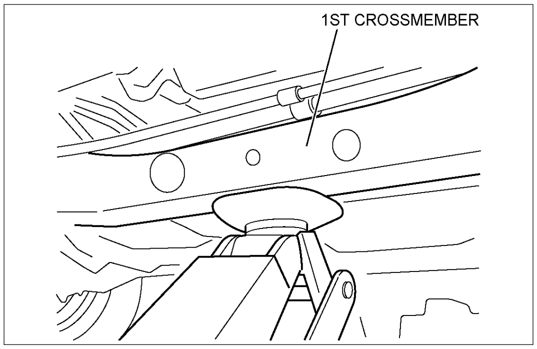
LIFTING POINT; FRONT

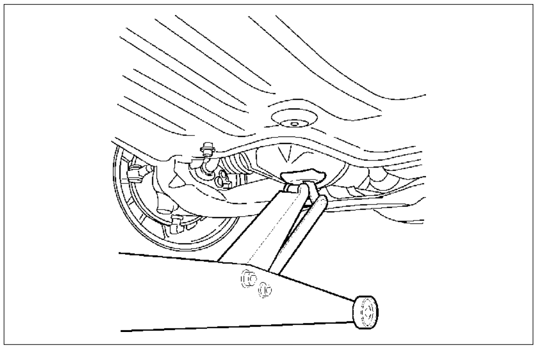
4×2 model



RUW50ASH000101

- When using floor jack, lift the center of 1st cross member.

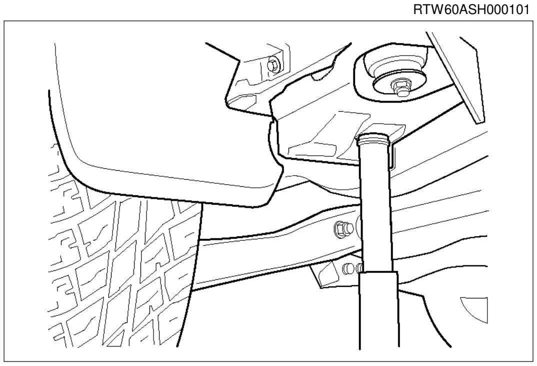
4×4 model



RTW60ASH000101

- When using floor jack, lift the center of front axle case.

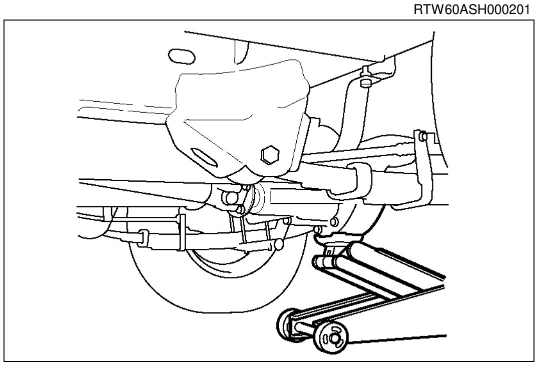
SUPPORTABLE POINT; FRONT



RTW60ASH000201

- Position the chassis stands at the bottom of the frame side member, backward of front wheel.

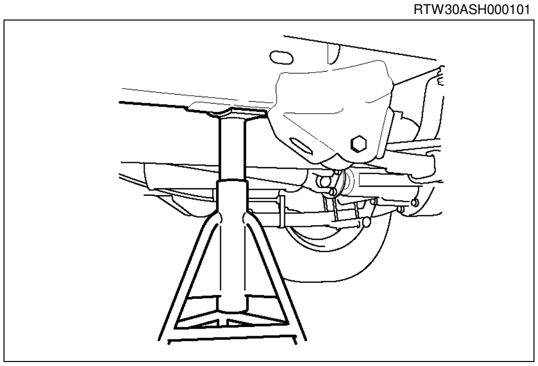
LIFTING POINT; REAR



RTW30ASH000101

- When using floor jack, lift the center of rear axle case.

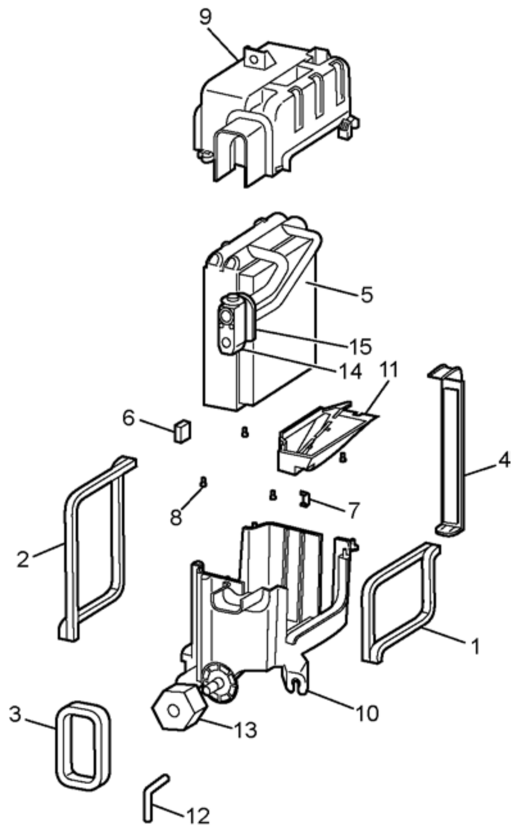
SUPPORTABLE POINT; REAR



RTW30ASH000201

- Position the chassis stands at the bottom of the frame side member, forward of the rear wheel.

DISASSEMBLY AND REASSEMBLY



This illustration is based on RHD model

RTW710MF000901

Disassembly Steps

1. Packing cooler outlet
2. Packing cooler inlet
3. Seal FOD cooler
4. Filter cover assembly
5. Air filter
6. Electronic thermostat
7. Clip heater
8. Attaching screws
9. Case : cooler upper

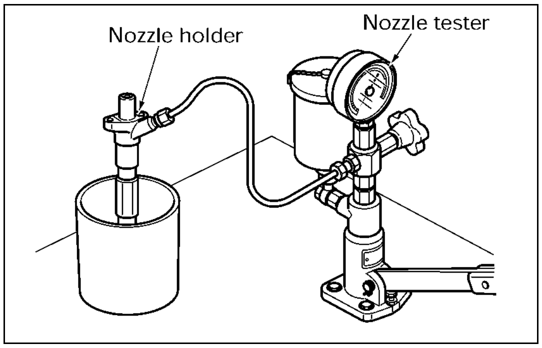
4. Filter cover assembly
3. Seal FOD cooler
2. Packing cooler inlet
1. Packing cooler outlet



040MV030.tif

4. Set the nozzle holder to the nozzle tester and check first nozzle opening pressure, spray condition, seat oil tightness and each part for oil leaks.
5. When replacing the nozzle, replace the nozzle, lift piece, pins and spacer as a set with the nozzle service kit.

CAUTION:

Pre-lift will not be as specified if only the nozzle is replaced.

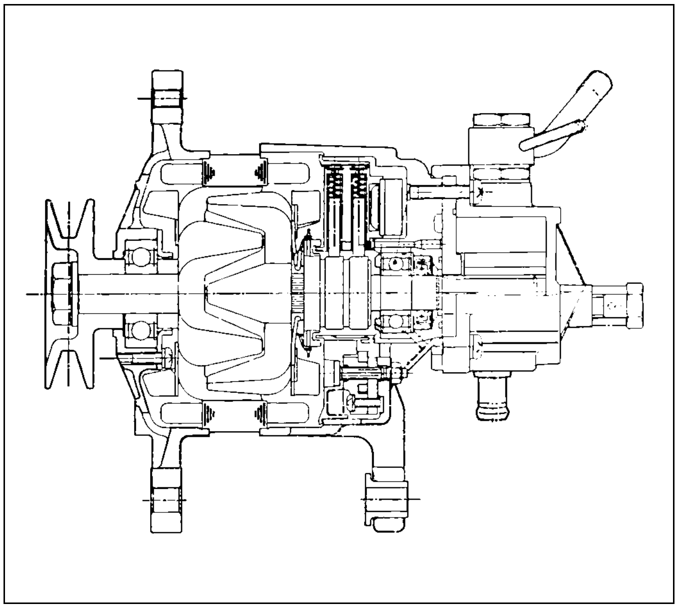
Weight	kg(lb)	4.7 (10.4)	

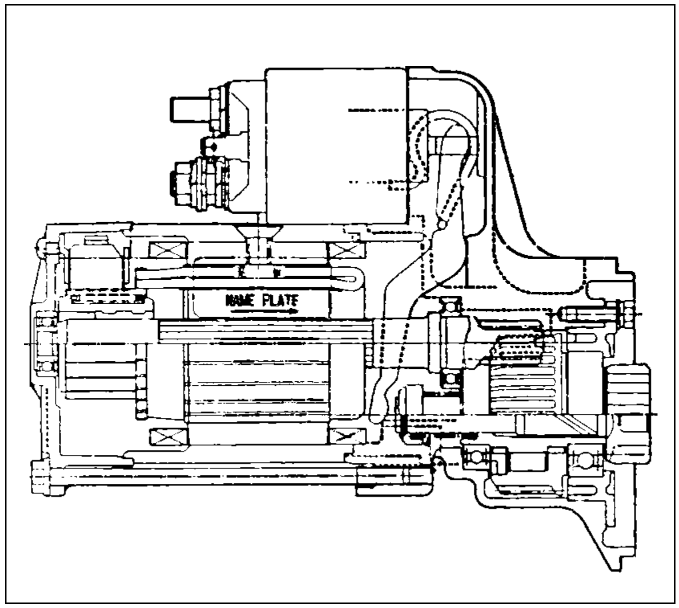
GENERAL DESCRIPTION

GENERATOR



066L300004

STARTER MOTOR



065L300002

The basic charging system is the IC integral regulator charging system. The internal components are connected electrically as shown in charging circuit diagram.
The generator features a solid state regulator that is mounted inside the generator. All regulator components are enclosed into a solid mold, and this unit along with the brush holder assembly is attached to the slip ring end frame. The generator voltage setting cannot be adjusted.
The starter motor circuit is composed of a 4-pole 4-brush type direct current series motor. The starter motor circuit utilizes negative ground polarity.

GENERATOR

REMOVAL AND INSTALLATION

Read this Section carefully before performing any removal and installation procedure. This Section gives you important points as well as the order of operation. Be sure that you understand everything in this Section before you begin.

P1010002

Important Operations-Removal

Cooling Fan Belt

1. Disconnect the battery cables at the battery terminals.
2. Loosen and remove the fan belt adjusting plate bolts.
3. Remove the fan belt from the generator drive pulley.

Generator

1. Remove the vacuum pump hose.
2. Remove the generator bolt and the generator from the bracket.

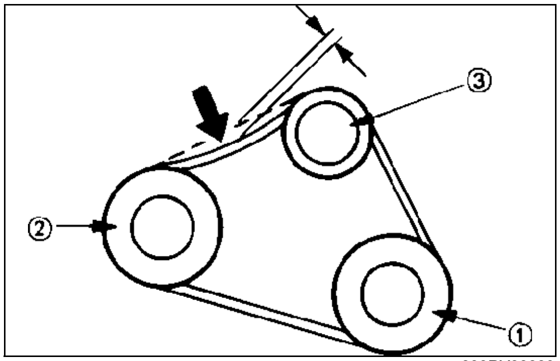
Important Operations-Installation

Follow the removal procedure in the reverse order to perform the installation procedure. Pay careful attention to the important points during the installation procedure.

Generator

1. Install the generator to the bracket.
2. Tighten the generator bolt to the specified torque.
3. Install the vacuum pump hose.

Generator Bolt Torque	N·m (kg·m/lb·ft)
40 (4.1/30)	



033RY00009

Cooling Fan Drive Belt

1. Hold the generator toward the engine.
2. Install the fan belt to the three pulleys.
   1 Crankshaft pulley
   2 Generator pulley
   3 Cooling fan drive pulley
3. Adjust the fan belt tension
   Fan belt tension is adjusted by moving the generator. Depress the drive belt mid-portion with a 98N (10 kg/22 lb) force.

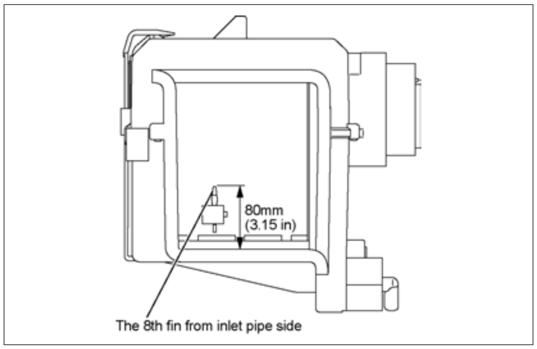
Cooling Fan Drive Belt Deflection mm (in)

New belt	4 - 7 (0.16 - 0.28)
Reuse belt	6 - 9 (0.24 - 0.35)

4. Tighten the adjusting plate bolts to the specified torque.

Adjusting Plate Bolt	N·m (kg·m/lb·ft)
19 (1.9/14)	

5. Reconnect the battery cable to the battery.



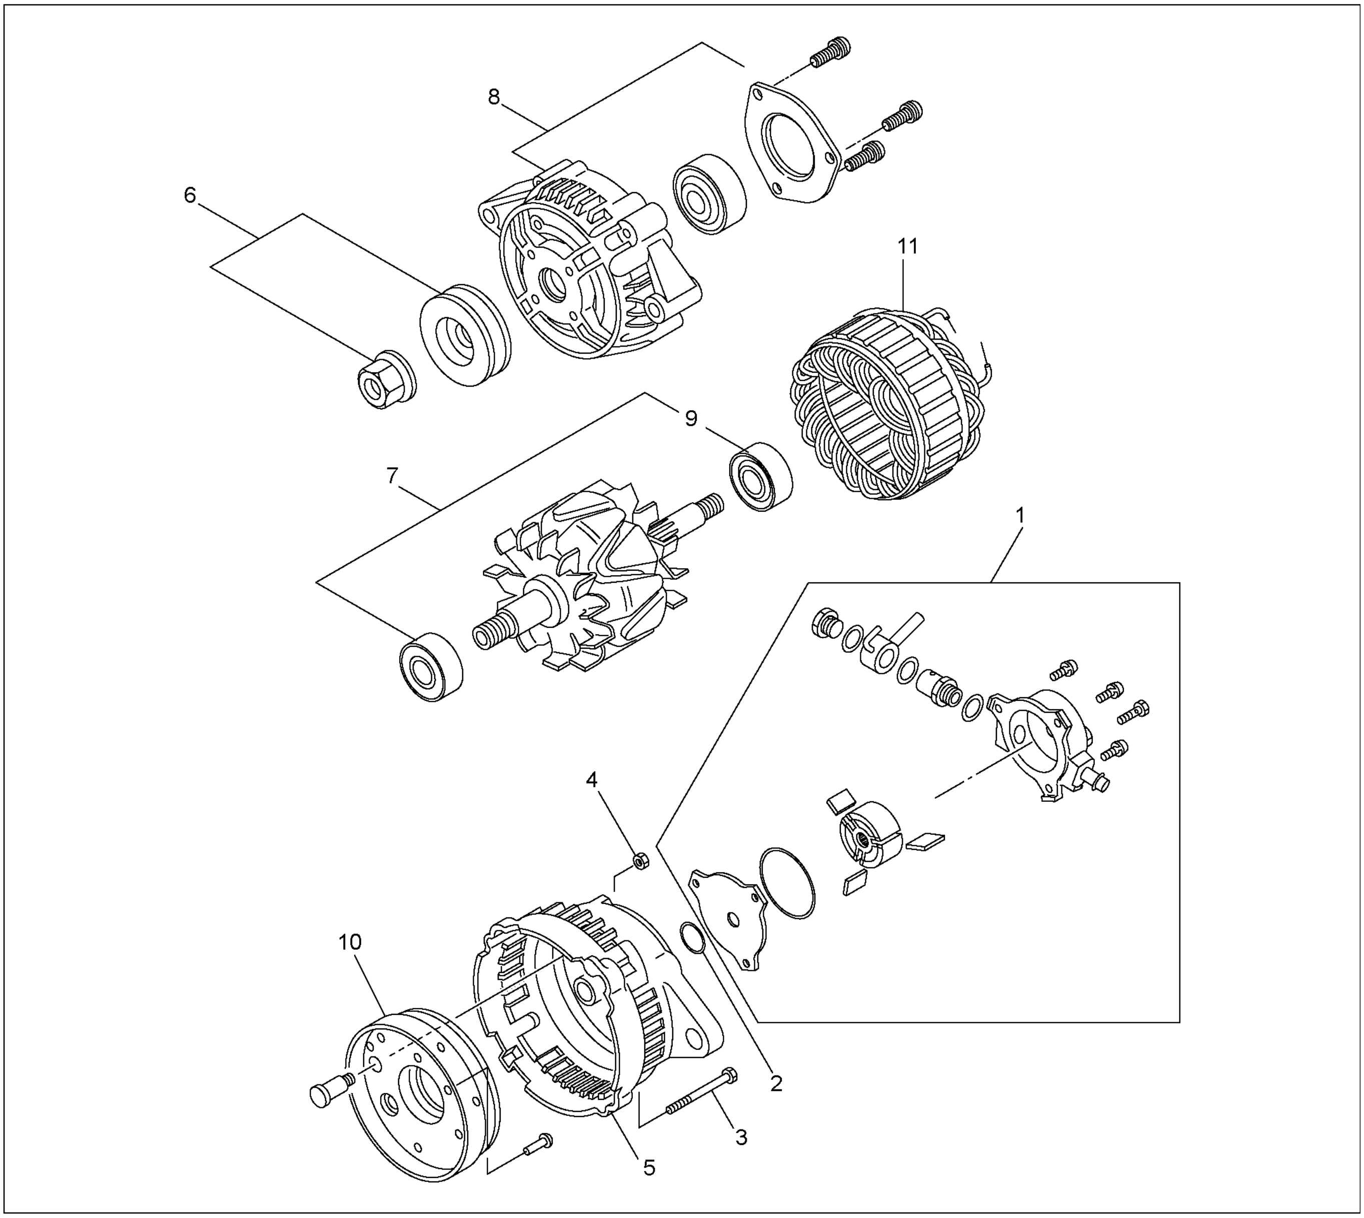
This illustration is based on RHD model

Important Operation -Reassembly

6. Electronic Thermostat

1) Install the electronic thermostat to the evaporator core specified position with the clip.
2) Sensor part must not interfere with the evaporator core.

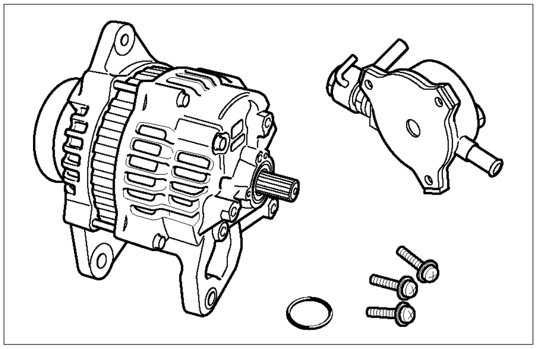
DISASSEMBLY



RTW46DLF000401

Disassembly Step

1. Vacuum pump
2. O-ring
3. Through bolt
4. B Terminal nut
5. Rear cover
6. Pulley
7. Rotor assembly
8. Front cover assembly
9. Rear rotor bearing
10. Rectifier assembly
11. Stator assembly
12. Rotor assembly



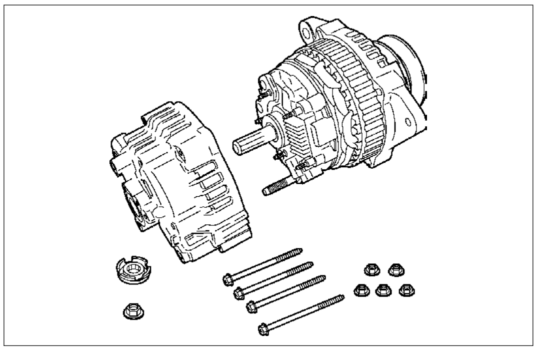
RTW46DSH000101

Important Operations

1. Vacuum Pump

1. Loosen the vacuum pump fixing screws.
2. Support the vacuum pump O-ring.
3. Carefully remove the O-ring.

2. Cover



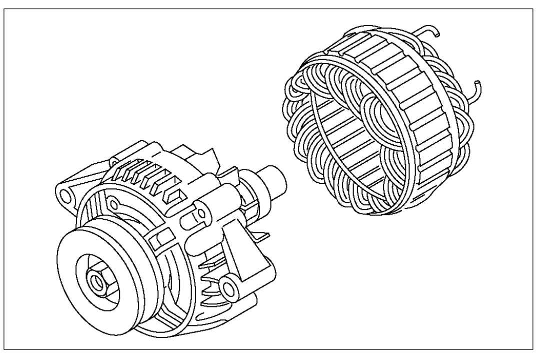
RTW46DSH000201

3. Through Bolt

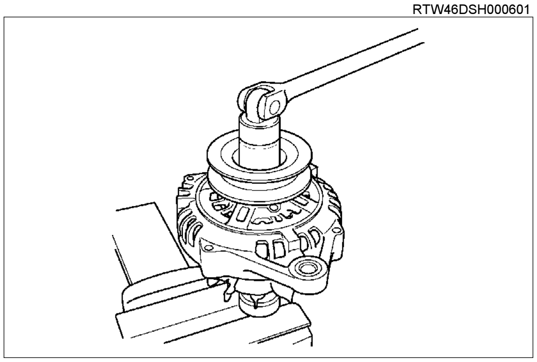
1. Remove the M5 through bolt.
2. Separate the front and rear sides of the vacuum pump.
3. Insert the tips of 2 ordinary screwdrivers into the space between the front cover and the stator core. Remove the front cover and rotor together with the rear cover and stator.

If removal is difficult, push the rear cover to the side and lightly tap the end of the shaft with a plastic hammer to loosen it.

- The front cover oil seal must be replaced with a new one when the front cover is removed.
- Take care not to damage the stator core with the screwdriver tips.



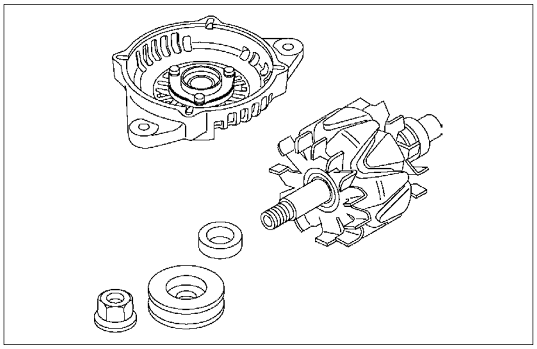
RTW46DSH000601



RTW46DSH002101

4. Pulley

1. Carefully clamp the rotor assembly in a vise.
2. Loosen the pulley nut.
3. Remove the pulley and the front cover from the rotor.

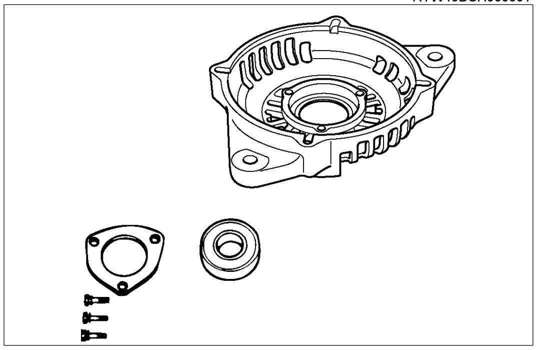


RTW46DSH000301

7. Rotor Assembly

1. Remove the rotor from front cover assembly.

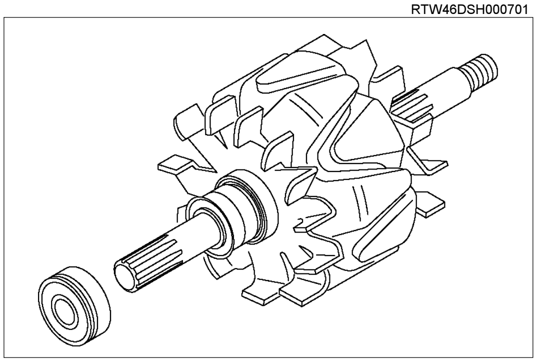
Remove the front cover stator and rectifier.



RTW46DSH000701

8. Front Cover Assembly

1. Remove the front cover bearing retainer screws.
2. Remove the bearing.



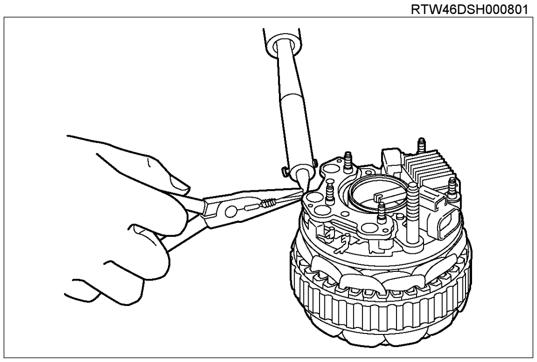
RTW46DSH000801

9. Rear rotor bearing

- Re-use improper parts.

10. Rectifier

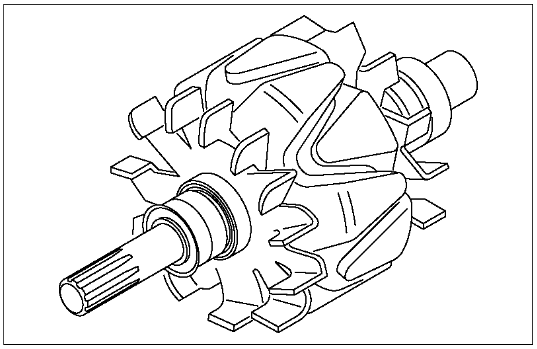
1. Disconnect the stator coil leads between each rectifier by melting the solder connection.
   Hold the lead wire between the solder and the rectifier with a pair of long nose pliers.
   This will prevent heat transfer and resultant damage to the rectifier.



RTW46DSH000401

INSPECTION AND REPAIR

Make the necessary adjustments, repairs, and part replacement if excessive wear or damage is discovered during inspection.



RTW06DSH000101

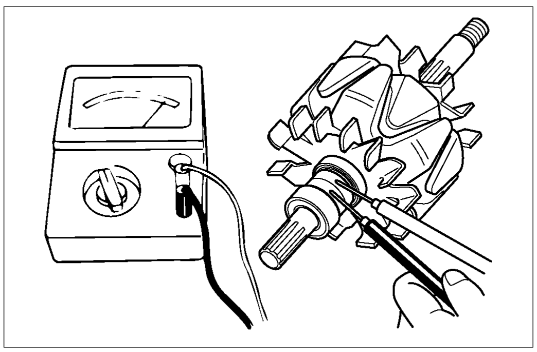
ROTOR ASSEMBLY

1. Inspect the slip ring faces for dirt and pitting.
   Wipe away any dirt with a clean cloth soaked in alcohol.
2. Measure the slip ring diameter.

Slip Ring Diameter mm (in)

Standard	Limit
31.6 (1.245)	30.6 (1.183)

If the slip ring diameter is less than the specified limit, the slip rings must be replaced.

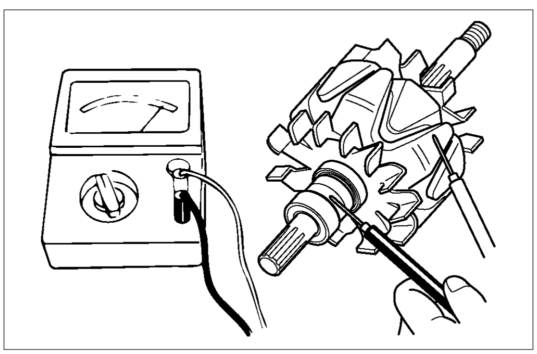


RTW46DSH001001

3. Measure the rotor coil resistance.

Rotor Coil Resistance at 20°C (68°F) ohms

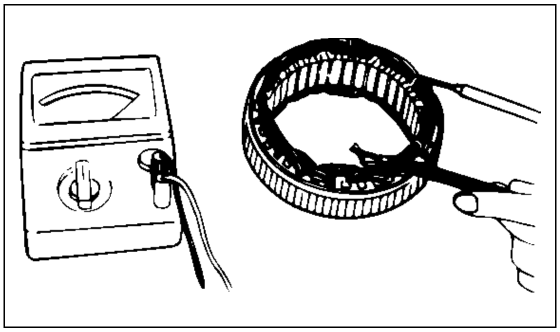
Standard	3.8



RTW46DSH001101

4. Check for continuity between the slip rings and the rotor core or shaft.
   If there is continuity, the entire rotor assmbly must be replaced.

STATOR COIL ASSEMBLY

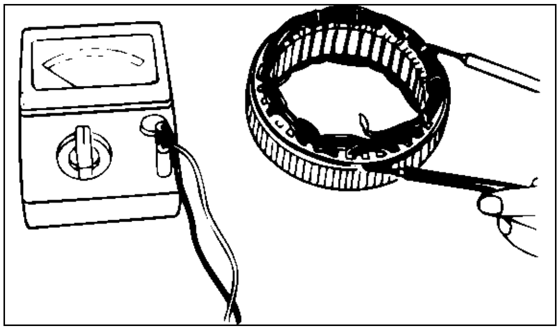


066RY00022

1. Check for continuity across the stator coils.
   If there is no continuity, the stator coils must be replaced.

Resistance Between The Terminal “N” and the Coil Ends (Reference) ohms

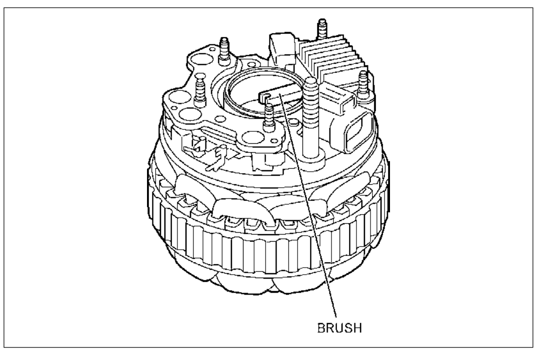
Standard	0.1



066RY00023

2. Check for continuity between each stator coils and the stator core.
   If there is continuity, the stator coils must be replaced.

BRUSH



RTW46DSH004801

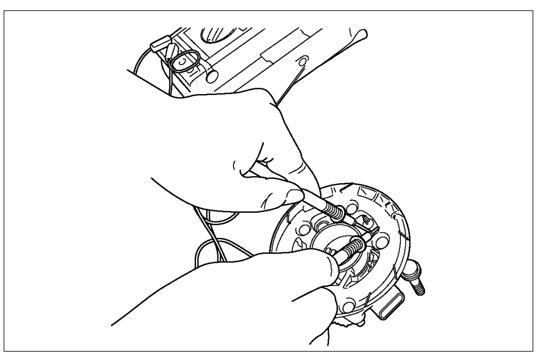
Measure the length of the brush. If abrasion has reduced the brush length to less than 6.5 mm, the brush must be replaced with a new one.

A wear line is inscribed in the brush. If the line is not visible, the brush must be replaced.

Brush Length (Reference) mm (in)

Standard	Limit
25 (1.0)	6.5 (0.25)

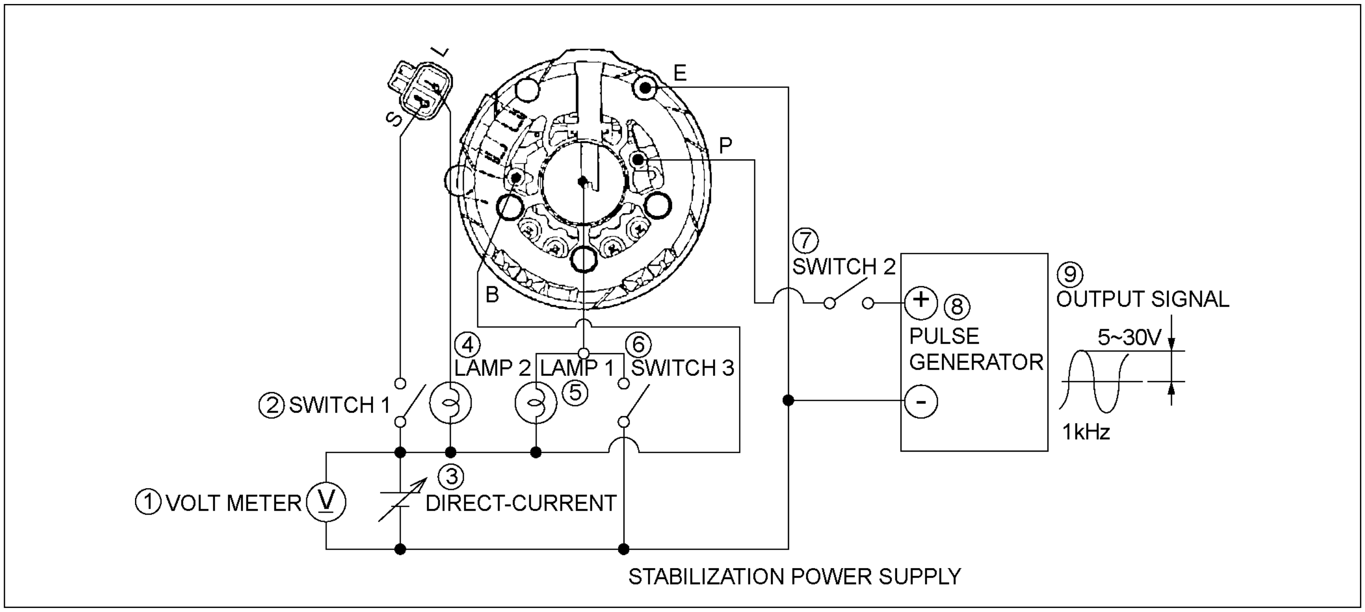
Rectifier



RTW46DSH001201

Tester wire						
E U, V, and WN	⊕	⊖		BAT U, V, and WN	⊕	⊖
⊕	-----	Conductivity		⊕	-----	No conductivity
⊖	No conductivity	-----		⊖	Conductivity	-----
Negative side diode check				Positive side diode check		

RECTIFIER ASSEMBLY



RTW46DSF000301

1. Voltmeter
2. Switch 1
3. DC regulated power supply
4. Lamp 2
5. Lamp 1
6. Switch 3
7. Switch 2
8. Pulse generator
9. Output signal

Test circuit

Refer to the judgment criteria shown in the Table below. Carefully check Items 1~5. If all the items are OK, the IC regulator is normal.

Circuit components

1	DC regulated power supply	0~20 volts variable with output of 1 ampere or more
2	Lamps (2)	12 volts, 1.4~3.4 watts
3	Switches (3)	-----
4	DC voltmeter	0~30 volts, 0.5 grade
5	Pulse generator (Oscillator)	5~30 volt output at a frequency of 1kHz

Judgment criteria

<table>
<tr><th rowspan="2">No.</th><th rowspan="2">Switch 1</th><th rowspan="2">Switch 2</th><th rowspan="2">Switch 3</th><th rowspan="2">Voltmeter reading</th><th colspan="2">Lamp condition</th><th rowspan="2">Remarks</th></tr>

<tr><td>5</td><td>ON</td><td>ON</td><td>ON</td><td>18V</td><td>On</td><td>Excess voltage check</td></tr>
</table>

Oil seal

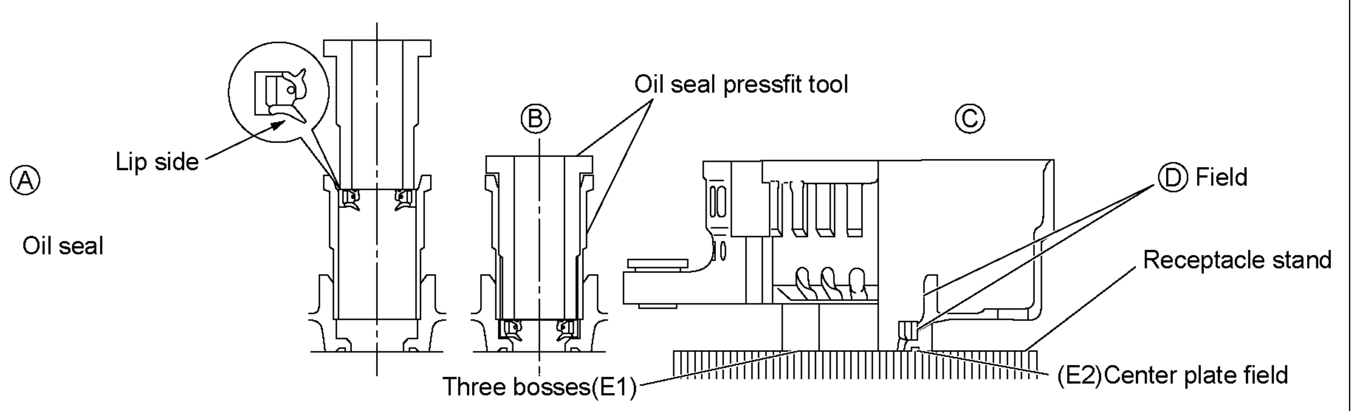
The oil seal must be replaced with a new one whenever the alternator is disassembled.

Oil Seal Replacement

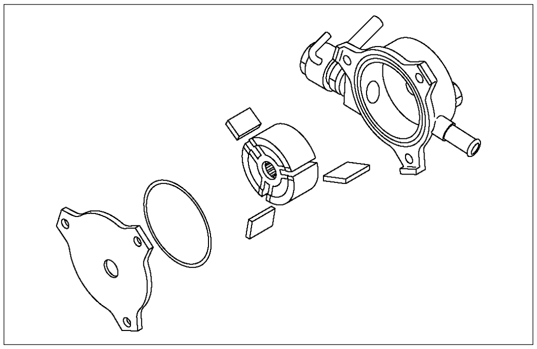
1. Push the old oil seal from the rear bracket outside holes.
2. Use the insertion tool to press the new oil seal into place. Follow the procedure shown in Figures A, B, C and D.
   - Position the oil seal beneath the shaft and the guide lip.
   - Position the cradle against the rear cover bosses (3 points) so that the E1 and E2 surfaces fit into the cradle. Take care not to damage the E1 and E2 surfaces.
   - After completing the procedure, carefully check the oil seal seating. Be absolutely sure that the seal is evenly inserted (no warp) and level with the surrounding surfaces.

Caution

- **Be sure that no foreign material enters the space between the oil seal and the rotor shaft surfaces during the installation procedure.**
- **Take care not to damage the D surface.**
- **Under no circumstances may the original oil seal be reused.**
- **The oil seal must be perfectly flat after being pressed into place. If the oil seal is tilted, there will be oil leakage.**



RTW46DSF000101



RTW46DSH000901

Vacuum Pump

Vacuum Pump Disassembly

1. Remove the center plate from the vacuum pump housing.
2. Remove the vacuum pump rotor and the vanes from the housing.

Inspection

Vacuum Pump Housing and Center Plate

Inspect the vacuum pump housing and the center plate for excessive wear, abrasion, and scoring.

If any of these conditions are present, the vacuum pump housing and center plate must be replaced.

Vane

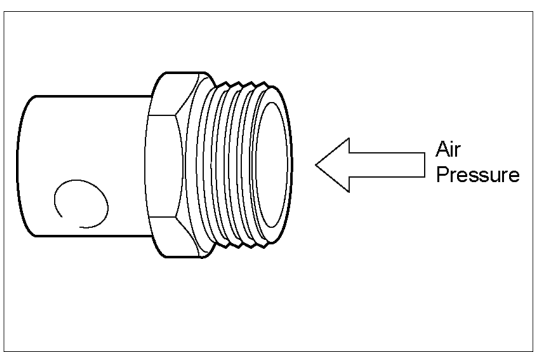
Inspect the vanes for excessive wear and damage.

Replace all four vanes if either of these conditions are present.

Never replace only one vane.

Rotor

1. Inspect the rotor for excessive wear, abrasion, and scoring.
   Pay particular attention to the internal spline.
   Replace the rotor if any of these conditions are present.
2. Inspect the generator rotor shaft splines for backlash.
   Replace the rotor if backlash is present.



RTW46DSH005201

Check Value

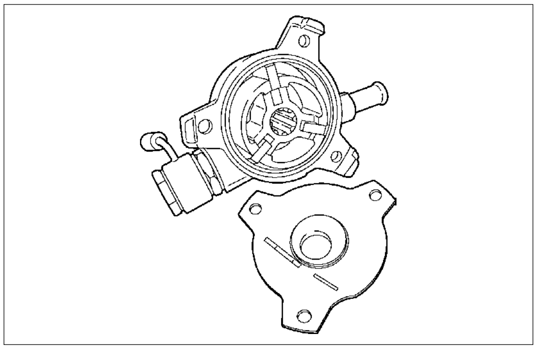
1. Carefully force the valve from the "B" side as shown in the illustration.
   The valve must move smoothly.
   If it does not, the check valve must be replaced.
2. Apply compressed air to the "A" side.

Air Pressure	kPa (kg/cm^2/psi)
98 - 490 (1-5/14 – 71)	

Check for air leakage from the check valve.

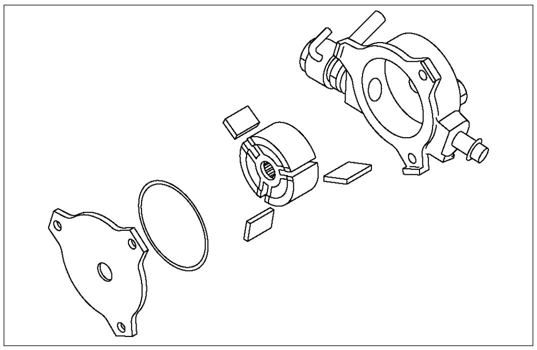
If there is air leakage, the valve must be replaced.

Vacuum Pump Reassembly



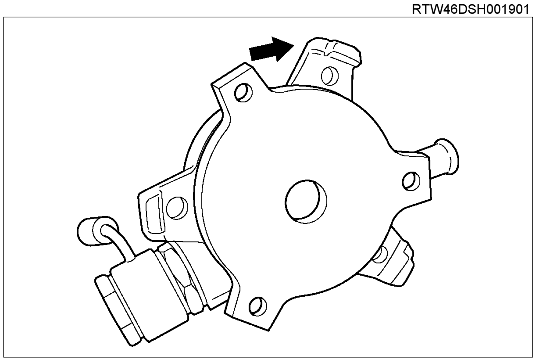
RTW46DSH001801

1. Install the vanes to the rotor slits.
   The rounded side of the vanes must be facing the rotor housing.



RTW46DSH001901

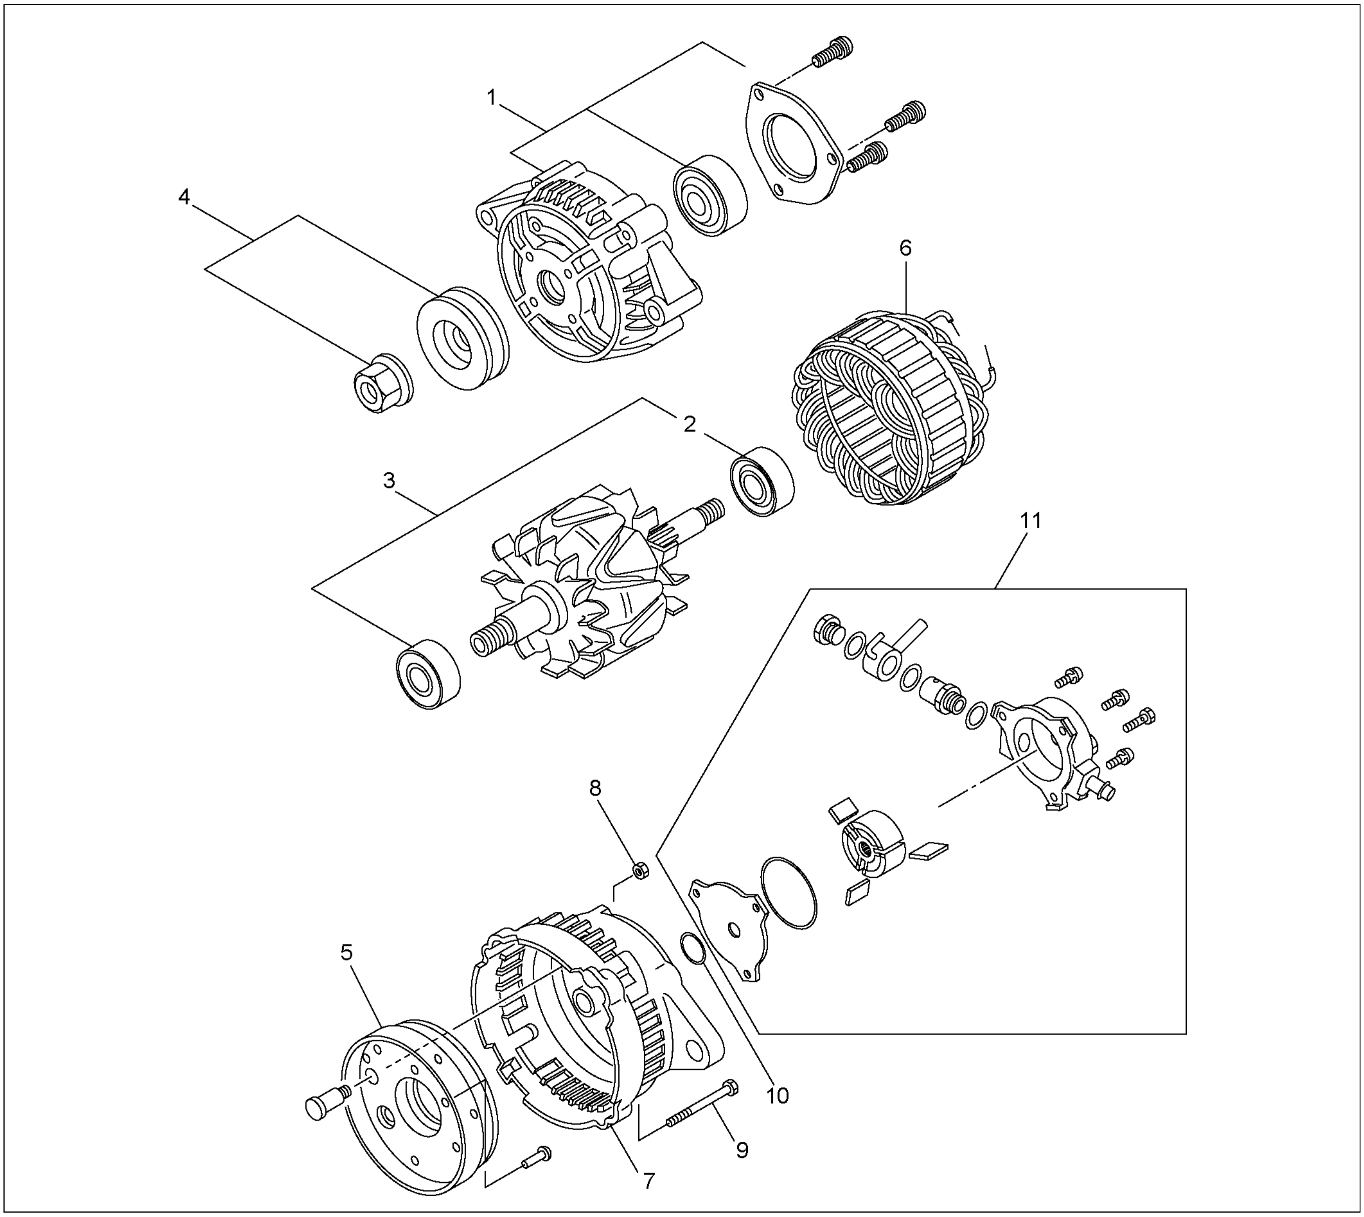
2. Install the rotor with the concave side facing the center plate.



RTW46DSH002001

3. Install the center plate to the rotor housing.
   Be sure to use a new O-ring.

REASSEMBLY



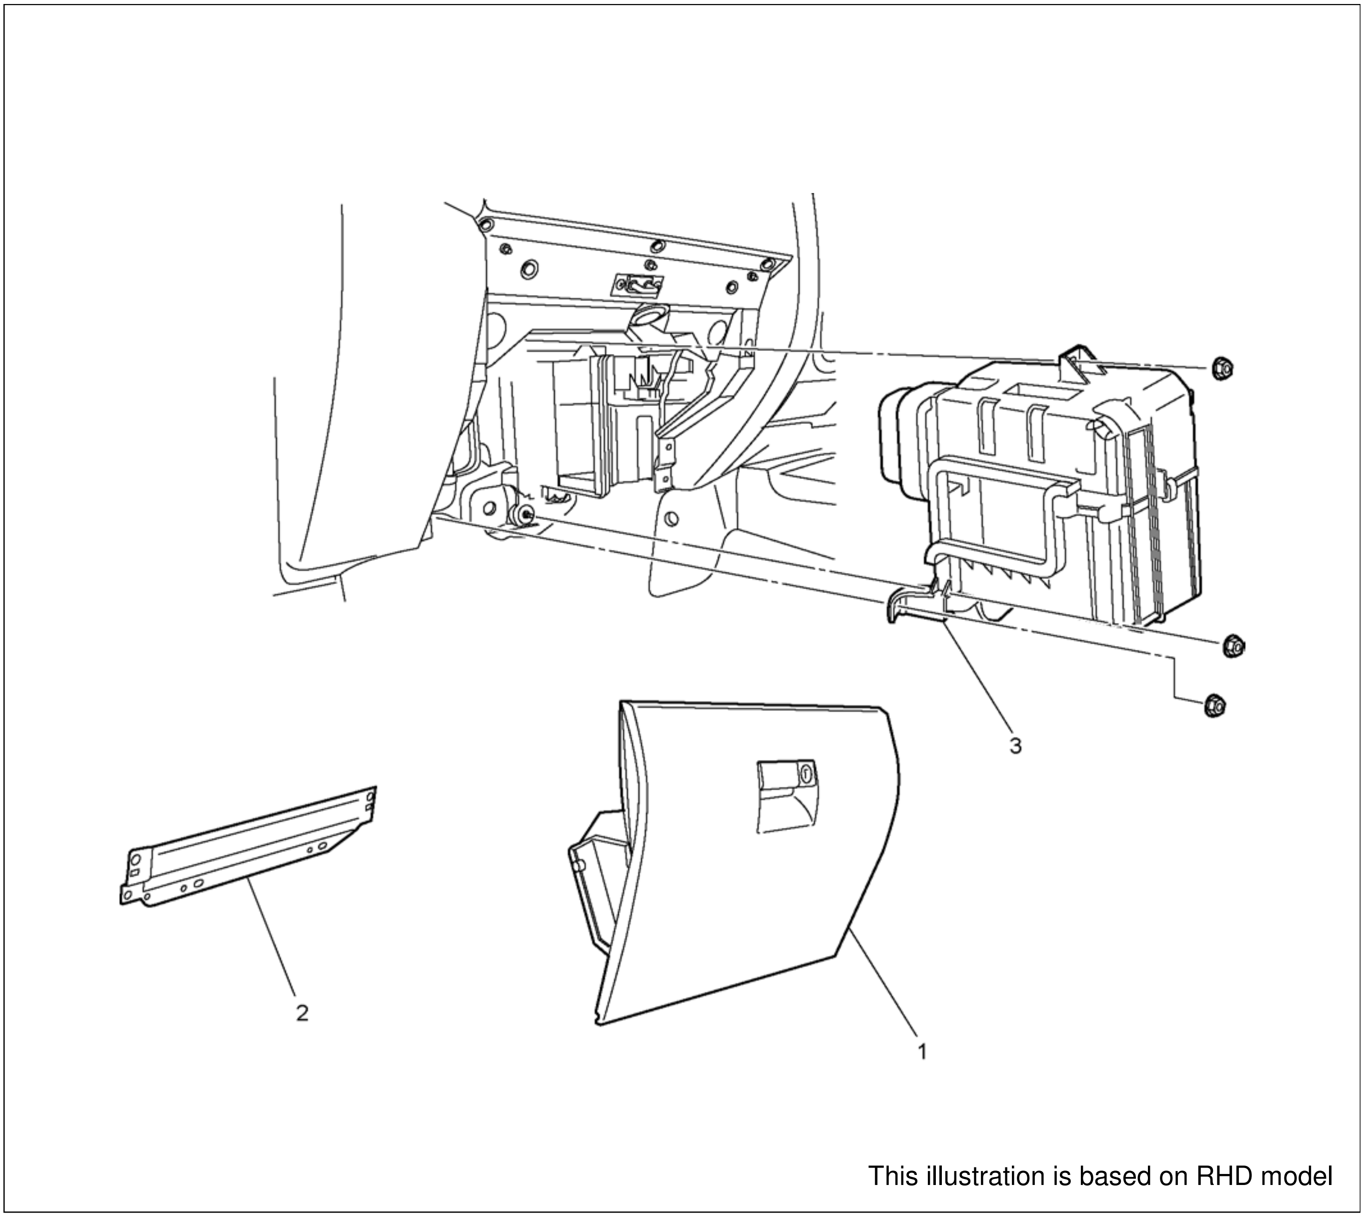
RTW46DLF000501

Reassembly Step

1. Front cover
2. Rear rotor bearing
3. Rotor Assembly
4. Pulley
5. Rectifier Assembly
6. Stator Assembly
7. Rear cover
8. B Terminal nuts
9. Through bolt
10. O-ring
11. Vacuum pump

DUCT (WITHOUT A/C)

REMOVAL AND INSTALLATION



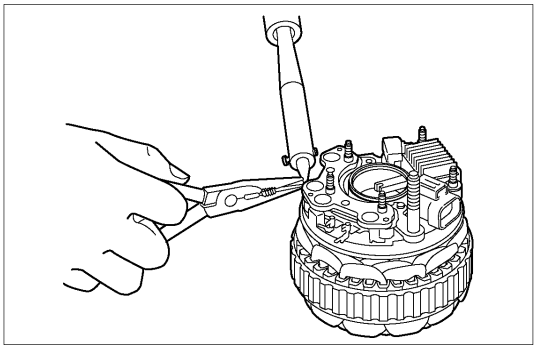
RTW710LF003901

Removal Steps

1. Glove box
2. Passenger lower bracket
3. Evaporator assembly

Installation Steps

3. Evaporator assembly
2. Passenger lower bracket
1. Glove box



RTW46DSH000401

Important Operations

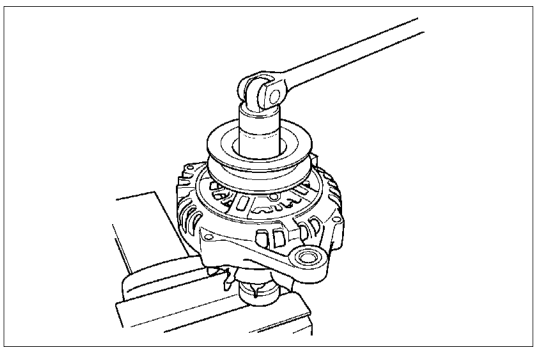
2. Rear rotor bearing

- Re-use improper parts.

5. Rectifier

6. Stator

Use a pair of long-nose plier to connect the stator coil leads and the rectifier leads.
Finish the work as quickly as possible to prevent the rectifier from heat transferred by the soldering.



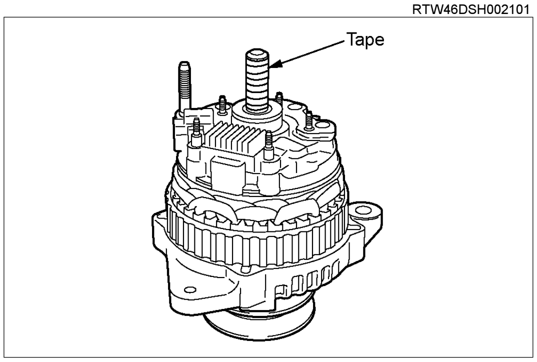
RTW46DSH002101

3. Rotor Assembly

4. Pulley Assembly

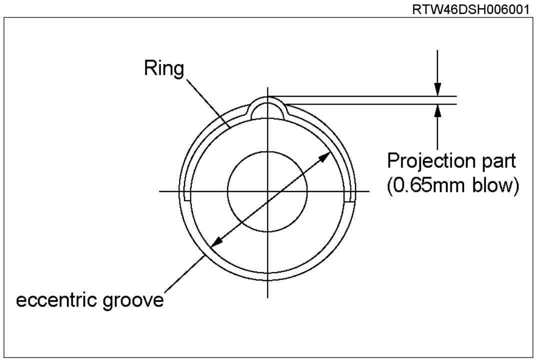
Clamp the rotor in a vise and install the pulley nut.

Pulley Nut Torque	N·m (kg·m/lb·ft)
	83.3 ~ 98.0 (8.5 ~ 10.0 / 61 ~ 72)



RTW46DSH006001

Remove the tape from the splines.

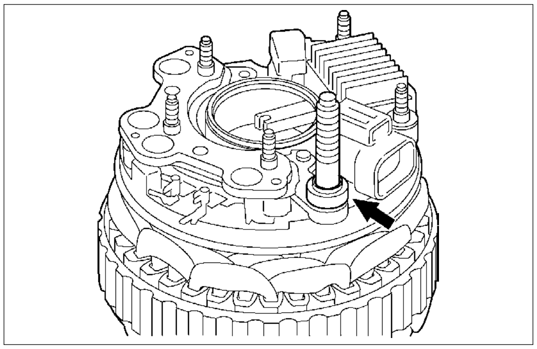


RTW46DSH004901

The rear ball bearing is pressed into the wheel eccentric groove. The bearing ring projects from the groove.

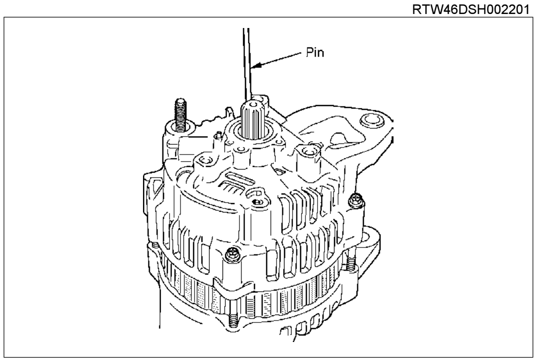
During installation, rotate the bearing to the point of minimum bearing ring projection.

Inspect the rear cover bearing box and replace it if it is damaged.



RTW46DSH002201

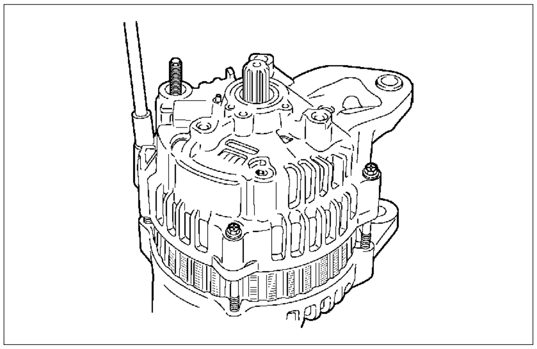
NOTE: Be sure to attach a cooler to B terminal.



RTW46DSH005301

Insert the pin from the outside of the rear cover. Press the brushes into the brush holder. Complete the assembly procedure.

Remove the pin after completion of the assembly procedure.



RTW06DSH000201

9. Through Bolt

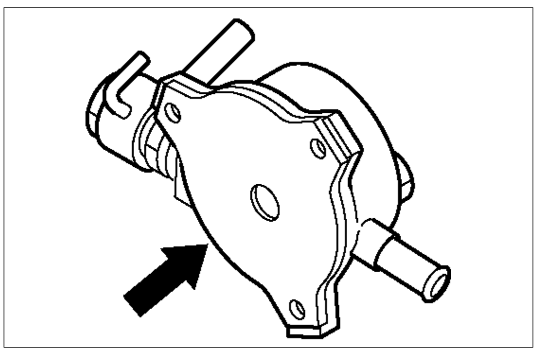
1. Place a pilot bar into the through bolt hole to align the front cover and the rear cover.
2. Install the through bolts and tighten them to the specified torque.

Through Bolt Torque	N·m (kg·m/lb·ft)
3.1 ~ 3.9 (0.32 ~ 0.41 / 2.6 ~ 3.5)	

11. Vaccum Pump

To install the generator -

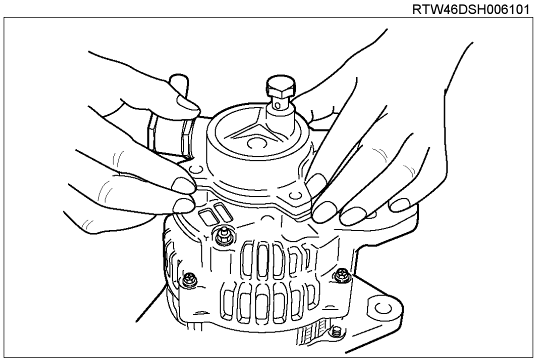
1. Note the direction of the arrow on the vacuum pump.
2. Look forward from the base of the arrow to locate the 3 generator fixing points.
3. Twist the fixing points down and to the left to align them with the middle of the center plate and the rotor.



RTW46DSH006101

Install vanes into slits in rotor.

The vanes should be installed with the chamfered side facing outward.

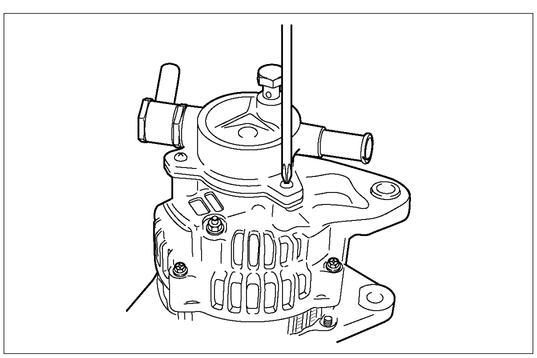


RTW46DSH002401

Install the vacuum pump housing.

Make sure that the O-ring is not projecting beyond the slots of the center plate.

Take care so that no scratching takes place on the vane resulted by contact with the housing.



RTW46DSH002501

Install the housing in the generator and fix it with the three bolts.

Supply engine oil (5cc or so) from the oil port and check that the generator pulley can be turned smoothly with your hand.

Generator Housing Bolt Torque	N·m (kg·m/lb·ft)
5.9 ~ 6.9 (0.6 ~ 0.7 / 5.2 ~ 6.1)	

STARTER MOTOR

REMOVAL AND INSTALLATION

Read this Section carefully before performing any removal and installation procedure. This Section gives you important points as well as the order of operation. Be sure that you understand everything in this Section before you begin.

Important Operations - Removal

Starter Motor

1. Disconnect the battery cable and the ground cable at the battery terminals.
2. Disconnect the magnetic switch cable at the terminal bolts.
3. Disconnect the battery cable at the starter motor and the ground cable at the cylinder body.
4. Remove the starter motor from the engine.

Important Operations – Installation

Follow the removal procedure in the reverse order to perform the installation procedure. Pay careful attention to the important points during the installation procedure.

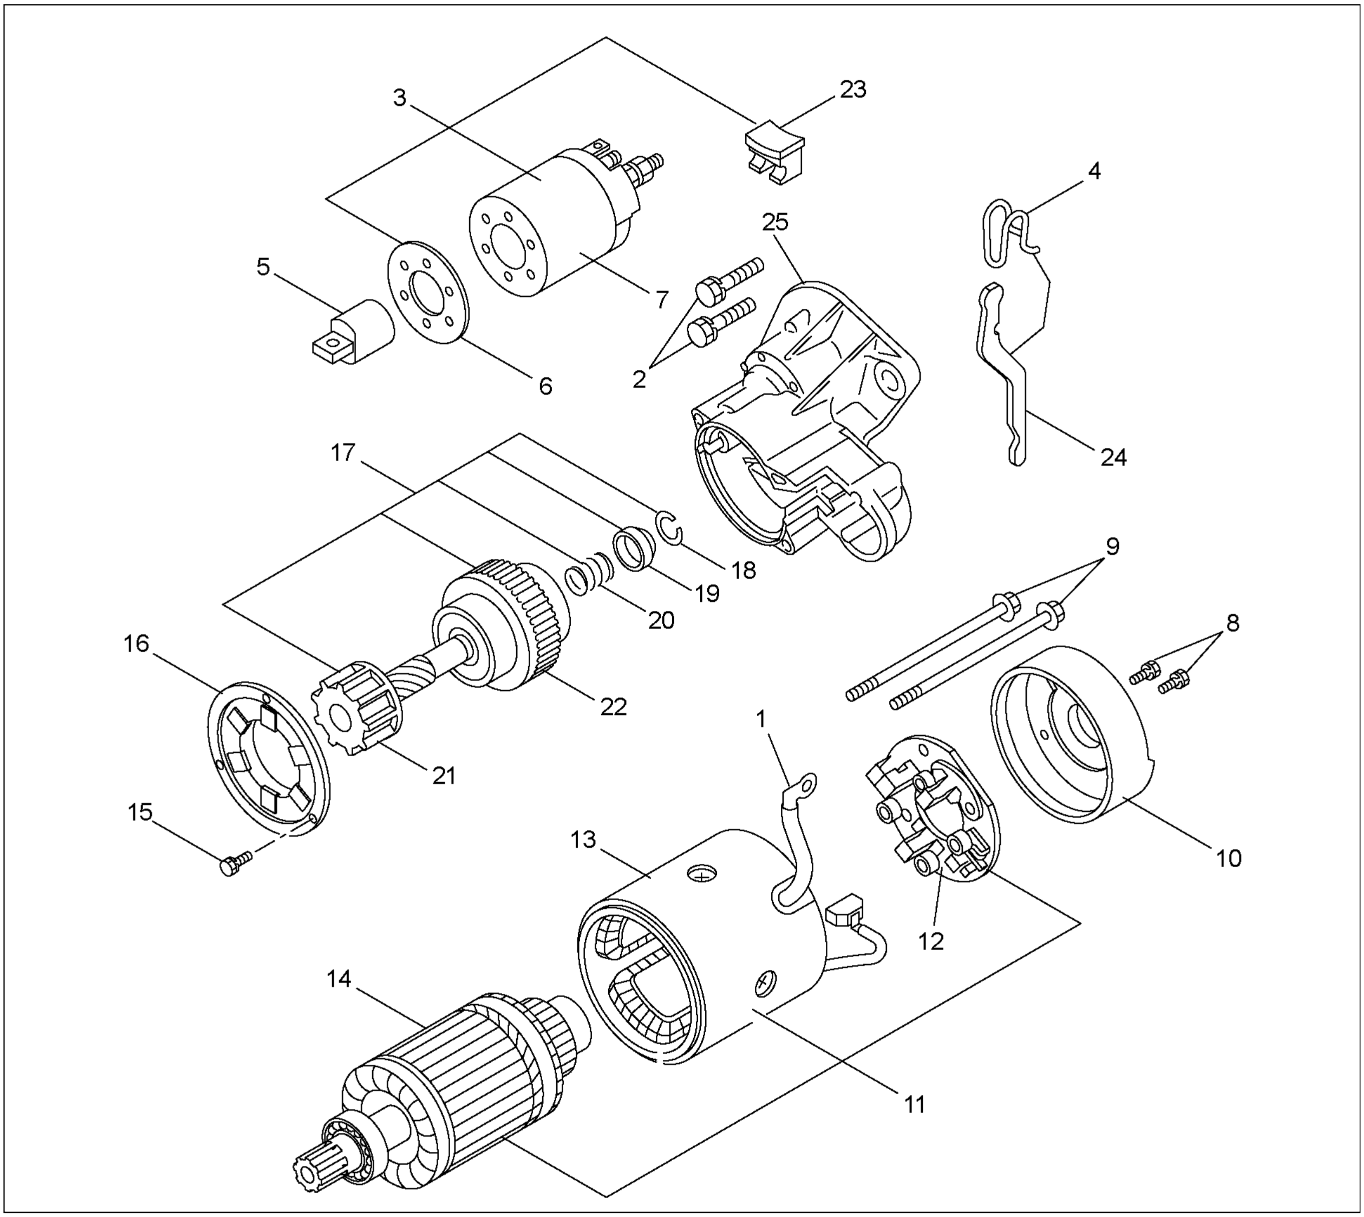
Starter Motor

1. Install the starter motor to the rear plate.
2. Tighten the starter motor bolts to the specified torque.

Starter Motor Bolt Torque	N·m (kg·m/lb·ft)
85 (8.7/63)	

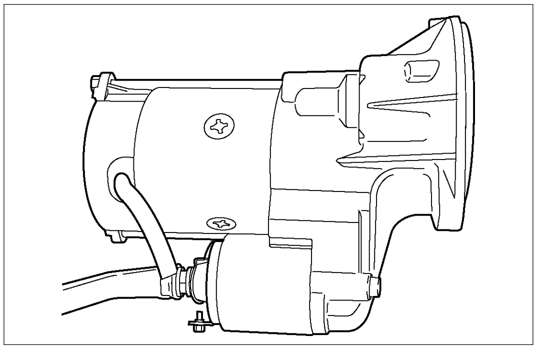
3. Reconnect the battery cable at the starter motor and the ground cable at the cylinder body.
4. Reconnect the battery cable and the ground cable at the battery terminals.

DISASSEMBLY



Disassembly Step

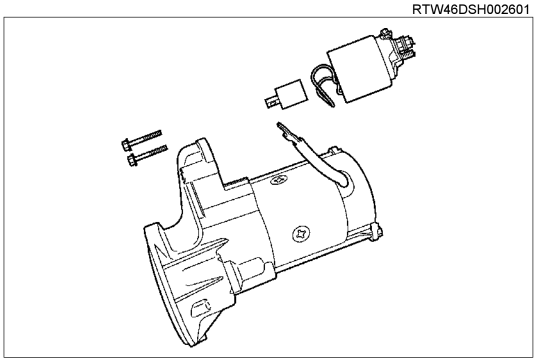
1. Lead wire
2. Bolt
3. Magnetic switch assembly
4. Torsion spring
5. Plunger
6. Dust cover
7. Magnetic switch
8. Screw
9. Through bolt
10. Rear cover
11. Motor assembly
12. Brush holder
13. Yoke
14. Armature
15. Bolt
16. Bearing retainer
17. Pinion assembly
18. Pinion stopper clip
19. Pinion stopper
20. Return spring
21. Pinion shaft
22. Clutch
23. Dust cover
24. Shift lever
25. Gear case



RTW46DSH002601

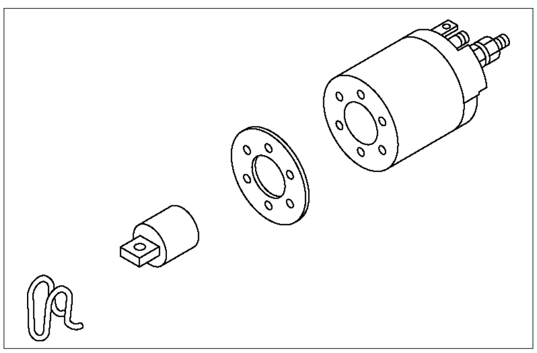
Important Operations

1. Lead Wire
Disconnect the lead wire at the magnetic switch.



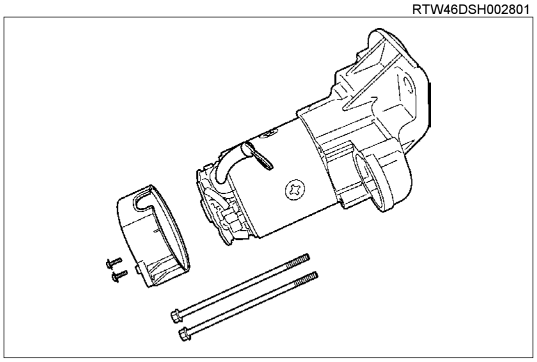
RTW46DSH002701

3. Magnetic Switch Assembly
Remove the magnetic switch bolts, then remove the switch from the shift lever.



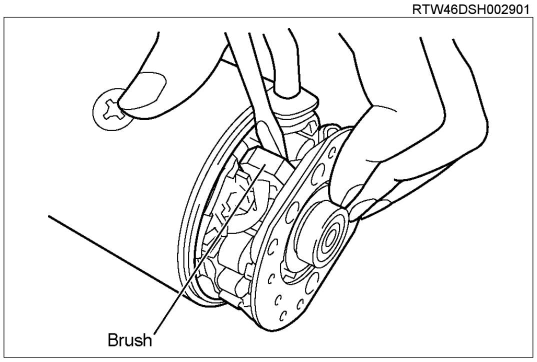
RTW46DSH002801

Remove the torsion spring from the magnetic switch.



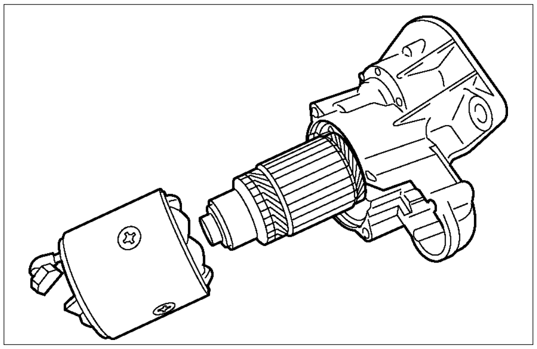
RTW46DSH002901

8. Through Bolt
9. Screw
10. Rear Cover
Remove the through bolts, then remove the rear cover.



RTW46DSH003001

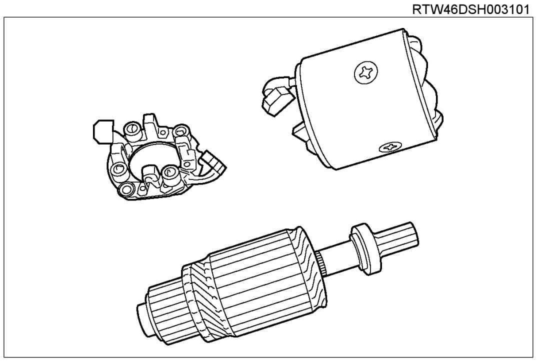
11. Motor Assembly
Remove the four brushes from the brush holders.



RTW46DSH003101

Remove the yoke along with the armature and the brush holder from the gear case.

Remove the brushes and commutator carefully so as not to allow them in contact with the adjacent parts.



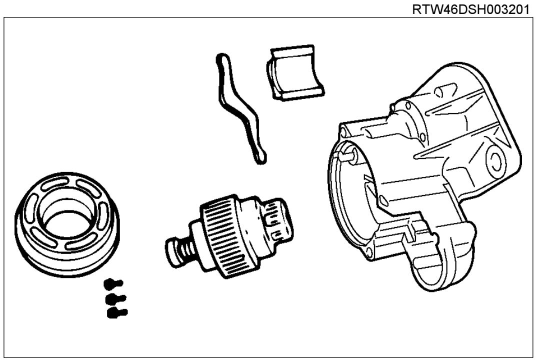
RTW46DSH003201

12. Brush Holder

13. Yoke

14. Armature

Remove the brush holder and pull out the armature assembly free from the yoke.



RTW46DSH003301

16. Bearing Retainer

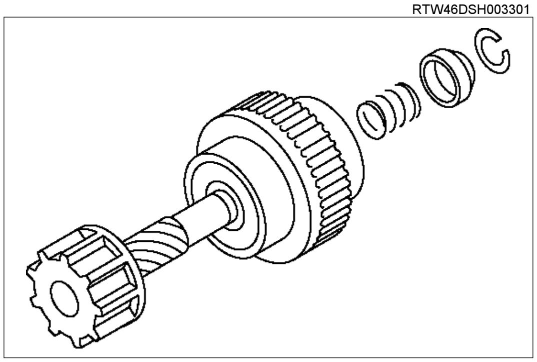
17. Pinion Assembly

23. Dust Cover

24. Shift Lever

25. Gear Case

1. Remove the bearing retainer.
2. Remove the pinion from the gear case.

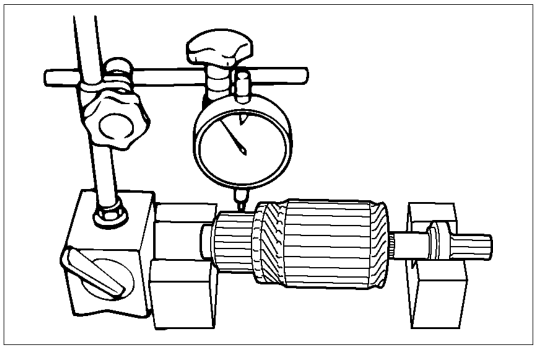


RTW46DSH003401

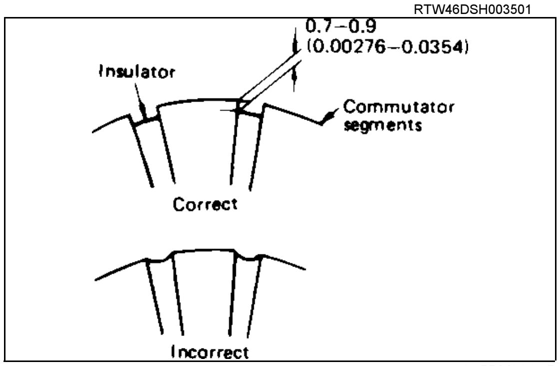
3. Use a screwdriver to remove the stopper clip. Then disassemble the pinion assembly.

INSPECTION AND REPAIR

Make the necessary adjustments, repairs, and part replacement if excessive wear or damage is discovered during inspection.



RTW46DSH003501



065RY00025

ARMATURE

1. Measure the commutator run-out.
   Replace the commutator if the measured run-out exceeds the specified limit.

Commutator Run-Out mm (in)

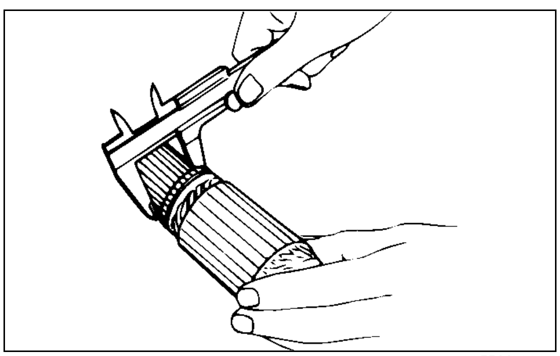
Standard	Limit
0.05 (0.002)	0.2 (0.008)

2. Check the commutator mica segments for excessive wear.
3. Measure the mica segment depth.

Mica Segment Depth mm (in)

Standard	Limit
0.5 ~ 0.8 (0.020 ~ 0.030)	0.2 (0.008)

If the mica segment depth is less than the standard but more than the limit, the commutator may be reground.
If the mica segment depth is less than the limit, the commutator must be replaced.



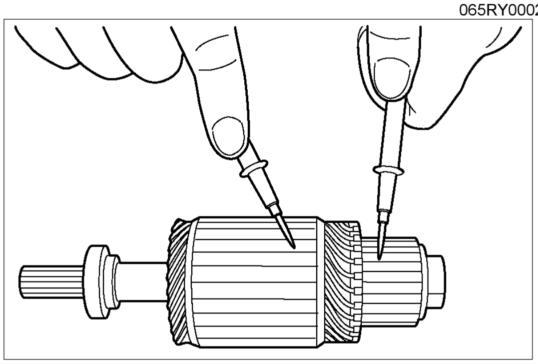
065RY00026

4. Measure the commutator outside diameter.

Commutator Outside Diameter mm (in)

Standard	Limit
36.5 (1.44)	35.5 (1.40)

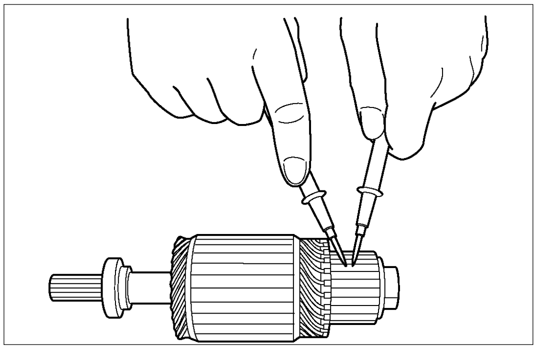
If the measured outside diameter is less than the specified limit, the commutator must be replaced.



RTW46DSH003601

5. Use a circuit tester to check the armature for grounding.
   1 Hold one probe of the circuit tester against the commutator segment.
   2 Hold the other circuit tester probe against the armature core.

   If the circuit tester indicates continuity, the armature is grounded.
   The armature must be replaced.

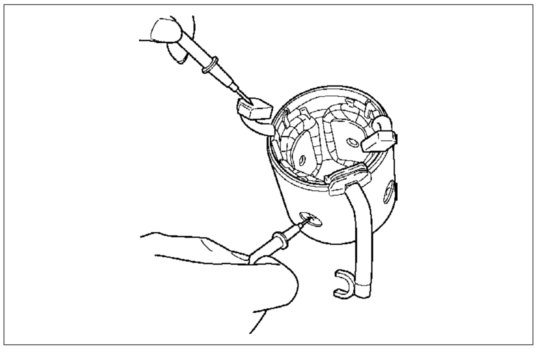


RTW46DSH003701

6. Use the circuit tester to check the armature for continuity.
   1 Hold the circuit tester probes against two commutator segments.
   2 Repear Step 1 at different segments of the armature core.

   There should be continuity between all segments of the commutator.
   If there is not, the armature must be replaced.

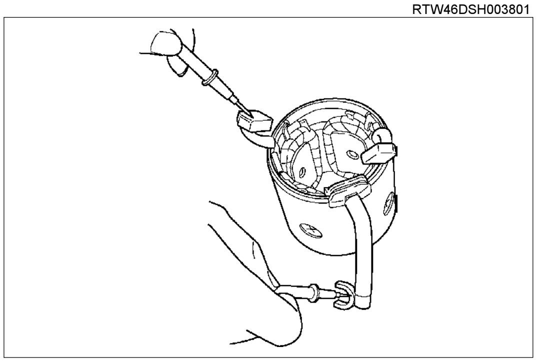
YOKE



RTW46DSH003801

1. Use a circuit tester to check the field winding ground.
   1 Hold one circuit tester probe against the field winding end or brush.
   2 Hold the other circuit tester probe against the bare surface of the yoke body.

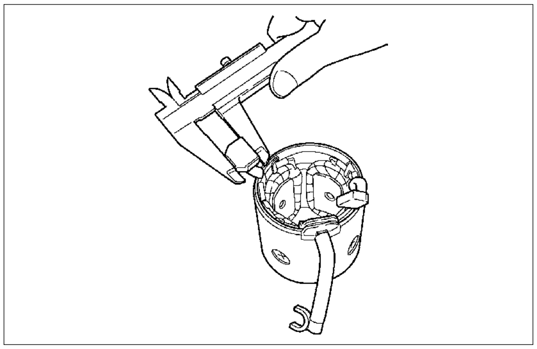
   There should be no continuity.
   If there is continuity, the field coil is grounded.
   The yoke must be replaced.



RTW46DSH003901

2. Use the circuit tester to check the field winding continuity.
   1 Hold one circuit tester probe against the “M” terminal lead wire.
   2 Hold the other circuit tester probe against the field winding brush.

   There should be continuity.
   If there is no continuity, the yoke must be replaced.



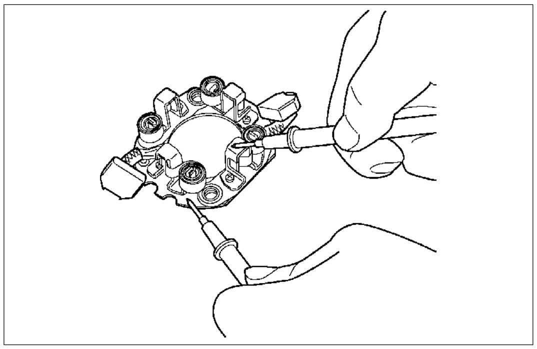
RTW46DSH004001

BRUSH AND BRUSH HOLDER

1. Use a vernier caliper to measure the brush length (four brushes).
   Replace the brushes as a set if one or more of the brush lengths is less than the specified limit.

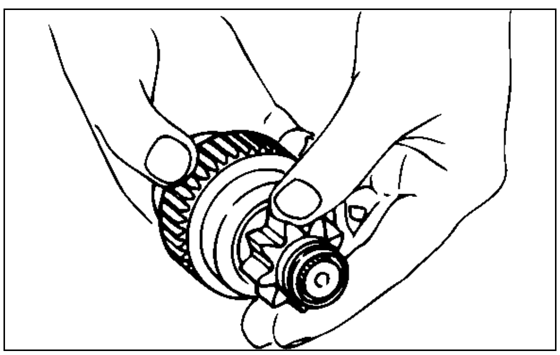
Brush Length mm (in)

Standard	Limit
15 (0.59)	12 (0.47)



RTW46DSH004101

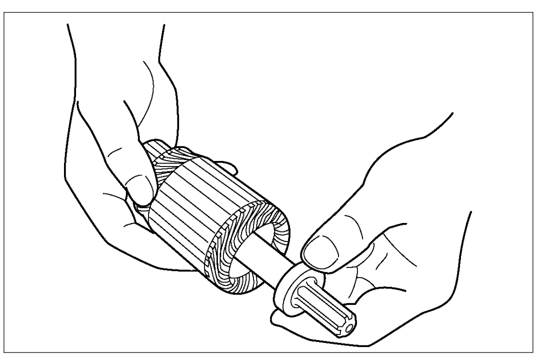
2. Use a circuit tester to check the brush holder insulation.
   Touch one probe to the holder plate and the other probe to the positive brush holder.
   There should be no continuity.
3. Inspect the brushes for excessive wear.
   If the negative brushes have excessive wear, the entire brush holder assembly must be replaced.
   If the positive brushes have excessive wear, the entire yoke must be replaced.



065RY00035

OVERRUNNING CLUTCH

1. Inspect the overrunning clutch gear teeth for excessive wear and damage.
   Replace the overrunning clutch if necessary.
2. Rotate the pinion clockwise.
   It should turn smoothly.
3. Try to rotate the pinion in the opposite direction.
   The pinion should lock.

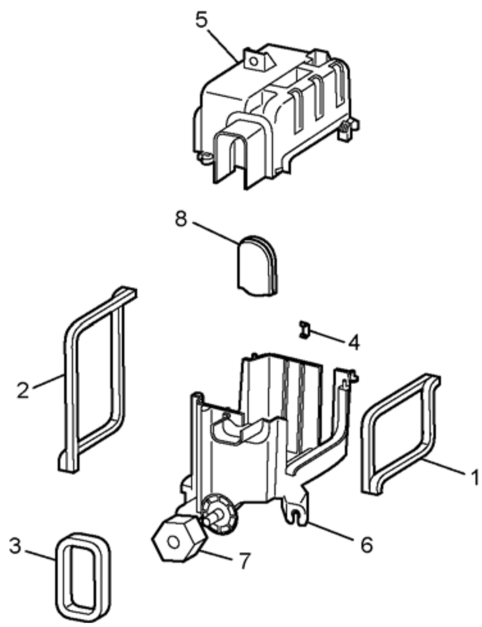


RTW46DSH004401

BEARING

Inspect the bearings for excessive wear and damage.
Replace the bearings if necessary.

DISASSEMBLY AND REASSEMBLY



RTW710MF001001

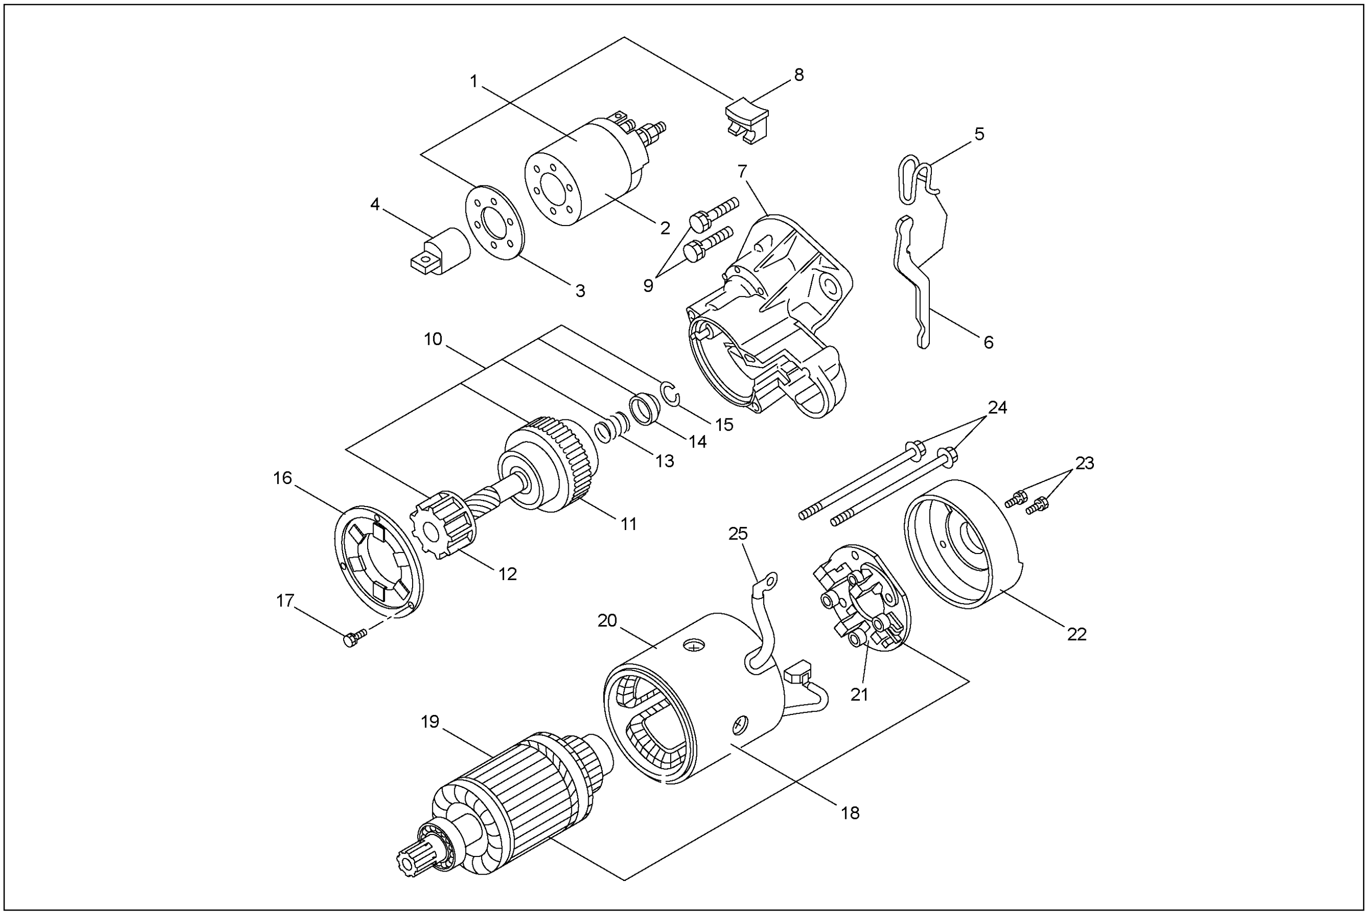
Disassembly Steps

1. Packing cooler outlet
2. Packing cooler inlet
3. Seal FOD cooler
4. Clip heater
5. Case : cooler upper
6. Case : cooler lower
7. Packing drain
8. Grommet

Reassembly Steps

8. Grommet
7. Packing drain
6. Case : cooler lower
5. Case : cooler upper
4. Clip heater
3. Seal FOD cooler
2. Packing cooler inlet
1. Packing cooler outlet

REASSEMBLY

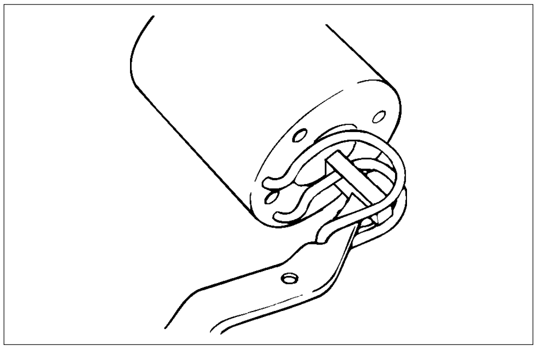


RTW46DLF000601

Reassembly Steps

1. Magnetic switch assembly
2. Magnetic switch
3. Dust cover
4. Plunger
5. Torsion spring
6. Shift lever
7. Gear case
8. Dust cover
9. Bolt
10. Pinion assembly
11. Clutch
12. Pinion shaft
13. Rerurn spring
14. Pinion stopper
15. Pinion stopper clip
16. Bearing retainer
17. Bolt
18. Motor assembly
19. Armature
20. Yoke
21. Brush holder
22. Rear cover
23. Screw
24. Through bolt
25. Lead wire

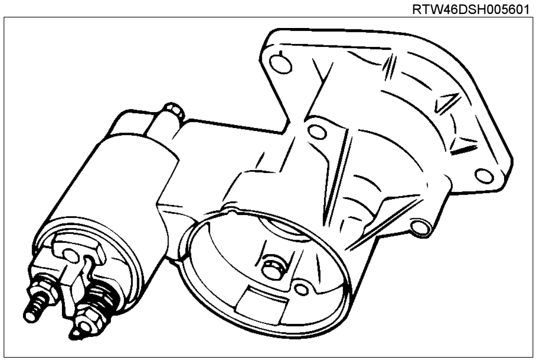
Important Operations



RTW46DSH005601

1. Magnetic Switch Assembly

1. Attach the torsion spring to the hole in the magnetic switch as illustrated.
2. Insert the shift lever into the plunger hole of the magnetic switch.



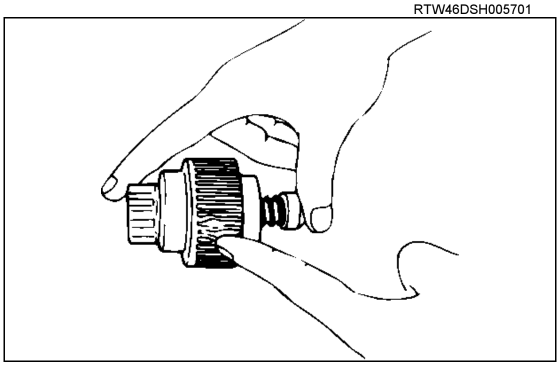
RTW46DSH005701

7. Gear Case

3,8. Dust Cover

1. Install the magnetic switch assembly in the gear case.
2. Install the dust cover.

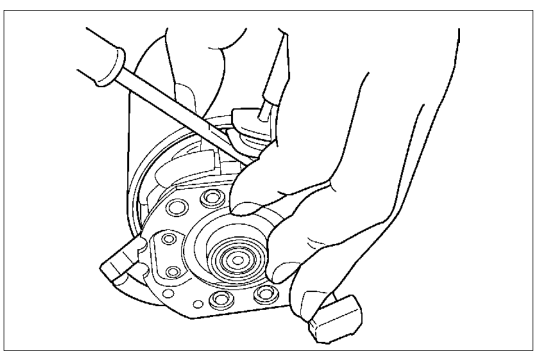
Dust Cover Bolt Torque	N·m (kg·m/lb·ft)
8 (0.8/5.4)	



065RY00041

10. Pinion Assembly

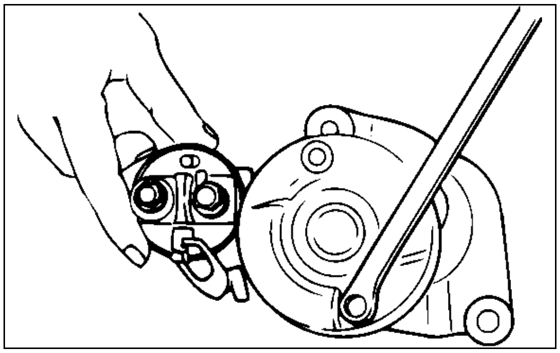
Apply a coat of grease to the reduction gear and install the pinion assembly to the armature shaft.



RTW46DSH004501

21. Brush Holders

1. Install the brushes into the brush holder with raising the spring end of the brush spring.
   Take care not to damage the commutator face.
2. Install the brush holder with aligning the peripheries of the yoke and the brush holder.

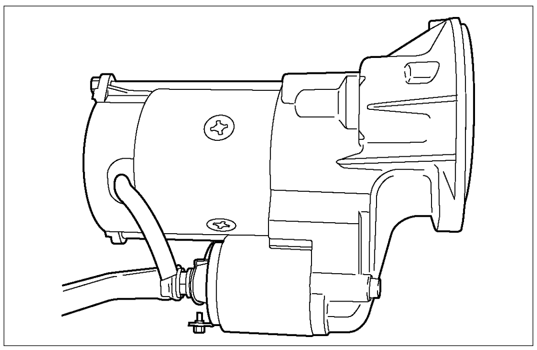


065RY00044

24. Through Bolt

Install the through bolts in the rear cover and tighten them to the specified torque.

Through Bolt Torque	N·m (kg·m/lb·ft)
8.1 (0.83/6.00)	

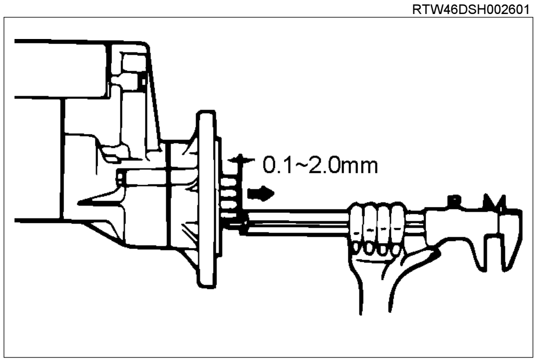


RTW46DSH002601

25. Lead Wire

Connect the lead wire in the magnetic switch and tighten the terminal nut to the specified torque.

Lead Wire Terminal Nut Torque	N·m (kg·m/lb·ft)
8.6 (0.88/6.40)	



RTW46DSH005801

Inspection After Assembly

Use a vernier caliper to measure the pinion shaft thrust play.

The pinion shaft thrust play is equal to the pinion shaft end and pinion stopper clearance.

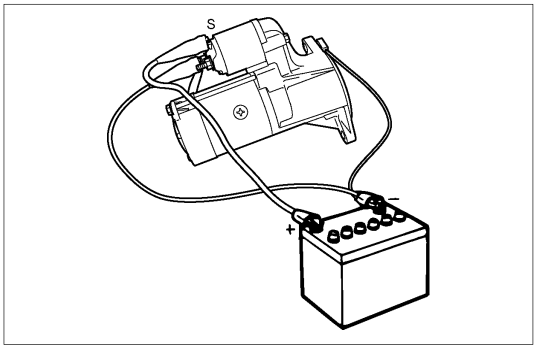
Pinion Shaft Thrust Play	mm (in)
0.1 – 2.0 (0.004 – 0.078)	

MAGNETIC SWITCH

The following tests must be performed with the starter motor fully assembled.

The yoke lead wire must be disconnected from the "M" terminal.

To prevent coil burning, complete each test as quickly as possible (within three to five seconds).

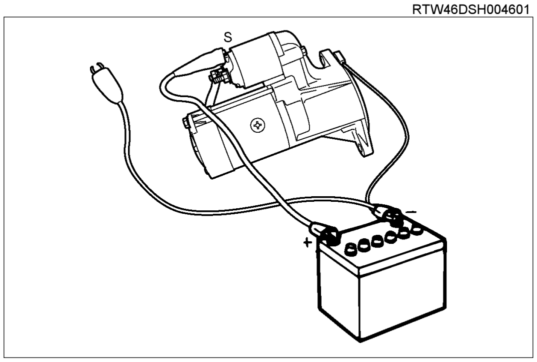


RTW46DSH004601

Temporarily connect the solenoid switch between the clutch and the housing and run the following test. Complete each test within three to five seconds.

1. **Pull-in Test**

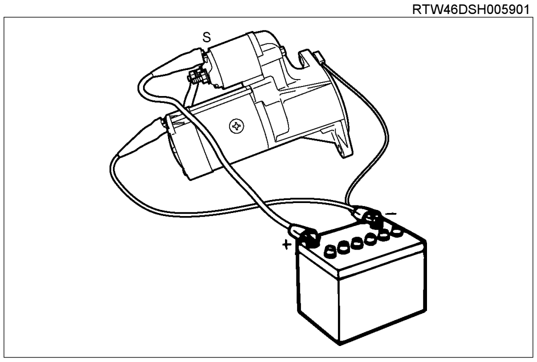
   Connect the battery negative terminal with the solenoid switch body and the M terminal. When current is applied to the S terminal from the battery positive terminal, the pinion should flutter.



RTW46DSH005901

2. **Hold-in Maintenance Test**

   Disconnect the lead at the M terminal. The pinion should continue to flutter.



RTW46DSH004701

3. **Return Test**

   Disconnect the battery positive lead at the S terminal.

   The pinion should return to its home position.

PRE-HEATING SYSTEM

INSPECTION AND REPAIR

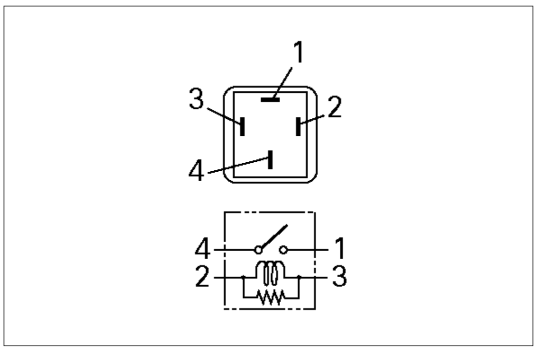
Make the necessary adjustments, repairs, and part replacement if excessive wear of damage is discovered during inspection.

VISUAL CHECK

Check the main fuses and glow indicator for damage.
Replace the part(s) if required.

GLOW RELAY

The glow relay is located in the relay box the engine compartment.

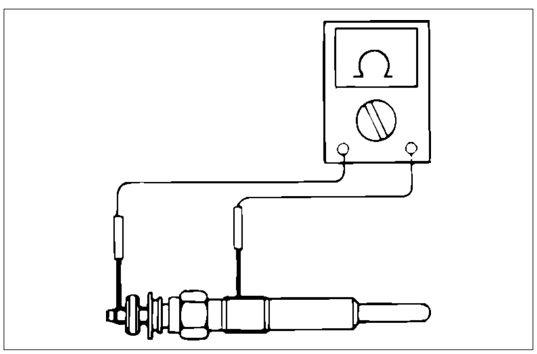


825R300046

Use an ohmmeter to measure the resistance between terminals No.2 and No.3.
If the measured value is outside the specified range, the glow relay must be replaced.

Glow Relay Resistance	Ohms
94 – 114	

GLOW PLUG



LNW21KSH001401

Use a circuit tester to test the glow plugs for continuity.

Glow Plug Resistance (Reference)	Ohms
Approximately 0.9	

EGR SYSTEM 4JA1T (L)

Refer to 6F-9. (EGR system diagram)

Driver's Name		Chassis No.	
Date Vehicle Brought In		Engine No.	
License No.		Odometer Reading	Km/miles

Problem Symptoms	☐ Engine Does Not Run	☐ Engine does not crank	☐ No initial combustion	☐ No complete combustion
	☐ Hard Start	☐ Engine cranks slowly	☐ Other (	)
	☐ Incorrect Idle	☐ Abnormal idling speed ☐ Rough idling ☐ Other (	☐ High idling speed (RPM)	☐ Low idling speed (RPM))
	☐ Poor Driveability	☐ Hesitation, sag, stumble ☐ Lack of power, sluggishness, sponginess ☐ Other (	☐ Surge, chuggles	☐ Cut out, misses)
	☐ Engine Stall	☐ Soon after starting ☐ During A/C operation ☐ Other (	☐ After accelerator pedal depressed ☐ After accelerator pedal released	 ☐ Shifting from N to D)
	☐ Others	☐ Black smoke ☐ Fuel knock, combustion noise ☐ Other (	☐ White smoke	☐ Poor fuel economy)

Dates problem occurred					
Problem frequency		☐ Constant ☐ Other (	☐ Intermittently (times per day/month)		☐ Once only)
Condition When Problem Occurs	Weather	☐ Fine ☐ Various/Other (	☐ Cloudy	☐ Rainy	☐ Snow)
	Outside Temperature	☐ Hot (approx.) ☐ Any temperature	☐ Warm	☐ Cool	☐ Cold (approx.)
	Place	☐ Highway ☐ Downhill	☐ Suburbs ☐ Rough road	☐ City area ☐ Other (	☐ Uphill)
	Load Condition	☐ Over (approx. tons) ☐ Other (approx. tons)		☐ No load	
	Engine Temperature	☐ Cold ☐ Other (	☐ Warming up	☐ After warming up	☐ Any temperature)
	Engine Operation	☐ Starting ☐ Racing ☐ Deceleration ☐ Other (	☐ Just after starting (☐ Driving ☐ A/C switch On/Off	Min.) ☐ Constant speed	☐ Idling ☐ Acceleration)
	Fuel Amount	☐ Full	☐ Above 1/2	☐ Below 1/2	☐ Near empty
	Fuel Bland				

Condition of MIL		☐ Remains On	☐ Intermittently turns On	☐ Does not turn On
Diagnostic Trouble Code (DTC) or Flash Code	Present Code	☐ Nothing	☐ P Code & Symptom Code No. (	)
	History Code	☐ Nothing	☐ P Code & Symptom Code No. (	)
Other Additional Condition				

Diagnostic Starting Point - Engine Controls

Begin the system diagnosis with Diagnostic System Check - Engine Controls. The Diagnostic System Check - Engine Controls will provide the following information:

- The identification of the control modules which command the system.
- The ability of the control modules to communicate through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTCs) and the their statuses.

The use of the Diagnostic System Check - Engine Controls will identify the correct procedure for diagnosing the system and where the procedure is located.

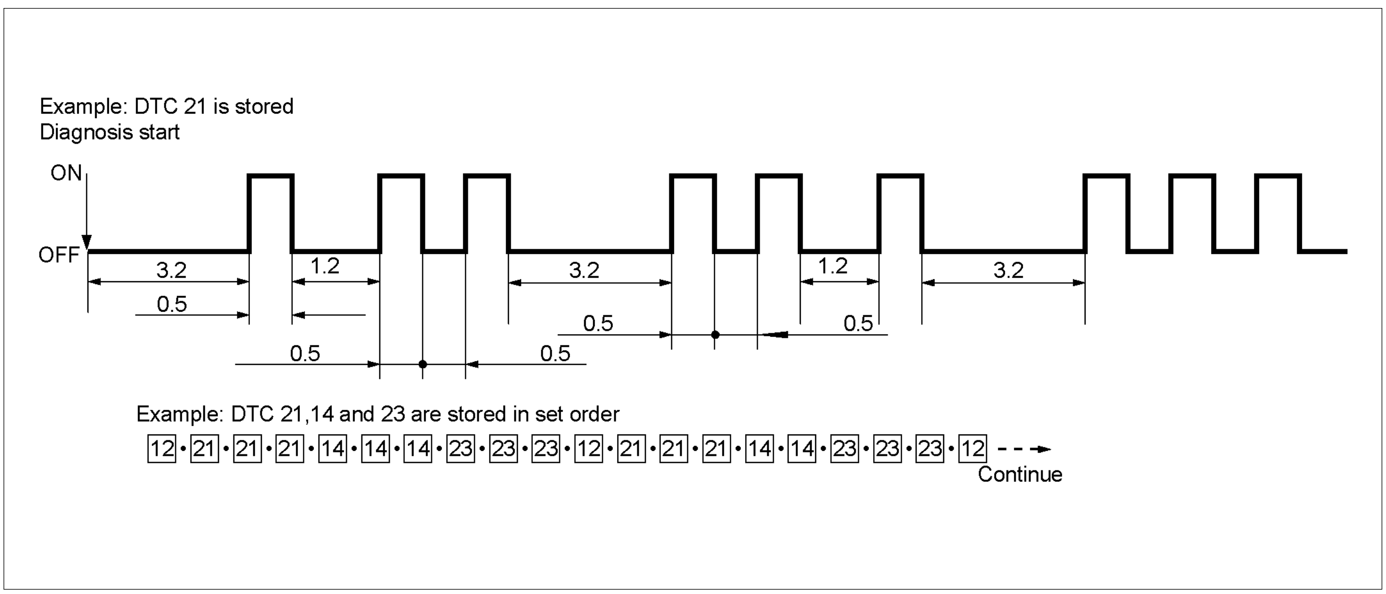
Important:

Engine Control System Check Sheet must be used to verify the complaint vehicle, you need to know the correct (normal) operating behavior of the system and verify that the customer complaint is a valid failure of the system.

Reading Flash Diagnostic Trouble Codes

The provision for communicating with the ECM is the Data Link Connector (DLC). The DTCs stored in the ECM memory can be read either through a hand-held diagnostic scanner such as scan tool plugged into the DLC or by counting the number of flashes of the MIL when the diagnostic test terminal of the DLC is grounded. The DLC terminal “6” (diagnostic request switch) is pulled “Low” (grounded) by jumped to DLC terminal “4”, which is a ground wire.

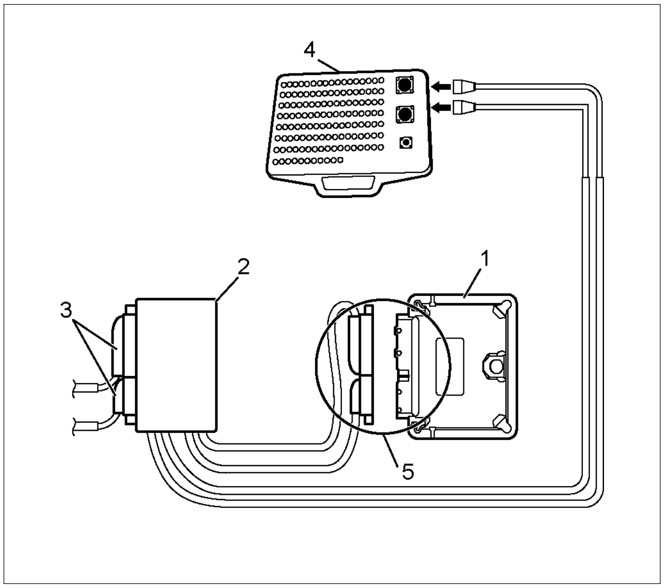
Once terminals “4” and “6” have been connected, the ignition switch must be moved to the “ON” position, with the engine not running. The MIL will initially flash 12. Then, the MIL will flash the first stored DTC three times, second stored DTC three times and so on. All the stored DTCs are flashed, then return 12 and continue to flash the DTC. If no DTC exists, the MIL flashes 12 continuously. The flash DTC display will continue as long as the DLC is shorted.



RTW66ESF000501

Breaker Box

Breaker Box Connection Type A



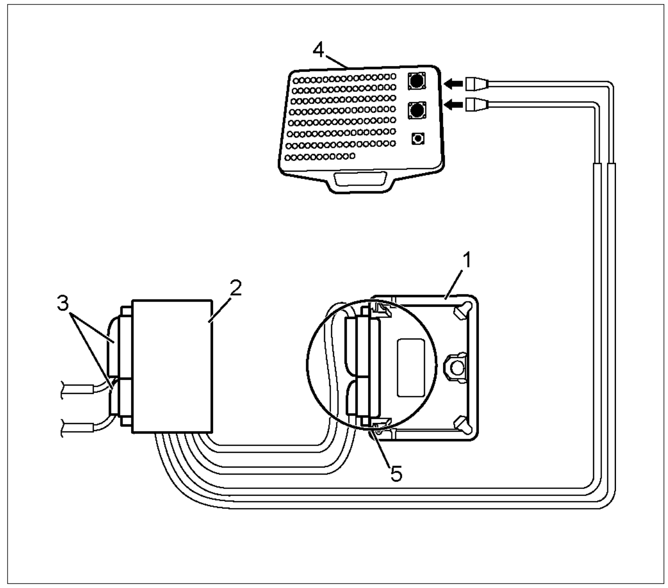
RTW66ESH003601

Legend

1. Engine Control Module (ECM)
2. Harness Adapter
3. ECM - Harness Connector
4. Breaker Box
5. ECM is disconnected

Although probe to the engine control module (ECM) harness connector is possible by Test Adapter, Breaker Box Connection Type A is suitable usage to prevent misprobe and damage of female terminals when test open circuit or short to ground between the ECM and electrical components, since the terminals where the harness connector of the ECM is thin have gathered.

Breaker Box Connection Type B



RTW66ESH003701

Legend

1. Engine Control Module (ECM)
2. Harness Adapter
3. ECM - Harness Connector
4. Breaker Box
5. ECM is connected

The ECM and other connectors have water proof terminal that is not allowed to back probe. Breaker Box Connection Type B is suitable usage to test short to voltage circuit or signal check between the ECM and electrical components.

Diagnostic System Check - Engine Controls

Description

The Diagnostic System Check-Engine Controls is an organized approach to identifying a condition that is created by a malfunction in the electronic engine control system. The Diagnostic System Check must be the starting point for any driveability concern. The Diagnostic System Check directs the service technician to the next logical step in order to diagnose the concern. Understanding and correctly using the diagnostic table reduces diagnostic time, and prevents the replacement of good parts.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. Lack of communication may be because of a partial or a total malfunction of the Keyword 2000 serial data circuit. The specified procedure determines the particular condition.

11. If there are other modules with DTCs set, refer to the DTC list. The DTC list directs you to the appropriate diagnostic procedure. If the control module stores multiple DTCs, diagnose the DTCs in the following order.

- Component level DTCs, such as sensor DTCs, solenoid DTCs, actuator DTCs, and relay DTCs. Diagnose the multiple DTCs within this category in numerical order. Begin with the lowest numbered DTC, unless the diagnostic table directs you otherwise.

Important:

- DO NOT perform this diagnostic if there is not a driveability concern, unless another procedure directs you to this diagnostic.
- Before you proceed with diagnosis, search for applicable service bulletins.
- Unless a diagnostic procedure instructs you, DO NOT clear the DTCs.
- If there is a condition with the starting system, refer to the starting system section in the engine mechanical.
- Ensure the battery has a full charge.
- Ensure the battery cables (+) (-) are clean and tight.
- Ensure the ECM grounds are clean, tight, and in the correct location.
- Ensure the ECM harness connectors are clean and correctly connected.
- Ensure the ECM terminals are clean and correctly mating.
- Ensure the fuel injection pump control unit (PCU) ground is clean, tight, and in the correct location.
- Ensure the PCU harness connectors are clean and correctly connected.
- Ensure the PCU terminals are clean and correctly mating.
- Ensure the vehicle maintenance has been done enough.

Step	Action	Value(s)	Yes	No
1	Install the scan tool. Does the scan tool turn ON?	—	Go to Step 2	Go to scan tool Does Not Power Up

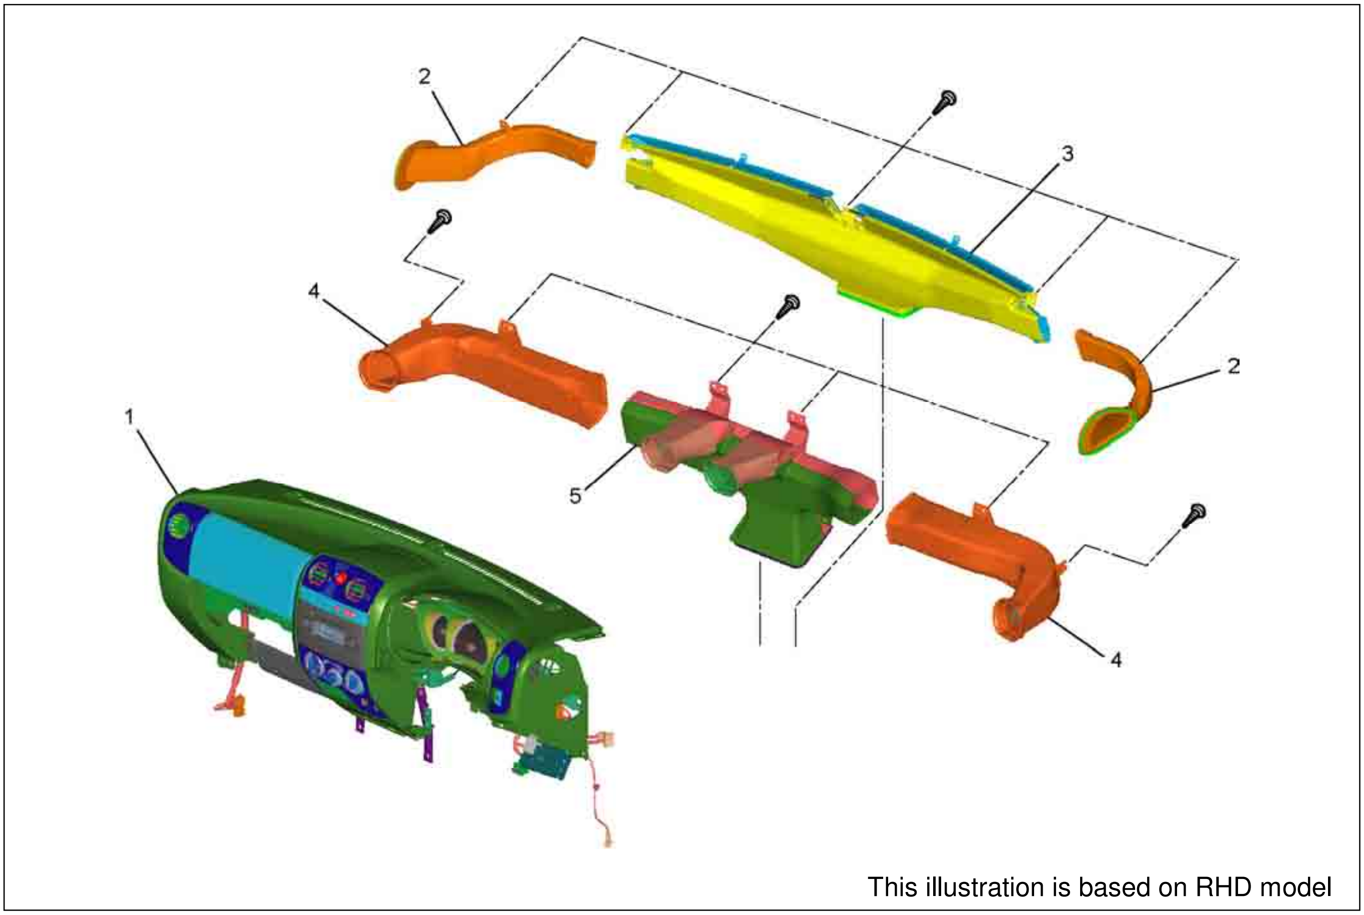
Step	Action	Value(s)	Yes	No
2	1. Turn ON the ignition, with the engine OFF. 2. Attempt to establish communication with the listed control modules. • Engine control module (ECM) • Transmission control module (TCM) (A/T only) • Electronic hydraulic control unit (EHCU) Does the scan tool communicate with all the listed control modules?	—	Go to Step 3	Go to scan tool Does Not Communicate with Keyword 2000 Device
3	Attempt to start the engine. Does the engine start and idle?	—	Go to Step 4	Go to Engine Cranks but Does Not Run
4	Select the DTC display function for the following control modules: • ECM • TCM (A/T only) • EHCU Does the scan tool display any DTCs?	—	Go to Step 5	Go to Step 12
5	1. Turn OFF the ignition for 30 seconds. 2. Start the engine. 3. Monitor the DTC Information with the scan tool. Did you complete the action?	—	Go to Step 6	—
6	Does the scan tool display ECM DTC P0602?	—	Go to Applicable DTC	Go to Step 7
7	Does the scan tool display ECM DTC P0251 (Symptom Code 9 or A), P0606 (Symptom Code A or B) or P1605 (Symptom Code C, D or E)?	—	Go to Applicable DTC	Go to Step 8
8	Does the scan tool display ECM DTC P0560 (Symptom Code 1, 2 or A)?	—	Go to Applicable DTC	Go to Step 9
9	Does the scan tool display following ECM DTC P0561 (Symptom Code A or B) or P1625 (Symptom Code A or B)?	—	Go to Applicable DTC	Go to Step 10
10	Does the scan tool display following ECM DTC P1650 (Symptom Code A or B) or P1651 (Symptom Code A or B)?	—	Go to Applicable DTC	Go to Step 11
11	Is there any other code in any controller that has not been diagnosed?	—	Go to Applicable DTC	Go to Step 12
12	Is the customer's concern with the automatic transmission?	—	Go to Diagnostic System Check Transmission Control	Go to Step 13
13	Is the customer's concern with the ABS system?	—	Go to Diagnostic System Check Brake Control	Go to Step 14

Step	Action	Value(s)	Yes	No
14	1. Review the following symptoms. 2. Refer to the applicable symptom diagnostic table: • Hard Start • Rough, Unstable, or Incorrect Idle and Stalling • Cuts Out, Misses • Surge/Chuggles • Lack of Power, Sluggishness, or Sponginess • Hesitation, Sag, Stumble • Fuel Knock/Combustion Noise • Poor Fuel Economy • Excessive Smoke (Black Smoke) • Excessive Smoke (White Smoke) Did you find and correct the condition?	—	System OK	Go to Intermittent Conditions

BACK TO CHAPTER INDEX

DEFROSTER NOZZLE AND VENT DUCT

REMOVAL AND INSTALLATION



RTW710MF000201

Removal Steps

▲ 1. Instrument panel assembly and cross beam
2. Side def hose RH/LH
3. Defroster nozzle
4. Vent duct driver side and assist side
5. Center vent duct

Installation Steps

5. Center vent duct
4. Vent duct driver side and assist side
3. Defroster nozzle
2. Side def hose RH/LH
1. Instrument panel assembly and cross beam

Important Operation - Removal

1. Instrument Panel Assembly and Cross Beam

Refer to SECTION 10 “INSTRUMENT PANEL”.

Scan Tool Data List

The scan tool Data List contains all engine related parameters that are available on the scan tool. Use the scan tool Data List only after the following is determined:

- The Diagnostic System Check - Engine Controls is completed.
- No diagnostic trouble codes (DTCs) are present.
- On-board diagnostics are functioning properly.

The scan tool values from a properly running engine may be used for comparison with the engine you are diagnosing. The scan tool Data List represents values that would be seen on a normal running engine.

Important:

A scan tool that displays faulty data should not be used. The scan tool problem should be reported to the manufacturer. Use of a faulty scan tool can result in misdiagnosis and unnecessary parts replacement. Only the parameters listed below are referenced in this service manual for use in diagnosis.

Scan Tool Parameter	Units Displayed	Typical Data Value at Engine Idle	Typical Data Value at 2000 RPM
Operating Conditions: Engine Idling or 2000 RPM / Engine Coolant Temperature is between 75-85°C (167-185°F) / Accelerator Pedal is Constant / Park or Neutral / Accessories OFF / Vehicle Located at Sea Level			
Ignition Switch	On/Off	On	On
System Voltage	V	11.0 – 15.0	11.0 – 15.0
ECM Main Relay	On/Off	On	On
Engine Speed	RPM	650 - 750	1950 – 2050
Desired Idle Speed	RPM	700	700
Injection Pump Speed	RPM	325 - 375	975 – 1025
Accelerator Pedal Position	%	0.0	5.0 – 7.0
Idle Switch	On/Off	On	Off
Intake Air Temperature	°C/°F	20 – 40°C / 68 – 104°F	20 – 40°C / 68 – 104°F
Engine Coolant Temperature	°C/°F	75 - 85°C / 167 - 185°F	75 - 85°C / 167 - 185°F
Fuel Temperature	°C/°F	20 – 60°C / 68 – 140°F	20 – 60°C / 68 – 140°F
Barometric Pressure	hPa	Nearly 1010 hPa at sea level	Nearly 1010 hPa at sea level
Vacuum Pressure Sensor	hPa	Nearly 2020 hPa at sea level	Nearly 2020 hPa at sea level
Turbocharger Solenoid Command	%	100% at sea level	100% at sea level
EGR Solenoid Command	%	Nearly 90%	Nearly 90%
Mass Air Flow Sensor	mg/strk	More than 430 mg/strk at sea level (with EGR system) More than 700 mg/strk at sea level (without EGR system)	More than 430 mg/strk at sea level (with EGR system) More than 700 mg/strk at sea level (without EGR system)
Desired Mass Air Flow	mg/strk	More than 430 mg/strk at sea level (with EGR system) 1500 mg/strk (without EGR system)	More than 430 mg/strk at sea level (with EGR system) 1500 mg/strk (without EGR system)
Actual Injection Quantity	mg/strk	6.0 – 9.0	7.0 – 11.0
Desired Injection Quantity	mg/strk	6.0 – 9.0	7.0 – 11.0
Actual Injection Timing	°CA	1.0 – 4.0	3.0 – 4.5
Desired Injection Timing	°CA	1.0 – 4.0	3.0 – 4.5
Neutral Switch	On/Off	On	On
Brake Pedal 1 Switch	Applied/ Released	Released	Released
Brake Pedal 2 Switch	Applied/ Released	Released	Released
Clutch Pedal Switch	Applied/ Released	Released	Released
Vehicle Speed	km/h / MPH	0	0

Scan Tool Parameter	Units Displayed	Typical Data Value at Engine Idle	Typical Data Value at 2000 RPM
Glow Relay Command	On/Off	Off	Off
Glow Indicator Lamp Command	On/Off	Off	Off
Malfunction Indicator Lamp (MIL) Command	On/Off	Off	Off
A/C Request Signal	On/Off	Off	Off
A/C Relay Command	On/Off	Off	Off

Scan Tool Data Definitions

A list of each message displayed on the scan tool will be explained in Engine Controls. This information will assist in emission or driveability problems. The displays can be viewed while the vehicle is being driven. Always perform the Diagnosis System Check – Engine Controls first. The Diagnostic System Check will confirm proper system operation.

Ignition Switch

This parameter displays the input status of the ignition switch to the ECM terminal (pin 39). The scan tool will display On or Off. On indicates the ignition switch is turned ON position.

System Voltage

This parameter displays the system voltage measured by the ECM terminal (pin 3) at the voltage feed from the ECM main relay.

ECM Main Relay

This parameter displays the commanded state of the ECM main relay control circuit (pin 58). The scan tool will display On or Off. On indicates the ECM main relay control circuit is being grounded by the ECM, allowing the main relay to supply voltage to the other circuits of the ECM. Off indicates the main relay is not being commanded On by the ECM.

Engine Speed

This parameter displays the speed of the crankshaft as calculated by the ECM based on input from the crankshaft position (CKP) sensor or camshaft position (CMP) sensor. The scan tool will display the engine speed in revolution per minute (RPM).

Desired Idle Speed

This parameter displays the idle speed requested by the ECM. The ECM will compensate for various engine loads based on engine coolant temperature (ECT) and A/C system status. If the A/C system is activated, the ECM sets 100 RPM higher than normal idle speed.

Injection Pump Speed

This parameter displays the speed of the injection pump as calculated by the fuel injection pump control unit (PCU) based on the input from the fuel injection pump camshaft position (CMP) sensor. The scan tool will display the injection pump speed in revolution per minute (RPM).

Accelerator Pedal Position

This parameter displays the angle of the accelerator pedal as calculated by the ECM using the signal from the accelerator pedal position (APP) sensor. The accelerator pedal position indicated angle is a range of values indicating a low percentage when the accelerator pedal is not depressed to a high percentage when the accelerator pedal is fully depressed.

Idle Switch

This parameter displays the input status of the idle switch to the ECM terminal (pin 69). The Tech will display On or Off. On indicates the accelerator pedal is not being pushed down. Off indicates the accelerator pedal is being depressed.

Intake Air Temperature

This parameter displays the temperature of the intake air based on a voltage input from the intake air temperature (IAT) sensor to the ECM. The scan tool will display a low temperature when signal voltage is high, and high temperature when the signal voltage is low. Note that the IAT sensor is internal to the mass air flow (MAF) sensor and the MAF sensor is heated.

Engine Coolant Temperature

This parameter displays the temperature of the engine coolant based on a voltage input from the engine coolant temperature (ECT) sensor to the ECM. The scan tool will display a low temperature when the signal voltage is high, and a high temperature when the signal voltage is low.

Fuel Temperature

This parameter displays the temperature of the fuel as calculated by the fuel injection pump control unit (PCU) using the signal from the fuel temperature sensor inside of the PCU.

Barometric Pressure

This parameter displays the barometric pressure as calculated by the ECM using the signal from the barometric pressure (BARO) sensor inside of the ECM.

Vacuum Pressure Sensor (High altitude specification only)

This parameter displays the amount of the vacuum pressure to the turbocharger wastegate valve. When a high vacuum pressure at a low vacuum pressure amount to the turbocharger wastegate valve. The scan tool will display doubled barometric pressure when the ignition is ON with the engine OFF.

Turbocharger Solenoid Command (High altitude specification only)

This parameter displays the turbocharger solenoid valuve control duty ratio commanded by the ECM terminal (pin 96) using the signal from various sensor inputs. When a low duty ratio, vacuum pressure to the turbocharger wastegate valve is controlled to increase. When a high duty ratio, vacuum pressure to the turbochager wastegate valve is controlled to reduce.

EGR Solenoid Command

This parameter displays the EGR solenoid valve control duty ratio commanded by the ECM terminal (pin 97) using the signal from engine speed, and injection volume and various sensor inputs. When a small duty ratio, the EGR valve is controlled to close. When a large duty ratio, the EGR valve is controlled to open.

Mass Air Flow Sensor

This parameter displays the air flow into the engine as calculated by the ECM based on the mass air flow (MAF) sensor input. The scan tool will display a high value at higher engine speeds, and a low value at idle. This can be compared to the Desired Mass Air Flow to determine MAF sensor accuracy, EGR problem or intake problem. Note that the MAF on the scan tool will only update with the engine running.

Desired Mass Air Flow

This parameter displays a mass air flow desired by the ECM based on current driving condition.

Actual Injection Quantity

This parameter displays the injection quantity calculated by the PCU based on the fuel injection solenoid valve On time which compensated from the timing device position and fuel temperature inputs. This can be compared to the Desired Injection Quantity to determine fuel system problem.

Desired Injection Quantity

This parameter displays an injection quantity desired by the ECM based on current driving condition using target injection maps.

Actual Injection Timing

This parameter displays the injection timing calculated by the PCU based on the timing device position which determined from the crankshaft position sensor and camshaft position sensor inputs. This can be compared to the Desired Injection Timing to determine timing device problem or fuel system problem.

Desired Injection Timing

This parameter displays injection timing desired by the ECM based on current driving condition using target injection timing maps. This timing is compensated by engine coolant temperature, altitude and intake air temperature, etc.

Neutral Switch

This parameter displays the state of the neutral switch as determined by the ECM terminal (pin 87) based on an input from the neutral switch or inhibitor switch.

Brake Pedal 1 Switch

This parameter displays the state of the brake pedal as determined by the ECM terminal (pin 30) based on an input from the brake pedal 1 switch. This switch turns On the stop lamps when the brake pedal is depressed. The scan tool will display Applied when the brake pedal is depressed.

Brake Pedal 2 Switch

This parameter displays the state of the brake pedal 2 switch as determined by the ECM terminal (pin 65). The scan tool will display Released or Applied. Released indicates the brake pedal is not being pushed down. Applied indicates the brake switch is being depressed.

Clutch Pedal Switch (M/T Only)

This parameter displays the state of the clutch pedal as determined by the ECM terminal (pin 31) based on an input from the clutch pedal switch. The scan tool will display Release or Applied. Release indicates the clutch pedal is not being push down. Applied indicates the clutch switch is being depressed.

Vehicle Speed

This parameter displays the vehicle speed calculated by the ECM based on an input from the vehicle speed sensor (VSS). The scan tool will display a high value at higher vehicle speeds, and low value at lower vehicle speeds.

Glow Relay Command

This parameter displays the commanded state of the glow plug relay control circuit (pin 94). The scan tool will display On or Off. On indicates the glow plug relay control circuit is being grounded by the ECM, allowing voltage to the glow plugs. Off indicates the glow plug relay is not being commanded On by the ECM.

Glow Indicator Lamp Command

This parameter displays the commanded state of the glow indicator lamp control circuit (pin 43). The glow indicator lamp should be On when the scan tool indicates On. The glow indicator should be Off when the scan tool indicates Off.

Malfunction Indicator Lamp (MIL) Command

This parameter displays the commanded state of the malfunction indicator lamp (MIL) control circuit (pin 42). The MIL should be On when the scan tool indicates On. The MIL should be Off when the scan tool indicates Off. The ECM will command the MIL On for a certain length of time when the ignition is On with the engine Off in order to perform a bulb check.

A/C Request Signal

This parameter displays the state of the air conditioning (A/C) request input to the ECM terminal (pin 33) from the heating, ventilation, and air conditioning (HVAC) controls. The scan tool will display On or Off. On indicates the ECM is receiving a request from the HVAC system to ground the A/C compressor relay control circuit, engaging the A/C compressor clutch. Off indicates the ECM is not receiving a request from the HVAC system.

A/C Relay Command

This parameter displays the commanded state of the A/C compressor relay control circuit (pin 41). The scan tool will display On or Off. On indicates the A/C compressor relay control circuit is being grounded by the ECM, allowing voltage to the A/C compressor clutch. Off indicates the A/C compressor relay is not being commanded On by the ECM.

Scan Tool Output Controls

scan tool Output Control	Additional Menu Selection(s)	Descriptions
EGR Solenoid Valve	Solenoids	The purpose of this test is for checking whether the EGR valve is correctly moved with command. Restricted valve movement by foreign materials, excessive deposits, a faulty vacuum hose routing, a faulty EGR valve or a faulty EGR solenoid could be considered if the mass air flow (MAF) sensor is not changed when commanded ON or OFF.
Engine Speed (RPM) Control	—	The purpose of this test is for checking whether the actual engine idle speed can change to match the commanded RPM.
Glow Indicator	Lamps	The purpose of this test is for checking whether the glow indicator lamp is operating when commanded ON. Faulty circuit(s) or an open bulb could be considered if not operating when commanded ON.
Glow Relay	Relays	The purpose of this test is for checking whether the glow relay is operating when commanded ON. Faulty circuit(s) or a faulty glow relay could be considered if not energizing when commanded ON.
Malfunction Indicator Lamp	Lamps	The purpose of this test is for checking whether the malfunction indicator lamp (MIL) is operating when commanded ON. Faulty circuit(s) or an open bulb could be considered if not operating when commanded ON.

Scan Tool Does Not Power Up

Circuit Description

The data link connector (DLC) is a standardized 16-cavity connector. Connector design and location is dictated by an industry wide standard, and is required to provide the following:

- Scan tool power battery positive voltage at terminal 16.
- Scan tool power ground at terminal 4.
- Common signal ground at terminal 5.

The scan tool will power up with the ignition OFF. Some modules however, will not communicate unless the ignition is ON.

Scan tool Does Not Power Up
Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views

Step	Action	Value(s)	Yes	No
1	**Important:** Make sure the scan tool works properly on another vehicle before using this chart. 1. Turn OFF the ignition. 2. Inspect the Meter (+B) (10A) fuse (C-19) in the cabin fuse box. Is the Meter (+B) (10A) fuse (C-19) open?	—	Go to Step 2	Go to Step 3
2	Replace the Meter (+B) (10A) fuse (C-19). If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the Meter (+B) (10A) fuse (C-19) or replace the shorted attached component fed by the Meter (+B) (10A) fuse (C-19). Did you complete the repair?	—	Go to Step 7	—
3	1. Check each circuit at the data link connector (DLC) (B-58 connector) for a backed out, spread or missing terminal. 2. Repair the terminal as necessary. Did you find and complete the repair?	—	Go to Step 7	Go to Step 4
4	Connect a test lamp between the B+ circuit (pin 16 of B-58 connector) at the DLC and a known ground. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 5
5	Repair the open in the battery voltage circuit to the DLC. Did you complete the repair?	—	Go to Step 7	—
6	1. Test each ground circuit at the DLC (pins 4 and 5 of B-58 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Intermittent Conditions
7	1. Connect the scan tool to the DLC. 2. Attempt to turn ON the scan tool. Does the scan tool ON?	—	System OK	Go to Step 1

Scan Tool Does Not Communicate with Keyword 2000 Device

Circuit Description

The engine control module (ECM), transmission control module (TCM) and anti-theft (keyless entry) control unit (ACU) all communicate with the scan tool over the Keyword 2000 serial data link. However, the ECM and fuel injection pump control unit (PCU) communicates with each other over the controller area network (CAN) link. The CAN link is not used for communication with the scan tool and is shared only between the ECM and PCU.

Diagnostic Aids

The following conditions will cause a loss of Keyword 2000 serial data communication between the TCM and EHCU or between the scan tool and any control module:

- A Keyword 2000 serial data circuit open.
- A Keyword 2000 serial data circuit shorted to ground.
- A Keyword 2000 serial data circuit shorted to voltage.
- An internal condition within a module or connector on the Keyword 2000 serial data circuit, that causes a short to voltage or ground to the Keyword 2000 serial data circuit.
- Open ground circuit (pin 5) at the DLC.

Scan tool Does Not Communicate with Keyword 2000 Device
Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Attempt to communicate with the listed control modules. • Engine control module (ECM) • Transmission control module (TCM) (A/T only) • Electronic hydraulic control unit (EHCU) Does the scan tool communicate with all the listed control modules?	—	Go to Step 3	Go to Step 8
3	Does the scan tool communicate with the ECM?	—	Go to Step 4	Go to Lost Communication with The ECM
4	Does the scan tool communicate with the TCM?	—	Go to Step 5	Go to Diagnostic System Check Transmission Control
5	Does the scan tool communicate with the EHCU?	—	Go to Step 6	Go to Diagnostic System Brake
6	Test the Keyword 2000 serial data circuit for an intermittently short to ground or intermittently short to voltage. Then, test the Keyword 2000 serial data circuit for an intermittently open (based on which control module did not communicate) at the connection in the circuit. Did you find and correct the condition?	—	Go to Step 15	System OK
7	Test the data link connector (DLC) ground circuit at terminal 5 for an open circuit or poor connection. Did you find and correct the condition?	—	Go to Step 15	Go to Step 8

Step	Action	Value(s)	Yes	No
8	1. Turn OFF the ignition. 2. Disconnect the ECM C-56 and C-57 harness connectors. 3. Turn ON the ignition, with the engine OFF. 4. Attempt to communicate with the TCM and EHCU. Does the scan tool communicate with the TCM and EHCU?	—	Go to Step 12	Go to Step 9
9	1. Turn OFF the ignition. 2. Reconnect the ECM C-56 and C-57 harness connectors. 3. Disconnect the TCM A and B harness connectors. 4. Turn ON the ignition, with the engine OFF. 5. Attempt to communicate with the ECM and EHCU. Does the scan tool communicate with the ECM and EHCU?	—	Go to Step 13	Go to Step 10
10	1. Turn OFF the ignition. 2. Reconnect the TCM A and B harness connectors. 3. Disconnect the EHCU C-67 harness connectors. 4. Turn ON the ignition, with the engine OFF. 5. Attempt to communicate with the ECM and TCM. Does the scan tool communicate with the ECM and TCM?	—	Go to Step 14	Go to Step 11
11	Repair the short to ground or short to voltage on the Keyword 2000 serial data circuit between the DLC and ECM, TCM and EHCU. Did you complete the repair?	—	Go to Step 15	—
12	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
13	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in the transmission section. Did you complete the replacement?	—	Go to Step 15	—
14	Replace the EHCU. Refer to Electronic Hydraulic Control Unit in the anti-lock brake system section. Did you complete the replacement?	—	Go to Step 15	—
15	Attempt to communicate with the ECM, TCM and EHCU. Does the scan tool communicate with the ECM, TCM and EHCU?	—	System OK	Go to Step 2

Lost Communication with The Engine Control Module (ECM)

Circuit Description

The engine control module (ECM), transmission control module (TCM) and electronic hydraulic control unit (EHCU) all communicate with the scan tool over the Keyword 2000 serial data link. However, the ECM and fuel injection pump control unit (PCU) communicates with each other over the controller area network (CAN) link. The CAN link is not used for communication with the scan tool and is shared only between the ECM and PCU.

Lost Communication with The Engine Control Module (ECM)

Schematic Reference: Engine Controls Schematics

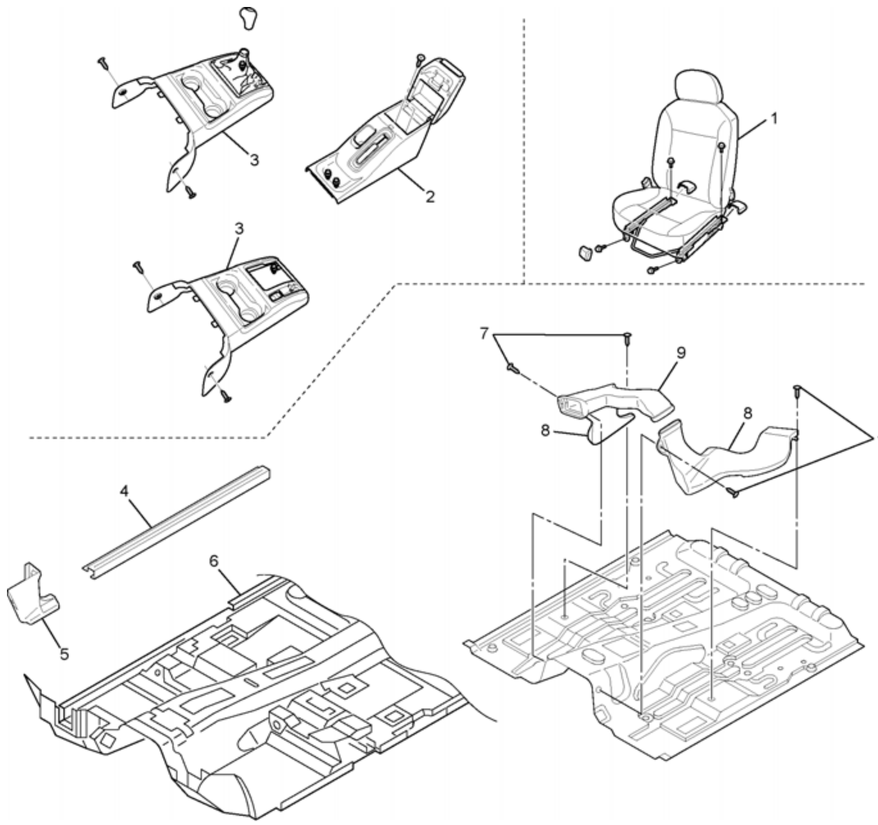
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	Attempt to establish engine control module (ECM) communications with the scan tool. Does the ECM communicate with the scan tool?	—	Go to Intermittent Conditions	Go to Step 3
3	Check the ECM C-56 and C-57 connectors for poor connections. Did you find and correct the condition?	—	Go to Step 17	Go to Step 4
4	Check the electronic hydraulic control unit (EHCU) C-67 connector for poor connection. Did you find and correct the condition?	—	Go to Step 17	Go to Step 5
5	1. Turn ON the ignition, with the engine OFF. 2. Check the ECM (30A) (SFB-4), ECM (10A) fuse (EB-4) and Engine (15A) fuse (C-6).Replace and retest if open. If any fuse continues to open, check for a short to ground on each circuit fed by that fuse. 3. Turn OFF the ignition. 4. Disconnect the ECM C-56 harness connector. 5. Turn ON the ignition, with the engine OFF. 6. Connect a test lamp to ground and check for voltage at the ignition voltage supply circuit at the ECM (pin 39 of C-56 connector). Does the test lamp illuminate?	—	Go to Step 6	Go to Step 14
6	1. Turn OFF the ignition. 2. Connect a DMM between the Keyword 2000 serial data circuit at the ECM (pin 35 of C-56 connector) and the EHCU (pin 11 of C-67 connector). 3. Test the circuits for an open circuit or high resistance. 4. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 7
7	1. Turn OFF the ignition. 2. Connect a DMM between the Keyword 2000 serial data circuit at the EHCU (pin 11 of C-67 connector) and the DLC (pin 7 of B-58 connector). 3. Test the circuits for an open circuit or high resistance. 4. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 8

Step	Action	Value(s)	Yes	No
8	**Important:** An open in a ground circuit at the ECM will not cause a loss of communication. 1. Check ECM ground for corrosion and tightness. 2. Clean or tighten grounds as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 9
9	1. Turn OFF the ignition. 2. Reconnect the ECM harness connector if previously disconnected. 3. Turn ON the ignition, with the engine OFF. 4. Replace the ECM main relay with the tail relay or replace with a known good relay. 5. Attempt to establish scan tool communications with the ECM. Does the ECM communicate with the scan tool?	—	Go to Step 15	Go to Step 10
10	1. Turn OFF the ignition. 2. Remove the ECM main relay. 3. Turn ON the ignition, with the engine OFF. 4. Using a test lamp, check for battery voltage at both of the battery voltage supply circuits to the ECM main relay (pins 2 and 5 of X-12 connector). 5. Repair the open in the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 11
11	1. Reinstall the ECM main relay. 2. Turn the ignition ON and OFF while listening or feeling for the ECM main relay click. Wait 2 seconds between transitions. Does the ECM main relay click when the ignition is turned ON or OFF?	—	Go to Step 13	Go to Step 12
12	Repair the ECM main relay control circuit between the ECM main relay (pin 4 of X-12 connector) and the ECM (pin 58 of C-56 connector) for the following conditions: • An open circuit • A short to battery or ignition voltage • High resistance or a poor connection at both the ECM and ECM main relay Did you find and correct the condition?	—	Go to Step 17	Go to Step 16
13	1. Check ECM main relay voltage supply circuit to the ECM between the ECM main relay (pin 1 of X-12 connector) and the ECM (pin 3 of C-56 connector) for the following conditions: • An open circuit • High resistance or a poor connection at the ECM and ECM main relay 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 16
14	Repair the open in the ignition voltage circuit to the ECM. Did you complete the repair?	—	Go to Step 17	—
15	Replace the ECM main relay. Did you complete the replacement?	—	Go to Step 17	—
16	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 17	—

REAR HEATER DUCT

REMOVAL AND INSTALLATION



RTW710LF004301

Disassembly Steps

1. Front seat assembly (RH/LH)
   - Refer to SECTION 10 “FRONT SEAT”.
2. Rear floor console
   - Refer to SECTION 10 “FLOOR CONSOLE”.
3. Front floor console (A/T, M/T Model)
   - Refer to SECTION 10 “FLOOR CONSOLE”.
4. Sill plate (RH/LH)
   - Refer to SECTION 10 “INTERIOR TRIM PANELS”.
5. Dash side trim cover (RH/LH)
6. Carpet
7. Clip
8. Rear Heater duct (RH/LH)
9. Rear Heater duct center

Reassembly Steps

9. Rear heater duct center
8. Rear heater duct (RH/LH)
7. Clip
6. Carpet
5. Dash side trim cover (RH/LH)
4. Sill plate (RH/LH)
   - Refer to SECTION 10 “INTERIOR TRIM PANELS”.
3. Front floor console (A/T, M/T Model)
   - Refer to SECTION 10 “FLOOR CONSOLE”.
2. Rear floor console
   - Refer to SECTION 10 “FLOOR CONSOLE”.
1. Front seat assembly (RH/LH)
   - Refer to SECTION 10 “FRONT SEAT”.

Step	Action	Value(s)	Yes	No
17	1. Turn OFF the ignition. 2. Reconnect all disconnected connectors. 3. Turn the ignition ON with the engine OFF. 4. Attempt to establish scan tool communications with the ECM. Does the scan tool communicate with the ECM?	—	System OK	Go to Step 3

Engine Cranks but Does Not Run

Description

The Engine Cranks but Does Not Run diagnostic table is an organized approach to identifying a condition that causes an engine to not start. The diagnostic table directs the service technician to the appropriate system diagnosis. The diagnostic table assumes the following conditions are met:

- The battery is completely charged and terminals are cleaned and tight.
- The engine cranking speed is normal.
- There is adequate fuel in the fuel tank.
- There is no fuel leak in the fuel line.
- There is no air in the fuel line.
- Filters (Air, Fuel) are clean.
- Fuse and slow blow fuse are normal.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Crank the engine for specified amount of time. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the scan tool display any DTCs that failed this ignition?	15 seconds	Go to Diagnostic Trouble Code (DTC) List	Go to Step 3
3	1. Check for normal readings at key up for the following inputs and output: Refer to the scan tool Data List or a known good vehicle to determine normal values. • System Voltage • Engine Coolant Temperature (ECT) • Intake Air Temperature (IAT) • Mass Air Flow (MAF) Sensor • Barometric Pressure • Desired Injection Quantity 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Inspect the high pressure side between the fuel injection pump and the fuel injection nozzles for fuel leakage. The following components may contain an external leak. • Fuel injection pump • Fuel injection pump control unit (PCU) • Fuel injection solenoid valve • Timing control valve (TCV) • Constant pressure valve (CPV) • Fuel pipe between the fuel injection pump and fuel injection nozzles • Each fuel pipe sleeve nuts • Each fuel pipe connectors • Each gaskets **Notice:** Fuel may leak into the engine from the fuel injection pump. In such case, the engine oil level will rise. Inspect for fuel leakage into the engine oil. 2. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 5
5	1. Turn OFF the ignition. 2. Check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. 3. Pump the priming pump on the fuel filter until it becomes firm. If there is a leak on the suction side of the fuel system between the priming pump and the fuel injection pump, the priming pump will not build up sufficient firmness and fuel leakage may occur. 4. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 6
6	1. Remove the fuel hose that connects to the fuel injection pump suction side. 2. Remove the fuel pipe connector that connects to the fuel injection pump suction side. 3. Inspect the eye bolt for any type of restriction or collapsed gauze filter. **Notice:** If any type of restriction found, check for a condition that causes contaminated fuel, such as the customer is using an aftermarket fuel filter or extended maintenance interval.Also inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system. 4. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 7

Step	Action	Value(s)	Yes	No
7	1. Disconnect the fuel hose that connects to the fuel injection pump suction side. In order to measure the discharged fuel amount, put the hose into a bottle or a container. 2. Pump the priming pump on the fuel filter. **Notice:** If there is a leak on the suction side of the fuel system, the fuel from the disconnected hose will not flow out sufficiently and fuel leakage may occur. Also if there is a restriction on the suction side of the fuel system, the fuel from the disconnected hose will not flow out sufficiently that is most likely caused by clogged fuel filter or kinked fuel hose or pipe. 3. Draw fuel from the fuel tank at the fuel line (as close to the fuel tank as possible) going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0/J-23738-A with a clear hose or equivalent). This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. 4. Repair any fuel system leaks and restrictions as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
8	1. Other possible causes for the no-start condition: • Fuel injection pump mechanical timing incorrect • Flywheel installed incorrectly causing the crankshaft position (CKP) sensor to be incorrectly timed to the engine. Disconnect sensor and attempt to start engine to verify. • Heavily restricted intake, exhaust or catalytic converter plugged solid • Poor engine compression • Water or gasoline contamination in fuel 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 9
9	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 10	—
10	1. Reconnect all previously disconnected harness connector(s). 2. Turn OFF the ignition for 30 seconds. 3. Attempt to start the engine. Does the engine start and continue to run?	—	Go to Step 11	Go to Step 2
11	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

Diagnostic Trouble Code (DTC) List

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on scan tool	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0100 (7)	65	ON	Mass Air Flow (MAF) Sensor Circuit 5V Reference High Voltage	• The ignition switch is ON.	• The ECM detects that the MAF sensor 5 volts reference circuit voltage is more than 5.2 volts for 0.5 seconds.	• Sensor 5V reference circuit is short to battery or ignition voltage. • Sensor 5V reference circuit is short to the sensor ignition voltage circuit. • Faulty MAF sensor. • Faulty ECM.
P0100 (9)	65	ON	Mass Air Flow (MAF) Sensor Voltage 5V Reference Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the MAF sensor 5 volts reference circuit voltage is less than 4.6 volts for 0.5 seconds.	• Sensor 5V reference circuit is short to ground. • Sensor 5V reference circuit is short to the low reference circuit. • Faulty MAF sensor. • Faulty ECM.
P0100 (B)	65	ON	Mass Air Flow (MAF) Sensor Circuit Low Voltage	• The ignition switch is ON. • The engine is running.	• The ECM calculated MAF is lower than -18.6 kg/h for 5 seconds.	• ECM (10A) fuse (EB1) open. • Sensor ignition voltage feed circuit is open circuit or high resistance. • Sensor 5V reference circuit is open circuit, high resistance, short to ground or short to the low reference circuit. • Sensor signal circuit is open circuit, high resistance, short to ground or short to the low reference circuit. • Poor harness connector connection. • Faulty MAF sensor installation. • Faulty MAF sensor. • Faulty ECM.
P0100 (C)	65	ON	Mass Air Flow (MAF) Sensor Circuit High Voltage	• The ignition switch is ON. • The engine is running.	• The ECM calculated MAF is higher than 984 kg/h for 10 seconds.	• Sensor signal circuit is short to any 5V reference circuit, short to battery or ignition voltage circuit. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty MAF sensor. • Faulty ECM.
P0105 (1)	34	ON	Vacuum Pressure Sensor Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the vacuum pressure sensor signal voltage is more than 4.4 volts for 3 seconds.	• Sensor 5V reference circuit is short to battery or ignition voltage. • Sensor signal circuit is short to any 5V reference circuit, short to battery or ignition voltage. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty vacuum pressure sensor. • Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on scan tool	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0105 (2)	34	ON	Vacuum Pressure Sensor Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the vacuum pressure sensor signal voltage is less than 0.5 volts for 3 seconds.	• Sensor 5V reference circuit is open circuit or high resistance, short to ground or short to the low reference circuit. • Sensor signal circuit is open circuit, high resistance, short to ground or short to the low reference circuit. • Poor harness connector connection. • Faulty vacuum pressure sensor. • Faulty ECM.
P0105 (7)	34	ON	Vacuum Pressure Sensor Voltage 5V Reference Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the vacuum pressure sensor 5 volts reference circuit voltage is more than 5.2 volts for 2.5 seconds.	• Sensor 5V reference circuit is short to battery or ignition voltage. • Faulty ECM.
P0105 (9)	34	ON	Vacuum Pressure Sensor Voltage 5V Reference Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the vacuum pressure sensor 5 volts reference circuit voltage is less than 4.5 volts for 2.5 seconds.	• Sensor 5V reference circuit is short to ground or short to low reference circuit. • Faulty vacuum pressure sensor. • Faulty ECM.
P0110 (1)	23	ON	Intake Air Temperature (IAT) Sensor Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the IAT sensor signal voltage is more than 4.7 volts for 3 seconds.	• Sensor signal circuit is open circuit, high resistance, short to any 5V reference circuit, short to battery or ignition voltage. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty IAT sensor. • Faulty ECM.
P0110 (2)	23	ON	Intake Air Temperature (IAT) Sensor Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the IAT sensor signal voltage is less than 0.3volts for 3 seconds.	• Sensor signal circuit is short to ground or short to the low reference circuit. • Faulty IAT sensor. • Faulty ECM.
P0115 (1)	14	ON	Engine Coolant Temperature (ECT) Sensor Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the ECT sensor signal voltage is more than 4.7 volts for 3 seconds.	• Sensor signal circuit is open circuit, high resistance, short to any 5V reference circuit, short to battery or ignition voltage. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty ECT sensor. • Faulty ECM.
P0115 (2)	14	ON	Engine Coolant Temperature (ECT) Sensor Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the ECT sensor signal voltage is less than 0.3volts for 3 seconds.	• Sensor signal circuit is short to ground or short to the low reference circuit. • Faulty ECT sensor. • Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on scan tool	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0180 (B)	15	ON	Fuel Temperature Sensor Circuit	• Ignition switch is ON.	• The PCU internal FT sensor output is lower than -40°C (-40°F) for 3 seconds or higher than 150°C (302°F) for 3 seconds.	• Faulty PCU.
P0215 (A)	52	ON at next ignition cycle	Engine Shutoff (ESO) Solenoid Control Circuit	• The ignition switch is OFF. • The engine speed is lower than 1500 RPM. • The vehicle speed is lower than 1.5 km/h (1 MPH).	• After the condition for running the DTC for 2 seconds, the engine speed is higher than 200 RPM when the ESO solenoid valve is commanded shutoff from the PCU.	• Faulty fuel injection pump.
P0215 (B)	52	ON	Engine Shutoff (ESO) Solenoid Control Circuit	• The ignition switch is ON.	• The PCU detects high voltage condition on the ESO solenoid valve control circuit for longer than 1 second when the ECM does not command shutoff.	• ESO solenoid valve control circuit is short to battery or ignition voltage. • Faulty PCU. • Faulty ECM.
P0215 (C)	52	ON	Engine Shutoff (ESO) Solenoid Control Circuit	• The ignition switch is OFF. • The engine speed is lower than 1500 RPM. • The vehicle speed is lower than 1.5 km/h (1 MPH).	• The engine speed is higher than 200 RPM within 2 seconds after the condition for running the DTC are met.	• ESO solenoid valve control circuit is open circuit, high resistance or short to ground. • Faulty PCU. • Faulty ECM.
P0215 (D)	52	ON	Engine Shutoff (ESO) Solenoid Control Circuit	• The ignition switch is OFF.	• The ECM detects internal CAN controller does not Bus OFF mode.	• Faulty ECM.
P0216 (A)	54	ON	Injection Timing Control Circuit	• The engine speed is higher than 700 RPM. • The fuel injection quantity is higher than 4 mg/strk.	• The PCU monitored actual fuel injection timing is advanced more than desired by 3°CA for longer than 12 seconds or retarded more than desired by 6°CA for longer than 12 seconds.	• Excessive air in the fuel system. • Loss fuel. • Fuel suction side looseness, kinks or blocked. • Faulty or clogged fuel filter. • Contaminated fuel. • Faulty timing device. • Faulty fuel injection pump CMP sensor.
P0216 (B)	54	ON	Injection Timing Control Circuit	• The engine speed is higher than 2014 RPM.	• The PCU monitored actual fuel injection timing is oscillated higher than desired by 5.2°CA.	• Excessive air in the fuel system. • Loss fuel. • Fuel suction side looseness, kinks or blocked. • Faulty or clogged fuel filter. • Contaminated fuel. • Faulty timing device. • Faulty fuel injection pump CMP sensor.

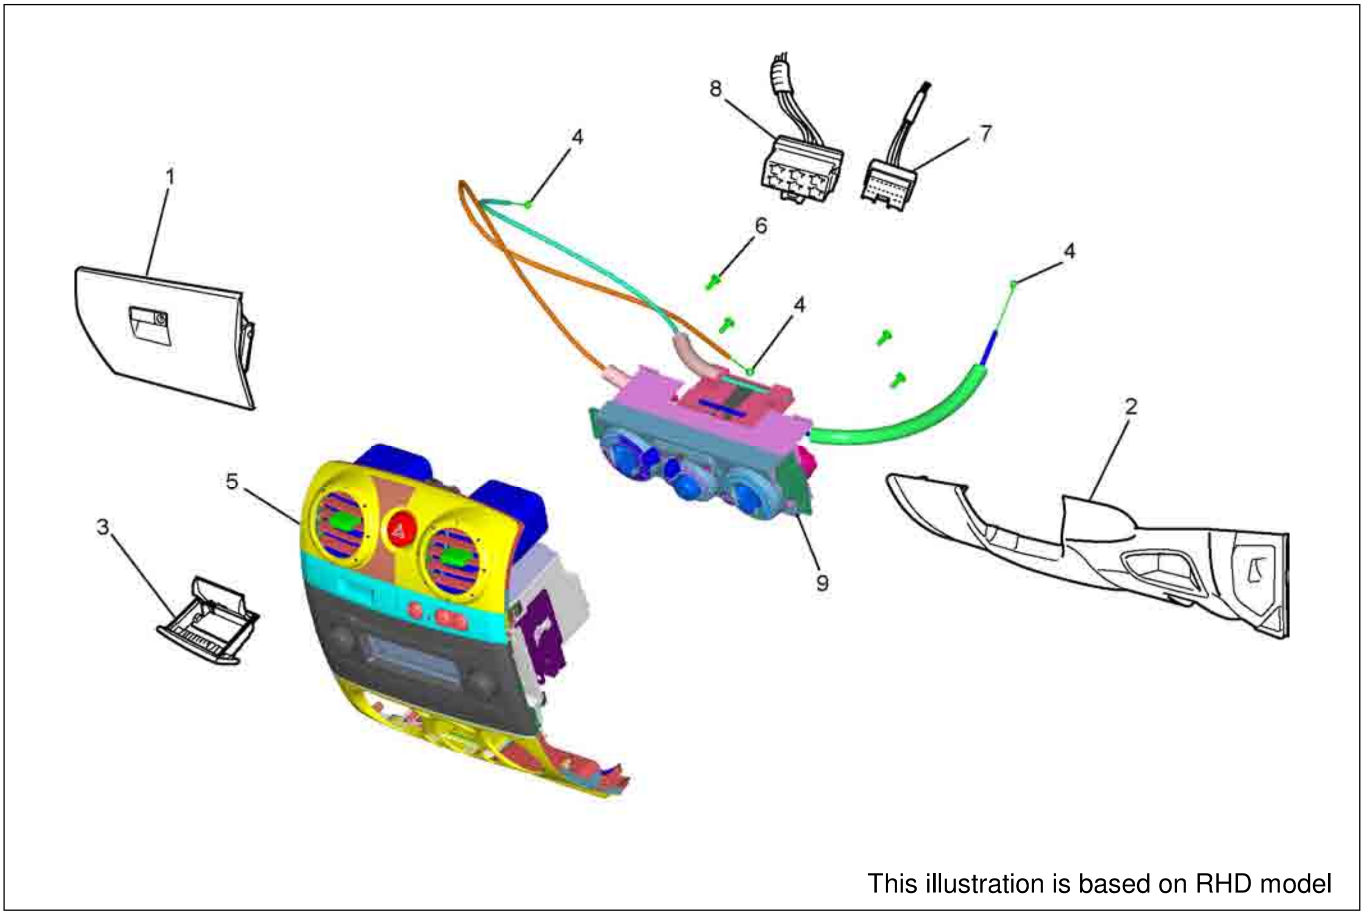
DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on scan tool	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0243 (3)	64	ON	Turbocharger Waste gate Solenoid Boost Solenoid Circuit	• The ignition switch is ON. • The BARO is between 0 hPa and 3500 hPa. • The IAT is between -50°C (-58 °F) and 200°C (392°F). • The ECT is between -50°C (-58 °F) and 150°C (302°F).	• The ECM detects that the vacuum pressure is 50 hPa lower than the desired vacuum pressure for 3 seconds.	• Vacuum pressure sensor circuits are high resistance. • Faulty vacuum hoses • Misrouted vacuum hoses. • Faulty vacuum pressure sensor. • Faulty turbocharger solenoid valve. • Faulty vacuum regulating valve. • Faulty turbocharger wastegate valve. • Faulty ECM.
P0243 (4)	64	ON	Turbocharger Waste gate Solenoid Boost Solenoid Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the low voltage condition on the turbocharger solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded OFF.	• ECM (10A) fuse (EB1) open. • Turbocharger solenoid valve ignition voltage feed circuit is open circuit or high resistance. • Turbocharger solenoid valve control circuit is open circuit, high resistance or short to ground. • Poor harness connector connection. • Faulty turbocharger solenoid valve. • Faulty ECM.
P0243 (5)	64	ON	Turbocharger Wastegate Solenoid Boost Solenoid Circuit	• The ignition switch is ON. • The BARO is between 0 hPa and 3500 hPa. • The IAT is between -50°C (-58 °F) and 200°C (392°F). • The ECT is between -50°C (-58 °F) and 150°C (302°F).	• The ECM detects that the vacuum pressure is 50 hPa higher than the desired vacuum pressure for 3 seconds.	• Vacuum pressure sensor low reference circuit is high resistance. • Faulty vacuum hoses • Misrouted vacuum hoses. • Faulty vacuum pressure sensor. • Faulty turbocharger solenoid valve. • Faulty vacuum regulating valve. • Faulty turbocharger wastegate valve. • Faulty ECM.
P0243 (6)	64	ON	Turbocharger Waste gate Solenoid Boost Solenoid Circuit	• The ignition switch is ON. • The ECT is between -50°C (-58 °F) and 150°C (302°F). • The EGR solenoid valve control is OFF. • The MAF sensor DTC P0100 is not set. • The vacuum pressure sensor DTC P0105 is not set. • The IAT sensor DTC P0110 is not set.	• The ECM detects that the MAF amount is 56 mg/strk higher than the desired MAF for 3 seconds.	• Faulty turbocharger wastegate valve. • MAF sensor low reference circuit is high resistance. • Faulty EGR valve vacuum control system. • Faulty EGR valve. • Faulty EGR solenoid valve. • Faulty EGR solenoid valve vacuum hose routing. • Faulty MAF sensor.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on scan tool	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0243 (8)	64	ON	Turbocharger Waste gate Solenoid Boost Solenoid Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the high voltage condition on the turbocharger solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded ON.	• Turbocharger solenoid valve control circuit is short to battery or ignition voltage circuit. • Faulty turbocharger solenoid valve. • Faulty ECM.
P0251 (6)	53	ON	Injection Pump Fuel Metering Control	• The fuel injection pump CMP sensor signal is generated. • The CAN communication between the ECM and PCU is normal.	• The PCU detects that the fuel injection solenoid valve is operated when the desired fuel injection quantity is commanded 0 mg/strk.	• Faulty fuel injection pump. • Faulty PCU.
P0251 (7)	53	ON	Injection Pump Fuel Metering Control	• The fuel injection pump CMP sensor signal is generated. • The CKP sensor signal is generated. • The engine speed is higher than 500 RPM.	• The PCU detects that the doubled fuel injection pump speed is lower than engine speed by 690 RPM for longer than 0.2 seconds.	• Faulty CKP sensor signal. • Faulty fuel injection pump CMP sensor signal. • Electrical interference. • Magnetic interference. • Faulty PCU.
P0251 (9)	53	ON	Injection Pump Fuel Metering Control	• The ignition switch is ON.	• The PCU detects internal fuel injection pump control maps are not programmed during self-test.	• Faulty PCU.
P0251 (A)	53	ON	Injection Pump Fuel Metering Control	• The ignition switch is ON.	• The PCU detects internal EEPROM or A/D converter is failed during self-test.	• Faulty PCU.
P0251 (B)	53	ON	Injection Pump Fuel Metering Control	• The ignition switch is ON.	• The PCU detects that the fuel injection solenoid valve drive circuit is failed during self-test.	• Faulty fuel injection pump. • Faulty PCU.
P0251 (D)	53	ON	Injection Pump Fuel Metering Control	• The ignition switch is ON.	• The PCU detects that the fuel injection solenoid valve drive circuit voltage level is abnormal during self-test.	• Faulty fuel injection pump. • Faulty PCU.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on scan tool	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0251 (E)	53	ON	Injection Pump Fuel Metering Control	• The ignition switch is ON.	• The ECM detects communication message from the PCU is not received for longer than 1 second.	• CAN high circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • CAN low circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • Electrical interference. • Magnetic interference. • Faulty PCU. • Faulty ECM.
P0335 (B)	43	ON	Crankshaft Position (CKP) Sensor Circuit	• The ignition switch is ON. • The engine speed is higher than 665 RPM.	• The ECM detects extra or missing CKP sensor signals while engine is running.	• Sensor signal circuit is open circuit, high resistance, short to ground, short to battery or short to ignition voltage. • Sensor low reference circuit is open circuit, high resistance, short to ground, short to battery or short to ignition voltage. • Sensor shield ground is open circuit, high resistance, short to ground, short to battery or short to ignition voltage. • Faulty CKP sensor. • Faulty ECM. • Electrical interference. • Magnetic interference. • Faulty sensor installation. • Faulty flywheel circumference.
P0335 (D)	43	ON	Crankshaft Position (CKP) Sensor Circuit	• DTC P0335 (Symptom Code B) is not set. • The ignition switch is ON. • The fuel injection pump CMP sensor signal is generated. • The CAN communication between the ECM and PCU is normal.	• The ECM detects that the CKP sensor signals are not generated when doubled fuel injection pump rotation speed is higher than 50 RPM.	• Sensor signal circuit is open circuit, high resistance, short to ground, short to battery or short to ignition voltage. • Sensor low reference circuit is open circuit, high resistance, short to ground, short to battery or short to ignition voltage. • Sensor shield ground is open circuit, high resistance, short to ground, short to battery or short to ignition voltage. • Faulty CKP sensor. • Faulty ECM. • Electrical interference. • Magnetic interference. • Faulty sensor installation. • Faulty flywheel circumference.
P0335 (E)	43	ON	Crankshaft Position (CKP) Sensor Circuit	• Ignition switch is ON.	• The ECM detects that the engine speed is higher than 5700 RPM for 0.2 seconds.	• Engine overrun. • Faulty CKP sensor. • Faulty ECM. • Electrical interference. • Magnetic interference. • Faulty flywheel circumference.

CONTROL LEVER ASSEMBLY

REMOVAL AND INSTALLATION



RTW710MF000801

Removal Steps

1. Glove box
▲ 2. Instrument panel driver side lower cover
3. Ash-tray
▲ 4. Control cables
▲ 5. Center cluster
6. Attaching screw
7. A/C switch connector
8. Fan switch connector
9. Control lever assembly

Installation Steps

▲ 9. Control lever assembly
8. Fan switch connector
7. A/C switch connector
6. Attaching screw
5. Center cluster
▲ 4. Control cables
3. Ash-tray
2. Instrument panel driver side lower cover
1. Glove box

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on scan tool	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0380 (4)	66	ON	Glow Plug Relay Control Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the low voltage condition on the glow relay control circuit for longer than 3 seconds when the relay is commanded OFF.	• ECM (10A) fuse (EB1) open. • Glow relay ignition voltage feed circuit on coil side is open circuit or high resistance. • Glow relay control circuit is open circuit, high resistance or short to ground. • Glow relay is poor installation. • Faulty glow relay. • Faulty ECM.
P0380 (8)	66	ON	Glow Plug Relay Control Circuit High Voltage	• The ignition switch is ON.	• The ECM detect that the high voltage condition on the glow relay control circuit for longer than 1 second when the relay is commanded ON.	• Glow relay control circuit is short to battery or ignition voltage circuit. • Faulty glow relay. • Faulty ECM.
P0381 (4)	67	ON	Glow Plug Indicator Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the low voltage condition on the glow indicator lamp control circuit for longer than 3 seconds when the indicator lamp is commanded OFF.	• Meter (15A) fuse (C-14) open. • Glow indicator lamp ignition voltage feed circuit is open circuit or high resistance. • Glow indicator lamp control circuit is open circuit, high resistance or short to ground. • Poor harness connector connection. • Glow indicator lamp bulb burned out. • Faulty instrument panel cluster (meter assembly). • Faulty ECM.
P0381 (8)	67	ON	Glow Plug Indicator Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the high voltage condition on the glow indicator lamp control circuit for longer than 1 second when the indicator lamp is commanded ON.	• Glow indicator lamp control circuit is short to battery or ignition voltage circuit. • Faulty instrument panel cluster (meter assembly). • Faulty ECM.
P0400 (3)	32	ON	Exhaust Gas Recirculation (EGR) System Performance	• The ignition switch is ON. • The engine is running. • The BARO is between 850 hPa and 1100 hPa. • The IAT is between 15°C (59°F) and 100°C (212°F). • The ECT is between 35°C (95°F) and 100°C (211°F).	• The ECM detects that the MAF amount is 150 mg/strk lower than the desired MAF for 60 seconds.	• MAF sensor circuits are high resistance. • MAF sensor signal circuit is short to IAT sensor signal circuit. • Intake air leakage. • Intake duct disconnected. • Intake system is obstructed. • Faulty turbocharger. • Faulty exhaust system. • Faulty EGR valve vacuum control system. • Faulty EGR valve. • Faulty EGR solenoid valve. • Faulty EGR solenoid valve vacuum hose routing. • Faulty MAF sensor.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on scan tool	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0400 (4)	32	ON	Exhaust Gas Recirculation (EGR) Solenoid Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the low voltage condition on the EGR solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded OFF.	• ECM (10A) fuse (EB1) open. • EGR solenoid valve ignition voltage feed circuit is open circuit or high resistance. • EGR solenoid valve control circuit is open circuit, high resistance or short to ground. • Poor harness connector connection. • Faulty EGR solenoid valve. • Faulty ECM.
P0400 (5)	32	ON	Exhaust Gas Recirculation (EGR) System Performance	• The ignition switch is ON. • The engine is running. • The BARO is between 850 hPa and 1100 hPa. • The IAT is between 15°C (59°F) and 100°C (212°F). • The ECT is between 35°C (95°F) and 100°C (211°F).	• The ECM detects that the MAF amount is 150 mg/strk higher than the desired MAF for 60 seconds.	• MAF sensor low reference circuit is high resistance. • Faulty EGR valve vacuum control system. • Faulty EGR valve. • Faulty vacuum pump • Faulty EGR solenoid valve. • Faulty EGR solenoid valve vacuum hose routing. • Faulty MAF sensor. • Faulty ECM.
P0400 (8)	32	ON	Exhaust Gas Recirculation (EGR) Solenoid Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the high voltage condition on the EGR solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded ON.	• EGR solenoid valve control circuit is short to battery or ignition voltage circuit. • Faulty EGR solenoid valve. • Faulty ECM.
P0500 (1)	24	ON	Vehicle Speed Sensor (VSS) Circuit	• The ignition switch is ON.	• The ECM detects that the vehicle speed is higher than 200 km/h (125 MPH) for 5 seconds.	• Vehicle speed too high. • Electrical interference. • Magnetic interference. • Faulty A/T VSS. (2WD with A/T) • Faulty VSS. (Except 2WD with A/T) • Faulty ECM.
P0500 (A)	24	ON	Vehicle Speed Sensor (VSS) Circuit	• The ignition switch is ON.	• The ECM detects that the vehicle speed sensor signal frequency is too high for 0.6 seconds.	• Electrical interference. • Magnetic interference. • Faulty A/T VSS. (2WD with A/T) • Faulty VSS. (Except 2WD with A/T) • Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on scan tool	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0500 (B)	24	ON	Vehicle Speed Sensor (VSS) Circuit	• The ignition switch is ON. • The engine speed is higher than 3600 RPM. • The fuel injection quantity is more than 41 mg/strk.	• The ECM detects that the vehicle speed is lower than 1.5km/h (1 MPH) for 60 seconds.	• 2WD with A/T • VSS signal circuit is open circuit, high resistance, short to ground, short to battery or ignition. • Poor harness connector connection. • Faulty instrument panel cluster (meter assembly). • Faulty TCM. • Faulty ECM. • Except 2WD with A/T • Meter (15A) fuse (C-14) open. • Sensor ignition voltage circuit is open circuit or high resistance. • Sensor signal circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty instrument panel cluster (meter assembly). • Faulty VSS. • Faulty ECM.
P0560 (1)	35	OFF	System Voltage	—	• The ECM detects that the battery voltage feed circuit voltage is more than 20 volts.	• Incorrect “Jump Starting”. • Faulty charging system. • Faulty ECM.
P0560 (2)	35	OFF	System Voltage	—	• The ECM detects that the battery voltage feed circuit voltage is less than 7 volts.	• Faulty charging system. • Battery voltage feed circuit is high resistance. • Faulty ECM.
P0560 (A)	35	OFF	System Voltage	—	• The PCU battery voltage feed circuit voltage is less than 4.5 volts or more than 27 volts.	• Incorrect “Jump Starting”. • Faulty charging system. • Battery voltage feed or ground circuit is high resistance. • Faulty PCU.
P0561 (A)	18	OFF	Ignition Switch Circuit	—	• The ECM detects that the ignition voltage circuit is changed ON to OFF during initialization.	• ECM main relay control circuit is short to ground. • Ignition voltage feed circuit is intermittently open circuit or high resistance. • Faulty ignition switch.
P0561 (B)	18	OFF	Ignition Switch Circuit	—	• The ECM detects internal ignition voltage feed circuit is failed after initialization.	• Faulty ECM.
P0602	-	ON	Control Module Not Programmed	—	• VIN in the ECM is not programmed.	• VIN is not programmed.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on scan tool	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0606 (A)	28	ON	Control Module Internal Performance	—	• The ECM detects that the internal CPU does not react.	• Faulty ECM.
P0606 (B)	28	ON	Control Module Internal Performance	• The accelerator pedal position is less than 1%. • The desired fuel injection quantity is 0 mg/strk.	• The ECM detects that the engine speed is higher than 2000 RPM.	• Faulty ECM.
P0645 (4)	46	ON	Air Conditioning (A/C) Clutch Relay Control Circuit Low Voltage	• The ignition switch is ON. • The A/C compressor relay is once commanded ON.	• The ECM detects that the low voltage condition on the A/C compressor relay control circuit for longer than 3 seconds when the relay is commanded OFF.	• ECM (10A) fuse (EB1) open. • A/C compressor relay ignition voltage feed circuit on coil side is open circuit or high resistance. • A/C compressor relay control circuit is open circuit, high resistance or short to ground. • A/C compressor relay is poor installation. • Faulty A/C compressor relay. • Faulty ECM.
P0645 (8)	46	ON	Air Conditioning (A/C) Clutch Relay Control Circuit High Voltage	• The ignition switch is ON. • The A/C compressor relay is once commanded ON.	• The ECM detects that the high voltage condition on the A/C compressor relay control circuit for longer than 3 seconds when the relay is commanded ON.	• A/C compressor relay control circuit is short to battery or ignition voltage circuit. • Faulty A/C compressor relay. • Faulty ECM.
P0703 (A)	25	ON	Brake Switch Circuit	• The ignition switch is ON. • The engine speed is higher than 665 RPM. • The vehicle speed is higher than 0 km/h (0 MPH).	• The ECM detects that the brake pedal 1 switch is ON (Applied) when the brake pedal 2 switch is OFF (Released) for longer than 30 seconds within the enabling conditions ever since ignition switch is ON.	• Stop (15A) fuse (C-15) open. • ECM (10A) fuse (EB-4) open. • Brake pedal 1 switch battery voltage feed circuit is open circuit or high resistance. • Brake pedal 1 switch signal circuit is open circuit, high resistance, short to battery or ignition voltage. • Brake pedal 2 switch ignition voltage feed circuit is open circuit or high resistance. • Brake pedal 2 switch signal circuit is open circuit, high resistance, short to battery or ignition voltage. • Misadjusted brake pedal switch. • Brake pedal switch is poor connection. • Faulty brake pedal switch. • Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on scan tool	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P0703 (B)	25	ON	Brake Switch Circuit	• The ignition switch is ON. • The engine speed is higher than 665 RPM. • The vehicle speed is higher than 0 km/h (0 MPH).	• The ECM detects that the brake pedal 1 switch is OFF (Released) when the brake pedal 2 switch is ON (Applied) for longer than 30 seconds.	• Stop (15A) fuse (C-15) open. • ECM (10A) fuse (EB-4) open. • Brake pedal 1 switch battery voltage feed circuit is open circuit or high resistance. • Brake pedal 1 switch signal circuit is open circuit, high resistance, short to battery or ignition voltage. • Brake pedal 2 switch ignition voltage feed circuit is open circuit or high resistance. • Brake pedal 2 switch signal circuit is open circuit, high resistance, short to battery or ignition voltage. • Misadjusted brake pedal switch. • Brake pedal switch is poor connection. • Faulty brake pedal switch. • Faulty ECM.
P0704 (6)	57	ON	Clutch Switch Input Circuit	• The ignition switch is ON.	• The ECM detects that the clutch pedal switch signal does not change during the vehicle speed changes between 1.5 km/h (1 MPH) and 80 km/h (50 MPH).	• ECM (10A) fuse (EB-4) open. • Clutch pedal switch ignition voltage feed circuit is open circuit or high resistance. • Clutch pedal switch signal circuit is open circuit, high resistance, short to battery or ignition voltage. • Misadjusted clutch pedal switch. • Clutch pedal switch is poor connection. • Faulty clutch pedal switch. • Faulty ECM.
P1105 (1)	86	ON	Barometric Pressure (BARO) Sensor Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the BARO sensor signal voltage is more than 4.4 volts for 1 second.	• Faulty ECM.
P1105 (2)	86	ON	Barometric Pressure (BARO) Sensor Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects that the BARO sensor signal voltage is less than 1.5 volts for 1 second.	• Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on scan tool	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1120 (1)	21	ON	Accelerator Pedal Position (APP) Sensor Circuit High Voltage	• The ignition switch is ON.	• The ECM detects that the APP sensor signal voltage is more than 4.5 volts for 0.5 seconds.	• Sensor 5V reference circuit is short to battery or ignition voltage. • Sensor 5V reference circuit is short to ground or short to the low reference circuit. • Sensor signal circuit is short to any 5V reference circuit, short to battery or ignition voltage circuit. • Sensor low reference circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty APP sensor. • Faulty ECM.
P1120 (7)	21	ON	Accelerator Pedal Position (APP) Sensor Circuit 5V Reference High Voltage	• The ignition switch is ON.	• The ECM detects that the APP sensor voltage supply circuit is more than 5.2 volts for 0.5 seconds.	• Sensor 5V reference circuit is short to battery or ignition voltage circuit. • Faulty ECM.
P1120 (9)	21	ON	Accelerator Pedal Position (APP) Sensor Circuit 5V Reference Low Voltage	• The ignition switch is ON.	• The ECM detects that the APP sensor voltage supply circuit is less than 4.6 volts for 0.5 seconds.	• Sensor 5V reference circuit is short to ground or short to the low reference circuit. • Faulty APP sensor. • Faulty ECM.
P1120 (D)	21	ON	Accelerator Pedal Position (APP) Sensor Circuit Correlation	• The ignition switch is ON. • The engine speed is higher than 1700 RPM. • The vehicle speed is higher than 1.5 km/h (1 MPH).	• The ECM detects APP sensor angle is stationary more than 8.7%, then brake pedal is depressed for longer than 2 seconds.	• Brake pedal 1 switch signal circuit is open circuit, high resistance, short to battery or ignition voltage. • Accelerator pedal stuck. • Intake throttle valve stuck. • Intake throttle valve control cable damaged, stuck or no free play. • Misadjusted APP sensor. • Faulty APP sensor. • Misadjusted brake pedal switch. • Faulty brake pedal switch. • Faulty ECM.
P1120 (E)	21	ON	Accelerator Pedal Position (APP) Sensor Circuit Correlation	• The ignition switch is ON.	Either of following condition is met. • The ECM detects APP sensor angle is less than 0.35%, then idle switch is OFF for longer than 0.6 seconds. OR • The ECM detects APP sensor angle is more than 8.7%, then idle switch is ON for longer than 0.6 seconds.	• APP sensor 5V reference circuit is open circuit or high resistance. • APP sensor signal circuit is open circuit, high resistance, short to ground or short to the low reference circuit. • APP sensor low reference circuit is high resistance. • Idle switch signal circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • Poor harness connector connection. • Faulty APP sensor. • Faulty idle switch. • Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on scan tool	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1173 (3)	22	OFF	Limitation of Injection Quantity	• The ignition switch is ON.	• The ECM detects an excessive high coolant temperature for longer than 30 seconds.	• Engine overheat. • Faulty engine cooling system. • Faulty ECT sensor.
P1173 (7)	22	OFF	Limitation of Injection Quantity	• The ignition switch is ON.	• The ECM detects an excessive high FT for longer than 30 seconds.	• Faulty PCU.
P1173 (A)	22	OFF	Limitation of Injection Quantity	• The ignition switch is ON.	• The ECM detects an excessive low FT for longer than 30 seconds.	• Faulty PCU.
P1335 (A)	43	ON	Crankshaft Position (CKP) Sensor Circuit	• The ignition switch is ON.	• The PCU detects CKP sensor signal from the ECM is faulty.	• CKP sensor signal output circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • Poor harness connector connection. • Faulty PCU. • Faulty ECM.
P1345 (A)	41	ON	Crankshaft Position (CKP) – Camshaft Position (CMP) Correlation	—	• The PCU received faulty fuel injection pump CMP sensor signal for 1 second.	• Faulty fuel injection pump. • Faulty PCU.
P1520 (A)	47	ON	Park/Neutral Position Switch Circuit	• The ignition switch is ON. • The engine speed is higher than 1500 RPM. • The vehicle speed is higher than 63 km/h (39 MPH) (M/T) or 78 km/h (49 MPH) (A/T). • The clutch pedal is released. (M/T)	• The ECM detects that the neutral switch signal is continuously ON (neutral or P/N range) during three consecutive driving cycles.	• Manual Transmission • Neutral switch signal circuit is short to battery or ignition voltage. • Faulty neutral switch. • Faulty ECM. • Automatic Transmission • P & N position switch signal circuit is short to battery or ignition voltage. • Misadjusted inhibitor switch. • Faulty inhibitor switch. • Faulty ECM.
P1520 (B)	47	ON	Park/Neutral Position Switch Circuit	• The ignition switch is ON. • The engine speed is higher than 665 RPM • The vehicle speed is lower than 2 km/h (1.2 MPH). • The clutch pedal is released after once depressed.	• The ECM detects that the neutral switch signal is continuously OFF (other than neutral) during three consecutive driving cycles.	• ECM (10A) fuse (EB-4) open. • Neutral switch ignition voltage feed circuit is open circuit or high resistance. • Neutral switch signal circuit is open circuit or high resistance. • Poor harness connector connection. • Faulty neutral switch. • Faulty ECM.
P1605 (C)	55	ON	Control Module Internal Performance	—	• The ECM detects internal seed or key file in EEPROM data is destroyed.	• Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on scan tool	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1605 (D)	55	ON	Control Module Internal Performance	—	• The ECM detects reading or writing from the EEPROM data is failed during initialization.	• Faulty ECM.
P1605 (E)	55	ON	Control Module Internal Performance	—	• The ECM detects total sum of EEPROM data is not equal to registered value during initialization.	• Faulty ECM.
P1610 (A) *1	56	ON	Immobilizer Function Not Programmed	—	• The ECM detects immobilizer security code and secret key is not programmed.	• Immobilizer function is not programmed into the ECM. • Faulty ECM.
P1611 (A) *1	56	ON	Wrong Security Code Entered	—	• The ECM detects wrong immobilizer security code is programmed.	• Programming ECM with wrong security code. • Faulty ECM.
P1612 (A) *1	56	ON	Immobilizer Wrong Signal	—	• The ECM receives wrong immobilizer response signal from the ICU.	• Keyword 2000 communication line is open circuit, high resistance, short to ground, short to battery or ignition voltage. • Electrical interference. • Magnetic interference. • Faulty ECM. • Faulty ICU.
P1613 (A) *1	56	ON	Immobilizer No Signal	—	• The ECM does not receive the immobilizer response signal from the ICU.	• Keyword 2000 communication line is open circuit, high resistance, short to ground, short to battery or ignition voltage. • Electrical interference. • Magnetic interference. • Faulty transponder key. • Faulty antenna coil. • Faulty ECM. • Faulty ICU.
P1614 (A) *1	56	ON	Wrong Transponder Key	—	• The ICU receives wrong immobilizer response signal from the transponder key.	• Faulty transponder key. • Faulty ICU.
P1625 (A)	76	OFF	ECM Main Relay Circuit	—	• The ECM detects that the ECM main relay is turned OFF before commanded turned OFF.	• ECM main relay control circuit is intermittently open circuit or high resistance. • ECM battery voltage feed circuit is intermittently open or high resistance. • Faulty ECM main relay.

*1: This DTC may be set if the ECM with wrong specification is installed.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on scan tool	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1625 (B)	76	OFF	ECM Main Relay Circuit	• The ignition switch is OFF.	• The ECM detects that the ECM main relay is turned ON for longer than 2 seconds.	• ECM main relay control circuit is short to ground. • ECM battery voltage circuit is short to battery. • Faulty ECM main relay. • Faulty ECM.
P1630 (A)	51	ON	Injection Pump Fuel Metering Control	—	• The ECM detects that the PCU monitored fuel injection solenoid valve control current is too high.	• Faulty fuel injection pump. • Faulty PCU.
P1630 (B)	51	ON	Injection Pump Fuel Metering Control	—	• The ECM detects that the PCU continuously flow the control current to the fuel injection solenoid valve.	• Faulty fuel injection pump. • Faulty PCU.
P1650 (A)	44	ON	CAN Device Offline	—	• The ECM detects that the PCU receives from the CAN controller reset or Bus Offline.	• CAN high circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • CAN low circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • Electrical interference. • Magnetic interference. • Faulty PCU. • Faulty ECM.
P1650 (B)	44	ON	CAN Device Hang-up	—	• The ECM detects internal CAN controller does not react.	• Faulty ECM.
P1651 (A)	45	ON	CAN Malfunction	—	• The ECM detects that the PCU does not receive the CAN messages from the ECM.	• CAN high circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • CAN low circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • Electrical interference. • Magnetic interference. • Faulty PCU. • Faulty ECM.

DTC (Symptom Code)	Flash Code	MIL Status	DTC Name on scan tool	Condition for Running the DTC	Condition for Setting the DTC	Possible Cause
P1651 (B)	45	ON	CAN Malfunction	—	• The ECM does not receive the CAN messages from the PCU.	• CAN high circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • CAN low circuit is open circuit, high resistance, short to ground, short to battery or ignition voltage. • Electrical interference. • Magnetic interference. • Faulty PCU. • Faulty ECM.
P1690 (4)	77	OFF	Malfunction Indicator Lamp (MIL) Control Circuit Low Voltage	• The ignition switch is ON.	• The ECM detects a low voltage condition on the MIL control circuit for longer than 3 seconds when the MIL is commanded OFF.	• Meter (15A) fuse (C-14) open. • MIL ignition voltage feed circuit is open circuit or high resistance. • MIL control circuit is open circuit, high resistance or short to ground. • Poor harness connector connection. • MIL bulb burned out. • Faulty instrument panel cluster (meter assembly). • Faulty ECM.
P1690 (8)	77	OFF	Malfunction Indicator Lamp (MIL) Circuit High Voltage	• The ignition switch is ON.	• The ECM detects a high voltage condition on the MIL control circuit for longer than 1 second when the MIL is commanded ON.	• MIL control circuit is short to battery or ignition voltage circuit. • Faulty instrument panel cluster (meter assembly). • Faulty ECM.

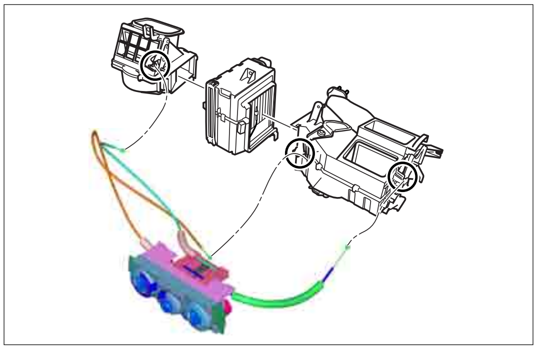
Important Operations - Removal

2. Instrument Panel Driver Lower Cover

Refer to SECTION 10 “INSTRUMENT PANEL” .

4. Control Cables

Disconnect control cables at each side of the unit.



RTW710SH000601

5. Center Cluster

Refer to SECTION 10 “INSTRUMENT PANEL”.

DTC P0100 (Symptom Code 7) (Flash Code 65)

Circuit Description

The mass air flow (MAF) sensor is an air flow meter that measures the amount of air that enters the engine. It is fitted between the air cleaner and turbocharger. A small quantity of air that enters the engine indicates deceleration or idle speed. A large quantity of air that enters the engine indicates acceleration or a high load condition. The MAF sensor has the following circuits.

- Ignition voltage circuit
- 5 volts reference circuit
- Low reference circuit
- MAF sensor signal circuit

The engine control module (ECM) provides 5 volts reference voltage through the reference circuit to the MAF sensor. The ECM monitors the voltage on the 5 volts reference circuit. If the ECM detects an excessively high MAF sensor 5 volts reference voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the MAF sensor 5 volts reference circuit voltage is more than 5.2 volts for 0.5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a MAF substitution of 1600 mg/strk for engine control.
- The ECM uses an EGR solenoid valve control substitution of 10%.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The MAF Sensor parameter on the scan tool will only update with engine running.

Test Description

The number below refers to the step number on the diagnostic table.

3. If the MAF sensor 5 volts reference circuit between the ECM and the sensor is normal, the sensor signal voltage low DTC P0100 (Symptom Code B) will set.

DTC P0100 (Symptom Code 7) (Flash Code 65)
Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the mass air flow (MAF) sensor harness connector. 3. Start the engine and let idle for 30 seconds. 4. Monitor the DTC Information with the scan tool. Does DTC P0100 (Symptom Code B) set, but not DTC P0100 (Symptom Code 7)?	—	Go to Step 5	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Test the 5 volts reference circuit between the engine control module (ECM) (pin 83 of C-57 connector) and the MAF sensor (pin 4 of C-116 connector) for the following conditions: • A short to battery or ignition voltage • A short to the sensor ignition voltage 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
5	Replace the MAF sensor. Refer to Mass Air Flow Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
6	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 8
8	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0100 (Symptom Code 9) (Flash Code 65)

Circuit Description

The mass air flow (MAF) sensor is an air flow meter that measures the amount of air that enters the engine. It is fitted between the air cleaner and turbocharger. A small quantity of air that enters the engine indicates deceleration or idle speed. A large quantity of air that enters the engine indicates acceleration or a high load condition. The MAF sensor has the following circuits.

- Ignition voltage circuit
- 5 volts reference circuit
- Low reference circuit
- MAF sensor signal circuit

The engine control module (ECM) provides 5 volts reference voltage through the reference circuit to the MAF sensor. The ECM monitors the voltage on the 5 volts reference circuit. If the ECM detects an excessively low MAF sensor 5 volts reference voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the MAF sensor 5 volts reference circuit voltage is less than 4.6 volts for 0.5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a MAF substitution of 1600 mg/strk for engine control.
- The ECM uses an EGR solenoid valve control substitution of 10%.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The MAF Sensor parameter on the scan tool will only update with engine running.

Test Description

The number below refers to the step number on the diagnostic table.

3. If the MAF sensor 5 volts reference circuit between the ECM and the sensor is normal, the sensor signal voltage low DTC P0100 (Symptom Code B) will set.

DTC P0100 (Symptom Code 9) (Flash Code 65)

Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the mass air flow (MAF) sensor harness connector. 3. Start the engine and let idle for 30 seconds. 4. Monitor the DTC Information with the scan tool. Does DTC P0100 (Symptom Code B) set, but not DTC P0100 (Symptom Code 9)?	—	Go to Step 5	Go to Step 4
4	1. Test the 5 volts reference circuit between the engine control module (ECM) (pin 83 of C-57 connector) and the MAF sensor (pin 4 of C-116 connector) for the following conditions: • A short to ground • A short to the low reference circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6

Step	Action	Value(s)	Yes	No
5	Replace the MAF sensor. Refer to Mass Air Flow Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
6	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 8
8	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0100 (Symptom Code B) (Flash Code 65)

Circuit Description

The mass air flow (MAF) sensor is an air flow meter that measures the amount of air that enters the engine. It is fitted between the air cleaner and turbocharger. A small quantity of air that enters the engine indicates deceleration or idle speed. A large quantity of air that enters the engine indicates acceleration or a high load condition. The MAF sensor has the following circuits.

- Ignition voltage circuit
- 5 volts reference circuit
- Low reference circuit
- MAF sensor signal circuit

The engine control module (ECM) monitors the MAF sensor signal for voltage outside the normal range of the MAF sensor. If the ECM detects an excessively low MAF sensor signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

- The ECM calculated MAF is lower than -18.6 kg/h for 5 seconds. This indicates the ECM detects that the MAF sensor signal voltage is smaller than a predetermined range during engine run.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a MAF substitution of 1600 mg/strk for engine control.
- The ECM uses an EGR solenoid valve control substitution of 10%.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL that the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Wrong direction of MAF sensor installation will cause this DTC to set.
- Contaminated or restricted MAF sensor will cause this DTC to set.
- The MAF Sensor parameter on the scan tool will only update with engine running.

Test Description

The number below refers to the step number on the diagnostic table.

7. If the MAF sensor signal circuit between the ECM and the sensor is short to ground or any low reference circuits, the sensor 5 volts reference voltage low DTC P0100 (Symptom Code 9) will set.

8. If the MAF sensor signal circuit between the ECM and the sensor is normal, the sensor signal voltage high DTC P0100 (Symptom Code C) will set.

DTC P0100 (Symptom Code B) (Flash Code 65)
Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle for 30 seconds. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Inspect the ECM (10A) fuse (EB-4) in the engine room fuse block. Is the ECM (10A) fuse (EB-4) open?	—	Go to Step 4	Go to Step 5
4	Replace the ECM (10A) fuse (EB-4). If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the ECM (10A) fuse (EB-4) or replace the shorted attached component fed by the ECM (10A) fuse (EB-4). Did you complete the repair?	—	Go to Step 17	—

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Disconnect the mass air flow (MAF) sensor harness connector. 3. Connect a test lamp between the ignition voltage feed circuit of the MAF sensor harness (pin 2 of C-116 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 9
6	1. Keep the ignition ON, with the engine OFF. 2. Connect a DMM between the 5 volts reference circuit of the MAF sensor harness (pin 4 of C-116 connector) and a known good ground. Is the DMM voltage more than the specified value?	4.5 volts	Go to Step 7	Go to Step 10
7	1. Turn OFF the ignition. 2. Connect a 3-amp fused jumper wire between the 5 volts reference circuit and the signal circuit of the MAF sensor harness (pins 4 and 5 of C-116 connector). 3. Turn ON the ignition, with the engine OFF. DO NOT start the engine. 4. Monitor the DTC Information with the scan tool. Does DTC P0100 (Symptom Code 9) set, but not DTC P0100 (Symptom Code B)?	—	Go to Step 11	Go to Step 8
8	1. Keep the 3-amp fused jumper wire with connected. 2. Start the engine and let idle for 30 seconds. Does DTC P0100 (Symptom Code C) set, but not DTC P0100 (Symptom Code B)?	—	Go to Step 13	Go to Step 12
9	Repair the open circuit or high resistance on the ignition voltage feed circuit between the ECM (10A) fuse (EB-4) and the MAF sensor (pin 2 of C-116 connector). Did you complete the repair?	—	Go to Step 17	—
10	1. Test the 5 volts reference circuit between the engine control module (ECM) (pin 83 of C-57 connector) and the MAF sensor (pin 4 of C-116 connector) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 14
11	1. Test the signal circuit between the ECM (pin 88 of C-57 connector) and the MAF sensor (pin 5 of C-116 connector) for the following conditions: • A short to ground • A short to the low reference circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 16
12	1. Test the signal circuit between the ECM (pin 88 of C-57 connector) and the MAF sensor (pin 5 of C-116 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 14

Step	Action	Value(s)	Yes	No
13	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the MAF sensor (pins 2, 4 and 5 of C-116 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 15
14	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the MAF sensor circuits at the harness connector of the ECM (pins 83 and 88 of C-57 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 16
15	Replace the MAF sensor. Refer to Mass Air Flow Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 17	—
16	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 17	—
17	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 18
18	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0100 (Symptom Code C) (Flash Code 65)

Circuit Description

The mass air flow (MAF) sensor is an air flow meter that measures the amount of air that enters the engine. It is fitted between the air cleaner and turbocharger. A small quantity of air that enters the engine indicates deceleration or idle speed. A large quantity of air that enters the engine indicates acceleration or a high load condition. The MAF sensor has the following circuits.

- Ignition voltage circuit
- 5 volts reference circuit
- Low reference circuit
- MAF sensor signal circuit

The engine control module (ECM) monitors the MAF sensor signal for voltage outside the normal range of the MAF sensor. If the ECM detects an excessively high MAF sensor signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

- The ECM calculated MAF is higher than 984 kg/h for 10 seconds. This indicates the ECM detects that the MAF sensor signal voltage is higher than a predetermined range during engine run.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a MAF substitution of 1600 mg/strk for engine control.
- The ECM uses an EGR solenoid valve control substitution of 10%.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The MAF Sensor parameter on the scan tool will only update with engine running.

Test Description

The number below refers to the step number on the diagnostic table.

3. If the MAF sensor signal circuit between the ECM and the sensor is normal, the sensor signal voltage low DTC P0100 (Symptom Code B) will set.

DTC P0100 (Symptom Code C) (Flash Code 65)

12	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0105 (Symptom Code 1) (Flash Code 34)

Circuit Description

The vacuum pressure sensor is installed to the turbocharger wastegate control hose and it detects the regulated vacuum pressure to the turbocharger wastegate valve. The vacuum pressure sensor is a transducer that varies voltage according to changes in the vacuum pressure inside the vacuum hose. The vacuum pressure sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- Vacuum pressure sensor signal circuit

The engine control module (ECM) supplies 5 volts to the vacuum pressure sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The vacuum pressure sensor provides a signal to the ECM on the vacuum pressure signal circuit which is relative to the vacuum pressure changes in the turbocharger wastegate valve control hose. The ECM should detect a low signal voltage at a high vacuum pressure and high signal voltage at a low vacuum pressure. The ECM monitors the vacuum pressure sensor signal for voltage outside the normal range of the vacuum pressure sensor. If the ECM detects an excessively high vacuum pressure sensor signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the vacuum pressure sensor signal voltage is more than 4.4 volts for 3 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.
- The ECM uses a barometric pressure of 615 hPa for turbocharger wastegate valve control.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the diagnostic table.

3. If the vacuum pressure sensor signal circuit between the ECM and the sensor is normal, the sensor signal voltage low DTC P0105 (Symptom Code 2) will set.

DTC P0105 (Symptom Code 2) (Flash Code 34)

Circuit Description

The vacuum pressure sensor is installed to the turbocharger wastegate control hose and it detects the regulated vacuum pressure to the turbocharger wastegate valve. The vacuum pressure sensor is a transducer that varies voltage according to changes in the vacuum pressure inside the vacuum hose. The vacuum pressure sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- Vacuum pressure sensor signal circuit

The engine control module (ECM) supplies 5 volts to the vacuum pressure sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The vacuum pressure sensor provides a signal to the ECM on the vacuum pressure signal circuit which is relative to the vacuum pressure changes in the turbocharger wastegate valve control hose. The ECM should detect a low signal voltage at a high vacuum pressure and high signal voltage at a low vacuum pressure. The ECM monitors the vacuum pressure sensor signal for voltage outside the normal range of the vacuum pressure sensor. If the ECM detects an excessively low vacuum pressure sensor signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the vacuum pressure sensor signal voltage is less than 0.5 volts for 3 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.
- The ECM uses a barometric pressure of 615 hPa for turbocharger wastegate valve control.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the diagnostic table.

4. If the vacuum pressure sensor signal circuit between the ECM and the sensor is normal, the sensor signal voltage high DTC P0105 (Symptom Code 1) will set.

DTC P0105 (Symptom Code 2) (Flash Code 34)

DTC P0105 (Symptom Code 7) (Flash Code 34)

Circuit Description

The vacuum pressure sensor is installed to the turbocharger wastegate control hose and it detects the regulated vacuum pressure to the turbocharger wastegate valve. The vacuum pressure sensor is a transducer that varies voltage according to changes in the vacuum pressure inside the vacuum hose. The vacuum pressure sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- Vacuum pressure sensor signal circuit

The engine control module (ECM) supplies 5 volts to the vacuum pressure sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. If the ECM detects an excessively high vacuum pressure sensor 5 volts reference voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the vacuum pressure sensor 5 volts reference circuit voltage is more than 5.2 volts for 2.5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0105 (Symptom Code 9) (Flash Code 34)

Circuit Description

The vacuum pressure sensor is installed to the turbocharger wastegate control hose and it detects the regulated vacuum pressure to the turbocharger wastegate valve. The vacuum pressure sensor is a transducer that varies voltage according to changes in the vacuum pressure inside the vacuum hose. The vacuum pressure sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- Vacuum pressure sensor signal circuit

The engine control module (ECM) supplies 5 volts to the vacuum pressure sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. If the ECM detects an excessively low vacuum pressure sensor 5 volts reference voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the vacuum pressure sensor 5 volts reference circuit voltage is less than 4.5 volts for 2.5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the diagnostic table.

3. If the vacuum pressure sensor 5 volts reference circuit between the ECM and the sensor is normal, the sensor signal voltage low DTC P0105 (Symptom Code 2) will set.

DTC P0105 (Symptom Code 9) (Flash Code 34)
Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the vacuum pressure sensor harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with the scan tool. Does DTC P0105 (Symptom Code 2) set, but not DTC P0105 (Symptom Code 9)?	—	Go to Step 5	Go to Step 4
4	1. Test the 5 volts reference circuit between the engine control module (ECM) (pin 82 of C-57 connector) and the vacuum pressure sensor (pin 3 of C-124 connector) for the following conditions: • A short to ground • A short to the low reference circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6

Step	Action	Value(s)	Yes	No
5	Replace the vacuum pressure sensor. Refer to Vacuum Pressure Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
6	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 8
8	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0110 (Symptom Code 1) (Flash Code 23)

Circuit Description

The intake air temperature (IAT) sensor is fitted between the air cleaner and turbocharger internal to the mass air flow (MAF) sensor. The IAT sensor is a variable resistor. The IAT sensor has a signal circuit and a low reference circuit. The IAT sensor measures the temperature of the air entering the engine. The engine control module (ECM) supplies 5 volts to the IAT signal circuit and a ground for the IAT low reference circuit. When the IAT sensor is cold, the sensor resistance is high. When the air temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the IAT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the IAT signal circuit. If the ECM detects an excessively high IAT signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the IAT sensor signal voltage is more than 4.7 volts for 3 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an IAT substitution of 0°C (32°F) for engine control.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Temperature vs. Resistance table to test the IAT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

Notice:

- The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake temperature if the ignition switch is being ON.

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Connect a 3-amp fused jumper wire between the signal circuit and the low reference circuit of the IAT sensor harness (pins 1 and 3 of C-116 connector). 3. Turn ON the ignition, with the engine OFF. 4. Observe the IAT parameter with the scan tool. Is the IAT parameter more than the specified value?	110°C (230°F)	Go to Step 9	Go to Step 6
6	1. Turn OFF the ignition. 2. Connect a 3-amp fused jumper wire between the signal circuit of the IAT sensor harness (pin 1 of C-116 connector) and a known good ground. 3. Turn ON the ignition, with the engine OFF. 4. Observe the IAT parameter with the scan tool. Is the IAT parameter more than the specified value?	110°C (230°F)	Go to Step 8	Go to Step 7
7	1. Test the signal circuit between the ECM (pin 84 of C-57 connector) and the IAT sensor (pin 1 of C-116 connector) for an open circuit high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 11
8	1. Test the low reference circuit between the ECM (pin 92 of C-57 connector) and the IAT sensor (pin 3 of C-116 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 11
9	1. Test the signal circuit between the ECM (pin 84 of C-57 connector) and the IAT sensor (pin 1 of C-116 connector) for a short to any 5 volts reference circuit. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 10
10	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the IAT sensor (pins 1 and 3 of C-116 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 12
11	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the IAT sensor circuits at the harness connector of the ECM (pins 84 and 92 of C-57 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13
12	Replace the IAT sensor. Refer to Mass Air Flow Sensor Replacement in this section. (IAT sensor is internal to MAF sensor) Did you complete the replacement?	—	Go to Step 14	—
13	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 14	—

Step	Action	Value(s)	Yes	No
14	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 15
15	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0110 (Symptom Code 2) (Flash Code 23)

Circuit Description

The intake air temperature (IAT) sensor is fitted between the air cleaner and turbocharger internal to the mass air flow (MAF) sensor. The IAT sensor is a variable resistor. The IAT sensor has a signal circuit and a low reference circuit. The IAT sensor measures the temperature of the air entering the engine. The engine control module (ECM) supplies 5 volts to the IAT signal circuit and a ground for the IAT low reference circuit. When the IAT sensor is cold, the sensor resistance is high. When the air temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the IAT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the IAT signal circuit. If the ECM detects an excessively low IAT signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the IAT sensor signal voltage is less than 0.3 volts for 3 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an IAT substitution of 0°C (32°F) for engine control.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Temperature vs. Resistance table to test the IAT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

Notice:

- The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake temperature if the ignition switch is being ON.

DTC P0115 (Symptom Code 1) (Flash Code 14)

Circuit Description

The engine coolant temperature (ECT) sensor is installed to the thermostat housing. The ECT sensor is a variable resistor. The ECT sensor has a signal circuit and a low reference circuit. The ECT sensor measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT signal circuit and a ground for the ECT low reference circuit. When the ECT sensor is cold, the sensor resistance is high. When the engine coolant temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the ECT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the ECT signal circuit. If the ECM detects an excessively high ECT signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the ECT sensor signal voltage is more than 4.7 volts for 3 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an ECT substitution of fuel temperature for engine control.
- The ECM uses an ECT substitution of 60°C (120°F) for injection timing control.
- The ECM uses an ECT substitution of -15°C (5°F) for glow control.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- After starting the engine, the ECT should rise steadily to about 80°C – 85°C (176°F – 185°F) then stabilize when the thermostat opens.
- Use the Temperature vs. Resistance table to test the ECT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

DTC P0115 (Symptom Code 2) (Flash Code 14)

Circuit Description

The engine coolant temperature (ECT) sensor is installed to the thermostat housing. The ECT sensor is a variable resistor. The ECT sensor has a signal circuit and a low reference circuit. The ECT sensor measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT signal circuit and a ground for the ECT low reference circuit. When the ECT sensor is cold, the sensor resistance is high. When the engine coolant temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the ECT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the ECT signal circuit. If the ECM detects an excessively low ECT signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the ECT sensor signal voltage is less than 0.3 volts for 3 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an ECT substitution of fuel temperature for engine control.
- The ECM uses an ECT substitution of 60°C (120°F) for injection timing control.
- The ECM uses an ECT substitution -15°C (5°F) for glow control.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- After starting the engine, the ECT should rise steadily to about 80°C – 85°C (176°F – 185°F) then stabilize when the thermostat opens.
- Use the Temperature vs. Resistance table to test the ECT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

DTC P0180 (Symptom Code B) (Flash Code 15)

Circuit Description

The fuel temperature (FT) sensor is internal to the fuel injection pump control unit (PCU). It detects fuel temperature in the fuel injection pump. The engine control module (ECM) and PCU communicates with each other over the controller area network (CAN) link. If the PCU internal FT sensor output is an excessively high or low, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The PCU internal FT sensor output is lower than -40°C (-40°F) for 3 seconds or higher than 150°C (302°F) for 3 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a default FT substitution for engine control.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- FT sensor is internal to the PCU and it is part of the fuel injection pump assembly.

DTC P0215 (Symptom Code A) (Flash Code 52)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.

The fuel injection solenoid valve is installed to the fuel injection pump rear side. The fuel injection event is determined by this solenoid ON/OFF command. The fuel injection solenoid valve cuts the fuel when the engine shutoff (ESO) solenoid valve is commanded shutoff from the PCU. (The fuel injection solenoid valve and engine shutoff (ESO) solenoid valve is same part. It calls ESO solenoid valve when fuel is shutoff.) When the ignition switch is turned OFF or commanded from fail-safe action, the ESO solenoid valve is commanded shutoff to stop the engine running. If the ECM detects that the engine is continuously run after the ignition switch is OFF, this DTC will set.

Condition for Running the DTC

- The ignition switch is OFF.
- The engine speed is lower than 1500 RPM.
- The vehicle speed is lower than 1.5 km/h (1 MPH).

Condition for Setting the DTC

- After the condition for running this DTC for 2 seconds, the engine speed is higher than 200 RPM when the ESO solenoid valve is commanded shutoff from the CPU. This indicates the PCU reacts to the command from the ECM but ESO solenoid valve does not react to the command from the PCU and fuel cannot shutoff.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) at next ignition cycle.
- The ECM cuts fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Fuel injection solenoid valve is internal to the fuel injection pump assembly.
- PCU is part of the fuel injection pump assembly.

DTC P0215 (Symptom Code A) (Flash Code 52)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle for 30 seconds. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. 5. Turn OFF the engine. Does the DTC fail this ignition before the engine control module (ECM) turned OFF?	—	Go to Step 3	Go to Step 4
3	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 4	—

4	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the scan tool. 5. Turn OFF the engine. Does the DTC fail this ignition before the ECM turns OFF?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0215 (Symptom Code B) (Flash Code 52)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.

The fuel injection solenoid valve is installed to the fuel injection pump rear side. The fuel injection event is determined by this solenoid ON/OFF command. The fuel injection solenoid valve cuts the fuel when the engine shutoff (ESO) solenoid valve is commanded shutoff from the PCU. (The fuel injection solenoid valve and engine shutoff (ESO) solenoid valve is same part. It calls ESO solenoid valve when fuel is shutoff.) When the ignition switch is turned OFF or commanded from fail-safe action, the ESO solenoid valve is commanded shutoff to stop the engine running. If the PCU detects that the ESO solenoid valve control circuit voltage level from the ECM to PCU is high, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The PCU detects high voltage condition on the ESO solenoid valve control circuit for longer than 1 second when the ECM does not command shutoff.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Fuel injection solenoid valve is internal to the fuel injection pump assembly.
- PCU is part of the fuel injection pump assembly.
- If this DTC is present, engine will not start.

DTC P0215 (Symptom Code B) (Flash Code 52)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. If the engine does not start, crank over the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the fuel injection pump control unit (PCU) harness connector. 3. Connect a test lamp between the engine shutoff (ESO) solenoid valve control signal circuit (pin 5 of E-6 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 5	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Reconnect the PCU harness connector. 3. Disconnect the engine control module (ECM) C-57 harness connector. Keep the C-56 harness connector with connected. 4. Connect a test lamp between the ESO solenoid valve control signal circuit (pin 105 of C-57 connector) and a known good ground. 5. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 6	Go to Diagnostic Aids
5	1. Test the ESO solenoid valve control signal circuit between the ECM (pin 105 of C-57 connector) and the PCU (pin 5 of E-6 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 7
6	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 8	—
7	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 8	—
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 9
9	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0215 (Symptom Code C) (Flash Code 52)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.

The fuel injection solenoid valve is installed to the fuel injection pump rear side. The fuel injection event is determined by this solenoid ON/OFF command. The fuel injection solenoid valve cuts the fuel when the engine shutoff (ESO) solenoid valve is commanded shutoff from the PCU. (The fuel injection solenoid valve and engine shutoff (ESO) solenoid valve is same part. It calls ESO solenoid valve when fuel is shutoff.) When the ignition switch is turned OFF or commanded from fail-safe action, the ESO solenoid valve is commanded shutoff to stop the engine running. If the ECM detects that the engine is continuously run after the ignition switch is OFF, this DTC will set.

Condition for Running the DTC

- The ignition switch is OFF.
- The engine speed is lower than 1500 RPM.
- The vehicle speed is lower than 1.5 km/h (1 MPH).

Condition for Setting the DTC

- The engine speed is higher than 200 RPM within 2 seconds after the condition for running the DTC are met. This indicates the PCU does not react to the command from the ECM and fuel cannot shutoff.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Fuel injection solenoid valve is internal to the fuel injection pump assembly.
- PCU is part of the fuel injection pump assembly.

12	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0215 (Symptom Code D) (Flash Code 52)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.

The ECM monitors CAN operational status by expecting a constant flow of messages from the PCU. If the ECM detects that the internal CAN controller does not Bus OFF when the ignition switch is OFF, this DTC will set.

Condition for Running the DTC

- The ignition switch is OFF.

Condition for Setting the DTC

- The ECM detects internal CAN controller does not Bus OFF mode.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- CAN controller is internal to the ECM.

DTC P0215 (Symptom Code D) (Flash Code 52)

5	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0216 (Symptom Code A, B) (Flash Code 54)

Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.

The timing device changes the optimum injection timing against various engine conditions. The pressure of the fuel fed from the feed pump is adjusted and it acts to the timing plunger by TCV controlled fuel pressure. (The TCV is installed to the fuel injection pump rear side and it is controlled by duty ratio cycle from the PCU.) The timing plunger is connected to the cam ring by a ball pin. Axial movement of the timing plunger is transferred to the cam ring in the form of rotational movement. Movement to the right of the timing plunger advances injection timing. If the PCU detects an excessive difference between actual and desired fuel injection timing, this DTC will set.

Condition for Running the DTC

Symptom Code A

- The engine speed is higher than 700 RPM.
- The fuel injection quantity is higher than 4 mg/strk.

Symptom Code B

- The engine speed is higher than 2014 RPM.

Condition for Setting the DTC

Symptom Code A

- The PCU monitored actual fuel injection timing is advanced more than desired by 3°CA for longer than 12 seconds or retarded more than desired by 6°CA for longer than 12 seconds.

Symptom Code B

- The PCU monitored actual fuel injection timing is oscillated higher than desired by 5.2°CA.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The fuel injection pump installation with incorrect mechanical timing may set this DTC.
- This DTC most likely indicate loss fuel pressure by restricted fuel line. Inspect the fuel line restriction between the fuel injection pump and fuel tank.
- The fuel system from the fuel tank(s) to the fuel injection pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight or if there is a crack in one of the fuel hoses. Air in the fuel system will cause fuel injection pump internal pressure fluctuations especially at high engine speed and load, which may set this DTC.
- Improper fuel will cause this DTC to set. Inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system.
- Contaminated fuel will cause this DTC to set. Inspect the pipe connector fixing bolt (eye bolt) on the fuel injection pump suction side.

Important:

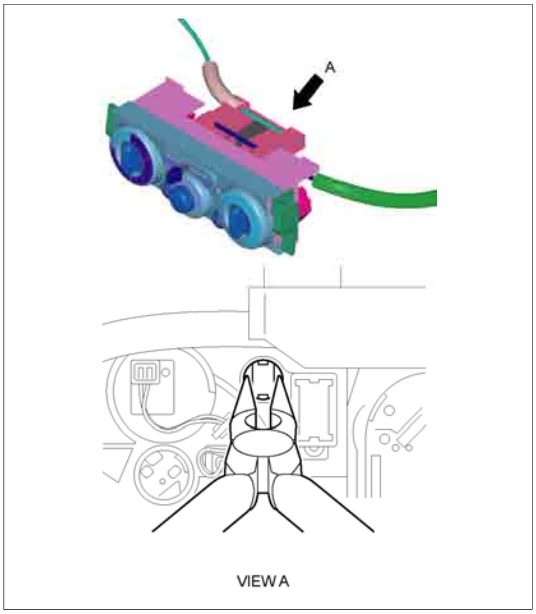
If the fuel tank is empty or near empty, air might be allowed to go into the fuel system. With air in the fuel system, smooth flow of fuel into the fuel injection pump is interrupted and this DTC may set. Perform bleeding of fuel system after refilling. Refer to air bleeding procedure in fuel system section.

DTC P0216 (Symptom Code A, B) (Flash Code 54)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls

Step	Action	Value(s)	Yes	No
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle for 30 seconds. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Is DTC P0335 (Symptom Code B or D), P1335 (Symptom Code A) or P1345 (Symptom Code A) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Turn OFF the engine. 2. Place the transmission in park or neutral (P or N) and set the park brake. 3. Start the engine and let engine idle for 30 seconds while observing the Actual Injection Timing parameter with the scan tool. 4. Accelerate the engine and keep the constant engine speed around 2000 RPM while observing the Actual Injection Timing parameter with the scan tool. 5. Accelerate the engine and keep the constant engine speed around 3000 RPM while observing the Actual Injection Timing parameter with the scan tool. Does the Actual Injection Timing parameter follow the Desired Injection Timing within 2°CA on each engine speed?	—	Go to Diagnostic Aids	Go to Step 4
4	1. Turn OFF the ignition. 2. Check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel injection pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel injection pump internal pressure fluctuations especially at high engine speed and load, which may set this DTC. 3. Pump the priming pump on the fuel filter until it becomes firm. If there is a leak on the suction side of the fuel system between the priming pump and the fuel injection pump, the priming pump will not build up sufficient firmness and fuel leakage may occur. 4. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Remove the fuel hose that connects to the fuel injection pump suction side. 2. Remove the fuel pipe connector that connects to the fuel injection pump suction side. 3. Inspect the eye bolt for any type of restriction or collapsed gauze filter. **Notice:** If any type of restriction found, check for a condition that causes contaminated fuel, such as the customer is using an aftermarket fuel filter or extended maintenance interval.Also inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system. 4. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 6
6	1. Disconnect the fuel hose that connects to the fuel injection pump suction side. In order to measure the discharged fuel amount, put the hose into a bottle or a container. 2. Pump the priming pump on the fuel filter. **Notice:** If there is a leak on the suction side of the fuel system, the fuel from the disconnected hose will not flow out sufficiently and fuel leakage may occur. Also if there is a restriction on the suction side of the fuel system, the fuel from the disconnected hose will not flow out sufficiently that is most likely caused by clogged fuel filter or kinked fuel hose or pipe. 3. Draw fuel from the fuel tank at the fuel line (as close to the fuel tank as possible) going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0/J-23738-A with a clear hose or equivalent). This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. 4. Repair any fuel system leaks and restrictions as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 7



RTW710MH000101

Important Operations - Removal

1. Control lever assembly

Refer to “CONTROL LEVER ASSEMBLY” in this section.

2. Illumination Bulb

To remove the illumination bulb, insert a pliers (long nose) into the cap at the back of the bulb. Turn the bulb counterclockwise and pull it free.

Step	Action	Value(s)	Yes	No
7	1. Reconnect the fuel pipe connector that connects to the fuel injection pump suction side. 2. Remove the fuel hose that connects to the fuel injection pump suction side. 3. Substitute a clear hose. **Notice:** A hose must be cleaned. 4. Connect the clear hose to the fuel injection pump. 5. Bleed the fuel system. Refer to the Diagnostic Aids. 6. Let the engine run at idle for at least 2 minutes. 7. Accelerator the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the clear hose. **Notice:** If many air bubbles appear in the fuel, check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. 8. Repair as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 8
8	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 9	—
9	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Place the transmission in park or neutral (P or N) and set the park brake. 4. Start the engine and let engine idle for 30 seconds while observing the Actual Injection Timing parameter with the scan tool. 5. Accelerate the engine and keep the constant engine speed around 2000 RPM while observing the Actual Injection Timing parameter with the scan tool. 6. Accelerate the engine and keep the constant engine speed around 3000 RPM while observing the Actual Injection Timing parameter with the scan tool. Does the Actual Injection Timing parameter follow the Desired Injection Timing within 2°CA on each engine speed?	—	Go to Step 10	Go to Step 2
10	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0243 (Symptom Code 3) (Flash Code 64)

Circuit Description

The engine control module (ECM) controls the turbocharger wastegate valve based on the barometric pressure in order to reduce turbocharger spinning speeds at high altitude area. The ECM controls the turbocharger wastegate valve diaphragm by acting the regulated vacuum pressure via controlling the solenoid valve. The vacuum pressure sensor monitors the regulated vacuum pressure to the turbocharger wastegate valve. The ECM calculates desired vacuum pressure and it compares the calculated desired vacuum pressure to the actual value to determine the solenoid valve position. When the actual vacuum pressure is higher than the desired value, the solenoid valve is closed to decrease the vacuum pressure. An expected vacuum pressure amount should be detected while the engine running. If the ECM detects the actual vacuum pressure amount is higher than desired vacuum pressure amount, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The barometric pressure (BARO) is between 0 hPa and 3500 hPa.
- The intake air temperature (IAT) is between -50°C (-58 °F) and 200°C (392°F).
- The engine coolant temperature (ECT) is between -50°C (-58 °F) and 150°C (302°F)

Condition for Setting the DTC

- The ECM detects that the vacuum pressure is 50 hPa higher than the desired vacuum pressure for 3 seconds. This indicates excessive high vacuum pressure.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.
- The ECM uses an EGR solenoid valve control substitution of 10%.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Misrouted vacuum hoses will cause this DTC to set.

Test Description

The numbers below refer to the step number on the diagnostic table.

4. A skewed vacuum pressure sensor value (shifted to a high pressure) can set this DTC. The Vacuum Pressure on the scan tool should read near doubled barometric pressure (BARO) with the key ON and engine OFF.

5. A skewed BARO sensor value (shifted to a lower pressure) may set this DTC. The BARO on the scan tool should read near surrounding barometric pressure.

DTC P0243 (Symptom Code 3) (Flash Code 64)

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle for 30 seconds. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Is DTC P0105 (Symptom Code 1, 2, 7 or 9) or P0243 (Symptom Code 4 or 8) set?	—	Go to Applicable DTC	Go to Step 3

Step	Action	Value(s)	Yes	No
3	1. Turn OFF the ignition. 2. Inspect for the following conditions: • Vacuum hoses are damaged or kinked. • Misrouted vacuum hoses. • A turbocharger solenoid valve is damaged. • A vacuum pump is damaged. • A vacuum regulating valve is damaged. • A turbocharger wastegate valve is damaged. • Contaminated, skewed or slow vacuum pressure sensor. 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 4
4	1. Turn ON the ignition, with the engine OFF. 2. Observe the Vacuum Pressure Sensor and Barometric Pressure (BARO) with the scan tool. Does the scan tool indicate that the difference between the Vacuum Pressure Sensor and doubled BARO is less than the specified value?	10 hPa	Go to Step 7	Go to Step 5
5	1. Observe the BARO parameter with the scan tool. 2. Compare the BARO value to the range specified in the altitude vs. barometric pressure table. Refer to Altitude vs. Barometric Pressure. Is the BARO parameter within the range specified?	—	Go to Step 6	Go to Step 14
6	1. Turn OFF the ignition. 2. Disconnect the vacuum pressure sensor harness connector. 3. Inspect for an intermittent and for poor connections at the vacuum pressure sensor harness connector (pins 1 and 3 of C-124 connector). 4. Disconnect the engine control module (ECM) harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on each vacuum pressure sensor circuit at the harness connector of the ECM (pins 82 and 85 of C-57 connector). 6. Test for high resistance on each vacuum pressure sensor circuit. 7. Test the vacuum pressure sensor signal circuit short to any other circuits. 8. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 10
7	1. Turn OFF the ignition. 2. Disconnect the vacuum hose from the turbocharger wastegate valve that is connected to the vacuum pressure sensor and the turbocharger solenoid valve. 3. Connect a hand-held vacuum pump (5-8840-0279-0/J-23738-A) to the turbocharger wastegate valve. This test is in order to verify an airtight of the turbocharger wastegate valve inside. 4. Start the engine and let engine idle. Does the hand-held vacuum pump indicate any vacuum pressure?	—	Go to Step 13	Go to Step 8

Step	Action	Value(s)	Yes	No
8	1. Turn OFF the ignition. 2. Disconnect the hand-held vacuum pump from the turbocharger wastegate valve. 3. Reconnect the vacuum hose to the turbocharger wastegate valve. 4. Disconnect the vacuum hose from the turbocharger solenoid valve that is connected to the vacuum regulating valve "Z" port. 5. Connect a hand-held vacuum pump (5-8840-0279-0/J-23738-A) to the disconnected vacuum hose. 6. Start the engine and let engine idle. Does the hand-held vacuum pump indicate less than 28 cmHg (11 inHg)?	—	Go to Step 9	Go to Step 12
9	1. Turn OFF the ignition. 2. Disconnect the hand-held vacuum pump from the vacuum hose. 3. Reconnect the vacuum hose to the turbocharger solenoid valve. 4. Disconnect the vacuum hose from the vacuum pressure sensor that is connected to the turbocharger solenoid valve and the turbocharger wastegate valve. 5. Connect a hand-held vacuum pump (5-8840-0279-0/J-23738-A) to the disconnected vacuum hose. 6. Disconnect the vacuum pressure sensor harness connector in order to active turbocharger solenoid valve. 7. Start the engine and let engine idle. Does the needle of hand-held vacuum pump shake between 0 and 20 cmHg (8 inHg)?	—	Go to Step 10	Go to Step 11
10	Replace the vacuum pressure sensor. Refer to Vacuum Pressure Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
11	Replace the turbocharger solenoid valve. Refer to Turbocharger Solenoid Valve Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
12	Replace the vacuum regulating valve. Did you compete the replacement?	—	Go to Step 15	—
13	Replace the turbocharger wastegate valve. Refer to Turbocharger in Engine Mechanical section. Did you complete the replacement?	—	Go to Step 15	—
14	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
15	1. Reconnect all previously disconnected hoses or harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 16

Step	Action	Value(s)	Yes	No
16	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0243 (Symptom Code 4) (Flash Code 64)

Circuit Description

The engine control module (ECM) controls the turbocharger wastegate valve based on the barometric pressure in order to reduce turbocharger spinning speeds at high altitude area. The ECM controls the turbocharger wastegate valve diaphragm by acting the regulated vacuum pressure via controlling the solenoid valve. The vacuum pressure sensor monitors the regulated vacuum pressure to the turbocharger wastegate valve. The ECM calculates desired vacuum pressure and it compares the calculated desired vacuum pressure to the actual value to determine the solenoid valve position. When the actual vacuum pressure is higher than the desired value, the solenoid valve is closed to decrease the vacuum pressure. If the ECM detects that an open circuit or short to ground on the turbocharger solenoid valve control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the low voltage condition on the turbocharger solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded OFF.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.
- The ECM uses a turbocharger solenoid valve control substitution of 68%.
- The ECM uses an EGR solenoid valve control substitution of 10%.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0243 (Symptom Code 4) (Flash Code 64)

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Inspect the ECM (10A) fuse (EB-4) in the engine room fuse block. Is the ECM (10A) fuse (EB-4) open?	—	Go to Step 4	Go to Step 5
4	Replace the ECM (10A) fuse (EB-4). If the fuse continues to open, repair the short to ground on one of the circuits that fed by the ECM (10A) fuse (EB-4) or replace the shorted attached component fed by the ECM (10A) fuse (EB-4). Did you complete the repair?	—	Go to Step 15	—
5	1. Turn OFF the ignition. 2. Disconnect the turbocharger solenoid valve harness connector. 3. Connect a test lamp between the voltage feed circuit of the turbocharger solenoid valve harness (pin 1 of C-123 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 8

Step	Action	Value(s)	Yes	No
6	1. Connect a test lamp between the control circuit of the turbocharger solenoid valve harness (pin 2 of C-123 connector) and battery voltage. 2. Turn ON the ignition, with the engine OFF. Does the test lamp continuously illuminate?	—	Go to Step 9	Go to Step 7
7	1. Keep the test lamp with connected. 2. Turn OFF the ignition. 3. Disconnect the vacuum pressure sensor harness connector in order to energize the turbocharger solenoid valve. 4. Turn ON the ignition, with the engine OFF. Does the test lamp blink?	—	Go to Step 11	Go to Step 10
8	Repair the open circuit or high resistance on the voltage feed circuit between the ECM (10A) fuse (EB-4) and the turbocharger solenoid valve (pin 1 of C-123 connector). Did you complete the repair?	—	Go to Step 15	—
9	1. Test the control circuit between the engine control module (ECM) (pin 97 of C-57 connector) and the turbocharger solenoid valve (pin 2 of C-115 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
10	1. Test the control circuit between the ECM (pin 96 of C-57 connector) and the turbocharger solenoid valve (pin 2 of C-123 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 12
11	1. Turn OFF the ignition. 2. Disconnect the turbocharger solenoid valve harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the turbocharger solenoid valve (pins 1 and 2 of C-123 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 13
12	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the turbocharger solenoid valve circuit at the harness connector of the ECM (pin 96 of C-57 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
13	Replace the turbocharger solenoid valve. Refer to Turbocharger Solenoid Valve Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
14	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—

Step	Action	Value(s)	Yes	No
15	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 16
16	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0243 (Symptom Code 5) (Flash Code 64)

Circuit Description

The engine control module (ECM) controls the turbocharger wastegate valve based on the barometric pressure in order to reduce turbocharger spinning speeds at high altitude area. The ECM controls the turbocharger wastegate valve diaphragm by acting the regulated vacuum pressure via controlling the solenoid valve. The vacuum pressure sensor monitors the regulated vacuum pressure to the turbocharger wastegate valve. The ECM calculates desired vacuum pressure and it compares the calculated desired vacuum pressure to the actual value to determine the solenoid valve position. When the actual vacuum pressure is higher than the desired value, the solenoid valve is closed to decrease the vacuum pressure. An expected vacuum pressure amount should be detected while the engine running. If the ECM detects the actual vacuum pressure amount is lower than desired vacuum pressure amount, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The barometric pressure (BARO) is between 0 hPa and 3500 hPa.
- The intake air temperature (IAT) is between -50°C (-58 °F) and 200°C (392°F).
- The engine coolant temperature (ECT) is between -50°C (-58 °F) and 150°C (302°F)

Condition for Setting the DTC

- The ECM detects that the vacuum pressure is 50 hPa lower than the desired vacuum pressure for 3 seconds. This indicates excessive low vacuum pressure.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.
- The ECM uses an EGR solenoid valve control substitution of 10%.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Misrouted vacuum hoses may set this DTC.
- A vacuum pump problem will cause this DTC.

Test Description

The numbers below refer to the step number on the diagnostic table.

4. A skewed vacuum pressure sensor value (shifted to a low pressure) can set this DTC. The Vacuum Pressure on the scan tool should read near doubled barometric pressure (BARO) with the key ON and engine OFF.

5. A skewed BARO sensor value (shifted to a higher pressure) may set this DTC. The BARO on the scan tool should read near surrounding barometric pressure.

DTC P0243 (Symptom Code 5) (Flash Code 64)

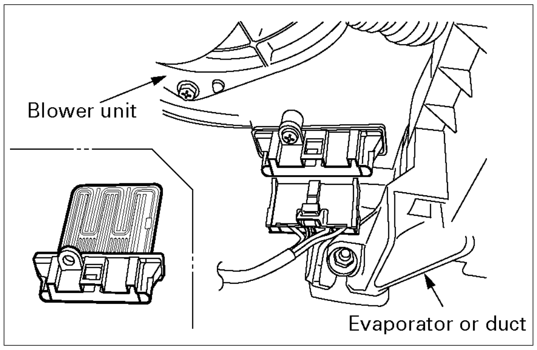
Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle for 30 seconds. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Is DTC P0105 (Symptom Code 1, 2, 7 or 9) or P0243 (Symptom Code 4 or 8) set?	—	Go to Applicable DTC	Go to Step 3

Step	Action	Value(s)	Yes	No
3	1. Turn OFF the ignition. 2. Inspect for the following conditions: • Vacuum hoses are damaged or kinked. • Misrouted vacuum hoses. • A turbocharger solenoid valve is damaged. • A vacuum pump is damaged. • A vacuum regulating valve is damaged. • A turbocharger wastegate valve is damaged. • Contaminated, skewed or slow vacuum pressure sensor. 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 4
4	1. Turn ON the ignition, with the engine OFF. 2. Observe the Vacuum Pressure Sensor and Barometric Pressure (BARO) with the scan tool. Does the scan tool indicate that the difference between the Vacuum Pressure Sensor and doubled BARO is less than the specified value?	10 hPa	Go to Step 7	Go to Step 5
5	1. Observe the BARO parameter with the scan tool. 2. Compare the BARO value to the range specified in the altitude vs. barometric pressure table. Refer to Altitude vs. Barometric Pressure. Is the BARO parameter within the range specified?	—	Go to Step 6	Go to Step 14
6	1. Turn OFF the ignition. 2. Disconnect the vacuum pressure sensor harness connector. 3. Inspect for an intermittent and for a poor connection at the vacuum pressure sensor harness connector (pin 2 of C-124 connector). 4. Disconnect the engine control module (ECM) harness connector. 5. Inspect for an intermittent, for a poor connection and corrosion on vacuum pressure sensor circuit at the harness connector of the ECM (pin 93 of C-57 connector). 6. Test for high resistance on vacuum pressure sensor low reference circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 10
7	1. Turn OFF the ignition. 2. Disconnect the vacuum hose from the turbocharger wastegate valve that is connected to the vacuum pressure sensor and the turbocharger solenoid valve. 3. Start the engine and accelerate the engine as necessary. Is there boost pressure leak from the turbocharger wastegate valve port?	—	Go to Step 13	Go to Step 8

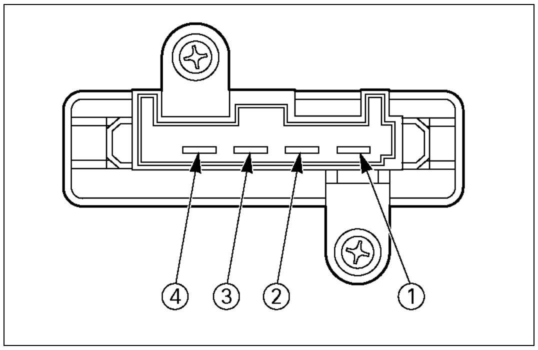
INSPECTION AND REPAIR



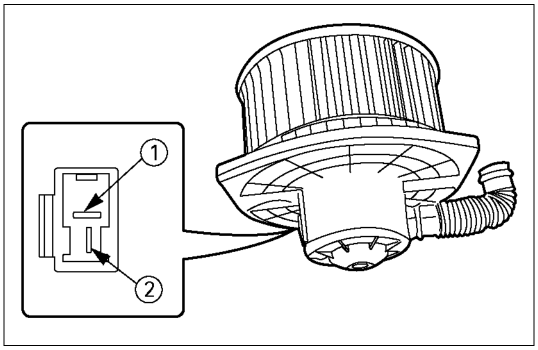
840R300005-X

Resistor

As for air-conditioning model, fixed on left (RHD) / right (LHD) side of the evaporator unit.
As for heater only model, fixed on left (RHD) / right (LHD) side of the duct placed between blower unit and heater unit.
Replace the resistor with a new on if the coil is found to be open or if the resistance value deviates from the specified range.



Terminal	Resistance
3 – 2	2.04 Ω
3 – 4	0.88 Ω
3 – 1	0.31 Ω



Blower motor

Check blower motor for smooth rotation.

Connect the battery positive terminal to the No.1 terminal of the blower motor and negative to the No.2.
Be sure to check to see if the blower motor operates correctly.

Step	Action	Value(s)	Yes	No
8	1. Turn OFF the ignition. 2. Reconnect the vacuum hose to the turbocharger wastegate valve. 3. Disconnect the vacuum hose from the turbocharger solenoid valve that is connected to the vacuum regulating valve "Z" port. 4. Connect a hand-held vacuum pump (5-8840-0279-0/J-23738-A) to the disconnected vacuum hose. 5. Start the engine and let engine idle. Does the hand-held vacuum pump indicate more than 23 cmHg (9 inHg)?	—	Go to Step 9	Go to Step 12
9	1. Turn OFF the ignition. 2. Disconnect the hand-held vacuum pump from the vacuum hose. 3. Reconnect the vacuum hose to the turbocharger solenoid valve. 4. Disconnect the vacuum hose from the vacuum pressure sensor that is connected to the turbocharger solenoid valve and the turbocharger wastegate valve. 5. Connect a hand-held vacuum pump (5-8840-0279-0/J-23738-A) to the disconnected vacuum hose. 6. Disconnect the vacuum pressure sensor harness connector in order to active turbocharger solenoid valve. 7 Start the engine and let engine idle. Does the needle of hand-held vacuum pump shake between 0 and 20 cmHg (8 inHg)?	—	Go to Step 10	Go to Step 11
10	Replace the vacuum pressure sensor. Refer to Vacuum Pressure Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
11	Replace the turbocharger solenoid valve. Refer to Turbocharger Solenoid Valve Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
12	Replace the vacuum regulating valve. Did you compete the replacement?	—	Go to Step 15	—
13	Replace the turbocharger wastegate valve. Refer to Turbocharger in Engine Mechanical section. Did you complete the replacement?	—	Go to Step 15	—
14	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
15	1. Reconnect all previously disconnected hoses or harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 16

Step	Action	Value(s)	Yes	No
16	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0243 (Symptom Code 6) (Flash Code 64)

Circuit Description

The engine control module (ECM) controls the turbocharger wastegate valve based on the barometric pressure in order to reduce turbocharger spinning speeds at high altitude area. The ECM controls the turbocharger wastegate valve diaphragm by acting the regulated vacuum pressure via controlling the solenoid valve. The vacuum pressure sensor monitors the regulated vacuum pressure to the turbocharger wastegate valve. The ECM calculates desired vacuum pressure and it compares the calculated desired vacuum pressure to the actual value to determine the solenoid valve position. When the actual vacuum pressure is higher than the desired value, the solenoid valve is closed to decrease the vacuum pressure.

The mass air flow (MAF) sensor monitors boost pressure by monitoring the amount of mass air flow. An expected MAF amount should be detected while the engine running. If the ECM detects the actual MAF amount is higher than desired MAF amount, this DTC will set. This indicates excessive high boost pressure and turbocharger wastegate valve most likely did not active.

Condition for Running the DTC

- The ignition switch is ON.
- The engine coolant temperature (ECT) is between -50°C (-58 °F) and 150°C (302°F).
- The EGR solenoid valve control is OFF.
- The MAF sensor DTC P0100 is not set.
- The vacuum pressure sensor DTC P0105 is not set.
- The intake air temperature (IAT) sensor DTC P0110 is not set.

Condition for Setting the DTC

- The ECM detects that the MAF amount is 56 mg/strk higher than the desired MAF for 3 seconds. This indicates an excessive high boost pressure.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.
- The ECM uses an EGR solenoid valve control substitution of 10%.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Check the wastegate for a sticking or stuck condition. Refer to Wastegate Operation in the Engine Mechanical section.
- Use the scan tool to verify the integrity of the MAF sensor signal. Compare the sensor values under all load conditions for an excessively high value. Use the scan tool data list values for nominal sensor readings.
- The fuel with which gasoline was mixed may set this DTC.
- A sticking or intermittently sticking the EGR valve may set this DTC.
- Misrouted vacuum hoses may set this DTC.

DTC P0243 (Symptom Code 6) (Flash Code 64)

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle for 30 seconds. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Is DTC P0105 (Symptom Code 1, 2, 7 or 9), P0243 (Symptom Code 3, 4, 5 or 8) or P0400 (Symptom Code 3, 4, 5 or 8) set?	—	Go to Applicable DTC	Go to Step 3

Step	Action	Value(s)	Yes	No
3	1. Inspect the following for possible causes of high boost pressure. • Wastegate valve for a stuck closed condition. Refer to the Turbocharger in Engine Mechanical section for diagnosis. • Restricted intake or collapsed hose. 2. Repair the condition as necessary. Did you find and correction the condition?	—	Go to Step 11	Go to Step 4
4	1. Turn OFF the ignition for 30 seconds. 2. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). 3. Perform the EGR Solenoid Valve test with the scan tool. 4. Command the EGR Solenoid Valve ON and OFF with the scan tool while observing the Mass Air Flow (MAF) Sensor parameter. Does the MAF Sensor parameter decrease by at least 200 mg/strk within 2 seconds when the EGR Solenoid Valve is commanded ON?	—	Go to Diagnostic Aids	Go to Step 5
5	1. Turn OFF the ignition. 2. Inspect for the following conditions: • An EGR valve control vacuum hose is damaged or kinked. • EGR solenoid valve vacuum hoses are damaged or kinked. • EGR solenoid valve ventilation is damaged. • An EGR valve is stuck close. • Restricted or collapsed EGR passage between the exhaust manifold and EGR valve. • Oil in the air tubing causing an incorrect MAF sensor signal. When there is adhesion of oil, inside of the tubing, intercooler and turbocharger needs to be wipe off. • Contaminated or skewed MAF sensor. 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 6
6	1. Turn OFF the ignition. 2. Disconnect the EGR valve control vacuum hose from the EGR valve. 3. Connect a hand-held vacuum pump (5-8840-0279-0/J-23738-A) to the disconnected vacuum hose. 4. Start the engine and let engine idle. 5. Perform the EGR Solenoid Valve test with the scan tool. 6. Command the EGR Solenoid Valve ON and OFF with the scan tool. Does the hand-held vacuum pump indicate more than 50 cmHg (20 inHg) when commanding the ON and less than 10 cmHg (4 inHg) when commanding OFF?	—	Go to Step 7	Go to Step 10

Step	Action	Value(s)	Yes	No
7	1. Turn OFF the ignition. 2. Disconnect the hand-held vacuum pump from the vacuum hose. 3. Connect the hand-held vacuum pump to the vacuum port of EGR valve. 4. Start the engine and let engine idle. 5. Apply vacuum pressure to the EGR valve while observing the MAF sensor parameter. Does the MAF Sensor parameter decrease by at least 200 mg/strk when the vacuum pressure is applied?	—	Go to Diagnostic Aids	Go to Step 8
8	1. Turn OFF the ignition. 2. Disconnect the MAF sensor harness connector. 3. Inspect for an intermittent, for a poor connection and corrosion at the harness connector of the MAF sensor (pin 3 of C-116 connector). 4. Disconnect the engine control module (ECM) harness connector. 5. Inspect for an intermittent, for a poor connection and corrosion on each MAF sensor circuit at the harness connector of the ECM (pin 92 of C-57 connector). 6. Test for high resistance on each MAF sensor circuit. 7. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 9
9	Replace the EGR valve. Refer to EGR Valve Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 11	—
10	Replace the EGR solenoid valve. Refer to EGR Solenoid Valve Replacement in this section. Did you complete the replacement?	—	Go to Step 11	—
11	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]) while observing the MAF Sensor parameter with the scan tool. Does the MAF Sensor parameter follow the Desired MAF parameter within 50 mg/strk?	—	Go to Step 12	Go to Step 2
12	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0243 (Symptom Code 8) (Flash Code 64)

Circuit Description

The engine control module (ECM) controls the turbocharger wastegate valve based on the barometric pressure in order to reduce turbocharger spinning speeds at high altitude area. The ECM controls the turbocharger wastegate valve diaphragm by acting the regulated vacuum pressure via controlling the solenoid valve. The vacuum pressure sensor monitors the regulated vacuum pressure to the turbocharger wastegate valve. The ECM calculates desired vacuum pressure and it compares the calculated desired vacuum pressure to the actual value to determine the solenoid valve position. When the actual vacuum pressure is higher than the desired value, the solenoid valve is closed to decrease the vacuum pressure. If the ECM detects that a short to battery or ignition voltage on the turbocharger solenoid valve control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the high voltage condition on the turbocharger solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded ON.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.
- The ECM uses a turbocharger solenoid valve control substitution of 32%.
- The ECM uses an EGR solenoid valve control substitution of 10%.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the diagnostic table.

3. If the control circuit of the turbocharger solenoid valve between the ECM and the solenoid valve is normal, the control circuit voltage low DTC P0243 (Symptom Code 4) will set.

DTC P0243 (Symptom Code 8) (Flash Code 64)

8	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0251 (Symptom Code 6) (Flash Code 53)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.
The fuel injection solenoid valve is installed to the fuel injection pump rear side. The fuel injection event is determined by this solenoid ON/OFF command. The fuel injection solenoid valve cuts the fuel when the engine shutoff (ESO) solenoid valve is commanded shutoff from the PCU. (The fuel injection solenoid valve and engine shutoff (ESO) solenoid valve is same part. It calls ESO solenoid valve when fuel is shut off.) When the ignition switch is turned OFF or commanded from fail-safe action, the ESO solenoid valve is commanded shutoff to stop the engine running. If the PCU detects that the fuel injection solenoid valve is operated when the desired injection quantity from the ECM is 0 mg/strk, this DTC will set.

Condition for Running the DTC

- The fuel injection pump CMP sensor signal is generated.
- The CAN communication between the ECM and PCU is normal.

Condition for Setting the DTC

- The PCU detects that the fuel injection solenoid valve is operated when the desired fuel injection quantity is commanded 0 mg/strk.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Fuel injection solenoid valve is internal to the fuel injection pump assembly.
- PCU is part of the fuel injection pump assembly.

DTC P0251 (Symptom Code 6) (Flash Code 53)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle for 30 seconds. 4. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 4	—

Step	Action	Value(s)	Yes	No
4	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle for 30 seconds. 4. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5

DTC P0251 (Symptom Code 7) (Flash Code 53)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU. The PCU also compares the engine speed signal sent from the ECM and the fuel injection pump speed. If the PCU detects that the doubled fuel injection pump speed is excessively lower than engine speed, this DTC will set.

Condition for Running the DTC

- The fuel injection pump CMP sensor signal is generated.
- The crankshaft position (CKP) sensor signal is generated.
- The engine speed is higher than 500 RPM.

Condition for Setting the DTC

- The PCU detects that the doubled fuel injection pump speed is lower than engine speed by 690 RPM for longer than 0.2 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- Electrical or magnetic interference may affect intermittent condition.
- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Fuel injection pump CMP sensor is internal to the fuel injection pump assembly.
- PCU is part of the fuel injection pump assembly.

DTC P0251 (Symptom Code 7) (Flash Code 53)

	4	○	○		○						
(A/C SW.)	OFF							○	○		
	ON							○	○	○	○

Step	Action	Value(s)	Yes	No
4	1. Observe the Engine Speed parameter with the scan tool. 2. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the scan tool. Does the Engine Speed parameter indicate correct engine speed?	—	Go to Step 9	Go to Step 5
5	1. Inspect the crankshaft position (CKP) sensor for tightness. 2. Remove the CKP sensor and check for damage, metal particles on magnet and for flywheel circumference damage. Did you find and correct the condition?	—	Go to Step 10	Go to Step 6
6	1. Turn OFF the ignition. 2. Disconnect the CKP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion on the CKP sensor terminal (pins 1, 2 and 3 of E-9 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition.	—	Go to Step 10	Go to Step 7
7	1. Turn OFF the ignition. 2. Disconnect the fuel injection pump control unit (PCU) harness connector. 3. Inspect for an intermittent, for a poor connection and corrosion on the CKP sensor signal input at the harness connector of the PCU (pin 8 of E-6 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
8	1. Turn OFF the ignition. Disconnect the engine control module (ECM) harness connector. 2. Inspect for an intermittent, for poor connections and corrosion on at the harness connector of the ECM (pins 90, 91, 98 and 101 of C-57 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 9
9	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 10	—
10	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the DTC Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 2	Go to Step 11
11	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0251 (Symptom Code 9, A, B, C) (Flash Code 53)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.

The fuel injection solenoid valve is installed to the fuel injection pump rear side. The fuel injection event is determined by this solenoid ON/OFF command. The fuel injection solenoid valve cuts the fuel when the engine shutoff (ESO) solenoid valve is commanded shutoff from the PCU. (The fuel injection solenoid valve and engine shutoff (ESO) solenoid valve is same part. It calls ESO solenoid valve when fuel is shutoff.) When the ignition switch is turned OFF or commanded from fail-safe action, the ESO solenoid valve is commanded shutoff to stop the engine running.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The PCU detects internal fuel injection pump control maps are not programmed during self-test. (Symptom Code 9)
- The PCU detects internal EEPROM or A/D converter is failed during self-test. (Symptom Code A)
- The PCU detects that the fuel injection solenoid valve drive circuit is failed during self-test. (Symptom Code B)
- The PCU detects that the fuel injection solenoid valve drive circuit voltage level is abnormal during self-test. (Symptom Code D)

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts fuel injection. (Symptom Code 9)
- The ECM limits fuel injection quantity. (Symptom Code A)

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Fuel injection solenoid valve is internal to the fuel injection pump assembly.
- PCU is part of the fuel injection pump assembly.

DTC P0251 (Symptom Code 9, A, B, D) (Flash Code 53)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 4	—

Step	Action	Value(s)	Yes	No
4	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0251 (Symptom Code E) (Flash Code 53)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.

The ECM monitors CAN operational status by expecting a constant flow of messages from the PCU. If the ECM detects that the communication message from the PCU is not received, this DTC will set.

Condition for Running the DTC

The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects communication message from the PCU is not received for longer than 1 second.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- PCU is part of the fuel injection pump assembly.

DTC P0251 (Symptom Code E) (Flash Code 53)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. If the engine does not start, crank over the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Is DTC P1650 (Symptom Code A or B) or P1651 (Symptom Code A or B) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Turn ON the ignition, with the engine OFF. 2. Monitor the DTC Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 4	Go to Step 5
4	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 5	—
5	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 2	Go to Step 6
6	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0335 (Symptom Code B, D) (Flash Code 43)

Circuit Description

The crankshaft position (CKP) sensor is located on top of the flywheel housing. There are 4 slits spaced 90° on the flywheel circumference. The CKP sensor is a magnetic coil type sensor, which generates an AC signal voltage based on the crankshaft rotational speed. The engine control module (ECM) monitors both the CKP sensor and injection pump camshaft position (CMP) sensor signals to ensure they correlate with each other.
If the ECM receives extra or missing CKP sensor signal pulses, this DTC will set. (Symptom Code B)
If the ECM receives a certain amount of injection pump CMP sensor signal pulses without a CKP sensor signal, this DTC will set. (Symptom Code D)

Condition for Running the DTC

Symptom Code B

- The ignition switch is ON.
- The engine speed is higher than 665 RPM

Symptom Code D

- DTC P0335 (Symptom Code B) is not set.
- The ignition switch is ON.
- The fuel injection pump CMP sensor signal is generated.
- The controller area network (CAN) communication between the ECM and PCU is normal.

Condition for Setting the DTC

Symptom Code B

- The ECM detects extra or missing CKP sensor signals while engine is running.

Symptom Code D

- The ECM detects that the CKP sensor signals are not generated when doubled fuel injection pump rotation speed is higher than 50 RPM.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
  The ECM uses an engine speed substitution of doubled fuel injection pump speed for engine control.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Ensure the sensor is tight and the flywheel circumference is not damaged.

DTC P0335 (Symptom Code B, D) (Flash Code 43)
Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine (Note a slight start delay may be noticed). 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the crankshaft position sensor (CKP) harness connector. 3. Connect a DMM across the CKP sensor terminals (pins 1 and 2 of E-9 connector). 4. Measure the resistance across the CKP sensor. Is the CKP sensor resistance within the specified value?	870 – 930 Ω	Go to Step 4	Go to Step 20

Step	Action	Value(s)	Yes	No
4	1. Connect a DMM across the CKP sensor terminals (measure the sensor output voltage). 2. Place the DMM on the AC volt scale. 3. Start the engine. 4. Monitor the DMM while accelerating the engine between idle and W.O.T. (accelerator pedal full travel). Does the DMM indicate an AC voltage increase in accordance with an engine speed increase (the range of approximately 1.4 volts is indicated from approximately 0.7 volts)?	—	Go to Step 5	Go to Step 19
5	1. Turn ON the ignition, with the engine OFF. 2. Connect a test lamp between the low reference circuit of the CKP sensor harness (pin 1 of E-9 connector) and a known good ground. Does the test lamp illuminate?	—	Go to Step 11	Go to Step 6
6	1. Keep the ignition switch ON, with the engine OFF. 2. Connect a test lamp between the low reference circuit of the CKP sensor harness (pin 1 of E-9 connector) and battery voltage. Does the test lamp illuminate?	—	Go to Step 7	Go to Step 12
7	1. Keep the ignition switch ON, with the engine OFF. 2. Connect a test lamp between the shield ground circuit of the CKP sensor harness (pin 3 of E-9 connector) and a known good ground. Does the test lamp illuminate?	—	Go to Step 13	Go to Step 8
8	1. Keep the ignition switch ON, with the engine OFF. 2. Connect a test lamp between the shield ground circuit of the CKP sensor harness (pin 1 of E-9 connector) and battery voltage. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 14
9	1. Keep the ignition switch ON, with the engine OFF. 2. Connect a test lamp between the signal circuit of the CKP sensor harness (pin 2 of E-9 connector) and battery voltage. Does the test lamp illuminate?	—	Go to Step 15	Go to Step 10
10	1. Keep the ignition switch ON, with the engine OFF. 2. Connect a DMM between the signal circuit of the CKP sensor harness (pin 2 of E-9 connector) and a known good ground. Is the DMM voltage more than the specified value?	1 volt	Go to Step 16	Go to Step 17
11	**Important:** The ECM may be damaged if the sensor low reference circuit is shorted to a voltage source. 1. Test the low reference circuit of the CKP sensor between the engine control module (ECM) (pin 98 of C-57 connector) and the CKP sensor (pin 1 of E-9 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 21

Step	Action	Value(s)	Yes	No
12	1. Test the low reference circuit of the CKP sensor between the ECM (pin 98 of C-57 connector) and the CKP sensor (pin 1 of E-9 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 18
13	**Important:** The ECM may be damaged if the sensor shield ground circuit is shorted to a voltage source. 1. Test the shield ground circuit of the CKP sensor between the ECM (pin 101 of C-57 connector) and the CKP sensor (pin 3 of E-9 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 21
14	1. Test the shield ground circuit of the CKP sensor between the ECM (pin 101 of C-57 connector) and the CKP sensor (pin 3 of E-9 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 18
15	1. Test the signal circuit of the CKP sensor between the ECM (pin 90 of C-57 connector) and the CKP sensor (pin 2 of E-9 connector) for the following conditions: • A short to ground • A short to the low reference circuit • A short to the shield ground 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 21
16	**Important:** The CKP sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit of the CKP sensor between the ECM (pin 90 of C-57 connector) and the CKP sensor (pin 2 of E-9 connector) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 21
17	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the CKP sensor (pins 1, 2 and 3 of E-9 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 20
18	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the CKP sensor circuits at the harness connector of the ECM (pins 90, 98 and 101 of C-57 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 21

Step	Action	Value(s)	Yes	No
19	1. Inspect the CKP sensor for tightness. 2. Retest if the sensor was loose. 3. Remove the CKP sensor and check for damage, metal particles on magnet and for flywheel circumference damage. Did you find and correct the condition?	—	Go to Step 22	Go to Step 20
20	Replace the CKP sensor. Refer to Crankshaft Position Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 22	—
21	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 22	—
22	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 23
23	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0335 (Symptom Code E) (Flash Code 43)

Circuit Description

The crankshaft position (CKP) sensor is located on top of the flywheel housing. The engine control module (ECM) calculates the engine speed and exact position of the crankshaft based on the signal from the CKP sensor. If the ECM detects an engine overrun condition, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the engine speed is higher than 5700 RPM for 0.2 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- Ensure the sensor is tight and the flywheel circumference is not damaged.

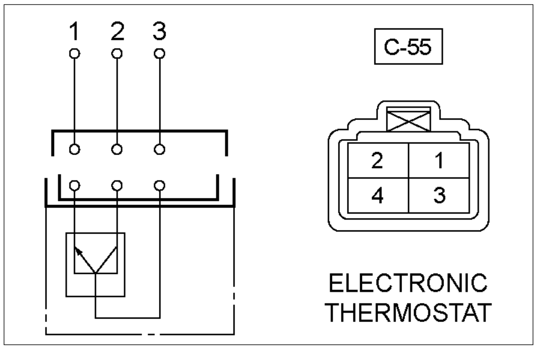
Notice:

- This DTC is caused by an engine over speed condition, which was most likely caused by driver error (i.e. downshifting a manual transmission on a steep grade). Ensure there are no signs of engine damage. Excessive engine over speed may damage internal engine components.

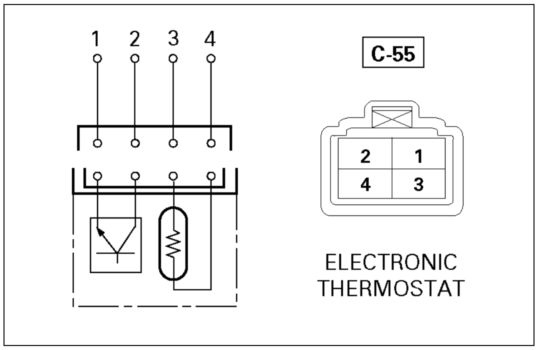
DTC P0335 (Symptom Code E) (Flash Code 43)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Start the engine. 3. Observe the Engine Speed parameter with the scan tool. 4. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the scan tool. Does the Engine Speed parameter ever exceed the specified value?	5000 RPM	Go to Step 4	Go to Step 3
3	Ask the driver if overrun is caused by gear slip-out, shift error, down-slope diving, etc. If engine overrun has experienced, the engine must be inspected and repaired as necessary. Did you complete the action?	—	Go to Step 7	—
4	1. Remove the crankshaft position (CKP) sensor. Refer to CKP Sensor replacement in this section. 2. Visually inspect the CKP sensor for the following conditions: • For physical damage • For being loose • For improper installation Did you find and correct the condition?	—	Go to Step 7	Go to Step 5
5	Visually inspect the flywheel circumference for damage. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
6	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—

Step	Action	Value(s)	Yes	No
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Observe the Engine Speed parameter with the scan tool. 6. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the scan tool. Does the Engine Speed parameter ever exceed the specified value?	5000 RPM	Go to Step 4	Go to Step 8
8	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK



RTW410SH000201



Electronic thermostat

Check for continuity between electronic thermostat side connector terminals.

(A/C)

(Cooler)

DTC P0380 (Symptom Code 4) (Flash Code 66)

Circuit Description

The engine control module (ECM) controls the glow relay which supplies power to the glow plugs based on engine coolant temperature. In the after glow phase, the glow indicator light is not illuminated but glow plugs remain active for a certain period. If the ECM detects an open circuit or short to ground on the glow relay control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the low voltage condition on the glow relay control circuit for longer than 3 seconds when the relay is commanded OFF.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Notice:

- The glow relay is commanded OFF with ignition ON and engine OFF when the engine coolant temperature is reached at 30°C (86°F).
- The glow relay is commanded OFF with engine run when the engine coolant temperature is reached at 60°C (140°F).

DTC P0380 (Symptom Code 4) (Flash Code 66)

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Perform the Glow Relay test with the scan tool. 4. Command the Glow Relay ON with the scan tool. Does the glow relay click when commanded ON with the scan tool?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Replace the glow relay with the starter relay or replace with a known good relay. 3. Turn ON the ignition, with the engine OFF. 4. Command the Glow Relay ON with the scan tool. Does the glow relay click when commanded ON with the scan tool?	—	Go to Step 12	Go to Step 4
4	1. Turn OFF the ignition. 2. Inspect the ECM (10A) fuse (EB-4) in the engine room fuse block. Is the ECM (10A) fuse (EB-4) open?	—	Go to Step 5	Go to Step 6
5	Replace the ECM (10A) fuse (EB-4). If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the ECM (10A) fuse (EB-4) or replace the shorted attached component fed by the ECM (10A) fuse (EB-4). Did you complete the repair?	—	Go to Step 16	—
6	1. Turn OFF the ignition. 2. Remove the glow relay. 3. Connect a test lamp between the voltage feed circuit of the glow relay coil side (pin 2 of X-5 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 7	Go to Step 9

Step	Action	Value(s)	Yes	No
7	1. Turn OFF the ignition. 2. Connect a test lamp between the control circuit of the glow relay (pin 3 of X-5 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp continuously illuminate (the test lamp blinks then goes out normally if the engine coolant temperature lower than 30°C [86°F])?	—	Go to Step 10	Go to Step 8
8	1. Keep the test lamp with connected. 2. Command the Glow Relay ON with the scan tool. Does the test lamp illuminate when commanded ON with the scan tool?	—	Go to Step 12	Go to Step 11
9	Repair the voltage feed circuit between the ECM (10A) fuse (EB-4) and the glow relay (pin 2 of X-5 connector) for an open circuit or high resistance. Did you complete the repair?	—	Go to Step 16	—
10	1. Test the control circuit of the glow relay between the engine control module (ECM) (pin 94 of C-57 connector) and the glow relay (pin 3 of X-5 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15
11	1. Test the control circuit of the glow relay between the ECM (pin 94 of C-57 connector) and the glow relay (pin 3 of X-5 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 13
12	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections on the glow relay terminals (pins 2 and 3 of X-5 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 14
13	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the glow relay control circuit at the harness connector of the ECM (pin 94 of C-57 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15
14	Replace the glow relay. Did you complete the replacement?	—	Go to Step 16	—
15	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 16	—

Step	Action	Value(s)	Yes	No
16	1. Reconnect all previously disconnected fuse, relay or harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and warm up (allow engine coolant temperature to reach at least 65°C [149°F]). 5. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 17
17	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0380 (Symptom Code 8) (Flash Code 66)

Circuit Description

The engine control module (ECM) controls the glow relay which supplies power to the glow plugs based on engine coolant temperature. In the after glow phase, the glow indicator light is not illuminated but glow plugs remain active for a certain period. If the ECM detects a short to battery or ignition voltage on the glow relay control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the high voltage condition on the glow relay control circuit for longer than 1 second when the relay is commanded ON.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Notice:

- The glow relay is commanded OFF with ignition ON and engine OFF when the engine coolant temperature is reached at 30°C (86°F).
- The glow relay is commanded OFF with engine run when the engine coolant temperature is reached at 60°C (140°F).

DTC P0381 (Symptom Code 4) (Flash Code 67)

Circuit Description

The glow indicator lamp is located on the instrument panel cluster (IPC). The glow control system is operated when the engine coolant temperature is low, which allows easier engine starting. If the ignition switch is turned ON when the engine coolant temperature is low, the engine control module (ECM) illuminates the glow indicator lamp and turns ON the glow plugs. After a fixed time passes, the ECM turns OFF the glow indicator lamp and the glow plugs. The ECM monitors the glow indicator lamp control circuit for conditions that are incorrect for the commanded state of the glow indicator lamp. If the ECM detects an open circuit or short to ground on the glow indicator control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the low voltage condition on the glow indicator lamp control circuit for longer than 3 seconds when the lamp is commanded OFF.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The glow indicator lamp is commanded OFF with the ignition ON and engine OFF when the engine coolant temperature is reached at 30°C (86°F).

20	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0381 (Symptom Code 8) (Flash Code 67)

Circuit Description

The glow indicator lamp is located on the instrument panel cluster (IPC). The glow control system is operated when the engine coolant temperature is low, which allows easier engine starting. If the ignition switch is turned ON when the engine coolant temperature is low, the engine control module (ECM) illuminates the glow indicator lamp and turns ON the glow plugs. After a fixed time passes, the ECM turns OFF the glow indicator lamp and the glow plugs. The ECM monitors the glow indicator lamp control circuit for conditions that are incorrect for the commanded state of the glow indicator lamp. If the ECM detects a short to battery or ignition voltage on the glow indicator control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the high voltage condition on the glow indicator lamp control circuit for longer than 1 second when the lamp is commanded ON.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The glow indicator lamp is commanded OFF with the ignition ON and engine OFF when the engine coolant temperature is reached at 30°C (86°F).

Test Description

The number below refers to the step number on the diagnostic table.

3. If the control circuit of the glow indicator lamp between the ECM and the IPC is normal, the control circuit voltage low DTC P0381 (Symptom Code 4) will set.

1 - 2 ····· Continuity	

DTC P0400 (Symptom Code 3) (Flash Code 32)

Circuit Description

The engine control module (ECM) controls the exhaust gas recirculation (EGR) flow amount based on the engine speed, engine coolant temperature, intake air temperature, barometric pressure and fuel injection quantity. The ECM controls the EGR valve by controlling the EGR solenoid valve. The mass air flow (MAF) sensor monitors EGR gas flow amount. An expected MAF amount should be detected while the engine running. If the ECM detects the actual MAF amount is lower than desired MAF amount, this DTC will set. This indicates excessive amount of EGR gas flow.

Condition for Running the DTC

- The ignition switch is ON.
- The engine is running.
- The barometric pressure (BARO) is between 850 hPa and 1100 hPa.
- The intake air temperature (IAT) is between 15°C (59°F) and 100°C (212°F).
- The ECT is between 35°C (95°F) and 100°C (211°F).

Condition for Setting the DTC

- The ECM detects that the MAF amount is 150 mg/strk lower than the desired MAF for 60 seconds. This indicates excessive amount of EGR flow.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- A sticking or intermittently sticking the EGR valve will cause this DTC to set.
- Misrouted vacuum hoses will cause this DTC to set.

DTC P0400 (Symptom Code 3) (Flash Code 32)
Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle for 30 seconds. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Is DTC P0100 (Symptom Code 7, 9, B or C) or P0400 (Symptom Code 4 or 8) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). 4. Perform the EGR Solenoid Valve test with the scan tool. 5. Command the EGR Solenoid Valve ON and OFF with the scan tool while observing the Mass Air Flow (MAF) Sensor parameter. Does the MAF Sensor parameter decrease by at least 200 mg/strk within 2 seconds when the EGR Solenoid Valve is commanded ON?	—	Go to Diagnostic Aids	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Inspect for the following conditions: • An EGR valve control vacuum hose is damaged or kinked. • EGR solenoid valve vacuum hoses are damaged or kinked. • EGR solenoid valve ventilation is damaged. • An EGR valve is stuck open. • Any type of restriction in the exhaust system. • Air leakage around the MAF sensor or debris in the sensor housing. • Air leaking around any of the air induction tubing between the MAF sensor and intake manifold. • Turbine shaft binding causing lower turbocharger shaft spinning speeds. Refer to the Turbocharger in Engine Mechanical section for diagnosis. • Restricted air cleaner element, restricted or collapsed air tubing between the air cleaner and the turbocharger. • Oil in the air tubing causing an incorrect MAF sensor signal. When there is adhesion of oil, inside of the tubing, intercooler and turbocharger needs to be wipe off. • Contaminated, skewed or slow MAF sensor. 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the EGR valve control vacuum hose from the EGR valve. 3. Connect a hand-held vacuum pump (5-8840-0279-0/J-23738-A) to the disconnected vacuum hose. 4. Start the engine and let engine idle. 5. Perform the EGR Solenoid Valve test with the scan tool. 6. Command the EGR Solenoid Valve ON and OFF with the scan tool. Does the hand-held vacuum pump indicate more than 50 cmHg (20 inHg) when commanding the ON and less than 10 cmHg (4 inHg) when commanding OFF?		Go to Step 6	Go to Step 9
6	1. Turn OFF the ignition. 2. Disconnect the hand-held vacuum pump from the vacuum hose. 3. Connect the hand-held vacuum pump to the vacuum port of EGR valve. 4. Start the engine and let engine idle. 5. Apply vacuum pressure to the EGR valve while observing the MAF Sensor parameter. Does the MAF Sensor parameter decrease by at least 200 mg/strk when the vacuum pressure is applied?	—	Go to Diagnostic Aids	Go to Step 7

Step	Action	Value(s)	Yes	No
7	1. Turn OFF the ignition. 2. Disconnect the MAF sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the MAF sensor (pins 2, 4 and 5 of C-116 connector). 4. Disconnect the engine control module (ECM) harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on each MAF sensor circuit at the harness connector of the ECM (pins 83 and 88 of C-57 connector). 6. Test for high resistance on each MAF sensor circuit. 7. Test the MAF sensor signal circuit short to intake air temperature (IAT) sensor signal. 8. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
8	Replace the EGR valve. Refer to EGR Valve Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 10	—
9	Replace the EGR solenoid valve. Refer to EGR Solenoid Valve Replacement in this section. Did you complete the replacement?	—	Go to Step 10	—
10	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]) while observing the MAF Sensor parameter with the scan tool. Does the MAF Sensor parameter follow the Desired MAF parameter within 50 mg/strk?	—	Go to Step 11	Go to Step 2
11	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0400 (Symptom Code 4) (Flash Code 32)

Circuit Description

The engine control module (ECM) controls the exhaust gas recirculation (EGR) flow amount based on the engine speed, engine coolant temperature, intake air temperature, barometric pressure and fuel injection quantity. The ECM controls the EGR valve by controlling the EGR solenoid valve. The mass air flow (MAF) sensor monitors EGR gas flow amount. An expected MAF amount should be detected while the engine running. If the ECM detects that an open circuit or short to ground on the EGR solenoid valve control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the low voltage condition on the EGR solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded OFF.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Inspect the ECM (10A) fuse (EB-4) in the engine room fuse block. Is the ECM (10A) fuse (EB-4) open?	—	Go to Step 4	Go to Step 5
4	Replace the ECM (10A) fuse (EB-4). If the fuse continues to open, repair the short to ground on one of the circuits that fed by the ECM (10A) fuse (EB-4) or replace the shorted attached component fed by the ECM (10A) fuse (EB-4). Did you complete the repair?	—	Go to Step 15	—
5	1. Turn OFF the ignition. 2. Disconnect the EGR control solenoid valve harness connector. 3. Connect a test lamp between the voltage feed circuit of the EGR control solenoid valve harness (pin 1 of C-115 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 8

Step	Action	Value(s)	Yes	No
6	1. Connect a test lamp between the control circuit of the EGR solenoid valve harness (pin 2 of C-115 connector) and battery voltage. 2. Perform the EGR Solenoid Valve test with the scan tool. 3. Command the EGR Solenoid Valve ON with the scan tool. Does the test lamp illuminate when commanded ON with the scan tool?	—	Go to Step 7	Go to Step 9
7	Command the EGR Solenoid Valve OFF with the scan tool. Does the test lamp continuously illuminate same as step 6 when commanded OFF with the scan tool (the test lamp slightly illuminates if the circuit is normal when commanded OFF)?	—	Go to Step 10	Go to Step 11
8	Repair the open circuit or high resistance on the voltage feed circuit between the ECM (10A) fuse (EB-4) and the EGR solenoid valve (pin 1 of C-115 connector). Did you complete the repair?	—	Go to Step 15	—
9	1. Test the control circuit between the engine control module (ECM) (pin 97 of C-57 connector) and the EGR solenoid valve (pin 2 of C-115 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 12
10	1. Test the control circuit between the ECM (pin 97 of C-57 connector) and the EGR solenoid valve (pin 2 of C-115 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
11	1. Turn OFF the ignition. 2. Disconnect the EGR solenoid valve harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the EGR solenoid valve (pins 1 and 2 of C-115 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 13
12	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the EGR solenoid valve control circuit at the harness connector of the ECM (pin 97 of C-57 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
13	Replace the EGR solenoid valve. Refer to EGR Solenoid Valve Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
14	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—

Step	Action	Value(s)	Yes	No
15	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 16
16	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0400 (Symptom Code 5) (Flash Code 32)

Circuit Description

The engine control module (ECM) controls the exhaust gas recirculation (EGR) flow amount based on the engine speed, engine coolant temperature, intake air temperature, barometric pressure and fuel injection quantity. The ECM controls the EGR valve by controlling the EGR solenoid valve. The mass air flow (MAF) sensor monitors EGR gas flow amount. An expected MAF amount should be detected while the engine running. If the ECM detects the actual MAF amount is higher than desired MAF amount, this DTC will set. This indicates insufficient amount of EGR gas flow.

Condition for Running the DTC

- The ignition switch is ON.
- The engine is running.
- The barometric pressure (BARO) is between 850 hPa and 1100 hPa.
- The intake air temperature (IAT) is between 15°C (59°F) and 100°C (212°F).
- The ECT is between 35°C (95°F) and 100°C (211°F).

Condition for Setting the DTC

- The ECM detects that the MAF amount is 150 mg/strk higher than the desired MAF for 60 seconds. This indicates insufficient amount of EGR flow.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- A sticking or intermittently sticking the EGR valve will cause this DTC to set.
- Misrouted vacuum hoses will cause this DTC to set.
- A vacuum pump problem will cause this DTC to set.

DTC P0400 (Symptom Code 5) (Flash Code 32)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle for 30 seconds. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Is DTC P0100 (Symptom Code 7, 9, B or C) or P0400 (Symptom Code 4 or 8) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). 4. Perform the EGR Solenoid Valve test with the scan tool. 5. Command the EGR Solenoid Valve ON and OFF with the scan tool while observing the Mass Air Flow (MAF) Sensor parameter. Does the MAF Sensor parameter decrease by at least 200 mg/strk within 2 seconds when the EGR Solenoid Valve is commanded ON?	—	Go to Diagnostic Aids	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Inspect for the following conditions: • An EGR valve control vacuum hose is damaged or kinked. • EGR solenoid valve vacuum hoses are damaged or kinked. • EGR solenoid valve ventilation is damaged. • An EGR valve is stuck close. • Restricted or collapsed EGR passage between the exhaust manifold and EGR valve. • A vacuum hose from the vacuum pump is damaged or kinked. • A vacuum pump is damaged. • Oil in the air tubing causing an incorrect MAF sensor signal. When there is adhesion of oil, inside of the tubing, intercooler and turbocharger needs to be wipe off. • Contaminated or skewed MAF sensor. 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the EGR valve control vacuum hose from the EGR valve. 3. Connect a hand-held vacuum pump (5-8840-0279-0/J-23738-A) to the disconnected vacuum hose. 4. Start the engine and let engine idle. 5. Perform the EGR Solenoid Valve test with the scan tool. 6. Command the EGR Solenoid Valve ON and OFF with the scan tool. Does the hand-held vacuum pump indicate more than 50 cmHg (20 inHg) when commanding the ON and less than 10 cmHg (4 inHg) when commanding OFF?		Go to Step 6	Go to Step 9
6	1. Turn OFF the ignition. 2. Disconnect the hand-held vacuum pump from the vacuum hose. 3. Connect the hand-held vacuum pump to the vacuum port of EGR valve. 4. Start the engine and let engine idle. 5. Apply vacuum pressure to the EGR valve while observing the MAF Sensor parameter. Does the MAF Sensor parameter decrease by at least 200 mg/strk when the vacuum pressure is applied?	—	Go to Diagnostic Aids	Go to Step 7

Step	Action	Value(s)	Yes	No
7	1. Turn OFF the ignition. 2. Disconnect the MAF sensor harness connector. 3. Inspect for an intermittent, for a poor connection and corrosion at the harness connector of the MAF sensor (pin 3 of C-116 connector). 4. Disconnect the engine control module (ECM) harness connector. 5. Inspect for an intermittent, for a poor connection and corrosion on each MAF sensor circuit at the harness connector of the ECM (pin 92 of C-57 connector). 6. Test for high resistance on each MAF sensor circuit. 7. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
8	Replace the EGR valve. Refer to EGR Valve Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 10	—
9	Replace the EGR solenoid valve. Refer to EGR Solenoid Valve Replacement in this section. Did you complete the replacement?	—	Go to Step 10	—
10	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]) while observing the MAF Sensor parameter with the scan tool. Does the MAF Sensor parameter follow the Desired MAF parameter within 50 mg/strk?	—	Go to Step 11	Go to Step 2
11	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0400 (Symptom Code 8) (Flash Code 32)

Circuit Description

The engine control module (ECM) controls the exhaust gas recirculation (EGR) flow amount based on the engine speed, engine coolant temperature, intake air temperature, barometric pressure and fuel injection quantity. The ECM controls the EGR valve by controlling the EGR solenoid valve. The mass air flow (MAF) sensor monitors EGR gas flow amount. An expected MAF amount should be detected while the engine running. If the ECM detects that detects a short to battery or ignition voltage on the EGR solenoid valve control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the high voltage condition on the EGR solenoid valve control circuit for longer than 3 seconds when the solenoid valve is commanded ON.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the diagnostic table.

3. If the control circuit of the EGR solenoid valve between the ECM and the solenoid valve is normal, the control circuit voltage low DTC P0400 (Symptom Code 4) will set.

DTC P0400 (Symptom Code 8) (Flash Code 32)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the EGR control solenoid valve harness connector. 3. Start the engine. 4. Monitor the DTC Information with the scan tool. Does the DTC P0400 (Symptom Code 4) set, but not DTC P0400 (Symptom Code 8)?	—	Go to Step 5	Go to Step 4
4	1. Test the control circuit between the engine control module (ECM) (pin 97 of C-57 connector) and the EGR solenoid valve (pin 2 of C-115 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
5	Replace the EGR solenoid valve. Refer to EGR Solenoid Valve Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—

TROUBLESHOOTING

FAN CONTROL KNOB (FAN SWITCH)

Current flows to the blower motor through the Heater & A/C relay (X-11) to activate the rotation of the blower motor by turning “ON” the fan control knob (fan switch). Blower motor speed is controlled in stages by the resistor, by operating the switch from “LOW” to “HIGH.”

6	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). 5. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 8
8	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0500 (Symptom Code 1, A) (Flash Code 24)

Circuit Description

The vehicle speed sensor (VSS) is used by the engine control module (ECM) and speedometer, which generates a speed signal from the transmission output shaft. The VSS has the following circuits.

- Ignition voltage feed circuit
- VSS signal circuit
- VSS low reference circuit

The VSS uses a hall effect element. It interacts with the magnetic field created by the rotating magnet and outputs square wave pulse signal. The 12 volts operating supply from the Meter fuse (except 2WD with A/T) or Back Up fuse (2WD with A/T). The ECM calculates the vehicle speed by the VSS. If the vehicle is 2WD with automatic transmission, VSS signals are sent from the transmission control module (TCM). If the ECM detects VSS signals are generated with high frequencies, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the vehicle speed is higher than 200 km/h (125 MPH) for 5 seconds. (Symptom Code 1)
- The ECM detects that the vehicle speed sensor signal frequency is too high for 0.6 seconds. (Symptom Code A)

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a vehicle speed substitution of 5 km/h (3 MPH) for engine control.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- Electrical or magnetic interference may affect intermittent condition.
- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0500 (Symptom Code B) (Flash Code 24)

Circuit Description

The vehicle speed sensor (VSS) is used by the engine control module (ECM) and speedometer, which generates a speed signal from the transmission output shaft. The VSS has the following circuits.

- Ignition voltage feed circuit
- VSS signal circuit
- VSS low reference circuit

The VSS uses a hall effect element. It interacts with the magnetic field created by the rotating magnet and outputs square wave pulse signal. The 12 volts operating supply from the Meter fuse (except 2WD with A/T) or Back Up fuse (2WD with A/T). The ECM calculates the vehicle speed by the VSS. If the vehicle is 2WD with automatic transmission, VSS signals are sent from the transmission control module (TCM). If the ECM detects VSS signals are not generated, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine speed is higher than 3600 RPM.
- The fuel injection quantity is more than 41 mg/strk.

Condition for Setting the DTC

- The ECM detects that the vehicle speed is lower than 1.5 km/h (1 MPH) for 60 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- Electrical or magnetic interference may affect intermittent condition.
- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Select the “JR405E Automatic Transmission” in the system selection menu. 5. Monitor the Read Diagnostic Trouble Code (DTC) Info As Stored By ECU with the scan tool. Does the transmission control module (TCM) DTC P0722 set?	—	Go to Applicable DTC in Automatic Transmission Section	Go to Step 3
3	1. Drive the vehicle. 2. Select the data display function of engine control module (ECM). 3. Observe the Vehicle Speed parameter with the scan tool. Does the Vehicle Speed parameter indicate correct vehicle speed?	—	Go to Diagnostic Aids	Go to Step 4
4	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Intermittently jump the VSS signal output circuit (pin A-10 of C-94 connector) with a test lamp that is connected to a known good ground while monitoring the Vehicle Speed parameter with the scan tool. Does the scan tool indicate any vehicle speed when the circuit is intermittently pulled to ground?	—	Go to Step 8	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Remove the instrument panel cluster (IPC) in order to disconnect the B-23 harness connector. 3. Disconnect the IPC B-23 harness connector. 4. Turn ON the ignition, with the engine OFF. 5. Intermittently jump the signal output circuit of the VSS signal output (pin 10 of B-23 connector) with a test lamp that is connected to a known good ground while monitoring the Vehicle Speed parameter with the scan tool. Does the scan tool indicate any vehicle speed when the circuit is intermittently pulled to ground?	—	Go to Step 6	Go to Step 7
6	1. Test the VSS signal output circuit between the IPC (pin 9 of B-23 connector) and the TCM (pin A-10 of C-94 connector) for the following conditions: • An open circuit • A short to ground • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 9
7	1. Test the VSS signal output circuit between the ECM (pin 68 of C-56 connector) and the IPC (pin 10 of B-23 connector) for the following conditions: • An open circuit • A short to ground • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 10
8	1. Turn OFF the ignition. 2. Inspect for an intermittent and for a poor connection on the VSS signal circuit at the harness connector of the TCM (pin A-10 of C-94 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 12
9	1. Turn OFF the ignition. 2. Disconnect the IPC B-23 harness connector. 3. Inspect for an intermittent and for poor connections on the VSS signal circuit at the harness connector of the IPC (pins 9 and 10 of B-24 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the VSS signal circuit at the harness connector of the ECM (pin 68 of C-56 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13

Step	Action	Value(s)	Yes	No
11	Replace the IPC (meter assembly). Refer to Meter Replacement in electrical section. Did you complete the replacement?	—	Go to Step 14	—
12	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to Transmission Control Module (TCM) Replacement in the transmission section. Did you complete the replacement?	—	Go to Step 14	—
13	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 14	—
14	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Drive the vehicle. 5. Observe the Vehicle Speed parameter with the scan tool. Does the Vehicle Speed parameter indicate correct vehicle speed?	—	Go to Step 15	Go to Step 2
15	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

Chart for except 2WD with A/T

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Drive the vehicle. 3. Observe the Vehicle Speed parameter with the scan tool. Does the Vehicle Speed parameter indicate correct vehicle speed?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Inspect the Meter (15A) fuse (C-14) in the cabin fuse block. Is the Meter (15A) fuse (C-14) open?	—	Go to Step 4	Go to Step 5
4	Replace the Meter (15A) fuse (C-14). If the fuse continues to open, repair the short to ground on one of the circuits that fed by the Meter (15A) fuse (C-14) or replace the shorted attached component fed by the Meter (15A) fuse (C-14). Did you complete the repair?	—	Go to Step 20	—

Step	Action	Value(s)	Yes	No
5	1. Remove the vehicle speed sensor (VSS). Refer to Vehicle Speed Sensor (VSS) Replacement in this section. 2. Visually inspect the VSS for the following conditions: • Physical damage • Being loose • Improper installation • For transmission output shaft teeth damage 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 6
6	1. Turn OFF the ignition. 2. Disconnect the VSS harness connector. 3. Connect a test lamp between the ignition voltage feed circuit of the VSS harness (pin 1 of E-44 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 7	Go to Step 9
7	1. Turn ON the ignition, with the engine OFF. 2. Connect a test lamp between the ignition voltage feed circuit and low reference circuit of the VSS harness (pins 1 and 2 of E-44 connector). Does the test lamp illuminate?	—	Go to Step 8	Go to Step 10
8	1. Turn ON the ignition, with the engine OFF. 2. Intermittently jump the signal circuit of the VSS (pin 3 of E-44 connector) with a test lamp that is connected to a known good ground while monitoring the Vehicle Speed parameter with the scan tool. Does the scan tool indicate any vehicle speed when the circuit is intermittently pulled to ground?	—	Go to Step 14	Go to Step 11
9	Repair the open or high resistance in the VSS ignition voltage feed circuit between the Meter (15A) fuse (C-14) and the VSS (pin 1 of E-44 connector). Did you complete the repair?	—	Go to Step 20	—
10	Repair the open or high resistance in the VSS low reference circuit between the VSS (pin 2 of E-44 connector) and the chassis ground. Did you complete the repair?	—	Go to Step 20	—
11	1. Turn OFF the ignition. 2. Remove the instrument panel cluster (IPC) in order to disconnect the B-24 harness connector. 3. Disconnect the IPC B-24 harness connector. 4. Turn ON the ignition, with the engine OFF. 5. Intermittently jump the signal output circuit of the VSS signal (pin 10 of B-24 connector) with a test lamp that is connected to a known good ground while monitoring the Vehicle Speed parameter with the scan tool. Does the scan tool indicate any vehicle speed when the circuit is intermittently pulled to ground?	—	Go to Step 12	Go to Step 13

Step	Action	Value(s)	Yes	No
12	1. Test the VSS signal circuit between the VSS (pin 3 of E-44 connector) and the IPC (pin 9 of B-23 connector) for the following conditions: • An open circuit • A short to ground • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 15
13	1. Test the VSS signal circuit between the engine control module (ECM) (pin 68 of C-56 connector) and the IPC (pin 10 of B-23 connector) for the following conditions: • An open circuit • A short to ground • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 16
14	1. Turn OFF the ignition. 2. Disconnect the VSS harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the VSS (pin 1, 2 and 3 of E-44 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 17
15	1. Turn OFF the ignition. 2. Disconnect the IPC B-23 harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the IPC (pins 9 and 10 of B-23 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 18
16	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the VSS signal circuit at the harness connector of the ECM (pin 68 of C-56 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 19
17	Replace the VSS. Refer to Vehicle Speed Sensor (VSS) Replacement in this section. Did you complete the replacement?	—	Go to Step 20	—

BLOWER MOTOR DOES NOT RUN

- Is heater & A/C relay (X-11) OK?

YES | NO → Replace

- Is No.SBF-6 (30A) (except C24SE) or No.SBF-8 (30A) (C24SE) slow blow fuse OK?

YES | NO → Replace

- Is resistor OK?

YES | NO → Replace

- Is fan control knob (Fan switch) OK?

YES | NO → Replace control lever assembly

- Is blower motor OK?

YES | NO → Replace

- Turn the ignition switch "ON" (Engine is running)
- Fan control knob (Fan switch) "ON"

- Check to see if battery voltage is present at chassis side connector terminal No.C105-1 is there a battery voltage?

YES → Open circuit either between chassis side connector terminal No.C105-2 and No.C104-3 or No.B13-1 and body ground No.C-109.

NO → Open circuit between No.SBF-6 (30A) (except C24SE) or No.SBF-8 (30A) (C24SE) slow blow fuse and No.C105-1.

DTC P0560 (Symptom Code 1) (Flash Code 35)

Circuit Description

The engine control module (ECM) monitors the system voltage on the ECM main relay load supply voltage terminal to make sure that the voltage stays within the proper range. If the ECM detects an excessively high system voltage, this DTC will set.

Condition for Setting the DTC

- The ECM detects that the battery voltage feed circuit voltage is more than 20 volts.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- A charging system problem may set this DTC.
- Jump starting the vehicle or a battery charger may have set this DTC.

DTC P0560 (Symptom Code 1) (Flash Code 35)
Schematic Reference: Engine Controls Schematics & Starting and Charging Schematics

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	Was the vehicle recently jump started from 24 volts system?	—	Go to Step 8	Go to Step 4
4	1. Start the engine and let idle for 30 seconds. 2. Observe the System Voltage parameter with the scan tool. Is the System Voltage parameter less than the specified value?	16 volts	Go to Diagnostic Aids	Go to Step 5
5	Test the charging system. Refer to Diagnosis of The Charging System in the Charging System Section. Did you find a charging system problem?	—	Go to Step 6	Go to Step 7
6	Repair the charging system. Refer to Diagnosis of The Charging System in the Charging System Section. Did you complete the repair?	—	Go to Step 8	—
7	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 8	—
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Observe the System Voltage parameter with the scan tool. Is the System Voltage parameter less than the specified value?	16 volts	Go to Step 9	Go to Step 5
9	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0560 (Symptom Code 2) (Flash Code 35)

Circuit Description

The engine control module (ECM) monitors the system voltage on the ECM main relay load supply voltage terminal to make sure that the voltage stays within the proper range. If the ECM detects an excessively low system voltage, this DTC will set.

Condition for Setting the DTC

- The ECM detects that the battery voltage feed circuit voltage is less than 7 volts.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- A charging system problem may set this DTC.

DTC P0560 (Symptom Code 2) (Flash Code 35)
Schematic Reference: Engine Controls Schematics & Starting and Charging Schematics
Connector End View Reference: Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Start the engine and let idle for 30 seconds. 2. Load the electrical system by turning ON the headlights, A/C, etc. 3. Observe the System Voltage parameter with the scan tool. Is the System Voltage parameter more than the specified value?	10 volts	Go to Diagnostic Aids	Go to Step 4
4	Test the charging system. Refer to Diagnosis of The Charging System in the Charging System Section. Did you find a charging system problem?	—	Go to Step 5	Go to Step 6
5	Repair the charging system. Refer to Diagnosis of The Charging System in the Charging System Section. Did you complete the repair?	—	Go to Step 8	—
6	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent, for a poor connection and corrosion on the battery voltage feed at the harness connector of the ECM (pin 3 of C-56 connector). 4. Repair or clean the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 7
7	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 8	—

Step	Action	Value(s)	Yes	No
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Load the electrical system by turning ON the headlights, A/C, etc. 6. Observe the System Voltage parameter with the scan tool. Is the System Voltage parameter more than the specified value?	10 volts	Go to Step 9	Go to Step 4
9	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0560 (Symptom Code A) (Flash Code 35)

Circuit Description

The fuel injection pump control unit (PCU) monitors the system voltage on the engine control module (ECM) main relay load supply voltage terminal to make sure that the voltage stays within the proper range. If the ECM detects an excessively high or low system voltage, this DTC will set.

Condition for Setting the DTC

- The PCU battery voltage feed circuit voltage is less than 4.5 volts or more than 27 volts.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- A charging system problem may set this DTC.
- Jump starting the vehicle or a battery charger may have set this DTC.

Notice:

- PCU is part of the fuel injection pump assembly.

DTC P0560 (Symptom Code A) (Flash Code 35)

Schematic Reference: Engine Controls Schematics & Starting and Charging Schematics

Connector End View Reference: Engine Controls Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Is DTC P0560 (Symptom Code 1 or 2) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Start the engine and let idle for 30 seconds. 2. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 4	Go to Diagnostic Aids
4	1. Turn OFF the ignition. 2. Disconnect the fuel injection pump control unit (PCU) harness connector. 3. Inspect for an intermittent, for poor connections and corrosion on the voltage feed or ground at the harness connector of the PCU (pins 6 and 7 of E-6 connector). 4. Repair or clean the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Step 5
5	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 6	
6	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and let idle for 30 seconds. 5. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 7

Step	Action	Value(s)	Yes	No
7	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0561 (Symptom Code A) (Flash Code 18)

Circuit Description

The engine control module (ECM) main relay is energized when the ECM receives an ignition voltage switch ON signal. When the ignition switch is OFF, the ECM main relay is de-energized after a certain length of time passed. If the ECM detects the ignition voltage switch signal is changed to OFF during the ECM is energized, this DTC will set.

Condition for Setting the DTC

- The ECM detects that the ignition voltage circuit is changed ON to OFF during initialization.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM turns OFF the ECM if the ignition voltage circuit is OFF even 1 second passes from the judgement.
- The ECM limits fuel injection quantity if the ignition voltage circuit is returned ON within 1 second from the judgement.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Faulty or sticking ECM main relay may set this DTC.

Notice:

- Quick repetition ON and OFF of ignition switch may set this DTC.

Test Description

The numbers below refer to the step number on the diagnostic table.

2. If DTC P1625 (Symptom Code A) is present, scan tool can communicate with the ECM when the ignition switch is OFF.

DTC P0561 (Symptom Code A) (Flash Code 18)
Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Is DTC P1625 (Symptom Code B) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the battery voltage feed harness connector (C-108) from the junction block (behind the cabin fuse block). 3. Inspect for an intermittent, for a poor connection and corrosion at the harness connector of the battery voltage feed (pin 2 of C-108 connector). 4. Disconnect the ignition switch harness connectors (B-62 and B-63) from the junction block (behind the cabin fuse block). 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ignition switch (pin 3 of B-62 connector and pin 3 of B-63 connector). 6. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Disconnect the ignition voltage feed harness connector (C-107) from the junction block (behind the cabin fuse block). 3. Inspect for an intermittent, for a poor connection and corrosion at the harness connector of the ignition voltage feed (pin 9 of C-107 connector). 4. Disconnect the engine control module (ECM) harness connector. 5. Inspect for an intermittent, for a poor connection and corrosion on ignition voltage feed circuit at the harness connector of the ECM (pin 39 of C-56 connector). 6. Test for high resistance on ignition voltage feed circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Step 5
5	Replace the ignition switch. Did you complete the replacement?	—	Go to Step 6	—
6	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Observe the DTC Information with the scan tool. 6. Turn OFF the ignition. Does the DTC fail this ignition before the ECM turns OFF?	—	Go to Step 2	Go to Step 7
7	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0561 (Symptom Code B) (Flash Code 18)

Circuit Description

The engine control module (ECM) main relay is energized when the ECM receives an ignition voltage switch ON signal. When the ignition switch is OFF, the ECM main relay is de-energized after a certain length of time passed. If the ECM detects the ignition voltage switch signal is changed to OFF during the ECM is energized, this DTC will set.

Condition for Setting the DTC

- The ECM detects internal ignition voltage feed circuit is failed after initialization.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM turns OFF the ECM.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P0561 (Symptom Code B) (Flash Code 18)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0602

Description

The engine control module (ECM) has the ability to set a diagnostic trouble code (DTC) if it detects that there is no vehicle identification (VIN) programmed.

Diagnostic Aids

Notice:

- Production and service ECM does not require software programming when it is replaced except calibration software update. This DTC indicates that a production or service ECM does not program VIN.

DTC P0602

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls

DTC P0606 (Symptom Code A, B) (Flash Code 28)

Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM).

Condition for Running the DTC

Symptom Code B

- The accelerator pedal position is less than 1%.
- The desired fuel injection quantity is 0 mg/strk.

Condition for Setting the DTC

Symptom Code A

- The ECM detects that the internal CPU does not react.

Symptom Code B

- The ECM detects that the engine speed is higher than 2000 RPM.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

DTC P0606 (Symptom Code A, B) (Flash Code 28)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

BLOWER MOTOR DOES NOT RUN IN CERTAIN POSITION

Blower motor does not run at Ⓐ1: (Low) Ⓑ2: (Medium Low) Ⓒ3: (Medium Hi) Ⓓ4: (High) Position

* Checking is performed only when in the malfunction mode.

- Is resistor OK?

NO → Replace

YES:

- Is fan control knob (Fan switch) OK?

NO → Replace control lever assembly

YES:

Ⓐ Condition:

Ⓓ Condition:

- Open circuit between chassis side connector terminal No. C105-2 and No. B13-4

DTC P0645 (Symptom Code 4) (Flash Code 46)

Circuit Description

The engine control module (ECM) controls the air conditioning (A/C) compressor relay, which supplies power to the A/C compressor clutch based on A/C request input to the ECM from the heating, ventilation and air conditioning (HVAC) controls. The ECM commands the A/C compressor relay ON at engine run. If the ECM detects an open circuit or short to ground on the A/C compressor relay control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The A/C compressor relay is once commanded ON.

Condition for Setting the DTC

- The ECM detects a low voltage condition on the A/C compressor relay control circuit for longer than 3 seconds when the relay is commanded OFF.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The A/C compressor relay is commanded OFF when the engine coolant temperature is reached around 105°C (221°F) and it commanded ON again below 100°C (212°F).

DTC P0645 (Symptom Code 4) (Flash Code 46)
Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Turn ON the blower motor switch and the A/C compressor switch. 5. Turn OFF the A/C compressor switch. 6. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Replace the A/C compressor relay with the tail relay or replace with a known good relay. 3. Turn ON the ignition, with the engine OFF. 4. Turn ON the blower motor switch and the A/C compressor switch. 5. Turn OFF the A/C compressor switch. 6. Monitor the DTC Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 4	Go to Step 14
4	1. Turn OFF the ignition. 2. Inspect the ECM (10A) fuse (EB-4) in the engine room fuse block. Is the ECM (10A) fuse (EB-4) open?	—	Go to Step 5	Go to Step 6
5	Replace the ECM (10A) fuse (EB-4). If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the ECM (10A) fuse (EB-4) or replace the shorted attached component fed by the ECM (10A) fuse (EB-4). Did you complete the repair?	—	Go to Step 16	—

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition. 2. Remove the A/C compressor relay. 3. Connect a test lamp between the voltage feed circuit of the A/C compressor relay coil side (pin 3 of X-14 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 7	Go to Step 9
7	1. Turn OFF the ignition. 2. Connect a test lamp between the A/C compressor relay control circuit (pin 5 of X-14 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 10	Go to Step 8
8	1. Keep the test lamp with connected. 2. Start the engine. 3. Turn ON the blower motor switch and the A/C compressor switch. Does the test lamp illuminate when the A/C Compressor Relay parameter is ON?	—	Go to Step 12	Go to Step 11
9	Repair the open circuit or high resistance on the voltage feed circuit between the ECM (10A) fuse (EB-4) and the A/C compressor relay (pin 3 of X-14 connector). Did you complete the repair?	—	Go to Step 16	—
10	1. Test the control circuit of the A/C compressor relay between the ECM (pin 41 of C-56 connector) and the A/C compressor relay (pin 5 of X-14 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15
11	1. Test the control circuit of the A/C compressor relay between the engine control module (ECM) (pin 41 of C-56 connector) and A/C compressor relay (pin 5 of X-14 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 13
12	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections on the A/C compressor relay terminal (pins 3 and 5 of X-14 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 14
13	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the A/C compressor relay control circuit at the harness connector of the ECM (pin 41 of C-56 connector). 4. Repair the connection (s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15
14	Replace the A/C compressor relay. Did you complete the replacement?	—	Go to Step 16	—

Step	Action	Value(s)	Yes	No
15	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 16	—
16	1. Reconnect all previously disconnected fuse, relay or harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Turn ON the blower motor switch and the A/C compressor switch. 6. Turn OFF the A/C compressor switch. 7. Monitor the DTC Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 17
17	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0645 (Symptom Code 8) (Flash Code 46)

Circuit Description

The engine control module (ECM) controls the air conditioning (A/C) compressor relay, which supplies power to the A/C compressor clutch based on A/C request input to the ECM from the heating, ventilation and air conditioning (HVAC) controls. The ECM commands the A/C compressor relay ON at engine run. If the ECM detects a short to battery or ignition voltage on the A/C compressor relay control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The A/C compressor relay is once commanded ON.

Condition for Setting the DTC

- The ECM detects a high voltage condition on the A/C compressor relay control circuit for longer than 3 seconds when the relay is commanded ON.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The A/C compressor relay is commanded OFF when the engine coolant temperature is reached around 105°C (221°F) and it commanded ON again below 100°C (212°F).

Turn ON the blower motor switch and the A/C compressor switch. 6. Monitor the DTC Information with the scan tool when the A/C Relay Command parameter is ON. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 8
8	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0703 (Symptom Code A, B) (Flash Code 25)

Circuit Description

The brake pedal switch is installed on the brake pedal bracket. The brake pedal 1 switch is a normally open type switch and the brake pedal 2 switch is a normally closed type switch. When the brake pedal is pressed, the brake pedal 1 switch signal is provided to the engine control module (ECM) and the stoplights are turned ON. Then, the brake pedal 2 switch signal to the ECM is stopped (low voltage). If the ECM detects the brake switch signals out of correlation, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine speed is higher than 665 RPM.
- The vehicle speed is higher than 0 km/h (0 MPH).

Condition for Setting the DTC

- The ECM detects that the brake pedal 1 switch (normally open type switch) signal and brake pedal 2 switch (normally closed type switch) signal correlation error for longer than 30 seconds within the enabling conditions ever since ignition switch is ON. (Symptom Code A)
- The ECM detects that the brake pedal 1 switch (normally open type switch) signal and brake pedal 2 switch (normally closed type switch) signal correlation error for longer than 30 seconds. (Symptom Code B)

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Misadjusted brake pedal switch will cause this DTC to set.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Observe the Brake Pedal 1 Switch parameter with the scan tool while fully depressing and releasing the brake pedal. Does the scan tool indicate Applied when the brake pedal is applied and Released when the brake pedal is released?	—	Go to Step 10	Go to Step 3
3	1. Check to ensure the brake pedal switch is adjusted correctly. The plunger should be all the way in when the pedal is released, yet should not impede with the brake pedal full upward travel. 2. Adjust the brake pedal switch as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 4
4	1. Turn OFF the ignition. 2. Inspect the Stop (15A) fuse (C-15) in the cabin fuse block. Is the Stop (15A) fuse (C-15) open?	—	Go to Step 5	Go to Step 6

Step	Action	Value(s)	Yes	No
5	Replace the Stop (15A) fuse (C-15). If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the Stop (15A) fuse (C-15) or replace the shorted attached component fed by the Stop (15A) fuse (C-15). Did you complete the repair?	—	Go to Step 22	—
6	1. Turn OFF the ignition. 2. Disconnect the brake pedal switch harness connector. 3. Connect a test lamp between the voltage feed circuit of the brake pedal 1 switch harness (pin 1 of C-44 connector) and a known good ground. Does the test lamp illuminate?	—	Go to Step 7	Go to Step 8
7	1. Turn ON the ignition, with the engine OFF. 2. Observe the Brake Pedal 1 Switch parameter with the scan tool while momentarily jumping 3-amp fused jumper wire across the brake pedal 1 switch harness connector between pins 1 and 2 of the C-44 connector. Does the scan tool indicate Applied when the circuit is jumpered and Released when the circuit is not jumpered?	—	Go to Step 18	Go to Step 9
8	Repair the open circuit or high resistance on the voltage feed circuit between the Stop (15A) fuse (C-15) and the brake pedal 1 switch (pin 1 of C-44 connector). Did you complete the repair?	—	Go to Step 22	—
9	1. Test the brake pedal 1 switch signal circuit between the ECM (pin 30 of C-56 connector) and the brake pedal 1 switch (pin 2 of C-44 connector) for the following conditions: • An open circuit • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 19
10	Observe the Brake Pedal 2 Switch parameter with the scan tool while fully depressing and releasing the brake pedal. Does the scan tool indicate Applied when the brake pedal is applied and Released when the brake pedal is released?	—	Go to Diagnostic Aids	Go to Step 11
11	1. Check to ensure the brake pedal switch is adjusted correctly. The plunger should be all the way in when the pedal is released, yet should not impede with the brake pedal full upward travel. 2. Adjust the brake pedal switch as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 12
12	1. Turn OFF the ignition. 2. Inspect the ECM (10A) fuse (EB-4) in the engine room fuse block. Is the ECM (10A) fuse (EB-4) open?	—	Go to Step 13	Go to Step 14

Step	Action	Value(s)	Yes	No
13	Replace the ECM (10A) fuse (EB-4). If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the ECM (10A) fuse (EB-4) or replace the shorted attached component fed by the ECM (10A) fuse (EB-4). Did you complete the repair?	—	Go to Step 22	—
14	1. Turn OFF the ignition. 2. Disconnect the brake pedal switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the voltage feed circuit of the brake pedal 2 switch harness (pin 3 of C-44 connector) and a known good ground. Does the test lamp illuminate?	—	Go to Step 15	Go to Step 16
15	1. Turn ON the ignition, with the engine OFF. 2. Observe the Brake Pedal 2 Switch parameter with the scan tool while momentarily jumping 3-amp fused jumper wire across the brake pedal 2 switch harness connector between pins 3 and 4 of the C-44 connector. Does the scan tool indicate Applied when the circuit is jumpered and Released when the circuit is not jumpered?	—	Go to Step 18	Go to Step 17
16	Repair the open circuit or high resistance on the voltage feed circuit between the ECM (10A) fuse (EB-4) and the brake pedal 2 switch (pin 3 of C-44 connector). Did you complete the repair?	—	Go to Step 22	—
17	1. Test the brake pedal 2 switch signal circuit between the ECM (pin 65 of C-56 connector) and the brake pedal 2 switch (pin 4 of C-44 connector) for the following conditions: • An open circuit • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 19
18	1. Turn OFF the ignition. 2. Disconnect the brake pedal switch harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the brake pedal switch (pins 1, 2, 3 and 4 of C-44 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 20
19	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the brake switch circuits at the harness connector of the ECM (pins 30 and 65 of C-56 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 22	Go to Step 21
20	Replace brake pedal switch. Refer to Brake Switch Replacement in this section. Did you complete the replacement?	—	Go to Step 22	—

Step	Action	Value(s)	Yes	No
21	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 22	—
22	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Brake Pedal 1 Switch and the Brake Pedal 2 Switch with the scan tool while fully depressing and releasing the brake pedal. Does the scan tool indicate Applied when the brake pedal is applied and Released when the brake pedal is released?	—	Go to Step 23	Go to Step 2
23	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P0704 (Symptom Code 6) (Flash Code 57)

Circuit Description

The clutch pedal switch is installed on the clutch pedal bracket. The clutch pedal switch is a normally closed type switch. When the clutch pedal is pressed, the clutch pedal switch signal to the engine control module (ECM) is stopped (low voltage). If the ECM detects the clutch pedal switch signal is not change during a predetermined vehicle speed range, this DTC will set. This DTC will only run once per ignition cycle within the enabling condition.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the clutch pedal switch signal does not change during the vehicle speed changes between 1.5 km/h (1 MPH) and 80 km/h (50 MPH). This DTC will only run once per ignition cycle within the enabling condition.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Misadjusted clutch pedal switch will cause this DTC to set.

NO

Replace control lever assembly

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition. 2. Disconnect the clutch pedal switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Clutch Pedal Switch parameter with the scan tool while momentarily jumping across the clutch pedal switch harness connector between pins 1 and 2 of C-77 connector. Does the scan tool indicate Applied when the circuit is jumped and Released when the circuit is not jumped?	—	Go to Step 12	Go to Step 7
7	1. Connect a test lamp between the ignition voltage feed circuit of the clutch pedal switch harness (pin 1 of C-77 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 8	Go to Step 9
8	1. Connect a test lamp between the signal circuit of the clutch pedal switch harness (pin 2 of C-77 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 10	Go to Step 11
9	Repair the open circuit or high resistance on the ignition voltage feed circuit between the ECM (10A) fuse (EB-4) and the clutch pedal switch (pin 1 of C-77 connector). Did you complete the repair?	—	Go to Step 16	—
10	1. Test the clutch pedal switch signal circuit between the engine control module (ECM) (pin 31 of C-56 connector) and the clutch pedal switch (pin 2 of C-77 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15
11	1. Test the clutch pedal switch signal circuit between the ECM (pin 31 of C-56 connector) and the clutch pedal switch (pin 2 of C-77 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 13
12	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the clutch pedal switch (pins 1 and 2 of C-77 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 14
13	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the clutch pedal switch circuit at the harness connector of the ECM (pin 31 of C-56 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15

Step	Action	Value(s)	Yes	No
14	Replace the clutch pedal switch. Refer to Clutch Pedal Switch Replacement in this section. Did you complete the replacement?	—	Go to Step 16	—
15	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 16	—
16	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Clutch Pedal Switch parameter with the scan tool while fully depressing and releasing the clutch pedal. Does the scan tool indicate Applied when the clutch pedal is applied and Released when the clutch pedal is released?	—	Go to Step 17	Go to Step 3
17	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1105 (Symptom Code 1) (Flash Code 86)

Circuit Description

The barometric pressure (BARO) sensor is installed inside of the engine control module (ECM) and converts the BARO into a voltage signal. The ECM uses this voltage signal to calibrate the fuel injection quantity and injection timing for altitude compensation. If the ECM detects an excessively high BARO sensor signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the BARO sensor signal voltage is more than 4.4 volts for 1 second.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a BARO substitution of 1013 hPa.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

DTC P1105 (Symptom Code 1) (Flash Code 86)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1105 (Symptom Code 2) (Flash Code 86)

Circuit Description

The barometric pressure (BARO) sensor is installed inside of the engine control module (ECM) and converts the BARO into a voltage signal. The ECM uses this voltage signal to calibrate the fuel injection quantity and injection timing for altitude compensation. If the ECM detects an excessively low BARO sensor signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the BARO sensor signal voltage is less than 1.5 volts for 1 second.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses a BARO substitution of 1013 hPa.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

DTC P1105 (Symptom Code 2) (Flash Code 86)

DTC P1120 (Symptom Code 1) (Flash Code 21)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the intake throttle assembly. The engine control module (ECM) uses the APP sensors to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injection control. The APP sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor signal circuit

The ECM supplies 5 volts to the APP sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The APP sensor provides a signal to the ECM on the APP sensor signal circuit, which is relative to the position changes of the accelerator pedal angle. The ECM monitors the APP sensor signal for voltages outside the normal range of the APP sensor. If the ECM detects an excessively high APP sensor signal voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the APP sensor signal voltage is more than 4.5 volts for 0.5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an engine speed substitution of 1400 RPM.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1120 (Symptom Code 1) (Flash Code 21)
Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the accelerator pedal position (APP) sensor harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Accelerator Pedal Position (APP) parameter with the scan tool. Does the APP parameter less than the specified value?	1%	Go to Step 4	Go to Step 5
4	1. Turn OFF the ignition. 2. Connect a test lamp between the low reference circuit of the APP sensor harness (pin 1 of E-22 connector) and battery voltage. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 11	Go to Step 8
5	1. Turn OFF the ignition. 2. Connect a DMM between the 5 volts reference circuit of the APP sensor harness (pin 3 of E-22 connector) and a known good ground. 3. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.5 volts	Go to Step 6	Go to Step 9

Step	Action	Value(s)	Yes	No
6	Is the DMM voltage less than the specified value at step 5?	5.5 volts	Go to Step 7	Go to Step 10
7	**Important:** The APP sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the engine control module (ECM) (pin 38 of C-56 connector) and the APP sensor (pin 2 of E-22 connector) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
8	. Test the low reference circuit between the 1ECM (pin 49 of C-56 connector) and the APP sensor (pin 1 of E-22 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 12
9	1. Test the 5 volts reference circuit between the ECM (pin 57 of C-56 connector) and the APP sensor (pin 3 of E-22 connector) for the following conditions: • A short to ground • A short to the low reference circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
10	1. Test the 5 volts reference circuit between the ECM (pin 57 of C-56 connector) and the APP sensor (pin 3 of E-22 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
11	1. Turn OFF the ignition. 2. Inspect for an intermittent and for a poor connection at the harness connector of the APP sensor (pin 1 of E-22 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 13
12	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the APP sensor circuit at the harness connector of the ECM (pin 49 of C-56 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
13	Replace APP sensor. Refer to Accelerator Pedal Position (APP) Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—
14	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 15	—

Step	Action	Value(s)	Yes	No
15	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Fully depress and release the accelerator pedal many times. 6. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 16
16	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1120 (Symptom Code 7) (Flash Code 21)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the intake throttle assembly. The engine control module (ECM) uses the APP sensors to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injection control. The APP sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor signal circuit

The ECM provides 5 volts reference voltage through the reference circuit to the APP sensor. The ECM monitors the voltage on the 5 volts reference circuit. If the ECM detects an excessively high APP sensor 5 volts reference voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the APP sensor voltage supply circuit is more than 5.2 volts for 0.5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an engine speed substitution of 1400 RPM.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

6	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1120 (Symptom Code 9) (Flash Code 21)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the intake throttle assembly. The engine control module (ECM) uses the APP sensors to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injection control. The APP sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor signal circuit

The ECM provides 5 volts reference voltage through the reference circuit to the APP sensor. The ECM monitors the voltage on the 5 volts reference circuit. If the ECM detects an excessively high APP sensor 5 volts reference voltage, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the APP sensor voltage supply circuit is less than 4.6 volts for 0.5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an engine speed substitution of 1400 RPM.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the diagnostic table.

3. If the APP sensor 5 volts reference circuit between the ECM and the sensor is normal, the sensor signal correlation DTC P1120 (Symptom Code E) will set.

4	1. Test the 5 volts reference circuit between the engine control module (ECM) (pin 57 of C-56 connector) and the APP sensor (pin 3 of E-22 connector) for the following conditions: • A short to ground • A short to the low reference circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6

AIR CONDITIONING CYCLE TROUBLESHOOTING

TROUBLE	POSSIBLE CAUSE	CORRECTION
No cooling or insufficient cooling	1. Magnetic clutch does not run	• Refer to "MAGNETIC CLUTCH" troubleshooting in this section
	2. Compressor is not rotating properly • Drive belt loosened or broken	• Adjust the drive belt to the specified tension or replace the drive belt
	• Magnetic clutch face is not clean and slips	• Clean the magnetic clutch face or replace
	• Incorrect clearance between magnetic drive plate and pulley	• Adjust the clearance (Refer to "COMPRESSOR OVERHAUL")
	• Compressor oil leaks from shaft seal or shell	• Replace the compressor
	• Compressor seized	• Replace the compressor
	3. Insufficient or excessive charge of refrigerant	• Discharge and recover refrigerant. Recharge to specified amount.
	4. Leaks in the refrigerant system	• Check refrigerant system for leaks and repair as necessary Discharge and recover refrigerant. Recharge to specified amount.
	5. Condenser clogged or insufficient radiation	• Clean the condenser or replace as necessary • Check radiator or condenser fan function
	6. Temperature control link unit of the heater unit defective	• Repair the link unit
	7. Unsteady operation due to foreign substance in expansion valve	• Replace the expansion valve
	8. Poor operation of electronic thermostat	• Check electronic thermostat and replace as necessary
Insufficient velocity of cooling air	1. Evaporator clogged or frosted	• Check evaporator core and replace or clean the core
	2. Air leaking from cooling unit or air duct	• Check evaporator and duct connection, then repair as necessary
	3. Blower motor does not rotate properly	• Refer to "FAN CONTROL KNOB (FAN SWITCH)" troubleshooting in this section

* For the execution of the charging and discharging operation in the table above, refer to the "RECOVERY, RECYCLING, EVACUATING AND CHARGING" in this section.

Step	Action	Value(s)	Yes	No
5	Replace the accelerator pedal position sensor. Refer to Accelerator Pedal Position Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
6	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Fully depress and release the accelerator pedal many times. 6. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 8
8	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1120 (Symptom Code D) (Flash Code 21)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the intake throttle assembly. The engine control module (ECM) uses the APP sensors to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injection control. The APP sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor signal circuit

The ECM supplies 5 volts to the APP sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The APP sensor provides a signal to the ECM on the APP sensor signal circuit, which is relative to the position changes of the accelerator pedal angle.

The brake pedal switch is installed on the brake pedal bracket. The brake pedal 1 switch is a normally open type switch and the brake pedal 2 switch is a normally closed type switch. When the brake pedal is pressed, the brake pedal 1 switch signal is provided to the ECM and the stoplights are turned ON. Then, the brake pedal 2 switch signal to the ECM is stopped (low voltage).

If the ECM detects accelerator pedal or APP sensor signal is stuck while brake pedal is depressed, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine speed is higher than 1700 RPM.
- The vehicle speed is higher than 1.5 km/h (1 MPH).

Condition for Setting the DTC

- The ECM detects APP sensor angle is stationary more than 8.7%, then brake pedal is depressed for longer than 2 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an engine speed substitution of 1400 RPM.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Misadjusted brake pedal switch may set this DTC.
- Misadjusted APP sensor may set this DTC.
- Misadjusted throttle cable may set this DTC.
- A sticking or intermittently sticking the intake throttle valve, control cable or pedal may set this DTC.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Was DTC P0703 (Symptom Code A or B) or P1120 (Symptom Code 1, 7, 9 or E) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Turn ON the ignition, with the engine OFF. 2. Observe the Brake Pedal 1 Switch parameter with the scan tool while fully depressing and releasing the brake pedal. Does the scan tool indicate Applied when the brake pedal is applied and Released when the brake pedal is released?	—	Go to Step 9	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Check to ensure the brake pedal switch is adjusted correctly. The plunger should be all the way in when the pedal is released, yet should not impede with the brake pedal full upward travel. 2. Adjust the brake pedal switch as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the brake pedal switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Brake Pedal 1 Switch parameter with the scan tool while momentarily jumping 3-amp fused jumper wire across the brake pedal 1 switch harness connector between pins 1 and 2 of the C-44 connector. Does the scan tool indicate Applied when the circuit is jumpered and Released when the circuit is not jumpered?	—	Go to Step 8	Go to Step 6
6	1. Test the brake pedal 1 switch signal circuit between the ECM (pin 30 of C-56 connector) and the brake pedal 1 switch (pin 2 of C-44 connector) for the following conditions: • An open circuit • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 7
7	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the brake switch circuit at the harness connector of the ECM (pin 30 of C-56 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	Replace the brake pedal switch. Refer to Brake Pedal Switch Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—
9	1. Turn ON the ignition, with the engine OFF. 2. Fully depress and release the accelerator pedal many times while observing the Accelerator Pedal Position (APP) parameter with the scan tool. Is the APP parameter smoothly changed within 0 to 100 % when the accelerator pedal is depressed and released?	—	Go to Diagnostic Aids	Go to Step 10
10	1. Turn OFF the ignition. 2. Inspect for the following conditions: • APP sensor is misadjusted. • An accelerator pedal that is stuck depressed. • An intake throttle valve control cable that is damaged, stuck or no free play. • An intake throttle valve that is stuck open. 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11

Step	Action	Value(s)	Yes	No
11	Replace the accelerator pedal position sensor. Refer to Accelerator Pedal Position Sensor Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Observe the APP parameter while fully depressing and releasing the accelerator pedal many times. Also observe the Brake Pedal 1 Switch parameter with the scan tool while depressing and releasing the brake pedal. Does the scan tool indicate the APP parameter smoothly changed within 0 to 100 % when the accelerator pedal is depressed and released, then scan tool indicate the Brake Pedal 1 Switch parameter Applied when the brake pedal is depressed and Released when the brake pedal is released?	—	Go to Step 14	Go to Step 2
14	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1120 (Symptom Code E) (Flash Code 21)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the intake throttle assembly. The engine control module (ECM) uses the APP sensors to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injection control. The APP sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor signal circuit

The ECM supplies 5 volts to the APP sensor on the 5 volts reference circuit. The ECM also provides a ground on the low reference circuit. The APP sensor provides a signal to the ECM on the APP sensor signal circuit, which is relative to the position changes of the accelerator pedal angle.
The idle switch is also mounted on the intake throttle assembly. The idle switch is part of the APP sensor assembly. The idle switch is a normally closed type switch. When the accelerator pedal is released, the idle switch signal to the ECM is low voltage.
If the ECM detects the APP sensor signal and the idle switch out of correlation, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

Either of following condition is met.

- The ECM detects APP sensor angle is less than 0.35%, then the idle switch is OFF for longer than 0.6 seconds.
- The ECM detects APP sensor angle is more than 8.7%, then the idle switch is ON for longer than 0.6 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses an engine speed substitution of 1400 RPM.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1120 (Symptom Code E) (Flash Code 21)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Turn ON the ignition, with the engine OFF. 2. Observe the Idle Switch parameter with the scan tool while depressing and releasing the accelerator pedal. Does the scan tool indicate OFF when the accelerator pedal is depressed and ON when the accelerator pedal is released?	—	Go to Step 10	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the idle switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Idle Switch parameter with the scan tool while momentarily jumping 3-amp fused jumper wire across the idle switch harness connector between pins 1 and 2 of the E-23 connector. Does the scan tool indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 9	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn ON the ignition, with the engine OFF. 2. Connect a DMM between the signal circuit of the idle switch harness (pin 2 of E-23 connector) and a known good ground. Is the DMM voltage more than the specified value?	4.5 volts	Go to Step 5	Go to Step 6
5	Is the DMM voltage less than the specified value at step 4?	5.5 volts	Go to Step 8	Go to Step 7
6	1. Test the switch signal circuit between the engine control module (ECM) (pin 69 of C-56 connector) and the idle switch (pin 2 of E-23 connector) for the following conditions: • An open circuit • A short to ground • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 21	Go to Step 18
7	**Important:** The idle switch may be damaged if the switch signal circuit is shorted to a voltage source. 1. Test the switch signal circuit between the ECM (pin 69 of C-56 connector) and the idle switch (pin 2 of E-23 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 21	Go to Step 20
8	Repair the open circuit or high resistance on the idle switch ground circuit between the idle switch (pin 1 of E-23 connector) and engine ground. Did you complete the repair?	—	Go to Step 21	—
9	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the idle switch (pins 1 and 2 of E-23 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 21	Go to Step 19
10	1. Turn ON the ignition, with the engine OFF. 2. Fully depress and release the accelerator pedal many times while observing the Accelerator Pedal Position (APP) parameter with the scan tool. Is the APP parameter smoothly changed within 0 to 100 % when the accelerator pedal is depressed and released?	—	Go to Diagnostic Aids	Go to Step 11
11	1. Turn OFF the ignition. 2. Reconnect the idle switch harness connector if disconnected. 3. Disconnect the APP sensor harness connector. 4. Turn ON the ignition, with the engine OFF. 5. Connect a DMM between the 5 volts reference circuit of the APP sensor harness (pin 3 of E-22 connector) and a known good ground. Is the DMM voltage more than the specified value?	4.5 volts	Go to Step 12	Go to Step 13

Step	Action	Value(s)	Yes	No
12	1. Turn OFF the ignition. 2. Connect a 3-amp fused jumper wire across the APP sensor connector between pins 2 and 3 of the E-22 connector. 3. Turn ON the ignition, with the engine OFF. Does DTC P1120 (Symptom Code 1) set, but not P1120 (Symptom Code E)?	—	Go to Step 15	Go to Step 14
13	1. Test the 5 volts reference circuit between the engine control module (ECM) (pin 57 of C-56 connector) and the APP sensor (pin 3 of E-22 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 21	Go to Step 18
14	1. Test the signal circuit between the ECM (pin 38 of C-56 connector) and the APP sensor (pin 2 of E-22 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 21	Go to Step 18
15	1. Test the signal circuit between the ECM (pin 38 of C-56 connector) and the APP sensor (pin 2 of E-22 connector) for the following conditions: • A short to ground • A short to the low reference circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 21	Go to Step 16
16	1. Test the low reference circuit between the ECM (pin 49 of C-56 connector) and the APP sensor (pin 1 of E-22 connector) for high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 21	Go to Step 17
17	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections or corrosion at the harness connector of the APP sensor (pin 1, 2 and 3 of E-22 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 21	Go to Step 19
18	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the APP sensor circuits at the harness connector of the ECM (pins 38, 49 and 57 of C-56 connector) or the idle switch circuit at the harness connector of the ECM (pin 69 of C-56 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 21	Go to Step 20
19	Replace the accelerator pedal position sensor. Refer to Accelerator Pedal Position Sensor Replacement in this section. (Idle switch is part of APP sensor) Did you complete the replacement?	—	Go to Step 21	—
20	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 21	—

Step	Action	Value(s)	Yes	No
21	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Observe the Idle Switch and APP parameter while fully depressing and releasing the accelerator pedal many times. Does the scan tool indicate the APP parameter smoothly changed within 0 to 100 % when the accelerator pedal is depressed and released, then scan tool indicate the Idle Switch parameter OFF when the accelerator pedal is depressed and ON when the accelerator pedal is released?	—	Go to Step 22	Go to Step 2
22	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1173 (Symptom Code 3) (Flash Code 22)

Circuit Description

The engine coolant temperature (ECT) sensor is installed to the thermostat housing. The ECT sensor is a variable resistor. The ECT sensor has a signal circuit and a low reference circuit. The ECT sensor measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT signal circuit and a ground for the ECT low reference circuit. When the ECT sensor is cold, the sensor resistance is high. When the engine coolant temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the ECT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the ECT signal circuit. If the ECM detects an excessive high coolant temperature, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects an excessive high coolant temperature for longer than 30 seconds.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- After starting the engine, the ECT should rise steadily to about 80°C – 85°C (176°F – 185°F) then stabilize when the thermostat opens.
- Use the Temperature vs. Resistance table to test the ECT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

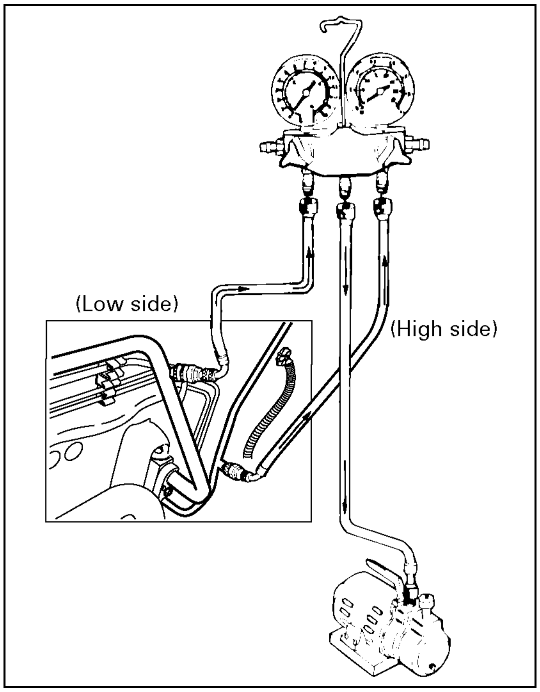
Notice:

- This DTC is caused by an engine overheat condition (i.e. low engine coolant level). Since this DTC does not illuminate any lamps, clear the DTC and ensure there are no signs of engine damage. Excessive engine overheat may damage internal engine components.

DTC P1173 (Symptom Code 3) (Flash Code 22)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and wait until engine is fully warms upped. 4. Observe the Engine Coolant Temperature (ECT) parameter with the scan tool. Is the ECT parameter more than the specified value?	100°C (212°F)	Go to Step 4	Go to Step 3
3	Ask the driver if overheat is caused by low engine coolant level, etc. If engine overheat has experienced, the engine must be inspected and repaired as necessary. Did you complete the action?	—	Go to Step 6	—
4	1. Test the ECT sensor at various temperature levels to evaluate the possibility if a skewed sensor. 2. Replace the ECT sensor as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Test the engine cooling system for the following condition. Refer to diagnosis of the engine cooling system section for testing. • Engine coolant level • Engine coolant leakage • Cooling fan belt slippage • Cooling fan clutch working • Thermostat working • Water pump working • Radiator clogging 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Diagnostic Aids
6	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and wait until engine is fully warms upped. 5. Observe the ECT parameter with the scan tool. Is the ECT parameter more than the specified value?	100°C (212°F)	Go to Step 4	Go to Step 7
7	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK



f06r300014

CHECKING REFRIGERANT SYSTEM WITH MANIFOLD GAUGE

Conditions;

- Ambient temperature at approx. 30~35°C (86~95°F)
- Run the engine at Idling
- A/C switch is “ON”
- Run the blower motor at “4” (high) position
- Temperature control knob sets at “MAX COLD”
- Air source selector lever at “CIRC”
- Close the all doors

Normal pressures kPa (kg/cm^2/psi);

Low-pressure side:

Approx. 127 – 245 (1.3 – 2.5 / 18 – 36)

High-pressure side:

Approx. 1373 – 1670 (14 – 17 / 199 – 242)

Connect the manifold gauge

Low-pressure hose (LOW) ~ Suction side

High-pressure hose (HI) ~ Discharge side

DTC P1173 (Symptom Code 7, A) (Flash Code 22)

Circuit Description

The fuel temperature (FT) sensor is internal to the fuel injection pump control unit (PCU). It detects fuel temperature in the fuel injection pump. If the PCU detects an excessively high or low fuel temperature, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects an excessive high FT for longer than 30 seconds. (Symptom Code 7)
- The ECM detects an excessive low FT for longer than 30 seconds. (Symptom Code A)

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The PCU limits fuel injection quantity. (Symptom Code 7)

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- FT sensor is internal to the PCU and it is part of the fuel injection pump assembly.

DTC P1173 (Symptom Code 7, A) (Flash Code 22)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. (Fuel temperature [FT] sensor is internal to the fuel injection pump control unit [PCU] and it is part of the fuel injection pump assembly.) Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1335 (Symptom Code A) (Flash Code 43)

Circuit Description

The crankshaft position (CKP) sensor is located on top of the flywheel housing. There are 4 slits spaced 90° on the flywheel circumference. The CKP sensor is a magnetic coil type sensor, which generates an AC signal voltage based on the crankshaft rotational speed. The engine control module (ECM) monitors both the CKP sensor and injection pump camshaft position (CMP) sensor signals to ensure they correlate with each other. If the fuel injection pump control unit (PCU) receives faulty CKP sensor signal pulses, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The PCU detects CKP sensor signal from the ECM is faulty.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- PCU is part of the fuel injection pump assembly.

DTC P1335 (Symptom Code A) (Flash Code 43)

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine (Note a slight start delay may be noticed). 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Is DTC P0335 (Symptom Code B or D) set?	—	Go to Applicable DTC	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the engine control module (ECM) C-57 harness connector. Keep the C-56 harness connector with connected. 3. Connect a DMM between the crankshaft position (CKP) sensor signal output circuit (pin 91 of C-57 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the DMM voltage more than the specified value?	10 volts	Go to Step 5	Go to Step 4
4	1. Test the CKP sensor signal output circuit between the ECM (pin 91 of C-57 connector) and the fuel injection pump (pin 8 of E-6 connector) for the following conditions: • An open circuit • A short to ground • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 6

Step	Action	Value(s)	Yes	No
5	1. Test the CKP sensor signal output circuit between the ECM (pin 91 of C-57 connector) and the fuel injection pump control unit (PCU) (pin 8 of E-6 connector) for a short to battery or ignition voltage. **Notice:** Perform this by connecting a test lamp between the ECM harness connector (pin 91 of C-57 connector) and a known good ground. If the test lamp illuminate, circuit is short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 7
6	1. Turn OFF the ignition. 2. Disconnect the PCU harness connector. 3. Inspect for an intermittent and for a poor connection on the CKP sensor signal circuit at the harness connector of the PCU (pin 8 of E-6 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
7	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the CKP sensor signal output circuit at the harness connector of the ECM (pin 92 of C-57 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 9
8	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 10	
9	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 10	—
10	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 11
11	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1345 (Symptom Code A) (Flash Code 41)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU. The PCU also compares the engine speed signal sent from the ECM and the fuel injection pump speed. If the PCU received faulty fuel injection pump CMP sensor signal, this DTC will set.

Condition for Setting the DTC

- The PCU received faulty fuel injection pump CMP sensor signal for 1 second.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Fuel injection pump CMP sensor is internal to the fuel injection pump assembly.
- PCU is part of the fuel injection pump assembly.

DTC P1345 (Symptom Code A) (Flash Code 41)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1520 (Symptom Code A) (Flash Code 47)

Circuit Description

(Manual Transmission)

The neutral switch is installed on the transmission gear control box. When the gear position is neutral, the switch is closed and the switch signal is provided to the engine control module (ECM). If the ECM detects the neutral switch signal is not changed from neutral during the predetermined engine speed and vehicle speed range, this DTC will set.

(Automatic Transmission)

The inhibitor switch is installed to the transmission case. When the selector position is P or N range, the switch is closed and the switch signal is provided to the Emir the ECM detects the neutral switch signal is not changed from P or N during the predetermined engine speed and vehicle speed range, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine speed is higher than 1500 RPM.
- The vehicle speed is higher than 63 km/h (39 MPH) (M/T) or 78 km/h (49 MPH) (A/T).
- The clutch pedal is released. (M/T).

Condition for Setting the DTC

- The ECM detects that the neutral switch signal is continuously ON (neutral or P/N range) during three consecutive driving cycles.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

Important:

- Following conditions must be met two consecutive driving cycles. (One driving cycle: Ignition switch ON > Engine run > Vehicle run > Ignition switch OFF for 10 seconds)
  - The engine speed is higher than 1500 RPM
  - The vehicle speed is higher than 63 km/h (39 MPH) (M/T) or 78 km/h (49 MPH) (A/T)
  - The clutch pedal is released (M/T)
  - Other than neutral or P/N range
  - After the above procedure is done, a history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1520 (Symptom Code A) (Flash Code 47)

1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Select the “JR405E Automatic Transmission” in the system selection menu. 5. Monitor the Read Diagnostic Trouble Code (DTC) Info As Stored By ECU with the scan tool. Does the transmission control module (TCM) DTC P0705 set?	—	Go to Applicable DTC in Automatic Transmission Section	Go to Step 3
3	1. Install the scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Observe the Neutral Switch parameter with the scan tool while shift to P or N and other positions. Does the scan tool indicate ON when the position is P or N and OFF when other than the P or N?	—	Go to Diagnostic Aids	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Check to ensure the inhibitor switch is adjusted correctly. 2. Adjust the inhibitor switch as necessary. Refer to Inhibitor Switch Adjustment in Automatic Transmission Section. Did you find and correct the condition?	—	Go to Step 7	Go to Step 5
5	1. Test the P & N position switch signal circuit between the engine control module (ECM) (pin 87 of C-57 connector) and the diode (pin 2 of X-16 connector) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
6	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. **Important:** Following conditions must be met two consecutive driving cycles before clear with the scan tool. (One driving cycle: Ignition switch ON > Engine run > Vehicle run > Ignition switch OFF for 10 seconds) • The engine speed is higher than 1500 RPM • The vehicle speed is higher than 78 km/h (49 MPH) • Other than P/N range 3. Turn ON the ignition, with the engine OFF. 4. Observe the Neutral Switch parameter with the scan tool while shift to P or N and other positions. Does the scan tool indicate ON when the position is P or N and OFF when other than the P or N?	—	Go to Step 8	Go to Step 2
8	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1520 (Symptom Code B) (Flash Code 47)

Circuit Description

The neutral switch is installed on the transmission gear control box. When the gear position is neutral, the switch is closed and the switch signal is provided to the engine control module (ECM). If the ECM detects the neutral switch signal is not changed from other than neutral during the predetermined engine speed and vehicle speed range, this DTC will set. This DTC runs only manual transmission.

Condition for Running the DTC

- The ignition switch is ON.
- The engine speed is higher than 665 RPM
- The vehicle speed is lower than 2 km/h (1.2 MPH).
- The clutch pedal is released after once depressed.

Condition for Setting the DTC

- The ECM detects that the neutral switch signal is continuously OFF (other than neutral) during three consecutive driving cycles.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the MIL/DTC

Important:

- Following conditions must be met two consecutive driving cycles. (One driving cycle: Ignition switch ON > Engine run > Ignition switch OFF for 10 seconds)
  - The engine speed is higher than 665 RPM
  - The vehicle speed is lower than 2 km/h (1.2 MPH)
  - The clutch pedal is released after once depressed
  - Neutral position
  - After the above procedure is done, a history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1520 (Symptom Code B) (Flash Code 47)
Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Observe the Neutral Switch parameter with the scan tool while shift to neutral and other positions. Does the scan tool indicate ON when the position is neutral and OFF when other than the neutral?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Inspect the ECM (10A) fuse (EB-4) in the engine room fuse block. Is the ECM (10A) fuse (EB-4) open?	—	Go to Step 4	Go to Step 5
4	Replace the ECM (10A) fuse (EB-4). If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the ECM (10A) fuse (EB-4) or replace the shorted attached component fed by the ECM (10A) fuse (EB-4). Did you complete the repair?	—	Go to Step 13	—

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Disconnect the neutral switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Neutral Switch parameter with the scan tool while momentarily jumping across the neutral switch harness connectors between pin 1 of E-11 connector and pin 1 of E-12 connector. Does the scan tool indicate ON when the circuit is jumped and OFF when the circuit is not jumped?	—	Go to Step 9	Go to Step 6
6	1. Connect a test lamp between the ignition voltage feed circuit of the neutral switch harness (pin 1 of E-12 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 8	Go to Step 7
7	Repair the open circuit or high resistance on the ignition voltage feed circuit between the ECM (10A) fuse (EB-4) and the neutral switch (pin 1 of E-12 connector). Did you complete the repair?	—	Go to Step 13	—
8	1. Test the neutral switch signal circuit between the engine control module (ECM) (pin 87 of C-57 connector) and the neutral switch (pin 1 of E-11 connector) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
9	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connectors of the neutral switch (pin 1 of E-11 connector and pin 1 of E-12 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the neutral switch circuit at the harness connector of the ECM (pin 87 of C-57 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
11	Replace the neutral switch. Refer to Neutral Switch Replacement in Transmission Section. Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 13	—

Step	Action	Value(s)	Yes	No
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. **Important:** Following conditions must be met two consecutive driving cycles before clear with the scan tool. (One driving cycle: Ignition switch ON > Engine run > Ignition switch OFF for 10 seconds) • The engine speed is higher than 665 RPM • The vehicle speed is lower than 2 km/h (1.2 MPH) • The clutch pedal is released after once depressed • Neutral position 3. Turn ON the ignition, with the engine OFF. 4. Observe the Neutral Switch parameter with the scan tool while shift to neutral and other positions. Does the scan tool indicate ON when the position is neutral and OFF when other than the neutral?	—	Go to Step 14	Go to Step 3
14	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

RESULT	SYMPTOM	TROUBLE CAUSE	CORRECTION
Discharge (High) pressure gauge abnormally high	Reduced or no air flow through the condenser	• Condenser clogged or dirty • Radiator (condenser) fan does not operate properly	• Clean • Check cooling fan operation
	No bubbles in sight glass when condenser is cooled by water (Insufficient cooling)	• Excessive refrigerant in system	• Check sight glass. (See "Reading Sight Glass") • Discharge and recover refrigerant. Recharge to specified amount
	After stopping air conditioning, pressure drops approx. 196 kPa (2.0kg/cm^2 / 28psi) quickly	• Air in system	• Evacuate and charge refrigerant system
Discharge (High) pressure gauge abnormally low	Insufficient cooling and excessive bubbles in the sight glass	• Insufficient refrigerant in system	• Check sight glass. (See "Reading Sight Glass") • Check for leaks • Discharge and recover refrigerant. Recharge to specified amount
	Low pressure gauge indicates vacuum	• Clogged or defective expansion valve	• Replace the expansion valve
	Frost or dew on refrigerant line before and after receiver/ drier or expansion valve, and low pressure gauge indicates vacuum	• Restriction caused by debris or moisture in receiver/drier	• Check system for restriction and replace receiver/drier
	After turning off air conditioning, high and low pressure gauge balanced quickly	• Compressor seal defective • Poor compression due to defective compressor gasket	• Replace or repair compressor
Suction (Low) pressure gauge abnormally high	Low pressure gauge is lowered after condenser is cooled by water	• Excessive refrigerant in system	• Discharge and recover refrigerant Recharge to specified amount
	Low pressure hose temperature around the compressor refrigerant line connector is lower than around evaporator	• Unsatisfactory valve operation due to defective temperature sensor of expansion valve • Expansion valve opens too long	• Replace the expansion valve
	After turning off air conditioning, high and low pressure gauge is balanced quickly	• Compressor gasket is defective	• Replace
	Air conditioning turns off before passenger compartment is sufficiently cool	• Electronic thermostat defective	• Check the electronic thermostat and replace as necessary

* For the charging and discharging operations in the table above, refer to "RECOVERY, RECYCLING, EVACUATION AND CHARGING" in this section.

DTC P1605 (Symptom Code C, D, E) (Flash Code 55)

Circuit Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM). The electronically erasable programmable read only memory (EEPROM) memorize some data for engine control and communication with other control module. If the ECM detects memory area malfunction inside of the ECM, this DTC will set.

Condition for Setting the DTC

- The ECM detects internal seed or key file in EEPROM data is destroyed (Symptom Code C).
- The ECM detects reading or writing from the EEPROM data is failed during initialization (Symptom Code D).
- The ECM detects total sum of EEPROM data is not equal to registered value during initialization (Symptom Code E).

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM uses default EPROM data substitution of faulty EEPROM. (Symptom Code D & E).

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

DTC P1605 (Symptom Code C, D, E) (Flash Code 55)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1610 (Symptom Code A) (Flash Code 56)

Circuit Description

The electronically erasable programmable read only memory (EEPROM) memorize immobilizer security code and secret key for communication with the immobilizer control unit (ICU). If the engine control module (ECM) detects immobilizer functions are not programmed into the ECM, this DTC will set.

Condition for Setting the DTC

- The ECM detects immobilizer security code and secret key is not programmed.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The desired fuel injection quantity is set 0 mg/strk.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- Non programmed ECM may set this DTC.
- ECM with wrong specification may set this DTC.

DTC P1610 (Symptom Code A) (Flash Code 56)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	Program or reprogram immobilizer function into the engine control module (ECM). Refer to Programming Engine Control Module (ECM) in immobilizer section. Did you find and correct the condition?	—	Go to Step 5	Go to Step 4
4	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 5	—
5	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 6
6	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1611 (Symptom Code A) (Flash Code 56)

Circuit Description

The electronically erasable programmable read only memory (EEPROM) memorize immobilizer security code and secret key for communication with the immobilizer control unit (ICU). If the engine control module (ECM) detects wrong security code is programmed into the ECM, this DTC will set.

Condition for Setting the DTC

- The ECM detects wrong immobilizer security code is programmed.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The desired fuel injection quantity is set 0 mg/strk.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- Programming ECM with wrong security code may set this DTC.
- ECM with wrong specification may set this DTC.

DTC P1611 (Symptom Code A) (Flash Code 56)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Select the “Immobilizer” in the system selection menu. 5. Monitor the Diagnostic Trouble Code (DTC) Info Ordered By Priority with the scan tool. Does the immobilizer DTCs fail this ignition which begin with B?	—	Go to Applicable DTC in Immobilizer Section	Go to Step 3
3	Monitor the DTC Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 4	Go to Diagnostic Aids
4	Program or reprogram immobilizer function into the engine control module (ECM). Refer to Programming Engine Control Module (ECM) in immobilizer section. Did you find and correct the condition?	—	Go to Step 6	Go to Step 5
5	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 6	—
6	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 7
7	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1612 (Symptom Code A) (Flash Code 56)

Circuit Description

The engine control module (ECM) communicates with the immobilizer control unit (ICU) to execute immobilizer function. The ECM sends request signal to the ICU. The ECM receives response signal from the ICU. Both communication signals are carried out through the Keyword 2000 serial data link. If the ECM receives wrong response signal from the ICU, this DTC will set.

Condition for Setting the DTC

- The ECM receives wrong immobilizer response signal from the ICU.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The desired fuel injection quantity is set 0 mg/strk.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- Non programmed ECM may set this DTC.
- Electrical or magnetic interference may affect intermittent condition.
- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Keyword 2000 serial data link circuit problem may cause this DTC set. The scan tool will not communicate. Refer to scan tool Does Not Communicate with Keyword 2000 Device in this section.
- ECM with wrong specification may set this DTC.

DTC P1612 (Symptom Code A) (Flash Code 56)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Select the “Immobilizer” in the system selection menu. 5. Monitor the Diagnostic Trouble Code (DTC) Info Ordered By Priority with the scan tool. Does the immobilizer DTCs fail this ignition which begin with B?	—	Go to Applicable DTC in Immobilizer Section	Go to Step 3
3	Monitor the DTC Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 4	Go to Diagnostic Aids
4	Program or reprogram immobilizer function into the engine control module (ECM). Refer to Programming Engine Control Module (ECM) in immobilizer section. Did you find and correct the condition?	—	Go to Step 6	Go to Step 5
5	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 6	—
6	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 7
7	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1613 (Symptom Code A) (Flash Code 56)

Circuit Description

The engine control module (ECM) communicates with the immobilizer control unit (ICU) to execute immobilizer function. The ECM sends request signal to the ICU. The ECM receives response signal from the ICU. Both communication signals are carried out through the Keyword 2000 serial data link. If the ECM does not detect response signal from the ICU, this DTC will set.

Condition for Setting the DTC

- The ECM does not receive the immobilizer response signal from the ICU.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The desired fuel injection quantity is set 0 mg/strk.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- Non programmed ECM may set this DTC.
- Transponder key problem may set this DTC.
- Antenna coil problem may set this DTC.
- Electrical or magnetic interference may affect intermittent condition.
- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Keyword 2000 serial data link circuit problem may cause this DTC set. The scan tool will not communicate. Refer to scan tool Does Not Communicate with Keyword 2000 Device in this section.
- ECM with wrong specification may set this DTC.

DTC P1613 (Symptom Code A) (Flash Code 56)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Select the “Immobilizer” in the system selection menu. 5. Monitor the Diagnostic Trouble Code (DTC) Info Ordered By Priority with the scan tool. Does the immobilizer DTCs fail this ignition which begin with B?	—	Go to Applicable DTC in Immobilizer Section	Go to Step 3
3	Monitor the DTC Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 4	Go to Diagnostic Aids
4	Program or reprogram immobilizer function into the engine control module (ECM). Refer to Programming Engine Control Module (ECM) in immobilizer section. Did you find and correct the condition?	—	Go to Step 6	Go to Step 5
5	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 6	—
6	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 7
7	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1614 (Symptom Code A) (Flash Code 56)

Circuit Description

The engine control module (ECM) communicates with the immobilizer control unit (ICU) to execute immobilizer function. The ECM sends request signal to the ICU. The ECM receives response signal from the ICU. Both communication signals are carried out through the Keyword 2000 serial data link. If ICU receives wrong immobilizer response signal from the transponder key, this DTC will set.

Condition for Setting the DTC

- The ICU receives wrong immobilizer response signal from the transponder key.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The desired fuel injection quantity is set 0 mg/strk.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- Non programmed ICU may set this DTC.
- Transponder key problem may set this DTC.
- ECM with wrong specification may set this DTC.

DTC P1614 (Symptom Code A) (Flash Code 56)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Select the “Immobilizer” in the system selection menu. 5. Monitor the Diagnostic Trouble Code (DTC) Info Ordered By Priority with the scan tool. Does the immobilizer DTCs fail this ignition which begin with B?	—	Go to Applicable DTC in Immobilizer Section	Go to Step 3
3	Monitor the DTC Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 4	Go to Diagnostic Aids
4	Program or reprogram immobilizer function into the immobilizer control unit (ICU). Refer to Programming Immobilizer Control Unit (ICU) in immobilizer section. Did you find and correct the condition?	—	Go to Step 6	Go to Step 5
5	**Important:** Replacement ICU must be programmed. Replace the ICU. Refer to Immobilizer Control Unit (ICU) Replacement in the immobilizer section. Did you complete the replacement?	—	Go to Step 6	—
6	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 7
7	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1625 (Symptom Code A) (Flash Code 76)

Circuit Description

The engine control module (ECM) main relay is energized when the ECM receives an ignition voltage switch ON signal. When the ignition switch is OFF, the ECM main relay is de-energized after a certain length of time passed. If the ECM detects the ECM main relay is turned OFF before ECM commanded OFF, this DTC will set.

Condition for Setting the DTC

- The ECM detects that the ECM main relay is turned OFF before commanded turned OFF.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Faulty ECM main relay may set this DTC.

DTC P1625 (Symptom Code A) (Flash Code 76)
Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. 5. Turn OFF the ignition. 6. Turn ON the ignition, with the engine OFF. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the ECM main relay. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM main relay (pins 1, 2, 4 and 5 of X-12 connector). 4. Disconnect the engine control module (ECM) harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on ECM main relay control and battery voltage feed circuit at the harness connector of the ECM (pins 3 and 58 of C-56 connector). 6. Test for high resistance on each ECM main relay circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 5	Go to Step 4
4	Replace the ECM main relay. Did you complete the replacement?	—	Go to Step 5	—

Step	Action	Value(s)	Yes	No
5	1. Reconnect all previously disconnected relay or harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Observe the DTC Information with the scan tool. 6. Turn OFF the ignition. 7. Turn ON the ignition, with the engine OFF. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 6
6	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1625 (Symptom Code B) (Flash Code 76)

Circuit Description

The engine control module (ECM) main relay is energized when the ECM receives an ignition voltage switch ON signal. When the ignition switch is OFF, the ECM main relay is de-energized after a certain length of time passed. If the ECM detects the ECM main relay has been ON since the ignition switch was turned OFF, this DTC will set.

Condition for Running the DTC

- The ignition switch is OFF.

Condition for Setting the DTC

- The ECM detects that the ECM main relay is turned ON for longer than 2 seconds.

Action Taken When the DTC Sets

- The ECM does not illuminate the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Faulty or sticking ECM main relay may set this DTC.

Test Description

The numbers below refer to the step number on the diagnostic table.

2. If this DTC is present, scan tool can communicate with the ECM when the ignition switch is OFF.

DTC P1625 (Symptom Code B) (Flash Code 76)
Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail with the ignition switch OFF?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Disconnect the ECM main relay. 2. Monitor the DTC Information with the scan tool. Does the DTC fail with the ignition switch OFF?	—	Go to Step 6	Go to Step 4
4	1. Turn OFF the ignition. 2. Disconnect the ECM main relay. 3. Connect a test lamp between the control circuit of the ECM main relay harness (pin 4 of X-12 connector) and battery voltage. 4. Keep the ignition switch OFF. Does the test lamp illuminate?	—	Go to Step 5	Go to Step 7
5	1. Test the control circuit of the ECM main relay between the engine control module (ECM) (pin 58 of C-56 connector) and the ECM main relay (pin 4 of X-12 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 9	Go to Step 8
6	Repair the short to battery on the voltage feed supply circuit to the ECM between the ECM (pin 3 of C-56 connector) and the ECM main relay (pin 1 of X-12 connector). Did you complete the repair?	—	Go to Step 9	—
7	Replace the ECM main relay. Did you complete the replacement?	—	Go to Step 9	—

Step	Action	Value(s)	Yes	No
8	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 9	—
9	1. Reconnect all previously disconnected relay or harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Monitor the DTC Information with the scan tool. Does the DTC with the ignition switch OFF?	—	Go to Step 3	Go to Step 10
10	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

RESULT	SYMPTOM	TROUBLE CAUSE	CORRECTION
Suction (Low) pressure abnormally low	Condenser is not hot and excessive bubble in sight glass	• Insufficient refrigerant	• Check sight glass.(See "Reading Sight Glass") • Check for leaks • Discharge and recover refrigerant. Recharge to specified amount
	Frost on the expansion valve inlet line	• Expansion valve clogged	• Replace the expansion valve
	A distinct difference in temperature between the inlet and outlet refrigerant lines of the receiver/drier	• Receiver/drier clogged	• Replace the receiver/ drier
	Expansion valve outlet refrigerant line is not cold and low-pressure gauge indicates vacuum	• The temperature sensor of the expansion valve is defective, and the valve cannot regulate the correct flow of the refrigerant	• Replace the expansion valve
	Discharge temperature is low and air flow from vents is restricted	• Frozen evaporator core fins	• Check electronic thermostat and replace as necessary
	Low-pressure gauge reading is low, or a vacuum reading may be shown	• Clogged or blocked refrigerant line	• Replace refrigerant line
Suction (Low) and Discharge (High) pressure abnor-mally high	No bubbles in sight glass after condenser is cooled by water (Insufficient cooling)	• Excessive refrigerant in system	• Check sight glass.(See "Reading Sight Glass") • Discharge and recover refrigerant. Recharge to specified amount
	Reduce air flow through con-denser	• Condenser clogged • Radiator (condenser) fan does not rotate properly	• Clean • Check cooling fan operation
	Suction (Low) pressure hose is not cold	• Air in system	• Evacuate and charge refrigerant
Suction (Low) and Discharge (High) pres-sure abnor-mally low	Insufficient cooling and excessive bubbles in the sight glass	• Insufficient refrigerant in system	• Check sight glass. (See "Reading Sight Glass") • Check for leaks • Discharge and recover refrigerant. Recharge to specified amount

DTC P1630 (Symptom Code A, B) (Flash Code 51)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.

The fuel injection solenoid valve is installed to the fuel injection pump rear side. The fuel injection event is determined by this solenoid ON/OFF command. The fuel injection solenoid valve cuts the fuel when the engine shutoff (ESO) solenoid valve is commanded shutoff from the PCU. (The fuel injection solenoid valve and engine shutoff (ESO) solenoid valve is same part. It calls ESO solenoid valve when fuel is shutoff.) When the ignition switch is turned OFF or commanded from fail-safe action, the ESO solenoid valve is commanded shutoff to stop the engine running. If the ECM detects that the fuel injection solenoid valve control current problem, this DTC will set.

Condition for Setting the DTC

- The ECM detects that the PCU monitored fuel injection solenoid valve control current is too high. (Symptom Code A)
- The ECM detects that the PCU continuously flow the control current to the fuel injection solenoid valve. (Symptom Code B)

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM limits fuel injection quantity. (Symptom Code A)
- The ECM cuts fuel injection. (Symptom Code B)

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Fuel injection solenoid valve is internal to the fuel injection pump assembly.
- PCU is part of the fuel injection pump assembly.

DTC P1630 (Symptom Code A, B) (Flash Code 51)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1650 (Symptom Code A) (Flash Code 44)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.
The ECM monitors CAN operational status by expecting a constant flow of messages from the PCU. If the ECM detects that the PCU receives from the CAN controller rest or Bus Offline, this DTC will set.

Condition for Setting the DTC

- The ECM detects that the PCU receives from the CAN controller reset or Bus Offline.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts the fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1650 (Symptom Code A) (Flash Code 44)
Schematic Reference: Engine Controls Schematics
Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Is DTC P1651 (Symptom Code A or B) set?	—	Go to Applicable DTC	Go to Step 3
3	Monitor the DTC Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 4	Go to Diagnostic Aids
4	1. Turn OFF the ignition. 2. Disconnect the fuel injection pump control unit (PCU) harness connector. 3. Connect a DMM across the controller area network (CAN) harness (pins 1 and 2 of E-6 connector). 4. Measure the resistance across the CAN terminals. Is the resistance within the specified value?	110-130 Ω	Go to Step 5	Go to Step 10
5	1. Connect a DMM between the CAN Low signal circuit (pin 1 of E-6 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Is the DMM voltage within the specified value?	1.5 – 2.5 volts	Go to Step 6	Go to Step 11
6	1. Keep the ignition switch ON, with the engine OFF. 2. Connect a DMM between the CAN High signal circuit (pin 2 of E-6 connector) and a known good ground. Is the DMM voltage within the specified value?	3.0 – 4.0 volts	Go to Step 7	Go to Step 12

Step	Action	Value(s)	Yes	No
7	1. Turn OFF the ignition. 2. Reconnect the PCU harness connector. 3. Disconnect the engine control module (ECM) C-57 harness connector. Keep the ECM C-56 harness connector with connected. 4. Connect a DMM across the CAN harness (pins 99 and 100 of C-57 connector). 5. Measure the resistance across the CAN terminals. Is the resistance within the specified value?	110-130 Ω	Go to Step 8	Go to Step 14
8	1. Connect a DMM between the CAN Low signal circuit of the ECM harness (pin 99 of C-57 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Is the DMM voltage within the specified value?	1.5 – 2.5 volts	Go to Step 9	Go to Step 16
9	1. Keep the ignition switch ON, with the engine OFF. 2. Connect a DMM between the CAN High signal circuit of the ECM harness (pin 100 of C-57 connector) and a known good ground. Is the DMM voltage within the specified value?	3.0 – 4.0 volts	Go to Step 13	Go to Step 16
10	1. Test the CAN Low and High circuit between the ECM (pins 99 and 100 of C-57 connector) and the PCU (pins 1 and 2 of E-6 connector) for the following conditions: • An open circuit • A short each other • High resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 15
11	1. Test the CAN Low circuit between the ECM (pin 99 of C-57 connector) and the PCU (pin 1 of E-9 connector) for the following conditions: • A short to ground • A short to battery or ignition voltage 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17
12	1. Test the CAN Low circuit between the ECM (pin 100 of C-57 connector) and the PCU (pin 2 of E-9 connector) for the following conditions: • A short to ground • A short to battery or ignition voltage 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Monitor the DTC Information with the scan tool. Is DTC P0251 (Symptom Code E) set?	—	Go to Step 16	Go to Diagnostic Aids

Step	Action	Value(s)	Yes	No
14	1. Turn OFF the ignition. 2. Disconnect the PCU harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the PCU (pins 1 and 2 of E-6 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 16
15	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the CAN Low or High circuits at the harness connector of the ECM (pins 99 and 100 of C-57 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17
16	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. (PCU is part of the fuel injection pump assembly) Did you complete the replacement?	—	Go to Step 18	—
17	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 18	—
18	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 2	Go to Step 19
19	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1650 (Symptom Code B) (Flash Code 44)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.
The ECM monitors CAN operational status by expecting a constant flow of messages from the PCU. If the ECM detects internal CAN controller does not react, this DTC will set.

Condition for Setting the DTC

- The ECM detects internal CAN controller does not react.

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM cuts the fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Notice:

- CAN controller is internal to the ECM.

DTC P1650 (Symptom Code B) (Flash Code 44)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1651 (Symptom Code A, B) (Flash Code 45)

Circuit Description

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensors. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.

The ECM monitors CAN operational status by expecting a constant flow of messages from the PCU. If the ECM fails to receive an expected message from the PCU, this will set depending on what communication is lost.

Condition for Setting the DTC

- The ECM detects that the PCU does not receive the CAN messages from the ECM. (Symptom Code A)
- The ECM does not receive the CAN messages from the PCU. (Symptom Code B)

Action Taken When the DTC Sets

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.

The ECM cuts the fuel injection.

Condition for Clearing the MIL/DTC

- The ECM turns OFF the MIL when the diagnostic runs and does not fail.
- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	1. Turn OFF the ignition. 2. Disconnect the fuel injection pump control unit (PCU) harness connector. 3. Connect a DMM across the controller area network (CAN) harness (pins 1 and 2 of E-6 connector). 4. Measure the resistance across the CAN terminals. Is the resistance within the specified value?	110-130 Ω	Go to Step 4	Go to Step 9
4	1. Connect a DMM between the CAN Low signal circuit (pin 1 of E-6 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Is the DMM voltage within the specified value?	1.5 – 2.5 volts	Go to Step 5	Go to Step 10
5	1. Keep the ignition switch ON, with the engine OFF. 2. Connect a DMM between the CAN High signal circuit (pin 2 of E-6 connector) and a known good ground. Is the DMM voltage within the specified value?	3.0 – 4.0 volts	Go to Step 6	Go to Step 11

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition. 2. Reconnect the PCU harness connector. 3. Disconnect the engine control module (ECM) C-57 harness connector. Keep the ECM C-56 harness connector with connected. 4. Connect a DMM across the CAN harness pins 99 and 100 of C-57 connector). 5. Measure the resistance across the CAN terminals. Is the resistance within the specified value?	110-130 Ω	Go to Step 7	Go to Step 13
7	1. Connect a DMM between the CAN Low signal circuit of the ECM harness (pin 99 of C-57 connector) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Is the DMM voltage within the specified value?	1.5 – 2.5 volts	Go to Step 8	Go to Step 15
8	1. Keep the ignition switch ON, with the engine OFF. 2. Connect a DMM between the CAN High signal circuit of the ECM harness (pin 100 of C-57 connector) and a known good ground. Is the DMM voltage within the specified value?	3.0 – 4.0 volts	Go to Step 12	Go to Step 15
9	1. Test the CAN Low and High circuit between the ECM (pins 99 and 100 of C-57 connector) and the PCU (pins 1 and 2 of E-6 connector) for the following conditions: • An open circuit • A short each other • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 14
10	1. Test the CAN Low circuit between the ECM (pin 99 of C-57 connector) and the PCU (pin 1 of E-9 connector) for the following conditions: • A short to ground • A short to battery or ignition voltage 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 16
11	1. Test the CAN Low circuit between the ECM (pin 100 of C-57 connector) and the PCU (pin 2 of E-9 connector) for the following conditions: • A short to ground • A short to battery or ignition voltage 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 16
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Monitor the DTC Information with the scan tool. Is DTC P0251 (Symptom Code E) set?	—	Go to Step 15	Go to Diagnostic Aids

Step	Action	Value(s)	Yes	No
13	1. Turn OFF the ignition. 2. Disconnect the PCU harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the PCU (pins 1 and 2 of E-6 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 15
14	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the CAN Low or High circuits at the harness connector of the ECM (pins 99 and 100 of C-57 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 16
15	**Important:** The fuel injection pump must be timed to the engine. Replace the fuel injection pump. Refer to Fuel Injection Pump Replacement in engine mechanical section. (PCU is part of the fuel injection pump assembly) Did you complete the replacement?	—	Go to Step 17	—
16	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 17	—
17	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 18
18	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1690 (Symptom Code 4) (Flash Code 77)

Circuit Description

The malfunction indicator lamp (MIL) is located on the instrument panel cluster (IPC). The battery voltage is supplied to the MIL. The engine control module (ECM) turns the MIL ON by grounding the MIL control circuit. After a fixed time passes, the ECM turns OFF the MIL with the ignition ON and the engine OFF. The MIL has the following functions:

- The MIL informs the driver that a malfunction has occurred and the vehicle should be taken in for service as soon as possible.
- The MIL illuminates during a bulb test and a system test.
- A DTC will be stored if a MIL is requested by the ECM.

If the ECM detects an open circuit or short circuit on the MIL control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects a low voltage condition on the MIL control circuit for longer than 3 seconds when the MIL is commanded OFF.

Action Taken When the DTC Sets

- The ECM does not illuminates the MIL when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1690 (Symptom Code 4) (Flash Code 77)

Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Perform the Malfunction Indicator Lamp (MIL) test with the scan tool. 4. Command the MIL ON with the scan tool. Does the MIL turn ON when commanded ON with the scan tool?	—	Go to Step 3	Go to Step 4
3	Command the MIL OFF with the scan tool. Does the MIL OFF?	—	Go to Step 17	Go to Step 10
4	1. Turn OFF the ignition. 2. Inspect the Meter (15A) fuse (C-14) in the cabin fuse block. Is the Meter (15A) fuse (C-14) open?	—	Go to Step 5	Go to Step 6
5	Replace the Meter (15A) fuse (C-14). If the fuse continues to open, repair the short to ground on one of the circuits that fed by the Meter (15A) fuse (C-14) or replace the shorted attached component fed by the Meter (15A) fuse (C-14). Did you complete the repair?	—	Go to Step 19	—
6	1. Turn OFF the ignition. 2. Disconnect the engine control module (ECM) harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Connect a 3-amp fused jumper wire between the MIL control circuit of the ECM harness connector (pin 42 of C-56 connector) and a known good ground. Does the MIL illuminate?	—	Go to Step 11	Go to Step 7

Step	Action	Value(s)	Yes	No
7	1. Turn OFF the ignition. 2. Remove the instrument panel cluster (IPC). 3. Remove the MIL bulb from the IPC (meter assembly). Is the MIL bulb burned out?	—	Go to Step 15	Go to Step 8
8	1. Disconnect the IPC harness B-23 connector. 2. Connect a test lamp between the voltage feed circuit of the MIL (pin 30 of B-23 connector) and a known good ground. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 12
9	1. Turn OFF the ignition. 2. Reconnect the ECM harness connector. 3. Connect a test lamp between the voltage feed circuit and control circuit of the MIL (pins 17 and 30 of B-23 connector). 4. Turn ON the ignition, with the engine OFF. 5. Perform the MIL test with the scan tool. 6. Command the MIL ON with the scan tool. Does the test lamp turn ON when commanded ON with the scan tool?	—	Go to Step 14	Go to Step 13
10	1. Test the control circuit of the MIL between the ECM (pin 42 of C-56 connector) and the IPC (pin 17 of B-23 connector) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
11	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection on the MIL control circuit at the harness connector of the ECM (pin 42 of C-56 connector). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
12	Repair the open circuit or high resistance on the voltage feed circuit of the MIL between the IPC (pin 8 of B-24 connector) and Meter (15A) fuse (C-14). Did you complete the repair?	—	Go to Step 19	—
13	Repair the open circuit or high resistance on the control circuit of the MIL between the ECM (pin 42 of C-56 connector) and the IPC (pin 17 of B-24 connector). Did you complete the repair?	—	Go to Step 19	—
14	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections on the MIL circuits at the IPC (pins 17 and 8 of B-24 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 16
15	Replace the MIL bulb. Did you complete the replacement?	—	Go to Step 19	—
16	Repair or replace the IPC (meter assembly). Did you complete the repair or replacement?	—	Go to Step 19	—

MAGNETIC CLUTCH

When the A/C switch and the fan control knob (fan switch) are turned on with the engine running, current flows through the thermostat and the compressor relay to activate the magnetic clutch.
The air conditioning can be stopped by turning off the A/C switch or the fan control knob (fan switch).
However, even when the air conditioning is in operation, the electronic thermostat, the pressure switch or the ECM is used to stop the air conditioning temporarily by turning off the magnetic clutch in the prearranged conditions to reduce the engine load which is being caused by the rise in the engine coolant temperature, and the acceleration of the vehicle, etc.

Step	Action	Value(s)	Yes	No
17	1. Turn OFF the ignition for 30 seconds. 2. Turn ON the ignition for 10 seconds, with the engine OFF. 3. Monitor the Diagnostic Trouble Code (DTC) Information with the scan tool. Does the DTC fail this ignition?	—	Go to Step 18	Go to Diagnostic Aids
18	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 19	—
19	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 20
20	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

DTC P1690 (Symptom Code 8) (Flash Code 77)

Circuit Description

The malfunction indicator lamp (MIL) is located on the instrument panel cluster (IPC). The battery voltage is supplied to the MIL. The engine control module (ECM) turns the MIL ON by grounding the MIL control circuit. After a fixed time passes, the ECM turns OFF the MIL with the ignition ON and the engine OFF. The MIL has the following functions:

- The MIL informs the driver that a malfunction has occurred and the vehicle should be taken in for service as soon as possible.
- The MIL illuminates during a bulb test and a system test.
- A DTC will be stored if a MIL is requested by the ECM.

If the ECM detects a short to battery or ignition voltage on the MIL control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects a high voltage condition on the MIL control circuit for longer than 1 second when the MIL is commanded ON.

Action Taken When the DTC Sets

- The ECM does not illuminates the MIL when the diagnostic runs and fails.

Condition for Clearing the DTC

- A history DTC clears after 40 consecutive driving cycles without a fault. Or clear with the scan tool.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the diagnostic table.

3. If the control circuit of the MIL between the ECM and the IPC is normal, the control circuit voltage low DTC P1690 (Symptom Code 4) will set.
4. If the control circuit of the MIL between the ECM and the IPC is normal, the control circuit voltage low DTC P1690 (Symptom Code 4) will set.

7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with the scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Monitor the DTC Information with the scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 8
8	Observe the DTC Information with the scan tool. Are there any DTCs that you have not diagnosed?	—	Go to Diagnostic Trouble Code (DTC) List	System OK

Glow Control System Check

Description

The glow control system consists of the engine control module (ECM), the glow relay and glow plugs. The glow control system is operated when the engine coolant temperature is low, which allows easier engine starting. The ECM commands the glow relay ON for a certain length of time at ignition switch is ON with engine OFF. In after glow phase, the glow plugs remain energized for a certain period with engine run.

Glow Control Operation

- The pre glow control system operates when the engine coolant temperature is less than 30°C (86°F).
- The after glow control system operates when the engine coolant temperature is less than 60°C (140°F).

1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check-Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information of the engine control system with the scan tool and check whether following DTC(s) is set: • P0115 (Symptom Code 1 & 2) • P0380 (Symptom Code 4 & 8) • P0381 (Symptom Code 4 & 8) Are any of the above DTC(s) set?	—	Refer to Applicable DTC	Go to Step 3
3	1. Turn OFF the ignition. 2. Make sure the metal bus bar that connects switched battery voltage supply terminal (E-49) and all glow plugs is secured tightly. 3. Turn ON the ignition, with the engine OFF 4. Connect a test lamp between the metal bus bar (glow plug power supply E-49 terminal) and a known good ground. 5. Perform the Glow Relay test with the scan tool. 6. Command the Glow Relay ON with the scan tool while observing the test lamp. Does the test lamp turn ON only when commanded ON with the scan tool?	—	Go to Step 4	Go to Step 5
4	1. Turn OFF the ignition. 2. Remove the metal bus bar from the glow plugs. 3. Measure resistance of each glow plug between the glow plug terminals and a known good ground. Make sure to record all measurements and take them quickly as to not allow engine temperature changes between measurements. Are the resistances within the specified value each other?	1 Ω	System OK	Go to Step 15

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Replace the glow relay with the starter relay or replace with a known good relay. 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the metal bus bar (glow plug power supply E-49 connector) and a known good ground. 5. Perform the Glow Relay test with the scan tool. 6. Command the Glow Relay ON with the scan tool while observing the test lamp. Does the test lamp turn ON only when commanded ON with the scan tool?	—	Go to Step 9	Go to Step 6
6	Inspect the Glow (60A) slow blow fuse (SBF-8) in the engine room fuse block. Is the Glow (60A) slow blow fuse (SBF-8) open?	—	Go to Step 10	Go to Step 7
7	1. Turn OFF the ignition. 2. Remove the glow relay in the engine room relay block. 3. Connect a test lamp between the voltage feed circuit of the glow relay terminal (pin 4 of X-5 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 8	Go to Step 11
8	1. Turn ON the ignition, with the engine OFF. 2. Connect a test lamp between the power supply circuit of glow plugs (pin 1 of X-5 connector) and a known good ground. Does the test lamp illuminate?	—	Go to Step 13	Go to Step 12
9	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the glow relay terminals (pins 1 and 4 of X-5 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 14
10	1. Replace the Glow (60A) slow blow fuse (SBF-8). If the slow blow fuse continues to open, repair the short to ground on a circuit fed by the slow blow fuse or check for a shorted attached component. 2. Repair the short to ground or replace the component as necessary. Did you complete the repair?	—	Go to Step 16	—
11	Repair the open circuit in the battery voltage supply circuit between the Glow (60A) slow blow fuse (SBF-8) and the glow relay (pin 1 of X-5 connector). Did you complete the repair?	—	Go to Step 16	—
12	Repair the open circuit in the switched battery voltage supply circuit between the glow relay (pin 1 of X-5 connector) and the glow plugs (E-49 terminal). Did you complete the repair?	—	Go to Step 16	—

Step	Action	Value(s)	Yes	No
13	**Important:** The glow plugs may be burnt out if the battery voltage supply circuit is shorted to a voltage source. Repair the short to battery or ignition voltage on the switched battery voltage supply circuit between the glow relay (pin 1 of X-5 connector) and the glow plugs (E-49 terminal). Did you complete the repair?	—	Go to Step 16	—
14	Replace the glow relay. Did you complete the replacement?	—	Go to Step 16	—
15	Replace the appropriate glow plug. Did you complete the replacement?	—	Go to Step 16	—
16	1. Reconnect all previously disconnected components, relay, fuse or harness connector(s). 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the metal bus bar (glow plug power supply E-49 connector) and a known good ground. 5. Perform the Glow Relay test with the scan tool. 6. Command the Glow Relay ON with the scan tool while observing the test lamp. Does the test lamp turn ON only when commanded ON with the scan tool?	—	Go to Step 4	Go to Step 2

DTC A/C Compressor System Check

Description

When air conditioning (A/C) and blower fan are selected, and if the system has a sufficient refrigerant charge. A 12-volt signal is supplied to the A/C request input of the Engine Control Module (ECM). The A/C request signal may be temporarily canceled during system operation by the electronic thermostat in the evaporator to prevent the evaporator icing. Also, it is cancelled when the pressure switch detected abnormal pressure in the line. When the A/C request signal is received by the ECM, the ECM supplies a ground from the A/C compressor relay if the engine operating conditions are within acceptable ranges. With the A/C compressor relay energized, voltage is supplied to the compressor clutch coil. The ECM will enable the compressor clutch to engage whenever A/C has been selected with the engine running and enable conditions are met.

Condition for Running the A/C Compressor:

- The engine is running.
- The A/C switch is ON.
- The engine coolant temperature (ECT) is less than 105°C(221°F).

A/C Compressor System Check

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or Engine Control Module (ECM) Connector End Views

Chart 1 of 2

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check-Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check – Engine Controls
2	1. Install the scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the Diagnostic Trouble Code (DTC) Information of the engine control system with the scan tool and check whether following DTC(s) is set: • P0115 (Symptom Code 1 & 2) • P0645 (Symptom Code 4 & 8) Are any of the above DTC(s) set?	—	Refer to Applicable DTC	Go to Step 3
3	1. Turn ON the ignition, with the engine OFF. 2. Turn ON the blower motor switch. Does the blower motor turn ON and operate correctly?	—	Go to Step 4	Refer to Applicable Diagnostic Chart in Heating & Air Conditioning Section
4	1. Turn OFF the blower motor switch. 2. Keep the A/C switch OFF. Does the A/C Request Signal parameter indicate OFF?	—	Go to Step 5	Go to Chart 2 of 2 with heater Step 1 OR Go to Chart 2 of 2 without heater Step 1
5	1. Start the engine and let the engine idle. 2. Keep the blower motor switch OFF. 3. Keep the A/C switch OFF. Does the A/C compressor clutch keep OFF (disengage)?	—	Go to Step 6	Go to Step 11
6	1. Turn ON the blower motor switch. 2. Keep the A/C switch OFF. Does the A/C compressor clutch keep OFF (disengage)?	—	Go to Step 7	Go to Chart 2 of 2 with heater Step 7 OR Go to Chart 2 of 2 without heater Step 4

Step	Action	Value(s)	Yes	No
7	1. Turn OFF the blower motor switch. 2. Turn ON the A/C switch. Does the A/C compressor clutch keep OFF (disengage)?	—	Go to Step 8	Go to Chart 2 of 2 with heater Step 8 OR Go to Chart 2 of 2 without heater Step 10
8	1. Turn ON the blower motor switch. 2. Keep the A/C switch ON. Does the A/C compressor clutch ON and OFF (engage and disengage) periodically within the Condition for Running the A/C Compressor?	—	Go to Step 9	Go to Step 10
9	Does the air flow cool enough.	—	System OK	Refer to Applicable Diagnostic Chart in Heating & Air Conditioning Section
10	Does the A/C Relay Command parameter indicate ON at previous step?	—	Go to Step 14	Go to Chart 2 of 2 with heater Step 9 OR Go to Chart 2 of 2 without heater Step 11
11	1. Turn OFF the ignition. 2. Disconnect the A/C compressor clutch harness connector (E-3). 3. Start the engine. Does the A/C compressor clutch ON (engage)?	—	Go to Step 22	Go to Step 12
12	1. Turn OFF the ignition. 2. Remove the A/C compressor relay from the engine room relay block. 3. Connect a test lamp between the A/C compressor clutch voltage supply circuit (pin 2 of X-14 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 13	Go to Step 21
13	Repair the short to battery or ignition voltage on the A/C compressor voltage feed circuit between the A/C compressor relay (pin 2 of X-14 connector) and the A/C compressor (E-3). Did you complete the repair?	—	Go to Step 23	—
14	1. Turn OFF the ignition. 2. Remove the A/C compressor relay from the engine room fuel block. 3. Connect a test lamp between the voltage feed circuit of the relay switch side terminal (pin 1 of X-14 connector) and known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 15	Go to Step 17
15	1. Keep the ignition ON, with the engine OFF. 2. Disconnect the test lamp. 3. Connect a 3-amp fused jumper wire between both switch side terminals of the A/C compressor relay (pins 1 and 2 of X-14 connector). Does the A/C compressor clutch click (engage)?	—	Go to Step 19	Go to Step 16

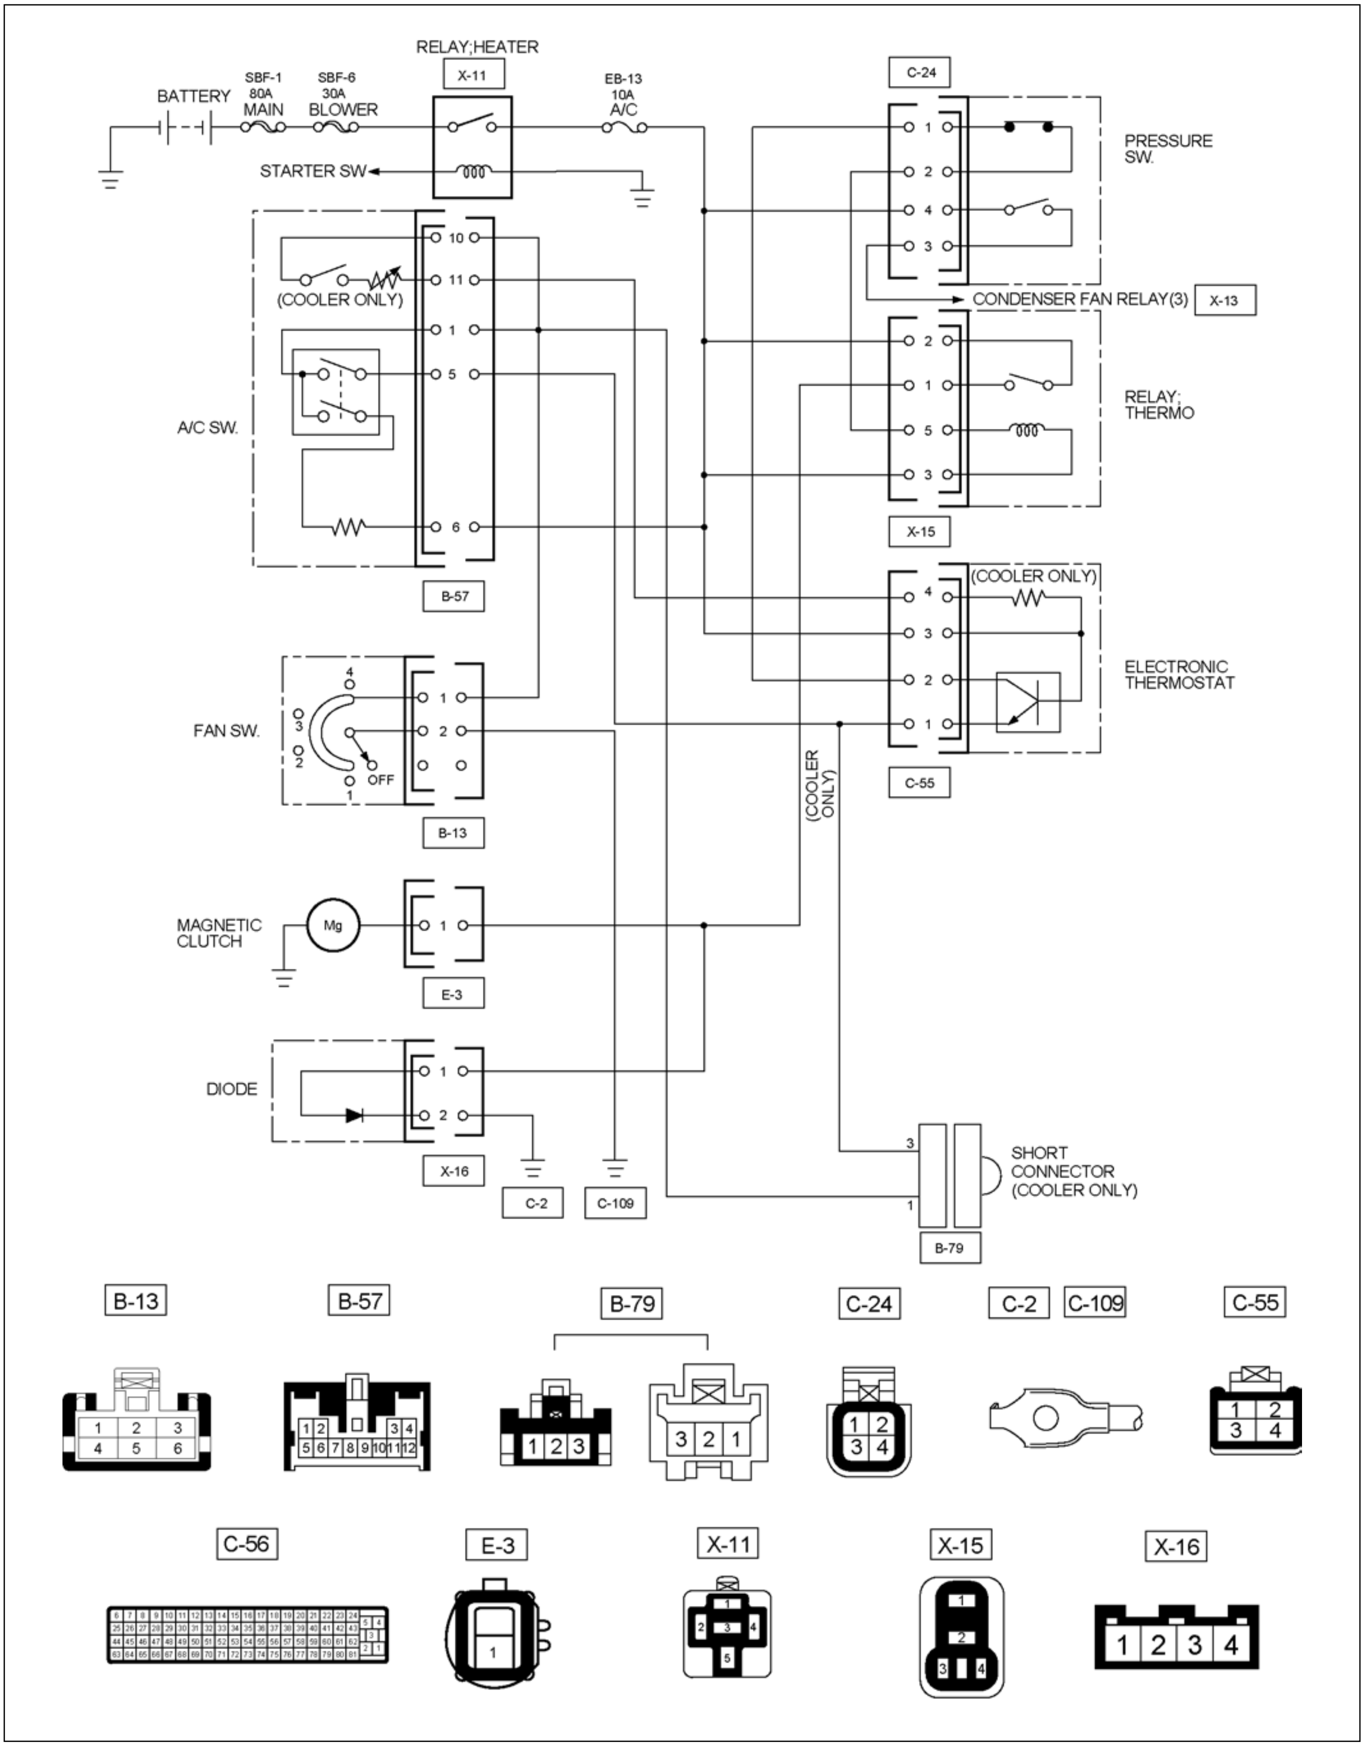
Step	Action	Value(s)	Yes	No
16	1. Keep the ignition ON, with the engine OFF. 2. Keep 3-amp fused jumper wire with connected. 3. Disconnect A/C compressor clutch harness connector. 4. Connect a test lamp between A/C compressor voltage feed circuit (E-3) and a known good ground. Does the test lamp illuminate?	—	Go to Step 20	Go to Step 18
17	Repair the open circuit or high resistance on the relay switch side voltage feed circuit between the A/C compressor relay (pin 1 of X-14 connector) and the A/C (10A) fuse (EB-13). Did you complete the repair?	—	Go to Step 23	—
18	Repair the open circuit or high resistance on the relay switched voltage supply circuit between the A/C compressor relay (pin 2 of X-14 connector) and the A/C compressor clutch (pin 1 of E-3 connector). Did you complete the repair?	—	Go to Step 23	—
19	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the A/C compressor relay terminals (pins 3 and 5 of X-14 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 23	Go to Step 21
20	1. Turn OFF the ignition. 2. Inspect for an intermittent and for a poor connection at the harness connector of the A/C compressor clutch (E-3). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 23	Go to Step 22
21	Replace the A/C compressor relay. Did you complete the replacement?	—	Go to Step 23	—
22	Replace the A/C compressor. Refer to Heating and Air Conditioning section. Did you complete the replacement?	—	Go to Step 23	—
23	1. Reconnect all previously disconnected fuse, relay or harness connector(s). 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Turn ON the blower motor switch. Does the blower motor turn ON and operate correctly?	—	Go to Step 4	Refer to Applicable Diagnostic Chart in Heating & Air Conditioning Section

Chart 2 of 2 with heater

Step	Action	Value(s)	Yes	No
1	1. Turn OFF the ignition. 2. Replace the thermo relay with the horn relay or replace with a known good relay. 3. Turn OFF the blower motor switch. 4. Turn OFF the A/C switch. 5. Turn ON the ignition, with the engine OFF. Does the A/C Request Signal parameter indicate OFF?	—	Go to Step 33	Go to Step 2

Step	Action	Value(s)	Yes	No
2	1. Turn OFF the ignition. 2. Remove the thermo relay from the engine room relay block. 3. Turn ON the ignition, with the engine OFF. Does the A/C Request Signal parameter indicate OFF?	—	Go to Step 3	Go to Step 4
3	1. Turn OFF the ignition. 2. Reinstall the thermo relay. 3. Remove the radiator grille in order to access the pressure switch. 4. Disconnect the pressure switch harness connector (C-24). 5. Turn OFF the blower motor switch. 6. Turn OFF the A/C switch. 7. Turn ON the ignition, with the engine OFF. Does the A/C Request Signal parameter indicate OFF?	—	Go to Step 6	Go to Step 5
4	Repair the short to battery or ignition voltage on the thermo relay signal input circuit between the thermo relay (pin 1 of X-15 connector) and the engine control module (ECM) (pin 33 of C-56 connector). Did you complete the repair?	—	Go to Step 39	—
5	Repair the short to ground between the thermo relay (pin 5 of X-15 connector) and pressure switch (pin 1 of C-24 connector). Did you complete the repair?	—	Go to Step 39	—
6	Repair the short to ground between the pressure switch (pin 2 of C-24 connector) and the electronic thermostat (pin 2 of C-55 connector), then electronic thermostat (pin 1 of C-56 connector) and the A/C switch (pin 5 of B-57 connector). Did you complete the repair?	—	Go to Step 39	—
7	1. Test the A/C switch circuits shorted each other. (pins 1 and 5 of B-57 connector). 2. Repair the circuits as necessary. Did you find and correct the condition?	—	Go to Step 39	Go to Step 36
8	1. Test the circuit between the blower motor switch (pin 1 of B-13 connector) and the A/C switch (pin 1 of B-57 connector) for a short to ground. 2. Repair the circuits as necessary. Did you find and correct the condition?	—	Go to Step 39	Go to Step 37
9	Inspect the A/C (10A) fuse (EB-13) in the engine room fuse block. Is the A/C (10A) fuse (EB-13) open?	—	Go to Step 10	Go to Step 11
10	1. Replace the A/C (10A) fuse (EB-13). If the fuse continues to open, repair the short to ground on a circuit fed by the fuse or check for a shorted attached component. 2. Repair the short to ground or replace the component as necessary. Did you complete the repair?	—	Go to Step 39	—

4JA1 – T



RTW710XF000201

Step	Action	Value(s)	Yes	No
11	1. Turn OFF the ignition. 2. Remove the thermo relay from the engine room relay block. 3. Connect a test lamp between the voltage feed circuit (pins 1 and 3 of X-15 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate on both circuits?	—	Go to Step 12	Go to Step 20
12	1. Turn OFF the ignition. 2. Reinstall the thermo relay. 3. Remove the radiator grille in order to access the pressure switch. 4. Disconnect the pressure switch harness connector (C-24). 5. Connect a 3-amp fused jumper wire between the pressure switch harness (pin 1 of C-24 connector) and a known good ground. 6. Turn ON the ignition, with the engine OFF. Does the thermo relay click (engage)?	—	Go to Step 13	Go to Step 15
13	Does the A/C Request Signal Request parameter indicate ON?	—	Go to Step 16	Go to Step 14
14	1. Turn OFF the ignition. 2. Keep the 3-amp fused wire with connected. 3. Disconnect the ECM C-56 harness connector. 4. Connect a test lamp between the thermo relay input circuit (pin 33 of C-56 connector) and a known good ground. 5. Turn ON the ignition, with the engine OFF. DO NOT START the engine. Does the test lamp illuminate?	—	Go to Step 32	Go to Step 21
15	1. Turn OFF the ignition. 2. Keep the 3-amp fused wire with connected. 3. Replace the thermo relay with the horn relay or replace with a known good relay. 4. Connect a 3-amp fused jumper wire between the pressure switch harness (pin 1 of C-24 connector) and a known good ground. 5. Turn ON the ignition, with the engine OFF. Does the thermo relay click (engage)?	—	Go to Step 27	Go to Step 22
16	1. Turn OFF the ignition. 2. Connect the pressure switch harness connector. 3. Remove the grove box in order to access electronic thermostat. 4. Disconnect the electronic thermostat harness connector (C-55). 5. Connect a 3-amp fused jumper wire between the electronic thermostat voltage feed circuit (pin 2 of C-55 connector) and a known good ground. 6. Turn ON the ignition, with the engine OFF. Does the thermo relay click (engage)?	—	Go to Step 17	Go to Step 23
17	1. Turn OFF the ignition. 2. Connect a test lamp between the electronic thermostat terminal (pin 1 of C-55 connector) and battery voltage. 3. Turn ON the blower motor switch. 4. Turn ON the A/C switch. Does the test lamp illuminate?	—	Go to Step 18	Go to Step 19

Step	Action	Value(s)	Yes	No
18	1. Turn OFF the ignition. 2. Connect a test lamp between the electronic thermostat voltage feed circuit (pin 3 of C-55 connector) and a known good ground. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 29	Go to Step 25
19	1. Turn OFF the ignition. 2. Remove the center cluster bezel in order to remove HVAC control lever. 3. Disconnect the A/C switch harness connector (B-57). 4. Connect a test lamp between the A/C switch ground harness (pin 1 of B-57 connector) and battery voltage. 5. Turn ON the blower motor switch. Does the test lamp illuminate?	—	Go to Step 24	Go to Step 26
20	Repair the open circuit or high resistance on the thermo relay voltage feed circuits between the thermo relay (pin 2 of X-15 connector) and ECM (10A) fuse (EB-4), then thermo relay (pin 3 of X-15 connector) and A/C (10A) fuse (EB-13). Did you complete the repair?	—	Go to Step 39	—
21	Repair the open circuit or high resistance on thermo relay input circuit between the ECM (pin 33 of C-56 connector) and the thermo relay (pin 1 of X-15 connector). Did you complete the repair?	—	Go to Step 39	—
22	Repair the open circuit or high resistance on the pressure switch voltage feed circuit between the thermo relay (pin 4 of X-15 connector) and pressure switch (pin 1 of C-24) connector. Did you complete the repair?	—	Go to Step 39	—
23	1. Test the voltage feed circuit between the pressure switch (pin 2 of C-24 harness connector) and electronic thermostat (pin 2 of C-55 connector) for an open or high resistance. 2. Repair the circuit as necessary. Did you find and correct the condition?	—	Go to Step 39	Go to Step 28
24	1. Test the electronic thermostat switching circuit between the electronic thermostat (pin 1 of C-55 connector) and the A/C switch (pin 5 of B-57 connector) for an open or high resistance. 2. Repair the circuit as necessary. Did you find and correct the condition?	—	Go to Step 39	Go to Step 30
25	Repair the open or high resistance on the voltage feed circuit on the electronic thermostat between the A/C (10A) fuse (EB-13) and the electronic thermostat (pin 3 of C-55 connector). Did you complete the repair?	—	Go to Step 39	—
26	1. Test the A/C switch ground circuit between the A/C switch (pin 1 of B-57 connector) and blower motor switch (pin 1 of B-13 connector) for an open or high resistance. 2. Repair the circuit as necessary. Did you find and correct the condition?	—	Go to Step 39	Go to Step 31

Step	Action	Value(s)	Yes	No
27	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the thermo relay terminals (pins 1, 2, 3 and 4 of X-15 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 39	Go to Step 33
28	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the pressure switch (pins 1 and 2 of C-24 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 39	Go to Step 34
29	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the electronic thermostat (pins 1, 2 and 3 of C-55 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 39	Go to Step 35
30	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the A/C switch (pins 1 and 5 of B-57 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 39	Go to Step 36
31	1. Turn OFF the ignition. 2. Inspect for an intermittent and for a poor connection at the harness connector of the blower motor switch (pin 1 of B-13 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 39	Go to Step 37
32	1. Turn OFF the ignition. 2. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 33 of C-56 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 39	Go to Step 38
33	Replace the thermo relay. Did you complete the replacement?	—	Go to Step 39	—
34	Replace the pressure switch. Refer to Heating and Air Conditioning section. Did you complete the replacement?	—	Go to Step 39	—
35	Replace the electronic thermostat. Refer to Heating and Air Conditioning section. Did you complete the replacement?	—	Go to Step 39	—
36	Replace the A/C switch. Refer to Heating and Air Conditioning section. Did you complete the replacement?	—	Go to Step 39	—
37	Replace the blower motor switch. Refer to Heating and Air Conditioning section. Did you complete the replacement?	—	Go to Step 39	—
38	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 39	—

Step	Action	Value(s)	Yes	No
39	1. Reconnect all previously disconnected fuse, relay or harness connector(s). 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Turn ON the blower motor switch. Does the blower motor turn ON and operate correctly?	—	Go to Char 1 of 2 Step 4	Refer to Applicable Diagnostic Chart in Heating & Air Conditioning Section

Chart 2 of 2 without heater

Step	Action	Value(s)	Yes	No
1	1. Turn OFF the ignition. 2. Replace the thermo relay with the horn relay or replace with a known good relay. 3. Turn OFF the blower motor switch. 4. Turn OFF the A/C switch. 5. Turn ON the ignition, with the engine OFF. Does the A/C Request Signal parameter indicate OFF?	—	Go to Step 37	Go to Step 2
2	1. Turn OFF the ignition. 2. Remove the thermo relay from the engine room relay block. 3. Turn ON the ignition, with the engine OFF. Does the A/C Request Signal parameter indicate OFF?	—	Go to Step 3	Go to Step 5
3	1. Turn OFF the ignition. 2. Reinstall the thermo relay. 3. Remove the radiator grille in order to access the pressure switch. 4. Disconnect the pressure switch harness connector (C-24). 5. Turn OFF the blower motor switch. 6. Turn OFF the A/C switch. 7. Turn ON the ignition, with the engine OFF. Does the A/C Request Signal parameter indicate OFF?	—	Go to Step 7	Go to Step 6
4	1. Turn OFF the ignition. 2. Remove the glove box in order to access the electronic thermostat. 3. Back probe a test lamp between the electronic thermostat harness (pin 2 of C-55 connector) and battery voltage. 4. Turn ON the blower motor switch. 5. Turn OFF the A/C switch. 6. Keep the ignition OFF. Does the test lamp illuminate?	—	Go to Step 8	Go to Step 9
5	Repair the short to battery or ignition voltage on the thermo relay signal input circuit between the thermo relay (pin 1 of X-15 connector) and the engine control module (ECM) (pin 33 of C-56 connector). Did you complete the repair?	—	Go to Step 43	—
6	Repair the short to ground between the thermo relay (pin 5 of X-15 connector) and pressure switch (pin 1 of C-24 connector). Did you complete the repair?	—	Go to Step 43	—

Step	Action	Value(s)	Yes	No
7	Repair the short to ground between the pressure switch (pin 2 of C-24 connector) and the electronic thermostat (pin 2 of C-55 connector). Did you complete the repair?	—	Go to Step 43	—
8	1. Test the electronic thermostat switching circuits shorted each other. (pins 1 and 2 of C-55 connector). 2. Repair the circuits as necessary. Did you find and correct the condition?	—	Go to Step 43	Go to Step 39
9	1. Test the electronic thermostat circuit between the electronic thermostat (pin 4 of C-55 connector) and the A/C switch (pin 11 of B-57 connector) for a short to ground. 2. Repair the circuits as necessary. Did you find and correct the condition?	—	Go to Step 43	Go to Step 40
10	1. Test the ground circuit among the electronic thermostat (pin 1 of C-55 connector), the blower motor switch (pin 1 of B-13 connector) and the A/C switch (pin 10 of B-57 connector) for a short to ground. 2. Repair the circuits as necessary. Did you find and correct the condition?	—	Go to Step 43	Go to Step 41
11	Inspect the A/C (10A) fuse (EB-13) in the engine room fuse block. Is the A/C (10A) fuse (EB-13) open?	—	Go to Step 12	Go to Step 13
12	1. Replace the A/C (10A) fuse (EB-13). If the fuse continues to open, repair the short to ground on a circuit fed by the fuse or check for a shorted attached component. 2. Repair the short to ground or replace the component as necessary. Did you complete the repair?	—	Go to Step 43	—
13	1. Turn OFF the ignition. 2. Remove the thermo relay from the engine room relay block. 3. Connect a test lamp between the voltage feed circuit (pins 2 and 3 of X-15 connector) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate on both circuits?	—	Go to Step 14	Go to Step 23
14	1. Turn OFF the ignition. 2. Reinstall the thermo relay. 3. Remove the radiator grille in order to access the pressure switch. 4. Disconnect the pressure switch harness connector (C-24). 5. Connect a 3-amp fused jumper wire between the pressure switch harness (pin 1 of C-24 connector) and a known good ground. 6. Turn ON the ignition, with the engine OFF. Does the thermo relay click (engage)?	—	Go to Step 15	Go to Step 17
15	Does the A/C Clutch Switch parameter indicate ON?	—	Go to Step 18	Go to Step 16

Step	Action	Value(s)	Yes	No
16	1. Turn OFF the ignition. 2. Keep the 3-amp fused wire with connected. 3. Disconnect the ECM C-56 harness connector. 4. Connect a test lamp between the thermo relay input circuit (pin 33 of C-56 connector) and a known good ground. 5. Turn ON the ignition, with the engine OFF. DO NOT START the engine. Does the test lamp illuminate?	—	Go to Step 36	Go to Step 24
17	1. Turn OFF the ignition. 2. Keep the 3-amp fused wire with connected. 3. Replace the thermo relay with the horn relay or replace with a known good relay. 4. Connect a 3-amp fused jumper wire between the pressure switch harness (pin 1 of C-24 connector) and a known good ground. 5. Turn ON the ignition, with the engine OFF. Does the thermo relay click (engage)?	—	Go to Step 31	Go to Step 25
18	1. Turn OFF the ignition. 2. Connect the pressure switch harness connector. 3. Remove the grove box in order to access electronic thermostat. 4. Disconnect the electronic thermostat harness connector (C-55). 5. Connect a 3-amp fused jumper wire between the electronic thermostat voltage feed circuit (pin 2 of C-55 connector) and a known good ground. 6. Turn ON the ignition, with the engine OFF. Does the thermo relay click (engage)?	—	Go to Step 19	Go to Step 26
19	1. Turn OFF the ignition. 2. Connect a test lamp between the electronic thermostat terminal (pin 1 of C-55 connector) and battery voltage. 3. Turn ON the blower motor switch. Does the test lamp illuminate?	—	Go to Step 20	Go to Step 27
20	1. Turn OFF the ignition. 2. Connect a test lamp between the electronic thermostat voltage feed circuit (pin 3 of C-55 connector) and a known good ground. 3. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 21	Go to Step 28
21	1. Turn OFF the ignition. 2. Connect a test lamp between the electronic thermostat terminal (pin 4 of C-55 connector) and battery voltage. 3. Turn ON the blower motor switch. 4. Turn ON the A/C switch. Does the test lamp illuminate?	—	Go to Step 33	Go to Step 22

Step	Action	Value(s)	Yes	No
22	1. Turn OFF the ignition. 2. Remove the center cluster bezel in order to remove HVAC control lever. 3. Disconnect the A/C switch harness connector (B-57). 4. Connect a test lamp between the A/C switch ground harness (pin 10 of B-57 connector) and battery voltage. 5. Turn ON the blower motor switch. Does the test lamp illuminate?	—	Go to Step 29	Go to Step 30
23	Repair the open circuit or high resistance on the thermo relay voltage feed circuits between the thermo relay (pin 2 of X-15 connector) and ECM (10A) fuse (EB-4), then thermo relay (pin 3 of X-15 connector) and A/C (10A) fuse (EB-13). Did you complete the repair?	—	Go to Step 43	—
24	Repair the open circuit or high resistance on thermo relay input circuit between the ECM (pin 33 of C-56 connector) and the thermo relay (pin 1 of X-15 connector). Did you complete the repair?	—	Go to Step 43	—
25	Repair the open circuit or high resistance on the pressure switch voltage feed circuit between the thermo relay (pin 5 of X-15 connector) and pressure switch (pin 1 of C-24) connector. Did you complete the repair?	—	Go to Step 43	—
26	1. Test the voltage feed circuit between the pressure switch (pin 2 of C-24 harness connector) and electronic thermostat (pin 2 of C-55 connector) for an open or high resistance. 2. Repair the circuit as necessary. Did you find and correct the condition?	—	Go to Step 43	Go to Step 32
27	1. Test the electronic thermostat switching circuit between the electronic thermostat (pin 1 of C-55 connector) and the blower motor switch (pin 1 of B-13 connector) for an open or high resistance. 2. Repair the circuit as necessary. Did you find and correct the condition?	—	Go to Step 43	Go to Step 35
28	Repair the open or high resistance on the voltage feed circuit on the electronic thermostat between the A/C (10A) fuse (EB-13) and the electronic thermostat (pin 3 of C-55 connector). Did you complete the repair?	—	Go to Step 43	—
29	1. Test the electronic thermostat circuit between the electronic thermostat (pin 4 of C-55 connector) and A/C switch (pin 11 of B-57 connector) for an open or high resistance. 2. Repair the circuit as necessary. Did you find and correct the condition?	—	Go to Step 43	Go to Step 34
30	1. Test the A/C switch ground circuit between the A/C switch (pin 10 of B-57 connector) and blower motor switch (pin 1 of B-13 connector) for an open or high resistance. 2. Repair the circuit as necessary. Did you find and correct the condition?	—	Go to Step 43	Go to Step 35

Step	Action	Value(s)	Yes	No
31	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the thermo relay terminals (pins 1, 2, 3 and 4 of X-15 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 43	Go to Step 37
32	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the pressure switch (pins 1 and 2 of C-24 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 43	Go to Step 38
33	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the electronic thermostat (pins 1, 2, 3 and 4 of C-55 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 43	Go to Step 39
34	1. Turn OFF the ignition. 2. Inspect for an intermittent and for poor connections at the harness connector of the A/C switch (pins 10 and 11 of B-57 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 43	Go to Step 40
35	1. Turn OFF the ignition. 2. Inspect for an intermittent and for a poor connection at the harness connector of the blower motor switch (pin 1 of B-13 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 43	Go to Step 41
36	1. Turn OFF the ignition. 2. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 33 of C-56 connector). 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 43	Go to Step 42
37	Replace the thermo relay. Did you complete the replacement?	—	Go to Step 43	—
38	Replace the pressure switch. Refer to Heating and Air Conditioning section. Did you complete the replacement?	—	Go to Step 43	—
39	Replace the electronic thermostat. Refer to Heating and Air Conditioning section. Did you complete the replacement?	—	Go to Step 43	—
40	Replace the A/C switch. Refer to Heating and Air Conditioning section. Did you complete the replacement?	—	Go to Step 43	—
41	Replace the blower motor switch. Refer to Heating and Air Conditioning section. Did you complete the replacement?	—	Go to Step 43	—
42	**Important:** Replacement ECM must be programmed. Replace the ECM. Refer to Engine Control Module (ECM) Replacement in this section. Did you complete the replacement?	—	Go to Step 43	—

Step	Action	Value(s)	Yes	No
43	1. Reconnect all previously disconnected fuse, relay or harness connector(s). 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Turn ON the blower motor switch. Does the blower motor turn ON and operate correctly?	—	Go to Char 1 of 2 Step 4	Refer to Applicable Diagnostic Chart in Heating & Air Conditioning Section

Symptoms – Engine Controls

Symptoms – Engine Controls

Important Preliminary Inspections Before Starting

Perform Diagnostic System Check – Engine Controls before using the symptom tables, and verify that all of the following are true:

- The engine control module (ECM) and malfunction indicator lamp (MIL) are operating correctly.
- There are no diagnostic trouble codes (DTCs) stored, or a DTC exists but without the MIL.
- The scan tool data is within the normal operating range. Refer to scan tool Data List in this section.
- Verify the customer concern and locate the correct symptom in the table of contents. Inspect the items indicated under that symptom.

Visual and Physical Inspection

Several of the symptom procedures ask for careful visual and physical inspection. This step is extremely important. The visual and physical inspection can lead to correcting a problem without further inspections, and can save valuable time. Ensure that:

- The ECM grounds are clean, tight, and in their proper location.
- The vacuum hoses are not split or kinked, and properly connected. Inspect thoroughly for any type of leak or restriction.
- The mass air flow (MAF) sensor is properly installed. The arrows on the plastic portion of the sensor must point toward the engine.
- The air intake ducts are not collapsed or damaged.
- There are no leaks at the MAF sensor, any connections or intake manifold sealing surfaces.
- The engine harness wiring and terminals are properly connected and are not pinched or cut.

Intermittent

Important:

Inspect for improper installation of electrical components if an intermittent condition exists. Inspect for aftermarket add-on electrical equipment devices, lights, and cellular phones. Verify that no aftermarket equipment is connected to the keyword 2000 serial data circuit. If you cannot locate an intermittent condition, a cellular phone communication signal may cause the condition.

Important:

The problem may or may not turn ON the MIL or store a DTC.

Faulty electrical connections or wiring cause most intermittent problems. Perform a careful visual and physical inspection of the suspect connectors for the following conditions:

- Improperly mated connector halves
- Terminals that are not seated
- Terminals that are damaged or improperly formed

Reform or replace connector terminals in the problem circuit in order to ensure proper contact tension. Remove the terminal from the connector body in order to inspect for poor terminal wire connection.

Road test the vehicle with the DMM connected to the suspected circuit. An abnormal reading that occurs when the malfunction occurs is a good indication that there is a malfunction in the circuit being monitored.

Use the scan tool in order to help detect intermittent conditions. Useful features of the scan tool include the following:

- Trigger the Snapshot feature in order to capture and store engine parameters when the malfunction occurs. Review this stored information in order to see the specific running conditions that caused the malfunction.
- Use the Plot Function on the scan tool in order to plot selected data parameters. Review this stored information to aid in locating an intermittent problem. Refer to the scan tool Users Guide for more information.

Important:

If the intermittent condition exists as a start and then stall, test for DTCs relating to the vehicle theft deterrent system. Test for improper installation of electrical options such as lights, cellular phones, etc.

Any of the following may cause an intermittent MIL with no stored DTC:

- The ECM grounds are loose or dirty. Refer to Engine Controls Schematics.
- The MIL circuit intermittently shorted to ground.
- Electrical system interference caused by a malfunctioning relay, ECM driven solenoid, or switch. The electrical component can cause a sharp electrical surge. Normally, the problem will occur when the malfunctioning component is operating.
- There is an open diode across the A/C compressor clutch or any other open diodes.

MAGNETIC CLUTCH DOES NOT RUN (4JA1-T)

- Are the No. SBF-6 fuse (30A) and the No. EB-13 (10A) fuses OK?
  - YES →
  - NO → Replace
- Are the A/C thermo (X-15) and heater & A/C (X-11) relay OK?
  - YES →
  - NO → Replace
- Is the pressure switch (C-24) OK?
  - YES →
  - NO → Defective switch or insufficient refrigerant
- Is the electronic thermostat (C-55) OK?
  - YES →
  - NO → Replace
- Are the A/C switch (B-57) and the fan switch (B-13) OK?
  - YES →
  - NO → Replace
- Turn the ignition switch "ON" (Engine is running)
- A/C switch and fan control knob (fan switch) "ON"
- Disconnect the magnetic clutch connector.
- Is there battery voltage between the engine room harness connector terminal No.1 (E-3) and ground?
  - YES → Does the magnetic clutch operate?
    - YES → Defective compressor
    - NO → Defective magnetic clutch
  - NO →
- Disconnect the A/C thermo relay.
- Is there continuity between the engine room harness connector terminal No.1 (E-3) and engine room harness connector terminal No.1 (X-15)?

Important:

The following symptom tables contain groups of possible causes for each symptom. The order of these procedures is not important. If the scan tool readings do not indicate the problems, then proceed in a logical order, easiest to check or most likely to cause first. In order to determine if a specific vehicle is using a particular system or component, refer to Engine Controls Schematics for an application.

Use the following tables when diagnosing a symptom complaint:

- Intermittent Conditions
- Hard Start
- Rough, Unstable, or Incorrect Idle and Stalling
- Cuts Out, Misses
- Surge/Chuggles
- Lack of Power, Sluggishness, or Sponginess
- Hesitation, Sag, Stumble
- Fuel Knock/Combustion Noise
- Poor Fuel Economy
- Excessive Smoke (Black Smoke)
- Excessive Smoke (White Smoke)

Intermittent Conditions

Checks	Action
DEFINITION:The problem is not currently present but is indicated in DTC History. OR There is a customer complaint, but the symptom cannot currently be duplicated, if the problem is not DTC related.	
Preliminary Checks	• Refer to Symptoms – Engine Controls before starting.
Harness/Connector	Many intermittent open or shorted circuits are affected by harness/connector movement that is caused by vibration, engine torque, bumps/rough pavement, etc. Test for this type of condition by performing the applicable procedure from the following list: • Move related connectors and wiring while monitoring the appropriate scan tool data. • Move related connectors and wiring with the component commanded ON, and OFF, with the scan tool. Observe the component operation. • With the engine running, move related connectors and wiring while monitoring engine operation. If harness or connector movement affects the data displayed, component/system operation, or engine operation, inspect and repair the harness/connections as necessary. Refer to Electrical Connections or Wiring.

Checks	Action
Electrical Connections or Wiring	Poor electrical connections, terminal tension or wiring problems cause most intermittent. To perform the following inspections: • Inspect for poor mating of the connector halves, or terminals improperly seated in the connector body. • Inspect for improperly formed or damaged terminals. Test for poor terminal tension. • Inspect for poor terminal to wire connections including terminals crimped over insulation. This requires removing the terminal from the connector body. • Inspect for corrosion/water intrusion. Pierced or damaged insulation can allow moisture to enter the wiring. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits. • Inspect for wires that are broken inside the insulation. • Inspect the harness for pinched, cut or rubbed through wiring. • Ensure that the wiring does not come in contact with hot exhaust components.
Control Module Power and Grounds Component Power and Grounds	Poor power or ground connections can cause widely varying symptoms. • Test all control module power supply circuits. Many vehicles have multiple circuits supplying power to the control module. Other components in the system may have separate power supply circuits that may also need to be tested. Inspect connections at the module/component connectors, fuses, and any intermediate connections between the power source and the module/component. A test lamp or a DMM may indicate that voltage is present, but neither tests the ability of the circuit to carry sufficient current. Ensure that the circuit can carry the current necessary to operate the component. • Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point. Inspect the connections at the component and in splice packs, where applicable. Ensure that the circuit can carry the current necessary to operate the component.
Temperature Sensitivity	• An intermittent condition may occur when a component/connection reaches normal operating temperature. The condition may occur only when the component/connection is cold, or only when the component/connection is hot. • If the intermittent is related to heat, review the data for a relationship with the following: - High ambient temperatures - Under hood/engine generated heat - Circuit generated heat due to a poor connection, or high electrical load - Higher than normal load conditions, towing, etc. • If the intermittent is related to cold, review the data for the following: - Low ambient temperatures–In extremely low temperatures, ice may form in a connection or component. Test for water intrusion. - The condition only occurs on a cold start. - The condition goes away when the vehicle warms up. • Information from the customer may help to determine if the trouble follows a pattern that is temperature related.

Checks	Action
Electromagnetic Interference (EMI) and Electrical Noise	Some electrical components/circuits are sensitive to EMI or other types of electrical noise. Inspect for the following conditions: • A misrouted harness that is too close to high voltage/high current devices such as injection components, motors, generator etc. These components may induce electrical noise on a circuit that could interfere with normal circuit operation. • Electrical system interference caused by a malfunctioning relay, or the engine control module (ECM) driven solenoid or switch. These conditions can cause a sharp electrical surge. Normally, the problem will occur when the malfunctioning component is operating. • Improper installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. These accessories may lead to an emission related failure while in use, but do not fail when the accessories are not in use. • Test for an open diode across the A/C compressor clutch and for other open diodes. Some relays may contain a clamping diode. • Test the generator for a bad rectifier bridge that may be allowing AC noise into the electrical system.
Incorrect ECM Programming	• There are only a few situations where reprogramming a ECM is appropriate: **Important:** DO NOT reprogram the ECM with the SAME software/calibration files that are already present in the ECM. This is not an effective repair for any type of driveability problem. - A ECM from another vehicle is installed. - Revised software/calibration files have been released for this vehicle. • Verify that the ECM contains the correct software/calibration. If incorrect programming is found, reprogram the ECM with the most current software/calibration.
Duplicating Failure Conditions	• If none of the previous tests are successful, attempt to duplicate and/or capture the failure conditions. • An alternate method is to drive the vehicle with the DMM connected to a suspected circuit. An abnormal reading on the DMM when the problem occurs, may help you locate the problem.
scan tool Snapshot	The scan tool can be set up to take a Snapshot of the parameters available via serial data. The Snapshot function records live data over a period of time. The recorded data can be played back and analyzed. The scan tool can also graph parameters singly or in combinations of parameters for comparison. The Snapshot can be triggered manually at the time the symptom is noticed, or set up in advance to trigger when a DTC sets. An abnormal value captured in the recorded data may point to a system or component that needs to be investigated further. Refer to the scan tool user instructions for more information on the Snapshot function.

Hard Start

Checks	Action
DEFINITION:The engine cranks OK, but does not start for a long time. The engine does eventually run, or may start but immediately dies.	
Preliminary Checks	• Diagnostic System Check - Engine Controls. • Ensure the driver is using the correct starting procedure. • Inspect the engine control module (ECM) and fuel injection pump control unit (PCU) grounds for being clean, tight, and in their proper locations. • Inspect that the harness connectors are correctly connected. • Inspect the fuel type and quality. • Inspect the scan tool Data List in this section. • Inspect the Service Bulletins for ECM software updates.

Checks	Action
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the scan tool Data List in this section. • Use the scan tool to compare the Engine Coolant Temperature (ECT) with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake air temperature if the ignition switch is being ON. FT sensor is internal to the PCU and it is part of the fuel injection pump assembly. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel circumference is not damaged.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect for water contamination in the fuel. • Inspect for external fuel leaks or fuel leakage into the engine oil. • Inspect the fuel lines between the fuel tank and fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel injection pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel injection pump internal pressure fluctuations especially at high engine speed and load. • Inspect for air in the fuel system. **Notice:** If many air bubbles appear in the fuel, check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. a. Remove the fuel hose that connects to the fuel injection pump suction side. b. Substitute a clear hose. **Notice:** A hose must be cleaned. c. Connect the clear hose to the fuel injection pump. d. Bleed the fuel system. e. Let the engine run at idle for at least 2 minutes. f. Accelerator the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the clear hose. • Inspect the fuel tank vent hose for a plugged or kinked. • Inspect inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. Draw fuel from the fuel tank at the fuel line (as close to the fuel tank as possible) going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0/J-23738-A with a clear hose or equivalent). This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. • Inspect the fuel injection pump operation. **Notice:** The fuel injection pump must be timed to the engine. • Inspect the eye bolt for any type of restriction or collapsed gauze filter. **Notice:** If any type of restriction found, check for a condition that causes contaminated fuel, such as the customer is using an aftermarket fuel filter or extended maintenance interval. Also inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system. • Inspect the fuel injection nozzle(s) for proper splay condition or operating pressure. **Notice:** Only first stage of operating pressure can be checked.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or deposit in the intake throttle bore. • Inspect for a restriction or leak in the intake manifold.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect for a restriction in the catalytic converter or exhaust pipes.

Checks	Action
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 2100 kPa (309 psi). • Improper mechanical timing (timing gear) • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes
Electrical System Checks	Inspect the engine electrical for the following conditions. Refer to the Engine Electrical section. • Inspect the glow plug control (preheating) system operation. • Inspect for slow cranking speed. • Inspect for weakened batteries.

Rough, Unstable, or Incorrect Idle And Stalling

Checks	Action
DEFINITION:Engine runs unevenly at idle. If severe, the engine or vehicle may shake. Engine idle speed may vary in RPM. Either condition may be severe enough to stall the engine.	
Preliminary Checks	• Diagnostic System Check - Engine Controls. • Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Inspect the Engine Control Module (ECM) and fuel injection pump control unit (PCU) grounds for being clean, tight, and in their proper locations. • Inspect that the harness connectors are correctly connected. • Inspect the fuel type and quality. • Inspect the scan tool Data List in this section. • Inspect the Service Bulletins for ECM software updates.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the scan tool Data List in this section. • Use the scan tool to compare the Engine Coolant Temperature (ECT) with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake air temperature if the ignition switch is being ON. FT sensor is internal to the PCU and it is part of the fuel injection pump assembly. • Use the scan tool to compare the MAF Sensor parameter with the Desired MAF parameter. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). The MAF Sensor parameter must follow the Desired MAF parameter within 100 mg/strk. If not, inspect the air intake system, EGR system components and contaminated, skewed or slow MAF sensor. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel circumference is not damaged.

Checks	Action
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect for water contamination in the fuel. • Inspect for external fuel leaks or fuel leakage into the engine oil. • Inspect the fuel lines between the fuel tank and fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel injection pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel injection pump internal pressure fluctuations especially at high engine speed and load. • Inspect for air in the fuel system. **Notice:** If many air bubbles appear in the fuel, check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. a. Remove the fuel hose that connects to the fuel injection pump suction side. b. Substitute a clear hose. **Notice:** A hose must be cleaned. d. Connect the clear hose to the fuel injection pump. c. Bleed the fuel system. e. Let the engine run at idle for at least 2 minutes. f. Accelerator the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the clear hose. • Inspect the fuel tank vent hose for a plugged or kinked. • Inspect inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. Draw fuel from the fuel tank at the fuel line (as close to the fuel tank as possible) going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0/J-23738-A with a clear hose or equivalent). This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. • Inspect the fuel injection pump operation. **Notice:** The fuel injection pump must be timed to the engine. • Inspect the eye bolt for any type of restriction or collapsed gauze filter. **Notice:** If any type of restriction found, check for a condition that causes contaminated fuel, such as the customer is using an aftermarket fuel filter or extended maintenance interval. Also inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system. • Inspect the fuel injection nozzle(s) for proper splay condition or operating pressure. **Notice:** Only first stage of operating pressure can be checked.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or deposit in the intake throttle bore. • Inspect for a restriction or leak in the intake manifold. • Inspect for a restriction or damage at MAF sensor.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect for a restriction in the catalytic converter or exhaust pipes.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 2100 kPa (309 psi). • Improper mechanical timing • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes • Inspect for incorrect basic engine parts.

Checks	Action
Additional Checks	• Electromagnetic interference (EMI) on the reference circuit can cause an engine miss condition. The scan tool can usually detect EMI by monitoring the engine speed. A sudden increase in speed with little change in actual engine speed change indicates that EMI is present. If a problem exists, check routing of high voltage components, such as fuel injection solenoid valve wiring, near the sensor circuits. • Inspect for faulty engine mounts. • Inspect faulty crank pulley. • Inspect faulty generator & A/C compressor. • Inspect the generator output voltage. Repair if less than 9 volts or more than 16 volts. • Inspect the EGR system operating correctly. • Inspect the A/C operation.

Cut Out, Misses

Checks	Action
DEFINITION:A constant jerking that follows the engine speed, usually more pronounced as the engine load increase. The exhaust has a steady spitting sound at idle, low speed, or hard acceleration for the fuel starvation that can cause the engine to cut-out.	
Preliminary Check	• Diagnostic System Check - Engine Controls. • Inspect that the harness connectors are correctly connected. • Inspect the engine control module (ECM) and fuel injection pump control unit (PCU) grounds for being clean, tight, and in their proper locations. • Inspect the scan tool Data List in this section. • Inspect the Service Bulletins for ECM software updates.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the scan tool Data List in this section. • Use the scan tool to observe the Accelerator Pedal Position. Accelerator Pedal Position indicating angle parameter should change linearly from 0% to 100% according to the accelerator pedal operation. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel circumference is not damaged.

Checks	Action
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect for water contamination in the fuel. • Inspect for external fuel leaks or fuel leakage into the engine oil. • Inspect the fuel lines between the fuel tank and fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel injection pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel injection pump internal pressure fluctuations especially at high engine speed and load. • Inspect for air in the fuel system. **Notice:** If many air bubbles appear in the fuel, check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. a. Remove the fuel hose that connects to the fuel injection pump suction side. b. Substitute a clear hose. **Notice:** A hose must be cleaned. c. Connect the clear hose to the fuel injection pump. d. Bleed the fuel system. e. Let the engine run at idle for at least 2 minutes. f. Accelerator the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the clear hose. • Inspect the fuel tank vent hose for a plugged or kinked. • Inspect inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. Draw fuel from the fuel tank at the fuel line (as close to the fuel tank as possible) going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0/J-23738-A with a clear hose or equivalent). This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. • Inspect the fuel injection pump operation. **Notice:** The fuel injection pump must be timed to the engine. Inspect the eye bolt for any type of restriction or collapsed gauze filter. **Notice:** If any type of restriction found, check for a condition that causes contaminated fuel, such as the customer is using an aftermarket fuel filter or extended maintenance interval. Also inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or deposit in the intake throttle bore. • Inspect for a restriction or leak in the intake manifold. • Inspect for a restriction or damage at mass air flow (MAF) sensor.
Additional Checks	• Inspect the generator output voltage. Repair if less than 9 volts or more than 16 volts. • Electromagnetic interference (EMI) on the reference circuit can cause an engine miss condition. The scan tool can usually detect EMI by monitoring the engine speed. A sudden increase in speed with little change in actual engine speed change indicates that EMI is present. If a problem exists, check routing of high voltage components, such as fuel injection solenoid wiring, near the sensor circuits.

Surges/Chuggles

Checks	Action
DIFINITION:The engine has a power variation under a steady throttle or cruise. The vehicle seems to speed up and slow down with no change in the accelerator pedal.	

Checks	Action
Preliminary Checks	• Diagnostic System Check - Engine Controls. • Ensure the driver understands the torque converter clutch (TCC) operation. • Ensure the driver understands the A/C compressor operation. • Use the scan tool in order to make sure the Vehicle Speed parameter reading matches the vehicle speedometer. • Inspect the engine control module (ECM) and fuel injection pump control unit (PCU) grounds for being clean, tight, and in their proper locations. • Inspect that the harness connectors are correctly connected. • Inspect the fuel type and quality. • Inspect the scan tool Data List in this section. • Inspect the Service Bulletins for ECM software updates.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the scan tool Data List in this section. • Use the scan tool to compare the Mass Air Flow (MAF) Sensor parameter with the Desired MAF parameter. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). The MAF Sensor parameter must follow the Desired MAF parameter within 100 mg/strk. If not, inspect the air intake system, EGR system components and contaminated, skewed or slow MAF sensor. • Use the scan tool to observe the Accelerator Pedal Position. Accelerator Pedal Position parameter should change linearly from 0% to 100% according to the accelerator pedal operation. Also inspect the Accelerator Pedal Position indicating angle when the accelerator pedal is steady. If the indicating angle fluctuates, check for an intermittent open, high resistance in the circuits or for a skewed sensor. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel circumference is not damaged.

Checks	Action
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect for water contamination in the fuel. • Inspect for external fuel leaks or fuel leakage into the engine oil. • Inspect the fuel lines between the fuel tank and fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel injection pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel injection pump internal pressure fluctuations especially at high engine speed and load. • Inspect for air in the fuel system. **Notice:** If many air bubbles appear in the fuel, check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. a. Remove the fuel hose that connects to the fuel injection pump suction side. b. Substitute a clear hose. **Notice:** A hose must be cleaned. c. Connect the clear hose to the fuel injection pump. d. Bleed the fuel system. e. Let the engine run at idle for at least 2 minutes. f. Accelerator the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the clear hose. • Inspect the fuel tank vent hose for a plugged or kinked. • Inspect inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. Draw fuel from the fuel tank at the fuel line (as close to the fuel tank as possible) going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0/J-23738-A with a clear hose or equivalent). This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. • Inspect the fuel injection pump operation. **Notice:** The fuel injection pump must be timed to the engine. • Inspect the eye bolt for any type of restriction or collapsed gauze filter. **Notice:** If any type of restriction found, check for a condition that causes contaminated fuel, such as the customer is using an aftermarket fuel filter or extended maintenance interval. Also inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system. • Inspect the fuel injection nozzle(s) for proper splay condition or operating pressure. **Notice:** Only first stage of operating pressure can be checked. • Inspect the timing device operating correctly. Observe the Actual Injection Timing parameter with the scan tool while running the engine. The Actual Injection Timing parameter must follow the Desired Injection Timing within 2°CA on each engine speed. Engine idle > around 2000 RPM> around 3000 RPM. If not, inspect the fuel system restriction, air in the fuel or fuel injection pump operation.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or deposit in the intake throttle bore. • Inspect for a restriction or leak in the intake manifold. • Inspect for a restriction or damage at MAF sensor.
Additional Checks	• Inspect the generator output voltage. Repair if less than 9 volts or more than 16 volts. • Inspect the EGR system operating correctly. • Inspect the A/C operation. • Inspect the torque converter clutch (TCC) operation. (A/T only)

YES

• Is there continuity between the engine room harness connector terminal No.2 (X-15) and ground?

NO

Open circuit between the engine room harness connector terminal No.1 (X-15).

YES

• Is there battery voltage between the engine room harness connector terminal No.3 (X-15) and ground?

NO

Open circuit between the engine room harness connector terminal No. 2 (X-15).

YES

• Disconnect the pressure switch.

• Is there continuity between the engine room harness connector terminal No. 5 (X-15) and the engine room harness connector terminal No. 2 (C-24)?

NO

Open circuit between the No. EB-13 fuse and the engine room harness connector terminal No. 3 (X-15).

YES

• Disconnect the condenser fan relay connector condenser fan.

• Is there continuity between the relay terminal No.3 (X-13)and engine room harness connector terminal No.3 (C-24)?

NO

Open circuit between the engine room harness connector terminal No. 5 (X-15) and the engine room harness connector terminal No. 2 (C-24).

YES

• Is there battery voltage between the engine room harness connector terminal No.4 (C-24) and ground?

NO

Open circuit between the condenser fan relay No. 3 (X-13) and engine room harness connector terminal No.3 (C-24).

Lack of Power, Sluggishness, Sponginess

Checks	Action
DEFINITION:The engine delivers less than expected power. There is little or no increase in speed when partially applying the accelerator pedal.	
Preliminary Checks	• Diagnostic System Check - Engine Controls. • Compare the vehicle with a similar unit. Ensure the vehicle has an actual problem. • Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Have the tire sizes changed? • Are excessively heavy loads being carried? • Inspect for clutch slip. • Inspect brake drag. • Inspect for a proper transmission shift pattern and down shift operation (A/T only). • Inspect the fuel quality (cetane index). • Inspect the engine oil level and quality. • Use the scan tool in order to make sure the Vehicle Speed parameter reading matches the vehicle speedometer. • Inspect the engine control module (ECM) and fuel injection pump control unit (PCU) grounds for being clean, tight, and in their proper locations. • Inspect the scan tool Data List in this section. • Inspect the Service Bulletins for ECM software updates.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the scan tool Data List in this section. • Use the scan tool to compare the Engine Coolant Temperature (ECT) with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake air temperature if the ignition switch is being ON. FT sensor is internal to the PCU and it is part of the fuel injection pump assembly. • Use the scan tool to compare the MAF Sensor parameter with the Desired MAF parameter. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). The MAF Sensor parameter must follow the Desired MAF parameter within 100 mg/strk. If not, inspect the air intake system, EGR system components and contaminated, skewed or slow MAF sensor. • Use the scan tool to observe the Accelerator Pedal Position Accelerator Pedal Position. Accelerator Pedal Position parameter should change linearly from 0% to 100% according to the accelerator pedal operation.

Checks	Action
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect for water contamination in the fuel. • Inspect for external fuel leaks or fuel leakage into the engine oil. • Inspect the fuel lines between the fuel tank and fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel injection pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel injection pump internal pressure fluctuations especially at high engine speed and load. • Inspect for air in the fuel system. **Notice:** If many air bubbles appear in the fuel, check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. a. Remove the fuel hose that connects to the fuel injection pump suction side. b. Substitute a clear hose. **Notice:** A hose must be cleaned. c. Connect the clear hose to the fuel injection pump. d. Bleed the fuel system. e. Let the engine run at idle for at least 2 minutes. f. Accelerator the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the clear hose. • Inspect the fuel tank vent hose for a plugged or kinked. • Inspect inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. Draw fuel from the fuel tank at the fuel line (as close to the fuel tank as possible) going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0/J-23738-A with a clear hose or equivalent). This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. • Inspect the fuel injection pump operation. **Notice:** The fuel injection pump must be timed to the engine. • Inspect the eye bolt for any type of restriction or collapsed gauze filter. **Notice:** If any type of restriction found, check for a condition that causes contaminated fuel, such as the customer is using an aftermarket fuel filter or extended maintenance interval. Also inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system. Inspect the fuel injection nozzle(s) for proper splay condition or operating pressure. **Notice:** Only first stage of operating pressure can be checked. • Inspect the timing device operating correctly. Observe the Actual Injection Timing parameter with the scan tool while running the engine. The Actual Injection Timing parameter must follow the Desired Injection Timing within 2°CA on each engine speed. Engine idle > around 2000 RPM> around 3000 RPM. If not, inspect the fuel system restriction, air in the fuel or fuel injection pump operation.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction or leak in the intercooler. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or deposit in the intake throttle bore. • Inspect for a restriction or leak in the intake manifold. • Inspect for a restriction or damage at MAF sensor. • Inspect for a worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Refer to turbocharger inspection in the Engine Mechanical section. • Inspect for turbocharger wastegate valve operation. Refer to wastegate valve inspection in the Engine Mechanical section.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect for a restriction in the catalytic converter or exhaust pipes.

Checks	Action
Engine Mechanical Check	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 2100 kPa (309 psi). • Improper mechanical timing • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes
Additional Checks	• Inspect the generator output voltage. Repair if less than 9 volts or more than 16 volts. • Inspect the EGR system operating correctly. • Inspect the engine overheat condition. Refer to the Engine Cooling section. • Inspect the A/C operation. • Inspect the torque converter clutch (TCC) operation (A/T only).

Hesitation, Sag, Stumble

Checks	Action
DEFINITION:The vehicle has a momentary lack of response when pushing down on the accelerator. The condition can occur at any vehicle speed. The condition is usually most severe when trying to make the vehicle move from a stop. If severe enough, the condition may cause the engine to stall.	
Preliminary Checks	• Diagnostic System Check - Engine Controls. • Compare the vehicle with a similar unit. Ensure the vehicle has an actual problem. • Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Inspect for a proper transmission shift pattern and down shift operation. • Inspect the fuel quality (cetane index). • Inspect the engine oil level and quality. • Inspect the scan tool Data List in this section. • Inspect the engine control module (ECM) and fuel injection pump control unit (PCU) grounds for being clean, tight, and in their proper locations. • Inspect the Service Bulletins for ECM software updates.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the scan tool Data List in this section. • Use the scan tool to compare the Engine Coolant Temperature (ECT) with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake air temperature if the ignition switch is being ON. FT sensor is internal to the PCU and it is part of the fuel injection pump assembly. • Use the scan tool to compare the MAF Sensor parameter with the Desired MAF parameter. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). The MAF Sensor parameter must follow the Desired MAF parameter within 100 mg/strk. If not, inspect the air intake system, EGR system components and contaminated, skewed or slow MAF sensor. • Use the scan tool to observe the Accelerator Pedal Position Accelerator Pedal Position. Accelerator Pedal Position parameter should change linearly from 0% to 100% according to the accelerator pedal operation.

Checks	Action
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect for water contamination in the fuel. • Inspect for external fuel leaks or fuel leakage into the engine oil. • Inspect the fuel lines between the fuel tank and fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** The fuel system from the fuel tank(s) to the fuel injection pump is under a slight vacuum with the engine running. As a result, air can enter the fuel system if these connections are not tight. Air in the fuel system will cause fuel injection pump internal pressure fluctuations especially at high engine speed and load. • Inspect for air in the fuel system. **Notice:** If many air bubbles appear in the fuel, check the fuel system line connections between the fuel tank and the fuel injection pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. a. Remove the fuel hose that connects to the fuel injection pump suction side. b. Substitute a clear hose. **Notice:** A hose must be cleaned. c. Connect the clear hose to the fuel injection pump. d. Bleed the fuel system. e. Let the engine run at idle for at least 2 minutes. f. Accelerator the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the clear hose. • Inspect the fuel tank vent hose for a plugged or kinked. • Inspect inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. Draw fuel from the fuel tank at the fuel line (as close to the fuel tank as possible) going to the fuel pickup tube to verify a clean stream of fuel comes out (use the hand-held vacuum pump 5-8840-0279-0/J-23738-A with a clear hose or equivalent). This will ensure the fuel pickup tube is not cracked drawing air into the fuel line. • Inspect the fuel injection pump operation. **Notice:** The fuel injection pump must be timed to the engine. • Inspect the eye bolt for any type of restriction or collapsed gauze filter. **Notice:** If any type of restriction found, check for a condition that causes contaminated fuel, such as the customer is using an aftermarket fuel filter or extended maintenance interval. Also inspect fuel waxing or icing that is caused by an incorrect fuel type used in winter season or water intrusion in the fuel system. • Inspect the fuel injection nozzle(s) for proper splay condition or operating pressure. **Notice:** Only first stage of operating pressure can be checked. • Inspect the timing device operating correctly. Observe the Actual Injection Timing parameter with the scan tool while running the engine. The Actual Injection Timing parameter must follow the Desired Injection Timing within 2°CA on each engine speed. Engine idle > around 2000 RPM> around 3000 RPM. If not, inspect the fuel system restriction, air in the fuel or fuel injection pump operation.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction or leak in the intercooler. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or deposit in the intake throttle bore. • Inspect for a restriction or leak in the intake manifold. • Inspect for a restriction or damage at MAF sensor. • Inspect for a worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Refer to turbocharger inspection in the Engine Mechanical section. • Inspect for turbocharger wastegate valve operation. Refer to wastegate valve inspection in the Engine Mechanical section.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect for a restriction in the catalytic converter or exhaust pipes.

Checks	Action
Engine Mechanical Check	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 2100 kPa (309 psi). • Improper mechanical timing • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes
Additional Checks	• Inspect the generator output voltage. Repair if less than 9 volts or more than 16 volts. • Inspect the EGR system operating correctly. • Inspect the A/C operation. • Inspect the torque converter clutch (TCC) operation.

Fuel Knock/Combustion Noise

Checks	Action
DEFINITION:A mild to severe ping, usually worse under acceleration. The engine makes sharp metallic knocks that change with the throttle opening.	
Preliminary Checks	• Diagnostic System Check - Engine Controls. • Ensure the vehicle has an actual problem. • Inspect for smoke associated with the combustion noise. • Inspect the fuel quality (cetane index). • Inspect the scan tool Data List in this section. • Inspect the Service Bulletins for ECM software updates.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the scan tool Data List in this section. • Use the scan tool to compare the Engine Coolant Temperature (ECT) with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake air temperature if the ignition switch is being ON. FT sensor is internal to the PCU and it is part of the fuel injection pump assembly. • Use the scan tool to compare the MAF Sensor parameter with the Desired MAF parameter. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). The MAF Sensor parameter must follow the Desired MAF parameter within 100 mg/strk. If not, inspect the air intake system, EGR system components and contaminated, skewed or slow MAF sensor. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel circumference is not damaged.
Fuel System Checks	• If excessive smoke is present, check for an injection nozzle(s).Remove each glow plug from the cylinder head and inspect the tip of the glow plugs for wet by fuel. Use the cylinder compression gauge. Proper compression is more than 2100 kPa (309 psi). If poor compression is observed, inspect the engine mechanical. • Inspect the fuel injection nozzle(s) for proper splay condition or operating pressure. **Notice:** Only first stage of operating pressure can be checked. • Inspect the timing device operating correctly. Observe the Actual Injection Timing parameter with the scan tool while running the engine. The Actual Injection Timing parameter must follow the Desired Injection Timing within 2°CA on each engine speed. Engine idle > around 2000 RPM> around 3000 RPM. If not, inspect the fuel system restriction, air in the fuel or fuel injection pump operation.

Checks	Action
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 2100 kPa (309 psi). • Inspect for incorrect basic engine parts such as camshaft, cylinder head, pistons, etc. • Inspect for any excessive oil entering combustion chamber.
Additional Checks	• Inspect the EGR system operating correctly. • Inspect other possible causes that can make similar noise such as loose component parts, bracket, mount and weak clutch damper spring.

Poor Fuel Economy

Checks	Action
DEFINITION:Fuel economy, as measured by actual road tests and several tanks of fuel, is noticeably lower than expected. Also, the economy is noticeably lower than it was on this vehicle at one time, as previously shown by actual road tests.	
Preliminary Checks	• Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Inspect the driving habits of the owner. • Is the A/C ON full time, defroster mode ON? • Are the tires at the correct pressure? • Are the tire sizes changed? • Are excessively heavy loads being carried? • Is the acceleration too much, too often? • Inspect for clutch slip. • Inspect brake drag. • Inspect dive belt tension. • Inspect for a proper transmission shift pattern and down shift operation (A/T only). • Inspect the fuel quality (cetane index). • Inspect the engine oil level and quality. • Suggest to the owner to fill the fuel tank and recheck the fuel economy. • Suggest to the driver to read the Important Facts on Fuel Economy in the Owner Manual. • Inspect the odometer is correctly operated. • Inspect the Service Bulletins for ECM software updates.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the scan tool Data List in this section. • Use the scan tool to compare the Engine Coolant Temperature (ECT) with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake air temperature if the ignition switch is being ON. FT sensor is internal to the PCU and it is part of the fuel injection pump assembly.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect the fuel type and quality. • Check fuel leak.
Cooling System Checks	Inspect the cooling system for the following conditions. Refer to the Cooling System Section. • Inspect the engine coolant level. • Inspect the engine thermostat for always being open or for the wrong heat range. • Inspect the engine cooling fan for always being ON.

Checks	Action
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction or leak in the intercooler. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or deposit in the intake throttle bore. • Inspect for a restriction or leak in the intake manifold. • Inspect for a restriction or damage at MAF sensor.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect for a restriction in the catalytic converter or exhaust pipes.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 2100 kPa (309 psi).

Excessive Smoke (Black Smoke)

Checks	Action
DEFINITION:Black smoke under load, idle or start up hot or cold.	
Preliminary Check	• Ensure the vehicle has an actual problem. • Inspect the engine control module (ECM) and fuel injection pump control unit (PCU) grounds for being clean, tight, and in their proper locations. • Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Inspect the fuel quality (cetane index). • Inspect the engine oil level and quality. • Inspect the Service Bulletins for ECM software updates.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the scan tool Data List in this section. • Use the scan tool to compare the Engine Coolant Temperature (ECT) with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake air temperature if the ignition switch is being ON. FT sensor is internal to the PCU and it is part of the fuel injection pump assembly. • Use the scan tool to compare the MAF Sensor parameter with the Desired MAF parameter. Start the engine and warm up (allow engine coolant temperature to reach at least 60°C [140°F]). The MAF Sensor parameter must follow the Desired MAF parameter within 100 mg/strk. If not, inspect the air intake system, EGR system components and contaminated, skewed or slow MAF sensor. • Use the scan tool to observe the Accelerator Pedal Position Accelerator Pedal Position. Accelerator Pedal Position indicating angle parameter should change linearly from 0% to 100% according to the accelerator pedal operation.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect the fuel injection nozzle(s) for proper splay condition or operating pressure. **Notice:** Only first stage of operating pressure can be checked. • Inspect the timing device operating correctly. Observe the Actual Injection Timing parameter with the scan tool while running the engine. The Actual Injection Timing parameter must follow the Desired Injection Timing within 2°CA on each engine speed. Engine idle > around 2000 RPM> around 3000 RPM. If not, inspect the fuel system restriction, air in the fuel or fuel injection pump operation.

Checks	Action
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction or leak in the intercooler. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or deposit in the intake throttle bore. • Inspect for a restriction or leak in the intake manifold. • Inspect for a restriction or damage at MAF sensor. • Inspect for a worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Refer to turbocharger inspection in the Engine Mechanical section.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section. • Inspect for a restriction in the catalytic converter or exhaust pipes.
Engine Mechanical Check	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 2100 kPa (309 psi). • Inspect for incorrect basic engine parts such as camshaft, cylinder head, pistons, etc. • Inspect for any excessive oil entering combustion chamber. • Improper mechanical timing • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes
Additional Checks	• Inspect the EGR system operating correctly. • Inspect the excessive blow-by gasses. • Inspect the scan tool Data List in this section.

Excessive Smoke (White Smoke)

Checks	Action
DIFINITION:White smoke under load, idle or start up hot or cold.	
Preliminary Check	• Ensure the vehicle has an actual problem. • Inspect the engine control module (ECM) and fuel injection pump control unit (PCU) grounds for being clean, tight, and in their proper locations. • Inspect the fuel quality (cetane index). • Inspect the Service Bulletins for ECM software updates.
Sensor Check	Inspect the engine control sensors for the following conditions. Refer to the scan tool Data List in this section. • Use the scan tool to compare the Engine Coolant Temperature (ECT) with the Intake Air Temperature (IAT) and Fuel Temperature (FT) on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance on the low reference circuit and signal circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT sensor may indicate a higher than normal intake air temperature if the ignition switch is being ON. FT sensor is internal to the PCU and it is part of the fuel injection pump assembly. • Inspect the crankshaft position (CKP) sensor is tight and the flywheel circumference is not damaged.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Inspect the fuel injection nozzle(s) for proper splay condition or operating pressure. **Notice:** Only first stage of operating pressure can be checked. • Inspect the timing device operating correctly. Observe the Actual Injection Timing parameter with the scan tool while running the engine. The Actual Injection Timing parameter must follow the Desired Injection Timing within 2°CA on each engine speed. Engine idle > around 2000 RPM> around 3000 RPM. If not, inspect the fuel system restriction, air in the fuel or fuel injection pump operation.

Checks	Action
Air Intake System Checks	Inspect the air intake system for the following conditions. • Inspect the air cleaner and air intake ducts for a restriction, holes, or leaks. • Inspect for a restriction or leak in the intercooler. • Inspect for a restriction in the turbocharger inlet duct. • Inspect for a restriction or leak in the intake manifold. • Inspect for a restriction or damage at MAF sensor. • Inspect for a worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Refer to turbocharger inspection in the Engine Mechanical section.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. Proper compression is more than 2100 kPa (309 psi). • Inspect for incorrect basic engine parts such as camshaft, cylinder head, pistons, etc. • Improper mechanical timing • Improper valve gap • Broken or weak valve springs • Worn camshaft lobes • Inspect for any excessive fuel entering combustion chamber. • Inspect for coolant entering the combustion chamber.
Electrical System Checks	Inspect the engine electrical for the following conditions. Refer to the Engine Electrical section. • Inspect the glow plug control (preheating) system operation.

Repair Instructions

Engine Control Module (ECM) Replacement

Engine Control Module (ECM) Replacement Procedure

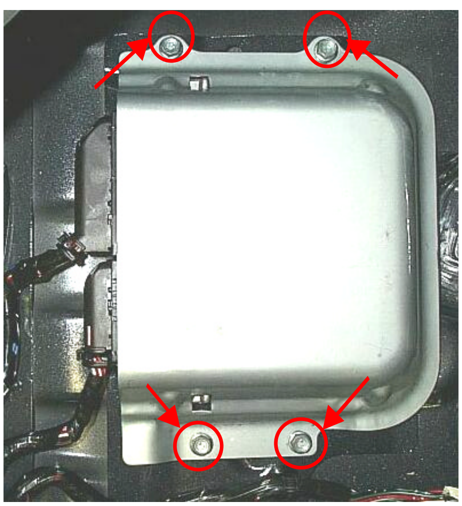
Important:

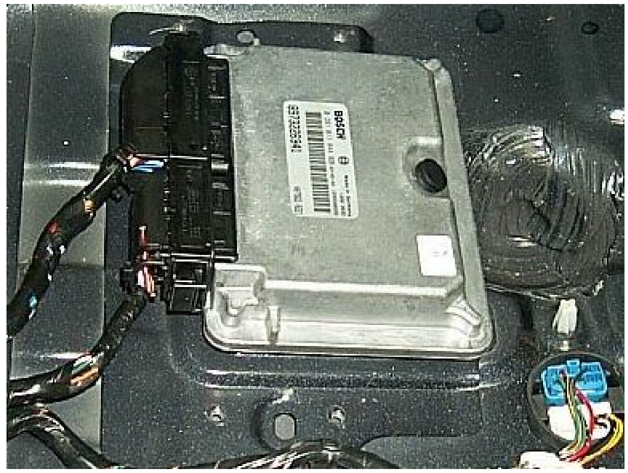
If the ECM is to be replaced the following programmed contents MUST be reprogrammed into the new ECM.

- Vehicle identification number (VIN).
- Latest software/calibrations if released. Refer to Service Programming System (SPS) Description and Service Programming System (SPS) (Remote Procedure) or Service Programming System (SPS) (Pass-Thru Procedure) in this section

Removal Procedure

1. Disconnect the negative battery cable.
2. Remove the seat left-hand side.
3. Roll up the floor carpet.
4. Remove four bolts from the ECM cover.
5. Disconnect the two connectors from the ECM.





Installation Procedure

1. Connect the two connectors to the ECM.
2. Put on the ECM to the floor panel.
3. Tighten the ECM cover by four bolts with specified tightening torque.

Tightening torque

- Bolts: 8.0 - 12.0 N.m (0.8 - 1.2 kgf.m)

4. Lay the floor carpet exactly.
5. Put on the seat to the floor panel and tighten with specified tightening torque.

Tightening torque

- Bolts: 40.0 N.m (4.1 kgf.m)

6. Connect the negative battery cable.

Vehicle Identification Number (VIN) Programming Procedure

Important:

If the ECM from another vehicle is installed, VIN is not programmed by the scan tool. Use the SPS to change the original VIN. Refer to Service Programming System (SPS) Description and Service Programming System (SPS) (Remote Procedure) or Service Programming System (SPS) (Pass-Thru Procedure) in this section.

Important:

If an updated software/calibrations is released, DO NOT program the VIN now. The VIN is programmed at SPS procedure. Refer to Service Programming System (SPS) Description and Service Programming System (SPS) (Remote Procedure) or Service Programming System (SPS) (Pass-Thru Procedure) in this section.

NO

Open circuit between the No. EB-13 fuse and engine room harness connector terminal No. 4 (C-24).

YES

- connect the A/C thermo relay connector.

- Disconnect the electronic thermostat.

- Is there continuity between the engine room harness connector terminal No. 2 (C-55) and the engine room harness connector terminal No. 1 (C-24)?

YES

- Is there battery voltage between the engine room harness connector terminal No.3 (C-55) and ground?

NO

Open circuit between the engine room harness connector terminal No. 2 (C-55) and the engine room harness connector terminal No. 1 (C-24).

YES

- Is there continuity between the engine room harness connector terminal No.1 (C-55) and the chassis side harness connector terminal No.5 (B-57) ? or (cooler only) the short connector terminal No.3 (B-79) and the chassis side harness connector terminal No.5 (B-57)?

NO

Open circuit between the No. EB-13 fuse and the engine room harness connector terminal No. 3 (C-55).

YES

- Is there continuity between the engine room harness connector (cooler only) terminal No. 4 (C-55) and the chassis side harness connector terminal No. 11 (B-57)?

NO

Open circuit between the engine room harness connector terminal No. 1 (C-55) or (cooler only) the short connector No. 3 (B-79) and the chassis side harness connector terminal No.5 (B-57).

1. Connect the scan tool to the vehicle DLC, with the engine and the scan tool OFF.
2. Turn ON the scan tool.
3. Select Diagnostic > appropriate vehicle identification > Powertrain > 4JH1-TC > Programming > Program VIN.
4. Input correct VIN reading from stamped VIN or affixed VIN plate on the vehicle.

Select Lock ECU and lock the programmed VIN.

Service Programming System (SPS) Description

The service programming system (SPS) allows a technician to program a control module through the data link connector (DLC). The information transfer circuit that is used at the DLC is the same serial data circuit used be the scan tool for retrieving diagnostic trouble codes (DTCs), displaying data, clearing DTCs etc. This procedure offers the ability to install software/calibrations matched to a particular vehicle.

Most control modules have two types of memory. The software/calibrations reside in the flash memory. The two types of memory are listed below:

- Electrically Erasable Programmable Read Only Memory (EEPROM).
  This type of memory allows selected portions of memory to be programmed while other portions remain unchanged.
  Certain learned values reside in the EEPROM, such as:
  - The vehicle identification number (VIN)
  - The software/calibrations identification numbers
  - The control module security information
- Flash Read Only Memory-Flash Memory
  Flash memory has increased memory storage capacity. During programming, all information within this type of memory is erased, and then replaced with entirely new information.

Service Programming Methods

The two methods of programming an engine control module (ECM) are listed below:

- Remote Programming
- Pass Thru Programming

For information on programming an ECM using one of the methods listed above, refer to Service Programming System (SPS) (Remote Procedure) or Service Programming System (SPS) (Pass-Thru Procedure).

Before Programming a Control Module

Important:

DO NOT program an existing ECM with the identical software/calibration package. This procedure is not a short cut to correct the driveability condition. This is an ineffective repair. An ECM should only be programmed when the following occurs:

- When a service procedure instructs you to replace the ECM. When the ECM from another vehicle is installed, VIN must be changed. And change vehicle information as necessary such as type of transmission.
- An updated software/calibrations is released.

Ensure that the following conditions are met before programming an ECM:

- The scan tool PCMCIA card is programmed with the latest software.
- The TIS 2000 is installed with the latest software.
- The hardware key is plugged into the computer port.
- Vehicle system voltage:
  - There are no charging system concerns. All charging system concerns must be repaired before programming the ECM.
  - The battery voltage is greater than 12 volts but less than 16 volts. The battery must be fully charged before programming the ECM.
  - A battery charger is NOT connected to the vehicles battery. Incorrect system voltage or voltage fluctuations from a battery charger may cause programming failure or ECM damage.
  - Turn OFF or disable any system that may put a load on the vehicles battery. Turn OFF or disable systems such as:
    ◊ Heating, ventilation, and air conditioning (HVAC) systems
    ◊ Headlights
    ◊ Room lights
    ◊ Accessory equipment
- The ignition switch is in the proper position. The scan tool prompts you to turn ON the ignition, with the engine OFF. DO NOT change the position of the ignition switch during the programming procedure unless instructed to do so.
- All tool connections are secure:
  - The RS-232 cable
  - The connection at the DLC
  - The voltage supply circuits

- DO NOT disturb the tool harnesses while programming. If an interruption occurs during the programming procedure, programming failure or ECM damage may occur.
- If you are performing the Pass-Thru programming procedure using a notebook computer without the power cord, ensure that the internal battery is fully charged.

Service Programming System (SPS) (Remote Procedure)

The Remote Service Programming System (SPS) method is a three-step process that involves the following procedures:

1. Connecting the scan tool to the vehicle and obtaining the information from the engine control module (ECM).
2. Connecting the scan tool to the terminal and downloading a new calibration file from the terminal into the scan tool memory.
3. Reconnecting the scan tool to the vehicle and uploading the new calibration file into the ECM.

Performing the Remote Procedure

1. Connect the scan tool to the vehicle and obtain the ECM information using the following procedure:

Important:
Ensure the ECM is installed in the vehicle and the battery is fully charged before programming.

   a. Connect the scan tool to the vehicle data link connector (DLC), with the engine and the scan tool OFF.
   b. Turn ON the scan tool.
   c. Press Enter at the title screen.
   d. Turn ON the ignition, with the engine OFF.
   e. Select Service Programming System at the Main Menu.
   f. Select Request Info.
   g. If there is already stored in the scan tool, the existing data is displayed on the screen. The scan tool asks user to keep existing data Keep Data or Continue to request new vehicle information from the ECM. If there is no data in the scan tool, it will immediately start vehicle identification.
   h. Enter the vehicle description by following the on-screen instructions based on stamped VIN or affixed VIN plate on the vehicle.
   i. During obtaining information, the scan tool is receiving information from any modules at the same time. But only ECM information is displayed on the screen.
   j. Turn OFF all accessories and select Continue.
   k. Verify that the correct VIN is entered on the scan tool. If the VIN is incorrect, write down the correct VIN.
2. Turn OFF the scan tool.
3. Disconnect the scan tool from the vehicle.
4. Turn OFF the ignition.
5. Transfer the data from the terminal to the scan tool using the following procedure:

Important:
The TIS supports service programming with the scan tool scan tool only.

   a. Connect the scan tool to the terminal.
   b. Launch the TIS application at the terminal.
   c. Select the Service Programming System at the main screen.
   d. Highlight the following information on the Select Diagnostic Tool and Programming Process screen:
      - Select Diagnostic Tool-Select scan tool.
      - Select Programming Process-Identify whether an existing ECM is being reprogrammed or an ECM is being replaced with a new one.
      - Select ECU Location-Select Vehicle.
   e. Select Next.
   f. Verify the connections on the Preparing for Communication screen and select Next.
   g. Verify the VIN on the Validate Vehicle Identification Number (VIN) screen and select Next.

Important:
If the ECM is replaced to new one, VIN does not displayed. Input correct VIN reading from stamped VIN or affixed VIN plate on the vehicle. If the ECM from another vehicle is installed, input correct VIN by same way.

   h. Highlight Engine on the System Type screen and select Next, if requested.
   i. Complete the following information based on the service ID plate on the Validate Vehicle Data screen until Next is highlighted:
      - Model
      - Model Year
      - Engine
      - Type of Transmission

- Destination Code

j. Select Next.
k. Verify your selection on the Summary screen.

Important:

Refer to Service Bulletins before service programming is performed if the bulletins are listed along with the calibration files.

Important:

Select Cancel if you receive a message stating that the calibration selected is already the current calibration in the ECM and reprogramming with the same download is not allowed.

l. Select Reprog.
m. The Transfer Data screen will appear until the progress bar reaches 100%.

6. Close the application and return to the TIS application selection screen after the download is complete.
7. Turn OFF the scan tool.
8. Disconnect the scan tool from the terminal.
9. Transfer the data from the scan tool to the ECM using the following procedure:
   a. Connect the scan tool to the vehicle DLC, with the engine and the scan tool OFF.
   b. Turn ON the scan tool.
   c. Press Enter at the Title screen.
   d. Turn ON the ignition, with the engine OFF.
   e. Select Service Programming System.
   f. Select the Program ECU on the scan tool.
   g. Follow the on-screen instructions and select Continue.
   h. Programming in Process will appear until the progress bar reaches 100%.

Important:

The vehicle fitted with automatic transmission, Check Trans lamp may blink while programming the ECM since communication between the ECM and TCM is interrupted. Clear DTC in any module after programming.

   i. Select Continue and exit the program after the scan tool displays Programming Was Successful.

10. Turn OFF the ignition.
11. Turn OFF the scan tool.
12. Disconnect the scan tool from the vehicle.

Service Programming System (SPS) (Pass-Thru Procedure)

Pass-Thru programming allows the scan tool to remain connected to the terminal and to the vehicle throughout the programming process. The vehicle must be in close proximity to the terminal while using Pass-Thru.

Important:

The TIS supports service programming with the scan tool scan tool only.

1. Launch the TIS application at the terminal.
2. Select the Service Programming System at the main screen.
3. Highlight the following information on the Select Diagnostic Tool and Programming Process screen:
   - Select Diagnostic Tool-Select Pass-Thru
   - Select Programming Process-Identify whether as existing engine control module (ECM) is being reprogrammed or an ECM is being replaced with a new one.
   - Select ECU Location-Select Vehicle.
4. Select Next.
5. Complete all vehicle data on the Preparing for Communication/Determine Vehicle screen until Next is highlighted.
6. Select Next.
7. Follow the instruction on the Preparing for Communication screen.

Important:

In order to reduce the potential for signal loss, the RS-232 cable should not be more than 25 feet long.

8. Select Next.
9. Verify the VIN on the Validate Vehicle Identification Number (VIN) screen and select Next.

Important:

If the ECM is replaced to new one, VIN does not displayed. Input correct VIN reading from stamped VIN or affixed VIN plate on the vehicle. If the ECM from another vehicle is installed, input correct VIN by same way.

10. Highlight Engine on the System Type screen and select Next, if requested.
11. Complete the following information based on the service ID plate on the Validate Vehicle Data screen until Next is highlighted:
    - Model
    - Model Year
    - Engine
    - Type of Transmission
    - Destination Code
12. Select Next.
13. Verify your selection on the Summary screen.

Important:

Refer to Service Bulletins before service programming is performed if the bulletins are listed along with the calibration files.

Important:

Select Cancel if you receive a message stating that the calibration selected is already the current calibration in the scan tool and reprogramming with the same download is not allowed.

14. Select Reprog.
15. The Transfer Data screen will appear until the progress bar reaches 100%.

Important:

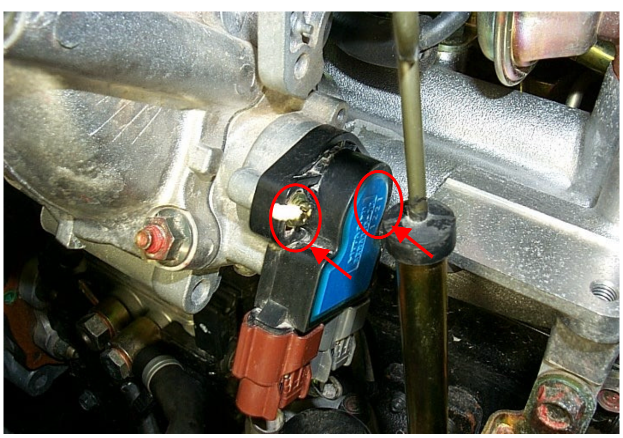
The vehicle fitted with automatic transmission, Check Trans lamp may blink while programming the ECM since communication between the ECM and TCM is interrupted. Clear DTC in any module after programming.

16. Select Close on the Programming Complete screen.
17. Turn OFF the scan tool.
18. Disconnect the scan tool from the vehicle.

Accelerator Pedal Position (APP) Sensor Replacement

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect the APP sensor connector.
3. Loosen two screws and remove APP sensor from the throttle body.



Installation Procedure

1. Temporary tighten the APP sensor by two screws.
2. Connect a APP sensor connectors to the APP sensor.
3. Connect the Tech2 to the vehicle.
4. Connect the negative battery cable.
5. Select "Data Display" with the Tech2.
6. Check the APP sensor data and adjust the APP sensor.
7. Tighten two screws.

Crankshaft Position (CKP) Sensor Replacement

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect connector from the CKP sensor.
3. Loosen a bolt and remove the CKP sensor from the clutch housing.

Installation Procedure

1. Install the CKP sensor to the clutch housing.
2. Tighten CKP sensor by a bolt with specified tightening torque.

Tightening Torque

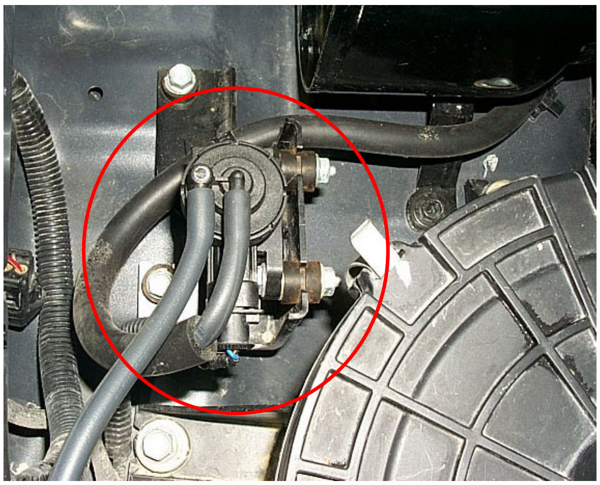
- Bolts: 8.0 - 12.0 N.m (0.8 - 1.2 kgf.m)

3. Connect a CKP sensor connector to the CKP sensor.
4. Connect the negative battery cable.

EGR Solenid Valve Replacement

Removal Procedure

1. Disconenct the negative battery cable.
2. Disconnect a EGR solenoid valve harness connector.
3. Disconnect two hoses from the EGR solenoid valve.
4. Loosen two bolts and remove the EGR solenoid valve from the bracket.



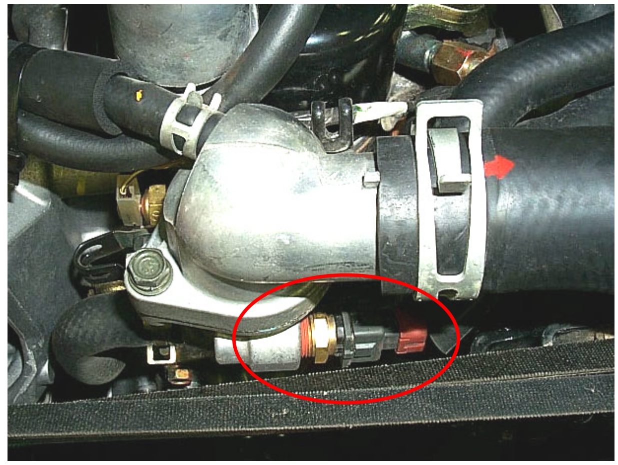
Installation Procedure

1. Tighten the purge solenoid by tow bolts.
2. Connect a connector to the EGR solenoid valve.
3. Connect two hoses to the EGR solenoid valve.
4. Connect the negative battery cable.

Engine Coolant Temperature (ECT) Sensor Replacement

1. Removal Procedure
2. Disconnect the negative battery cable.
3. Drain enough engine coolant so that the coolant level will be below the ECT sensor.
4. Disconnect connector from the ECT sensor.
5. Loosen and remove the ECT sensor from the thermostat housing.

Notice: Cool down the engine before above procedures are carried out.



Installation Procedure

1. Apply sealer to threads of screw at the ECT sensor.
2. Tighten the ECT sensor with specified tightening torque.

Tightening Torque

- Bolt: 13 N.m (1.3 kgf.m)

3. Connect a ECT sensor connector to the ECT sensor.
4. Fill the engine coolant.
5. Connect the negative battery cable.

Notice: Verify no engine coolant leaking from the sensor threads after replacement.

Mass Air Flow (MAF) / Intake Air Temperature (IAT) Sensor Replacement

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect a MAF & IAT sensor connector from the MAF & IAT sensor assembly.
3. Loosen the clips and remove the MAF & IAT sensor assembly from the intake duct housing.

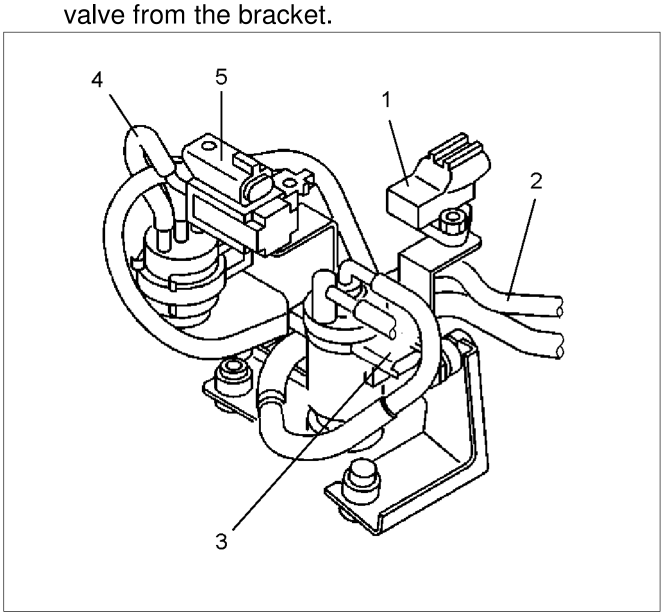
Installation Procedure

1. Install the MAF & IAT sensor assembly into intake air duct.
2. Tighten the clips.
3. Connect a MAF & IAT sensor connector to the MAF & IAT sensor assembly.
4. Connect the negative battery cable.

Turbocharger Solenoid Valve Replacement [High Altitude Spec]

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect a harness connector from the turbocharger solenoid valve.
3. Disconnect two hoses from the turbocharger solenoid valve.
4. Loosen a nut and remove the turbocharger solenoid valve from the bracket.



RTW66ESH004001

Legend

1. Vaccum Pressure Sensor
2. To Turbocharger
3. EGR Solenoid Valve
4. To Vacuum Regulating Valve
5. Turbocharger Solenoid Valve

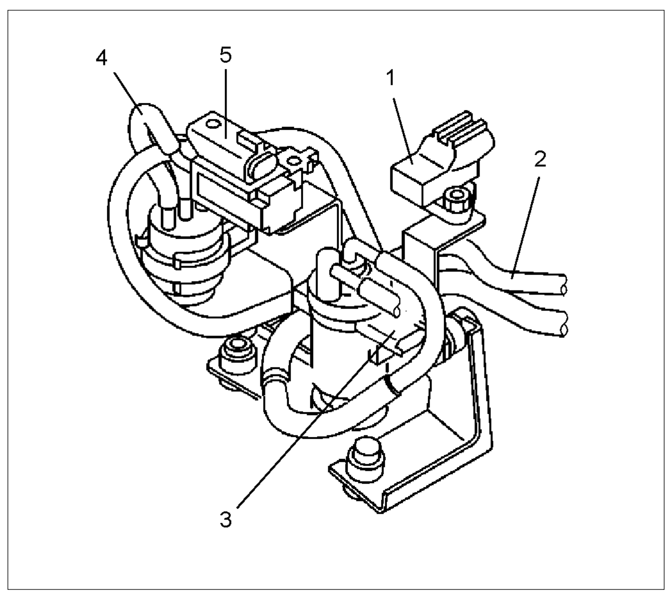
Installation Procedure

1. Set the turbocharger solenoid valve on the bracket and tighten a nut.
2. Connect a harness connector to the turbocharger solenoid valve.
3. Connect two hoses to the turbocharger solenoid valve.
4. Connect the negative battery cable.

Vacuum Pressure Sensor Replacement [High Altitude Spec]

Removal Procedure

1. Disconnect the negative battery cable.
2. Disconnect a harness connector from the vacuum pressure sensor.
3. Loosen a bolt and remove the vacuum pressure sensor from the bracket.



RTW66ESH004001

Legend

1. Vaccum Pressure Sensor
2. To Turbocharger
3. EGR Solenoid Valve
4. To Vacuum Regulating Valve
5. Turbocharger Solenoid Valve

Installation Procedure

1. Set the vacuum pressure sensor on the bracket and tighten a bolt.
2. Connect a harness connector to the vacuum pressure sensor.
3. Connect the negative battery cable.

Vehicle Speed Sensor (VSS) Replacement

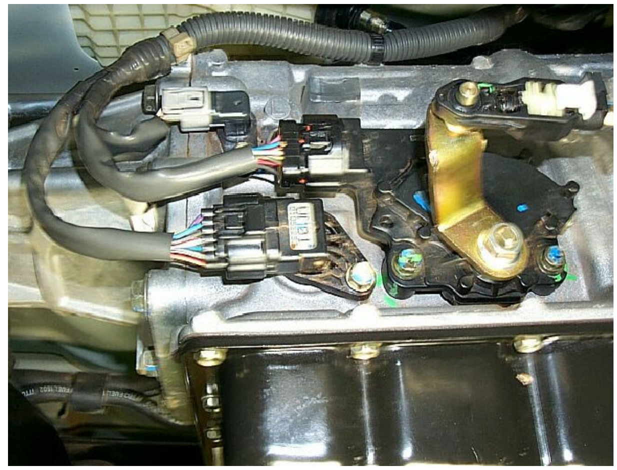
Removal Procedure

M/T & A/T (4WD)

1. Disconnect the negative battery cable.
2. Disconnect a harness connector from the vehicle speed sensor (VSS).
3. Remove the VSS from the transmission.

A/T (2WD)

1. Disconnect the negative battery cable.
2. Disconnect a harness connector from the vehicle speed sensor (VSS).
3. Loosen a bolt and remove the VSS from the transmission.



Installation Procedure

M/T & A/T (4WD)

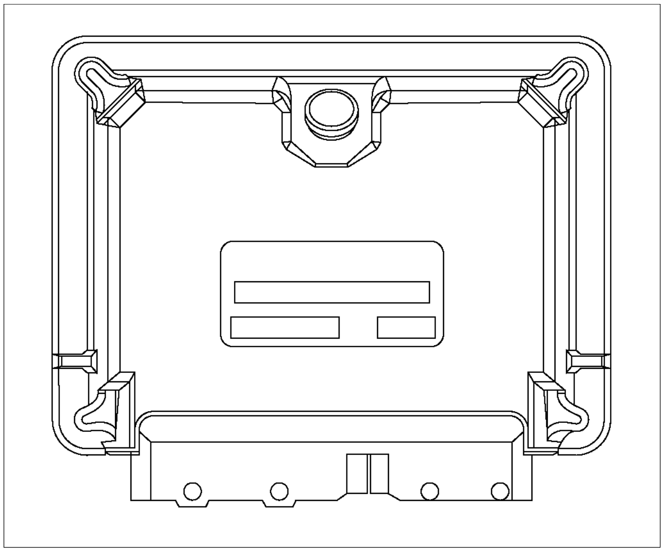
1. Install the VSS at the transmission.
2. Connect a harness connector to the VSS.
3. Connect the negative battery cable.

M/T & A/T (4WD)

1. Set the VSS at the transmission and tighten a bolt.
2. Connect a harness connector to the VSS.
3. Connect the negative battery cable.

Description And Operation

Engine Control Module (ECM) Description



RTW66ESH001201

The engine control module (ECM) is designed to withstand normal current draws associated with vehicle operation. Avoid overloading any circuit. When testing for opens and shorts, do not ground or apply voltage to any of the ECM circuits unless instructed to do so. In some cases, these circuits should only be tested using a digital multi meter (DMM). The ECM should remain connected to the ECM harness.

The ECM is located on the floor panel. The ECM mainly controls the following.

- The fuel system control
- The exhaust gas recirculation (EGR) system control
- The preheating (glow) system control
- The A/C compressor control
- On-board diagnostics for engine control

The ECM constantly observes the information from various sensor s. The ECM controls the systems that affect vehicle performance. The ECM performs the diagnostic function of the system. The ECM can recognize operational problems, alert the driver through the malfunction indicator lamp (MIL), and store diagnostic trouble codes (DTCs). DTCs identify the system faults to aid the technician in making repairs.

ECM Voltage Description

The ECM supplies a buffered voltage to various switches and sensor s. The ECM can do this because resistance in the ECM is so high in value that a test lamp may not illuminate when connected to the circuit. An ordinary shop voltmeter may not give an accurate reading because the voltmeter input impedance is too low. Use a 10-megaohm input impedance DMM, to ensure accurate voltage readings. The input and/or output devices in the ECM include analog-to-digital converters, signal buffers, counters, and special drivers. The ECM controls most components with electronic switches which complete a ground circuit when turned ON.

Aftermarket Electrical and Vacuum Equipment

Aftermarket or add-on electrical and vacuum equipment is defined as any equipment which connects to the vehicle's electrical or vacuum systems that is installed on a vehicle after the vehicle leaves the factory. No allowances have been made in the vehicle design for this type of equipment. No add-on vacuum equipment should be added to this vehicle. Add-on electrical equipment must only be connected to the vehicle's electrical system at the battery power and ground. Add-on electrical equipment, even when installed to these guidelines, may still cause the powertrain system to malfunction. This may also include equipment not connected to the vehicle electrical system such as portable telephones and audios. Therefore, the first step in diagnosing any powertrain fault is to eliminate all aftermarket electrical equipment from the vehicle. After this is done, if the fault still exists, the fault may be diagnosed in the normal manner.

Electrostatic Discharge Damage

Electronic components used in the ECM are often designed to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. By comparison, as much as 4,000 volts may be needed for a person to feel even the zap of a static discharge. There are several ways for a person to become statically charged. The most common methods of charging are by friction and induction.

- An example of charging by friction is a person sliding across a vehicle seat.

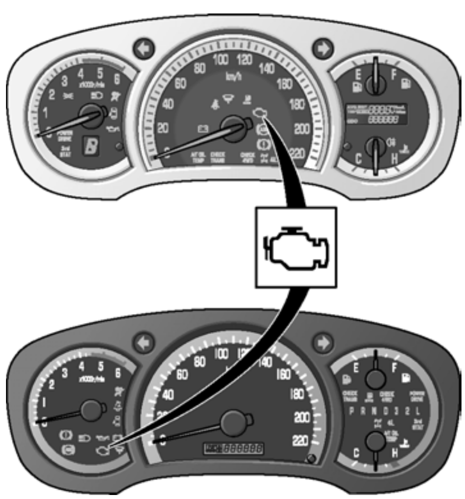
Important:

To prevent possible electrostatic discharge damage, follow these guidelines:

- Do not touch the ECM connector pins or soldered components on the ECM circuit board.
- Do not open the replacement part package until the part is ready to be installed.
- Before removing the part from the package, ground the package to a known good ground on the vehicle.
- If the part has been handled while sliding across the seat, while sitting down from a standing position, or while walking a distance, touch a known good ground before installing the part.
- Charge by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with opposite polarity.

Malfunction Indicator Lamp (MIL) Operation

The malfunction indicator lamp (MIL) is located in the instrument panel cluster (IPC). The MIL will display the following symbols when commanded ON:



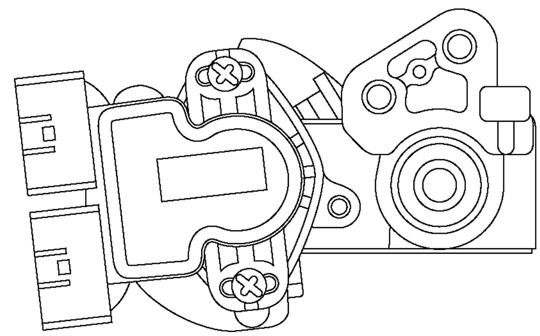
RTW76ESH004001

The MIL indicates that an emission or performance related fault has occurred and vehicle service is required. The following is a list of the modes of operation for the MIL:

- The MIL illuminates for approximately 2 seconds when the ignition switch is turned ON, with the engine OFF. This is a bulb test to ensure the MIL is able to illuminate.
- The MIL remains illuminated after the engine is started if the ECM detects a fault. A DTC is stored any time the ECM illuminates the MIL due to an emission or performance related fault.

Engine Control Component Description

Accelerator Pedal Position (APP) Sensor & Idle Switch

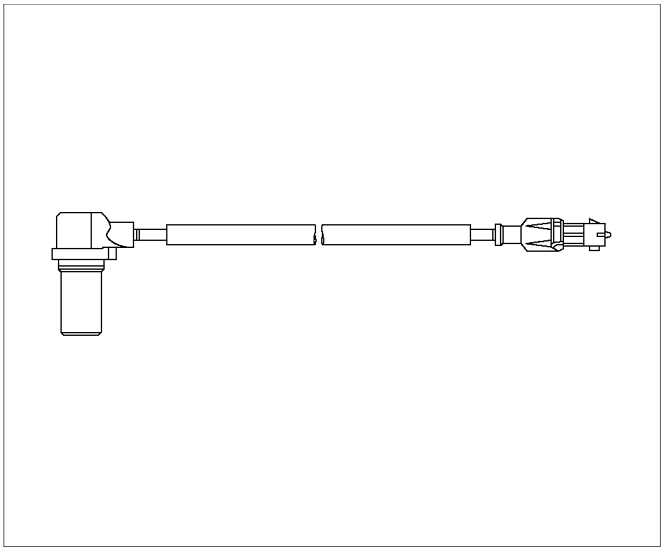


RTW66ESH001301

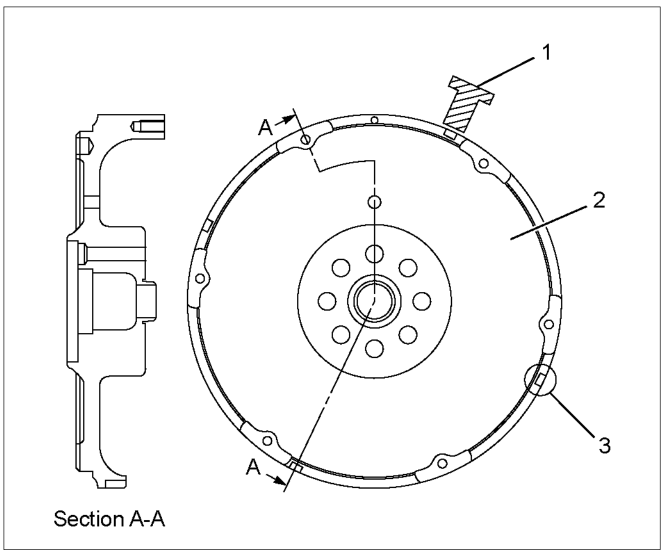
The accelerator pedal position (APP) sensor is mounted on the throttle assembly. The engine control module (ECM) uses the APP sensor s to determine the amount of acceleration or deceleration desired by the person driving the vehicle via the fuel injection control.

The idle switch is also mounted on the intake throttle assembly. The idle switch is part of the APP sensor assembly. The idle switch is a normally closed type switch. When the accelerator pedal is released, the idle switch signal to the ECM is low voltage.

Crankshaft Position (CKP) Sensor



RTW06ESH000101



RTW66ESH001401

Legend

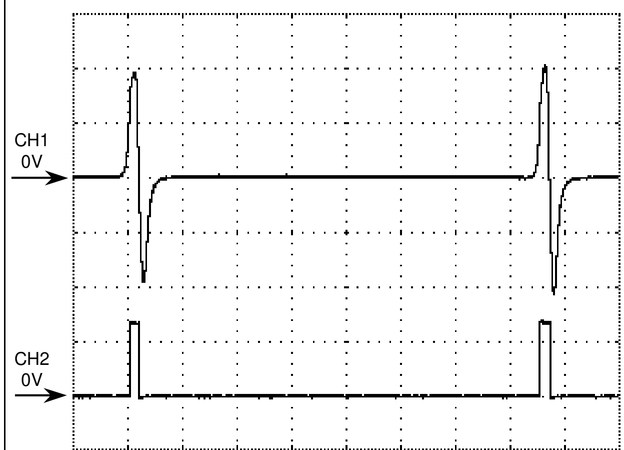
1. Crankshaft Position (CKP) Sensor
2. Flywheel
3. Slit

The crankshaft position (CKP) sensor is located on top of the flywheel housing. There are 4 slits spaced 90° on the flywheel circumference. The CKP sensor is a magnetic coil type sensor , which generates an AC signal voltage based on the crankshaft rotational speed. The ECM monitors both the CKP sensor and injection pump camshaft position (CMP) sensor signals to ensure they correlate with each other.

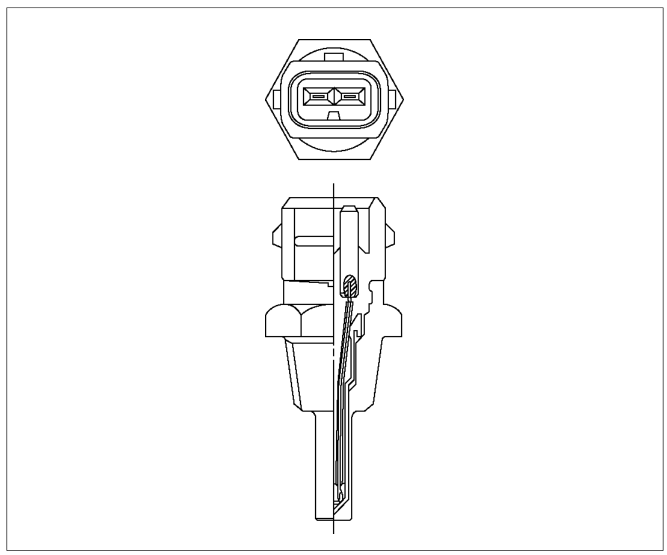
The following waveform aids to diagnose when there is an oscilloscope or equivalent.

Engine Coolant Temperature (ECT) Sensor

- Amplitudes of CKP sensor signal (CH1) increase as engine speed increases.
- Each waveform cycle shorten as the engine speed increases.



Terminal: 90 (CH1), 91 (CH2) (+) / GND (-)
Scale: 10V/div 2ms/div
Condition: Approximately 1000RPM



RTW66ESH001501

Legend

1. Engine Coolant Temperature (ECT) Sensor

The engine coolant temperature (ECT) sensor is installed to the thermostat housing. The ECT sensor is a variable resistor. The ECT sensor measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 volts to the ECT signal circuit and a ground for the ECT low reference circuit. When the ECT sensor is cold, the sensor resistance is high. When the engine coolant temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the ECT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the ECT signal circuit.

YES

- Is there battery voltage between the chassis side harness connector terminal No. 10 (B-57) and ground?

NO

Open circuit between the engine room harness connector (cooler only) terminal No. 4 (C-55) and the chassis side harness connector terminal No. 11 (B-57).

YES

- Disconnect the A/C switch.

- Is there battery voltage between the chassis side harness connector terminal No. 6 (B-57) and ground (C-109)?

NO

Open circuit between the chassis side harness connector No. 1 (B-79) and the chassis side harness connector terminal No. 10 (B-57).

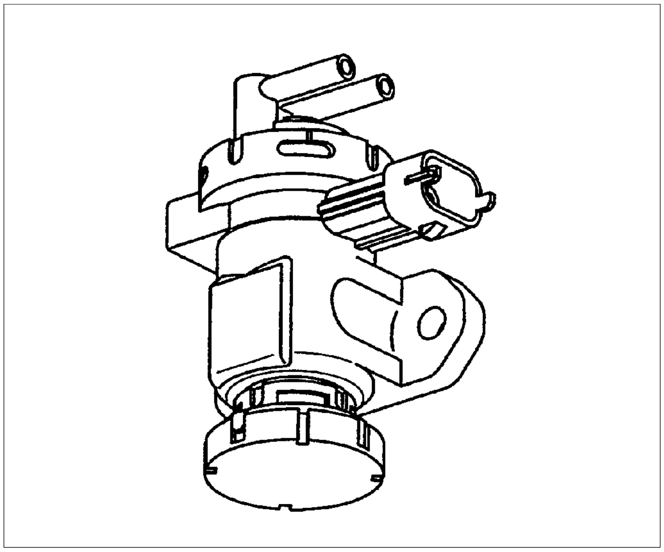
YES

- Defective ECM

NO

Open circuit between the No. EB-13 fuse and the chassis side harness connector No. 6 (B-57).

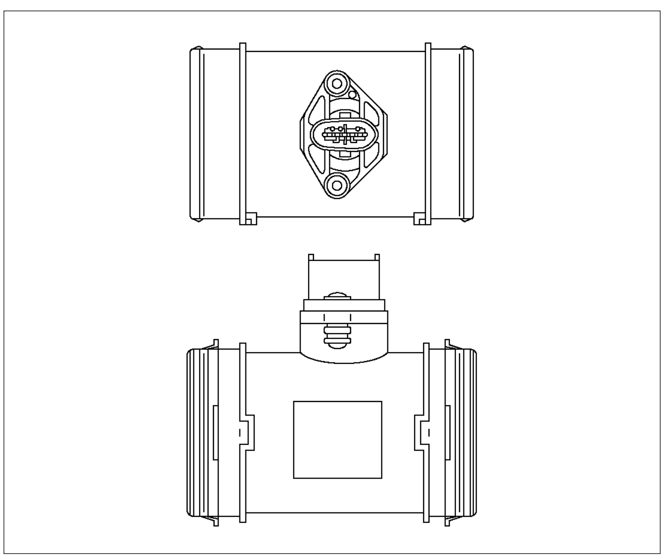
Exhaust Gas Recirculation (EGR) Solenoid Valve



RTW76ESH003601

The engine control module (ECM) controls the exhaust gas recirculation (EGR) flow amount based on the engine speed, engine coolant temperature, intake air temperature, barometric pressure and fuel injection quantity. The ECM controls the EGR valve by controlling the EGR solenoid valve. The mass air flow (MAF) sensor monitors EGR gas flow amount. An expected MAF amount should be detected while the engine running.

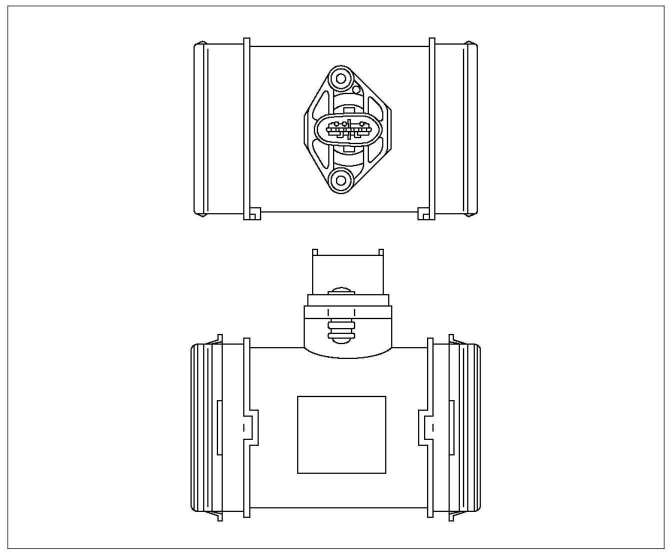
Intake Air Temperature (IAT) Sensor



RTW66ESH001701

The intake air temperature (IAT) sensor is fitted between the air cleaner and turbocharger internal to the mass air flow (MAF) sensor. The IAT sensor is a variable resistor. The IAT sensor measures the temperature of the air entering the engine. The engine control module (ECM) supplies 5 volts to the IAT signal circuit and a ground for the IAT low reference circuit. When the IAT sensor is cold, the sensor resistance is high. When the air temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the IAT signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the IAT signal circuit.

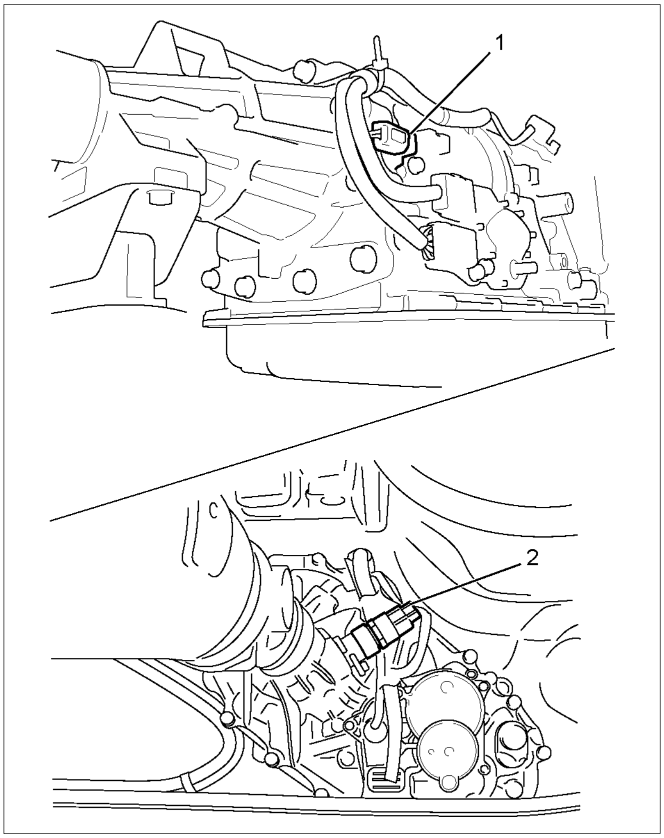
Mass Air Flow (MAF) Sensor



RTW66ESH001701

The mass air flow (MAF) sensor is an air flow meter that measures the amount of air that enters the engine. It is fitted between the air cleaner and turbocharger. A small quantity of air that enters the engine indicates deceleration or idle. A large quantity of air that enters the engine indicates acceleration or a high load condition. The MAF sensor assembly consists of a MAF sensor element and an intake air temperature sensor that are both exposed to the air flow to be measured. The MAF sensor element measures the partial air mass through a measurement duct on the sensor housing.

Vehide Speed Sensor (VSS)



RTW56EMH000301

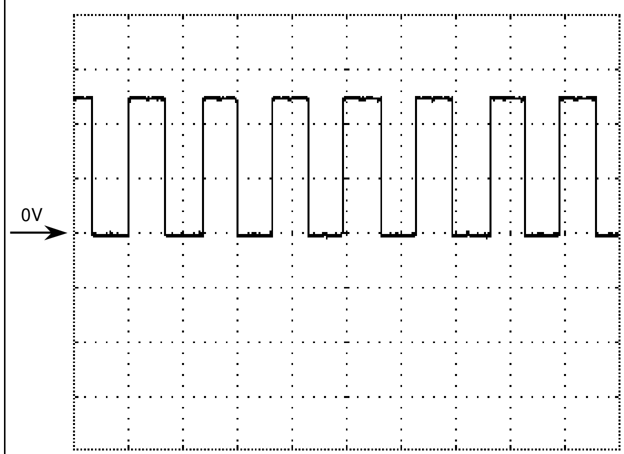
Legend

1. Vehicle Speed Sensor (VSS) 2WD with A/T
2. Vehicle Speed Sensor (VSS) except 2WD with A/T

The vehicle speed sensor (VSS) is used by the engine control module (ECM) and speedometer, which generates a speed signal from the transmission output shaft. The VSS uses a hall effect element. It interacts with the magnetic field created by the rotating magnet and outputs square wave pulse signal. The ECM calculates the vehicle speed by the VSS.

The following waveform aids to diagnose when there is an oscilloscope or equivalent.

- VSS waveform cycle shorten as the vehicle speed increases.



Terminal: 68 (+) / GND (-)
Scale: 5V/div 50ms/div
Condition: Approximately 20km/h (12MPH)

Fuel Injection System Description

11. Radial Plunger

Bosch VP44 Fuel Injection Pump

Instead of the previous face cam type, the radial plunger distributor type injection pump utilizes a cam ring to enable fuel injection at high-pressures, marking it suitable for small, high-speed direct injection diesel engines. This pump was developed to provide the most suitable fuel injection quantity and injection timing to satisfy the demand for engine reliability, driveability, low smoke, low noise, high output and low exhaust emissions.

The engine control module (ECM) calculates the desired fuel injection quantity and timing using data sent from various sensor s. These desired data are sent to the fuel injection pump control unit (PCU) via a controller area network (CAN) communication bus. The PCU also receives signals from the internal inputs: pump camshaft position (CMP) sensor that is located inside the fuel injection pump to determine the cam ring rotation angle and the fuel injection pump speed. The fuel temperature (FT) sensor is internal the PCU. These values are used to compare the desired values sent from the ECM then PCU determines the injection timer piston position and fuel injection quantity, and actuates timing control valve (TCV) & fuel injection solenoid valve based on control maps in the PCU.

The timing device changes the optimum injection timing against various engine conditions. The pressure of the fuel fed from the feed pump is adjusted and it acts to the timing plunger by TCV controlled fuel pressure. (The TCV is installed to the fuel injection pump rear side and it is controlled by duty ratio cycle from the PCU.) The timing plunger is connected to the cam ring by a ball pin. Axial movement of the timing plunger is transferred to the cam ring in the form of rotational movement.

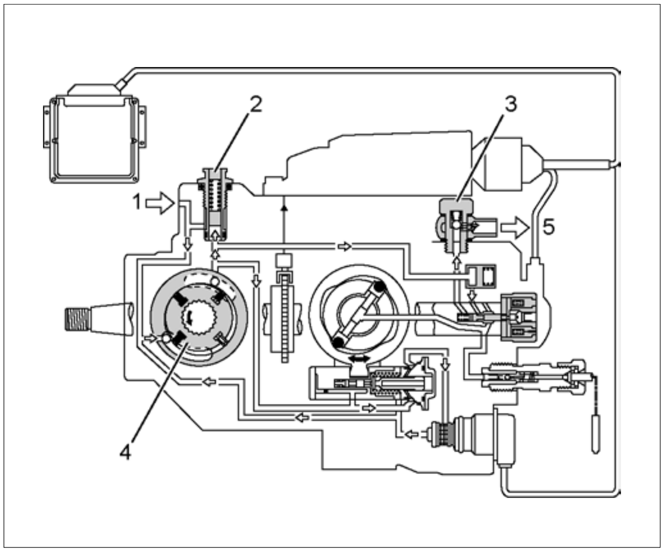
Low Pressure Fuel Circuit Description



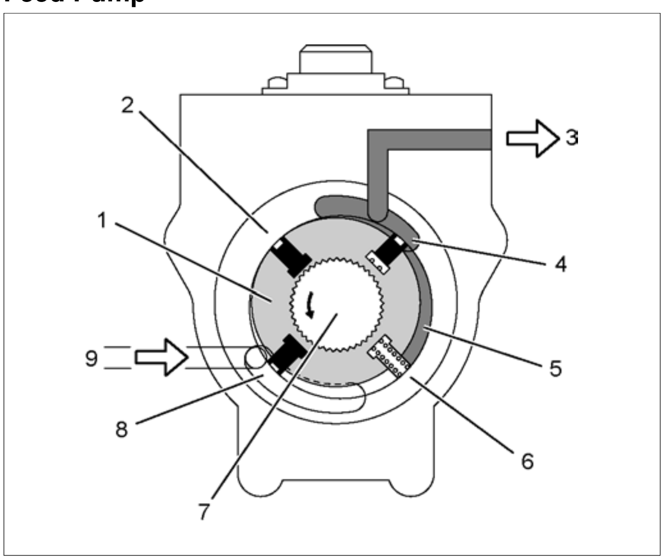
RTW66ESH002101

Legend

1. Fuel Suction
2. Regulating Valve
3. Overflow Valve
4. Feed Pump
5. To Fuel Tank

The low pressure fuel circuit must supply sufficient fuel to the high pressure fuel circuit. The main components are the feed pump, the regulating valve and the overflow valve.

Feed Pump



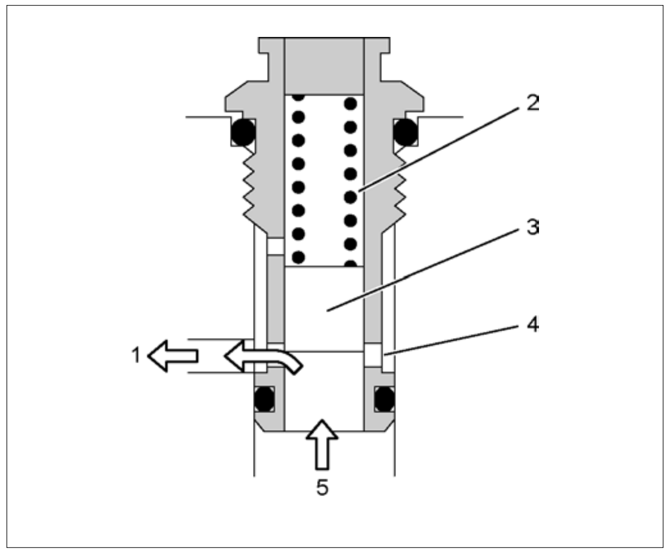
RTW66ESH002201

Legend

1. Rotor
2. Casing Ring
3. Fuel Supply
4. Outlet
5. Chamber
6. Vane
7. Driveshaft
8. Inlet
9. Fuel Suction

The feed pump is driven by the drive shaft, performs suction and supply of fuel. The vanes assembled in the rotor are pressed against the inside of the casing ring by spring forces and centrifugal force during rotation to form chambers. When the vanes rotate, the volume of these chambers increase when they reach recesses the casing ring connected to the inlet port. Pressure then decreases and fuel is drawn in. When the chambers have passed the inlets and recesses, the volume decreases and the fuel is compressed. Fuel pressure increases until the chamber reaches the outlet, where the fuel passes through the regulating valve to the high pressure fuel circuit.

Regulating Valve



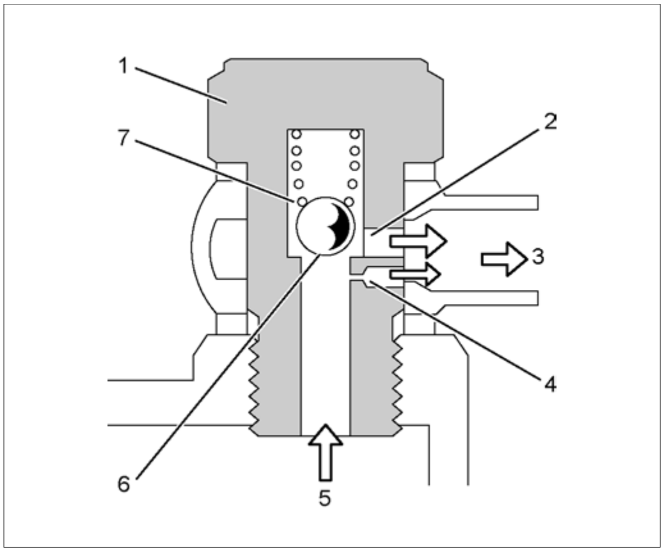
RTW66ESH002301

Legend

1. To Inlet
2. Spring
3. Valve Piston
4. Port
5. From Outlet

When feed pump speed increases so that the delivery pressure of the fuel delivered from the outlet exceeds the regulating valve spring force, the plunger is pushed upwards. Excess fuel passes through the ports and returns to the inlet side, and the delivery pressure is maintained within a specified range. When feed pump speed decreases so that the delivery pressure decreases, the plunger is pushed downwards by spring force to close the port.

Overflow Valve



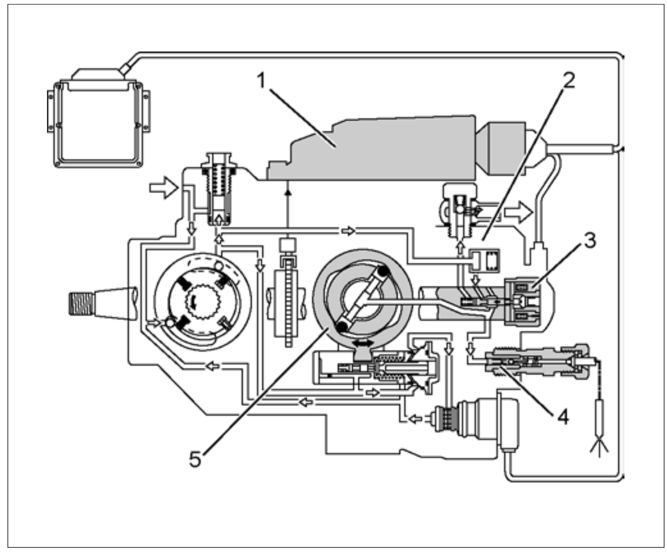
RTW66ESH002401

Legend

1. Valve Holder
2. Port
3. To Fuel Tank
4. Orifice Port
5. From Fuel Tank
6. Ball Valve
7. Spring

When the pressure of the fuel, returned from the distributor head, exceeds the spring force, the overflow valve's ball valve is pushed up. Excess fuel presses through the port and returns to the tank, and fuel pressure inside the pump chamber does not exceed a specified pressure. The flow of excess fuel serves cooling and automatic bleeding of the fuel pump during operation. Also the orifice port is installed to assist in automatic air bleeding.

High Pressure Fuel Circuit Description



RTW66ESH002501

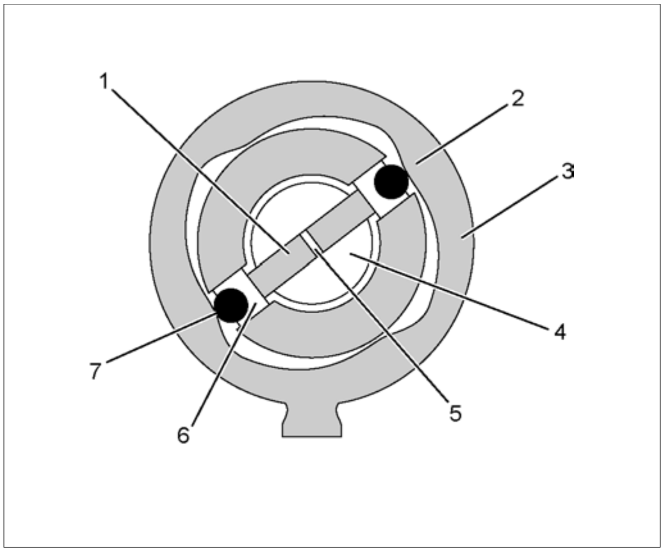
Legend

1. Fuel Injection Pump Control Unit (PCU)
2. Distributor Head
3. Fuel Injection Solenoid Valve
4. Constant Pressure Valve (CPV)
5. Radial Plunger

In addition high pressure generating device, the high pressure circuit also consists of fuel piping, and devices to set the beginning of injection and fuel injection quantity. The main components are as follows:

- High pressure generation: Radial Plunger
- Fuel distribution: Distributor Head
- Beginning of injection timing: Timing Device
- Prevention of secondary injection: Constant Pressure Valve (CPV)

Radial Plunger



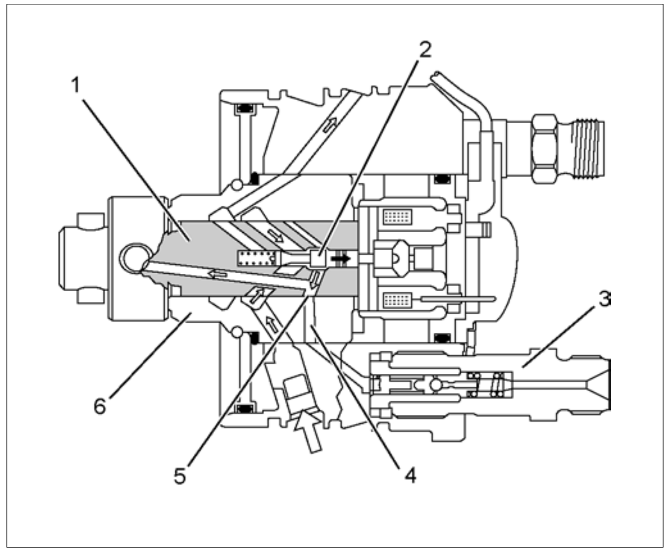
RTW66ESH002601

Legend

1. Radial Plunger
2. Internal Cam
3. Cam Ring
4. Rotor Shaft
5. Plunger Chamber
6. Roller Shoe
7. Roller

While the radial plungers assembled to the rotor shaft rotate, they are held against the inside of the cam ring (via the roller shoes and rollers) by fuel delivery pressure from the feed pump and centrifugal force. The radial plungers perform rotational movement as well as internal cam induced reciprocating movement to suck in and compress the fuel in the plunger chamber.

Distributor Head



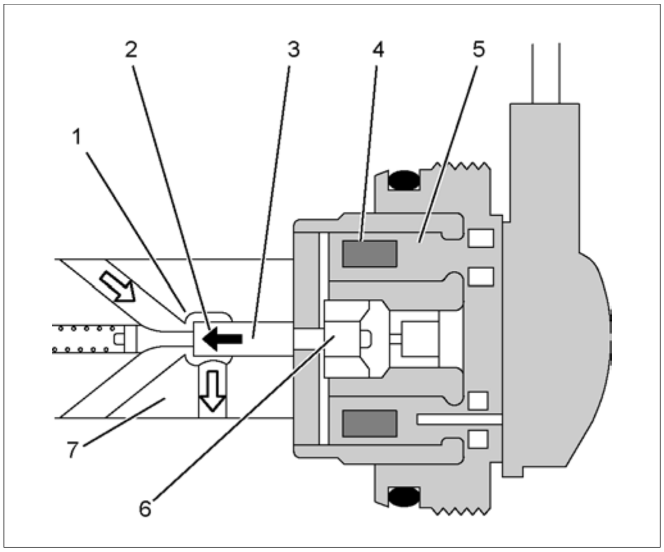
RTW66ESH002701

Legend

1. Rotor Shaft
2. Valve Needle
3. Constant Pressure Valve (CPV) Holder
4. High Pressure Outlet
5. Distributor Shaft
6. Barrel

The distributor head distribute the high pressure fuel that has flowed through the rotating rotor shaft's distributor slits and the barrel's high pressure outlets (4 cylinders: 4) to the engine cylinders via the constant pressure valve (CPV) and the nozzle holder assemblies. The fuel injection solenoid valve needle changes the passage to the radial plunger high pressure pump between fuel suction and fuel compression.

Fuel Injection Solenoid Valve



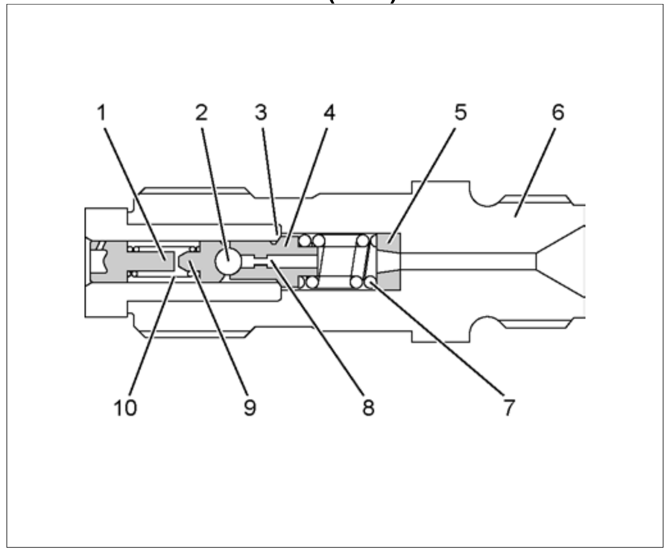
RTW66ESH002801

Legend

1. Valve Seat
2. Valve Closing Direction
3. Valve Needle
4. Coil
5. Magnet
6. Magnet Anchor
7. Rotor Shaft

The fuel injection solenoid valve consists of a valve seat, a valve needle, and a magnet anchor (a movable iron core), a coil and a magnet. The valve needle rotates together with the rotor shaft. When current controlled by the fuel injection pump control unit (PCU) flows to the coil, the magnet anchor and the valve needle are pushed towards the valve seat. When the valve seat is completely closed by the valve needle, the fuel in the high pressure passage is isolated from the low pressure passage, is compressed by the radial plunger high pressure pump, and injected into the engine cylinder through the nozzle holder assembly. When the required injection quantity is reached, the current to the coil is cut, the valve seat opens and injection of fuel is completed.

Constant Pressure Valve (CPV)



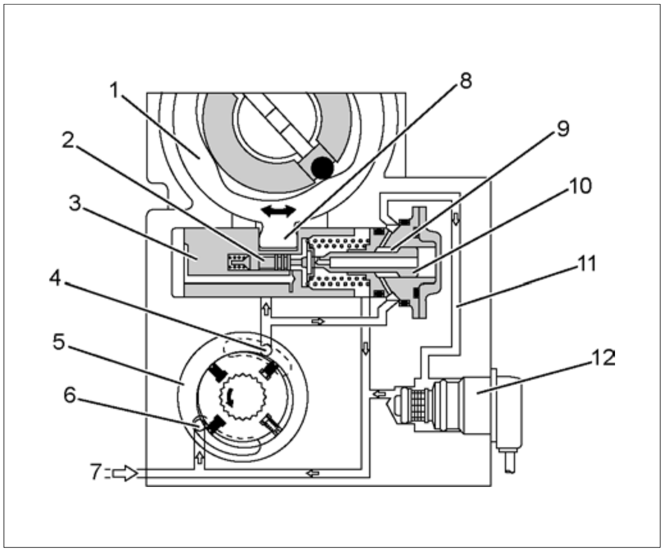
RTW66ESH002901

Legend

1. Plug
2. Ball
3. Seat
4. Valve
5. Spacer
6. Holder
7. Valve Spring
8. Oriffice
9. Ball Support
10. Spring

The constant pressure valve (CPV) consists of a holder, a spacer, a valve spring, a valve, a seat, a ball, a ball support, a spring and a plug. The valve is equipped with an orifice to suppress the reflected pressure wave (the cause of secondary injection) caused by nozzle closing at the end of the injection and maintains a stable pressure in the injection pipe (residual pressure) to ensure stabilized injection timing for subsequent injection. The valve is opened by pressurized fuel and this high pressure fuel is delivered to the nozzle holder assembly.

Timing Control Device Description



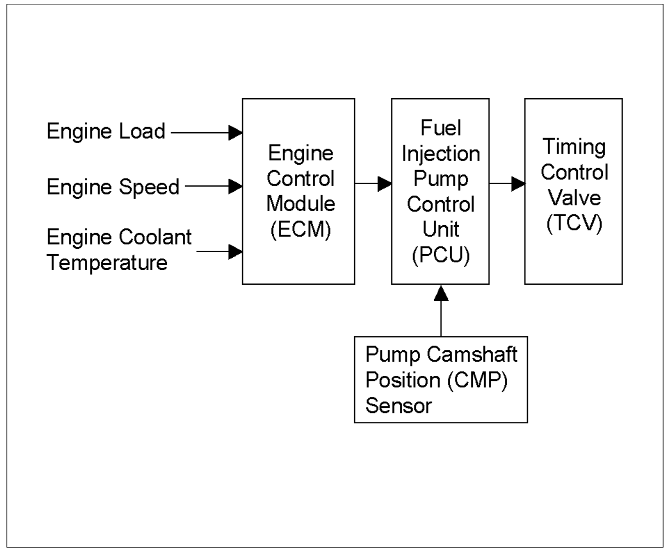
RTW66ESH003001

Legend

1. Cam Ring
2. Servo Valve
3. Timer Piston
4. Outlet
5. Feed Pump
6. Inlet
7. Fuel Suction
8. Ball Pin
9. Annular Chamber
10. Hydraulic Stopper
11. Return Passage
12. Timing Control Valve (TCV)

The timing device determines the optimum injection timing against variations in engine speed. The pressure of the fuel fed from the feed pump is adjusted in accordance with speed by the regulating valve. This delivery pressure acts on the hydraulic stopper's annular chamber as control pressure. The chamber pressure of the annular chamber is controlled by the timing control valve (TCV). The timing plunger is connected to the cam ring by a ball pin. Axial movement of the timing plunger is transferred to the cam ring in the form of rotational movement. Movement to the right of the timing plunger (to the spring side) advances injection timing. The main components are timing plunger, the TCV and pump camshaft position (CMP) sensor.

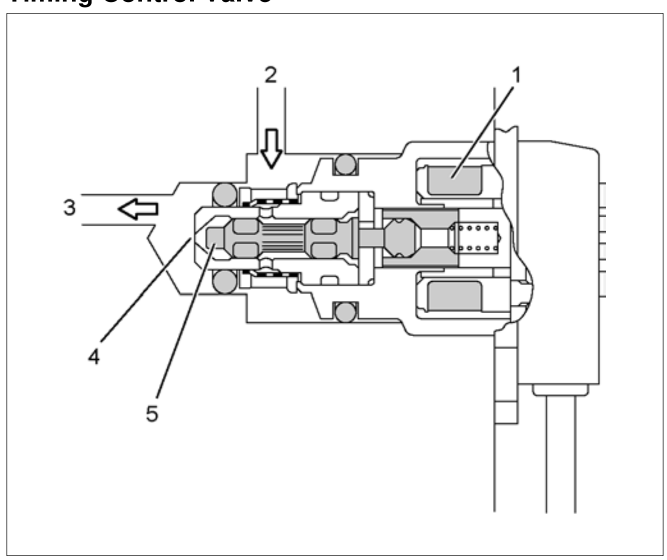
Beginning of Injection Staring



RTW66ESH003101

The engine control module (ECM) contains characteristic maps of the beginning of injection, corresponding to engine operating conditions (engine load, engine speed and engine coolant temperature). The fuel injection pump control unit (PCU) is constantly comparing the set beginning of injection timing and the actual beginning of injection timing. If there is a difference, the timing control valve (TCV) is controlled by the duty ratio. (The actual beginning of injection timing is determined from the pump camshaft position [CMP] sensor.)

Timing Control Valve



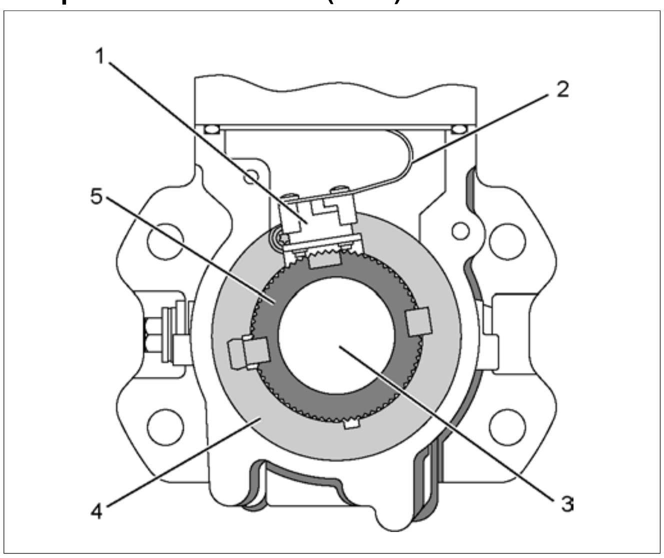
RTW66ESH003201

Legend

1. Coil
2. From Annular Chamber
3. To Feed Pump
4. Orifice
5. Valve Needle

The timing control valve (TCV) acts as a variable throttle, using the rapid opening and closing (cycling) of the valve needle in the TCV. At normal operation, the TCV controls the pressure acting on the annular chamber so that the hydraulic stopper cam move to any position, from the retard position to the advance position. At this time, the duty ratio is set by the fuel injection pump control unit (PCU).
When control current flows to the TCV coil, the valve needle opens and the fuel annular chamber flows through the orifice to the feed pump inlet. Consequently, the pressure of the annular chamber decreases and the hydraulic stopper is moved to the retard side.
When control current to the TCV coil is cut, the valve needle closes and the return passage is closed. Consequently, the pressure of the annular chamber increases and the hydraulic stopper is moved to the advance side.

Pump Camshaft Position (CMP) Sensor



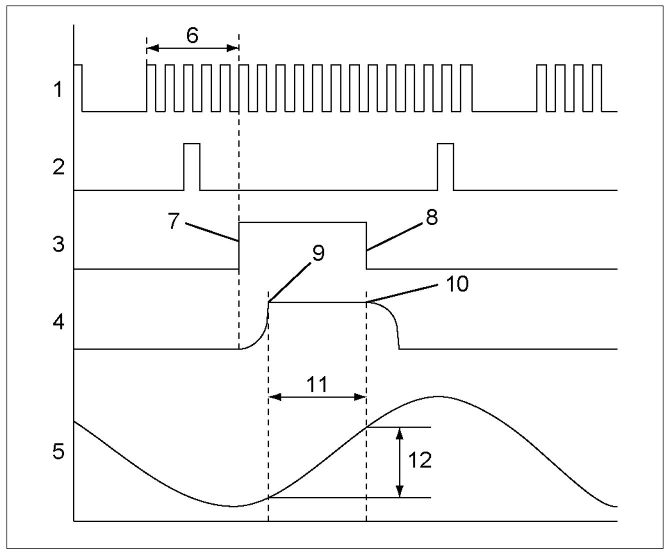
RTW66ESH003301

Legend

1. Pump Camshaft Position (CMP) Sensor
2. Flexible Connecting Harness
3. Drive Shaft
4. Pump Camshaft Position (CMP) Sensor Retaining Ring
5. Sensor Wheel

When the drive shaft rotates, the pump camshaft position (CMP) sensor receives signal form the sensor wheel, and an electric pulse is sent through the flexible connecting harness to the fuel injection pump control unit (PCU). From these signals the PCU can determine the average pump speed and the momentary pump speed. The pump CMP sensor is mounted to the cam ring. Thus, the relationship between the cam ring and the pump CMP sensor signal is constant. The pump CMP sensor signal is utilized for the following purposes:

- To determine the momentary angular position of the cam ring.
- To calculate the actual speed of the fuel injection pump.
- To determine the actual timing plunger position.



RTW66ESH003401

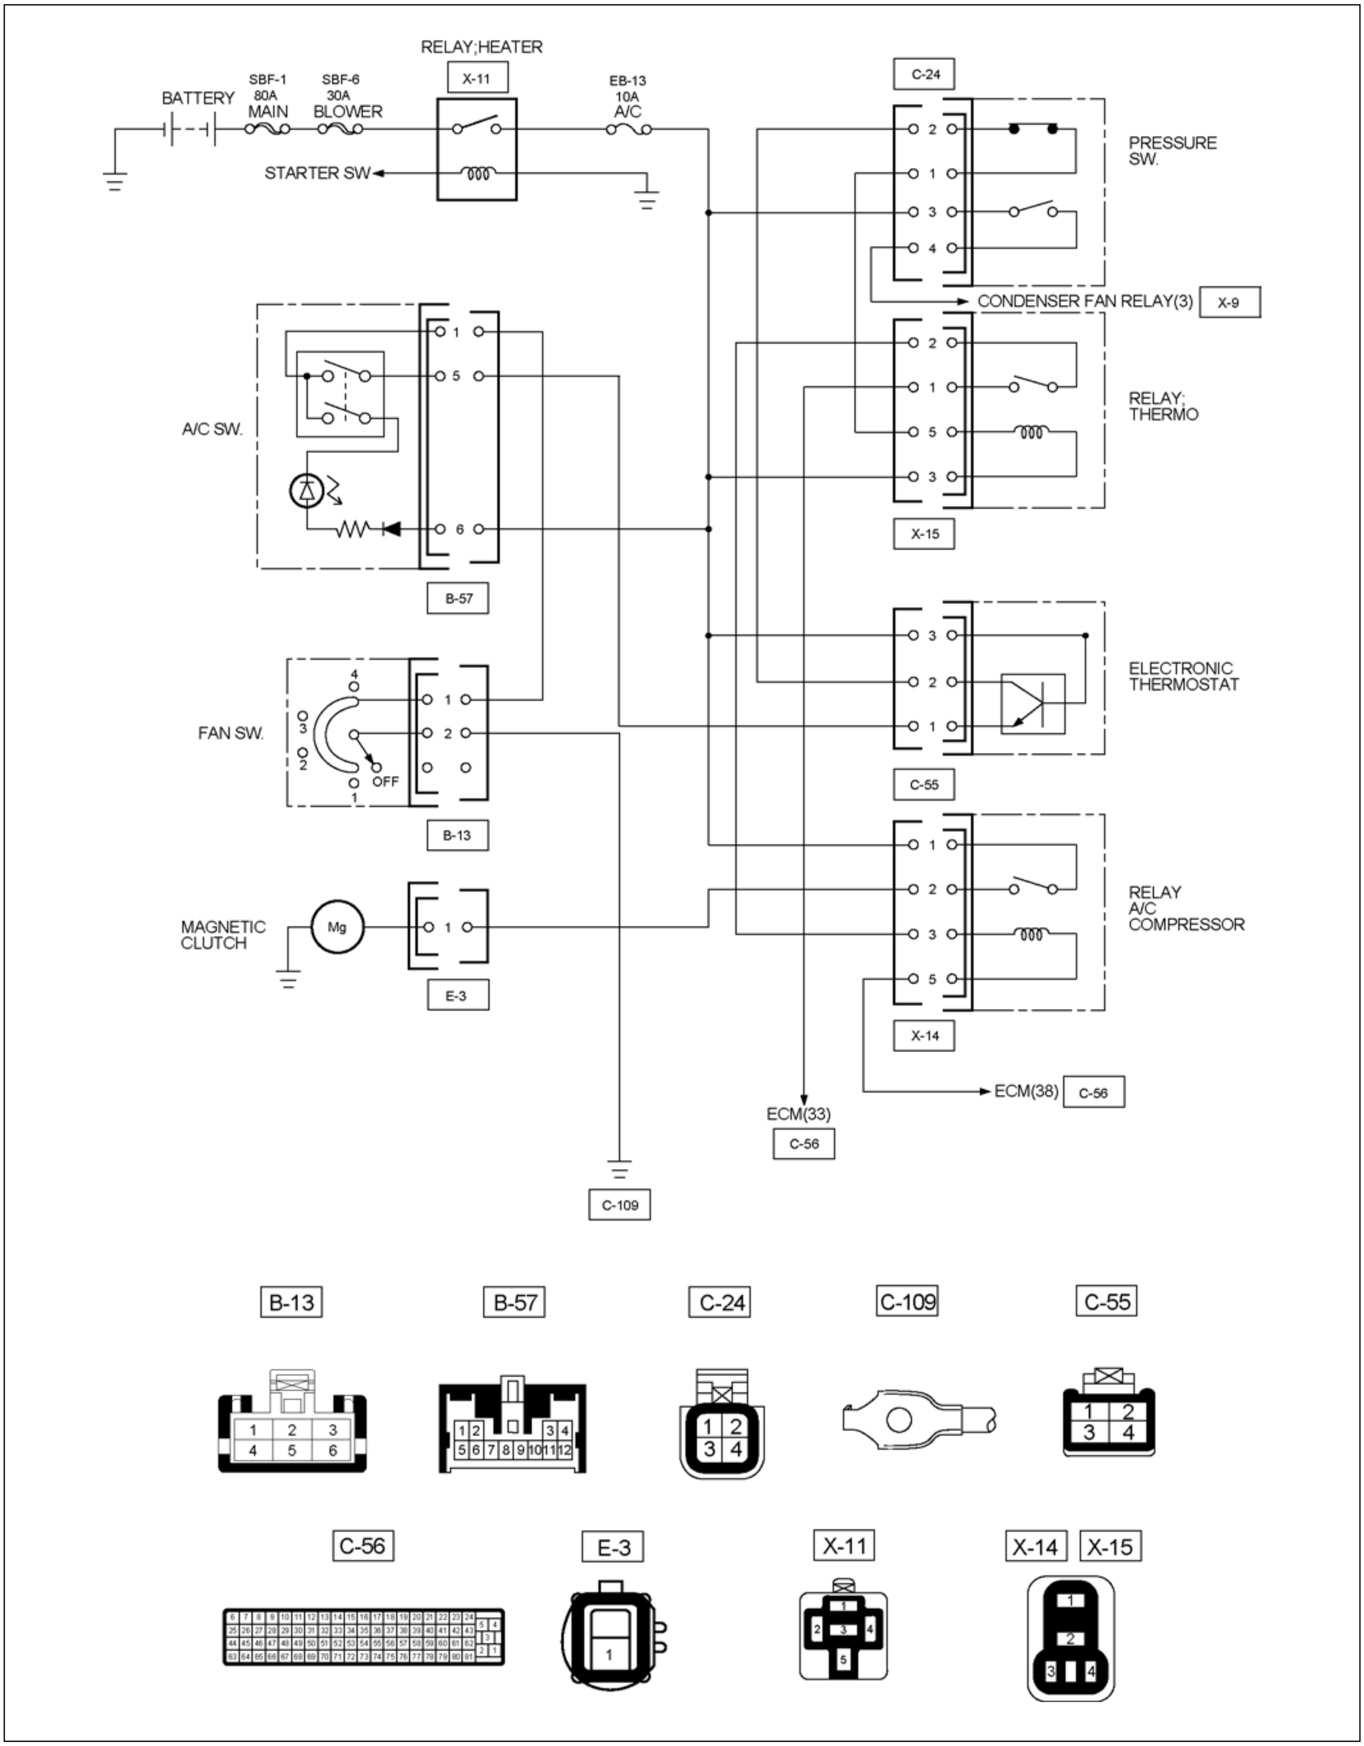
12. Effective Stroke

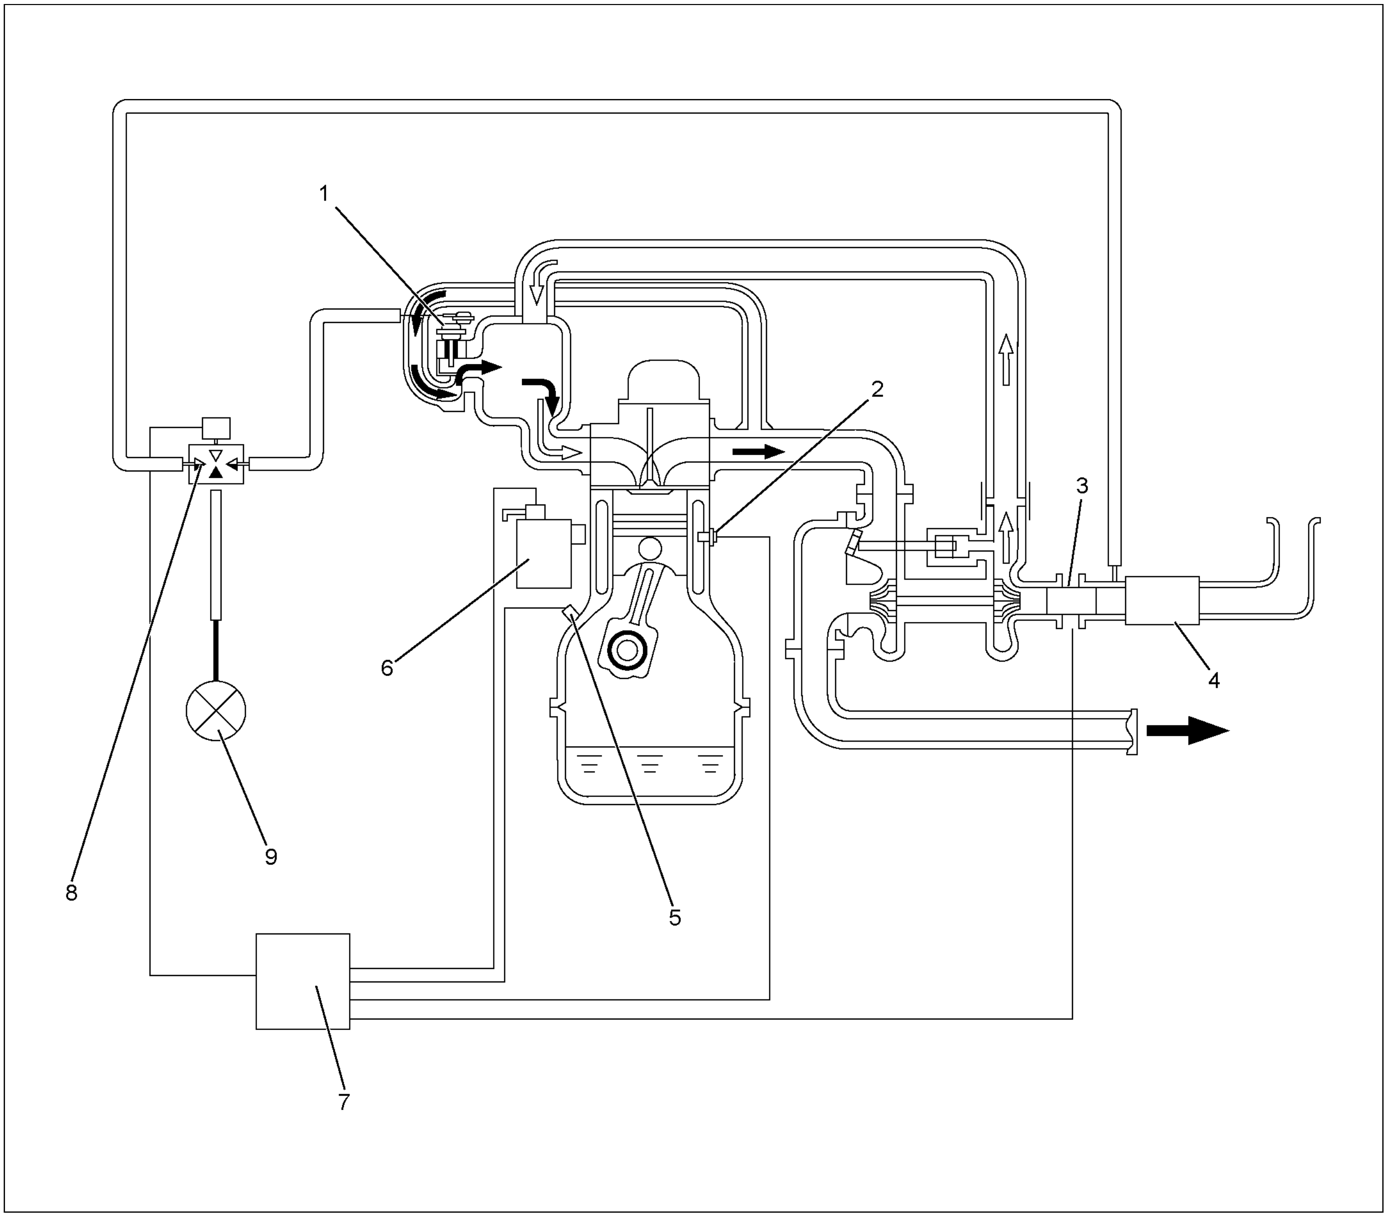
4JH1 – TC



RTW710XF000301

- Momentary Cam Ring Angular Position
  The momentary angular position of the cam ring is input into the fuel injection PCU as a fuel injection solenoid valve control signal. From momentary input of angular position for fluctuations in running conditions, the fuel injection solenoid valve open and close intervals corresponding to the cam ring's cam lift can be accurately determined.
- Actual Injection Pump Speed
  When the crankshaft position (CKP) sensor is faulty, the engine control module (ECM) uses the pump CMP signal as a replacement signal.
- Actual Timing Plunger Position
  The actual timing plunger position can be determined by comparing the CKP sensor signal with the pump CMP sensor angle. This position is used for timer control.

Exhaust Gas Recirculation (EGR) System Description



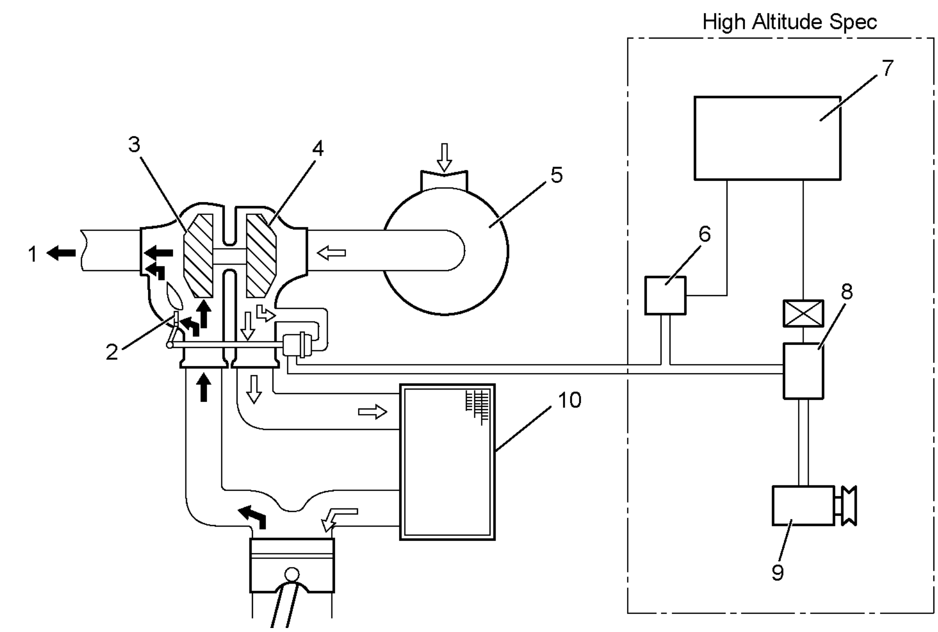
RTW66ELF000101

Legend

1. EGR Cooler
2. Engine Coolant Outlet
3. Engine Coolant Inlet
4. EGR Valve
5. ECM
6. MAF & IAT Sensor
7. Intake Throttle Valve

The EGR system recirculates a part of exhaust gas back into the intake manifold, which results in reducing nitrogen oxide (NOx) emissions. The EGR control system uses an electronic control system solenoid valve and vacuum control EGR valve to ensure both driveability and low emission. The engine control module (ECM) controls the EGR flow amount based on the engine speed, engine coolant temperature, intake air temperature, barometric pressure and fuel injection quantity. The ECM controls the EGR valve opening by controlling the EGR solenoid valve drive duty. The mass air flow (MAF) sensor monitors EGR gas flow amount. An expected MAF amount should be detected while the engine running.

Turbocharger Description



RTW66EMF000501

Legend

1. Exhaust Gas
2. Wastegate Valve
3. Turbine Wheel
4. Compressor Wheel
5. Air Cleaner
6. Vacuum Pressure Sensor
7. Engine Control Module (ECM)
8. Turbocharger Solenoid Valve
9. Vacuum Pump (ACG)
10. Change Air Cooler (Intercooler)

The turbocharger is used to increase the amount of air that enters the engine cylinders. This allows a proportional increase of fuel to be injected into the cylinders, resulting in increased power output, more complete combustion of fuel, and increased cooling of the cylinder heads, pistons, valves, and exhaust gas. This cooling effect helps extend engine life.
Heat energy and pressures in the engine exhaust gas are utilized to drive the turbine. Exhaust gas is directed to the turbine housing. The turbine housing acts as a nozzle to direct the shaft wheel assembly. Since the compressor wheel is attached directly to the shaft, the compressor wheel rotates at the same speed as the turbine wheel. Clean air from the air cleaner is drawn into the compressor housing and wheel. The air is compressed and delivered through a crossover pipe to the engine air intake manifold, then into the cylinders. The amount of air pressure rise and air volume delivered to the engine from the compressor outlet is regulated by a wastegate valve in the exhaust housing. The position of the wastegate valve is controlled by the amount of pressure built up on the intake side of the turbocharger. The diaphragm on the inside of the wastegate is pressure sensitive, and controls the position of the valve inside the turbocharger. The position of the valve will increase or decrease the amount of boost to the turbocharger.
The charge air cooler also helps the performance of the diesel. Intake air is drawn through the air cleaner and into the turbocharger compressor housing. Pressurized air from the turbocharger then flows forward through the charge air cooler located in the front of the radiator.
From the charge air cooler, the air flows back into the intake manifold.
The charge air cooler is a heat exchanger that uses air flow to dissipate heat from the intake air. As the turbocharger increases air pressure, the air temperature increases. Lowering the intake air temperature increases the engine efficiency and power by packing more air molecules into the same space.

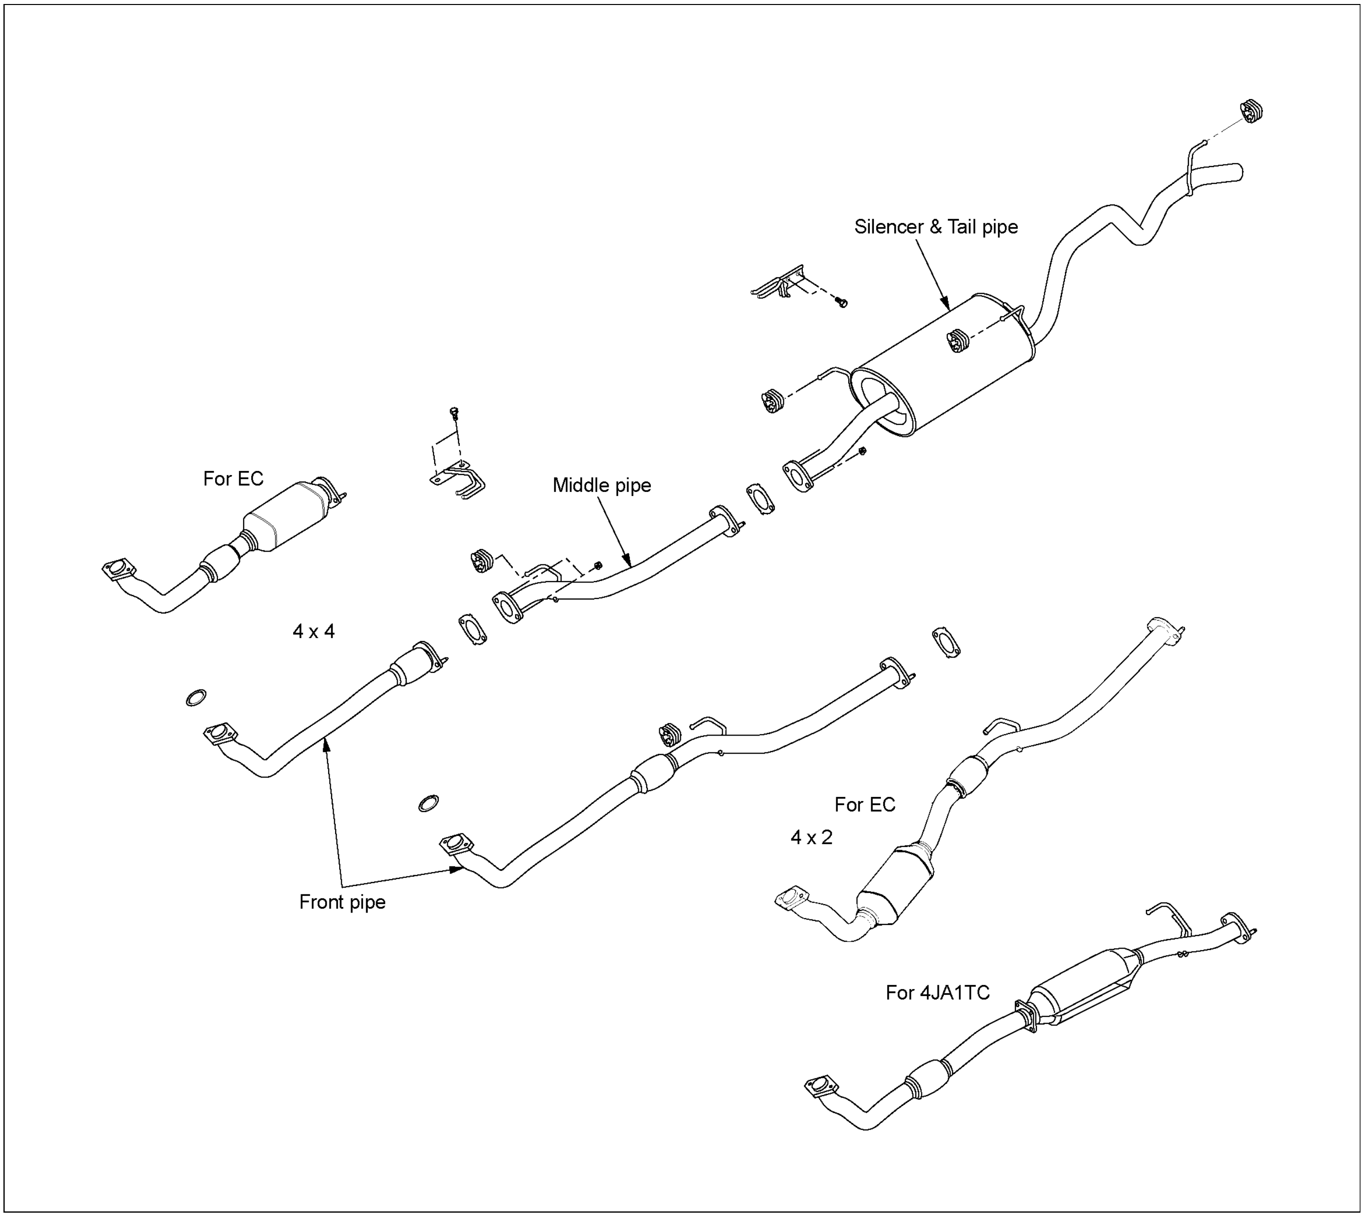
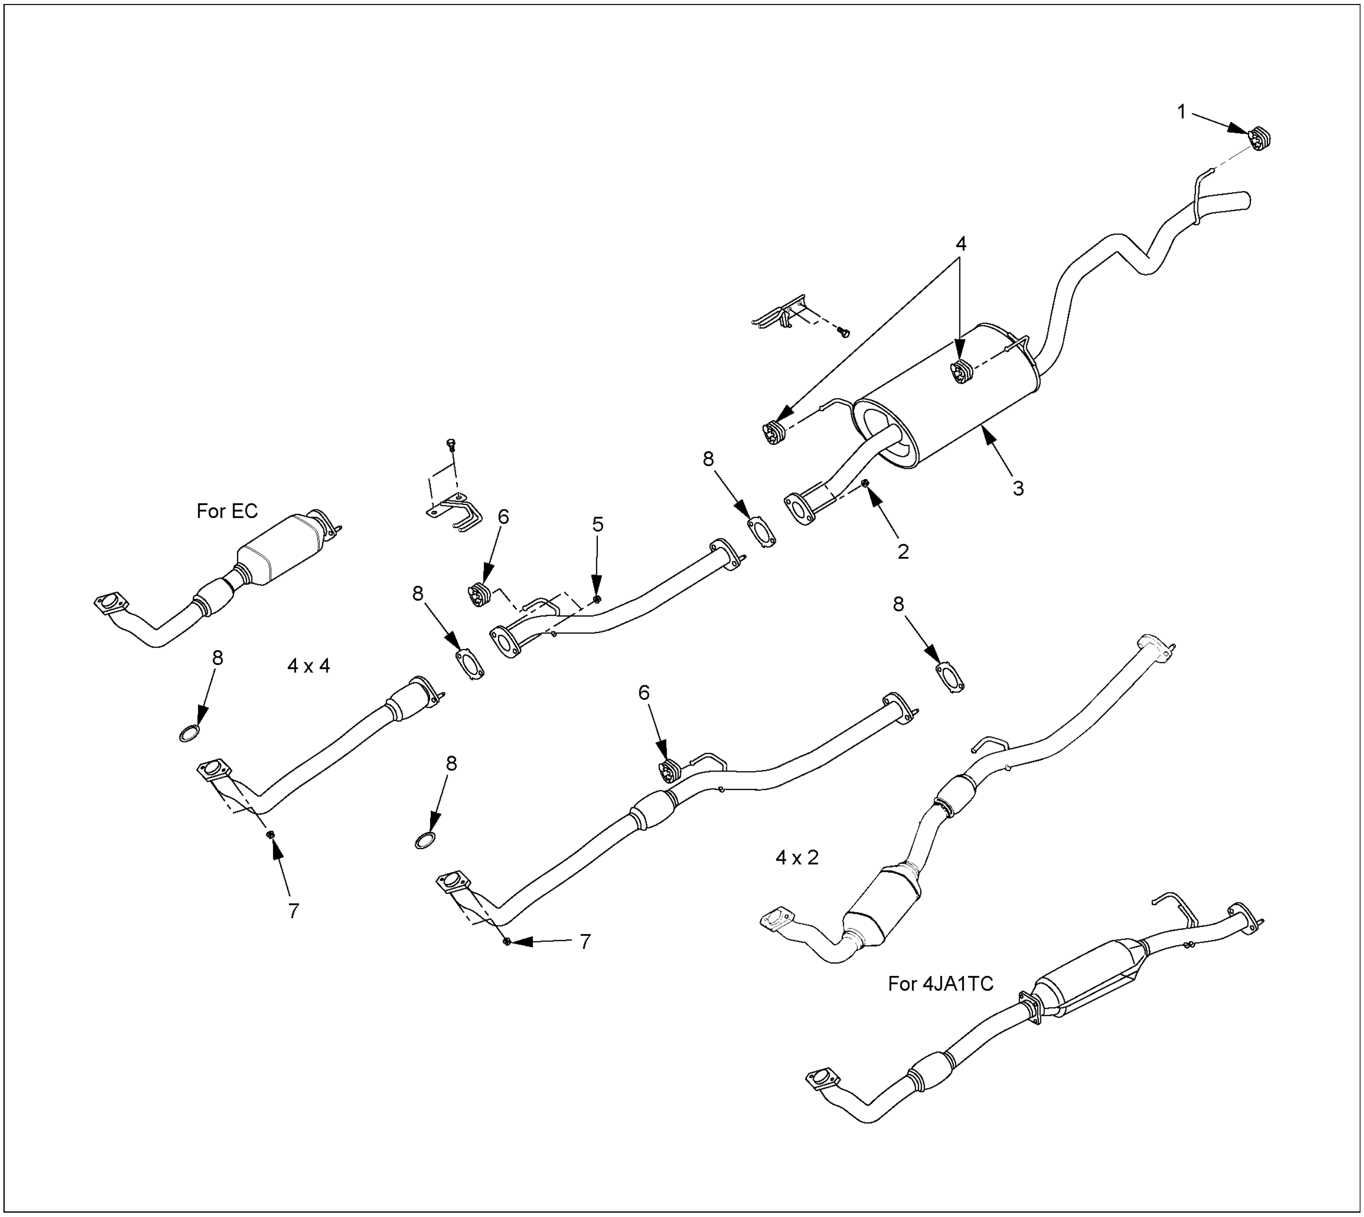
GENERAL DESCRIPTION



RTW46FLF000201

The exhaust pipe layout is described in the above illustration.
The catalytic coverter is installed between the turbocharger and the front pipe.

REMOVAL AND INSTALLATION



RTW46FLF000101

Removal Steps

1. Rear hanger rubber
2. Silencer front nut
3. Exhaust silencer
4. Silencer hanger rubber
5. Middle pipe nut
6. Front hanger rubber
7. Front pipe nut
8. Exhaust pipe gasket

Important Operations – Installation

Follow the removal procedure in the reverse order to perform the installation procedure. Pay careful attention to the important points during the installation procedure.

1. Front Pipe Nut

Connect the exhaust pipe to the catalytic converter.

Torque	N·m (kg·m/lb·ft)
67 (6.8/49)	

2. Middle pipe Nut (4×4 only)

Connect the middle pipe to the front pipe.

Torque	N·m (kg·m/lb·ft)
43 (4.4/32)	

3. Silencer Front Nut

Connect the silencer to the front or middle pipe.

Torque	N·m (kg·m/lb·ft)
43 (4.4/32)	

INSPECTION AND REPAIR

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Front Exhaust Pipe

Exhaust Silencer

Check the pipes for corrosion, cracking, damage or misalignment and repair as required.

Check the rubber rings for deterioration or damage and repair as required.

Catalytic Converter

1. Inspect outside the catalytic converter for any hitting mark.
2. Visual check inside the catalytic converter for crack or break converter element.
3. If find any problem during the inspection, replace the catalytic converter assembly.

MAGNETIC CLUTCH DOES NOT RUN (4JH1-TC)

- Are the No. SBF-6 fuse (30A) and the No. EB-13 (10A) fuses OK?

NO → Replace

YES

- Are the A/C thermo (X-15) and heater & A/C (X-11) and A/C compressor (X-14) relay OK?

NO → Replace

YES

- Is the pressure switch (C-24) OK?

NO → Replace

YES

- Is the electronic thermostat (C-55) OK?

NO → Defective switch or insufficient refrigerant

YES

- Are the A/C switch (B-57) and the fan switch (B-13) OK?

NO → Replace

YES

- Turn the ignition switch "ON" (Engine is running)
- A/C switch and fan control knob (fan switch) "ON"

- Disconnect the magnetic clutch connector.

- Is there battery voltage between the engine room harness connector terminal No.1 (E-3) and ground?

YES → Does the magnetic clutch operate?

- YES → Defective compressor
- NO → Defective magnetic clutch

NO

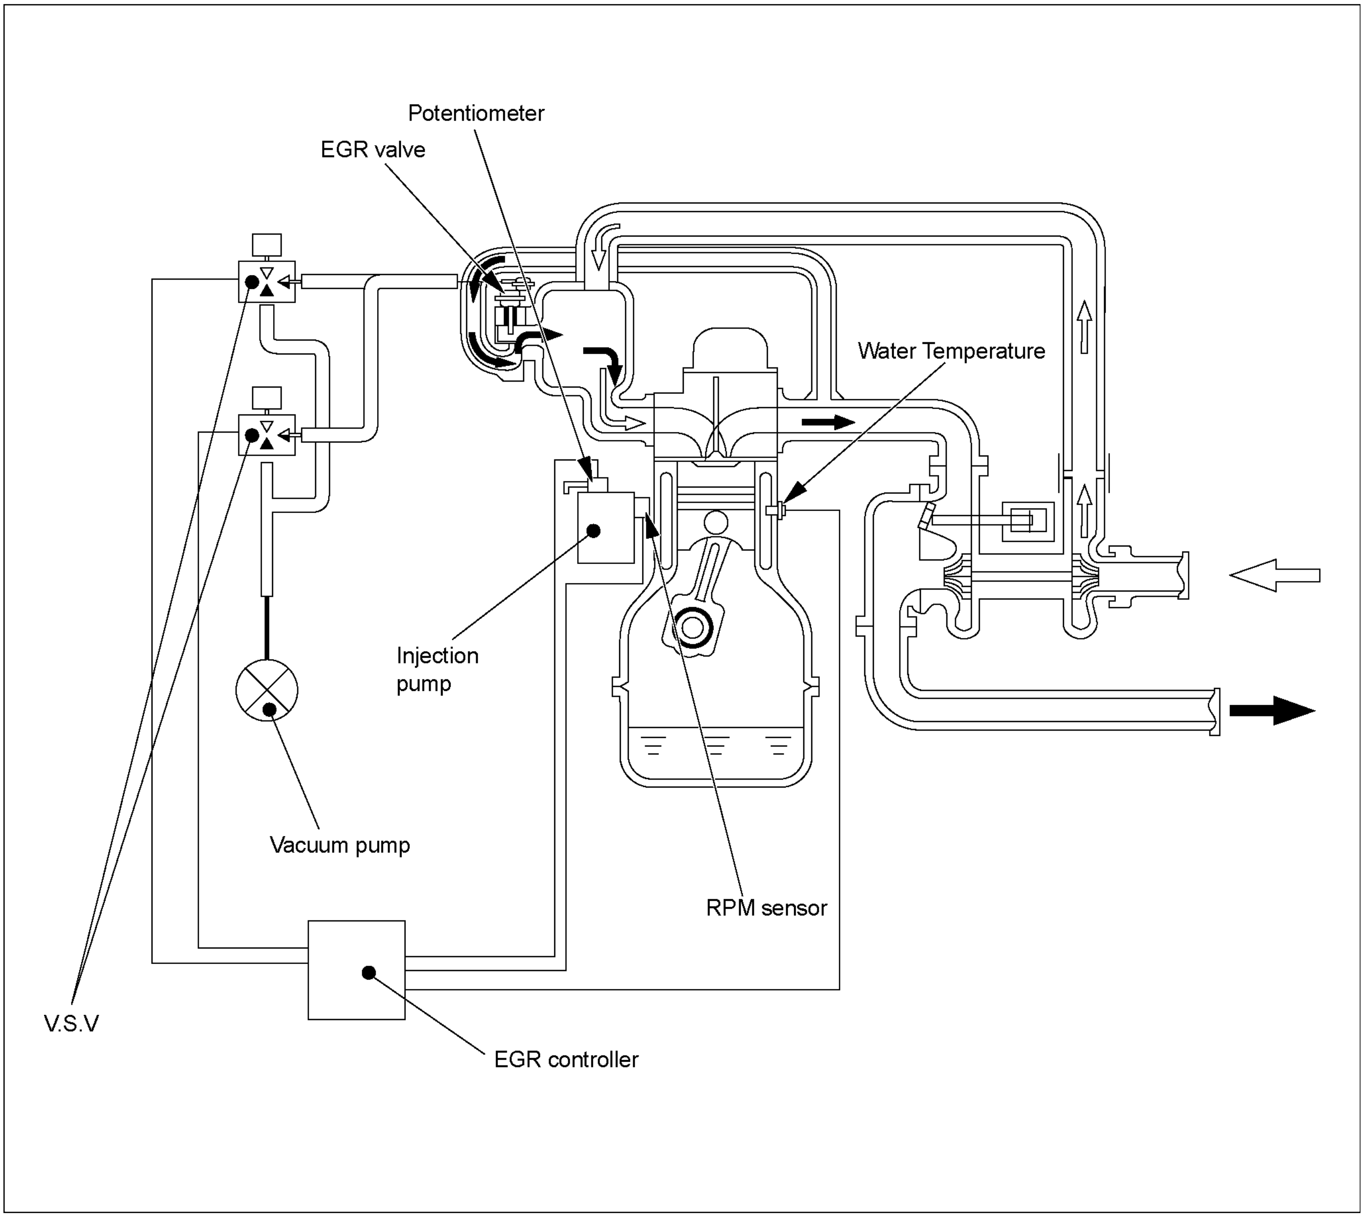
- Disconnect the A/C compressor relay.

- Is there continuity between the engine harness connector terminal No.1 (E-3) and the engine room harness connector terminal No.2 (X-14)?

GENERAL DESCRIPTION

This system controls the formation of NOx emission by recirculating the exhaust gas into the combustion chamber through the intake manifold.

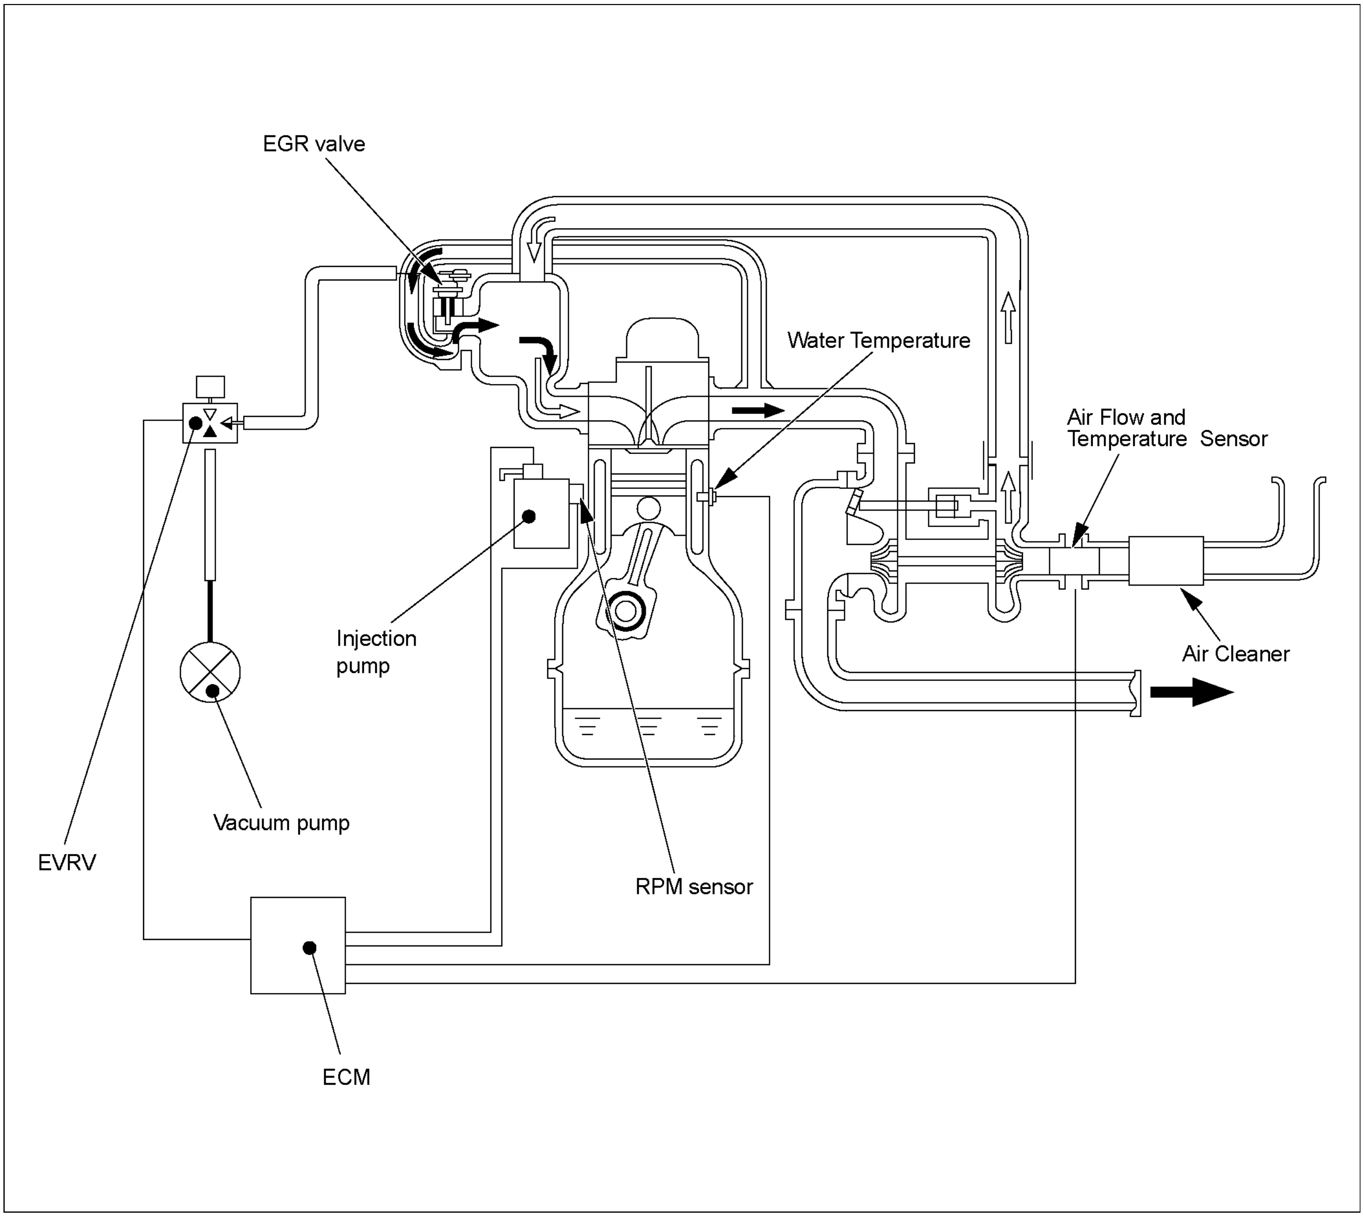
4JA1T(L):
The two EGR valves are controlled by two Vacuum Switching Valve (VSV) controlled by EGR controller according to signals from various sensors.
The amount of EGR depends on the number of engine rotations and the opening of the accelerator.



RTW46ELF001201

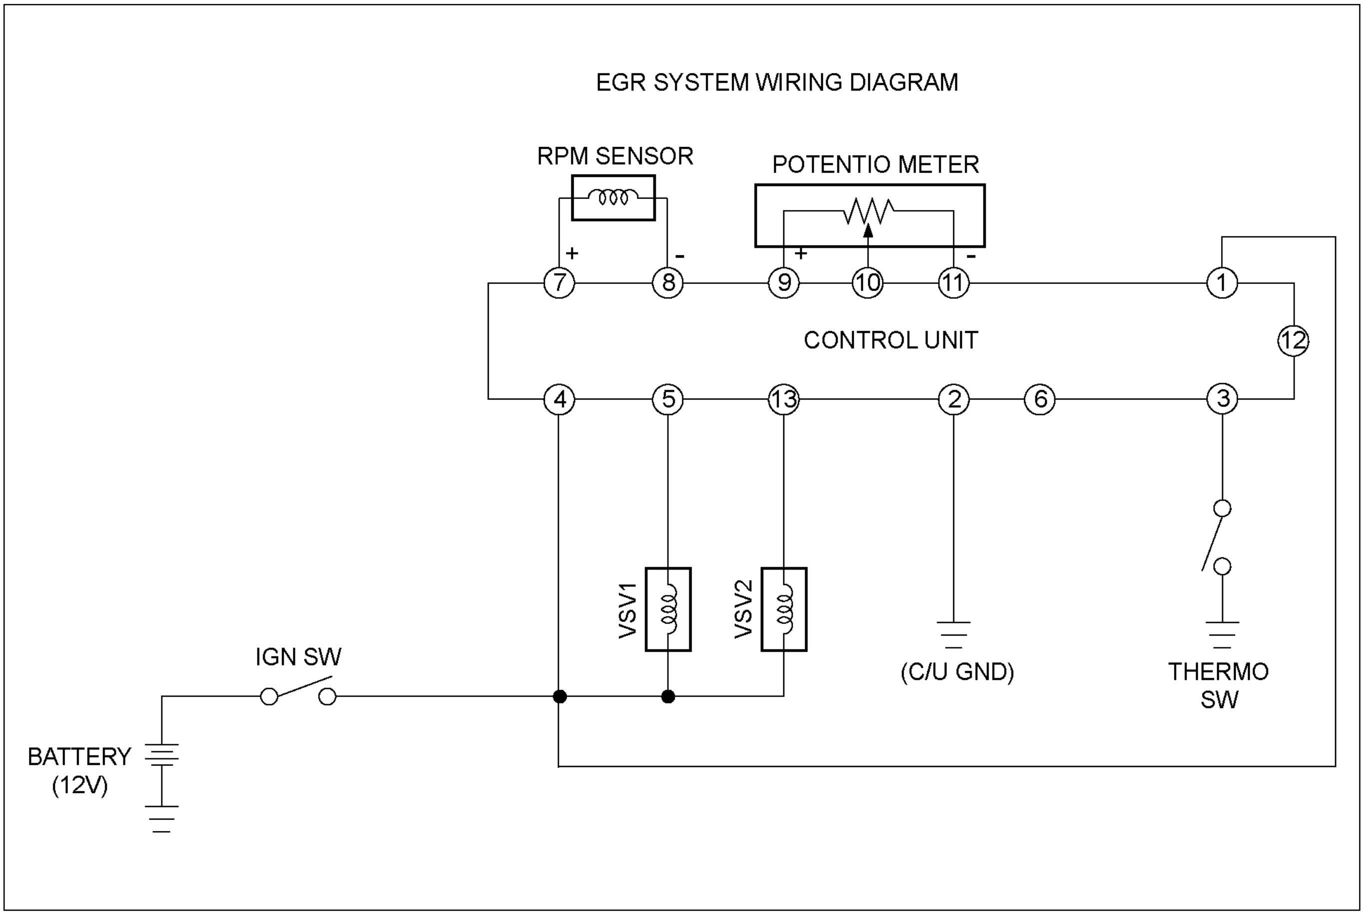
4JA1TC/4JH1TC

The EGR system engine is controlled by ECM. Refer to “Engine driveability and emissions” section for detail.



RTW46ELF001101

EGR SYSTEM DIAGRAM 4JA1T (L)



RTW46AMF000301

EGR System Operation

Inspect EGR valve motion visually while changing engine RPM under no load condition after warming-up.

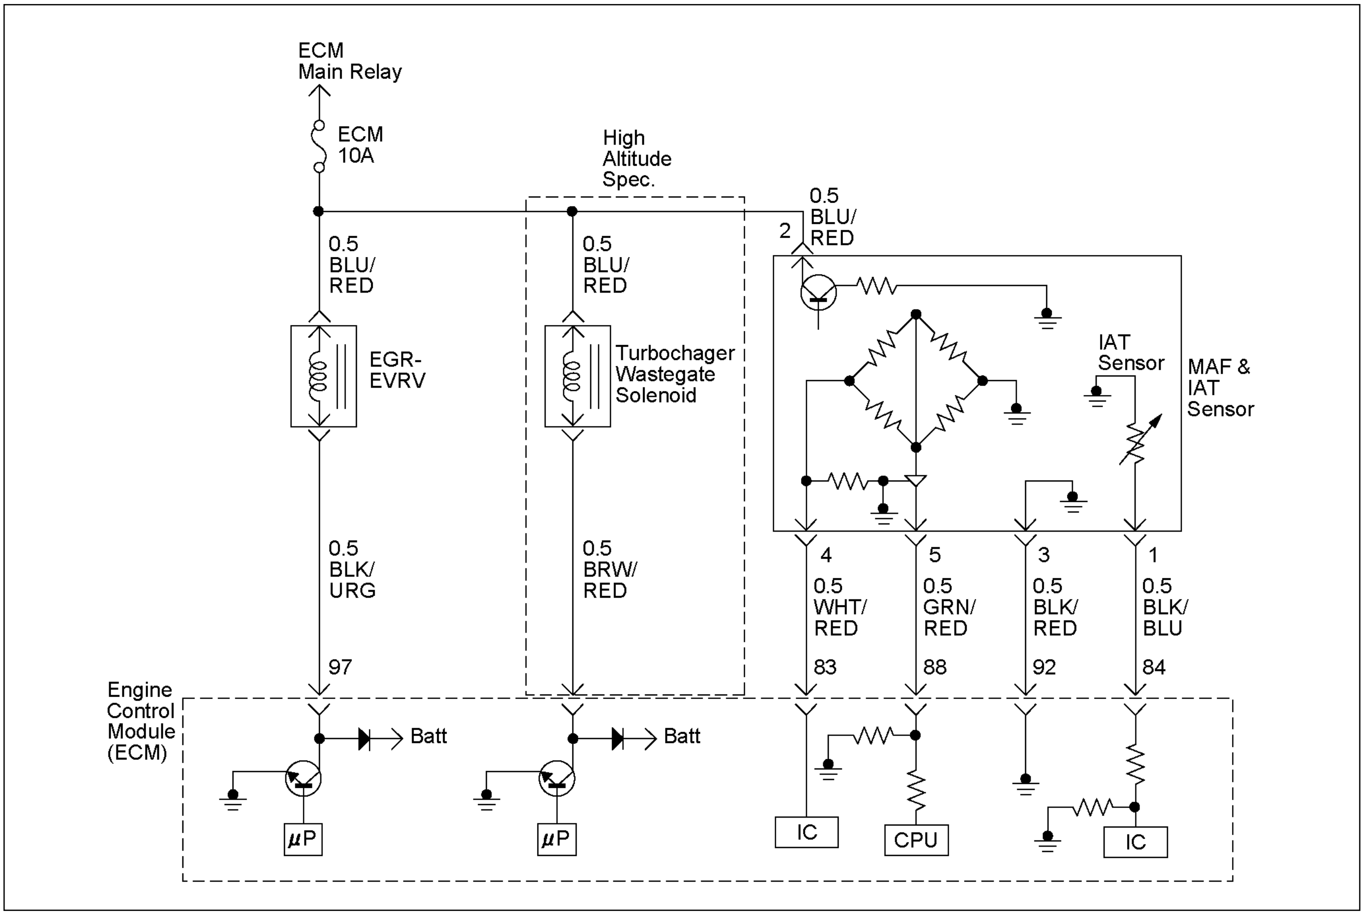
- **Inspection point (Engine RPM)**

RPM	Idling	900 ~ 960	2000	3250
Engine Front Side VSV-1	ON	ON	ON	OFF
Engine Rear Side VSV-2	ON	OFF	ON	OFF

ON means VSV should receive signal to move EGR valve.
OFF means VSV shouldn’t receive signal to move EGR valve.

4JA1TC/4JH1TC

The EGR system engine is controlled by ECM. Refer to "Engine driveability and emissions" section for detail.

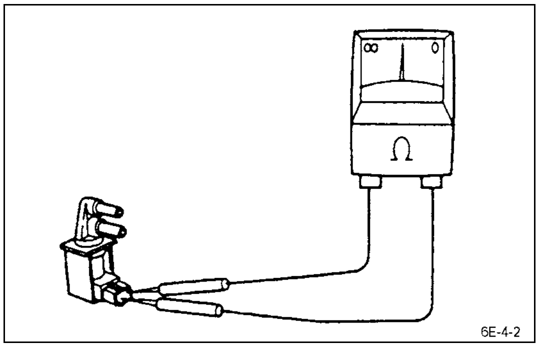


RTW46EMF000701

INSPECTION

4JA1T(L)

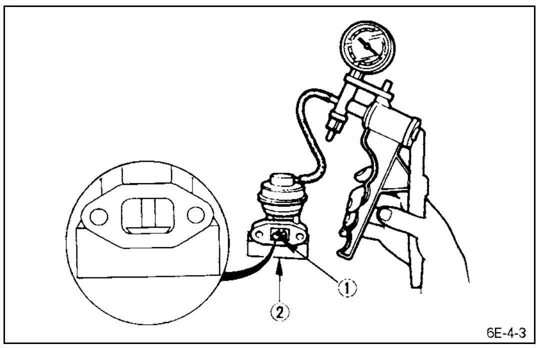
Vacuum switch valve (VSV)



Use a circuit tester to measure the V.S.V. resistance.

V.S.V Resistance	Ω at 20°C
37 ~ 44	

If the resistance is not within specification, replace it.



EGR Valve

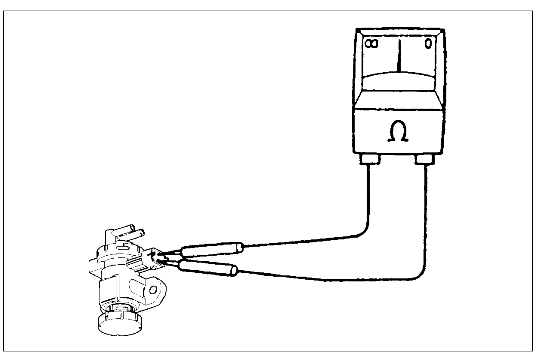
Apply vacuum to the EGR valve, check to see the valve operation.

Negative Pressure

Less then 180 mmHg	Not operation
More than 240 mmHg	Operation

4JA1TC/4JH1TC

EVRV

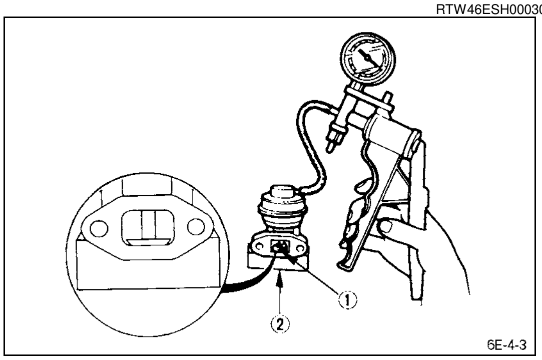


RTW46ESH000301

Use a circuit tester to measure the EVRV resistance.

EVRV Resistance	Ω at 20°C
14	

If the resistance is not within specification, replace it.



EGR Valve

Apply vacuum to the EGR valve, check to see the valve operation.

Negative Pressure 4JH1TC

Less than 250 mmHg	Not operation
More than 300 mmHg	Operation

Negative Pressure 4JA1TC

Less than 100 mmHg	Not operation
More than 170 mmHg	Operation

EGR COOLER (4JA1TC/4JH1TC EURO-III MODEL)

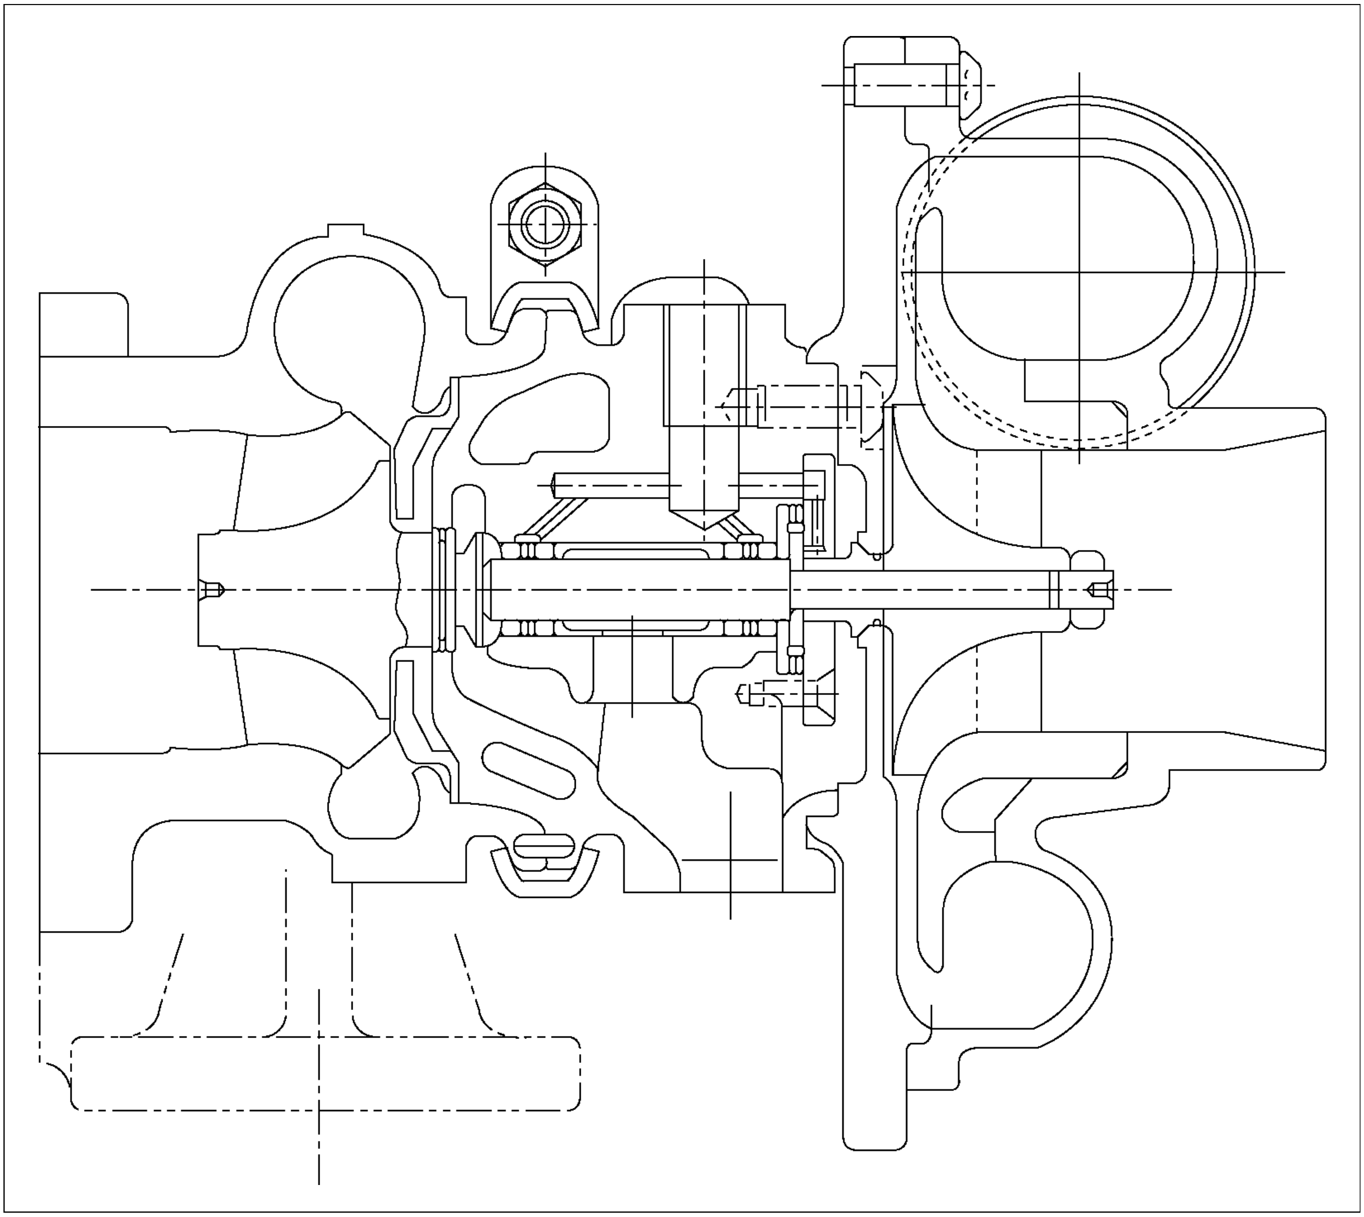
TURBOCHARGER

MAIN DATA AND SPECIFICATIONS

Engine	4JA1T(L)	4JA1TC	4JH1TC
Model	IHI RHF4H	IHI RHF4H	IHI RHF5
Turbine type	Mixed type		
Compressor type	Backword & rake type		
Maximum permissible speed rpm	190,000	190,000	180,000

IHI : Ishikawajima Harima Heavy Industries., Ltd.

GENERAL DESCRIPTION



036LV002

The turbocharger internal mechanism consists of the turbine wheel, the compressor wheel, and the radial bearings. These parts are supported by the bearing housing.

The turbocharger external mechanism consists of the compressor housing air intake port and the turbine housing air exhaust port.

The turbocharger increases air intake efficiency. This results in increased engine power, reduced fuel consumption, and minimal engine noise.

The turbocharger operates at very high speeds and temperatures. Part materials have been carefully selected and machined to extremely high precision.

Turbocharger servicing requires great care and expertise.

If reduced performance is noted, check the engine for damage or wear. If there is no apparent engine damage or wear, trouble with the turbocharger is indicated.

YES

- Is there battery voltage between the engine room harness connector terminal No.1 (X-14) and ground?

NO

Open circuit between the engine harness connector terminal No.1 (E-3) and the engine room harness connector terminal No.2 (X-14).

YES

- Disconnect the A/C thermo relay.

- Is there continuity between the engine room harness connector terminal No.3 (X-14) and No.2 (X-15)?

NO

Open circuit between the No. EB-13 fuse and the engine room harness connector terminal No.1 (X-14).

YES

- Disconnect the ECM harness connector.

- Is there continuity between the ECM harness connector terminal No.38 (C-56) and the engine room harness connector terminal No.5 (X-14)?

NO

Open circuit between the engine room harness connector terminal No.2 (X-15) and the engine room harness connector terminal No. 3 (X-14).

YES

- Is there continuity between the ECM harness connector terminal No.33 (C-56) and the engine room harness connector terminal No.1 (X-15)?

NO

Open circuit between the ECM harness connector terminal No.38 (C-56) and the engine room harness connector terminal No. 5 (X-14).

YES

- Is there battery voltage between the engine room harness connector terminal No.3 (X-15) and ground?

NO

Open circuit between the ECM harness connector No. 33 (C-56) and the engine room harness connector terminal No. 1 (X-15).

YES

- Disconnect the pressure switch?

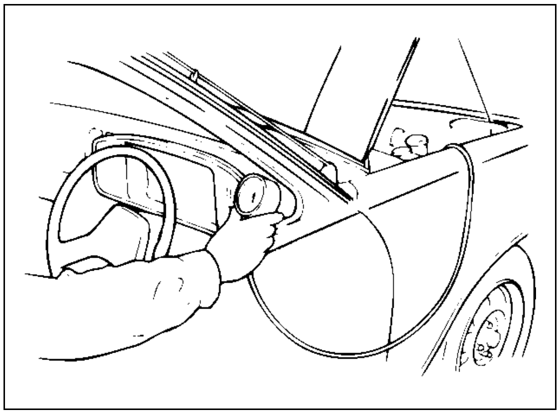
- Is there continuity between the engine room harness connector terminal No. 5 (X-15) and the engine room harness connector terminal No. 1 (C-24)?

NO

Open circuit between the No. EB-13 fuse and the engine room harness connector terminal No. 3 (X-15).

INSPECTION AND REPAIR

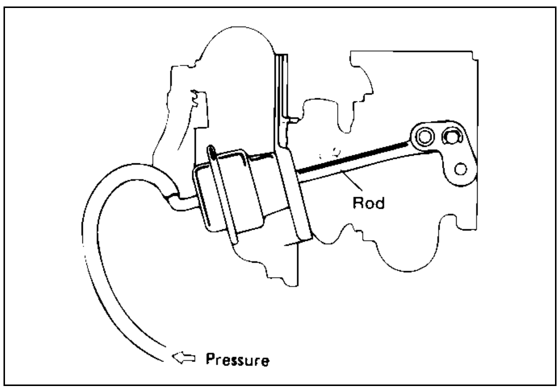
Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.



150RY00030

Turbocharger pressure check

1. Remove the hose between the waste gate and the compressor outlet pipe.
2. Connect the pressure gauge. To compressor outlet pipe.
3. Start the engine and gradually increase the engine speed (the vehicle must be stationary with no load applied to the engine).
4. Check to see that turbocharger pressure rises to approximately 141.3 Kpa (1060 mmHg).
   Pressure Gauge : 5-8840-0075-0



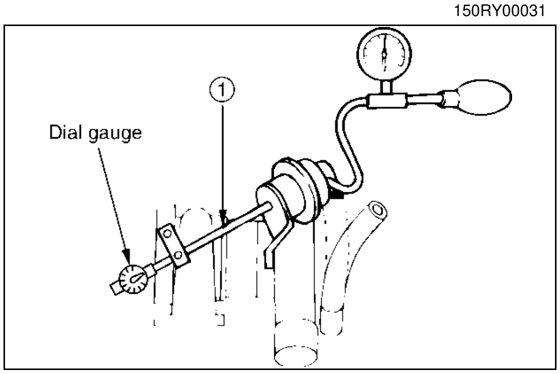
150RY00031

Waste gate operation check

1. Remove the hose between the waste gate and the compressor outlet pipe.
2. Connect the pressure gauge. To waste gate actuator.
3. Check to see that the rod begins to move when a pressure of approximately 118 Kpa (885 mmHg) is applied to the waste gate.

Note:

Do not apply a pressure greater than 150Kpa (1125 mmHg) to the waste gate during this check.



150RY00032

Unit Inspection (Remove Turbo. from engine)

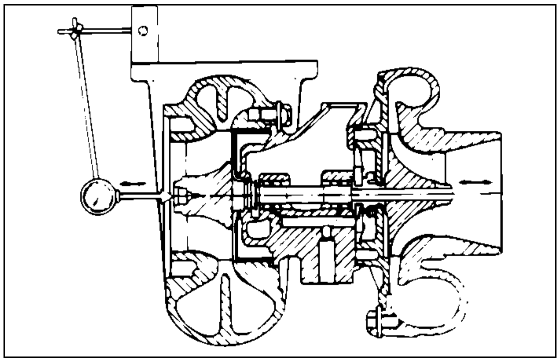
Check to see the pressure required to move the control rod 2 mm is within the limits shown below.

Kpa/mmHg

4JH1TC	134.8/1011
4JA1TC	147.7/1108

Contact the “ISUZU MOTORS LIMITED” Dealer service department or “IHI SERVICE FACILITY” for major repairs and maintenance.

Important wheel shaft end play and bearing clearance standards and limits are included below for your reference.



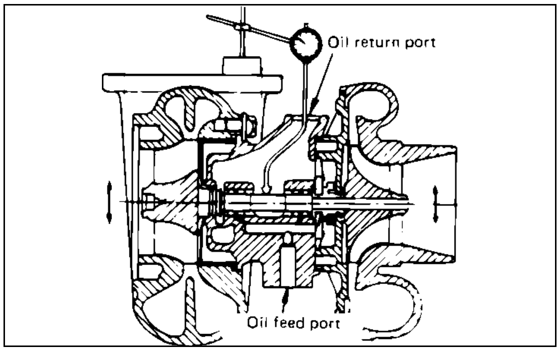
150RY00034

Wheel Shaft End Play

Use a dial indicator to measure the wheel shaft end play. Apply a force of 1.2 kg (2.6 lb/11.8N) alternately to the compressor wheel end and the turbine wheel end.

Wheel Shaft End Play mm (in)

Standard	Limit
0.03 - 0.06 (0.001 - 0.002)	0.09 (0.004)



150RY00036

Wheel Shaft and Bearing Clearance

Use a dial indicator to measure the wheel shaft and bearing clearance.

Wheel Shaft and Bearing Clearance mm (in)

Standard	Limit
0.056 - 0.127 (0.0022 - 0.0050)	0.127 (0.0050)

SPECIAL TOOLS

RTW46HMH000201

Removal

1. Disconnect the accelerator control cable from the accelerator pedal and dash panel.
2. Remove the cable clips.
3. Remove the accelerator control cable from accelerator control cable bracket.
   1) Slide the lock in direction A
   2) Rotate the ratchet ring in undirection an arrow 90°.
4. Remove the accelerator control cable from the throttle.

Inspection

Check the following items and replace the control cable if any abnormality is found.

- The control cable should move smoothly.
- The control cable should not be bent or kinked.
- The control cable should not be damage or corrosion.

Installation

1. Install the accelerator control cable to accelerator control pedal dash panel.
2. Install the accelerator control cable to throttle.
   Attach T-END and inner cable to throttle cam of engine.
3. Install accelerator control cable to accelerator bracket.
   1) Rotate the ratchet ring in direction an arrow 90° until both white marking are aligned.
   2) Confirm marking of outer cap must be upper side.
   3) Slider the lock in direction B.
   4) Confirm ratchet ring is locked.
4. Install the cable clips to accelerator control cable.

NOTE:

Confirm that the throttle (engine side) is at full stroke when the accelerator pedal is at full stroke.

YES

- Disconnect the condenser fan relay connector condenser fan.

- Is there continuity between the relay terminal No. 3 (X-9) and engine room harness connector terminal No.4 (C-24)?

NO

Open circuit between the engine room harness connector terminal No. 5 (X-15) and the engine room harness connector terminal No. 1 (C-24).

YES

- Is there battery voltage between the engine room harness connector terminal No.3 (C-24) and ground?

NO

Open circuit between the condenser fan relay No.3 (X-9) and the engine room harness connector terminal No. 4 (C-24).

NO

Open circuit between the No. EB-13 fuse and engine room harness connector terminal No. 3 (C-24).

YES

- connect the A/C thermo relay connector.

- Disconnect the electronic thermostat.

- Is there continuity between the engine room harness connector terminal No. 2 (C-55) and the engine room harness connector terminal No. 2 (C-24)?

YES

- Is there battery voltage between the engine room harness connector terminal No.3 (C-55) and ground?

NO

Open circuit between the engine room harness connector terminal No. 2 (C-55) and the engine room harness connector terminal No. 2 (C-24).

YES

- Is there continuity between the engine room harness connector terminal No.1 (C-55) and ground (C-109) ?

NO

Open circuit between the No. EB-13 fuse and the engine room harness connector terminal No. 3 (C-55).

ISUZU DIESEL ENGINE (4JK1/4JJ1)

Service Precautions

Matters that require attention in terms of maintenance

To prevent damage to the engine and ensure reliability of its performance, pay attention to the following in maintaining the engine:

- When lifting up or supporting the engine, do not apply a jack on the oil pan.
  When taking down the engine on the ground, do not make the bearing surface of the oil pan touch the ground directly. Use a wooden frame, for example, to support the engine with the engine foot and the flywheel housing.
  Because there is only a small clearance between the oil pan and the oil pump strainer, it can damage the oil pan and the oil strainer.
- When the air duct or air cleaner is removed, cover the air intake opening to prevent foreign matter from getting into the cylinder. If it gets contaminated, it can considerably damage the cylinder and others while the engine is operating.
- When maintaining the engine, never fail to remove the battery earth cable. If not, it may damage the wire harness or electrical parts. If you need electricity on for the purpose of inspection, for instance, watch out for short circuits and others.
- Apply engine oil to the sliding contact surfaces of the engine before reassembling it. This ensures adequate lubrication when the engine is first started.
- When valve train parts, pistons, piston rings, connecting rods, connecting rod bearings or crankshaft journal bearings are removed, put them in order and keep them.
- When installing them, put them back in the same location they were removed from.
- Gaskets, oil seals, O-rings, etc. must be replaced with new ones when the engine is reassembled.
- As for parts where a liquid gasket is used, remove an old liquid gasket completely and clean it up thoroughly so that no oil, water or dust is clinging to them. Then, apply the designated liquid gasket to each place anew before assembly.
- Surfaces covered with liquid gasket must be assembled within 5 minutes of gasket application. If more than 5 minutes has elapsed, remove the existing liquid gasket and apply a new liquid gasket.
- When assembling or installing parts, fasten them with the prescribed tightening torque so that they are installed properly.

Matters that require attention in specifically dealing with this engine.

Holes or clearances in the fuel system, which serve as a passage of fuel, including the inside of the injector, are made with extreme precision. For this reason, they are highly sensitive to foreign matter and, if it gets in, it can lead to an accident on the road, for instance; thus, make sure that foreign matter is prevented from getting in.

When servicing the fuel system, every precaution must be taken to prevent the entry of foreign material into the system.

- Before beginning the service procedure, wash the fuel line and the surrounding area.
- Perform the service procedures with clean hands. Do not wear work gloves.
- Immediately after removing the fuel hose and/or fuel pipe, carefully tape vinyl bags over the exposed ends of the hose or pipe.
- If parts are to be replaced (fuel hose, fuel pipe, etc.) do not open the new part packaging until installation.

Work procedure

- The fuel opening must be quickly sealed when removing the fuel pipe, injection pipe, fuel injector, fuel supply pump, and fuel rail.
- The eyebolts and gasket must be stored in a clean parts box with a lid to prevent adhesion of foreign matter.
- Fuel leakage could cause fires. Therefore, after finishing the work, wipe off the fuel that has leaked out and make sure there is no fuel leakage after starting the engine.

How to read the model (This illustration is 4JK1 engine)

2. Engine Number (Stamped)
3. Front

Explanation of functions and operations

Electronic engine control

With the control unit, the range from injection to air intake/exhaust, including fuel injection quantity, injection timing, intake air restriction, EGR, and idling rpm, is controlled.

Piston

The piston is aluminum-alloy and a thermal flow piston with a strut cast, while the combustion chamber is a round reentrant type.

Cylinder head

The cylinder head is aluminum-alloy and there are 4 valves per cylinder. The angular tightening method of the cylinder head bolt further increases reliability and durability.

EGR system

Based upon data, including water temperature, engine speeds or engine loads, it is controlled via Engine Control Module (ECM) to purify exhaust by recycling part of it.

Its main components include an EGR valve, an EGR cooler and various sensors.

Connecting rod cap bolt

The angular tightening method of the connecting rod cap bolt further increases reliability and durability.

Fuel rail-type electronic control injection system

The fuel rail-type electronic control injection system is composed of a fuel supply pump that sets the target pressure of high-pressure fuel and supply it, a fuel rail that measures such high-pressure fuel and a fuel injector that turns it into a fine spray and injects it. Each is controlled via ECM based upon various signals, while injection timing or fuel injection quantity is controlled under every possible driving condition.

Fuel injector

The fuel injector is a 6-hole nozzle that adjusts fuel injection quantity or injection timing by opening or closing an electromagnetic valve on the head of the fuel injector.

ECM corrects the dispersion of fuel injection quantity between fuel injector according to ID code data in memory. At the replacement of fuel injector, ID code data should be stored in ECM.

Fuel filter with sedimenter

It is a fuel filter with sedimenter that gets rid of water by making use of the difference in specific gravity between light oil and water, which comes with an indicator that notifies you that it is filled with water.

Preheating system

The preheating system consists of the ECM, the glow relay, glow plugs and the glow indicator lamp. The preheating system is operated when the engine coolant temperature is low, and makes the engine easy to start.

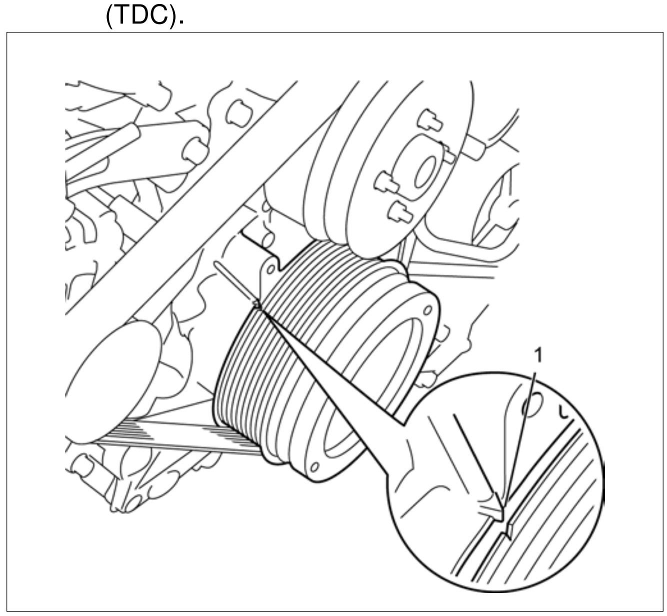
Lubrication system

It is an oil filter with full-flow bypass, which uses a water-cool oil cooler and oil jet to cool the piston.

Functional inspection

Inspection/adjustment of valve clearance

1. Inspection of valve clearance
   - Remove the fuel injector harness assembly.
   - Remove the leak off hose.
   - Remove the cylinder head cover.
   - Rotate the crankshaft to make the No.1 cylinder meet the compression top dead center (TDC).



RTW76ASH001301

Legend

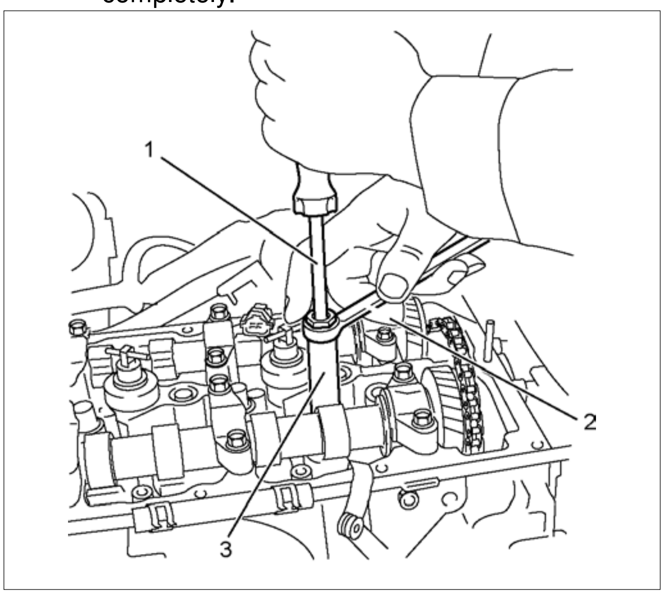
1. TDC

- Insert a 0.15 mm (0.006 in) thickness gauge between the roller of the rocker arm and the camshaft to tighten up the adjusting screw of the rocker arm. When the movement of the thickness gauge becomes tight, fasten the adjusting screw nut of the rocker arm.

Valve clearance	mm (in)
Intake valve	0.15 (0.006)
Exhaust valve	0.15 (0.006)

Note:
Adjust while cold.

2. Adjustment of valve clearance
   - Loosen each adjusting screw of the rocker arm completely.



RTW56ASH003701

Legend

1. Screwdriver
2. Ring Spanner
3. Valve Clearance Adjust Nut Wrench

Special tool
Valve clearance adjust nut wrench: 5-8840-2822-0

- Insert a 0.15 mm (0.006 in) thickness gauge between the roller of the rocker arm and the camshaft to tighten up the adjusting screw of the rocker arm. When the movement of the thickness gauge becomes tight, fasten the adjusting screw nut of the rocker arm.

Adjustment table

Cylinder No.	1		2		3		4	
Valve arrangement	IN	EX	IN	EX	IN	EX	IN	EX
No. 1 cylinder Compression TDC	○	○	○			○		
No. 4 cylinder Compression TDC				×	×		×	×

- If the No.1 cylinder is the compression TDC, adjust a valve clearance with ○ mark given on the table and if the No. 4 cylinder is the compression TDC, adjust that with × mark.
- Install the cylinder head cover.
  Refer to "Cylinder Head Cover."
- Install the leak off hose.
- Install the fuel injector harness assembly.

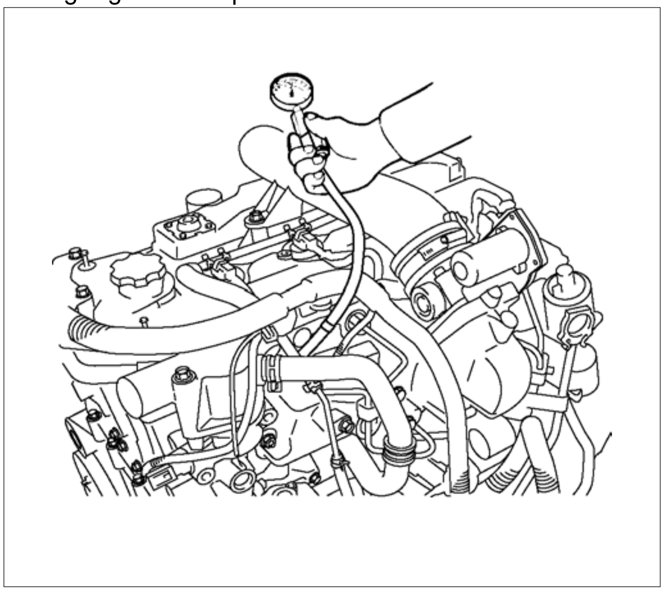
Compression pressure inspection

- Warm up the engine.
- Disconnect the negative battery cable.

- Remove the all glow plugs.

Note:
When the harness connector is removed, ECM judges that it broke down and DTC is recorded. Upon completion of measurement, never fail to clear the memory of the ECM.
(For how to clear the memory of the ECM, refer to "ENGINE CONTROL SYSTEM" Section)

- Connect the negative battery cable.
- Turn on the starter to emit foreign matter within the cylinders.
- Install an adapter and a gauge of a compression gauge of the special tool.



RTW56ASH003801

Compression gauge: 5-8840-2675-0
Gauge adapter: 5-8840-2815-0

- Turn on the starter to inspect compression pressure.

Compression pressure	MPa(psi)/200rpm
Standard	2.84 – 3.24 (412 – 469)
Limit	1.96 (284)
Differences among the cylinders	294 kPa (43)

- Measure each cylinder one by one.

Note:
To keep engine speed at 200 rpm or more, use fully charged batteries.

- Remove a compression gauge of the special tool.
- Disconnect the negative battery cable.
- Install the glow plugs.
- Connect the negative battery cable.

A list of defective phenomena

- Engine does not turn over.
- Engine turns over but does not start.
- Excessive black exhaust smoke.
- Excessive white exhaust smoke.
- Engine knocking.
- Abnormal engine rotation.
- Abnormal battery charging.
- Turbocharger trouble shooting.

Trouble Shooting

Engine does not turn over

Condition	Possible Cause	Correction
Starter motor does not rotate	Dead or weak battery	Charge battery Replace battery
	Incomplete circuit	Connect Repair
	Starter motor brushes stuck, worn, or broken	Replace brushes
	Starter motor internal damage	Repair motor
Starter motor not meshed with flywheel	Ring gear abrasion	Replace ring gear
	Magnetic switch (starter motor) not properly adjusted	Adjust
Starter motor pinion meshed with ring gear but does not rotate	Dead or weak battery	Charge battery Replace battery
	Insufficient contact pressure between starter motor brushes and commutator	Adjust pressure
	Armature (starter motor) stuck	Repair armature
	Engine internal damage (Seizure)	Repair engine

Engine turns over but does not start

Condition	Possible Cause	Correction
Fuel is not delivered to fuel supply pump	Air in fuel system	Bleed air from fuel system
	Air entering fuel pipe	Replace pipe and bleed air from fuel system
	Empty fuel tank	Replenish fuel
	Clogged strainer (fuel suction)	Clean or replace strainer
	Clogged fuel pipe	Clean or replace pipe
	Feed pump malfunction	Replace pump
	Use of wrong fuel for prevailing temperatures	Drain existing fuel and replace with appropriate fuel
	Clogged fuel filter	Replace filter
Fuel is delivered to fuel supply pump	Loose injection pipe connections	Tighten connections
	Loose or broken electrical connectors	Tighten and/or replace connectors
	Bad rotational sensor	Replace sensor
	Engine control system malfunction	System diagnosis
Insufficient or unstable fuel delivery volume	Air in fuel system	Bleed air from fuel system
	Feed pump malfunction	Repair pump
	Loose or broken electrical connectors	Tighten and/or replace connectors
	Clogged fuel filter	Replace filter
	Engine control system malfunction	System diagnosis

Excessive black exhaust smoke

Condition	Possible Cause	Correction
Bad injection timing	Engine control system malfunction	System diagnosis
Bad fuel injector condition	Carbon deposit at nozzle tip	Clean fuel injector assembly
	Sticking nozzle	Replace fuel injector assembly
	Engine control system malfunction	System diagnosis
Insufficient compression pressure	Excessive valve clearance	Adjust clearance
	Sticking valve stem (valve open)	Repair or replace valve
	Damaged valve spring	Replace spring
	Valve seat abrasion	Repair valve seat
	Compression leakage due to damaged piston ring	Replace piston ring
	Damaged gasket	Replace gasket
	Piston scoring	Replace piston
Fuel condition	Water in fuel	Drain existing fuel and replace with new fuel
	Poor fuel quality	Drain existing fuel and replace with new fuel
Poor engine aspiration	Clogged intake pipes	Clean or replace pipes
	Clogged air cleaner element	Clean or replace element
Malfunction detected by engine control system	Defective sensor	Replace sensor
	Engine control system malfunction	System diagnosis
EGR valve and/or intake throttle valve malfunction	Intake throttle valve sticking	Repair or replace valve
	EGR valve sticking	Repair or replace valve
	Engine control system malfunction	System diagnosis
Turbocharger malfunction	Damaged turbocharger blade	Replace turbocharger
	Rough turbocharger shaft rotation	Replace turbocharger
	Oil leakage from oil seal	Replace turbocharger
	Broken actuator	Replace turbocharger

NO

Open circuit between the engine room harness connector terminal No. 1 (C-55) and ground (C-109).

YES

- Disconnect the A/C switch.

- Is there battery voltage between the chassis side harness connector terminal No. 6 (B-57) and ground (C-109)?

YES

- Defective ECM

NO

Open circuit between the No. EB-13 fuse and the chassis side harness connector No. 6 (B-57).

Excessive white exhaust smoke

Condition	Possible Cause	Correction
Bad injection timing	Engine control system malfunction	System diagnosis
Malfunction detected by engine control system	Defective sensor	Replace sensor
	Control unit malfunction	Replace unit
	Engine control system malfunction	System diagnosis
Insufficient compression pressure	Excessive valve clearance	Adjust clearance
	Sticking valve stem (valve open)	Repair or replace valve
	Damaged valve spring	Replace spring
	Valve seat abrasion	Repair valve seat
	Compression leakage due to damaged piston ring	Replace piston ring
	Damaged gasket	Replace gasket
	Piston scoring	Replace piston
Fuel condition	Water in fuel	Drain existing fuel and replace with new fuel
Excessive oil consumption	Worn or damaged piston ring(s)	Replace ring(s)
	Defective valve stem oil seal	Replace oil seal
	Defective turbocharger oil seal	Replace turbocharger
	Clogged turbocharger oil return pipe	Repair pipe

Engine knocking

Condition	Possible Cause	Correction
Bad timing	Engine control system malfunction	System diagnosis
Malfunction detected by engine control system	Defective sensor	Replace sensor
	Control unit malfunction	Replace unit
	Engine control system malfunction	System diagnosis
Fuel condition	Poor quality fuel	Drain existing fuel and replace with new fuel
Poor engine aspiration	Clogged air cleaner element	Clean or replace element
	Clogged intake pipes	Clean or replace pipes
	Engine control system malfunction	System diagnosis
Engine break-down	Foreign material in cylinders	Engine overhaul
	Scored pistons and/or bearings	Replace pistons and/or bearings

Abnormal engine rotation

Condition	Possible Cause	Correction
Engine speed cannot be increased	Defective control unit	Replace unit
	Engine control system malfunction	System diagnosis
Engine speed unstable	Defective control unit	Replace unit
	Engine control system malfunction	System diagnosis
	Clogged fuel filter element	Replace element
	Defective fuel injector(s)	Replace fuel injector assembly
	Water in fuel	Drain existing fuel and replace with new fuel
	Air in fuel system	Bleed air from fuel system
Turbocharger malfunction	Damaged turbocharger fan	Replace turbocharger
	Rough turbocharger shaft rotation	Replace turbocharger
	Broken actuator	Replace turbocharger

Abnormal battery charging

Condition	Possible Cause	Correction
No charging	Open or shorted wiring and/or connectors	Repair or replace wiring and/or connectors
	Defective generator	Repair or replace generator
	Defective battery	Replace battery
Insufficient charging	Open or shorted wiring and/or connectors	Repair or replace wiring and/or connectors
	Defective generator	Repair or replace generator
	Loose generator drive belt	Adjust belt tension or replace belt
	Defective battery	Replace battery
Excessive charging	Shorted wiring	Repair or replace wiring
	Defective generator	Repair or replace generator
	Defective battery	Replace battery

Turbocharger Troubleshooting

Condition	Possible Cause	Correction
Engine has less than normal power	Air leakage from intake pipe rubber hose	Repair
	Air leakage from intake cover	Repair
	Clogged intercooler cooling section	Clean
	Clogged air cleaner element	Clean or replace
	Intake throttle valve stuck	Repair or replace
	Turbine and housing contact (Interference)	Replace
	Excessive carbon deposit near turbine exhaust port that interferes with turbine	Clean or repair
	Rough turbine shaft rotation	Repair or replace
	Damaged turbine blade	Repair or replace
Blue exhaust smoke	Oil leakage from turbocharger oil seal	Repair or replace
	Clogged turbocharger oil return pipe	Repair
	Clogged center housing oil passages	Repair or replace
	Engine oil deterioration	Change engine oil
Noisy turbocharger operation	Gas leakage from intake or exhaust system	Repair
	Turbine and housing contact (Interference)	Repair or replace
	Damaged turbine blade	Replace
	Turbine shaft bearing abrasion or scoring	Repair or replace
Excessive rotating part wear	Engine oil deterioration	Change engine oil
	Clogged turbocharger oil feed pipe	Repair
	Low engine oil pressure	Repair

Main Data and specifications

Item		Engine model 4JK1	Engine model 4JJ1
Type		Diesel/4-cycle/water cooling-type in-line DOHC	
Combustion chamber type		Direct injection type	
Cylinder liner type		Liner less	
Number of cylinders -cylinder bore × strokes mm (in)		4-95.4 (3.76) × 87.4 (3.44)	4-95.4(3.76) × 104.9(4.13)
Displacement cc (cu.in)		2499 (152)	2999 (183)
Compression ratio		18.3	17.5
Compression pressure MPa (psi)/rpm		3 (435)/200	
Idling speed rpm		700 ± 25	
Valve clearance mm (in)	Intake	0.15 (0.006) (cold)	
	Exhaust	0.15 (0.006) (cold)	
Ignition type		Compressed ignition	
Injection order		1 - 3 - 4 - 2	
Lubricating system			
Lubricating type		Pressure delivery type	
Oil pump type		Gear type	
Volume of lubricating oil L (qts)		8.0 (8.5)	
Oil filter type		Full flow filter (cartridge type)	
Oil cooling type		Built-in-type, water cooling	
Cooling system			
Cooling type		Water cooling type	
Radiator type		Corrugated fin (pressure type)	
Water pump type		Centrifugal, belt drive type	
Thermostat type		Wax-type units	
Thermostat valve-opening temperature °C (°F)		85 (185)	
Volume of coolant L (qts)		M/T8.7 (9.2) A/T 8.6 (9.1) (incl. radiator)	
Fuel system			
Injection pump type		Fuel supply pump fuel rail type	
Fuel injector type		Electronic control injector 6-hole	
Fuel pump type		Into the fuel tank type	
Charging system			
Generator type		AC type	
Power output V-A		12 - 90	

Item		Engine model 4JK1	Engine model 4JJ1
Regulator type		IC	
Starting system		Engage magnet type	
Starter type		Reduction type	
Power output	V-kW	12 – 2.3	
Preheat system type		Glow plug	
Glow plug standard voltage/electric current	V-A	12 - 3.5

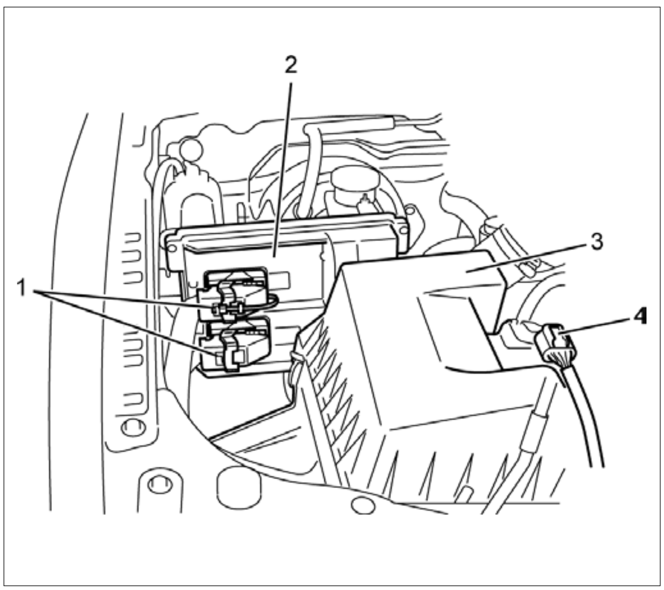
Engine Assembly

Removal

1. Disconnect the negative battery cable.
2. Remove the engine hood.
3. Drain the coolant.
4. Remove the starter motor.
5. Remove the transmission assembly.
   Refer to removal procedure for “TRANSMISSION” in this manual.
6. Disconnect the ECM harness connector.
7. Remove the ECM.
8. Remove the air cleaner.
   - Disconnect the MAF sensor harness connector.
   - Remove the intake pipe with the lid of air cleaner box.
   - Remove the air cleaner box.

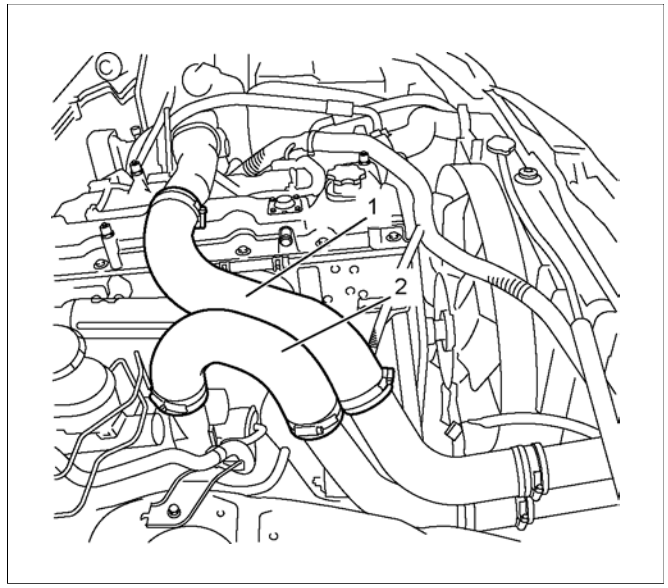


RTW76ASH000401

Legend

1. ECM Harness Connector
2. ECM
3. Air Cleaner Box
4. MAF Sensor Harness Connector

9. Remove the intake hose (intercooler - intake throttle) (Standard output).
10. Remove the intake hose (turbocharger - intercooler) (Standard output).
    Remove the harness connector.

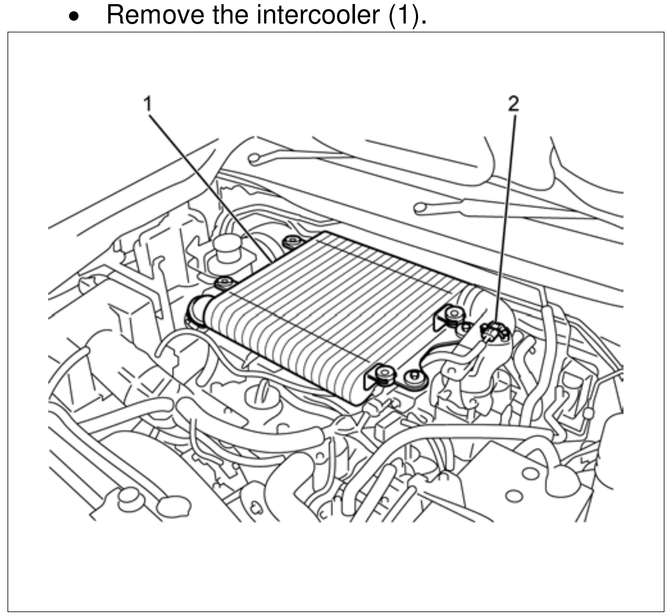


RTW56ASH004001

Legend

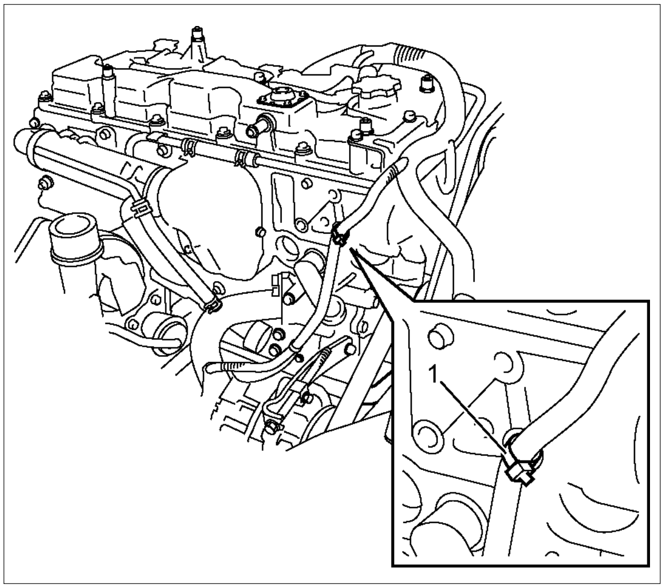
1. Intake Hose (intercooler - intake throttle)
2. Intake Hose (turbocharger - intercooler)

11. Remove the intercooler (High output).
    - Disconnect the BARO sensor harness connector (2).
    - Remove the two intake hoses.
    - Remove the intercooler (1).

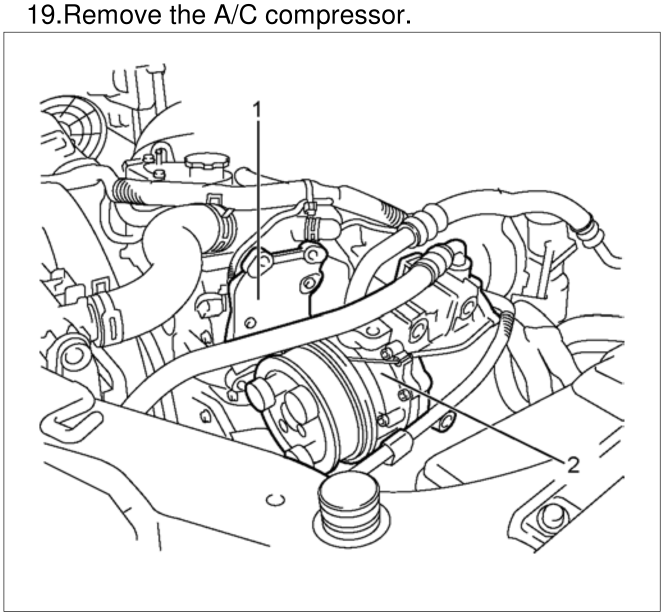


RTW76ASH000501

12. Remove the radiator upper hose.
13. Remove the engine harness clip (1).



14.Remove the breather hose and lower hose of the radiator.
15.Remove the fan guide.
16.Remove the drive belt.
17.Remove the fan assembly.
18.Remove the radiator.
19.Remove the A/C compressor.

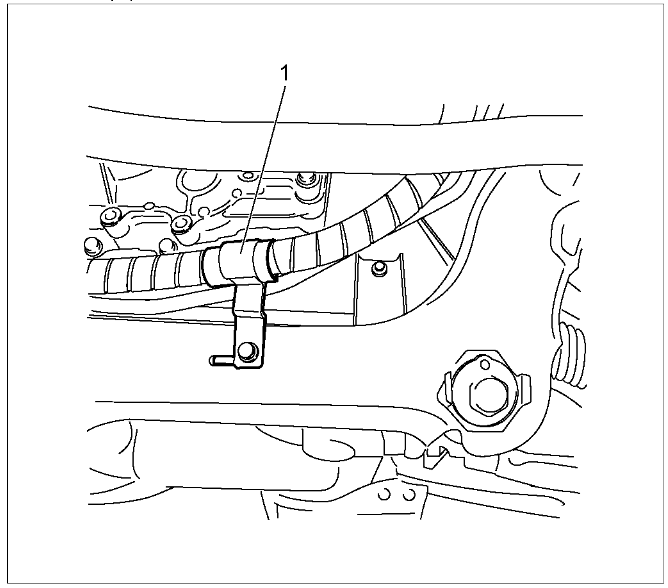


Legend

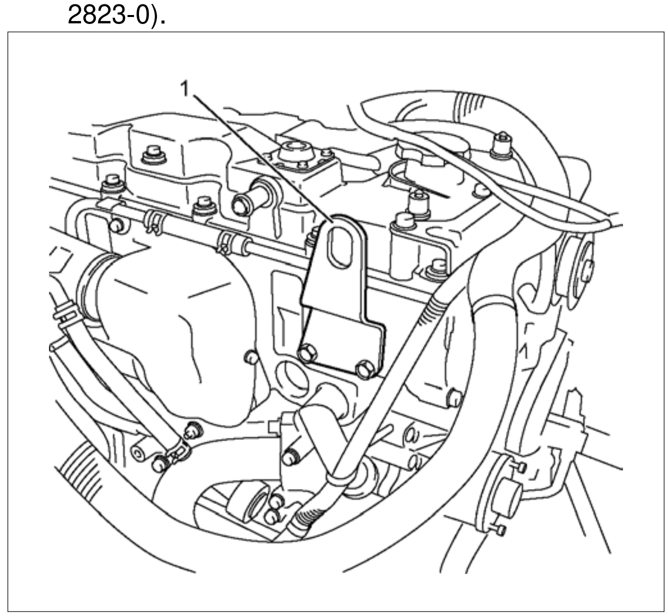
1. A/C Compressor Bracket
2. A/C Compressor

- Disconnect the connector.
- Disconnect the A/C generator harness.
- Disconnect the terminal B cable and harness connector from the generator.

20.Remove the power steering pump.
- Remove the bracket of power steering oil hose (1).

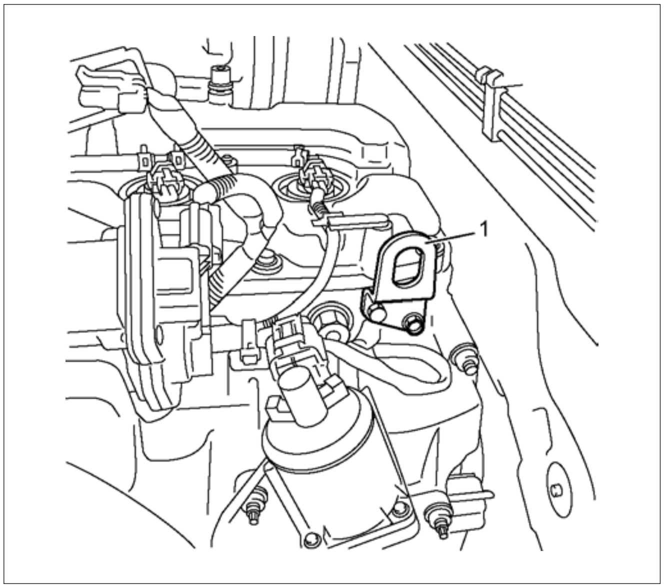


21.Remove the harness of engine, battery and earth from the body side.
22.Remove the connector of the shift on the fly (4×4).
23.Remove the vacuum hose of brake master-vac.
24.Remove the front exhaust pipe.
25.Disconnect the fuel hose on the feed and return sides.
26.Install the engine hanger (special tool 5-8840-2823-0).



Legend

1. Engine Hanger (Front Side)



RTW56ASH004401

Legend

1. Engine Hanger (Rear Side)

27. Hang wire on the engine hanger and hoist to lift up the engine slightly.
28. Remove the engine mount.
- Remove the fastening bolts for the engine mount on the engine side.
29. Remove the engine assembly.
- Hoist the engine slightly to provide space to remove the catalytic converter.

Installation

Notice:
Be absolutely sure that each harness is reconnected to its original position.

1. Install the engine assembly.
- Hang wire on the engine hanger and hoist to lift up the engine.
- Operate a hoist slowly to move the engine to the place where it is to be installed.
- Make the transmission side lower and operate a hoist slowly, pulling it backward to the engine.
2. Install the engine mount.

Tightening torque: 48 N·m (4.9kg·m / 35 lb ft)

3. Remove the engine hanger.
4. Install the catalytic converter.

Tightening torque: 27 N·m (2.8kg·m /20 lb ft)

5. Install the front exhaust pipe.

Tightening torque: 67 N·m (6.8kg·m / 49 lb ft)

6. Install the fuel hose on the feed and return sides.
7. Install the vacuum hose of brake master-vac.
8. Install the connector of the shift on the fly (4×4).
9. Install the harness of engine, battery and earth to the body side.
10. Install the power steering pump.

Tightening torque: 25 N·m (2.5kg·m / 18 lb ft)

- Install the bracket of power steering oil hose.
11. Install the A/C compressor.

Tightening torque: 25 N·m (2.5kg·m / 18 lb ft)

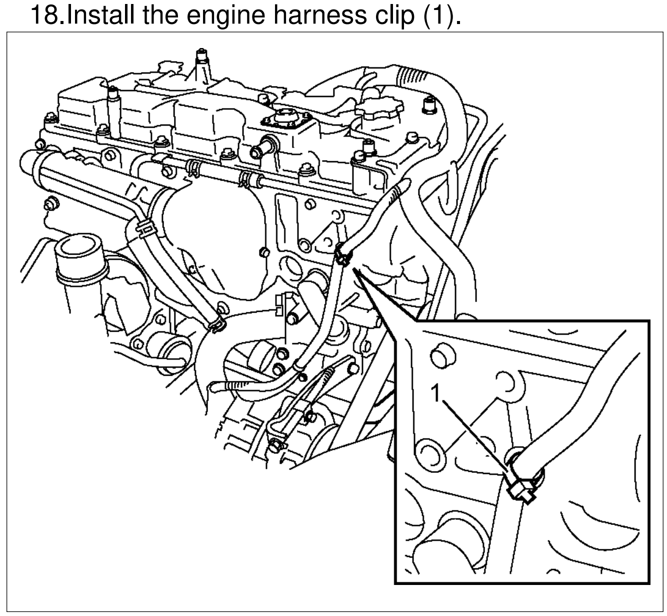
- Install the connector.
12. Install the A/C generator harness.
- Install the terminal B cable and the harness connector to the generator.
13. Install the radiator.

Tightening torque: 25 N·m (2.5kg·m / 18 lb ft)

14. Install the fan assembly.

Tightening torque: 8 N·m (0.8kg·m / 69 lb in)

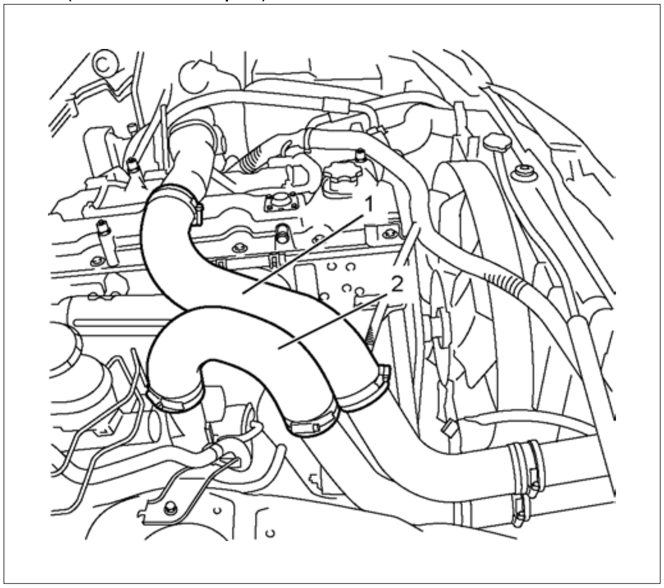
15. Install the drive belt.
Refer to removal procedure for drive belt in this manual.
16. Install the fan guide.
17. Install the breather hose and lower hose of the radiator.
18. Install the engine harness clip (1).



RTW76ASH001401

19. Install the radiator upper hose.
20. Install the intake hose (turbocharger -intercooler) (Standard output).
- Install the harness connector.

21.Install the intake hose (intercooler - intake throttle) (Standard output).



RTW56ASH004001

22.Install the intercooler (High output).
- Install the intercooler.
- Install the two intake hoses.
- Connect the BARO sensor harness connector.

23.Install the air cleaner.
- Install the intake pipe with the lid of air cleaner box.
- Install the air cleaner box.
- Connect the MAF sensor harness connector.

24.Install the ECM.

25.Connect the ECM harness connector.

26.Install the transmission assembly.
Refer to installation procedure for "TRANSMISSION".

27.Install the starter motor.

Tightening torque: 94 N·m (9.6kg·m / 69 lb ft)

28.Replenish the coolant.

29.Install the engine hood.

Tightening torque: 10 N·m (1.0kg·m / 87 lb in)

30.Connect the negative battery cable.

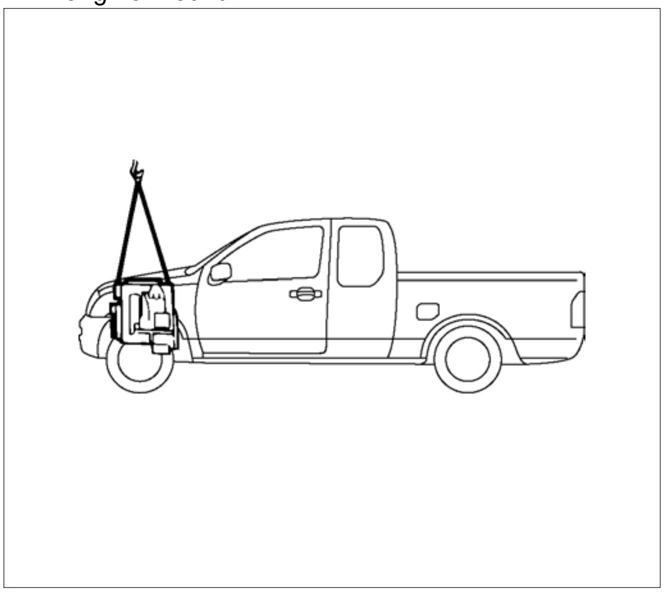
12. Bolt (L = 100 mm / 3.94 in)
13. Engine Foot LH
14. Engine Mount LH

Removal

1. Remove the engine hood.
2. Remove the engine cover.
3. Set the hoist and the engine hanger of the special tool (special tool 5-8840-2823-0).
4. Remove the engine mount.

- Before removing the engine mount, hang the engine with a hoist.
- Remove the bolts of the engine mount.
- Hoist the engine assembly slightly to remove the engine mount.



RTW56ASH004501

Installation

1. Install the engine mount and tighten up with the specified torque.

Tightening torque: 52 N·m (5.3 kg·m / 38 lb ft)

2. Install the engine cover.
3. Install the engine hood.
   - Check if nothing is wrong with the engine mount by starting the engine.

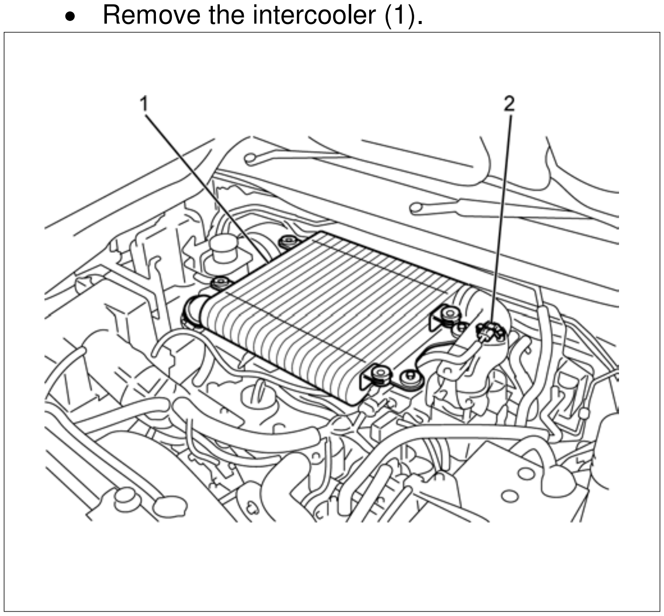
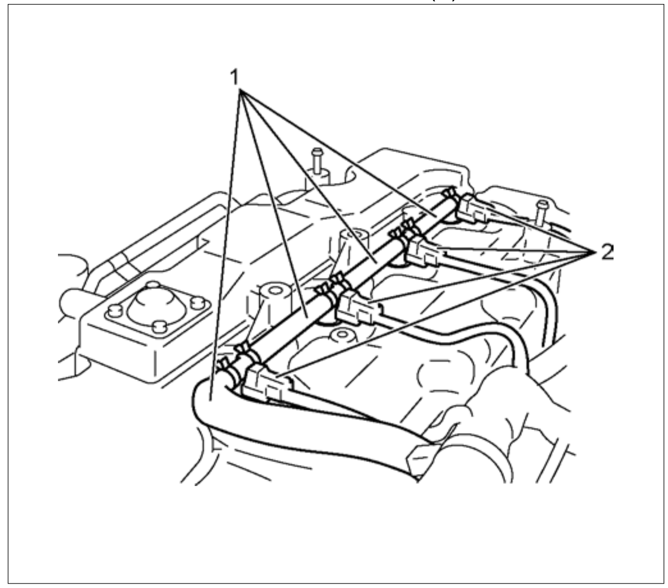
   - Remove the two intake hoses.
   - Remove the intercooler (1).



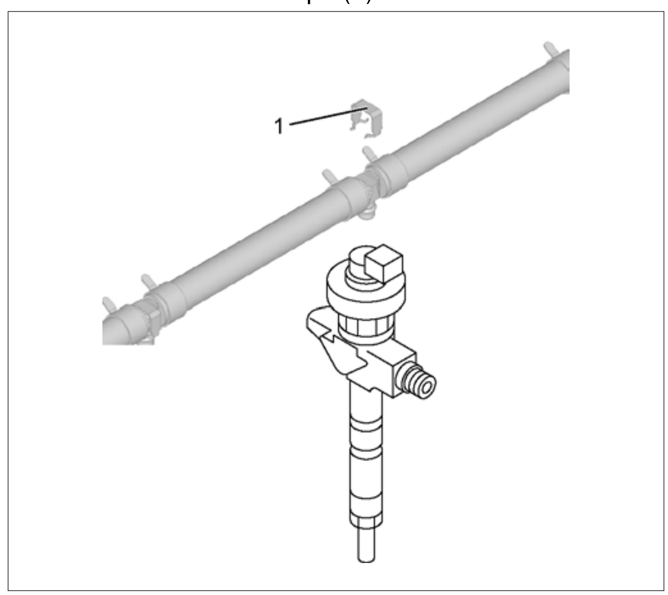
RTW76ASH000501

5. Disconnect the fuel injector connector (2).
6. Remove the fuel leak off hose (1).



RTW76ASH000101

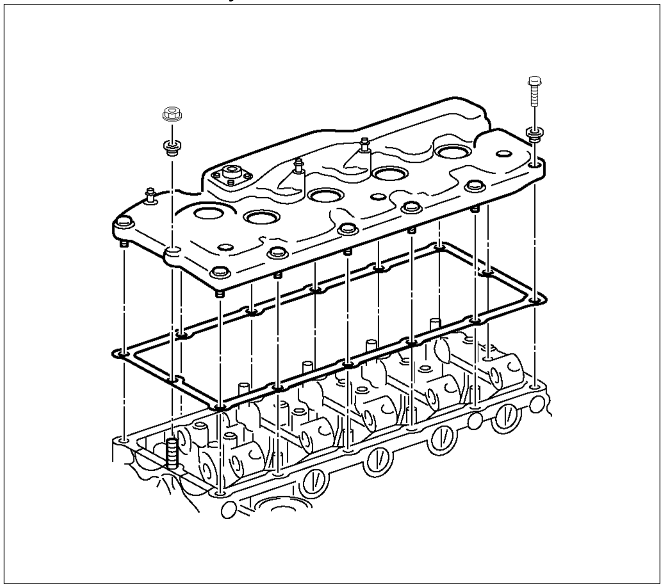
Note: Do not reuse the clips (1).



LNW76ASH002101

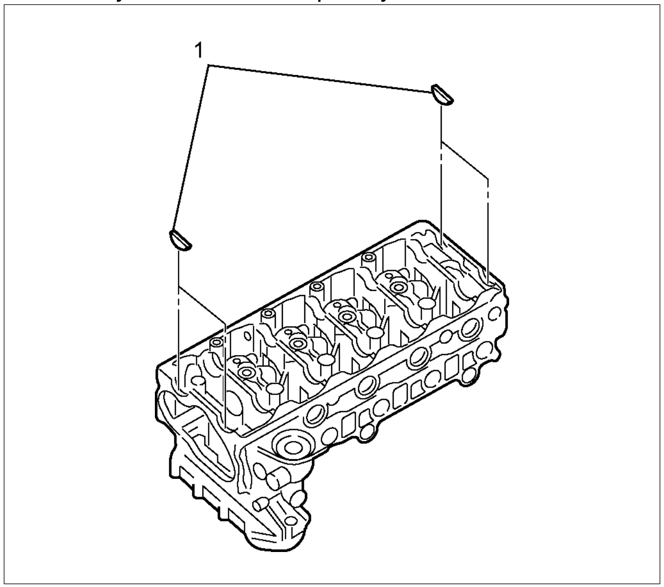
7. Disconnect the blow-by hose.

8. Remove the cylinder head cover.



LNW71BSH000401

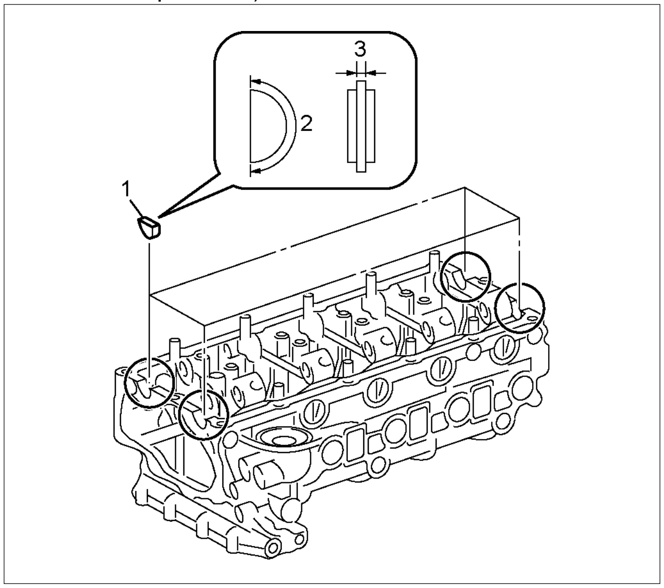
9. Remove the nozzle seal cover from the cylinder head cover.
   - Remove from the lower side of cylinder head cover.
10. Remove the cam end gasket (1).
   - Remove the liquid gasket that has adhered to cylinder head completely.



RTW56ASH020501

Installation

1. Install the nozzle seal cover.
   - Insert from the lower side of cylinder head cover.
   - Apply soapy water or engine oil to the surface of cylinder head cover side.
   - Insert the nozzle seal cover as far as it will go.
2. Install the cam end gasket.
   - Apply the liquid gasket (ThreeBond TB-1207B or equivalent) and mount.



RTW56ASH020601

Legend

1. Cam End Gasket
2. Apply The Liquid Gasket

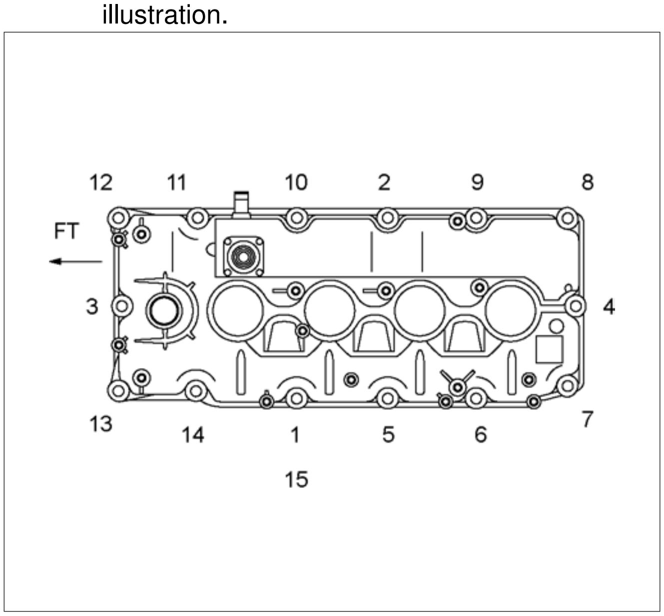
2. 3.0 - 5.0 mm (0.118 - 0.197 in)

3. Install the cylinder head cover.

   Tightening torque: 10 N·m (1.0 kg·m / 87 lb in)

   - Tighten the nut and bolts in order shown in the illustration.



RTW56ASH004801

4. Install the blow-by hose.
5. Install the leak-off hose and the fuel injector connector.
6. Install the harness bracket to the cylinder head cover.
7. Install the intercooler (High output).
   - Install the intercooler.
   - Install the two intake hoses.
   - Connect the BARO sensor harness connector.
8. Install the intake air duct.

   Tightening torque: 25 N·m (2.5 kg·m / 18 lb in)

9. Install the engine cover.

Intake Manifold

Components (Standard Output)

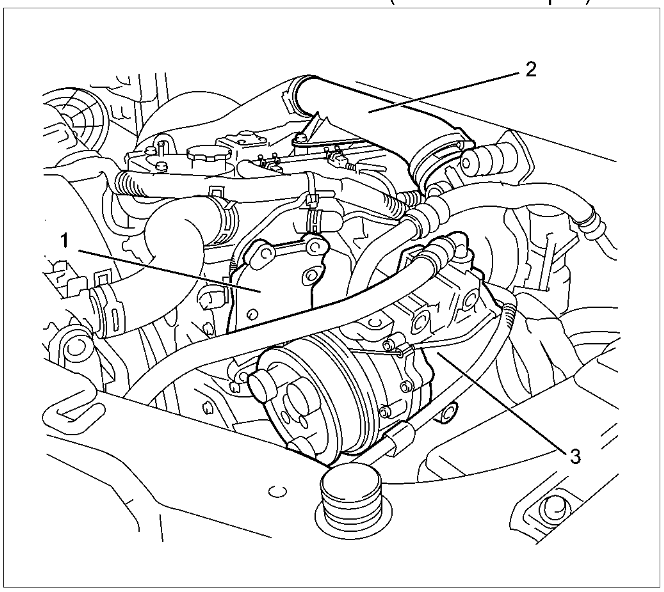
Removal

1. Remove the engine cover.
2. Disconnect the connectors.
   - Fuel Injector
   - Throttle Assembly
   - EGR Valve
   - Glow Plug
   - Barometric Sensor
   - A/C Compressor Connector
3. Remove the A/C belt
4. Remove the A/C compressor.
5. Remove the A/C compressor bracket.
6. Remove the intake air duct (Standard output).

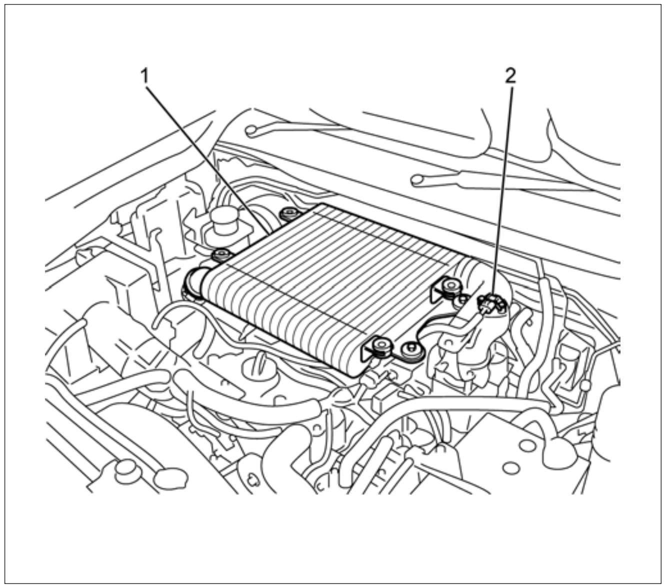


RTW56ASH024801

Legend

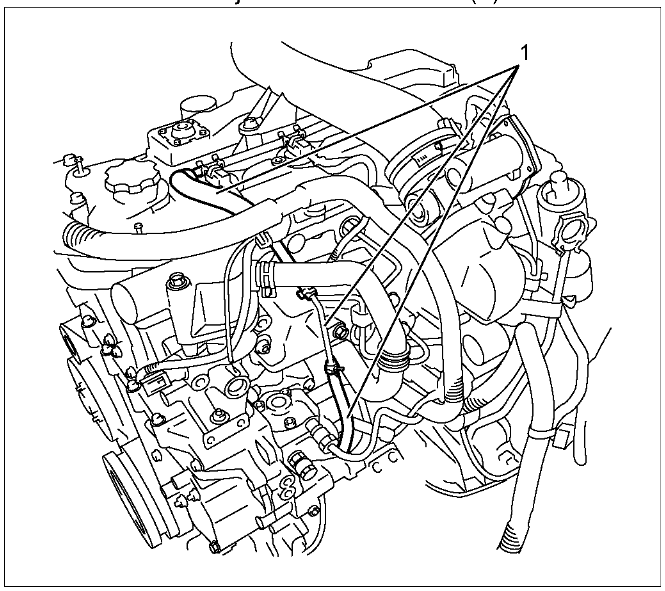
1. A/C Compressor Bracket
2. Intake Air Duct
3. A/C Compressor

7. Remove the intercooler (High output).
   - Disconnect the BARO sensor harness connector (2).
   - Remove the two intake hoses.
   - Remove the intercooler (1).



RTW76ASH000501

8. Remove the injector leak-off hose (1).



RTW56ASH024301

9. Remove the engine oil level gauge guide tube.
10. Remove the EGR valve.

MAGNETIC CLUTCH DOES NOT RUN (4JJ1-TC Standard Output, 4JJ1-TC High Output, 4JK1-TC High Output RHD MODEL)

- Are the No. SBF-6 fuse (30A) and the No. EB-13 (10A) fuses OK?

YES | NO → Replace

- Are the A/C thermo (X-15), heater & A/C (X-11) and A/C compressor (X-14) relay OK?

YES | NO → Replace

- Is the pressure switch (C-24) OK?

YES | NO → Defective switch or insufficient refrigerant

- Is the electronic thermostat (C-55) OK?

YES | NO → Replace

- Are the A/C switch (B-57) and the fan switch (B-13) OK?

YES | NO → Replace

- Turn the ignition switch "ON" (Engine is running)
- A/C switch and fan control knob (fan switch) "ON"

- Disconnect the magnetic clutch connector.

- Is there battery voltage between the engine room harness connector terminal No.1 (E-3) and ground?

NO

- Disconnect the A/C compressor relay.

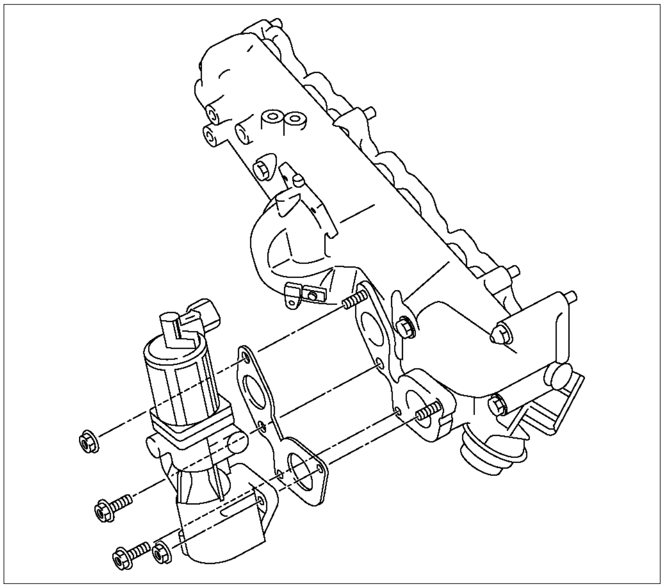
- Is there continuity between the engine harness connector terminal No.1 (E-3) and the engine room harness connector terminal No.2 (X-14)?

YES

Does the magnetic clutch operate?

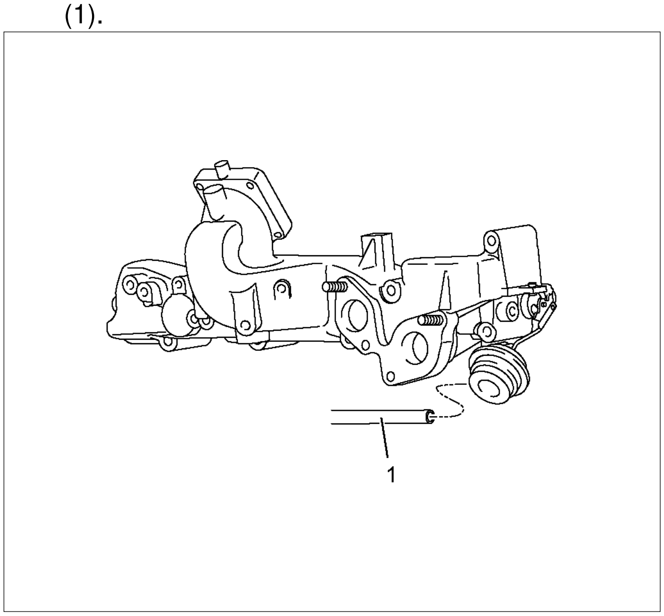
YES → Defective compressor

NO → Defective magnetic clutch



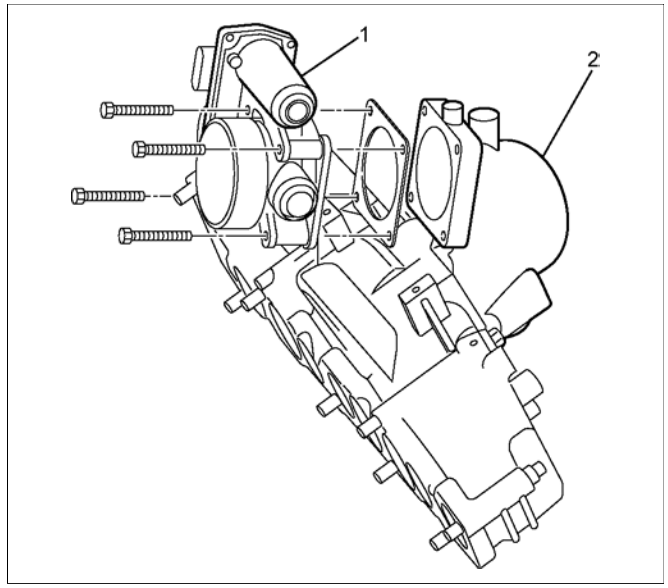
RTW66ASH003001

11. Remove the injection pipes.
    - Remove sequentially from No.1 cylinder.
12. Disconnect the vacuum hose of swirl control valve (1).



RTW66ASH003101

13. Remove the throttle assembly and gasket.

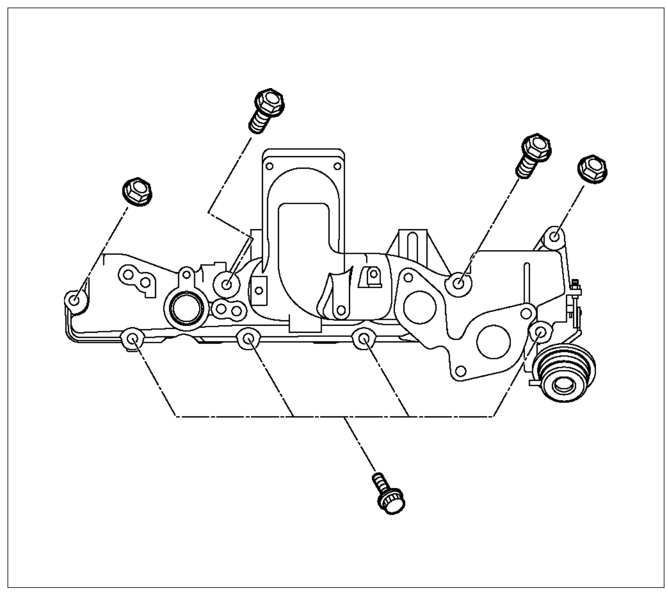


RTW56ASH005201

Legend

1. Throttle Assembly
2. Intake Manifold

14. Remove the intake manifold.



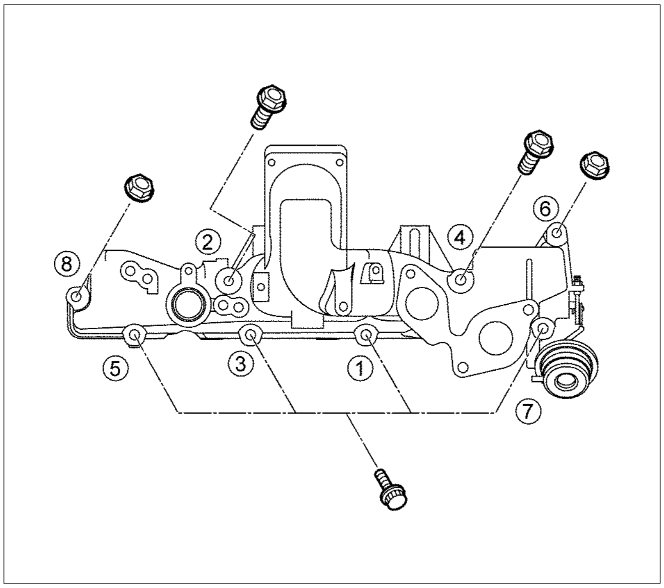
RTW56ASH018001

15. Remove the intake manifold gasket.

Installation

1. Install the intake manifold gasket.
2. Install the intake manifold.
   - Tighten the nuts and bolts in the order described in the drawing.

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)



RTW56ASH018001

3. Install the throttle assembly and gasket.
   - Tighten the bolts to the specified torque.

Tightening torque: 10 N·m (1.0 kg·m / 87 lb in)

4. Install the vacuum hose of swirl control valve.
5. Install the injection pipe (fuel rail - fuel injector).
   - It installs sequentially from No. 4 cylinder.

Tightening torque: 29 N·m (3.0 kg·m / 22 lb ft)

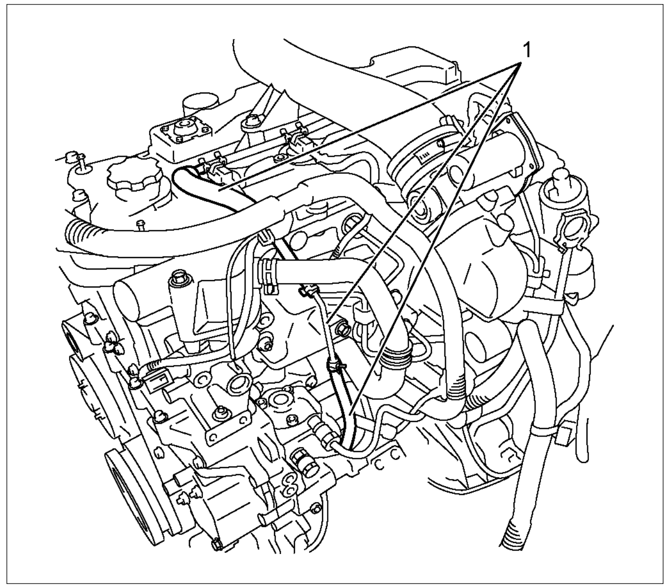
6. Install the EGR valve.
   - Tighten the nuts to the specified torque.

Tightening torque: 27 N·m (2.8 kg·m / 20 lb ft)

7. Install the engine oil level guide tube.
   Tighten the nuts to the specified torque.

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)

8. Install the intercooler (High output).
9. Connect the connector of other parts.
   - Fuel Injector
   - Throttle Assembly
   - EGR Valve
   - Glow Plug
   - Barometric Sensor
   - A/C Compressor Connector
10. Install the leak-off hose.



RTW56ASH024301

Legend

1. Injector Leek-off Hose

11. Install the intake air duct.

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)

12. Install the A/C compressor bracket.

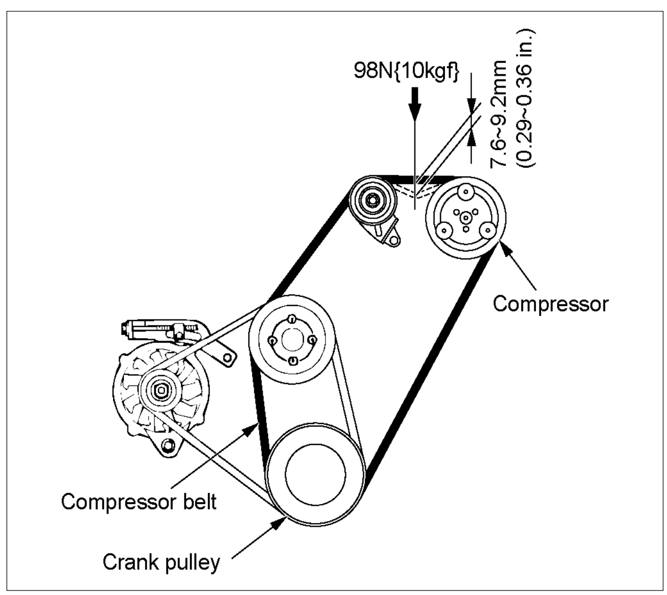
Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)

13. Install the A/C compressor and A/C compressor connector.

Tightening torque: 44 N·m (4.5 kg·m / 33 lb ft)

14. Install the A/C belt.
    Check the A/C belt tension.
    Depress the A/C belt mid-portion with 98 N (10 kg / 22 lb) force.

Standard deflection: 7.6 - 9.2 mm (0.29 - 0.36 in)



RTW510SH000201

15. Install the engine cover.

Torque Specifications

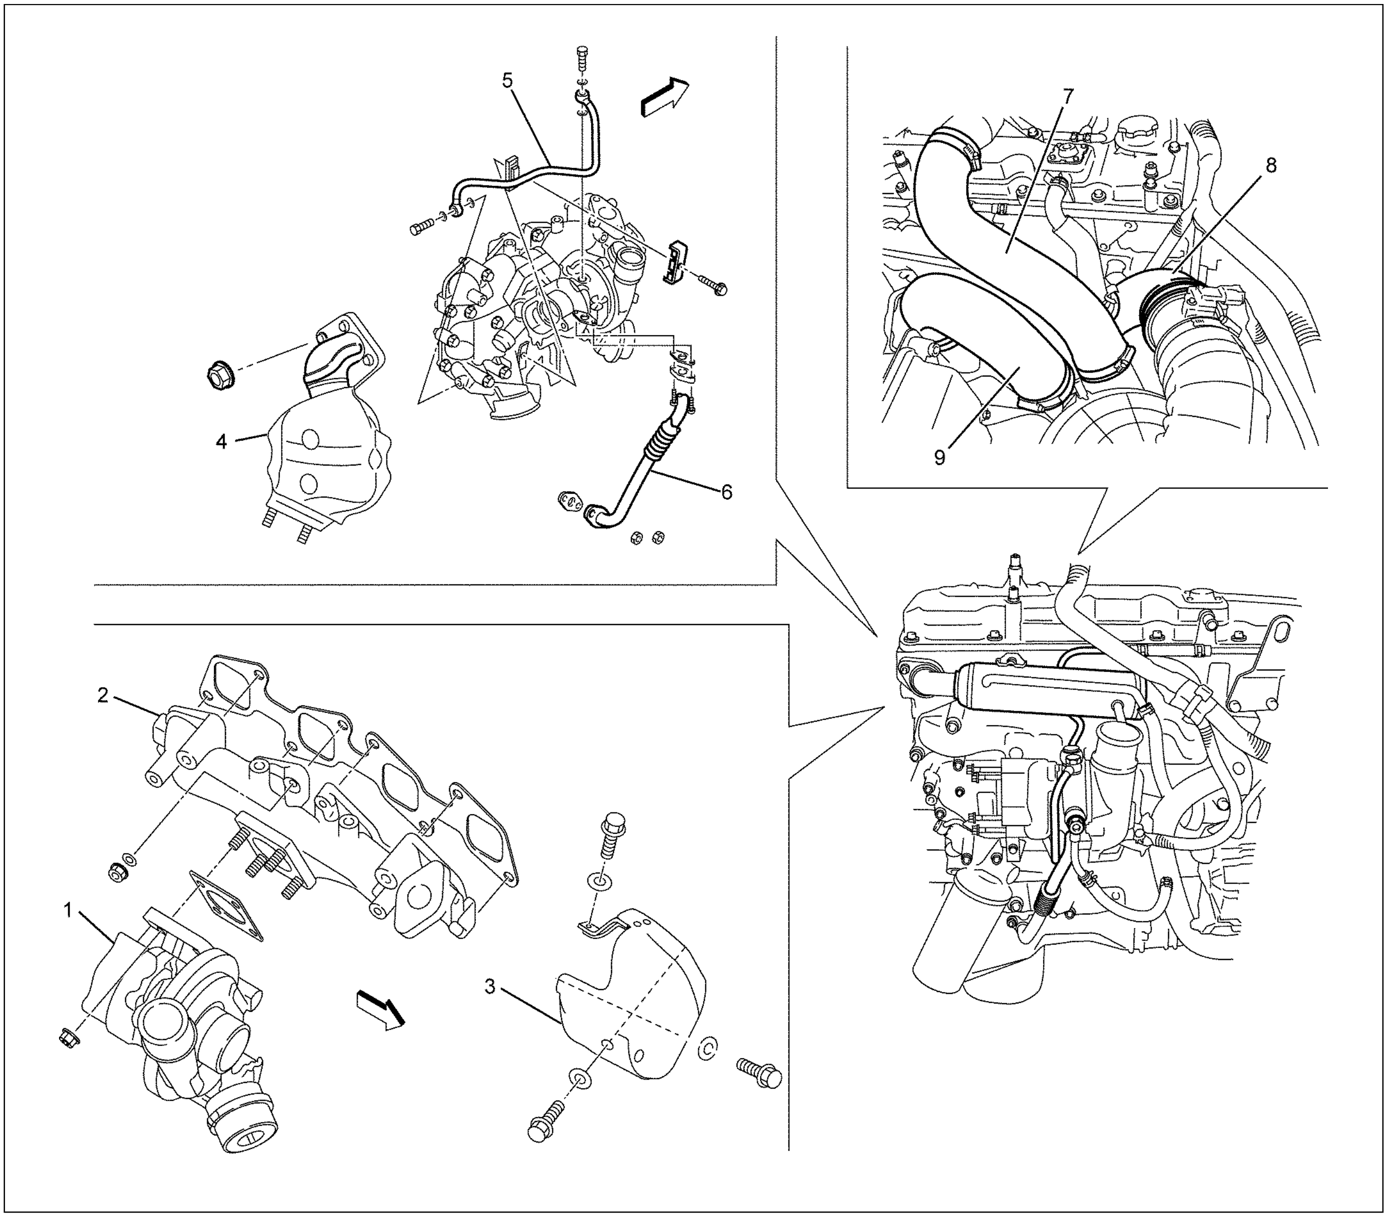
Turbocharger and Exhaust Manifold (Standard Output)

Components

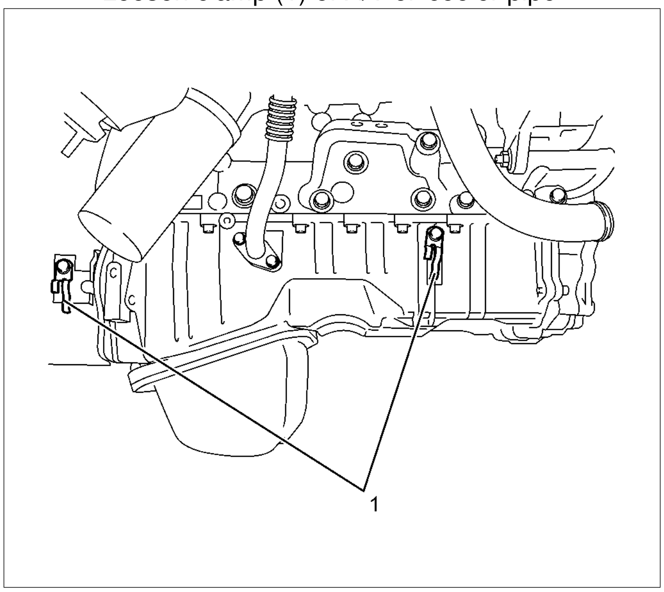


Legend

1. Turbocharger Assembly
2. Exhaust Manifold
3. Heat Protector
4. Catalyst Converter
5. Oil Feed Pipe
6. Oil Return Pipe
7. Intake Hose for Intercooler and Intake Throttle
8. Intake Duct for Turbocharger and Air Cleaner
9. Intake Hose for Turbocharger and Intercooler

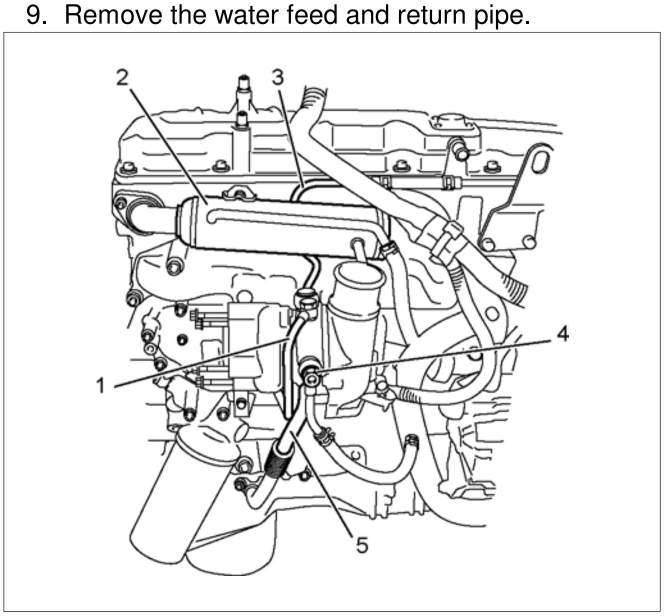
Removal

1. Loosen the radiator drain plug to drain coolant.
2. Remove the engine cover.
3. Remove the intake hose from the intercooler and intake throttle.
4. Remove the intake hose from the turbocharger and the intercooler.
5. Remove the air intake duct from the turbocharger and the air cleaner.
6. Remove the EGR cooler.
   Refer to “EGR Cooler” in EXHAUST SYSTEM Section.
7. Remove the oil feed pipe.
8. Remove the oil return pipe.
   - Loosen clamp (1) of A/T oil cooler pipe.



RTW56ASH025101

9. Remove the water feed and return pipe.

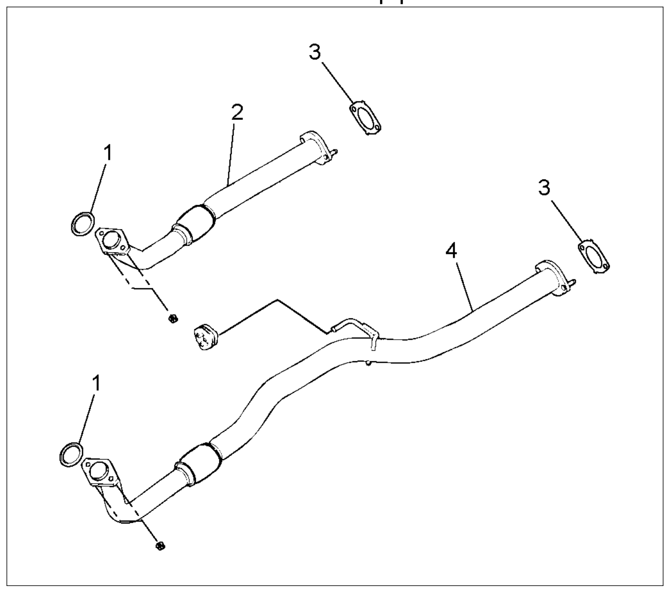


RTW56ASH005401

Legend

1. Oil Feed Pipe
2. EGR Cooler
3. Water Feed Pipe
4. Water Return Pipe
5. Oil Return Pipe

10. Remove the front exhaust pipe.

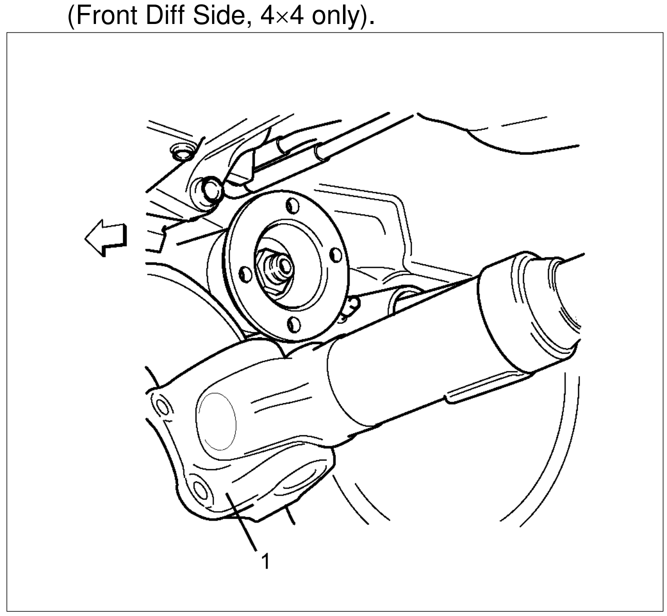


RTW56ASH018301

Legend

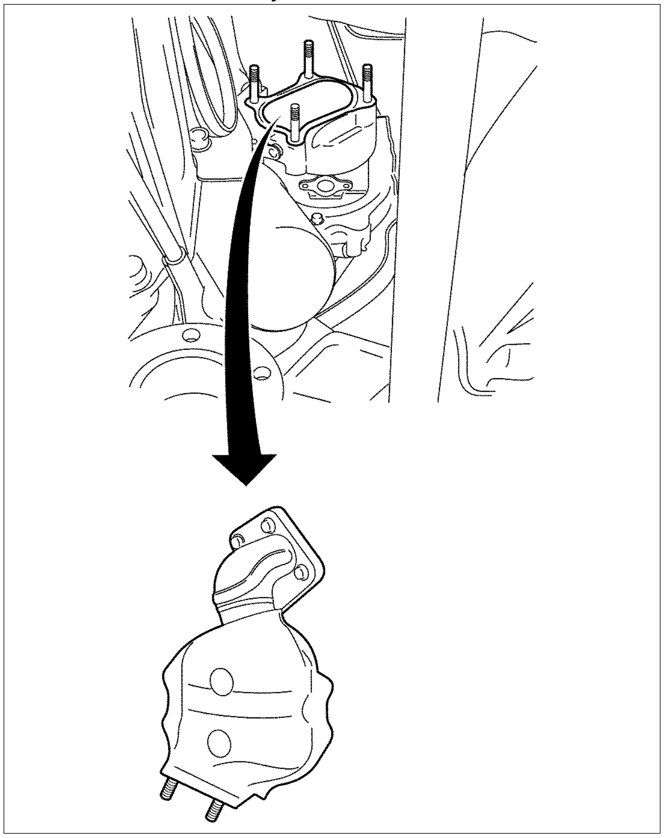
1. Gasket
2. Front Exhaust Pipe (4×2 High Ride Suspention, 4×4)
3. Gasket
4. Front Exhaust Pipe (4×2 Except High Ride Suspention)

11. Disconnect the front propeller shaft flange (1) (Front Diff Side, 4×4 only).



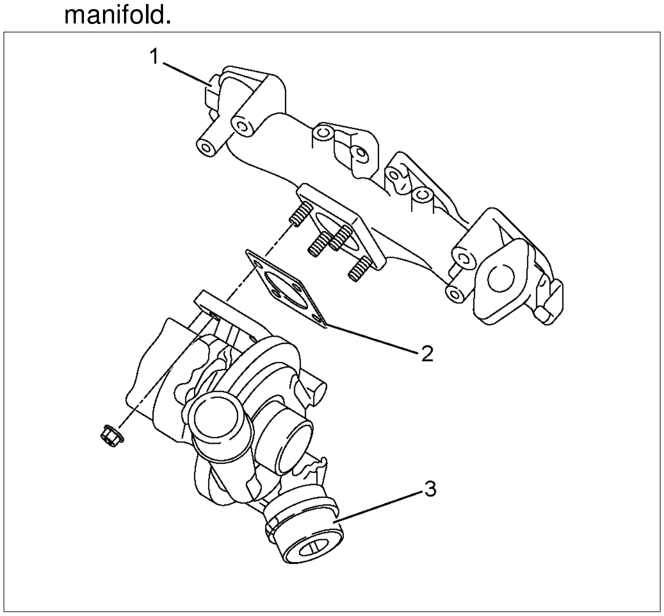
RTW76ASH002301

12. Remove the catalyst converter.



RTW56ALH000201

13. Remove the turbocharger from the exhaust manifold.

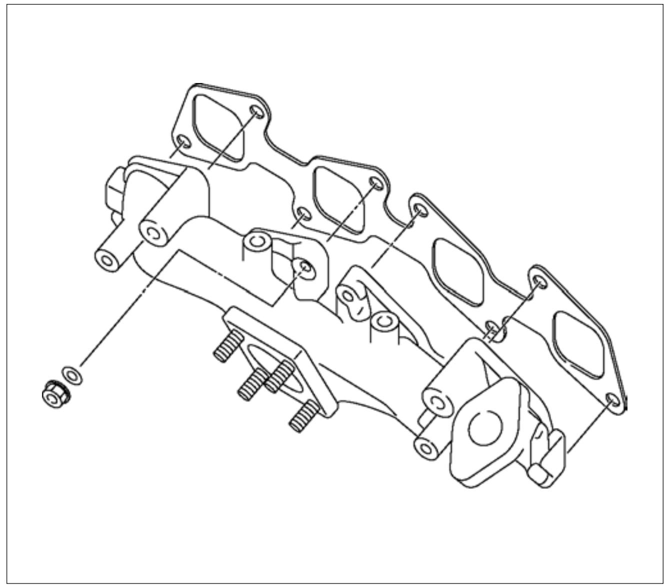


RTW56ASH005501

Legend

1. Exhaust Manifold
2. Gasket
3. Turbocharger

14. Remove the exhaust manifold.
    - Remove the 8 nuts from the exhaust manifold.



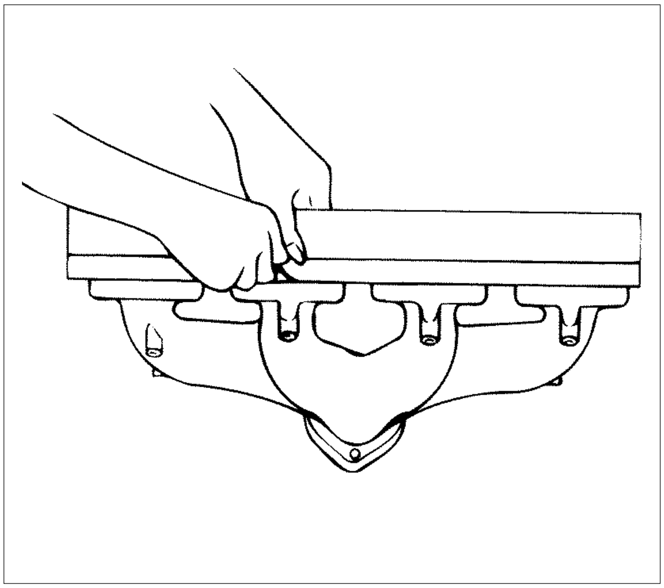
RTW56ASH005601

Inspection

- Inspection of the exhaust manifold. Inspect the plane surface of the plane on which the manifold and the cylinder head are to be installed.

Manifold installation plane surface	mm (in)
Standard	0.3 (0.01) or lower
Limit	0.5 (0.02)

Note:
If the plane surface exceeds the limit, replace it.



LNW21BSH022301

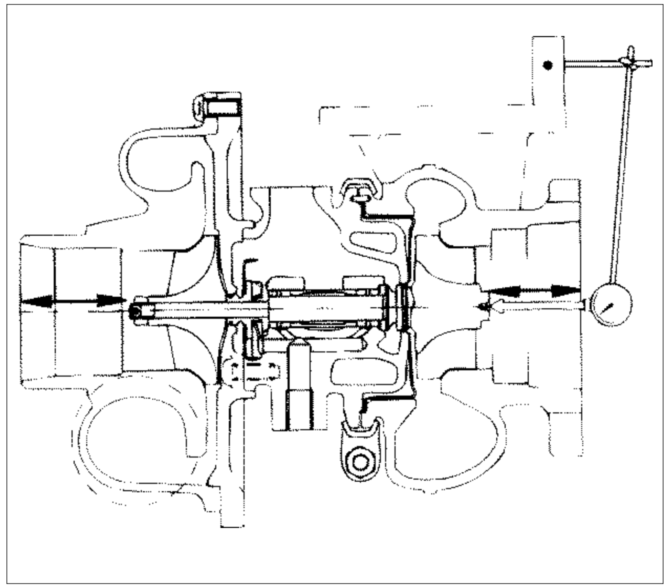
- Check a crack in the exhaust manifold visually.

Carefully inspect the turbocharger for abrasion and/or excessive wear. Make any necessary adjustments, repairs, and/or part replacements.

Wheel shaft axial play

Use a dial gauge to measure the wheel axle shaft play when a force of 12 N (1.2 kg / 2.6 lb) is alternately applied to both sides of the compressor wheel.

Axial play	mm (in)
Standard	0.03 – 0.06 (0.0012 – 0.0024)
Limit	0.09 (0.0035)

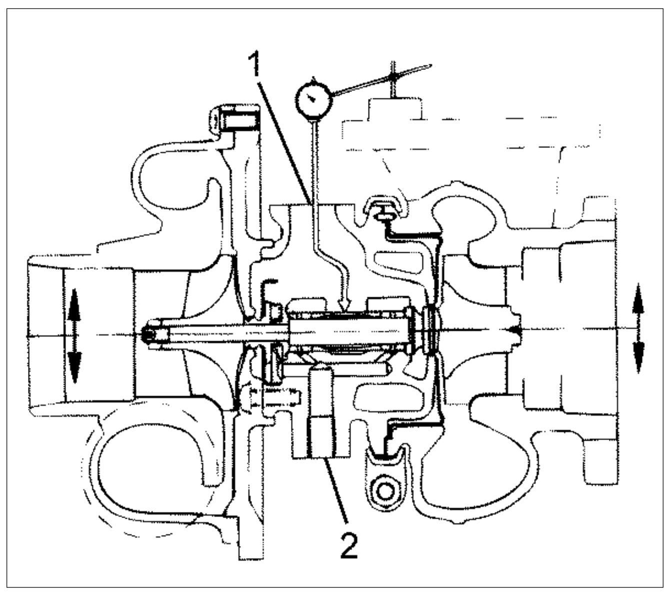


LNW21BSH022201

Wheel shaft and bearing clearance

Use a dial gauge to measure the clearance between the wheel shaft and the bearing.

Clearance	mm (in)
Standard	0.056 – 0.127 (0.0022 – 0.0050)
Limit	0.14 (0.0055)



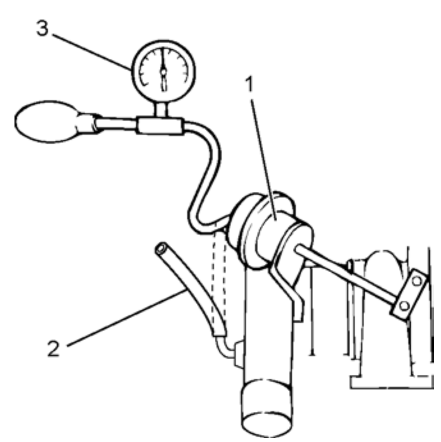
LNW21BSH022301

Legend

1. Oil Outlet
2. Oil Intake

Waste gate operation

1. Remove the hose from the waste gate actuator.
2. Install the pressure gauge (general tool). Refer to the illustration.



RTW56ASH005701

Legend

1. Waste Gate Actuator
2. Waste Gate Hose
3. Pressure Gauge (General Tool)

3. Use the pressure gauge pump to apply pressure (load) to the waste gate actuator (the engine must be off).
4. Note the pressure at which the control rod moves 2 mm (0.078 in). This pressure must be within the specified limit.

Control rod pressure range:	kPa (mmHg / psi)
109 – 118 (818 – 885 / 16 – 17)	

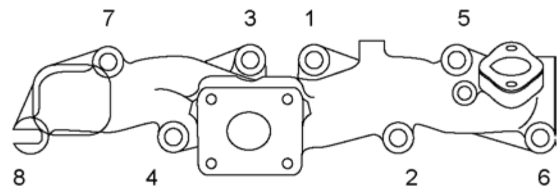
5. Inspect the hose for cracks and other damage. Replace the hose if necessary.
6. Do not apply a pressure of more than 120 kPa (900 mmHg) to the waste gate actuator.

Installation

1. Put the gasket in to install the exhaust manifold.
   - Tighten up with the 8 nuts according to the order given in the figure.

Tightening torque: 52 N·m (5.3 kg·m / 38 lb ft)

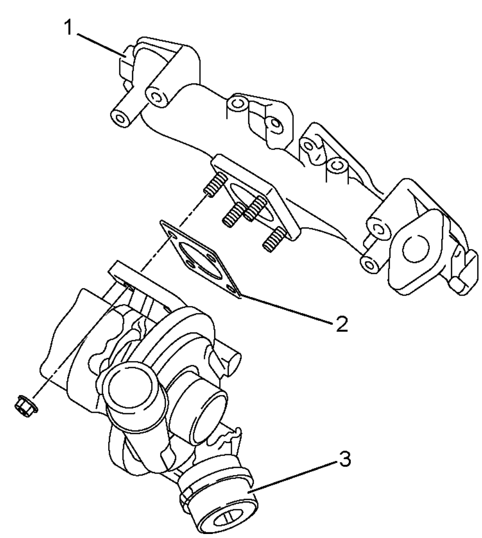
Note:
Do not tighten up too much because it hampers expansion and contraction due to the heat from the manifold.



RTW56ASH005801

2. Install the gasket and turbocharger to the exhaust manifold. Tighten the nuts to the specified torque.

Tightening torque: 27 N·m (2.8 kg·m / 20 lb ft)



RTW56ASH005501

Legend

1. Exhaust Manifold
2. Gasket
3. Turbocharger

3. Install the catalyst converter.
   Tighten the nuts to the specified torque.

Tightening torque: 27 N·m (2.8 kg·m / 20 lb ft)

4. Connect the front propeller shaft flange (Front Diff Side, 4×4 only).
5. Install the front exhaust pipe.
   Tighten the nuts to the specified torque.

Tightening torque

Exhaust Manifold Side: 67 N·m (6.8 kg·m / 49 lb ft)

Exhaust Pipe Side: 43 N·m (4.4 kg·m / 32lb ft)

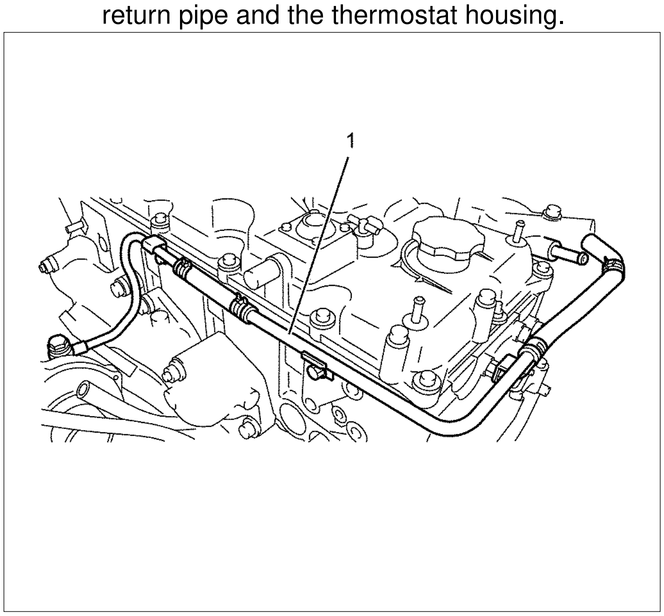
6. Install the water feed pipe to the turbocharger (1).
   - Tighten the joint bolts to the specified torque.

Tightening torque: 54 N·m (5.5 kg·m / 40 lb ft)

   - Install the pipe bracket and tighten the bolts to the specified torque.

Tightening torque: 10 N·m (1.0 kg·m / 87 lb in)

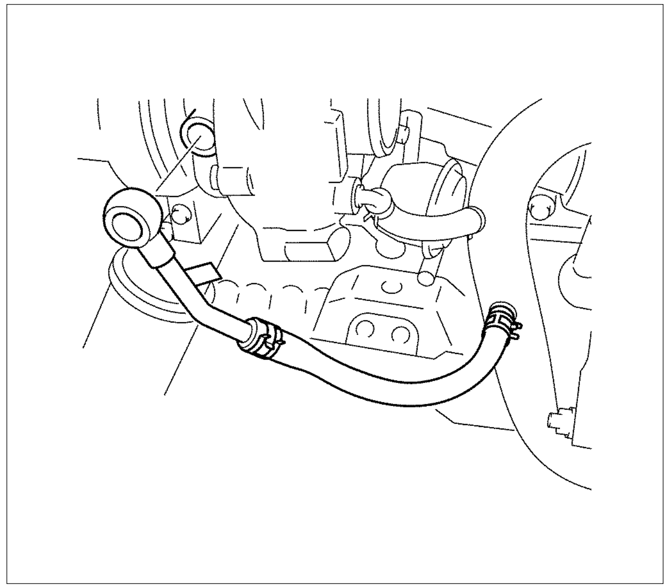
   - Install the rubber hose between the water return pipe and the thermostat housing.



RTW56ASH019101

7. Install the water return pipe. Tighten the joint bolt to the specified torque.

Tightening torque: 54 N·m (5.5 kg·m / 40 lb ft)



RTW56ASH019001

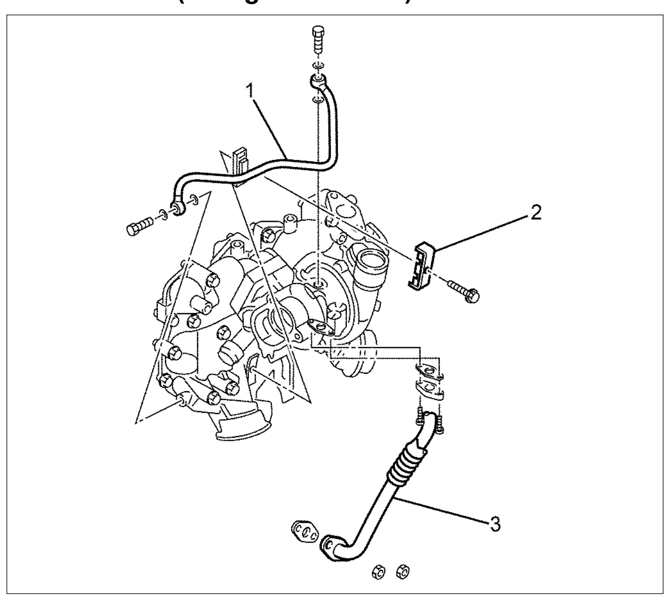
8. Install the turbocharger oil feed pipe to the top of the turbocharger. Tighten the joint bolts to the specified torque.

Tightening torque (Turbo charger side):
23 N·m (2.3 kg·m / 17 lb ft)

Tightening torque (Oil cooler side):
23 N·m (2.3 kg·m / 17 lb ft)

   - Install the pipe bracket and tighten the bolts to the specified torque.

Tightening torque: (Clip)
10 N·m (1.0 kg·m / 87 lb in)



RTW56ASH00610

Legend

1. Oil Feed Pipe
2. Clip
3. Oil Return Pipe

9. Tighten the oil return pipe bolts and nuts to the specified torque.

Tightening torque (Turbocharger side):
10 N·m (1.0 kg·m / 87 lb in)

Tightening torque (Crank case side):
25 N·m (2.5 kg·m / 18 lb ft)

10. Install the EGR cooler.
    - Refer to "EGR Cooler" in EXHAUST SYSTEM section.
11. Install the heat protector.
    - Refer to "EGR Cooler" in EXHAUST SYSTEM section.
12. Install the intake hose between the intercooler and the intake throttle (7).
13. Install the intake hose between the turbocharger and the intercooler (9).
14. Install the intake duct between the turbocharger and the air cleaner (8).

Tightening torque: 6 N·m (0.6 kg·m / 52 lb in)

15. Replenish the coolant.

YES

- Is there battery voltage between the engine room harness connector terminal No.1 (X-14) and ground?

NO

Open circuit between the engine harness connector terminal No.1 (E-3) and the engine room harness connector terminal No.2 (X-14).

YES

- Disconnect the A/C thermo relay.
- Is there continuity between the engine room harness connector terminal No.3 (X-14) and the engine room harness connector terminal No.1 (X-15).

NO

Open circuit between the No. EB-13 fuse and the engine room harness connector terminal No.1 (X-14).

YES

- Disconnect the ECM harness connector.
- Is there continuity between the ECM harness connector terminal No.55 (C-58) and the engine room harness connector terminal No.5 (X-14)?

NO

Open circuit between the engine room harness connector terminal No.3 (X-14) and the engine room harness connector terminal No. 1 (X-15).

YES

- Is there continuity between the ECM harness connector terminal No.4 (C-58) and the engine room harness connector terminal No.1 (X-15)?

NO

Open circuit between the ECM harness connector terminal No.55 (C-58) and the engine room harness connector terminal No. 5 (X-14).

YES

- Is there battery voltage between the engine room harness connector terminal No.2 (X-15) and ground?

NO

Open circuit between the ECM harness connector terminal No. 4 (C-58) and the engine room harness connector terminal No. 1 (X-15).

YES

- Disconnect the pressure switch.
- Is there continuity between the engine room harness connector terminal No. 5 (X-15) and the engine room harness connector terminal No. 1 (C-24)?

NO

Open circuit between the No. EB-13 fuse and the engine room harness connector terminal No. 2 (X-15).

Torque Specifications

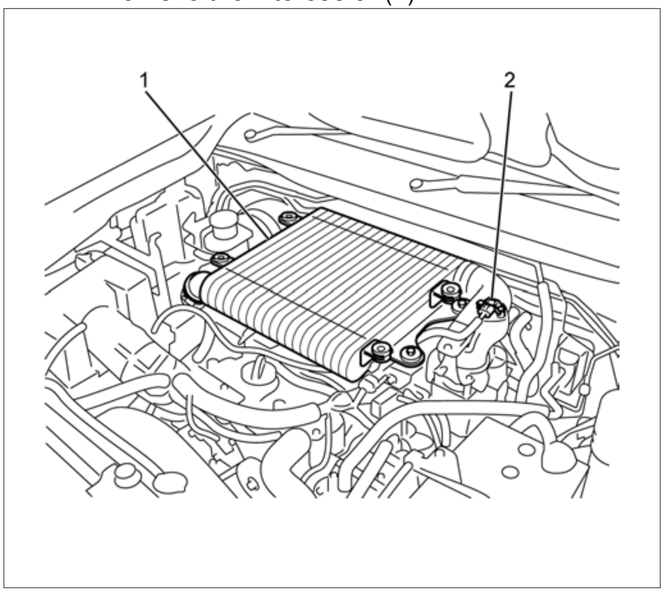
6. Oil Feed and Return Pipe Gasket
7. Oil Feed and Return Pipe
8. Catalyst Converter Gasket
9. Catalyst Converter

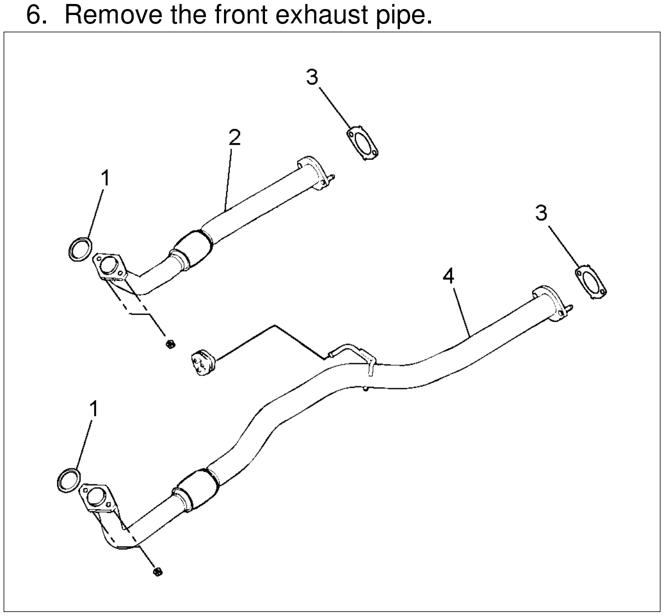
Removal

1. Drain the engine coolant.
2. Remove the engine cover.
3. Remove the intercooler.
   - Disconnect the BARO sensor harness connector (2).
   - Remove the two intake hoses.
   - Remove the intercooler (1).



RTW76ASH000501

4. Disconnect the vacuum hose from the turbocharger actuator.
5. Remove the air intake duct from the turbocharger and the air cleaner.
6. Remove the front exhaust pipe.

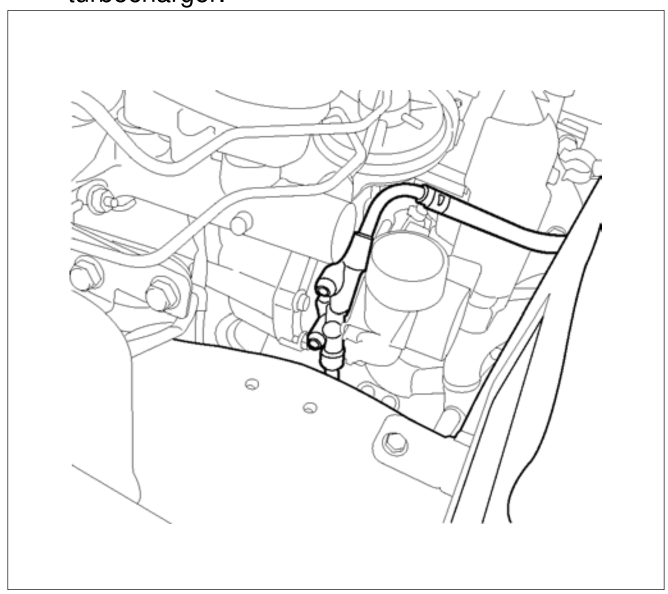


RTW56ASH018301

Legend

1. Gasket
2. Front Exhaust Pipe (4×2 High Ride Suspention, 4×4)
3. Gasket
4. Front Exhaust Pipe (4×2 Except High Ride Suspention)

7. Remove the heat protector of the turbocharger.
   - Remove the mud cover of front RH fender skirt (4×4 only).
   - Loosen the bolt of Turbocharger bracket.
8. Remove the catalyst converter.
9. Remove the turbocharger bracket.
10. Remove the oil feed and return pipe.
11. Remove the water feed and return pipe from the turbocharger.



RTW76ASH001001

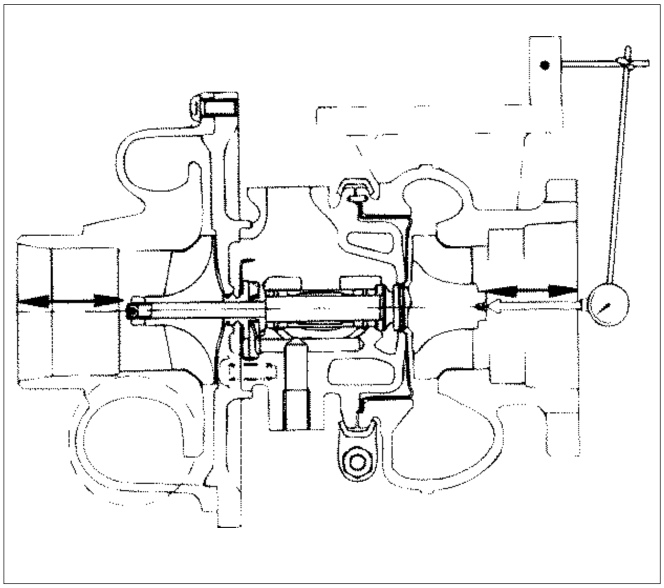
12. Remove the turbocharger from the exhaust manifold.

Inspection

Wheel shaft axial play

Use a dial gauge to measure the wheel axle shaft play when a force of 12 N (1.2kg / 2.6 lb) is alternately applied to both sides of the compressor wheel.

Axial play	mm (in)
Standard	0.03 – 0.06 (0.0012 – 0.0024)
Limit	0.09 (0.0035)

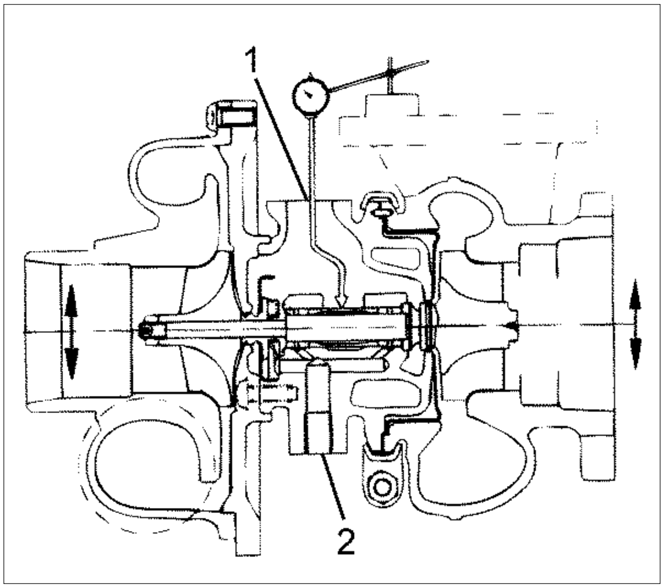


LNW21BSH022201

Wheel shaft and bearing clearance

Use a dial gauge to measure the clearance between the wheel shaft and the bearing.

Clearance	mm (in)
Standard	0.056 – 0.127 (0.0022 – 0.0050)
Limit	0.14 (0.0055)



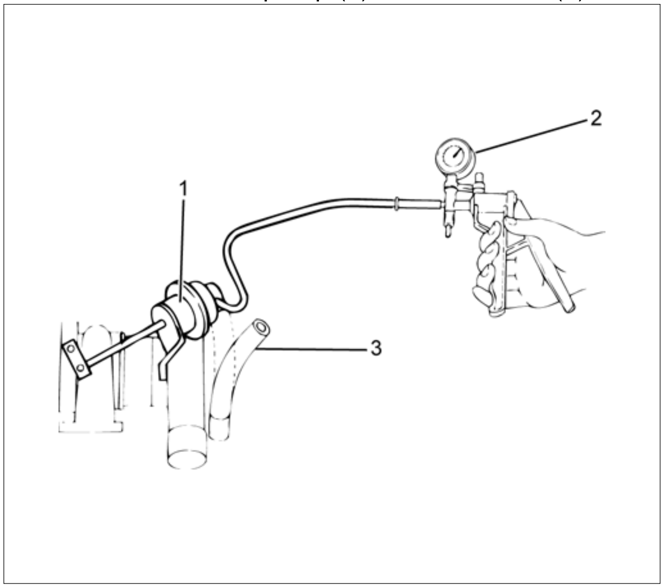
LNW21BSH022301

Legend

1. Oil Outlet
2. Oil Intake

Actuator operation

1. Install a vacuum pump (2) to the actuator (1).



LNW71JSH000201

2. Operate the vacuum pump and apply vacuum pressure to the actuator.

Working vacuum pressure	kPa (mmHg / psi)
52.8 (396 / 7.66)	

3. Place a vernier caliper on the end of the control rod of actuator. Release the vacuum pressure and check the control rod moves. Measure the length of the control rod moving.

Standard length	mm (in)
12 (0.48)	

Installation

1. Install the gasket and the turbocharger to the exhaust manifold. Temporarily tighten nuts.
2. Install the oil feed and return pipe and temporarily tighten.
3. Tighten the turbocharger nuts to the specified torque.

Tightening torque: 27 N·m (2.8 kg·m / 20 lb ft)

4. Tighten the oil feed and return pipe bolts and nuts to the specified torque.

Tightening torque (Turbocharger side):
10 N·m (1.0 kg·m / 87 lb in)

Tightening torque (Crank case side):
25 N·m (2.5 kg·m / 18 lb ft)

5. Install the water feed and return pipe to the turbocharger.

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)

6. Install the heat protector to the turbocharger.

Tightening torque: 10 N·m (1.0 kg·m / 18 lb ft)

7. Install the turbocharger bracket.
8. Install the catalyst converter.
   Tighten the nuts to the specified torque.

Tightening torque: 27 N·m (2.8 kg·m / 20 lb ft)

9. Install the mud cover of front RH fender skirt (4×4 only).
10. Install the front exhaust pipe.
    Tighten the nuts to the specified torque.

Tightening torque

Exhaust Manifold Side: 67 N·m (6.8 kg·m / 49 lb ft)

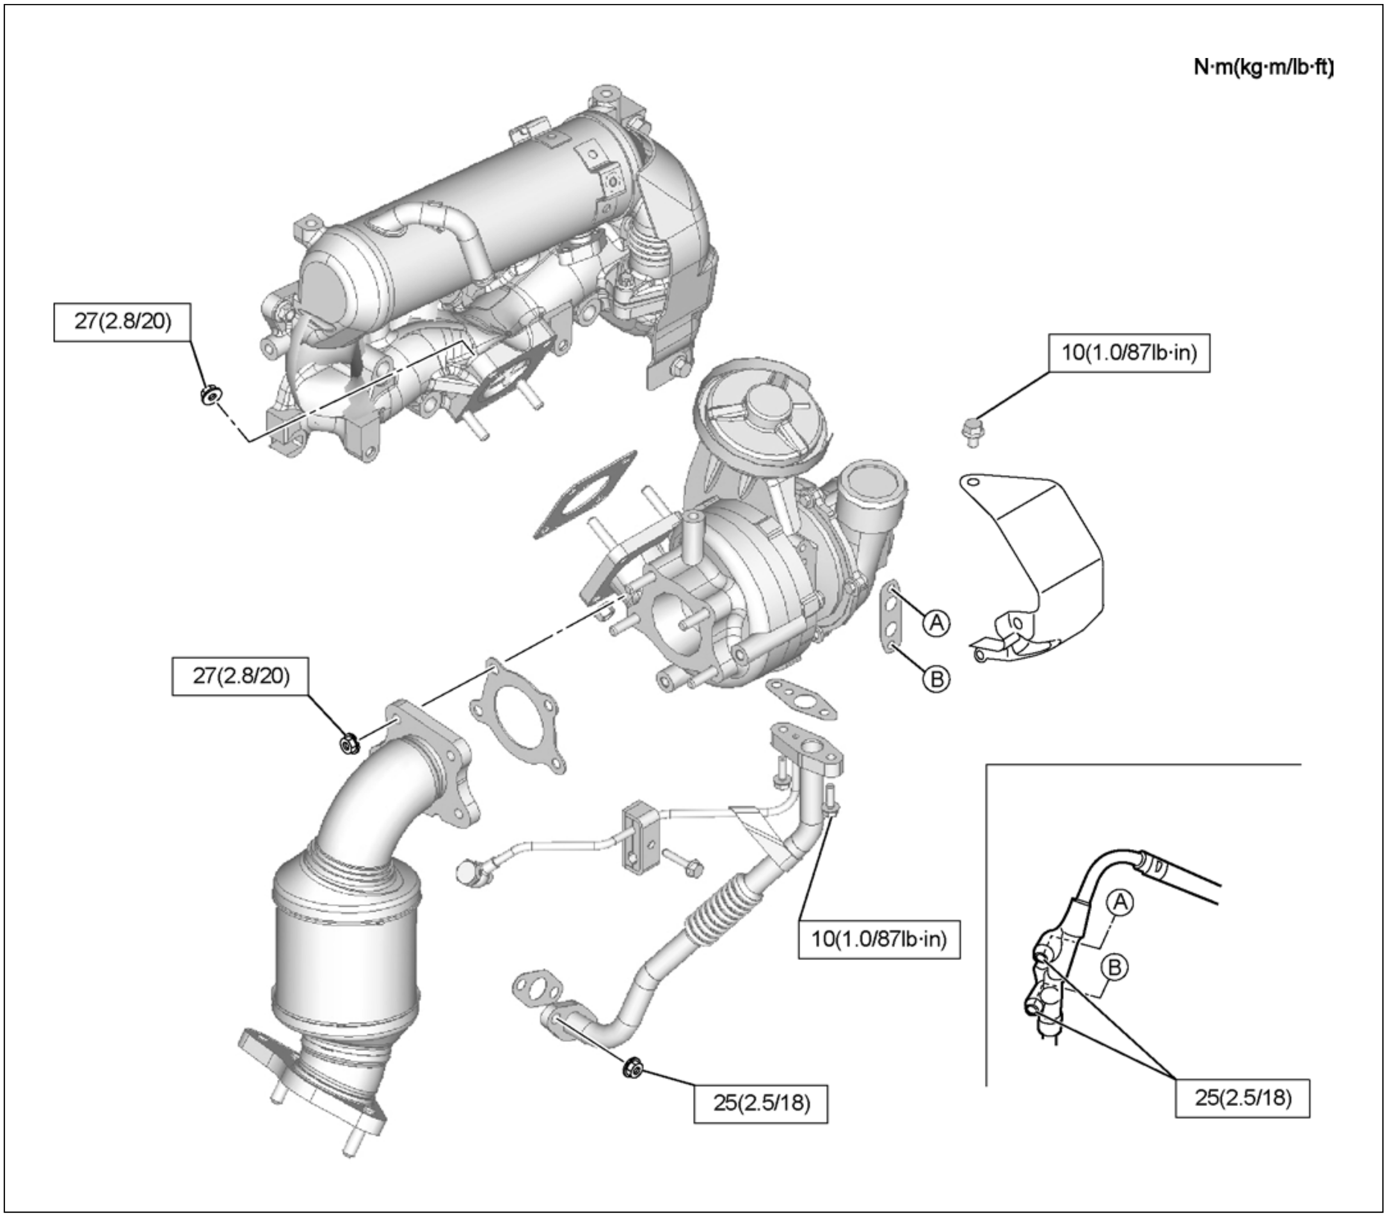
Exhaust Pipe Side: 43 N·m (4.4 kg·m / 32lb ft)

11. Install the intercooler.
    - Install the intercooler.
    - Install the two intake hoses.
    - Connect the BARO sensor harness connector.
12. Install the intake duct between the turbocharger and the air cleaner.

Tightening torque: 6 N·m (0.6 kg·m / 52 lb in)

13. Replenish the coolant.

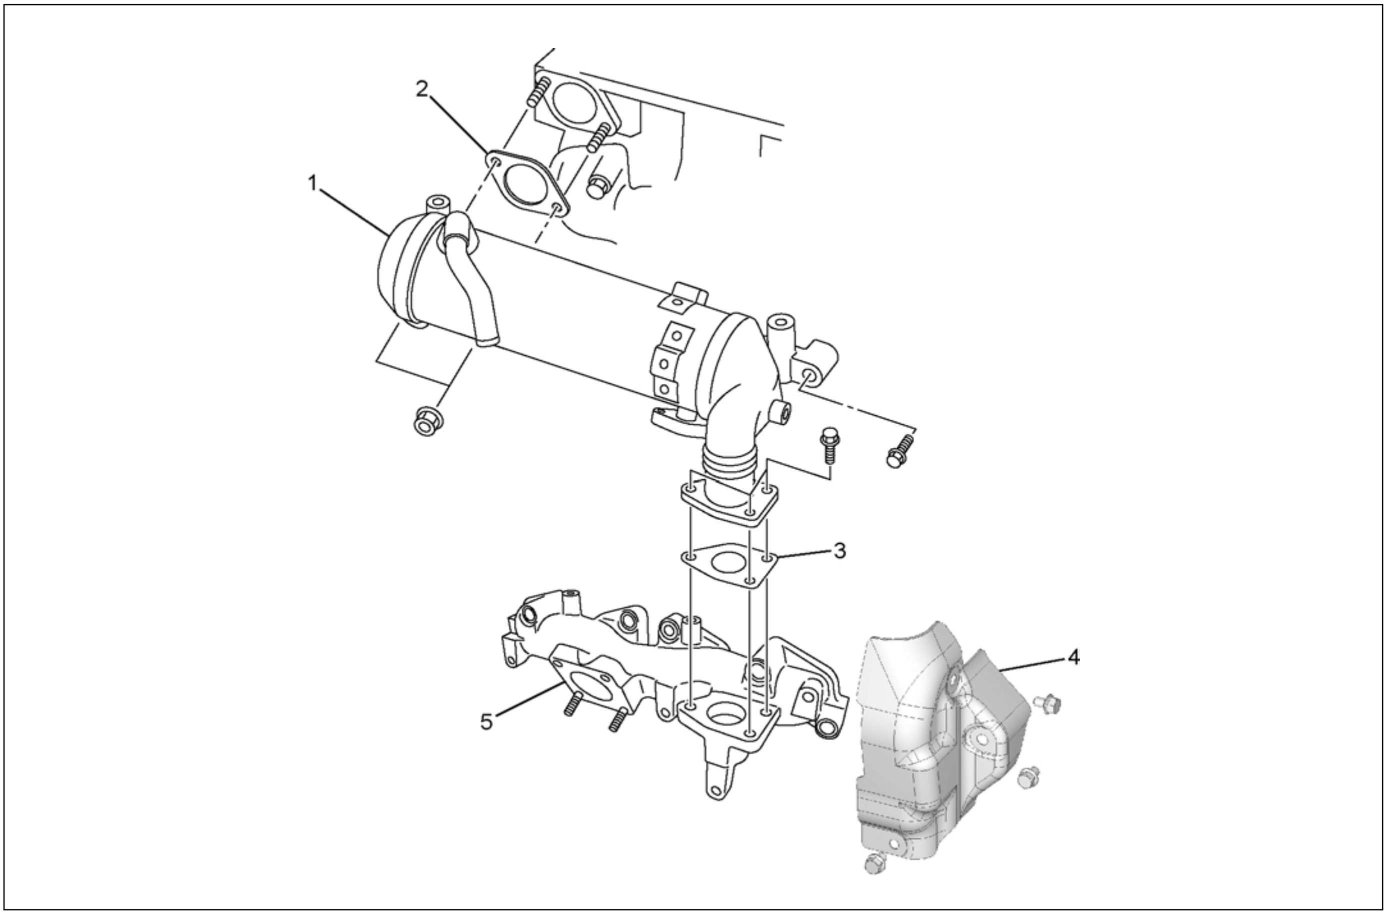
Torque Specifications



RTW76ALF000501

Exhaust Manifold (High Output)

Components



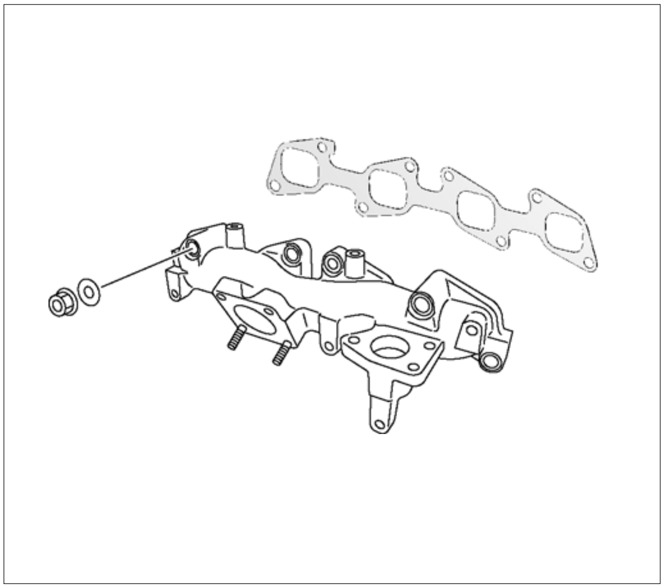
RTW76FMF000101

Legend

1. EGR Cooler
2. EGR Cooler Gasket
3. EGR Cooler Gasket
5. Heat Protector
6. Exhaust Manifold

Removal

1. Drain the engine coolant.
2. Remove the turbocharger.
   - Refer to “Turbocharger”.
3. Remove the EGR cooler heat protector.
4. Disconnect the water hoses from the EGR cooler water pipes.
5. Remove the EGR cooler.
6. Remove the exhaust manifold.



RTW76ASH002101

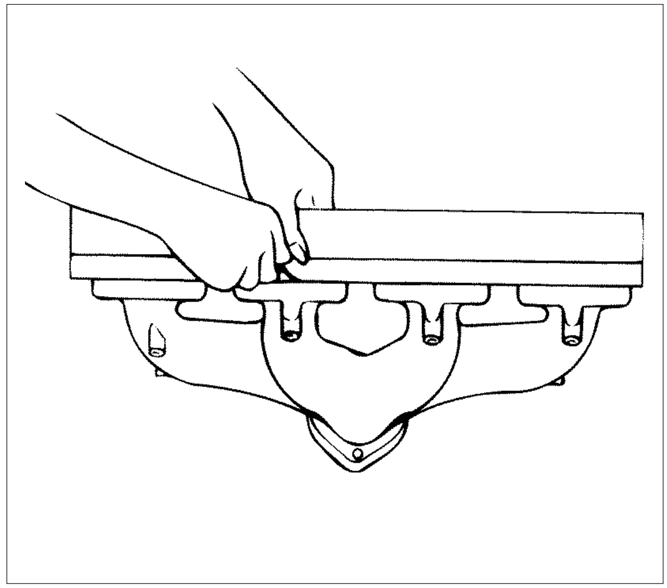
Inspection

- Inspection of the exhaust manifold. Inspect the plane surface of the plane on which the manifold and the cylinder head are to be installed.

Manifold installation plane surface	mm (in)
Standard	0.3 (0.01) or lower
Limit	0.5 (0.02)

Caution:

If the plane surface exceeds the limit, replace it.



LNW21BSH022301

- Check a crack in the exhaust manifold visually.

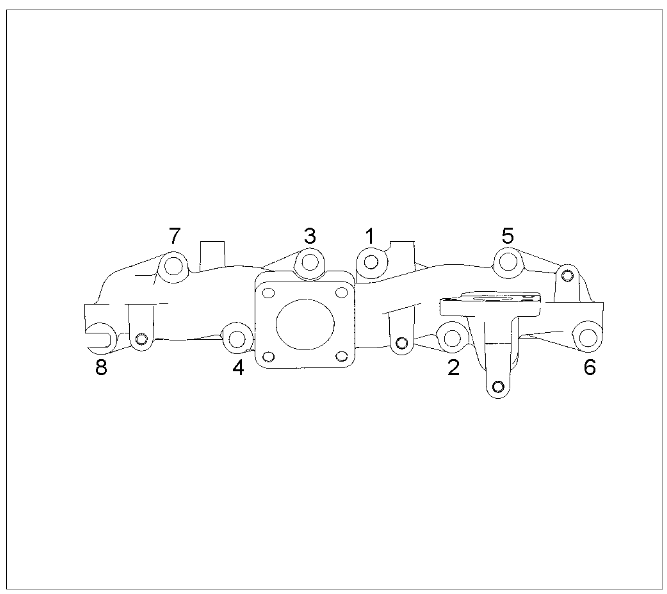
Carefully inspect the turbocharger for abrasion and/or excessive wear. Make any necessary adjustments, repairs, and/or part replacements.

Installation

1. Put the gasket in to install the exhaust manifold.
   - Tighten up with the 8 nuts according to the order given in the illustration.

Tightening torque: 52 N·m (5.3 kg·m / 38 lb ft)

Caution:
Do not tighten up too much because it hampers expansion and contraction due to the heat from the manifold.



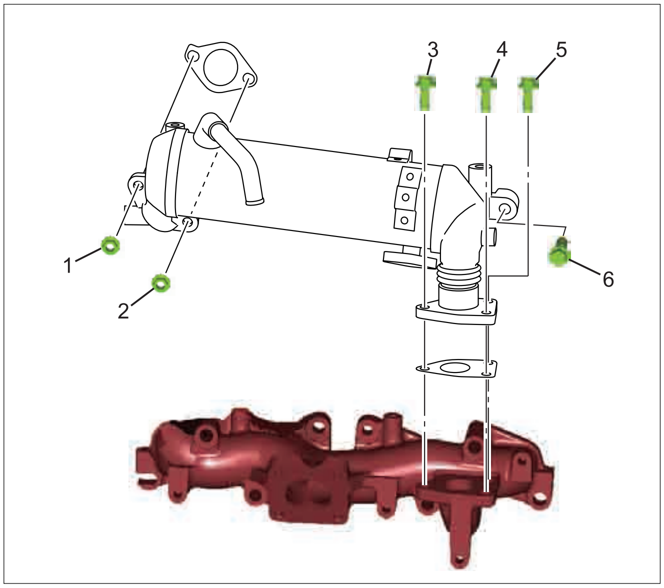
RTW76ASH002201

2. Install the EGR cooler.
   - Install the gaskets.
   - Install the EGR cooler.
   - Temporary tightening order.
     1→2→3→4→5→6
   - Fully tightening order.
     3→4→5→1→2→6

   Tighten the nut and bolts to the specified torque.

Tightening torque:

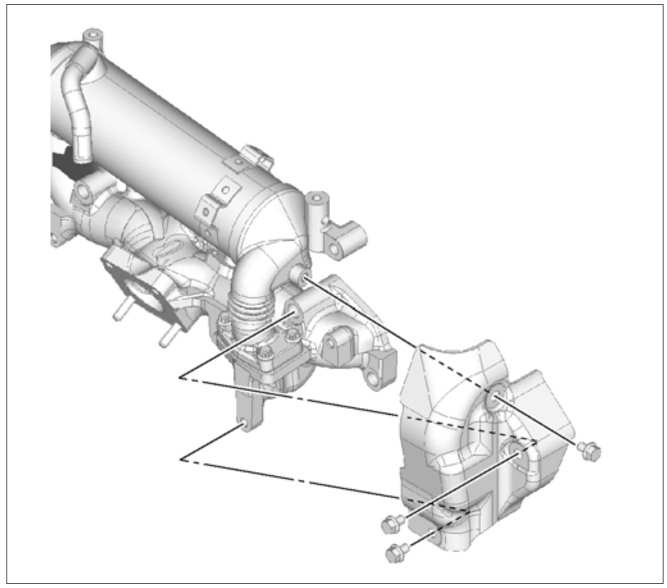
Nuts and bots 1-5: 27 N·m (2.8 kg·m / 20 lb ft)
Bolt 6: 52 N·m (5.3 kg·m / 38 lb ft)



RTW76FSH000201

3. Install the water hoses to the EGR cooler water pipes.
4. Heat protector.
   Tighten the bolts to the specified torque.

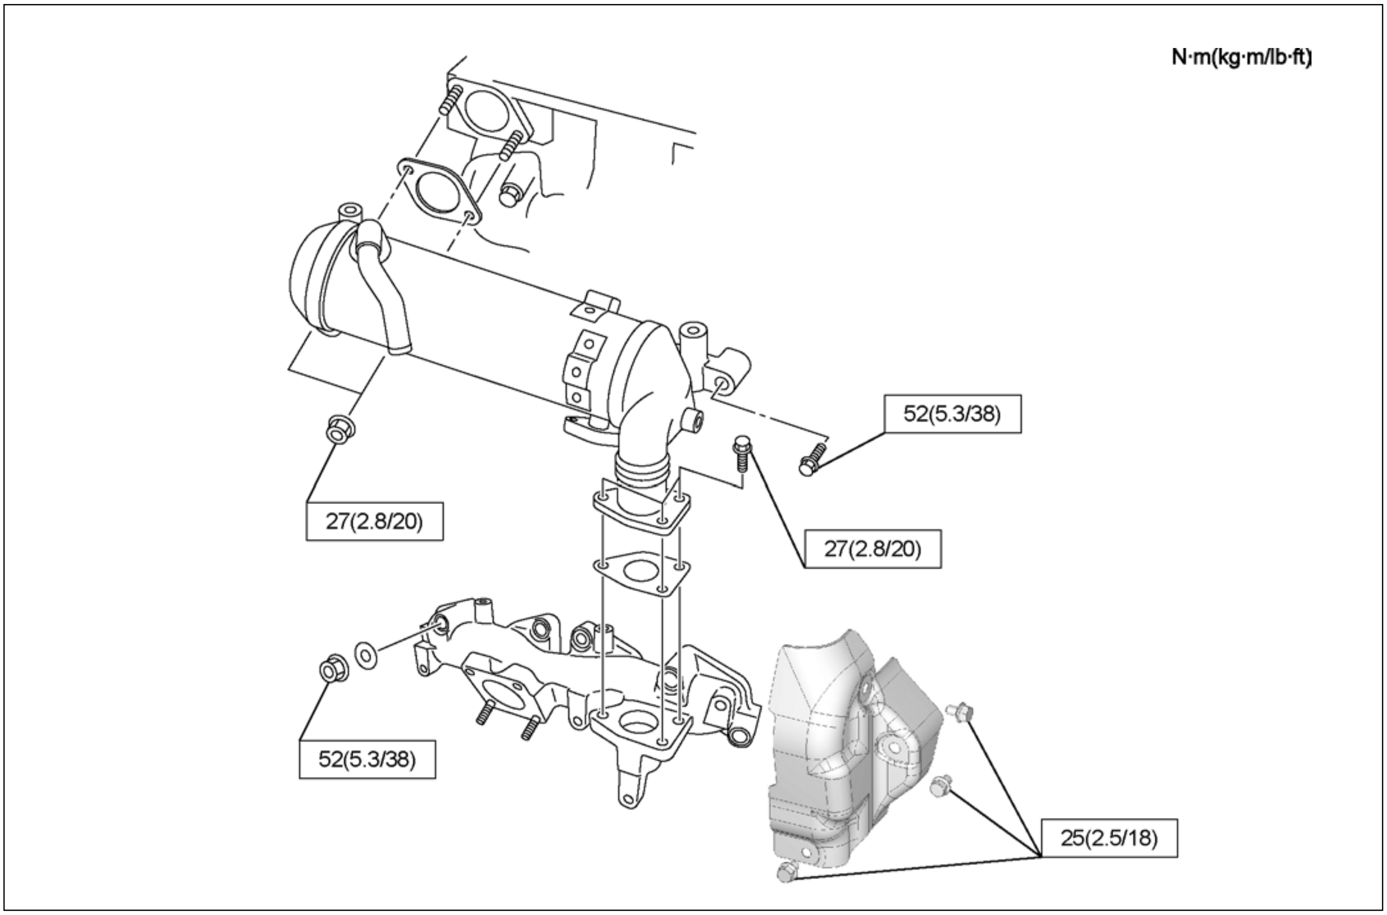
Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)



RTW76FSH000101

5. Install the turbocharger.
   - Refer to “Turbocharger”.
6. Replenish the engine coolant.

Torque Specifications



RTW76AMF000701

YES

- Disconnect the condenser fan relay.

- Is there continuity between the relay terminal No. 3 (X-9) and engine room harness connector terminal No.4 (C-24)?

NO

Open circuit between the engine room harness connector terminal No. 5 (X-15) and the engine room harness connector terminal No. 1 (C-24).

YES

- Is there battery voltage between the engine room harness connector terminal No.3 (C-24) and ground?

NO

Open circuit between the condenser fan relay No.3 (X-9) and the engine room harness connector terminal No. 4 (C-24).

NO

Open circuit between the No. EB-13 fuse and engine room harness connector terminal No. 3 (C-24).

YES

- connect the A/C thermo relay connector.
- Disconnect the electronic thermostat.
- Is there continuity between the engine room harness connector terminal No. 2 (C-55) and the engine room harness connector terminal No. 2 (C-24)?

YES

- Is there battery voltage between the engine room harness connector terminal No.3 (C-55) and ground?

NO

Open circuit between the engine room harness connector terminal No. 2 (C-24) and the engine room harness connector terminal No. 2 (C-55).

YES

- Is there continuity between the engine room harness connector terminal No.1 (C-55) and ground (C-109) ? or (cooler only) the short connector terminal No.3 (B-79) and ground (C-109)?

NO

Open circuit between the No. EB-13 fuse and the engine room harness connector terminal No. 3 (C-55).

Timing Gear Train

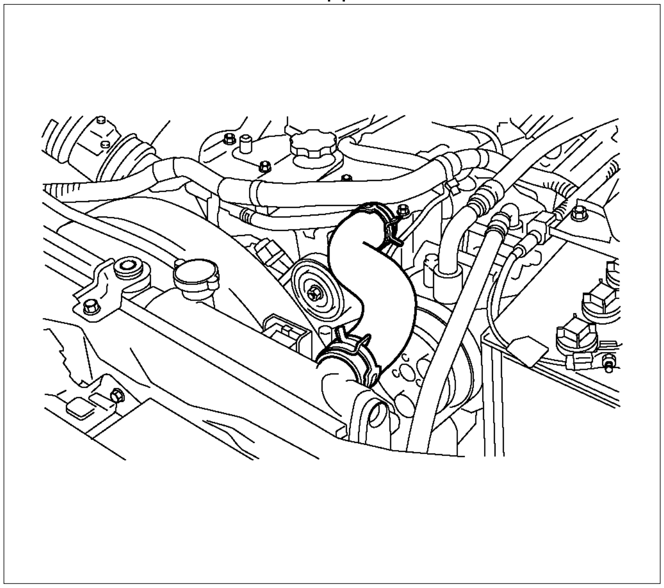
10. Idle Gear A
11. Vacuum Pump Gear
12. Power Steering Oil Pump Gear
13. Idle Gear C

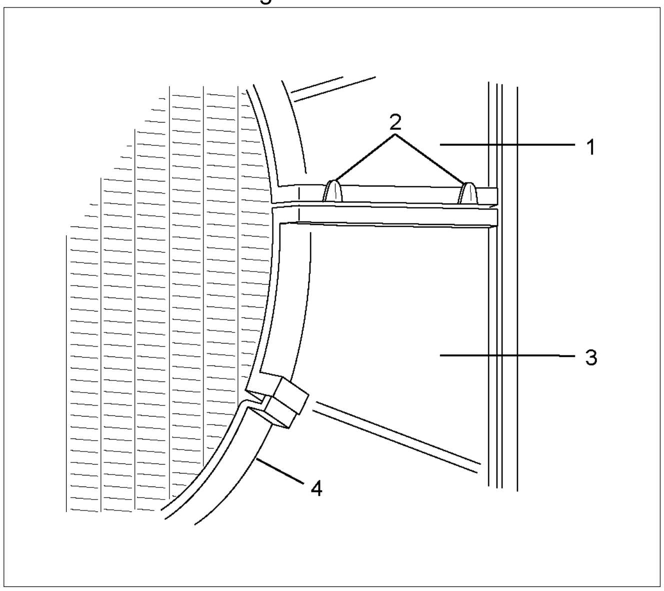
Removal

1. Partially drain the engine coolant.
2. Remove the radiator upper hose.



RTW56FSH000101

3. Remove the fan guide.

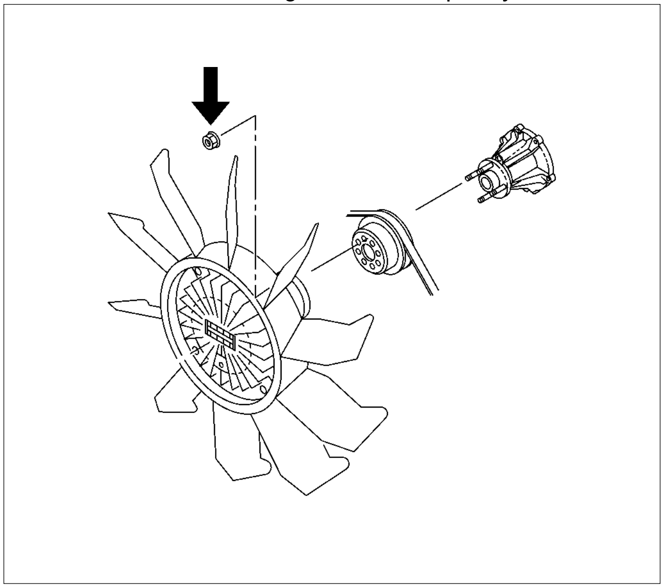


RTW46BSH000101

Legend

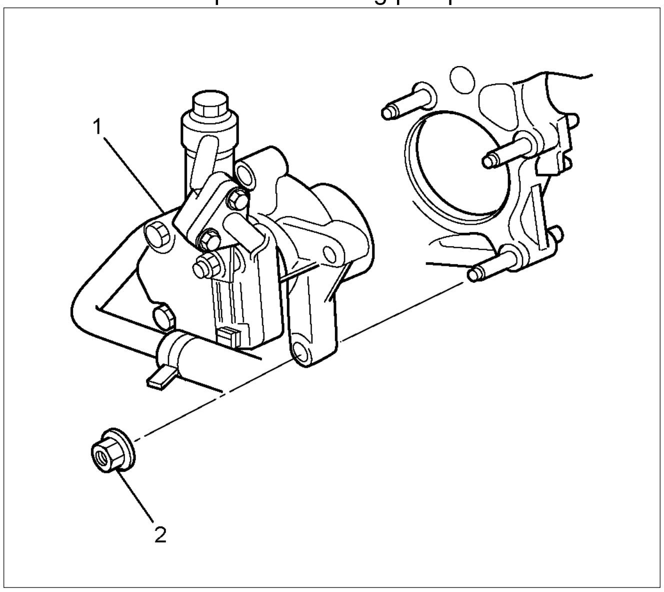
1. Fan Guide
2. Clips
3. Lower Fan Guide
4. Fan Shroud

4. Remove the cooling fan and fan pulley.



RTW56ASH025401

5. Remove the A/C compressor drive belt and fan belt.
6. Remove the crank pulley.
7. Remove the power steering pump with hose.

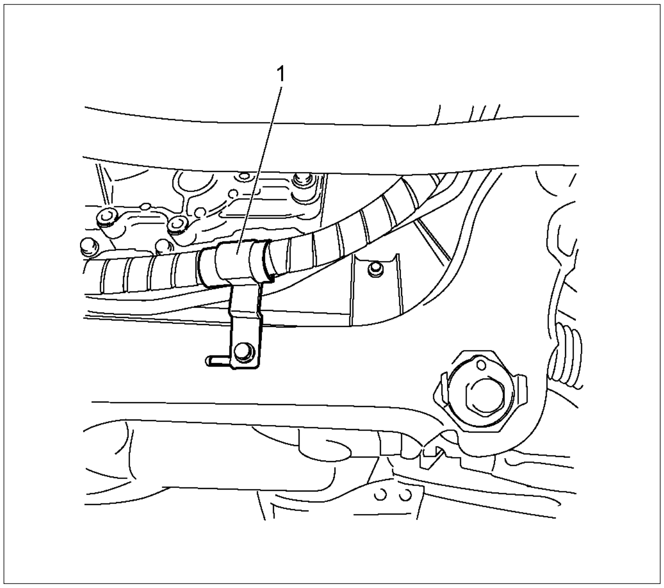


RTW56ASH021101

Legend

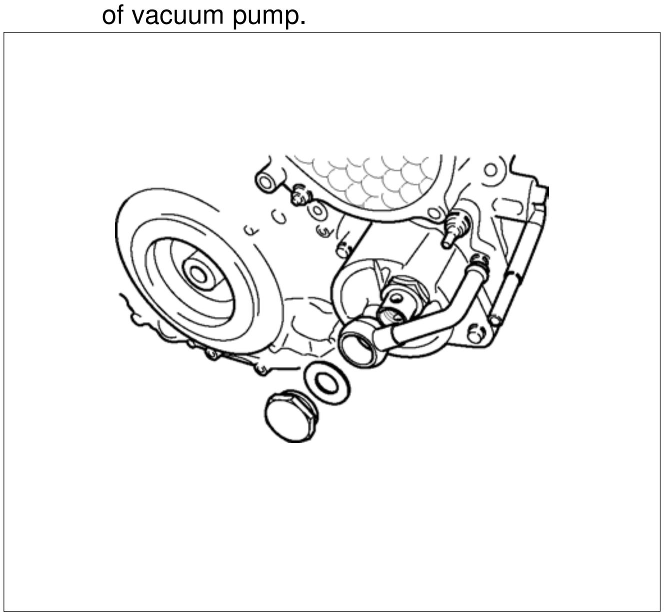
1. Power Steering Pump
2. Nut

- Disconnect the bracket (1) of power steering oil hose.



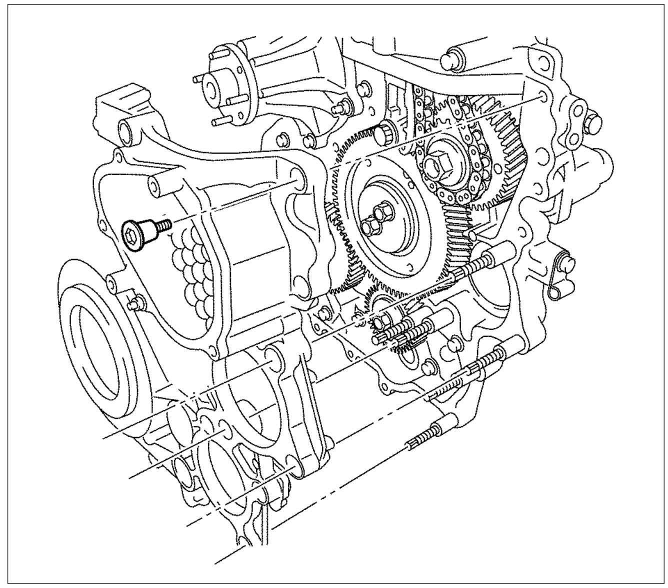
LTW56ASH000101

8. Remove the vacuum pump.
   - Remove the vacuum pipe bracket and vacuum pipe.
   - Remove the oil pipe (feed side and return side) of vacuum pump.



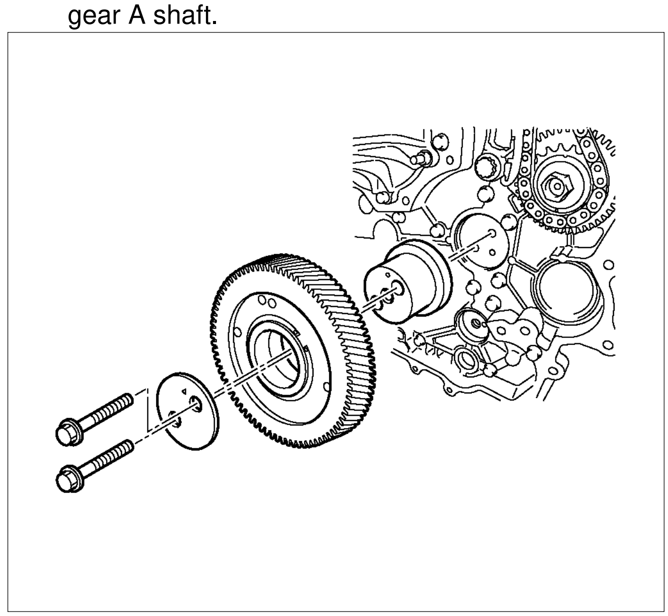
RTW76ASH000201

9. Remove the front cover.



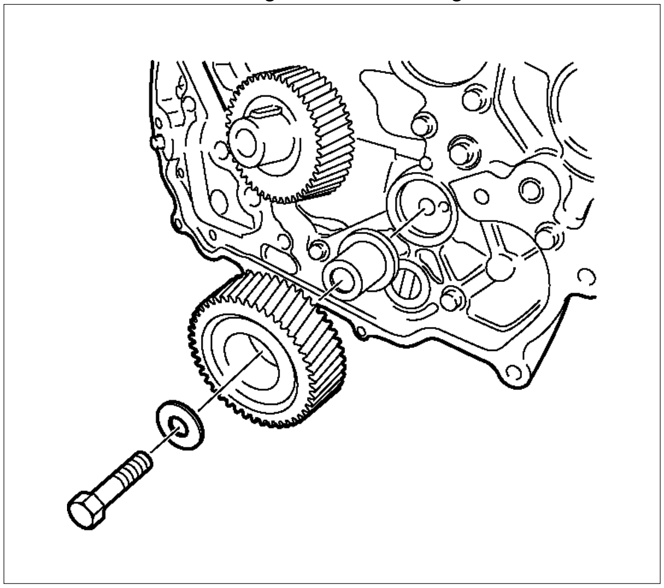
RTW56ASH019701

10. Install the M6 bolt to the idle gear A.
11. Remove the idle gear A and idle gear A flange, idle gear A shaft.



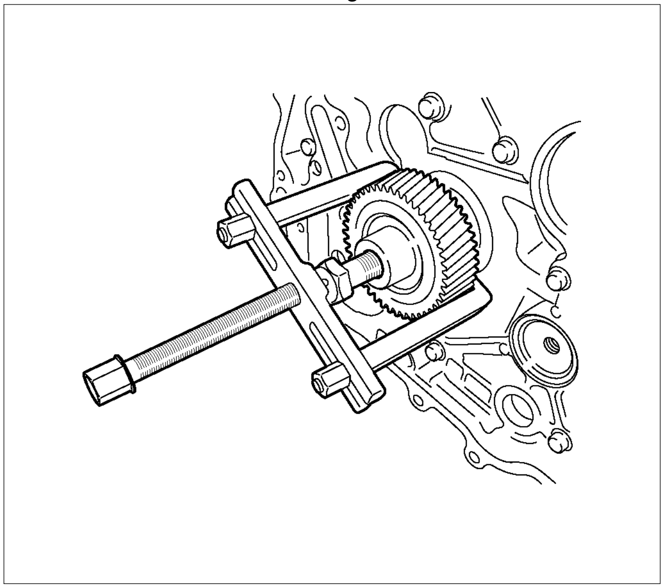
RTW56ASH011301

12. Remove the idle gear C and idle gear C shaft.



RTW56ASH011401

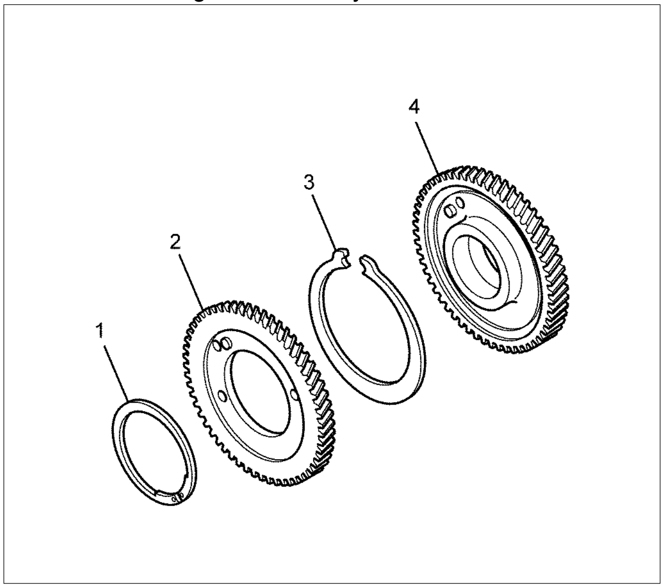
13. Remove the crankshaft gear.



RTW56ASH021501

Disassembly

1. Remove the scissor gear assembly.
   - Clamp the vise. Insert soft metal protectors (aluminum) between the vise and component. Use a pair of snap ring pliers to remove the scissor gear assembly.



RTW56ASH022001

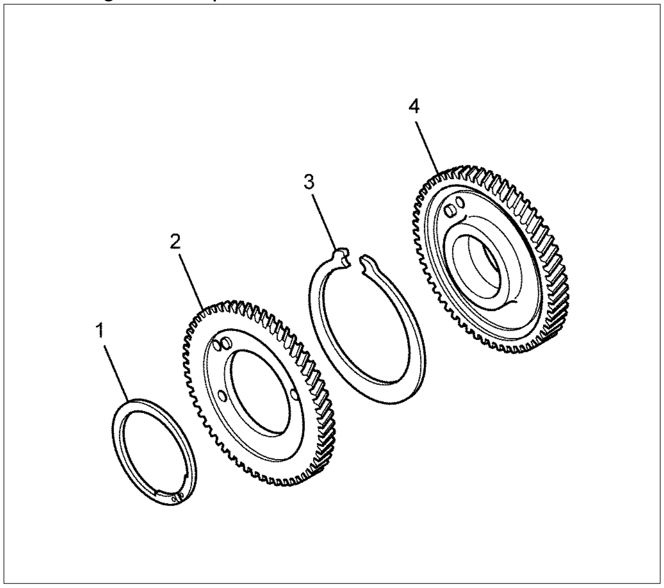
Legend

1. Snap Ring
2. Sub-gear
3. Spring
4. Idle Gear A

Reassembly

1. Install the scissor gear assembly.
   - Clamp the vise. Insert soft metal protectors (aluminum) between the vise and component. Press against the pin on the left side of the idle gear A spring to make a gap on the right side of the spring. Push the spring into place.

- Align the sub gear pin with the hole in the right side of the idle gear A spring. Press the sub-gear into place.



RTW56ASH022001

Legend

1. Snap Ring
2. Sub-gear
3. Spring
4. Idle Gear A

- Use a pair of snap ring pliers to snuggly install the snap ring.

Inspection

1. Measurement of idle gear backlash
   - Apply a dial gauge on the teeth of the idle gear to be measured and move the gear to right and left lightly to read how much the dial gauge shook (never fail to fix the gear).
   - If the measurement exceeds the limit, replace the idle gear.

Backlash of the idle gear	mm (in)
Standard	0.10 – 0.17 (0.004 – 0.006)
Limit	0.30 (0.01)

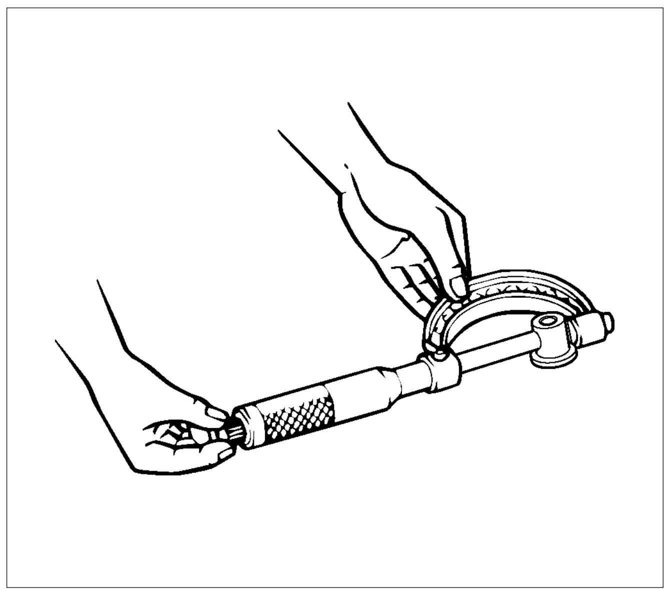
   - Measure backlash of the idle gear before removing the idle gear A.
2. Measurement of end clearance of the idle gear.
   - Insert a thickness gauge between the idle gear and the thrust collar to measure a clearance.
   - If the measurement exceeds the limit, replace either the idle gear or the thrust collar.

End clearance of the idle gear	mm (in)
Standard	0.080 – 0.155 (0.003 – 0.006)
Limit	0.20 (0.008)

   - Measure an end clearance of the idle gear before removing the idle gear B.
3. External diameter of the idle gear shaft.
   - Use a micrometer to measure an external diameter of each idle gear shaft.
   - If the measurement exceeds the limit, replace the shaft.

External diameter of the idle gear A shaft	mm (in)
Standard	44.950 – 44.957 (1.7697 – 1.7700)
Limit	44.80 (1.764)

External diameter of the idle gear C shaft	mm (in)
Standard	24.959 – 24.980 (0.9826 – 0.9835)
Limit	24.80 (0.976)



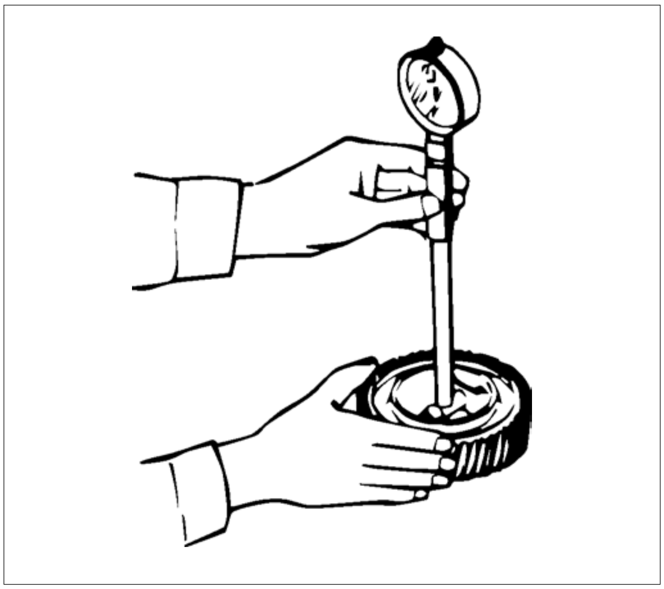
RTW56ASH021601

4. Clearance between the idle gear and the idle gear shaft
   - Measure an inside diameter of the idle gear bush to calculate a clearance between the idle gear and the idle gear shaft.

- If the measurement exceeds the limit, replace either the idle gear or the shaft.

Clearance between the idle gear A and the shaft mm (in)	
Standard	0.020 – 0.062 (0.0007 – 0.0024)
Limit	0.200 (0.0079)

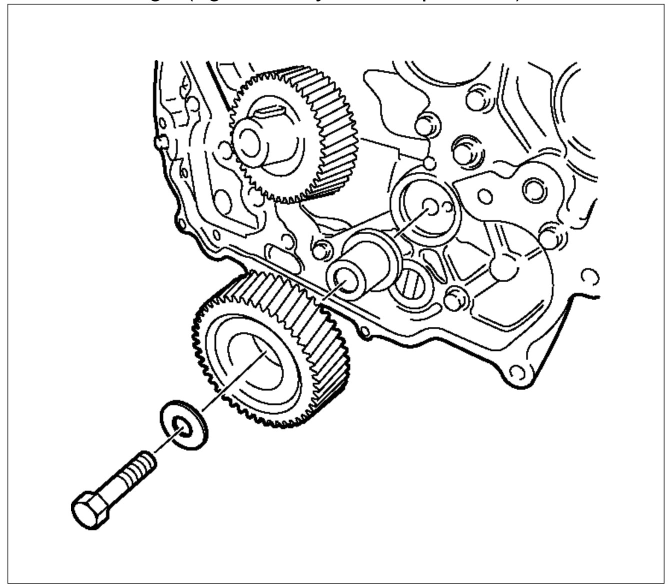
Clearance between the idle gear C and the shaft mm (in)	
Standard	0.025 – 0.075 (0.0010 – 0.0030)
Limit	0.200 (0.0079)



LNW21BSH003601

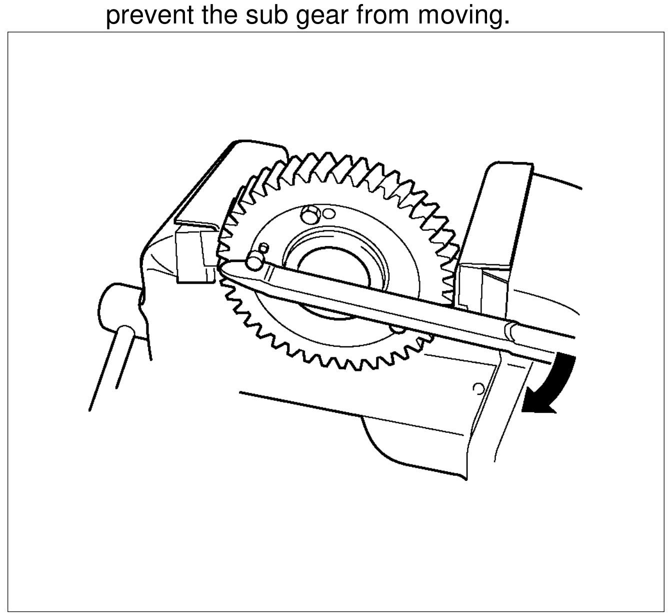
Installation

1. Install the crankshaft gear.
2. Install the idle gear C.
   - Apply engine oil over the part where the gear of the idle gear shaft is to be put together.
   - Apply engine oil to the bolt screw thread and seat, and temporarily tighten together with the flange (tighten fully in later process).



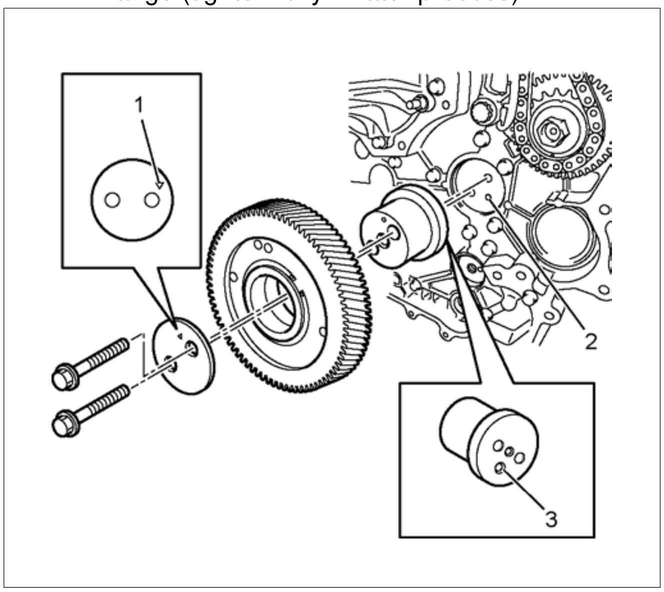
RTW56ASH011401

3. Install the idle gear A.
4. Tighten sub gear setting bolt.
   - Use the M6 bolts and lever to turn sub gear to right direction until it aligns with the M6 bolt hole between idle gear A and sub gear.
   - Tighten the M6 bolt to a suitable torque to prevent the sub gear from moving.



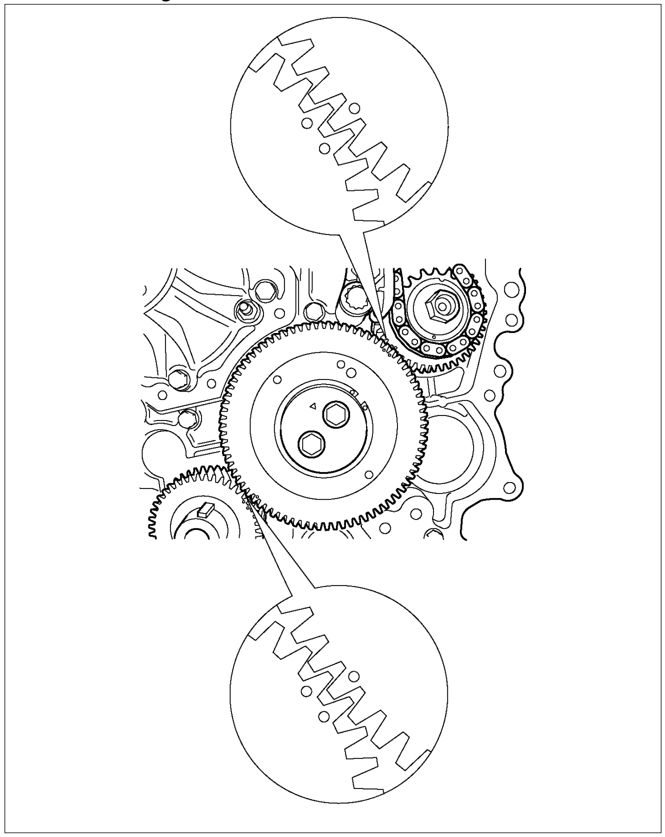
RTW56ASH011501

- Align the oil hole of the cylinder body (2) with the oil hole of the idle gear A shaft (3).
- Install the flange so that the front mark (1) face toward the front.
- Install the idle gear A and idle gear A flange, idle gear A shaft at the position shown in the figure.
- Apply engine oil over the part where the gear of the idle gear shaft is to be put together.
- Apply engine oil to the bolt screw thread and seat, and temporarily tighten together with the flange (tighten fully in later process).



LNW71BSH000501

- Attach, aligning with the gear crank: idle A and timing mark.

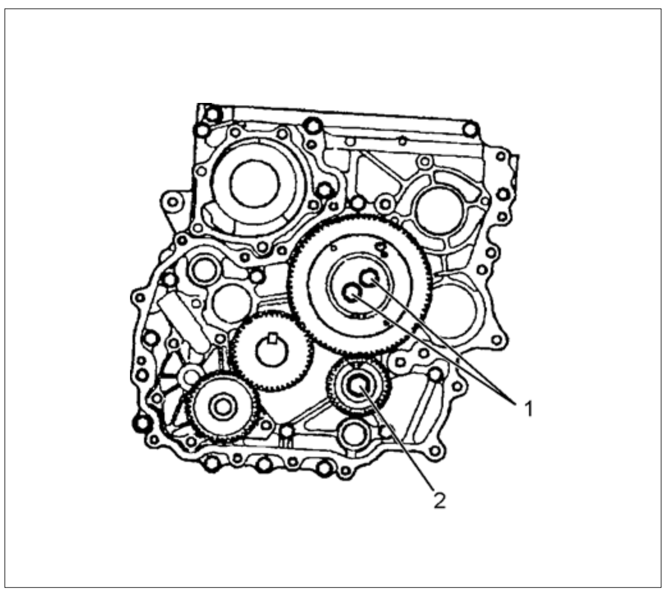


RTW56ALH000301

5. Tighten the bolts of idle gear A and idle gear C to the specified torque.

Tightening torque:

idle gear A 32 N·m (3.3 kg·m / 24 lb ft)
idle gear C 59 N·m (6.0 kg·m / 43 lb ft)

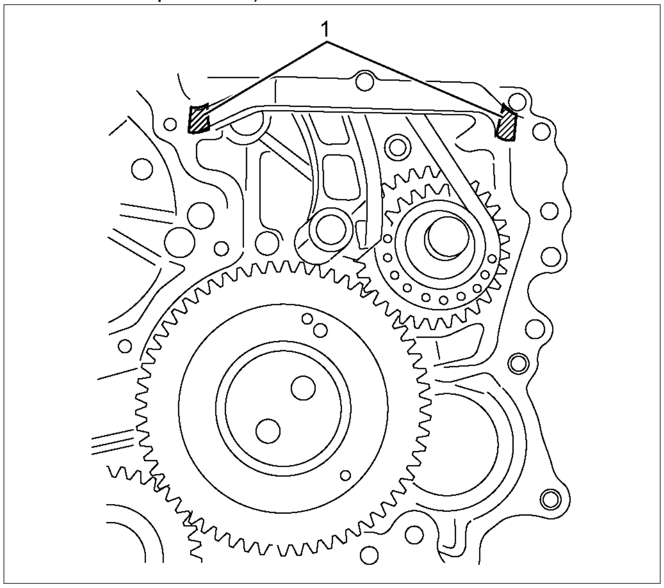


RTW56ASH011701

Legend

1. Idle Gear A Bolt
2. Idle Gear C Bolt

6. Remove the M6 bolt from the idle gear A.
7. Install the gear case cover.
   - Apply the liquid gasket (ThreeBond TB-1207B or equivalent).



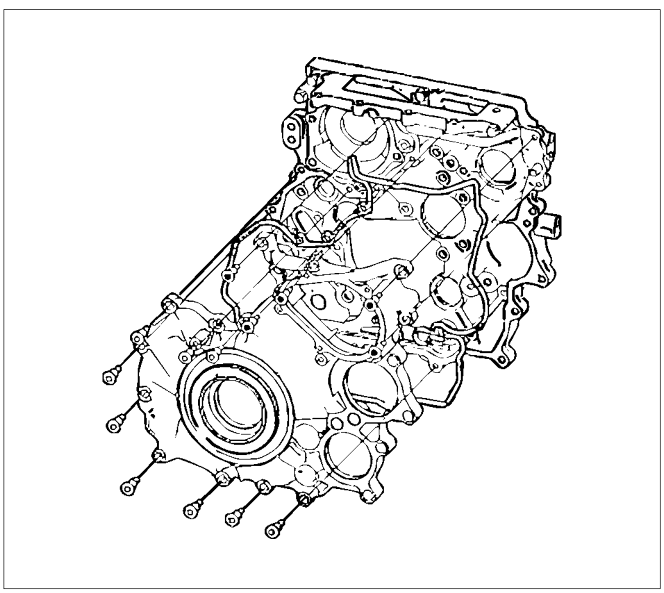
RTW56ASH020101

Legend

1. Apply the liquid gasket

   - Install the gasket in slot of the gear case cover.
   - Tighten the bolts to the specified torque.

Tightening torque: 8 N·m (0.8 kg·m / 69 lb in)



RTW56ASH012101

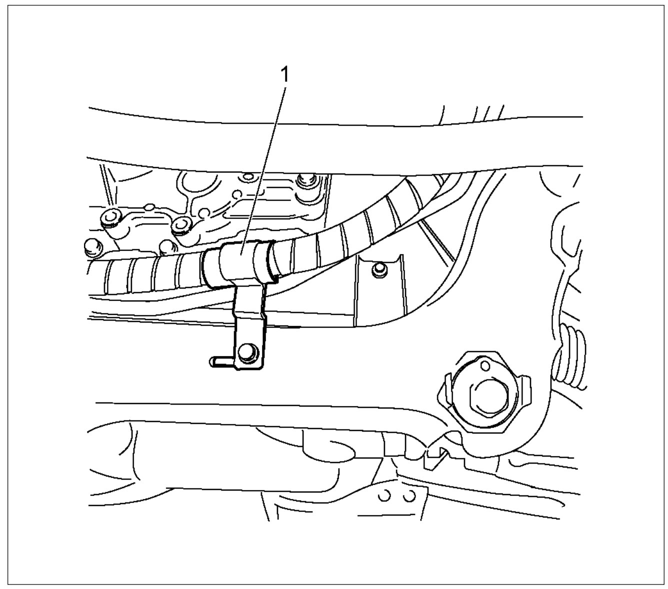
8. Install the vacuum pump.

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)

   - Install the oil pipe (feed side and return side) of vacuum pump.
   - Install the vacuum pipe bracket and vacuum pipe.
9. Install the power steering pump.
   - Tighten the nuts to the specified torque.

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)

   - Connect the bracket (1) of power steering oil hose.



LTW56ASH000101

10. Install the crank pulley.

Tightening torque: 294 N·m (30.0 kg·m / 217 lb ft)

11. Install the A/C compressor drive belt and fan belt.
    Refer to drive belt tension check procedure for Heating and air conditioning and Engine cooling in this manual.
12. Install the cooling fan.
13. Install the fan guide.
14. Install the radiator upper hose.
15. Replenish the engine coolant.

Torque Specifications

7. Bolt

YES

- Is there continuity between the engine room harness connector (cooler only) terminal No. 4 (C-55) and the chassis side harness connector terminal No. 11 (B-57)?

NO

Open circuit between the engine room harness connector terminal No. 1 (C-55) or (cooler only) the short connector No. 3 (B-79) and ground (C-109).

YES

- Is there battery voltage between the chassis side harness connector terminal No. 10 (B-57) and ground?

NO

Open circuit between the engine room harness connector (cooler only) terminal No. 4 (C-55) and the chassis side harness connector terminal No. 11 (B-57).

YES

- Disconnect the A/C switch.

- Is there battery voltage between the chassis side harness connector terminal No. 6 (B-57) and ground?

NO

Open circuit between the chassis side harness connector No. 1 (B-79) and the chassis side harness connector terminal No. 10 (B-57).

YES

- Is the electronic thermostat OK?

NO

Open circuit between the No. EB-13 fuse and the chassis side harness connector No. 6 (B-57).

YES

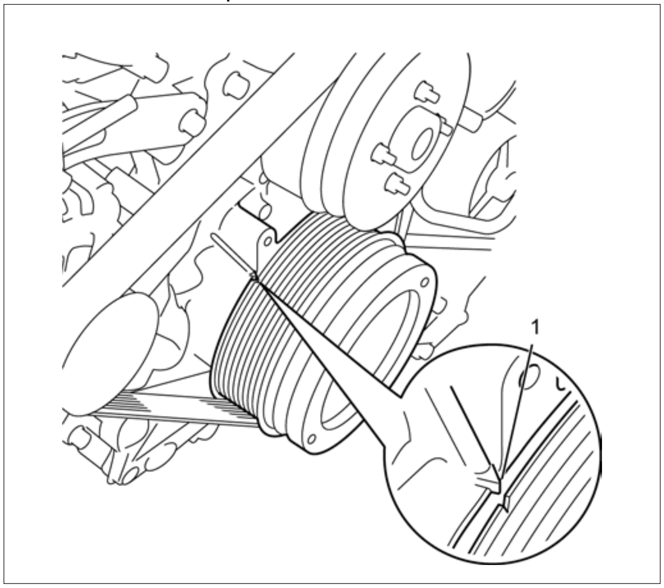
- Defective ECM

NO

Replace electronic thermostat

Removal

1. Rotate the crankshaft to make the No. 1 cylinder meet the compression TDC.

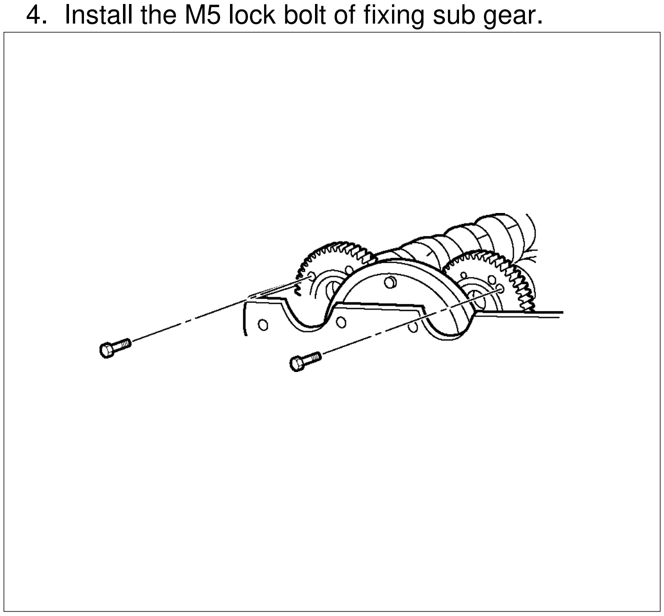


RTW76ASH001301

Legend

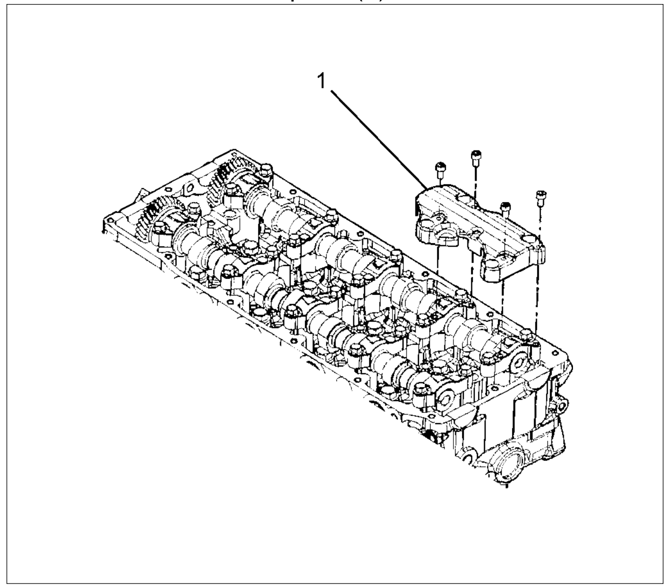
1. TDC

2. Remove the engine cover.
3. Remove the cylinder head cover.
   Refer to "Cylinder Head Cover".
4. Install the M5 lock bolt of fixing sub gear.



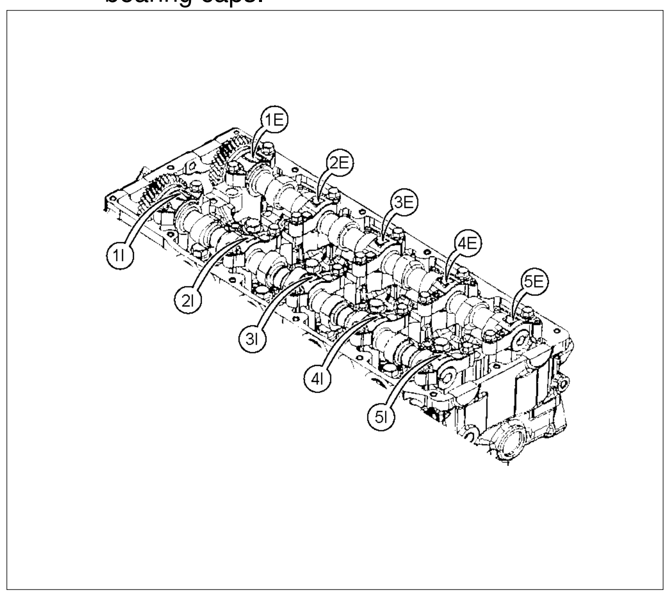
RTW56ASH007101

5. Remove the baffle plate (1).

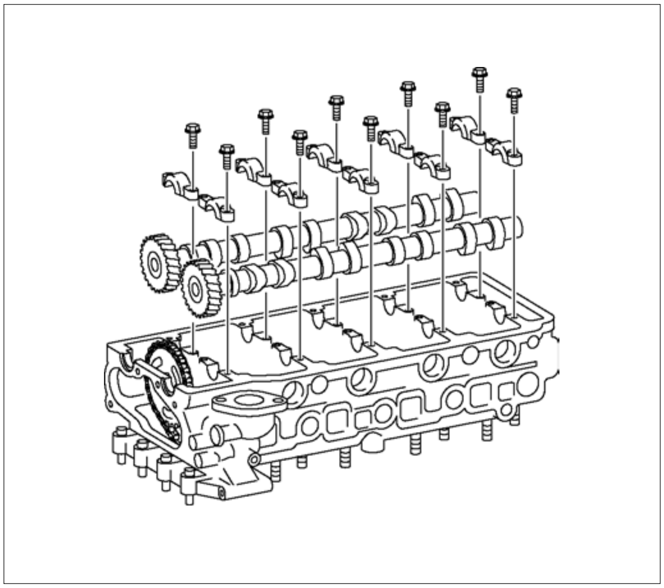


RTW56ASH006301

6. Remove the camshaft bearing cap and camshaft.
   - Check the engraved making on the camshaft bearing caps.



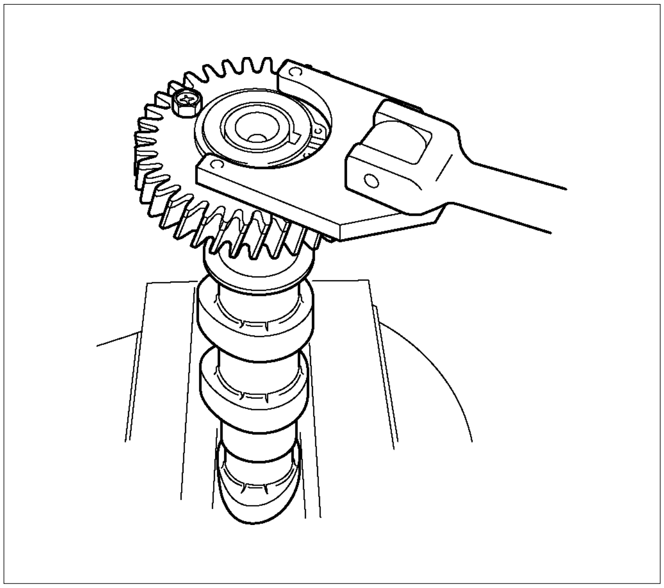
RTW56ASH018401



RTW56ASH013801

Disassembly

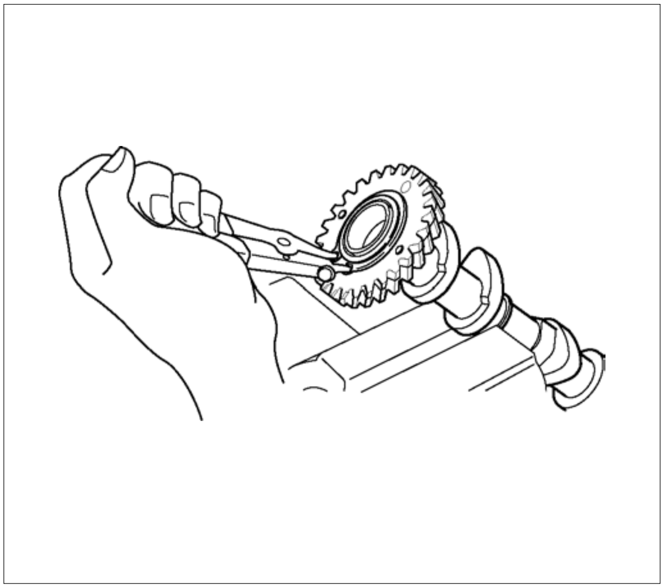
1. Remove the sub gear assembly.
   - Clamp the camshaft in a vise. Insert soft metal protectors (aluminum) between the vise surfaces and the camshaft.
   - Use 5-8840-2591-0 to turn sub gear to right direction to remove the M5 bolt.



RTW56ASH006801

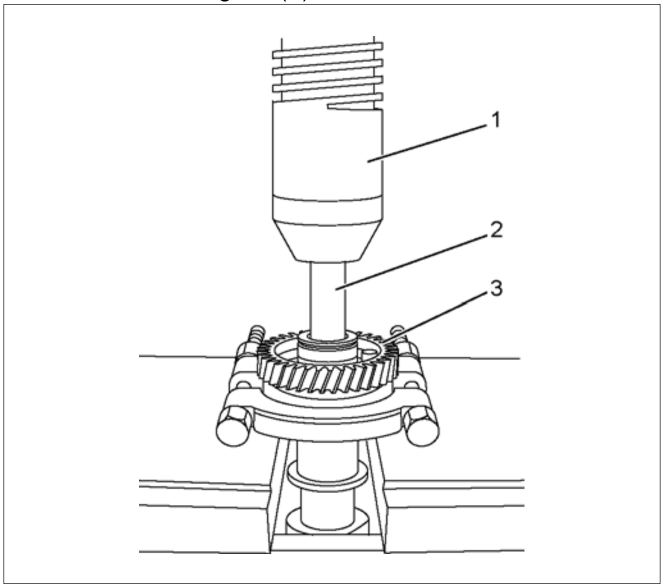
   - Use a pair of snap ring pliers to remove the scissor gear assembly.

Note:
Take care not to damage the camshaft cams and journals.



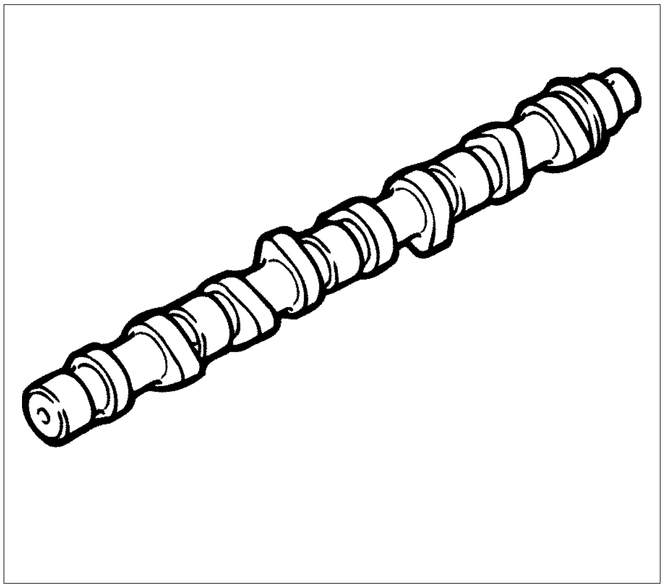
RTW56ASH006401

2. Remove the camshaft gear.
   - Use a press (1) and socket (2) to remove the camshaft gear (3).



RTW56ASH006501

3. Remove the dowel pin.
4. Inspect the camshaft visually.
   - Check if the journal and cam parts of the camshaft are worn or damaged, if so, replace it.

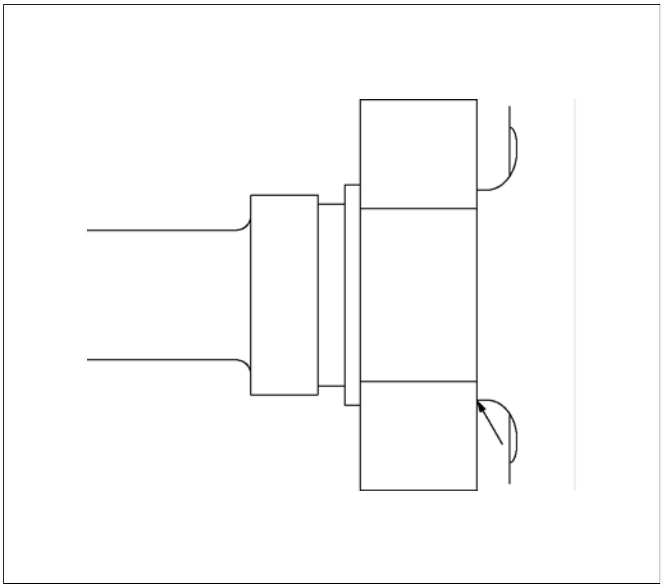


LNW21BSH020201

5. Inspect an end clearance of the camshaft.
   - Use a thickness gauge to measure an end clearance of the camshaft gear and the camshaft bracket.
   - If the measurement exceeds the limit, replace the camshaft gear or the camshaft.

End clearance of the camshaft	mm (in)
Standard	0.085 – 0.205 (0.003 – 0.008)
Limit	0.25 (0.010)

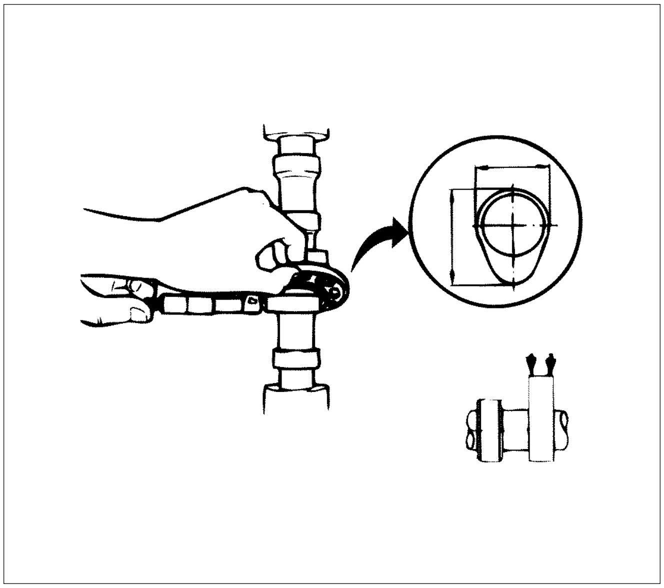
Note:
Measure an end clearance of the camshaft before disassembling.



RTW56ASH013901

6. Check if the cam lobe is worn.
   - Use a micrometer to measure the height of the cam lobe.
   - If the height of the cam lobe is at the limit or less, replace the camshaft.

Height of the cam lobe		mm (in)
	Inlet	Exhaust
Standard	40.6 (1.60)	40.6 (1.60)
Limit	39.6 (1.56)	39.6 (1.56)

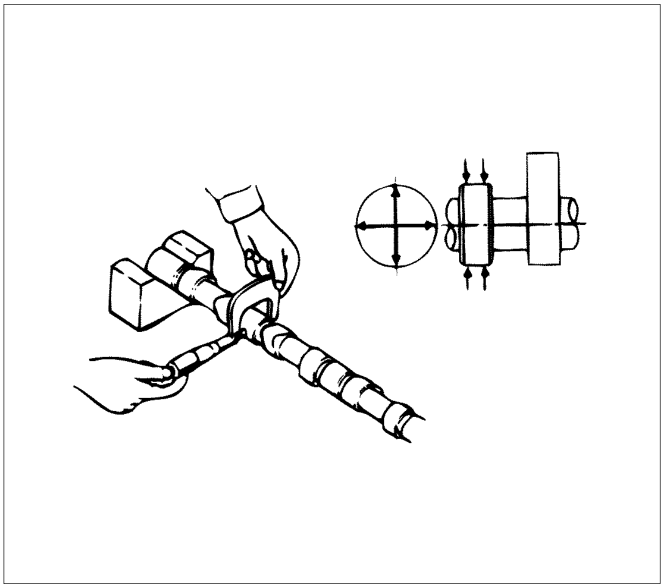


LNW21BSH020401

7. Check if the camshaft journal is worn.
   - Use a micrometer to measure wear which is not even with a diameter of the camshaft journal.
   - If the measured uneven wear exceeds the limit, replace the camshaft.

External diameter of the camshaft journal part mm (in)	
Standard	29.909 – 29.930 (1.1775 – 1.1783)
Limit	29.809 (1.1736)

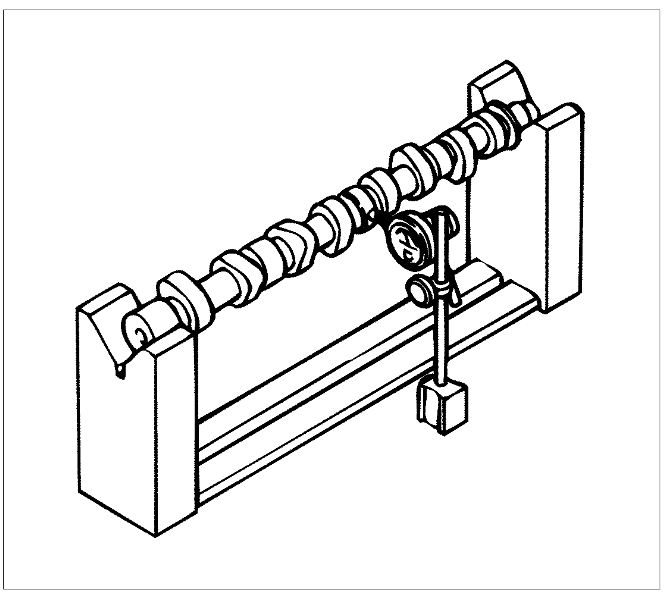
Partial wear of the camshaft journal part	mm (in)
Limit	0.05 (0.0020)



LNW21BSH020501

8. Check if the camshaft is runout.
   - Place the camshaft on a V block to measure a runout with a dial gauge.
   - Rotate the camshaft slowly to measure how much the dial indicator shook. If it exceeds the limit, replace the camshaft.

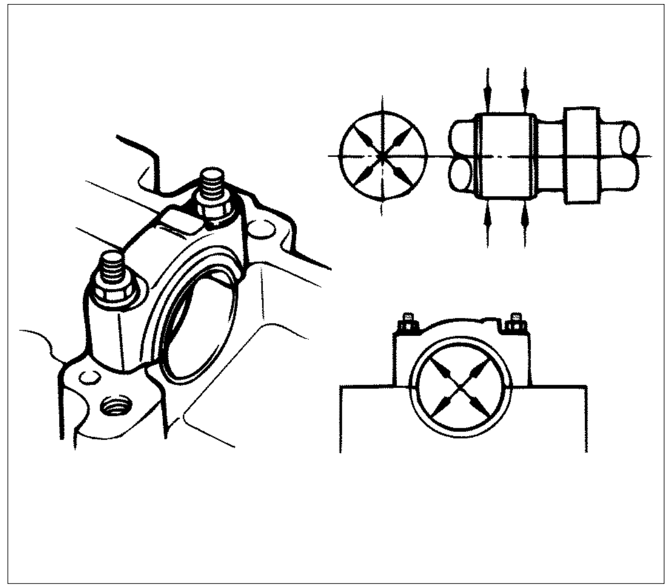
Runout of the camshaft	mm (in)
Limit	0.05 (0.0020)



LNW21BSH020601

9. Measure a camshaft journal oil clearance.
   a. Measure an inside diameter of the camshaft bearing with a dial gauge.
   b. Read the difference between the inside diameter of the camshaft bearing and the diameter of the camshaft journal.
      If the measured oil clearance exceeds the limit, replace the camshaft bearing.

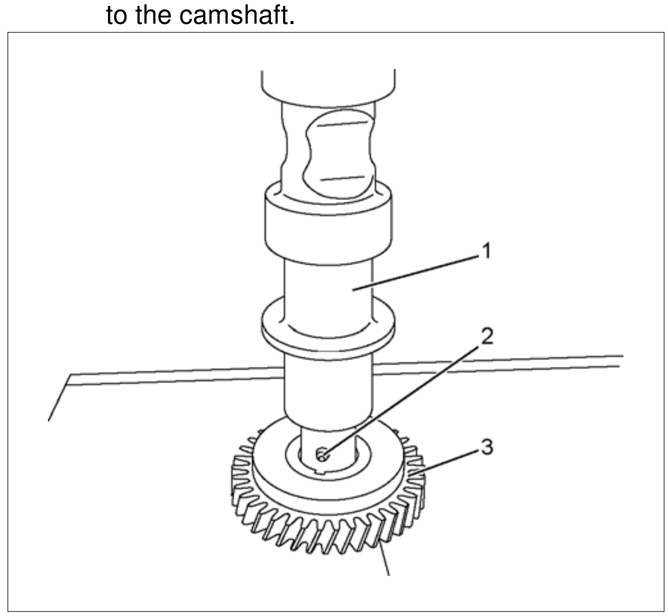
Clearance of the journal part	mm (in)
Standard	0.025 – 0.087 (0.0010 – 0.0034)
Limit	0.15 (0.0059)



LNW21BSH054601

Reassembly

1. Install the dowel pin.
2. Install the camshaft gear.
   - Align the knock pin with the slot in the camshaft gear. Use a press to install the camshaft gear to the camshaft.

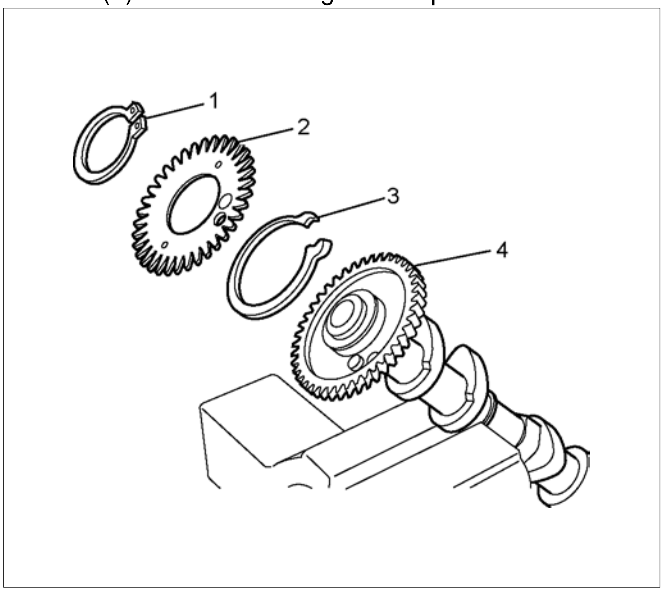


RTW56ASH006601

Legend

1. Camshaft
2. Dowel Pin
3. Camshaft Gear

3. Install the sub gear assembly.
   - Clamp the camshaft in a vise. Insert soft metal protectors (aluminum) between the vise surfaces and the camshaft. Press against the pin on the left side of the camshaft gear spring (3) to make a gap on the right side of the spring. Push the spring into place.
   - Align the sub gear pin (2) with the hole in the right side of the camshaft gear damper spring (3). Press the sub-gear into place.



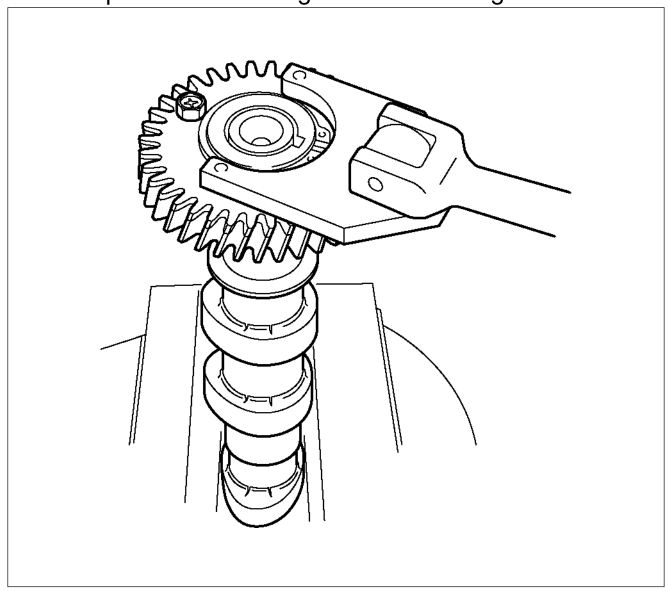
RTW56ASH006701

Legend

1. Snap Ring
2. Sub-gear
3. Damper Spring
4. Camshaft Gear

- Use a pair of snap ring pliers to snuggly install the snap ring.

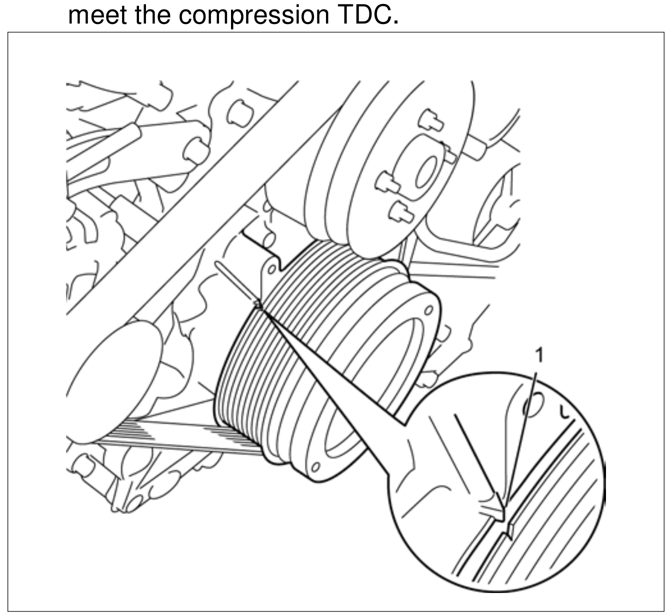
4. Tighten sub gear setting bolt.
   - Use 5-8840-2591-0 to turn sub gear to right direction until it aligns with the M5 bolt hole between camshaft driven gear and sub gear.
   - Tighten the M5 bolt to a suitable torque to prevent the sub-gear from moving.



RTW56ASH006801

Installation

1. Check the crankshaft to make the No. 1 cylinder meet the compression TDC.

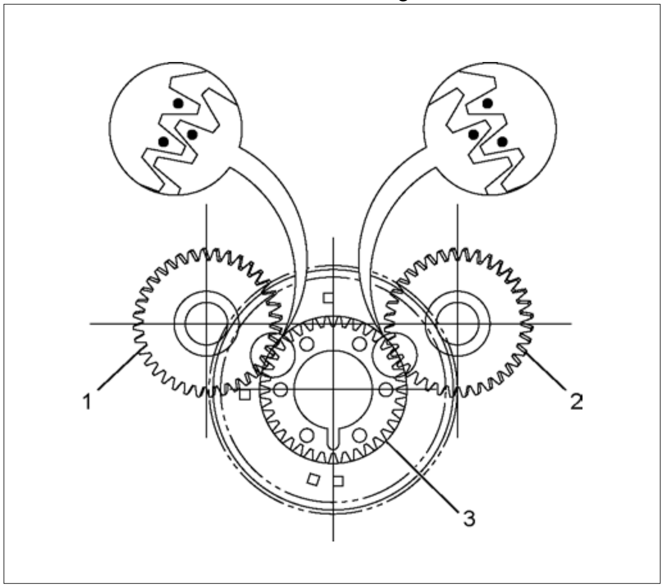


RTW76ASH001301

Legend

1. TDC

2. Install the camshaft assembly.
   - Align timing mark on intake camshaft and exhaust camshaft to idle gear D.

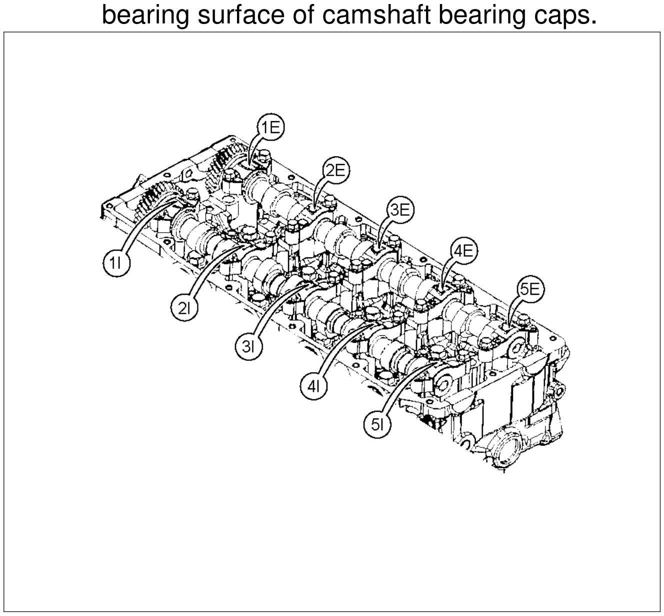


RTW56ASH007001

Legend

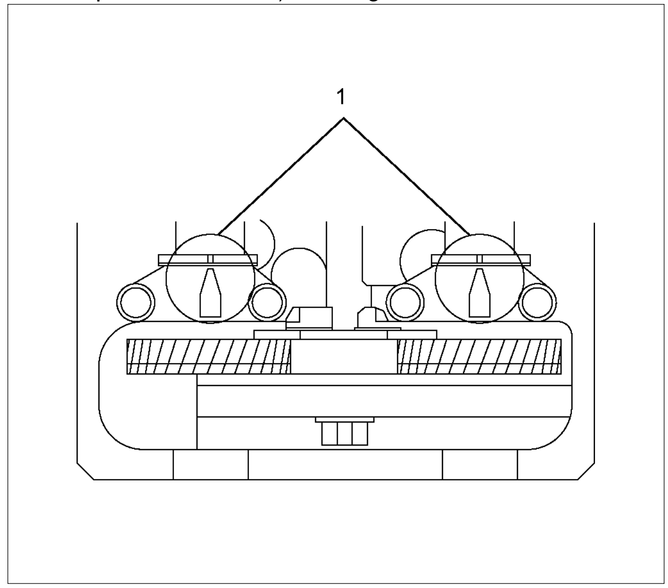
1. Exhaust Camshaft Gear
2. Intake Camshaft Gear
3. Idle Gear D

3. Camshaft bearing caps, tighten ten bolts on one side bank to the specified torque.
   - Apply engine oil to camshaft journal and bearing surface of camshaft bearing caps.



RTW56ASH018401

4. Check that the alignment marks (camshaft bearing cap and camshaft) are aligned.



RTW56ASH006901

Legend

1. Align mark on intake camshaft and exhaust camshaft to mark of bearing cap

   - Apply engine oil over the screw part and tighten up the bearing cap with the prescribed torque.

Tightening torque: 18 N·m (1.8kg·m / 13 lb ft)

5. Remove the M5 lock bolt of fixing sub gear.
6. Adjustment of valve clearance.
   - Refer to installation procedure for inspection / adjustment of valve clearance in this manual.
7. Install the baffle plate. Tighten the bolts to the specified torque.

Tightening torque: 10 N·m (1.0 kg·m/87 lb in)

8. Install the cylinder head cover.
   Refer to "Cylinder Head Cover".
9. Install the engine cover.

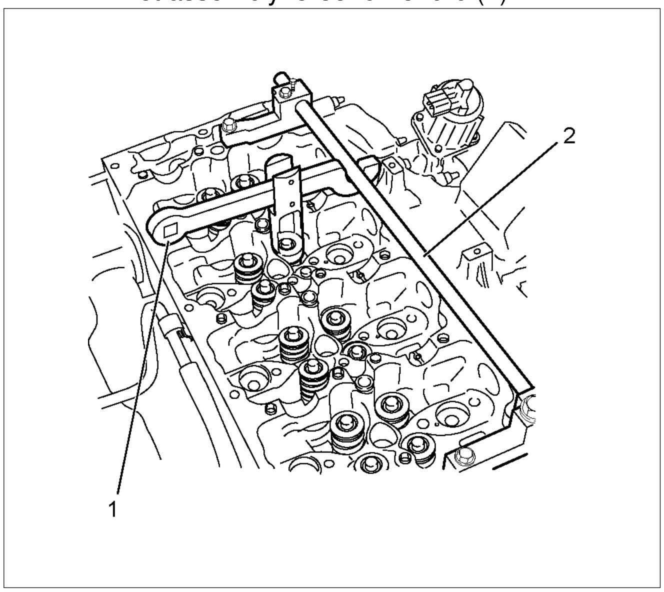
12. Spring Upper Seat
13. Split Collar
14. Valve Stem End Cap

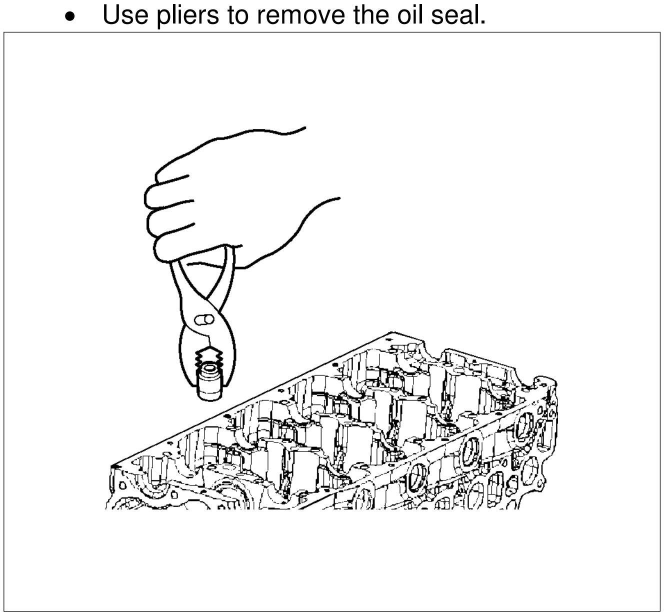
Removal

1. Remove the cylinder head.
   Refer to “Cylinder Head”.
2. Remove the split collar.
   - Use a replacer to compress the valve spring to remove the split collar.
     Special tool
     Valve spring replacer: 5-8840-2818-0 (1)
     Pivot assembly: 5-8840-2819-0 (2)



RTW56ASH012301

3. Remove the spring upper seat.
   - Remove the special tool to remove the upper seat.
4. Remove the valve spring.
   Put the removed valve springs in order by cylinder number.
5. Remove the valve stem oil seal.
   - Use pliers to remove the oil seal.



RTW56ASH012401

Note:
Do not use the removed oil seal again.

6. Remove the spring lower seat.

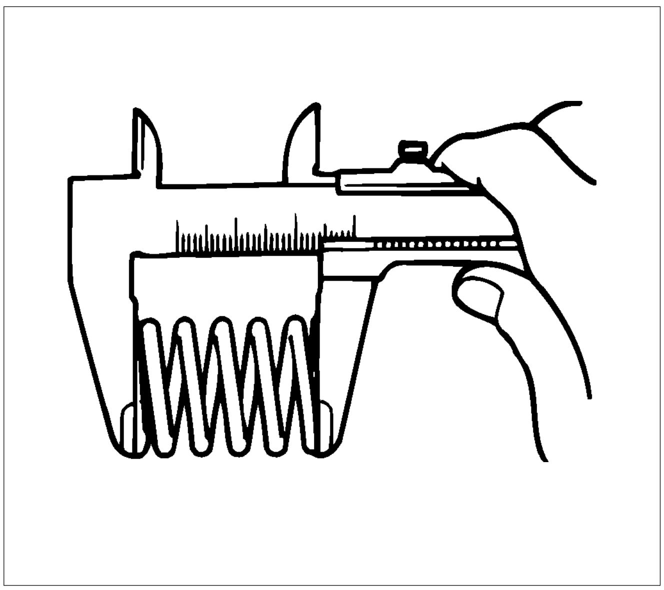
Inspection

Inspect the valve spring

Note:
Check the valve spring visually and if there is clear damage or wear, replace it.

1. Free length
   - Measure free length of the spring and if it is shorter than the prescribed limit, replace the spring.

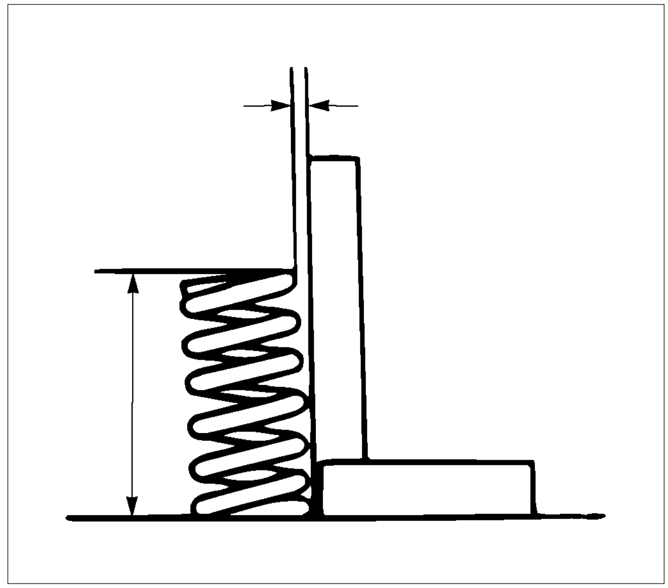
Free length of the valve spring	mm (in)
	Inlet / Exhaust
Standard	49.04 (1.93)
Limit	48.15 (1.89)



LNW21BSH017001

2. Valve spring squareness.
   - Use a surface plate and a square to measure the valve spring squareness.
     If the measured value exceeds the specified limit, the valve spring must be replaced.

Valve spring squareness	mm (in)
Limit	2.1 (0.083)



LNW21BSH017101

3. Tension
   - Use a spring tester to compress the spring to the installation height. Measure tension of the compressed spring. If the measurement is lower than the limit, replace the spring.

Tension of the valve spring	N (kg / lb)
	Inlet / Exhaust
Installation length mm (in)	37.80 (1.488)
Standard	213 (21.7 / 47.8)
Limit	188 (19.2 / 42.3)

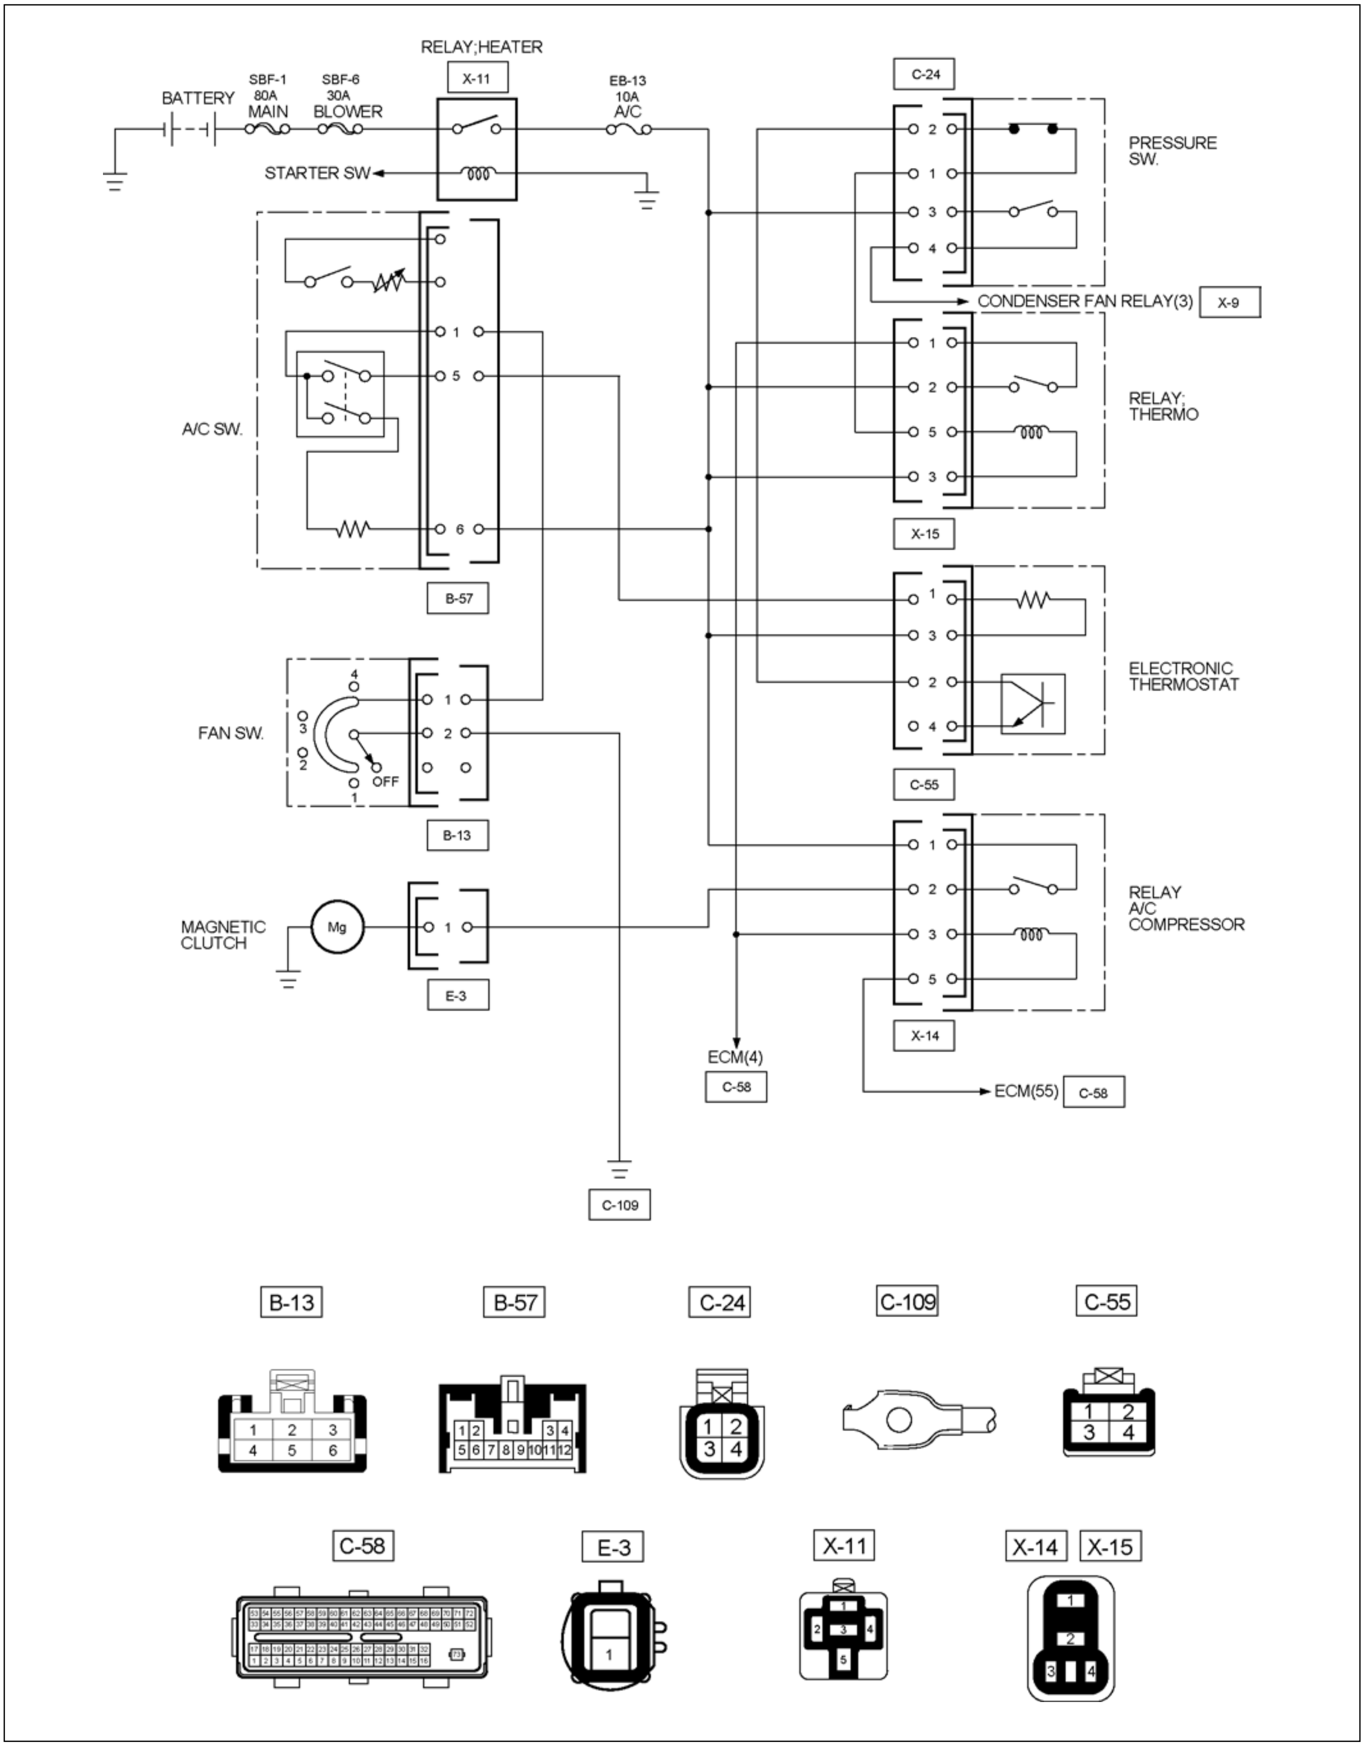
4JJ1-TC Standard Output, 4JJ1-TC High Output, 4JK1-TC High Output LHD MODEL



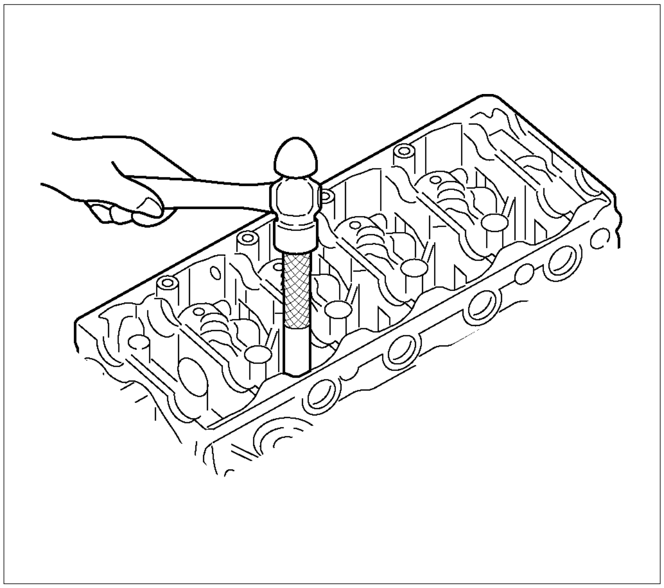
RTW710XF000501

Installation

1. Install the spring lower seat.
2. Install the valve stem oil seal.
   - Apply engine oil over the peripheral part of the valve guide and install the oil seal by using a valve stem seal installer.

Note:
After installing the valve stem oil seal, check if it is inserted nice and deep and the oil seal is not tilted or the garter spring has not come off.

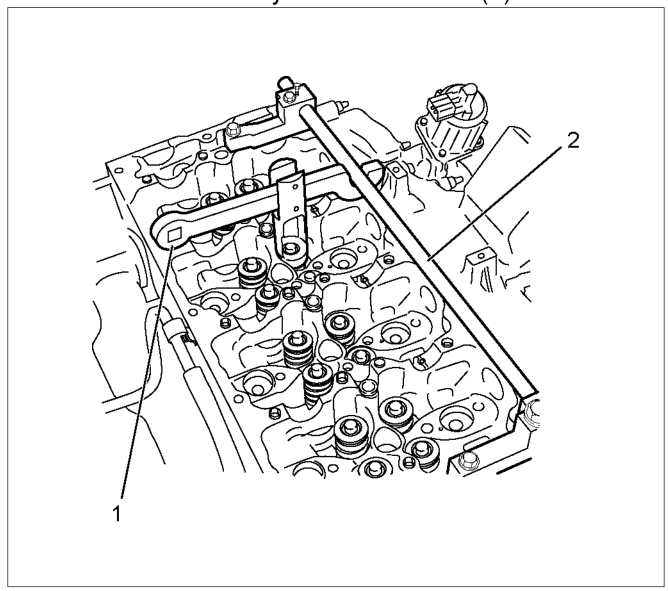
Special tool
Valve stem seal installer: 5-8840-2817-0



RTW56ASH013701

3. Install the valve spring.
4. Install the spring upper seat.
5. Install the split collar.
   - Use a replacer to compress the valve spring and install the split collar.

Special tool
Valve spring replacer: 5-8840-2818-0 (1)
Pivot assembly: 5-8840-2819-0 (2)



RTW56ASH012301

Note:
Move it up and down to check if it moves smoothly.

6. Install the cylinder head.
   Refer to “Cylinder Head”.

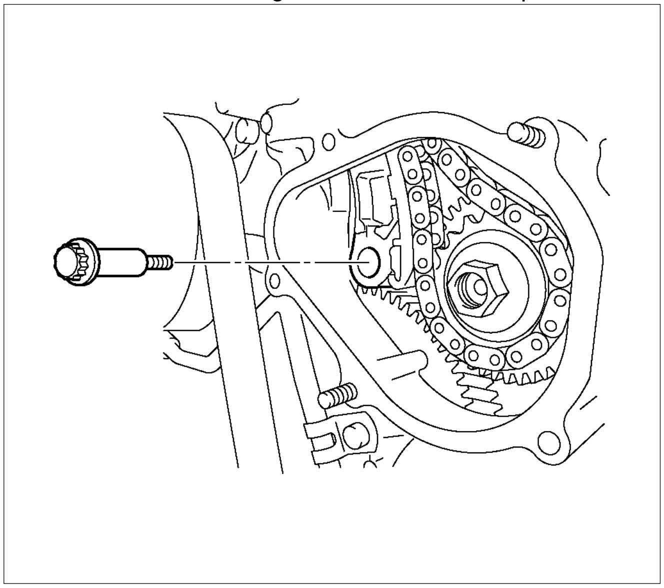
- Disconnect the A/C compressor relay.
- Is there continuity between the engine harness connector terminal No.1 (E-3) and the engine room harness connector terminal No.2 (X-14)?

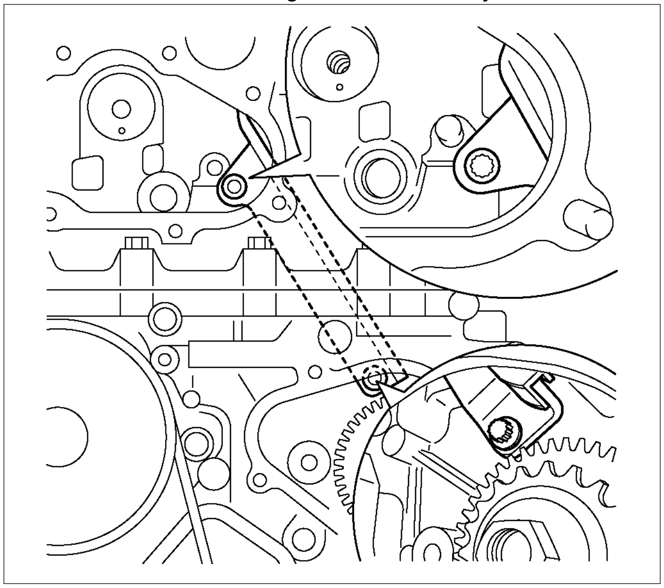
49. Remove the timing chain tension lever pivot.



RTW56ASH019401

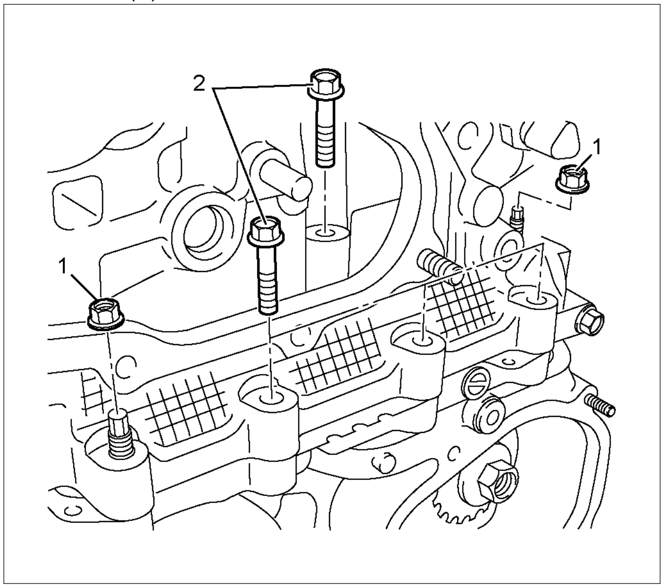
50. Remove the timing chain from supply pump sprocket.

51. Remove the chain guide bolt from cylinder head.



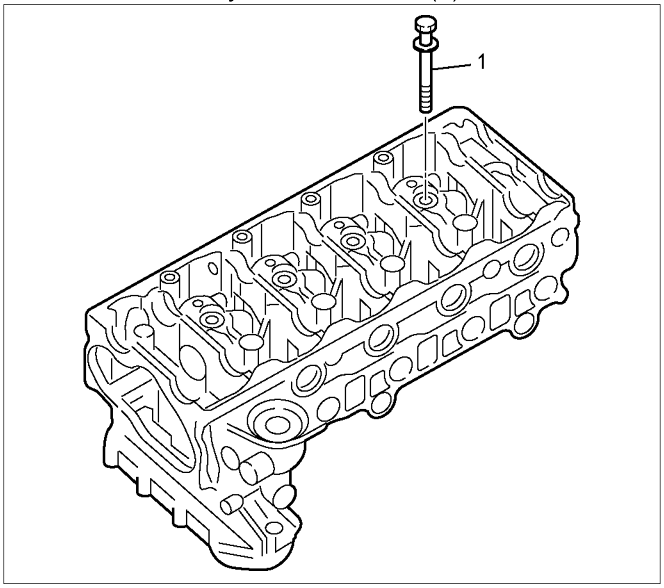
RTW56ASH019501

52. Remove the cylinder head gear case nuts (1) and bolts (2).



RTW56ASH020801

53. Remove the cylinder head bolt (1).

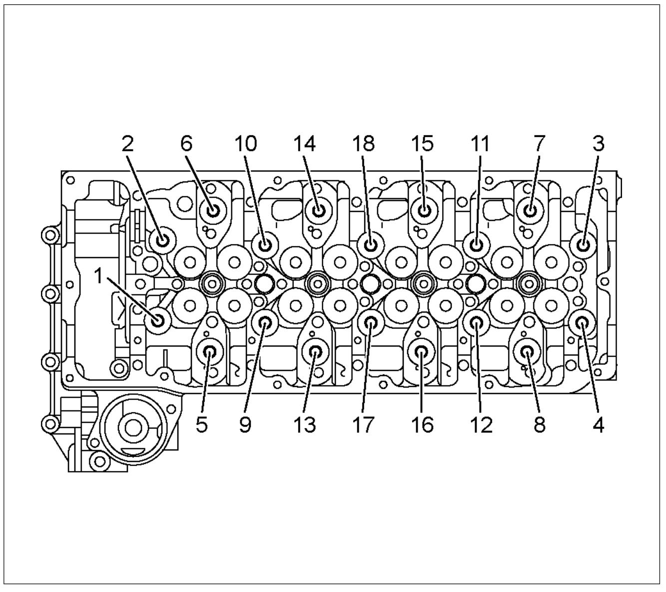


RTW56ASH008501

Note:
Do not reuse the cylinder head bolt.

54. Remove the cylinder head assembly.
- Loosen the cylinder head bolts in the order described in the drawing.
- Remove the cylinder head gasket.

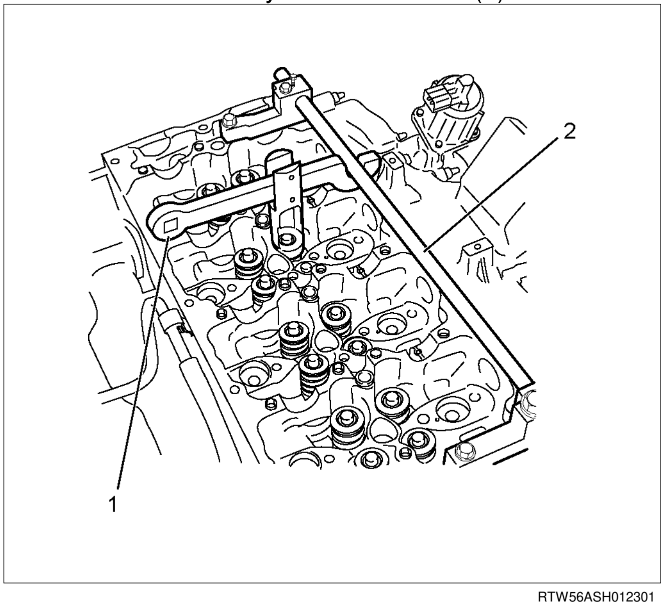
Note:
Replace the head gasket with a new one once it is removed.



RTW56ASH008601

Disassembly

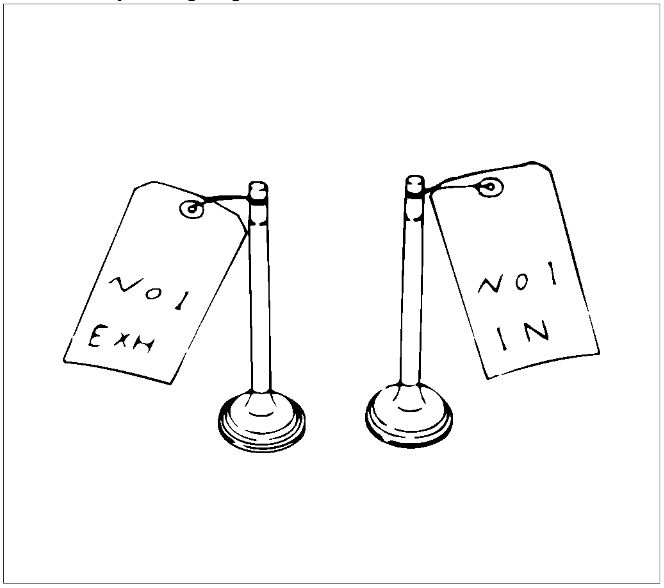
1. Remove the throttle assembly.
   - Refer to procedure for Intake Manifold in this manual.
2. Remove the intake manifold assembly.
   - Refer to procedure for Intake Manifold in this manual.
3. Remove the turbocharger.
   - Refer to “Turbocharger and Exhaust Manifold”.
4. Remove the exhaust manifold assembly.
   - Refer to procedure for Turbocharger and Exhaust Manifold in this manual.
5. Remove the water outlet pipe.
6. Remove the valve stem cap.
   Refer to procedure for valve stem and valve in this manual.
7. Remove the split collar.
   - Use a replacer to compress the valve spring to remove the split collar.
     Special tool
     Valve spring replacer: 5-8840-2818-0 (1)
     Pivot assembly: 5-8840-2819-0 (2)



RTW56ASH012301

8. Remove the spring upper seat.
   - Remove the special tool to remove the upper seat.
9. Remove the valve spring.
   - Put the removed valve springs in order by cylinder number.

10. Remove the intake and exhaust valve.
    - Sort the removed valves according to cylinders by using tags others.



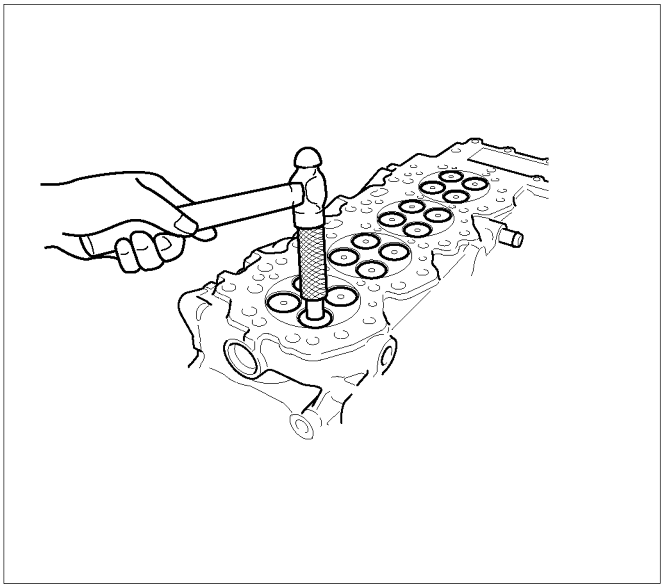
LNW21BSH016801

11. Remove the valve stem oil seal.
    - Refer to procedure for valve stem and valve in this manual.
12. Remove the spring lower seat.
13. Remove the valve guide.
    - Use the valve guide replacer to press out the valve guides from the bottom side of the cylinder head.

      Special tool

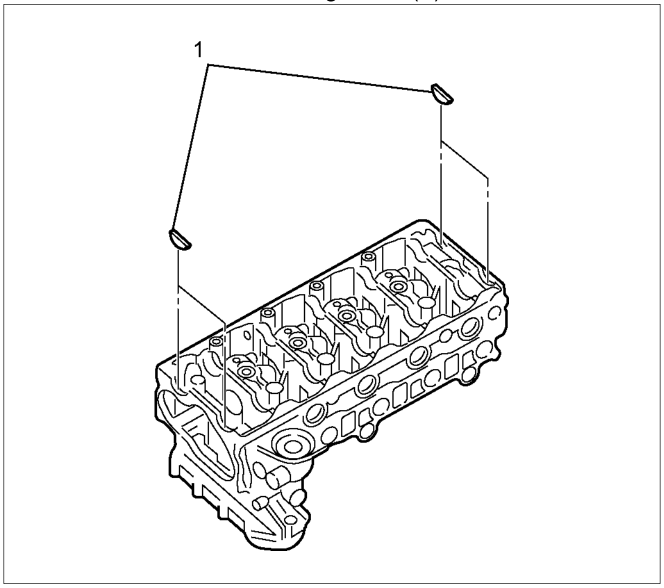
      Valve guide remover and installer:

      5-8840-2816-0



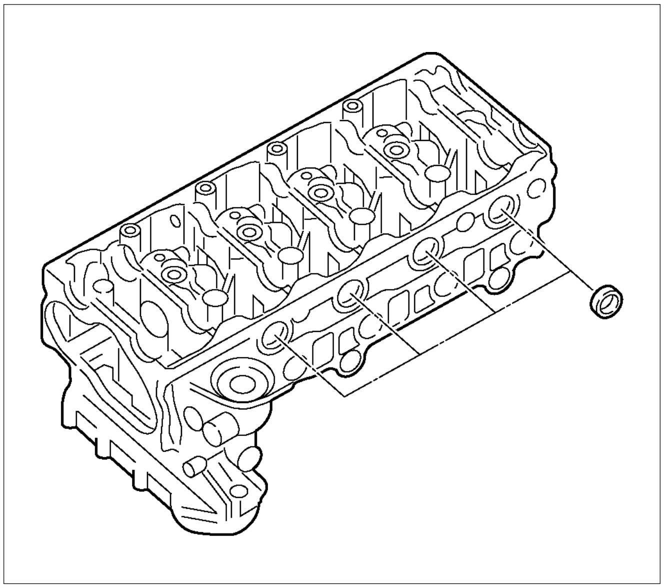
RTW56ASH008701

14. Remove the cam end gasket (1).



RTW56ASH020501

15. Remove the oil seal.



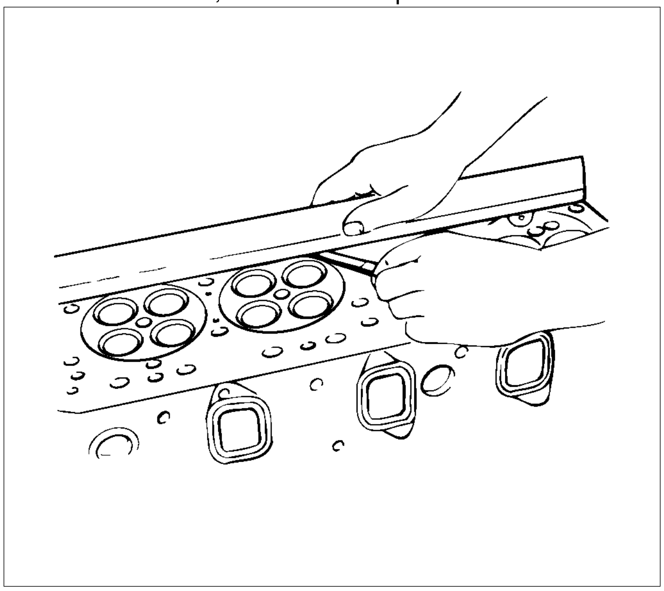
RTW56ASH008801

Inspection

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Cylinder Head Lower Face Warpage

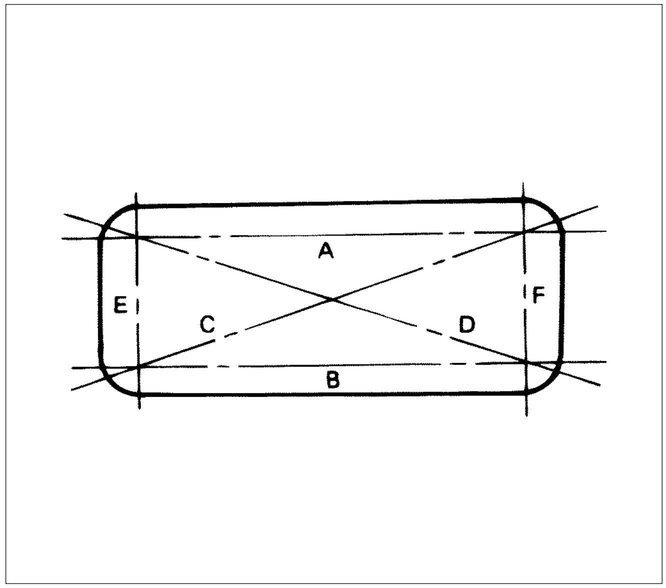
1. Use a straight edge and a thickness gauge to measure the four sides and the two diagonals of the cylinder head lower face.
2. The cylinder head lower surface warpage is more than the limit, it should be replaced.



RTW56ASH008901

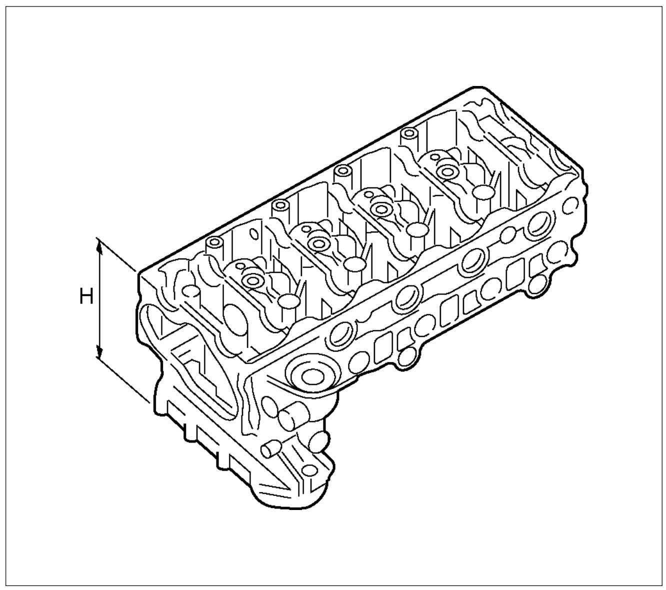
Cylinder Head Lower Face Warpage	mm (in)
Standard	0.05 (0.002) or less
Limit	0.20 (0.0079)

NOTE:
The cylinder head lower face cannot be regrind.



011RY00013

Cylinder Head Height (H) (Reference)	mm (in)
Standard	143.4 (5.646)



RTW56ASH017401

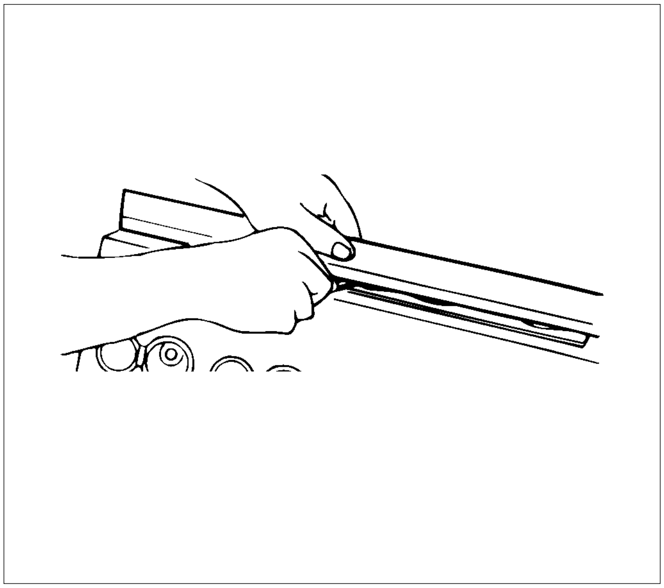
Manifold Fitting Face Warpage

Use a straight edge and a feeler gauge to measure the manifold cylinder head fitting face warpage.

Regrind the manifold cylinder head fitting surfaces if the measured values are greater than the specified limit but less than the maximum grinding allowance.

If the measured values exceed the maximum grinding allowance, the cylinder head must be replaced.

Manifold Fitting Face Warpage	mm (in)
Standard	0.05 (0.002) or less
Limit	0.20 (0.008)
Maximum Grinding Allowance	0.40 (0.016)



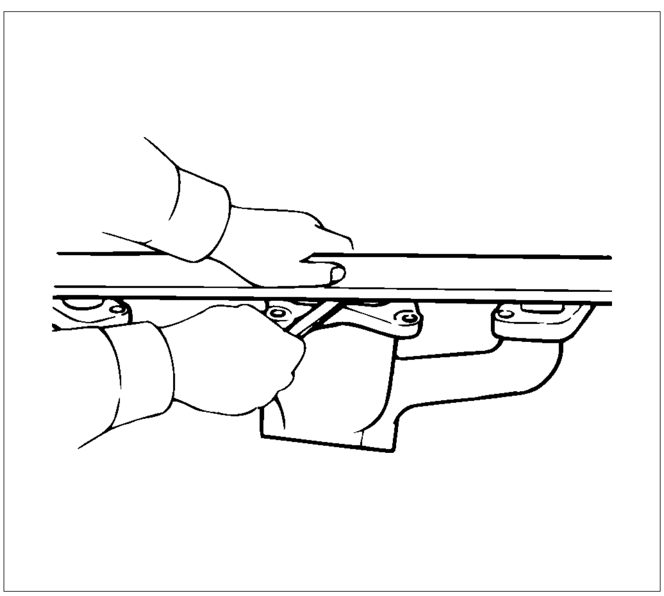
RTW56ASH017501

Exhaust Manifold Warpage

Use a straight edge and a feeler gauge to measure the manifold cylinder head fitting face warpage.

If the measured values exceed the specified limit, the manifold must be replaced.

Exhasut Manifold Warpage	mm (in)
Standard	0.05 (0.002) or less
Limit	0.20 (0.008)



027RY00002

Valve Stem Cap

Make the necessary part replacements.

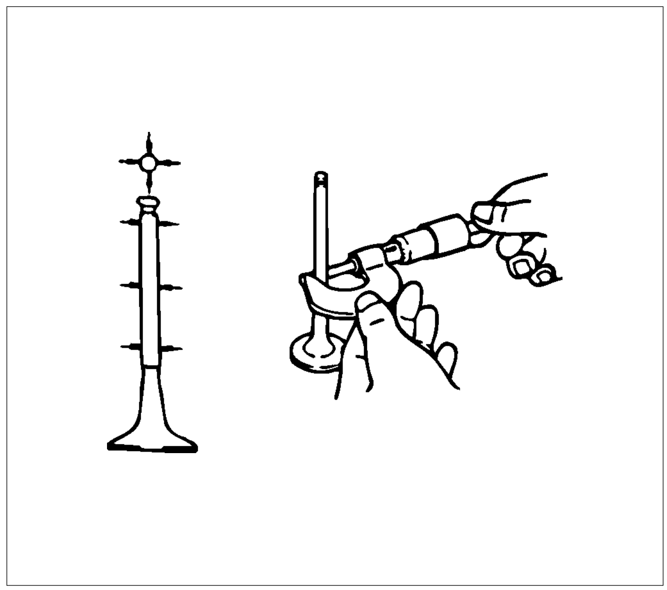
If excessive wear or damage is discovered during inspection.

Valve Stem Outside Diameter

Measure the valve stem diameter at three points.

If the measured value is less than the specified limit, the valve and the valve guide must be replaced as a set.

Valve Stem Outside Diameter		mm (in)
	Intake Valve	Exhaust Valve
Standard	6.955 – 6.970 (0.2738 – 0.2744)	6.939 – 6.949 (0.2732 – 0.2736)
Limit	6.935 (0.2730)	6.920 (0.2724)

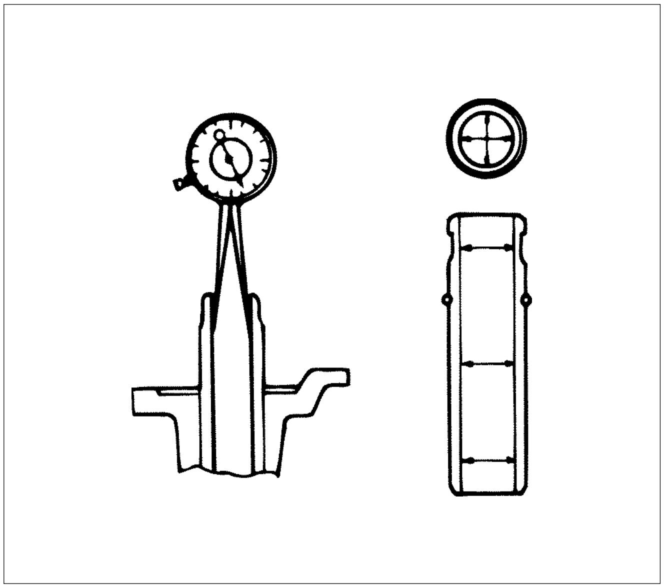


011LX027

Valve Stem and Valve Guide Clearance

1. Measure the valve stem outside diameter.
   Refer to the item "Valve Stem Outside Diameter".
2. Use a caliper calibrator or a telescoping gauge to measure the valve guide inside diameter.
   If the measured values exceed the specified limit, the valve and the valve guide must be replaced as a set.

Valve Stem Clearance		mm (in)
	Intake Valve	Exhaust Valve
Standard	0.039 – 0.071 (0.0015 – 0.0028)	0.064 – 0.096 (0.0025 – 0.0038)
Limit	0.200 (0.008)	0.250 (0.0098)

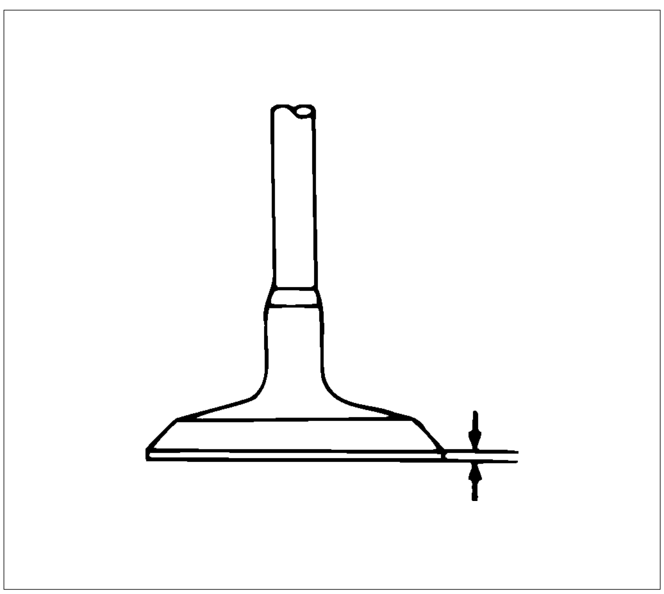


011RY00023

Valve Thickness

Measure the valve thickness.
If the measured value is less than the specified limit, the valve and the valve guide must be replaced as a set.

Intake and Exhasut Valve Thickness	mm (in)
Standard	1.32 (0.052)
Limit	1.1 (0.043)

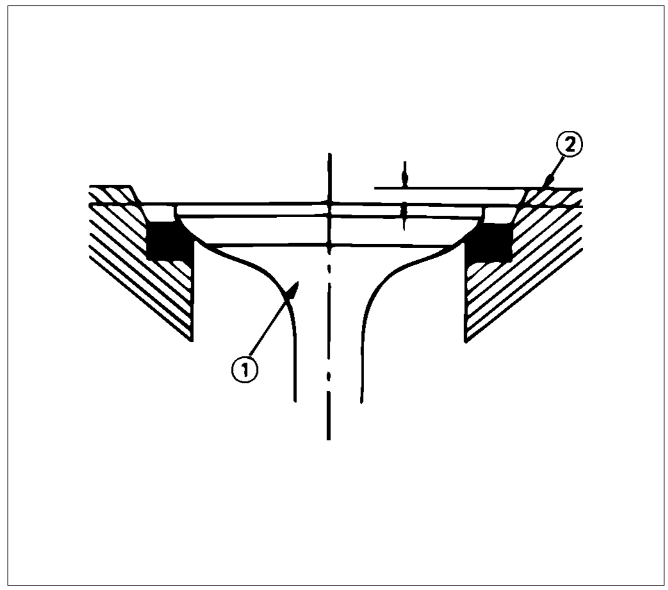


014RY00020

Valve Depression

1. Install the valve (1) to the cylinder head (2).
2. Use a depth gauge or a straight edge with steel rule to measure the valve depression from the cylinder head lower surface.
   If the measured value exceeds the specified limit, the valve seat insert must be replaced.

Valve Depression	mm (in)
Standard	1.8 (0.07)
Limit	2.5 (0.098)

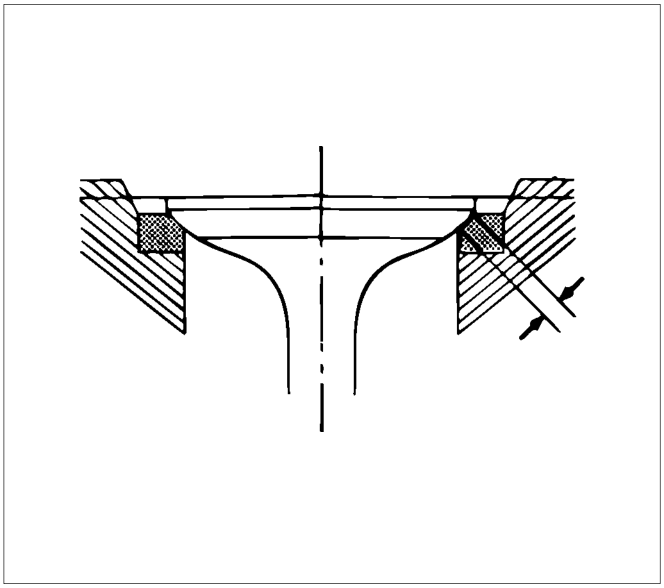


014RY00021

Valve Contact Width

1. Check the valve contact faces for roughness and unevenness. Make smooth the valve contact surfaces.
2. Measure the valve contact width.
   If the measured value exceeds the specified limit, the valve seat insert must be replaced.

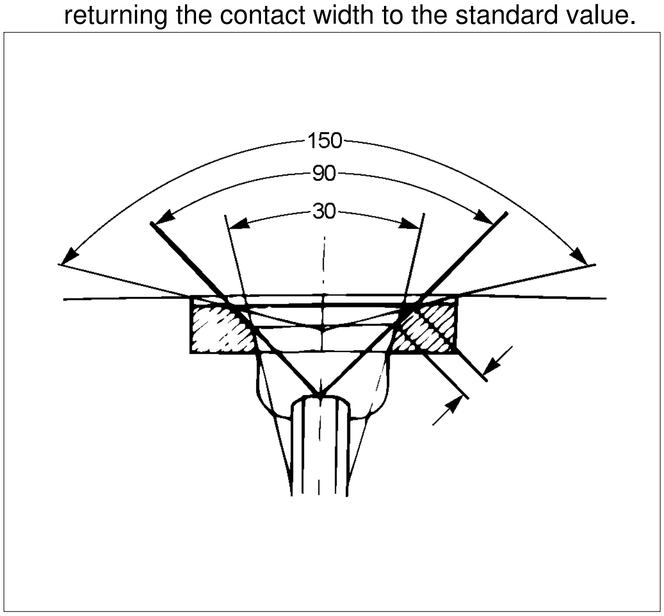
Valve Contact Width		mm (in)
	Intake	Exhaust
Standard	1.7 (0.067)	2.0 (0.079)
Limit	2.2 (0.087)	2.5 (0.098)



014RY00027

Repair of the seat surface

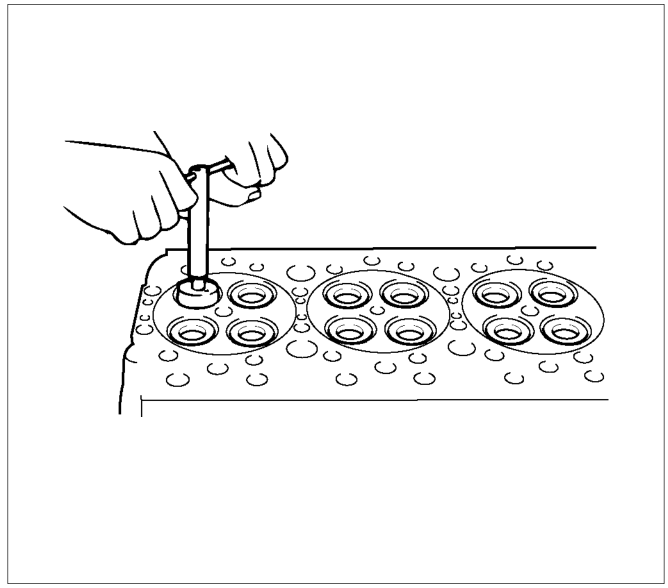
- Remove carbon from the surface of the valve insert seat.
- Use a seat cutter to minimize the scratch and other roughness (15/45/75 degree-blade), thereby returning the contact width to the standard value.



LNW21BSH018201

Note:
Remove only scratches and roughness, and do not cut the surface too much.
Use the free adjustment valve cutter pilot.
Do not let the valve cutter pilot waver inside the valve guide.

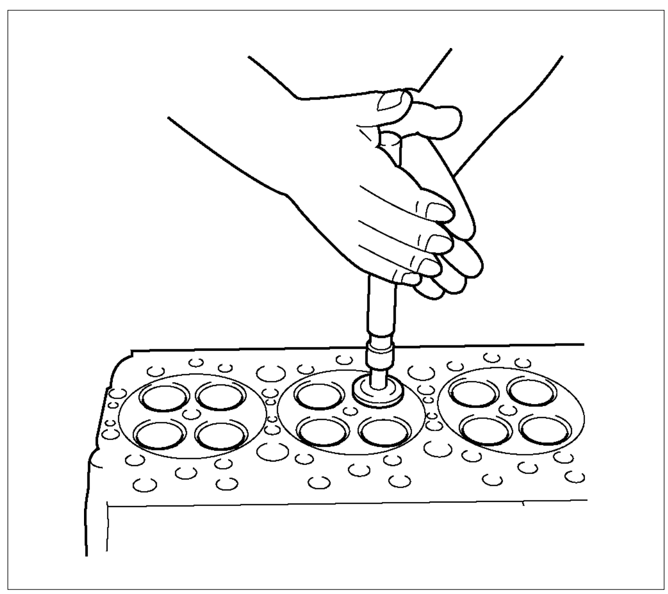
Valve Seat Angle	Degree
45	



LNW21BSH056101

- Attach compound in the valve insert seat.
- Insert the valve into the valve guide.
- Attach compound on the valve seat surface, rotate the valve and hit it lightly to grind it, and confirm that it has even contact all round.

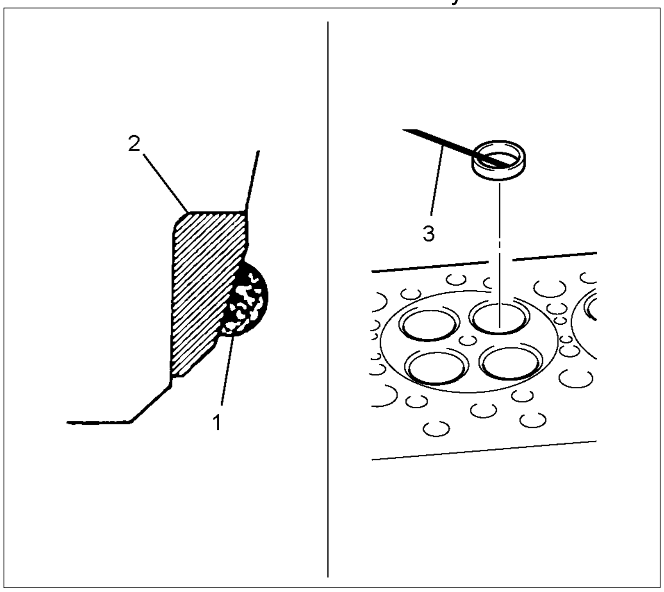
Note:
Remove compound completely after grinding.



LNW21BSH031801

Remove the valve seat insert

- Arc-weld the entire inner diameter of the valve seat insert.
- Cool the valve seat insert for two to three minutes. Contraction due to cooling makes it easier to remove the valve seat insert.
- Remove the valve seat insert, using a screw driver . Be sure not to harm the cylinder head.



LNW21BSH056001

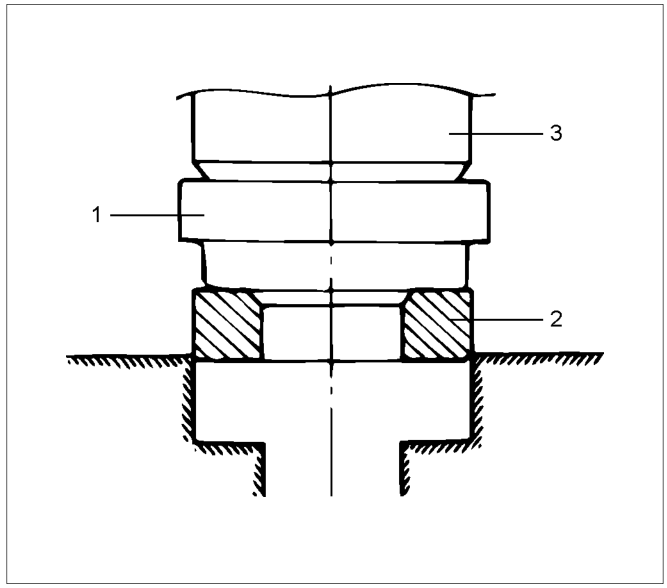
Legend

1. Arc-Weld
2. Valve Seat Insert
3. Screw Driver

Install the valve seat insert

- Carefully place a washer (the outer diameter is smaller than the valve seat insert) on the valve seat insert.
- Use the press to apply pressure gradually on the washer, thereby pushing the valve seat insert.

Note:
Do not apply too much pressure with the press. Attach compound on the valve seat surface, rotate the valve and hit it lightly to grind it, and confirm that it has even contact all round.



LNW21BSH018601

Legend

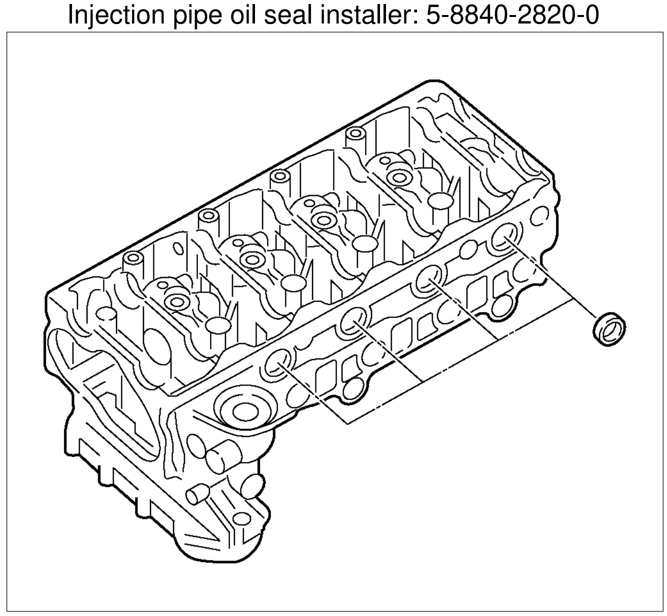
1. Attach Compound
2. Valve Seat
3. Press

Reassembly

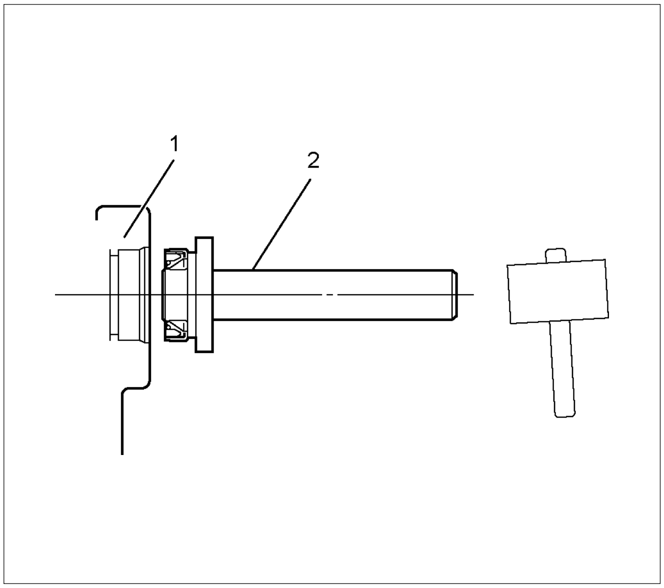
1. Install the oil seal.
   - Install on the surface of the injection pipe insert.
   - Hammer it in so that the seal does not incline.

Note:
Be sure not to harm the lip.

Special tool
Injection pipe oil seal installer: 5-8840-2820-0



RTW56ASH008801



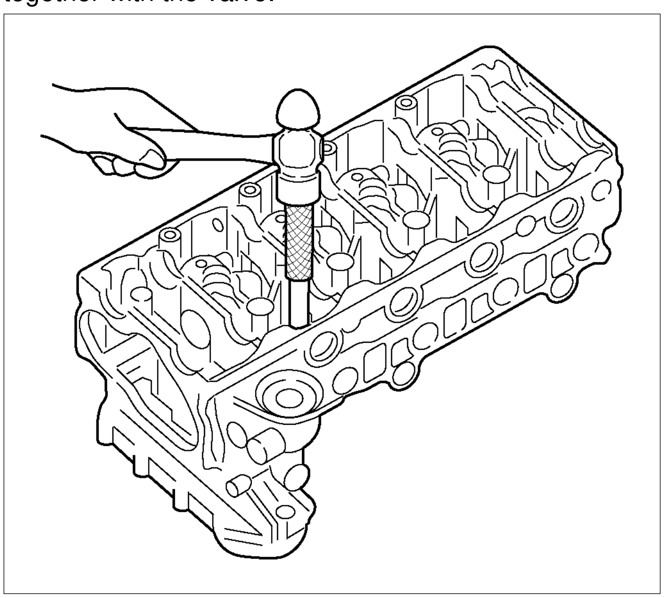
RTW56ASH009101

Legend

1. Cylinder Head
2. Oil Seal Installer

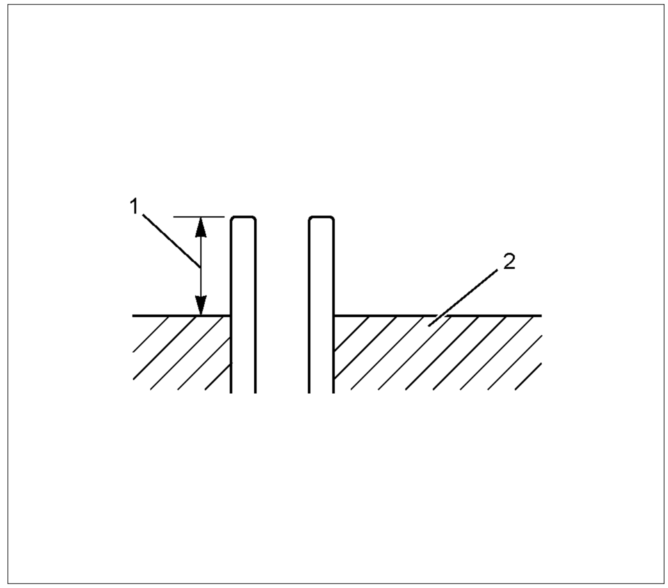
2. Install the valve guide.
   - Hammer in the valve guide from the upper surface of the cylinder head, using the valve guide installer.
     Special tool
     Valve guide remover and installer:
     5-8840-2816-0

Note:
When replacing the valve guide, it must be replaced together with the valve.



RTW56ASH009001

- Height from the upper surface of the cylinder head to the edge surface of the valve guide



RTW56ASH023001

Legend

1. 12.6 ± 0.1 mm (0.50 ± 0.0039 in)
2. Cylinder Head

3. Install the valve spring lower seat.
4. Install the valve stem oil seal.
   - Refer to procedure for valve stem and valve in this manual.
5. Install the intake and exhaust valve.
   - Apply engine oil on the valve stem part and install the valve.
6. Install the valve spring, the valve spring upper seat and the split collar.
   - Refer to procedure for valve stem and valve in this manual.
7. Install the rocker arm and shaft assembly.
   - Refer to procedure for valve stem and valve in this manual.
8. Install the exhaust manifold assembly.
   - Refer to procedure for Turbocharger and Exhaust Manifold in this manual.
9. Install the turbocharger.
   - Refer to procedure for Turbocharger and Exhaust Manifold in this manual.
10. Install the intake manifold assembly.
    - Refer to procedure for Intake Manifold in this manual.
11. Install the throttle assembly.
    - Refer to procedure for Intake Manifold in this manual.

Installation

1. Select the cylinder head gasket.

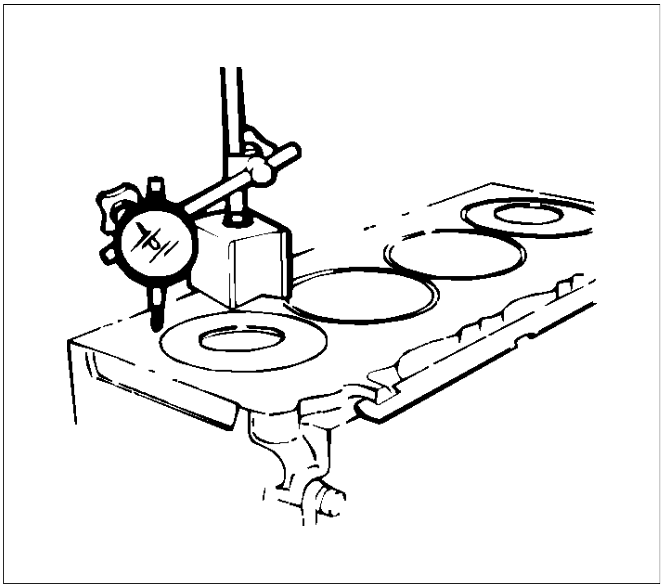
Cylinder Head Gasket Selection

Cylinder head gasket is determined by the piston head projection from the cylinder body upper surface, in order to improve engine performance.

Three types of gasket are provided with difference of thickness. Select the appropriate one out of three grades of

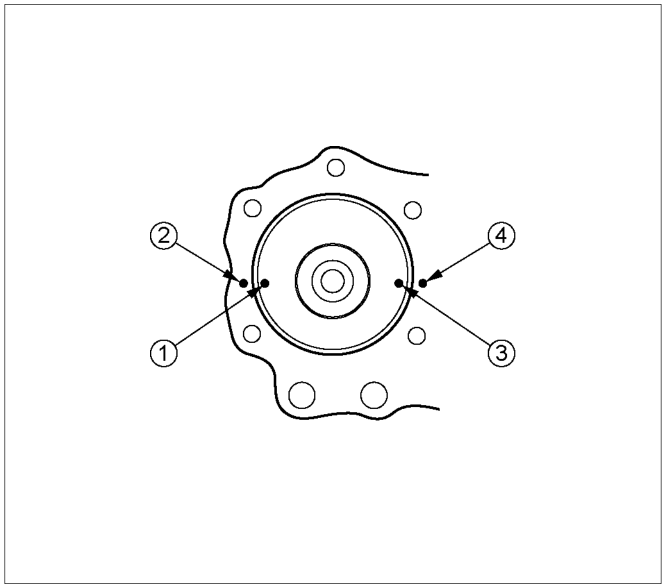
gasket, according to the following procedure.

Before measurement, clear off carbon from the piston head and cylinder body surface and also clean the place where the gasket was installed.



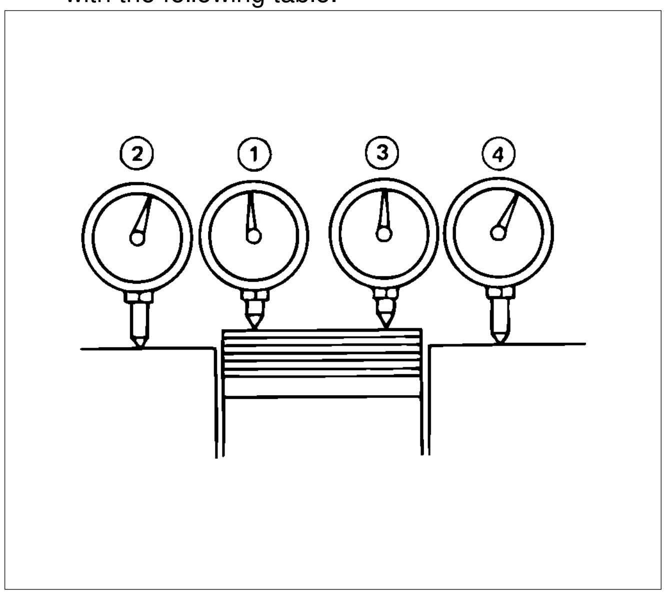
011LX011

1. Use a dial indicator to measure the piston projection amount.
2. Refer to the illustration for the piston head projection measuring positions. All measuring positions should be as close as possible to the cylinder block.



RTW36ASH001701

3. Measure the points 1, 2, 3, 4 and obtain two differences 1-2 and 3-4 on each cylinder. Calculate the average value of the piston head projection on each cylinder.
4. Obtain the maximum value in the four cylinders.
5. Determine the gasket grade required to the maximum value described above in accordance with the following table.



011RY00027

YES

- Is there battery voltage between the engine room harness connector terminal No.1 (X-14) and ground?

NO

Open circuit between the engine harness connector terminal No.1 (E-3) and the engine room harness connector terminal No.2 (X-14).

YES

- Disconnect the A/C thermo relay.
- Is there continuity between the engine room harness connector terminal No.3 (X-14) and the engine room harness connector terminal No.1 (X-15)?

NO

Open circuit between the No. EB-13 fuse and the engine room harness connector terminal No.1 (X-14).

YES

- Disconnect the ECM harness connector.
- Is there continuity between the ECM harness connector terminal No.55 (C-58) and the engine room harness connector terminal No.5 (X-14)?

NO

Open circuit between the engine room harness connector terminal No.3 (X-14) and the engine room harness connector terminal No. 1 (X-15).

YES

- Is there continuity between the ECM harness connector terminal No.4 (C-58) and the engine room harness connector terminal No.1 (X-15)?

NO

Open circuit between the ECM harness connector terminal No.55 (X-58) and the engine room harness connector terminal No. 5 (X-14).

YES

- Is there battery voltage between the engine room harness connector terminal No.2 (X-15) and ground?

NO

Open circuit between the ECM harness connector terminal No. 4 (C-58) and the engine room harness connector terminal No. 1 (X-15).

YES

- Disconnect the pressure switch.
- Is there continuity between the engine room harness connector terminal No. 5 (X-15) and the engine room harness connector terminal No. 1 (C-24)?

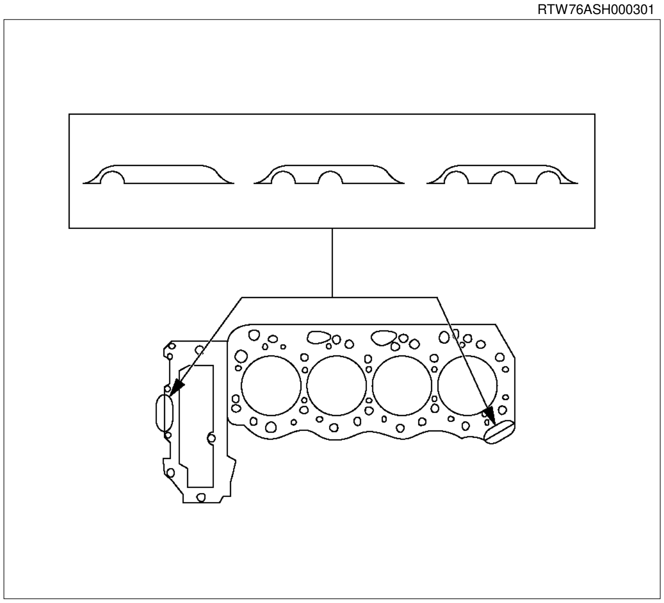
NO

Open circuit between the No. EB-13 fuse and the engine room harness connector terminal No. 2 (X-15).

Cylinder Head Gasket Combination mm (in)

Gasket Grade Mark	Piston Projection	Gasket Thickness
A	0.067-0.117 (0.0026-0.0046)	0.95 (0.0374)
B	0.117-0.167 (0.0046-0.0066)	1.00 (0.0394)
C	0.167-0.217 (0.0066-0.0085)	1.05 (0.0413)

RTW76ASH000301

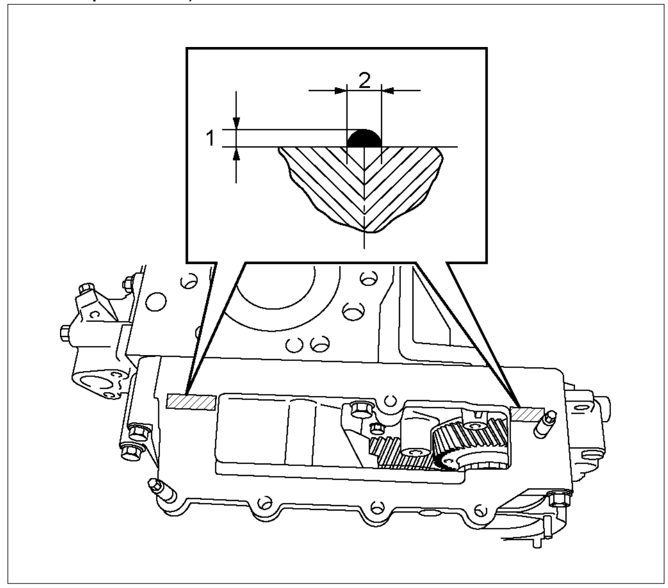


RTW56ASH009501

Note:
Difference of each piston projection must be equal or within 0.05 mm (0.002 in).

7. Select the gear case gasket.
   - This should be of the same grade as the cylinder gasket.

8. Apply liquid gasket (ThreeBond 1207B or equivalent) at the two locations.



RTW56ASH020901

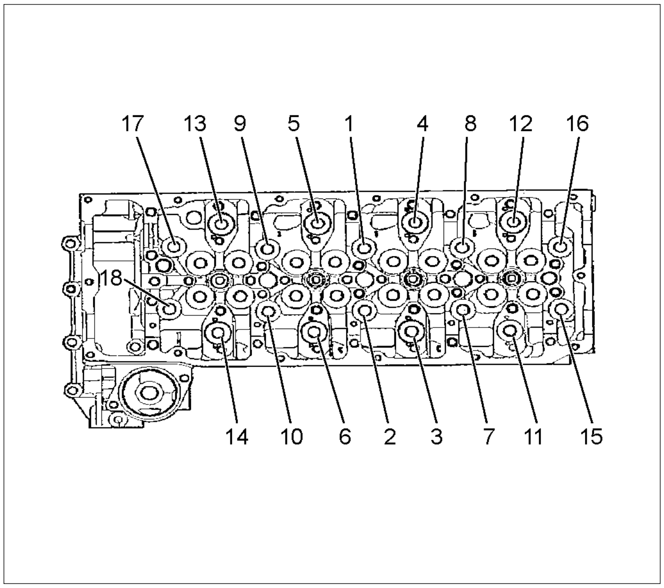
Legend

1. 2 - 3 mm (0.079 - 0.118 in)
2. 3 - 4 mm (0.118 - 0.157 in)

9. Install the cylinder head within 5 minutes application of the liquid gasket.
10. Install the cylinder head.
    - Wipe the cylinder head lower face.
    - Install the cylinder head, adjusting the dowel of the cylinder block.
11. Install the cylinder head bolt.
    - Please use new cylinder head bolt.
    - Use a torque wrench and angle gauge to tighten the head bolts in the order described in the drawing.

Tightening torque:

1st step = 70 N·m (7.1 kg·m / 51 lb ft)
2nd step = 70 N·m (7.1 kg·m / 51 lb ft)
3rd step = 60° (degrees)
4th step = 60° (degrees)

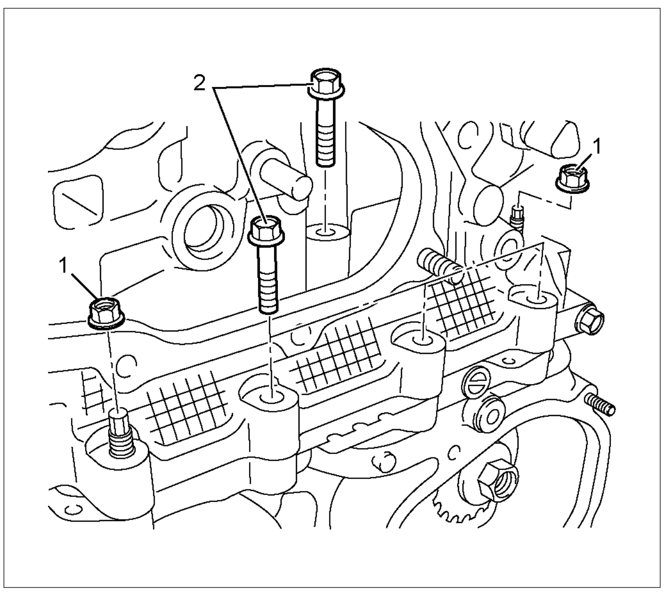


RTW56ASH009701

Special tool
Angle gauge: 5-8840-0266-0

12. Install the cylinder head gear case bolt and nut.
    - Tighten the nuts (1) and bolts (2) to the specified torque.

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)

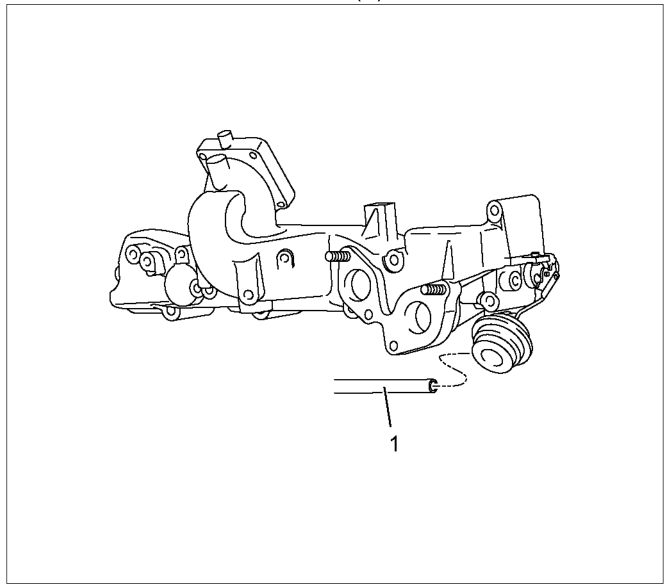


RTW56ASH020801

13. Install the water by pass pipe.
    Apply soapy water to the O-ring.
    Tighten the bolt to the specified torque.

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)

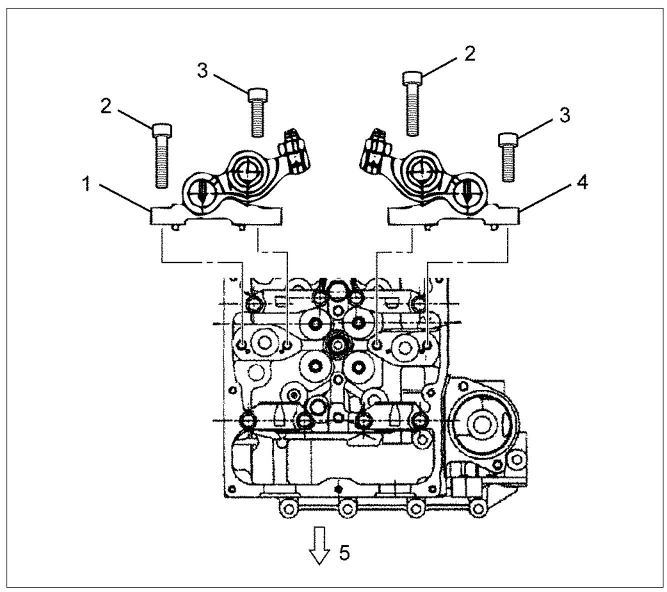
14. Install the vacuum hose (1).



RTW66ASH003101

15. Install the rocker arm shaft assembly.
    - Apply the engine oil.
    - Attach the rocker arm shaft assembly in sequence from No.1 to No.4.

Tightening torque: 21 N·m (2.1 kg·m / 15 lb ft)



RTW56ASH012201

Legend

1. Exhaust Rocker Arm Shaft Assembly

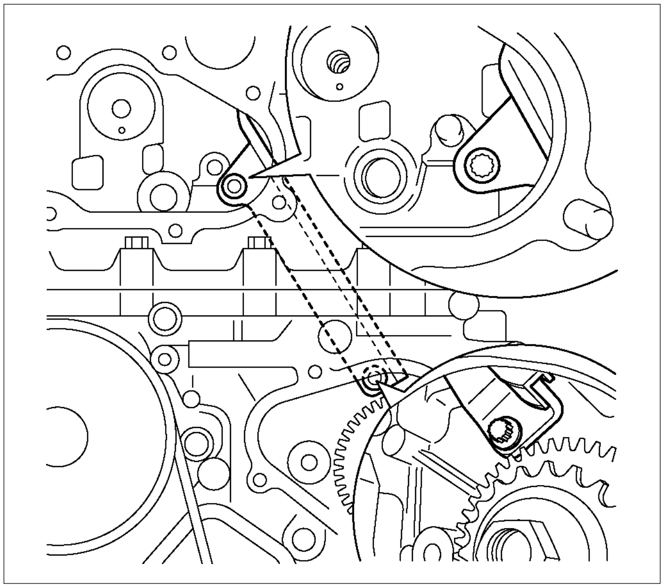
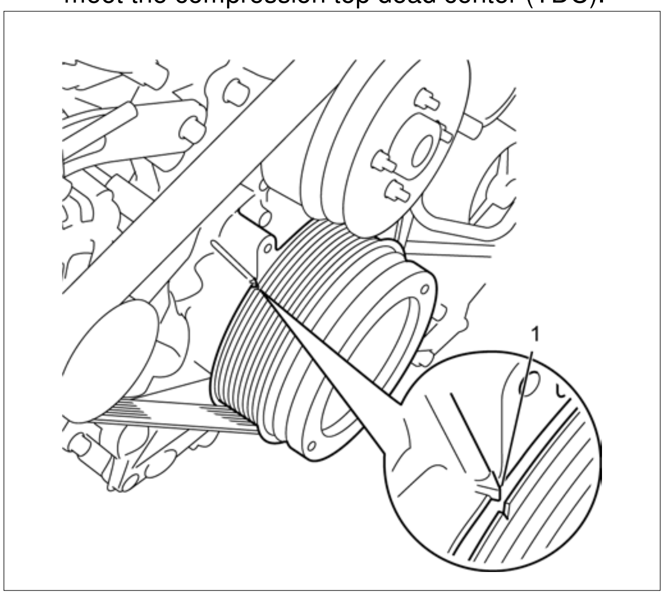
16. Install the chain guide bolt from cylinder head.
    Tighten the bolt to the specified torque.

Tightening torque: 25 N·m (2.5 kg·m/18 lb ft)



RTW56ASH019501

17. Install the tension lever.
18. Rotate the crankshaft to make the No.1 cylinder meet the compression top dead center (TDC).



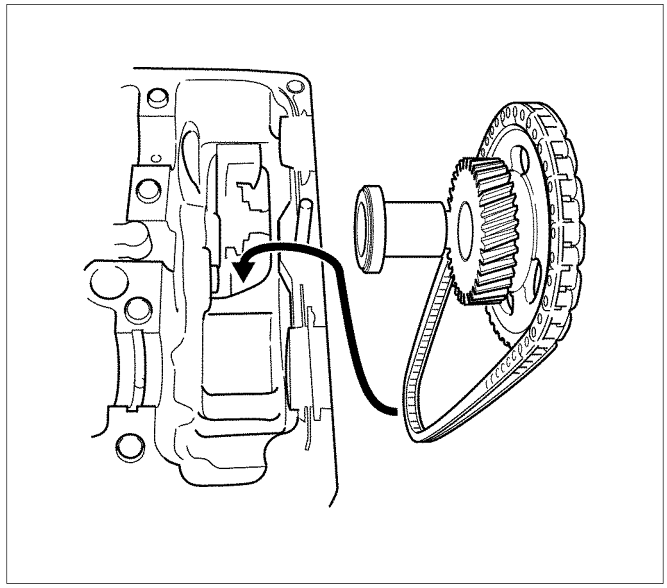
RTW76ASH001301

Legend

1. TDC

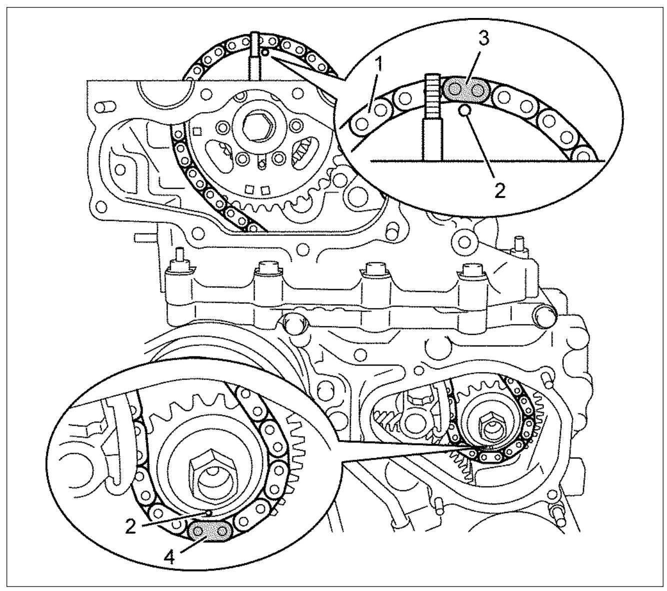
19. Install the timing chain with idle gear D.
    - Apply the engine oil bolt thread and seat.

Tightening torque : 59 N·m (6.0 kg·m/43 lb ft)



RTW56ASH021801

- Align the timing marks at two locations as shown.



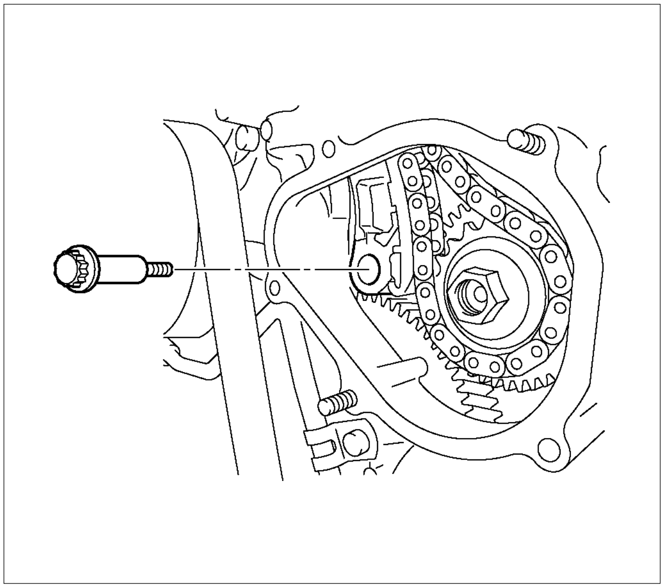
RTW56ASH020301

Legend

1. Timing Chain
2. Timing Mark
3. Blue Link
4. Yellow Link

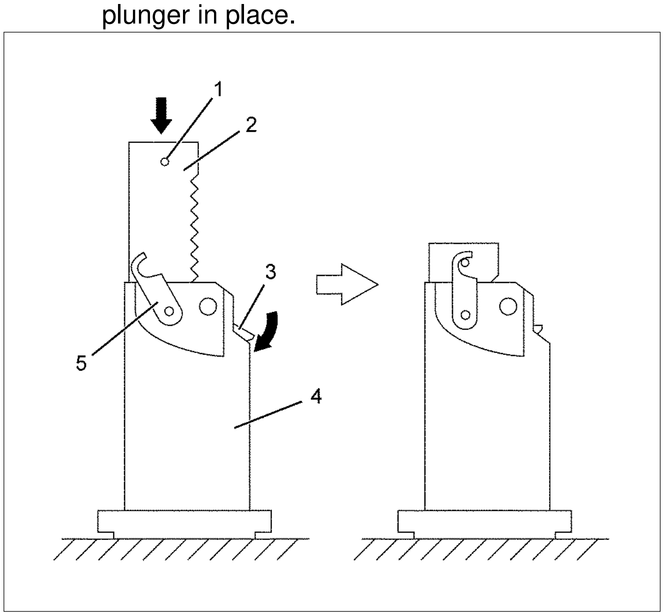
20. Install the timing chain tension lever pivot.
    Tighten the bolt to the specified torque.

Tightening torque: 27 N·m (2.8 kg·m / 20 lb ft)



RTW56ASH019401

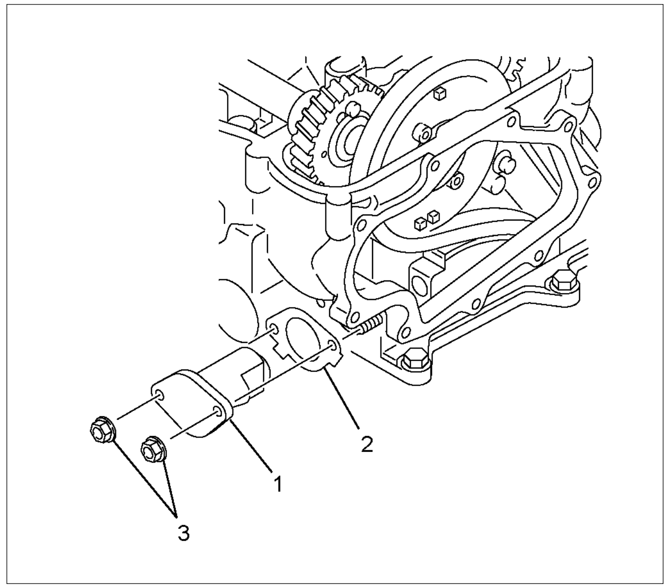
21. Attach the hook of the timing chain tensioner.
    - Hold the latch (3) depressed. Insert the plunger (2). Attach the hook (5) to the pin (1) to hold the plunger in place.



RTW56CSH004401

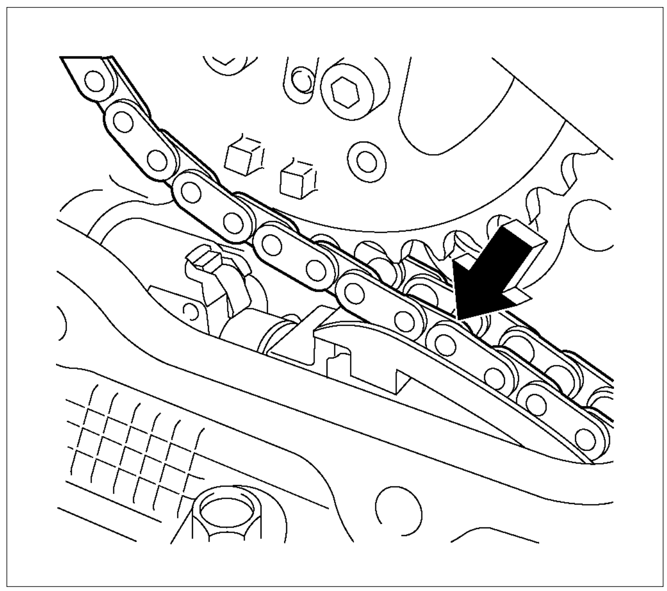
22. Install the timing chain tensioner (1) and the gasket (2).
    Tighten the nuts (3) to the specified torque.

Tightening torque: 10 N·m (1.0 kg·m / 87 lb in)



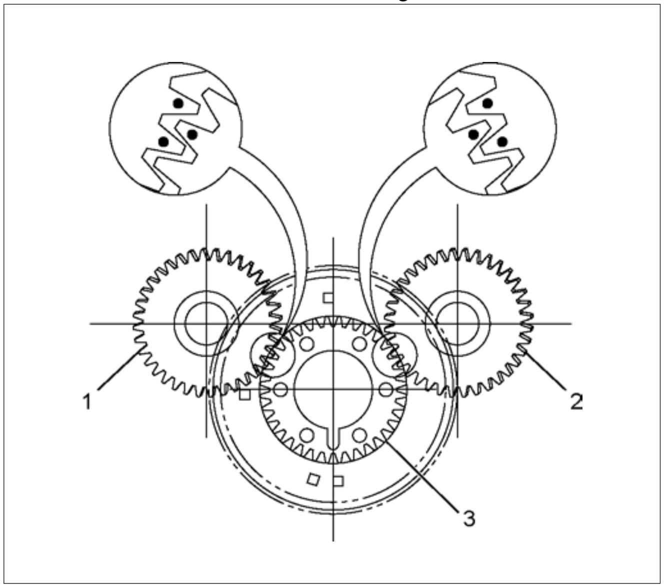
RTW56CSH001701

23. Unlock the tensioner hook.
    - Press the place of the arrow in the figure.
    - The hook is opened. The plunger pushes the tension lever.



RTW56ASH020401

24. Install the camshaft assembly.
    - Align timing mark on intake camshaft and exhaust camshaft to idle gear D.

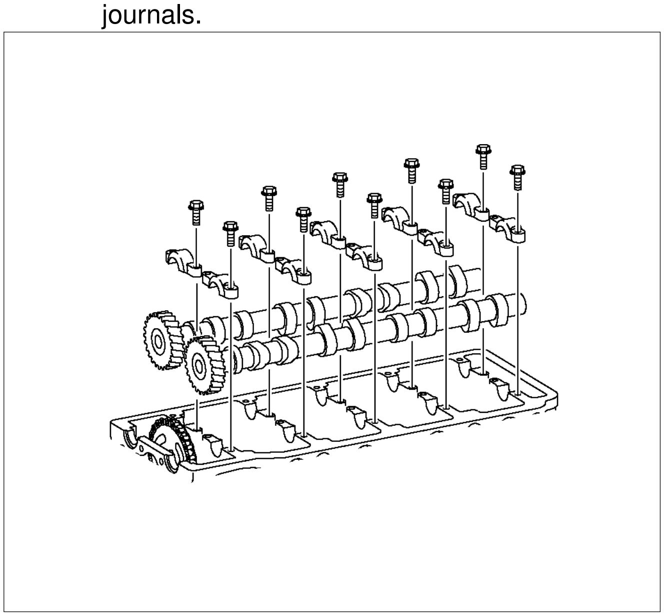


RTW56ASH007001

Legend

1. Exhaust Camshaft Gear
2. Intake Camshaft Gear
3. Idle Gear D

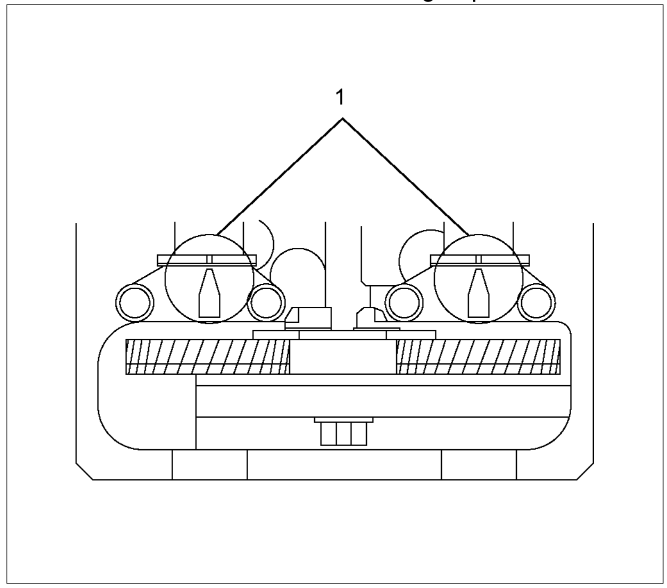
25. Install the camshaft bearing cap.
    - Apply engine oil to all of the cylinder head journals.



RTW56ASH013801

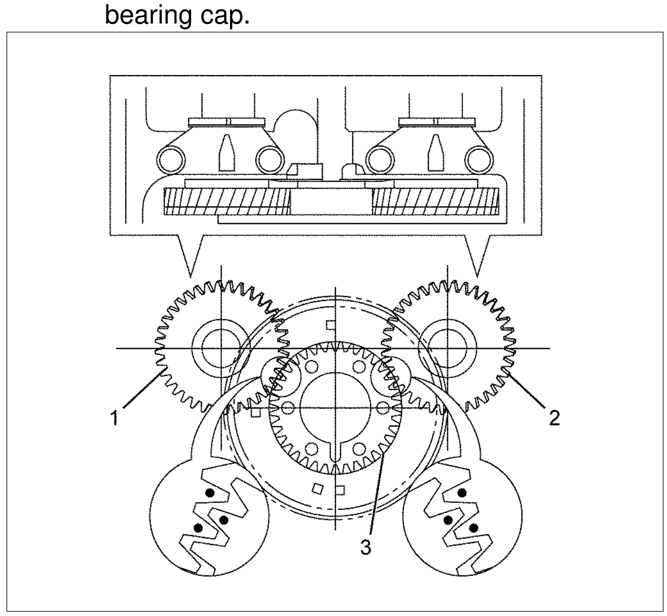
Tightening torque: 18 N·m (1.8 kg·m / 13 lb ft)

26. Align mark on camshaft to mark on camshaft bearing cap.
    - Align mark (1) on intake camshaft and exhaust camshaft to mark of bearing cap.



RTW56ASH006901

27. Remove the lock bolt from the camshaft gear.
28. Turn the crank pulley two rotation (720°CA).
    - Align mark on camshaft to mark on camshaft bearing cap.



RTW56ASH020701

Legend

1. Exhaust Camshaft Gear
2. Intake Camshaft Gear
3. Idle Gear D

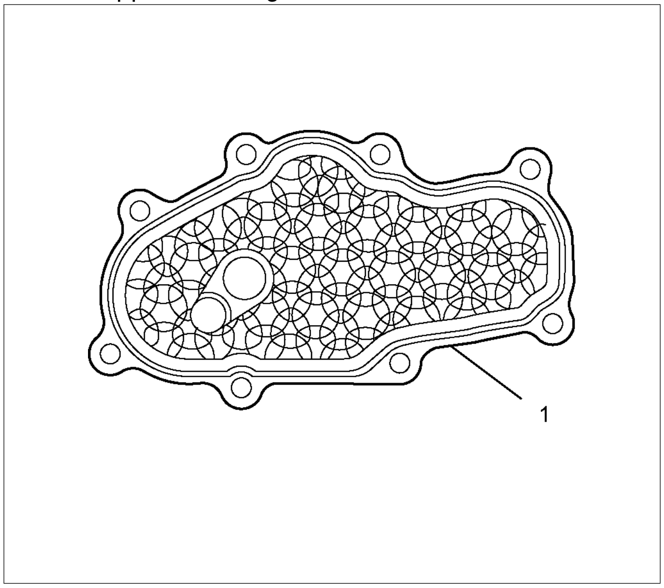
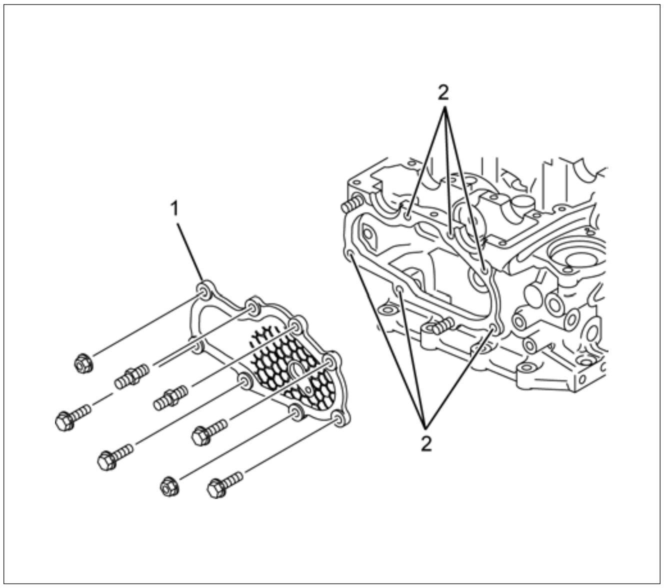
29. Apply liquid gasket (ThreeBond TB-1207C or equivalent) to timing chain cover upper (1).
    - Attach cover within 5minutes after the application of gasket.



RTW56CSH002101

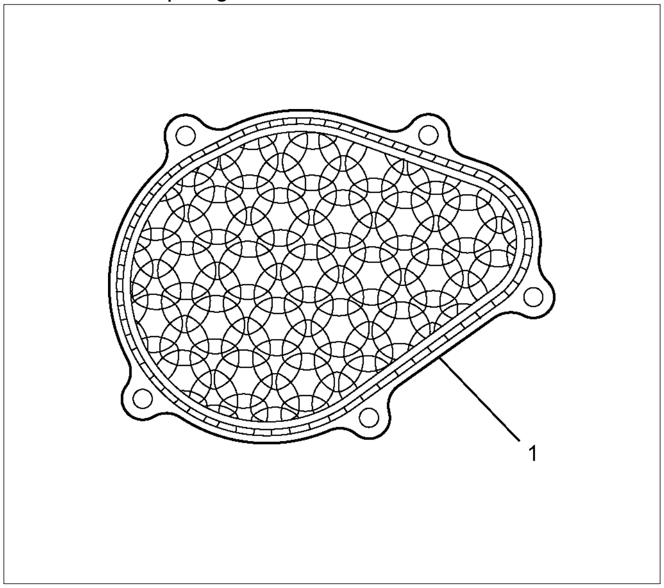
30. Install the timing chain cover upper (1).
    Tighten the bolt to the specified torque.
    - Apply loctite #262 or equivalent to the bolt and stud threads of cylinder side head side (2).

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)



RTW76CSH001201

31. Apply liquid gasket (ThreeBond TB-1207C or equivalent) to the timing chain cover lower (1).
    - Attach the cover within 5 minutes of applying the liquid gasket.



RTW56CSH002301

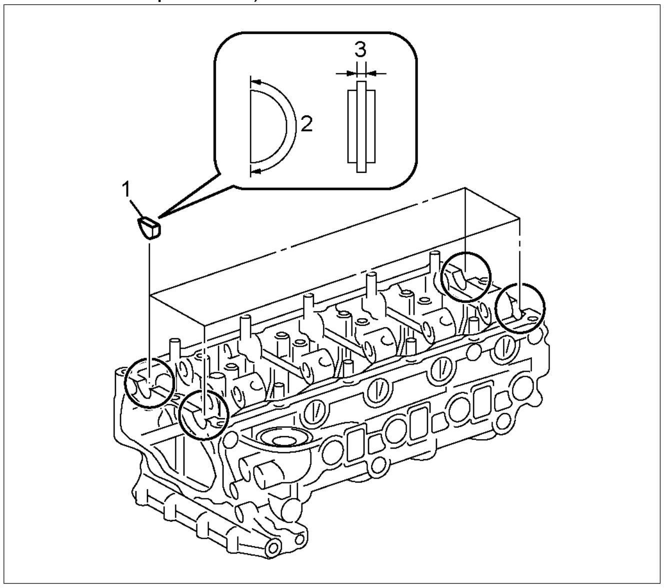
32. Install the timing chain cover lower.
    Tighten the bolts and nuts to the specified torque.

Tightening torque: 10 N·m (1.0 kg·m / 87 lb in)

33. Install the noise cover to the timing chain cover lower.
    Tighten the bolts to the specified torque.

Tightening torque: 10 N·m (1.0 kg·m / 87 lb in)

34. Inspection / adjustment of valve clearance.
    - Refer to procedure for Service Precautions in this manual.
35. Install the fuel injector.
    - Refer to procedure for Fuel System in this manual.
36. Install the baffle cover.
    - Refer to procedure for Camshaft Assembly in this manual.
37. Install the cam end gasket.
    - Apply the liquid gasket (ThreeBond TB-1207B or equivalent).



RTW56ASH020601

Legend

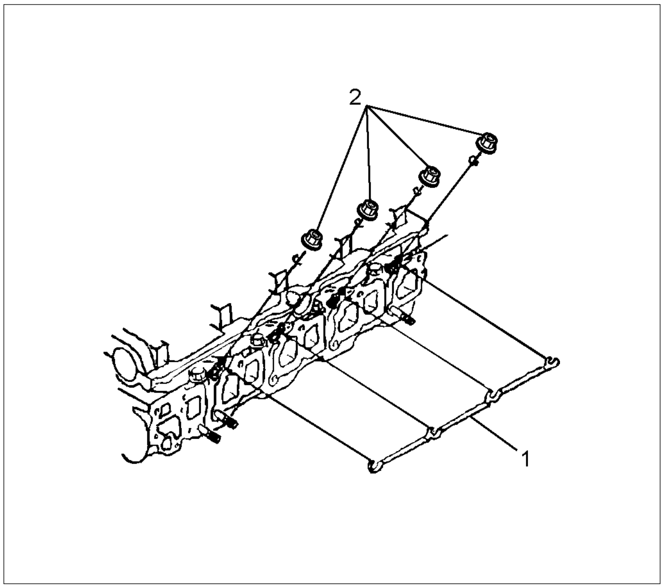
1. Cam End Gasket
2. 2.0 - 3.0 mm (0.078 - 0.118 in)

38. Install the cylinder head cover.
    Refer to procedure for Cylinder Head Cover in this manual.
39. Install the glow plug .
    Tighten the glow plug to the specified torque.

Tightening torque: 18 N·m (1.8 kg·m / 13 lb ft)

40. Install the glow plug connector.
    Tighten the nut to the specified torque.

Tightening torque: 2 N·m (0.2 kg·m / 17 lb in)



RTW56ASH010201

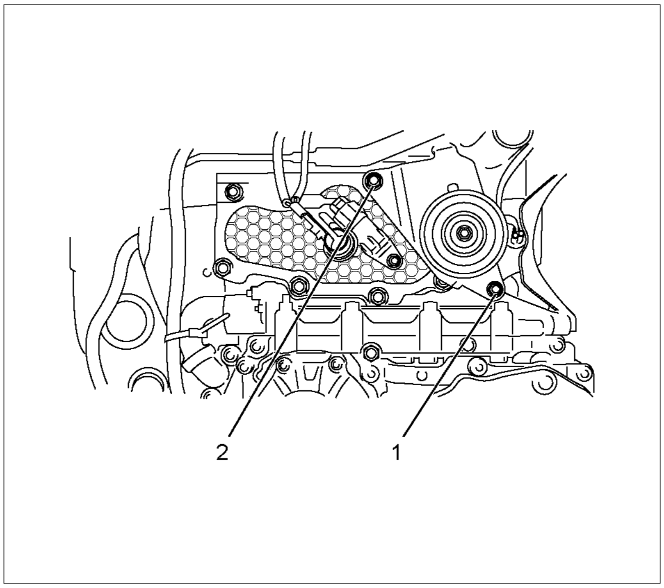
Legend

1. Glow Plug Connector
2. Nut

47. Install the A/C compressor adjust pulley.
    Tighten the bolt and nut to the specified torque.

Tightening torque: bolt 25 N·m (2.6 kg·m/19 lb ft)

Tightening torque: nut 25 N·m (2.6 kg·m/19 lb ft)



RTW56ASH010601

Legend

1. Bolt

54 Install the A/T oil cooler pipe bracket.
Refer to procedure for automatic transmission in this manual.

55. Install the catalyst converter.
Refer to procedure for Turbocharger and Exhaust Manifold in this manual.

56. Connect the front drive shaft. (4×4)
Refer to procedure for front propeller shaft in this manual.

57. Install the exhaust front pipe.
  - Refer to procedure for “Exhaust System” in this manual.

58. Install the EGR cooler.
  - Refer to procedure for “Exhaust System” in this manual.

59. Install the EGR cooler water pipe.
  - Refer to procedure for “Exhaust System” in this manual.

60. Install the EGR cooler heat protector.
  - Refer to procedure for “Exhaust System” in this manual.

61. Install the cooling fan.
  - Refer to procedure for “Engine Cooling” in this manual.

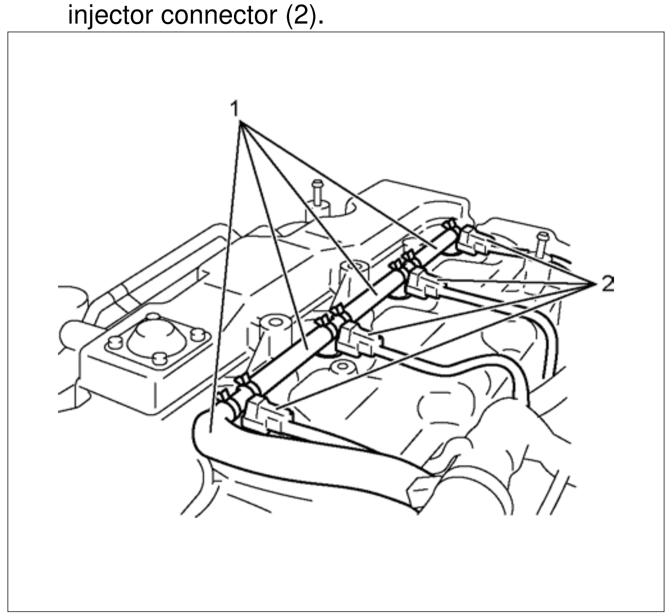
62. Install the A/C drive belt.
  - Refer to procedure for “Intake Manifold” in this manual.

63. Install the radiator fan shroud. Upper and lower.

64. Install the radiator upper hose.
  - Refer to procedure for engine cooling in this manual.

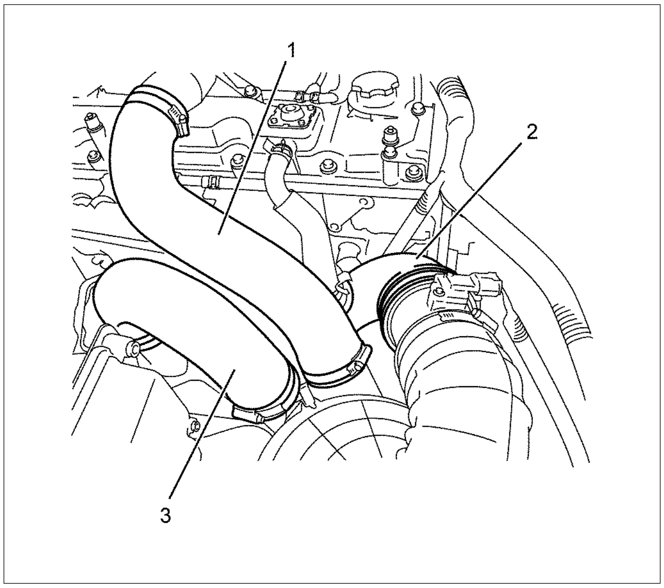
65. Install the harness bracket.

66. Install the fuel leak off hose (1), and the fuel injector connector (2).



RTW76ASH000101

67. Install the intercooler (High output).
    - Install the intercooler.
    - Install the two intake hoses.
    - Connect the BARO sensor harness connector.
68. Install the intake hose.



RTW56ASH022501

Legend

1. Intake Hose for Intercooler and Intake Throttle
2. Intake Duct for Turbocharger and Air Cleaner
3. Intake Hose for Turbocharger and Intercooler

69. Install the engine head cover.
70. Replenish the coolant.

YES

• Disconnect the condenser fan relay.

• Is there continuity between the relay terminal No. 3 (X-9) and engine room harness connector terminal No.4 (C-24)?

NO

Open circuit between the engine room harness connector terminal No. 5 (X-15) and the engine room harness connector terminal No. 1 (C-24).

YES

• Is there battery voltage between the engine room harness connector terminal NO.3 (C-24) and ground?

NO

Open circuit between the condenser fan relay No.3 (X-9) and the engine room harness connector terminal No. 4 (C-24).

NO

Open circuit between the No. EB-13 fuse and engine room harness connector terminal No. 3 (C-24).

YES

• connect the A/C thermo relay connector.

• Disconnect the electronic thermostat.

• Is there continuity between the engine room harness connector terminal No. 2 (C-55) and the engine room harness connector terminal No. 2 (C-24)?

YES

• Is there battery voltage between the engine room harness connector terminal No.3 (C-55) and ground?

NO

Open circuit between the engine room harness connector terminal No. 2 (C-24) and the engine room harness connector terminal No. 2 (C-55).

YES

• Is there continuity between the engine room harness connector terminal No.1 (C-55) and ground (C-109)?

NO

Open circuit between the No. EB-13 fuse and the engine room harness connector terminal No. 3 (C-55).

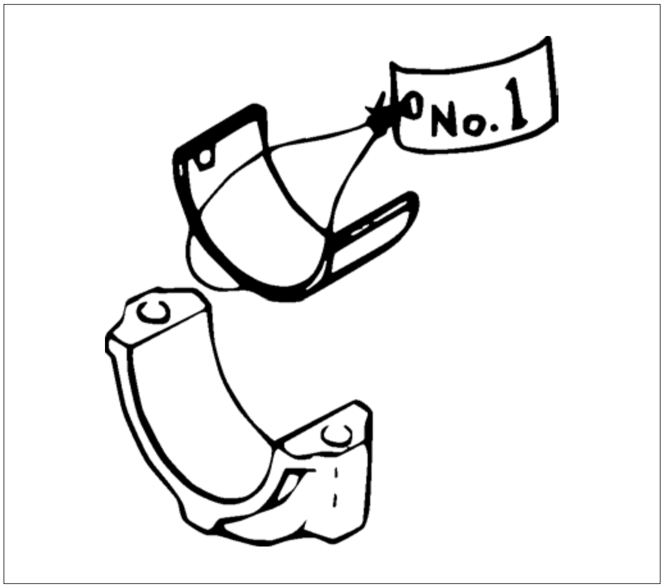
4. Piston
5. Connecting Rod
6. Bearing

Removal

1. Demount the engine assembly.
   Refer to “Engine Assembly”.
2. Remove the cylinder head cover.
   Refer to “Cylinder Head Cover”.
3. Remove the camshaft assembly.
   Refer to “Camshaft Assembly”.
4. Remove the cylinder head.
   Refer to “Cylinder Head”.
5. Remove the gear case assembly.
   Refer to “Gear Case Assembly”.
6. Remove the oil pan.
   Refer to “Oil Pan” .
7. Remove the connecting rod cap.

Note:
Sort the removed bearings according to cylinders by using tags.



LNW21BSH004901

8. Remove the piston and connecting rod.
   - Remove carbon on the upper side of the cylinder block with a scraper.
   - Pull out the piston and connecting rod towards the cylinder head.

Note:
Be sure not to damage the oil jet and cylinder block when pushing out the connecting rod.

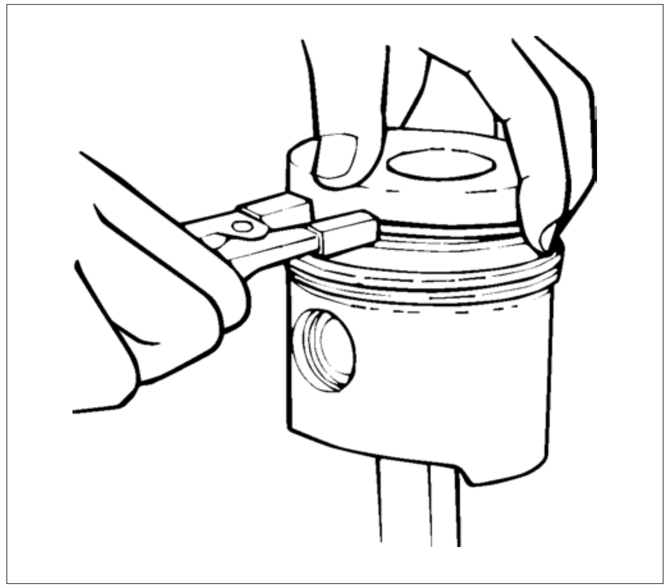
9. Remove the connecting rod bearing.

Note:
Sort the bearings in the order of cylinders when reusing them so that they are not confused with the bearings of other cylinders.

Disassembly

1. Remove the piston ring.
   - Use ring pliers to remove the piston ring.

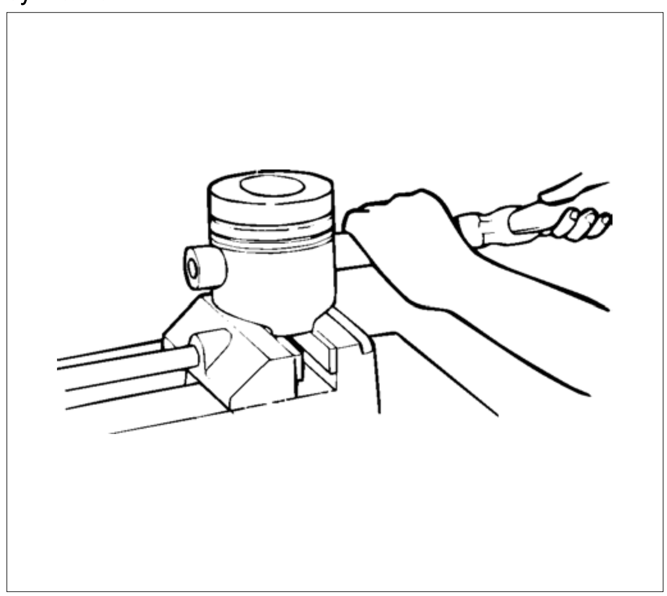
Note:
Sort the piston rings in the same order as the cylinders when reusing them so that they are not confused with the pistons and piston rings of other cylinders.



LNW21BSH005101

2. Remove the snap ring.
3. Remove the piston pin.

Note:
Sort the disassembled piston pins, pistons and connecting rods together in the same order as the cylinders.



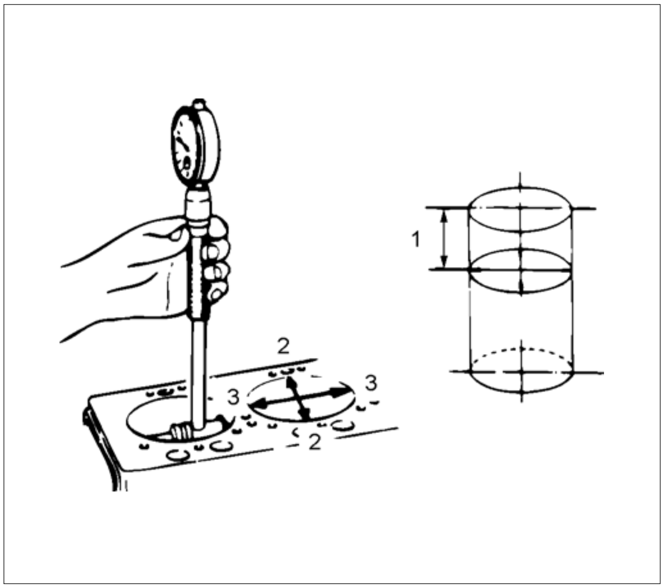
LNW21BSH005201

4. Remove the connecting rods from the piston.
5. Clean the piston.
   - Carefully clean carbon that is adhered to the head of the piston and the groove of the piston ring.

Note:
Do not use a wire brush to clean the piston because it scratches the piston.
Visually inspect the piston for cracks, burns and other excessive wear, and replace it if there is any abnormality.

6. Measure the gap between the piston and the inner diameter of the cylinder block.
   Inner diameter of the cylinder block.
   - Use a cylinder bore dial indicator to measure the cylinder block inner diameter both in the thrust and radial directions in the designated position.
   - Measurement position (from the upper surface of the cylinder block) 20 mm (0.79 in)
   - Measure the cylinder block inner diameter based on the average value of the actual measurement values on 6 positions.

Cylinder block inner diameter mm (in)
95.421 – 95.450 (3.75673 – 3.75787)



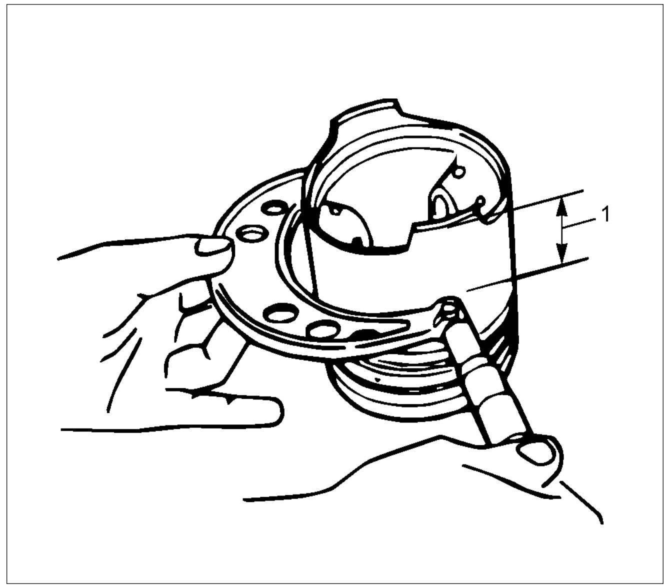
LNW61ASH006401

Legend

1. 20 mm (0.79 in)
2. Radial
3. Thrust

Piston outside diameter

- Use a micrometer to measure the outside diameter of the piston in the right angle to the piston pin in the designated position.
- Measurement position (from the bottom surface of the piston) 11.00 mm (0.43 in).



RTW56ASH023101

Legend

1. 11 mm (0.43 in)

Gap between the piston and the inner diameter of the cylinder block mm (in)	
Standard	0.082 – 0.100 (0.0032 – 0.0039)

NOTE:

If the gap exceeds the standard value, replace the piston or rebore the cylinder block.

7. Piston replacement
   - The head of piston has a marking of grade A, B or C.
   - Refer to “Cylinder Block” if over size piston is installed.

Piston Grade (Service Part) mm (in)	
A	95.330 – 95.339 (3.75314 – 3.75350)
B	95.340 – 95.349 (3.75354 – 3.75389)
C	95.350 – 95.359 (3.75393 – 3.75428)

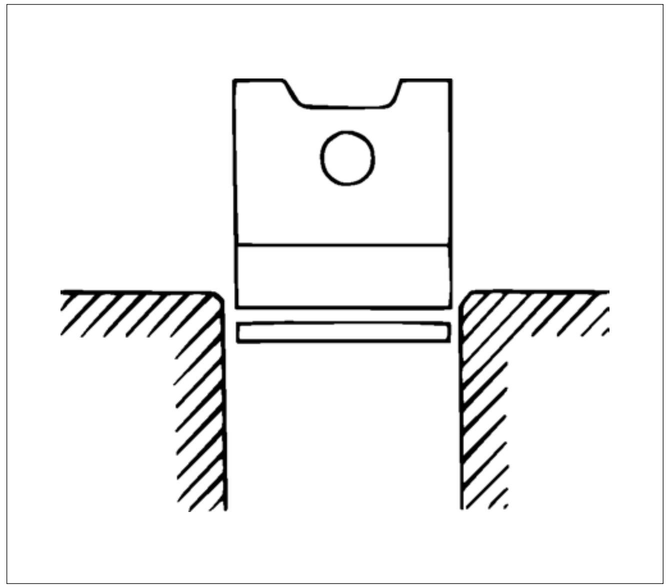
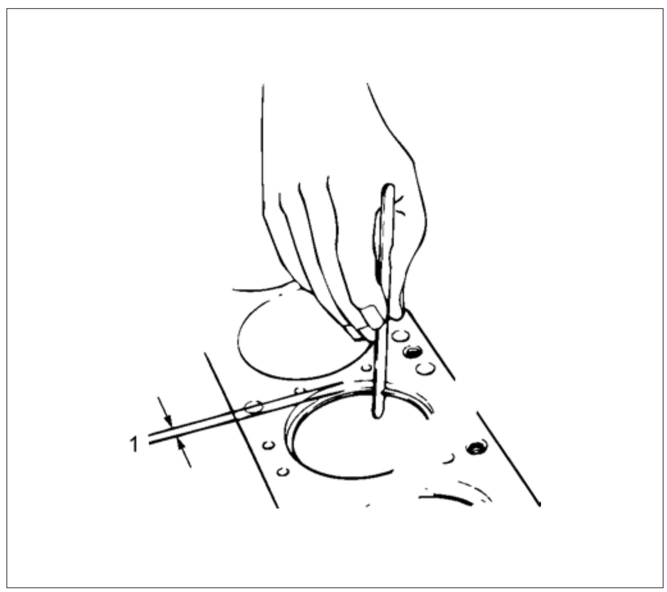
8. Inspect the piston ring.
   - Insert the piston ring horizontally (in the position it would assume if it were installed to the piston) into the cylinder block.

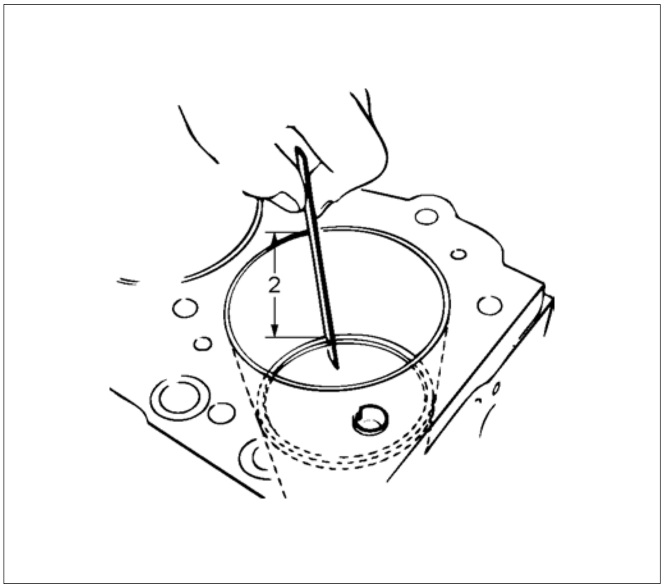


LNW21BSH009301

- Push the piston ring into the cylinder bore until it reaches the measuring point 1 or 2 where the cylinder block bore is the smallest.
  Do not allow the piston ring to slant to one side or the other. It must be perfectly horizontal.
  Measuring Point 1 10 mm (0.4 in)
  or
  Measuring Point 2 120 mm (4.7 in).



LNW61ASH004401



LNW61ASH004501

- Use a thickness gauge to measure the piston ring gap.
  If the measured value exceeds the specified limit, the piston ring must be replaced.

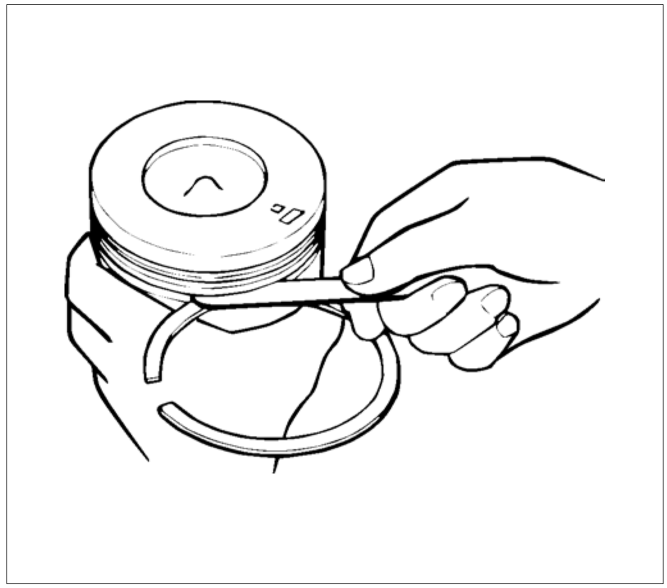
Piston ring gap		mm (in)
	Standard	Limit
1st compression ring	0.3 - 0.5 (0.0118 - 0.0197)	1.50 (0.059)
2nd compression ring	0.3 - 0.5 (0.0118 - 0.0197)	1.50 (0.059)
Oil ring	0.25 - 0.45 (0.0098- 0.0177)	1.50 (0.059)

Measure the clearance between the piston ring groove and the piston.

- Remove carbon in the piston ring groove.
- Put the piston ring in the piston ring groove, use a thickness gauge to measure the gap between them.
- If the clearance between the piston ring groove and the piston exceeds the limit, replace the piston and the piston ring.

Piston ring and piston ring groove clearance		mm (in)
	Standard	Limit
1st compression ring	— *	— *
2nd compression ring	0.05 - 0.09 (0.0020 - 0.0035)	1.50 (0.059)
Oil ring	0.03 - 0.07 (0.0012- 0.0028)	1.50 (0.059)

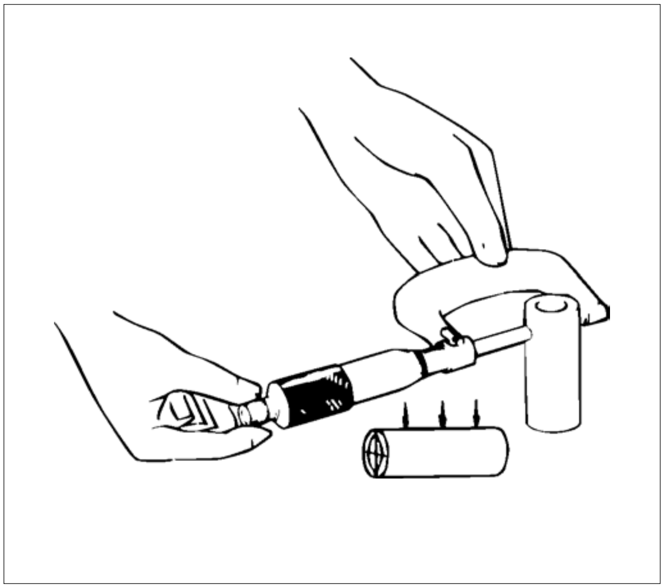
* Measurement is impossible



LNW21BSH009501

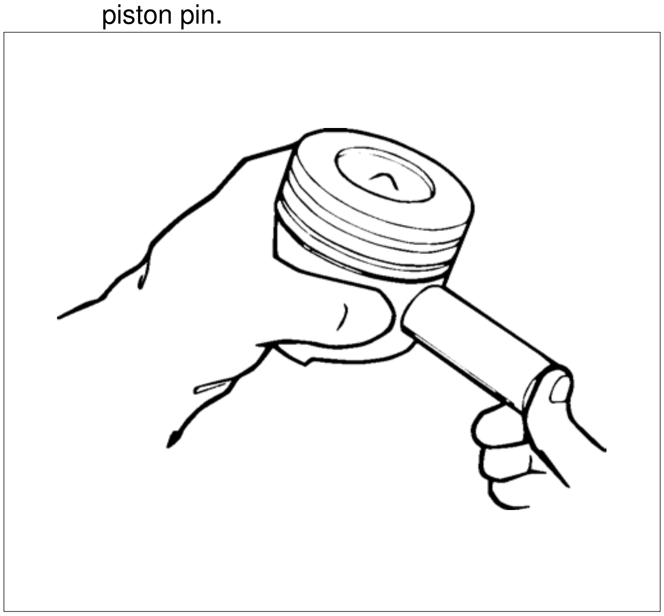
9. Inspect the piston pin.
   - Visually inspect the piston pin for cracks, scratches and other damage, and replace it if necessary.
   - Use a micrometer to measure the outer diameter of the piston pin. If the measured value exceeds the limit, replace the piston pin.

Piston pin outer diameter	mm (in)
Standard	33.995 – 34.000 (1.33838 – 1.33858)
Limit	33.970 (1.33740)



LNW21BSH009601

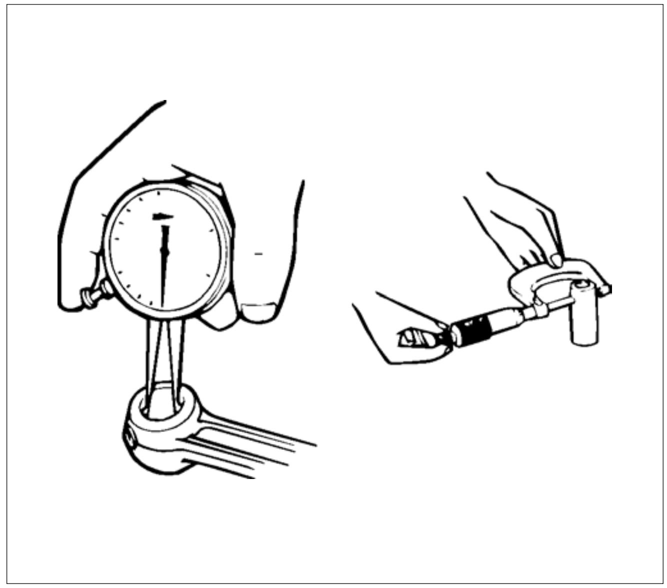
- Inspect to make sure that there is a resistance to the extent which the piston can push the piston pin lightly in normal temperatures.
- If it feels a large looseness or instability in normal temperatures, replace the piston or piston pin.



LNW21BSH009701

- Measure the bush of the small edge of the connecting rod. If the clearance of the bush inner diameter and the pin diameter exceeds the limit, replace the bush or connecting rod assembly, and the pin.

Piston pin and connecting rod small end bushing clearance mm (in)	
Standard	0.008 - 0.020 (0.0003 - 0.0008)
Limit	0.05 (0.0020)



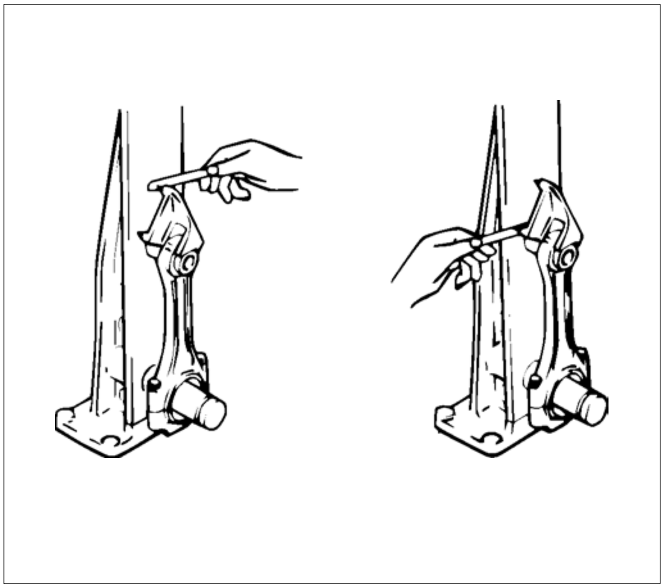
LNW21BSH009801

10. Measure the clearance between the piston and the piston pin.
    - Apply engine oil on the piston pin. Use your finger to push it in the piston hole and rotate it. If the pin smoothly rotates without instability, the clearance is normal. If there is instability, measure the clearance. If the clearance exceeds the limit, replace the piston and the piston pin.

Piston pin and piston pin hole clearance mm (in)	
Standard	0.004 - 0.017 (0.0002 - 0.0007)
Limit	0.04 (0.0016)

11. Measure the connecting rod alignment.
    - Use a connecting rod aligner to measure the torsion and parallel level of the big end hole and the small end hole. If the measured value exceeds the limit, replace it.

Connecting rod alignment (par length of 100 mm (3.94 in)) mm (in)		
	Standard	Limit
Distortion	0.08 (0.003) or less	0.20 (0.008)
Parallelism	0.05 (0.002) or less	1.50 (0.060)



LNW21BSH010401

12. Measure the bearing oil clearance.
    - Install the bearing to the connecting rod big end.
    - Tighten the bearing cap to the two step of angular tightening method.
    - Use an inside dial indicator to measure the connecting rod bearing inside diameter.

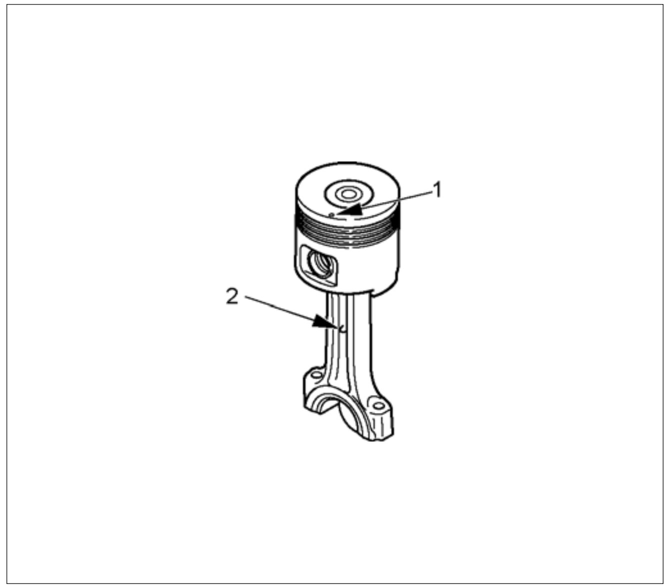
Connecting rod bearing cap bolt torque: N·m (kg·m / lb ft)	
1st step	29.4 (3.0 / 22)
2nd step	45 deg

If the clearance between the measured bearing inside diameter and the crankpin exceeds the specified limit, the bearing and/or the crankshaft must be replaced.

Crankpin and bearing clearance	mm (in)
Standard	0.029 - 0.083 (0.0011 - 0.0033)
Limit	0.10 (0.0039)

Reassembly

1. Install the piston.
2. Install the connecting rod.
    - Install it so that the front mark of the head of the piston, and the connecting rod forging mark (projecting) on the connecting rod, both face in the same direction.
    - Install the snap ring of one side.



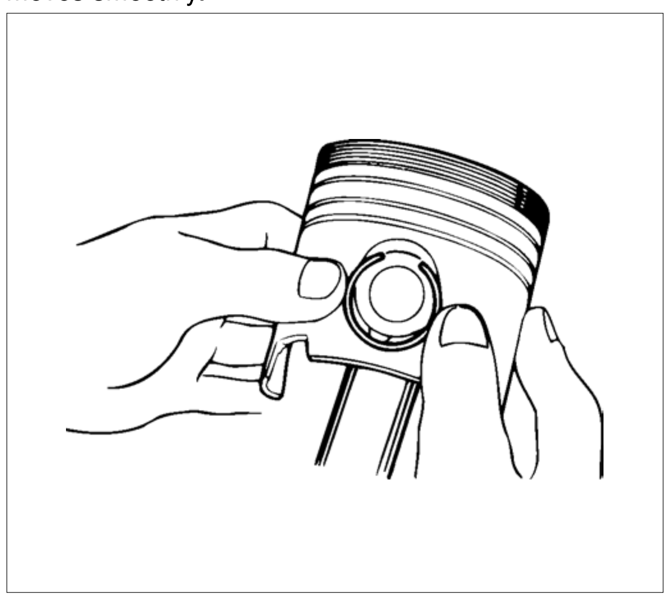
LNW46ASH004601

Legend

1. Front Mark
2. Forging Mark (Projecting)

4. Apply enough engine oil on the piston pin, push it in the piston and the connecting rod small edge.
5. Use snap ring pliers to install the snap ring.

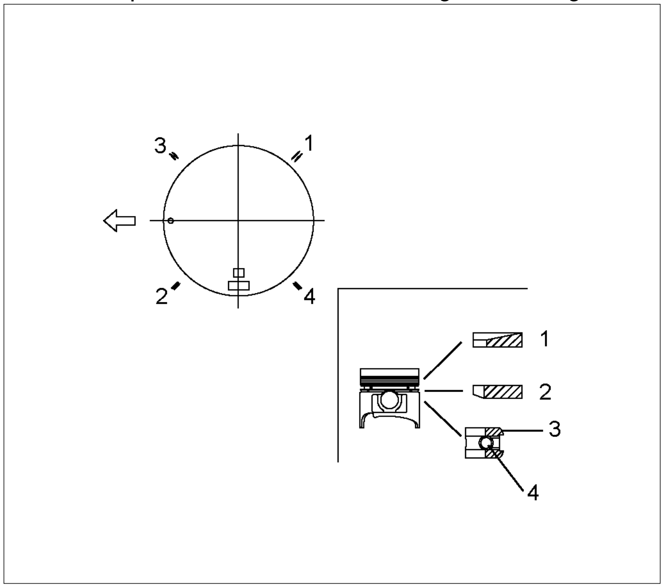
Note:
Make sure that the snap ring is installed in the ring groove properly. Make sure that the connecting rod moves smoothly.



015R100001

6. Use ring pliers to install the piston ring.
    - Install the piston rings in the order shown in the illustration.
    - Install 2nd and 1st compression rings in this order so that the marks “2N” and “N” face upward.

- Insert the expander coil into the oil ring groove so that there is no gap on either side of the expander coil before installing the oil ring.



RTW56ASH023201

Legend

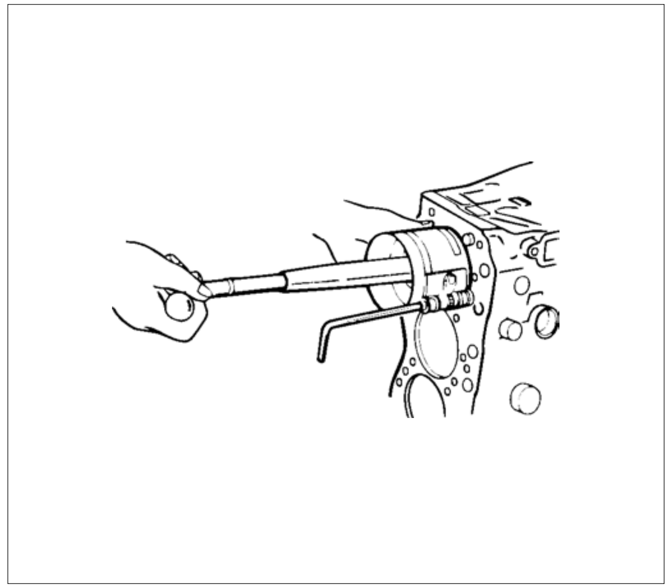
1. Compression Ring 1st
2. Compression Ring 2nd
3. Oil Ring
4. Expander

Installation

1. Install the connecting rod bearing.
   - Install the bearing on the connecting rod, and apply engine oil on the bearing.
2. Install the piston and connecting rod assembly.
   - Apply enough engine oil on the piston ring, ring groove and piston side surface.
   - With the piston front mark cut facing forward, use the piston ring compressor to insert the piston in the cylinder block.

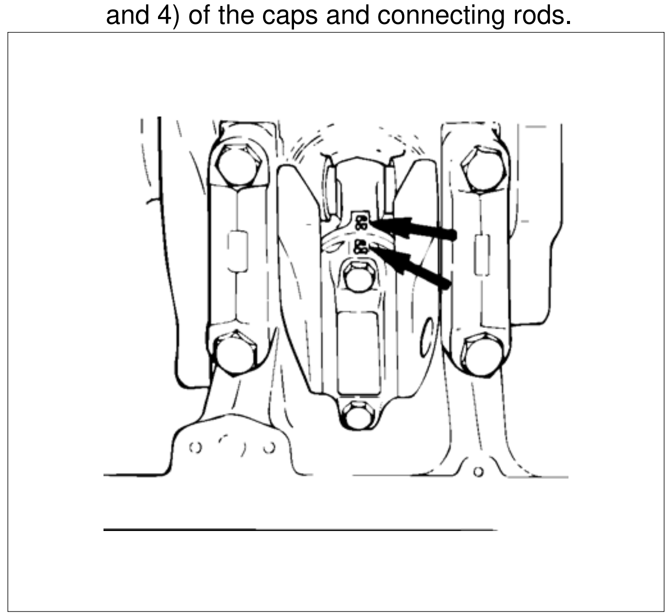
Note:

- Be sure not to make the connecting rod touch the oil jet when pushing in the piston.
- Be sure not to harm the inside of the cylinder block when pushing in the piston.
  Special tool
  Piston ring compressor: 5-8840-9018-0



015LX096

3. Install the connecting rod cap.
   - Install the bearing on the connecting rod cap and apply engine oil.
   - Install the cap, matching the numbers (1, 2, 3, and 4) of the caps and connecting rods.



015R100007

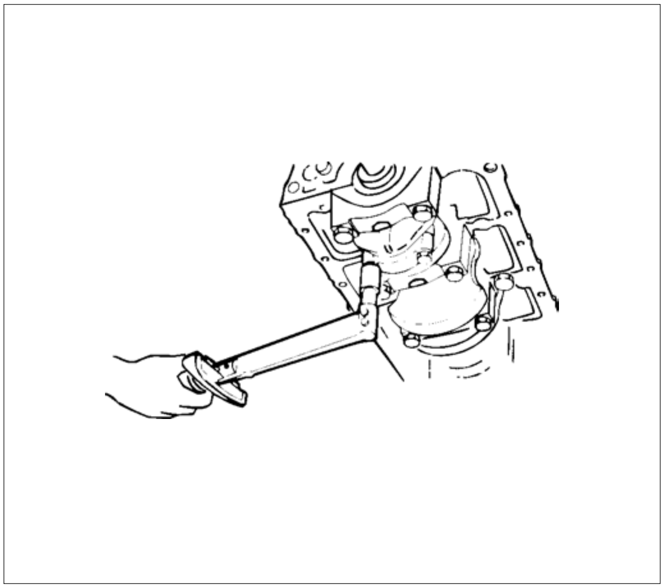
- Apply engine oil disulfide on the screw part and the setting face of the tightening bolt and tighten it with the designated torque.

Tightening torque:

1st step = 29 N·m (3.0 kg·m / 22 lb ft)
2nd step = 45° (degrees)

Special tool
Angle gauge: 5-8840-0266-0

Note:
Make sure that the crankshaft smoothly rotates.



015LX130

4. Install the oil pan.
   Refer to “Oil Pan”.
5. Install the gear case assembly.
   Refer to “Gear Case Assembly”.
6. Install the cylinder head.
   Refer to “Cylinder Head”.
7. Install the camshaft assembly.
   Refer to “Camshaft Assembly”.
8. Install the cylinder head cover.
   Refer to “Cylinder Head Cover”.

YES

- Disconnect the A/C switch.

NO

Open circuit between the engine room harness connector terminal No. 1 (C-55) and ground (C-109).

- Is there battery voltage between the chassis side harness connector terminal No. 6 (B-57) and ground?

YES

- Is the electronic thermostat OK?

NO

Open circuit between the No. EB-13 fuse and the chassis side harness connector No. 6 (B-57)

YES

- Defective ECM

NO

Replace electronic thermostat

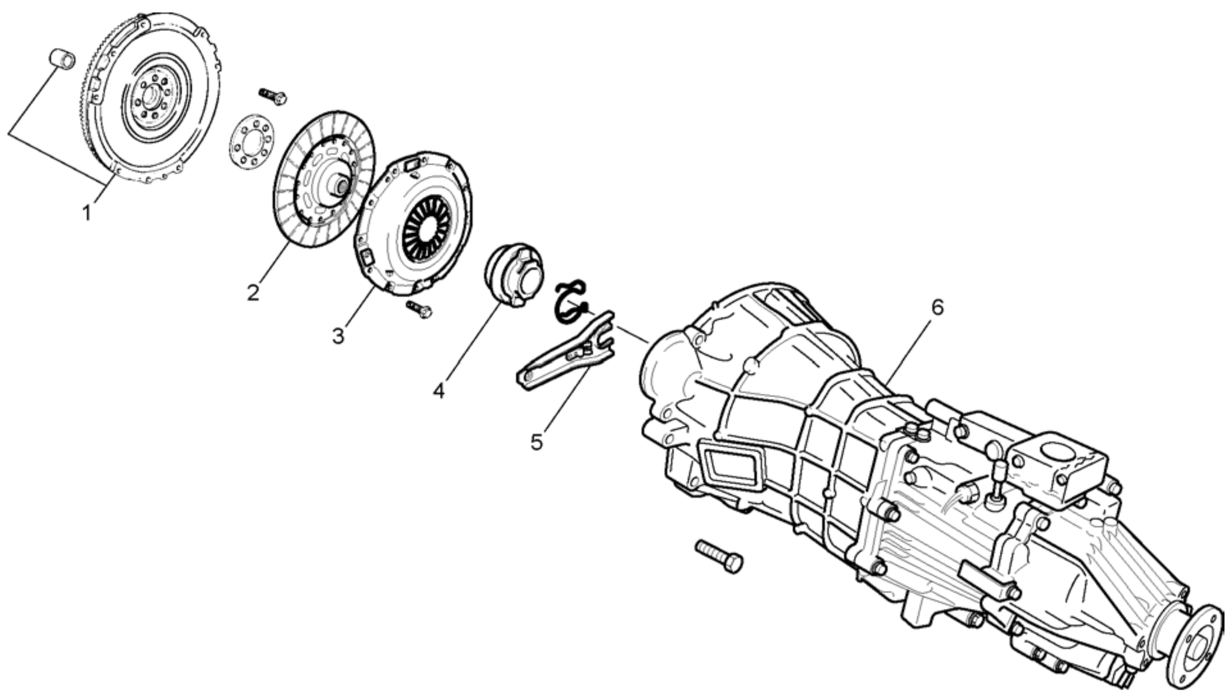
Flywheel

Components



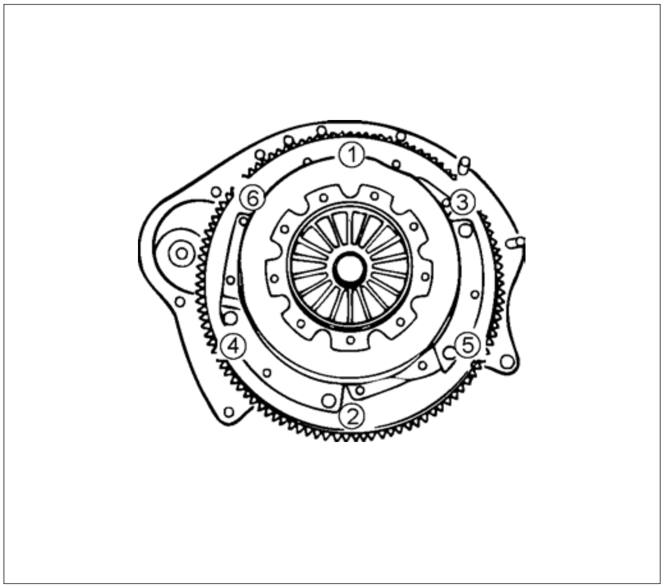
RTW56ALF001701

Legend

1. Flywheel Assembly and Pilot Bearing
2. Driven Plate
3. Pressure Plate Assembly
4. Release Bearing
5. Shift Fork
6. Transmission Assembly

Removal

1. Remove the transmission assembly.
   Refer to "transmission assembly removal and installation".
2. Remove the clutch pressure plate.
   - Remove the pressure plate installation bolts in the order shown in the drawing.
   - Remove the pressure plate from the flywheel.



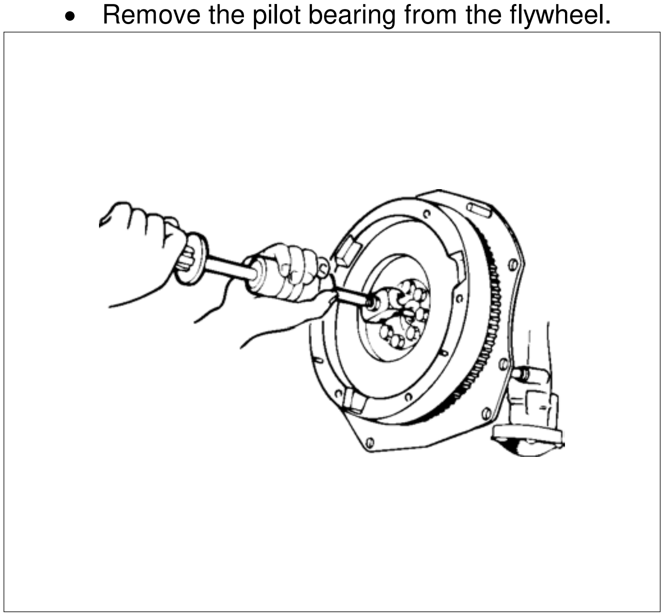
RTW56ASH014201

3. Remove the driven plate.
   - Remove the driven plate from the flywheel along with the clutch aligner.
   - Install the crankshaft stopper in the starter installation part of the rear plate.

Note:
Make sure that the stopper is applied with the ring gear and installed properly.

Special tool
Crankshaft stopper: 5-8840-0214-0

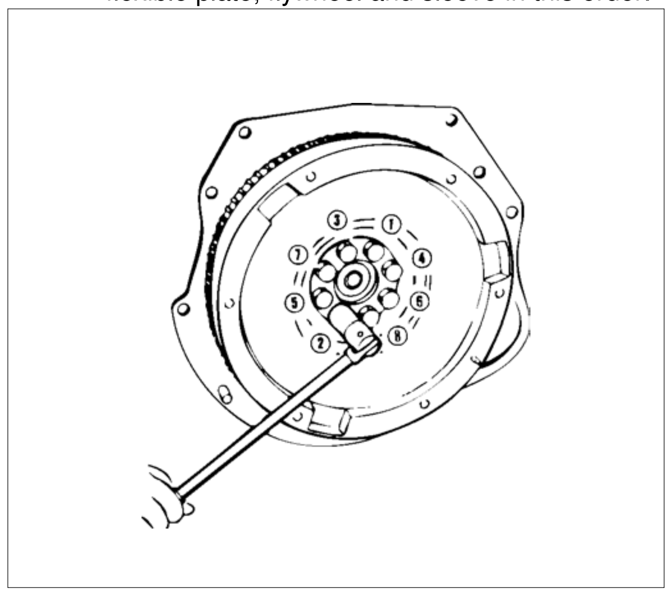
4. Remove the pilot bearing.
   - Remove the pilot bearing from the flywheel.



015RY00018

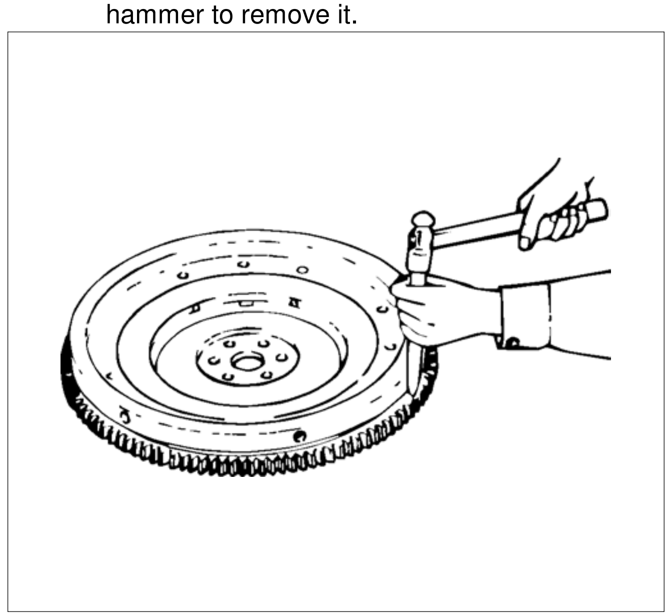
Special tool
Pilot Bearing Remover: 5-8840-2000-0
Sliding Hammer: 5-8840-0019-0

5. Remove the flywheel.
   - Gradually loosen the flywheel installation bolts in the order shown in the drawing so that the flywheel does not rotate.
   - After loosening the bolts, remove the stopper and remove the flywheel.
   - In the case of A/T car, after loosening the flywheel installation bolts, remove the washer, flexible plate, flywheel and sleeve in this order.



015RY00001

6. Remove the ring gear.
   - Put a bar on the ring gear and hit it with a hammer to remove it.



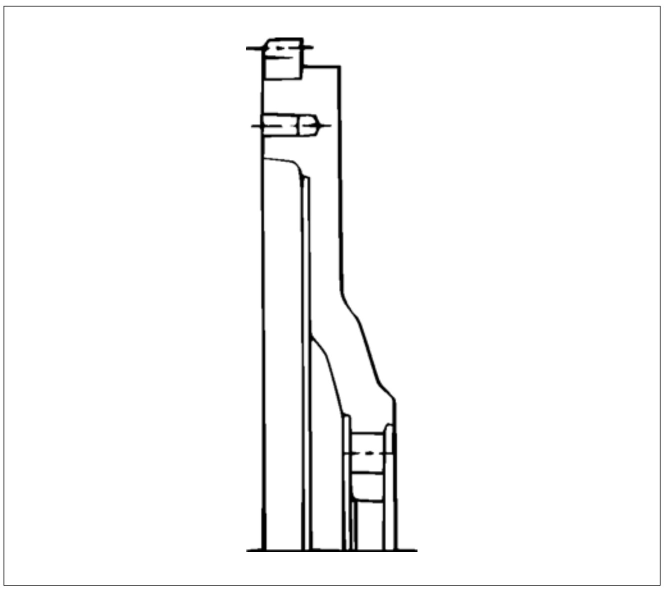
LNW21BSH012001

Inspection

1. Visual inspection
   - Inspect the flywheel friction surface for cracks and damages, and replace it if it has abnormality.
   - Inspect the tooth part of the ring gear, replace the ring gear if it has damage or serious wear.
2. Measurement of the friction surface
   - Measure the depth of the friction surface of the flywheel.
   - Adjust it if the measured value is within the standard value and the limit.
   - If the measured value exceeds the limit, replace the flywheel.

Depth of the friction surface of the flywheel	mm (in)
Standard	18 (0.7087)
Limit	19 (0.7480)

Depth = From the pressure installation surface to the friction surface.



LNW21BSH011901

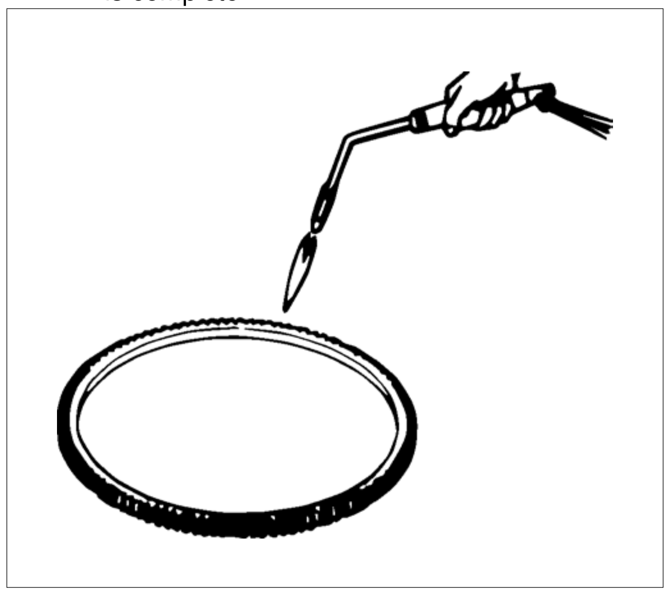
3. Flywheel installation bolts.
   - There is no damage in appearance.
   - Exchange for a new part if damage is extensive.

Installation

1. Install the ring gear.
   - Heat the ring gear evenly with a gas burner to invite thermal expansion. Do not allow the temperature of the gas burner to exceed 200°C (392°F).
   - Install the ring gear when it is sufficiently heated. The ring gear must be installed with the chamfer facing the clutch.

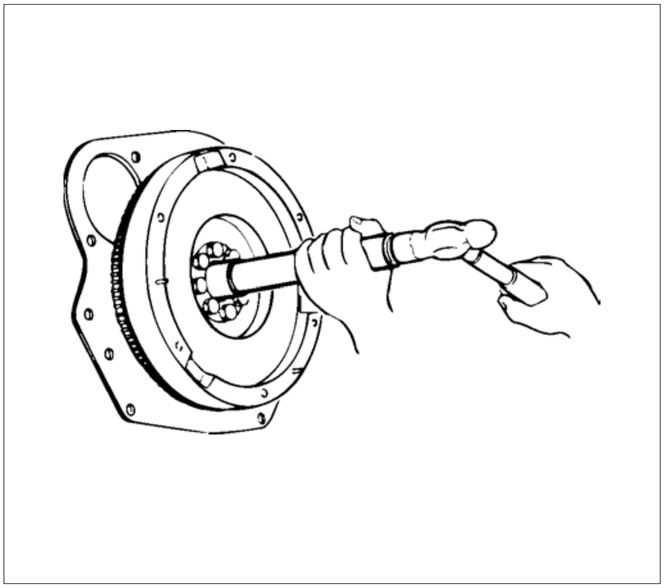
Note:

- Install the ring gear so that the side with a pattern faces forward.
- Shrink fit the ring gear to the flywheel.
  Make sure that flywheel and ring gear adhesion is complete.



LNW21BSH01201

2. Install the pilot bearing.
   - Place the crankshaft pilot bearing right angle across the crankshaft bearing installation hole.
   - Tap around the edges of the crankshaft pilot bearing outer races with a brass hammer to drive the bearing into the crankshaft bearing installation hole.
     Special tool
     Pilot Bearing Installer: 5-8522-0024-0



015RY00010

3. Install the flywheel.
   - Install the flywheel of the crankshaft, tighten them in the order shown in the illustration.
   - Apply molybdenum disulfide on the screw part and setting face of the bolt.
   - Install the crankshaft stopper on the starter installation part of the rear plate.

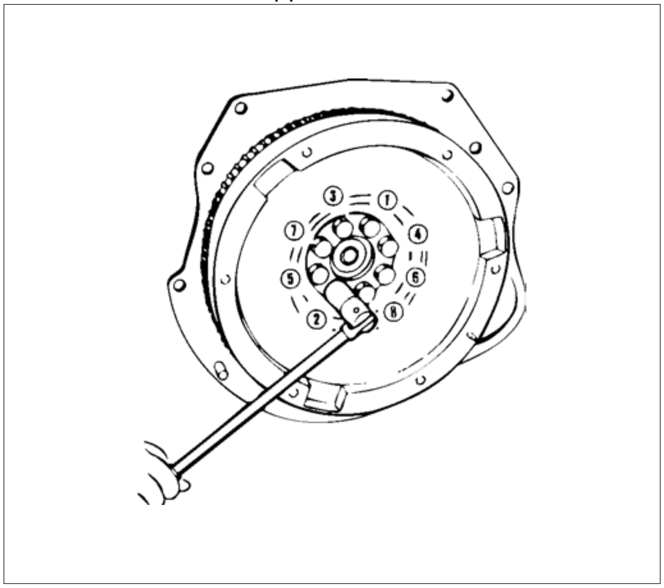
Tightening torque:

1st step = 59 N·m (6.0 kg·m / 43 lb ft)

2nd step = 60° - 90° (degrees)

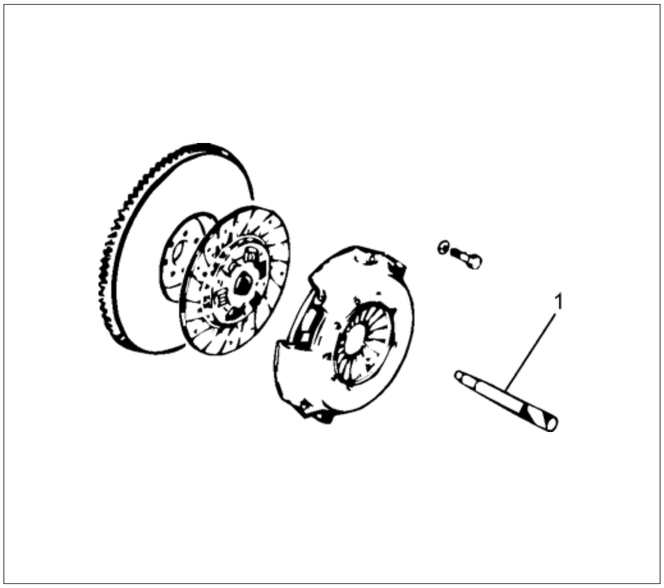
Special tool

Crankshaft stopper: 5-8840-0214-0



015RY00001

4. Install the driven plate.
   - Use a clutch aligner to install the driven plate on the flywheel.



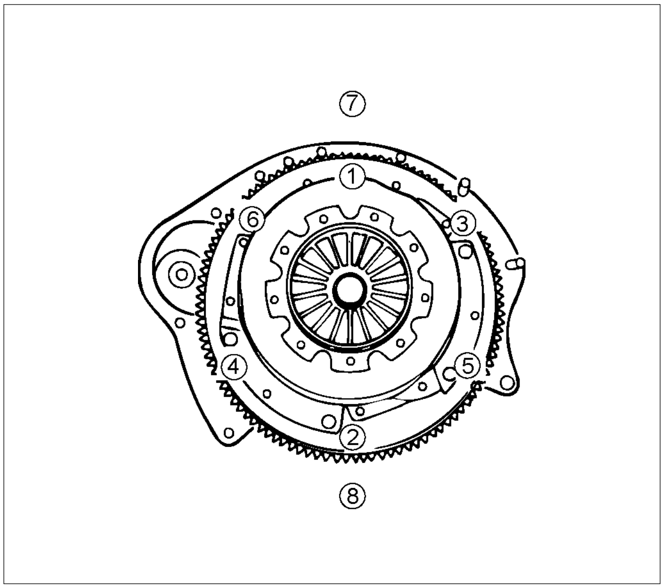
LNW21BSH002601

Legend

1. Clutch Aligner

5. Install the clutch pressure plate.
   - Install the pressure plate on the flywheel so that the installation hole of the pressure plate matches with the dowel pins of the flywheel.
   - Tighten the pressure plate in the order shown in the illustration.

Tightening torque: 18 N·m (1.8 kg·m / 13 lb ft)



RTW56ASH023301

6. Install the transmission assembly.
   Refer to removal procedure for “TRANSMISSION”.

Removal

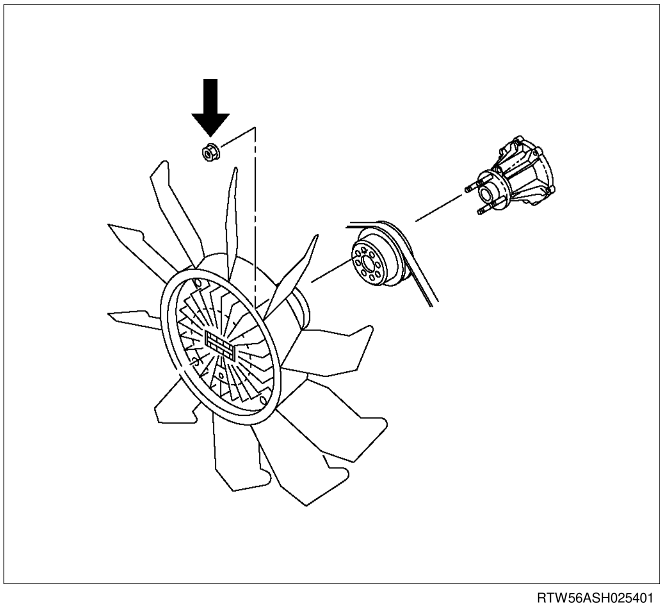
1. Remove the fan assembly.
   - Remove the fan assembly unscrewing four mounting nuts.

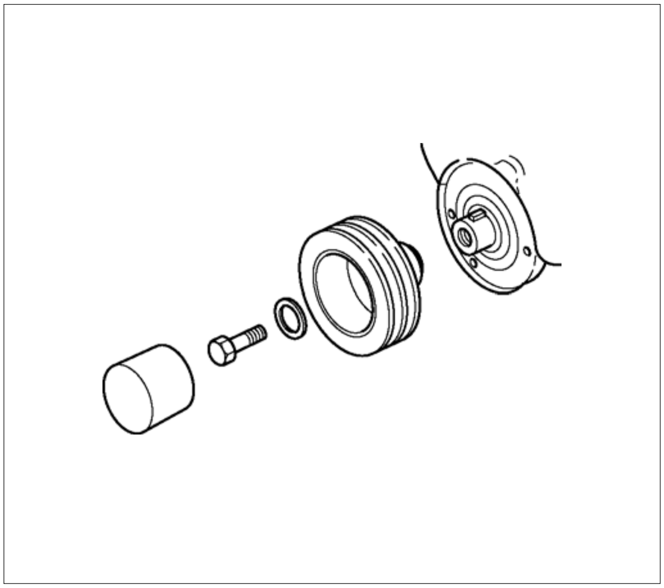


RTW56ASH025401

2. Remove the fan belt.

3. Remove the crankshaft pulley.

Note:
Do not reuse the bolt and the washer.

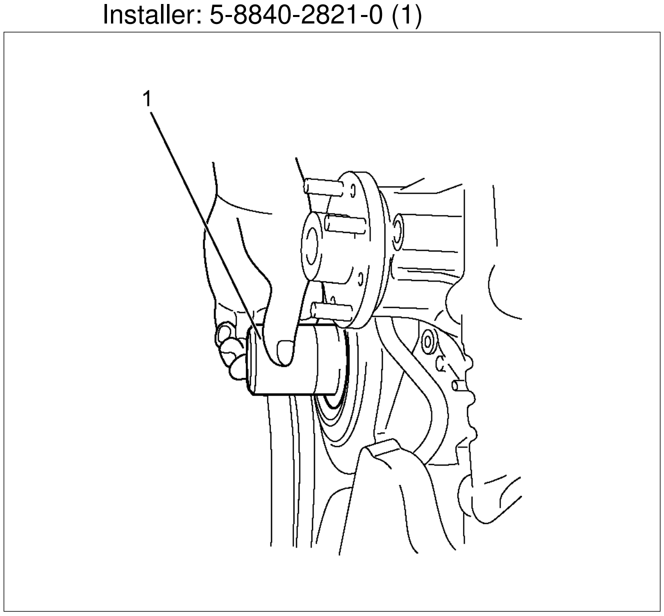


LNW61ASH005301

4. Remove the crankshaft front oil seal.
   - Remove only the oil seal with a screwdriver or the like, avoiding damage to the oil seal contact surface on the front cover and the shaft.

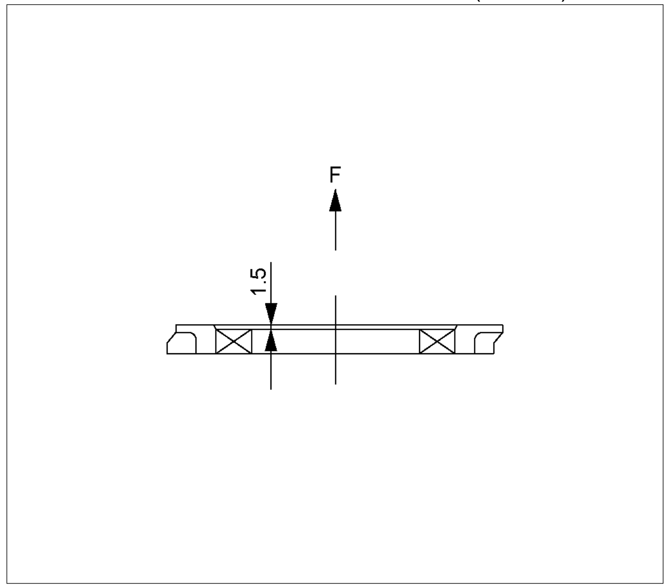
Installation

1. Install the crankshaft front oil seal.
   - Use the special tool to install the front oil seal.
     Front Oil Seal
     Installer: 5-8840-2821-0 (1)



RTW56ASH016501

- Apply engine oil to the lip of the oil seal.
- With the seal pressed in check the dimension of the oil seal section.
  Standard Dimension = 1.5 mm (0.06 in)

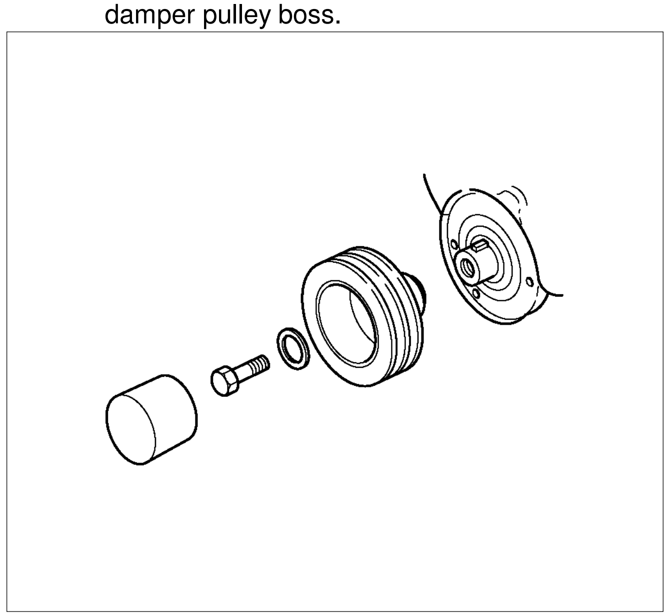


RTW56ASH016601

2. Install the crankshaft damper pulley.
   - Install the crankshaft pulley aligning with the key on the crankshaft.
   - Hold the flywheel ring gear stationary to prevent the crankshaft from turning when tightening the damper pulley bolt.

Tightening torque: 294 N·m (30 kg·m/217 lb ft)

   - Take care not to damage the crankshaft damper pulley boss.



014R100014

3. Install the fan belt.
   - Refer to “Engine Cooling”

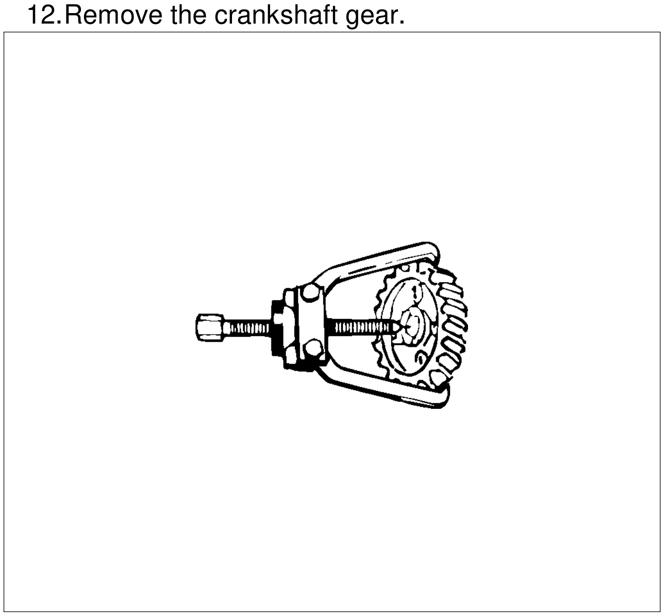
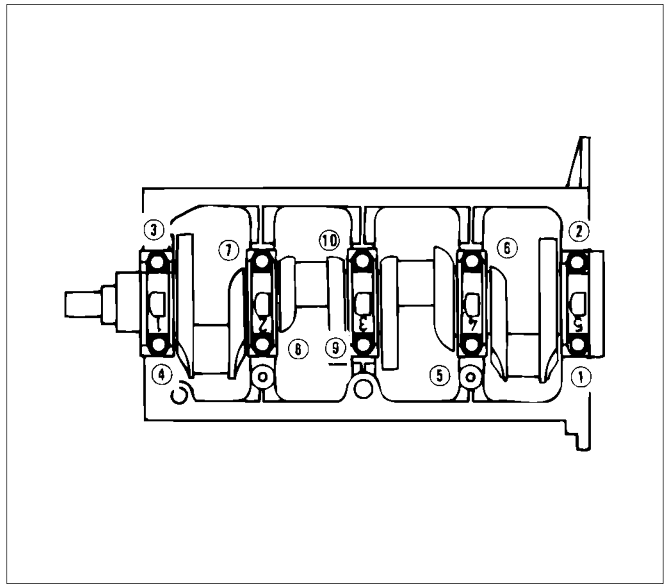
    Refer to "Oil Pump".
11. Remove the gear case assembly.
    Refer to “Gear Case Assembly”.
12. Remove the crankshaft gear.



901R100008

13. Remove the crank case.
    Refer to "Crank Case and Oil Pan".
14. Remove pistons and connecting rods.
    Refer to "Piston and Connecting Rod".
15. Remove the bearing cap.
    - Loosen the crankshaft bearing cap bolts in numerical order a little at a time.

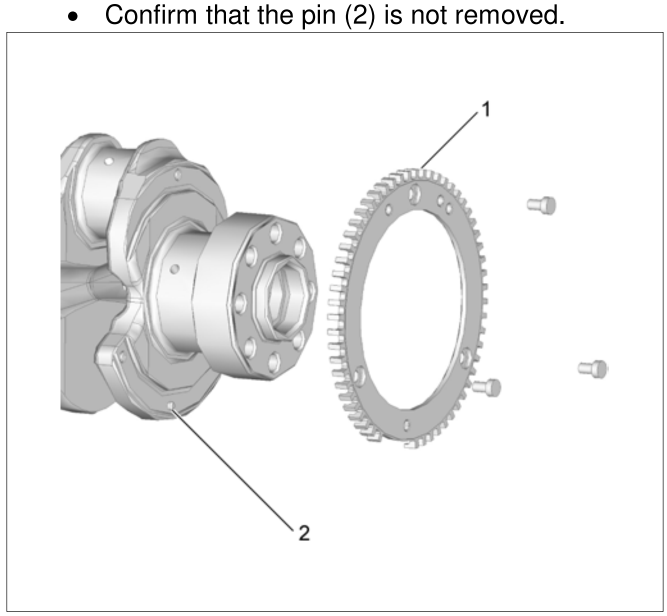


015RY00003

16. Remove the lower crankshaft bearings.
17. Remove the crankshaft assembly.
18. Remove the thrust bearing.
19. Remove the upper crankshaft bearings.

Disassembly

1. Remove the crank angle sensor rotor (1).
   - Confirm that the pin (2) is not removed.

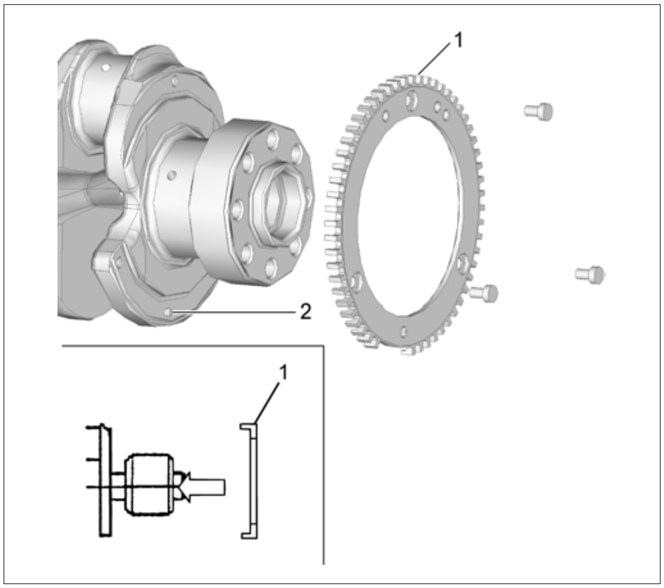


RTW76ASH001501

Reassembly

1. Install the crank angle sensor rotor.
   - Attach by making a rotor tooth's running out side into a front side.
   - Apply Loctite #262 or the equivalent to the bolt threads (if a new bolt is used, Loctite application is not required).

Tightening torque: 12 N·m (1.2 kg·m / 104 lb in)



RTW76ASH001601

Legend

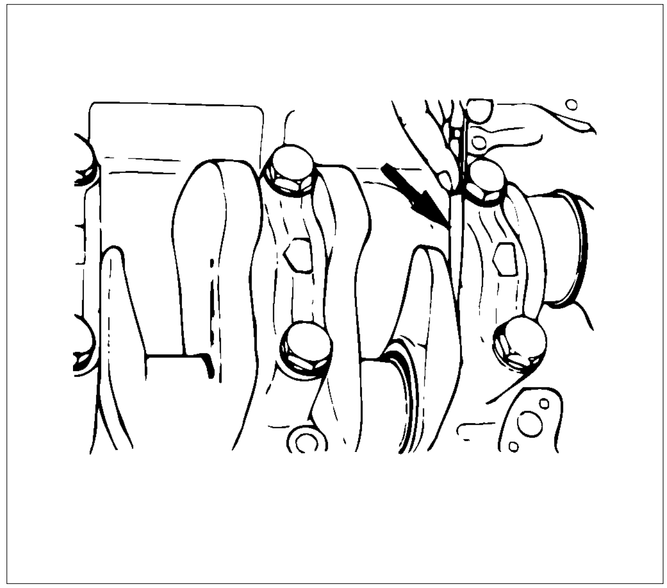
1. Crank Angle Sensor Rotor
2. Pin

Inspection

1. Thrust clearance
   - Measure the crankshaft end play at the center journal of the crankshaft.
   - Do this before removing the crankshaft bearing caps. If the measured value exceeds the specified limit, the crankshaft thrust bearing must be replaced.

Axial play of the crankshaft	mm (in)
Standard	0.10 (0.004)
Limit	0.30 (0.012)

Note:
Measure the thrust clearance before dismounting.



015RY00002

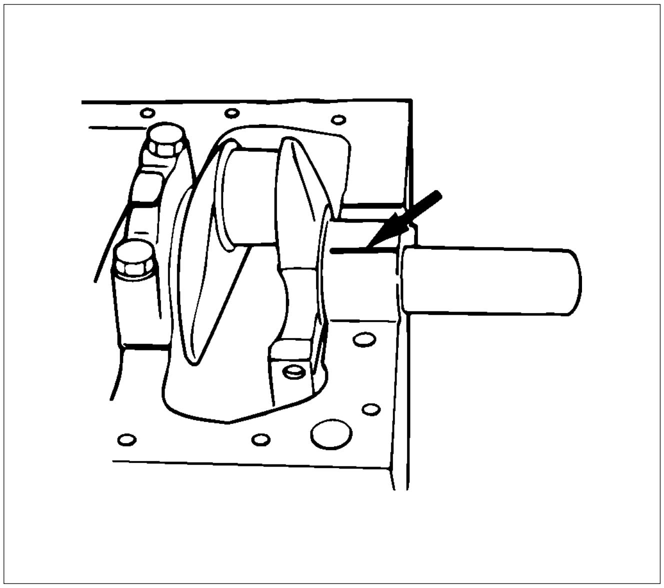
2. Main bearing clearance
   - Remove the crank case.
     Set out disassembled main bearings in the order of the numbers.
   - Remove the crankshaft. Remove the main bearings.
   - Clean the crankshaft journal and upper and lower bearings.
   - Check the bearings for damage or excessive wear.

     If you find damage or excessive wear, replace the bearings in pairs.

   - Place the upper bearings and the crankshaft on the cylinder block. Install the crankshaft so that it is horizontal.

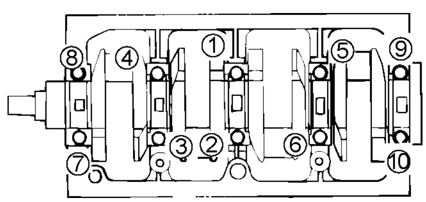
Note:
Turn the crankshaft about 30 degrees to allow the bearings to settle in.

   - Place plastigage on the crankshaft journal as shown.
   - Place the lower bearings at original positions on the bearing cap.



015RY00012

- Install the bearing cap and tighten bolts to the specified tightening torque.
- Tighten the bearing cap in the sequence shown using a torque wrench and an angle gauge.



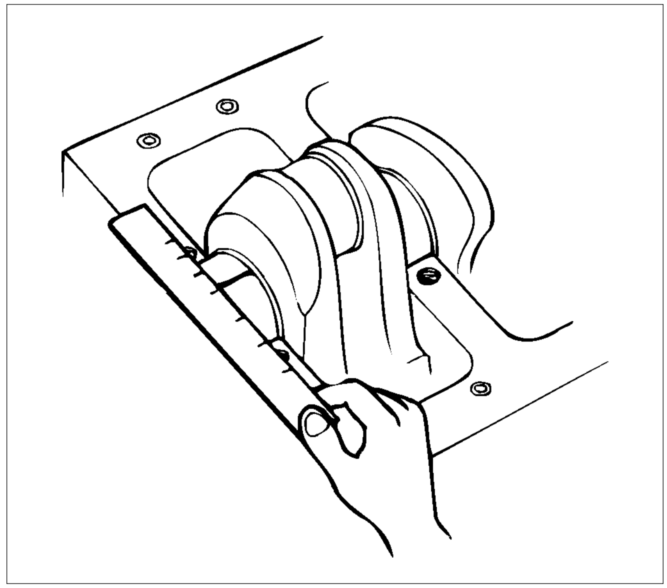
015LX129

Tightening torque: 166 N·m (16.9 kg·m / 122 lb ft)

Note:
Do not turn the crankshaft after you have tightened the bearing cap.

- Loosen the bolts and gently remove the bearing cap.
- Measure the widest part of the Plastigage flattened by tightening the bearing cap to determine the clearance.

Journal oil clearance	mm (in)
Standard	0.032 - 0.077 (0.0013 - 0.0030)
Limit	0.11 (0.0043)



LNW21BSH024401

- If the journal oil clearance exceeds the limit, replace the main bearings altogether or the crankshaft.
- Remove the Plastigage from the bearings and the crankshaft.

Inspection of the crankshaft

- Check the crankshaft journal and crank pin surfaces for wear and damage. Check the oil seal contact surface for excessive wear and damage.
- Check the oil port for clogging.

3. Crankshaft run-out
   Carefully set the crankshaft on the V block. Slowly turn the crankshaft to measure the run-out. If the crankshaft run-out exceeds the limit, replace the crankshaft.

Crankshaft run-out	mm (in)
Standard	0.05 or less (0.0020 or less)
Limit	0.08 (0.003)

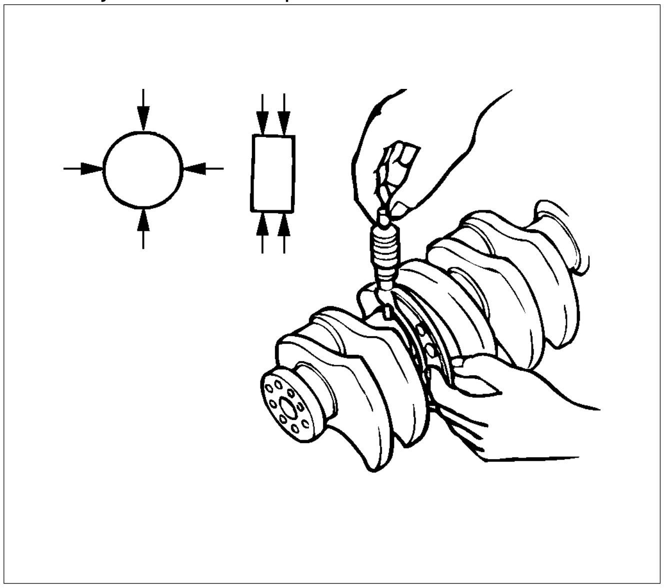
015LX061

4. Measure the journal and the crankpin diameters and uneven wear.
   - Measure outer diameters of the journal and the pin and calculate differences between the maximum and the minimum values. Take measurements at four positions for both the journal and the pin.



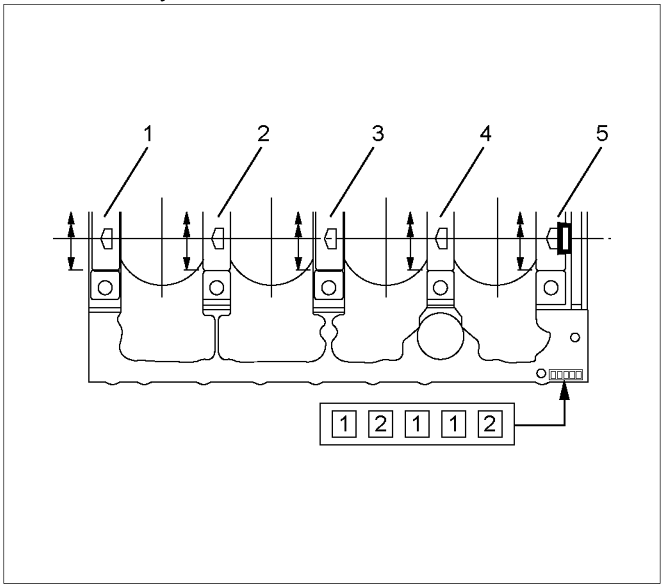
LNW21BSH024601

Crankshaft outside diameter		mm (in)
	Standard	Limit
Journal	69.917 – 69.932 (2.7526 – 2.7532)	69.91 (2.7524)
Pin	52.915 – 52.930 (2.0833 – 2.0839)	52.9 (2.083)

Note:
Tufftriding (soft nitriding treatment) is applied to enhance strength of the crankshaft. Therefore, you should not polish the surface of the crankshaft.

Crankshaft bearing selection

- Crankshaft bearing selection is based on the measured diameters of the crankshaft journals and the bearing inserts.
- Match the crankshaft bearing housing grade marks and the crankshaft journal grade marks in the table below to determine the correct crankshaft bearing size.
- Crankshaft bearing housing grade marks 1, 2 or 3 are stamped on the rear right hand side of the cylinder block.



RTW56ASH017101

Legend

1. No.1
2. No.2
3. No.3
4. No.4
5. No.5

- The crankshaft journal grade marks (1 or -, 2 or --, 3 or ---) are stamped on each crankshaft journal web.
  The crankshaft journal and bearing clearance must be the same for each position after installation of the crankshaft and the crankshaft bearings.

Bearing Selection Table

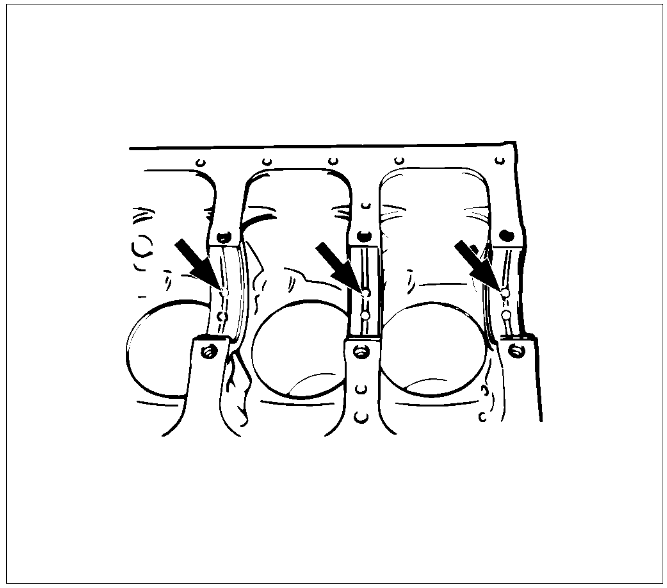
mm (in)

Crankshaft Bearing Housing		Crankshaft Journal		Crankshaft Bearing Size Code
Grade Mark	Diameater	Grade Mark	Diameater	
1	73.992-74.000 (2.9131-2.9134)	1 or -	69.927-69.932 (2.7530-2.7532)	4
		2 or - -	69.922-69.927 (2.7528-2.7530)	
		3 or - - -	69.917-69.922 (2.7526-2.7528)	5
2	73.983-73.991 (2.9127-2.9130)	1 or -	69.927-69.932 (2.7530-2.7532)	2
		2 or - -	69.922-69.927 (2.7528-2.7530)	3
		3 or - - -	69.917-69.922 (2.7526-2.7528)	4
3	73.975-73.982 (2.9124-2.9127)	1 or -	69.927-69.932 (2.7530-2.7532)	1
		2 or - -	69.922-69.927 (2.7528-2.7530)	2
		3 or - - -	69.917-69.922 (2.7526-2.7528)	

Installation

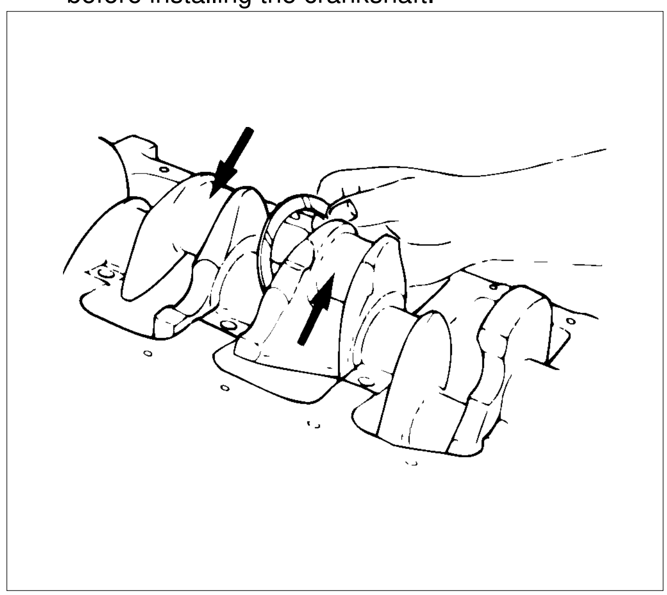
1. Install the crankshaft upper bearing.
   - The crankshaft upper bearings have an oil hole and an oil groove. The lower bearings do not.
   - Carefully wipe any foreign material from the upper bearing.
   - Locate the position mark applied at disassembly if the removed upper bearings are to be reused.

Note:
Do not apply engine oil to the bearing back faces and the cylinder block bearing fitting surfaces.



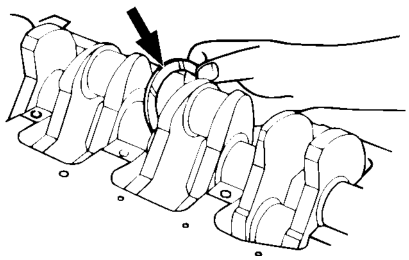
015LX125

2. Install the crankshaft assembly.
   Apply an ample coat of engine oil to the crankshaft journals and the crankshaft bearing surfaces before installing the crankshaft.



015R100004

3. Install the thrust bearing.
   - Apply an ample coat of engine oil to the thrust bearings before installation. Install the thrust bearings to the crankshaft center journal.
   - The thrust bearing oil grooves must be facing the sliding faces.

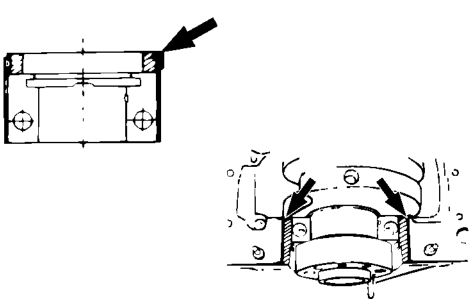


015LX115

4. Install the lower crankshaft bearing.
   - Before the crankshaft bearing installation, select the appropriate bearings in accordance with the description in CRANK BEARING SELECTION of INSPECTION AND REPAIR.
   - Apply the recommended liquid gasket or its equivalent to the No. 5 crankshaft bearing cap cylinder body fitting surfaces at the points shown in the illustration.

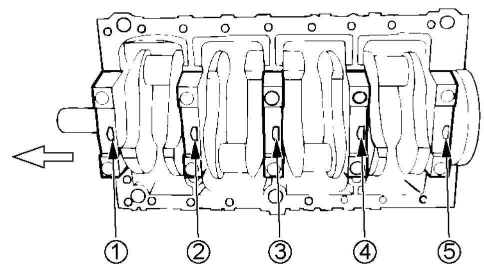
Note:
Be sure that the bearing cap fitting surface is completely free of oil before applying the liquid gasket. ThreeBond 1207B Do not allow the liquid gasket to obstruct the cylinder thread holes and bearings.

ThreeBond 1207B is a fast-drying liquid gasket. Tighten the bearing caps immediately after applying the gasket.



015LX127

5. Install the bearing cap.
   - Install the bearing caps with the bearing cap head arrow mark facing the front of the engine. The bearing cap numbers must be facing up.



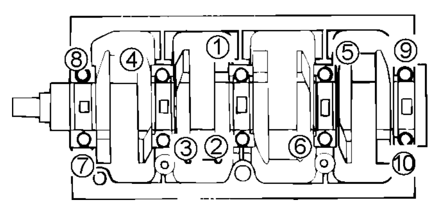
015LX128

   - Tighten the crankshaft bearing cap bolts to the specified torque a little at time in the sequence shown in the illustration.

Crankshaft Bearing Cap Torque	N·m (kg·m / lb ft)
166 (16.9 / 122)	

Check to see the crankshaft turns smoothly by rotating it manually.

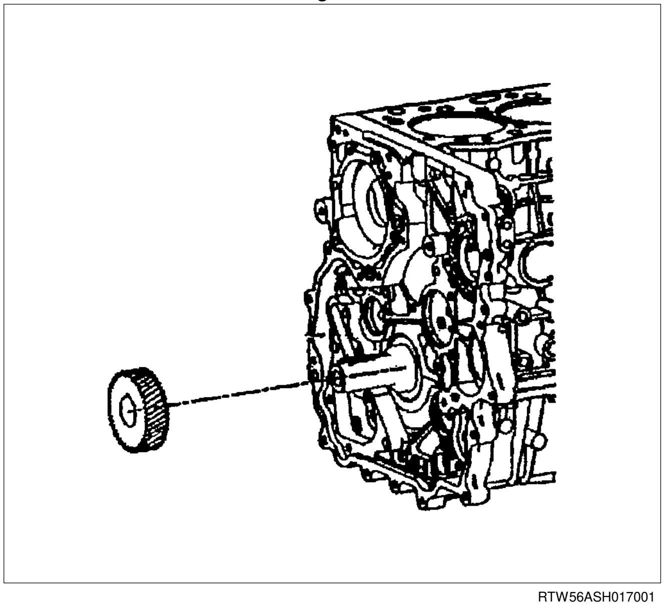
Note:
Confirm that the crankshaft turns smoothly.



015LX129

6. Install pistons and connecting rods.
   Refer to "Piston and Connecting Rod".

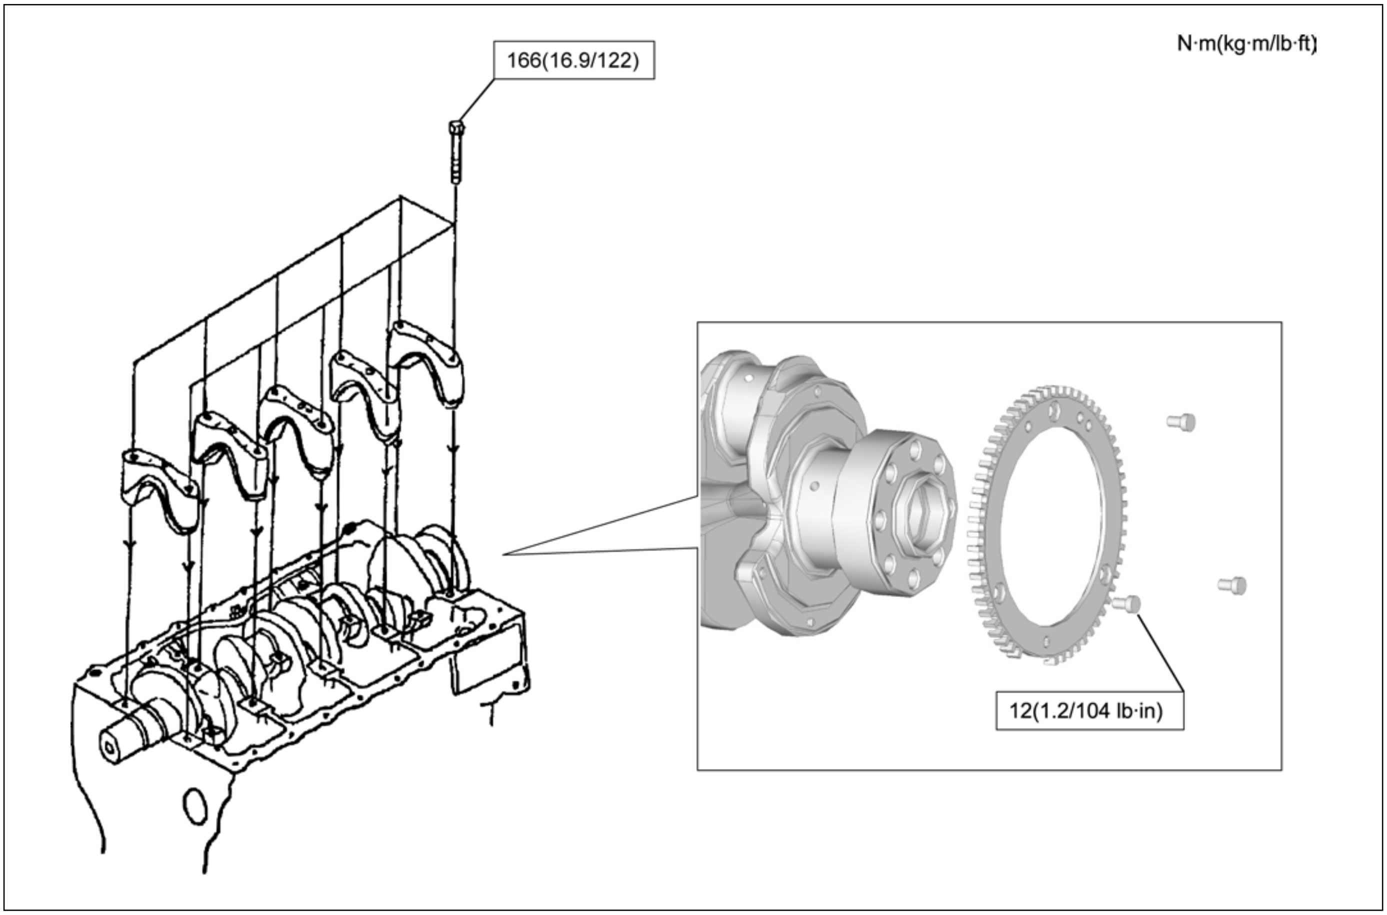
7. Install the crank case.
   Refer to "Crank Case and Oil Pan".
8. Install the crankshaft gear.



RTW56ASH017001

9. Install the gear case assembly.
   Refer to "Gear Case Assembly".
10. Install the oil pump.
    Refer to "Oil Pump".
11. Install the timing gear train.
    Refer to "Timing Gear Train".
12. Install the water pump.
    Refer to "Water Pump" in Cooling System Section.
13. Install the front cover.
    Refer to "Timing Gear Train".
14. Install the crankshaft rear oil seal.
    Refer to "Crankshaft Rear Oil Seal".
15. Install the fuel supply pump and fuel rail.
    Refer to "Fuel Supply Pump" and "Fuel Rail".
16. Install the cylinder head.
    Refer to "Cylinder Head".
17. Install the camshaft assembly.
    Refer to "Camshaft Assembly".
18. Install the cylinder head cover.
    Refer to "Cylinder Head Cover".
19. Mount the engine assembly on the chassis.
    Refer to "Engine Assembly".

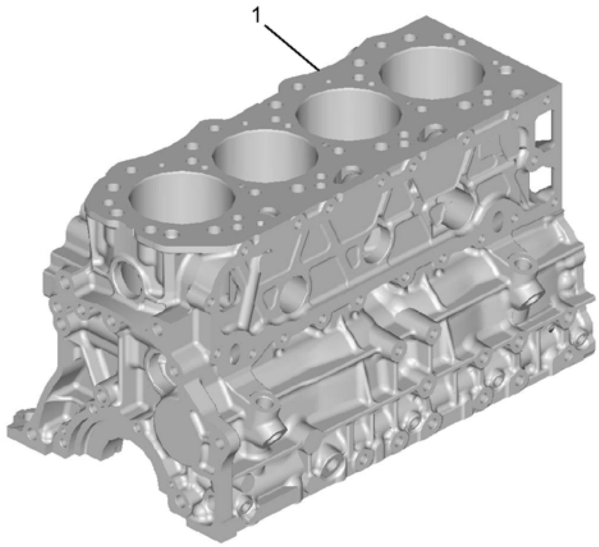
Torque Specifications



RTW76AMF000301

Cylinder Block

Components



RTW76ASF000101

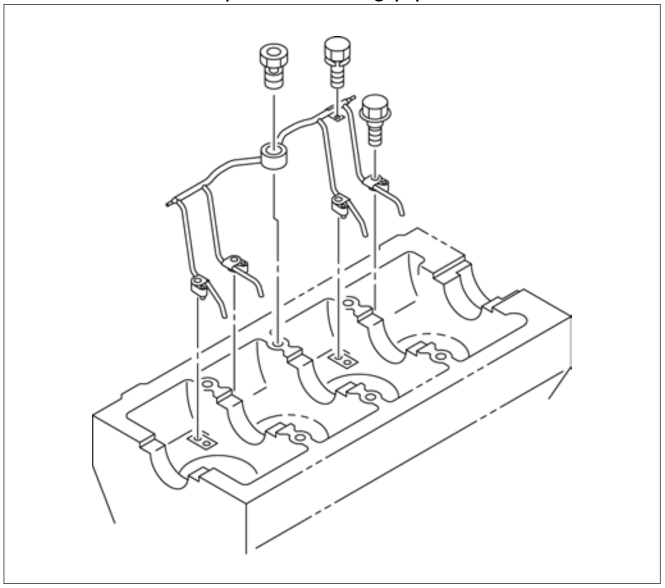
Legend

1. Cylinder Block

Removal

1. Demount the engine assembly.
   Refer to "Engine Assembly".
2. Remove the cylinder head cover.
   Refer to "Cylinder Head Cover".
3. Remove the camshaft assembly.
   Refer to "Camshaft Assembly".
4. Remove the cylinder head.
   Refer to "Cylinder Head".
5. Remove the fuel supply pump and fuel rail assembly.
   Refer to "Fuel Supply Pump" and "Fuel Rail Assembly" in FUEL SYSTEM Section.
6. Remove the oil filter assembly and oil cooler.
   Refer to “Oil Filter Assembly and Oil Cooler”.
7. Remove the crankshaft front oil seal.
   Refer to "Crankshaft Front Oil Seal".
8. Remove the crankshaft rear oil seal.
   Refer to "Crankshaft Rear Oil Seal".
9. Remove the oil pan.
   Refer to "Oil Pan".
10. Remove the water pump.
    Refer to "Water Pump" in Cooling System Section.
11. Remove the front cover.
    Refer to "Front Cover".
12. Remove the timing gear train.
    Refer to "Timing Gear Train".
13. Remove the oil pump.
    Refer to "Oil Pump".
14. Remove pistons and connecting rods.
    Refer to "Piston and Connecting Rod".
15. Remove the crankshaft.
    Refer to "Crankshaft".

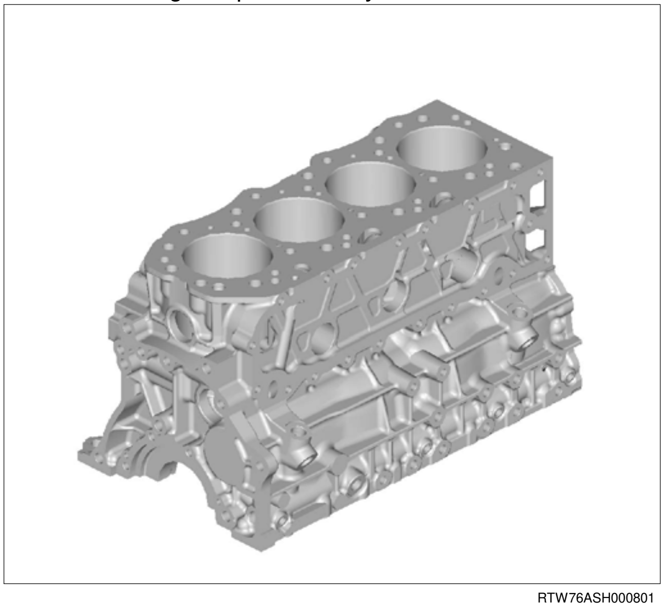
16. Remove the piston cooling pipe.



RTW76ASH001101

Inspection

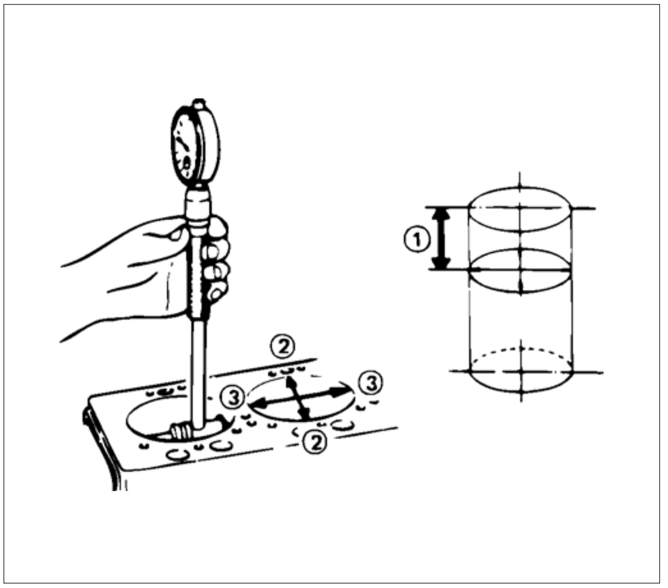
1. Carefully remove water stains or other foreign matters on the surface of the cylinder block.
   - Be careful not to damage the cylinder block.
2. Carefully remove the liquid gasket on the crankcase mounting surface.
3. Clean up the cylinder block.
4. Visually inspect the cylinder block.
   - Conduct color check and hydraulic (or pneumatic) test and if you find a crack or other damage, replace the cylinder block.



RTW76ASH000801

5. Cylinder block wear measurement.
   - Use a cylinder indicator to measure the cylinder bore at measuring point (1) in the thrust (2-2) and axial (3-3) directions of the crankshaft.
   - Measuring Point (1): 20 mm (0.79 in)

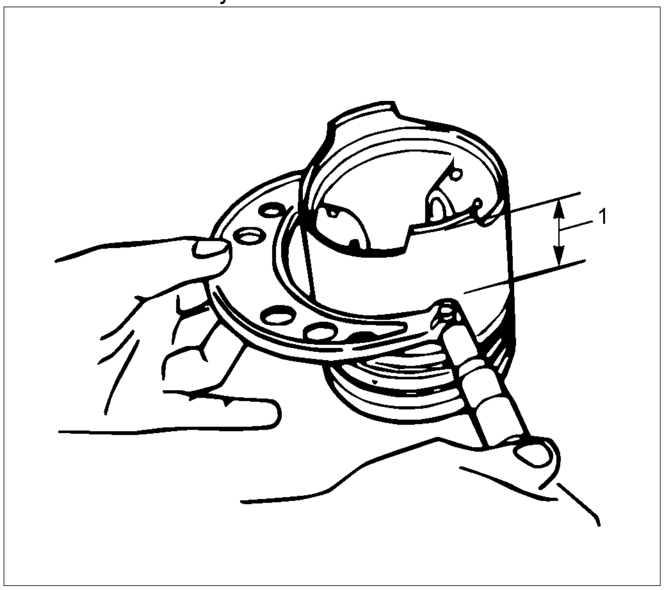
     If the measured value exceeds the specified limit, the cylinder block must be replaced or rebored.



012RY00010

Cylinder block bore diameter	mm (in)
Standard	95.421 – 95.450 (3.7567 – 3.7579)
Limit	95.48 (3.7590)

6. Cylinder Reboring.
   - Select oversize pistons to fit the largest cylinder bore (previously measured).
   - At a point 11 mm (0.43 in) above the lower edge of the piston skirt, measure the piston diameter at a right angle to the piston pin. Calculate the additional cylinder boring required for each cylinder.



RTW56ASH023101

Legend

1. 11mm (0.43in)

- Formula

Boring inside diameter = D + C - H ± E

D = Piston outside diameter

(Measured Oversize Piston)

C = Piston and cylinder bore clearance

0.082 - 0.100 mm (0.0032 - 0.0039 in)

H = Honing allowance

0.03 mm (0.0012 in) or less

E = Boring machine error

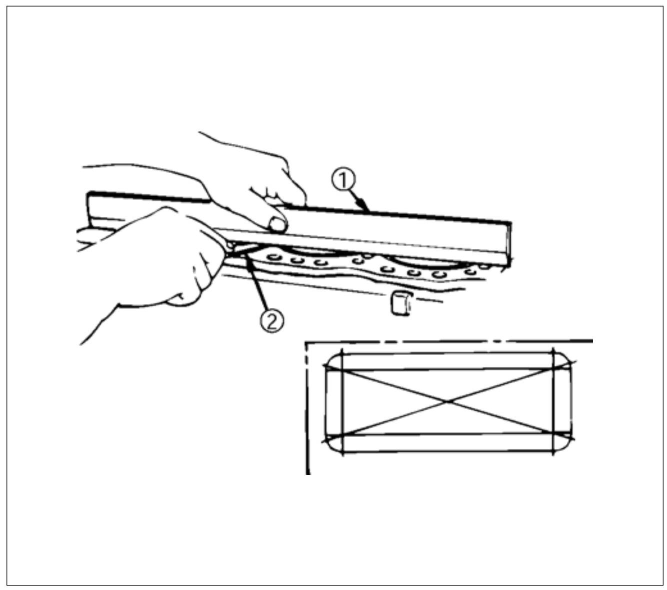
Piston size		mm (in)
Standard		95.330 - 95.359 (3.7531 - 3.7543)
Oversize	(0.25)	95.580 - 95.609 (3.7629 - 3.7641)
	(0.50)	95.830 - 95.859 (3.7728 - 3.7739)
	(0.75)	96.080 - 96.109 (3.7826 - 3.7838)

- Bore and hone the individual cylinders as required.
- Once again, measure the individual cylinder bores.

Each cylinder bore remainder mm (in)
0.02 (0.0008) or less.

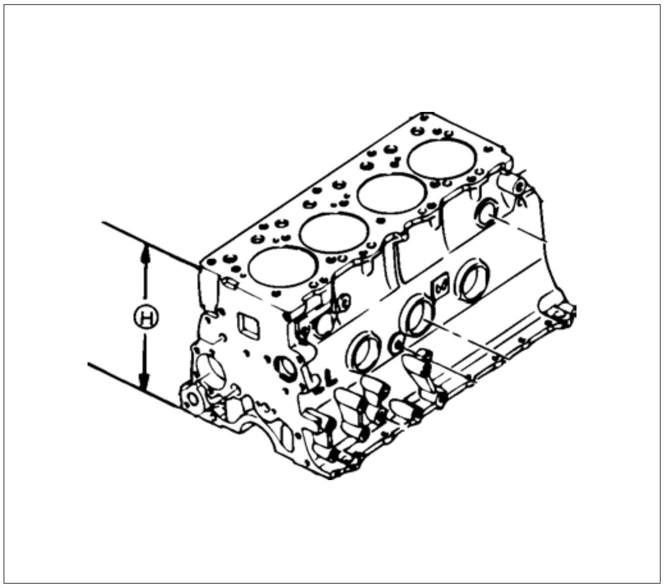
7. Cylinder block upper face warpage.
   - Use a straight edge (1) and a thickness gauge (2) to measure the four sides and the two diagonals of the cylinder block upper face.
   - If the measured values exceeds the limit, the cylinder block must be replaced.

Cylinder block upper face warpage	mm (in)
Standard	0.05 or less (0.002 or less)
Limit	0.20 (0.0080)



012R100001

Cylinder block height (H) (Reference)	mm (in)
Standard	259.945 – 260.055 (10.2340 – 10.2384)



012R100009

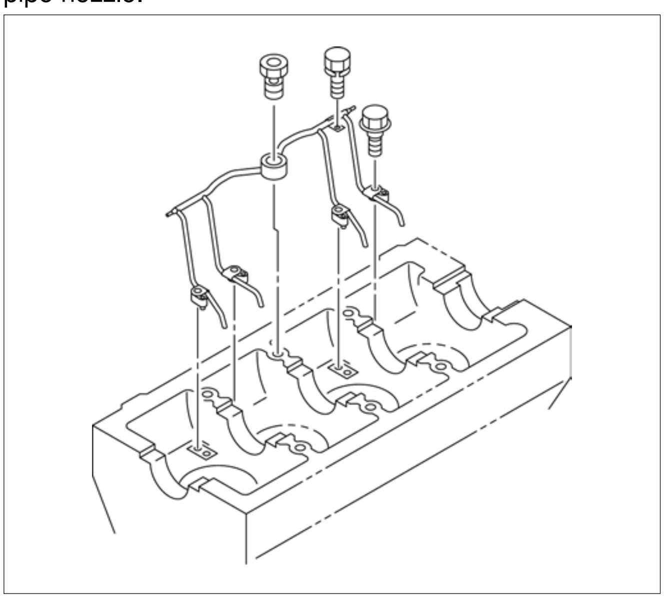
Installation

1. Install the piston cooling pipe.
   - Align the dowel pin of the piston cooling pipe with the pin hole on the cylinder block and tighten with the relief valve.

Tightening torque:

Relief valve 30 N·m (3.1 kg·m / 22 lb ft)
bolts M8 25 N·m (2.5 kg·m / 18 lb ft)
bolts M6 8 N·m (0.8 kg·m / 69 lb in)

Note:
Be careful not to deform or damage the piston cooling pipe nozzle.



RTW76ASH001101

2. Install the crankshaft.
   Refer to "Crankshaft".
3. Install pistons and connecting rods.
   Refer to "Piston and Connecting Rod".
4. Install the oil pump.
   Refer to "Oil Pump".
5. Install the timing gear train.
   Refer to "Timing Gear Train".
6. Install the front cover.
   Refer to "Front Cover".
7. Install the water pump.
   Refer to "Water Pump" in Cooling System Section.
8. Install the oil pan.
   Refer to "Oil Pan".
9. Install the crankshaft rear oil seal.
   Refer to "Crankshaft Rear Oil Seal".
10. Install the crankshaft front oil seal.
    Refer to "Crankshaft Front Oil Seal".
11. Install the oil filter assembly and oil cooler.
    Refer to "Oil Filter Assembly and Oil Cooler".
12. Install the fuel supply pump and fuel rail assembly.
    Refer to "Fuel Supply Pump" and "Fuel Rail Assembly " in Fuel System Section.
13. Install the cylinder head.
    Refer to "Cylinder Head".
14. Install the camshaft assembly.
    Refer to "Camshaft Assembly".
15. Install the cylinder head cover.
    Refer to "Cylinder Head Cover".
16. Mount the engine assembly on the chassis.
    Refer to "Engine Assembly".

YES

- Is there battery voltage between the engine room harness connector terminal No.1 (X-14) and ground?

NO

Open circuit between the engine harness connector terminal No.1 (E-2) and the engine room harness connector terminal No.2 (X-14).

YES

- Disconnect the A/C thermo relay.

- Is there battery voltage the engine room harness connector terminal No.3 (X-14) and ground?

NO

Open circuit between the No. EB-13 fuse and the engine room harness connector terminal No.1 (X-14).

YES

- Disconnect the ECM harness connector.

- Is there continuity between the ECM harness connector terminal C24SE No. 14 (C-56) and the engine room harness connector terminal No.4 (X-14)?

NO

Open circuit between the No. EB-13 fuse and the engine room harness connector terminal No. 3 (X-14).

YES

- Is there continuity between the ECM harness connector terminal C24SE No. 26 (C-56) and the engine room harness connector terminal No. 1 (X-15)?

NO

Open circuit between the ECM harness connector terminal C24SE No.14 (C-56) and the engine room harness connector terminal No. 4 (X-14).

YES

- Is there battery voltage between the engine room harness connector terminal No. 2 (X-15) and ground?

NO

Open circuit between the ECM harness connector terminal C24SE No. 26 (C-56) and the engine room harness connector terminal No. 1 (X-15).

YES

- Disconnect the pressure switch?

- Is there continuity between the engine room harness connector terminal No. 3 (X-15) and the engine room harness connector terminal No. 1 (C-24).

NO

Open circuit between the No. EB-13 fuse and engine room harness connector terminal No. 2 (X-15).

Lubrication System

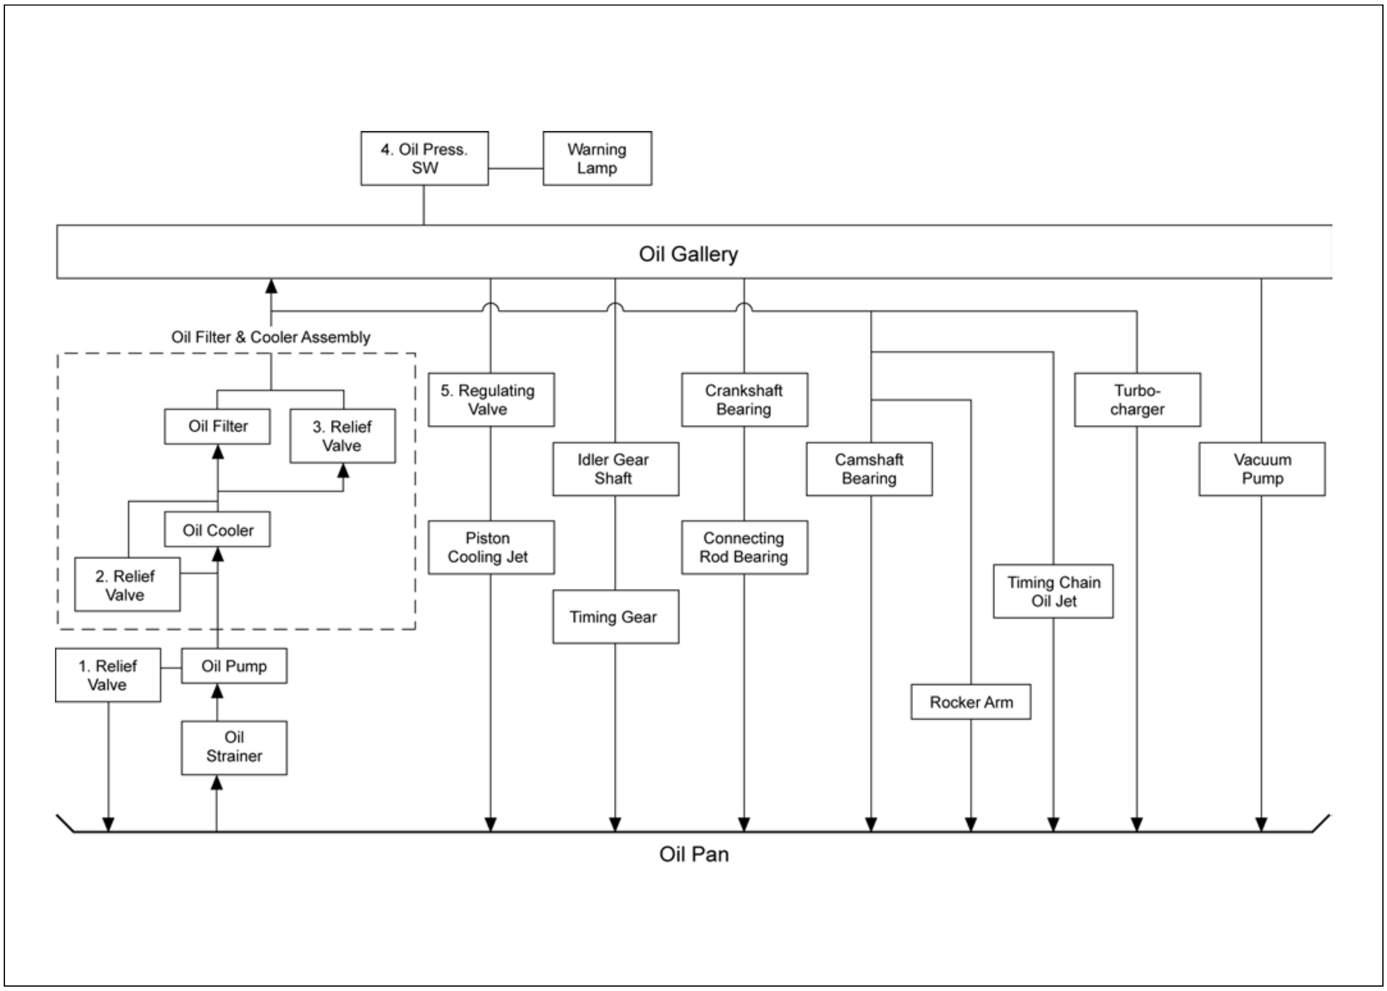
Service Precautions

- During each disassembly, remove the old gasket adhering to each part and mating part completely using a scraper at the location, where the fluid gasket is to be used, clean the traces of oil, moisture, and dirt completely using waste cotton and apply the specified new fluid gasket at each location.
- Avoid excessive or insufficient coating volume. Note that seizure may occur in case of excessive coating due to clogging of the oil gallery and oil jet, and oil and water leakage may occur if the coating is insufficient.
- Always, the start and end of the application should be overlapped.

Explanations on functions and operation

The lubrication system uses the filter element combined with a full flow bypass, water-cooled oil cooler, and oil jet for piston cooling.

Lubricating system diagram



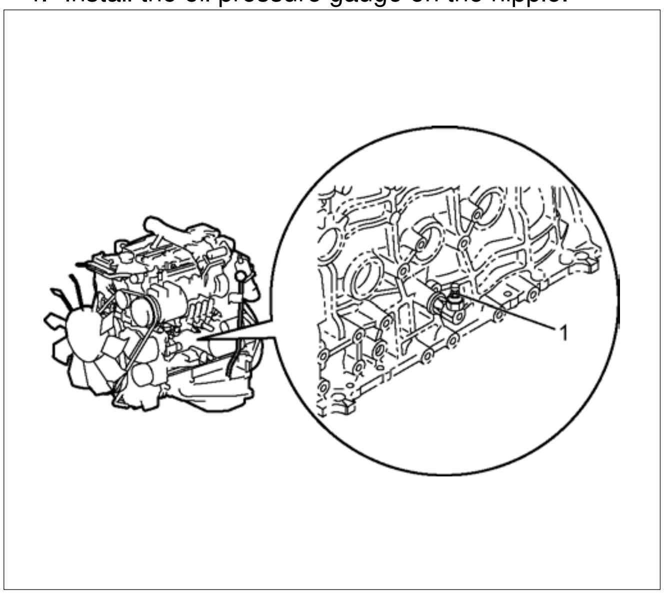
LNW76ALF000201

1. Oil Pump Relief Valve Operating Pressure: 490 – 686 kPa (5.0 – 7.0 kg/cm^2 / 71 – 100 psi)
2. Oil Cooler Relief Valve Opening Pressure: 176 – 216 kPa (1.8 – 2.2 kg/cm^2 / 26 – 31 psi)
3. Oil Filter Relief Valve Opening Pressure: 80 – 120 kPa (0.8 – 1.2 kg/cm^2 / 11 – 17 psi)
4. Oil Pressure Switch Operating Pressure: 29.4 – 49.0 kPa (0.3 – 0.5 kg/cm^2 / 4.3 – 7.1 psi)
5. Regulating Valve: 176 – 216 kPa (1.8 – 2.2 kg/cm^2 / 26 – 31 psi)

Functional Check

Oil pressure check

1. Check whether the engine oil is contaminated with dirt, light oil, or water. If contaminated with dirt, light oil, or water (after examining the cause and taking the appropriate measures for light oil or water contamination), replace the oil.
2. Check the engine oil level. The oil level should be between the two holes of the level gauge. If the oil level is insufficient, replenish it.
3. Remove the oil pressure switch on the nipple.
4. Install the oil pressure gauge on the nipple.



RTW56ASH015501

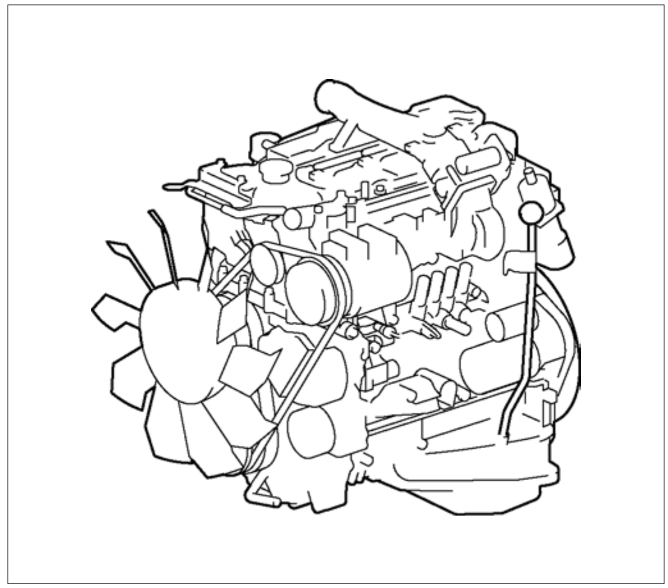
Legend

1. Oil Pressure Switch

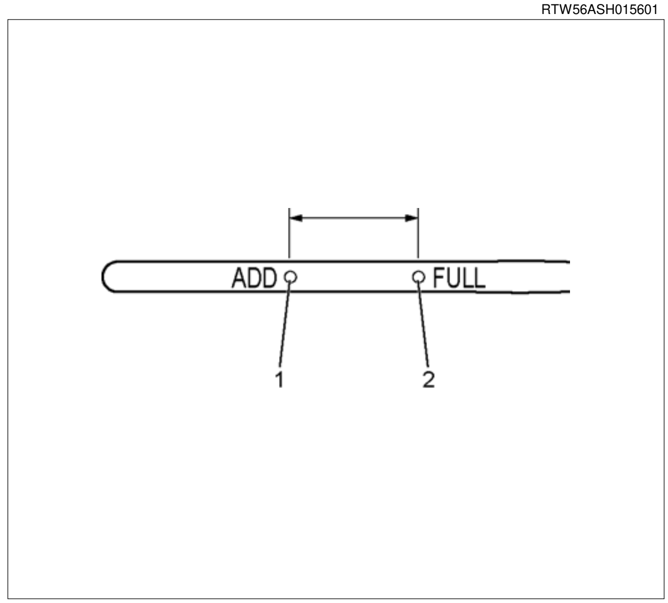
5. Warm the engine.
6. Measure the oil pressure, to check whether it is more than 400 kPa (4 kg/cm^2 / 58 psi) at 3600 rpm.
7. Stop the engine.
8. Remove the oil pressure gauge.
9. Install the oil pressure switch.
10. Start the engine and check for oil leakage.

Engine oil

- Ensure the car is on level ground. Before starting the engine or when 30 minutes or more have elapsed after stopping the engine, check the engine oil volume using the level gauge. The volume is appropriate if the engine oil is between the upper and lower limits of the level gauge. Replenish the engine oil, if level is below the lower limit. Also, check for contamination of the engine oil.



RTW56ASH015601



RTW56ASH015701

Legend

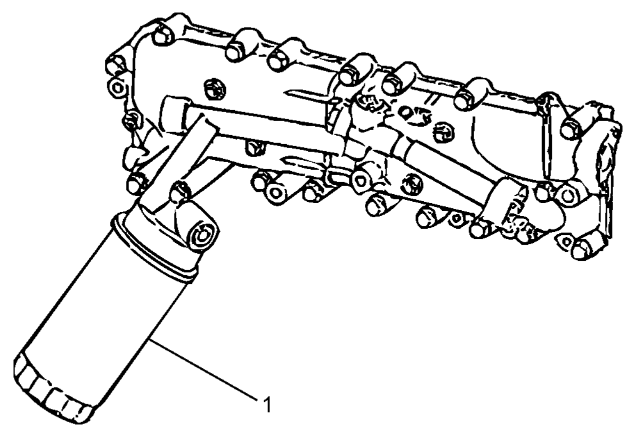
1. Lower Limit
2. Upper Limit

Engine oil leakage

- In the lift up condition, confirm that there are no leaks from the cylinder head cover and oil pan.

Oil Filter Cartridge

Components



RTW56ASF000101

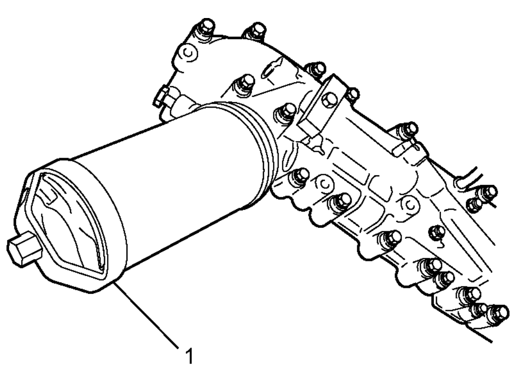
Legend

1. Oil Filter Cartridge

Removal

1. Place a tray under the oil filter cartridge.
2. Remove the oil filter cartridge using the oil filter wrench.

   Special tool
   Oil filter wrench: 5-8840-0203-0 (1)



RTW56ASH012501

Installation

1. Install the oil filter cartridge.
   - Apply grease or engine oil to the seal in the cartridge and install it using the oil filter wrench.
   - Tighten the cartridge using the specified torque.

Tightening torque: 20 N·m (2.0 kg·m / 14 lb ft)
Or
After it comes in contact with the oil seal, tighten it through an additional turn of 1 and 1/4.

Special tool
Oil filter wrench: 5-8840-0203-0

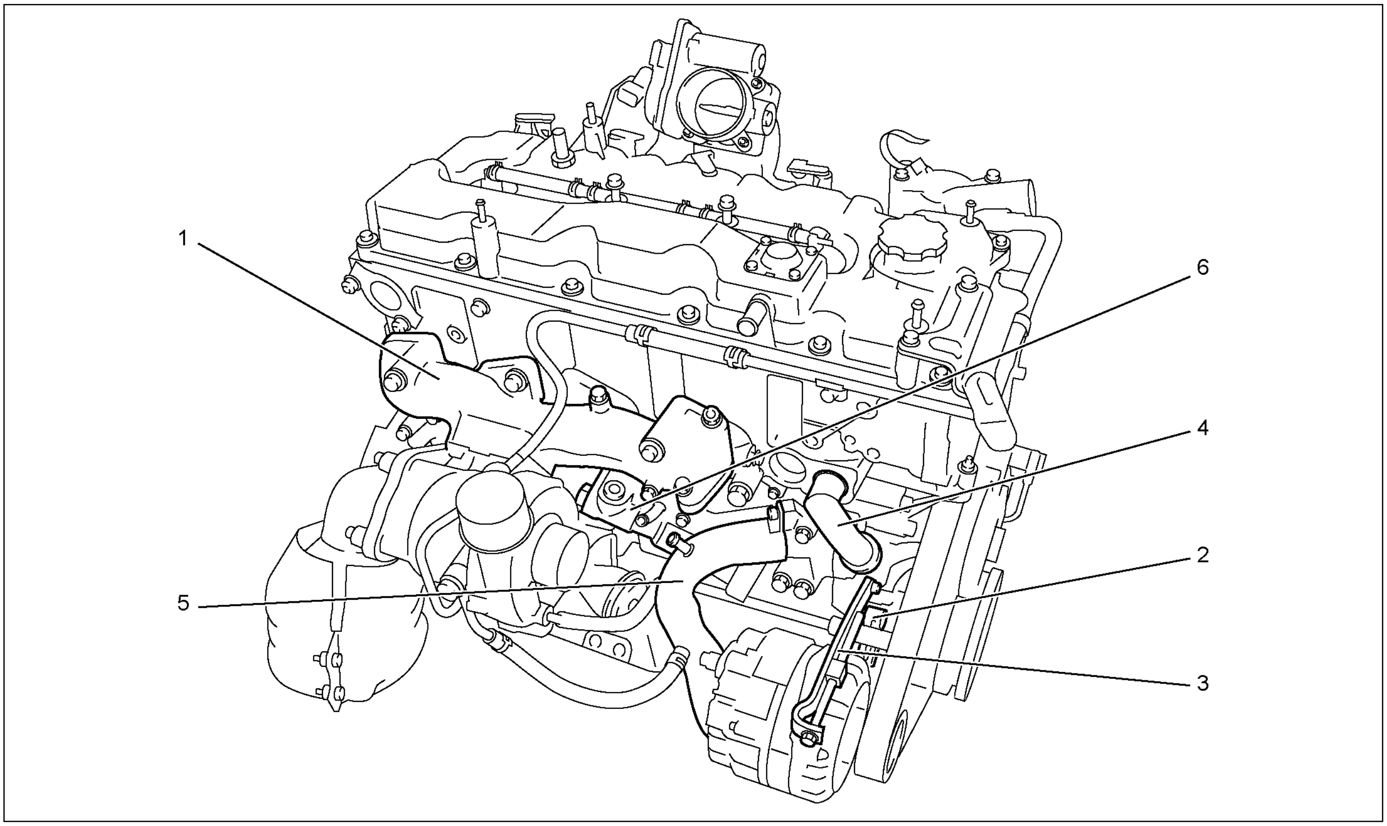
Oil Filter Assembly and Oil Cooler

Components



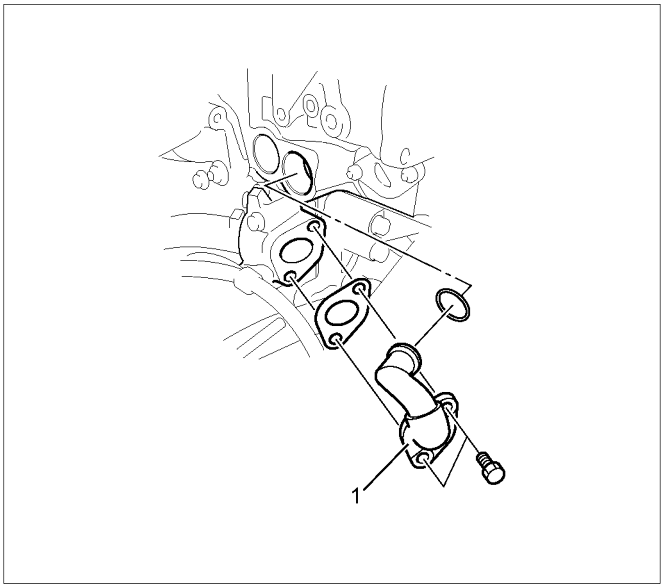
RTW56AMF000401

Legend

1. Exhaust Manifold
2. Generator Bracket
3. Generator Adjustment Bracket
4. Water Bypass Pipe
5. Water Intake Pipe
6. Oil Filter Assembly and Oil Cooler

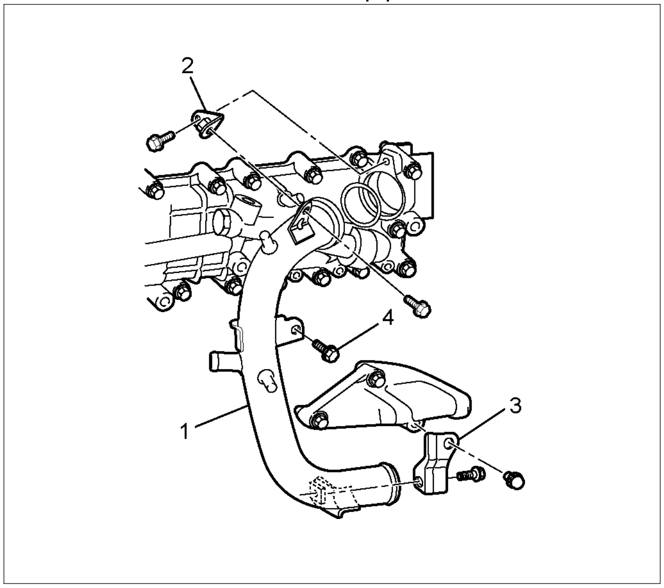
Removal

1. Remove the exhaust manifold.
   Refer to removal procedure for "Turbocharger and Exhaust Manifold" in this manual.
2. Remove the generator.
   Refer to removal procedure for generator in this manual.
3. Remove the adjustment bracket of generator.
4. Remove the bracket of generator.
5. Remove the water bypass pipe (1).



RTW56ASH008401

6. Remove the water intake pipe.

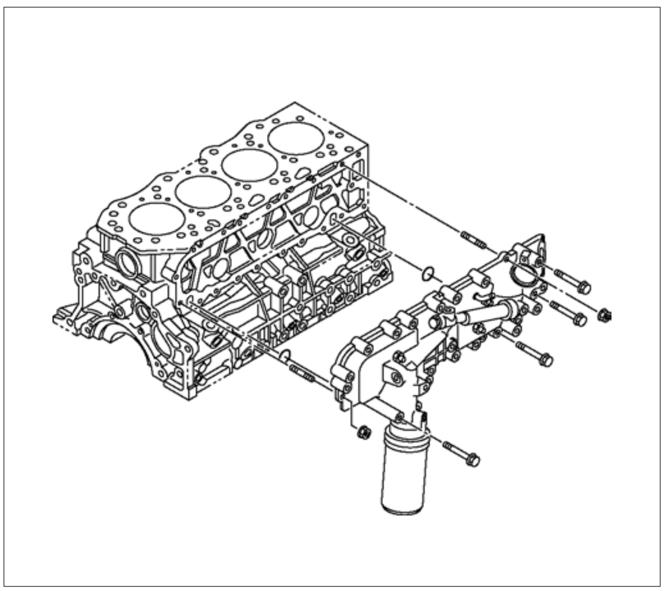


RTW56ASH012601

Legend

1. Water Intake Pipe
2. Bracket
3. Bracket
4. Bolt

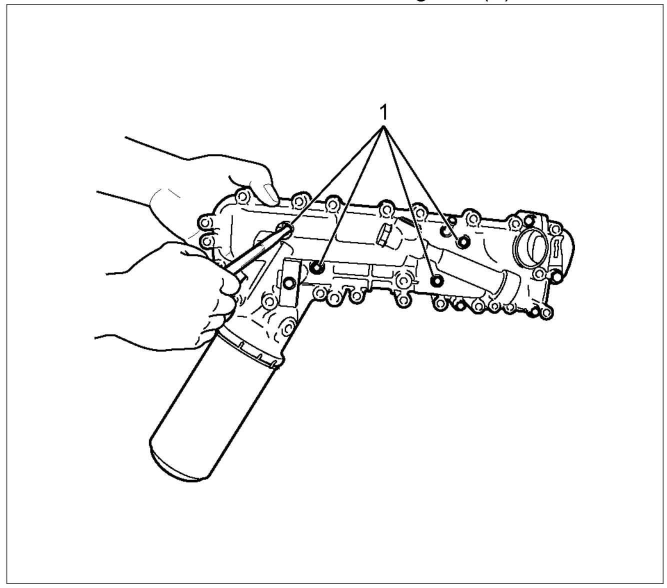
7. Remove the oil cooler.



RTW66ASH009101

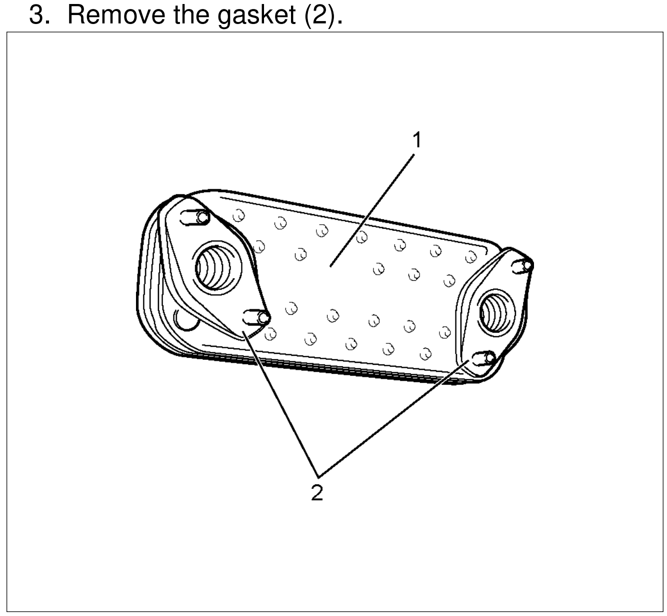
Disassembly

1. Remove the element mounting nut (1).



RTW56ASH012901

2. Remove the element (1).
3. Remove the gasket (2).



RTW56ASH013001

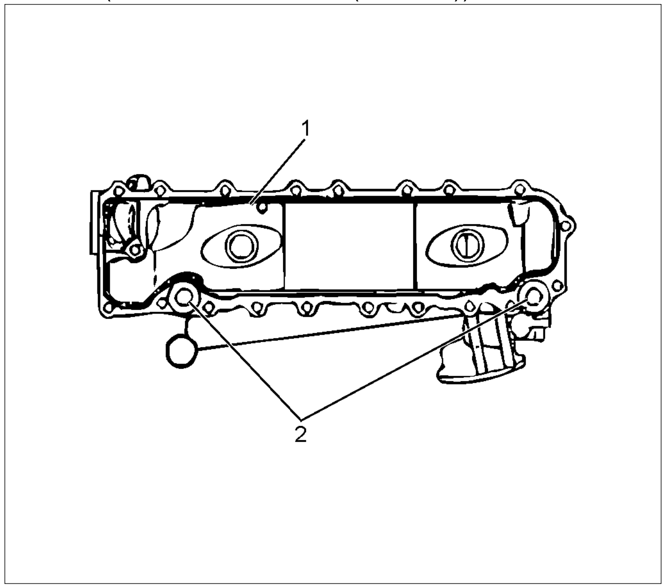
Reassembly

1. Install the gasket on the element.
2. Install the element.
3. Tighten the element fixing nut using the specified torque.

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)

Installation

1. Install the oil filter and cooler.
   - Install the O-ring on the oil filter and cooler, apply grease.
   - Apply the liquid gasket and mount within 5 minutes. Apply liquid gasket (ThreeBond TB-1207C or equivalent) to the flange surface groove (cylinder block). Bead diameter must be between 2 and 3 mm (0.079 and 0.118 in). Refer to the illustration for the offset position (no more than 1 mm (0.004 in)).

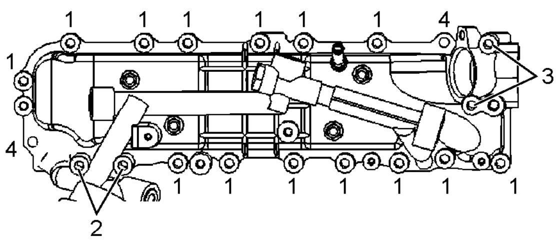


RTW56ASH013101

Legend

1. Liquid Gasket
2. O-ring

   - Align the oil filter and cooler holes with the cylinder block studs. Install the oil cooler to the cylinder clock.



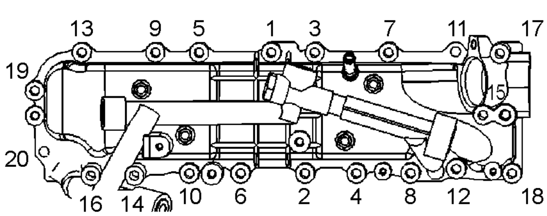
RTW56ASH013201

Legend

1. Bolt 45 mm (1.77 in)
2. Bolt 110 mm (4.33 in)
3. Bolt 70 mm (2.76 in)
4. Nut

- Tighten the bolts to the specified torque in the order shown in the illustration.

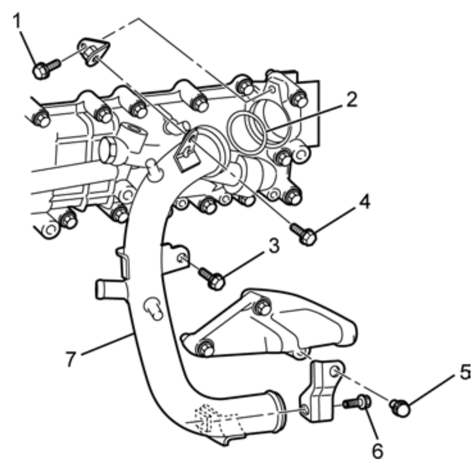
Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)



RTW56ASH013301

2. Install the water intake pipe.
   a. Temporarily tighten the bolt (6).
   b. Install the O-ring (2) to the water intake pipe (7).
   c. Apply soapy water to the O-ring (2) and install the water intake pipe (7).
      - Take care not to twist the O-ring.
   d. Temporarily tighten the bolts.
      Temporary tightening order: 1→3→4→5
   e. Tighten the bolts to the specified torque.
      Fully tightening order: 3→4→1→5→6

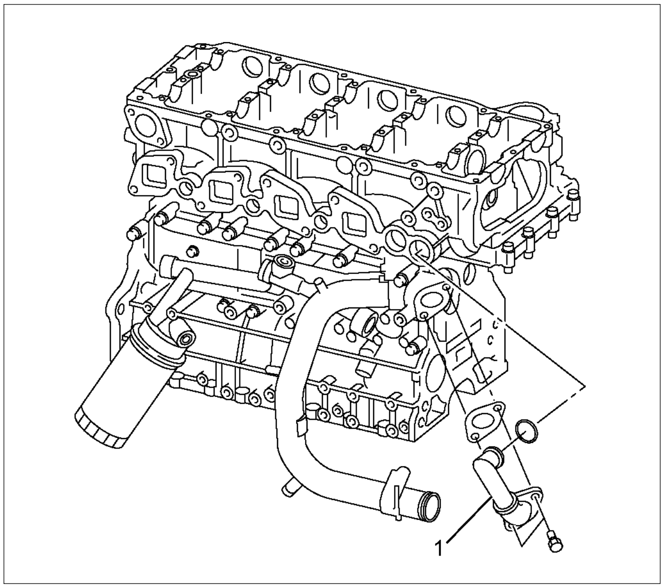
Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)



RTW76ASH001701

3. Install the water bypass pipe (1).
   - After applying soapy water to O-ring, set it on bypass pipe and insert into the cylinder head. Tighten the bolts to the specified torque.

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)



RTW56ASH008401

4. Install the bracket of generator.
   Tighten the bolts to the specified torque.

Tightening torque: 51 N·m (5.2 kg·m / 38 lb ft)

5. Install the adjustment bracket of generator.
   Tighten the bolts to the specified torque.

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)

6. Install the generator.
   Refer to Installation procedure for generator in this manual.
7. Install the exhaust manifold.
   Refer to Installation procedure for turbocharger and exhaust manifold in this manual.

YES

- Disconnect the condenser fan relay connector condenser fan.

- Is there continuity between the relay terminal No. 3 (X-10) and engine room harness connector terminal No.4 (C-24)?

NO

Open circuit between the engine room harness connector terminal No.3 (X-15) and the engine room harness connector terminal No. 1 (C-24).

YES

- Is there battery voltage between the engine room harness connector terminal NO. 3 (C-24) and ground?

NO

Open circuit between the condenser fan relay No.3 (X-10) and engine room harness connector terminal No. 4 (C-24).

NO

Open circuit between the No. EB-13 fuse and engine room harness connector terminal No. 3 (C-24).

YES

- Disconnect the pressure switch.

- Is there continuity between the engine room harness connector terminal No. 4 (X-15) and the engine room harness connector terminal No. 1 (C-24).

NO

Open circuit between the No. EB-13 fuse and the engine room harness connector terminal No. 2 (X-15).

YES

- Connect the A/C thermo relay connector.

- Disconnect the electronic thermostat.

- Is there continuity between the engine room harness connector terminal No. 2 (C-55) and the engine room harness connector terminal No. 2 (C-24)?

NO

Open circuit between the engine room harness connector terminal No. 4 (X-15) and the engine room harness connector terminal No. 1 (C-24).

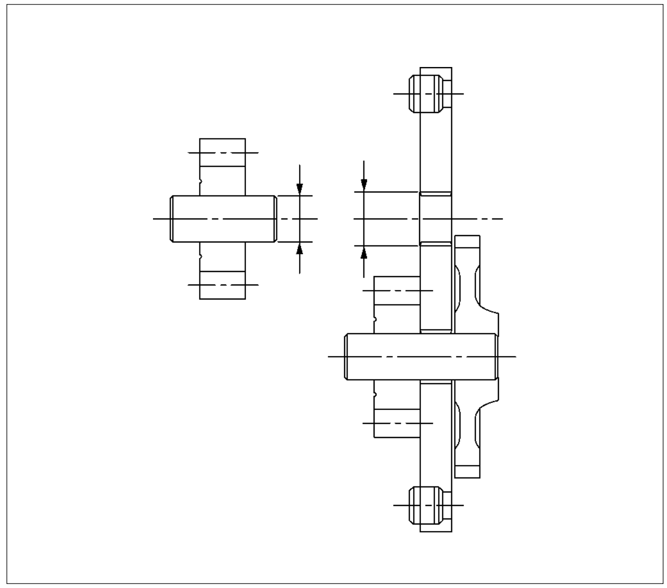
Inspection

NOTE:
Think to match direction of ditch of gear when assembling it.

1. Measure the clearance between the driven gear/drive gear shaft and the bush.
   - Measure the outside diameter of the driven gear shaft using a micrometer.

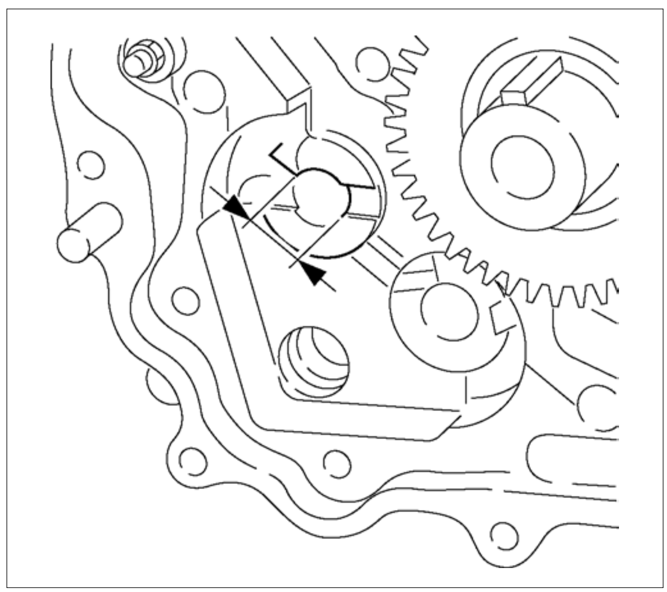
Outside diameter of the driven gear shaft/drive gear shaft mm (in)	
Standard	15.989 - 16.000 (0.62949 - 0.62992)
Limit	15.900 (0.62598)



RTW56ASH025601

- Measure the inside diameter of the bushes of the cylinder block using the dial gauge.
- If the clearance between the driven gear shaft/drive gear shaft and bush exceeds the limit, replace the oil pump assembly.

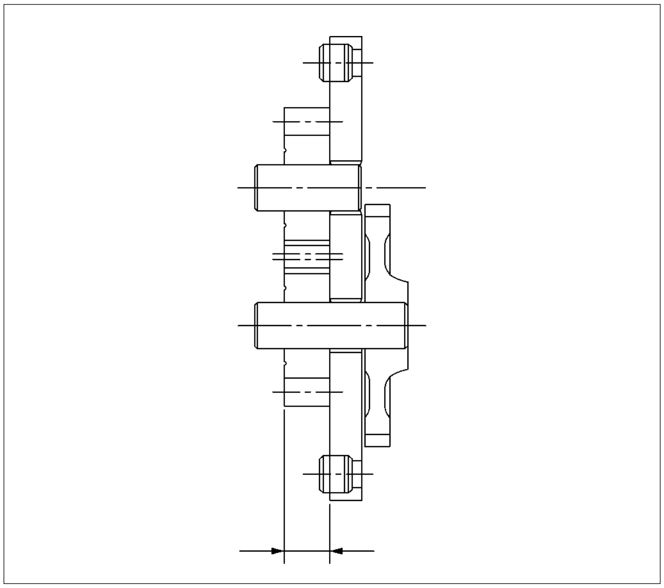
Clearance between the driven gear shaft/drive gear shaft and bush mm (in)	
Standard	0.04 - 0.07 (0.0016 - 0.0028)
Limit	0.20 (0.0079)



RTW56ASH014701

2. Measure the clearance between the gear side surface and the gear side surface of the oil pump housing.
   - Measure the width size the driven gear/drive gear.

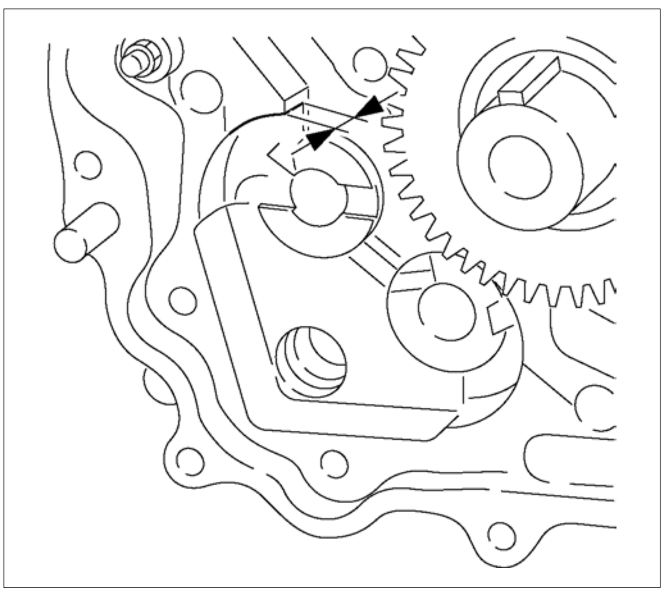
Width size the driven gear/drive gear mm (in)	
Standard	14.5 (0.5709)



RTW56ASH025501

- Measure the Depth size of the gear case housing surface and the oil pump housing gear case side.

Depth size the gear case housing surface and the oil pump housing gear case side mm (in)	
Standard	14.500 - 14.527 (0.5709 - 0.5719)



RTW56ASH014801

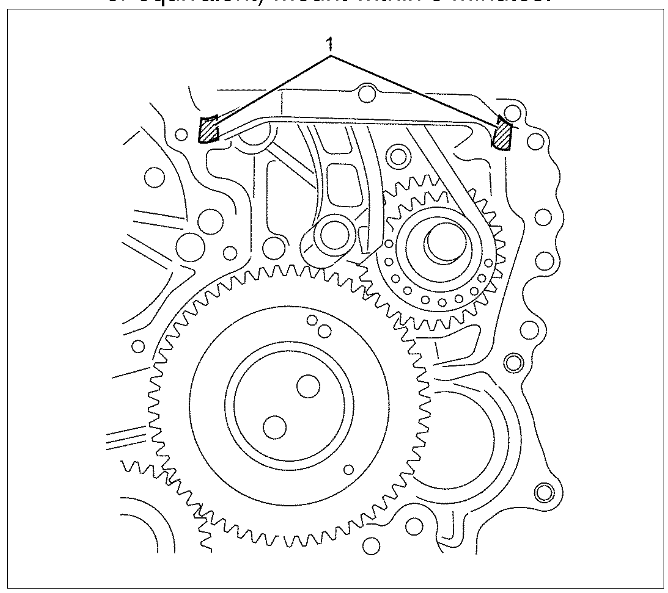
Clearance between the gear side surface and the gear side surface of the oil pump housing mm (in)	
Standard	0.063 - 0.027 (0.0025 - 0.0011)
Limit	0.20 (0.0079)

Installation

1. Install the oil pump.
   - Apply engine oil to the oil pump attachment gearbox.
   - Tighten the bolts to the specified torque.

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)

   - Installed pump gear should be smooth to rotate.
2. Install the gear case cover.
   - Apply the liquid gasket (Threebond TB-1207B or equivalent) mount within 5 minutes.



RTW56ASH020101

Legend

1. Apply the liquid gasket in area

YES

- Is there battery voltage between the engine room harness connector terminal No. 3 (C-55) and ground?

NO

Open circuit between the engine room harness connector terminal No. 2 (C-24) and the engine room harness connector terminal No. 2 (C-55).

YES

- Is there continuity between the engine room harness connector terminal No. 1 (C-55) and ground (C-109)?

NO

Open circuit between the No. EB-13 fuse and the engine room harness connector terminal No. 3 (C-55).

YES

- Disconnect the A/C switch.
- Is there battery voltage between the chassis side harness connector terminal No. 6 (B-57) and ground?

NO

Open circuit between the engine room harness connector No. 1 (C-55) and ground (C-109).

YES

- Is the electronic themostat OK?

NO

Open circuit between the No. EB-13 fuse and the chassis side harness connector No. 6 (B-57).

YES

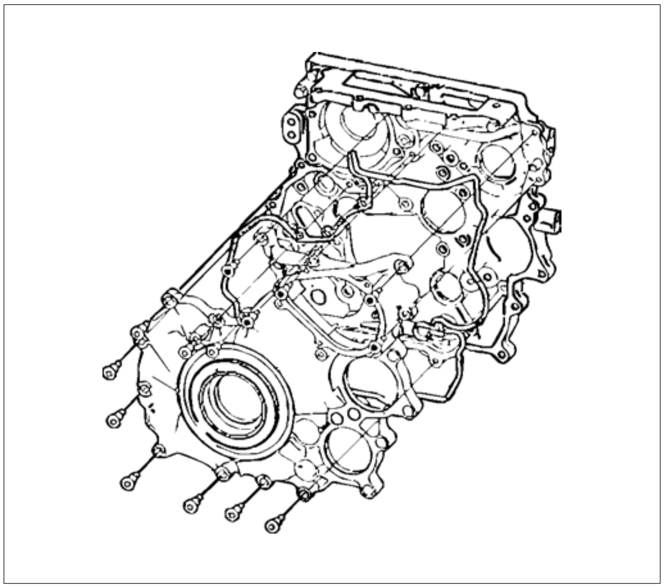
- Defective ECM

NO

Replace electronic thermostat

- Install the gasket in the slot of the gear case cover.
- Tighten the bolts to the specified torque.

Tightening torque: 8 N·m (0.8 kg·m / 69 lb in)



RTW56ASH012101

3. Install the crank pulley.
   - Tighten the bolts to the specified torque.

Tightening torque: 294 N·m (30.0 kg·m / 217 lb ft)

4. Install the noise cover to the timing chain cover lower.
   - Tighten the bolts to the specified torque.

Tightening torque: 10 N·m (1.0 kg·m / 87 lb in)

5. Install the vacuum pump.
   - Tighten the nuts to the specified torque.

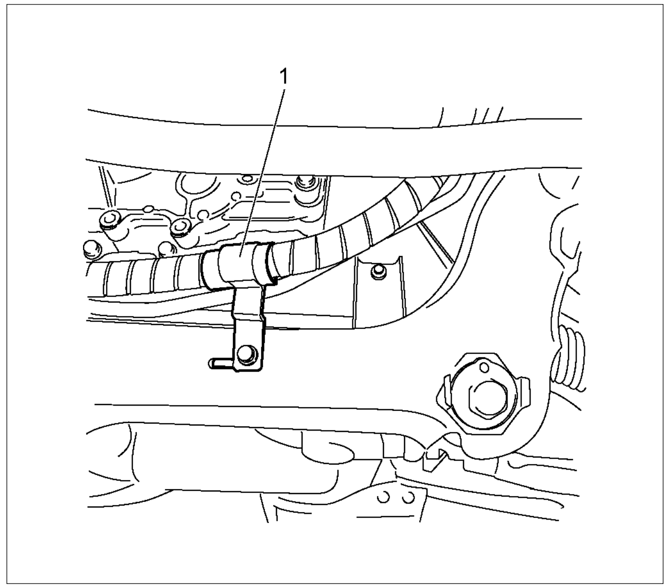
Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)

- Install the oil pipe (feed side and return side) of vacuum pump.
- Install the vacuum pipe bracket and vacuum pipe.

6. Install the power steering pump.
   - Tighten the nuts to the specified torque.

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)

- Install the bracket of power steering oil hose clip (1).



LTW56ASH000101

7. Install the lower fan shroud.
8. Install the fan drive belt and pulley.
   - Install the fan drive belt with the fan pulley.
9. Install the fan and fan clutch.
   - Tighten the bolts to the specified torque.

Tightening torque: 8 N·m (0.8 kg·m / 69 lb in)

10. Adjust the drive belt of generator and A/C compressor.
    - Apply tension to the fan drive belt by moving the generator.
    - Apply a force of 98 N (10 kg / 22 lb) to the drive belt mid portion to check the drive belt deflection.

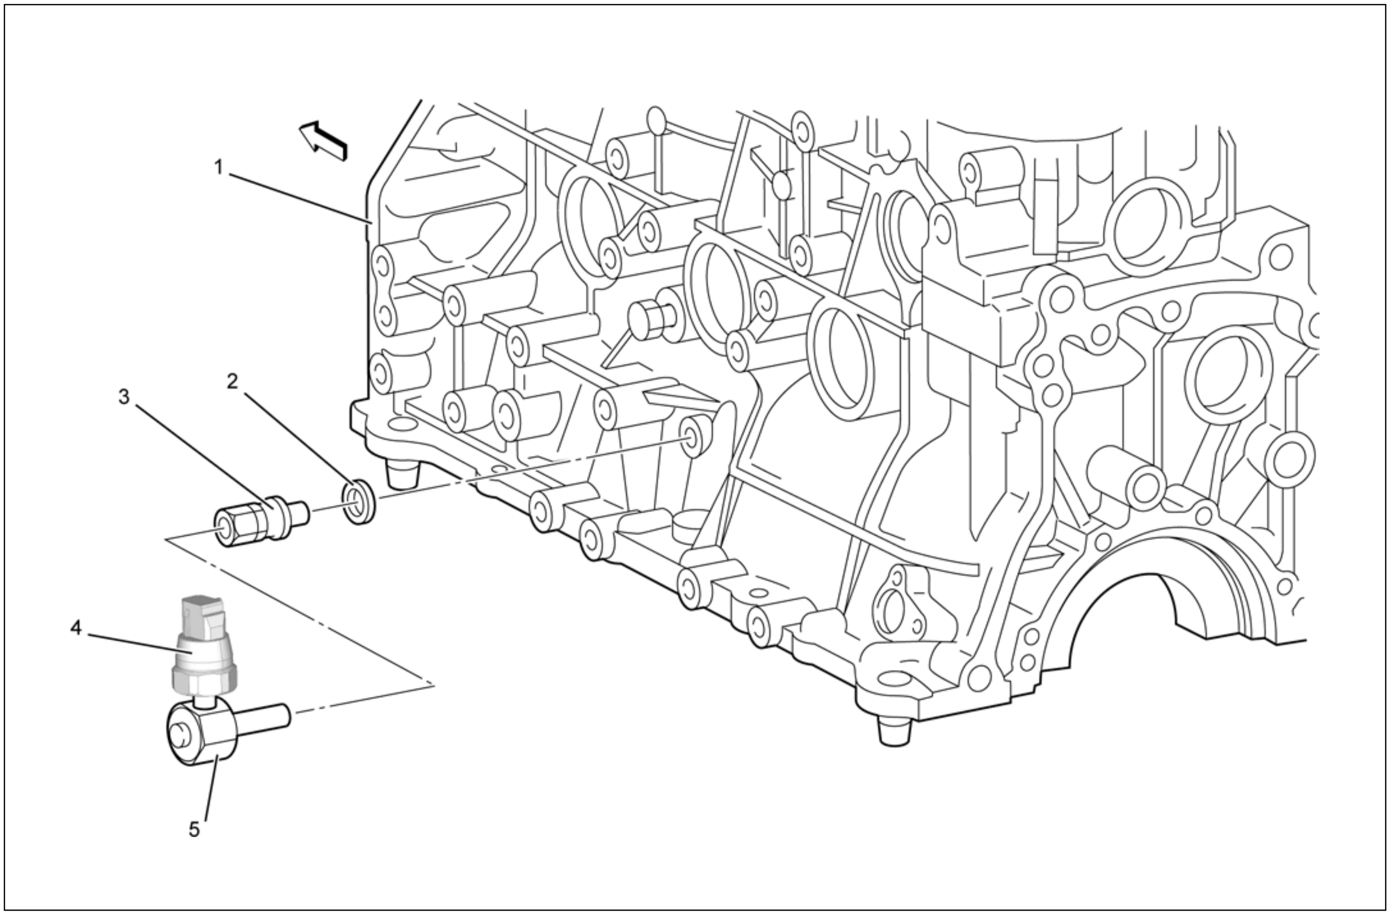
Generator drive belt deflection	mm (in)
New belt	5 - 6 (0.20 – 0.24)
Reuse belt	7 - 8 (0.28 – 0.31)

A/C compressor drive belt deflection	mm (in)
New belt	6 - 7 (0.24 – 0.28)
Reuse belt	8 - 9 (0.31 – 0.35)

11. Install the upper fan shroud.
12. Install the radiator upper hose.
13. Replenish the engine coolant.

Oil Pressure SW

Components



RTW76AMF000401

Legend

1. Cylinder Block
2. Gasket
3. Nipple; Oil Pressure Warning SW
4. Oil Pressure SW
5. Nipple; Oil Gallery

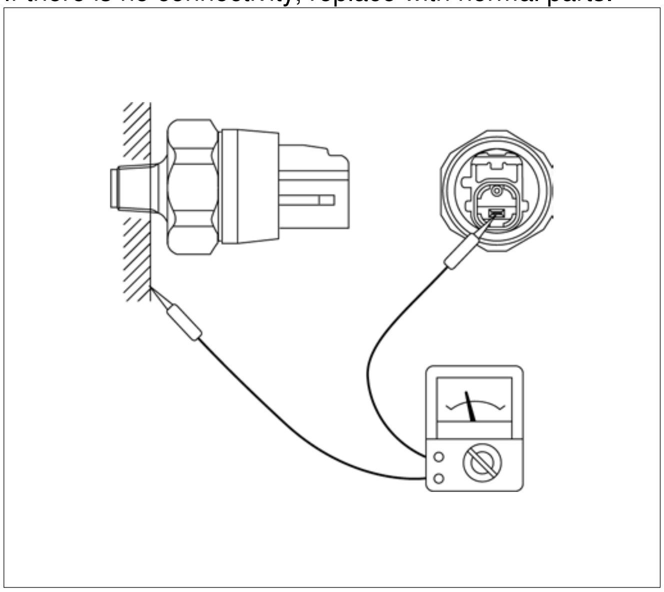
Removal

1. Remove the oil pressure SW.
2. Remove the nipple; oil gallery.
3. Remove the nipple; oil pressure warning SW and gasket.

Inspection

Check the continuity between the switch terminal and the body grounding in a no-load condition.

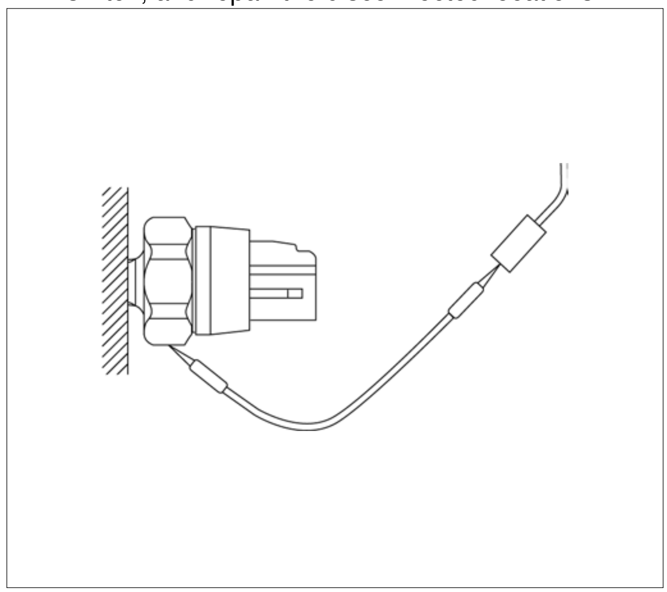
If there is no connectivity, replace with normal parts.



LNW21HSH003301

Circuit check

1. Turn the starter switch to ON.
2. Disconnect the oil pressure switch connector, and confirm that the oil pressure-warning lamp lights when the connector on the harness side is grounded.
   If the warning lamp does not light up, check the circuit between the meter and the oil pressure switch, and repair the disconnected locations.



LNW21HSH003401

Installation

1. Install the nipple; oil gallery, oil pressure warning SW and gasket.

   Tightening torque: 25 N·m (2.5 kg·m/18 lb ft)

2. Install the Nipple.

   Tightening torque: 15 N·m (1.5 kg·m/11 lb ft)

3. Install the oil pressure SW.

   Tightening torque: 15 N·m (1.5 kg·m/11 lb ft)

Air Cleaner Element

Removal

1. Remove the air cleaner cover fixing clip.
2. Remove the air cleaner element assembly.

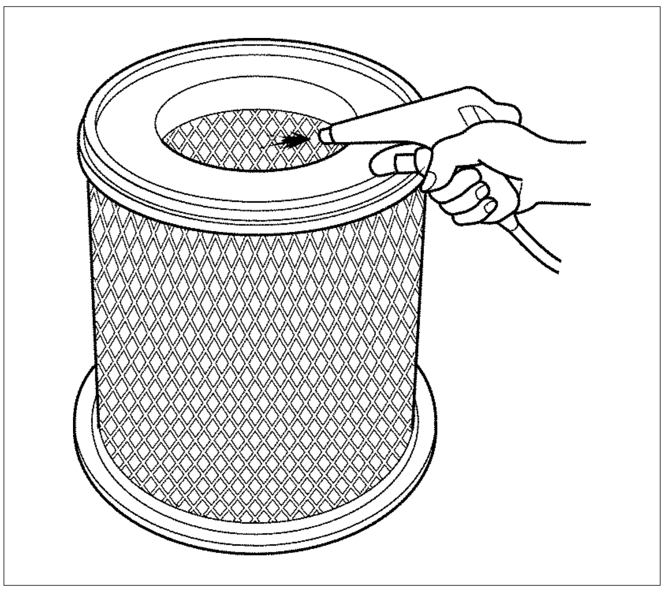
Cleaning

Dry type element

- Rotate the element with your hand while applying compressed air to the inside of the element. This will blow the dust free.

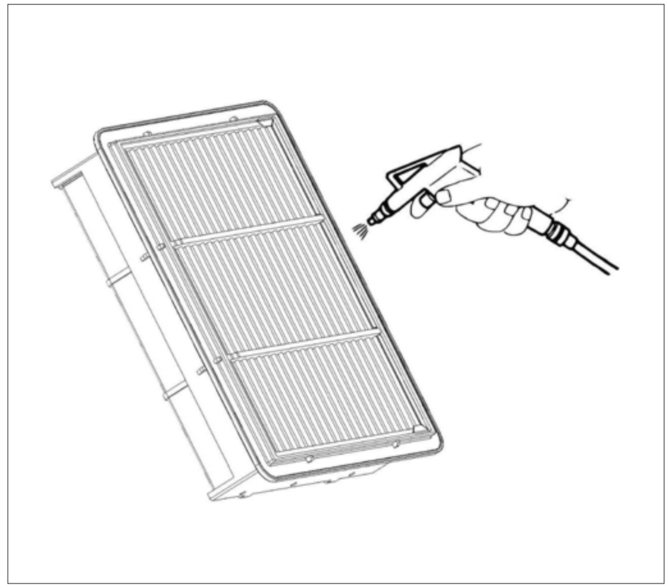
Compressed air pressure	kPa (kg/cm^2 /psi)
392 – 490 (4 – 5/57 – 71)	

Standard Output



LNW46ASH003201

High Output



LNW71BSH000201

Installation

1. Install the air cleaner element assembly.
2. Install the air cleaner cover.

SECTION 6B

ENGINE COOLING

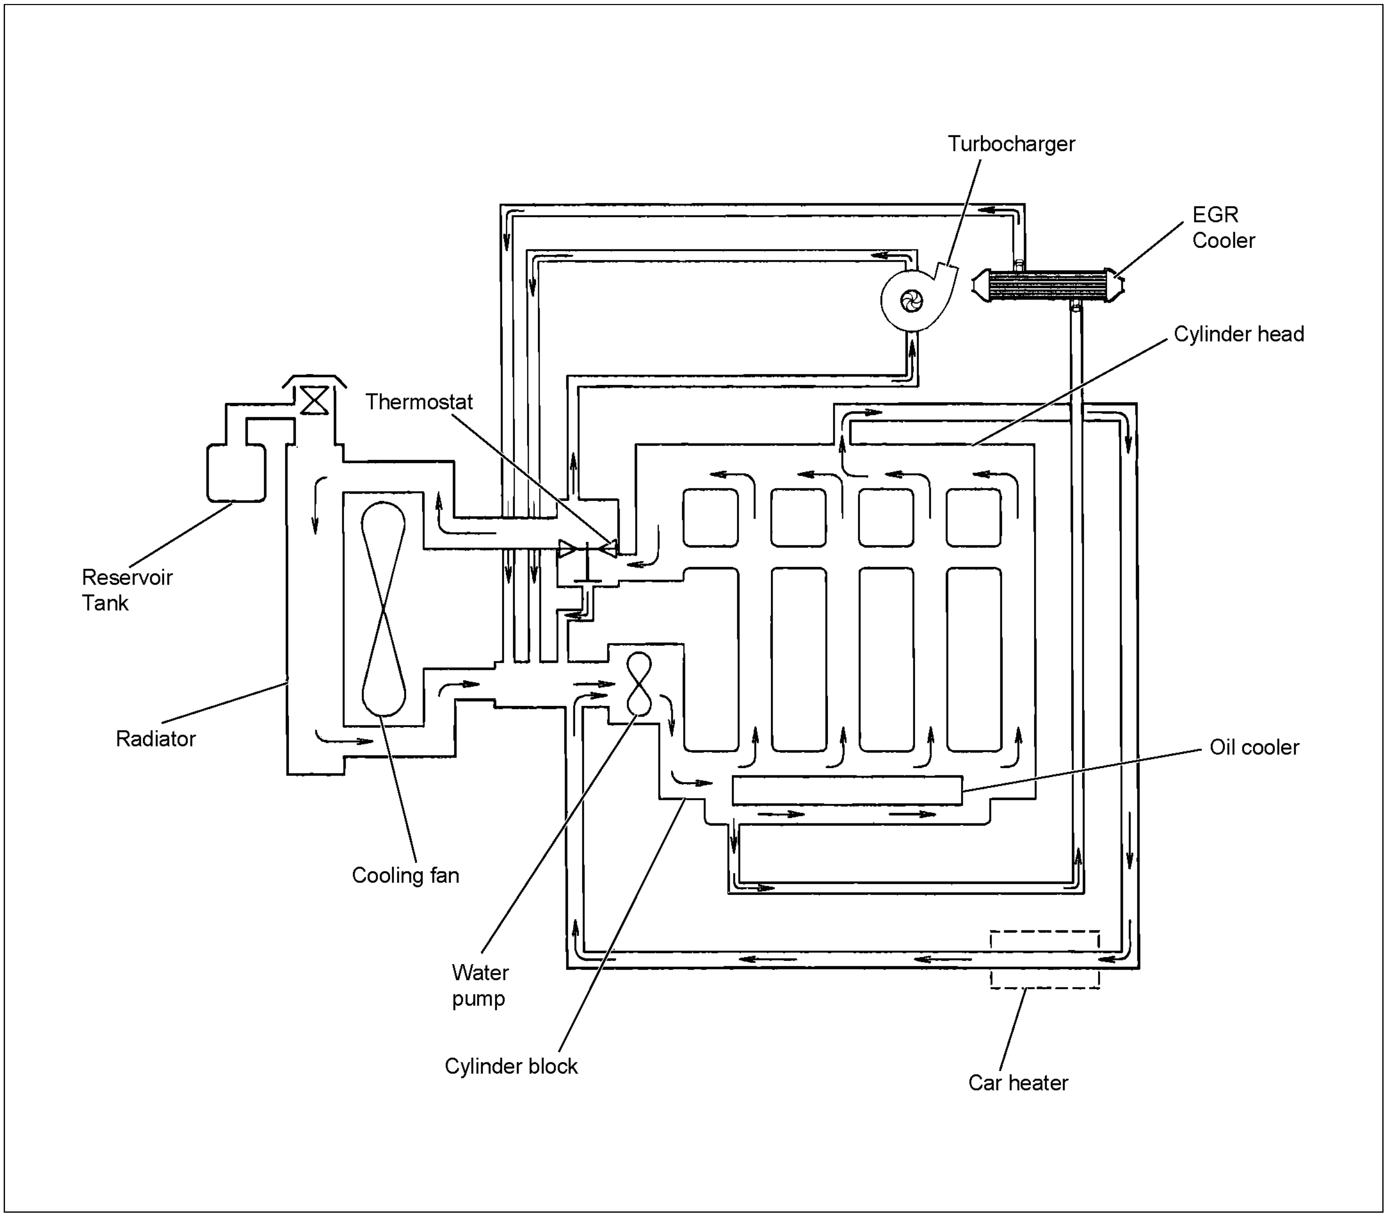
TABLE OF CONTENTS

Main Data and Specifications

Item		Description	
		M/T	A/T
Cooling system		Engine coolant forced circulation	
Water pump type		Centrifugal impeller type	
Pump to crankshaft speed ratio	(To 1)	1.25	
Delivery volume	lit (US/UK gal)/min	240 (63.1/53.3)	
Pump speed at 5600 rpm			
Water temperature at 30°C (86°F)			
Pump bearing type		Double row shaft	
Thermostat type		Wax pellet with jiggle valve	
Valve initial opening temperature	°C (°F)	85 (185)	
Valve full opening temperature	°C (°F)	100 (212)	
Valve lift at fully open position	mm (in)	10 (0.39)	
Radiator		Tube type corrugated	
Heat radiation capacity	kW (kcal/h)	93 (80.2)	
Heat radiation area	m^2 (ft^2)	11.63 (125.2)	
Radiator front area	m^2 (ft^2)	0.28 (3)	
Radiator dry weight	N (kg/lb)	52	53
Radiator cap valve opening pressure	kPa (kg/cm^2/psi)	93.3 - 122.7 (0.95 - 1.25/13.5 - 17.8)	
Engine coolant capacity	lit (U.S pint)	4.0 (8.5)	4.0 (8.5)
Engine coolant total capacity	lit (U.S pint)	8.7 (18.4)	8.6 (18.2)

General Description

Coolant Flow



RTW76BLF000301

The engine cooling system consists of the radiator, the water pump, the cooling fan, and the thermostat.

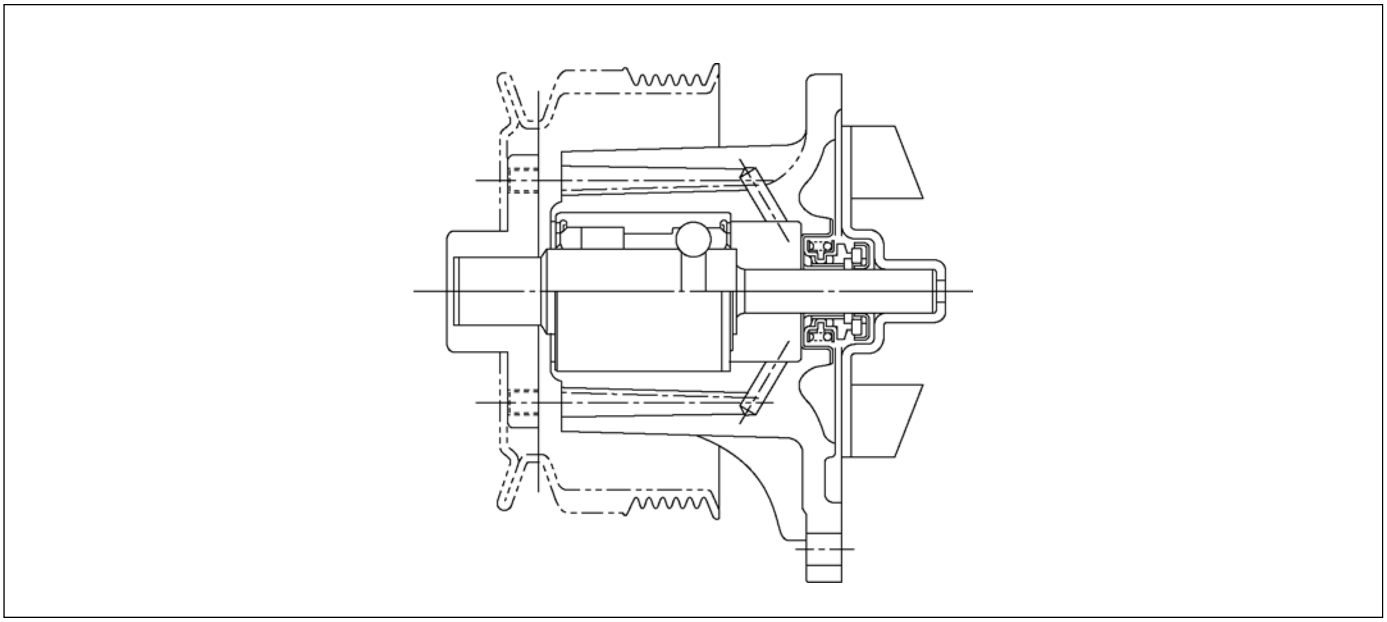
To quickly increase cold engine coolant temperature for smooth engine operation, the coolant is circulated by the water pump and thermostat through the bypass pipe and back to the cylinder body.

The coolant does not circulate through the radiator.

When the coolant temperature reaches the specified value, the thermostat will begin to open and a gradually increasing amount of coolant will circulate through the radiator.

The thermostat will be fully open when the coolant temperature reaches the specified value. All of the coolant is now circulating through the radiator for effective engine cooling.

Water Pump

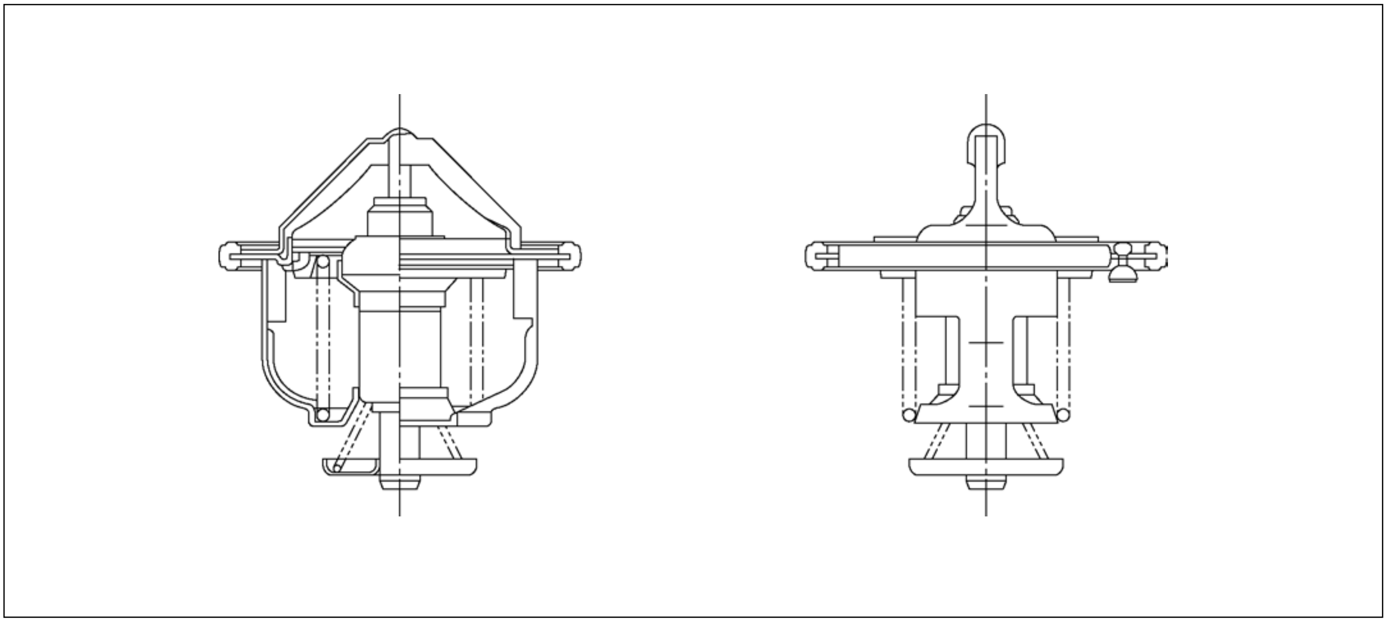


RTW56BSF000101

A centrifugal type water pump forcefully circulates the coolant through the cooling system.

The water pump is not a disassembled type.

Thermostat

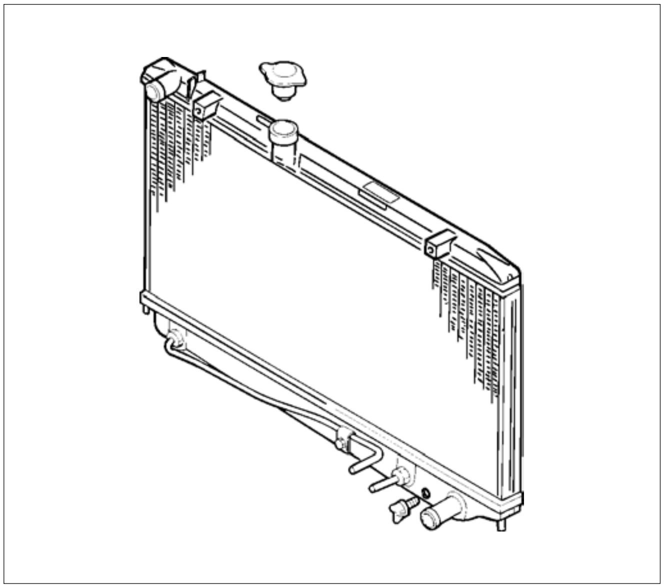


RTW56BSF000201

A wax pellet type thermostat is used.

Radiator

The radiator is a tube type with corrugated fins. In order to raise the boiling point of the coolant, the radiator is fitted with a cap in which the valve is operated at 93.3 - 122.7 kPa (0.95 - 1.25 kg / cm^2 / 13.5 - 17.8 psi) pressure. (No oil cooler provided for M/T)



RTW56BSH000301

Antifreeze Solution

NOTE:
Antifreeze solution + Water = Total cooling system capacity.

Total Cooling System Capacity Lit (US / UK gal) (US pint)

M/T 8.7 (2.3/1.9) (18.4)
A/T 8.6 (2.3/1.9) (18.2)

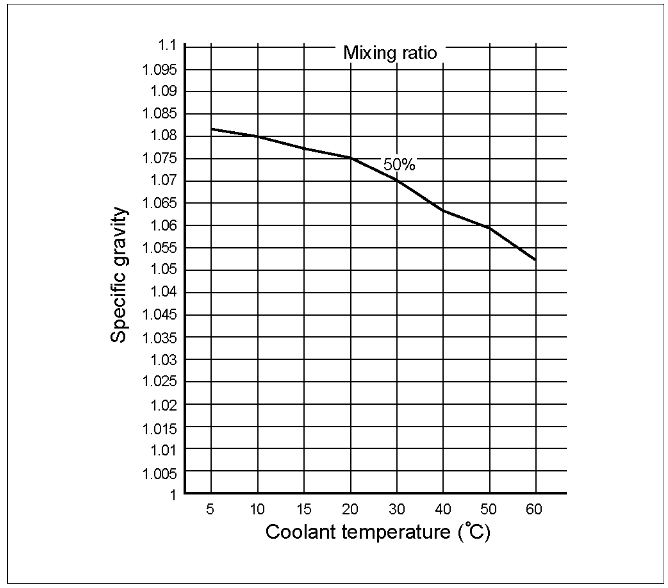
See section 0B *MAINTENANCE AND LUBRICATION*.

Mixing ratio

$$= \frac{\text{Antifreeze solution (Lit/gal.)}}{\text{Antifreeze solution (Lit/gal.) + Water (Lit/gal.)}}$$

F06RW005

NOTE:
To maintain the corrosion resistance of the aluminum radiator, water and antifreeze must be combined in a 1:1 solution (50% antifreeze and 50% water).



RTW76BSH000201

Diagnosis

Engine Cooling Trouble

Condition	Possible Cause	Correction
Engine overheating	Low Engine Coolant level	*Replenish*
	Thermo meter unit faulty	*Replace*
	Faulty thermostat	*Replace*
	Faulty Engine Coolant temperature sensor	*Repair or replace*
	Clogged radiator	*Clean or replace*
	Faulty radiator cap	*Replace*
	Low engine oil level or use of improper engine oil	*Replenish or change oil*
	Clogged exhaust system	*Clean exhaust system or replace faulty parts*
	Faulty Throttle Position sensor	*Replace throttle valve assembly*
	Open or shorted Throttle Position sensor circuit	*Repair or replace*
	Damaged cylinder head gasket	*Replace*
Engine overcooling	Faulty thermostat	*Replace*
Engine slow to warm–up	Faulty thermostat	*Replace*
	Thermo unit faulty	*Replace*

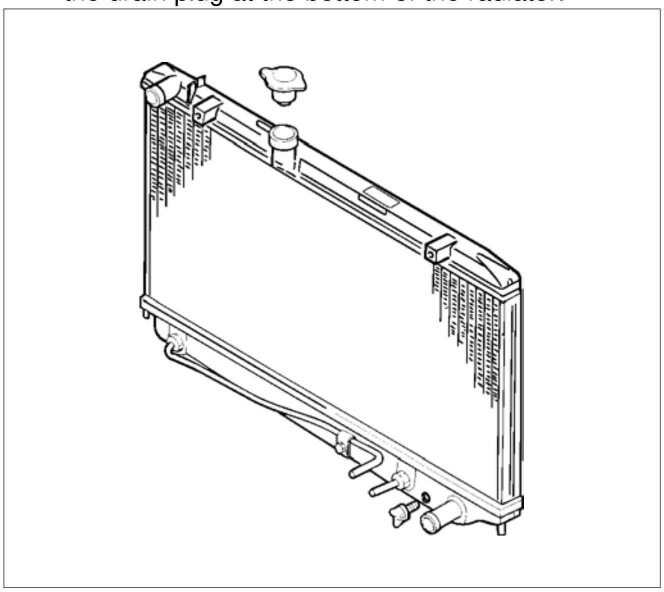
Draining and Refilling Cooling System

Before draining the cooling system, inspect the system and perform any necessary service to ensure that it is clean, does not leak and is in proper working order. The engine coolant (EC) level should be between the “MIN" and “MAX" lines of the reserve tank when the engine is cold. If low, check for leakage and add EC up to the “MAX" line.

There should not be any excessive deposit of rust or scales around the radiator cap or radiator filler hole, and the EC should also be free from oil.

Replace the EC if excessively dirty.

1. Remove the radiator skid plate.
2. Completely drain the cooling system by opening the drain plug at the bottom of the radiator.



RTW56BSH000301

3. Remove the radiator cap.

WARNING:
To avoid the danger of being burned, do not remove the cap while the engine and radiator are still hot. Scalding fluid and steam can be blown out under pressure.

4. Disconnect all hoses from the EC reserve tank. Scrub and clean the inside of the reserve tank with soap and water. Flush it well with clean water, then drain it. Install the reserve tank and hoses.
5. Refill the cooling system with the EC using a solution that is at least 50 percent antifreeze.

Procedure for filling with coolant (in case of full change).

- Make sure that the engine is cool.
- Open radiator cap and pour coolant up to filler neck.
- Pour coolant into reservoir tank up to “MAX" line.
- Tighten radiator cap and start the engine. After idling for 2 to 3 minutes, stop the engine and reopen the radiator cap. If the water level is lower, replenish.

WARNING:
When the coolant is heated to a high temperature, be sure not to loosen or remove the radiator cap. Otherwise you might get scalded by hot vapor or boiling water. To open the radiator cap, put a piece of thick cloth on the cap and loosen the cap slowly to reduce the pressure when the coolant has become cooler.

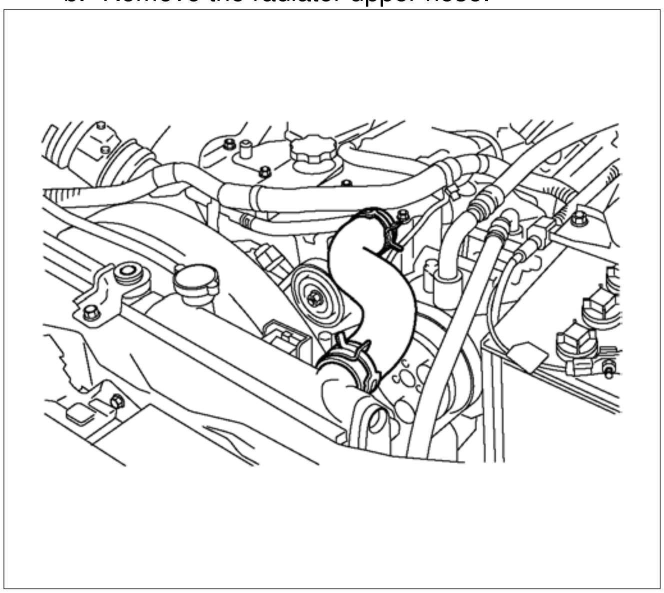
- After tightening the radiator cap, warm up the engine at about 2000 rpm. Set heater adjustment to the highest temperature position, and let the coolant circulate also into heater water system.
- Check to see the thermostat has opened through the needle position of the water thermometer, conduct a 5–minute idling again and stop the engine.
- When the engine has been cooled, check filler neck for water level and replenish if required. Should extreme shortage of coolant be found, check the cooling system and reservoir tank hose for leakage.
- Pour coolant into the reservoir tank up to “MAX" line.

Water Pump

Read this Section carefully before performing any removal and installation procedure. This Section gives you important points as well as the order of operation. Be sure that you understand everything in this Section before you begin.

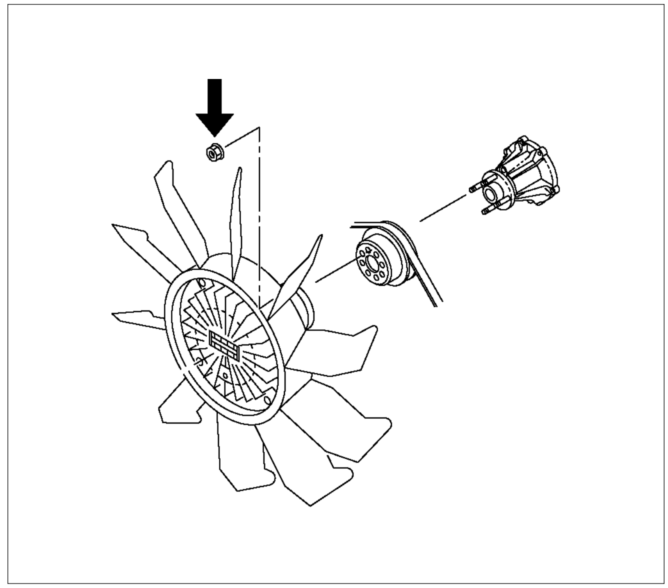
Removal

1. Remove the engine cover.
2. Radiator Upper Hose
   a. Partially drain the engine coolant.
   b. Remove the radiator upper hose.



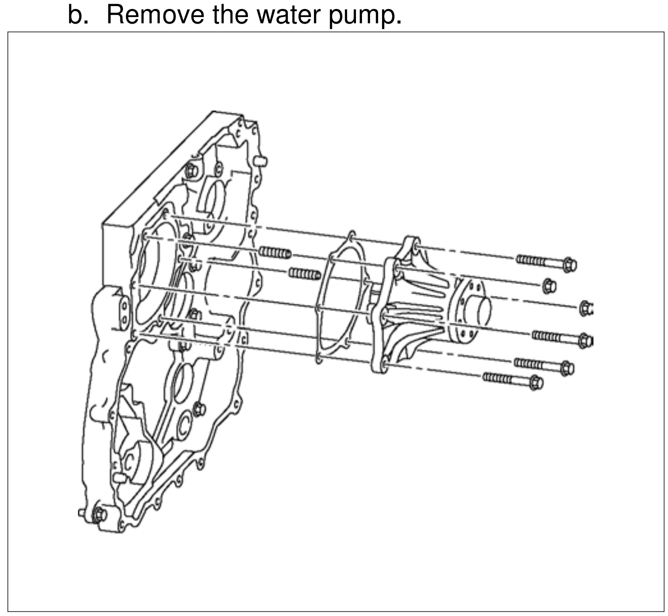
RTW56FSH000101

3. Water Outlet Pipe
   a. Disconnect the turbocharger-cooling pipe from the outlet pipe.
   b. Loosen the fixing bolt and remove the water outlet bolt.
4. Upper Fan Shroud
5. Fan and Fan Clutch
   a. Loosen the fan clutch nuts.
   b. Remove the fan together with the fan clutch. Take care not to damage the radiator core.
6. Fan Drive Belt and Pulley
   a. Loosen the tension adjust bolt on the generator.
   b. Remove the fan drive belt with the fan pulley.



RTW56ASH025401

7. Water Pump
   a. Remove the water pump bolts and nuts.
   b. Remove the water pump.



RTW56BSH000201

Inspection and Repair

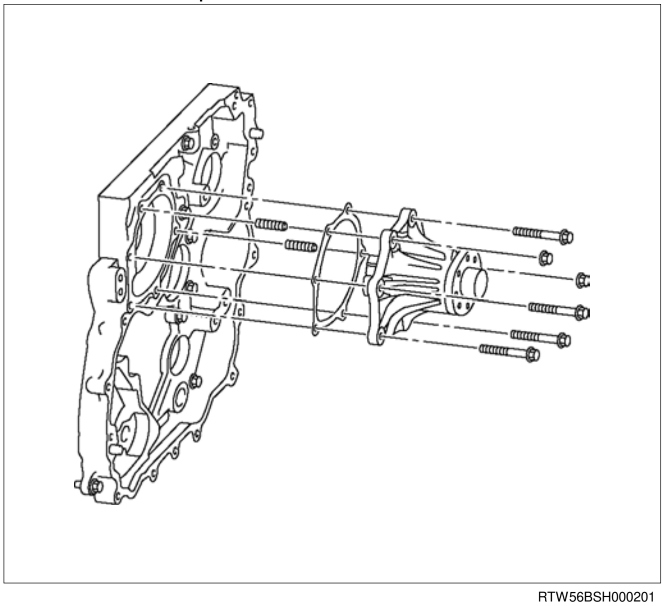
The water pump is not disassembled type.

Make necessary parts replacement if extreme wear or damage is found during inspection. Should any of the following problems occur, the entire water pump assembly must be replaced.

- Cracks in the water pump body.
- Coolant leakage from the sealed unit.
- Excessive radial play or abnormal noise in the fan center when rotated by hand.
- Excessive thrust play in the fan center (Standard play: less than 0.2 mm (0.0078 in)).
- Cracks or corrosion in the impeller.

Installation

1. Water Pump



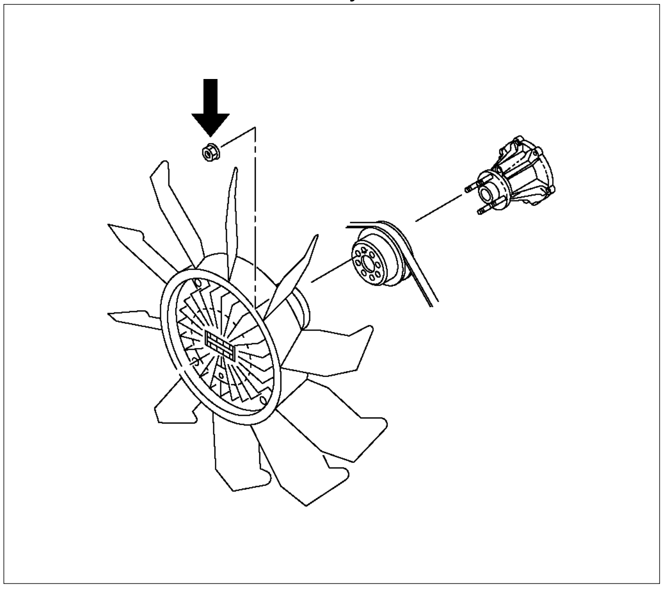
RTW56BSH000201

a. Install the water pump with a new gasket.

b. Tighten bolts and nuts to specified torque.

Water Pump Nut/Bolt Torque:
25 N·m (2.5 kg·m /18 lb ft)

2. Fan Drive Belt and Pulley and Fan and Fan Clutch.



RTW56ASH025401

a. Install the fan drive belt and fan pulley and fan and fan clutch.

b. Tighten the nuts to specified torque.

Fan Clutch Nut Torque: 8 N·m (0.8 kg·m /69 lb in)

c. Apply tension to the fan drive belt by moving the generator.

d. Apply a force of 98 N (10 kg/22 lb) to the drive belt mid-portion to check the drive belt deflection.

Fan Drive Belt Deflection	mm (in)
New belt	5 - 6 (0.20 – 0.24)
Reuse belt	7 - 8 (0.28 – 0.32)

3. Upper Fan Shroud
4. Water Outlet Pipe.

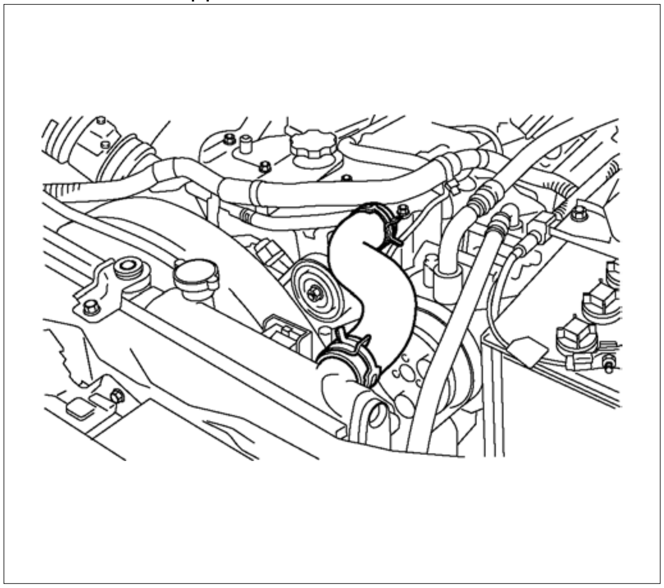
a. Install the water outlet pipe to the thermostat housing.

b. Tighten the outlet pipe bolt to specified torque.

Outlet Pipe Bolt Torque:
25 N·m (2.5 kg·m /18 lb ft)

c. Connect the turbocharger-cooling pipe to outlet pipe.

5. Radiator Upper Hose.



RTW56FSH000101

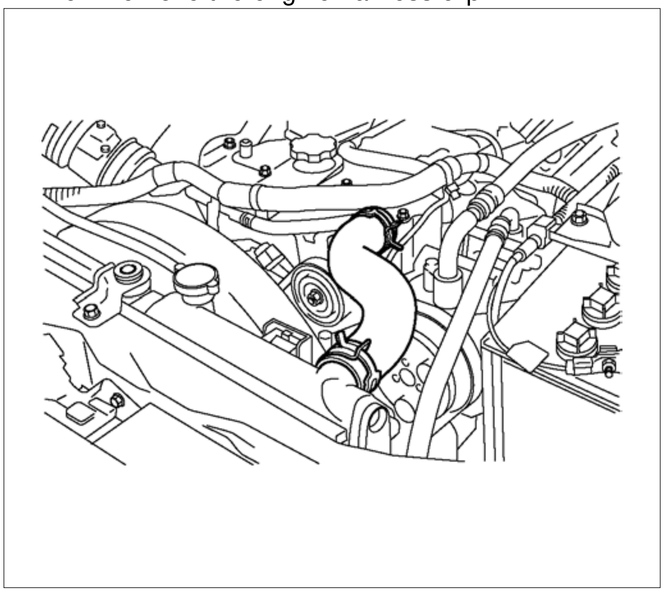
   a. Connect the radiator upper hose to the water outlet pipe.
   b. The knob of clamp shall be directed to horizontal.
   c. Replenish the engine coolant.
6. Install the engine cover.

Thermostat

Read this Section carefully before performing any removal and installation procedure. This Section gives you important points as well as the order of operation. Be sure that you understand everything in this Section before you begin.

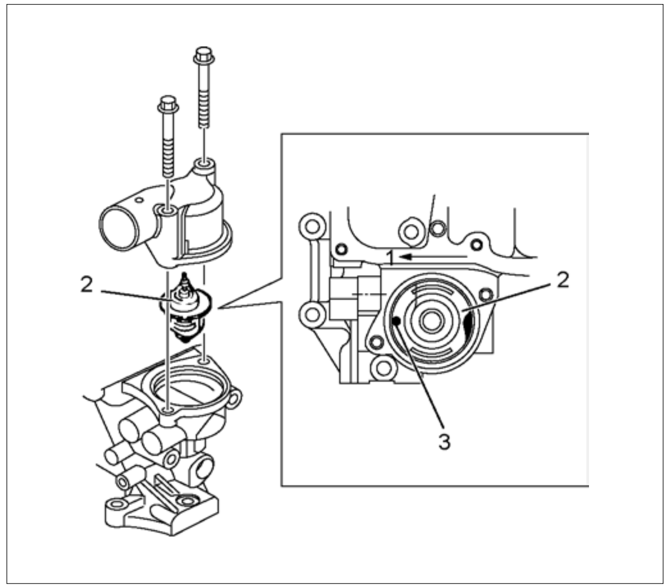
Removal

1. Remove the engine cover.
2. Radiator Upper Hose
   a. Partially drain the engine coolant.
   b. Remove the radiator upper hose.
   c. Remove the engine harness clip.



RTW56FSH000101

3. Water Outlet Pipe
   a. Disconnect the turbocharger-cooling pipe from outlet pipe.
   b. Loosen the fixing bolt and remove the water outlet bolt.
4. Thermostat
   Remove the thermostat from the thermostat housing.
   Take care not to damage the thermostat.



RTW56BSH000101

Legend

1. Front
2. Thermostat
3. Jiggle Valve

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Operating Test of Thermostat

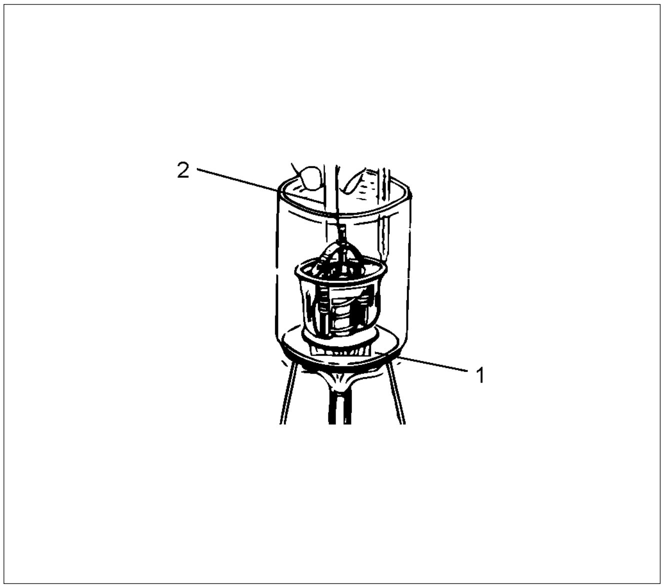
1. Completely submerge the thermostat in water.
2. Heat the water.Stir the water constantly to avoid direct heat being applied to the thermostat.
3. Check the thermostat initial opening temperature.

Thermostat Initial Opening Temperature °C (°F)
85 (185)

4. Check the thermostat full opening temperature.

Thermostat Full Opening Temperature °C (°F)
100 (212)

Valve Lift At Fully Open Position mm (in)
10 (0.39)



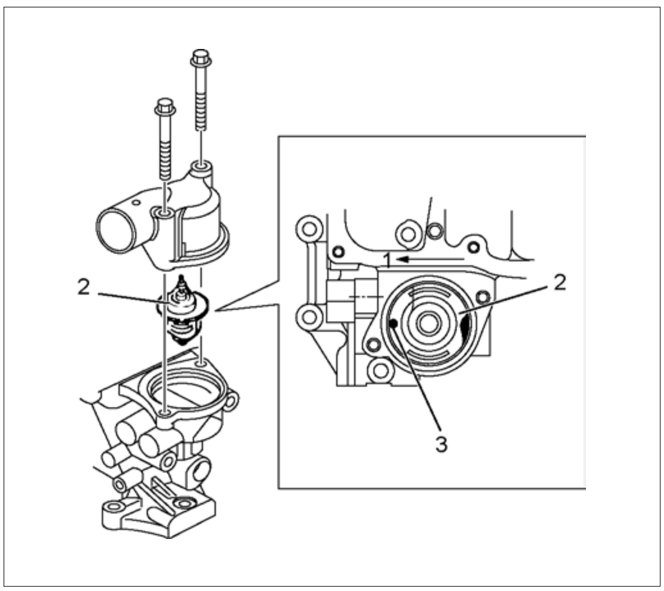
MFW41CSH001401

Legend

1. Wooden Piece
2. Agitating Rod

Installation

1. Thermostat
   Install the thermostat.
   Mount the jiggle valve with the valve facing engine front.



RTW56BSH000101

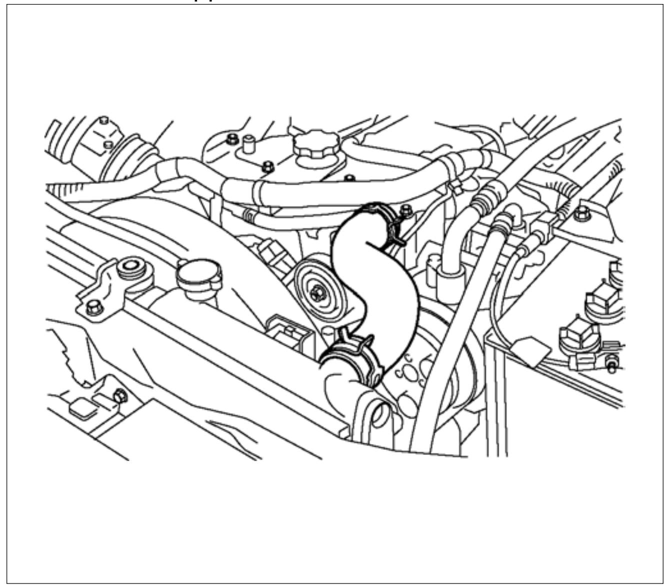
Legend

1. Front
2. Thermostat
3. Jiggle Valve

2. Water Outlet Pipe.
   a. Install the water outlet pipe with new gasket to the thermostat housing.
   b. Tighten the outlet pipe bolt to specified torque.

Outlet Pipe Bolt Torque:
25 N·m (2.5 kg·m /18 lb ft)

   c. Connect the turbocharger-cooling pipe to outlet pipe.
   d. Install the engine harness clip.
3. Radiator Upper Hose.



RTW56FSH000101

   a. Connect the radiator upper hose to the water outlet pipe.
   b. The knob of the clamp should be directed to the horizontal side.
   c. Replenish the engine coolant.
4. Install the engine cover.

Radiator

Radiator and Associated Parts

3. Radiator Hose
4. Fan Guide; Lower
5. Fan Guide
6. Radiator Assembly
7. Drain Plug
8. Radiator Cap
9. Bracket

9. Lift up and remove the radiator assembly with hose, taking care not to damage the radiator core with a fan blade.

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Radiator Cap

Measure the valve opening pressure of the pressurizing valve with a radiator filler cap tester.

Replace the cap if the valve opening pressure is outside the standard range.

Valve opening pressure:

93.3 - 122.7 kPa (0.95 - 1.25 kg / cm^2 / 13.5 - 17.8 psi)

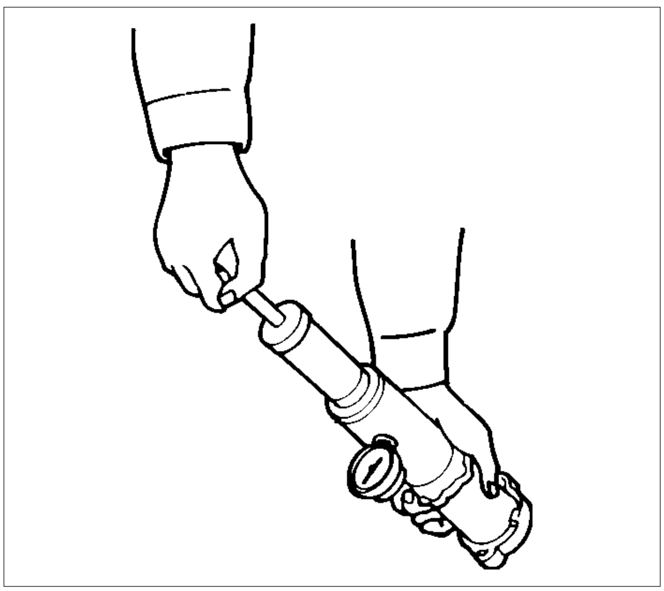
Cap tester: 5–8840–0277–0

Adapter: 5–8840–2603–0

Check the condition of the vacuum valve in the center of the valve seat side of the cap. If considerable rust or dirt is found, or if the valve seat cannot be moved by hand, clean or replace the cap.

Valve opening vacuum:

1.96 - 4.91 kPa (0.02 - 0.05 kg / cm^2 / 0.28 - 0.71 psi)



110RS006

Radiator Core

1. A bent fin may result in reduced ventilation and overheating may occur. All bent fins must be straightened. Pay close attention to the base of the fin when it is being straightened.
2. Remove all dust, bugs and other foreign material.

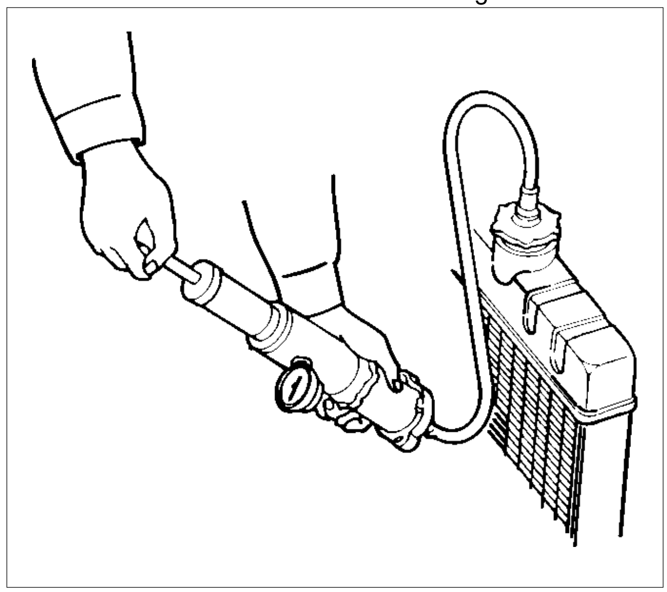
Flushing the Radiator

Thoroughly wash the inside of the radiator and the engine coolant passages with cold water and mild detergent. Remove all signs of scale and rust.

Cooling System Leakage Check

Use a radiator cap tester to force air into the radiator through the filler neck at the specified pressure of 196 kPa (2.0 kg / cm^2 / 28.5 psi) with a cap tester:

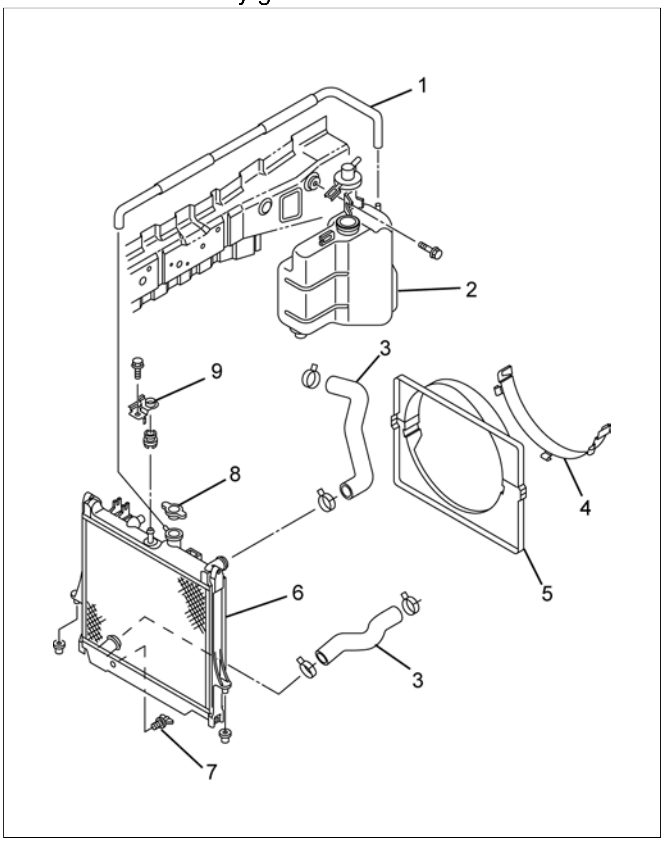
- Leakage from the radiator.
- Leakage from the coolant pump.
- Leakage from the water hoses.
- Check the rubber hoses for swelling.



110RS005

Installation

1. Install radiator assembly (6) with hose, taking care not to damage the radiator core with a fan blade.
2. Support the radiator upper tank with the bracket (9) and secure the radiator.
3. Connect reserve tank hose (1).
4. Install lower fan guide (4).
5. Connect radiator inlet hose and outlet hose (3) to the engine.
6. Install the engine cover.
7. Connect oil cooler hose to automatic transmission.
8. Connect battery ground cable.

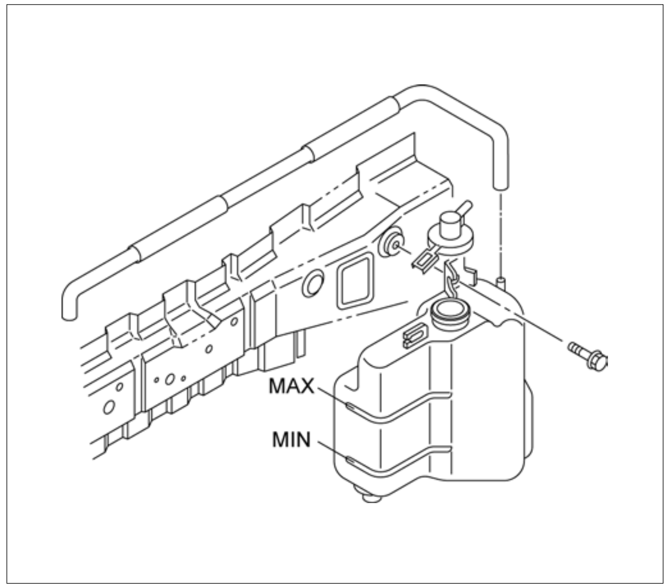


RTW76BMH000101

Legend

1. Reserve Tank Hose
2. Reserve Tank
3. Radiator Hose
4. Fan Guide; Lower
5. Fan Guide
6. Radiator Assembly
7. Drain Plug
8. Radiator Cap
9. Bracket

9. Pour engine coolant up to filler neck of radiator, and up to MAX mark of reserve tank.
   Important operation (in case of 100% engine coolant change) procedure for filling with engine coolant.



RTW76BSH000101

Engine coolant change

Refer to change procedure for Draining and Refilling Cooling System in this section.

SECTION 2

FRAME AND CAB

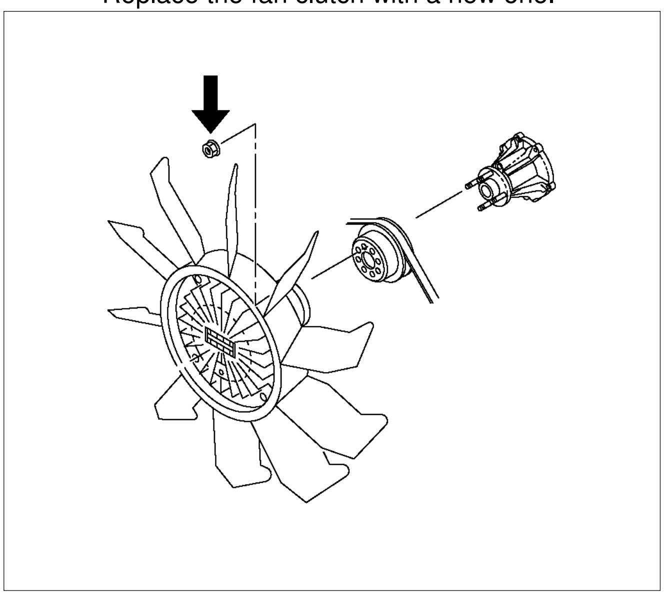
Fan Clutch with Cooling Fan

Inspection and Repair

Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

Visually inspect for damage, leak (silicon grease) or other abnormal conditions.

1. Inspection (on-vehicle)
   a) Turn the fan clutch by hand when in a low temperature condition before starting the engine, and confirm that it can be turned readily.
   b) Start the engine to warm it up until the temperature at the fan clutch portion gets to around 85°C (185°F). Then stop the engine and confirm that the fan clutch can be turned with considerable effort (clutch torque) when turned by hand.
   If the fan clutch rotates more readily, however, this indicates that the silicone grease is leaking internally.
   Replace the fan clutch with a new one.



RTW56ASH025401

2. Inspection (in unit)
   Warm up the bimetal of the fan clutch by using the heat gun until the temperature gets to about 85°C when measured with the thermistor. Then confirm that the fan clutch can be turned with considerable effort (clutch torque).
   If the fan clutch rotates more readily at this time, this indicates that the silicone grease is leaking internally.
   Replace the fan clutch with a new one.

SECTION 6C

FUEL SYSTEM

TABLE OF CONTENTS

Fuel System

Service Precautions

Parts of the fuel system such as the internal part of the fuel injector, and holes and clearances that form passages for fuel are finished to a very high degree of accuracy. They are therefore highly sensitive to foreign matter and the entry of foreign matter could cause damage to the fuel passage. Therefore, effective measures should be taken to prevent the entry of foreign matter.

If a water removal agent is used in the fuel then it will absorb moisture in the light oil and may cause rust. Therefore, do not use a water removal agent in the fuel tank.

When servicing the fuel system, every precaution must be taken to prevent the entry of foreign material into the system.

- Before beginning the service procedure, wash the fuel line and the surrounding area.
- Perform the service procedures with clean hands. Do not wear work gloves.
- Immediately after removing the fuel hose and/or fuel pipe, carefully tape vinyl bags over the exposed ends of the hose or pipe.
- If parts are to be replaced (fuel hose, fuel pipe, etc.) do not open the new part packaging until installation.

Discard gaskets and O-rings and replace them with new ones.

Work procedure

- The fuel opening must be quickly sealed when removing the fuel pipe, injection pipe, fuel injector, fuel supply pump, and fuel rail.
- The eyebolts and gasket must be stored in a clean parts box with a lid to prevent adhesion of foreign matter.
- Fuel leakage could cause fires. Therefore, after finishing the work, wipe off the fuel that has leaked out and make sure there is no fuel leakage after starting the engine.

5. Drain Plug

Functional check

Air bleeding

1. Ignition switch is turned to the ON position for 15 seconds.
2. Ignition switch is turned to the OFF position.
3. The above operation is repeated 5 times.

Note: If the air bleeding work is insufficient then it could lead to faults in the engine. Therefore, the procedures after starting the engine should always be implemented.

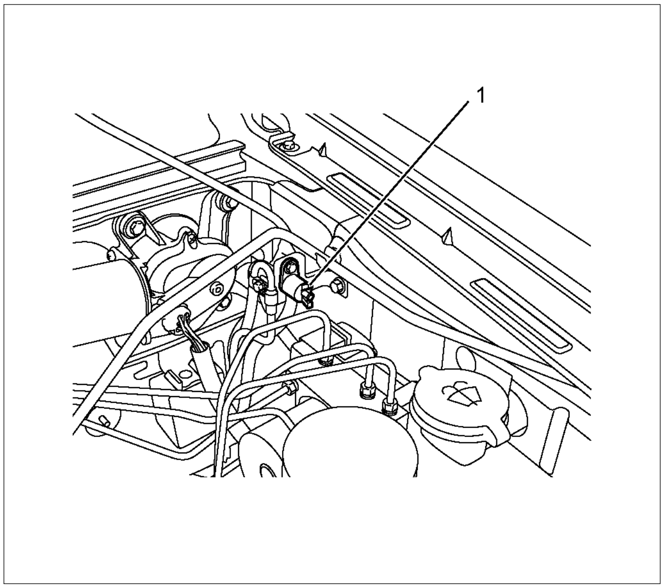
Water drain

A warning lamp will light up if water above the specified volume collects in the sedimenter. In such cases, drain out the water by performing the following operations:

1. Draining with fuel filter drain plug.
   a. Set a container at the tip of the plastic hose.
   b. Loosen the air bleeding plug and the drain plug.
   c. Discharge the water.
   d. Tighten the drain plug after discharging the water.
   e. Tighten the air bleeding plug to the specified torque.
      Tightening torque: 3 N·m(0.3 kg·m/26 lb in)
   f. Ignition switch is turned ON for 15 seconds check for fuel leakage.

g. Check that the warning lamp in the meter is off.

2. Draining with drain plug in engine room.
   a. With the engine off, open the engine hood and loosen the drain plug (1) located on the left hand side of the engine room. (3-4 turns)
   b. Turn the starter switch to the "ON" position for 10 seconds, and then turn the starter switch to the "OFF" position for 10 seconds. Then, once again turn the starter switch to the "ON" position for 10 seconds.
   c. Tighten the drain plug firmly.
   d. After starting the engine, check that there is no fuel leakage from the drain plug. Also check that the water separator indicator has turned off.



RTW76CSH001301

NOTE:

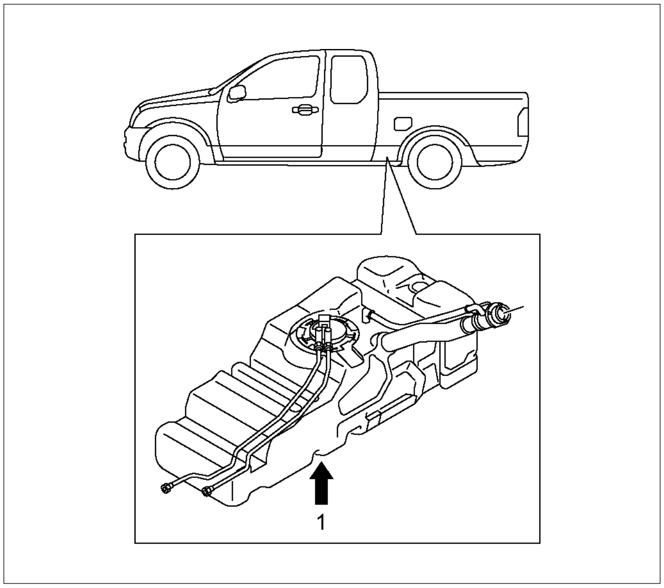
- If the water separator requires frequent draining, have the fuel tank drained at your ISUZU/GM Dealer.
- Be sure to stop the engine when draining the fuel tank.
- Confirm that there are no combustible materials under the drain hose, and use a receptacle to catch the drained water.

Engine starting cautions

- Before starting the engine, turn the ignition switch to the "ON" position. Wait 15 seconds. Return the switch to the "LOCK" position. Repeat this procedure 5 times.
- After starting the engine, allow it to idle for 10 minutes.

Fuel Pump Functional Check

1. Turn the starter switch to "ON" position.
2. Touch the under portion of the Fuel Tank by the hand as shown in the following figure within 12 seconds.



RTW56CSH003501

Legend

1. Touch this area by the hand

3. Make sure a vibration by the Fuel Pump is detected.
   Fuel Pump stops within 12 seconds of turning the starter switch to the "ON" position.
   When the check is repeated, return the starter switch to the "LOCK" position for 10 – 15 seconds and perform procedures 1 – 3.

WARNING: FUEL PUMP FUNCTIONAL CHECK MUST BE CONDUCTED UNDER THE FOLLOWING CONDITIONS TO AVOID INJURY.

- **APPLY THE PARKING BRAKE.**
- **STOP THE ENGINE.**

Trouble Shooting

Problems with starting

Condition	Possible Cause	Correction
Problems with starting	Fuel tank is empty	Fill the tank.
	Air has entered the fuel system.	Bleed the air.
	Fuel line or fuel cooler is clogged or damaged. Connection to the fuel line is loose.	Repair or replace the fuel line and fuel cooler. Re-tighten the connection.
	Fuel filter element is clogged.	Replace the cartridge.
	Fault in the feed pump	Replace the fuel supply pump.
	Regulating valve is open.	Replace
	Sticking of the fuel injector	Replace the fuel injector.
	Defective engine control system	Diagnose the engine control system.

Hunting during idling

Condition	Possible Cause	Correction
Hunting during idling	Air has entered the fuel system.	Bleed air from the fuel system.
	Leakage or clogging of the fuel system	Repair or replace the fuel system.
	Drops of water have entered the fuel system.	Replace the fuel.
	Fuel filter element is clogged.	Replace the fuel filter element (cartridge).
	Sticking of the fuel injector	Replace the fuel injector.
	Defective engine control system	Diagnose the engine control system.

Insufficient horsepower

Condition	Possible Cause	Correction
Insufficient horsepower	Air has entered the fuel system.	Bleed air from the fuel system.
	Leakage or clogging of the fuel system	Repair or replace the fuel system.
	Water mixes in the fuel system	Replace the fuel.
	Fuel filter element is clogged.	Replace the element or the cartridge.
	Sticking of the fuel injector	Replace the fuel injector.
	Defective engine control system	Diagnose the engine control system.

Maximum engine speed is too low

Condition	Possible Cause	Correction
Maximum engine speed is too low	Fuel line, fuel cooler is clogged or damaged.	Repair or replace the fuel line, fuel cooler.
	Defective engine control system	Diagnose the engine control system.

Exhaust gas is blue or black.	Reduction in injection-valve opening pressure or defective atomizing status	Replace the fuel injector.
	Engine control system malfunction	System diagnosis.

Fuel System Check

Description

Conforms to a fuel leak. Engine acceleration raises fuel pressure and which increases the leak.

Leak could be in the following pipes and locations.

- Between injectors and fuel rail.
- Between fuel rail and fuel supply pump.
- Between fuel supply pump and fuel filter.
- Between fuel filter and fuel tank.
- Between pressure limiter and fuel cooler.
- Between fuel cooler and fuel tank.
- Between injector over flow and leak off pipe.

Diagnostic Aids

Check the following items.

- Air in the fuel line
- Clogged fuel filter
- Fuel pipe malfunction (Crushing, breakage, clogging, disconnection, etc.)
- Fuel cooler malfunction (Crushing, breakage, clogging, disconnection, etc.)
- Fuel tank malfunction
- Injector malfunction
- Fuel supply pump malfunction
- Pressure limiter malfunction

An intermittent may be caused by a poor connection, rubbed-through wire insulation or a wire broken inside the insulation. Check for poor connections or a damaged harness.

Inspect the ECM harness and connector for improper mating, broken locks, improperly formed or damaged terminals, poor terminal-to-wire connection, and damaged harness.

ECU may set a DTC, if there is adequate air in fuel line.

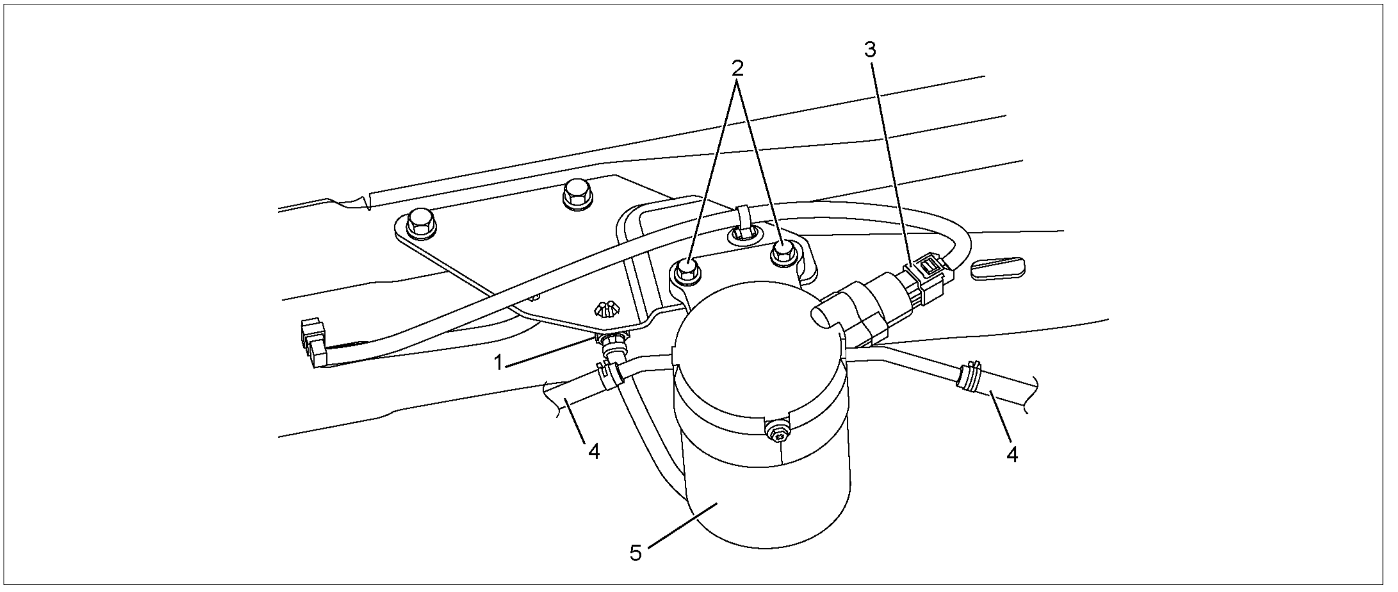
Schematic Reference: Engine Controls Schematics

Step	Action	Value(s)	Yes	No
1	Check the fuel quantity. Was a problem found?	—	Go to *Step 2*	Add fuel and Go to *Step 2*
2	Check the fuel quality. 1. Discharge the fuel from fuel tank 2. Replenish the tank with specified fuel 3. Bleed the air from the fuel system 4. Start the engine Could the engine be started?	—	Go to *Step 7*	Go to *Step 3*
3	Bleed the air from fuel system. Refer to Fuel System Air Bleeding in this section. Is the action complete?	—	Go to *Step 4*	—
4	Check the main fuel filter for clogging. Clean, repair, or replace as required. Notice: Replacement of a fuel filter is checking to a dealer. Is the action complete?	—	Go to *Step 5*	—
5	Check the fuel line and fuel cooler for damage and leakage. Clean, repair, or replace as required. • Crushed areas • Breakage • Cracks • Loose connections Is the action complete?	—	Go to *Step 6*	—

Step	Action	Value(s)	Yes	No
6	Check the fuel tank. If a problem is found, clean, repair, or replace as necessary. • Foreign material (Clogged suction port) • Bent or cracked suction pipe • Fuel tank distortion • Fuel tank improper installation • Fuel pump and sender malfunction • Clogged fuel cap hole • Water Is the action complete?	—	Go to *Step 7*	—
7	Bleed the air from the fuel pipe again. Refer to Fuel System Air Bleeding in this section. Is the action complete?	—	Verify repair	—

Fuel Filter Assembly

Components



RTW76CSF000101

Legend

1. Fuel Sedimenter Connector
2. Bolt
3. Harness Connector
4. Fuel Hose
5. Fuel Filter Assembly

Removal

1. Remove the fuel filler cap.
2. Remove the fuel sedimenter connector.
3. Disconnect the harness connector.
4. Remove the feed hose and the return hose from the fuel filter and plug it so that the fuel does not flow out.
5. Remove the bolts for mounting the fuel filter.
6. Remove the fuel filter assembly.

Installation

1. Install the fuel filter assembly.
2. Install the bolts for mounting the fuel filter.
3. Install the feed hose and the return hose.
4. Connect the harness connector.
5. Install the fuel sedimenter connector.
6. Install the fuel filler cap.
7. Bleed out the air.
   - Refer to "Fuel System".

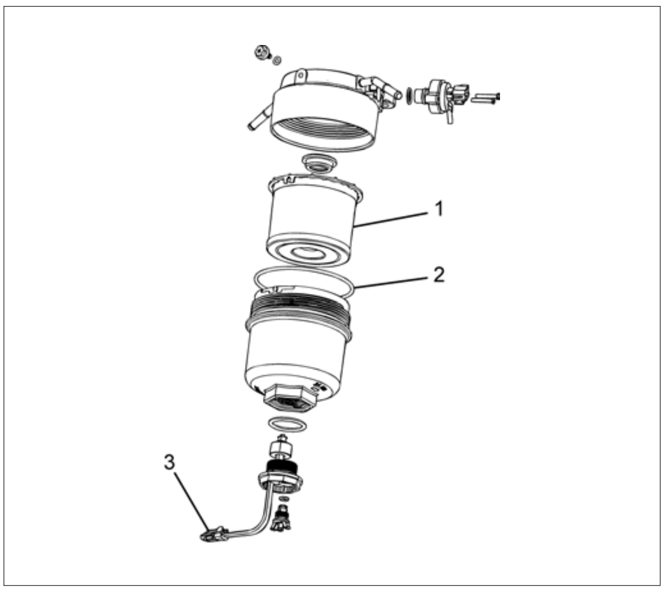
Fuel Filter Element

Removal

1. Detach the drain hose on the lower part of the fuel filter or the drain plug, loosen the air bleed plug, and drain the fuel from the fuel filter.
2. Detach the water-in-fuel switch harness.
3. Turn the element case counterclockwise to detach, and remove the filter element.
4. Replace the O-ring and confirm the snap-fit position, and fit a new filter element inside the element case.

NOTE

It is strongly advisable to use the ISUZU/GM genuine fuel filter for replacement.



RTW76CSH000901

Legend

1. Element
2. O-ring
3. Sedimenter Sensor

Installation

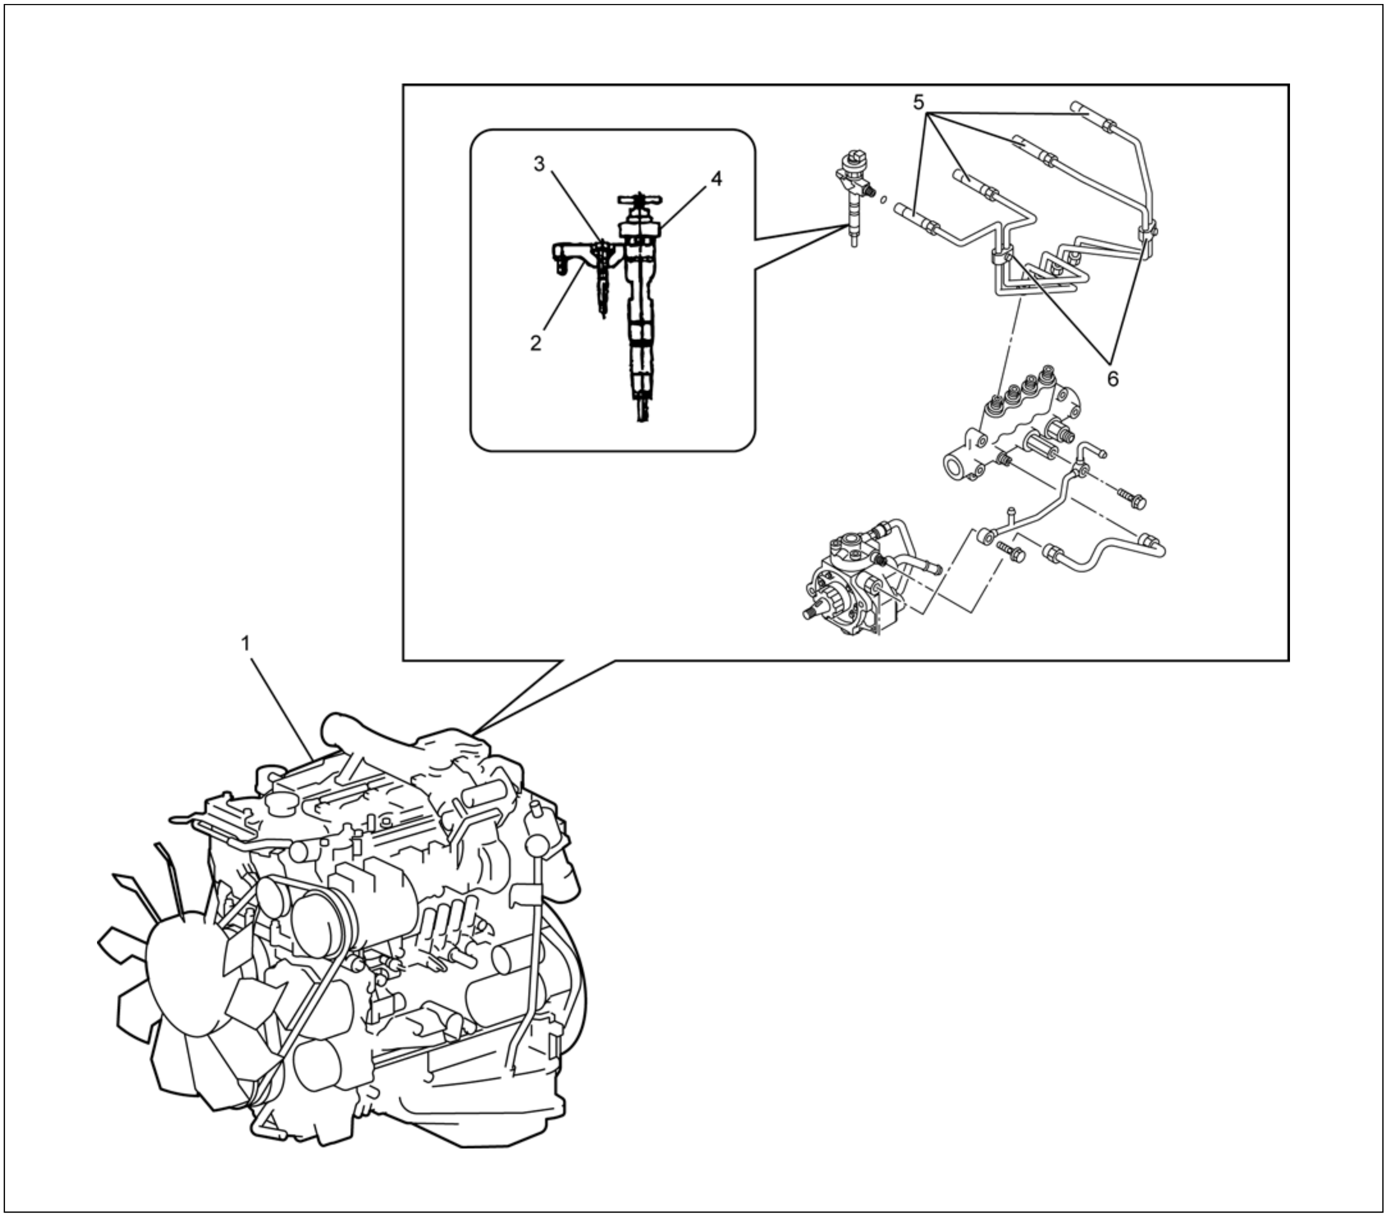
1. Apply a light coat of new diesel oil to the O-ring and gasket.
2. Turn the element case clockwise until it is completely seated against the upper cover. Then check that the drain hose is in its correct position, and then use a filter wrench and tighten to the specified torque.

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)

3. Use a clip to fix the drain hose at the base of the fuel filter, and fit the water-in-fuel switch harness.

Fuel Injector

Components



RTW76CLF000101

Legend

1. Cylinder Head Cover
2. Fuel Injector Clamp
3. Fuel Injector Clamp Bolt
4. Fuel Injector
5. Fuel Injection Pipe
6. Fuel Injection Pipe Clip

The fuel system consists of many tiny holes and spaces that allow the movement of fuel from one place to another. These holes and spaces are milled to extremely high precision. This is especially true of the fuel injector.

The fuel injector is very sensitive to foreign material. Foreign material will result in fuel system breakdown. Exercise great care not to allow the entry of foreign material into the fuel system or fuel injector during the removal and installation procedure.

Note: To avoid electric shock;
Set the switch to the 'OFF' position and disconnect the negative battery cable before checking or repairing the fuel injector, wiring or/and connectors.

Removal

1. Remove the cylinder head cover.
   Refer to the removal procedure for the cylinder head cover in this manual.

Remove the attachment bolt of the engine oil gauge guide tube.

2. Loosen the fuel injector clamp fixing bolts and remove the fuel injector.
   If the fuel injector is difficult to remove, use the remover. Use a screwdriver to force the fuel injector clamp off the fuel injector.

Note: Do not remove the fuel injector sleeve.

Note: Cover the areas exposed during parts removal to prevent the entry of foreign material into the fuel system.

3. Mark each fuel injector with the number of the cylinder from which it was removed. Store the fuel injector in a safe place. Position the fuel injector so that the nozzle is protected.

Note: Do not tamper with the electromagnetic portion of the fuel injector. Reduced electromagnetic function will result in injector failure.

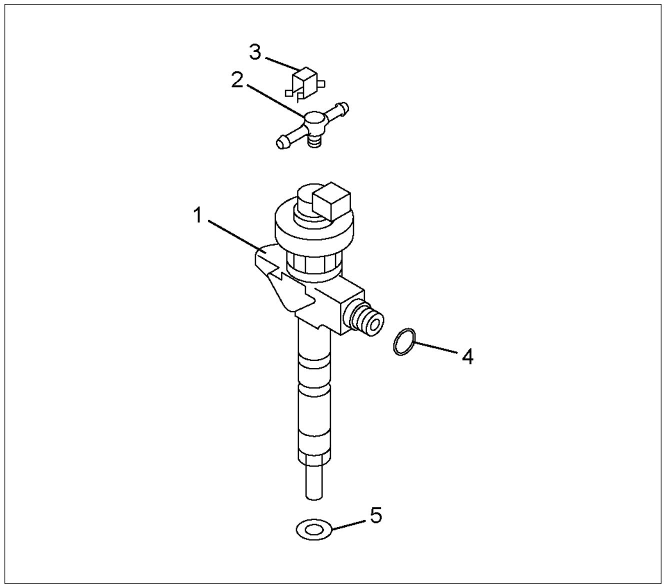
Note: After replacement of the fuel injector, perform the following procedure.

- All fuel injectors are replaced:
  Remove the fuel injector ID code label on the cylinder head cover.
- Any fuel injector(s) is replaced:
  Black out the replaced cylinder of the fuel injector ID code on the fuel injector ID code label with a marking pen or equivalent.

Installation

1. Install the new gasket and O-ring to each fuel injector.

Note: Do not reuse the clips (3).

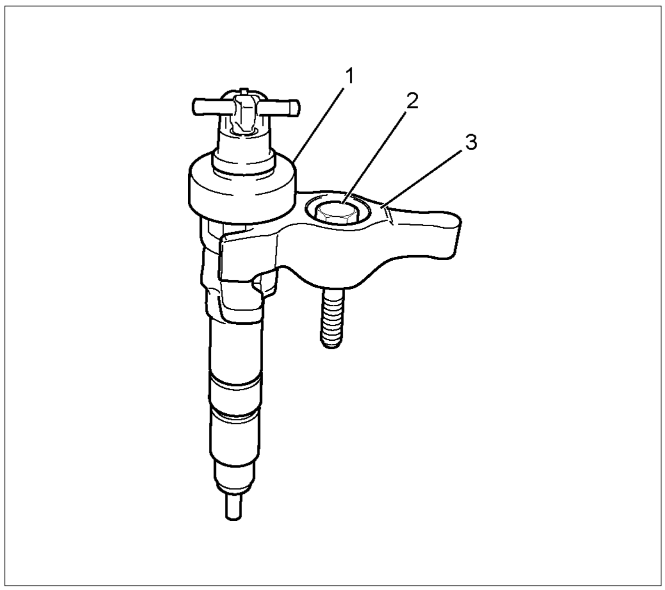


RTW66CSH000101

Legend

1. Fuel Injector
2. Leak Off Pipe
3. Clip
4. O-ring
5. Gasket

2. Install the fuel injector clamps. Refer to the illustration.



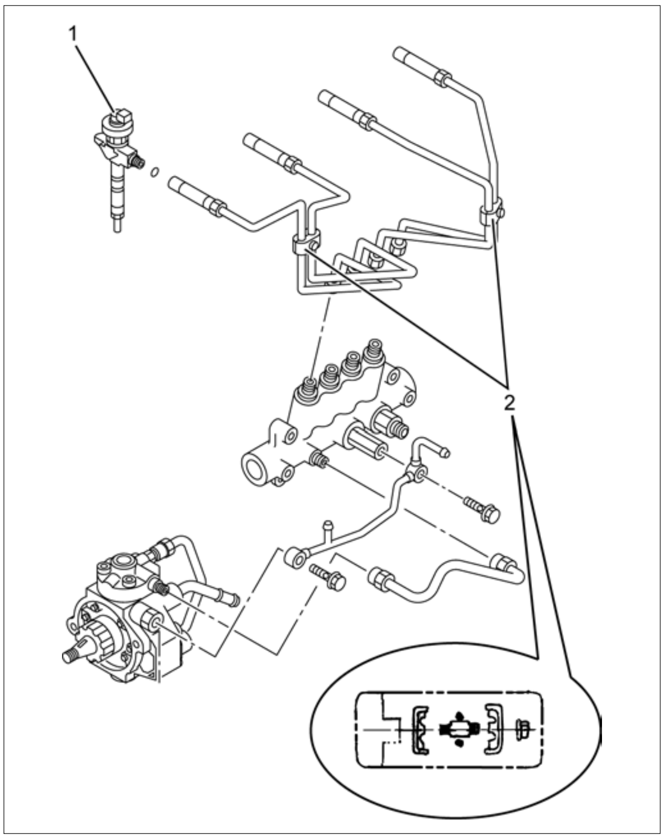
RTW56CSH000601

Legend

1. Fuel Injector
2. Bolt
3. Fuel Injector Clamp

3. Apply Engine oil to the threads and seating surfaces of the clamp bolts.
4. Install the fuel injector clamps to the cylinder head.
5. Temporarily tighten the clamp bolts.
6. Apply a thin coat of engine oil to the outer surface of the fuel injector side sleeve nuts.
7. Install the fuel injector pipes to the position shown in the illustration.
8. Use a spanner to carefully tighten the sleeve nuts until the fuel injector pipes contact the fuel injector and fuel rail.
9. Tighten the fuel injector pipe clips to the specified torque.

Tightening torque: 8 N·m (0.8 kg·m / 69 lb in)



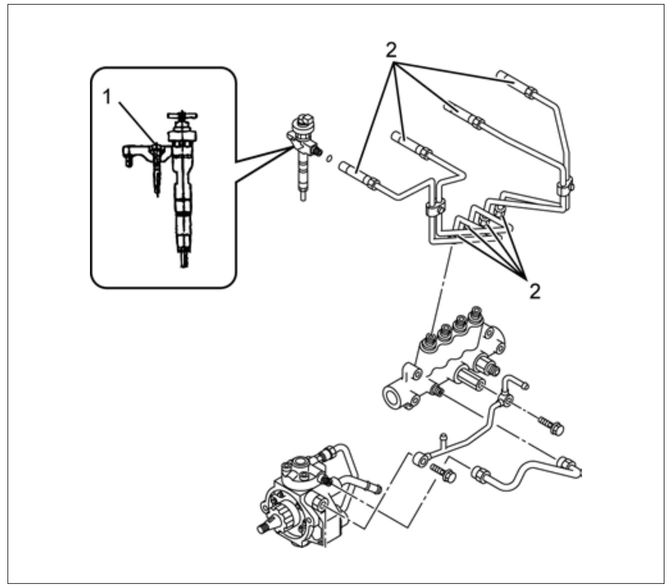
RTW76CMH000101

Legend

1. Fuel Injector
2. Pipe Clip

10. Tighten the injection pipes to the specified torque.

Tightening torque: 30 N·m (3.1 kg·m / 22 lb ft)



RTW76CSH000201

Legend

1. Clamp Bolt
2. Sleeve Nut

11. Tighten the fuel injector clamp bolts to the specified torque.

Tightening torque: 26 N·m (2.7 kg·m / 20 lb ft)

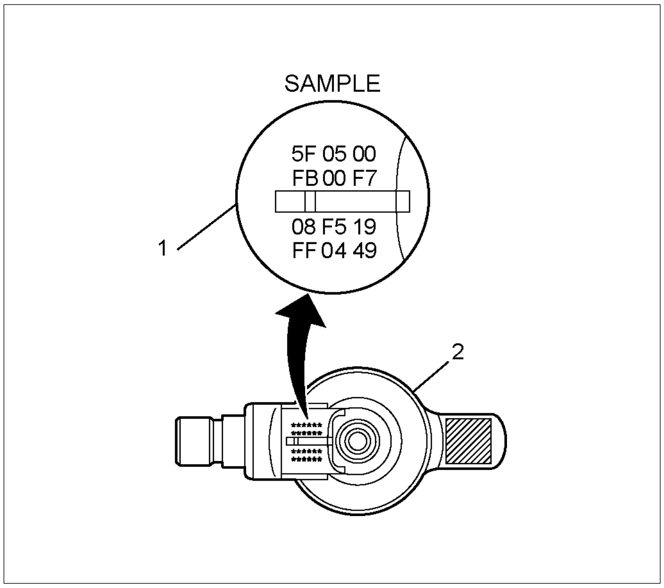
12. Tighten the engine oil level gauge guide tube.

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)

13. Install the cylinder head cover.
    Refer to the install procedure for the cylinder head cover in this manual.

Record the Fuel Injector ID Code Data from each injector housing

1. Remove each fuel injector harness connector.
2. Record all numbers of each cylinder on the harness connector housing. The correct order for the fuel injector ID codes of the following illustration is as follows:
   5F 05 00 FB 00 F7 08 F5 19 FF 04 49



RTW76ESH002601

Legend

1. Fuel Injector ID Code
2. Fuel Injector

Programming Fuel Injector ID Codes

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > appropriate vehicle identification > 4JK1 or 4JJ1 > Programming > Replace Injector.
4. In order to get programming approval, the on-screen displays a message to user. Get programming approval from the TIS 2000 using the following procedure:
   a. Connect a scan tool to the terminal that installed TIS 2000 with the latest software and the hardware key is plugged into port.
   b. Turn ON the scan tool and keep at title screen.
   c. Launch the TIS application.
   d. Select the Security Access at the main screen.
   e. Highlight the "Tech" 2 on the Diagnostic Tool Selection screen and click "Next".
   f. Click "Close" on the Security Access Enabled screen.
   g. Turn OFF the scan tool.
   h. Disconnect the scan tool from the terminal.
5. Reinstall a scan tool to the vehicle.
6. Turn ON the ignition, with the engine OFF.
7. Select Diagnostics > appropriate vehicle identification > 4JK1 or 4JJ1 > Programming > Replace Injector.
8. Enter 24 figures of replaced fuel injector ID code.
9. After complete the programming, turn OFF the ignition for 30 seconds.
10. Start the engine and let idle.
11. Inspect for a proper engine running condition and for no DTC's. Refer to the Diagnostic System Check - Engine Controls if needed.

2. Fuel Rail Pressure Sensor
3. Fuel Pressure Limiter

Reassembly

1. Install the fuel pressure limiter.

Tightening torque: 172 N·m (17.5 kg·m/127 lb ft)

2. Install the fuel pressure sensor.

Tightening torque: 98 N·m (10.0 kg·m/72 lb ft)

Installation

1. Tighten the fuel rail bracket and fuel rail using the specified torque.

Tightening torque: 25 N·m (2.5 kg·m/18 lb ft)

2. Tighten the vacuum pipe to the fuel rail bracket using the specified torque.

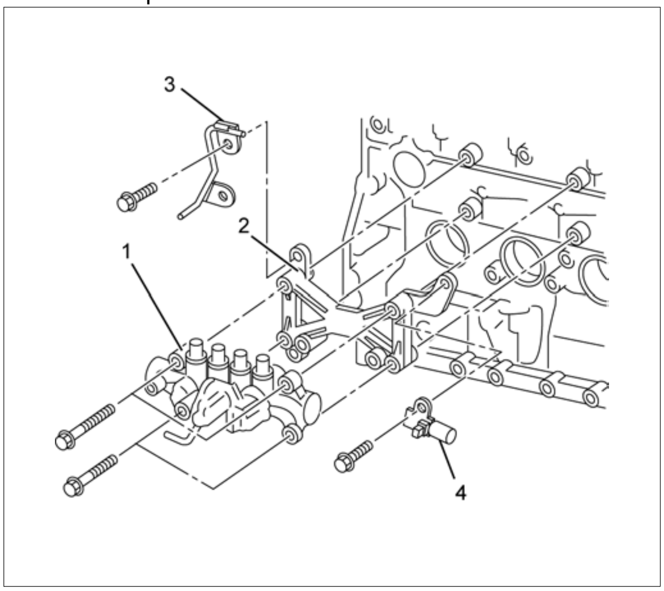
Tightening torque: 10 N·m (1.0 kg·m/87 lb in)

3. Tighten the swirl control solenoid valve to the fuel rail bracket using the specified torque.

Tightening torque: 20 N·m (2.0 kg·m/14 lb ft)

Note:

- Do not grasp the pressure sensor, during the fuel rail removal procedure.
- Take care not to damage the connector unit of the pressure sensor.



RTW76CSH000801

Legend

1. Fuel Rail
2. Fuel Rail Bracket
3. Vacuum Pipe
4. Swirl Control Solenoid Valve

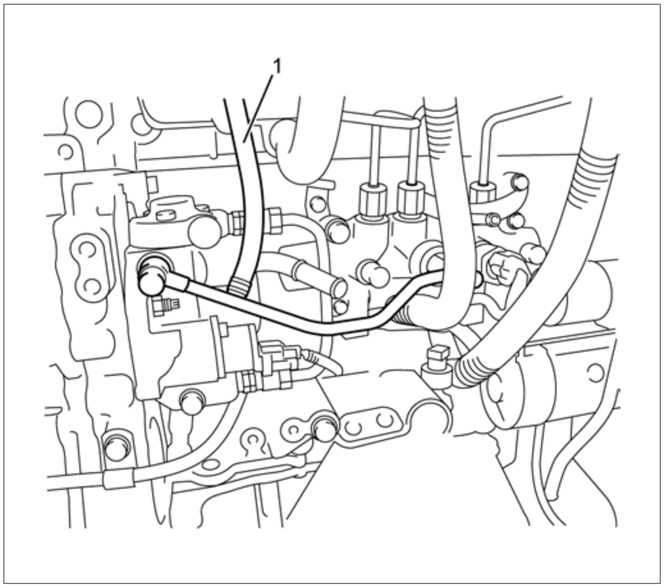
4. Tighten the fuel pipe using the mounting sleeve nut and the specified torque.

Tightening torque: 25 N·m (2.5 kg·m/18 lb ft)

5. Connect the fuel rail pressure sensor harness connector.

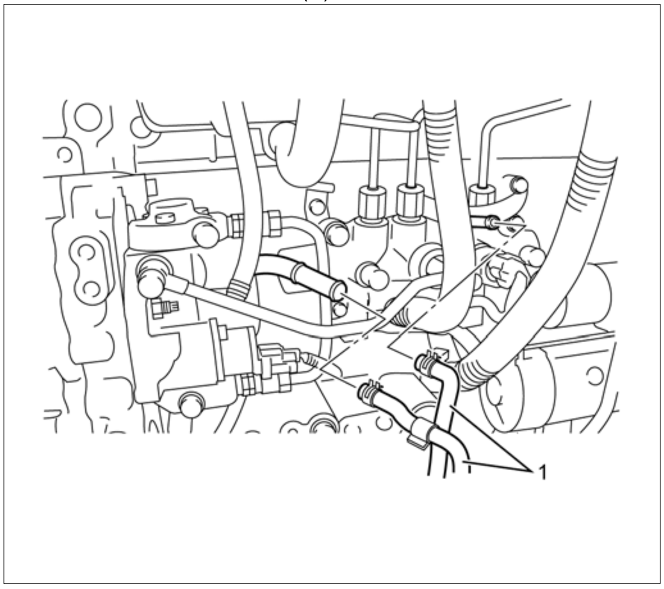
6. Tighten the fuel leak off pipe and hose (1) using the mounting eyebolt using the specified torque.

Tightening torque: 10 N·m (1.0 kg·m/87 lb in)



RTW76CSH000401

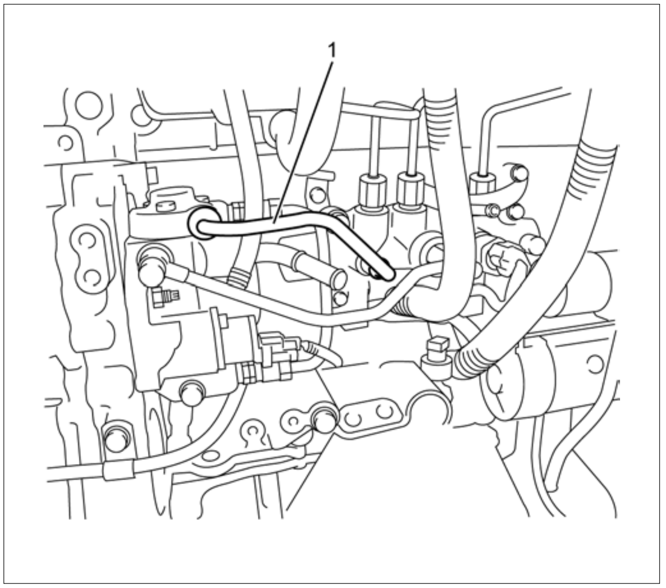
7. Install the fuel hose (1).



RTW76CSH000601

8. Install the fuel feed pipe (1) for supply pump and tighten the bolts to the specified torque.

Tightening torque: 44 N·m (4.5 kg·m/33 lb ft)



RTW76CSH000501

9. Install the starter motor.
   - Refer to removal procedure for engine electricals in this manual.

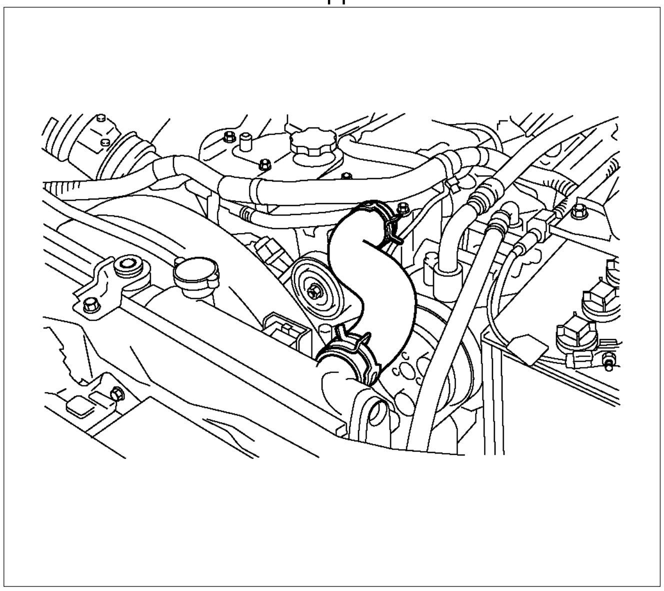
The fuel system consists of many tiny holes and spaces that allow the movement of fuel from one place to another. These holes and spaces are milled to extremely high precision. This is especially true of the fuel injector.

The fuel injector is very sensitive to foreign material. Foreign material will result in fuel system breakdown. Exercise great care not to allow the entry of foreign material into the fuel system or fuel injector during the removal and installation procedure.

Removal

1. Partially drain the engine coolant.
   Refer to drain procedure for engine cooling in this manual.
2. Remove the radiator upper hose.



RTW56FSH000101

3. Remove the fan guide.

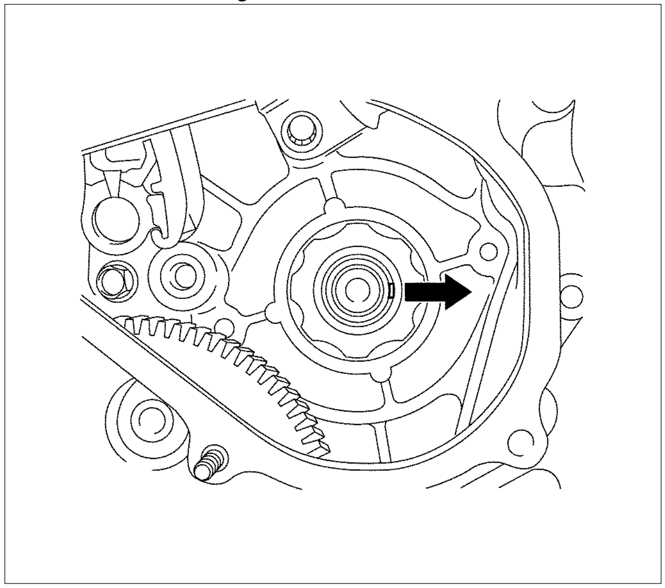
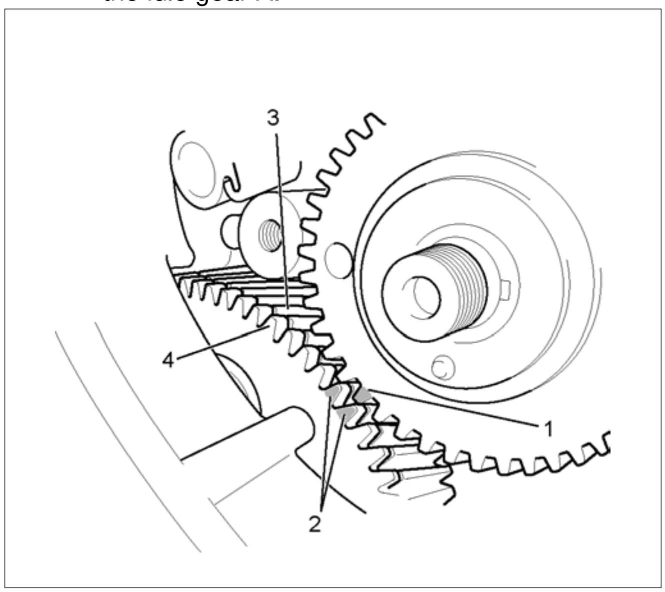
2. Fuel Supply Pump Bracket

4. Confirm that the supply pump camshaft key is turned to the right and is horizontal.



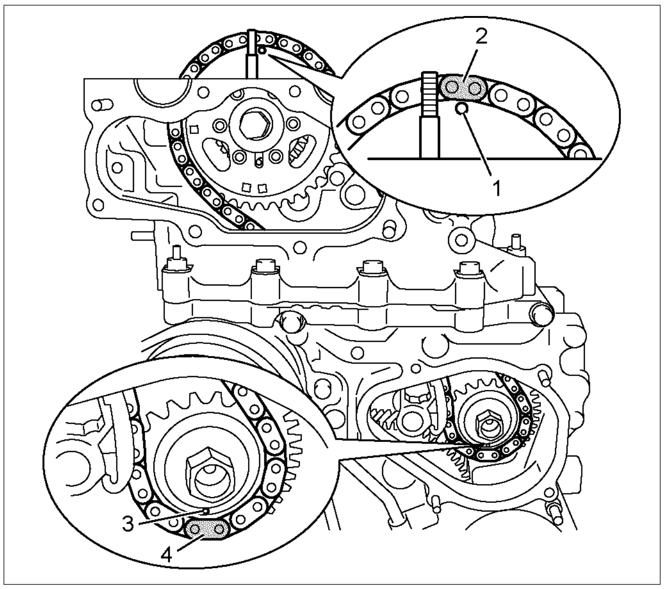
RTW56CSH004301

5. Install the fuel supply pump gear to the pump shaft.
   a. Align the fuel pump gear timing mark (1) with the idle gear A paint marks (2).
   b. Ensure that the pump gear is bitten with main gear (3) of the idle gear A. Depress the pump gear when it is bitten with scissors gear (4) of the idle gear A.



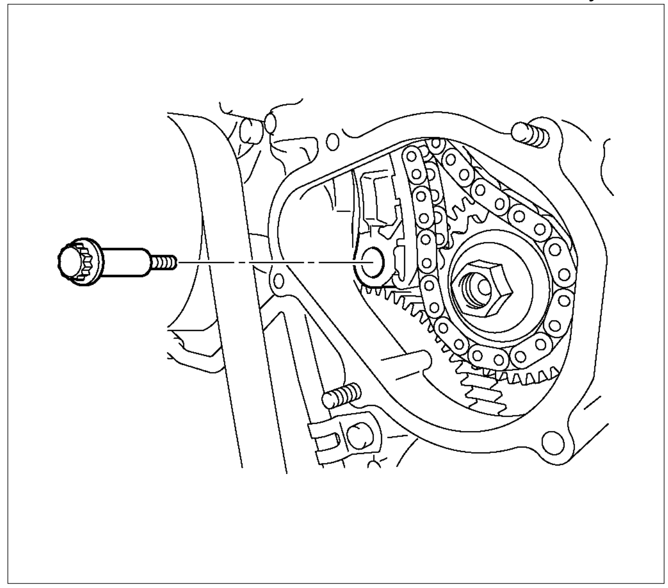
RTW56CSH005101

6. Install the timing chain to the each sprocket and install the fuel supply pump sprocket to the pump shaft.
   a. Align the camshaft sprocket timing mark (1) with the dark plate timing chain link (2).
   b. Align the fuel supply pump sprocket timing mark (3) with the yellow plate timing chain link (4).
   c. Install the fuel supply pump sprocket to the fuel pump shaft by aligning the dowel pin that is attached to the gear.
   d. Hand-tighten the fuel supply pump shaft nut.



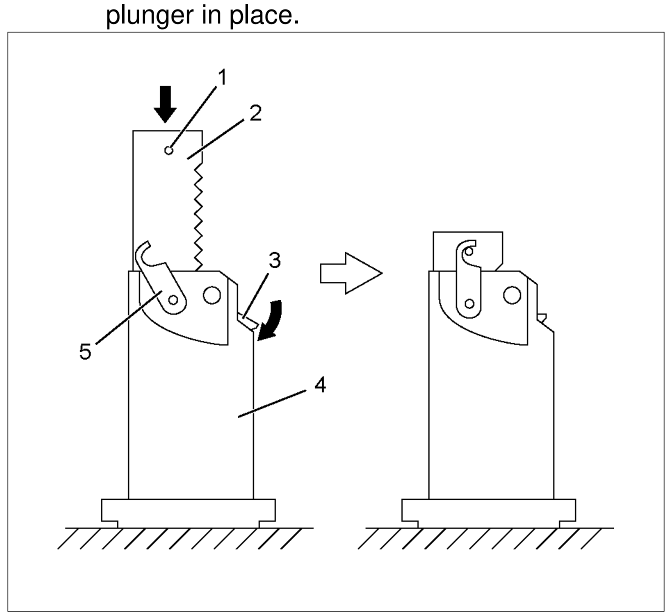
RTW56CSH005001

7. Install the timing chain tension lever pivot. Hand-tighten the pivot bolt.
   - Confirm the tension lever moves smoothly.



RTW56ASH019401

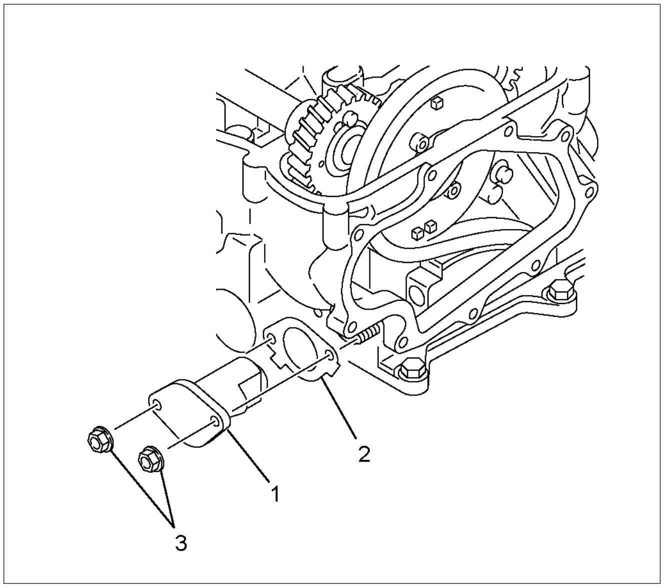
8. Attach the hook of the timing chain tensioner.
   - Hold the latch (3) depressed. Insert the plunger (2). Attach the hook (5) to the pin (1) to hold the plunger in place.



RTW56CSH004401

9. Install the timing chain tensioner.
   Tighten the nut to the specified torque.

Tightening torque: 10 N·m (1.0 kg·m/ 87 lb in)

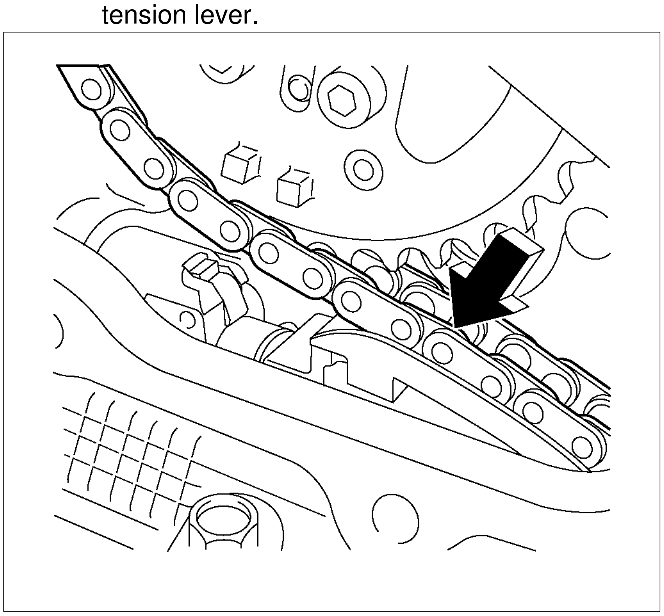


RTW56CSH001701

Legend

1. Timing Chain Tensioner
2. Gasket
3. Nut

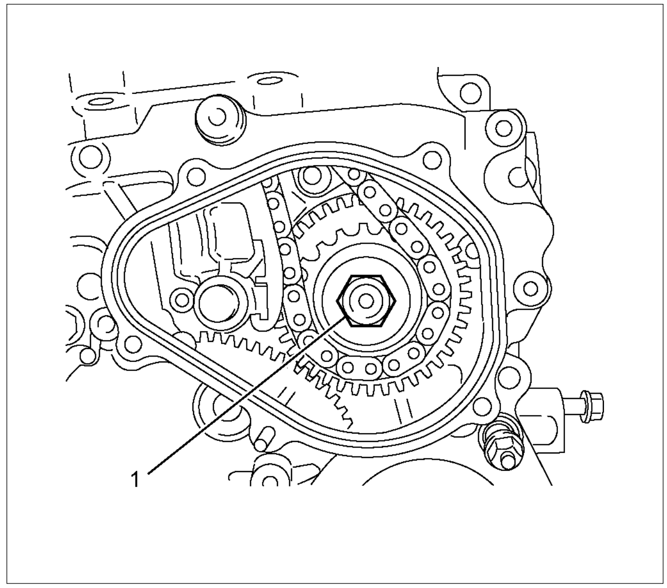
10. Unlock the tensioner hook.
    - Press the place of the arrow in the figure.
    - The hook is opened. The plunger pushes the tension lever.



RTW56ASH020401

11. Tighten the fuel supply pump shaft nut.
    Tighten the nut (1) to the specified torque.

Tightening torque: 130 N·m (13.3 kg·m / 96 lb ft)

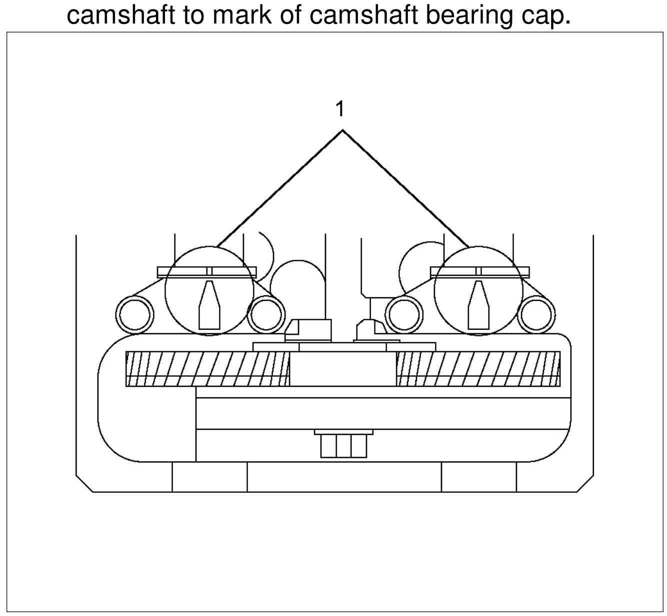


RTW56CSH001601

12. Tighten the timing chain tension lever pivot bolt to the specified torque.

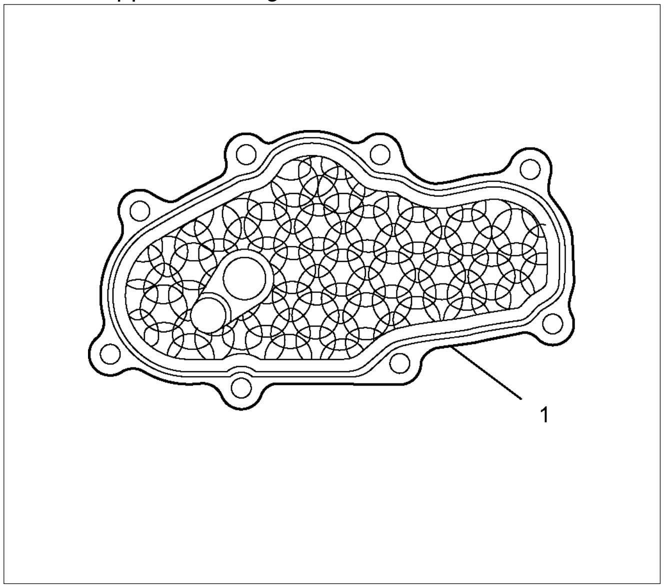
Tightening torque: 27 N·m (2.8 kg·m / 20 lb ft)

13. Turn the crank pulley two rotations (720°CA).
14. Check mark (1) on intake camshaft and exhaust camshaft to mark of camshaft bearing cap.



RTW56ASH006901

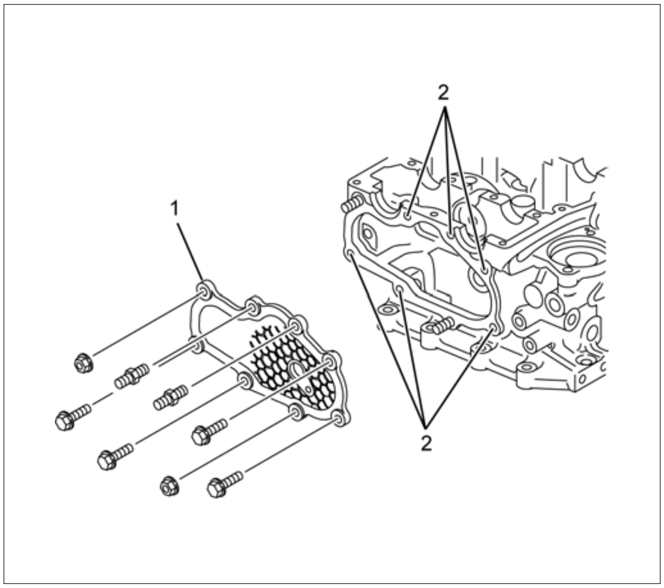
15. Install the cylinder head cover.
    Refer to "Cylinder Head Cover" in ENGINE MECHANICAL section.
16. Apply liquid gasket (ThreeBond TB-1207C or equivalent) to timing chain cover upper (1).
    - Attach cover within 5minutes after the application of gasket.



RTW56CSH002101

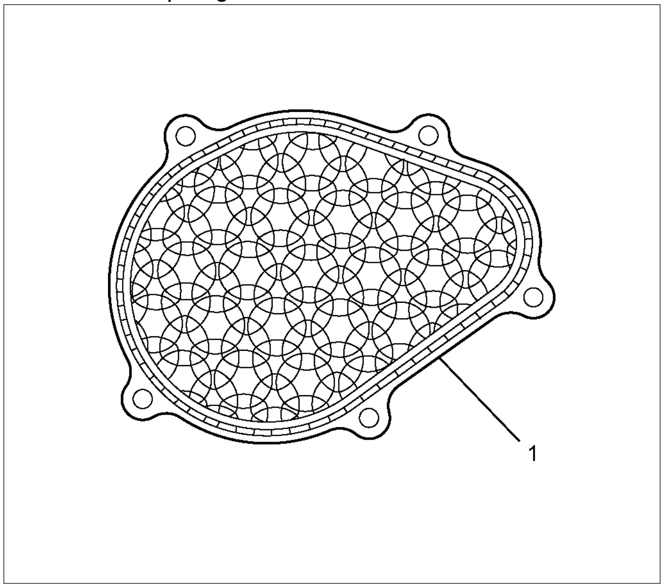
17. Install the timing chain cover upper (1).
    Tighten the bolt to the specified torque.
    - Apply Loctite #262 or equivalent to the bolt and stud threads of cylinder head side (2).

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)



RTW76CSH001201

18. Apply liquid gasket (ThreeBond TB-1207C or equivalent) to the timing chain cover lower (1).
    - Attach the cover within 5 minutes of applying the liquid gasket.



RTW56CSH002301

19. Install the timing chain cover lower.
    Tighten the nuts and bolts to the specified torque.

Tightening torque: 10 N·m (1.0 kg·m / 87 lb in)

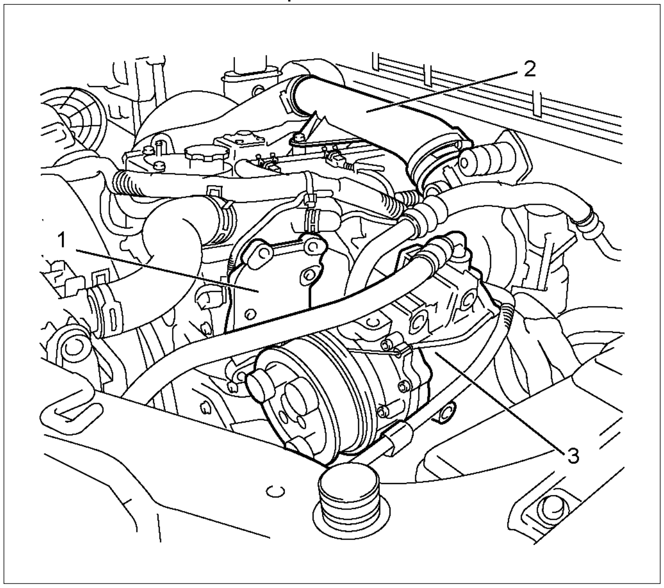
20. Install the noise cover to the timing chain cover lower.
    Tighten the bolts to the specified torque.

Tightening torque: 10 N·m (1.0 kg·m / 87 lb in)

21. Connect the connectors.
    - Supply pump
    - Camshaft position sensor
22. Install the fuel rail assembly.
    - Refer to the Install procedure for "Fuel rail assembly" in this manual.
23. Install the A/C compressor bracket.
    Tighten the bolts to the specified torque.

Tightening torque: 25 N·m (2.5 kg·m / 18 lb ft)

24. Install the A/C compressor.



RTW56ASH004201

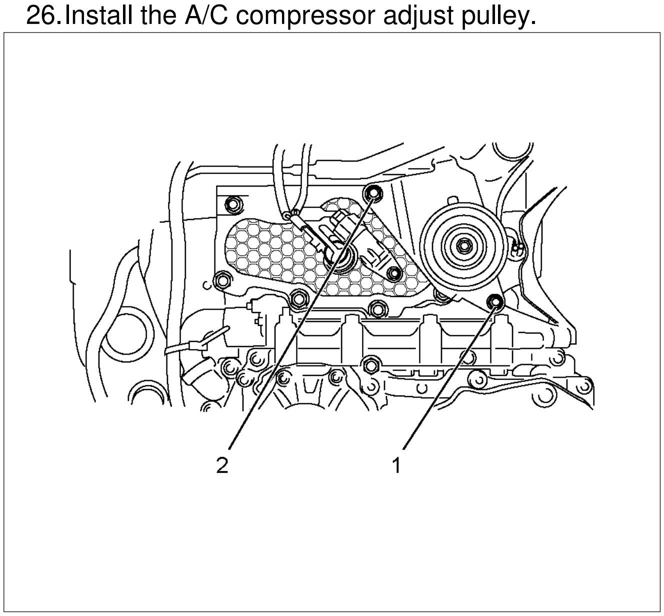
Legend

1. A/C Compressor Bracket
2. Intake Duct
3. A/C Compressor

Tighten the bolts to the specified torque.

Tightening torque: 44 N·m (4.5 kg·m / 33 lb ft)

25. Install the battery.
26. Install the A/C compressor adjust pulley.



RTW56ASH010601

Legend

1. Bolt
2. Nut

Tighten the nut and bolt to the specified torque.

Bolt Tightening torque: 25 N·m (2.5 kg·m/18 lb ft)

Nut Tightening torque: 25 N·m (2.5 kg·m/18 lb ft)

27. Install the A/C compressor drive belt.
Refer to the drive belt tension check procedure for Heating and air conditioning in this manual.
28. Install the cooling fan.
29. Install the fan guide.
30. Install the radiator upper hose.
31. Replenish the engine coolant.

Fuel Supply Pump Relearn Procedure

The ECM goes through a fuel supply pump learn procedure to fine tune the current supplied to the fuel rail pressure (FRP) regulator. This learning process in only performed when the engine is idling.

1. Install the scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Command the Supply Pump Learn Reset with the scan tool.
4. Observe the Supply Pump Status parameter with the scan tool. Confirm the scan tool indicates Not Learn.
5. Start the engine and let idle until engine coolant temperature (ECT) reads 149°F (65°C) or higher while observing Supply Pump Status parameter with the scant tool. The scan tool changes status Not Learn > Learning > Learned.
6. If the ECM has correctly learned the fuel supply pump current adjustment, the Supply Pump Status parameter on the scan tool will repeatedly indicate Learning and Learned.

Torque Specifications

4. Fog Light

Tighten the fixing nuts to the specified torque.

Torque	N·m(kgf·m/lb·in)
7 (0.7 / 61)	

Fuel Sedimenter Switch

Inspection

1. Check that there is continuity between the switch connector terminals when the float in the fuel sedimenter is above the water drain line.
2. Turn on the ignition switch, remove the fuel sedimenter connector, and connect the terminals of the connectors on the harness side. Confirm that the sedimenter warning lamp lights up.

If abnormalities are detected during the check, replace the switch parts and carry out repairs in case of defective connection between circuits or short circuits.

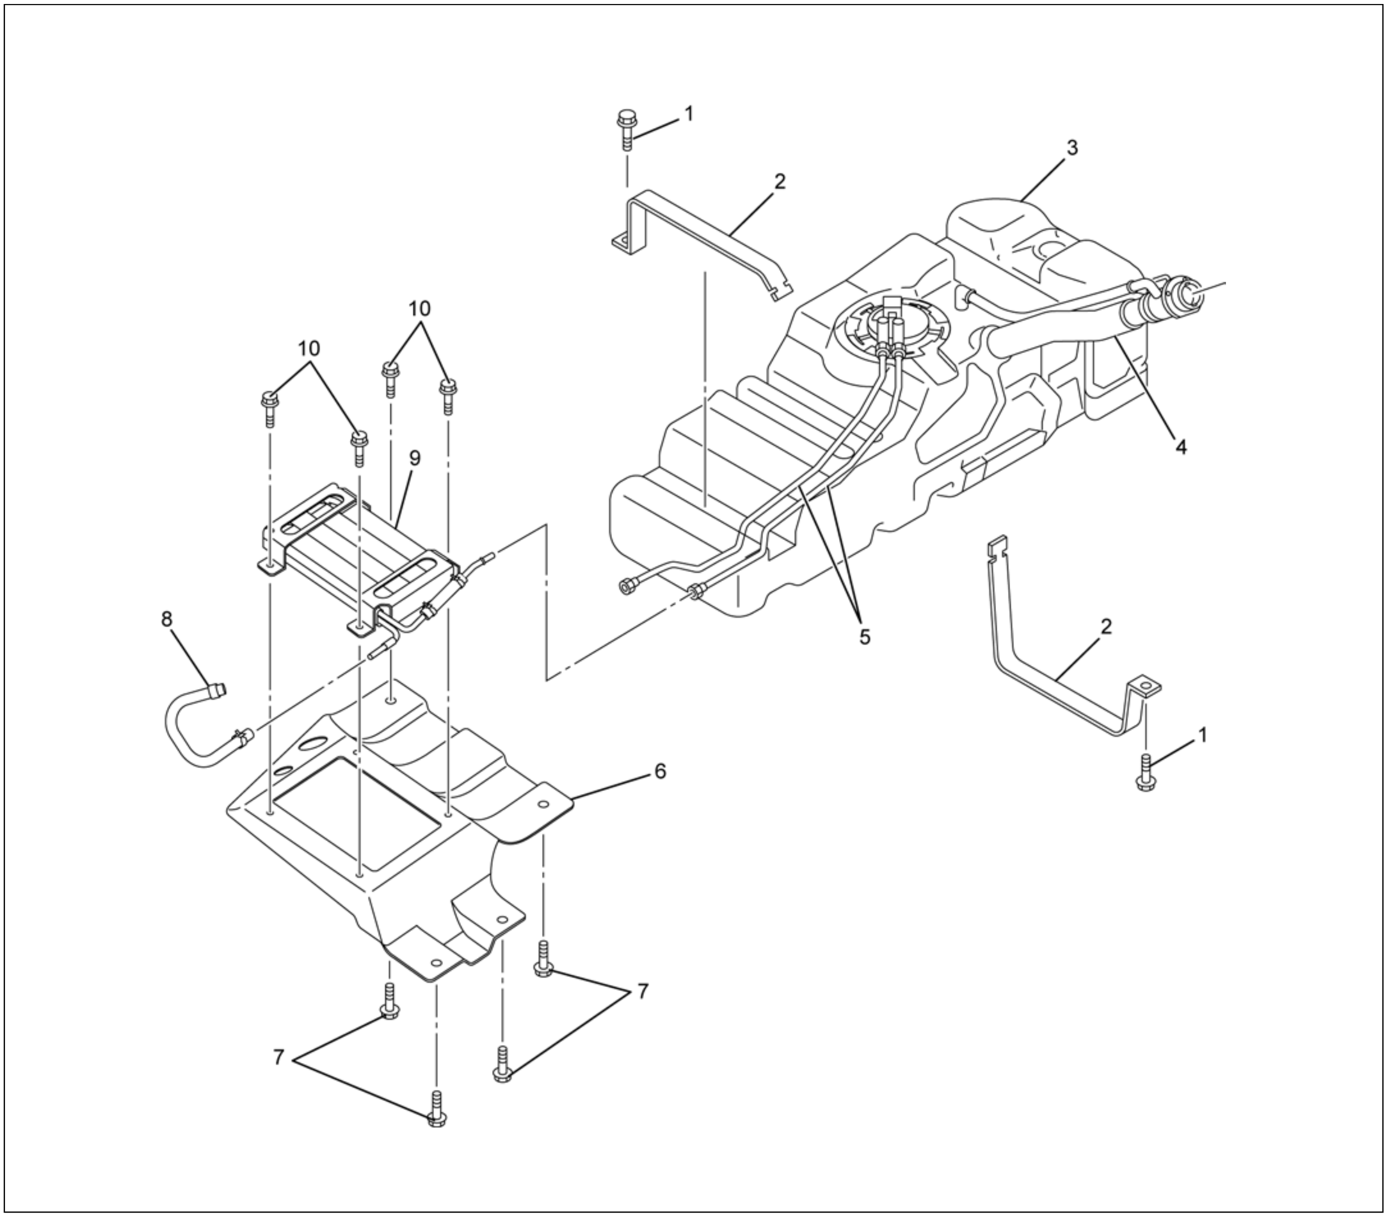
Fuel Tank and Fuel Cooler

Fuel Tank and Associated Parts



RTW76CLF000501

Legend

1. Bolt; Fuel Tank
2. Fuel Tank Band
3. Fuel Tank
4. Fuel Filler Hose and Pipe
5. Fuel Tube/Quick Connector
6. Bracket; Fuel Cooler
7. Bolt; Fuel Cooler Bracket
8. Fuel Return Hose
9. Fuel Cooler
10. Bolt; Fuel Cooler

Removal

Note: When repairs to the fuel system have been completed, start the engine and check the fuel system for loose connections or leakage. For the fuel system diagnosis, see Section "Drivability and Emission".

1. Disconnect the battery ground cable.
2. Slowly loosen the fuel filler cap.

Note: Be careful that fuel does not spout out because of change of pressure in the fuel tank.

Note: Cover opening of the filler neck to prevent any dust entering.

3. Jack up the vehicle.
4. Disconnect the quick connector (5) of the fuel tube at the fuel cooler way.
5. Remove fuel return hose (8) from the pipe.
6. Remove fixing bolt (7) of the bracket fuel cooler and remove bracket fuel cooler (6).

Note: Cover the opening of the pipe to prevent any dust and fuel leakage.

Note: For remove fuel cooler, Remove bolts (10) of the fuel cooler and remove fuel cooler.

7. Support underneath of the fuel tank with a lifter.
8. Remove the inner liner of the wheel house at rear left side.
9. Remove fixing bolt of the filler neck from the body.
10. Disconnect the quick connector (5) of the fuel tube from the fuel pipe and the evapo tube from evapo joint connector.

Note: Cover the quick connector to prevent any dust entering and prevent fuel leakage.

Note: Refer to "Fuel Tube/Quick Connector Fittings" in this section when performing any repairs.

11. Remove fixing bolt (1) of the tank band and remove the tank band (2).
12. Disconnect the pump and sender connector on the fuel pump and remove the harness from the weld clip on the fuel tank.
13. Lower the fuel tank (3).

Note: When lowering the fuel tank from the vehicle, do not scratch the hoses and tubes by contact with other parts.

Installation

1. Raise the fuel tank.

Note: When raising the fuel tank to the vehicle, do not scratch the hoses and tubes by contact with other parts.

2. Connect the pump and sender connector to the fuel pump and install the harness to the weld clip on the tank.

Note: The connector must be securely connected against the stopper.

3. Install the tank band and fasten bolt.

Torque: 68 N·m (6.9 kg·m /50 lb ft)

Note: The anchor of the tank band must be securely installed to the guide hole on the frame.

4. Connect the quick connector of the fuel tube to the fuel pipe and the evapo tube from evapo joint connector.

Note: Pull off the left checker on the fuel pipe.

Note: Refer to "Fuel Tube/Quick Connector Fittings" in this section when performing any repairs.

5. Install the filler neck to the body with bolt.

Note: For install the fuel cooler to the bracket with bolt.

Torque: 6.5 N·m (0.7 kg·m /61 lb in)

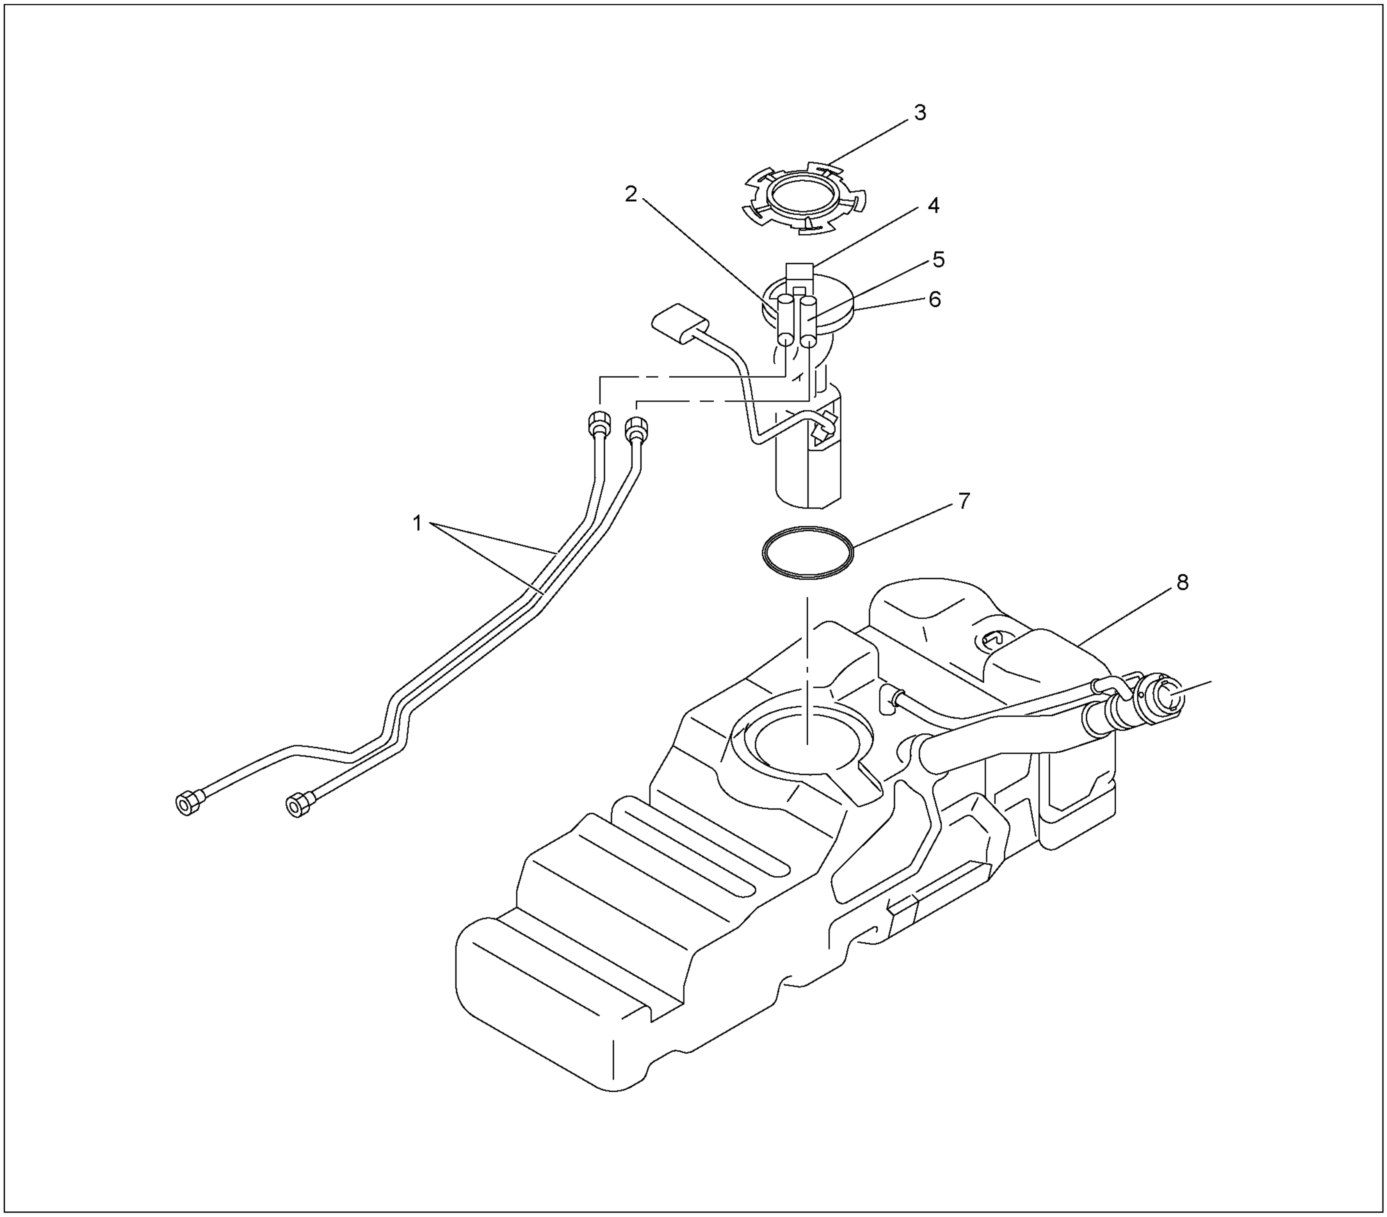
6. Install the bracket to Frame with bolt.

Torque: 48 N·m (4.9 kg·m /35 lb ft)

7. Install the fuel return hose at the fuel cooler way.
8. Install the quick connector at the fuel cooler way.
9. Install the inner liner of the wheel house at rear left side.
10. Remove lifter from the fuel tank.
11. Lower the vehicle.
12. Tighten the filler cap until at least three clicks.
13. Connect the battery ground cable.

Fuel Gauge Unit

Fuel Gauge Unit and Associated Parts



RTW56CLF001001

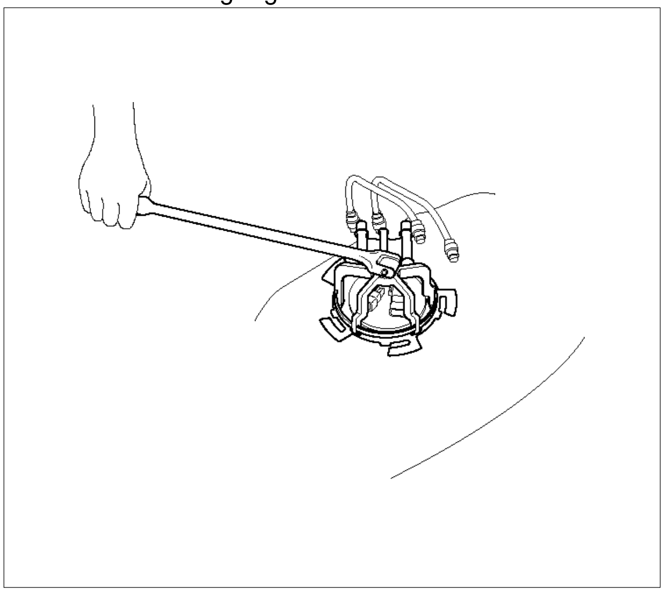
Legend

1. Fuel Tube/Quick Connector
2. Fuel Feed Port
3. Retainer Ring (Fuel Gauge Unit Lock)
4. Connector; Fuel Gauge Unit
5. Fuel Return Port
6. Fuel Gauge Unit and Sender Assembly
7. Seal; Fuel Gauge Unit
8. Fuel Tank Assembly

Removal

Note: When repairs to the fuel system have been completed, start the engine and check the fuel system for loose connections or leakage. For the fuel system diagnosis, see Section "Drivability and Emission".

1. Remove the fuel tank assembly (8). Refer to "Fuel Tank Removal" in this section.
2. Disconnect the quick connector (1) of the fuel tube from the fuel gauge unit.



140R100035

3. Remove the retainer ring (3) from the fuel tank with the removal tool 5-8840-2602-0.
4. Slowly remove the fuel gauge unit (6) from the fuel tank as no bend float arm.

Note: Cover opening for the fuel gauge unit on the fuel tank to prevent any dust entering.

5. Discard the fuel gauge unit seal (7) because it cannot be reused.

Installation

1. Clean the seal surface of the fuel tank and the fuel gauge unit.

Note: If there is dust on the seal surface, it can cause a fuel leak.

2. Install the new fuel gauge unit seal (7) to the opening of the fuel tank along the groove.
3. Slowly install the fuel gauge unit (6) into the fuel tank so there is no bend in the float arm.
4. Set the flange of the fuel gauge unit on the fuel gauge unit seal as mating convexity of the fuel gauge unit and reentrant of the fuel tank.
5. Slowly lock the retainer ring (3) to the fuel tank with the remover tool 5-8840-2602-0.
6. Connect the quick connector (1) of the fuel tube to the gauge unit.

Note: Pull off the left checker of the fuel pipe.

Note: Refer to "Fuel Tube/Quick Connector Fittings" in this section when performing any repairs.

7. Check for leak.

   Method of leak check.

   1. Plug the end of the quick connector and breather hose (Pull off the breather hose from fuel tank) and tighten fuel filler cap until at least one click is heard.
   2. Apply soapy water around the fuel gauge unit seal area.
   3. Pressure air into the fuel tank from the end of the breather pipe at 34.3 kPa (0.35 kg / cm^2 / 5 psi) over 15 seconds.
   4. Verify that no bubbles from around the fuel gauge unit seal area.

8. Install the fuel tank assembly (8).

Note: Refer to "Install the fuel tank" in this section.

Special Tool

ILLUSTRATION	PART NO. PART NAME
 5884026020	**5-8840-2602-0** Remover: fuel pump retainer ring

Fuel Tube / Quick - Connector Fittings

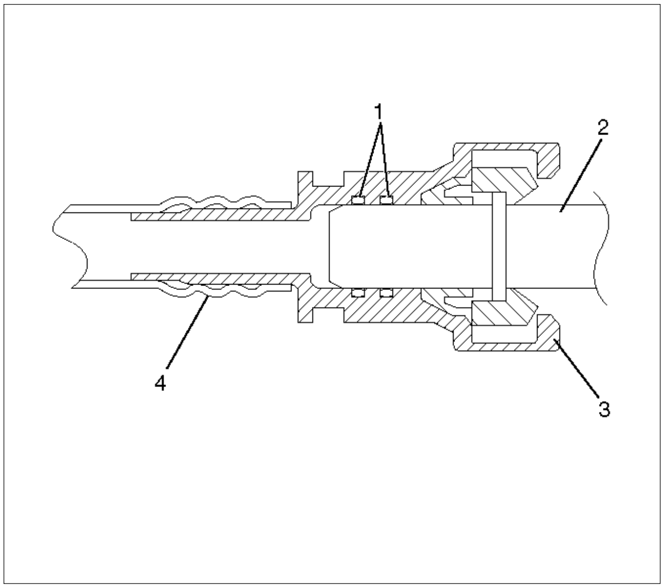
Precautions

- Do not light a match or create a flame.
- Keep flames away from your work area to prevent flammable materials from catching fire.
- Disconnect the battery ground cable to prevent electrical shorts.
- Pre–treat the piping system or associated parts from thermal damage or from spattering when welding or similar heat–generating work.

Cautions During Work

Do not expose the assembly to battery electrolyte or do not wipe the assembly with a cloth used to wipe off spilt battery electrolyte.

Piping that has been splattered with battery electrolyte or battery electrolyte soaked cloth that was wiped on the piping cannot be used.



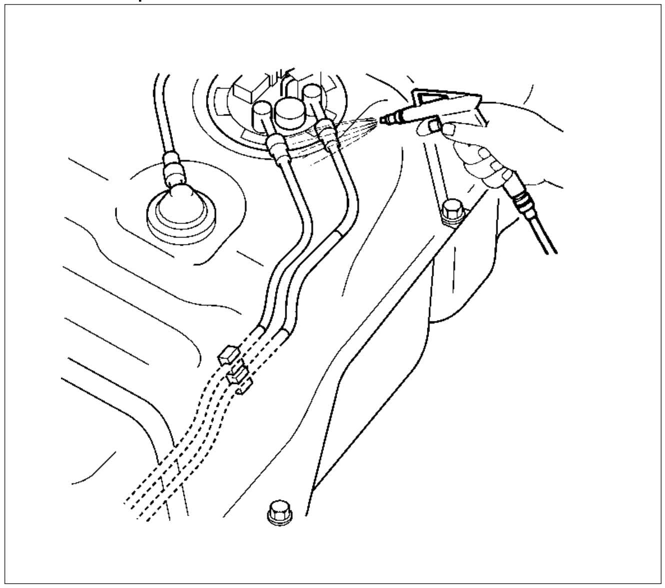
140R100032

Legend

1. O-ring
2. Port
3. Connector
4. Plastic Tube

Removal

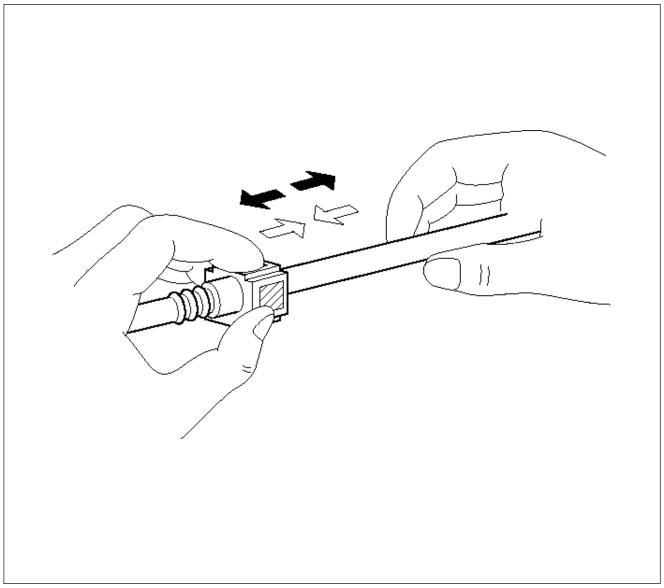
1. Open the fuel cap to relieve the fuel pressure in the tank. Use compressed air to remove any dirt on the fuel quick connect fittings prior to disconnecting the fittings. When disconnecting the fuel pipe, cover the area with a cloth to prevent fuel from splashing as the fuel pipe may still have some pressure in it.



140R100002

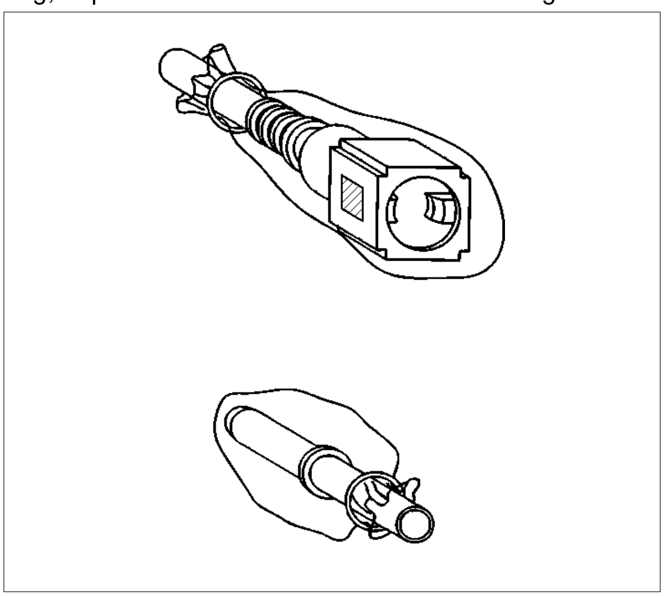
2. For removal of the quick connector, hold the quick connector in one hand, and pull out the connector with the other hand while pressing the square release button of the connector, as illustrated.

Note: Do not use tools of any kind. Only use bare hands when disconnecting the connector. Use a lubricant (light oil) and/or push and pull the connector until the pipe is disconnected.



140R100037

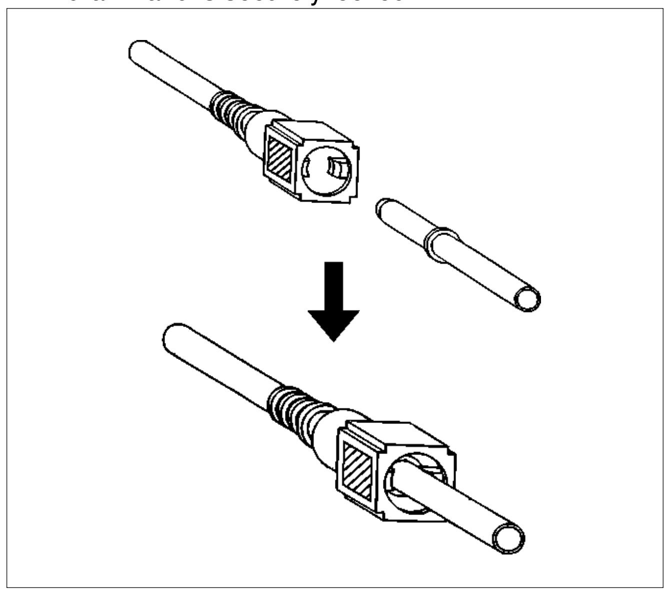
Cover the connectors that were removed with a plastic bag, to prevent dust or rain water from entering.



140R100028

Reuse of Quick-Connector

- Replace the port and connector if a scratch, dent or crack is found.
- Remove any dirt build up on the port when installing the connector. Replace the connector, if there is any rust, dents or scratches.
- After cleaning the port, insert it straight into the connector until it clicks. After it clicks, try pulling it out at 49 N (5 kg / 11 lb) to make sure that it is not drawn and is securely locked.



140R100036

Assembling Advice

By applying engine oil or light oil to the pipe, port makes pipe assembly easier. The pipe assembly should take place immediately after applying oil (to prevent dust from sticking to the pipe surface - which may decrease sealing ability).

Test/Inspection After Assembling

1. Reconnect the battery negative cable.
2. Start the engine and observe the engine idle speed. The presence of dirt in the fuel system may affect the fuel injection system.
3. Check for fuel leakage from the connector.

Filler Neck

Removal

1. Remove the fuel tank.

Note: Refer to "Fuel Tank" in this section.

2. Put a marking on the following points as the filler neck assembly is restored.
   - Each joint area of the hose (to restore axial direction and insertion length of the hose)
   - Each fasten area of the clamp (to restore axial direction and position of the clamp)
   - Each bolt in the clamp (to restore fasten length of bolt in the clamp)
   - The band clip (to restore position and fasten length of the band clip)

Note: Cover end of each hose and pipe to prevent any dust entering.

Installation

1. Align each marking and restore the following point.
   - Each joint area of the hose (Restore axial direction and insertion length of the hose)
   - Each fasten area of the clamp (Restore axial direction and position of the clamp)

   Tightening torque: 2.5 N·m (0.25 kg·m /21.7 lb in)

   Filler neck side except flat deck model.
   - Each bolt in the clamp (Restore fasten length of bolt in the clamp)

   Tightening torque: 2.5 N·m (0.25 kg·m /21.7 lb in)

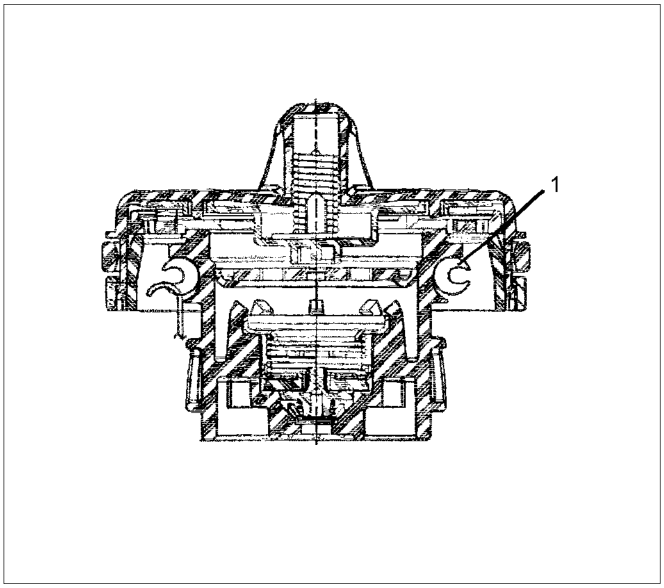
   Filler neck side except flat deck model.
   - The band clip (Restore position and fasten length of the band clip)
2. Install the fuel tank.

Note: Refer to "Fuel Tank" in this section.

Fuel Filler Cap

General Description

A vacuum valve and pressure valve are built into the fuel filler cap which adjusts the fuel pressure in the fuel tank to prevent fuel tank damage.



RTW46CSH000301

Legend

1. Seal Ring

Inspection

The fuel filler cap must be inspected for seal condition.

The fuel filler cap must be replaced if found defective.

Note: A replacement fuel filler cap must be the same as the original. The fuel filler cap valve was designed primarily for this application and must be replaced with the same type or decreased engine performance may occur.

Charging System

Servicing Cautions

- Battery polarity is important. If the battery cables are reversed, the generator diodes will be destroyed.
- Do not remove the battery cables or the charging circuit wiring when the engine is running.
- Confirm that the terminal wires are connected to the proper terminals by checking the terminal numbers (the number on the terminal wire and the terminal must be the same).
- Disconnect the battery negative cable (-) before inspecting the generator.
- Do not open or close the battery relay switch when the engine is running.
- Disconnect the battery negative cable (-) when using external equipment (Quick-Charge) to charge the battery.
- When steam cleaning or washing the engine, do not allow steam or water to come in direct contact with the battery and other electrical system components.
- Be sure to read the item on belt tension adjustment before beginning the procedure.

Important Generator Components and Function

- The generator used on 4JK1 engine cannot be disassembled.
- The generator uses a built-in solid-state IC voltage regulator. The regulator and other important components together with their connections are shown in the illustration.
- The voltage regulator is installed to the rear cover assembly of the generator together with the brush holder and the rectifier. The generator requires no additional voltage regulation.
- 9 diodes are connected to the stator coil to convert AC to DC. The DC voltage is delivered to the generator output terminal.

Troubleshooting

Symptoms

- No charging
- Inadequate charging
- Excessive charging
- Unstable charging current
- Abnormal generator noise

No charging

Possible problem	Countermeasure
Dead battery	Replace
Open or shorted wiring	Repair
Open or shorted ammeter	
Loose wiring connections	
One or more generator coils open or shorted	Replace
Bad diode	
Bad regulator	
Loose regulator connections	Repair

Inadequate charging

Possible problem	Countermeasure
Dead battery	Replace
Open or shorted wiring	Repair
Loose wiring connections	
Loose generator drive belt	Adjust belt tension
Stator coil intermittent short	Replace
Bad diode	
Loose battery connections	Repair
Bad regulator	Replace
Loose regulator connections	Repair

Excessive charging

Possible problem	Countermeasure
Bad regulator	Replace

Unstable charging current

Possible problem	Countermeasure
Open wiring connection or broken wire	Repair
Loose generator drive belt	Adjust belt tension
Open or shorted stator coil	Replace
Loose terminal connections	Repair
Bad regulator	Replace
Loose regulator terminal connections	Repair

Abnormal operating noise

Possible problem	Countermeasure
Loose generator drive belt	Adjust belt tension
Bad bearing	Replace
Loose rotor core or stator core	Repair
Bad diode	Replace
Open or shorted stator coil	Replace

Diagnosis

On-vehicle Inspection

The charging system warning light tells the vehicle operator of possible problems with the system.

When the ignition switch is moved to the ON position, the light turns on. The light turns off immediately after the engine is started. If the light turns on during engine operation, there is a problem with the charging system. Perform the checks described below.

1. Check the belt (broken or loose).
2. Check the harness connectors (loose or disconnected).
3. With the engine off, turn the ignition switch to the ON position. If the warning lamp does not light, remove the harness connector from the generator. Ground the connector IG terminal. The lamp should light. If it does not, the bulb is burned out. Replace the bulb.
4. Start the engine. If the warning lamp remains on, the generator must be repaired or replaced.

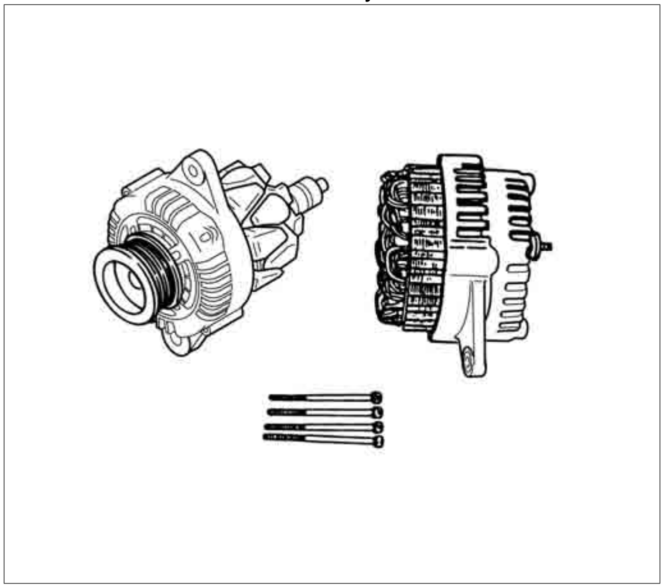
8. Terminal Insulation Plate
9. Rear Cover Assembly
10. Rectifier
11. Brush Holder
12. Regulator Assembly

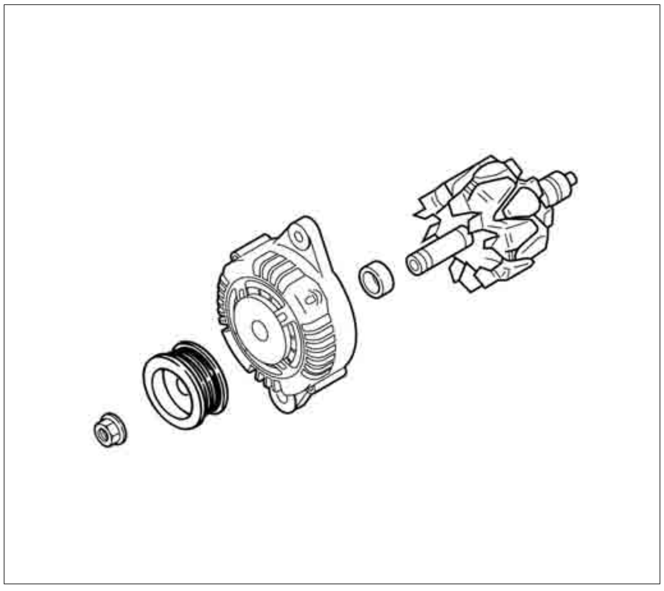
Disassembly

1. Remove the through bolts.
2. Insert a flat-blade screwdriver between the front cover and the stator. Pry the parts apart.
3. Separate the front cover/rotor assembly from the rear cover/stator assembly.



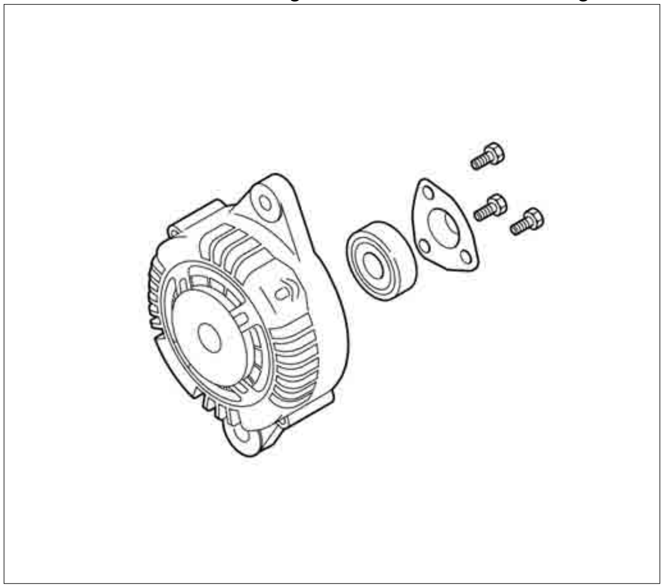
RTW56DSH000301

4. Place the front cover and rotor in a vise.
5. Remove the pulley nut and the pulley.
6. Remove the rotor from the front cover.



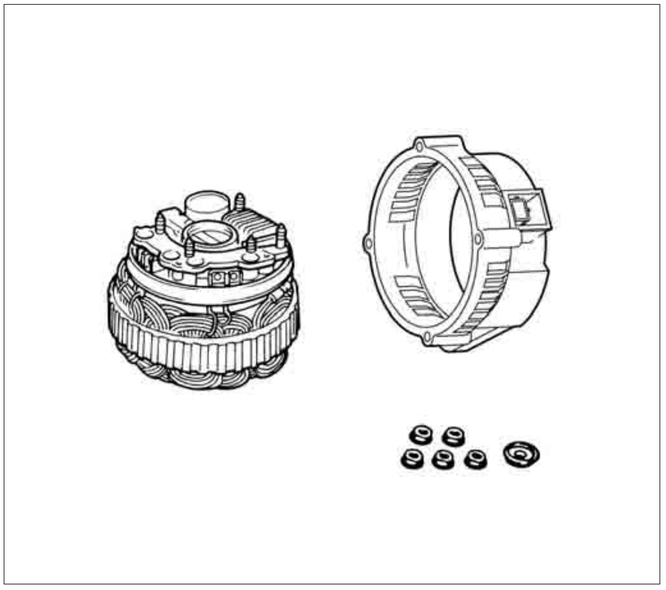
RTW56DSH000501

7. Remove the screw from the front cover.
8. Remove the bearing retainer and the bearing.



RTW56DSH000601

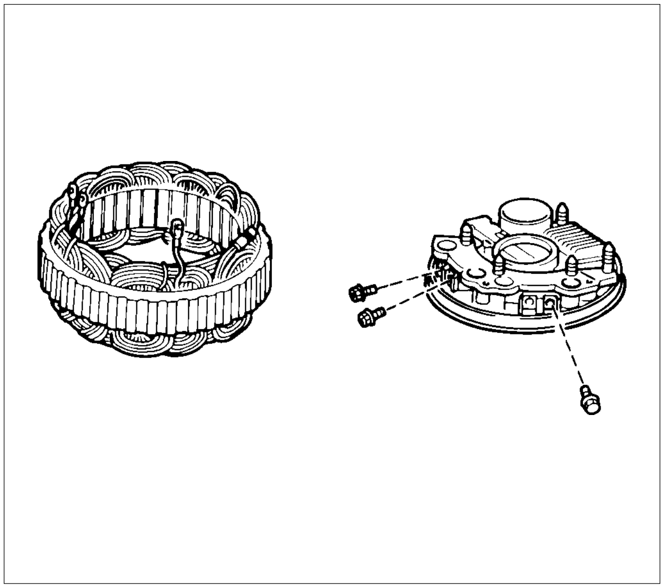
9. Remove the B-terminal nut.
10. Remove the rectifier and the brush holder.
11. Remove the rear cover from the stator.



RTW56DSH000401

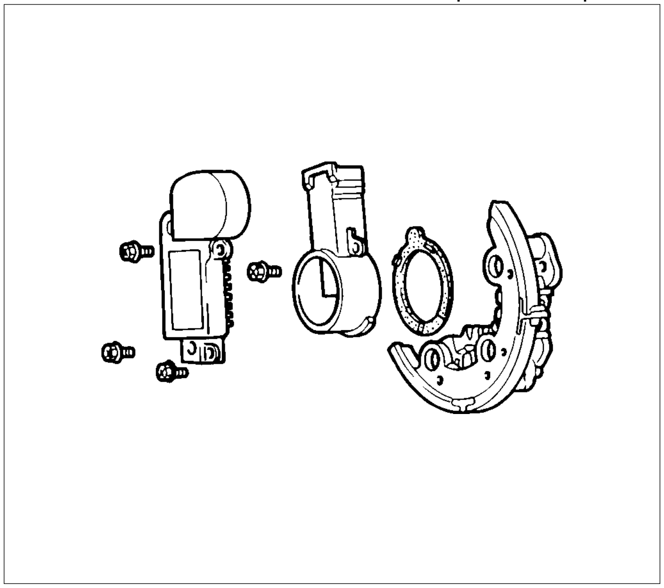
12. Remove the bolts securing the stator terminal to the rectifier.

13.Remove the stator.



066RS030

14.Remove the bolts securing the regulator, the rectifier, and the brush holder. Separate the parts.



066RW025

Inspection and Repair

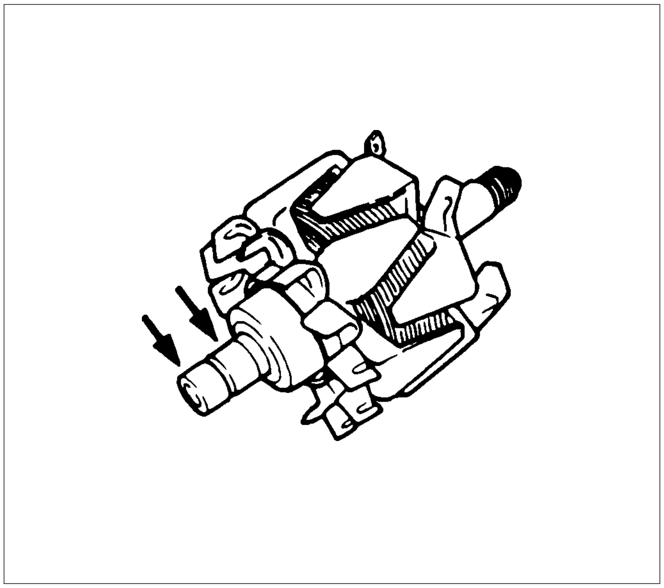
Repair or replace any parts found to be excessively worn or damaged during the inspection procedure.

Rotor Assembly

1. Check for dirty or rough slip ring surfaces. Remove dirt from the surfaces with a clean rag. Use No. 500 or No. 600 sandpaper to smooth the surfaces.
2. Measure the slip ring diameters. Replace the slip ring if the diameter is less than the specified limit.

Slip ring diameter mm (in)

Standard	27 (1.063)
Limit	26 (1.024)

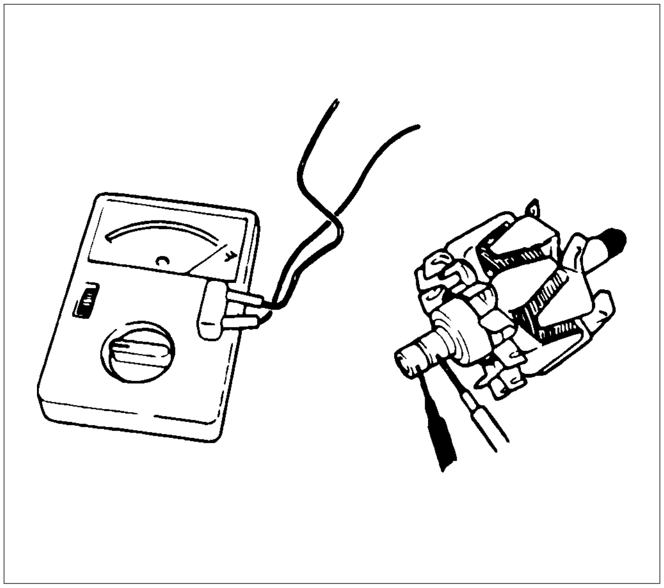


066RS032

3. Measure the electrical resistance between the slip rings. If the resistance is greater than the specified limit (open circuit), repair is required.

Slip ring resistance Ω

Less than 3.75



066RS033

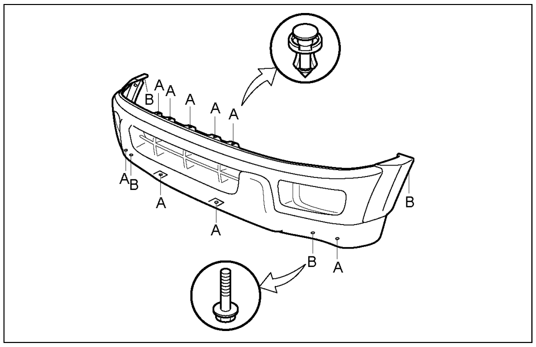
Important Operations - Removal

1. Front Combi Lamp Assembly

2. Radiator Grille

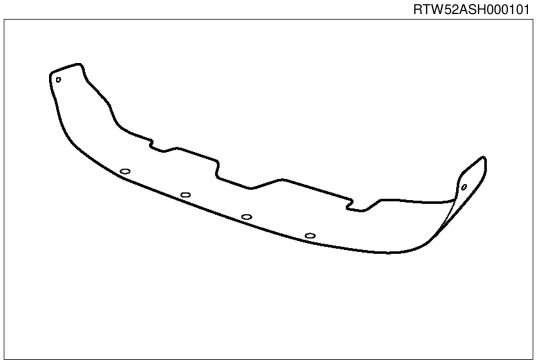
Refer to the Radiator Grille in this section.



RTW52ASH000101

3. Front Bumper Fascia

- Remove the 9 clips and 4 screws.
- Disconnect the fog light harness connectors.

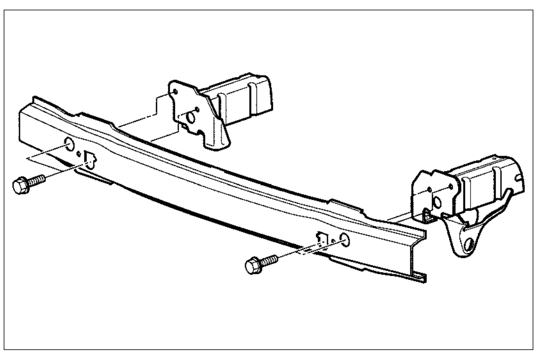


RTW52ASH000401

6. Bumper Seal

Remove 6 clips.

Important Operations - Installation



10.Front Bumper Impact Bar Assembly

Tighten the fixing bolts to the specified torque.

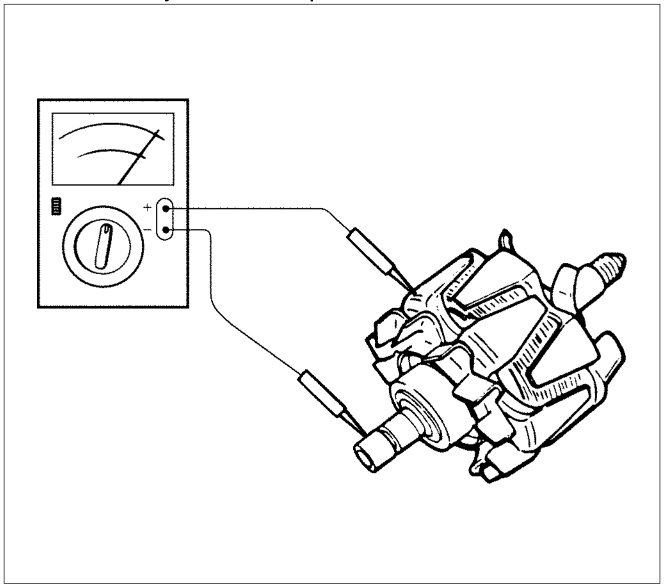
Torque	N·m(kgf·m/lb·ft)
62 (6.3 / 46)	

7. Front Bumper Flare Assembly

Tighten the fixing nuts to the specified torque.

Torque	N·m(kgf·m/lb·in)
7 (0.7 / 61)	

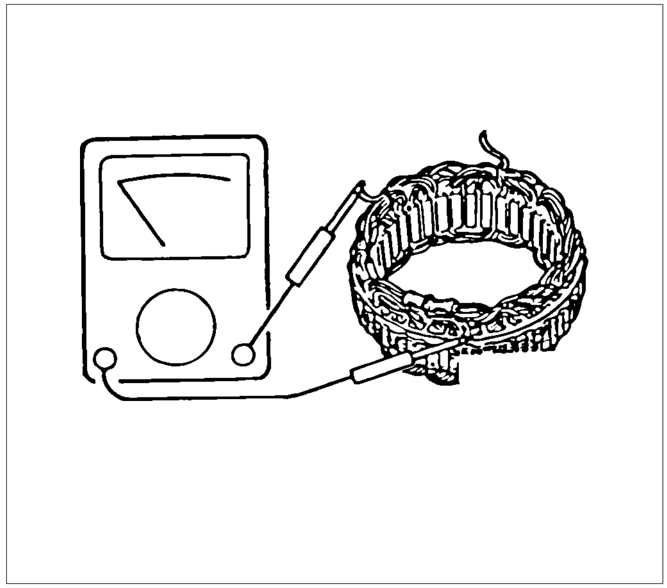
4. Check for conductivity between the slip rings and the rotor core. If there is continuity, the rotor assembly must be replaced.



066RS017

Stator coil/core resistance MΩ

1



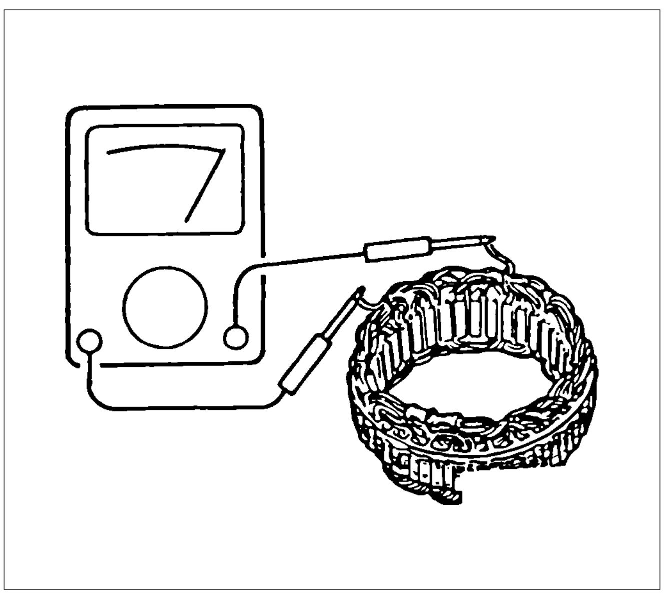
066RS035

Stator Coil

1. Measure the stator coil resistance. If the resistance is less than the specified value, the stator coil must be replaced.

Stator coil resistance

0.07Ω at 20°C (68°F)



066RS034

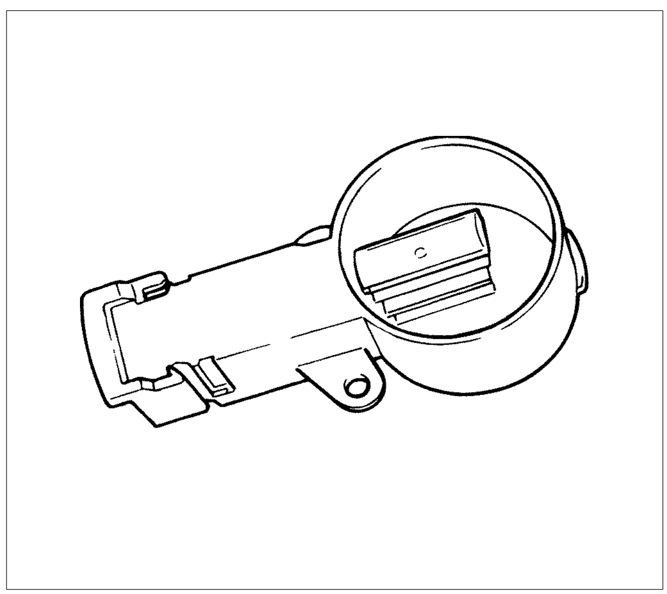
2. Measure the resistance between the stator coil and the stator core. If the resistance is less than the specified value, the stator coil must be replaced.

Brushes

Measure the brush height. If the height is less than the specified limit, the brushes must be replaced.

Brush height mm (in)

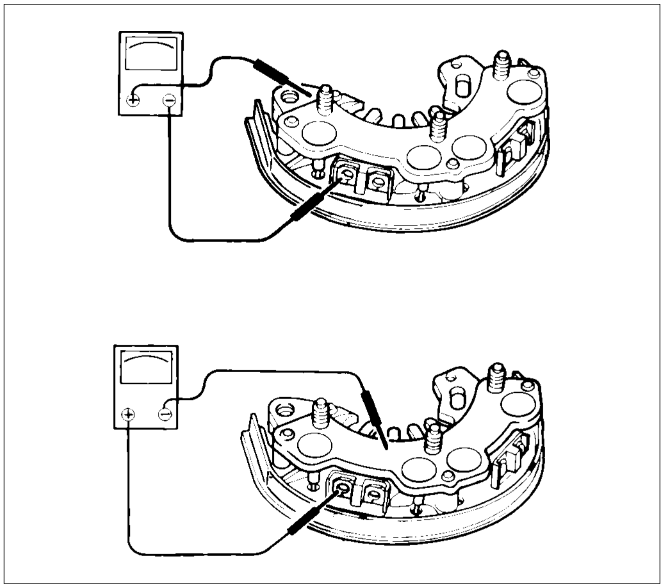
Standard	18 (0.709)
Limit	5.5 (0.217)



066RW024

Rectifier

Measure each of the diode resistances in both directions (anode/cathode and cathode/anode). If any of the diodes have the same resistance in both directions, the rectifier must be replaced.



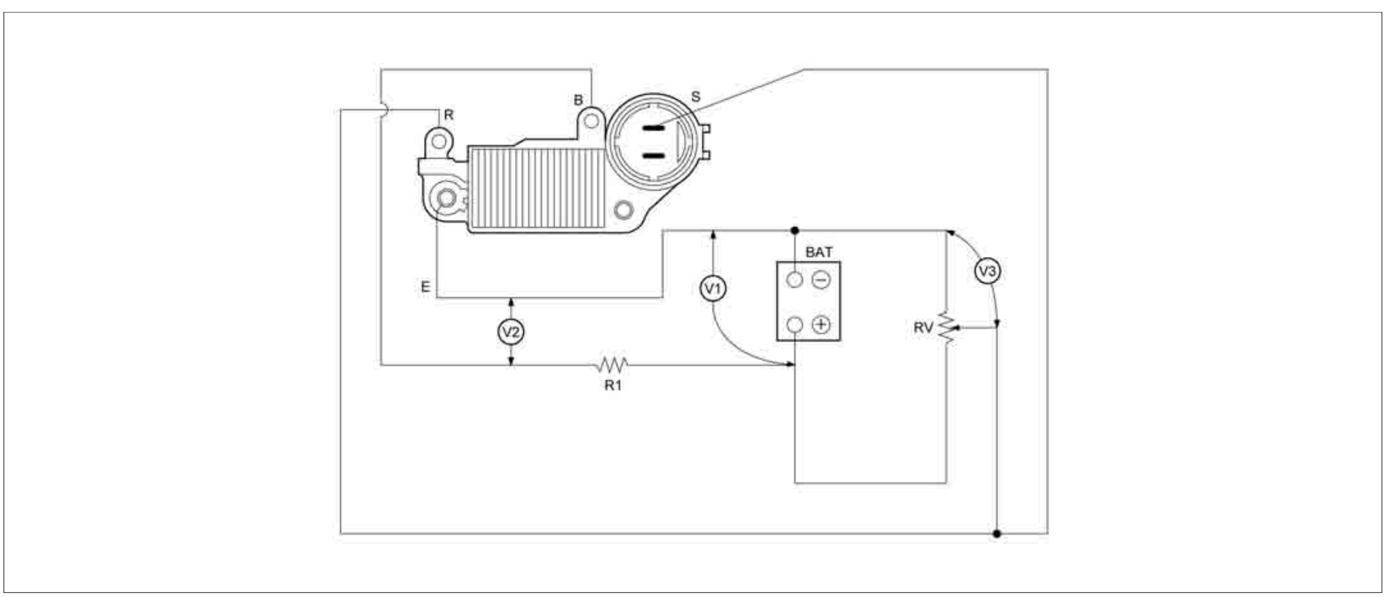
066RS036

Regulator Assembly

There are 3 checkpoints (12V batteries, 10 ohms 3W resistor, 0-50V/0.5V steps, and 300 ohms 12W variable resistor). Refer to the schematic below.

Measuring Procedure

1. Measure the voltage (BAT) at the V1 checkpoint. A 10-13 volt reading indicates that the BAT battery is good.
2. Measure the voltage at checkpoints V1 and V2 as you gradually increase the resistance of the variable resistor from 0. The voltage at V1 should change with the voltage at V2. If it does not, the regulator is damaged and must be replaced.
3. Measure the voltage at checkpoint V3 with the variable resistor setting fixed. If the measured voltage is 14.4 ± 0.3, the regulator is good. If the measured voltage is outside this range, the regulator is damaged and must be replaced.



RTW56DMF000301

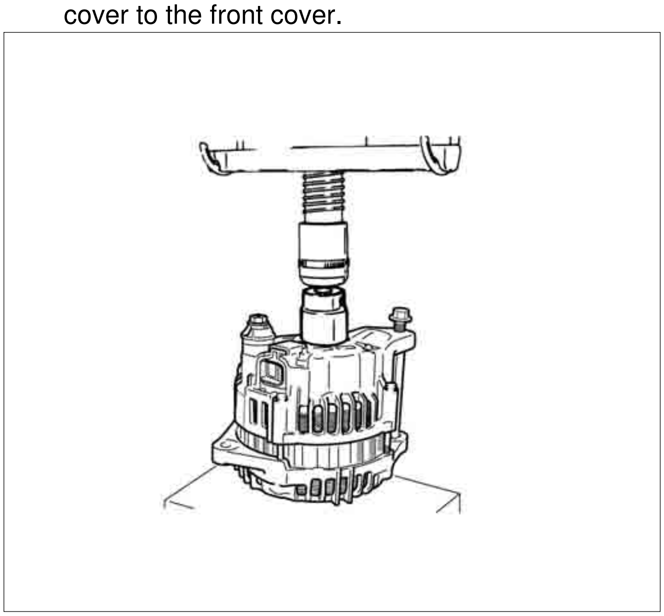
Reassembly

Follow the disassembly steps in reverse order to reassemble the generator. Pay close attention to the items below.

- Be very careful not to reverse battery polarity. Reversed battery polarity will destroy the rectifier diodes.
- Do not ground the generator B-terminal. Heat and fire damage to the harness will result.
- If using a fast charge procedure, be sure to disconnect the battery positive cable. If you do not, the rectifier diodes will be exposed to high positive voltage that will destroy them.
- Be very careful to reassemble the parts to their original positions. Particular care must be taken with insulated parts.
- Carefully clean all insulated parts so that they are completely free of oil and/or grease.
- Be sure that B-terminal twist-type stoppers (round terminal) are securely inserted before tightening the nuts.

Final Assembly

1. Use a bench press to install the rotor and rear cover to the front cover.

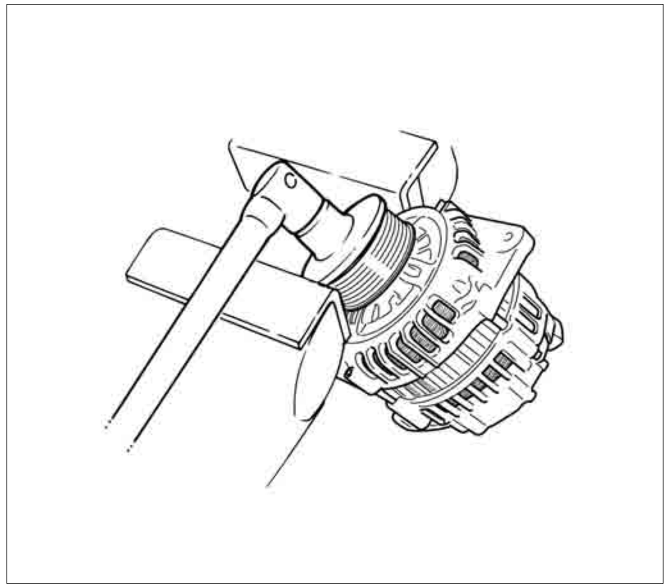


RTW56DSH000201

2. Install the pulley to the rotor shaft and tighten the bolt to the specified torque.

Pulley bolt torque N·m (kg·m / lb ft)

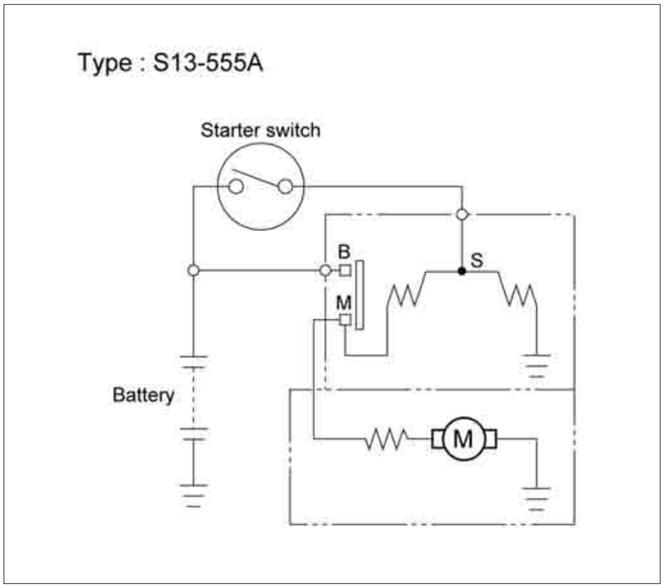
111 (11.3 / 81.7)



RTW56DSH000101

Starter Motor

Starting Circuit Diagram



RTW46DSH005501

Removal and Installation

Read this Section carefully before performing any removal and installation procedure. This Section gives you important points as well as the order of operation. Be sure that you understand everything in this Section before you begin.

Important Operations - Removal

Starter Motor

1. Disconnect the battery cable and the ground cable at the battery terminals.
2. Remove the A/T oil level gage.
3. Remove the Engine oil level gage.
4. Disconnect the magnetic switch cable at the terminal bolts.
5. Disconnect the battery cable at the starter motor and the ground cable at the cylinder body.
6. Remove the starter motor from the engine.

Important Operations – Installation

Follow the removal procedure in the reverse order to perform the installation procedure. Pay careful attention to the important points during the installation procedure.

Starter Motor

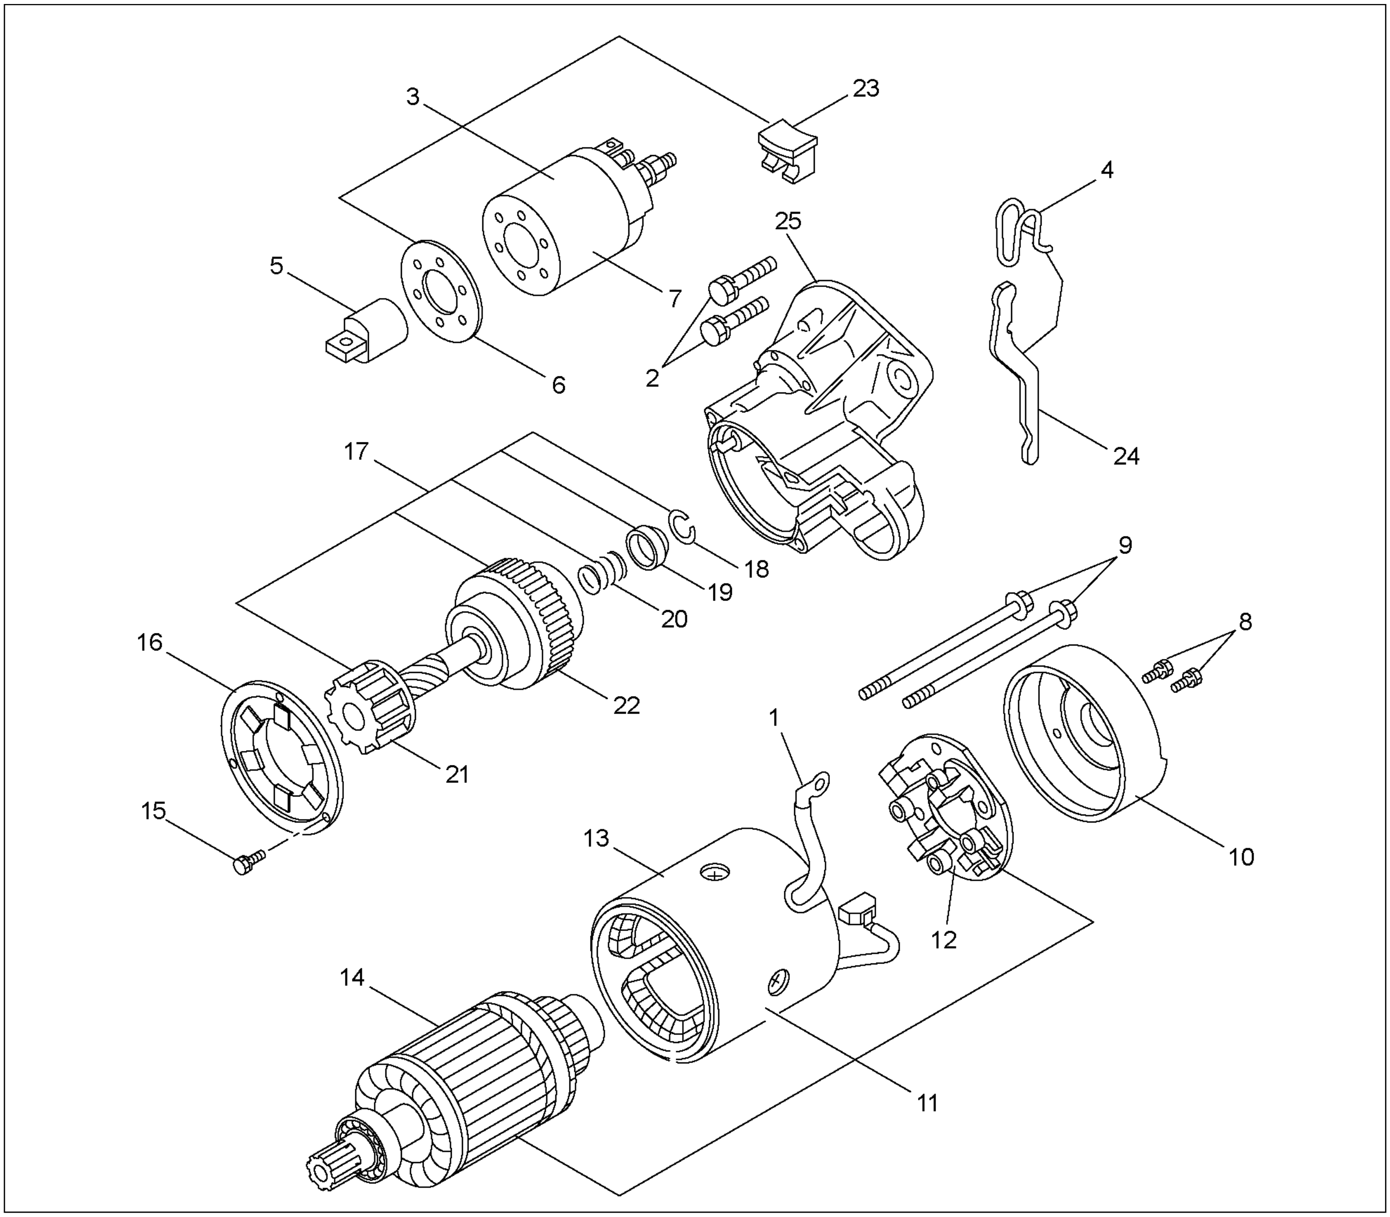
1. Install the starter motor to the rear plate.
2. Tighten the starter motor bolts to the specified torque.

Starter Motor Bolt Torque N·m (kg·m/lb ft)

85 (8.7 / 63)

3. Install the Engine oil level gage.
4. Install the A/T oil level gage.
5. Reconnect the battery cable at the starter motor and the ground cable at the cylinder body.
6. Reconnect the battery cable and the ground cable at the battery terminals.

Disassembly



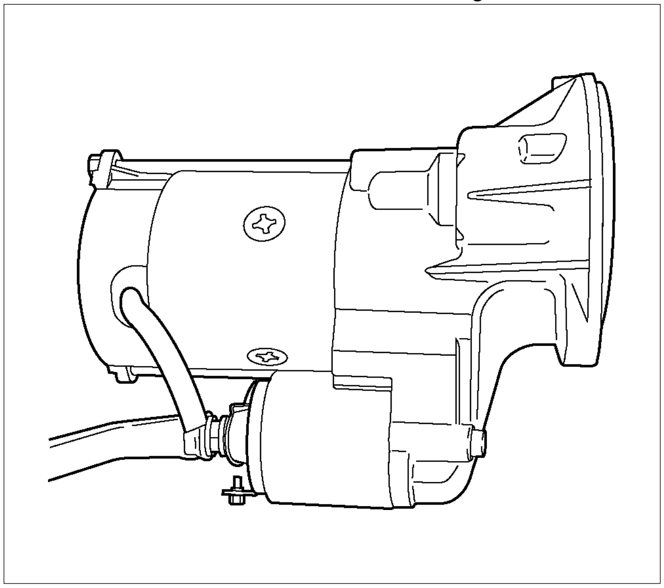
RTW460LF000201

Disassembly Steps

1. Lead Wire
2. Bolt
3. Magnetic Switch Assembly
4. Torsion Spring
5. Plunger
6. Dust Cover
7. Magnetic Switch
8. Screw
9. Through Bolt
10. Rear Cover
11. Motor Assembly
12. Brush Holder
13. Yoke
14. Armature
15. Bolt
16. Bearing Retainer
17. Pinion Assembly
18. Pinion Stopper Clip
19. Pinion Stopper
20. Return Spring
21. Pinion Shaft
22. Clutch
23. Dust Cover
24. Shift Lever
25. Gear Case

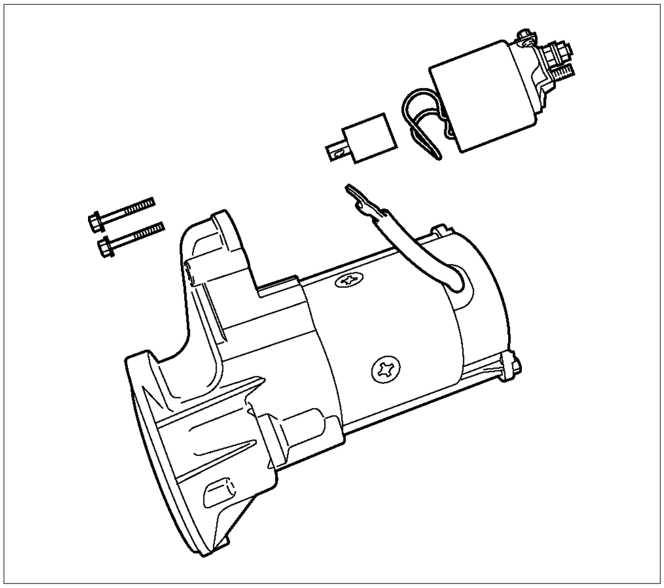
Important Operations

1. Lead Wire
   Disconnect the lead wire at the magnetic switch.



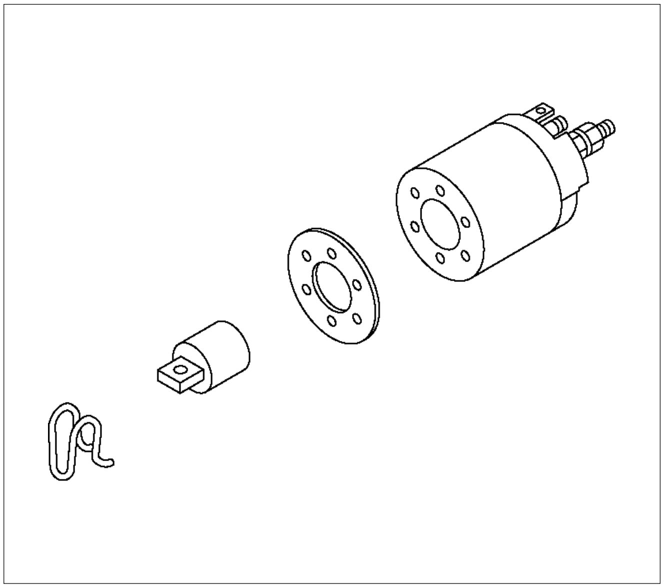
RTW46DSH002601

2. Magnetic Switch Assembly
   Remove the magnetic switch bolts, then remove the switch from the shift lever.



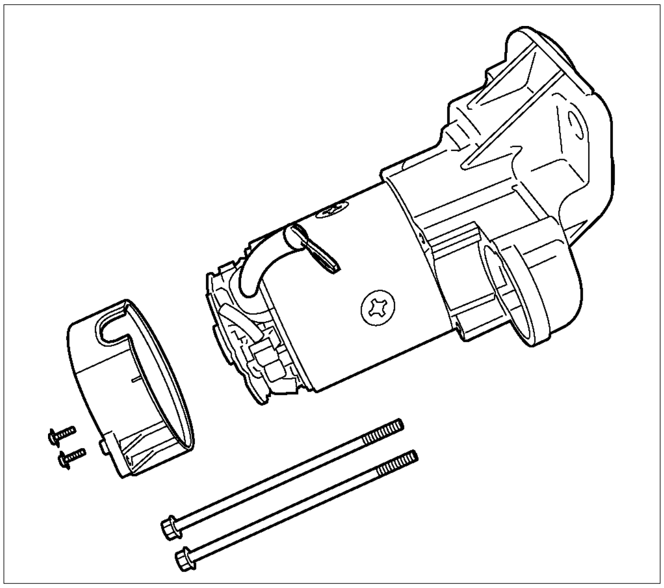
RTW46DSH002701

Remove the torsion spring from the magnetic switch.



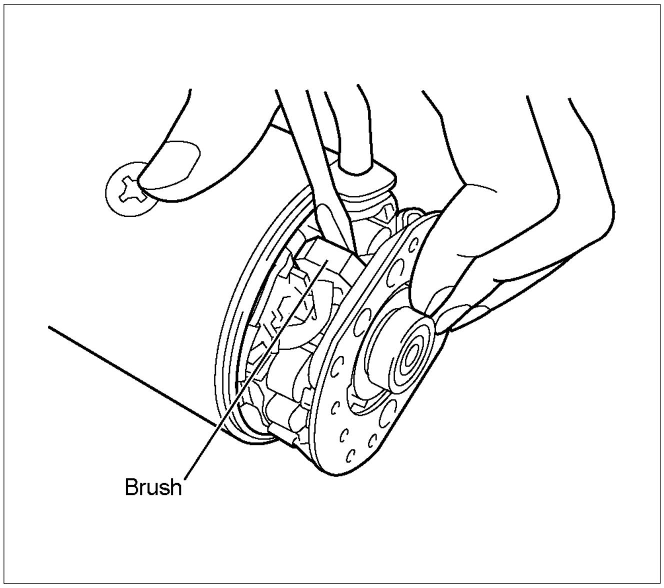
RTW46DSH002801

3. Through Bolt
4. Screw
5. Rear Cover
   Remove the through bolts, then remove the rear cover.



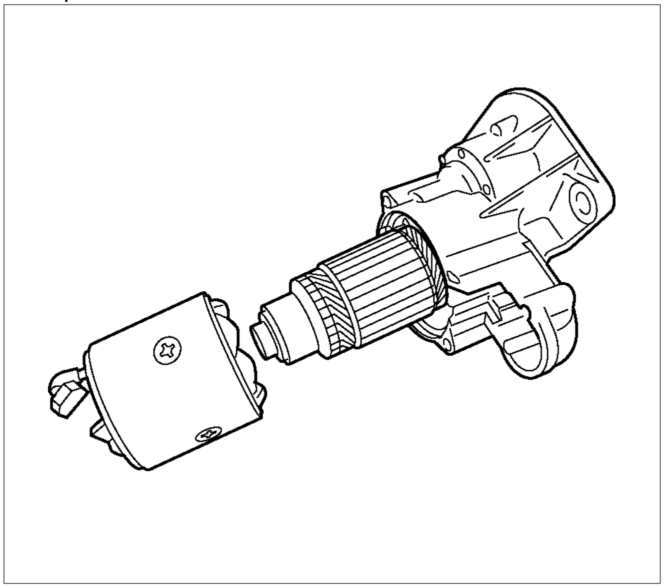
RTW46DSH002901

6. Motor Assembly
   Remove the four brushes from the brush holders.



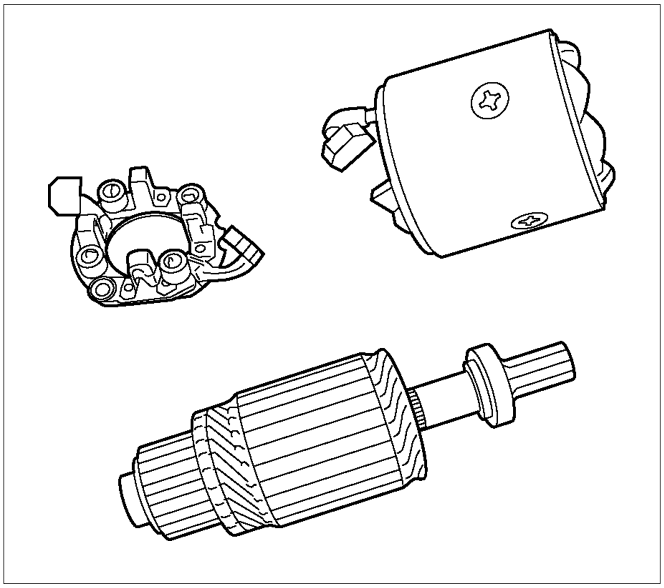
RTW46DSH003001

   Remove the yoke along with the armature and the brush holder from the gear case.
   Remove the brushes and commutator carefully so as not to allow them in contact with the adjacent parts.



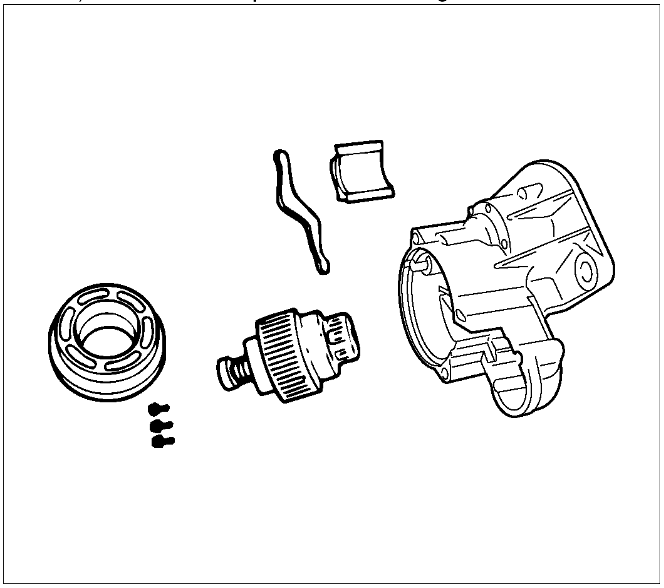
RTW46DSH003101

7. Brush Holder
8. Yoke
9. Armature
   Remove the brush holder and pull out the armature assembly free from the yoke.



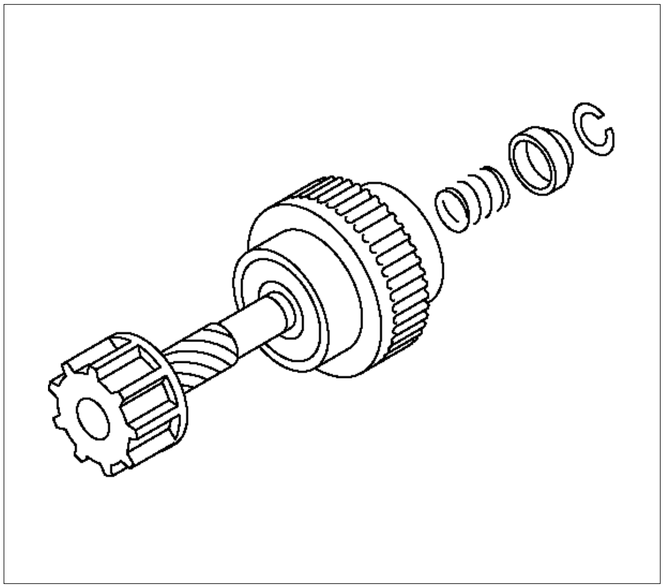
RTW46DSH003201

10. Bearing Retainer
11. Pinion Assembly
12. Dust Cover
13. Shift Lever
14. Gear Case
    1) Remove the bearing retainer.
    2) Remove the pinion from the gear case.



RTW46DSH003301

    3) Use a screwdriver to remove the stopper clip. Then disassemble the pinion assembly.



RTW46DSH003401

Inspection and Repair

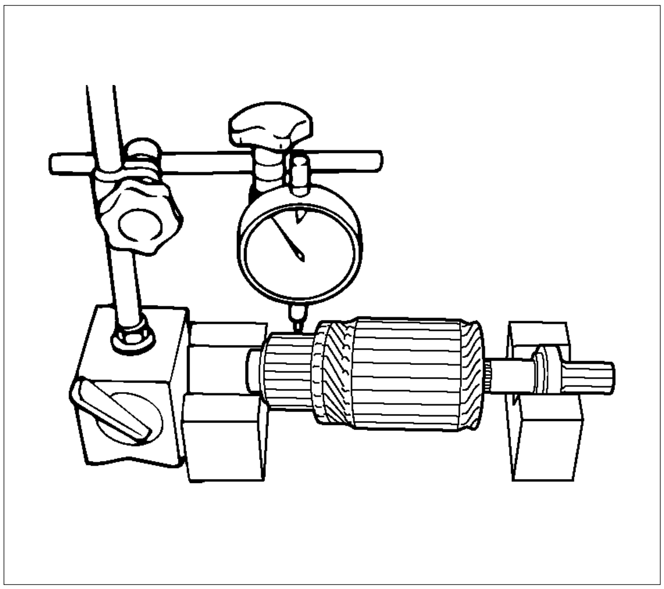
Make the necessary adjustments, repairs, and part replacement if excessive wear or damage is discovered during inspection.

Armature

1. Measure the commutator run-out. Replace the commutator if the measured run-out exceeds the specified limit.

Commutator Run-Out mm (in)

Standard	Limit
0.05 (0.002)	0.25 (0.010)



RTW46DSH003501

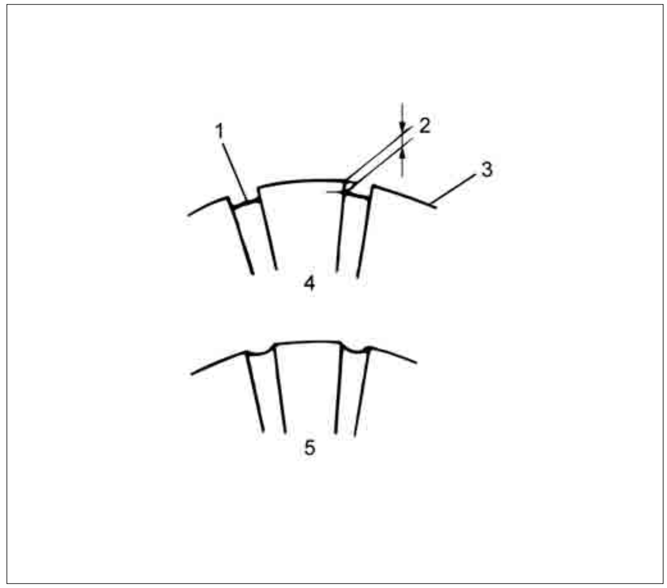
2. Check the commutator mica segments for excessive wear.
3. Measure the mica segment depth.

Mica Segment Depth mm (in)

Standard	Limit
0.5 - 0.8 (0.020 - 0.030)	0.2 (0.008)

If the mica segment depth is less than the standard but more than the limit, the commutator may be reground.

If the mica segment depth is less than the limit, the commutator must be replaced.



RTW56DSH000701

Legend

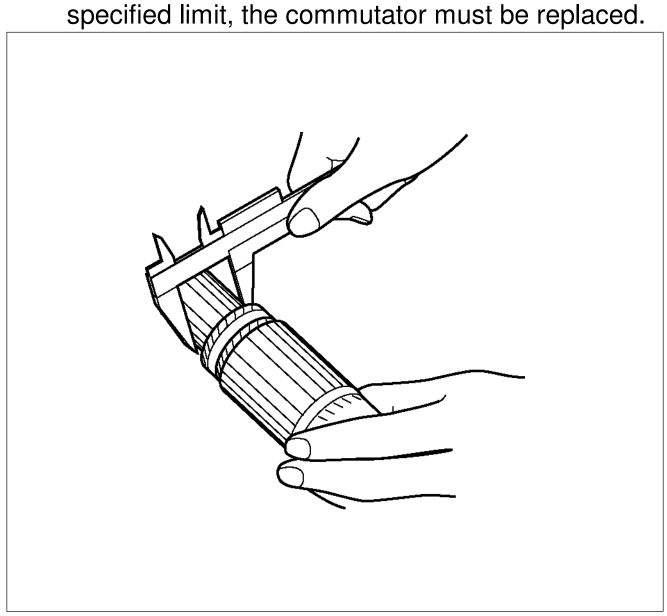
1. Insulator
2. 0.5 - 0.8 mm (0.020 - 0.030 in)
3. Commutator Segments
4. Correct
5. Incorrect

4. Measure the commutator outside diameter.

Commutator Outside Diameter mm (in)

Standard	Limit
36.5 (1.44)	35.5 (1.40)

If the measured outside diameter is less than the specified limit, the commutator must be replaced.

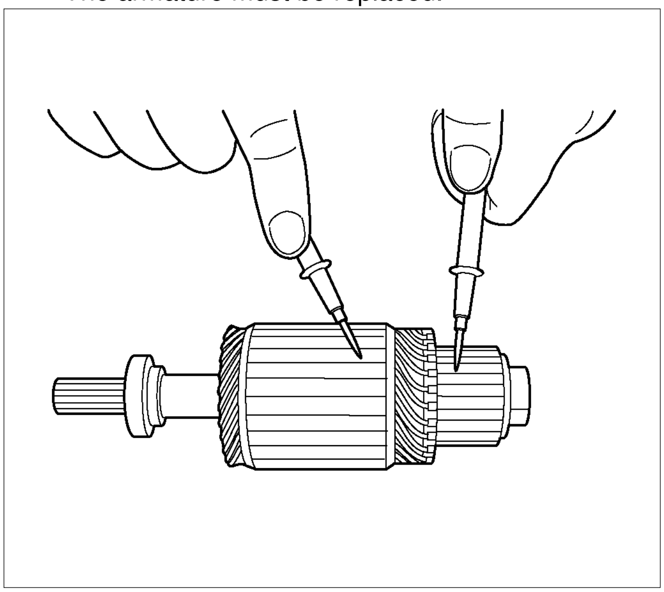


HCW51ESH000901

5. Use a circuit tester to check the armature for grounding.
   1) Hold one probe of the circuit tester against the commutator segment.
   2) Hold the other circuit tester probe against the armature core.

   If the circuit tester indicates continuity, the armature is grounded.

   The armature must be replaced.

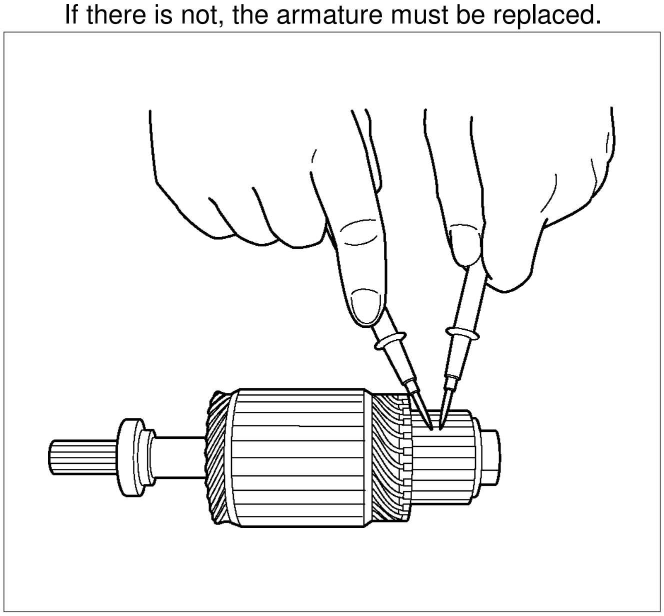


RTW46DSH003601

6. Use the circuit tester to check the armature for continuity.
   1) Hold the circuit tester probes against two commutator segments.
   2) Repair Step 1 at different segments of the armature core.

   There should be continuity between all segments of the commutator.

   If there is not, the armature must be replaced.

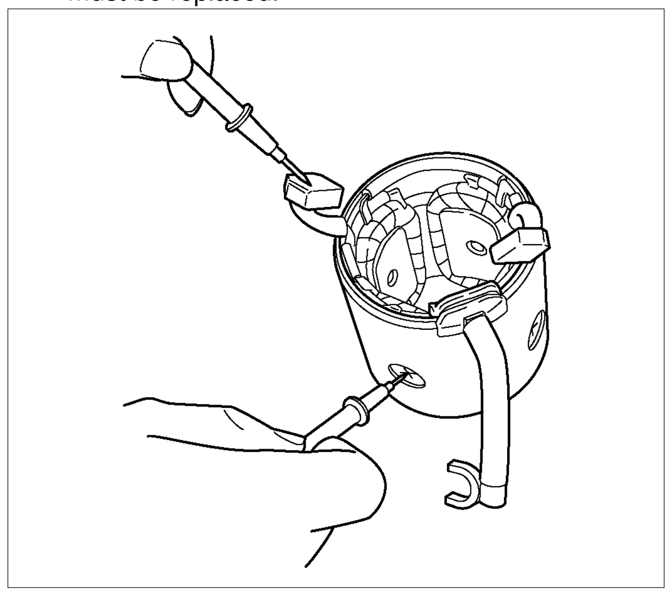


RTW46DSH003701

Yoke

1. Use a circuit tester to check the field winding ground.
   1) Hold one circuit tester probe against the field winding end or brush.
   2) Hold the other circuit tester probe against the bare surface of the yoke body.

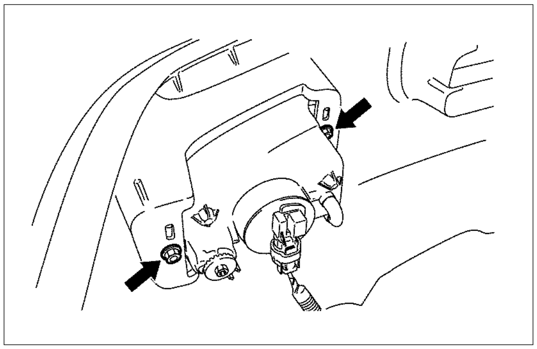
   There should be no continuity. If there is continuity, the field coil is grounded. The yoke must be replaced.



RTW46DSH003801

2. Use the circuit tester to check the field winding continuity.
   1) Hold one circuit tester probe against the “M” terminal lead wire.
   2) Hold the other circuit tester probe against the field winding brush.

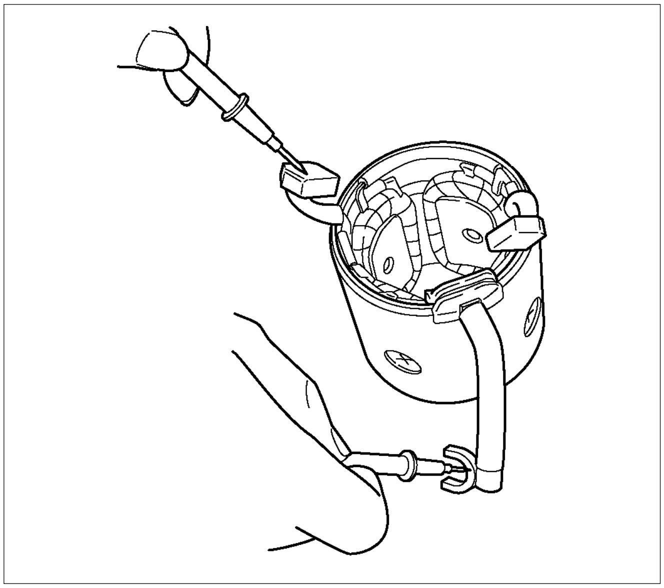
   There should be continuity.If there is no continuity, the yoke must be replaced.



5. Fog Light

Tighten the fixing nuts to the specified torque.

Torque	N·m(kgf·m/lb·in)
7 (0.7 / 61)	



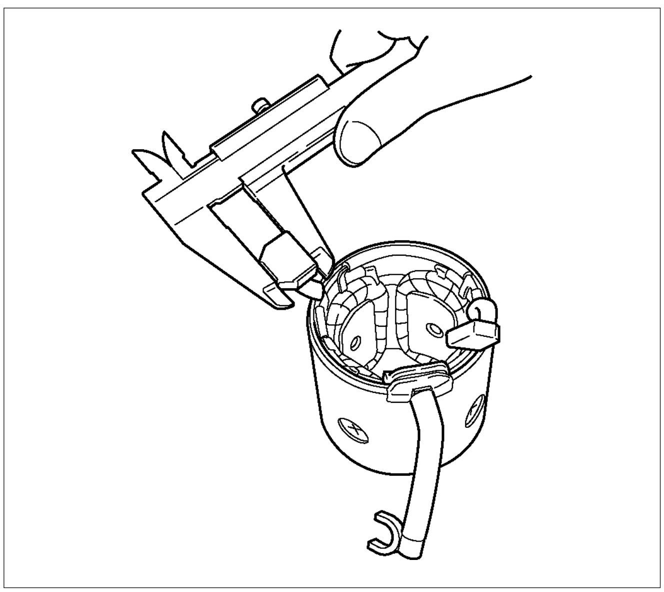
RTW46DSH003901

Brush and Brush Holder

1. Use a vernier caliper to measure the brush length (four brushes).
   Replace the brushes as a set if one or more of the brush lengths is less than the specified limit.

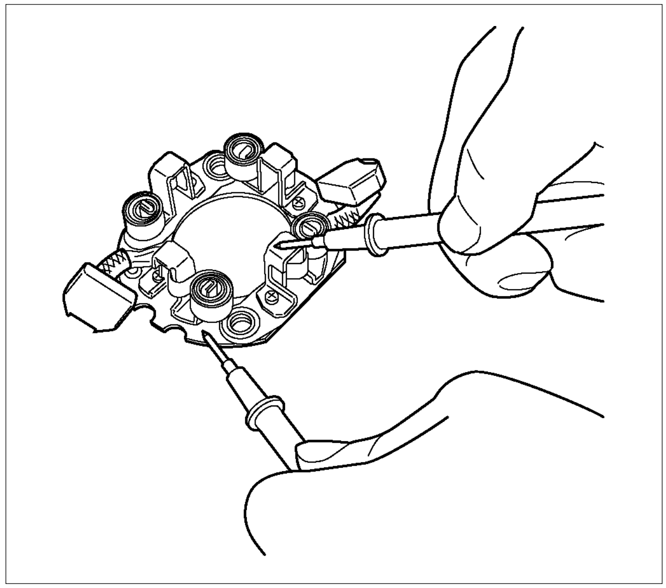
Brush Length mm (in)

Standard	Limit
15 (0.59)	12 (0.47)



RTW46DSH004001

2. Use a circuit tester to check the brush holder insulation.
   Touch one probe to the holder plate and the other probe to the positive brush holder.
   There should be no continuity.

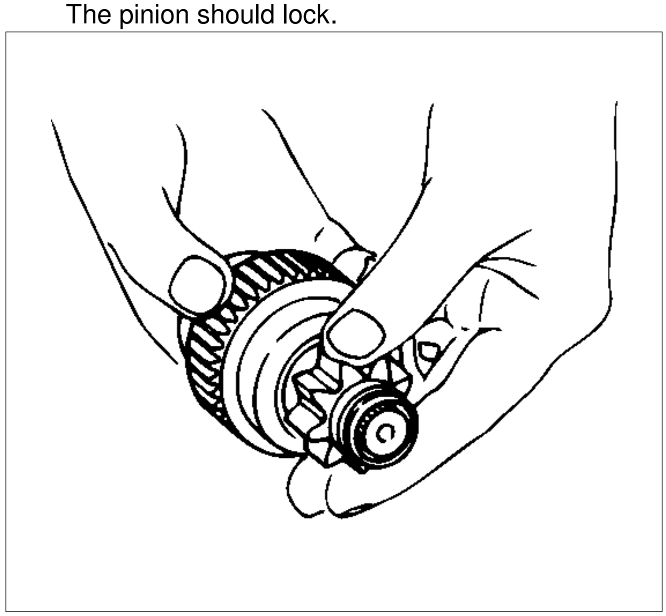


RTW46DSH004101

3. Inspect the brushes for excessive wear.
   If the negative brushes have excessive wear, the entire brush holder assembly must be replaced.
   If the positive brushes have excessive wear, the entire yoke must be replaced.

Overrunning Clutch

1. Inspect the overrunning clutch gear teeth for excessive wear and damage.
   Replace the overrunning clutch if necessary.
2. Rotate the pinion clockwise.
   It should turn smoothly.
3. Try to rotate the pinion in the opposite direction.
   The pinion should lock.

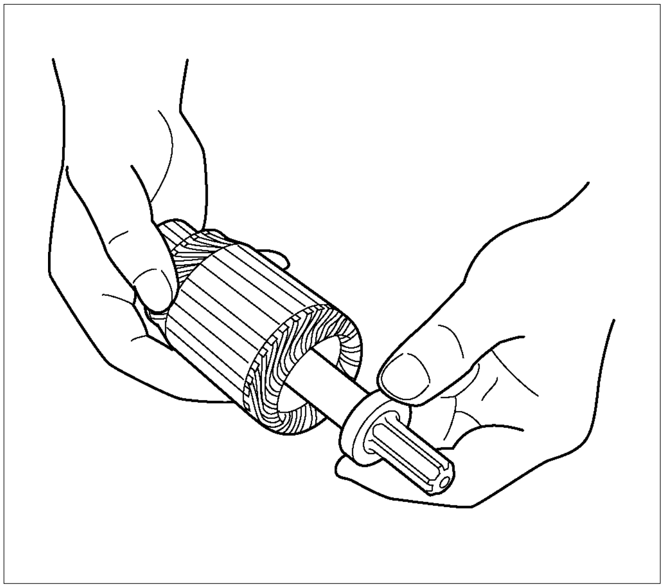


065RY00035

Bearing

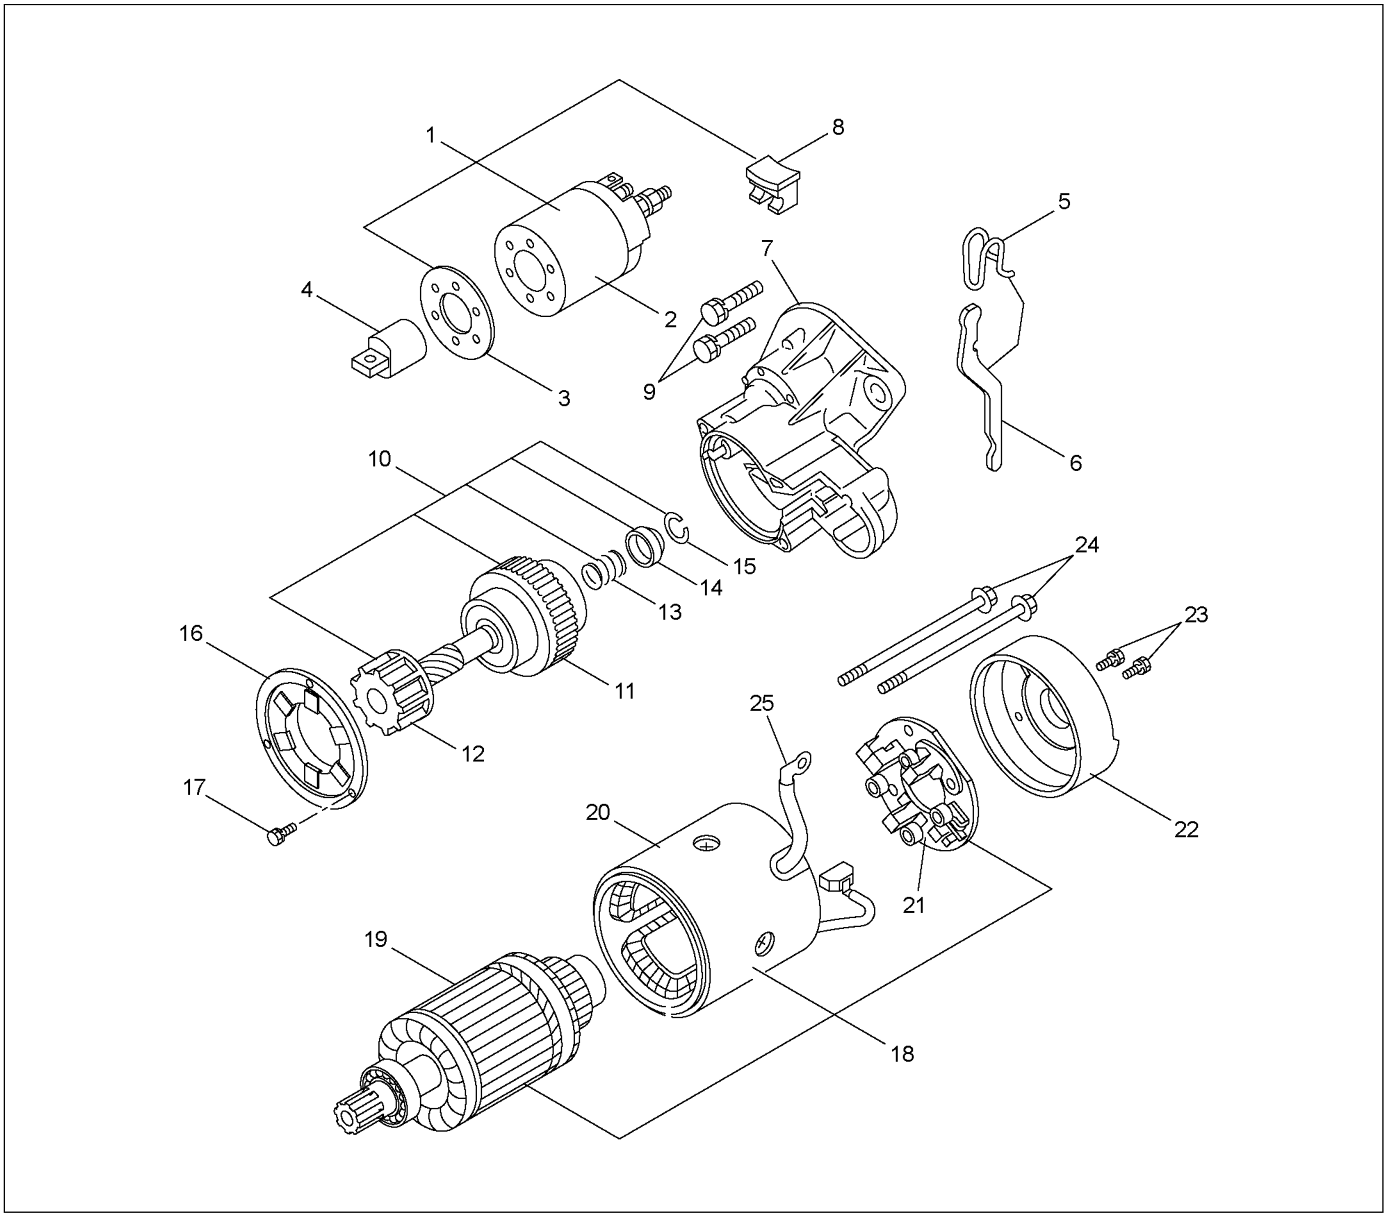
Inspect the bearings for excessive wear and damage.

Replace the bearings if necessary.



RTW46DSH004401

Reassembly



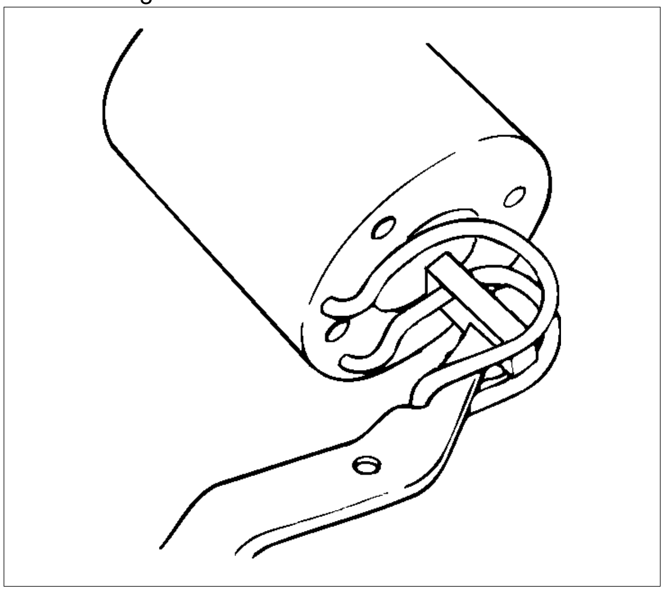
RTW46DLF000601

Reassembly Steps

1. Magnetic Switch Assembly
2. Magnetic Switch
3. Dust Cover
4. Plunger
5. Torsion Spring
6. Shift Lever
7. Gear Case
8. Dust Cover
9. Bolt
10. Pinion Assembly
11. Clutch
12. Pinion Shaft
13. Return Spring
14. Pinion Stopper
15. Pinion Stopper Clip
16. Bearing Retainer
17. Bolt
18. Motor Assembly
19. Armature
20. Yoke
21. Brush Holder
22. Rear Cover
23. Screw
24. Through Bolt
25. Lead Wire

Important Operations

1. Magnetic Switch Assembly
   1) Attach the torsion spring to the hole in the magnetic switch as illustrated.
   2) Insert the shift lever into the plunger hole of the magnetic switch.

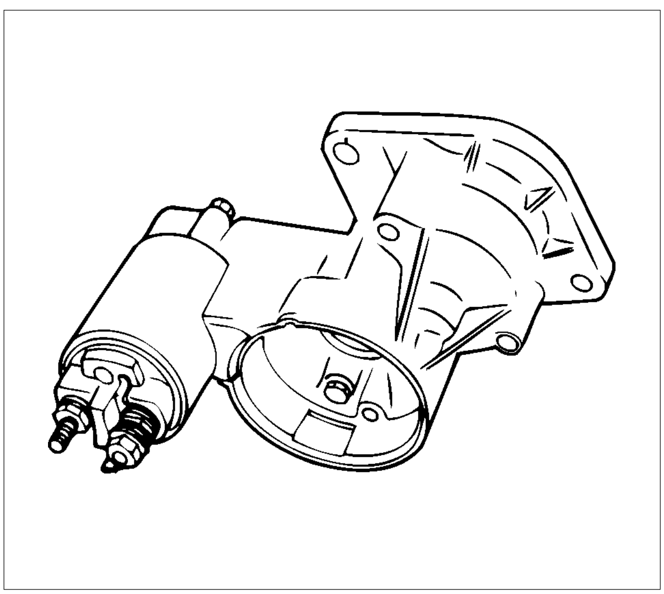


RTW46DSH005601

2. Gear Case
3. Dust Cover
   1) Install the magnetic switch assembly in the gear case.
   2) Install the dust cover.

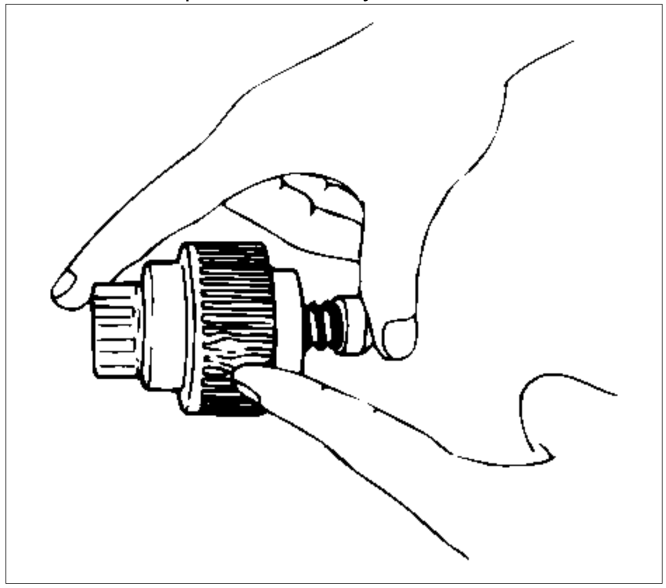
Dust Cover Bolt Torque N·m (kg·m/lb in)

8 (0.8 / 69)



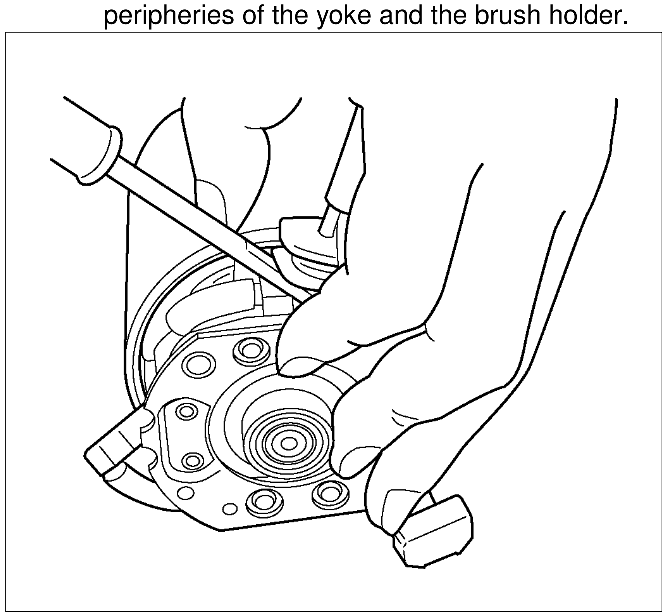
RTW46DSH005701

4. Pinion Assembly
   Apply a coat of grease to the reduction gear and install the pinion assembly to the armature shaft.



065RY00041

5. Brush Holders
   1) Install the brushes into the brush holder with raising the spring end of the brush spring.
      Take care not to damage the commutator face.
   2) Install the brush holder with aligning the peripheries of the yoke and the brush holder.

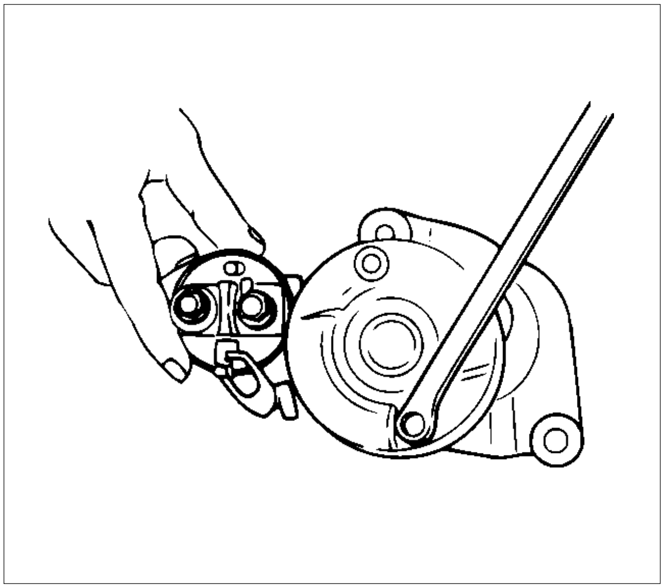


RTW46DSH004501

6. Through Bolt
   Install the through bolts in the rear cover and tighten them to the specified torque.

Through Bolt Torque N·m (kg·m/lb in)

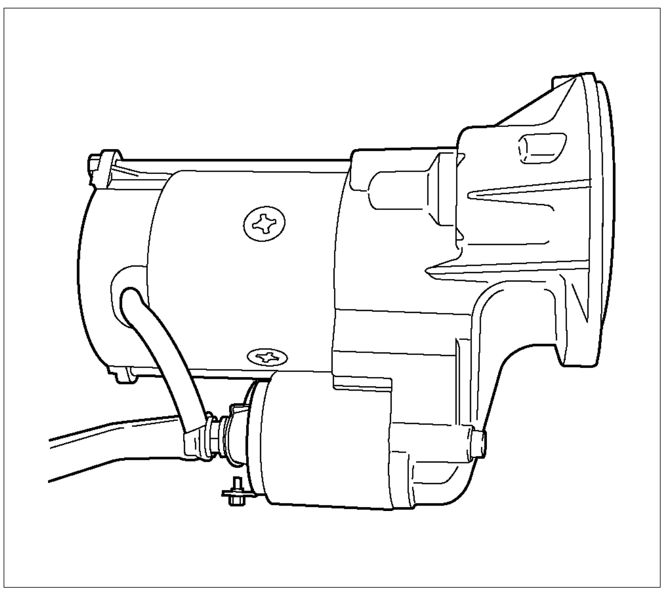
8.1 (0.83 / 69.7)



065RY00044

7. Lead Wire
   Connect the lead wire in the magnetic switch and tighten the terminal nut to the specified torque.

Lead Wire Terminal Nut Torque	N·m (kg·m/lb in)
8.6 (0.88 / 74.9)	



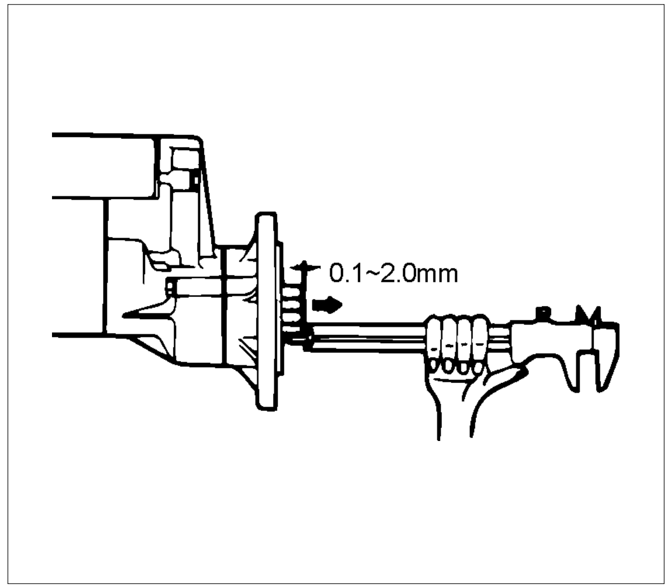
RTW46DSH002601

Inspection After Assembly

Use a vernier caliper to measure the pinion shaft thrust play.

The pinion shaft thrust play is equal to the pinion shaft end and pinion stopper clearance.

Pinion Shaft Thrust Play	mm (in)
0.1 – 2.0 (0.004 – 0.078)	



RTW46DSH005801

Magnetic Switch

The following tests must be performed with the starter motor fully assembled.

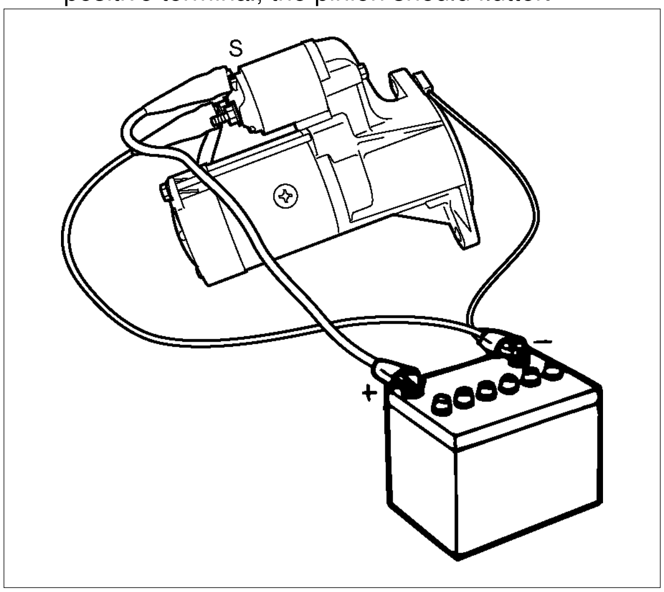
The yoke lead wire must be disconnected from the “M” terminal.

To prevent coil burning, complete each test as quickly as possible (within three to five seconds).

Temporarily connect the solenoid switch between the clutch and the housing and run the following test. Complete each test within three to five seconds.

1. Pull-in Test

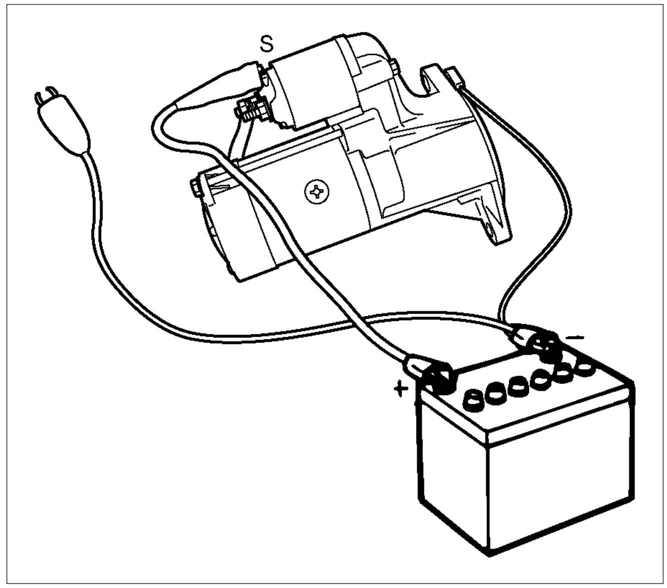
   Connect the battery negative terminal with the solenoid switch body and the M terminal. When current is applied to the S terminal from the battery positive terminal, the pinion should flutter.



RTW46DSH004601

2. Hold-in Maintenance Test

   Disconnect the lead at the M terminal. The pinion should continue to flutter.

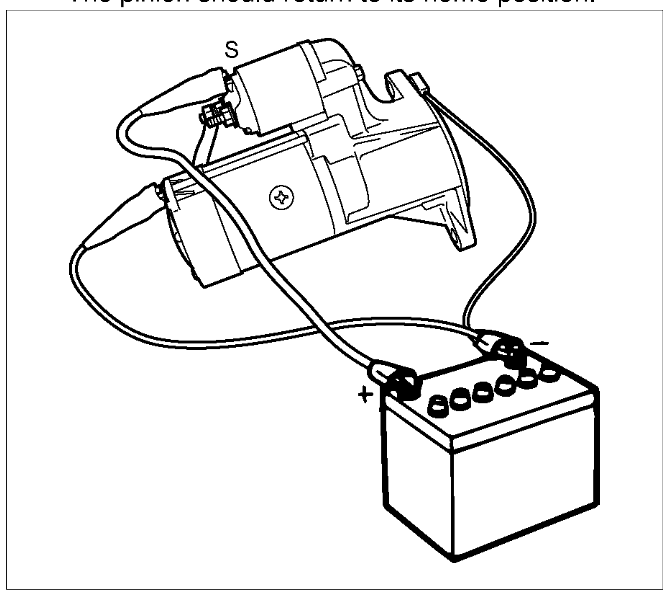


RTW46DSH005901

3. Return Test

   Disconnect the battery positive lead at the S terminal.

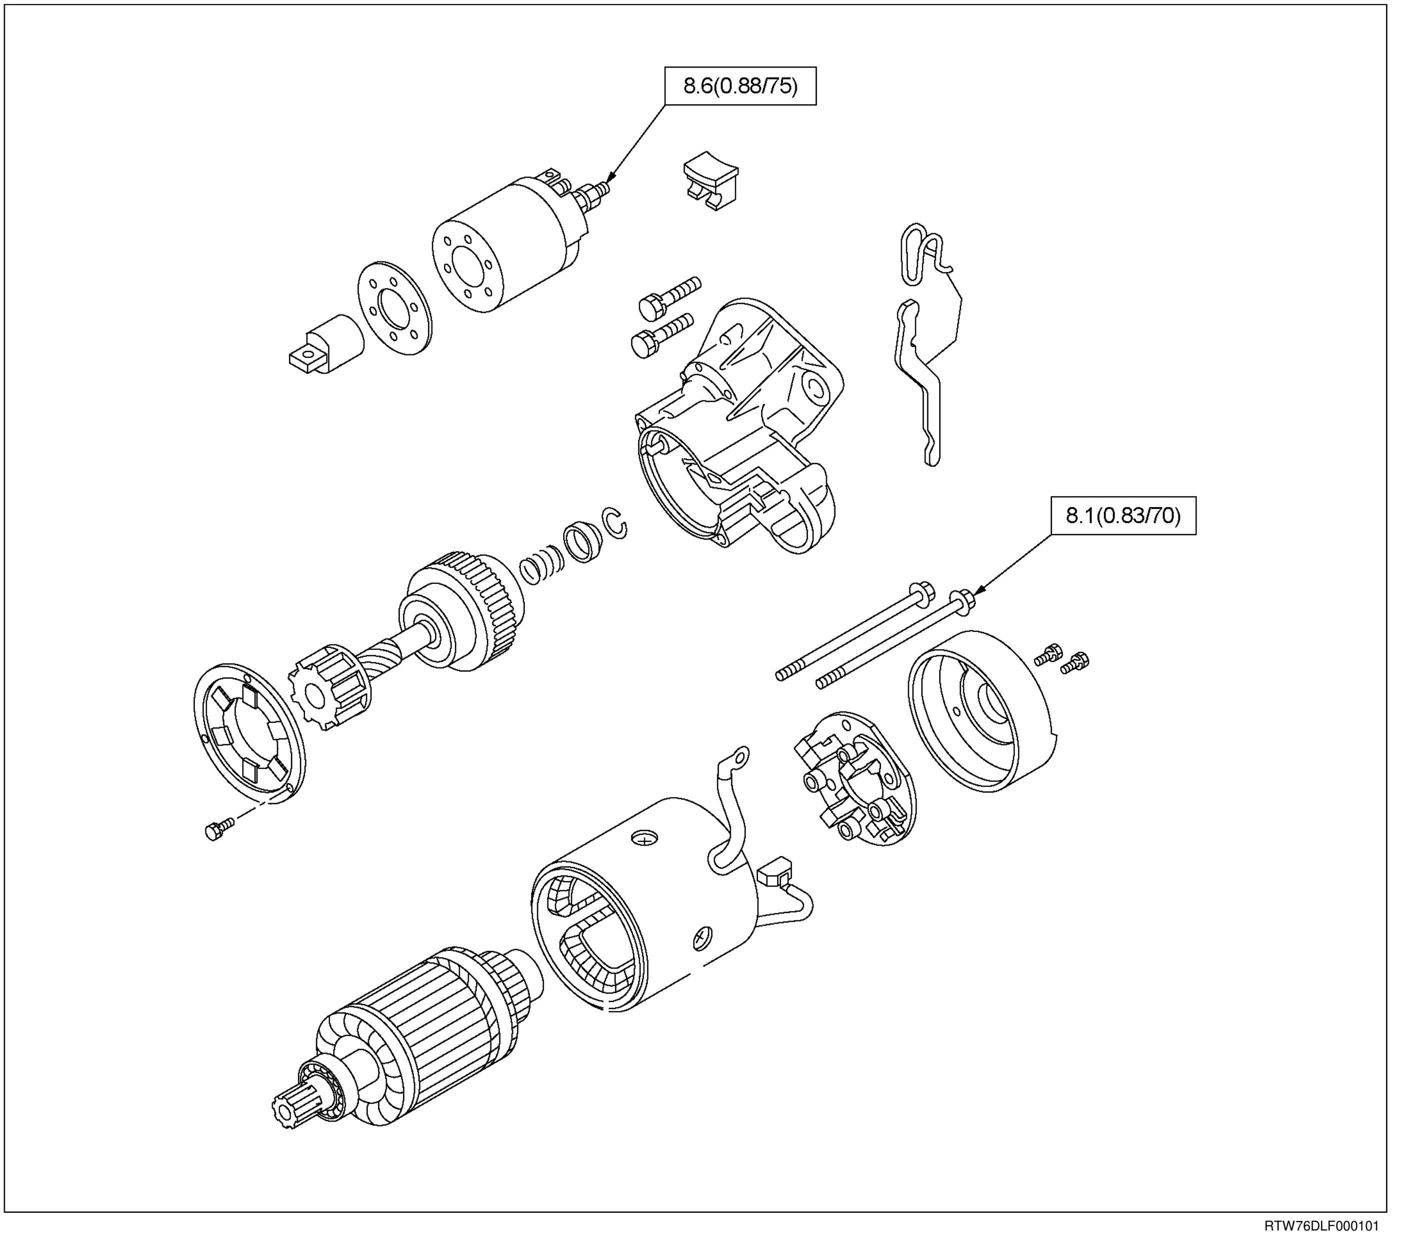
   The pinion should return to its home position.



RTW46DSH004701

Torque Specifications

N·m (kg·m/lb in)



RTW76DLF000101

Pre-Heating System

Inspection and Repair

Make the necessary adjustments, repairs, and part replacement if excessive wear of damage is discovered during inspection.

Visual Check

Check the main fuses and glow indicator for damage.

Replace the part(s) if required.

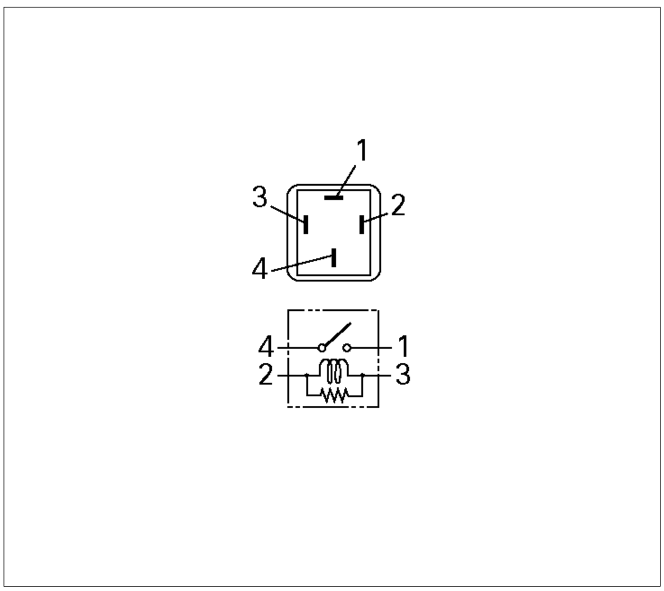
Glow Relay

The glow relay is located in the relay box the engine compartment.

Use an ohmmeter to measure the resistance between terminals No.2 and No.3.

If the measured value is outside the specified range, the glow relay must be replaced.

Glow Relay Resistance	Ohms
94 - 114	



825R300046

Glow Plug

Use a circuit tester to test the glow plugs for continuity.

Glow Plug Resistance (Reference)	Ohms
Approximately 0.9

Diagnostic Trouble Code (DTC) Type Definitions

Emission Related DTC

Action Taken When the DTC Sets - Type A

- The ECM illuminates the malfunction indicator lamp (MIL) when the diagnostic runs and fails.
- The ECM records the operating conditions at the time the diagnostic fails. The ECM stores this information in the Freeze Frame/ Failure Records.

Action Taken When the DTC Sets - Type B

- The ECM illuminates the MIL on the second consecutive driving cycle when the diagnostic runs and fails.
- The ECM records the operating conditions at the time the diagnostic fails. The first time the diagnostic fails, the ECM stores this information in the Failure Records. If the diagnostic reports a failure on the second consecutive driving cycle, the ECM records the operating conditions at the time of failure and stores this information in the Freeze Frame and updates the Failure Records.

Conditions for Clearing the MIL/ DTC - Type A or Type B

- The ECM turns OFF the MIL after 3 consecutive driving cycles when the diagnostic runs and does not fail. (Euro 4 Specification)
- The ECM turns OFF the MIL after 1 driving cycle when the diagnostic runs and does not fail. (Except Euro 4 Specification)
- A current DTC clears when the diagnostic runs and passes after 1 driving cycle.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported.
- Use a scan tool to clear the MIL and the DTC.

Non-Emissions Related DTCs

Action Taken When the DTC Sets - Type C

- The ECM illuminates the Service Vehicle Soon (SVS) lamp when the diagnostic runs and fails.
- The ECM records the operating conditions at the time the diagnostic fails. The ECM stores this information in the Failure Records.

Conditions for Clearing the SVS Lamp/ DTC - Type C

- The ECM turns OFF the SVS lamp after 1 driving cycle when the diagnostic runs and does not fail.
- A current DTC clears when the diagnostic runs and passes after 1 driving cycle.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported.
- Use a scan tool to clear the SVS lamp and the DTC.

Action Taken When the DTC Sets - Type D

- The ECM will not illuminate the MIL or SVS lamp.
- The ECM records the operating conditions at the time the diagnostic fails. The ECM stores this information in the Failure Records.

Conditions for Clearing the DTC - Type D

- A current DTC clears when the diagnostic runs and passes after 1 driving cycle.
- A history DTC clears after 40 consecutive warm-up cycles, if no failures are reported.
- Use a scan tool to clear the DTC.

Diagnostic Trouble Code (DTC) List

DTC	Flash Code	DTC Type			DTC Descriptor
		Euro 4 Specification	Except Euro 4 Specification (High Output)	Except Euro 4 Specification (Standard Output)

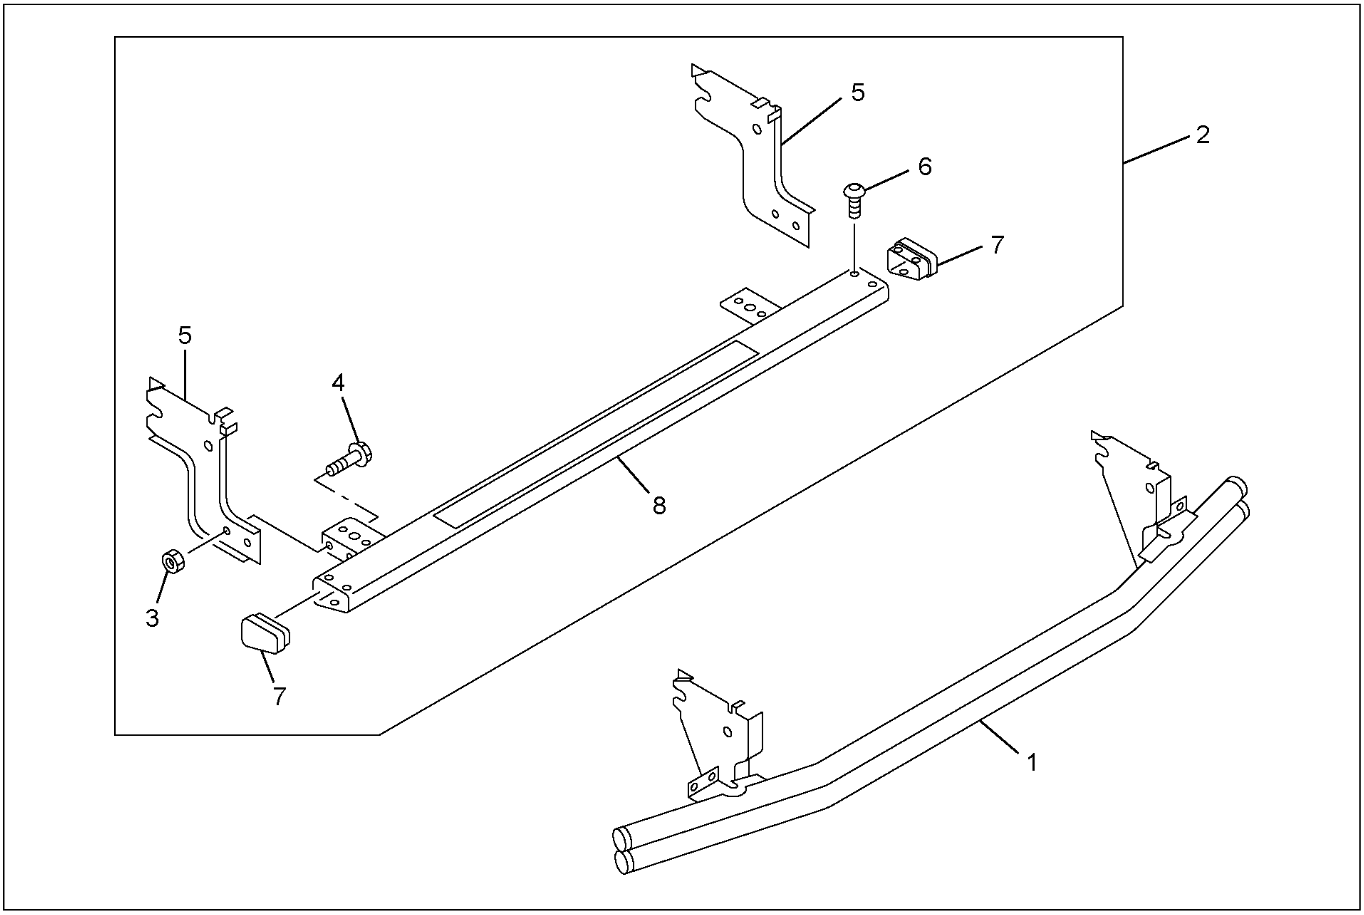
REAR BUMPER AND REAR GUARD

REMOVAL AND INSTALLATION



RTW42AMF000201

Removal Steps

▲ 1. Rear guard assembly
▲ 2. Rear bumper assembly
3. Nut
4. Bolt
5. Bumper bracket
6. Screw
7. Cap
8. Rear bumper

Installation Steps

8. Rear bumper
7. Cap
6. Screw
5. Bumper bracket
4. Bolt
▲ 3. Nut
▲ 2. Rear bumper assembly
▲ 1. Rear guard assembly

Important Operations - Removal

1. Rear Guard Assembly

- Remove the 2 bolts from each side.

2. Rear bumper assembly

- Remove the 2 bolts from each side.

5	—	Not used
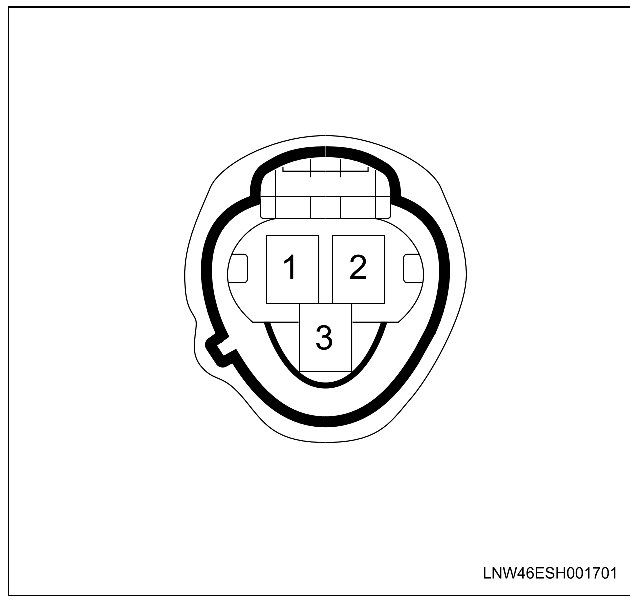
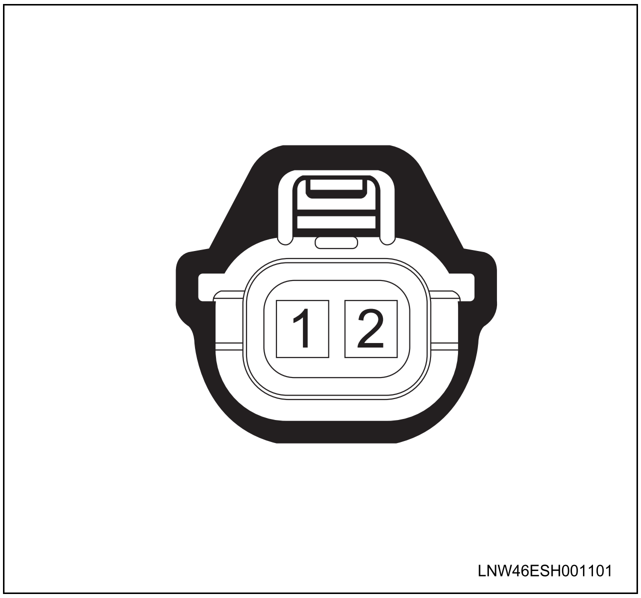
6	YEL	Solenoid control low side (PWM)

Engine Coolant Temperature (ECT) Sensor



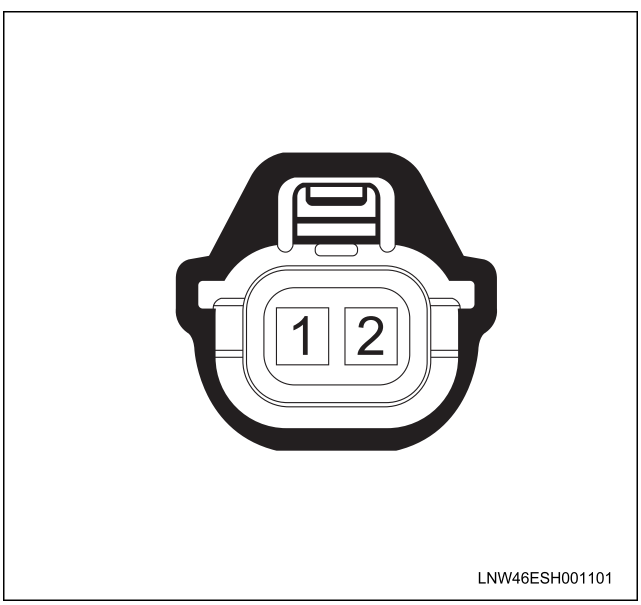
Connector No.		E-41
Connector Color		Gray
Test Adapter No.		J-35616-64A
Pin No.	Wire Color	Pin Function
1	GRN/ RED	Sensor signal
2	WHT	Sensor low reference
3	YEL/ BLK	Gauge signal

Fuel Injector No.1 Cylinder



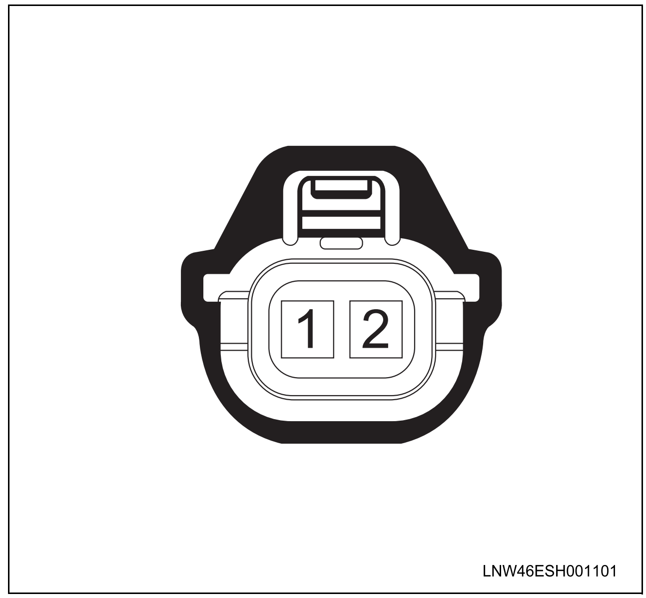
Connector No.		E-13
Connector Color		Gray
Test Adapter No.		J-35616-64A
Pin No.	Wire Color	Pin Function
1	BLU/ YEL	Solenoid control
2	BLU	Charge voltage

Fuel Injector No.2 Cylinder



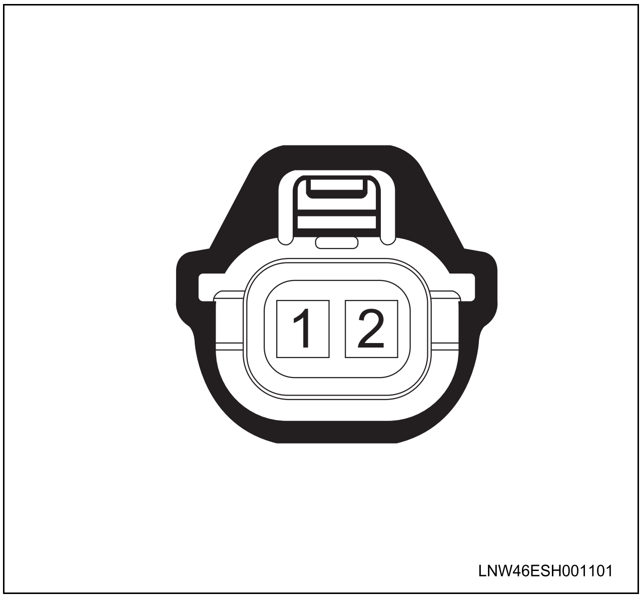
Connector No.		E-14
Connector Color		Gray
Test Adapter No.		J-35616-64A
Pin No.	Wire Color	Pin Function
1	YEL	Solenoid control
2	RED	Charge voltage

Fuel Injector No.3 Cylinder



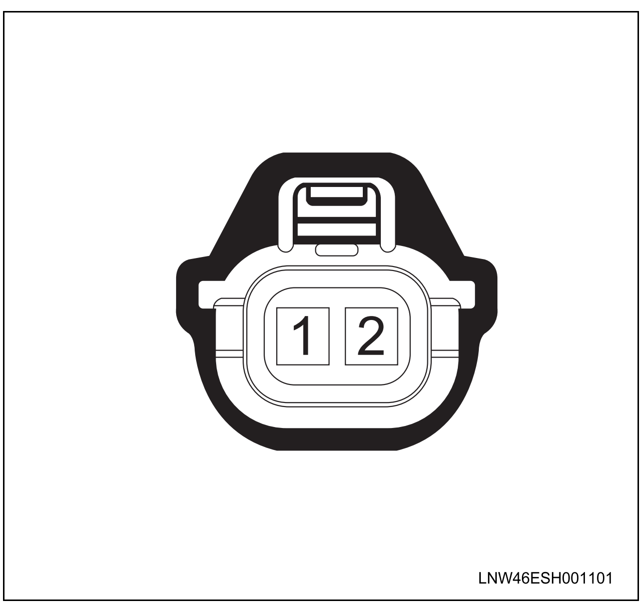
Connector No.		E-15
Connector Color		Gray
Test Adapter No.		J-35616-64A
Pin No.	Wire Color	Pin Function
1	BRN	Solenoid control
2	WHT	Charge voltage

Fuel Injector No.4 Cylinder



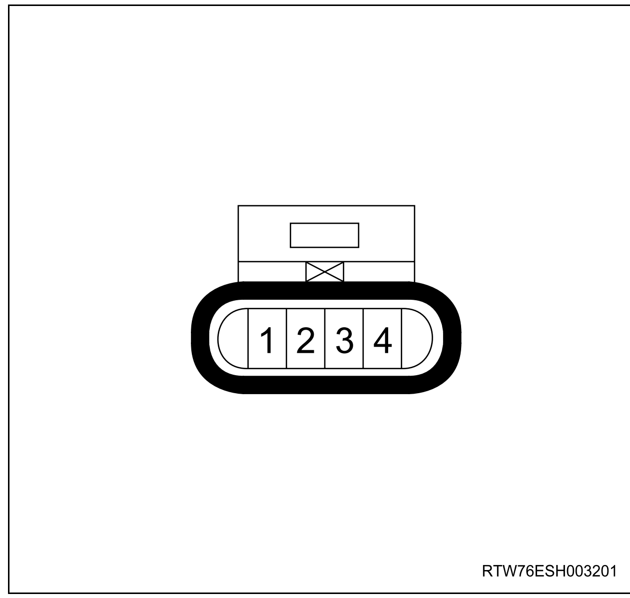
Connector No.		E-16
Connector Color		Gray
Test Adapter No.		J-35616-64A
Pin No.	Wire Color	Pin Function
1	GRN	Solenoid control
2	PNK	Charge voltage

Fuel Rail Pressure (FRP) Regulator



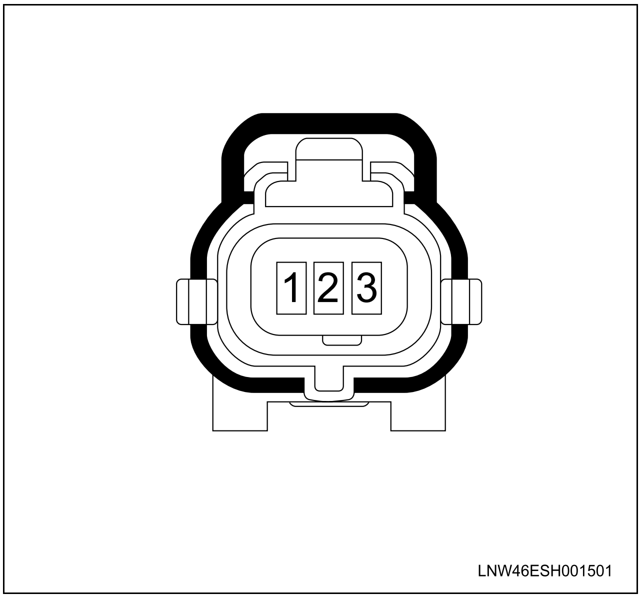
Connector No.		E-50
Connector Color		Gray
Test Adapter No.		J-35616-64A
Pin No.	Wire Color	Pin Function
1	BLK/ YEL	Control high side (PWM)
2	BLU/ RED	Low side

Fuel Pump & Sender Assembly



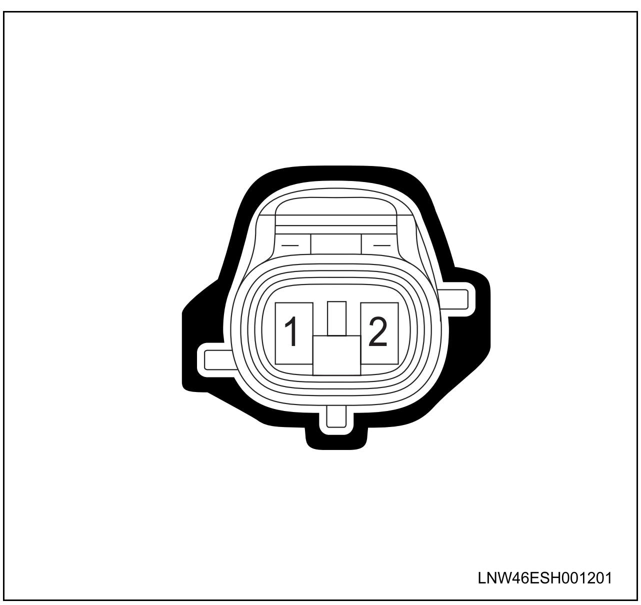
Connector No.		F-2
Connector Color		White
Test Adapter No.		J-35616-4A
Pin No.	Wire Color	Pin Function
1	ORN/ BLU	Fuel pump motor voltage feed
2	BLK	Fuel gauge ground
3	YEL/RED	Fuel gauge signal
4	BLK	Fuel pump motor ground

Fuel Rail Pressure (FRP) Sensor



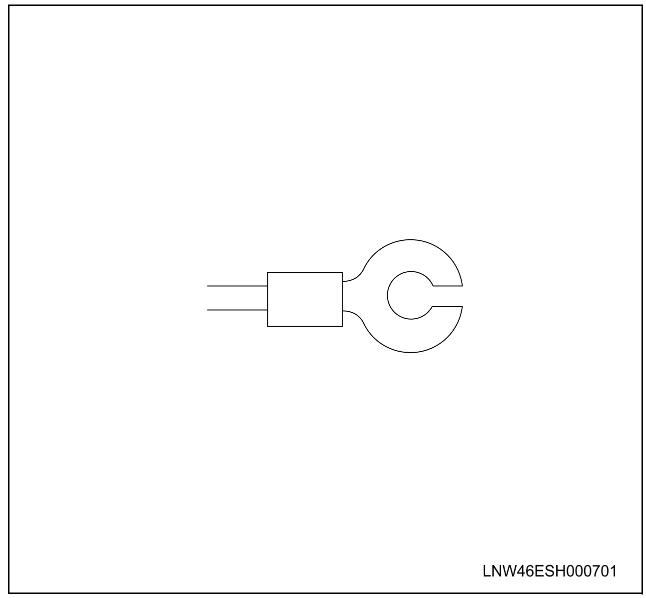
Connector No.		E-48
Connector Color		Black
Test Adapter No.		J-35616-64A
Pin No.	Wire Color	Pin Function
1	BLK	Sensor low reference
2	WHT	Sensor signal
3	RED	Sensor 5V reference

Fuel Temperature (FT) Sensor



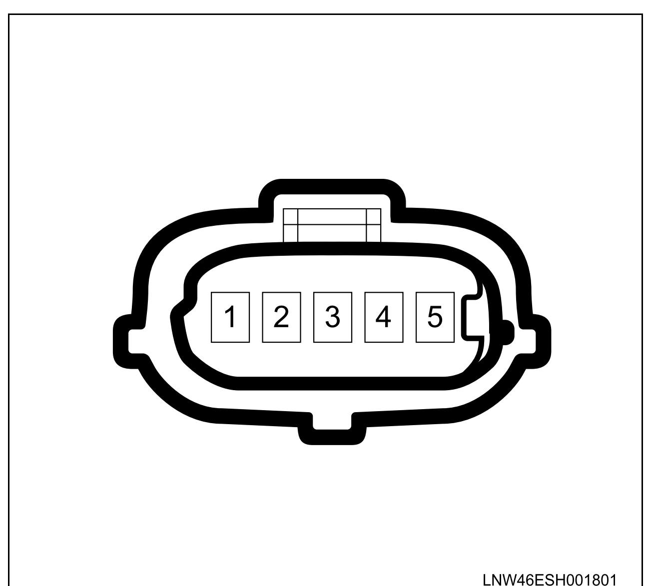
Connector No.		E-27
Connector Color		Gray
Test Adapter No.		J-35616-64A
Pin No.	Wire Color	Pin Function
1	YEL/ RED	Sensor low reference
2	PNK	Sensor signal

Glow Plug



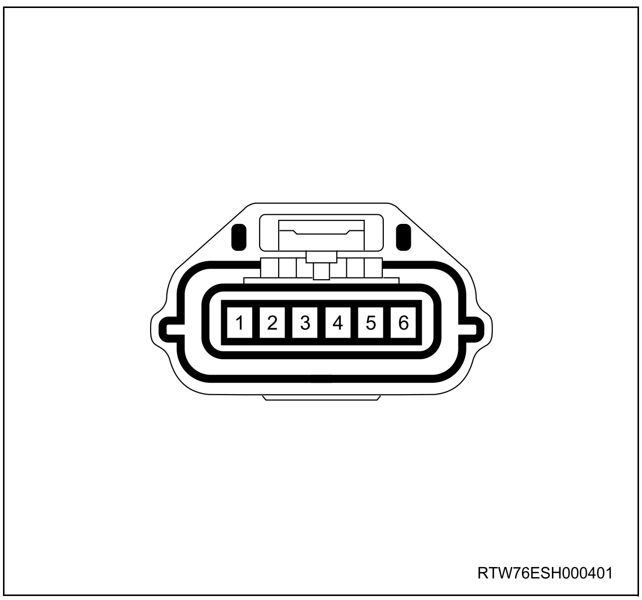
Connector No.		E-49
Connector Color		Silver
Pin No.	Wire Color	Pin Function
1	BLK/ RED	Power supply

Mass Air Flow (MAF)/ Intake Air Temperature (IAT) Sensor



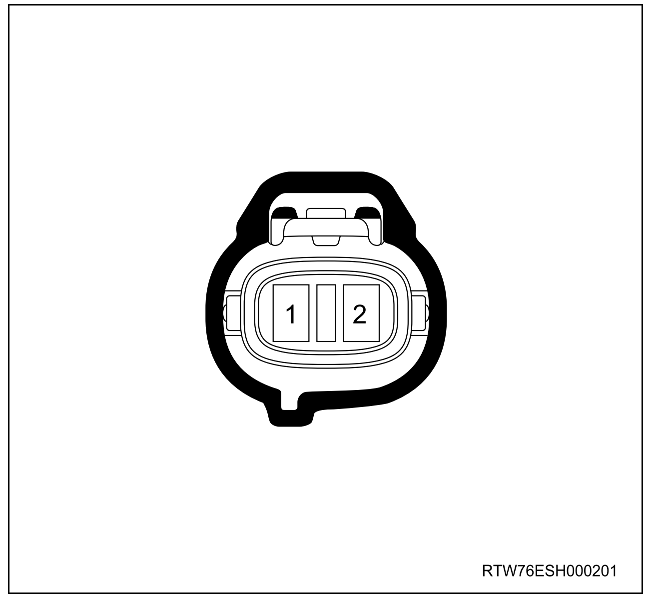
Connector No.		E-47
Connector Color		Black
Test Adapter No.		J-35616-64A
Pin No.	Wire Color	Pin Function
1	RED/ BLU	MAF sensor ignition voltage feed
2	WHT/ BLU	MAF sensor low reference
3	ORN/ BLU	MAF sensor signal
4	BLU/ RED	IAT sensor signal
5	BLU/ GRN	IAT sensor low reference

Intake Throttle Valve



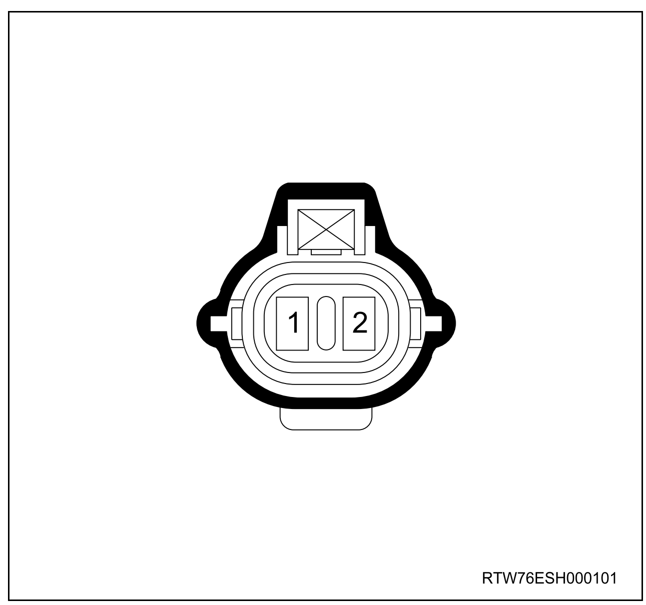
Connector No.		E-38
Connector Color		Black
Test Adapter No.		J-35616-64A
Pin No.	Wire Color	Pin Function
1	RED	Solenoid control low side (PWM)
2	WHT	Solenoid drive voltage
3	BLU	Position sensor low reference
4	—	Not used
5	ORN	Position sensor signal
6	GRY	Position sensor 5V reference

Swirl Control Solenoid Valve



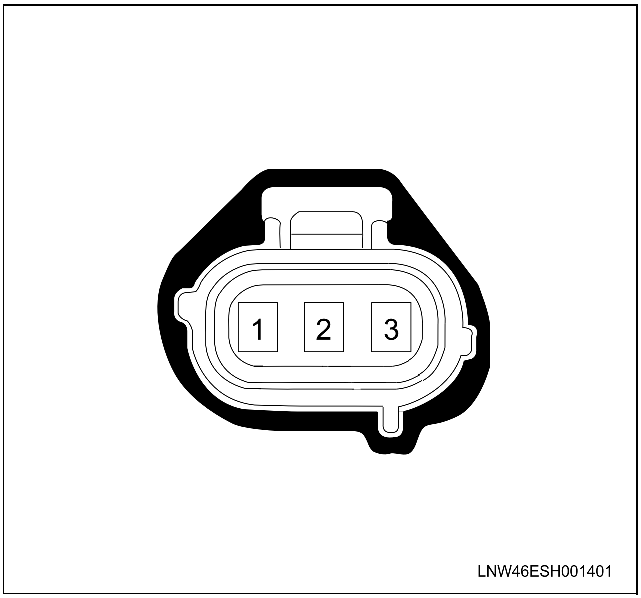
Connector No.		E-67
Connector Color		Brown
Test Adapter No.		J-35616-64A
Pin No.	Wire Color	Pin Function
1	YEL	Solenoid valve control
2	RED/ BLU	Ignition voltage feed

Turbocharger Nozzle Control Solenoid Valve



Connector No.		E-106
Connector Color		Brown
Test Adapter No.		J-35616-64A
Pin No.	Wire Color	Pin Function
1	YEL/ BLK	Solenoid valve control (PWM)
2	RED/ BLU	Ignition voltage feed

Vehicle Speed Sensor (VSS)



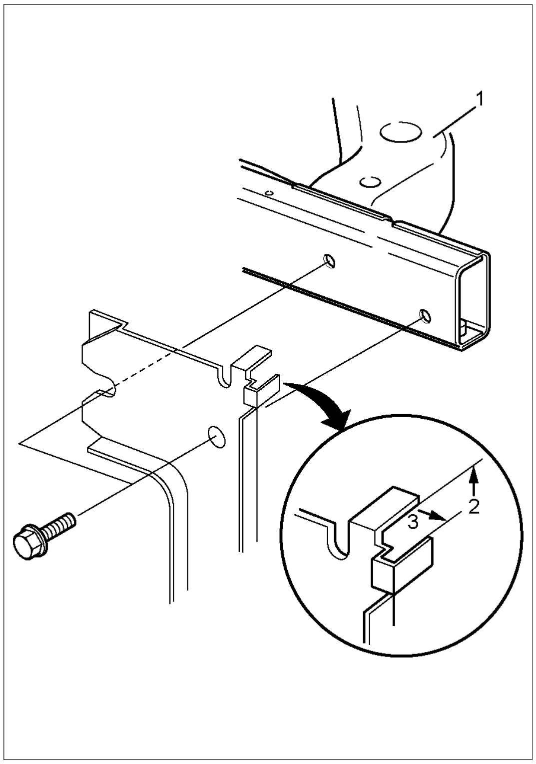
Connector No.		E-44
Connector Color		Gray
Test Adapter No.		J-35616-64A
Pin No.	Wire Color	Pin Function
1	YEL	Ignition voltage feed
2	GRN/ WHT	Sensor low reference
3	BLK/ YEL	Sensor signal

Important Operations - Installation

3. Nut

- Tighten the fixing bolts to the specified torque.

Torque	N·m (kgf·m/lb·ft)
116 (11.8 / 85)	



RTW72AMH000201

2. Rear Bumper Assembly

1) Align the back bar to the frame (1) as follows:
   - Face A (2) should be contacted with the upper face of the frame
   - Face B (3) should be contacted with the rear end of the frame.
2) Tighten the 2 fixing bolts on the each side of back bar.

Torque	N·m (kgf·m/lb·ft)
150 (15.3 / 111)	

1. Rear Guard Assembly

1) Align the back bar to the frame (1) as follows:
   - Face A (2) should be contacted with the upper face of the frame
   - Face B (3) should be contacted with the rear end of the frame.
2) Tighten the 2 fixing bolts on the each side of back bar.

Torque	N·m (kgf·m/lb·ft)
150 (15.3 / 111)	

Diagnostic Information and Procedures

Engine Control System Check Sheet

ENGINE CONTROL SYSTEM CHECK SHEET		Inspectors Name	
Customer's Name		Model & Model Year	
Driver's Name		Chassis No.	
Date Vehicle Brought In		Engine No.	
License No.		Odometer Reading	Km/miles

Problem Symptoms	☐ Engine Does Not Run	☐ Engine does not crank	☐ No initial combustion	☐ No complete combustion
	☐ Hard Start	☐ Engine cranks slowly	☐ Other (	)
	☐ Incorrect Idle	☐ Abnormal idling speed ☐ Rough idling ☐ Other (	☐ High idling speed (RPM)	☐ Low idling speed (RPM))
	☐ Poor Driveability	☐ Hesitation, sag, stumble ☐ Lack of power, sluggishness, sponginess ☐ Other (	☐ Surge	☐ Cut out)
	☐ Engine Stall	☐ Soon after starting ☐ During A/C operation ☐ Other (	☐ After accelerator pedal depressed ☐ After accelerator pedal released	 ☐ Shifting from N to D)
	☐ Others	☐ Black smoke ☐ Fuel knock, combustion noise ☐ Other (	☐ White smoke	☐ Poor fuel economy)

Dates problem occurred					
Problem frequency		☐ Constant ☐ Other (	☐ Intermittently (times per day/month)		☐ Once only)
Condition When Problem Occurs	Weather	☐ Fine ☐ Various/Other (	☐ Cloudy	☐ Rainy	☐ Snow)
	Outside Temperature	☐ Hot (approx.) ☐ Any temperature	☐ Warm	☐ Cool	☐ Cold (approx.)
	Place	☐ Highway ☐ Downhill	☐ Suburbs ☐ Rough road	☐ City area ☐ Other (	☐ Uphill)
	Load Condition	☐ Over (approx. tons) ☐ Other (approx. tons)		☐ No load	
	Engine Temperature	☐ Cold ☐ Other (	☐ Warming up	☐ After warming up	☐ Any temperature)
	Engine Operation	☐ Starting ☐ Racing ☐ Deceleration ☐ Other (	☐ Just after starting (Min.) ☐ Driving ☐ A/C switch On/Off	 ☐ Constant speed	☐ Idling ☐ Acceleration)
	Fuel Amount	☐ Full	☐ Above 1/2	☐ Below 1/2	☐ Near empty
	Fuel Bland				

Condition of MIL or SVS lamp		☐ Remains On	☐ Intermittently turns On	☐ Does not turn On
DTC or Flash Code	Present Code	☐ Nothing	☐ P or U Code No. (	)
	History Code	☐ Nothing	☐ P or U Code No. (	)
Other Additional Condition				

Diagnostic Starting Point - Engine Controls

Begin the system diagnosis with Diagnostic System Check - Engine Controls. The Diagnostic System Check - Engine Controls will provide the following information:

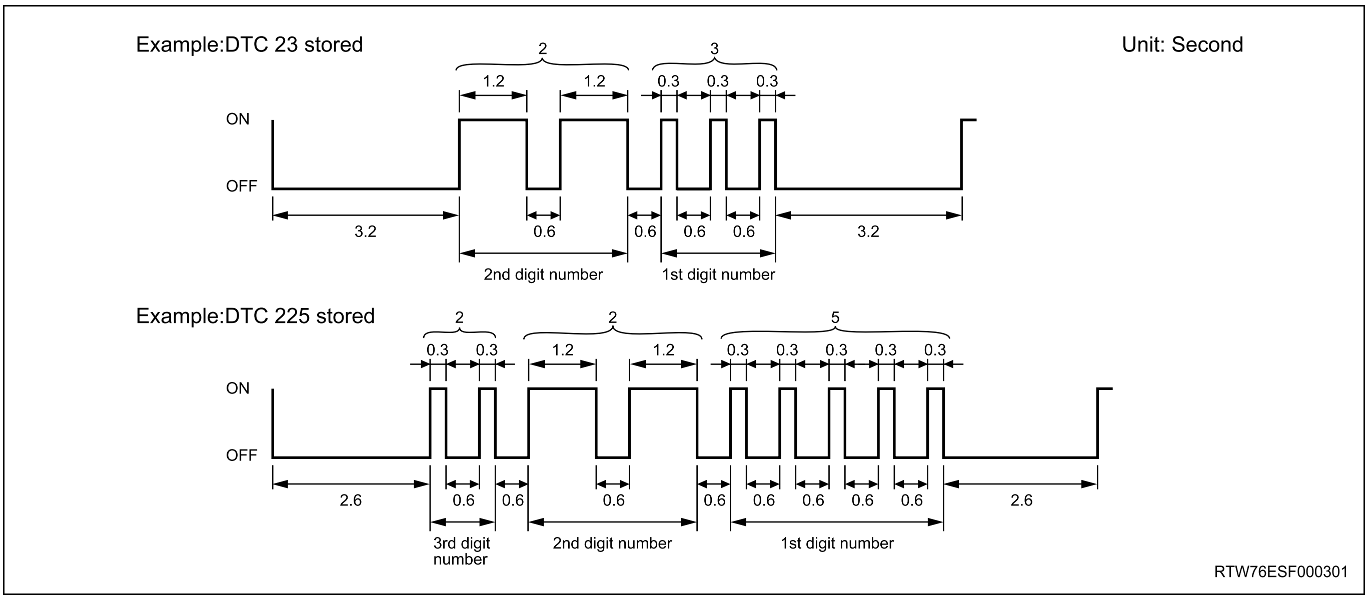
- The identification of the control modules which command the system.
- The ability of the control modules to communicate through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTCs) and the their statuses.

The use of the Diagnostic System Check - Engine Controls will identify the correct procedure for diagnosing the system and where the procedure is located.

Important: Engine Control System Check Sheet must be used to verify the complaint vehicle, you need to know the correct (normal) operating behavior of the system and verify that the customer complaint is a valid failure of the system.

Reading Flash Diagnostic Trouble Codes (DTC)

The provision for communicating with the ECM is the Data Link Connector (DLC). The DTC(s) stored in the ECM memory can be read either through a hand-held diagnostic scanner such as Tech 2 plugged into the DLC or by counting the number of flashes of the malfunction indicator lamp (MIL) or the service vehicle soon (SVS) lamp when the diagnostic test terminal of the DLC is grounded. The DLC terminal "1" (diagnostic request) is pulled "Low" (grounded) by jumped to DLC terminal "4", which is a ground wire. Once terminals "1" and "4" have been connected, turn the ignition switch ON, with the engine OFF. The MIL (except Euro 4 specification) or the SVS lamp (Euro 4 specification) will indicate a DTC three times is a DTC is present and history. If more than one DTC has been stored in the ECM's memory, the DTCs will be output set order with each DTC being displayed three times. The flash DTC display will continue as long as the DLC is shorted.



Diagnostic System Check - Engine Controls

Description

The Diagnostic System Check - Engine Controls is an organized approach to identifying a condition that is created by a malfunction in the electronic engine control system. The Diagnostic System Check must be the starting point for any driveability concern. The Diagnostic System Check directs the service technician to the next logical step in order to diagnose the concern. Understanding and correctly using the diagnostic table reduces diagnostic time, and prevents the replacement of good parts.

Test Description

The numbers below refer to the step numbers on the diagnostic table.
2. Lack of communication may be because of a partial or a total malfunction of the serial data circuit.
7. The presence of DTCs which begin with U, indicate that some other module is not communicating.
10. If there are other modules with DTCs set, refer to the DTC list. The DTC list directs you to the appropriate diagnostic procedure. If the control module stores multiple DTCs, diagnose the DTCs in the following order:

- Component level DTCs, such as sensor DTCs, solenoid DTCs, actuator DTCs, and relay DTCs. Diagnose the multiple DTCs within this category in numerical order. Begin with the lowest numbered DTC, unless the diagnostic table directs you otherwise.

Diagnostic System Check Engine Controls Important:

- DO NOT perform this diagnostic if there is not a driveability concern, unless another procedure directs you to this diagnostic.
- Before you proceed with diagnosis, search for applicable service bulletins.
- Unless a diagnostic procedure instructs you, DO NOT clear the DTCs.
- If there is a condition with the starting system, refer to the starting system section in the engine mechanical.
- Ensure the battery has a full charge.
- Ensure the battery cables (+) (-) are clean and tight.
- Ensure the ECM grounds are clean, tight, and in the correct location.
- Ensure the ECM harness connectors are clean and correctly connected. DO NOT attempt to crank the engine with ECM harness connectors disconnect.
- Ensure the ECM terminals are clean and correctly mating.
- Ensure the fuel injector ID code data is correctly programmed in to the ECM.
- Ensure the immobilizer security information is correctly programmed into the ECM and immobilizer control unit (ICU).
- If there are fuel system DTC's (P0087, P0088, P0089, P0093, P1093 or P1094), diagnose sensor DTCs, solenoid DTCs, actuator DTCs and relay DTCs first.

Diagnostic System Check - Engine Controls

Step	Action	Value(s)	Yes	No
1	Install a scan tool. Does the scan tool turn ON?	—	Go to Step 2	Go to Scan Tool Does Not Power Up
2	1. Turn ON the ignition, with the engine OFF. 2. Attempt to establish communication with the listed control modules. • ECM • Immobilizer control unit (ICU) (If so equipped) • Transmission control module (TCM) (AISIN A/T only) Does the scan tool communicate with all the listed control modules?	—	Go to Step 3	Go to Scan Tool Does Not Communicate with CAN Device

Step	Action	Value(s)	Yes	No
3	**Notice:** If an immobilizer system is active the ECM will disable the fuel injection causing the engine to stall immediately after starting and energize the starter cut relay to disable cranking. Attempt to crank the engine. Does the engine crank?	—	Go to Step 4	Go to Step 5
4	Attempt to start the engine. Does the engine start and idle?	—	Go to Step 6	Go to Engine Cranks but Does Not Run
5	Does the scan tool display ECM DTCs P0615, P0633, P161B or U0167?	—	Go to Applicable DTC	Problem is relating to starting system. Refer to the applicable diagnostic chart in starting system
6	Select the DTC display function for the following control modules: • ECM • ICU (If so equipped) • TCM (AISIN A/T only) Does the scan tool display any DTCs?	—	Go to Step 7	Go to Step 11
7	Does the scan tool display DTCs which begin with U or other control module communication fault DTCs?	—	Go to Applicable DTC	Go to Step 8
8	Does the scan tool display ECM DTCs P0601, P0602, P0604, P0606 or P1621?	—	Go to Applicable DTC	Go to Step 9
9	Does the scan tool display ECM DTCs P0562 or P0563, P156A or P156B?	—	Go to Applicable DTC	Go to Step 10
10	Is there any other code in any controller that has not been diagnosed?	—	Go to Applicable DTC	Go to Step 11
11	Is the customer's concern with the automatic transmission?	—	Go to Diagnostic System Check - Transmission Controls	Go to Step 12
12	Is the customer's concern with the immobilizer system?	—	Go to Diagnostic System Check - Immobilizer Controls	Go to Step 13
13	1. Review the following symptoms. 2. Refer to the applicable symptom diagnostic table: • Hard Start • Rough, Unstable, or Incorrect Idle and Stalling • High Idle Speed • Cuts Out • Surges • Lack of Power, Sluggishness, or Sponginess • Hesitation, Sag, Stumble • Abnormal Combustion Noise • Poor Fuel Economy • Excessive Smoke (Black Smoke) • Excessive Smoke (White Smoke) Did you find and correct the condition?	—	System OK	Go to Intermittent Conditions

Scan Tool Data List

The Engine Scan Tool Data List contains all engine related parameters that are available on the scan tool. A given parameter may appear in any one of the data lists, and in some cases may appear more than once, or in more than one data list in order to group certain related parameters together. Use the Engine Scan Tool Data List only after the following is determined:

- The Engine Controls - Diagnostic System Check is completed.
- On-board diagnostics are functioning properly.

Scan tool values from a properly running engine may be used for comparison with the engine you are diagnosing. The Engine Scan Tool Data List represents values that would be seen on a normal running engine. Only the parameters listed below are referenced in this service manual for use in diagnosis.

Scan Tool Parameter	Units Displayed	Typical Data Value at Engine Idle	Typical Data Value at 2000RPM
Operating Conditions: Engine idling or 2000RPM/ Engine coolant temperature is between 75 to 85°C (167 to 185°F)/ Accelerator pedal is constant/ Neutral or Park/ Accessories OFF/ Vehicle located at sea level			
Engine Speed	RPM	Nearly 700 RPM	Nearly 2000 RPM
Desired Engine Idle Speed	RPM	700 RPM	700 RPM
Calculated Engine Load	%	-	-
Coolant Temperature	°C/ °F	75 to 85 °C/ 167 to 185°F	75 to 85 °C/ 167 to 185°F
Engine Coolant Temperature Sensor	Volts	0.4 to 0.6 volts	0.4 to 0.6 volts
Intake Air Temperature	°C/ °F	20 to 40 °C/ 68 to 104 °F	20 to 40 °C/ 68 to 104 °F
Intake Air Temperature Sensor	Volts	1.4 to 2.3 volts	1.4 to 2.3 volts
Fuel Temperature	°C/ °F	20 to 60 °C/ 68 to 140 °F	20 to 60 °C/ 68 to 140 °F
Fuel Temperature Sensor	Volts	0.8 to 2.3 volts	0.8 to 2.3 volts
MAF (Mass Air Flow)	g/sec	300 to 600 g/sec	200 to 600 g/sec
MAF Sensor (Mass Air Flow)	Volts	1.2 to 1.6 volts	2.0 to 2.7 volts
Barometric Pressure	kPa/psi	Nearly 100 kPa/ 14.5 psi at sea level	Nearly 100 kPa/ 14.5 psi at sea level
Barometric Pressure Sensor	Volts	Nearly 2.3 volts at sea level	Nearly 2.3 volts at sea level
Turbocharger Solenoid Command	%	50 to 60 %	50 to 60 %
Desired Boost Pressure	kPa/ psi	Nearly 100 kPa/ 14.5 psi at sea level	Less than 120 kPa/ 17.4 psi
Boost Pressure	kPa/ psi	Nearly 100 kPa/ 14.5 psi at sea level	Less than 120 kPa/ 17.4 psi
Boost Pressure Sensor	Volts	Nearly 1.0 volt	Less than 1.3 volts
Desired Fuel Rail Pressure	MPa/ psi	30 MPa/ 4,350 psi	More than 70 MPa/ 10,200 psi (4JJ1 Euro 4 specification) More than 50 MPa/ 7,250 psi (4JJ1 except Euro 4 specification) More than 60 MPa/ 8,700 psi (4JK1)
Fuel Rail Pressure	MPa/ psi	27 to 33 MPa/ 3,900 to 4,800 psi	More than 70 MPa/ 10,200 psi (4JJ1 Euro 4 specification) More than 50 MPa/ 7,250 psi (4JJ1 except Euro 4 specification) More than 60 MPa/ 8,700 psi (4JK1)

Scan Tool Parameter	Units Displayed	Typical Data Value at Engine Idle	Typical Data Value at 2000RPM
Fuel Rail Pressure Sensor	Volts	1.4 to 1.5 volts	More than 2.1 volts (4JJ1 Euro 4 specification) More than 1.8 volts (4JJ1 except Euro 4 specification) More than 1.9 volts (4JK1)
FRP Regulator Command (Fuel Rail Pressure)	%	35 to 50 %	35 to 45 %
FRP Regulator Commanded Fuel Flow	mm^3/sec	More than 1,000 mm^3/sec	More than 2,000 mm^3/sec
FRP Regulator Feedback (Fuel Rail Pressure)	mA	1,600 to 2,000 mA	1,500 to 1,800 mA
Accelerator Pedal Position	%	0%	10 to 25 %
APP Sensor 1 (Accelerator Pedal Position)	Volts	0.2 to 1.0 volts	1.0 to 1.7 volts
APP Sensor 2 (Accelerator Pedal Position)	Volts	3.8 to 4.6 volts	3.3 to 3.9 volts
APP Sensor 3 (Accelerator Pedal Position)	Volts	3.8 to 4.6 volts	3.7 to 4.0 volts
EGR Solenoid Command	%	Less than 30 %	Less than 30 %
Desired EGR Position	%	Less than 70 %	Less than 80 %
EGR Position	%	Less than 70 %	Less than 80 %
EGR Position Sensor	Volts	Less than 2.9 volts	Less than 3.1 volts
Intake Throttle Solenoid Command	%	Less than 30 %	Less than 40 %
Desired Intake Throttle Position	%	Less than 30 %	Less than 80 %
Intake Throttle Position	%	Less than 30 %	Less than 80 %
Intake Throttle Position Sensor	Volts	Less than 1.6 volts	Less than 3.3 volts
Desired Injection Quantity	mm^3	7 to 12 mm^3	7 to 12 mm^3
Main Injection Quantity	mm^3	3 to 8 mm^3	5 to 10 mm^3
Main Injection Timing	°CA	2 to 12 °CA	0 to 10 °CA
Main Injection On Time	ms	600 to 800 ms	400 to 550 ms
Pre Injection Quantity	mm^3	1 to 4 mm^3	2 to 4 mm^3
Pre Injection Interval	°CA	3 to 20 °CA	10 to 30 °CA

Scan Tool Data Definitions

This information will assist in emission or driveability problems. The displays can be viewed while the vehicle is being driven. Always perform the Diagnostic System Check - Engine Controls first. The Diagnostic System Check will confirm proper system operation.

Engine Speed
This parameter displays the rotational speed of the crankshaft as calculated by the ECM based on inputs from the crankshaft position (CKP) sensor or camshaft position (CMP) sensor.

Desired Idle Speed
This parameter displays the idle speed requested by the ECM. The ECM will change desired idle speed based on engine coolant temperature and other inputs.

Calculate Engine Load
This parameter displays the engine load in percent based on inputs to the ECM from various engine sensors. The scan tool will display a lower percentage when the engine is at idle with little or no load. The scan tool will display a higher percentage when the engine is running at high engine speed under a heavy load.

Coolant Temperature
This parameter displays the temperature of the engine coolant as calculated by the ECM using the signal from the engine coolant temperature (ECT) sensor. The scan tool will display a low temperature when the ECT sensor signal voltage is high, and a high temperature when the ECT sensor signal voltage is low.

Engine Coolant Temperature Sensor
This parameter displays the voltage signal sent to the ECM from the engine coolant temperature (ECT) sensor. ECT sensor is a range of value indicating a low voltage when the temperature is high, and a high voltage when the temperature is low.

Intake Air Temperature
This parameter displays the temperature of the intake air as calculated by the ECM using the signal from the intake air temperature (IAT) sensor. The scan tool will display a low temperature when the IAT sensor signal voltage is high, and a high temperature when the IAT sensor signal voltage is low.

Intake Air Temperature Sensor
This parameter displays the voltage signal sent to the ECM from the intake air temperature (IAT) sensor. IAT sensor is a range of value indicating a low voltage when the temperature is high, and a high voltage when the temperature is low.

Fuel Temperature
This parameter displays the temperature of the fuel as calculated by the ECM using the signal from the fuel temperature (FT) sensor. The scan tool will display a low temperature when the FT sensor signal voltage is high, and a high temperature when the FT sensor signal voltage is low.

Fuel Temperature Sensor
This parameter displays the voltage signal sent to the ECM from the fuel temperature (FT) sensor. FT sensor is a range of value indicating a low voltage when the temperature is high, and a high voltage when the temperature is low.

MAF (Mass Air Flow)
This parameter displays the air flow into the engine as calculated by the ECM based on the mass air flow (MAF) sensor input. The scan tool will display a high value at higher engine speeds, and a low value at lower engine speed.

MAF Sensor (Mass Air Flow)
This parameter displays the voltage signal sent to the ECM from the mass air flow (MAF) sensor. MAF sensor is a range of value indicating a low voltage at lower engine speed, and a high voltage at a higher engine speeds.

Barometric Pressure
This parameter displays the barometric pressure (BARO) as calculated by the ECM using the signal from the BARO sensor. The scan tool will display a low barometric pressure in high altitude area.

Barometric Pressure Sensor
This parameter displays the voltage signal sent to the ECM from the barometric pressure (BARO) sensor. BARO sensor is a range of value indicating a low voltage in high altitude area, and a middle voltage in sea level.

Turbocharger Solenoid Command
This parameter displays the turbocharger nozzle control solenoid valve control duty ratio based on inputs to the ECM from various engine sensors. The scan tool will display a lower percentage when the nozzle is controlled to open (vacuum pressure supply to the actuator is reduced). The scan tool will display a higher percentage when the nozzle is controlled to close (vacuum pressure supply to the actuator is increased).

Desired Boost Pressure
This parameter displays boost pressure desired by the ECM based on current driving conditions. This can be compared to the actual boost pressure to determine sensor accuracy or turbocharger control problems.

Boost Pressure
This parameter displays the boost pressure in the intake duct as calculated by the ECM using the signal from the boost pressure sensor. The scan tool will display a low boost pressure when the low engine load, and a high boost pressure when the high engine load. Note that the true boost pressure is determined by subtracting barometric pressure from the actual reading.

Boost Pressure Sensor
This parameter displays the voltage signal sent to the ECM from the boost pressure sensor. Boost pressure sensor is a range of value indicating a low voltage when the boost pressure is low (idle or lower engine load) and a high voltage when the boost pressure is high (higher engine load).

Desired Fuel Rail Pressure
This parameter displays fuel rail pressure desired by the ECM based on current driving conditions. This can be compared to the actual fuel rail pressure to determine sensor accuracy or fuel pressure control problems.

Fuel Rail Pressure
This parameter displays the fuel rail pressure as calculated by the ECM using the signal from the fuel rail pressure (FRP) sensor. The scan tool will display a low pressure when the low engine load, and a high pressure when the high engine load.

Fuel Rail Pressure Sensor
This parameter displays the voltage signal sent to the ECM from the fuel rail pressure (FRP) sensor. FRP sensor is a range of value indicating a low voltage when the fuel rail pressure is low, and a high voltage when the fuel rail pressure is high.

FRP Commanded Fuel Flow (Fuel Rail Pressure)
This parameter displays the commanded fuel flow quantity of the fuel rail pressure (FRP) regulator to the fuel rail.

FRP Regulator Command (Fuel Rail Pressure)
This parameter displays the fuel rail pressure (FRP) regulator control duty ratio based on inputs to the ECM from various engine sensors. The scan tool will display a lower percentage when the FRP regulator is controlled to open (fuel supply quantity to the fuel rail is increased). The scan tool will display higher percentage when the FRP regulator is controlled to close (fuel supply quantity to the fuel rail is reduced).

FRP Regulator Feedback (Fuel Rail Pressure)
This parameter displays the fuel rail pressure (FRP) regulator control feedback current as measured by the ECM. The scan tool will display a low current when the FRP regulator is controlled to open (fuel supply quantity to the fuel rail is increased). The scan tool will display a high current when the FRP regulator is controlled to close (fuel supply quantity to the fuel rail is reduced).

Accelerator Pedal Position
This parameter displays the angle of the accelerator pedal as calculated by the ECM using the signals from the accelerator pedal position (APP) sensors. The scan tool will display linearly from 0 to 100% according to the pedal operation.

APP Sensor 1 (Accelerator Pedal Position)
This parameter displays the voltage signal sent to the ECM from the accelerator pedal position (APP) sensor 1 of the APP sensor assembly. APP sensor 1 is a range of value indicating a low voltage when the accelerator pedal is not depressed, and a high voltage when the accelerator pedal is fully depressed.

APP Sensor 2 (Accelerator Pedal Position)
This parameter displays the voltage signal sent to the ECM from the accelerator pedal position (APP) sensor 2 of the APP sensor assembly. APP sensor 2 is a range of value indicating a high voltage when the accelerator pedal is not depressed, and a low voltage when the accelerator pedal is fully depressed.

APP Sensor 3 (Accelerator Pedal Position)
This parameter displays the voltage signal sent to the ECM from the accelerator pedal position (APP) sensor 3 of the APP sensor assembly. APP sensor 3 is a range of value indicating a high voltage when the accelerator pedal is not depressed, and a middle voltage when the accelerator pedal is fully depressed.

EGR Solenoid Command
This parameter displays the EGR solenoid valve control duty ratio based on inputs to the ECM from various engine sensors. The scan tool will display a lower percentage when the EGR solenoid valve is controlled to close (EGR gas supply to the intake is reduced). The scan tool will display a higher percentage when the EGR solenoid valve is controlled to open (EGR gas supply to the intake is increased).

Desired EGR Position
This parameter displays EGR position desired by the ECM based on current driving conditions. This can be compared to the actual EGR position to determine sensor accuracy or EGR control problems.

EGR Position
This parameter displays the EGR valve position calculated by the ECM using the signal from EGR position sensor. The scan tool will display a low percentage when the EGR valve is closed, and a high percentage when the ERG valve is opened.

EGR Position Sensor
This parameter displays the voltage signal sent to the ECM from the EGR position sensor. EGR position sensor is a range of value indicating a low voltage when the EGR valve is closed, and a high voltage when the EGR valve is opened.

Intake Throttle Solenoid Command
This parameter displays the intake throttle solenoid valve control duty ratio based on inputs to the ECM from various engine sensors. The scan tool will display a lower percentage when the intake throttle solenoid valve is controlled to open. The scan tool will display a higher percentage when the intake throttle solenoid valve is controlled to close.

Desired Intake Throttle Position
This parameter displays intake throttle position desired by the ECM based on current driving conditions. This can be compared to the actual intake throttle position to determine sensor accuracy or intake throttle control problems.

Intake Throttle Position
This parameter displays the intake throttle valve position calculated by the ECM using the signal from intake throttle position sensor. The scan tool will display a low percentage when the intake throttle valve is closed, and a high percentage when the intake throttle valve is opened. Note that the intake throttle position indicates over 100% if the solenoid is commanded OFF.

Intake Throttle Position Sensor
This parameter displays the voltage signal sent to the ECM from the intake throttle position sensor. Intake throttle position sensor is a range of value indicating a low voltage when the intake throttle valve is closed to a high voltage when the intake throttle valve is opened.

Desired Injection Quantity
This parameter displays a total injection quantity (main injection quantity + pre injection quantity) desired by the ECM based on current driving conditions.

Main Injection Quantity
This parameter displays a main injection quantity desired by the ECM based on current driving conditions.

Main Injection Timing
This parameter displays a main injection timing desired by the ECM based on current driving conditions.

Main Injection On Time
This parameter displays the time the ECM turns ON the fuel injectors. The scan tool will display a higher value with a longer pulse width, or a lower value with a shorter pulse width.

Pre Injection Quantity
This parameter displays a pilot injection quantity desired by the ECM based on current driving conditions.

Pre Injection Interval
This parameter displays a injection interval between end of pilot injection and start of main injection desired by the ECM based on current driving condition.

Fuel Compensation Cyl. 1 to 4
This parameter displays the adjustment of fuel volume for each cylinder at low engine speed area as calculated by the ECM. The scan tool will display a negative value if the fuel volume is lowered. The scan tool will display a positive value if the fuel volume is increased. If there is a cylinder that is excessively high or low value, it may indicate faulty fuel injector, weak or slightly seized cylinder or an incorrectly programmed fuel injector ID code.

Cylinder Balancing Update
This parameter displays the state of the fuel compensation for each cylinder. Enabled indicates the adjustment of fuel volume for each cylinder is being executed by the ECM when the engine is idle speed, the engine coolant temperature sensor, the intake air temperature sensor, barometric pressure sensor and the vehicle speed sensor inputs are normal state.

Fuel Supply Pump Status
This parameter displays the learning state of the fuel supply pump. Not Learn indicates initialized state that is replaced to a new ECM or adjustment value is reset. After engine is warm upped, leaning will start at idle speed. Learning indicates learning state. Learned indicates learning process is completed state.

Rail Pressure Feedback Mode
This parameter displays the state of the fuel rail pressure feedback to the ECM. Wait Mode indicates the ignition switch is turned ON position. Feedback Mode indicates the engine is during crank or run. Shutoff Mode indicates the ignition switch is turned OFF position.

Engine Mode
This parameter displays the state of engine. Ignition On indicates the ignition switch is turned ON position. Cranking indicates the engine is during crank. Running indicates the engine is run. Off indicates the ignition switch is tuned OFF position.

Torque	N·m (kgf·m/lb·in)
3 (0.3 / 26)	

Cam/ Crank Sensor Signal/ Synchronization Status
This parameter displays the synchronization state of the crankshaft position (CKP) sensor signal and camshaft position (CMP) sensor signal. Asynchronous indicates the CMP sensor signal is not detected or only CKP sensor signal is detected. No Crank Signal indicates CMP sensor signal is detected but CKP sensor signal is not detected. Synchronous indicates both sensor signals are detected correctly.

Engine Runtime
This parameter displays the time elapsed since the engine start. The scan tool will display the time in hours, minutes and seconds. The engine run time will reset to zero as soon as the ignition switch is OFF.

Vehicle Speed
This parameter indicates the vehicle speed calculated by the ECM using the signal from the vehicle speed sensor (VSS). The scan tool will display a low value at lower vehicle speeds, and a high value at higher vehicle speeds.

Transmission Gear
This parameter displays the estimated transmission gear position as calculated by the ECM based on inputs from the vehicle speed and the engine speed.

Starter Switch
This parameter displays the input status of the starter switch to the ECM. When the ignition switch is turned at START position, the scan tool displays On.

Ignition Switch
This parameter displays the input status of the ignition switch to the ECM. When the ignition switch is turned ON position, the scan tool displays On.

Ignition Voltage
This parameter displays the ignition voltage measured at the ignition feed circuit of the ECM. Voltage is applied to the ECM when the ignition switch is ON position.

Battery Voltage
This parameter displays the battery voltage measured at the ECM main relay switched voltage feed circuit of the ECM. Voltage is applied to the ECM when the ECM main relay is energized.

Fuel Pump Relay Command
This parameter displays the commanded state of the fuel pump relay control circuit. On indicates the fuel pump relay control circuit is being grounded by the ECM, allowing fuel pumping from the tank.

Swirl Control Solenoid Command
This parameter displays the commanded state of the swirl control solenoid control circuit. On indicates the swirl control solenoid control circuit is being grounded by the ECM, allowing vacuum pressure to the swirl control actuator.

Fuel Filter Switch
This parameter displays the input state of the fuel pressure switch to the ECM. When the large vacuum pressure is generated in the fuel suction line such as clogged fuel filter, the scan tool displays Off.

A/C Request Signal
This parameter displays the input state of the air conditioning (A/C) request to the ECM from the heating, ventilation, and air conditioning (HVAC) controls. When the HVAC system is requesting to ground the A/C compressor clutch, the scan tool displays On.

A/C Relay Command
This parameter displays the commanded state of the A/C compressor relay control circuit. On indicates the A/C compressor relay control circuit is being grounded by the ECM, allowing voltage to the A/C compressor.

Park/ Neutral Switch
This parameter displays the input state of the neutral switch to the ECM. When the transmission gear is Park or Neutral, the scan tool displays Neutral.

Glow Relay Command
This parameter displays the commanded state of the glow relay control circuit. On indicates the glow relay control circuit is being grounded by the ECM, allowing voltage to the glow plugs.

Glow Plug Lamp Command
This parameter displays the commanded state of the glow indicator lamp control circuit. The glow indicator lamp should be On when the scan tool indicates command On. The glow indicator lamp should be Off when the scan tool indicates command Off.

Brake Switch 1
This parameter displays the input state of the brake pedal switch 1 to the ECM. When the brake pedal is depressed, scan tool displays Applied.

Brake Switch 2
This parameter displays the input state of the brake pedal switch 2 to the ECM. When the brake pedal is depressed, scan tool displays Applied.

Clutch Pedal Switch
This parameter displays the input state of the clutch pedal switch to the ECM. When the clutch pedal is depressed, scan tool displays Applied.

Cruise Main Lamp Command
This parameter displays the commanded state of the cruise main lamp control circuit. The cruise main lamp should be On when the scan tool indicates command On. The cruise main lamp should be Off when the scan tool indicates command Off.

Cruise Main Switch
This parameter displays the input state of the cruise main switch to the ECM. When the Cruise Main switch is pushed, the scan tool displays On.

Cruise Cancel Switch
This parameter displays the input state of the cruise cancel switch to the ECM. When the Cruise Cancel switch is applied, the scan tool displays Off.

Cruise Resume Switch
This parameter displays the input state of the cruise resume/accel. switch to the ECM. When the Cruise Resume/Accel. switch is applied, the scan tool displays On.

Cruise Set Switch
This parameter displays the input state of the cruise set/coast switch to the ECM. When the Cruise Set/Coast switch is pushed, the scan tool displays On.

MIL Command (Malfunction Indicator Lamp)
This parameter displays the commanded state of the malfunction indicator lamp (MIL) control circuit. The MIL should be On when the scan tool indicates command On. The MIL should be Off when the scan tool indicates command Off.

SVS Lamp Command (Service Vehicle Soon)
This parameter displays the commanded state of the service vehicle soon (SVS) lamp control circuit. The SVS lamp should be On when the scan tool indicates command On. The SVS lamp should be Off when the scan tool indicates command Off.

Limp Home Mode
This parameter indicates the state of the limp-home mode. None indicates limp-home mode is not applied. 1, 2, 3 and 4 indicates fuel injection quantity reduction is applied. 2 or higher number inhibits pilot injection. If 4 is indicated, engine running will be stopped when the vehicle speed is less than 5 km/h (3 MPH) for 5 seconds.

Distance While MIL is Activated
This parameter displays the mileage since the malfunction indicator lamp (MIL) is turned ON.

Engine Runtime With MIL Active
This parameter displays the engine run time elapsed since the malfunction indicator lamp (MIL) is turned ON. The scan tool will display the time in minutes.

Total Engine Overspeed Event
This parameter indicates counter of engine overspeed event. Counter will be zero if any DTC is cleared.

Total Engine Coolant Overtemperature Event
This parameter indicates counter of engine overheat event. The counter is active if engine coolant is over 110°C (230°F). Counter will be zero if any DTC is cleared.

Total Fuel Temperature Overtemperature Event
This parameter indicates counter of fuel temperature excessively high condition. The counter is active if fuel temperature is over 95°C (203°F). Counter will be zero if any DTC is cleared.

Total Intake Air Temperature Overtemperature Event
This parameter indicates counter of intake air temperature excessively high condition. The counter is active if intake air temperature is over 55°C (131°F). Counter will be zero if any DTC is cleared.

Immobilizer Function Programmed
This parameter displays the state of the immobilizer function programming in the ECM. The scan tool will display Yes or No. Yes indicates the immobilizer security information is correctly programmed in the ECM. No indicates the ECM is not programmed or ECM is reset.

Wrong Immobilizer Signal
This parameter displays the input state of the received response signal to the ECM. When the ECM received wrong response signal from the immobilizer control unit (ICU), the scan tool displays Yes.

Immobilizer Signal
This parameter displays the input state of the response signal to the ECM. When the ECM received any response signal from the immobilizer control unit (ICU), the scan tool displays Yes.

Security Wait Time
This parameter displays the security wait time length in the ECM. Inactive indicates not in security wait time. Time indicates under security wait time. This wait time stage will prevent any further attempts to enter the security code until the wait time has elapsed. The wait time will increase each time an incorrect security code is entered. Note that this parameter is not count downed. It keeps displaying the same time until that wait time has elapsed. The ignition switch must be kept at ON position during the wait time period.

Scan Tool Output Controls

Scan Tool Output Control	Descriptions
Fuel Supply Pump Learn Resetting	The purpose of this test to reset the fuel supply pump adjustment value. **Important:** The fuel supply pump relearn procedure must be done when the fuel supply pump or engine is replaced, or an ECM from another vehicle is installed. Refer to Fuel Supply Pump Replacement.
Fuel Pressure Control	The purpose of this test is for checking whether the fuel rail pressure is changing when commanded within 30 to 80MPa (4,350 to 11,600psi) when commanded. Faulty fuel supply pump, fuel rail pressure (FRP) regulator, pressure limiter valve or other fuel lines could be considered if the differential fuel rail pressure is large.
Pilot Injection Control	The purpose of this test is for checking whether the pilot fuel injection is operated when it is commanded to ON/ OFF. Faulty injector(s) could be considered if engine noise does not change when commanded OFF.
Injection Timing Control	The purpose of this test is for checking whether the main injection timing is changing when commanded Retard/ Advance within -5 to 5°CA.
Injector Force Drive	The purpose of this test is for checking whether the fuel injector is correctly operating when commanded ON. Faulty injector(s) could be considered if it does not create a clicking noise (solenoid operating noise), contains an interrupted noise or has abnormal noise when commanded ON.
Cylinder Balance Test	The purpose of this test is for checking whether the fuel injector is operating when commanded ON/ OFF. Faulty injector(s) could be considered if engine does not change speed when commanded OFF.
Intake Throttle Solenoid Control	The purpose of this test is for checking whether the intake throttle valve is correctly moved with command. Restricted valve movement by foreign materials, excessive deposits or a faulty valve could be considered if the position difference is large.
EGR Solenoid Control	The purpose of this test is for checking whether the EGR valve is correctly moved with command. Restricted valve movement by foreign materials, excessive deposits or a faulty valve could be considered if the position difference is large.
Swirl Control Solenoid Control	The purpose of this test is for checking whether the swirl control solenoid is operating when commanded ON. Faulty circuit(s) or a faulty solenoid could be considered if not energizing when commanded ON.
Turbocharger Solenoid Control	The purpose of this test is for checking whether the turbocharger nozzle control actuator is correctly moved with command. Restricted actuator movement by foreign materials, excessive deposits, misrouted vacuum hoses, a faulty solenoid or a faulty actuator could be considered if the actuator is not moved correctly.
Glow Relay Control	The purpose of this test is for checking whether the glow relay is operating when commanded ON. Faulty circuit(s) or a faulty glow relay could be considered if not energizing when commanded ON.
Glow Plug Lamp Control	The purpose of this test is for checking whether the glow indicator lamp is operating when commanded ON. Faulty circuit(s) or an open circuit could be considered when not operating when commanded ON.
Malfunction Indicator Lamp (MIL) Control	The purpose of this test is for checking whether the MIL is operating when commanded ON. Faulty circuit(s) or an open circuit could be considered when not operating when commanded ON.
Service Vehicle Soon (SVS) Lamp Control	The purpose of this test is for checking whether the SVS lamp is operating when commanded ON. Faulty circuit(s) or an open circuit could be considered when not operating when commanded ON.
Cruise Main Lamp Control	The purpose of this test is for checking whether the cruise main lamp is operating when commanded ON. Faulty circuit(s) or an open circuit could be considered when not operating when commanded ON.
Cruise Set Lamp Control	The purpose of this test is for checking whether the cruise set lamp is operating when commanded ON. Faulty circuit(s) or an open circuit could be considered when not operating when commanded ON.

Scan Tool Does Not Power Up

Circuit Description

The data link connector (DLC) is a standardized 16-cavity connector. Connector design and location is dictated by an industry wide standard, and is required to provide the following:

- Scan tool power battery positive voltage at terminal 16.
- Scan tool power ground at terminal 4.
- Common signal ground at terminal 5.

The scan tool will power up with the ignition OFF. Some modules however, will not communicate unless the ignition is ON.

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing Scan Tool Does Not Power Up

Step	Action	Value(s)	Yes	No
1	**Important**: Make sure the scan tool works properly on another vehicle before using this chart. 1. Turn OFF the ignition. 2. Inspect the Meter (+B) (10A) fuse in the cabin fuse block. Is the Meter (+B) (10A) fuse open?	—	Go to Step 2	Go to Step 3
2	Replace the Meter (+B) (10A) fuse. If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the Meter (+B) (10A) fuse or replace the shorted attached component. Did you complete the repair?	—	Go to Step 7	—
3	1. Check each circuit at the data link connector (DLC) (B-58) for a backed out, spread or missing terminal. 2. Repair the terminal as necessary. Did you find and complete the repair?	—	Go to Step 7	Go to Step 4
4	Connect a test lamp between the +B circuit (pin 16 of B-58) at the DLC and a known good ground. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 5
5	Repair the open in the battery voltage circuit to the DLC. Did you complete the repair?	—	Go to Step 7	—
6	1. Test each ground circuit at the DLC (pins 4 and 5 of B-58) for an open circuit or high resistance. 2. Repair the circuit(s), clean or tighten ground as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Intermittent Conditions
7	1. Connect the scan tool to the DLC. 2. Attempt to turn ON the scan tool. Does the scan tool ON?	—	System OK	Go to Step 1

Scan Tool Does Not Communicate with CAN Device

Circuit Description

The ECM, transmission control module (TCM) (AISIN A/T only) and immobilizer control unit (ICU) all communicate with the scan tool over the controller area network (CAN) link. The ECM, TCM, ICU and the data recording module (DRM) communicate with each other over the same CAN link. If no immobilizer system is installed, the instrument panel (IP) cluster has a CAN terminating resistor instead of the ICU.

Diagnostic Aids

The following conditions will cause a loss of CAN serial data communication between the TCM and ICU or between the scan tool and any control module:

- A CAN serial data circuit open
- A CAN serial data circuit shorted to ground
- A CAN serial data circuit shorted to voltage
- An internal condition within a module or connector on the CAN serial data circuit, that causes a short to voltage or ground to the CAN serial data circuit

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing Scan Tool Does Not Communicate with CAN Device

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	**Important**: Make sure the CANdi module is not malfunctioning. When functioning properly, the CANdi module LED will be flashing. In the event of a problem, the LED will be continually illuminated or not illuminated. 1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Attempt to establish communication with the listed control modules. • ECM • Immobilizer Control Unit (ICU) (If so equipped) • Transmission control module (TCM) (AISIN A/T only) Does the scan tool communicate with any of the listed control modules?	—	Go to Step 3	Go to Step 7
3	Does the scan tool communicate with the ECM?	—	Go to Step 4	Go to Lost Communication with The Engine Control Module (ECM)
4	**Notice:** If no AISIN automatic transmission is installed, skip to Step 5. Does the scan tool communicate with the TCM?	—	Go to Step 5	Go to Diagnostic System Check - Transmission Controls
5	**Notice:** If no immobilizer system is installed, skip to Step 6. Does the scan tool communicate with the ICU?	—	Go to Step 6	Go to Diagnostic System Check - Immobilizer Controls
6	Test the CAN Low and High serial data circuit for an intermittently short to ground or intermittently short to voltage. Then, test the CAN Low and High serial data circuit for an intermittently open (based on which control module did not communicate) at the connection in the circuit. Did you find and correct the condition?	—	Go to Step 19	System OK

Step	Action	Value(s)	Yes	No
7	1. Inspect for an intermittent, for poor connections and for corrosion at the data link connector (DLC) (pins 6 and 14 of B-58). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 8
8	**Notice:** If no data recording module (DRM) is installed, skip to Step 9. 1. Turn OFF the ignition. 2. Disconnect the DRM C-139 harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Attempt to communicate with the ECM, TCM and ICU. Does the scan tool communicate with the ECM, TCM and ICU?	—	Go to Step 14	Go to Step 9
9	1. Turn OFF the ignition. 2. Reconnect the DRM harness connector if disconnected. 3. Disconnect the ECM J1 (E-90) and J2 (C-58) harness connectors. 4. Turn ON the ignition, with the engine OFF. 5. Attempt to communicate with the TCM and ICU. Does the scan tool communicate with the TCM and ICU?	—	Go to Step 15	Go to Step 10
10	**Notice:** If no AISIN automatic transmission is installed, skip to Step 11. 1. Turn OFF the ignition. 2. Reconnect the ECM J1 (E-90) and J2 (C-58) harness connectors. 3. Disconnect the TCM C-94 and C-95 harness connectors. 4. Turn ON the ignition, with the engine OFF. 5. Attempt to communicate with the ECM and ICU. Does the scan tool communicate with the ECM and ICU?	—	Go to Step 16	Go to Step 11
11	**Notice:** If no immobilizer system is installed, skip to Step 12. 1. Turn OFF the ignition. 2. Reconnect the ECM J1 (E-90) and J2 (C-58) harness connectors if disconnected. 3. Reconnect the TCM C-94 and C-95 harness connectors if disconnected. 4. Disconnect the ICU B-68 harness connector. 5. Turn ON the ignition, with the engine OFF. 6. Attempt to communicate with the ECM and TCM. Does the scan tool communicate with the ECM and TCM?	—	Go to Step 17	Go to Step 13

Step	Action	Value(s)	Yes	No
12	1. Turn OFF the ignition. 2. Reconnect the ECM J1 (E-90) and J2 (C-58) harness connectors if disconnected. 3. Reconnect the TCM C-94 and C-95 harness connectors if disconnected. 4. Disconnect the instrument panel (IP) cluster B-23 and B-24 harness connector. 5. Turn ON the ignition, with the engine OFF. 6. Attempt to communicate with the ECM and TCM. Does the scan tool communicate with the ECM and TCM?	—	Go to Step 18	Go to Step 13
13	Repair the open circuit, short to ground or short to voltage on the CAN Low or High serial data circuit between the DLC and ECM, TCM, ICU, DRM or IP cluster. Did you complete the repair?	—	Go to Step 19	—
14	Replace the DRM. Refer to DRM Replacement. Did you complete the replacement?	—	Go to Step 19	—
15	**Important**: Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 19	—
16	**Important**: Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 19	—
17	**Important**: Replacement ICU must be programmed. Replace the ICU. Refer to ICU Replacement. Did you complete the replacement?	—	Go to Step 19	—
18	Replace the IP cluster. Refer to IP Cluster Replacement. Did you complete the replacement?	—	Go to Step 19	—
19	Attempt to establish communication with the ECM, TCM and ICU. Does the scan tool communicate with the ECM, TCM and ICU?	—	System OK	Go to Step 2

Lost Communication with The Engine Control Module (ECM)

Circuit Description

The ECM, transmission control module (TCM) (AISIN A/T only) and immobilizer control unit (ICU) all communicate with the scan tool over the controller area network (CAN) link. The ECM, TCM, ICU and the data recording module (DRM) communicate with each other over the same CAN link. If no immobilizer system is installed, the instrument panel (IP) cluster has a CAN terminating resistor instead of the ICU.

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing Lost Communication with The Engine Control Module (ECM)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	Attempt to establish communication with the ECM. Does the scan tool communicate with the ECM?	—	Go to Intermittent Conditions	Go to Step 3
3	Check the ECM C-58 and E-90 connectors for poor connections. Did you find and correct the condition?	—	Go to Step 16	Go to Step 4
4	1. Check the ECM (40A) slow blow fuse, ECM (B) (10A) fuse and Engine (10A) fuse. Replace and retest if open. If any fuse continues to open, repair the short to ground on each circuit fed by that fuse. 2. Turn OFF the ignition. 3. Disconnect the ECM C-58 harness connector. 4. Turn ON the ignition, with the engine OFF. 5. Connect a test lamp to ground and check for voltage at the ignition voltage supply circuit at the ECM (pin 72 of C-58). Does the test lamp illuminate?	—	Go to Step 5	Go to Step 13
5	1. Turn OFF the ignition. 2. Disconnect the scan tool from the data link connector (DLC) if connected. 3. Measure the resistance across the CAN Low and High circuits by probing the DLC (pins 6 and 14 of B-58). Is the resistance within the specified value (parallel resistance of the 120 Ω resistor in the ECM and the 120 Ω resistor in the ICU or IP cluster should be 60Ω)?	50 to 70 Ω	Go to Step 7	Go to Step 6
6	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 66 and 67 of C-58). 4. Test for high resistance on each circuit. 5. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15

Step	Action	Value(s)	Yes	No
7	1. Check ECM ground for corrosion and tightness. 2. Clean or tighten grounds as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 8
8	1. Turn OFF the ignition. 2. Reconnect the ECM harness connector if disconnected. 3. Replace the ECM main relay with the heater relay or replace with a known good relay. 4. Turn ON the ignition, with the engine OFF. 5. Attempt to establish communication with the ECM. Does the scan tool communicate with the ECM?	—	Go to Step 14	Go to Step 9
9	1. Turn OFF the ignition. 2. Remove the ECM main relay. 3. Turn ON the ignition, with the engine OFF. 4. Using a test lamp, check for both voltage supply circuits to the ECM main relay (pins 4 and 5 of X-12). 5. Repair the open circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 10
10	1. Reinstall the ECM main relay. 2. Turn the ignition ON and OFF while listening of feeling for the ECM main relay click. Wait 7 seconds between transitions. Does the ECM main relay click when the ignition switch is turned ON or OFF?	—	Go to Step 12	Go to Step 11
11	Repair the ECM main relay ground circuit between the ECM main relay (pin 2 of X-12) and engine room ground terminal (C-36) for the following conditions: • An open circuit • High resistance or a poor connection at the ECM main relay or ground terminal Did you complete the repair?	—	Go to Step 16	—
12	1. Test the battery voltage circuit between the ECM (pin 73 of C-58) and the ECM main relay (pin 1 of X-12) for the following conditions: • An open circuit • High resistance or a poor connection at ECM or ECM main relay 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15
13	Repair the open in the ignition voltage circuit to the ECM. Did you complete the repair?	—	Go to Step 16	—
14	Replace the ECM main relay. Did you complete the replacement?	—	Go to Step 16	—

Step	Action	Value(s)	Yes	No
15	**Important**: Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 16	—
16	1. Turn OFF the ignition. 2. Reconnect all previously disconnected fuse, relay or harness connector(s). 3. Turn ON the ignition, with the engine OFF. 4. Attempt to establish communication with the ECM. Does the scan tool communicate with the ECM?	—	System OK	Go to Step 3

Engine Cranks but Does Not Run

Description

The Engine Cranks but Does Not Run diagnostic table is an organized approach to identifying a condition that causes an engine to not start. The diagnostic table directs the service technician to the appropriate system diagnosis. The diagnostic table assumes the following conditions are met:

- The battery is completely charged and terminals are cleaned and tight.
- The engine cranking speed is normal.
- There is adequate fuel in the fuel tank.
- There is no fuel leak in the fuel line.
- There is no air in the fuel line.
- Filters (air, fuel) are clean.
- Fuse and slow blow fuse are normal.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the Circuit/ System Testing.

5. If the fuel rail pressure (FRP) regulator low side circuits between the ECM and the FRP regulator are shorted to ground, FRP Regulator Feedback will be approximately 400mA lower as compared with normal.

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing Engine Cranks but Does Not Run (1of 2)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Crank the engine for the specified amount of time. 4. Monitor the DTC Information with a scan tool. Does the scan tool display any DTCs that failed this ignition?	15 seconds	Go to Applicable DTC	Go to Step 3
3	1. Turn OFF the ignition. 2. Wait 1 minute for the fuel pressure to bleed down from the fuel rail. 3. Turn ON the ignition, with the engine OFF. DO NOT start the engine. 4. Observe the Fuel Rail Pressure parameter with a scan tool. Does the scan tool indicate the specified value?	0 MPa (0 psi)	Go to Step 4	Go to Step 6
4	**Notice:** If the vehicle has run out of fuel, air may be trapped in the fuel system. 1. Make sure the fuel tank have adequate fuel and the fuel quality is good (take a sample). 2. Observe the Fuel Rail Pressure parameter on the scan tool while cranking over the engine for 5 seconds. Does the scan tool indicate more than the specified value during crank?	20 MPa (2,900 psi)	Go to Step 9	Go to Step 5
5	Observe the FRP Regulator Feedback parameter on the scan tool while cranking over the engine for 5 seconds. Does the scan tool indicate more than the specified value during crank?	1500 mA	Go to 2 of 2 Step 1	Go to Step 8

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition. 2. Disconnect the FRP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP sensor (pins 1, 2 and 3 of E-48). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 47, 48, 68 and 69 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 7
7	Replace the FRP sensor. Refer to FRP Sensor Replacement. Did you complete the replacement?	—	Go to Step 11	—
8	Repair the short to ground between the ECM (pins 50 and 70 of E-90) and the FRP regulator (pin 2 of E-50). Did you compete the repair?	—	Go to Step 11	—
9	1. Check for normal readings at key up for the following sensor inputs: Use the Scan Tool Data List or a known good vehicle to determine nominal values. • Engine Coolant Temperature Sensor • Barometric Pressure (BARO) Sensor • Boost Pressure Sensor • Intake Throttle Position Sensor 2. Repair the circuit(s) or replace the sensor as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 10
10	1. Other possible causes for the no-start condition: • Engine mechanical timing • Heavily restricted intake or exhaust plugged solid. • Poor engine compression. • Water or gasoline contamination in fuel. 2. Repair as necessary. Did you find and correct the condition?	—	Go to Step 11	—
11	1. Reconnect all previously disconnected harness connector(s). 2. Turn OFF the ignition for 30 seconds. 3. Attempt to start the engine. Does the engine start and continue to run?	—	Go to Step 12	Go to Step 2
12	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing Engine Cranks but Does Not Run (2 of 2)

Step	Action	Value(s)	Yes	No
1	1. Remove the engine cover. 2. Perform the Injector Force Drive with a scan tool. 3. Command each injector ON and verify clicking noise (solenoid operating noise). Is there an injector that does not create a clicking noise (solenoid operating noise), contains an interrupted noise or abnormal noise when commanded ON?	—	Go to Step 8	Go to Step 2
2	1. Inspect the high pressure side between the fuel supply pump and the fuel injectors for fuel leakage. The following components may contain an external leak. • Fuel supply pump • Fuel rail • Pressure limiter valve • Fuel rail pressure (FRP) sensor • Fuel pipe between the fuel supply pump and fuel rail • Fuel pipe between the fuel rail and fuel injectors • Each fuel pipe sleeve nuts **Notice:** Fuel may leak under the cylinder head cover from the inlet high pressure line. In such case, the engine oil level will rise. Inspect for fuel leakage into the engine oil. 2. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 3
3	1. Check the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 4

Step	Action	Value(s)	Yes	No
4	**Notice:** Make sure the in-tank fuel pump operation before performing the following procedures. Refer to In-tank Fuel Pump System Check in this section. 1. Turn OFF the ignition. 2. Disconnect the fuel hose from the fuel supply pump suction side. In order to measure the discharged fuel amount, put the hose into a bottle or a container with a scale. (The inlet of a bottle or a container must be larger than the diameter of hose.) 3. Turn ON the ignition for 20 seconds, with the engine OFF. 4. Turn OFF the ignition for 10 seconds. 5. Perform 3 and 4 three times. The accumulated fuel of three ignition cycles must be more than 300 cc. (Normal amount is more than 100 cc per one ignition cycle.) **Notice:** If there is a leak or a restriction on the suction side, the fuel from the hose will not flow out sufficiently that is most likely caused by fuel leakage, clogged fuel filter, kinked or crushed fuel hose or pipe. Also inside the fuel tank for any foreign materials may be getting drawn into the fuel line pickup. 6. Repair fuel system leaking or restrictions as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 5
5	1. Turn OFF the ignition. 2. Remove the Fuel Pump (10A) fuse from the engine room fuse block in order to disable in-tank fuel pump. 3. Disconnect each fuel injector harness connector from all fuel injectors in order to disable injection. 4. Remove the rubber fuel hose from the leak-off pipe. Then, remove the leak-off pipe assembly from the engine that is jointed to the fuel supply pump and the pressure limiter valve. Use a pan to catch the fuel from the removed fuel line. 5. Crank over the engine while observing the fuel leak from the pressure limiter valve. **Important:** Safety glasses must be worm. Fuel may splash if the pressure limiter valve is faulty. Is there fuel leak from the pressure limiter valve?	—	Go to Step 11	Go to Step 6

Step	Action	Value(s)	Yes	No
6	1. Remove the rubber hoses from the leak-off pipes that are connected to each fuel injector. 2. Crank over the engine while observing the fuel leak from the leak-off pipe of each fuel injector (very small leak is normal). **Important:** Safety glasses must be worm. Fuel may splash if the fuel injector is faulty. **Important:** Replacement fuel injector must be programmed. 3. Replace the fuel injector(s) that return fuel is excessive. Refer to Fuel Injector Replacement/ Fuel Injector ID Code Data Programming. 4. Retest after replacement of the fuel injector(s). Did you find and correct the condition?	—	Go to Step 12	Go to Step 7
7	1. Remove each glow plug from the cylinder head. 2. Inspect for fuel leakage into the combustion chamber. Is there a cylinder that fuel leakage into the combustion chamber?	—	Go to Step 9	Go to Step 10
8	**Important**: Replacement fuel injector must be programmed. Replace the appropriate fuel injector that does not create a clicking noise (solenoid operating noise), contains an interrupted noise or abnormal noise at Step 1. Refer to Fuel Injector Replacement/ Fuel Injector ID Code Data Programming. Did you complete the replacement?	—	Go to Step 12	—
9	**Important**: Replacement fuel injector must be programmed. Replace the appropriate fuel injector that was leaking fuel found at Step 7 and inspect the engine mechanical for any damage or poor engine compression. Refer to Fuel Injector Replacement/ Fuel Injector ID Code Data Programming and engine mechanical section. Did you complete the replacement?	—	Go to Step 12	—
10	**Important**: The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. **Notice:** Always replace the fuel filter cartridge when a fuel supply pump is replaced. Replace the fuel supply pump and fuel filter cartridge. Refer to Fuel Supply Pump Replacement and Fuel Filter Cartridge Replacement. Did you complete the replacement?	—	Go to Step 12	—
11	Replace the pressure limiter valve. Refer to Fuel Rail Replacement. Did you complete the replacement?	—	Go to Step 12	—

Step	Action	Value(s)	Yes	No
12	1. Reconnect all previously disconnected harness connector(s). 2. Turn OFF the ignition for 30 seconds. 3. Attempt to start the engine. Does the engine start and continue to run?	—	Go to Step 13	Go to Step 1
13	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0016 (Flash Code 16)

Circuit Description

The crankshaft position (CKP) sensor is located on the left-hand of the cylinder block rear and it is behind the starter motor. The sensor rotor is fixed on the crankshaft. There are 56 notches spaced 6° apart and a 30° section that is open span. This open span portion allows for the detection of top dead center (TDC).
The camshaft position (CMP) sensor is installed on the timing chain sprocket cover at the front of the camshaft idle gear. The CMP sensor detects total of five projections per one engine cycle (four projections arranged equally every 90° and one reference projection on the timing chain sprocket surface).
Detecting the open span portion from the CKP sensor and one reference projection from the CMP sensor, the ECM determines cylinder #1 compression TDC to ensure they correlate with each other. If the ECM detects both signals are out of synchronization, this DTC will set.

Condition for Running the DTC

- DTCs P0335, P0336, P0340 and P0341 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The CKP sensor signal pulse is detected.
- The CMP sensor signal pulse is detected.

Condition for Setting the DTC

- The ECM detects that the CKP sensor signals and CMP sensor signals are out of synchronization during engine rotations.

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- This DTC is caused by an incorrect mechanical timing condition, which is most likely caused by wrong installation of timing gear or chain.
- The engine reverse rotation may set this DTC.

Circuit/ System Testing DTC P0016

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. If the engine does not start, crank over the engine for 10 seconds. 4. Monitor the DTC Information with a scan tool. Is DTC P0335, P0336, P0340 or P0341 also set?	—	Go to Applicable DTC	Go to Step 3

Step	Action	Value(s)	Yes	No
3	1. Inspect the crankshaft position (CKP) sensor and the camshaft position (CMP) sensor for the following conditions: • Physical damage of sensor • Loose or improper installation of sensor • Excessive air gap • Foreign material passing between sensor and sensor rotor or chain sprocket • Physical damage of sensor rotor or chain sprocket • Loose or improper installation of sensor rotor or chain sprocket 2. Inspect the engine mechanical timing for the following conditions: • Incorrectly installed timing gear or chain • Faulty timing chain tensioner • Excessive play in the timing chain • Timing chain that jumped teeth 3. Repair or replace as necessary. Did you complete the repair?	—	Go to Step 4	—
4	1. Reconnect all previously disconnected harness connector(s) if disconnected. 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. If the engine does not start, crank over the engine for 10 seconds. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 5
5	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0045 (Flash Code 33)

Circuit Description

The position of the turbocharger nozzle is controlled by the ECM. The ECM utilizes a turbocharger nozzle control solenoid valve and a boost pressure sensor to control the turbocharger nozzles. When the engine is not under load, the turbocharger nozzles are in an open position, or no boost condition. When the engine is under load, the ECM commands the control solenoid valve to close the turbocharger nozzles, thus increasing the boost. The ECM will vary the boost dependant upon the load requirements of the engine. The ECM uses a pulse width modulation (PWM) on the control circuit to open and control the solenoid valve. If the ECM detects an open circuit or short circuit on the solenoid valve circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects a low voltage condition on the turbocharger nozzle control solenoid circuit when the solenoid is commanded OFF.
- The ECM detects a high voltage condition on the turbocharger nozzle control solenoid circuit when the solenoid is commanded ON.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test description

The number below refers to the step number on the Circuit/ System Testing.

4. If the solenoid control circuit between the ECM and the solenoid is normal, the test lamp changes from Bright to Dim when commanded from Increase to Decrease.

Schematic Reference: Vacuum Hose Routing Diagram and Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing DTC P0045

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the turbocharger nozzle control solenoid valve harness connector. 3. Connect a test lamp between the ignition voltage feed circuit (pin 2 of E-106) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 4	Go to Step 5

Step	Action	Value(s)	Yes	No
4	1. Connect a test lamp between the control circuit (pin 1 of E-106) and battery voltage. 2. Perform the Turbocharger Solenoid Control with a scan tool. 3. Command the solenoid valve Increase and Decrease while observing the test lamp. Does the test lamp change brightness when commanded Increase and Decrease?	—	Go to Step 7	Go to Step 6
5	Repair the open circuit or high resistance between the Engine (10A) fuse and the solenoid valve (pin 2 of E-106). Check the Engine (10A) fuse first. Did you complete the repair?	—	Go to Step 11	—
6	1. Test the control circuit between the ECM (pin 66 of E-90) and the solenoid valve (pin 1 of E-106) for the following conditions: • An open circuit • A short to ground • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 8
7	1. Inspect for an intermittent and for poor connections at the harness connector of the solenoid valve (pins 1 and 2 of E-106). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 9
8	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 66 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 10
9	Replace the turbocharger nozzle control solenoid valve. Did you complete the replacement?	—	Go to Step 11	—
10	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 11	—
11	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 12

4×2, LWB, EXTEND CAB MODEL

This illustration is based on the RHD model.

12	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0087 (Flash Code 225)

Description

The common rail fuel system is comprised of two fuel pressure sections: a suction side between the fuel tank and the fuel supply pump and a high-pressure side between the fuel supply pump and the fuel injectors. Fuel is drawn from the fuel tank via a feed pump and then pumped into the fuel rail by two plungers, all of which are internal to the fuel supply pump. This high pressure is regulated by the ECM using the fuel rail pressure (FRP) regulator dependant upon values from the FRP sensor attached to the fuel rail. In case of fuel rail overpressure, a pressure limiter valve threaded into the fuel rail will open to release overpressure and return fuel back to the fuel tank. If the ECM detects that the fuel rail pressure went excessively high, then sharply decreased, this DTC will set indicating high fuel pressure, which activated the pressure limiter valve.

Condition for Running the DTC

- DTCs P0192 and P0193 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

- The ECM detects that the pressure limiter valve is activated with overpressure (more than 190 MPa [27,600 psi]) in the fuel rail.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- An intermittently sticking FRP regulator may have allowed the fuel pressure to become high enough to open the pressure limiter valve.
- A skewed FRP sensor value can set this DTC. The FRP Sensor on the scan tool should read 0.9 to 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 1 minute.

Notice:

- If the fuel tank is empty or near empty, air might be allowed to go into the fuel system. With air in the fuel system, smooth flow of fuel into the supply pump is interrupted and this DTC may set. Perform bleeding of fuel system after refilling.

Schematic Reference: Fuel System Routing Diagram and Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing DTC P0087

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0088, P0089, P0091, P0092, P0192, P0193, P0201 - P0204, P1064, P1065, P124B or P2146 - P2151 set?	—	Go to Applicable DTC	Go to Step 3

Step	Action	Value(s)	Yes	No
3	1. Turn OFF the ignition. 2. Place the transmission in Neutral and set the parking brake. 3. Start the engine. 4. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 4	Go to Diagnostic Aids
4	1. Turn OFF the ignition. 2. Wait 1 minute for the fuel pressure to bleed down from the fuel rail. 3. Turn ON the ignition, with the engine OFF. DO NOT start the engine. 4. Observe the Fuel Rail Pressure (FRP) Sensor parameter with the scan tool. Does the scan tool indicate within the specified value?	0.9 to 1.0 volt	Go to Step 5	Go to Step 10
5	1. Start the engine. 2. Perform the Cylinder Balance Test with a scan tool. 3. Command each injector OFF and verify an engine speed change for each injector. Is there an injector that does not change engine speed when commanded OFF?	—	Go to Step 12	Go to Step 6
6	1. Check the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** Air in the fuel system will cause fuel rail pressure fluctuations especially at high engine speed and load, which may set this DTC. 2. Start the engine and check for high side fuel system leaks at the fuel supply pump and fuel rail. **Notice:** Fuel may leak under the cylinder head cover from the inlet high pressure line. In such case, the engine oil level will rise. Inspect for fuel leakage into the engine oil. 3. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 7

Step	Action	Value(s)	Yes	No
7	**Notice:** Make sure the in-tank fuel pump operation before performing the following procedures. Refer to In-tank Fuel Pump System Check in this section. 1. Turn OFF the ignition. 2. Disconnect the fuel hose from the fuel supply pump suction side. In order to measure the discharged fuel amount, put the hose into a bottle or a container with a scale. (The inlet of a bottle or a container must be larger than the diameter of hose.) 3. Turn ON the ignition for 20 seconds, with the engine OFF. 4. Turn OFF the ignition for 10 seconds. 5. Perform 3 and 4 three times. The accumulated fuel of three ignition cycles must be more than 300 cc. (Normal amount is more than 100 cc per one ignition cycle.) **Notice:** If there is a leak or a restriction on the suction side, the fuel from the hose will not flow out sufficiently that is most likely caused by fuel leakage, clogged fuel filter, kinked or crushed fuel hose or pipe. Also inside the fuel tank for any foreign materials may be getting drawn into the fuel line pickup. 6. Repair fuel system leaking or restrictions as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 8
8	1. Remove the fuel hose that connects to the fuel supply pump suction side and substitute a clear hose. **Notice:** The hose must be cleaned before connecting to the fuel line. Otherwise, foreign material internal to the hose may damage the fuel supply pump. 2. Bleed the fuel system. Repeat as necessary until the engine starts. 3. Let the engine run at idle for at least 1 minute. 4. Observe the clear hose while holding the engine speed higher than 3000 RPM for a minimum of 1 minute. **Notice:** If many air bubbles appear in the fuel, check the fuel line connections between the fuel supply pump and the fuel tank for tightness and all fuel hoses for cuts, cranks and for the uses of proper clamps. 5. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 9

Step	Action	Value(s)	Yes	No
9	1. Turn OFF the ignition. 2. Disconnect the FRP regulator harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP regulator (pins 1 and 2 of E-50). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 34, 50, 54 and 70 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13
10	1. Turn OFF the ignition. 2. Disconnect the FRP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP sensor (pins 1, 2 and 3 of E-48). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 47, 48, 68 and 69 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 11
11	Replace the FRP sensor. Refer to FRP sensor Replacement. Did you complete the replacement?	—	Go to Step 14	—
12	**Important:** Replacement fuel injector must be programmed. Replace the appropriate fuel injector that does not change engine speed when commanded OFF. Refer to Fuel Injector Replacement/ Fuel Injector ID Code Data Programming. Did you complete the replacement?	—	Go to Step 14	—
13	**Important:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. **Notice:** Always replace the fuel filter cartridge when a fuel supply pump is replaced. Replace the fuel supply pump and fuel filter cartridge. Refer to Fuel Supply Pump Replacement and Fuel Filter Cartridge Replacement. Did you complete the replacement?	—	Go to Step 14	—

Step	Action	Value(s)	Yes	No
14	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 15
15	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0088 (Flash Code 118)

Description

The common rail fuel system is comprised of two fuel pressure sections: a suction side between the fuel tank and the fuel supply pump and a high-pressure side between the fuel supply pump and the fuel injectors. Fuel is drawn from the fuel tank via a feed pump and then pumped into the fuel rail by two plungers, all of which are internal to the fuel supply pump. This high pressure is regulated by the ECM using the fuel rail pressure (FRP) regulator dependant upon values from the FRP sensor attached to the fuel rail.

If the ECM detects that the fuel pressure went excessively high for a certain length of time, this DTC will set (First Stage). If the ECM detects that during the same ignition cycle the fuel pressure rose even higher than the amount to set DTC P0088 for a certain length of time, the engine is stopped (Second Stage). If the engine is stopped, the fuel pressure was too high and the pressure limiter valve did not active or did not active quick enough.

Condition for Running the DTC

- DTCs P0192 and P0193 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

First Stage

- The ECM detects that the fuel rail pressure is more than 197 MPa (28,600 psi) for longer than 5 seconds.

Second Stage

- The ECM detects that the fuel rail pressure is more than 200 MPa (29,000 psi) for longer than 5 seconds.

Action Taken When the DTC Sets

First Stage

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Second Stage

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.
- The ECM stops engine running when the vehicle speed is lower than 5 km/h (3 MPH) for 5 seconds. The engine will run after the key is cycled when the ignition has been tuned OFF for longer than 10 seconds.

Condition for Clearing the DTC

First Stage

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Second Stage

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- An intermittently sticking Fuel Rail Pressure regulator may have allowed the fuel pressure to become high enough to set this DTC.
- Normal Fuel Rail Pressure readings on the scan tool with the engine running in neutral at idle is around 27 to 33 MPa (3,900 to 48,00 psi) after warm up.
- A skewed FRP sensor value can set this DTC. The FRP Sensor on the scan tool should read 0.9 to 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 1 minute.

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing DTC P0088

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls

Step	Action	Value(s)	Yes	No
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0089, P0091, P0092, P0192, P0193, P0201 - P0204, P0219, P1064, P1065, P124B or P2146 - P2151 set?	—	Go to Applicable DTC	Go to Step 3
3	1. Turn OFF the ignition. 2. Place the transmission in Neutral and set the parking brake. 3. Start the engine. 4. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the Fuel Rail Pressure parameter with a scan tool. Does the Fuel Rail Pressure parameter ever exceed the specified value?	190 MPa (27,600 psi)	Go to Step 4	Go to Step 11
4	1. Turn OFF the ignition. 2. Wait 1 minute for the fuel pressure to bleed down from the fuel rail. 3. Turn ON the ignition, with the engine OFF. DO NOT start the engine. 4. Observe the Fuel Rail Pressure (FRP) Sensor parameter with the scan tool. Does the scan tool indicate within the specified value?	0.9 to 1.0 volt	Go to Step 5	Go to Step 10
5	1. Start the engine. 2. Perform the Cylinder Balance Test with a scan tool. 3. Command each injector OFF and verify an engine speed change for each injector. Is there an injector that does not change engine speed when commanded OFF?	—	Go to Step 13	Go to Step 6
6	1. Check the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** Air in the fuel system will cause fuel rail pressure fluctuations especially at high engine speed and load, which may set this DTC. 2. Start the engine and check for high side fuel system leaks at the fuel supply pump and fuel rail. **Notice:** Fuel may leak under the cylinder head cover from the inlet high pressure line. In such case, the engine oil level will rise. Inspect for fuel leakage into the engine oil. 3. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 7

Step	Action	Value(s)	Yes	No
7	**Notice:** Make sure the in-tank fuel pump operation before performing the following procedures. Refer to In-tank Fuel Pump System Check in this section. 1. Turn OFF the ignition. 2. Disconnect the fuel hose from the fuel supply pump suction side. In order to measure the discharged fuel amount, put the hose into a bottle or a container with a scale. (The inlet of a bottle or a container must be larger than the diameter of hose.) 3. Turn ON the ignition for 20 seconds, with the engine OFF. 4. Turn OFF the ignition for 10 seconds. 5. Perform 3 and 4 three times. The accumulated fuel of three ignition cycles must be more than 300 cc. (Normal amount is more than 100 cc per one ignition cycle.) **Notice:** If there is a leak or a restriction on the suction side, the fuel from the hose will not flow out sufficiently that is most likely caused by fuel leakage, clogged fuel filter, kinked or crushed fuel hose or pipe. Also inside the fuel tank for any foreign materials may be getting drawn into the fuel line pickup. 6. Repair fuel system leaking or restrictions as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 8
8	1. Remove the fuel hose that connects to the fuel supply pump suction side and substitute a clear hose. **Notice:** The hose must be cleaned before connecting to the fuel line. Otherwise, foreign material internal to the hose may damage the fuel supply pump. 2. Bleed the fuel system. Repeat as necessary until the engine starts. 3. Let the engine run at idle for at least 1 minute. 4. Observe the clear hose while holding the engine speed higher than 3000 RPM for a minimum of 1 minute. **Notice:** If many air bubbles appear in the fuel, check the fuel line connections between the fuel supply pump and the fuel tank for tightness and all fuel hoses for cuts, cranks and for the uses of proper clamps. 5. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 9

Step	Action	Value(s)	Yes	No
9	1. Turn OFF the ignition. 2. Disconnect the FRP regulator harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP regulator (pins 1 and 2 of E-50). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 34, 50, 54 and 70 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
10	1. Turn OFF the ignition. 2. Disconnect the FRP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP sensor (pins 1, 2 and 3 of E-48). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 47, 48, 68 and 69 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 12
11	**Notice:** An intermittent problem by foreign material in the fuel is suspected. Replace the fuel filter cartridge. Refer to Fuel Filter Cartridge Replacement. Did you complete the replacement?	—	Go to Step 15	—
12	Replace the FRP sensor. Refer to FRP sensor Replacement. Did you complete the replacement?	—	Go to Step 15	—
13	**Important:** Replacement fuel injector must be programmed. Replace the appropriate fuel injector that does not change engine speed when commanded OFF. Refer to Fuel Injector Replacement/ Fuel Injector ID Code Data Programming. Did you complete the replacement?	—	Go to Step 15	—

DTC P0089 (Flash Code 151)

Description

The common rail fuel system is comprised of two fuel pressure sections: a suction side between the fuel tank and the fuel supply pump and a high-pressure side between the fuel supply pump and the fuel injectors. Fuel is drawn from the fuel tank via a feed pump and then pumped into the fuel rail by two plungers, all of which are internal to the fuel supply pump. This high pressure is regulated by the ECM using the fuel rail pressure (FRP) regulator dependant upon values from the FRP sensor attached to the fuel rail. If the ECM detects that fuel pressure is a certain pressure higher than the desired pressure, this DTC will set.

Condition for Running the DTC

- DTCs P0091, P0092, P0192, P0193, P0652, P0653, P0201 - P0204, P1064, P1065, P124B and P2146 - P2151 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

- The ECM detects that the actual fuel rail pressure is more than 20 to 40 MPa (2,900 to 5,800 psi) over the desired pressure for longer than 20 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- An intermittently sticking FRP regulator may have allowed the fuel pressure to become high enough to set this DTC.
- Normal Fuel Rail Pressure readings on the scan tool with the engine running in neutral at idle is around 27 to 33 MPa (3,900 to 4,800 psi) after warm up.
- A skewed FRP sensor value can set this DTC. The FRP Sensor on the scan tool should read 0.9 to 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 1 minute.

Circuit/ System Testing DTC P0089

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0091, P0092, P0192, P0193, P0201 - P0204, P0219, P1064, P1065, P124B or P2146 - P2151 set?	—	Go to Applicable DTC	Go to Step 3
3	1. Turn OFF the ignition. 2. Wait 1 minute for the fuel pressure to bleed down from the fuel rail. 3. Turn ON the ignition, with the engine OFF. DO NOT start the engine. 4. Observe the Fuel Rail Pressure (FRP) Sensor parameter with the scan tool. Does the scan tool indicate within the specified value?	0.9 to 1.0 volt	Go to Step 4	Go to Step 5

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Disconnect the FRP regulator harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP regulator (pins 1 and 2 of E-50). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 34, 50, 54 and 70 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 6
5	1. Turn OFF the ignition. 2. Disconnect the FRP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP sensor (pins 1, 2 and 3 of E-48). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 47, 48, 68 and 69 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
6	1. Turn OFF the ignition. 2. Place the transmission in Neutral and set the parking brake. 3. Start the engine. 4. Accelerate the engine between idle and W.O.T (accelerator pedal full travel) many times while observing the Fuel Rail Pressure and Desired Fuel Rail Pressure Parameter with a scan tool. Does the Fuel Pressure parameter follow within the specified value quick enough (compare with a similar unit if available)?	±5 MPa (±725 psi)	Go to Step 7	Go to Step 9
7	**Notice:** An intermittent problem by foreign material in the fuel is suspected. Replace the fuel filter cartridge. Refer to Fuel Filter Cartridge Replacement. Did you complete the replacement?	—	Go to Step 10	—
8	Replace the FRP sensor. Refer to FRP Sensor Replacement. Did you complete the replacement?	—	Go to Step 10	—

Step	Action	Value(s)	Yes	No
9	**Important:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. **Notice:** Always replace the fuel filter cartridge when a fuel supply pump is replaced. Replace the fuel supply pump and fuel filter cartridge. Refer to Fuel Supply Pump Replacement and Fuel Filter Cartridge Replacement. Did you complete the replacement?	—	Go to Step 10	—
10	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 11
11	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0091 or P0092 (Flash Code 247)

Circuit Description

The fuel rail pressure (FRP) regulator is installed to the fuel supply pump and controls the suction fuel quantity into the fuel rail. The FRP regulator is fully opened in the normal state and larger drive current results in smaller opening. The ECM calculates desired fuel rail pressure and fuel flow rate and it compares the calculated desired fuel rail pressure to the actual value to determine the FRP regulator position. When the actual fuel rail pressure is higher than the desired value, the FRP regulator is closed to decease the flow rate. If the ECM detects an excessively low or high FRP regulator feedback current, DTC P0091 or P0092 will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the FRP regulator feedback current is less than 100mA, or more than 1000mA below the desired current. (DTC P0091)
- The ECM detects that the FRP regulator feedback current is more than 2450mA, or more than 1000mA over the desired current. (DTC P0092)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The number below refers to the step number on the Circuit/ System Testing.
8. If the FRP regulator high side circuit is shorted to voltage, engine stalls and will not start.
9. If the FRP regulator low side circuit is shorted to ground, this DTC may not set. This will cause engine stall or no engine start.

Circuit/ System Testing DTC P0091 or P0092

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	Is DTC P1064 also set?	—	Go to DTC P1064	Go to Step 4
4	Observe the Fuel Rail Pressure (FRP) Regulator Feedback parameter with a scan tool. Does the scan tool indicate more than the specified value?	300 mA	Go to Step 5	Go to Step 6
5	Does the scan tool indicate more than the specified value at Step 4?	1300 mA	Go to Step 8	Go to Step 9

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition for 30 seconds. 2. Disconnect the FRP regulator harness connector. 3. Connect a test lamp between the high side circuit (pin 1 of E-50) and a known good ground. 4. Turn ON the ignition, with the engine OFF. DO NOT start the engine. Does the test lamp illuminate then go out?	—	Go to Step 7	Go to Step 10
7	1. Turn OFF the ignition for 30 seconds. 2. Connect a test lamp between the low side circuit (pin 2 of E-50) and battery voltage. 3. Turn ON the ignition, with the engine OFF. DO NOT start the engine. Does the test lamp illuminate then go out?	—	Go to Step 12	Go to Step 11
8	1. Test the high side circuits between the ECM (pins 34 and 54 of E-90) and the FRP regulator (pin 1 of E-50) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15
9	1. Test the low side circuits between the ECM (pins 50 and 70 of E-90) and the FRP regulator (pin 2 of E-50) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15
10	1. Test the high side circuits between the ECM (pins 34 and 54 of E-90) and the FRP regulator (pin 1 of E-50) for the following conditions: • An open circuit • A short to ground • A short to the low side circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 13
11	**Important:** The ECM may be damaged if the FRP regulator low side circuit is shorted to a voltage source. 1. Test the low side circuits between the ECM (pins 50 and 70 of E-90) and the FRP regulator (pin 2 of E-50) for the following conditions: • An open circuit • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 13

Step	Action	Value(s)	Yes	No
12	1. Inspect for an intermittent and for poor connections at the harness connector of the FRP regulator (pins 1 and 2 of E-50). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 14
13	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 34, 50, 54 and 70 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15
14	Replace the FRP regulator. Refer to Fuel Pump Replacement. Did you complete the replacement?	—	Go to Step 16	—
15	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 16	—
16	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 17
17	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0093 (Flash Code 227)

Description

The common rail fuel system is comprised of two fuel pressure sections: a suction side between the fuel tank and the fuel supply pump and a high-pressure side between the fuel supply pump and the fuel injectors. Fuel is drawn from the fuel tank via a feed pump and then pumped into the fuel rail by two plungers, all of which are internal to the fuel supply pump. This high pressure is regulated by the ECM using the fuel rail pressure (FRP) regulator dependant upon values from the FRP sensor attached to the fuel rail. If the ECM detects that the fuel rail pressure is certain pressure low as compared with the engine speed, this DTC will set.

Condition for Running the DTC

- DTC P0087, P0091, P0092, P0192, P0193, P0652, P0653, P0201 - P0204, P1064, P1065, P124B and P2146 - P2151 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

- The ECM detects that the actual fuel rail pressure is lower than 15 MPa (2,180 psi) for longer than 5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- An intermittently sticking FRP regulator may have allowed the fuel pressure to become low enough to set this DTC.
- Normal Fuel Rail Pressure readings on the scan tool with the engine running in neutral at idle is around 27 to 33 MPa (3,900 to 4,800 psi) after warm up.
- A skewed FRP sensor value can set this DTC. The FRP Sensor on the scan tool should read 0.9 to 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 1 minute.

Notice:

- This DTC most likely indicates a loss of fuel pressure by a fuel leak from the high pressure side. Inspect the high pressure side fuel leakage between the fuel supply pump and fuel injector first.
- If the fuel tank is empty or near empty, air might be allowed to go into the fuel system. With air in the fuel system, smooth flow of fuel into the supply pump is interrupted and this DTC may set. Perform bleeding of fuel system after refilling.

Schematic Reference: Fuel System Routing Diagram and Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing DTC P0093

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls

Step	Action	Value(s)	Yes	No
2	1. Inspect the high pressure side between the fuel supply pump and the fuel injectors for fuel leakage. The following components may contain an external leak. • Fuel supply pump • Fuel rail • Pressure limiter valve • Fuel rail pressure (FRP) sensor • Fuel pipe between the fuel supply pump and fuel rail • Fuel pipe between the fuel rail and fuel injectors • Each fuel pipe sleeve nuts **Notice:** Fuel may leak under the cylinder head cover from the inlet high pressure line. In such case, the engine oil level will rise. Inspect for fuel leakage into the engine oil. **Notice:** Remove and inspect the inlet high pressure joint to the fuel injectors for fuel leaking from the sleeve nut(s). Replace the fuel injector and injection pipe when foreign material was in contact. 2. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 3
3	1. Remove each glow plug from the cylinder head. 2. Inspect for fuel leakage into the combustion chamber. Is there a cylinder that fuel leakage into the combustion chamber?	—	Go to Step 13	Go to Step 4
4	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0087, P0091, P0092, P0192, P0193, P0201 - P0204, P1064, P1065, P124B or P2146 - P2151 set?	—	Go to Applicable DTC	Go to Step 5
5	1. Turn OFF the ignition. 2. Wait 1 minute for the fuel pressure to bleed down from the fuel rail. 3. Turn ON the ignition, with the engine OFF. DO NOT start the engine. 4. Observe the FRP Sensor parameter with the scan tool. Does the scan tool indicate within the specified value?	0.9 to 1.0 volt	Go to Step 6	Go to Step 11

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition. 2. Place the transmission in Neutral and set the parking brake. 3. Start the engine. 4. Perform the Cylinder Balance Test with a scan tool. 5. Command each injector OFF and verify an engine speed change for each injector. Is there an injector that does not change engine speed when commanded OFF?	—	Go to Step 14	Go to Step 7
7	1. Check the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** Air in the fuel system will cause fuel rail pressure fluctuations especially at high engine speed and load, which may set this DTC. 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 8
8	**Notice:** Make sure the in-tank fuel pump operation before performing the following procedures. Refer to In-tank Fuel Pump System Check in this section. 1. Turn OFF the ignition. 2. Disconnect the fuel hose from the fuel supply pump suction side. In order to measure the discharged fuel amount, put the hose into a bottle or a container with a scale. (The inlet of a bottle or a container must be larger than the diameter of hose.) 3. Turn ON the ignition for 20 seconds, with the engine OFF. 4. Turn OFF the ignition for 10 seconds. 5. Perform 3 and 4 three times. The accumulated fuel of three ignition cycles must be more than 300 cc. (Normal amount is more than 100 cc per one ignition cycle.) **Notice:** If there is a leak or a restriction on the suction side, the fuel from the hose will not flow out sufficiently that is most likely caused by fuel leakage, clogged fuel filter, kinked or crushed fuel hose or pipe. Also inside the fuel tank for any foreign materials may be getting drawn into the fuel line pickup. 6. Repair fuel system leaking or restrictions as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 9

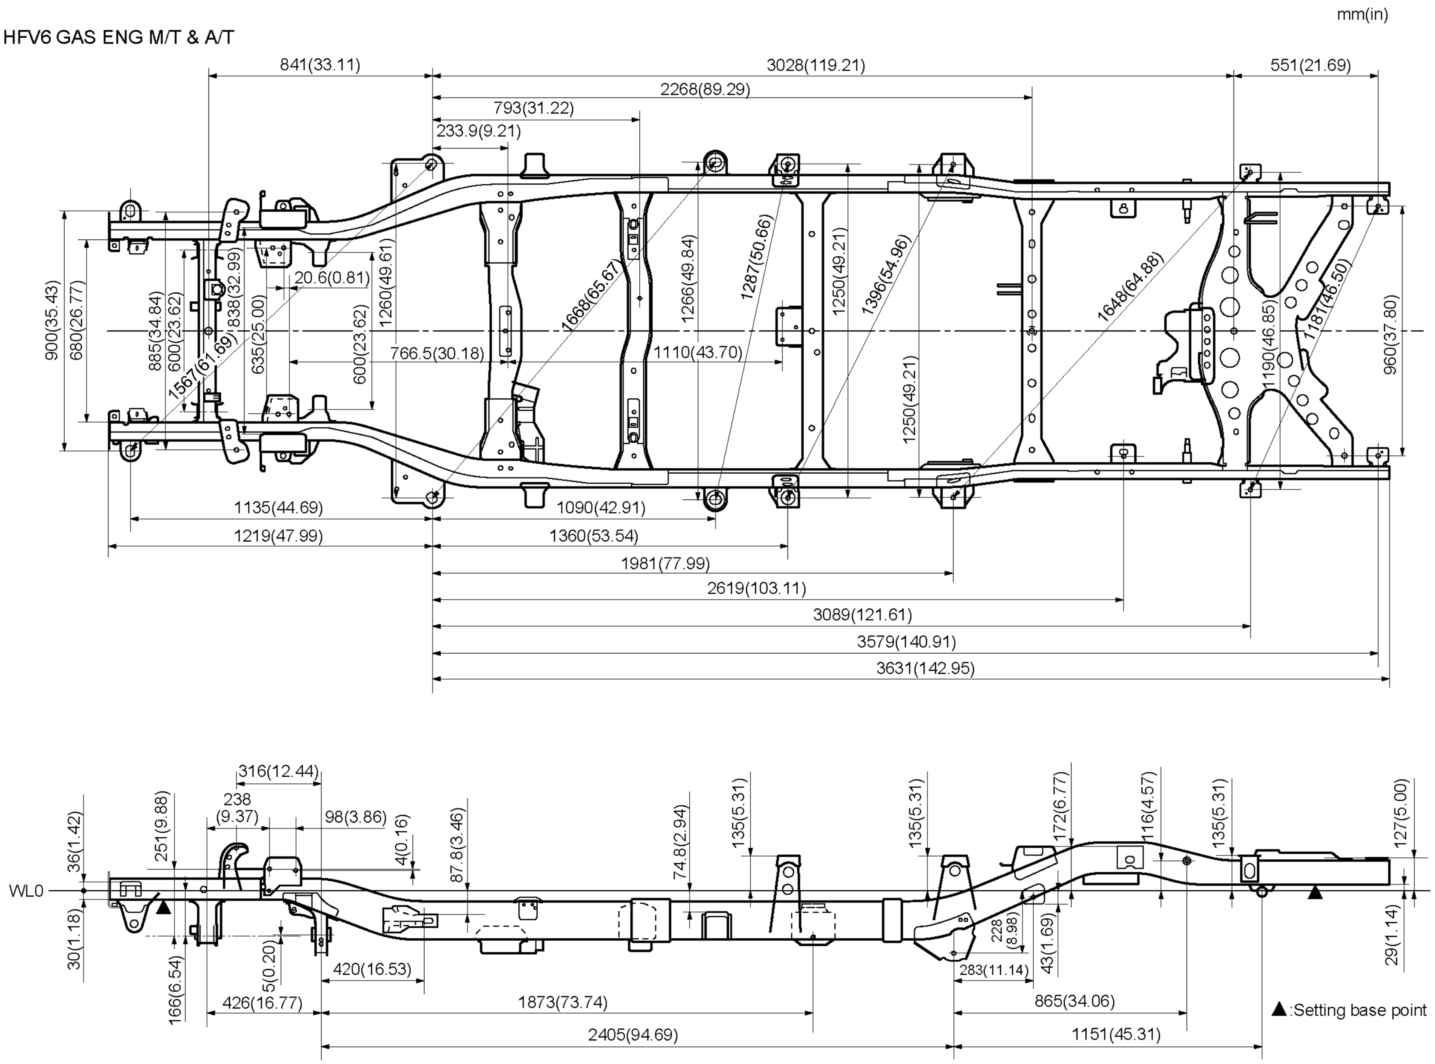
4×2, EXTRA LWB, REGULAR CAB MODEL

This illustration is based on the RHD model.



RTW72AXF001101

ISUZU KB P190 2007
TO MODEL INDEX

Step	Action	Value(s)	Yes	No
9	1. Remove the fuel hose that connects to the fuel supply pump suction side and substitute a clear hose. **Notice:** The hose must be cleaned before connecting to the fuel line. Otherwise, foreign material internal to the hose may damage the fuel supply pump. 2. Bleed the fuel system. Repeat as necessary until the engine starts. 3. Let the engine run at idle for at least 1 minute. 4. Observe the clear hose while holding the engine speed higher than 3000 RPM for a minimum of 1 minute. **Notice:** If many air bubbles appear in the fuel, check the fuel line connections between the fuel supply pump and the fuel tank for tightness and all fuel hoses for cuts, cranks and for the uses of proper clamps. 5. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 10
10	1. Turn OFF the ignition. 2. Disconnect the FRP regulator harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP regulator (pins 1 and 2 of E-50). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 34, 50, 54 and 70 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 15
11	1. Turn OFF the ignition. 2. Disconnect the FRP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP sensor (pins 1, 2 and 3 of E-48). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 47, 48, 68 and 69 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 16	Go to Step 12

Step	Action	Value(s)	Yes	No
12	Replace the FRP sensor. Refer to FRP Sensor Replacement. Did you complete the replacement?	—	Go to Step 16	—
13	**Important:** Replacement fuel injector must be programmed. Replace the appropriate fuel injector that was leaking fuel found at Step 3 and inspect the engine mechanical for any damage or poor engine compression. Refer to Fuel Injector Replacement/ Fuel Injector ID Code Data Programming and engine mechanical section. Did you complete the replacement?	—	Go to Step 16	—
14	**Important:** Replacement fuel injector must be programmed. Replace the appropriate fuel injector that does not change engine speed when commanded OFF. Refer to Fuel Injector Replacement/ Fuel Injector ID Code Data Programming. Did you complete the replacement?	—	Go to Step 16	—
15	**Important:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. **Notice:** Always replace the fuel filter cartridge when a fuel supply pump is replaced. Replace the fuel supply pump and fuel filter cartridge. Refer to Fuel Supply Pump Replacement and Fuel Filter Cartridge Replacement. Did you complete the replacement?	—	Go to Step 16	—
16	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 17
17	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0101 (Flash Code 92)

Circuit Description

The mass air flow (MAF) sensor is an air flow meter that measures the amount of air that enters the engine. It is fitted between the air cleaner and turbocharger. A small quantity of air that enters the engine indicates deceleration or idle speed. A large quantity of air that enters the engine indicates acceleration or a high load condition. The ECM will calculate a predicted MAF value and compares the actual MAF sensor voltage signal to the predicted MAF value. This comparison will determine if the signal is stuck, or is too low or too high for a given operating condition. If the ECM detects that the actual MAF sensor signal voltage is not within a predetermined range of the calculated MAF value, this DTC will set.

Condition for Running the DTC

- DTCs P0045, P0102, P0103, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0122, P0123, P0234, P0403, P0404, P0405, P0406, P0638, P0652, P0653, P0698, P0699, P1404, P2100, P2101, P2103, P2227, P2228 and P2229 are not set.

AND following conditions are met longer than 10 seconds.

- The battery voltage is between 10.0 to 16.0 volts.
- The ignition switch is ON.
- The intake air temperature is less than 110°C (230°F).
- The engine coolant temperature is between 0 to 110°C (32 to 230°F).
- The engine speed is between 850 to 3700 RPM.
- The EGR control is commanded OFF.
- The intake throttle control is commanded OFF.
- The commanded fuel injection quantity is OFF (accelerator pedal is not depressed).
- The engine run time is longer than 5 seconds.

Condition for Setting the DTC

- The ECM detects that the MAF sensor signal voltage is not within a predetermined range of the calculated MAF value for longer than 10 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits EGR control.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- Any unmetered air that enters the engine downstream of the MAF sensor will cause this DTC to set.
- High resistance in the MAF sensor circuit will set this DTC.
- A short between the signal circuit of the MAF sensor and the signal circuit of the intake air temperature (IAT) sensor will skew the MAF sensor lower than normal at higher air flows.

Notice:

- The MAF Sensor parameter on scan tool will only update with engine running or one time after the key is cycled when the ignition has been turned OFF for longer than 10 seconds.

DTC P0102 or P0103 (Flash Code 91)

Circuit Description

The mass air flow (MAF) sensor is an air flow meter that measures the amount of air that enters the engine. It is fitted between the air cleaner and turbocharger. A small quantity of air that enters the engine indicates deceleration or idle speed. A large quantity of air that enters the engine indicates acceleration or a high load condition. The sensor has the following circuits.

- Ignition voltage circuit
- Low reference circuit
- MAF sensor signal circuit

The ECM monitors the MAF sensor signal voltage. This output voltage will display on the scan tool as a voltage parameter and as a grams per second (g/s) parameter. If the ECM detects an excessively low or high signal voltage, DTC P0102 or P0103 will set.

Condition for Running the DTC

- The battery voltage is between 11.5 to 16.0 volts.
- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

- The ECM detects that the MAF sensor signal voltage is less than 0.1 volts. (DTC P0102)
- The ECM detects that the MAF sensor signal voltage is more than 4.9 volts for 3 seconds. (DTC P0103)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM uses a MAF substitution of default value.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits EGR control.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The MAF Sensor parameter on scan tool will only update with engine running or one time after the key is cycled when the ignition has been turned OFF for longer than 10 seconds.

Test description

The number below refers to the step number on the Circuit/ System Testing.
DTC P0102
4. This step tests for proper operation of the circuit in the signal circuit. If the fuse in the jumper opens when you perform this test, the signal circuit is shorted to ground or low reference circuits.

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing DTC P0102

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Observe the Mass Air Flow (MAF) Sensor parameter with a scan tool. Is the MAF Sensor parameter less than the specified value?	0.1 volts	Go to Step 3	Go to Diagnostic Aids

Step	Action	Value(s)	Yes	No
3	1. Turn OFF the ignition. 2. Disconnect the MAF sensor harness connector. 3. Connect a test lamp between the ignition voltage feed circuit (pin 1 of E-47) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 4	Go to Step 5
4	1. Turn OFF the ignition for 30 seconds. 2. Connect a 3-amp fused jumper wire between the ignition voltage feed circuit and the signal circuit (pins 1 and 3 of E-47). 3. Turn ON the ignition, with the engine OFF. Is the MAF Sensor parameter more than the specified value?	4.9 volts	Go to Step 7	Go to Step 6
5	Repair the open circuit or high resistance between the ECM Main Relay (pin 1 of X-12) and the MAF sensor (pin 1 of E-47) for and open circuit or high resistance. Check the Engine (10A) fuse first. Did you complete the repair?	—	Go to Step 11	—
6	1. Test the signal circuit between the ECM (pin 40 of E-90) and the MAF sensor (pin 3 of E-47) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 8
7	1. Inspect for an intermittent and for poor connections at the harness connector of the MAF sensor (pins 1 and 3 of E-47). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 9
8	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 40 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 10
9	Replace the MAF sensor. Refer to MAF Sensor Replacement. Did you complete the replacement?	—	Go to Step 11	—
10	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 11	—

Step	Action	Value(s)	Yes	No
11	1. Reconnect all previously disconnected fuse, relay or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 12
12	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P0103

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Observe the Mass Air Flow (MAF) Sensor parameter with a scan tool. Is the MAF Sensor parameter more than the specified value?	4.9 volts	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition for 30 seconds. 2. Disconnect the MAF sensor harness connector. 3. Turn ON the ignition, with the engine OFF. Is the MAF Sensor parameter less than the specified value?	0.1 volts	Go to Step 4	Go to Step 5
4	Connect a test lamp between the low reference circuit (pin 2 of E-47) and battery voltage. Does the test lamp illuminate?	—	Go to Step 7	Go to Step 6
5	1. Test the signal circuit between the ECM (pin 40 of E-90) and the MAF sensor (pin 3 of E-47) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 10
6	1. Test the low reference circuit between the ECM (pin 43 of E-90) and the MAF sensor (pin 2 of E-47) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 8

Step	Action	Value(s)	Yes	No
7	1. Inspect for an intermittent and for a poor connection at the harness connector of the MAF sensor (pin 2 of E-47). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 9
8	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 43 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 10
9	Replace the MAF sensor. Refer to MAF Sensor Replacement. Did you complete the replacement?	—	Go to Step 11	—
10	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 11	—
11	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 12
12	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0107 or P0108 (Flash Code 32)

Circuit Description

The boost pressure sensor is located in the air induction tubing. The boost pressure sensor is a transducer that varies voltage according to changes in the air pressure inside the air tubing. The sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- Boost pressure sensor signal circuit

The boost pressure sensor provides a signal to the ECM on the signal circuit, which is relative to the pressure changes in the air tubing. The ECM should detect a low signal voltage at a low boost pressure, such as low engine load. The ECM should detect high signal voltage at a high boost pressure, such as high engine load. If the ECM detects an excessively low or high signal voltage, DTC P0107 or P0108 will set.

Condition for Running the DTC

- DTCs P0698 and P0699 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the boost pressure sensor signal voltage is less than 0.1 volts. (DTC P0107)
- The ECM detects that the boost pressure sensor signal voltage is more than 4.75 volts. (DTC P0108)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM uses a boost pressure substitution of default value.
- The ECM limits fuel injection quantity.
- The ECM inhibits EGR control.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

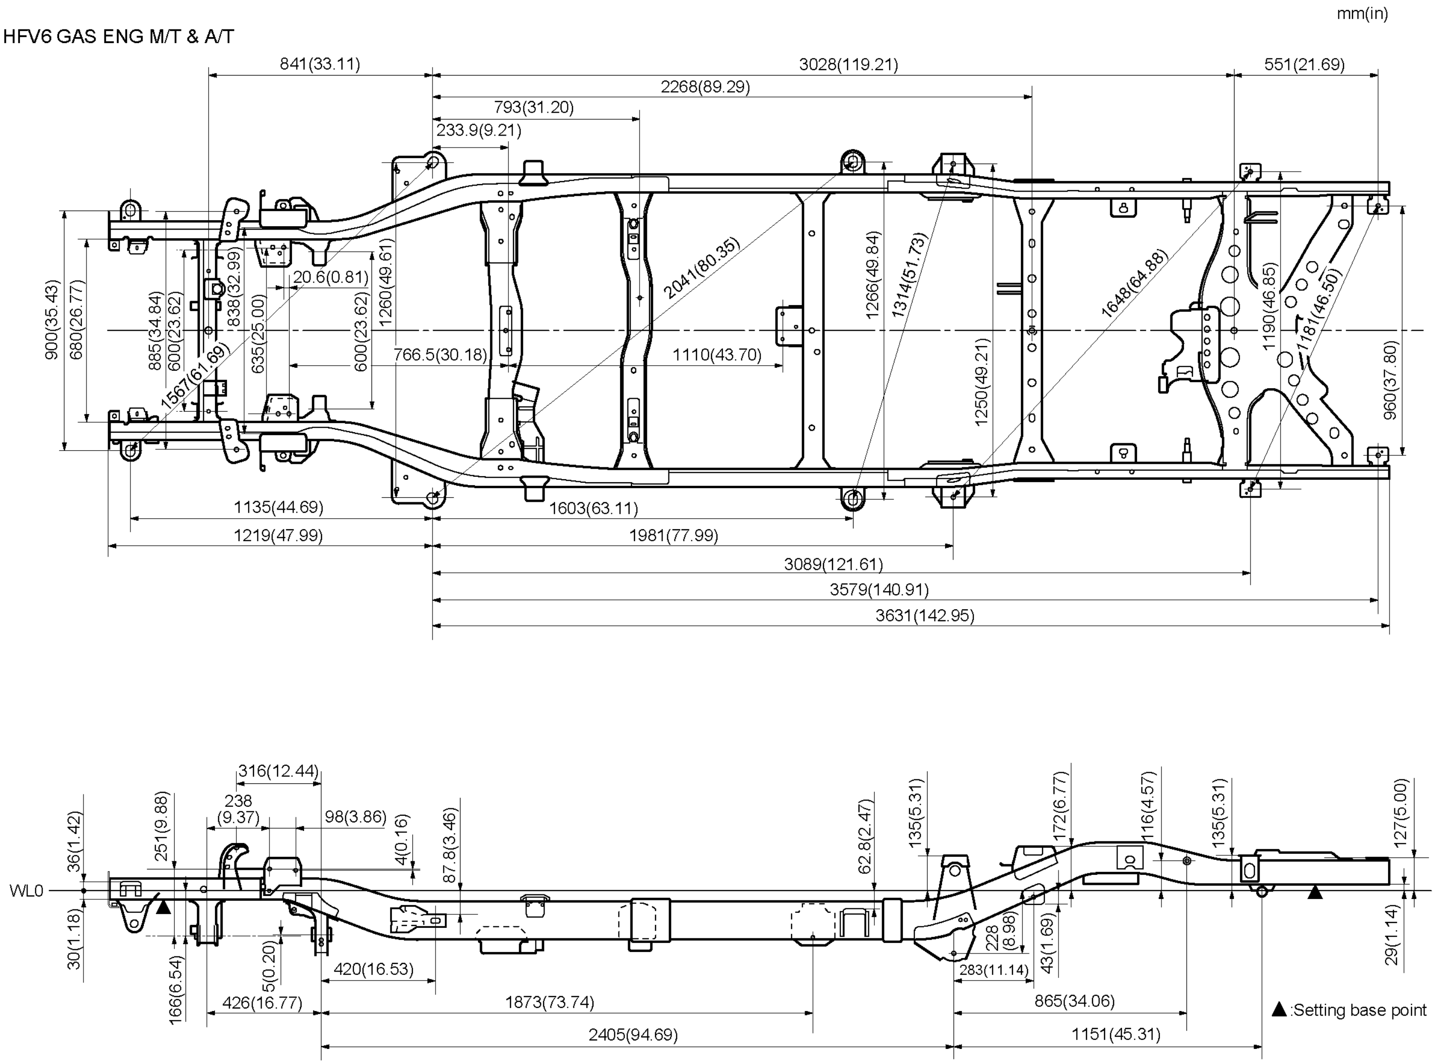
4×2, EXTRA LWB, EXTEND CAB MODEL

This illustration is based on the RHD model.



RTW72AXF001201

Step	Action	Value(s)	Yes	No
5	Connect a 3-amp fused jumper wire between the 5 volts reference circuit and the signal circuit (pins 3 and 1 of E-107). Is the Boost Pressure Sensor parameter more than the specified value?	4.7 volts	Go to Step 8	Go to Step 7
6	1. Test the 5 volts reference circuit between the ECM (pin 20 of E-90) and the boost pressure sensor (pin 3 of E-107) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
7	1. Test the signal circuit between the ECM (pin 21 of E-90) and the boost pressure sensor (pin 1 of E-107) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
8	1. Inspect for an intermittent and for poor connections at the harness connector of the boost pressure sensor (pins 1 and 3 of E-107). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 20 and 21 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
10	Replace the boost pressure sensor. Refer to Boost Pressure Sensor Replacement. Did you complete the replacement?	—	Go to Step 12	—
11	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 12	—
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 13

Step	Action	Value(s)	Yes	No
13	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P0108

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Observe the Boost Pressure Sensor parameter with a scan tool. Is the Boost Pressure Sensor parameter more than the specified value?	4.7 volts	Go to Step 3	Go to Diagnostic Aids
3	Monitor the DTC Information with a scan tool. Is DTC P0699 also set?	—	Go to Step 4	Go to Step 5
4	1. Turn OFF the ignition. 2. Disconnect the boost pressure sensor harness connector. 3. Turn ON the ignition, with the engine OFF. Is the Boost Pressure Sensor parameter less than the specified value?	0.1 volts	Go to DTC P0699	Go to Step 7
5	1. Turn OFF the ignition. 2. Disconnect the boost pressure sensor harness connector. 3. Turn ON the ignition, with the engine OFF. Is the Boost Pressure Sensor parameter less than the specified value?	0.1 volts	Go to Step 6	Go to Step 7
6	Connect a test lamp between the low reference circuit (pin 2 of E-107) and battery voltage. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 8
7	**Important:** The boost pressure sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the ECM (pin 21 of E-90) and the boost pressure sensor (pin 1 of E-107) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	1. Test the low reference circuit between the ECM (pin 23 of E-90) and the boost pressure sensor (pin 2 of E-107) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10

Step	Action	Value(s)	Yes	No
9	1. Inspect for an intermittent and for a poor connection at the harness connector of the boost pressure sensor (pin 2 of E-107). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 23 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
11	Replace the boost pressure sensor. Refer to Boost Pressure Sensor Replacement. Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 14
14	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0112 or P0113 (Flash Code 22)

Circuit Description

The intake air temperature (IAT) sensor is fitted between the air cleaner and turbocharger. It is internal to the mass air flow (MAF) sensor. The IAT sensor is a variable resistor and it measures the temperature of the air entering the engine. The sensor has a signal circuit and a low reference circuit. The ECM supplies 5 volts to the signal circuit and a ground for the low reference circuit. When the IAT sensor is cold, the sensor resistance is high. When the air temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the signal circuit. If the ECM detects an excessively low or high signal voltage, DTC P0112 or P0113 will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The engine run time is longer than 3 minutes. (DTC P0113)

Condition for Setting the DTC

- The ECM detects that the IAT sensor signal voltage is less than 0.1 volts for 3 seconds. (DTC P0112)
- The ECM detects that the IAT sensor signal voltage is more than 4.75 volts for 3 seconds. (DTC P0113)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM uses an IAT substitution of default value.
- The ECM limits fuel injection quantity.
- The ECM inhibits EGR control.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Temperature vs. Resistance table to test the IAT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

Circuit/ System Testing DTC P0112

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Intake Air Temperature (IAT) Sensor parameter with a scan tool. Is the IAT Sensor parameter less than the specified value?	0.1 volts	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the mass air flow/ intake air temperature (MAF/ IAT) sensor harness connector. 3. Turn ON the ignition, with the engine OFF. Is the IAT Sensor parameter more than the specified value?	4.7 volts	Go to Step 5	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Test the signal circuit between the ECM (pin 41 of E-90) and the IAT sensor (pin 4 of E-47) for the following conditions: • A short to ground • A short to the low reference circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 6
5	Replace the MAF sensor. Refer to MAF Sensor Replacement. (IAT sensor is internal to MAF sensor) Did you complete the replacement?	—	Go to Step 8	—
6	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect connections at the harness connector of the ECM (pins 41 and 61 of E-90) for corrosion. 4. Repair or clean the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 7
7	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 8	—
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 9
9	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P0113

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Intake Air Temperature (IAT) Sensor parameter with a scan tool. Is the IAT Sensor parameter more than the specified value?	4.7 volts	Go to Step 3	Go to Diagnostic Aids

Step	Action	Value(s)	Yes	No
3	1. Turn OFF the ignition. 2. Disconnect the mass air flow/ intake air temperature (MAF/ IAT) sensor harness connector. 3. Connect a DMM between the signal circuit (pin 4 of E-47) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	5.3 volts	Go to Step 4	Go to Step 5
4	**Important:** The IAT sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the ECM (pin 41 of E-90) and the IAT sensor (pin 4 of E-47) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13
5	Connect a 3-amp fused jumper wire between the signal circuit and the low reference circuit (pins 4 and 5 of E-47). Is the IAT Sensor parameter less than the specified value?	0.1 volts	Go to Step 9	Go to Step 6
6	Connect a 3-amp fused jumper wire between the signal circuit (pin 4 of E-47) and a known good ground. Is the IAT Sensor parameter less than the specified value?	0.1 volts	Go to Step 8	Go to Step 7
7	1. Test the signal circuit between the ECM (pin 41 of E-90) and the IAT sensor (pin 4 of E-47) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 11
8	1. Test the low reference circuit between the ECM (pin 61 of E-90) and the IAT sensor (pin 5 of E-47) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 11
9	1. Test the signal circuit between the ECM (pin 41 of E-90) and the IAT sensor (pin 4 of E-47) for a short to any 5 volts reference circuit. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 10
10	1. Inspect for an intermittent and for poor connections at the harness connector of the IAT sensor (pins 4 and 5 of E-47). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 12

Step	Action	Value(s)	Yes	No
11	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 41 and 61 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13
12	Replace the MAF sensor. Refer to MAF Sensor Replacement. (IAT sensor is internal to MAF sensor) Did you complete the replacement?	—	Go to Step 14	—
13	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 14	—
14	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. 15	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0116 (Flash Code 23)

Circuit Description

The engine coolant temperature (ECT) sensor is installed to the thermostat housing. The ECT sensor is a variable resistor and it measures the temperature of the engine coolant. If the ECM detects that the difference of engine coolant temperature is smaller than the calculated range during the predetermined conditions, this DTC will set. This DTC will only run once per ignition cycle within the enabling condition.

Condition for Running the DTC

- DTCs P0117, P0118, P0201 - P0204, P0500, P0501 P124B, P1261, P1262 and P2146 - P2151 are not set.
- The ignition switch is ON.
- The engine coolant temperature is between -10 to 110°C (14 to 230°F).
- The vehicle run time is longer than 18 minutes.
- The engine run time is longer than 5 minutes with engine speed is more than 1200 RPM.
- The accumulation fuel injection quantity since engine start is more than a threshold.

Condition for Setting the DTC

- The ECM detects that the difference of maximum and minimum engine coolant temperature is less than 5°C (9°F).

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits EGR control.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- After starting the engine the ECT should rise steadily to about 80 to 85°C (176 to 185°F) then stabilize when the thermostat opens.
- Use the Temperature vs. Resistance table to test the ECT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

Circuit/ System Testing DTC P0116

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Test the engine cooling system for the following condition. Refer to diagnosis of the engine cooling system section for testing. • Engine coolant level • Engine coolant leakage 2. Repair or replace as necessary Did you find and correct the condition?	—	Go to Step 6	Go to Step 3
3	1. Turn OFF the ignition 2. Disconnect the engine coolant temperature (ECT) sensor harness connector. 3. Inspect for an intermittent, for poor connectors and corrosion at the harness connector of the ECT sensor (pins 1 and 2 of E-41). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 26 and 27 of E-90). 6. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Test each sensor circuit between the ECM (pins 26 and 27 of E-90) and the ECT sensor (pins 1 and 2 of E-41) for high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Step 5
5	Replace the ECT sensor. Refer to ECT Sensor Replacement. Did you complete the replacement?	—	Go to Step 6	—
6	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Cool down the engine as necessary (allow engine coolant temperature to cool down at least 50°C [122°F]). 5. Start the engine and wait until engine is warm upped while comparing the Coolant Temperature parameter on the scan tool to the water temperature gauge on the instrument panel (IP) cluster. Does the Coolant Temperature rise from 50 to 80°C (122 to 176°F) in proportion to the coolant temperature gauge indicates from lowest scale to slightly below middle?	—	Go to Step 7	Go to Step 2
7	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0117 or P0118 (Flash Code 23)

Circuit Description

The engine coolant temperature (ECT) sensor is installed to the thermostat housing. The ECT sensor is a variable resistor and it measures the temperature of the engine coolant. The sensor has a signal circuit and a low reference circuit. The ECM supplies 5 volts to the signal circuit and a ground for the low reference circuit. When the ECT sensor is cold, the sensor resistance is high. When the engine coolant temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the signal circuit. If the ECM detects an excessively low or high signal voltage, DTC P0117 or P0118 will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The engine run time is longer than 3 minutes. (DTC P0118)

Condition for Setting the DTC

- The ECM detects that the ECT sensor signal voltage is less than 0.1 volts for 3 seconds. (DTC P0117)
- The ECM detects that the ECT sensor signal voltage is more than 4.75 volts for 3 seconds. (DTC P0118)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM uses an ECT substitution of default value.
- The ECM limits fuel injection quantity.
- The ECM inhibits EGR control.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Temperature vs. Resistance table to test the ECT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

DTC P0122 or P0123 (Flash Code 43)

Circuit Description

The intake throttle position sensor is installed on the intake throttle valve body together with the control solenoid. The intake throttle position sensor changes output voltage according to intake throttle valve position. The sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- Intake throttle position sensor signal circuit

The intake throttle position sensor provides a signal to the ECM on the signal circuit, which is relative to the position changes of the intake throttle valve. If the ECM detects an excessively low or high signal voltage, DTC P0122 or P0123 will set.

Condition for Running the DTC

- DTCs P0698 and P0699 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the intake throttle position sensor signal voltage is less than 0.1 volts. (DTC P0122)
- The ECM detects that the intake throttle position sensor signal voltage is less than 4.75 volts. (DTC P0123)

Action Taken When the DTC Sets

- The ECM illuminates the MIL on the second consecutive driving cycle when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type B. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM inhibits EGR control.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type B (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Circuit/ System Testing DTC P0122

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0698 also set?	—	Go to DTC P0698	Go to Step 3
3	Observe the Intake Throttle Position Sensor parameter with a scan tool. Is the Intake Throttle Position Sensor parameter less than the specified value?	0.1 volts	Go to Step 4	Go to Diagnostic Aids
4	1. Turn OFF the ignition. 2. Disconnect the intake throttle valve harness connector. 3. Connect a DMM between the 5 volts reference circuit (pin 6 of E-38) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 5	Go to Step 6

Step	Action	Value(s)	Yes	No
5	Connect a 3-amp fused jumper wire between the 5 volts reference circuit and the signal circuit (pins 5 and 6 of E-38). Is the Intake Throttle Position Sensor parameter more than the specified value?	4.7 volts	Go to Step 8	Go to Step 7
6	1. Test the 5 volts reference circuit between the ECM (pin 36 of E-90) and the intake throttle valve (pin 6 of E-38) for an open circuit for high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
7	1. Test the signal circuit between the ECM (pin 57 of E-90) and the intake throttle valve (pin 5 of E-38) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
8	1. Inspect for an intermittent and for poor connections at the harness connector of the intake throttle valve (pins 5 and 6 of E-38). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 36 and 57 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
10	Replace the intake throttle valve. Refer to Intake Throttle Valve Replacement. Did you complete the replacement?	—	Go to Step 12	—
11	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 12	—
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 13

Step	Action	Value(s)	Yes	No
13	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P0123

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Observe the Intake Throttle Position Sensor parameter with a scan tool. Is the Intake Throttle Position Sensor parameter more than the specified valve?	4.7 volts	Go to Step 3	Go to Diagnostic Aids
3	Monitor the DTC Information with a scan tool. Is DTC P0699 also set?	—	Go to Step 4	Go to Step 5
4	1. Turn OFF the ignition. 2. Disconnect the intake throttle valve harness connector. 3. Turn ON the ignition, with the engine OFF. Is the Intake Throttle Position Sensor parameter less than the specified value?	0.1 volts	Go to DTC P0699	Go to Step 7
5	1. Turn OFF the ignition. 2. Disconnect the intake throttle valve harness connector. 3. Turn ON the ignition, with the engine OFF. Is the Intake Throttle Position Sensor parameter less than the specified value?	0.1 volts	Go to Step 6	Go to Step 7
6	Connect a test lamp between the low reference circuit (pin 3 of E-38) and battery voltage. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 8
7	**Important:** The intake throttle position sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the ECM (pin 57 of E-90) and the intake throttle valve (pin 5 of E-38) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	1. Test the low reference circuit between the ECM (pin 35 of E-90) and the intake throttle valve (pin 3 of E-38) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10

Step	Action	Value(s)	Yes	No
9	1. Inspect for an intermittent and for a poor connection at the harness connector of the intake throttle valve (pin 3 of E-38). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 35 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
11	Replace the intake throttle valve. Refer to Intake Throttle Valve Replacement. Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 14
14	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0182 or P0183 (Flash Code 211)

Circuit Description

The fuel temperature (FT) sensor is installed to the fuel supply pump. The FT sensor is a variable resistor and it measures the temperature of the fuel entering the fuel supply pump. The sensor has a signal circuit and a low reference circuit. The ECM supplies 5 volts to the signal circuit and a ground for the low reference circuit. When the FT sensor is cold, the sensor resistance is high. When the fuel temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the signal circuit. If the ECM detects an excessively low or high signal voltage, DTC P0182 or P0183 will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The engine run time is longer than 3 minutes. (DTC P0183)

Condition for Setting the DTC

- The ECM detects that the FT sensor signal voltage is less than 0.1 volts for 3 seconds. (DTC P0182)
- The ECM detects that the FT sensor signal voltage is more than 4.75 volts for 3 seconds. (DTC P0183)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM uses a FT substitution of default value.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- Before starting a cold engine, FT sensor and engine coolant temperature (ECT) sensor temperature should be relatively close to each other.
- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Use the Temperature vs. Resistance table to test the FT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.

DTC P0192 or P0193 (Flash Code 245)

Circuit Description

The fuel rail pressure (FRP) sensor is installed to the fuel rail and it detects the fuel pressure in the fuel rail, converts the pressure into a voltage signal, and sends the signal to the ECM. The sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- FRP sensor signal circuit

The ECM monitors the FRP sensor signal voltage. Higher fuel rail pressure provides higher signal voltage while lower pressure provides lower signal voltage. The ECM calculates actual fuel rail pressure (fuel pressure) from the voltage signal and uses the result in fuel injection control and other control tasks. If the ECM detects an excessively low or high signal voltage, DTC P0192 or P0193 will set.

Condition for Running the DTC

- DTCs P0652 and P0653 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the FRP sensor signal voltage is less than 0.4 volts. (DTC P0192)
- The ECM detects that the FRP sensor signal voltage is more than 4.75 volts. (DTC P0193)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM uses a FRP substitution of default value.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electromagnetic interference may affect intermittent condition.

Circuit/ System Testing DTC P0192

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0652 also set?	—	Go to DTC P0652	Go to Step 3
3	Observe the Fuel Rail Pressure (FRP) Sensor parameter with a scan tool. Is the FRP Sensor parameter less than the specified value?	0.4 volts	Go to Step 4	Go to Diagnostic Aids
4	1. Turn OFF the ignition. 2. Disconnect the FRP sensor harness connector. 3. Turn ON the ignition, with the engine OFF. Is the FRP Sensor parameter more than the specified value?	4.7 volts	Go to Step 5	Go to Step 6
5	Connect a DMM between the 5 volts reference circuit (pin 3 of E-48) and a known good ground. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 8	Go to Step 7

Step	Action	Value(s)	Yes	No
6	1. Test the signal circuits between the ECM (pins 48 and 68 of E-90) and the FRP sensor (pin 2 of E-48) for the following conditions: • A short to ground • A short to the low reference circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
7	1. Test the 5 volts reference circuit between the ECM (pin 47 of E-90) and the FRP sensor (pin 3 of E-48) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
8	1. Inspect for an intermittent and for a poor connection at the harness connector of the FRP sensor (pin 3 of E-48). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 47 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
10	Replace the FRP sensor. Refer to FRP Sensor Replacement. Did you complete the replacement?	—	Go to Step 12	—
11	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 12	—
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 13
13	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P0193

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0653 also set?	—	Go to DTC P0653	Go to Step 3
3	Observe the Fuel Rail Pressure (FRP) Sensor parameter with a scan tool. Is the FRP Sensor parameter more than the specified value?	4.7 volts	Go to Step 4	Go to Diagnostic Aids
4	1. Turn OFF the ignition. 2. Disconnect the FRP sensor harness connector. 3. Connect a DMM between the signal circuit (pin 2 of E-48) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	5.3 volts	Go to Step 10	Go to Step 5
5	1. Connect a test lamp between the signal circuit (pin 2 of E-48) and a known good ground. 2. Connect a DMM between the probe of the test lamp and a known good ground. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 9	Go to Step 6
6	Connect a 3-amp fused jumper wire between the signal circuit and the low reference circuit (pins 1 and 2 of E-48). Is the FRP Sensor parameter less than the specified value?	0.1 volts	Go to Step 11	Go to Step 7
7	1. Test the low reference circuit between the ECM (pin 69 of E-90) and the FRP sensor (pin 1 of E-48) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 8
8	1. Test the signal circuit between the ECM (pins 48 and 68 of E-90) and the FRP sensor (pin 2 of E-48) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 12
9	1. Test the signal circuits between the ECM (pins 48 and 68 of E-90) and the FRP sensor (pin 2 of E-48) for a short to any 5 volts reference circuit. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14

Step	Action	Value(s)	Yes	No
10	**Important:** The FRP sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuits between the ECM (pins 48 and 68 of E-90) and the FRP sensor (pin 2 of E-48) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
11	1. Inspect for an intermittent and for poor connections at the harness connector of the FRP sensor (pins 1 and 2 of E-48). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 13
12	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 48, 68 and 69 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
13	Replace the FRP sensor. Refer to FRP Sensor Replacement. Did you complete the replacement?	—	Go to Step 15	—
14	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 15	—
15	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 16
16	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0201, P0202, P0203 or P0204 (Flash Code 271, 272, 273 or 274)

Circuit Description

The ECM calculates the optimum fuel injection ON time using data sent from various engine sensors. The ECM supplies a high voltage along with grounding the fuel injector control circuit when it needs to energize the fuel injector (turn it ON). If the fuel injector charge voltage circuit or solenoid control circuit is open circuit, this DTC will set. DTC P0201 - P0204 will set depending upon which cylinder injector circuit failed.

Condition for Running the DTC

- DTCs P2146, P2147 and P2148 are not set. (DTC P0201 or P0204)
- DTCs P2149, P2150 and P2151 are not set. (DTC P0203 or P0204)
- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The engine is running.
- The engine speed is lower than 2000RPM.

Condition for Setting the DTC

- The ECM detects an open circuit on the fuel injector solenoid circuits.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- Each DTC agrees with engine cylinder order.
  - P0201: Cylinder #1
  - P0202: Cylinder #2
  - P0203: Cylinder #3
  - P0204: Cylinder #4

Schematic Reference: Engine Controls Schematics

Circuit/ System Testing DTC P0201

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the cylinder #1 fuel injector harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector (pins 1 and 2 of E-13). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 4
4	Measure the resistance of cylinder #1 fuel injector solenoid. Is the resistance less the specified value?	2.0 Ω	Go to Step 5	Go to Step 9

Step	Action	Value(s)	Yes	No
5	1. Disconnect the cylinder #4 fuel injector harness connector. 2. Measure the resistance of the charge voltage circuit between the cylinder #1 and #4 fuel injector (pin 2 of E-13 and pin 2 of E-16). Is the resistance less than the specified value?	1.0 Ω	Go to Step 6	Go to Step 7
6	1. Test the control circuit between the ECM (pin 33 of E-90) and the cylinder #1 fuel injector (pin 1 of E-13) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 8
7	1. Test the charge voltage circuit between the ECM (pin 52 of E-90) and the cylinder #1 fuel injector (pin 2 of E-13) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 8
8	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 33 and 52 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 10
9	**Important:** Replacement fuel injector must be programmed. Replace the cylinder #1 fuel injector. Refer to Fuel Injector Replacement/ Fuel Injector ID Code Data Programming. Did you complete the replacement?	—	Go to Step 11	—
10	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 11	—
11	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 12
12	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P0202

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the cylinder #2 fuel injector harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector (pins 1 and 2 of E-14). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 4
4	Measure the resistance of cylinder #2 fuel injector solenoid. Is the resistance less the specified value?	2.0 Ω	Go to Step 5	Go to Step 9
5	1. Disconnect the cylinder #3 fuel injector harness connector. 2. Measure the resistance of the charge voltage circuit between the cylinder #2 and #3 fuel injector (pin 2 of E-14 and pin 2 of E-15). Is the resistance less than the specified value?	1.0 Ω	Go to Step 6	Go to Step 7
6	1. Test the control circuit between the ECM (pin 24 of E-90) and the cylinder #2 fuel injector (pin 1 of E-14) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 8
7	1. Test the charge voltage circuit between the ECM (pin 71 of E-90) and the cylinder #2 fuel injector (pin 2 of E-14) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 8
8	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 24 and 71 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 10
9	**Important:** Replacement fuel injector must be programmed. Replace the cylinder #2 fuel injector. Refer to Fuel Injector Replacement/ Fuel Injector ID Code Data Programming. Did you complete the replacement?	—	Go to Step 11	—

Step	Action	Value(s)	Yes	No
10	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 11	—
11	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 12
12	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P0203

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the cylinder #3 fuel injector harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector (pins 1 and 2 of E-15). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 4
4	Measure the resistance of cylinder #3 fuel injector solenoid. Is the resistance less the specified value?	2.0 Ω	Go to Step 5	Go to Step 9
5	1. Disconnect the cylinder #2 fuel injector harness connector. 2. Measure the resistance of the charge voltage circuit between the cylinder #2 and #3 fuel injector (pin 2 of E-14 and pin 2 of E-15). Is the resistance less than the specified value?	1.0 Ω	Go to Step 6	Go to Step 7

Step	Action	Value(s)	Yes	No
6	1. Test the control circuit between the ECM (pin 25 of E-90) and the cylinder #3 fuel injector (pin 1 of E-15) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 8
7	1. Test the charge voltage circuit between the ECM (pin 51 of E-90) and the cylinder #3 fuel injector (pin 2 of E-15) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 8
8	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 25 and 51 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 10
9	**Important:** Replacement fuel injector must be programmed. Replace the cylinder #3 fuel injector. Refer to Fuel Injector Replacement/ Fuel Injector ID Code Data Programming. Did you complete the replacement?	—	Go to Step 11	—
10	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 11	—
11	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 12
12	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P0204

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls

DTC P0217 (Flash Code 542)

Circuit Description

The engine coolant temperature (ECT) sensor is installed to the thermostat housing. The ECT sensor is a variable resistor and it measures the temperature of the engine coolant. If the ECM detects an excessive high coolant temperature, this DTC will set.

Condition for Running the DTC

- DTCs P0116, P0117 and P0118 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

- The ECM detects that the engine coolant temperature is more than 110°C (230°F) for 5 seconds.

Action Taken When the DTC Sets

- The ECM will not illuminate the MIL or SVS lamp. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type D.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the DTC - Type D.

Diagnostic Aids

- After starting the engine, the ECT should rise steadily to about 80 to 85°C (176 to 185°F) then stabilize when the thermostat opens.
- Use the Temperature vs. Resistance table to test the ECT sensor at various temperature levels to evaluate the possibility of a skewed sensor. A skewed sensor could result in poor driveability concerns.
- The Total Engine Coolant Overtemperature Events parameter on scan tool indicates number of overheat events.

Notice:

- This DTC is caused by an engine overheat condition (e.g. low engine coolant level). Since this DTC does not illuminate any lamps, clear the DTC and ensure there are no signs of engine damage. Excessive engine overheat may damage internal engine components.

Circuit/ System Testing DTC P0217

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0117 also set?	—	Go to DTC P0117	Go to Step 3
3	1. Test the engine cooling system for the following condition. Refer to diagnosis of the engine cooling system section for testing. • Engine coolant level • Engine coolant leakage • Cooling fan belt slippage • Cooling fan clutch working • Thermostat working • Water pump working • Radiator clogging 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 4
4	Start the engine and wait until engine is fully warm upped while observing the Coolant Temperature parameter with a scan tool. Does the scan tool indicate more than the specified value?	110°C (230°F)	Go to Step 6	Go to Step 5

Step	Action	Value(s)	Yes	No
5	Ask the driver if overheat is caused by low engine coolant level, etc. If engine overheat has experienced, the engine must be inspected and repaired as necessary. Did you complete the action?	—	Go to Step 7	—
6	1. Test the engine coolant temperature (ECT) sensor at various temperature levels to evaluate the possibility of a skewed sensor. 2. Replace the ECT sensor as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Diagnostic Aids
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and wait until engine is fully warm upped while observing the Coolant Temperature parameter with a scan tool. Does the scan tool indicate more than the specified value?	110°C (230°F)	Go to Step 2	Go to Step 8
8	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0219 (Flash Code 543)

Circuit Description

The crankshaft position (CKP) sensor is located on the left-hand of the cylinder block rear and it is behind the starter motor. The ECM calculates the engine speed and exact position of the crankshaft based on the signal pulse from the CKP sensor. If the ECM detects an engine overrun condition, this DTC will set.

Condition for Setting the DTC

- The ECM detects that the engine speed is more than 4900 RPM (4JK1 standard output) or 4700 RPM (4JK1 high output and 4JJ1).

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.
- The ECM stops engine running when the vehicle speed is lower than 5 km/h (3 MPH) for 5 seconds. The engine will run after the key is cycled when the ignition has been tuned OFF for longer than 10 seconds.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- Make sure the CKP sensor is tight and the teeth are not damaged.
- Electromagnetic interference in the CKP sensor circuits may set this DTC.
- The Total Engine Overspeed Events parameter on scan tool indicates number of overrun events.

Notice:

- This DTC is caused by an engine overspeed condition, which was most likely caused by driver error (i.e. downshifting a manual transmission on a steep grade). Excessive engine overspeed may damage internal engine components.

Circuit/ System Testing DTC P0219

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	**Important:** If DTC P0335 or P0336 is set, diagnose that DTC first. 1. Install a scan tool. 2. Start the engine. 3. Observe the Engine Speed parameter with a scan tool. 4. Accelerate the engine as necessary. Does the Engine Speed parameter ever exceed the specified value?	5000 RPM	Go to Step 4	Go to Step 3
3	Ask the driver if overrun is caused by gear slip-out, shift error, down-slope driving, etc. If engine overrun has experienced, the engine must be inspected and repaired as necessary. Did you complete the action?	—	Go to Step 6	—

Step	Action	Value(s)	Yes	No
4	1. Inspect the CKP sensor and sensor rotor for the following conditions: • Physical damage of sensor • Loose or improper installation of sensor • Excessive air gap • Foreign material passing between sensor and sensor rotor • Physical damage of sensor rotor • Loose or improper installation of sensor rotor 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Step 5
5	Replace the CKP sensor. Refer to CKP Sensor Replacement. Did you complete the replacement?	—	Go to Step 5	—
6	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the Engine Speed parameter with a scan tool. Does the Engine Speed parameter ever exceed the specified value?	5000 RPM	Go to Step 4	Go to Step 7
7	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0231 or P0232 (Flash Code 69)

Circuit Description

The ECM controls the fuel pump relay which supplies power to the fuel pump in the fuel tank. The ECM commands the fuel pump relay ON for a certain length of time at ignition switch is ON with the engine OFF. During the engine running it is continuously commanded ON. If the ECM detects an improper voltage level on the relay control circuit, DTC P0231 or P0232 will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects a low voltage condition on the fuel pump relay control circuit for longer than 3 second when the relay is commanded OFF. (DTC P0231)
- The ECM detects a high voltage condition on the fuel pump relay control circuit for longer than 3 second when the relay is commanded ON. (DTC P0232)

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- The fuel pump relay is commanded ON for 12 seconds at ignition switch is ON with the engine OFF.

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing DTC P0231

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition for 20 seconds while observing the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Replace the fuel pump relay with the head light relay or replace with a known good relay. 3. Turn ON the ignition for 20 seconds while observing the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 4	Go to Step 7

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Remove the fuel pump relay. 3. Probe the ignition voltage feed circuit of the relay coil side (pin 3 of X-13) with a test lamp that is connected a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 5	Go to Step 6
5	1. Test the control circuit between the ECM (pin 54 of C-58) and the relay (pin 5 of X-13) for the following conditions: • An open circuit • A short to ground • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 8
6	Repair the open circuit or high resistance between the ECM main relay (pin 1 of X-12) and the fuel pump relay (pin 3 of X-13). Did you complete the repair?	—	Go to Step 11	—
7	1. Remove the fuel pump relay. 2. Inspect for an intermittent and for a poor connection on each relay terminal. 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 9
8	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 54 of C-58). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 10
9	Replace the fuel pump relay. Did you complete the replacement?	—	Go to Step 11	—
10	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 11	—
11	1. Reconnect all previously disconnected fuse, relay or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition for 20 seconds while observing the DTC Information with a scan tool. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 12
12	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Replace the fuel pump relay with the head light relay or replace with a known good relay. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail?	—	Go to Step 4	Go to Step 5
4	1. Test the control circuit between the ECM (pin 54 of C-58) and the relay (pin 5 of X-13) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
5	Replace the fuel pump relay. Did you complete the replacement?	—	Go to Step 7	—
6	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected relay or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 8
8	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0234 (Flash Code 42)

Circuit Description

The boost pressure sensor is located in the air induction tubing. The sensor is a transducer that varies voltage according to changes in the air pressure inside the air tubing. The ECM monitors the boost pressure sensor signal for abnormal values. If the ECM detects that the sensor signal is excessively high, this DTC will set. This indicates excessive high boost pressure.

Condition for Running the DTC

- DTCs P0045, P0107 and P0108 are not set.
- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

- The ECM detects that the actual boost pressure is more than 20 kPa (3 psi) over the desired boost pressure under certain conditions for longer than 10 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Diagnostic Aids

- An open circuit or high resistance in the boost pressure low reference circuit may set this DTC.
- Misrouted vacuum hoses may set this DTC.
- Check the turbocharger nozzle control actuator for a sticking. Refer to Turbocharger in the Engine Mechanical section.
- Use a scan tool to verify the integrity of the boost pressure sensor signal. Compare the Boost Pressure to the Desired Boost Pressure under all load conditions for an excessively high value.
- The fuel with which gasoline was mixed may set this DTC.

Test Description

The numbers below refer to the step number on the Circuit/ System Testing.

3. A skewed boost pressure sensor value (shifted to a higher pressure) can set this DTC. The Boost Pressure on the scan tool should read near Barometric Pressure (BARO) with the key ON and engine OFF.

4. A skewed BARO sensor value (shifted to a lower pressure) may indicate a wrong boost pressure. The BARO on the scan tool should read near surrounding barometric pressure.

RTW72AXF001401

Step	Action	Value(s)	Yes	No
4	Compare the BARO value to the range specified in the altitude vs. barometric pressure table. Refer to Altitude vs Barometric Pressure. Is the BARO parameter within the range specified?	—	Go to Step 6	Go to Step 7
5	1. Inspect the following for possible causes of high boost pressure. • Misrouted turbocharger nozzle control actuator vacuum hoses • Turbocharger nozzle control actuator or solenoid valve for a stuck condition. Refer to Turbocharger Control System Check in this section. • Intake throttle valve sticking. Perform the Intake Throttle Solenoid Control with a scan tool • Oil in the air induction tubing causing an incorrect boost pressure sensor signal. When there is adhesion of oil inside of the tubing, intercooler or turbocharger it needs to be wiped off. 2. Repair or replace as necessary. Did you find and correction the condition?	—	Go to Step 10	Go to Diagnostic Aids
6	1. Turn OFF the ignition. 2. Disconnect the boost pressure sensor harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the boost pressure sensor (pin 2 of E-107). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for a poor connection and corrosion at the harness connector of the ECM (pin 23 of E-90). 6. Test for high resistance of the low reference circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
7	1. Turn OFF the ignition. 2. Disconnect the BARO sensor harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the BARO sensor (pins 2 and 3 of E-40). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 18 and 19 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 9

Step	Action	Value(s)	Yes	No
8	Replace the boost pressure sensor. Refer to Boost Pressure Sensor Replacement. Did you complete the replacement?	—	Go to Step 10	—
9	Replace the BARO sensor. Refer to BARO Sensor Replacement. Did you complete the replacement?	—	Go to Step 10	—
10	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Drive the vehicle that the Calculated Engine Load parameter reaches at least 50% for longer than 10 seconds (such as acceleration on ramp) while comparing the Boost Pressure to the Desired Boost Pressure. Does the Boost Pressure parameter follow within the specified value?	±20 kPa (±3 psi)	Go to Step 11	Go to Step 2
11	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0299 (Flash Code 65)

Circuit Description

The boost pressure sensor is located in the air induction tubing. The sensor is a transducer that varies voltage according to changes in the air pressure inside the air tubing. The ECM monitors the boost pressure sensor signal for abnormal values. If the ECM detects that the sensor signal is excessively low, this DTC will set. This indicates excessive low boost pressure.

Condition for Running the DTC

- DTCs P0045, P0087, P0088, P0089, P0091, P0092, P0093, P0101, P0102, P0103, P0107, P0108, P0116, P0117, P0118, P0122, P0123, P0192, P0193, P0401, P0403, P0404, P0405, P0406, P0638, P0652, P0653, P0698, P0699, P1064, P1065, P1093, P1404, P2100, P2101, P2103, P2227, P2228 and P2229 are not set.
- The ignition switch is ON.
- The engine is running.
- The fuel injection quantity is higher than a predetermined value.

Condition for Setting the DTC

- The ECM detects that the actual boost pressure is more than 40 kPa (6 psi) below the desired boost pressure under certain conditions for longer than 10 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- Induction air leakage can cause a low boost pressure condition. A whistling noise may be heard if a component is allowing air to enter the induction system.
- Check for cracked air tubing that may only open during certain engine movement conditions.
- Misrouted vacuum hoses may set this DTC.
- Check the turbocharger nozzle control actuator for a sticking. Refer to Turbocharger in the Engine Mechanical section.
- Use a scan tool to verify the integrity of the boost pressure sensor signal. Compare the Boost Pressure to the Desired Boost Pressure under all load conditions for an excessively low value.
- Loss of vacuum pressure or vacuum pump problem sets this DTC.

Test Description

The numbers below refer to the step number on the diagnostic table.
4. A skewed boost pressure sensor value (shifted to a lower pressure) can set this DTC. The Boost Pressure on the scan tool should read near Barometric Pressure (BARO) with the key ON and engine OFF.
5. A skewed BARO sensor value (shifted to a higher pressure) may indicate a wrong boost pressure. The BARO on the scan tool should read near surrounding barometric pressure.

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition. 2. Disconnect the boost pressure sensor harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the boost pressure sensor (pins 1 and 3 of E-107). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 20 and 21 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 8
7	1. Turn OFF the ignition. 2. Disconnect the BARO sensor harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the BARO sensor (pin 1 of E-40). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for a poor connection and corrosion at the harness connector of the ECM (pin 17 of E-90). 6. Test for high resistance of the low reference circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 10	Go to Step 9
8	Replace the boost pressure sensor. Refer to Boost Pressure Sensor Replacement. Did you complete the replacement?	—	Go to Step 10	—
9	Replace the BARO sensor. Refer to BARO Sensor Replacement. Did you complete the replacement?	—	Go to Step 10	—
10	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Drive the vehicle that the engine speed is more than 2000 RPM and the Calculated Engine Load parameter reaches at least 50% for longer than 10 seconds (such as acceleration on ramp) while comparing the Boost Pressure to the Desired Boost Pressure. Does the Boost Pressure parameter follow within the specified value?	±20 kPa (±3 psi)	Go to Step 11	Go to Step 2
11	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0335 (Flash Code 15)

Circuit Description

The crankshaft position (CKP) sensor is located on the left-hand of the cylinder block rear and it is behind the starter motor. The sensor rotor is fixed on the crankshaft. There are 56 notches spaced 6° apart and a 30° section that is open span. This open span portion allows for the detection of top dead center (TDC). The CKP sensor is a magnetic resistance element (MRE) type sensor, which generates a square wave signal pulse. The sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- CKP sensor signal circuit

The ECM monitors both CKP sensor and camshaft position (CMP) sensor signal pulses to ensure they correlate with each other. If the ECM receives a certain amount of CMP sensor signal pulses without a CKP sensor signal pulse, this DTC will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The CMP sensor signal pulse is detected.

Condition for Setting the DTC

- The ECM detects that the CKP sensor signal pulses are not generated during engine rotations.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electromagnetic interference in the CKP sensor circuits may set this DTC.
- An intermittent CKP sensor signal pulse may set this DTC.
- Ensure the sensor is tight and the sensor rotor teeth are not damaged.

Notice:

- If the CKP sensor signal pulse is lost while running, the engine will stop.

Circuit/ System Testing DTC P0335

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine (Note a slight start delay may be noticed). 4. Monitor the DTC Information with a scan tool. Is DTC P0340, P0341, P0698 or P0699 also set?	—	Go to Applicable DTC	Go to Step 3
3	Observe the Cam/ Crank Sensor Signal Synchronization Status parameter with a scan tool. Does the scan tool indicate Synchronous?	—	Go to Diagnostic Aids	Go to Step 4
4	1. Turn OFF the ignition. 2. Disconnect the crankshaft position (CKP) sensor harness connector. 3. Connect a DMM between the 5 volts reference circuit (pin 3 of E-52) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 5	Go to Step 9

Step	Action	Value(s)	Yes	No
5	Connect a DMM between the signal circuit (pin 1 of E-52) and a known good ground. Is the DMM voltage more than the specified value?	5.3 volts	Go to Step 12	Go to Step 6
6	Is the DMM voltage more than the specified value at Step 5?	4.7 volts	Go to Step 7	Go to Step 11
7	1. Connect a test lamp between the signal circuit (pin 1 of E-52) and a known good ground. 2. Connect a DMM between the probe of the test lamp and a known good ground. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 13	Go to Step 8
8	Connect a DMM between the 5 volts reference circuit and low reference circuit (pins 2 and 3 of E-52). Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 14	Go to Step 10
9	1. Test the 5 volts reference circuit between the ECM (pin 37 of E-90) and the CKP sensor (pin 3 of E-52) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 15
10	1. Test the low reference circuit between the ECM (pin 39 of E-90) and the CKP sensor (pin 2 of E-52) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 15
11	1. Test the signal circuit between the ECM (pin 58 of E-90) and the CKP sensor (pin 1 of E-52) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 15
12	**Important:** The CKP sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the ECM (pin 58 of E-90) and the CKP sensor (pin 1 of E-52) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
13	1. Test the signal circuit between the ECM (pin 58 of E-90) and the CKP sensor (pin 1 of E-52) for a short to any 5 volts reference. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18

Step	Action	Value(s)	Yes	No
14	1. Inspect for an intermittent and for poor connections at the harness connector of the CKP sensor (pins 1, 2 and 3 of E-52). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 16
15	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 37, 38, 39 and 58 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
16	1. Inspect the CKP sensor and sensor rotor for the following conditions: • Physical damage of sensor • Loose or improper installation of sensor • Excessive air gap • Foreign material passing between sensor and sensor rotor • Physical damage of sensor rotor • Loose or improper installation of sensor rotor 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 17
17	Replace the CKP sensor. Refer to CKP Sensor Replacement. Did you complete the replacement?	—	Go to Step 19	—
18	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 19	—
19	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 20
20	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0336 (Flash Code 15)

Circuit Description

The crankshaft position (CKP) sensor is located on the left-hand of the cylinder block rear and it is behind the starter motor. The sensor rotor is fixed on the crankshaft. There are 56 notches spaced 6° apart and a 30° section that is open span. This open span portion allows for the detection of top dead center (TDC). The ECM monitors both CKP sensor and camshaft position (CMP) sensor signal pulses to ensure they correlate with each other. If the ECM receives extra or missing CKP sensor signal pulse, this DTC will set.

Condition for Running the DTC

- DTC P0335 is not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The CKP sensor signal pulse is detected.

Condition for Setting the DTC

- The ECM detects extra or missing CKP sensor signal pulses during engine rotations.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electromagnetic interference in the CKP sensor circuits may set this DTC.
- An intermittent CKP sensor signal pulse may set this DTC.
- Ensure the sensor is tight and the sensor rotor teeth are not damaged.

RTW72AXF001901

BACK TO CHAPTER INDEX
ISUZU KB P190 2007
TO MODEL INDEX

DTC P0340 (Flash Code 14)

Circuit Description

The camshaft position (CMP) sensor is installed on the timing chain sprocket cover at the front of the camshaft idle gear. The CMP sensor detects total of five projections per one engine cycle (four projections arranged equally every 90° and one reference projection on the timing chain sprocket surface). The CMP sensor is a magnetic resistance element (MRE) type sensor, which generates a square wave signal pulse. The sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- CMP sensor signal circuit

The ECM monitors both crankshaft position (CKP) sensor and CMP sensor signal pulses to ensure they correlate with each other. If the ECM receives a certain amount of CKP sensor signal pulses without a CMP sensor signal pulse, this DTC will set.

Condition for Running the DTC

- DTCs P0016 and P0341are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The CKP sensor signal pulse is detected.

Condition for Setting the DTC

- The ECM detects that the CMP sensor signal pulses are not generated during engine rotations.

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electromagnetic interference in the CMP sensor circuits may set this DTC.
- An intermittent CMP sensor signal pulse may set this DTC.
- Ensure the sensor is tight and the timing chain sprocket is not damaged.

Notice:

- If the CMP sensor signal pulse is lost while running, the engine will operate normally. If the CMP sensor signal pulse is not present on start-up, the engine will not start.

Circuit/ System Testing DTC P0340

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. If the engine does not start, crank over the engine for 10 seconds. 4. Monitor the DTC Information with a scan tool. Is DTC P0652 or P0653 also set?	—	Go to Applicable DTC	Go to Step 3
3	Start the engine. If the engine does not start, crank over the engine for 10 seconds while observing the Cam/ Crank Sensor Signal Synchronization Status parameter with a scan tool. Does the scan tool indicate Synchronous?	—	Go to Diagnostic Aids	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Disconnect the camshaft position (CMP) sensor harness connector. 3. Connect a DMM between the 5 volts reference circuit (pin 3 of E-39) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 5	Go to Step 9
5	Connect a DMM between the signal circuit (pin 1 of E-39) and a known good ground. Is the DMM voltage more than the specified value?	5.3 volts	Go to Step 12	Go to Step 6
6	Is the DMM voltage more than the specified value at Step 5?	4.7 volts	Go to Step 7	Go to Step 11
7	1. Connect a test lamp between the signal circuit (pin 1 of E-39) and a known good ground. 2. Connect a DMM between the probe of the test lamp and a known good ground. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 13	Go to Step 8
8	Connect a DMM between the 5 volts reference circuit and low reference circuit (pins 2 and 3 of E-39). Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 14	Go to Step 10
9	1. Test the 5 volts reference circuit between the ECM (pin 46 of E-90) and the CMP sensor (pin 3 of E-39) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 15
10	1. Test the low reference circuit between the ECM (pin 44 of E-90) and the CMP sensor (pin 2 of E-39) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 15
11	1. Test the signal circuit between the ECM (pin 45 of E-90) and the CKP sensor (pin 1 of E-39) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 15
12	**Important:** The CMP sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the ECM (pin 45 of E-90) and the CMP sensor (pin 1 of E-39) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18

Step	Action	Value(s)	Yes	No
13	1. Test the signal circuit between the ECM (pin 45 of E-90) and the CMP sensor (pin 1 of E-39) for a short to any 5 volts reference. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
14	1. Inspect for an intermittent and for poor connections at the harness connector of the CMP sensor (pins 1, 2 and 3 of E-39). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 16
15	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 44, 45, 46 and 64 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 18
16	1. Inspect the CMP sensor and chain sprocket for the following conditions: • Physical damage of sensor • Loose or improper installation of sensor • Excessive air gap • Foreign material passing between sensor and chain sprocket • Physical damage of chain sprocket • Loose or improper installation of chain sprocket 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 17
17	Replace the CMP sensor. Refer to CMP Sensor Replacement. Did you complete the replacement?	—	Go to Step 19	—
18	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 19	—
19	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 20
20	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0341 (Flash Code 14)

Circuit Description

The camshaft position (CMP) sensor is installed on the timing chain sprocket cover at the front of the camshaft idle gear. The CMP sensor detects total of five projections per one engine cycle (four projections arranged equally every 90° and one reference projection on the timing chain sprocket surface). The ECM monitors both crankshaft position (CKP) sensor and CMP sensor signal pulses to ensure they correlate with each other. If the ECM receives extra or missing CMP sensor signal pulse, this DTC will set.

Condition for Running the DTC

- DTCs P0016 and P0340 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The CMP sensor signal pulse is detected.

Condition for Setting the DTC

- The ECM detects extra or missing CMP sensor signal pulses during engine rotations.

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electromagnetic interference in the CMP sensor circuits may set this DTC.
- An intermittent CMP sensor signal pulse may set this DTC.
- Ensure the sensor is tight and the timing chain sprocket is not damaged.

Circuit/ System Testing DTC P0341

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. If the engine does not start, crank over the engine for 10 seconds. 4. Monitor the DTC Information with a scan tool. Is DTC P0340, P0652 or P0653 also set?	—	Go to Applicable DTC	Go to Step 3
3	1. Inspect all of the circuits going to the camshaft position (CMP) sensor for the following conditions: • Routed too closely to fuel injection wiring or components • Routed too closely to after-market add-on electrical equipment • Routed too closely to solenoids and relays 2. If you find incorrect routing, correct the harness routing. Did you find and correct the condition?	—	Go to Step 7	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Disconnect the CMP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the CMP sensor (pins 1, 2 and 3 of E-39). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 44, 45, 46 and 64 of E-90). 6. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 5
5	1. Inspect the CMP sensor and chain sprocket for the following conditions: • Physical damage of sensor • Loose or improper installation of sensor • Excessive air gap • Foreign material passing between sensor and chain sprocket • Physical damage of chain sprocket • Loose or improper installation of chain sprocket 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
6	Replace the CMP sensor. Refer to CMP Sensor Replacement. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 8
8	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0380 (Flash Code 66)

Circuit Description

The ECM controls the glow relay which supplies power to the glow plugs based on engine coolant temperature. In the after glow phase, the glow indicator light is not illuminated but glow plugs remain active for a certain period. If the ECM detects an open circuit or short circuit on the relay control circuit, this DTC will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects a low voltage condition on the glow relay control circuit for longer than 3 second when the relay is commanded OFF.
- The ECM detects a high voltage condition on the glow relay control circuit for longer than 3 second when the relay is commanded ON.

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Test Description

The numbers below refers to the step number on the Circuit/ System Testing.
2. Listen for an audible click when the glow relay operates. Command both the ON and OFF states.

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing DTC P0380

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Perform the Glow Relay Control with a scan tool. 3. Command the relay ON and OFF. Does the glow relay click with each command?	—	Go to Step 3	Go to Step 4
3	1. Turn OFF the ignition for 30 seconds. 2. Disconnect the engine coolant temperature (ECT) sensor harness connector in order to gain glow ON time long enough. 3. Turn ON the ignition for 30 seconds while observing the DTC Information with a scan tool. Does the DTC P0380 fail this ignition?	—	Go to Step 11	Go to Diagnostic Aids

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Replace the glow relay with the starter relay or replace with a known good relay. 3. Perform the Glow Relay Control with a scan tool. 4. Command the relay ON and OFF. Does the glow relay click with each command?	—	Go to Step 8	Go to Step 5
5	1. Turn OFF the ignition. 2. Remove the glow relay. 3. Turn ON the ignition, with the engine OFF. 4. Probe the ignition voltage feed circuit of the relay coil side (pin 2 of X-5) with a test lamp that is connected to a known good ground. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 7
6	1. Test the control circuit between the ECM (pin 37 of C-58) and the relay (pin 3 of X-5) for the following conditions: • An open circuit • A short to ground • A short to battery or ignition voltage 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
7	Repair the open circuit or high resistance between the Engine (10A) fuse and the glow relay coil side (pin 2 of X-5). Check the Engine (10A) fuse first. Did you complete the repair?	—	Go to Step 12	—
8	1. Remove the glow relay. 2. Inspect for an intermittent and for a poor connection on each relay terminal. 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 37 of C-58). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
10	Replace the glow relay. Did you complete the replacement?	—	Go to Step 12	—
11	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 12	—

Step	Action	Value(s)	Yes	No
12	1. Reconnect all previously disconnected fuse, relay or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Disconnect the ECT sensor harness connector in order to gain glow ON time long enough. 5. Turn ON the ignition for 30 seconds while observing the DTC Information with a scan tool. Did the DTC P0380 fail this ignition?	—	Go to Step 2	Go to Step 13
13	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0401 (Flash Code 93)

Circuit Description

The ECM controls the EGR valve opening based on the engine running condition and by controlling the EGR solenoid. The EGR valve position is detected by the position sensor, and relayed to the ECM. When the proper enabling conditions are met, the ECM will open the EGR valve while monitoring the mass air flow (MAF) signal. An expected MAF difference should be detected between the closed and open positions. If the ECM detects the MAF difference less than expected, this DTC will set. This DTC will only run once per ignition cycle within the enabling conditions.

Condition for Running the DTC

- DTCs P0101, P0102, P0103, P0112, P0113, P0116, P0117, P0118, P0122, P0123, P0403, P0404, P0405, P0406, P0500, P0501, P0652, P0653, P0698, P0699, P2100, P2101, P2102, P2103, P2227, P2228 and P2229 are not set.
- The battery voltage is between 10 to 16 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the MAF amount is not within the calculated range during the EGR flow test. This indicates insufficient amount of EGR flow.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- A sticking or intermittently sticking the EGR valve may set this DTC.

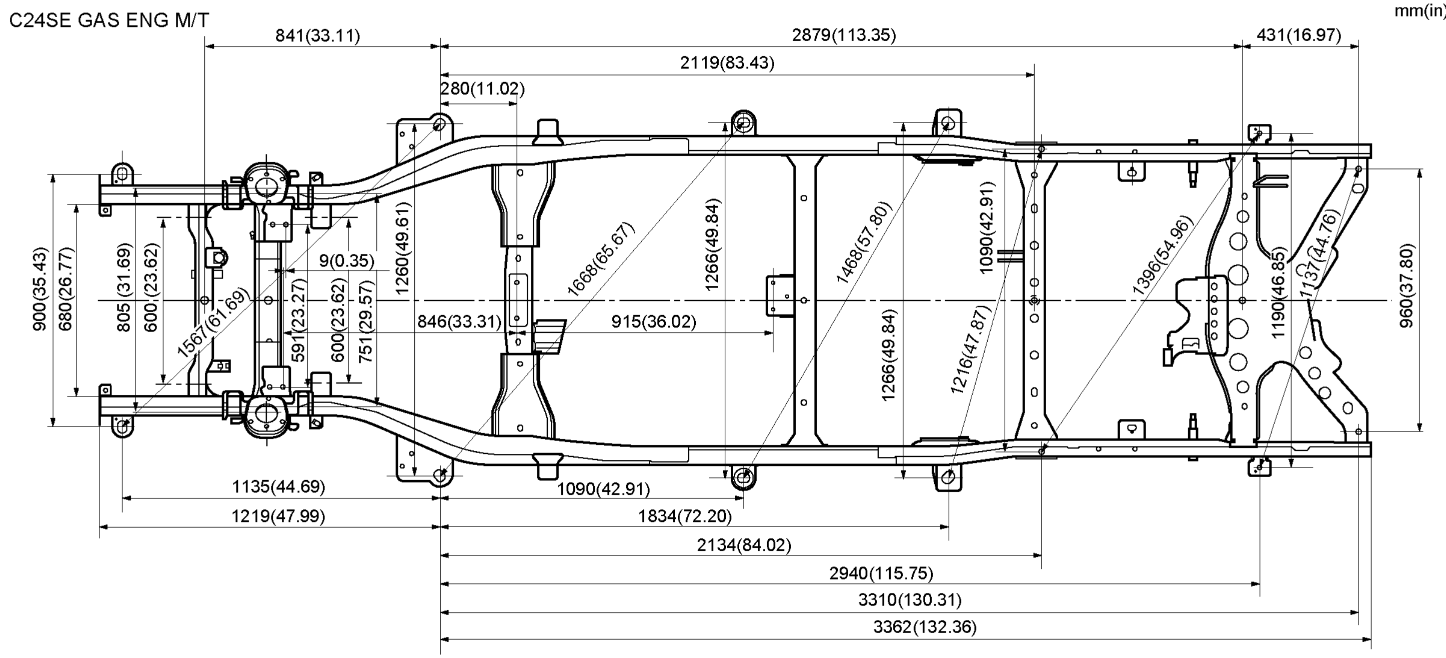
Circuit/ System Testing DTC P0401

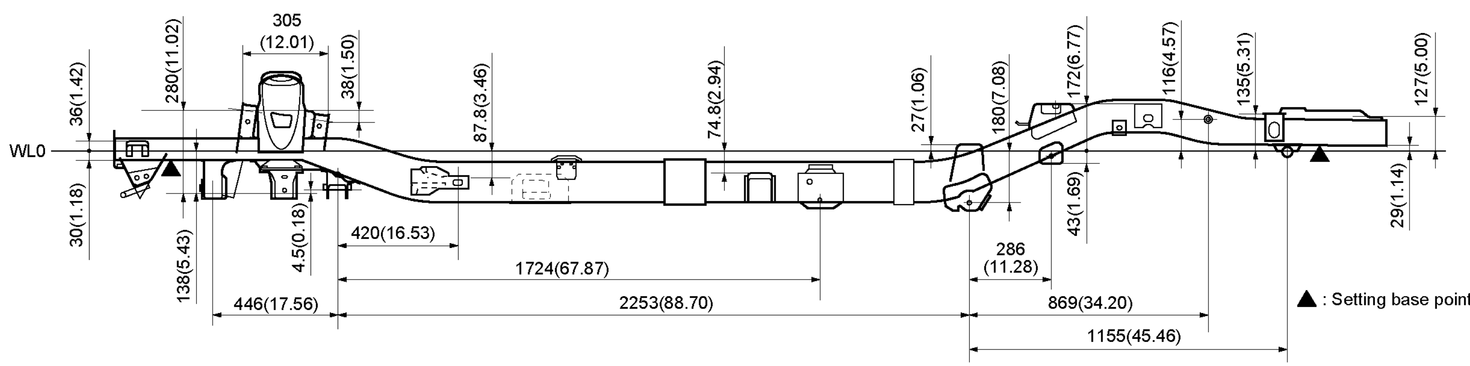
Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and warm up as necessary (allow engine coolant temperature to reach at least 60°C [140°F]). 4. Perform the EGR Solenoid Control with a scan tool. 5. Command the Desired EGR Position Increase or Decrease while observing the Mass Air Flow (MAF) Sensor parameter with a scan tool. Does the MAF Sensor parameter decrease by at least 0.5 volts when the Desired EGR Position is commanded from 0 to 90%?	—	Go to Diagnostic Aids	Go to Step 3

Step	Action	Value(s)	Yes	No
3	1. Inspect the following conditions: • An EGR valve gasket that is missing or damaged • A sticking EGR valve • EGR gas leakage from any of the EGR passages between the exhaust manifold and intake manifold • Restricted or collapsed EGR passage between the exhaust manifold and the EGR valve • Any type of restriction in the exhaust system • Restricted air cleaner element, restricted or collapsed air tubing between the air cleaner and the intake manifold • Any air induction leak • Any water intrusion in the induction system • Any contamination or objects that block the MAF sensor inlet • Skewed or slow MAF sensor • A ventilation duct that is connected to the exhaust tail pipe. Retest without the duct if connected. 2. Repair or replace as necessary Did you find and correct the condition?	—	Go to Step 5	Go to Step 4
4	Replace the EGR valve. Refer to EGR Valve Replacement. Did you complete the replacement?	—	Go to Step 5	—
5	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and warm up as necessary (allow engine coolant temperature to reach at least 60°C [140°F]). 5. Perform the EGR Solenoid Control with a scan tool. 6. Command the Desired EGR Position Increase or Decrease while observing the MAF Sensor parameter with a scan tool. Does the MAF parameter decrease by at least 0.5 volts when the Desired EGR Position is commanded from 0 to 90%?	—	Go to Step 6	Go to Step 3
6	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

4×2, LWB, CREW CAB MODEL

This illustration is based on the RHD model.





RTW72AXF001501

DTC P0403 (Flash Code 37)

Circuit Description

The ECM controls the EGR valve opening based on the engine running condition and by controlling the EGR solenoid. The EGR valve position is detected by the position sensor, and relayed to the ECM. If the ECM detects an open circuit or short circuit on the solenoid circuits, this DTC will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects an open circuit on the EGR solenoid circuits.
- The ECM detects a short to ground on the EGR solenoid circuits.
- The ECM detects a short to voltage circuit on the EGR solenoid circuits.

Action Taken When the DTC Sets

- The ECM illuminates the MIL on the second consecutive driving cycle when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type B. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM inhibits EGR control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type B (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Circuit/ System Testing DTC P0403

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the EGR valve harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Connect a DMM between the drive voltage circuit (pin 4 of E-71) and a known good ground. 5. Connect a DMM between the low side circuit (pin 6 of E-71) and a known good ground. Are both voltage readings within the specified value?	1.4 - 1.8 volts	Go to Step 5	Go to Step 4
4	Is the DMM voltage more than the specified value at Step 3?	—	Go to Step 7	Go to Step 6

Step	Action	Value(s)	Yes	No
5	1. Test the circuits between the ECM (pins 62 and 63 of E-90) and the EGR valve (pins 4 and 6 of E-71) for a short circuit each other. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 8
6	1. Test the circuits (which ever voltage reading did not read within the specified value at Step 3) between the ECM (pins 62 and 63 of E-90) and the EGR valve (pins 4 and 6 of E-71) for the following conditions: • An open circuit • A short to ground • A short to the position sensor low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
7	1. Test the circuits (which ever voltage reading did not read within the specified value at Step 3) between the ECM (pins 62 and 63 of E-90) and the EGR valve (pins 4 and 6 of E-71) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
8	1. Inspect for an intermittent and for poor connections at the harness connector of the EGR valve (pins 4 and 6 of E-71). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 62 and 63 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
10	Replace the EGR valve. Refer to EGR Valve Replacement. Did you complete the replacement?	—	Go to Step 10	—
11	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 12	—

Step	Action	Value(s)	Yes	No
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 13
13	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0404 (Flash Code 45)

Circuit Description

The ECM controls the EGR valve opening based on the engine running condition and by controlling the EGR solenoid. The EGR valve position is detected by the position sensor, and relayed to the ECM. If the ECM detects a variance between the actual EGR valve position and desired EGR valve position for a calibrated amount of time while the EGR valve is commanded ON, this DTC will set.

Condition for Running the DTC

- DTCs P0112, P0113, P0116, P0117, P0118, P0405, P0406, P0652, P0653, P2227, P2228 and P2229 are not set.
- The battery voltage is between 10 to 16 volts.
- The ignition switch is ON.
- The engine coolant temperature is between 20 to 110 °C (68 to 230 °F).
- The intake air temperature is between 0 to 110 °C (32 to 230°F).
- The barometric pressure is between 60 to 120 kPa (8.7 to 17.4 psi).
- The EGR control is commanded ON.

Condition for Setting the DTC

- The ECM detects that the actual EGR position is more than 10% below the desired position for 4 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits EGR control.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- A sticking or intermittently sticking EGR valve may set this DTC.

Circuit/ System Testing DTC P0404

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0403, P0405 or P0406 also set?	—	Go to Applicable DTC	Go to Step 3
3	1. Perform the EGR Solenoid Control with a scan tool several times. 2. Command the Desired EGR Position Increase and Decrease while observing the EGR Position. Does the EGR Position parameter follow within the specified value quick enough (compare with a similar unit if available)?	± 5%	Go to Diagnostic Aids	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Remove the EGR valve assembly from the engine. 2. Inspect the EGR valve for the following conditions: • Restricted EGR valve by foreign materials • Excessive deposits at valve • Bent valve shaft 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the EGR valve harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the EGR valve (pins 1, 2, 3, 4 and 6 of E-71). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 30, 31, 32, 62 and 63 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
6	Replace the EGR valve. Refer to EGR Valve Replacement. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 8
8	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0405 or P0406 (Flash Code 44)

Circuit Description

The exhaust gas recirculation (EGR) position sensor is installed on the EGR valve body together with the control solenoid. The EGR position sensor changes output voltage according to EGR valve position. The sensor has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- EGR position sensor signal circuit

The EGR position sensor provides a signal to the ECM on the signal circuit, which is relative to the position changes of the EGR valve. If the ECM detects an excessively low or high signal voltage, DTC P0405 or P0406 will set.

Condition for Running the DTC

- DTCs P0652 and P0653 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the EGR position sensor signal voltage is less than 0.2 volts for 3 seconds. (DTC P0405)
- The ECM detects that the EGR position sensor signal voltage is more than 4.6 volts for 3 seconds. (DTC P0406)

Action Taken When the DTC Sets

- The ECM illuminates the MIL on the second consecutive driving cycle when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type B. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM inhibits EGR control.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type B. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Circuit/ System Testing DTC P0405

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0652 also set?	—	Go to DTC P0652	Go to Step 3
3	Observe the EGR Position Sensor parameter with a scan tool. Is EGR Position Sensor parameter less than the specified value?	0.2 volts	Go to Step 4	Go to Diagnostic Aids
4	1. Turn OFF the ignition. 2. Disconnect the EGR valve harness connector. 3. Connect a DMM between the 5 volts reference circuit (pin 1 of E-71) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 5	Go to Step 6

Step	Action	Value(s)	Yes	No
5	Connect a 3-amp fused jumper wire between the 5 volts reference circuit and the signal circuit (pins 1 and 3 of E-71). Is the EGR Position Sensor parameter more than the specified value?	4.7 volts	Go to Step 8	Go to Step 7
6	1. Test the 5 volts reference circuit between the ECM (pin 31 of E-90) and the EGR valve (pin 1 of E-71) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
7	1. Test the signal circuit between the ECM (pin 32 of E-90) and the EGR valve (pin 3 for E-71) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
8	1. Inspect for an intermittent and for poor connections at the harness connector of the EGR valve (pins 1 and 3 of E-71). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 31 and 32 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
10	Replace the EGR valve. Refer to EGR Valve Replacement. Did you complete the replacement?	—	Go to Step 12	—
11	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 12	—
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 13

Step	Action	Value(s)	Yes	No
13	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P0406

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Observe the EGR Position Sensor parameter with a scan tool. Is the EGR Position Sensor parameter more than the specified valve?	4.6 volts	Go to Step 3	Go to Diagnostic Aids
3	Monitor the DTC Information with a scan tool. Is DTC P0653 also set?	—	Go to Step 4	Go to Step 5
4	1. Turn OFF the ignition. 2. Disconnect the EGR valve harness connector. 3. Turn ON the ignition, with the engine OFF. Is the EGR Position Sensor parameter less than the specified value?	0.1 volts	Go to DTC P0653	Go to Step 7
5	1. Turn OFF the ignition. 2. Disconnect the EGR valve harness connector. 3. Turn ON the ignition, with the engine OFF. Is the EGR Position Sensor parameter less than the specified value?	0.1 volts	Go to Step 6	Go to Step 7
6	Connect a test lamp between the low reference circuit (pin 2 of E-71) and battery voltage. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 8
7	**Important:** The EGR position sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the ECM (pin 32 of E-90) and the EGR valve (pin 3 of E-71) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	1. Test the low reference circuit between the ECM (pin 30 of E-90) and the EGR valve (pin 2 of E-71) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10

Step	Action	Value(s)	Yes	No
9	1. Inspect for an intermittent and for a poor connection at the harness connector of the EGR valve (pin 2 of E-71). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 30 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
11	Replace the EGR valve. Refer to EGR Valve Replacement. Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 14
14	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0500 (Flash Code 25)

Circuit Description

The vehicle speed sensor (VSS) is used by the ECM and speedometer, which generates a speed signal from the transmission output shaft rotational speed or transfer output shaft rotational speed. The sensor has the following circuits.

- Ignition voltage circuit
- Low reference circuit
- VSS signal circuit

The VSS uses a hall effect element. It interacts with the magnetic field created by the rotating magnet and outputs square wave pulse signal. The ECM calculates the vehicle speed by the VSS. If the 2WD fitted with Jatco automatic transmission, VSS signals are sent from the TCM. If the ECM detects VSS signals are not generated, this DTC will set.

Condition for Running the DTC

- The ignition voltage is more than 9 volts.
- The ignition switch is ON.
- The engine speed is more than 1000 RPM.
- The commanded fuel injection quantity is OFF (accelerator pedal is not depressed).

Condition for Setting the DTC

- The ECM detects that the VSS signals are not generated for 5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electromagnetic interference in the VSS circuits may set this DTC.

Notice:

- If this DTC set, the Vehicle Speed parameter on the scan tool will display 3 km/h (2 MPH).

16	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0501 (Flash Code 25)

Circuit Description

The vehicle speed sensor (VSS) is used by the ECM and speedometer, which generates a speed signal from the transmission output shaft rotational speed or transfer output shaft rotational speed. The sensor has the following circuits.

- Ignition voltage feed circuit
- Low reference circuit
- VSS signal circuit

The VSS uses a hall effect element. It interacts with the magnetic field created by the rotating magnet and outputs square wave pulse signal. The ECM calculates the vehicle speed by the VSS. If the 2WD fitted with Jatco automatic transmission, VSS signals are sent from the TCM. If the ECM detects VSS signals are sharply changed, this DTC will set.

Condition for Running the DTC

- The ignition voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the VSS signal are changed larger than a predetermined vehicle speed within a very short calibrated time.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electromagnetic interference in the VSS circuits may set this DTC.

Notice:

- If this DTC set, the Vehicle Speed parameter on the scan tool will display 3 km/h (2 MPH).

Circuit/ System Testing DTC P0501

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Inspect all of the circuits going to the vehicle speed sensor (VSS) for the following conditions: • Routed too closely to fuel injection wiring or components • Routed too closely to after-market add-on electrical equipment • Routed too closely to solenoids, relays, and motors 2. If you find incorrect routing, correct the harness routing. Did you find and correct the condition?	—	Go to Step 8	Go to Step 3
3	1. Inspect for an intermittent, for poor connections and corrosion at the Meter (10A) fuse. 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 4
4	1. Inspect for an intermittent, a poor connection and corrosion at the ground terminal (E-10). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Disconnect the VSS harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the VSS (pins 1, 2 and 3 of E-44). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for a poor connection and corrosion at the harness connector of the ECM (pin 62 of C-58). 6. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 6
6	1. Inspect the VSS, drive gear, driven gear or output shaft for the following conditions: • Physical damage of sensor, drive gear or driven gear • Loose or improper installation of sensor, drive gear or driven gear • Transmission output shaft teeth damage • Excessive transmission output shaft play • Transfer output shaft teeth damage • Excessive transfer output shaft play 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 7
7	Replace the VSS. Refer to VSS Replacement. Did you complete the replacement?	—	Go to Step 8	—
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Drive the vehicle while observing the Vehicle Speed with a scan tool. Does the scan tool parameter indicate correct vehicle speed?	—	Go to Step 9	Go to Step 2
9	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0512 (Flash Code 417)

Circuit Description

The starter switch signal is inputted to the ECM during the ignition switch START position. If the ECM detects the starter switch signal continuously ON during the engine running, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

- The ECM detects that the starter switch signal is stuck at the ON position (high voltage) for longer than 20 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- This DTC will set if the ignition switch continues being START position for longer than 20 seconds.

Circuit/ System Testing DTC P0512

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Turn OFF the ignition. 2. Remove the starter cut relay in order to inhibit starter motor engagement at ignition switch ON. 3. Install a scan tool. 4. Turn ON the ignition, with the engine OFF. 5. Observe the Starter Switch parameter with a scan tool. Does the Starter Switch parameter indicate OFF?	—	Go to Diagnostic Aids	Go to Step 3
3	Remove the Starter (10A) fuse in the cabin fuse block. Does the Starter Switch parameter indicate OFF?	—	Go to Step 4	Go to Step 5
4	1. Test the signal circuit between the starter switch (pin 1 of B-63) and each terminal of the ignition switch (pins 1, 2, 3 and 4 of B-62 and pin 3 of B-63) for short circuit each other at the ignition switch ON. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 7
5	1. Test the signal circuit between the ECM (pin 44 of C-58) and the Starter (10A) fuse or starter relay (pin 3 of X-8) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 6

Step	Action	Value(s)	Yes	No
6	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect the connection on the starter switch signal circuit at the harness connector of the ECM (pin 44 of C-58) for corrosion. 4. Repair the connection(s) as necessary. Did you complete the action?	—	Go to Step 8	—
7	Repair or replace the ignition switch. Did you complete the repair or replacement?	—	Go to Step 8	—
8	1. Reconnect all previously disconnected relay or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 9
9	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0562 or P0563 (Flash Code 35)

Circuit Description

The ECM monitors the ignition voltage on the ignition feed terminal to make sure that the voltage stays within the proper range. If the ECM detects an excessively low or high ignition voltage, DTC P0562 or P0563 will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.

Condition for Setting the DTC

- The ECM detects that the ignition voltage feed circuit is less than 8 volts for 5 seconds. (DTC P0562)
- The ECM detects that the ignition voltage feed circuit is more than 16 volts for 5 seconds. (DTC P0563)

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity. (DTC P0563)
- The ECM inhibits pilot injection. (DTC P0563)
- The ECM inhibits cruise control. (DTC P0563)

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- A charging system problem may set this DTC.
- The weakened battery may set DTC P0562.
- Jump starting the vehicle or a battery charger may have set this DTC P0563.

DTC P0565 (Flash Code 515)

Circuit Description

The cruise control keeps the vehicle speed at a driver's set speed. When the cruise main switch is turned ON, signal is provided to the ECM and the cruise main indicator lamp on the switch or the instrument panel cluster will light up. If the ECM detects the cruise main switch signal repeats ON/ OFF or continuously ON, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the cruise main switch signal is repeated ON/ OFF continuously within a very short calibrated time.
- The ECM detects that the cruise main switch signal is stuck at the ON position (high voltage) for longer than 15 seconds.

Action Taken When the DTC Sets

- The ECM will not illuminate the MIL or SVS lamp. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type D.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the DTC - Type D.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- This DTC will set if the cruise main switch continues being pushed for longer than 15 seconds.

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing DTC P0565

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Observe the Cruise Main Switch parameter with a scan tool. Does the scan tool indicate ON when the switch is pushed and OFF when the switch is released?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the cruise main switch harness connector. (Remove the switch from the IP bezel as necessary) 3. Turn ON the ignition, with the engine OFF. Does the Cruise Main Switch indicate OFF?	—	Go to Step 5	Go to Step 4
4	1. Test the signal circuit between the ECM (pin 14 of C-58) and the cruise main switch (pin 3 of B-67) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
5	Repair or replace the cruise main switch. Did you complete the repair or replacement?	—	Go to Step 7	—
6	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 7	—

Step	Action	Value(s)	Yes	No
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Cruise Main Switch parameter with a scan tool. Dose the scan tool indicate ON when the switch is pushed and OFF when the switch is released?	—	Go to Step 8	Go to Step 3
8	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0566 (Flash Code 516)

Circuit Description

The cruise control keeps the vehicle speed at a driver's set speed. When the cruise main switch is turned ON, signal is provided to the ECM and the cruise main indicator lamp on the switch or the instrument panel cluster will light up. The cruise cancel switch is a normally closed type switch. When the cruise cancel switch is applied, the switch signal to the ECM is stopped (low voltage) and the cruise control system is inactive. If the ECM detects the cruise cancel switch signal repeats ON/ OFF or continuously OFF this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the cruise cancel switch signal is repeated ON/ OFF continuously within a very short calibrated time.
- The ECM detects that the cruise cancel switch signal is stuck at the OFF position (low voltage) for longer than 40 seconds.

Action Taken When the DTC Sets

- The ECM will not illuminate the MIL or SVS lamp. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type D.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the DTC - Type D.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- This DTC will set if the cruise cancel switch continues being applied for longer than 40 seconds.

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing DTC P0566

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Observe the Cruise Cancel Switch parameter with a scan tool. Does the scan tool indicate OFF when the switch is applied and ON when the switch is released?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the combination switch harness connector (B-59). (Remove the IP cluster lower cover as necessary) 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the ignition voltage feed circuit of the combination switch harness (pin 11 of B-59 male side) and a known good ground. Does the test lamp illuminate?	—	Go to Step 4	Go to Step 5

Step	Action	Value(s)	Yes	No
4	Observe the Cruise Cancel Switch parameter with a scan tool while momentarily jumping 3-amp fused jumper wire across the combination switch harness connector (male side) between pins 10 and 11 of B-59. Does the scan tool indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 7	Go to Step 6
5	Repair the open circuit or high resistance between the Engine (10A) fuse and the combination switch (pin 11 of B-59). Check Engine (10A) fuse first. Did you complete the repair?	—	Go to Step 11	—
6	1. Test the signal circuit between the ECM (pin 13 of C-58) and the combination switch (pin 11 of B-59) for and open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did your find and correct the condition?	—	Go to Step 11	Go to Step 8
7	1. Inspect fro an intermittent and for a poor connection at the harness connector of the combination switch (pin 11 of B-59). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 9
8	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pin 13 of C-58). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 10
9	Repair or replace the combination switch. Did you complete the repair or replacement?	—	Go to Step 11	—
10	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 11	—
11	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Cruise Cancel Switch parameter with a scan tool. Dose the scan tool indicate OFF when the switch is applied and ON when the switch is released?	—	Go to Step 12	Go to Step 3
12	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0567 (Flash Code 517)

Circuit Description

The cruise control keeps the vehicle speed at a driver's set speed. When the cruise main switch is turned ON, signal is provided to the ECM and the cruise main indicator lamp on the switch or the instrument panel cluster will light up. When the cruise resume/ accel. switch is applied, the switch signal is provided to the ECM and the vehicle speed is reset to the previous set speed or vehicle speed is increased. If the ECM detects the cruise resume/ accel. switch signal repeats ON/ OFF or continuously ON, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the cruise resume/ accel. switch signal is repeated ON/ OFF continuously within a very short calibrated time.
- The ECM detects that the cruise resume/ accel. switch signal is stuck at the ON position (high voltage) for longer than 120 seconds.

Action Taken When the DTC Sets

- The ECM will not illuminate the MIL or SVS lamp. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type D.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the DTC - Type D.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- This DTC will set if the cruise resume/ accel. switch continues being applied for longer than 120 seconds.

Schematic Reference: Engine Controls Schematics

Circuit/ System Testing DTC P0567

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Observe the Cruise Resume Switch parameter with a scan tool. Does the scan tool indicate ON when the switch is applied and OFF when the switch is released?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the combination switch harness connector (B-59). (Remove the IP cluster lower cover as necessary) 3. Turn ON the ignition, with the engine OFF. Does the Cruise Resume Switch parameter indicate OFF?	—	Go to Step 5	Go to Step 4
4	1. Test the signal circuit between the ECM (pin 29 of C-58) and the combination switch (pin 9 of B-59) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
5	Repair or replace the combination switch. Did you complete the repair or replacement?	—	Go to Step 7	—

Step	Action	Value(s)	Yes	No
6	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Cruise Resume Switch parameter with a scan tool. Dose the scan tool indicate ON when the switch is applied and OFF when the switch is released?	—	Go to Step 8	Go to Step 3
8	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0568 (Flash Code 518)

Circuit Description

The cruise control keeps the vehicle speed at a driver's set speed. When the cruise main switch is turned ON, signal is provided to the ECM and the cruise main indicator lamp on the switch or the instrument panel cluster will light up. When the cruise set/ coast switch is turned ON, the switch signal is provided to the ECM and the vehicle speed is set or vehicle speed is decreased. If the ECM detects the cruise set/ coast switch signal repeats ON/ OFF or continuously ON, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the cruise set/ coast switch signal is repeated ON/ OFF continuously within a very short calibrated time.
- The ECM detects that the cruise set/ coast switch signal is stuck at the ON position (high voltage) for longer than 120 seconds.

Action Taken When the DTC Sets

- The ECM will not illuminate the MIL or SVS lamp. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type D.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the DTC - Type D.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- This DTC will set if the cruise set/ coast switch continues being pushed for longer than 120 seconds.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Observe the Cruise Set Switch parameter with a scan tool. Does the scan tool indicate ON when the switch is pushed and OFF when the switch is released?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the combination switch harness connector (B-59). (Remove the switch from the IP bezel as necessary) 3. Turn ON the ignition, with the engine OFF. Does the Cruise Set Switch parameter indicate OFF?	—	Go to Step 5	Go to Step 4
4	1. Test the signal circuit between the ECM (pin 30 of C-58) and the combination switch (pin 12 of B-59) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
5	Repair or replace the combination switch. Did you complete the repair or replacement?	—	Go to Step 7	—

Step	Action	Value(s)	Yes	No
6	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn ON the ignition, with the engine OFF. 4. Observe the Cruise Set Switch parameter with a scan tool. Dose the scan tool indicate ON when the switch is pushed and OFF when the switch is released?	—	Go to Step 8	Go to Step 3
8	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0571 (Flash Code 26)

Circuit Description

The brake switch is installed on the brake pedal bracket. The brake switch 1 is a normally open type switch and the brake switch 2 is a normally closed type switch. When the brake pedal is pressed, the brake switch 1 signal is provided to the ECM and the stoplights are turned ON. Then, the brake switch 2 signal to the ECM is stopped (low voltage). If the ECM detects the brake switch signals out of correlation, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects a brake switch 1 (normally open type switch) signal and brake switch 2 (normally closed type switch) signal correlation error for longer than 10 seconds over 33 times since ignition switch is ON.

Action Taken When the DTC Sets

- The ECM will not illuminate the MIL or SVS lamp. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type D.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the DTC - Type D.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Misadjusted brake switch will cause this DTC to set.

Circuit/ System Testing DTC P0571

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Observe the Brake Switch 1 parameter with a scan tool while fully depressing and releasing the brake pedal. Does the scan tool indicate Applied when the brake pedal is applied and Released when the brake pedal is released?	—	Go to Step 8	Go to Step 3
3	1. Check to ensure the brake switch is adjusted correctly. The plunger should be all the way in when the pedal is released, yet should not impede with the brake pedal full upward travel. 2. Adjust the brake switch as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 4
4	1. Turn OFF the ignition. 2. Disconnect the brake switch harness connector. 3. Connect a test lamp between the battery voltage feed circuit of the brake switch 1 harness (pin 1 of C-44) and a known good ground. Does the test lamp illuminate?	—	Go to Step 5	Go to Step 6

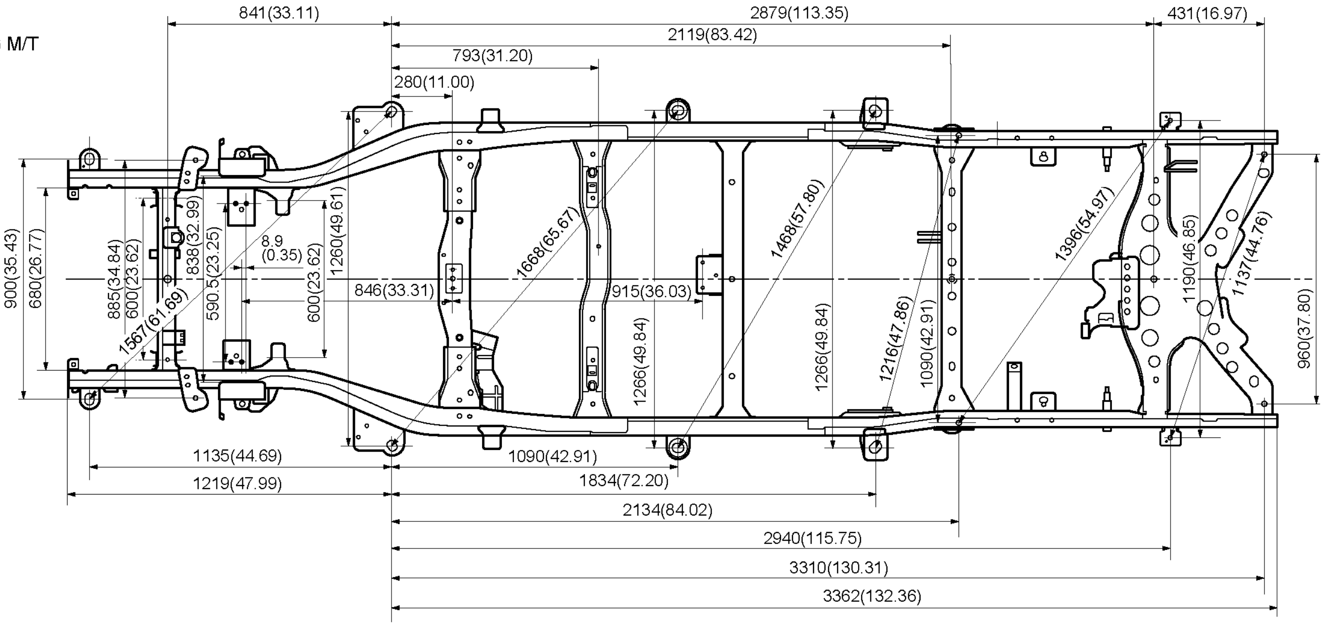
Step	Action	Value(s)	Yes	No
5	1. Turn ON the ignition, with the engine OFF. 2. Observe the Brake Switch 1 parameter with a scan tool while momentarily jumping 3-amp fused jumper wire across the brake switch harness connector between pins 1 and 2 of the C-44. Does the scan tool indicate Applied when the circuit is jumpered and Released when the circuit is not jumpered?	—	Go to Step 14	Go to Step 7
6	Repair the open circuit or high resistance between the Stop Light (15A) fuse and the brake switch (pin 1 of C-44). Check the Stop Light (15A) fuse first. Did you complete the repair?	—	Go to Step 18	—
7	1. Test the signal circuit between the ECM (pin 21 of C-58) and the brake switch (pin 2 of C-44) for the following conditions: • An open circuit • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 15
8	Observe the Brake Switch 2 parameter with a scan tool while fully depressing and releasing the brake pedal. Does the scan tool indicate Applied when the brake pedal is applied and Released when the brake pedal is released?	—	Go to Diagnostic Aids	Go to Step 9
9	1. Check to ensure the brake switch is adjusted correctly. The plunger should be all the way in when the pedal is released, yet should not impede with the brake pedal full upward travel. 2. Adjust the brake switch as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 10
10	1. Turn OFF the ignition. 2. Disconnect the brake switch harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the ignition voltage feed circuit of the brake switch 2 harness (pin 4 of C-44) and a known good ground. Does the test lamp illuminate?	—	Go to Step 11	Go to Step 12
11	Observe the Brake Switch 2 parameter with a scan tool while momentarily jumping 3-amp fused jumper wire across the brake switch harness connector between pins 3 and 4 of the C-44. Does the scan tool indicate Released when the circuit is jumpered and Applied when the circuit is not jumpered?	—	Go to Step 14	Go to Step 13
12	Repair the open circuit or high resistance between the Engine (10A) fuse and the brake switch (pin 4 of C-44). Check the Engine (10A) fuse first. Did you complete the repair?	—	Go to Step 18	—

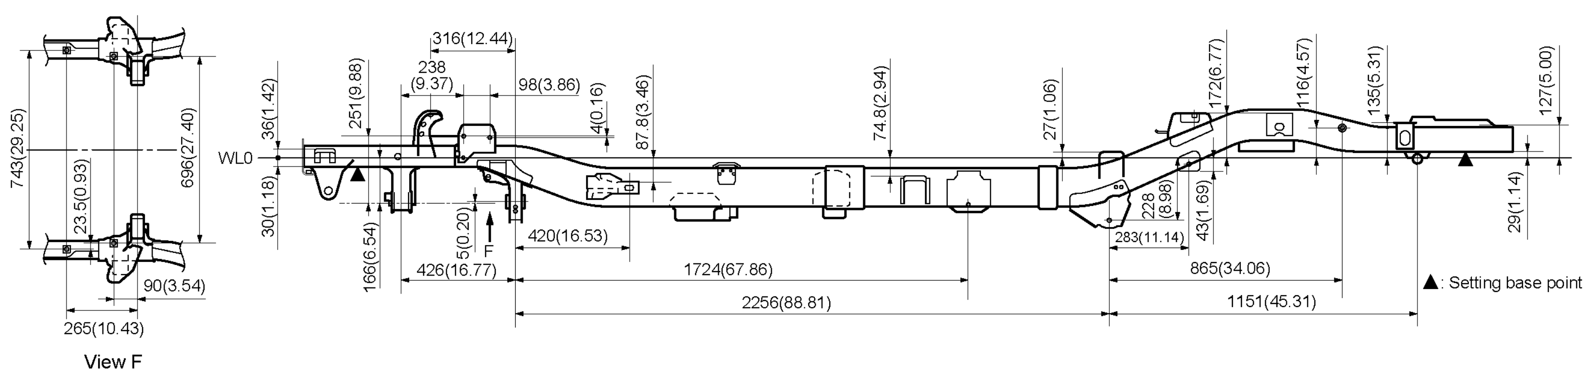
4×2, HIGH RIDE, LWB, CREW CAB MODEL

This illustration is based on the RHD model.

mm(in)

C24SE GAS ENG M/T





RTW72AXF002101

Step	Action	Value(s)	Yes	No
13	1. Test the signal circuit between the ECM (pin 1 of C-58) and the brake switch (pin 3 of C-44) for the following conditions: • An open circuit • A short to battery or ignition voltage • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 15
14	1. Inspect for an intermittent and for poor connections at the harness connector of the brake switch (pins 1, 2, 3 and 4 of C-44). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 16
15	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 1 and 21 of C-58). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 18	Go to Step 17
16	Replace brake switch. Refer to Brake Switch Replacement. Did you complete the replacement?	—	Go to Step 18	—
17	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 18	—
18	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Observe the Brake Switch 1 and Brake Switch 2 parameter with a scan tool while fully depressing and releasing the brake pedal. Does the scan tool indicate Applied when the brake pedal is applied and Released when the brake pedal is released on each parameter?	—	Go to Step 19	Go to Step 2
19	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0601 (Flash Code 53)

Circuit Description

This diagnostic applies to internal microprocessor integrity conditions within the ECM.

Condition for Setting the DTC

- The ECM detects that the calculated checksum does not agree with the ECM internal registered checksum.

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.
- The ECM stops engine running when the vehicle speed is lower than 5 km/h (3 MPH) for 5 seconds. The engine will run after the key is cycled when the ignition has been tuned OFF for longer than 10 seconds.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Circuit/ System Testing DTC P0601

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0602 (Flash Code 154)

Circuit Description

The electrically erasable & programmable read only memory (EEPROM) memorizes fuel injector ID code information. If the ECM detects fuel injector ID codes are not programmed into the ECM or an error in the programmed fuel injector ID codes, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects that the fuel injector ID code is not programmed.
- The ECM detects an error in the programmed fuel injector ID code.

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Notice:

- Clear the DTC with a scan tool after programming the fuel injector ID code.

Circuit/ System Testing DTC P0602

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Ensure that all tool connections are secure. 2. Ensure that programming equipment is operating correctly. 3. Install a scan tool. 4. Turn OFF the ignition for 30 seconds. 5. Turn ON the ignition, with the engine OFF. 6. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
3	1. Verify the correct fuel injector ID codes are entered into the ECM with a scan tool. Refer to ECM Replacement. If the fuel injector ID codes are correctly entered, clear the DTC with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. Does the DTC fail this ignition?	—	Go to Step 4	Go to Step 5
4	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 5	—

Step	Action	Value(s)	Yes	No
5	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 6
6	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0604 or P0606 (Flash Code 153 or 51)

Circuit Description

This diagnostic applies to internal microprocessor integrity conditions within the ECM.

Condition for Setting the DTC

- The ECM detects a malfunction in its internal random access memory (RAM). (DTC P0604)
- The ECM detects a malfunction in its internal main central processing unit (CPU) or sub integrated circuit (IC). (DTC P0606)

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity. (DTC P0604)
- The ECM inhibits pilot injection. (DTC P0604)
- The ECM inhibits cruise control. (DTC P0604)
- The ECM stops engine running when the vehicle speed is lower than 5 km/h (3 MPH) for 5 seconds. The engine will run after the key is cycled when the ignition has been tuned OFF for longer than 10 seconds. (DTC P0604)

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Circuit/ System Testing DTC P0604 or P0606

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0615 (Flash Code 19)

Circuit Description

The ECM controls the starter cut relay, which de-energizes the starter relay based on engine speed inputs or immobilizer command signal. The starter cut relay uses normally close type relay. During engine stopping, the starter cut relay is closed to allow grounding the starter relay. Once engine run, the ECM energizes the starter cut relay to open the starter relay circuit and starter motor is disengaged even the ignition is positioned at START. If the ECM detects an improper voltage on the starter cut relay control circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects a short to ground circuit condition on the starter cut relay control circuit for longer than 3 seconds when the relay is commanded OFF.
- The ECM detects a short to voltage circuit condition on the starter cut relay control circuit for longer than 3 seconds when the relay is commanded ON.

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- If the starter cut relay control circuit is short to ground, engine does not crank.

DTC P0633 (Flash Code 176)

Circuit Description

The electronically erasable & programmable read only memory (EEPROM) memorizes immobilizer security information for communication with the immobilizer control unit (ICU) and enabling the engine to start. If the ECM detects immobilizer security information are not programmed into the ECM, this DTC will set.

Condition for Setting the DTC

- The ECM detects that the immobilizer security information is not programmed.

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- Non-programmed ECM sets this DTC.

3	Program immobilizer security information into the ECM. Refer to Resetting and Programming Guidelines in immobilizer section. Did you complete the programming?	—	Go to Step 4	—
4	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0638 (Flash Code 61)

Circuit Description

The ECM controls the intake throttle valve opening based on the engine running condition and by controlling the intake throttle solenoid. The intake throttle valve position is detected by the position sensor, and relayed to the ECM. If the ECM detects a variance between the actual intake throttle position and desired intake throttle position while the intake throttle solenoid is commanded ON, this DTC will set.

Condition for Running the DTC

- DTCs P0122, P0123, P0698 and P0699 are not set.
- The battery voltage is between 11 to 16 volts.
- The ignition switch is ON.
- The intake throttle solenoid commanded ON.
- The desired intake throttle position is stable.

Condition for Setting the DTC

- The ECM detects that the difference between the actual and the desired intake throttle position is more than 10% for 5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits EGR control.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- A sticking or intermittently sticking intake throttle valve may set this DTC.
- A sticking intake throttle valve at full closed position will cause engine starting problem.

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing DTC P0638

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0122, P0123, P2100, P2101 or P2103 also set?	—	Go to Applicable DTC	Go to Step 3
3	1. Perform the Intake Throttle Solenoid Control with a scan tool several times. 2. Command the Desired Intake Throttle Position Increase and Decrease while observing the Intake Throttle Position. Does the Intake Throttle Position parameter follow within the specified value quick enough (compare with a similar unit if available)?	± 5%	Go to Diagnostic Aids	Go to Step 4

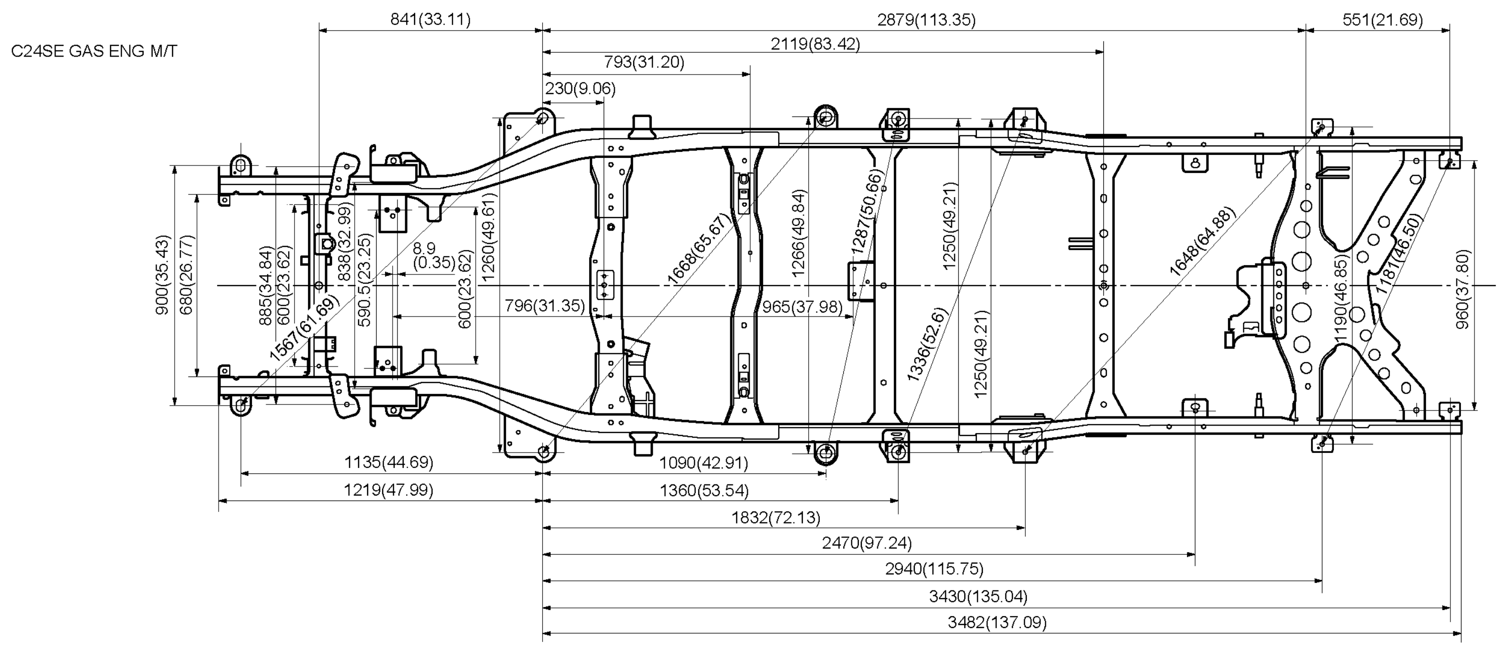
Step	Action	Value(s)	Yes	No
4	1. Remove the intake duct that is connected to the intake throttle valve. 2. Inspect the intake throttle valve for the following conditions: • Restricted intake throttle valve by foreign materials • Excessive deposits at throttle bore • Bent butterfly valve **Notice:** Replace the intake throttle valve if there is any sticking. 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the intake throttle valve harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the intake throttle valve (pins 1, 2, 3, 5 and 6 of E-38). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 35, 36, 55, 56 and 57 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
6	Replace the intake throttle valve. Refer to Intake Throttle Valve Replacement. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 8
8	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

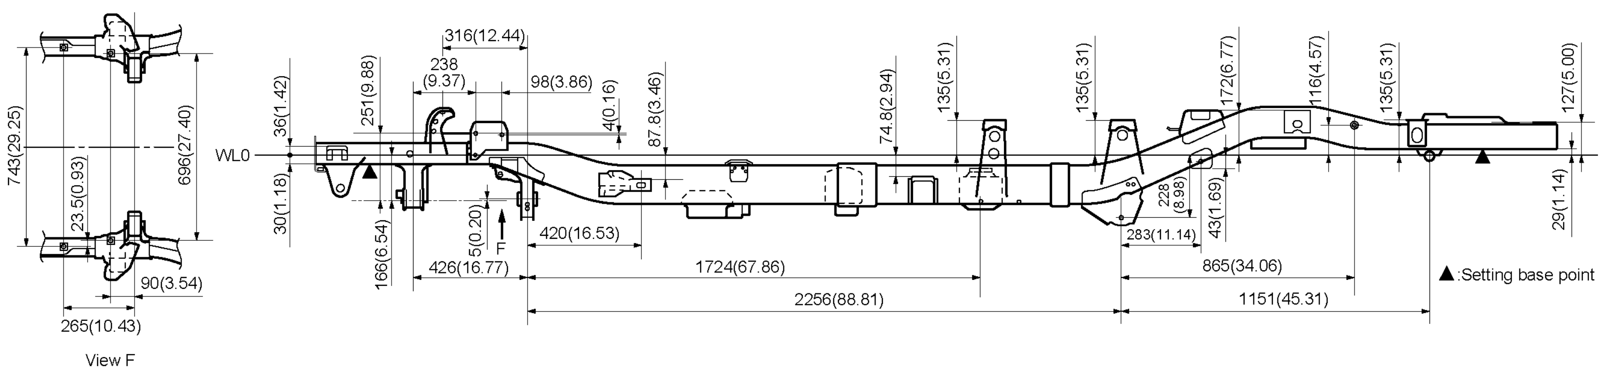
BACK TO CHAPTER INDEX

4×4, LWB, REGULAR CAB MODEL

This illustration is based on the RHD model.

mm(in)





RTW72AXF001701

DTC P0642 or P0643 (Flash Code 55)

Circuit Description

The ECM provides 5 volts reference voltage through the reference circuit 1 to the accelerator pedal position (APP) sensor 1. The ECM monitors the voltage on the 5 volts reference circuit 1. If the ECM detects the voltage is excessively low or high, DTC P0642 or P0643 will set.

Condition for Running the DTC

- The battery voltage is more than 6 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the 5 volts reference circuit 1 voltage is less than 4.7 volts. (DTC P0642)
- The ECM detects that the 5 volts reference circuit 1 voltage is more than 5.3 volts. (DTC P0643)

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Circuit/ System Testing DTC P0642

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the accelerator pedal position (APP) sensor harness connector. 3. Connect a DMM between the 5 volts reference circuit (pin 10 of C-40) and a known good ground. 4. Turn ON the ignition, with engine OFF. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 5	Go to Step 4
4	1. Test the 5 volts reference circuit between the ECM (pin 11 of C-58) and the APP sensor (pin 10 of C-40) for the following conditions: • A short to ground • A short to the low reference circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6

Step	Action	Value(s)	Yes	No
5	Replace the APP sensor. Refer to APP Sensor Replacement. Did you complete the replacement?	—	Go to Step 7	—
6	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 8
8	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P0643

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Test the 5 volts reference circuit between the ECM (pin 11 of C-58) and the APP sensor 1 (pin 10 of C-40) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 5	Go to Step 4
4	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 5	—

Step	Action	Value(s)	Yes	No
5	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 6
6	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0650 (Flash Code 77)

Circuit Description

The malfunction indicator lamp (MIL) is located on the instrument panel (IP) cluster. The MIL informs the driver that an emission system fault has occurred and that the engine control system requires service.
The ECM monitors the MIL control circuit for conditions that are incorrect for the commanded state of the MIL. For example, a failure condition exists if the ECM detects low voltage when the MIL is commanded OFF, or high voltage when the MIL is commanded ON. If the ECM detects an improper voltage level on the control circuit, this DTC will set.

Condition for Running the DTC

- The ignition voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects a low voltage condition on the MIL control circuit when the lamp is commanded OFF.
- The ECM detects a high voltage condition on the MIL control circuit when the lamp is commanded ON.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing DTC P0650

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Verify whether the instrument panel (IP) cluster is operational. 2. Install a scan tool. 3. Perform the Malfunction Indicator Lamp (MIL) Control with a scan tool. 4. Command the lamp ON and OFF. Does the MIL turn ON and OFF with each command?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Inspect the Meter (10A) fuse in the cabin fuse block. Is the Meter (10A) fuse open?	—	Go to Step 4	Go to Step 5
4	Replace the Meter (10A) fuse. If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the Meter (10A) fuse or replace the shorted attached component. Did you complete the repair?	—	Go to Step 17	—
5	1. Turn OFF the ignition. 2. Disconnect the ECM J-2 (C-58) harness connector. 3. Turn ON the ignition, with the engine OFF. Is the MIL OFF?	—	Go to Sep 6	Go to Step 12

Step	Action	Value(s)	Yes	No
6	1. Remove the Meter (10A) fuse that supplies voltage to the MIL. 2. Turn ON the ignition, with the engine OFF. 3. Measure the voltage from the MIL control circuit in the ECM harness connector (pin 57 of C-58) to a known good ground. Is the voltage less than the specified value?	1 volt	Go to Step 7	Go to Step 13
7	1. Turn OFF the ignition. 2. Reinstall the Meter (10A) fuse. 3. Turn ON the ignition, with the engine OFF. 4. Connect a 3-amp fused jumper wire between the ECM harness connector (pin 57 of C-58) and a known good ground. Is the MIL illuminated?	—	Go to Step 11	Go to Step 8
8	1. Turn OFF the ignition. 2. Remove the IP cluster. 3. Connect a test lamp between the ignition voltage feed circuit of the IP cluster harness connector (pin 8 of B-24) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 14
9	1. Test the control circuit between the ECM (pin 57 of C-58) and the IP cluster (pin 38 of B-23) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 10
10	1. Inspect for an intermittent and for poor connections at the harness connector of the IP cluster (pin 8 of B-24 and pin 38 of B-23). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 15
11	1. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 57 of C-58). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 16
12	Repair the short to ground between the ECM (pin 57 of C-58) and the IP cluster (pin 38 of B-23). Did you complete the repair?	—	Go to Step 17	—
13	Repair the short to battery or ignition voltage between the ECM (pin 57 of C-58) and the IP cluster (pin 38 of B-23). Did you complete the repair?	—	Go to Step 17	—
14	Repair the open circuit or high resistance on the ignition voltage feed circuit between the Meter (10A) fuse and the IP cluster (pin 8 of B-24). Did you complete the repair?	—	Go to Step 17	—
15	Repair or replace the IP cluster. Did you complete the repair or replacement?	—	Go to Step 17	—

Step	Action	Value(s)	Yes	No
16	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 17	—
17	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Perform the MIL Control with a scan tool. 5. Command the lamp ON and OFF. Does the MIL turn ON and OFF with each command?	—	Go to Step 18	Go to Step 3
18	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0652 or P0653 (Flash Code 56)

Circuit Description

The ECM provides 5 volts reference voltage through the reference circuit 2 to the following sensors:

- Accelerator pedal position (APP) sensor 2
- Fuel rail pressure (FRP) sensor
- Barometric pressure (BARO) sensor
- Camshaft position (CMP) sensor
- EGR position sensor

The 5 volts reference circuits are independent of each other outside the ECM, but are bussed together inside the ECM. Therefore, a short circuit condition on one 5 volts reference circuit affects the entire 5 volts reference circuit 2. The ECM monitors the voltage on the 5 volts reference circuit 2. If the ECM detects the voltage is excessively low or high, DTC P0652 or P0653 will set.

Condition for Running the DTC

- The battery voltage is more than 6 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the 5 volts reference circuit 2 voltage is less than 4.7 volts. (DTC P0652)
- The ECM detects that the 5 volts reference circuit 2 voltage is more than 5.3 volts. (DTC P0653)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits EGR control.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- If this DTC is present, the engine cranks but does not start.

Circuit/ System Testing DTC P0652

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the barometric pressure (BARO) sensor harness connector. 3. Connect a DMM between the 5 volts reference circuit (pin 3 of E-40) and a known good ground. 4. Turn ON the ignition, with engine OFF. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 9	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Leave the DMM connected to the BARO sensor harness connector. 2. Turn OFF the ignition. 3. Disconnect the EGR valve harness connector. 4. Turn ON the ignition, with the engine OFF. Does the DMM voltage change to more than the specified value?	4.7 volts	Go to Step 10	Go to Step 5
5	1. Leave the DMM connected to the BARO sensor harness connector. 2. Turn OFF the ignition. 3. Disconnect the fuel rail pressure (FRP) sensor harness connector. 4. Turn ON the ignition, with the engine OFF. Does the DMM voltage change to more than the specified value?	4.7 volts	Go to Step 11	Go to Step 6
6	1. Leave the DMM connected to the BARO sensor harness connector. 2. Turn OFF the ignition. 3. Disconnect the camshaft position (CMP) sensor harness connector. 4. Turn ON the ignition, with the engine OFF. Does the DMM voltage change to more than the specified value?	4.7 volts	Go to Step 12	Go to Step 7
7	1. Leave the DMM connected to the BARO sensor harness connector. 2. Turn OFF the ignition. 3. Disconnect the accelerator pedal position (APP) sensor harness connector. 4. Turn ON the ignition, with the engine OFF. Does the DMM voltage change to more than the specified value?	4.7 volts	Go to Step 13	Go to Step 8
8	1. Test the 5 volts reference circuit between the ECM and the following components for a short to ground or short to the low reference circuit: • ECM (pin 19 of E-90) and BARO sensor (pin 3 of E-40) • ECM (pin 31 of E-90) and EGR position sensor (pin 1 of E-71) • ECM (pin 47 of E-90) and FRP sensor (pin 3 of E-48) • ECM (pin 46 of E-90) and CMP sensor (pin 3 of E-39) • ECM (pin 9 of C-58) and APP sensor 2 (pin 8 of C-40) 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
9	Replace the BARO sensor. Refer to BARO Sensor Replacement. Did you complete the replacement?	—	Go to Step 15	—
10	Replace the EGR valve. Refer to EGR Valve Replacement. Did you complete the replacement?	—	Go to Step 15	—

Step	Action	Value(s)	Yes	No
11	Replace the FRP sensor. Refer to FRP Sensor Replacement. Did you complete the replacement?	—	Go to Step 15	—
12	Replace the CMP sensor. Refer to CMP Sensor Replacement. Did you complete the replacement?	—	Go to Step 15	—
13	Replace the APP sensor. Refer to APP Sensor Replacement. Did you complete the replacement?	—	Go to Step 15	—
14	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 15	—
15	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 16
16	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P0653

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids

Step	Action	Value(s)	Yes	No
3	1. Test the 5 volts reference circuit between the ECM and the following components for a short to battery or ignition voltage: • ECM (pin 19 of E-90) and BARO sensor (pin 3 of E-40) • ECM (pin 31 of E-90) and EGR position sensor (pin 1 of E-71) • ECM (pin 47 of E-90) and FRP sensor (pin 3 of E-48) • ECM (pin 46 of E-90) and CMP sensor (pin 3 of E-39) • ECM (pin 9 of C-58) and APP sensor 2 (pin 8 of C-40) 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 5	Go to Step 4
4	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 5	—
5	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 6
6	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0661 or P0662 (Flash Code 58)

Circuit Description

The ECM controls the swirl levels, which energize the swirl control solenoid valve based on the engine running condition. The ECM commands the swirl control solenoid valve to apply vacuum pressure to the diaphragm actuator to operate swirl control butterflies that is provided each intake port. If the ECM detects an open circuit or short circuit on the solenoid valve circuit, DTC P0661 or P0662 will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects a low voltage condition on the swirl control solenoid valve circuit when the solenoid is commanded OFF. (DTC P0661)
- The ECM detects a high voltage condition on the swirl control solenoid valve circuit when the solenoid is commanded ON. (DTC P0662)

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity. (DTC P0661)
- The ECM inhibits cruise control. (DTC P0661)

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Circuit/ System Testing DTC P0661

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the swirl control solenoid valve harness connector. 3. Connect a test lamp between the ignition voltage feed circuit (pin 2 of E-67) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 4	Go to Step 6

Step	Action	Value(s)	Yes	No
4	1. Connect a test lamp between the control circuit (pin 1 of E-67) and battery voltage. 2. Perform the Swirl Control Solenoid Test with a scan tool. 3. Command the solenoid valve ON and OFF. Does the test lamp turn ON and OFF with each command (if test is aborted, go to Step 5)?	—	Go to Step 9	Go to Step 5
5	Does the test lamp remain illuminated with each command?	—	Go to Step 8	Go to Step 7
6	Repair the open circuit or high resistance between the Engine (10A) fuse and the solenoid valve (pin 2 of E-67). Check the Engine (10A) fuse first. Did you complete the repair?	—	Go to Step 13	—
7	1. Test the control circuit between the ECM (pin 67 of E-90) and the solenoid valve (pin 1 of E-67) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
8	1. Test the control circuit between the ECM (pin 67 of E-90) and the solenoid valve (pin 1 of E-67) for a short to ground. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
9	1. Inspect for an intermittent and for poor connections at the harness connector of the solenoid valve (pins 1 and 2 of E-67). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection at harness connector of the ECM (pin 67 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
11	Replace the swirl control solenoid valve. Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 13	—

Step	Action	Value(s)	Yes	No
13	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Turn ON the ignition, with the engine OFF. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 14
14	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P0662

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the swirl control solenoid valve harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Is DTC P0661 set, but not P0662?	—	Go to Step 5	Go to Step 4
4	1. Test the control circuit between the ECM (pin 67 of E-90) and the solenoid valve (pin 1 of E-67) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
5	Replace the swirl control solenoid valve. Did you complete the replacement?	—	Go to Step 7	—
6	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 7	—

Step	Action	Value(s)	Yes	No
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 8
8	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0698 or P0699 (Flash Code 57)

Circuit Description

The ECM provides 5 volts reference voltage through the reference circuit 3 to the following sensors:

- Accelerator pedal position (APP) sensor 3
- Boost pressure sensor
- Crankshaft position (CKP) sensor
- Intake throttle position sensor

The 5 volts reference circuits are independent of each other outside the ECM, but are bussed together inside the ECM. Therefore, a short circuit condition on one 5 volts reference circuit affects the entire 5 volts reference circuit 3. The ECM monitors the voltage on the 5 volts reference circuit 3. If the ECM detects the voltage is excessively low or high, DTC P0698 or P0699 will set.

Condition for Running the DTC

- The battery voltage is more than 6 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the 5 volts reference circuit 3 voltage is less than 4.7 volts. (DTC P0698)
- The ECM detects that the 5 volts reference circuit 3 voltage is less than 5.3 volts. (DTC P0699)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits EGR control.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing DTC P0698

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the accelerator pedal position (APP) sensor harness connector. 3. Connect a DMM between the 5 volts reference circuit (pin 1 of C-40) and a known good ground. 4. Turn ON the ignition, with engine OFF. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 8	Go to Step 4
4	**Notice:** If no boost pressure sensor is installed, skip to Step 5. 1. Leave the DMM connected to the APP sensor harness connector. 2. Turn OFF the ignition. 3. Disconnect the boost pressure harness connector. 4. Turn ON the ignition, with the engine OFF. Does the DMM voltage change to more than the specified value?	4.7 volts	Go to Step 9	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Leave the DMM connected to the APP sensor harness connector. 2. Turn OFF the ignition. 3. Disconnect the intake throttle valve harness connector. 4. Turn ON the ignition, with the engine OFF. Does the DMM voltage change to more than the specified value?	4.7 volts	Go to Step 10	Go to Step 6
6	1. Leave the DMM connected to the APP sensor harness connector. 2. Turn OFF the ignition. 3. Disconnect the camshaft position (CKP) sensor harness connector. 4. Turn ON the ignition, with the engine OFF. Does the DMM voltage change to more than the specified value?	4.7 volts	Go to Step 11	Go to Step 7
7	1. Test the 5 volts reference circuit between the ECM and the following components for a short to ground or short to the low reference circuit: • ECM (pin 7 of C-58) and APP sensor 3 (pin 1 of C-40) • ECM (pin 20 of E-90) and boost pressure sensor (pin 3 of E-107) • ECM (pin 36 of E-90) and intake throttle position sensor (pin 6 of E-38) • ECM (pin 37 of E-90) and CKP sensor (pin 3 of E-52) 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	Replace the APP sensor. Refer to APP Sensor Replacement. Did you complete the replacement?	—	Go to Step 13	—
9	Replace the boost pressure sensor. Refer to Boost Pressure Sensor Replacement. Did you complete the replacement?	—	Go to Step 13	—
10	Replace the intake throttle valve. Refer to Intake Throttle Valve Replacement. Did you complete the replacement?	—	Go to Step 13	—
11	Replace the CKP sensor. Refer to CKP Sensor Replacement. Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 13	—

Step	Action	Value(s)	Yes	No
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 14
14	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P0699

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Test the 5 volts reference circuit between the ECM and the following components for a short to battery or ignition voltage: • ECM (pin 7 of C-58) and APP sensor 3 (pin 1 of C-40) • ECM (pin 20 of E-90) and boost pressure sensor (pin 3 of E-107) • ECM (pin 36 of E-90) and intake throttle position sensor (pin 6 of E-38) • ECM (pin 37 of E-90) and CKP sensor (pin 3 of E-52) 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 5	Go to Step 4
4	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 5	—

Step	Action	Value(s)	Yes	No
5	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 6
6	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P0700 (Flash Code 185)

Circuit Description

The transmission control module (TCM) requests to illuminate the malfunction indicator lamp (MIL) via a controller area network (CAN) communication bus to the ECM when the TCM sets a MIL request DTC(s). If the ECM detects the MIL illumination request signal, this DTC will set.

Condition for Running the DTC

- DTCs U0001 and U0101 are not set.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the MIL illumination is requested by the TCM.

Action Taken When the DTC Sets

- The ECM illuminates MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- Under normal conditions if the TCM sets a DTC that requests the MIL to be illuminated, P0700 will set.

Test Description

The number below refers to the step number on the Circuit/ System Testing.
2. If the TCM has DTCs set that are requesting MIL illumination, diagnose that DTC first.
3. If the TCM has DTCs set, clear the DTCs in the TCM first.

Circuit/ System Testing DTC P0700

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the transmission DTC Information with a scan tool. Are there any transmission DTCs set?	—	Go to Applicable DTC in Automatic Transmission Section	Go to Step 3
3	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 4
4	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P1064 or P1065 (Flash Code 247)

Circuit Description

The fuel rail pressure (FRP) regulator is installed to the fuel supply pump and controls the suction fuel quantity into the fuel rail. The FRP regulator is fully opened in the normal state and larger drive current results in smaller opening. The ECM calculates desired fuel rail pressure and fuel flow rate and it compares the calculated desired fuel rail pressure to the actual value to determine the FRP regulator position. When the actual fuel rail pressure is higher than the desired value, the FRP regulator is closed to decease the flow rate.

If the ECM detects an over current condition on the FRP regulator feedback circuit, DTC P1064 will set.

If the ECM detects an improper voltage level on the FRP regulator control high side circuit, DTC P1065 will set.

Condition for Running the DTC

- DTC P1064 is not set. (DTC P1065)
- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects an over current condition on the FRP regulator feedback circuit. (DTC P1064)
- The ECM detects a low or high voltage condition on the FRP regulator high side circuit. (DTC P1065)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1093 (Flash Code 227)

Description

The common rail fuel system is comprised of two fuel pressure sections: a suction side between the fuel tank and the fuel supply pump and a high-pressure side between the fuel supply pump and the fuel injectors. Fuel is drawn from the fuel tank via a feed pump and then pumped into the fuel rail by two plungers, all of which are internal to the fuel supply pump. This high pressure is regulated by the ECM using the fuel rail pressure (FRP) regulator dependant upon values from the FRP sensor attached to the fuel rail. If the ECM detects that the fuel rail pressure is certain pressure lower than the desired pressure, this DTC will set.

Condition for Running the DTC

- DTC P0087, P0091, P0092, P0192, P0193, P0652, P0653, P0201 - P0204, P1064, P1065, P124B and P2146 - P2151 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The engine is running.
- The FRP regulator commanded fuel flow is more than a threshold.

Condition for Setting the DTC

- The ECM detects that the actual fuel rail pressure is more than 10 to 20 MPa (1,450 to 2,900 psi) below the desired pressure for longer than 5 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- An intermittently sticking FRP regulator may have allowed the fuel pressure to become low enough to set this DTC.
- Normal Fuel Rail Pressure readings on the scan tool with the engine running in neutral at idle is around 27 to 33 MPa (3,900 to 4,800 psi) after warm up.
- A skewed FRP sensor value can set this DTC. The FRP Sensor on the scan tool should read 0.9 to 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 1 minute.

Notice:

- This DTC most likely indicates a loss of fuel pressure by a restricted suction side fuel line. Inspect the suction side fuel restriction between the fuel supply pump and the fuel tank.
- If the fuel tank is empty or near empty, air might be allowed to go into the fuel system. With air in the fuel system, smooth flow of fuel into the supply pump is interrupted and this DTC may set. Perform bleeding of fuel system after refilling.

Circuit/ System Testing DTC P1093

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0087, P0091, P0092, P0192, P0193, P0201 - P0204, P1064, P1065, P1094, P124B or P2146 - P2151 set?	—	Go to Applicable DTC	Go to Step 3

Step	Action	Value(s)	Yes	No
3	1. Turn OFF the ignition. 2. Wait 1 minute for the fuel pressure to bleed down from the fuel rail. 3. Turn ON the ignition, with the engine OFF. DO NOT start the engine. 4. Observe the Fuel Rail Pressure (FRP) Sensor parameter with the scan tool. Does the scan tool indicate within the specified value?	0.9 to 1.0 volt	Go to Step 4	Go to Step 10
4	1. Turn OFF the ignition. 2. Place the transmission in Neutral and set the parking brake. 3. Start the engine. 4. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times. 5. Let idle for at least 3 minutes while observing the DTC Information with a scan tool. Is DTC P1094 set?	—	Go to Step 14	Go to Step 5
5	1. Start the engine. 2. Perform the Cylinder Balance Test with a scan tool. 3. Command each injector OFF and verify an engine speed change for each injector. Is there an injector that does not change engine speed when commanded OFF?	—	Go to Step 12	Go to Step 6
6	1. Check the fuel system line connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, cracks and for the use of proper clamps. **Notice:** Air in the fuel system will cause fuel rail pressure fluctuations especially at high engine speed and load, which may set this DTC. 2. Start the engine and check for high side fuel system leaks at the fuel supply pump and fuel rail. **Notice:** Fuel may leak under the cylinder head cover from the inlet high pressure line. In such case, the engine oil level will rise. Inspect for fuel leakage into the engine oil. 3. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 7

Step	Action	Value(s)	Yes	No
7	**Notice:** Make sure the in-tank fuel pump operation before performing the following procedures. Refer to In-tank Fuel Pump System Check in this section. 1. Turn OFF the ignition. 2. Disconnect the fuel hose from the fuel supply pump suction side. In order to measure the discharged fuel amount, put the hose into a bottle or a container with a scale. (The inlet of a bottle or a container must be larger than the diameter of hose.) 3. Turn ON the ignition for 20 seconds, with the engine OFF. 4. Turn OFF the ignition for 10 seconds. 5. Perform 3 and 4 three times. The accumulated fuel of three ignition cycles must be more than 300 cc. (Normal amount is more than 100 cc per one ignition cycle.) **Notice:** If there is a leak or a restriction on the suction side, the fuel from the hose will not flow out sufficiently that is most likely caused by fuel leakage, clogged fuel filter, kinked or crushed fuel hose or pipe. Also inside the fuel tank for any foreign materials may be getting drawn into the fuel line pickup. 6. Repair fuel system leaking or restrictions as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 8
8	1. Remove the fuel hose that connects to the fuel supply pump suction side and substitute a clear hose. **Notice:** The hose must be cleaned before connecting to the fuel line. Otherwise, foreign material internal to the hose may damage the fuel supply pump. 2. Bleed the fuel system. Repeat as necessary until the engine starts. 3. Let the engine run at idle for at least 1 minute. 4. Observe the clear hose while holding the engine speed higher than 3000 RPM for a minimum of 1 minute. **Notice:** If many air bubbles appear in the fuel, check the fuel line connections between the fuel supply pump and the fuel tank for tightness and all fuel hoses for cuts, cranks and for the uses of proper clamps. 5. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 9

Step	Action	Value(s)	Yes	No
9	1. Turn OFF the ignition. 2. Disconnect the FRP regulator harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP regulator (pins 1 and 2 of E-50). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 34, 50, 54 and 70 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 13
10	1. Turn OFF the ignition. 2. Disconnect the FRP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP sensor (pins 1, 2 and 3 of E-48). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion on at the harness connector of the ECM (pins 47, 48, 68 and 69 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 11
11	Replace the FRP sensor. Refer to FRP sensor Replacement. Did you complete the replacement?	—	Go to Step 15	—
12	**Important:** Replacement fuel injector must be programmed. Replace the appropriate fuel injector that does not change engine speed when commanded OFF. Refer to Fuel Injector Replacement/ Fuel Injector ID Code Data Programming. Did you complete the replacement?	—	Go to Step 15	—
13	**Important:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. **Notice:** Always replace the fuel filter cartridge when a fuel supply pump is replaced. Replace the fuel supply pump and fuel filter cartridge. Refer to Fuel Supply Pump Replacement and Fuel Filter Cartridge Replacement. Did you complete the replacement?	—	Go to Step 15	—

Step	Action	Value(s)	Yes	No
14	**Notice:** There is a possibility that the pressure limiter valve stuck open or opening pressure has fallen. Replace the pressure limiter valve. Refer to Fuel Rail Replacement. Did you complete the replacement?	—	Go to Step 15	—
15	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 16
16	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P1094 (Flash Code 226)

Description

The common rail fuel system is comprised of two fuel pressure sections: a suction side between the fuel tank and the fuel supply pump and a high-pressure side between the fuel supply pump and the fuel injectors. Fuel is drawn from the fuel tank via a feed pump and then pumped into the fuel rail by two plungers, all of which are internal to the fuel supply pump. This high pressure is regulated by the ECM using the fuel rail pressure (FRP) regulator dependant upon values from the FRP sensor attached to the fuel rail.

If the ECM detects that the difference between the actual and the desired fuel pressure is small at low engine speed but the FRP regulator commanded fuel flow is certain amount high, this DTC will set. (FRP Regulator Commanded High DTC)

If the ECM detects that the fuel rail pressure is sharply decreased when fuel cut, this DTC will also set. (Fuel Pressure Drop DTC)

Condition for Running the DTC

FRP Regulator Commanded High DTC

- DTCs P0087, P0091, P0092, P0117, P0118, P0182, P0183, P0192, P0193, P0500, P0501, P0652, P0653, P0201 - P0204, P1064, P1065, P124B and P2146 - P2151 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The accelerator pedal is not depressed.
- The engine coolant temperature is more than 50°C (122°F).
- The vehicle speed is less than 3km/h (2MPH).

Fuel Pressure Drop DTC

- DTCs P0087, P0091, P0092, P0182, P0183, P0192, P0193, P0652, P0653, P0201 - P0204, P1064, P1065, P124B and P2146 - P2151 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The accelerator pedal is not depressed.
- The engine speed is more than 1500RPM.
- The vehicle speed is more than 3km/h (2MPH).

Condition for Setting the DTC

FRP Regulator Commanded High DTC

- The ECM detects that the FRP regulator commanded fuel flow is more than a predetermined range for longer than 10 seconds when the engine speed is near idle speed.

Fuel Pressure Drop DTC

- The ECM detects that the fuel rail pressure is dropped more than a threshold when the commanded fuel is cut.

Action Taken When the DTC Sets

FRP Regulator Commanded High DTC

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Fuel Pressure Drop DTC

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.
- The ECM stops engine running when the vehicle speed is lower than 5 km/h (3 MPH) for 5 seconds. The engine will run after the key is cycled when the ignition has been tuned OFF for longer than 10 seconds.

Condition for Clearing the DTC

FRP Regulator Commanded High DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Fuel Pressure Drop DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- An intermittently sticking FRP regulator may have allowed the fuel pressure to become low enough to set this DTC.
- Normal Fuel Rail Pressure readings on the scan tool with the engine running in neutral at idle is around 27 to 33 MPa (3,900 to 4,800 psi) after warm up.
- A skewed FRP sensor value can set this DTC. The FRP Sensor on the scan tool should read 0.9 to 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 1 minute.

Notice:

- This DTC most likely indicates a loss of fuel pressure by a fuel leak from the high pressure side. Inspect the high pressure side fuel leakage between the fuel supply pump and fuel injector first.
- If the fuel tank is empty or near empty, air might be allowed to go into the fuel system. With air in the fuel system, smooth flow of fuel into the supply pump is interrupted and this DTC may set. Perform bleeding of fuel system after refilling.

Circuit/ System Testing DTC P1094

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Inspect the high pressure side between the fuel supply pump and the fuel injectors for fuel leakage. The following components may contain an external leak. • Fuel supply pump • Fuel rail • Pressure limiter valve • Fuel rail pressure (FRP) sensor • Fuel pipe between the fuel supply pump and fuel rail • Fuel pipe between the fuel rail and fuel injectors • Each fuel pipe sleeve nuts **Notice:** Fuel may leak under the cylinder head cover from the inlet high pressure line. In such case, the engine oil level will rise. Inspect for fuel leakage into the engine oil. **Notice:** Remove and inspect the inlet high pressure joint to the fuel injectors for fuel leaking from the sleeve nut(s). Replace the fuel injector and injection pipe when foreign material was in contact. 2. Repair any fuel system leaks as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 3
3	1. Remove each glow plug from the cylinder head. 2. Inspect for fuel leakage into the combustion chamber. Is there a cylinder that fuel leakage into the combustion chamber?	—	Go to Step 15	Go to Step 4
4	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0087, P0091, P0092, P0192, P0193, P0201 - P0204, P1064, P1065, P124B or P2146 - P2151 set?	—	Go to Applicable DTC	Go to Step 5

Did you find and correct the condition?	—	Go to Step 19	Go to Step 11
11	1. Remove the fuel hose that connects to the fuel supply pump suction side and substitute a clear hose. **Notice:** The hose must be cleaned before connecting to the fuel line. Otherwise, foreign material internal to the hose may damage the fuel supply pump. 2. Bleed the fuel system. Repeat as necessary until the engine starts. 3. Let the engine run at idle for at least 1 minute. 4. Observe the clear hose while holding the engine speed higher than 3000 RPM for a minimum of 1 minute. **Notice:** If many air bubbles appear in the fuel, check the fuel line connections between the fuel supply pump and the fuel tank for tightness and all fuel hoses for cuts, cranks and for the uses of proper clamps. 5. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 12

Step	Action	Value(s)	Yes	No
12	1. Turn OFF the ignition. 2. Disconnect the FRP regulator harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP regulator (pins 1 and 2 of E-50). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 34, 50, 54 and 70 of E-90). 6. Test for high resistance on each FRP regulator circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 17
13	1. Turn OFF the ignition. 2. Disconnect the FRP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the FRP sensor (pins 1, 2 and 3 of E-48). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 47, 48, 68 and 69 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 19	Go to Step 14
14	Replace the FRP sensor. Refer to FRP sensor Replacement. Did you complete the replacement?	—	Go to Step 19	—
15	**Important:** Replacement fuel injector must be programmed. Replace the appropriate fuel injector that was leaking fuel found at Step 3 and inspect the engine mechanical for any damage or poor engine compression. Refer to Fuel Injector Replacement/ Fuel Injector ID Code Data Programming and engine mechanical section. Did you complete the replacement?	—	Go to Step 19	—
16	**Important:** Replacement fuel injector must be programmed. Replace the appropriate fuel injector that does not change engine speed when commanded OFF. Refer to Fuel Injector Replacement/ Fuel Injector ID Code Data Programming. Did you complete the replacement?	—	Go to Step 19	—

Step	Action	Value(s)	Yes	No
17	**Important:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. **Notice:** Always replace the fuel filter cartridge when a fuel supply pump is replaced. Replace the fuel supply pump and fuel filter cartridge. Refer to Fuel Supply Pump Replacement and Fuel Filter Cartridge Replacement. Did you complete the replacement?	—	Go to Step 19	—
18	**Notice:** There is a possibility that the pressure limiter valve stuck open or opening pressure has fallen. Replace the pressure limiter valve. Refer to Fuel Rail Replacement. Did you complete the replacement?	—	Go to Step 19	—
19	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 20
20	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P1196, P1197 or P1198 (Flash Code 461)

Circuit Description

The ECM controls the intake throttle valve opening based on the engine running condition and by controlling the intake throttle solenoid. The intake throttle valve position is detected by the position sensor, and relayed to the ECM. If the ECM detects an excessively high temperature condition in its internal intake throttle solenoid drive circuit for certain length of time, DTC P1196, P1197 or P1198 will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects an excessively high temperature in its internal intake throttle solenoid drive circuit for longer than 30 seconds. (DTC P1196)
- The ECM detects an excessively high temperature in its internal intake throttle solenoid drive circuit for longer than 60 seconds in accumulation time during same ignition cycle. (DTC P1197)
- The ECM detects an excessively high temperature in its internal intake throttle solenoid drive circuit for longer than 120 seconds in accumulation time exceeding ignition cycle. (DTC P1198)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- A sticking or intermittently sticking intake throttle valve may set this DTC.

Circuit/ System Testing DTC P1196, P1197 or P1198

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0638 also set?	—	Go to DTC P0638	Go to Step 3
3	1. Perform the Intake Throttle Solenoid Control with a scan tool several times. 2. Command the Desired Intake Throttle Position Increase and Decrease while observing the Intake Throttle Position. Does the Intake Throttle Position parameter follow within the specified value quick enough (compare with a similar unit if available)?	± 5%	Go to Diagnostic Aids	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Remove the intake duct that is connected to the intake throttle valve. 2. Inspect the intake throttle valve for the following conditions: • Restricted intake throttle valve by foreign materials • Excessive deposits at throttle bore • Bent butterfly valve **Notice:** Replace the intake throttle valve if there is any sticking. 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Step 5
5	Replace the intake throttle valve. Refer to Intake Throttle Valve Replacement. Did you complete the replacement?	—	Go to Step 6	—
6	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 7	Go to Step 9
7	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 8	—
8	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 9
9	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P124B (Flash Code 157)

Circuit Description

The ECM calculates the optimum fuel injection ON time using data sent from various engine sensors. The common 1 and common 2 fuel injector charge voltage circuit is a high-voltage supply which drives fuel injectors for each cylinder in conjunction with the ECM grounding the fuel injector solenoid control circuit. If the fuel injector charge voltage circuit or solenoid control circuit is shorted across the bank, this DTC will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The engine speed is lower than 2000RPM.

Condition for Setting the DTC

- The ECM detects that the fuel injector charge voltage circuit or solenoid control circuit is shorted across the bank.

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1261 (Flash Code 34)

Circuit Description

The charge up circuit in the ECM steps up the voltage for fuel injectors and is divided into two banks, common 1 and common 2. The common 1 covers fuel injectors in cylinders #1 and #4, and the common 2 covers fuel injectors in cylinders #2 and #3.
If the common 1 fuel injector charge up circuit in the ECM is an insufficient charge or an overcharge, this DTC will set. (Charge Up Voltage DTC)
If the supply voltage to the common 1 and common 2 fuel injector charge up circuits is an excessively low or high voltage, this DTC will also set. (Supply Voltage Low or High DTC)

Condition for Running the DTC

Charge Up Voltage DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The engine is not running.

Supply Voltage Low or High DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

Charge Up Voltage DTC

- The ECM detects that the common 1 fuel injector charge up circuit is an insufficient charge or an overcharge.

Supply Voltage Low or High DTC

- The ECM detects that the supply voltage to the common 1 and common 2 fuel injector charge up circuits is an excessively low or high voltage.

Action Taken When the DTC Sets

Charge Up Voltage DTC & Supply Voltage Low DTC

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits cruise control.

Supply Voltage High DTC

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

Charge Up Voltage DTC & Supply Voltage Low DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A

Supply Voltage High DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1262 (Flash Code 34)

Circuit Description

The charge up circuit in the ECM steps up the voltage for fuel injectors and is divided into two banks, common 1 and common 2. The common 1 covers fuel injectors in cylinders #1 and #4, and the common 2 covers fuel injectors in cylinders #2 and #3. If the common 2 fuel injector charge up circuit in the ECM is an insufficient charge or an overcharge, this DTC will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The engine is not running.

Condition for Setting the DTC

- The ECM detects that the common 2 fuel injector charge up circuit is an insufficient charge or an overcharge.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P1404 (Flash Code 45)

Circuit Description

The ECM controls the EGR valve opening based on the engine running condition and by controlling the EGR solenoid. The EGR valve position is detected by the position sensor, and relayed to the ECM.
If the ECM detects that the actual EGR position is higher than certain amount, this DTC will set. (Closed Position Error DTC)
If the ECM detects a variance between the learned closed position and actual closed position, this DTC will also set. (Learned Position Error DTC)

Condition for Running the DTC

Closed Position Error DTC

- DTCs P0112, P0113, P0116, P0117, P0118, P0404 P0405, P0406, P0652, P0653, P2227, P2228 and P2229 are not set.
- The battery voltage is between 10 to 16 volts.
- The ignition switch is ON.
- The engine coolant temperature is between 20 to 110 °C (68 to 230 °F).
- The intake air temperature is between 0 to 110 °C (32 to 230 °F).
- The barometric pressure is between 60 to 120 kPa (8.7 to 17.4 psi)

Learned Position Error DTC

- DTCs P0404, P0405 and P0406 are not set.

Condition for Setting the DTC

Closed Position Error DTC

- The ECM detects that the actual EGR position is more than 20% for 5 seconds when the EGR control is commanded OFF.

Learned Position Error DTC

- The ECM detects that the EGR learned minimum position is more than 10% or less than -10% when the ignition switch is OFF.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits EGR control. (Closed Position Error DTC)
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- A sticking or intermittently sticking EGR valve may set this DTC.

DTC P1411, P1412 or P1413 (Flash Code 445)

Circuit Description

The ECM controls the EGR valve opening based on the engine running condition and by controlling the EGR solenoid. The EGR valve position is detected by the position sensor, and relayed to the ECM. If the ECM detects an excessively high temperature condition in its internal EGR solenoid drive circuit for certain length of time, DTC P1411, P1412 or P1413 will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects an excessively high temperature in its internal EGR solenoid drive circuit for longer than 30 seconds. (DTC P1411)
- The ECM detects an excessively high temperature in its internal EGR solenoid drive circuit for longer than 60 seconds in accumulation time during same ignition cycle. (DTC P1412)
- The ECM detects an excessively high temperature in its internal EGR solenoid drive circuit for longer than 120 seconds in accumulation time exceeding ignition cycle. (DTC P1413)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits pilot injection.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- A sticking or intermittently sticking EGR valve may set this DTC.

DTC P156A or P156B (Flash Code 135)

Circuit Description

The ECM monitors the battery voltage on the ECM main relay voltage feed terminal to make sure that the voltage stays within the proper range. If the ECM detects an excessively low or high battery voltage, DTC P156A or P156B will set.

Condition for Running the DTC

- The ignition voltage is more than 9 volts. (DTC P156B)

Condition for Setting the DTC

- The ECM detects that the battery voltage feed circuit is less than 8 volts for 20 seconds. (DTC P156A)
- The ECM detects that the battery voltage feed circuit is more than 16 volts for 5 seconds. (DTC P156B)

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity. (DTC P156B)
- The ECM inhibits pilot injection. (DTC P156B)
- The ECM inhibits cruise control. (DTC P156B)

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- A charging system problem may set this DTC.
- The weakened battery may set DTC P156A.
- Jump starting the vehicle or a battery charger may have set DTC P156B.

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing DTC P156A

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine and let idle. 4. Load the electrical system by turning ON the headlights, A/C, etc. while observing the Battery Voltage parameter with a scan tool. Does the scan tool indicate more than the specified value?	10.0 volts	Go to Diagnostic Aids	Go to Step 3
3	Test the charging system. Refer to Diagnosis of The Charging System in the Charging System Section. Did you find a charging system problem?	—	Go to Step 4	Go to Step 5
4	Repair the charging system. Refer to Diagnosis of The Charging System in the Charging System Section. Did you complete the repair?	—	Go to Step 6	—

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent, for a poor connection and for corrosion at the harness connector of the ECM (pin 73 of C-58). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 6	Go to Diagnostic Aids
6	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and let idle. 5. Load the electrical system by turning ON the headlights, A/C, etc. while observing the Battery Voltage parameter with a scan tool. Does the scan tool indicate more than the specified value?	10.0 volts	Go to Step 7	Go to Step 3
7	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P156B

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	Was the vehicle recently jump started or a battery charger placed on the battery?	—	Go to Step 7	Go to Step 3
3	1. Install a scan tool. 2. Start the engine and let idle. 3. Observe the Battery Voltage parameter with the scan tool. Does the scan tool indicate less than the specified value?	16.0 volts	Go to Diagnostic Aids	Go to Step 4
4	Test the charging system. Refer to Diagnosis of The Charging System in the Charging System Section. Did you find a charging system problem?	—	Go to Step 5	Go to Diagnostic Aids
5	Repair the charging system. Refer to Diagnosis of The Charging System in the Charging System Section. Did you complete the repair?	—	Go to Step 6	—

Step	Action	Value(s)	Yes	No
6	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine and let idle. 5. Observe the Battery Voltage parameter with a scan tool. Does the scan tool indicate less than the specified value?	16.0 volts	Go to Step 7	Go to Step 4
7	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

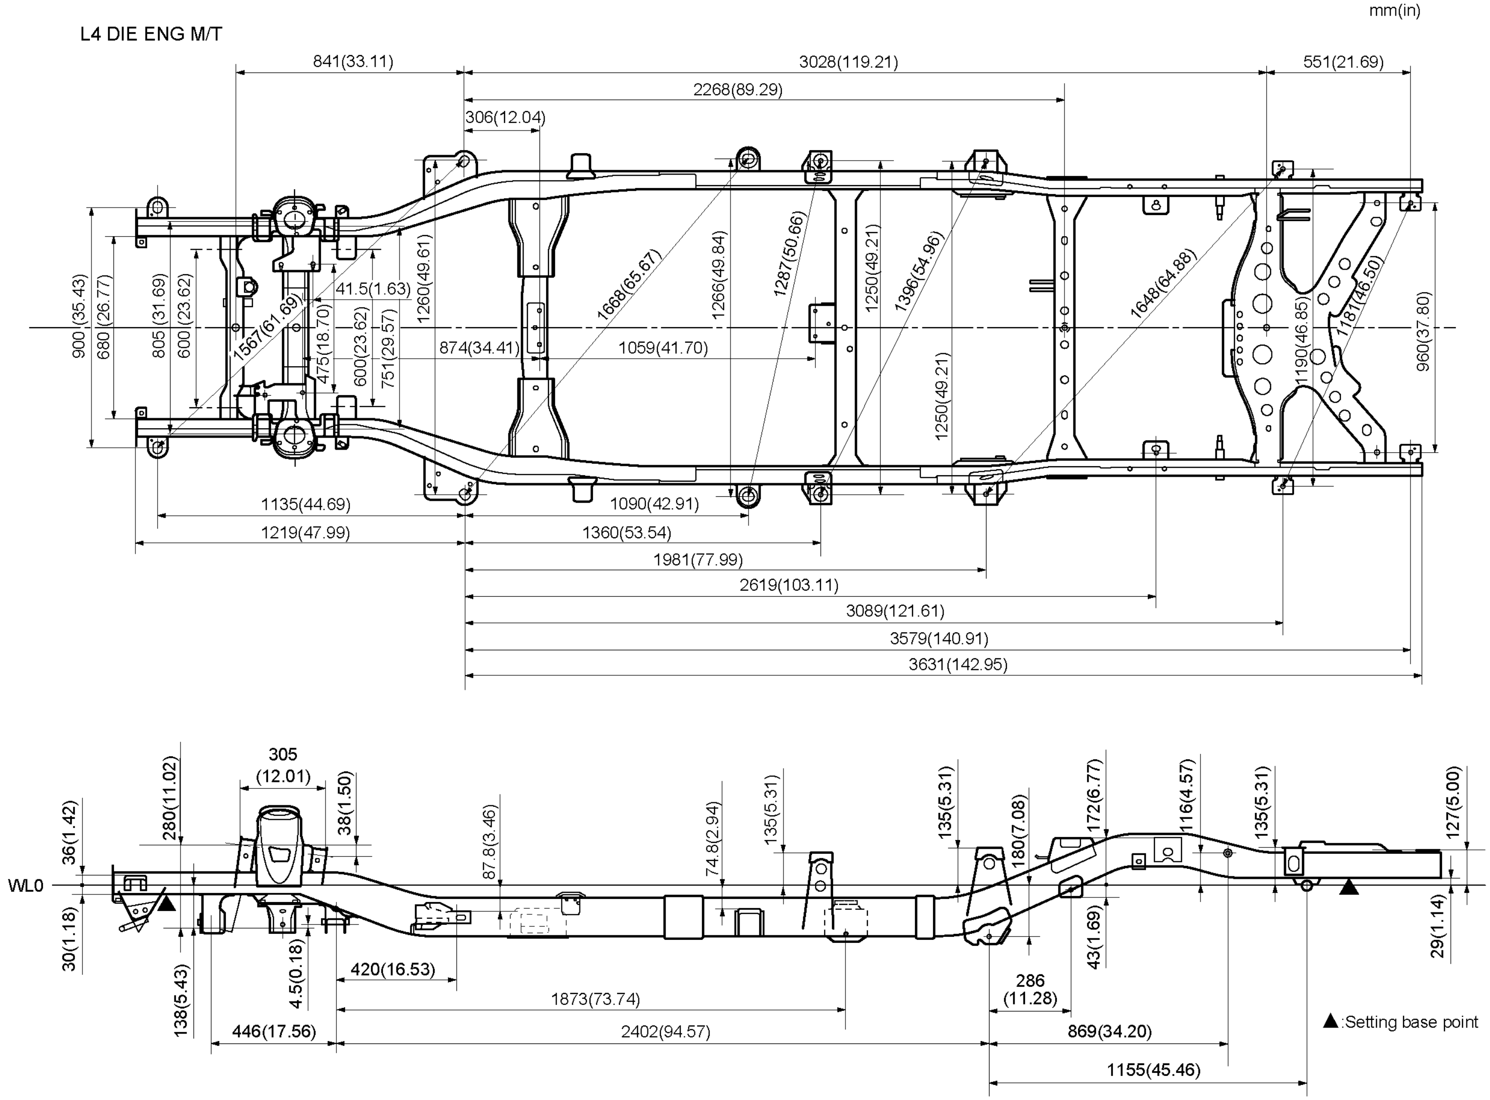
This illustration is based on the RHD model.

mm(in)



RTW72AXF002601

DTC P161B (Flash Code 179)

Circuit Description

The ECM communicates with the immobilizer control unit (ICU) to execute immobilizer function. The ECM transmits a specific request signal to the ICU and the ICU sends back a response signal to the ECM. Both communication signals are carried out via a controller area network (CAN) communication bus. If the ECM receives a wrong response signal from the ICU, this DTC will set.

Condition for Setting the DTC

- The ECM receives a wrong immobilizer response signal from the ICU.

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electromagnetic interference may affect intermittent condition.

Circuit/ System Testing DTC P161B

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Is DTC P0633, U0001 or U0167 also set?	—	Go to Applicable DTC	Go to Step 3
3	Monitor the immobilizer DTC Information with a scan tool. Does the immobilizer DTCs fail this ignition which begin with B or U?	—	Go to Applicable DTC in Immobilizer Section	Go to Step 4
4	Program immobilizer security information into the ECM. Refer to Resetting and Programming Guidelines in immobilizer section. Did you find and correct the condition?	—	Go to Step 6	Go to Step 5
5	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 6	—

Step	Action	Value(s)	Yes	No
6	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 7
7	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P1621 (Flash Code 54, 254)

Circuit Description

The electrically erasable & programmable read only memory (EEPROM) memorizes learning data, VIN data and immobilzer security information. If the ECM detects an error in either of their data, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

Either of following condition is met:

- The ECM detects a faulty learning data in its internal EEPROM. (Flash Code 54)
- The ECM detects a faulty VIN data or immobilizer security information in its internal EEPROM. (Flash Code 254)

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity. (Flash Code 54)
- The ECM inhibits cruise control. (Flash Code 54)

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Circuit/ System Testing DTC P1621

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Ensure that all tool connections are secure. 2. Ensure that programming equipment is operating correctly. 3. Install a scan tool. 4. Turn OFF the ignition for 30 seconds. 5. Turn ON the ignition, with the engine OFF. 6. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
3	1. Verify the correct VIN and immobilizer code are entered into the ECM with a scan tool. Refer to ECM Replacement. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. Does the DTC fail this ignition?	—	Go to Step 4	Go to Step 5
4	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 5	—

Step	Action	Value(s)	Yes	No
5	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 6
6	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P1664 (Flash Code 76)

Circuit Description

The service vehicle soon (SVS) lamp is located on the instrument panel (IP) cluster. The SVS lamp informs the driver that a non-emission related fault has occurred and vehicle service required.
The ECM monitors the SVS lamp control circuit for conditions that are incorrect for the commanded state of the SVS lamp. For example, a failure condition exists if the ECM detects low voltage when the SVS lamp is commanded OFF, or high voltage when the SVS lamp is commanded ON. If the ECM detects an improper voltage level on the control circuit, this DTC will set.

Condition for Running the DTC

- The ignition voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

Low Voltage DTC

- The ECM detects a low voltage condition on the SVS lamp control circuit when the lamp is commanded OFF.

High Voltage DTC

- The ECM detects a high voltage condition on the SVS lamp control circuit when the lamp is commanded ON.

Action Taken When the DTC Sets

Low Voltage DTC

- The ECM will not illuminate the MIL or SVS lamp.
- Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type D.

High Voltage DTC

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C.

Condition for Clearing the DTC

Low Voltage DTC

- Refer to DTC Type Definitions for Condition for Clearing the DTC - Type D.

High Voltage DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing DTC P1664

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Verify whether the instrument panel (IP) cluster is operational. 2. Install a scan tool. 3. Perform the Service Vehicle Soon (SVS) Lamp Control with a scan tool. 4. Command the lamp ON and OFF. Does the SVS lamp turn ON and OFF with each command?	—	Go to Diagnostic Aids	Go to Step 3
3	1. Turn OFF the ignition. 2. Inspect the Meter (10A) fuse in the cabin fuse block. Is the Meter (10A) fuse open?	—	Go to Step 4	Go to Step 5
4	Replace the Meter (10A) fuse. If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the Meter (10A) fuse or replace the shorted attached component. Did you complete the repair?	—	Go to Step 17	—

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Disconnect the ECM J-2 (C-58) harness connector. 3. Turn ON the ignition, with the engine OFF. Is the SVS lamp OFF?	—	Go to Sep 6	Go to Step 12
6	1. Remove the Meter (10A) fuse that supplies voltage to the SVS lamp. 2. Turn ON the ignition, with the engine OFF. 3. Measure the voltage from the SVS lamp control circuit in the ECM harness connector (pin 71 of C-58) to a known good ground. Is the voltage less than the specified value?	1 volt	Go to Step 7	Go to Step 13
7	1. Turn OFF the ignition. 2. Reinstall the Meter (10A) fuse. 3. Turn ON the ignition, with the engine OFF. 4. Connect a 3-amp fused jumper wire between the ECM harness connector (pin 71 of C-58) and a known good ground. Is the SVS lamp illuminated?	—	Go to Step 11	Go to Step 8
8	1. Turn OFF the ignition. 2. Remove the IP cluster. 3. Connect a test lamp between the ignition voltage feed circuit of the IP cluster harness connector (pin 8 of B-24) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 14
9	1. Test the control circuit between the ECM (pin 71 of C-58) and the IP cluster (pin 26 of B-23) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 10
10	1. Inspect for an intermittent and for poor connections at the harness connector of the IP cluster (pin 8 of B-24 and pin 26 of B-23). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 15
11	1. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 71 of C-58). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 16
12	Repair the short to ground between the ECM (pin 71 of C-58) and the IP cluster (pin 26 of B-23). Did you complete the repair?	—	Go to Step 17	—
13	Repair the short to battery or ignition voltage between the ECM (pin 71 of C-58) and the IP cluster (pin 26 of B-23). Did you complete the repair?	—	Go to Step 17	—

Step	Action	Value(s)	Yes	No
14	Repair the open circuit or high resistance on the ignition voltage feed circuit between the Meter (10A) fuse and the IP cluster (pin 8 of B-24). Did you complete the repair?	—	Go to Step 17	—
15	Repair or replace the IP cluster. Did you complete the repair or replacement?	—	Go to Step 17	—
16	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 17	—
17	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Perform the SVS Lamp Control with a scan tool. 5. Command the lamp ON and OFF. Does the SVS lamp turn ON and OFF with each command?	—	Go to Step 18	Go to Step 3
18	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P2100, P2101 or P2103 (Flash Code 446)

Circuit Description

The ECM controls the intake throttle valve opening based on the engine running condition and by controlling the intake throttle solenoid. The intake throttle valve position is detected by the position sensor, and relayed to the ECM. If the ECM detects an open circuit or short circuit on the solenoid circuits, DTC P2100, P2101 or P2103 will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects an open circuit on the intake throttle solenoid circuits. (DTC P2100)
- The ECM detects a short to ground on the intake throttle solenoid circuits. (DTC P2101)
- The ECM detects a short to voltage circuit on the intake throttle solenoid circuits. (DTC P2103)

Action Taken When the DTC Sets

- The ECM illuminates the MIL on the second consecutive driving cycle when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type B. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM inhibits EGR control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type B (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Circuit/ System Testing DTC P2100, P2101 or P2103

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Disconnect the intake throttle valve harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Connect a DMM between the drive voltage circuit (pin 2 of E-38) and a known good ground. 5. Connect a DMM between the low side circuit (pin 1 of E-38) and a known good ground. Are both voltage readings within the specified value?	1.4 to 1.8 volts	Go to Step 5	Go to Step 4
4	Is the DMM voltage more than the specified value at Step 3?	—	Go to Step 7	Go to Step 6

Step	Action	Value(s)	Yes	No
5	1. Test the circuits between the ECM (pins 55 and 56 of E-90) and the intake throttle valve (pins 1 and 2 of E-38) for a short circuit each other. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 8
6	1. Test the circuits (which ever voltage reading did not read within the specified value at Step 3) between the ECM (pins 55 and 56 of E-90) and the intake throttle valve (pins 1 and 2 of E-38) for the following conditions: • An open circuit • A short to ground • A short to the position sensor low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
7	1. Test the circuits (which ever voltage reading did not read within the specified value at Step 3) between the ECM (pins 55 and 56 of E-90) and the intake throttle valve (pins 1 and 2 of E-38) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
8	1. Inspect for an intermittent and for poor connections at the harness connector of the intake throttle valve (pins 1 and 2 of E-38). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 55 and 56 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
10	Replace the intake throttle valve. Refer to Intake Throttle Valve Replacement. Did you complete the replacement?	—	Go to Step 10	—
11	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 12	—

Step	Action	Value(s)	Yes	No
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 13
13	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

RTW72AXF002701

BACK TO CHAPTER INDEX

ISUZU KB P190 2007
TO MODEL INDEX

DTC P2122 or P2123 (Flash Code 121)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal control assembly. The sensor is made up of three individual sensors within one housing. The ECM uses the APP sensors to determine the amount of acceleration or deceleration that is desired. The APP sensor 1 has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor 1 signal circuit

The APP sensor 1 provides a signal to the ECM on the signal circuit, which is relative to the position changes of the accelerator pedal angle. If the ECM detects an excessively low or high signal voltage, DTC P2122 or P2123 will set.

Condition for Running the DTC

- DTCs P0642 and P0643 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the APP sensor 1 signal voltage is less than 0.15 volts. (DTC P2122)
- The ECM detects that the APP sensor 1 signal voltage is more than 4.85 volts. (DTC P2123)

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- APP sensor 1 may have an intermittent open somewhere in the pedal range.

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing DTC P2122

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0642 also set?	—	Go to DTC P0642	Go to Step 3
3	Fully depress and release the accelerator pedal while observing the Accelerator Pedal Position (APP) Sensor 1 parameter with a scan tool. Does the scan tool indicate less than the specified value during depressing or releasing the pedal?	0.2 volts	Go to Step 4	Go to Diagnostic Aids

Step	Action	Value(s)	Yes	No
4	1. Turn OFF the ignition. 2. Disconnect the APP sensor harness connector. 3. Connect a DMM between the 5 volts reference circuit (pin 10 of C-40) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 5	Go to Step 6
5	Connect a 3-amp fused jumper wire between the 5 volts reference circuit and the signal circuit (pins 5 and 10 of C-40). Is the APP Sensor 1 parameter more than the specified value?	4.7 volts	Go to Step 8	Go to Step 7
6	1. Test the 5 volts reference circuit between the ECM (pin 11 of C-58) and the APP sensor (pin 10 of C-40) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
7	1. Test the signal circuit between the ECM (pin 12 of C-58) and the APP sensor (pin 5 of C-40) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
8	1. Inspect for an intermittent and for poor connections at the harness connector of the APP sensor (pins 5 and 10 of C-40). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 11 and 12 of C-58). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
10	Replace the APP sensor. Refer to APP Sensor Replacement. Did you complete the replacement?	—	Go to Step 12	—
11	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 12	—

Step	Action	Value(s)	Yes	No
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Fully depress and release the accelerator pedal while observing the APP Sensor 1 parameter with the scan tool. Does the scan tool indicate less than the specified value during depressing or releasing the pedal?	0.2 volts	Go to Step 3	Go to Step 13
13	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P2123

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Fully depress and release the accelerator pedal while observing the Accelerator Pedal Position (APP) Sensor 1 parameter with a scan tool. Does the scan tool indicate more than the specified value during depressing or releasing the pedal?	4.8 volts	Go to Step 3	Go to Diagnostic Aids
3	Monitor the DTC Information with a scan tool. Is DTC P0643 also set?	—	Go to Step 4	Go to Step 5
4	1. Turn OFF the ignition. 2. Disconnect the APP sensor harness connector. 3. Turn ON the ignition, with the engine OFF. Is the APP Sensor 1 parameter less than the specified value?	0.1 volts	Go to DTC P0643	Go to Step 7
5	1. Turn OFF the ignition. 2. Disconnect the APP sensor harness connector. 3. Turn ON the ignition, with the engine OFF. Is the APP Sensor 1 parameter less than the specified value?	0.1 volts	Go to Step 6	Go to Step 7
6	Connect a test lamp between the low reference circuit (pin 4 of C-40) and battery voltage. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 8

Step	Action	Value(s)	Yes	No
7	**Important:** The APP sensor 1 may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the ECM (pin 12 of C-58) and the APP sensor (pin 5 of C-40) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	1. Test the low reference circuit between the ECM (pin 27 of C-58) and the APP sensor (pin 4 of C-40) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10
9	1. Inspect for an intermittent and for a poor connection at the harness connector of the APP sensor (pin 4 of C-40). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 27 of C-58). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
11	Replace the APP sensor. Refer to APP Sensor Replacement. Did you complete the replacement?	—	Go to Step 13	—

DTC P2127 or P2128 (Flash Code 122)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal control assembly. The sensor is made up of three individual sensors within one housing. The ECM uses the APP sensors to determine the amount of acceleration or deceleration that is desired. The APP sensor 2 has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor 2 signal circuit

The APP sensor 2 provides a signal to the ECM on the signal circuit, which is relative to the position changes of the accelerator pedal angle. If the ECM detects an excessively low or high signal voltage, DTC P2127 or P2128 will set.

Condition for Running the DTC

- DTCs P0652 and P0653 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the APP sensor 2 signal voltage is less than 0.15 volts. (DTC P2127)
- The ECM detects that the APP sensor 2 signal voltage is more than 4.85 volts. (DTC P2128)

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- APP sensor 2 may have an intermittent open somewhere in the pedal range.

Circuit/ System Testing DTC P2127

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0652 also set?	—	Go to DTC P0652	Go to Step 3
3	Fully depress and release the accelerator pedal while observing the Accelerator Pedal Position (APP) Sensor 2 parameter with a scan tool. Does the scan tool indicate less than the specified value during depressing or releasing the pedal?	0.2 volts	Go to Step 4	Go to Diagnostic Aids
4	1. Turn OFF the ignition. 2. Disconnect the APP sensor harness connector. 3. Turn ON the ignition, with the engine OFF. Is the APP Sensor 2 parameter more than the specified value?	4.7 volts	Go to Step 5	Go to Step 6

Step	Action	Value(s)	Yes	No
5	Connect a DMM between the 5 volts reference circuit (pin 8 of C-40) and a known good ground. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 8	Go to Step 7
6	1. Test the signal circuit between the ECM (pin 10 of C-58) and the APP sensor (pin 9 of C-40) for the following conditions: • A short to ground • A short to the low reference circuit 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
7	1. Test the 5 volts reference circuit between the ECM (pin 9 of C-58) and the APP sensor (pin 8 of C-40) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
8	1. Inspect for an intermittent and for a poor connection at the harness connector of the APP sensor (pin 8 of C-40). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 9 of C-58). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
10	Replace the APP sensor. Refer to APP Sensor Replacement. Did you complete the replacement?	—	Go to Step 12	—
11	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 12	—
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Fully depress and release the accelerator pedal while observing the APP Sensor 2 parameter with the scan tool. Does the scan tool indicate less than the specified value during depressing or releasing the pedal?	0.2 volts	Go to Step 3	Go to Step 13
13	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P2128

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0653 also set?	—	Go to DTC P0653	Go to Step 3
3	Fully depress and release the accelerator pedal while observing the Accelerator Pedal Position (APP) Sensor 2 parameter with a scan tool. Does the scan tool indicate more than the specified value during depressing or releasing the pedal?	4.8 volts	Go to Step 4	Go to Diagnostic Aids
4	1. Turn OFF the ignition. 2. Disconnect the APP sensor harness connector. 3. Connect a DMM between the signal circuit (pin 9 of C-40) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	5.3 volts	Go to Step 10	Go to Step 5
5	1. Connect a test lamp between the signal circuit of the sensor 2 harness (pin 9 of C-40) and a known good ground. 2. Connect a DMM between the probe of the test lamp and a known good ground. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 9	Go to Step 6
6	Connect a 3-amp fused jumper wire between the signal circuit and the low reference circuit of the sensor 2 harness (pins 3 and 9 of C-40). Is the APP Sensor 2 parameter less than the specified value?	0.2 volts	Go to Step 11	Go to Step 7
7	1. Test the low reference circuit between the ECM (pin 25 of C-58) and the APP sensor (pin 3 of C-40) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 8
8	1. Test the signal circuit between the ECM (pin 10 of C-58) and the APP sensor (pin 9 of C-40) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 12
9	1. Test the signal circuit between the ECM (pin 10 of C-58) and the APP sensor (pin 9 of C-40) for short to any 5 volts reference circuit. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14

Step	Action	Value(s)	Yes	No
10	**Important:** The APP sensor 2 may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the ECM (pin 10 of C-58) and the APP sensor (pin 9 of C-40) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
11	1. Inspect for an intermittent and for poor connections at the harness connector of the APP sensor (pins 3 and 9 of C-40). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 13
12	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 10 and 25 of C-58). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
13	Replace the APP sensor. Refer to APP Sensor Replacement. Did you complete the replacement?	—	Go to Step 15	—
14	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 15	—
15	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Fully depress and release the accelerator pedal while observing the APP Sensor 2 parameter with the scan tool. Does the scan tool indicate more than the specified value during depressing or releasing the pedal?	4.8 volts	Go to Step 3	Go to Step 16
16	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P2132 or P2133 (Flash Code 123)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal control assembly. The sensor is made up of three individual sensors within one housing. The ECM uses the APP sensors to determine the amount of acceleration or deceleration that is desired. The APP sensor 3 has the following circuits.

- 5 volts reference circuit
- Low reference circuit
- APP sensor 3 signal circuit

The APP sensor 3 provides a signal to the ECM on the signal circuit, which is relative to the position changes of the accelerator pedal angle. If the ECM detects an excessively low or high signal voltage, DTC P2132 or P2133 will set.

Condition for Running the DTC

- DTCs P0698 and P0699 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the APP sensor 3 signal voltage is less than 1.2 volts. (DTC P2132)
- The ECM detects that the APP sensor 3 signal voltage is more than 4.85 volts. (DTC P2133)

Action Taken When the DTC Sets

DTC P2132

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity.
- The ECM inhibits cruise control.

DTC P2133

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

DTC P2132

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

DTC P2133

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- APP sensor 3 may have an intermittent open somewhere in the pedal range.

DTC P2138, P2139 or P2140 (Flash Code 124, 125 or 126)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal control assembly. The sensor is made up of three individual sensors within one housing. The APP sensor 1, APP sensor 2 and APP sensor 3 are potentiometer type sensors, each with the following circuits.

- 5 volts reference circuit
- Low reference circuit
- Signal circuit

The APP sensor provides a signal to the ECM on the signal circuits, which is relative to the position changes of the accelerator pedal angle. The APP sensor 1 signal voltage is low at rest and increases as the pedal is depressed. The APP sensor 2 and APP sensor 3 signal voltage is high at rest and decreases as the pedal is depressed. If the ECM detects that each APP sensor signal voltage is out of the correlation, DTC P2138, P2139 or P2140 will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The APP sensor 1 signal voltage is between 0.15 to 4.85 volt. (DTC P2138 or P2139)
- The APP sensor 2 signal voltage is between 0.15 to 4.85 volt. (DTC P2138 or P2140)
- The APP sensor 3 signal voltage is between 1.20 to 4.85 volt. (DTC P2139 or P2140)

Condition for Setting the DTC

- The ECM detects that the APP sensor 1 and 2 are more than 40% out of range of each other. (DTC P2138)
- The ECM detects that the APP sensor 1 and 3 are more than 40% out of range of each other. (DTC P2139)
- The ECM detects that the APP sensor 2 and 3 are more than 40% out of range of each other. (DTC P2140)

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)
- The ECM limits fuel injection quantity.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Circuit/ System Testing DTC P2138

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0642, P0643, P0652, P0653, P0698, P0699, P2132 or P2133 also set?	—	Go to Applicable DTC	Go to Step 3
3	Fully depress and release the accelerator pedal while observing the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 4	Go to Diagnostic Aids
4	Is DTC P2140 also set?	—	Go to Step 6	Go to Step 5
5	Is DTC P2139 also set?	—	Go to Step 7	Go to Step 8

Step	Action	Value(s)	Yes	No
6	1. Test each accelerator pedal position (APP) sensor 2 circuits between the ECM (pins 9, 10 and 25 of C-58) and the APP sensor (pins 3, 8 and 9 of C-40) for high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 7
7	1. Test each APP sensor 1 circuits between the ECM (pins 11, 12 and 27 of C-58) and the APP sensor (pins 4, 5 and 10 of C-40) for high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 8
8	1. Test each APP sensor 3 circuits between the ECM (pins 7, 8 and 23 of C-58) and the APP sensor (pins 1, 6 and 7 of C-40) for high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 9
9	1. Turn OFF the ignition. 2. Disconnect the APP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the APP sensor (pins 1, 3, 4, 5, 6, 7, 8, 9 and 10 of C-40). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 7, 8, 9, 10, 11, 12, 23, 25 and 27 of C-58). 6. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 10
10	1. Test the APP sensor 1 and sensor 3 signal circuit between the ECM (pins 8 and 12 of C-58) and the APP sensor (pins 5 and 6 of C-40) for a short circuit each other. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 11
11	Replace the APP sensor. Refer to APP Sensor Replacement. Did you complete the replacement?	—	Go to Step 12	—
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Fully depress and release the accelerator pedal while observing the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 13	Go to Step 15

Step	Action	Value(s)	Yes	No
13	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 14	—
14	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Fully depress and release the accelerator pedal while observing the DTC Information with a scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 15
15	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P2139

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0642, P0643, P0652, P0653, P0698, P0699, P2127 or P2128 also set?	—	Go to Applicable DTC	Go to Step 3
3	Fully depress and release the accelerator pedal while observing the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 4	Go to Diagnostic Aids
4	Is DTC P2138 also set?	—	Go to DTC P2138	Go to Step 5
5	Is DTC P2140 also set?	—	Go to DTC P2140	Go to Step 6
6	1. Test each accelerator pedal position (APP) sensor 2 circuits between the ECM (pins 9, 10 and 25 of C-58) and the APP sensor (pins 3, 8 and 9 of C-40) for high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 7

Step	Action	Value(s)	Yes	No
7	1. Turn OFF the ignition. 2. Disconnect the APP sensor harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the APP sensor (pins 3, 8 and 9 of C-40). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 9, 10 and 25 of C-58). 6. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 8
8	1. Test the APP sensor 1 and sensor 2 signal circuit between the ECM (pins 10 and 12 of C-58) and the APP sensor (pins 5 and 9 of C-40) for a short circuit each other. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
9	Replace the APP sensor. Refer to APP Sensor Replacement. Did you complete the replacement?	—	Go to Step 10	—
10	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Fully depress and release the accelerator pedal while observing the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 11	Go to Step 13
11	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 12	—
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Fully depress and release the accelerator pedal while observing the DTC Information with a scan tool. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 13
13	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P2140

Step	Action	Value(s)	Yes	No

DTC P2146, P2147 or P2148 (Flash Code 158)

Circuit Description

The ECM calculates the optimum fuel injection ON time using data sent from various engine sensors. The common 1 fuel injector charge voltage circuit is a high-voltage supply which drives fuel injectors for cylinder #1 and #4 in conjunction with the ECM grounding the fuel injector solenoid control circuit. If the common 1 fuel injector charge voltage circuit is shorted to cylinder #1 or #4 fuel injector solenoid control circuit, shorted to ground or shorted voltage circuit DTC P2146, P2147 or P2148 will set. If the cylinder #1 and #4 fuel injector solenoid control circuit is shorted each other, shorted to ground or shorted voltage circuit DTC P2146, P2147 or P2148 will also set.

Condition for Running the DTC

- DTCs P0201, P0204, P2147 and P2148 are not set. (DTC P2146)
- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

- The ECM detects that the common 1 fuel injector charge voltage circuit is shored to cylinder #1 or #4 fuel injector solenoid control circuit, or cylinder #1 and #4 fuel injector solenoid control circuit is shorted each other. (DTC P2146)
- The ECM detects that the common 1 fuel injector charge voltage circuit, cylinder #1 or #4 fuel injector solenoid control circuit is shorted to ground. (DTC P2147)
- The ECM detects that the common 1 fuel injector charge voltage circuit, cylinder #1 or #4 fuel injector solenoid control circuit is shorted to voltage circuit. (DTC P2148)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P2149, P2150 or P2151 (Flash Code 159)

Circuit Description

The ECM calculates the optimum fuel injection ON time using data sent from various engine sensors. The common 2 fuel injector charge voltage circuit is a high-voltage supply which drives fuel injectors for cylinder #2 and #3 in conjunction with the ECM grounding the fuel injector solenoid control circuit. If the common 2 fuel injector charge voltage circuit is shorted to cylinder #2 or #3 fuel injector solenoid control circuit, shorted to ground or shorted voltage circuit DTC P2149, P2150 or P2151 will set. If the cylinder #2 and #3 fuel injector solenoid control circuit is shorted each other, shorted to ground or shorted voltage circuit DTC P2149, P2150 or P2151 will also set.

Condition for Running the DTC

- DTCs P0202, P0203, P2150 and P2151 are not set. (DTC P2149)
- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The engine is running.

Condition for Setting the DTC

- The ECM detects that the common 2 fuel injector charge voltage circuit is shored to cylinder #2 or #3 fuel injector solenoid control circuit, or cylinder #2 and #3 fuel injector solenoid control circuit is shorted each other. (DTC P2149).
- The ECM detects that the common 2 fuel injector charge voltage circuit, or cylinder #2 or #3 fuel injector solenoid control circuit is shorted to ground. (DTC P2150)
- The ECM detects that the common 2 fuel injector charge voltage circuit, or cylinder #2 or #3 fuel injector solenoid control circuit is shorted to voltage circuit. (DTC P2151)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P2227 (Flash Code 71)

Circuit Description

The barometric pressure (BARO) sensor is located on the intake manifold. The BARO sensor is a transducer that varies voltage according to changes the barometric pressure. Within the ECM, the diagnostic compares the BARO sensor input to the boost pressure sensor input. If the ECM detects that the inputs are not within a specified amount of each other, this DTC will set.

Condition for Running the DTC

- DTCs P0101, P0102, P0103, P0107, P0108, P0116, P0117, P0118, P0122, P0123, P0500, P0501, P0638, P0652, P0653, P0698, P0699, P2100, P2101, P2103, P2228 and P2229 are not set.

AND following conditions are met for longer than 3 seconds.

- The ignition switch is ON.
- The engine coolant temperature is more than 5°C (41°F).
- The engine speed is less than 800 RPM.
- The fuel injection quantity is less than a predetermined value.
- The accelerator pedal is not depressed.
- The vehicle is not running.
- The engine run time is longer than 5 seconds.

Condition for Setting the DTC

- The ECM detects that the differential pressure between the barometric pressure and the boost pressure is more than 10 kPa (1.5 psi) for 10 seconds.

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM limits fuel injection quantity.
- The ECM inhibits EGR control.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

DTC P2228 or P2229 (Flash Code 71)

Circuit Description

The barometric pressure (BARO) sensor is located on the intake manifold. The BARO sensor is a transducer that varies voltage according to changes the barometric pressure. The sensor has the following circuits.

- 5 volts reference circuit.
- Low reference circuit.
- BARO sensor signal circuit.

The BARO sensor provides a signal to the ECM on the signal circuit, which is relative to the pressure changes of the barometric pressure. The ECM should detect a low signal voltage at a low barometric pressure, such as high altitude place. The ECM should detect high signal voltage at a high barometric pressure. The ECM uses this voltage signal to calibrate the fuel injection quantity and injection timing for altitude compensation. If the ECM detects an excessively low or high signal voltage, DTC P2228 or P2229 will set.

Condition for Running the DTC

- DTCs P0652 and P0653 are not set.
- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the BARO sensor signal voltage is less than 0.1 volts for 3 seconds. (DTC P2228)
- The ECM detects that the BARO sensor signal voltage is less than 4.3 volts for 3 seconds. (DTC P2229)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM uses a BARO substitution of default value.
- The ECM limits fuel injection quantity.
- The ECM inhibits EGR control.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Circuit/ System Testing DTC P2228

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0652 also set?	—	Go to DTC P0652	Go to Step 3
3	Observe the Barometric Pressure (BARO) Sensor parameter with a scan tool. Is the BARO Sensor parameter less than the specified value?	0.1 volts	Go to Step 4	Go to Diagnostic Aids
4	1. Turn OFF the ignition. 2. Disconnect the BARO sensor harness connector. 3. Connect a DMM between the 5 volts reference circuit (pin 3 of E-40) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	4.7 volts	Go to Step 5	Go to Step 6

Step	Action	Value(s)	Yes	No
5	Connect a 3-amp fused jumper wire between the 5 volts reference circuit and the signal circuit (pins 2 and 3 of E-40). Is the BARO Sensor parameter more than the specified value?	4.7 volts	Go to Step 8	Go to Step 7
6	1. Test the 5 volts reference circuit between the ECM (pin 19 of E-90) and the BARO sensor (pin 3 of E-40) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
7	1. Test the signal circuit between the ECM (pin 18 of E-90) and the BARO sensor (pin 2 of E-40) for the following conditions: • An open circuit • A short to ground • A short to the low reference circuit • High resistance 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 9
8	1. Inspect for an intermittent and for poor connections at the harness connector of the BARO sensor (pins 2 and 3 of E-40). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 10
9	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 18 and 19 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 12	Go to Step 11
10	Replace the BARO sensor. Refer to BARO Sensor Replacement. Did you complete the replacement?	—	Go to Step 12	—
11	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 12	—
12	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 13

Step	Action	Value(s)	Yes	No
13	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P2229

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Observe the Barometric Pressure (BARO) Sensor parameter with a scan tool. Is the BARO Sensor parameter more than the specified value?	4.3 volts	Go to Step 3	Go to Diagnostic Aids
3	Monitor the DTC Information with a scan tool. Is DTC P0653 also set?	—	Go to Step 4	Go to Step 5
4	1. Turn OFF the ignition. 2. Disconnect the BARO sensor harness connector. 3. Turn ON the ignition, with the engine OFF. Is the BARO Sensor parameter less than the specified value?	0.1 volts	Go to DTC P0653	Go to Step 7
5	1. Turn OFF the ignition. 2. Disconnect the BARO sensor harness connector. 3. Turn ON the ignition, with the engine OFF. Is the BARO Sensor parameter less than the specified value?	0.1 volts	Go to Step 6	Go to Step 7
6	Connect a test lamp between the low reference circuit (pin 1 of E-40) and battery voltage. Does the test lamp illuminate?	—	Go to Step 9	Go to Step 8
7	**Important:** The BARO sensor may be damaged if the sensor signal circuit is shorted to a voltage source. 1. Test the signal circuit between the ECM (pin 18 of E-90) and the BARO sensor (pin 2 of E-40) for the following conditions: • A short to battery or ignition voltage • A short to any 5 volts reference 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
8	1. Test the low reference circuit between the ECM (pin 17 of E-90) and the BARO sensor (pin 1 of E-40) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 10

Step	Action	Value(s)	Yes	No
9	1. Inspect for an intermittent and for a poor connection at the harness connector of the BARO sensor (pin 1 of E-40). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 11
10	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 17 of E-90). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 13	Go to Step 12
11	Replace the BARO sensor. Refer to BARO Sensor Replacement. Did you complete the replacement?	—	Go to Step 13	—
12	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 13	—
13	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 14
14	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC P2621 or P2622 (Flash Code 94)

Circuit Description

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal control assembly. The analogue APP signals are converted by the ECM into a pulse width modulation (PWM) signal. This converted signal is sent from the ECM to the TCM to determine appropriate shift points depending on the accelerator pedal pressing amount. If the ECM detects an improper voltage level on the APP PWM signal circuit, DTC P2621 or P2622 will set.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects a low voltage condition on the APP PWM signal circuit for longer than 3 seconds. (DTC P2621)
- The ECM detects a high voltage condition on the APP PWM signal circuit for longer than 3 seconds. (DTC P2622)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Schematic Reference: Engine Controls Schematics

Circuit/ System Testing DTC P2621

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	1. Turn OFF the ignition. 2. Back probe a DMM between the accelerator pedal position (APP) signal circuit of the TCM harness connector (pin 16 of C-94) and a known good ground. 3. Turn ON the ignition, with the engine OFF. Is the DMM voltage more than the specified value?	10.0 volts	Go to Step 6	Go to Step 4
4	Is the DMM voltage more than the specified value at Step 3?	2.0 volts	Go to Step 7	Go to Step 5
5	Repair the short to ground between the ECM (pin 56 of C-58) and the TCM (pin 16 of C-94). Did you complete the repair?	—	Go to Step 11	—
6	1. Test the signal circuit between the ECM (pin 56 of C-58) and the TCM (pin 16 of C-94) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 8

Step	Action	Value(s)	Yes	No
7	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the TCM (pin 16 of C-94). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 9
8	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 56 of C-58). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 10
9	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 11	—
10	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 11	—
11	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 12
12	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Circuit/ System Testing DTC P2622

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Start the engine. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids

Step	Action	Value(s)	Yes	No
3	1. Turn OFF the ignition. 2. Disconnect the TCM harness connector. 3. Connect a test lamp between the accelerator pedal position (APP) signal circuit of the TCM harness connector (pin 16 of C-94) and a known good ground. 4. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 4	Go to Step 5
4	1. Test the signal circuit between the ECM (pin 56 of C-58) and the TCM (pin 16 of C-94) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Step 6
5	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 7	—
6	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 7	—
7	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 8
8	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC U0001 or U0101 (Flash Code 84 or 85)

Circuit Description

The ECM, the transmission control module (TCM), the immobilizer control unit (ICU), the data recording module (DRM), instrument panel (IP) cluster and scan tool communicate control and diagnostic information via a controller area network (CAN) communication bus. The ECM monitors CAN operational status by expecting a constant flow of messages from the TCM, ICU, DRM and IP cluster. If the ECM fails to send or receive an expected message from the TCM, ICU, DRM and IP cluster, DTC U0001 or U0101 will set depending on what communication is lost.

Condition for Running the DTC

- The battery voltage is more than 9 volts.
- The ignition switch is ON.

Condition for Setting the DTC

- The ECM detects that the CAN Bus OFF status. (DTC U0001)
- The ECM detects that the CAN Bus messages from the TCM are not being received. (DTC U0101)

Action Taken When the DTC Sets

- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A.
- The ECM inhibits cruise control.

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A.

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.

Notice:

- If the TCM has DTCs set, clear the DTCs in the TCM first.

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing DTC U0001 or U0101

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	Refer to Scan Tool Does Not Communicate with The CAN Device in this section. Did you complete the action?	—	Go to Step 3	—
3	1. Reconnect all previously disconnected harness connector(s). 2. Clear the DTCs with a scan tool. 3. Turn OFF the ignition for 30 seconds. 4. Start the engine. 5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/ Failure Records. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 4
4	Observe the DTC information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC U0167 (Flash Code 177)

Circuit Description

The ECM communicates with the immobilizer control unit (ICU) to execute immobilizer function. The ECM sends request signal to the ICU. The ECM receives response signal from the ICU. Both communication signals are carried out via a controller area network (CAN) communication bus. If the ECM does not detect a response signal from the ICU, this DTC will set.

Condition for Setting the DTC

- The ECM does not receive an immobilizer response signal from the ICU.

Action Taken When the DTC Sets

- The ECM illuminates the SVS lamp when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type C. (Euro 4 Specification)
- The ECM illuminates the MIL when the diagnostic runs and fails. Refer to DTC Type Definitions for Action Taken When the DTC Sets - Type A. (Except Euro 4 Specification)

Condition for Clearing the DTC

- Refer to DTC Type Definitions for Condition for Clearing the SVS Lamp/ DTC - Type C. (Euro 4 Specification)
- Refer to DTC Type Definitions for Condition for Clearing the MIL/ DTC - Type A. (Except Euro 4 Specification)

Diagnostic Aids

- If an intermittent condition is suspected, refer to Intermittent Conditions in this section.
- Electromagnetic interference may affect intermittent condition.
- Any communication fault with the ICU may set this DTC.

Circuit/ System Testing DTC U0167

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Is DTC U0001 also set?	—	Go to DTC U0001	Go to Step 3
3	Attempt to communicate with the immobilizer control unit (ICU) via the Immobilizer Data table. Does the scan tool communicate with the ICU?	—	Go to Step 4	Go to Diagnostic System Check - Immobilizer Controls
4	Monitor the immobilizer DTC Information with a scan tool. Does the immobilizer DTCs fail this ignition which begin with B or U?	—	Go to Applicable DTC in Immobilizer Section	Go to Step 5
5	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 6	—
6	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 7
7	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

EGR Control System Check

Description

The EGR system recirculates a part of exhaust gas back into the intake manifold, which results in reducing NOx emissions. The EGR control system uses an electronic control system to ensure both driveability and low emission. A control current from the ECM operates a solenoid to control the lift amount of EGR valve. Also, an EGR position sensor is provided at the rear of the solenoid to feed actual valve lift amount back to the ECM for more precision control.

The EGR control starts when the conditions for engine speed, engine coolant temperature, intake air temperature and barometric pressure are satisfied. Then, the valve opening is calculated according to the engine speed, and target fuel injection quantity. Based on this valve opening, the drive duty of the solenoid is determined and the valve is driven accordingly. The intake throttle valve is provided to adequate intake manifold depression to ensure EGR gas flow.

EGR Control Operation

- The engine coolant temperature (ECT) is between 5°C (41°F) and 100°C (212°F).
- The intake air temperature (IAT) is more than 5°C (41°F).
- The barometric pressure (BARO) is more than 90kPa (13psi).

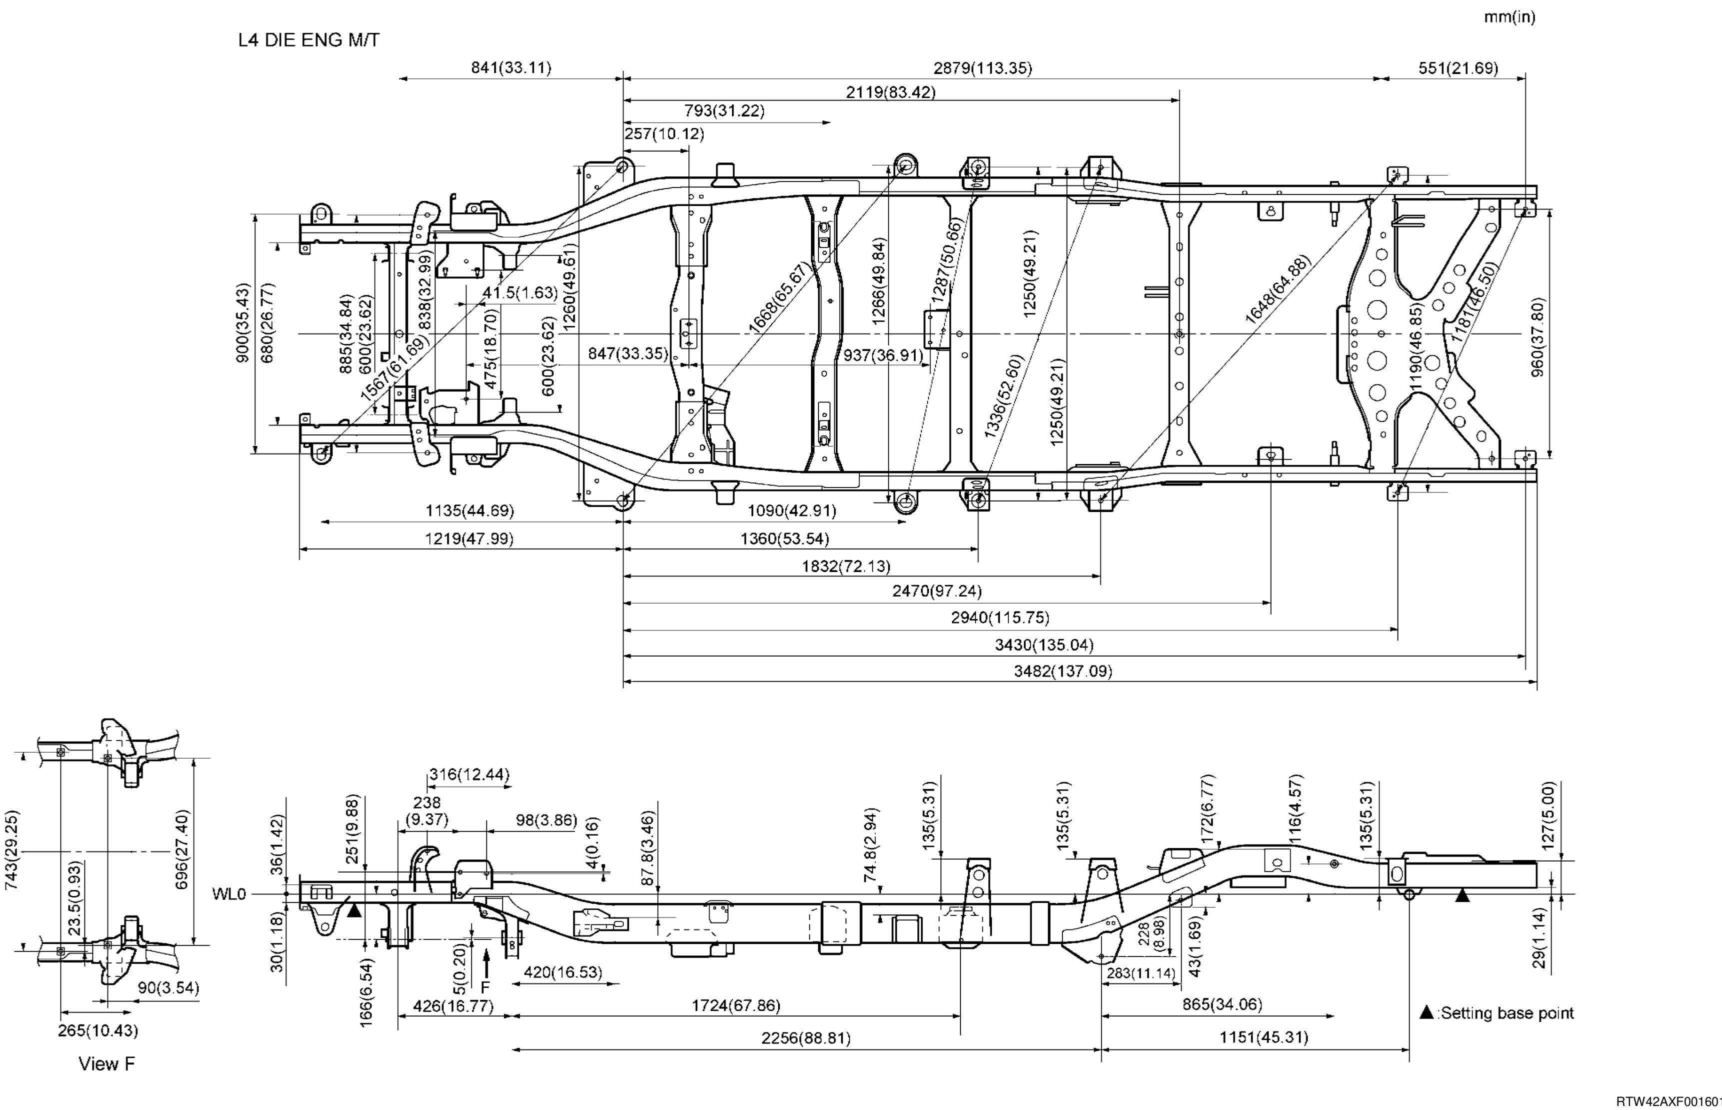
Circuit/ System Testing EGR Control System Check

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Are any DTCs set in which the “Action Taken When the DTC Sets” under that particular code states, “The ECM inhibits EGR control”?	—	Refer to Applicable DTC	Go to Step 3

BACK TO CHAPTER INDEX

4×4, LWB, REGULAR CAB MODEL

This illustration is based on the RHD model.



ISUZU KB P190 2007
TO MODEL INDEX

Step	Action	Value(s)	Yes	No
3	1. Inspect the following conditions: • An EGR valve gasket that is missing or damaged • A sticking EGR valve • EGR gas leakage any of the EGR passage between the exhaust manifold and intake manifold • Restricted or collapsed EGR passage between the exhaust manifold and the EGR valve • Any type of restriction in the exhaust system • Restricted air cleaner element, restricted or collapsed air tubing between the air cleaner and the intake manifold • Any air induction leak • Any water intrusion in the induction system • Any contamination or objects that block the MAF sensor inlet • Skewed or slow MAF sensor • Skewed engine coolant temperature (ECT) sensor. Refer to Temperature vs Resistance table to test the ECT sensor at various temperature levels to evaluate the possibility of a skewed sensor. • Skewed barometric pressure (BARO) sensor. Determine the outside barometric pressure from you location specified in the altitude vs barometric pressure table. Refer to Altitude vs Barometric Pressure. • A sticking intake throttle valve 2. Repair the condition as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 4
4	1. Place the transmission in Neutral and set the parking brake. 2. Start the engine and warm up (arrow engine coolant temperature to reach at least 60°C [140°F]). 3. Accelerate the engine between idle and W.O.T (accelerator pedal full travel) many times while observing the Desired EGR Position and EGR Position parameter with a scan tool. Does the EGR Position parameter follow within the specified value?	±5%	Go to Step 5	Go to Step 8
5	1. Perform the EGR Solenoid Control with a scan tool several times. 2. Command the Desired EGR Position Increase and Decrease while observing the EGR Position. Does the EGR Position parameter follow within the specified value quick enough?	±5%	Go to Step 6	Go to Step 8

Step	Action	Value(s)	Yes	No
6	**Notice:** If the intake throttle solenoid is commanded OFF, Intake Throttle Position parameter indicates over 100%. Observe the Desired Intake Throttle Position and Intake Throttle Position parameter with a scan tool. Does the Intake Throttle Position parameter follow within the specified value?	±5%	Go to Step 7	Go to Step 10
7	1. Perform the Intake Throttle Solenoid Control with a scan tool several times. 2. Command the Desired Intake Throttle Position Increase and Decrease while observing the Intake Throttle Position. Does the Intake Throttle Position parameter follow within the specified value quick enough?	±5%	System OK	Go to Step 10
8	1. Remove the EGR valve assembly from the engine. 2. Inspect the EGR valve for the following conditions: • Restricted EGR valve by foreign materials • Excessive deposits at valve • Bent valve shaft 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 9
9	1. Turn OFF the ignition. 2. Disconnect the EGR valve harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the EGR valve (pins 1, 2, 3, 4 and 6 of E-71). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 30, 31, 32, 62 and 63 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 12
10	1. Remove the intake duct that is connected to the intake throttle valve. 2. Inspect the intake throttle valve for the following conditions: • Restricted intake throttle valve by foreign materials • Excessive deposits at throttle bore • Bent butterfly valve **Notice:** Replace the intake throttle valve is there is any sticking 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 11

Step	Action	Value(s)	Yes	No
11	1. Turn OFF the ignition. 2. Disconnect the intake throttle valve harness connector. 3. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the intake throttle valve (pins 1, 2, 3, 5 and 6 of E-38). 4. Disconnect the ECM harness connector. 5. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the ECM (pins 35, 36, 55, 56 and 57 of E-90). 6. Test for high resistance on each circuit. 7. Repair the connection(s) or circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 14	Go to Step 13
12	Replace the EGR valve. Refer to EGR valve Replacement. Did you complete the replacement?	—	Go to Step 14	—
13	Replace the intake throttle valve. Refer to Intake Throttle Valve Replacement. Did you complete the replacement?	—	Go to Step 14	—
14	Reconnect all previously disconnected components or harness connector(s). Did you complete the action?	—	Go to Step 2	—

Glow Control System Check

Description

The glow control system consists of the ECM, the glow relay, the glow indicator lamp and glow plugs. The glow control system is operated when the engine coolant temperature is low, which allows easier engine starting. The ECM commands the glow relay ON for a certain length of time at ignition switch is ON with engine OFF. In after glow phase, the glow plugs remain energized for a certain period with engine run.

Glow Control Operation

- The glow indicator lamp illuminates between 0.5 seconds to 7 seconds depending upon the engine coolant temperature.
- The pre glow control system operates when the engine coolant temperature is less than 30°C (86°F).
- The after glow control system operates when the engine coolant temperature is less than 60°C (140°F).

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing Glow Control System Check (1 of 2)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Is DTC P0117, P0118 or P0380 set?	—	Refer to Applicable DTC	Go to Step 3
3	**Notice:** If no glow indicator lamp is equipped, skip to Step 3. 1. Verify whether the instrument panel (IP) cluster is operational. 2. Perform the Glow Plug Lamp Control with a scan tool. 3. Command the lamp ON and OFF. Does the glow indicator lamp turn ON and OFF with each command?	—	Go to Step 4	Go to 2 of 2 Step 1
4	1. Turn OFF the ignition. 2. Make sure the metal bus bar that connects switched battery voltage supply terminal (E-49) and all glow plugs is secured tightly. 3. Turn ON the ignition, with the engine OFF 4. Connect a test lamp between the metal bus bar (glow plug power supply E-49 terminal) and a known good ground. 5. Perform the Glow Relay Control with a scan tool. 6. Command the relay ON while observing the test lamp. Does the test lamp turn ON only when commanded ON?	—	Go to Step 5	Go to Step 6

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Remove the metal bus bar from the glow plugs. 3. Measure resistance of each glow plug between the glow plug terminals and a known good ground. Make sure to record all measurements and take them quickly as to not allow engine temperature changes between measurements. Are the resistances within the specified value each other?	1Ω	System OK	Go to Step 16
6	1. Turn OFF the ignition. 2. Replace the glow relay with the starter relay or replace with a known good relay. 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the metal bus bar (glow plug power supply E-49 connector) and a known good ground. 5. Perform the Glow Relay Control with a scan tool. 6. Command the relay ON while observing the test lamp. Does the test lamp turn ON only when commanded ON?	—	Go to Step 14	Go to Step 7
7	Inspect the Glow (60A) slow blow fuse in the engine room fuse block. Is the Glow (60A) slow blow fuse open?	—	Go to Step 8	Go to Step 9
8	Replace the Glow (60A) slow blow fuse. If the slow blow fuse continues to open, repair the short to ground on a circuit fed by the slow blow fuse or check for a shorted attached component. Did you complete the repair?	—	Go to Step 17	—
9	1. Turn OFF the ignition. 2. Remove the glow relay. 3. Probe the battery voltage feed circuit of the relay (pin 4 of X-5) with a test lamp that is connected to a known good ground. Does the test lamp illuminate?	—	Go to Step 10	Go to Step 11
10	1. Probe the voltage supply circuit of glow plugs (pin 1 of X-5) with a test lamp that is connected to a known good ground. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 13	Go to Step 12
11	Repair the open circuit or high resistance between the Glow (60A) slow blow fuse and the glow relay (pin 4 of X-5). Did you complete the repair?	—	Go to Step 17	—
12	Repair the open circuit or high resistance between the glow relay (pin 1 of X-5) and the glow plugs (E-49 terminal). Did you complete the repair?	—	Go to Step 17	—

Step	Action	Value(s)	Yes	No
13	**Important**: The glow plugs may be burnt out if the battery voltage supply circuit is shorted to a voltage source. Repair the short to battery or ignition voltage between the glow relay (pin 1 of X-5) and the glow plugs (E-49 terminal). Did you complete the repair?	—	Go to Step 17	—
14	1. Remove the glow relay. 2. Inspect for an intermittent and for poor connection on each glow relay terminal. 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 15
15	Replace the glow relay. Did you complete the replacement?	—	Go to Step 17	—
16	Replace the appropriate glow plug. Did you complete the replacement?	—	Go to Step 17	—
17	1. Reconnect all previously disconnected components, relay, fuse or harness connector(s). 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the metal bus bar (glow plug power supply E-49 connector) and a known good ground. 5. Perform the Glow Relay Control with a scan tool. 6. Command the relay ON while observing the test lamp. Does the test lamp turn ON only when commanded ON?	—	Go to Step 5	Go to Step 2

Circuit/ System Testing Glow Control System Check (2 of 2)

Step	Action	Value(s)	Yes	No
1	1. Turn OFF the ignition. 2. Inspect the Meter (10A) fuse in cabin fuse block. Is the Meter (10A) fuse open?	—	Go to Step 2	Go to Step 3
2	Replace the Meter (10A) fuse. If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the Meter (10A) fuse or replace the shorted attached component. Did you complete the repair?	—	Go to Step 14	—
3	1. Turn OFF the ignition. 2. Disconnect the ECM J-2 (C-58) harness connector. 3. Turn ON the ignition, with the engine OFF. Is the glow indicator lamp OFF?	—	Go to Step 4	Go to Step 10

Step	Action	Value(s)	Yes	No
4	1. Remove the Meter (10A) fuse that supplies voltage to the glow indicator lamp. 2. Turn ON the ignition, with the engine OFF. 3. Measure the voltage from the glow indicator lamp control circuit in the ECM harness connector (pin 51 of C-58) to a known good ground. Is the voltage less than the specified value?	1 volt	Go to Step 5	Go to Step 11
5	1. Turn OFF the ignition. 2. Reinstall the Meter (10A) fuse. 3. Turn ON the ignition, with the engine OFF. 4. Connect a 3-amp fused jumper wire between the ECM harness connector (pin 51 of C-58) and a known good ground. Is the glow indicator lamp illuminated?	—	Go to Step 9	Go to Step 6
6	1. Turn OFF the ignition. 2. Remove the IP cluster. 3. Connect a test lamp between the ignition voltage feed circuit of the IP cluster harness connector (pin 8 of B-24) and a known good ground. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate?	—	Go to Step 7	Go to Step 12
7	1. Test the control circuit between the ECM (pin 51 of C-58) and the IP cluster (pin 35 of B-23) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 8
8	1. Inspect for an intermittent and for poor connections at the harness connector of the IP cluster (pin 35 of B-23 and pin 8 of B-24). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 13
9	1. Inspect for an intermittent and for a poor connection at the harness connector of the ECM (pin 51 of C-58). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
10	Repair the short to ground between the ECM (pin 51 of C-58) and the IP cluster (pin 35 or of B-23). Did you complete the repair?	—	Go to Step 15	—
11	Repair the short to battery or ignition voltage between the ECM (pin 51 of C-58) and the IP cluster (pin 35 of B-23). Did you complete the repair?	—	Go to Step 15	—
12	Repair the open circuit or high resistance on ignition the voltage feed circuit the Meter (10A) fuse and the IP cluster (pin 8 of B-24). Did you complete the repair?	—	Go to Step 15	—

Step	Action	Value(s)	Yes	No
13	Repair or replace the IP cluster. Did you complete the repair or replacement?	—	Go to Step 15	—
14	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 15	—
15	1. Reconnect all previously disconnected fuse or harness connector(s). 2. Perform the Glow Plug Lamp Control with a scan tool. 3. Command the lamp ON and OFF. Does the glow indicator lamp turn ON and OFF with each command?	—	Go to 1 of 2 Step 4	Go to Step 1

In-Tank Fuel Pump System Check

Description

The ECM controls the fuel pump relay, which supplies power to the fuel pump in the fuel tank. The ECM commands the fuel pump relay ON for a certain length of time at ignition switch is ON with the engine OFF. During the engine is running it is continuity commanded ON.

In-tank Fuel Pump Control Operation

- The battery voltage is more than 9 volts.
- The ignition switch is ON.
- The fuel pump is commanded ON for 12 seconds at ignition switch is ON with the engine OFF.
- The fuel pump is continuously ON while engine is running.

Schematic Reference: Engine Controls Schematics

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing In-Tank Fuel Pump System Check

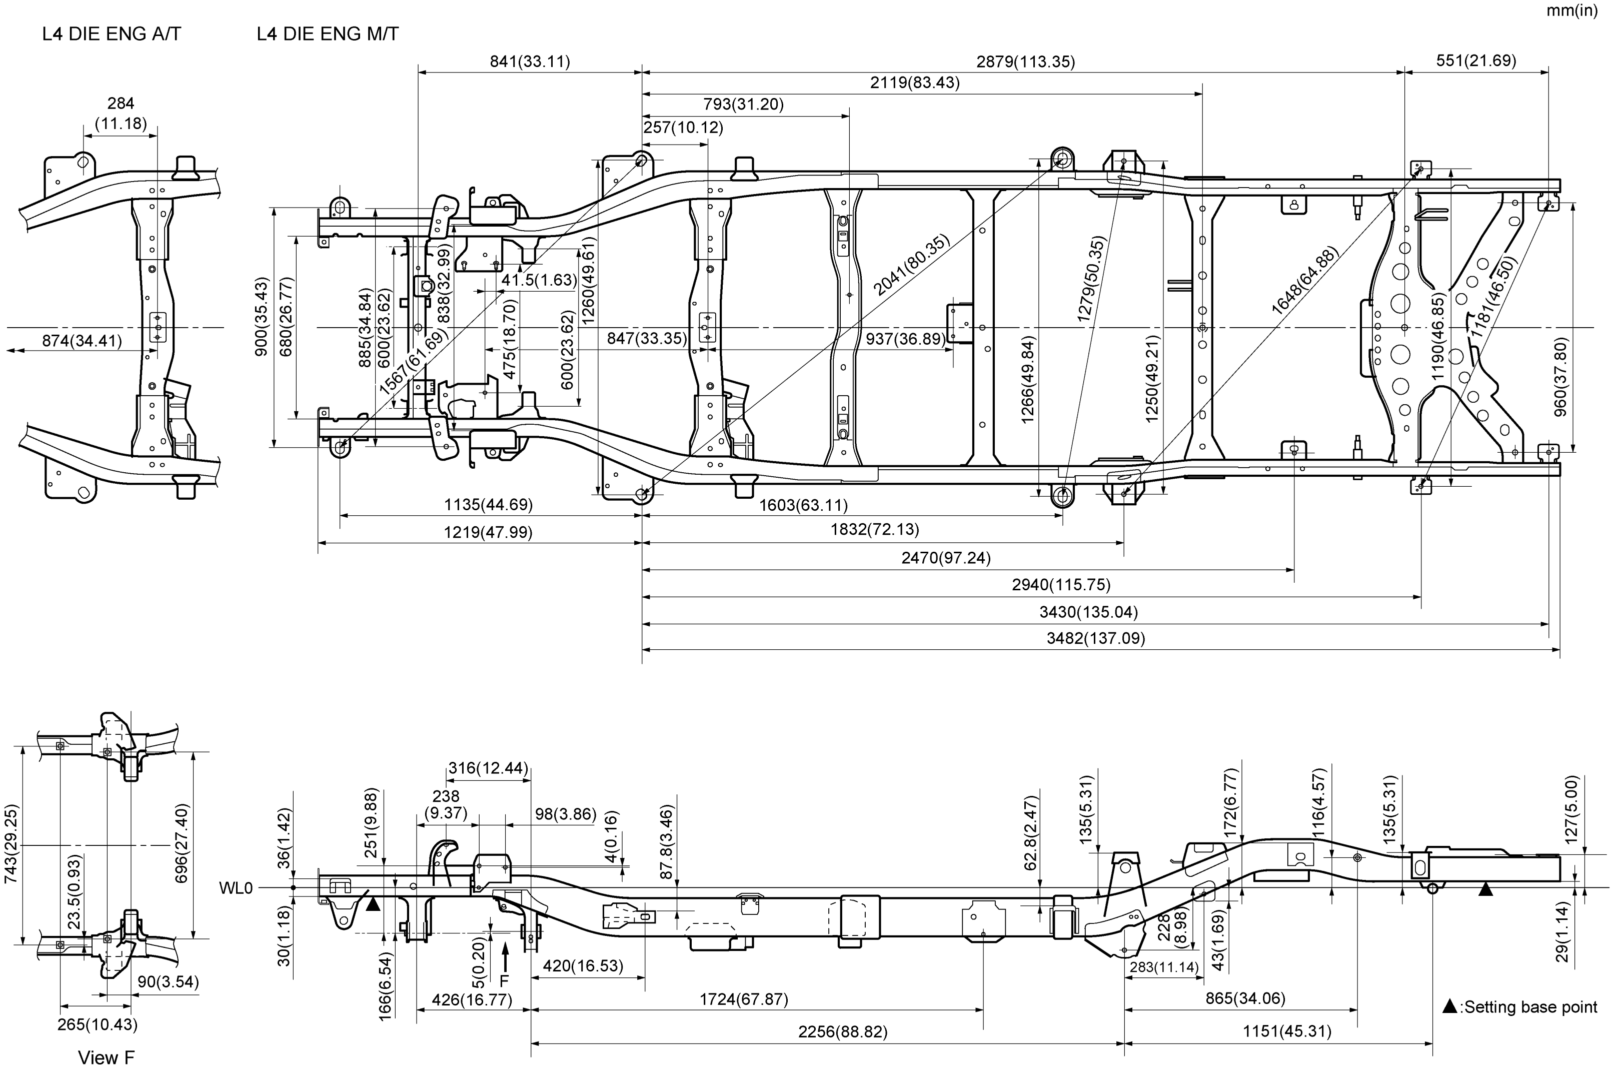
Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition for 20 seconds, then start the engine. 4. Monitor the DTC Information with a scan tool. Is DTC P0231 or P0232 set?	—	Refer to Applicable DTC	Go to Step 3
3	1. Turn OFF the ignition for 30 seconds. 2. Remove the fuel filler cap. 3. Turn ON the ignition, with the engine OFF. Is the fuel pump operating sound heard from the fuel filler?	—	Go to Step 4	Go to Step 7
4	Does the fuel pump operating sound stop after approximately 12 seconds passed?	—	Go to Step 21	Go to Step 5
5	1. Turn OFF the ignition for 30 seconds. 2. Replace the fuel pump relay with the head light relay or replace with a known good relay. 3. Turn ON the ignition, with the engine OFF. Does the fuel pump operating sound stop after approximately 12 seconds passed?	—	Go to Step 20	Go to Step 6
6	Repair the short to battery or ignition voltage between the fuel pump relay (pin 2 of X-13) and the fuel pump (pin 1 of F-2). Did you complete the repair?	—	Go to Step 25	—
7	1. Turn OFF the ignition for 30 seconds. 2. Replace the fuel pump relay with the head light relay or replace with a known good relay. 3. Turn ON the ignition, with the engine OFF. Is the fuel pump operating sound heard from the fuel filler?	—	Go to Step 17	Go to Step 8
8	Inspect the Fuel Pump (10A) fuse in the engine room fuse block. Is the Fuel Pump (10A) fuse open?	—	Go to Step 9	Go to Step 10

Step	Action	Value(s)	Yes	No
9	Replace the Fuel Pump (10A) fuse. If the fuse continues to open, repair the short to ground on a circuit fed by the fuse or check for a shorted attached component. Did you complete the repair?	—	Go to Step 25	—
10	1. Turn OFF the ignition. 2. Remove the fuel pump relay. 3. Probe the battery voltage feed circuit of the relay (pin 1 of X-13) with a test lamp that is connected to a known good ground. Does the test lamp illuminate?	—	Go to Step 12	Go to Step 11
11	Repair the open circuit or high resistance between the Fuel Pump (10A) fuse and the fuel pump relay (pin 1 of X-13). Did you complete the repair?	—	Go to Step 25	—
12	1. Reconnect the fuel pump relay. 2. Disconnect the fuel pump resistor harness connector. 3. Measure the resistance across the fuel pump resistor. Is the resistance within the specified value?	2.2 to 2.7 Ω	Go to Step 13	Go to Step 23
13	1. Connect a test lamp between the fuel pump side voltage feed circuit on the resistor harness (pin 1 of C-157) and a known good ground. 2. Turn ON the ignition, with the engine OFF. Does the test lamp illuminate for approximately 12 seconds then go out?	—	Go to Step 14	Go to Step 15
14	Connect a test lamp between the ground circuit on the resistor harness (pin 2 of C-157) and battery voltage. Does the test lamp illuminate?	—	Go to Step 18	Go to Step 16
15	1. Test the fuel pump circuit between the fuel pump (pins 1 and 4 of F-2) and the fuel pump relay (pin 2 of X-13) or the fuel pump resistor (pin 1 of C-157) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 19
16	Repair the open circuit or high resistance between the fuel pump resistor (pin 2 of C-57) and the body ground terminal (C-109). Clean or tighten ground as necessary. Did you complete the repair?	—	Go to Step 25	—
17	1. Remove the fuel pump relay. 2. Inspect for an intermittent and for poor connection on each relay terminal. 3. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 20

BACK TO CHAPTER INDEX

4×4, LWB, EXTEND CAB MODEL

This illustration is based on the RHD model.



RTW32AXF005801

ISUZU KB P190 2007
TO MODEL INDEX

Step	Action	Value(s)	Yes	No
18	1. Inspect for an intermittent, poor connections and corrosion at the harness connector of the fuel pump resistor (pins 1 and 2 of C-57). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	—
19	1. Inspect for an intermittent, for poor connections and corrosion at the harness connector of the fuel pump (pins 1 and 4 of F-2). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 24
20	Replace the fuel pump relay. Did you complete the replacement?	—	Go to Step 25	—
21	1. Make sure the fuel amount in the fuel tank. Refill adequate fuel as necessary. 2. Check the fuel system connections between the fuel tank and the fuel supply pump for tightness and all fuel hoses for cuts, kinks, cracks and for the use of proper clamps. Repair or replace as necessary. 3. Turn OFF the ignition. 4. Disconnect the fuel hose that connects to the fuel filter inlet side. In order to measure the discharged fuel amount, put the hose into a bottle or a container with a scale. (The inlet of a bottle or a container must be larger than the diameter of hose.) 5. Turn ON the ignition for 20 seconds, with the engine OFF. 6. Turn OFF the ignition for 10 seconds. 7. Perform 5 and 6 three times. The accumulated fuel of three ignition cycles must be more than 300cc. (Normal amount is more than 100cc per one ignition cycle.) Is enough amount of fuel discharged?	—	System OK	Go to Step 22
22	1. Remove the fuel pump from the fuel tank. Refer to Fuel Gauge Unit in the Fuel System section. 2. Inspect the fuel pump for any type of restriction or damage on the fuel pipes. 3. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 25	Go to Step 24
23	Replace the fuel pump resistor. Did you complete the replacement?	—	Go to Step 25	—
24	Replace the fuel pump. Refer to Fuel Gauge Unit in the Fuel System section. Did you complete the replacement?	—	Go to Step 25	—
25	Reconnect all previously disconnected components, fuse, relay or harness connector(s). Did you complete the action?	—	Go to Step 3	—

Cruise Control System Check

Description

The cruise control system consists of the ECM, the cruise main switch, set/ coast switch, resume/ accel. switch and cancel switch. The cruise control keeps the vehicle speed at a driver's set speed. When the cruise main switch is turned ON, signal is provided to the ECM and the cruise main indicator lamp on the switch will light up. When the cruise set/ coast switch is turned ON, the switch signal is provided to the ECM and the vehicle speed is set. The vehicle speed is increased or decreased if the set/ coast switch or the resume/ accel. switch is turned ON. When the cruise cancel switch is applied, the switch signal is provided to the ECM and the cruise control system is inactive.

Condition for Running the Cruise Control

- The vehicle speed is between approximately 40 km/h (24 MPH) to 175 km/h (105 MPH).
- The engine speed is less than 4500 PRM.
- The cruise main switch is ON.

1. Function of "SET"
If the set/ coast switch is pressed and released while condition for running the cruise control are satisfied, the ECM memorize and maintain the vehicle speed at that time.
2. Function of "COAST"
If the set/ coast switch is pressed while the cruise control system is operating, the vehicle speed is decreased. Then, when the set/ coast switch is released, the vehicle will maintain the vehicle speed at that time.
3. Function of "RESUME"
If the resume/ accel. switch is applied while the cruise control system is operating and the ECM memorizes the vehicle speed, the vehicle speed is returned to the vehicle speed memorized by the ECM.
4. Function of "ACCEL"
If the resume/ accel. switch is applied while the cruise control system is operating, the vehicle speed is increased. Then, when the resume/ accel. switch is released, the vehicle will maintain the vehicle speed at that time.
5. Function of "TAP UP"
If the resume/ accel. switch is tapped (momentarily applied) while the cruise control system is operating, the vehicle speed is increased 1 km/h (0.6 MPH) at a time.
6. Function of "TAP DOWN"
If the set/ coast switch is tapped while the cruise control system is operating, the vehicle speed is decreased 1 km/h (0.6 MPH).
7. Function of Temporary Acceleration
If the accelerator pedal is pressed while the cruise control system is operating, the vehicle speed is increased.
8. Function of Temporary Cancellation
The cruise control is canceled temporarily if any of the following condition is met:
   - The cruise cancel switch is applied.
   - The brake pedal is depressed.
   - The clutch pedal is depressed (M/T).
   - The selector lever position is not D, 3, 2 or L (A/T).
   - The cruise set/ coast switch and resume/ accel. switch are ON at the same time.
   - The actual vehicle speed becomes less than approximately 35 km/h (22 MPH).
   - The actual vehicle speed is more than 40 km/h (24 MPH) over the set speed, or more than 10 km/h (6 MPH) over the set speed for longer than 3 minutes.
   - The actual vehicle speed is more than 70 km/h (42 MPH) below the set speed, or more than 10 km/h (6 MPH) below the set speed for 3 minutes.

   By applying the resume/ accel. switch, the vehicle speed is returned to the vehicle speed memorized by the ECM (resume function) if within the condition for running the cruise control are satisfied.
9. Function of Complete Cancellation
The cruise control is canceled completely if any of the following condition is met:
   - The cruise main switch is OFF.
   - The ignition switch is OFF.
   - The vehicle is once stopped.
   - The DTCs relating to the cruise control system inhibits are set.

Connector End View Reference: Engine Controls Connector End Views or ECM Connector End Views

Circuit/ System Testing Cruise Control System Check (1 of 2)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls

Step	Action	Value(s)	Yes	No
2	1. Drive the vehicle at 50 km/h (30 MPH) on a flat level road. 2. Press and release the cruise main switch. 3. Press and release the cruise set/ coast switch. 4. Verify the 50 km/h (30 MPH) vehicle speed is maintained. 5. Tap the cruise set/ coast. Did the vehicle maintain the set speed of 50 km/h (30 MPH), and then decrease by 1 km/h (0.6 MPH) each time the switch was tapped?	—	Go to Step 3	Go to Step 7
3	Tap (momentarily apply) the cruise resume/ accel. switch 10 times. Does the vehicle speed increase by 1 km/h (0.6 MPH) each time the switch was tapped (momentarily applied)?	—	Go to Step 4	Go to Step 10
4	Are the cruise main and cruise set lamps illuminated while in cruise control?	—	Go to Step 5	Go to 2 of 2 Step 1
5	Apply the cruise cancel switch Does the cruise control cancel?	—	Go to Step 6	Go to Step 11
6	1. Reenter the cruise control. 2. Depress and release the brake pedal. Does the cruise control cancel?	—	System OK	Refer to DTC P0571 for brake switch diagnosis
7	1. Park the vehicle. 2. Install a scan tool. 3. Monitor the DTC Information with a scan tool. Are any DTCs set in which the “Action Taken When the DTC Sets” under that particular code states, “The ECM inhibits cruise control” ?	—	Refer to Applicable DTC	Go to Step 8
8	Observe the Cruise Main Switch parameter with a scan tool. Does the scan tool indicate ON when the switch is pushed and OFF when the switch is released?	—	Go to Step 9	Go to Step 12
9	Observe the Cruise Set/ Coast Switch parameter with a scan tool. Does the scan tool indicate ON when the switch is pushed and OFF when the switch is released?	—	Retest the cruise control. Refer to Condition for Running the Cruise Control	Go to Step 17
10	Observe the Cruise Resume/ Accel. Switch parameter with a scan tool. Does the scan tool indicate ON when the switch is applied and OFF when the switch is released?	—	Go to Intermittent Conditions	Go to Step 19
11	Observe the Cruise Cancel Switch parameter with a scan tool. Does the scan tool indicate OFF when the switch is applied and ON when the switch is released?	—	Go to Intermittent Conditions	Go to Step 23

Step	Action	Value(s)	Yes	No
12	1. Turn OFF the ignition. 2. Disconnect the cruise main switch harness connector. (Remove the switch from the IP bezel as necessary) 3. Turn ON the ignition, with the engine OFF. 4. Connect a test lamp between the ignition voltage feed circuit of the cruise main switch harness (pin 4 of B-56) and a known good ground. Does the test lamp illuminate?	—	Go to Step 13	Go to Step 14
13	Observe the Cruise Main Switch parameter with a scan tool while momentarily jumping 3-amp fused jumper wire across the cruise main switch harness connector between pins 3 and 4 of the B-67. Does the scan tool indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 16	Go to Step 15
14	Repair the open circuit or high resistance between the Engine (10A) fuse and the cruise main switch (pin 4 of B-67). Did you complete the repair?	—	Go to Step 28	—
15	1. Test the signal circuit between the ECM (pin 14 of C-58) and the cruise main switch (pin 3 of B-67) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 28	Go to Step 22
16	1. Inspect for an intermittent and for poor connections at the harness connector of the cruise main switch (pins 3 and 4 of B-67). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 28	Go to Step 25
17	1. Turn OFF the ignition. 2. Disconnect the combination switch harness connector (B-59). (Remove the IP cluster lower cover as necessary) 3. Turn ON the ignition, with the engine OFF. 4. Observe the Cruise Set Switch parameter with a scan tool while momentarily jumping 3-amp fused jumper wire across the combination switch harness connector (male side) between pins 11 and 12 of B-59. Does the scan tool indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 21	Go to Step 18
18	1. Test the signal circuit between the ECM (pin 30 of C-58) and the combination switch (pin 12 of B-59) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 28	Go to Step 22

Step	Action	Value(s)	Yes	No
19	1. Turn OFF the ignition. 2. Disconnect the combination switch harness connector (B-59). (Remove the IP cluster lower cover as necessary) 3. Turn ON the ignition, with the engine OFF. 4. Observe the Cruise Resume Switch parameter with a scan tool while momentarily jumping 3-amp fused jumper wire across the combination switch harness connector (male side) between pins 9 and 11 of B-59. Does the scan tool indicate ON when the circuit is jumpered and OFF when the circuit is not jumpered?	—	Go to Step 21	Go to Step 20
20	1. Test the signal circuit between the ECM (pin 29 of C-58) and the combination switch (pin 9 of B-59) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 28	Go to Step 22
21	1. Inspect for an intermittent and for poor connections at the harness connector of the combination switch (pins 9 or 12 of B-59). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 28	Go to Step 26
22	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections at the harness connector of the ECM (pins 14, 29 or 30 of C-58). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 28	Go to Step 27
23	1. Turn OFF the ignition. 2. Disconnect the combination switch harness connector (B-59). 3. Turn ON the ignition, with the engine OFF. Does the Cruise Cancel Switch indicate OFF?	—	Go to Step 26	Go to Step 24
24	1. Test the signal circuit between the ECM (pin 13 of C-58) and the combination switch (pin 10 of B-59) for a short to battery or ignition voltage. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 28	Go to Step 27
25	Repair or replace the cruise main switch. Did you complete the repair or replacement?	—	Go to Step 28	—
26	Repair or replace the combination switch. Did you complete the repair or replacement?	—	Go to Step 28	—
27	**Important**: Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 28	—

Step	Action	Value(s)	Yes	No
28	Reconnect all previously disconnected components, fuse or harness connector(s). Did you complete the action?	—	Go to Step 2	—

Circuit/ System Testing Cruise Control System Check (2 of 2)

Step	Action	Value(s)	Yes	No
1	1. Verify whether the instrument panel (IP) cluster is operational. 2. Install a scan tool. 3. Perform the Lamp Control with a scan tool. 4. Command the lamp ON and OFF with a scan tool. 5. Perform the Cruise Set Lamp Control with a scan tool. 6. Command the lamp ON and OFF with a scan tool. Are both lamps ON and OFF when commanded with a scan tool?	—	Go to Intermittent Conditions	Go to Step 2
2	Is the cruise main lamp inoperative?	—	Go to Step 3	Go to Step 7
3	1. Remove the Meter (10A) fuse that supplies voltage to the IP cluster (Euro 4 specification) or the Engine (10A) fuse that supplies voltage to the cruise main switch (Except Euro 4 specification). 2. Turn ON the ignition, with the engine OFF. 3. Measure the voltage from the cruise main lamp control circuit in the ECM harness connector (pin 50 of C-58) to a good ground. Is the voltage less than the specified value?	1 volt	Go to Step 4	Go to Step 6
4	1. Turn OFF the ignition. 2. Reinstall the Meter (10A) or Engine (10A) fuse. 3. Turn ON the ignition, with the engine OFF. 4. Connect a 3-amp fused jumper wire between the cruise main lamp control circuit of the ECM harness connector (pin 50 of C-58) and a known good ground. Is the cruise main lamp illuminated?	—	Go to Step 12	Go to Step 5
5	1. Test the control circuit between the ECM (pin 50 of C-58) and the IP cluster (pin 2 of B-23) or the cruise main switch (pin 6 of B-67) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 11
6	Repair the short to battery or ignition voltage on the control circuit between the ECM (pin 50 of C-58) and the IP cluster (pin 2 of B-23) or the cruise main switch (pin 6 of B-67). Did you complete the repair?	—	Go to Step 15	—

Step	Action	Value(s)	Yes	No
7	1. Remove the Meter (10A) fuse that supplies voltage to the IP cluster. 2. Turn ON the ignition, with the engine OFF. 3. Measure the voltage from the cruise set lamp control circuit in the ECM harness connector (pin 49 of C-58) to a good ground. Is the voltage less than the specified value?	1 volt	Go to Step 8	Go to Step 10
8	1. Turn OFF the ignition. 2. Reinstall the Meter (10A) fuse. 3. Turn ON the ignition, with the engine OFF. 4. Connect a 3-amp fused jumper wire between the cruise set lamp control circuit of the ECM harness connector (pin 49 of C-58) and a known good ground. Is the cruise main lamp illuminated?	—	Go to Step 12	Go to Step 9
9	1. Test the control circuit between the ECM (pin 49 of C-58) and the IP cluster (pin 23 of B-23) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 11
10	Repair the short to battery or ignition voltage on the control circuit between the ECM (pin 49 of C-58) and the IP cluster (pin 23 of B-23). Did you complete the action?	—	Go to Step 15	—
11	1. Inspect for an intermittent and for a poor connection at the harness connector of the IP cluster (pins 23 of B-23). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 13
12	1. Turn OFF the ignition. 2. Disconnect the ECM harness connector. 3. Inspect for an intermittent and for poor connections on the cruise main or set lamp control circuit at the harness connector of the ECM (pin 49 or 50 of C-58). 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 15	Go to Step 14
13	Repair or replace the IP cluster. Did you complete the repair or replacement?	—	Go to Step 15	—
14	**Important**: Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 15	—
15	Reconnect all previously disconnected components, fuse or harness connector(s). Is the action complete?	—	Go to 1 of 2 Step 2	—

Turbocharger Control System Check

Description

The position of the turbocharger nozzle is controlled by the ECM. The ECM utilizes a turbocharger nozzle control solenoid valve and a boost pressure sensor to control the turbocharger nozzles. When the engine is not under load, the turbocharger nozzles are in an open position, or no boost condition. When the engine is under load, the ECM commands the control solenoid valve to close the turbocharger nozzles, thus increasing the boost. The ECM will vary the boost dependant upon the load requirements of the engine. The ECM uses a pulse width modulation (PWM) on the control circuit to open and control the solenoid valve.

Notice:

- This Circuit/ System Testing is only applicable to high output engine.

Circuit/ System Testing Turbocharger Control System Check

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Engine Controls?	—	Go to Step 2	Go to Diagnostic System Check - Engine Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Is DTC P0045, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0234, P0299, P0638, P0698, P0699, P1196, P1197, P1198, P2227, P2228 or P2229 also set?	—	Go to Applicable DTC	Go to Step 3

Step	Action	Value(s)	Yes	No
3	1. Inspect the following conditions: • Air leakage around the boost pressure sensor objects that block the sensor hole. • Air leaking around any of the air induction tubing between the turbocharger and intake manifold. Check for damaged components and for loose clamps. • Misrouted, disconnected or kinked turbocharger nozzle control actuator vacuum hoses. Refer to Vacuum Hose Routing Diagram in this section for correct routing. • Turbine shaft binding causing lower turbocharger spinning speeds. Refer to the Turbocharger in engine mechanical section for diagnosis. • Turbocharger nozzle control actuator for a stuck condition or slow movement. Refer to Turbocharger in engine mechanical section for testing. • Intake throttle valve sticking. Perform the Intake Throttle Solenoid Control with a scan tool. • Restricted air cleaner element, restricted or collapsed air tubing between the air cleaner and the boost pressure sensor. • Oil in the air induction tubing causing an incorrect boost pressure sensor signal. When there is adhesion of oil inside of tubing, intercooler or turbocharger it needs to be wiped off. 2. Repair the condition as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 4
4	1. Place the transmission in Neutral and set the parking brake. 2. Accelerate the engine between idle and W.O.T. (accelerator pedal full travel) many times while observing the Desired Boost Pressure and Boost Pressure parameter with a scan tool. 3. Drive the vehicle that the engine speed is more than 2000 RPM and the Calculated Engine Load parameter reaches at least 50% for longer than 10 seconds (such as acceleration on ramp) while comparing the Boost Pressure to the Desired Boost Pressure. Does the Boost Pressure parameter follow within the specified value?	±20 kPa (±3 psi)	System OK	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Turn OFF the ignition. 2. Disconnect the vacuum hose from the turbocharger nozzle control actuator diaphragm. 3. Connect a hand-held vacuum pump (5-8840-0279-0/ J-23738-A) to the disconnected vacuum hose. 4. Start the engine and let idle. 5. Perform the Turbocharger Solenoid Control with a scan tool. 6. Command the solenoid valve Increase and Decrease while observing the vacuum pump. Does the hand-held vacuum pump reading more than 50 cmHg (20 inHg) when commanded maximum Increase and ZERO range when commanded minimum Decrease?	—	Go to Step 8	Go to Step 6
6	1. Inspect the following conditions: • Misrouted, disconnected, kinked or plugged turbocharger nozzle actuator control vacuum hose. • Misrouted, disconnected, kinked or plugged solenoid valve ventilation hose. • Misrouted, disconnected, kinked or plugged vacuum source hose or pipe. 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 7
7	Replace the turbocharger nozzle control solenoid valve. Did you complete the replacement?	—	Go to Step 8	—
8	1. Reconnect all previously disconnected components or harness connector(s). 2. Clear the DTCs with a scan tool if set. 3. Turn OFF the ignition for 30 seconds. Did you complete the action?	—	Go to Step 2	—

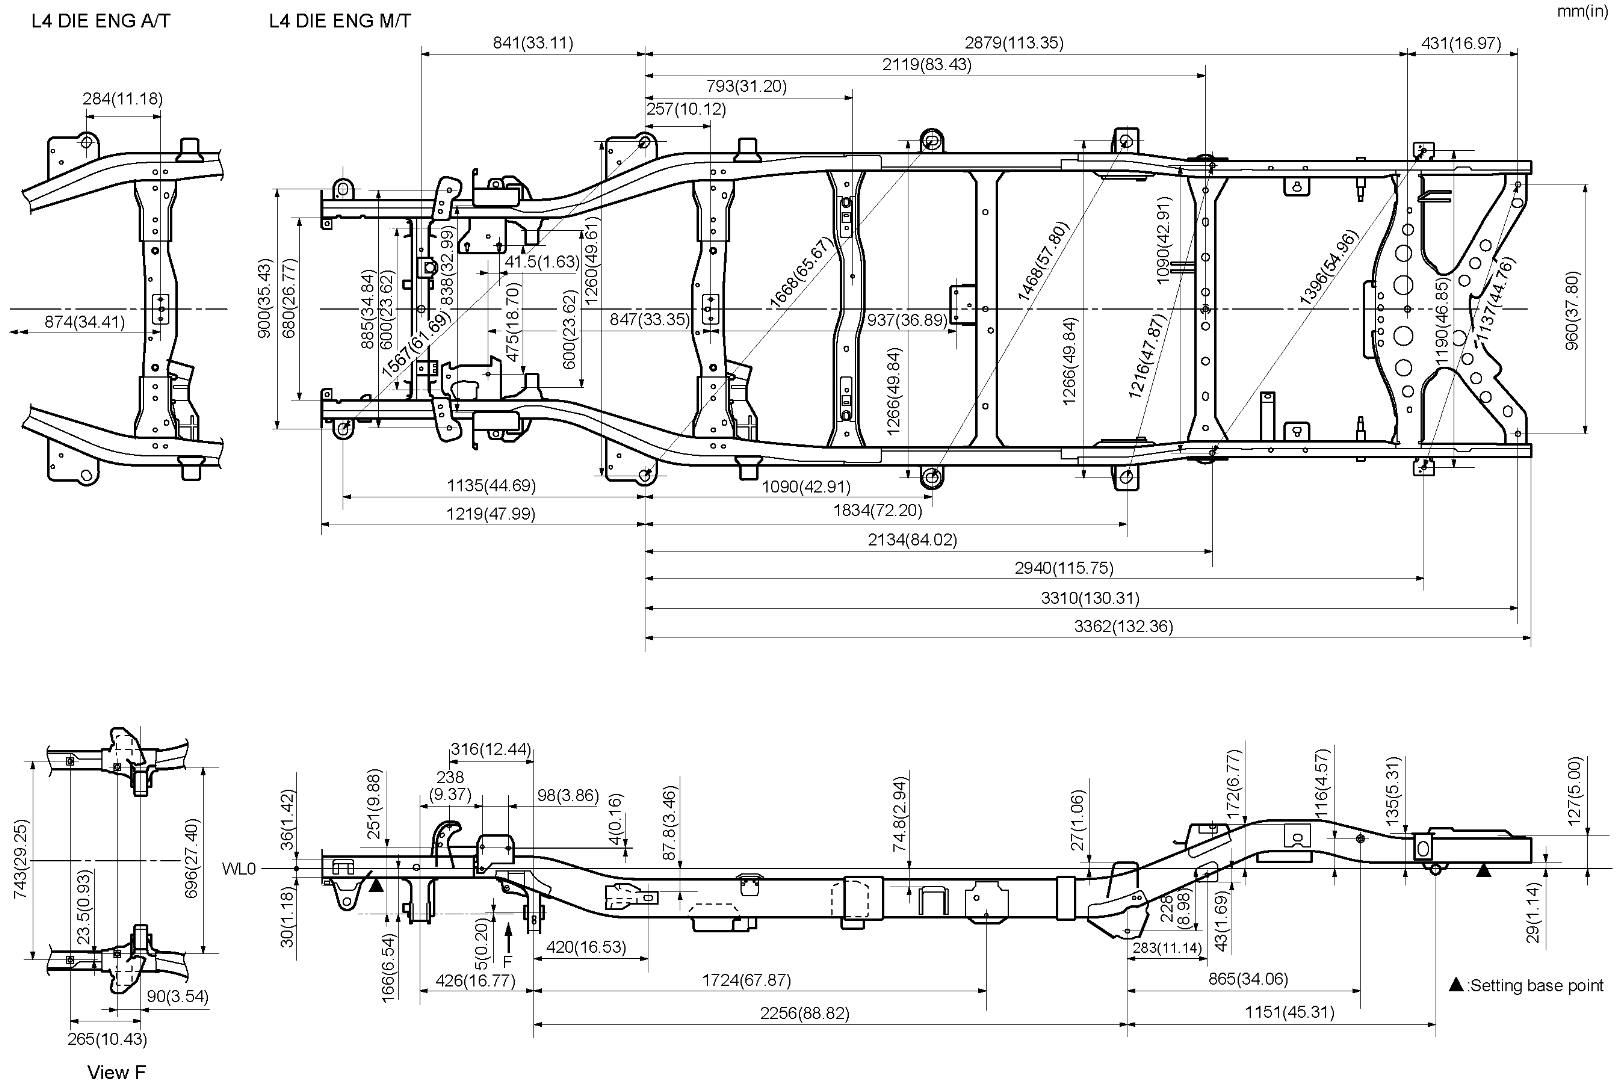
4×4, LWB, CREW CAB MODEL

This illustration is based on the RHD model



RTW72AXF002901

ISUZU KB P190 2007
TO MODEL INDEX

Symptoms - Engine Controls

Symptoms - Engine Controls

Important Preliminary Inspections Before Starting

Perform Diagnostic System Check - Engine Controls before using the symptom tables, and verify that all of the following are true:

- The ECM and malfunction indicator lamp (MIL)/ service vehicle soon (SVS) lamp are operating correctly.
- The scan tool data is within the normal operating range. Refer to Scan Tool Data List in this section.
- Verify the customer concern and locate the correct symptom in the table of contents. Inspect the items indicated under that symptom.

Visual and Physical Inspection

Several of the symptom procedures ask for careful visual and physical inspection. This step is extremely important. The visual and physical inspection can lead to correcting a problem without further inspections, and can save valuable time. Ensure that:

- The ECM grounds are clean, tight, and in their proper location.
- The vacuum hoses are not split or kinked, and properly connected. Inspect thoroughly for any type of leak or restriction.
- The air intake ducts are not collapsed or damaged.
- The exhaust pipes are not collapsed or damaged.
- The engine harness wiring and terminals are properly connected and are not pinched or cut.

Intermittent

Important: Inspect for improper installation of electrical components if an intermittent condition exists. Inspect for aftermarket add-on electrical equipment devices, lights, and cellular phones. Verify that no aftermarket equipment is connected to the controller area network (CAN) or other serial data circuit.

Important: The problem may or may not turn ON the MIL/ SVS lamp or store a DTC. Faulty electrical connections or wiring cause most intermittent problems. Perform a careful visual and physical inspection of the suspect connectors for the following conditions:

- Improperly mated connector halves
- Terminals that are not seated
- Terminals that are damaged or improperly formed

Reform or replace connector terminals in the problem circuit in order to ensure proper contact tension. Remove the terminal from the connector body in order to inspect for poor terminal wire connection.
Road test the vehicle with the DMM connected to the suspected circuit. An abnormal reading that occurs when the malfunction occurs is a good indication that there is a malfunction in the circuit being monitored.
Use the scan tool in order to help detect intermittent conditions. Useful features of the Tech 2 scan tool include the following:

- Trigger the Snapshot feature in order to capture and store engine parameters when the malfunction occurs. Review this stored information in order to see the specific running conditions that caused the malfunction.
- Freeze Frame/ Failure Record can also aid in locating an intermittent condition. Review and capture the information in the Freeze Frame/ Failure Record associated with the intermittent DTC being diagnosed. Drive the vehicle within the conditions that were present when the DTC originally set.
- Use the Plot Function on the scan tool in order to plot selected data parameters. Review this stored information to aid in locating an intermittent problem. Refer to the scan tool Users Guide for more information.

Use the data recording module (DRM) in order to help detect intermittent conditions. The DRM has ability to store engine log data when an event of DTC. Maximum three log data can be stored in the DRM memory. If more than maximum number of storage is set, oldest log data is overwritten. However, if same DTC is set within eight hours that DTC is not stored in the DRM memory.
The manual trigger function is to store the log data by an arbitrary operation of the driver when an event of wrong vehicle performance that is instead of an event of DTC. If the driver presses and releases the manual trigger switch once, that time becomes a trigger and one log data before and behind the trigger is stored in the DRM memory. When there is a space in the DRM memory, log data is stored in that space. However, when more than maximum number of storage is set, oldest log data is overwritten.
Refer to the DRM Users Guide for more information.

Important: If the intermittent condition exists as a start and then stall, test for DTCs relating to the vehicle theft deterrent system. Test for improper installation of electrical options such as lights, cellular phones, etc..
Any of the following may cause an intermittent MIL/ SVS lamp with no stored DTC:

- The ECM grounds are loose or dirty. Refer to Engine Controls Schematics.

- The MIL/ SVS lamp circuit intermittently shorted to ground
- Electrical system interference caused by a malfunctioning relay, ECM driven solenoid, or switch. The electrical component can cause a sharp electrical surge. Normally, the problem will occur when the malfunctioning component is operating.
- There are any open diodes.

Important: The following symptom tables contain groups of possible causes for each symptom. The order of these procedures is not important. If the scan tool readings do not indicate the problems, then proceed in a logical order, easiest to check or most likely to cause first. In order to determine if a specific vehicle is using a particular system or component, refer to Engine Controls Schematics for an application.
Use the following tables when diagnosing a symptom complaint:

- Intermittent Conditions
- Hard Start
- Rough, Unstable, or Incorrect Idle and Stalling
- High Idle Speed
- Cuts Out
- Surges
- Lack of Power, Sluggishness or Sponginess
- Hesitation, Sag or Stumble
- Abnormal Combustion Noise
- Poor Fuel Economy
- Excessive Smoke (Black Smoke)
- Excessive Smoke (White Smoke)

Intermittent Conditions

Checks	Action
Definition: The problem is not currently present but is indicated in DTC History. OR There is a customer complaint, but the symptom cannot currently be duplicated, if the problem is not DTC related.	
Preliminary Checks	• Refer to Symptoms - Engine Controls before starting.
Harness/ Connector	Many intermittent open or shorted circuits are affected by harness/ connector movement that is caused by vibration, engine torque, bumps/ rough pavement, etc. Test for this type of condition by performing the applicable procedure from the following list: • Move related connectors and wiring while monitoring the appropriate scan tool data. • Move related connectors and wiring with the component commanded ON, and OFF, with the scan tool. Observe the component operation. • With the engine running, move related connectors and wiring while monitoring engine operation. If harness or connector movement affects the data displayed, component/ system operation, or engine operation, inspect and repair the harness/ connections as necessary.
Electrical Connections or Wiring	Poor electrical connections, terminal tension or wiring problems cause most intermittent. To perform the following inspections: • Poor mating of the connector halves, or terminals improperly seated in the connector body. • Improperly formed or damaged terminals. Test for poor terminal tension. • Poor terminal to wire connections including terminals crimped over insulation. This requires removing the terminal from the connector body. • Corrosion/ water intrusion. Pierced or damaged insulation can allow moisture to enter the wiring. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits. • Wires that are broken inside the insulation. • Harness for pinched, cut or rubbed through wiring. • Ensure that the wiring does not come in contact with hot exhaust components.
Control Module Power and Grounds Component Power and Grounds	Poor power or ground connections can cause widely varying symptoms. • Test all control module power supply circuits. Many vehicles have multiple circuits supplying power to the control module. Other components in the system may have separate power supply circuits that may also need to be tested. Inspect connections at the module/ component connectors, fuses, and any intermediate connections between the power source and the module/ component. A test lamp or a DMM may indicate that voltage is present, but neither tests the ability of the circuit to carry sufficient current. Ensure that the circuit can carry the current necessary to operate the component. • Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point. Inspect the connections at the component and in splice packs, where applicable. Ensure that the circuit can carry the current necessary to operate the component.

Checks	Action
Temperature Sensitivity	• An intermittent condition may occur when a component/ connection reaches normal operating temperature. The condition may occur only when the component/ connection is cold, or only when the component/ connection is hot. • Freeze Frame, Failure Records or Snapshot Data may help with this type of intermittent conditions, where applicable. • If the intermittent is related to heat, review the data for a relationship with the following: - High ambient temperatures. - Underhood/ engine generated heat. - Circuit generated heat due to a poor connection, or high electrical load. - Higher than normal load conditions, towing, etc.. • If the intermittent is related to cold, review the data for the following: - Low ambient temperatures-In extremely low temperatures, ice may form in a connection or component. Test for water intrusion. - The condition only occurs on a cold start. - The condition goes away when the vehicle warms up. • Information from the customer may help to determine if the trouble follows a pattern that is temperature related.
Electromagnetic Interference (EMI) and Electrical Noise	Some electrical components/ circuits are sensitive to EMI or other types of electrical noise. Inspect the following conditions: • A misrouted harness that is too close to high voltage/ high current devices such as injection components, motors, generator etc. These components may induce electrical noise on a circuit that could interfere with normal circuit operation. • Electrical system interference caused by a malfunctioning relay, or the ECM driven solenoid or switch. These conditions can cause a sharp electrical surge. Normally, the problem will occur when the malfunctioning component is operating. • Improper installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. These accessories may lead to an emission related failure while in use, but do not fail when the accessories are not in use. • Test for any open diodes. Some relays may contain a clamping diode. • Test the generator for a bad rectifier bridge that may be allowing AC noise into the electrical system.
Incorrect ECM Programming	• There are only a few situations where reprogramming a ECM is appropriate: - An ECM from another vehicle is installed. - Revised software/ calibration files have been released for this vehicle. **Important:** DO NOT reprogram the ECM with the SAME software/ calibration files that are already present in the ECM. This is not an effective repair for any type of driveability problem. • Verify that the ECM contains the correct software/ calibration. If incorrect programming is found, reprogram the ECM with the most current software/ calibration.
Duplicating Failure Conditions	• If none of the previous tests are successful, attempt to duplicate and/ or capture the failure conditions. • Freeze Frame/ Failure Records data, where applicable, contains the conditions that were present when the DTC set. - Review and record Freeze Frame/ Failure Records data. - Operate the vehicle under the same conditions that were noted in Freeze Frame/ Failure Records data, as closely as possible. The vehicle must also be operating within the Conditions for Running the DTC. Refer to Conditions for Running the DTC in the supporting text of the DTC being diagnosed. • An alternate method is to drive the vehicle with the DMM connected to a suspected circuit. An abnormal reading on the DMM when the problem occurs, may help you locate the problem.

Checks	Action
Scan Tool Snapshot	The scan tool can be set up to take a Snapshot of the parameters available via serial data. The Snapshot function records live data over a period of time. The recorded data can be played back and analyzed. The scan tool can also graph parameters singly or in combinations of parameters for comparison. The Snapshot can be triggered manually at the time the symptom is noticed, or set up in advance to trigger when a DTC sets. An abnormal value captured in the recorded data may point to a system or component that needs to be investigated further. Refer to the scan tool Users Guide for more information.
DRM Memory	Use data stored in the DRM memory or use manual trigger function. The DRM has ability to store engine log data when an event of DTC. The manual trigger function is to store the log data by an arbitrary operation of the driver when an event of wrong vehicle performance that is instead of an event of DTC. If the driver presses and releases the manual trigger switch once, that time becomes a trigger and one log data before and behind the trigger is stored in the DRM memory. Refer to the DRM Users Guide for more information.

Hard Start

Checks	Action
Definition: The engine cranks OK, but does not start for a long time. The engine does eventually run, or may start but immediately dies.	
Preliminary Checks	• Diagnostic System Check - Engine Controls. • Ensure the driver is using the correct starting procedure. • Inspect the ECM grounds for being clean, tight, and in their proper locations. • Inspect that the harness connectors are correctly connected. • Inspect the fuel type and quality. • Inspect the programmed fuel injector ID code for each cylinder. • Inspect the Scan Tool Data List in this section. • Inspect the Service Bulletin.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Scan Tool Data List in this section. • Compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) parameters on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance in each circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT may indicate a higher than normal intake air temperature if the ignition switch is being ON. • Observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor should read 0.9 to 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 1 minute. If not, check for high resistance in each circuit or for a skewed sensor. • Crankshaft position (CKP) sensor is tight and the sensor rotor is not damaged. • Camshaft position (CMP) sensor is tight and the timing chain sprocket is not damaged.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to Fuel System Check chart and appropriate procedure in the Fuel System section. • Air in the fuel system. • Water contamination in the fuel. • Fuel waxing or icing. • Fuel filter indicator lamp is continuously or frequently turned ON with engine run. • External fuel leaks or high engine oil level. • In-tank fuel pump operation. Refer to In-tank Fuel Pump System Check in this section. • Fuel leak off from the fuel pressure limiter valve and fuel injectors. • Fuel lines between the fuel tank and fuel supply pump for being crushed, kinked, tightness, cracks and plugged. • A plugged fuel tank vent valve and hose. • Inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. • Fuel supply pump operation. **Notice:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. • Perform the Cylinder Balance Test with a scan tool. • Perform the Injector Force Drive with a scan tool. • Observe the FRP Regulator Feedback current on the scan tool.

Checks	Action
Air Intake System Checks	Inspect the air intake system for the following conditions. • Air cleaner, air intake ducts and charge air cooler for a restriction, holes, or leaks. • A restriction in the turbocharger inlet duct. • Intake throttle valve for a stuck condition. • A restriction or leak in the intake manifold.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Poor cylinder compression. • Improper mechanical timing (timing gear and timing chain). • Improper valve gap. • Broken or weak valve springs. • Worn camshaft lobes.
Electrical System Checks	Inspect the engine electrical for the following conditions. Refer to the Engine Electrical section. • Glow plug control system operation. Refer to Glow Control System Check in this section. • Slow cranking speed. • Weakened batteries.

Rough, Unstable, or Incorrect Idle and Stalling

Checks	Action
Definition: Engine runs unevenly at idle. If severe, the engine or vehicle may shake. Engine idle speed may vary in RPM. Either condition may be severe enough to stall the engine.	
Preliminary Checks	• Diagnostic System Check - Engine Controls. • Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Inspect the ECM grounds for being clean, tight, and in their proper locations. • Inspect that the harness connectors are correctly connected. • Inspect the fuel type and quality. • Inspect the programmed fuel injector ID code for each cylinder. • Inspect the Scan Tool Data List in this section. • Inspect the Service Bulletin.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Scan Tool Data List in this section. • Compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) parameters on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance in each circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT may indicate a higher than normal intake air temperature if the ignition switch is being ON. • Observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor should read 0.9 to 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 1 minute. If not, check for high resistance in each circuit or for a skewed sensor. • Observe the Fuel Rail Pressure parameter at idle in Neutral. The Fuel Rail Pressure should always be within 27 to 33 MPa (3,900 to 4,800 psi) after warm up. • Crankshaft position (CKP) sensor is tight and the sensor rotor is not damaged. • Camshaft position (CMP) sensor is tight and the timing chain sprocket is not damaged.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to Fuel System Check Chart and appropriate procedure in the Fuel System section. • Air in the fuel system. • Water contamination in the fuel. • Fuel waxing or icing. • Fuel filter indicator lamp is continuously or frequently turned ON with engine run. • External fuel leaks or high engine oil level. • In-tank fuel pump operation. Refer to In-tank Fuel Pump System Check in this section. • Fuel leak off from the fuel pressure limiter valve and fuel injectors. • Fuel lines between the fuel tank and fuel supply pump for being crushed, kinked, tightness, cracks and plugged. • A plugged fuel tank vent valve and hose. • Inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. • Fuel supply pump operation. **Notice:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. • Perform the Cylinder Balance Test with a scan tool. • Perform the Injector Force Drive with a scan tool. • Observe the Fuel Compensation for each cylinder at idle on the scan tool. • Observe the FRP Regulator Feedback current on the scan tool.

Checks	Action
Air Intake System Checks	Inspect the air intake system for the following conditions. • Air cleaner, air intake ducts and charge air cooler for a restriction, holes, or leaks. • A restriction in the turbocharger inlet duct. • Intake throttle valve for a stuck condition. • A restriction or leak in the intake manifold.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Poor cylinder compression. • Improper mechanical timing (timing gear and timing chain). • Improper valve gap. • Broken or weak valve springs. • Worn camshaft lobes. • Incorrect basic engine parts such as camshaft, cylinder head, pistons, etc..
Additional Checks	• Electromagnetic interference (EMI) on the reference circuit can cause an engine miss condition. The scan tool can usually detect EMI by monitoring the engine speed. A sudden increase in speed with little change in actual engine speed change indicates that EMI is present. If a problem exists, check routing of high voltage components, such as fuel injector solenoid valve wiring, near the sensor circuits. • Faulty engine mounts. • Faulty crank pulley. • Faulty generator & A/C compressor. • Generator output voltage. • EGR system operating correctly. Refer to EGR Control System Check in this section. • A/C operation.

High Idle Speed

Checks	Action
Definition: Engine idle speed is higher than normal in regardless of engine coolant temperature.	
Preliminary Checks	• Diagnostic System Check - Engine Controls. • Inspect that the harness connectors are correctly connected. • Use the scan tool to compare the engine speed and tachometer on the instrument panel (IP) cluster. • Inspect the battery voltage. If the battery voltage is less than 11 volts, the ECM set the idle speed 50RPM higher than normal. • Inspect the A/C operation. • Inspect the fuel type and quality. • Inspect the engine oil level. • Inspect the Scan Tool Data List in this section. • Inspect the Service Bulletin.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Scan Tool Data List in this section. • Compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) parameters on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance in each circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT may indicate a higher than normal intake air temperature if the ignition switch is being ON. • Observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor should read 0.9 to 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 1 minute. If not, check for high resistance in each circuit or for a skewed sensor. • Observe the Fuel Rail Pressure parameter at idle in Neutral. The Fuel Rail Pressure should always be within 27 to 33 MPa (3,900 to 4,800 psi) after warm up. • Observe the Accelerator Pedal Position (APP). APP parameter should change linearly from 0 to 100% according to the accelerator pedal operation.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Fuel injectors. Remove the injectors and visually inspect. (Injector tip(s) may be damaged)

BACK TO CHAPTER INDEX

ISUZU KB P190 2007
TO MODEL INDEX

Cuts Out

Checks	Action
Definition: A constant jerking that follows the engine speed, usually more pronounced as the engine load increase. The exhaust has a steady spitting sound at idle, low speed, or hard acceleration for the fuel starvation that can cause the engine to cut-out.	
Preliminary Check	• Diagnostic System Check - Engine Controls. • Inspect that the harness connectors are correctly connected. • Inspect the ECM grounds for being clean, tight, and in their proper locations. • Inspect the Scan Tool Data List in this section. • Inspect the Service Bulletin.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Scan Tool Data List in this section. • Observe the Mass Air Flow (MAF) parameter for a skewed or slow MAF sensor. • Observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor should read 0.9 to 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 1 minute. If not, check for high resistance in each circuit or for a skewed sensor. • Observe the Fuel Rail Pressure and Desired Fuel Rail Pressure parameter between idle and W.O.T. (accelerator pedal full travel) in Neutral. Fuel Rail Pressure parameter should follow within ± 5 MPa (± 725 psi) quick enough. • Observe the Accelerator Pedal Position (APP). APP parameter should change linearly from 0 to 100% according to the accelerator pedal operation. • Crankshaft position (CKP) sensor is tight and the sensor rotor is not damaged.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to Fuel System Check Chart and appropriate procedure in the Fuel System section. • Air in the fuel system. • Water contamination in the fuel. • Fuel waxing or icing. • Fuel filter indicator lamp is continuously or frequently turned ON with engine run. • In-tank fuel pump operation. Refer to In-tank Fuel Pump System Check in this section. • Fuel leak off from the fuel pressure limiter valve and fuel injectors. • Fuel lines between the fuel tank and fuel supply pump for being crushed, kinked, tightness, cracks and plugged. • Inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. • Perform the Cylinder Balance Test with a scan tool. • Perform the Injector Force Drive with a scan tool. • Observe the Fuel Compensation for each cylinder at idle on the scan tool.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Air cleaner, air intake ducts and charge air cooler for a restriction, holes, or leaks. • A restriction in the turbocharger inlet duct. • Intake throttle valve for a stuck condition. • A restriction or leak in the intake manifold. • A restriction or damaged at MAF sensor.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section.
Additional Checks	• Electromagnetic interference (EMI) on the reference circuit can cause an engine miss condition. The scan tool can usually detect EMI by monitoring the engine speed. A sudden increase in speed with little change in actual engine speed change indicates that EMI is present. If a problem exists, check routing of high voltage components, such as fuel injector solenoid valve wiring, near the sensor circuits.

Surges

Checks	Action
Difinition: The engine has a power variation under a steady throttle or cruise. The vehicle seems to speed up and slow down with no change in the accelerator pedal.	
Preliminary Checks	• Diagnostic System Check - Engine Controls. • Ensure the driver understands the A/C compressor operation. • Use the scan tool in order to make sure the Vehicle Speed parameter reading matches the vehicle speedometer. • Inspect the ECM grounds for being clean, tight, and in their proper locations. • Inspect that the harness connectors are correctly connected. • Inspect the fuel type and quality. • Inspect the programmed fuel injector ID code for each cylinder. • Inspect the Scan Tool Data List in this section. • Inspect the Service Bulletin.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Scan Tool Data List in this section. • Observe the Mass Air Flow (MAF) parameter for a skewed or slow MAF sensor. • Observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor should read 0.9 to 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 1 minute. If not, check for high resistance in each circuit or for a skewed sensor. • Observe the Fuel Rail Pressure and Desired Fuel Rail Pressure parameter between idle and W.O.T. (accelerator pedal full travel) in Neutral. Fuel Rail Pressure parameter should follow within ± 5 MPa (± 725 psi) quick enough. • Observe the Accelerator Pedal Position (APP). APP parameter should change linearly from 0 to 100% according to the accelerator pedal operation.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to Fuel System Check chart and appropriate procedure in the Fuel System section. • Air in the fuel system. • Water contamination in the fuel. • Fuel waxing or icing. • Fuel filter indicator lamp is continuously or frequently turned ON with engine run. • In-tank fuel pump operation. Refer to In-tank Fuel Pump System Check in this section. • Fuel leak off from the fuel pressure limiter valve and fuel injectors. • Fuel lines between the fuel tank and fuel supply pump for being crushed, kinked, tightness, cracks and plugged. • A plugged fuel tank vent valve and hose. • Inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. • Fuel supply pump operation. **Notice:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. • Perform the Cylinder Balance Test with a scan tool. • Perform the Injector Force Drive with a scan tool.

Checks	Action
Air Intake System Checks	Inspect the air intake system for the following conditions. • Air cleaner, air intake ducts and charge air cooler for a restriction, holes, or leaks. • A restriction in the turbocharger inlet duct. • Intake throttle valve for a stuck condition. • A restriction or leak in the intake manifold. • A restriction or damaged at MAF sensor. • Perform the Swirl Control Solenoid Test with a scan tool. Inspect the diaphragm valve operation when it commanded ON/ OFF. • Turbocharger wastegate valve operation. Refer to wastegate valve inspection in the Engine Mechanical section. (Standard output) • Turbocharger nozzle control actuator operation. Refer to Turbocharger Control System Check in this section. (High output)
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section.
Additional Checks	• Inspect the EGR system operating correctly. Refer to EGR Control System Check in this section. • Inspect the A/C operation. • Inspect the torque converter clutch (TCC) operation. (A/T only) • Inspect deformed tire(s) that may cause surges at fixed vehicle speed range.

Lack of Power, Sluggishness or Sponginess

Checks	Action
Definition: The engine delivers less than expected power. There is little or no increase in speed when partially applying the accelerator pedal.	
Preliminary Checks	• Diagnostic System Check - Engine Controls. • Compare the vehicle with a similar unit. Ensure the vehicle has an actual problem. • Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Have the tire sizes changed? • Are excessively heavy loads being carried? • Inspect for clutch slip. • Inspect brake drag. • Inspect for a proper transmission shift pattern and down shift operation. • Inspect the fuel quality (cetane index). • Inspect the engine oil level and quality. • Use the scan tool in order to make sure the Vehicle Speed parameter reading matches the vehicle speedometer. • Inspect the ECM grounds for being clean, tight, and in their proper locations. • Inspect the programmed fuel injector ID code for each cylinder. • Inspect the Scan Tool Data List in this section. • Inspect the Service Bulletin.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Scan Tool Data List in this section. • Compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) parameters on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance in each circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT may indicate a higher than normal intake air temperature if the ignition switch is being ON. • Observe the MAF parameter for a skewed or slow MAF sensor. • Observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor should read 0.9 to 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 1 minute. If not, check for high resistance in each circuit or for a skewed sensor. • Observe the Fuel Rail Pressure and Desired Fuel Rail Pressure parameter between idle and W.O.T. (accelerator pedal full travel) in Neutral. Fuel Rail Pressure parameter should follow within ± 5 MPa (± 725 psi) quick enough. • Observe the Accelerator Pedal Position (APP). APP parameter should change linearly from 0 to 100% according to the accelerator pedal operation. • Observe the Barometric Pressure (BARO) parameter. The BARO parameter should indicate near surrounding barometric pressure. Refer to Altitude vs. Barometric Pressure. (Standard output) • Observe the Boost Pressure and BARO with ignition ON and engine OFF. Both parameters should be within the 7.0 kPa (1.0 psi) each other. (High output)

Checks	Action
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to Fuel System Check chart and appropriate procedure in the Fuel System section. • Air in the fuel system. • Water contamination in the fuel. • Fuel waxing or icing. • Fuel filter indicator lamp is continuously or frequently turned ON with engine run. • External fuel leaks or high engine oil level. • In-tank fuel pump operation. Refer to In-tank Fuel Pump System Check in this section. • Fuel leak off from the fuel pressure limiter valve and fuel injectors. • Fuel lines between the fuel tank and fuel supply pump for being crushed, kinked, tightness, cracks and plugged. • A plugged fuel tank vent valve and hose. • Inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. • Fuel supply pump operation. **Notice:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. • Perform the Cylinder Balance Test with a scan tool. • Perform the Injector Force Drive with a scan tool. • Observe the Fuel Compensation for each cylinder at idle on the scan tool.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Air cleaner, air intake ducts and charge air cooler for a restriction, holes, or leaks. • A restriction in the turbocharger inlet duct. • Intake throttle valve for a stuck condition. • A restriction or leak in the intake manifold. • A restriction or damaged at MAF sensor. • Perform the Swirl Control Solenoid Test with a scan tool. Inspect the diaphragm valve operation when it commanded ON/ OFF. • A worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Refer to turbocharger inspection in the Engine Mechanical section. • Turbocharger wastegate valve operation. Refer to wastegate valve inspection in the Engine Mechanical section. (Standard output) • Turbocharger nozzle control actuator operation. Refer to Turbocharger Control System Check in this section. (High output)
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Poor cylinder compression. • Improper valve gap. • Broken or weak valve springs. • Worn camshaft lobes.
Additional Checks	• Inspect the EGR system operating correctly. Refer to EGR Control System Check in this section. • Observe the Park/ Neutral Switch parameter with a scan tool. • Inspect for an engine overheat condition. Refer to Engine Cooling section. • Inspect the A/C operation. • Inspect the torque converter clutch (TCC) operation. (A/T only).

Hesitation, Sag or Stumble

Checks	Action
Definition: The vehicle has a momentary lack of response when pushing down on the accelerator. The condition can occur at any vehicle speed. The condition is usually most severe when trying to make the vehicle move from a stop. If severe enough, the condition may cause the engine to stall.	
Preliminary Checks	• Diagnostic System Check - Engine Controls. • Compare the vehicle with a similar unit. Ensure the vehicle has an actual problem. • Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Inspect for a proper transmission shift pattern and down shift operation. • Inspect the fuel quality (cetane index). • Inspect the engine oil level and quality. • Inspect the ECM grounds for being clean, tight, and in their proper locations. • Inspect the programmed fuel injector ID code for each cylinder. • Inspect the Scan Tool Data List in this section. • Inspect the Service Bulletin.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Scan Tool Data List in this section. • Compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) parameters on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance in each circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT may indicate a higher than normal intake air temperature if the ignition switch is being ON. • Observe the MAF parameter for a skewed or slow MAF sensor. • Observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor should read 0.9 to 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 1 minute. If not, check for high resistance in each circuit or for a skewed sensor. • Observe the Fuel Rail Pressure and Desired Fuel Rail Pressure parameter between idle and W.O.T. (accelerator pedal full travel) in Neutral. Fuel Rail Pressure parameter should follow within ± 5 MPa (± 725 psi) quick enough. • Observe the Accelerator Pedal Position (APP). APP parameter should change linearly from 0 to 100% according to the accelerator pedal operation. • Observe the Barometric Pressure (BARO) parameter. The BARO parameter should indicate near surrounding barometric pressure. Refer to Altitude vs. Barometric Pressure. (Standard output) • Observe the Boost Pressure and BARO with ignition ON and engine OFF. Both parameters should be within the 7.0 kPa (1.0 psi) each other. (High output) • Crankshaft position (CKP) sensor is tight and the sensor rotor is not damaged.

Checks	Action
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to Fuel System Check Chart and appropriate procedure in the Fuel System section. • Air in the fuel system. • Water contamination in the fuel. • Fuel waxing or icing. • Fuel filter indicator lamp is continuously or frequently turned ON with engine run. • External fuel leaks or high engine oil level. • In-tank fuel pump operation. Refer to In-tank Fuel Pump System Check in this section. • Fuel leak off from the fuel pressure limiter valve and fuel injectors. • Fuel lines between the fuel tank and fuel supply pump for being crushed, kinked, tightness, cracks and plugged. • A plugged fuel tank vent valve and hose. • Inside the fuel tank for any foreign material that may be getting drawn into the fuel line pickup causing a blocked condition. • Fuel supply pump operation. **Notice:** The fuel supply pump must be timed to the engine and adjustment value must be learned to the ECM. • Perform the Cylinder Balance Test with a scan tool. • Perform the Injector Force Drive with a scan tool. • Observe the Fuel Compensation for each cylinder at idle on the scan tool.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Air cleaner, air intake ducts and charge air cooler for a restriction, holes, or leaks. • A restriction in the turbocharger inlet duct. • Intake throttle valve for a stuck condition. • A restriction or leak in the intake manifold. • A restriction or damaged at MAF sensor. • Perform the Swirl Control Solenoid Test with a scan tool. Inspect the diaphragm valve operation when it commanded ON/ OFF. • A worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Refer to turbocharger inspection in the Engine Mechanical section. • Turbocharger wastegate valve operation. Refer to wastegate valve inspection in the Engine Mechanical section. (Standard output) • Turbocharger nozzle control actuator operation. Refer to Turbocharger Control System Check in this section. (High output)
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Poor cylinder compression. • Improper valve gap. • Broken or weak valve springs. • Worn camshaft lobes.
Additional Checks	• Inspect the EGR system operating correctly. Refer to EGR Control System Check in this section. • Inspect for an engine overheat condition. Refer to Engine Cooling section. • Inspect the A/C operation. • Inspect the torque converter clutch (TCC) operation. (A/T only)

Abnormal Combustion Noise

Checks	Action
Definition: A mild to severe ping, usually worse under acceleration. The engine makes sharp metallic knocks that change with the throttle opening.	
Preliminary Checks	• Diagnostic System Check - Engine Controls. • Ensure the vehicle has an actual problem. • Inspect for smoke associated with the combustion noise. • Inspect the fuel quality (cetane index). • Inspect the programmed fuel injector ID code for each cylinder. • Inspect the Scan Tool Data List in this section. • Inspect the Service Bulletin.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Scan Tool Data List in this section. • Compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) parameters on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance in each circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT may indicate a higher than normal intake air temperature if the ignition switch is being ON. • Observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor should read 0.9 to 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 1 minute. If not, check for high resistance in each circuit or for a skewed sensor. • Observe the Fuel Rail Pressure and Desired Fuel Rail Pressure parameter between idle and W.O.T. (accelerator pedal full travel) in Neutral. Fuel Rail Pressure parameter should follow within ± 5 MPa (± 725 psi) quick enough. • Crankshaft position (CKP) sensor is tight and the sensor rotor is not damaged.
Fuel System Checks	• If excessive smoke is present, check for a stuck open fuel injector. Inspect for fuel leakage into the combustion chamber. • Inspect the fuel injectors. Remove the injectors and visually inspect. • Perform the Cylinder Balance Test with a scan tool. • Perform the Injector Force Drive with a scan tool. • Observe the Fuel Compensation for each cylinder at idle on the scan tool.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Poor cylinder compression. • Incorrect basic engine parts such as camshaft, cylinder head, pistons, etc.. • Inspect for any excessive oil entering combustion chamber.
Additional Checks	• Inspect other possible causes that can make similar noise such as loose component parts, bracket, mount and weak clutch damper spring.

Poor Fuel Economy

Checks	Action
Definition: Fuel economy, as measured by actual road tests and several tanks of fuel, is noticeably lower than expected. Also, the economy is noticeably lower than it was on this vehicle at one time, as previously shown by actual road tests.	
Preliminary Checks	• Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Inspect the driving habits of the owner. • Is the A/C ON full time, defroster mode ON? • Are the tires at the correct pressure? • Are the tire sizes changed? • Are excessively heavy loads being carried? • Is the acceleration too much, too often? • Inspect for clutch slip. • Inspect brake drag. • Inspect dive belt tension. • Inspect for a proper transmission shift pattern and down shift operation. • Inspect the fuel quality (cetane index). • Inspect the engine oil level and quality. • Suggest to the owner to fill the fuel tank and recheck the fuel economy. • Inspect the odometer is correctly operated. • Inspect the Scan Tool Data List in this section. • Inspect the Service Bulletin.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Scan Tool Data List in this section. • Compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) parameters on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance in each circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT may indicate a higher than normal intake air temperature if the ignition switch is being ON.
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Fuel type and quality. • Check fuel leak.
Cooling System Checks	Inspect the cooling system for the following conditions. Refer to the Cooling System Section. • Engine coolant level. • Engine thermostat for always being open or for the wrong heat range. • Engine cooling fan for always being ON.

Checks	Action
Air Intake System Checks	Inspect the air intake system for the following conditions. • Air cleaner, air intake ducts and charge air cooler for a restriction, holes, or leaks. • A restriction in the turbocharger inlet duct. • Intake throttle valve for a stuck condition. • A restriction or leak in the intake manifold. • A restriction or damaged at MAF sensor. • Perform the Swirl Control Solenoid Test with a scan tool. Inspect the diaphragm valve operation when it commanded ON/ OFF. • A worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Refer to turbocharger inspection in the Engine Mechanical section. • Turbocharger wastegate valve operation. Refer to wastegate valve inspection in the Engine Mechanical section. (Standard output) • Turbocharger nozzle control actuator operation. Refer to Turbocharger Control System Check in this section. (High output)
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section.
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Poor cylinder compression. • Improper valve gap. • Broken or weak valve springs. • Worn camshaft lobes.

Excessive Smoke (Black Smoke)

Checks	Action
Definition: Black smoke under load, idle or start up hot or cold.	
Preliminary Check	• Ensure the vehicle has an actual problem. • Inspect the ECM grounds for being clean, tight, and in their proper locations. • Remove the air cleaner and check for dirt, or for air ducts being plugged or restricted. Replace as necessary. • Inspect the fuel quality (cetane index). • Inspect the engine oil level and quality. • Inspect the programmed fuel injector ID code for each cylinder. • Inspect the Scan Tool Data List in this section. • Inspect the Service Bulletin.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Scan Tool Data List in this section. • Compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) parameters on a cold engine condition. If the difference among temperature reading is more than 5°C (9°F) on a cold engine, check for high resistance in each circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT may indicate a higher than normal intake air temperature if the ignition switch is being ON. • Observe the MAF parameter for a skewed or slow MAF sensor. • Observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor should read 0.9 to 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 1 minute. If not, check for high resistance in each circuit or for a skewed sensor. • Observe the Fuel Rail Pressure and Desired Fuel Rail Pressure parameter between idle and W.O.T. (accelerator pedal full travel) in Neutral. Fuel Rail Pressure parameter should follow within ±5 MPa (±725 psi) quick enough. • Observe the Barometric Pressure (BARO) parameter. The BARO parameter should indicate near surrounding barometric pressure. Refer to Altitude vs. Barometric Pressure. (Standard output) • Observe the Boost Pressure and BARO with ignition ON and engine OFF. Both parameters should be within the 7.0 kPa (1.0 psi) each other. (High output)
Fuel System Checks	Inspect the fuel system for the following conditions. Refer to the Fuel System section. • Fuel injectors. Remove the injectors and visually inspect. • Perform the Cylinder Balance Test with a scan tool. • Perform the Pilot Injection Control with a scan tool. • Observe the Fuel Compensation for each cylinder at idle on the scan tool.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Air cleaner, air intake ducts and charge air cooler for a restriction, holes, or leaks. • A restriction in the turbocharger inlet duct. • Intake throttle valve for a stuck condition. • A restriction or leak in the intake manifold. • A restriction or damaged at MAF sensor. • A worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Refer to turbocharger inspection in the Engine Mechanical section.
Exhaust System Checks	Inspect the exhaust system for a possible restriction. Refer to the Exhaust System section.

Checks	Action
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Inspect for poor cylinder compression. • Improper mechanical timing (timing gear and timing chain). • Improper valve gap. • Broken or weak valve springs. • Worn camshaft lobes. • Any excessive oil entering combustion chamber.
Additional Checks	• EGR system operating correctly. Refer to EGR Control System Check in this section. • Excessive blow-by gasses.

Excessive Smoke (White Smoke)

Checks	Action
Difinition: White smoke under load, idle or start up hot or cold.	
Preliminary Check	• Ensure the vehicle has an actual problem. • Inspect the ECM grounds for being clean, tight, and in their proper locations. • Inspect the fuel quality (cetane index). • Inspect the programmed fuel injector ID code for each cylinder. • Inspect the Scan Tool Data List in this section. • Inspect the Service Bulletin.
Sensor Checks	Inspect the engine control sensors for the following conditions. Refer to the Scan Tool Data List in this section. • Compare the Coolant Temperature with the Intake Air Temperature (IAT) and Fuel Temperature (FT) parameters on a cold engine condition. If the difference among temperature reading is more than 5 °C (9 °F) on a cold engine, check for high resistance in each circuit or for a skewed sensor. **Notice:** The mass air flow (MAF) sensor is heated and as a result the IAT may indicate a higher than normal intake air temperature if the ignition switch is being ON. • Observe the Fuel Rail Pressure (FRP) Sensor parameter with the engine OFF. The FRP Sensor should read 0.9 to 1.0 volt with the key ON and engine OFF after the engine has stopped running for a minimum of 1 minute. If not, check for high resistance in each circuit or for a skewed sensor. • Observe the Fuel Rail Pressure and Desired Fuel Rail Pressure parameter between idle and W.O.T. (accelerator pedal full travel) in Neutral. Fuel Rail Pressure parameter should follow within ± 5 MPa (± 725 psi) quick enough. • Observe the Accelerator Pedal Position (APP). APP parameter should change linearly from 0 to 100% according to the accelerator pedal operation. • Observe the Boost Pressure and Barometric Pressure (BARO) with ignition ON and engine OFF. Both parameters should be within the 7.0 kPa (1.0 psi) each other. • Crankshaft position (CKP) sensor is tight and the sensor rotor is not damaged.
Fuel System Checks	• If excessive smoke is present, check for a stuck open fuel injector. Inspect for fuel leakage into the combustion chamber. • Fuel injectors. Remove the injectors and visually inspect. • Perform the Cylinder Balance Test with a scan tool. • Perform the Pilot Injection Control with a scan tool. • Observe the Fuel Compensation for each cylinder at idle on the scan tool.
Air Intake System Checks	Inspect the air intake system for the following conditions. • Air cleaner, air intake ducts and charge air cooler for a restriction, holes, or leaks. • A restriction in the turbocharger inlet duct. • Intake throttle valve for a stuck condition. • A restriction or leak in the intake manifold. • A restriction or damaged at MAF sensor. • Perform the Swirl Control Solenoid Test with a scan tool. Inspect the diaphragm valve operation when it commanded ON/ OFF. • A worn or damaged turbocharger turbine wheel, shaft or compressor wheel. Oil leak from turbocharger. Refer to turbocharger inspection in the Engine Mechanical section.

Checks	Action
Engine Mechanical Checks	Inspect the engine mechanical for the following conditions. Refer to the Engine Mechanical section. • Poor cylinder compression. • Improper mechanical timing (timing gear and timing chain). • Improper valve gap. • Broken or weak valve springs. • Worn camshaft lobes. • Thermostat working (open stuck). • Any excessive oil entering combustion chamber.
Electrical System Checks	• Glow plug control (preheating) system operation. Refer to Glow Control System Check in this section.

Repair Instructions

Engine Control Module (ECM) Replacement

Description

The following A - G steps provide an overview procedure to replace and reprogram an ECM. Each A - G steps is explained further in this section.

A. Record the fuel injector ID codes manually from the old ECM.
B. Reset the immobilizer security information in the old ECM. (If so equipped)
C. Replace the old ECM with the new ECM.
D. Program the immoblizer security information into the new ECM. (If so equipped)
E. Program the latest software and calibrations into the new ECM using the Service Programming System (SPS).
F. Program the recorded fuel injector ID codes and the vehicle identification number (VIN) into the ECM using a scan tool programming function.
G. Perform the fuel supply pump relearn procedure by allowing the engine to idle in Park or Neutral until normal operating temperature is achieved.

A. Recoding Fuel Injector ID Code

Each fuel injector is designated with 24 hexadecimal characters (0 - 9 or A - F) that MUST be programmed into the ECM for correct engine fueling for each specific cylinder. These characters can be retrieved in one of following places:

Retrieving the Fuel Injector ID Code Data from the ECM

The current fuel injector ID code data can be retrieved with a scan tool. If the old ECM cannot be communicated with a scan tool, go to the next procedure.

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > appropriate vehicle identification > 4JK1 or 4JJ1 > Programming > Injector ID Code.
4. Record 24 digits of each fuel injector ID code.
5. After complete the recording, turn OFF the scan tool.
6. Turn OFF the ignition.

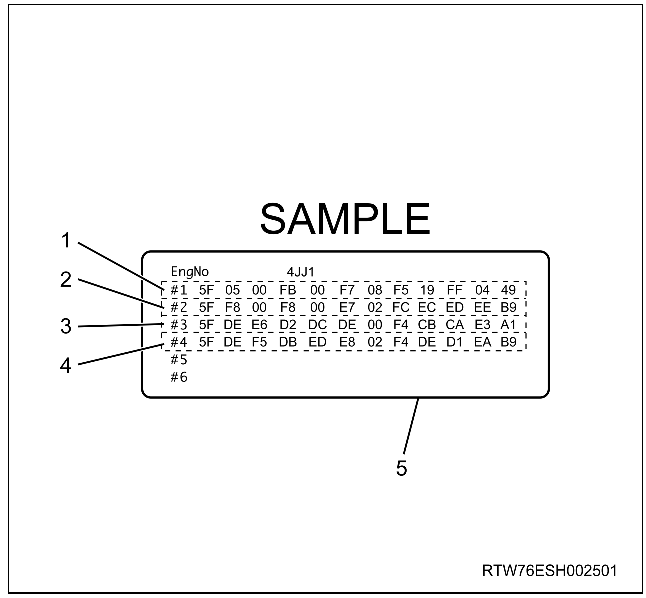
Retrieving the Fuel Injector ID Code Data with a Non-communicating ECM

If a scan tool does not communicate, the fuel injector ID codes must be recorded from the factory affixed label on the cylinder head cover or each fuel injector harness connector housing.

Recording from the label on cylinder head cover

Notice: Only perform this procedure if the fuel injectors are not being replaced in the past.

1. Record all numbers of each cylinder on the label.



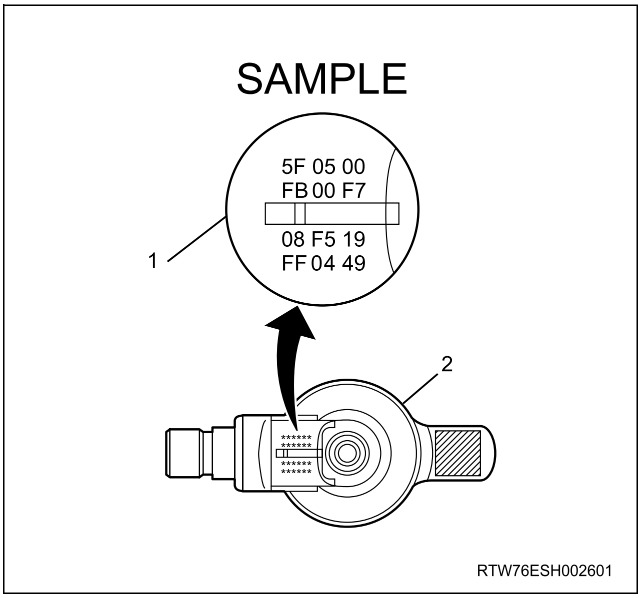
Legend

1. Cylinder #1 fuel injector ID code
2. Cylinder #2 fuel injector ID code
3. Cylinder #3 fuel injector ID code
4. Cylinder #4 fuel injector ID code
5. Injector ID code label

Recording from each fuel injector

1. Disconnect each fuel injector harness connector.

2. Record all numbers of each cylinder on the harness connector housing. The correct order for the fuel injector ID codes of the following illustration is as follows:
5F 05 00 FB 00 F7 08 F5 19 FF 04 49



Legend
1. Fuel injector ID code
2. Fuel injector

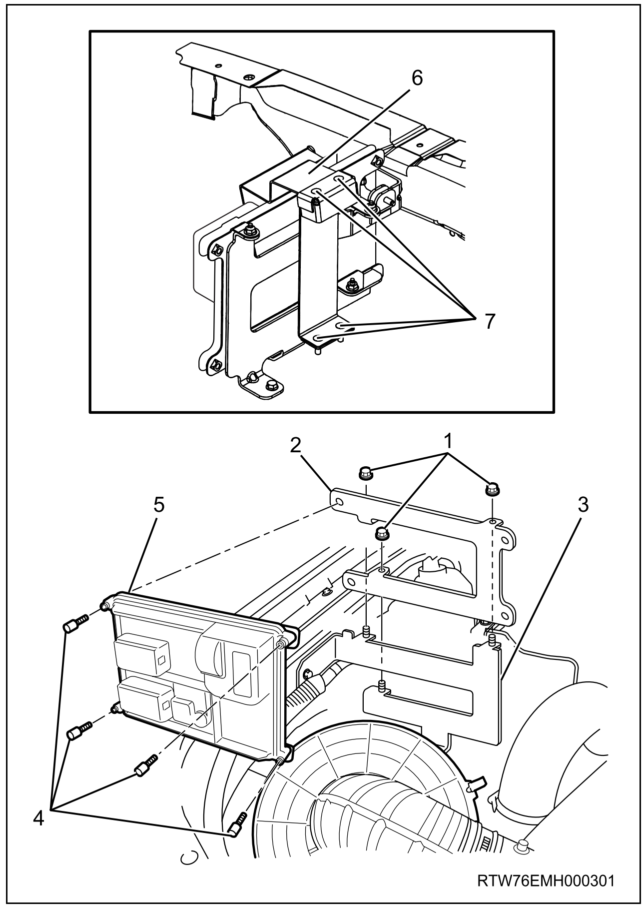
B. Resetting Immobilizer Security Information (If so equipped)

Reset immobilizer security information in the old ECM. Refer to Resetting and Programming Guidelines in immobilizer section. If the old ECM cannot be communicated with a scan tool, go to the next produce.

C. Removal and Installation

Removal Procedure

1. Disconnect the negative battery cable.
2. Loosen bolts (7) and remove the ECM cover (6). (If so equipped)
3. Disconnect the ECM harness connectors.
4. Loosen nuts (1) and remove the ECM with bracket (2) from the base bracket (3).
5. Loosen bolts (4) and remove the ECM (5).



Installation Procedure

1. Install the ECM (5) to the bracket (2) and tighten bolts (4).
2. Install the ECM with bracket (2) to the base bracket (3) and tighten nuts (1).
3. Connect the ECM harness connectors.
4. Install the ECM cover (6) and tighten bolts (7).
5. Connect the negative battery cable.

D. Programming Immobilizer Security Information (If so equipped)

Programming immobilizer security information into the ECM. Refer to Resetting and Programming Guidelines in immobilizer section.

E. Programming Software and Calibrations

Program latest software/ calibrations if released. Refer to Service Programming System (SPS) Description and SPS (Remote Procedure) or SPS (Pass-Thru Procedure) in this section.

F. Programming Fuel Injector ID Codes and VIN

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > appropriate vehicle identification > 4JK1 or 4JJ1 > Programming > Program ECU.

4. In order to get programming approval, the on-screen displays a message to user. Get programming approval from the TIS 2000 using the following procedure:
   a. Connect a scan tool to the terminal that installed TIS 2000 with the latest software and the hardware key is plugged into port.
   b. Turn ON the scan tool and keep at title screen.
   c. Launch the TIS application.
   d. Select the Security Access at the main screen.
   e. Highlight the “Tech 2” on the Diagnostic Tool Selection screen and click “Next”.
   f. Click “Close” on the Security Access Enabled screen.
   g. Turn OFF the scan tool.
   h. Disconnect the scan tool from the terminal.
5. Install a scan tool to the vehicle.
6. Turn ON the ignition, with the engine OFF.
7. Select Diagnostics > appropriate vehicle identification > 4JK1 or 4JJ1 > Programming > Program ECU.
8. Verify the VIN on the screen if programmed at previously described SPS. If not programmed or incorrect VIN, input correct VIN.
9. Input 24 digits of each fuel injector ID code.
10. After complete the programming, turn OFF the ignition for 30 seconds.
11. Start the engine and let idle.
12. Inspect for a proper engine running condition and for no DTC's. Refer to the Diagnostic System Check - Engine Controls if needed.

G. Supply Pump Relearn

1. Install a scan tool.
2. Start the engine and let idle until engine coolant temperature reads 65°C (149°F) or higher while observing the Supply Pump Status parameter with a scan tool. The scan tool parameter changes status Not Learn > Learning > Learned.
3. If the ECM has correctly learned the fuel supply pump current adjustment, the Supply Pump Status parameter on the scan tool will repeatedly indicate Learning and Learned.

Service Programming System (SPS) Description

The service programming system (SPS) allows a technician to program a control module through the data link connector (DLC). The information transfer circuit that is used at the DLC is the same serial data circuit used by the scan tool for retrieving DTCs, displaying data, clearing DTCs etc. This procedure offers the ability to install software/ calibrations matched to a particular vehicle.
Most control modules have two types of memory. The software/ calibrations reside in the flash memory. The two types of memory are listed below:

- Electrically Erasable Programmable Read Only Memory (EEPROM)
  This type of memory allows selected portions of memory to be programmed while other portions remain unchanged.
  Certain learned values reside in the EEPROM, such as:
  - The vehicle identification number (VIN)
  - The software/ calibrations identification numbers
  - The control module security information
- Flash Read Only Memory-Flash Memory
  Flash memory has increased memory storage capacity. During programming, all information within this type of memory is erased, and then replaced with entirely new information.

Service Programming Methods

The two methods of programming an ECM are listed below:

- Remote Programming
- Pass Thru Programming

For information on programming an ECM using one of the methods listed above, refer to Service Programming System (SPS) (Remote Procedure) or Service Programming System (SPS) (Pass-Thru Procedure).

Before Programming a Control Module

Important: DO NOT program an existing ECM with the identical software/ calibration package. This procedure is not a short cut to correct the driveability condition. This is an ineffective repair. An ECM should only be programmed when the following occurs:

- When a service procedure instructs you to replace the ECM.
- An updated software/ calibrations is released.

Ensure that the following conditions are met before programming an ECM:

- The scan tool PCMCIA card is programmed with the latest software.
- The TIS 2000 is installed with the latest software.

- The hardware key is plugged into the computer port.
- Vehicle system voltage:
  - There are no charging system concerns. All charging system concerns must be repaired before programming the ECM.
  - The battery voltage is greater than 12 volts but less than 16 volts. The battery must be fully charged before programming the ECM.
  - A battery charger is NOT connected to the vehicles battery. Incorrect system voltage or voltage fluctuations from a battery charger may cause programming failure or ECM damage.
  - Turn OFF or disable any system that may put a load on the vehicles battery. Turn OFF or disable systems such as:
    - ◊ Heating, ventilation, and air conditioning (HVAC) systems
    - ◊ Headlights
    - ◊ Room lights
    - ◊ Accessory equipment
- The ignition switch is in the proper position. The scan tool prompts you to turn ON the ignition, with the engine OFF. DO NOT change the position of the ignition switch during the programming procedure unless instructed to do so.
- All tool connections are secure:
  - The RS-232 cable
  - The connection at the DLC
  - The voltage supply circuits
- DO NOT disturb the tool harnesses while programming. If an interruption occurs during the programming procedure, programming failure or ECM damage may occur.
- If you are performing the Pass-Thru programming procedure using a notebook computer without the power cord, ensure that the internal battery is fully charged.

Service Programming System (SPS) (Remote Procedure)

Notice: Some module will not accept SPS remote procedure using 10MB PCMCIA card. In such case, use 32MB PCMCIA card or SPS pass-thru procedure. The Remote SPS method is a three-step process that involves the following procedures:

1. Connecting the scan tool to the vehicle and obtaining the information from the ECM.
2. Connecting the scan tool to the terminal and downloading a new calibration file from the terminal into the scan tool memory.
3. Reconnecting the scan tool to the vehicle and uploading the new calibration file into the ECM.

Performing the Remote Procedure

1. Connect a scan tool to the vehicle and obtain the ECM information using the following procedure:

Notice: Ensure the ECM is installed in the vehicle and the battery is fully charged before programming.

   a. Install a scan tool.
   b. Turn ON the ignition, with the engine OFF.
   c. Select Service Programming System (SPS) > Request Info.
   d. If there is already stored in the scan tool, the existing data is displayed on the screen. The scan tool asks user to keep existing data "Keep Data" or "Continue" to request new vehicle information from the ECM. If there is no data in the scan tool, it will immediately start vehicle identification.
   e. Select the vehicle description by following the on-screen instructions based on stamped VIN or affixed VIN plate on the vehicle.
   f. During obtaining information, the scan tool is receiving information from all modules at the same time. But only ECM information is displayed on the screen.
   g. Turn OFF all accessories and press "Okay".
   h. Verify that the correct VIN is displayed on the scan tool. If the VIN is incorrect or no VIN, record the correct VIN.
2. Turn OFF the ignition.
3. Turn OFF the scan tool and disconnect from the vehicle.
4. Transfer the data from the terminal to the scan tool using the following procedure:

Notice: The TIS supports service programming with the Tech 2 scan tool only.

   a. Connect the scan tool to the terminal.
   b. Launch the TIS application.
   c. Select the Service Programming System at the main screen.
   d. Highlight the following information on the Select Diagnostic Tool and Programming Process screen, then click "Next".
      - Select Diagnostic Tool - Tech 2
      - Select Programming Process - Identify whether an existing ECM is being reprogrammed or an ECM is being replaced with a new one
      - Select ECU Location - Vehicle
   e. Verify the connections on the Preparing for Communication screen, then click "Next".
   f. Verify the VIN on the Validate Vehicle Identification Number (VIN) screen, then click "Next".

Notice: If the ECM is replaced to new one, VIN does not displayed. Input correct VIN reading from stamped VIN or affixed VIN plate on the vehicle. If the ECM from another vehicle is installed, input correct VIN by same way.

g. Highlight Engine on the Select System Type screen, then click "Next", if on-screen instruction displayed.
h. Complete the following information based on the service ID plate on the Validate Vehicle Data screen until "Next" is highlighted, then click "Next".
   - Model
   - Model year
   - Engine type
   - Model designator
   - Destination code
   - Transmission type
i. Verify your selection on the Summary screen.

Notice: Refer to Service Bulletin and Description column before service programming is performed if the bulletins are listed along with the calibration files.

Notice: Select Cancel if you receive a message stating that the calibration selected is already the current calibration in the ECM and reprogramming with the same download is not allowed.

j. Click "Reprog".
k. The Transfer Data screen will appear until the progress bar reaches 100%.

5. Close the application and return to the TIS application selection screen after the download is completed.
6. Turn OFF the scan tool and disconnect from the terminal.
7. Transfer the data from the scan tool to the ECM using the following procedure:
   a. Install a scan tool.
   b. Turn ON the ignition, with the engine OFF.
   c. Select Service Programming System (SPS) > Program ECU.
   d. Turn OFF all accessories and press "Continue".
   e. Programming in Process will appear until the progress bar reaches 100%.

Notice: Some warning lamp may turn ON or blink while programming the ECM since communication between the ECM and other modules are interrupted. Clear DTC in any module after programming.

   f. Press "Continue" and exit the program after the scan tool displays "Programming Was Successful".
8. Turn OFF the ignition.
9. Turn OFF the scan tool and disconnect from the vehicle.

Service Programming System (SPS) (Pass-Thru Procedure)

Pass-Thru programming allows the scan tool to remain connected to the terminal and to the vehicle throughout the programming process. The vehicle must be in close proximity to the terminal while using Pass-Thru.

1. Launch the TIS application.
2. Select the Service Programming System at the main screen.
3. Highlight the following information on the Select Diagnostic Tool and Programming Process screen, then click "Next":
   - Select Diagnostic Tool-Select Pass - Thru
   - Select Programming Process - Identify whether as existing ECM is being reprogrammed or an ECM is being replaced with a new one.
   - Select ECU Location - Vehicle
4. Complete all vehicle data on the Preparing for Communication/ Determine Vehicle screen until "Next" is highlighted, then click "Next".
5. Follow the instruction on the Preparing for Communication screen, then click "Next".

Notice: In order to reduce the potential for signal loss, the RS-232 cable should not be more than 25 feet long.

6. Verify the VIN on the Validate Vehicle Identification Number (VIN) screen, then click "Next".

Notice: If the ECM is replaced to new one, VIN does not displayed. Input correct VIN reading from stamped VIN or affixed VIN plate on the vehicle. If the ECM from another vehicle is installed, input correct VIN by same way.

7. Highlight Engine on the Select System Type screen, then click "Next", if on-screen instruction displayed.
8. Complete the following information based on the service ID plate on the Validate Vehicle Data screen until "Next" is highlighted, then click "Next".
   - Model
   - Model year
   - Engine type
   - Model designator
   - Destination code
   - Transmission type
9. Verify your selection on the Summary screen.

Notice: Refer to Service Bulletin and Description column before service programming is performed if the bulletins are listed along with the calibration files.

Notice: Select Cancel if you receive a message stating that the calibration selected is already the current calibration in the ECM and reprogramming with the same download is not allowed.

10. Click "Reprog".

11. The Transfer Data screen will appear until the progress bar reaches 100%.

Notice: Some warning lamp may turn ON or blink while programming the ECM since communication between the ECM and other modules are interrupted. Clear DTC in any module after programming.

12. Close the application and return to the TIS application selection screen after the download is completed.
13. Turn OFF the ignition.
14. Turn OFF the scan tool and disconnect from the vehicle.

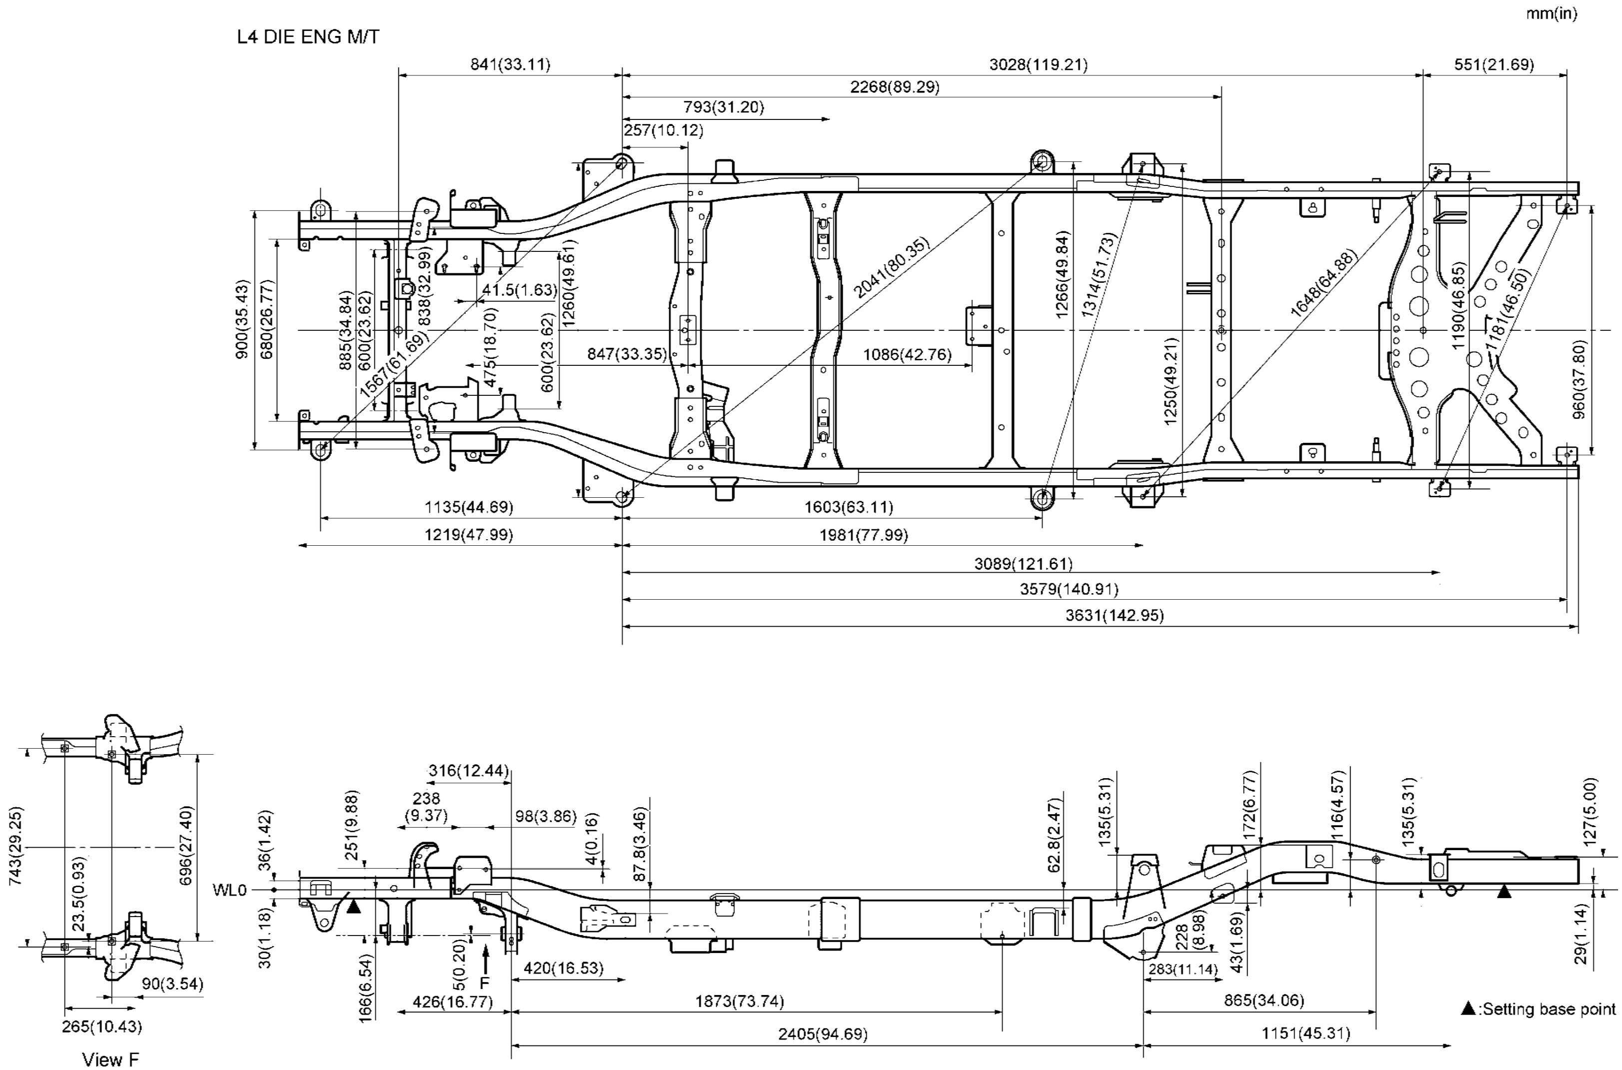
4×4, EXTRA LWB, CREW CAB MODEL

This illustration is based on the RHD model.



RTW32AXF005001

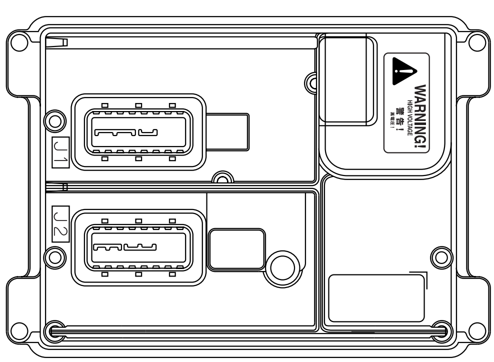
Description and Operation

Engine Control Module (ECM) Description

Engine Control Module (ECM) Service Precautions

RTW56ESH000201

Important: The symbol ! warns you of an electric shock hazard. To avoid shock and possible serious injury, DO NOT touch the terminals. When disconnecting the harness connectors, always turn OFF the ignition switch or disconnect the battery cable.



RTW56ESH004401

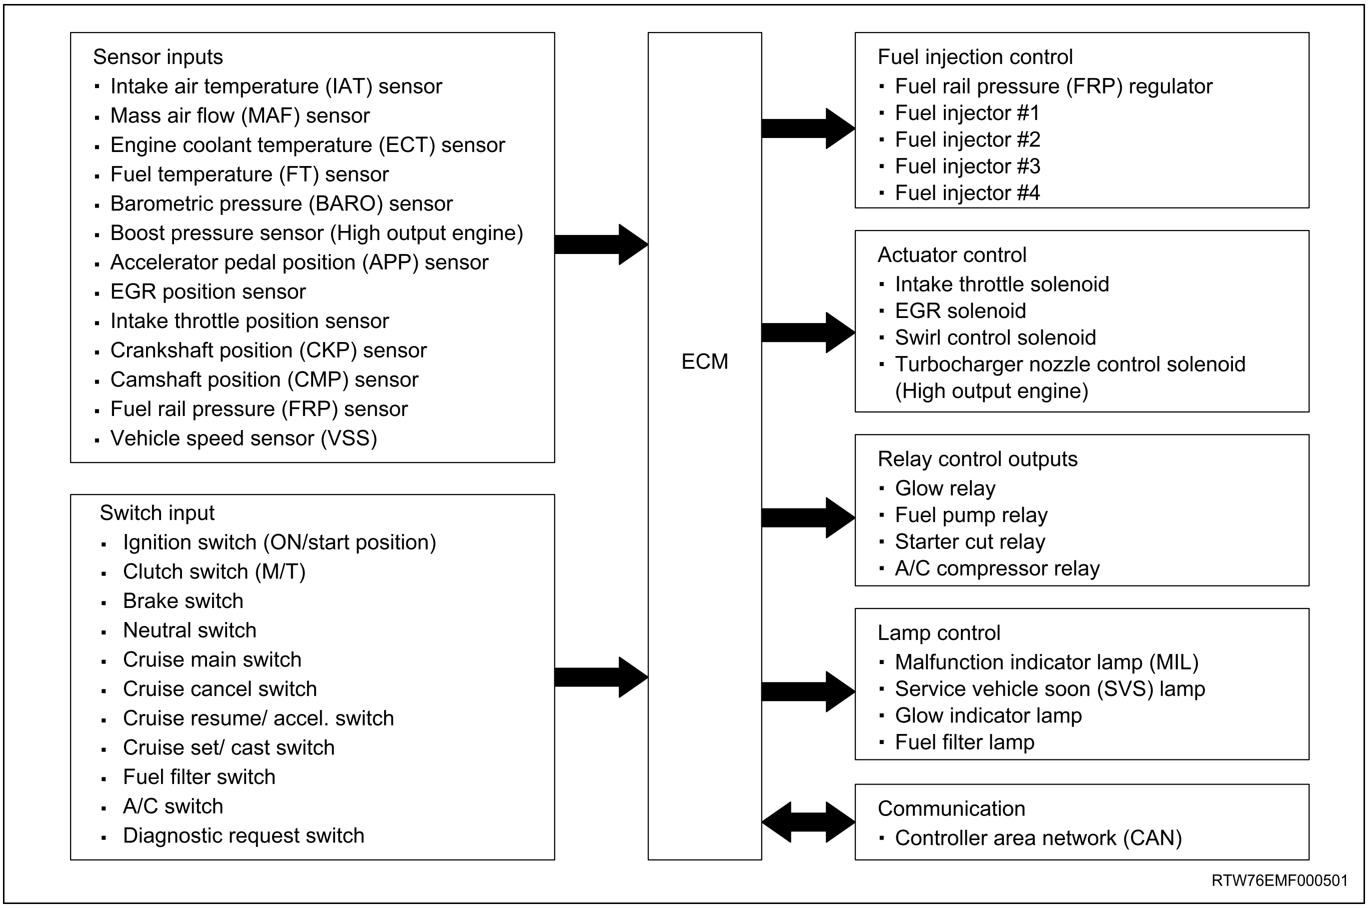
The engine control module (ECM) is designed to withstand normal current draws associated with vehicle operation. Avoid overloading any circuit. When testing for opens and shorts, do not ground or apply voltage to any of the ECM circuits unless instructed to do so. In some cases, these circuits should only be tested using a DMM. The ECM should remain connected to the ECM harness.

The ECM is located inside of engine compartment via mounting bracket and is behind air cleaner case. The ECM mainly controls the following.

- The fuel system control
- The exhaust gas recirculation (EGR) system control
- The preheating (glow) system control
- The A/C compressor control
- The immobilizer control
- On-board diagnostics for engine control

The ECM constantly observes the information from various sensors. The ECM controls the systems that affect vehicle performance. The ECM performs the diagnostic function of the system. The ECM can recognize operational problems, alert the driver through the malfunction indicator lamp (MIL), and store diagnostic trouble codes (DTCs). DTCs identify the system faults to aid the technician in making repairs.

ECM Input & Output



ECM Voltage Description

The ECM supplies a buffered voltage to various switches and sensors. The ECM can do this because resistance in the ECM is so high in value that a test lamp may not illuminate when connected to the circuit. An ordinary shop voltmeter may not give an accurate reading because the voltmeter input impedance is too low. Use a 10-megaohm input impedance DMM, to ensure accurate voltage readings. The input and/ or output devices in the ECM include analog-to-digital converters, signal buffers, counters, and special drivers. The ECM controls most components with electronic switches which complete a ground circuit when turned ON.

Aftermarket Electrical and Vacuum Equipment

Aftermarket or add-on electrical and vacuum equipment is defined as any equipment which connects to the vehicle's electrical or vacuum systems that is installed on a vehicle after the vehicle leaves the factory. No allowances have been made in the vehicle design for this type of equipment. No add-on vacuum equipment should be added to this vehicle. Add-on electrical equipment must only be connected to the vehicle's electrical system at the battery power and ground. Add-on electrical equipment, even when installed to these guidelines, may still cause the powertrain system to malfunction. This may also include equipment not connected to the vehicle electrical system such as portable telephones and audios. Therefore, the first step in diagnosing any powertrain fault is to eliminate all aftermarket electrical equipment from the vehicle. After this is done, if the fault still exists, the fault may be diagnosed in the normal manner.

Electrostatic Discharge Damage

Electronic components used in the ECM are often designed to carry very low voltage. Electronic components are susceptible to damage caused by electrostatic discharge. By comparison, as much as 4,000 volts may be needed for a person to feel even the zap of a static discharge. There are several ways for a person to become statically charged. The most common methods of charging are by friction and induction.

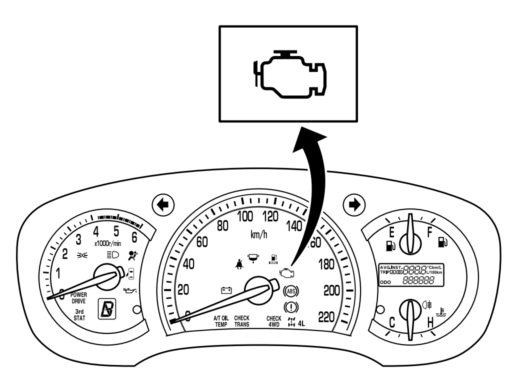
- An example of charging by friction is a person sliding across a vehicle seat.

Important: To prevent possible electrostatic discharge damage, follow these guidelines:

- Do not touch the ECM connector pins or soldered components on the ECM circuit board.
- Do not open the replacement part package until the part is ready to be installed.
- Before removing the part from the package, ground the package to a known good ground on the vehicle.
- If the part has been handled while sliding across the seat, while sitting down from a standing position, or while walking a distance, touch a known good ground before installing the part.
- Charge by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with opposite polarity.

Malfunction Indicator Lamp (MIL) Operation

The MIL is located in the instrument panel cluster. The MIL will display the following symbols when commanded ON:



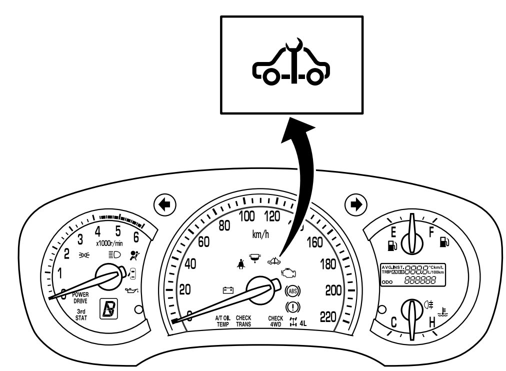
RTW76ESH001901

The MIL indicates that an emission related fault (Type A or B) has occurred (Euro 4 specification) or engine performance related fault has occurred (except Euro 4 specification) and vehicle service is required. The following is a list of the modes of operation for the MIL:

- The MIL illuminates when the ignition switch is turned ON, with the engine OFF. This is a bulb test to ensure the MIL is able to illuminate.
- The MIL turns OFF after the engine is started if a diagnostic fault is not present.
- The MIL remains illuminated after the engine is started if the ECM detects a fault. A DTC is stored any time the ECM illuminates the MIL due to an emission related fault (Euro 4 specification), and engine performance related fault has occurred (except Euro 4 specification).

Service Vehicle Soon (SVS) Lamp Operation (Euro 4 Specification)

The service vehicle soon (SVS) lamp is located in the instrument panel cluster. The SVS lamp will display the following symbol when commanded ON:



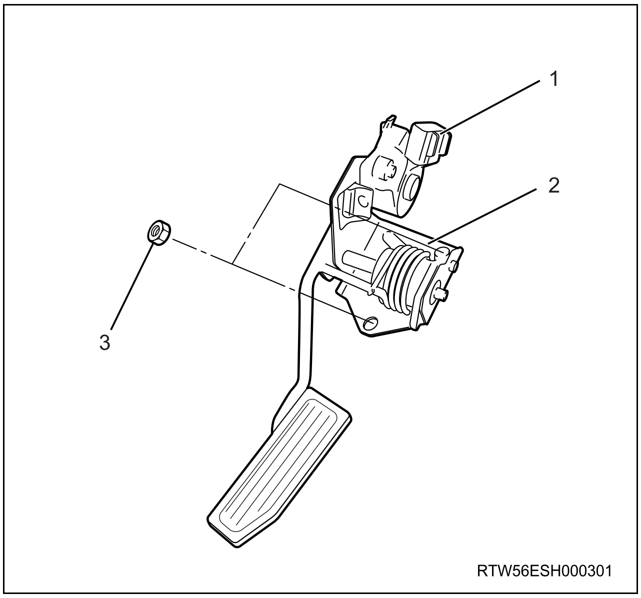
RTW76ESH002901

The SVS lamp indicates that a non-emission related fault (Type C) has occurred and vehicle service required. The following is a list of the modes of operation for the SVS lamp:

- The SVS lamp illuminates when the ignition switch is turned ON, with the engine OFF. This is a bulb test to ensure the SVS lamp is able to illuminate.
- The SVS lamp turns OFF after the engine is started if a diagnostic fault is not present.
- The SVS lamp remains illuminated after the engine is started if the ECM detects a fault. A DTC is stored any time the ECM illuminates the SVS lamp due to a non-emission related fault.

Engine Control Component Description

Accelerator Pedal Position (APP) Sensor

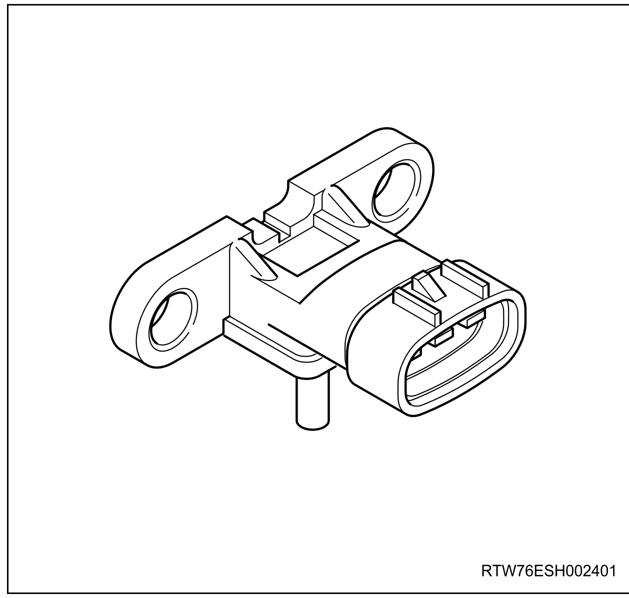


Legend

1. Accelerator pedal position (APP) sensor
2. Accelerator pedal bracket
3. Nut

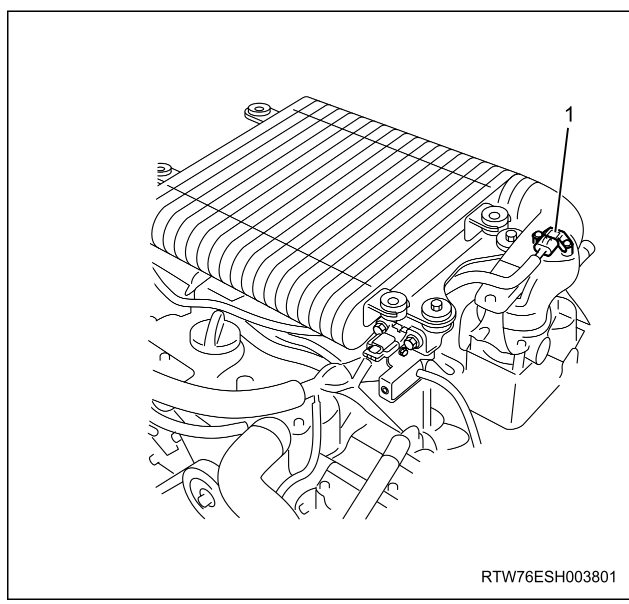
The APP sensor is mounted on the accelerator pedal control assembly. The sensor is made up of three individual sensors within one housing. The ECM uses the APP sensors to determine the amount of acceleration or deceleration that is desired. The APP sensors are potentiometer type sensors. Each APP sensor provides a different signal to the ECM on the each signal circuit, which relative to the position changes of the accelerator pedal angle. The APP sensor 1 signal voltage is low at rest and increases as the pedal is depressed. The APP sensor 2 and APP sensor 3 signal voltage is high at rest and decreases as the pedal is depressed.

Barometric Pressure (BARO) Sensor



The BARO sensor is located on the intake manifold. The BARO sensor is a transducer that varies voltage according to changes the barometric pressure. The BARO sensor provides a signal to the ECM on the signal circuit, which is relative to the pressure changes of the barometric pressure. The ECM should detect a low signal voltage at a low barometric pressure, such as high altitude place. The ECM should detect high signal voltage at a high barometric pressure. The ECM uses this voltage signal to calibrate the fuel injection quantity and injection timing for altitude compensation.

Boost Pressure Sensor

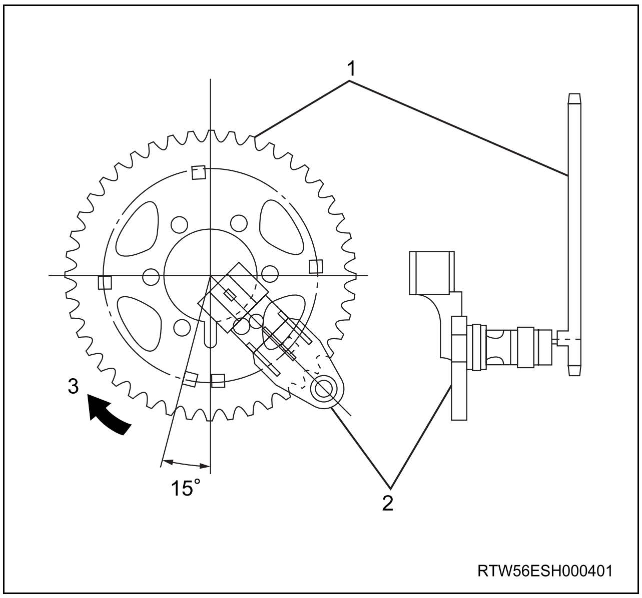


Legend

1. Boost pressure sensor

The boost pressure sensor is located in the air induction tubing. The boost pressure sensor is a transducer that varies voltage according to changes in the air pressure inside the air tubing. The boost pressure sensor provides a signal to the ECM on the signal circuit, which is relative to the pressure changes in the air tubing. The ECM should detect a low signal voltage at a low boost pressure, such as low engine load. The ECM should detect high signal voltage at a high boost pressure, such as high engine load.

Camshaft Position (CMP) Sensor

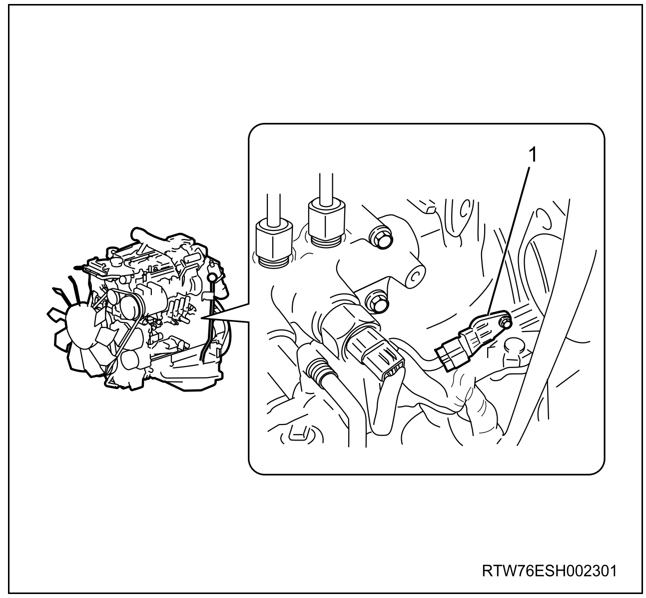


Legend

1. Timing chair sprocket
2. Camshaft position (CMP) sensor
3. Rotating direction

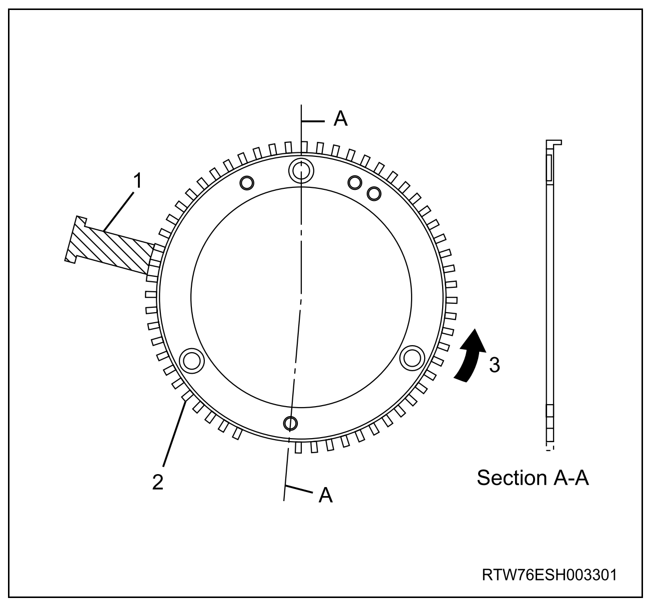
The CMP sensor is installed on the timing chain sprocket cover at the front of the camshaft idle gear. The CMP sensor detects total of five projections per one engine cycle (four projections arranged equally every 90° and one reference projection on the timing chain sprocket surface). The CMP sensor is a magnetic resistance element (MRE) type sensor, which generates a square wave signal pulse.

Crankshaft Position (CKP) Sensor



Legend

1. Crankshaft position (CKP) sensor

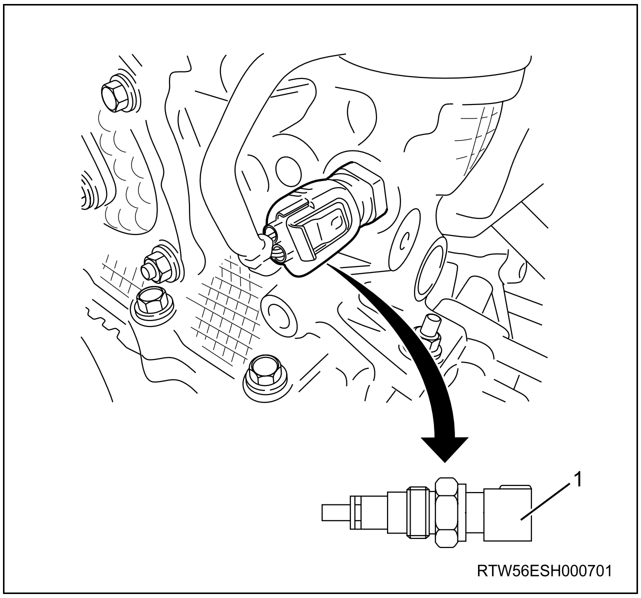


Legend

1. Crankshaft position (CKP) sensor
2. Sensor rotor
3. Rotating direction

The CKP sensor is located on the left-hand of the cylinder block rear and it is behind the starter motor. The sensor rotor is fixed on the crankshaft. There are 56 notches spaced 6° apart and a 30° section that is open span. This open span portion allows for the detection of top dead center (TDC). The CKP sensor is a magnetic resistance element (MRE) type sensor, which generates a square wave signal pulse. Detecting the open span portion from the CKP sensor and one reference projection from the camshaft position (CMP) sensor, the ECM determines cylinder #1 compression TDC to ensure they correlate with each other.

Engine Coolant Temperature (ECT) Sensor

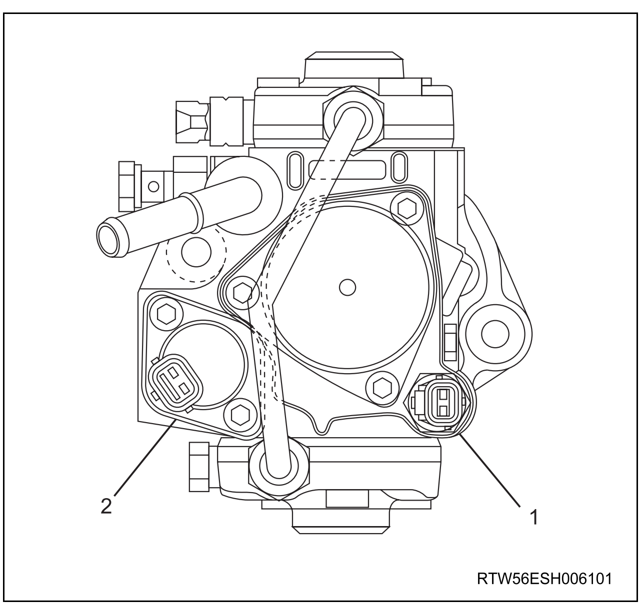


Legend

1. Engine coolant temperature (ECT) sensor

The ECT sensor is installed to the thermostat housing. The ECT sensor is a variable resistor and it measures the temperature of the engine coolant. When the ECT sensor is cold, the sensor resistance is high. When the engine coolant temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the signal circuit.

Fuel Temperature (FT) Sensor

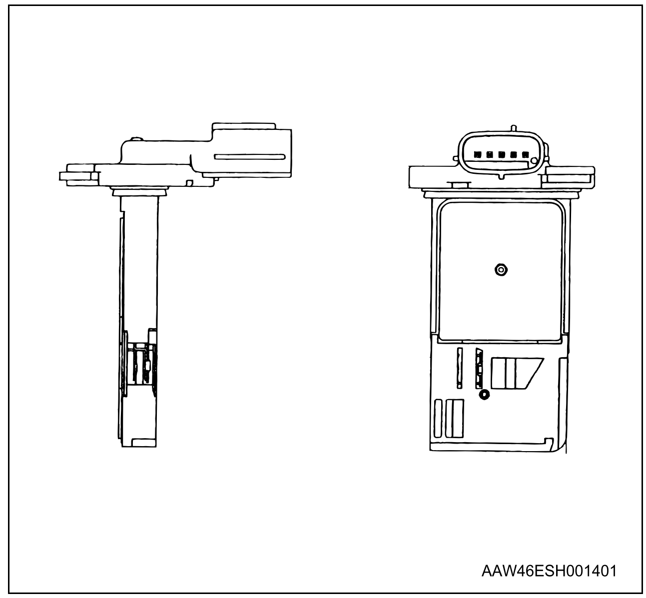


Legend

1. Fuel temperature (FT) sensor
2. Fuel rail pressure (FRP) regulator

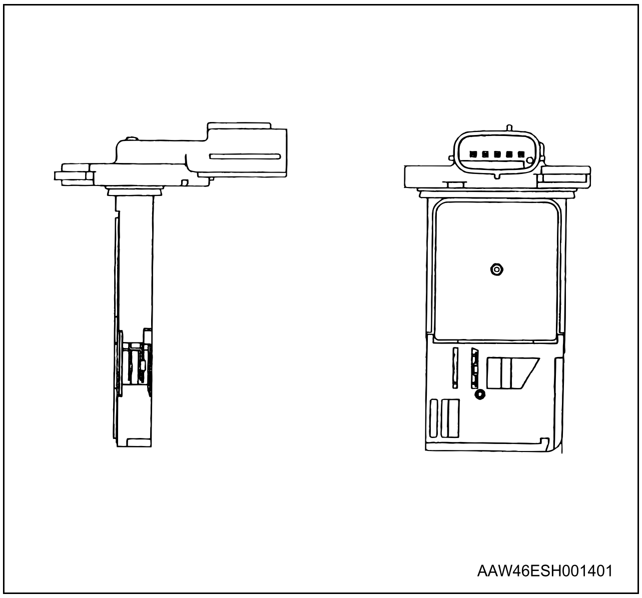
The FT sensor is installed to the fuel supply pump. The FT sensor is a variable resistor and it measures the temperature of the fuel entering the fuel supply pump. When the FT sensor is cold, the sensor resistance is high. When the fuel temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the signal circuit.

Intake Air Temperature (IAT) Sensor



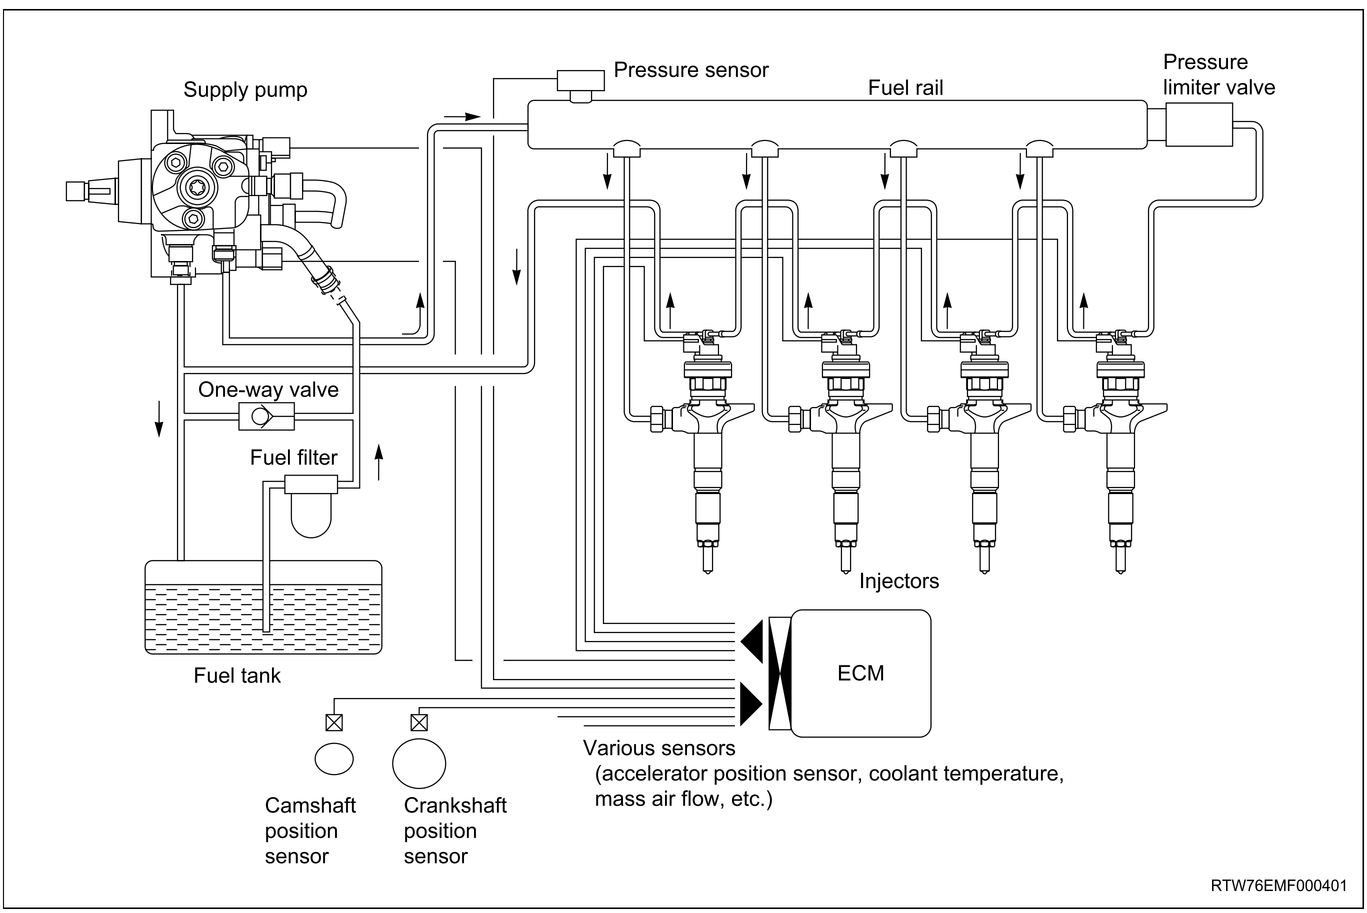
The IAT sensor is fitted between the air cleaner and turbocharger. It is internal to the mass air flow (MAF) sensor. The IAT sensor is a variable resistor and it measures the temperature of the air entering the engine. When the IAT sensor is cold, the sensor resistance is high. When the air temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a high voltage on the signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the signal circuit.

Mass Air Flow (MAF) Sensor



The MAF sensor is an air flow meter that measures the amount of air that enters the engine. It is fitted between the air cleaner and turbocharger. A small quantity of air that enters the engine indicates deceleration or idle speed. A large quantity of air that enters the engine indicates acceleration or a high load condition. The MAF sensor assembly consists of a MAF sensor element and an intake air temperature (IAT) sensor that are both exposed to the air flow to be measured. The MAF sensor element measures the partial air mass through a measurement duct on the sensor housing.

Fuel System Description



The common rail system uses a type of accumulator chamber called the fuel rail to store pressurized fuel, and injectors that contain electronically controlled solenoid valves to spray the pressurized fuel in the combustion chambers. The injection system (injection pressure, injection rate, and injection timing) is controlled by the ECM, and therefore the common rail system can be controlled independently, free from the influence of engine speed and load. This ensures a stable injection pressure at all time, particularly in the low engine speed range, so that black smoke specific to diesel engines generated during vehicle starting or acceleration can be reduced dramatically. As a result, exhaust gas emissions are clear and reduced, and higher output is achieved.

1. High Pressure Control

- Enables high pressure injection from low engine speed range.
- Optimizes control to minimize particulate matter and NOx emissions.

2. Injection Timing Control

- Enables finely tuned optimized control in accordance with running conditions.

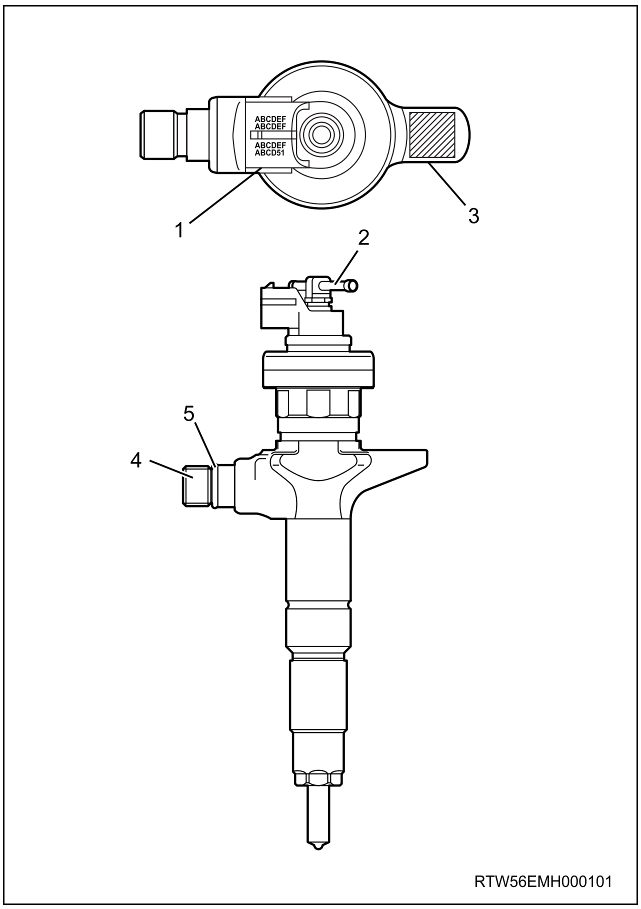
3. Injection Rate Control

- Pilot injection control that performs a small amount of injection before main injection.

The fuel rail system consists primarily of a fuel supply pump, fuel rail, injectors, and ECM.

Fuel System Component Description

Injector



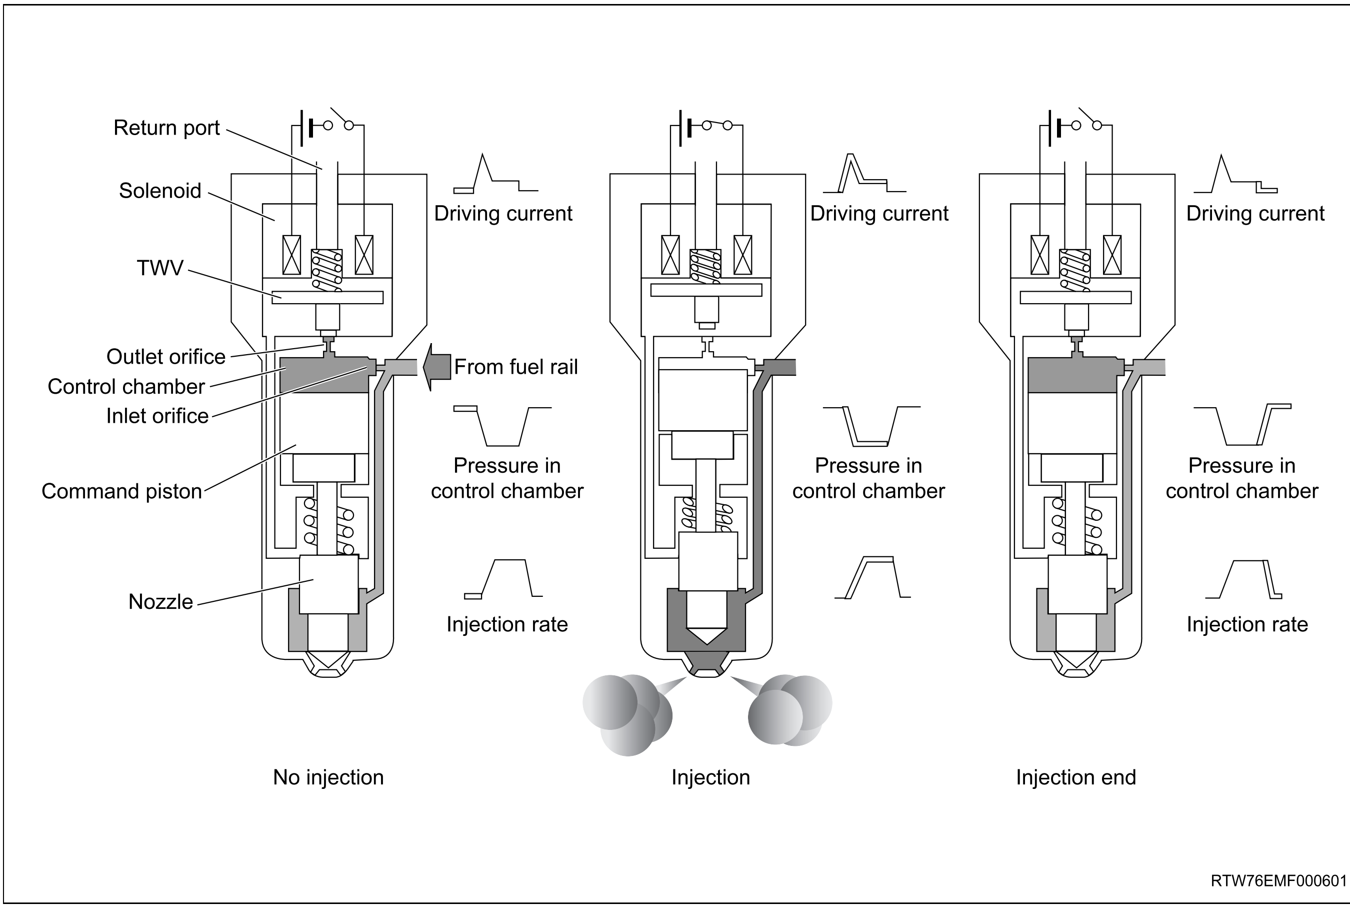
Legend

1. Fuel injector ID code
2. Leak off pipe
3. Two dimensional barcode
4. Port for mounting the injection pipe
5. O-ring

Electronic control type injectors controlled by the ECM are used. Compared with conventional injection nozzles, a command piston, solenoid valve, etc. are added.

ID codes displaying various injector characteristic are laser marked on the connector housing, and ID codes showing these in numeric form (24 alphanumeric figures). This system uses fuel injector flow rate information (ID codes) to optimize injection quantity control. When an injector is newly installed in a vehicle, it is necessary to input the ID codes in the ECM.

QR (Quick Response) codes or fuel injector flow rate (ID codes) have been adopted to enhance the injection quantity precision of the injectors. The adoption of codes enables injection quantity dispersion control throughout all pressure ranges, contributing to improvement in combustion efficiency and reduction in exhaust gas emissions.



1) Non-injection state

The two way valve (TWV) closes the outlet orifice by means of a spring force, when no current is supplied from the ECM to the solenoid. At this time, the fuel pressure applied to the nozzle leading end is equal to the fuel pressure applied to the control chamber through the inlet orifice. As for the force competition in this state, the pressure on the command piston upper surface + nozzle spring force defeat the pressure on the nozzle leading end, and consequently the nozzle is pushed downward to close the injection holes.

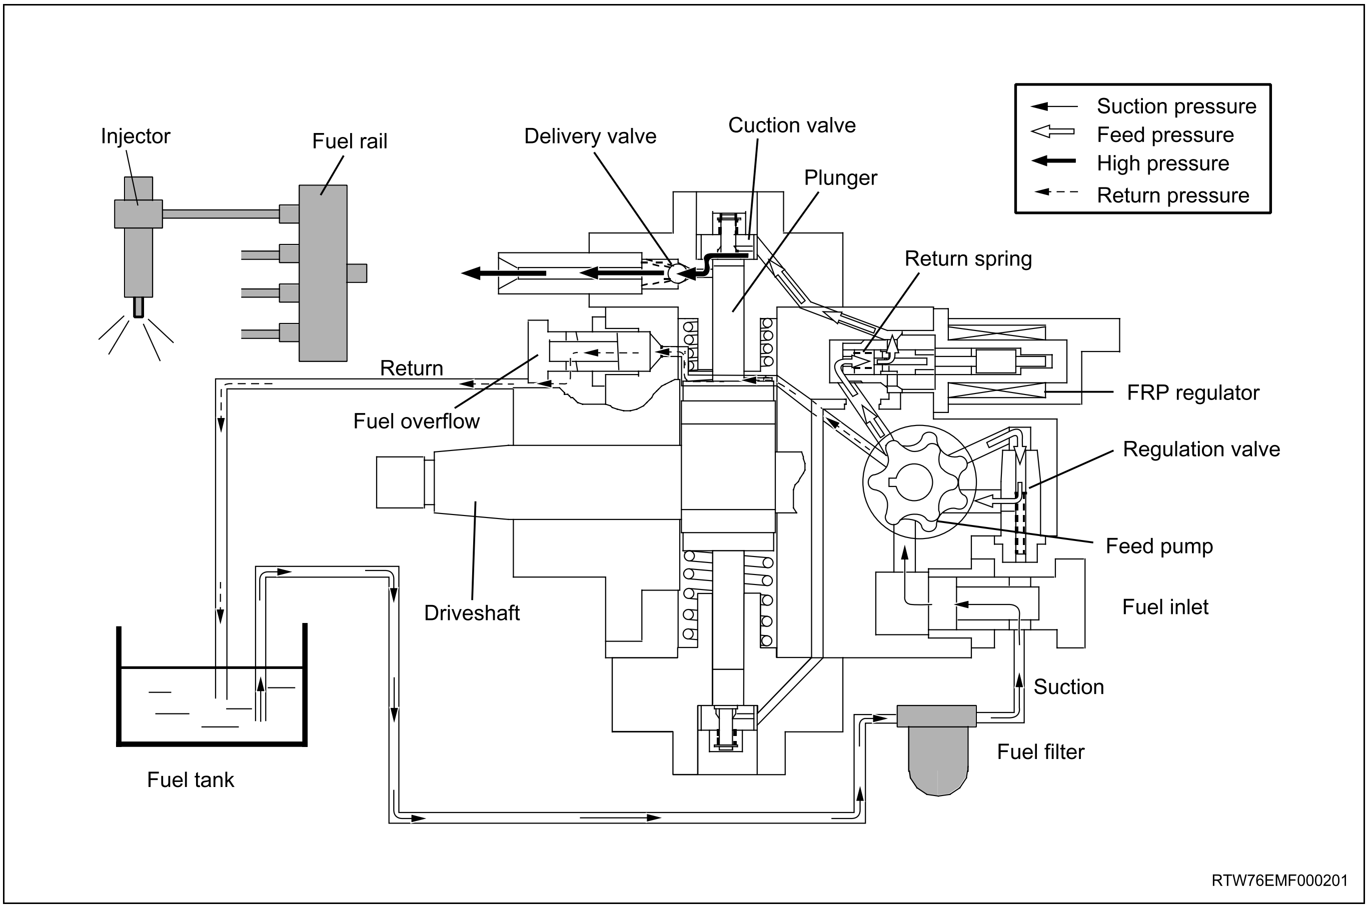
2) Injection start

The TWV is pulled up to open the outlet orifice, and thus the fuel leaks toward the return port, when the current is supplied from the ECM to the solenoid. As a result, the nozzle is pushed up together with the command piston by the fuel pressure applied to the nozzle leading end, and then the nozzle injection holes open to inject the fuel.

3) Injection end

The TWV lowers to close the outlet orifice, when the ECM shuts off a current supply to the solenoid. As a result, the fuel cannot leak from the control chamber, and thus the fuel pressure in the control chamber rises abruptly and then the nozzle is pushed down by the command piston to close the nozzle injection holes, resulting in the end of fuel injection.

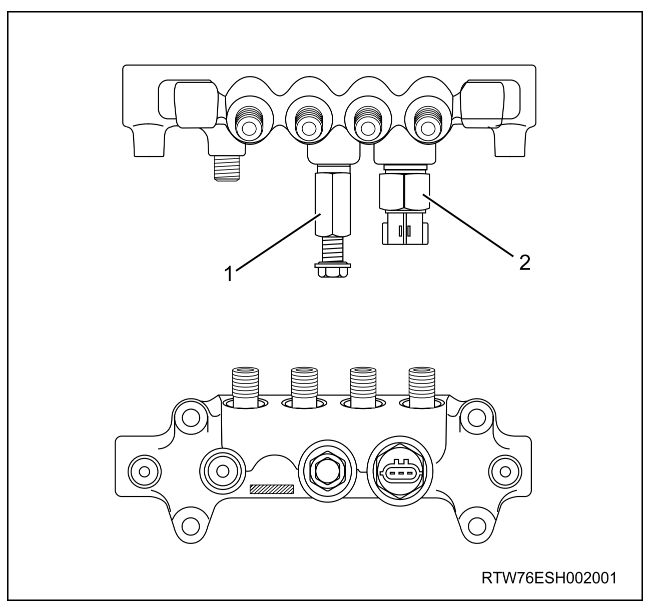
Fuel Supply Pump



The fuel supply pump is the heart of the common rail type electronic fuel injection system. The fuel supply pump is installed at the same location as the conventional injection type pump, which spins at a 1 to 1 ratio of fuel supply pump to crankshaft speed. A fuel rail pressure (FRP) regulator and fuel temperature sensor are part of the fuel supply pump assembly.

Fuel is drawn from the fuel tank via the fuel supply pump by the use of an internal feed pump (trochoid type). This feed pump pumps fuel into a 2-plunger chamber also internal to the fuel supply pump. Fuel into this chamber is regulated by the FRP regulator solely controlled by current supplied from the ECM. No current to the solenoid results in maximum fuel flow whereas full current to the solenoid produces no fuel flow. As the engine spins, these two plungers produce high pressure in the fuel rail. Since the ECM controls the flow of fuel into this 2-plunger chamber, it therefore controls the quantity and pressure of the fuel supply to the fuel rail. This optimizes performance, improves economy and reduces NOx emissions.

Fuel Rail (Common Rail)



Legend

1. Pressure limiter valve
2. Fuel rail pressure (FRP) sensor

SECTION 2B

SHEET METAL

This section includes items of front end sheet metal that are attached by bolts, screws or clips and related accessory components.

Anticorrosion materials have been applied to the interior surfaces of some metal panels to provide rust resistance. When servicing these panels, areas on which this material has been disturbed, should be properly recoated with service-type anticorrosion material.

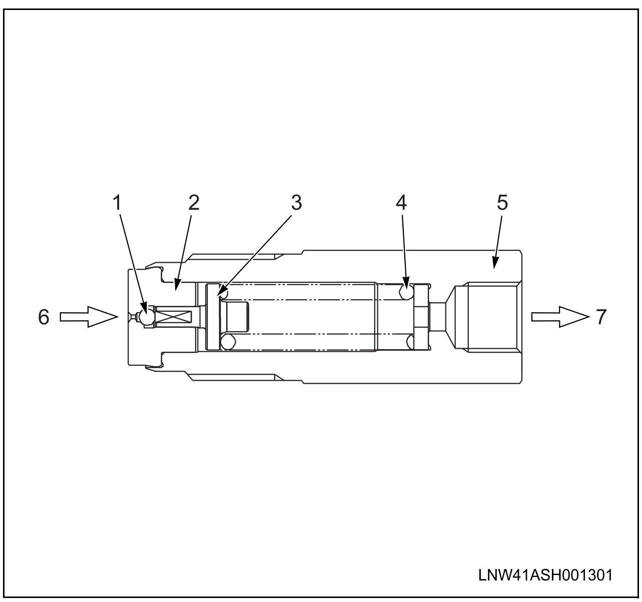
TABLE OF CONTENTS

Along with the employment of a common rail type electronic control fuel injection system, the fuel rail is provided to store high pressure fuel between supply pump and injectors. A pressure sensor and a pressure limiter are installed on the fuel rail. The pressure sensor detects the fuel pressure inside the fuel rail and sends its signal to the ECM. Based on this signal, the ECM controls the fuel pressure inside the fuel rail via the fuel rail pressure (FRP) regulator of the supply pump. The pressure limiter opens the valve mechanically to relieve the pressure when the fuel pressure inside the fuel rail is excessive.

Fuel Rail Pressure Sensor

The FRP sensor is installed to the fuel rail and it detects the fuel pressure in the fuel rail, converts the pressure into a voltage signal, and sends the signal to the ECM. The ECM monitors the FRP sensor signal voltage. Higher fuel rail pressure provides higher signal voltage while lower pressure provides lower signal voltage. The ECM calculates actual fuel rail pressure (fuel pressure) from the voltage signal and uses the result in fuel injection control and other control tasks.

Pressure Limiter Valve

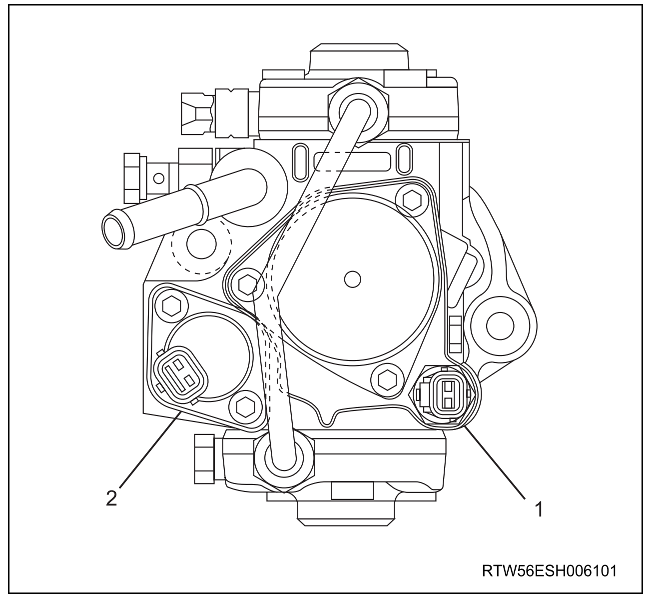


Legend

1. Valve
2. Valve body
3. Valve guide
4. Spring
5. Housing
6. Fuel rail
7. Fuel return pipe

The pressure limiter relieves pressure by opening the valve if abnormally high pressure is generated. The valve opens when pressure in rail reaches approximately 220 MPa (32,000 psi), and closes when pressure falls to approximately 50 MPa (7,250 psi). Fuel leakage through the pressure limiter re-turns to the fuel tank.

Fuel Rail Pressure (FRP) Regulator



The ECM controls the duty ratio of the linear type fuel rail pressure (FRP) regulator (the length of time that the current is applied to the FRP regulator), in order to control the quantity of fuel that is supplied to the high-pressure plungers. Since only the quantity of fuel that is required for achieving the target rail pressure is drawn in, the drive load of the supply pump is decreased. When current flows to the FRP regulator, variable electromotive force is created in accordance with the duty ratio, moving the armature to the left side. The armature moves the cylinder to the left side, changing the opening of the fuel passage and thus regulating the fuel quantity. With the FRP regulator OFF, the return spring contracts, completely opening the fuel passage and supplying fuel to the plungers (Full quantity intake and full quantity discharge). When the FRP regulator is ON, the force of the return spring moves the cylinder to the right, closing the fuel passage (normally opened). By turning the FRP regulator ON/OFF, fuel is supplied in an amount corresponding to the actuation duty ratio, and fuel is discharged by the plungers.

Fuel Injection System Description

Fuel Injection Quantity Control

This control determines the fuel injection quantity by adding coolant temperature, fuel temperature, intake air temperature, barometric pressure, mass air flow and some switch inputs information corrections to the basic injection quantity is calculated by the ECM based on the engine operating conditions (engine speed, accelerator pedal pressing amount and boost pressure sensor). More fuel rate indicates if the engine load is increased as the accelerator pedal is stepped on at constant engine speed.
Combined with high pressure injection of atomized fuel, this control improves exhaust gas and ensures proper fuel consumption. Compared with conventional mechanical governors, an electronic control system provides higher degree of freedom of fuel injection quantity control, thereby presenting high accelerator response (acceleration feeling and pressing feeling).

Starting Injection Quantity Control

At the engine starting (after the key switch is turned to the START position to start the engine, up to return of key switch to the ON position), optimum fuel injection quantity is controlled based on the information on the engine speed and coolant temperature. At low temperature, the fuel injection quantity increases. When the engine started completely, this boosted quantity mode at the starting is cancelled and normal running mode is restored.

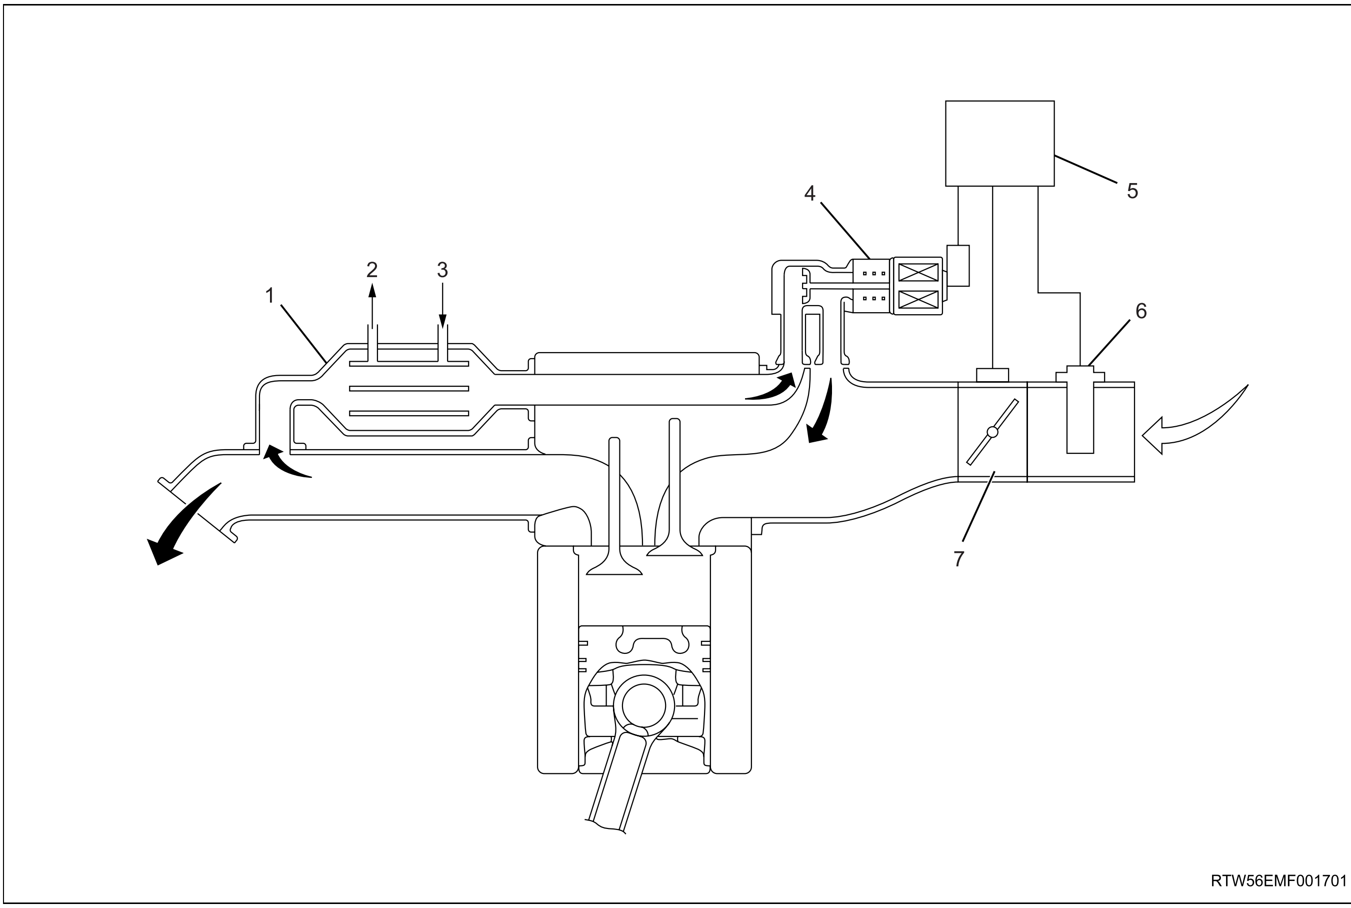
Idle Speed Control

A control is made so as to achieve stable idling speed at all time regardless of engine secular changes or engine condition variations. The ECM sets target idling speed and controls the fuel injection quantity according to the engine conditions (actual engine speed, coolant temperature and engine load) to follow actual engine speed to the target idling speed so as to ensure stable idling speed.

Idle Vibration Control

A control is made so as to reduce the engine vibration caused by torque variations between cylinders due to variations in fuel injection quantity of each cylinder or injector performance. The ECM corrects the injection quantity between cylinders based on the revolution signals from the crankshaft position (CKP) sensor. Normal range of correction quantity between cylinders is within ±5 mm^3.

Exhaust Gas Recirculation (EGR) System Description

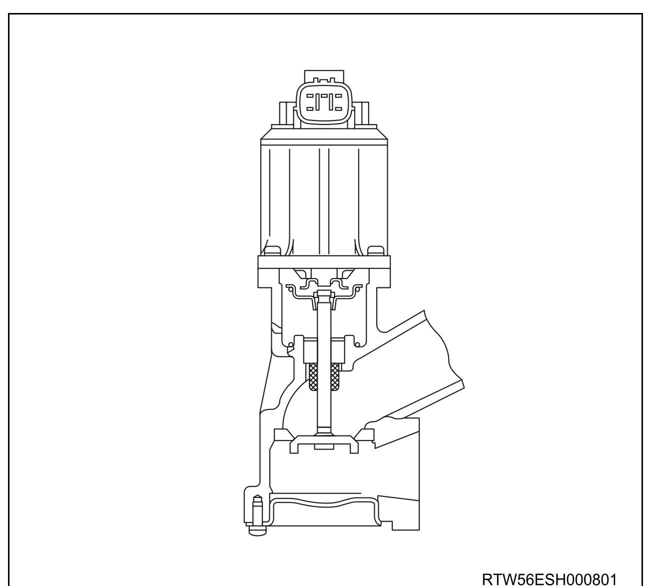


Legend

1. EGR cooler
2. Engine coolant outlet
3. Engine coolant inlet
4. EGR valve
5. ECM
6. MAF sensor
7. Intake throttle valve

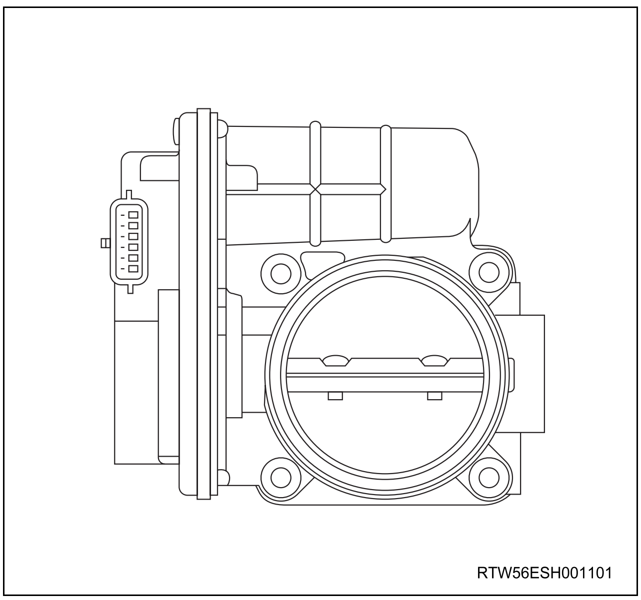
The EGR system recirculates a part of exhaust gas back into the intake manifold, which results in reducing nitrogen oxide (NOx) emissions. The EGR control system uses an electronic control system to ensure both driveability and low emission. A control current from the ECM operates a solenoid to control the lift amount of EGR valve. Also, an EGR position sensor is provided at the rear of the motor to feed actual valve lift amount back to the ECM for more precision control of the EGR amount.
The EGR control starts when the conditions for engine speed, engine coolant temperature, intake air temperature and barometric pressure are satisfied. Then, the valve opening is calculated according to the engine speed, and target fuel injection quantity. Based on this valve opening, the drive duty of the solenoid is determined and the valve is driven accordingly. The intake throttle valve is provided to adequate intake manifold depression to ensure EGR gas flow.

EGR Valve



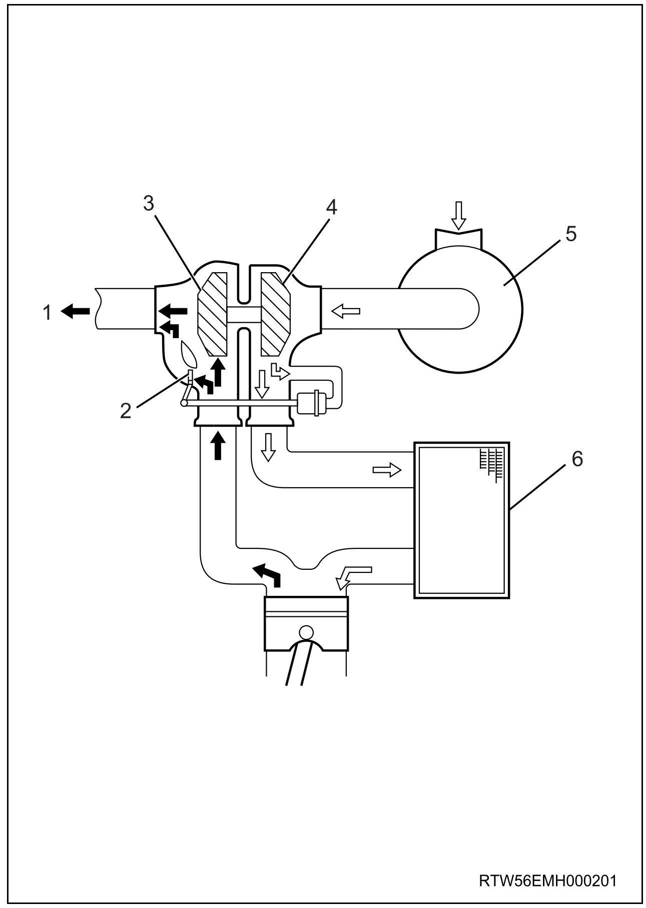
The EGR valve is mounted on the intake manifold. The ECM controls the EGR valve opening based on the engine running condition. The ECM controls the EGR valve by controlling the solenoid. The solenoid is controlled based on pulse width modulation (PWM) signal sent from the ECM. A duty ratio change 0% to appropriate percentage is EGR valve lift control. To open the valve, duty ratio is increased. To close the valve, duty ratio becomes small.
The EGR valve position is detected by the position sensor, and relayed to the ECM. The position sensor provides a signal to the ECM on the signal circuit, which is relative to the position changes of the EGR valve. The ECM should detect a low signal voltage at a small lift amount or closed position. The ECM should detect high signal voltage at a large lift amount.

Intake Throttle Valve



The intake throttle valve is located on the intake manifold inlet. The ECM controls the intake throttle valve opening based on the engine running condition. The ECM controls the intake throttle valve by controlling the solenoid. The solenoid is controlled based on pulse width modulation (PWM) signal sent from the ECM. A duty ratio change 0% to appropriate percentage is intake throttle valve opening angle control. To open the valve, duty ratio is increased. To close the valve, duty ratio becomes small.
The intake throttle valve position is detected by the position sensor, and relayed to the ECM. The position sensor provides a signal to the ECM on the signal circuit, which is relative to the position changes of the intake throttle valve. The ECM should detect a low signal voltage at a small opening amount or closed position. The ECM should detect high signal voltage at a large opening amount.

Turbocharger Description

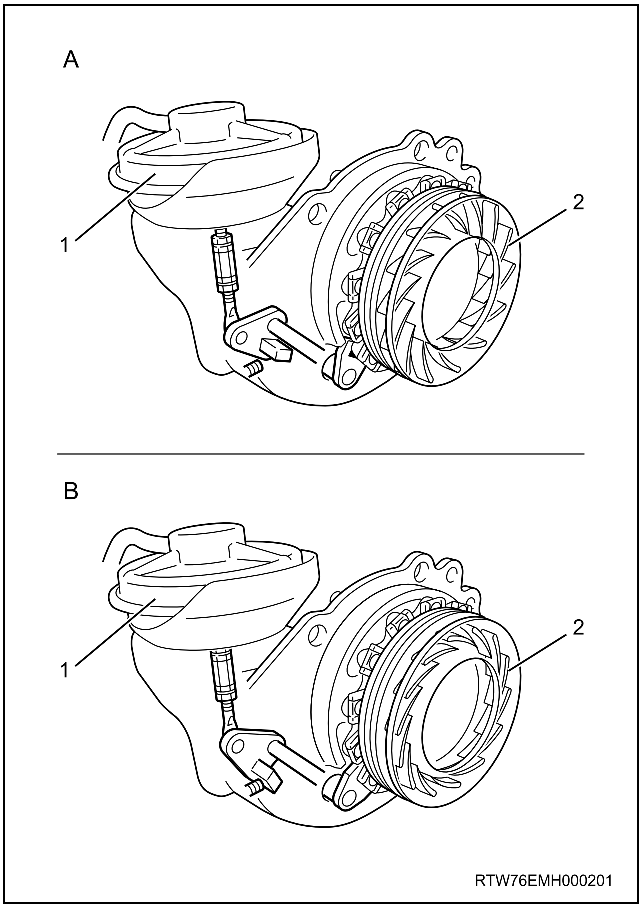


Legend

1. Exhaust gas
2. Waste gate valve
3. Turbine wheel
4. Compressor wheel
5. Air cleaner
6. Charge air cooler (Intercooler)

The turbocharger is used to increase the amount of air that enters the engine cylinders. This allows a proportional increase of fuel to be injected into the cylinders, resulting in increased power output, more complete combustion of fuel, and increased cooling of the cylinder heads, pistons, valves, and exhaust gas. This cooling effect helps extend engine life.
Heat energy and pressures in the engine exhaust gas are utilized to drive the turbine. Exhaust gas is directed to the turbine housing. The turbine housing acts as a nozzle to direct the shaft wheel assembly. Since the compressor wheel is attached directly to the shaft, the compressor wheel rotates at the same speed as the turbine wheel. Clean air from the air cleaner is drawn into the compressor housing and wheel. The air is compressed and delivered through a crossover pipe to the engine air intake manifold, then into the cylinders.

The amount of air pressure rise and air volume delivered to the engine from the compressor outlet is regulated by a waste gate valve in the exhaust housing. The position of the waste gate valve is controlled by the amount of pressure built up on the intake side of the turbocharger. The diaphragm on the inside of the waste gate is pressure sensitive, and controls the position of the valve inside the turbocharger. The position of the valve will increase or decrease the amount of boost to the turbocharger. (Standard output engine)



Legend

1. Turbocharger nozzle control actuator
2. Nozzle

The amount of air pressure rise and air volume delivered to the engine from compressor outlet is regulated by a turbocharger nozzle control actuator indirectly. The position of the turbocharger nozzle is controlled by the ECM. The ECM utilizes a turbocharger nozzle control solenoid valve and a boost pressure sensor to control the turbocharger nozzles. When the engine is not under load, the turbocharger nozzles are in an open position (A), or no boost condition (vacuum pressure supply to the actuator is reduced). When the engine is under load, the ECM commands the control solenoid valve to close the turbocharger nozzles (B), thus increasing the boost (vacuum pressure supply to the actuator is increased). The ECM will vary the boost dependant upon the load requirements of the engine. The ECM uses a pulse width modulation (PWM) on the control circuit to open and control the solenoid valve. (High output engine)

The charge air cooler also helps the performance of the diesel. Intake air is drawn through the air cleaner and into the turbocharger compressor housing. Pressurized air from the turbocharger then flows forward through the charge air cooler located in the front of the radiator. From the charge air cooler, the air flows back into the intake manifold.

The charge air cooler is a heat exchanger that uses air flow to dissipate hear from the intake air. As the turbocharger increases air pressure, the air temperature increases. Lowering the intake air temperature increases the engine efficiency and power by packing more air molecules into the same space.

RTW76FMF000101

Legend

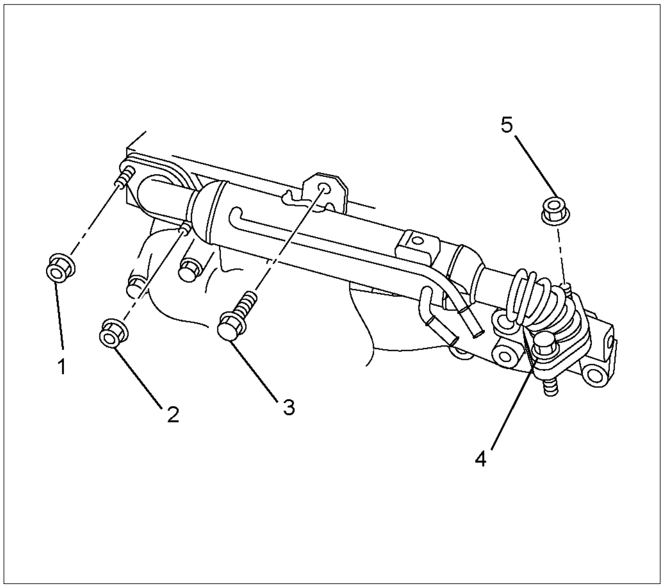
1. EGR Cooler
2. EGR Cooler Gasket
3. EGR Cooler Gasket
4. Heat Protector
5. Exhaust Manifold

Removal

1. Drain the coolant.
2. Remove the intercooler.
3. Remove the heat protector.
4. Disconnect the water hoses from the EGR cooler water pipes.
5. Remove the EGR cooler.

Installation (Standard Output)

1. Gasket
2. EGR Cooler
3. Nuts and Bolts



RTW56FSH000201

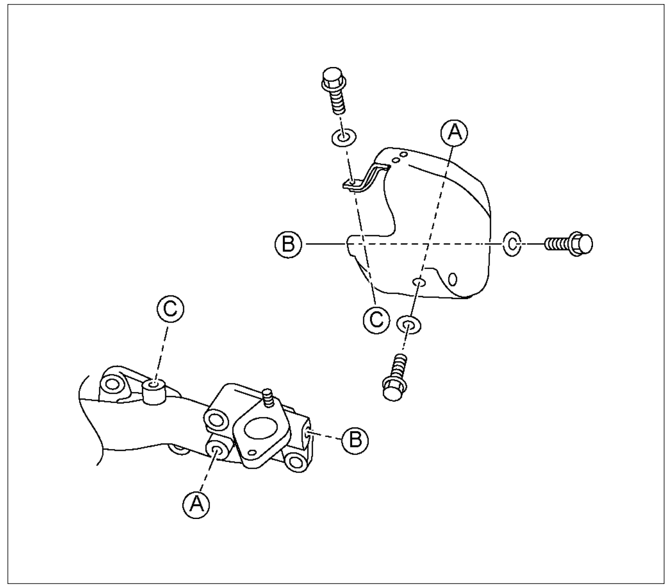
- Temporary tightening order
  1 – 2 – 4 – 5 - 3
- Fully tightening order
  4 – 5 – 1 – 2 - 3

Tighten the nuts and bolts to the specified torque.

Tightening torque:
27 N·m (2.8 kg·m / 20 lb ft)

4. Water hose
5. Heat protector
   - Tighten the bolts to the specified torque.

Tightening torque:
10 N·m (1.0 kg·m / 87 lb in)

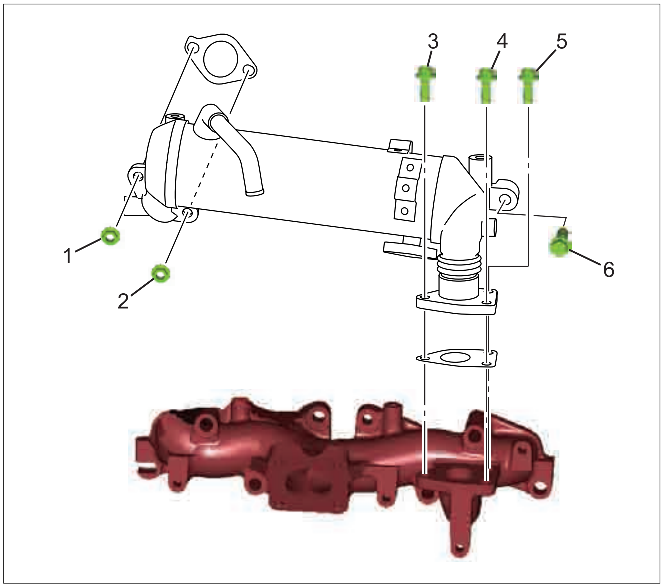


RTW56ASH014601

6. Replenish the engine coolant.

Installation (High Output)

1. Gasket
2. EGR Cooler
3. Nuts and Bolts



RTW76FSH000201

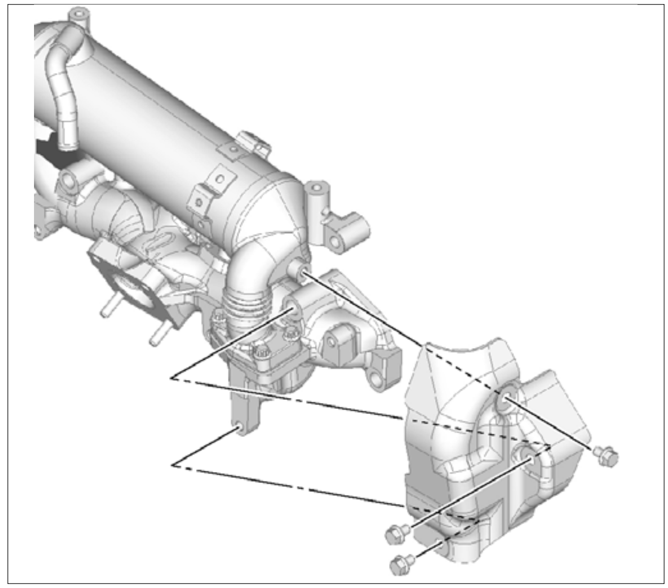
- Temporary tightening order
  1→2→3→4→5→6
- Fully tightening order
  3→4→5→1→2→6

Tighten the nuts and bolts to the specified torque.

Tightening torque:
Nuts and bolts 1-5: 27 N·m (2.8 kg·m / 20 lb ft)
Bolt 6: 52 N·m (5.3 kg·m / 38 lb ft)

4. Water hose
5. Heat protector
   - Tighten the bolts to the specified torque.

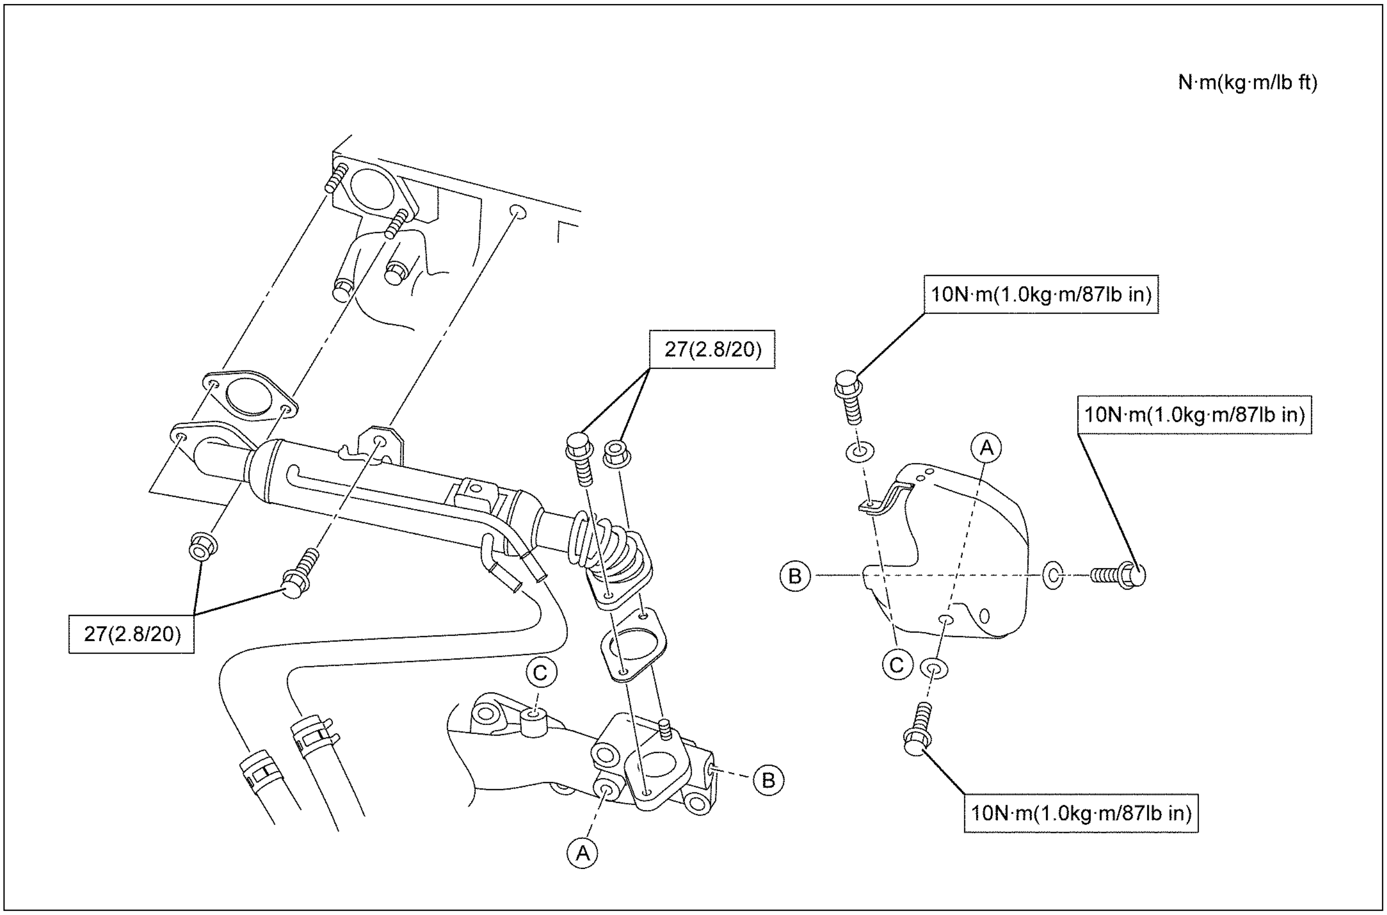
Tightening torque:
25 N·m (2.5 kg·m / 18 lb ft)



RTW76FSH000101

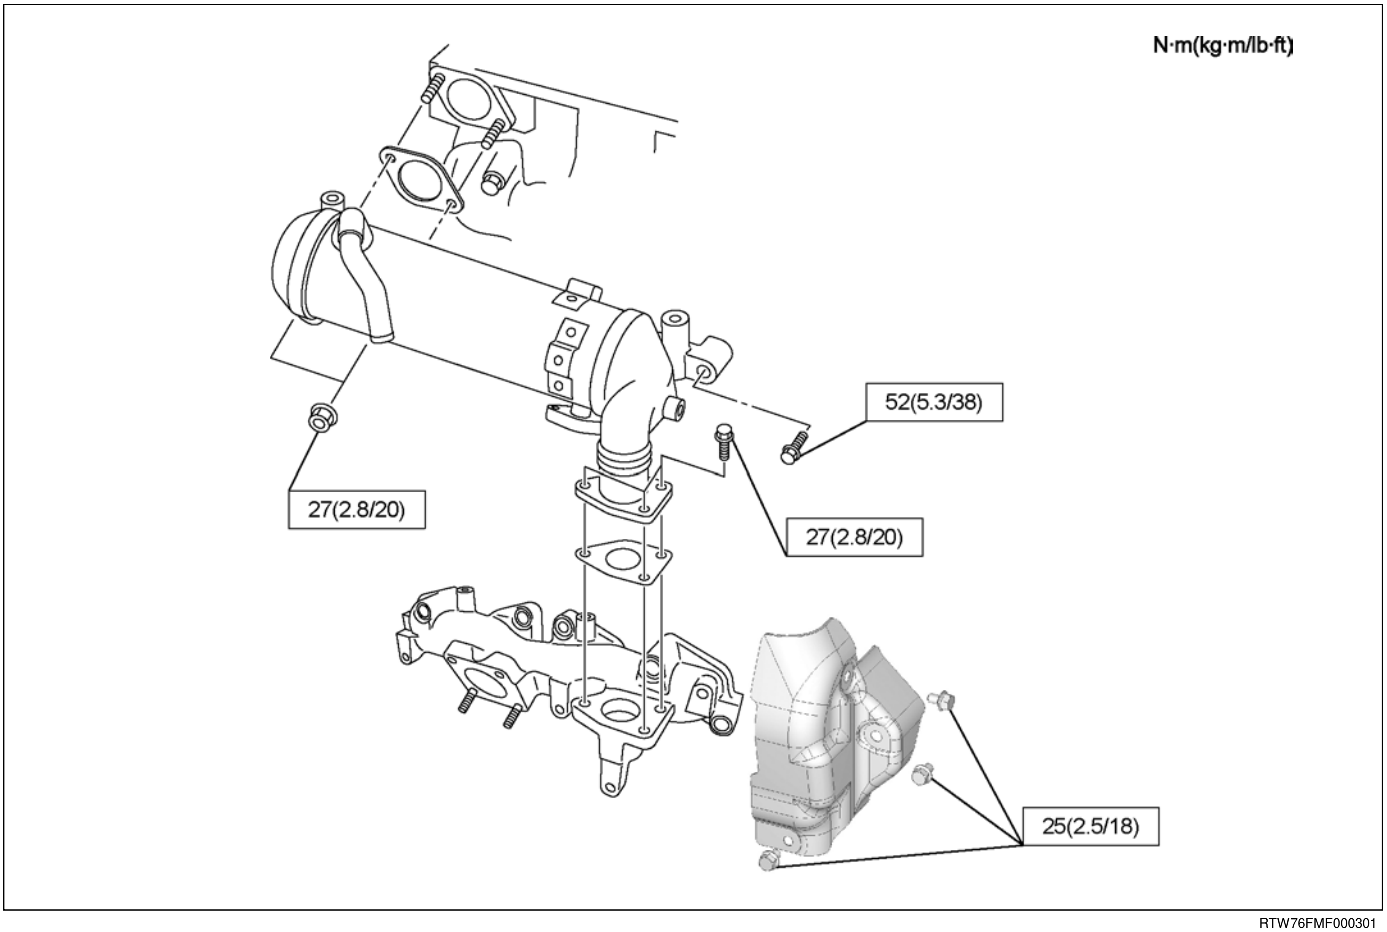
6. Replenish the engine coolant.

Torque Specifications (Standard Output)



RTW56AMF002201

Torque Specifications (High Output)



SECTION 6H

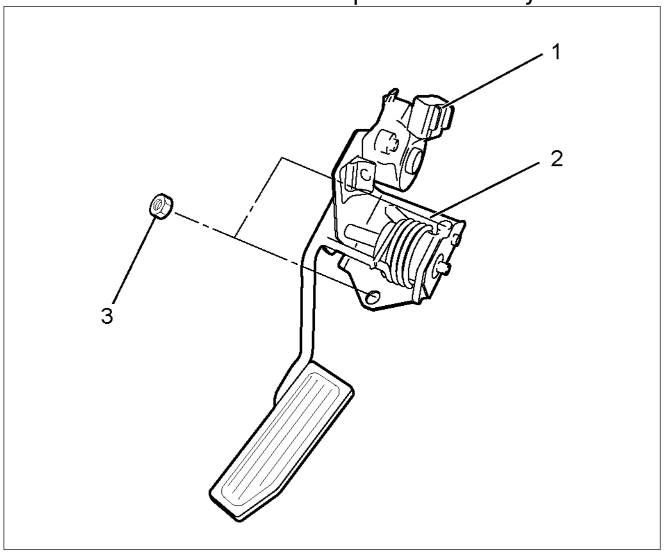
ENGINE SPEED CONTROL SYSTEM

CONTENTS

Accelerator Pedal Position (APP) Sensor

Removal

1. Turn OFF the ignition.
2. Disconnect the APP sensor harness connector.
3. Loosen the accelerator pedal assembly nuts (3).
4. Remove the accelerator pedal assembly.



RTW56ESH000301

5. Remove the APP sensor (1) from accelerator pedal bracket (2).

Installation

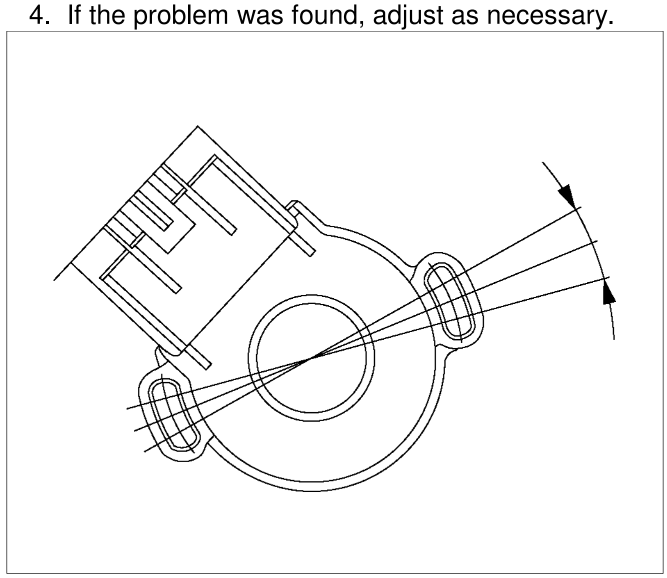
1. Install the APP sensor (1) in accelerator pedal bracket (2).
2. Install the accelerator pedal assembly.
3. Tighten the accelerator pedal assembly nuts (3).
4. Connect the APP sensor harness connector.

How to adjust for APP Sensor

1. Install the Tech2.
2. Turn ON the ignition.
3. Observe the APP sensor parameter.
   Check the unique functionality of each sensor as shown in the table below.

APP Sensor	Pedal Position	Pedal Position as Observed on the Tech2 (%)	Voltage as Observed on the Tech2 (volt)
1	Pedal at reset	0	0.1-1.2
1	Pedal at full travel	100	3.8-4.8
2	Pedal at reset	0	3.8-4.8
2	Pedal at full travel	100	0.2-1.2
3	Pedal at reset	0	3.8-4.8
3	Pedal at full travel	100	1.2-2.2

4. If the problem was found, adjust as necessary.



101RY00011

MAINTENANCE SCHEDULE (For GENERAL EXPORT)

Items followed by an asterisk (*) require more frequent maintenance if the vehicle is driven under severe conditions.
Replace the fuel filter (**Mark) when the fuel filter indicator light is lit.
Refer to "SEVERE CONDITIONS MAINTENANCE SCHEDULE."

I : Inspect and correct or replace as necessary A : Adjust
R : Replace or change T : Tighten to specified torque L : Lubricate

SERVICE INTERVAL: × 1,000 km	5	10	15	20	25	30	35	40	45	50	55	60	65	70	75	80	85	90	95	100

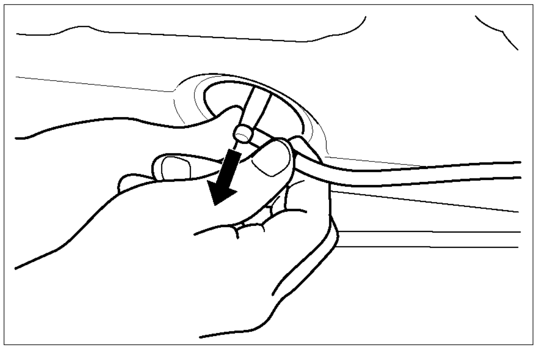
Important Operations - Removal

1. Washer Nozzle Tube

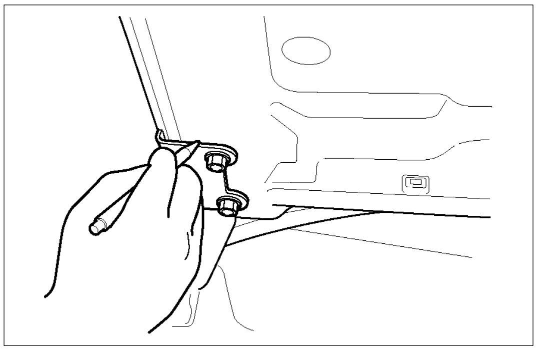
1) Open the hood.
2) Support the hood.
3) Remove the windshield washer nozzle tube.



RUW52BSH002501

2. Hood Hinge Bolt

- Before removing the hinges from the engine hood, scribe a mark showing location of the hinges to facilitate installation in the original position.

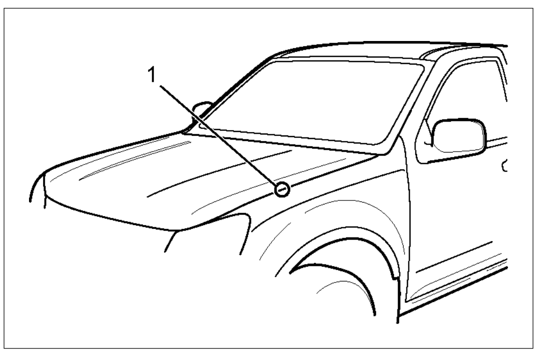


RUW52BSH002601

Important Operations - Installation

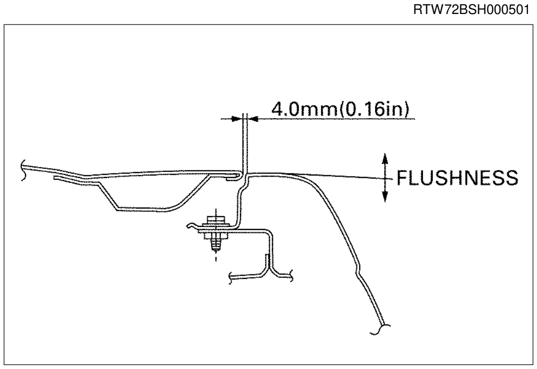
3. Engine Hood

- Check the engine hood and fender (1).

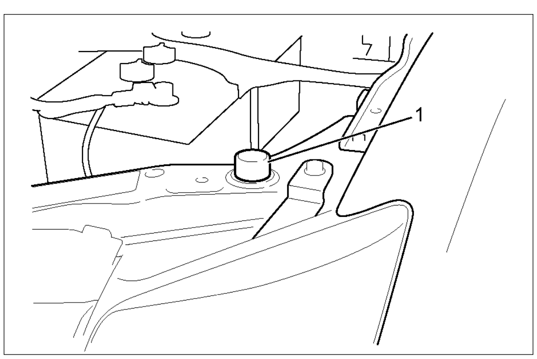


RTW72BSH000501

- Clearance : 4.0 mm (0.16 in)
- Height (step) : Flushness
- Adjust clearance using the hinges on the engine hood.



- Adjust height (step) using the hood rests (1).



RTW72BSH000701

Engine Hood Striker

- Apply a light coat of grease to the striker.

SECTION 6

ENGINE DIAGNOSIS

TABLE OF CONTENTS

Engine Diagnosis

Hard Starting

1.Starting Motor Does Not Turn Over

Trouble Shooting Procedure

Turn on headlights and starter switch.

Condition	Possible cause	Correction
Headlights go out or dim considerably	Battery run down or under charged	Recharge or replace battery
	Terminals poorly connected	Clean battery posts and terminals and connect properly
	Starting motor coil circuit shorted	Overhaul or replace
	Starting motor defective	Overhaul or replace

2.Ignition Trouble - Starting Motor Turns Over But Engine Does Not Start

Spark Test

Disconnect a high tension cable from any spark plug. Connect the spark plug tester (use commercially available tool), crank the engine, and check if a spark is generated in the spark plug tester. Before cranking the engine, make sure that the spark plug tester is properly grounded. To avoid electrical shock, do not touch the high tension cable while the engine is running.

Condition	Possible cause	Correction
Spark jumps across gap	Spark plug defective	Clean, adjust spark gap or replace
	Spark plug wire in correct	Connect properly or replace
	Ignition timing incorrect	Refer to Ignition System
	Fuel not reaching fuel injector(s) or engine	Refer to item 3 (Trouble in fuel system)
	Valve timing incorrect	Adjust
	Engine lacks compression	Refer to item 4 (Engine lacks compression)
No sparking takes place	Ignition coil disconnected or broken	Connect properly or replace
	Electronic Ignition System with module	Replace
	Poor connections in engine harness	Correct
	Engine Control Module cable disconnected or defective	Correct or replace

3.Trouble in Fuel System

Condition	Possible cause	Correction
Starting motor turns over and spark occurs but engine does not start.	Fuel tank empty	Fill
	Water in fuel system	Clean
	Fuel filter clogged	Replace filter
	Fuel pipe clogged	Clean or replace
	Fuel pump defective	Replace
	Fuel pump circuit open	Correct or replace
	Evaporative Emission Control system circuit clogged	Correct or replace
	Multiport Fuel Injection System faulty	Refer to "Electronic Fuel Injection" section

4.Engine Lacks Compression

Condition	Possible cause	Correction
Engine lacks compression	Spark plug loosely fitted or spark plug gasket defective	Tighten to specified torque or replace gasket
	Spark plug wire incorrect	Connect properly or replace
	Valve timing incorrect	Adjust
	Cylinder head gasket defective	Replace gasket
	Valve incorrectly seated	Lap valve
	Valve stem seized	Replace valve and valve guide
	Valve spring weakened	Replace
	Cylinder or piston rings worn	Overhaul engine
	Piston ring seized	Overhaul engine.

Engine Compression Test Procedure

1. Start and run the engine until the engine reaches normal operating temperature.
2. Turn the engine off.
3. Remove all the spark plugs.
4. Remove ignition coil fuse (15A) and disable the ignition system.
5. Remove the fuel pump relay from the relay and fuse box.
6. Engage the starter and check that the cranking speed is approximately 300 rpm.
7. Install cylinder compression gauge into spark plug hole.
8. With the throttle valve opened fully, keep the starter engaged until the compression gauge needle reaches the maximum level. Note the reading.
9. Repeat the test with each cylinder.
   The pressure difference between the individual cylinders should not exceed 100kPa (14.5 psi).

Rough Engine Idling or Engine Stalling

Condition	Possible cause	Correction
Trouble in fuel injection system	Idle air control valve defective	Replace
	Throttle shutting off incomplete	Correct or replace
	Throttle position sensor circuit open or shorted	Correct or replace
	Fuel injector circuits open or shorted	Correct or replace
	Fuel injectors damaged	Replace
	Fuel pump relay defective	Replace
	Manifold Absolute Pressure Sensor cable disconnected or broken	Correct or replace
	Manifold Absolute Pressure Sensor defective	Replace
	Engine Coolant Temperature Sensor cable disconnected or broken	Correct or replace
	Engine Coolant Temperature Sensor defective	Replace
	Intake Air Temperature sensor cable disconnected or broken	Correct or replace
	Intake Air Temperature sensor defective	Replace
	Knock Sensor (KS) circuits open or shorted	Correct or replace
	KS defective	Replace
	KS Module circuits open or ground	Correct or replace
	KS Module defective	Replace
	Vehicle Speed Sensor circuit open or shorted	Correct or replace
	Vehicle Speed Sensor defective	Replace
Trouble in emission control system	Engine Control Module defective	Replace
	Canister purge solenoid circuit open	Correct
	Canister purge solenoid defective	Replace
	Evaporative Emission Canister Purge control valve defective	Replace
	Trouble in ignition system	Refer to Hard Start Troubleshooting Guide
Others	Engine lacks compression	Refer to Hard Start Troubleshooting Guide
	Valve incorrectly seated	Lap valve
	Air Cleaner Filter clogged	Replace filter element
	Valve timing incorrect	Readjust
	Idle air control valve broken	Replace

Rough Engine Running

Condition	Possible cause	Correction
Engine misfires regularly	Ignition coil layer shorted	Replace
	Spark plugs fouling	Clean or install hotter type plug
	Spark plug(s) insulator nose leaking	Replace
	Spark plug wire incorrect	Connect properly or replace
	Fuel injector(s) defective	Replace
	Engine control module faulty	Replace
Engine knocks regularly	Spark plugs running too hot	Install colder type spark plugs
	Powertrain control module faulty	Replace
Engine lacks power	Spark plugs fouled	Clean
	Spark plug wire incorrect	Connect properly or replace
	Fuel injectors defective	Replace
	Manifold Absolute Pressure (MAP) Sensor or Manifold Absolute Pressure Sensor circuit defective	Correct or replace
	Engine Coolant Temperature Sensor or Engine Coolant Temperature Sensor circuit defective	Correct or replace
	Engine Control Module faulty	Replace
	Intake Air Temperature Sensor or Intake Air Temperature Sensor circuit defective	Correct or replace
	Throttle Position Sensor or Throttle Position Sensor circuit defective	Correct or replace
	Knock Sensor or Knock Sensor circuits defective	Correct or replace
	Knock Sensor Module or Knock Sensor Module circuits defective	Correct or replace

Hesitation

Condition	Possible cause	Correction
Hesitation on acceleration	Throttle Position Sensor adjustment incorrect	Replace throttle valve assembly
	Throttle Position Sensor circuit open or shorted	Correct or replace
	Excessive play in accelerator linkage	Adjust or replace
	Manifold Absolute Pressure (MAP) Sensor circuit open or shorted	Correct or replace
	MAP Sensor defective	Replace
	Intake Air Temperature (IAT) Sensor circuit open or shorted	Correct or replace
	Knock Sensor (KS) Circuit open or shorted	Correct or replace
	KS defective	Replace
	KS Module circuits open or shorted	Correct or replace
	KS Module defective	Replace
	IAT Sensor defective	Replace
Hesitation at high speeds (Fuel pressure too low)	Fuel tank strainer clogged	Clean or replace
	Fuel pipe clogged	Clean or replace
	Fuel filter clogged	Replace
	Defective fuel pump system	Check and replace
	Fuel Pressure Control Valve leaking	Replace
Hesitation at high speeds (Fuel injector not working normally)	Power supply or ground circuit for Multiport Fuel Injection System shorted or open	Check and correct or replace
	Cable of Multiport Fuel Injection System disconnected or defective	Correct or replace
Hesitation at high speeds	Engine Control Module defective	Replace
	Throttle Position Sensor circuit open or shorted	Correct or replace
	Throttle Position Sensor defective	Replace
	Engine Coolant Temperature Sensor circuit open or shorted	Correct or replace
	Engine Coolant Temperature Sensor defective	Replace
	MAP Sensor cable open or shorted	Correct or replace
	MAP Sensor defective	Replace
	IAT Sensor circuit open or shorted	Correct or replace
	IAT Sensor defective	Replace
	KS Circuit open or shorted	Correct or replace
	KS defective	Replace
	KS Module circuit open or shorted	Correct or replace
	KS Module defective	Replace
	Throttle valve not wide opened	Check and correct or replace
	Air Cleaner Filter clogged	Replace filter element
	Power supply voltage too low	Check and correct or replace

Engine Lacks Power

Condition	Possible cause	Correction
Trouble in fuel system	Fuel Pressure Control Valve not working normally	Replace
	Fuel injector clogged	Clean or replace
	Fuel pipe clogged	Clean
	Fuel filter clogged or fouled	Replace
	Fuel pump drive circuit not working normally	Correct or replace
	Fuel tank not sufficiently breathing due to clogged Evaporative Emission Control System circuit	Clean or replace
	Water in fuel system	Clean
	Inferior quality fuel in fuel system	Use fuel of specified octane rating
	Engine Control Module supplied poor voltage	Correct circuit
	Throttle Position Sensor cable disconnected or broken	Correct or replace
	Throttle Position Sensor defective	Replace
	Manifold Absolute Pressure Sensor not working normally	Replace
	Intake Air Temperature sensor not working normally	Replace
	Engine Coolant Temperature Sensor circuit open or shorted	Correct or replace
	Engine Coolant Temperature Sensor defective	Replace
	Engine Control Module defective	Replace
Trouble in intake or exhaust system	Air Cleaner Filter clogged	Replace filter element
	Air duct kicked or flattened	Correct or replace
Ignition failure	-	Refer to Hard Start Troubleshooting Guide
	Heat range of spark plug inadequate	Install spark plugs of adequate heat range
	Electronic Ignition System with module	Replace

Condition	Possible cause	Correction
Engine overheating	Level of Engine Coolant too low	Replenish
	Thermo switch or fan motor defective	Replace
	Thermostat defective	Replace
	Engine Coolant pump defective	Correct or replace
	Radiator clogged	Clean or replace
	Radiator filter cap defective	Replace
	Level of oil in engine crankcase too low or wrong oil in engine	Change or replenish
	Resistance in exhaust system increased	Clean exhaust system or replace defective parts
	Throttle Position Sensor adjustment incorrect	Adjust Wide Open Throttle switch setting
	Throttle Position Sensor circuit open or shorted	Correct or replace
	Cylinder head gasket damaged	Replace
	Cooling Fan clutch defective	Replace
	Fan belt slipping	Adjust tension of V-belt or replace V-belt
Engine overcooling	Thermostat defective	Replace (Use a thermostat set to open at 92°C (197.6°F))
Engine lacks compression	-	Refer to Hard Start
Others	Tire inflation pressure abnormal	Adjust to recommend pressures
	Brake drag	Adjust
	Clutch slipping	Adjust or replace
	Level of oil in engine crankcase too high	Correct level of engine oil

Engine Noisy

Abnormal engine noise often consists of various noises originating in rotating parts, sliding parts and other moving parts of the engine. It is, therefore, advisable to locate the source of noise systematically.

Condition	Possible cause	Correction
Noise from crank journals or from crank bearings (Faulty crank journals and crank bearings usually make dull noise that becomes more evident when accelerating)	Oil clearance increased due to worn crank journals or crank bearings	Replace crank bearings and crankshaft or regrind crankshaft and install the over size bearing
	Crankshaft out of round	Replace crank bearings and crankshaft or regrind crankshaft and install the over size bearing
	Crank bearing seized	Replace crank bearings and crankshaft or regrind crankshaft and install the over size bearing

Abnormal Noise Due to Hydraulic Lash Adjuster

Should abnormal noise due to the hydraulic lash adjuster trouble be heard immediately after the engine is started, inspect as follows:

Condition	Possible cause	Correction
Abnormal noise is heard	Air contaminated	Bleed
HLA is spongy	Check ball valve broken	Repair
	Safety valve in cylinder head broken	Replace
Valve clearance is not zero	HLA inside stick	Replace HLA assembly

Troubleshooting Procedure

Short out each spark plug in sequence using insulated spark plug wire removers. Locate cylinder with defective bearing by listening for abnormal noise that stops when spark plug is shorted out.

Condition	Possible cause	Correction
Noise from connecting rods or from connecting rod bearings (Faulty connecting rods or connecting rod bearings usually make an abnormal noise slightly higher than the crank bearing noise, which becomes more evident when engine is accelerated)	Bearing or crankshaft pin worn	Replace connecting rod bearings and crankshaft or regrind crankshaft and install the under size bearing
	Crankpin out of round	Replace connecting rod bearings and crankshaft or regrind crankshaft and install the under size bearing
	Connecting rod bent	Correct or replace
	Connecting rod bearing seized	Replace connecting rod bearings and crankshaft or regrind crankshaft and install the under size bearing

Troubleshooting Procedure

Abnormal noise stops when the spark plug on the cylinder with defective parts is shorted out.

Condition	Possible cause	Correction
Piston and cylinder (Faulty piston or cylinder usually makes a combined mechanical thumping noise which increases when engine is suddenly accelerated but diminishes gradually as the engine warms up)	Piston clearance increased due to cylinder wear	Replace piston and cylinder body
	Piston seized	Replace piston and cylinder body
	Piston ring broken	Replace piston and cylinder body
	Piston defective	Replace pistons and others

2. Hood Hinge Bolt

- Tighten the engine hood hinge fixing bolts to the specified torque.

Torque	N·m(kgf·m/lb·in)
10 (1.0 / 87)	

Troubleshooting Procedure

Condition	Possible cause	Correction
Piston pin noise (Piston makes noise each time it goes up and down)	Piston pin or piston pin hole worn	Replace piston, piston pin and connecting rod assy

Troubleshooting Procedure

The slapping sound stops when spark plug on bad cylinder is shorted out.

Condition	Possible cause	Correction
Timing belt noise	Timing belt tension is incorrect	Replace pusher or adjust the tension pulley or replace timing belt
	Tensioner bearing defective	Replace
	Timing belt defective	Replace
	Timing wheels defective	Replace
	Timing belt comes in contact with timing cover	Replace timing belt and timing cover
Valve noise	Valve and valve guide seized	Replace valve and valve guide
	Valve spring broken	Replace
	Valve seat off-positioned	Correct
Crankshaft noise	Crankshaft end play excessive (noise occurs when clutch is engaged)	Replace thrust bearing
Engine knocking	Preignition due to use of spark plugs of inadequate heat range	Install Spark Plugs of adequate heat range
	Fuel too low in octane rating	Replace fuel
	Wide Open Throttle enrichment system failure	Refer to Section 6E
	Selection of transmission gear incorrect	Caution operator or incorrect gear selection
	Engine overheating	Refer to "Engine Lacks Power"
Others	Water pump defective	Replace
	V-belt slipping	Adjust tension of V-belt or replace V-belt

Abnormal Combustion

Condition	Possible cause	Correction
Trouble in fuel injection system	Fuel pressure control valve defective	Replace
	Fuel filter clogged	Replace
	Fuel pump clogged	Clean or replace
	Fuel tank or fuel pipe clogged	Clean or replace
	Fuel injector clogged	Clean or replace
	Fuel pump relay defective	Replace
	Power supply cable for fuel pump loosely connected or defective	Reconnect, correct or replace
	Manifold Absolute Pressure Sensor circuit open or shorted	Correct or replace
	Manifold Absolute Pressure Sensor defective	Replace
	Engine Coolant Temperature (ECT) Sensor circuit open or shorted	Correct or replace
	ECT Sensor defective	Replace
	Throttle Position Sensor adjustment incorrect	Reconnect
	Throttle Position Sensor defective	Replace
	Throttle Position Sensor connector loosely connected	Reconnect
	Vehicle Speed Sensor cable loosely connected or defective	Correct or replace
	Vehicle Speed Sensor loosely fixed	Fix tightly
	Vehicle Speed Sensor in wrong contact or defective	Replace
	Engine Control Module cable loosely connected or defective	Correct or replace
Trouble in emission control system	Heated Oxygen Sensor circuit open (If applicable)	Correct or replace
	Heated Oxygen Sensor defective (If applicable)	Replace
	Signal vacuum hose loosely fitted or defective	Correct or replace
	ECT Sensor circuit open or shorted	Correct or replace
	ECT Sensor defective	Replace
	Evaporative Emission Control system (If applicable)	Refer to Section 6E
Trouble in ignition system	-	Refer to "Engine Lacks Power"
Trouble in cylinder head parts	Carbon deposits in combustion chamber	Remove carbon
	Carbon deposit on valve, valve seat and valve guide	Remove carbon

Engine Oil Consumption Excessive

Condition	Possible cause	Correction
Oil leaking	Oil pan drain plug loose	Retighten or replace gasket
	Oil pan setting bolds loosened	Retighten
	Oil pan gasket broken	Replace gasket
	Front cover retaining bolts loose or gasket broken	Retighten or replace gasket
	Head cover retaining bolts loose or gasket broken	Retighten or replace gasket
	Oil filter adapter cracked	Replace
	Oil filter attaching bolt loose or rubber gasket broken	Retighten or replace oil filter
	Crankshaft front or rear oil seal defective	Replace oil seal
	Oil pressure unit loose or broken	Retighten or replace
	Blow-by gas hose broken	Replace hose
	Engine/Transmission coupling area	Replace oil seal
Oil leaking into combustion chambers due to poor seal in valve system	Valve stem oil seal defective	Replace
	Valve stem or valve guide worn	Replace valve and valve guide
Oil leaking into combustion chambers due to poor seal in cylinder parts	Cylinders and pistons worn excessively	Rebore cylinder and replace pistons and others
	Piston ring gaps incorrectly positioned	Correct
	Piston rings set with wrong side up	Correct
	Piston rings sticking	Rebore cylinder and replace pistons and others
	Piston ring and ring groove worn	Replace pistons and others
	Return ports in oil rings clogged	Clean piston and replace rings
Crank case ventilation, Positive Crankcase Ventilation System malfunctioning	Positive Crankcase Ventilation Hose clogged	Clean
Others	Improper oil viscosity	Use oil of recommended S.A.E. viscosity
	Continuous high speed driving and or severe usage such as trailer towing	Continuous high speed operation and or severe usage will normally cause increased oil consumption

Fuel Consumption Excessive

Condition	Possible cause	Correction
Trouble in fuel system	Mixture too rich or too lean due to trouble in fuel injection system	Refer to "Abnormal Combustion"
	Fuel cut function does not act	Refer to "Abnormal Combustion"
Trouble in ignition system	Misfiring or abnormal combustion due to trouble in ignition system	Refer to Hard Start or Abnormal Combustion Troubleshooting Guide
Others	Engine idle speed too high	Reset Idle Air Control Valve
	Returning of accelerator control sluggish	Correct
	Fuel system leakage	Correct or replace
	Clutch slipping	Correct
	Brake drag	Correct
	Selection of transmission gear incorrect	Caution operator of incorrect gear selection

Oil Problems

Condition	Possible cause	Correction
Oil pressure too low	Wrong oil in use	Replace with correct engine oil
	Relief valve sticking	Replace
	Oil pump not operating properly	Correct or replace
	Oil pump strainer clogged	Clean or replace strainer
	Oil pump worn	Replace
	Oil pressure gauge defective	Correct or replace
	Crankshaft bearing or connecting rod bearing worn	Replace
Oil contamination	Wrong oil in use	Replace with new engine oil
	Oil filter clogged	Replace oil filter
	Cylinder head gasket damage	Replace gasket
	Burned gases leaking	Replace piston and piston rings or rebore cylinders
Oil not reaching valve system	Oil passage in cylinder head or cylinder body clogged	Clean or correct

Engine Oil Pressure Check

1. Check for dirt, gasoline or water in the engine oil.
   a. Check the viscosity of the oil.
   b. Change the oil if the viscosity is outside the specified standard.
   c. Refer to the "Maintenance and Lubrication" section of this manual.
2. Check the engine oil level.
   The level should fall somewhere between the "ADD" and the "FULL" marks on the oil level dipstick.
   If the oil level does not reach the "ADD" mark on the oil level dipstick, engine oil must be added.
3. Remove the oil pressure unit.
4. Install an oil pressure gauge.
5. Start the engine and allow the engine to reach normal operating temperature (About 80°C).
6. Measure the oil pressure.

   Oil pressure should be:
   150 kPa(21.8 psi) at idle speed.
7. Stop the engine.
8. Remove the oil pressure gauge
9. Install the oil pressure unit.
10. Start the engine and check for leaks.

Malfunction Indicator Lamp

The instrument panel "CHECK ENGINE" Malfunction Indicator lamp (MIL) illuminates by self diagnostic system when the system checks the starting of engine, or senses malfunctions.

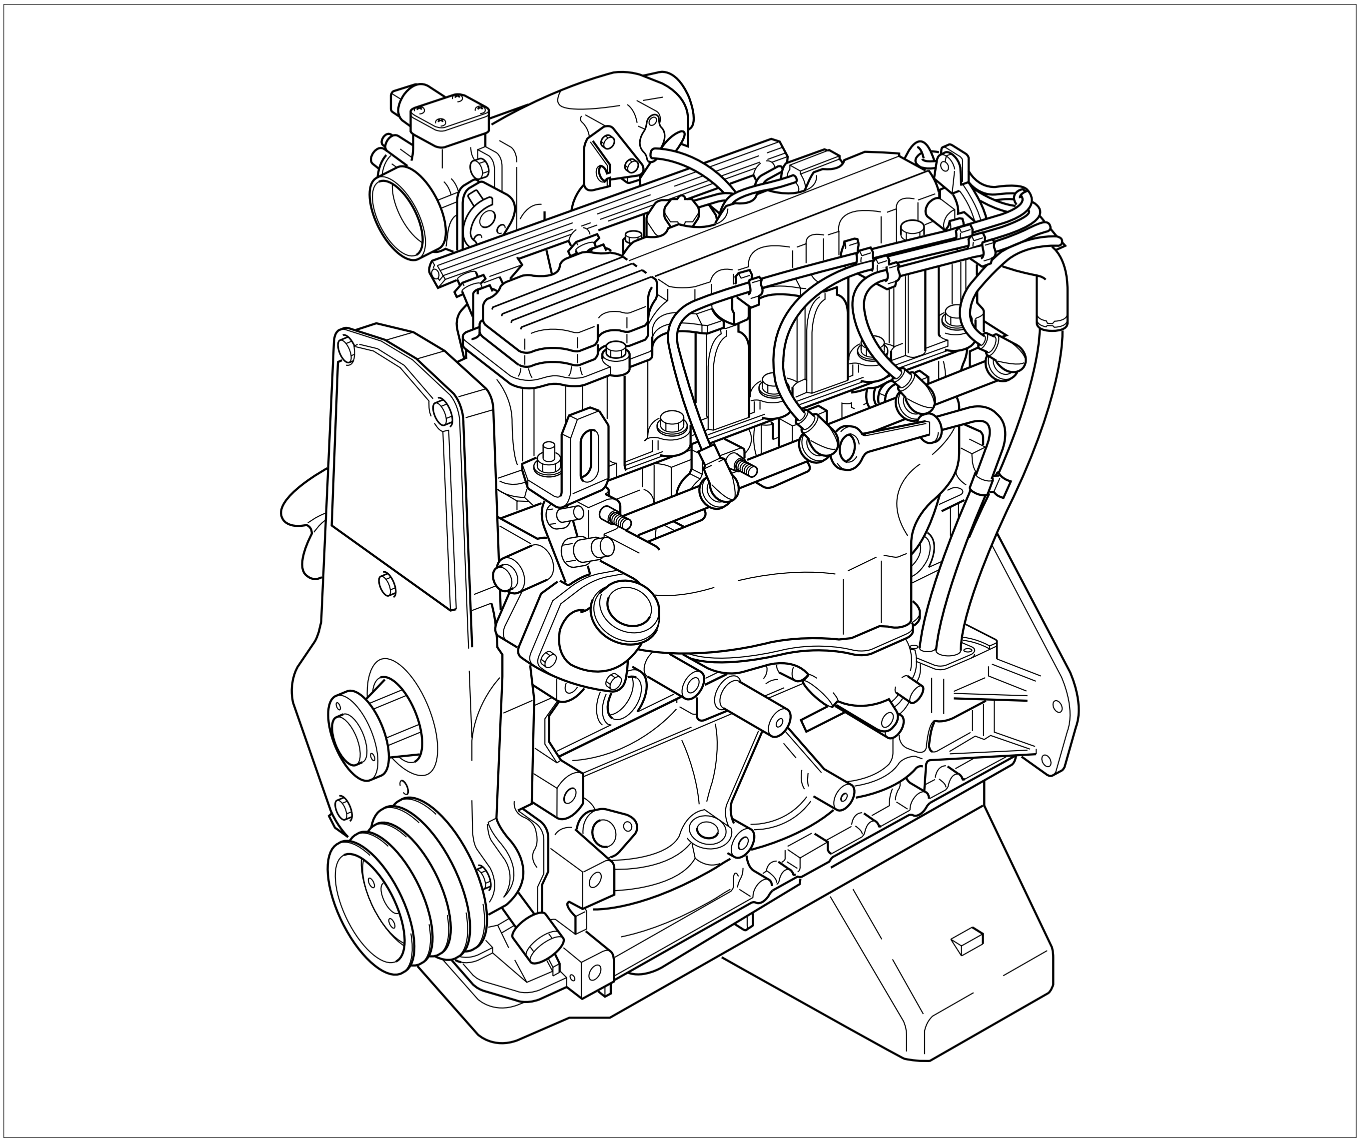
Condition	Possible cause	Correction
"CHECK ENGINE" MIL does not illuminate at the starting of engine	Bulb defective	Replace
	MIL circuit open	Correct or replace
	Command signal circuit to operate self diagnostic system shorted	Correct or replace
	Engine Control Module (ECM) cable loosely connected, disconnected or defective	Correct or replace
	ECM defective	Replace
"CHECK ENGINE" MIL illuminates, and stays on	Deterioration heated oxygen sensor of internal element	Replace
	Heated oxygen sensor connector terminal improper contact (If applicable)	Reconnect properly
	Heated oxygen sensor lead wire shorted (If applicable)	Correct
	Heated oxygen sensor circuit open (If applicable)	Correct or replace
	Deterioration engine coolant temperature sensor of internal element	Replace
	Engine coolant temperature sensor connector terminal improper contact	Reconnect properly
	Engine coolant temperature sensor lead wire shorted	Correct
	Engine coolant temperature sensor circuit open	Correct or replace
	Throttle position sensor open or shorted circuits	Correct or replace
	Deterioration of crankshaft position sensor	Replace
	Crankshaft position sensor circuit open or shorted	Correct or replace
	Vehicle speed sensor circuit open	Correct or replace
	Manifold absolute pressure sensor circuit open or shorted	Correct or replace
	Intake air temperature sensor circuit open or shorted	Correct or replace
	Fuel injector circuit open or shorted	Correct or replace
	ECM driver transistor defective	Replace EPROM or ECM
	Malfunctioning of ECM RAM (Random Access Memory) or Malfunctioning of ECM PROM (Programmed Read Only Memory)	Replace EPROM or ECM

SECTION 6A
ENGINE MECHANICAL

TABLE OF CONTENTS

PAGE

GENERAL DESCRIPTION



Engine Cleanliness And Care

An automobile engine is a combination of many machined, honed, polished and lapped surfaces with tolerances that are measured in the thousandths of a millimeter (ten thousandths of an inch). Accordingly, when any internal engine parts are serviced, care and cleanliness are important. Throughout this section, it should be understood that proper cleaning and protection of machined surfaces and friction areas is part of the repair procedure. This is considered standard shop practice even if not specifically stated.

- A liberal coating of engine oil should be applied to all friction areas during assembly to protect and lubricate the surfaces on initial operation.
- Whenever valve train components, pistons, piston rings, connecting rods, rod bearings, and crankshaft journal bearings are removed for service, they should be retained in order.
- At the time of installation, they should be installed in the same locations and with the same mating surfaced as when removed.
- Battery cables should be disconnected before any major work is performed on the engine. Failure to disconnect cables may result in damage to wire harness or other electrical parts.
- The four cylinders of this engine are identified by numbers; cylinders 1, 2, 3 and 4, as counted from crankshaft pulley.

General Information on Engine Service

The following information on engine service should be noted carefully, as it is important in preventing damage and contributing to reliable engine performance:

- When raising or supporting the engine for any reason, do not use a jack under the oil pan. Due to the small clearance between the oil pan and the oil pump strainer, jacking against the oil pan may cause damage to the oil pick up unit.
- The 12-volt electrical system is capable of damaging circuits. When performing any work where electrical terminals could possible be grounded, the ground cable of the battery should be disconnected at the battery.
- Any time the intake air duct or air cleaner is removed, the intake opening should be covered. This will protect against accidental entrance of foreign material into the cylinder which could cause extensive damage when the engine is started.

Cylinder Block

The cylinder block is made of cast iron. The crankshaft is supported by five bearings. The bearing cap is made of nodular cast iron.

Cylinder Head

The cylinder head is made of aluminum alloy casting with a spark plug in the center.

Valve Train

Valve system is a single over head camshaft.
The valves clearance adjustment are hydraulic.
Hydraulic valve lifter adjustment, no adjustment necessary.

Intake Manifold

The intake manifold is made of aluminum alloy.

Exhaust Manifold

The exhaust manifold is made of high Si-Mo nodular iron.

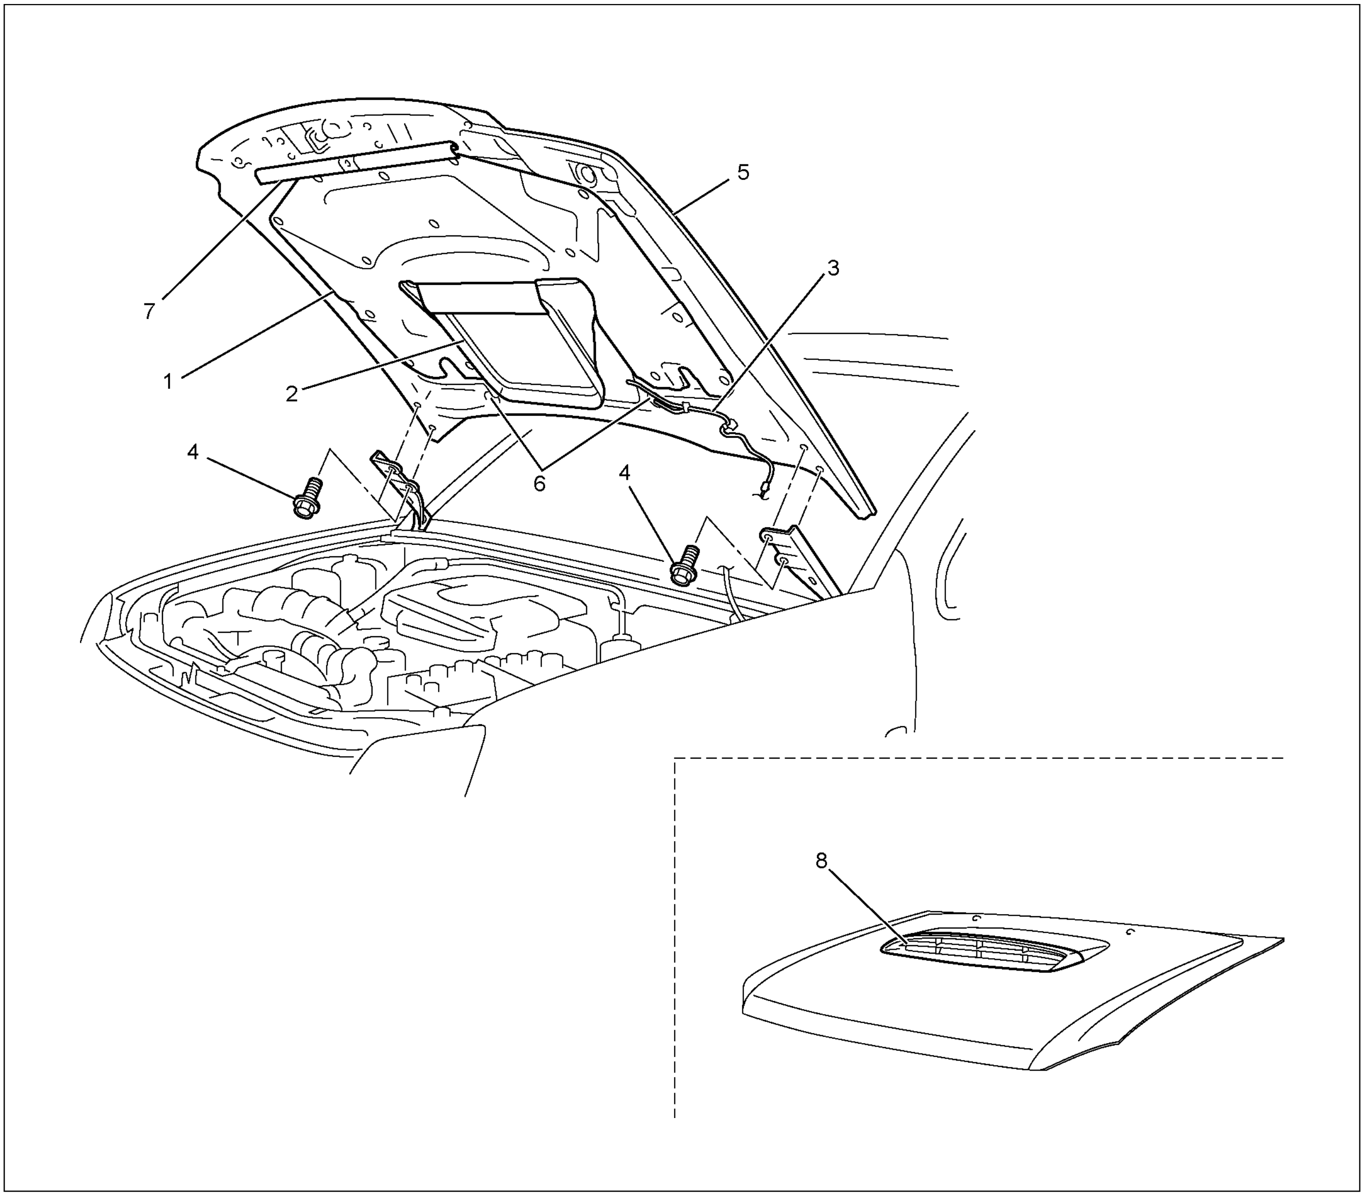
Pistons and Connecting Rods

Aluminum pistons are used after selecting the grade that meets the cylinder bore diameter. Each piston has two compression rings and one oil ring. The piston pin is made of cast hardened steel. The connecting rod bearings are made of modular cast iron. The connecting rod bearings are made of steel backed with tri-metal babbitt metal.

Crankshaft and Bearings

The crank shaft is made of modular cast iron. Pins and journal are graded for correct size selection for their bearing.

REMOVAL AND INSTALLATION



RTW72BLF000701

4JK1 (High Output) / 4JJ1 (High Output) Model

Removal Steps

1. Hood insulator
2. ▲ Intercooler seal
3. ▲ Washer nozzle tube
4. ▲ Hood hinge bolt
5. Engine hood
6. Washer nozzle
7. Hood seal
8. ▲ Engine hood bulge

Installation Steps

8. Engine hood bulge
7. Hood seal
6. Washer nozzle
5. ▲ Engine hood
4. ▲ Hood hinge bolt
3. Washer nozzle tube
2. Intercooler seal
1. Hood insulator

Main Data and Specifications

Engine - General	C24SE
Engine type	Four-cycle, water cooled cross-flow with single over head camshaft Micro-computer control, fuel injection
Combustion chamber type (Volume)	Hemispherical (43.3cm^3)
Timing train system	Belt drive
No. of cylinders-bore × stroke mm (in)	4-87.5×100.0 (3.44×3.93)
Bore Spacing(C/L to C/L)	93.0 mm (3.66 in)
Firing Order	1-3-4-2
Bore×Stroke mm (in)	87.5×100.0 (3.44×3.93)
Total piston displacement cm^3 (in^3)	2,405(146.80)
Combustion Chamber Volume	43.3cm^3
No. of piston ring	Compression ring: 2, Oil ring: 1
Compression pressure kg/cm^2 (psi/pa)	12.2-16.3 (174-232/1200-1600)
Ignition timing (BTDC)	No adjustment
Idling speed: rpm(WO/AC,W/AC) A/C off	825
Valve clearances (At cold)	
Intake mm (in)	0 (0) (Hydraulic valve lash adjustment)
Exhaust mm (in)	0 (0) (")
Open at (BTDC) deg	17°30’
Close at (ABDC) deg	76°30’
Exhaust valves	
Open at (BBDC) deg	58°30’
Close at (ATDC) deg	35°30’
Ignition system	Fully transistorized battery ignition
Distributor type	Not applicable, Electronic Spark Timing control
Distributor advance type	Not applicable, Electronic Spark Timing control
Spark plug type	RN9YC4
Spark plug gap mm (in)	1.0--1.1 (0.039--0.043)
Lubrication system	
Lubricating method	Fully flow pressure circulation
Special engine oil (API grade)	SE, SF, SG or SH grade
Oil pressure kg/cm^2 (psi/Pa) rpm	4-4.6 (56.9-65.4/400-450)
Oil pump type	Gear
Oil filter type	Cartridge full flow
Oil capacity lit. (US/UK gal.)	4.25
Cooling system	
Radiator type	Corrugated fin with reserve tank
Coolant capacity lit. (US/UK gal.)	2.3 (0.66/0.55)
Water pump type	Centrifugal
Thermostat	Wax pellet with jiggle hole

Engine - General	C24SE
Fuel system	Electronically controlled Multi Port Fuel Injection System
Fuel pump type	Electric
Fuel pressure kg/cm^2 (psi/Pa)	3.4 (48.4/334)
Fuel filter type	Cartridge paper element
Air cleaner type	Dry paper element
Battery Type/V-Ax No. of units	34B19L/50D20L
Alternator	
Capacity V-A(W)	12-90 (1080), 12-100 (1200)
Starter	
Output V-kW	1.4
Exhaust system CO Adjustment	(1) Applicable to Open Loop System (Not equipped H2OS)
	(2) Not applicable to Closed Loop System (Equipped H2OS)
Compression Ratio (with Tolerance)	9.6:1±0.25
Cylinder Head Material	Aluminum Alloy (gravity cast)
Cylinder Block Material	Cast Iron
No. of Mounting Points (including trans.)	3
Engine Installation Angles -Longitudinal	4° 60'
-Lateral	7° 50' (towards exhaust side)
Overall Dimensions (L × W ×H):	
- TF (2.4Litre/2WD)	610×564×708mm
- TF (2.4Litre/4WD)	610×564×746mm
Engine Weight	
Engine Weight - TF (2.4Liter/Man)	140kg
Camshaft Type	SOHC
No. of Valves per Cylinder - Inlet	1
- Exhaust	1
Spark Plug Location	Side
Port Arrangement	Cross Flow
Working Principle	Spark Ignition 4-stroke

Valve System	C24SE
Actuation Type	Direct-acting Inverted Bucked Tappet
Valve Clearance Adjustment	Hydraulic
Valve Rotor Type	None
Inlet-Valve Material	Chromium Alloyed Steel
-Seat Insert Material	Sintered Iron
Exhaust-Valve Material	Head: Cr-Mn-Ni Alloyed Shaft: Cr-Si Alloyed &Cr plated
-Seat Insert Material	Sintered Iron
Valve Spring Material	GME 06 100-C1
Valve Guide Material	QS 13 MR 00
Valve Seal Type	Lip

Water Pump	C24SE
Type	Centrifugal
Drive-Material &Type	HNBR Toothed-belt
Bearing Type	Double Row Ball
Shaft Seal Type	Mechanical Ceramic

Thermostat-Coolant	C24SE
Type	Bypass

Oil Pump & Filter	C24SE
Type	Gear Pump
Location	Front of Engine
Drive	Direct Crankshaft Driven
Filter Type	Full Flow with Bypass for blocked filter

Oil & Oil Reservoir	C24SE
Reservoir-Description & Location	1-piece below Engine
Reservoir Material	Aluminum Alloy (pressure cast)
Replacement Oil Fill Volume	
-With Filter change	4.25liters
-Without Filter change	4.00liters
Recommended Oil-Run-in	10W/30SG
-Service (above-18°C)	10W/40SG
-Service (below-18°C)	5W/30SG
Oil Classification	API&CCMC

Ignition Components	C24SE
Spark Plugs	Conventional
Type	Electronic Spark Control
No. of Coils &Type	2 Solid State
Coil Location	Engine-mounted
Ignition Lead Type	Inductive (hi-resistance)

Crankshaft	C24SE
Material	Nodular Cast Iron
Bearing subjected to End Thrust	Guide Bearing NO.3
Main Bearing-Material &Type	Steel Backed Tri-metal Babbitt
Front Seal-Diameter &Type	35.0mm Lip Seal
Rear seal-Diameter &Type	90.0mm Micro-lip Seal
Crankshaft Balancing	Individually Balanced
No. of Counterweights	8

Camshaft	C24SE
Location	Overhead (Cylinder Head)
Material	Grey Cast Iron
Bearing Material	Aluminum
No. of Bearings Camshaft Drive-Material &Type	200-250 HB5/750 (Camshaft drive type: toothed belt Camshaft drive material: rubber composite GD380)

Pistons	C24SE
Material	Aluminum Alloy
Finish & Type	Tin-coated Strutless
Piston Rings	
Function (top to bottom) -Ring 1	Compression Ring
-Ring 2	Compression Ring
-Ring 3	Oil Ring
Description -Ring 1	Rectangular
-Ring 2	Taper Face
-Ring 3	3-piece (2 Scrapers&1 Expander)
Material -Ring 1	Molybdenum Inlay Nodular Cast Iron
-Ring 2	Cast Iron (individually cast)
-Ring 3	Steel
Material	Case Hardened Steel
Retention	Locked in Rod
Bearing	Machined in Piston Pin Boss

Connecting Rod	C24SE
Material	Nodular Cast Iron
Bearing-Material &Type	Steel Backed Tri-metal Babbitt

Inlet Manifold	C24SE
Material	Aluminum Alloy

Exhaust Manifold	C24SE
Description	Dual Take-down
Material	High Si-Mo Nodular Iron

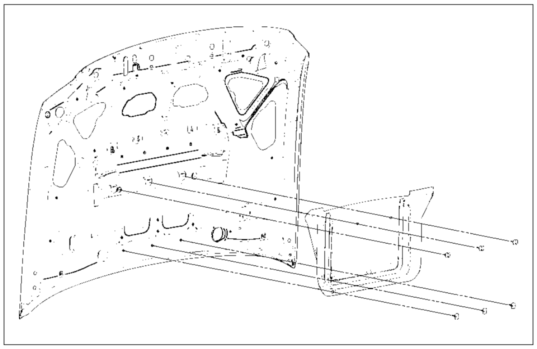
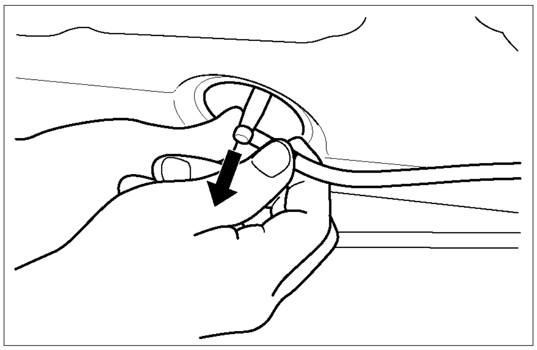
Important Operations - Removal



RTW72BSH000301

2. Intercooler Seal

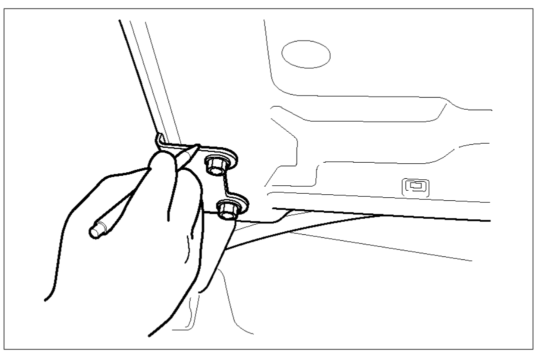
- Remove the 6 clips.



RUW52BSH002501

3. Washer Nozzle Tube

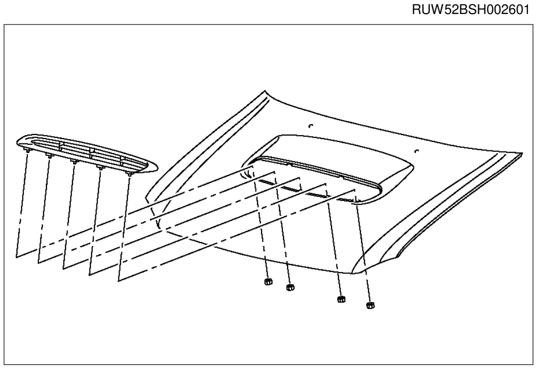
1) Open the hood.
2) Support the hood.
3) Remove the windshield washer nozzle tube.



RUW52BSH002601

4. Hood Hinge Bolt

- Before removing the hinges from the engine hood, scribe a mark showing location of the hinges to facilitate installation in the original position.

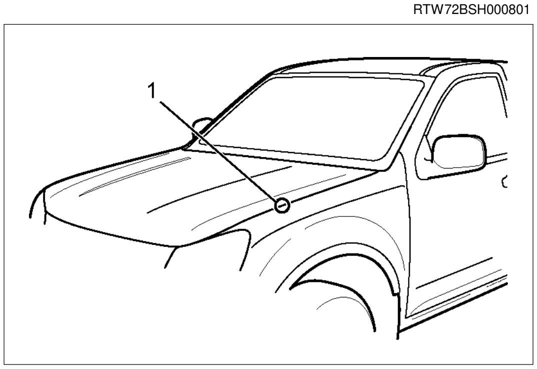


RTW72BSH000801

8. Engine Hood Bulge

- Remove the 4 nuts.

Important Operations - Installation

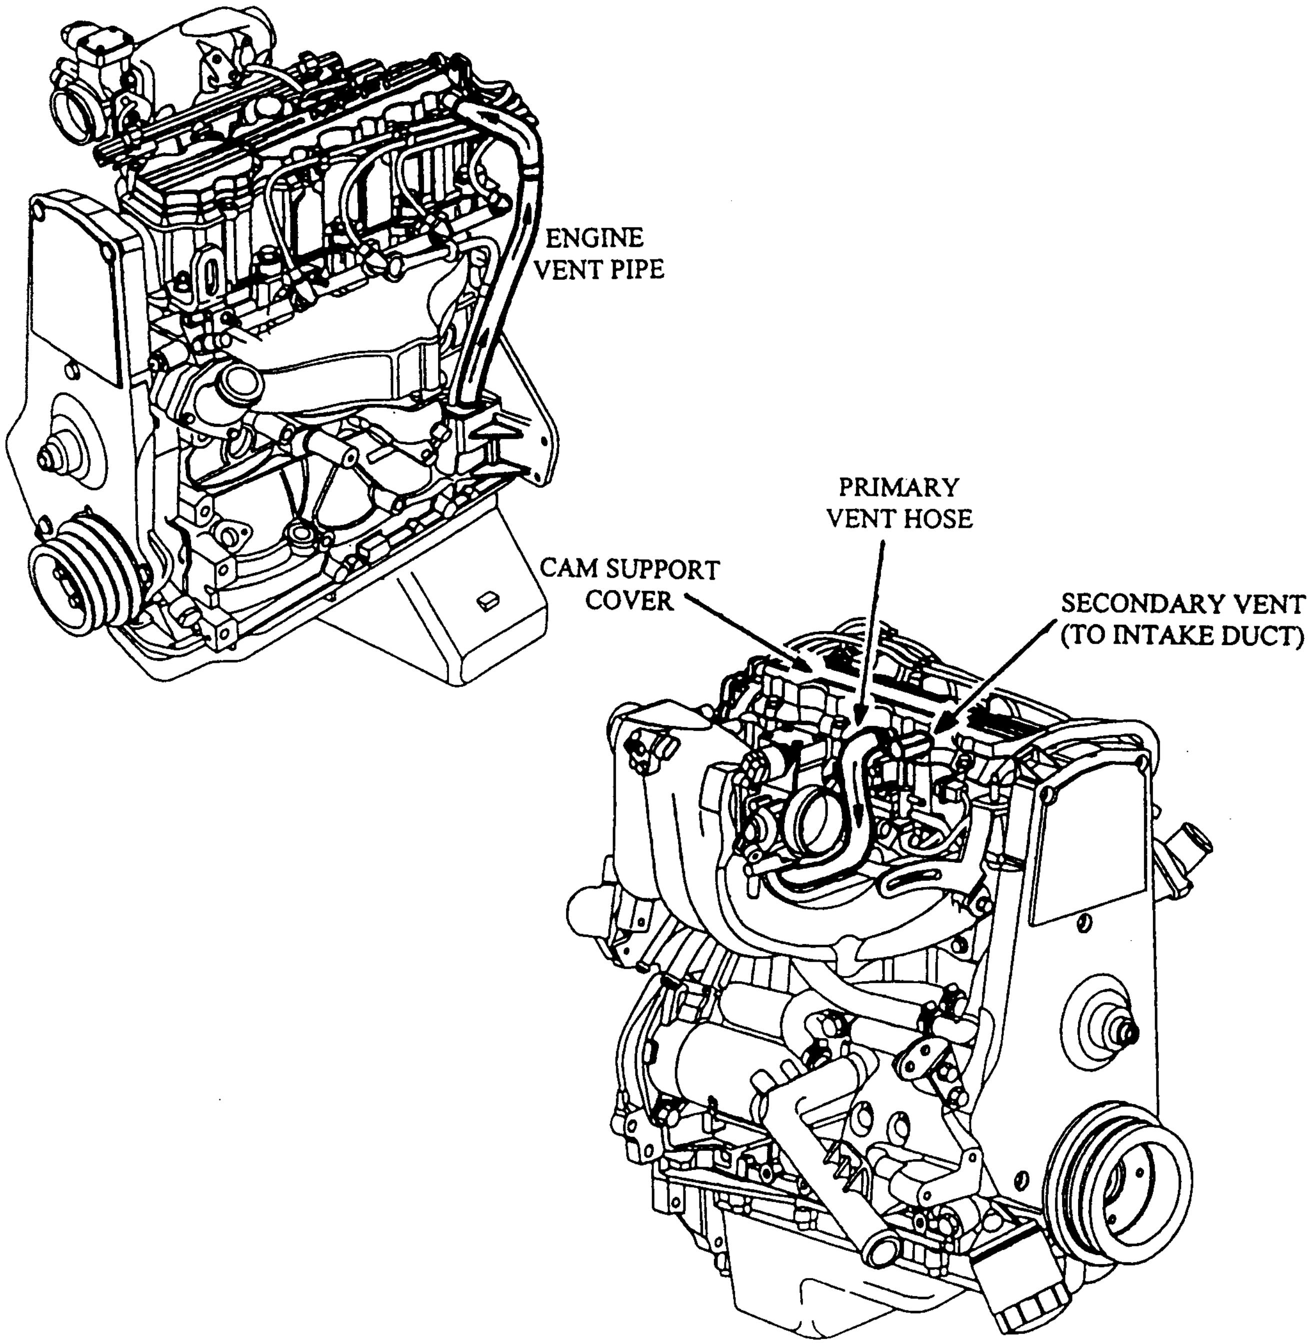


RTW72BSH000501

5. Engine Hood

- Check the engine hood and fender (1).

CRANKCASE VENTILATION SYSTEM



The Engine Ventilation System passes crankcase vapours, via the Engine Vent Pipe, to the Cam Support Cover, where separation of oil and exhaust gases occur. The oil drains into the Cylinder Head, via the Camshaft Support. The gases pass through the Primary and Secondary Vent Hoses to the intake system, and are consumed during the combustion process.

ENGINE ASSEMBLY & LOOSE PARTS

16 Cooling Fan

Engine Assembly

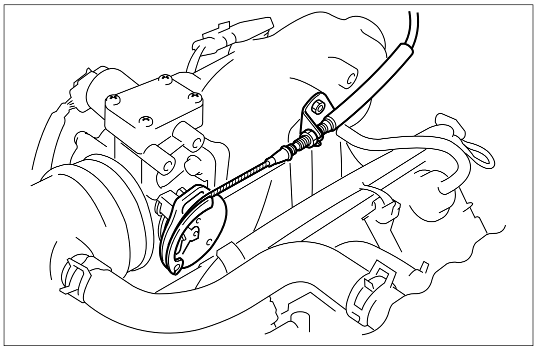
20 C24SE

OPERATIONS ON ENGINE AGGREGATES

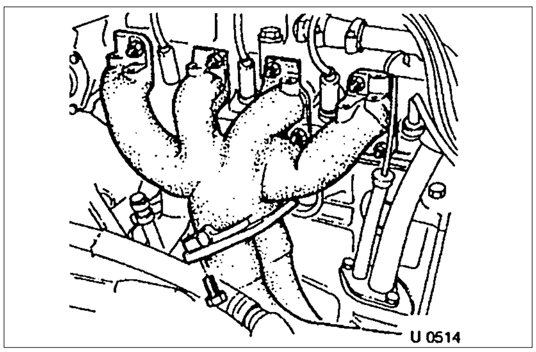
Engine Damping Blocks (Engine Without Transmission)

Removal

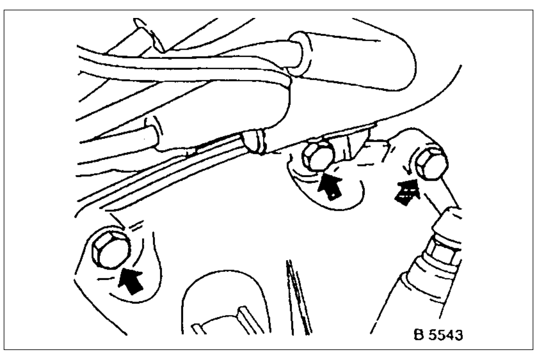
1. Remove bonnet.
2. Remove radiator.
3. Remove air inlet hose.
4. Remove power steering pump drive belt and power steering pump from engine.



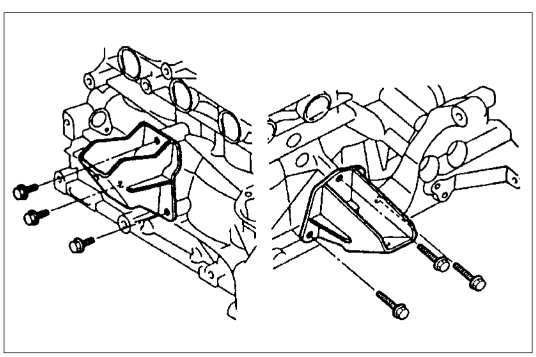
5. Remove all cable connections, hoses and lines from engine.
6. Remove accelerator cable from inlet pipe.



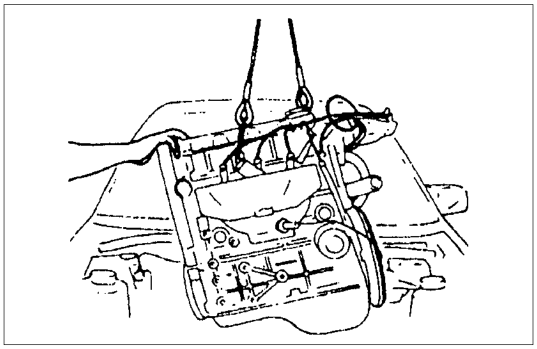
7. Remove exhaust pipe from manifold.



8. Remove lower nine bolts and transmission from engine block.
9. Remove clutch slave cylinder and allow to hang free.
10. Remove starter from engine block.



11. Remove upper bolts of left and right engine mounting from damping blocks.
12. Raise engine slightly.
13. Remove lower bolts of left and right damping blocks.
14. Remove damping blocks.



Attach engine to cable, support transmission with car jack and remove upper transmission fastening bolt.

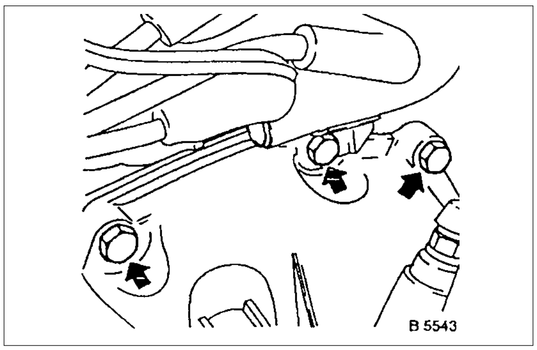
Press off engine from transmission and lift out of engine compartment.

Installation

Lower engine into engine compartment and insert guide bushings on cylinder block into transmission.

Tighten (Torque)

Transmission to cylinder block (M10)	-45 N·m (4.6 kgf·m)
Transmission to cylinder block (M12)	-60 N·m (6.1 kgf·m)

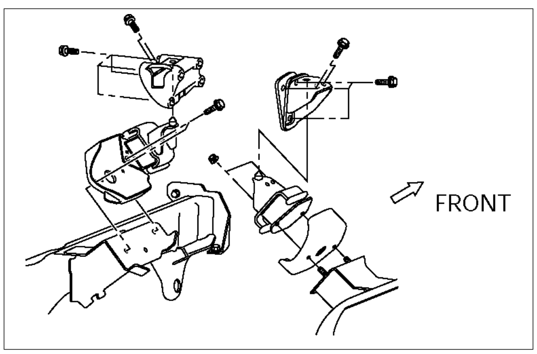


Installation

1. Install engine to vehicle and transmission.
2. Install clutch slave cylinder.

Tighten (Torque)

Transmission to engine block bolts - 76 N·m (7.6 kgf·m)



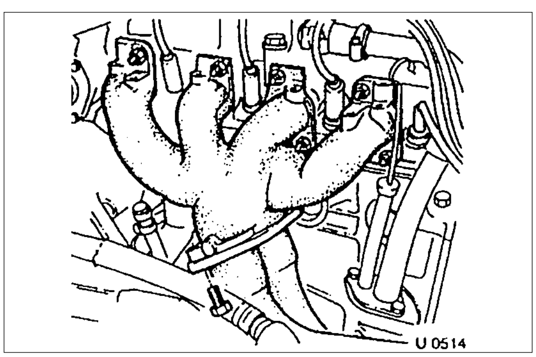
RTW46ASH000401

3. Install left engine damping block to side member.
4. Install left and right engine damping blocks to engine brackets.

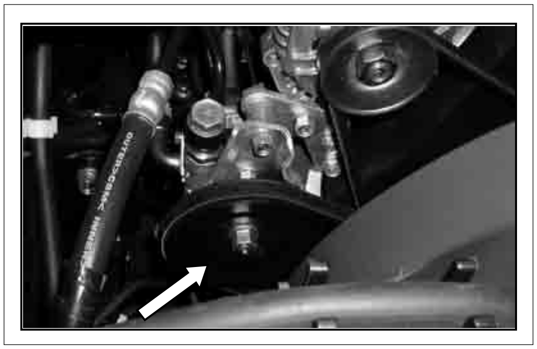
Tighten (Torque)

Engine damper block to side member - 52 N·m (5.3 kgf·m)

Engine damper block to engine bracket - 85 N·m (8.7 kgf·m)



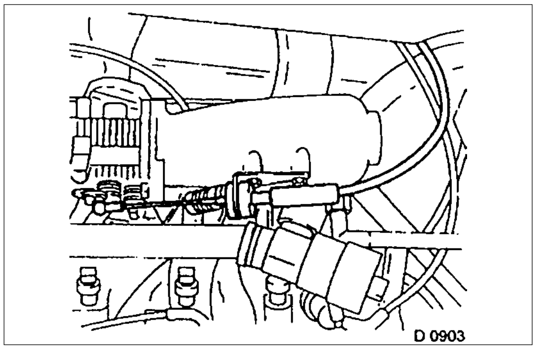
5. Install exhaust pipe to manifold.



6. Install power steering pump and V-belt.

Adjust

Adjust power steering pump V-belt tension according to the corresponding operation.



Installation

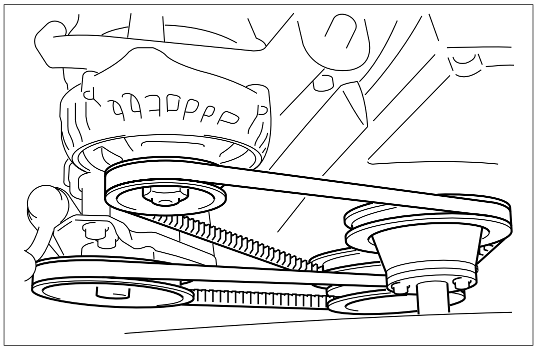
7. Install radiator according to the corresponding operation.
8. Install air inlet hose.
9. Install all electrical cable connections, hoses and lines to engine.
10. Install accelerator cable from inlet pipe.
11. Install bonnet.

Inspection

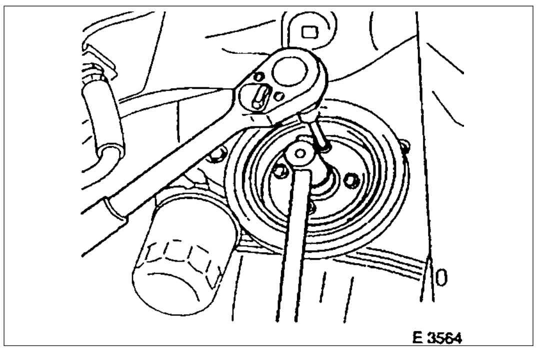
1. Check engine oil level.
2. Fill up cooling system and bleed according to the corresponding operation.

Toothed Belt and Timing Check

Removal

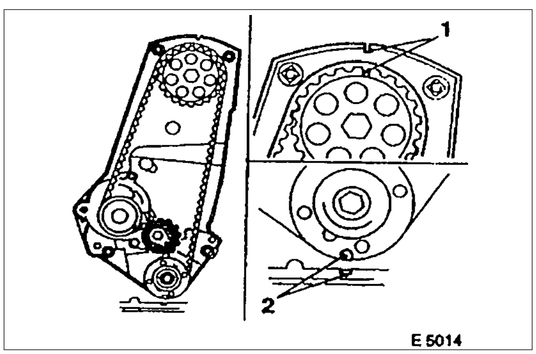


1. Remove the belts on the bracket for alternator.
2. Remove the fan.
3. Remove the V-belt for power steering.
4. Remove the V-belt for A/C.
5. Remove the fan belt.
6. Remove the fan shroud.

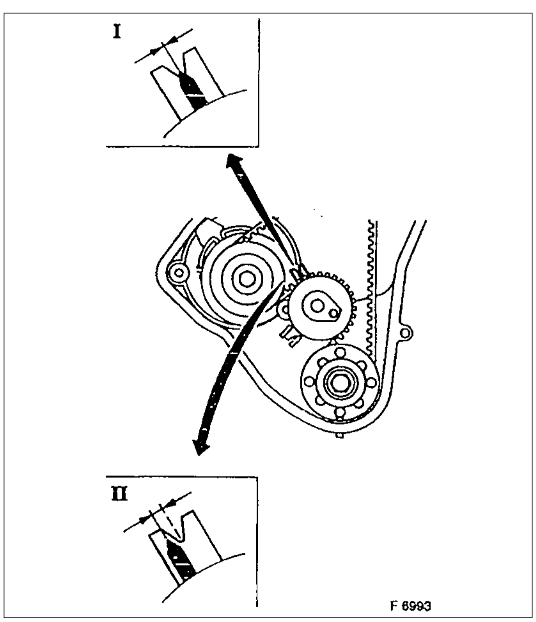


7. Remove the crankshaft pulley while counterholding on the fastening bolt of toothed belt drive gear.
8. Remove the toothed belt from cover.

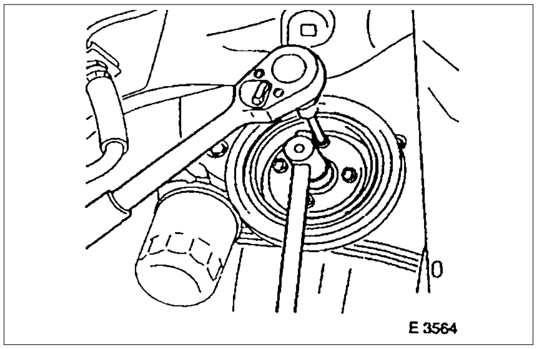
Inspection



1. Turn the crankshaft in the engine rotational direction mark(2) so that the notch (1) on the camshaft gear aligns with the mark on toothed belt rear cover.
2. Check the timing belt for worn, cracks or oil adhesion.



3. Check that the cast on the water pump aligns with the counterpart on cylinder block (arrowed).
4. The tension of a toothed belt is correctly adjusted when the pointer and the center of the notch are aligned(I). The tension of a run-in toothed belt (regardless of mileage covered) is correctly adjusted when the pointer is positioned approx. 4mm (0.16 in.) to the left of the center of the notch(II).
   Check the condition of the run-in toothed belt for suitability for reuse. Only toothed belts of the toothed belt tension rollers must be replaced and the source of oil contamination must be eliminated.

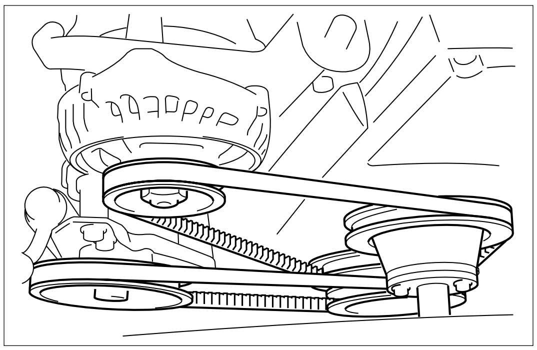


Installation

1. Install the toothed belt to the cover.
2. Install the crankshaft pulley while counterholding on the fastening bolt of toothed belt drive gear.
3. Install the fan shroud.

Tighten(Torque)

Crankshaft pulley bolts - 20 N·m (2.1 kgf·m)



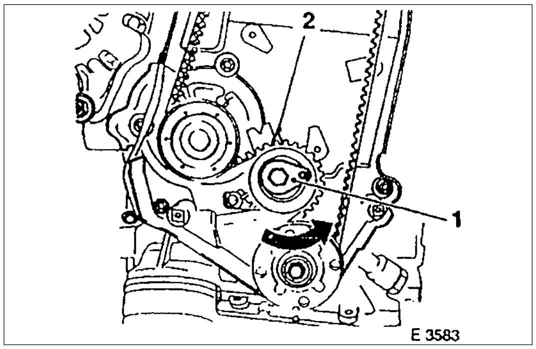
4. Install the fan belt
5. Install the V-belt for A/C.
6. Install the V-belt for power steering.
7. Install the fan.
8. Install the belts on the bracket for alternator.

Toothed Belt Tension, Adjust (Engines with toothed belt tension roller)

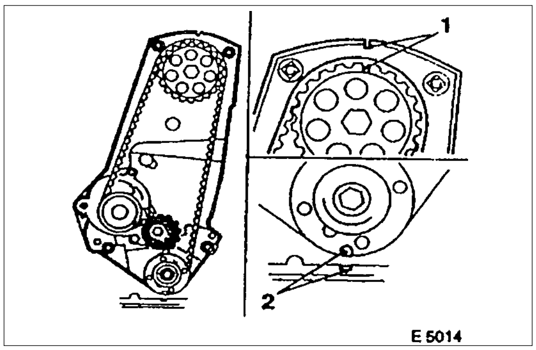
Removal

Refer to 6A-21. Toothed Belt and Timing check and removal steps.

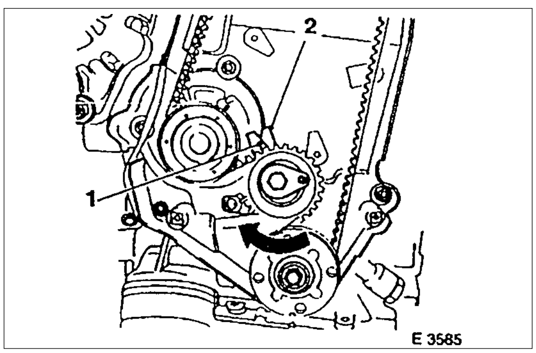
Adjust



1. Loosen the fastening bolt of the toothed belt tension roller.
2. Turn the toothed belt tension roller at adjustment eccentric (1) in the direction of arrow (counterclockwise), until pointer (2) comes to the right stop.
3. If necessary tighten the fastening bolt of toothed belt tension roller.



4. Rotate the crankshaft twice (720°) in the engine rotational direction until marks (2) and (1) align again.

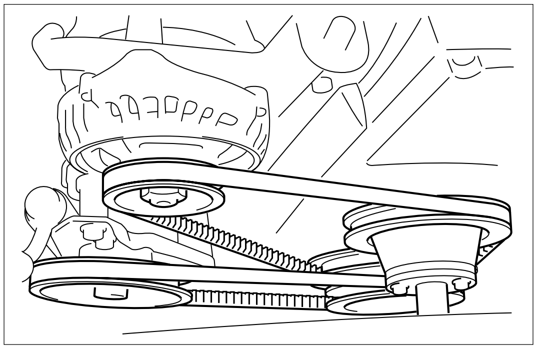


5. Turn the eccentric in the direction of arrow (clockwise) until pointer (1) and notch (2) are positioned to suit age of toothed belt.
6. Rotate the crankshaft twice (720°) in the engine rotational direction again and correct adjustment if necessary.

Installation

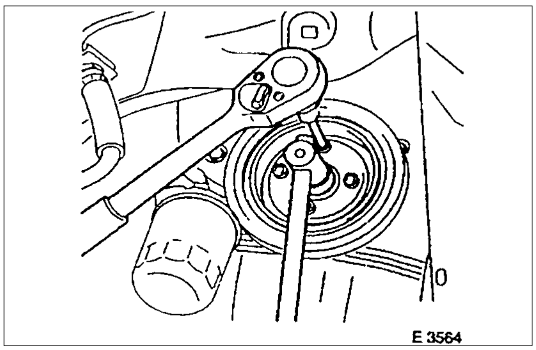
Refer to 6A-21. Toothed Belt and Timing check and installation steps.

Toothed Belt, Replace (Engine with toothed belt tension roller)

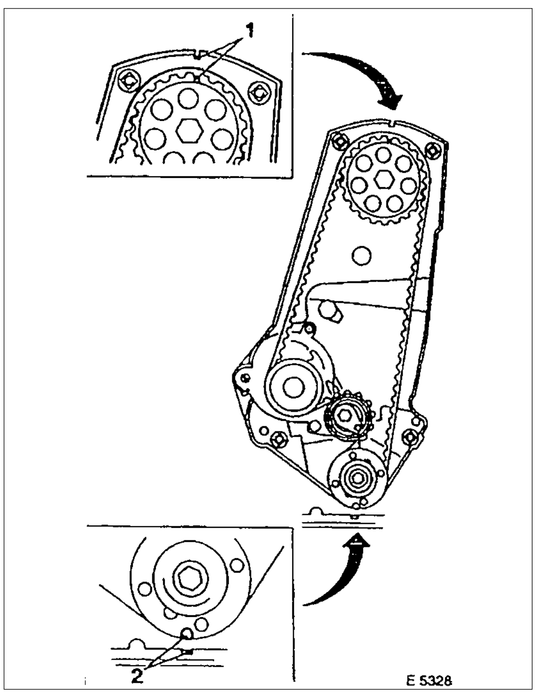


Removal

1. Remove the belts on the bracket for alternator.
2. Remove the fan.
3. Remove the V-belt for power steering.
4. Remove the V-belt for A/C.
5. Remove the fan belt.
6. Remove the fan shroud.

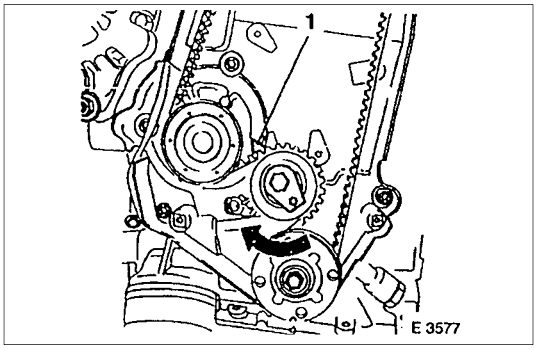


7. Remove the crankshaft pulley while counterholding on the fastening bolt of toothed belt drive gear.
8. Remove the toothed belt from cover.



Adjust

Turn the crankshaft in the engine rotational direction to mark(2).
Align markings on toothed belt and on toothed belt rear cover. Simultaneously, notch (1) on camshaft gear must align with the mark on toothed belt rear cover.
Turn the crankshaft slowly and smoothly.



Adjust

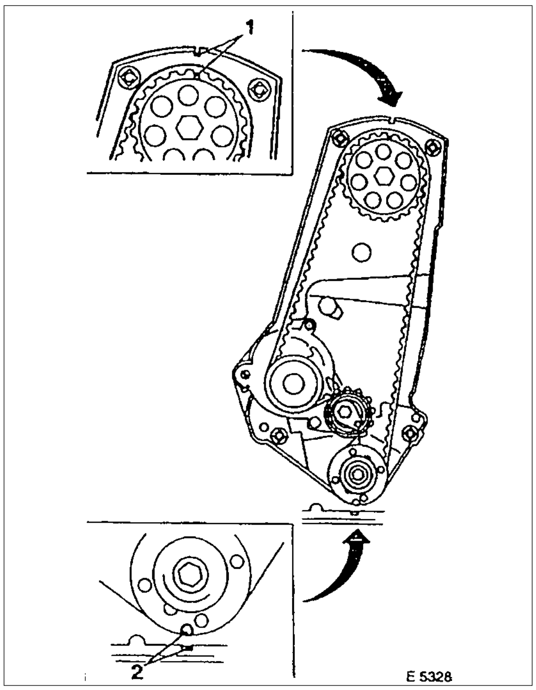
Loosen the fastening bolt of the toothed belt tension roller and turn the adjustment eccentric in the direction of arrow (clockwise) until pointer (1) comes to the left stop.
Remove the toothed belt.

Installation

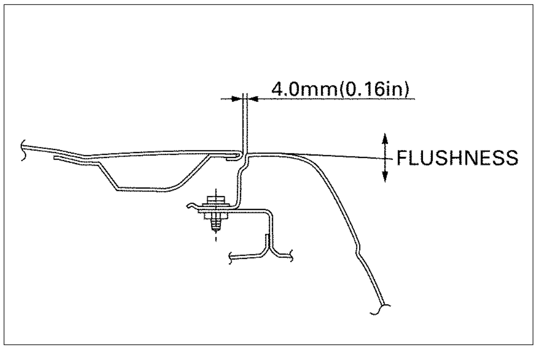
1. Install a new toothed belt while keeping tension side taut.

Adjust

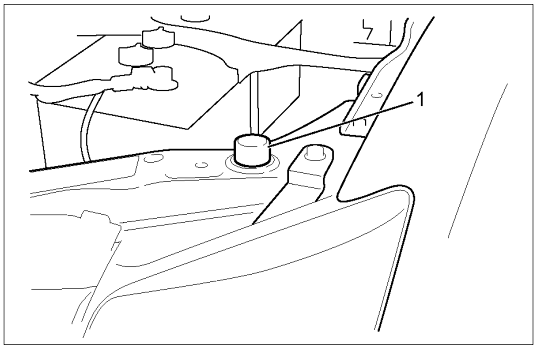
Toothed belt tension - see operation " Toothed Belt Tension".



2. Install the toothed belt to the cover.
3. Install the crankshaft pulley while counterholding on the fastening bolt of toothed belt drive gear.
4. Install the fan shroud.
5. Install the fan belt.
6. Install the V-belt for A/C.
7. Install the V-belt for power steering.
8. Install the fan.
9. Install the belts to the bracket for alternator.



- Clearance : 4.0 mm (0.16 in)
- Height (step) : Flushness
- Adjust clearance using the hinges on the engine hood.



RTW72BSH000701

- Adjust height (step) using the hood rests (1).

Engine Hood Striker

- Apply a light coat of grease to the striker.

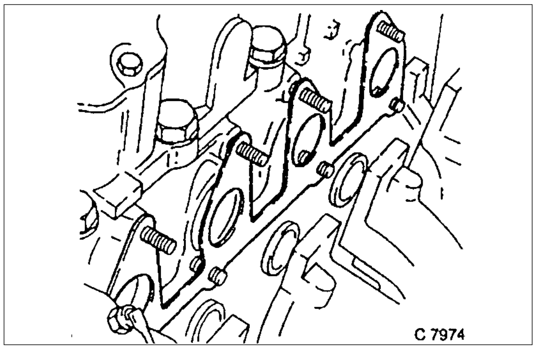
4. Hood Hinge Bolt

- Tighten the engine hood hinge fixing bolts to the specified torque.

Torque	N·m(kgf·m/lb·in)
10 (1.0 / 87)	

OPERATIONS ON INSTALLED ENGINE

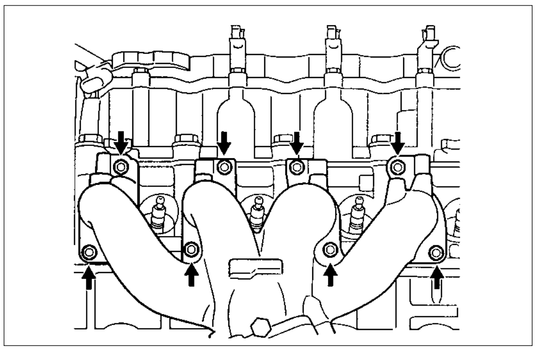
SEALING OPERATIONS



Gasket, Exhaust Manifold, Cylinder Head

Removal

1. Remove front exhaust pipe from exhaust manifold.
2. Remove exhaust manifold heat shield.
3. Remove exhaust manifold retaining nut.
4. Remove exhaust manifold from cylinder head.

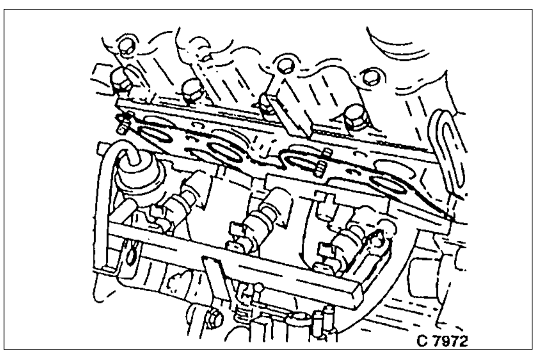


Clean

Sealing surfaces.

Tighten (Torque)

Exhaust manifold to cylinder head - 22 N·m (2.2 kgf·m)
Front exhaust pipe to exhaust manifold - 25 N·m (2.6 kgf·m)



Gasket, Intake Manifold, Cylinder Head

Removal

1. Remove air intake hose.
2. Remove drive belt for alternator.
3. Remove bolt clamping bracket for alternator from intake manifold.
4. Remove intake manifold from cylinder head.

Clean

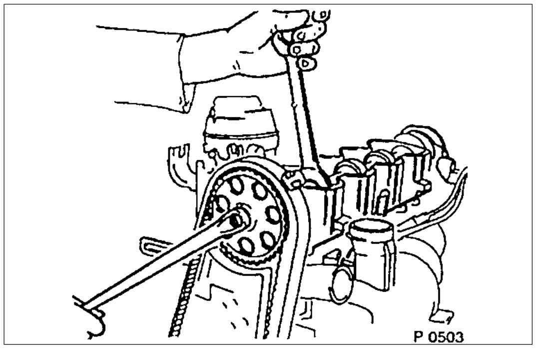
Sealing surfaces

Tighten (Torque)

Intake manifold to cylinder head - 22 N·m (2.2 kgf·m)
Clamping bracket for alternator to intake manifold - 25 N·m (2.5 kgf·m)

Installation

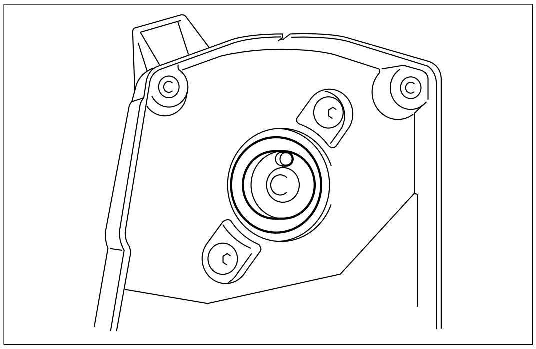
1. Install V-belt according to the corresponding operation.
2. Install air intake hose.



Seal Ring, Camshaft Housing, Timing Side

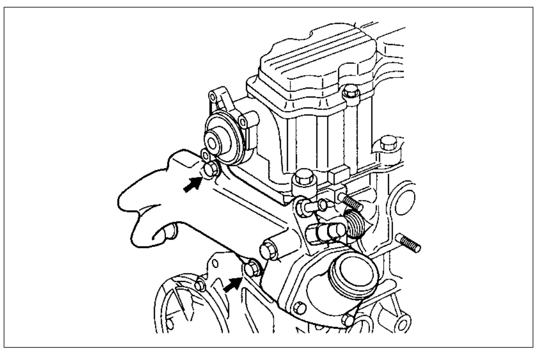
Removal

1. Remove front toothed belt cover toothed belt from camshaft timing gear according to the corresponding operation.
2. Remove camshaft housing cover and camshaft timing gear.
3. Remove sealing ring by making hole in middle of ring, turning in self-tapping screw and edging out.



Installation

1. Install sealing ring by using 5-8840-0451-0 with camshaft sprocket bolt and washer.
2. Install coat seal lips of shaft seal ring slightly.



Seal Ring, Thermostat Housing, Cylinder Head

Removal

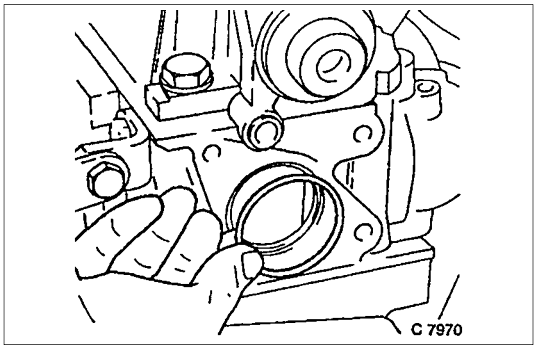
1. Open radiator drain tap and collect coolant.
2. Remove toothed belt rear cover and toothed belt according to the corresponding operation.
3. Remove camshaft housing cover.
4. Remove camshaft timing gear by counterholding camshaft with a flat spanner.
5. Remove cable from temperature sensor.
6. Remove upper inner hex bolts of rear toothed belt cover.
7. Turn rear toothed belt cover to one side.
8. Remove thermostat housing.
9. Remove sealing ring from cylinder head.

Clean

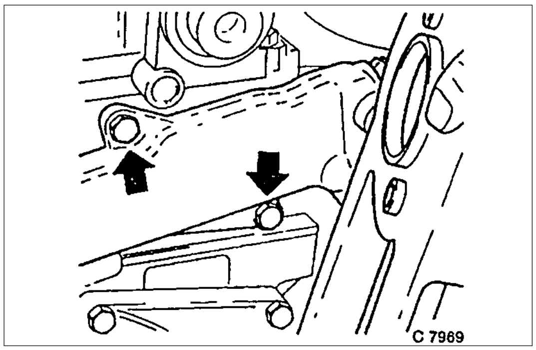
Sealing surfaces in cylinder head and thermostat housing.

Installation

1. Install sealing ring in recess of cylinder head.

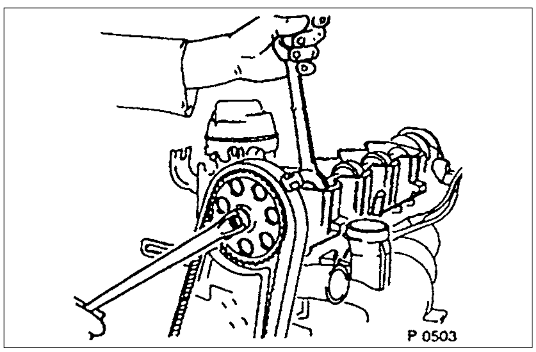


2. Install cable to temperature sensor.
3. Install upper bolts of rear toothed belt rear cover.
4. Install camshaft timing gear then check timing according to the corresponding operation.
5. Install camshaft housing cover.
6. Install toothed belt and front cover.
7. Fill up and bleed cooling system according to the corresponding operation.



Tighten (Torque)

Thermostat housing to cylinder head - 15 N·m/1.5 kgf·m.

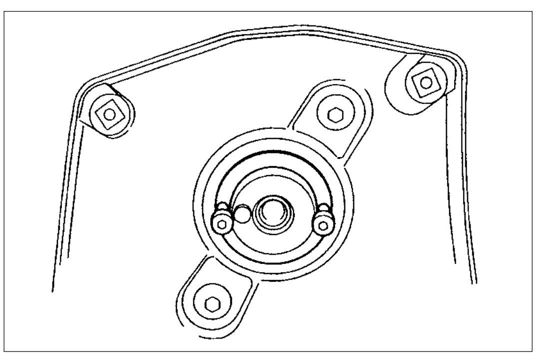


Seal Ring - Front Camshaft Housing, Replace

Removal

Mark running direction of toothed belt.
Remove toothed belt-see operation “Toothed Belt, Replace”.

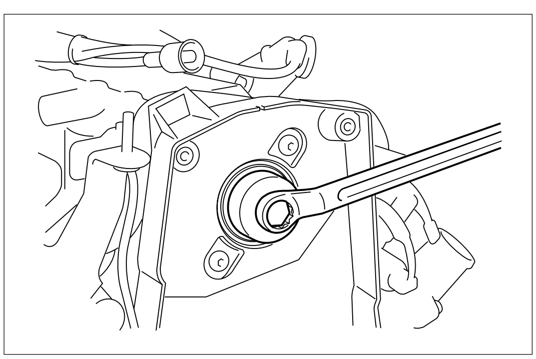
Camshaft housing cover, camshaft pulley-counterhold on hex of camshaft.



Removal

Screw self-tapping screw into seal ring.

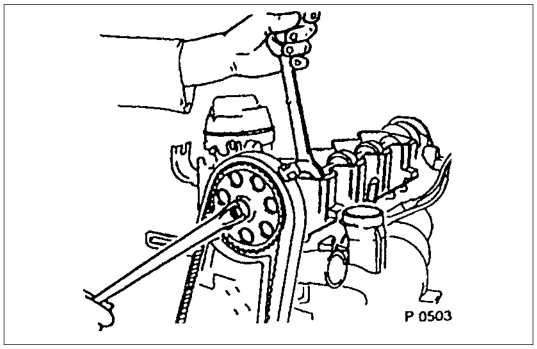
Edge out seal ring.



Installation

Lightly coat sealing lip of seal ring with protective grease.

Install seal ring with 5-8840-0451-0 into camshaft housing-use screw and washer of camshaft pulley.



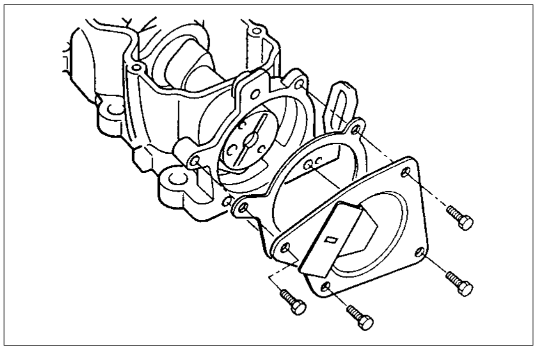
Installation

Camshaft pulley-counterhold at hex head of camshaft, camshaft housing cover.

Toothed belt-see operation “Toothed Belt, Replace”. Note operating erection of toothed belt.

Tighten (Torque)

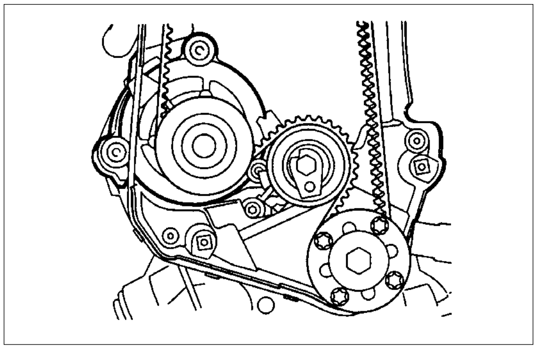
Camshaft pulley to cammshaft-45 N·m (3.7 kgf·m)



Tighten (Torque)

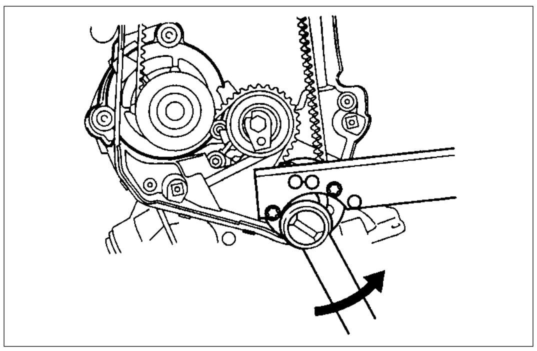
Camshaft housing cover to cover to housing-8 N·m (0.8 kgf·m)

Toothed Belt Rear Cover (Engine with toothed belt tension roller)

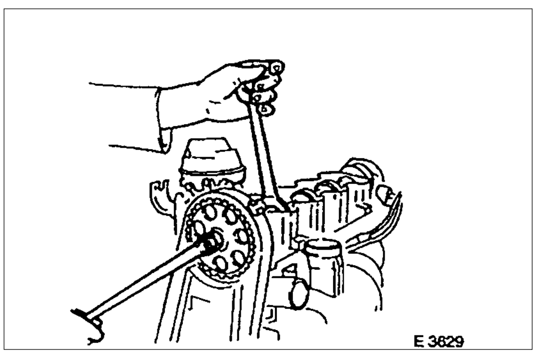


Removal

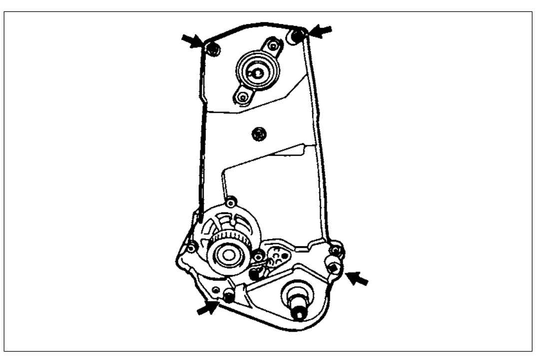
1. Mark operating direction of toothed belt.
2. Remove toothed belt according to the operation "Toothed Belt".
3. Remove toothed belt tension roller according to the operation "Toothed Belt Tension Roller ".



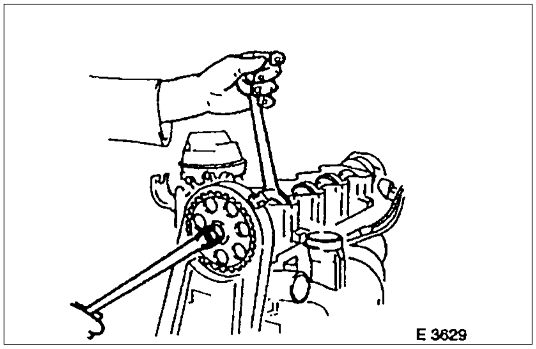
4. Remove fastening bolt while counterholding with 5-8840-2598-0 (Holding wrench).



5. Remove toothed belt drive gear while counterholding with 5-8840-2598-0 (Holding wrench).
6. Remove camshaft housing cover.
7. Remove camshaft pulley while counterholding at hex head of camshaft.



8. Remove toothed belt rear cover (arrows) from oil pump and camshaft housing.



Installation

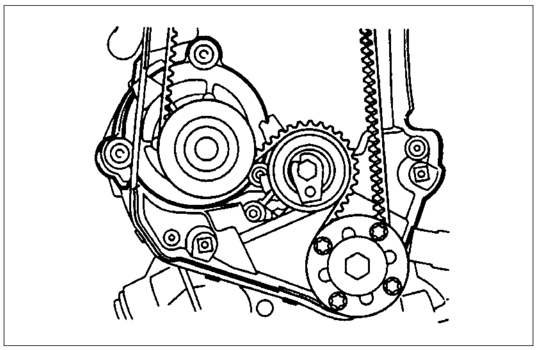
1. Install toothed belt rear cover.
2. Install camshaft pulley while counterholding at camshaft hex head.
3. Install camshaft housing cover.

Tighten (Torque)

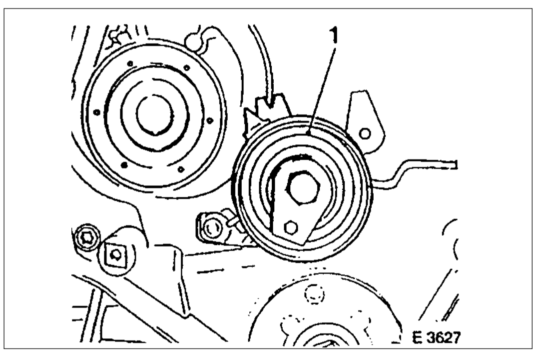
Toothed belt rear cover to oil pump and camshaft housing - 6 N·m/4 lbf ft.

Camshaft housing cover to housing - 6 N·m (0.6 kgf·m).

Camshaft pulley to camshaft - 45 N·m (4.6 kgf·m).



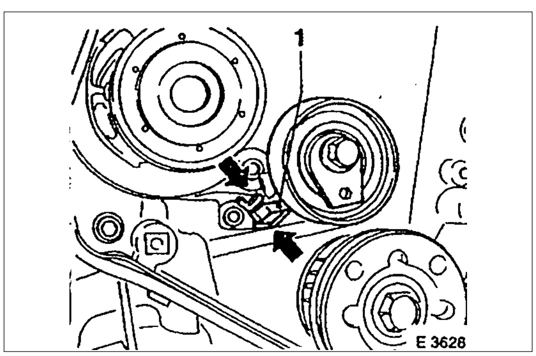
4. Install toothed belt drive gear to crankshaft - 130 N·m (13.3 kgf·m).
5. Install toothed belt according to the operation "Toothed Belt".



Toothed Belt Tension Roller

Removal

1. Mark operating direction of toothed belt.
2. Remove toothed belt according to the operation "Toothed Belt".
3. Remove toothed belt tension roller (1) from oil pump.



Installation

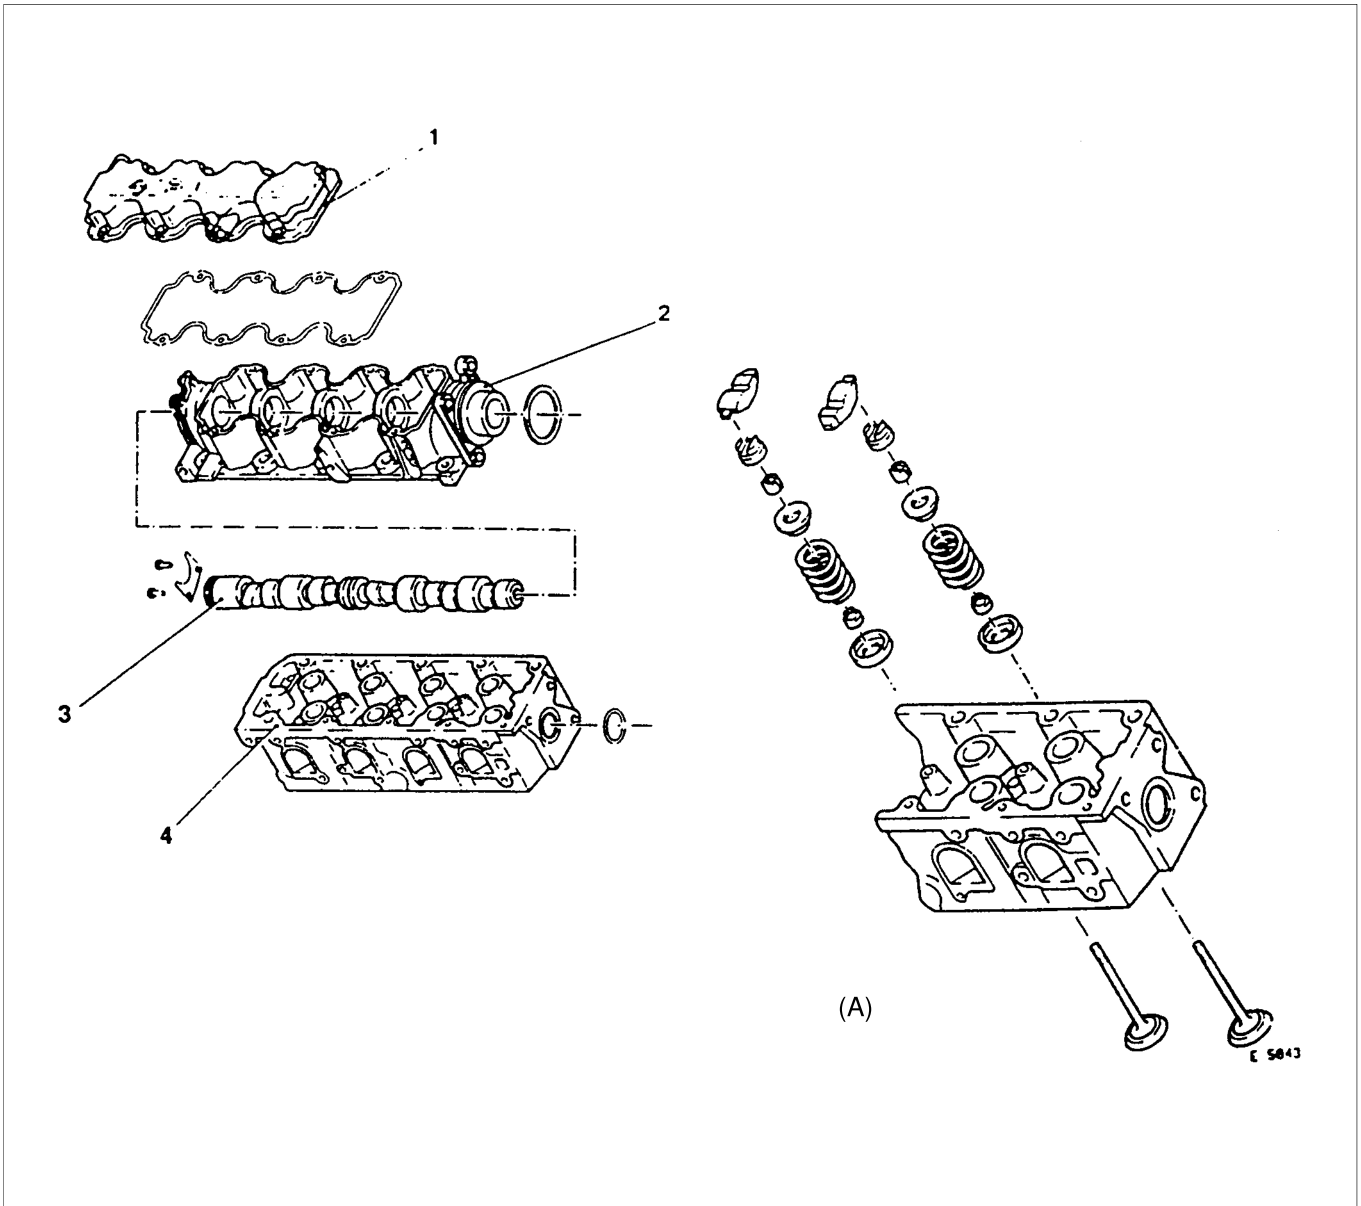
1. Install toothed belt tension roller and make sure that the locking lever (1) engages in the guide lugs (arrowed) on the oil pump housing.
2. Install toothed belt according to the operation "Toothed Belt" with paying attention to the operating direction of toothed belt.

Tighten (Torque)

Toothed belt tension roller to oil pump - 25 N·m (2.5 kgf·m)

COMPONENT PARTS

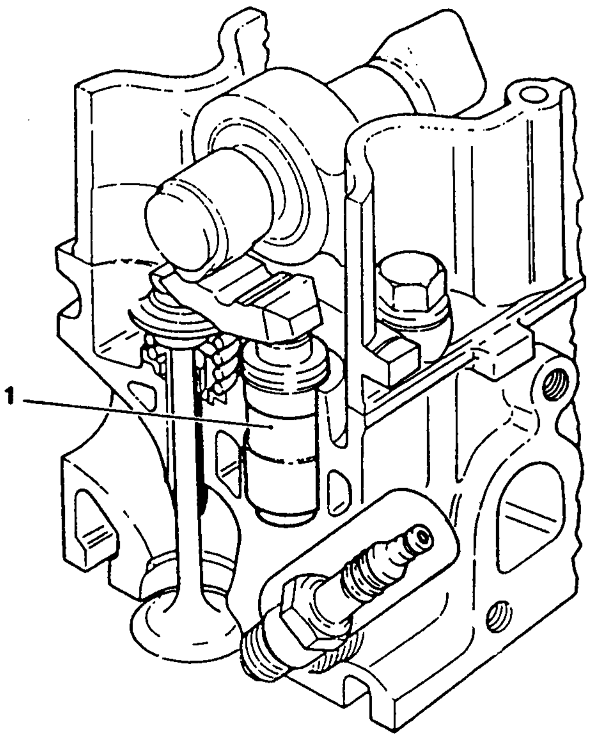
CYLINDER HEAD

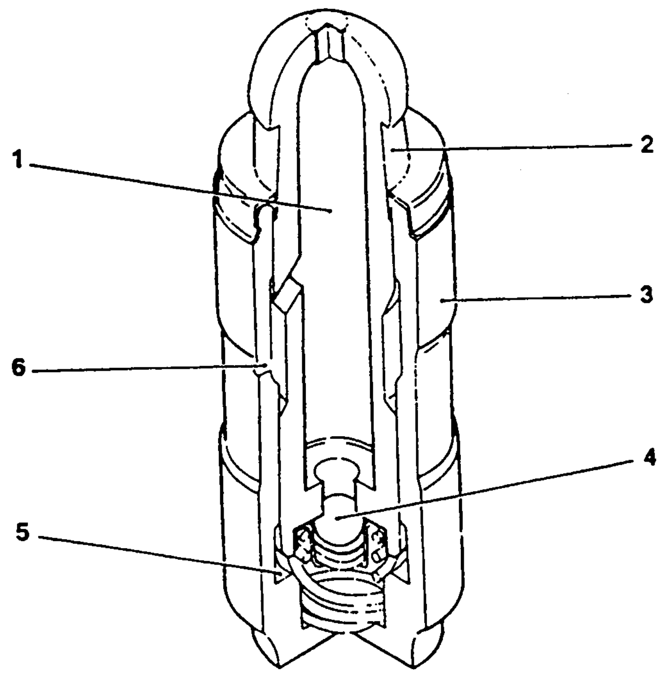


1. Camshaft Housing Cover
2. Camshaft Housing
3. Camshaft
4. Cylinder Head

(A) Valve Drive

HYDRAULIC VALVE LIFTER



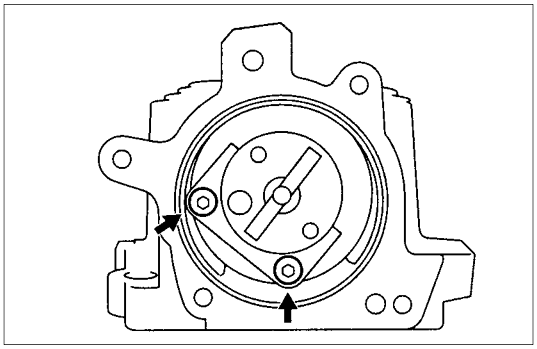


1. Hydraulic Valve Lifter

1. Oil reservoir
2. Piston with ball head (moving)
3. Pressure cylinder (fixed)
4. Check ball
5. Pressure chamber
6. Oil feed

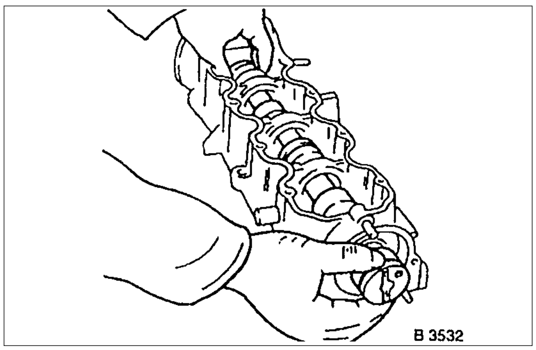
OPERATIONS ON CYLINDER HEAD AND CAMSHAFT HOUSING

Camshaft



Removal

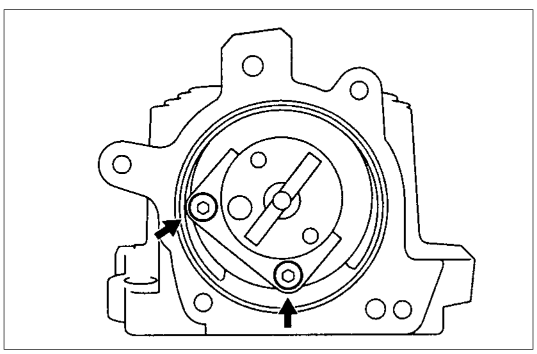
1. Remove cylinder head according to the corresponding operation.
2. Remove camshaft housing from cylinder head and lay housing on base provided
3. Remove rear sealing gasket and plate camshaft housing with taking care not to damage housing.
4. Remove thrust plate.



5. Remove camshaft.
6. Remove front sealing gasket and plate from camshaft housing with taking care not to damage housing.

Inspection

All parts.



Installation

1. Install camshaft.
2. Coat sliding surfaces with molybdenum disulphate paste.

Tighten (Torque)

Thrust plate for camshaft housing - 8 N·m (0.8 kgf·m)

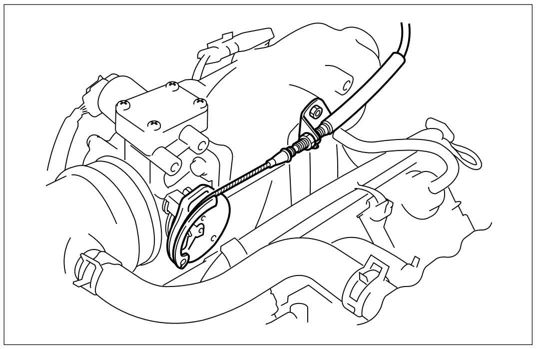
Camshaft Housing, Removal and Installation

Cylinder Head

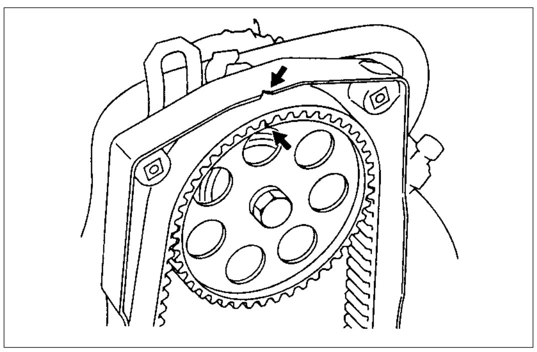
Important!

Remove cylinder head only from cold engine (room temperature).

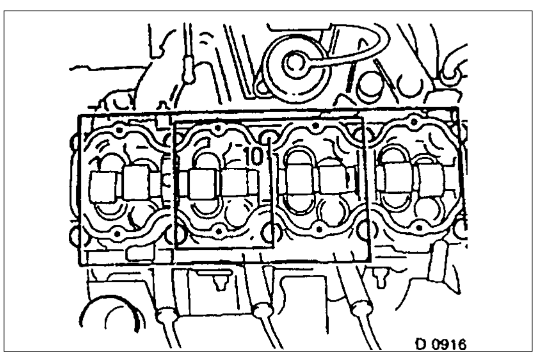
Removal



1. Remove ground cable from battery.
2. Open radiator drain tap and collect coolant.
3. Remove air intake hose.
4. Remove all cable connections, hoses and lines to the cylinder head.
5. Remove accelerator cable on the throttle valve.
6. Remove V-belt for alternator.



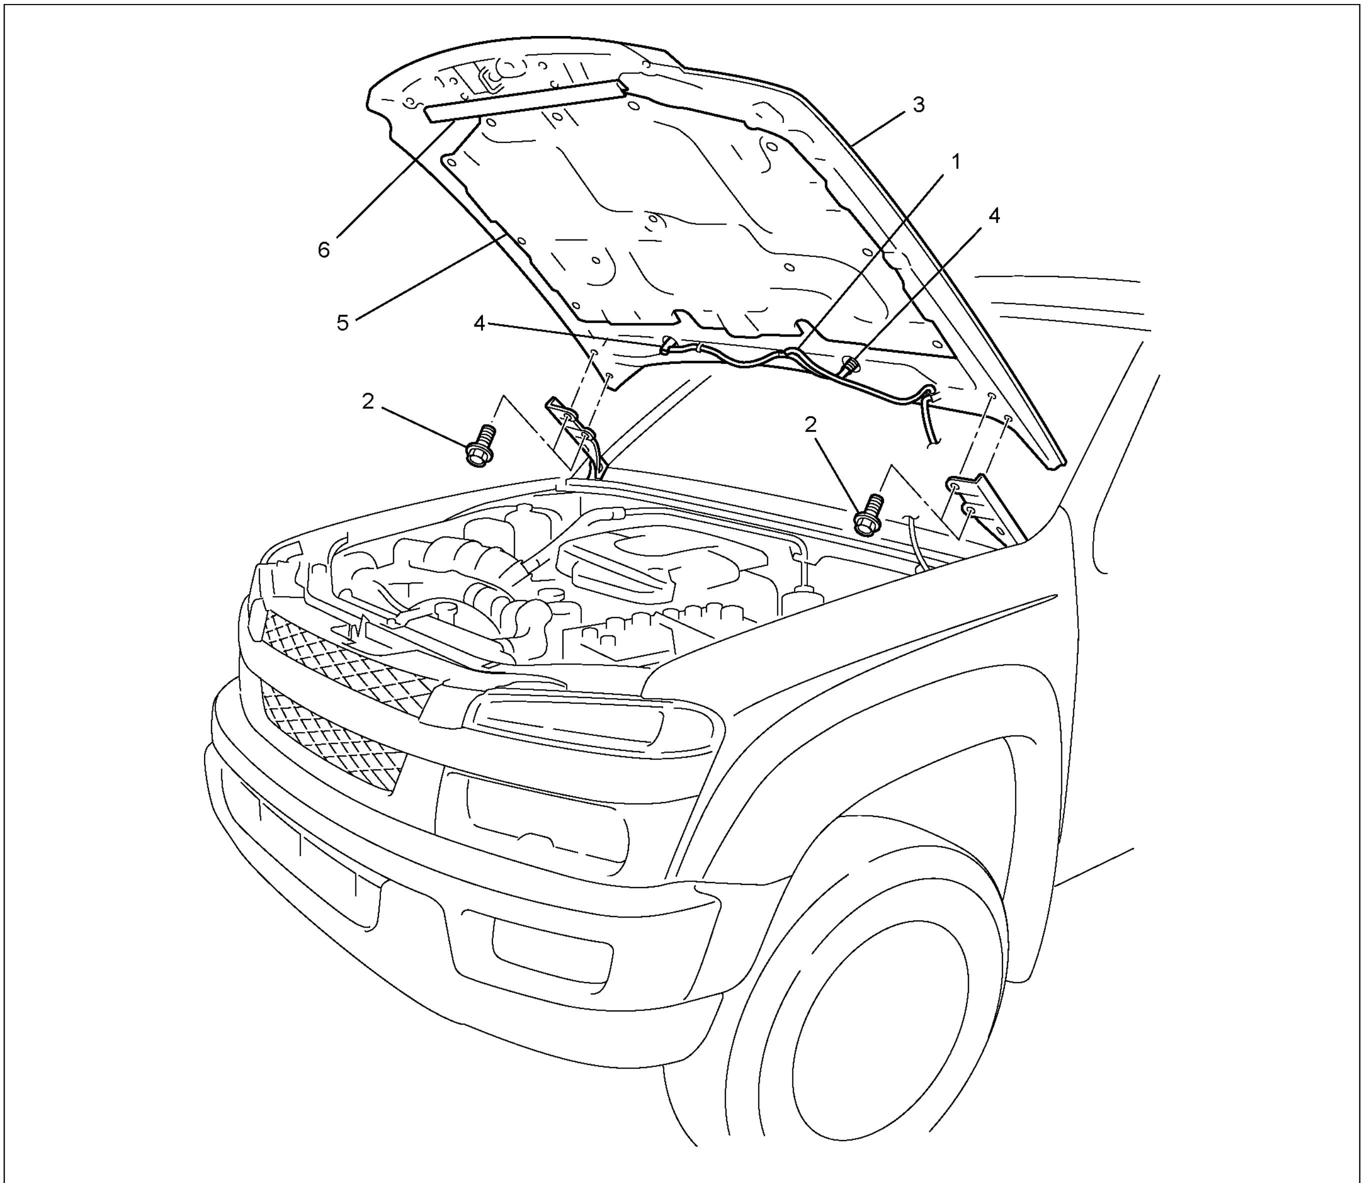
7. Remove front toothed belt cover according to the corresponding operation.
8. Bring piston of 1st cylinder to TDC and mark the position.
9. Remove camshaft housing cover.
10. Remove camshaft timing gear after releasing tension on toothed belt.



11. Remove upper bolts of rear toothed belt cover.
12. Remove exhaust pipe from exhaust manifold.
13. Remove cylinder head after loosening bolts from outside inwards (at first quarter turn then half turn) in a spiral pattern.
14. Remove camshaft housing from cylinder head.
15. Remove rocker arm, pressure parts and hydraulic valve lifter adjuster.

ENGINE HOOD ASSEMBLY (B TYPE)

REMOVAL AND INSTALLATION



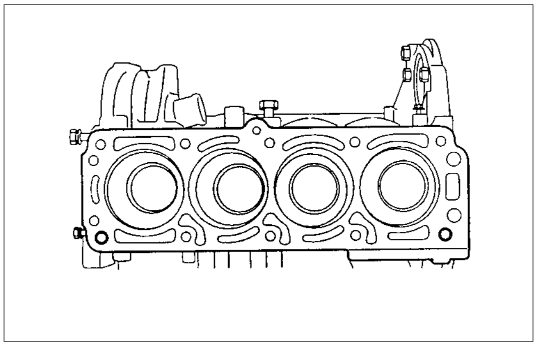
RTW72BLF000901

Removal Steps

▲ 1. Washer nozzle tube
▲ 2. Hood hinge bolts
3. Engine hood
4. Washer nozzle
5. Hood insulator
6. Hood seal

Installation Steps

6. Hood seal
5. Hood insulator
4. Washer nozzle
▲ 3. Engine hood
▲ 2. Hood hinge bolts
1. Washer nozzle tube



Clean

All sealing surfaces, drill holes in cylinder head bolts.

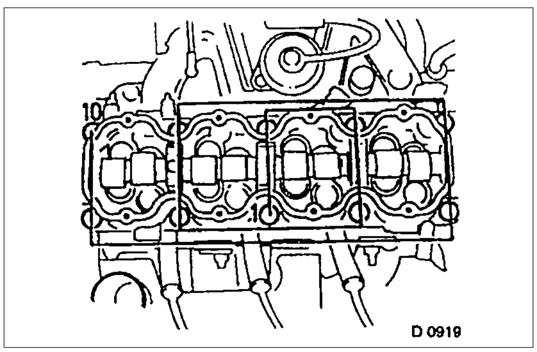
Check cylinder block and cylinder head for plane surface according to the corresponding operations.

Installation

1. Install cylinder head sealing with marking "OBEN/TOP" facing upwards and to right side of engine.
2. Install cylinder head on cylinder block.
3. Install hydraulic valve lash adjuster, pressure parts and rocker arm - molybdenum disulphate paste.
4. Install camshaft housing-Sealing Compound TB-1207C or equivalent.

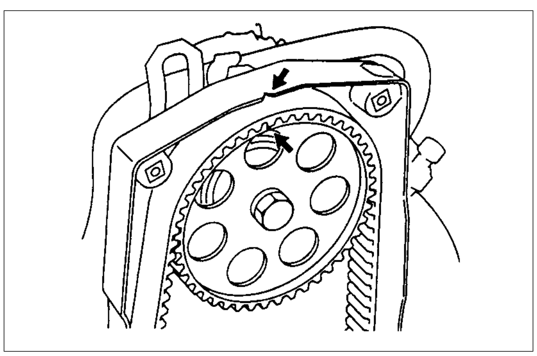
Important!

Use new cylinder head bolts.
Screw in bolts until they rest on cover.



Torque - Angle Method

Cylinder head to cylinder block - 25 N·m (2.5 kgf·m)
Further turn angle 90°+90°+ 90°.
Tighten cylinder head bolts from inside outwards. In four stages in a spiral pattern.

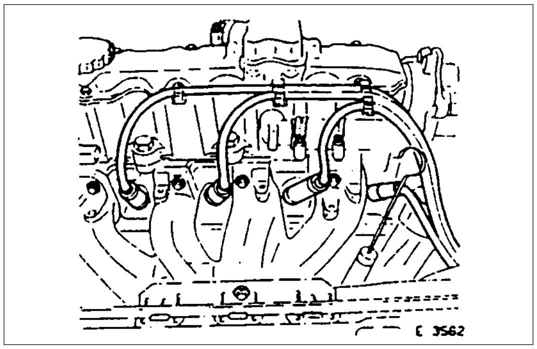


5. Install rear toothed belt cover onto camshaft housing.
6. Install toothed belt and apply tension according to the corresponding operation.

Tighten (Torque)

Camshaft timing gear to camshaft - 45 N·m (4.6 kgf·m)

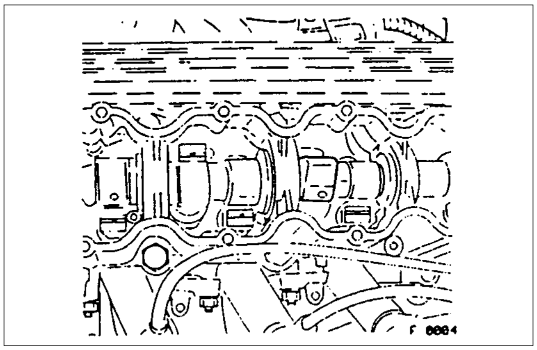
7. Install camshaft housing cover and front toothed belt cover.
8. Install cable connections, all hoses and lines onto cylinder head.
9. Adjust accelerator cable for free of play.
10. Install V-belt according to the corresponding operation.
11. Install air intake hose.
12. Install front exhaust pipe.
13. Install ground cable onto battery.
14. Fill up cooling system and bleed according to the corresponding operation.



Hydraulic Valve Lifters, Replace

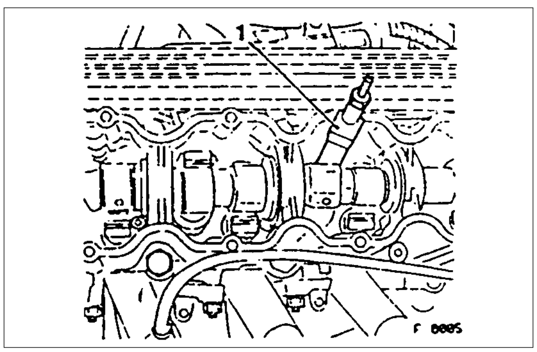
Removal

1. Remove the spark plug connectors and spark plugs.
2. Remove the camshaft housing cover.



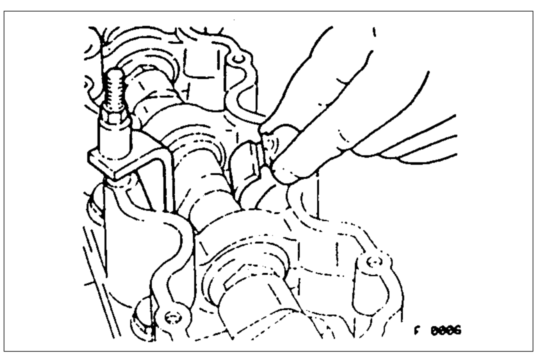
Removal

3. Turn the crankshaft at fastening bolt of toothed belt drive gear in the direction of the engine rotation until the cam of hydraulic valve lifter being replaced stands vertically.



Removal

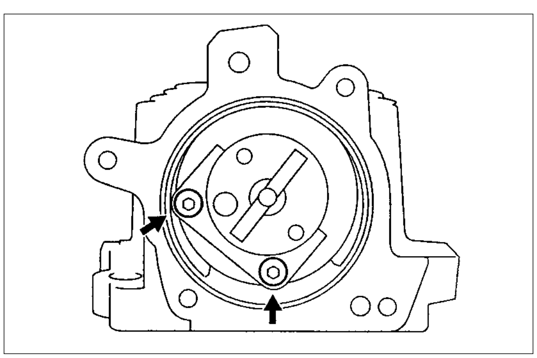
4. Apply 5-8840-0457-0 to the camshaft housing, valve spring cap and tension valve spring.



Removal

5. Remove the cam follower from camshaft housing.

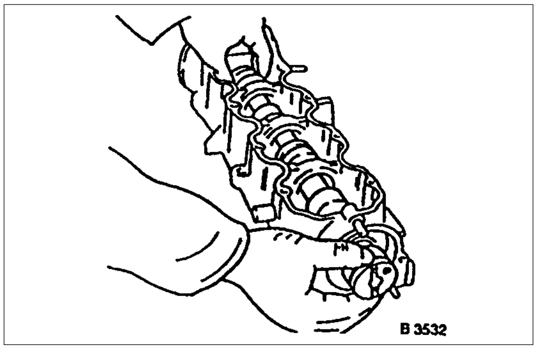
   Note thrust pieces.
6. Remove hydraulic valve lifter from camshaft housing.



Camshaft Housing, Replace

Removal

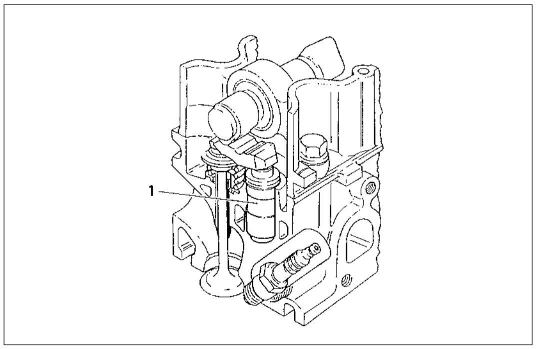
Cylinder head-see operation “Cylinder Head. Remove and Install”.



Inspection

All parts, if necessary replace.

When replacing camshaft, always replace all cam followers.



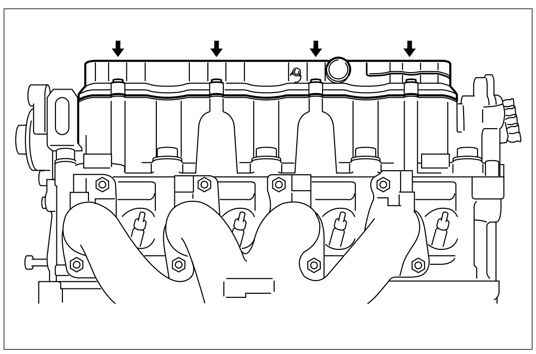
Installation

Insert hydraulic valve lifter (1) in camshaft housing.

Coat sliding surfaces of rocker arm with Mcs, Paste and insert in camshaft housing.

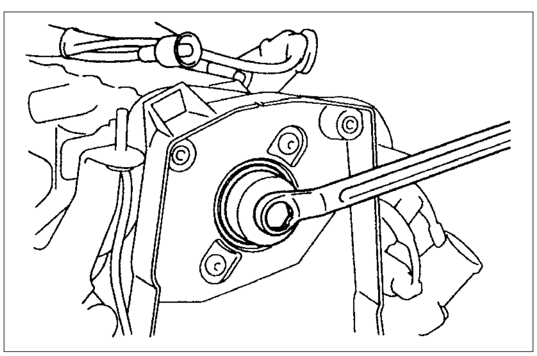
Adjust

Adjustment of the hydraulic valve liters is not required.
Pretension is provided by the design.



Installation

1. Remove 5-8840-0457-0 and install the camshaft housing cover.
2. Insert the spark plug connectors.

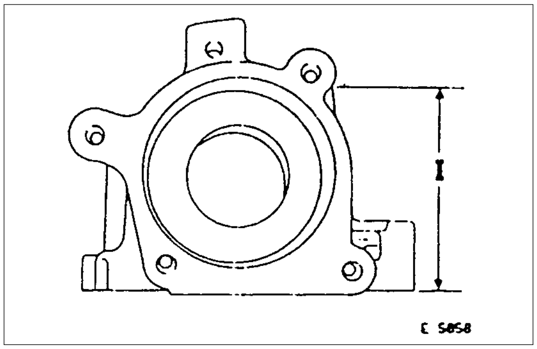


Tighten (Torque)

Guide plate to camshaft housing.
Insert camshaft with MoS_2 paste.

Installation

1. Install the front seal ring in camshaft housing with 5-8840-0451-0.
2. Install the camshaft housing rear cover.
3. Install the cylinder head.



Camshaft Housing, Check for Plane Surface

Clean

Sealing surfaces.

Inspection

Check length and width of sealing surface for deformation and diagnosis for warpage and use straight edge feeler gauge.

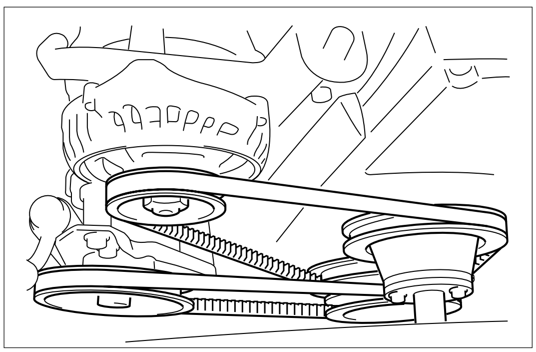
Measure

Height of camshaft housing (sealing surface to sealing surface).
Dimension I: (74.0 mm)

Cylinder Head, Removal and Installation

Important

Only remove cylinder head with engine cold (room temperature).

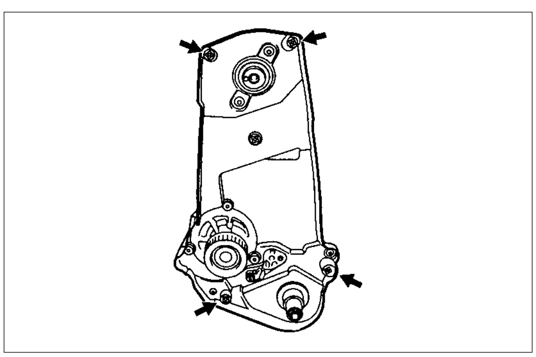


Removal

1. Remove the alternator, power steering and V-belts.

Removal

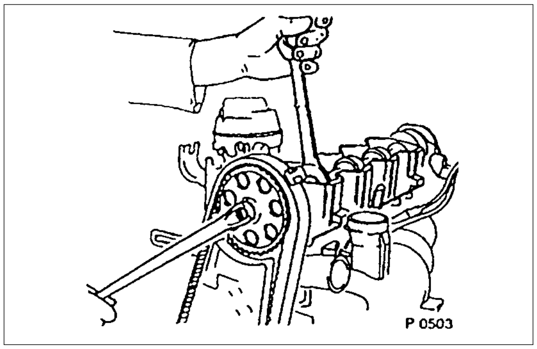
2. Loosen the fastening bolts from alternator.
3. Loosen the lower alternator fastening bolt by swinging the alternator to the rear.



Removal

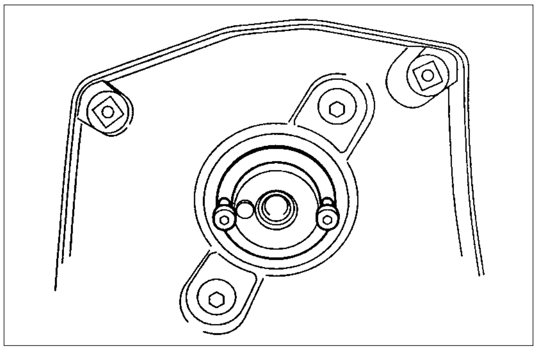
4. Remove the front toothed belt cover.
5. Remove the toothed belt from camshaft pulley.

   See operation "Timing Check and Adjust".



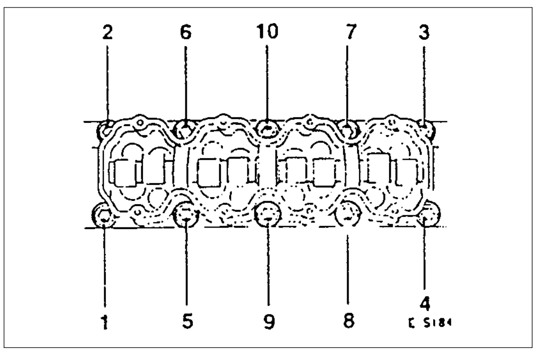
Removal

6. Remove the camshaft housing cover and camshaft pulley by counter-holding at the hex head of camshaft.



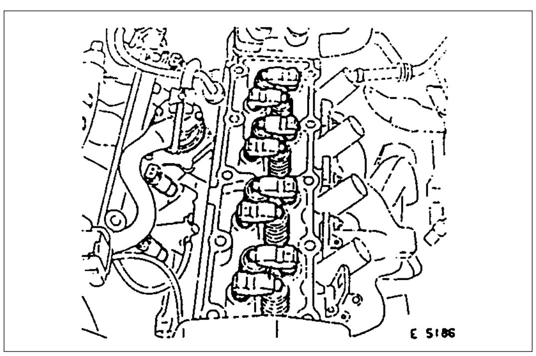
Removal

7. Remove the fastening bolts from camshaft housing.



Removal

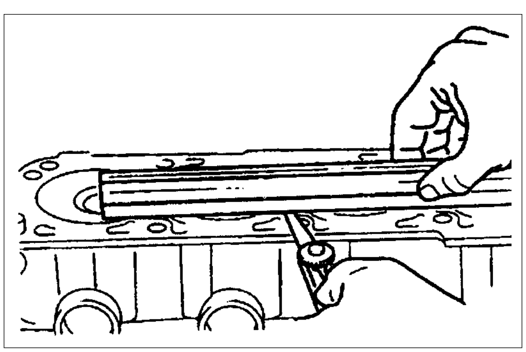
8. Remove the exhaust pipe from exhaust manifold.
9. Loosen the cylinder head bolts spirally from the outside inwards (first 1/4, then 1/2 revolution).



Removal

1. Remove the camshaft housing from cylinder head.
2. Remove the cam followers, thrust pieces and hydraulic valve lifters.

   Note the allocation.
3. Remove the cylinder head.

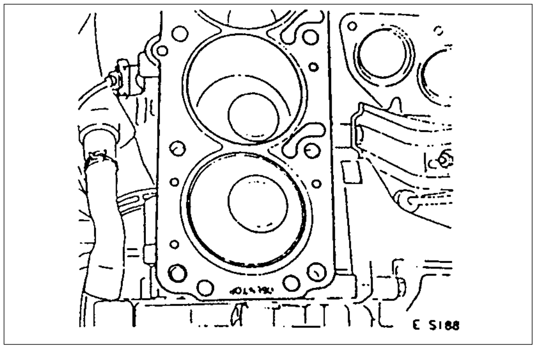


Clean

Sealing surfaces, bores and threads of cylinder head bolts.

Inspection

Check cylinder head and cylinder block for plane surfface-see operations “Cylinder Head, Check for Plane Surface” and “Cylinder Block, Check for Plane Surface.”

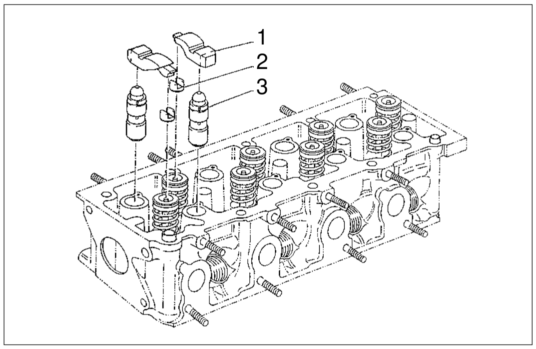


Installation

1. Install the cylinder head gasket.

   Mark "OBEN/TOP" on top and turn it towards timing side of engine.

2. Place cylinder head on cylinder block.



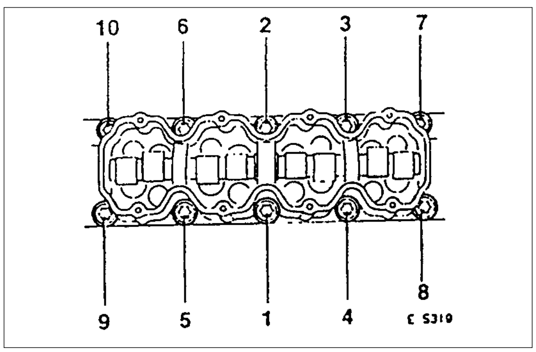
Installation

1. Insert the hydraulic valve lifters (3), thrust pieces (2) and cam followers (1) with MoS2 paste.

   Note allocation.

2. Apply a bead of Sealing Compound TB1207C to sealing surface of cylinder head.

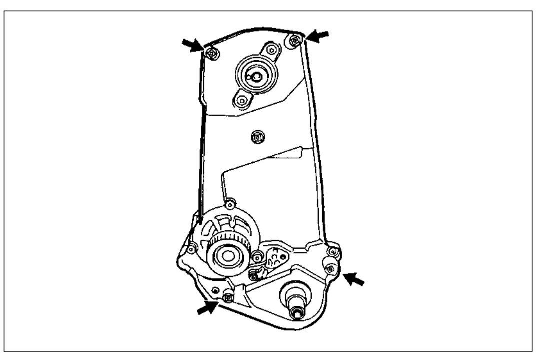
3. Install the camshaft housing on cylinder head.



Torque-Angle Method

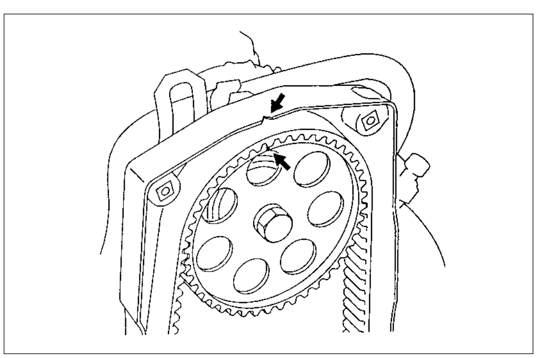
Cylinder head and camshaft housing with new cylinder head bolts to cylinder block.

Cylinder head bolts in sequence shown.



Installation

1. Install the rear toothed belt cover to camshaft housing.
2. Install the camshaft pulley to camshaft.
3. Install the camshaft housing cover to housing.



Installation

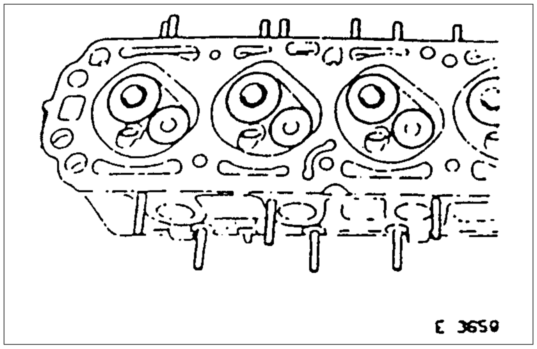
1. Install the toothed belt on camshaft pulley.

   See operation "Timing Adjust".

2. Install the front toothed belt cover.

Installation

1. Install the fastening bolts.
2. Loosen the lower alternator fastening bolt.
3. Install the alternator, power steering and V-belts.

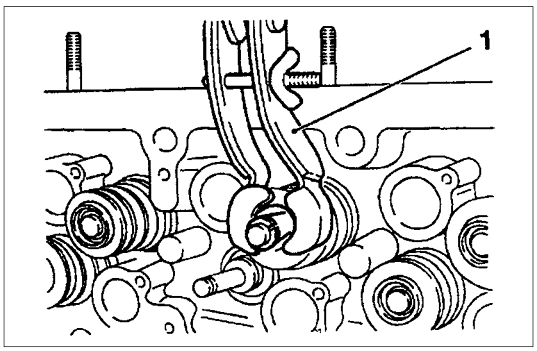


Cylinder Head, Disassemble and Assemble

Removal

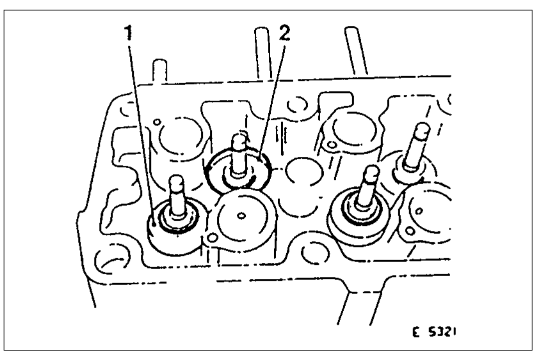
1. Remove the hydraulic valve lifters.

   Lay aside in installation positions.
2. Remove the spark plugs, exhaust manifold and intake manifold from cylinder head.



Removal

1. Mark valves.
2. Remove the tension valve springs with 5-8840-2594-0 (1).
3. Remove valve keepers, valve spring cap and valve spring.



Removal

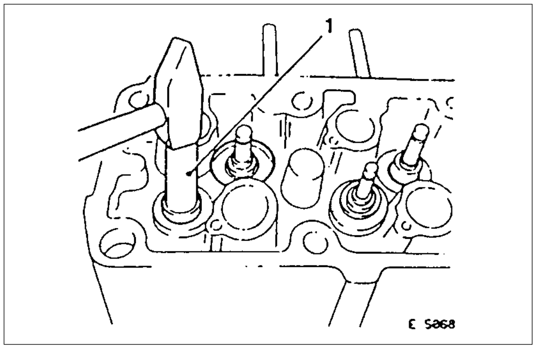
1. Remove the valve and valve stem seal.
2. Remove the valve spacer ring (1-exhaust) and valve spring seat (2-intake).
3. Remove valve from cylinder head.

Clean

Sealing surfaces.

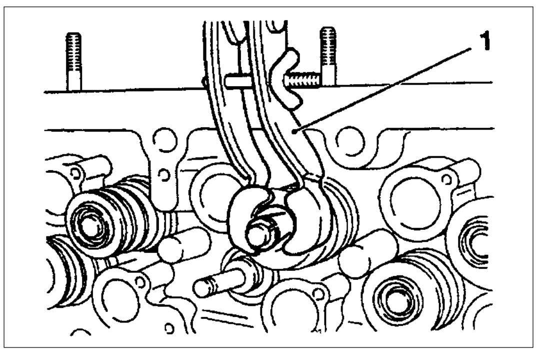
Inspection

Sealing surfaces for plane surface, guides, sliding and bearing points for wear-see operation “Cylinder Head. Overhaul”.



Installation

1. Coat the valves with engine oil and insert in cylinder head.
2. Install the valve spacer ring or valve rotator(exhaust) and valve spring seal(intake).
3. Push the accompanying assembly sleeve onto valve stem and coat with engine oil.
4. Insert a new valve stem seal with 5-8840-2601-0 (1).
5. Drive the valve stem seal carefully in to stop with light hammer blow.

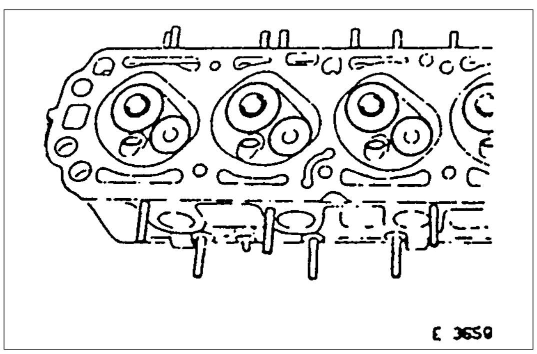


Installation

1. Install the valve springs and valve spring caps.
2. Install the tension valve springs with 5-8840-2594-0 (1), valve keeper.

Important!

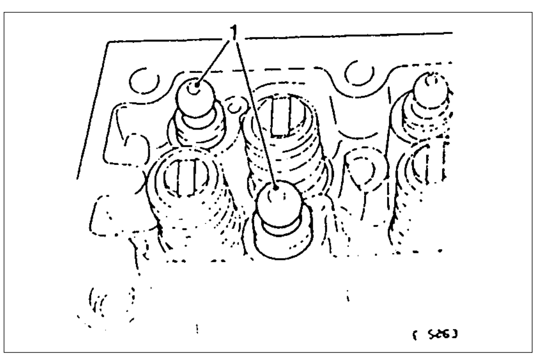
Note markings made on valves.



Tighten (Torque)

Exhaust manifold and intake manifold with new gaskets to cylinder head.

Thermostat housing with new seal ring to cylinder head:



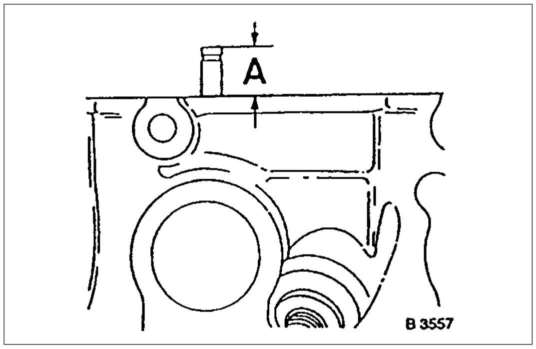
Tighten (Torque)

Spark plugs with spark plug wrench to cylinder head.

Installation

1. Coat hydraulic valves lifters (1) with oil.
2. Insert them in cylinder head.

   Note installation position.

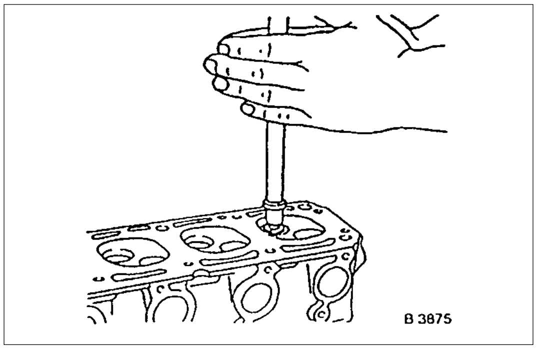


Valve, Grind

Valves can be reused once or twice after regrinding-only if there are no crater-like burns on the valve cone.
Excessive grinding can cause the upper valve head edge to become too thin.

Important!

Valve stem protection must not exceed dimension “A”-use 5-8840-2596-0.
Do not regrind valve stem ends.
For all valve reworking note that angle of valve head is 44° and the valve seat 45°-see also “Technical Data”.



Valve, Grind In

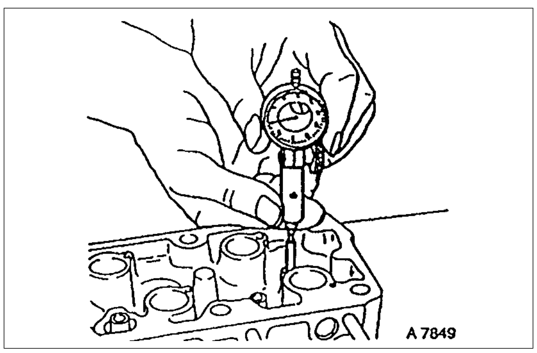
Grind-In the valve to improve valve seating.
Grind-In by rhythmically lifting valves and turning uniformly.
Use commercially available grinding tool.

Important!

Use only fine-grained pastes for grinding.
Lubricate valve stem before grinding in.

Clean

After grinding, carefully clean valve and valve soat.



Valve Guide, Ream

Measure

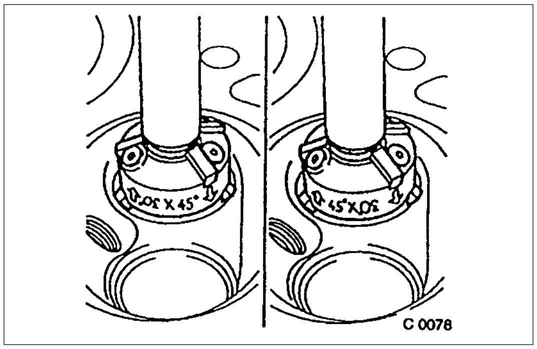
Diameter of valve guide-dial gauge and internal measuring instrument.

Important!

Valve oversizes are available ex-works.
Oversize identification, on the valve guide and on the valve stem end with the following specified identificaton flgures/letters-see also “Technical Data”.

	Identification Mark		
Size	Production	Customer Service	Reamer
Normal	none	K	
0.075 mm	1	K1	
0.150mm	2	K2	

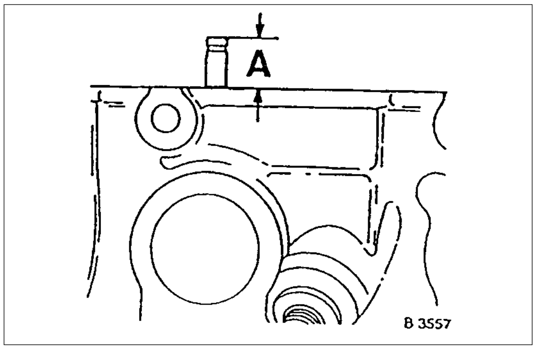
Ream valve guide from the upper side of the cylinder head to the next oversize (use 5-8840-2599-0).
After reaming, cross out identification mark and stamp in new identification mark.



Valve Seating, Mill

Place cylinder head on block of wood.
Inlet and exhaust, Guide Drift and Valve Seat Cutter 5-8840-2593-0.
Valve seat-45°, side face, upper correction-30°, side face (arrows on cutter).
Valve seat width:

Inlet-1.0 to 1.5 mm/0.04 to 0.06 in.
Exhaust-1.7 to 2.2 mm/0.072 to 0.088 in.

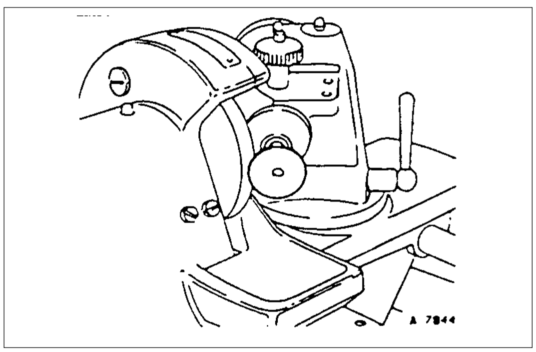


Inspection

Valve stem projection-use 5-8840-2596-0.

Important!

If dimension “A” is exceeded, use new valves.
Check valve stem projection again. If dimension “A” is exceeded, replace cylinder head.



Cylinder Head, Overhaul

Cylinder head disassembled.

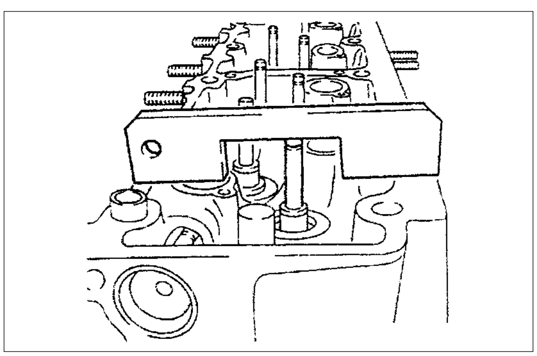
Valve, Grind

Important!

Ensure that there are no crater-like burns on the valve cone.

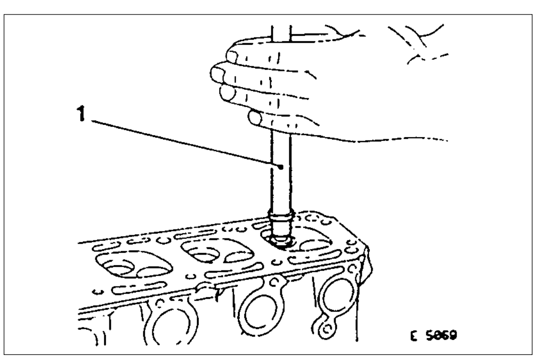
Regrinding possible once or twice.
Grinding of valve stem end is not permitted.

Angle at valve head-44°



Inspection

Check valve stem projection as shown 5-8840-2596-0.

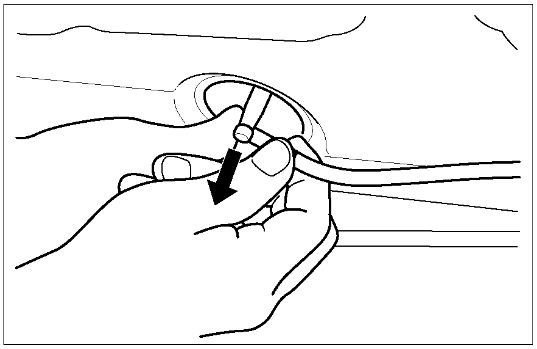


Valve, Grind in

Lubricate valve stem, use fine-graining grinding paste.

Lift up valve from seat rythmically using valve grinding tool (1) for distribution of grinding paste.

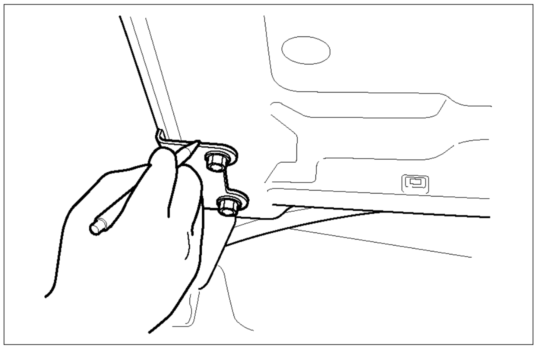
Important Operations - Removal



RUW52BSH002501

1. Washer Nozzle Tube

4) Open the hood.
5) Support the hood.
6) Remove the windshield washer nozzle tube.

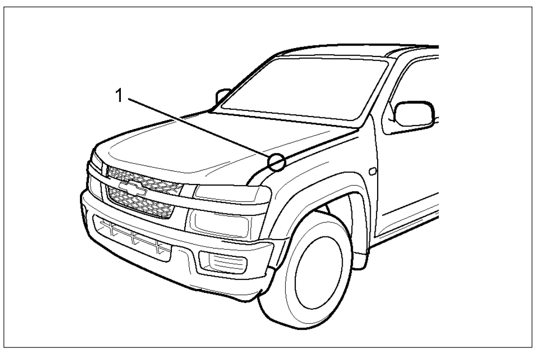


RUW52BSH002601

2. Hood Hinge Bolts

- Before removing the hinges from the engine hood, scribe a mark showing location of the hinges to facilitate installation in the original position.

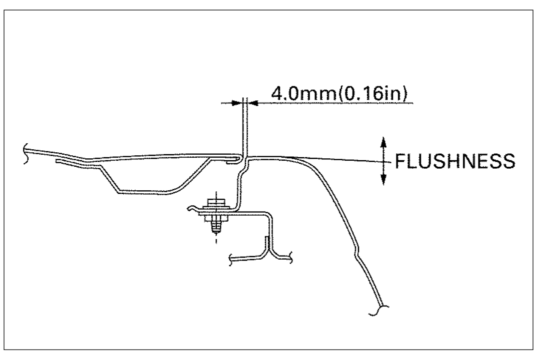
Important Operations - Installation



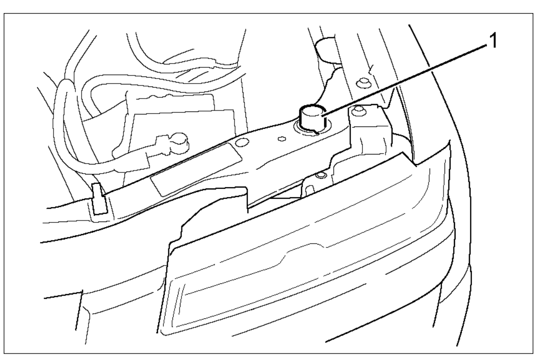
RTW72BSH001101

3. Engine Hood

- Check the engine hood and fender. (1)



- Clearance : 4.0 mm (0.16 in)
- Height (step) : Flushness
- Adjust clearance using the hinges on the engine hood.

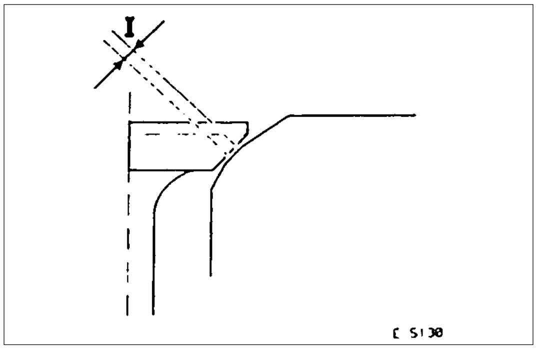


RTW52BSH000301

- Adjust height (step) using the hood rests (1).

Engine Hood Striker

- Apply a light coat of grease to the striker.



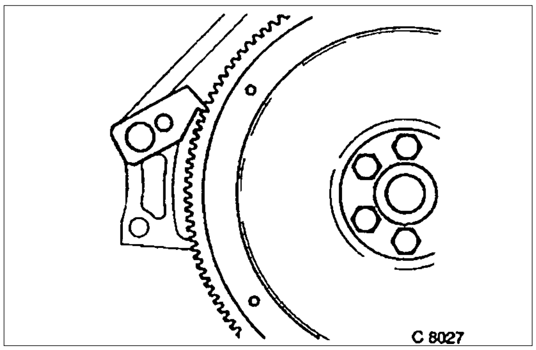
Inspection

Check contact pattern (I) on valve seat and in cylinder head.

Clean

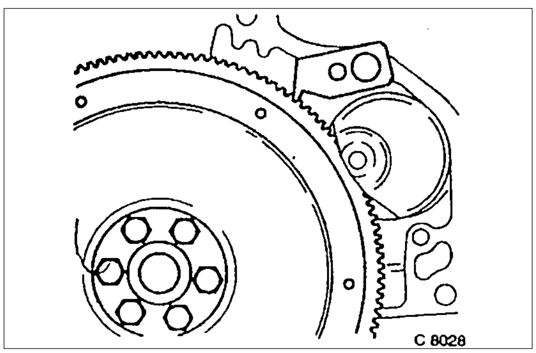
Valves, valve guides, cylinder head.

Flywheel



Removal

1. Remove transmission and clutch.
2. Remove flywheel while locking with 5-88400-446-0.



Torque - Angle Method

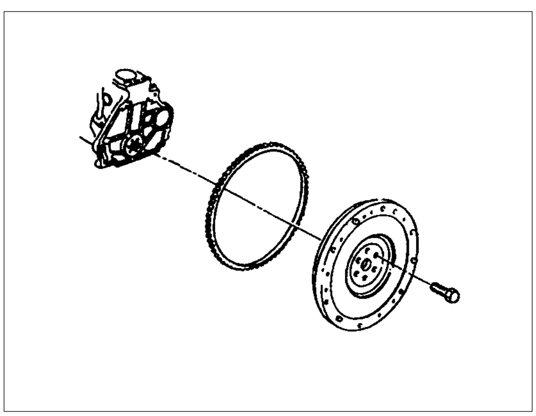
Flywheel to crankshaft - 65 Nm/6.5 kgf·m.+30° to 45°

Important!

Use new bolts.
Do not apply grease to the thread.

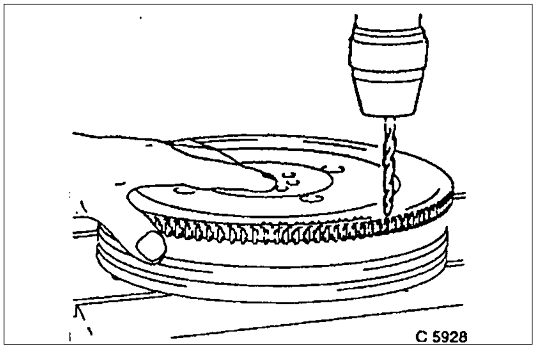
Installation

1. Install clutch and transmission.



Component Parts

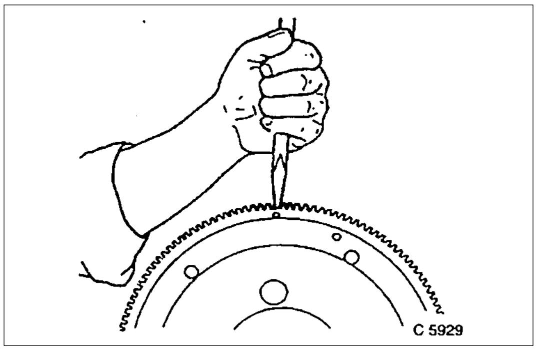
Flywheel and Ring gear. (Manual Transmission)



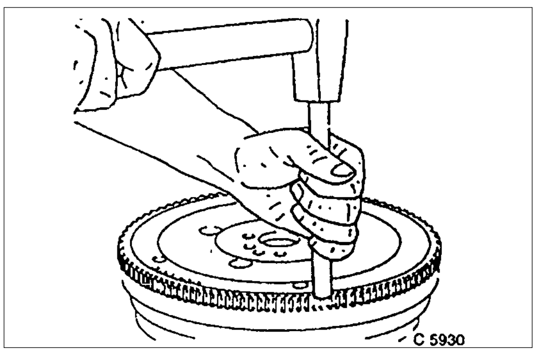
Starter Ring Gear (Manual Transmission)

Removal

1. Remove flywheel according to the corresponding operation.
2. Drill starter ring gear underneath tooth gap approx. 8mm/0.30in. deep with 8mm/0.25in. diameter drill.

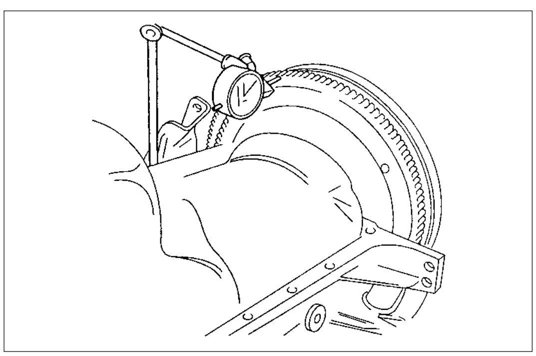


3. Separate starter ring gear with chisel on the drilling point.



Installation

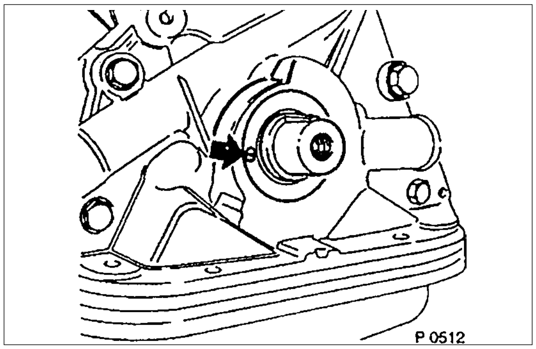
1. Install starter ring gear with inner chamfered edge to flywheel.
2. Heat starter ring gear evenly to 180°C /356°F to 230°C /446°F (yellow paint mark)
3. Install flywheel according to the corresponding operation.



Inspection

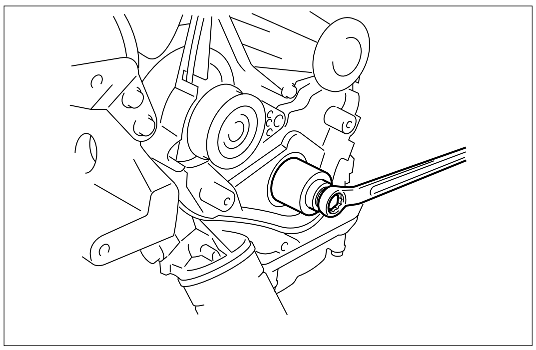
Lateral run-out of starter ring gear - max. 0.5mm/0.02in.

Seal Ring, Crankshaft (Oil Pump Housing)



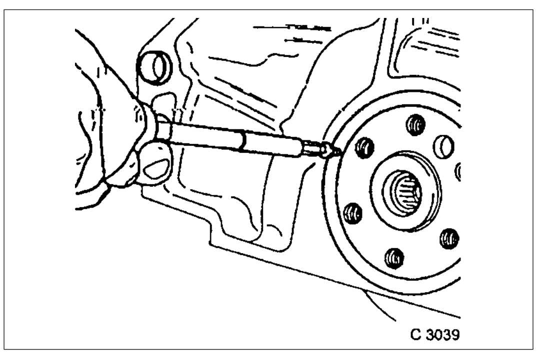
Removal

1. Remove toothed belt rear cover according to the corresponding operation.
2. Remove sealing ring by making hole in middle of ring, turning in self-tapping screw and edging out.



Installation

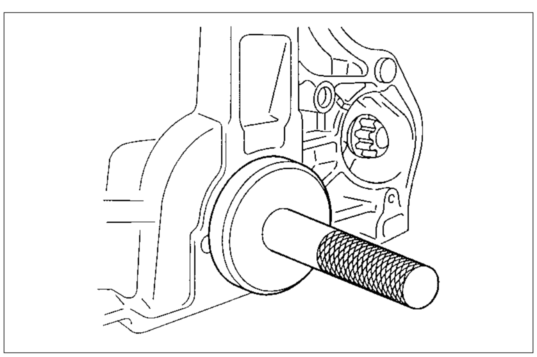
1 Install the protective sleeve to the crankshaft.
2. Coat the sealing lip with protective grease.
3. Install the sealing ring.
4. Install the sealing ring using 5-8840-0455-0.
5. Install the rear toothed belt cover and toothed belt according to the corresponding operations.
6. Replace the sealing ring with a new one.
7. Tighten the belt to the crankshaft.



Seal Ring, Crankshaft Rear

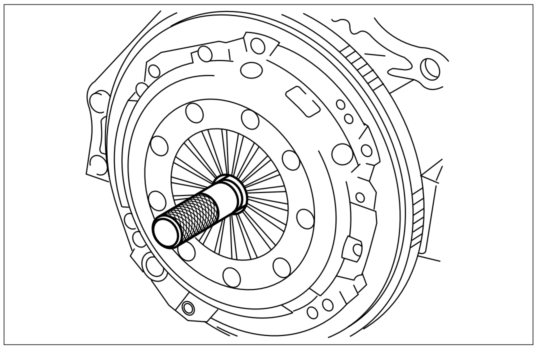
Removal

1. Remove transmission and clutch.
2. Remove flywheel or flex plate according to the corresponding operations.
3. Make hole in middle of sealing ring, turn in self-tapping screw and edge out.



Installation

1. Install protective sleeve.
2. Coat sealing lip with Protective Grease.
3. Install sealing ring using 5-8840-0459-0 and 5-8840-2597-0.
4. Install flywheel, clutch and transmission.



Reassembly

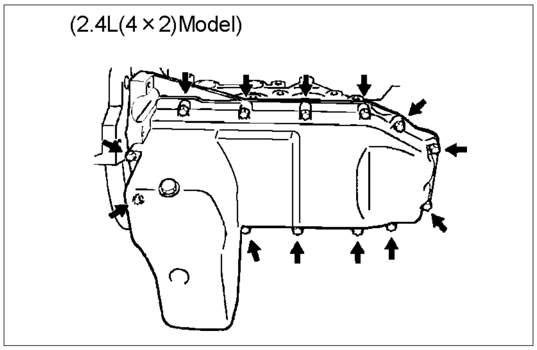
Reassemble clutch assembly.

Disassembly

Disassemble clutch assembly to flywheel using 5-8840-2634-0

Torque Angle-Method

Clutch assembly to flywheel-17.6Nm/1.8 kgf·m.

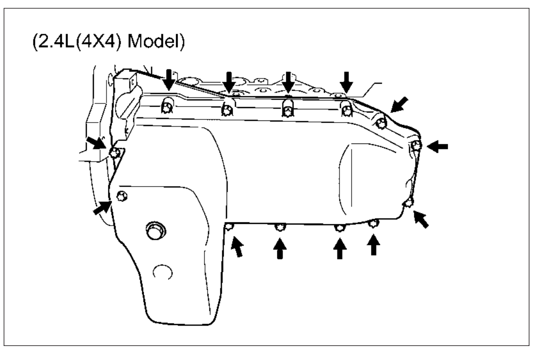


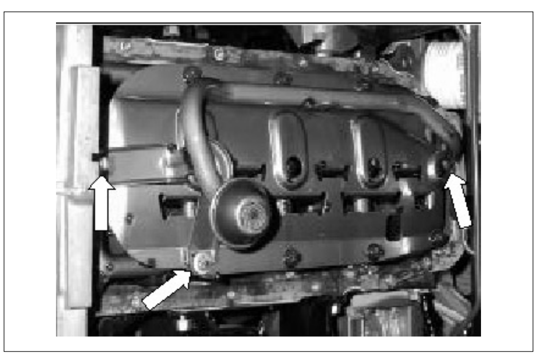
RTW46ASH002801

Oil Pan and Bearing Bridge

Removal

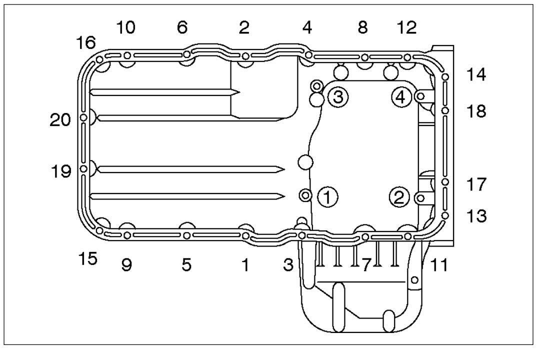
1. Remove the crossmember.
2. Shift downward the power steering unit (and front axle [4×4 model only]).
3. Loosen fixing bolts.
4. Remove oil pan from oil pump and cylinder block.
5. Remove oil intake pipe, oil intake pipe bracket, and oil baffle plate.
6. Remove the bearing bridge.





Clean

Sealing surfaces.



013RW004

Installation

1. Apply a bead of Sealing Compound, TB120TC or eguivalent to joint of oil pump.
2. Apply the recommended light gasket to the oil pan fitting surface as shown in the illustration.
3. Install the bearing bridge.
4. Install baffle plate, or reuse baffle plate.

Caution

Baffle plates can be retrofitted without difficulty - replace baffle plate.

5. Install oil intake pipe to oil pump and oil intake pipe bracket to cylinder block.
6. Install oil pan and new gasket to cylinder block and insert bolts with Locking Compound 15 10 177 (90 167 347). Maximum assembly time including torque check is 10 min.
7. Return the power steering unit (and front axle [4×4 model only]).
8. Install the crossmember.

Tighten (Torque)

Oil intake pipe to oil pump -8N·m (0.8 kgf·m)

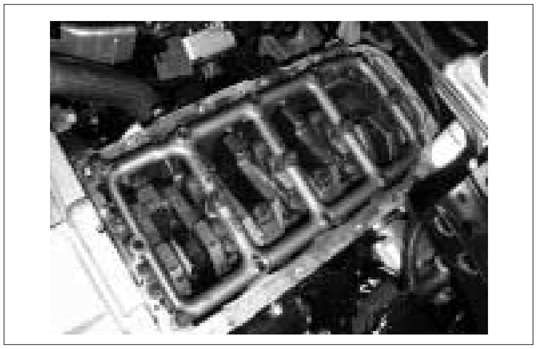
Oil intake pipe bracket to cylinder block - 6 N·m (0.6 kgf·m)

Oil pan to cylinder block - 8 N·m (0.8 kgf·m)

Bearing bridge to cylinder block – 8 N·m (0.8 kgf·m)

OPERATIONS ON CRANK DRIVE

Con-Rod Bearing

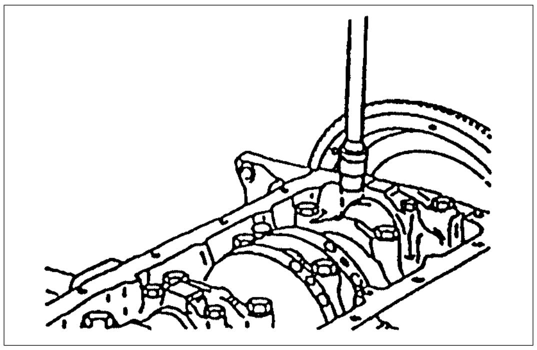


Removal

1. Remove oil pan and bearing bridge according to the corresponding operation.
2. Remove con-rod bearing cap and con-rod bearing after marking both sides.

Clean

Con-rod journal, con-rod bearing cap



Installation

1. Install new bearing shafts lightly coated with engine oil.
2. Install con-rod bearing cap.

Torque-Angle Method

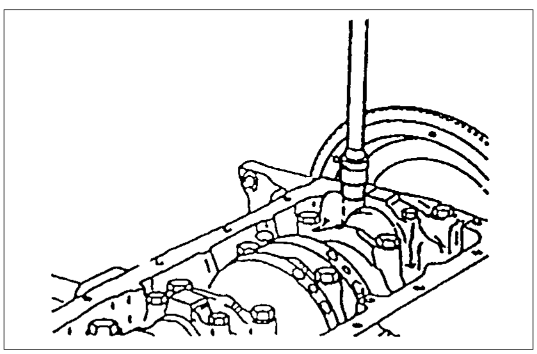
Con-rod bearing cap to con-rod - 35N·m (3.5 kgf·m) +45° to 60°

Important!

Use new bolts.

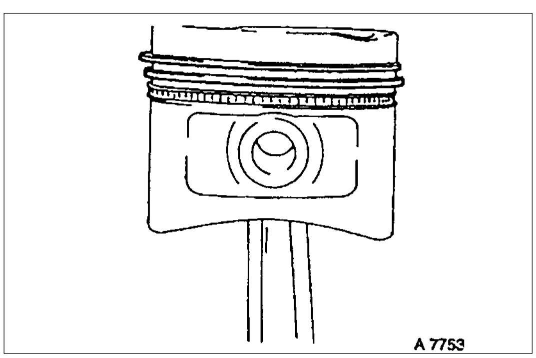
3. Install oil pan and bearing bridge according to the corresponding operation.

Piston with Con-Rod



Removal

1. Remove cylinder head and oil pan according to the corresponding operations.
2. Remove piston with con-rod after marking con-rod bearing cap.



Inspection

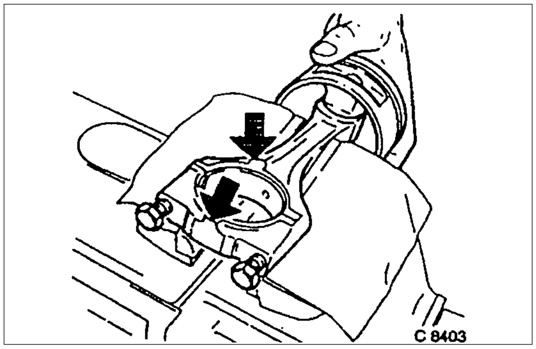
Remove and install all parts, if applicable.

Important!

Ring gap offset:

Piston rings - 180°.

Oil scraper rings - 25 to 50 mm/1 to 2 in. from gap of intermediate ring to the left and to the right.



Installation

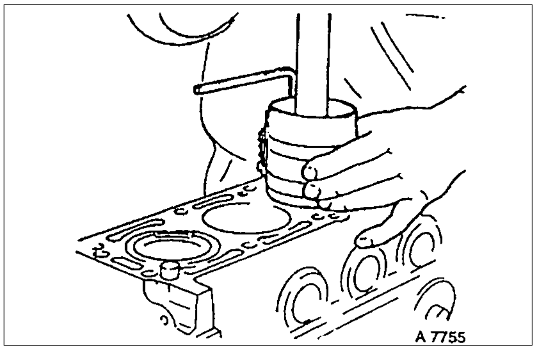
1. Install piston with con-rod by inserting with engine oil.
2. Coat piston rings with engine oil and compress with piston ring compressor.

Important!

Installation position:

Arrow / notch on piston head on timing side of engine

Beads on con-rod on clutch side



Torque-Angle Method

Piston to cylinder block.

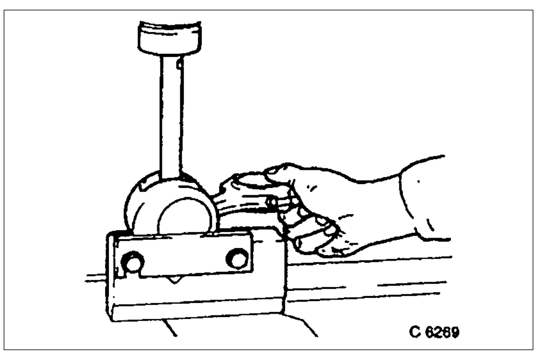
Con-rod bearing cap to con-rod-35N·m (3.5 kgf·m) +45° to 60°

Important!

Use new bolts.

Installation

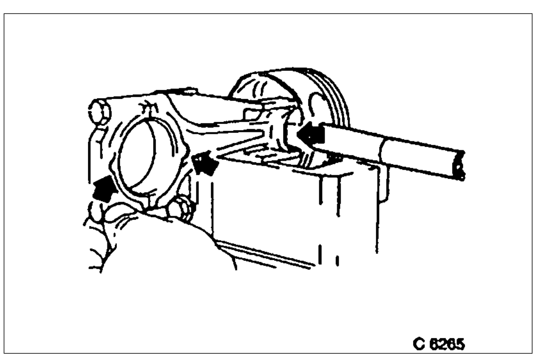
1. Install oil pan and cylinder head according to the corresponding operations.
2. Install sealing Gasket or replace if damaged.
3. Install camshaft housing to cylinder head.
4. Install cylinder head according to the corresponding operation.



Con-Rod

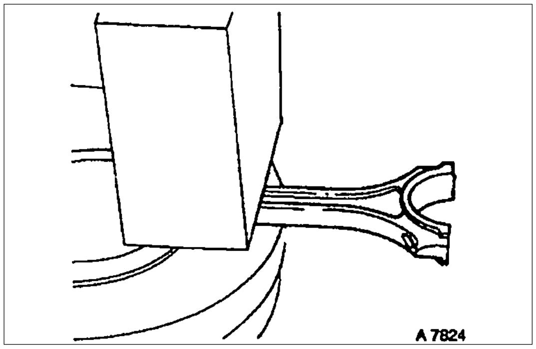
Removal

1. Remove piston with con-rod according to the corresponding operation.
2. Disassemble con-rod piston assembly by pressing out piston pin, using 5-8840-0468-0.

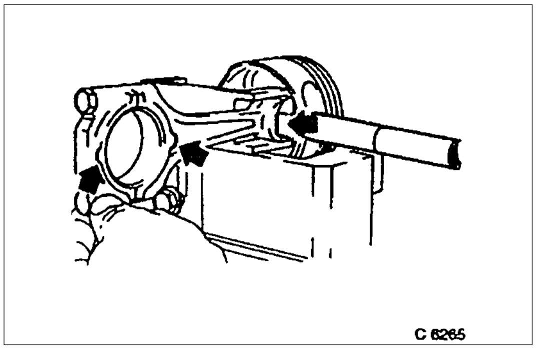


Installation

1. Slide guide drift (5-8840-0468-0) in horizontal position through piston and con-rod as far as side plate stops.
2. Tighten bolts evenly so that the piston rests flush on the rear plate.
3. Remove centre piece from guide drift and insert piston bolts (lubricated) into guide drift.



4. Heat a new con-rod to 280°C in the oil bath.
5. Install the con-rod to the piston and insert the piston pin.



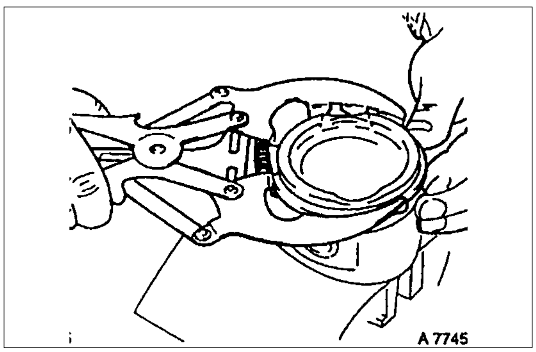
Important!

Since the con-rods have no weight balancing studs, re-working is not possible.

Exchange con-rods in sets only.

Installation position, beads on con-rod point to the flattening on the piston pin eye.

Firmly seated piston pin cannot be pushed in. Carry out installation quickly.



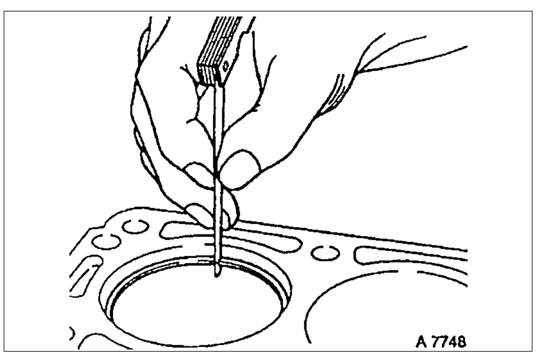
Piston Rings

Removal

1. Remove piston with con-rod according to the corresponding operation.
2. Remove piston rings using commercially available ring installer or piston ring clamp pliers.

Clean

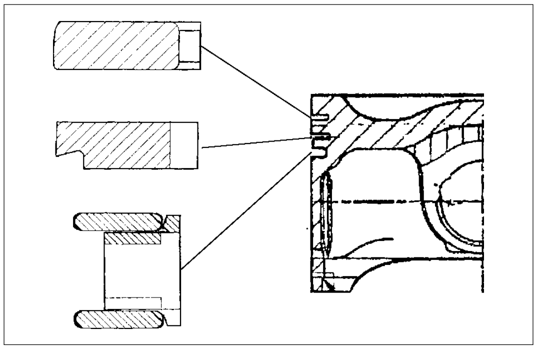
Piston ring grooves - ground piece of old piston ring



Inspection

Piston ring gap

For piston ring sizes, permissible piston ring gaps - see "Technical Data"



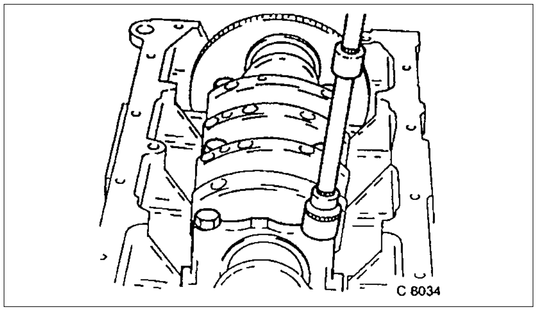
RTW46ASH002401

Installation

1. Install oil scraper ring.
2. Offset ring gaps of steel band rings each 25 to 50 mm/1 to 2in. to the left or right of the intermediate ring gap.
3. Install piston rings.
4. Offset ring gaps by approx. 180°.
5. Install second piston ring with identification mark "TOP" facing upwards.
6. Install piston with con-rod according to the corresponding operation.

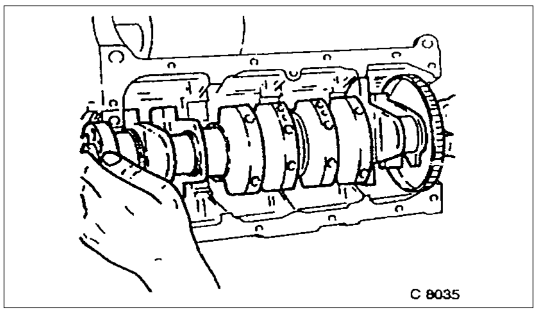
OPERATIONS ON REMOVED ENGINE

Crankshaft



Removal

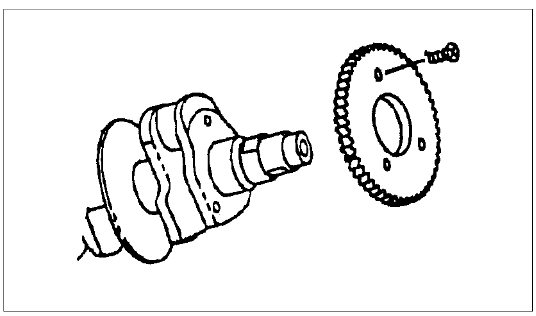
1. Mount the engine on an engine overhaul stand with appropriate adapters.
2. Remove the aggregates, flywheel/drive disc, oil pan, bearing bridge and oil pump according to the corresponding operation.
3. Mark the con-rod bearing cover.
4. Remove the crankshaft bearing cover.
5. Remove the crankshaft from cylinder block.



Inspection

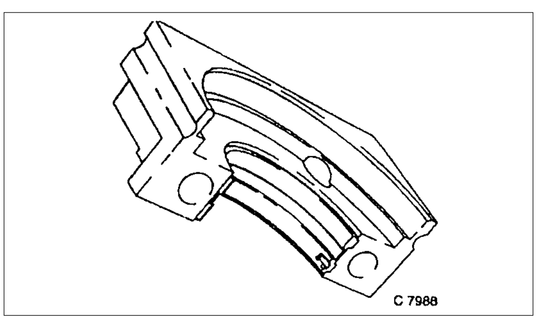
Remove and install all parts if necessary.

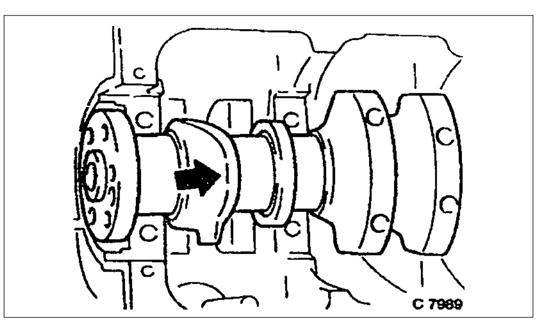
Crankshaft pulse pickup sensor rotor inspection and repair.
Inspect the crankshaft pulse pickup sensor rotor for excessive wear and damage.
Replace the crankshaft pulse pickup rotor if the inspection results exceed wear and damage limits.



Installation

1. **Install the crankshaft pulse pickup sensor.**
   Torque: 13N·m (1.3 kgf·m)
2. **Install new bearing shells into the cylinder block and bearing cover.**
3. **Coat the bearing shafts with engine oil.**
   For oversizes-see "Technical Data"
4. **Install a new crankshaft into the cylinder block.**





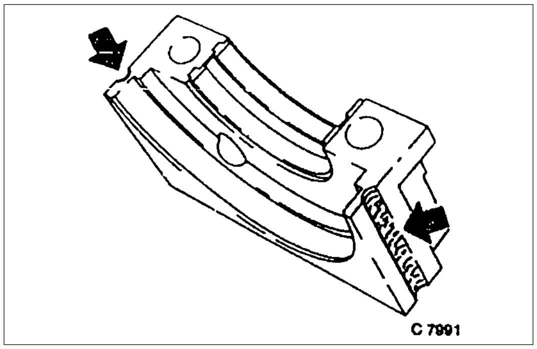
Note

The sealing of the crankshaft can be corrected with light blows with a rubber hammer on the crank arm (arrowed).

2. Hood Hinge Bolts

- Tighten the engine hood hinge fixing bolts to the specified torque.

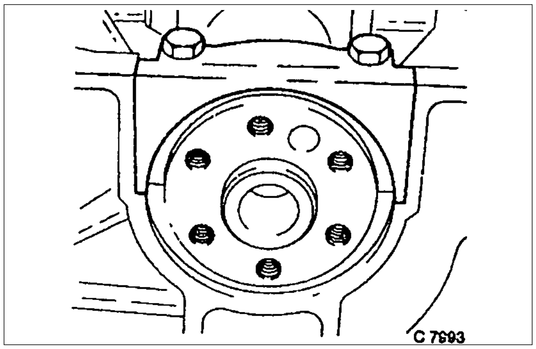
Torque	N·m(kgf·m/lb·in)
10 (1.0 / 87)	



5. Apply a bead of sealant (TB-1207C or equivalent) in the grooves of both bearing shells.

Important!

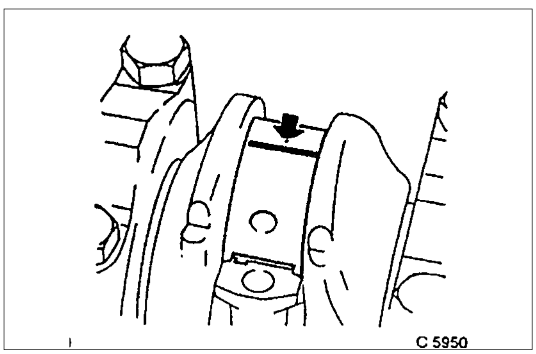
After installation of bearing cover, press in sealing compound again from above, until compound emerges at the joints.



Torque - Angle Method

Bearing cover to cylinder block - 50 N·m (5.1 kgf·m) +40° to 50°
Con-rod bearing cover to con-rod - 35 N·m (3.5 kgf·m) +45° to 60°.
Use new bolts.

6. Install oil pump, oil pan, bearing bridge rear crankshaft sealing, flywheel/drive plate, and aggregates according to the corresponding operations.



Inspection

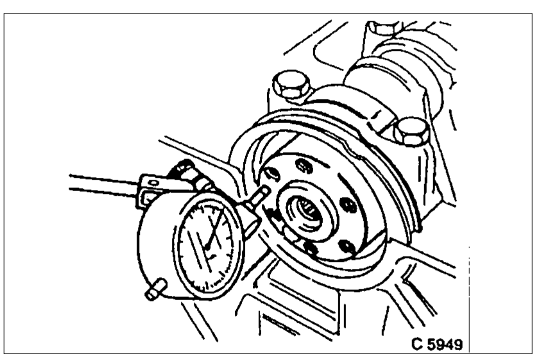
Bearing play - bearing cover removed

Measure

With "Plastigage" (ductile plastic threads)
Cut threads to length of bearing width and lay axiaity between crankshaft journal and bearing shell (arrowed).
Install bearing cover with correct torque.

Important!

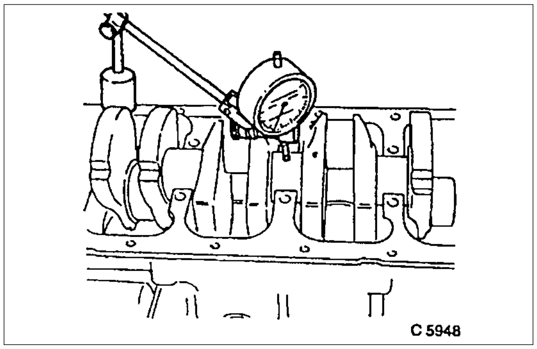
Grease crankshaft journal and lubricate bearing shell slightly so that the thread does not tear when the bearing cover is moved.



Crankshaft

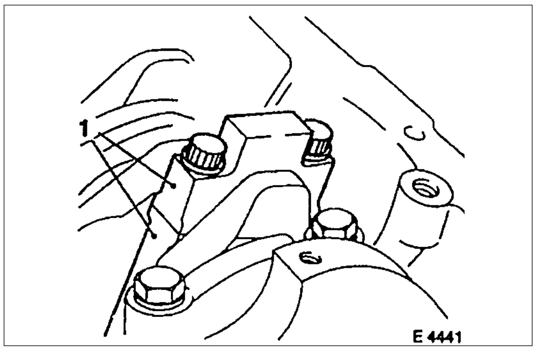
Inspection

End play when bearing shells are installed.
Front end contact surfaces of flywheel/flexible plate.
Permissible end play - see "Technical Data "



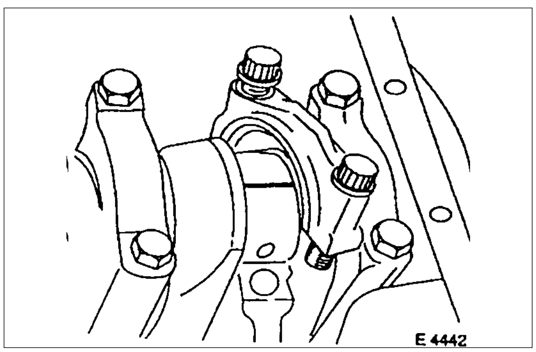
Inspection

Out-of-round (run-out)-middle bearing shell removed when mounting on front and rear bearing.
Permissible out-of-round - see "Technical Data"



Bearing Free Play Measurement

Two methods for measuring bearing free play are described - 1. Plastigage method and 2. micrometer and gauge method. The two procedures are suitable for measuring both con-rod and main bearing free play.
For both methods ensure con-rod and main bearing caps are identified (1) prior to removal as they are machine matched.



1.Plastigage Method

Removal

1. Remove bearing cap and shell.
2. Lightly coat journals and bearings with engine oil to prevent Plastigage from tearing when cap is removed.

Installation

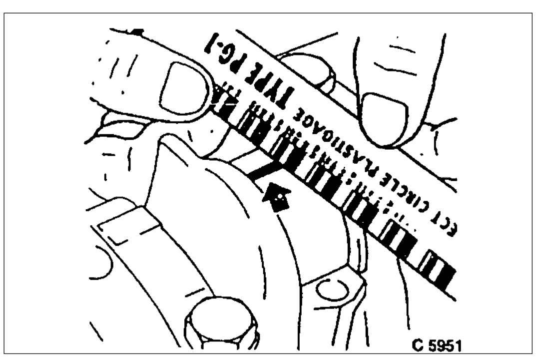
1. Lay a length of Plastigage across width of crank pin and fit bearing cap and shell using old bolts at this stage.

Important!

Do not allow crankshaft to rotate.

Torque - Angle Method

Main bearing cap bolt - 60 N·m (6.1 kgf·m) +40° + to 50°.
Con-rod bearing cap bolts - 35 N·m (3.6 kgf·m) +45°.



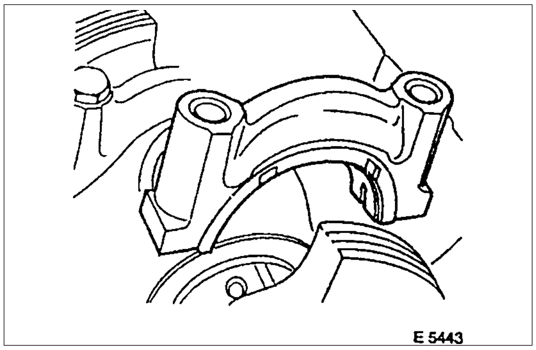
Removal

1. Remove bearing cap and shell.

Measure

Width of Plastigage -use scale supplied with Plastigage.

If con-rod bearing clearance exceeds 0.031mm/0.001in or main journal bearing clearance exceeds 0.04mm/0.02in. - check crankshaft journal diameters - see corresponding operation.
Replace bearing if crankshaft is within specification - see "Technical Data"



Clean

Plastigage from journals.

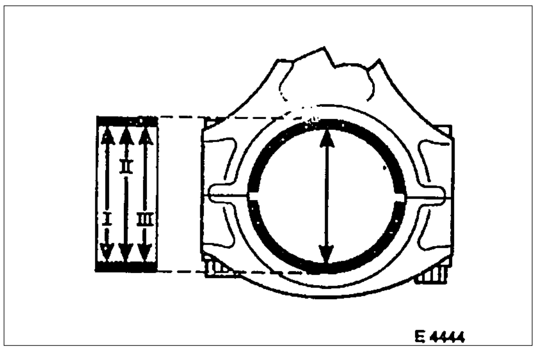
Lightly coat journals and bearings with engine oil.

Installation

Install bearing cap and shell using new bolts.

Torque - Angle Method

Main bearing cap bolt - 60 N·m (6.1 kgf·m) +40° to 50°.
Con-rod bearing cap bolts - 35 N·m (3.9 kgf·m) +45°.

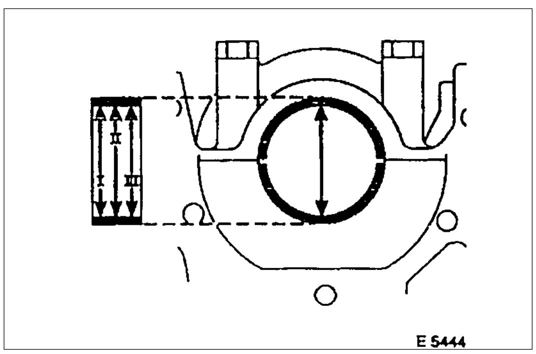


2.Micrometer and gauge method.

Crankshaft removed.

Installation

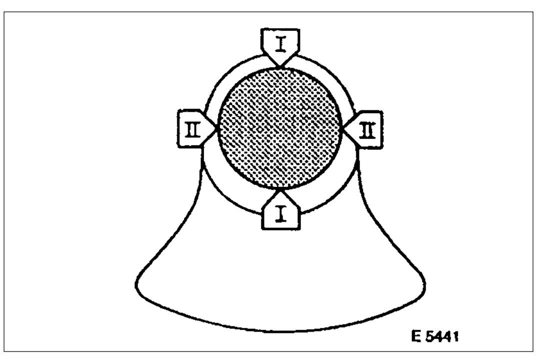
1. Install caps and bearing shells to con-rods and cylinder block.



Measure

Con-rod and main bearing diameters at three points I, II, III (arrowed).
Divide the sum of the three measurements by three to obtain a mean diameter.

The top illustration shows con-rod measuring points.
The second illustration shows main bearing measuring points.



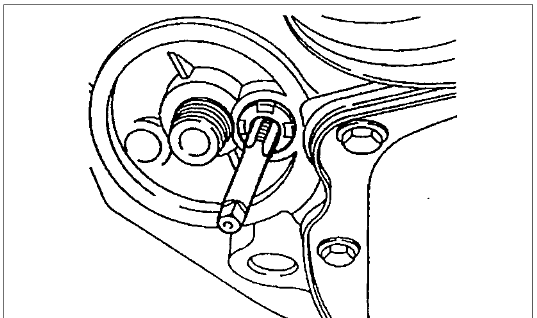
Measure

Crankshaft main and con-rod bearing journals at points I and II. Divide the sum of both measurements to obtain a mean diameter.

Crankshaft must be replaced if mean diameter of main or con-rod journals is below specified limit - see "Technical Data".

If crankshaft is serviceable subtract crankshaft mean journal diameters from corresponding shell bearing mean diameters to determine bearing clearance.

Permissible main bearing clearance - 0.015 to 0.04mm/0.0006 to 0.002in.
Permissible con-rod bearing clearance - 0.006 to 0.031mm/0.002 to 0.001in.



B 2774

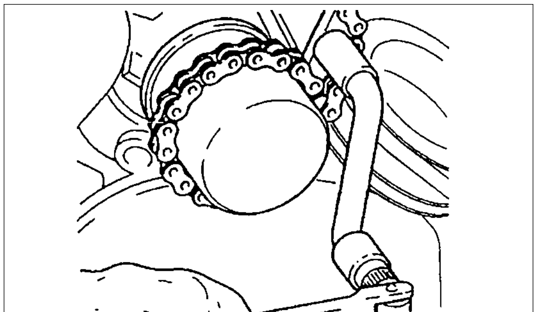
Bypass Valve

Removal

1. Remove oil filter.
2. Remove bypass valve by cutting thread in locking disc with M 10 tap (3rd stage), turning in M 10 bolt and taking out bypass valve from seating.

Installation

1. Install bypass valve using drift (diameter approx. 15mm/0.6in.).



C 7982

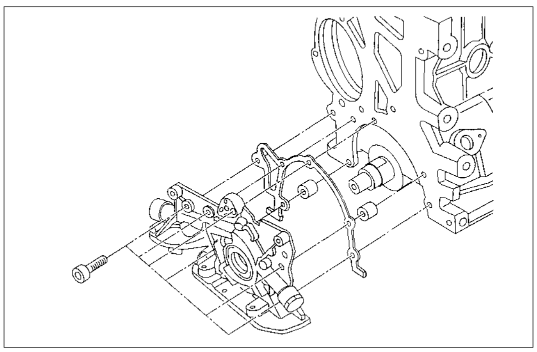
Oil Filter

Removal

1. Remove oil filter using commercially available tool.

Installation

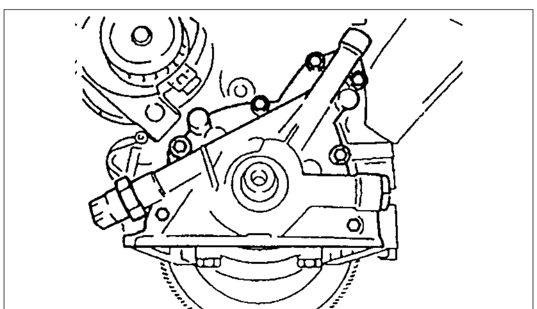
1. Install oil filter by hand and oil seal ring.
2. Fill up engine oil while preventing overflow.



Oil Pump

Removal

1. Remove rear toothed belt cover, and oil pan according to the corresponding operations.
2. Remove oil filter, wiring plug from oil pressure switch, oil pump from cylinder block, and oil pressure switch from oil pump.



P 0531

Clean

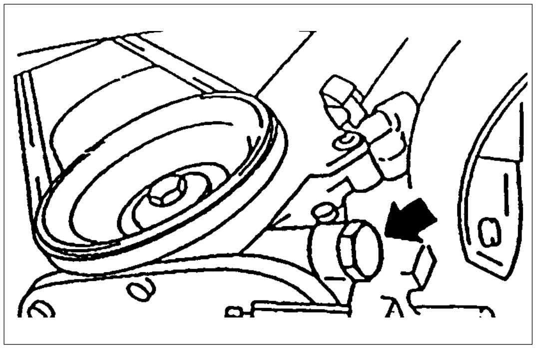
Sealing surfaces

Installation

1. Install oil pressure switch to oil pump, oil pump to cylinder block, oil pan, bearing bridge wiring plug, oil filter and toothed belt cover.

Tighten (Torque)

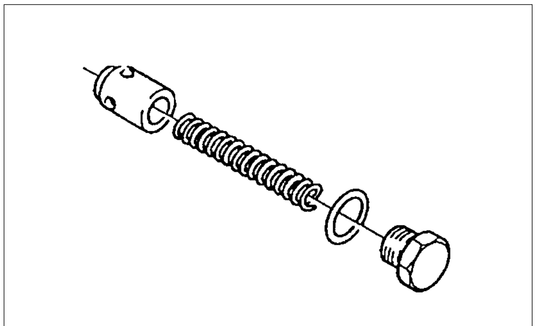
Oil pressure switch to oil pump - 30 N·m (3.2 kgf·m)
Oil pump to cylinder block - 6 N·m (0.6 kgf·m)
Oil intake pipe to oil pump - 8 N·m (0.8 kgf·m)
Intake pipe bracket to cylinder block - 8 N·m (0.8 kgf·m)
*Insert bolts with Locktite (Refer to General Description Recommended Liguid Gasket)



Oil Pump Safety Valve

Removal

1. Remove closure plug.
2. Remove seal ring.
3. Remove spring.
4. Remove piston.

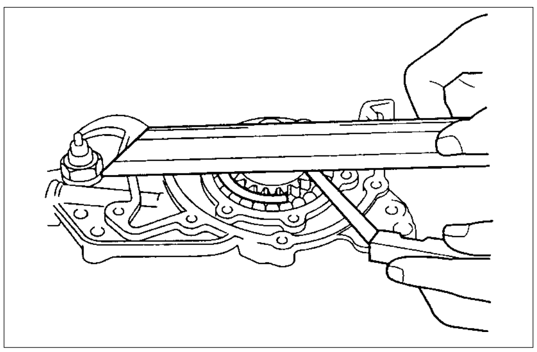


Installation

1. Install piston (observe installation position).
2. Install spring.
3. Install seal ring.
4. Install closure plug.

Tighten (Torque)

Closure plug - 30 N·m (3.0 kgf·m)



Oil Pump (Overhaul)

Removal

1. Remove oil pump according to the corresponding operation.
2. Remove oil cover and pressure control valve.

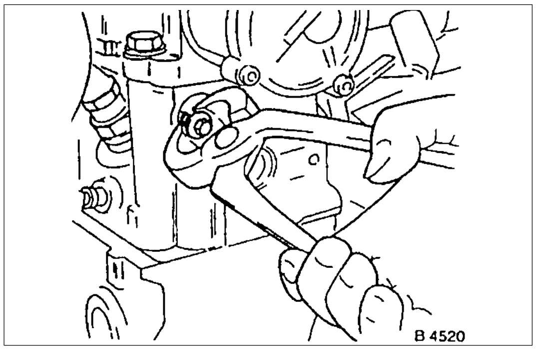
Inspect

Clearance between gear pair and housing upper edge - see “Technical Data”.
Check housing, cover and pressure control valve.

Installation

1. Install pump cover with Sealing Compound 15 03 166 (90 094 714).
2. Install oil pump safety valve according to the corresponding operation.
3. Install oil pump according to the corresponding operation.

OPERATIONS ON OIL CIRCULATION



B 4520

Cylinder Head Safety Valve

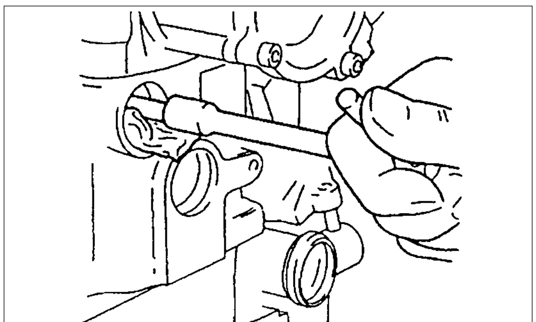
Removal

1. Remove cylinder head according to the corresponding operation.
2. Make hole in core plugs with pointed drift, turn in self tapping screw and edge out.

Important!

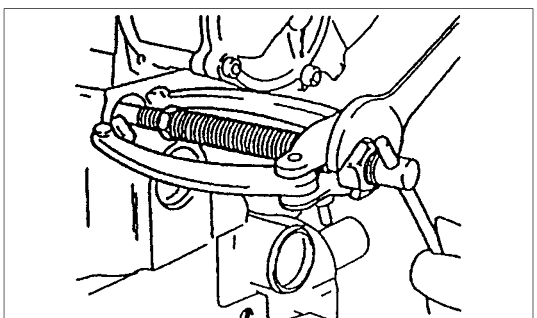
Cover oil duct in cylinder head with piece of cloth.

3. Pull out valve retainer, using commercially available tool.
4. Remove ball and spring.



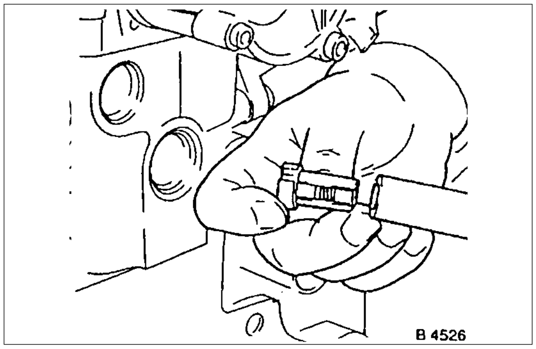
B 4523

5. Cut three threads in the ball seating with M 10 tap (3rd stage).
6. Coat tap with grease.



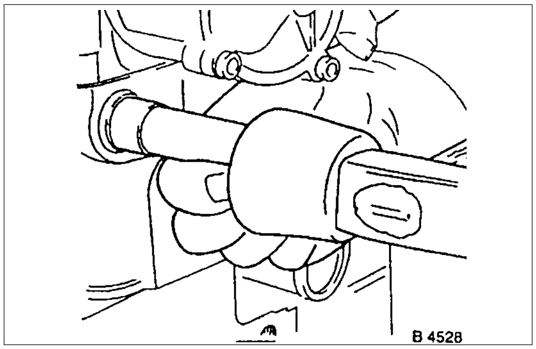
B 4525

7. Remove ball seating from cylinder head with commercially available tool.
   Do not damage cylinder head.



Installation

1. Install new pressure valve into cylinder head - with suitable pipe until stop.

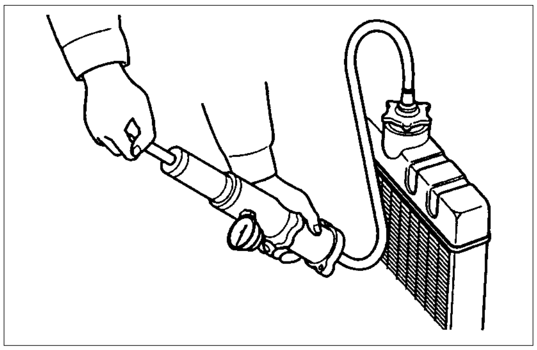


2. Install core hole plugs into cylinder head - with suitable pipe to end of chamfer.

OPERATIONS ON COOLING SYSTEM

Caution!

Before working with the cooling system, be sure to confirm that the temperature of the engine is cooled down.
Failure to observe this may cause burn.



Cooling System, Check for Leaks

Installation

1. Install commercially available coolant checking instrument onto compensation tank (Refer to section 6B; Engine cooling).
2. Check coolant level.

Inspection

Use 5-8840-0277-0 tester & 5-8840-2603-0 adaptor.

Cooling System, Fill Up and Bleed

Important!

Radiator and heater core are made from alminium.
To avoid corrosion, use only anti-freeze with corrosion protection.

Replace Coolant

1. Confirm the engine is cold enough.
2. Open the radiator cap, pour coolant to the filler neck level and close the cap.
3. Pour coolant into the reservoir until MAX line is reached.
4. Start the engine, run 2 ~ 3 minutes at idling speed and switch off the engine.
5. Refill coolant if the coolant level is lowered.

Important!

Do not loosen or open the radiator cap when coolant is hot. Doing so may cause hot water or steam to splash out, resulting in burn. When opening the radiator cap, be sure to confirm the coolant is cold. Cover a thick cloth over the cap and loosen it slowly to reduce pressure, then open the cap.

6. Close the radiator cap firmly and run the engine at approx. 2000 rpm. In addition, set the heater temperature adjuster to the max position to circulate coolant in the heater conduit system.
7. Confirm that the temperature gauge reads half or more of full scale and that the thermostat is activated. Then continue idling 5 minutes more and switch off the engine, and allow it to cool.
8. After the engine cools down, check the coolant level and refill it if necessary. When the level is lowered extremely, check the coolant conduit system and reservoir hose for leak.
9. Pour coolant into the reservoir to MAX level.

Refill Coolant

Important!

After closing the cooling system, let engine run warm until thermostat opens (coolant approx. 92°C/197.6F)

Inspection

Coolant level

Allow engine to cool. If necessary, refill coolant.

Check that cooling system self-bleeds during engine warming-up phase.

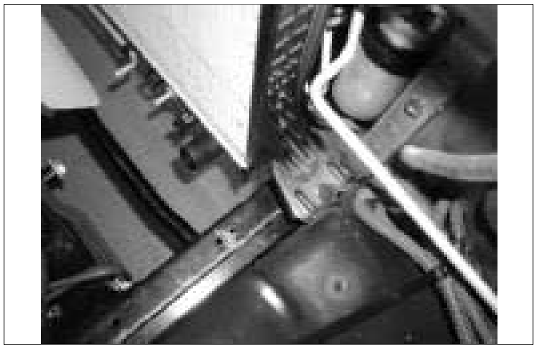
Ignition Timing, Check

No Adjustment

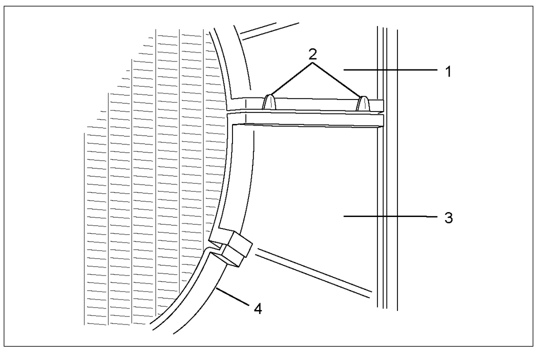
ENGINE EXTERNAL PARTS

Radiator

Removal

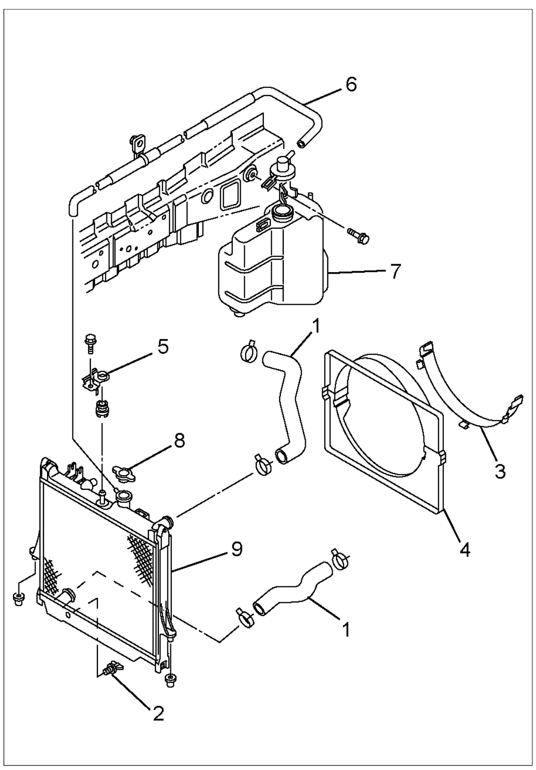


1. Disconnect battery ground cable.
2. Loosen a drain plug to drain EC.
3. Disconnect radiator inlet hose and outlet hose from the engine.



RTW46BSH000101

4. Remove fan guide(1), clips(2) on both sides and the bottom lock, then remove lower fan guide(3) with fan shroud(4).
5. Disconnect the reserve tank hose(6) from radiator.

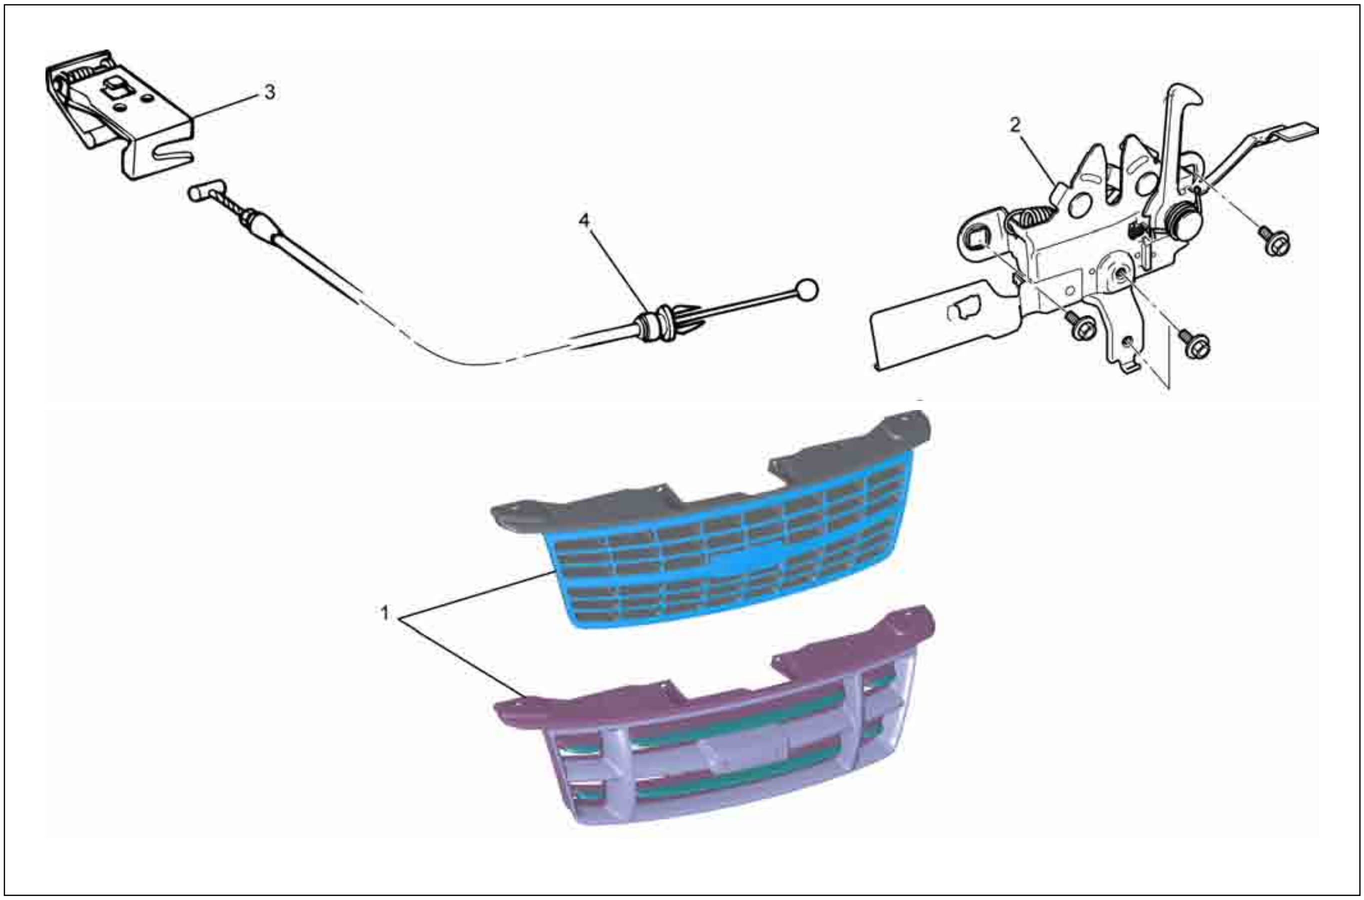


RTW36BMH000101

6. Remove bracket(5).
7. Lift up and remove the radiator assembly with hose, taking care not to damage the radiator core with a fan blade.

ENGINE HOOD LOCK (A TYPE)

REMOVAL AND INSTALLATION



RTW72BMF000201

Removal Steps

▲ 1. Radiator grille
▲ 2. Engine hood lock assembly
3. Hood lock control lever
▲ 4. Control cable

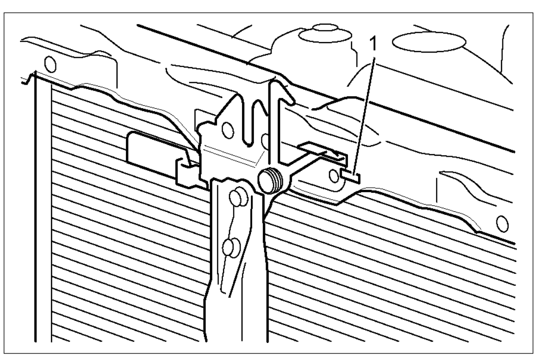
Installation Steps

▲ 4. Control cable
3. Hood lock control lever
▲ 2. Engine hood lock assembly
1. Radiator grille

Important Operations - Removal

1. Radiator Grille
Refer to the Radiator Grille in this section.

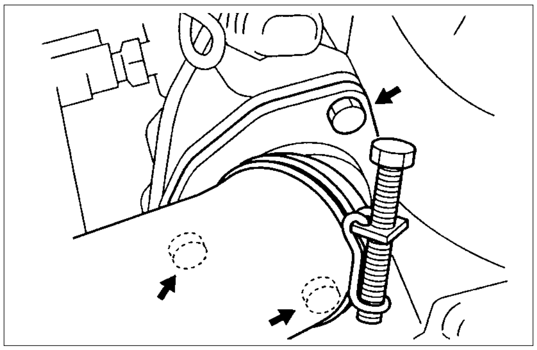
2. Engine Hood Lock Assembly
Apply setting marks (1) to the hood lock assembly and the body prior to removal.



4. Control Cable
Pull out the control cable toward the passenger compartment.

Installation

Follow the removal procedure in the reverse order to install the radiator.



Thermostat

Removal

1. Remove water outlet nozzles with thermostat from thermostat housing.
2. Remove coolant hose and collect coolant.

Important!

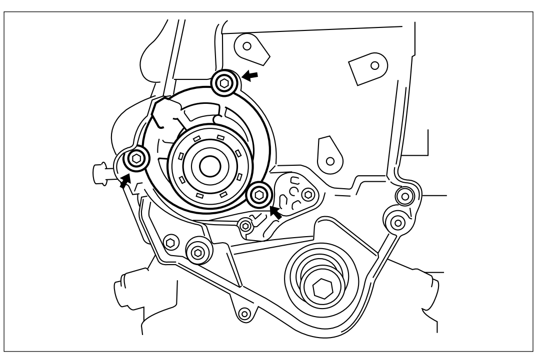
Remove and Install thermostat only together with water outlet nozzles.

Tighten (Torque)

Water outlet nozzles to thermostat housing - 8 N·m (0.8 kgf·m)

Installation

1. Install coolant hose.
2. Fill cooling system and bleed according to the corresponding operation.



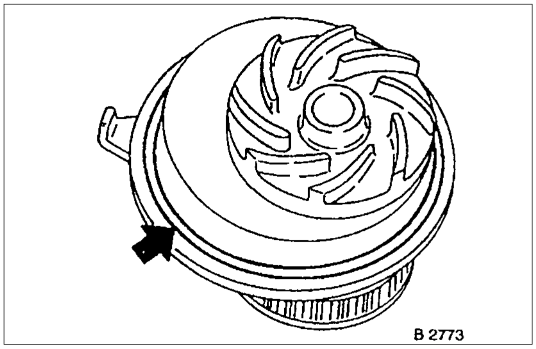
Water Pump

Removal

1. Remove lower hose band from pipe band and collect coolant.
2. Remove front toothed belt cover according to the corresponding operation.
3. Remove water pump from cylinder block after releasing tension on toothed belt.

Clean

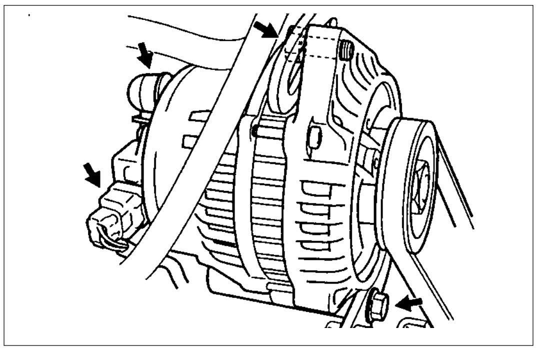
Sealing surfaces



Coating sealing surfaces with Silicone Grease

Installation

1. Install water pump to cylinder block with new rubber O-ring.
2. Apply tension to toothed belt according to the corresponding operation.
3. Install coolant hoses.
4. Fill cooling system and bleed according to the corresponding operation.



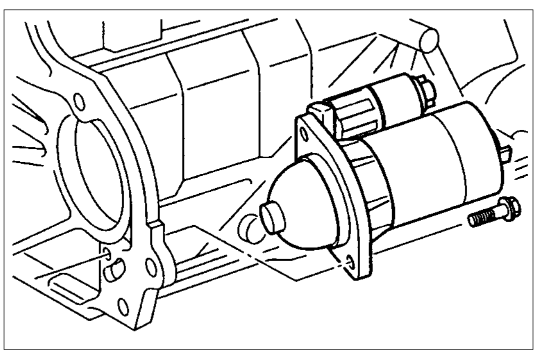
Alternator

Removal

1. Remove ground cable from battery.
2. Remove cable connection from alternator and V-belt.
3. Remove alternator from retaining strap and lower fastening.

Installation

1. Install alternator by tightening firmly by hand.
2. Install V-belt and apply tension according to the corresponding operation.
3. Install cable connections to alternator.
4. Install ground cable to battery.



Starter

Removeal

1. Remove cable connections from starter.
2. Remove upper bolt of transmission side.
3. Remove lower bolt of engine side.

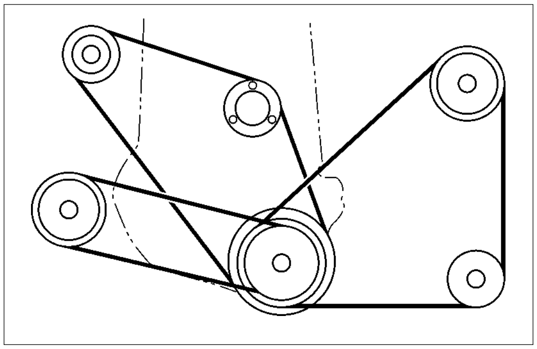
Tighten (Torque)

Starter to cylinder block:
Engine side - 51 N·m (5.2 kgf·m)
Transmission side - 75 N·m (7.6 kgf·m)

Starter support to cylinder block - 25 N·m (2.5 kgf·m)

Re-connect cables.

V-belt Tension of Alternator



RTW66ASH000101

Measure

Measure V-belt tension of alternator.
Permitted values for new V-belt are approx. 311-489N (31-50 kgf).
Note:
V-belt to deflection as loaded with 10kg : 8-12mm.

Adjust

Adjust V-belt tension by loosening clamping bracket and lower alternator bracket and moving alternator.

Tighten (Torque)

Clamping bracket to alternator - 35 N·m (3.6 kgf·m)
Lower alternator bracket - 25 N·m (2.6 kgf·m)

V-Belt Tension of Power Steering Pump

Measure

Measure V-belt tension of power steering pump. Permitted values for new belt are approx. 578-712N (59-73 kgf) and 534-667N (54-68 kgf) for used belt.
Note:
V-belt to deflection as loaded with 10kg : 8-12mm.

Adjust

Adjust V-belt tension by loosening clamping bolt, lower pump bracket, and adjusting nuts and moving steering pump.

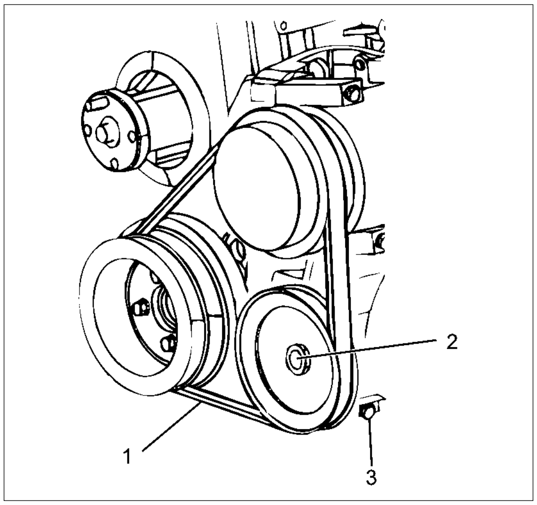
Tighten (Torque)

Adjusting nuts - 18 N·m (1.8 kgf·m)
Clamping bolt - 25 N·m (2.6 kgf·m)
Lower pump bracket - 26 N·m (2.6 kgf·m)

V-Belt Tension of Air Conditioning Compressor

Measure

Measure V-belt tension of air conditioning compressor.
Permitted values for new V-belt are approx. 422N (43 kgf).
Note:
V-belt to deflection as loaded with 10kg : 8-12mm.



RTW66ASH000201

Adjust

Adjust the A/C compressor V-belt (1) for adjustment of belt.

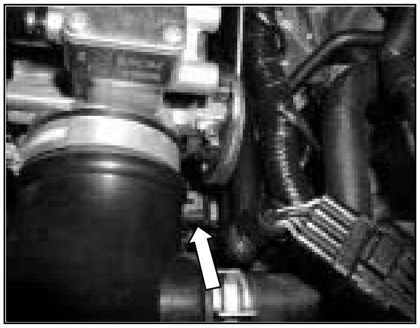
1. Loosen the tension pulley lock nut (2) and tension pulley adjusting bolt (3) of the tension pulley of the A/C compressor V-belt (1) and bring the belt to free state.
2. Rotate the adjusting bolt (3) of A/C compressor adjust the belt (remove and fit).
   - When replacing the belt, you must always replace both the belts.
3. After adjustments, tighten the lock nut (2) using the specified torque.

Tightening torque: 40 N·m (4.1 kgf·m)

- Finally, adjust the tension of A/C compressor V-belt.

FUEL INJECTION SYSTEM

MAP SENSOR

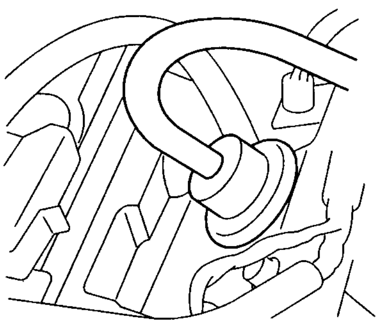


Removal

1. Disconnect the battery cable.
2. Disconnect the electrical connector from the sensor.
3. Remove the mounting bolts securing the sensor to the manifold.
4. Remove the sensor from the intake manifold.

Installation

1. Push MAP sensor into the manifold.
2. Install the mounting bolts and tighten them.
3. Connect electrical connector.
4. Connect the battery cable.



Pressure Regulator

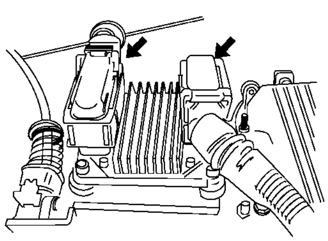
Removal

1. Remove vacuum hose.
2. Remove fuel hoses.
3. Remove pressure regulator.

Installation

1. Install pressure regulator.
2. Install fuel hoses.
3. Install vacuum hoses.

(2.4L Model)



ECM (Engine Control Module)

Removal

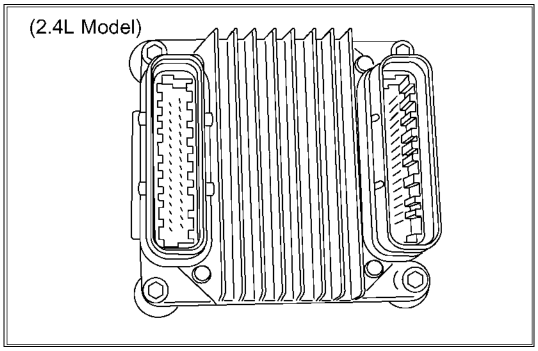
(2.4L)

1. Disconnect the ECM connector.
2. Remove the four hex bolts and nuts.
3. Remove the ECM from the ECM bracket on engine.

Installation

(2.4L)

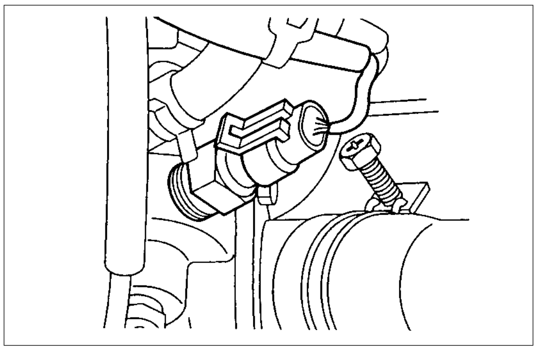
1. Install the ECM to the ECM bracket on engine.
2. Tighten the four screws to the bracket.
3. Connect the connector.



ECT

Removal

1. Remove wiring harness plug and coolant temperature sensor.



Tighten (Torque)

Temperature sensor to intake pipe - 10 N·m (1.0 kgf·m)
Wiring harness plug to temperature sensor

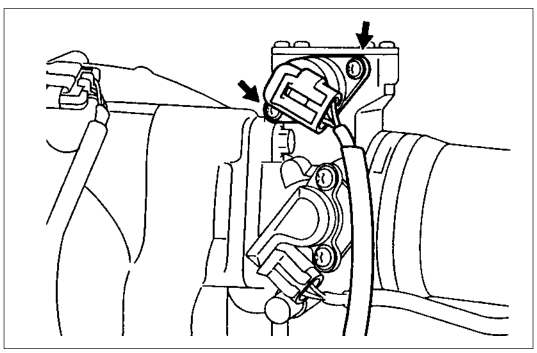
Inspection

Coolant level

Idle Air Control (IAC) Valve

Removal

1. Remove wiring harness plug, hose clamps and idle speed adjuster.



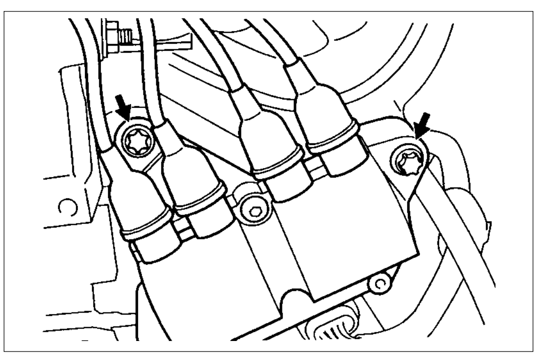
Installation

1. Install idle speed adjuster, hose clamps and wiring harness plug.

Ignition Coil

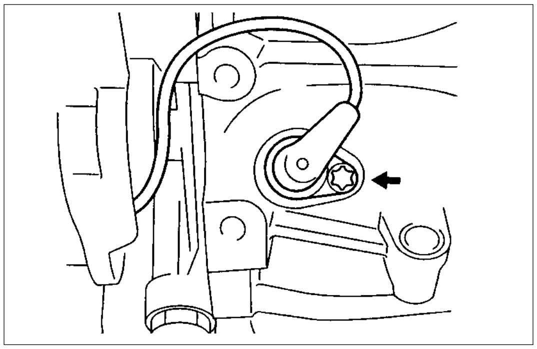
Removal

1. Remove 2 bolts, plug and ignition coil.



Installation

1. Install ignition coil, plug and bolts.



Crank Position Sensor

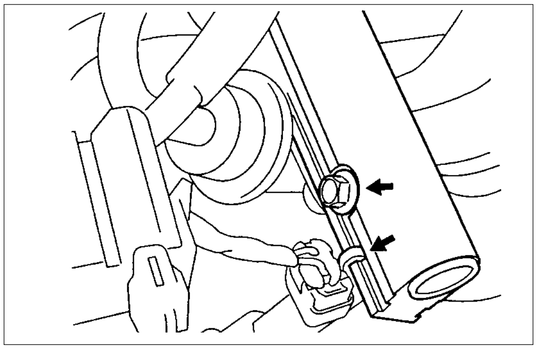
Removal

1. Remove crank position sensor.

Installation

1. Install crank position sensor.

FUEL INJECTOR



Removal

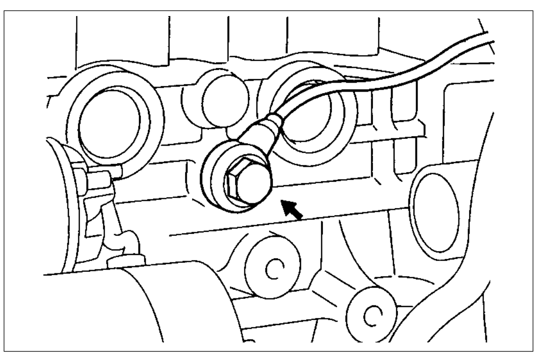
Caution: To reduce the risk of fire and personal injury, it is necessary to relieve the fuel system pressure before servicing the fuel system components.

Caution: After relieving the fuel system pressure, a small amount of fuel may be released when servicing fuel lines or connections. Reduce the chance of personal injury by covering the fuel line fitting with a shop towel before disconnecting the fittings. The towel will absorb any fuel that may leak out. When the disconnect is completed, place the towel in an approved container.

1. Depressurize the fuel system.
2. Disconnect the fuel inlet.
3. Disconnect the fuel return line.
4. Remove the fuel rail from the intake manifold.
5. Remove the fuel injector from the fuel rail by disengaging claws.

Installation

1. Install the fuel injector to the fuel rail by engaging claws.
2. Install the fuel rail to the intake manifold.
3. Connect the fuel return line firmly.
4. Connect the fuel supply line firmly.



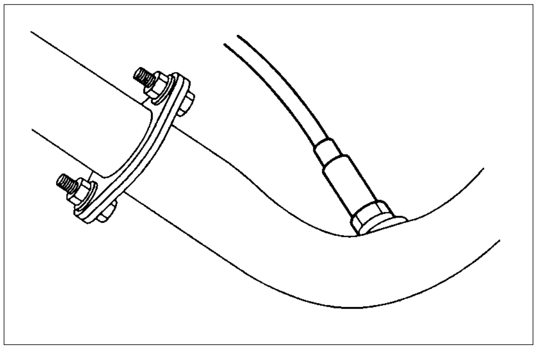
Knock sensor

Removal

1. Remove fixing bolts.
2. Disconnect the connector at the other side.

Tighten (Torque)

Oxygen sensor in exhaust pipe - 30N·m (3.1 kgf·m)
When re-using, insert oxygen sensor.



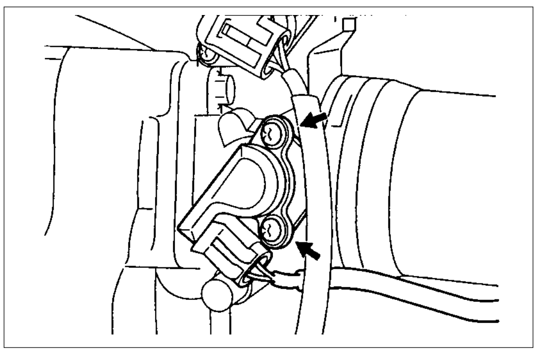
Oxygen Sensor (If applicable)

Removal

1. Remove wiring harness plug.
2. Remove oxygen sensor from the front exhaust pipe.

Tighten (Torque)

Oxygen sensor in exhaust pipe - 30 N·m (3.1 kgf·m)



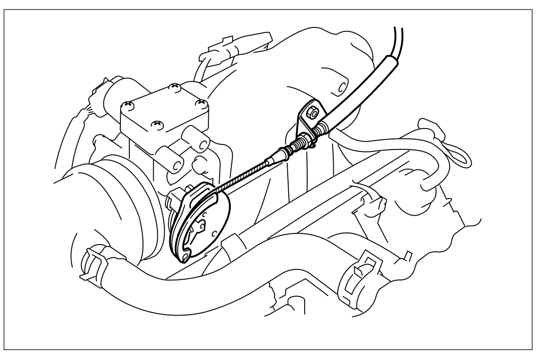
Throttle Valve Position Sensor

Removal

1. Remove wiring harness connector.
2. Remove throttle valve position sensor.

Installation

1. Install throttle valve position sensor.
2. Install wiring harness connector.



Accelerator Pedal and Cable

Removal

1. Remove pad stopper from pedal stop bolt.

Installation

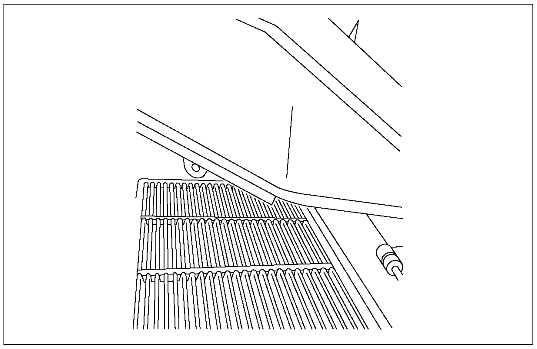
1. Install pad stopper.

Inspection

Ensure that accelerator pedal is fully in idle position and accelerator level at engine is in closed position.

Pull outer sleeve of accelerator cable towards pedal and check that clip on sleeve is in slot nearest to grommet.

Reposition clip if necessary, and check that full throttle and idle positions are obtained at engine lever.



RTW46JSH000101

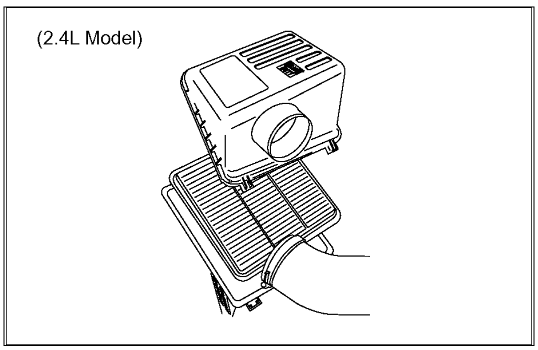
Air Cleaner Filter

NOTE:
The air cleaner filter is not damaged with the edge of the air cleaner housing.

Removal

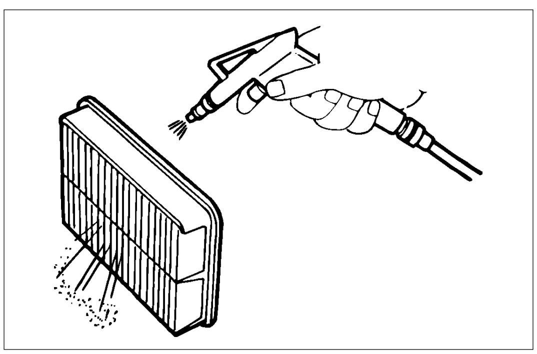
(2.4L)

1. Remove air cleaner cover and air cleaner element.
2. Remove air intake nose.
3. Remove lower air cleaner.
4. Remove mud guard.
5. Remove front fender cover.
6. Remove outside air intake duct.



Inspection

Check the air cleaner filter for damage or dust clogging.
Replace if it is damaged, or clean if it is clogged.



130RW002

Cleaning Method

Tap the air cleaner filter gently so as not to damage the paper filter, or clean the element by blowing with compressed air of about 490 kPa (71 psi) from the clean side if it is extremely dirty.

Installation

(2.4L)

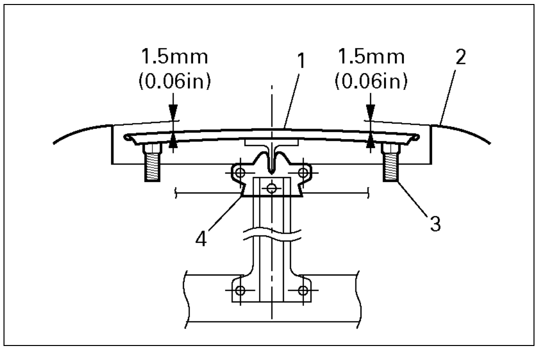
1. Install outside air intake duct.
2. Install front fender cover.
3. Install mud guard.
4. Install lower air cleaner.
5. Install air intake hose.
6. Install air cleaner element and air cleaner cover.

Important Operations - Installation

4. Control Cable

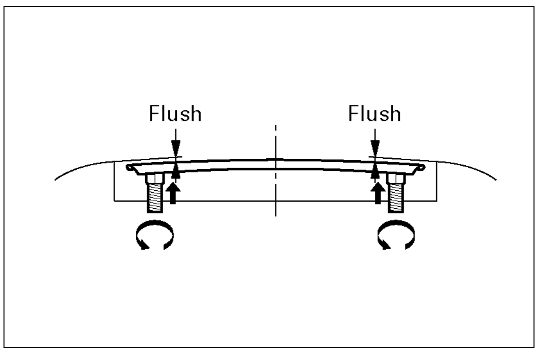
Reroute the control cable to its original position, and check to see if the lock assembly and control lever work normally.

2. Engine Hood Lock Assembly



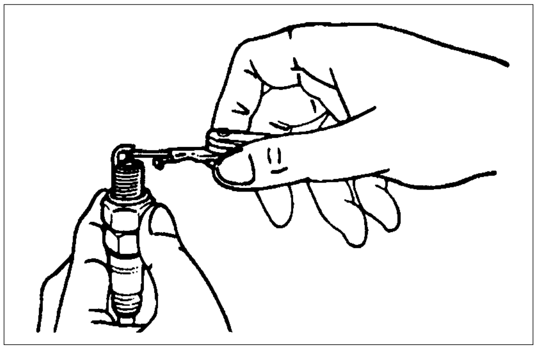
Adjustment

1) Install the engine hood lock assembly (4) and temporarily tighten the bolts securing it.
2) Close the hood.
3) Position the hood so that the stepped portion between the hood (1) and the fender (2) is precisely 1.5 mm (0.06 in) high.
4) Finally tighten the bolts securing the engine hood lock assembly.



5) Turn the buffers (3) counterclockwise until the stepped portion between the hood and the fender disappears.
6) Tighten the hood lock assembly fixing bolts to the specified torque.

Torque	N·m(kgf·m/lb·in)
10 (1.0 / 87)	



Spark Plug Thread

Recondition

Ream thread and recut using commercially available spark plug thread drill (observe manufacturer's instructions).

Removal

Remove thread bush on spark plug. (dimensions (A) = 17mm/0.67in.)

Tighten (Torque)

Spark plug with thread bush into cylinder head - 25N·m (2.5 kgf·m) - use.

TECHNICAL DATA

SOHC Gasoline Engine C24SE

Engine Oil Viscosity

The following engine oils can be used:
A = single-grade oils
B = multigrade oils
C = easy run oils
depending on the outside temperature.

Engine Oil Quality

It is important that the following API and CCMC classes are used:

Engines	Single and multigrade oils	Easy run oils
Petrol	API-SF/CC, SF/CD, SG/CC, SG/CD, CCMC/G4	API-SF/CC, SF/CD, SG/CD CCMC-G5/PD2

Important!

CD engine oils designed by manufacturers specially for diesel engines are not suitable for petrol engines, unless a sufficient performance class for petrol engines (e.g. API-SF/CCMC-G4) is also indicated.

Disposal.

Observe the relevant national regulations when disposing of used oil.

Engine Oil Filling Quantities

Engine Model	Initial filling (litres)	Filling quantity with filter change* (litres)	MIN to MAX (litres)
2.4L	4.80	4.25	1.00

*Up to mark "MAX" on oil dipstick

Oil Pump

Backlash 0.1 to 0.2mm
Gaps in gears opposite housing 0.03 to 0.1mm
Oil pressure at idle speed Engine at operating temperature (>70°C oil and approx. 80°C coolant) 450 - 500 kpa

Oil drain plug M14 × 1.5

Cooling System

Radiator

Type: Cross-flow

Radiator core surface in cm^2: 2000

Cooling system capacity (in litres): 8

Anti-freeze Mixture

Anti-freeze Mixture

Required Quantity (in litres)	Up to-10°C Quantity in litres		Up to-20°C Quantity in litres		Up to-30°C Quantity in litres		Up to-40°C Quantity of litres	
	Water (80%)	Anti-Freeze (20%)	Water (66%)	Anti-Freeze (34%)	Water (56%)	Anti-Freeze (44%)	Water (48%)	Anti-Freeze (52%)
7.2	5.7	1.5	4.7	2.5	4.0	3.2	3.4	3.8

Cooling System (continued)

Fan

Type Visco Clutch Fan
Number of blades 5
Distribution of blades asymmetric
Diameter mm

Radiator cap

Boiling point 123°C
Opening pressure kPa (bar) 120 to 135 (1.20 to 1.35)

Thermostat

Start of opening 92°C
Fully opened 107°C
Type Bypassed

Idle Speeds, CO Content, Ignition Adjustment

Applicable System	Idle speed in min^{-1} (rpm) Manual	CO content in vol. %	Ignition timing in CA BTDC (adjustment ensues at able speed, ignition marks must align) with TDC sensor measuring instrument:
Closed Loop System	825	*<0.4	*** 8 to 12
Open Loop System	825	**$1.0^{+0.2}_{-0.5}$	*** 8 to 12

Note) * CO content adjustment not applicable.
** CO content adjustment refer to Section 6E1 (W/O catalytic converter system)
*** Ignition timing adjustment not possible.

Adjustment Values/Checking Values

Valve clearance	
Inlet	Hydraulic valve lash adjustment
Outlet	No adjustment necessary
Spark plugs - electrode gap	1.0 ~ 1.1mm
Compression	The difference in compression between the individual cylinders in the engine must not exceed 100 kPa (1 bar).
Pressure loss	The pressure loss of an engine in perfect condition per cylinder is not more than max. 25%

Cylinder Head

Cylinder Head Gasket		
Thickness - installed	mm	1.2
Valve seat width at cylinder head		
inlet	mm	1.0 to 1.5

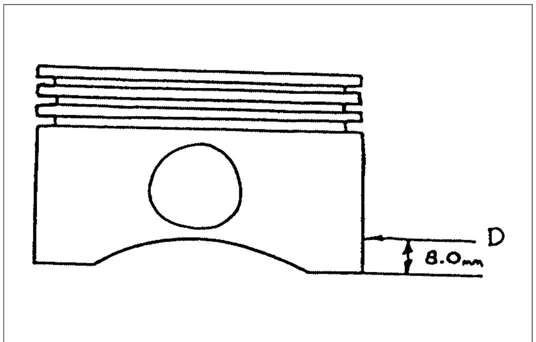
Piston diameter must be measured at the position "D".
*inclusive



Cylinder Bore

Rebore cylinder — Permissible oversize to 0.5mm (see parts microfiche)

After reboring, invalidate original crankcase housing coefficient and drive in new oversize coefficient

Permissible out-of-round: 0.013mm
Permissible taper: 0.013mm
Measure out-of-round in bore at 4 different heights

Piston projection above upper edge of cylinder block
0.40mm

Piston

Type — Recessed pistons

Clearance — For short-blocks and cylinder blocks with complete pistons, the clearance is 0.02 to 0.04mm

For replacement (oversize), depending on available pistons, a clearance of 0.02 to 0.04mm is permissible

Crankshaft, Cylinder Block (continued)

Piston Rings

			2.4L
Square ring	Height	mm	1.2
Tapered ring	Height	mm	1.5
Oil scraper	Height	mm	2.5
Ring gap offset			180°

Note that the upper steel band ring gap is offset 25 to 50mm to the left and the lower 25 to 50mm to the right opposite the intermediate ring gap.

Piston Pin

Length		mm	61.5
Diameter		mm	21
Type			Shrunk into con-rod
Play		mm	2.4L
	in piston		0.010-0.015
	in con-rod		none
Installation			When installing piston pins, heat con-rods to approx. 280°C in oil bath. This temperature should under no circumstances be exceeded.

Crankshaft, Cylinder Block (continued)

The permissible weight variation of con-rods without piston and bearing shell inside an engine is 8 g.
As the con-rods do not have balancing studs, reworking is not possible.
Con-rods can only be replaced in sets.

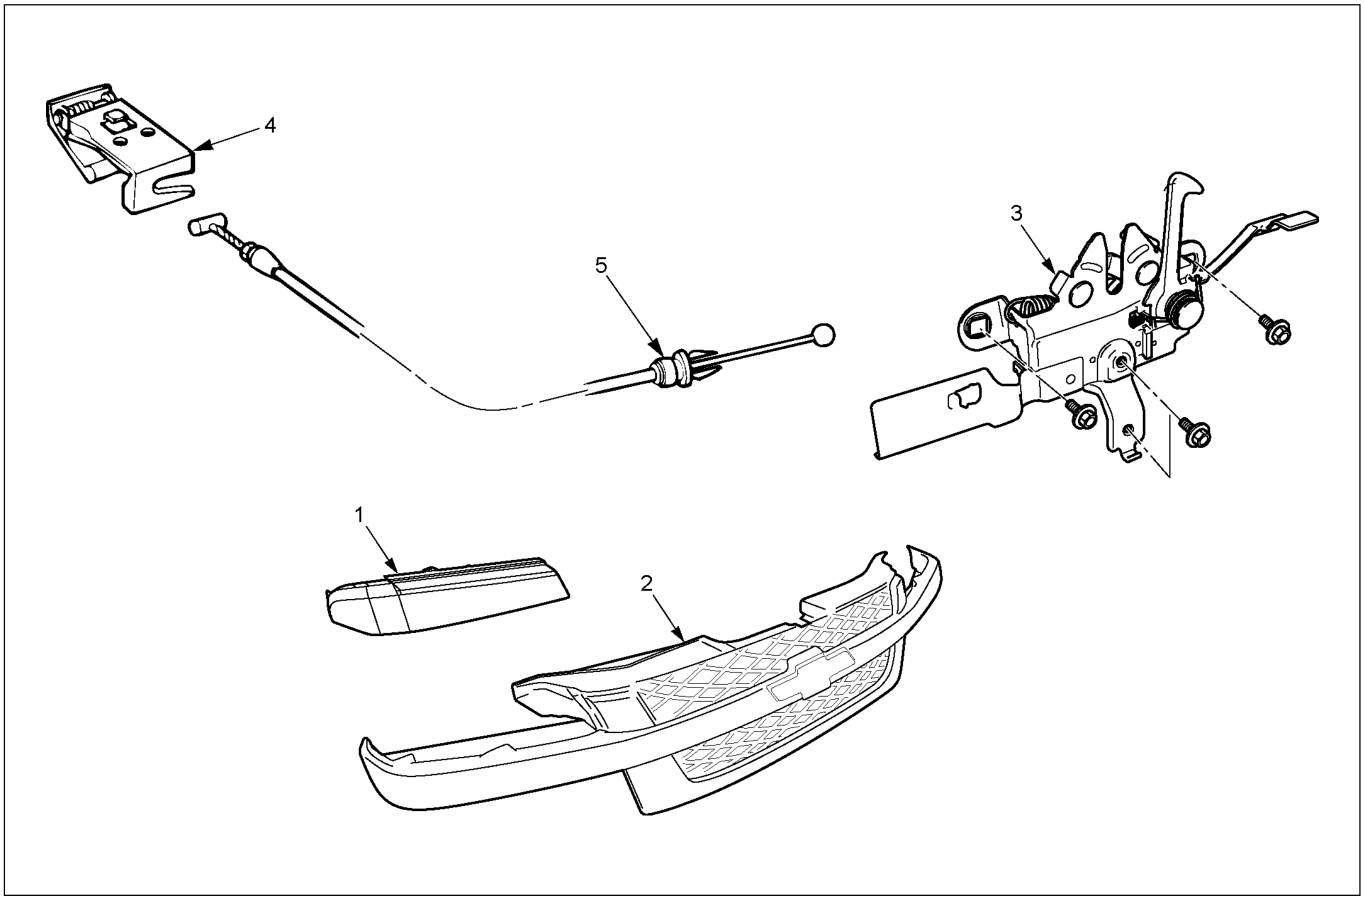
ENGINE HOOD LOCK (B TYPE)

REMOVAL AND INSTALLATION



RTW52BMF000101

Removal Steps

▲ 1. Front combi lamp assembly
▲ 2. Radiator grille
▲ 3. Engine hood lock assembly
4. Hood lock control lever
▲ 5. Control cable

Installation Steps

▲ 5. Control cable
4. Hood lock control lever
▲ 3. Engine hood lock assembly
2. Radiator grille
1. Front combi lamp assembly

Important Operations - Removal

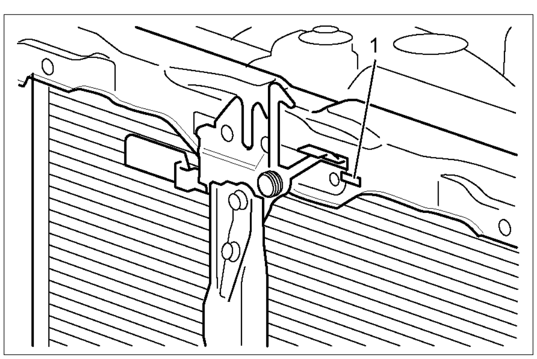
1. Front combi lamp assembly

2. Radiator Grille

Refer to the Radiator Grille in this section.

3. Engine Hood Lock Assembly

Apply setting marks (1) to the hood lock assembly and the body prior to removal.



RUW52BSH002801

5. Control Cable

Pull out the control cable toward the passenger compartment.

Con-rod

Permissible, weight variation of con-rods without pistons and bearing shells within an engine 8 g.
As the con-rods have no counterweights, re-working is not possible. Con-rods must be replaced only as a set.

Crankshaft Grinding Dimensions					
	Crankshaft bearing journals I, II, III, IV, V diameter in mm/colour code	Guide bearings III width in mm	Con-Rod bearing journals 1 to 4 diameter in mm	 width in mm	Con-rod width in mm
	Standard Size for Production and Service				
	from 57.974 white to 57.981 over 57.981 green to 57.988 over 57.988 brown to 57.995	26.002 25.950	48.988 48.970	26.580 26.450	26.390 26.338

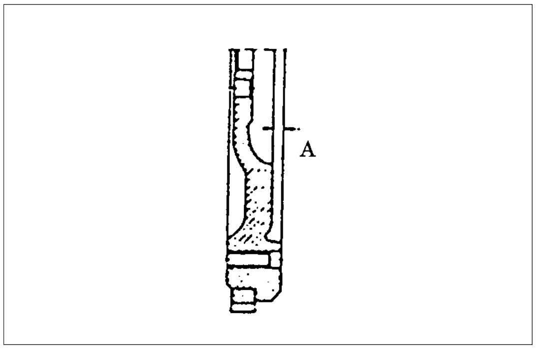
Crankshaft, Cylinder Block (continued)

Crankshaft and con-rod journal	Permissible out-of-round: 0.04mm
Out-of-round	Permissible variation of middle crankshaft bearing journal when seating shaft into cylinder block: 0.03mm
Permissible end play	0.05 to 0.152mm
Permissible main bearing play	Bearing I to V0.015 to 0.04mm
Permissible con-rod play	0.006 to 0.031mm
Permissible con-rod and play	0.07 to 0.24mm

Crankshaft, Cylinder Block (continued)

Flywheel

Starter ring gear	Before fitting, heat ring gear to 180°C - 230°C
Lateral run-out	Permissible lateral run-out of installed starter ring gear to flywheel: 0.5mm
Precision turning	Permissible removal of material in clutch disc lining surface area: 0.3mm In order to achieve the functional relationship again after removal of material, the same removal of material must take place on the fore part of the flywheel (contact for clutch assembly)



Dimension A: 2.1 to 2.2mm

Cylinder block

Top deck flatness	mm	0.05
Cylinder block height	mm	280±0.075

Recommended Torque Values

	N·m	(kgf·m)	
Bearing cover to cylinder block	60 [1]	6.1	+40° to 50°

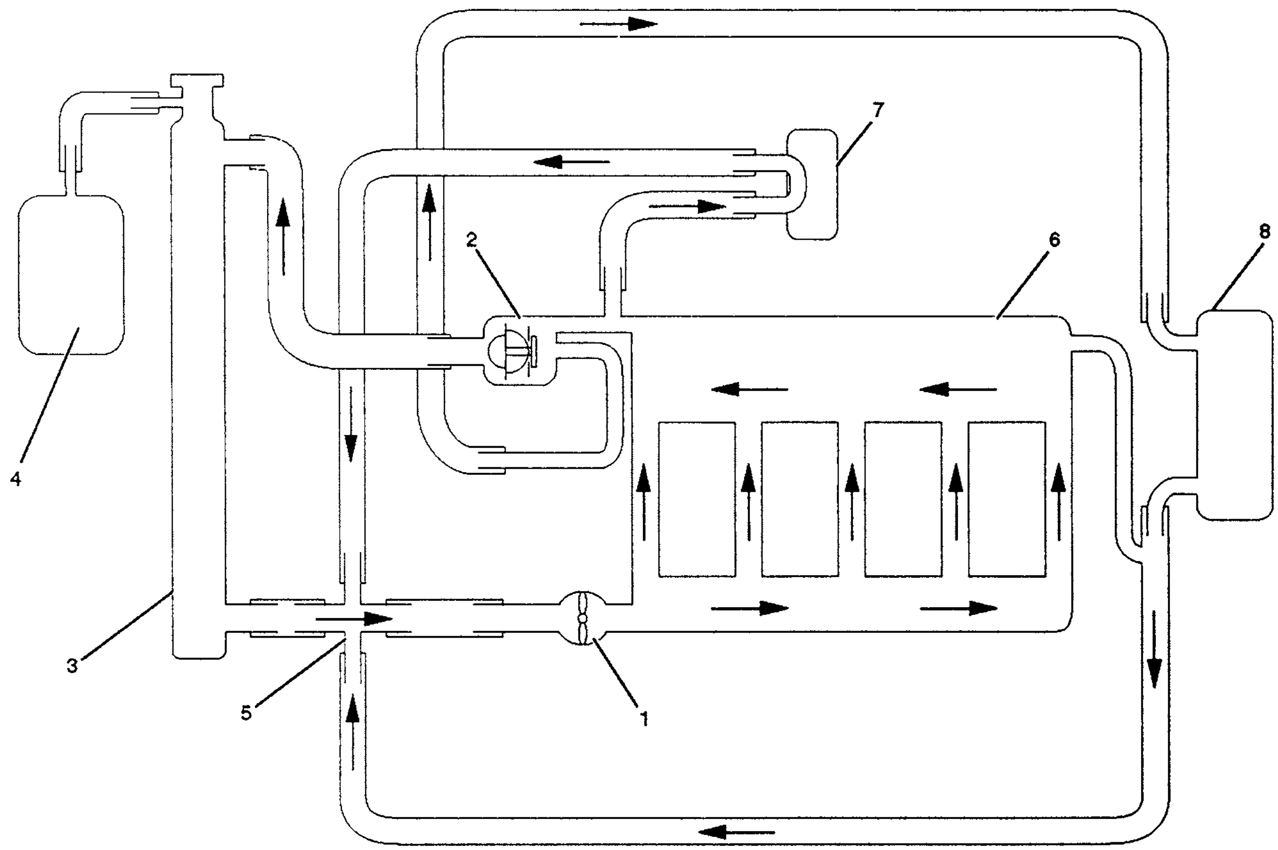
SECTION 6B

ENGINE COOLING

TABLE OF CONTENTS

PAGE

General Description



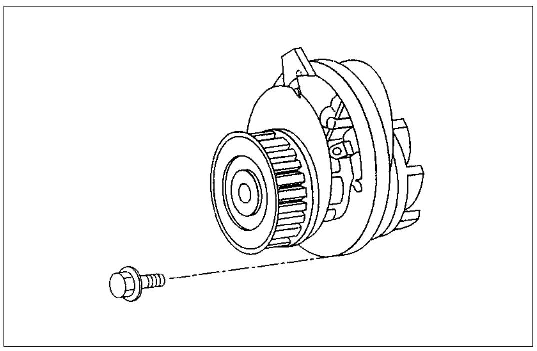
Legend

1 Water Pump
2 Thermostat
3 Radiator
4 Reserve Tank
5 Coolant Distributor
6 Cylinder Block and Head
7 Throttle Body
8 Heater

The Cooling System is a pressurized type, where the water pump, which is cambelt driven, forces the circulation of the coolant through the cylinder block and head. The thermostat regulates the flow of coolant between the radiator and the bypass circuit. The heater is part of the bypass circuit. The throttle body pre-heat is a separate circuit which is not regulated by the thermostat. An oil cooler may be fitted as part of this circuit.

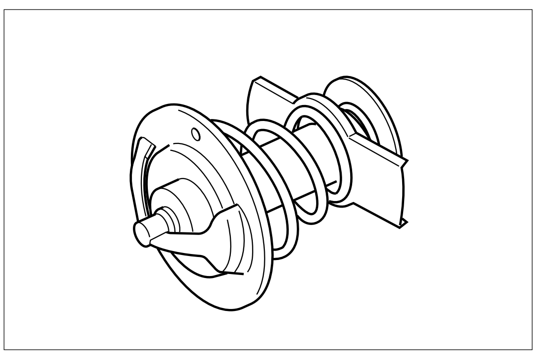
Service Precaution

CAUTION:
Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.



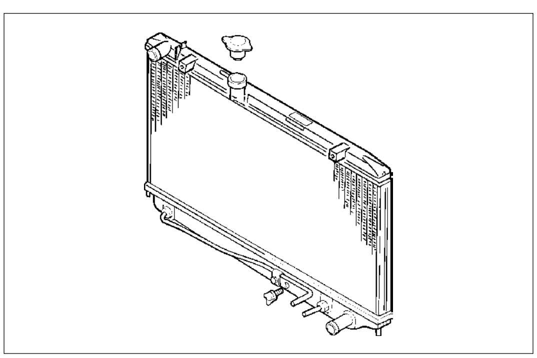
Water pump

The water pump is centrifugal type and is driven by timing belt.



Thermostat

The thermostat is a bypass type and is a wax pellet type with a air hole.



110RS001

Radiator

The radiator is a flow type with corrugated fins.

Antifreeze Solution

- Calculating mixing ratio

Mixing ratio

$$= \frac{\text{Antifreeze solution (Lit/gal.)}}{\text{Antifreeze solution (Lit/gal.) + Water (Lit/gal.)}}$$

NOTE: Antifreeze solution + Water = Total cooling system capacity.

- **Total Cooling System Capacity**

  8Lit

- Mixing ratio

  Check the specific gravity of engine coolant in the cooling system temperature ranges from 0°C to 50°C using a suction type hydrometer, then determine the density of the engine coolant by referring to the table.

NOTE: The LLC is 50% at all environment in order to prevent the corrosion of cooling system parts.

Diagnosis
Engine Cooling Trouble

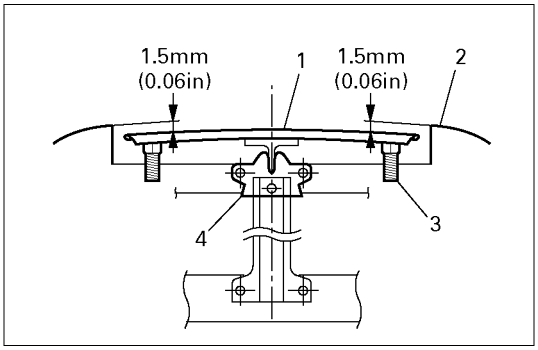
Condition	Possible cause	Correction
Engine overheating	Low Engine Coolant level	Replenish
	Thermo mater unit faulty	Replace
	Faulty thermostat	Replace
	Faulty Engine Coolant temperature sensor	Repair or replace
	Clogged radiator	Clean or replace
	Faulty radiator cap	Replace
	Low engine oil level or use of improper engine oil	Replenish or change oil
	Clogged exhaust system	Clean exhaust system or replace faulty parts
	Faulty Throttle Position sensor	Replace throttle valve assembly
	Open or shorted Throttle Position sensor circuit	Repair or replace
	Damaged cylinder head gasket	Replace
	Loosen V-belt tension	Adjust belt tension or replace.
	Collapsed hoses	Replace
	Faulty Fan clutch	Replace
Engine overcooling	Faulty thermostat	Replace
Engine slow to warm-up	Faulty thermostat	Replace
	Thermo unit faulty	Replace

Important Operations - Installation

5. Control Cable

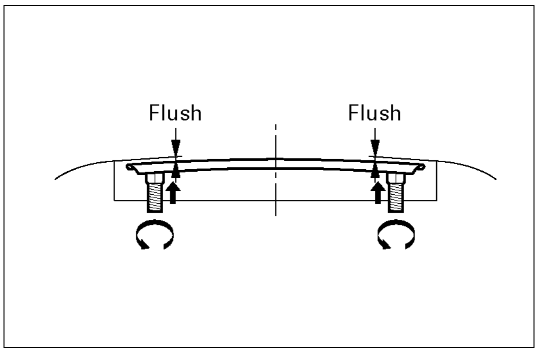
Reroute the control cable to its original position, and check to see if the lock assembly and control lever work normally.

3. Engine Hood Lock Assembly



Adjustment

6) Install the engine hood lock assembly (4) and temporarily tighten the bolts securing it.
7) Close the hood.
8) Position the hood so that the stepped portion between the hood (1) and the fender (2) is precisely 1.5 mm (0.06 in) high.
9) Finally tighten the bolts securing the engine hood lock assembly.



10) Turn the buffers (3) counterclockwise until the stepped portion between the hood and the fender disappears.
6) Tighten the hood lock assembly fixing bolts to the specified torque.

Torque	N·m(kgf·m/lb·in)
10 (1.0 / 87)	

Draining and Refilling Cooling System

Before draining the cooling system, inspect the system and perform any necessary service to ensure that it is clean, does not leak and is in proper working order. The engine coolant level should be between the "MIN" and "MAX" lines of reserve tank when the engine is cold. If low, check for leakage and add engine coolant up to the "MAX" line. There should not be any excessive deposit of rust or scales around the radiator cap or radiator filler hole, and the engine coolant should also be free from oil.
Replace the engine coolant if excessively dirty.

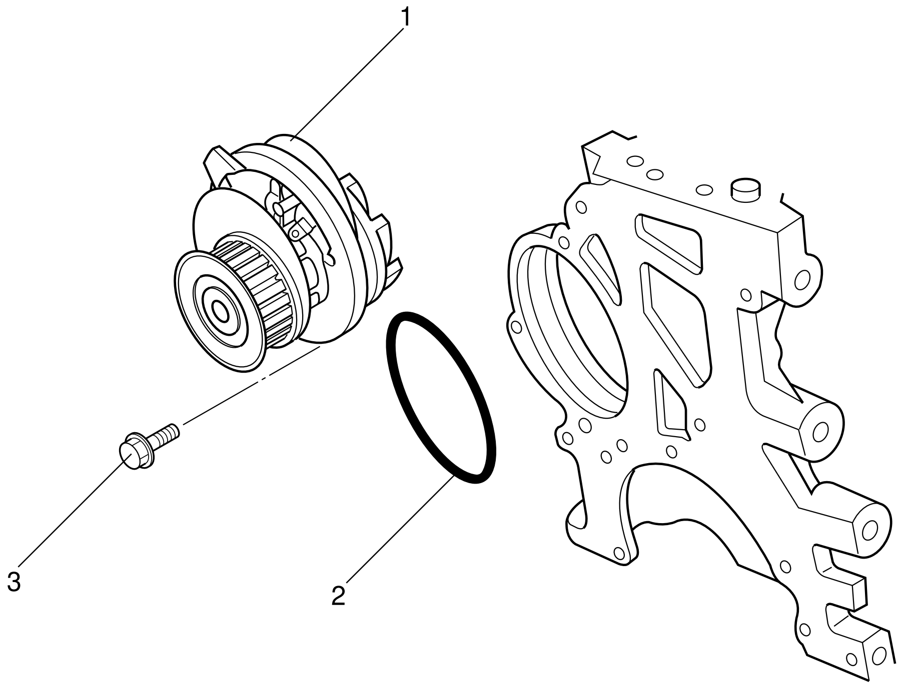
1. Completely drain the cooling system by opening the drain plug at the bottom of the radiator.
2. Remove the radiator cap.

WARNING: TO AVOID THE DANGER OF BEING BURNED, DO NOT REMOVE THE CAP WHILE THE ENGINE AND RADIATOR ARE STILL HOT. SCALDING FLUID AND STEAM CAN BE BLOWN OUT UNDER PRESSURE.

3. Disconnect all hoses from the engine coolant reserve tank. Scrub and clean the inside of the reserve tank with soap and water. Flush it well with clean water, then drain it. Install the reserve tank and hoses.
4. Refill the cooling system with the engine coolant using a solution that is at least 50 percent antifreeze.
5. Fill the radiator to the base of the filler neck. Fill the engine coolant reserve tank to "MAX" line when the engine is cold.
6. Block the drive wheels and firmly apply the parking brake and place the shift lever in the "NEUTRAL" position.
7. Remove the radiator cap. Start the engine and warm it up at 2,500 - 3,000 rpm for about 30 minutes.
8. When the air comes out from the radiator filler neck and the engine coolant level has gone down, replenish with the engine coolant. Repeat this procedure until the engine coolant level does not go down. Then stop the engine and install the radiator cap. Let the engine cool down.
9. After the engine has cooled, replenish with engine coolant up to the "MAX" line of the reserve tank.
10. Start the engine. With the engine running at 3,000 rpm, make sure there is no running water sound from the heater core (behind the center console).
11. If the running water sound is heard, repeat steps 8 to 10.

Water Pump

Water Pump and Associated Parts



Legend
1 Water Pump Assembly
2 O-Ring
3 Bolt

Removal

1. Disconnect battery ground cable.
2. Drain coolant.
3. Disconnect radiator hose (on inlet pipe side).
4. Remove timing belt, refer to "Timing Belt" in this manual.
5. Remove water pump assembly.

Inspection

Make necessary repair and parts replacement if extreme wear or damage is found during inspection. Should any of the following problems occur, the entire water pump assembly must be replaced:

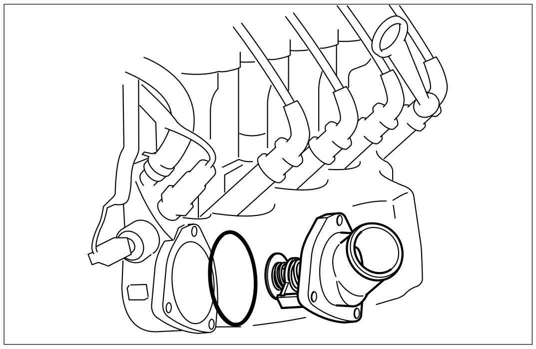
- Crack in the water pump body
- EC leakage from the seal unit
- Play or abnormal noise in the bearing
- Cracks or corrosion in the impeller

Installation

1. Before installing water pump, coat sealing surface with silicon grease.
2. Install water pump assembly and tighten bolts to the specified torque.

   Torque: 25 N·m (2.5 kgf·m)
3. Timing belt
   - Install timing belt, refer to timing belt installation step in "Timing Belt" in this manual.
4. Connect radiator hose and replenish EC.
5. Connect battery ground cable.

Thermostat



Removal

1. Disconnect battery ground cable.
2. Drain engine coolant from the radiator and engine.
3. Disconnect radiator hose from the inlet pipe.
4. Remove thermostat housing.
5. Remove thermostat from thermostat housing.

Inspection

Suspend the thermostat in a water-filled container using thin wire. Place a thermometer next to the thermostat.
Do not directly heat the thermostat.
Gradually increase the water temperature. Stir the water so that the entire water is same temperature.
Confirm the temperature when the valve first begins to open.

Valve opening temperature 92°C (197.6°F)

Confirm the temperature when the valve is fully opened.

Valve full open temperature 107°C(224.6°F)

Make necessary repair and parts replacement if extreme wear or damage is found during inspection.

Installation

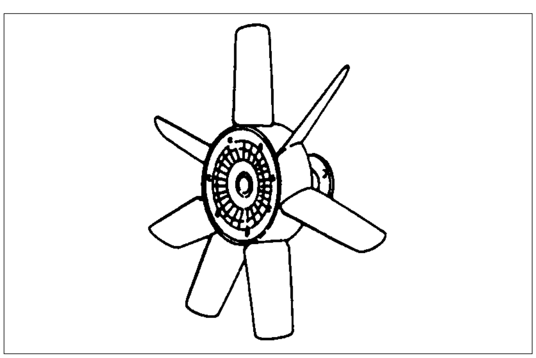
1. Before installing thermostat, coat sealing surface with silicon grease.
2. Install O-ring.
3. Install thermostat housing and tighten bolts to the specified torque.

   Torque: 15 N·m (1.5 kgf·m)
4. Installation rubber hose.
5. Replenish engine coolant (EC).
6. Start engine and check for EC leakage.

Fan Clutch with Cooling Fan

Inspection and Repair

Make necessary correction or parts replacement if wear, damage or any other abnormal condition are found through inspection.



Visually inspect for damage, leak (silicon grease) or other abnormal conditions.

1. Inspection (on-vehicle)

1) Turn the fan clutch by hand when in a low temperature condition before starting the engine, and confirm that it can be turned readily.

2) Start the engine to warm it up until the temperature at the fan clutch portion gets to around 80°C. Then stop the engine and confirm that the fan clutch can be turned with considerable effort (clutch torque) when turned by hand.

If the fan clutch rotates more readily, however, this indicates that the silicon grease is leaking internally. Replace the fan clutch with a new one.

2. **Inspection (in unit)**

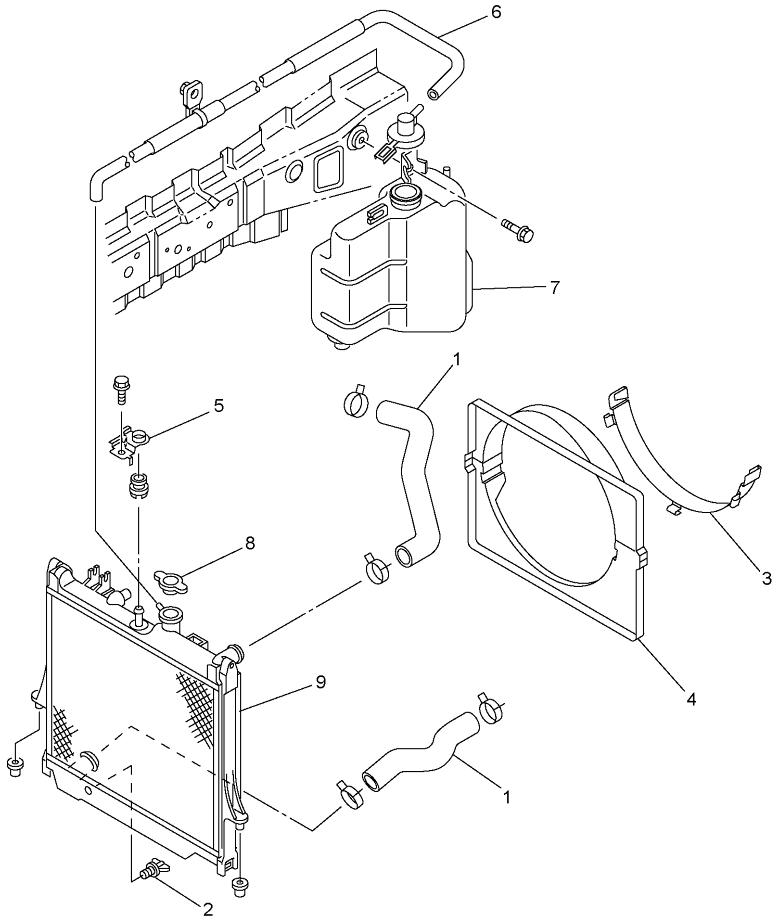
   Warm up the bimetal of the fan clutch by using the heat gun until the temperature gets to about 80°C when measured with the thermistor. Then confirm that the fan clutch can be turned with considerable effort (clutch torque).

   If the fan clutch retates more readily at this time, this indicates that the silicon grease is leaking internally.

   Replace the fan clutch with a new one.

Radiator

Radiator and Associated Parts

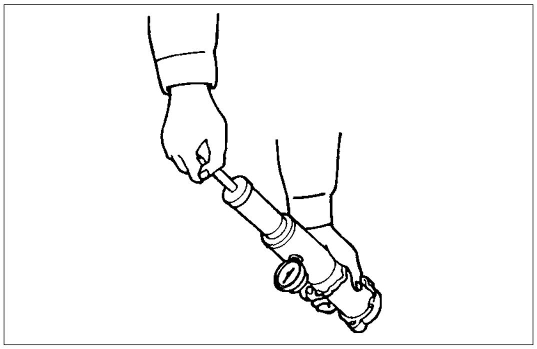


Legend

1 Radiator Hose
2 Drain Plug
3 Fan Guide, Lower
4 Fan Guide
5 Bracket
6 Reserve Tank Hose
7 Reserve Tank
8 Radiator Cap
9 Radiator Assembly

Removal

1. Disconnect battery ground cable.
2. Loosen a drain plug to drain engine coolant (EC).
3. Disconnect radiator inlet hose and outlet hose.
4. Disconnect the reserve tank hose from radiator.
5. Lift out the radiator assembly, taking care not to damage the radiator core.



Inspection

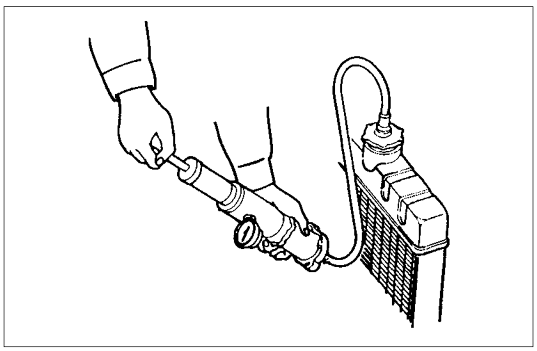
Radiator Cap

Measure the valve opening pressure of the pressurizing valve with a radiator filler cap tester.
Replace the cap if the valve opening pressure is outside the standard range.

Valve opening pressure kPa (psi) 88.3 – 103.0 (13.5 – 15.7)

Cap tester: 5-8840-0277-0
Adapter: 5-8840-2603-0
Check the condition of the vacuum valve in the center of the valve seat side of the cap. If considerable rust or dirt is found, or if the valve seat cannot be moved by hand, clean or replace the cap.

Valve opening vacuum kPa (psi) 1.9 - 4.9 (0.28 - 0.71)



Radiator Core

1. A bent fin may result in reduced ventilation and overheating may occur. All bent fins must be straightened. Pay close attention to the base of the fin when it is being straightened.
2. Remove all dust, bugs and other foreign material.

Flushing the Radiator

Thoroughly wash the inside of the radiator and the engine coolant passages with cold water and mild detergent. Remove all sign of scale and rust.

Cooling System Leakage Check

Use a radiator cap tester to force air into the radiator through the filler neck at the specified pressure of 196 kPa (28.5 psi) with a cap tester:

- Leakage from the radiator
- Leakage from the coolant pump
- Leakage from the water hoses
- Check the rubber hoses for swelling.

Cap tester: 5-8840-0277-0
Adapter: 5-8840-2603-0

Installation

1. Install radiator assembly, taking care not to damage the radiator core.
2. Install the radiator assembly.
3. Connect reserve tank hose.
4. Connect radiator inlet hose and outlet hose.
5. Pour engine coolant up to filler neck of radiator, and up to MAX mark of reserve tank.
   Important operation (in case of 100% engine coolant change) procedure for filling with engine coolant.

- Remove radiator cap.
- Fill with engine coolant to the radiator filler neck.
- Fill with EC to the "MAX" line on the reservoir tank.
- Start the engine with the radiator cap removed and bring to operating temperature by running engine at 2,500 - 3,000 rpm for 30 minutes.
- By engine coolant temperature gauge reading make sure that the thermostat is open.
- If air bubbles come up to the radiator filler neck, replenish with engine coolant. Repeat until the EC level does not drop any further. Install the radiator cap and stop the engine.
- Replenish engine coolant to the "MAX" line on the reservoir tank and leave as it is until the engine gets cool.
- After the engine gets cool, start the engine and make sure there is no water running noise heard from the heater core while the engine runs at 3000 rpm.
- Should water running noise be heard, repeat the same procedure from the beginning.

Main Data and Specifications

General Specifications

Cooling system	Engine Coolant forced circulation
Radiator	Tube type corrugated (2 tube in row)
Heat radiation capacity	66.3 kcal/h
Heat radiation area	7.08 m^2
Radiator front area	028 m^2
Radiator dry (weight)	3.1 kg
Radiator cap valve opening pressure	93.3 – 122.7 kpa
Engine coolant capacity	3.4L
Engine coolant pump	Centrifugal type
Thermostat	Bypass type
Engine coolant total capacity	8lit

** Not applicable to EVAP Emission Control System

When working on the fuel system, there are several things to keep in mind:

- Any time the fuel system is being worked on, disconnect the negative battery cable except for those tests where battery voltage is required.
- Always keep a dry chemical (Class B) fire extinguisher near the work area.
- Replace all pipes with the same pipe and fittings that were removed.
- Clean and inspect "O" rings. Replace if required.
- Always relieve the line pressure before servicing any fuel system components.
- Do not attempt repairs on the fuel system until you have read the instructions and checked the pictures relating to that repair.
- Adhere to all Notices and Cautions.

All gasoline engines are designed to use only unleaded gasoline. Unleaded gasoline must be used for proper emission control system operation.

Its use will also minimize spark plug fouling and extend engine oil life. Using leaded gasoline can damage the emission control system and could result in loss of emission warranty coverage.

All cars are equipped with an Evaporative Emission Control System. The purpose of the system is to minimize the escape of fuel vapors to the atmosphere.

Service Precaution

CAUTION:

Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Fuel Metering

Engine Control Module (ECM) is in complete control of this fuel delivery system during normal driving conditions.

The intake manifold function, like that of a diesel, is used only to let air into the engine. The fuel is injected by separate injectors that are mounted over the intake manifold.

The Manifold Absolute Pressure (MAP) sensor measures the changes in the intake manifold pressure which result from engine load and speed changes, which the MAP sensor converts to a voltage output.

This sensor generates the voltage to change corresponding to the flow of the air drawn into the engine.

The changing voltage is transformed into an electric signal and provided to the ECM.

With receipt of the signals sent from the MAP sensor, Intake Air Temperature sensor and others, the ECM determines an appropriate fuel injection pulse width feeding such information to the fuel injector valves to effect an appropriate air/fuel ratio.

The Multiport Fuel Injection system utilizes an injection system where the injectors turn on at every crankshaft revolution. The ECM controls the injector on time so that the correct amount of fuel is metered depending on driving conditions.

Two interchangeable "O" rings are used on the injector that must be replaced when the injectors are removed.

The fuel rail is attached to the top of the intake manifold and supplies fuel to all the injectors.

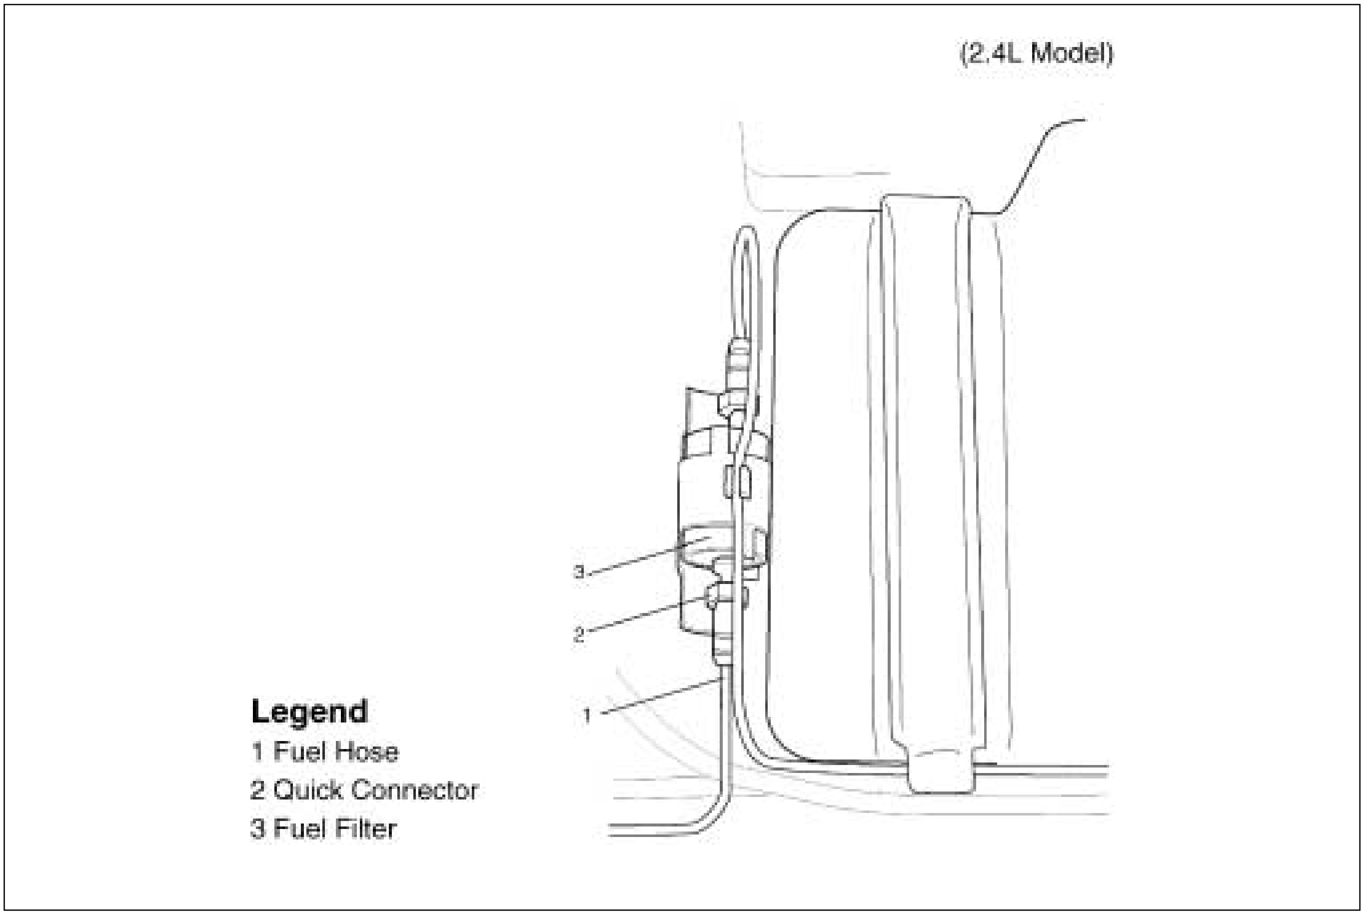
Fuel is recirculated through the rail continually while the engine is running. This removes air and vapors from the fuel as well as keeping the fuel cool during hot weather operation.

The fuel pressure control valve that is mounted on the fuel rail maintains a pressure differential across the injectors under all operating conditions. It is accomplished by controlling the amount of fuel that is recirculated back to the fuel tank based on engine demand.

See Section "Driveability and Emission" for more information and diagnosis.

Fuel Filter

Fuel Filter and Associated Parts



Removal

CAUTION: When repair to the fuel system has been completed, start engine and check the fuel system for loose connections or leakage. For the fuel system diagnosis, see Section "Driveability and Emissions".

(2.4L)

1. Disconnect battery ground cable.
2. Disconnect the quick connector from the fuel filter.
3. Pull off fuel filter from the holder to side member side.
4. Remove the fuel filter.

Fuel Filter

Inspection

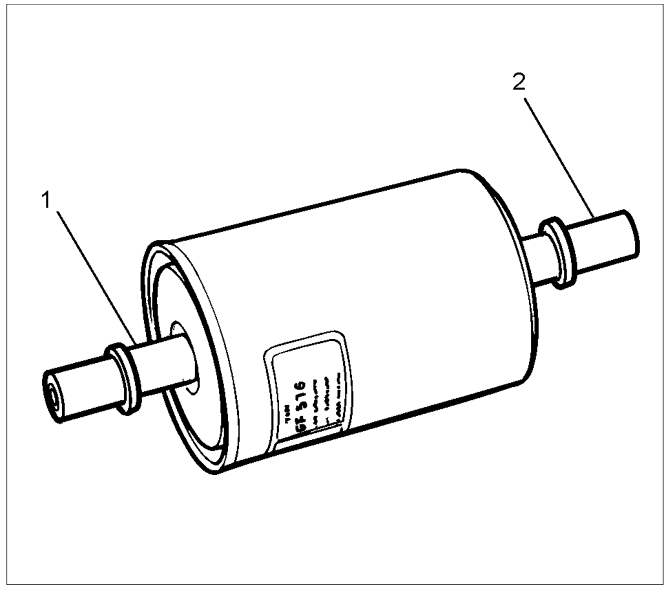
1. Replace the fuel filter if the fuel leaks from fuel filter body or if the fuel filter body itself is damaged.
2. Replace the filter if it is clogged with dirt or sediment.

Installation

1. Install the filter to holder from fuel tank front side.

NOTE: Attend direction of fuel filter. (1) to engine side (2) to fuel tank side.

NOTE: Verify to hang holder hook to fuel filter.



RTW36CSH000301

2. Connect the quick connector from the fuel tube to the fuel filter.

NOTE: Pull of the left checker into the fuel pipe.

NOTE: Refer to “Fuel Tube/Quick Connector Fittings” in this section when performing any repairs.

3. Tighten fuel filler cap until at least one click are heard.
4. Connect the battery ground cable.

Inspection

After installation, start engine and check for fuel leakage.

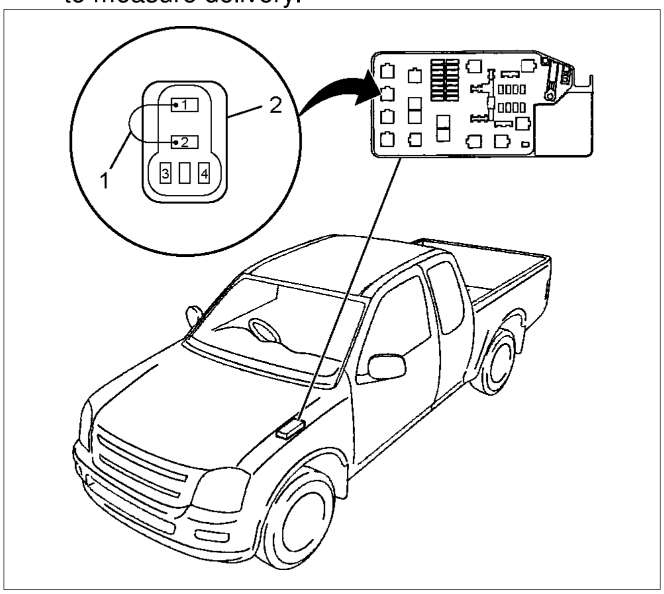
In–Tank Fuel Filter

The filter is located on the lower end of fuel pickup tube in the fuel tank. It prevents dirt from entering the fuel pipe and also stops water unless the filter is completely submerged in the water. It is a selfcleaning type, not requiring scheduled maintenance. Excess water and sediment in the tank restricts fuel supply to the engine, resulting in engine stoppage. In such a case, the tank must be cleaned thoroughly.

Fuel Pump Flow Test

If reduction of fuel supply is suspected, perform the following checks.

1. Make sure that there is fuel in the tank.
2. With the engine running, check the fuel feed pipe and hose from fuel tank to injector for evidence of leakage. Retighten, if pipe or hose connection is loose. Also, check pipes and hoses for squashing or clogging.
3. Insert the hose from fuel feed pipe into a clean container, and check for fuel pump flow rate.
4. Connect the pump relay terminals (2) with a jumper wire (1) as shown and start the fuel pump to measure delivery.



RTW36CSH000201

CAUTION: Never generate sparks when connecting a jumper wire.

Delivery	Delivery
15 seconds	0.38 liters minimum

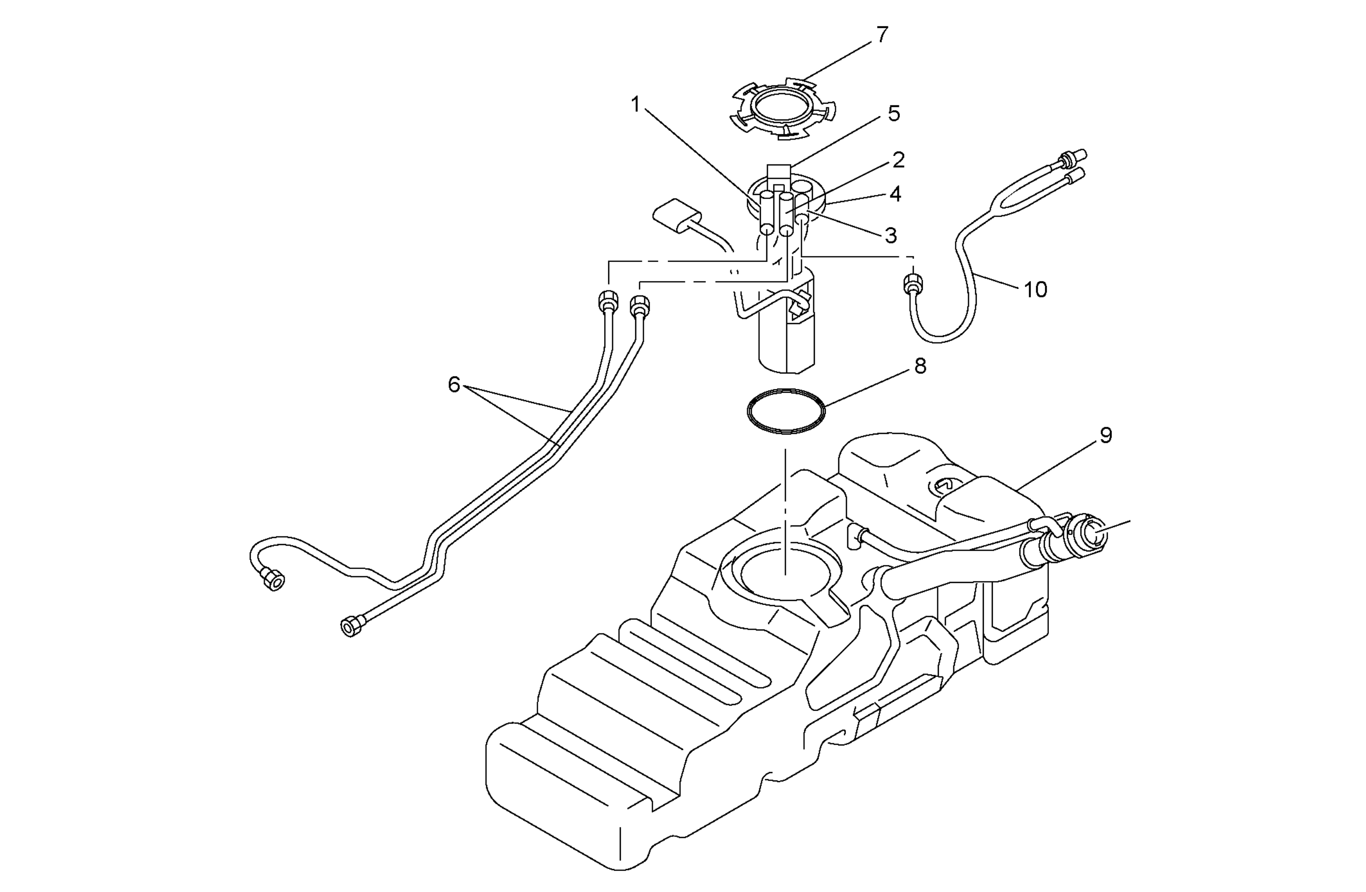
If the measure value is out of standard, conduct the pressure test.

Pressure test

For the pressure test to the fuel system, see Section 6E “Fuel Control System".

Fuel Pump

Fuel Pump and Associated Parts



RTW46FMF000401

Legend

(1) Fuel Feed Port
(2) Fuel Return Port
(3) Fuel Emission Port

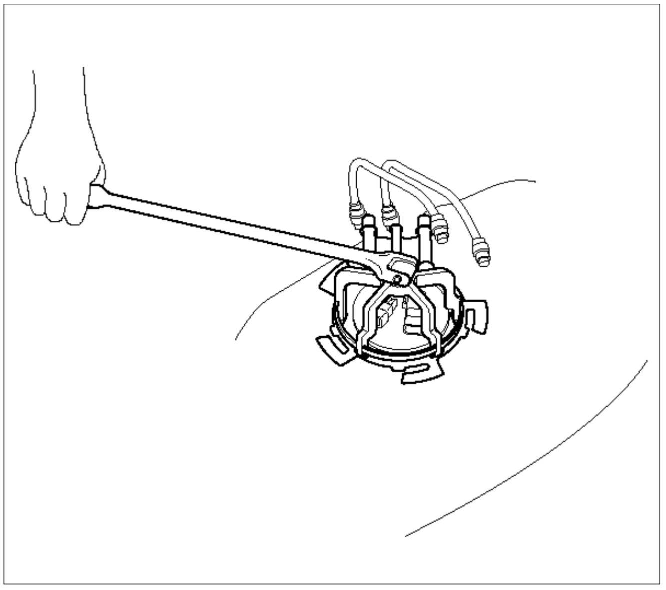
(6) Fuel Tube/Quick Connector
(7) Retainer Ring (Fuel Pump Lock)
(8) Seal; Fuel Pump
(9) Fuel Tank Assembly
(10) Evapo Tube/Quick Connector

Removal

CAUTION: When repair to the fuel system has been completed, start engine and check the fuel system for loose connection or leakage. For the fuel system diagnosis, see Section “Driveability and Emission".

1. Remove fuel tank assembly (9). Refer to “Fuel Tank Removal" in this section.
2. Disconnect the quick connector (6) into the fuel tube from fuel pump.
3. Disconnect the quick connector (10) into the evapo tube from fuel pump.

3. Remove the retainer ring (7) from the fuel tank with the removal tool 5-8840-2602-0.



140R100035

4. Remove slowly the fuel pump (4) from the fuel tank as no bend float arm.

NOTE: Cover opening for the fuel pump on fuel tank to prevent any dust enthering.

5. Discard fuel pump seal (8) because it cannot be reusable.

Installation

1. Clean the seal surface of the fuel tank and the fuel pump.

NOTE: If there is dust on the seal surface, it becomes cause of fuel leak.

2. Install the new fuel pump seal (8) to opening of the fuel tank as along the groove.
3. Install slowly the fuel pump (4) into the fuel tank as no bend float arm.
4. Set flange of the fuel pump on fuel pump seal as mating convexity of the fuel pump and reentrant of the fuel tank.
5. Lock slowly the retainer ring (7) to the fuel tank with the remover tool 5-8840-2602-0.
6. Connector the quick conector (10) into the evapo tube to fuel pump.
7. Connect the quick connector (6) into the fuel tube to fuel pump.

NOTE: Pull off the left ckecker into the fuel pipe.

NOTE: Refer to “Fuel Tube/Quick Connector Fittings” in this section when performing any repairs.

8. Check leak.

Methed of leak check.

(1) Plug end of quick connector and breather hose (Pull off the breather hose from fuel tank) and tighten fuel filler cap until at least one click are heard.

(2) Apply water soap around the fuel pump seal area.

(3) Pressure air into the fuel tank from end of breather pipe at 5psi (34.3 kPa/2.8kgf/cm^2) over 15 seconds.

(4) Verify no bubbles around the fuel pump seal area.

8. Install the fuel tank assembly (9).

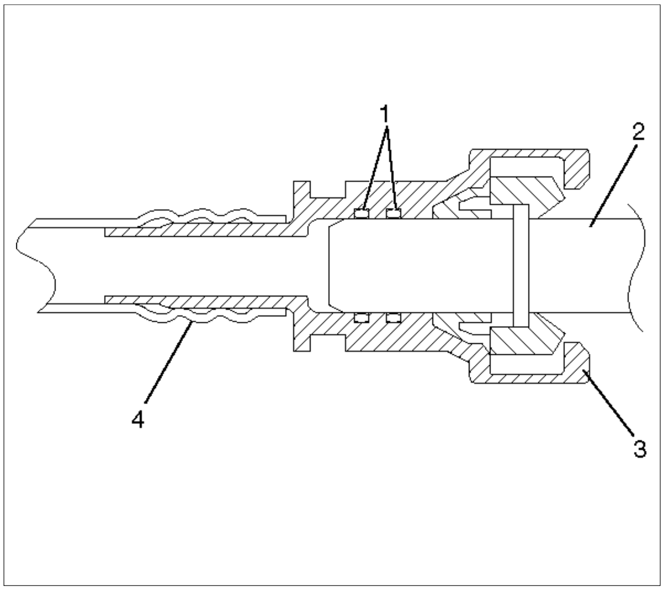
NOTE: Refer to “Install the fuel tank” in this section.

Fuel Tube / Quick – Connector Fittings

Precautions

- Do not light a match or create a flame.
- Keep flames away from your work area to prevent flammable materials from catching fire.
- Disconnect battery ground cable to prevent electrical shorts.
- Pre-treat piping system or associated parts from thermal damage or from spattering when welding or similar heat-generating work.

Cautions During Work



140R100032

Legend

(1) O-ring
(2) Port
(3) Connector
(4) Plastic Tube

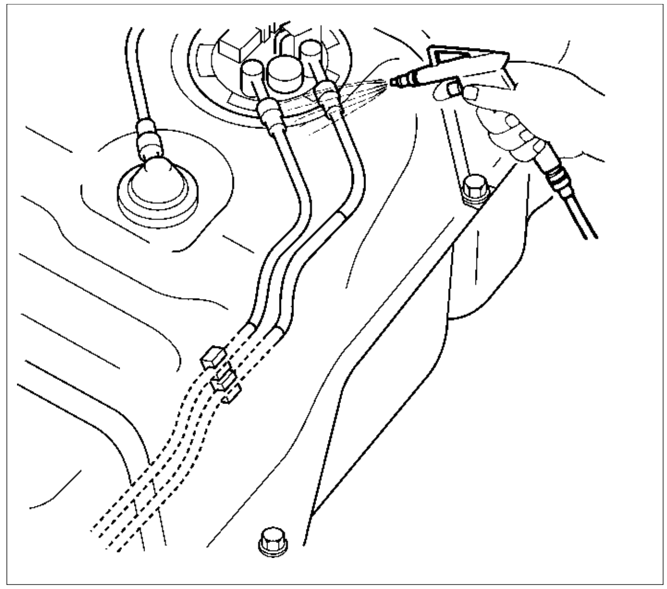
Do not expose the assembly to battery electrolyte or do not wipe the assembly with a cloth used to wipe off spilt battery electorolyte.

Piping that has been splattered with battery electrolyte or battery electrolyte soaked cloth that was wiped on the piping cannot be used.

Removal

1. Open the fuel cap to relieve the fuel pressure in the tank.

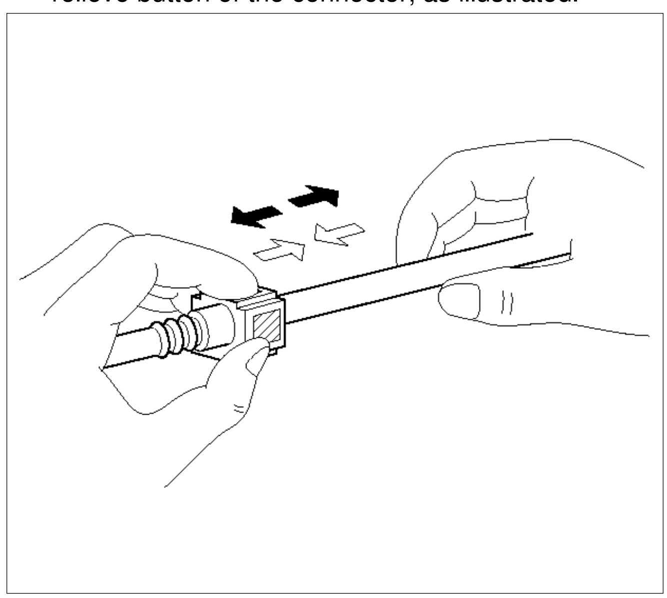
   Use compressed air to remove any dirt on the fuel quick connect fittings prior to disconnecting the fittings.



141R100002

   When disconnecting the fuel pipe, cover the area with a cloth to prevent fuel from splashing as the fuel pipe may still have some pressure in it.

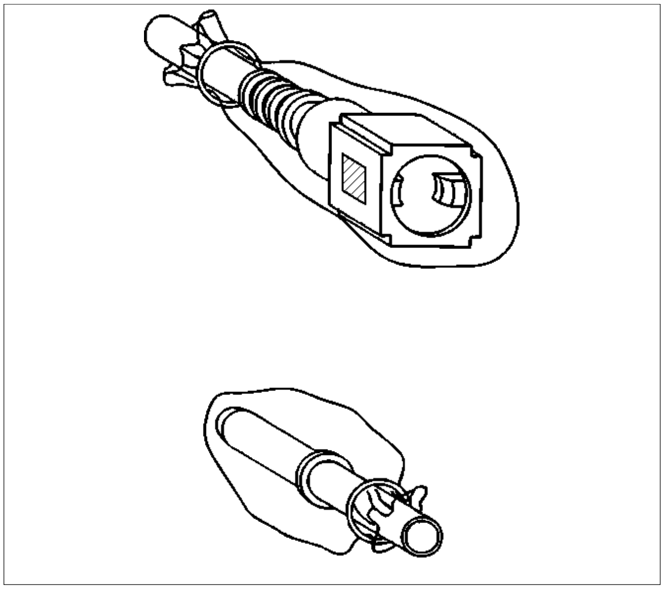
2. For removal of the quick connector, hold the quick connector in one hand, and pull out the connentor with the other hand while pressing the square relieve button of the connector, as illustrated.



140R100037

NOTE: Do not use tools of any kind. Only use bare hands when disconnecting the connector. Use a lubricant (light oil) and/or push and pull the connector until the pipe is disconnected.

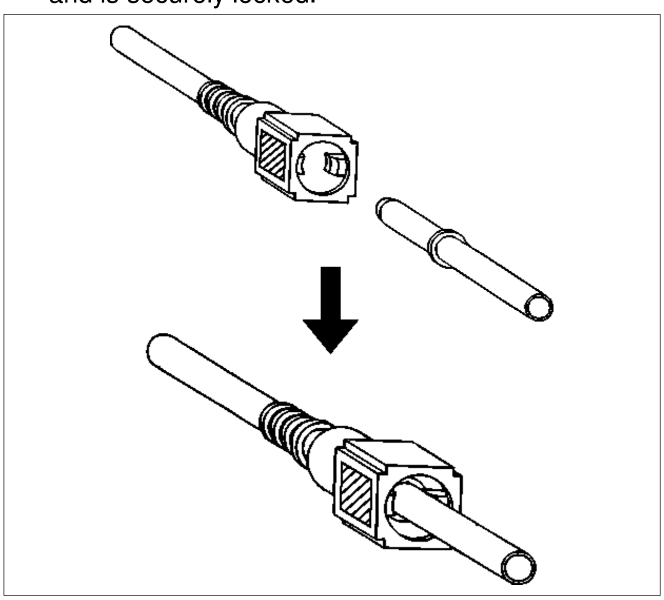
   Cover the connectors that was removed with a plastic bag, to prevent dust or rain water from entering.



140R100028

Reuse of Quick–Connector

- Replace the port and connector if scratch, dent or crack is found.
- Remove any dirt build up on the port when installing the connector. Replace the connector, if there is any forms of rust, dent, scratch.
- After cleaning the port, insert it straight into the connector until it clicks. After it clicks, try pulling at 49N (5kgf) it out to make sure that it is not drawn and is securely locked.



140R100036

Assembling Advice

By applying engine oil or light oil to the pipe, port makes pipe assembly easier. The pipe assembly should take place immediately after applying oil (to prevent dust from sticking to the pipe surface – which may decrease sealing ability).

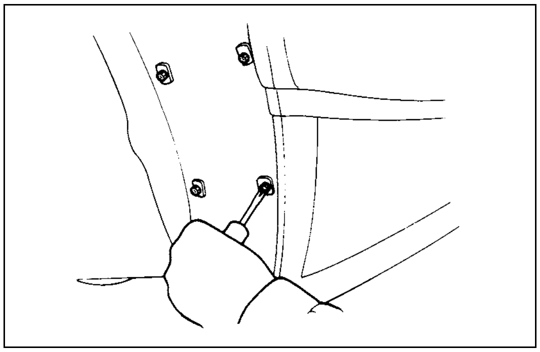
Test/Inspection After Assembling

1. Reconnect the battery negative cable.
2. Turn the ignition key to the “ON" position and listen for pump start-up sound. Inspect for leaks, the fuel pressure will increase as the fuel pump is actuated.
3. Perform leak inspection (step 2) several times.
4. Start the engine and observe the engine idle speed. The presence of dirt in the fuel system may affect the fuel injection system.

Important Operations - Removal

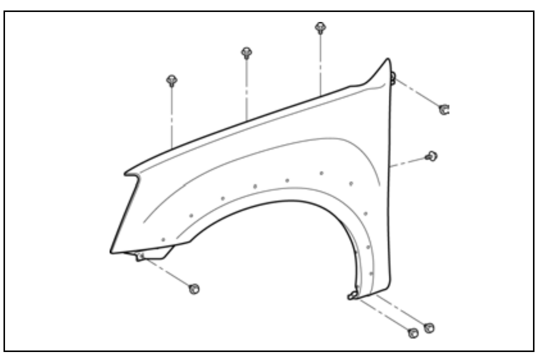
1. Radiator Grille
Refer to the Radiator Grille in this section.

3. Front wheel extension (W/front wheel extension)
Refer to the SECTION 10 “Front Wheel Extension”.



4. Inner Liner
Remove the inner liner fixing screws.

5. Front Bumper Fascia
Refer to the Front Bumper in this section.



RTW72BSH000201

7. Front Fender Panel
Remove the 8 fixing bolts.

Important Operation - Installation

7. Front Fender Panel

1) Tighten the front fender panel fixing bolts to the specified torque.

Torque	N·m(kgf·m/lb·in)
10 (1.0 / 87)	

Fuel Pump Relay

General Description

In order to control the fuel pump and sender assembly (FPAS) operation, the FPAS relay is provided. When the starter switch is turned to “ON" position, the FPAS relay operates the FPAS for 2 seconds.

When it is turned to “START" position, the Engine Control Module receives the reference pulse from the Ignition Control Module and it operates the relay, again causing the FPAS to feed fuel.

Fuel Tank

Removal

CAUTION: When repair to the fuel system has been completed, start engine and check the fuel system for loose connection or leakage. For the fuel system diagnosis, see Section "Driveability and Emission".

1. Disconnect battery ground cable.
2. Loosen slowly the fuel filler cap.

NOTE: To prevent spouting out fuel to change the pressure in the fuel tank.

NOTE: Cover opening of the filler neck to prevent any dust entering.

3. Jack up the vehicle.
4. Support underneath of the fuel tank with a lifter.
5. Remove the inner liner of the wheel house on rear left side.
6. Remove fasten bolt to the filler neck from the body.
7. Disconnect the quick connector (8) into the fuel tube from the fuel pipe and the evapo tube from evapo joint connector.

NOTE: Cover the quick connector to prevent any dust entering and fuel leaking.

NOTE: Refer to "Fuel Tube/Quick Connector Fittings" in this section when performing any repairs.

8. Remove fasten bolt (1) to the tank band and the tank band (2).
9. Disconnect the pump and sender connector on the fuel pump and remove the harness from weld clip on the fuel tank.
10. Lower the fuel tank (6).

NOTE: When the fuel tank is lowered from the vehicle, don't scratch each hose and tube by around other pars.

Installation

1. Rise the fuel tank into position.

NOTE: Ensure hoses and tubes do not foul on other component.

2. Connect the pump and sender connector to the fuel pump and install harness to into the plastic clip welded to the top of the fuel tank..

NOTE: The connector must be certainly connected against stopper.

Ensure tank band anchor mates with guide hole on frame.

3. Install the tank band to fasten bolt.

Torque: 68 N·m (6.9kg·m/50 lb ft)

NOTE: The anchor of the tank band must be certainly installed to guide hole on frame.

4. Connect the quick connector from the fuel tube to the fuel pipe and the evapo tube from evapo joint connector.

NOTE: Pull off the left checker into the fuel pipe.

NOTE: Refer to "Fuel Tube/Quick Connector Fittings" in this section when performing any repairs.

5. Install the filler neck to the body by bolt.
6. Install the inner liner of the wheel house on rear side.
7. Remove lifter to support underneath of the fuel tank.
8. Put back the vehicle.
9. Tigten the filler cap until at least three clicks are heard.
10. Connect the battery ground cable.

Filler Neck

Removal

1. Remove the fuel tank.

NOTE: Refer to "Fuel Tank" in this section.

2. Put a marking the following point as the filler neck assembly is restored.
   - Each joint area of the hose (to restore axial direction and insertion length of the hose)
   - Each fasten area of the clamp (to restore axial direction and position of the clamp)
   - Each bolt in the clamp (to restore fasten length of bolt in the clamp)
   - The band clip (to restore position and fasten length of the band clip)

NOTE: Cover end of each hose and pipe to prevent any dust entering.

Installation

1. Align each marking and restore the following point.
   - Each joint area of the hose (Restore axial direction and insertion length of the hose)
   - Each fasten area of the clamp (Restore axial direction and position of the clamp)
   - Each bolt in the clamp (Restore fasten length of bolt in the clamp)

   Torque: 2.5 N·m (0.25 kg·m / 2 lb ft) … filler neck side except flat deck model.

   - The band clip (Restore position and fasten length of the band clip)
2. Install the fuel tank.

NOTE: Refer to "Fuel Tank" in this section.

Fuel Gauge Unit

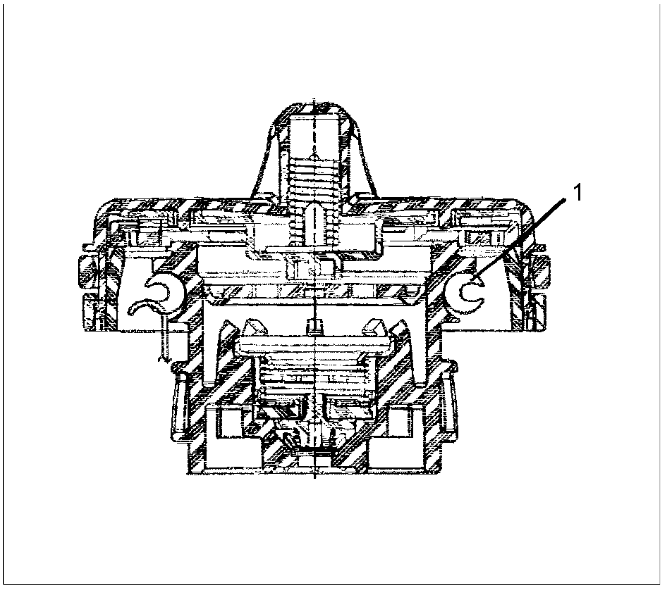
Removal and Installation

As for removal and installation of the Fuel Gauge Unit, refer to “Fuel Tank" of this section 6C as the fuel gauge unit is combined with the fuel pump and sender assembly.

Fuel Filler Cap

General Description

A vacuum valve and pressure valve are built into the fuel filler cap which adjusts the fuel pressure in the fuel tank to prevent fuel tank damage.



RTW46CSH000301

Legend

(1) Seal Ring

Inspection

The fuel filler cap must be inspected for seal condition.

The fuel filler cap must be replaced if found defective

CAUTION: A replacement fuel filler cap must be the same as the original. The fuel filler cap valve was designed primarily for this application and must be replaced with the same type or decreased engine performance may occur.
