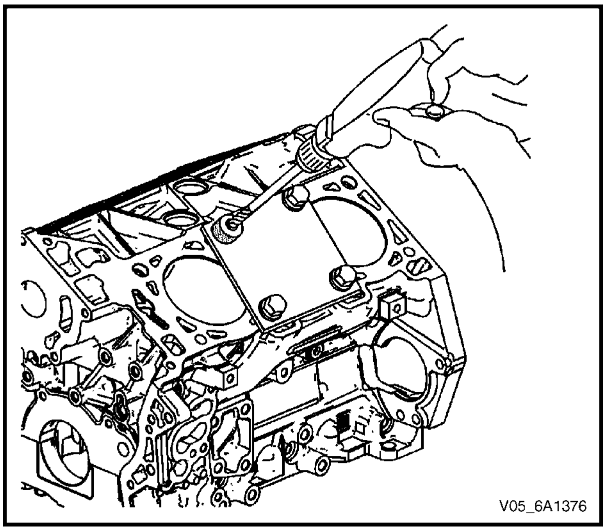

Figure 6A1 – 591

NOTE

All swarf must be removed from the drilled hole prior to tapping.

WARNING

Safety glasses must be worn when using compressed air.

7 Using compressed air, clean out any swarf.

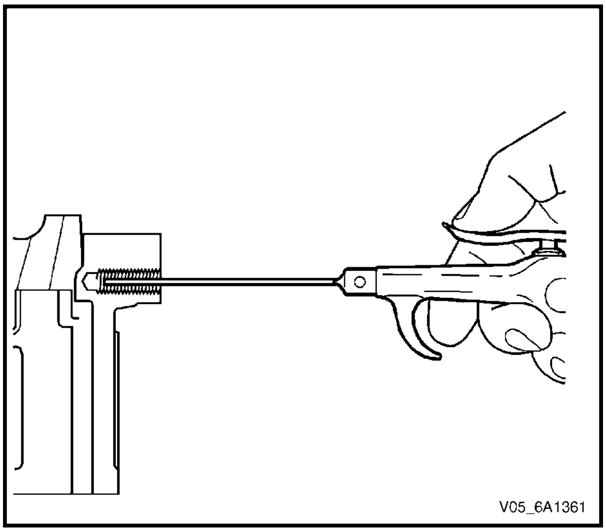

Figure 6A1 – 592

CAUTION

Do not remove the fixture plate during the machining and installation processes of the insert.

NOTE

- During the tapping process, repeatedly remove the tap and clean swarf from the hole and the flutes of the tap.
- Ensure the tap has created full threads at least to the depth equal to the insert length.

8 Using a suitable tapping wrench, tap the threads of the drilled hole by hand only.

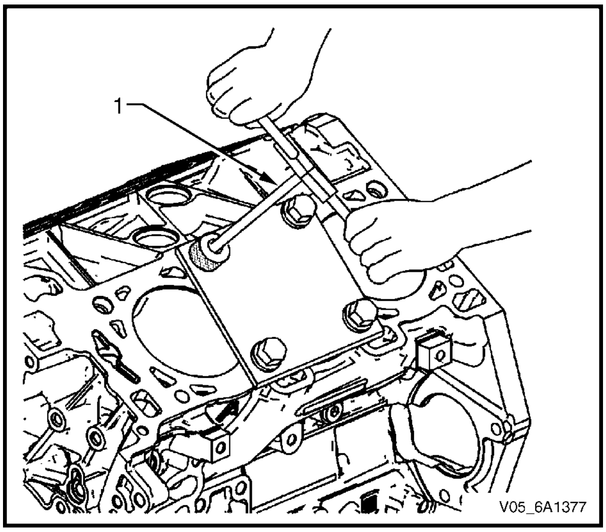

Figure 6A1 – 593

9 In order to tap the new threads for the insert to the correct depth, rotate the tap into the cylinder head bolt hole until the mark (1) on the tap aligns with the top of the drill bushing (2).

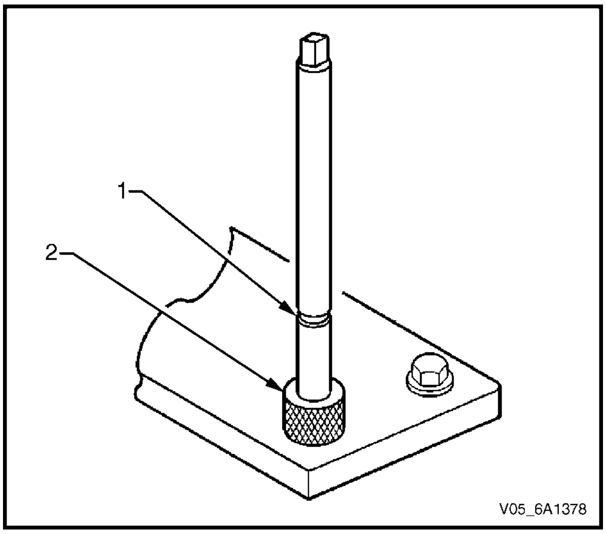

Figure 6A1 – 594

NOTE

Remove the fixture plate prior to installing the insert with the installer tool.

10 Remove the bushing (1) and fixture plate bolts (2) from the cylinder block (4) and remove the fixture plate (3).

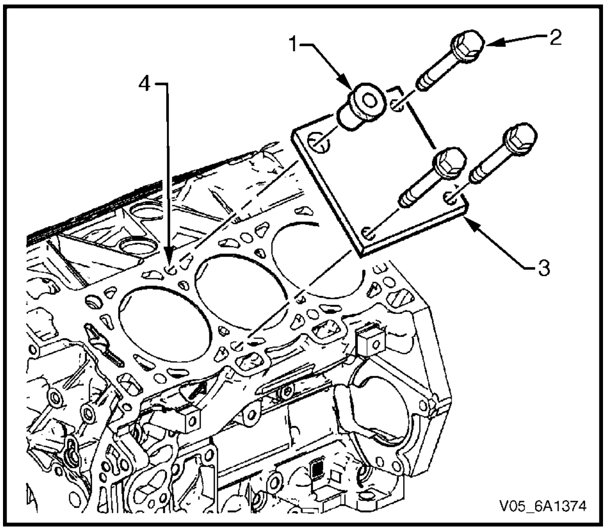

Figure 6A1 – 595

NOTE

All swarf must be removed from the tapped hole prior to insert installation.

WARNING

Safety glasses must be worn when using compressed air.

11 Using compressed air, clean out any swarf.

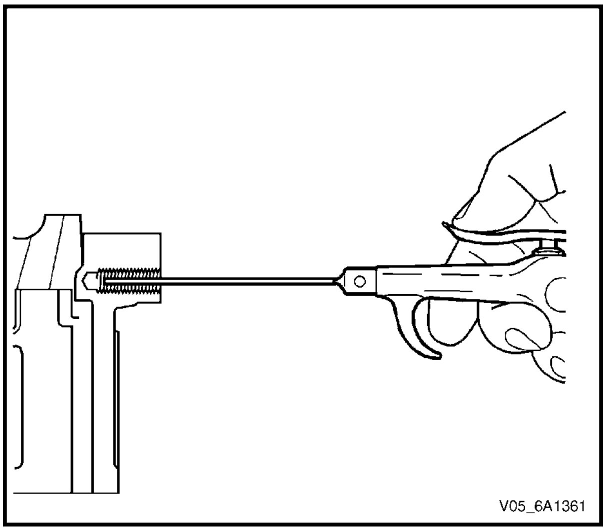

Figure 6A1 – 596

12 Spray a commercially available thread cleaner into the tapped hole.

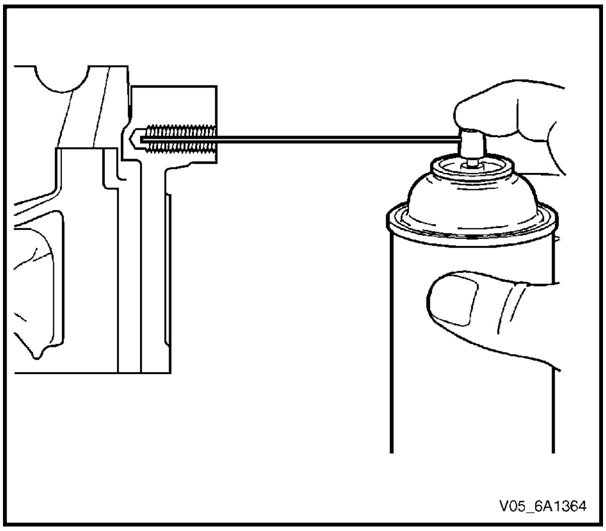

Figure 6A1 – 597

NOTE

All swarf must be removed from the tapped hole prior to insert installation.

WARNING

Safety glasses must be worn when using compressed air.

13 Using compressed air, clean out any swarf.

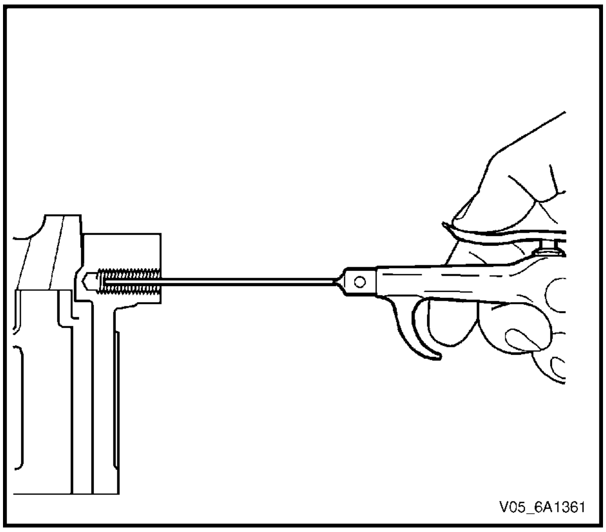

Figure 6A1 – 598

NOTE

Do not allow oil or other foreign material to contact the outside diameter (OD) of the insert.

14 Lubricate the threads of the driver installation tool (2) with the driver oil (1).

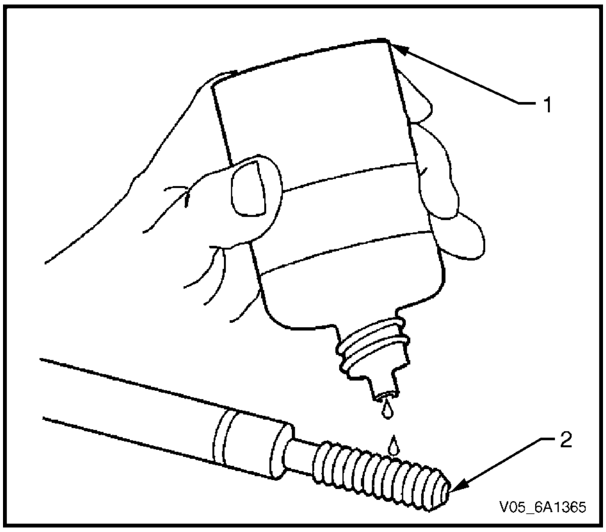

Figure 6A1 – 599

15 Install the insert (2) onto the driver installation tool (1).

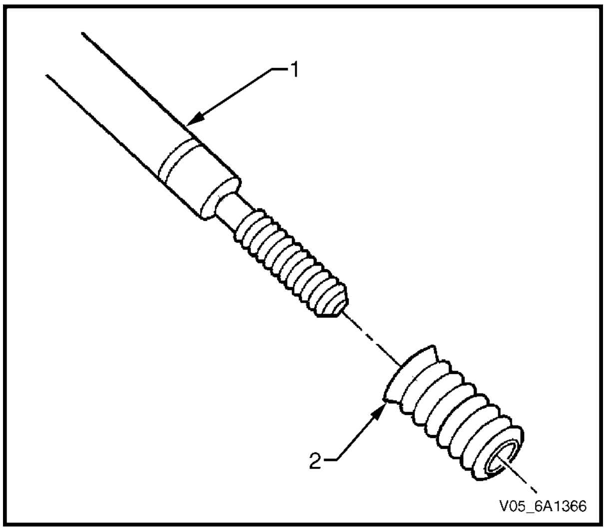

Figure 6A1 – 600

16 Apply thread lock sealant (1) such as Loctite 277® or equivalent to the insert OD threads (2).

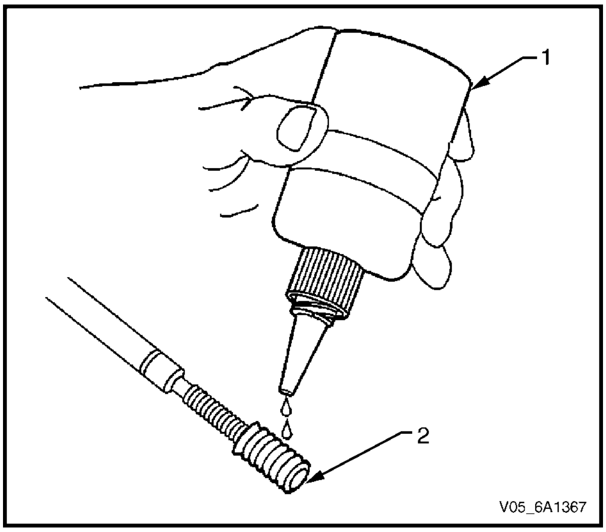

Figure 6A1 – 601

17 Install the insert and installation driver (1) into the tapped hole by hand only.

18 Start the insert into the threaded hole.

CAUTION

If the insert will not thread down until the flange contacts the counter-bored surface, remove the insert immediately with a screw extracting tool and inspect the tapped hole for any remaining swarf and/or incorrect tapping.

19 Install the insert until the flange of the insert contacts the counter-bored surface.

NOTE

The driver installation tool will tighten up before cutting completely through the insert. This is acceptable. The threads at the bottom of the insert are being formed and the insert is mechanically locking the insert into the base material threads.

20 Continue to rotate the driver installation tool through the insert.

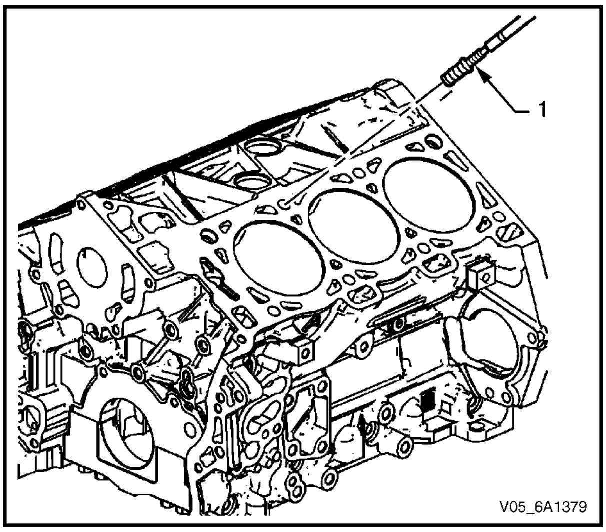

Figure 6A1 – 602

21 In order to completely form the new threads in the insert, rotate the driver installation tool through the insert until the mark on the driver installation tool (1) aligns with the surface of the engine block deck (2).

22 Inspect the insert for correct installation into the tapped hole.

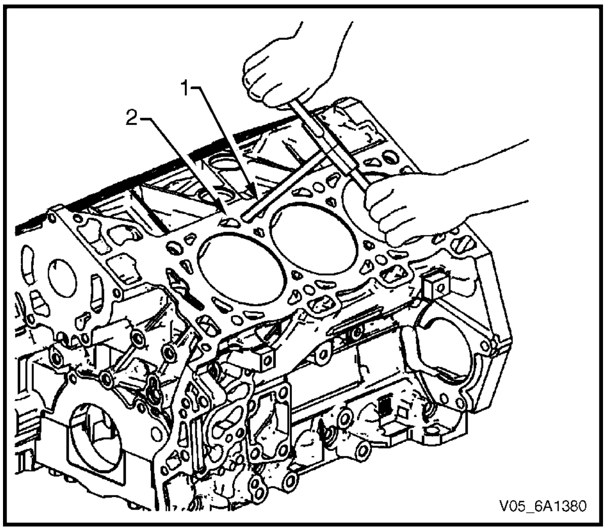

Figure 6A1 – 603

RECOMMENDED FLUIDS AND LUBRICANTS (For EUROPE)

In order to obtain maximum performance and longest service life from your ISUZU vehicles, it is very important to select and use correctly the best lubricants and diesel fuels.
When lubricating, be sure to use ISUZU genuine lubricants or recommended lubricants listed below, according to the maintenance schedule for each vehicle model.

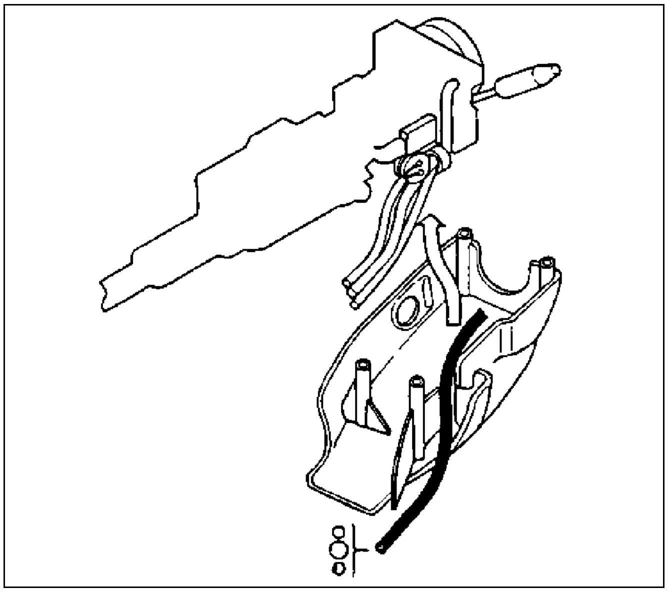
LUBRICATION/FLUID	GRADE		
	API	ACEA	OTHER
Diesel engine crankcase		B2/B3 E2/E3	
Manual transmission Transfer case		B2/B3 E2/E3	
Differential Shift on the fly system (GL-5 only)	**GL-5**		**BESCO GEAR OIL SH (80W-90, 90, 140) (ISUZU GENUINE)** **BESCO SHIFT ON THE FLY (75W-90) (ISUZU GENUINE)** THURBAN GL-5 EP (80W-90, 85W-140) (CALTEX) SPIRAX A (140) (SHELL) TRANSELF TYPE B (80W-90, 85W-140) (ELF) TRANSMISSION TM (80W-90, 85W-140) (TOTAL) EPX90 (90)(CASTROL) DYNA DRIVE (80W-90) (CASTROL) ENERGEAR HYPO (90) (BP) ENERGEAR EP (80W-90) (BP)
Differential (Limited Slip Differential) (GL-5 only)	**GL-5**		**BESCO GEAR OIL LSD (140) (ISUZU GENUINE)** GEAR OIL LSD (90) (CALTEX) SPIRAX A LS 90 (90) (SHELL) TRANSELF TYPE BLS (90) (ELF) TRANSMISSION DA (85W-90) (TOTAL) HYPOY LSX (90) (CASTROL) ENERGEAR LS-M (90) (BP)
Automatic transmission			MOBIL ATF 3309
Power steering			DEXRON® III
Propeller shaft sliding yoke Universal joint (General purpose grease in Molybdenum)			NLGI #2 or #3 multi purpose type grease containing molybdenum disulfide
Engine cooling system			Good quality ethylene glycol antifreeze or GM spec. 6033-M or equivalent

NOTE:
* If GL-5 Limited Slip Differential Lubricant is not available, use GL-5 Lubricant mixed with 1 bottle (118ml) of Limited Slip Differential Lubricant additive (Parts No. 8-01052-358-0) or equivalent.

FLUID	TYPE
Clutch and brake fluid reservoir	**Besco brake fluid (For light duty)** Hydraulic brake fluid SAE J1703 FMVSS 116 DOT.3 grade

DIESEL FUEL/APPLICABLE STANDARD	
JIS (JAPANESE INDUSTRIAL STANDARD)	Based on K2204 GAS OIL
DIN (DEUTSCHE INDUSTRIE NORMEN)	Based on EN590: 1997L
SAE (SOCIETY OF AUTOMOTIVE ENGINEERS)	Based on SAE J-313C
BS (BRITISH STANDARD)	Based on BS EN590: 1997

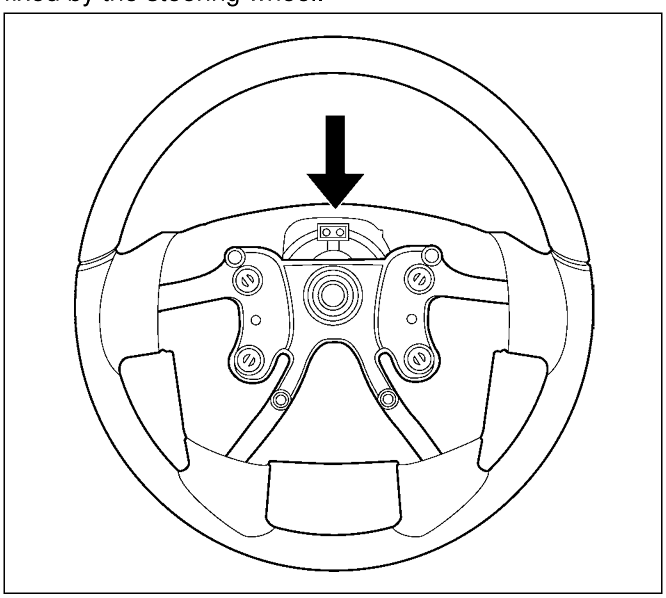
NOTE:
Use the applicable standard or equivalent for diesel fuels.



825RS048

4. Install the driver knee bolster assembly.
5. Install the steering lower cover and engine hood opening lever.
6. Install the steering wheel and align the setting marks. Refer to the adjustment method in case a mark has not been applied in this section.

NOTE: Confirm SRS and horn harness connector is fixed by the steering wheel.



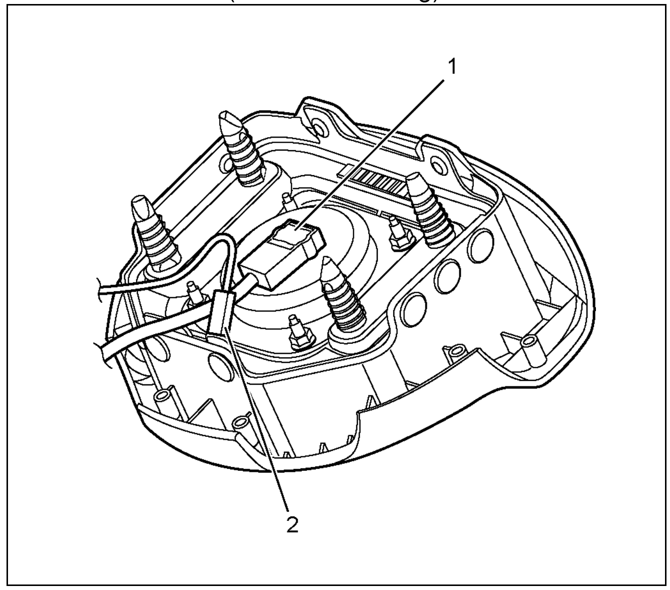
RTW73BSH000701

CAUTION: Never apply force to the steering wheel in the direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

7. Tighten the steering wheel fixing nut to the specified torque.

   Torque: 35 N·m (3.6 kgf·m/26 lb·ft)

8. Support inflator module and carefully connect the SRS connector (1) and horn lead (2), then install inflator module (with SRS air bag).



RTW73BSH001101

9. Connect the horn leads at center of wheel (without SRS air bag).

NOTE: The horn leads (1) are passed along the top of the bracket (2).
(Plastic type steering wheel only)

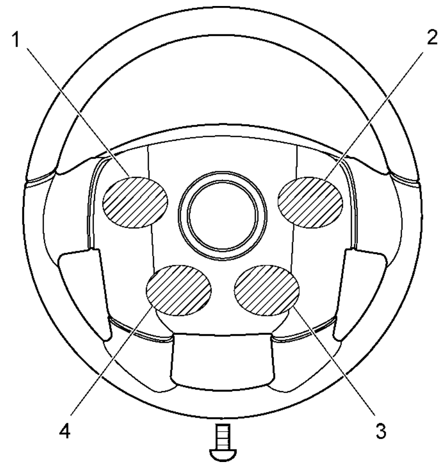
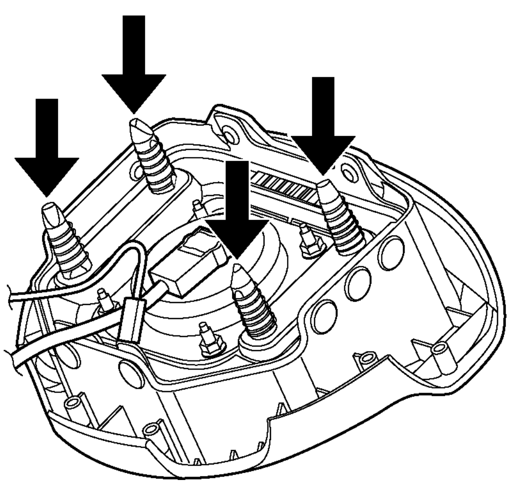
10. Push the horn pad at areas 1-4.
    Tighten the horn pad fixing screw to the specifed torque (without SRS air bag).
    Torque: 3 N·m (0.3 kgf·m/26 lb·in)

NOTE: A horn pad should not be struck during attachment.

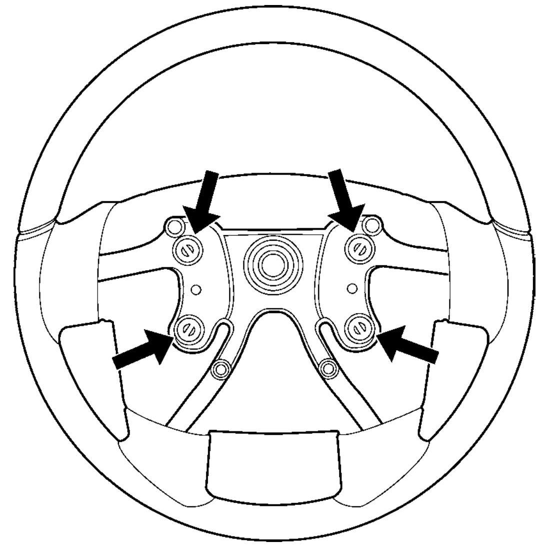


RTW73BSH000201

11. Align each snap stud of driver air bag to the holes on steering wheel (with SRS air bag).

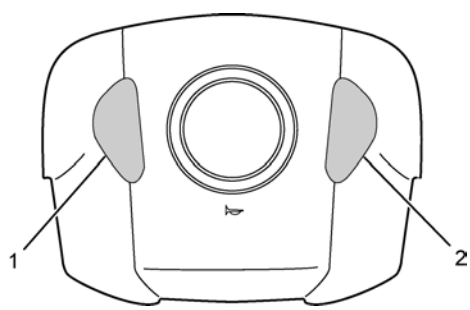


RTW73BSH001201



RTW73BSH000401

12. Push the SRS air bag at area-1 (1) and area-2 (2). At that time confirm the audible noise of each stud. (with SRS air bag)



RTW73BSH000301

13. Enable the SRS (Refer to "Enabling the SRS" in this section) (with SRS air bag).
14. Install driver knee bolster (reinforcement).
15. Install instrument panel lower cover, then install the engine hood opening lever.
16. Connect the yellow 2-way SRS connector located under the steering column (with SRS air bag).
17. Connect the battery "-" terminal cable (with SRS air bag).

System Inspection (with SRS air bag)

Turn the ignition switch to "ON" while watching warning light.

The light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

5 Specifications

General

Engine Type V6
Bank Angle .... 60°
Displacement .... 3.6 litre (3,565 cm3)
Bore .... 94 mm
Stroke .... 85.6 mm
Compression Ratio 10.2:1
Cranking Speed at 40°C .... 80 r.p.m.
Spark Plug Gap .... 1.1 mm
Firing Order 1-2-3-4-5-6

Cylinder Block

Cylinder Bore Diameter .... 93.992 – 94.008 mm
Cylinder Out-of-Round – Production Maximum .... 0.013 mm
Crankshaft Main bearing bore Diameter .... 72.867 – 72.881 mm
Cylinder Head Deck Surface Flatness .... 0.05 mm

Crankshaft

Connecting Rod Journal Diameter .... 55.992 – 56.008 mm
Connecting Rod Journal Out-of-Round .... 0.005 mm
Connecting Rod Journal Taper .... .0.005 mm
Connecting Rod Journal Width (Production) .... 22.000 mm
Connecting Rod Journal Width (Service limit) .... 21.920 – 22.080 mm
Crankshaft End Play .... 0.100 – 0.330 mm
Crankshaft Main Bearing Clearance .... 0.010 – 0.060 mm
Crankshaft Main Journal Diameter .... .67.992 – 68.008 mm
Crankshaft Main Journal Out-of-Round .... 0.005 mm
Crankshaft Main Journal Taper .... .0.005 mm
Crankshaft Main Journal Width, #2, 4 (Production) .... 24 mm
Crankshaft Main Journal Width, #2, 4 (Service) .... 23.900 – 24.100 mm
Crankshaft Main Journal Width, #3 (Production) .... 24.400 mm
Crankshaft Main Journal Width, #3 (Service) .... 24.360 – 24.440 mm
Crankshaft Main Journal Thrust Wall Runout .... 0.000 – 0.040 mm
Crankshaft Main Journal Thrust Wall Square .... 0.000 – 0.010 mm
Crankshaft Rear Flange Runout .... 0.025 mm
Crankshaft Reluctor Ring Runout - Maximum .... 1.500 mm
Crankshaft Thrust Bearing Clearance .... 0.076 – 0.305 mm
Crankshaft Thrust Surface Runout .... 0.040 mm
Crankshaft Thrust Surface – Height Diameter .... 95.000 mm

Connecting Rod

Connecting Rod Length - Bore Centre-to-Centre .... 150.400 mm
Connecting Rod Bore Diameter - Bearing End .... 59.620 – 59.636 mm
Connecting Rod Bore Diameter - Pin End .... 24.007 – 24.021 mm
Connecting Rod Width .... 21.775 mm
Connecting Rod Side Clearance .... 0.095 – 0.355 mm
Connecting Rod Bearing Clearance .... 0.010 – 0.070 mm

Piston

Piston Diameter	93.956 – 93.974 mm
Piston Pin Bore Diameter	24.005 – 24.009 mm
Piston Ring Groove Width - First (Top) Compression Ring	1.220 – 1.240 mm
Piston Ring Groove Width - Second Compression Ring	1.510 – 1.530 mm
Piston Ring Groove Width - Oil Control Ring	2.510 – 2.530 mm
Piston to Bore Clearance	0.026 – 0.052 mm

Piston Pin

Piston Pin Diameter	23.997 - 24.000 mm
Piston Pin Length	60.600 – 61.100 mm
Piston Pin Clearance to Connecting Rod Bore	0.007 – 0.024mm
Piston Pin Clearance to Piston Pin Bore	0.004 – 0.012mm

Piston Rings

Piston Ring to Groove Clearance:

• First (Top) Compression Ring	0.030 – 0.065 mm
• Second Compression Ring	0.015 – 0.060 mm
• Oil Control Ring	0.030 – 0.170 mm

Piston Ring End Gap:

• First (Top) Compression Ring	0.150 – 0.300 mm
• Second Compression Ring	0.280 – 0.480 mm
• Oil Control Ring	0.150 – 0.600 mm

Cylinder Head

Combustion Chamber Volume	53.600 cc
Valve Guide Bore Diameter – Intake	6.000 – 6.020 mm
Valve Guide Bore Diameter – Exhaust	6.000 – 6.020 mm
Valve Guide Installed Height	14.050 – 14.550 mm
Stationary Hydraulic Lash Adjuster (SHLA) Bore Diameter	12.008 – 12.030 mm
Valve Seat Angle – Seating Surface	45°
Valve Seat Angle – Relief Surface	30°
Valve Seat Angle – Undercut Surface	60°
Valve Seat Runout – Maximum	0.050 mm
Valve Seat Width – Exhaust Seating Surface	1.400 – 1.800 mm
Valve Seat Width – Exhaust Relief Surface	0.700 – 0.900 mm
Valve Seat Width – Intake Seating Surface	1.000 – 1.400 mm
Valve Seat Width – Intake Relief Surface	0.500 – 0.700 mm
Engine Block Deck Surface Flatness	0.05 mm
Exhaust Manifold Deck Surface Flatness	0.25 mm
Intake Manifold Deck Surface Flatness	0.05 mm

Valve System

Face Angle	44.25°
Face Runout	0.038 mm
Valve Face Width – Exhaust	2.750 mm
Valve Face Width – Intake	2.180 mm
Valve Head Diameter – Exhaust	30.470 – 30.730 mm
Valve Head Diameter – Intake	36.830 – 37.090 mm
Valve Installed Height	35.26 – 36.69 mm
Valve Length – Exhaust	97.110 mm
Valve Length – Intake	101.230 mm
Valve Stem Diameter (standard)	5.955 – 5.975 mm
Valve Stem Diameter (oversize)	6.013 – 6.033 mm
Valve Stem to Guide Clearance	0.025 – 0.065 mm

Hydraulic Lash Adjuster Diameter .... 11.986 – 12.000 mm
Hydraulic Lash Adjuster to Bore Clearance .... 0.037 – 0.041 mm
Rocker Arm/Camshaft Follower Ratio 1.68:1
Rocker Arm/Camshaft Follower Roller Diameter .... 17.740 – 17.800 mm
Valve Spring Free Length .... 42.500 – 45.500 mm
Valve Spring Installed Height – Closed .... 35.000 mm
Valve Spring Installed Height – Open .... 24.000 mm
Valve Spring Load – Closed .... 247 – 273 N
Valve Spring Load – Open .... 598 – 662 N
Valve Spring Diameter – Inside Top .... 12.200 – 12.700 mm
Valve Spring Diameter – Outside Top .... 18.000 – 20.500 mm
Valve Spring Diameter – Inside Bottom .... 17.950 – 18.450 mm
Valve Spring Diameter – Outside Bottom .... 26.000 mm
Valve Spring Coil Thickness .... 3.250 – 3.900 mm
Valve Spring Total Number of Coils 7.1

Camshaft

Camshaft Bearing Inside Diameter – Front Number 1 .... 35.000 – 35.020 mm
Camshaft Bearing Inside Diameter – Middle & Rear Number 2 - 4 .... 27.000 – 27.020 mm
Camshaft End Play .... 0.045 – 0.215 mm
Camshaft Journal Diameter – Front Number 1 .... 34.936 – 34.960 mm
Camshaft Journal Diameter – Middle & Rear Number 2 - 4 .... 26.936 – 26.960 mm
Camshaft Journal Out-of-round .... 0.006 mm
Camshaft Journal to Bore Clearance .... 0.040 – 0.084 mm
Camshaft Runout – Front & Rear Number 1 and 4 .... 0.025 mm
Camshaft Runout – Middle Number 2 and 3 .... 0.050 mm
Camshaft Lobe Duration – Exhaust (@ 0.150 mm Lift) .... 238°
Camshaft Lobe Duration – Intake (@ 0.150 mm Lift) .... 237°
Camshaft Lobe Height – Exhaust .... 6.6 mm
Camshaft Lobe Height – Intake .... 6.5 mm
Camshaft Lobe Overlap (@ 0.150 mm Lift) .... -5° (no overlap)
Valve Opens – Exhaust .... 229° BTDC
Valve Opens – Intake .... 14° ATDC
Centre-line – Exhaust .... 111° BTDC
Centre-line – Intake .... 132° ATDC
Valve Closes – Exhaust .... 9° ATDC
Valve Closes – Intake .... 252° ATDC
Valve Lift – Exhaust .... 10.8 mm
Valve Lift – Intake .... 10.8 mm

Oil Pump

Type .... Gerotor
Gear Diameter – Outer .... 87.095 – 87.175 mm
Gear Bore Depth .... 15.565 – 15.600 mm
Gear Bore Diameter .... 87.275 – 87.325 mm
Gear Thickness .... 15.511 – 15.536 mm
Gear to Cover Clearance .... 0.030 – 0.085 mm
Gear to Housing Clearance .... 0.100 – 0.230 mm
Inner Gear Tip Clearance .... 0.075 – 0.180 mm
Crankshaft Clearance to Housing .... 0.040 – 0.130 mm
Inner Gerotor Hub Diameter .... 53.310 – 53.335 mm
Housing Hub Diameter .... 53.380 – 53.420 mm
Inner Gerotor Hub Clearance to Housing .... 0.045 – 0.110 mm

Lubrication System

Oil Type	SAE 5W30
Oil Capacity – with Filter	6.5 L
Oil Pressure – Minimum at idle	69 kPa
Oil Pressure – Minimum at 2000 r.p.m.	138 kPa
Piston Cooling Jet Valve Opening Pressure	170 – 230 kPa

6 Torque Wrench Specifications

ATTENTION

- ■ **Fasteners must be replaced after loosening.**
- ♦ **Fasteners either have micro encapsulated sealant applied or incorporate a mechanical thread lock and should only be re-used once. If in doubt, replacement is recommended.**

Oil Pan Drain Plug .... 25.0 Nm
Oil Filter Adaptor Attaching Bolt .... 20.0 – 26.0 Nm
Oil Level Indicator Tube Attaching Bolt .... 8.0 – 12.0 Nm
Accessory Drive Belt Idler Pulley Attaching Bolt .... 50.0 Nm
Accessory Drive Belt Tensioner Attaching Bolt .... 50.0 Nm
Power Steering Reservoir Bracket Attaching Screw .... 9.0 Nm
Power Steering Pump Bracket Attaching Bolt .... 49.0 – 67.0 Nm
Upper Intake Manifold to Lower Intake Manifold Attaching Bolt .... 23.0 Nm
Upper Intake Manifold to Cylinder Head Attaching Bolt .... 23.0 Nm
Lower Intake Manifold to Cylinder Head Attaching Bolt .... 23.0 Nm
Fuel Injector Wiring Harness Bracket Attaching bolt .... 9.0 Nm
Exhaust Manifold to Cylinder Head Attaching Bolt .... 17.0 - 23.0 Nm
Exhaust Manifold Heat Shield Attaching Bolt .... 8.0 - 12.0 Nm
Battery Harness Ground Terminal Attaching Nut .... 13.0 Nm
Camshaft Cover Attaching Bolt .... 8.0 – 12.0 Nm
Engine Ground Connector Bolt .... 10.0 Nm
Engine Wiring Harness Former Attaching Bolt .... 12.0 – 16.0 Nm
■ ♦ Crankshaft Balancer Assembly Attaching Bolt:
Stage 1 .... 90.0 –110.0 Nm
Stage 2 .... 150°
Engine Front Cover Assembly Attaching Bolt .... 20.0 – 26.0 Nm
Camshaft Intermediate Sprocket Attaching Bolt .... 58.0 – 72.0 Nm
Secondary Timing Chain Guide Attaching Bolt .... 20.0 – 26.0 Nm
Secondary Timing Chain Shoe Attaching Bolt .... 20.0 – 26.0 Nm
Secondary Timing Chain Tensioner Attaching Bolt .... 20.0 – 26.0 Nm
Primary Timing Chain Upper Guide Attaching Bolt .... 20.0 – 26.0 Nm
Primary Timing Chain Tensioner Attaching Bolt .... 20.0 – 26.0 Nm
Oil Pump Assembly Attaching Bolt .... 20.0 – 26.0 Nm
Camshaft Sprocket Attaching Bolt .... 49.0 – 67.0 Nm
Exhaust Camshaft Sprocket Attaching Bolt .... 49.0 – 67.0 Nm
Camshaft Bearing Cap Attaching Bolt .... 8.0 – 12.0 Nm
Cylinder Head Threaded Plug .... 31.0 Nm
■ Cylinder Head M11 Attaching Bolt:
Stage 1 .... 40.0 – 50.0 Nm
Stage 2 .... 120°
■ Cylinder Head M8 Attaching Bolt:
Stage 1 .... 12.0 – 18.0 Nm
Stage 2 .... 60°
Engine Mount Bracket to Cylinder Block Attaching Bolt .... 43.0 – 57.0 Nm
Engine Mount to Bracket Attaching Nut .... 70.0 – 90.0 Nm
Engine Mount to Frame Attaching Nut .... 44.0 – 60.0 Nm
Engine Lift Bracket Attaching Bolt .... 58.0 – 72.0.0 Nm
Knock Sensor Attaching Nut .... 23.0 Nm

Power Steering High Pressure Line Attaching Bolt .... 8.0 – 12.0 Nm

Power Steering High Pressure Line Flare Nut.......................... 25.0 – 35.0 Nm

Steering Gear Housing Mounting Nut:
Stage 1 .... 60.0 Nm
Stage 2 .... 40° – 50°

Oil Suction Pipe Attaching Bolt.. 10.0 Nm

Crankshaft Oil Deflector Attaching bolt... 10.0 Nm

Oil Level Sensor .... 20.0 Nm

Oil Pan to Cylinder Block Attaching Bolt.................................. 20.0 – 26.0 Nm

Oil Pan to Crankshaft Rear Oil Seal Housing Attaching Bolt........ 8.0 - 12.0 Nm

■ ♦ Flexplate Attaching Bolt:

Stage 1 .... 26.0 – 34.0 Nm

Stage 2 .... 45°

Crankshaft Rear Oil Seal Housing Attaching Bolt....................... 8.0 – 12.0 Nm

■ Connecting Rod Cap Attaching Bolt:

Stage 1 .... 30.0 Nm

Stage 2 .... Loosen Completely

Stage 3 .... 25.0 Nm

Stage 4 .... 110°

Crankshaft Bearing Cap Remover Nut .... 11.0 Nm

■ Crankshaft Main Bearing Cap Inboard Attaching Bolt:

Stage 1 .... 20.0 Nm

Stage 2 .... 80°

■ Crankshaft Main Bearing Cap Outboard Attaching Bolt:

Stage 1 .... 15.0 Nm

Stage 2 .... 110°

■ ♦ Crankshaft main Bearing Cap Side Attaching Bolt:

Stage 1 .... 30.0 Nm

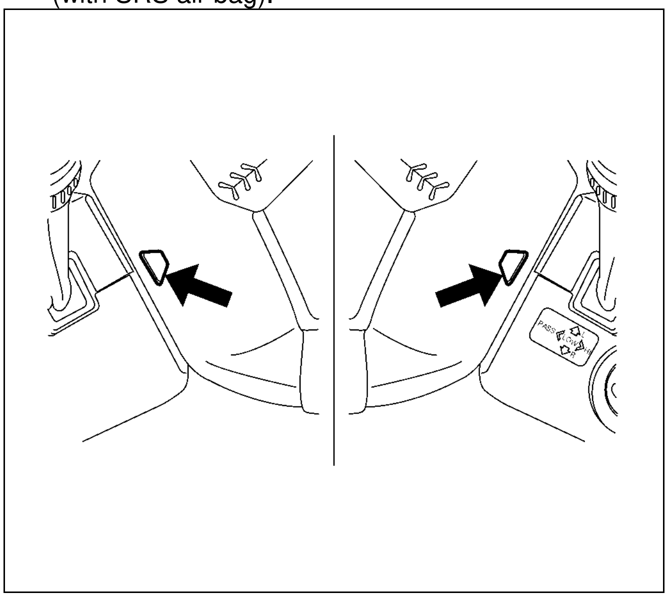
Stage 2 .... 60°

Cylinder Block Threaded Plug .... 27.0 - 35.0 Nm

Oil Jet Attaching Bolt .... 8.0 – 12.0 Nm

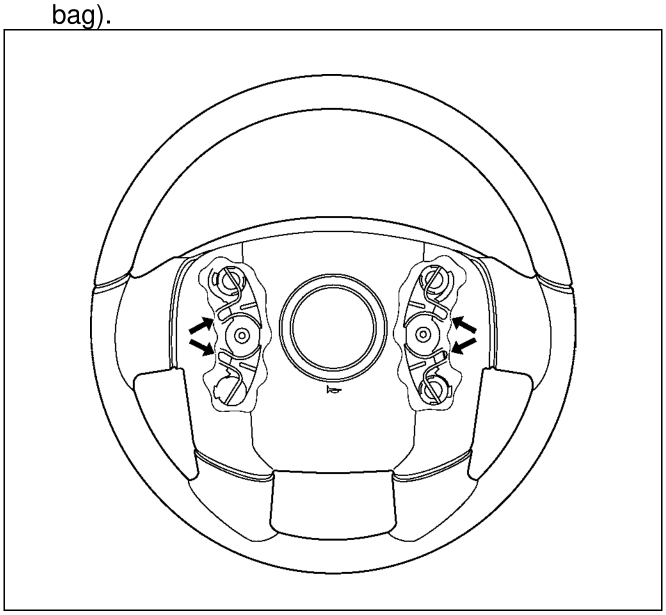
CAUTION: The wheel of the vehicle must be straight ahead and the steering column in the "LOCK" position before disconnecting the steering column from the steering gear. Failure to do so will cause the SRS coil assembly to lose its centering which will cause damage to the SRS coil assembly (with SRS air bag).

5. Remove the engine hood opening lever and steering lower cover.
6. Remove the driver knee bolster (reinforcement).
7. Disable the SRS (Refer to "Disabling the SRS" in this section) (with SRS air bag).
8. Check the holes on both sides of the steering cover (with SRS air bag).



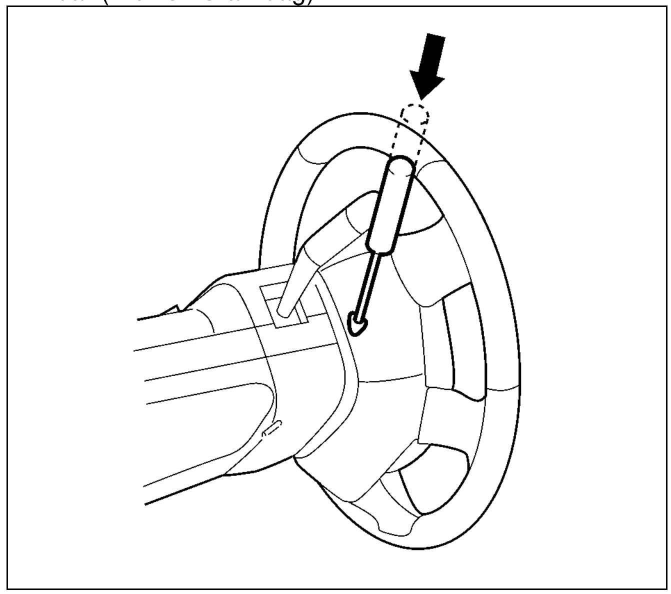
060R300025

9. Check the position of the pins in thier holes. Push the pin in the direction of the arrow (with SRS air bag).



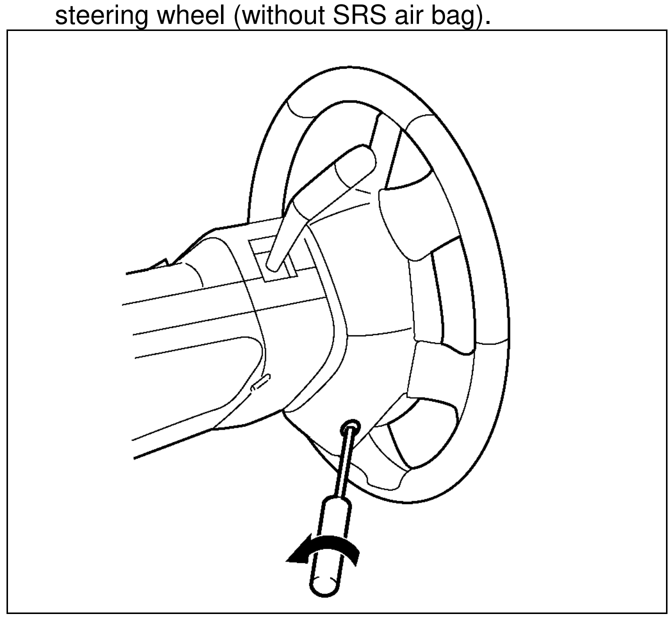
RTW73BSH000101

10. Push the four pins with a ϕ 5~6 mm (0.20~0.24 in) bar (with SRS air bag).



060R300031

11. Cancel the lock to release the four pins (with SRS air bag).
12. Loosen the horn pad fixing screw at the rear of the steering wheel (without SRS air bag).



430R300009

7 Special Tools

Tool Number	Illustration	Description
E-308		Seal Remover Previously released.
EN-46101		Spark Plug Tube Seal Guide Set Used to protect the spark plug lip seals when installing the camshaft cover to the cylinder head.
EN-46103		Camshaft Actuator Valve Seal Installer Used to install the camshaft actuator valve seals into the front cover.
EN-46105 – 1 and 2		Camshaft Locking Tool Set Used to retain camshaft position during timing chain or camshaft actuator replacement.
EN-46106		Flexplate Holding Tool Used to retain crankshaft position during valve-train overhaul and harmonic balancer removal.
EN-46108		Timing Chain Retention Tool Set Used to retain timing chain tension during camshaft and sprocket removal.

Tool Number	Illustration	Description
EN-46109		Engine Front Cover / Oil Pan / Crankshaft Rear Oil Seal Housing Installation Guide Pins Used to align the engine front cover/oil pan/crankshaft rear oil seal housing during engine assembly.
EN-46110		On-vehicle Valve Spring Compressor Used to remove valve springs with the cylinder heads assembled to the cylinder block.
EN-46111		Crankshaft Rotation Socket Used to rotate the crankshaft during engine overhaul.
EN-46112		Timing Chain Tensioner Retraction Springs Used to retain the timing chain tensioner plunger within the tensioner bore during assembly of timing chains to engine.
EN-46114		Engine Lift Brackets Used in conjunction with commercially available lifting equipment to lift engine.
EN-46116		Valve Stem Seal Remover / Installer Used to remove/install the valve stem seals.

Tool Number	Illustration	Description
EN-46117		Valve Stem Key Remover / Installer Used in conjunction with J-8062 or EN-46110 to remove and reinstall the valve stem keys.
EN-46119		Off-vehicle Valve Spring Compressor Adaptor Used in conjunction with J-8062 to remove valve springs with the engine disassembled.
EN-46120 and J-42096		Valve Guide Reamer Used to oversize valve guides prior to the installation of new oversized valves.
EN-46121		Connecting Rod Guide Pin Set Used to guide connecting rods onto the crankshaft journals and prevent damage to the cylinder bores, journal faces and piston cooling jets during engine assembly procedures.
EN-46122		Oil Control Valve Check Ball Remover / Installer
EN-7115		Torque Angle Wrench Used to accurately tighten fasteners when an angle torque is required.

Tool Number	Illustration	Description
J-29184		Crankshaft Front Oil Seal Installer
J-36648-A		Oil Pressure Gauge Adaptor
j-41816		three legged puller
J-41818		Main Bearing Cap Removal Tool Used in conjunction with J-6125-1B to remove the main bearing caps from the cylinder block during engine disassembly procedures.
J-41998-B		Crankshaft Balancer Installer
J-42385-2000		Thread Insert Kit Used to repair damaged threads during engine overhaul.
J-42385-700		High Feature Thread Repair Kit Used to repair damaged threads during engine overhaul.

Tool Number	Illustration	Description
J-45027		Tensioner Tool Used to reset the timing chain tensioner plunger.
J-6125-1B		Slide Hammer Used in conjunction with J-41818 to remove the main bearing caps from the cylinder block during engine disassembly.
J-8062		Valve Spring Compressor Used in conjunction with EN-46119 to remove valve springs with the engine disassembled.
J-8087		Cylinder Bore Gauge Commercial equivalent also available
EN-48313		Timing Chain Retention Tool

Section 6B1
Engine Cooling – V6

ATTENTION

Before performing any Service Operation or other procedure described in this Section, refer to 1.1 WARNING, CAUTION and NOTES for correct workshop practices with regard to safety and/or property damage.

1 General Information

The cooling system for the HFV6 engine has been re-designed to accommodate this engine’s unique configuration and engine cooling performance requirements. The following list is a summary of new and modified components:

- Revised radiator assembly.
- New plumbing including radiator hoses, inlet pipe, heater pipes, heater hoses and heater water valve.
- New rear mount thermostat assembly and thermostat housing.
- New coolant outlet with pressure cap.
- New coolant specification.
- New side chutes and radiator shroud.
- Modified cooling fan operating strategy.
- A four stage cooling fan operating system is used.

The cooling fan motor is controlled by duty signal from the ECM which results in the fan operating from low speed Stage 1), up to high speed (Stage 4).

Operation of the cooling fan is dependant on the engine temperature, vehicle speed, A/C request (where fitted) and A/C system pressure. Refer to 6C1 – 1 Engine management general information.

1.1 WARNING, CAUTION and NOTES

This Section contains various WARNINGS, CAUTIONS and NOTE statements that you must observe carefully to reduce the risk of death or injury during service, repair procedures or vehicle operation. Incorrect service or repair procedures may damage the vehicle or cause operational faults. WARNINGS, CAUTION and NOTE statements are not exhaustive. HOLDEN LTD can not possibly warn of all the potentially hazardous consequences of failure to follow these instructions.

1.2 Definition of WARNING, CAUTION and NOTE Statements

Diagnosis and repair procedures in this Section contain both general and specific WARNING, CAUTION and NOTE statements. HOLDEN LTD is dedicated to the presentation of service information that helps the technician to diagnose and repair the systems necessary for proper operation of the vehicle. Certain procedures may present a hazard to the technician if they are not followed in the recommended manner. WARNING, CAUTION and NOTE statements are designed to help prevent these hazards from occurring, but not all hazards can be foreseen.

WARNING defined

A WARNING statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in death or injury. A WARNING statement alerts you to take necessary action or not to take a prohibited action. If a WARNING statement is ignored, the following consequences may occur:

- Death or injury to the technician or other personnel working on the vehicle,
- Death or injury to other people in or near the workplace area, and / or
- Death or injury to the driver / or passenger(s) of the vehicle or other people, if the vehicle has been improperly repaired.

CAUTION defined

A CAUTION statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in damage to or destruction of equipment, or corruption of data. If a CAUTION statement is ignored, the following consequences may occur:

- Damage to the vehicle,
- Unnecessary vehicle repairs or component replacement,
- Faulty operation or performance of any system or component being repaired,
- Damage to any system or components which depend on the proper operation of the system or component being repaired,
- Faulty operation or performance of any systems or components which depend on the proper operation or performance of the system or component under repair,
- Damage to fasteners, basic tools or special tools and / or
- Leakage of coolant, lubricant or other vital fluids.

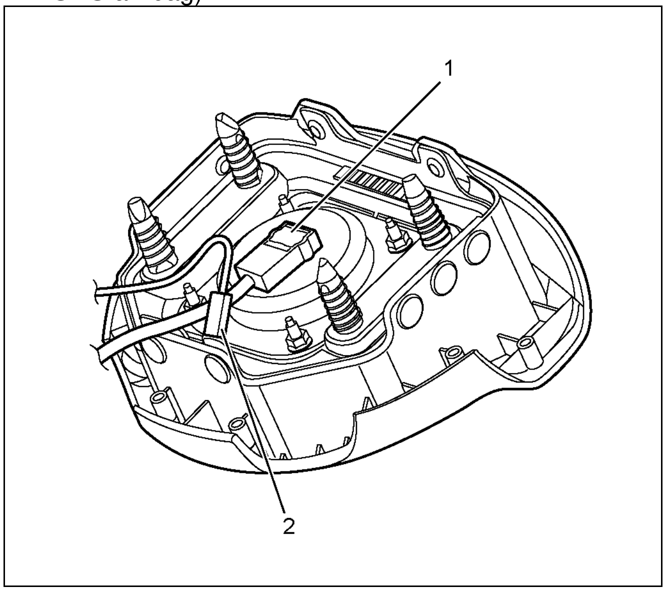
NOTE defined

A NOTE statement immediately precedes or follows an operating procedure, maintenance practice or condition that requires highlighting. A NOTE statement also emphasises necessary characteristics of a diagnostic or repair procedure. A NOTE statement is designed to:

- Clarify a procedure,
- Present additional information for accomplishing a procedure,
- Give insight into the reasons for performing a procedure in the recommended manner, and / or

Present information that gives the technician the benefit of past experience in accomplishing a procedure with greater ease.

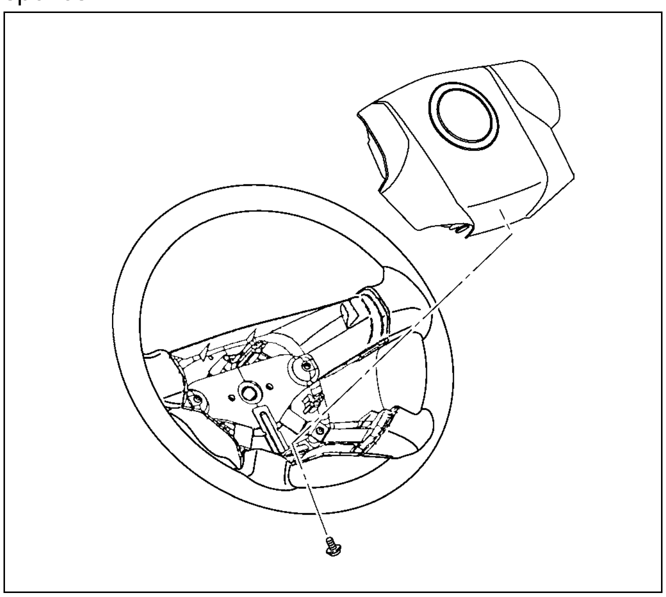
13. Disconnect the SRS air bag connector (1) and horn lead connector (2) located behind the air bag assembly and remove the air bag assembly (with SRS air bag).



RTW73BSH001101

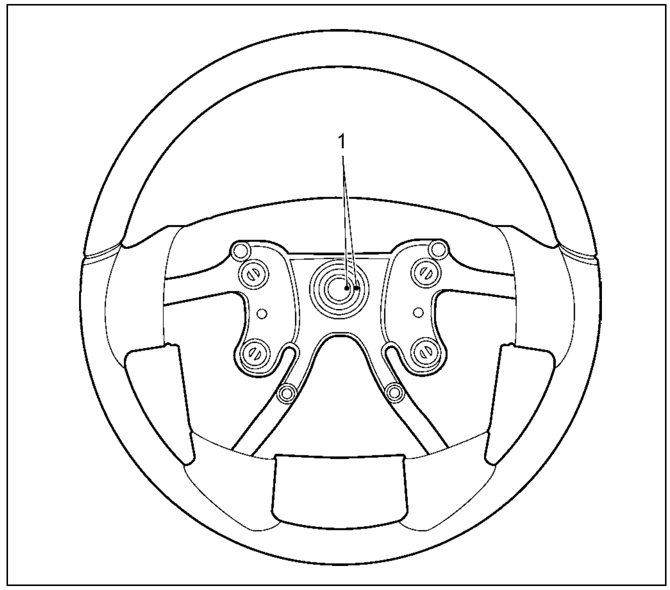
14. Remove the horn pad and the horn leads at the center of the wheel (without SRS air bag).

NOTE: It should be removed first from the bottom spokes.

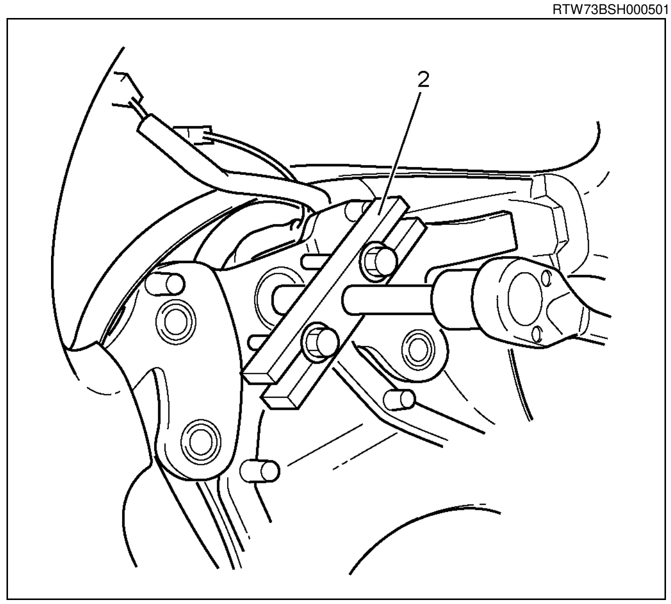


RTW73BSH000601

15. Apply a setting mark (1) across the steering wheel and shaft so parts can be reassembled in their original position. Move the front wheels to the straight ahead position, then use steering wheel remover 5-8521-0016-0 (2) to remove the steering wheel.



RTW73BSH000501



RTW73BSH001301

2 General Description

2.1 Radiator Assembly

The radiator has an aluminium core and is of the cross-flow design. Plastic side tanks are attached to the core by clinch tabs. The clinch tabs are formed as part of the core assembly.

The lower frame of the radiator assembly is attached to the vehicle frame by two bolts supported in rubber mounts, pegs are attached to the upper area of each side tank. These pegs are used to support the radiator with two rubber insert mounting brackets.

A high temperature rubber seal is used to seal the mating surface between the core and each side tank. The seal(s) must be replaced any time the side tank is removed from the core.

NOTE

The radiator core side tanks or transmission oil cooler cannot be replaced separately. If there is a fault with any of these components, the radiator assembly must be replaced. Small core repairs may be made using an aluminised silicon based liquid repair agent. Refer to 3.15 Radiator in this Section.

For vehicles with automatic transmission, a transmission oil cooler is located in the right-hand side radiator tank. The cooler pipes from and to the transmission are connected to the oil cooler flexible hoses by means of quick connect fittings.

The cooling fan motor is attached by three screws to the one-piece plastic fan shroud. In turn, the fan shroud is mounted to the rear of the radiator and is located and supported by two bolts and two locating tabs. The upper clips lock the fan shroud in place and can be released by hand to facilitate fan shroud removal. The shroud must be removed to allow fan motor and blade assembly removal.

One harness connector is mounted to the upper section of the fan shroud allowing the fan motor and blade assemblies to be removed individually from the shroud. The fan motor and blade is balanced as an assembly. These two components are serviced only as a unit and are not to be separated.

The shroud, fan assembly and transmission cooler hoses can be removed and installed individually from the vehicle. For removal and installation procedures, refer to 3.13 Cooling Fan and Shroud Assembly, 3.14 Flexible Transmission Cooler Hose and 3.15 Radiator in this Section.

2.2 Cooling Fan – Standard Specification

Overview

The fan is a standard cooling system rated at 400 Watts with a blade diameter of 500 mm, which consists of a single four speed fan. The fan motor is operated by duty signal from the ECM incorporating, low speed (Stage 1) up to high speed (Stage 4).

The following outlines the operation of the cooling system, at block level, also showing what inputs the Engine Control Module (ECM) requires.

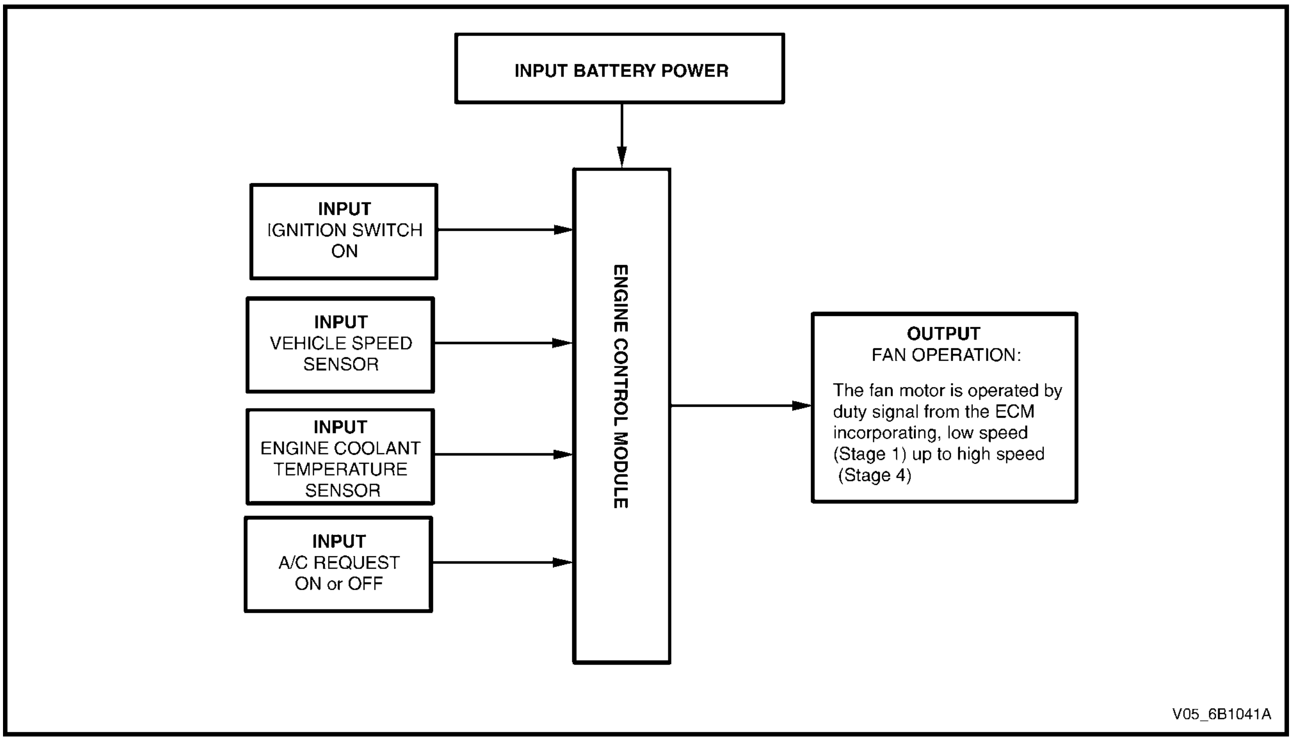

Figure 6B1 – 2

Cooling Fan and Shroud Assembly

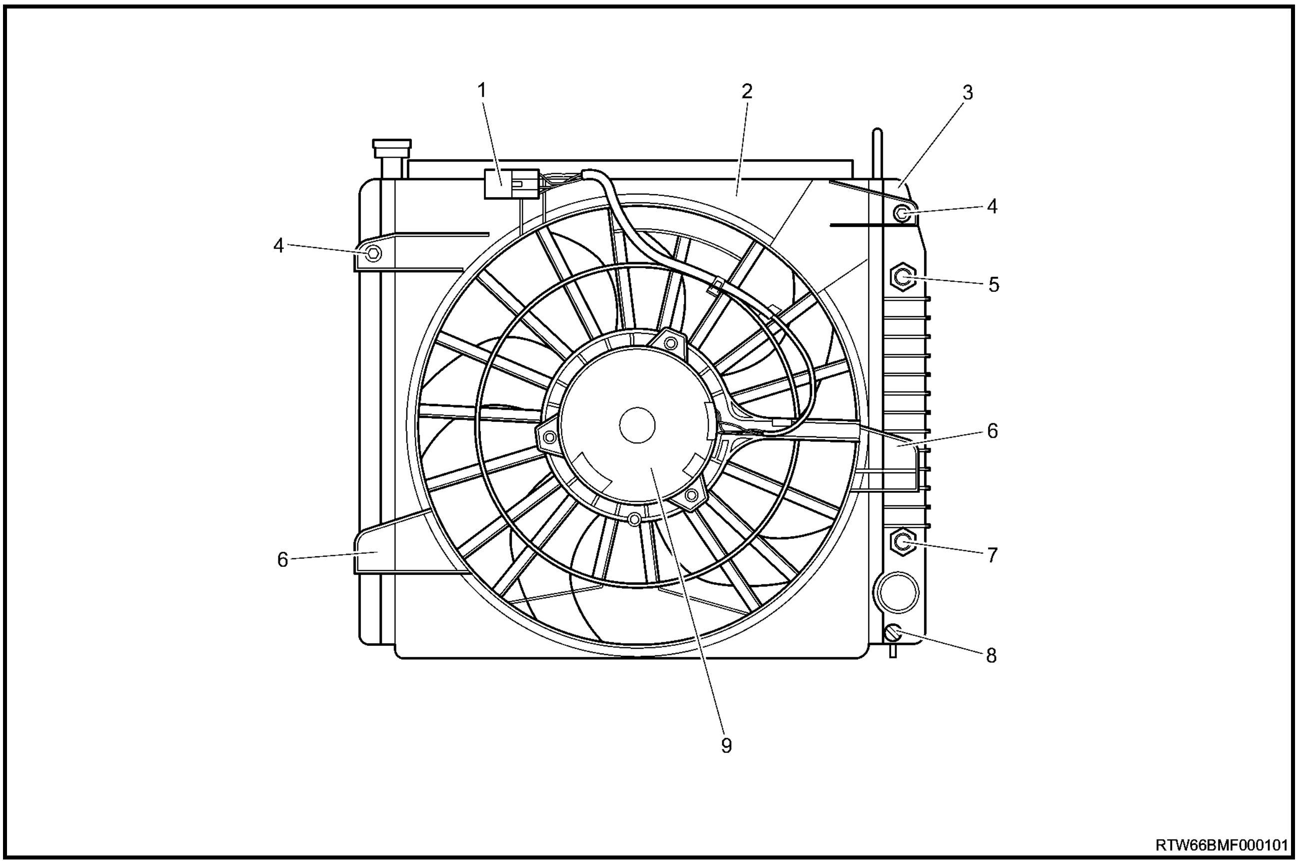

Figure 6B1 – 3

2	Fan Shroud	6	Fan Shroud Lower Support
3	Radiator	7	Oil Cooler, Lower Line Connection (Auto Trans Only)
4	Fan Shroud Upper Support	8	Radiator Drain Tap
		9	Fan Motor

Fan Motor

When the Standard Cooling Fan System is fitted to the HFV6 engine, the fan motor is 12 Volt and variable-speed. The internal construction of the fan motor consists of two brushes and two permanent magnets. A three-wire pigtail harness is permanently connected to the motor and is attached to the polypropylene fan shroud by integral clips moulded as part of the fan shroud.

The enclosed fan motor housing is constructed of yellow zinc coated steel. A drain hole is located in the bottom of the housing to allow for breathing and draining of any moisture ingress.

The fan motor rotates in an anticlockwise direction when viewed from the fan motor side.

The motor is rated at 400 Watts and drives a (500 mm) diameter fan blade at approximately 2,400 ± 240 rpm at high speed (stage 4).

The fan and motor is balanced as a unit and the fan blade must not be separated from the motor. The fan motor and blade are serviced only as an assembled unit. However, it should be noted that the central nut attaching the fan blade to the motor shaft has a left-hand thread.

Fan Operation

On vehicles with HFV6 engines, the engine cooling fan motor has three terminals; one positive and one negative and one the drive signal from the ECM. The positive terminal is permanently connected to battery voltage, via fuse SBF –3.

The cooling fan operation is enabled when the ECM via connector C – 56, pin 20 supplies a duty signal which varies dependant on the engine temperature, vehicle speed, A/C request (where fitted) and A/C system pressure, the speed varies from low speed (Stage 1) up to high speed (Stage 4). Refer to 6C1 – 1 Engine management general information.

V6 Cooling Fan Wiring Diagram

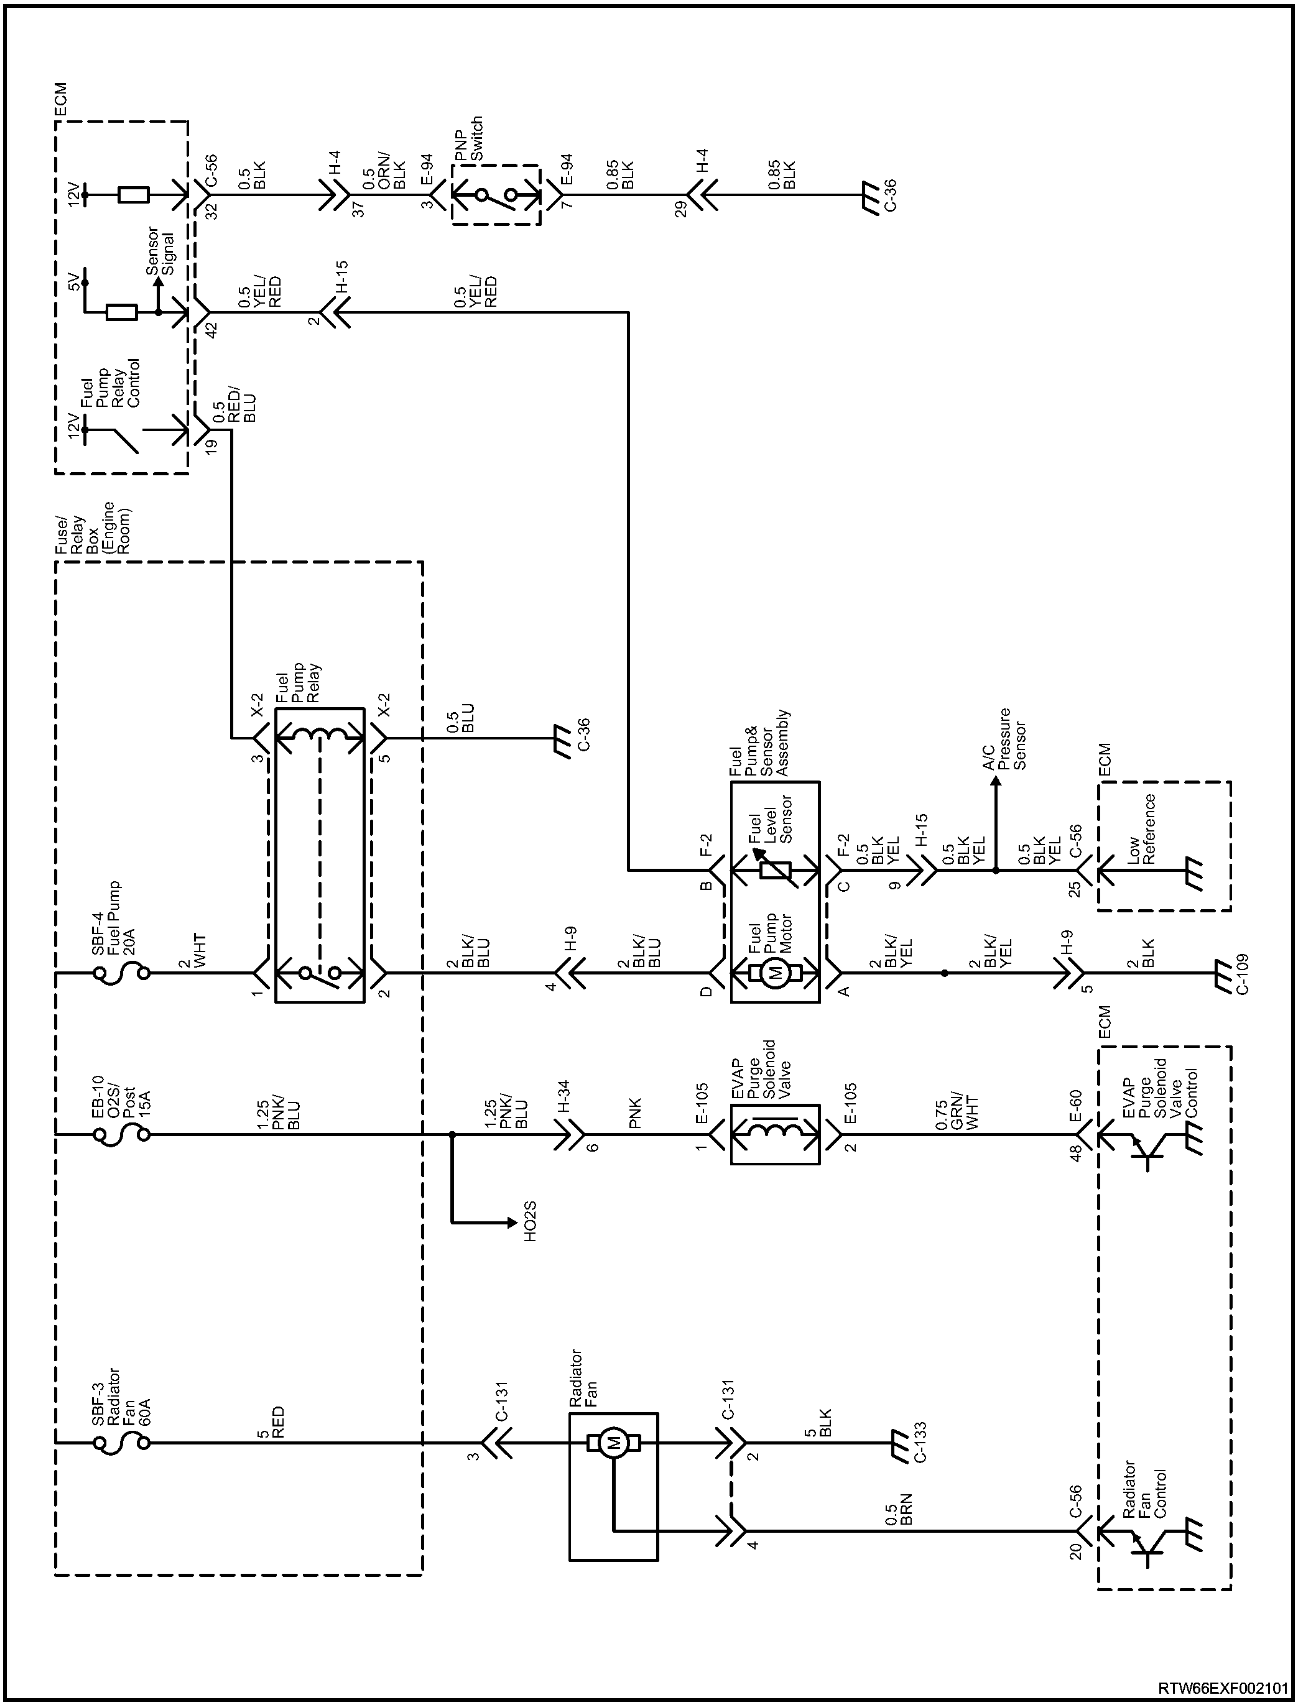

Figure 6B1 – 4

Fan Assembly connector

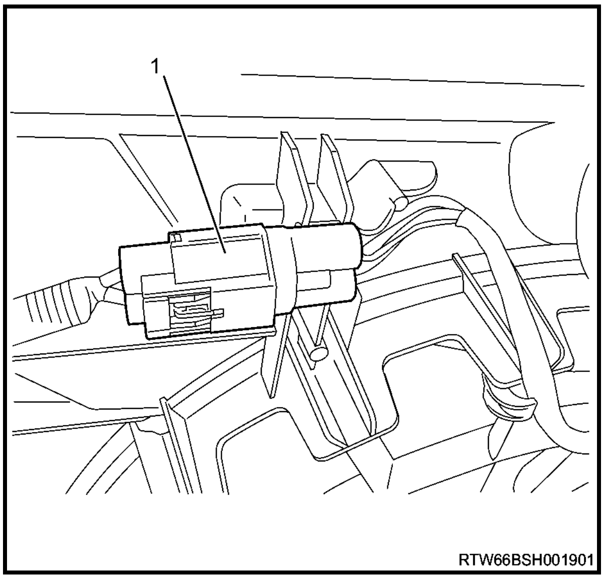

Figure 6B1 – 5

2.3 Coolant Pump

The coolant pump is a centrifugal vane impeller type pump. The pump consists of a housing and an impeller. The impeller is a flat plate mounted on the pump shaft with a series of flat or curved blades (vanes). When the impeller rotates, the coolant between the vanes is thrown outward by centrifugal force. The impeller shaft is supported by sealed bearings. The sealed bearings do not need to be lubricated. Grease cannot leak out, dirt and water cannot get in as long as the seal is not damaged or worn.

The coolant pump (1) is mounted to the engine front cover and is driven by the crankshaft pulley (2) via a multi-ribbed drive belt (3), turning the pump pulley (4), bolted to the coolant pump flange (5). Coolant enters the engine through the coolant inlet pipe and thermostat at the rear of engine and passes through the engine to the coolant pump on the front engine cover and exits via the coolant outlet housing (6) located at the front of the intake manifold.

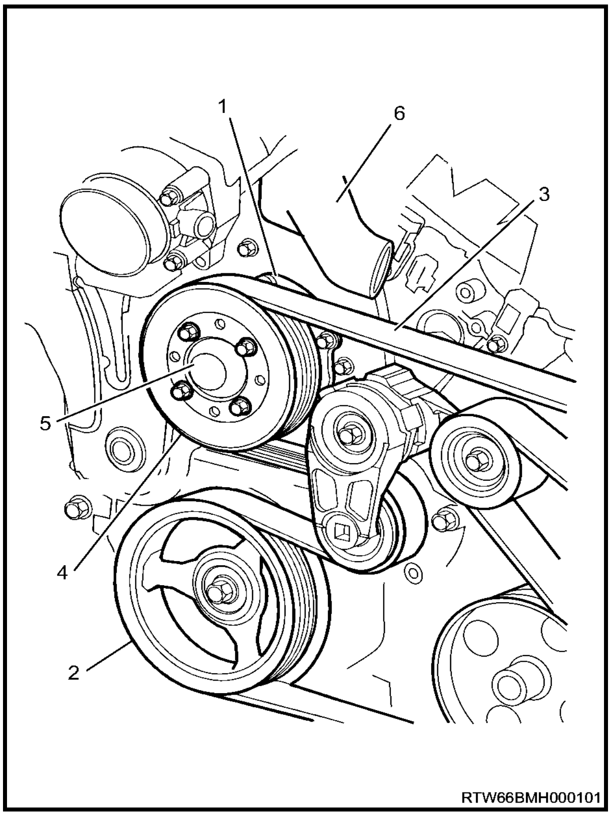

Figure 6B1 – 6

2.4 Coolant Outlet Housing

The coolant outlet housing (1) is located at the front of the intake manifold (2).

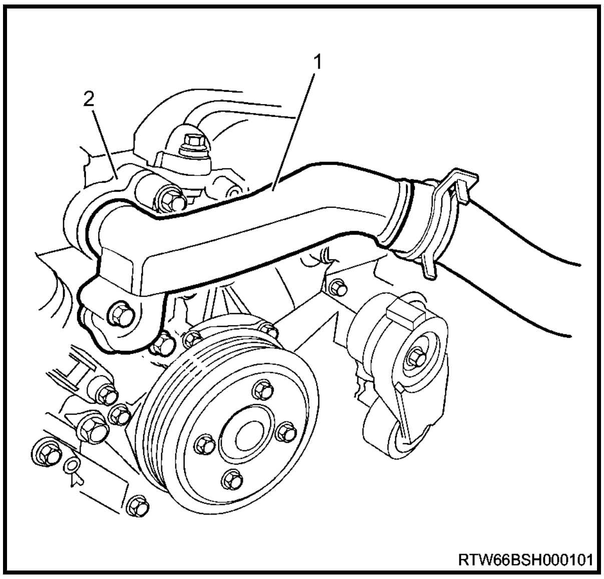

Figure 6B1 – 7

2.5 Thermostat

The thermostat housing (1) is located at the rear of the engine between the coolant inlet pipe (2) and the rear of the intake manifold, underneath the heater pipe assembly (3).

1	Bypass Valve	5	Air Bleed Valve	9	Rubber Diaphragm
2	Thermostat Retaining Bar	6	Piston Centre Support	10	Thermostat Spring
3	Thermostat Assembly Retaining Lugs	7	Thermostat Housing	11	Bypass Spring
4	Wax Pellet	8	Piston		

A wax pellet type thermostat is used in the coolant inlet passage to control the flow of coolant, providing fast engine warm up and regulating coolant temperature. The wax pellet or power element in the thermostat expands when heated and contracts when cooled. The wax pellet is connected through a piston to a valve and when the pellet is heated, pressure is exerted against a metal valve, which is forced to open.

As the pellet is cooled, the contraction allows a spring to close the valve. Thus, the valve remains closed while the coolant is cold, preventing circulation of coolant through the radiator, but allowing the coolant to circulate throughout the engine to warm it quickly and evenly. As the engine becomes warm, the pellet expands and the thermostat opens, permitting the coolant to flow through to the radiator where heat is transferred to the surrounding air, through the radiator walls.

This opening and closing of the thermostat valve permits enough coolant to enter the radiator to keep the engine within specified temperature limits.

The thermostat also provides a restriction in the cooling system, even after it has opened. This restriction creates a pressure difference, which prevents cavitation at the coolant pump and forces coolant to circulate through the engine block.

2.6 Coolant Filler Cap

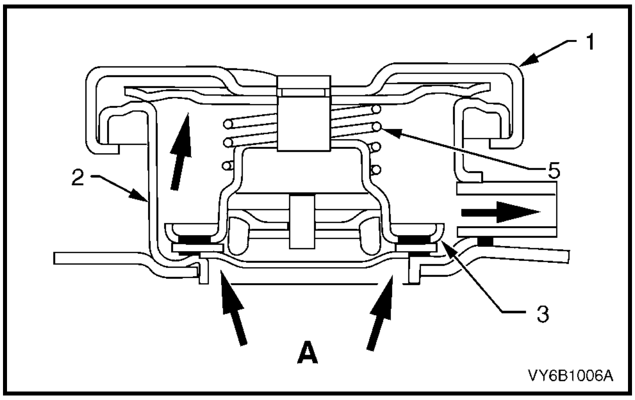

Figure 6B1 – 10

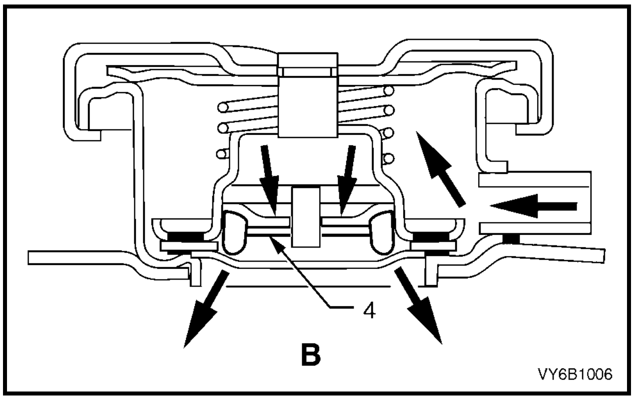

Figure 6B1 – 11

The pressurised coolant filler cap (1), fitted to the filler neck (2) on the coolant outlet housing, causes the cooling system to operate at higher than atmospheric pressure. The higher pressure raises the boiling point of the coolant, resulting in increased engine cooling efficiency. The coolant filler cap contains a pressure valve (3) and a vacuum (atmospheric) valve (4).

Referring to view ‘A’, the pressure valve is held against its seat by a spring (5), which determines the maximum operating pressure of the cooling system (120 kPa).

Referring to view ‘B’, the vacuum valve (4) is held against its seat by a light spring and opens during cool down because of the drop in pressure with contraction of the coolant volume. This pressure drop over-comes the spring force and the vacuum valve is opened, preventing the radiator hoses from collapsing. In addition, coolant can also flow back into the cooling system from the coolant recovery reservoir while this valve is open maintaining a full volume of coolant within the engine and radiator.

CAUTION

Should the radiator pressure cap require replacement, only fit the correct cap (with the correct pressure-rating) for this engine. Refer to the current release of Partfinder™ for this information.

2.7 Coolant Recovery Reservoir

The coolant is maintained at the ideal level in the radiator by the coolant filler cap and the coolant recovery reservoir, resulting in increased cooling efficiency.

The coolant recovery reservoir is located on the left-hand side front of the engine compartment, between the radiator support panel and air cleaner assembly. The coolant recovery reservoir is connected to the radiator overflow connection by a small diameter hose.

As the engine temperature rises, the coolant is heated and expands. The fluid displaced by expansion flows from the radiator into the recovery reservoir.

When the engine is turned OFF, the coolant contracts as it cools. Coolant is then drawn back into the radiator through the coolant filler cap atmospheric valve.

Coolant level should be maintained between the MAX and MIN indicator lines on the coolant recovery reservoir, as shown in Figure 6B1 – 12, when the engine is cold.

The cooling system is designed to use a coolant, DEX-COOL® long-life coolant or equivalent to GM specification 6277M (a mixture of ethylene glycol antifreeze and corrosion inhibitors and water), rather than plain water to maintain the integrity of the cooling system, and to prevent oxidation occurring within the engine.

NOTE

Some HFV6 Series vehicle markets call for DEX-COOL® long-life coolant and others for its equivalent, known as Extended Life Anti-freeze Coolant, conforming to GM specification 6277M. If in doubt regarding the correct coolant to be used, refer to the Owner's Handbook.

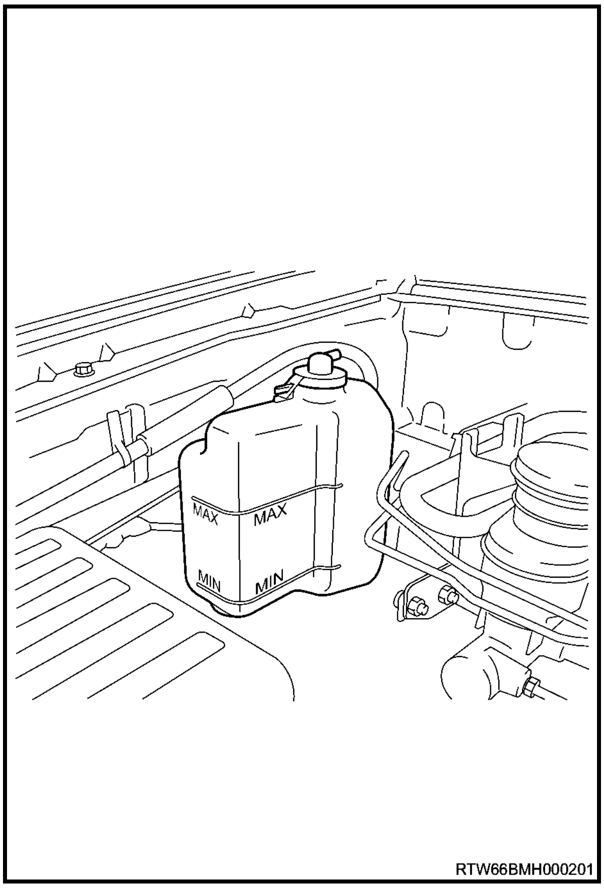

Figure 6B1 – 12

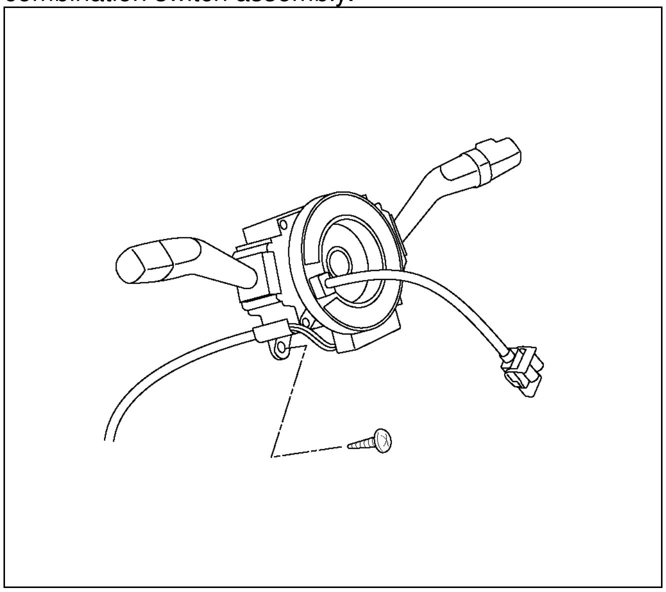
16. Remove steering column cover.
17. Disconnect the wiring harness connectors located under the steering column.
18. Remove the combination switch assembly with SRS coil.

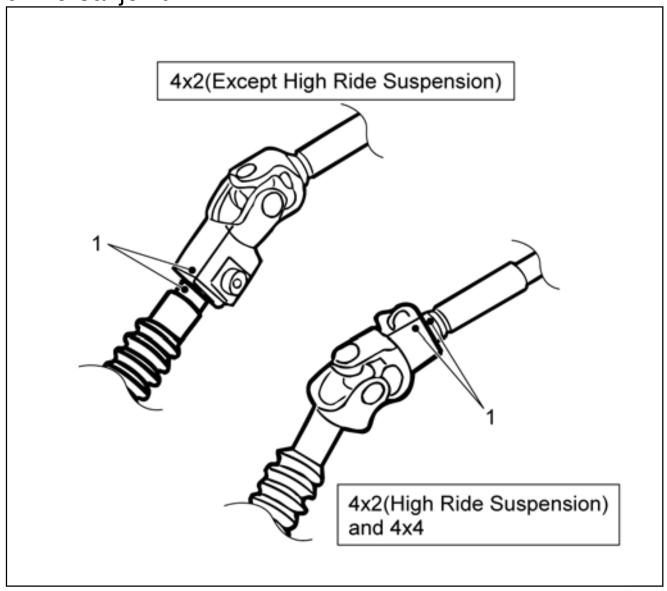
NOTE: The SRS coil is a part of the combination switch assembly, which cannot be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly.



RTW73BSH001001

19. Disconnect the starter switch harness connector located under the steering column, then remove lock cylinder assembly.
20. Apply a setting mark (1) across the universal joint and steering shaft to reassemble the parts in their original position, then remove steering column assembly and second shaft.

NOTE: A setting mark can be easily made if the shaft is withdrawn a little by loosening the steering shaft universal joint.



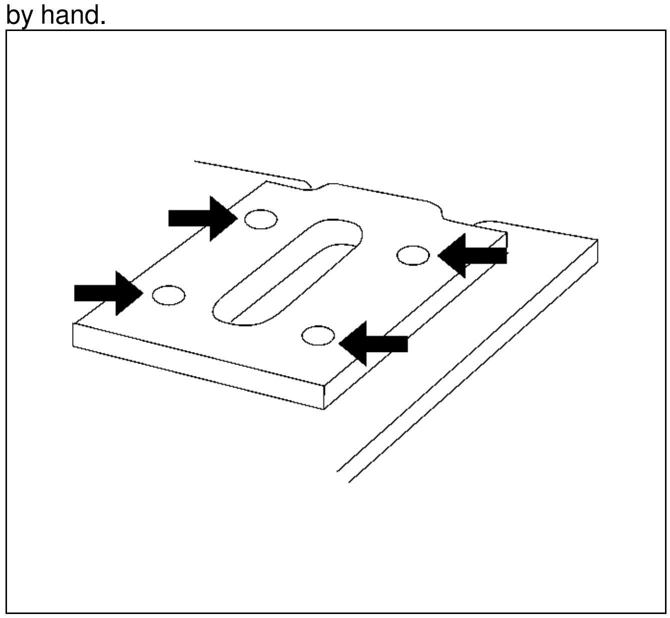
RTW53BSH000301

Inspection

If abnormal conditions are found during inspection, replace the steering column assembly.

Column Capsules

Check capsules on steering column bracket assembly; all must be securely seated in bracket slots and checked for any loose condition when pushed or pulled by hand.



431RW030

2.8 Engine Coolant Temperature Sensor

An Engine Coolant Temperature (ECT) sensor (2) is mounted in the left-hand side cylinder head, just above the exhaust manifold. The ECT sensor is used in conjunction with the instrument panel temperature gauge. The ECT sensor generates a signal, which is used by the engine management system for calculation of the various engine management functions.

Figure 6B1 – 13 shows the wiring harness connector (1) and the ECT sensor (2).

Refer to 6C1-1 Engine Management General Information for further information on the ECT sensor.

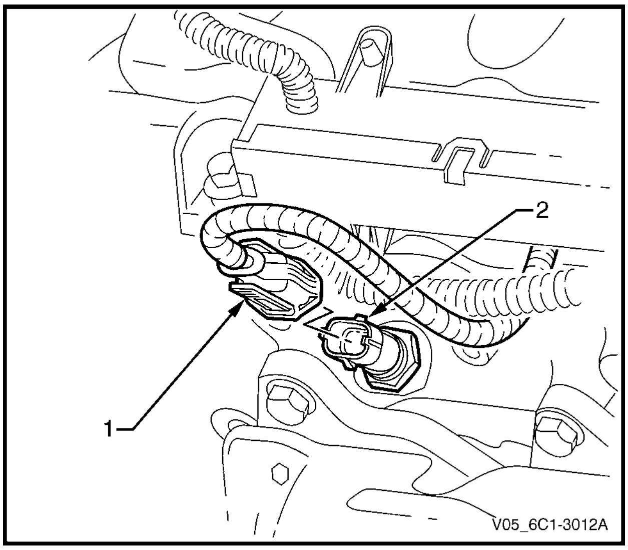


Figure 6B1 – 13

3 Service Operations

3.1 Service Notes

Safety

WARNING

- **To avoid serious personal injury, never remove the coolant filler pressure cap on the coolant outlet housing when the engine is hot, even if the cooling system should require filling. Sudden release of cooling system pressure is very dangerous.**
- **The vehicle is fitted with an electric radiator cooling fan. When working around the engine compartment, keep clear of the fan as it may start without warning.**

Before removing the coolant filler cap, allow the engine to cool, then place a shop rag over the coolant filler cap and then slowly turn the cap anticlockwise, approximately 1½ turns, until the pressure relief position is reached. The pressure relief position will allow any remaining pressure within the system to escape into the coolant recovery reservoir. Continue to rotate the cap anticlockwise until the cap can be safely removed.

Periodic Servicing

The cooling system requires little attention except for maintaining the coolant to the correct level in the recovery reservoir and periodic servicing at the time or distance intervals as outlined in 0B Lubrication and Service.

Periodic servicing includes:

1 Checking coolant level. Refer to 3.3 Draining and Filling Cooling System in this Section.

2 Checking coolant concentration. Refer to 3.2 Coolant Maintenance – Testing Coolant Concentration in this Section.

3 Pressure test cooling system and coolant filler cap. Refer to 3.7 Pressure Testing in this Section.

4 Tighten hose clamps and inspect all hoses. Refer to 3.6 Coolant Hoses in this Section. Replace hoses if swollen or deteriorated.

WARNING

Always wear protective safety glasses when working with spring type hose clamps. Failure to do so could result in eye injury.

5 Clean out cooling system, refer to 3.4 Cleaning Cooling System – Cooling System Flush, in this Section and refill. Refer to 3.3 Draining and Filling Cooling System in this Section.

Environmental Issues

To reduce environmental impact and maintenance cost, whenever the coolant is drained from any engine, the service records are to be checked to determine when the coolant was last changed. If more than six months life is left before the next coolant change, then the following procedure is to be followed:

1 When draining the coolant from the engine, use a clean container to hold at least 12 litres of coolant and ensure that the coolant is not contaminated in the draining process.

2 After repairs have been completed, refill the engine cooling system with the drained coolant.

3 Top up as required, using a 50 / 50 mix of clean water and the recommended coolant, which is either DEX-COOL® long-life coolant or its equivalent, known as Extended Life Anti-freeze Coolant conforming to GM specification 6277M. Refer to 3.2 Coolant Maintenance and 3.3 Draining and Filling Cooling System in this Section, for the necessary procedures and further information.

3.2 Coolant Maintenance

CAUTION

Do not mix different types of anti-freeze or corrosion inhibitors, as they may be incompatible. If a different type has been used in the cooling system, flush the system with clean water, refer to 3.4 Cleaning Cooling System – Cooling System Flush in this Section and refill cooling system with the correct coolant. Refer to 3.3 Draining and Filling Cooling System in this Section.

The cooling system is designed to use a coolant (a mixture of ethylene glycol antifreeze with added corrosion inhibitors, and water), rather than plain water. The use of glycol also raises the boiling point and increases the cooling system efficiency. For this reason, it is of the utmost importance that the correct concentration level of ethylene glycol in the cooling system is maintained.

Addition of plain water into the cooling system when 'topping-up' may dilute the coolant mixture to a point where the antifreeze / anti-boil and corrosion inhibitor properties of ethylene glycol become ineffective.

The coolant should comprise of a mixture 50% ethylene glycol antifreeze / inhibitor with 50% clear, clean water.

Ethylene glycol conforming to the correct specification is either named DEX-COOL® long-life coolant or its equivalent, known as Extended Life Anti-freeze Coolant conforming to GM specification 6277M. Both are available in a number of different quantities. Check the current release of Partfinder™ for specific details.

Topping Up the Cooling System

Under normal operating conditions, the cooling system should not be topped up at the coolant filler cap. The level can be checked at the coolant recovery reservoir, and coolant (in the correct concentration with clear, clean water) added as necessary to bring the level between the MAX and MIN indicator lines on the coolant recovery reservoir, as shown in Figure 6B1 – 14, when the engine is cold.

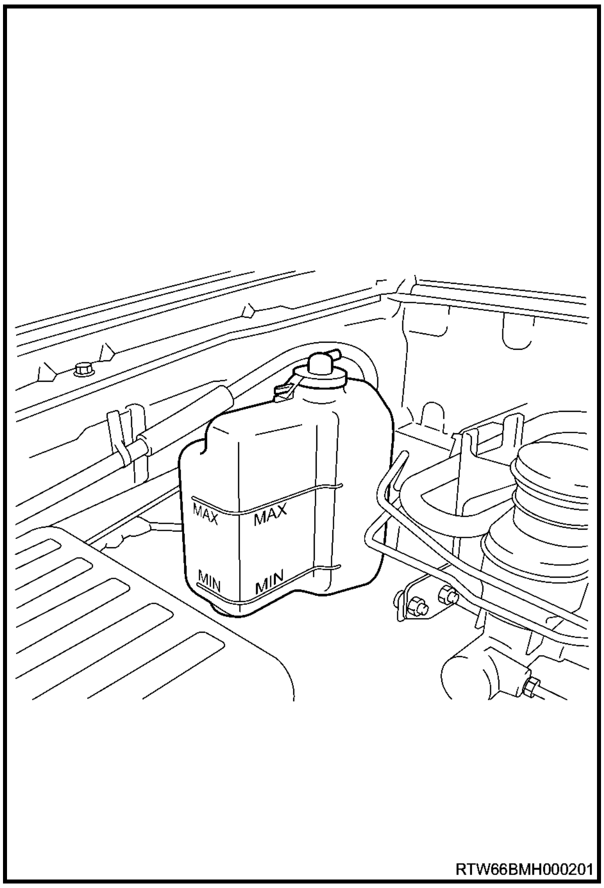

Figure 6B1 – 14

Testing Coolant Concentration

To ensure the specified ethylene glycol concentration is maintained in the engine coolant, the coolant concentration must be checked at the time or distance intervals outlined in the Owner's Handbook or Service Booklet in the glove box.

NOTE

- While a number of coolant concentration measuring devices are available, the two preferred types are as described.
- The procedures detailed, apply to either coolant type used.

Method 1 – Refractometer

NOTE

- Coolant tester, Tool No. J26568, automatically compensates for temperature.
- Ensure that the eyepiece of the tester is free of coolant before looking through it.
- Before each use, swing back the plastic cover at the slanted end of the coolant tester, exposing the measuring window and the bottom of the plastic cover. Carefully wipe the measuring window dry with a tissue or clean, soft cloth. Close the plastic cover.

1 Check the calibration of the coolant tester as follows:

BACK TO CHAPTER INDEX

ISUZU KB P190 2007
TO MODEL INDEX

a Place a few drops of distilled water (between 21 and 29° C) onto the measuring window, then close the plastic cover.

b Point the tester toward any light source, look into the eyepiece and check that the indicated reading is zero. If not, then re-calibrate the tester as detailed at the end of this Test Method, Calibrating the Tester.

2 Release the tip of the bulb pump from under the refractometer body. It is not necessary to remove the complete pump from the tool.

WARNING

Refer to 3.1 Service Notes in this Section, for important safety items.

3 Carefully remove the coolant filler cap.

4 Insert the tube of the pump into the coolant, and then press the bulb to obtain a sample.

5 Bend the tube around and insert the end into the cover plate opening.

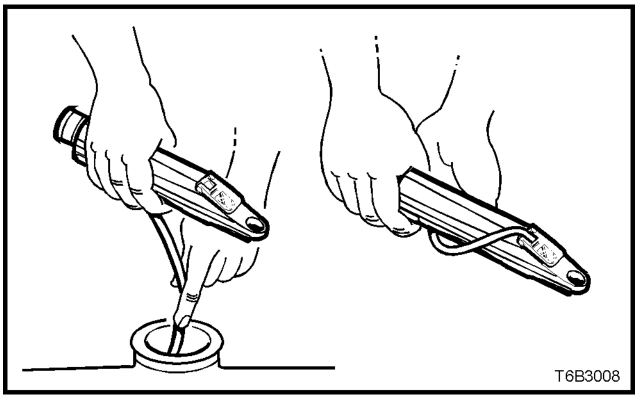

Figure 6B1 – 15

6 Press the pump bulb to deposit a few drops of coolant onto the measuring surface. Do not open the plastic cover when taking readings, as moisture evaporation will change the reading obtained.

7 Point the coolant tester toward any light source, looking into the eyepiece.

a The coolant protection reading is at the point where the dividing line between the light and dark, crosses the scale.

b The scale for ethylene glycol (bold arrow) is the reference scale for either DEX-COOL® long-life coolant or its equivalent, known as Extended Life Anti-freeze Coolant conforming to GM specification 6277M.

NOTE

The temperature scale is reversed from that of a conventional thermometer. Below zero readings are on the upper half of the scale.

8 A reading between – 30 and – 52°C (corresponding to a coolant concentration between 45 to 60%), is satisfactory for the HFV6 engine cooling system.

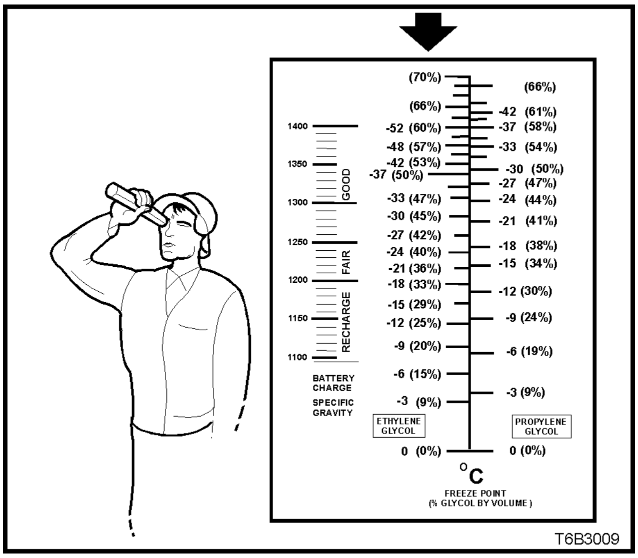

Figure 6B1 – 16

COOLANT CONCENTRATION

Concentration Reading %	Litres Of Coolant To Be Added	
	Automatic Transmission	Manual Transmission
0	4.95	5.15
5	4.46	4.62
10	3.96	4.12
15	3.47	3.61
20	2.97	3.08
25	2.48	2.57
30	1.98	2.01
35	1.48	1.54
40	0.99	1.05
45	0.50	0.52
50	0	0

NOTE

If the reading is not clear, then properly clean and dry the measuring surface, then conduct another test. Also ensure that there is sufficient fluid on the measuring prism.

9 If the reading shows that the concentration level of the coolant is inadequate, refer to the Coolant Concentration table to determine the amount of coolant that needs to be added to the coolant recovery reservoir.

10 Start and run the engine until normal operating temperature is reached, to allow the added coolant to be distributed throughout the engine cooling system.

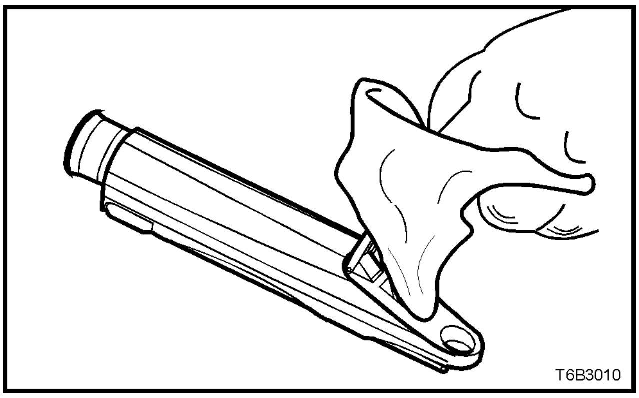

Figure 6B1 – 17

Calibrating the Tester

The coolant tester calibration is checked at manufacture. If however, the calibration check detailed in Step 1 of this method shows that the instrument is not reading correctly, then conduct the following recalibration procedure:

1 Remove the sealant covering the adjustment screw on the underneath of the tester.

2 With a distilled water sample on the measuring surface, carefully adjust the screw until a zero reading is obtained.

NOTE

DO NOT completely remove the screw.

3 After recalibration, reseal the screw with a small amount of silicone sealant.

Method 2 – Hydrometer

1 The cooling system should be at or close to ambient temperature.

2 Carefully remove the coolant filler cap from the coolant outlet housing and, while holding the rubber bulb squeezed, insert nozzle of coolant tester hydrometer, Tool No. AU505 into coolant. Releasing the rubber bulb will then draw sufficient coolant into the tester to float hydrometer bulb freely.

3 Hold tester at eye level and read scale on hydrometer bulb at coolant level.

The reading shows the percentage of ethylene glycol antifreeze contained in the engine coolant.

4 The hydrometer reading should show 50% if the coolant concentration is correct.

- If a reading of less than 50% is achieved, the cooling system requires topping up with either DEX-COOL® long-life coolant or its equivalent, known as Extended Life Anti-freeze Coolant conforming to GM specification 6277M.
- Refer to the Coolant Concentration table shown for the previous method to determine how much coolant additive of either type is required to be added to the cooling system to bring the coolant to the specified concentration.

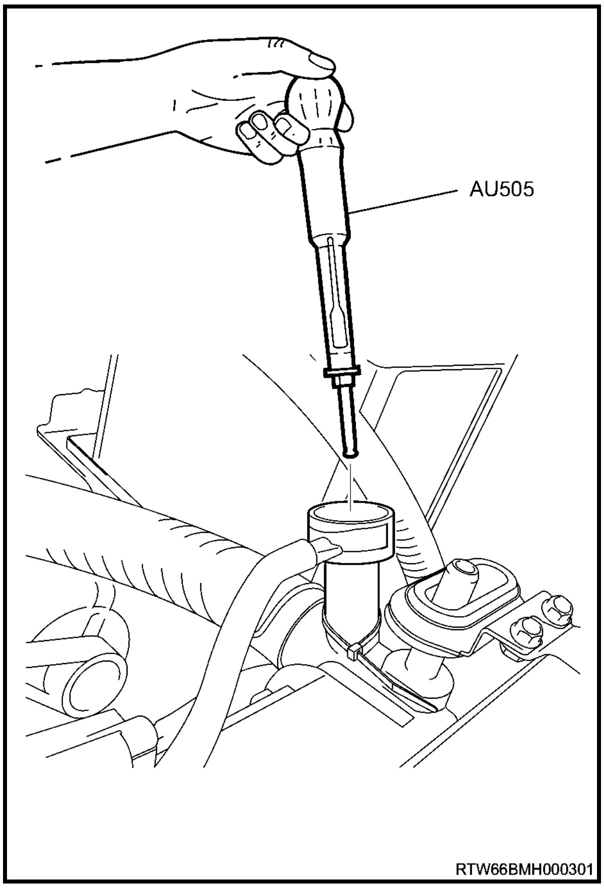

Figure 6B1 – 18

5 Drain sufficient quantity of coolant from cooling system to allow top-up with coolant additive, then add the required amount of the correct additive. Install coolant filler cap to the coolant outlet housing.

6 Start and run the engine until normal operating temperature is reached. This will allow the added coolant to be distributed throughout the engine cooling system.

3.3 Draining and Filling Cooling System

Draining

WARNING

Refer to 3.1 Service Notes in this Section, for important safety items.

1 Allow engine to cool to ambient temperature (less than 50° C), and then remove the coolant filler cap (located near the brake booster assembly).

CAUTION

Disconnection of the battery affects certain vehicle electronic systems. Refer to 1.1 WARNING, CAUTION and NOTES, before removing the ground lead.

2 Disconnect the battery ground lead. Refer to 6D1– 3 Battery – V6.

3 Drain the coolant from the system via the radiator drain tap on the lower RHS of the radiator below the lower hose outlet. Attach a suitable piece of rubber tubing to the tap outlet to help direct the flow of the coolant into a suitable container (capacity at least 12 litres).

Filling

During any service operation that requires the cooling system to be partly or completely drained, the following instructions must be followed when refilling the cooling system, to ensure that all air is bleed from system.

WARNING

- **Refer to 3.1 Service Notes in this Section, for important safety items.**
- **Before opening the radiator bleed screw, the cooling system must first be completely depressurised with the engine coolant filler cap removed.**

CAUTION

Do not mix different types of anti-freeze or corrosion inhibitors, as they may be incompatible. Always check which coolant is to be added to the particular vehicle being serviced. If a different type has been used in the cooling system (or is added accidentally), flush the system with clean water. Refer to 3.4 Cleaning Cooling System in this Section.

NOTE

Ensure that the radiator drain tap located at the bottom of right-hand side radiator tank is closed before proceeding.

1 With the engine off, remove the coolant filler cap on the coolant outlet housing, located at the front left-hand side of the engine.

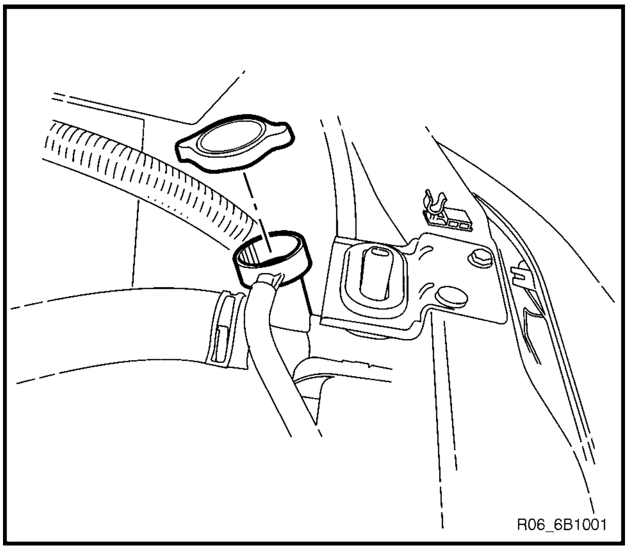

Figure 6B1 – 19

2 If filling a completely empty cooling system for automatic transmission models, mix 5 litres of clean water with 5 litres of the recommended coolant or 5.2 litres of each for manual transmission models.

3 Add coolant via the engine coolant filler neck on the coolant outlet housing.

NOTE

Do not replace the coolant filler cap before starting the engine (in step 6). Leaving the filler cap off allows the engine to warm up without pressurising.

4 Reconnect battery ground lead. Refer to 6D1 – 3 Battery – V6.

5 Start the engine and set the HVAC controls to:

- Full hot
- Low fan

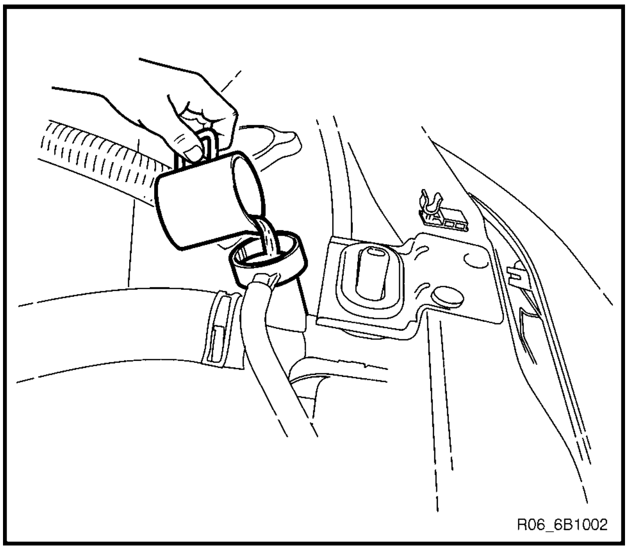

Figure 6B1 – 20

6 Run the engine at approximately 2,000 rpm to warm up the engine.

7 Wait until the radiator fan switches on.

8 When the radiator fan has switched on, let the engine rpm drop back to idle.

9 Turn the engine off when the radiator fan switches off.

10 Top up the coolant until full.

11 Replace the coolant filler cap.

CAUTION

Do not loosen or remove the radiator filler cap when the coolant temperature is high. Steam or boiling coolant will gush out and you may be burnt. To open the radiator filler cap, cover the filler cap with a thick cloth when the coolant has cooled, release the pressure by slowly turning the filler cap, and remove the cap.

12 Open the coolant reservoir tank cap.

13 Top up the radiator coolant recovery reservoir to the MAX line.

14 Reinstall the coolant recovery reservoir cap.

NOTE

This condition only applies when the cooling system is first being filled after a major loss of coolant. The level of coolant in the reservoir will then drop, once the engine is started and normal operating temperature is reached. The coolant level should then be maintained at the correct level (between the MAX and MIN Lines).

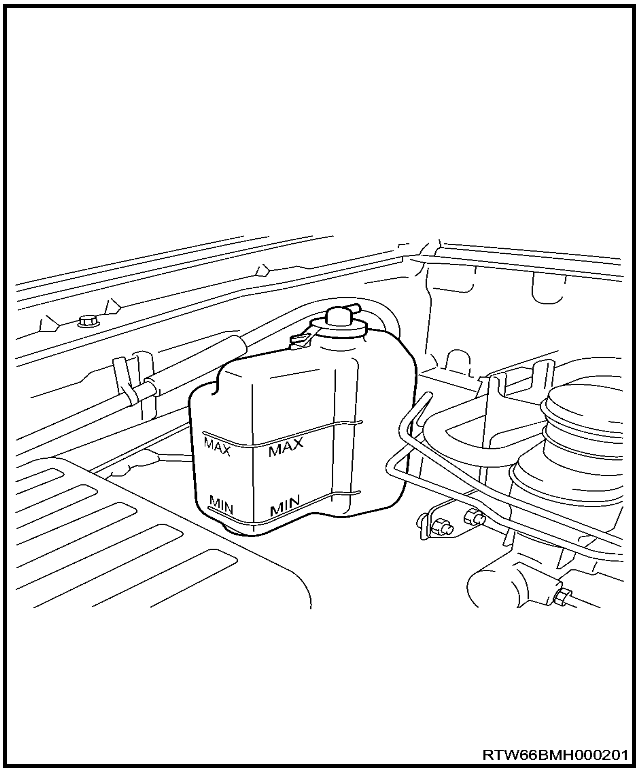

Figure 6B1 – 21

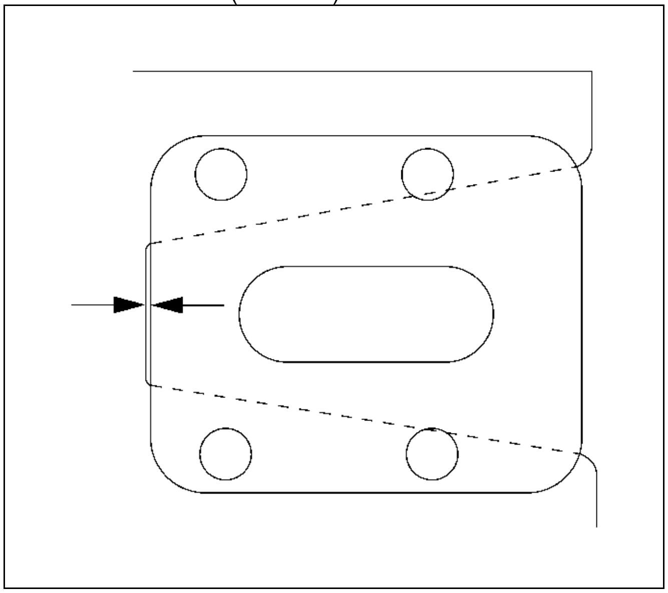
Check clearance between capsule and bracket. It must be less than 1 mm (0.039 in).



431RW031

Column Universal Joint (between the power steering unit and the steering shaft)

If resistance is felt when checked by rotating the joint, replace the lower second steering shaft.

Shaft Universal Joint (between the lower second steering shaft and the second steering shaft)

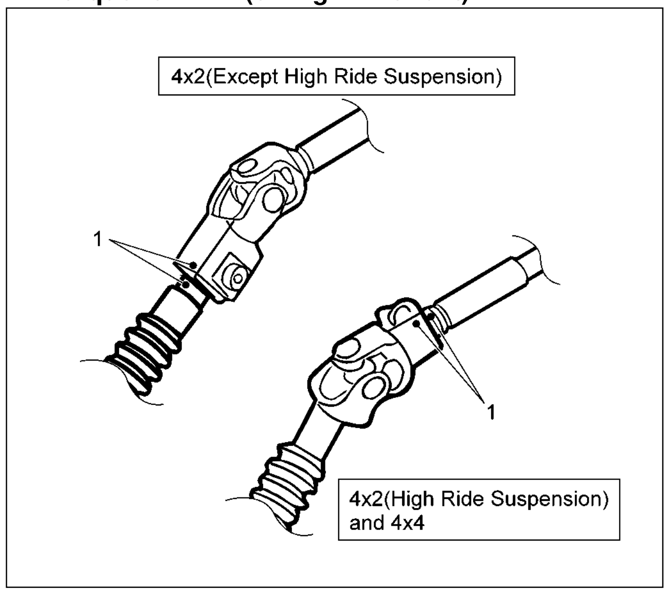
If resistance is felt when checked by rotating the joint, replace the second steering shaft assembly.

Tilt Mechanism

The tilt mechanism should move smoothly.
While locking the tilt mechanism, be sure the steering column is latched securely by pushing the steering wheel upward and downward.

Installation

1. Align the setting mark (1) on the second steering shaft and the steering column assembly (applied at disassembly).
2. Connect the steering column assembly to the second steering shaft. Tighten the bolts to the specified torque.
   Torque: 31 N·m (3.2 kgf·m/23 lb·ft)



RTW53BSH00301

3. Thread the steering column assembly through the hole in the dashpanel. Temporarily tighten the steering column and the second steering shaft fixing bolts.
4. Align the setting marks (applied at disassembly) and connect the lower second steering shaft and the second steering shaft. Tighten the universal joint bolts to the specified torque.
   Torque: 31 N·m (3.2 kgf·m/23 lb·ft)
5. Tighten the steering column fixing bolt (pedal bracket side) to the specified torque (This bolt was temporarily tightened in Step 3).
   Torque: 20 N·m (2.0 kgf·m/14 lb·ft)
6. Tighten the second steering shaft fixing bolt to the specified torque (This bolt was temporarily tightened in Step 3)
   Torque: 20 N·m (2.0 kgf·m/14 lb·ft)
7. Tighten the steering column fixing bolt (dashpanel side) to the specified torque (This bolt was temporarily tightened in Step 3).
   Torque: 20 N·m (2.0 kgf·m/14 lb·ft)
8. Install combination switch and SRS coil assembly. After installation of combination switch assembly, connect the combination switch wiring harness connector and the SRS 2-way connector located under the steering column.

3.4 Cleaning Cooling System

NOTE

- Before carrying out reverse flushing procedures, it is recommended that a cleaning solution be used to loosen scale and corrosion. Only use a Holden approved radiator cleaner following the instructions on the container label.
- This operation should only be carried out when the engine and radiator are at ambient temperature.
- When using specialised cooling system flushing equipment, connect the equipment as recommended by the manufacturer.

Cooling System Reverse Flush

Radiator

CAUTION

Refer to 'Environmental Issues' in 3.1 Service Notes, before draining the coolant.

1 Drain the cooling system. Refer to 3.3 Draining and Filling Cooling System in this Section.

WARNING

Always wear eye protection when working with spring-type hose clamps. Failure to do so may result in eye injury.

2 Remove the lower radiator outlet hose (1) at the coolant inlet pipe connection (2).

3 Remove the upper radiator inlet hose (3) at the coolant outlet housing connection (4).

4 Attach a lead-away hose to the open end of the upper radiator hose.

5 Attach a suitable piece of hose or adaptor between the flushing gun and the open end of the lower radiator hose.

6 Connect and operate the flushing equipment as recommended by the manufacturer.

CAUTION

Apply air pressure gradually and not in excess of 120 kPa, otherwise radiator damage will result.

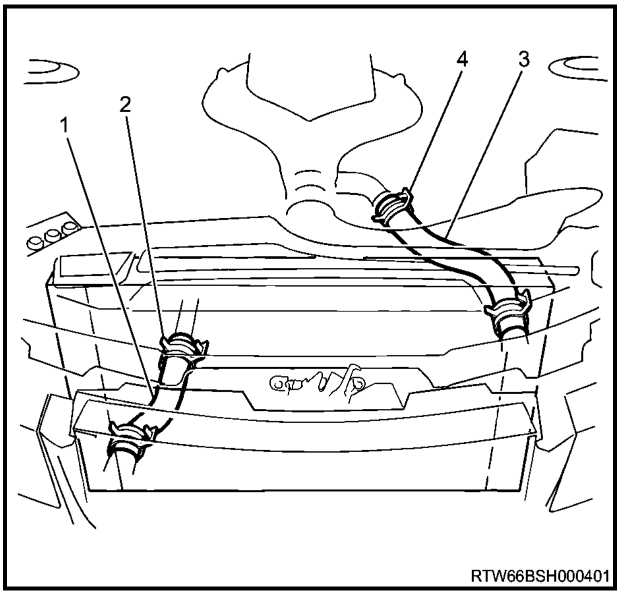


Figure 6B1 – 22

7 Continue flushing until the water from the lead-away hose runs clean and clear.

8 Install all disconnected hoses, ensuring that they are correctly positioned and securely clamped.

9 Fill the cooling system. Refer to 3.3 Draining and Filling Cooling System in this Section.

10 Pressure test the cooling system. Refer to 3.7 Pressure Testing in this Section.

Engine

CAUTION

Refer to ‘Environmental Issues’ in 3.1 Service Notes, before draining the coolant.

1 Drain the cooling system. Refer to 3.3 Draining and Filling Cooling System in this Section.

WARNING

Always wear eye protection when working with spring-type hose clamps. Failure to do so may result in eye injury.

2 Remove the upper and lower radiator hoses from the coolant outlet housing and coolant inlet pipe connections. Refer to Figure 6B1 – 22.

3 Remove the thermostat housing from the rear of the engine block. Refer to 6A1 Engine Mechanical – V6..

4 Remove the thermostat from the thermostat housing and reinstall the housing to the rear of the intake manifold. Refer to 3.8 Thermostat in this Section.

5 Remove both heater hoses (1) and (2) from their connections at the heater pipe assembly, noting which hose was connected to which connection. Seal the heater pipe assembly connections by looping the heater inlet connection to the outlet connection using a suitable piece of hose and two hose clamps.

6 Install a lead-away hose to the coolant inlet pipe connection and a length of suitable hose between the coolant outlet housing connection and the flushing equipment.

7 Connect and operate the flushing equipment as recommended by the manufacturer.

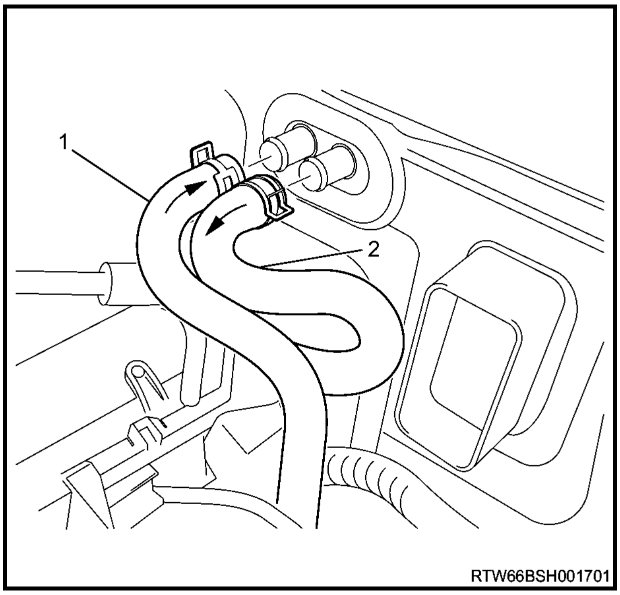

Figure 6B1 – 23

8 Continue flushing until the water from the lead-away hose runs clear.

9 Remove the coolant recovery reservoir, flush it out with clean water and install. Refer to 3.9 Coolant Recovery Reservoir in this Section.

10 Install the thermostat. Refer to 3.8 Thermostat in this Section.

11 Install all disconnected hoses, ensuring that they are correctly positioned and securely clamped.

12 Fill the cooling system. Refer to 3.3 Draining and Filling Cooling System in this Section.

13 Pressure-test the cooling system. Refer to 3.7 Pressure Testing in this Section.

Heater Hoses and Core

CAUTION

Refer to ‘Environmental Issues’ in 3.1 Service Notes, before draining the coolant.

1 Drain the cooling system. Refer to 3.3 Draining and Filling Cooling System in this Section.

WARNING

Always wear eye protection when working with spring-type hose clamps. Failure to do so may result in eye injury.

2 Remove both heater hoses (1) and (2) from their connections at the heater pipe assembly, noting which hose was connected to which connection.

3 Direct the hose (1) that was connected to the heater pipe assembly's front connection into a suitable container.

4 Attach the hose (2) from the rear-most connection to the flushing gun.

5 Cycle the heater switch to ensure that the water valve is open.

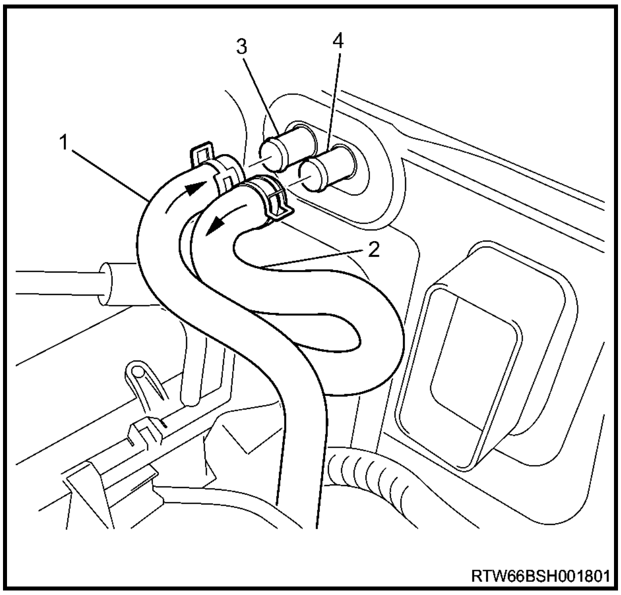

Figure 6B1 – 24

6 Connect and operate the flushing equipment as recommended by the manufacturer.

CAUTION

Apply air pressure gradually and not in excess of 130 kPa, otherwise heater core damage will result.

7 Install all disconnected hoses, ensuring that they are correctly positioned and securely clamped.

8 Fill the cooling system. Refer to 3.3 Draining and Filling Cooling System in this Section.

9 Pressure test the cooling system. Refer to 3.7 Pressure Testing in this Section.

3.5 Drive Belt Tension

An automatic tensioner assembly provides drive belt tension. The tensioner is an idler pulley mounted on a spring-loaded arm that maintains the drive belt at the proper tension, without imposing undue loads on the various components.

Throughout its functional travel, the tensioner mechanism will maintain correct belt tension, using a pulley (1) mounted to a spring-loaded arm (2), which compensates for increases in belt wear and stretch.

When the indicator pointer (3) on the tensioner has reached minimum tension range (4), the tensioner has reached the full extent of its travel and replacement of the belt (5) is necessary.

The maximum tension range is shown at (6).

Drive belt tension can be checked using Tool No. BT3373-F. Refer to 6A1 Engine Mechanical.

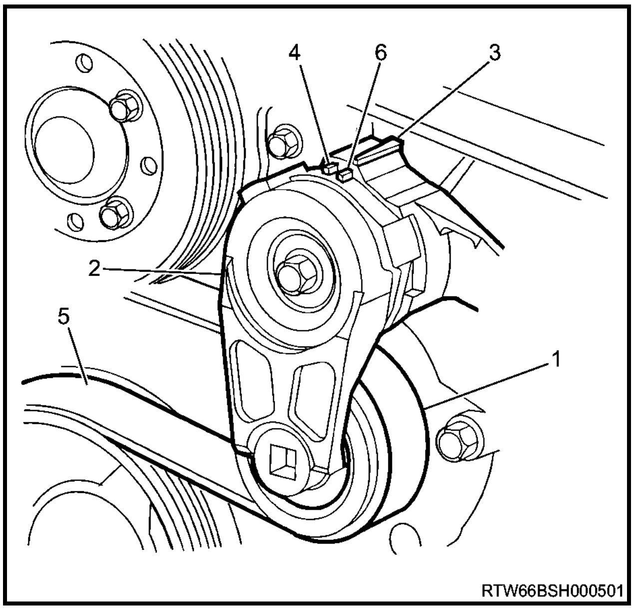

Figure 6B1 – 25

Inspect

The four views in Figure 6B1 – 26 show the various stages of drive belt wear, to assist in belt replacement decisions.

NOTE

Condition of the belt ribs can be better assessed if the belt is wrapped over the coolant pump drive pulley.

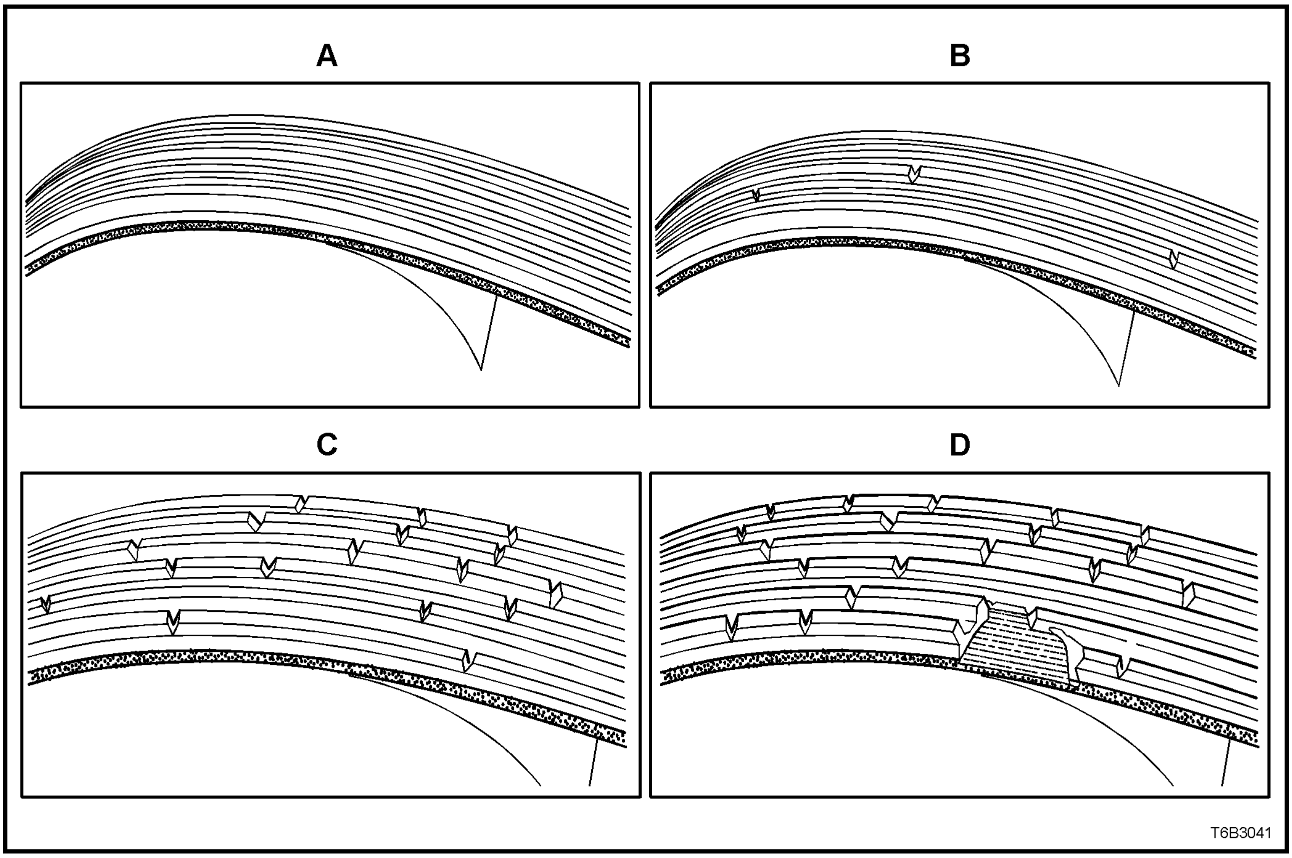

Figure 6B1 – 26

Legend

A New Belt: No cracks or chunks.

B Moderately Used Belt: Few cracks, with some wear on the ribs and in the grooves. Belt replacement not required.

C Severely Used Belt: Several cracks per 30 mm. Should be replaced before chunking occurs

D Failed Belt: Separation of rib material from backing (chunking). Belt must be replaced immediately.

3.6 Coolant Hoses

WARNING

Always wear protective safety glasses when working with spring type hose clamps. Failure to do so could result in eye injury.

Coolant hoses are installed as shown in the following illustrations, taking note that there are a number of variants, depending on a specific vehicle specification.

Hose connections should be thoroughly cleaned before installing any new hose.

After all hoses are installed, always refill the cooling system with correct concentration of coolant, refer to 3.3 Draining and Filling Cooling System and pressure test cooling system, refer to 3.7 Pressure Testing in this Section.

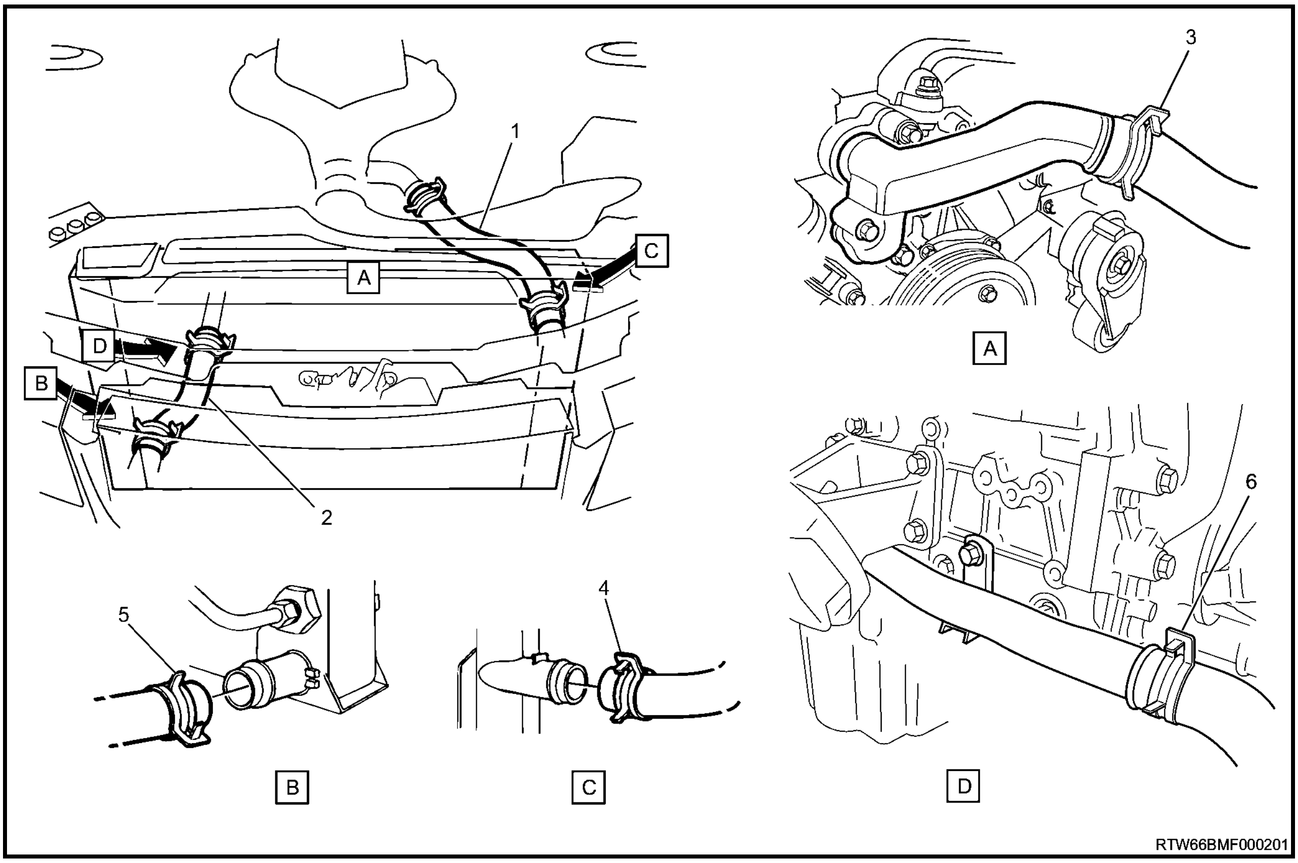

Figure 6B1 – 27

Legend

1 Radiator Hose – Upper
2 Radiator Hose – Lower
3 Hose Clamp – Upper Hose to Engine Outlet Housing
4 Hose Clamp – Upper Hose to Radiator Inlet
5 Hose Clamp – Lower Hose to Radiator Outlet
6 Hose Clamp – Lower Hose to Engine Coolant Inlet Pipe

3.7 Pressure Testing

Coolant Filler Cap Pressure Testing

WARNING

Refer to 3.1 Service Notes in this Section, for important safety items.

1 Allow engine to cool to ambient temperature (less than 50° C), then remove coolant filler cap.

2 Inspect and clean both sides (1) of coolant filler cap gasket with a wet cloth.

NOTE

Use only water to wet the cleaning cloth.

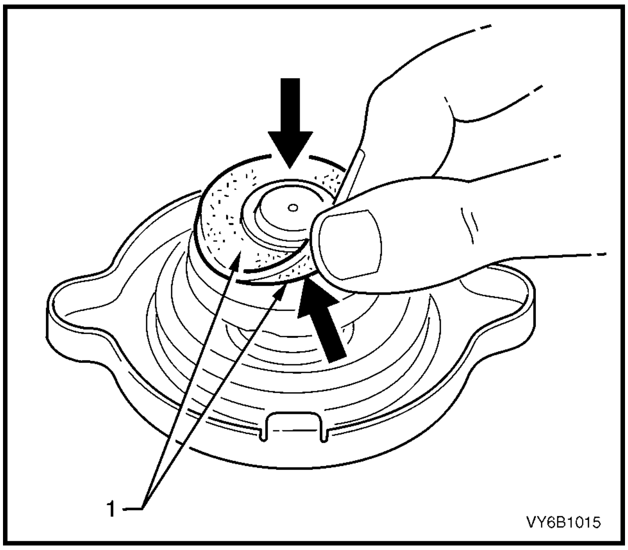

Figure 6B1 – 28

3 Lift centre vacuum valve. Clean and inspect the gasket and sealing surface under the valve (1).

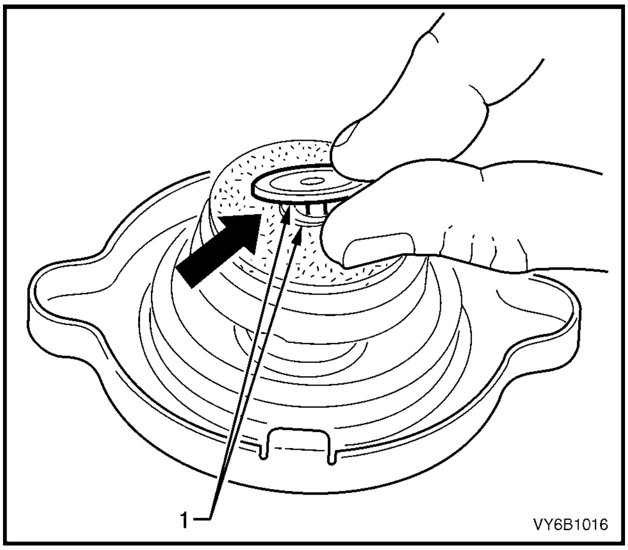

Figure 6B1 – 29

4 Attach coolant filler cap (2) to a commercially available cooling system pressure tester (1), using the pressure cap adaptor.

5 Slowly pressurise cap to 120 – 130 kPa. The cap is serviceable if it unloads slightly above this pressure range and holds pressure at 120 kPa.

NOTE

Should the cap fail to reach or hold the specified pressure, replace the cap.

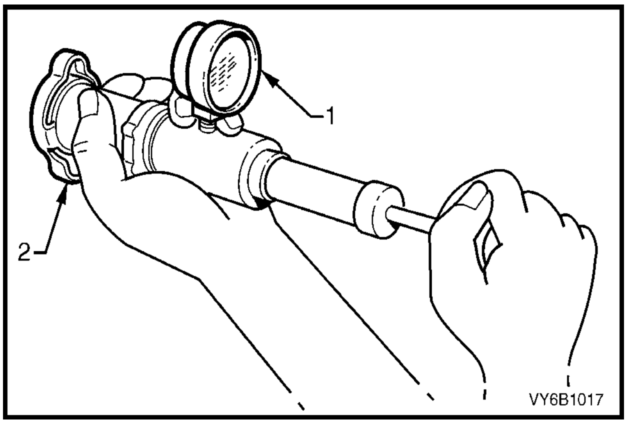

Figure 6B1 – 30

6 Prior to installing coolant filler cap ensure that the coolant filler neck cap seating surface is clean and free from obstruction.

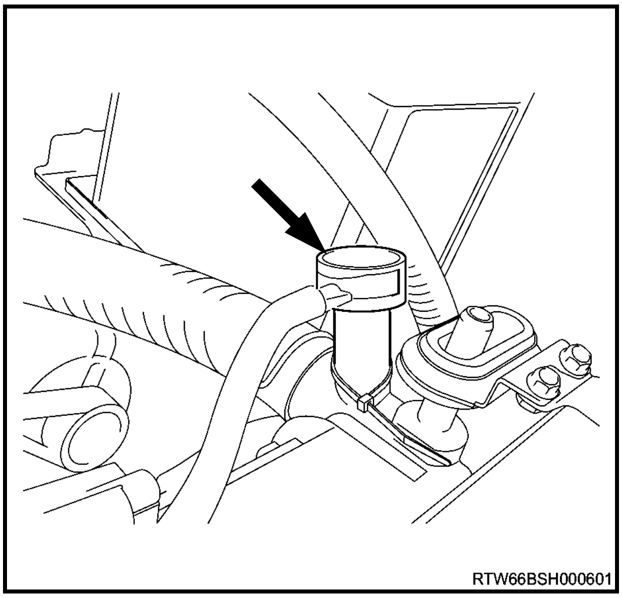

Figure 6B1 – 31

Cooling System Pressure Testing

WARNING

Refer to 3.1 Service Notes in this Section, for important safety items.

1 Allow the engine to cool to ambient temperature (less than 50° C), then remove coolant filler cap.

2 Ensure that the coolant level is correct.

3 Install the coolant filler neck adaptor, to a commercially available cooling system pressure tester (1).

4 Install the assembly to the engine coolant filler neck.

5 Using compressed air, blow dry any spilled coolant around coolant filler neck.

CAUTION

Do not exceed the stated pressure, as damage to the cooling system could otherwise result.

6 Using the cooling system pressure tester pump, pressurise cooling system to 130 kPa absolute maximum and check for leaks at the following points:

- All hoses and hose connections
- Overflow hose connection at coolant outlet housing connection

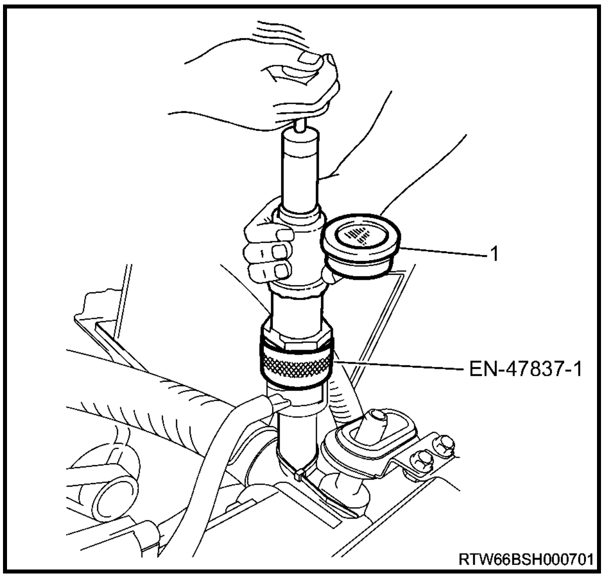

Figure 6B1 – 32

- Radiator seams and core
- Corroded or faulty engine Welch plugs
- Coolant pump and gasket
- Thermostat housing and coolant inlet pipe connection
- Radiator drain tap and bleed screw
- Vehicle heating system (e.g. heater core and water valve)

NOTE

For heater Removal and Installation, refer to 2A – Heater and Air-conditioning.

7 Check engine oil dipstick for evidence of engine oil contamination with coolant.

8 If pressure will not hold, there is a leak in the cooling system. Repair as necessary.

NOTE

If visible loss of coolant is not evident from pressure testing, then the use of a dye and black light, may be necessary. Refer to 4.7 Black Light and Dye Leak Diagnosis Method, in this Section.

3.8 Thermostat

Remove

WARNING

Do not remove coolant filler cap while the engine coolant temperature is above 50° C, as personal injury may result.

1 Allow engine to cool to ambient temperature (less than 50° C), then remove the coolant filler cap (located at the front left-hand side of the engine).

CAUTION

Disconnection of the battery affects certain vehicle electronic systems. Refer to 00 Warnings, Cautions and Notes, before removing the ground lead.

2 Disconnect the battery ground lead. Refer to 6D1-3 Battery – V6.

CAUTION

Refer to 'Environmental Issues' in 3.1 Service Notes, before draining the coolant.

3 Drain the coolant from the system. Refer to 3.3 Draining and Filling Cooling System in this Section.

4 Remove the complete intake manifold assembly. Refer to 6A1 Engine Mechanical – V6.

5 Plug each of the exposed intake ports with lint free cloth to prevent the entry of foreign matter.

6 Remove the coolant inlet pipe. Refer to 3.12 Coolant Inlet Pipe in this Section.

WARNING

Always wear protective safety glasses when working with spring type hose clamps. Failure to do so could result in eye injury.

7 Use a straight-blade screwdriver (3) to release the heater hose quick connect clips (4).

8 Disconnect the heater hoses (1) from the heater pipes (2) in two places.

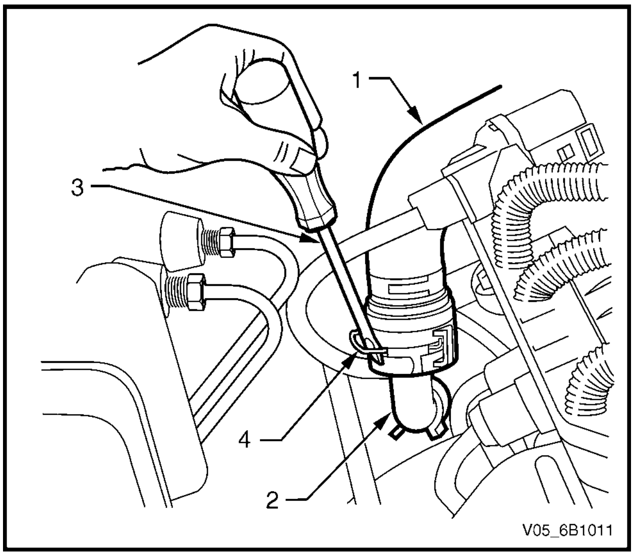

Figure 6B1 – 33

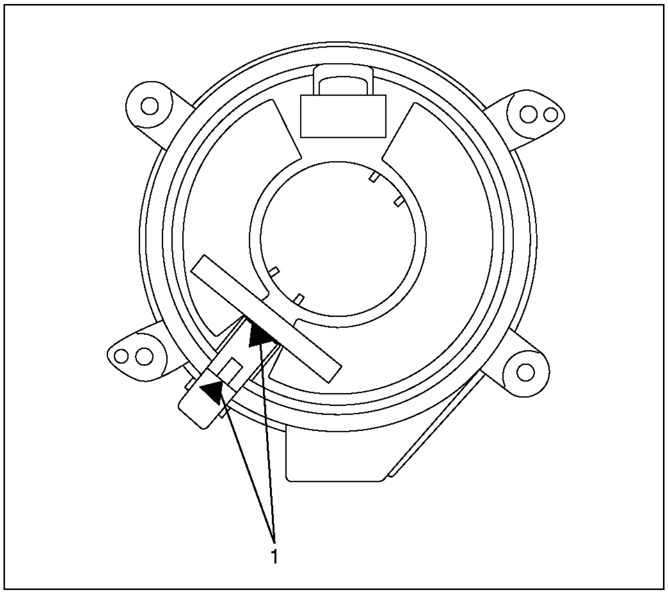
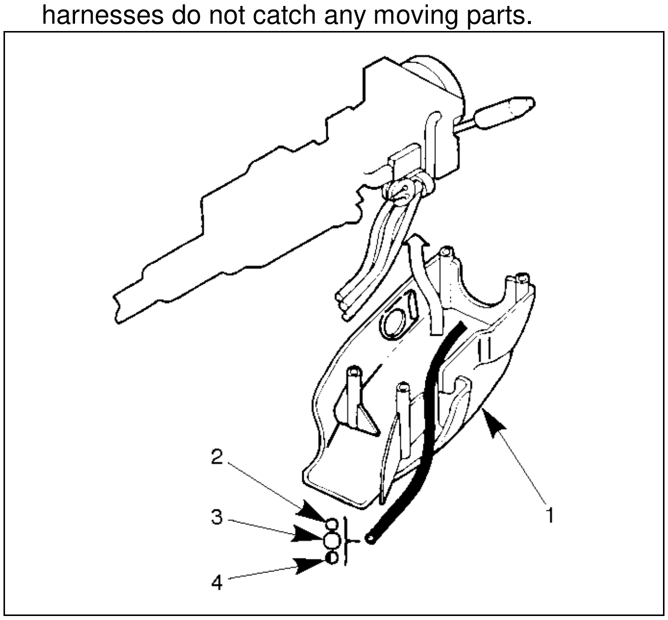
9. Turn the SRS coil fully counterclockwise, return about 3 turns and align the neutral mark (1). (with SRS air bag)

CAUTION: When turning the SRS coil fully counterclockwise, stop turning if resistance is felt. Further forced turning may damage to the cable in the SRS coil.



826RW014

10. When installing the steering column cover, be sure to route each wiring harness as illustrated so that the harnesses do not catch any moving parts.



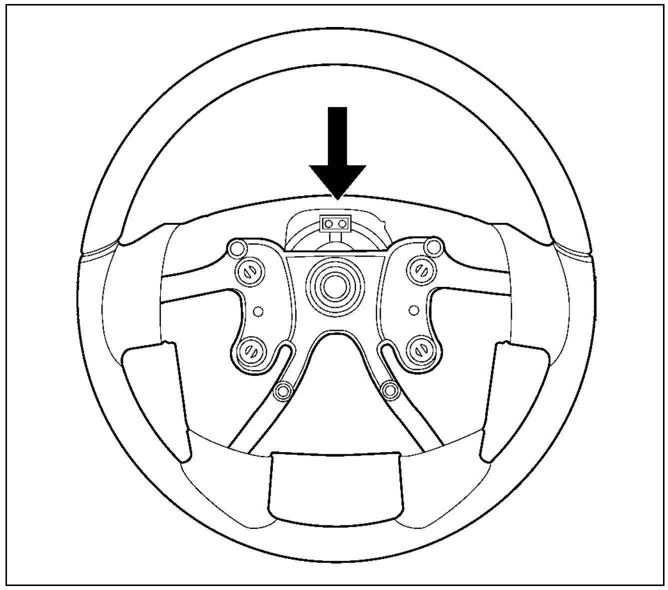
825RW017

Legend

(1) Steering Column Cover
(2) Starter Switch Harness
(3) Combination Switch Harness
(4) Inflator Module Harness

11. Install steering wheel and align the setting marks made when removing.
Refer to the adjustment method in case a mark has not been applied in this section.

NOTE: Confirm SRS and horn harness connector is fixed by the steering wheel.



RTW73BSH000701

CAUTION: Never apply force to the steering wheel in the direction of the shaft by using a hammer or other impact tools in an attempt to remove the steering wheel. The steering shaft is designed as an energy absorbing unit.

12. Tighten the steering wheel fixing nut to the specified torque.
Torque: 35 N·m (3.6 kgf·m/26 lb·ft)
13. Support the module and carefully connect the module connector and horn lead, then install inflator module.

NOTE: Pass the lead wire through the tabs on the plastic cover (wire protector) of inflator to prevent lead wire from being pinched.

14. Tighten bolts to specified torque.
Torque: 3 N·m (0.3 kgf·m/26 lb·in)
15. Install driver knee bolster (reinforcement).
16. Install instrument panel lower cover.
17. Install the engine hood opening lever.
18. Connect the yellow 2-way SRS connector and horn lead located under the steering column.
19. Connect the battery "-" terminal cable (with SRS air bag).

9 To gain easier access to the heater pipe flange and thermostat housing bolts, disconnect the engine harness and lay back on the right side of the engine bay. Apart from those harness connectors removed during the intake manifold removal, this involves the removal of wiring harness connectors and fasteners, as detailed:

a Pull out the release bar (arrows) on each of the ignition coil packs (1) on cylinders 2, 4 and 6, before disconnecting each connector.

b The coolant temperature sensor.

c The left side Pre-O2 sensor connector, 2, 4 & 6.

NOTE

Refer to 8A – Electrical Body & Chassis for the location of harness connectors, not shown.

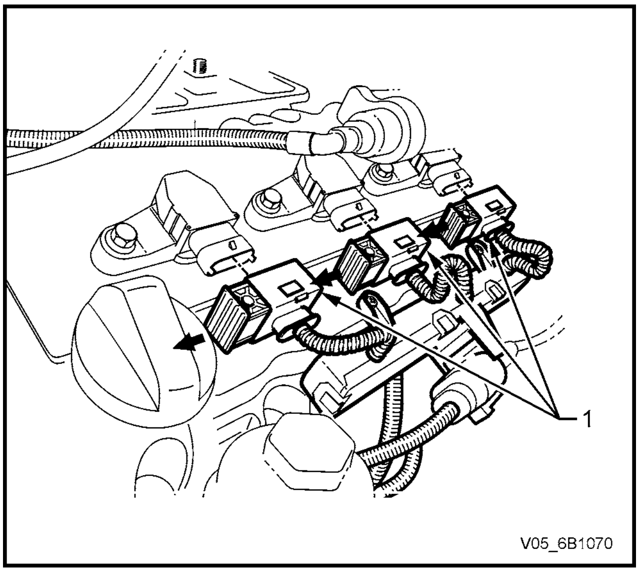


Figure 6B1 – 34

10 Remove the bolt (1) securing the engine harness ground terminal (2), to the cylinder block.

11 Prise both locking legs of the left side engine harness former (4), free, then lift up on the harness former to release.

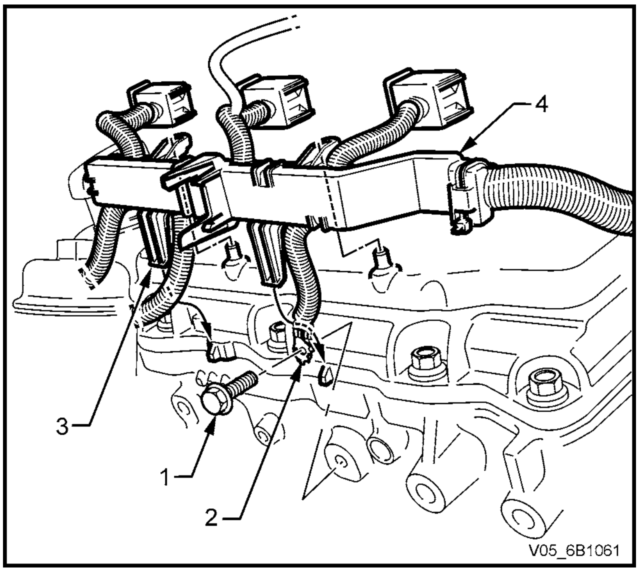

Figure 6B1 – 35

12 Working at the rear of the engine, disconnect the engine harness to transmission harness connector (1), as required.

13 Remove the two bolts (2) securing the engine harness former (3) to the rear of the engine.

14 Carefully lift the engine harness free and drape on the right side of the engine.

NOTE

For further information on removing the thermostat housing and associated components, refer to 6A1 Engine Mechanical – V6.

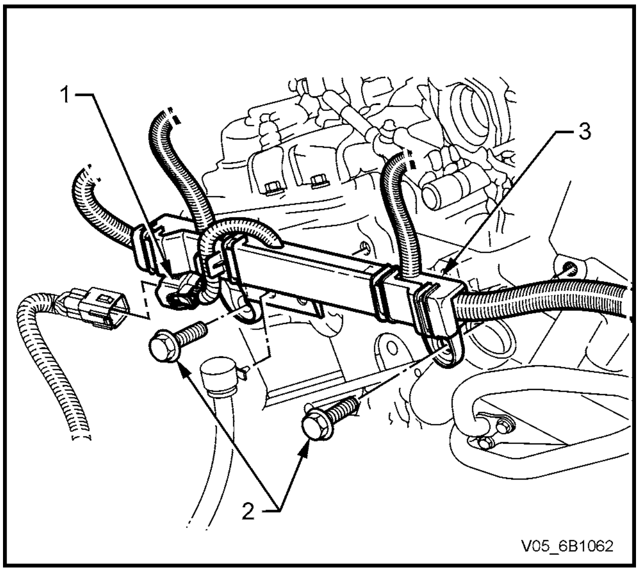

Figure 6B1 – 36

15 Remove the heater pipe assembly (1) to right-hand side cylinder head (2) attaching bolt (3).

16 Remove the heater pipe assembly to thermostat housing (4) attaching bolts (5), then remove the heater pipe assembly.

17 Remove and discard the heater pipe assembly to thermostat housing O-ring seals (6).

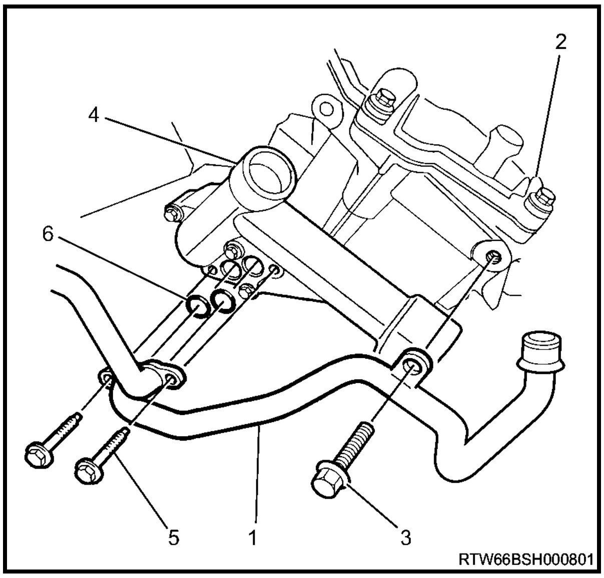

Figure 6B1 – 37

18 Remove the three thermostat housing attaching bolts (1), rubber grommets (2), then remove the thermostat housing (3).

NOTE

The upper thermostat housing attaching bolt is longer than the two lower bolts.

19 Remove and discard the thermostat housing to engine block gasket (4).

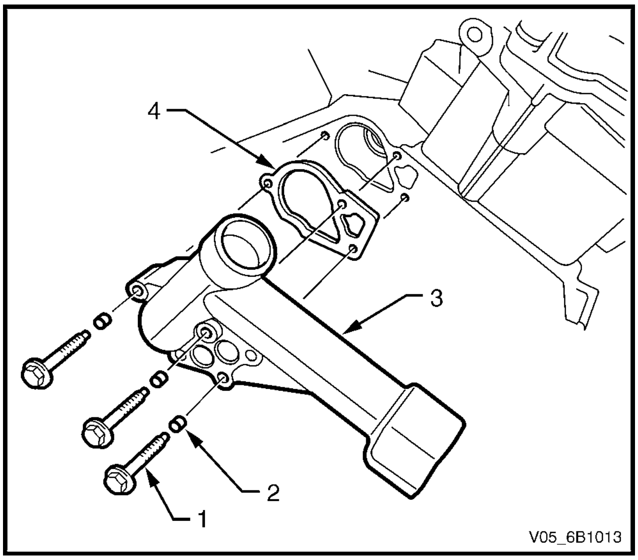

Figure 6B1 – 38

Test

1 With the thermostat (1) installed in the housing, suspend it and a suitable thermometer (2) in a container of 50% clean fresh water and 50% Dexron ® long life coolant, (conforming to GM 6277M).

NOTE

Neither the thermostat assembly (1) nor the thermometer (2) should rest on the bottom of the container because of uneven concentration of heat at this point when the container is heated.

2 Heat container until thermostat begins to open. Agitate solution to ensure uniform temperature. Note temperature and ensure thermostat opens within specified temperature range.

Thermostat Opening Specifications	
Opening Temperature	82° C
Fully Open Temperature	95° C

3 Replace thermostat if it does not meet these operating conditions.

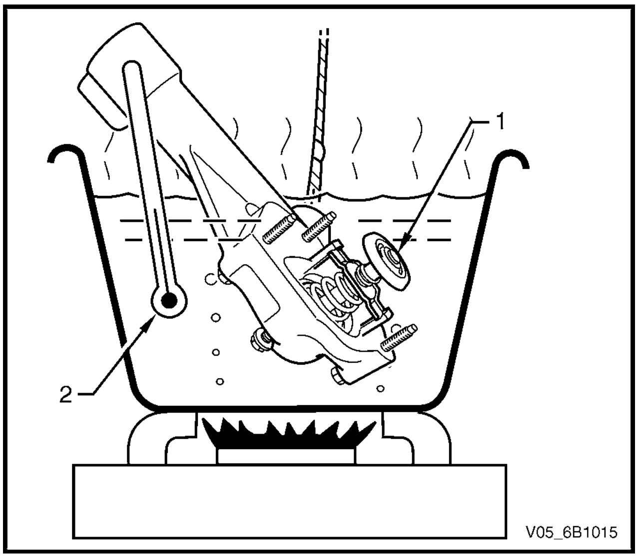

Figure 6B1 – 39

Dismantle

CAUTION

Only dismantle the thermostat if a reverse flushing operation of the cylinder block is to be carried out. If the testing operation indicates that the thermostat is faulty, then the housing and thermostat are only serviced as an assembly.

Remove thermostat (1) from thermostat housing (2) as follows:

a Secure the thermostat housing by gripping in a vice fitted with soft jaws.

WARNING

Always wear protective safety glasses when working with spring-loaded devices. Failure to do so could result in eye injury.

b Depress the retaining bar (3) on both sides of the thermostat and rotate the thermostat until it clears the retaining lugs (4) on the thermostat housing (2).

c Release the thermostat spring force.

d Remove the thermostat assembly from the thermostat housing.

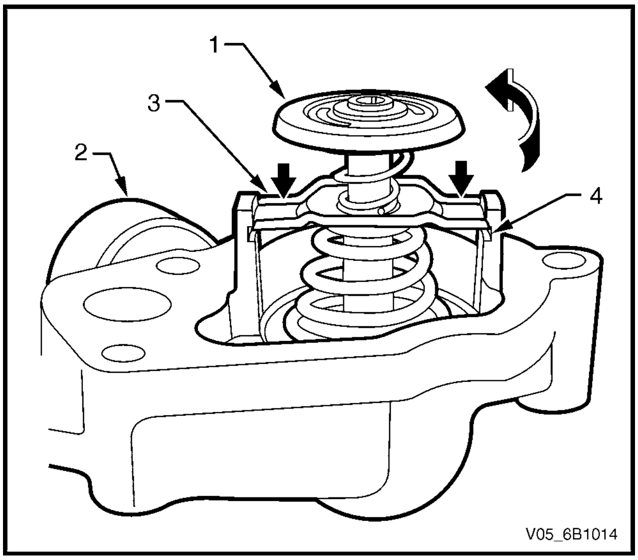

Figure 6B1 – 40

Reassembly

The reassembly process is the reverse to that used for disassembly, with the following exceptions:

1 Check that the valve sealing surface is undamaged.

2 Wipe the valve sealing surface to ensure a clean surface.

Install

WARNING

Always wear protective safety glasses when working with spring-loaded devices. Failure to do so could result in eye injury.

1 Install the thermostat into the housing (reverse to removal procedure).

2 Ensure that the engine block and thermostat housing mating surfaces are clean and dry.

3 Install a new gasket to the thermostat housing.

4 Install the thermostat housing to the engine block and secure with the attaching bolts (with rubber grommets installed). Tighten all bolts to the correct torque specification.

Thermostat housing to engine block bolt torque specification.............................10 N.m

5 Ensure that the heater pipe assembly and thermostat housing mating surfaces are clean and dry.

6 Install new O-rings to the heater pipe assembly.

7 Install heater pipe assembly to thermostat housing and secure with the attaching bolts. Tighten all bolts to the correct torque specification.

Heater pipe assembly to thermostat housing bolt torque specification.........................10 N.m

8 Install heater pipe assembly to right-hand cylinder head bolt. Tighten bolt to the correct torque specification.

Heater pipe assembly to cylinder head bolt torque specification ....35 N.m

WARNING

Always wear protective safety glasses when working with spring type hose clamps. Failure to do so could result in eye injury.

9 Reinstall the engine wiring harness, securing the rear harness former to the rear of the engine with the two retaining bolts, tightened to the correct torque specification.

Rear engine harness former retaining bolts torque specification......................15 N.m

10 Reinstall the left side engine harness former to the two locating pegs, then push inward to secure.

11 Reinstall the bolt securing the engine harness ground terminal, to the left side of the cylinder block and tighten to the correct torque specification.

Engine harness ground terminal attaching bolt torque specification.......................12 N.m

12 Reinstall each wiring harness connector to its correct location, ensuring that all security clips are installed correctly.

13 Connect the heater hoses to the heater pipe assembly.

14 Install the coolant inlet pipe. Refer to 3.12 Coolant Inlet Pipe in this Section.

15 Close the radiator drain tap on the lower LHS of the radiator and remove the piece of rubber tubing to the tap outlet.

16 Reinstall the complete intake manifold assembly. Refer to 6A1 Engine Mechanical.

17 Refill cooling system. Refer to 3.3 Draining and Filling Cooling System in this Section.

18 Check for coolant leaks. Refer to 3.7 Pressure Testing in this Section.

19 Install the radiator shroud.

20 Install the engine dress covers. Refer to 6A1 Engine Mechanical.

21 Reconnect battery ground lead. Refer to 8A_ Electrical Body & Chassis.

22 Road test the vehicle to check for correct operation.

3.9 Coolant Recovery Reservoir

Remove

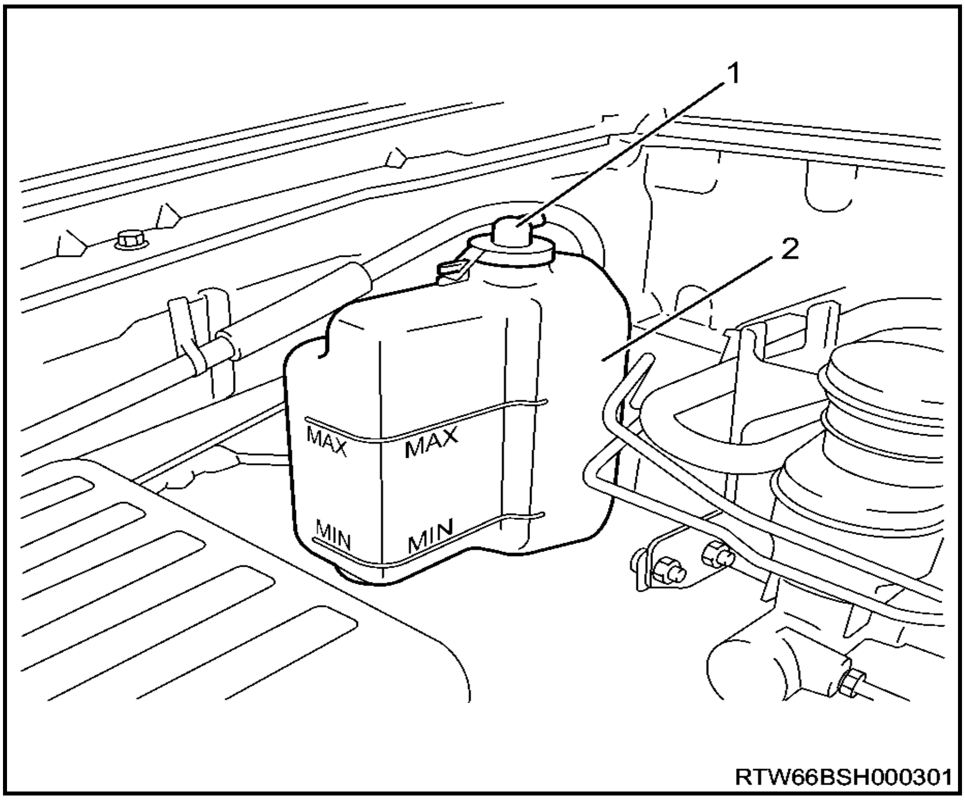

Figure 6B1 – 41

Legend

1 Filler Cap
2 Reservoir

Remove the reservoir assembly attaching screws, and remove the reservoir assembly from the vehicle.

Inspect

1 Drain contents from reservoir assembly.

2 Clean the reservoir assembly with water and dry using compressed air.

3 Check reservoir and assembly for damage, for example abrasions, cracks or distortion. Replace if required.

Install

Installation of the reservoir assembly is the reverse of removal procedures, noting the following points:

1 Refill cooling recovery reservoir and cooling system with the correct concentration of coolant. Refer to 3.3 Draining and Filling Cooling System in this Section.

2 Check coolant recovery system for leaks.

3.10 Coolant Pump

Remove

WARNING

Refer to 3.1 Service Notes in this Section, for important safety items.

NOTE

The coolant pump is not to be disassembled and is replaced only as an assembly.

1 Allow engine to cool to ambient temperature (less than 50° C), and then remove the coolant filler cap (located at the front left-hand side of the engine).

CAUTION

Disconnection of the battery affects certain vehicle electronic systems. Refer to 1.1 WARNING, CAUTION and NOTES, before removing the ground lead.

2 Disconnect the battery ground lead. Refer to 8A – Electrical Body & Chassis.

3 Loosen coolant pump pulley to hub bolts (1).

NOTE

While the view shows the drive belt removed, it will be easier to loosen the four pulley bolts, with the belt installed.

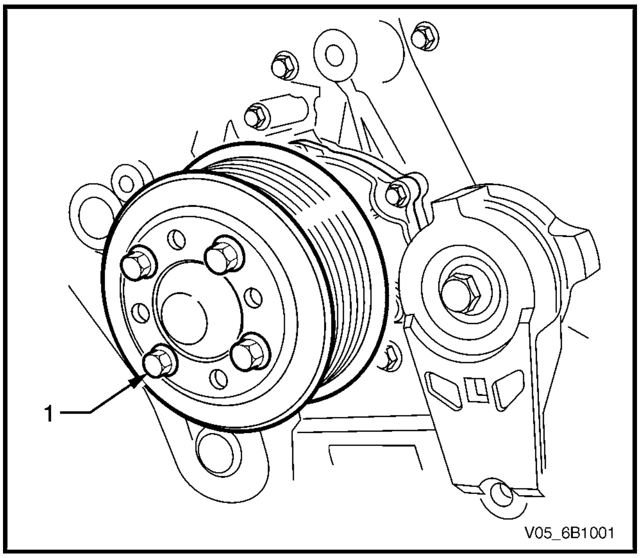

Figure 6B1 – 42

Figure 6B1 – 42 shows the drive belt routing for the HFV6 engine without air conditioning.

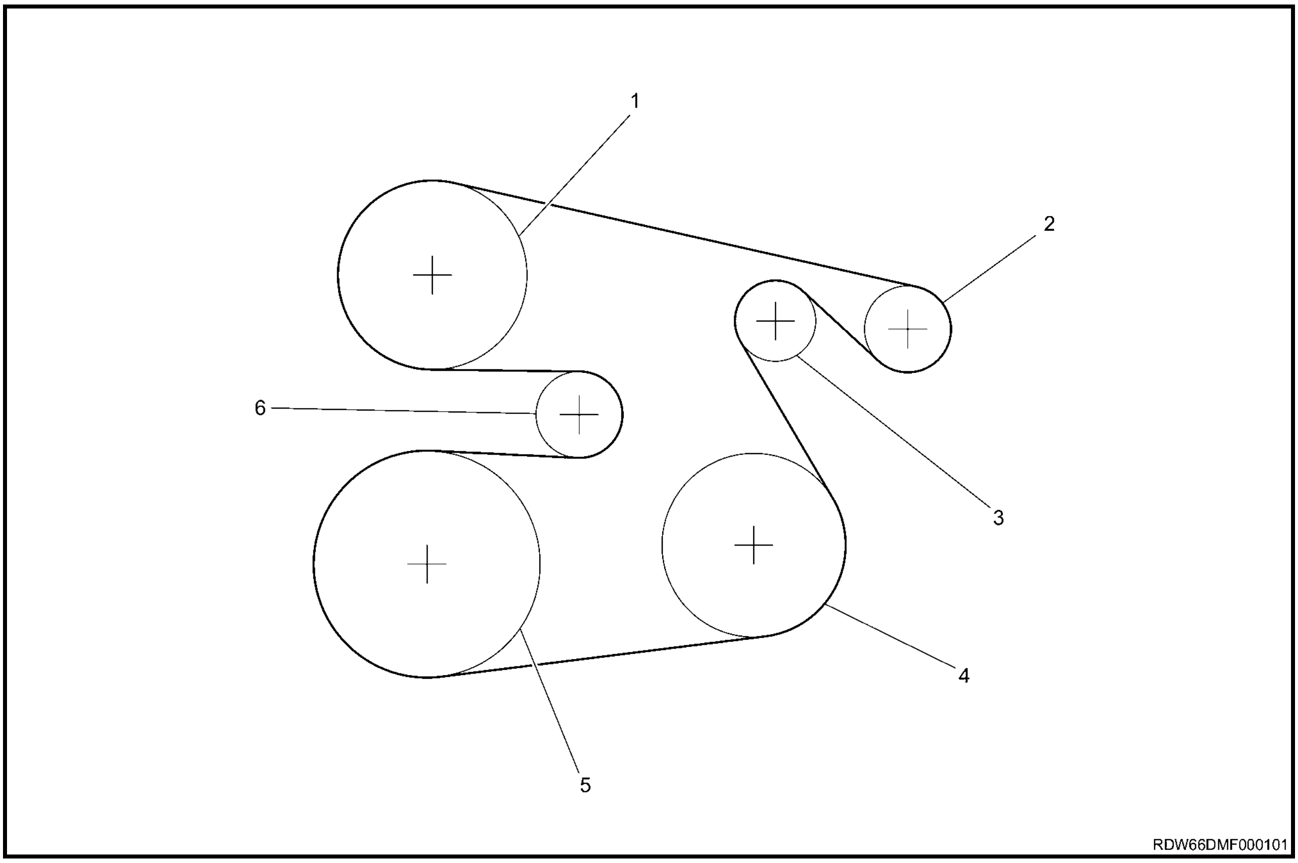

Figure 6B1 – 43

Legend

1	Coolant Pump	4	Power Steering
2	Generator	5	Crankshaft
3	Idler	6	Tensioner

4 Remove the drive belt from the coolant pump pulley:

a Rotate the drive belt tensioner pulley clockwise (arrow) using a 1/2” drive extension in order to release the drive belt tension.

b Remove the drive belt from the coolant pump pulley.

c Slowly release the drive belt tensioner.

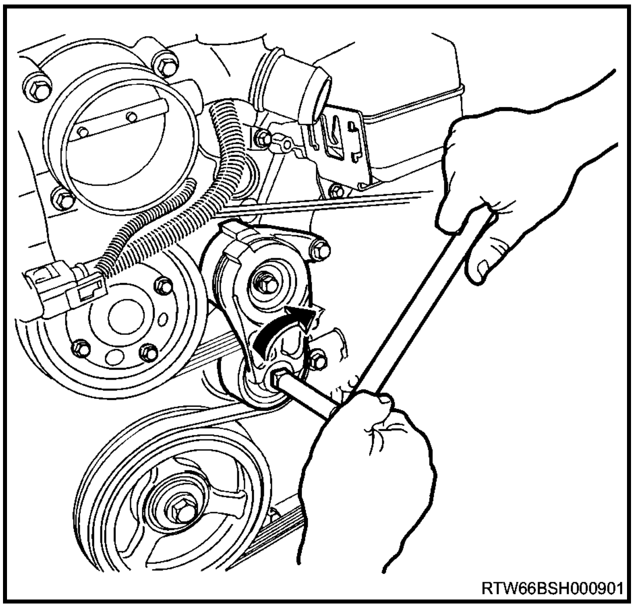

Figure 6B1 – 44

5 Drain the coolant from the system. Refer to 3.3 Draining and Filling Cooling System in this Section.

6 Remove the four coolant pump pulley attaching bolts (1), then remove the pulley (2) from the hub (3).

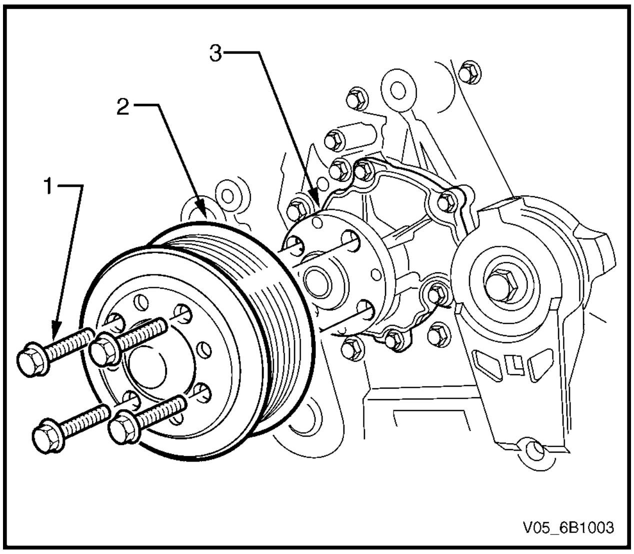

Figure 6B1 – 45

7 Remove the six coolant pump attaching bolts (1) from the coolant pump (2).

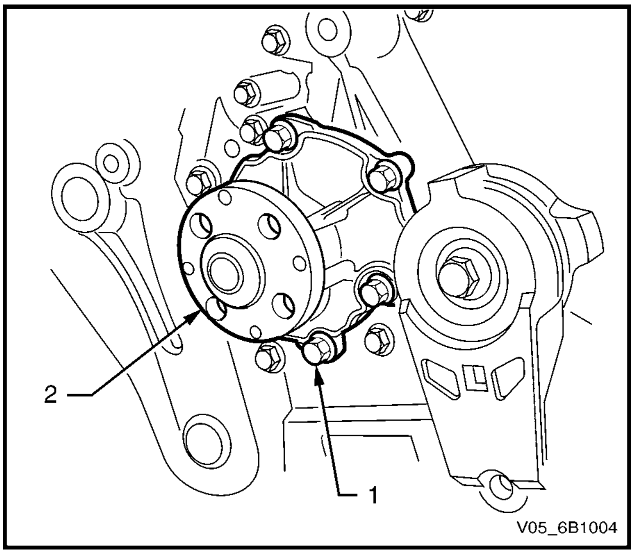

Figure 6B1 – 46

8 Remove the coolant pump (1) from the engine front cover.

NOTE

If necessary, use a soft-faced hammer to lightly tap coolant pump housing to separate it from front cover.

9 Remove coolant pump to front cover gasket (2) and discard.

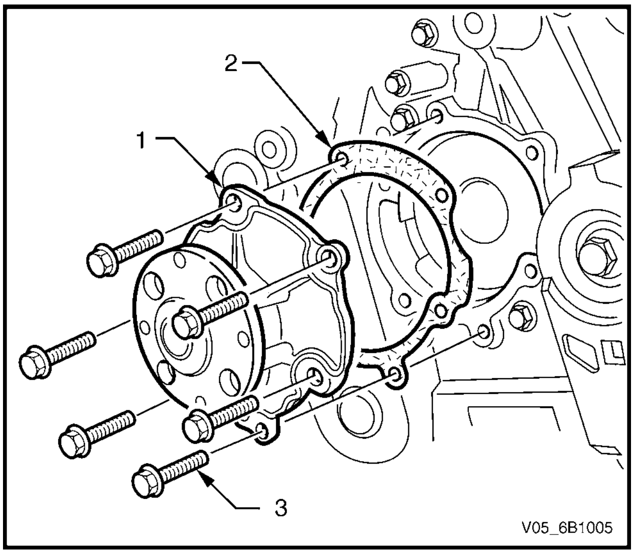

Figure 6B1 – 47

Inspect

1 Rotate the coolant pump hub (1). The hub and impeller (2) should turn straight and smoothly. If the hub wobbles, is noisy or feels rough when rotated, replace the coolant pump.

2 Inspect the exterior of the coolant pump for the following:

- Damage to the coolant pump hub bolt threads for the coolant pump pulley
- Damage to the coolant pump bolt holes

3 Examine the coolant pump shaft (3) and the weep hole (4) in the coolant pump housing (5) for signs of leakage. If coolant leakage is evident, replace the coolant pump.

4 Inspect the interior of the coolant pump for the following:

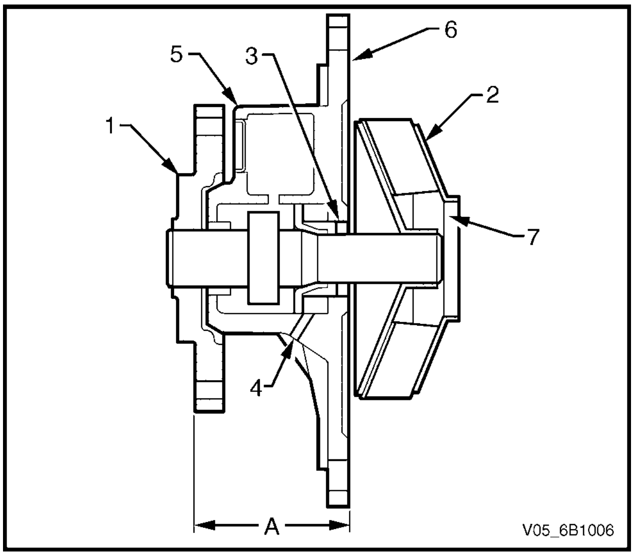

Figure 6B1 – 48

- Damage to the coolant pump gasket-sealing flange surface (6)
- Damage, corrosion or restrictions to the coolant pump impeller
- Damage, corrosion or restrictions to the coolant passages (7)

NOTE

Hub Flange to rear of Pump Housing measurement (A) should be 44 ± 0.25 mm.

5 Replace the coolant pump as necessary.

Reinstall

1 Ensure that the coolant pump and front cover mating surfaces are clean and dry.

2 Install a new gasket to the front cover.

3 Clean threads of coolant pump to front cover and cylinder block attaching bolts.

4 Install coolant pump and attaching bolts. Tighten all bolts to the correct torque specification.

Coolant pump to front cover bolt torque specification ....10 N.m

5 Install coolant pump pulley and attaching bolts (1).

6 Install drive belt (reverse to removal procedures) and ensure that the drive belt is aligned with all accessory pulleys and crankshaft balancer drive belt grooves.

NOTE

Refer to Figure 6B1 – 43, as required for the correct drive belt routing.

7 Tighten coolant pump pulley attaching bolts (1) to the correct torque specification.

Coolant pump pulley to hub bolt torque specification	12 N.m

8 Close the radiator drain tap on the lower LHS of the radiator and remove the piece of rubber tubing to the tap outlet.

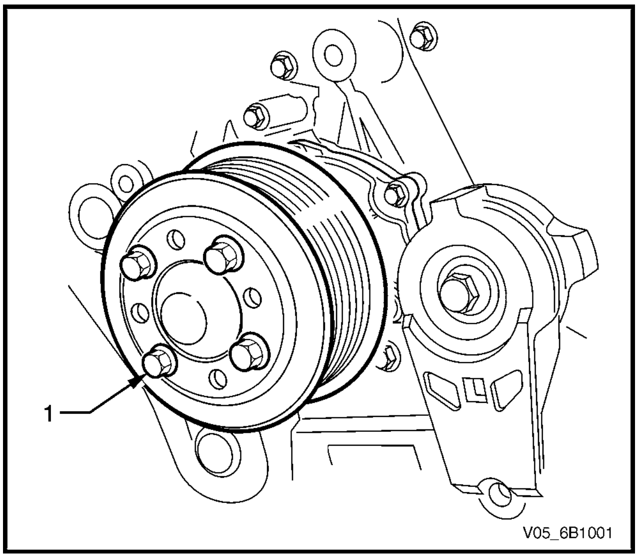

Figure 6B1 – 49

9 Refill cooling system. Refer to 3.3 Draining and Filling Cooling System in this Section.

10 Check for coolant leaks. Refer to 3.7 Pressure Testing in this Section.

11 Install the radiator shroud.

12 Reconnect battery ground lead. Refer to 8A – Electrical Body & Chassis.

System Inspection (with SRS air bag)

Turn the ignition switch to "ON" while watching warning light.

The light should flash 7 times and then go off. If lamp does not operate correctly, refer to Restraints section.

3.11 Coolant Outlet Housing

Remove

WARNING

Refer to 3.1 Service Notes in this Section, for important safety items.

1 Allow engine to cool to ambient temperature (less than 50° C), and then remove the coolant filler cap (located at the front left-hand side of the engine).

CAUTION

Disconnection of the battery affects certain vehicle electronic systems. Refer to 1.1 WARNING, CAUTION and NOTES, before removing the ground lead.

2 Disconnect the battery ground lead. Refer to 8A – Electrical Body & Chassis Battery.

3 Drain the coolant from the system. Refer to 3.3 Draining and Filling Cooling System.

4 Remove the complete intake manifold assembly. Refer to 6A1 Engine Mechanical.

WARNING

Always wear protective safety glasses when working with spring type hose clamps. Failure to do so could result in eye injury.

5 Remove upper radiator hose clamp (1) at the coolant outlet housing connection (2), disconnect hose from coolant outlet.

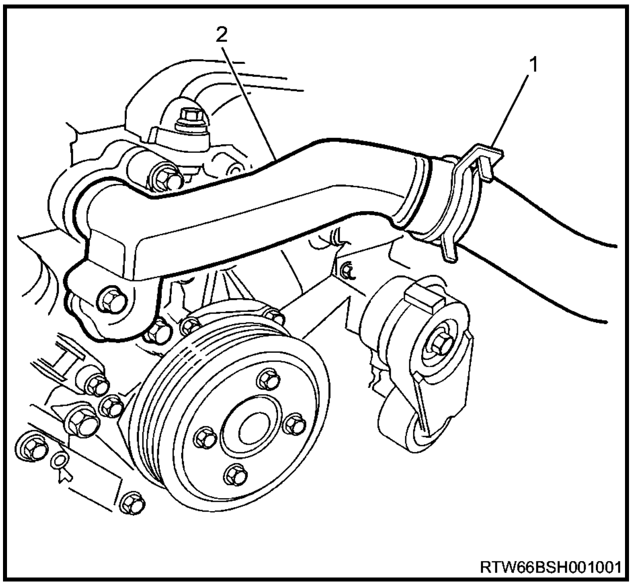

Figure 6B1 – 50

6 Remove the two coolant outlet housing attaching bolts (1), and remove coolant outlet housing (2).

7 Remove and discard coolant outlet housing O-ring (3) and seal (4).

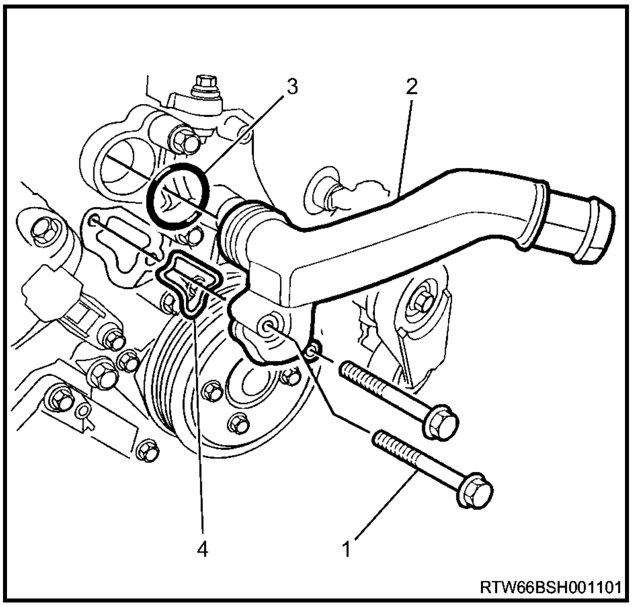

Figure 6B1 – 51

Reinstall

1 Ensure that the coolant outlet housing and front outlet mating surfaces are clean and dry.

2 Install new O-ring and seal to coolant outlet housing.

3 Install coolant outlet housing and attaching bolts. Tighten all bolts to the correct torque specification.

Coolant outlet housing to front outlet bolt torque specification..............................10 N.m

WARNING

Always wear protective safety glasses when working with spring type hose clamps. Failure to do so could result in eye injury.

4 Connect the upper radiator hose and clamp to the coolant outlet housing connection.

5 Close the radiator drain tap on the lower RHS of the radiator and remove the piece of rubber tubing to the tap outlet.

6 Reinstall the intake manifold assembly. Refer to 6A1 Engine Mechanical.

7 Refill cooling system. Refer to 3.3 Draining and Filling Cooling System in this Section.

8 Check for coolant leaks. Refer to 3.7 Pressure Testing in this Section.

9 Reconnect battery ground lead. Refer to 8A – Electrical Body & Chassis.

3.12 Coolant Inlet Pipe

Remove

WARNING

Refer to 3.1 Service Notes in this Section, for important safety items.

1 Allow engine to cool to ambient temperature (less than 50° C), and then remove the coolant filler cap (located at the front left-hand side of the engine).

CAUTION

Disconnection of the battery affects certain vehicle electronic systems. Refer to 1.1 WARNING, CAUTION and NOTES, before removing the ground lead.

2 Disconnect the battery ground lead. Refer to 8A – Electrical Body & Chassis.

CAUTION

Refer to ' Environmental Issues ' in 3.1 Service Notes, before draining the coolant.

3 Draining the coolant from the system. Refer to 3.3 Draining and Filling Cooling System in this Section.

4 Raise the front of the vehicle and support on safety stands. Refer to 0A General Information for the location of jacking and support points.

WARNING

Always wear protective safety glasses when working with spring type hose clamps. Failure to do so could result in eye injury.

5 Remove lower radiator outlet hose clamp (1) at the coolant inlet pipe connection, then disconnect the hose from coolant inlet pipe (2).

6 Remove the coolant inlet pipe from the engine block by removing the attaching bolt (3).

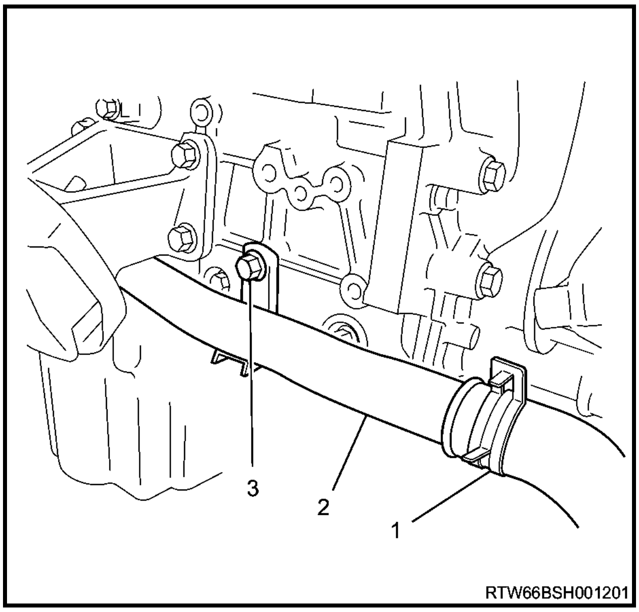

Figure 6B1 – 52

7 Remove the coolant inlet pipe (1) to thermostat housing (2) attaching bolt (3).

8 Remove the coolant inlet pipe by manoeuvring the pipe to the front of the vehicle and withdrawing the pipe from below the vehicle, between the cross member and radiator.

9 Remove and discard coolant inlet pipe O-ring (4) from the thermostat end of the coolant inlet pipe.

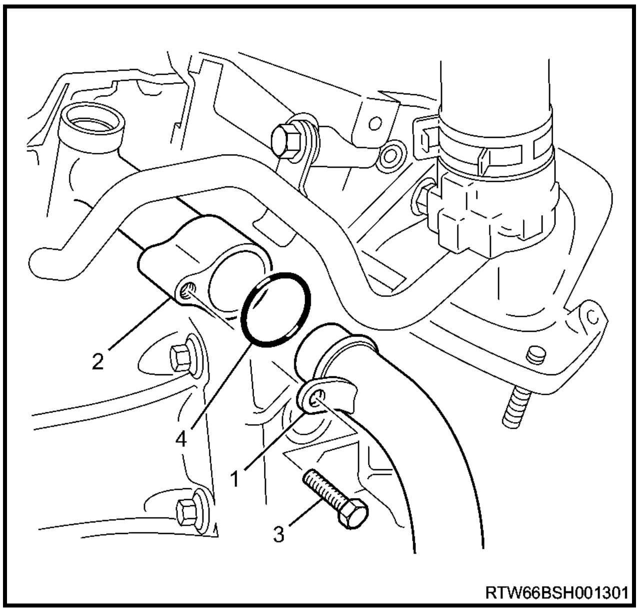

Figure 6B1 – 53

Install

1 Ensure that the coolant inlet pipe and thermostat housing mating surfaces are clean and dry.

2 Install new O-ring to the coolant inlet pipe.

3 Install coolant inlet pipe at the thermostat housing and secure with the attaching bolt. Tighten all bolts to the correct torque specification.

Coolant inlet pipe to thermostat housing bolt torque specification..........................23 N.m

4 Raise the front of the vehicle and support on safety stands. Refer to 0A General Information for the location of jacking and support points.

5 Reinstall the coolant inlet pipe to the engine block and secure with the bolt tightened to the correct torque specification.

Coolant inlet pipe to engine block bolt torque specification..25 N.m

WARNING

Always wear protective safety glasses when working with spring type hose clamps. Failure to do so could result in eye injury.

6 Connect the lower radiator outlet hose and clamp to the coolant inlet pipe connection.

7 Close the radiator drain tap on the lower RHS of the radiator and remove the piece of rubber tubing to the tap outlet.

8 Lower the front of the vehicle.

9 Refill cooling system. Refer to 3.3 Draining and Filling Cooling System in this Section.

10 Check for coolant leaks. Refer to 3.7 Pressure Testing in this Section.

11 Reconnect battery ground lead. Refer to 8A – Electrical Body & Chassis.

3.13 Cooling Fan and Shroud Assembly

Remove

CAUTION

Disconnection of the battery affects certain vehicle electronic systems. Refer to 1.1 WARNING, CAUTION and NOTES, before removing the ground lead.

1 Disconnect the battery ground lead. Refer to 8A – Electrical Body & Chassis.

2 Remove the intake duct and mass air flow as an assembly. Refer to 6A1 Engine Mechanical.

3 Remove the coolant recovery hose from the fan shroud retaining clip.

4 Depress tang on main wiring harness to cooling fan motor wiring harness connector and separate connector (1).

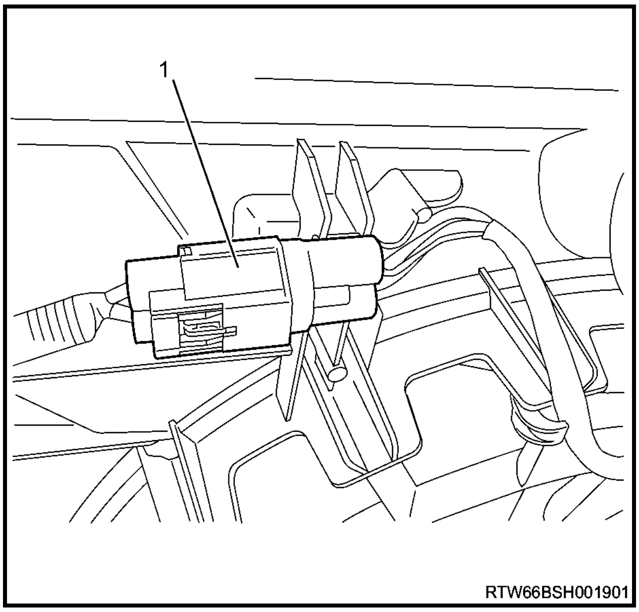

Figure 6B1 – 54

7 Remove the attaching bolt (1), from both sides of the radiator fan and shroud assembly.

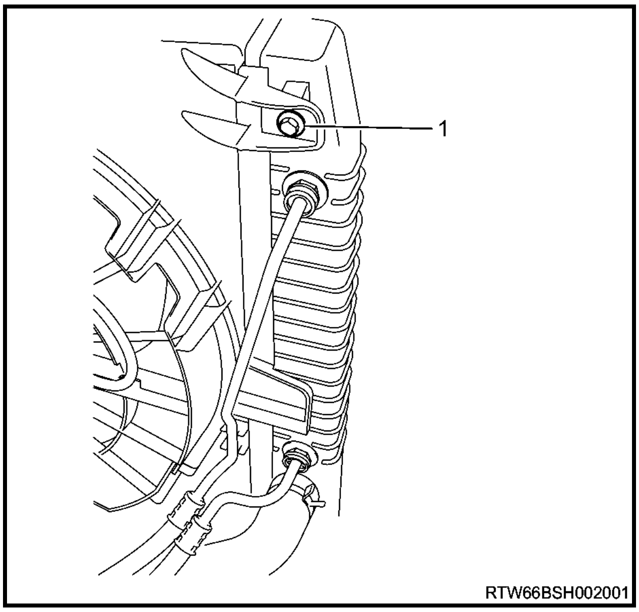

Figure 6B1 – 55

CAUTION

When removing, transporting or installing the fan and shroud assembly, do not grasp the assembly by the fan rings (1) as this may bend the fan motor shaft and cause fan vibrations

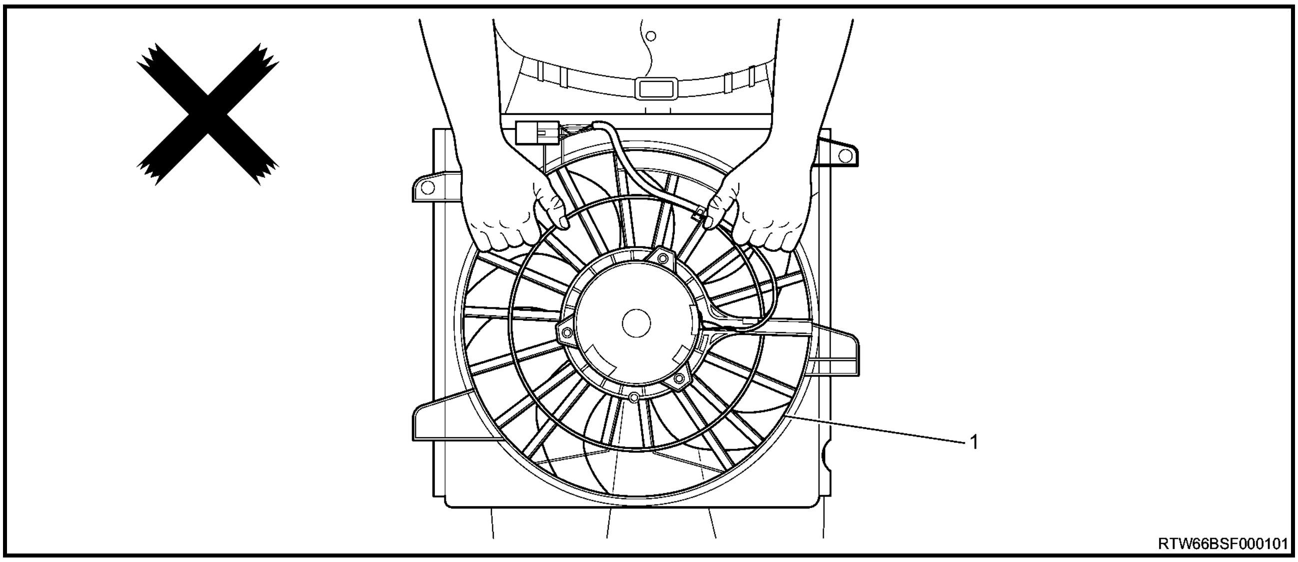

Figure 6B3 – 56

When handling the fan assembly, always hold the assembly at the fan shroud (1).

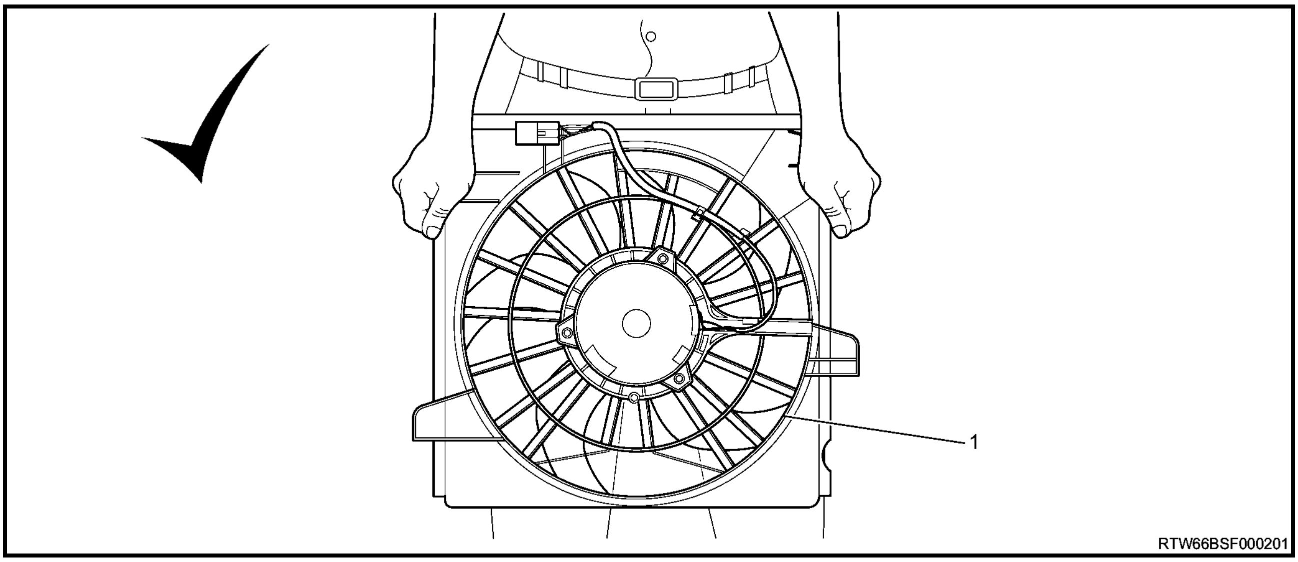

Figure 6B3 – 57

Install

Installation of the cooling fan and shroud assembly is the reverse of removal procedures, noting the following points:

1. Ensure that fan and shroud assembly to radiator attaching clips are fully engaged.
2. Ensure that the top automatic transmission cooling pipe (if fitted) is installed to the integral shroud clip.
3. Check cooling fan operation. Refer to 6C1-2 Engine Management Diagnostics. Also check for correct rotational direction of the cooling fan.

Disassemble

1 Remove cooling fan and shroud assembly as previously described.

NOTE

Neither fan is to be separated from its fan motor. The assembly is carefully balanced during manufacture and duplicating this balance on reassembly, is not possible.

2 Remove the motor assembly wiring harness (1) from the integral clips that form a part of the shroud (2).

3 Remove screws (3) attaching the motor assembly (to the shroud, then remove each motor, fan and wiring assembly (4) from the shroud.

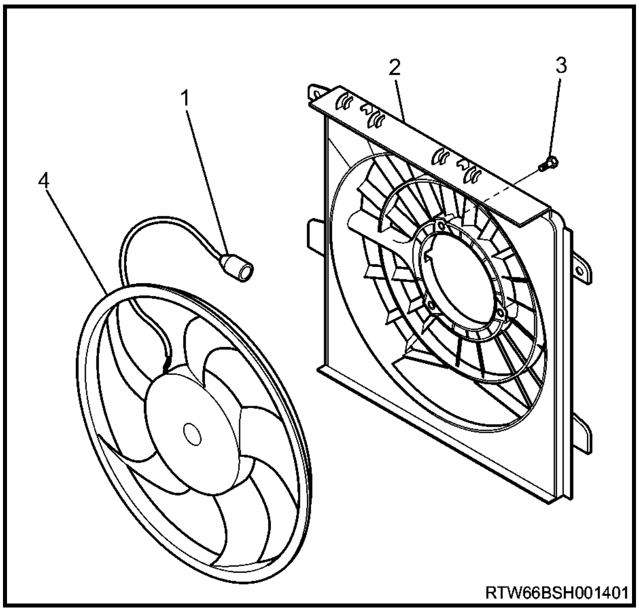

Figure 6B1 – 58

Reassemble

Reassembly is the reverse of disassembly procedures, noting the following points:

1 Tighten motor to shroud attaching screws to the correct torque specification. Do not over-tighten.

Fan motor to shroud screw torque specification	5 N.m

2 Ensure that all wiring is routed correctly and secured by the shroud clips.

3 Install cooling fan and shroud assembly to the radiator, as previously described.

3.14 Flexible Transmission Cooler Hose

Replace

NOTE

The flexible hoses are not serviced separately. Therefore, should a hose require replacement, then the hose and radiator to hose cooler pipe assembly must be fitted.

1 Place a drip tray beneath the engine and radiator section.

2 Disconnect the transmission cooler pipes from the transmission.

- Release the verifier disk (2) by pulling back with the fingers, then slide back down the cooler line (1).
- Open the cooler line release tool J-41623-B and slip over cooler line to be disconnected from the transmission, above the verifier disk (2), as shown.
- Slide the release tool along the line to engage with the quick-connect fitting.
- While pushing inwards, rotate the tool about one sixth of a turn to release the spring clip holding the line.
- With the release tool held in this position, pull back on the cooler line to release.
- Repeat this process with the remaining line and quick-connect fitting.

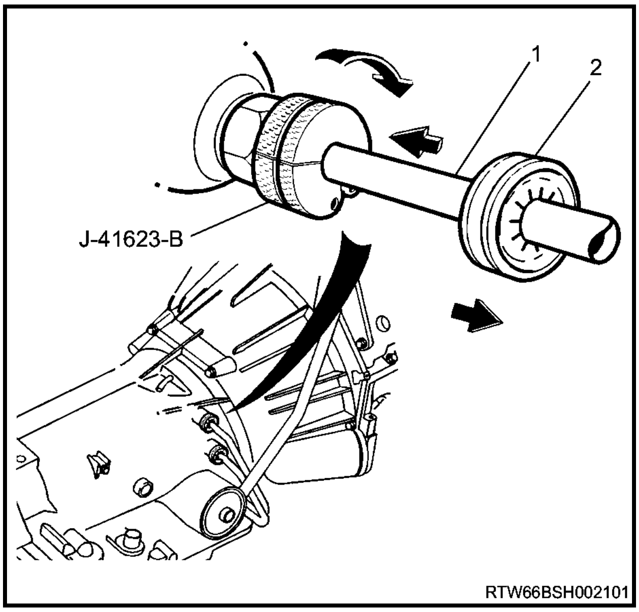

Figure 6B1 – 59

3 Plug both pipe openings and hoses to minimise fluid loss and prevent foreign matter entry.

4 Disconnect the transmission cooler hose/line assemblies from the radiator quick connect fittings as follows:

- Pull back the verifier disc (1) from the quick connect fitting (2) and slide it back along the line.
- Open the release tool, Tool No J-41623-B (3), slip it over the cooler line to be disconnected from the radiator, ahead of the verifier disc.
- Slide the release tool along the cooler line and engage it with the quick-connect fitting (2).
- While pushing inwards, rotate the release tool clockwise, about one sixth of a turn to release the spring clip holding the cooler line.
- With the release tool held in this position, pull back on the cooler line to release it.
- Plug the openings to prevent fluid loss and/or contamination.
- Repeat the procedure to remove the remaining cooler line.

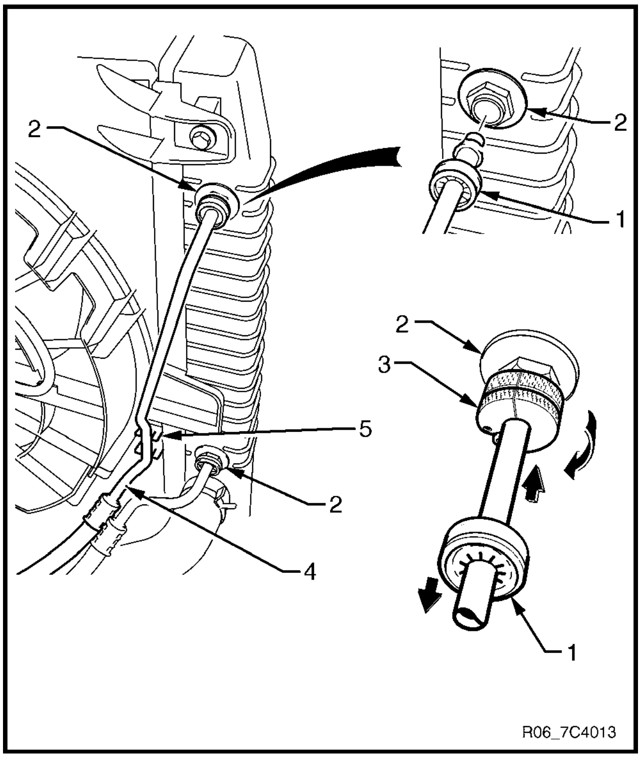

Figure 6B1 – 60

NOTE

If the spring clip and/or O-ring seal in the quick-connect fitting is damaged during the removal process, the complete fitting must be replaced.

5 Unclip the outlet cooler line (4) from the radiator fan shroud (5).

NOTE

Should the spring clip or the O-ring seal in the quick connect fitting be damaged during the line removal process, then the complete fitting must be replaced.

Reinstall

1 Remove the plugs installed in the transmission cooler line and hose openings and wipe all exposed parts with a clean shop rag.

- Smear clean automatic transmission fluid on each cooler line end, then push into the radiator quick connect fittings. As a security check gently pull on the connector to ensure correct engagement.
- As a security check, push and clip each verification disc into place over the quick-connect fittings. If difficulty is experienced, repeat the installation process until the verification disc can be clipped into place over the radiator quick-connect fitting.

CAUTION

If the verifier disc does not clip into place, the quick-connect fitting is not engaged, rectify this before proceeding.

- Snap the outlet cooler line (4) in the clip (5) of the radiator fan shroud
- At the transmission end, again clean the line ends and proceed as detailed in step 2. As a further security check ensure that each verification disc can be pushed into place over the quick connect fitting. If difficulty is experienced, then the line has not been completely installed. Remove and repeat the installation process again until the verification disc can be clipped into place over the transmission quick connect fitting
- Ensure that all line clamps are fitted correctly and that the lines and hoses are correctly routed and free of obstructions
- Tighten the screw attaching the cooler lines bracket to the correct torque specifications
- If required, top up the transmission fluid level (cold)
- Start the engine and check for any fluid leak at the fittings. If a leak is found, stop the engine and rectify the leak

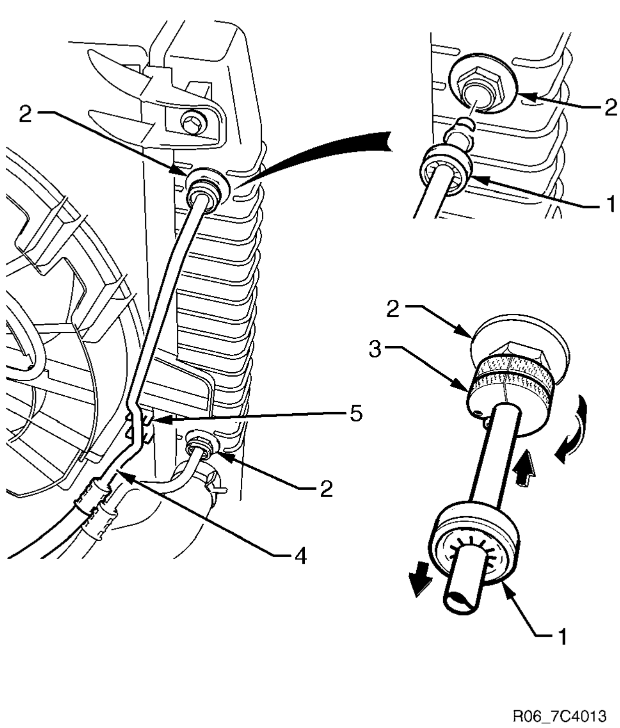

Figure 6B1 – 61

Transmission cooler lines bracket attaching screw torque specification ....23.0 Nm

3.15 Radiator

Remove

WARNING

Refer to 3.1 Service Notes in this Section, for important safety items.

1 Allow engine to cool to ambient temperature (less than 50° C), then remove coolant filler cap.

CAUTION

Disconnection of the battery affects certain vehicle electronic systems. Refer to 00 Warnings, Cautions and Notes, before removing the ground lead.

2 Disconnect the battery ground lead. Refer to 8A – Electrical Body & Chassis.

3 Depress the tang on the main wiring harness to the cooling fan motor wiring harness connector (1) and separate the connector.

4 Remove the radiator cooling fan and shroud assembly. Refer to 3.13 Cooling Fan and Shroud Assembly in this Section.

5 Drain the coolant from the system. Refer to 3.3 Draining and Filling Cooling System in this Section.

CAUTION

Refer to 'Environmental Issues' in 3.1 Service Notes, before draining the coolant.

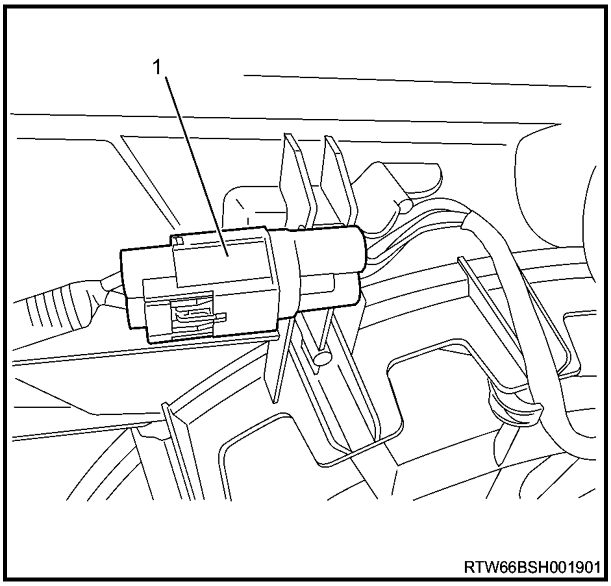

Figure 6B1 – 62

Legend

1	Radiator Hose – Upper	4	Hose Clamp – Upper Hose to Radiator Inlet
2	Radiator Hose – Lower	5	Hose Clamp – Lower Hose to Radiator Outlet
3	Hose Clamp – Upper Hose to Engine Outlet Housing	6	Hose Clamp – Lower Hose to Engine Coolant Inlet Pipe

6 Remove radiator upper hose (1) from radiator connection.

7 Remove radiator lower hose (2) from radiator connection.

8 Remove the two rubber insert mounting brackets supporting the top of the radiator.

9 Remove the two lower attaching bolts (either side) and the rubber mounts.

10 Remove the radiator from the vehicle.

WARNING

Always wear protective safety glasses when working with spring type hose clamps. Failure to do so could result in eye injury.

Reinstall

Installation of the radiator is the reverse of removal procedures, noting the following points:

1 Before installing radiator, inspect core to ensure that there is no foreign matter in core fins. Clean out between core fins with compressed air, blowing from rear to front.

2 If the vehicle is fitted with an automatic transmission, remove plugs from the removed cooling pipe ends and the two quick connect fittings.

3 After wiping cooler line ends and smearing clean automatic transmission fluid over each flared line end, push into the quick connect fitting to engage. As a security check, tug on each line to ensure correct engagement.

4 Check the transmission fluid level. Refer to the following references as required:

- 7C4 Automatic Transmission
- 4L60E On-vehicle Servicing

5 Install the following hoses:

a. Lower radiator hose, securing with the hose clamp.

b. Upper radiator hose, securing with the hose clamp.

6 Install the radiator cooling fan and shroud assembly. Refer to 3.13Cooling Fan and Shroud Assembly in this Section. Ensure that electrical connectors and the transmission cooler lines are seated correctly in the integral retainer clips before install upper radiator shroud.

7 Refill cooling system. Refer to 3.3 Draining and Filling Cooling System in this Section.

8 Check for coolant leaks. Refer to 3.7 Pressure Testing in this Section.

9 Reconnect battery ground lead. Refer to 8A Electrical Body & Chassis.

10 Check cooling fan operation. Refer to 6C1-2 Engine Management Diagnostics. Also check for correct rotational direction of cooling fan.

Radiator Repair Procedure

Repairable Leaks

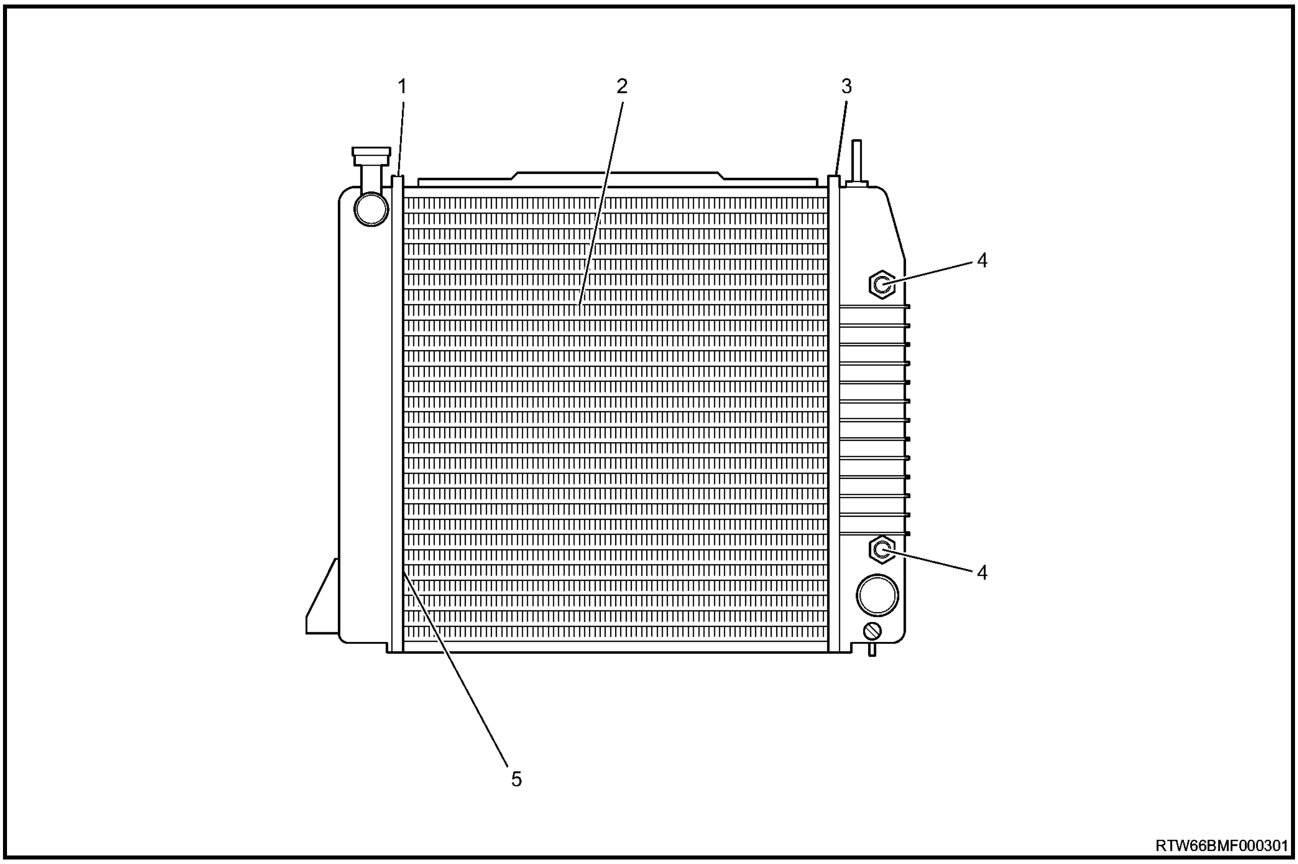

Figure 6B1 – 64

Legend:

1 Left-hand Side Tank Seal
2 Core Tubes
3 Right-hand Side Tank Seal
4 Oil Cooler Pipe Fittings
5 Joint Between Tube and Header

There are two types of leaks that can be repaired on the aluminium-plastic radiator; core leaks and automatic transmission oil cooler seal leaks. Leaks in the plastic tanks or the seals between the side tanks and the headers cannot be repaired; therefore the radiator must be replaced.

Core leaks may occur in a tube or in the joints between the tubes and the headers. Seal leaks may occur in the joints between the plastic tanks and the headers or in the joints between the oil cooler fittings and the tank (vehicles with automatic transmission).

While some leaks can be repaired while the radiator is installed in the vehicle, it is strongly recommended that the radiator is first removed from the vehicle.

NOTE

Minor damage to tubes, or tube to header joint (holes up to 1 mm diameter max.) can be repaired. Core replacement is necessary if damage is any greater.

Repair Method

Repairs to the aluminium radiator core should only be made using the recommended 'Aluminised Silicon' based liquid repair agent, in accordance with the recommended procedure outlined in General Core Repair in this Section. Refer to the current Partfinder™ for Aluminised Silicon base liquid part number.

For damaged areas that are between the cooling fins, it may be necessary to remove some of the fins. Do not remove more fins than is necessary. Usually 6 mm (distance ‘A’) beyond the leak or damage area, up to a maximum of 25 mm of total fin material, is enough to make an effective repair.

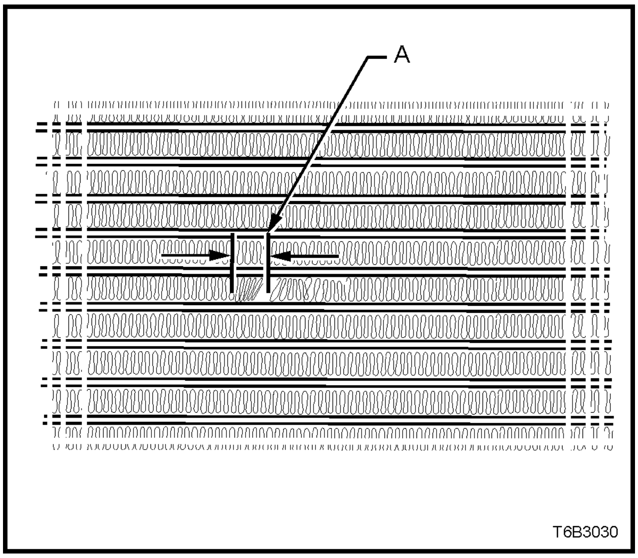

Figure 6B1 – 65

Tube Blocking

If a tube is severely damaged, it can be blocked off.

NOTE

Do not block off more than two tubes in a radiator. Blocking off more than two tubes will reduce the cooling capacity and efficiency of the system and possibly result in an overheated engine.

The tube should be cut off 6 mm from the header (1) and pinched shut before it is cleaned and sealed. Refer to General Core Repair in this Section.

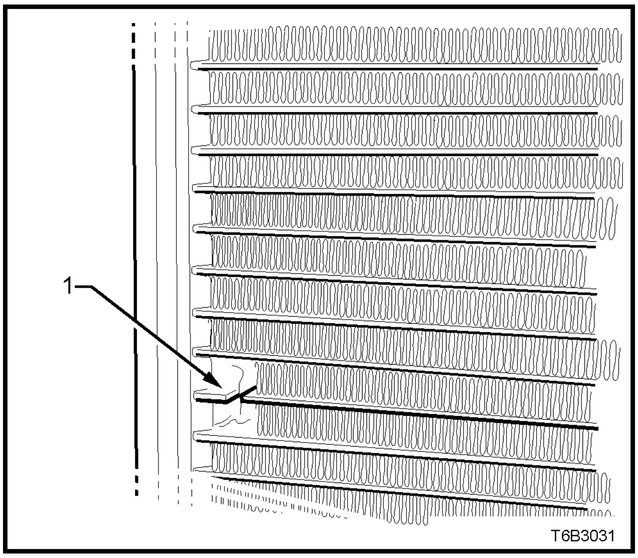

Figure 6B1 – 66

Header Repair

If the header or a tube near the header requires a repair, the side tank does not have to be removed. If the repair requires the removal of the header tank, then the radiator must be replaced.

General Core Repair

NOTE

The need for careful preparation of the surface in the repair area cannot be over-emphasised. If the leak area surface is not clean, the repair material will not adhere to the surface.

CAUTION

Refer to 'Environmental Issues' in 3.1 Service Notes, before draining the coolant.

1 Drain the coolant from the system. Refer to 3.3 Draining and Filling Cooling System in this Section.

2 Remove the radiator. Refer to 3.15 Radiator in this Section.

3 If necessary, carefully cut away fins to expose the damaged area.

NOTE

Do not cut away more than 25 mm total fin material.

4 Clean away dirt etc. with water. Dry the affected area using hot air from a hair drier.

CAUTION

Do not apply flame to dry damaged area.

5 Clean affected area with petrol to remove any traces of oil.

6 Thoroughly stir contents of repair agent.

NOTE

In cases of extended shelf life, the silicon in solution may separate from the thinner base. Should this occur, mix contents well until agent is again homogeneous.

7 Apply repair agent sparingly to damaged area. Do not apply an excessive amount, as this will cause blockage of the radiator tube.

NOTE

Use a clean, dry wooden applicator to 'DRIP' agent onto damaged area of radiator.

8 Allow radiator to stand in a clean, dry area for a minimum of 3 hours (at ambient temperature of 20 – 30° C) with adequate ventilation.

NOTE

Do not apply heat or flame to promote drying.

9 Reinstall the radiator. Refer to 3.15 Radiator in this Section.

Transmission Oil Cooler Leak Test

If the transmission oil cooler is suspected of leaking oil, test it before the radiator is replaced, as follows:

1 Disconnect oil cooler pipes at the flexible hose connections. Refer to 3.14 Flexible Transmission Cooler Hose, in this Section.

2 Plug one of the connections, using a blocked pipe fitting and attach an air supply to the other flexible hose.

3 Remove coolant filler cap and check that the coolant is filled to the coolant filler cap filler neck.

4 Apply air pressure gradually, increasing up to an absolute maximum of 110 kPa. If bubbles appear in radiator neck, the oil cooler is leaking and the radiator assembly must be replaced.

Transmission Oil Cooler Seal Replacement.

It is strongly recommended that the transmission oil cooler connector fittings to the right-hand side radiator header tank, not be disturbed. If coolant is found to leak from either of these two areas, then the radiator should be replaced.

4 Engine Cooling System Diagnosis

4.1 Poor Heater Operation

Little or no heat coming from the heater, especially at idle could be an indication of a cooling system problem.

As the coolant level begins to get lower than normal, air enters the system to replace the missing coolant. The heater core is one of the highest parts of the cooling system and therefore, the first area to lose coolant circulation.

At first, with a small amount of coolant loss, lack of heat will be most noticeable at idle. As driving speed increases, the engine pumps more coolant and more heat is now able to pass through the heater core.

If coolant level drops even lower, heater operation will become less effective, even during normal driving. Cooling and engine systems can be adversely affected if problem is not corrected before overheating occurs.

4.2 Leaking Cylinder Head Gasket

Combustion gases leaking past the cylinder head gasket can pressurise the cooling system, forcing coolant out of the system and into the coolant recovery reservoir.

Indications are air bubbles in the coolant or an overflow condition of the recovery reservoir.

4.3 Question the Customer

To avoid needless time and cost in diagnosing cooling system complaints, the customer should be questioned about driving conditions that place abnormal loads on the cooling system.

1 Is overheating occurring after prolonged idle, in gear, with air conditioning system operating?

   If answer is YES – instruct owner on driving techniques that would avoid overheating such as:

   - Idle in neutral as much as possible – increase engine rpm to get higher air flow (due to an increase in voltage to the fan) and coolant flow through the radiator
   - Turn air conditioning system off during extended idling periods if overheating is indicated on temperature gauge. Further diagnostic checks should not be required

2 Is overheating occurring after prolonged driving in slow city traffic, traffic jams, parades, etc?

   If answer is YES, explain driving technique to the customer, that would avoid overheating – same as for prolonged idle – No.1. Further diagnostic checks should not be required.

4.4 Diagnostic Chart

If none of the above conditions apply, refer to the following Diagnosis Chart.

To effectively use this chart, question the customer to determine which of the following three categories apply to the complaint:

1 If complaint is hot indication on temperature gauge.

   Was temperature reading accompanied by boiling?

   - If answer is YES, go to overheating on diagnosis chart
   - If answer is NO, check temperature gauge and sender

2 If complaint is boiling – go to overheating on diagnosis chart.

3 If complaint is coolant loss. Determine if customer is filling the system correctly.

4 If incorrect filling is not the problem, go to coolant loss in the diagnosis chart.

WARNING

Refer to 3.1 Service Notes in this Section, for important safety items before removing the coolant filler pressure cap or servicing the system.

CAUTION

The cooling system is designed to operate at 120 – 130 kPa and a maximum temperature not above 130°C.

Cooling System Diagnosis

Step	Action	Result	Yes	No
1	Check Temperature gauge reading	High Temp. Low Temp.	Go to Step 2 Go to Step 6	–
2	Check drive belt condition and tension. Refer to 6A1 Engine Mechanical.	To Specification	Go to Step 3	Replace drive belt or tensioner.
3	Check coolant	Boiling	Go to Step 4	Go to Step 5
4	Check coolant level. Refer to 3.2 Coolant Maintenance in this Section.	Low	Go to Step 10	Go to Step 6
5	Check coolant filler cap. Refer to 3.7 Pressure Testing – Coolant Filler Cap Pressure Testing in this Section	OK?	Go to Step 8	Replace Coolant filler cap
6	Check thermostat. Refer to 3.8 Thermostat in this Section.	OK?	Go to Step 9	Go to Step 13
7	Check Engine Coolant Temperature (ECT) sensor. Refer to 6C1 Engine Management General Information.	Faulty	Replace	Go to Step 12
8	Check cooling fan operation. Refer to 6C1 Engine Management General Information.	Operational	Go to Step 10	Repair
9	Check for collapsed upper or lower radiator hose.	Collapsed	Replace	Go to Step 13
10	Visual system check	Leaks	Go to Step 13	Go to Step 11
11	Check coolant concentration. Refer to 3.2 Coolant Maintenance.	To Specification	Go to Step 12	Correct Concentration Level
12	Check radiator core for bent fins, dirt, bugs or other obstructions.	Obstructed	Clean or straighten	Go to Step 14
13	Pressure Test cooling system. Refer to 3.7 Pressure Testing in this Section.	Leaks	Repair	System OK
14	If none of the above require repair, the problem is complex or of a major nature. Refer to 4.5 Problems Not Requiring Disassembly of Cooling System or 4.6Problems Requiring Disassembly of Cooling System.	–	–	–

4.5 Problems Not Requiring Disassembly of Cooling System

1 Large obstructions blocking radiator or condenser airflow.

- Auxiliary oil coolers
- License plate
- Obstruction of radiator grille, for example, driving lights or mud

2 Loose, damaged or missing air chute side panels.

3 Missing or damaged air baffle.

4 Cracked or loose coolant recovery system hose.

5 Leaking heater component such as the heater core or water valve.

4.6 Problems Requiring Disassembly of Cooling System

1 Damaged cooling fan or faulty motor operation.

2 Pressure test cooling system.

3 Defective coolant pump.

- Eroded or broken impeller vanes
- Failed bearing or seal – check for shaft or bearing end play

4 Internally blocked radiator core.

5 Obstruction of coolant recovery system.

6 Internal system leaks.

- Head gaskets
- Cracked cylinder block
- Engine front cover
- Intake manifold gaskets

7 Blocked coolant passages in cylinder heads or block – remove cylinder heads and check.

4.7 Black Light and Dye Leak Diagnosis Method

It is strongly recommended that this diagnostic method be used to diagnose fluid leaks. This method is a proven and reliable method that identifies the specific leak source.

The black light kit can be used for the leak detection of a number of fluids, when used with the appropriate tracer dye.

Examples are: Coolant, Engine Oil, Automatic Transmission Fluid and Air Conditioning Refrigerant (R134A).

The following is a summary of the steps involved in detecting a cooling system fluid leak using black light and dye:

1 Pour specified amount of dye into the cooling system via the coolant filler cap on the outlet housing. Refer 3.1 Service Notes in this Section.

2 Road test the vehicle under normal operating conditions.

3 Direct the light towards the suspect area. The fluid leak will appear as a brightly coloured path leading from the source.

4 Repair fluid leak and recheck to ensure that leak has been rectified.

5 Refer to the manufacturer's directions when using this method.

5 Specifications

General

Coolant Filler Cap Pressure Rating ....120 kPa

Cooling System Capacity

Automatic Transmission... 9.9 litres

Manual Transmission .... 10.3 litres

Coolant Corrosion Inhibitor Quantity When Refilling System

Automatic Transmission Models... 5 litres

Manual Transmission Models... 5.2 litres

NOTE

DEX-COOL® long life coolant or equivalent such as Extended Life Anti-freeze Coolant, conforming to GM Specification 6277M, must be used when changing coolant.

Thermostat

Type..Power element (wax pellet)

Start to Open at ....82 ± 2° C

Fully Open at .... 95° C max.

Coolant Pump

Type.. Centrifugal

Drive .... Multi-Vee Serpentine Belt

Tool number	Illustration	Description	Classification
AU505		**Coolant Tester** Used for testing the coolant concentration level. Previously released.	Mandatory
AU525		**Quick Connect Release Tool** Used to release the quick connect fittings on automatic transmission fluid cooler lines at the radiator end, when fitted. Previously released.	Mandatory
BT3373–F		**Belt Tension Gauge** Used when checking drive and accessory belt tension and adjustments. Previously released.	Desirable
J 26568		**Refractometer** Used for testing coolant concentration level. Previously released, as AU 435.	Mandatory
J28431–B		**Fluid Dye** Available in 24 x 1-ounce bottles. Used in conjunction with a black light such as J42220 to locate the source of various fluid leaks. Previously released.	Desirable
J42220		**Black Light, Leak Detection Lamp** Used with dye, J28431–B to locate the source of various vehicle fluid leaks. Previously released.	Desirable
N/A		**Cooling System Pressure Tester** Previously released. Commercially available.	Mandatory

6C
Fuel System – V6

ATTENTION

Before performing any service operation or other procedure described in this Section, refer to 1.1 WARNING, CAUTION and NOTES for correct workshop practices with regard to safety and/or property damage.

1 General Information

Description

Fuel is injected into the engine by separate fuel injectors that are mounted in the intake manifold (common chamber). Fuel is supplied to the injectors under pressure from the fuel tank through the fuel lines and the fuel rail, which is attached to the top of the common chamber.

A fuel pressure control valve is installed on the fuel rail to maintain fuel line pressure across the injectors under all operating conditions. Fuel pressure is maintained by controlling the amount of fuel that is supplied from the fuel tank, based on the demand of the engine via the engine control module (ECM).

Two interchangeable “O” rings are used on the fuel injector and must be replaced when the injectors are removed.
The Multiport Fuel Injection system utilizes an injection system where the injectors turn on at every crankshaft revolution.
The ECM controls the injector on time so that the correct amount of fuel is metered depending on driving conditions.
The V6 engine is designed to use only unleaded petrol.

Unleaded petrol must be used for correct emission control system operation and its use will also minimize spark plug fouling and extend engine oil life.

Using leaded petrol can damage the emission control system and could void the vehicle warranty. All vehicles are equipped with an Evaporative Emission Control System. The purpose of the system is to minimize the escape of fuel vapours into the atmosphere.

Service Precautions

- Use extreme care when working on the fuel system and follow all safety precautions.
- When working on the fuel system, disconnect the battery ground cable except for tests where battery voltage is required.
- Always keep a dry chemical (class B) fire extinguisher near the work area.
- Relace all fuel lines and fittings with the same type of line and fitting as those removed.
- Clean and inspect “O” rings carefully and replace if required.
- Always depressurize the fuel lines before servicing any fuel system components.
- Do not attempt any repairs on the fuel system until, all warnings and instructions, relating to that repair have been read and ensure all notices and cautions are adhered to.
- Do not allow any naked frames or sparks near the work area when working on the fuel system.
- If draining of the fuel system is required, this should be done in a well ventilated area.
- Protect the fuel lines and associated parts from thermal damage, spattering when welding.

1.1 WARNING, CAUTION and NOTES

This Section contains various WARNINGS, CAUTIONS and NOTE statements that you must observe carefully to reduce the risk of death or injury during service, repair procedures or vehicle operation. Incorrect service or repair procedures may damage the vehicle or cause operational faults. WARNINGS, CAUTION and NOTE statements are not exhaustive. GM HOLDEN LTD can not possibly warn of all the potentially hazardous consequences of failure to follow these instructions.

Definition of WARNING, CAUTION and NOTE Statements

Diagnosis and repair procedures in this Section contain both general and specific WARNING, CAUTION and NOTE statements. GM HOLDEN LTD is dedicated to the presentation of service information that helps the technician to diagnose and repair the systems necessary for proper operation of the vehicle. Certain procedures may present a hazard to the technician if they are not followed in the recommended manner. WARNING, CAUTION and NOTE statements are designed to help prevent these hazards from occurring, but not all hazards can be foreseen.

WARNING defined

A WARNING statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in death or injury. A WARNING statement alerts you to take necessary action or not to take a prohibited action. If a WARNING statement is ignored, the following consequences may occur:

- Death or injury to the technician or other personnel working on the vehicle,
- Death or injury to other people in or near the workplace area, and / or
- Death or injury to the driver / or passenger(s) of the vehicle or other people, if the vehicle has been improperly repaired.

CAUTION defined

A CAUTION statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in damage to or destruction of equipment, or corruption of data. If a CAUTION statement is ignored, the following consequences may occur:

- Damage to the vehicle,
- Unnecessary vehicle repairs or component replacement,
- Faulty operation or performance of any system or component being repaired,
- Damage to any system or components which depend on the proper operation of the system or component being repaired,
- Faulty operation or performance of any systems or components which depend on the proper operation or performance of the system or component under repair,
- Damage to fasteners, basic tools or special tools and / or
- Leakage of coolant, lubricant or other vital fluids.

NOTE defined

A NOTE statement immediately precedes or follows an operating procedure, maintenance practice or condition that requires highlighting. A NOTE statement also emphasises necessary characteristics of a diagnostic or repair procedure. A NOTE statement is designed to:

- Clarify a procedure,
- Present additional information for accomplishing a procedure,
- Give insight into the reasons for performing a procedure in the recommended manner, and / or
- Present information that gives the technician the benefit of past experience in accomplishing a procedure with greater ease.

2 System Components

Fuel System

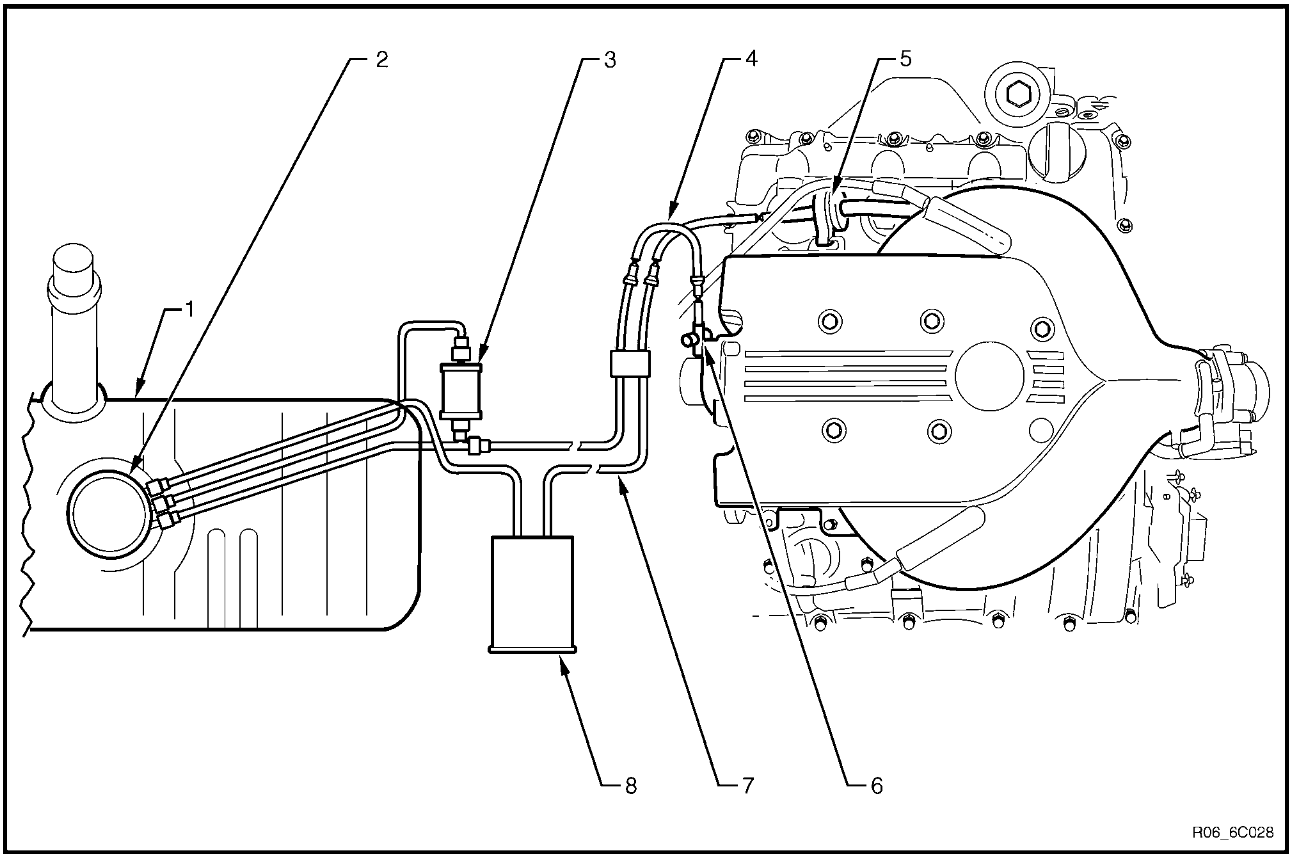

Figure 6C – 1

Legend

1	Fuel Tank
2	Fuel Pump and Sender Assembly
3	Fuel Filter
4	Fuel Feed Line
5	Evaporative Control Valve
6	Fuel Pressure Test Point
7	Evaporative Return Line
8	Evaporative Canister

Description

The modular fuel pump and sender assembly maintains an optimum fuel level in the reservoir. This ensures a continuous fuel flow under all fuel level conditions and vehicle attitudes. The modular fuel pump and sender assembly also provides an accurate means of measuring the fuel level within the fuel tank.

Fuel Pump

Single Turbine Fuel Pump

The fuel pump is an integral part of the Fuel Pump and Sender Assembly, refer to Figure 6C – 3.

Figure 6C– 2 details the fuel flow through the single turbine fuel pump.

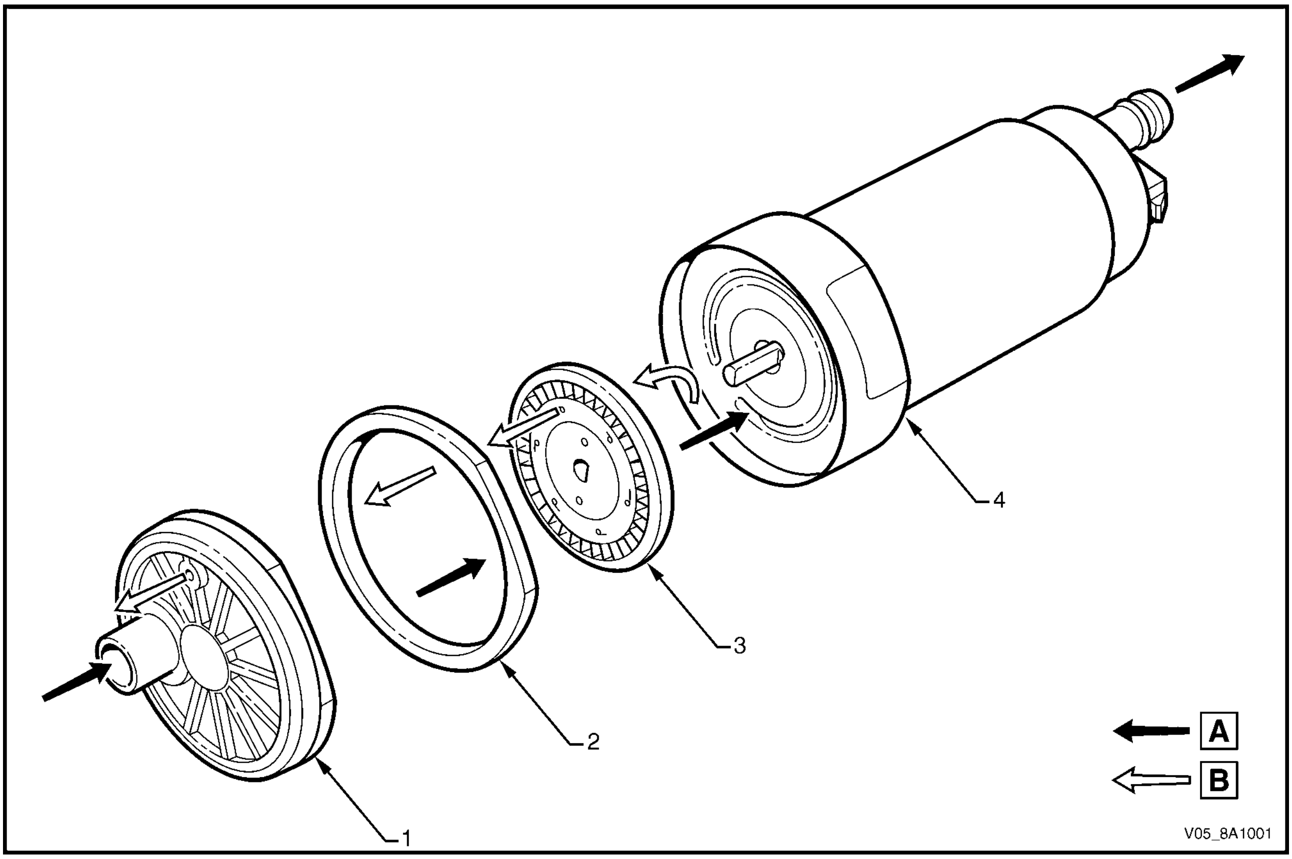

Figure 6C– 2

Legend

A	Fuel
B	Vapour out

1	Inlet Body
2	Impeller Housing
3	Impeller
4	Fuel Pump Housing

Fuel Flow

Fuel (A) is drawn into the modular fuel pump and sender assembly reservoir from the fuel tank, through the primary umbrella valve (5) and into the fuel pump impeller, via the internal strainer (4) at the fuel pump (1) inlet. At the impeller, vapour (C) is separated from the fuel. The vapour is ejected from the fuel pump into the reservoir via a port next to the fuel pump inlet.

High-pressure fuel then flows through the end cap, the lower connector and the flexible line. From the flexible line, fuel exits the modular fuel pump and sender assembly through the fuel feed port and flows on to the externally-mounted fuel filter and the engine.

A fuel pressure regulator is located in the modular fuel pump and sender assembly; fuel not used by the engine (B) is returned to the modular fuel pump and sender assembly via the fuel return line and the fuel return port in the modular fuel pump and sender assembly cover. The return fuel enters the jet pump standpipe (3) of the reservoir via the return fuel tube.

Vehicle fuel line pressure is maintained by a pressure regulator (2) located within the modular fuel pump and sender assembly.

When the engine is switched off, the reservoir remains full of fuel, due to the action of the primary umbrella valve. At high fuel levels, fuel tank overflow enters the reservoir over the top of the reservoir. Fuel level in the reservoir is also maintained by returned engine fuel.

Electrical power is supplied to the fuel pump by a connector secured to the modular fuel pump and sender assembly cover. An internal harness (not shown) assembly completes the connection to the pump.

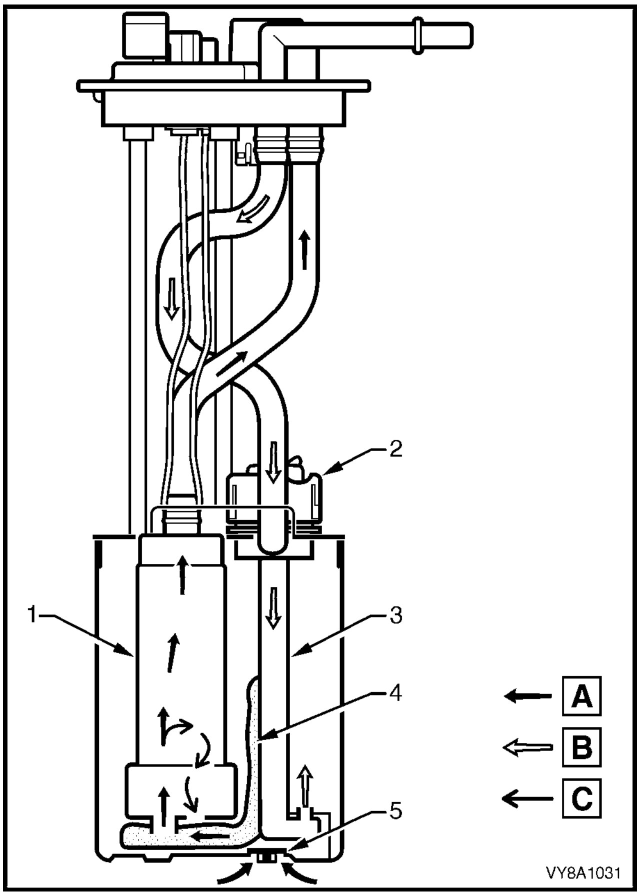

Figure 6C – 3

MAIN DATA AND SPECIFICATIONS

4×2 (Except High Ride Suspension) Model

Front suspension	**Type**	**Independent wishbone arms, coil spring with stabilizer bar.**
Coil spring	Spring Rate	9.62 kg/mm (94.3 N/mm)
Front shock absorber	Type	Gas-sealed, twin tube
	Stroke	116.5 mm (4.59 in)
	Compressed length	284.0 mm (11.18 in)
	Extended length	400.5 mm (15.77 in)
Stabilizer bar	Diameter	25.0 mm (0.98 in)

4×2 (High Ride Suspension) Model

Front suspension	**Type**	**Independent wishbone arms, torsion bar spring with stabilizer bar.**
Torsion bar spring	Length	1,142 mm (44.96 in)
	Diameter	29.0 mm (1.14 in)
Front shock absorber	Type	Gas-sealed, twin tube
	Stroke	121.0 mm (4.76 in)
	Compressed length	257.0 mm (10.12 in)
	Extended length	378.0 mm (14.88 in)
Stabilizer bar	Diameter	26.0 mm (1.02 in)

4×4 Model

Front suspension	**Type**	**Independent wishbone arms, torsion bar spring with stabilizer bar.**
Torsion bar spring	Length	1,142 mm (44.96 in)
	Diameter	29.0 mm (1.14 in)
Front shock absorber	Type	Gas-sealed, twin tube
	Stroke	121.0 mm (4.76 in)
	Compressed length	257.0 mm (10.12 in)
	Extended length	378.0 mm (14.88 in)
Stabilizer bar	Diameter	26.0 mm (1.02 in)

BACK TO CHAPTER INDEX

3 System Checks

3.1 Fuel Pump Flow Test

If a reduction of the fuel supply is suspected, perform the following checks.

1 Ensure there is sufficient fuel in the tank.

2 With the engine running, check the fuel lines from the fuel tank to the injectors for evidence of leakage. Retighten, if the lines or the connections are loose. Also, check the fuel lines for restrictions such as squashed or clogged fuel line.

3 Depressurize the fuel system, refer to 3.4 Fuel System Depressurisation.

4 Disconnect the fuel line at the fuel rail.

5 Connect a hose from the fuel line and place the open end into a clean container.

6 Connect the fuel pump relay terminals (2) with a jumper wire (1) as shown, then turn the ignition to the ON position to operate the fuel pump, then check the fuel pump flow rate.

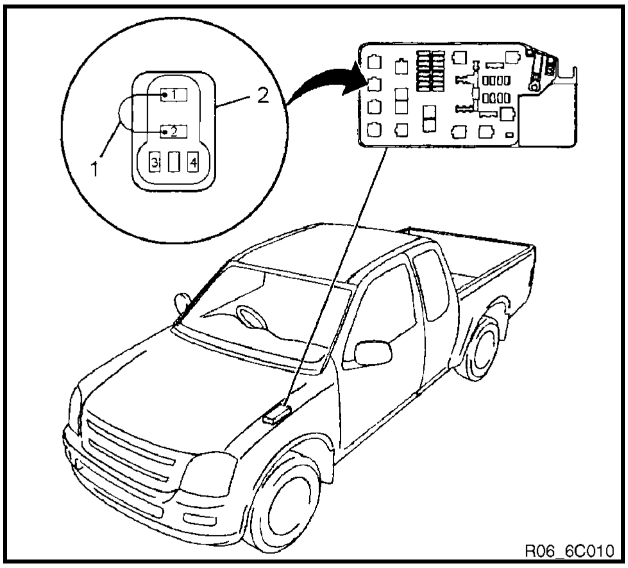

Figure 6C – 4

CAUTION

Do not generate any sparks when connecting the jumper wire.

Fuel delivery test time	15.0 Sec
Fuel delivery rate	0.38 Litres Min

NOTE

If the fuel flow rate is below the minimum value, conduct a fuel pressure test, refer to 3.2 Fuel Pressure Test.

3.2 Fuel Pressure Test

WARNING

To reduce the risk of fire or personal injury, depressurise the fuel system before servicing any fuel system components, refer to 3.4 Fuel System Depressurisation.

Gauge Installation

1 Turn the ignition switch off.

2 Depressurise the fuel system, refer to 3.4 Fuel System Depressurisation.

WARNING

A small amount of fuel may be released when connecting the fuel pressure gauge to the fuel pressure test point. Cover the fittings with a shop towel to absorb any fuel spillage before connecting the fuel pressure gauge. After the fuel pressure test procedure, place the soiled towel in an approved container for disposal.

3 At the fuel pressure test point, remove the Schrader valve sealing cap.

4 Connect the fuel pressure gauge (1) (tool No. J 34730–1A) to the fuel gauge Schrader fitting adapter (2) (tool No. AU453), then install to the fuel pressure test port (3). Wrap a shop towel around the fitting while connecting the fuel pressure gauge to avoid and/or capture any fuel spillage.

5 Route the bleed hose of the fuel gauge into an approved fuel container.

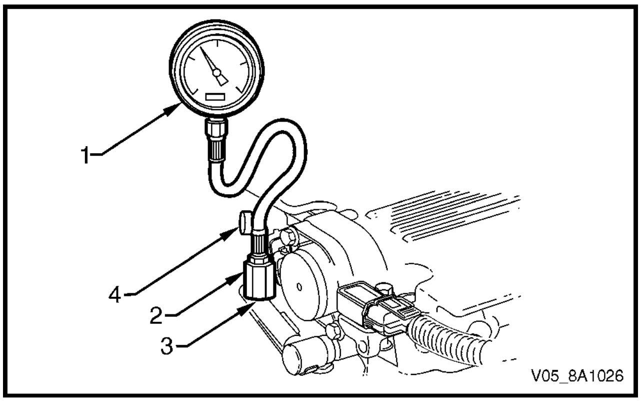

Figure 6C – 5

CAUTION

After connecting the fuel pressure gauge and pressurising the fuel system, inspect for fuel leaks at the fuel pressure gauge and the fuel pressure test point.

6 Either:
Using Tech 2, enable the fuel pump to pressurise the fuel system, refer to 0C Tech 2. Inspect for fuel leaks at the fuel pressure gauge and fuel pressure test point, then bleed the air from the fuel pressure gauge.

or:
Reinstall the fuel pump relay and fuel pump fuse, then open the fuel gauge bleed valve (4) to bleed the air from the fuel pressure gauge, refer to Figure 6C – 5.

7 Remove and place the soiled shop towel in an approved container.

Test

1 Start the engine and record the fuel pressure.

2 Turn the ignition switch off.

3 If required, perform any tests and/or diagnostic procedures:

- For the fuel system leak test, refer to 3.3 Fuel Leak Test.
- For the fuel injector leak-down test (for vehicles fitted with a V6 engine, refer to 6C1-3 Engine Management – V6 – Service Operations.

4 Depressurise the fuel system, refer to 3.4 Fuel System Depressurisation.

Removal

1 Turn the ignition switch off.

2 Depressurise the fuel system, refer to 3.4 Fuel System Depressurisation.

WARNING

After relieving the fuel system pressure, a small amount of fuel may be released when servicing the fuel lines or connections. Cover the fittings with a shop towel before disconnecting. This catches any leaking fuel. Place the soiled towel in an approved container when disconnection is completed.

3 Wrap a shop towel around the fuel pressure test point to absorb any fuel spillage.

4 Remove the fuel pressure gauge and drain any fuel remaining in the fuel pressure gauge into an approved fuel container.

5 Remove the soiled shop towel and place in an approved container.

6 Repressurise the fuel system, refer to 3.4 Fuel System Depressurisation.

7 Road-test the vehicle and check for correct operation.

3.3 Fuel Leak Test

CAUTION

After installing any fuel system component and before starting the engine, check the fuel system for leaks.

NOTE

For the fuel injector leak-down test (for vehicles fitted with a V6 engine), refer to 6C1-3 Engine Management – V6 – Service Operations.

1 Turn the ignition switch on for two seconds.

2 Turn the ignition switch off for 10 seconds.

3 Turn the ignition switch on.

4 Check for fuel leaks, particularly at points marked ● (that is, quick-connect fittings, fuel rails, fuel injectors, Schrader valve and evaporative emission control canister purge solenoid, refer to Figure 6C – 6.

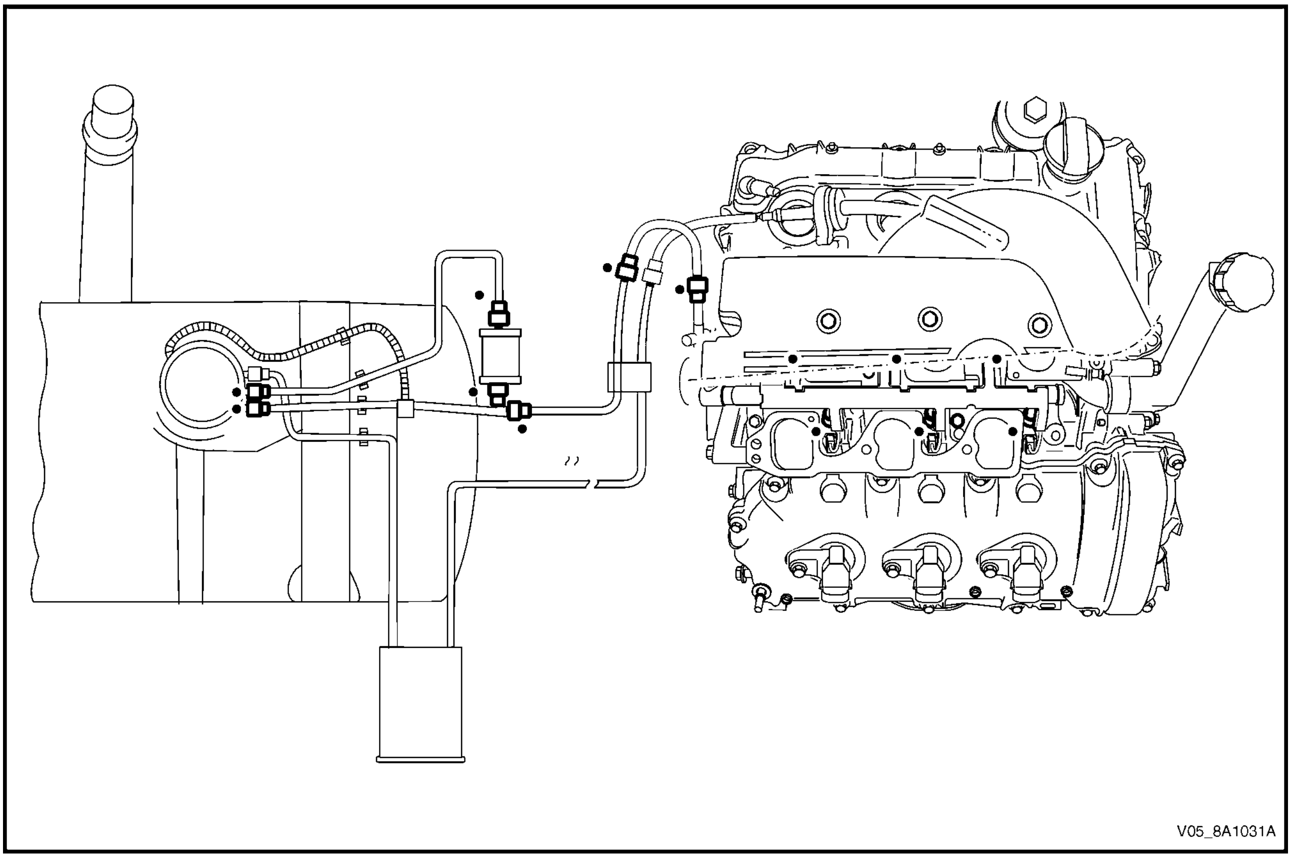

Figure 6C – 6

5 Replace any faulty components and repeat step 2 to step 5 inclusive.

6 Replace all engine components removed to perform the fuel leak test, refer to 6C1-3 Engine Management – V6 – Service Operations.

3.4 Fuel System Depressurisation

WARNING

To reduce the risk of fire or personal injury, depressurise the fuel system before servicing any fuel system components.

1 Turn the ignition switch off.

2 Remove the fuel pump fuse and fuel pump relay, refer to 8A Electrical Body and Chassis.

3 Loosen the fuel filler cap to relieve the fuel tank vapour pressure.

4 With the throttle closed, crank the engine.

NOTE

The engine may start and operate until the fuel remaining in the fuel delivery system depletes.

5 When the engine stops, crank the engine for another 10 seconds to ensure the fuel feed line pressure has been fully relieved.

6 Clean the area around the fuel pressure test point.

CAUTION

A small amount of fuel may be released when pressing on the Schrader valve. Cover the fitting with a shop towel to absorb any fuel spillage before removing the Schrader valve sealing cap. Place the soiled towel in an approved container for disposal.

7 At the fuel pressure test point (2), remove the Schrader valve sealing cap (1), refer to Figure 6C – 7.

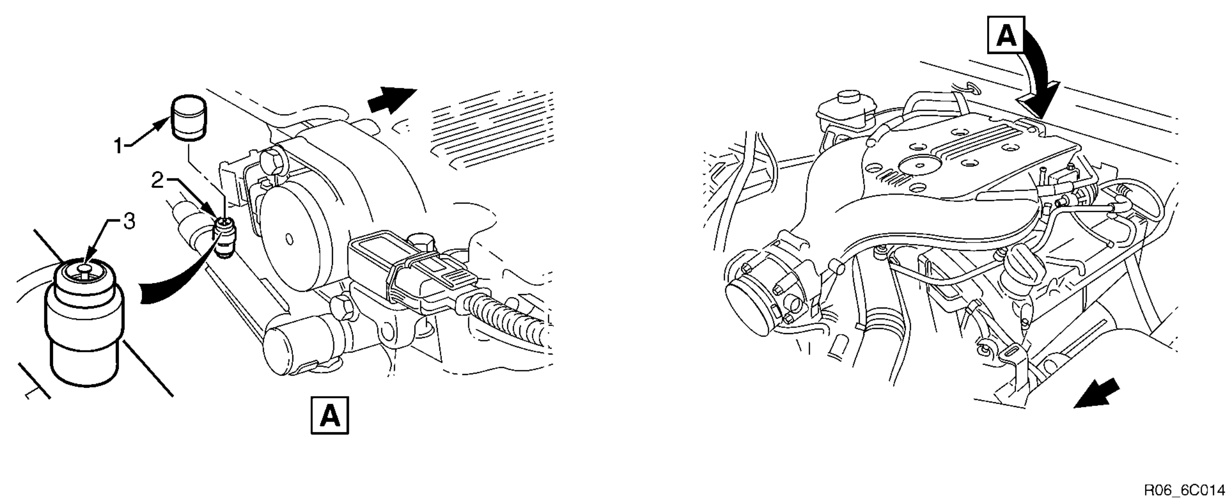

Figure 6C – 7

Legend

1 Schrader Valve Sealing Cap
2 Pressure Test Point
3 Schrader Valve

WARNING

Wear safety glasses when performing the fuel pressure relief procedure.

8 Place a shop towel around the Schrader valve to soak up the expelled petrol.

9 Use a small screwdriver to press the Schrader valve down (3).

10 Remove the soiled shop towel and place in an approved container.

Repressurise

1 Reinstall the fuel pump relay and fuel pump fuse.

2 Perform the following procedure to inspect for leaks at the fuel pressure test point:

a Turn the ignition switch on for two seconds.

b Turn the ignition switch off for 10 seconds.

c Turn the ignition switch on.

d Check for leaks at the fuel pressure test point.

3 Tighten the fuel filler cap.

4 Start the engine and recheck for leaks.

5 Reinstall the Schrader valve sealing cap.

4 Service Operations

4.1 Fuel Lines And Quick Connect Fittings

Description

The fuel line connector fittings contain the following components:

1 O-rings

2 Fuel line port

3 Connector

4 Plastic fuel line tube

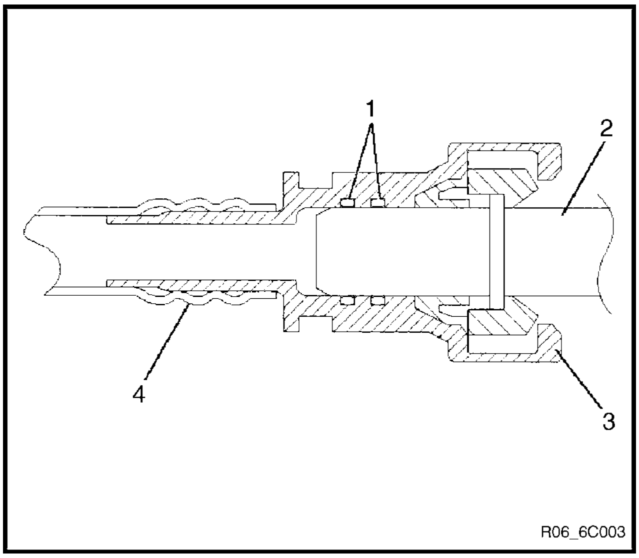

Figure 6C – 8

Leak Test and Inspection

1. Turn the ignition key to the ON position and ensure the fuel pump runs for a short time by listening for the pump start up sound. The fuel pressure will increase when the fuel pump is actuated.

2 Perform a preliminary check of the system by inspecting the system for any leaks around the connections and fittings.

3 Perform steps 1 and 2 several times.

4 If the preliminary check of the system produces no leaks, start the engine and check the system again for any sign of leaks around the connections and lines.

CAUTION

Ensure all service precautions have been observed prior to removing any connector fittings.

Removal

1 Depressurize the fuel system, refer to 3.4 Fuel System Depressurisation.

2 Use compressed air to remove any dirt around the fuel line quick connect fittings prior to disconnecting the fittings.

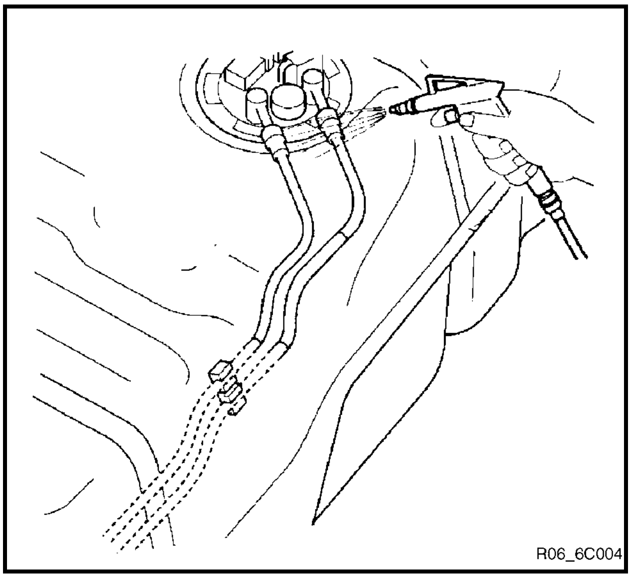

Figure 6C – 9

3 Hold the connector in one hand and depress the square release buttons on the connector body while gently pulling the quick connector and the fuel line apart with the other hand.

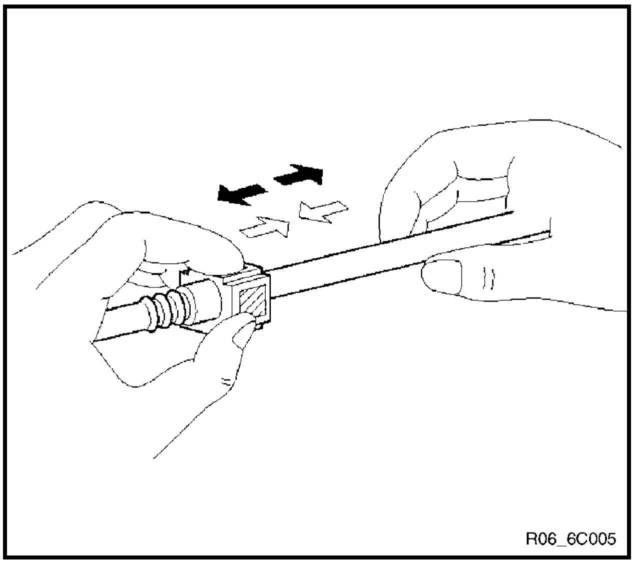

Figure 6C – 10

4 Cover the quick connect fittings to prevent dirt or other foreign material from entering the system.

NOTE

- Check the fuel lines and connector fittings for any scratches, rust, dents, or cracks. Replace the connector or the fuel line if found to be defective.
- Inspect the O-rings in the quick connectors and replace the connector if found to be defective.

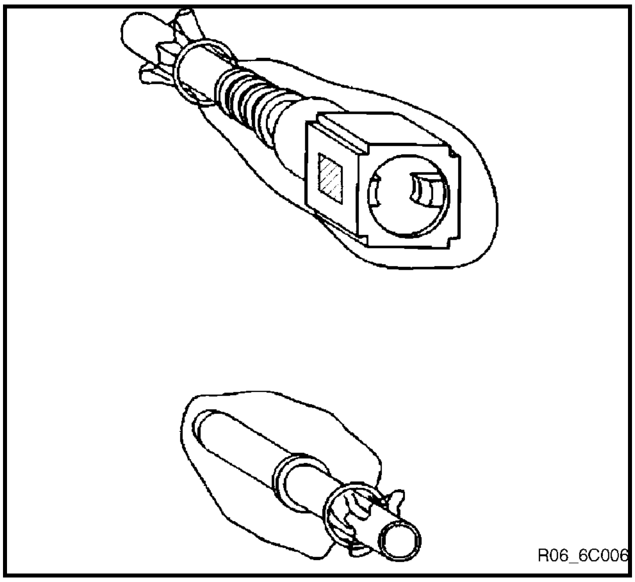

Figure 6C – 11

Reinstall

1 Apply a small amount of engine oil or light oil to the fuel line to assist in the assembly of the connector.

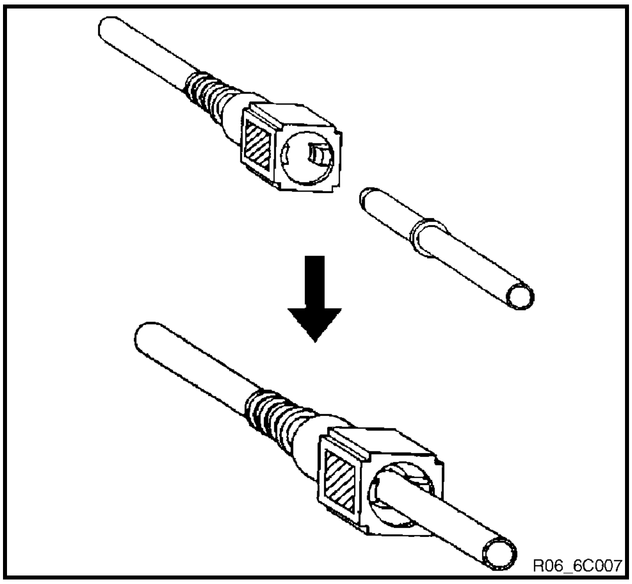

Figure 6C – 12

NOTE

Assembly of the fuel line and quick connectors should take place immediately after applying the oil to prevent any dust from sticking to the surface, which may cause the connector to leak.

4.2 Fuel Filter

Removal

1 Depressurize the fuel system, refer to 3.4 Fuel System Depressurisation.

2 Disconnect the battery ground cable.

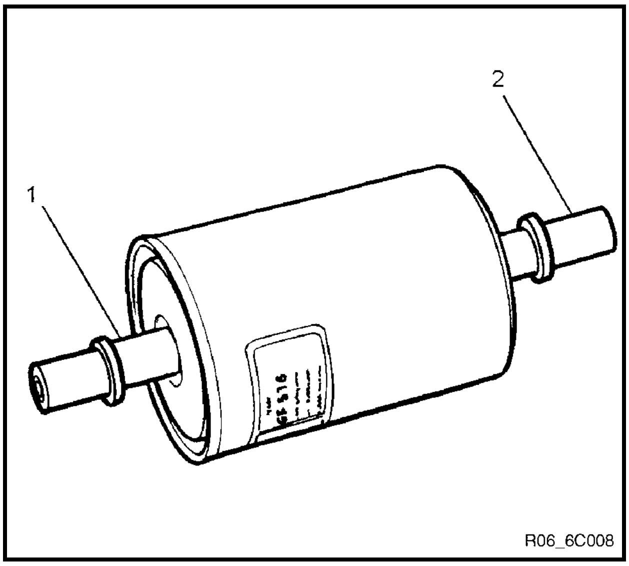

Figure 6C – 13

CAUTION

A small amount of fuel will flow out of the fuel lines and filter when disconnected.

3 Locate the fuel filter attached to the front of the fuel tank, place a drain tray below the fuel filter and remove the fuel line quick connectors from the inlet (2) and the outlet (1) of the fuel filter, refer to 4.1 Fuel Lines And Quick Connect Fittings.

4 Release the 3 clips (1) on the passenger side of the fuel filter holder and slide the fuel filter from the holder in the direction of the arrow.

NOTE

Cover the quick connectors to prevent any dirt from entering the fuel system.

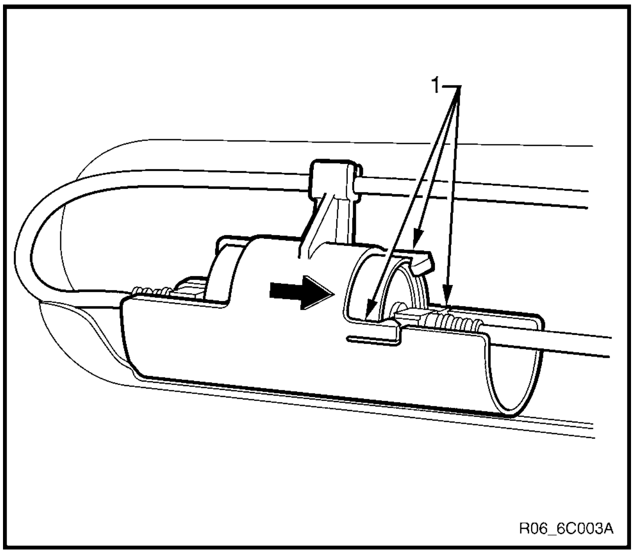

Figure 6C – 14

Inspection

1 Replace the fuel filter if fuel leaks from the filter body or if the fuel filter body itself is damaged.

2 Replace the fuel filter if it is clogged with dirt or sediment or the filter shows signs of being contaminated with water or other foreign materials.

Reinstallation

1 Slide the fuel filter into the holder attached to the front of the fuel tank, make sure the three plastic locking clips secure the filter in place.

NOTE

- Ensure the fuel filter inlet line is facing the drivers side if the vehicle and the outlet line is facing the passengers side of the vehicle.
- The direction arrow indicates the direction of fuel flow.

2 Connect the inlet and outlet fuel line quick connectors to the fuel filter, refer to 4.1 Fuel Lines And Quick Connect Fittings.

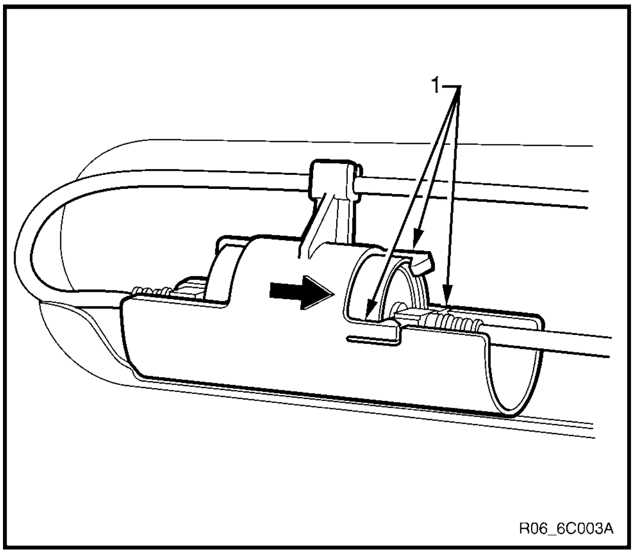

Figure 6C – 15

Remove

WARNING

- **A depressurised fuel system contains fuel in the fuel filter and fuel lines that can be spilled during service operations.**
- **Fuel vapour remains in the fuel tank even when completely empty. Seal all openings in the fuel tank using suitable material or a plastic plug. Ensure no naked flames or other ignition sources are nearby. Ensure all cellular phones (and transmission devices that may cause any metal objects to become unintentional receiving antennas) are switched off.**
- **Place a dry chemical (Class B) fire extinguisher nearby before performing any on-vehicle service procedures. Failure to follow these precautions may result in personal injury.**

1 Remove the fuel pump relay, refer to 8A Electrical Body and Chassis.

2 Depressurise the fuel system, refer to 3.4 Fuel System Depressurisation.

WARNING

Never drain or store fuel into an open container, due to the possibility of fire or explosion.

3 Siphon the fuel tank, using commercially-available equipment.

CAUTION

Before proceeding, clean all traces of dirt and other foreign material from the top of the fuel tank, near the modular fuel pump and sender assembly.

7 Place a drain tray under the fuel filter area.

WARNING

Fuel can spill from the disconnected filter.

8 From behind the fuel filler door (1), unscrew the fuel filler cap (4) and cover the end of the fuel filler neck with a suitable material to prevent foreign objects from entering the fuel tank.

9 Remove the screw (2) securing the fuel filler neck (3) to the fuel filler pocket.

10 Remove the front half of the right-hand rear wheelhouse liner, refer to 10 Cab.

Fuel filler neck attaching screw torque specification ....5.0 Nm

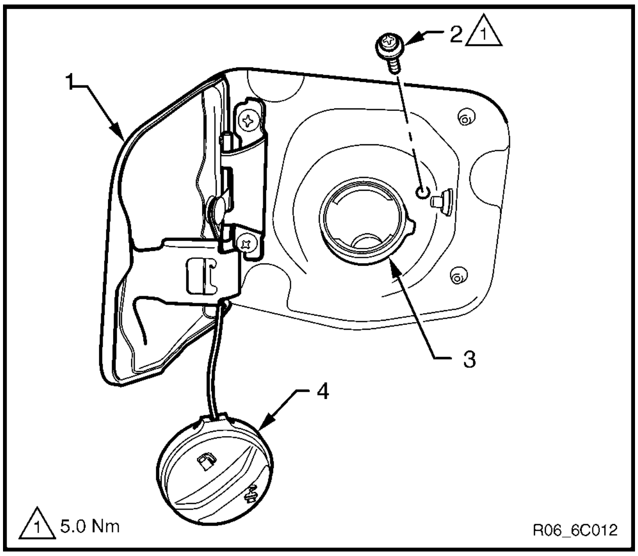

Figure 6C – 18

11 Unclip the fuel filler door release cable (1) from the retainer on the fuel filler neck (2).

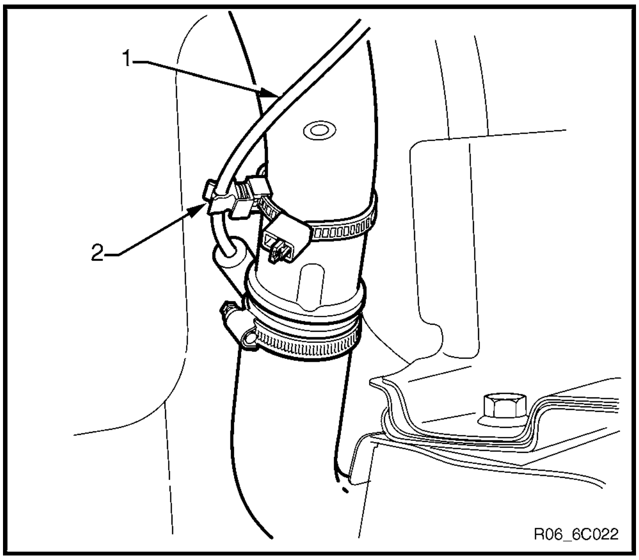

Figure 6C – 19

12 Lower the fuel filler neck and breather hose assembly.

13 Loosen the clamp (2) and disconnect the fuel tank breather hose (3) from the fuel filler neck (1).

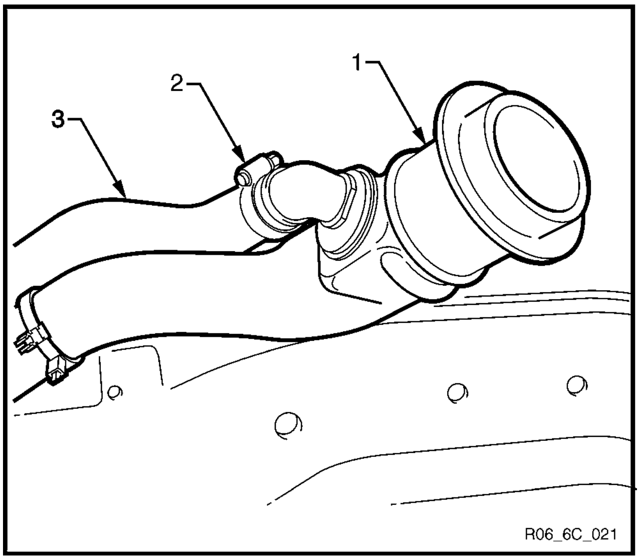

Figure 6C – 20

14 Remove the clamp (1) from the fuel filler neck and disconnect from the rubber fuel tank inlet hose (2), place the removed filler neck (3) in a safe location.

15 Raise the vehicle, preferably on a hoist, refer to 0A General Information.

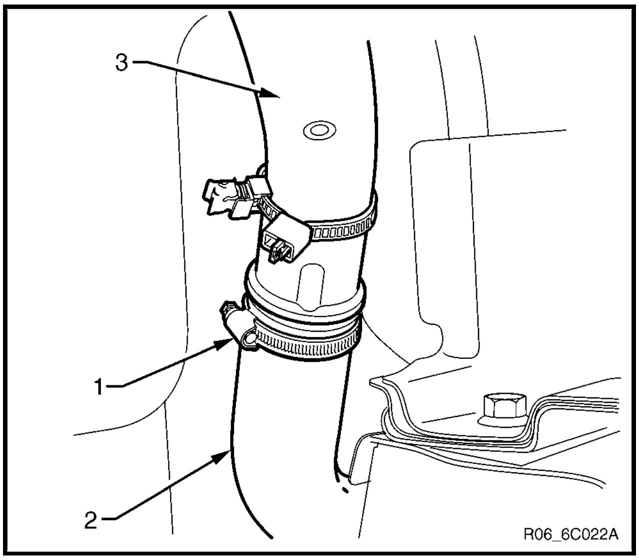

Figure 6C – 21

WARNING

Wear safety glasses when using compressed air. Do not blow compressed air onto any body part.

16 Use compressed air to ensure that all dirt and foreign materials are removed from all fuel connections before the parts are disconnected.

17 Disconnect the quick-connect fitting from the fuel supply line at the front of the fuel tank (1) and the evaporative line quick-connect fitting at the rear of the fuel tank (2), refer to 4.1 Fuel Lines And Quick Connect Fittings.

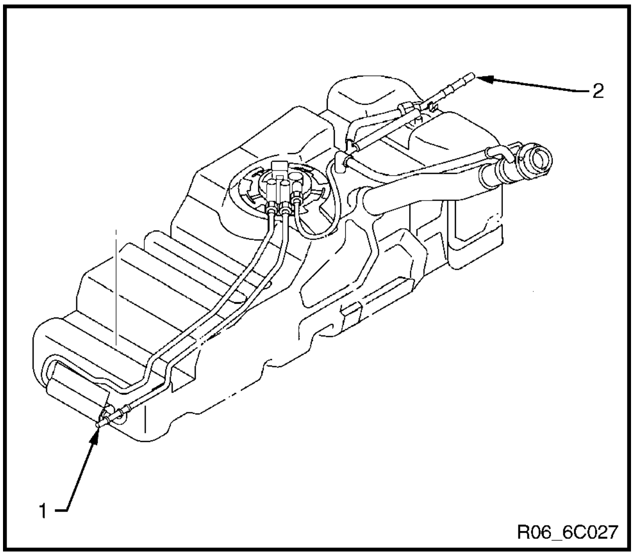

Figure 6C – 22

18 Remove the bolt securing the front fuel tank strap (1) to the crossmember and remove the strap (2), refer to Figure 6C – 17.

CAUTION

Support the fuel tank with stands or have an assistant on hand to help in the fuel tank removal.

19 Remove the bolt from the rear fuel tank strap (8) then remove the strap (9) refer to Figure 6C – 17.

20 Lower the rear of the fuel tank enough to allow access to the fuel pump electrical connector, release the connector clip and remove the connector from the socket.

21 Lower the fuel tank from the vehicle, ensuring the fuel tank inlet and breather hoses do not foul on any obstruction during the process.

22 Remove the fuel tank from the vehicle.

Reinstall

Reinstallation of the fuel tank is the reverse of the removal procedure, noting the following:

1 Lift the fuel tank into position reinserting the fuel tank inlet and breather hoses into the body opening. Raise the fuel tank into place and rest the front of the tank on the crossmember.

2 Replace the fuel pump electrical connector, be sure to engage the locking tab.

3 Fit the fuel tank mounting straps in the following order, refer to Figure 6C – 17,

  a Loosely reattach the rear fuel tank mounting strap and bolt (8 & 9), refer to Figure 6C – 17.

  b Loosely attach the front mounting strap and bolt (1 & 2), refer to Figure 6C – 17.

  c Ensure that the fuel tank is located in the correct position then,

  d Tighten the rear mounting strap bolt (8), Figure 6C – 17.

  e Tighten the front mounting strap bolt (1), Figure 6C – 17.

4 Tighten all fuel tank mounting strap bolts to the correct torque specification.

Fuel tank mounting strap bolts torque specification ....68.0 Nm

WARNING

Install the fuel filter with the flow arrow on its body pointing in the same direction as the fuel flow to the front of the vehicle.

5 Install the disconnected quick-connect fittings to the fuel supply line at the front of the fuel tank and the evaporative line quick-connect fitting at the rear of the fuel tank. Refer to 4.1 Fuel Lines And Quick Connect Fittings, for the correct component routeing.

6 Lower the vehicle to a comfortable working height and reinstall the clamp (1) to the fuel filler neck and reconnect the rubber fuel tank inlet hose (2) and tighten the clamp, refer to Figure 6C – 21.

7 Reinstall the fuel tank breather hose (3) to the fuel filler neck (1) and tighten the clamp (2), refer to Figure 6C – 20.

8 Clip the fuel filler door release cable (1) to the retainer on the fuel filler neck (2), refer to Figure 6C – 19.

9 Locate the fuel filler neck (3) to the filler pocket and attach with the securing screw (2), remove the cover material from the fuel filler neck inlet and refit the fuel filler cap (4), refer to Figure 6C – 18.

10 Reinstall the front half of the right-hand rear wheelhouse liner, refer to 10 Cab.

11 Before starting the vehicle, perform a fuel system leak test, refer to 3.3 Fuel Leak Test.

4.5 Modular Fuel Pump and Sender Assembly

NOTE

If the modular fuel pump and sender assembly develops a fault it must be replaced as a complete unit. The only serviced parts are the retainer locking ring and the O-ring seal.

Remove

WARNING

- **A depressurised fuel system contains fuel in the fuel filter and fuel lines that can be spilled during service operations.**
- **Fuel vapour remains in the fuel tank even when completely empty. Seal all openings in the fuel tank using suitable material or a plastic plug. Ensure no naked flames or other ignition sources are nearby. Ensure all cellular phones (and transmission devices that may cause any metal objects to become unintentional receiving antennas) are switched off.**
- **Place a dry chemical (Class B) fire extinguisher nearby before performing any on-vehicle service procedures. Failure to follow these precautions may result in personal injury.**
- **Wear safety glasses when using compressed air. Do not blow compressed air directly onto any body part.**

1 Remove the fuel pump relay, refer to 8A Engine Body and Chassis.

2 Remove the fuel tank assembly from the vehicle, refer to 4.4 Fuel Tank.

CAUTION

Before proceeding, clean all traces of dirt and other foreign material from the top of the fuel tank, near the modular fuel pump and sender assembly.

3 Use compressed air to ensure all dirt and foreign materials are removed from all fuel connections before disconnecting the parts.

WARNING

Fuel can spill from the disconnected modular fuel pump and sender assembly.

4 Tag the fuel feed line connecting the fuel feed port (1) on the modular fuel pump and sender assembly cover.

5 Tag the fuel return port (2) on the modular fuel pump and sender assembly cover.

6 Tag the evaporative line on the modular fuel pump and sender assembly cover (3).

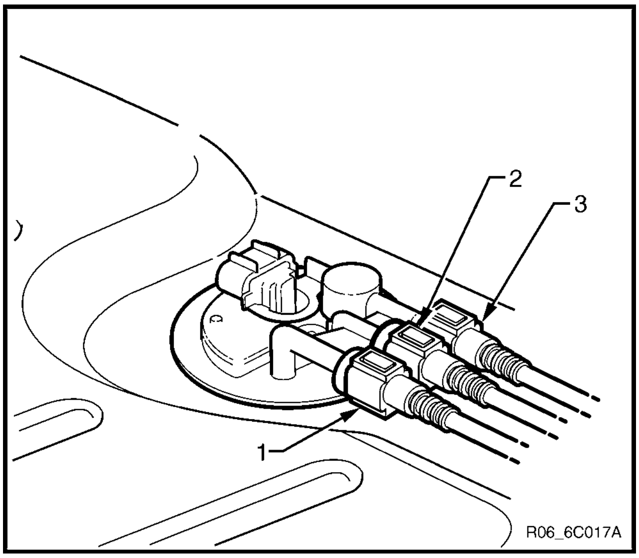

Figure 6C – 23

7 Disengage the fuel feed line quick-connect fitting (1).

8 Disengage the fuel return line quick-connect fitting (2).

9 Disengage the evaporative line quick-connect fitting (3).

Refer to 4.1 Fuel Lines And Quick Connect Fittings.

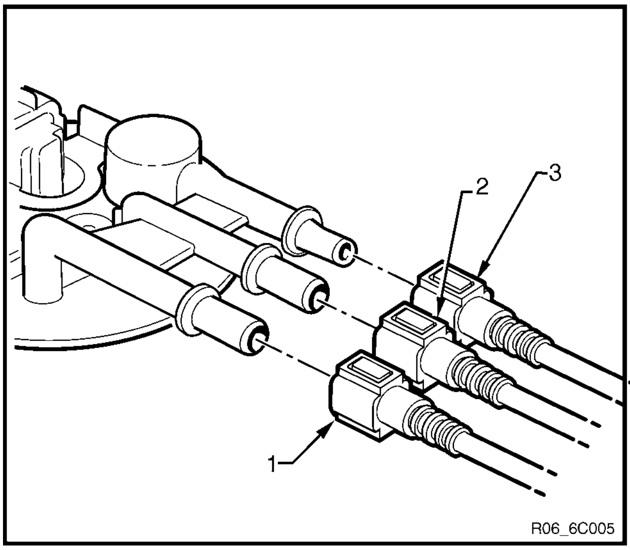

Figure 6C – 24

CAUTION

- **Ensure tool No. AU469 is seated firmly and positively in the modular fuel pump and sender assembly cover retainer lock ring while removing the modular fuel pump and sender assembly.**
- **Assistance will be required to hold the tank in position during this procedure; if not held adequately, you may slip and damage the modular fuel pump and sender assembly.**

10 Using tool No. AU469 (3) and a half-inch breaker bar (1), remove the modular fuel pump and sender assembly cover retainer lock ring (2) by turning it anticlockwise.

11 Remove the modular fuel pump and sender assembly cover retainer lock ring.

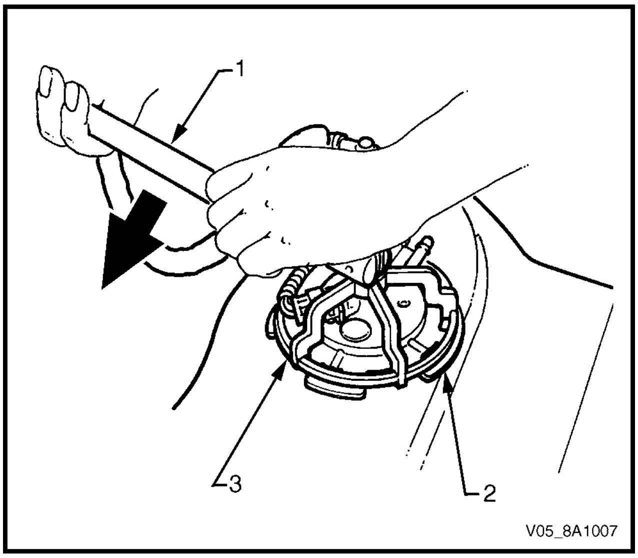

Figure 6C – 25

WARNING

The reservoir will be full of fuel. When the modular fuel pump and sender assembly is removed from the fuel tank, pour any remaining fuel in the reservoir into a suitable container. Do not drain or store fuel into an open container, due to the possibility of fire or explosion.

12 Place the modular fuel pump and sender assembly cover retainer lock ring (1) in a safe location away from the immediate worksite.

13 Carefully lift the modular fuel pump and sender assembly from the fuel tank, taking care not to:

- damage the fuel level sender float and arm (2), or
- spill any fuel remaining in the reservoir

NOTE

The fuel sender float arm is not serviced separately. If damaged, the modular fuel pump and sender assembly is replaced as a complete assembly.

14 Remove and discard the O-ring (3).

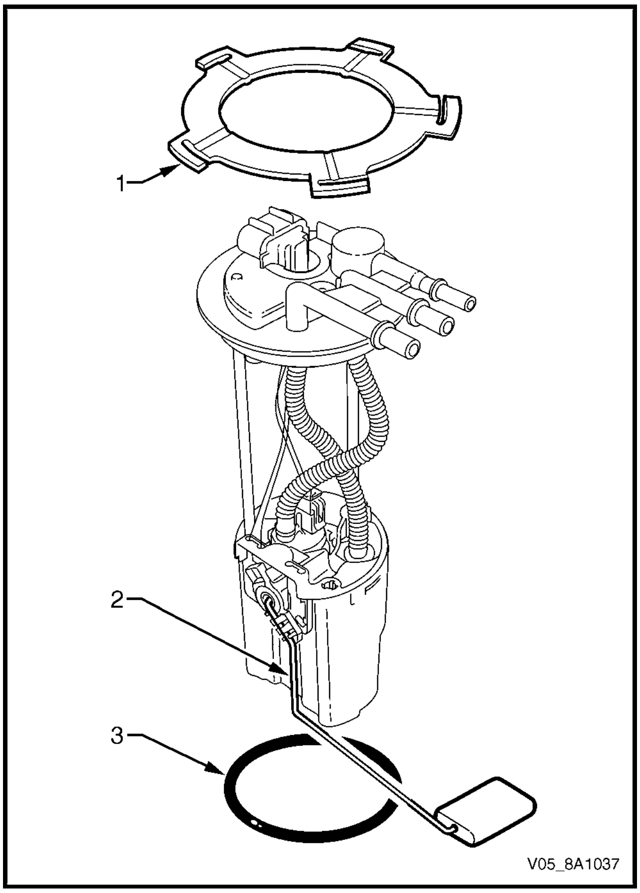

Figure 6C – 26

WARNING

Fuel vapour remains in the fuel tank even when completely empty. Seal all openings in the fuel tank using suitable material or a plastic plug. Ensure no naked flames or other ignition sources are nearby. Ensure all cellular phones (and transmission devices that may cause any metal objects to become unintentional receiving antennas) are switched off.

15 Place a suitable material over the opening in the fuel tank to prevent any foreign matter from entering the fuel system.

Fuel Level Sender Assembly

Test

1 Measure the resistance across terminals 2 and 3 of the fuel pump connector. Take the following measurements:

a With the float arm assembly in the empty position, the resistance should be approximately 250 Ω.

b With the float arm assembly rotated to the full position, the resistance should be approximately 40 Ω.

2 If the resistance at either of these positions is not within tolerance, replace the modular fuel pump and sender assembly.

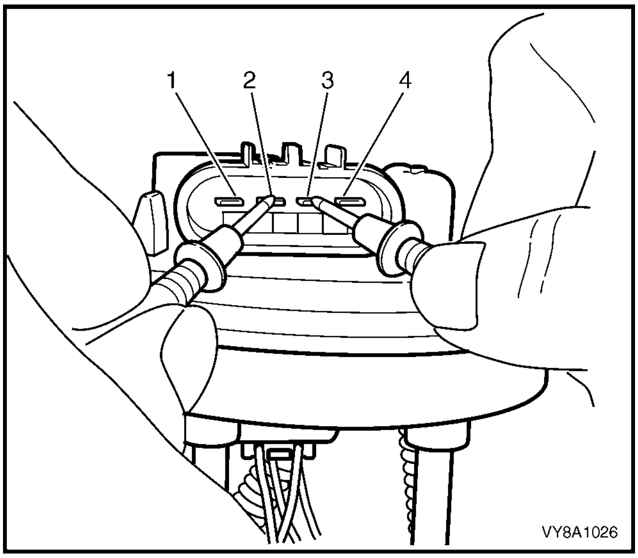

Figure 6C – 27

Reinstall

Reinstallation of the modular fuel pump and sender assembly is the reverse of the removal procedure, noting the following:

1 Fit a new O-ring (3) to the modular fuel pump and sender assembly.

2 Install the modular fuel pump and sender assembly into the fuel tank, taking care not to damage the fuel sender float or arm.

3 Ensure the locator in the pump cover engages in the slot in the fuel tank opening.

4 Using tool No. AU469 and a half-inch breaker bar, install the modular fuel pump and sender assembly cover retainer lock ring by turning it clockwise.

5 Refit the three quick connect fittings.

4.6 Evaporative Emission Control Canister

Remove

1 Raise the vehicle on a hoist to give access to the evaporative emission control canister, located above the spare wheel , refer to 0A General Information.

2 Disconnect the evaporative emission control canister purge line (3) by using the following procedure:

a Grasp both sides of the quick-connect fitting. Twist the connector 1/4 turn in each direction in order to loosen any dirt within the quick-connect fitting.

WARNING

Wear safety glasses when using compressed air. Do not blow compressed air onto any body part.

b Using compressed air, blow any dirt out of the quick-connect fitting.

c Grasp the quick-connect fitting and push it towards the canister.

d Squeeze the quick-connect fitting to release the retaining tabs, then pull back on the connector to remove the canister purge line from the canister.

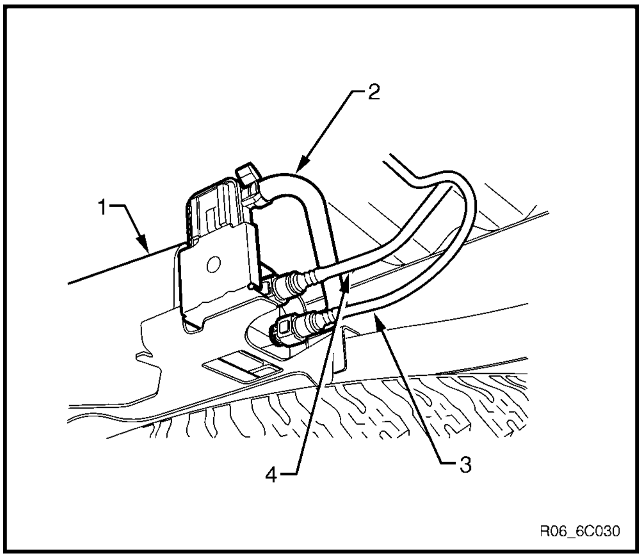

Figure 6C – 28

3 Disconnect the fuel tank vent line (4) by using the following procedure:

a Grasp both sides of the quick-connect fitting. Twist the connector 1/4 turn in each direction in order to loosen any dirt within the quick-connect fitting.

WARNING

Wear safety glasses when using compressed air. Do not blow compressed air onto any body part.

b Using compressed air, blow any dirt out of the quick connect fitting.

c Grasp the quick-connect fitting and push it towards the canister.

d Squeeze the quick-connect fitting to release the retaining tabs, then pull back on the connector to remove the tank vent line from the canister.

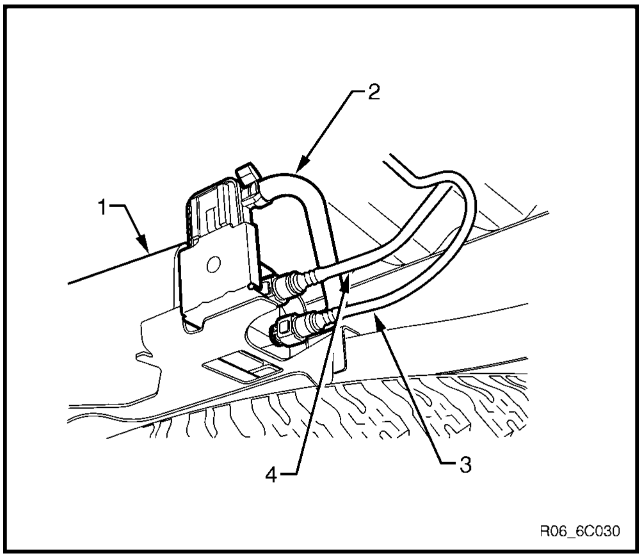

Figure 6C – 29

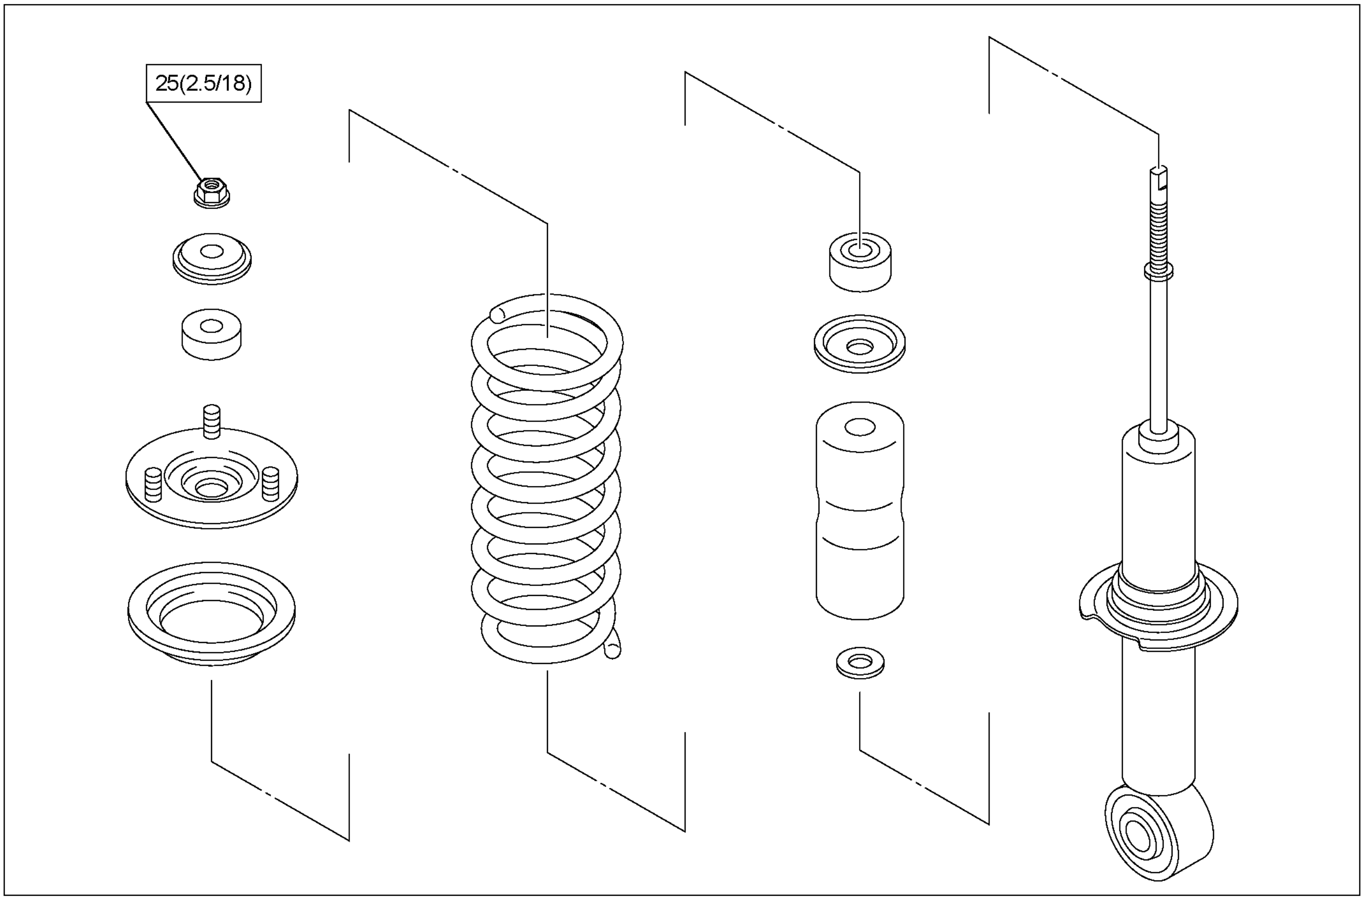
4×2 (Except High Ride Suspension) Model N·m (kgf·m/lb·ft)



RTW440MF000201

4 Remove the canister vent line (2) from the canister (1) by twisting and pulling it off.

Refer to 4.1 Fuel Lines And Quick Connect Fittings for further information.

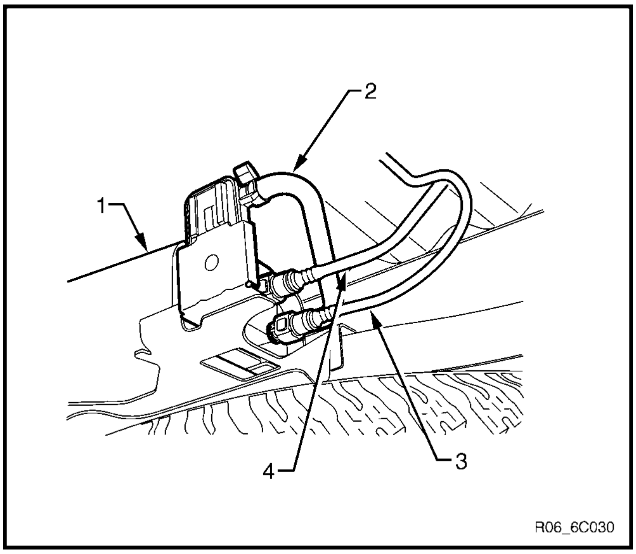


Figure 6C – 30

5 Remove the canister retaining nut (2).

6 Remove the canister from the retaining stud and then slide the canister (3) out of the retaining bracket (1).

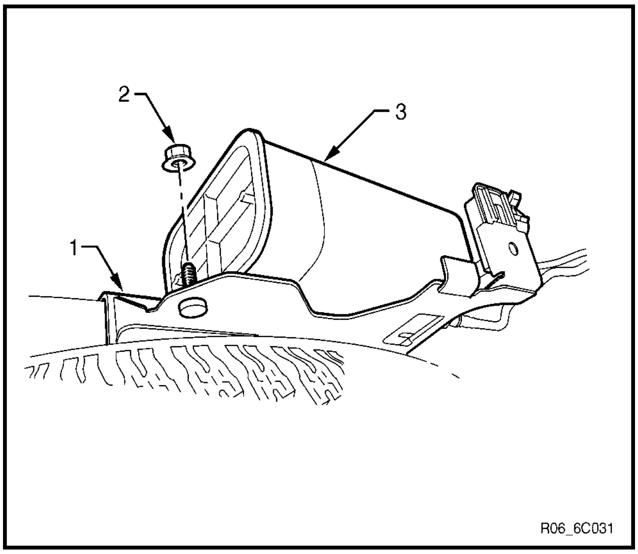

Figure 6C – 31

Service Check

1 Remove the canister.

2 Shake the canister. There should be no audible sound of carbon movement.

3 Using low pressure compressed air (20–35 kPa), blow into the tank vent port (3). Check that air flows freely from the canister vent port (1). Block the canister vent port (1); air should flow from the canister purge port (2).

4 If airflow through the canister vent port (1) is limited, clean the atmospheric filter by blocking off the fuel tank vent port (3) and blow compressed air at approximately 300 kPa through the canister purge port (2).

5 Check airflow through the filter as in step 3. If airflow through the canister vent port (1) is still limited, replace the canister.

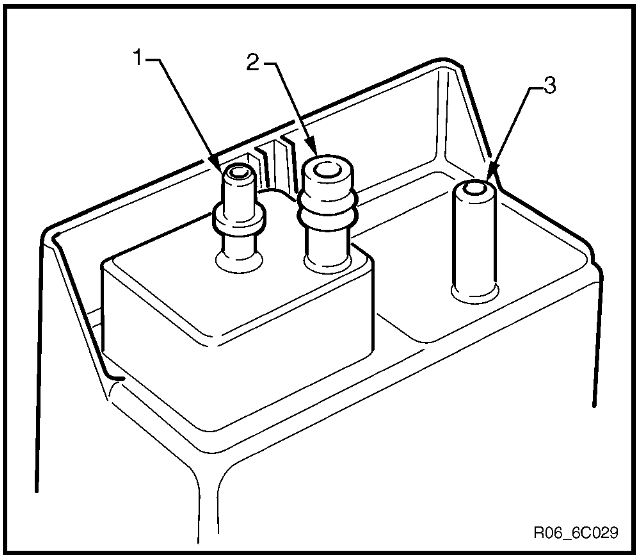

Figure 6C – 32

6 Block the canister vent port (1) and the canister purge port (2). Apply low-pressure compressed air (20–35 kPa) to the tank vent port (3). If any air leaks from the canister (that is, around the ports or seams), replace the canister.

NOTE

In dusty areas, an alternative is to block the canister purge port (2). Blow air through the canister vent (1) port and check that air is expelled through the tank vent port (3).

Reinstall

Reinstallation of the evaporative emission control canister is the reverse of the removal procedure.

1 Reinstall the canister into the retainer (1) and over the retaining stud.

2 Reinstall the canister retaining nut (2), then hand-tighten.

3 Ensure the canister is located correctly and tighten the canister retaining nut (2) to the specified torque.

Evaporative emission control canister retaining nut torque specification ....2.0 – 5.0 Nm

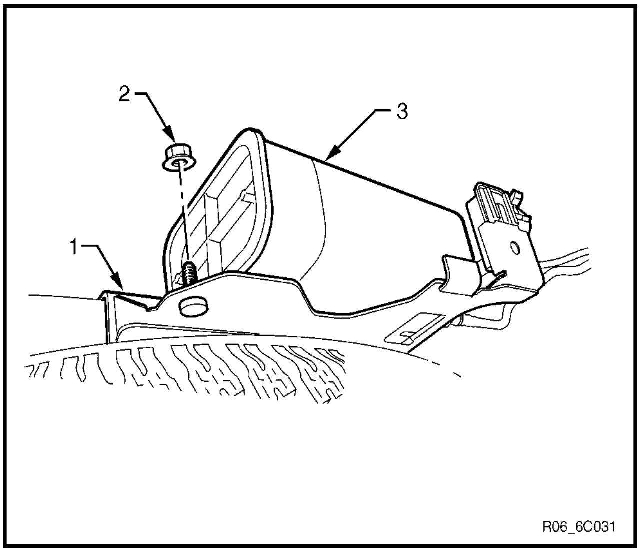

Figure 6C – 33

4 Reinstall the canister vent line (2).

5 Align the canister purge line quick-connect (3) with the canister purge line port. Push the quick-connect firmly onto the port.

6 Align the fuel tank vent line quick-connect (4) with the fuel tank vent port. Push the quick-connect firmly onto the port.

7 After installation, pull on each quick-connect to ensure the connections are secure and locked in position.

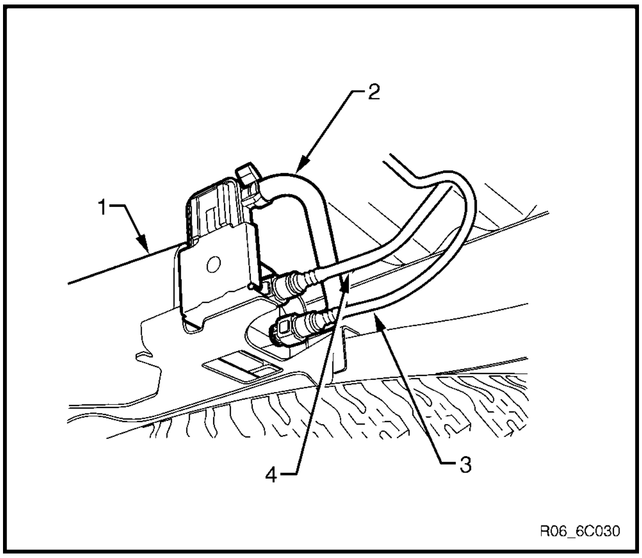

Figure 6C – 34

4.7 Fuel Tank Siphon Procedure

WARNING

- **Fuel vapour remains in the modular fuel pump and sender assembly and fuel lines that can be spilled during service operations. Ensure no naked flames or other ignition sources are nearby. Ensure all cellular phones (and transmission devices that may cause any metal objects to become unintentional receiving antennas) are switched off.**
- **Place a dry chemical (Class B) fire extinguisher nearby before performing any on-vehicle service procedures. Failure to follow these precautions may result in personal injury.**

For an exploded view of fuel tank components, refer Figure 6C – 17.

1 Depressurise the fuel system, refer to 3.4 Fuel System Depressurisation.

2 Reinstall the fuel pump relay, refer to 8A Electrical Body and Chassis.

CAUTION

Disconnecting the battery affects certain vehicle electronic systems. 1.1 WARNING, CAUTION and NOTES.

3 Disconnect the negative battery terminal.

4 Remove the fuel filler cap.

NOTE

Lubricate the fuel siphon hose with J36850 TransJel Transmission Assembly Lubricant or equivalent to aid hose insertion. Use only an approved lubricant.

5 Install J44284–2 flapper door holder (2) into the fuel filler neck to hold the door open.

WARNING

Do not siphon, drain or store fuel into an open container, due to the possibility of fire or explosion, or contamination. Always use and approved fuel storage container.

6 Insert the J45004–1 fuel tank siphon hose (1) into the fuel tank filler neck and gradually twist it until the tip of the hose meets the fuel tank check valve (3) and continues to the bottom of the fuel tank.

7 Use a hand-operated or air-operated pump device to siphon as much fuel through the fuel fill pipe as possible.

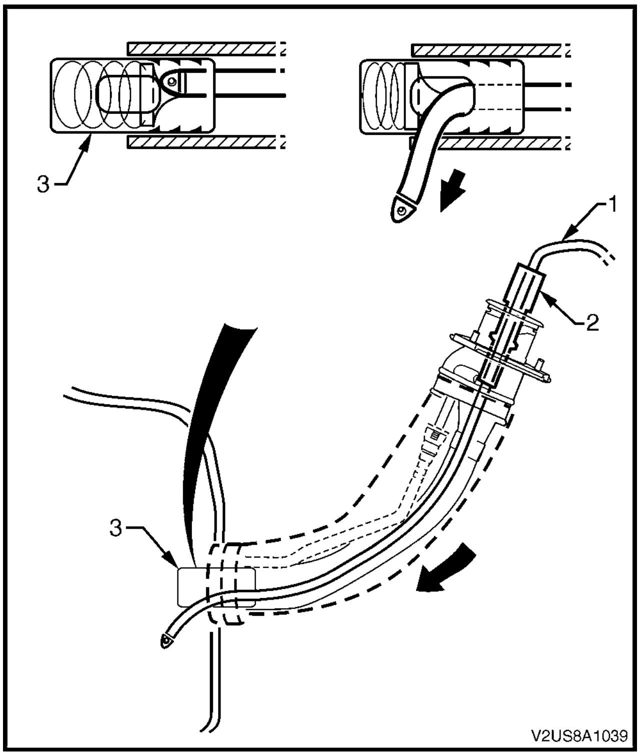

Figure 6C – 35

WARNING

Fuel vapour remains in the fuel tank even when completely empty. Seal all openings in the fuel tank using suitable material or a plastic plug. Ensure no naked flames or other ignition sources are nearby. Ensure all cellular phones (and transmission devices that may cause any metal objects to become unintentional receiving antennas) are switched off.

CAUTION

Do not use excessive force when removing the fuel siphon hose from the fuel filler neck. If the fuel siphon hose gets stuck upon removal, gently twist and tug the fuel siphon hose back and forth until it releases.

NOTE

- If fuel does not siphon from the fuel tank, the fuel siphon hose may have entered the fuel tank through a roof-facing check valve opening. If required, insert the J45004–1 fuel siphon hose (1) into the fuel tank filler neck, refer to Figure 6C – 35, but twist the fuel siphon hose 90° as it slides down the filler neck. This enables the fuel siphon hose to enter the fuel tank through a floor-facing check valve opening.
- The siphon procedure will not remove all fuel from the fuel tank. If required, fuel remaining in the fuel tank may be siphoned out through the top of the fuel tank, once the modular fuel pump and sender assembly is removed from the tank, refer to 4.4 Fuel Tank.

8 Remove the siphon equipment.

4.8 Fuel Filler Cap

The fuel filler cap is a 'screw on' type, with an integrated tightening torque limiting mechanism. When installing the fuel filler cap, tighten it until a ratcheting (clicking) sound is audible, indicating the fuel filler cap is properly tightened. The fuel filler cap is tethered to the fuel filler pocket.

Remove

The fuel filler cap requires a quarter of a turn anticlockwise to be removed.

Vacuum and pressure valves are built into the fuel filler cap which regulate the pressure in the fuel tank and prevent fuel tank and system damage.

Inspection

Inspect the fuel filler cap and seal for any signs of damage. Replace the fuel filler cap if found to be defective.

1 Pressure Valve

2 Vacuum Valve

3 Seal Ring

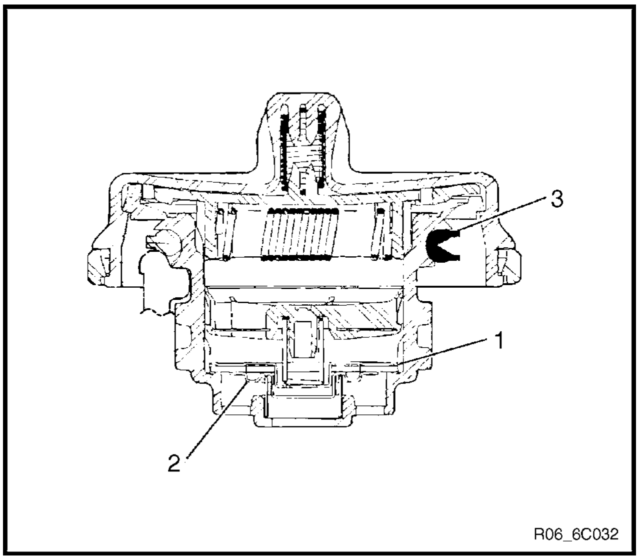

Figure 6C – 36

CAUTION

A replacement fuel filler cap must be the same type as the original. The fuel filler cap pressure and vacuum valves are specific to a particular application and must be replaced with the same type or fuel system damage may occur.

WARNING

If the fuel filler cap needs replacing, use only a 'screw on' fuel tank filler cap with an integrated tightening torque limiting mechanism. Failure to use the correct fuel tank filler cap can result in a serious malfunction of the emission control or fuel system.

1. Untwist and remove the fuel filler cap (2) from the fuel filler neck opening.
2. Cover the fuel filler opening with a suitable material to prevent foreign objects from entering the fuel tank.
3. To remove the fuel filler cap tether line use a flat-bladed screwdriver to prise the tether line fastener (2) from it's mounting hole.

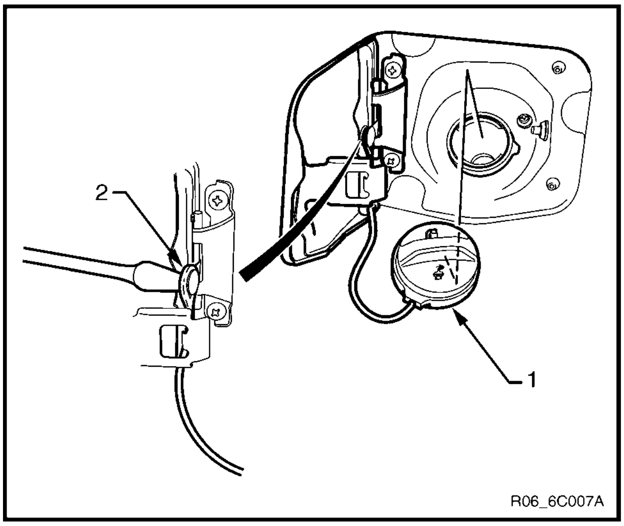

Figure 6C – 37

NOTE

Check the fuel filler cap for serviceability and replace if required.

Reinstall

Reinstallation of the fuel filler cap is the reverse of the removal procedure.

4.9 Fuel Lines

Remove

WARNING

- **A depressurised fuel system contains fuel in the fuel filter and fuel lines that can be spilled during service operations.**
- **Fuel vapour remains in the fuel tank even when completely empty. Seal all openings in the fuel tank using suitable material or a plastic plug. Ensure no naked flames or other ignition sources are nearby. Ensure all cellular phones (and transmission devices that may cause any metal objects to become unintentional receiving antennas) are switched off.**
- **Place a dry chemical (Class B) fire extinguisher nearby before performing any on-vehicle service procedures. Failure to follow these precautions may result in personal injury.**
- **Wear safety glasses when using compressed air. Do not blow compressed air onto any body part.**

1 Remove the fuel pump relay, refer to 8A Electrical Body and Chassis.

2 Depressurise the fuel system, refer to 3.4 Fuel System Depressurisation.

WARNING

Never drain or store fuel into an open container, due to the possibility of fire or explosion.

3 Raise the vehicle, preferably on a hoist, refer to 0A General Information.

CAUTION

Before proceeding, clean all traces of dirt and other foreign material from the fuel lines.

4 Use compressed air to ensure that all dirt and foreign materials are removed from all fuel connections before the parts are disconnected.

5 If required, remove the stone guard, refer to Figure 6C – 17 and fuel lines. Use the following illustrations showing the fuel line layout and location of other items relating to the fuel system as a guide, also refer to 4.1 Fuel Lines And Quick Connect Fittings and 4.6 Evaporative Emission Control Canister.

Fuel Tank Lines

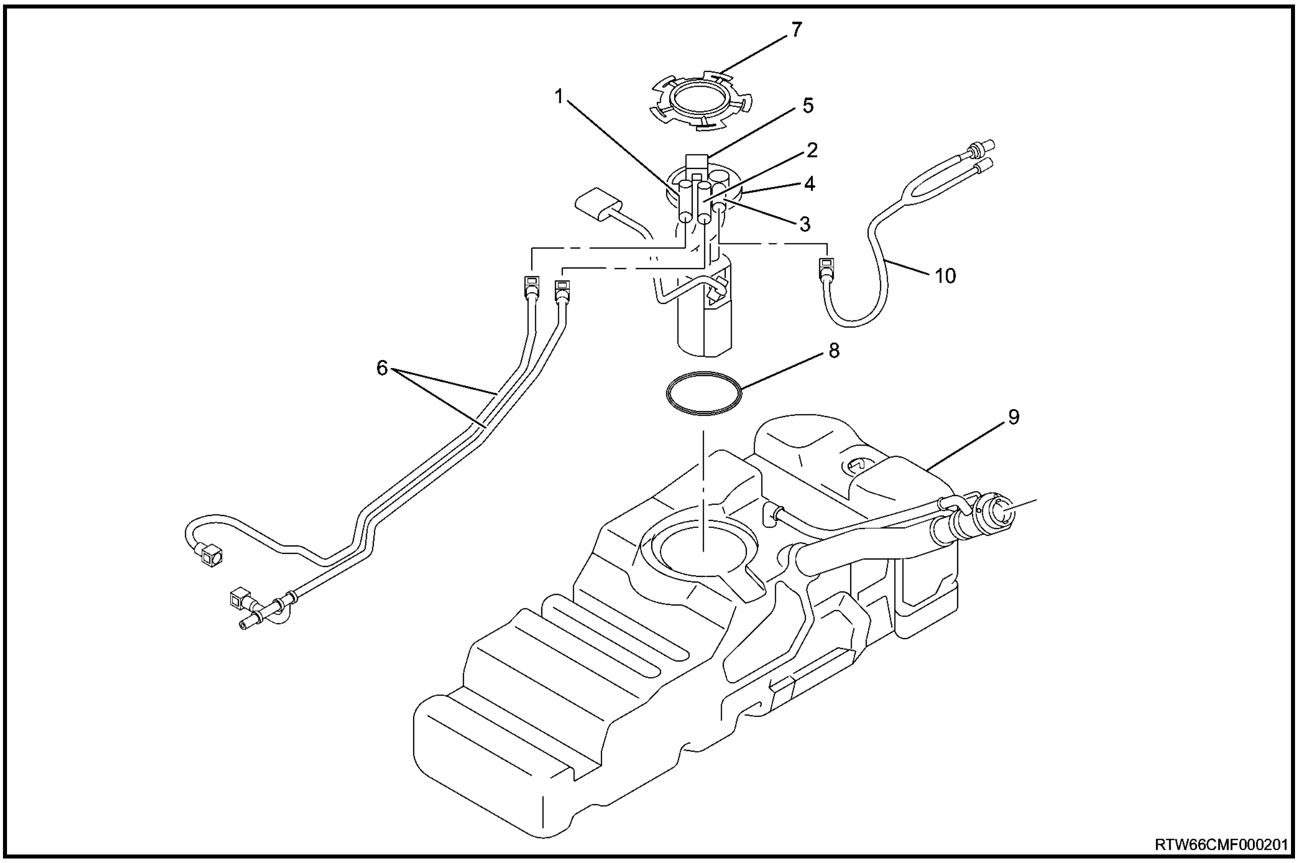

Figure 6C – 38

Legend

1	Fuel Feed Line	6	Fuel Lines
2	Fuel Return Line	7	Retainer Ring (Fuel Pump Lock)
3	Fuel Vapour emission port	8	"O" Ring Seal
4	Fuel Pump and Sender Assembly	9	Fuel Tank Assembly
5	Connector; Fuel Pump and Sender	10	Fuel Vapour Vent Line

Reinstall

CAUTION

Ensure the plastic fuel line clips are in good condition before proceeding. If not, replace the defective clips.

Reinstallation of the stone guard and fuel lines is the reverse of the removal procedure, noting the following:

1 Tighten the Fuel line securing nut to the correct torque specification, refer to Figure 6C – 39.

Fuel line securing nut torque specification ....8 – 12 Nm

2 Tighten the stone guard securing bolts to the correct torque specification.

Stone guard securing bolt torque specification ....5.0 – 7.0 Nm

Fuel Line Routing

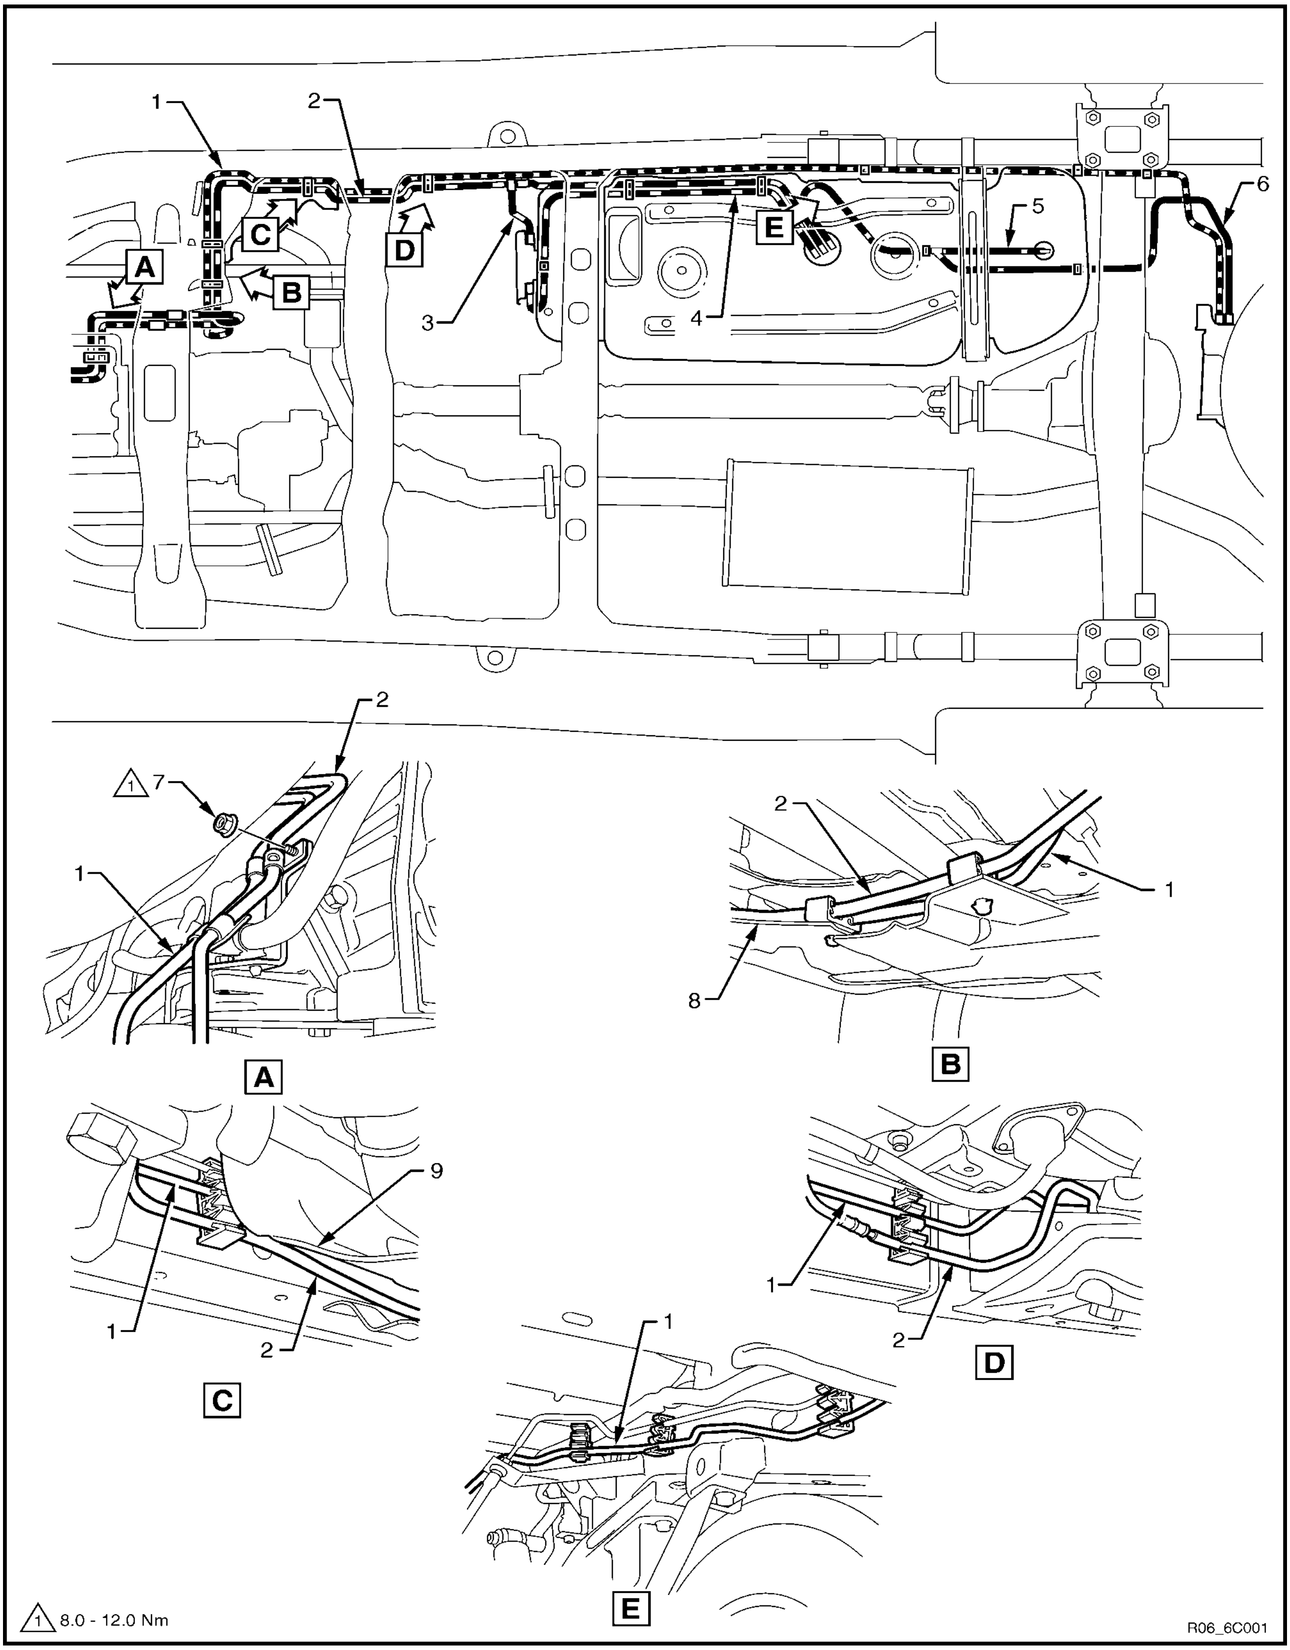

Figure 6C – 39

7 Fuel Line Securing Nut

8 Stone Guard

9 Side Stone Guard

Bell Housing Fuel Lines

1 Remove the bolt (1) securing the fuel line bracket to the upper left-hand side of the bell housing, refer to 7B1 Transmission.

NOTE

The left-hand front exhaust pipe may need to be moved aside to gain access to the fuel line retaining bracket bolt (1), refer to 6F Exhaust System – V6.

Fuel line bracket bolt torque specification ....8.0 – 12.0 Nm

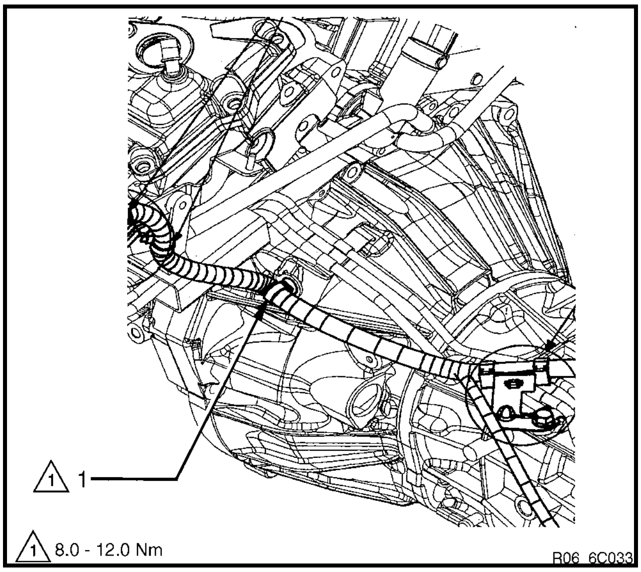

Figure 6C – 40

Engine Bay Fuel Lines

1 Remove the nut (5) from the fuel line bracket (4).

2 Unclip the fuel lines from the engine, refer to 4.1 Fuel Lines And Quick Connect Fittings.

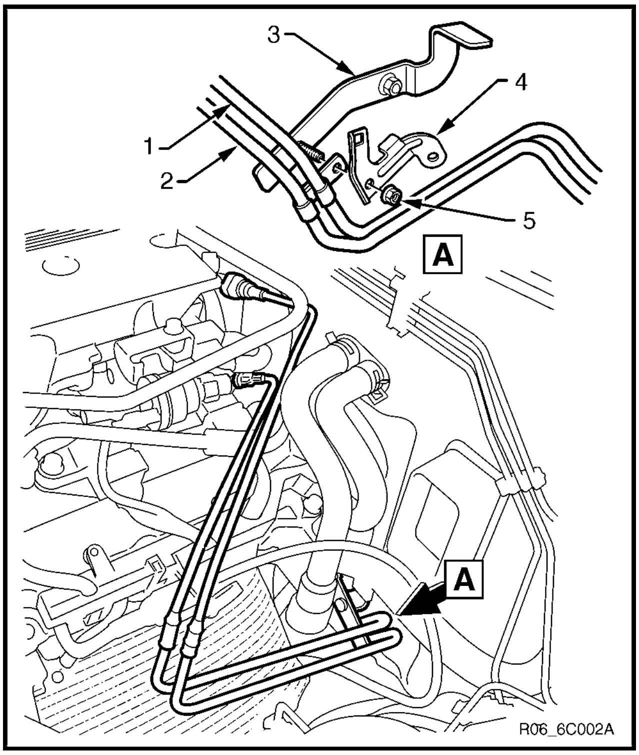

Figure 6C – 41

4.10 Rollover Valve

The fuel tank incorporates two rollover valves. The rollover valve limits vapour venting to the evaporative emission control canister using a fixed-sized orifice that is normally open (View A). If the vehicle rolls over (View B), the fuel tank vent line to the evaporative emission control canister is safely shut off by the rollover valve, preventing liquid fuel from flooding the evaporative emission control canister.

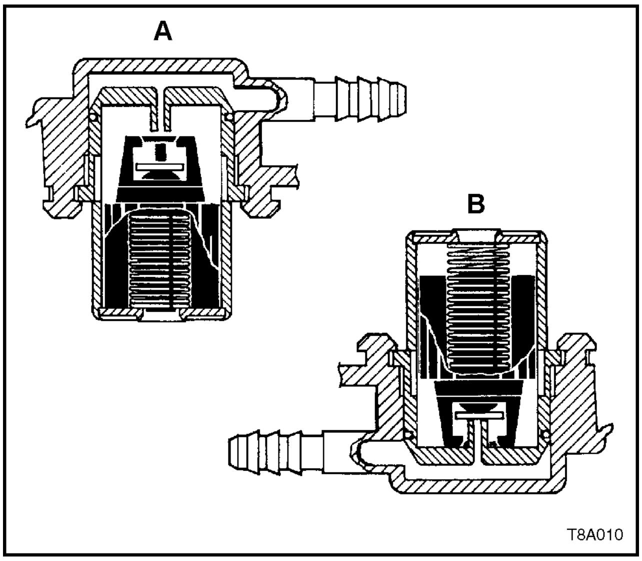

Figure 6C – 42

NOTE

The rollover valve is welded to the top of the fuel tank and is not a serviceable item. If the rollover valve becomes unserviceable, the fuel tank must be replaced, refer to 4.4 Fuel Tank.

J44284–2	 J44284-2	**Fuel Flapper Door Holder** Holds open the fuel filler neck flapper door to allow the fuel tank siphon hose to be fed down into the fuel filler neck.	Mandatory
J45004–1	 J45004	**Fuel Tank Siphon Hose** Flexible fuel siphoning hose with grounding wire and threaded vacuum pump fitting.	Mandatory

6C1-1 Engine Management – V6 General Information

ATTENTION

Before performing any service operation or other procedure described in this Section, refer to 1.3 Warning Caution and Notes for correct workshop practices with regard to safety and / or property damage.

1 General Information

WARNING

The V6 engine management system incorporates functions and components that could cause personal injury or vehicle damage. Refer to 6C1-2 Engine Management – V6 – Diagnostics, and 6C1-3 Engine Management – V6 – Service Operations, before attempting any diagnosis or repairs.

1.1 Introduction

The V6 engine management system is designed to improve engine performance and increase vehicle safety while meeting the stringent Euro 3 vehicle emission standard. This is achieved by the introduction of the following engine management sub-systems and components:

- Throttle actuator control (TAC) System – the TAC system allows the engine control module (ECM) to electronically control the throttle plate opening eliminating the need for the following components:
  - mechanical link between the throttle plate and accelerator pedal,
  - cruise control module, and
  - idle air control motor.

  Refer to 3.5 Throttle Actuator Control System for details of the TAC System operation and to 3.6 Cruise Control System for details of the cruise control operation.

  This feature results in improved driveability, better fuel economy and emission control.
- Wide band heated oxygen sensor provides a more accurate measurement of the oxygen concentration in the exhaust gas. Refer to 4.14 Heated Oxygen Sensors.
- Dual spray fuel injectors are now used. The use of this spray pattern is used in engines with two intake valves per cylinder. The dual spray is achieved by having two openings in the spray orifice disc that are arranged in such a way that two fuel sprays result, being aimed at each intake valve port. Refer to 4.12 Fuel Injectors.
- Pencil Coil – allows the ignition coil to be fitted directly on the spark plug eliminating the need for spark plug wires. Refer to 4.15 Ignition Coil and Spark Plug.

The engine management system has a self diagnostic capability, as well as connections to enable diagnosis of faults. If the ECM recognises operational problems it can alert the driver via the malfunction indicator lamp (MIL) in the instrument cluster. The ECM also interfaces with other systems in the vehicle as required.

For further information on the air-conditioning system refer to 2A Heater and Air-conditioning,

For the location of fuses, fusible links and relays, refer to 8A Electrical-Body and Chassis.

1.2 Emission Control

ADR 79/01 Emissions Standards

MY2006 I190 Rodeo has been configured to comply with Australian Design Rule 79/01, that adopts the technical requirements of the European Council Directive 98/69/EC. Commonly referred to as “Euro 3”, the new legislation modifies the exhaust emissions, compared to the existing ADR 37/01 (or ‘Euro 2’) vehicle emissions standards.

Australian Design Rule 79/01 implements the 'Euro 3' exhaust and evaporative emissions requirements for petrol fuelled passenger cars, forward control vehicles and passenger off-road vehicles with a gross vehicle mass (GVM) up to 3.5 tonnes. All new vehicles within these categories and first registered from January 1, 2006 must comply with ADR 79/01.

The next table shows a comparison between the existing ADR 37/01 (‘Euro 2’) and ADR 79/01 (‘Euro 3’)

	Carbon Monoxide (g/km)	Hydrocarbons		Oxides of Nitrogen (g/km)	Particulate Matter (g/test)
		Exhaust (g/km)	Evaporative (g/test)		

ADR 37/01 (Petrol)	2.1	0.26	2	0.63	Not Applicable
ADR 79/01 (Petrol, LPG, CNG)	2.3	0.2	2	0.15	0.05

1.3 Warning Caution and Notes

This Section contains various WARNINGS, CAUTIONS and NOTE statements that you must observe carefully to reduce the risk of death or injury during service, repair procedures or vehicle operation. Incorrect service or repair procedures may damage the vehicle or cause operational faults. WARNINGS, CAUTION and NOTE statements are not exhaustive. GM Holden LTD can not possibly warn of all the potentially hazardous consequences of failure to follow these instructions.

Definition of WARNING, CAUTION and NOTE Statements

Diagnosis and repair procedures in this Section contain both general and specific WARNING, CAUTION and NOTE statements. GM Holden LTD is dedicated to the presentation of service information that helps the technician to diagnose and repair the systems necessary for proper operation of the vehicle. Certain procedures may present a hazard to the technician if they are not followed in the recommended manner. WARNING, CAUTION and NOTE statements are designed to help prevent these hazards from occurring, but not all hazards can be foreseen.

WARNING defined

A WARNING statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in death or injury. A WARNING statement alerts you to take necessary action or not to take a prohibited action. If a WARNING statement is ignored, the following consequences may occur:

- Death or injury to the technician or other personnel working on the vehicle,
- Death or injury to other people in or near the workplace area, and / or
- Death or injury to the driver / or passenger(s) of the vehicle or other people, if the vehicle has been improperly repaired.

CAUTION defined

A CAUTION statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in damage to or destruction of equipment, or corruption of data. If a CAUTION statement is ignored, the following consequences may occur:

- Damage to the vehicle,
- Unnecessary vehicle repairs or component replacement,
- Faulty operation or performance of any system or component being repaired,
- Damage to any system or components which depend on the proper operation of the system or component being repaired,
- Faulty operation or performance of any systems or components which depend on the proper operation or performance of the system or component under repair,
- Damage to fasteners, basic tools or special tools and / or
- Leakage of coolant, lubricant or other vital fluids.

NOTE defined

A NOTE statement immediately precedes or follows an operating procedure, maintenance practice or condition that requires highlighting. A NOTE statement also emphasises necessary characteristics of a diagnostic or repair procedure. A NOTE statement is designed to:

- Clarify a procedure,
- Present additional information for accomplishing a procedure,
- Give insight into the reasons for performing a procedure in the recommended manner, and / or
- Present information that gives the technician the benefit of past experience in accomplishing a procedure with greater ease.

2 Component Locations

2.1 Cylinder Numbering

Engine cylinder identification follows the international standard OBD II. This standard calls for the engine cylinder bank number one to be identified by the location of cylinder number one. Therefore the numbering for the V6 engine is:

The V6 engine cylinders are numbered as follows:

- 1, 3, 5 – Right-hand side (Bank 1),
- 2, 4, 6 – Left-hand side (Bank 2).

The engine firing order is 1, 2, 3, 4, 5, 6.

5	Accelerator Pedal Assembly

3 System Operation

The engine control module (ECM) is the control centre of the V6 engine management system. The ECM constantly monitors and evaluates inputs from various sensors and switches. Based on these inputs, the ECM controls the operation of the engine management system. Refer to Figure 6C1-1 – 6 for the illustration of the inputs and outputs of the ECM.

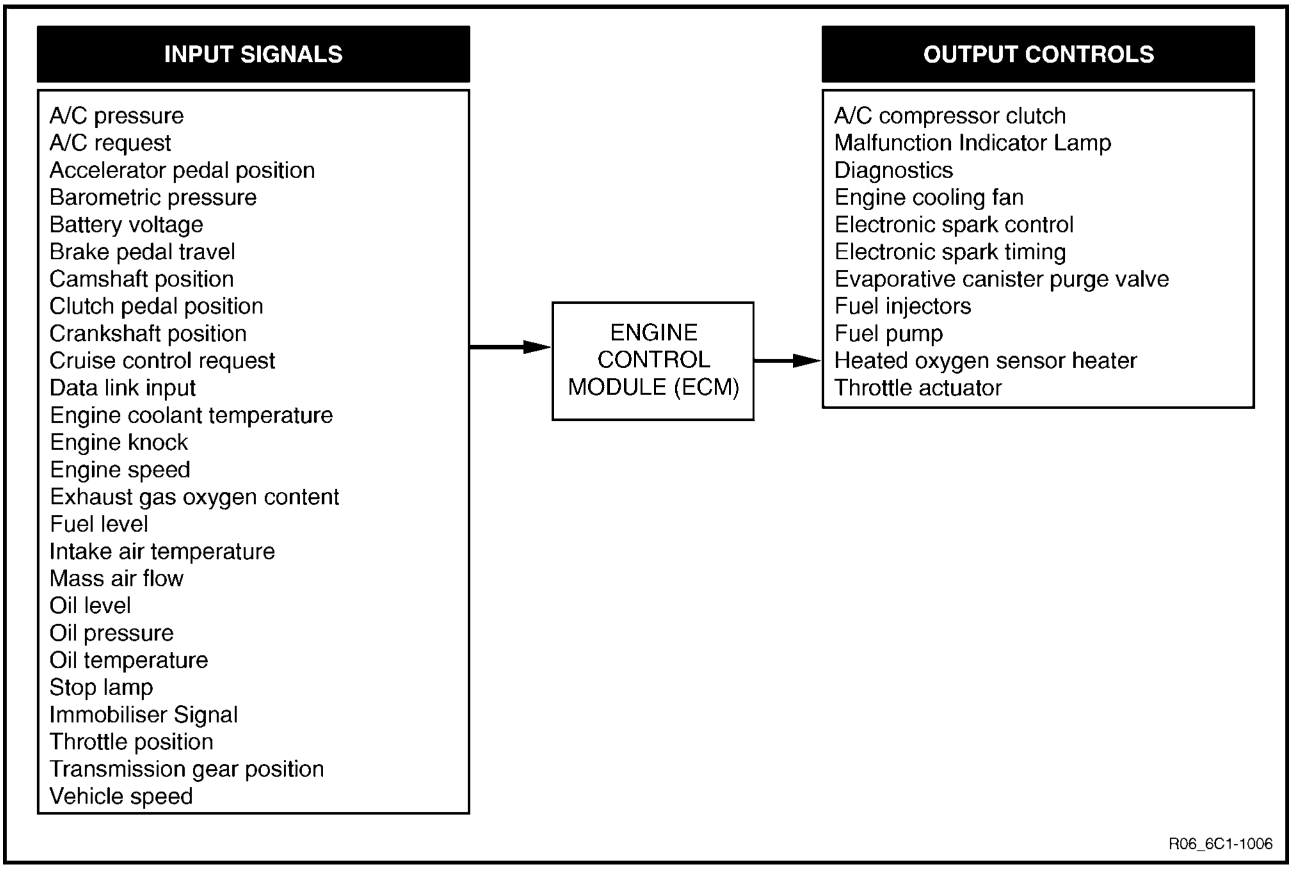

Figure 6C1-1 – 6

3.1 Fuel Delivery System

Fuel System Pressure

When the ignition switch is turned on, the ECM energises the fuel pump circuit and the fuel pump runs and builds up pressure in the fuel system. The fuel pump will continue to operate if the engine is started or as long as the engine is cranking or running and the ECM detects crankshaft position (CKP) sensor signal pulses. If the CKP sensor signal pulses stop, the ECM de-energises the fuel pump circuit within two seconds, which stops the fuel pump operation.

The vehicle is fitted with a modular fuel pump and sender assembly that provides delivery of fuel from the fuel tank and information on the fuel level. The fuel delivery system is a single line, on-demand design. With the fuel pressure regulator incorporated into the modular fuel pump and sender assembly, the need for a return pipe from the engine is eliminated.

The electric fuel pump contained in the modular fuel pump and sender assembly provides fuel at a pressure greater than the regulated pressure which is supplied to the fuel rail. The fuel is then distributed through the fuel rail to six injectors located directly above each cylinder's two intake valves.

Having a single line fuel supply system reduces the internal temperature of the fuel tank by not returning hot fuel from the engine. In reducing the internal temperature of the fuel tank, lower evaporative emissions are achieved.

Unleaded fuel must be used to ensure correct emission parameters and engine operation. Leaded fuel damages the emission control system and use of leaded fuel can result in loss of emission warranty. Using unleaded fuel will also minimise any spark plug fouling and extend engine oil life.

Fuel Injection System

Each cylinder of the V6 engine is fitted with one fuel injector. The engine control relay applies ignition positive voltage to the fuel injector ignition circuit. The ECM controls the operation of the fuel injectors by applying a pulse width modulated (PWM) ground to the fuel injector control circuit to control each fuel injector on-time.

While the engine is running, the ECM constantly monitors the various inputs and recalculates the appropriate on-time for each injector. The calculation is based on the following:

- The injector flow rate,
- Mass of fuel passed by the energised injector per unit of time,
- The desired air / fuel ratio, and
- Actual air mass in each cylinder.

The ECM calculates the duration of the fuel injector on-time to deliver the correct amount of fuel for optimum drivability and emission control. The period of time the fuel injector is energised is called the injector on-time and is measured in milliseconds (thousandths of a second).

The V6 engine uses the sequential fuel injection system. Each fuel injector is energised individually at the correct moment during its firing stroke as the cylinder's intake valves are closing to provide enough time for the fuel to atomise completely and mix with the intake air.

Short Term Fuel Trim

The short term fuel trim (STFT) represents the duration of the fuel injector on-time as calculated by the ECM, while the ECM is in Closed Loop mode. The STFT allows the ECM to calculate the fuel injector on-time based on the heated oxygen sensor (HO2S) signal input to the ECM. Therefore, the STFT is disabled when the ECM is in Open Loop mode.

- If the air / fuel mixture in the exhaust is balanced (lambda = 1) or when the STFT is disabled, the STFT value is 0%.
- When the HO2S sends an input signal to the ECM indicating the air / fuel mixture is rich, the STFT will be less than 0%, which indicates the ECM is decreasing the fuel injector on-time to reduce the amount of fuel in the air / fuel mixture.
- When the HO2S sends an input signal to the ECM indicating the air / fuel mixture is lean, the STFT will be greater than 0%, which indicates the ECM is increasing the fuel injector on-time to increase the amount of fuel in the air / fuel mixture.

The percentage values of the STFT range from –25% to +25% and are directly proportional to the duration of the fuel injector on-time.

Long Term Fuel Trim

The ECM stores the long term fuel trim (LTFT) in its memory to adjust the fuel injector on-time according to the long term changes or deterioration in the engine components. The normal LTFT value is 0%.

The following describes the LTFT operation when the engine air filter is dirty that causes a restricted intake airflow fault condition:

1. The HO2S sends an input signal to the ECM the air / fuel mixture is rich because of the reduced airflow. The STFT may reduce to a value of –10%, which decreases the fuel injector on-time to reduce the amount of fuel in the air / fuel mixture supplied to the engine.

   Without the use of the LTFT, the restricted airflow caused by the dirty air filter may reduce the STFT value to –10% until the air filter is replaced. This will decrease the range of negative adjustment available to the STFT to compensate for other factors.

2. When the ECM detects the STFT has remained at –10% for a specific period, the ECM switches to the LTFT. The LTFT adjusts the duration of the fuel injector on-time until the air / fuel mixture in the exhaust is balanced (lambda = 1) and the STFT value returns to 0%.

3. The ECM stores this Long Term FT value in its memory, which is used to calculate the base fuel injector on-time.

The percentage values of the Long Term FT range from –100% to +100%. If the ECM detects the LTFT values are outside the specified percentage range for a predetermined period, the ECM will set a Diagnostic Trouble Code and switch to Open Loop mode.

3.2 Air / Fuel Control System

The engine control module (ECM) controls the amount of air and fuel delivered into each of the engine cylinders. Based on the various ECM inputs, the ECM switches to the following air / fuel control system mode to provide the optimum air / fuel ratio under all engine operating conditions.

Starting Mode

When the ignition switch is moved to the START position and the engine begins to turn, a prime pulse may be injected to speed starting. As soon as the ECM receives an input signal from the camshaft position (CMP) and crankshaft position (CKP) sensor and determines which cylinder is in the firing stroke, the ECM applies a pulse width modulated (PWM) ground to the injector control circuit. The ECM monitors mass air flow, intake air temperature, engine coolant temperature, and throttle position to determine the required fuel injector on-time required for starting the engine.

Run Mode

The engine switches to run mode when the engine speed reaches 480 rpm after being started. The run mode has two sub-modes called Open Loop and Closed Loop.

Open Loop Mode

The heated oxygen sensor (HO2S) does not produce a usable signal voltage output until it reaches operating temperature. Therefore, while the HO2S is below its operating temperature, the ECM switches to open loop mode.

In open loop, the ECM ignores the signals from the HO2S and calculates the required injector pulse width based primarily on inputs from the mass air flow (MAF), intake air temperature (IAT), and engine coolant temperature sensors. The system will stay in the open loop mode until the HO2S produce a usable output.

Closed Loop Mode

Once the HO2S reaches operating temperature and starts producing its own signal voltage output, the ECM switches to the closed loop mode.

In closed loop mode, the ECM initially calculates injector pulse width based on the same sensors used in open loop, and additionally the ECM uses the oxygen sensor signals to modify and fine tune the fuel pulse width calculations to precisely maintain the ideal 14.7 to 1 air / fuel ratio.

Acceleration Mode

The ECM monitors and calculates input signals from the accelerator pedal position (APP) and MAF sensor signals to determine when the vehicle is being accelerated. If the ECM detects the accelerator pedal is depressed and there is a demand for the vehicle to accelerate, the ECM switches to acceleration mode. In acceleration mode, the ECM increases the fuel injector on-time to provide more fuel accordingly.

Deceleration Mode

The ECM monitors and calculates input signals from the APP and MAF sensor signals to determine when the vehicle is being decelerated. If the ECM detects the vehicle is decelerating, the ECM switches to deceleration mode. In deceleration mode, the ECM decreases the fuel injector on-time, or disables the fuel injectors for short periods, to reduce exhaust emissions and improve fuel economy.

Fuel Shut-off Mode

To protect the engine from damage or to improve the vehicle's driveability, the ECM switches to the fuel shut-off mode. In fuel shut-off mode, the ECM performs the following:

- The ECM disables the six fuel injectors under the following conditions:
  - Ignition off – to prevent engine dieseling,
  - Ignition on but no ignition reference signal – prevents flooding or backfiring,
  - At high engine speed – greater than the red line (rev limiter),
  - At high vehicle speed – greater than the rated tire speed (vehicle speed limiter), or
  - Extended high speed closed throttle coast-down – reduces engine emissions and increases engine braking.
- The ECM selectively disables the appropriate number of fuel injectors when torque management has been enabled.

Battery Voltage Correction Mode

The ECM monitors the battery voltage circuit to ensure the voltage available to the engine management system stays within the specified range. A low system voltage changes the voltage across the fuel injectors, which affects the fuel injector flow rate. In addition, a low system voltage fault condition may cause other engine management system components to malfunction.

The ECM switches to battery voltage correction mode when the ECM detects a low battery voltage fault condition. While in battery voltage correction mode, the ECM performs the following functions to compensate for the low system voltage:

- Increases the injector on-time to maintain the correct amount of fuel being delivered, and
- Increases the idle speed to increase the generator output.

Limp Mode

The programming in the ECM software allows the engine to run in a back-up fuel strategy or limp mode when the ECM fails to receive signal inputs from critical sensors or when a critical engine management fault condition exists.

The ECM switches to limp mode to enable the vehicle to be driven until service operations can be performed.

Engine Protection Mode

Engine protection mode is engaged to protect engine components from friction damage in the event of an engine over-temperature condition being detected by the ECM.

When the ECM is in engine protection mode, fuel injectors are systematically disabled and re-activated. The injectors that have been shut down allow the air being drawn into the engine to assist with engine cooling.

Clear Flood Mode

If the engine is flooded with fuel during starting and will not start, the clear flood mode can be manually selected by depressing the accelerator pedal to wide open throttle (WOT). In this mode, the ECM will completely disable the fuel injectors, and will maintain this state during engine cranking as long as the ECM detects a WOT condition with engine speed less than 1,000 rpm.

3.3 Ignition Control System

The electronic ignition system provides a spark to ignite the compressed air / fuel mixture at the correct time. The ECM maintains correct spark timing and dwell for all engine operating conditions. The ECM calculates the optimum spark parameters from information received from the various sensors and triggers the appropriate ignition module / coil to fire the spark plug.

3.4 Starter Motor Operation

The engine control module controls the activation of the start relay in response to inputs from:

- Ignition switch,
- Battery,
- Immobiliser system, and
- Automatic transmission gear selector position / clutch pedal position switch for vehicles with manual transmissions.

3.5 Throttle Actuator Control System

Description

The throttle actuator control (TAC) system is used to improve emissions, fuel economy and driveability. The TAC system eliminates the mechanical link between the accelerator pedal and the throttle plate and eliminates the need for a cruise control module and idle air control motor. The TAC system comprises of:

- The accelerator pedal assembly which includes:
  - The accelerator pedal,
  - The accelerator pedal position (APP) sensor one, and
  - The accelerator pedal position (APP) sensor two.

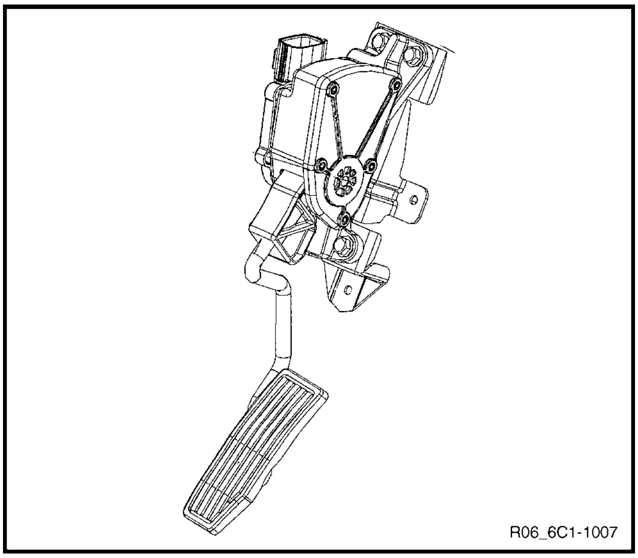

Figure 6C1-1 – 7

WARNING

To avoid serious personal injury, never attempt to rotate the throttle plate manually whilst the throttle body harness connector is connected to the throttle body.

- The throttle body assembly which includes:
  - the throttle position (TP) sensor one
  - the throttle position (TP) sensor two
  - the throttle actuator control (TAC) motor, and
  - the throttle plate.
- The engine control module (ECM).

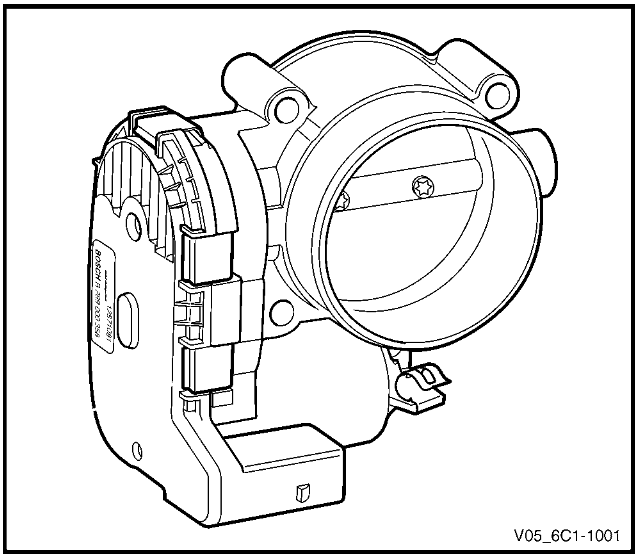

Figure 6C1-1 – 8

The ECM monitors the accelerator pedal position through the two APP sensors and processes this information, along with other system sensor inputs, to command the throttle plate to a certain position.

The throttle plate is controlled by a direct current motor called the throttle actuator control motor. The ECM operates this motor in the forward or reverse direction by controlling battery voltage and / or ground to two internal drivers. The throttle plate is held at a rest position of seven percent open using a constant force return spring. This spring holds the throttle plate to the rest position when there is no current flowing to the actuator motor.

The ECM monitors the throttle plate angle through two TP sensors. Using this information, the ECM can precisely adjust the throttle plate.

The ECM performs diagnostics that monitor the voltage levels of both APP sensors, both TP sensors and the throttle actuator control motor circuit. It also monitors the spring return rate. These diagnostics are performed at different times based on whether the engine is running, not running, or whether the ECM is currently in a throttle body relearn procedure.

Two sensors within the accelerator pedal assembly and throttle body assembly are used to provide redundancy. If a malfunction is detected, the throttle plate is moved to a pre-determined position.

Every ignition cycle, the ECM performs a quick throttle return spring test to ensure the throttle plate can return to the seven percent rest position from the zero percent position. This is to ensure the throttle plate can be brought to the rest position in case of an actuator motor circuit failure.

Throttle Body Relearn Procedure

The ECM stores values that include the lowest possible TP sensor positions (zero percent), the rest positions (seven percent), and the spring return rate. These values will only be erased or overwritten if the ECM is reprogrammed or if a throttle body relearn procedure is performed.

NOTE

If the battery has been disconnected, the ECM performs a throttle body relearn procedure once the battery has been reconnected and the ignition turned on.

The ECM performs a throttle body relearn procedure anytime the ignition is turned on and the following conditions have been met:

- The engine has been off for greater than 29 seconds,
- The engine speed is less than 40 rpm,
- The vehicle speed is 0 km/h,
- The engine coolant temperature (ECT) is 5 – 60°C; if Tech 2 is used to perform the relearn procedure, the ECT is 5 – 100°C,
- The intake air temperature (IAT) is greater than 5 – 60°C; if Tech 2 is used to perform the relearn procedure, the IAT is 5 – 100°C,
- The APP sensor angle is less than 15 percent, and
- Ignition voltage is greater than 10 V.

The throttle body relearn procedure is performed 29 seconds after the ignition is turned on. The ECM commands the throttle plate from the rest position (seven percent open) to full closed (zero percent), then to around 10 percent open. This procedure takes about six – eight seconds. If any faults occur in the TAC system, a DTC sets. At the start of this procedure, the Tech 2 TAC Learn Counter parameter should display 0, then count up to 11 after the procedure is completed. If the counter did not start at 0, or if the counter did not end at 11, a fault has occurred and a DTC should set.

TAC System Default Actions / Reduce Power Modes

The ECM switches to the following reduce power modes if the ECM detects a fault condition in the TAC system:

- If an APP sensor circuit fault or TP sensor circuit fault is detected, the ECM limits engine torque so the vehicle cannot reach speeds of greater than 100 km/h. The ECM remains in this reduce power mode during the entire ignition cycle, even if the fault is corrected.
- If there is a fault condition with the throttle actuator control circuits, a throttle actuator command vs. actual position fault, a return spring check fault, or a TP sensor one circuit fault, the ECM limits engine speed to 2500 rpm and three – six fuel injectors are randomly disabled. At this time the reduce power indicator is commanded on. The ECM remains in the reduce power mode during the entire ignition cycle even if the fault is corrected.

NOTE

If a TP sensor one or throttle actuator control circuit fault is present at the time the vehicle is at idle, with no accelerator pedal angle, the engine may stall.

Forced Engine Shutdown

A further safety feature which is built into the TAC system is the ECM will initiate an engine shut down if, the ECM's internal monitoring functions detects a serious internal fault, the fuel injectors will be turned off.

3.6 Cruise Control System

The cruise control system integrates with the engine control module (ECM) through the powertrain interface module (PIM), to control the electronic throttle actuator and maintain the vehicle at the speed set by the driver.

When the cruise control ON-OFF switch, located on the right hand side of the dash panel, is pressed, the PIM, on receiving the input from the switch, turns on the cruise ON-OFF switch warning lamp to inform the user that the cruise control has been engaged.

When the cruise control switch assembly is pressed to SET/COAST, the PIM on receiving the input, sends a signal via the serial data bus to the ECM. Providing the pre-conditions for cruise control operation have been met, the ECM activates cruise control and commands the PIM to turn on the instrument cluster cruise set warning lamp, to inform the user that cruise control is active. The ECM receives all the various inputs required to maintain the correct speed and then controls the throttle plate depending on the load on the engine (ascending or descending hills, etc).

The cruise control is deactivated by either pressing the brake pedal, clutch pedal, cruise CANCEL or by the cruise control ON-OFF button. In each of these instances, the ECM receives an input when any of these switches are activated. For further information on the cruise control system, refer to 8C Cruise Control – HFV6.

3.7 Brake Torque Management

Brake torque management places limits on engine torque when the brakes are applied, regardless of the accelerator pedal position (APP). The conditions under which brake torque management occur are as follows:

- The accelerator has been depressed before the brakes are applied,
- The brakes are applied and the ECM receives an input from the stop lamp switch,
- Vehicle speed is greater than 5 km/h,
- Engine speed is greater than 1200 rpm and
- Conditions exist for greater than 2.5 seconds.

When brake torque management has been implemented, the torque is reduced by altering the throttle plate opening by 25%. The ECM will monitor the rate at which the vehicle is slowing and adjust the throttle plate opening accordingly.

3.8 Emission Control Systems

Evaporative Emission Control System

The evaporative emission control system used is the activated carbon (charcoal) canister storage method. Fuel vapour is drawn from the fuel tank into the canister where it is held by the activated carbon until the ECM commands the evaporative emission (EVAP) purge solenoid valve to open.

The ECM energises the EVAP purge solenoid valve by applying a pulse width modulated (PWM) ground to the EVAP purge solenoid valve control circuit.

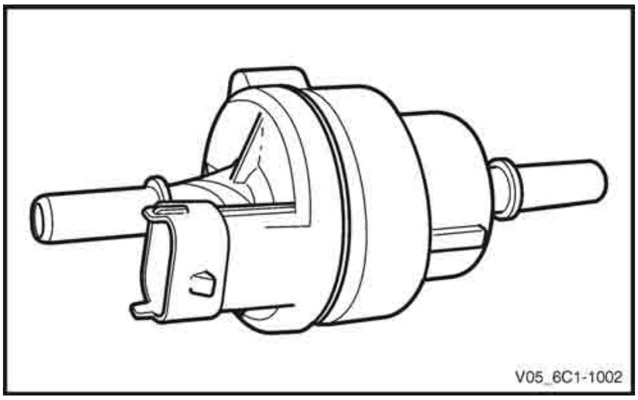

Figure 6C1-1 – 9

When ECM commands the EVAP valve (1) to open, the fuel vapours are drawn from the canister line (2) into the intake manifold where it is consumed in the normal combustion process.

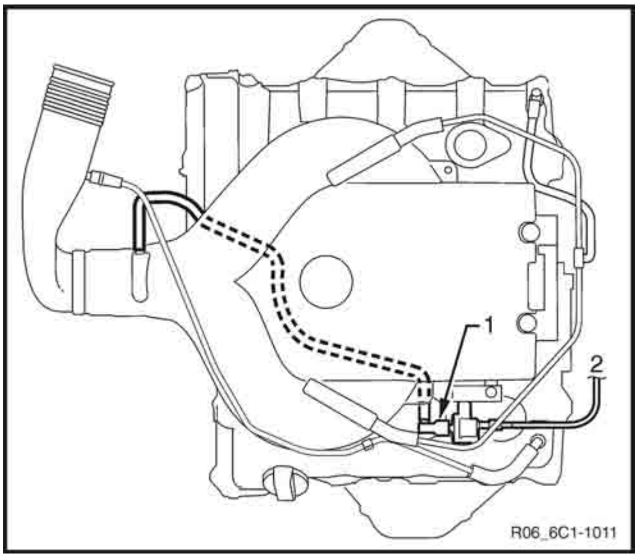

Figure 6C1-1 – 10

The ECM energises the EVAP valve when the appropriate conditions have been met, such as:

- Engine coolant temperature is less than 20°C at cold start up and the engine has been running longer than three minutes and 10 seconds, or
- Engine coolant temperature is greater than 80°C and the engine has been running longer than five seconds, or
- Engine is not in decel fuel cut-off mode and the throttle opening is less than 96%, or
- The engine is in closed loop fuel mode.

A higher purge rate is used under conditions that are likely to produce large amounts of vapour, when the following conditions have been met:

- Intake air temperature is greater than 50°C, or
- Engine coolant temperature is greater than 100°C, or
- The engine has been running for greater than 15 minutes.

The EVAP purge PWM duty cycle varies according to operating conditions determined by mass air flow, fuel trim and intake air temperature. The EVAP canister purge valve is re-enabled when throttle position angle decreases below 96%. For further information on the evaporative emission control system, refer to 6C Fuel System.

Engine Ventilation System

The engine ventilation system contains a Positive crankcase ventilation (PCV) valve (1) located in the right-hand camshaft cover. A hose is routed from the PCV valve to each side of the intake manifold which provides an even distribution of crankcase fumes, thereby improving spark plug reliability and a reduction in emissions.

A breather pipe is routed from the intake manifold to the left-hand camshaft cover and provides fresh filtered air from the intake duct to the engine.

For further information of the engine ventilation system, refer to 6A1 Engine Mechanical – V6.

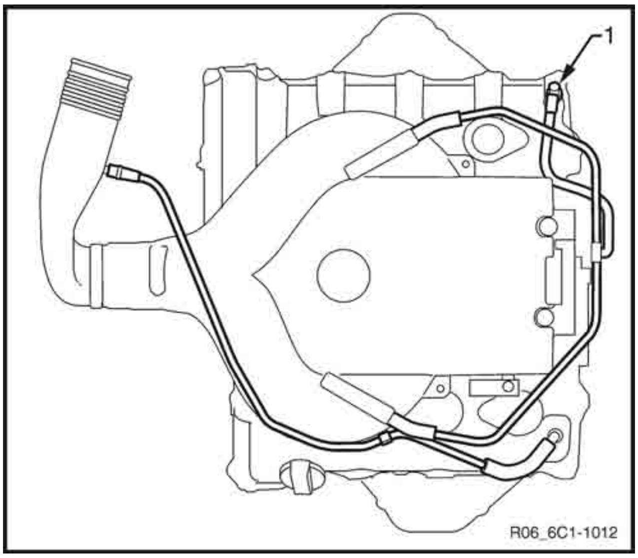

Figure 6C1-1 – 11

3.9 Serial Data Communication System

The engine control module (ECM) communicates directly with the following control units using the General Motors local area network (GM LAN) serial data communication protocol:

- Transmission control module (TCM) (if fitted)
- Powertrain interface module (PIM)

The immobiliser control unit (ICU) communicates directly with the PIM using Keyword 2000 serial data communication protocol. Refer to 11A Immobiliser for further information

As the GM LAN serial data communication protocol is not compatible with the Keyword 2000 serial data communication protocol, a powertrain interface module (PIM) is integrated to the serial data communication system to perform the following tasks (Refer to 6E1 Powertrain Interface Module – V6):

- Translate the GM LAN serial data transmitted by the ECM into a Keyword 2000 serial data that can be received and recognised by the ICU.
- Translate the cruise control switch, automatic transmission power mode switch and 3rd start switch signal into a GM LAN serial data that can be received and recognised by the ECM.

3.10 Self Diagnostics System

The ECM constantly performs self-diagnostic tests on the engine management system. When the ECM detects a malfunction, it also stores a diagnostic trouble code (DTC). A stored DTC will identify the problem area(s) and is designed to assist the technician in rectifying the fault. In addition, DTCs are classified as either Current or History DTC.

Depending on the type of DTC set, the ECM may turn on the malfunction indicator lamp (MIL) (1) to warn the driver there is a fault in the Engine Management System.

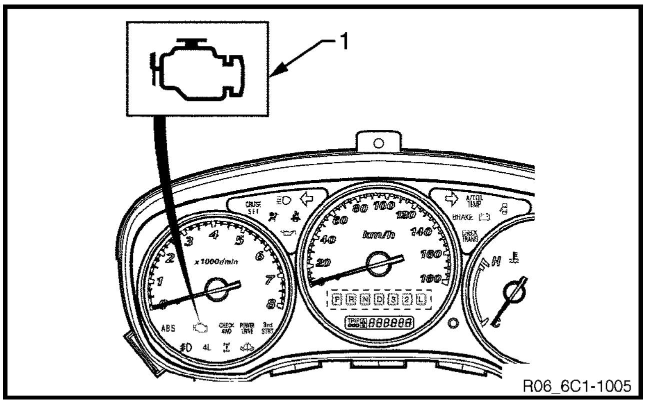

Figure 6C1-1 – 12

3.11 Service Programming System

The ECM has an Electronically erasable programmable read only memory (EEPROM) where the software and calibration information required to operate the engine management system are stored.

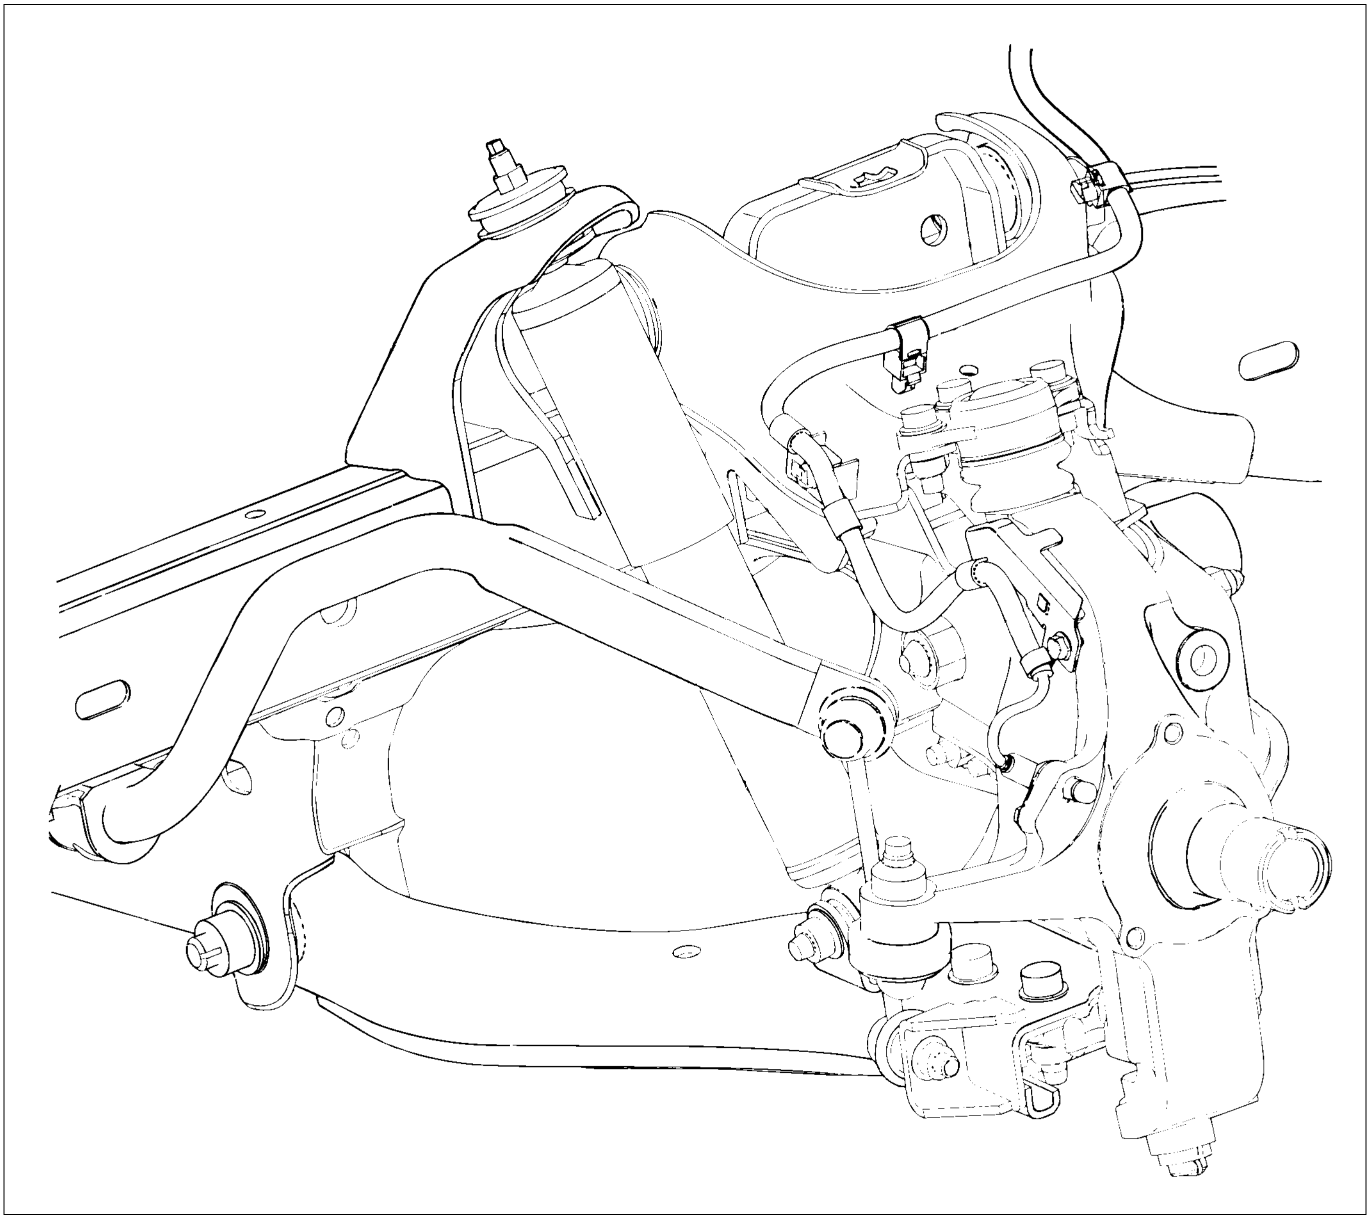
The ECM features a service programming system (SPS) to flash program the EEPROM in the ECM with the latest ECM software to provide optimum performance, driveability and emissions control or to program a new ECM.

Flash programming refers to the SPS used to transfer (or download) ECM data from a computer terminal to the vehicle's ECM. The system is designed so the vehicle verification procedures are required to eliminate EEPROM tampering that could increase engine emission levels.

There are three main flash programming techniques:

1. Direct programming (pass through). This is where the vehicle's data link connector (DLC) is connected directly to a computer terminal. On screen directions are then followed for downloading.
2. Remote Programming. Reprogramming information is downloaded from a computer terminal to Tech 2. Tech 2 is then connected to the vehicle's DLC. On screen directions are then followed for downloading.
3. Off-board Programming. The off-board programming method is used when a re-programmable ECM must be programmed while it is removed from the vehicle. For example, an independent repair facility may find it necessary to replace a faulty ECM. On flash programming equipped vehicles, the replacement ECM must be programmed with data for the specific vehicle identification number (VIN) or the vehicle may not operate properly.

4×2 (High Ride Suspension) and 4×4 Model



RTW340LF000801

The links attach to the vehicle with bolts and bushings at their inner pivot points and to the steering knuckle, which is part of the front wheel spindle, at their outer points.

The knuckle is mounted to the upper and lower links each of which has a ball joint to permit pivoting of the knuckle for steering operations. The hub is supported in position on the knuckle spindle by means of the two bearings and the rotor is mounted on the hub.

The front suspension is an independent type utilizing torsion bar springs (4×4, 4×2 (High ride suspension)) and coil springs (4×2 (except High ride suspension)).

The torsion bar spring has splines on each end. Height control is provided on the third crossmember. Both the upper and lower links are pressed steel and the torsion bar is supported at the ends by lower link in front and by height control arm in rear.

3.12 Immobiliser System

The vehicle incorporates an immobiliser system. After the ignition switch is turned to the ON position, and the powertrain interface module (PIM) has authenticated the immobiliser control unit (ICU), the PIM sends an encrypted security code to the engine control module (ECM). The ECM compares the received security code with its own security code, and if it is valid, the ECM enables the vehicle to be started. For further information and diagnosis of the immobiliser system, refer to 11A Immobiliser.

For further information on the PIM, refer to 6E1 Powertrain Interface Module – V6.

4 Component Description and Operation

4.1 A/C Refrigerant Pressure Sensor

The engine control module (ECM) applies a positive 5 V reference voltage and ground to the air-conditioner (A/C) refrigerant pressure sensor. The A/C refrigerant pressure sensor provides signal voltage to the ECM that is proportional to the A/C refrigerant pressure. The ECM monitors the A/C refrigerant pressure sensor signal voltage to determine the refrigerant pressure.

- The A/C refrigerant pressure sensor voltage increases as the refrigerant pressure increases.
- When the ECM detects the refrigerant pressure exceeds a predetermined value, the ECM activates the cooling fans to reduce the refrigerant pressure.
- When the ECM detects the refrigerant pressure is too high or too low, the ECM disables the A/C clutch to protect the A/C compressor from damage.

4.2 Brake Pedal Switch Assembly

Stop Lamp and Initial Brake Apply Switch

The stop lamp and initial brake apply switch assembly (1) is located on the brake pedal support.

The engine control module (ECM) uses the brake pedal switch inputs to determine when the brake pedal is depressed.

The ECM uses the two break pedal switch inputs for:-

- Enabling cruise control,
- Brake torque management,
- Cross referencing the stop lamp switch against the initial brake apply switch for correct operation.

For further information on brake torque management, refer to 3.7 Brake Torque Management.

For further information on the cruise control system, refer to 3.6 Cruise Control System.

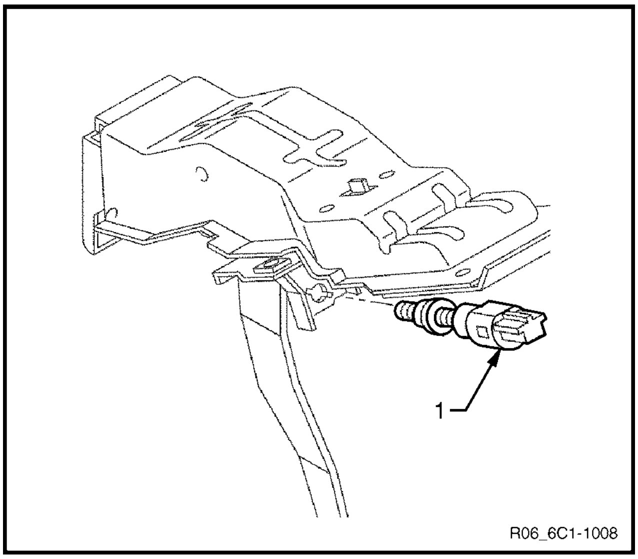


Figure 6C1-1 – 13

Stop Lamp Switch

The stop lamp switch contacts are normally open with the brake pedal at rest and closed when the brake pedal is depressed.

Initial Brake Apply Switch

The initial brake apply switch contacts are normally closed with the brake pedal at rest and open when the brake pedal is depressed.

4.3 Barometric Pressure Sensor

The barometric pressure (BARO) sensor measures barometric (atmospheric) pressure. The ECM uses this signal to make corrections to the operating parameters of the system based on changes in air density, since the oxygen content of atmospheric air varies proportionally to air density (barometric / atmospheric pressure). Barometric pressure is affected mainly by altitude and climate.

The BARO sensor provides a voltage signal to the ECM that is a function of barometric pressure. It does this through a series of deformation resistors, which change resistance when a mechanical force is applied. This force is applied to the resistors by a diaphragm on which the atmospheric pressure acts.

The ECM supplies the BARO sensor with a 5 V reference and a ground circuit.

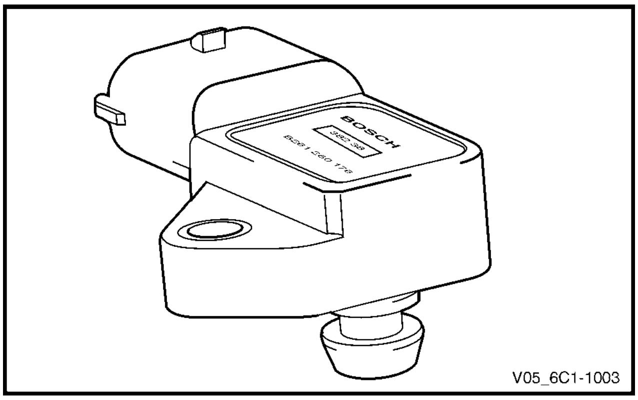

Figure 6C1-1 – 14

4.4 Camshaft Position Sensor

The HFV6 engine is fitted with an inlet camshaft position (CMP) sensor.

The CMP sensor is used by the ECM to determine the position of the camshafts. In conjunction with the crankshaft position sensor, the CMP enables the ECM to determine engine rotational position.

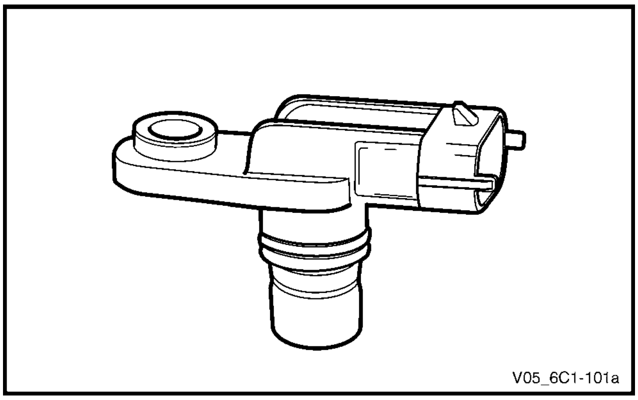

Figure 6C1-1 – 15

The CMP sensor operates on the dual-Hall sensing principle. The sensor contains two hall elements (1) which operate in conjunction with a two-track trigger wheel (2) mounted on the camshaft.

As the tracks (3) on the trigger wheel pass the elements, magnetic flux affects a voltage in the Hall elements. The integrated circuit inside the sensor conditions the signal generated by the Hall elements to provide a rectangular wave on / off signal to the ECM.

The ECM supplies the CMP sensors with a 5 V reference and ground circuit.

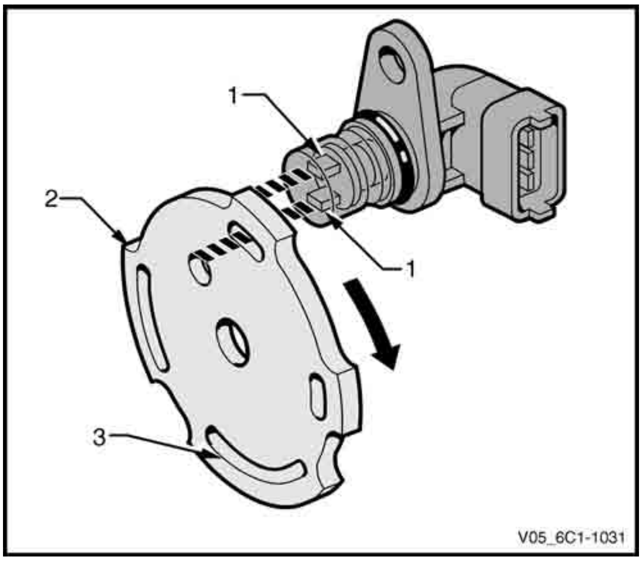

Figure 6C1-1 – 16

4.5 Crankshaft Position Sensor

In conjunction with the camshaft position sensor, the crankshaft position (CKP) sensor enables the ECM to determine engine rotational position. The CKP is also used to determine engine speed (rpm).

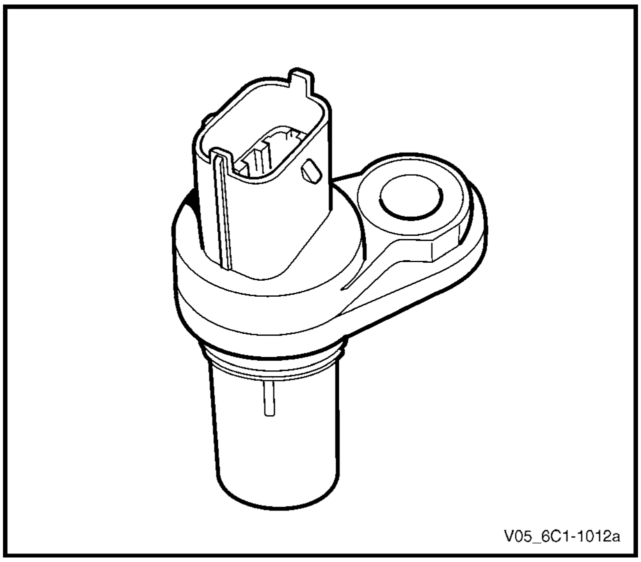

Figure 6C1-1 – 17

The CKP sensor (1) operates on the variable reluctance (pulse generator) sensing principle. It contains a magnet and pickup coil and is used in conjunction with a 58 tooth ferromagnetic reluctor wheel (2) attached to the crankshaft (3).

As the crankshaft rotates, the reluctor wheel revolves past the CKP, causing fluctuations in the magnetic field inside the sensor. This action creates an AC voltage across the pickup coil which is processed by the ECM. An increase in engine speed will increase the output voltage and frequency.

The reluctor wheel teeth are placed six degrees apart. Having only 58 teeth leaves a 12 degree open span, which creates a signature pattern that enables the ECM to determine the crankshaft position. The ECM determines which two cylinders are approaching the top dead centre based on the crankshaft position sensor signal. The CMP sensor signals are used by the ECM to determine which cylinder is on the firing stroke.

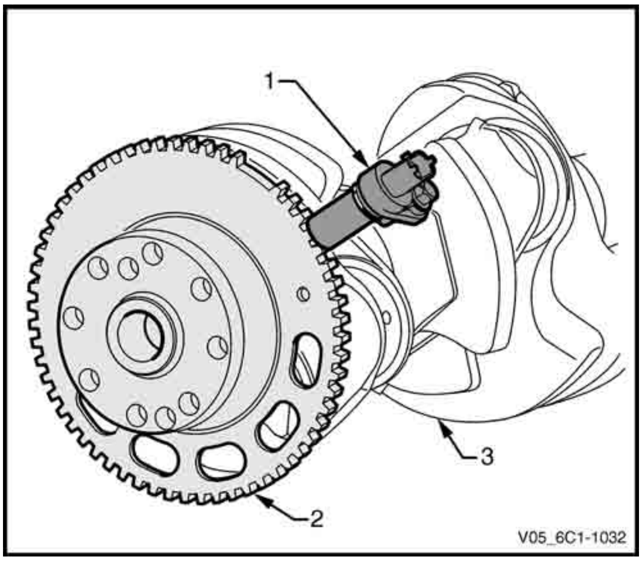

Figure 6C1-1 – 18

4.6 Clutch Pedal Switch Assembly – Manual Vehicles Only

The cruise control cancel switch (1) is normally closed when the clutch pedal is at rest, opening when the pedal is pressed. Activation of this switch removes the signal to the ECM which will then deactivate the cruise control. For further information on the cruise control system, refer to 7A1 Clutch – V6.

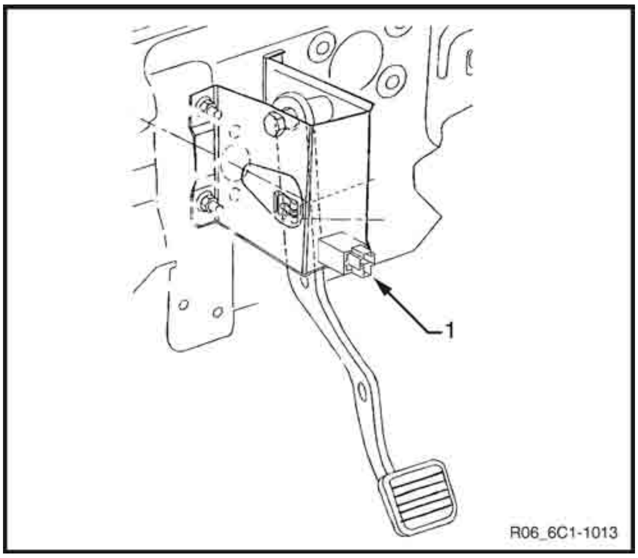

Figure 6C1-1 – 19

4.7 Engine Control Module

Located at the right front of the engine assembly, the engine control module (ECM) monitors input signals from the various sensors and switches connected to the engine management system. The ECM processes this information, to control the following:

- fuel delivery and injection system,
- throttle actuation system,
- ignition system,
- on-board diagnostics,
- the engine cooling fan, and
- the air-conditioner compressor clutch (where fitted).

The ECM supplies 5 V to the various sensors through pull-up resistors to the internal regulated power supplies.

The ECM controls output circuits such as the injectors, etc. by applying control signal to the ground circuits of the components through transistors or a device inside the ECM called a driver. The exception to this is the fuel pump relay control circuit. The fuel pump relay is the only ECM controlled circuit where the ECM controls the 12 V sent to the coil of the relay. The ground side of the fuel pump relay coil is connected to engine ground.

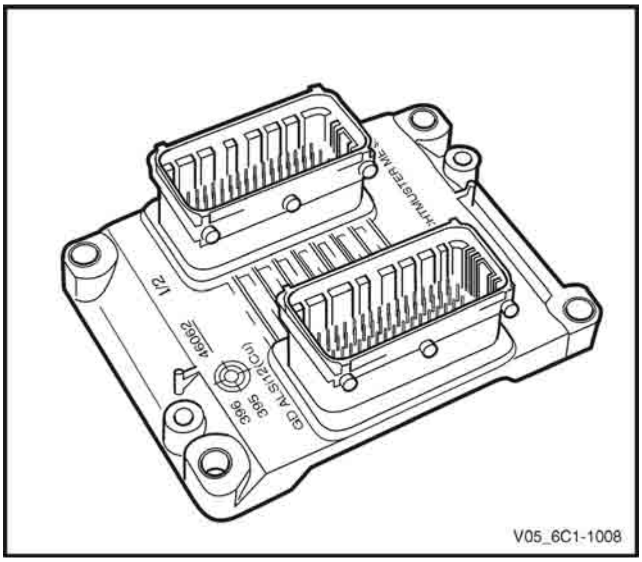

Figure 6C1-1 – 20

The ECM communicates directly with the various control units within the vehicle using the General Motors local area network (GM LAN) serial data communication protocol. Refer to 3.9 Serial Data Communication System.

4.8 Engine Coolant Temperature Sensor

The engine coolant temperature (ECT) sensor is a thermistor, which is a resistor that changes it's resistance value based on temperature.

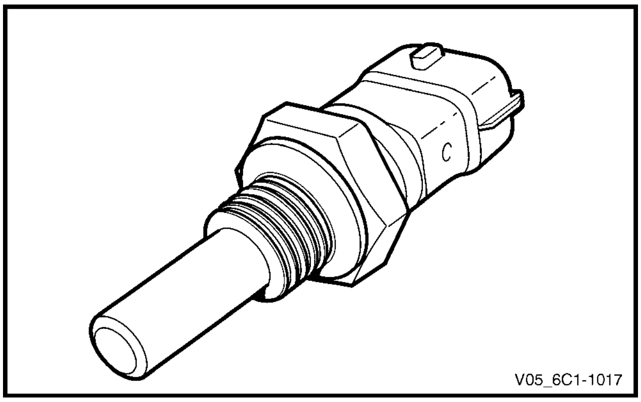

Figure 6C1-1 – 21

The ECT is mounted in the engine coolant stream and as it is a negative temperature coefficient (NTC) type, low engine coolant temperature produces a high sensor resistance while high engine coolant temperature causes low sensor resistance.

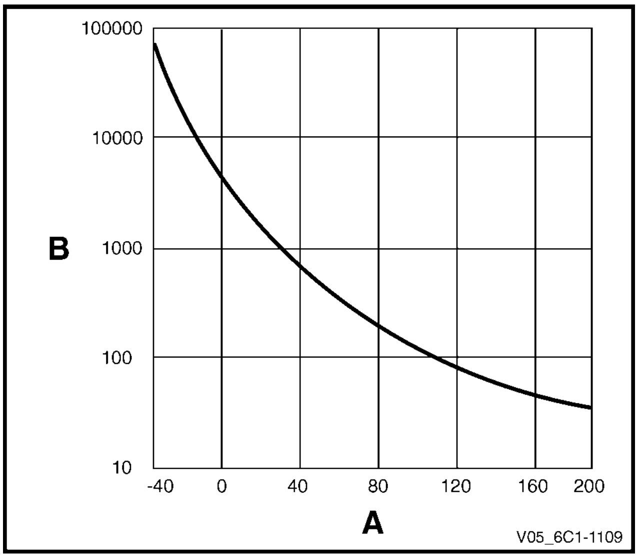

Figure 6C1-1 – 22

Legend

A Temperature

B Resistance

The ECM provides a 5 V reference signal to the ECT and monitors the return signal which enables it to calculate the engine temperature.

The ECM uses this signal to make corrections to the operating parameters of the system based on changes in engine coolant temperature.

4.9 Electric Cooling Fan

The ECM controls the operation of the electric engine cooling fan. The ECM applies a pulse width modulated (PWM) signal to the cooling fan motor to control the fan speed based on current vehicle conditions. For further information on cooling fan operation, refer to 6B1 Engine Cooling – V6.

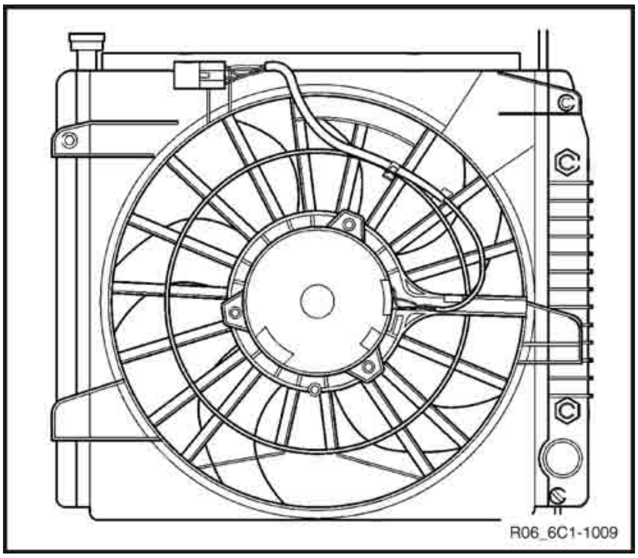

Figure 6C1-1 – 23

4.10 Engine Oil Level and Temperature Sensor

The engine oil level (EOL) and temperature sensor is a dual purpose sensor and is fitted in the engine sump. It combines a switch to signal oil level and a thermistor type temperature sensor to provide oil temperature signal to the ECM.

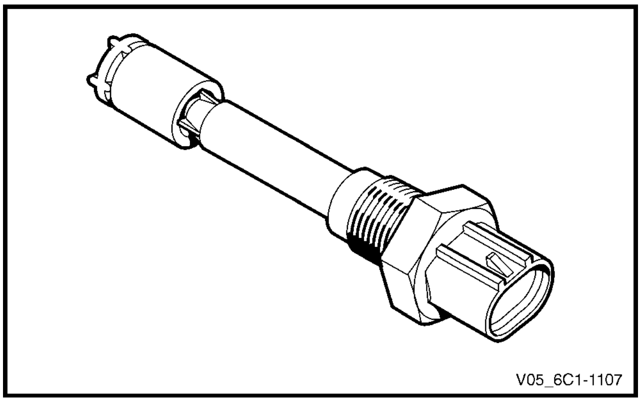

Figure 6C1-1 – 24

Engine Oil Temperature Sensor

The engine oil temperature sensor is a negative temperature coefficient (NTC) type. At low engine oil temperature, the sensor produces a high resistance, whilst at high temperature the sensor produces a low resistance.

Legend

A Temperature

B Resistance

The ECM provides a 5 V reference signal to the engine oil temperature sensor and monitors the return signal which enables it to calculate the engine oil temperature.

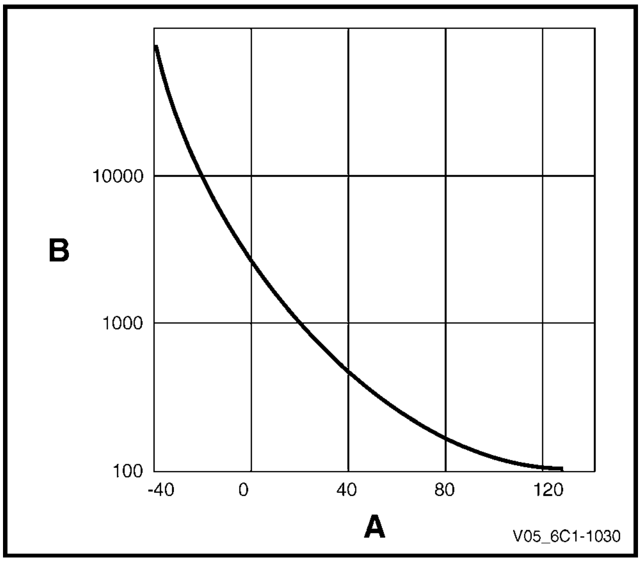

Figure 6C1-1 – 25

Engine Oil Level Sensor

The engine oil level sensor is comprised of a magnetic reed switch (1) contained within the sensor, a float (2) and a magnetic pin (3). The magnetic reed switch is a normally open switch, which closes when a magnet field is present.

When the engine oil level is within specifications, the pin on the inside of the float is pushed up against the reed switch (view A). When the oil level drops and the magnetic pin moves away from the reed switch (view B), the switch contacts opens.

The ECM provides a 5 V reference signal to the engine oil temperature sensor and monitors the return signal. The ECM only monitors the oil level signal prior to engine start-up, and once the engine is cranking, the ECM disregards the oil level sensor signal.

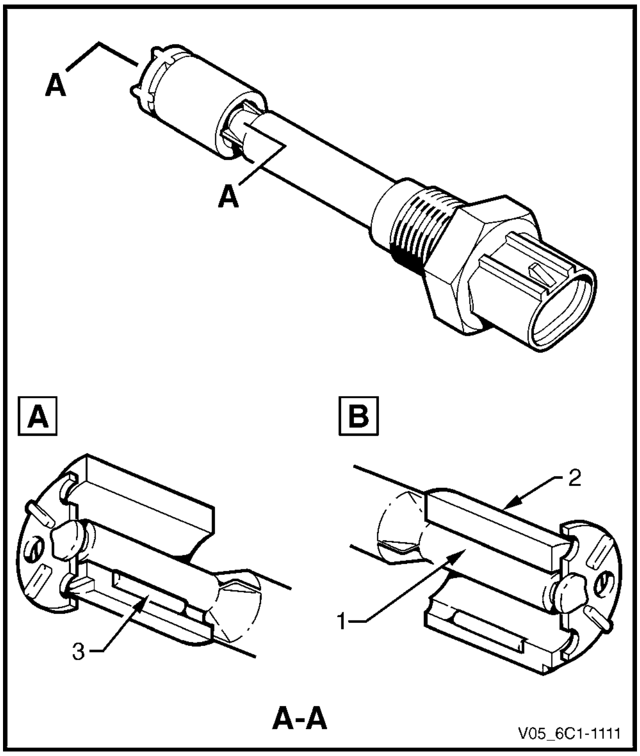

Figure 6C1-1 – 26

4.11 Engine Oil Pressure Sensor

The engine oil pressure (EOP) sensor measures engine oil pressure. When the EOP sensor signal is below a certain value, the ECM sends a serial data message to the powertrain interface module (PIM) requesting the PIM to turn on the engine oil pressure warning lamp.

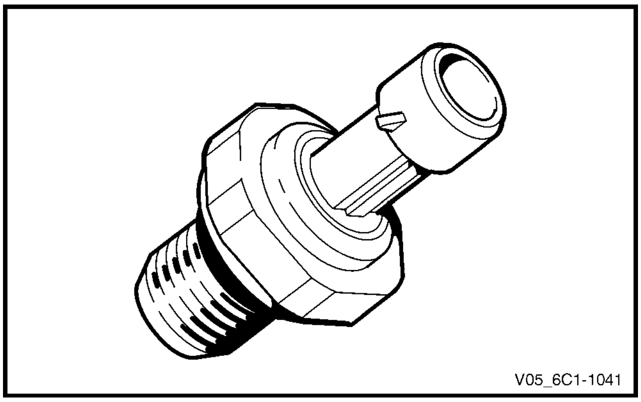

Figure 6C1-1 – 27

The EOP sensor provides a voltage signal to the ECM that is a function of engine oil pressure. It does this through a series of deformation resistors (1), which change resistance when a mechanical force is applied. This force is applied to the resistors by a diaphragm on which the engine oil pressure acts (2).

The sensor has an internal evaluation circuit (3) and is provided with a 5 V reference voltage, a ground and a signal circuit.

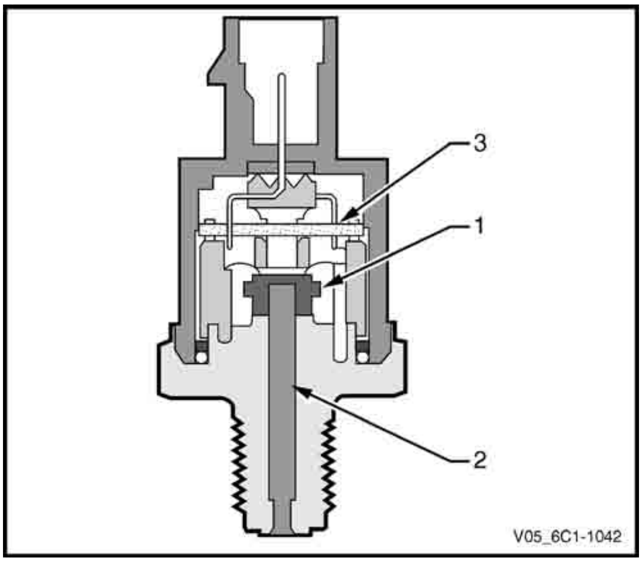

Figure 6C1-1 – 28

4.12 Fuel Injectors

A fuel injector is a solenoid device that is controlled by the ECM. The six injectors deliver a precise amount of fuel into each of the intake ports as required by the engine.

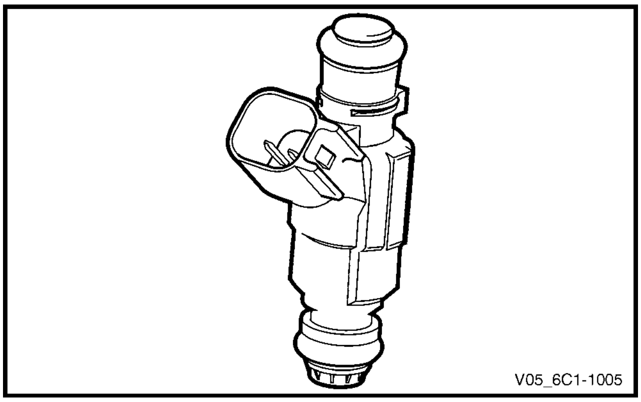

Figure 6C1-1 – 29

The fuel port (1) connects to the fuel rail. A strainer (2) is provided in the port to protect the injector from fuel contamination.

In the de-energised state (no voltage), the valve needle and sealing ball assembly (3) are held against a cone-shaped valve seat (4) by spring force (5) and fuel pressure.

When the injector is energised by the ECM, the valve needle, which has an integral armature, is moved upward by the injector solenoids magnetic field, un-seating the ball.

An orifice plate (6), located at the base of the injector has openings that are arranged in such a way that two fuel sprays emerge from the injector.

Each fuel spray is then directed at one of the intake valves, causing the fuel to become further vaporised before entering the combustion chamber.

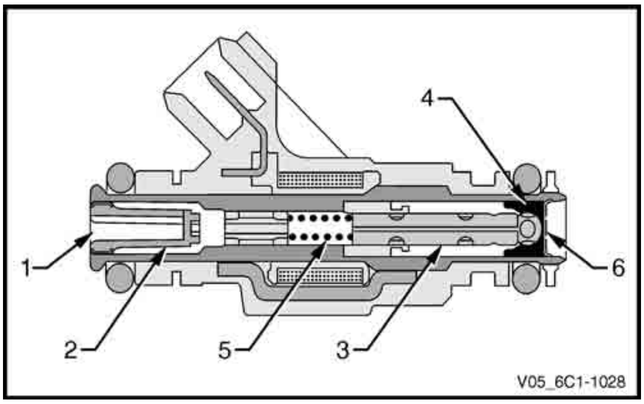

Figure 6C1-1 – 30

4.13 Fuel Rail Assembly

The fuel rail assembly is mounted on the lower intake manifold and distributes the fuel to each cylinder through individual fuel injectors. The fuel rail assembly consists of:

- the pipe that carries fuel to each injector,
- a fuel pressure test port,
- six individual fuel injectors,
- wiring harness, and
- wiring harness tray.

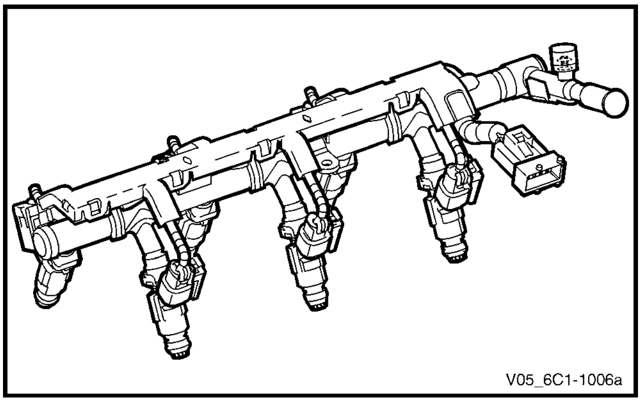

Figure 6C1-1 – 31

4.14 Heated Oxygen Sensors

The heated oxygen sensors (HO2S) are mounted in the exhaust system and enable the ECM to measure oxygen content in the exhaust stream. The ECM uses this information to accurately control the air / fuel ratio, because the oxygen content in the exhaust gas is indicative of the air / fuel ratio of engine combustion.

When the sensor is cold, it produces little or no signal voltage, therefore the ECM only reads the HO2S signal when the HO2S sensor is warm. As soon as the HO2S are warm and outputting a usable signal, the ECM begins making fuel mixture adjustments based on the HO2S signals. This is known as closed loop mode.

The HFV6 engine has four HO2S, one LSU 4.2 wide-band planar type HO2S upstream of the catalytic converter in each exhaust pipe, and one LSF 4.2 two-step planar type HO2S in each exhaust pipe downstream of the catalytic converter.

LSF 4.2 Two-step Planar Heated Oxygen Sensors

The LSF 4.2 two-step planar heated oxygen sensors have four wires:

- The internal heater element supply, which has 12 V continually applied whenever the ignition is on.
- Heater element ground – The ECM applies pulse width modulated (PWM) ground to the HO2S heater control circuit to control the rate at which the sensor heats up. This reduces the risk of the sensor being damaged from heating up too quickly under certain conditions such as extreme cold temperatures. Once the sensor has reached the desired operating temperature, the ECM will monitor and continue to maintain the sensor temperature.
- Sensor signal to the ECM.
- Sensor ground.

(4×2 Except High Ride Suspension)

TABLE OF CONTENTS

Measurement is achieved by comparing the oxygen content of the exhaust gas to the oxygen content of a reference gas (outside air) using the Nernst principle. Oxygen molecules from the exhaust gas will accumulate on the outer electrode, while oxygen molecules from the reference gas will accumulate on the inner electrode. This creates a voltage difference across the Nernst cell, between the two electrodes, which is the signal voltage to the ECM.

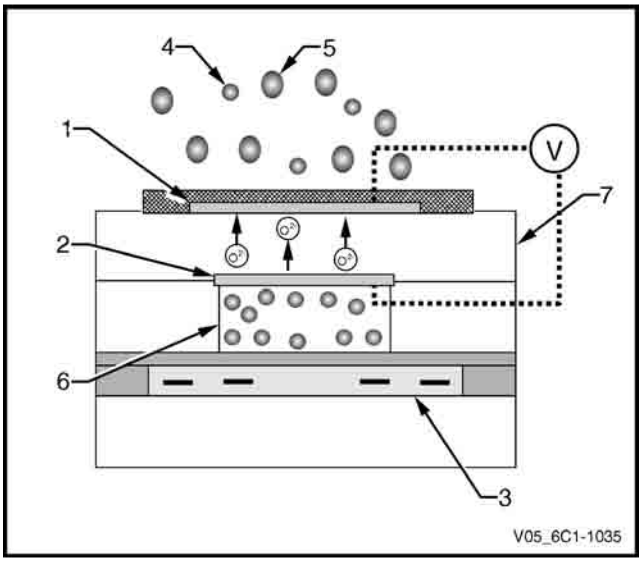

Figure 6C1-1 – 33

V Signal Voltage

When the fuel system is correctly operating in the closed-loop mode, the oxygen sensor voltage output is rapidly changing several times per second, fluctuating from approximately 100mV (high oxygen content – lean mixture) to 900mV (low oxygen content – rich mixture). The transition from rich to lean occurs quickly at about 450-500 mV (air flow (A/F) ratio 14.7:1, or lambda = 1). Due to this, two-step HO2S sensors are also known as switching type HO2S sensors.

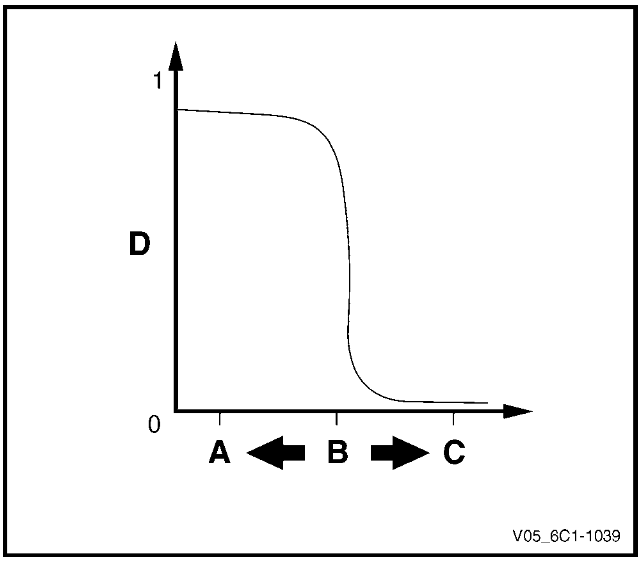

Figure 6C1-1 – 34

D Sensor Voltage

LSU 4.2 Wide-band Planar Heated Oxygen Sensors

The LSU 4.2 wide-band planar heated oxygen sensors have six wires:

- The internal heater element supply, which has 12 V continually applied whenever the ignition is on.
- Heater element ground – The ECM applies pulse width modulated (PWM) ground to the HO2S heater control circuit to control the rate at which the sensor heats up. This reduces the risk of the sensor being damaged from heating up too quickly under certain conditions such as extreme cold temperatures. Once the sensor has reached the desired operating temperature, the ECM will monitor and continue to maintain the sensor temperature.
- Output voltage.
- Sensor ground.
- Trim current.
- Pumping current.

10 PTFE Shaped Sleeve

Similar to the two-step HO2S, measurement is achieved by comparing the oxygen content of the exhaust gas to the oxygen content of a reference gas. However, the way in which the ECM calculates the exhaust oxygen content is different, and results in a continual signal. This allows the ECM to monitor not only whether the fuel mixture is rich or lean, but exactly how rich or how lean. The wide-band HO2S is basically a two-step HO2S with the addition of a pump cell.

The ECM applies a pump voltage across the pump cell, which causes oxygen to be pumped from the exhaust gas into or out of the diffusion gap through the diffusion barrier. While monitoring the Nernst cell, the ECM varies the pump current so the gas in the diffusion gap remains constant at an A/F ratio of 14.7:1 (Nernst cell output of 450 mV).

A	Pump Current
V	Nernst Cell Voltage

If the exhaust gas is lean, the pump cell pumps oxygen to the outside (positive pump current). If the exhaust gas is rich, oxygen is pumped from the exhaust gas into the diffusion gap (negative pump current). By monitoring how much it has to vary the pumping current, the ECM determines the exact A/F ratio.

4.15 Ignition Coil and Spark Plug

Long-life platinum tip spark plugs are used which, along with the ignition coil spark plug boot and spring, require replacement at 100,000 kilometre service intervals. The spark plugs, featuring a J-gap and a conical seat, do not require inspection between services, and must not be re-gapped.

Individual pencil-type ignition coils, one for each cylinder, are mounted in the centre of the camshaft covers, and have short boots connecting the coils directly to the spark plugs.

The pencil coil makes use of the space available in the spark plug cavity in the cylinder head and camshaft cover. As a pencil coil is always mounted directly on to the spark plug, no high-tension ignition leads are required, further enhancing reliability.

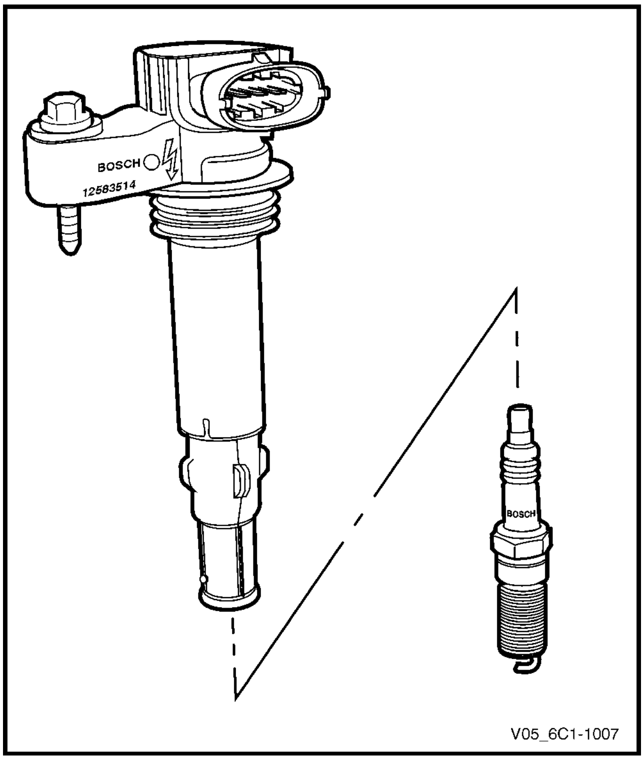

Figure 6C1-1 – 38

Pencil coils operate similarly to other compact coils, however due to their shape, the structure differs considerably.

The central rod core (1) consists of laminations of varying widths, stacked in packs that are nearly spherical. A yoke plate (2), made from layered electrical sheet steel, provides the magnetic circuit. The primary winding (3) is located around the secondary winding (4), which supports the core.

A printed circuit board, or driver module, (5) is located at the top of the coil and controls the firing of the coil based on input from the ECM.

The ECM is responsible for maintaining correct spark timing and dwell for all driving conditions. The ECM calculates the optimum spark parameters from information received from the various sensors, and triggers the appropriate ignition module which then operates the coil.

The ignition coil / modules are supplied with the following circuits:

- Ignition feed circuit.
- Ground circuit.
- Ignition control circuit.
- Reference low circuit.

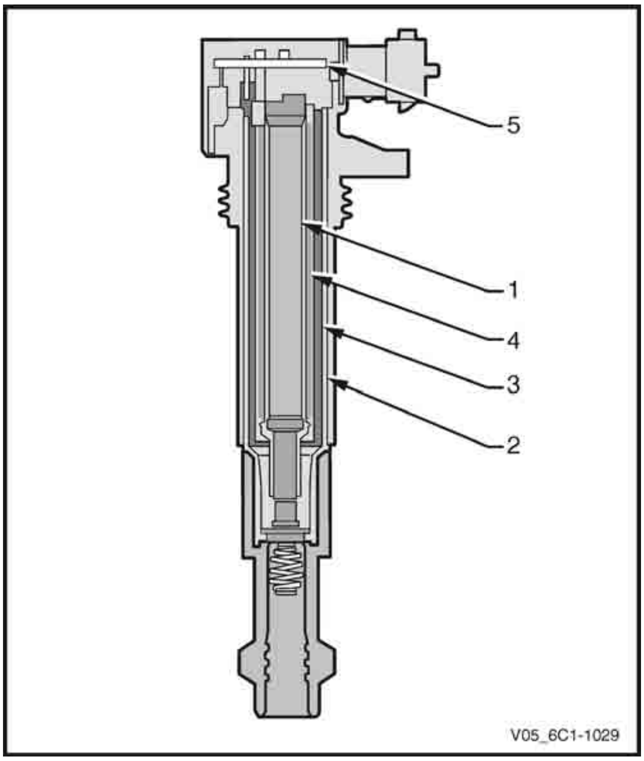

Figure 6C1-1 – 39

4.16 Intake Air Temperature Sensor

The intake air temperature (IAT) sensor is a thermistor, which is a resistor that changes it's resistance value based on temperature.

The IAT sensor is part of the air mass sensor and is not a serviceable item. The sensor is a negative temperature coefficient (NTC) type, intake air temperature produces a high sensor resistance while high engine coolant temperature causes low sensor resistance.

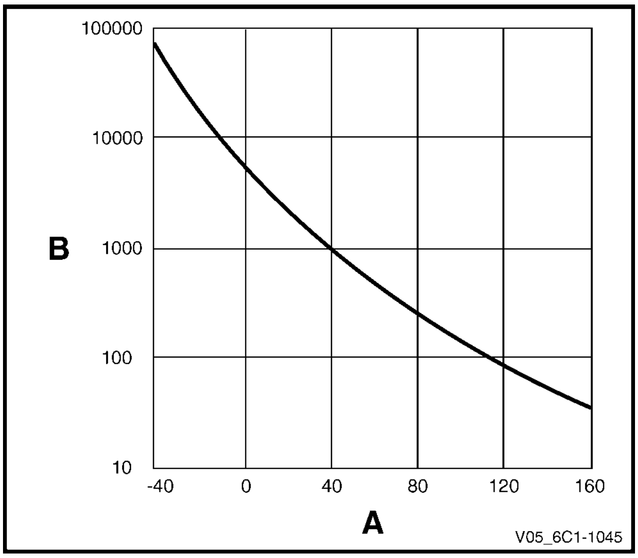

Figure 6C1-1 – 40

Legend

A Temperature

B Resistance

The ECM provides a 5 V reference signal to the IAT and monitors the return signal which enables it to calculate the intake air temperature.

The ECM uses this signal to make corrections to the operating parameters of the system based on changes in air intake temperature.

4.17 Knock Sensor

The knock sensor (KS) signal is used by the ECM to provide optimum ignition timing while minimising engine knock or detonation.

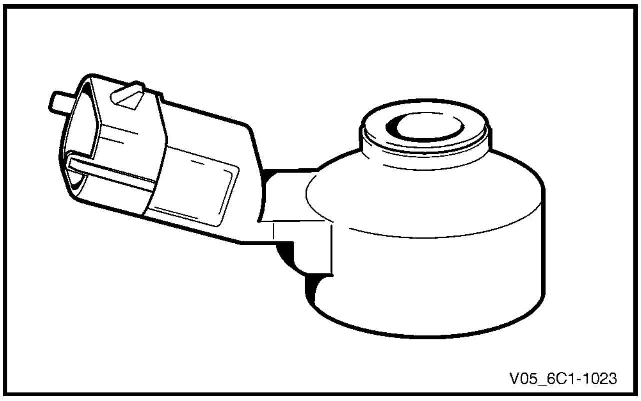

Figure 6C1-1 – 41

The ECM monitors the voltage of the left-hand (Bank 2) sensor during the 45 degrees after cylinder 2, 4, or 6 has fired and the voltage of the right-hand (Bank 1) sensor during the 45 degrees after cylinder 1, 3, or 5 has fired.

If knock occurs in any of the cylinders, the ignition will be retarded by three degrees for that particular cylinder. If the knocking then stops, the ignition will be restored to what it was before in steps of 0.75 degrees.

Should knocking continue in the same cylinder despite of the ignition being retarded, the ECM will retard the ignition an additional step of three degrees, and so on, up to a maximum of 12.75 degrees. The ignition will also be retarded at high ambient temperatures to counteract knocking tendencies provoked by high intake air temperatures.

Should either Bank 1 or Bank 2 sensor fail to work, or should an open circuit occur, the ignition timing will then be set at a default strategy that will retard the ignition much more than normal.

The knock sensor is tuned to detect the frequency of the vibration created by combustion knock. The vibration is transferred to the knock sensor through the cylinder block (1).

Inside the sensor is a mass (2) that is excited by this vibration, and the mass exerts a compressive force onto a piezo-ceramic element (3). The compressive force causes a charge transfer inside the element, so that an AC voltage appears across the two outer faces (4) of the element. The amount of the AC voltage produced is proportional to the amount of knock.

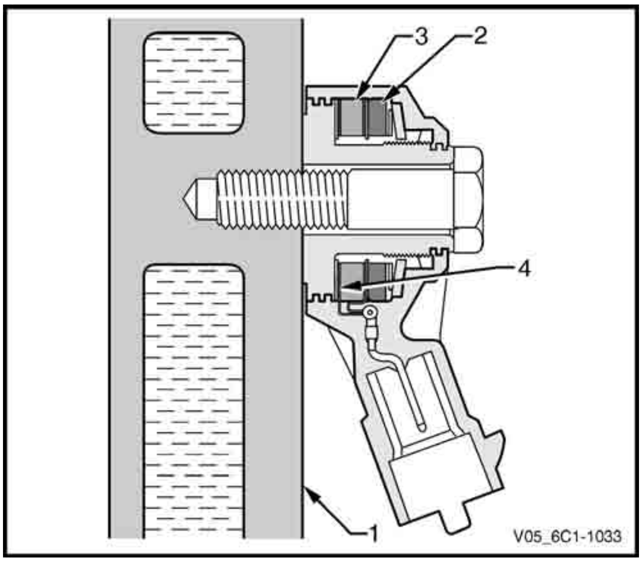

Figure 6C1-1 – 42

4.18 Mass Air Flow Sensor

Air Intake System

The air intake system draws outside air through an air cleaner assembly (1). The air is then routed through a mass air flow (MAF) sensor (2) and into the throttle body and intake manifold. The air is then directed into the intake manifold runners, through the cylinder heads and into the cylinders.

An arrow marked on the body of the MAF sensor indicates correct air flow direction. The arrow must point toward the engine.

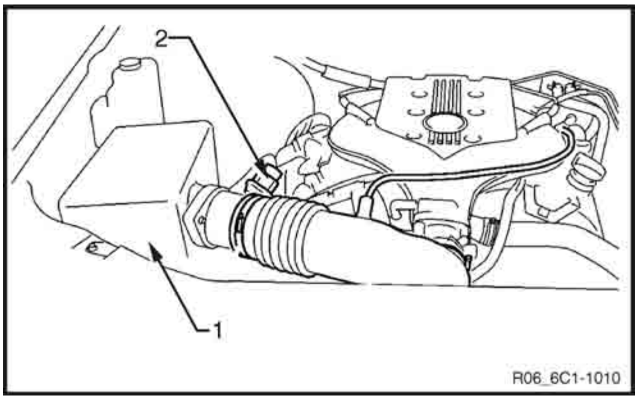

Figure 6C1-1 – 43

Mass Air Flow Sensor

A hot film type mass air flow (MAF) sensor is used which measures the air mass inducted into the engine, regardless of the engine's operating state. The MAF precisely measures a portion of the total airflow and takes into account the pulsation and reverse flows generated by the engine's inlet and exhaust valves.

Changes in intake air temperature have no effect on measuring accuracy.

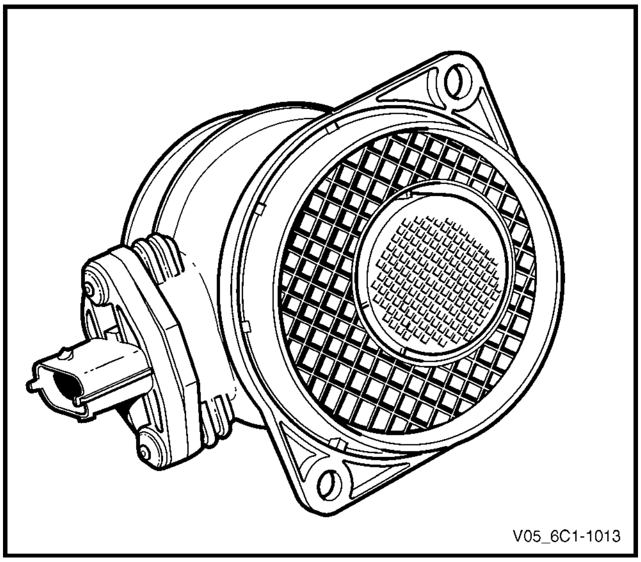

Figure 6C1-1 – 44

Construction

Projecting into the MAF sensor body is the compact design sensor assembly (1), which consists of:

- the sensor element (2),
- partial airflow measuring tube (3), and
- integrated evaluation electronics (4).

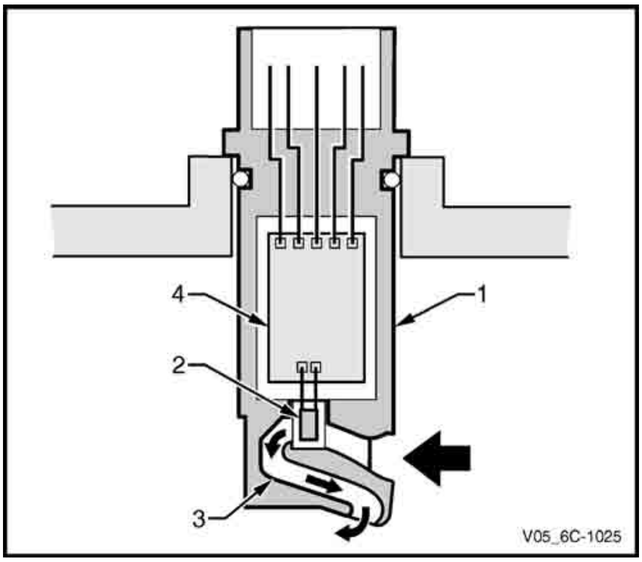

Figure 6C1-1 – 45

Operation

A diaphragm (1) on the sensor element (2) is heated by a centrally mounted heater resistor (3), which is held at a constant temperature. The temperature drops sharply each side of the heating zone.

Temperature of the diaphragm is registered to the evaluation electronics by two temperature-dependent resistors located on the upstream (4) and downstream (5) side of the resistor.

With no air flow through the air flow measuring tube and over the sensor element, the temperature characteristic is the same each side of the heating zone and the resistance values are identical.

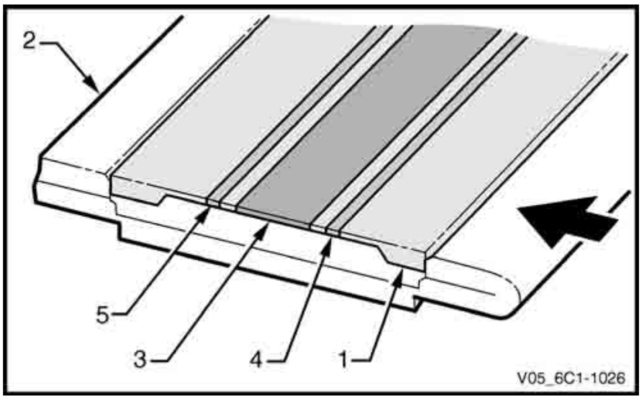

Figure 6C1-1 – 46

As air flows over the sensor element, the upstream resistor value alters due to the cooling effect of the air flow. As the air flows over the heating zone the air temperature is increased.

The air then passes over the downstream resistor and alters the resistance value, but as the air temperature is higher, the value is different to the upstream resistor. This change in temperature creates a temperature differential between the two resistors.

It is this differential that is used to calculate the air mass flow, which is independent of absolute temperature. The differential is also directional, which means the MAF not only measures the mass of the incoming air, but also its direction.

As the evaluation electronics are measuring the resistance differential between the resistors, the air mass flow for the entire amount of air passing through the MAF is calculated and sent to the ECM as an analogue signal of 0 – 5 V.

The ECM can also detect air flow that is inappropriate for a given operating condition based on the signal voltage, or a signal that appears to be fixed based on the lack of normal signal fluctuations expected during engine operation.

Tech 2 can display the MAF value in grams per second (g/s). Values should change rather quickly on acceleration, but should remain fairly stable at any given engine speed.

5 Abbreviations and Glossary of Terms

Abbreviations and terms used in this Section are listed below in alphabetical order with an explanation of the abbreviation or term.

Abbreviation	Description
A/C	Air-conditioning
AC	Alternating Current – An electrical current where the polarity is constantly changing between positive and negative
A/F	Air / Fuel (A/F Ratio)
Analogue Signal	An electrical signal that constantly varies in voltage within a given parameter
Barometric Pressure	Barometric absolute pressure (atmospheric pressure)
CAN	Controller Area Network – A type of serial data for communication between electronic devices.
Catalytic Converter	A muffler-shaped device fitted in the exhaust system, usually close to the engine. Through chemical reaction, a catalytic converter converts harmful gases produced by the combustion process such as HC, CO, and NOx, into environmentally safe water vapour, carbon dioxide, and nitrogen.
CKT	Circuit
Closed Loop	A fuel control mode of operation that uses the signal from the exhaust oxygen sensor(s), to control the air / fuel ratio precisely at a 14.7 to 1 ratio. This allows maximum efficiency of the catalytic converter.
CO	Carbon Monoxide. One of the gases produced by the engine combustion process.
DC	Direct Current
Digital Signal	An electrical signal that is either on or off.
DLC	Data Link Connector. Used at the assembly plant to evaluate the engine management system. For service, it allows the use of Tech 2 in performing system checks.
DLC Data Stream	An output from the ECM initiated by Tech 2 and transmitted via the Data Link Connector(DLC).
DMM (10 MΩ)	Digital Multimeter. A multipurpose meter that has capability of measuring voltage, current flow and resistance. A digital multimeter has an input impedance of 10 MΩ (megohms), which means they draw very little power from the device under test, they are very accurate and will not damage delicate electronic components
Driver	An electronic device, usually a power transistor, that operates as an electrical switch.
DTC	Diagnostic Trouble Code. If a fault occurs in the engine management system, the ECM may set a four digit diagnostic trouble code (DTC) which represents the fault condition. Tech 2 is used to interface with the ECM and access the DTC(s). The ECM may also operate the malfunction indicator lamp in the instrument cluster.
Duty Cycle	The time, in percentage, that a circuit is on versus off.
ECT Sensor	Engine Coolant Temperature sensor. A device that provides a variable voltage to the ECM based on the temperature of the engine coolant.
EEPROM	Electrically Erasable Programmable Read Only Memory. A type of read only memory (ROM) that can be electrically programmed, erased and reprogrammed using Tech 2. Also referred to as Flash Memory
EMI or Electrical Noise	An unwanted signal interfering with a required signal. A common example is the effect of high voltage power lines on an AM radio.
Engine Braking	A condition where the engine is used to slow the vehicle on closed throttle or low gear.
EPROM	Erasable Programmable Read Only Memory. A type of Read Only Memory (ROM) that can be erased with ultraviolet light and then reprogrammed.
ESD	Electrostatic Discharge. The discharge of static electricity which has built up on an insulated material
EVAP	Evaporative emission control system. Used to prevent fuel vapours from the fuel tank from entering into the atmosphere. The vapours are stored in a canister that contains an activated charcoal element. The fuel vapours are purged from the canister into the manifold to be burned in the engine.
GM LAN	General Motors Local Area Network - A type of serial data for communication between electronic devices.
Fuse	A thin metal strip which melts when excessive current flows through it, creating an open circuit and protecting a circuit from damage.
HC	Hydrocarbon. Result of unburned fuel produced by incomplete combustion.
Heavy Throttle	Approximately 3/4 of accelerator pedal travel (75% throttle position)
IAT Sensor	Intake Air Temperature sensor. A device that provides a variable voltage to the ECM based on the temperature of air entering the intake system.
Ideal Mixture	The air / fuel ratio which provides the best performance, while maintaining maximum conversion of exhaust emissions, typically 14.7 to 1 on spark ignition engines
IGN	Ignition
Inputs	Information from sensors (MAF, TP, etc.) and switches (A/C request, etc.) used by the ECM to determine how to control its outputs.

Intermittent	An electrical signal that occurs now and then; not continuously. In electrical circuits, refers to occasional open, short, or ground in a circuit
Light Throttle	Approximately 1/4 of accelerator pedal travel (25% throttle position)
Low	A voltage less than a specific threshold. Operates the same as a ground and may, or may not, be connected to chassis ground.
MAF Sensor	Mass Air Flow Sensor. A device that provides a variable voltage to the ECM based on the amount of air flow entering in the intake system.
Medium Throttle	Approximately 1/2 of accelerator pedal travel (50% throttle position)
N.C	Normally Closed. Switch contacts that are closed when they are in the normal operating position
N.O	Normally Open. Switch contacts that are normally open when in the normal operating position
NOx	Nitrogen Oxide. One of the pollutants found in spark ignition engine exhaust that is formed from normal combustion and increases in severity with combustion temperature.
O2 Sensor	Oxygen Sensor. A device located in the exhaust system that provides a variable voltage to the ECM based on the oxygen content of exhaust gas. May also include a heating circuit to provide faster initial warm-up (HO2 sensor).
OBD	On Board Diagnostic
Open Loop	ECM control of the fuel control system without the use of the oxygen sensor signal.
Output	Functions that are controlled by the ECM, typically these can include solenoids and relays, etc.
ECM	Engine Control Module. An electronic device which controls the engine management system.
ECU	Electronic Control Unit. An electronic device which controls specific system functions
PCV	Positive Crankcase Ventilation. Method of reburning crankcase fumes rather than passing them directly into the atmosphere
PIM	Powertrain Interface Module – The PIM acts as a communication translator between the ECM and other on-board controllers that use a different serial data protocol.
PM	Permanent Magnet
PWM	Pulse Width Modulated. A digital signal turned on and off for a percentage of available cycle time. A signal that is 30% on and 70% of would be termed a 30% on PWM signal.
Quad Driver	A transistor in the ECM capable of operating four separate outputs. Outputs can be either on-off or pulse width modulated.
RAM	Random Access Memory. A microprocessor can write into or read from this memory as needed. This memory is volatile and needs a constant power supply to be retained. If the power is lost or removed, RAM data is lost.
r.p.m.	Revolutions Per Minute
Serial Data	Serial data is a series of rapidly changing voltage signals pulsed from high to low. These signals are typically transmitted through a wire often referred to as the Serial Data Circuit.
SFI	Sequential Fuel Injection. Method of injecting fuel into the engine one cylinder at a time in relation to the engines firing order.
Solenoid	An electromagnetic coil which creates a magnetic field when current is applied, causing a plunger or ball to move.
Switch	Device to opens and close a circuit, thereby controlling current flow.
Tech 2	Tech 2 is a peripheral device that aids in the diagnosis and repair of electronic systems such as engine management, transmission control etc. Tech 2 connects to the vehicle's Data Link Connector (DLC).
TP Sensor	Throttle Position sensor. A device that provides a variable voltage to the ECM based on the position of the throttle plate.
Vacuum – manifold	Vacuum sourced downstream of the throttle plate.
Vacuum – ported	Vacuum sourced upstream of the throttle plate.
VSS	Vehicle Speed Sensor. A permanent magnet type device that provides a digital voltage to the ECM.
WOT	Wide Open Throttle – Full travel of the accelerator pedal (100% throttle position).

6C1-2 Engine Management – V6 Diagnostics

ATTENTION

Before performing any service operation or other procedure described in this Section, refer to 1.5 Warning Caution and Notes for correct workshop practices with regard to safety and/or property damage.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU/GM will indicate those fasteners that require replacement after removal. ISUZU/GM will also indicate the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

1 General Information

1.1 Diagnostic System Check

The engine management diagnostic procedure is organised in a logical structure that begins with the Diagnostic System Check. The Diagnostic System Check directs the diagnostic procedure to the logical steps necessary to diagnose an engine driveability fault condition.

1.2 Diagnostic Trouble Code Tables

The Diagnostic System Check directs the diagnostic procedure to the appropriate diagnostic trouble code (DTC) tables if there is a DTC currently stored in the engine control module (ECM).

The diagnostic tables locate a faulty circuit or component through a logic based on the process of elimination. These diagnostic tables are developed with the following assumptions:

- the vehicle functioned correctly at the time of assembly,
- there are no multiple faults, and
- the problem currently exists.

Understanding and the correct use of the diagnostic tables are essential to reduce diagnostic time and to prevent misdiagnosis.

Multiple DTC Fault Conditions

Some fault conditions trigger multiple component DTCs even if the fault condition exists only on a single component. If there are multiple DTCs stored in the ECM, the service technician must view and record all DTCs logged.

The relationship between the logged DTCs can then be analysed to determine the source of the fault condition. Always begin the diagnostic process with the DTC table of the fault condition that may trigger other DTCs to set.

The following fault conditions may trigger multiple DTCs:

- a fault in the serial data communication circuit,
- a system voltage that is too low may cause incorrect engine management system operation or engine management component malfunction,
- a system voltage that is too high may damage the ECM and/or other engine management components,
- fault condition in the ECM read only memory (ROM) or random access memory (RAM),
- fault condition in the ECM internal circuitry or programming,
- improperly connected sensor or component wiring connector, or
- an electrical fault condition in the following shared ECM electrical circuits trigger DTCs on components or sensors that share in the faulty shared circuit. Test the electrical circuit of the appropriate sensors or components to isolate the fault condition. Refer to 3 Wiring Diagrams and Connector Charts in this Section.
  - 5 V Reference Circuit,
  - Low Reference Circuit, or
  - Ignition Control Voltage Circuit.

If there are no obvious faults to begin a multiple DTC fault condition diagnostic procedure, diagnose the DTCs in the following order unless directed otherwise:

1 Always start with the lowest numbered component level DTCs such as:
   - sensor DTCs,
   - solenoid DTCs, or
   - relay DTCs.
2 Then follow with system level DTCs such as:
   - misfire DTCs,

- fuel trim DTCs, or
- catalyst DTCs.

1.3 Symptoms Diagnostics

The Diagnostic System Check directs the service technician to the symptoms diagnostics if the following conditions exist:

- a vehicle driveability fault condition exists,
- there is no current diagnostic trouble code presently stored in the ECM, and
- all Tech 2 engine data parameters are within normal operating range.

1.4 Diagnostic Trouble Codes

The ECM constantly performs self-diagnostic tests on the engine management system. When the ECM detects a fault condition in the engine operating parameters, the ECM sets a diagnostic trouble code (DTC) to represent that fault condition. The following are the types of DTCs programmed in the ECM. In addition, DTCs are classified as either a current or history DTC.

- Type A – emission related DTCs,
- Type B – emission related DTCs, and
- Type C – non-emission related DTCs.

NOTE

Depending on the type of DTC set, the ECM may command the malfunction indicator lamp (MIL) to illuminate and warn the driver there is a fault in the engine management system.

Type A – Emission Related DTCs

The ECM takes the following action when a Type A DTC runs and fails:

- sets a current Type A DTC that represents the fault condition,
- illuminates the instrument cluster malfunction indicator lamp (MIL), and
- records the operating condition at the time the diagnostic fails and stores this information in the freeze frame failure record.

Type B – Emission Related DTCs

The ECM takes the following action when a Type B DTC runs and fails:

- On the first time a Type B DTC fails, the ECM takes the following actions:
  - sets a current Type B DTC that represents the fault condition, and
  - records the operating conditions at the time the fault sets and stores this information in the failure records.
- On the second consecutive ignition cycle that a Type B DTC fails, the ECM takes the following actions:
  - activates the instrument cluster malfunction indicator lamp (MIL), and
  - records the operating condition at the time the diagnostic fails and stores this information in the freeze frame failure record.

Conditions for Clearing Type A or Type B DTCs

- The current DTC clears when there is no fault condition in the current ECM self-diagnostics.
- If there are no DTCs logged after three or four consecutive ignition cycles, the ECM deactivates the instrument cluster malfunction indicator lamp (MIL).
- Type A or Type B History DTC clears when there is no fault condition after 40 consecutive warm-up cycles.

- Use Tech 2 to clear DTC/s.

Type C – Non-Emission Related DTCs

The ECM takes the following action when a Type A DTC runs and fails:

- sets a current Type C DTC that represents the fault condition, and
- records the operating conditions at the time the DTC is logged and stores this information in the Failure Record, and:

NOTE

The instrument cluster malfunction indicator lamp (MIL) is not activated when a Type C DTC sets.

Conditions for Clearing Type C DTCs

- The current DTC clears when there is no fault condition in the current ECM self-diagnostics.
- Type C History DTC clears when there is no fault condition after 40 consecutive warm-up cycles.
- Use Tech 2 to clear DTCs.

Current DTCs

A DTC is a Current DTC if the fault condition that triggers that DTC is present during the last ECM self-diagnostics.

History DTCs

A DTC is a History DTC if the fault condition that triggers that DTC is not present during the last ECM self-diagnostics.

1.5 Warning Caution and Notes

This Section contains various WARNINGS, CAUTIONS and NOTE statements that you must observe carefully to reduce the risk of death or injury during service, repair procedures or vehicle operation. Incorrect service or repair procedures may damage the vehicle or cause operational faults. WARNINGS, CAUTION and NOTE statements are not exhaustive. GM Holden LTD can not possibly warn of all the potentially hazardous consequences of failure to follow these instructions.

Definition of WARNING, CAUTION and NOTE Statements

Diagnosis and repair procedures in this Section contain both general and specific WARNING, CAUTION and NOTE statements. GM Holden LTD is dedicated to the presentation of service information that helps the technician to diagnose and repair the systems necessary for proper operation of the vehicle. Certain procedures may present a hazard to the technician if they are not followed in the recommended manner. WARNING, CAUTION and NOTE statements are designed to help prevent these hazards from occurring, but not all hazards can be foreseen.

WARNING defined

A WARNING statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in death or injury. A WARNING statement alerts you to take necessary action or not to take a prohibited action. If a WARNING statement is ignored, the following consequences may occur:

- Death or injury to the technician or other personnel working on the vehicle,
- Death or injury to other people in or near the workplace area, and / or
- Death or injury to the driver / or passenger(s) of the vehicle or other people, if the vehicle has been improperly repaired.

CAUTION defined

A CAUTION statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in damage to or destruction of equipment, or corruption of data. If a CAUTION statement is ignored, the following consequences may occur:

- Damage to the vehicle,
- Unnecessary vehicle repairs or component replacement,
- Faulty operation or performance of any system or component being repaired,
- Damage to any system or components which depend on the proper operation of the system or component being repaired,
- Faulty operation or performance of any systems or components which depend on the proper operation or performance of the system or component under repair,
- Damage to fasteners, basic tools or special tools and / or
- Leakage of coolant, lubricant or other vital fluids.

NOTE defined

A NOTE statement immediately precedes or follows an operating procedure, maintenance practice or condition that requires highlighting. A NOTE statement also emphasises necessary characteristics of a diagnostic or repair procedure. A NOTE statement is designed to:

- Clarify a procedure,
- Present additional information for accomplishing a procedure,
- Give insight into the reasons for performing a procedure in the recommended manner, and / or
- Present information that gives the technician the benefit of past experience in accomplishing a procedure with greater ease.

3.3 Engine Control Connector End Views

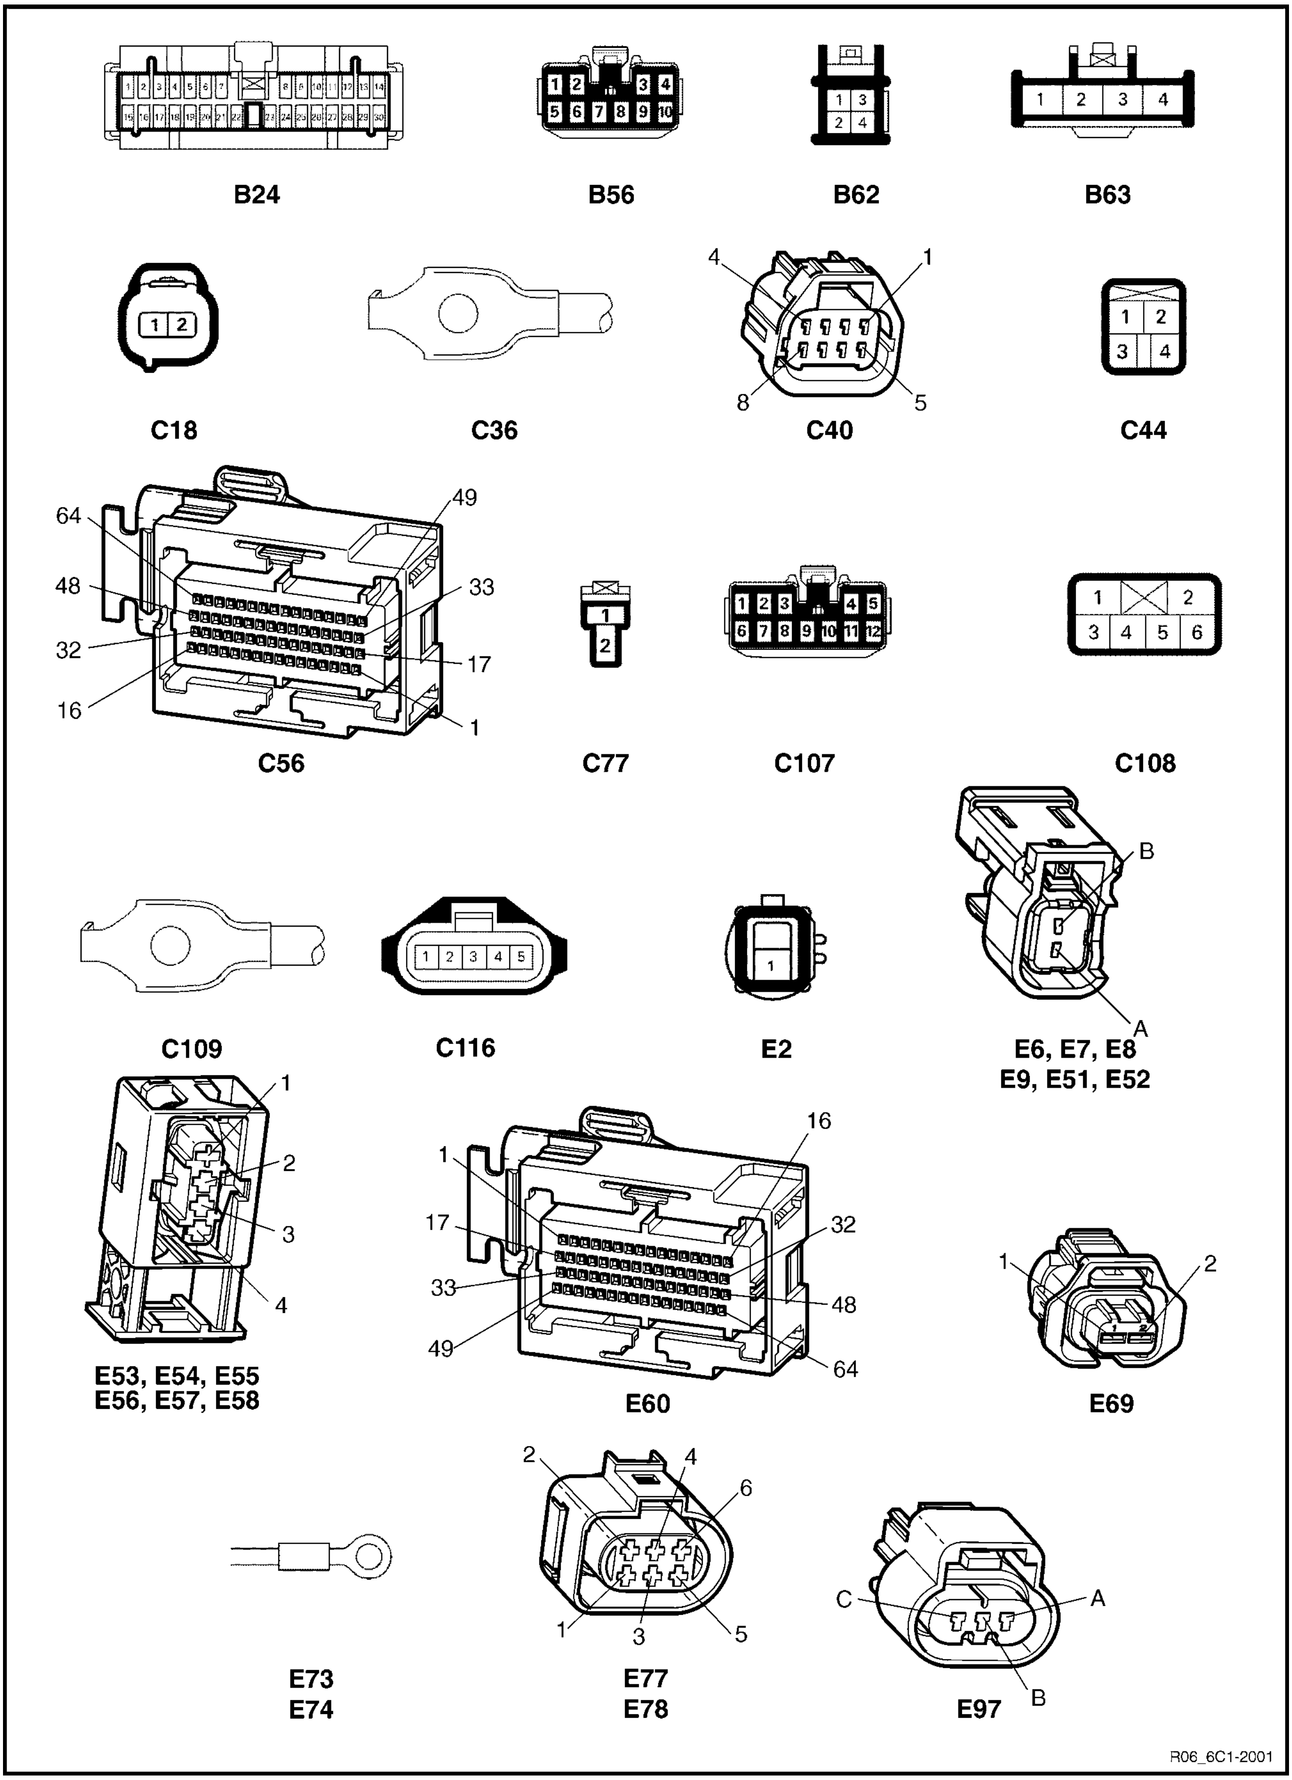

Figure 6C1-2 – 7

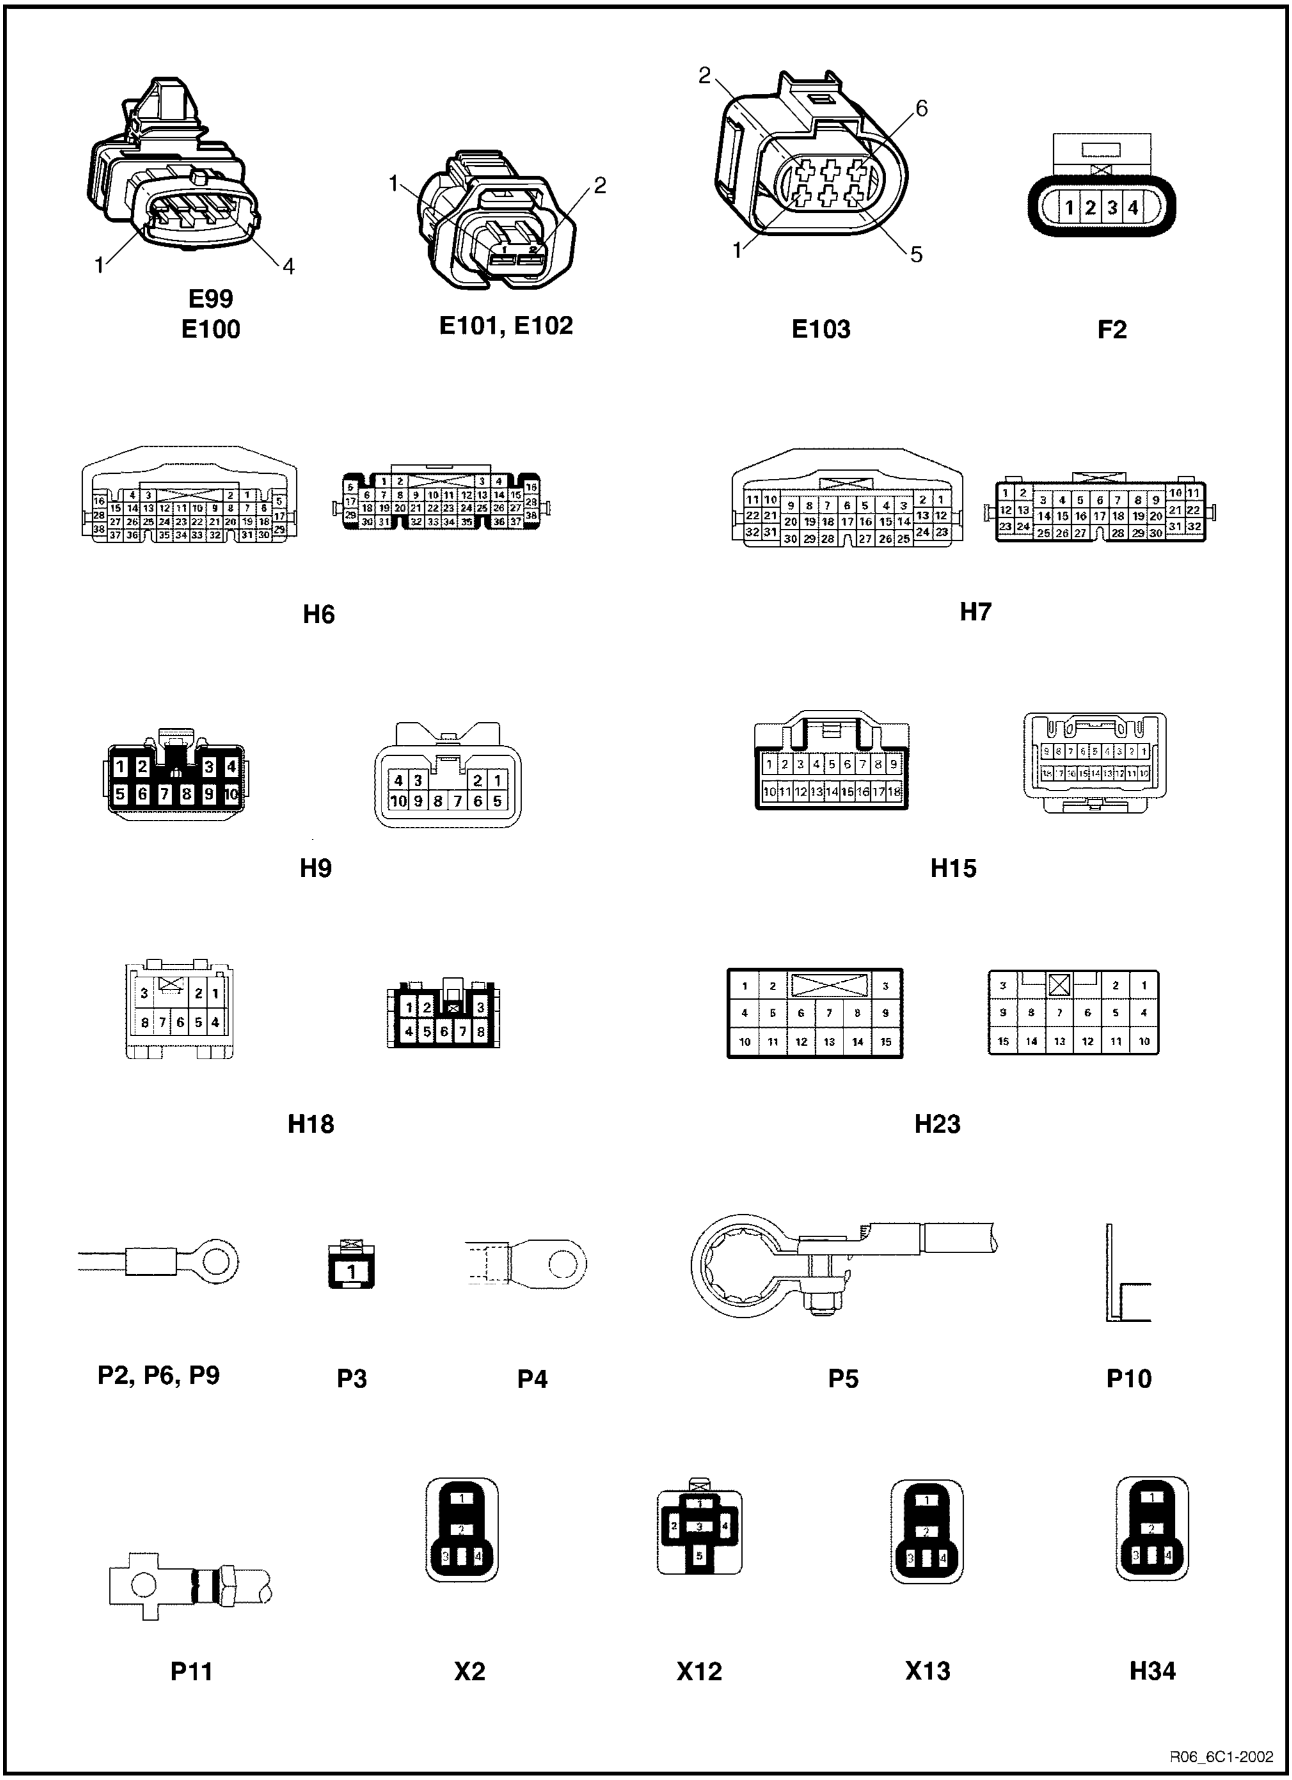

Figure 6C1-2 – 8

4 Diagnostics Starting Point

4.1 Basic Requirements

Basic Knowledge Required

CAUTION

A lack of basic understanding regarding electronics, electrical wiring circuits and use of electrical circuit testing tools when performing an engine management system diagnostic procedure could result in incorrect diagnostic results or damage to engine management system components.

Understanding of the following is required to perform the diagnostic procedures detailed in this Section. Refer to 8A Electrical - Body and Chassis and to Basic Tools Required.

- Basic electronics,
- Electrical wiring circuits,
- Electrical circuits testing, and
- Correct use of the basic engine management system diagnostic tools.

In addition, understanding of the engine management system is essential to prevent misdiagnosis and component damage. Refer to 6C1-1 Engine Management – V6 – General Information.

Basic Tools Required

CAUTION

Use of incorrect electrical circuit diagnostic tools when performing the Engine Management diagnostic procedures could result in incorrect diagnostic results or damage to engine management system components.

The following electrical circuit testing tools are required to perform the diagnostic procedures detailed in this Section.

- Tech 2,
- Test lamp, refer to 8A Electrical - Body and Chassis, and
- Digital multimeter with 10 MΩ impedance, refer to 8A Electrical - Body and Chassis.

4.2 Diagnostic Precautions

The following precautions must be observed when performing the powertrain diagnostic procedure, otherwise incorrect diagnostic results or damage to engine management system components will occur:

- Disconnection of the battery affects certain vehicle electronic systems. Refer to 6D1-3 Battery – V6 before disconnecting the battery.
- Disconnect the battery negative lead when performing the following procedures:
  - Disconnecting the ECM connectors, or
  - Charging the battery.
- Disconnect the battery terminal lead and the ECM connectors before attempting any electric arc welding on the vehicle.

- Do not start the engine if the battery terminal is not properly secured to the battery.
- Do not disconnect or reconnect the following while the ignition is switched on or when the engine is running:
  - Any engine management system component electrical wiring connector, or
  - Battery terminal leads.
- Ensure the correct procedure for disconnecting and connecting engine management system electrical wiring connectors is always followed. For information on the correct procedure for disconnecting and connecting specific wiring connectors, refer to 6C1-3 Engine Management – V6 – Service Operations.
- Ensure that all wiring harness connectors are fitted correctly.
- When steam or pressure cleaning engines, do not direct the cleaning nozzle at engine management system components.
- Do not clear any DTCs unless instructed.
- The fault must be present when using the diagnostic trouble code (DTC) diagnostic tables. Otherwise, misdiagnosis or replacement of good parts may occur.
- Do not touch the ECM connector pins or soldered components on the ECM circuit board to prevent ECM Electrostatic Discharge damage. Refer to 8A Electrical - Body and Chassis for information on Electrostatic Discharge.
- Use only the test equipment specified in the diagnostic tables as other test equipment may give incorrect results or damage good components.
- The ECM is designed to withstand normal current draw associated with vehicle operations. However, the following fault conditions or incorrect test procedure may overload the ECM internal circuit and damage the ECM:
  - A short to voltage fault condition in any of the ECM low reference circuits may cause internal ECM and / or sensor damage. Therefore, any short to voltage fault condition in the ECM low reference circuits must be rectified before replacing a faulty component.
  - A short to ground fault condition in any of the ECM 5 V reference circuits may cause internal ECM and / or sensor damage. Therefore, any short to ground fault condition in the ECM 5 V reference circuits must be rectified before replacing a faulty component.
  - When using a test lamp to test an electrical circuit, do not use any of the ECM low reference circuits or 5 V reference circuits as a reference point. Otherwise, excessive current draw from the test lamp may damage the ECM.
- Disregard DTCs that set while performing the following diagnostic Steps:
  - Using Tech 2 actuator tests, or
  - Disconnecting an engine management system sensor connector then switching on the ignition.
- After completing the required diagnostics and service operations, road test the vehicle to ensure correct engine management system operation.

4.3 Preliminary Checks

The preliminary checks are a set of visual and physical checks or inspections that may quickly identify engine management system fault condition.

- Refer to the appropriate Service Techlines for relevant information regarding the fault condition.
- Ensure the battery is fully charged.
- Inspect the battery connections for corrosion or a loose terminal.
- Ensure that all engine management system related fuses are serviceable.
- Inspect for incorrect aftermarket theft deterrent devices, lights or mobile phone installation.
- Ensure there is no speaker magnet positioned too close to any electronic module that contains relays.
- Inspect the engine wiring harness for proper connections, pinches or cuts.
- Ensure that all engine management related electrical wiring connectors are fitted correctly.
- Inspect the ECM ground connections for corrosion, loose terminal or incorrect position.

- Ensure the resistance between the ECM housing and the battery negative cable is less than 0.5 Ω.
- Check the ECM bracket fasteners for correct torque value.
- Check all engine management related components for correct installation.
- Inspect the vacuum hoses for splits, kinks, oil contamination and proper connections, refer to the vehicle emission control information label. Check the hoses thoroughly for any type of leak or restriction.
- Inspect the air intake ducts for being collapsed, split or for having damaged areas.
- Inspect for air leaks at the throttle body mounting area, mass air flow (MAF) sensor, intake manifold and intake manifold sealing surfaces.
- Check for wiring harness routing that may be positioned too close to a high voltage or high current device such as the following:
  - Secondary ignition components, and
  - Motors and generators.

NOTE

High voltage or high current devices may induce electrical noise on a circuit, which can interfere with normal circuit operation.

4.4 Diagnostic System Check

Description

The engine management diagnostic procedure is organised in a logical structure that begins with the Diagnostic System Check. The Diagnostic System Check directs the diagnostic procedure to the logical steps necessary to diagnose an engine driveability fault condition.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

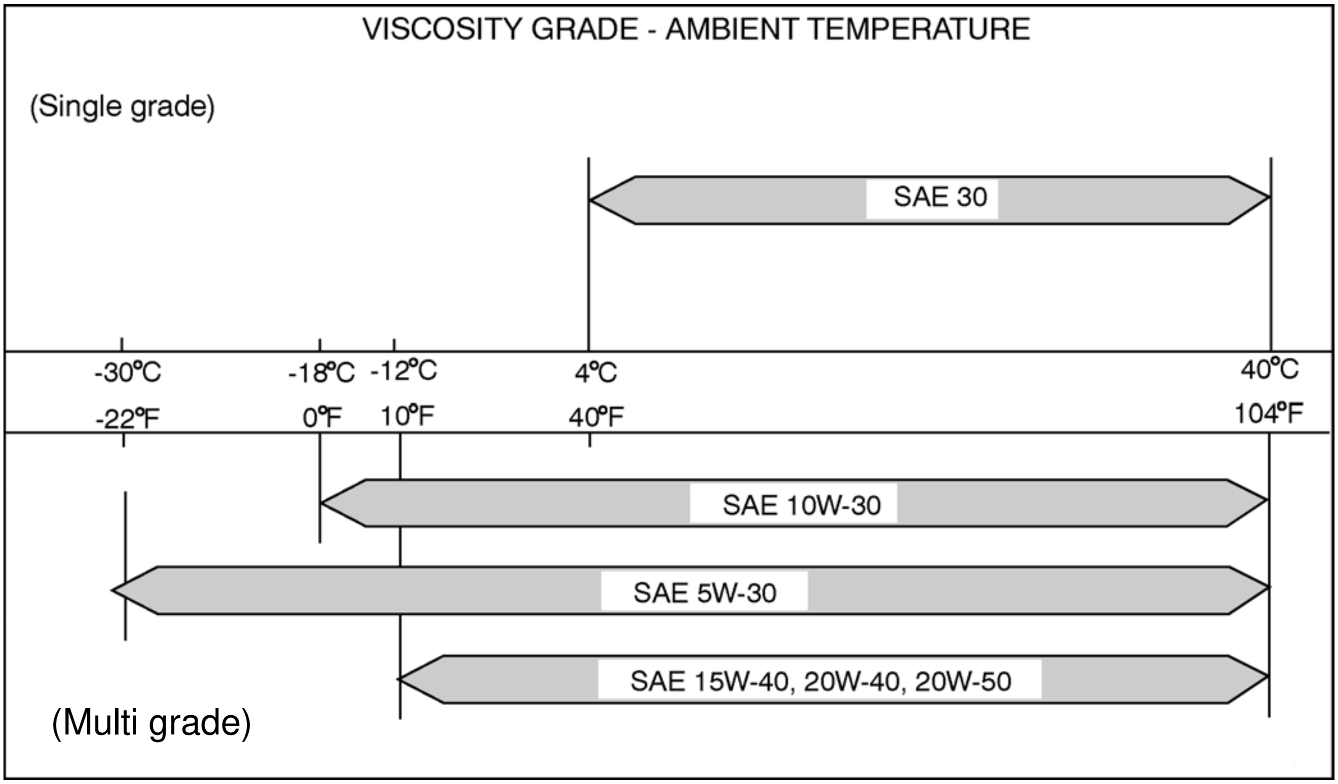
6 Tests the integrity of the GM LAN serial data communication circuit. A PIM DTC sets if the PIM detects a fault condition in the communication circuit. A fault condition on the serial data communication circuit may trigger multiple DTCs on other sensors and components.

Step	Action	Yes	No
1	Have you read the basic requirements?	Go to Step 2	Refer to 4.1 Basic Requirements
2	Have you read the diagnostic precautions?	Go to Step 3	Refer to 4.2 Diagnostic Precautions
3	Have you performed the preliminary checks?	Go to Step 4	Refer to 4.3 Preliminary Checks
4	Using Tech 2, attempt to communicate with the PIM. Does the PIM fail to communicate?	Refer to 6E1 Powertrain Interface Module – V6	Go to Step 5
5	Does DTC B3902, C0550, U2100, U2105, U2106, P0633, or P1611 also set in the PIM?	Refer to 6E1 Powertrain Interface Module – V6	Go to Step 6
6	Using Tech 2, view and record DTCs set at the ECM and TCM. Does Tech 2 display any DTC?	Go to Step 7	Refer to 5.1 Symptoms Diagnosis Table

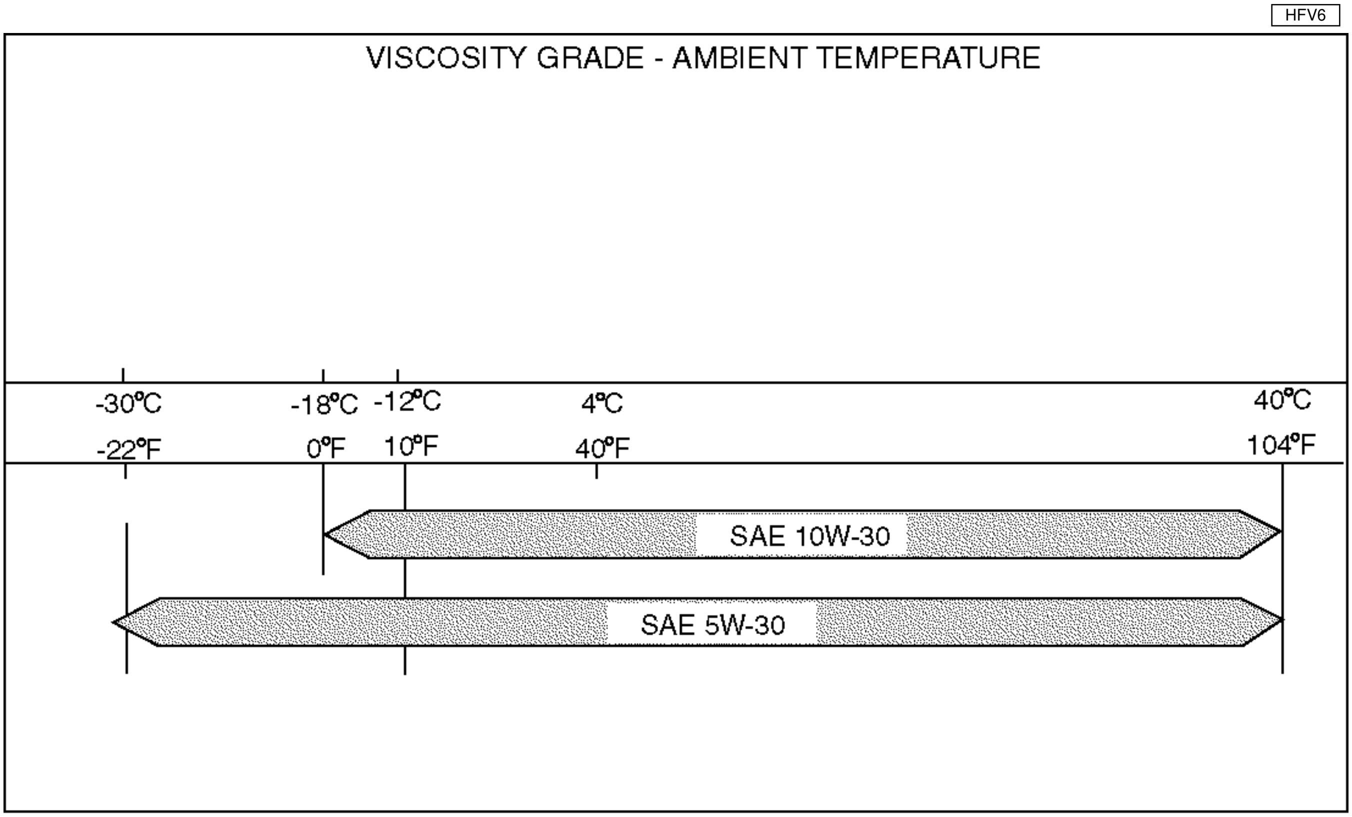
Step	Action	Yes	No
7	Does Tech 2 display multiple DTCs?	Go to Step 8	Go to the diagnostic table of the DTC displayed. Refer to 7.1 DTC List
8	Does Tech 2 display any serial data communication circuit DTC?	Go to the appropriate serial data communication circuit DTC table. Refer to 7.1 DTC List	Go to Step 9
9	Does Tech 2 display any immobiliser circuit DTC?	Go to the appropriate immobiliser circuit DTC table. Refer to 7.1 DTC List	Go to Step 10
10	Refer to the DTC Table of the fault condition that is most likely to trigger multiple DTCs. Refer to 1.2 Diagnostic Trouble Code Tables in this Section.	—	—
When all diagnosis and repairs are completed, check the system for correct operation.			

OIL VISCOSITY CHART FOR GASOLINE ENGINE
APPLY GASOLINE ENGINE OIL

C24SE



HFV6

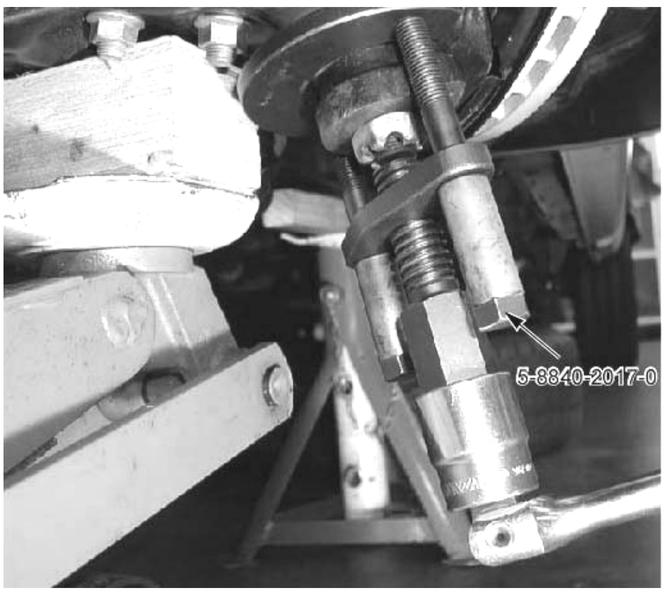


Removal

1. Raise the vehicle and support it with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel Replacement in this section.
3. Remove link nut.

CAUTION: Be careful not to damage the ball joint boot.

4. Support lower control arm with a jack.
5. Remove the shock absorber bolt and nut.
6. Remove lower ball joint nut and cotter pin, then use remover 5-8840-2017-0 to remove the lower ball joint from the knuckle.



P1010003

7. Apply the setting marks to the front and rear cam bolt and crossmember, then loosen nut, and cam bolt.
8. Remove the shock absorber nut.
9. Remove the shock absorber asm.

5 Symptoms Diagnostics

5.1 Symptoms Diagnosis Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check
2	Is the fault intermittent?	Refer to 5.2 Intermittent Fault Conditions	Go to Step 3
3	Does the engine backfire?	Refer to 5.3 Backfire	Go to Step 4
4	Does the engine crank but does not run?	Refer to 5.4 Cranks But Does Not Run	Go to Step 5
5	Does the engine cut-out or miss?	Refer to 5.5 Cuts Out, Misses	Go to Step 6
6	Is there a detonation or spark knock noise coming from the engine?	Refer to 5.6 Detonation / Spark Knock	Go to Step 7
7	Is there an engine dieseling or run-on condition?	Refer to 5.7 Dieseling, Run-on	Go to Step 8
8	Is there an engine hard starting condition?	Refer to 5.8 Hard Start	Go to Step 9
9	Is there an engine hesitation, sag or stumble condition?	Refer to 5.9 Hesitation, Sag and Stumble	Go to Step 10
10	Does the engine suffer from lack of power, sluggishness or sponginess?	Refer to 5.10 Lack of Power, Sluggishness or Sponginess	Go to Step 11
11	Does the engine suffer from poor fuel economy?	Refer to 5.11 Poor Fuel Economy	Go to Step 12
12	Does the engine suffer from rough, unstable or incorrect idle and engine stalling?	Refer to 5.12 Rough, Unstable, Incorrect Idle or Stalling	Go to Step 13
13	Does the engine surge or chuggle?	Refer to 5.13 Surges / Chuggles	Go to Step 14
When all diagnosis and repairs are completed, check the system for correct operation.			

5.2 Intermittent Fault Conditions

Description

A fault condition is intermittent if one of the following conditions exists:

- the fault condition is not always present,
- the fault condition cannot be presently duplicated, or

- there is no Current DTC but a History DTC is stored.

Diagnostic Table

Checks	Actions

Preliminary	• Perform the preliminary checks. Refer to 4.3 Preliminary Checks in this Section.
	• Gather information from the customer regarding the conditions that trigger the intermittent fault such as:
	  • At what engine or ambient temperature range does the fault occur?
	  • Does the fault occur when operating aftermarket electrical equipment inside the vehicle?
	  • Does the fault occur on rough roads or in wet road conditions?
	• If the intermittent fault is a start and then stall condition, check the immobiliser system. Refer to 11A Immobiliser.

Tech 2 Tests	The following are lists of Tech 2 diagnostic tests that may be used to diagnose intermittent faults: • Wriggle test the suspected wiring harness and connectors while observing Tech 2 operating parameters. If Tech 2 read-out fluctuates during this procedure, check the tested wiring harness circuit for a loose connection. • Observe the freeze frame / failure records for the suspected history DTC and then operate the vehicle in the conditions that triggers the intermittent fault while an assistant observes the suspected Tech 2 operating parameter data. • Capture and store data in the snapshot mode when the fault occurs. The stored data may be played back at a slower rate to aid diagnostics. Refer to Tech 2 User Instructions for further information on the Snapshot function. • Compare the engine operating parameters of the engine being diagnosed to the engine operating parameters of a known good engine.

Malfunction Indicator Lamp	The following conditions may cause an intermittent Malfunction Indicator Lamp fault with no DTC listed:
	• Electromagnetic interference (EMI) caused by a faulty relay, ECM controlled solenoid, switch or other external source.
	• Incorrect installation of aftermarket electrical equipment such as the following:
	  • mobile phones,
	  • lights, or
	  • radio equipment.
	• ECM grounds are loose.

Checks	Actions

Temperature Related	Temperature related intermittent fault condition occurs only when the engine or ambient temperature is hot, or only when it is cold.
	• If the intermittent fault is heat related, review Tech 2 data in relationship to the following:
	  • high ambient temperature,
	  • engine generated heat,
	  • circuit generated heat due to a poor electrical connection or high electrical load, and
	  • higher than normal load conditions (towing, etc.).
	• If the intermittent fault is related to cold ambient or engine temperature, review Tech 2 data in relationship to the following:
	  • low ambient temperature, and
	  • the fault condition that occurs only on a cold start situation.

Additional Tests	• Incorrect installation of aftermarket electrical equipment such as the following:
	  • mobile phones,
	  • theft deterrent alarms,
	  • lights, or
	  • radio equipment.
	• Electromagnetic interference (EMI) caused by a faulty relay, ECM controlled solenoid or switch. The fault is triggered when the relay or solenoid is activated.
	• Test the A/C compressor clutch and some relays that contain a clamping diode or resistor for an open circuit.
	• Test the generator for a faulty rectifier bridge that may allow the A/C noise into the ECM electrical circuit.

When all diagnosis and repairs are completed, check the system for correct operation.	

5.3 Backfire

Description

The air / fuel mixture in the intake manifold or in the exhaust system ignites which produces a loud popping noise.

Checks	Actions
Preliminary	Perform the Preliminary Checks. Refer to 4.3 Preliminary Checks in this Section.
Sensor / System	• Check the air intake system and crankcase for air leaks. • Check the PCV System for correct operation. Refer to 6A1 Engine Mechanical – V6. • Use Tech 2 to monitor the knock sensor system for excessive spark retard activity. Check for items that cause spark retard activity.

Checks	Actions
Fuel System	• Check the fuel system for the following fault conditions. Refer to 6C Fuel System – V6 – V6. • restricted fuel filter, • incorrect fuel pressure, and • contaminated fuel. • Check the operation of the fuel injectors. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Perform the fuel injector balance test, refer to 6.3 Fuel Injector Balance Test in this Section. • Check the items that can cause an engine to run lean. • Check the items that cause an engine to run rich.
Ignition System	• Check for an intermittent ignition circuit malfunction. • Inspect for moisture or corrosion around the spark plug / ignition coil area. • Test the ignition coil voltage output. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Remove and inspect the spark plugs. Refer to 6C1-3 Engine Management – V6 – Service Operations. **NOTE** If the spark plugs are fouled, determine the cause of the fouling before replacing the spark plugs. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Check for loose ignition coil ground circuit.
Engine Cooling System	Check the engine for over-heating. Refer to 6B1 Engine Cooling – V6.
Engine Mechanical	Check for the following engine fault conditions. Refer to 6A1 Engine Mechanical – V6. • low compression, and • worn valve train components.
Additional Checks	• Check the exhaust system for possible restrictions. Refer to 6F Exhaust System – V6. • Electromagnetic interference (EMI) on the crankshaft position (CKP) sensor can cause an engine misfire condition. Using Tech 2, monitor the engine speed parameter. A sudden increase in the engine speed parameters without moving the throttle position indicates that an Electromagnetic Interference fault may be present. Wiring harness routing which may be positioned very close to a high voltage or high current device such as the following may induce EMI: • secondary ignition components, or • motors and generators. Dirty starter motor commutator or brushes can mask the crankshaft position sensor signal. • Check the torque converter clutch (TCC) operation. A TCC that applies too soon can cause engine detonation, which will trigger spark retard activity. Refer to 7C1 Automatic Transmission – 4L60E – General Information.
When all diagnosis and repairs are completed, check the system for correct operation.	

5.4 Cranks But Does Not Run

Definition

The engine cranks normally but does not start.

Checks	Actions
Preliminary	• Perform the preliminary checks. Refer to 4.3 Preliminary Checks in this Section. • Check the immobiliser system for correct operation. Refer to 11A Immobiliser.
Sensor / System	• Check the engine coolant temperature (ECT) sensor for an incorrect value. Compare the engine coolant temperature against the intake air temperature (IAT) on a cold engine. The ECT and IAT sensor values should be within ± 3°C of each other. Refer to 6C1-3 Engine Management – V6 – Service Operations for details of the Temperature vs. Resistance Table. • Check the mass air flow (MAF) sensor installation. Incorrect installation of the MAF sensor may cause hard start condition. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Check for a dirty starter motor commutator or brushes that can mask the crankshaft position sensor signal.

Fuel System	• Check the fuel system for the following fault conditions. Refer to 6C Fuel System – V6.
	  • restricted fuel filter,
	  • incorrect fuel pressure,
	  • contaminated fuel, and
	  • incorrect fuel pump relay operation.
	• Check the operation of the fuel injectors. Refer to 6C1-3 Engine Management – V6 – Service Operations.

Ignition System	• Inspect for moisture or corrosion around the spark plug / ignition coil area. • Test the ignition coil voltage output. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Remove and inspect the spark plugs. Refer to 6C1-3 Engine Management – V6 – Service Operations. **NOTE** If the spark plugs are fouled, determine the cause of the fouling before replacing the spark plugs. Refer to 6C1-3 Engine Management – V6 – Service Operations. Check for loose ignition coil ground circuit.

Engine Mechanical	• Check for excessive oil in combustion chamber. Refer to 6A1 Engine Mechanical – V6.
	• Check for the following engine fault conditions. Refer to 6A1 Engine Mechanical – V6.
	  • low compression, and
	  • worn valve train components.

When all diagnosis and repairs are completed, check the system for correct operation.	

5.5 Cuts Out, Misses

Description

Steady pulsation or jerking that is usually more severe as the engine load increases. This condition is not normally felt greater than 1500 rpm or 48 km/h. The exhaust has a steady spitting sound at idle or low speed.

Checks	Actions
Preliminary	• Perform the preliminary checks. Refer to 4.3 Preliminary Checks in this Section. • Check the air filter element and intake air ducts for blockages. • Check for intake manifold vacuum leak.
Sensor / System	• Using Tech 2, check the heated oxygen sensor (HO2s) operating parameters. The HO2s should respond quickly to different throttle positions. • Use Tech 2 to monitor the knock sensor system for excessive spark retard activity. Check for items that cause spark retard activity. Refer to 7.19 DTC P0327, P0328, P0332 or P0333.

Fuel System	• Check the fuel system for the following fault conditions. Refer to 6C Fuel System – V6.
	  • restricted fuel filter,
	  • incorrect fuel pressure, and
	  • contaminated fuel.
	• Check the operation of the fuel injectors. Refer to 6C1-3 Engine Management – V6 – Service Operations.
	• Perform the fuel injector balance test, refer to 6.3 Fuel Injector Balance Test in this Section.
	• Check for fault conditions that cause an engine to run rich or to run lean.

Ignition System	• Inspect for moisture or corrosion around the spark plug / ignition coil area. • Test the ignition coil voltage output. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Remove and inspect the spark plugs. Refer to 6C1-3 Engine Management – V6 – Service Operations. **NOTE** If the spark plugs are fouled, determine the cause of the fouling before replacing the spark plugs. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Check for loose ignition coil grounds.
Engine Mechanical	Check for the following engine fault conditions. Refer to 6A1 Engine Mechanical –V6. • low compression, and • worn valve train components.

Checks	Actions

Additional Checks	• Check the exhaust system for possible restrictions. Refer to 6F Exhaust System – V6.
	• Electromagnetic interference (EMI) on the crankshaft position (CKP) sensor can cause an engine misfire condition.
	Using Tech 2, monitor the engine speed parameter. A sudden increase in the engine speed parameters without moving the throttle position indicates that an electromagnetic interference fault may be present.
	• Wiring harness routing which may be positioned very close to a high voltage or high current device such as the following may induce EMI:
	  • secondary ignition components, or
	  • motors and generators.

When all diagnosis and repairs are completed, check the system for correct operation.	

5.6 Detonation / Spark Knock

Description

The engine produces sharp rapid metallic knocks that are more audible during acceleration.

Checks	Actions
Preliminary	Perform the preliminary checks. Refer to 4.3 Preliminary Checks in this Section.
Sensor System	Use Tech 2 to monitor the knock sensor system.

Fuel System	• Check the fuel system for the following fault conditions. Refer to 6C Fuel System – V6.
	  • restricted fuel filter,
	  • incorrect fuel pressure, and
	  • contaminated fuel.
	• Check the operation of the fuel injectors. Refer to 6C1-3 Engine Management – V6 – Service Operations.
	• Perform the fuel injector balance test, refer to 6.3 Fuel Injector Balance Test in this Section.
	• Ensure the fuel tank is filled with petrol that has a minimum octane reading of 92.
	• Check for fault conditions that can cause an engine to run lean.

Ignition System	Check the spark plugs for proper heat range. Refer to 6C1-3 Engine Management – V6 – Service Operations.
Engine Mechanical	• Check the combustion chambers for excessive carbon build-up. Refer to 6A1 Engine Mechanical – V6. • Check the camshaft timing. Refer to 6A1 Engine Mechanical – V6.
Additional Checks	• Check the torque converter clutch (TCC) operation. The TCC applying too soon can cause the engine to spark knock. Refer to 7C2 Automatic Transmission – 4L60E – Electrical Diagnosis.
When all diagnosis and repairs are completed, check the system for correct operation.	

5.7 Dieseling, Run-on

Description

The engine continues to run after the ignition is switched off but runs very roughly and then stalls.

Checks	Actions
Preliminary	Perform the preliminary checks. Refer to 4.3 Preliminary Checks in this Section.
Fuel System	Inspect the injectors for leaking condition. Refer to 6C1-3 Engine Management – V6 – Service Operations.
Engine Cooling System	• Check for engine overheating. Refer to 6B1 Engine Cooling – V6. • Check the engine thermostat for proper operation and correct heat range. Refer to 6B1 Engine Cooling – V6.
Engine Mechanical	• Check for build up of carbon deposit in the combustion chamber, which may cause hot spots and increased compression ratio. Refer to 6A1 Engine Mechanical – V6. • Using Tech 2, check for incorrect engine idle speed.
Additional	• If the engine continues to run after the ignition is switched off but the engine runs normally, check the following: • ignition switch operation, • voltage feedback from alternator L terminal to ignition switch, and • sticking ignition control relay.
When all diagnosis and repairs are completed, check the system for correct operation.	

5.8 Hard Start

Definition

The engine cranks normally but takes longer to start than usual. As soon as the engine runs, the engine may stall immediately.

Checks	Actions
Preliminary	• Perform the preliminary checks. Refer to 4.3 Preliminary Checks in this Section. • Check the immobiliser system for correct operation. Refer to 11A Immobiliser.
Sensor / System	• Check the engine coolant temperature (ECT) sensor for an incorrect value. Compare the engine coolant temperature against the intake air temperature (IAT) on a cold engine. The ECT and IAT sensor values should be within ± 3°C of each other. Refer to 6C1-3 Engine Management – V6 – Service Operations for details of the Temperature vs. Resistance Table. • Check the mass air flow (MAF) sensor installation. Incorrect installation of the MAF sensor may cause hard start condition. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Test the resistance of the crankshaft position (CKP) sensor. The CKP sensor resistance must be within 700 – 1,200 Ω at all temperatures. • Check for dirty starter motor commutator or brushes that can mask the crankshaft position sensor signal.
Fuel System	• Check the fuel system for the following fault conditions. Refer to 6C Fuel System – V6. • restricted fuel filter, • incorrect fuel pressure, and • contaminated fuel. • Check the operation of the fuel injectors. Refer to 6C1-3 Engine Management – V6 – Service Operations.

Checks	Actions
Ignition System	• Inspect for moisture or corrosion around the spark plug / ignition coil area. • Test the ignition coil voltage output. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Remove and inspect the spark plugs. Refer to 6C1-3 Engine Management – V6 – Service Operations. **NOTE** If the spark plugs are fouled, determine the cause of the fouling before replacing the spark plugs. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Check for loose ignition coil ground circuit.

Engine Mechanical	• Check for excessive oil in combustion chamber. Refer to 6A1 Engine Mechanical – V6.
	• Check for the following engine fault conditions. Refer to 6A1 Engine Mechanical – V6.
	  • low compression, and
	  • worn valve train components.

When all diagnosis and repairs are completed, check the system for correct operation.	

5.9 Hesitation, Sag and Stumble

Description

Momentary lack of response or hesitation as the accelerator is depressed. This condition is usually more severe when first trying to make the vehicle move from a standing start but can occur at any vehicle speed.

Checks	Actions
Preliminary	• Perform the preliminary checks. Refer to 4.3 Preliminary Checks in this Section. • Check the air filter element and intake air ducts for blockages.
Sensor / System	• Using Tech 2, check the heated oxygen sensor (HO2s) operating parameters. The HO2s should respond quickly to different throttle positions. • Inspect the accelerator pedal position (APP) sensor harness connector for correct connection. Poor connection of this connector will not set a DTC.

Fuel System	• Check the fuel system for the following fault conditions. Refer to 6C Fuel System – V6.
	  • restricted fuel filter,
	  • incorrect fuel pressure, and
	  • contaminated fuel.
	• Check the operation of the fuel injectors. Refer to 6C Fuel System – V6.
	• Perform the fuel injector balance test, refer to 6.3 Fuel Injector Balance Test in this Section.
	• Check for fault conditions that cause an engine to run rich or to run lean.

Checks	Actions
Ignition System	• Inspect for moisture or corrosion around the spark plug / ignition coil area. • Test the ignition coil voltage output. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Remove and inspect the spark plugs. Refer to 6C1-3 Engine Management – V6 – Service Operations. **NOTE** If the spark plugs are fouled, determine the cause of the fouling before replacing the spark plugs. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Check for loose ignition coil ground circuit.
Engine Cooling System	Check the engine thermostat for correct operation and heat range. Refer to 6B1 Engine Cooling – V6.
Additional Checks	• Check the generator output voltage. Refer to 6D1-1 Charging System – V6.
When all diagnosis and repairs are completed, check the system for correct operation.	

5.10 Lack of Power, Sluggishness or Sponginess

Description

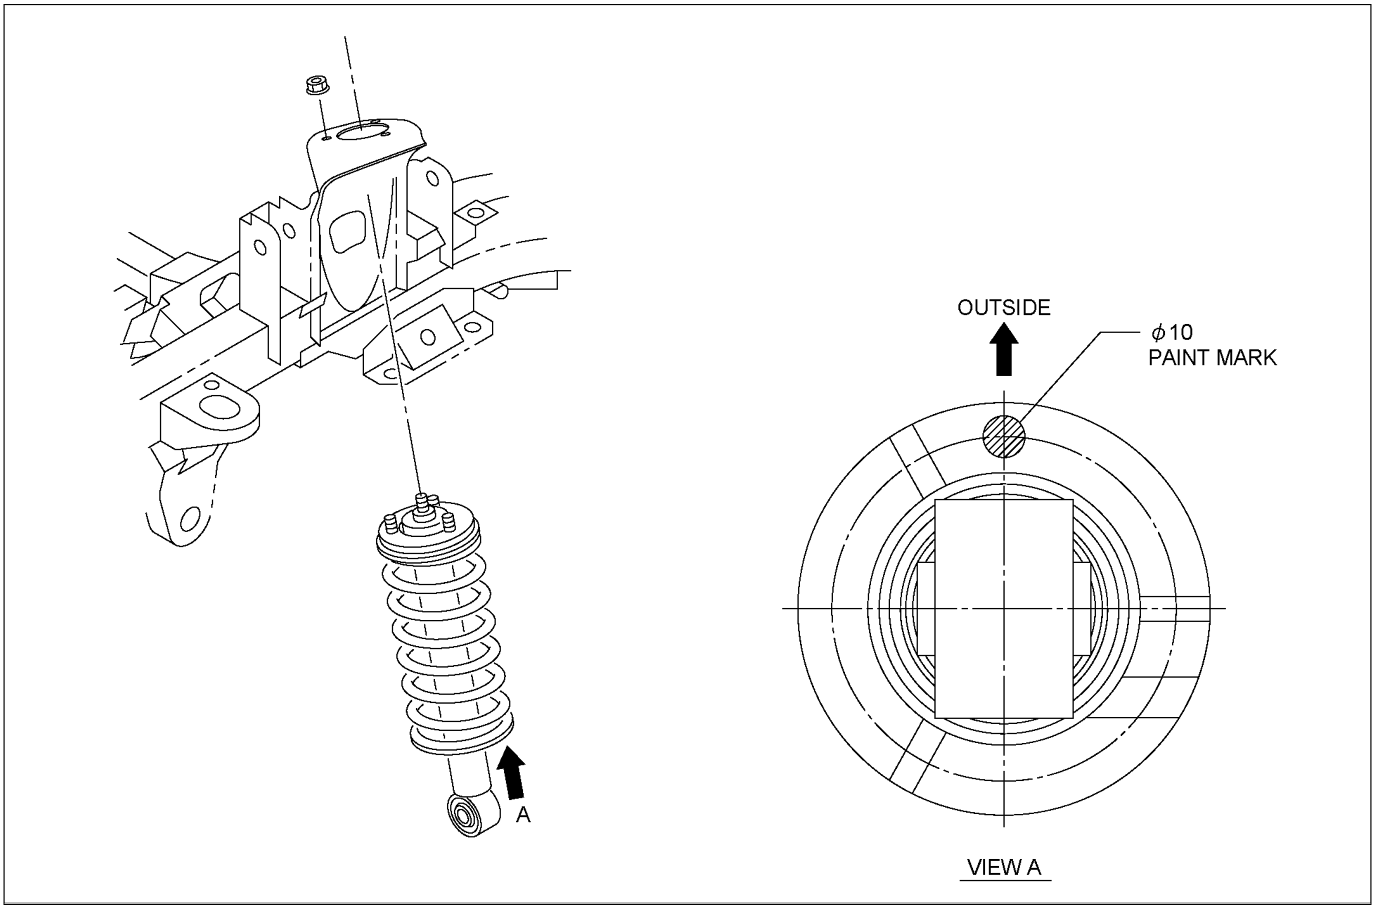
The engine delivers less than normal power. There is little or no increase in vehicle speed when the accelerator pedal is partially depressed.

Checks	Actions
Preliminary	• Perform the preliminary checks. Refer to 4.3 Preliminary Checks in this Section. • Check the air filter element and intake air ducts for blockages.
Sensor / System	• Use Tech 2 to monitor the knock sensor system for excessive spark retard activity. Check for items that cause spark retard activity. • Inspect the accelerator pedal position (APP) sensor harness connector for correct connection. Poor connection of this connector will not set a DTC.

Fuel System	• Check the fuel system for the following fault conditions. Refer to 6C Fuel System – V6.
	  • restricted fuel filter,
	  • incorrect fuel pressure, and
	  • contaminated fuel.
	• Check the operation of the fuel injectors. Refer to 6C1-3 Engine Management – V6 – Service Operations.
	• Perform the fuel injector balance test, refer to 6.3 Fuel Injector Balance Test in this Section.
	• Check for fault conditions that can cause the engine to run rich or run lean.

Installation

1. Install shock absorber.



RTW340MF000801

NOTE: Paint mark to be on outer side after assembly to vehicle.

2. Install shock absorber nut, then tighten it to the specified torque.

   Torque: 55 N·m (5.6 kgf·m/41lb·ft)

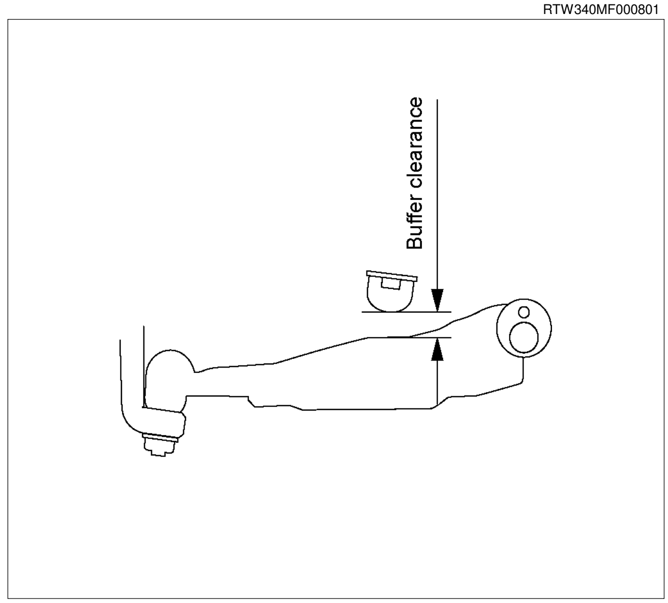
3. Install shock absorber bolt and nut, and then tighten to the specified torque.

   Buffer clearance: 25.9 mm (1.02 in)

   Torque: 137 N·m (14.0 kgf·m/101 lb·ft)

NOTE: Apply oil to the thread.

NOTE: Tighten the bolt and nut with the parts in the position shown in the illustration below.



RTW53ASH000201

Checks	Actions
Ignition System	• Inspect for moisture or corrosion around the spark plug / ignition coil area. • Test the ignition coil voltage output. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Remove and inspect the spark plugs. Refer to 6C1-3 Engine Management – V6 – Service Operations. **NOTE** If the spark plugs are fouled, determine the cause of the fouling before replacing the spark plugs, refer to 6C1-3 Engine Management – V6 – Service Operations. • Check for loose ignition coil ground circuit.
Engine Mechanical	• Check for the following engine mechanical fault condition. Refer to 6A1 Engine Mechanical – V6. • low engine compression, and • worn valve train components.
Additional Checks	• Check the exhaust system for possible restrictions. Refer to 6F Exhaust System – V6. • Test for other TCM related faults that may cause the transmission to operate in the default mode. • Check for transmission mechanical faults that may produce similar symptoms such as slipping clutch.
When all diagnosis and repairs are completed, check the system for correct operation.	

5.11 Poor Fuel Economy

Description

As confirmed by an actual road test, the fuel economy as compared to the previous fuel consumption of the same vehicle is noticeably lower.

Checks	Actions
Preliminary	• Perform the preliminary checks. Refer to 4.3 Preliminary Checks in this Section. • Check the air filter element and intake air ducts for blockages. • Check for correct tyre pressure. Refer to the Owners Manual. • Check the recent driving conditions are the same compared to the previous when the fuel consumption is normal. The following are list of driving conditions that may affect fuel consumption: – vehicle load, – acceleration rate, – A/C or other electrical equipment use, and – vehicle used for towing.

Checks	Actions
Sensor / System	• Check the air intake system and crankcase for air leaks. • Check the PCV System for correct operation. Refer to 6A1 Engine Mechanical – V6. • Check for the correct calibration of the speedometer. Refer to 8A Electrical-Body. • Use Tech 2 to monitor the knock sensor system for excessive spark retard activity. Check for items that cause spark retard activity. • Using Tech 2, check the heated oxygen sensor (HO2s) operating parameters. The HO2s should respond quickly to different throttle positions.
Fuel System	• Check the fuel system for the following fault conditions. Refer to 6C Fuel System – V6. – restricted fuel filter, – incorrect fuel pressure, and – contaminated fuel. • Check the operation of the fuel injectors. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Perform the fuel injector balance test, refer to 6.3 Fuel Injector Balance Test in this Section. • Check the items that cause an engine to run rich. • Check for foreign material accumulation in the throttle bore, carbon build-up on the throttle valve or on the throttle shaft. • Check the throttle body for tampering.
Ignition System	• Inspect for moisture or corrosion around the spark plug / ignition coil area. • Test the ignition coil voltage output. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Remove and inspect the spark plugs. Refer to 6C1-3 Engine Management – V6 – Service Operations. **NOTE** If the spark plugs are fouled, determine the cause of the fouling before replacing the spark plugs. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Check for loose ignition coil ground circuit.
Engine Cooling System	• Check the engine thermostat for proper operation and correct heat range. Refer to 6B1 Engine Cooling – V6.
Engine Mechanical	Check for the following engine fault conditions. Refer to 6A1 Engine Mechanical – V6. • low compression, and • worn valve train components.

Checks	Actions
Additional Checks	• Check the exhaust system for possible restrictions. Refer to 6F Exhaust System – V6. • Electromagnetic interference (EMI) on the crankshaft position (CKP) sensor can cause an engine misfire condition. Using Tech 2, monitor the engine speed parameter. A sudden increase in the engine speed parameters without moving the throttle position indicates that an Electromagnetic Interference fault may be present. Wiring harness routing which may be positioned very close to a high voltage or high current device such as the following may induce EMI: • secondary ignition components, and • motors and generators. • Check the torque converter clutch (TCC) operation. A TCC that applies too soon can cause engine detonation, which will trigger spark retard activity. Refer to 7C2 Automatic Transmission – 4L60E – Electrical Diagnosis. • Test for other TCM related faults that may cause the transmission to operate in the default mode. Refer to 7C2 Automatic Transmission – 4L60E – Electrical Diagnosis. • Check for transmission mechanical faults such as slipping clutch. Refer to 7C3 Automatic Transmission – 4L60E – Hydraulic and Mechanical Diagnosis. • Check the brake system including the parking brake for sticking or incorrect operation.
When all diagnosis and repairs are completed, check the system for correct operation.	

5.12 Rough, Unstable, Incorrect Idle or Stalling

Description

Engine idle speed fluctuates causing the engine to run unevenly. If the engine idle speed drops too low, the engine may stall.

Checks	Actions
Preliminary	• Perform the preliminary checks. Refer to 4.3 Preliminary Checks in this Section. • Check the air filter element and intake air ducts for blockages.
Sensor / System	• Check the throttle actuator control (TAC) system. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Check the air intake system and crankcase for air leaks. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Check the PCV System for correct operation. Refer to 6A1 Engine Mechanical – V6. • Use Tech 2 to monitor the knock sensor system for excessive spark retard activity. Check for items that cause spark retard activity. • Using Tech 2, check the heated oxygen sensor (HO2s) operating parameters. The HO2s sensor should respond quickly to different throttle positions.

Checks	Actions
Fuel System	• Check the fuel system for the following fault conditions. Refer to 6C Fuel System – V6. – restricted fuel filter, – incorrect fuel pressure, and – contaminated fuel. • Check the operation of the fuel injectors. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Perform the fuel injector balance test, refer to 6.3 Fuel Injector Balance Test in this Section. • Check the items that cause an engine to run rich.
Ignition System	• Inspect for moisture or corrosion around the spark plug and ignition coil area. • Test the ignition coil voltage output. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Remove and inspect the spark plugs. Refer to 6C1-3 Engine Management –V6 – Service Operations. **NOTE** If the spark plugs are fouled, determine the cause of the fouling before replacing the spark plugs. Refer to 6C1-3 Engine Management – V6 – Service Operations. • Check for loose ignition coil grounds.
Engine Mechanical	• Parasitic load on the engine such as the following: • automatic transmission fault condition, or • a belt driven accessory fault condition. • Check for the following engine fault conditions. Refer to 6A1 Engine Mechanical – V6. • low compression, or • worn valve train components.
When all diagnosis and repairs are completed, check the system for correct operation.	

5.13 Surges / Chuggles

Description

With the accelerator pedal in a steady position, the vehicle speeds up and slows down or the engine power fluctuates.

Checks	Actions
Preliminary	Perform the preliminary checks. Refer to 4.3 Preliminary Checks in this Section.
Sensor / System	• Using Tech 2, check the heated oxygen sensor (HO2s) operating parameters. The HO2s should respond quickly to different throttle positions. • Test the resistance of the crankshaft position (CKP) sensor. The CKP sensor resistance must be 700 – 1,200 Ω at all temperatures.

<table>
<tr><th>Checks</th><th>Actions</th></tr>
<tr><td>Fuel System</td><td>• Check the fuel system for the following fault conditions. Refer to 6C Fuel System – V6.
• restricted fuel filter,
• incorrect fuel pressure, and
• contaminated fuel.
• Check the operation of the fuel injectors. Refer to 6C1-3 Engine Management – V6 – Service Operations.
• Perform the fuel injector balance test, refer to 6.3 Fuel Injector Balance Test in this Section.
• Check the items that cause an engine to run rich.
• Check for fault conditions that can cause an engine to run lean.</td></tr>
<tr><td>Ignition System</td><td>• Inspect for moisture or corrosion around the spark plug / ignition coil area.

6 Functional Checks

6.1 General Information

The items detailed in the following pages are to be used when there is a customer complaint and there are no diagnostic trouble codes set, or one or more of the Tech 2 data values are not within the typical values. They are also to be used when instructed from a DTC table. Before using these tables, you should refer to 5 Symptoms Diagnostics in this Section, which may direct you to using the following functional checks.

The purpose of these tables is to diagnose engine control module (ECM) controlled components or sub-systems that do not have diagnostic trouble codes assigned to them. Another purpose of these tables is for Technicians who feel confident that a particular part of the sub-system is not operating properly and wants only to check that particular item for proper operation without going through lengthy diagnostic procedures.

6.2 Fuel Injector Coil Test

The fuel injector coil test is divided into two parts. Begin by performing the fuel injector coil quick test. Then only perform the Injector Coil Test – With Special Tool J39021 procedure if the quick test determines that there is a faulty fuel injector.

Fuel Injector Coil Quick Test

Test Description

The following numbers refer to the step numbers in the diagnostic table:

1 This step checks if the engine coolant temperature is within the correct range.

2 This step tests each fuel injector resistance within a specific temperature range.

3 This step determines if all of the fuel injectors are within 3 ohms of each other.

Step	Action	Value(s)	Yes	No
1	Using Tech 2, observe the engine coolant temperature (ECT). Is the ECT within the specified range?	10 – 32°C	Go to Step 2	Go to Step 3
2	1 Disconnect the fuel injector harness connector, refer to 2.13 Fuel Rail Assembly, in 6C1-3 Engine Management – V6 – Service Operations. 2 Using a digital ohmmeter and connector test adaptor kit J 35616-A, measure the resistance of each fuel injector between the ignition voltage circuit and the fuel injector control circuit. Refer to 8A Electrical - Body and Chassis for information on testing for continuity and to Figure 6C1-2 – 9 and Figure 6C1-2 – 10 for the fuel injector harness connector. Do any of the fuel injectors display a resistance outside the specified range?	11 – 14 Ω	Refer to Injector Coil Test – With Special Tool J39021 in this Section	Injectors OK

Step	Action	Value(s)	Yes	No
3	1 Disconnect the fuel injector harness connector, refer to 2.13 Fuel Rail Assembly, in 6C1-3 Engine Management – V6 – Service Operations. 2 Using a digital ohmmeter and connector test adaptor kit J 35616-A, measure the resistance of each fuel injector between the ignition voltage circuit and the fuel injector control circuit. Refer to 8A Electrical - Body and Chassis for information on testing for continuity and to Figure 6C1-2 – 9 and Figure 6C1-2 – 10 for the fuel injector harness connector. 3 Record each fuel injector value. 4 Subtract the lowest resistance value from the highest. Is the difference equal to, or less than, the specified value?	3 Ω	Injectors OK	Refer to Injector Coil Test – With Special Tool J39021 in this Section.

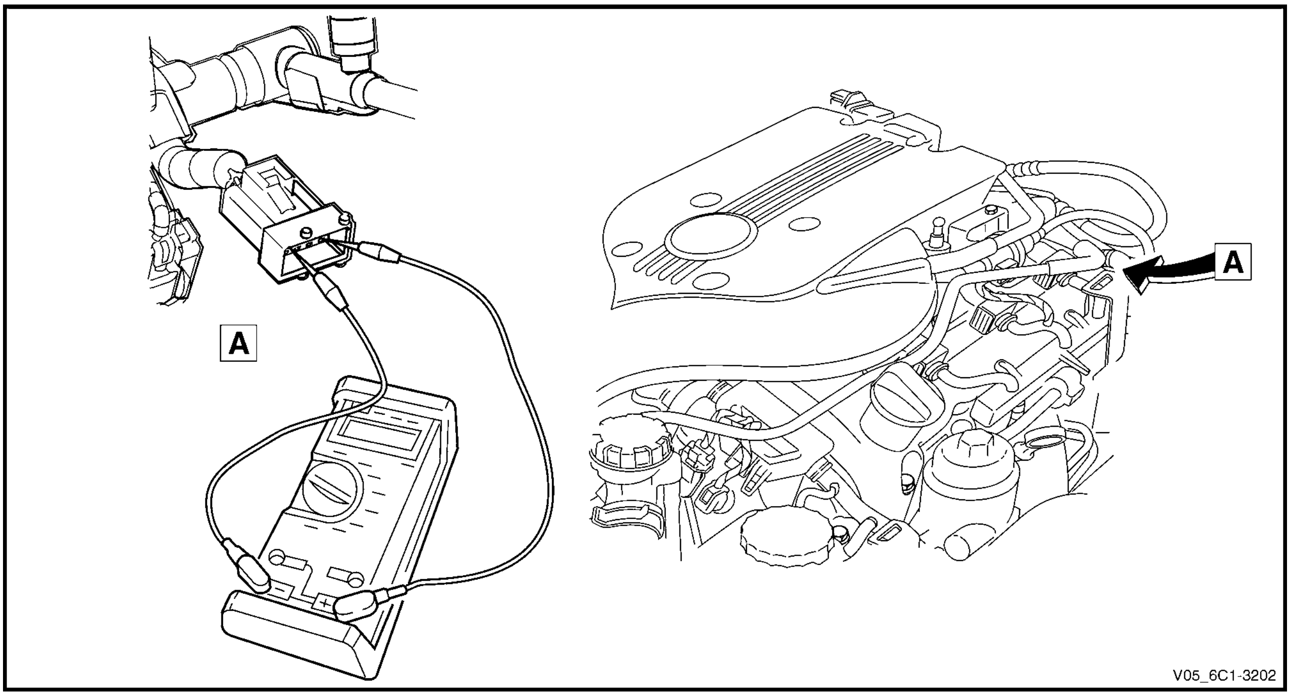

Figure 6C1-2 – 9

Fuel Injector Harness to Engine Harness Connector

Pin Description

Pin	Function	Circuit Number
1	Ignition Voltage Circuit – Cyl. 1, 3, 5	639
2	Ignition Voltage Circuit – Cyl. 2, 4, 6	1039
3	Injector 1 Control Circuit	1744
4	Injector 3 Control Circuit	1746
5	Injector 5 Control Circuit	845
6	Injector 2 Control Circuit	1745
7	Injector 4 Control Circuit	844
8	Injector 6 Control Circuit	846

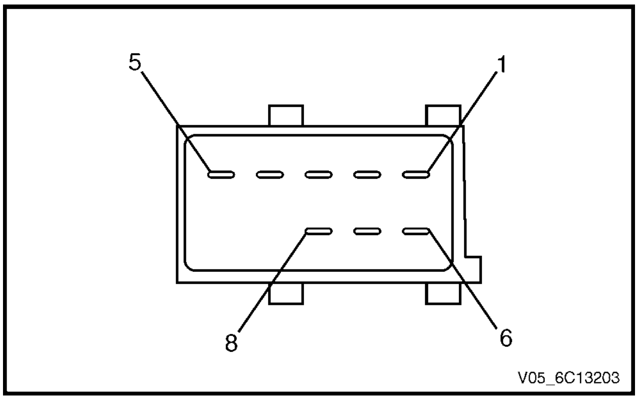

Figure 6C1-2 – 10

Injector Coil Test – With Special Tool J39021

1 Depressurise the fuel system, refer to 6C Fuel System – V6.

2 Turn the ignition OFF.

NOTE

After removing the upper intake manifold, plug the lower manifold opening to prevent dirt and other contaminants from entering.

3 Remove the upper intake manifold assembly, refer to 6A1 Engine Mechanical – V6.

4 Using Tech 2, observe the engine coolant temperature (ECT). If the ECT is 10 – 32°C, refer to Engine Coolant Temperature Between 10 – 32°C, or if the ECT is outside this range, refer to Engine Coolant Temperature Outside 10 – 32°C.

Engine Coolant Temperature Between 10 – 32°C

Step	Action	Value(s)	Yes	No
1	1 Set the amperage supply selector switch on the fuel injector tester (1), special tool J 39021 to the Coil Test 0.5 A position. Refer to Figure 6C1-2 – 11. 2 Connect the fuel injector tester leads (4 and 5) to B+ and ground. 3 Connect the digital multimeter (2) positive and negative lead to the fuel injector tester. Set the multimeter to read DC Voltage. 4 Connect the fuel injector tester, using fuel injector harness adapter, special tool J44602 to a fuel injector. 5 Press the Push to Start Test button on the fuel injector tester. 6 Observe and record the voltage reading on the digital multimeter. **NOTE** The voltage reading may rise during the test. Record the voltage reading after one second of the test. 7 Repeat steps 4 through 6 for each fuel injector. **NOTE** The table in Figure 6C1-2 – 12 shows an example of the results from a fuel injector coil test. Did any fuel injector have an erratic voltage reading (large fluctuations in voltage that did not stabilise), or voltage readings outside of the specified value?	5.5 – 6.6 V	Replace the faulty fuel injector/s. Refer to 2.13 Fuel Rail Assembly, in 6C1-3 Engine Management – V6 – Service Operations.	System OK
When all repairs are completed, check the system for fuel leaks and correct operation.				

Engine Coolant Temperature Outside 10 – 32°C

Step	Action	Value(s)	Yes	No
1	1 Set the amperage supply selector switch on the fuel injector tester (1), special tool J 39021 to the Coil Test 0.5 A position. Refer to Figure 6C1-2 – 11. 2 Connect the fuel injector tester leads (4 and 5) to B+ and ground. 3 Connect the digital multimeter (2) positive and negative lead to the fuel injector tester. Set the multimeter to read DC Voltage. 4 Connect the fuel injector tester, using injector harness adapter, special tool J44602 to a fuel injector. 5 Press the Push to Start Test button on the fuel injector tester. 6 Observe and record the voltage reading on the digital multimeter. **NOTE** The voltage reading may rise during the test. Record the voltage reading after one second of the test. 7 Repeat steps 4 through 6 for each fuel injector. 8 Identify the highest voltage reading recorded from the six fuel injectors tested that is 9.5 V or less. **NOTE** Disregard those voltage readings that are greater than 9.5 V. Voltage readings greater than 9.5 V indicate a faulty fuel injector. 9 Subtract the remaining voltage readings recorded in Step 8, from the highest voltage reading. Are any of the values recorded in Step 9 greater than the specified value?	0.6 V	Go to Step 2	System OK
2	1 Replace any fuel injector that has any of the following: – a subtracted value exceeding 0.6 V, – an initial reading greater than 9.5 V, and – an erratic reading. **NOTE** The table in Figure 6C1-2 – 13 shows an example of the results from a fuel injector coil test. Has the repair been completed?	–	System OK.	–
When all repairs are completed, check the system for fuel leaks and correct operation.

Fuel Injector Coil Test Example – Engine Coolant Temperature 10 – 32°C (Typical Values Shown)		
Fuel Injector No.	Voltage Reading	Pass / Fail (acceptable range 5.5 - 6.6 V)
1	6.6	Pass
2	5.4	Fail
3	6.2	Pass
4	6.1	Pass
5	6.7	Fail
6	6.0	Pass

Figure 6C1-2 – 12

Fuel Injector Coil Test Example – Engine Coolant Temperature Greater / Less Than 10 – 32°C (Typical Values Shown)				
Fuel Injector No.	Voltage Reading	Highest Voltage Reading (9.5 V or less)	Subtracted Value (acceptable voltage 0.6 V)	Pass / Fail
1	9.8	–	–	Fail
2	6.4	7.0	0.6	Pass
3	6.9	7.0	0.1	Pass
4	5.8	7.0	1.2	Fail
5	7.0	7.0	0.0	Pass
6	6.3	7.0	0.7	Fail

Figure 6C1-2 – 13

4. Install link nut, then tighten it to the specified torque.

Torque: 50 N·m (5.1 kgf·m/37 lb·ft)

5. Tighten the cam bolt and lower control arm nut, setting it to the interim torque, then turn the cam bolt to the setting mark applied during disassembly.
6. Install ball joint nut, then tighten it to the specified torque with just enough additional torque to align cotter pin holes. Install new cotter pin.

Torque: 147 N·m (15.0 kgf·m/108 lb·ft)

NOTE: Check the trim height. Refer to Front Alignment Inspection and Adjustment.

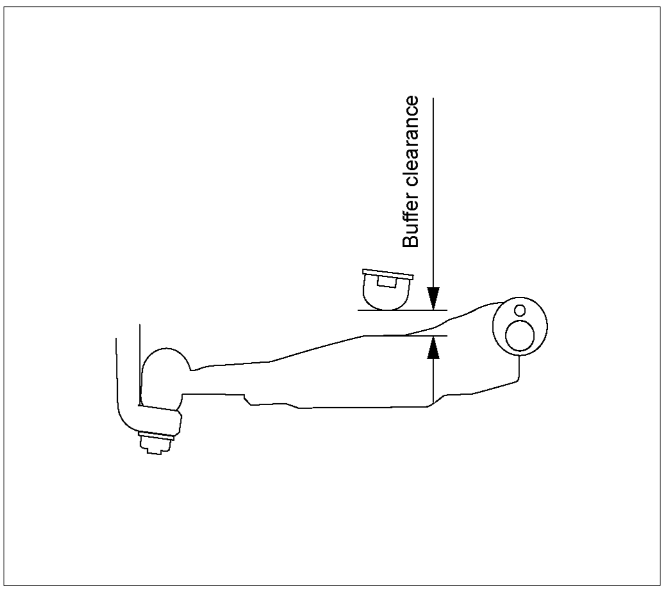
7. Lower control arm nut tightens it to the specified torque.

Buffer clearance: 25.9 mm (1.02 in)

Torque: 186 N·m (19.0 kgf·m/137 lb·ft)

NOTE: Apply oil to the thread.

NOTE: Tighten the bolt and nut with the parts in the position shown in the illustration below.



RTW53ASH000201

8. Install wheel and tire assembly. Refer to wheel in this section.

6.3 Fuel Injector Balance Test

CAUTION

To avoid irregular fuel pressure readings, do not perform this procedure if the engine coolant temperature is greater than 94° C.

Fuel Injector Balance Test – With Tech 2

1 Check the engine coolant temperature is less than 94°C.

2 Perform the fuel injector coil test and replace any fuel injectors that are not functioning correctly before proceeding. Refer to 6.2 Fuel Injector Coil Test.

3 Perform the fuel system pressure check and ensure the fuel system is functioning correctly before proceeding with the fuel injector balance test. Refer to 6C Fuel System – V6.

4 While the fuel pressure gauge is still connected to the fuel pressure test point, pressurise the fuel system. Refer to 6C Fuel System – V6.

5 When the fuel pressure reading stabilises, record the fuel pressure reading indicated by the fuel pressure gauge.

NOTE

The fuel pressure reading taken in Step 5 is known as the first pressure reading.

6 Connect Tech 2 to the data link connector (DLC) and turn the ignition on.

7 On Tech 2 select **Engine** / **V6 Engine** / **Actuator Test** / **Fuel Injector Balance**.

8 Follow the Tech 2 prompts, recording the fuel pressure gauge reading for each injector.

NOTE

The fuel pressure readings taken in Step 8 are known as the second pressure reading

9 Perform the Fuel Injector Pressure Drop Calculation in this Section.

Fuel Injector Balance Test – Without Tech 2

1 Check the engine coolant temperature is less than 94°C.

2 Perform the fuel injector coil test and replace any fuel injectors that are not functioning correctly before proceeding. Refer to 6.2 Fuel Injector Coil Test.

3 Perform the fuel system pressure check and ensure the fuel system is functioning correctly before proceeding with the fuel injector balance test. Refer to 6C Fuel System – V6.

4 While the fuel pressure gauge is still connected to the fuel pressure test point, pressurise the fuel system. Refer to 6C Fuel System – V6.

5 When the fuel pressure reading stabilises, record the fuel pressure reading indicated by the fuel pressure gauge.

NOTE

The fuel pressure reading taken in Step 5 is known as the first pressure reading.

6 Remove the upper intake manifold assembly, refer to 6A1 Engine Mechanical – V6.

NOTE

After removing the upper intake manifold, plug the lower manifold opening to prevent dirt and other contaminants from entering.

7 Connect Tool No. J 39021 Fuel Injector Tester (1), and Tool No. J 44602 (3) to the fuel injector connector. Refer to Figure 6C1-2 – 14.

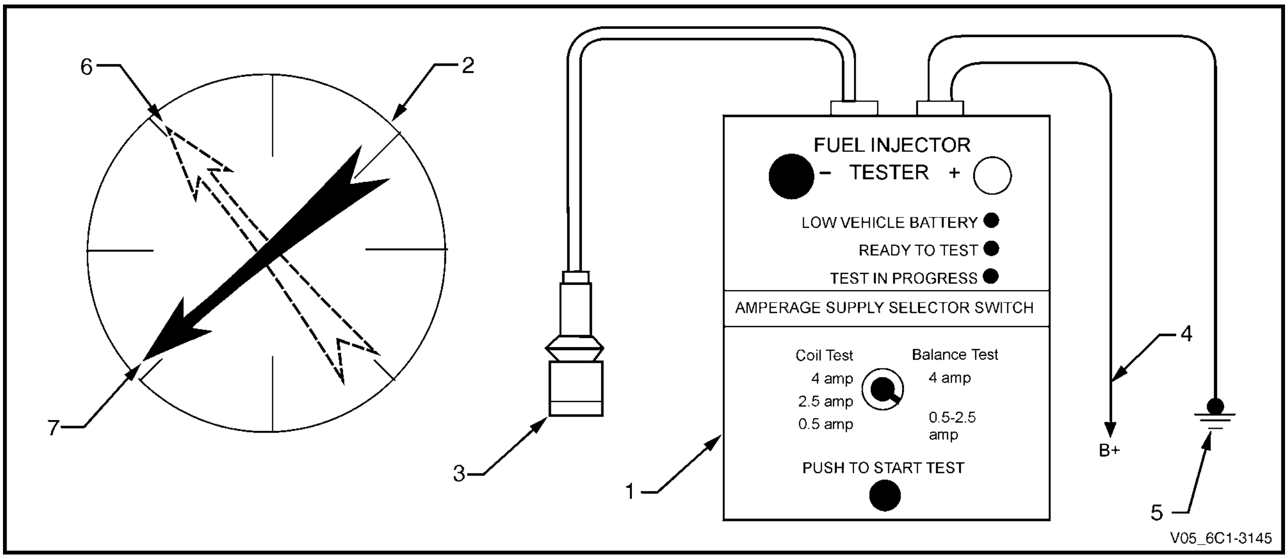


Figure 6C1-2 – 14

Legend

1 Fuel Injector Tester – Special Tool J39021
2 Fuel Pressure Gauge – Special Tool SD28018
3 Fuel Injector Harness Adapter – Special Tool J44602
4 To Battery Positive Terminal
5 Battery Earth
6 First Pressure Reading
7 Second Pressure Reading

8 Connect the fuel injector tester battery positive lead (4) and battery negative lead (5) to the battery, refer to Figure 6C1-2 – 14.

9 Set the amperage supply selector of the fuel injector tester to the Balance Test 0.5 – 2.5 A position.

CAUTION

As the fuel pressure tends to increase after the fuel injector stops fuel delivery, record the fuel pressure value immediately after the fuel injector stops fuel delivery. Do not record the higher fuel pressure value.

10 Press the Push to Start Test Button on the fuel injector tester to activate the fuel injector.

11 Record the fuel pressure reading indicated by the fuel pressure gauge.

NOTE

The fuel pressure readings taken in Step 10 is known as the second pressure reading

12 Repeat the balance test pressure reading for each fuel injector.

13 Perform the Fuel Injector Pressure Drop Calculation in this Section.

Fuel Injector Pressure Drop Calculation

Fuel Injector Balance Test Example – Typical Values Shown						
Cylinder	1	2	3	4	5	6
1st Pressure Reading	360 kPa	360 kPa	360 kPa	360 kPa	360 kPa	360 kPa
2nd Pressure Reading	155 kPa	131 kPa	155 kPa	200 kPa	146 kPa	150 kPa
Amount of Pressure Drop	205 kPa	229 kPa	205 kPa	160 kPa	214 kPa	210 kPa
Average Range 194 - 214 kPa	Injector OK	Replace fuel injector – too much pressure drop	Injector OK	Replace fuel injector – too little pressure drop	Injector OK	Injector OK

Figure 6C1-2 – 15

1 Subtract the second pressure reading from the first pressure reading to calculate the pressure drop value. Refer to the table in Figure 6C1-2 – 15, typical results.

2 Calculate the pressure drop value for each fuel injector.

3 Add all the individual pressure drop values of each fuel injector to calculate the total pressure drop.

4 Divide the total pressure drop by the number of fuel injectors to calculate the average pressure drop.

Fuel Injector Pressure Drop Analysis

1 A fuel injector is faulty if its pressure drop value deviates from the average pressure drop by more than 10 kPa.

CAUTION

Do not repeat any portion of the test before running the engine to prevent the engine from flooding.

2 Re-test any fuel injector that does not meet the specification.

3 Replace all faulty fuel injectors, refer to 2.13 Fuel Rail Assembly, in 6C1-3 Engine Management – V6 – Service Operations.

6.4 Fuel Injector Leak Down Test

1 Turn the ignition switch OFF.

NOTE

After removing the upper intake manifold, plug the lower manifold opening to prevent dirt and other contaminants from entering.

2 Remove the upper intake manifold assembly, refer to 6A1 Engine Mechanical – V6.

CAUTION

Clean around the area where the fuel injectors enter the lower intake manifold.

3 Remove the bolt (1), three places, attaching the fuel rail to the lower intake manifold.

CAUTION

Care must be taken when removing the fuel rail and injector assembly to prevent damage to the injector spray tips and injector harness connector terminals.

Support the fuel rail and injector assembly after removal.

4 Lift up and support the fuel rail and injector assembly.

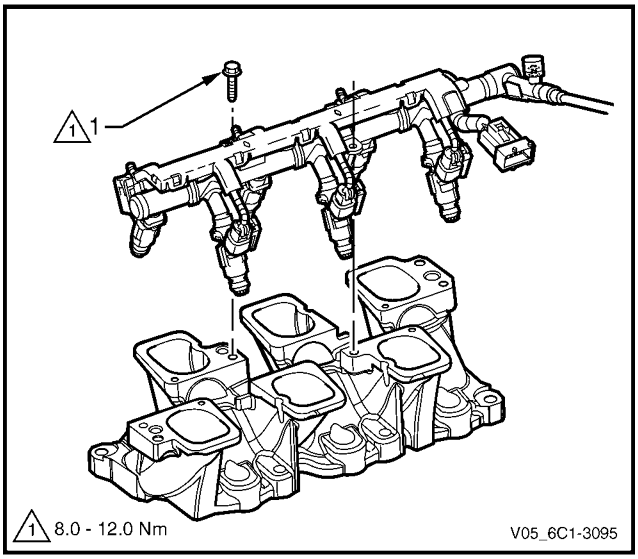

Figure 6C1-2 – 16

NOTE

Do not disconnect the fuel feed hose from the fuel rail.

5 Place a board (1) with a sheet of clean paper (2), preferably white, onto the lower intake manifold.

6 Using Tech 2, enable the fuel pump to pressurise the fuel system.

7 Whilst the fuel system is pressurised, check the following:

- Signs of fuel stains on the paper (3).
- Signs of weeping at the fuel injector spray tips (4).

8 If any of the above conditions are present, replace the leaking fuel injector/s, refer to 2.13 Fuel Rail Assembly, in 6C1-3 Engine Management – V6 – Service Operations.

9 Carefully reinstall the fuel rail and injector assembly.

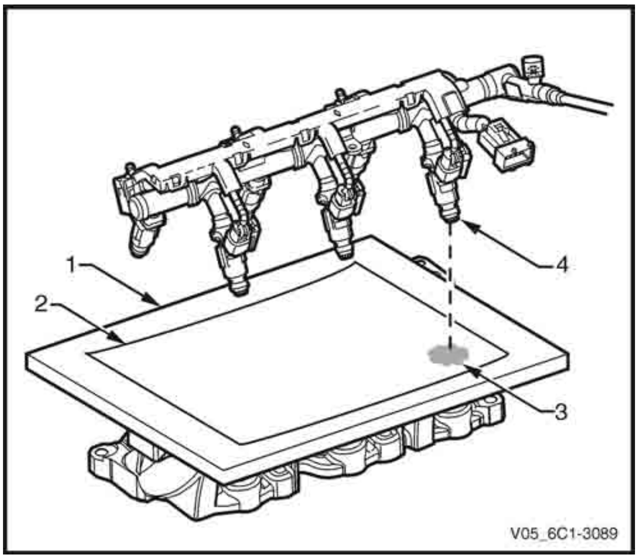

Figure 6C1-2 – 17

CAUTION

Ensure the fuel injectors are correctly seated in the lower intake manifold, and the fuel rail attaching brackets are correctly located prior to tightening the attaching bolts.

10 Tighten the fuel rail bolts to the correct torque specification.

Fuel rail attaching bolt torque specification ....8.0 – 12.0 Nm

11 Reinstall the upper intake manifold assembly, refer to 6A1 Engine Mechanical – V6.

12 Inspect the fuel rail and quick connect fitting for leaks, refer to 6C Fuel System – V6.

13 Road test the vehicle and check for correct operation.

6.5 Alcohol / Contaminants in Fuel Diagnosis

Description

Water contamination in the fuel system may cause driveability conditions such as hesitation, stalling, no start, or misfires in one or more cylinders. Water may collect near a single fuel injector at the lowest point in the fuel rail, and cause a misfire in that cylinder. If the fuel system is contaminated with water, inspect the fuel system components for rust, or deterioration.

Alcohol (e.g. Ethanol) concentrations more than 10% in the fuel can be detrimental to fuel system components. Alcohol contamination may cause fuel system corrosion, deterioration of rubber components, and subsequent fuel filter restriction. Fuel contaminated with alcohol may cause driveability conditions such as hesitation, lack of power, stalling, or no start. Some types of alcohol are more detrimental to fuel system components than others.

Alcohol in Fuel Testing Procedure

NOTE

The procedures detailed are not intended to be accurate but rather, indicative of a contamination situation.

The fuel sample should be drawn from the bottom of the tank so that any water present in the tank will be detected. The sample should be bright and clear. If alcohol contamination is suspected, then use the following procedure to test the fuel quality.

- Using a 100 ml graduated cylinder with 1 ml marks, fill the cylinder with fuel to the 90 ml mark.
- Add 10 ml of water to bring the total fluid volume to 100 ml and install a stopper.
- Shake the cylinder vigorously for 10 – 15 seconds.
- Carefully loosen the stopper to release the pressure.
- Re-install the stopper and shake the cylinder vigorously again for 10 – 15 seconds.
- Put the cylinder on a level surface for approximately 5 minutes to allow adequate liquid separation.

If alcohol is present in the fuel, the volume of the lower layer, that now contains both alcohol and water, will be more than 10 ml. For example, if the volume of the lower layer is increased to 15 ml, this indicates at least 5 percent alcohol in the fuel. The actual amount of alcohol may be somewhat more because this procedure does not extract all of the alcohol from the fuel. To obtain an accurate determination of the amount of alcohol contamination in a given fuel sample, then professional analysis should be sought.

Particulate Contaminants in Fuel Testing Procedure

The fuel sample should be drawn from the bottom of the tank so that any contaminants present in the tank will be detected. The sample should be bright and clear. If the sample appears cloudy or contaminated with water as indicated by a water layer at the bottom of the sample, use the following procedure to diagnose the fuel.

- Using an approved fuel container, draw approximately 0.5 litre of fuel.
- Place the cylinder on a level surface for approximately 5 minutes to allow settling of the particulate contamination.

Particulate contamination will show up in various shapes and colours. Sand will typically be identified by a white or light brown crystals. Rubber will appear as black and irregular particles. If particles are found, clean the entire fuel system thoroughly. Refer to 6C Fuel System – V6.

6.6 Crankshaft Position (CKP) System Variation Learn Procedure

Description

The crankshaft position system variation learn feature is carried out automatically on the HFV6 engine under decel with fuel cut. The road speed and duration of the self-learn process varies with different vehicle equipment levels such as transmission, final drive ratio etc.

The variation learn procedure cannot be over-written, nor can it be accessed with Tech 2.

6.7 Throttle Body Relearn

A throttle body relearn procedure is performed in one of two ways:

- Engine Control Module initiated throttle body relearn, or
- Tech 2 initiated throttle body relearn.

Engine Control Module Throttle Body Relearn

The engine control module (ECM) will automatically perform a throttle body relearn procedure if either of the following conditions exist:

- The battery has been disconnected, or
- The ignition switch is in the ON position for greater than 29 seconds, and the following conditions are met:
  - Engine speed is less than 40 rpm,
  - Vehicle speed is 0 km/h,
  - Engine coolant temperature is 5 – 60°C,
  - Intake air temperature is 5 – 60°C,
  - Accelerator pedal position sensor angle is less than 14.9%, and
  - Ignition voltage is greater than 10 V.

Tech 2 Throttle Body Relearn

To perform a throttle body relearn using Tech 2, complete the following procedure:

NOTE

Tech 2 will not initiate a throttle body relearn if the engine is running.

1. Connect Tech 2 to the data link connector (DLC) and turn the ignition on.
2. On Tech 2 select Engine / Programming / Throttle Body Relearn.
3. When Tech 2 displays ‘Do you really want to Reset?’, press the ‘Yes’ soft key.
4. When Tech 2 displays ‘Programming Completed’, and the electronic throttle control value displayed by Tech 2 is ‘11’, press the ‘Confirm’ soft key to return to the Tech 2 Programming screen.
5. The throttle body relearn is now complete.

6.8 Electronic Ignition (EI) System Diagnosis

Circuit Description

The engine control module (ECM) controls the ignition coils by pulsing the ignition control (IC) circuits, which triggers an ignition coil and fires the spark plug. The ECM controls the sequencing and the timing of each ignition coil. The ignition system consist of the following components:

- The six ignition coils
- The crankshaft position (CKP) sensor
- The four camshaft position (CMP) sensors
- The ECM

The ignition coils use the following circuits:

- An IC circuit
- An ignition 1 voltage circuit
- Two ground circuits

Additional Information

- Use the J 35616-B Connector Test Adapter Kit for any test that requires probing the ECM harness connector or a component harness connector.
- Inspect the ignition coils for aftermarket devices. An aftermarket device connected to the ignition coil circuits, may cause a condition with the ignition coils.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

4 The ignition coils for each bank are fused separately. If a fuse opens or the ignition 1 voltage circuit opens between the fuse and the splice, all the ignition coils for one bank of the engine would be inoperative. If the ground circuit opens at the engine block, the ignition coils would be inoperative for one bank of the engine.

5 This step tests for an open or a high resistance in the ignition 1 voltage circuit of the ignition coil. If the DMM does not display near battery voltage there is an open or a high resistance in the circuit.

6 This step determines if the ground circuit is open. If the circuit is open, the ignition coils would be inoperative for one bank of the engine.

7 This step determines if the ignition 1 voltage circuit is shorted to ground. If the fuse is open, the ignition coils would be inoperative for one bank of the engine.

Diagnostic Table

Step	Action	Value(s)	Yes	No
1	Has the Diagnostic System Check been performed?	—	Go to Step 2	Refer to 4.4 Diagnostic System Check
2	Were you sent here from DTC P0300 or P0301-P0306?	—	Go to Step 3	Go to DTC P0300 or DTC P0301 – P0306
3	1 Start the engine. 2 Allow the engine to reach operating temperature. 3 Operate the engine at 2,000 rpm. 4 Monitor all of the Misfire Current Counters with a scan tool. There are a total of 6 counters, 1 counter per cylinder. Are any of the Misfire Current Counters incrementing?	—	Go to Step 4	Go to 5.2 Intermittent Fault Conditions
4	Are all the misfire counters incrementing for one bank of the engine?	—	Go to Step 7	Go to Step 5
5	1 Ignition OFF. 2 Disconnect the appropriate ignition coil. 3 Ignition ON, engine OFF. 4 Connect a test lamp between the battery voltage circuit of the ignition coil and a good ground. 5 Measure the voltage between the probe of the test lamp and a good ground with a DMM. Refer to 8A Electrical - Body and Chassis for the procedure to measure voltage drop. Is the voltage at the specified value?	B+	Go to Step 6	Go to Step 9

6	1 Connect the test lamp between the battery voltage circuit of the ignition coil and to each ground circuit of the ignition coil. Does the test lamp illuminate at each ground circuit?	—	Go to Step 8	Go to Step 10
7	1 Test the battery voltage circuit for an open or high resistance at the splice of the affected bank of ignition coils. Refer to 8A Electrical - Body and Chassis for circuit testing procedures. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10
8	1 Test for an intermittent and for a poor connection at the ignition coil. Refer to 8A Electrical - Body and Chassis for circuit testing procedures. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
9	**NOTE** The battery voltage circuit is shared with other components. Disconnecting a component on the shared battery voltage circuit may isolate a shorted component. Review the electrical schematic and diagnose the shared circuits and components. 1 Repair a short to ground, an open or high resistance in the ignition 1 voltage circuit. Refer to Refer to 8A Electrical - Body and Chassis for wiring repair procedures. 2 Replace the fuse as necessary. Did you complete the repair?	—	Go to Step 12	—
10	1 Repair the open or high resistance in the ground circuit. Refer to 8A Electrical - Body and Chassis for wiring repair procedures. Did you complete the repair?	—	Go to Step 12	—
11	1 Replace the ignition coil. Refer to 2.15 Ignition Coils, in 6C1-3 Engine Management – V6 – Service Operations. Did you complete the replacement?	—	Go to Step 12	—
12	1 Connect all disconnected components. 2 Use Tech 2 to clear the DTC/s. 3 Start the engine. 4 Observe the Capture Info with Tech 2. Do any of the misfire counters increment?	—	Go to Step 2	Go to Step 13
13	1 Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	—	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, clear all DTCs and verify correct operation				

7 Diagnostic Trouble Code Tables

7.1 DTC List

As a number of diagnostic tables cater for multiple DTC numbers, a specific DTC table may be difficult to locate. To make a specific DTC diagnostic table easier to find, the next list is arranged in numerical ascending order. The actual diagnostic table can be located by selecting the link provided.

DTC	Description	Diagnostic Table
P0008	Engine Position System Performance (Bank 1)	7.2 DTC P0008, P0009 or P0016
P0009	Engine Position System Performance (Bank 2)	7.2 DTC P0008, P0009 or P0016
P0016	Crankshaft / Intake Camshaft Position not Plausible (Bank 1)	7.2 DTC P0008, P0009 or P0016
P0030	O2 Sensor Heater Circuit Malfunction (Bank 1, Sensor 1)	7.3 DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 or P0058
P0031	O2 Sensor Heater Circuit Low Voltage (Bank 1, Sensor 1)	7.3 DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 or P0058
P0032	O2 Sensor Heater Circuit High Voltage (Bank 1, Sensor 1)	7.3 DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 or P0058
P0036	O2 Sensor Heater Circuit Malfunction (Bank 1, Sensor 2)	7.3 DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 or P0058
P0037	O2 Sensor Heater Circuit Low Voltage (Bank 1, Sensor 2)	7.3 DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 or P0058
P0038	O2 Sensor Heater Circuit High Voltage (Bank 1, Sensor 2)	7.3 DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 or P0058
P0040	O2 Sensor Signals Not Plausible (Bank 1, Sensor 1 & Bank 2, Sensor 1)	7.4 DTC P0040 or P0041
P0041	O2 Sensor Signals Not Plausible (Bank 1, Sensor 2 & Bank 2, Sensor 2)	7.4 DTC P0040 or P0041
P0050	O2 Sensor Heater Circuit Malfunction (Bank 2, Sensor 1)	7.3 DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 or P0058
P0051	O2 Sensor Heater Circuit Low Voltage (Bank 2, Sensor 1)	7.3 DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 or P0058
P0052	O2 Sensor Heater Circuit High Voltage (Bank 2, Sensor 1)	7.3 DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 or P0058
P0053	O2 Sensor Heater Resistance Range / Performance (Bank 1, Sensor 1)	7.5 DTC P0053 or P0059
P0056	O2 Sensor Heater Circuit Malfunction (Bank 2, Sensor 2)	7.3 DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 or P0058
P0057	O2 Sensor Heater Circuit Low Voltage (Bank 2, Sensor 2)	7.3 DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 or P0058

DTC	Description	Diagnostic Table
P0058	O2 Sensor Heater Circuit High Voltage (Bank 2, Sensor 2)	7.3 DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 or P0058
P0059	O2 Sensor Heater Resistance Range / Performance (Bank 2, Sensor 1)	7.5 DTC P0053 or P0059
P0101	Mass Air Flow Sensor Circuit Range / Performance	7.6 DTC P0101, P0102 or P0103
P0102	Mass Air Flow Sensor Voltage Low	7.6 DTC P0101, P0102 or P0103
P0103	Mass Air Flow Sensor Voltage High	7.6 DTC P0101, P0102 or P0103
P0112	Intake Air Temperature Sensor Circuit Low Voltage	7.7 DTC P0112 or P0113
P0113	Intake Air Temperature Sensor Circuit High Voltage	7.7 DTC P0112 or P0113
P0116	Engine Coolant Temperature Sensor Circuit Range / Performance	7.8 DTC P0116, P0117, P0118, P0125 or P1258
P0117	Engine Coolant Temperature Sensor Circuit Low Voltage	7.8 DTC P0116, P0117, P0118, P0125 or P1258
P0118	Engine Coolant Temperature Sensor Circuit High Voltage	7.8 DTC P0116, P0117, P0118, P0125 or P1258
P0121	Throttle Position Sensor 1 Circuit Range / Performance	7.9 DTC P0121, P0122, P0123, P0221, P0222,or P0223
P0122	Throttle Position Sensor 1 Circuit Low Voltage	7.9 DTC P0121, P0122, P0123, P0221, P0222,or P0223
P0123	Throttle Position Sensor 1 Circuit High Voltage	7.9 DTC P0121, P0122, P0123, P0221, P0222,or P0223
P0125	Insufficient Engine Coolant Temperature For Closed Loop Fuel Control	7.8 DTC P0116, P0117, P0118, P0125 or P1258
P0130	O2 Sensor Circuit Malfunction (Bank 1, Sensor 1)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P0131	O2 Sensor Circuit Low Voltage (Bank 1, Sensor 1)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P0132	O2 Sensor Circuit High Voltage (Bank 1 Sensor 1)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P0133	O2 Sensor Circuit Slow Response (Bank 1 Sensor 1)	7.11 DTC P0133 or P0153
P0135	O2 Sensor Heater Circuit Range / Performance (Bank 1, Sensor 1)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P0137	O2 Sensor Circuit Low Voltage (Bank 1, Sensor 2)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298

DTC	Description	Diagnostic Table
P0138	O2 Sensor Circuit High Voltage (Bank 1, Sensor 2)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P0139	O2 Sensor Slow Response (Bank1 Sensor 2)	7.12 DTC P0139 or P0159
P0140	O2 Sensor Circuit No Activity Detected (Bank 1 Sensor 2)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P0141	O2 Sensor Heater Circuit Range / Performance (Bank 1, Sensor 2)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P0150	O2 Sensor Circuit Malfunction (Bank 2, Sensor 1)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P0151	O2 Sensor Circuit Low Voltage (Bank 2, Sensor 1)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P0152	O2 Sensor Circuit High Voltage (Bank 2, Sensor 1)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P0153	O2 Sensor Circuit Slow Response (Bank 2 Sensor 1)	7.11 DTC P0133 or P0153
P0155	O2 Sensor Heater Circuit Range / Performance (Bank 2, Sensor 1)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P0157	O2 Sensor Circuit Low Voltage (Bank 2, Sensor 2)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P0158	O2 Sensor Circuit High Voltage (Bank 2, Sensor 2)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P0159	O2 Sensor Slow Response (Bank1 Sensor 2)	7.12 DTC P0139 or P0159
P0160	O2 Sensor Circuit No Activity Detected (Bank 2, Sensor 2)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P0161	O2 Sensor Heater Circuit Range / Performance (Bank 2, Sensor 2)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298

DTC	Description	Diagnostic Table
P0196	Engine Oil Temperature Sensor Range / Performance	7.13 DTC P0196, P0197 or P0198
P0197	Engine Oil Temperature Voltage Low	7.13 DTC P0196, P0197 or P0198
P0198	Engine Oil Temperature Voltage High	7.13 DTC P0196, P0197 or P0198
P0201	Injector 1 Control Circuit Malfunction	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0202	Injector 2 Control Circuit Malfunction	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0203	Injector 3 Control Circuit Malfunction	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0204	Injector 4 Control Circuit Malfunction	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0205	Injector 5 Control Circuit Malfunction	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0206	Injector 6 Control Circuit Malfunction	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0219	Engine Overspeed Condition	7.15 DTC P0219
P0221	Throttle Position Sensor 2 Circuit Range / Performance	7.9 DTC P0121, P0122, P0123, P0221, P0222,or P0223
P0222	Throttle Position Sensor 2 Circuit Low Voltage	7.9 DTC P0121, P0122, P0123, P0221, P0222,or P0223
P0223	Throttle Position Sensor 2 Circuit High Voltage	7.9 DTC P0121, P0122, P0123, P0221, P0222,or P0223
P0261	Injector 1 Control Circuit Low Voltage	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0262	Injector 1 Control Circuit High Voltage	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0264	Injector 2 Control Circuit Low Voltage	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0265	Injector 2 Control Circuit High Voltage	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0267	Injector 3 Control Circuit Low Voltage	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277

DTC	Description	Diagnostic Table
P0268	Injector 3 Control Circuit High Voltage	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0270	Injector 4 Control Circuit Low Voltage	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0271	Injector 4 Control Circuit High Voltage	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0273	Injector 5 Control Circuit Low Voltage	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0274	Injector 5 Control Circuit High Voltage	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0276	Injector 6 Control Circuit Low Voltage	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0277	Injector 6 Control Circuit High Voltage	7.14 DTC P0201, P0202, P0203, P0204, P0205, P0206, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276 or P0277
P0300	Engine Misfire Detected	7.16 DTC P0300
P0301	Cylinder 1 Misfire Detected	7.17 DTC P0301, P0302, P0303, P0304, P0305 or P0306
P0302	Cylinder 2 Misfire Detected	7.17 DTC P0301, P0302, P0303, P0304, P0305 or P0306
P0303	Cylinder 3 Misfire Detected	7.17 DTC P0301, P0302, P0303, P0304, P0305 or P0306
P0304	Cylinder 4 Misfire Detected	7.17 DTC P0301, P0302, P0303, P0304, P0305 or P0306
P0305	Cylinder 5 Misfire Detected	7.17 DTC P0301, P0302, P0303, P0304, P0305 or P0306
P0306	Cylinder 6 Misfire Detected	7.17 DTC P0301, P0302, P0303, P0304, P0305 or P0306
P0324	Knock Sensor Module Performance	7.18 DTC P0324
P0327	Knock Sensor Circuit Low Frequency (Bank 1)	7.19 DTC P0327, P0328, P0332 or P0333
P0328	Knock Sensor Circuit High Frequency (Bank 1)	7.19 DTC P0327, P0328, P0332 or P0333
P0332	Knock Sensor Circuit Low Frequency (Bank 2)	7.19 DTC P0327, P0328, P0332 or P0333
P0333	Knock Sensor Circuit High Frequency (Bank 2)	7.19 DTC P0327, P0328, P0332 or P0333
P0335	Crankshaft Position Sensor Circuit Malfunction	7.20 DTC P0335, P0336, P0337 or P0338
P0336	Crankshaft Position Sensor Signal Range / Performance	7.20 DTC P0335, P0336, P0337 or P0338
P0337	Crankshaft Position Sensor Circuit Low Duty Cycle	7.20 DTC P0335, P0336, P0337 or P0338
P0338	Crankshaft Position Sensor Circuit High Duty Cycle	7.20 DTC P0335, P0336, P0337 or P0338

DTC	Description	Diagnostic Table
P0341	Intake Camshaft Position Sensor Range / Performance (Bank 1)	7.21 DTC P0341, P0342 or P0343
P0342	Intake Camshaft Position Sensor Low Voltage (Bank 1)	7.21 DTC P0341, P0342 or P0343
P0343	Intake Camshaft Position Sensor High Voltage (Bank 1)	7.21 DTC P0341, P0342 or P0343
P0351	Ignition Coil Cylinder 1 Circuit Malfunction	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P0352	Ignition Coil Cylinder 2 Circuit Malfunction	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P0353	Ignition Coil Cylinder 3 Circuit Malfunction	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P0354	Ignition Coil Cylinder 4 Circuit Malfunction	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P0355	Ignition Coil Cylinder 5 Circuit Malfunction	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P0356	Ignition Coil Cylinder 6 Circuit Malfunction	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P0420	Catalytic System – Low Efficiency (Bank 1)	7.23 DTC P0420 or P0430
P0430	Catalytic System – Low Efficiency (Bank 2)	7.23 DTC P0420 or P0430
P0443	Evaporative Emission Control System Purge Solenoid Circuit Malfunction	7.24 DTC P0443, P0458 or P0459
P0458	Evaporative Emission Control System Purge Solenoid Circuit Low Voltage	7.24 DTC P0443, P0458 or P0459
P0459	Evaporative Emission Control System Purge Solenoid Circuit High Voltage	7.24 DTC P0443, P0458 or P0459
P0460	Fuel Level Sensor Range / Performance	7.25 DTC P0460, P0461, P0462 or P0463
P0461	Fuel Level Sensor Range / Performance	7.25 DTC P0460, P0461, P0462 or P0463
P0462	Fuel Level Sensor Low Voltage	7.25 DTC P0460, P0461, P0462 or P0463
P0463	Fuel Level Sensor High Voltage	7.25 DTC P0460, P0461, P0462 or P0463
P0480	Cooling Fan Relay 1 Circuit Malfunction	7.26 DTC P0480, P0691 or P0692
P0500	Vehicle Speed Sensor Circuit Malfunction	7.27 DTC P0500
P0504	Brake Switch Circuit Malfunction	7.28 DTC P0504 or P0571
P0506	Idle Speed Control rpm Too Low	7.29 DTC P0506, P0507, P0638, P1551, P2100, P2101, P2119 or P2176
P0507	Idle Speed Control rpm Too High	7.29 DTC P0506, P0507, P0638, P1551, P2100, P2101, P2119 or P2176
P0513	Wrong Transponder Key	7.30 DTC P0513, P0633, P1629, P1632, P1677, P1678 or P1679
P0521	Oil Pressure Sensor Range / Performance	7.31 DTC P0521, P0522 or P0523

DTC	Description	Diagnostic Table
P0522	Oil Pressure Sensor Voltage Low	7.31 DTC P0521, P0522 or P0523
P0523	Oil Pressure Sensor Voltage High	7.31 DTC P0521, P0522 or P0523
P0532	A/C Pressure Sensor Voltage Low	7.32 DTC P0532 or P0533
P0533	A/C Pressure Sensor Voltage High	7.32 DTC P0532 or P0533
P0560	System Voltage Malfunction	7.33 DTC P0560, P0562 or P0563
P0562	System Voltage Low Voltage	7.33 DTC P0560, P0562 or P0563
P0563	System Voltage High Voltage	7.33 DTC P0560, P0562 or P0563
P0571	Cruise Control Brake Switch Circuit	7.28 DTC P0504 or P0571
P0601	Replace Electronic Control Unit (ECU)	7.34 DTC P0601, P0602, P0604 or P0606
P0602	Program Electronic Control Unit (ECU)	7.34 DTC P0601, P0602, P0604 or P0606
P0604	Replace Electronic Control Unit (ECU)	7.34 DTC P0601, P0602, P0604 or P0606
P0606	Replace Electronic Control Unit (ECU)	7.34 DTC P0601, P0602, P0604 or P0606
P0615	Starter Relay Circuit Malfunction	7.35 DTC P0615, P0616 or P0617
P0616	Starter Relay Circuit Low Voltage	7.35 DTC P0615, P0616 or P0617
P0617	Starter Relay Circuit High Voltage	7.35 DTC P0615, P0616 or P0617
P0625	Alternator F Terminal Low Voltage	7.36 DTC P0625 or P0626
P0626	Alternator F Terminal High Voltage	7.36 DTC P0625 or P0626
P0627	Fuel Pump Relay Circuit Malfunction	7.37 DTC P0627, P0628 or P0629
P0628	Fuel Pump Relay Voltage Low	7.37 DTC P0627, P0628 or P0629
P0629	Fuel Pump Relay Voltage High	7.37 DTC P0627, P0628 or P0629
P0633	Immobiliser Function Not Programmed	7.30 DTC P0513, P0633, P1629, P1632, P1677, P1678 or P1679
P0638	Commanded Versus Actual Throttle Position Correlation	7.29 DTC P0506, P0507, P0638, P1551, P2100, P2101, P2119 or P2176
P0645	A/C Relay Circuit Malfunction	7.38 DTC P0645, P0646 or P0647
P0646	A/C Relay Voltage Low	7.38 DTC P0645, P0646 or P0647
P0647	A/C Relay Voltage High	7.38 DTC P0645, P0646 or P0647
P0685	Engine Control Ignition Relay Circuit Malfunction	7.39 DTC P0685, P0686 or P0687
P0686	Engine Control Ignition Relay Circuit Low Voltage	7.39 DTC P0685, P0686 or P0687
P0687	Engine Control Ignition Relay Circuit High Voltage	7.39 DTC P0685, P0686 or P0687
P0691	Cooling Fan Relay 1 Circuit Low Voltage	7.26 DTC P0480, P0691 or P0692
P0692	Cooling Fan Relay 1 Circuit High Voltage	7.26 DTC P0480, P0691 or P0692
P0700	Malfunction Indicator (MI) Request from Transmission Control Module (TCM)	7.40 DTC P0700
P0704	Clutch Switch Input Circuit Malfunction	7.41 DTC P0704
P0850	Park / Neutral Signal Circuit Incorrect Signal	7.42 DTC P0850
P1258	Engine Coolant Over Temperature – Protection Mode Active	7.8 DTC P0116, P0117, P0118, P0125 or P1258
P1551	Throttle Control Lower Position Not Reached during Learning Mode	7.29 DTC P0506, P0507, P0638, P1551, P2100, P2101, P2119 or P2176

DTC	Description	Diagnostic Table
P1629	Immobiliser Fuel Enable Signal Not Received	7.30 DTC P0513, P0633, P1629, P1632, P1677, P1678 or P1679
P1632	Immobiliser Fuel Disable Signal Received	7.30 DTC P0513, P0633, P1629, P1632, P1677, P1678 or P1679
P1648	Wrong Security Code Entered	7.43 DTC P1648
P1668	Alternator L Terminal Circuit Malfunction	7.44 DTC P1668, P2500 or P2501
P1677	Immobiliser Function not Enabled	7.30 DTC P0513, P0633, P1629, P1632, P1677, P1678 or P1679
P1678	Engine Control Module Identification Failed	7.30 DTC P0513, P0633, P1629, P1632, P1677, P1678 or P1679
P1679	Immobiliser Environment Identification Failed	7.30 DTC P0513, P0633, P1629, P1632, P1677, P1678 or P1679
P1845	Engine Torque Reduction Malfunction	7.45 DTC P1845
P2096	Post Catalyst O2 Sensor Fuel Trim Below Lower Limit (Bank 1)	7.46 DTC P2096 or P2098
P2097	Post Catalyst O2 Sensor Fuel Trim Above Upper Limit (Bank 1)	7.47 DTC P2097 or P2099
P2098	Post Catalyst O2 Sensor Fuel Trim Below Lower Limit (Bank 2)	7.46 DTC P2096 or P2098
P2099	Post Catalyst O2 Sensor Fuel Trim Above Upper Limit (Bank 2)	7.47 DTC P2097 or P2099
P2100	Throttle Control Motor Malfunction	7.29 DTC P0506, P0507, P0638, P1551, P2100, P2101, P2119 or P2176
P2101	Throttle Control Position Range / Performance	7.29 DTC P0506, P0507, P0638, P1551, P2100, P2101, P2119 or P2176
P2105	Throttle Control Forced Engine Shutdown	7.48 DTC P2105
P2107	Throttle Control Malfunction	7.49 DTC P2107
P2119	Closed Throttle Position Range / Performance	7.29 DTC P0506, P0507, P0638, P1551, P2100, P2101, P2119 or P2176
P2122	Accelerator Pedal Position Sensor 1 Voltage Low	7.50 DTC P2122, P2123, P2127, P2128 or P2138
P2123	Accelerator Pedal Position Sensor 1 Voltage High	7.50 DTC P2122, P2123, P2127, P2128 or P2138
P2127	Accelerator Pedal Position Sensor 2 Voltage Low	7.50 DTC P2122, P2123, P2127, P2128 or P2138
P2128	Accelerator Pedal Position Sensor 2 Voltage High	7.50 DTC P2122, P2123, P2127, P2128 or P2138
P2138	Accelerator Pedal Position Sensor 1-2 Correlation	7.50 DTC P2122, P2123, P2127, P2128 or P2138
P2176	Throttle Control Lower Position not Learned	7.29 DTC P0506, P0507, P0638, P1551, P2100, P2101, P2119 or P2176
P2177	Fuel Trim Lean during Cruising/Acceleration (Bank 1)	7.51 DTC P2177 or P2179
P2178	Fuel Trim Rich during Cruising/Acceleration (Bank 1)	7.52 DTC P2178 or P2180
P2179	Fuel Trim Lean during Cruising/Acceleration (Bank 2)	7.51 DTC P2177 or P2179
P2180	Fuel Trim Rich during Cruising/Acceleration (Bank 2	7.52 DTC P2178 or P2180
P2187	Fuel Trim Lean during Idling/Deceleration (Bank 1)	7.53 DTC P2187 or P2189
P2188	Fuel Trim Rich during Idling/Deceleration (Bank 1)	7.54 DTC P2188 or P2190

DTC	Description	Diagnostic Table
P2189	Fuel Trim Lean during Idling/Deceleration (Bank 2)	7.53 DTC P2187 or P2189
P2190	Fuel Trim Rich during Idling/Deceleration (Bank 2)	7.54 DTC P2188 or P2190
P2195	B1S1 O2 Sensor – System Too Lean (Bank 1 Sensor 1)	7.55 DTC P2195 or P2197
P2196	B1S1 O2 Sensor – System Too Rich (Bank 1 Sensor 1)	7.56 P2196 or P2198
P2197	B2S1 O2 Sensor – System Too Lean (Bank 2 Sensor 1)	7.55 DTC P2195 or P2197
P2198	B2S1 O2 Sensor – System Too Rich (Bank 2 Sensor 1)	7.56 P2196 or P2198
P2227	Barometric Pressure Sensor Range / Performance	7.57 DTC P2227, P2228 or P2229
P2228	Barometric Pressure Sensor Voltage Low	7.57 DTC P2227, P2228 or P2229
P2229	Barometric Pressure Sensor Voltage High	7.57 DTC P2227, P2228 or P2229
P2231	O2 Sensor Signal Interference by Heater Circuit (Bank 1, Sensor 1)	7.58 DTC P2231, P2232, P2234, P2235, P2251 or P2254
P2232	O2 Sensor Signal Short to Heater Circuit (Bank 1 Sensor 2)	7.58 DTC P2231, P2232, P2234, P2235, P2251 or P2254
P2234	O2 Sensor Signal Interference by Heater Circuit (Bank 2, Sensor 1)	7.58 DTC P2231, P2232, P2234, P2235, P2251 or P2254
P2235	O2 Sensor Signal Short to Heater Circuit (Bank 2 Sensor 2)	7.58 DTC P2231, P2232, P2234, P2235, P2251 or P2254
P2237	O2 Sensor Pump Current Circuit Malfunction (Bank 1, Sensor 1)	7.59 DTC P2237, P2238, P2239, P2240, P2241 or P2242
P2238	O2 Sensor Pump Current Circuit Low Voltage (Bank 1, Sensor 1)	7.59 DTC P2237, P2238, P2239, P2240, P2241 or P2242
P2239	O2 Sensor Pump Current Circuit High Voltage (Bank 1, Sensor 1)	7.59 DTC P2237, P2238, P2239, P2240, P2241 or P2242
P2240	O2 Sensor Pump Current Circuit Malfunction (Bank 2, Sensor 1)	7.59 DTC P2237, P2238, P2239, P2240, P2241 or P2242
P2241	O2 Sensor Pump Current Circuit Low Voltage (Bank 2, Sensor 1)	7.59 DTC P2237, P2238, P2239, P2240, P2241 or P2242
P2242	O2 Sensor Pump Current Circuit High Voltage (Bank 2, Sensor 1)	7.59 DTC P2237, P2238, P2239, P2240, P2241 or P2242
P2243	O2 Sensor Voltage Signal Circuit Malfunction (Bank 1, Sensor 1)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P2247	O2 Sensor Voltage Signal Circuit Malfunction (Bank 2, Sensor 1)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P2251	O2 Sensor Ground Circuit Malfunction (Bank 1, Sensor 1)	7.58 DTC P2231, P2232, P2234, P2235, P2251 or P2254
P2254	O2 Sensor Ground Circuit Malfunction (Bank 2, Sensor 1)	7.58 DTC P2231, P2232, P2234, P2235, P2251 or P2254
P2270	O2 Sensor Lean / Rich Switch Signal Malfunction (Bank 1, Sensor 2)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298

DTC	Description	Diagnostic Table
P2271	O2 Sensor Rich / Lean Switch Signal Malfunction (Bank 1, Sensor 2)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P2272	O2 Sensor Lean / Rich Switch Signal Malfunction (Bank 2, Sensor 2)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P2273	O2 Sensor Rich / Lean Switch Signal Malfunction (Bank 2, Sensor 2)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P2297	O2 Sensor Range / Performance During Deceleration Fuel Cutoff (Bank 1, Sensor 1)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P2298	O2 Sensor Range / Performance During Deceleration Fuel Cutoff (Bank 2, Sensor 1)	7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298
P2300	Ignition Coil Cylinder 1 Circuit Low Voltage	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P2301	Ignition Coil Cylinder 1 Circuit High Voltage	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P2303	Ignition Coil Cylinder 2 Circuit Low Voltage	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P2304	Ignition Coil Cylinder 2 Circuit High Voltage	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P2306	Ignition Coil Cylinder 3 Circuit Low Voltage	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P2307	Ignition Coil Cylinder 3 Circuit High Voltage	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P2309	Ignition Coil Cylinder 4 Circuit Low Voltage	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P2310	Ignition Coil Cylinder 4 Circuit High Voltage	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316

DTC	Description	Diagnostic Table
P2312	Ignition Coil Cylinder 5 Circuit Low Voltage	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P2313	Ignition Coil Cylinder 5 Circuit High Voltage	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P2315	Ignition Coil Cylinder 6 Circuit Low Voltage	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P2316	Ignition Coil Cylinder 6 Circuit High Voltage	7.22 DTC P0351, P0352, P0353, P0354, P0355, P0356, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315 or P2316
P2500	Alternator L Terminal Low Voltage	7.44 DTC P1668, P2500 or P2501
P2501	Alternator L Terminal High Voltage	7.44 DTC P1668, P2500 or P2501
P2626	O2 Sensor Pump Current Trim Circuit Malfunction (Bank 1, Sensor 1)	7.59 DTC P2237, P2238, P2239, P2240, P2241 or P2242
P2629	O2 Sensor Pump Current Trim Circuit Malfunction (Bank 2, Sensor 1)	7.59 DTC P2237, P2238, P2239, P2240, P2241 or P2242
U0001	No Communication with CAN-Bus (High Speed)	7.61 DTC U0001
U0101	CAN-Bus No Communication With TCM (Transmission Control Module)	7.62 DTC U0101
U0155	CAN-Bus No Communication With Gateway	7.63 DTC U0155 or U0423
U0423	CAN-Bus Invalid Data From Gateway	7.63 DTC U0155 or U0423

7.2 DTC P0008, P0009 or P0016

DTC Descriptor

This diagnostic procedure supports the following DTCs:

- DTC P0008 – Engine Position System Performance (Bank 1)
- DTC P0009 – Engine Position System Performance (Bank 2)
- DTC P0016 – Crankshaft / Intake Camshaft Position Not Plausible (Bank 1)

Circuit Description

The engine control relay applies ignition positive battery voltage to the camshaft position (CMP) actuator solenoids through the ignition voltage circuit.

Using a device called a driver, the ECM applies a pulse width modulated (PWM) ground to the individual CMP solenoid control circuit. This controls the oil pressure that advances or retards each camshaft position.

The ECM compares the camshaft position to the crankshaft position to detect CMP system malfunction. A CKP / CMP sensor correlation DTC sets if the ECM detects a deviation between the target position of the camshaft and the crankshaft position.

Conditions for Running the DTC

DTC P0008 or P0009

Run continuously once the following conditions are met.

- DTCs P0341, P0342, P0343, ran and passed:
- The engine is running.
- The ECM has learned the camshafts position.

DTC P0016

Run continuously once the following conditions are met.

- DTCs P0335, P0336, P0338, P0341, P0342 and P0343 ran and passed:
- The calculated engine oil temperature is less than 95°C.
- The engine coolant temperature is 20 – 90°C.
- The engine is running for greater than 5 seconds.

Conditions for Setting the DTC

DTC P0008

The ECM detects that both camshafts on bank 1 of the engine are misaligned with the crankshaft.

DTC P0009

The ECM detects that both camshafts on bank 2 of the engine are misaligned with the crankshaft.

DTC P0016

The ECM detects the following deviation in the correlation between the camshaft position and the crankshaft position for greater than 10 minutes:

- a camshaft position is too advanced in relationship to the crankshaft, or
- a camshaft position is too retarded in relationship to the crankshaft.

Conditions for Clearing DTC

The CKP / CMP sensor correlation DTCs are Type B DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type B DTCs set and conditions for clearing Type B DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the CMP system operation.
- Inspect the engine for recent engine mechanical repairs. Incorrect camshaft, camshaft actuator or timing chain installation will trigger these DTCs.
- The engine oil condition has a major impact on the operation of the camshaft actuator.
- A low oil level may set these DTCs.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

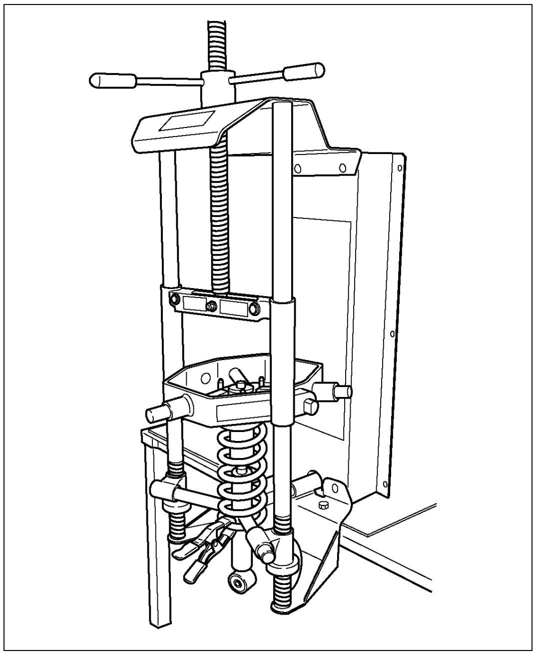
Test Description

The following numbers refer to the step numbers in the diagnostic table:

3 A fault condition in any of the listed sensors will trigger these DTCs.

5 Incorrect camshaft, camshaft actuator or timing chain installation will trigger these DTCs.

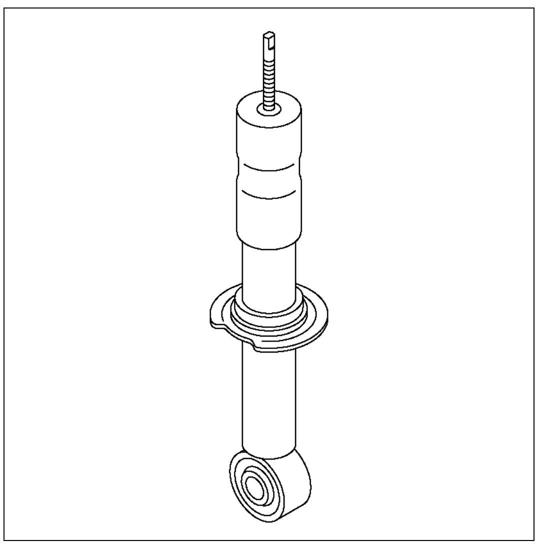
Disassembly



RTW73CMH000101

1. Install the shock absorber assembly on the strut spring compressor (5-8840-2842-0).
   For the details of the actual operation, follow the steps the strut spring compressor manufacturer's instructions.
2. Remove the nut with spring in place.

CAUTION:
Take care not to apply excessive force to the nut during removal.



CAUTION:
The shock absorbers have been charged with gas at the factory. Exposure to high temperatures or an open flame can result in a dangerous explosion.
Keep the shock absorbers away from high temperatures and open flames.

INSPECTION AND REPAIR

Make all necessary adjustments, repairs, and part replacements if wear, damage, or other problems are discovered during inspections.

Visual Check

Inspect the following parts for wear, damage or other abnormal conditions.

- Shock absorber
- Rubber bushing
- Coil spring

DTC P0008, P0009 or P0016 Diagnostic Table

Step	Action	Yes	No
1	1 Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Allow the engine to reach the normal operating temperature. 4 Increase the engine speed to 2,000 rpm for 10 seconds. 5 Using Tech 2, select the DTC display function. Does DTC P0008, P0009 or P0016 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Are DTCs relating to the following DTCs also set: • Camshaft actuator circuit • CMP sensor circuit • CKP sensor circuit	Go to the appropriate DTC Table in this Section	Go to Step 4
4	1 Inspect the engine for the following fault conditions. Refer to 6A1 Engine Mechanical – V6: • incorrect installation of the CMP sensor, • incorrect installation of the CKP sensor, • timing chain tensioner fault condition, • incorrectly installed timing chain, • excessive play in the timing chain, and • timing chain that jumped teeth. Was any fault found and rectified?	Go to Step 5	Refer to Additional Information in this DTC
5	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the crankshaft / camshaft position correlation DTCs fail this ignition cycle?	Go to Step 2	Go to Step 6
6	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.3 DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 or P0058

DTC Descriptor

This diagnostic procedure supports the following DTCs:

- DTC P0030 – O2 Sensor Heater Circuit Malfunction (Bank 1, Sensor 1)
- DTC P0031 – O2 Sensor Heater Circuit Low Voltage (Bank 1, Sensor 1)

- DTC P0032 – O2 Sensor Heater Circuit High Voltage (Bank 1, Sensor 1)
- DTC P0036 – O2 Sensor Heater Circuit Malfunction (Bank 1, Sensor 2)
- DTC P0037 – O2 Sensor Heater Circuit Low Voltage (Bank 1, Sensor 2)
- DTC P0038 – O2 Sensor Heater Circuit High Voltage (Bank 1, Sensor 2)
- DTC P0050 – O2 Sensor Heater Circuit Malfunction (Bank 2, Sensor 1)
- DTC P0051 – O2 Sensor Heater Circuit Low Voltage (Bank 2, Sensor 1)
- DTC P0052 – O2 Sensor Heater Circuit High Voltage (Bank 2, Sensor 1)
- DTC P0056 – O2 Sensor Heater Circuit Malfunction (Bank 2, Sensor 2)
- DTC P0057 – O2 Sensor Heater Circuit Low Voltage (Bank 2, Sensor 2)
- DTC P0058 – O2 Sensor Heater Circuit High Voltage (Bank 2, Sensor 2)

Circuit Description

The engine control relay applies positive voltage to the heater ignition voltage circuits of the HO2S. The ECM applies a pulse width modulated (PWM) ground to the heater control circuit of the HO2S through a device within the ECM called a driver, to control the HO2S rate of heating.

The driver has a feedback circuit that is pulled-up when the voltage is approximately 3.3 V. The ECM monitors the driver feedback circuit to determine if the control circuit is open, shorted to ground or shorted to a positive voltage.

An HO2S heater control circuit DTC sets if the ECM detects a high resistance, open circuit, short to ground or short to voltage fault condition in the HO2S heater control circuit.

Conditions for Running the DTC

Runs continuously once the following conditions are met:

- The ignition voltage is 10.0 – 16.0 V.
- Engine speed is greater than 80 rpm

Conditions for Setting the DTC

DTC P0030, P0036, P0050 or P0056

The ECM detects an open circuit fault condition in the HO2S heater control circuit when the HO2S heater is commanded off.

DTC P0031, P0037, P0051 or P0057

The ECM detects a short to ground fault condition in the HO2S heater control circuit when the HO2S heater is commanded off.

DTC P0032, P0038, P0052 or P0058

The ECM detects a short to voltage fault condition in the HO2S heater control circuit for five seconds when the HO2S heater is commanded on.

Conditions for Clearing the DTC

The HO2S heater control circuit DTCs are Type B DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type B DTC sets and conditions for clearing Type B DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the HO2S system operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- A faulty HO2S heater element may cause an open heater circuit condition. This fault may be intermittent or only show up after the sensor has operated for a period.

- Inspect the HO2S wiring harness for contact with the exhaust system.
- The front and the rear HO2Ss have a separate fuse connection. If both front or both the rear DTCs are set, the appropriate HO2S ignition voltage circuit may be open.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following number refers to the step number in the diagnostic table:

4 The ECM monitors the driver feedback circuit to determine if the heater control circuit is open, shorted to ground or shorted to a positive voltage. If the voltage is outside the specified range, there is a fault condition with the heater control circuit.

DTC P0030 to P0032, P0036 to P0038, P0050 to P0052 and P0056 to P0058 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Allow the engine to run at idle speed for at least 30 seconds. 4 Increase the engine speed to 2,000 rpm for 10 seconds. 5 Using Tech 2, select the DTC display function. Does DTC P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 or P0058 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Disconnect the appropriate HO2S wiring connector. 2 Switch on the ignition with the engine not running. 3 Connect a test lamp between the HO2S heater ignition voltage circuit and the ECM housing. Does the test lamp illuminate?	Go to Step 4	Go to Step 5
4	Using a digital multimeter, measure the voltage between the HO2S heater control circuit and a good ground. Does the multimeter display: • HO2S 1: 4.6 – 5.2 V? • HO2S 2: 2.8 – 4.2 V?	Go to Step 7	Go to Step 6
5	**NOTE** The HO2S ignition voltage circuit is shared with other sensors. Ensure that all circuits and components that share this ignition voltage circuit are tested for a short to ground. Repair the high resistance open circuit or short to ground fault condition in the HO2S heater ignition voltage circuit. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures. Was the repair completed?	Go to Step 9	—

Step	Action	Yes	No
6	Test the HO2S heater control circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 9	Go to Step 8
7	Replace the appropriate HO2S. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 9	—
8	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 9	—
9	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the HO2S heater control circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 10
10	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.4 DTC P0040 or P0041

DTC Descriptor

This diagnostic procedure supports the following DTCs:

- DTC P0040 – O2 Sensor Signals Not Plausible (Bank 1, Sensor 1 & Bank 2, Sensor 1)
- DTC P0041 – O2 Sensor Signals Not Plausible (Bank 1, Sensor 2 & Bank 2, Sensor 2)

Circuit Description

The engine control relay applies positive voltage to the heater ignition voltage circuits of the HO2S. The ECM applies a pulse width modulated (PWM) ground to the heater control circuit of the HO2S through a device within the ECM called a driver, to control the HO2S rate of heating.

The ECM applies a voltage of approximately 450 mV between the reference signal circuit and low reference circuit of the HO2S while the sensor temperature is less than the operating range.

Once the HO2S reaches operating temperature, the sensor varies this reference signal voltage, which constantly fluctuates between the high voltage output and the low voltage output.

- The low voltage output is 0 – 450 mV, which occurs if the air fuel mixture is lean.
- The high voltage output is 450 – 1,000 mV, which occurs if the air fuel mixture is rich.

The ECM monitors, stores and evaluates the HO2S voltage fluctuation information to determine the level of oxygen concentration in the exhaust.

An HO2S signal not plausible or wire connector swapped DTC sets if the ECM detects the HO2S signal voltages are heading in the opposite direction of what was commanded.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the HO2S system operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.

- The HO2S must be tightened correctly. A loose HO2S will trigger these DTCs.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Conditions for Running the DTC

Run continuously once the following conditions are met:

- The ignition voltage is 10.0 – 16.0 V.
- The engine is running.
- The O2 Sensors are in closed loop.
- The ECM is commanding the HO2Ss fuel trim.

Conditions for Setting the DTC

The ECM detects the HO2S signal voltages are heading in the opposite direction of what was commanded.

Conditions for Clearing the DTC

The HO2S signal not plausible DTCs are Type B DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type B DTC sets and conditions for clearing Type B DTCs.

DTC P0040 and P0041 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Allow the engine to reach the normal operating temperature. 4 Increase the engine speed to 2,000 rpm for 10 seconds. 5 Using Tech 2, select the DTC display function. Does P0040 or P0041 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Check the HO2S 2 wiring connectors for a swapped connector fault condition. Was any fault found and rectified?	Go to Step 5	Go to Step 4
4	Are DTCs relating to other circuits of the HO2S also set?	Go to the appropriate DTC in this Section	Refer to Additional Information in this DTC
5	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the HO2S signal not plausible or wire connector swapped DTCs fail this ignition cycle?	Go to Step 2	Go to Step 6

Step	Action	Yes	No
6	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.5 DTC P0053 or P0059

DTC Descriptor

This diagnostic procedure supports the following DTCs:

- DTC P0053 – O2 Sensor Heater Resistance Range / Performance (Bank 1, Sensor 1)
- DTC P0059 – O2 Sensor Heater Resistance Range / Performance (Bank 2, Sensor 1)

Circuit Description

The engine control relay applies positive voltage to the heater ignition voltage circuits of the HO2S. The ECM applies a pulse width modulated (PWM) ground to the heater control circuit of the HO2S through a device within the ECM called a driver, to control the HO2S rate of heating.

The ECM maintains the voltage between the reference signal circuit and low reference circuit of the HO2S 1 to about 450 mV by increasing or decreasing the oxygen content in the HO2S diffusion gap. To achieve this, the ECM controls the current applied to the oxygen pumping cell in the HO2S.

- If the air / fuel mixture in the exhaust is balanced (lambda = 1), the oxygen pumping cell current is zero.
- If the exhaust gas in the HO2S 1 diffusion gap is lean, the ECM applies a positive current to the oxygen pumping cell to discharge oxygen from the diffusion gap.
- If the exhaust gas in the HO2S 1 diffusion gap is rich, the ECM applies a negative current to the oxygen pumping cell to draw oxygen into the diffusion gap.

The pumping current required to maintain the HO2S 1 signal circuit voltage to about 450 mV is proportional to the level of oxygen concentration in the exhaust gas. The ECM monitors and evaluates the oxygen pumping current to determine the level of oxygen concentration in the exhaust.

An HO2S internal heater resistance performance DTC sets if the ECM detects an internal fault condition in the ECM HO2S heater circuit.

Conditions for Running the DTC

Run continuously once the following conditions are met:

- DTCs P0030, P0031, P0032, P0101, P0121, P012, P0123, P0131, P0132, P0133, P0221, P0222, P0223, P0336, P0338, P2237, P2243 and P2626 ran and passed.
- The calculated exhaust temperature is greater than 400ºC.
- The engine does not misfire.
- The ignition voltage is 10.0 – 16.0 V.
- The HO2S is commanded on.
- The engine is running at speed greater than 25 rpm

Conditions for Setting the DTC

There is an internal fault condition in the ECM HO2S heater circuit.

Conditions for Clearing the DTC

The HO2S internal heater resistance performance DTCs are Type B DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type B DTC sets and conditions for clearing Type B DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the HO2S system operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- The HO2S must be tightened correctly. A loose HO2S will trigger these DTCs.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P0053 and P0059 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Allow the engine to reach the normal operating temperature. 4 Increase the engine speed to 2,000 rpm for 10 seconds. 5 Using Tech 2, select the DTC display function. Does P0053 or P0059 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Are DTCs relating to other circuits of the HO2S also set?	Go to the appropriate DTC Table in this Section	Go to Step 4
4	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 5	—
5	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the HO2S internal heater resistance performance DTCs fail this ignition cycle?	Go to Step 2	Go to Step 6
6	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.6 DTC P0101, P0102 or P0103

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0101 – Mass Air Flow Sensor Circuit Range / Performance
- DTC P0102 – Mass Air Flow Sensor Voltage Low
- DTC P0103 – Mass Air Flow Sensor Voltage High

Circuit Description

The ignition control relay applies ignition positive voltage to the mass airflow (MAF) sensor. The ECM applies 5 V reference voltage and ground through the low reference circuit.

A heater resistor on the MAF sensor heats a micro-mechanical sensor diaphragm at a constant temperature. Two temperature dependent resistors positioned at each side of the heater resistor measure the intake air temperature:

- The first is located at a position before the intake air passes through the heater resistor. This temperature dependent resistor measures the temperature of the intake air before the air is heated.
- The second is located at a position after the intake air has passed through the heater resistor. This sensor measures the temperature of the intake air after the air is heated.

The evaluation circuit on the MAF sensor converts the difference in the resistance value of these two temperature dependent resistors into an analogue signal voltage. The ECM monitors this signal voltage through the MAF sensor signal to calculate the engine intake air mass.

A MAF sensor circuit DTC sets if the ECM detects the actual MAF sensor signal is not within the predetermined range of the calculated MAF sensor value.

Conditions for Running the DTC

DTC P0101

Runs continuously once the following conditions are met:

- DTCs P0121, P0122, P0123, P0221, P0222 and P0223 ran and passed.
- The engine is running.
- The ignition voltage is 10.0 – 16.0 V.
- The MAF sensor signal is -11.6 to +295 grams per second.
- The ECM detects greater than 150 crankshaft revolutions.

DTC P0102

Runs continuously once the following conditions are met:

- DTCs P0121, P0122, P0123, P0221, P0222 and P0223 ran and passed.
- The engine is running.
- The ignition voltage is 10.0 – 16.0 V.

DTC P0103

Runs continuously once the following conditions are met:

- DTCs P0121, P0122, P0123, P0221, P0222 and P0223 ran and passed.
- The engine is running at speed greater than 320 rpm
- The ignition voltage is 10.0 – 16.0 V.

Conditions for Setting the DTC

DTC P0101

The ECM detects the MAF sensor signal is not within the predetermined range of the calculated MAF value for 2 seconds.

DTC P0102

The ECM detects the MAF sensor signal is less than -11.7 grams per second.

DTC P0103

The ECM detects the MAF sensor signal is greater than 294 grams per second.

Additional Information

- The MAF sensor circuit DTCs is a Type B DTC. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type B DTC sets and conditions for clearing Type B DTC.
- Refer to 6C1-1 Engine Management – V6 – General Information for details of the MAF sensor operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Inspect the MAF sensor for an incorrectly routed harness or if the harness is too close to the following:
  – ignition coil,
  – solenoids,
  – relays, and
  – motors.
- A low minimum air rate may cause this DTC to set during deceleration. Inspect for the following conditions:
  – a plugged or a collapsed intake air duct, or a dirty air filter element,
  – objects that block the MAF sensor air inlet screen, and
  – sticking or dirty throttle plate or throttle bore.
- Any un-metered air that enters the engine may cause this DTC to set. Inspect for vacuum leaks in the following:
  – intake manifold,
  – throttle body,
  – barometric pressure (BARO) sensor seal,
  – EVAP canister purge valve seal,
  – brake booster system,
  – air induction system, and
  – crankcase ventilation system.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P0101, P0102 or P0103 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0101, P0102 or P0103 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC

Step	Action	Yes	No
3	Inspect for the following fault conditions: • engine vacuum leak, • air leak in the intake air duct between the MAF sensor and the throttle body, • plugged or collapsed intake air duct, • objects that block the MAF sensor inlet screen, • restricted air filter element, • restricted throttle plate or carbon build-up around the throttle plate, • unseated engine oil dipstick, • loose or missing engine oil cap, and • over filled crankcase. Was any fault found and rectified?	Go to Step 14	Go to Step 4
4	1 Disconnect the MAF sensor wiring connector. 2 Connect a test lamp between the MAF sensor ignition voltage circuit and the ECM housing. 3 Switch on the ignition with the engine not running. Does the test lamp illuminate?	Go to Step 5	Go to Step 11
5	1 Switch on the ignition with the engine not running. 2 Using a digital multimeter, measure the voltage between the MAF sensor 5 V reference circuit and the ECM housing. Does the multimeter display 4.8 – 5.2 V?	Go to Step 6	Go to Step 8
6	1 Switch off the ignition. 2 Connect a 3 A fused jumper wire between the MAF sensor 5 V reference circuit and signal circuit. 3 Switch on the ignition with the engine not running. 4 Using Tech 2, observe the MAF sensor voltage parameter. Does Tech 2 display 4.8 – 5.2 V?	Go to Step 7	Go to Step 9
7	1 Switch off the ignition. 2 Remove ECM Fuse 29 from the engine compartment fuse and relay panel assembly. 3 Using a digital multimeter, measure the resistance between the MAF sensor low reference circuit and the ECM housing. **NOTE** Install ECM Fuse 29 to the engine compartment fuse and relay panel assembly after completing the test. Does the multimeter display 5 Ω?	Go to Step 12	Go to Step 10

Reassembly

1. Reassemble the parts inside the strut spring compressor.
2. When tightening the drive screw shaft, compress the spring so that it does not apply pressure to the spring seat.
3. Install the nut, and then tighten to the specified torque.

   Torque: 25 N·m (2.5 kgf·m/18 lb·ft)

Step	Action	Yes	No
8	Test the MAF sensor 5 V reference circuit for a high resistance, open circuit or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. **NOTE** The MAF sensor shares the 5 V reference circuit with other sensors. A fault condition in the 5 V reference circuit will trigger DTCs on sensors that share this circuit. Was any fault found and rectified?	Go to Step 14	Go to Step 13
9	Test the MAF sensor signal circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 14	Go to Step 13
10	Test the MAF sensor low reference circuit for a high resistance or an open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 14	Go to Step 13
11	Repair the high resistance or open circuit fault condition in the MAF sensor circuit ignition voltage. Refer to 8A Electrical - Body and Chassis for information on electrical wiring repair procedures. Was the repair completed?	Go to Step 14	—
12	Replace the MAF sensor. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 14	—
13	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 14	—
14	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the MAF Sensor Circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 15
15	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.7 DTC P0112 or P0113

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0112 – Intake Air Temperature Sensor Circuit Low Voltage
- DTC P0113 – Intake Air Temperature Sensor Circuit High Voltage

Circuit Description

The ECM applies a reference 5 V to the intake air temperature (IAT) sensor signal circuit and ground through the low reference circuit. The IAT sensor is a variable resistor that measures the engine intake air temperature.

- Increased temperature in the intake air decreases the resistance value of the IAT sensor. This increases the IAT sensor pull-down rate to ground. Therefore, the higher the intake air temperature, the lower the signal voltage output of the IAT sensor.
- Decreased temperature in the intake air increases the resistance value of the IAT sensor. This reduces the IAT sensor pull-down rate to ground. Therefore, the lower the intake air temperature, the higher the signal voltage output of the IAT sensor.

An IAT sensor circuit DTC sets if the ECM detects the intake air temperature is outside the specified range.

Conditions for Running the DTC

Runs continuously once the following conditions are met:

- The engine is running for longer than 3.0 minutes.
- The engine is idling for longer than 10.0 seconds

Conditions for Setting the DTC

DTC P0112

The ECM detects the intake air temperature is greater than 132°C for longer than 3.0 seconds.

DTC P0113

The ECM detects the intake air temperature is less than - 38°C for longer than 3.0 seconds.

Conditions for Clearing the DTC

The IAT sensor DTCs are Type B DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type B DTC sets and conditions for clearing Type B DTC.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the IAT Sensor operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Test the IAT sensor using the IAT Temperature vs. Resistance in 6C1-3 Engine Management – V6 – Service Operations. If the engine has sat overnight, the IAT sensor should display within 3°C of the ECT sensor values.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

3 Tests the signal circuit of the IAT sensor.

4 Measures the integrity of the IAT sensor low reference circuit. Removal of the ECM Fuse 29 enables the ECM to power down completely prior to the test procedure.

DTC P0112 or P0113 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section

Step	Action	Yes	No
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Allow the engine to reach the normal operating temperature. 4 Using Tech 2, select the DTC display function. Does DTC P0112 or P0113 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Switch off the ignition. 2 Disconnect the IAT sensor wiring connector. 3 Switch on the ignition with the engine not running. 4 Using a digital multimeter, measure the voltage between the IAT sensor signal circuit and the ECM housing. Does the multimeter display 4.8 – 5.2 V?	Go to Step 4	Go to Step 5
4	1 Switch off the ignition. 2 Remove ECM Fuse 29 from the engine compartment fuse and relay panel assembly. 3 Using a digital multimeter, measure the resistance between the IAT sensor low reference circuit and the ECM housing. **NOTE** Install the ECM Fuse 29 to the engine compartment fuse and relay panel assembly after completing this test. Does the multimeter display 5 Ω?	Go to Step 7	Go to Step 6
5	Test the IAT sensor signal circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 9	Go to Step 8
6	Test the IAT sensor low reference circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. **NOTE** The IAT sensor shares the low reference circuit with other sensors. A fault condition in the low reference circuit may trigger DTCs on sensors that share this circuit. Refer to 3 Wiring Diagrams and Connector Charts in this Section, to assist diagnosis. Was any fault found and rectified?	Go to Step 9	Go to Step 8
7	Replace the IAT sensor. Refer to 6C1-3 Engine Management – V6 – Service Operations Was the repair completed?	Go to Step 9	—
8	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations Was the repair completed?	Go to Step 9	—

Step	Action	Yes	No
9	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the IAT sensor DTCs fail this ignition cycle?	Go to Step 2	Go to Step 10
10	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.8 DTC P0116, P0117, P0118, P0125 or P1258

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0116 – Engine Coolant Temperature Sensor Circuit Range / Performance
- DTC P0117 – Engine Coolant Temperature Sensor Circuit Low Voltage
- DTC P0118 – Engine Coolant Temperature Sensor Circuit High Voltage
- DTC P0125 – Insufficient Engine Coolant Temperature For Closed Loop Fuel Control
- DTC P1258 – Engine Coolant Over Temperature - Protection Mode Active

Circuit Description

The ECM applies a reference 5 V to the engine coolant temperature (ECT) sensor signal circuit and ground through the low reference circuit. The ECT sensor is a variable resistor that measures the temperature of the engine coolant.

- Increased temperature in the engine coolant decreases the resistance value of the ECT sensor. This increases the ECT sensor pull-down rate to ground. Therefore, the higher the engine coolant, the lower the signal voltage output of the ECT sensor.
- Decreased temperature in the engine coolant increases the resistance value of the ECT sensor. This reduces the ECT sensor pull-down rate to ground. Therefore, the lower the engine coolant temperature, the higher the signal voltage output of the ECT sensor.

An ECT sensor DTC sets if the ECM detects the engine coolant temperature is outside the predetermined range.

Conditions for Running the DTC

DTC P0116

Runs continuously when the engine is running.

DTC P0117, P0118 and P1258

Runs continuously when the ignition is switched on.

DTC P00125

Runs continuously once the following conditions are met:

- DTCs P0112, P0113, P0117 or P0118 are not set.
- The engine is running.

Conditions for Setting the DTC

DTC P0116

The ECM detects the engine coolant temperature sensor value is 10°C less than the minimum calculated engine temperature.

DTC P0117

The ECM detects the engine coolant temperature is greater than 140°C for longer than 3 seconds.

DTC P0118

The ECM detects the engine coolant temperature is less than -39°C for longer than 3 seconds.

DTC P0125

The ECM determines the calculated engine temperature by measuring the amount of airflow into the engine. This DTC sets if the ECM detects the actual ECT sensor is not within 10ºC of the calculated engine temperature for approximately 2 – 5 minutes.

DTC P1258

The ECM detects the engine coolant temperature is greater than 131°C for longer than 2 seconds.

Conditions for Clearing the DTC

The ECT sensor DTCs are Type B DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type B DTC sets and conditions for clearing Type B DTC.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the ECT sensor operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- DTCs P0116, P0117, P0118 and P0125 diagnostic table is developed with the assumption the engine cooling system is functioning correctly. Therefore, rectify any engine cooling system fault conditions before proceeding with this diagnostic table.
- Test the ECT sensor using the ECT Temperature vs. Resistance in 6C1-3 Engine Management –V6 – Service Operations. If the engine has sat overnight, the ECT sensor should display within 3°C of the IAT sensor values. When the engine is first started, the ECT should rise steadily to about 90°C then stabilise when thermostat opens.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

2 A fault condition in the engine cooling system may trigger these DTCs.

7 The ECT sensor low reference circuit is shared with other components. DTC P0118 may set if the shared low reference circuit is shorted to voltage. Test the low reference circuit of all components that share this circuit to find the source of the fault condition.

DTC P0116, P0117, P0118, P0125 and P1258 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section

Step	Action	Yes	No
2	Test the engine cooling system for correct operation. Refer to 6B1 Engine Cooling – V6. Was any fault found and rectified?	Go to Step 10	Go to Step 3
3	1 Switch off the ignition for 30 seconds. 2 Operate the vehicle within the conditions for running the DTC. 3 Using Tech 2, select the DTC display function. Does DTC P0116, P0117, P0118, P0125 or P1258 fail this ignition cycle?	Go to Step 4	Refer to Additional Information in this DTC
4	1 Switch off the ignition. 2 Disconnect the ECT sensor wiring connector. 3 Switch on the ignition with the engine not running. 4 Using a digital multimeter, measure the voltage between the ECT sensor signal circuit and the ECM housing. Does the multimeter display 4.8 – 5.2 V?	Go to Step 5	Go to Step 6
5	1 Switch off the ignition. 2 Remove ECM Fuse 29 from the engine compartment fuse and relay panel assembly. 3 Using a digital multimeter, measure the resistance between the ECT sensor low reference circuit and the ECM housing. **NOTE** Install the ECM Fuse 29 to the engine compartment fuse and relay panel assembly after completing this test. Does the multimeter display 5 Ω?	Go to Step 8	Go to Step 7
6	Test the IAT sensor signal circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 10	Go to Step 9
7	Test the ECT sensor low reference circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. **NOTE** The ECT sensor shares the low reference circuit with other sensors. A fault condition in the low reference circuit may trigger DTCs on sensors that share this circuit. Refer to 3 Wiring Diagrams and Connector Charts in this Section, to assist diagnosis. Was any fault found and rectified?	Go to Step 10	Go to Step 9
8	Replace the ECT sensor. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 10	—
9	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 10	—

Step	Action	Yes	No
10	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the ECT sensor DTCs fail this ignition cycle?	Go to Step 2	Go to Step 11
11	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.9 DTC P0121, P0122, P0123, P0221, P0222,or P0223

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0121 – Throttle Position Sensor 1 Circuit Range / Performance
- DTC P0122 – Throttle Position Sensor 1 Circuit Low Voltage
- DTC P0123 – Throttle Position Sensor 1 Circuit High Voltage
- DTC P0221 – Throttle Position Sensor 2 Circuit Range / Performance
- DTC P0222 – Throttle Position Sensor 2 Circuit Low Voltage
- DTC P0223 – Throttle Position Sensor 2 Circuit High Voltage

Circuit Description

The ECM applies 5 V to the throttle position (TP) sensor 1 through the 5 V reference circuit and the ground through the low reference circuit. TP sensor 1 and TP sensor 2 share common 5 V reference circuit and low reference circuit.

The TP sensor 1 and TP sensor 2 have individual signal circuits with opposite functionality. These signal circuits provide the ECM with a signal voltage that is proportional to the throttle plate movement.

- The TP sensor 1 signal voltage is less than 1 V when the throttle plate is in closed position, which increases to greater than 4 V when the throttle plate is moved to wide-open throttle.
- The TP sensor 2 signal voltage is greater than 4 V when the throttle plate is in closed position, which decreases to less than 1 V when the throttle plate is moved to wide-open throttle.

The ECM monitors and compares the TP sensor 1 signal voltage to the TP sensor signal voltage 2. In addition, the ECM compares the TP sensor signal to the MAF sensor signal to determine a calculated TP sensor signal.

A TP sensor DTC sets if the ECM detects a fault condition in the TP sensor signal output.

Conditions for Running the DTC

DTC P0121 runs continuously once the following conditions are met:

- The ignition voltage is greater than 7 V.
- The TP sensor 1 signal voltage is 0.17 – 4.6 V.

DTC P0122, P0123, P0222 and P0223 runs continuously once the following conditions are met:

- The ignition voltage is greater than 7 V.
- The ignition is switched on.

DTC P0221 runs continuously once the following conditions are met:

- The battery voltage is greater than 7 V.

- The TP sensor 2 signal voltage is 0.15 – 4.8 V.

DTC P0222 runs continuously once the following conditions are met:

- The battery voltage is greater than 7 V.
- The ignition is switched on.

Conditions for Setting the DTC

DTC P0121

The following conditions exist:

- The TP sensor 1 signal voltage and the TP sensor 2 signal voltage have a difference of greater than 9 percent.
- The TP sensor signal voltage has a difference of greater than 9 percent from the calculated TP sensor signal voltage.

DTC P0122

The ECM detects the TP sensor 1 signal voltage is less than 0.18 volt.

DTC P0123

The ECM detects the TP sensor 1 signal voltage is greater than 4.6 V.

DTC P0221

The following conditions exist:

- The TP sensor 2 signal voltage and the TP sensor 1 signal voltage have a difference of greater than 9 percent.
- The TP sensor 2 signal voltage has a difference of greater than 9 percent from the calculated TP sensor signal voltage.

DTC P0222

The ECM detects the TP sensor 2 signal voltage is less than 0.16 volt.

DTC P0223

The ECM detects the TP sensor 2 signal voltage is greater than 4.8 V.

Conditions for Clearing the DTC

DTCs P0121, P0122, P0123, P0221, P0222 are P0223 are Type B DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when a Type B DTC sets and conditions for clearing Type B DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the TP sensor operation.
- The ECM defaults to a reduced power mode if there is a fault condition in the TP sensor circuits for the entire ignition cycle, even if the fault condition is corrected.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- The TP sensors share a common 5 V reference circuit, test for a fault condition in the 5 V reference circuit if both DTCs P0122 and P0222 are set.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

Test Description

The following number refers to the step number in the diagnostic table:

6 Measures the integrity of the TP sensor low reference circuit. Removal of the ECM Fuse 29 enables the ECM to power down completely prior to the test procedure.

DTC P0121, P0122, P0123, P0221, P0222 or P0223 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Quickly depress the accelerator pedal to wide-open throttle then release pedal. Repeat this procedure several times or operate the vehicle within the conditions for running the DTC. 4 Using Tech 2, select the DTC display function. Does DTC P0121, P0122, P0123, P0221, P0222 or P0223 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	1 Disconnect the throttle actuator wiring connector. 2 Switch on the ignition with the engine not running. 3 Using a digital multimeter, measure the voltage between the TP sensor 5 V reference circuit and the ECM housing. Does the multimeter display 4.8 – 5.2 V?	Go to Step 4	Go to Step 7
4	1 Connect a 3 A fused jumper wire between the TP sensor 5 V reference circuit and the TP sensor 1 signal circuit. 2 Switch on the ignition with the engine not running. 3 Using Tech 2, observe the TP sensor 1 voltage parameter. Does Tech 2 display **4.8 – 5.2 V**?	Go to Step 5	Go to Step 8
5	1 Connect a 3 A fused jumper wire between the TP sensor 5 V reference circuit and the TP sensor 2 signal circuit. 2 Using Tech 2, observe the TP sensor 2 voltage parameter. Does Tech 2 display **4.8 – 5.2 V**?	Go to Step 6	Go to Step 9
6	1 Switch off the ignition. 2 Remove ECM Fuse 29 from the engine compartment fuse and relay panel assembly. 3 Using a digital multimeter, measure the resistance between the TP sensor low reference circuit and the ECM housing. **NOTE** Install the ECM Fuse 29 to the engine compartment fuse and relay panel assembly after completing the test. Does the multimeter display 5 Ω?	Go to Step 11	Go to Step 10

Step	Action	Yes	No
7	**NOTE** TP sensor 1 share the 5 V reference circuit with TP sensor 2. A fault condition in the TP sensor 5 V reference circuit may trigger DTCs on both sensors. Test the TP sensor 5 V reference circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 13	Go to Step 12
8	Test the TP sensor 1 signal circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 13	Go to Step 12
9	Test the TP sensor 2 signal circuit for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 13	Go to Step 12
10	Test the TP sensor low reference circuit for a high resistance or an open circuit fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 13	Go to Step 12
11	Replace the throttle body assembly. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 13	—
12	Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 13	—
13	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any of the TP Sensor Circuit DTCs fail this ignition cycle?	Go to Step 2	Go to Step 14
14	Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298

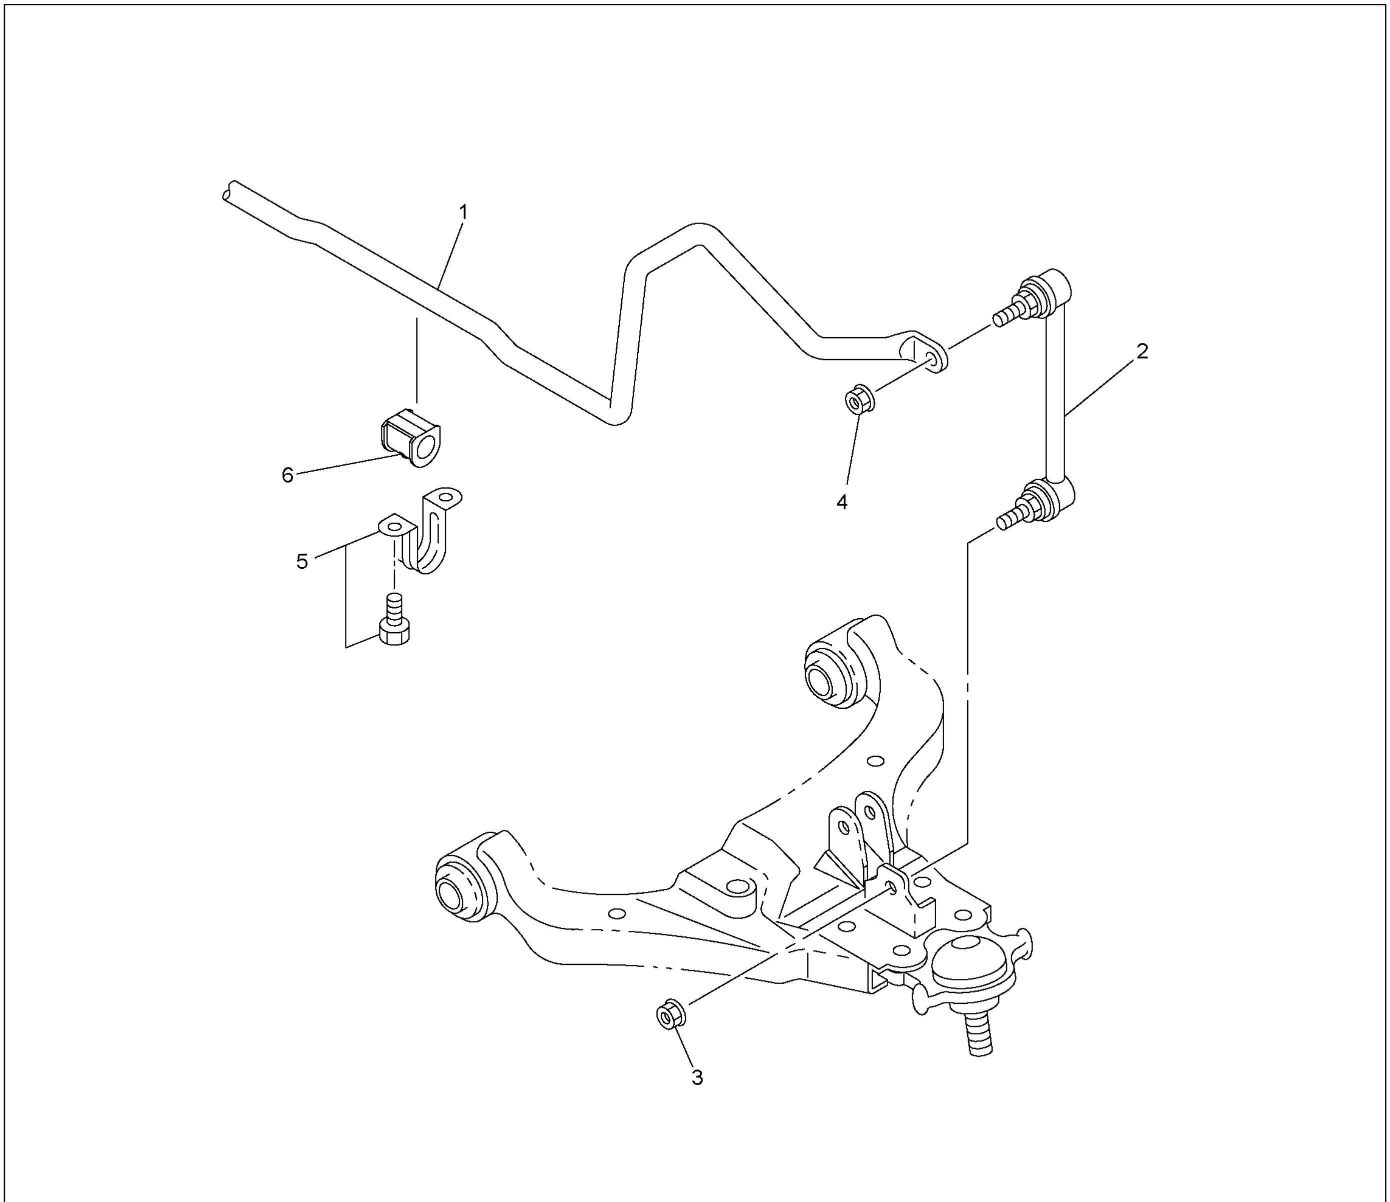
DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0130 – O2 Sensor Circuit Malfunction (Bank 1, Sensor 1)

Stabilizer Bar

Stabilizer Bar and Associated Parts



RTW340LF000901

Legend

(1) Stabilizer Bar
(2) Link
(3) Link Nut
(4) Link Nut
(5) Bracket and Bolt
(6) Rubber Bushing

Removal

1. Raise the vehicle and support the frame with suitable safety stands.
2. Remove wheel and tire assembly. Refer to Wheel Replacement in this section.
3. Remove link nut.

CAUTION: Be careful not to damage the ball joint boot.

4. Remove link.
5. Remove bracket and bolt.
6. Remove stabilizer bar.
7. Remove rubber bushing.

- DTC P0131 – O2 Sensor Circuit Low Voltage (Bank 1, Sensor 1)
- DTC P0132 – O2 Sensor Circuit High Voltage (Bank 1, Sensor 1)
- DTC P0133 –
- DTC P0135 – O2 Sensor Heater Circuit Range / Performance (Bank 1, Sensor 1)
- DTC P0137 – O2 Sensor Circuit Low Voltage (Bank 1, Sensor 2)
- DTC P0138 – O2 Sensor Circuit High Voltage (Bank 1, Sensor 2)
- DTC P0140 – O2 Sensor Circuit No Activity Detected (Bank 1, Sensor 2)
- DTC P0141 – O2 Sensor Heater Circuit Range / Performance (Bank 1, Sensor 2)
- DTC P0150 – O2 Sensor Circuit Malfunction (Bank 2, Sensor 1)
- DTC P0151 – O2 Sensor Circuit Low Voltage (Bank 2, Sensor 1)
- DTC P0152 – O2 Sensor Circuit High Voltage (Bank 2, Sensor 1)
- DTC P0155 –O2 Sensor Heater Circuit Range / Performance (Bank 2, Sensor 1)
- DTC P0157 – O2 Sensor Circuit Low Voltage (Bank 2, Sensor 2)
- DTC P0158 – O2 Sensor Circuit High Voltage (Bank 2, Sensor 2)
- DTC P0160 – O2 Sensor Circuit No Activity Detected (Bank 2, Sensor 2)
- DTC P0161 – O2 Sensor Heater Circuit Range / Performance (Bank 2, Sensor 2)
- DTC P2243 – O2 Sensor Voltage Signal Circuit Malfunction (Bank 1, Sensor 1)
- DTC P2247 – O2 Sensor Voltage Signal Circuit Malfunction (Bank 2, Sensor 1)
- DTC P2270 – O2 Sensor Lean / Rich Switch Signal Malfunction (Bank 1, Sensor 2)
- DTC P2271 – O2 Sensor Rich / Lean Switch Signal Malfunction (Bank 1, Sensor 2)
- DTC P2272 – O2 Sensor Lean / Rich Switch Signal Malfunction (Bank 2, Sensor 2)
- DTC P2273 – O2 Sensor Rich / Lean Switch Signal Malfunction (Bank 2, Sensor 2)
- DTC P2297 – O2 Sensor Range / Performance During Deceleration Fuel Cutoff (Bank 1, Sensor 1)
- DTC P2298 – O2 Sensor Range / Performance During Deceleration Fuel Cutoff (Bank 2, Sensor 1)

Circuit Description

The engine control relay applies positive voltage to the heater ignition voltage circuits of the HO2S. The ECM applies a pulse width modulated (PWM) ground to the heater control circuit of the HO2S through a device within the ECM called a driver, to control the HO2S rate of heating.

HO2 Sensor 2

The ECM applies a voltage of approximately 450 mV between the reference signal circuit and low reference circuit of the HO2S while the sensor temperature is less than the operating range.

Once the HO2S reaches operating temperature, the sensor varies this reference signal voltage, which constantly fluctuates between the high voltage output and the low voltage output.

- The low voltage output is 0 – 450 mV, which occurs if the air fuel mixture is lean.
- The high voltage output is 450 – 1,000 mV, which occurs if the air fuel mixture is rich.

The ECM monitors, stores and evaluates the HO2S voltage fluctuation information to determine the level of oxygen concentration in the exhaust.

HO2 Sensor 1

The ECM maintains the voltage between the reference signal circuit and low reference circuit of the HO2S 1 to about 450 mV by increasing or decreasing the oxygen content in the HO2S diffusion gap. To achieve this, the ECM controls the current applied to the oxygen pumping cell in the HO2S

The pumping current required to maintain the HO2S 1 signal circuit voltage to about 450 mV is proportional to the level of oxygen concentration in the exhaust gas.

- If the air/fuel mixture in the exhaust is balanced (lambda = 1), the oxygen pumping cell current is zero.
- If the exhaust gas in the HO2S 1 diffusion gap is lean, the ECM applies a positive current to the oxygen pumping cell to discharge oxygen from the diffusion gap.
- If the exhaust gas in the HO2S 1 diffusion gap is rich, the ECM applies a negative current to the oxygen pumping cell to draw oxygen into the diffusion gap.

The ECM monitors and evaluates the oxygen pumping current to determine the level of oxygen concentration in the exhaust.

An HO2S reference circuit DTC sets if the ECM detects the HO2S signal voltage is outside the predetermined range for a specified period.

Conditions for Running the DTC

DTC P0130, P0131, P0132, P0137, P0138, P0140, P0150, P0151 or P0152

Run continuously once the following conditions are met:

- The ignition voltage is 10.0 – 16.0 V.
- The engine is running.

DTC P0135 and P0155

Condition 1

Run continuously once the following conditions are met:

- DTCs P0030, P0031, P0032, P0050, P0051, P0052, P0101, P103, P0121, P0122, P0123, P0131, P0132, P0151, P0152, P0221, P0222, P0223, P0335, P0336, P0338, P2237, P2240, P2243, P2247, P2251 and P2254 ran and passed.
- The ignition voltage is 10.0 – 16.0 V.
- The HO2S is at operating temperature.
- The ECM internal sensing element resistance test is enabled.

Condition 2

Run continuously once the following conditions are met:

- DTCs P0030, P0031, P0032, P0050, P0051, P0052, P0101, P103, P0121, P0122, P0123, P0131, P0132, P0151, P0152, P0221, P0222, P0223, P0335, P0336, P0338, P2237, P2240, P2243, P2247, P2251 and P2254 ran and passed.
- The ignition voltage is 10.0 – 16.0 V.
- The HO2S is at operating temperature.
- The ECM internal sensing element resistance test is enabled.
- The fuel injectors are not disabled.
- If the engine is operating and the ignition is turned off, the engine must be off for at least 5 minutes for this DTC to run.

DTC P0137 and P0157

Run continuously once the following conditions are met:

- DTCs P0117, P0118, P0125 and P0128 ran and passed.
- The engine is operating for longer than two minutes.
- The ignition voltage is 10.0 – 16.0 V.
- The HO2S is at operating temperature.

- The calculated exhaust temperature is 250ºC – 800ºC.
- The engine coolant temperature is less than 40ºC at start-up and greater than 60ºC when the ignition was turned off last ignition cycle.
- The fuel tank level is greater than 25 percent.

DTC P0138 and P0158

Run continuously once the following conditions are met:

- The engine is operating for longer than two minutes.
- The ignition voltage is 10.0 – 16.0 V.
- The HO2S is at operating temperature.
- The calculated exhaust temperature is 250ºC – 800ºC.

DTC P0140 and P0160

Run continuously once the following conditions are met for longer than 90 seconds:

- The engine is operating.
- The ignition voltage is 10.0 – 16.0 V.
- The calculated exhaust temperature is 250º C – 800º C.

DTC P0141 and P0161

Run continuously once the following conditions are met:

- DTCs P0036, P0037, P0038, P0056, P0057, and P0058 ran and passed.
- DTCs P0137, P0138, P0140, P0157, P0158, or P0160 are not set.
- The engine is operating.
- The ECM internal sensing element resistance is valid.
- The fuel system is not in decel fuel shut-off.
- The intake air temperature is greater than -7ºC.
- If the engine is operating and the ignition is turned off, the engine must be off for at least 5 minutes for this DTC to run.
- The ignition voltage is 10.0 – 16.0 V.
- The calculated exhaust temperature is 360ºC – 500ºC.

DTC P2243 and P2247

Run continuously once the following conditions are met:

- DTCs P0030, P0031, P0032, P0050, P0051 and P0052 ran and passed.
- The ECM internal sensing element resistance is greater than 570 Ω.
- The HO2S is at operating temperature.

DTC P2270 and P2272

Run continuously once the following conditions are met:

- DTCs P0036, P0037, P0038, P0056, P0057, P0058, P0137, P0138, P0140, P0141, P0157, P0158, P0160, P0161, P0342, P0343, P0443, P0458 and P0459 ran and passed.
- The engine is running.
- The HO2S 2 are at operating temperature for longer than 10 seconds.
- The long term fuel control is enabled.

- The MAF sensor is greater than 10 g/s.

DTC P2297 and P2298

Condition 1

Run continuously once the following conditions are met:

- DTCs P0130 and P0150 ran and passed.
- The HO2S 1 are at operating temperature.
- The desired HO2S 1 signal is less than 1.6 lambda.
- The internal ECM HO2S 1 signal voltage is less than 4.81 V.
- The fuel injectors are enabled.

Condition 2

Run continuously once a decel fuel cut-off has occurred 11 times with successful adjustments

Conditions for Setting the DTC

DTC P0130 and P0150

The ECM detects the HO2S signal voltage is out of range.

DTC P0131 and P0151

The ECM internal HO2S voltage is less than the specified threshold.

DTC P0132 and P0152

The ECM internal HO2S voltage is less than the specified threshold.

DTC P0135 and P0155

Condition 1

The ECM internal HO2S sensing element resistance is less than the specified threshold for longer than 15 seconds.

Condition 2

The ECM detects the calculated HO2S temperature is greater than a predetermined threshold.

DTC P0137 and P0157

The ECM detects the HO2S signal voltage is less than 60 mV.

DTC P0138 and P0158

The ECM detects the HO2S signal voltage is greater than 1050 mV.

DTC P0140 and P0160

The ECM detects one of the following conditions:

- The HO2S signal voltage is 400 – 500 mV for longer than 5 minutes, or
- the internal resistance of the HO2S is greater than 40,000 Ω when the calculated exhaust temperature is greater than 600ºC.

DTC P0141 and P0161

The ECM detects the HO2S internal resistance is not within the expected range for longer than 6 seconds.

DTC P2243 and P2247

The ECM detects the internal HO2S signal voltage is not 0.2 – 4.7 V.

DTC P2270 and P2272

When the ECM detects the HO2S 2 is less than 650 mV for 100 seconds, the ECM enriches the fuel mixture up to 30 percent for 10 seconds. This DTC sets if the ECM detects the HO2S 2 is still less than 650 mV.

DTC P2271 and P2273

When the ECM detects the HO2S 2 is greater than 650 mV for 100 seconds, the ECM leans the fuel mixture up to -7 percent for 10 seconds. If this signal voltage is still greater than 650 mV, the ECM tests the HO2S at the next decel fuel cut-off. This DTC sets if the ECM detects the HO2S 2 signal voltage is greater than 200 mV after 4 seconds in decel fuel cu-off mode.

DTC P2297 and P2298

The ECM detects the internal HO2S 1 signal voltage is greater than 3.7 V for longer than 10 seconds.

Conditions for Clearing the DTC

The HO2S reference circuit DTCs are Type B DTCs. Refer to 1.4 Diagnostic Trouble Codes in this Section, for action taken when Type B DTC sets and conditions for clearing Type B DTCs.

Additional Information

- Refer to 6C1-1 Engine Management – V6 – General Information for details of the HO2S system operation.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- The HO2S must be tightened correctly. A loose HO2S will trigger these DTCs.
- A fault condition in the fuel delivery system, air intake system or exhaust system may trigger these DTCs.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section, for the system wiring diagram and connector charts.

DTC P0130 to P0132, P0135 to P0138, P0140, P0141, P0150 to P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270 to P2273, P2297 or P2298 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been performed?	Go to Step 2	Refer to 4.4 Diagnostic System Check in this Section
2	1 Switch off the ignition for 30 seconds. 2 Start the engine. 3 Allow the engine to reach the normal operating temperature. 4 Increase the engine speed to 2,000 rpm for 10 seconds or operate the vehicle within the conditions for setting the DTC. 5 Using Tech 2, select the DTC display function. Does DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150, P0151, P0152, P0155, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298 fail this ignition cycle?	Go to Step 3	Refer to Additional Information in this DTC
3	Are DTCs relating to the heater circuit of the O2 sensor, also set? (e.g. P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057 or P0058)	Go to the appropriate DTC Table in this Section	Go to Step 4

Step	Action	Yes	No
4	1 Disconnect the appropriate HO2S wiring connector. 2 Switch on the ignition with the engine not running. 3 Using a digital multimeter, measure the voltage between the HO2S reference signal circuit and low reference circuit. Does the multimeter display 350 – 550 mV?	Go to Step 7	Go to Step 5
5	1 Test the reference signal circuit of the HO2S for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 10	Go to Step 6
6	1 Test the low reference circuit of the HO2S for a high resistance, open circuit, short to ground or short to voltage fault condition. Refer to 8A Electrical - Body and Chassis for information on electrical fault diagnosis. Was any fault found and rectified?	Go to Step 10	Go to Step 9
7	1 Test or inspect for the following conditions that may cause the HO2S to detect an incorrect air / fuel mixture: – lean or rich fuel injector fuel delivery, – restricted air intake system, – contaminated fuel, – low fuel line pressure, – exhaust leak near the HO2S, and – leak in the crankcase or vacuum line. Was any fault found and rectified?	Go to Step 10	Go to Step 8
8	1 Replace the appropriate HO2S. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 10	—
9	1 Replace the ECM. Refer to 6C1-3 Engine Management – V6 – Service Operations. Was the repair completed?	Go to Step 10	—
10	1 Using Tech 2, clear the DTCs. 2 Switch off the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the conditions for running the DTC. Does any HO2S reference circuit DTC fail this ignition cycle?	Go to Step 2	Go to Step 11
11	1 Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, check the system for correct operation.			

7.11 DTC P0133 or P0153

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0133 – HO2S Circuit Slow Response – Bank 1 Sensor 1

- DTC P0153 – HO2S Circuit Slow Response – Bank 2 Sensor 1

Circuit Description

The wide band heated oxygen sensor (HO2S) measures the amount of oxygen in the exhaust system and provides more information than the switching style HO2S. The wide band sensor consists of an oxygen sensing cell, an oxygen pumping cell, and a heater.

The exhaust gas sample passes through a diffusion gap between the sensing cell and the pumping cell. The engine control module (ECM) supplies a voltage to the HO2S and uses this voltage as a reference to the amount of oxygen in the exhaust system. An electronic circuit within the ECM controls the pump current through the oxygen pumping cell to maintain a constant voltage in the oxygen sensing cell. The ECM monitors the voltage variation in the sensing cell and attempts to keep the voltage constant by increasing or decreasing the amount of current flow, or oxygen ion flow, to the pumping cell.

By measuring the amount of current required to maintain the voltage in the sensing cell, the ECM can determine the concentration of oxygen in the exhaust. The HO2S voltage is displayed as a lambda value. A lambda value of 1 is equal to a stoichiometric air fuel ratio of 14.7:1. Under normal operating conditions, the lambda value will remain around 1. When the fuel system is lean, the oxygen level will be high and the lambda signal will be high or more than 1. When the fuel system is rich, the oxygen level will be low, and the lambda signal will be low or less than 1. The ECM uses this information to maintain the correct air / fuel ratio.

Conditions for Running the DTC

- Before the ECM can report DTC P0133 or P0153 failed, DTCs P0121, P0122, P0123, P0221, P0222, P0223, P0336, P0338, P2237, and P2240 must run and pass.
- DTCs P0030, P0031, P0032, P0050, P0051, P0052, P0053, P0059, P0130, P0131, P0132, P0135, P0150, P0151, P0151, P0152, P0155, P0442, P0443, P0446, P0455, P0458, P0459, P0496, P167A, P167B, P2096, P2097, P2098, P2099, P2231, P2234, P2243, P2247, P2251, P2254, P2297, P2298, P2626, and P2629 are not set.
- The HO2S is at operating temperature.
- The HO2S is between 0.94 – 1.06 lambda.
- The engine speed is between 1,480 – 2,040 rpm.
- The volumetric efficiency is between 16.5 – 38.3 percent.
- The change in volumetric efficiency is less than 3 percent.
- The evaporative emission (EVAP) purge is not active, or the ECM determines the EVAP hydrocarbon (HC) concentration is less than a predetermined amount when EVAP purge is active.
- The long term fuel trim correction is active.
- DTCs P0133 and P0153 run continuously once the above conditions are met for 10 minutes.

Conditions for Setting the DTC

- The ECM has determined that the dynamic value of the affected HO2S is less than a predetermined threshold.
- The above condition is met for more than 4 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) on the second consecutive ignition cycle that the diagnostic runs and fails.
- The control module records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive ignition cycle, the control module records the operating conditions at the time of the failure. The control module writes the operating conditions to the Freeze Frame and updates the Failure Records.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the malfunction indicator lamp (MIL) after four consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC, Last Test Failed, clears when the diagnostic runs and passes.

- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- Use Tech 2 to clear the MIL/DTC.

Additional Information

- Use the J 35616 Connector Test Adapter Kit for any test that requires probing the ECM harness connector or a component harness connector.
- The lower connector of the ECM is connector A43-X1 and the upper connector of the ECM is connector A43-X2. Refer to 3 Wiring Diagrams and Connector Charts in this Section.
- The front wide band sensors do not toggle or switch like a switching HO2S. The front HO2S signals will be relatively stable for an idling engine.
- For an intermittent fault condition, refer to 5.2 Intermittent Fault Conditions in this Section.
- Since fault condition in a wiring connector may trigger DTCs, always test the connectors related to this diagnostic procedure for shorted terminals or poor wiring connection before replacing any component. Refer to 8A Electrical-Body and Chassis for information on electrical fault diagnosis.
- To assist diagnosis, refer to 3 Wiring Diagrams and Connector Charts in this Section for the system wiring diagram and connector charts.
- The following table illustrates the typical voltages for the HO2S circuits:

HO2S Voltages	
Conditions: • Ignition ON, Engine OFF • HO2S Disconnected	
HO2S Circuit	**Voltage**
Heater Control	4.6 – 5.0 V
Heater Supply Voltage	B+
Reference Voltage	2.6 – 3.1 V
Low Reference	2.2 – 2.7 V
Pump Current	Less than 0.5 A
Input Pump Current	Less than 0.5 A

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2 This step determines if the condition exists.

4 This step determines if the fuel system is contaminated.

DTC P0133 or P0153 Diagnostic Table

Step	Action	Yes	No
1	Has the Diagnostic System Check been completed?	Go to Step 2	Refer to 4.4 Diagnostic System Check

Step	Action	Yes	No
2	**NOTE** • DTC P0133 is for bank 1 sensor 1 and DTC P0153 is for bank 2 sensor 1. • DTC P0132 causes DTC P0153 to set. If DTC P0132 is set with DTC P0153, refer to 7.10 DTC P0130, P0131, P0132, P0135, P0137, P0138, P0140, P0141, P0150 P0151, P0152, P0155, P0157, P0158, P0160, P0161, P2243, P2247, P2270, P2271, P2272, P2273, P2297 or P2298 in this Section. • Inspect the heated oxygen sensor (HO2S) for being secure before proceeding with this DTC. A sensor that is loose could cause this DTC to set. 1 Start engine and allow to reach operating temperature. 2 Observe the diagnostic trouble code (DTC) information with Tech 2. Did DTC P0133 and / or DTC P0153 fail this ignition cycle?	Go to Step 4	Go to Step 3
3	1 Observe the Freeze Frame / Failure Records for this DTC. 2 Turn OFF the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame / Failure Records. Did the DTC fail this ignition?	Go to Step 4	Go to Additional Information in this DTC
4	Did DTC P0133 and DTC P0153 fail this ignition cycle?	Go to Step 7	Go to Step 5
5	1 Inspect for an exhaust leak near the HO2S. Refer to 6F Exhaust System – V6. After you inspect the exhaust system, return to this diagnostic. Did you find and correct the condition?	Go to Step 8	Go to Step 6
6	1 Inspect or test for the following conditions: • Inspect that the HO2S is securely installed. • Inspect for corrosion on the HO2S terminals. • Inspect the terminal tension at the HO2S and at the engine control module (ECM). Refer to 8A Electrical-Body and Chassis. • Inspect the HO2S wiring for damage. Did you find and correct the condition?	Go to Step 8	Go to Step 7

Step	Action	Yes	No
7	**NOTE** If both DTCs are set, determine and correct the cause of the contamination before replacing a sensor. 1 Inspect for the following conditions: • Fuel contamination – refer to 6.5 Alcohol / Contaminants in Fuel Diagnosis in this Section. • The correct RTV sealant. • Engine oil consumption – refer to 6A1 Engine Mechanical – V6. • Engine coolant consumption – refer to 6B1 Engine Cooling – V6. 2 Replace the HO2S. Refer to 6C1-3 Engine Management – V6 – Service Operations. Did you complete the replacement?	Go to Step 8	—
8	1 Use Tech 2 to Clear the DTCs. 2 Turn OFF the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame / Failure Records. Did the DTC fail this ignition?	Go to Step 2	Go to Step 9
9	1 Using Tech 2, select the DTC display function. Does Tech 2 display any DTCs?	Go to the appropriate DTC Table in this Section	System OK
When all diagnosis and repairs are completed, clear all DTCs and verify correct operation			

7.12 DTC P0139 or P0159

DTC Descriptors

This diagnostic procedure supports the following DTCs:

- DTC P0139 – O2 Sensor Circuit Slow Response (Bank 1 Sensor 2)
- DTC P0159 – O2 Sensor Circuit Slow Response (Bank 2 Sensor 2)

Circuit Description

The post catalytic converter heated oxygen sensor (HO2S) produces a voltage that varies between 100 – 900 mV under normal operating conditions. The engine control module (ECM) produces a bias voltage on the HO2S signal circuit of 420 – -480 mV. The reference ground for the sensor is provided through the ECM.

The ECM monitors the signal voltage to determine if the exhaust is lean or rich. The oxygen sensor voltage is high when the exhaust is rich, and low when the exhaust is lean. The ECM constantly monitors the HO2S signal during the Closed Loop operation. If the ECM detects that the decel fuel cut-off rich-to-lean transition time is too long, DTC P0139 will set for bank 1 sensor 2, or DTC P0159 will set for bank 2 sensor 2.

Conditions for Running the DTC

- DTCs P0021, P0024, P0030, P0031, P0032, P0036, P0037, P0038, P0050, P0051, P0052, P0056, P0057, P0058, P0101, P0102, P0103, P0106, P0107, P0108, P0116, P0117, P0118, P0121, P0122, P0123, P0125, P0128, P0131, P0132, P0135, P0137, P0138, P0139, P0140, P0141, P0151, P0152, P0155, P0157, P0158, P0159, P0160, P0161, P0201-P0208, P0221, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P0279, P0280, P0282, P0283, P0300, P0301-P0308, P0335, P0336,

Inspection and Repair

Make the necessary adjustments or parts replacement if wear, damage, corrosion or any other abnormal condition is found during inspection.

Check the following parts:

- Stabilizer bar
- Rubber bushing
- Link ball joint

Installation

1. Install rubber bushing.
2. Install stabilizer bar.
3. Install bracket and bolt then tighten it to the specified torque.

Torque: 25 N·m (2.5 kgf·m/18 lb·ft)

4. Install link.
5. Install link nut, then tighten it to the specified torque.

Torque: 50 N·m (5.1 kgf·m/37 lb·ft)

P0340, P0341, P0345, P0346, P0351-P0358, P0365, P0366, P0390, P0391, P0442, P0443, P0446, P0449, P0453, P0454, P0455, P0458, P0459, and P0496 are not set.

- The ECT Sensor parameter is more than 66° C.
- The Vehicle Speed Sensor parameter is between 5 – 180 km/h.
- The calculated catalytic converter temperature is more than 520° C.
- DTC P0139 or P0159 runs continuously once the above conditions are met.

Conditions for Setting the DTC

- The ECM detects that the decel fuel cut-off and rich-to-lean transition time has exceeded 1 second.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) on the second consecutive ignition cycle that the diagnostic runs and fails.
- The ECM records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the control module stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive ignition cycle, the control module records the operating conditions at the time of the failure.
- The ECM writes the operating conditions to the Freeze Frame and updates the Failure Records.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the malfunction indicator lamp (MIL) after three consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC, Last Test Failed, clears when the diagnostic runs and passes.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported by this or any other emission related diagnostic.
- Use Tech 2 to clear the MIL and the DTC.

DTC P0139 or P0159 Diagnostic Table

Step	Action	Value(s)	Yes	No
1	Has the Diagnostic System Check been completed?	—	Go to Step 2	Refer to 4.4 Diagnostic System Check
2	1 Start and run the engine until normal operating temperature is reached. 2 Quickly cycle the throttle from closed throttle to wide open throttle (WOT) 3 times within 5 seconds while observing the HO2S Bank 1 Sensor 2 or HO2S Bank 2 Sensor 2 voltage parameter with Tech 2. Does the voltage react immediately when performing the above action?	—	Go to Step 3	Go to Step 4
3	1 Observe the Freeze Frame / Failure Records for this DTC. 2 Turn OFF the ignition for 30 seconds. 3 Start the engine. 4 Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame / Failure Records. Did the DTC fail this ignition?	—	Go to Step 4	Go to 5.2 Intermittent Fault Conditions in this Section.

4	1 Ignition OFF. 2 Disconnect the affected heated oxygen sensor (HO2S) 2 3 Connect a 3 Amp fused jumper wire between the HO2S high signal circuit, on the engine harness side connector, and a good ground. 4 Ignition ON, engine OFF. 5 Use Tech 2 to observe the affected HO2S 2 parameter Is the voltage less than the specified value?	25 mV	Go to Step 5	Go to Step 7
5	1 Remove the jumper wire from the previous step. 2 Connect a 3 Amp fused jumper wire between the HO2S high signal circuit and the HO2S low signal circuit, on the engine harness side connector. 3 Use Tech 2 to observe the HO2S 2 parameter. Is the voltage less than the specified value?	25 mV	Go to Step 6	Go to Step 8
6	1 Remove the jumper wire from the previous step. 2 Measure the resistance of the following circuits with a DMM: • The HO2S heater low control circuit. • The ignition voltage circuit Refer to 8A Electrical-Body and Chassis. Is the resistance of either circuit more than the specified value?	5 Ω	Go to Step 12	Go to Step 9
7	1 Test the HO2S high signal circuit for an open or high resistance. Refer to 8A Electrical-Body and Chassis. Did you find and correct the condition?	—	Go to Step 15	Go to Step 11
8	1 Test the HO2S low signal circuit for an open or high resistance. Refer to 8A Electrical-Body and Chassis. Did you find and correct the condition?	—	Go to Step 15	Go to Step 11

9	1 The HO2S is detecting a rich or lean exhaust condition or may be contaminated. Inspect for one of the following conditions: • HO2S connector water intrusion. • A silicon-contaminated HO2S. • Fuel-contaminated engine oil – refer to 6.5 Alcohol / Contaminants in Fuel Diagnosis. • Rich fuel injectors. • Lean fuel injectors. Refer to 6C Fuel System – V6 • An exhaust leak between the HO2S and the engine. Refer to 6F Exhaust System – V6. • Vacuum leaks. • Fuel contamination. Water, even in small amounts, can be delivered to the fuel injectors, causing a lean exhaust to be indicated. Excessive alcohol in the fuel can also cause this condition. Refer to 6.5 Alcohol / Contaminants in Fuel Diagnosis in this Section. • An inaccurate mass air flow (MAF) sensor. 2 Repair any of the above or similar engine conditions, as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 10
10	1 Test for intermittent and poor connections at the HO2S. Refer to 8A Electrical-Body and Chassis. Did you find and correct the condition?	—	Go to Step 15	Go to Step 13
11	1 Test for intermittent and poor connections at the engine control module (ECM). Refer to 6C1-3 Engine Management – V6 – Service Operations. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
12	1 Repair the circuit with high resistance. Refer to 8A Electrical-Body and Chassis. Did you complete the repair?	—	Go to Step 15	—
