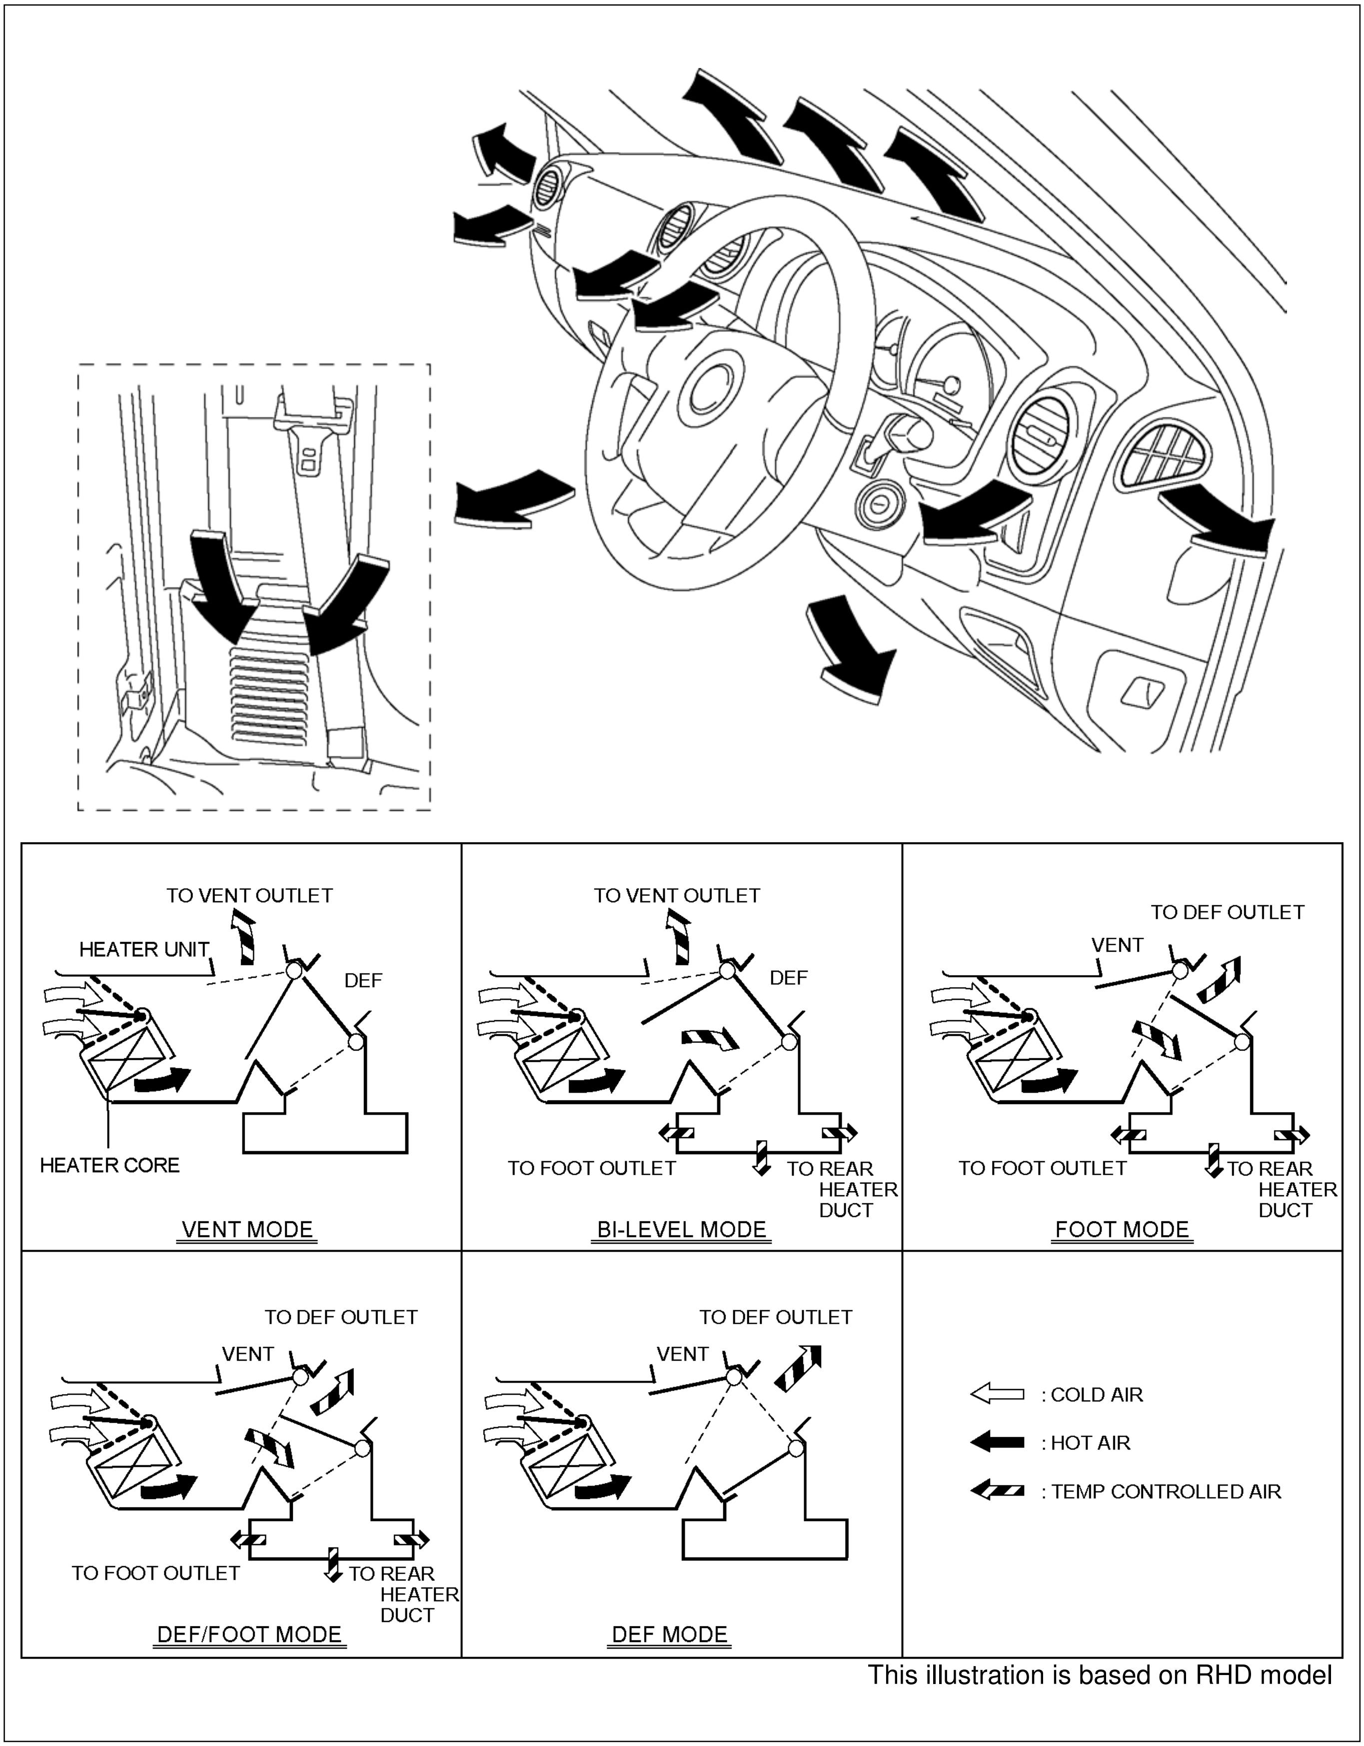
Reassembly steps

- Coat the parts with ATF before installing them.
- Install the control valve to the upper body.
- Install the 11 steel balls and springs to the upper body.

VENTILATION



RTW710MF000601 & RTW410MF000301

RECOMMENDED LIQUID GASKET

Type	Brand Name	Manufacture	Remarks
RTV* Silicon Base	ThreeBond 1207B ThreeBond 1207C ThreeBond 1215	Three Bond Three Bond Three Bond	For Engine Repairs For Axle Case Repairs, T/M
Water Base	ThreeBond 1141E	Three Bond	For Engine Repairs
Solvent	ThreeBond 1104 BelcoBond 4 BelcoBond 401 BelcoBond 402	Three bond Isuzu Isuzu Isuzu	For Engine Repairs
Anaerobic	LOCTITE 515 LOCTITE 518	Loctite Loctite	All

* RTV : Room Temperature Vulcanizer

Note :

1. **It is very important that the liquid gaskets listed above or their exact equivalent be used on the vehicle.**
2. **Be careful to use the specified amount of liquid gasket.**
   Follow the manufacture's instructions at all times.
3. **Be absolutely sure to remove all lubricants and moisture from the connecting surfaces before applying the liquid gasket.**
   The connecting surfaces must be perfectly dry.
4. **LOCTITE 515 and LOCTITE 518 harden upon contact with a metal surface.**
   Do not apply LOCTITE 515 or LOCTITE 518 between two metal surfaces having a clearance of greater than 0.25 mm (0.01 in). Poor adhesion will result.

RECOMMENDED THREAD LOCKING AGENTS

LOCTITE Type	LOCTITE Color	Application Steps
LOCTITE 242	Blue	1. Completely remove all lubricant and moisture from the bolts and the female threaded surfaces of the parts to be joined. The surfaces must be perfectly dry.
LOCTITE 262	Red	2. Apply LOCTITE to the bolts. LOCTITE 270	Green	
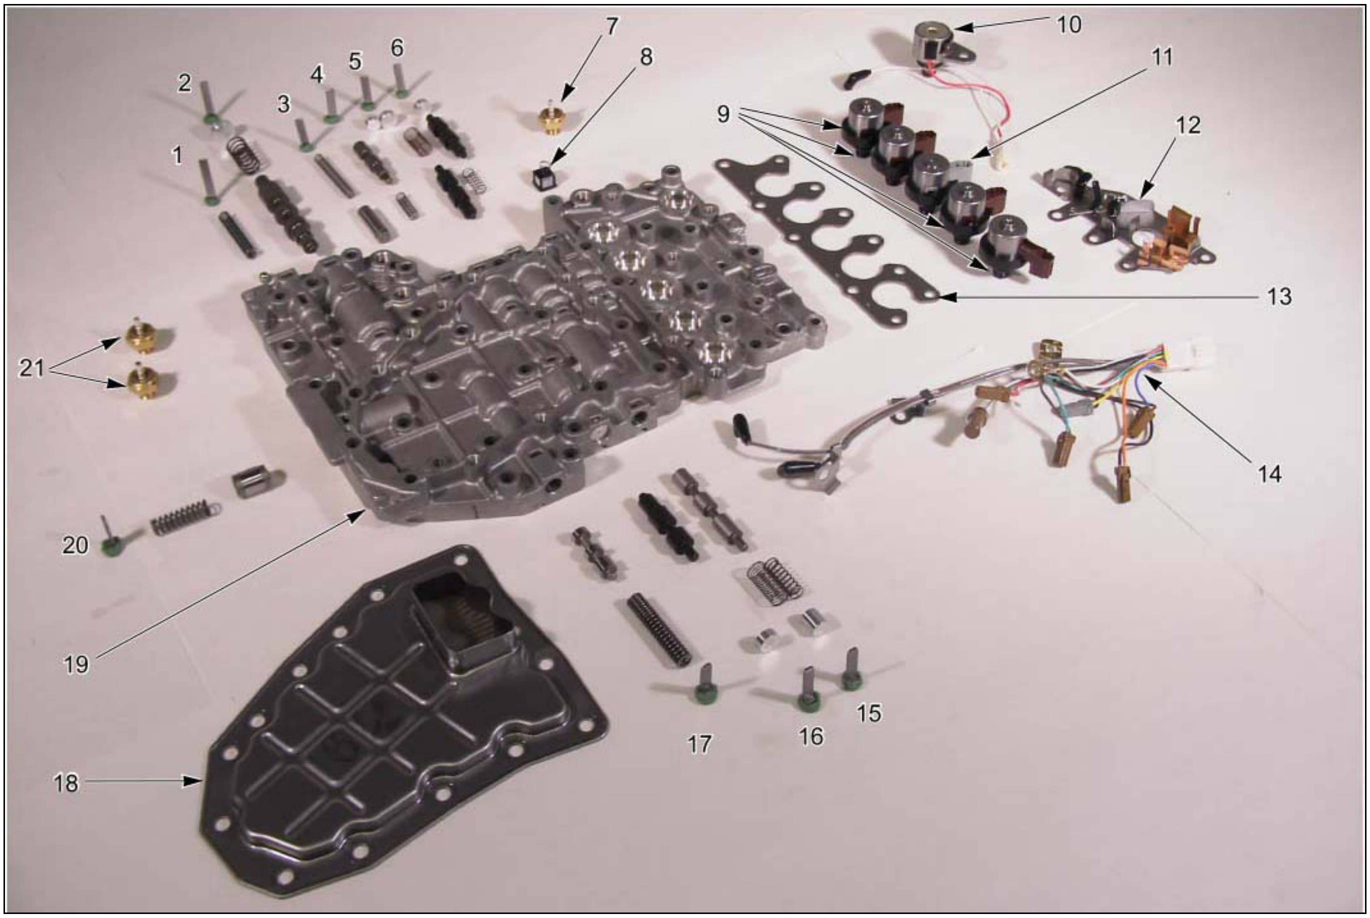
LOCTITE 271	Red	3. Tighten the bolts to the specified torque. 4. Wait at least one hour before continuing the installation procedure.

CONTROL VALVE LOWER BODY



Legend

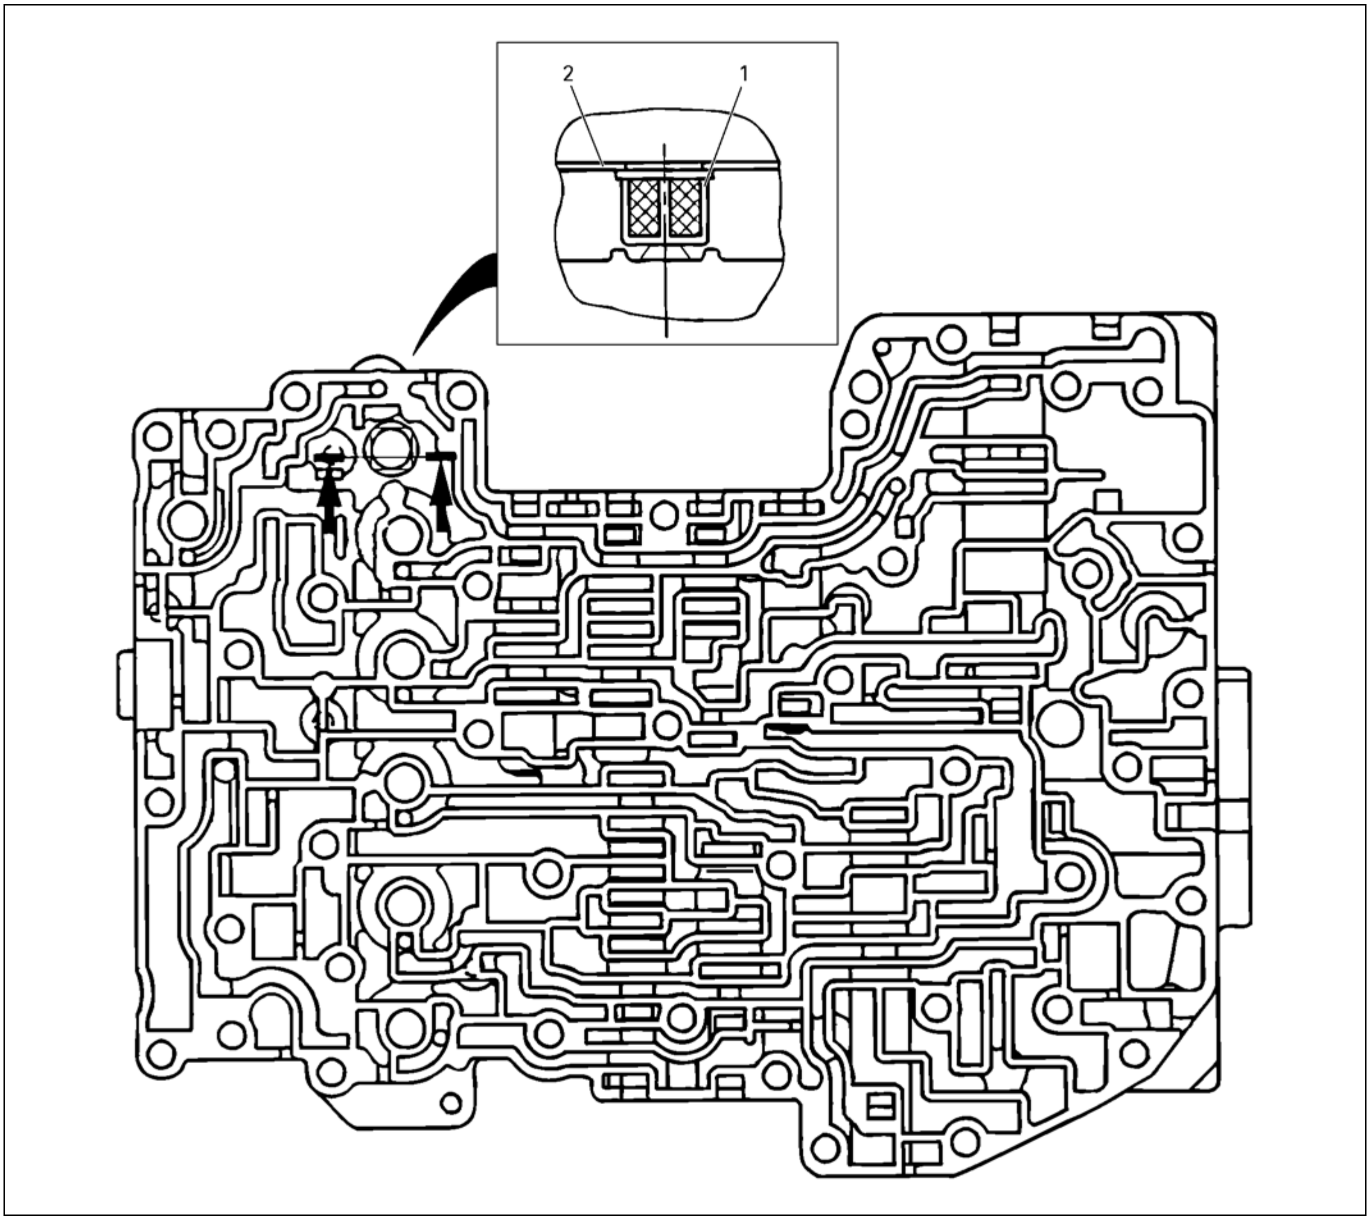
20. Retainer plate, spring, and 2-4 brake solenoid accumulator
21. Oil pressure switch

Disassembly steps

- Remove the oil filter from the control valve lower body.



244L300009

Legend

1. Oil filter
2. Separation plate

- Remove the control valve from the control valve lower body.

NOTE:
Place the control valve where it will not get mixed up with the other parts.

Inspection

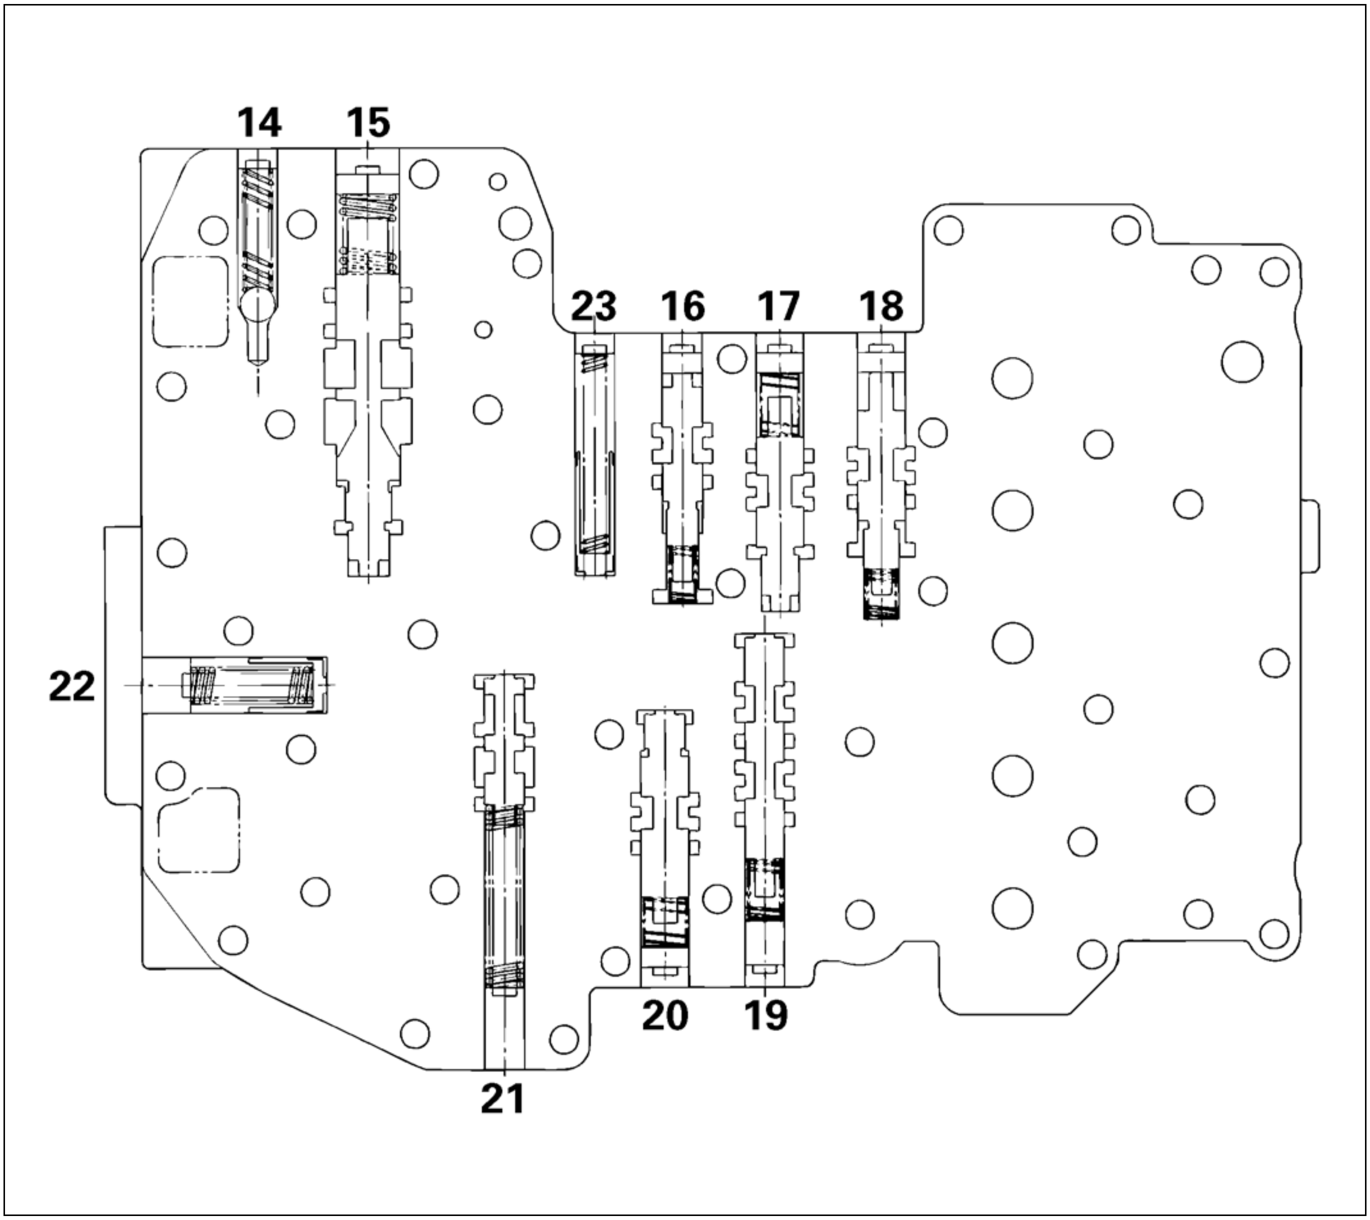
Valve

Inspect each of the valves for denting and other damage.

Spring

Inspect each of the springs for wear and fatigue.

Valve specifications



244L300008

No.	Valve nomenclature	Diameter (mm / in)	Length (mm / in)	Configuration

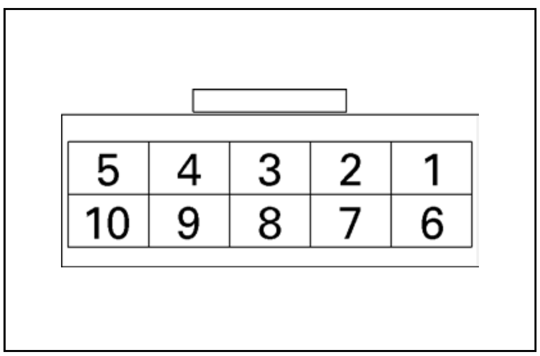
Oil pressure switch

Apply compressed air (390 kPa/4.0 kgf/cm^2/57 psi) to the oil pressure switch to check the oil pressure switch continuity between the connector and screw.



244L300011

Oil temperature sensor (harness assembly)

Check the oil temperature sensor resistance between harness terminals 7 and 6 (ground).

Oil temperature sensor resistance: 2,400～2,600 ohms (20°C)

Solenoids

Measure the resistance of each solenoid.

Resistance:
Brown connector – 3.0~3.4 ohms (20°C)
Gray connector – 12.0~13.2 ohms (20°C)
White connector – 12.2~13.4 ohms (20°C)

Reassembly steps

- Coat the parts with ATF before installing them.
- Install the control valve to the control valve lower body.
- Install the oil filter to the control valve lower body.

OIL PUMP ASSEMBLY

01PUMP32

Legend

1. Oil seal
2. O-ring (small)
3. Oil pump housing
4. Inner rotor
5. Outer rotor
6. Oil pump cover
7. O-ring (large)
8. Seal ring (large)
9. Seal ring (small)
10. Bearing race

02PUMP07

Disassembly steps

1. **Oil pump cover**
2. **Oil pump housing**
   - Loosen the 8 bolts evenly a little at a time.

04PUMP10

- Separate the oil pump cover from the oil pump housing by tapping on each of the bolts with a plastic hammer.

06PUMP13

3. Inner rotor

Remove the inner rotor from the oil pump housing.

07PUMP14

4. Outer rotor

Remove the outer rotor from the oil pump housing.

15PUMP18

5. O-ring (small)

Remove the O-ring (small) from the oil pump housing.

08PUMP09

6. O-ring (large)

Remove the O-ring (large) from the oil pump cover.

09PUMP05

7. Seal ring

Remove the 4 seal rings from the oil pump cover.

11PUMP43

Inspection

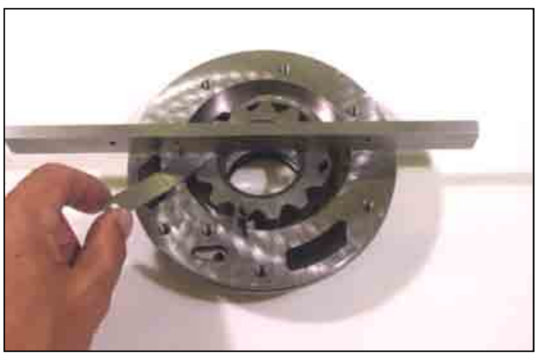
Oil pump cover

- Install new seal rings to the oil pump cover.

NOTE:

The seal ring with the large inside diameter fits into the primary mating surface of the cover.

- Measure the gap between the seal ring and the seal ring groove.
  If the measured gap is outside the specified range, the oil pump cover must be replaced.
  Seal ring and seal ring groove gap: 0.10~0.25 mm (0.0039~0.0098 in)



12PUMP45

Inner rotor

- Install the inner rotor to the oil pump housing.
- Use a straight edge to measure the side clearance between the oil pump housing and the inner rotor.
  If the measured clearance is outside the specified range, the inner rotor must be replaced.
  Oil pump housing and inner rotor side clearance: 0.02~0.04 mm (0.0008~0.0016 in)

13PUMP46

Outer rotor

- Install the outer rotor to the oil pump housing.
- Measure the gap between the outer rotor and the crescent.
  If the measured gap is outside the specified range, the outer rotor must be replaced.
  Outer rotor and crescent gap: 0.02~0.15 mm (0.0008~0.0059 in)

Reassembly steps

15PUMP18

1. **O-ring (small)**
   Install new O-ring (small) to the oil pump housing.

16PUMP29

2. **Outer rotor**
3. **Inner rotor**
   Install the outer rotor and the inner rotor to the oil pump housing.

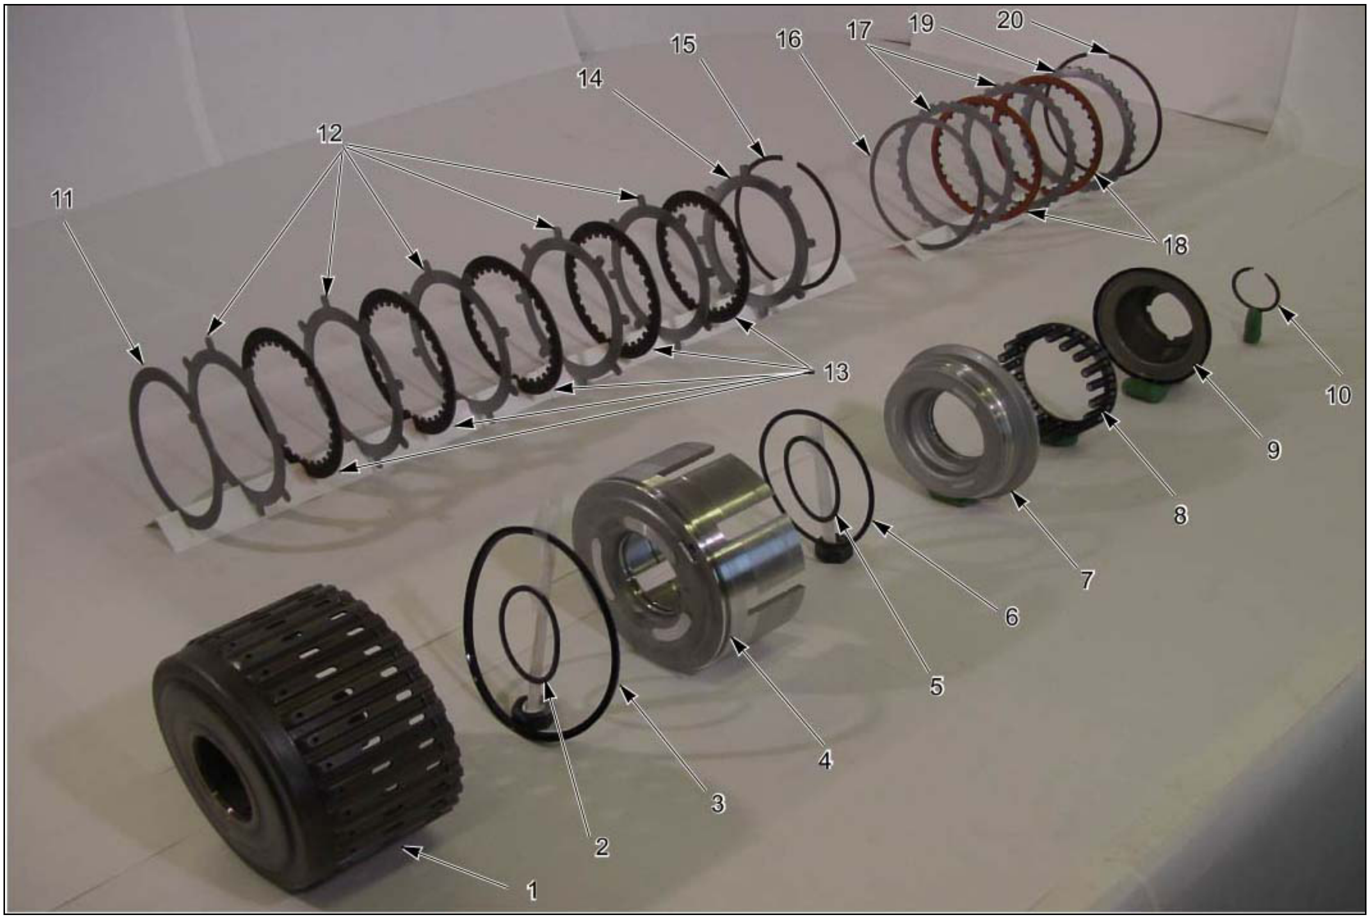
17PUMP42

NOTE:
The identification mark on the inner rotor must be facing the inside of the oil pump housing.

18PUMP07

4. **Oil pump cover**
5. **Oil pump housing**
   Install the oil pump cover to the oil pump housing.
   Tighten the 8 bolts to the specified torque.
   Torque: 9 N·m (0.9 kgf·m/78 lb·in)
6. **O-ring (large)**
   Install the O-ring (large) to the oil pump cover.
7. **Seal ring**
   Install the 4 seal rings to the oil pump cover.

CLUTCH PACK (REVERSE AND HIGH CLUTCH ASSEMBLY)



01R&H17

Legend

17. Driven plate (2, reverse clutch)
18. Drive plate (2, reverse clutch)
19. Retaining plate (reverse clutch)
20. Snap ring (reverse clutch)

02R&H18

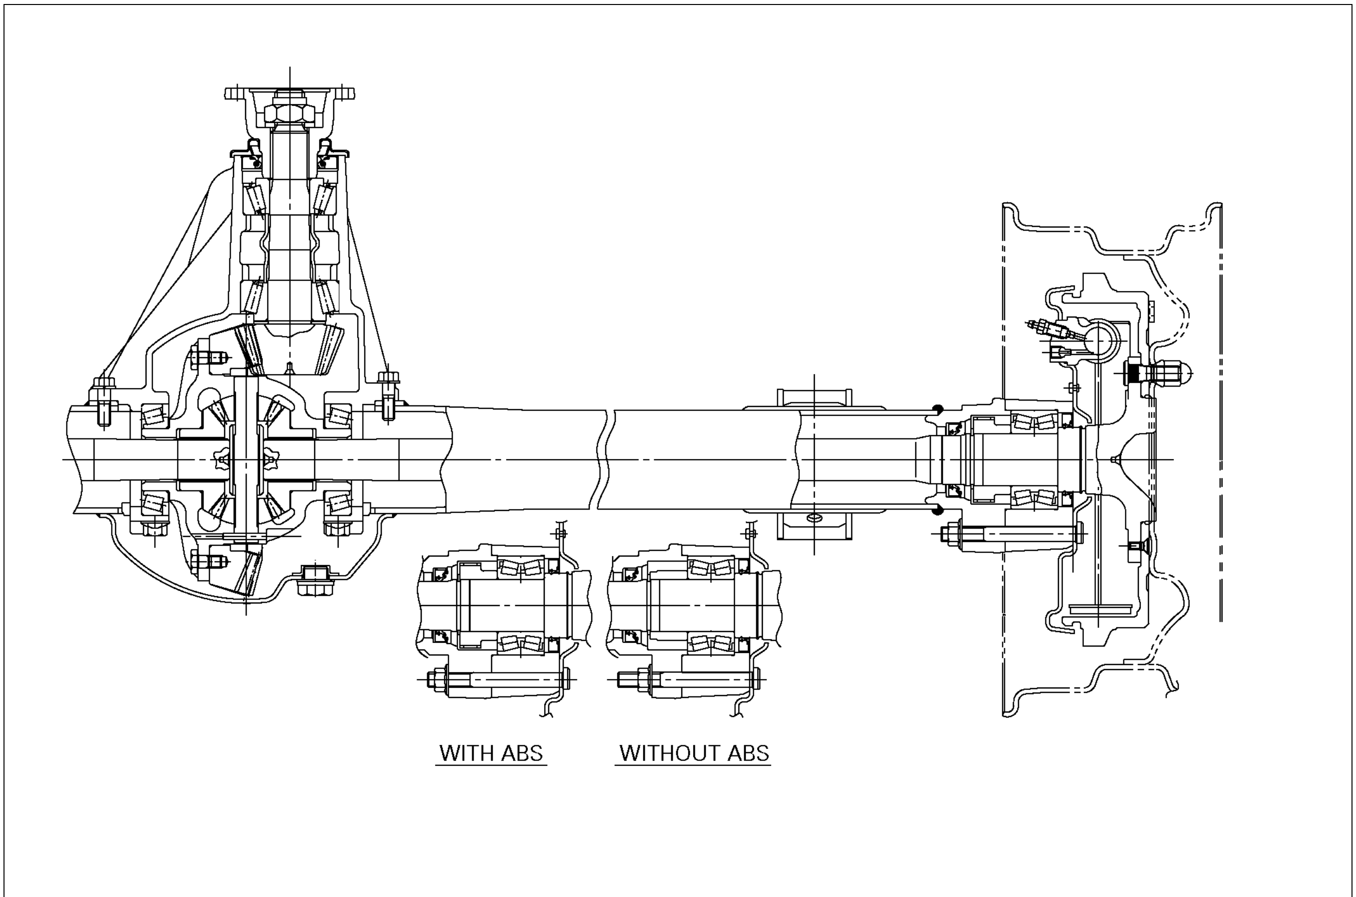
Disassembly steps

1. Snap ring

Remove the reverse clutch snap ring.

REAR AXLE ASSEMBLY

General Description



The rear axle assembly is of the semi–floating type in which the vehicle weight is carried on the axle housing .

The center line of the pinion gear is below the center line of the ring gear (hypoid drive).

All parts necessary to transmit power from the propeller shaft to the rear wheels are enclosed in a banjo type axle housing.

The ϕ220 mm (8.6 in) or ϕ194mm (7.6 in) ring gear rear axle uses a conventional ring and pinion gear set to transmit the driving force of the engine to the rear wheels. This gear set transfers this driving force at a 90 degree angle from the propeller shaft to the drive shafts.

The axle shafts are supported at the wheel end of the shaft by a double tapered roller bearing.

The pinion gear is supported by two tapered roller bearings. The pinion depth is set by a shim pack located between the gear end of the pinion and the roller bearing that is pressed onto the pinion. The pinion bearing preload is set by crushing a collapsible spacer between the bearings in the axle housing.

The ring gear is bolted onto the differential cage with 12 bolts.

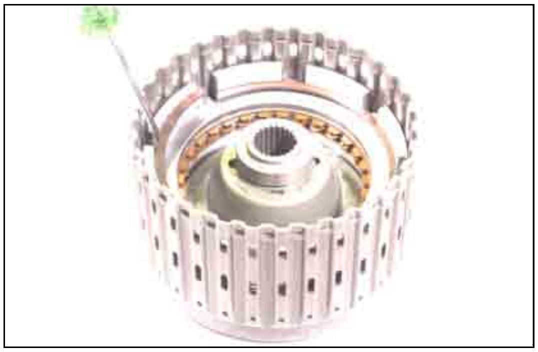
The differential cage is supported in the axle housing by two tapered roller bearings. The differential and ring gear are located in relationship to the pinion by using selective shims and spacers between the bearing and the differential cage. To move the ring gear, shims are deleted from one side and an equal amount are added to the other side. These shims are also used to preload the bearings, which are pressed onto the differential cage. Two bearing caps are used to hold the differential into the rear axle housing.

The differential is used to allow the wheels to turn at different rates of speed while the rear axle continues to transmit the driving force. This prevents tire scuffing when going around corners and prevents premature wear on internal axle parts.

The rear axle is sealed with a pinion seal, a seal at each axle shaft end, and by a liquid gasket between the differential carrier and the axle housing.

03R&H21

2. **Retaining plate, drive plates, driven plates and dish plate**
   Remove the reverse clutch retaining plate, the 2 drive plates, the 2 driven plates, and the dish plate.



04R&H22

3. **Snap ring**
   Remove the high clutch snap ring.

05R&H25

4. **Retaining plate, drive plates, driven plates and dish plate**
   Remove the high clutch retaining plate, the 5 drive plates, the 5 driven plates, and the dish plate.

07R&H28

5. **Snap ring**
6. **High clutch cover**
7. **Return spring**
   - Install the spring compressor to the reverse and high clutch drum.
     Spring compressor: 5-8840-2767-0
   - Carefully press the high clutch cover down.
     Take care not to damage the return spring.
   - Remove the snap ring.
   - Remove the high clutch cover and the return spring.

08R&H36

8. High clutch piston

9. Reverse clutch piston

- Install the reverse and high clutch drum to the oil pump.
- Force compressed air into the oil pump oil channels.
- Remove the high clutch piston and the reverse clutch piston.

09R&H37

12R&H39

10.Seal ring (high clutch)

Remove the 2 seal rings from the high clutch piston.

13R&H38

11.Seal ring (reverse clutch)

Remove the 2 seal rings from the reverse clutch piston.

Inspection

Drive plates

- Measure the drive plate facing thickness at 3 points.
- Calculate the average value.
  If the average value is less than the specified limit, the drive plate must be replaced.
  Drive plate facing thickness:
  Standard – 2.0 mm (0.079 in)
  Limit – 1.8 mm (0.071 in)

Return springs

- Check the number of effective return spring coils.
  If the number is less than the specified minimum, the return spring must be replaced.
  Effective return spring coils (standard): 10.2
- Measure the return spring outside diameter, free length, and linear diameter.
  If any of the measured values exceed the specified limit, the return spring must be replaced.
  Return spring measurements (standard):
  Outside diameter – 8.0 mm (0.315 in)
  Free length – 27.1 mm (1.067 in)
  Linear diameter – 1.1 mm (0.043 in)

10R&H40

Reverse clutch piston

- Apply compressed air (390 kPa/4.0 kgf/cm^2/57 psi) to the reverse clutch piston from the outside to the inside.
  The flow of air should be blocked.

11R&H44

- Apply compressed air (390 kPa/4.0 kgf/cm^2/57 psi) to the reverse clutch piston from inside to the outside.
  The flow of air should be unrestricted.

12R&H39

Reassembly steps

Coat the parts with ATF before installing them.

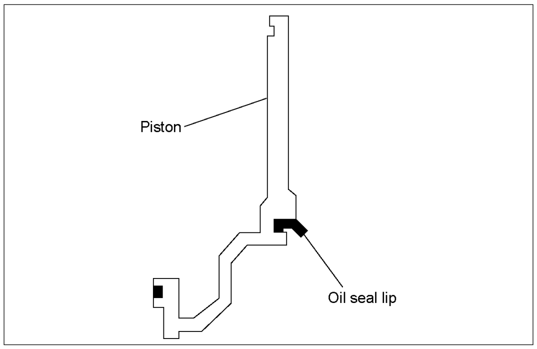
1. Seal ring (high clutch)

Install new seal rings to the high clutch piston.

13R&H38

2. Seal ring (reverse clutch)

Install new seal rings to the reverse clutch piston.



RTW47ASH000601

As shown in a figure, oil seal lip is attached.

14R&H32

3. Reverse clutch piston

Install the reverse clutch piston to the reverse and high clutch drum.

15R&H31

4. High clutch piston

Install the high clutch piston to the reverse clutch piston.

16R&H33

5. Return spring

Install the return spring to the high clutch piston.

17R&H30

6. **High clutch cover**
   - Carefully center the high clutch cover and install it.

NOTE:
If the clutch cover is not centered, the cover outside seal gum will be forced into the piston area where it will be damaged.

18R&H27

7. **Snap ring**
   - Install the spring compressor to the reverse and high clutch drum.
   - Use the spring compressor to carefully force the high clutch cover down.

   Spring compressor: 5-8840-2767-0

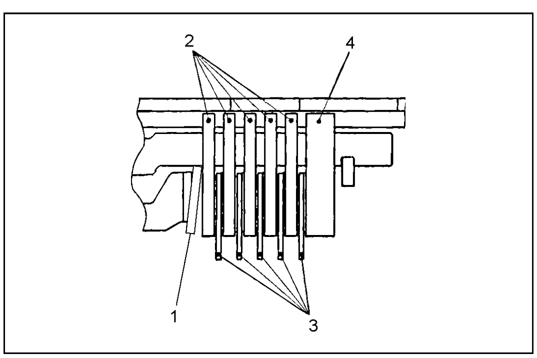
NOTE:
To avoid damage to the return springs, use only as much force as is required to press the high clutch cover into place.

19R&H28

   - Install the new snap ring to the reverse and high clutch drum.

20R&H25

8. **Dish plate, drive plates, driven plates, and retaining plate**
   Install the high clutch dish plate (1), the 5 driven plates (2), the 5 drive plates (3), and retaining plate (4).



RTW47ASH000501

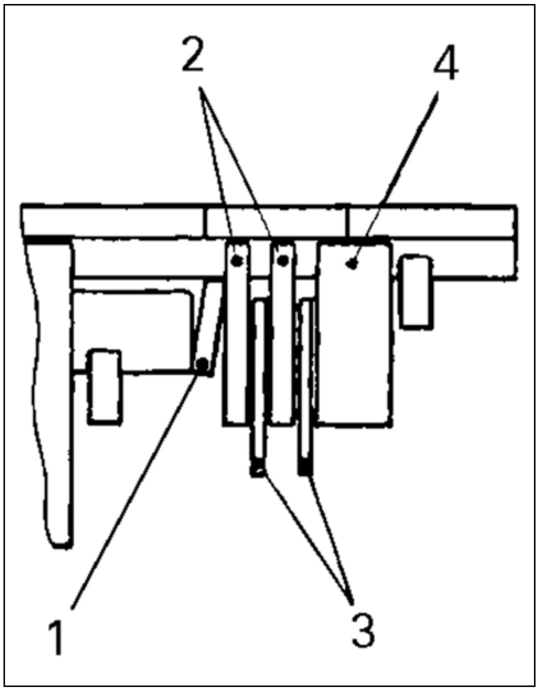
9. **Snap ring**
   Install the snap ring.

NOTE:
Ensure the attachment direction of dish plate (1) is correct.

21R&H21

10.Dish plate, drive plates, driven plates, and retaining plate

Install the reverse clutch dish plate (1) the 2 driven plates (2), the 2 drive plates (3), and retaining plate (4).

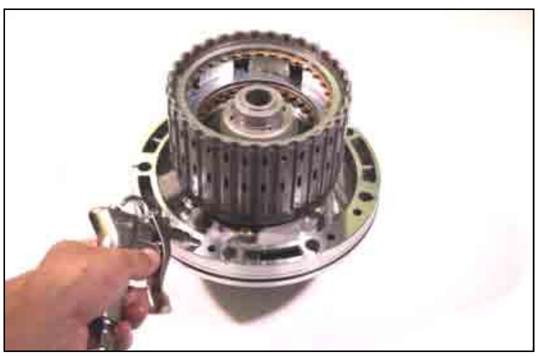


248L300003

11.Snap ring

Install the snap ring.

NOTE:
Ensure the attachment direction of dish plate (1) is correct.

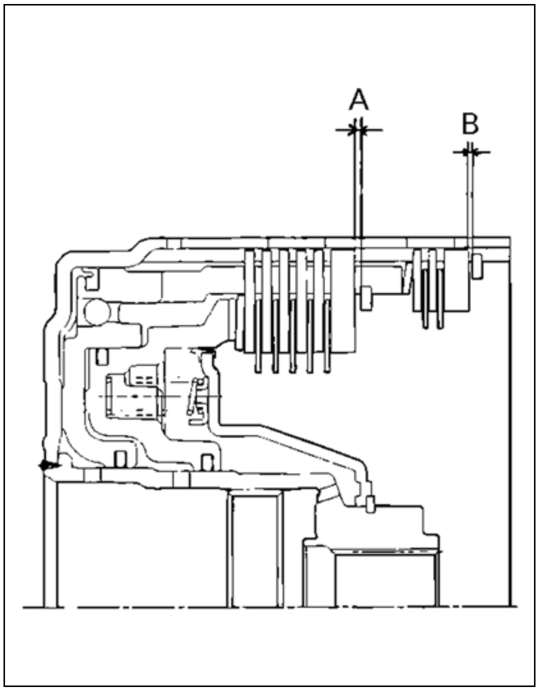


22R&H35

- Install the reverse and high clutch drum to the oil pump assembly.
- Force compressed air (390 kPa/4.0 kgf/cm^2/57 psi) through the oil pump oil passages to check high clutch operation.
  If the clutch does not operate, the seal ring may be damaged or the parts may have been installed in the wrong order.

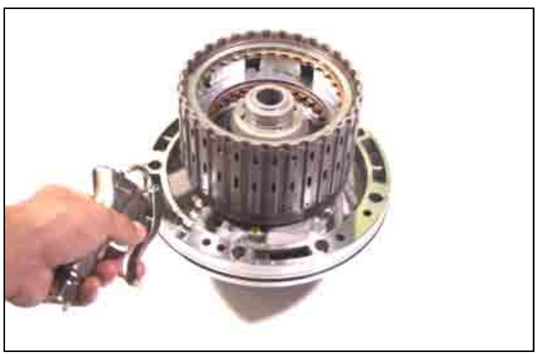
23CLEAR02

- Measure the clearance between the high clutch retaining plate and the snap ring.
  If the clearance is outside the specified range, replace the existing retaining plate with a new plate of the proper size (thickness).
  High clutch retaining plate and snap ring clearance (A): 1.2~1.6 mm (0.047~0.063 in)
  Available high clutch retaining plate thicknesses
  4.6 mm (0.181 in)
  4.8 mm (0.189 in)



248L300004

5.0 mm (0.197 in)
5.2 mm (0.205 in)
5.4 mm (0.213 in)



24R&H34

- Force compressed air (390 kPa/4.0 kgf/cm^2/57 psi) through the oil pump oil passages to check reverse clutch operation.
  If the clutch does not operate, the seal ring may be damaged or the parts may have been installed in the wrong order.

25CLEAR04

- Measure the clearance between the reverse clutch retaining plate and the snap ring.
  If the clearance is outside the specified range, replace the existing retaining plate with a new plate of the proper size (thickness).
  Reverse clutch retaining plate and snap ring clearance (B):
  0.6~0.9 mm (0.024~0.035 in)
  Available reverse clutch retaining plate thicknesses
  4.8 mm (0.189 in)
  5.0 mm (0.197 in)
  5.2 mm (0.205 in)
  5.4 mm (0.213 in)

CARRIER AND LOW CLUTCH ASSEMBLY

06C&L-SUB08

07C&L-SUB09

08C&L-SUB10

09C&L-SUB11

10C&L-SUB12

- Remove the bearing race from the rear internal gear.

11C&L-SUB13

11.Snap ring

Remove the low clutch snap ring.

12C&L-SUB15

12.Retaining plate, drive plates, driven plates, and dish plate

Remove the low clutch retaining plate, the 7 drive plates, the 7 driven plates, and the dish plate.

13C&L-SUB18

13.Snap ring

- Install the spring compressor to the low clutch drum.
  Spring compressor: 5-8840-2759-0
- Carefully press the cancel cover down.
  Take care not to damage the return spring.

14C&L-SUB19

- Remove the snap ring.

31C&L-SUB20

14.Cancel cover

Remove the cancel cover.

30C&L-SUB21

15.Return spring

Remove the return spring.

15C&L-SUB38

16.Low clutch piston

- Insert the low one-way clutch inner race to the low clutch drum.
- Force compressed air through the oil passages of the low one-way clutch inner race to remove the low clutch piston.

29C&L-SUB22

16C&L-SUB25

17.Snap ring

- Raise the low one-way clutch side.
- Remove the low one-way clutch snap ring.

17C&L-SUB27

18.Side plate

Remove the side plate.

18C&L-SUB28

19.Low one-way clutch

Remove the low one-way clutch.

19C&L-SUB29

20.Snap ring

Remove the snap ring from the low clutch drum.

20C&L-SUB31

21.Bearing

Remove the bearing.

Inspection

Drive plates

- Measure the drive plate facing thickness at 3 points.
- Calculate the average value.
  If the average value is less than the specified limit, the drive plate must be replaced.
  Drive plate facing thickness:
  Standard – 2.0 mm (0.079 in)
  Limit – 1.8 mm (0.071 in)

Return springs

- Check the number of effective return spring coils.
  If the number is less than the specified minimum, the return spring must be replaced.
  Effective return spring coils (standard): 9.9
- Measure the return spring outside diameter, free length, and linear diameter.
  If any of the measured values exceed the specified limit, the return spring must be replaced.
  Return spring measurements (standard):
  Outside diameter – 9.7 mm (0.382 in)

Free length – 36.4 mm (1.433 in)
Linear diameter – 1.2 mm (0.047 in)

21C&L-SUB31

Reassembly steps

Coat the parts with ATF before installing them.

1. **Bearing**
   Install the bearing into the low clutch drum.

22C&L-SUB30

2. **Snap ring**
   Install the snap ring to the low clutch drum.

23C&L-SUB28

3. **Low one-way clutch**
   Install the low one-way clutch to the low clutch drum.

24C&L-SUB33

NOTE:
The flanged side of the low one-way clutch must face the outside.

25C&L-SUB27

4. Side plate

Install the side plate.

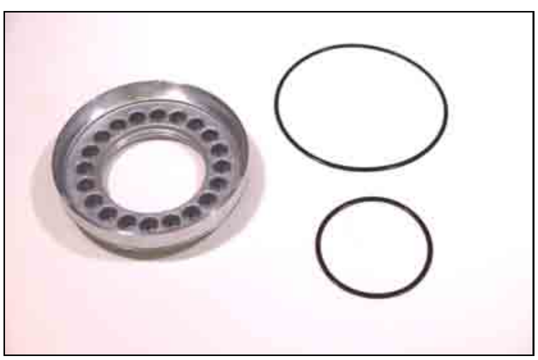
26C&L-SUB26

5. Snap ring

Install the snap ring to the low clutch drum.

27C&L-SUB58

- Attach the low one-way clutch inner race to the low clutch drum in the opposite direction of the normal position.
- Rotate the one-way clutch inner race clockwise. It should turn smoothly with little resistance.
- Rotate the low one-way clutch inner race counterclockwise.
  It should immediately lock (rotation is impossible).
  If it does not, check the low one-way clutch installation direction.
  Inspect and replace the low one-way clutch if required.
- Remove the low one-way clutch inner race.
- Reverse the low clutch drum.



28C&L-SUB32

6. Low clutch piston

- Install new seal rings to the low clutch piston.

29C&L-SUB22

- Install the low clutch piston to the low clutch drum.

30C&L-SUB21

7. **Return spring**

   Install the return spring to the low clutch piston.

31C&L-SUB20

8. **Cancel cover**

   - Carefully center the cancel cover and install it.

NOTE:

If the cancel cover is not centered, the cover outside seal ring gum will be forced into the low clutch piston area where it will be damaged.

32C&L-SUB18

- Install the spring compressor to the low clutch.

  Spring compressor: 5-8840-2759-0

33C&L-SUB19

9. **Snap ring**

   - Use the spring compressor to carefully force the cancel cover down.

NOTE:

To avoid damage to the return spring, use only as much force as is required to press the cancel cover into place.

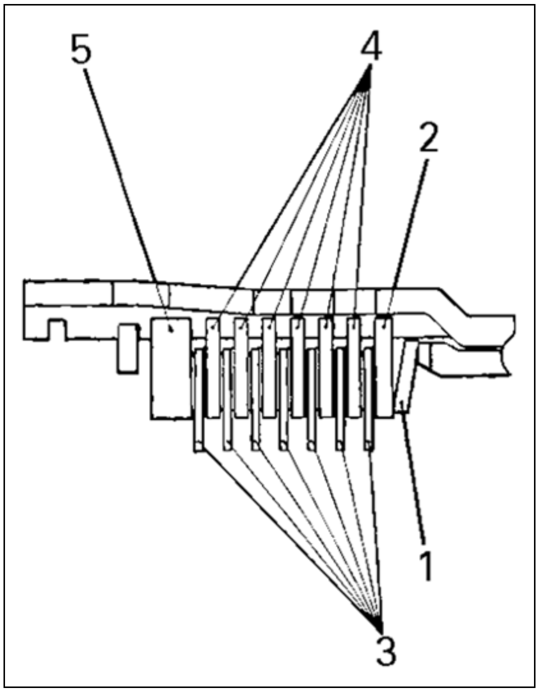
- Install new snap ring to the low clutch drum.

34C&L-SUB15

10.Dish plate, drive plates, driven plates, and retaining plate

Install the low clutch dish plate (1), the 2 mm thick driven plate (2), the 7 drive plates (3), the other 6 driven plates (4), and the retaining plate (5).

NOTE:
The dish plate side with the identification mark must face the driven plate.



248L300006

11.Snap ring

Install the snap ring to the low clutch drum.

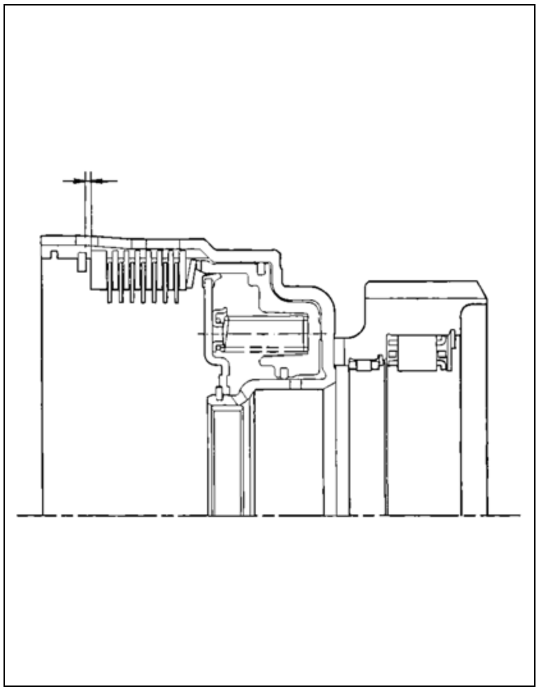
NOTE:
Ensure the attachment direction of dish plate is correct.

Inspection

35C&L-SUB38

- Insert the low one-way clutch inner race to the low clutch drum.
- Force compressed air (390 kPa/4.0 kgf/cm^2/57 psi) through the oil passages of the low one-way clutch inner race to check low clutch operation.
  If the low clutch does not operate, the seal rings may be damaged or the parts may have been installed in the wrong order.
- Measure the clearance between the low clutch retaining plate and the snap ring.
  If the clearance is outside the specified range, replace the existing plate with a new plate of the proper size (thickness).
  Low clutch retaining plate and snap ring clearance:
  0.9~1.3 mm (0.035~0.051 in)
  Available low clutch retaining plate thicknesses
  3.8 mm (0.150 in)
  4.0 mm (0.157 in)

36CLEAR06



248L300007

4.2 mm (0.165 in)
4.4 mm (0.173 in)
4.6 mm (0.181 in)
4.8 mm (0.189 in)

37C&L-SUB40

12.Bearing race

13.Rear internal gear

14.Bearing

Install the bearing race and the bearing to the rear internal gear.

NOTE:

Apply Vaseline to the fitting surfaces of the rear internal gear to prevent the bearing race and the bearing from falling during the installation process.

38C&L-SUB43

39C&L-SUB60

- Install the rear internal gear to the low clutch drum.

40C&L-SUB46

15.Bearing race

16.Rear carrier

17.Bearing

Install the bearing race and the bearing to the rear carrier.

NOTE:

Apply Vaseline to the fitting surfaces of the rear carrier to prevent the bearing race and the bearing from falling during the installation process.

41C&L-SUB49

42C&L-SUB61

- Install the rear carrier to the low clutch drum.

43C&L-SUB07

18.Rear sun gear

Install the rear sun gear to the low clutch drum.

44C&L-SUB52

19.Bearing (with bearing race)

20.Front carrier

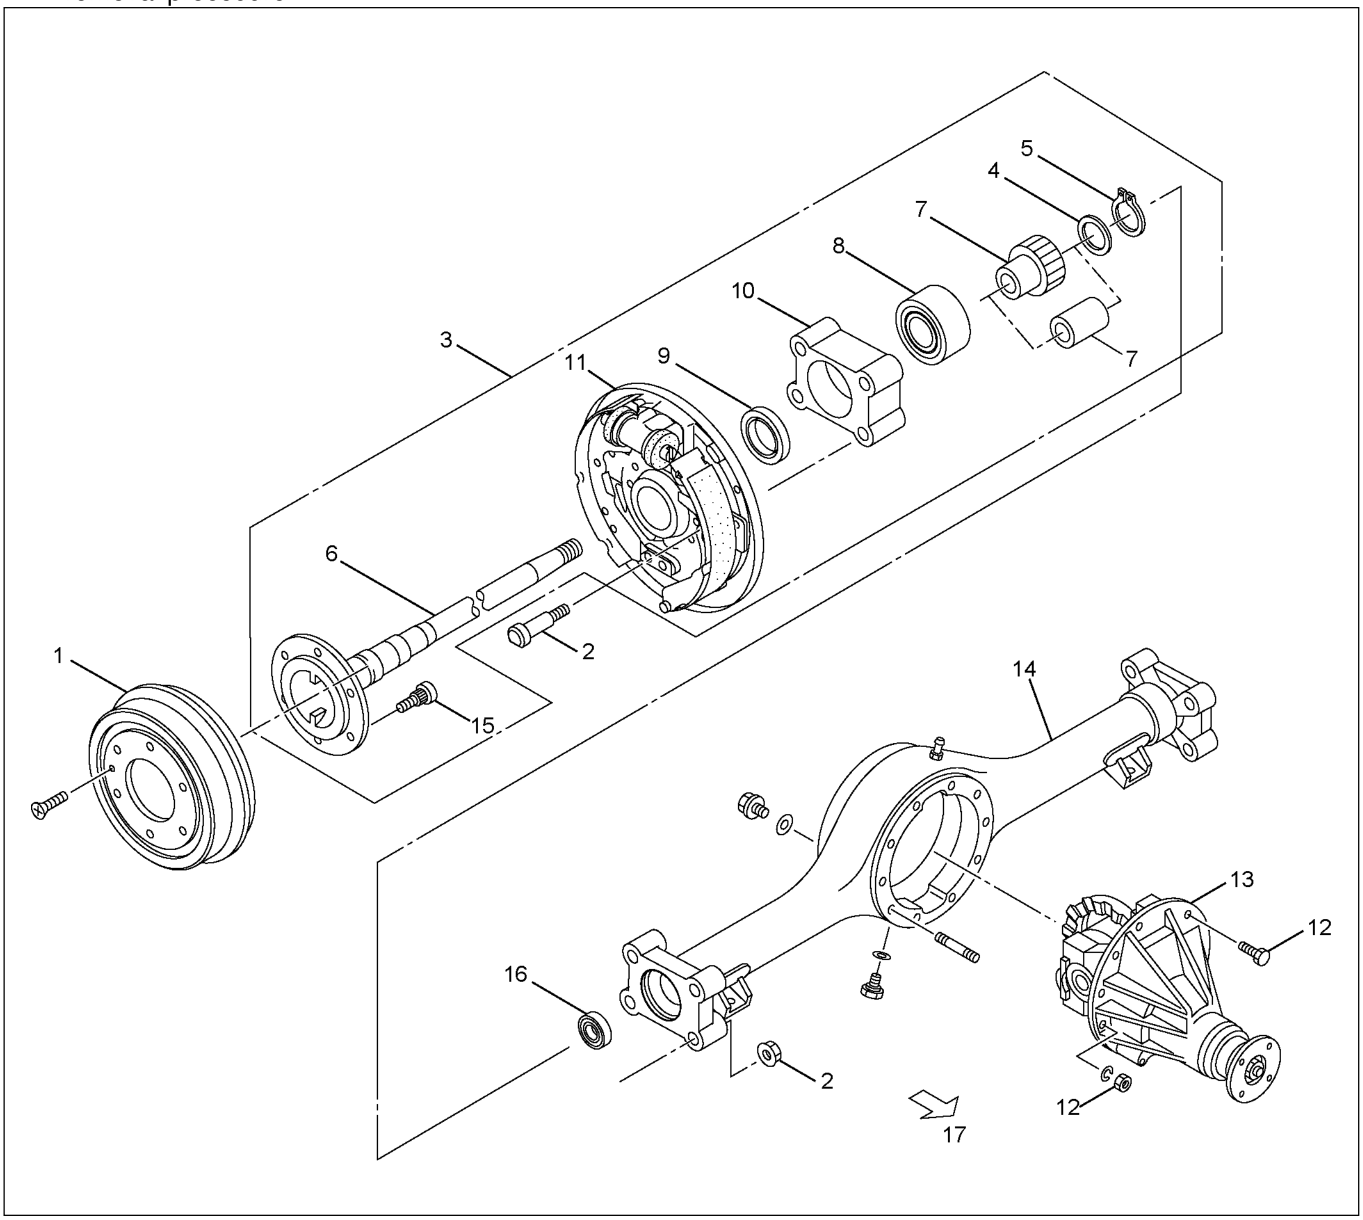
Install the bearing (with bearing race) to the front carrier.

NOTE:

Apply Vaseline to the fitting surfaces of the front carrier to prevent the bearing from falling during the installation process.

REAR AXLE

1. Refer to Section 3E “WHEELS and TIRES” for road wheel Disassembly procedure.
2. Refer to Section 5 “BRAKE” for rear brake removal procedure.



Legend

1. Brake Drum
2. Bolt and Nut
3. Axle Shaft Assembly with Brake
4. Shim
5. Snap Ring
6. Axle Shaft
7. Retainer (with ABS)
   Retainer (without ABS)
8. Double Taper Roller Bearing
9. Oil Seal
10. Bearing Holder
11. Rear Brake
12. Bolt and Nut
13. Differential Assembly
14. Rear Axle Case Assembly
15. Wheel Pin
16. Axle Case Oil Seal
17. Front

45C&L-SUB04

21.Snap ring

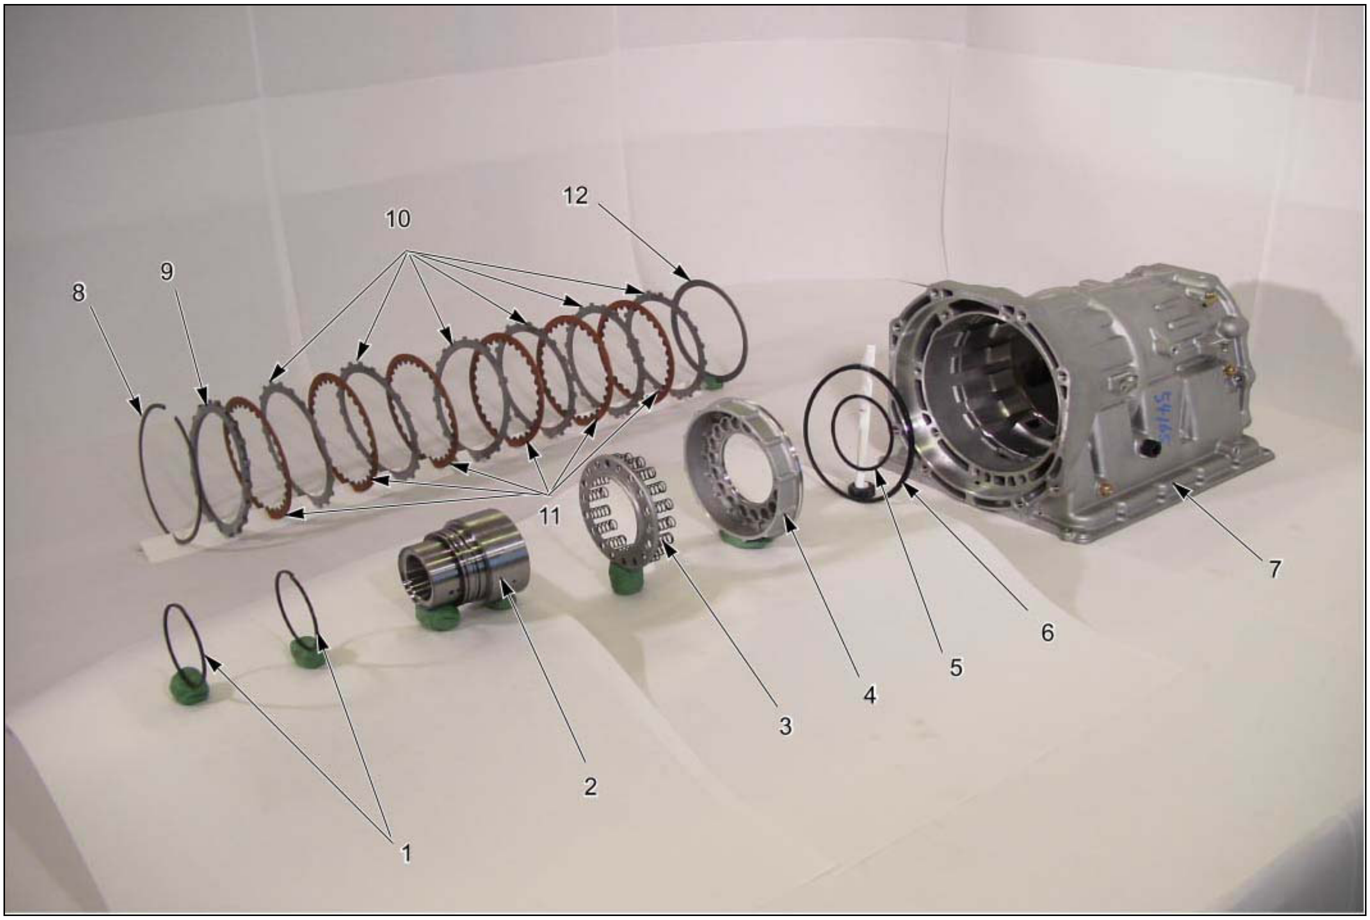
- Install the front carrier to the low clutch drum.
- Install the snap ring to the low clutch drum.

TRANSMISSION CASE

02CASE-BK06

Legend

1. Transmission case
2. Spring pin (slender)
3. Spring pin (fat)
4. Manual plate
5. Detent spring
6. Parking rod
7. Manual shaft
8. Oil seal
9. Inhibitor switch



01L&R-CS05

Legend

1. Seal ring
2. Low one-way clutch inner race
3. Return spring
4. Low and reverse brake piston
5. Seal ring
6. Lip seal
7. Transmission case
8. Snap ring
9. Retaining plate
10. Driven plate
11. Drive plate
12. Dish plate

04CASE-AY52

Disassembly steps

1. Harness assembly

Remove the fixing bolt and the harness assembly.

05CASE-AY30

2. Parking rod

- Use a pin punch to force out the parking rod spring pin.

06CASE-AY37

- Rotate the manual plate as you pull the parking rod free.

08CASE-AY45

3. Detent spring

Remove the fixing bolt and the detent spring.

09CASE-AY28

4. Manual shaft and manual plate

- Remove the manual shaft spring pin.

10CASE-AY21

- Remove the manual shaft together with the manual plate.

11CASE-AY01

5. **Oil seal**

   Using a screwdriver, remove the oil seal from the transmission case.

Inspection

2 – 4 brake drive plates

Measure the 2-4 brake drive plate facing thickness at 3 points and calculate the average value.

If the average value is less than the specified limit, the 2-4 brake drive plate must be replaced.

2 – 4 brake drive plate facing thickness:

Standard = 2.0 mm (0.079 in)

Limit = 1.8 mm (0.071 in)

Low and reverse brake drive plates

Measure the low and reverse brake drive plate facing thickness at 3 points and calculate the average value.

If the average value is less than the specified limit, the low and reverse drive plate must be replaced.

Low and reverse brake drive plate facing thickness:

Standard = 2.0 mm (0.079 in)

Limit = 1.8 mm (0.071 in)

2 – 4 brake return springs

- Check the number of effective 2-4 brake return spring coils.

  Effective return spring coils (Standard): 10.2
- Measure the 2-4 brake return spring outside diameter, free length, and linear diameter.

  If any of the measured values exceed the specified limit, the 2-4 brake return spring must be replaced.

  2 – 4 brake return spring measurements (Standard):

  Outside diameter = 6.9 mm (0.272 in)

  Free length = 22.5 mm (0.886 in)

  Linear diameter = 1.1 mm (0.043 in)

Low and reverse brake return springs

- Check the number of effective low and reverse brake return spring coils.

  Effective return spring coils (standard): 4.8
- Measure the low and reverse brake return spring outside diameter, free length, and linear diameter.

  If any of the measured values exceed the specified limit, the low and reverse return spring must be replaced.

  Low and reverse brake return spring measurements (Standard):

  Outside diameter = 11.2 mm (0.441 in)

Free length = 22.3 mm (0.878 in)
Linear diameter = 1.1 mm (0.043 in)

Reassembly steps

1. Oil seal, manual shaft, and manual plate

12CASE-AY06

- Use the oil seal installer to force the manual plate oil seal into place.
  Oil seal installer: 5-8840-2758-0

14CASE-AY21

- Install the manual shaft together with the manual plate.

15CASE-AY26

- Drive the spring pin into the transmission case.

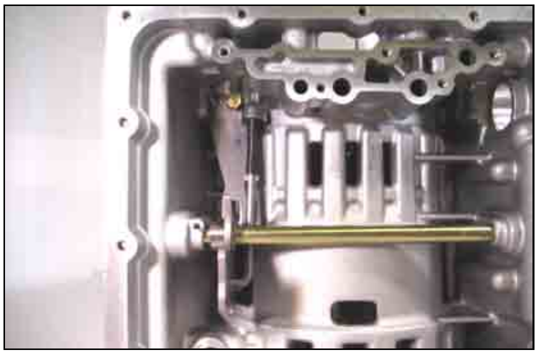
2. Parking rod

16CASE-AY37

- Rotate the manual plate while installing the parking rod.

18CASE-AY43

- Use a pin punch to drive the manual plate spring pin into place.



21CASE-AY48

3. **Detent spring**
   - Install the detent spring and tighten the fixing bolt to the specified torque.
     Torque: 7 N·m (0.7 kgf·m/61 lb·in)

23CASE-AY53

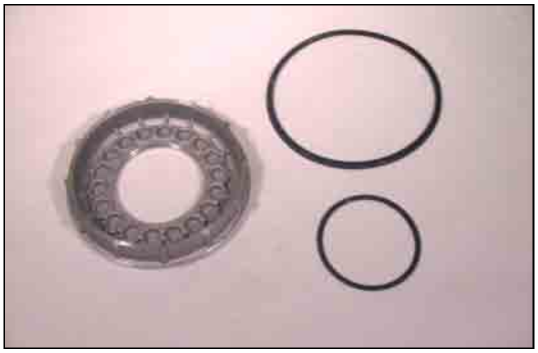
4. **Harness assembly**
   - Apply automatic transmission fluid to the new O-ring and install them to the harness assembly.
   - Install the harness assembly to the transmission case. Tighten the fixing bolt to the specified torque.
     Torque: 6 N·m (0.6 kgf·m/52 lb·in)

24ASSY003

5. **Low one-way clutch inner race**
   - Install new seal rings to the low one-way clutch inner race.

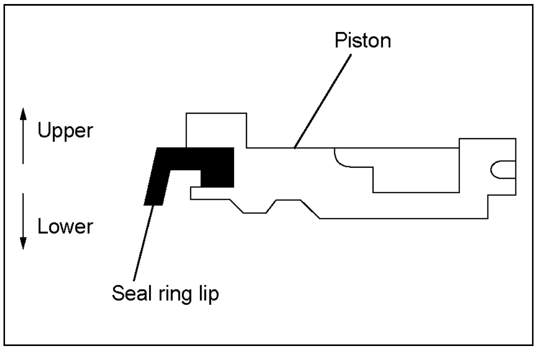
25ASSY126

- Measure the gap between the seal ring and the ring groove.
  If the measured valve is outside the specified range the low one-way clutch inner race must be replaced.
  Sealing ring and ring groove gap:
  0.10~0.25 mm (0.0039~0.0098 in)



26L&R01

6. **Low and reverse brake piston**
   - Install new seal rings to the low and reverse piston.



RTW47ASH000701

As shown in a figure, a sealing lip is attached.

27ASSY004

   - Install the low and reverse brake piston to the transmission case.

28ASSY005

7. **Return spring**
   - Install the return spring to the low and reverse brake piston.

29ASSY006

8. **Low one-way clutch inner race**
   - Install the low one-way clutch inner race to the transmission case.
   - Temporarily tighten the 7 fixing bolts.

31ASSY074

- Tighten each of the bolts a little at a time to the specified torque.
  Be sure that the return spring and the low one-way clutch inner race installation position does not change as you tighten the bolts.
  Torque: 24 N·m (2.4 kgf·m/17 lb·ft)

32ASSY007

9. Dish plate, driven plates, drive plates, and retaining plate (low and reverse brake)

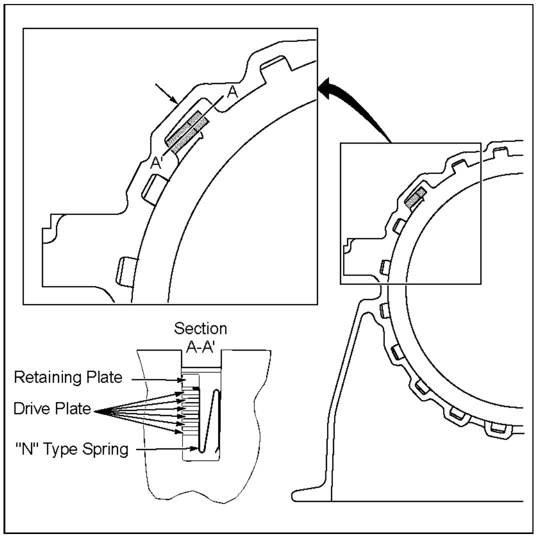
- Install the dish plate (1) followed by the 6 driven plates (2) and drive plates (3) sets.

33ASSY008

34ASSY009

- Install the N-type spring.

35N-SPG02



RTW37AMF0001-X

36ASSY10

- Install the retaining plate (4).

37ASSY011

- Install the snap ring.

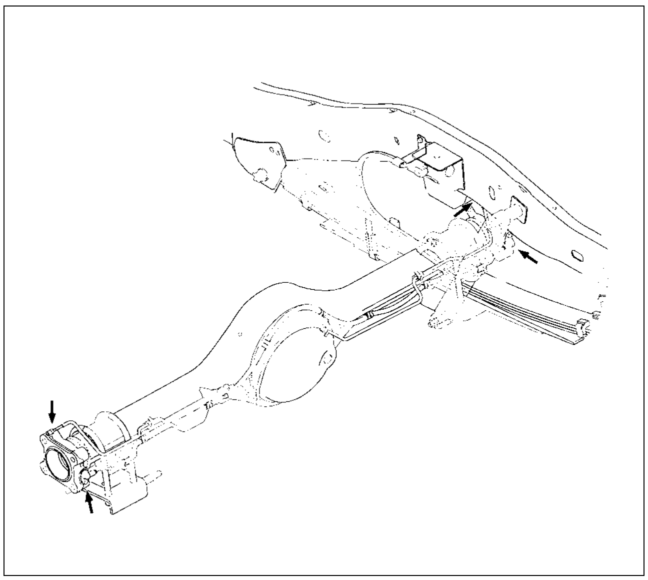
38L&R03

- Force compressed air (390 kPa/4.0 kgf/cm^2/57 psi) through the oil passages of the transmission case to check low and reverse brake operation.
  If the low and reverse brake does not operate, check the seal rings for damage and replace if necessary. Also check that no parts have been installed out of place.

Disassembly

- Raise vehicle to the working level.
- Support the axle assembly with the proper jack and chassis stands.
- Remove wheel and tire.
- Drain differential oil.
- Remove propeller shaft. (Refer to the section “Rear Propeller Shaft”.)

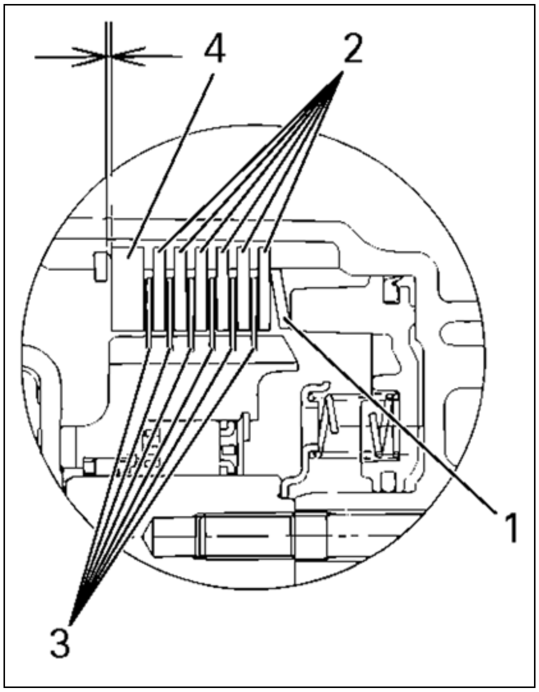
1. Remove brake drum.
2. Remove ABS sensor. (Refer to the section “ABS”.)
3. Remove brake pipe from wheel cylinder.



420R300003

39L&R04

- Measure the clearance between the low and reverse retaining plate and the snap ring.
  If the clearance is outside the specified range, replace the existing retaining plate with a new plate of the proper size (thickness).
  Low and reverse retaining and snap ring clearance:
  0.7~1.1 mm (0.028~0.043 in)
  Available low and reverse brake retaining plate thicknesses
  5.2 mm (0.205 in)
  5.4 mm (0.213 in)
  5.6 mm (0.220 in)
  5.8 mm (0.228 in)
  6.0 mm (0.236 in)



249L300003

10.Dish plate, drive plates, driven plates, and retaining plate. (2-4 brake)

NOTE:

Ensure the attachment direction of dish plate is correct.
If 2-4 brake clearance measurement is required, it must be done now.
Brake clearance cannot be measured after the carrier assembly has been installed.

402-4B08

- Install the 2-4 brake dish plate to the transmission case (plate contact surface).

412-4B09

- Install the drive plates, driven plates, and the retaining plate.

422-4B10

432-4B11

442-4B12

11.2 – 4 brake piston and 2 – 4 brake retainer

- Install new seal ring to the 2-4 brake piston.
- Install the 2-4 brake piston to the 2-4 brake retainer.

452-4B15

- Install the 2-4 brake piston and the 2-4 brake retainer to the transmission case.
  Pay close attention to the retainer projection from the case groove.

472-4B17

- Install the spring compressor to the transmission case.
  Spring compressor: 5-8840-2764-0

NOTE:
Be sure that the spring compressor is perfectly centered (an off-center special tool will damage the return spring).

- Use the spring compressor to force the 2-4 brake retainer.

482-4B18

NOTE:
To avoid damaging the return spring, apply as little force as possible to the 2-4 brake retainer.

- Install the snap ring.

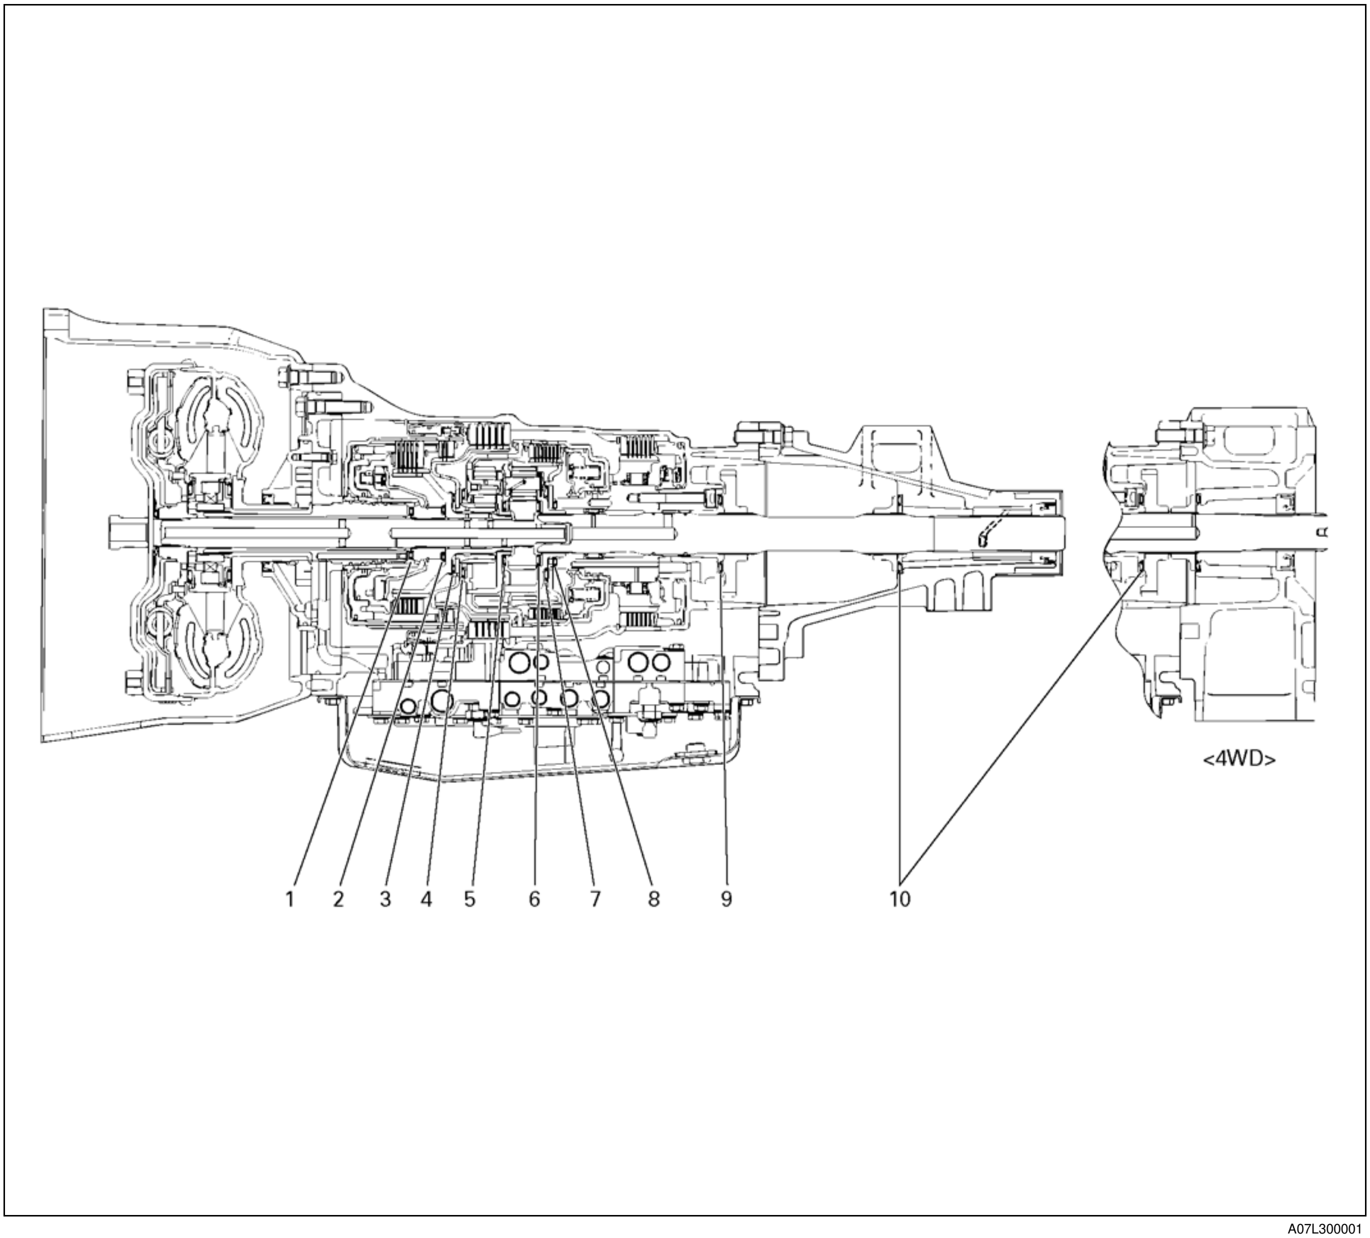
492-4B22

- Force compressed air (390 kPa/4.0 kgf/cm^2/57 psi) through the oil passages of the transmission case to operate and break-in the 2-4 brake.

502-4B19

- Measure the clearance between the 2-4 brake retainer and the retaining plate.
  If the clearance is outside the specified range, replace the existing brake retainer with a new one of the proper size (thickness).
  2 – 4 brake retainer and retaining plate clearance:
  1.0~1.4 mm (0.039~0.055 in)
  Available 2-4 brake retaining plate thicknesses
  5.4 mm (0.213 in)
  5.6 mm (0.220 in)
  5.8 mm (0.228 in)
  6.0 mm (0.236 in)
  6.2 mm (0.244 in)
  6.4 mm (0.252 in)
- Use the spring compressor to release the 2-4 brake.

BEARING AND BEARING RACE INSTALLATION POSITION



01BRG16

1. **Bearing and bearing race**

		Outside diameter
Bearing	–	46 mm (1.811 in)
Bearing race	–	45 mm (1.772 in)

02BRG02

2. **Bearing (with bearing race)**

		Outside diameter
Bearing	–	46 mm (1.811 in)

Bearing race (black color) installation direction – Facing the front of the transmission.

03BRG04

3. **Bearing and bearing race**

		Outside diameter
Bearing	–	65 mm (2.559 in)
Bearing race	–	64 mm (2.520 in)

04BRG05

4. **Bearing and bearing race**

		Outside diameter
Bearing	–	73 mm (2.874 in)
Bearing race	–	72 mm (2.835 in)

05BRG06

5. **Bearing (with bearing race)**

		Outside diameter
Bearing	–	53 mm (2.087 in)

Bearing race (black color) installation direction – Facing the front of the transmission.

06BRG07

6. Bearing

		Outside diameter
Bearing	–	53 mm (2.087 in)

07BRG08

7. Bearing and bearing race

		Outside diameter
Bearing	–	78 mm (3.071 in)
Bearing race	–	76 mm (2.992 in)

08BRG09

8. Bearing and bearing race

		Outside diameter
Bearing	–	53.4 mm (2.102 in)
Bearing race	–	51 mm (2.008 in)

09BRG18

9. Bearing (with bearing race)

		Outside diameter
Bearing	–	64 mm (2.520 in)

Bearing race (black color) installation direction – Facing the rear of the transmission.

10BRG17

10. Bearing (with bearing race)

		Outside diameter
Bearing	–	64 mm (2.520 in)

Bearing race (black color) installation direction – Facing the front of the transmission.

AUTOMATIC TRANSMISSION REASSEMBLY

Assembly cautions

- Use your bare hands or vinyl gloves to reassemble the transmission. Do not use ordinary work gloves (loosen threads from the gloves may fall into the transmission and cause problems).
- Before installing the drive plates, immerse them in the recommended automatic transmission fluid (BESCO ATF III). If the drive plate is new, it must be immersed for at least two hours to ensure oil penetration and saturation of the facing.
- Apply ATF to all sliding and contact surfaces before assembly. Also apply ATF to seal rings and O-rings. Assemble the parts carefully to avoid damaging them.
- Replace any snap ring that appears worn, bent out of shape, or damaged.
- If any part contacting the transmission case is damaged, it must be replaced with a new part.
- Be careful not to damage the plates during reassembly (oil leakage from the plate will result).
- If you are reusing a seal, remove the old adhesive agent and clean the surface with cleaning oil before applying the new adhesive agent.
- Wait at least two hours after installing the oil seals before installing the plates.
- Do not replace O-rings, snap rings, bearings, and/or bearing races with inferior substitutes.

10. Bearing race
11. Bearing
12. Carrier and low clutch assembly
13. Bearing
14. Transmission case

Reassembly steps

1. Transmission case

Rotate the transmission case so that the converter housing installation surfaces are facing up.

02ASSY012

2. Bearing

Install the bearing to the low and one-way clutch inner race. Refer to the item “Transmission Case” for more detailed information.

NOTE:

Apply Vaseline to the bearing to prevent them from failing during the installation procedure.

03ASSY013

3. Carrier and low clutch assembly

Install the carrier and low clutch assembly to the transmission case.

NOTE:

Do not allow the low clutch drum end to protrude beyond the 2-4 brake plate contact surface (transmission case).

04ASSY014

4. Bearing

Install the bearing to the carrier and low clutch assembly.

05ASSY015

5. Driven plates, drive plates, retaining plate, and dish plate (2 – 4 brake)

Install the 2-4 brake 5 driven plates (1), 5 drive plates (2), retaining plate (3), and dish plate (4) in that order.

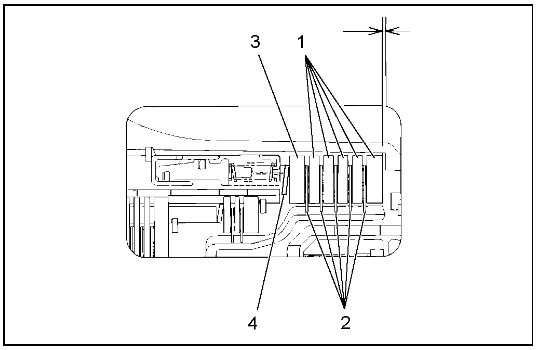
NOTE:

- **The thickest driven plate (5.6 mm) must be installed at the bottom (transmission case plate surface).**
- **The dish plate side with the identification mark must face the retaining plate.**

06ASSY016

07ASSY017

08ASSY018

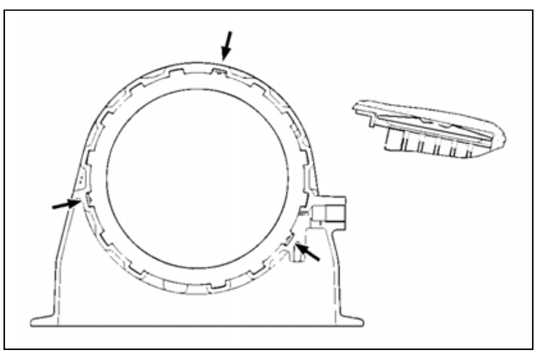


RTW47ASH000401

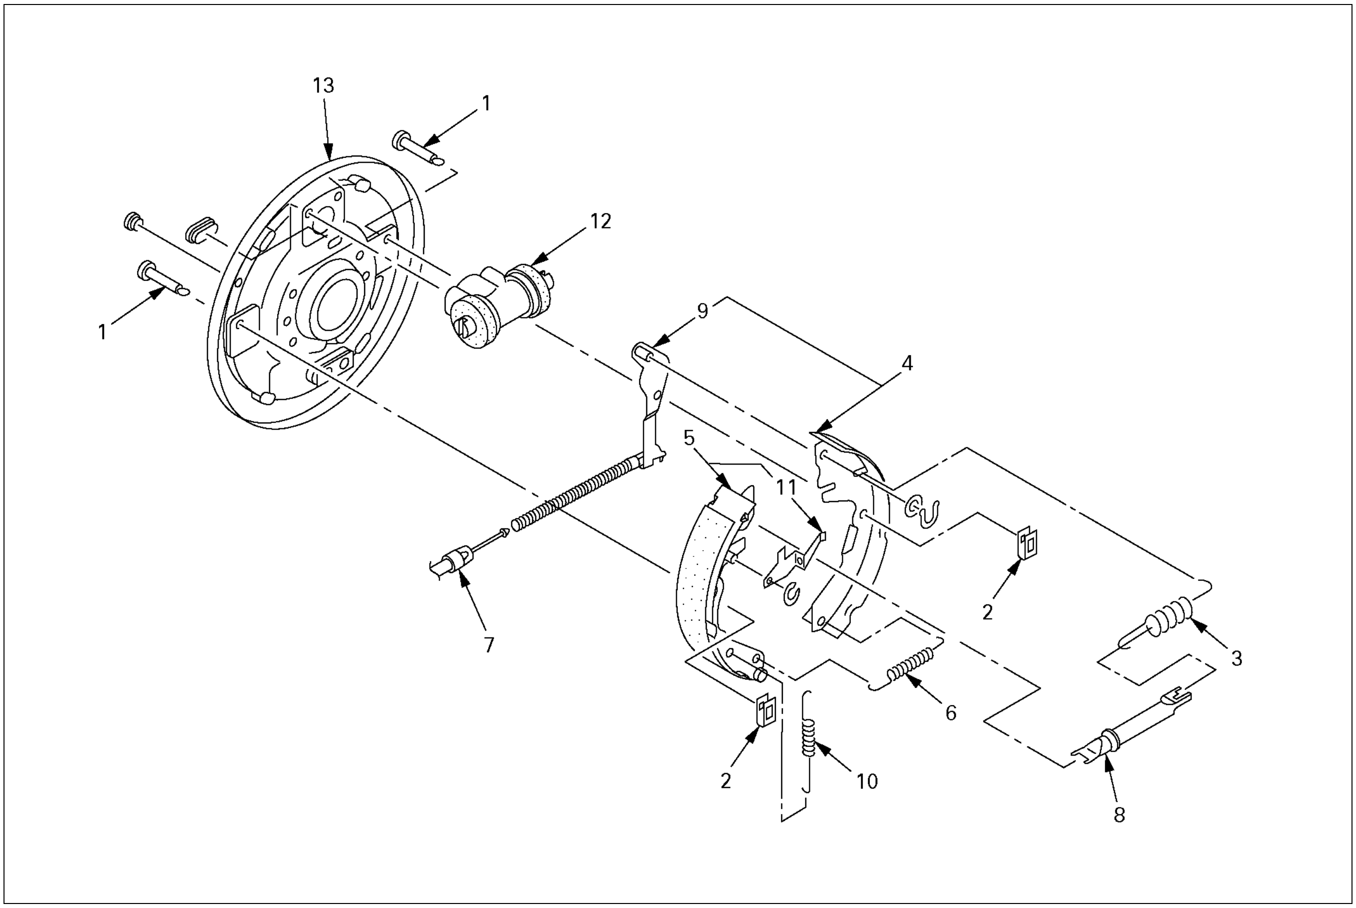
09U-SPG2

6. 2 – 4 brake spring

Install the three 2-4 brake springs to the transmission case.



248L300009



Legend

1. Tension Pin
2. Shoe Clamp Spring
3. Return Spring
4. Shoe Assembly with Parking Brake Lever
5. Shoe Assembly with Adjuster Lever
6. Spring
7. Parking Brake Cable
8. Adjuster
9. Parking Brake Lever
10. Adjuster Spring
11. Adjuster Lever
12. Wheel Cylinder
13. Back plate

4. Remove tension pin and shoe clamp spring.
5. Remove return spring.
6. Remove shoe assembly with parking brake lever.
7. Remove shoe assembly with adjuster lever and spring.
8. Remove parking brake inner cable from parking brake lever.

10ASSY019

7. Return spring and 2 – 4 brake retainer

- Align the transmission case groove and the 2-4 brake retainer projection.
- Install the return spring and the 2-4 brake retainer.

11ASSY028

12ASSY029

- Install the spring compressor to the transmission case.

  Spring compressor: 5-8840-2764-0

NOTE:
Carefully center the spring compressor to prevent damage to the return spring.

- Push the 2-4 brake retainer into place.

NOTE:
Do not push the brake retainer too far.
Damage to the return spring will result.

- Install the snap ring.

14ASSY031

17ASSY113

8. Sleeve and seal ring

- Install the new sleeve and seal ring to the transmission case.

192-4B22

- Force compressed air (390 kPa/4.0 kgf/cm^2/57 psi) through the transmission case oil passage to 2-4 brake operation.
  If the 2-4 brake does not operate, the seal ring may be damaged or the parts may have been installed in the wrong order.

20ASSY037

9. Bearing race, front sun gear, and bearing

- Install the bearing race to the front sun gear.

NOTE:

Apply Vaseline to the bearing race and bearing to prevent them from falling during the installation procedure.

21ASSY040

- Install the front sun gear to the transmission case.

22ASSY042

- Install the bearing to the front sun gear.

23ASSY045

10.High clutch hub and bearing race

Install the bearing race to the high clutch hub.

NOTE:

Apply Vaseline to the bearing race.

24ASSY047

- Install the high clutch hub and the bearing race to the transmission case.

25R&H42

11.Clutch pack (reverse and high clutch assembly)

- Install the bearing (with bearing race) to the clutch pack.

NOTE:

- **The black side (bearing race) of the bearing must contact the clutch pack.**
- **Apply Vaseline to the bearing.**

26ASSY049

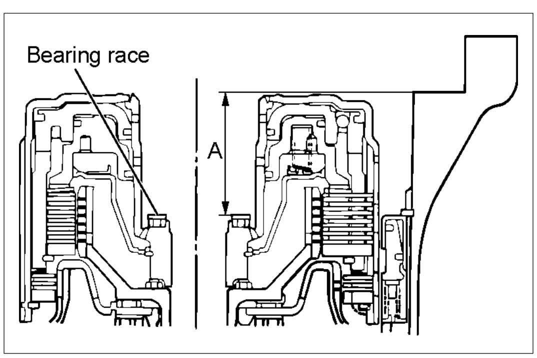
- Install the clutch pack and bearing to the transmission case.

27ASSY051

- Install the bearing to the clutch pack.

NOTE:

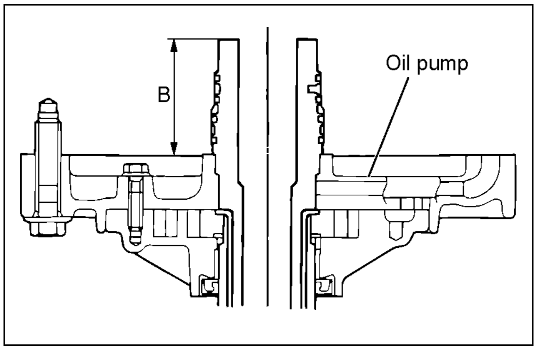
Apply Vaseline to the bearing.



RTW47ASH000101

Total end play measurement

- Install the bearing race (oil pump) to the clutch pack.
- Measure the distance (A) between the oil pump installation surface and the bearing race.



RTW47ASH000201

- Measure the distance (B) between the bearing race installation surface and the machined surface.
- Calculate the total end play using the following formula.

  Total end play = distance (A) – distance (B)

  If the measured and calculated end play is outside the specified range, replace the existing bearing race with a bearing race of the proper size (thickness).

  Total end play = 0.25~0.55 mm (0.0098~0.0217 in)

  Available oil pump bearing race thicknesses

  1.4 mm (0.055 in)

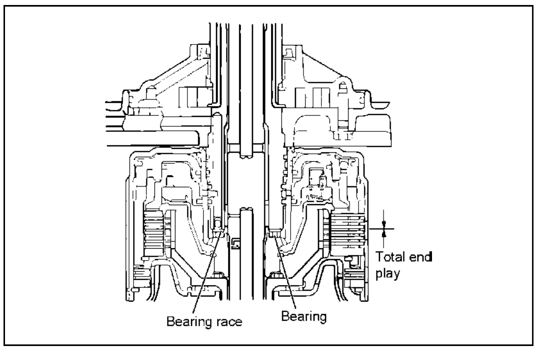
  1.6 mm (0.063 in)

  1.8 mm (0.071 in)

  2.0 mm (0.079 in)

  2.2 mm (0.087 in)

  2.4 mm (0.094 in)



RTW47ASH000201

28ASSY058

12.Input shaft

Install the input shaft.

29PUMP02

13.Oil pump assembly

- Install a new O-ring to the outside of the oil pump.
- Install the bearing race to the oil pump.

NOTE:

Apply Vaseline to the bearing race.

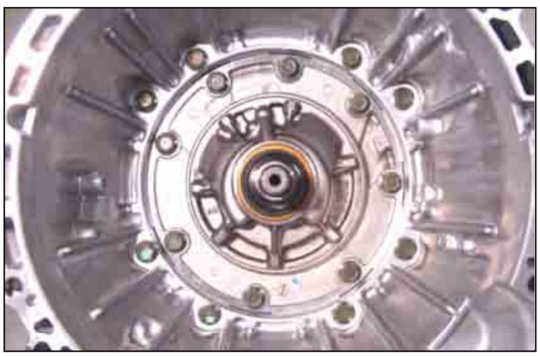
30ASSY067

- Apply ATF to the O-ring at the outside of the oil pump.
- Install the oil pump assembly to the transmission case.
- Apply sealing agent (TB1215) to the threaded surfaces of the 8 fixing bolts and tighten to the specified torque.
  Torque: 58 N·m (5.9 kgf·m/43 lb·ft)

31ASSY068

14.O-ring

Install a new O-ring to the input shaft.



32ASSY116

15.Converter housing

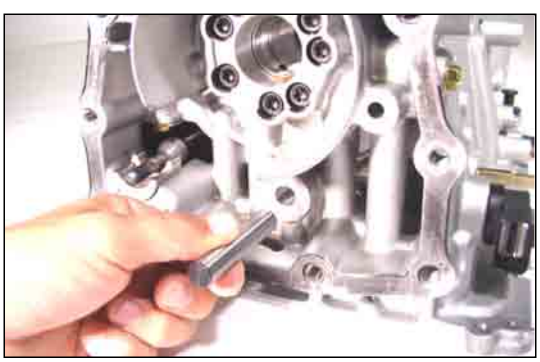
Install the converter housing and tighten the bolts to the specified torque.

Torque: 53 N·m (5.4 kgf·m/39 lb·ft)

33ASSY075

16.Actuator support

Install the actuator support.



34ASSY077

17.Parking pawl, shaft, spring, and spacer

Install the parking pawl, the shaft, the spring, and the spacer.

35ASSY082

36ASSY084

37ASSY086

38OUTPUT25

18.Output shaft

- Install a new seal ring to the output shaft assembly.
- Measure the gap between the seal ring and the ring groove.
  If the gap is outside the specified range, the output shaft must be replaced.
  Seal ring and ring groove gap:
  0.10~0.25 mm (0.0039~0.0098 in)
- Install the bearing to the case.

NOTE:

- **Apply Vaseline to the bearing (with bearing race).**
- **The black side (bearing race) of the bearing must be visible.**

29ASSY089

40ASSY091

- Push the output shaft into place.

19.Rear extension (2WD) or adapter case (4WD)

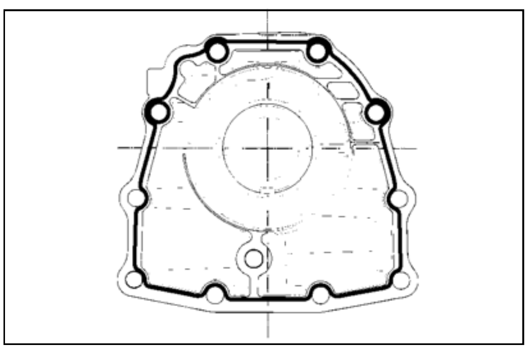
- Use the oil seal installer to install the oil seal to the rear extension (2WD) or adapter case (4WD).
  Oil seal installer:
  5-8840-2769-0 (2WD)
  5-8840-2770-0 (4WD)

41ASSY096

- Install the bearing (with bearing race) to the rear extension (2WD) or adapter case (4WD).

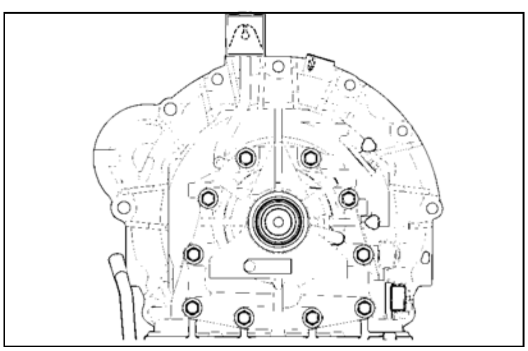
NOTE:

- **The black side (bearing race) of the bearing must be visible.**
- **Apply Vaseline to the bearing.**



249L300005

- Apply sealing agent (TB1216B) to the rear extension (2WD) or adapter case (4WD) contact surfaces.



249L300006

- Install the rear extension (2WD) or adapter case (4WD) to the transmission case and tighten the 10 bolts to the specified torque.
  Torque: 53 N·m (5.4 kgf·m/39 lb·ft)

43ASSY119

20.Control valve assembly

- Align the manual valve and the manual plate of the transmission case.

44ASSY121

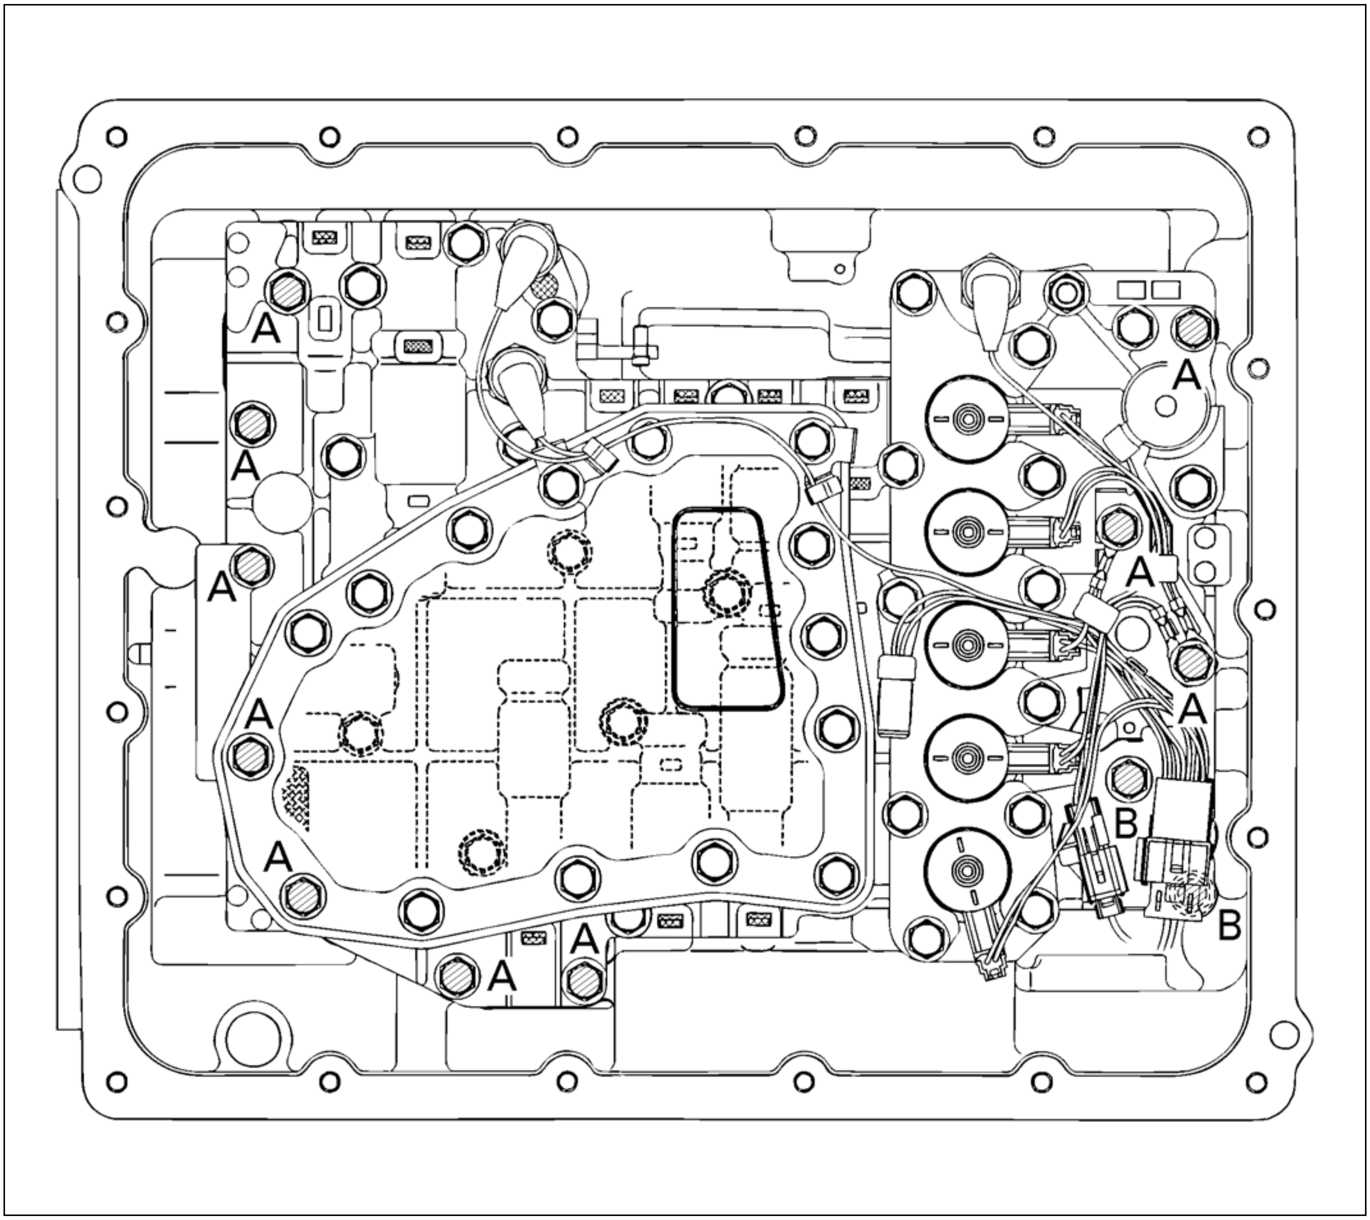
- Install the control valve assembly and tighten the 12 fixing bolts to the specified torque.

Number of bolts	Length	Color
10 (A)	40 mm (1.57 in)	Gold
2 (B)	30 mm (1.18 in)	Gold

Torque: 8 N·m (0.8 kgf·m/69 lb·in)

45CV29

- Connect the harness assembly and control valve assembly connectors.



244L300001

21.Oil pan

- Install a new gasket and the oil pan.
- Tighten the bolts to the specified torque.

  Torque: 8 N·m (0.8 kgf·m/69 lb·in)

22.Inhibitor switch

47INH-SW01

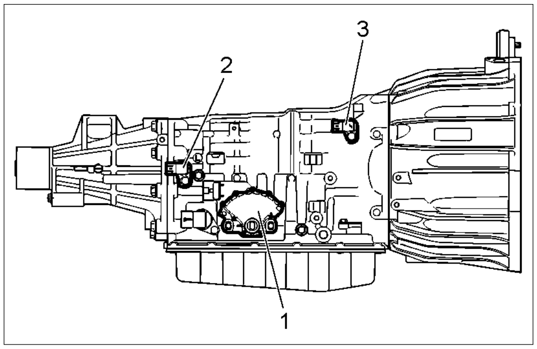
- Secure the inhibitor switch (1) by hand-tightening the 2 bolts.
- Use the inhibitor switch set plate to align the neutral holes (manual shaft and inhibitor switch).

  Turn the inhibitor switch to adjust it.

  Inhibitor switch set plate: 5-8840-2763-0

NOTE:
Inhibitor switch adjustment is very important.
If the inhibitor switch is not correctly adjusted, the automatic transmission will not function normally.

- Tighten the 2 inhibitor switch bolts to the specified torque.



RTW47ASH001001

Torque: 6 N·m (0.6 kgf·m/52 lb·in)

- Remove the holding fixture from the transmission case.

23.Speed sensor and turbine sensor

- Apply ATF to the new O-rings and install them in the speed sensor (2) and the turbine sensor (3).
- Install the speed sensor and the turbine sensor. Tighten the bolt to the specified torque.

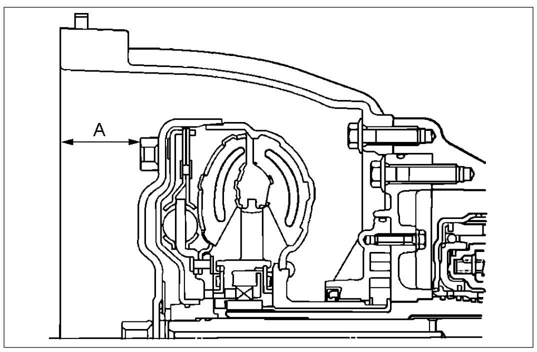
Torque: 6 N·m (0.6 kgf·m/52 lb·in)

24.Torque converter

- Pour the new ATF into the torque converter.
- Shake the torque converter to thoroughly clean the inside.
- Drain the ATF from the torque converter.
- Pour the new ATF into the torque converter.

NOTE:

If significant amounts of foreign material (clutch facing, metallic fragments, etc.) are found in the automatic transmission at time of disassembly, the existing torque converter must be replaced with a new one.



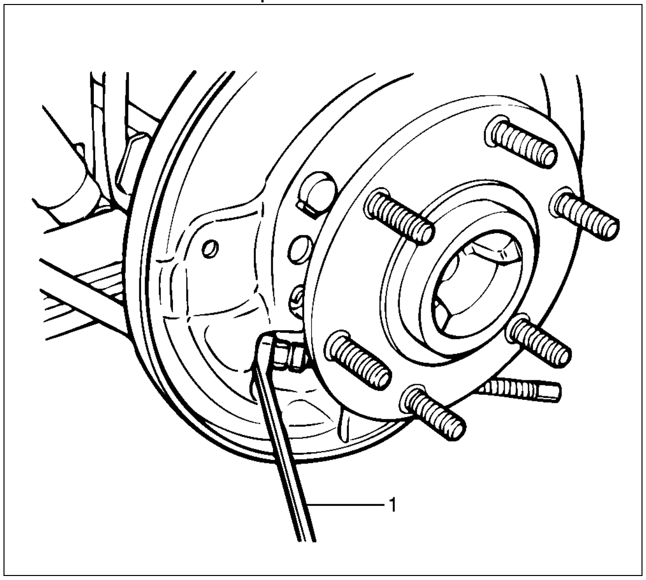
RTW47ASH000901

- Install the torque converter.
- Measure the torque converter end play (A).

If the measured value is greater than the specified minimum, the torque converter is correctly installed.

Torque converter end pay (Minimum): 67 mm (2.64 in)

9. Use offset box wrench to compress locking lugs on the cable, then remove parking brake outer cable from back plate.

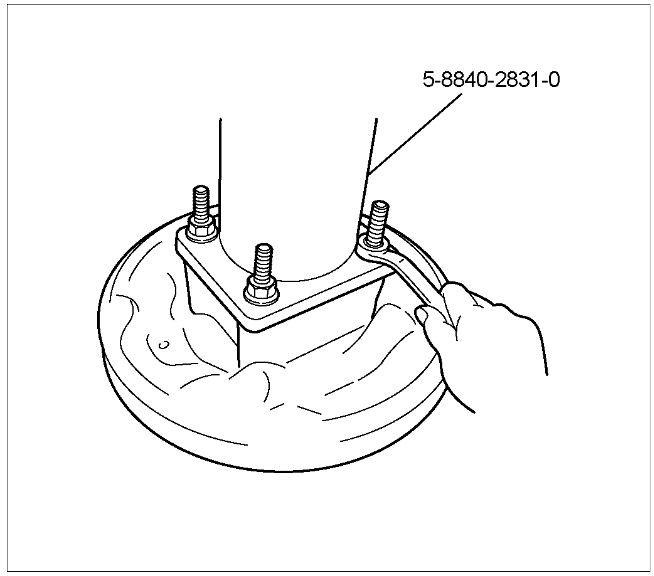


311RS012

Legend

1. Offset Box Wrench

10. Remove wheel cylinder.
11. Remove bearing holder fixing nuts.
12. Take out axle shaft assembly with back plate and set it on a bench press as following illustration. When axle shaft is extracted, since axle case oil seal is damaged, replace the axle case oil seal.
13. Remove snap ring. Use snap ring pliers to remove. Snap ring is prohibition of reuse.
14. Remove shim (If so equipped)
15. Grind the retainer surfaces using a grinder, then chisel them out with a chisel.
16. Position remover 5-8840-2831-0 on the bearing holder with 4 nuts.



RTW54BSH000801

MANUAL TRANSMISSION

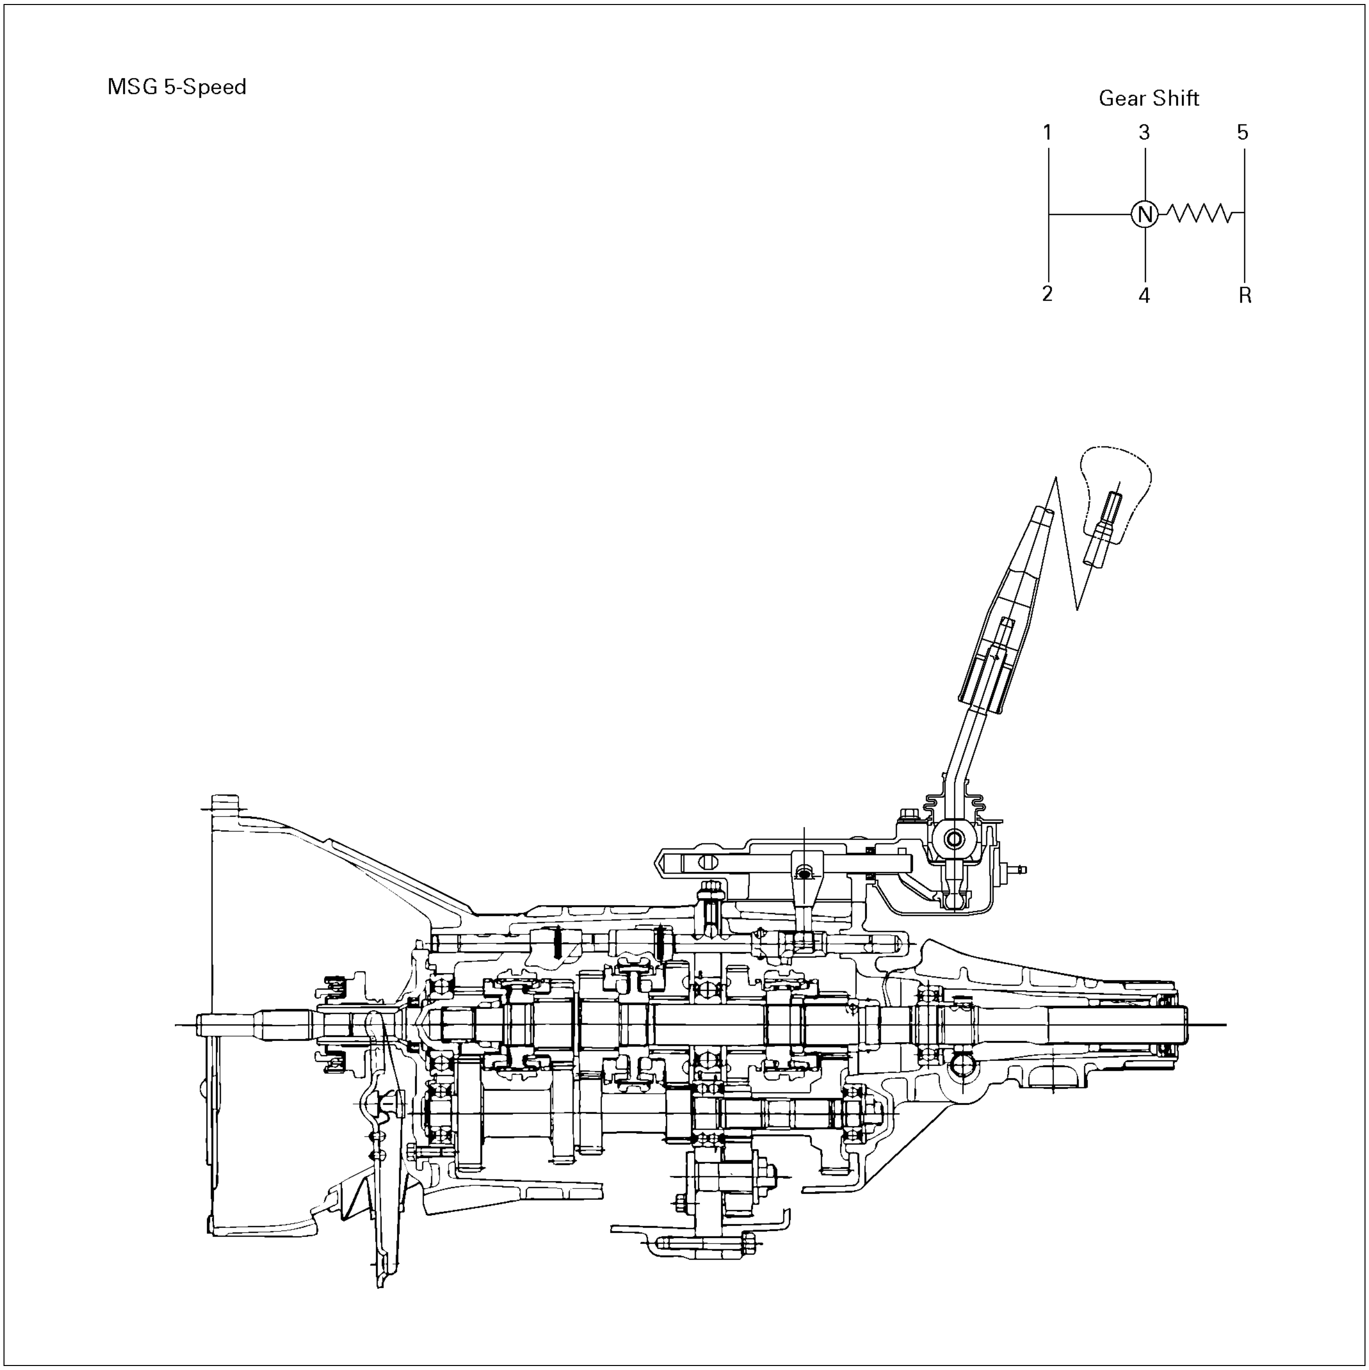
(MSG)

TABLE OF CONTENTS

MAIN DATA AND SPECIFICATIONS

Transmission type	Fully synchronized 5-forward gears with a constant mesh type reverse gear.
Transmission Control	Direct control with the gear shift lever on the floor.
Gear ratio	MSG5K
1st :	4.122
2nd :	2.493
3rd :	1.504
4th :	1.000
5th :	0.855
Rev :	3.720
Oil capacity lit. (US gal.)	1.55(0.41)
Weight ; approx. kg(lbs)	33.3(73.8)

GENERAL DESCRIPTION



The MSG type transmission is fully synchronized 5-speed unit with blocking ring type synchronizers and a constant mesh type reverse gear.
The unit consists principally of a case with an integral clutch housing, intermediate plate, rear cover and gears.
The top of the rear cover is a quadrant box containing the transmission control mechanism.
The case and rear cover are cast aluminum alloy to reduce weight.

TORQUE SPECIFICATION

STANDDARD BOLTS

The torque values given in the following table should be applied where a particular torque is not specified.

N·m (kgf·m/lb·ft)

Strength Class		4.8/4T	7T	8.8		9.8/9T
				Refined	Non-Refined	
Bolt Identification						
	Bolt Diameter× Pitch (mm)	 No mark	-			Standard Hex. Head Bolt	M6 × 1.0	6 (0.6 / 52 lb.in)	7 (0.7 / 61 lb.in)	8 (0.8 / 69 lb.in)		-
	M8 × 1.25	13 (1.3 / 113 lb.in)	17 (1.7 / 12)	20 (2.0 / 14)		24 (2.4 / 17)
	M10 × 1.25	27 (2.8 / 20)	37 (3.8 / 27)	42 (4.3 / 31)		50 (5.1 / 37)
	M12 × 1.25	61 (6.3 / 45)	76 (7.8 / 56)	87 (8.9 / 64)		95 (9.7 / 70)
	M14 ×1.5	96 (9.8 / 71)	116 (11.8 / 85)	133 (13.6 / 98)		142 (14.5 / 105)
	M16 × 1.5	130 (13.3 / 96)	170 (17.3 / 125)	193 (19.7 / 143)		200 (20.4 / 148)
	M18 × 1.5	188 (19.2 / 139)	244 (24.9 / 180)	278 (28.3 / 205)		287 (29.3 / 212)
	M20 × 1.5	258 (26.3 / 190)	337 (34.4 / 249)	385 (39.3 / 284)		396 (40.4 / 292)
	M22 × 1.5	332 (33.9 / 245)	453 (46.3 / 335)	517 (52.7 / 381)		530 (54.1 / 391)
	M24 × 2.0	449 (45.8 / 331)	570 (58.2 / 421)	651 (66.3 / 480)		692 (70.6 / 511)
	*M10 × 1.5	26 (2.7 / 20)	36 (3.7 / 27)	41 (4.2 / 30)		48 (4.9 / 35)
	*M12 × 1.75	57 (5.8 / 42)	71 (7.2 / 52)	80 (8.2 / 59)		89 (9.1 / 66)
	*M14 × 2.0	89 (9.1 / 66)	110 (11.2 / 81)	125 (12.7 / 92)		133 (13.6 / 98)
	*M16 × 2.0	124 (12.7 / 92)	162 (16.5 / 119)	185 (18.9 / 137)		191 (19.5 / 141)
Flange Bolt	M6 × 1.0	7 (0.7 / 61 lb.in)	8 (0.8 / 69 lb.in)	9 (0.9 / 78 lb.in)		-
	M8 × 1.25	15 (1.5 / 11)	19 (1.9 / 14)	22 (2.2 / 16)		26 (2.7 / 20)
	M10 × 1.25	31 (3.2 / 23)	41 (4.2 / 30)	47 (4.8 / 35)		56 (5.7 / 41)
	M12 × 1.25	69 (7.0 / 51)	85 (8.7 / 63)	97 (9.9 / 72)		106 (10.8 / 78)
	M14 × 1.5	104 (10.6 / 77)	126 (12.8 / 93)	144 (14.6 / 106)		154 (15.7 / 114)
	M16 × 1.5	145 (14.8 / 127)	188 (19.2 / 139)	214 (21.8 / 158)		221 (22.5 / 163)
	M18 × 1.5	-	-	-		-
	M20 × 1.5	-	-	-		-
	M22 × 1.5	-	-	-		-
	M24 × 2.0	-	-	-		-
	*M10 × 1.5	30 (3.1 / 22)	40 (4.1 / 30)	46 (4.7 / 34)		54 (5.5 / 40)
	*M12 × 1.75	64 (6.5 / 47)	78 (8.0 / 58)	89 (9.1 / 66)		99 (10.1 / 73)
	*M14 × 2.0	97 (9.9 / 72)	119 (12.1 / 88)	135 (13.8 / 99.7)		144 (14.7 / 107)
	*M16 × 2.0	137 (14.0 / 101)	178 (18.2 / 132)	203 (20.7 / 132)		210 (21.5 / 155)

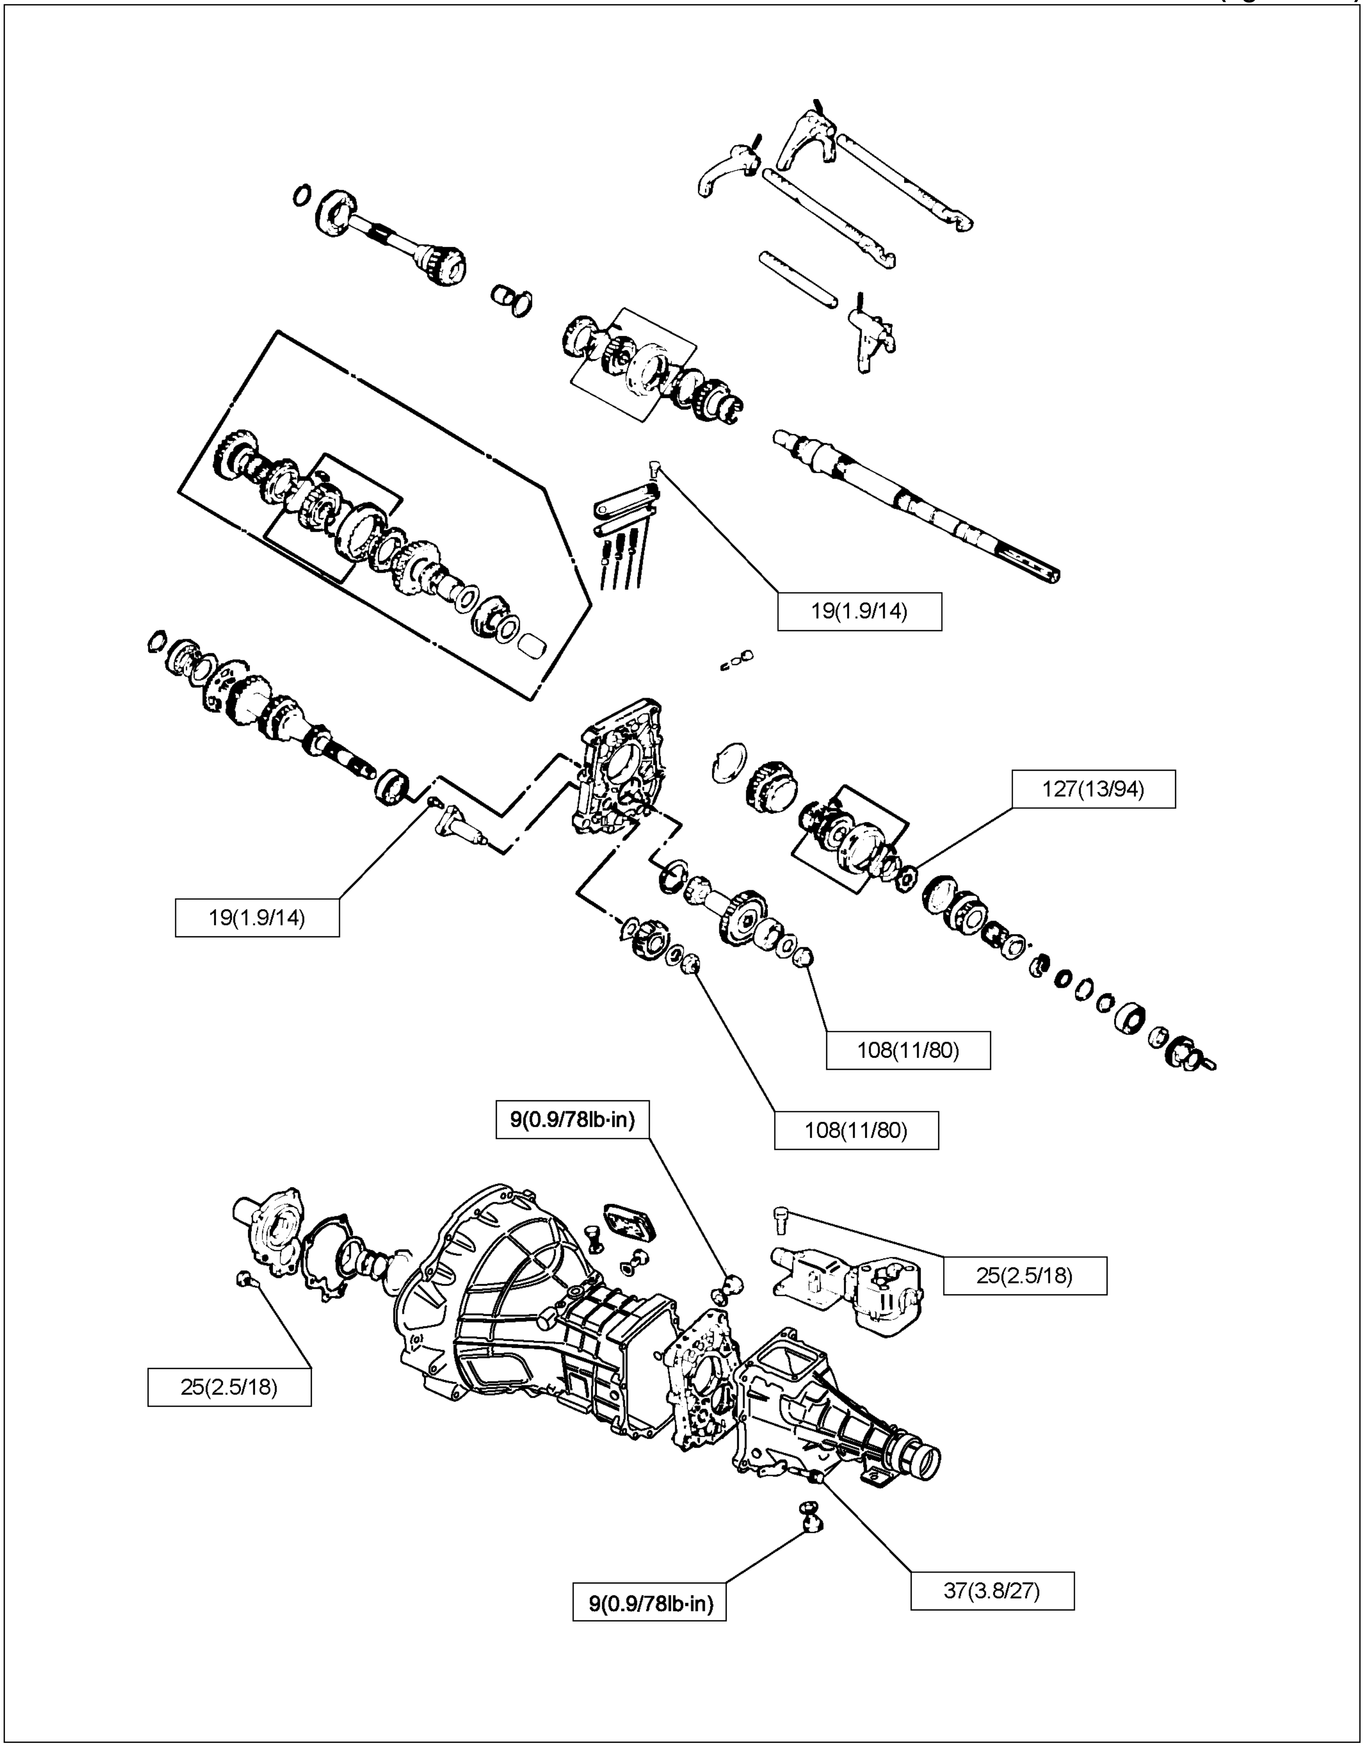
The asterisk * indicates that the bolts are used for female-threaded parts that are made of soft materials such as casting, etc.

FLARE NUTS

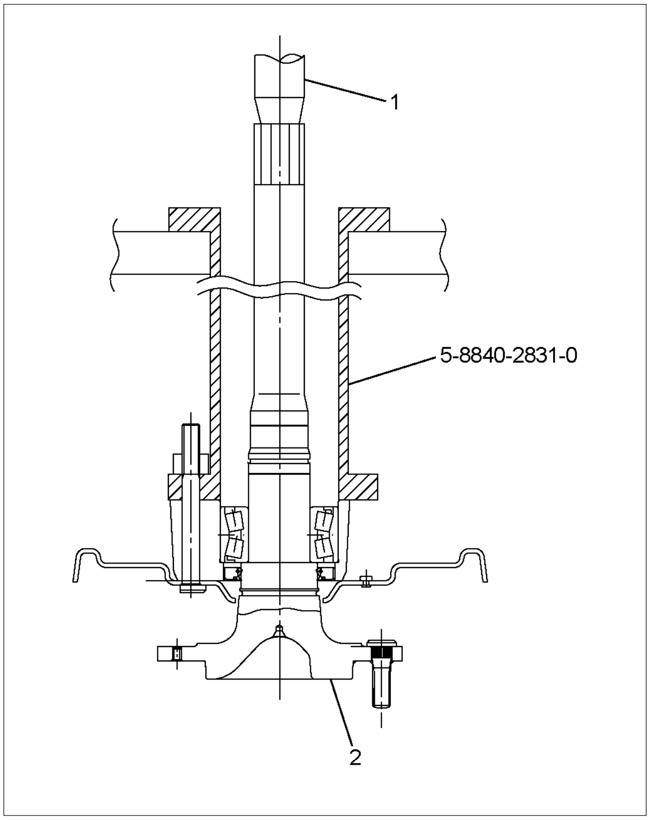
Pipe diameter mm (in)	Torque N·m (kgf·m/lb·ft)	Pipe diameter mm (in)	Torque N·m (kgf·m/lb·ft)
4.76 (0.187)	16 (1.6 / 12)	10.00 (0.394)	54 (5.5 / 40)
6.35 (0.250)	26 (2.7 / 20)	12.00 (0.472)	88 (9.0 / 65)
8.00 (0.315)	44 (4.5 / 33)	15.00 (0.591)	106 (10.8 / 78)

SPECIAL PARTS FIXING NUTS AND BOLTS

N·m (kgf·m/lb·ft)



17. Remove double taper roller bearing, oil seal, bearing holder, and back plate from axle shaft by means of a press.
    - Discard used oil seal, double taper roller bearing, snap ring, retainer.



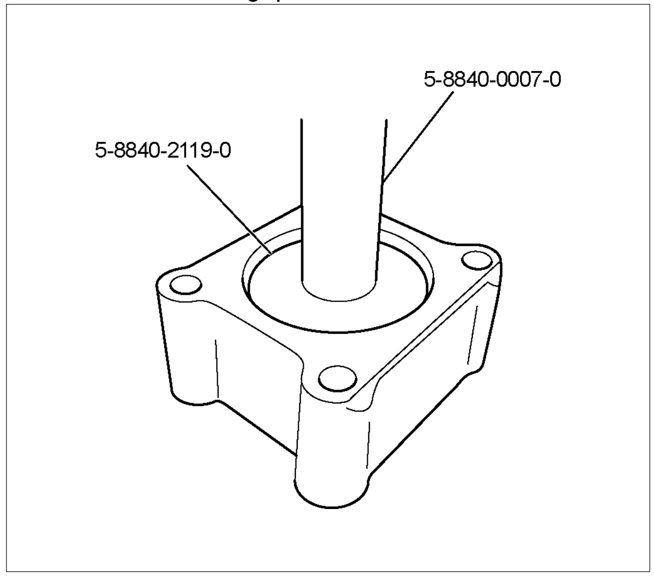
RTW54BMH000201

Legend

1. Bench Press Fitting
2. Axle Shaft

18. Oil seal is removed from bearing holder.

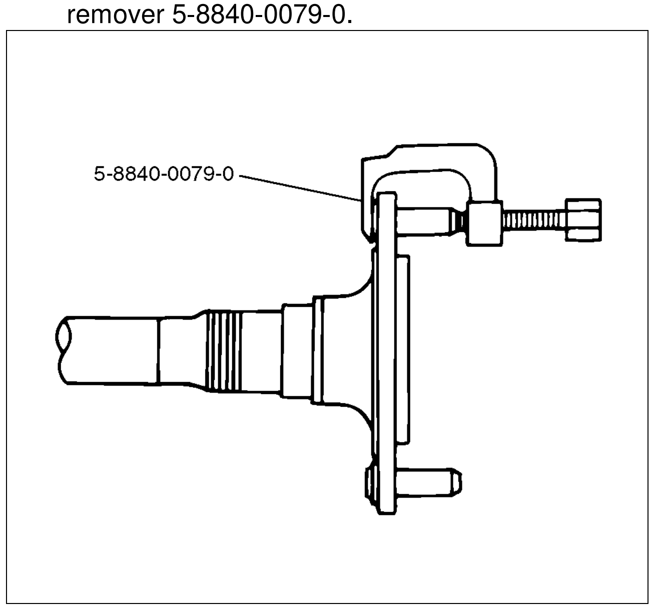
19. Bearing outer race is removed from bearing holder.
    - When it cannot remove by hand, bearing outer race is removed using installer 5-8840-2119-0 and grip 5-8840-0007-0.



RTW54BSH000701

20. Remove differential assembly fixing bolts and nuts and take out differential assembly.
    - ϕ194mm differential assembly has three kinds of bolts.
      Note the installation holes.

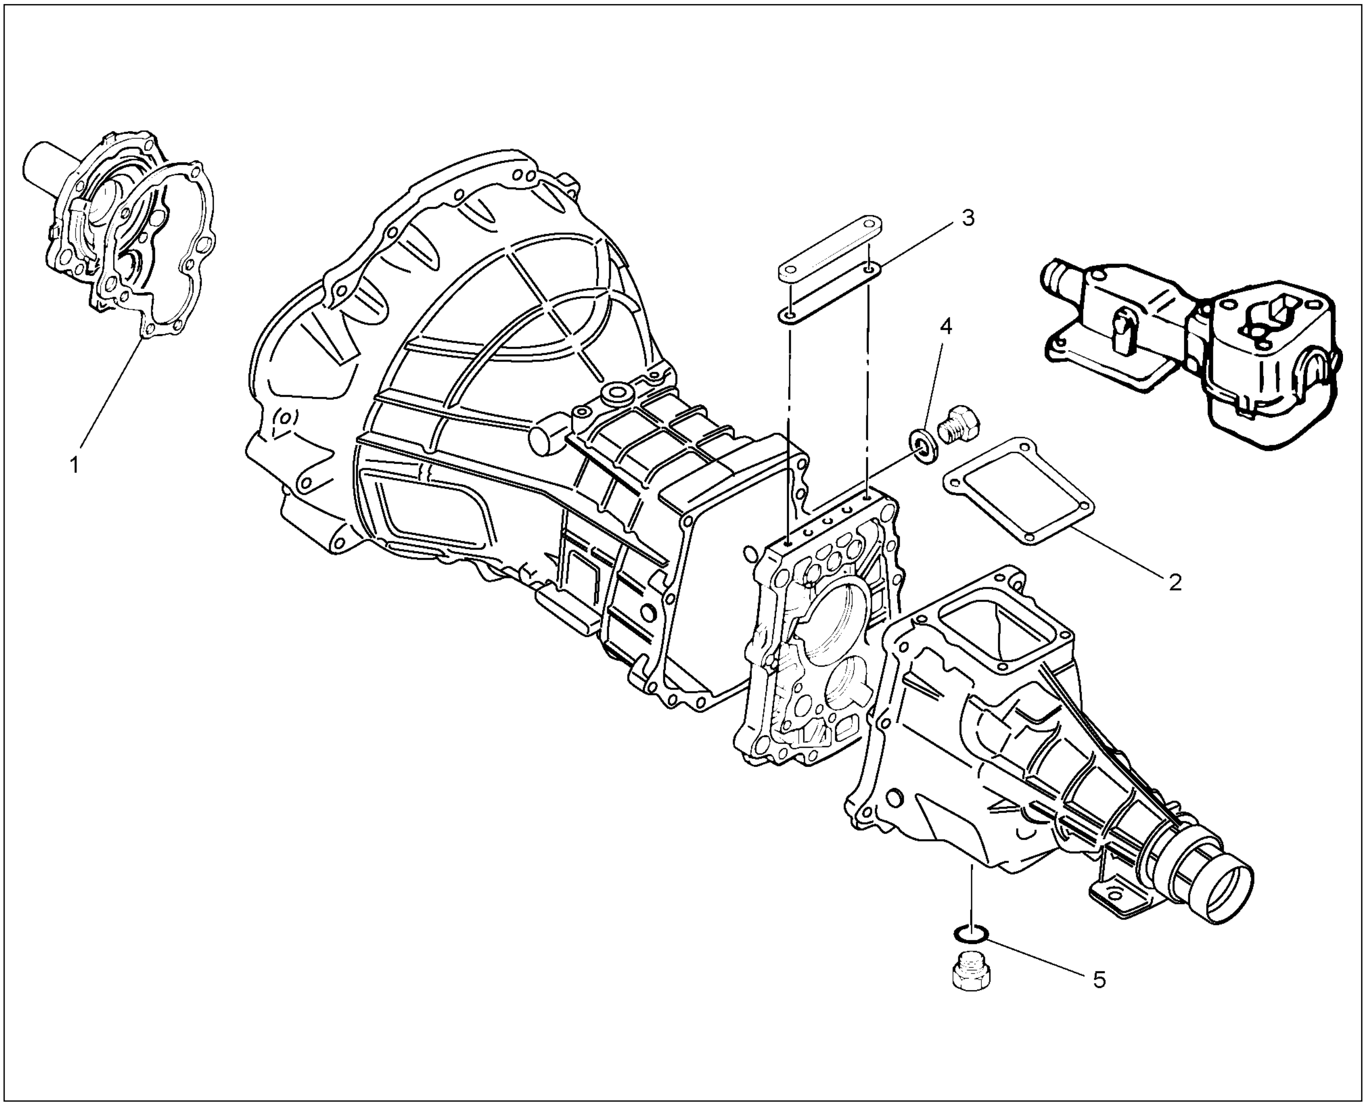
21. Remove wheel pin from axle shaft, using the remover 5-8840-0079-0.



420L100009

22. Remove axle case oil seal.
    - Discard used oil seal.

REPAIR KIT



RTW47BLF000201

1. Case to front cover gasket
2. Control box gasket
3. Plate gasket
4. Filler plug O-ring
5. Drain plug O-ring

REMOVAL AND INSTALLATION

Read this Section carefully before performing any removal and installation procedure. This Section gives you important points as well as the order of operation. Be sure that you understand everything in this Section before you begin.

Important Operations - Removal

Battery Cable

Disconnect the negative (-) cable from the battery terminal.

Engine Hood

Apply setting marks to the engine hood and the engine hood hinges before removing the engine hood.

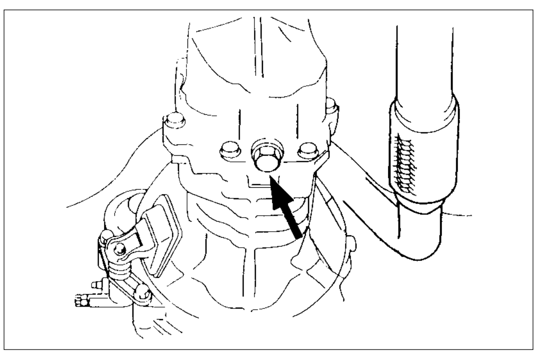
Gear Shift Lever

1. Place the gear shift lever in the neutral position.
2. Remove the gear shift lever knob.
3. Remove the front console assembly.
4. Remove the gear shift lever grommet and dust cover.
5. Remove the gear shift lever cover bolts.
6. Remove the gear shift lever.

Note:
Cover the shift lever hole to prevent the entry of foreign material into the transmission.

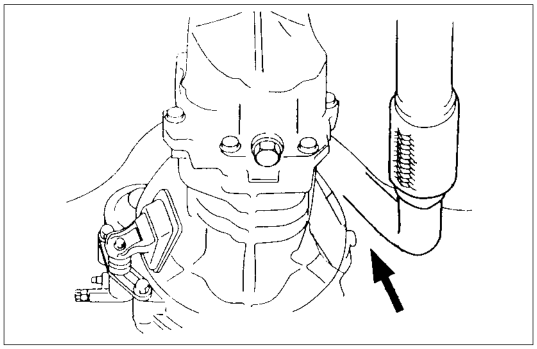
Lifting the Vehicle

1. Jack up the vehicle.
2. Place chassis stands at the front and the rear of the vehicle.



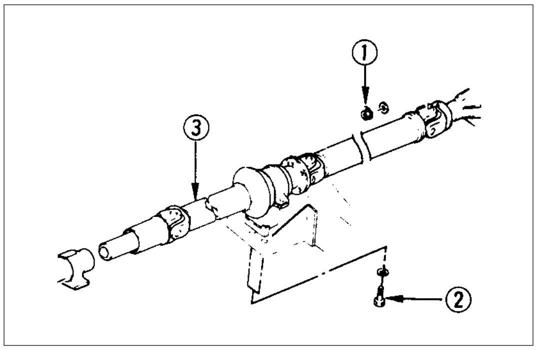
Transmission Oil Draining

1. Remove the transmission oil drain plug.
2. Replace the drain plug after draining the oil.



Exhaust Pipe

1. Remove the exhaust pipe bracket from the transmission case.
2. Remove the exhaust pipe.

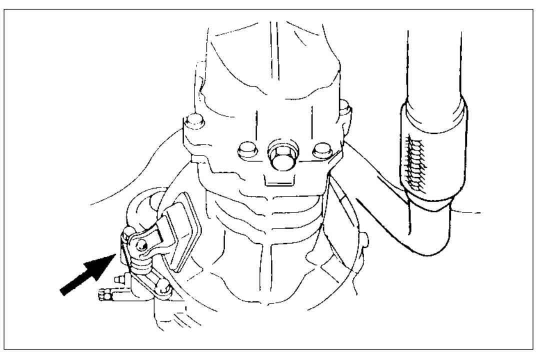


Rear Propeller Shaft (Dual Shaft Type)

1. Apply setting marks to the 2nd propeller shaft flange yoke.
   This will prevent mispositioning during the installation procedure.
2. Remove the 2nd propeller shaft flange yoke nuts at the drive pinion side ①.
3. Remove the center bearing retainer bolts ②.
4. Remove the 1st propeller shaft with the center bearing and the 2nd propeller shaft.
   Pull the 1st propeller shaft toward the rear of the vehicle until the spline yoke is free of the transmission main shaft.

Harness Connector

Disconnect the back up light switch connector and the speedometer sensor connector.

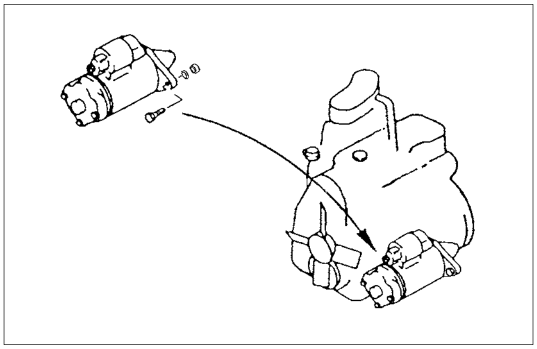


Slave Cylinder

Remove the slave cylinder from the transmission case.

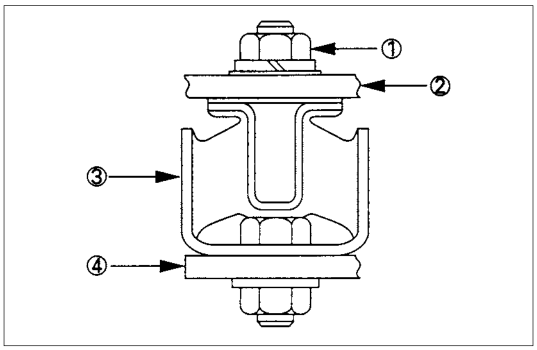
Engine Lifting Hanger

1. Attach the engine lifting hanger to the front portion of the engine.
2. Attach the lifting wire to both ends of the engine lifting hanger.



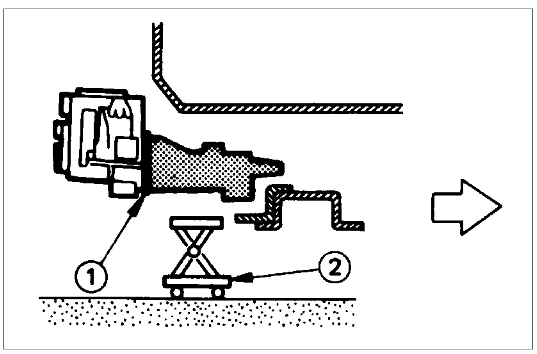
Starter Motor

Remove the starter motor from the engine rear plate.

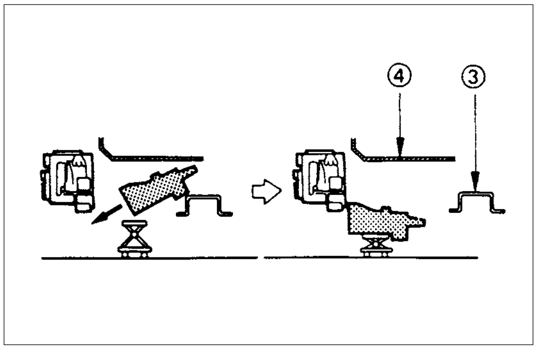


Transmission

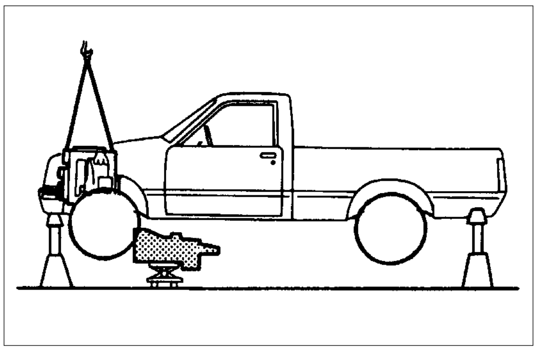
1. Support the transmission with a transmission jack.
2. Remove the engine rear mounting bracket bolts and nuts ① from the transmission ②.
3. Remove the bracket from No.3 crossmember.
4. Loosen the nuts for the rear mounting rubber.
5. Remove the rear mounting rubber ③ from the No.3 crossmember ④.
6. Remove the gear control box from the transmission.



7. Remove the transmission from the engine.
   The removal of the transmission will require the cooperative efforts of two mechanics.
   1) Remove the transmission nuts and bolts ① from the engine rear plate.
   2) Place a transmission jack ② beneath the transmission .
   Do not raise the transmission jack.



3) Manually move the transmission as far as possible toward the rear of the vehicle (into the space between the No.3 crossmember ③ and the floor panel ④.
4) Lower the clutch housing end of the transmission toward the transmission jack.
   The rear of the transmission is supported by the No.3 crossmember at this time.
5) Firmly grasp the transmission rear cover (1st mechanic).
   Raise the transmission jack toward the transmission (2nd mechanic).
   Carefully lower the transmission onto the transmission jack.
   The transmission must be centered on the transmission jack.

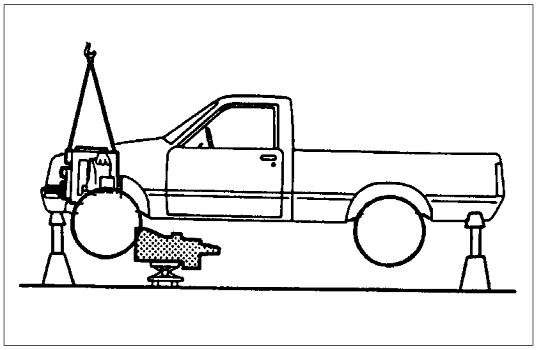


8. Carefully pull the transmission jack with the transmission from beneath the vehicle.

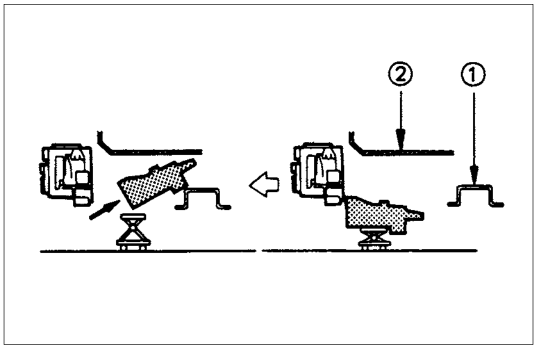
Important Operations - Installation

Follow the removal procedure in the reverse order to perform the installation procedure.
Pay careful attention to the important points during the installation procedure.

Transmission

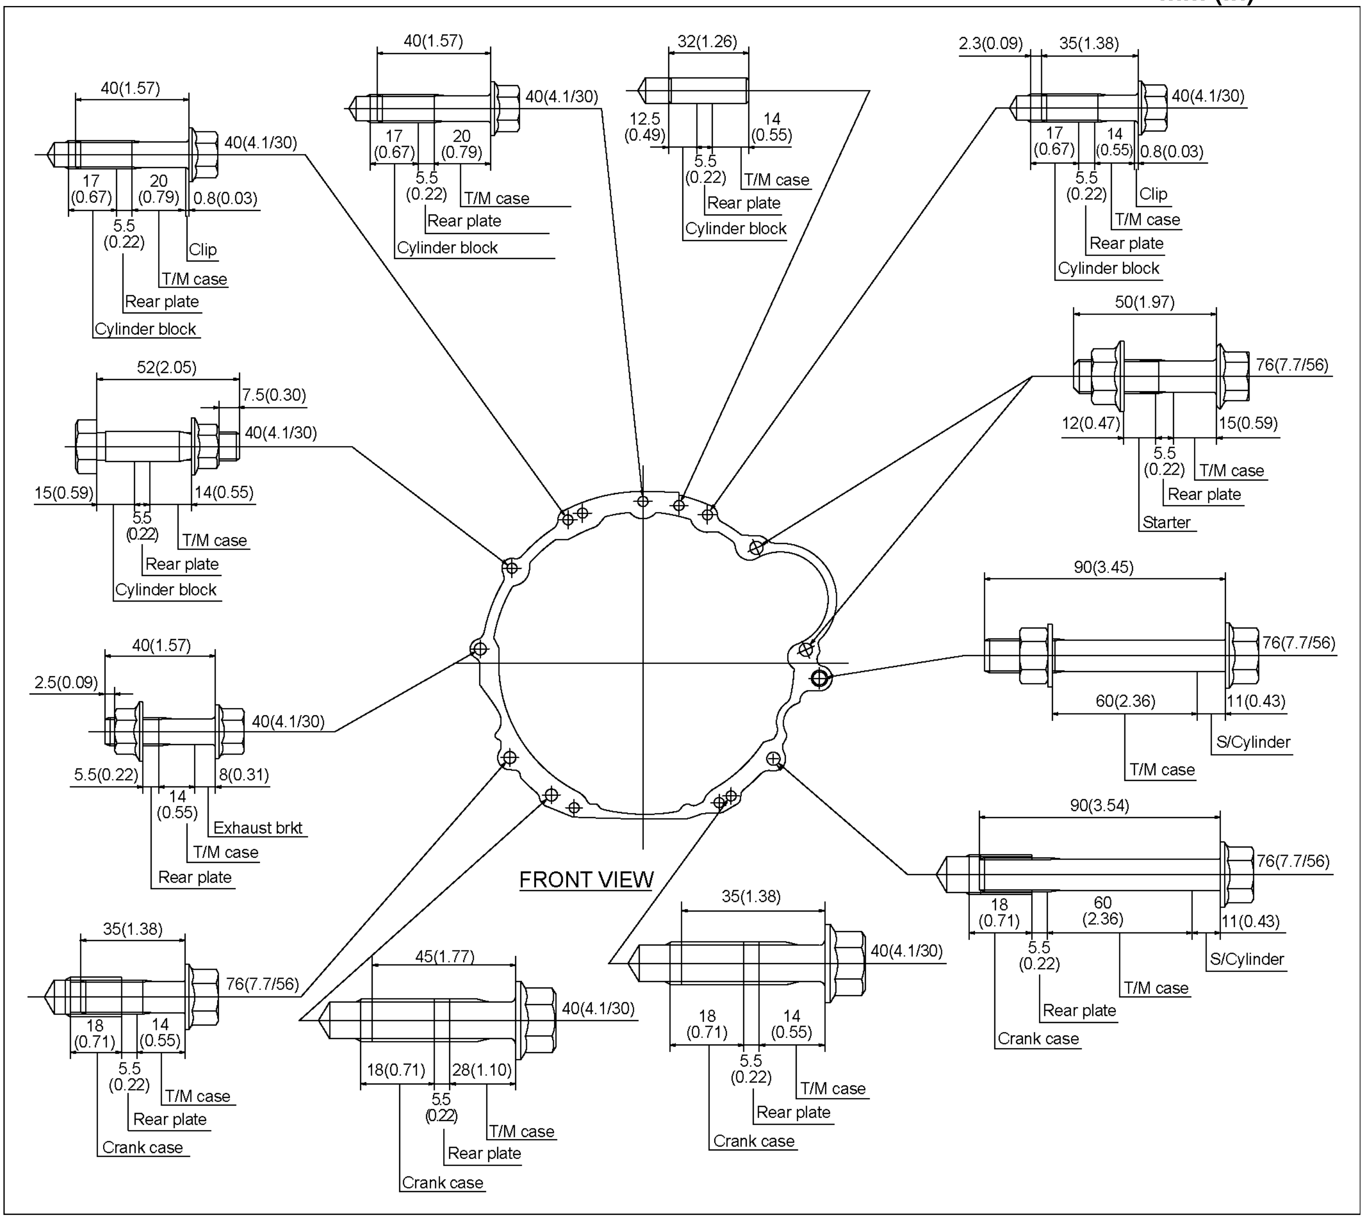


1. Apply a thin coat of molybdenum disulfide grease to the top gear shaft spline.
2. Place the transmission on a transmission jack.
3. Carefully move the transmission jack and transmission into position behind the engine.

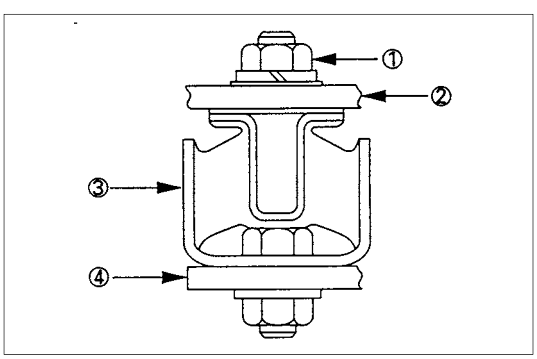


4. Slowly operate the transmission jack to raise the transmission until the rear of the transmission is at the same level as the No.3 crossmember ①.
5. Manually support the transmission rear cover.
   Move the transmission into position between the No.3 crossmember and the floor panel ②.
6. Slowly raise the transmission jack until the front of the transmission is aligned with the rear of the engine.
   The slope of the engine and the transmission must be the same.
7. Install the gear control box the transmission.
8. Align the top gear shaft spline with the clutch drive plate spline.
9. Install the transmission to the engine.
   Tighten the transmission nuts and bolts as shown in the figure.

N·m (kgf·m/lb·ft)
mm (in)



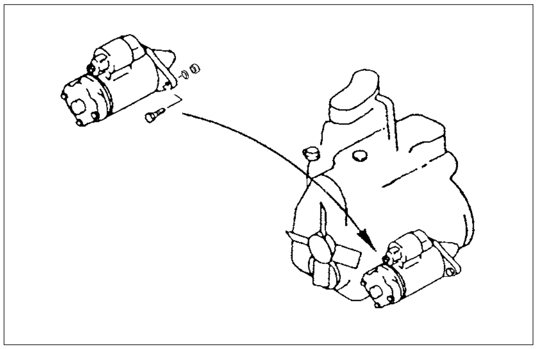
RTW77BLF004201



10. Install the rear mounting rubber ③ to the transmission ②. Install the rear mounting rubber ③ to the No.3 crossmember ④.
11. Tighten the rear mounting rubber nuts ① to the specified forque.

Rear Mounting Rubber Nut Torque	N·m (kgf·m/lb·ft)
41 (4.2 / 30)	

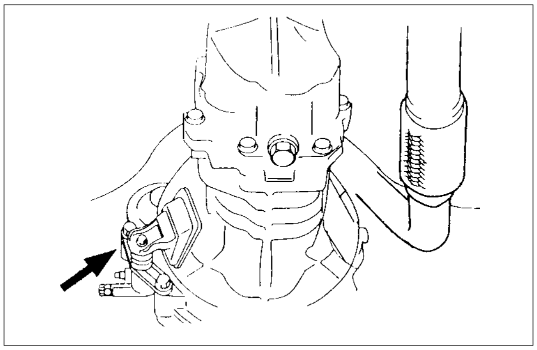
Mounting Bolt Torgue	N·m (kgf·m/lb·ft)
41 (4.2 / 30)	



Starter Motor

1. Install the starter motor to the engine rear plate.
2. Tighten the starter motor bolts to the specified torque.

Starter Motor Torque	N·m (kgf·m/lb·ft)
78 (8.0 / 58)	



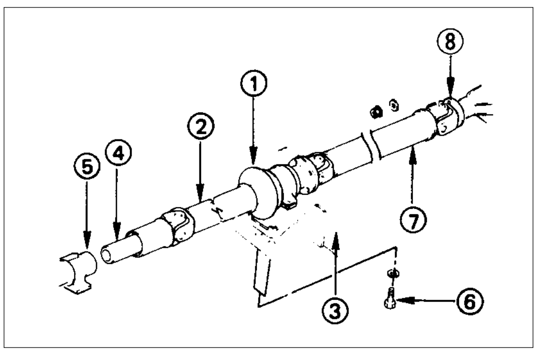
Slave Cylinder

Install the slave cylinder to the transmission case.

Slave Cylinder Bolt Torque	N·m (kgf·m/lb·ft)
78 (8.0 / 58)	

Harness Connector

Connect the back up light switch connector and speedometer sensor connector.



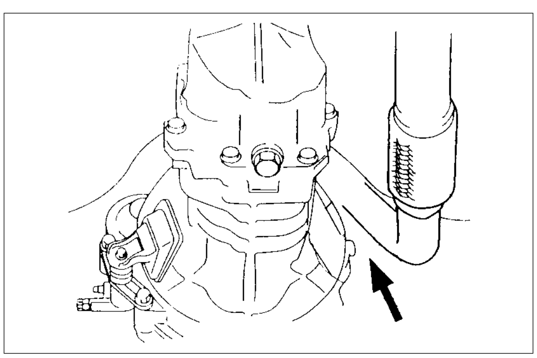
Rear Propeller Shaft (Dual Shaft Type)

1. Place the center bearing and retainer ① together with the 1st propeller shaft ② and 2nd propeller shaft ⑦ on the No.4 crossmember ③.
2. Insert the splined yoke ④ into the transmission main shaft spline ⑤.
3. Tighten the center bearing retainer bolts ⑥ to the specified torque.

Center Bearing Retainer Bolt Torque	N·m (kgf·m/lb·ft)
61 (6.2 / 45)	

4. Connect the 2nd propeller shaft ⑦ and drive pinion side ⑧. Be sure to align the setting marks applied at disassembly.
5. Tighten the coupling bolts to the specified torque.

Propeller Shaft Flange Yoke Bolt Torque	N·m (kgf·m/lb·ft)
M8 : 35 (3.6 / 26) M10 : 63 (6.4 / 46)	



Exhaust Pipe

1. Install the exhaust pipe to the exhaust manifold and the 2nd exhaust pipe.
2. Install the exhaust pipe bracket to the transmission case.

Gear Shift Lever

1. Replenish the transmission case with the specified engine oil.

Transmission Case Oil	lit(US gal.)
1.55 (0.41)	

2. Install the gear shift lever to the gear control box.
3. Tighten the gear shift lever cover bolts to the specified torque.

Shift Lever Cover Bolt Torque	N·m(kgf·m/lb·ft)
20 (2.0 / 14)	

4. Install the dust cover and the grommet.
5. Install the front console assembly.
6. Install the gear shift lever knob.

Lowering the Vehicle

1. Place a jack beneath the vehicle.
2. Raise the jack to remove the chassis stands.
3. Lower the vehicle to the ground.

Engine Hood

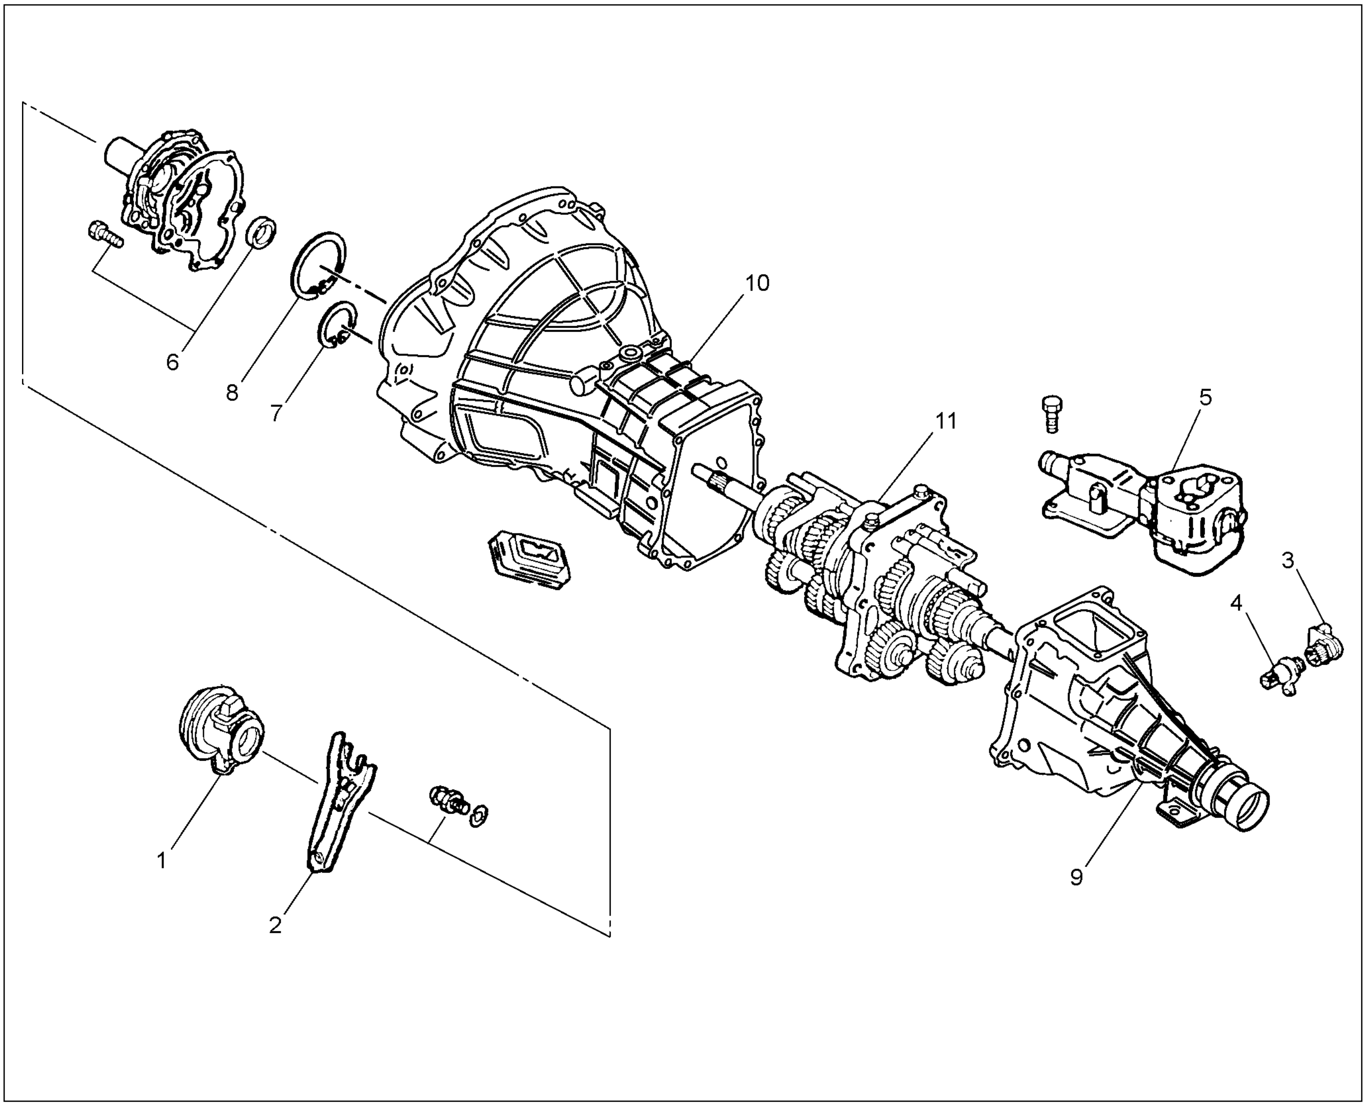
Align the setting marks(applied at removal)on the engine hood and the engine hood hinges to install the engine hood.

Battery Cable

Connect the negative (-) cable to the battery terminal.

DISASSEMBLY

MAJOR COMPONENTS



RTW47BLF000301

Disassembly Steps

1. Clutch shift block and release bearing
2. Clutch shift fork
3. Speedometer sensor
4. Speedometer driven gear assembly
5. Gear control box assembly

▲ 6. Front cover with oil seal

▲ 7. Counter gear snap ring

▲ 8. Bearing snap ring

9. Rear cover with oil seal
10. Transmission case
11. Intermediate plate with gear assembly

Inspection and Repair

Make all necessary adjustments, repairs, and part replacements if wear, damage, or other problems are discovered during inspections.

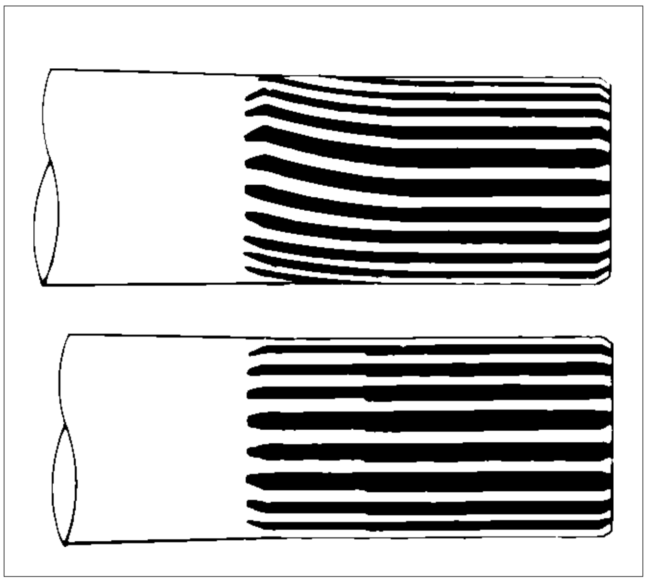
Visual Check

Inspect the following parts for wear, damage or other abnormal conditions.

- Axle Shaft

Axle Shaft

When checking the axle shaft, pay special attention to the splined portions and replace the shaft if distortion or step wear is noticeable. Correct slight step wear with a pencil grinder.



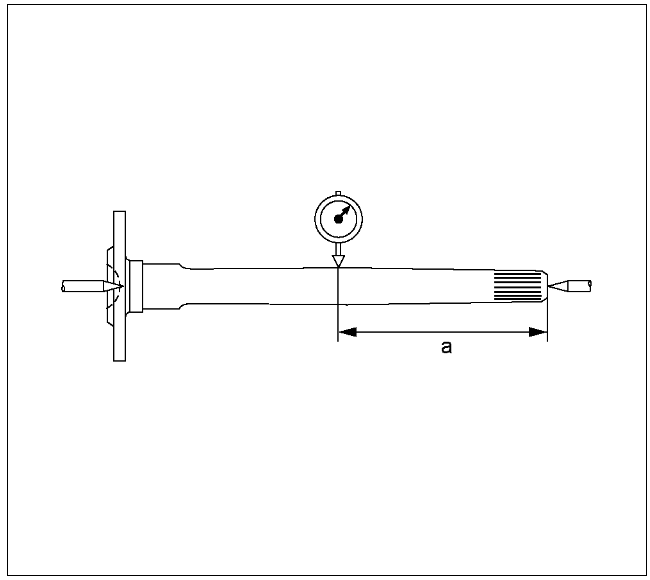
420RS008

Axle Shaft Run-Out

Check the shafts for bending with the use of a dial indicator in contact with the shaft. Rotate the shaft slowly and observe the dial indicator.

Limit	mm (in)
1.0 (0.039)	

Note :
Never use heat to correct bending.



RTW74BSH000101

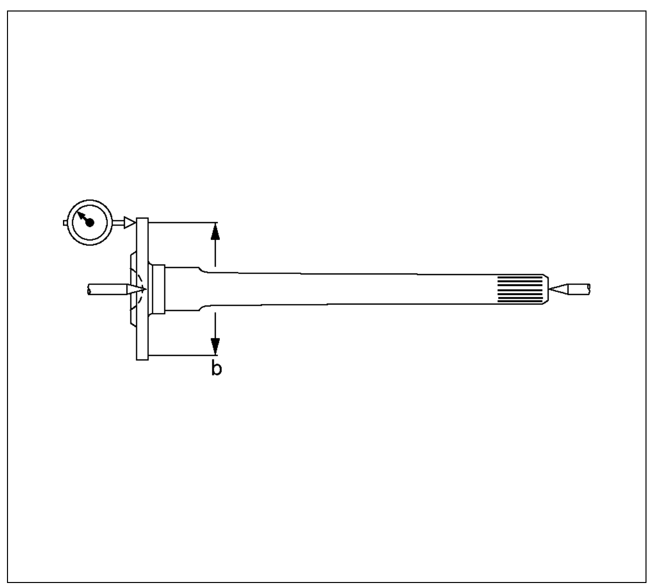
Legend

a. 350 mm (13.8 in)

Axle Shaft Flange Run-Out

Check the axle shaft flange for run-out. Hold the probe of a dial indicator in contact with the flange. Rotate the shaft slowly and observe the dial.

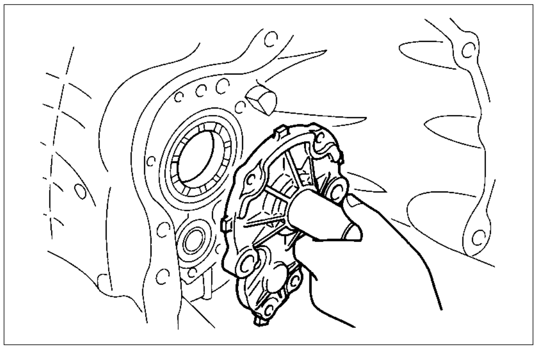
Limit	mm (in)
0.08 (0.003)	



RTW74BSH000201

Legend

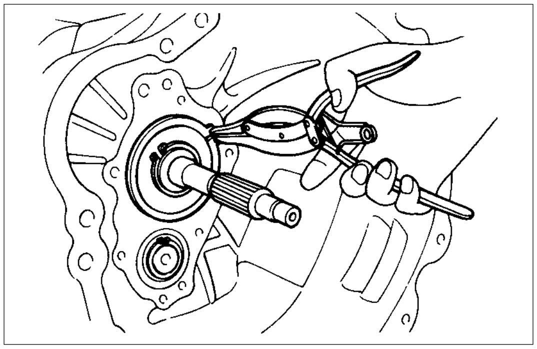
b. 160 mm (6.3 in)



Important Operations

6. Front Cover with Oil Seal

Remove the front cover with oil seal from the transmission case.



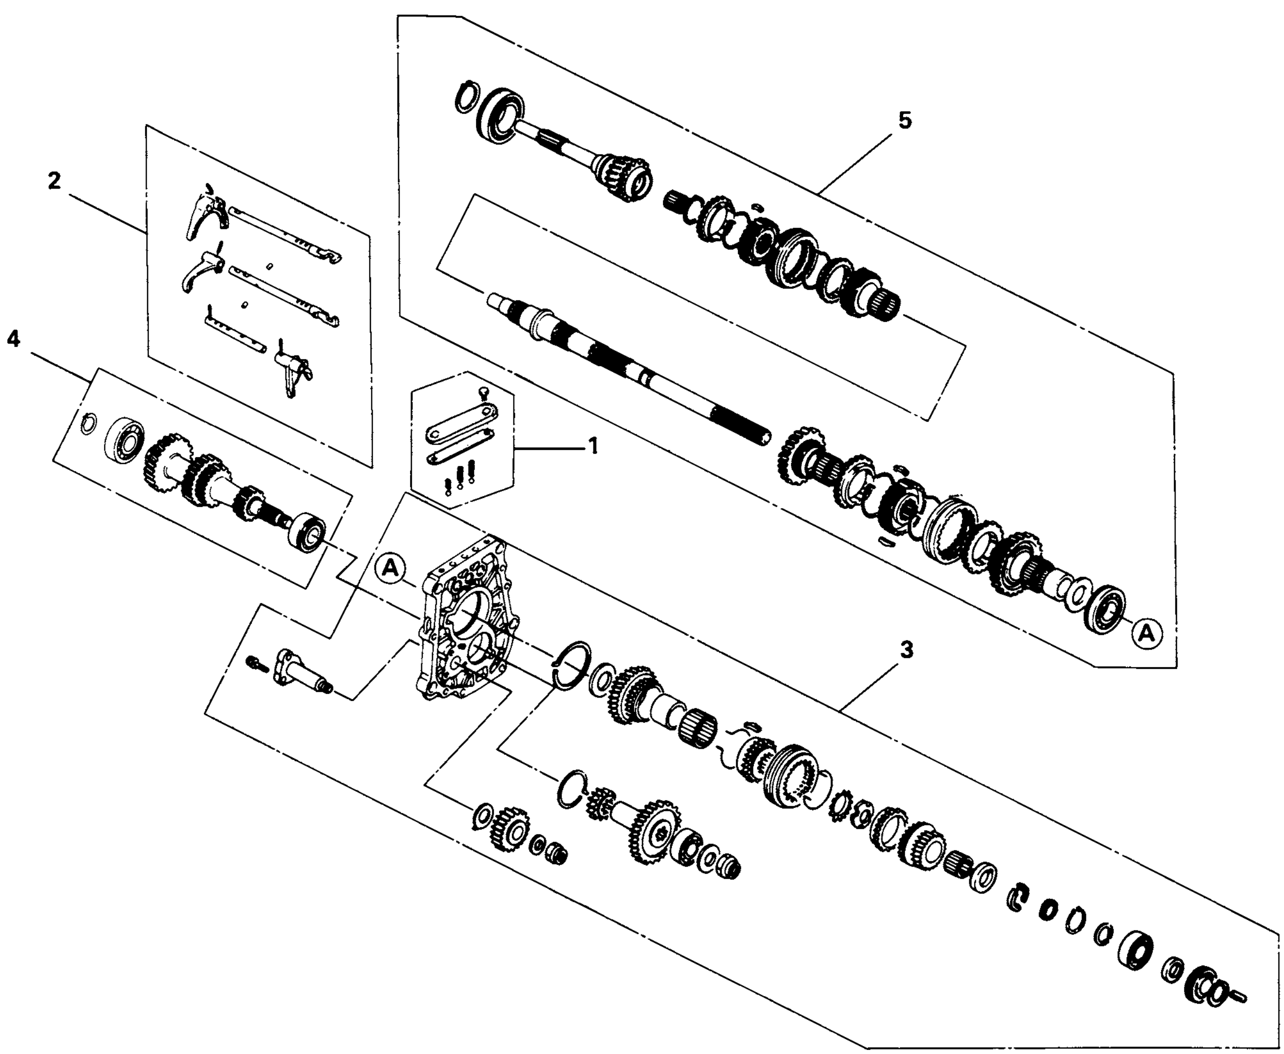
7. Counter Gear Snap Ring

8. Bearing Snap Ring

Use a pair of snap ring pliers to remove the snap ring.

MAJOR COMPONENT

INTERNAL PARTS

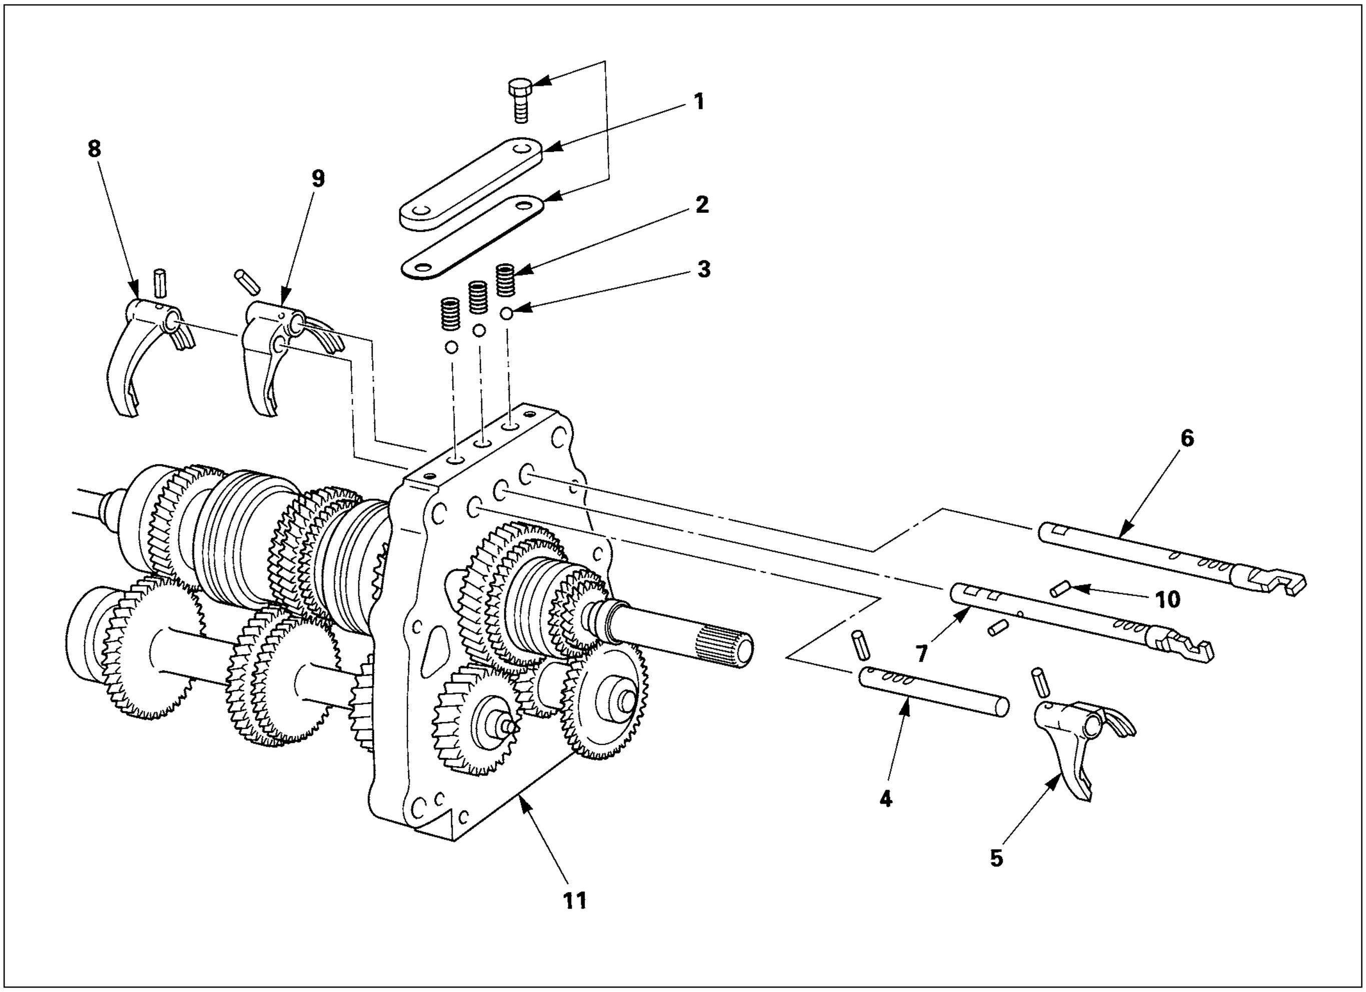


Disassembly steps

1. Detent assembly
2. Shift arm assembly & interlock pin
3. Rev. and 5th gear assembly
4. Counter gear shaft assembly
5. Top & main gear shaft assembly

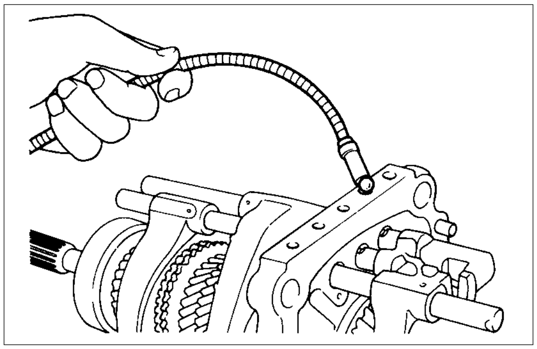
MINOR COMPONENTS

DETENT, SHIFT ARM ASSEMBLY AND INTERLOCK PIN



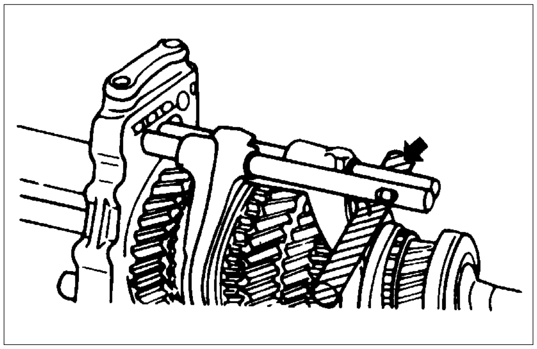
Disassembly Steps

1. Detent spring plate and gasket
2. Detent spring
▲ 3. Detent ball
4. Rev. - 5th shift rod
5. Rev. - 5th shift arm
6. 1st - 2nd shift rod
▲ 7. 3rd - 4th shift rod
▲ 8. 3rd - 4th shift arm
▲ 9. 1st - 2nd shift arm
10. Interlock pin
11. Intermediate plate and gear assembly



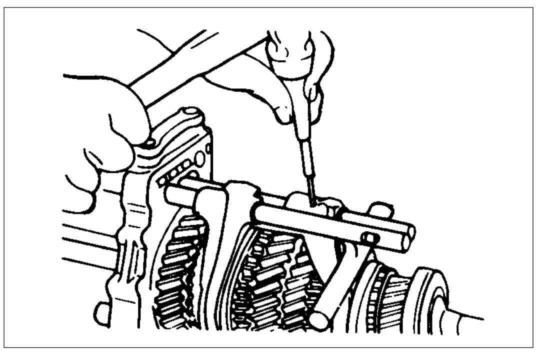
Important Operations

3. Detent Ball



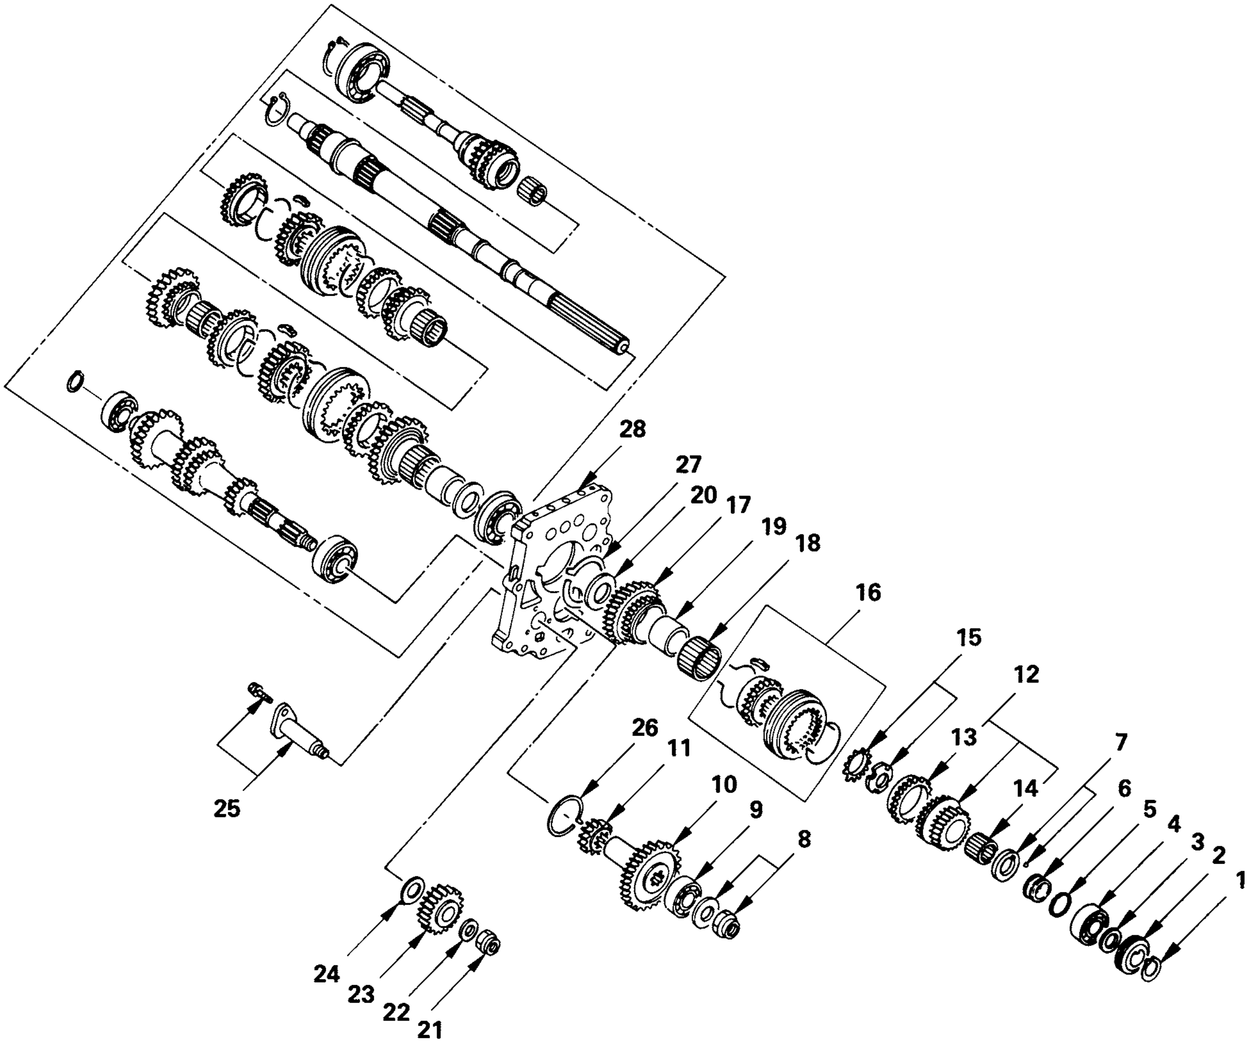
7. 3rd - 4th Shift Rod
8. 3rd - 4th Shift Arm
9. 1st - 2nd Shift Arm

1) Hold a round bar against the shift arm end.
   This will prevent damage to other components.



2) Use a spring pin remover to remove the shift arm spring pin from the shift arm and the shift rod.
   Spring Pin Remover : 9-8529-2201-0
   Discard the used spring pin.
3) Move the 3rd - 4th shift rod forward.
   Take care not to lose the interlock pins.

REVERSE GEAR AND 5TH GEAR



Disassembly Steps

1. Bearing snap ring
2. Speedometer drive gear and lock ball
3. Bearing spacer
4. Mainshaft end ball bearing
5. Thrust ring snap ring
6. Thrust washer thrust ring
7. Thrust washer and lock ball
8. Counter reverse gear nut and washer
▲ 9. Counter end ball bearing
▲10. Counter 5th gear
11. Counter reverse gear
12. 5th gear
13. 5th block ring
14. Needle bearing
▲15. Mainshaft lock nut and washer
▲16. Rev. - 5th synchronizer assembly
17. Reverse gear

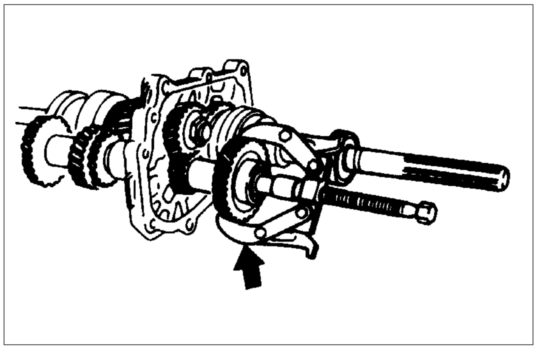
▲27. Bearing snap ring
▲28. Intermediate plate

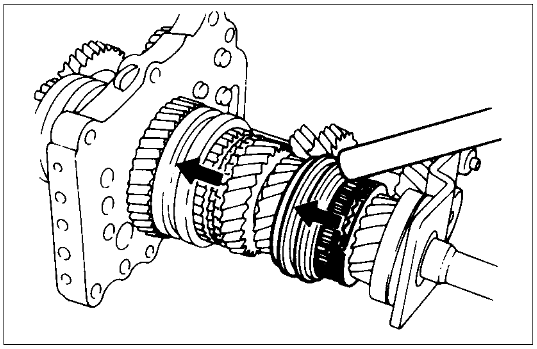


Important Operations

9.Counter End Ball Bearing

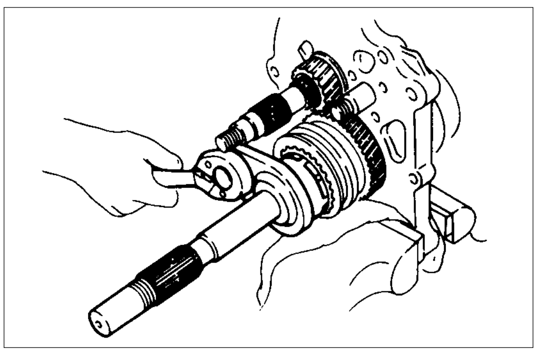
10.Counter 5th Gear

Use a gear remover to remove the counter 5th gear with the ball bearing.
Gear Remover : 5-8840-0013-0 (J-22888)

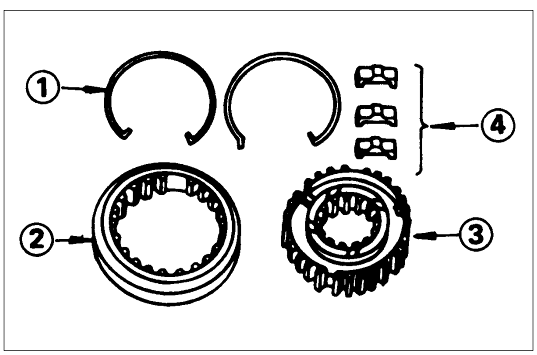


15. Mainshaft Lock Nut and Washer

1) Engage the 3rd - 4th synchronizer with the 3rd gear.
2) Engage the 1st - 2nd synchronizer with the 1st gear.
3) Attach a holding fixture to the mainshaft and the countergear.
   Holding Fixture : 5-8840-2001-0 (J-29768)

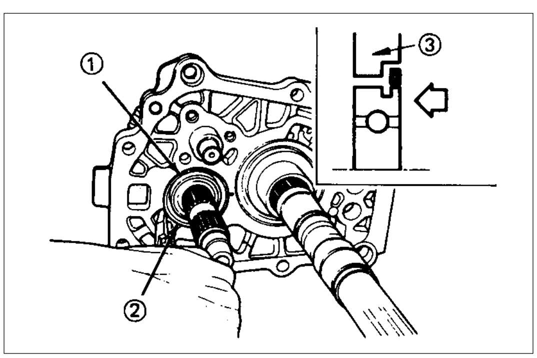


4) Use a lock nut wrench to remove the lock nut.
   Lock Nut Wrench: 5-8840-0353-0 (J-36629)



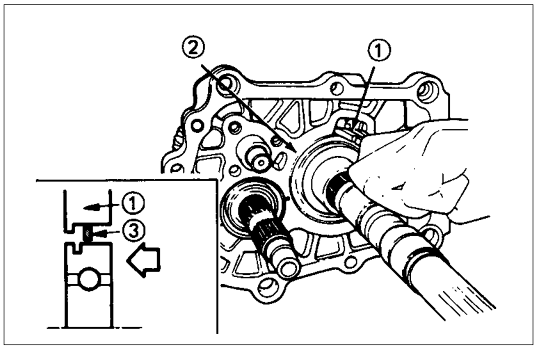
16.Rev. - 5th Synchronizer Assembly

1) Remove the synchronizer assembly as a set.
2) Disassemble the synchronizer assembly.
   ① Springs
   ② Sleeve
   ③ Clutch Hub
   ④ Inserts



26.Bearing Snap Ring

1) Insert the snap ring pliers ① into the counter gear bearing snap ring hole ②.
   The snap ring hole is in the intermediate plate ③.
2) Use the snap ring pliers to force open the counter gear bearing snap ring.
   Tap on the front of the intermediate plate.
   The ball bearing snap ring will come free.

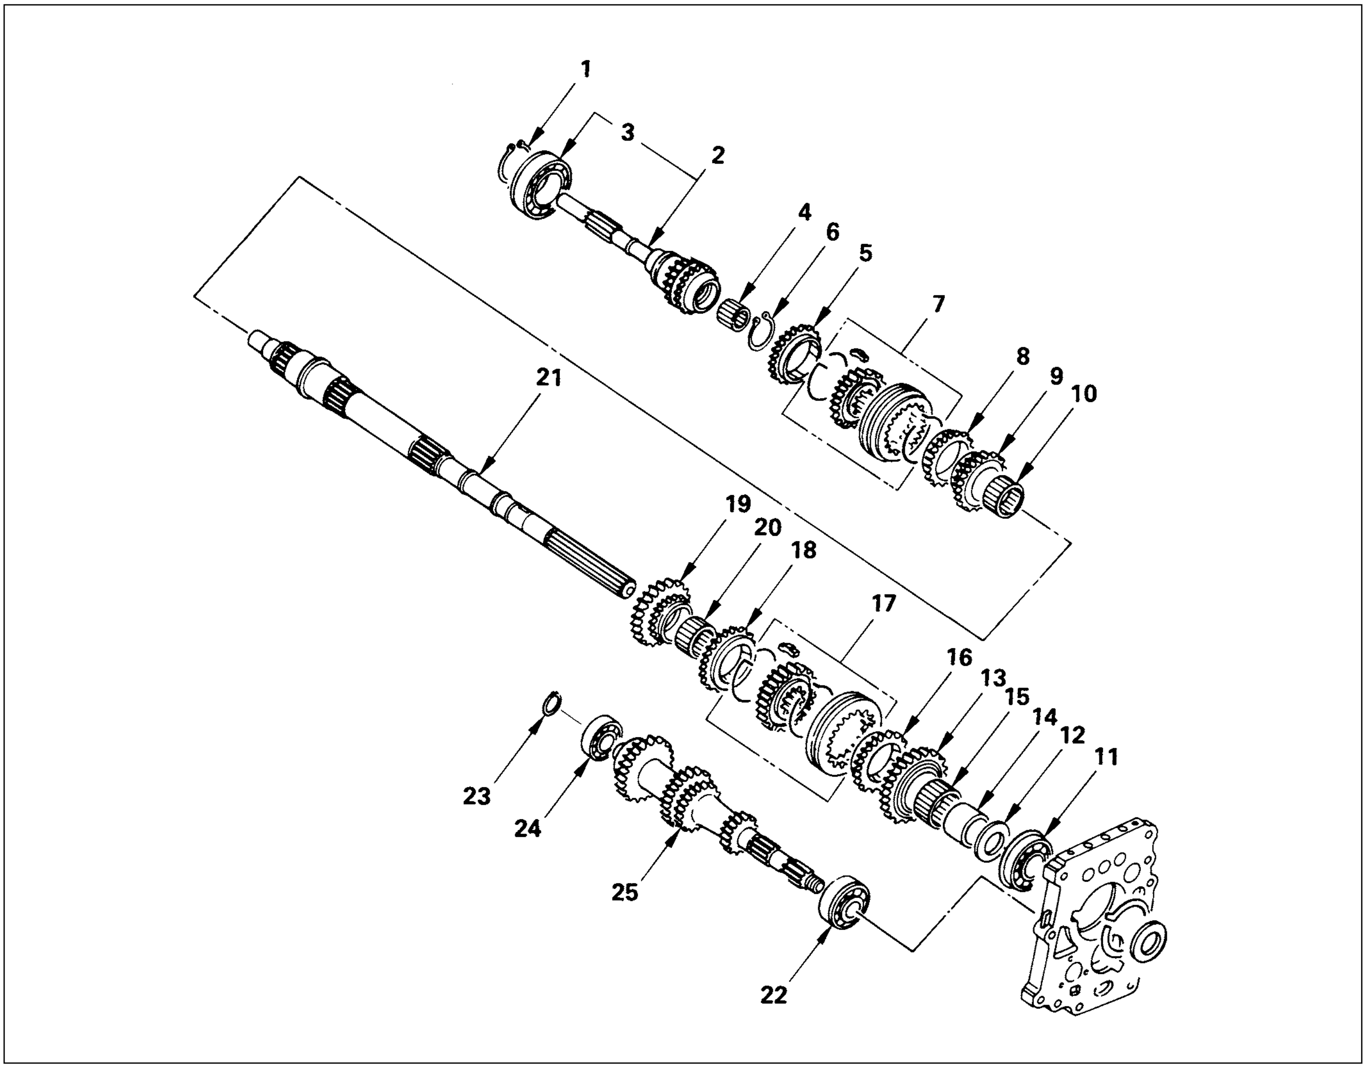


27.Bearing Snap Ring

28.Intermediate Plate

1) Insert the snap ring pliers into the mainshaft bearing snap ring hole.
   The snap ring hole is in the intermediate plate ②.
2) Use the snap ring pliers ① to force open the mainshaft bearing snap ring ③.
   Hold the snap ring open with the pliers.
3) Push the intermediate plate toward the rear of the transmission to remove it.
   The ball bearing snap ring will come free.

TOP GEAR SHAFT, MAINSHAFT GEAR AND COUNTER GEAR



Disassembly Steps

▲ 1. Top gear shaft snap ring
▲ 2. Top gear shaft
▲ 3. Ball bearing

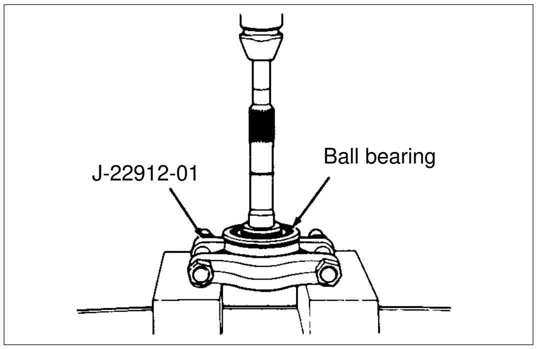
▲17. 1st - 2nd synchronizer assembly
18. 2nd block ring
19. 2nd gear
20. Needle bearing
21. Mainshaft
▲22. Rear ball bearing
23. Bearing snap ring
▲24. Front ball bearing
25. Counter gear

Important Operations

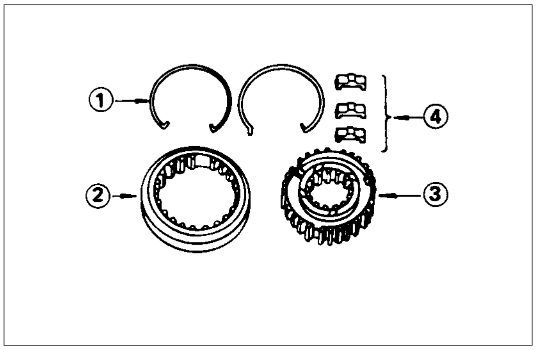


1. Top Gear Shaft Snap Ring

2. Top Gear Shaft

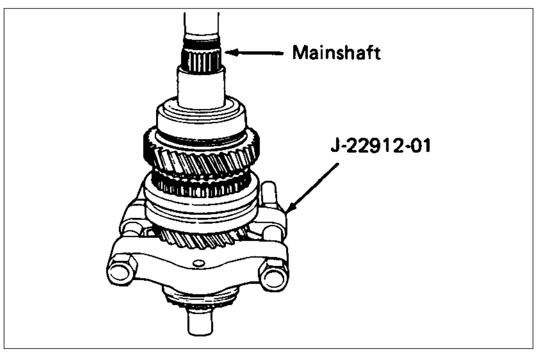
3. Ball Bearing

1) Use a pair of snap ring pliers to remove the snap ring.
2) Use a bench press and a bearing remover to remove the ball bearing.
Bearing Remover : 5-8840-0015-0 (J-22912-01)



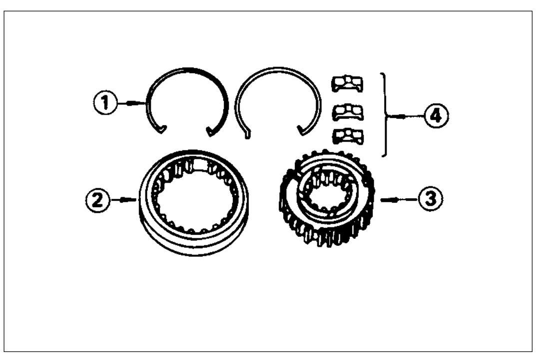
7. 3rd - 4th Synchronizer Assembly

1) Remove the synchronizer assembly as a set.
2) Disassemble the synchronizer assembly.
① Springs
② Sleeve
③ Clutch Hub
④ Inserts



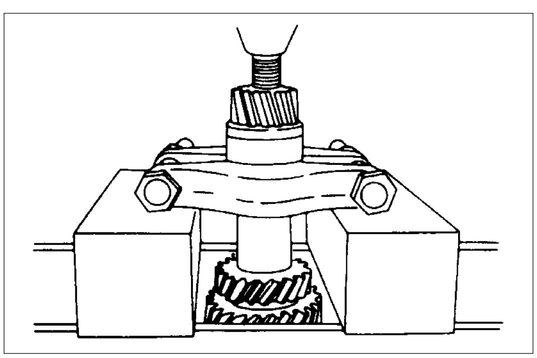
11.Mainshaft Ball Bearing

Use a bench press and a bearing remover to remove the ball bearing.
Bearing Remover : 5-8840-0015-0 (J-22912-01)



17.1st - 2nd Synchronizer Assembly

1) Remove the synchronizer assembly as a set.
2) Disassemble the synchronizer assembly.
① Springs
② Sleeve
③ Clutch Hub
④ Inserts



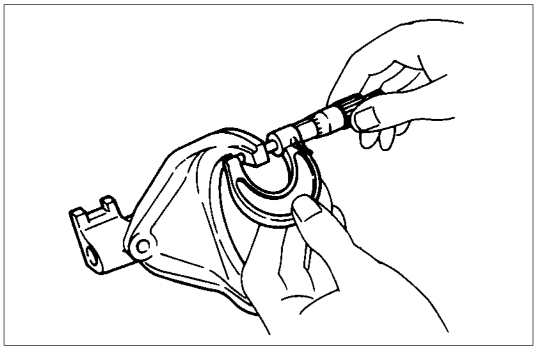
22.Rear Ball Bearing

24.Front Ball Bearing

Use a bench press and a bearing remover to remove the ball bearing.
Bearing Removar : 5-8840-0015-0 (J-22912-01)

INSPECTION AND REPAIR

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

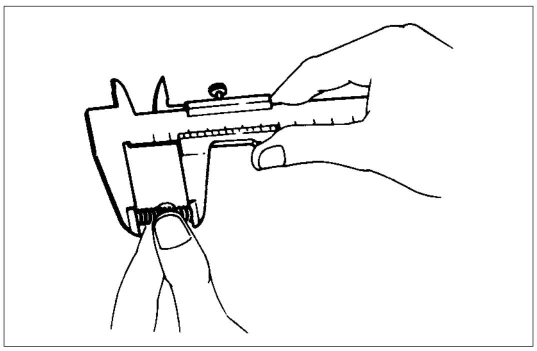


SHIFT ARM THICKNESS

Use a micrometer to measure the shift arm thickness.
If the measured value is less than the specified limit, the shift arm must be replaced.

Shift Arm Thickness mm(in)

	Standard	Limit
1st-2nd	9.6-9.8 (0.378-0.386)	9.0 (0.354)
3rd-4th	6.95-7.2 (0.274-0.283)	6.5 (0.256)
Rev.-5th	6.8-6.9 (0.268-0.272)	6.3 (0.248)

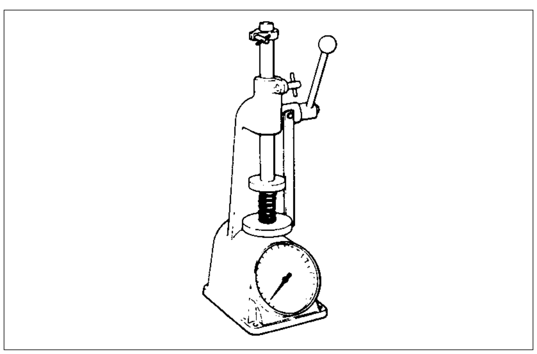


DETENT SPRING FREE LENGTH

Use a venier caliper to measure the detent spring free length.
If the measured value is less than the specified limit, the detent spring must be replaced.

Detent Spring Free Length mm(in)

Standard	Limit
25.6 (1.01)	23.6 (0.93)

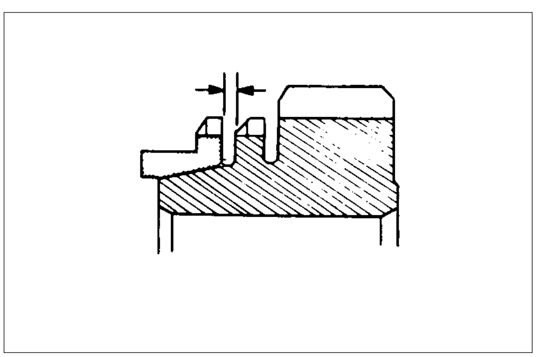


DETENT SPRING TENSION

Use a spring tester to measure the valve spring tension.
If the measured value is less than the specified limit, the valve spring must be replaced.

Valve Spring Tension N(kg/lb)

Compressed Height mm(in)	Standard	Limit
22.1 (0.870)	61.8-65.7 (6.3-6.7/13.9-14.8)	55.9 (5.7/12.6)



BLOCK RING AND DOG TEETH CLEARANCE

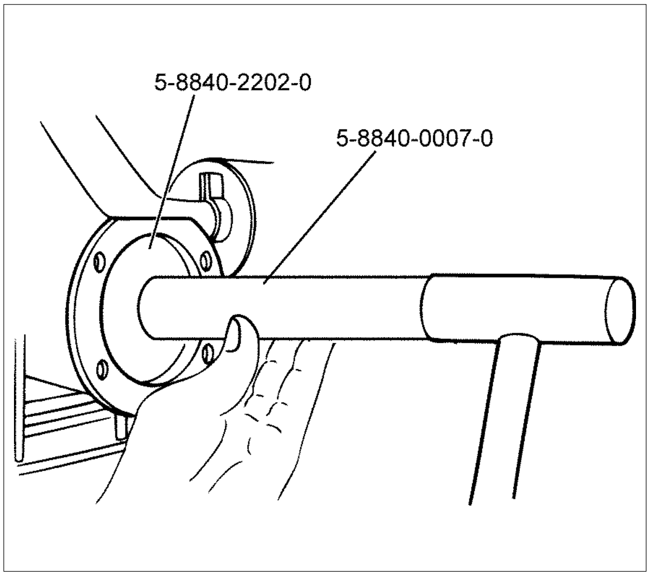
Use a thickness gauge to measure the clearance between the block ring and the dog teeth.
If the measured value exceeds the specified limit, the block ring must be replaced.

Block Ring and Dog Teeth Clearance mm(in)

	Standard	Limit
1st,2nd	2.0 (0.079)	1.3 (0.051)
3rd, 4th, 5th	1.5 (0.059)	0.8 (0.031)

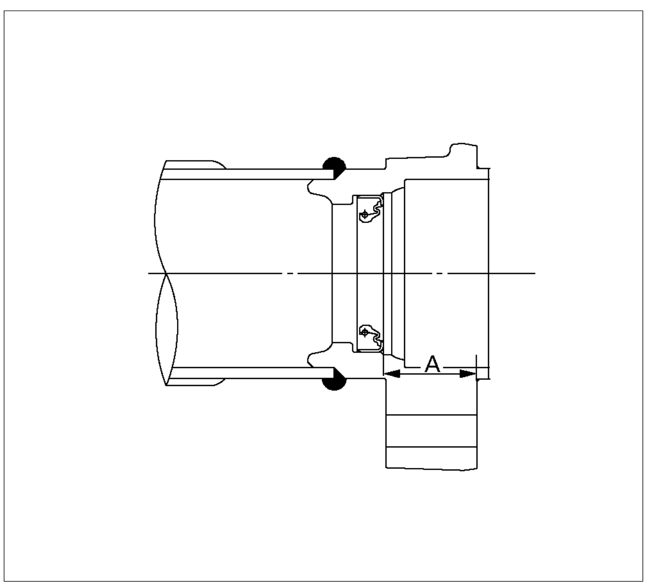
Reassembly

1. Using the oil seal installer 5-8840-2202-0 and grip 5-8840-0007-0, install new axle case oil seal.



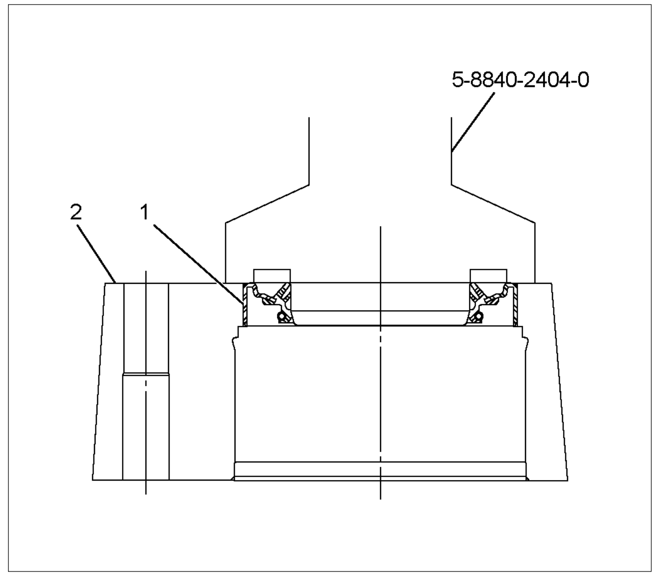
RTW54BSH000301

Note :
Confirm that the dimension : A should be 34.5 – 36.1 mm (1.36 – 1.42 in)



A03R300004

2. Install new oil seal in bearing holder, using the oil seal installer 5-8840-2404-0.

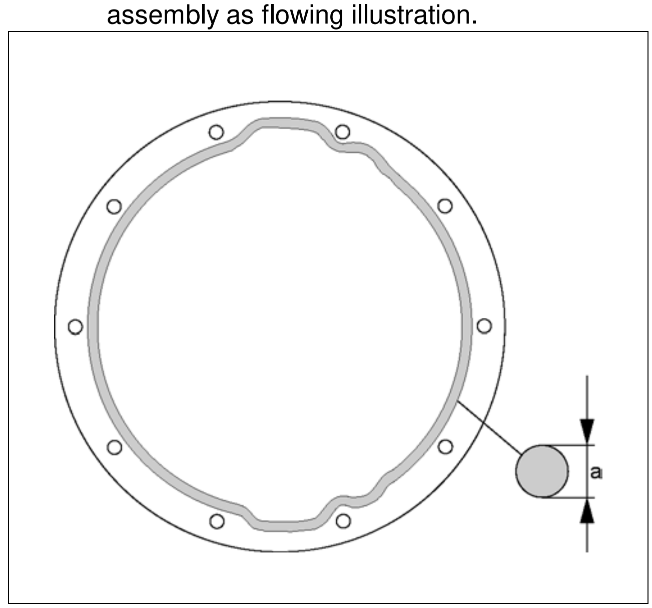


RTW54BSH000501

Legend

1. Oil Seal
2. Bearing Holder

3. Drive wheel pin into axle shaft flange, using a hammer.
4. Differential assembly
   a. Clean the mating surface of axle case and differential carrier.
   b. Apply Three Bond 1215 (TB1215) or equivalent on the surface of differential assembly as flowing illustration.

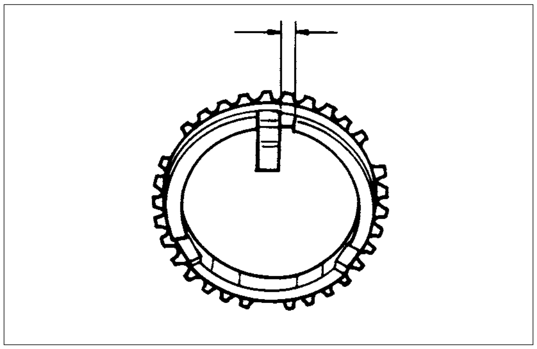


RTW74BSH000301

Legend

a. 3 mm (0.12 in)

   c. Tighten bolts and nuts to the specified torque.

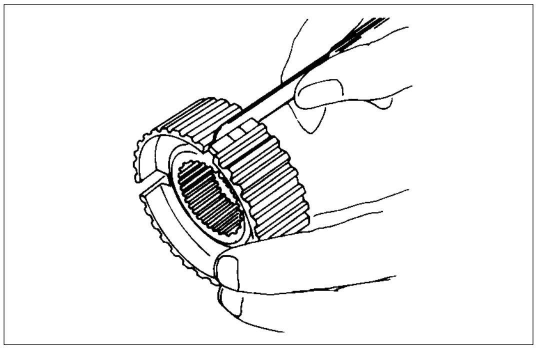


BLOCK RING AND INSERT CLEARANCE

Use a thickness gauge to measure the clearance between the block ring and the insert.
If the measured value exceeds the specified limit, the block ring and the insert must be replaced.

Block Ring and Insert Clearance mm(in)

	Standard	Limit
1st,2nd	3.46-3.74 (0.136-0.147)	4.0 (0.157)
3rd, 4th, 5th	3.51-3.79 (0.138-0.149)	

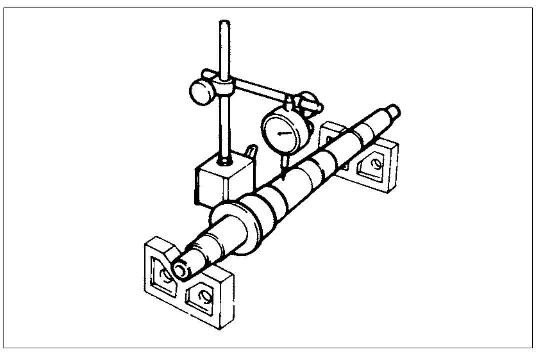


CLUTCH HUB AND INSERT CLEARANCE

Use a thickness gauge to measure the clearance between the clutch hub and the insert.
If the measured value exceeds the specified limit, the clutch hub and the insert must be replaced.

Clutch Hub and Insert Clearance mm(in)

Standard	Limit
0.01 - 0.19 (0.0004 - 0.0075)	0.3 (0.012)



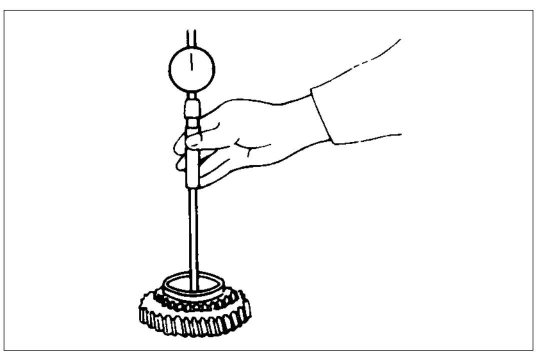
MAINSHAFT RUN - OUT

1. Install the mainshaft to a grinding machine.
2. Use a dial indicator to measure the mainshaft central portion run-out.

   If the measured mainshaft run-out exceeds the specified limit, the mainshaft must be replaced.

Mainshaft Run - Out mm(in)

Limit
Less than 0.03 (0.0012)

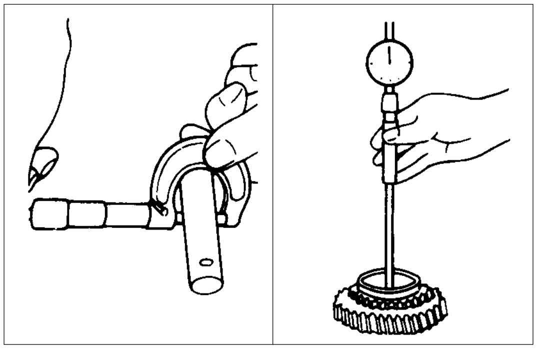


GEAR INSIDE DIAMETER

Use an inside dial indicator to measure the gear inside diameter.
If the measured value is less than the specified limit, the gear must be replaced.

Gear Inside Diameter mm(in)

	Standard	Limit
1st Rev.	45.00-45.01 (1.7717-1.7720)	45.10 (1.7756)
2nd 3rd	41.00-41.01 (1.6142-1.6146)	41.10 (1.6181)
5th	34.03-34.04 (1.3398-1.3402)	34.10 (1.3425)

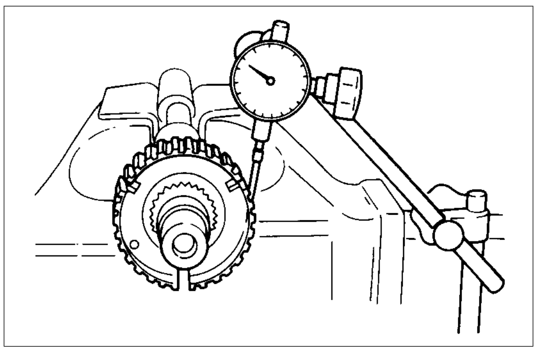


REVERSE IDLER GEAR AND IDLER GEAR SHAFT CLEARANCE

1. Use a micrometer to measure the idler gear shaft diameter.
2. Use an inside dial indicator to measure the idler gear inside diameter.
3. Calculate the idler gear and idler gear shaft clearance.
   Idler gear inside diameter - idler gear shaft diameter = idler gear and idler gear shaft clearance.
   If the measured value exceeds the specified limit, the idler gear and/or the idler gear shaft must be replaced.

Idler Gear and Idler Gear Shaft Clearance mm(in)

Standard	Limit
0.041 - 0.074 (0.0016 - 0.0029)	0.150 (0.0059)

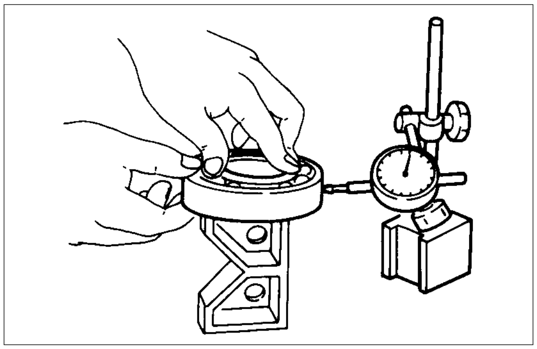


CLUTCH HUB SPLINE PLAY

1. Set a dial indicator to the clutch hub to be measured.
2. Move the clutch hub as far as possible to both the right and the left.
   Note the dial indicator reading.
   It the measured value exceeds the specified limit, the clutch hub must be replaced.

Clutch Hub Spline Play mm(in)

Standard	Limit
0 - 0.019 (0 - 0.0075)	0.20 (0.0079)



BALL BEARING PLAY

Use a dial indicator to measure the ball bearing play.

Ball Bearing Play mm(in)

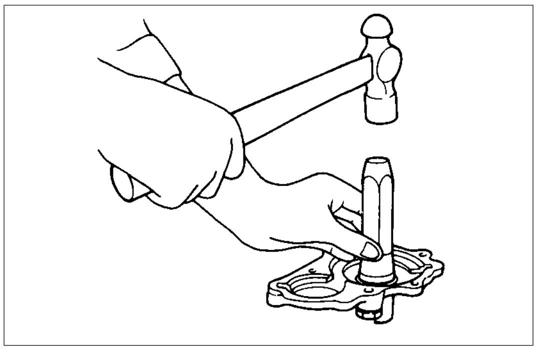
Limit
0.2 (0.0079)

FRONT COVER OIL SEAL

Oil Seal Replacement

Oil Seal Removal

Use a screwdriver to pry the oil seal from the front cover.



Oil Seal Installation

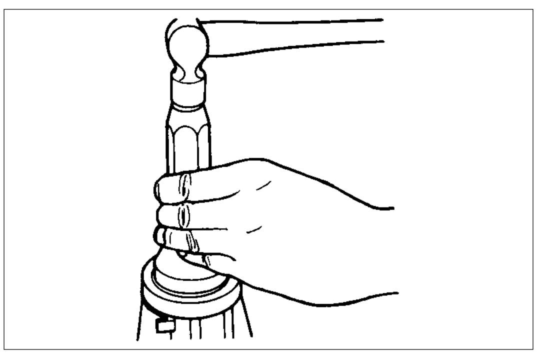
1. Use a oil seal installer to install the oil seal to the front cover.
   Oil Seal Installer : 5-8840-0026-0 (J-26540)
2. Apply engine oil to the oil seal lip.

REAR COVER OIL SEAL

Oil Seal Replacement

Oil Seal Removal

Use a screwdriver to pry the oil seal from the rear cover.



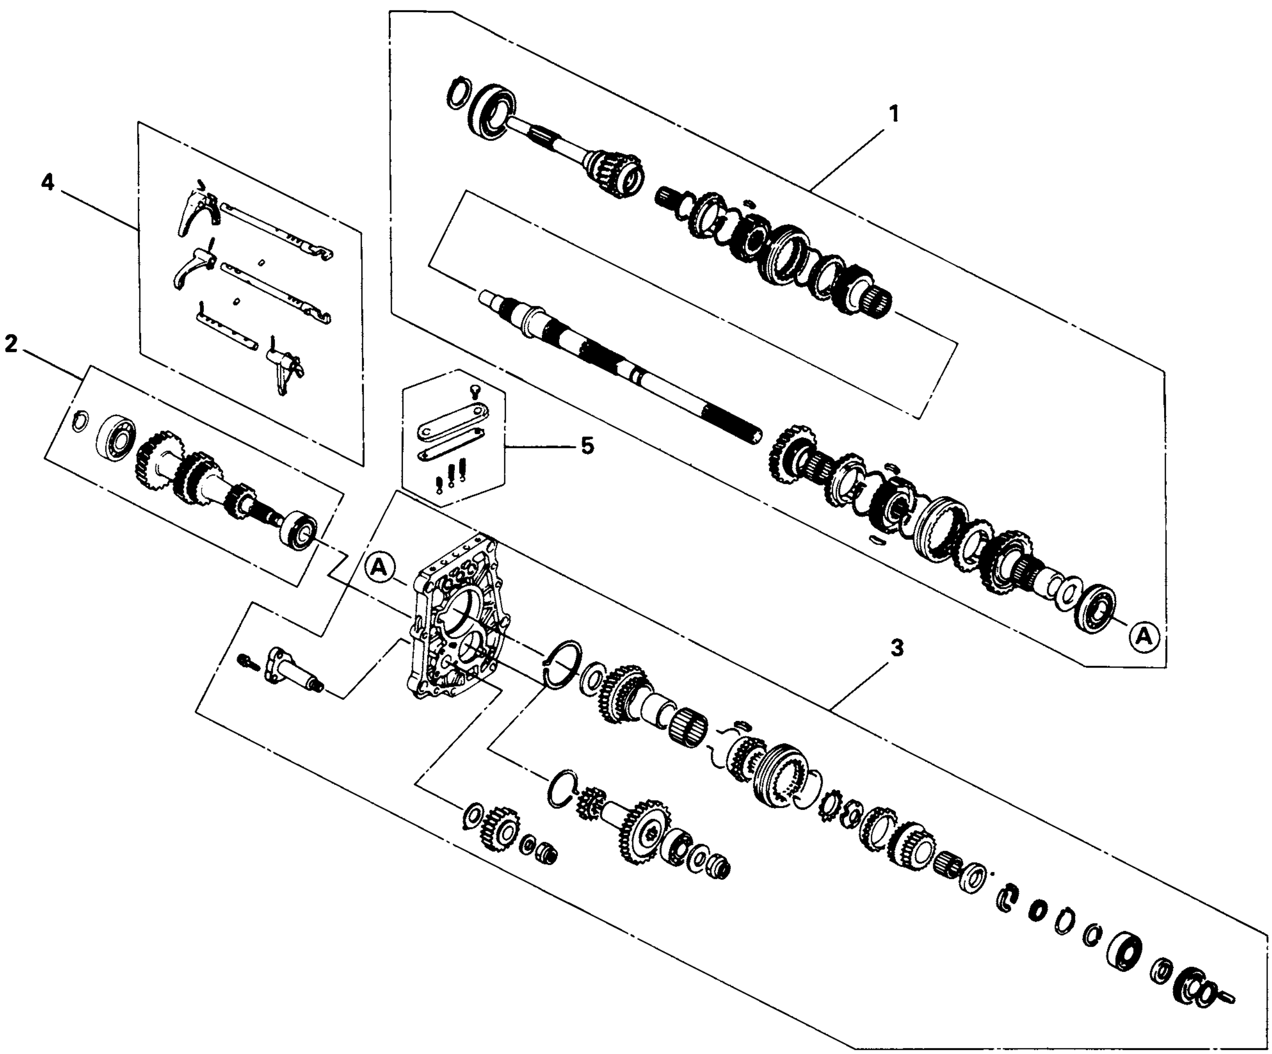
Oil Seal Installation

1. Use a oil seal installer to install the oil seal to the rear cover.
   Oil Seal Installer : 5-8522-0050-0 (J-29769)
2. Apply engine oil to the oil seal lip.

REASSEMBLY

MAJOR COMPONENT

INTERNAL PARTS

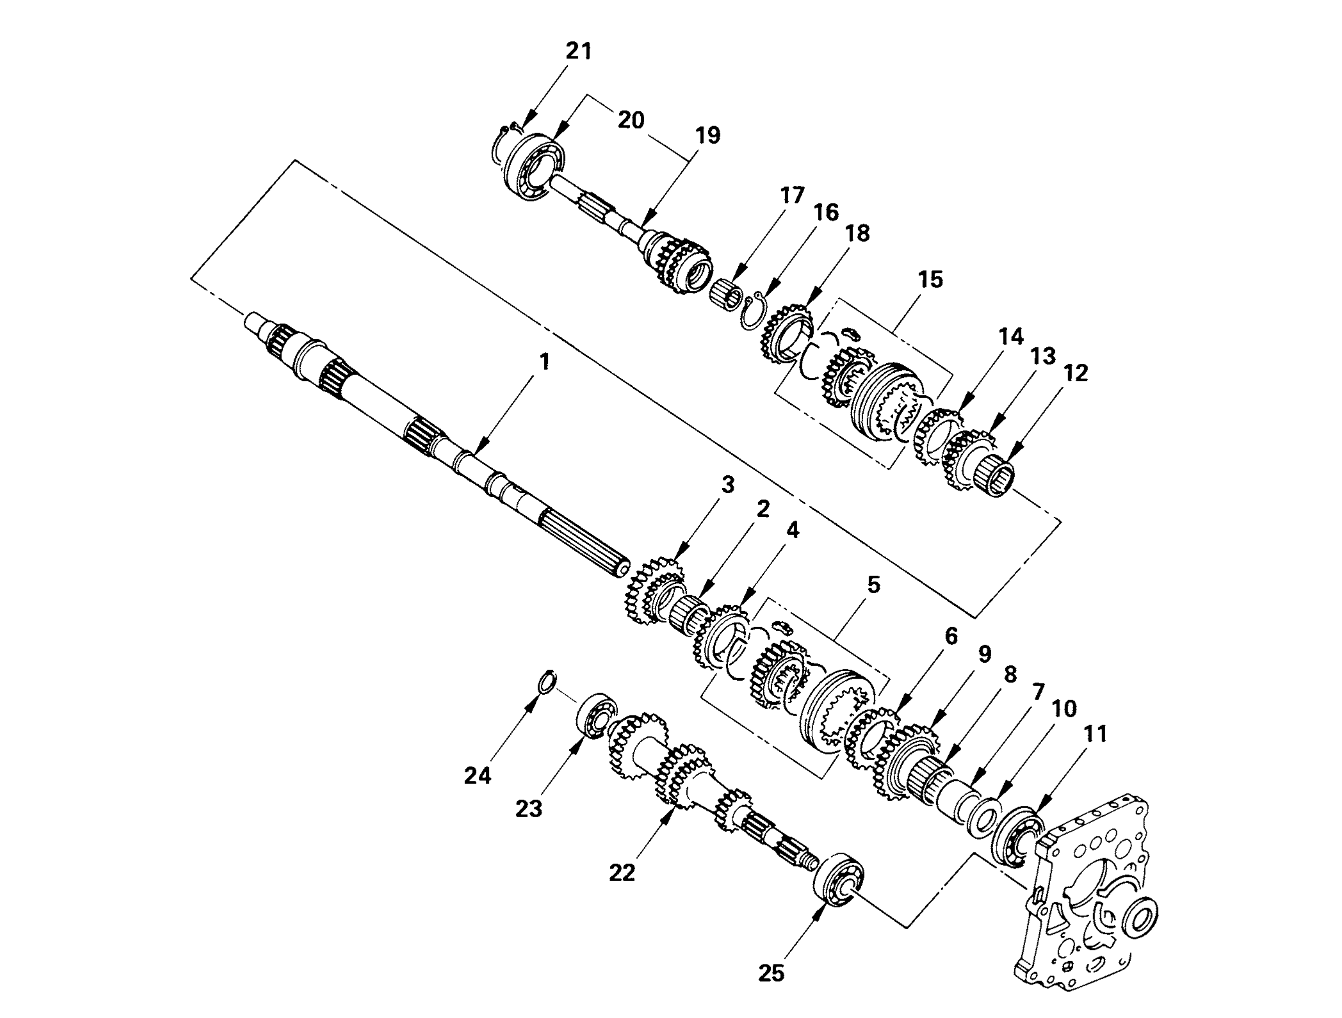


Reassembly steps

1. Top & main gear shaft assembly
2. Counter gear shaft assembly
3. Rev. and 5th gear assembly
4. Shift arm assembly & interlock pin
5. Detent assembly

MINOR COMPONENTS

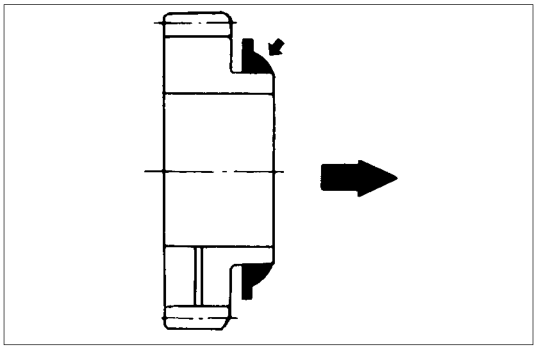
TOP GEAR SHAFT, MAINSHAFT GEAR AND COUNTER GEAR



Reassembly Steps

1. Mainshaft
▲ 2. Needle bearing
▲ 3. 2nd gear
4. 2nd block ring
▲ 5. 1st-2nd synchronizer assembly
6. 1st block ring
▲ 7. Needle bearing collar
▲ 8. Needle bearing
▲ 9. 1st gear
▲10. 1st gear thrust washer
▲11. Mainshaft ball bearing
▲12. Needle bearing
▲13. 3rd gear
14. 3rd block ring
▲15. 3rd-4th synchronizer assembly
▲16. Mainshaft snap ring
17. Needle bearing
18. 4th block ring
▲19. Top gear shaft
▲20. Ball bearing
21. Top gear shaft snap ring
22. Counter gear
23. Front ball bearing
24. Bearing snap ring
▲25. Rear ball bearing

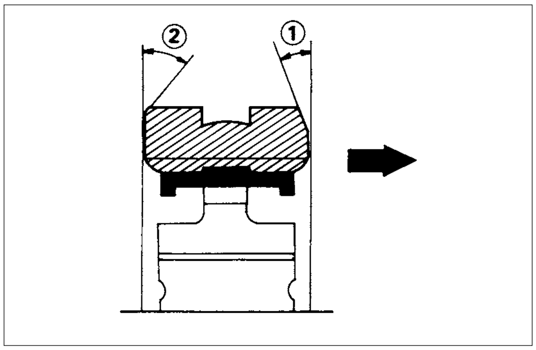
Important Operations



2. Needle Bearing

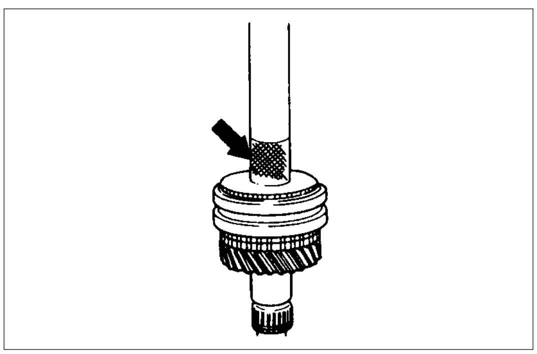
3. 2nd Gear

1) Apply the engine oil to the 2nd needle bearing and the 2nd gear.
2) Install the needle bearing and the 2nd gear to the mainshaft.
   The dog teeth of the 2nd gear must be facing the rear side of the transmission.



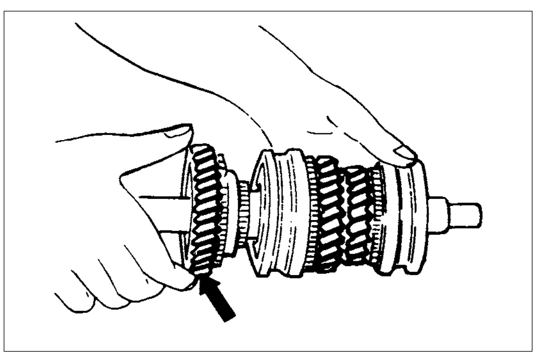
5. 1st-2nd Synchronizer Assembly

1) Apply the engine oil to the clutch hub spline.
2) Install the synchronizer assembly to the mainshaft.
   The outside sleeve heavy chamfering must be facing the rear of the transmission.
   ① Chamfer Angle = 30°
   ② Chamfer Angle = 45°



7. Needle Bearing Collar

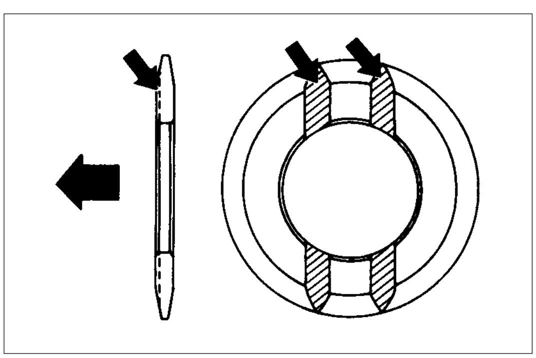
Use a bench press and a collar installer to install the needle bearing collar.
Collar Installer : 5-8840-0178-0 (J-33851)



8. Needle Bearing

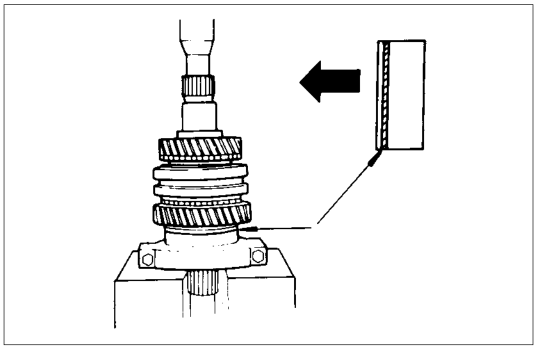
9. 1st Gear

1) Apply the engine oil to the 1st needle bearing and the 1st gear.
2) Install the needle bearing and the gear to the mainshaft.
   The dog teeth of the 1st gear must be facing the front side of the transmission.



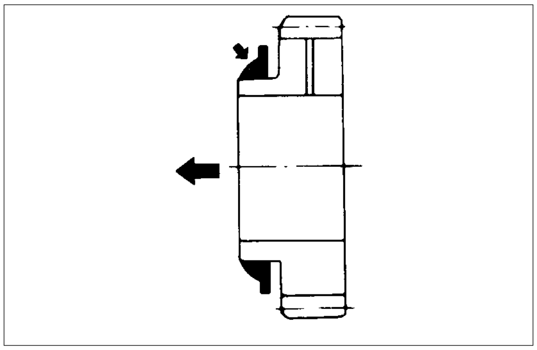
10.1st Gear Thrust Washer

Install the thrust washer to the mainshaft.
The thrust washer oil groove must be facing the 1st gear side.



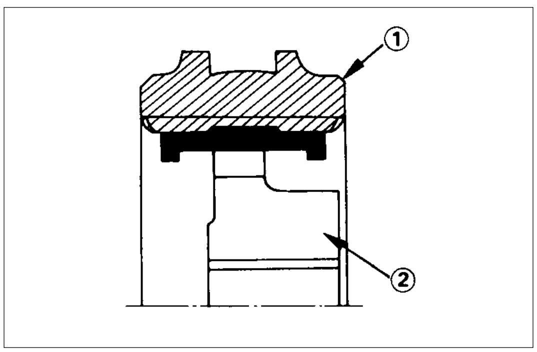
11.Mainshaft Ball Bearing

1) Apply the engine oil to the ball bearing inside circumference.
2) Use a bench press and a bearing installer to install the bearing.
   The bearing snap ring groove must be facing the front of the transmission.
   Bearing Installer : 5-8840-0015-0 (J-22912-01)



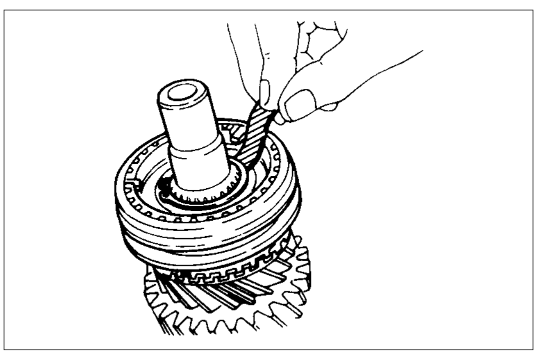
12.Needle Bearing
13.3rd Gear

1) Apply the engine oil to the 3rd needle bearing and the 3rd gear.
2) Install the needle bearing and the gear to the mainshaft.
   The dog teeth of the 3rd gear must be facing the front side of the transmission.



15.3rd-4th Synchronizer Assembly

1) Apply the recommended lubricating oil to the clutch hub spline.
2) Install the synchronizer assembly to the mainshaft.
   The sleeve light chamfering ① and the clutch hub heavy boss ② must be facing the rear of the transmission.

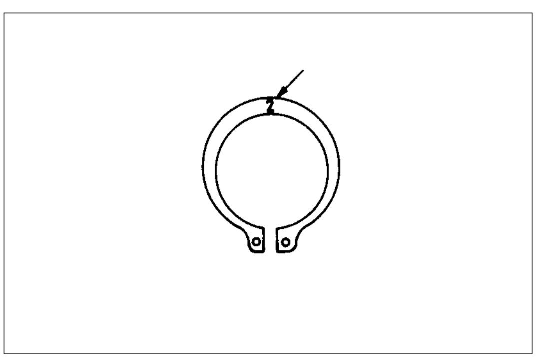


16.Mainshaft Snap Ring

1) Select the snap ring which will provide the minimum clearance between the mainshaft and the snap ring.
   There are four snap ring sizes available.
   The snap rings are numbered to indicate their thickness.

Mainshaft and Snap Ring Clearance mm(in)

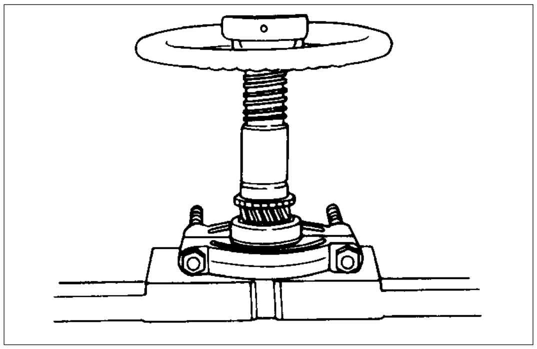
Standard
0 - 0.05 (0 - 0.002)



Snap Ring Availability mm(in)

Thickness	Identification Number
1.50 (0.059)	1
1.55 (0.061)	2
1.60 (0.063)	3
1.65 (0.065)	4

2) Use a pair of snap ring pliers to install the snap ring to the mainshaft.



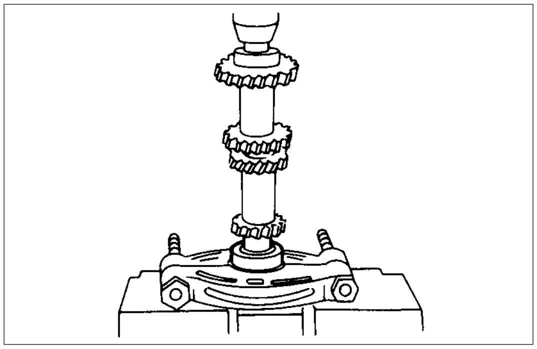
19.Top Gear Shaft

20.Ball Bearing

Use a bench press and a installer to install the ball bearing to the top gear shaft.

The snap ring groove must be facing the front of the transmission.

Bearing Installer : 5-8840-0015-0 (J-22912-01)

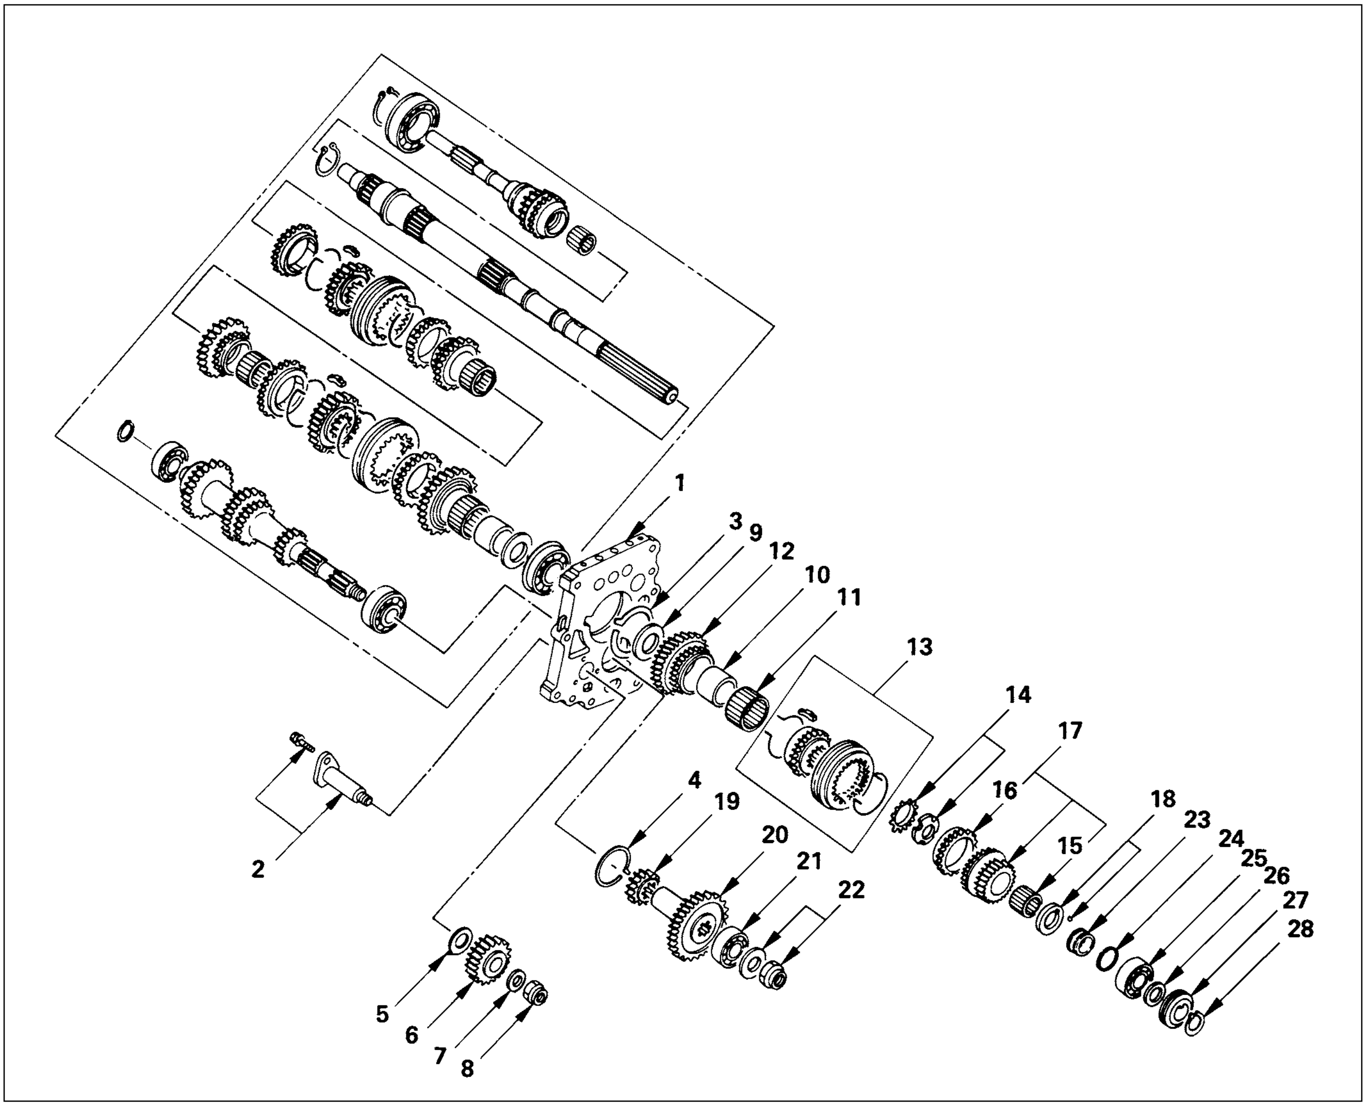


25.Rear Ball Bearing

Use a bench press and a bearing installer to install the bearing to the counter gear.

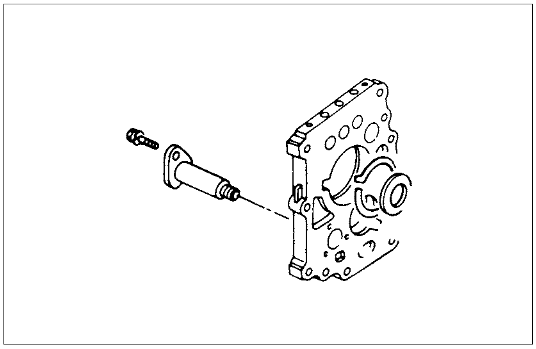
Bearing Installer : 5-8840-0015-0 (J-22912-01)

REVERSE GEAR AND 5TH GEAR



Reassembly Steps

▲ 1. Intermediate plate
▲ 2. Reverse idler shaft
3. Bearing snap ring
4. Bearing snap ring
5. Thrust washer
▲ 6. Reverse idler gear
7. Thrust washer
▲ 8. Counter reverse gear lock nut
▲ 9. Thrust washer
10. Needle bearing collar
11. Needle bearing
12. Reverse gear
▲13. Rev.-5th synchronizer assembly
▲14. Mainshaft lock nut and washer
15. Needle bearing
16. 5th block ring
17. 5th gear
▲18. Thrust washer and lock ball
19. Counter reverse gear
20. Counter 5th gear
21. Counter end ball bearing
▲22. Counter reverse gear nut and washer
▲23. Thrust washer thrust ring
▲24. Thrust ring snap ring
25. Mainshaft end ball bearing
26. Bearing spacer
27. Speedometer drive gear and lock ball
28. Bearing snap ring



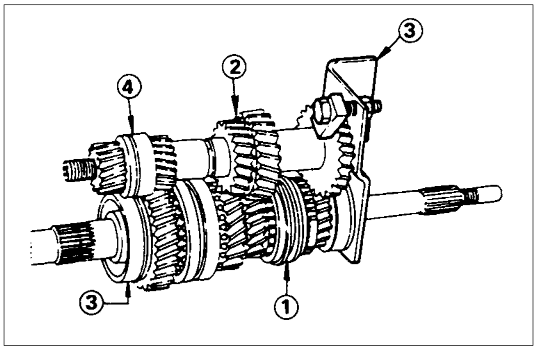
Important Operations

1. Intermediate Plate

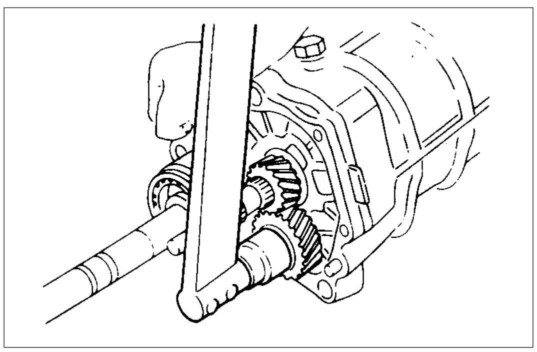
2. Reverse Idler Shaft

1) Install the reverse idler shaft to the intermediate plate.
2) Tighten the reverse idler shaft bolt to the specified torque.

Idler Shaft Bolt Torque	N·m(kgf·m/lb·ft)
19 (1.9 / 14)	



3) Set the mainshaft with gear assembly ① and the counter gear assembly ② to a holding fixture ③.
   Holding Fixture : 5-8840-2001-0 (J-29768)
4) Place the holding fixture (with the mainshaft and the counter shaft) in a vise.
5) Mesh the 3rd-4th synchronizer to the 3rd gear.
   Mesh the 1st-2nd synchronizer to the 1st gear.
6) Install the intermediate plate to the mainshaft and the counter gear ball bearings.

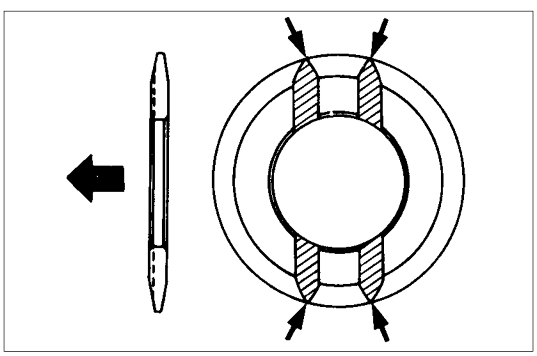


6. Reverse Idler Gear

8. Counter Reverse Gear Lock Nut

1) Apply the engine oil to the idler shaft and the reverse gear inside circumference.
2) Install the reverse gear to the idler shaft.
3) Install a new counter reverse gear lock nut.
   Never reinstall the old lock nut.
4) Tighten the reverse gear lock nut to the specified torque.

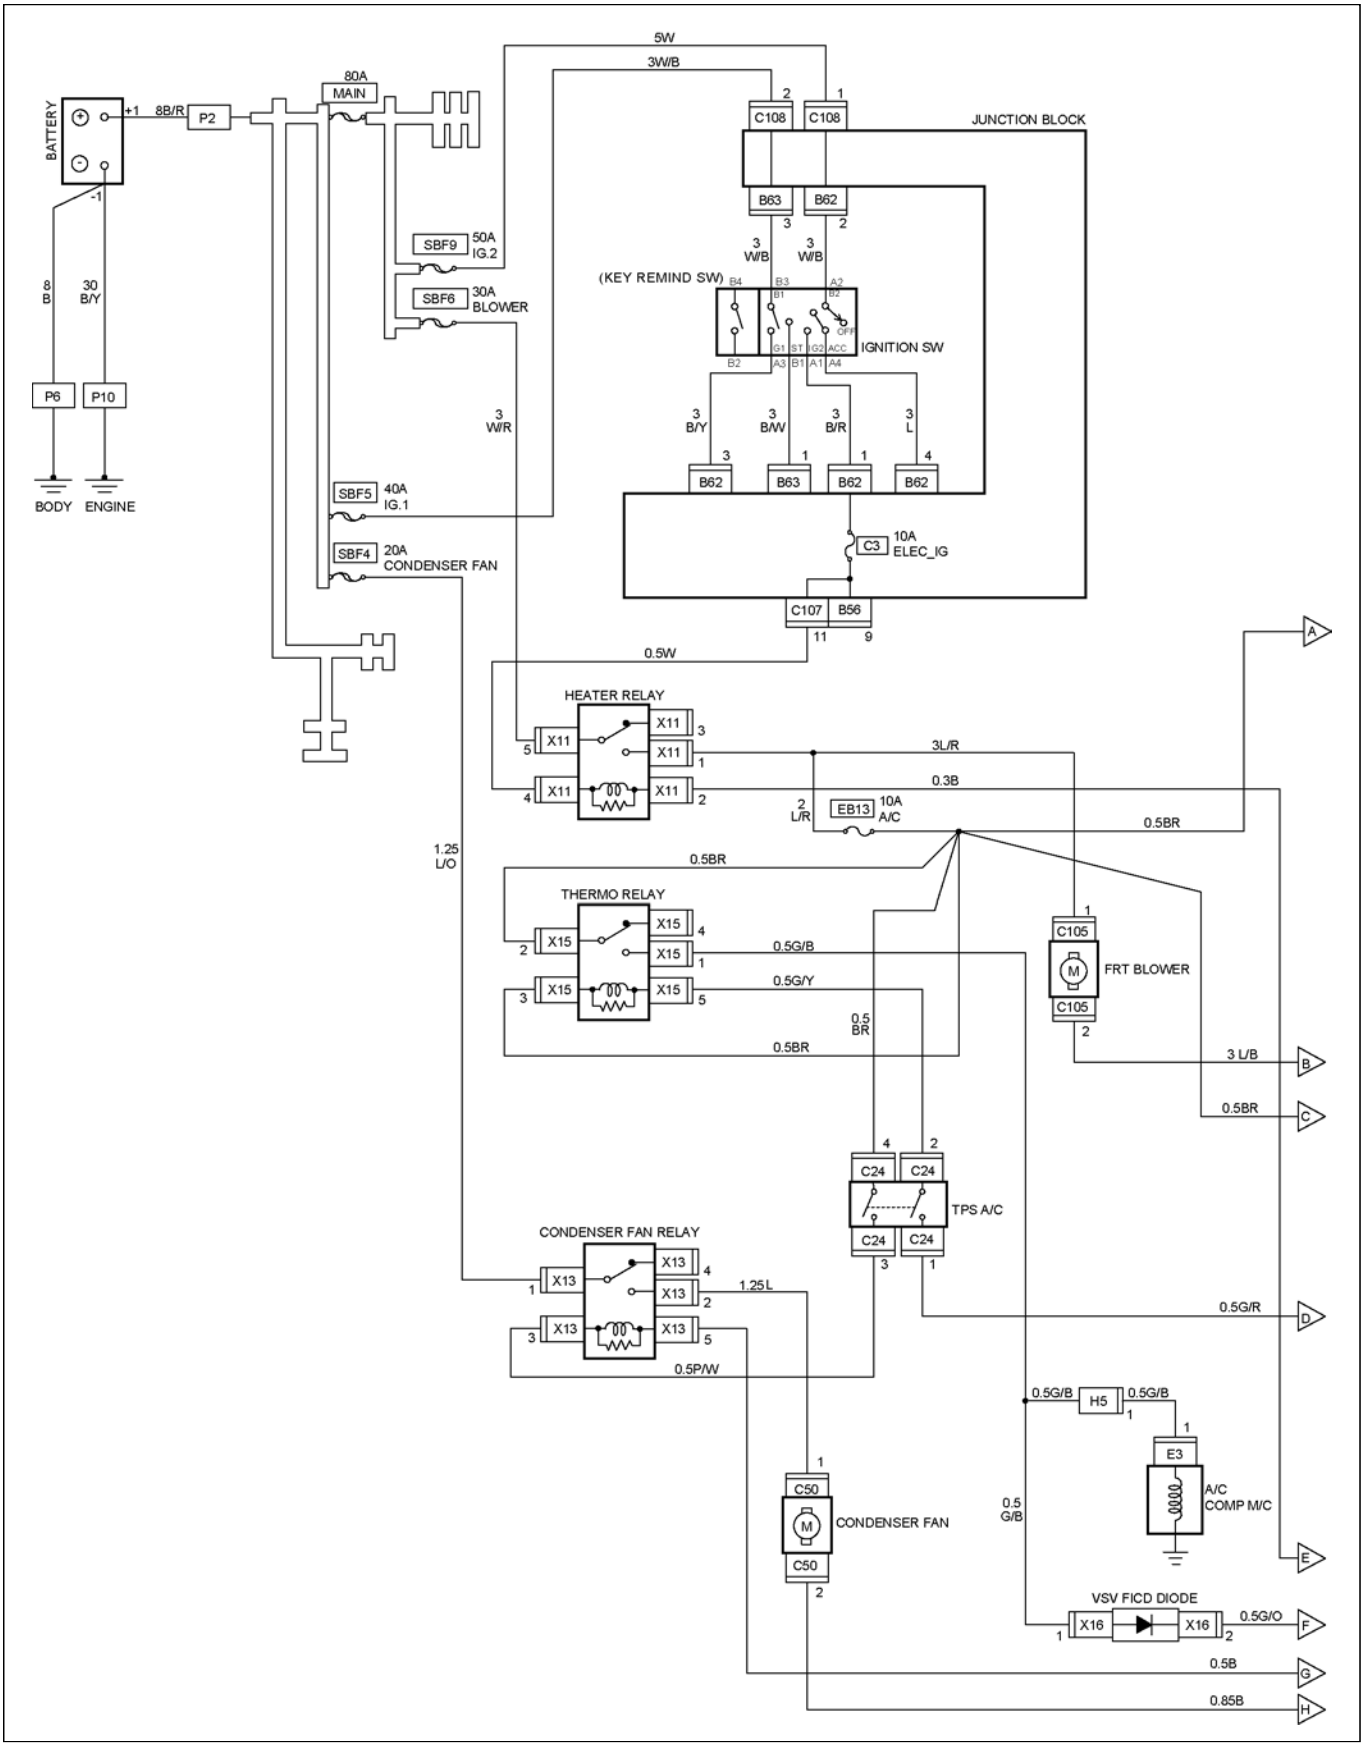
Lock Nut Torque	N·m (kgf·m/lb·ft)
108 (11 / 80)	



9. Thrust Washer

1) Apply the engine oil to both sides of the thrust washer.
2) Install the thrust washer to the mainshaft.
   The thrust washer oil groove must be facing the reverse gear side.

WIRING DIAGRAM (4JA1-T)



RTW78AXF008201

ϕ220mm

Torque : Bolt 64 N·m (6.5 kgf·m/47 lb·ft)

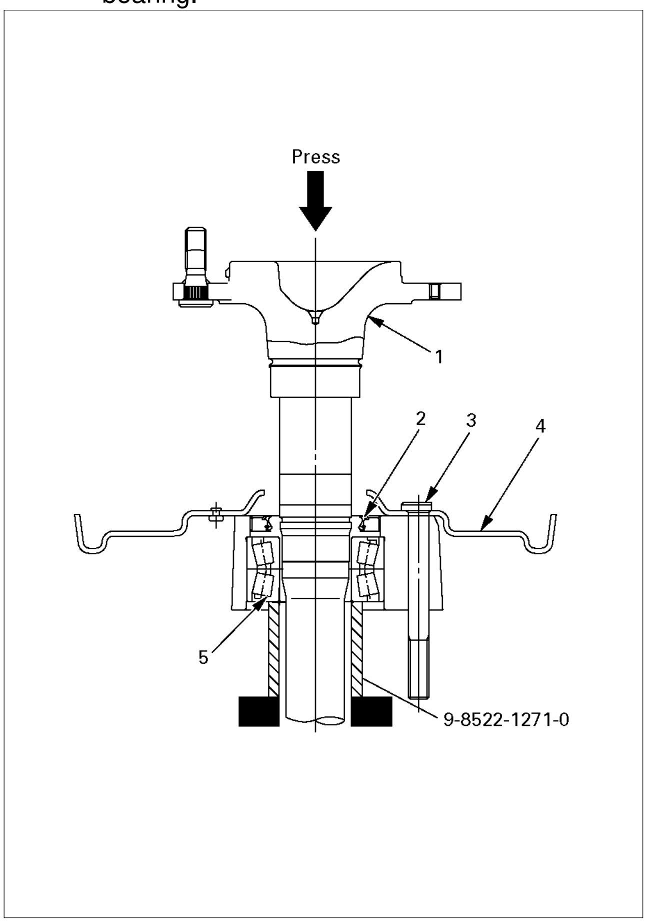
Nut 44 N·m (4.5 kgf·m/33 lb·ft)

ϕ194mm

Torque : Bolt 25 N·m (2.5 kgf·m/18 lb·ft)

Nut 37 N·m (3.8 kgf·m/27 lb·ft)

5. Axle Shaft Assembly
   a. Insert new double taper roller bearing in the bearing holder with oil seal.
   b. Set special tool (support stand : 9-8522-1271-0) on a bench press.
   c. Put bearing holder with bearing and oil seal and back plate on the support stand as following illustration.
   d. Insert bolts and axle shaft, aligning center of holes.
   e. Press fit axle shaft into double taper roller bearing.

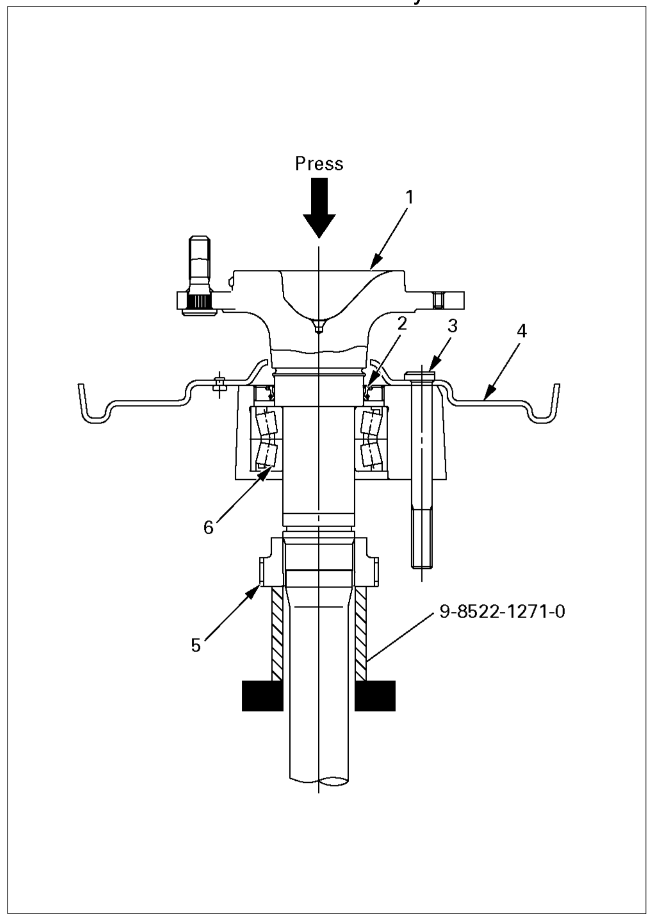


420R300010

Legend

1. Axle shaft
2. Oil Seal
3. Bolt
4. Back Plate
5. Double Taper Roller Bearing

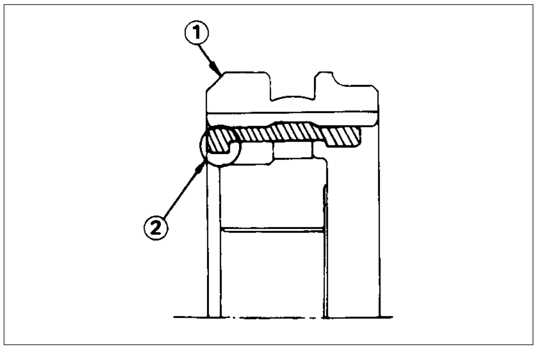
6. Put new retainer on the special tool 9-8522-1271-0.
7. Press fit axle shaft with the bearing into retainer and make axle shaft assembly.



420R300011

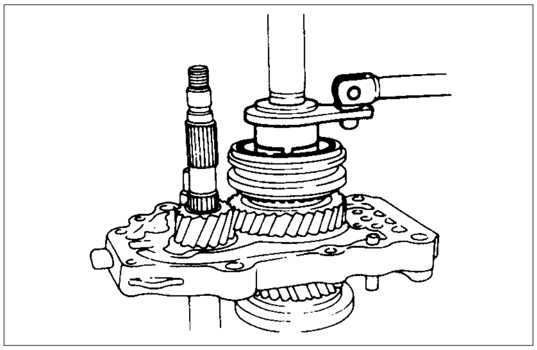
Legend

1. Axle shaft
2. Oil Seal
3. Bolt
4. Back Plate
5. Retainer
6. Double Taper Roller Bearing



13. Rev.-5th Synchronizer Assembly

1) Apply the engine oil to the clutch hub spline.
2) Install the synchronizer assembly to the mainshaft.
   The sleeve heavy chamfer ① and the insert short side ② must be facing to the rear side of the transmission.



14. Mainshaft Lock Nut and Washer

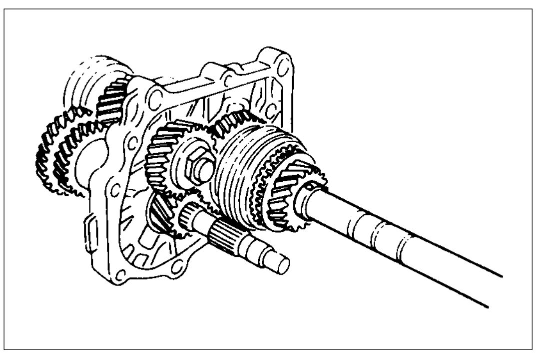
1) Install a new lock nut and washer to the mainshaft.
   Never reinstall the used lock nut and washer.
2) Use a lock nut wrench to tighten the lock nut to the specified torque.
   Lock Nut Wrench : 5-8840-0353-0 (J-36629)

Lock Nut Torque	N·m(kgf·m/lb·ft)
127 (11 / 94)	

22. Counter Reverse Gear Nut and Washer

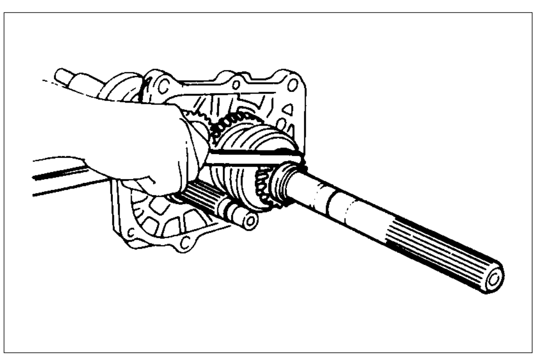
Tighten the counter gear lock nut to the specified torque.

Reverse Gear Nut Torque	N·m(kgf·m/lb·ft)
108 (11 / 80)	



18. Thrust Washer and Lock Ball
23. Thrust Washer Thrust Ring
24. Thrust Ring Snap ring

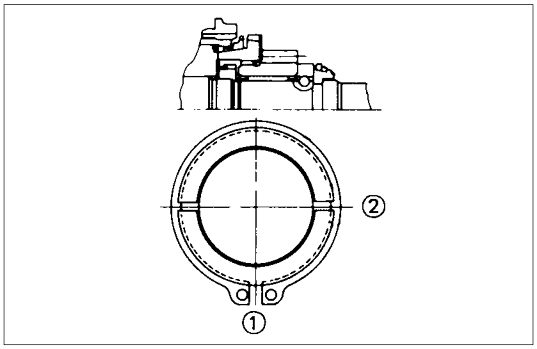
1) Install the thrust washer with lock ball together with the thrust ring to the mainshaft.
2) Use a pair of snap ring pliers to install the snap ring.



3) Use a thickness gauge to measure the clearance between the 5th gear and the thrust washer.

5th Gear and Thrust Washer Clearance	mm(in)
Standard	
0.1 - 0.3 (0.004 - 0.012)	

   If required, replace the existing thrust washer with a new thrust washer to bring the clearance to specification.



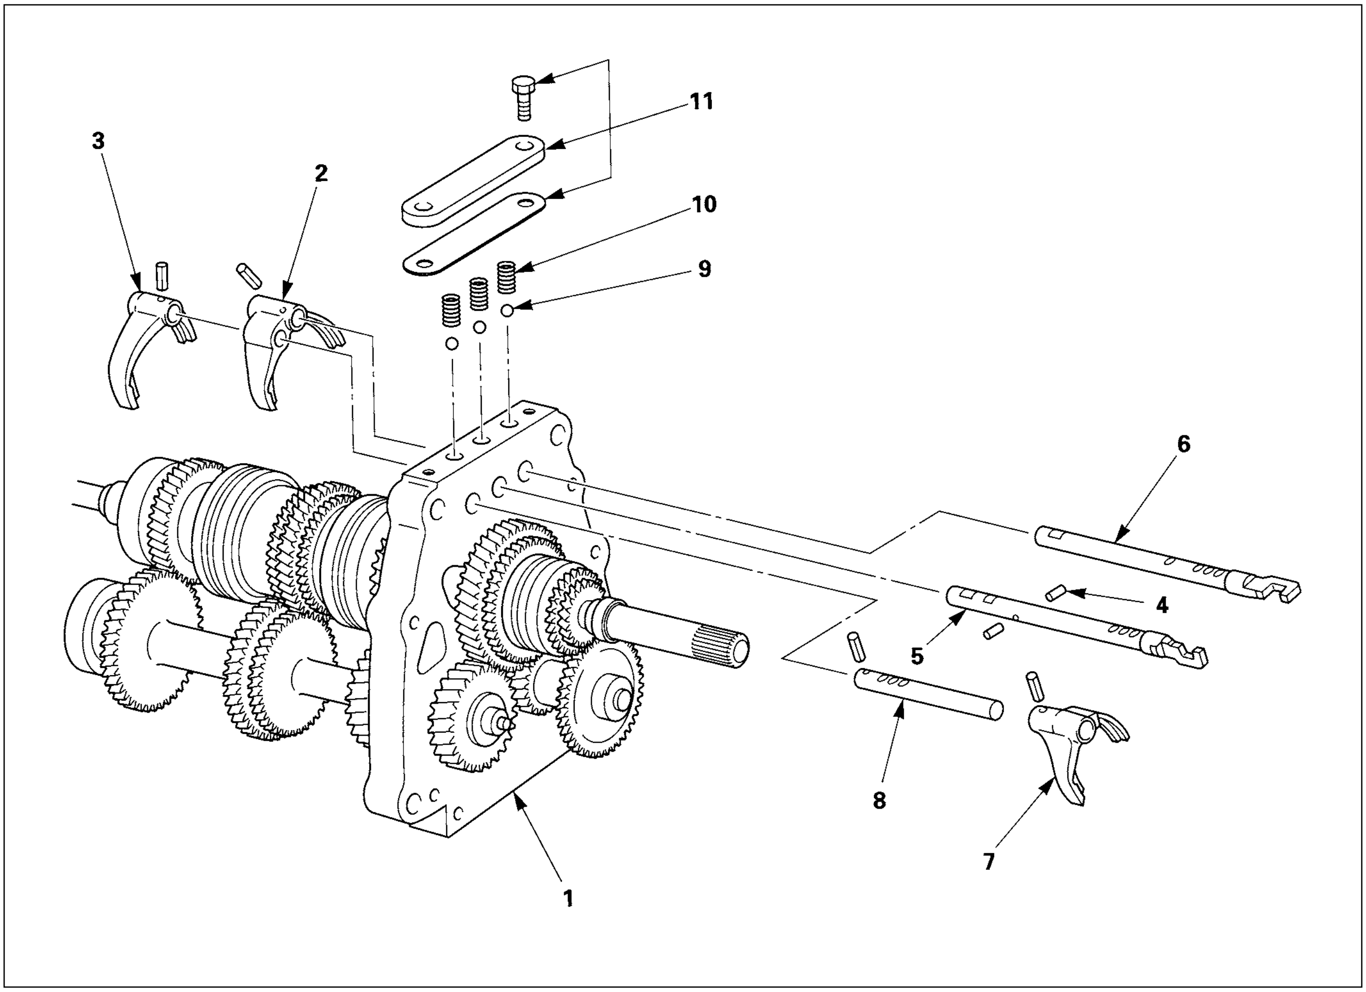
There are six thrust washer sizes available.

Thrust Washer Availability mm(in)

7.8 (0.307)	7.9 (0.311)	8.0 (0.315)
8.1 (0.319)	8.2 (0.323)	8.3 (0.327)

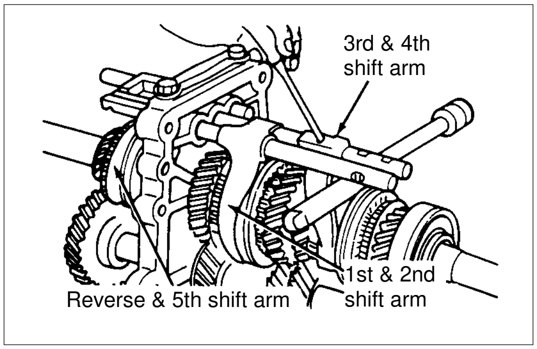
4) Position the thrust ring snap ring gap ① and the thrust ring gap ② so that they are separated at a 90° angle.

DETENT AND SHIFT ARM ASSEMBLY



Reassembly Steps

1. Intermediate plate and gear assembly
▲ 2. 1st-2nd shift arm
▲ 3. 3rd-4th shift arm
4. Interlock pin
5. 3rd-4th shift rod
6. 1st-2nd shift rod
▲ 7. Rev.-5th shift arm
8. Rev.-5th shift rod
9. Detent ball
10. Detent spring
▲11. Detent spring plate and gasket



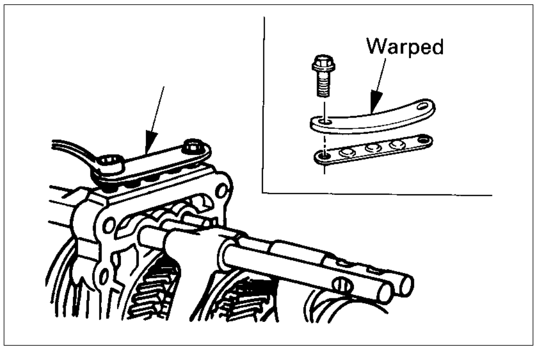
Important Operations

2. 1st-2nd Shift Arm

3. 3rd-4th Shift Arm

7. Rev.-5th Shift Arm

1) Hold a round bar against the shift rod end lower face to protect it against damage.
2) Use a spring pin installer to install the spring pin to the shift arm and the shift rod.
   Never reinstall the used spring pins.

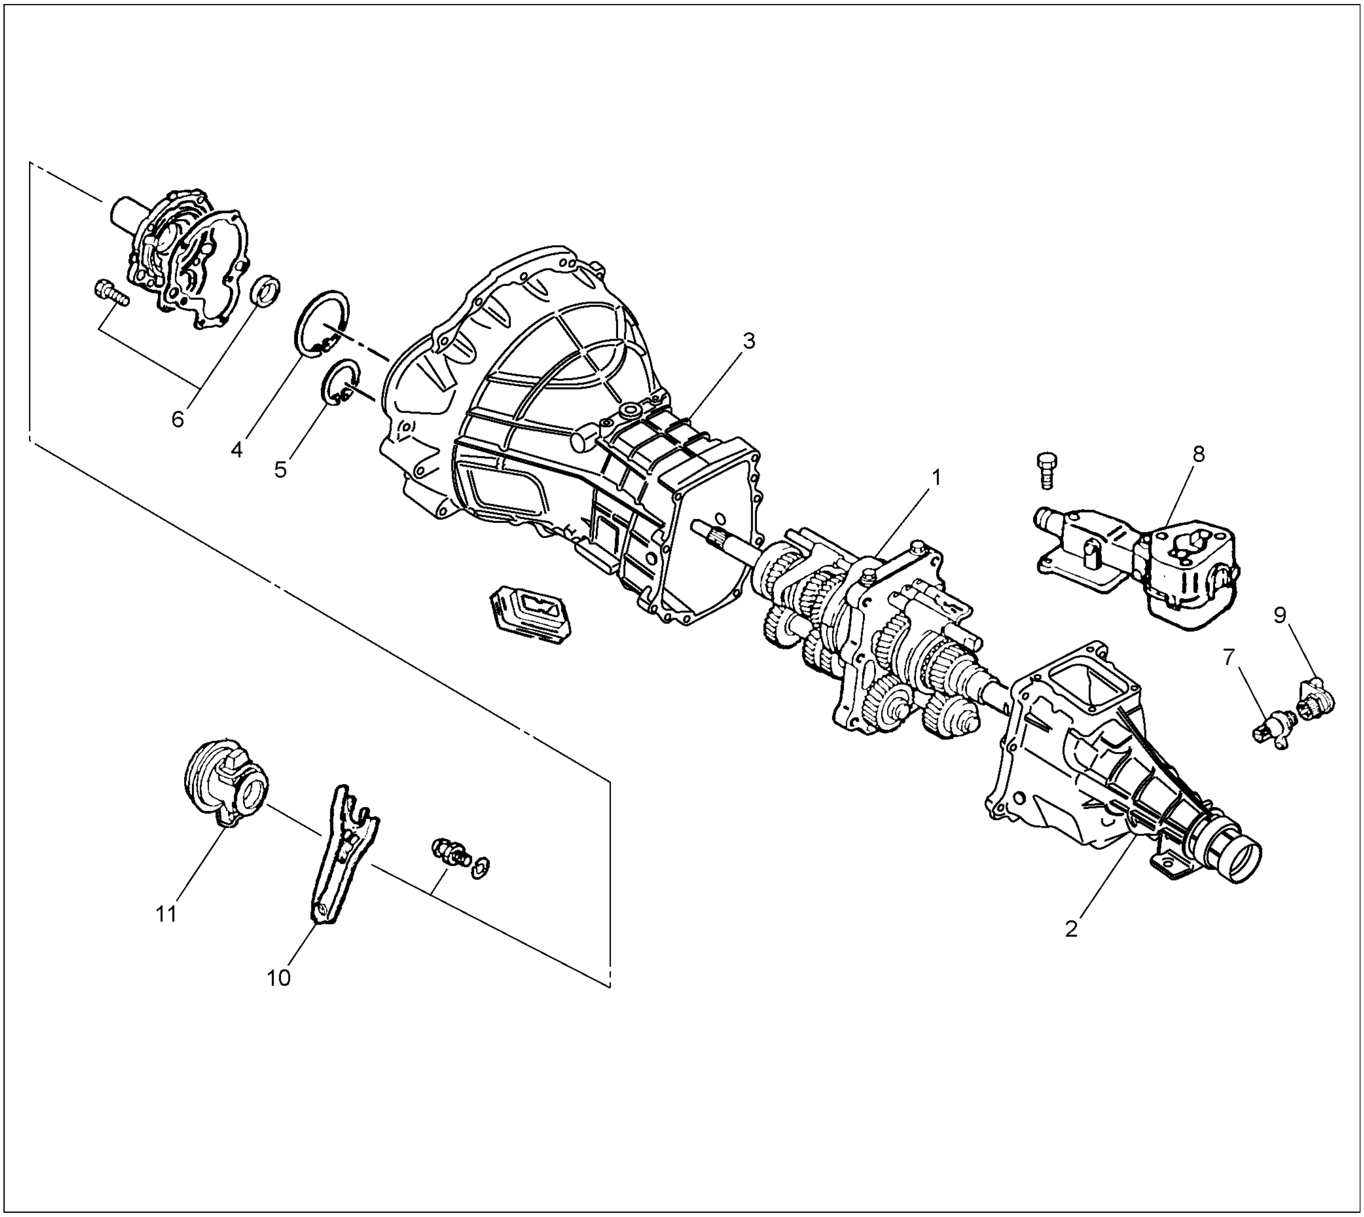


11. Detent spring Plate and Gasket.

1) Install the new detent plete and new gasket onto the transmission case into the correct direction.
2) Tighten the detent spring plate bolts to the specified torque.

Detent Spring Plate Bolt Torque	N·m(kgf·m/lb·ft)
19 (1.9 / 14)	

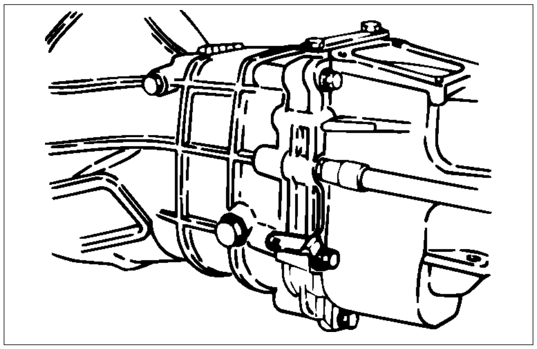
MAJOR COMPONENTS



RTW47BLF000401

Reassembly steps

1. Intermediate plate with gear assembly
▲ 2. Rear cover with oil seal
▲ 3. Transmission case
▲ 4. Bearing snap ring
5. Counter gear snap ring
▲ 6. Front cover with oil seal
7. Speedometer driven gear
8. Gear control box assembly
9. Speedometer sensor
10. Clutch shift fork
11. Clutch shift block and release bearing



RTW47BSH000201

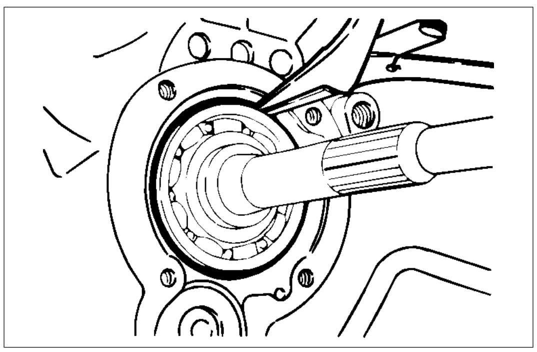
Important Operations

2. Rear Cover with Oil Seal

1) Align the pins at the lower side of the rear cover with the holes in the lower side of the intermediate plate.
2) Apply recommended liquid gasket (Three Bond TB1215) or its equivalent to the rear cover fitting surfaces.
3) Install the rear cover to the intermediate plate.
4) Tighten the rear cover bolts to the specified torque.

Rear Cover Bolt Torque	N·m(kgf·m/lb·ft)
37 (3.8 / 27)	

Note:
Take care not to twist or puncture the oil seal during the installation procedure.

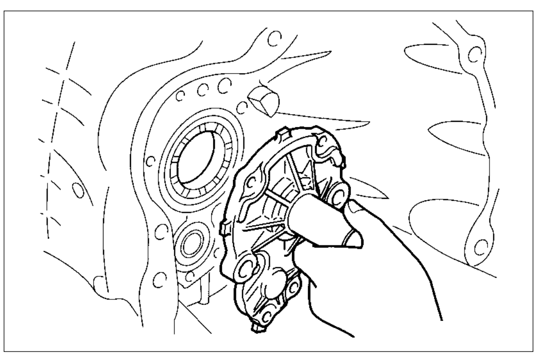


RTW47BSH000301

3. Transmission Case

4. Bearing Snap Ring

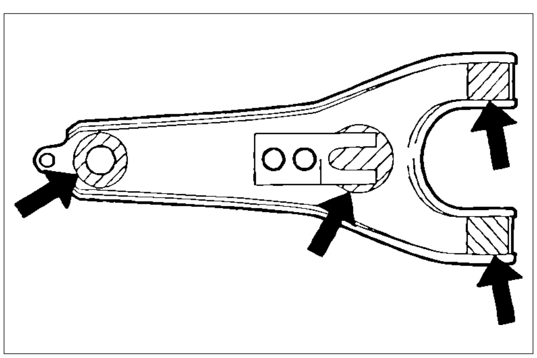
1) Apply the engine oil to the transmission case top gear shaft ball bearing fitting faces.
2) Apply recommended liquid gasket or its equivalent to the transmission case fitting surfaces.
3) Install the transmission case to the intermediate plate.
4) Pull the top gear shaft from the transmission case until the ball bearing snap ring grove protrudes from the transmission case front cover fitting faces.
5) Use a pair of snap ring pliers to install the snap ring to the ball bearing.



6. Front Cover with Oil Seal

1) Clean and apply recommended liquid gasket or its equivalent to the through bolt threads.
2) Install the new gasket and tighten the new cover bolt to the specified torque.

Front Cover Bolt Torque	N·m(kgf·m/lb·ft)
25 (2.5 / 18)	



RTW47BSH000101

10.Shift Fork

Apply molybdenum disulfide type grease to the areas as shown in the figure and install shift fork (Diesel engine).

SPECIAL SERVICE TOOL

ILLUSTRATION	PART NO.	PART NAME

SECTION 7B1

MANUAL TRANSMISSION (MUA)

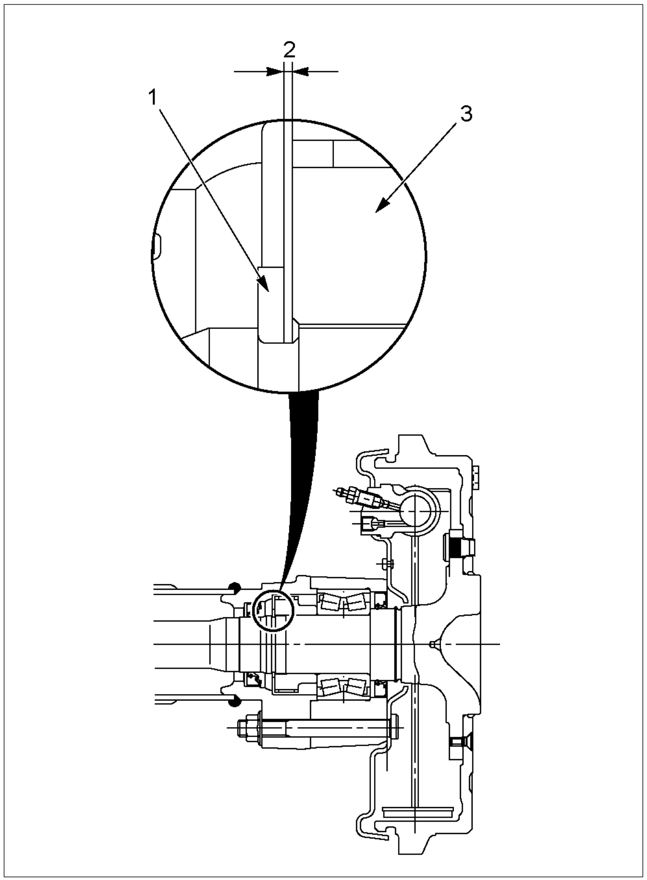
TABLE OF CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNECESSARY SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU/GM will call out those fasteners that require a replacement after removal. ISUZU/GM will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

8. Certainly install new snap ring, use snap ring pliers. When transform or damage, replace new one.



RTW34BMH000101

Legend

1. Snap ring
2. Crevice
3. Retainer (with ABS)
   Retainer (without ABS)

9. Insert a shim of sufficient thickness between snap ring and end of retainer.

   Standard 0 – 0.2 mm (0 – 0.008 in)

   Crevice is measured using thickness gauge, and when crevice exceeds 0.2 mm (0.008 in), it adjusts so that is may become 0.2 mm (0.008 in) or less using shim.

Shim Pats No.	Thickness
① 9-41519110-∗	0.18 mm (0.0071 in)
② 8-97130387-∗	0.50 mm (0.0197 in)

Crevice	No. of shim		Total
mm (in)	①	②	mm (in)
1.0(0.0394)	—	2	1.00(0.0394)
0.9(0.0354)	2	1	0.86(0.0339)
0.8(0.0315)	1	1	0.68(0.0268)
0.7(0.0276)	1	1	0.68(0.0268)
0.6(0.0236)	—	1	0.50(0.0197)
0.5(0.0197)	—	1	0.50(0.0197)
0.4(0.0157)	2	—	0.36(0.0142)
0.3(0.0118)	1	—	0.18(0.0071)
0.2(0.0079)	1	—	0.18(0.0071)

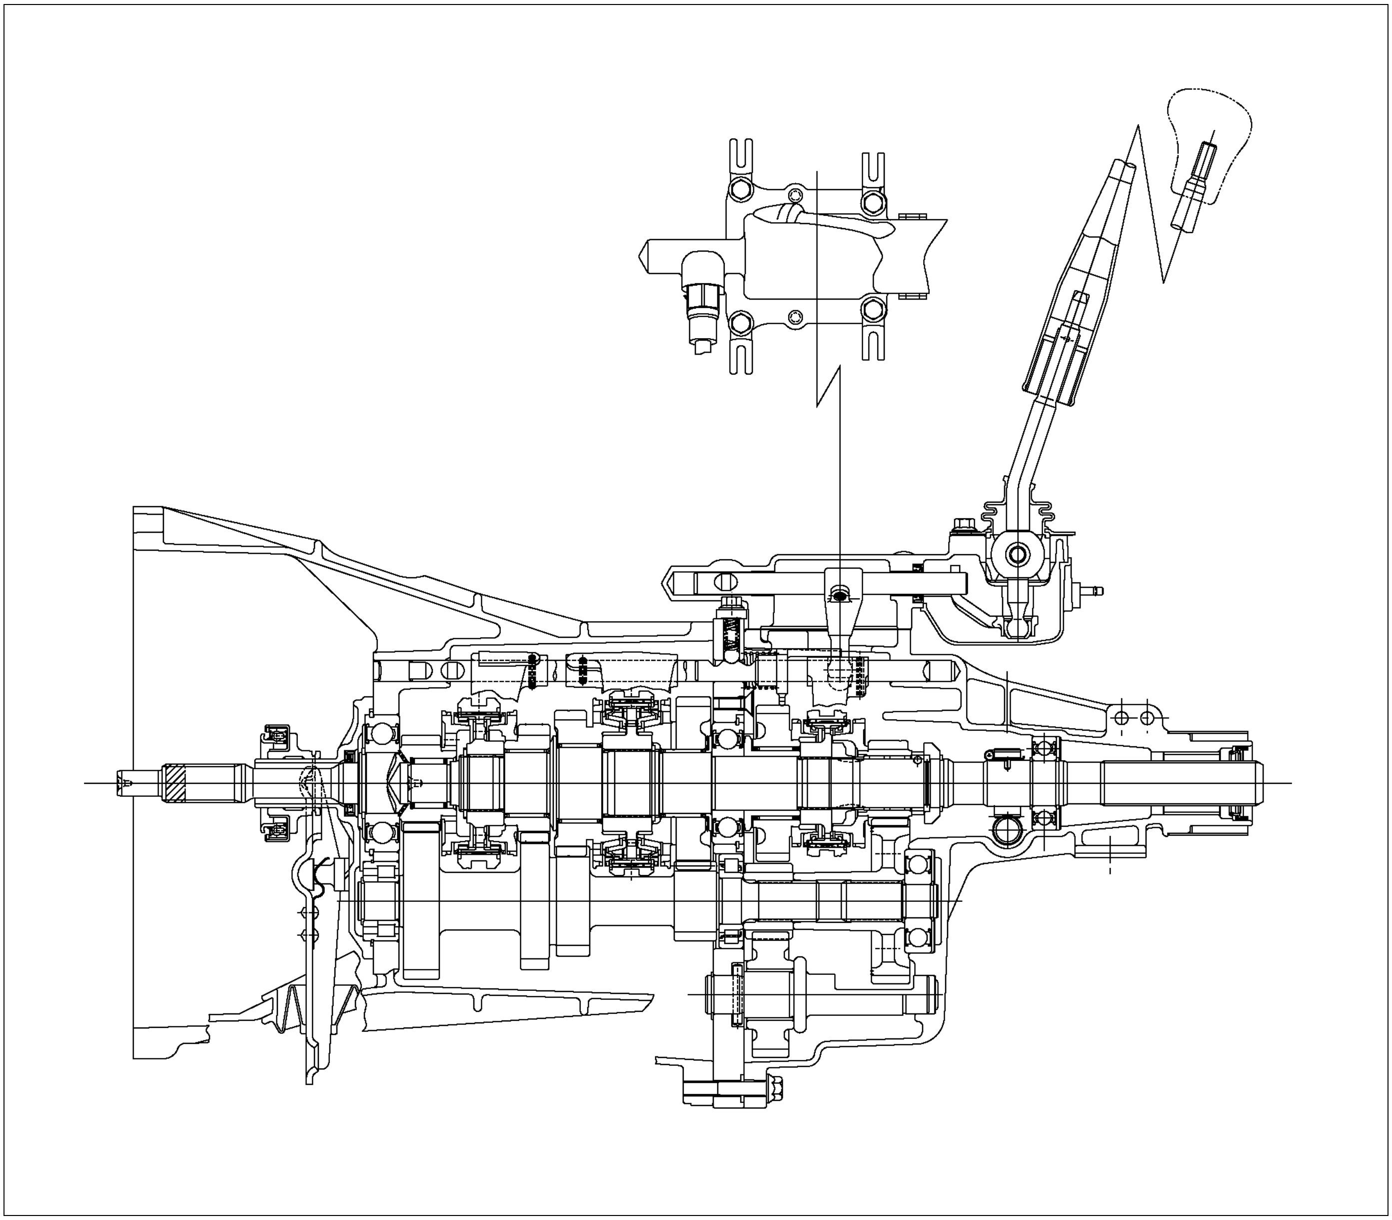
10. Install axle shaft assembly in rear axle case assembly.
    a. Clean the mating surface of axle case and bearing holder.
    b. Apply Three Bond 1215 (TB1215) or equivalent on the surface of axle case assembly.

Note:
When inserting an axle shaft, it inserts so that an oil seal may not be damaged.

11. Install and tighten bearing holder fixing nut to the specified torque.
    Torque : 84 N·m (8.6 kgf·m/62 lb·ft)
12. Install wheel cylinder and tighten the bolt to the specified torque.
    Torque : 9 N·m (0.9 kgf·m/78 lb·in)
13. Install parking brake outer cable in back plate and inner cable in parking brake lever.

General Description

MUA5G/5H/5S Transmission (4×2)



A07R300006

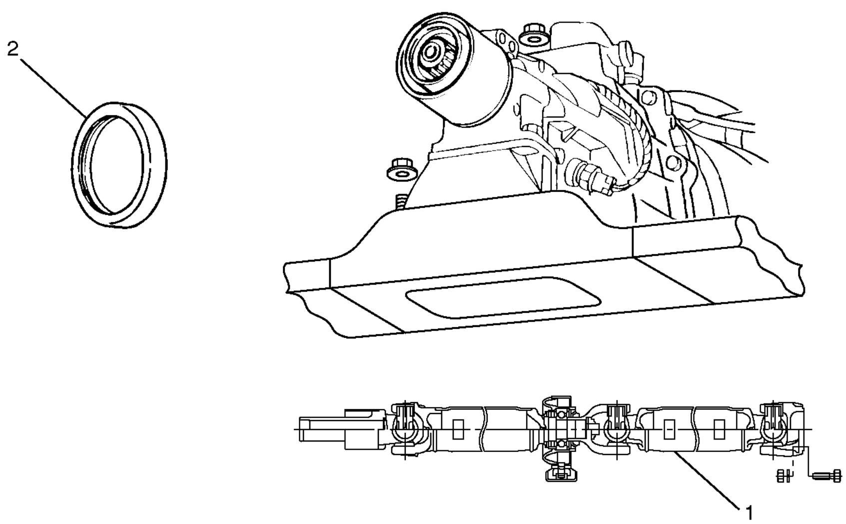
The MUA5G/5H/5S is a constant mesh transmission, synchronized in all speeds. The transmission has been designed to provide low shift effort and low gear noise.

Principle parts of the transmission are the integral clutch housing, the intermediate plate, the rear cover, and the gears.

The transmission control box is built into the transmission.

Rear Oil Seal

Disassembled View



220R300030

Legend

(1) Rear Propeller Shaft

(2) Rear Oil Seal

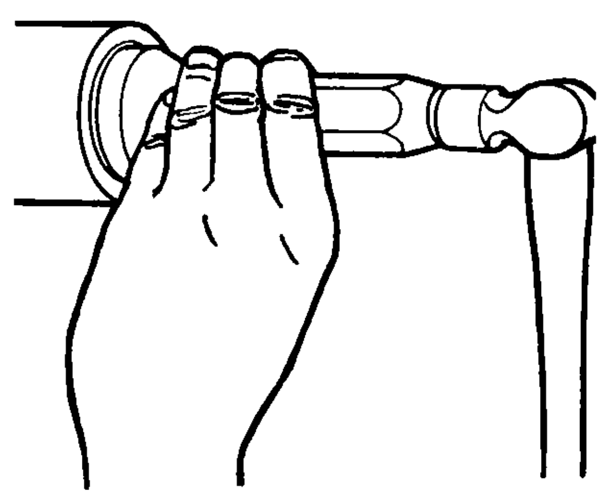
Removal

1. Raise and support the vehicle with suitable jack stands.
2. Remove the propeller shaft flange yoke bolts and nuts at the differential side.
3. Remove center bearing from the crossmember.
4. Remove prepeller shaft from the transmission main shaft spline.

   Refer to the section “Rear Propeller Shaft”.
5. Use a screwdriver to pry the rear oil seal from the rear cover.

Installation

1. Install a new oil seal using the installer 5-8522-0050-0.



220RS044

2. Insert the splined yoke into the transimission mainshaft spline.
3. Install the propeller shaft flange yoke to the drive pinion flange.

Torque : 63 N·m (6.4 kgf·m/46 lb·ft)

4. Install center bearing on crossmember.

Torque : 69 N·m (7.0 kgf·m/51 lb·ft)

5. Check transmission fluid level.
6. Lower the vehicle.

Transmission (4×2)

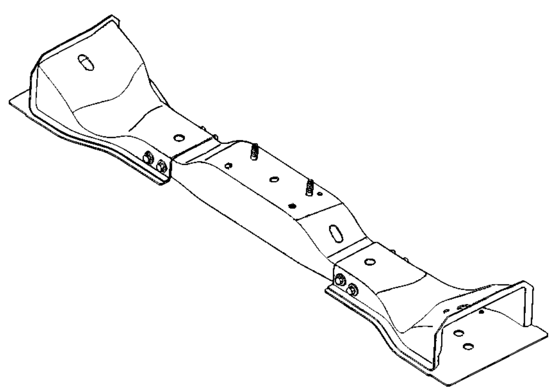
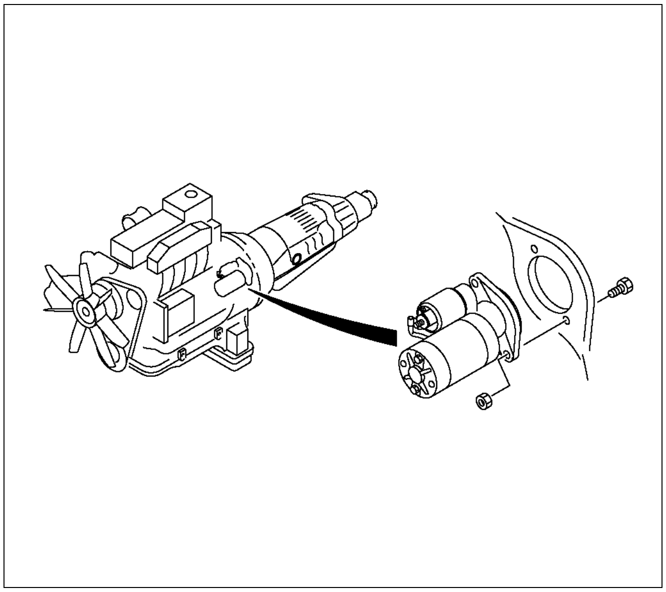
(4) Nut: rear mount to crossmember
(5) Transmission Crossmember

16. Remove the middle part of the transmission crossmember by removing four fixing bolts and nuts.



501R300008

17. Take out the rear mount rubber.
18. Remove the starter (Diesel engine only).



060L100070

19. Remove transmission retaining nuts and bolts.

    Remove the transmission assembly from the vehicle.

Installation

1. Apply a thin coat of molybdenum disulfide grease to the top gear shaft spline.
2. Slowly operate the transmission jack until the front of the transmission is aligned with the rear of the engine.

   The slope of the engine and the transmission must be the same.
3. Align the top gear shaft spline with the clutch driven plate spline.
4. Install the transmission assembly to the engine.

   Tighten the transmission nuts and bolts as shown in the figure.

Diesel engine

13. Back plate

5. Install the starter. (Diesel engine only)

NOTE: Tighten the lower bolt temporarily.

After installing the fuel pipe assembly, tighten the bolt to the specified torque.

Torque: 76 N·m (7.7 kgf·m/56 lb·ft)

6. Install the rear support rubber on the transmission and tighten the nuts to the specified torque.

Torque: 52 N·m (5.3 kgf·m/38 lb·ft)

7. Install the middle part of the transmission crossmember and the bolts.

Tighten the nuts to the specified torque.

Torque: 67 N·m (6.8 kgf·m/49 lb·ft)

8. Install the engine rear mount nuts fixing on the transmission crossmember.

Torque: 52 N·m (5.3 kgf·m/38 lb·ft)

Remove the transmission jack from transmission side.

9. Apply grease to the top hole portion of the shift fork.

Install the slave cylinder and tighten the bolts to the specified torque.

Torque: 76 N·m (7.7 kgf·m/56 lb·ft)

10. Install the fuel pipe brackets on the transmission.

Install the fuel pipe assembly to the fuel brackets.

Torque:	**Bolt & Nut**	**76 N·m (7.7 kgf·m/56 lb·ft)**
	Nut	**37 N·m (3.8 kgf·m/27 lb·ft)**

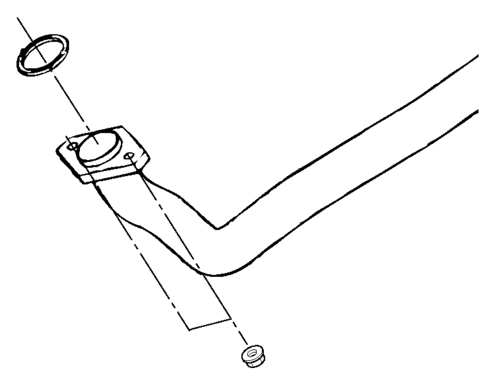
Scan-1

11. Connect the transmission harness connectors and clip. Connector: neutral switch, car speed sensor, and backup switch.

12. Tighten the exhaust pipe fixing nuts to the specified torque. (Diesel engine only)

Torque: 67 N·m (6.8 kgf·m/49 lb·ft)



RTW67BSH000101

13. Install the rear propeller shaft.

    Torque: 59 N·m (6.0 kgf·m/43 lb·ft)

14. Install the center bearing on crossemember.

    Torque: 69 N·m (7.0 kgf·m/51 lb·ft)

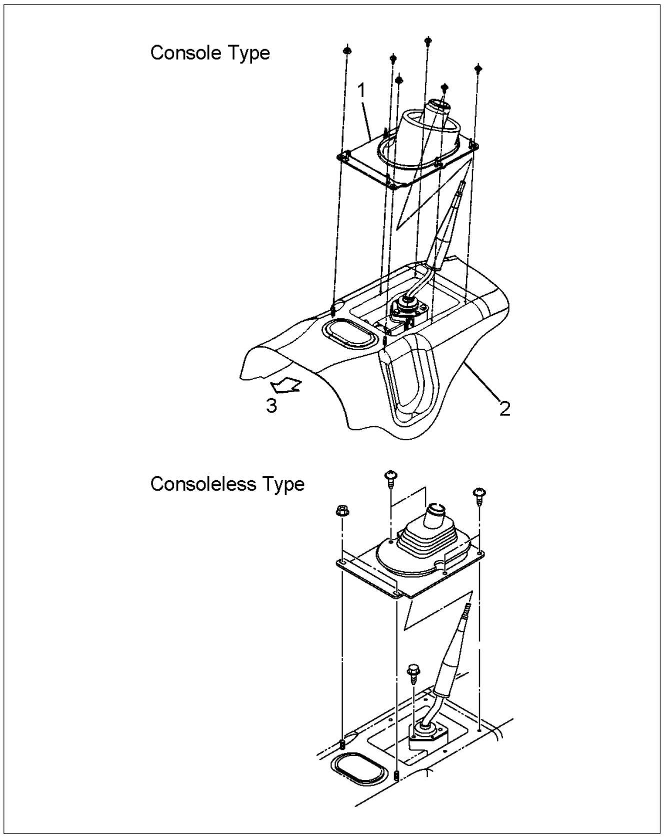
15. Install the gear control lever.

    Torque: 19 N·m (1.9 kgf·m/14 lb·ft)

16. Install the grommet assembly.

    Torque: Screw 1.4 N·m (0.14 kgf·m/12 lb·in)

    Nut 7 N·m (0.7 kgf·m/61 lb·in)



RTW47BMH000101

Legend

(1) Grommet Assembly

(2) Floor Panel

(3) Front

17. Install the front floor console and the rear floor console.
18. Install the gear control lever knob.

    To the female thread portion, apply 3 - 4 drops of adhesive (TB1344 or LOCTITE 222 or equiv.) and tighten the transmission knob.

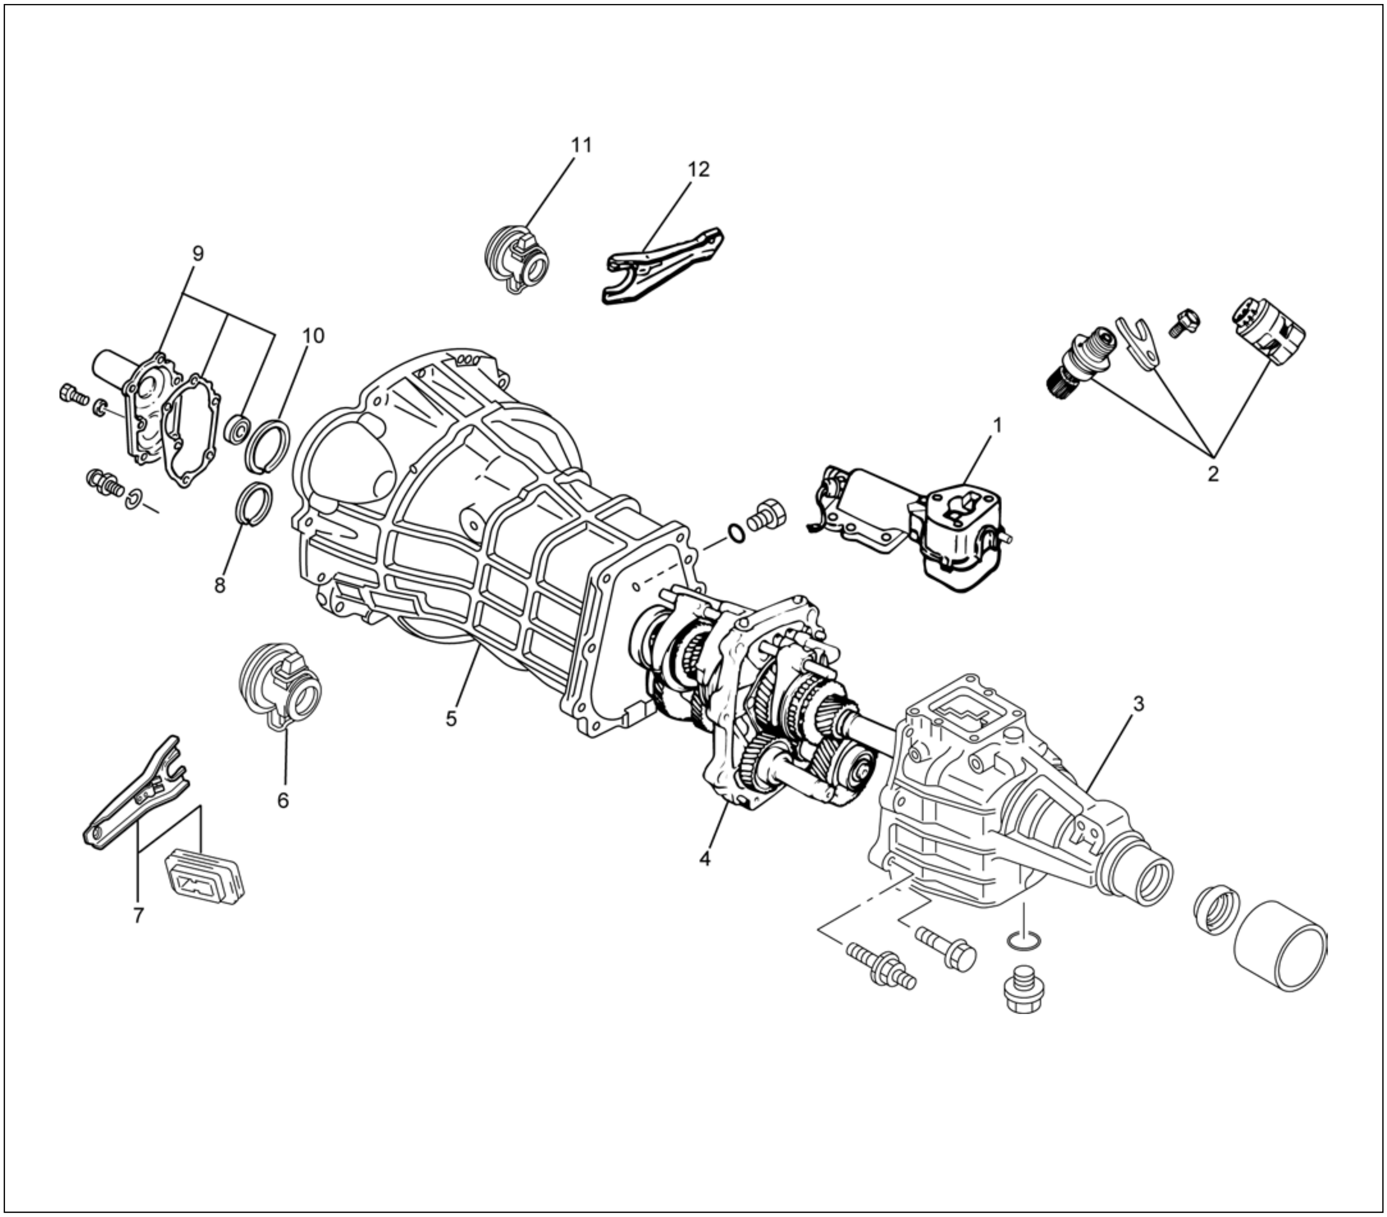
    Torque: 9 N·m (0.9 kgf·m/78 lb·in)

    After tightening to specified torque, rewrench the knob until the direction of the shift pattern is in the due positioned.

19. Connect the battery ground cable.

Transmission Case

Major Component



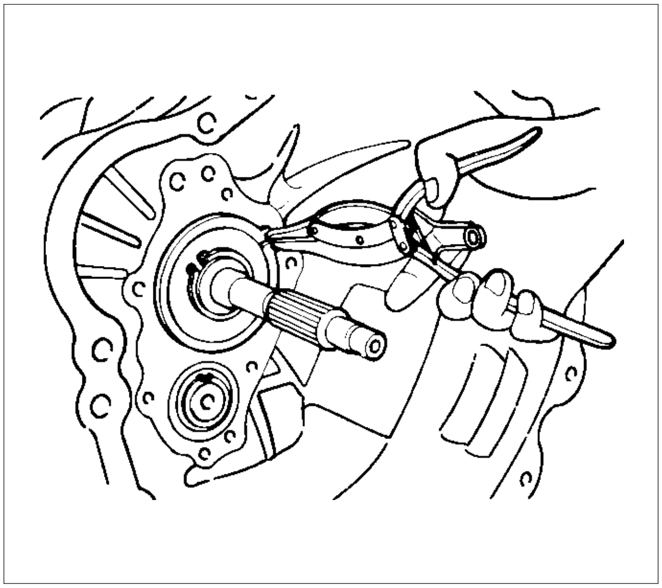
RTW77BLF003301

Legend

(1) Gear Control Box Assembly and Gasket
(2) Speedometer Sensor and Driven Gear
(3) Rear Cover Assembly
(4) Intermediate Plate with Gear Assembly
(5) Transmission Case
(6) Release Bearing (with Spring) : Diesel engine
(7) Shift Fork and Cover: Diesel engine
(8) Counter Front Bearing Snap Ring
(9) Front Cover (with Oil Seal)
(10) Top Gear Bearing Snap Ring
(11) Release Bearing: C24SE
(12) Shift Fork: C24SE

Disassembly

1. Clean the exterior of the unit with solvent.
2. Remove the drain plug from the transmission case and drain the lubricant.
3. Remove the clutch release bearing with spring from the transmission case.
4. Remove the shift fork, and boot.
5. Remove the front cover and gasket from the transmission case.
6. Remove the snap ring fixing counter front bearing.
7. Use a pair of snap ring pliers to remove the snap ring fixing top gear bearing.



226RS001

8. Remove the speedometer sensor.

   Remove the plate.

   Remove the driven gear bushing and driven gear.

NOTE: Apply a reference mark to the driven gear bushing before removal.

9. Remove the gear control box assembly.
10. Remove the rear cover assembly from the transmission case and intermediate plate.
11. Remove the intermediate plate with gear assembly from the transmission case.

Reassembly

1. Apply recommended liquid gasket (Three Bond TB1215) or its equivalent to the transmission case, intermediate plate and rear cover fitting surfaces.
2. Install the intermediate plate with the gear assembly to the transmission case.

   Pull out the top gear shaft until the ball bearing snap ring groove protrudes from the transmission case front cover fitting face.

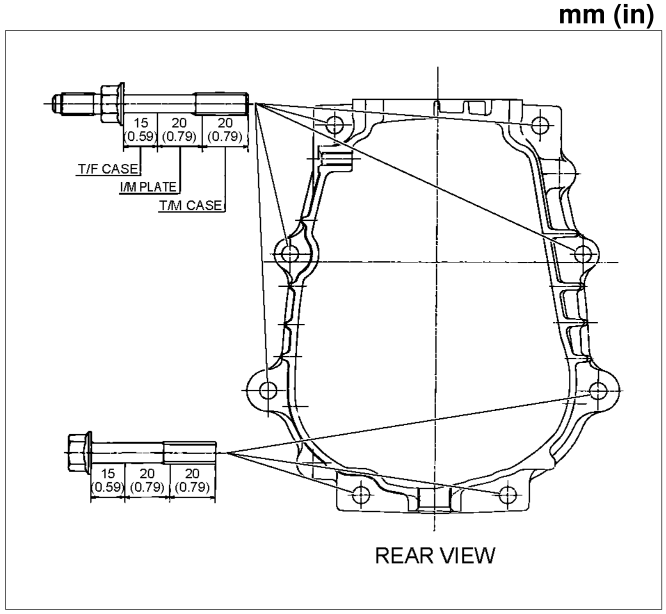
   Avoid subjecting the main shaft to sudden shock or stress.

3. Install the rear cover with an oil seal on the intermediate plate, with the gear, by performing the following steps.
   - Cover the shaft splines with adhesive tape.

     This will prevent damage to the oil seal lip.
   - Tighten the transmission rear case bolts and nuts to the specified torque.

   Torque: 37 N·m (3.8 kgf·m/27 lb·ft)

mm (in)



RTW77BSH008601

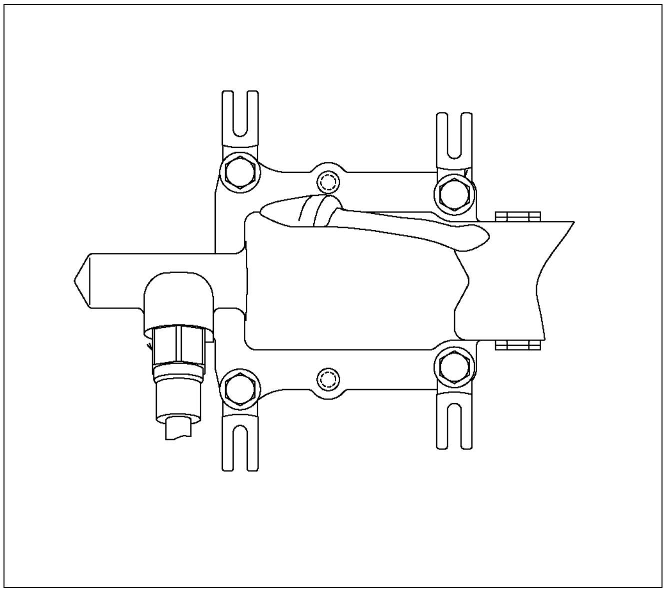
Notes When Tightening the Bolt:

- After cleaning the bolt hole, air dry it thoroughly.
- After cleaning the screw face of a removed or new bolt, dry it thoroughly. Apply recommended liquid gasket (LOCTITE 242) or its equivalent, before tightening.

4. Install a new gasket and gear control box assembly.

   Install the harness clips and brackets and then tighten four new gear control box bolts to the specified torque.

   Torque: 20 N·m (2.0 kgf·m/14 lb·ft)



261R300004

5. Install the O-ring (3) to the speedometer driven gear bushing (2).

   Install the driven gear to the speedometer driven gear bushing (2).

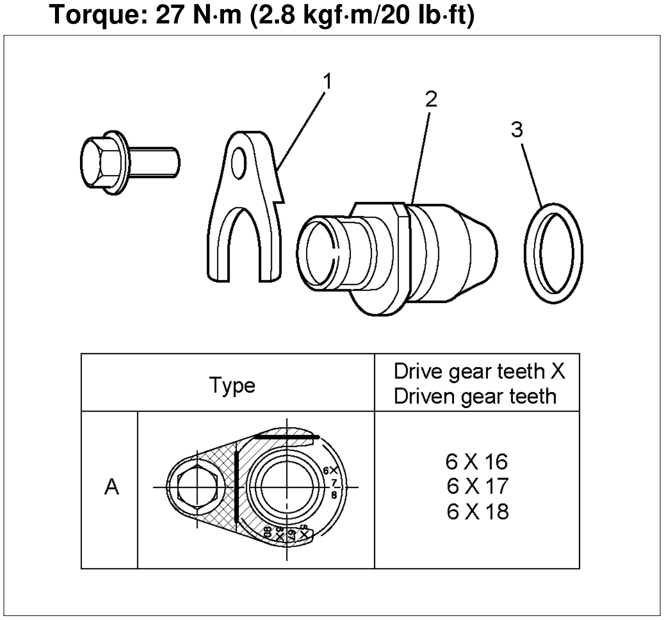
6. Install the speedometer driven gear assembly to the transmission rear cover.

   Install the plate (1) to the transmission rear cover.

   Torque: 15 N·m (1.5 kgf·m/11 lb·ft)

7. Install the speedometer sensor.

   Torque: 27 N·m (2.8 kgf·m/20 lb·ft)

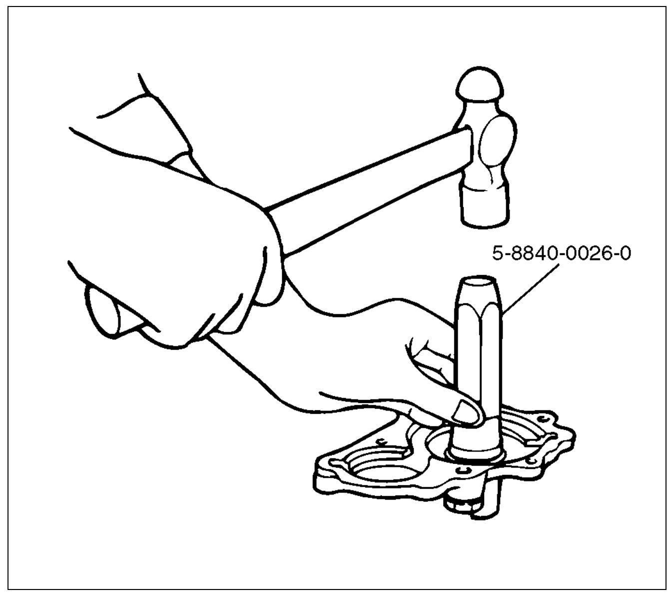


RTW77BSH008501

8. Install top gear bearing snap ring and counter front bearing snap ring.
   - Use a pair of snap ring pliers to install the snap rings to the mainshaft and countershaft.
   - The snap rings must be fully inserted into the bearing snap ring groove.

9. Front cover with oil seal.

   Front Cover Oil Seal Replacement
   - Remove the oil seal from the front cover.
   - Apply engine oil to a new oil seal, on the outer circumference.
   - Apply recommended grease to the oil seal lip.
   - Use the oil seal installer 5-8840-0026-0 to install the oil seal to the front cover.



220R3000020

10. Install a new gasket and front cover to the transmission case.

NOTE: Take care not to damage the oil seal.

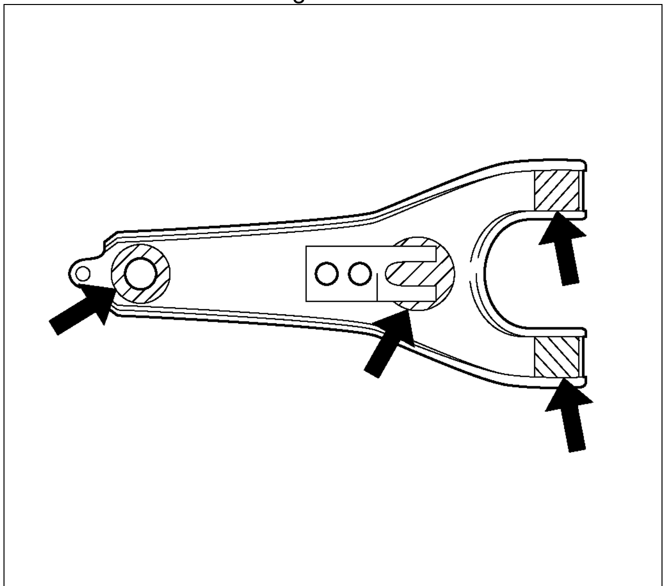
Notes When Tightening the Bolt:

- After cleaning the bolt hole, air dry it thoroughly.
- After cleaning the screw face of a removed or new bolt, dry it thoroughly. Apply recommended liquid gasket (LOCTITE 242) or its equivalent before tightening.

  Tighten the six front cover bolts to the specified torque.

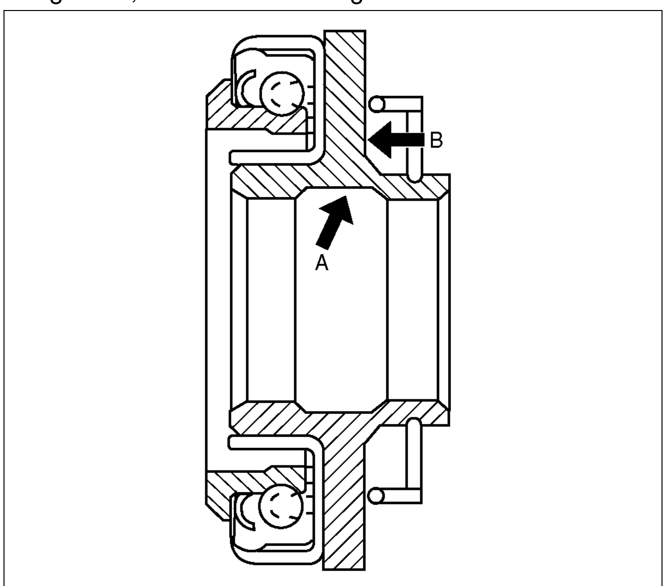
  Torque: 25 N·m (2.6 kgf·m/19 lb·ft)

11. Apply molybdenum disulfide type grease to the areas shown in the figure and install the shift fork.



F07L100026

12. Pack the inside recess (A) and coat the back (B) of the release bearing with molybdenum disulfide type grease, as shown in the figure.

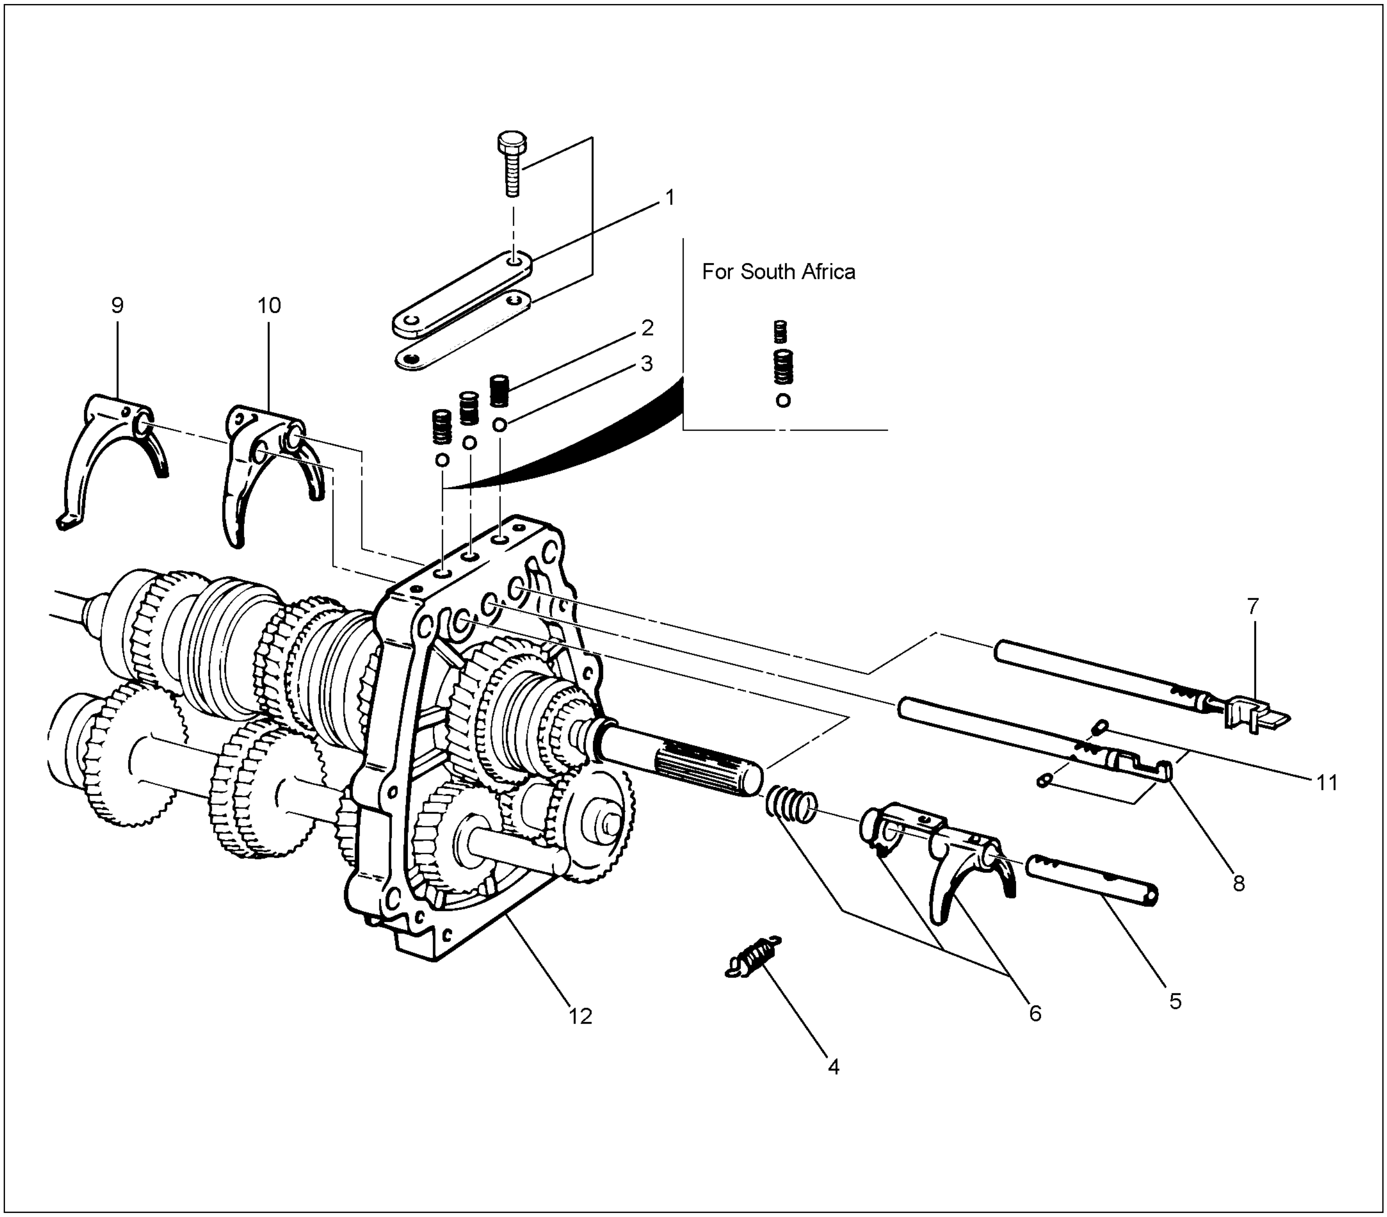


A07RW075

13. Install the release bearing on the front cover, joining it to the shift frok.

Intermediate Plate with Gear Assembly, Detent, Shift Arm, Shift Rod, and Interlock Pin

Disassembled View



RTW57BLF000201

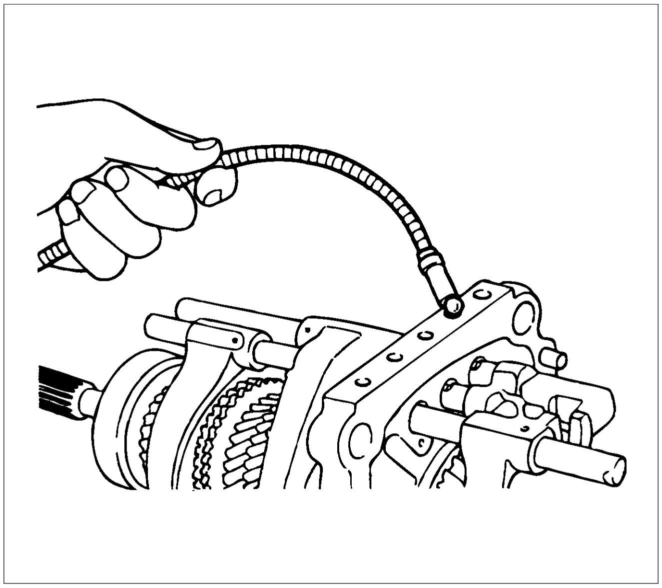
Legend

(1) Detent Spring Plate and Gasket
(2) Detent Spring
(3) Detent Ball
(4) Spring
(5) Rev-5th Shift Rod
(6) Rev-5th Shift Arm and Reverse Inhibitor
(7) 1st-2nd Shift Rod
(8) 3rd-4th Shift Rod
(9) 3rd-4th Shift Arm
(10) 1st-2nd Shift Arm
(11) Interlock Pin
(12) Intermediate Plate and Gear Assembly

Disassembly

1. Remove the detent spring plate and gasket, the detent spring and detent ball.

   Use a magnetic hand to remove the detent balls from the intermediate plate.

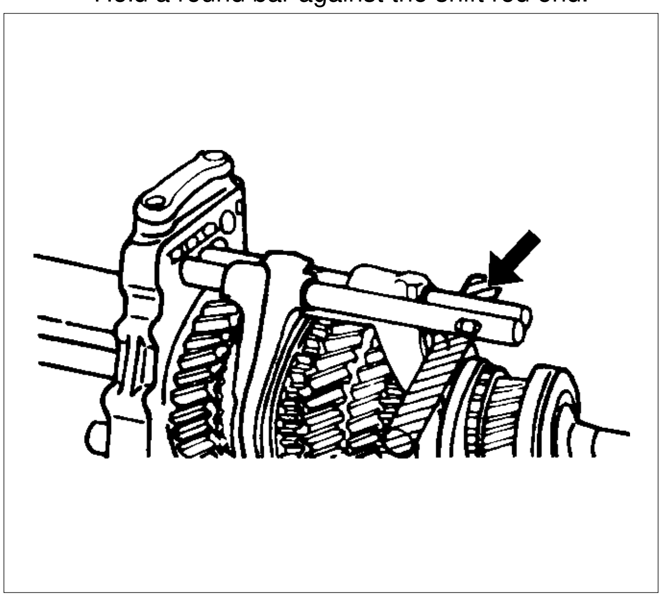


220RS011

2. Remove the spring.
3. Remove the rev-5th shift rod, and rev-5th shift arm and the reverse inhibitor.

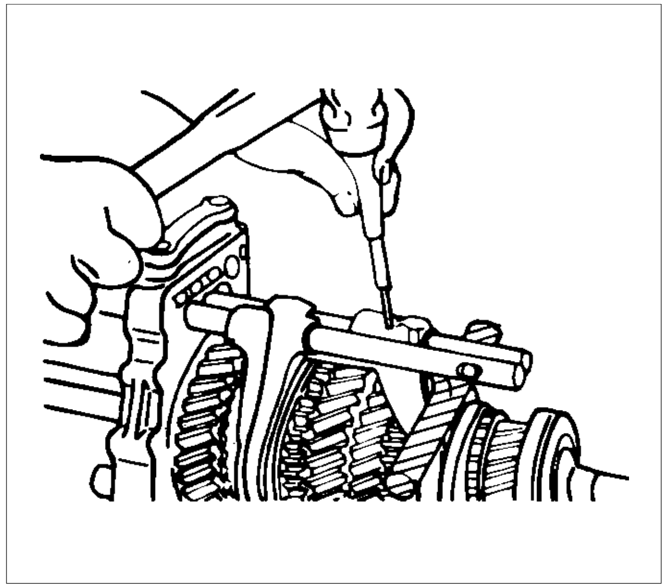
   Remove the 1st-2nd shift rod, 3rd-4th shift rod, 3rd-4th shift arm, and 1st-2nd shift arm.

   - Hold a round bar against the shift rod end.



230RS003

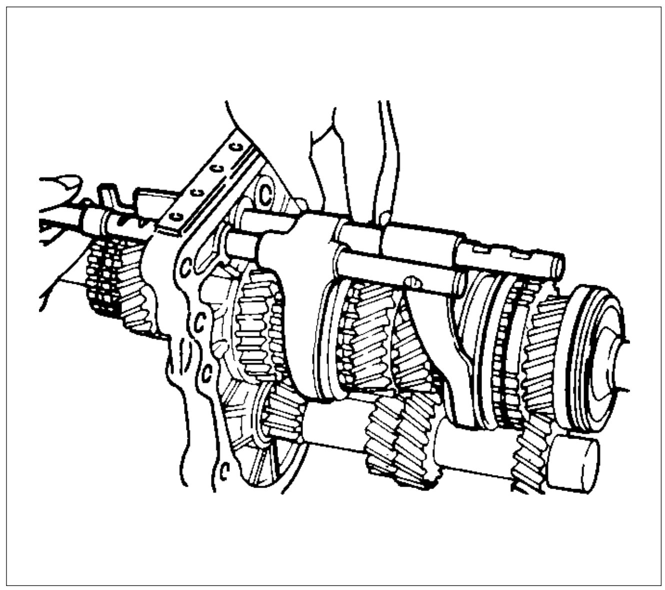
   - Use a spring pin remover to remove the shift arm spring pins from the shift arms, and the shift rods.



230RS0004

   - Be careful not to lose the interlock pins, when pulling out the shift rod rearward.

     The interlock pins are located between the shifter rods in the intermediate plate.



230RS0005

   - Remove the rev-5th, 1st-2nd and 3rd-4th shift rods carefully.

4. Remove the interlock pin from the intermediate plate and gear assembly.

Inspection and Repair

Make the necessary adjustments and part replacements if excessive wear or damage is discovered during inspection.

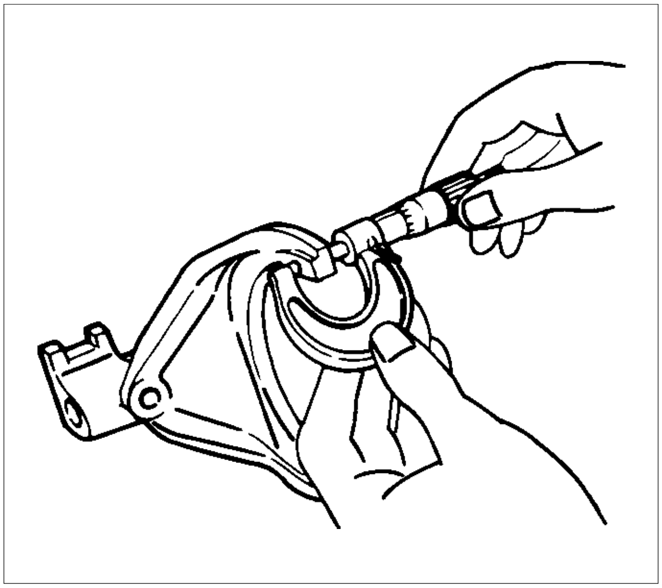
Shift Arm Thickness

- Use a micrometer to measure the shift arm thickness.

  If the measured value is less than the specified limit, the shift arm must be replaced.

Shift Arm Thickness

	Standard	Limit
1st-2nd	9.60 - 9.85 mm (0.378 - 0.388 in)	9.0 mm (0.354 in)
3rd-4th Rev.5th	9.60 - 9.80 mm (0.378 - 0.386 in)	



230RS006

Detent Spring Free Length

- Use a vernier caliper to measure the detent spring free length.

  If the measured value is less than the specified limit, the detent spring must be replaced.

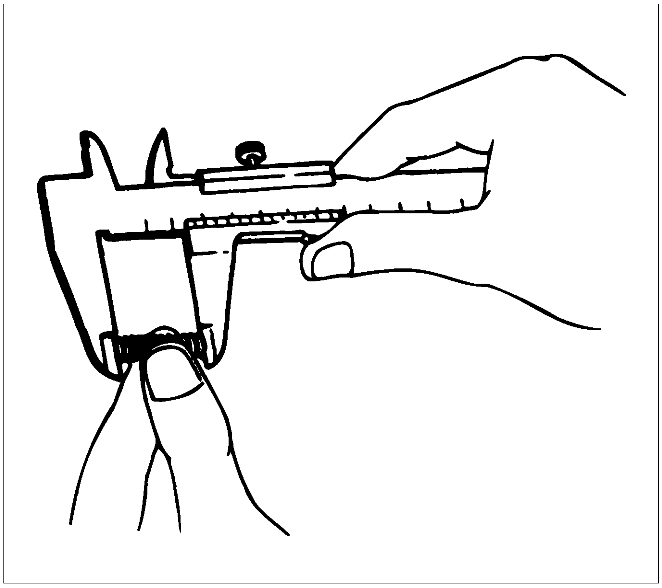
Detent Spring Free Length

Standard	Limit
26.8 mm (1.06 in)	26.2 mm (1.03 in)

SOUTH AFRICA 5th-Rev Only

Detent Spring Free Length

	Standard	Limit
Outer	27.6 mm (1.09 in)	27.0 mm (1.06 in)
Inner	26.6 mm (1.05 in)	26.0 mm (1.02 in)



220RS012

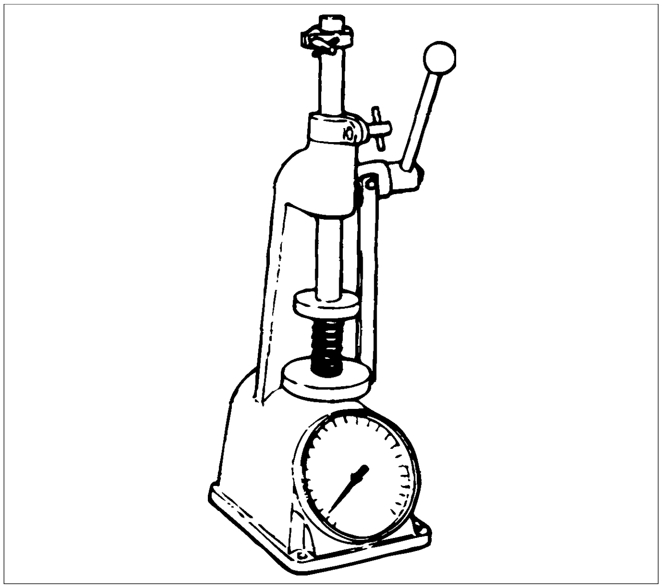
Detent Spring Tension

- Use a spring tester to measure the detent spring tension.

  If the measured value is less than the specified limit, the detent spring must be replaced.

Detent Spring Tension

Compressed height	Standard
20 mm (0.787 in)	87.2 - 97.1 N (19.6 - 21.8 lb)



220RS013

SOUTH AFRICA 5th-RV Only

Detent Spring Free Length

	Compressed	Standard
Outer	20 mm (0.787 in)	93.5 – 103.3 N (21.0 – 23.3 lb)
Inner	20 mm (0.787 in)	26.4 – 36.3 N (5.9 – 8.2 lb)

Reassembly

1. Install the rev-5th shift arm and reverse inhibitor and the rev-5th shift rod.
   - Apply oil to the reverse inhibitor inner surface.
   - Install the shift rod in the intermediate plate.
   - Hold a round bar against the shift rod end lower face to protect it against damage.
   - Install a new spring pin.

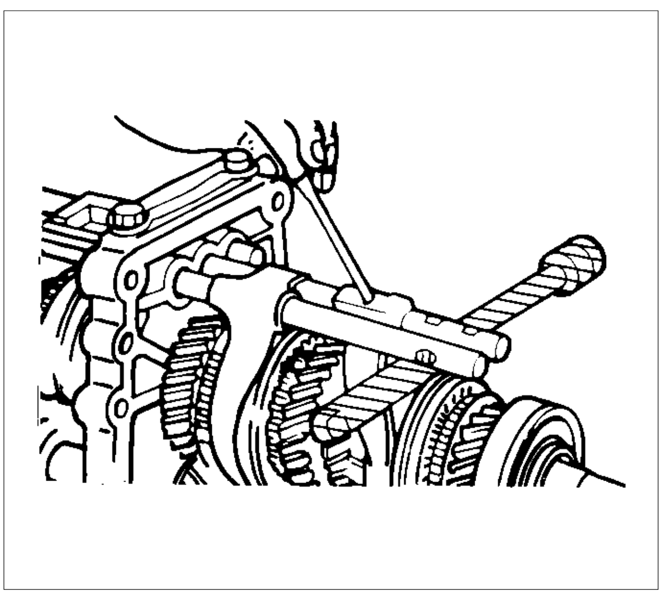
     Never reinstall the used spring pin.
   - Install the interlock pin in the intermediate plate.

     Do not allow the interlock pin to fall from the intermediate plate.
2. Install the 1st-2nd shift arm and 3rd-4th shift arm to the intermediate plate and gear assembly.
3. Install the 3rd-4th shift rod and 1st-2nd shift rod.
   - Install the interlock pin in the intermediate plate and gear assembly.
   - Install the 3rd-4th shift rod in the intermediate plate.

     Do not allow the interlock pin to fall from the intermediate plate.
   - Install the interlock pin and then 1st-2nd shift rod in the intermediate plate.

     Do not allow the interlock pin to fall from the intermediate plate.
   - Hold a round bar against the shift rod end lower face to protect it against damage.
   - Install a new spring pin.

     Never reinstall the used spring pin.



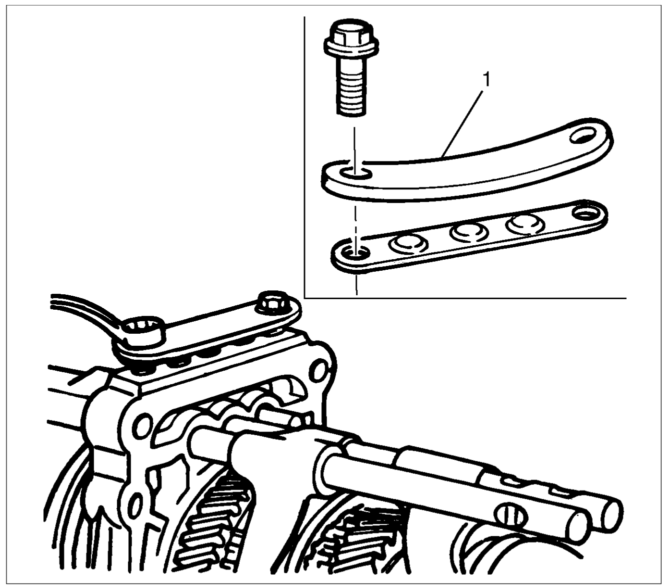
230RS007

4. Install the spring.
5. Put the detent balls in the intermediate plate holes.
   - Apply oil to the detent balls.
6. Install the detent springs and detent spring plate and gasket.

NOTE: For South Africa model, it has double detent spring for Rev-5th shift rod.

- Install a new gasket and the detent spring plate.
- Tighten the detent spring plate bolts to the specified torque.

Torque: 25 N·m (2.5 kgf·m/18 lb·ft)



220RS030

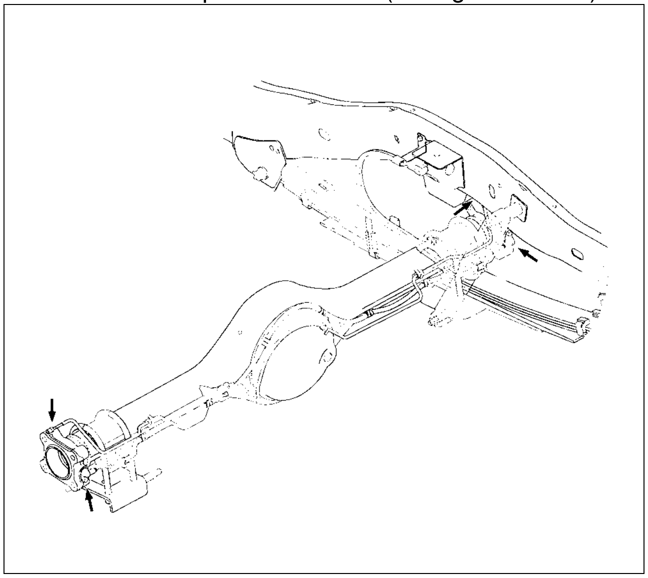
Legend

(1) Warped

17. Install brake pipe and ABS sensor and tighten it to the specified torque.

    Torque :

ABS Sensor	8 N·m (0.8 kgf·m/69 lb·in)
Brake Pipe	16 N·m (1.6 kgf·m/12 lb·ft)



420R30003

18. Bleed brake pipe at the wheel cylinder. (Refer to the section “Power-assisted Brake System”)
19. Install brake drum.
    - Install propeller shaft. (Refer to Section “Rear Propeller Shaft”.)
    - Refill differential oil.
    - Install wheel and tire.
    - Lower vehicle.

Reverse Gear and 5th Gear

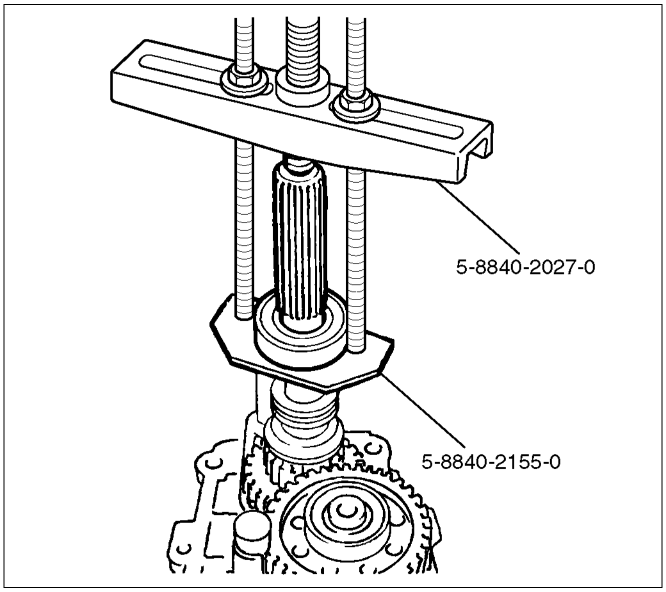
(23)	Mainshaft Nut	(28)	Bearing Plate and Screw
(24)	Rev-5th Synchronizer Assembly	(29)	Bearing Snap Ring
(25)	Reverse Block Ring	(30)	Intermediate Plate

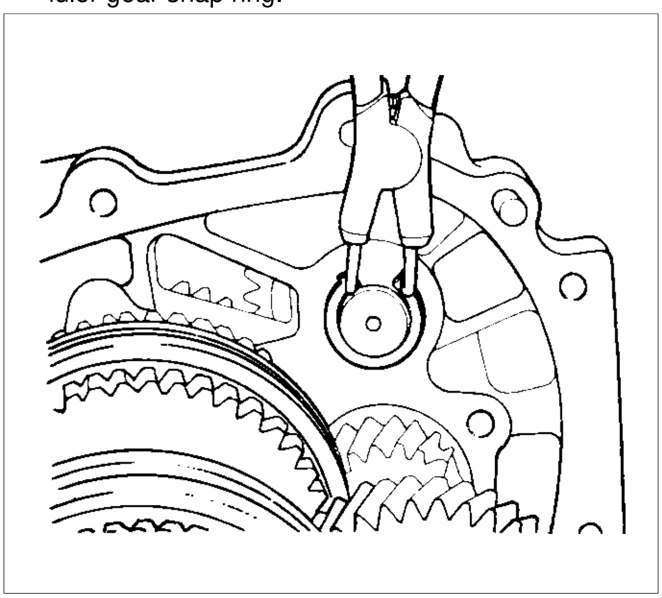
Disassembly

1. Use a pair of snap ring pliers to remove the bearing snap ring.
2. Set the bearing remover 5-8840-2155-0 and the puller 5-8840-2027-0 to the bearing and the mainshaft end, to remove the ball bearing.



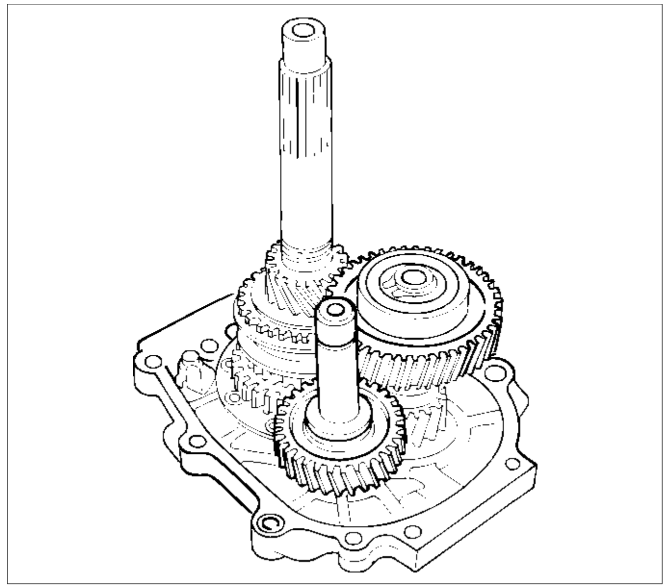
262L100001

3. Remove the bearing snap ring, clip, speedometer drive gear, retainer snap ring and the retainer.
4. Remove the thrust plate, thrust washer and lock ball.
5. Use a pair of snap ring pliers to remove the reverse idler gear snap ring.



226RS004

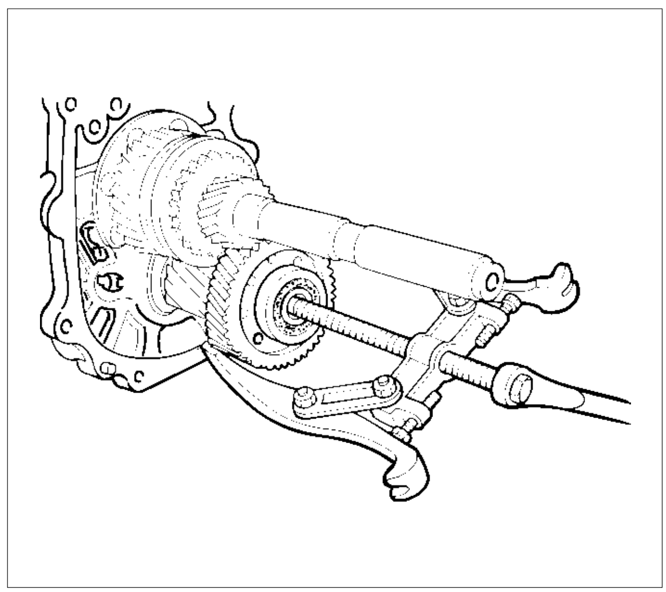
6. Remove the reverse idler gear assembly from the intermediate plate.



226RS005

7. Remove the idle shaft pin, thrust washer, reverse idler gear, and reverse idler shaft.
8. Use a pair of snap ring pliers to remove the snap ring.
9. Attach a universal puller to the counter gear shaft.

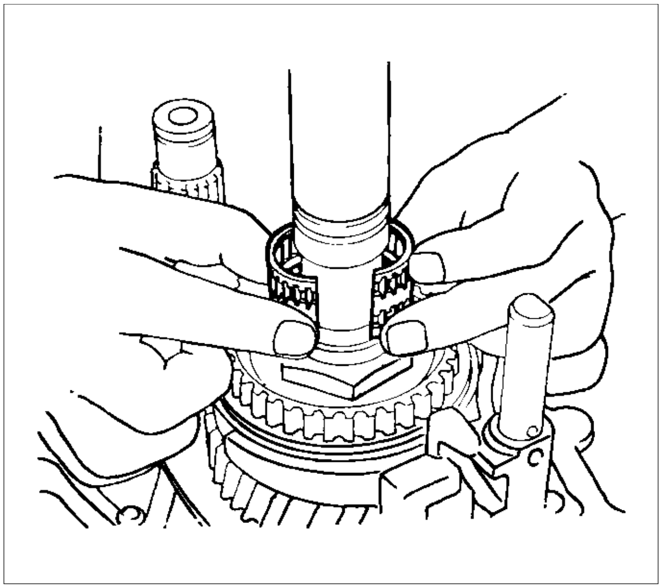
   Use a universal puller to remove the ball bearing and the counter 5th gear.



226RS006

10. Remove the counter reverse gear.

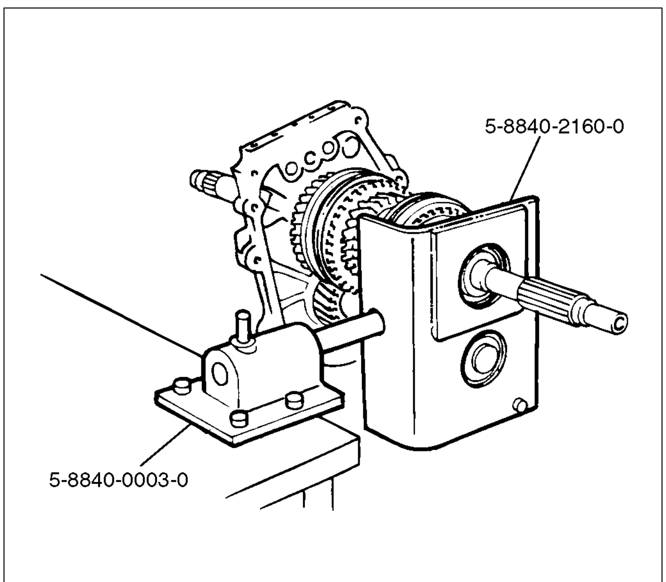
11. Remove the 5th gear, 5th block ring, and needle bearing (2 piece type).



226RS007

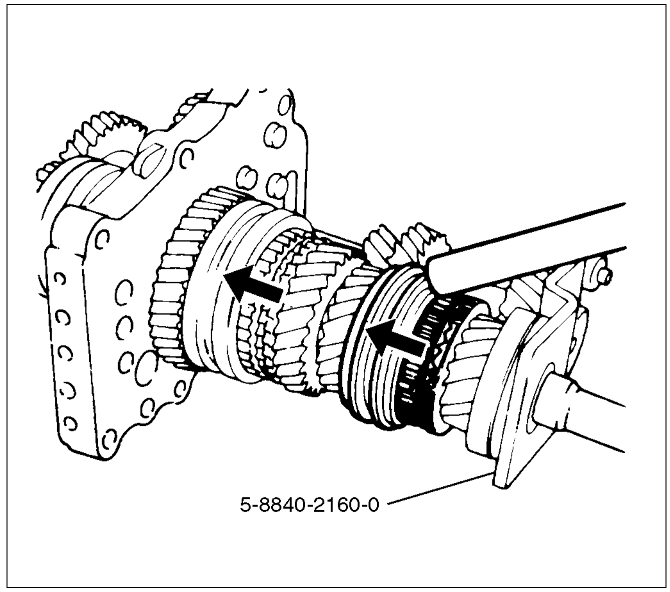
12. Remove the mainshaft nut according to following steps.

    Attach the holding fixture 5-8840-2160-0 and the base 5-8840-0003-0 to the mainshaft and the counter gear.



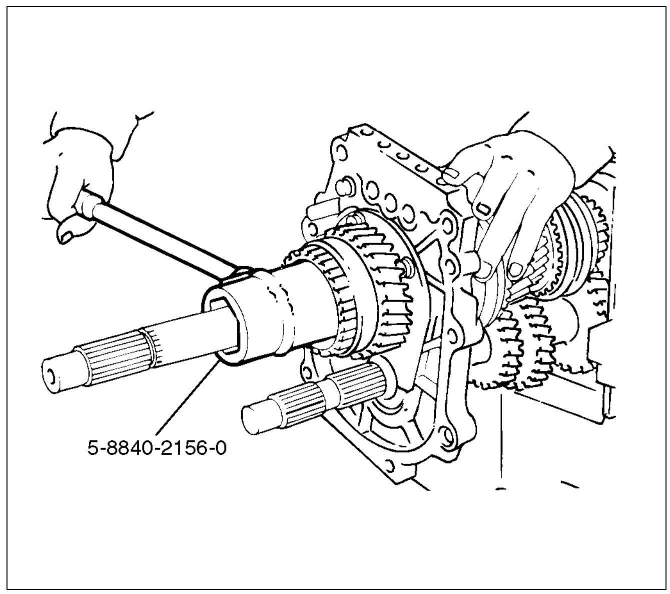
226RW212

- Engage the 3rd-4th synchronizer with the 3rd gear.
- Engage the 1st-2nd synchronizer with the 1st gear.



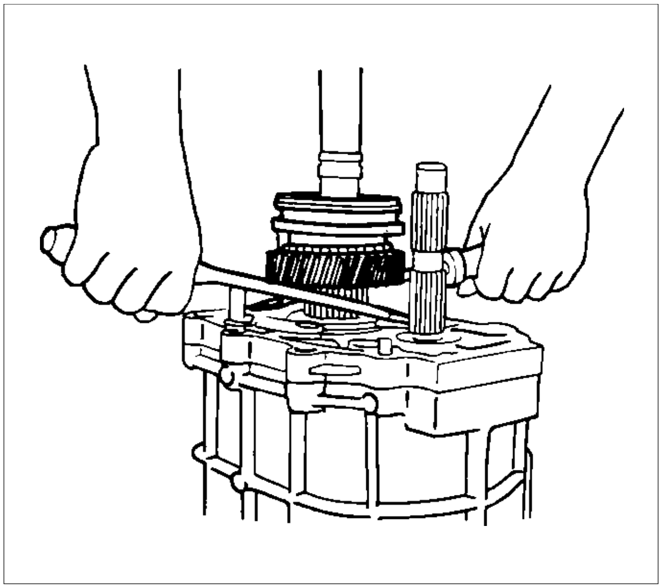
226RW210

- Use the mainshaft nut wrench 5-8840-2156-0 to remove the mainshaft nut.



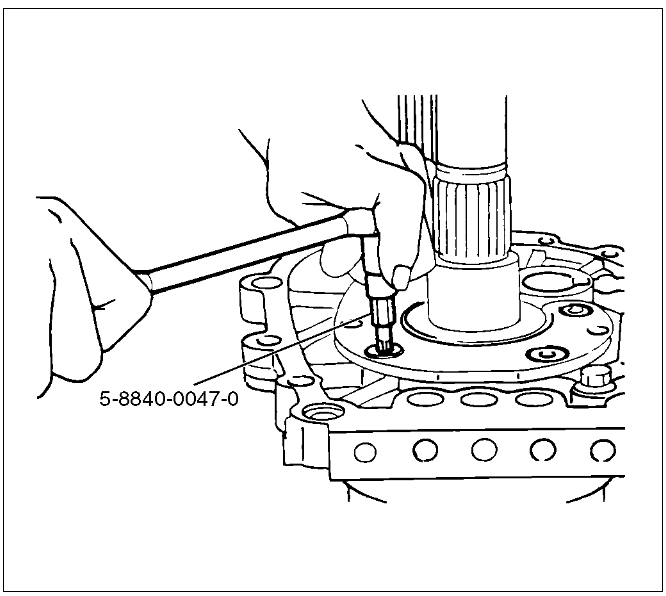
226RW211

13. Use screw drivers between the reverse gear and the bearing plate to remove the Rev-5th synchronizer assembly, together with the reverse block ring and reverse gear.



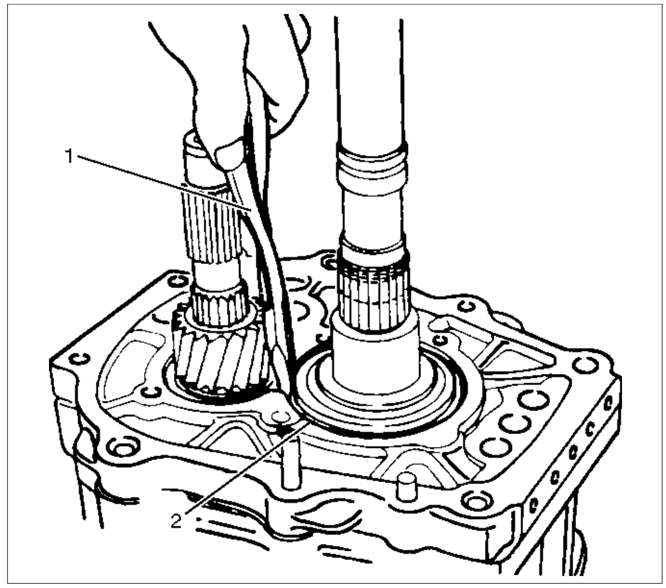
226RS010

14. Remove the needle bearing.
15. Use the torx bit wrench (T- 45) 5-8840-0047-0 to remove the bearing plate and screw from the intermediate plate.



220RW137

16. Use the snap ring pliers (1) to remove the mainshaft bearing snap ring (2).



226RS011

17. Hold the snap ring open with the pliers.

    Push the intermediate plate toward the rear of the transmission to remove it.

    The bearing snap ring will come free.

Inspection and Repair

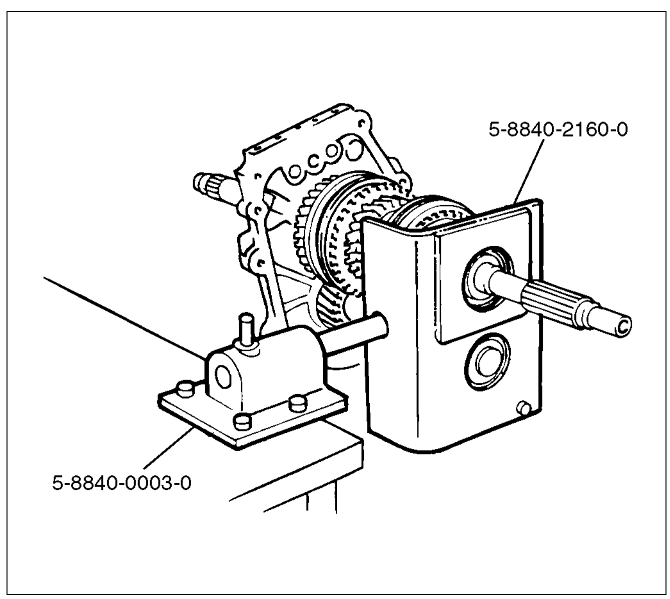
Refer to Top Gear Shaft, Main Gear Shaft, and Counter Gear in this section for inspection and repair.

Reassembly

1. Mesh the counter gear with the mainshaft assembly.

   Set the holding fixture 5-8840-2160-0 to the mainshaft and the counter gear, and then install it on the base 5-8840-0003-0.

   Install the intermediate plate on the gear assembly.



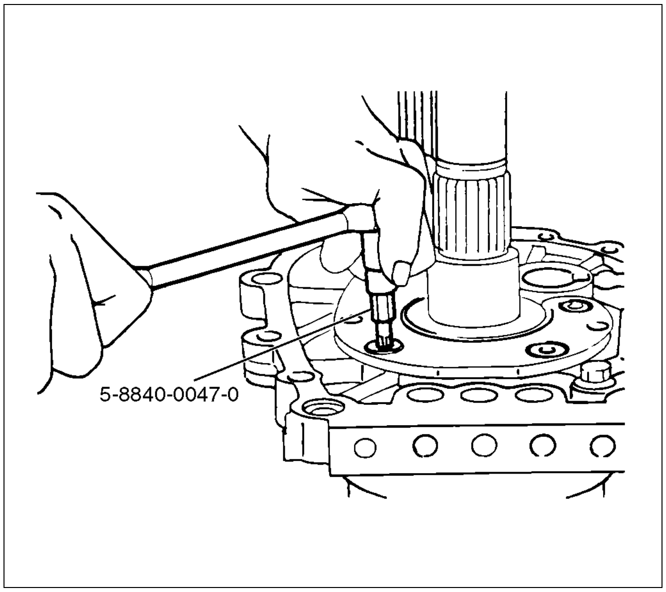
226RW212

2. Install the bearing snap ring.
3. Apply the recommended thread locking agents (LOCTITE 242) or its equivalent to each of the bearing plate screw threads.

   Install the bearing plate and screw.

   Tighten the screws to the specified torque by using torx bit wrench (T- 45) 5-8840-0047-0.

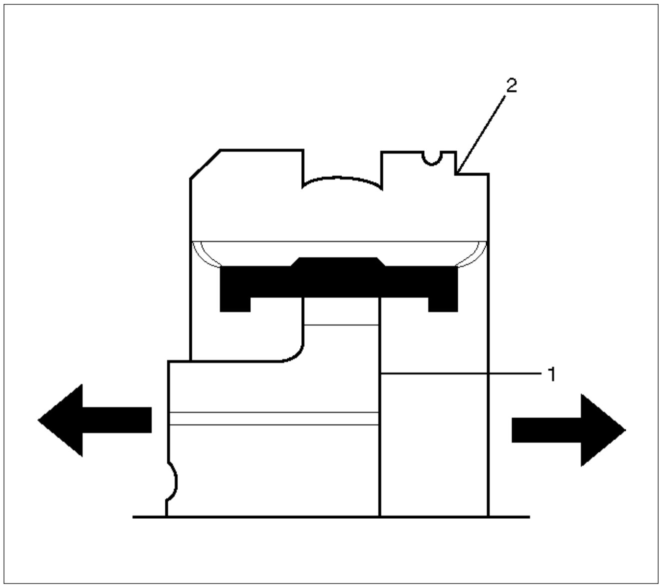
   Torque: 15 N·m (1.5 kgf·m/11 lb·ft)



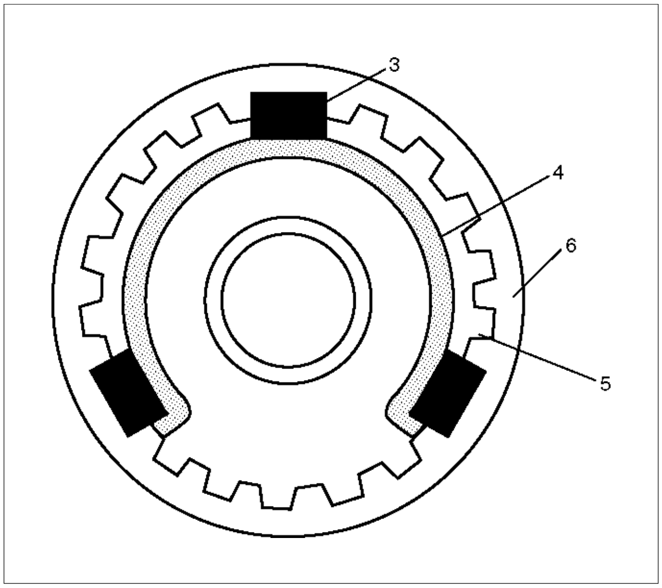
220RW137

4. Install the needle bearing, reverse gear, and reverse block ring.
5. Assemble rev-5th synchronizer assembly by performing the following steps.
   1. Turn the clutch hub face (1) toward the sleeve groove (2) (rear side) on the outer circumference.
   2. Check that the inserts (3) fit snugly into the clutch hub (5) ring insert grooves.
   3. Check that the inserts springs (4) are fitted to the inserts as shown in the illustration.
   4. Check that the clutch hub (5) and the sleeve (6) slide smoothly.
   5. Install the synchronizer assembly to the mainshaft.

   The clutch hub face with the heavy boss must be facing the reverse gear side.

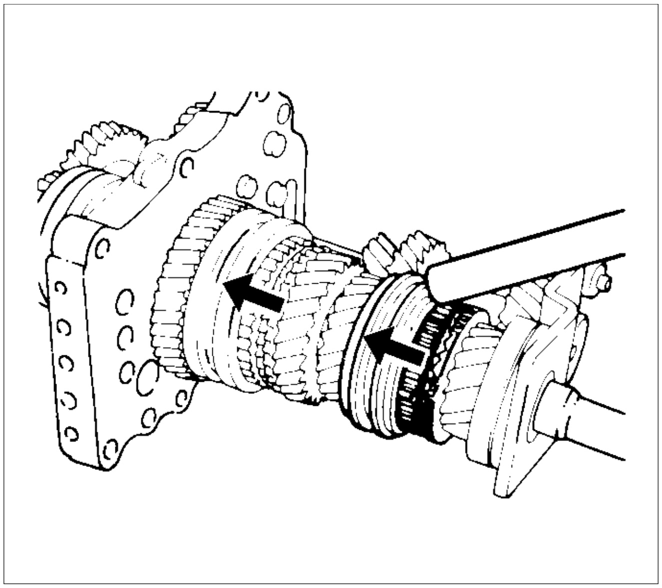


226RS013



226RS049

6. Mesh the 1st-2nd and 3rd-4th synchronizers with both the 1st and 3rd gears (double engagement).



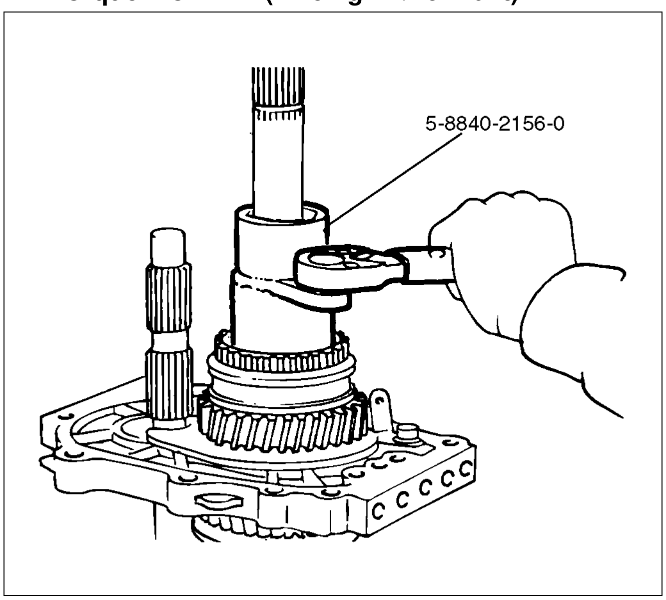
226RS015

This will prevent the mainshaft from turning.

7. Install the new mainshaft hub nut.

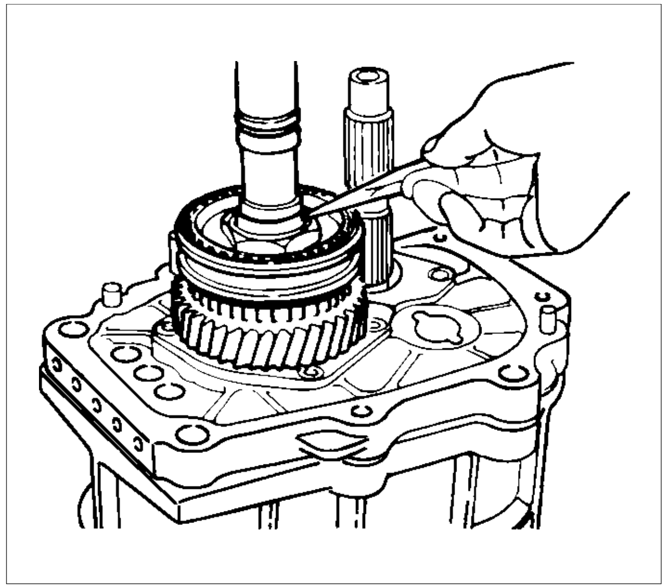
Use the mainshaft nut wrench 5-8840-2156-0 to tighten the mainshaft nut to the specified torque.

Torque: 137 N·m (14.0 kgf·m/101 lb·ft)



226RW214

8. Use a punch to stake the mainshaft nut.

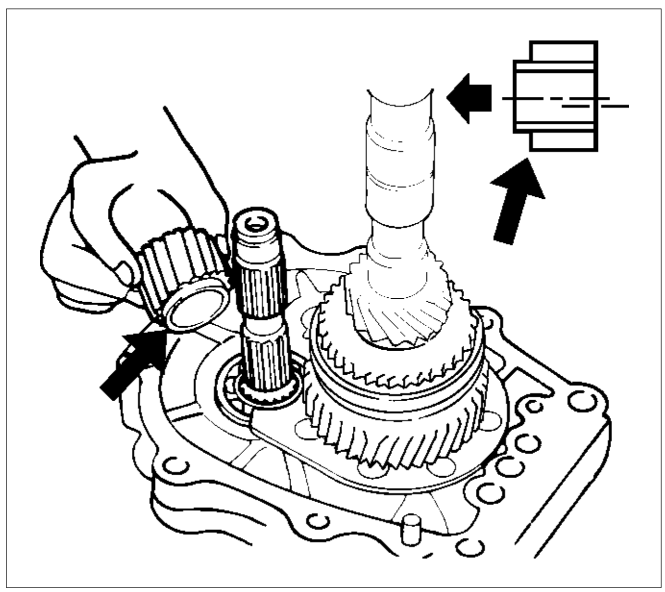


226RW153

9. Install the needle bearing, 5th block ring, and 5th gear.
10. Apply engine oil to the counter reverse gear and the reverse gear.

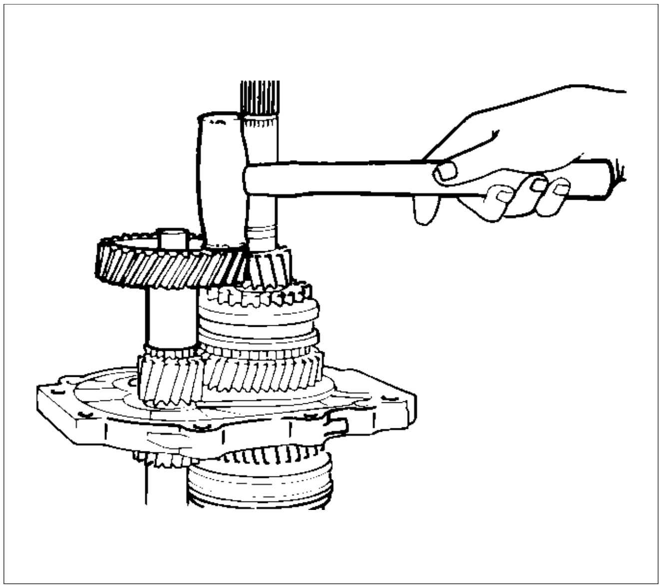
Install the counter reverse gear to the counter shaft.

The reverse gear projection must be facing the intermediate plate.



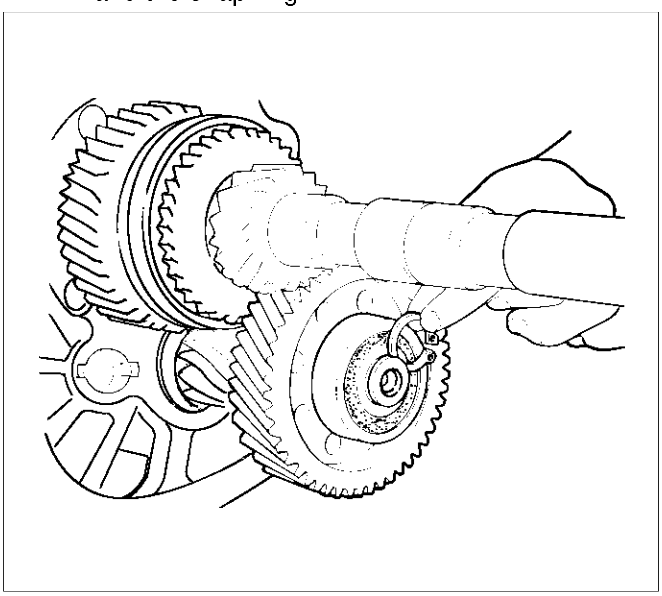
226RW151

11. Install the counter 5th gear to the counter shaft.



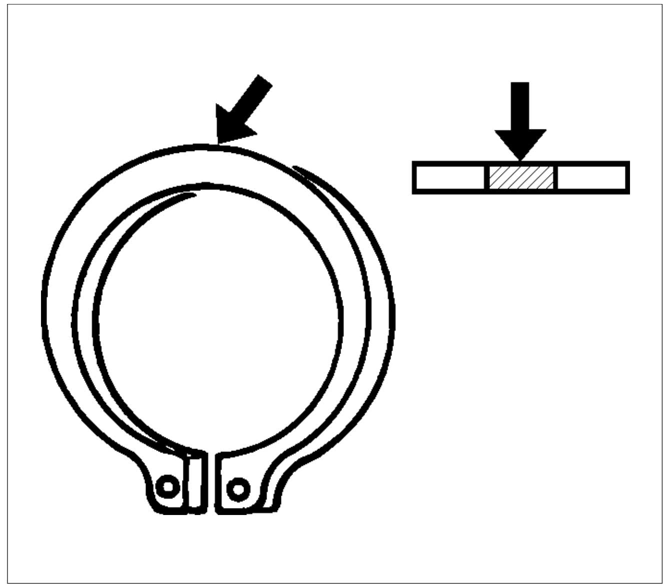
226RS019

12. Install the ball bearing and bearing snap ring by performing the following steps:
    - Select the snap ring which will provide the minimum clearance between the ball bearing and the snap ring.



226RS020

- There are six snap ring sizes available.
  The snap rings are color‐coded to indicate their thickness.



226RS021

Ball Bearing and Snap Ring Clearance

Standard: 0 - 0.15 mm (0 - 0.0059 in)

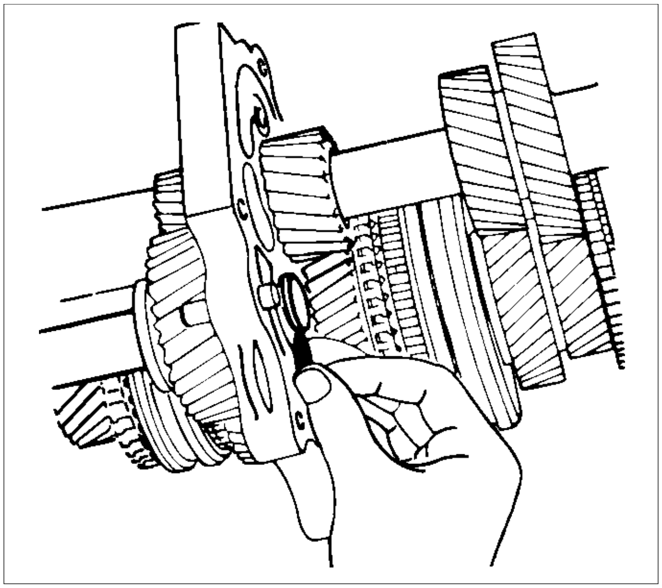
Snap Ring Availability

Thickness	Color Coding
1.1 mm (0.043 in)	White
1.2 mm (0.047 in)	Yellow
1.3 mm (0.051 in)	Blue
1.4 mm (0.055 in)	Pink
1.5 mm (0.059 in)	Green
1.6 mm (0.063 in)	Brown

- Use a pair of snap ring pliers to install the snap ring to the counter gear shaft.
  The snap ring must be fully inserted into the counter gear shaft snap ring groove.

13. Assemble the reverse idler shaft, reverse idler gear, thrust washer, and idle shaft pin into the reverse idler gear assembly.
    The thrust washer should be assembled with the oil groove faces to gear side.

14. Select the reverse idler gear snap ring which will provide the minimum clearance between the intermediate plate and the snap ring.



226RS022

- There are three snap ring sizes available.

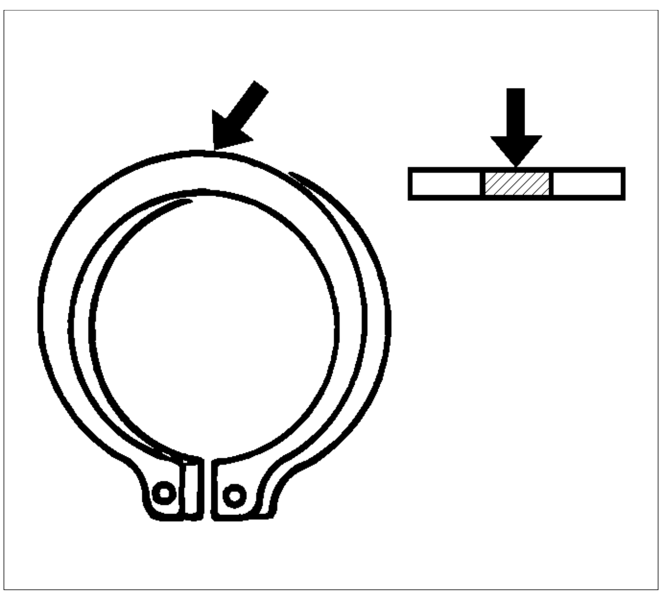
  The snap rings are color-coded to indicate their thickness.

Intermediate Plate and Snap Ring Clearance

Standard: 0 - 0.15 mm (0 - 0.0059 in)

Snap Ring Availability

Thickness	Color Coding
1.2 mm (0.047 in)	White
1.3 mm (0.051 in)	Yellow
1.4 mm (0.055 in)	Blue



226RS021

- Use a pair of snap ring pliers to install the snap ring to the reverse idler shaft.

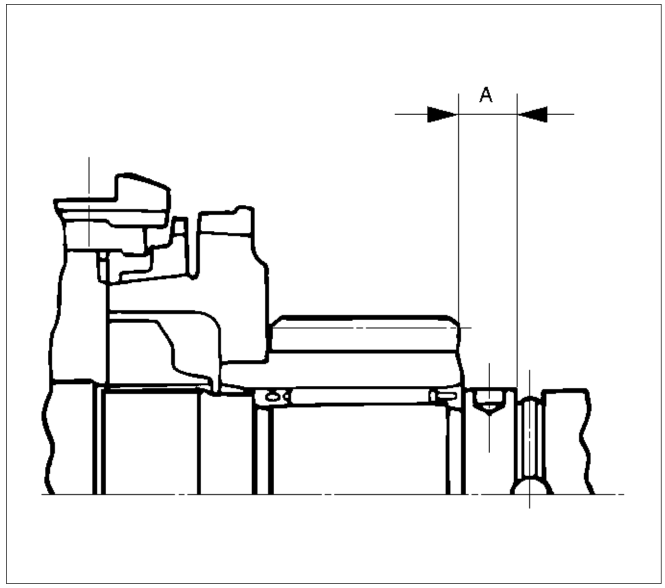
  The snap ring must be fully inserted into the reverse idler shaft snap ring groove.

15. Install the thrust washer and lock ball by performing the following steps:
    - Use a thickness gauge to measure the clearance between the 5th gear and the thrust washer.

5th Gear and Thrust Washer Clearance

Standard: 0.10 - 0.25 mm (0.004 - 0.010 in)

- Measure clearance "A" as shown in the figure.



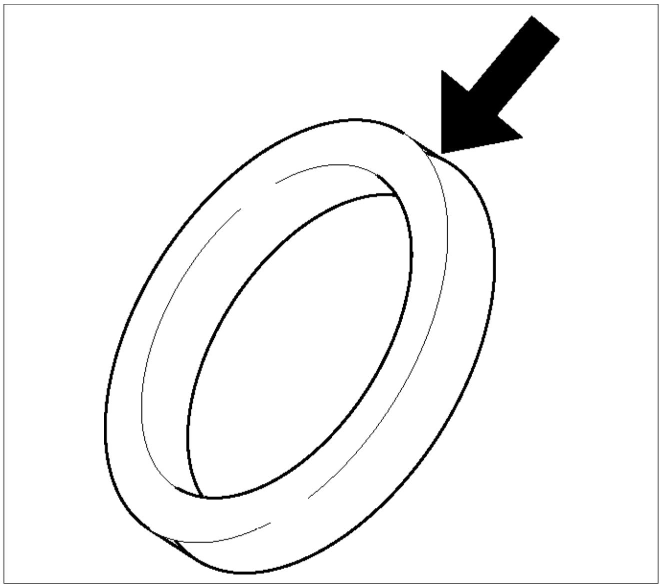
226RS023

- Select an appropriate thrust washer from the chart.
- There are four thrust washer sizes available.

Thrust Washer Availability

Thickness mm (in)	Color Coding	A mm (in)	Clearance mm (in)
7.9 (0.311)	White	8.05 - 8.1 (0.317-0.319)	0.15 - 0.25 (0.006-0.010)
8.0 (0.315)	Yellow	8.1 - 8.2 (0.319-0.323)	0.1 - 0.25 (0.004-0.010)
8.1 (0.319)	Green	8.2 - 8.3 (0.323-0.327)	0.1 - 0.25 (0.004-0.010)
8.2 (0.323)	Blue	8.3 - 8.36 (0.327-0.329)	0.1 - 0.21 (0.004-0.008)

- The thrust washers are color-coded to indicate their thickness, as shown in the figure.

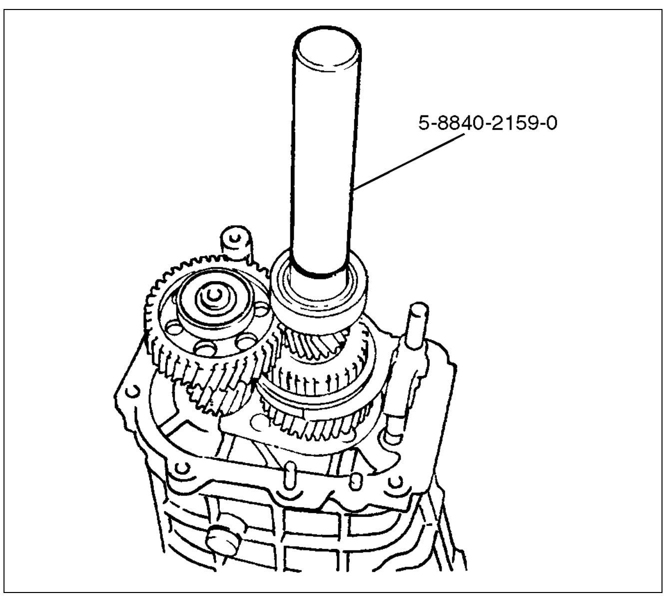


226RS024

- Apply grease to the thrust washer and the lock ball.
- Install the thrust washer and the lock ball.

16. Install the thrust plate and retainer.
17. Install the retainer snap ring, clip, speedometer drive gear and bearing snap ring.
18. Apply engine oil to the bearing inner and outer circumference.

    Use the installer 5-8840-2159-0 to install the ball bearing to the mainshaft.



226L100002

19. Install the bearing snap ring.

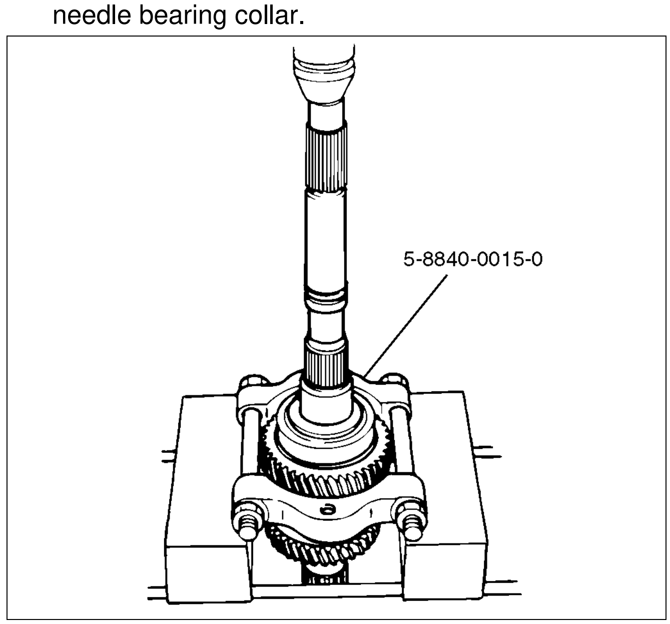
(3) Clutch Hub
(4) Inserts

7. Remove the 3rd block ring, 3rd gear, and needle bearing.
8. Use a bench press and the bearing remover 5-8840-0015-0 to remove the 1st gear together with the mainshaft ball bearing, 1st gear thrust bearing, and needle bearing collar.

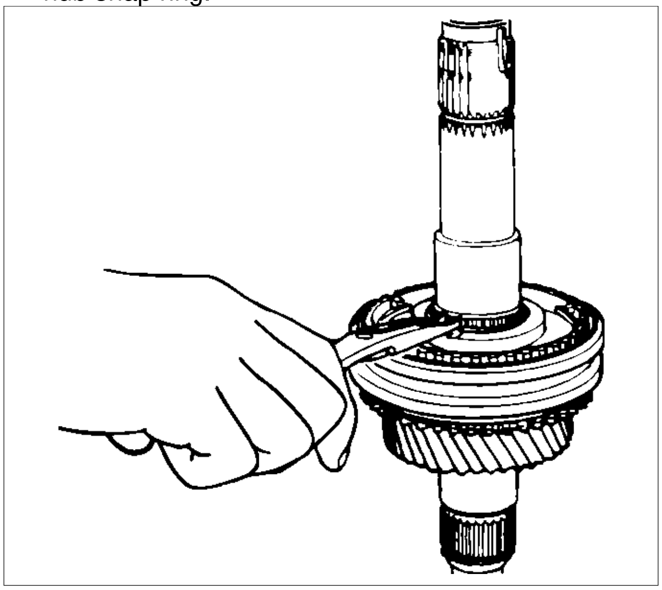


226RW218

9.Disassemble the 1st inside ring, 1st outside ring, and 1st block ring.

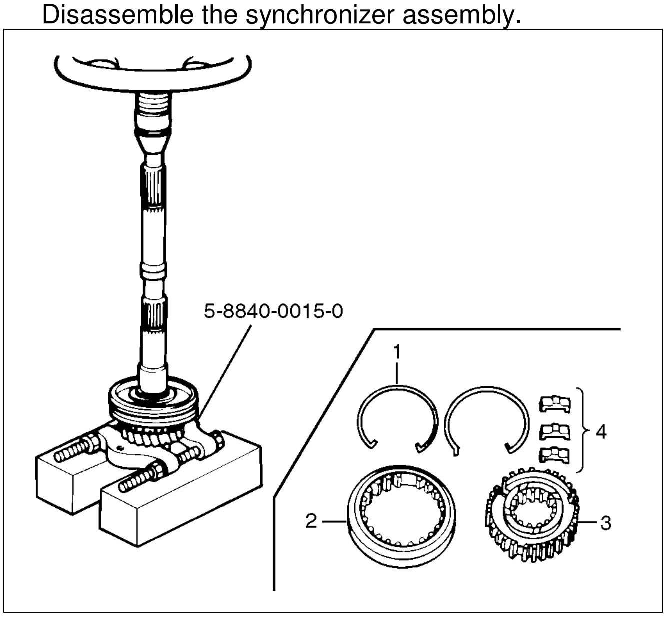
10.Remove the needle bearing.

11.Use a pair of snap ring pliers to remove the clutch hub snap ring.



226RS031

12.Use the bench press and the bearing remover 5-8840-0015-0 to remove the 2nd gear together with the 1st-2nd synchronizer assembly, 2nd block ring, 2nd outside ring, and the inside ring.
Disassemble the synchronizer assembly.

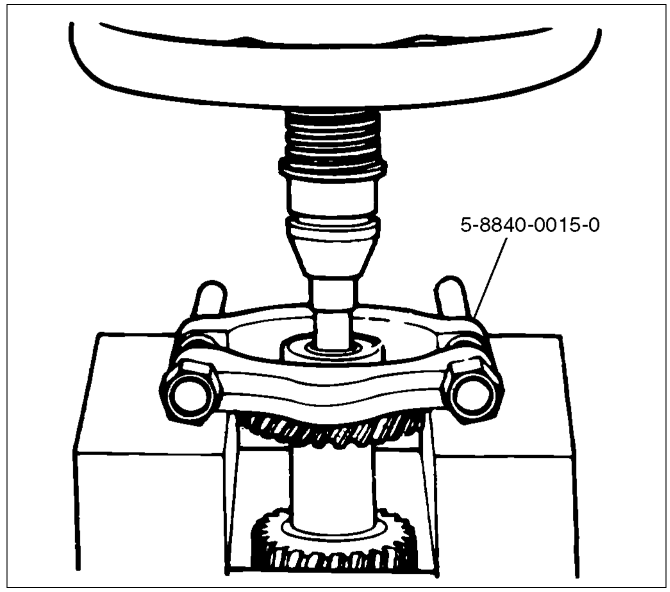


226RW220

Legend

(1) Springs
(2) Sleeve
(3) Clutch Hub
(4) Inserts

13. Remove the needle bearing from mainshaft.
14. Remove the bearing snap ring.
15. Remove the front roller bearing by performing the following steps.
    - Remove the ring, outer race and bearing assembly by using a bench press and remover 5-8840-0015-0.
    - Remove the inner race by using a bench press and remover 5-8840-0015-0.



226RW219

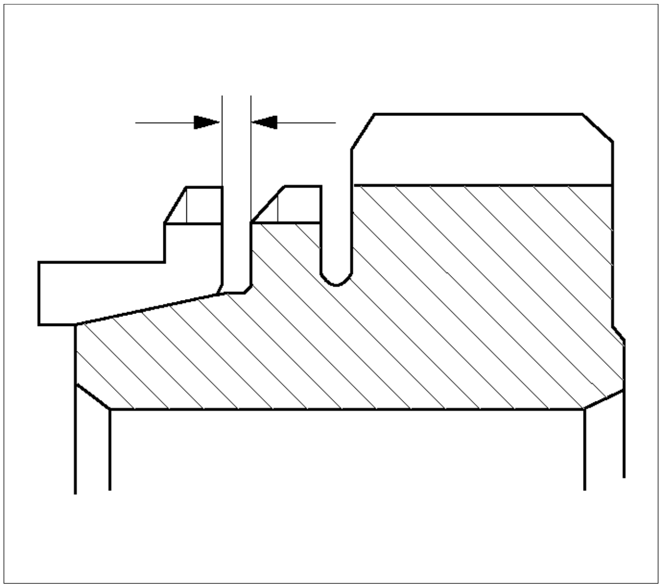
16. Remove the center roller bearing from the counter gear shaft.

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Block Ring and Dog Teeth Clearance

- Use a thickness gauge to measure the clearance between the block ring and the dog teeth.



226RS035

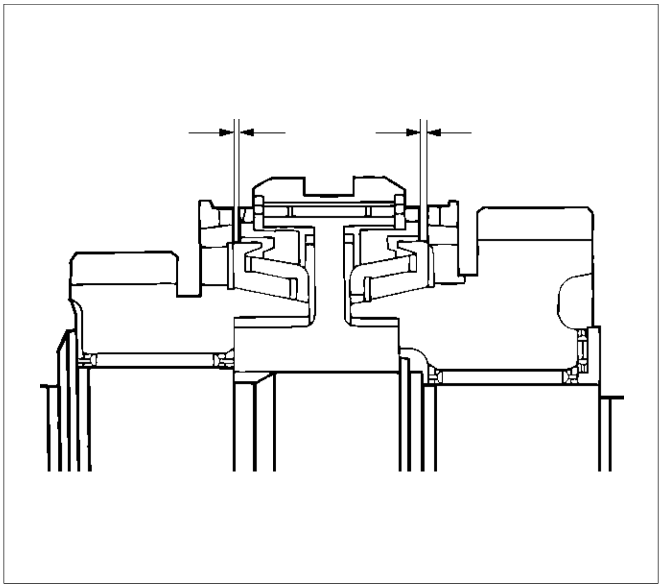
If the measured value exceeds the specified limit, the block ring must be replaced.

Block Ring and Dog Teeth Clearance

Standard	Limit
1.5 mm (0.059 in)	0.8 mm (0.031 in)

1st-2nd Synchronizer (3-CONE)

- Use a thickness gauge to measure the clearance between the block ring and the dog teeth.



226RS036

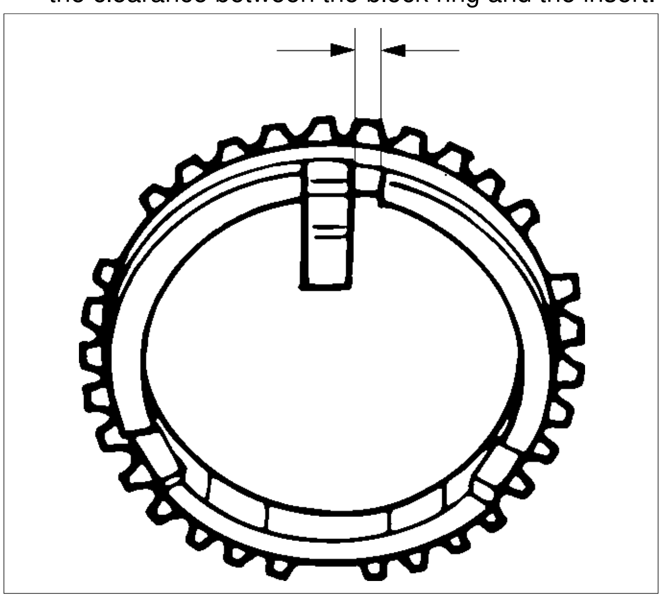
If the measured value exceeds the specified limit, the 1st-2nd synchronizer assembly must be replaced.

Block Ring and Dog Teeth Clearance

Standard	Limit
1.5 mm (0.059 in)	0.8 mm (0.031 in)

Block Ring and Insert Clearance

- Use a vernier caliper or thickness gauge to measure the clearance between the block ring and the insert.



226RS037

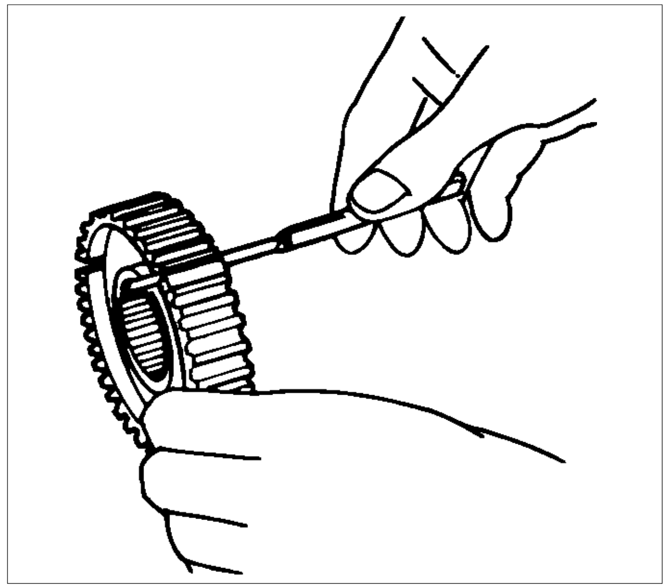
If the measured value exceeds the specified limit, the block ring and the insert must be replaced.

Block and Insert Clearance

	Standard	Limit
3rd-4th	3.46 - 3.76 mm (0.136 - 0.148 in)	4.0 mm (0.157 in)
1st-2nd	3.86 – 4.16 mm (0.152 - 0.164 in)	4.9 mm (0.193 in)
Rev.5th	3.59 - 3.91 mm (0.141 - 0.154 in)	4.1 mm (0.161 in)

Clutch Hub and Insert Clearance

- Use a thickness gauge to measure the clearance between the clutch hub and the insert.



226RS038

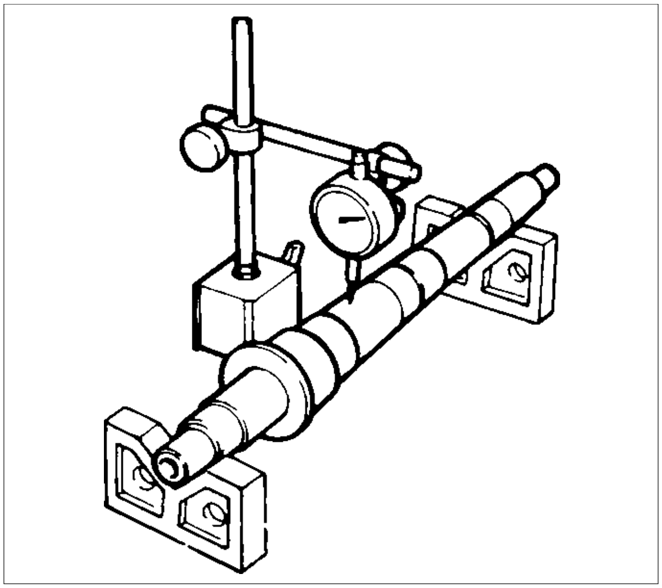
If the measured value exceeds the specified limit, the clutch hub and the insert must be replaced.

Clutch Hub and Insert Clearance

	Standard	Limit
1st-2nd 3rd-4th	0.01 – 0.21 mm (0.0004 - 0.0083 in)	0.3 mm (0.012 in)
Rev-5th	0.09 – 0.31 mm (0.0035 - 0.0122 in)	0.4 mm (0.016 in)

Mainshaft Run-out

- Install the mainshaft to V-blocks.
- Use a dial indicator to measure the mainshaft central portion run-out.



226RS039

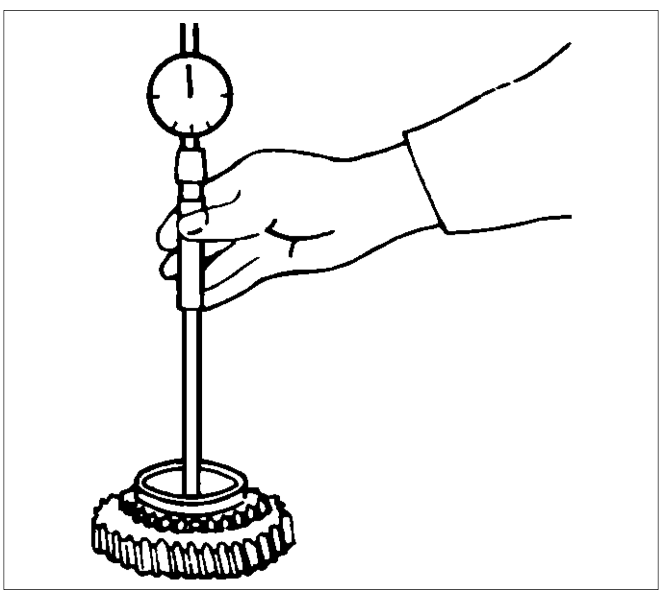
If the measured mainshaft run-out exceeds the specified limit, the mainshaft must be replaced.

Mainshaft Run-out

Limit: 0.05 mm (0.0020 in)

Gear Inside Diameter

- Use an inside dial indicator to measure the gear inside diameter.



226RS040

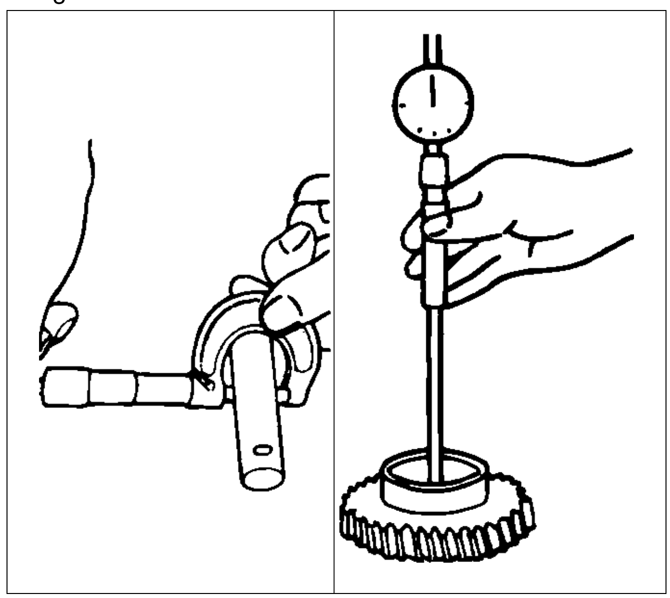
If the measured value is less than the specified limit, the gear must be replaced.

Gear Inside Diameter

	Standard	Limit
1st 3rd	45.000 - 45.013 mm (1.771 - 1.772 in)	45.100 mm (1.776 in)
2nd	52.000 - 52.013 mm (2.047 - 2.048 in)	52.100 mm (2.051 in)
Rev.	48.000 - 48.013 mm (1.889 - 1.890 in)	48.100 mm (1.894 in)
5th	32.000 - 32.013 mm (1.259 - 1.260 in)	32.100 mm (1.246 in)

Reverse Idler Gear and Idler Gear Shaft Clearance

- Use a micrometer to measure the idler gear shaft diameter.
- Use an inside dial indicator to measure the idler gear inside diameter.



226RS041

- Calculate the idler gear and idler gear shaft clearance.

  Idler gear inside diameter-idler gear shaft diameter = idle gear and idler gear shaft clearance.

  If the measured value exceeds the specified limit, the idle gear and/or the idler gear shaft must be replaced

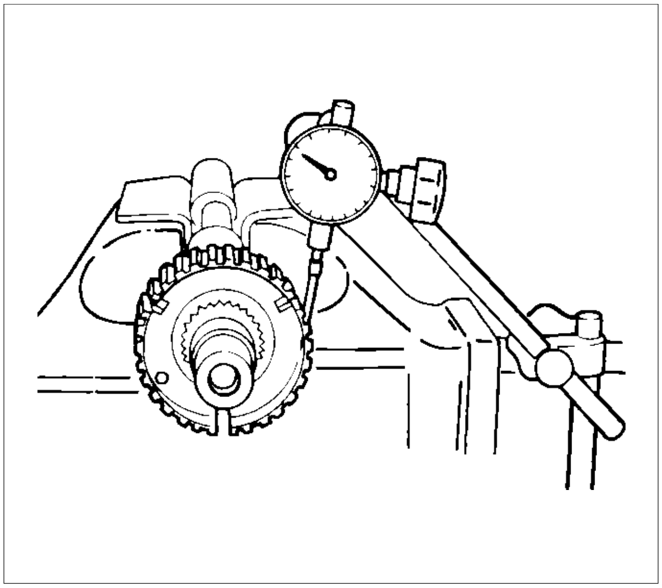
  Idler Gear and Idler Gear Shaft Clearance

  Standard: 0.041 - 0.074 mm (0.0016 -0.0029 in)

  Limit: 0.150 mm (0.0059 in)

Clutch Hub Spline Play

- Set a dial indicator to the clutch hub which requires measuring.



226RS042

- Move the clutch hub as far to the right and left as possible.

  Note the dial indicator reading.

  If the measured value exceeds the specified limit, the clutch hub must be replaced.

Clutch Hub Spline Play

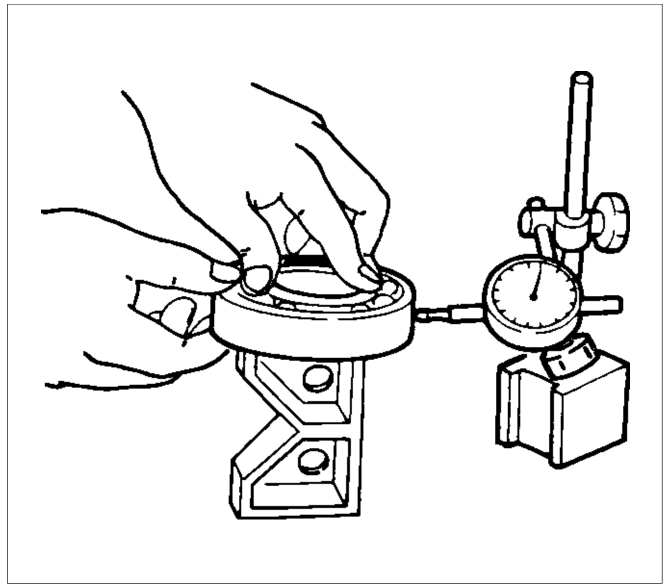
	Standard	Limit
1st-2nd 3rd-4th	0 - 0.1 mm (0 - 0.004 in)	0.2 mm (0.008 in)
Rev. 5th	0 - 0.2 mm (0 - 0.008 in)	0.3 mm (0.012 in)

Ball Bearing Play

- Use a dial indicator to measure the ball bearing play.

  Ball Bearing Play

  Limit: 0.2 mm (0.008 in)

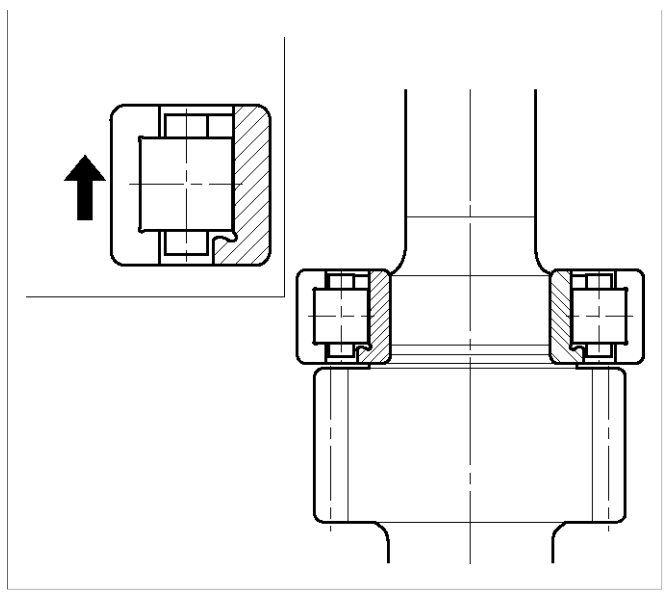


226RS043

Reassembly

1. Install the center roller bearing to counter gear shaft.
   - Apply engine oil to the bearing inner and outer circumferences.
   - Install the roller bearing in the proper direction.

NOTE: Check that the outer race moves only in the direction of the arrow.

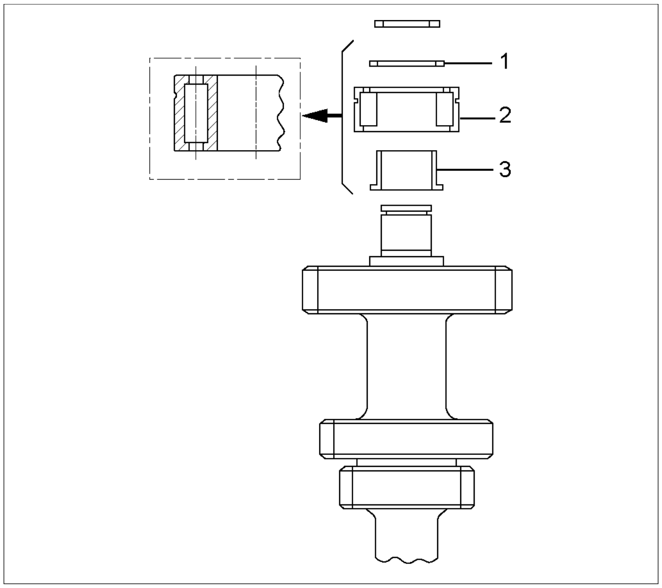


226RS044

2. Install the front roller bearing by performing the following steps.
   - Use bearing installer 5-8840-2194-0 to install the front roller bearing inner race to the counter gear shaft.
   - Install the outer race and roller assembly.

     The snap ring groove must be facing the transmission front side.

- Use bearing installer 5-8840-2194-0 to install the ring.



RTW57BSH000101

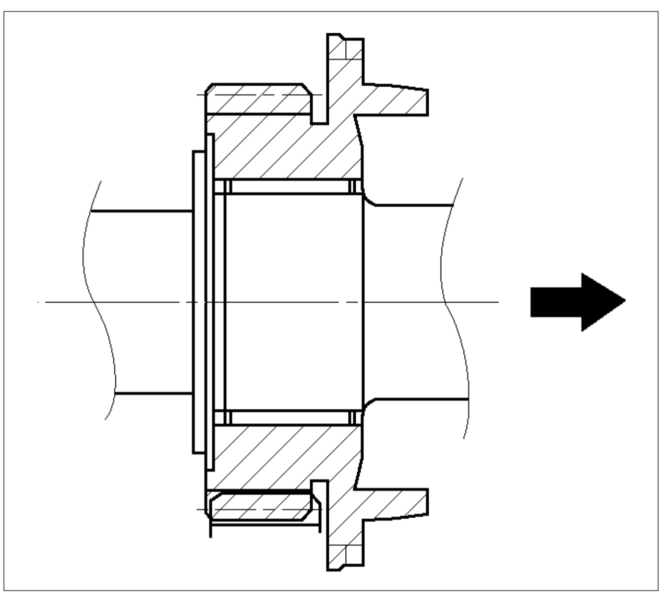
Legend

(1) Ring
(2) Outer Race and Roller Assembly
(3) Inner Race

3. Install the bearing snap ring to the counter gear shaft.
4. Apply engine oil to the needle bearing and the 2nd gear thrust surfaces.

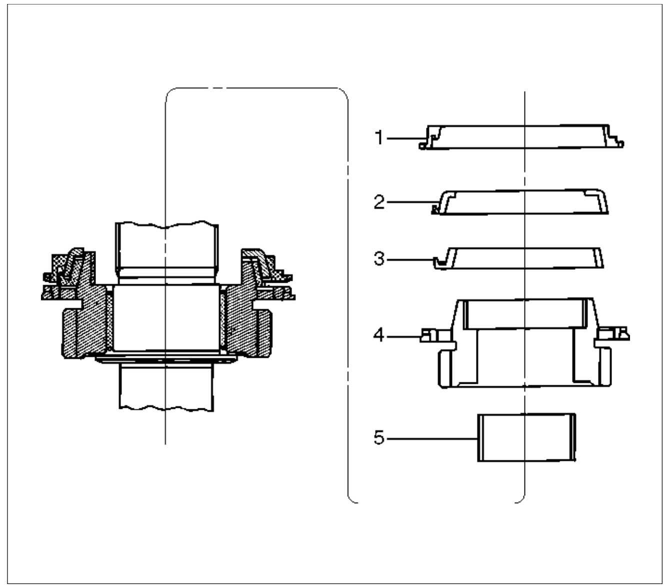
   Install the needle bearing and the 2nd gear to the mainshaft.

   The 2nd gear dog teeth must be facing the transmission rear side.



226RS046

5. Assemble the 2nd inside ring, 2nd outside ring, and 2nd block ring on the 2nd gear.
   - Apply engine oil to the synchronizer ring friction surfaces.

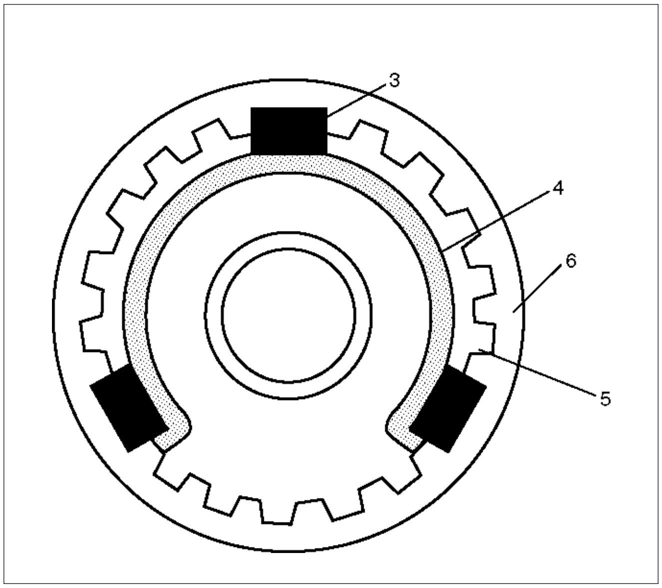


226RS047

Legend

(1) Block Ring
(2) Outside Ring
(3) Inside Ring
(4) 2nd Gear
(5) Needle Bearing

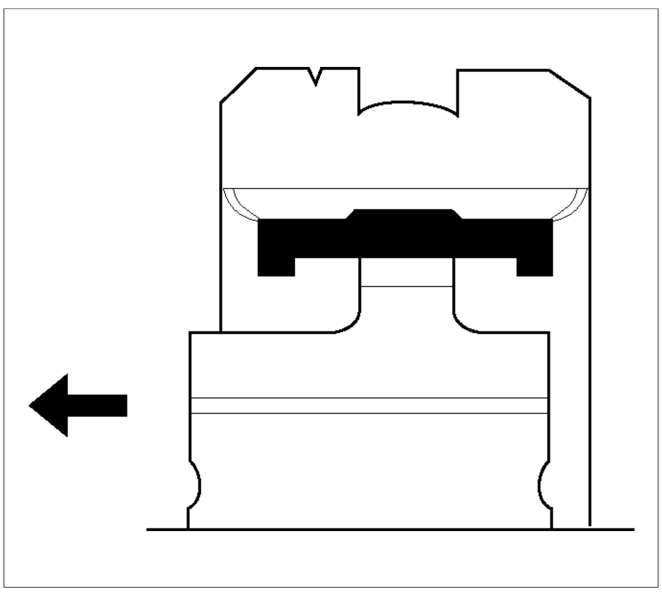
6. Assemble 1st-2nd synchronizer assembly by performing the following steps:
   1. Check that the inserts (3) fit snugly into the clutch hub (5) insert grooves.
   2. Check that the inserts springs (4) are fitted to the inserts as shown in the illustration.
   3. Check that the clutch hub (5) and the sleeve (6) slide smoothly.



266RS049

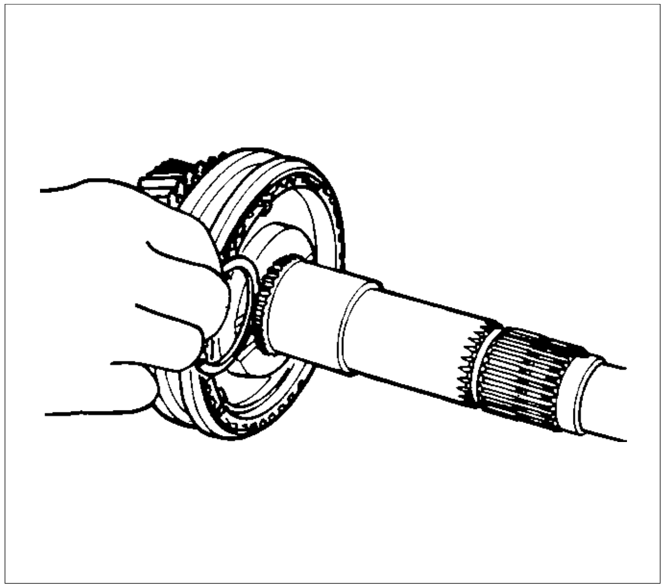
7. Install the synchronizer assembly to the mainshaft.

   The clutch hub face with the heavy boss must be facing the 2nd gear side.



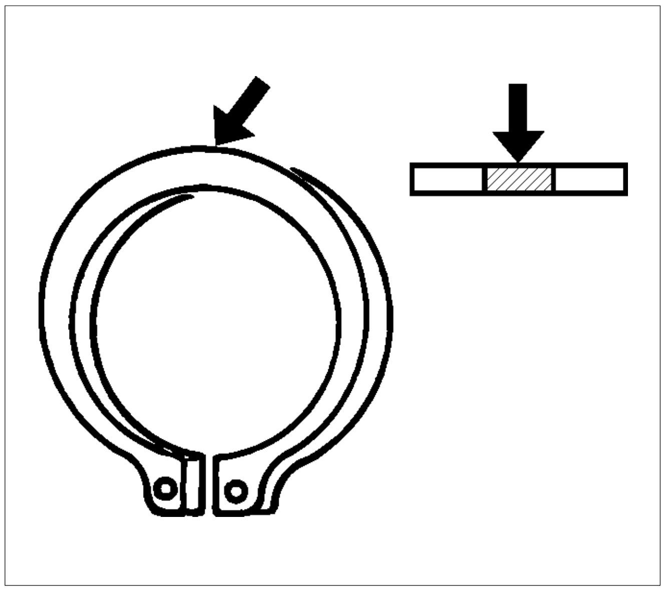
226RS048

8. Install the clutch hub snap ring by performing the following steps:
   - Select the snap ring which will provide the minimum clearance between the 1st-2nd clutch hub and the snap ring.



226RS050

- There are three snap ring sizes available.
- The snap rings are color-coded to indicate their thickness as shown in the figure.



226RS021

Clutch Hub and Snap Ring Clearance

Standard: 0 - 0.1 mm (0 - 0.004 in)

Snap Ring Availability

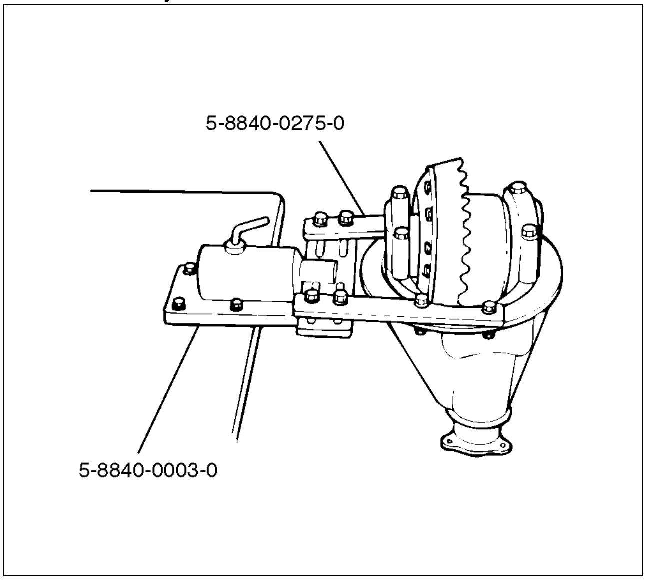
Thickness	Color Coding
1.80 mm (0.071 in)	White
1.85 mm (0.073 in)	Yellow
1.90 mm (0.075 in)	Blue

- Use a pair of snap ring pliers to install the snap ring to the mainshaft.

  The snap ring must be fully inserted into the mainshaft snap ring groove.

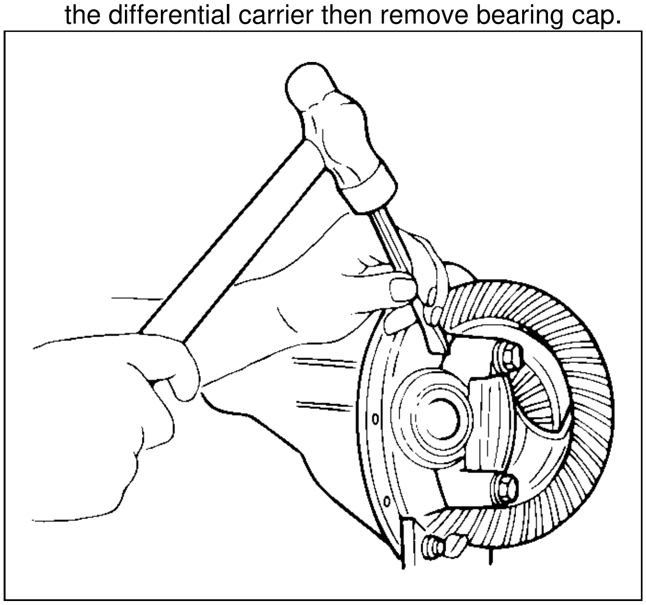
Disassembly

1. Using holding fixture 5-8840-0275-0 and holding fixture base 5-8840-0003-0, fix the differential assembly to the bench.



425L100007

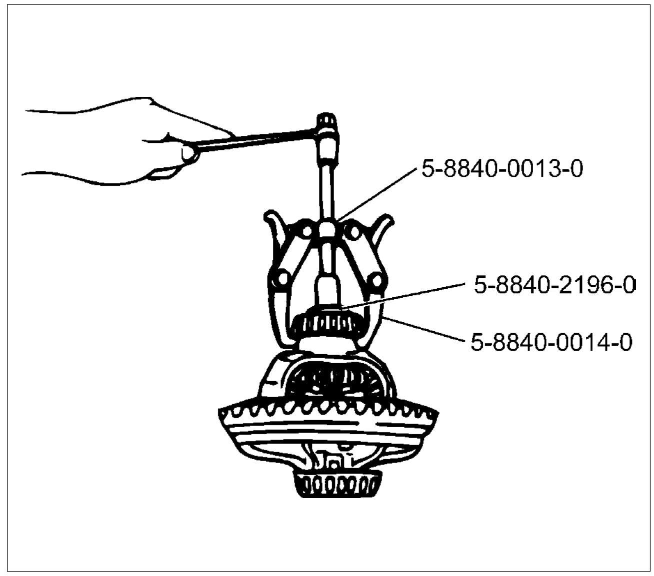
2. Apply a setting mark to the side bearing cap and the differential carrier then remove bearing cap.



425RS009

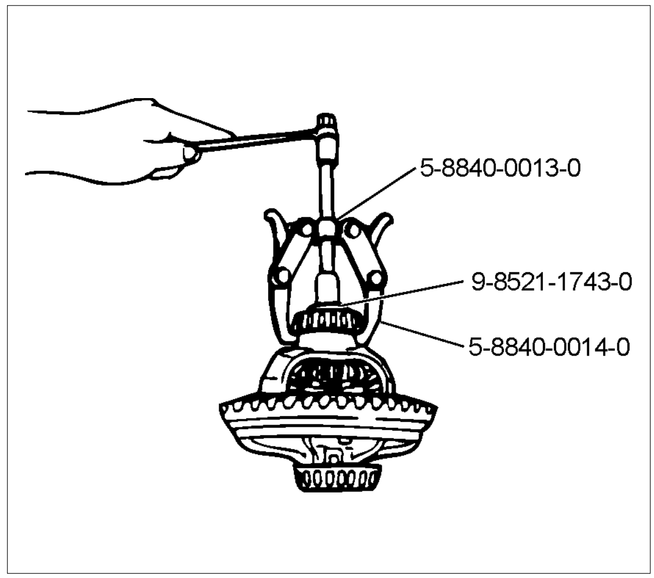
3. Remove differential cage assembly.
4. Remove side bearing outer race. After removal, keep the right and left hand side bearing assemblies separate to maintain inner and outer race combinations.
5. Remove side bearing by using remover 5-8840-0013-0, 5-8840-0014-0, adapter 5-8840-2196-0 (for ϕ220mm) and 9-8521-1743-0 (for ϕ194mm).

ϕ220mm



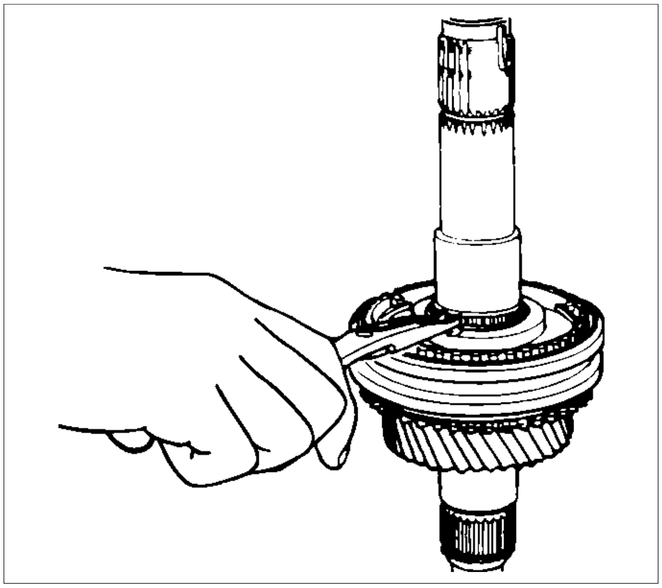
RTW54BSH000101

ϕ194mm



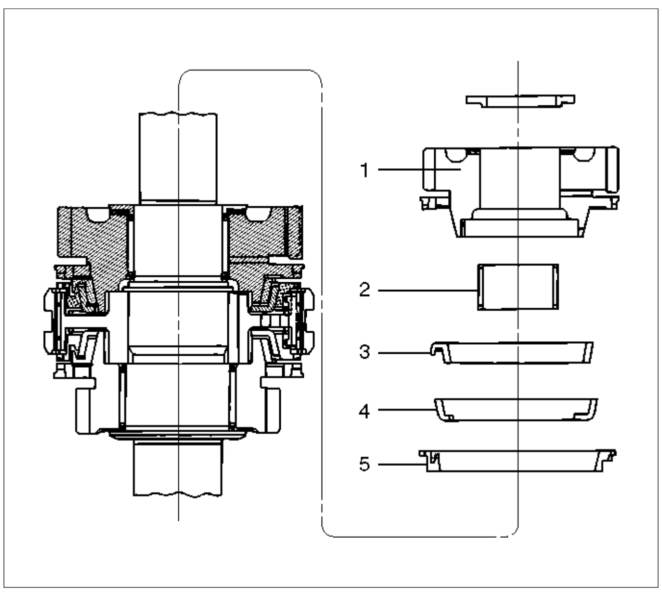
RTW54BSH000201

6. Note the thickness and position of the shims then remove adjust shim.
7. Remove the flange nut by using pinion flange holder 5-8840-0133-0 after raising up its staked parts completely.



226RS031

9. Install the needle bearing, 1st block ring, 1st outside ring , 1st inside ring, and 1st gear.
   - Apply engine oil to the needle bearing, 1st gear thrust surfaces and synchronizer ring friction surfaces.
   - The 1st gear dog teeth must be facing the transmission front side.



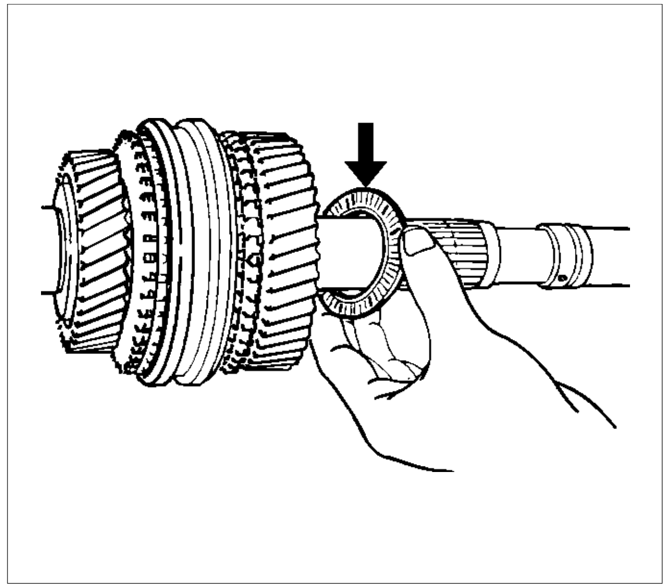
226RS053

Legend

(1) 1st Gear
(2) Needle Bearing
(3) Inside Ring
(4) Outside Ring
(5) Block Ring

10. Install the 1st gear thrust bearing and the race to the main shaft.

    The thrust bearing side must be facing the transmission front side.



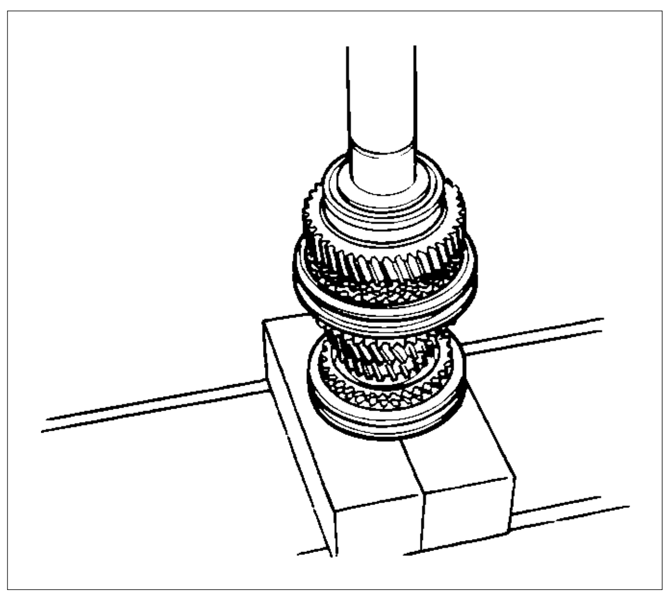
226RS054

11. Apply engine oil to the mainshaft ball bearing and the mainshaft.

    Install the ball bearing and needle bearing collar to the mainshaft.

    The ball bearing snap ring groove must be facing the transmission rear side.

    Use a bench press and installer 9-8522-1165-0 to slowly force the collar into place.

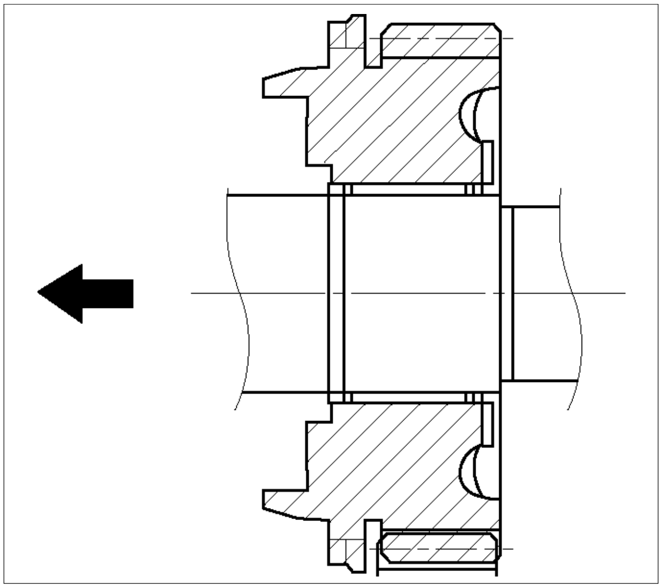


226RS055

12. Apply engine oil to the needle bearing and the 3rd gear thrust surfaces.

    Install the needle bearing and the 3rd gear to the mainshaft.

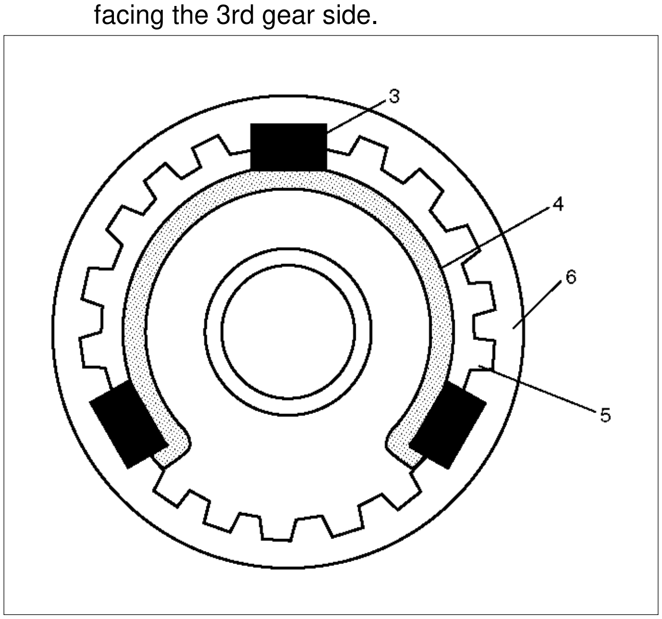
    The 3rd gear dog teeth must be facing the transmission front side.



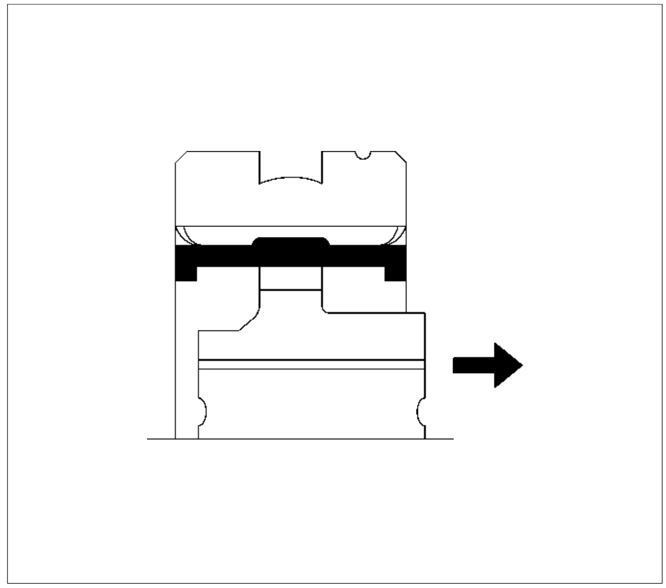
226RS056

13. Install the 3rd block ring.
14. Check and install the 3rd-4th synchronizer assembly using the following steps:
    1. Check that the inserts (3) fit snugly into the clutch hub insert grooves.
    2. Check that the insert springs (4) are fitted to the inserts, as shown in the illustration.
    3. Check that the clutch hub (5) and the sleeve (6) slide smoothly.
    4. Install the synchronizer assembly to the mainshaft.

    The clutch hub face with the heavy boss must be facing the 3rd gear side.



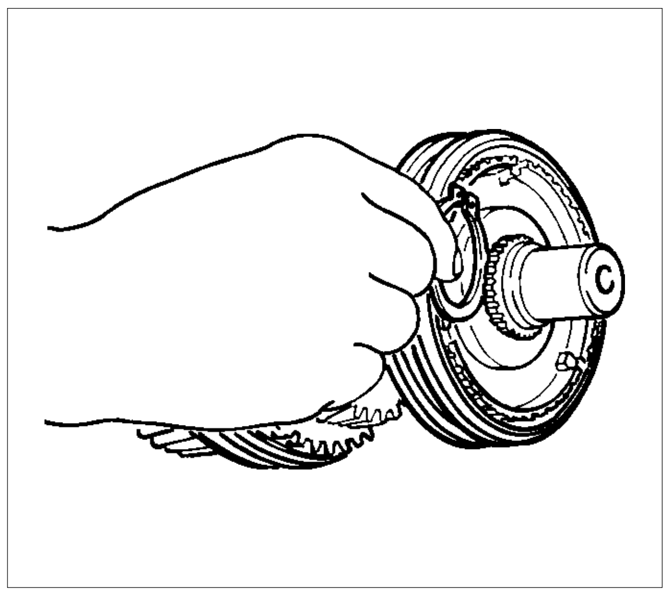
226RS049



226RW221

15. Select and install mainshaft snap ring using the following instructions:

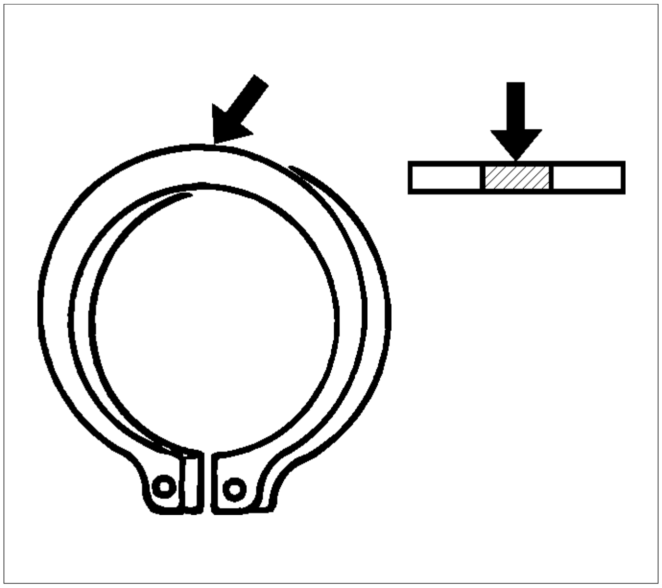
    Select the snap ring which will provide the minimum clearance between the 3rd-4th clutch hub and the snap ring.



226RS058

There are three snap ring sizes available.

The snap rings are color-coded to indicate their thickness as shown in the figure.



226RS021

Clutch Hub and Snap Ring Clearance

Standard: 0 - 0.1 mm (0 - 0.004 in)

Snap Ring Availability

Thickness	Color Coding
1.80 mm (0.071 in)	White
1.85 mm (0.073 in)	Yellow
1.90 mm (0.075 in)	Blue

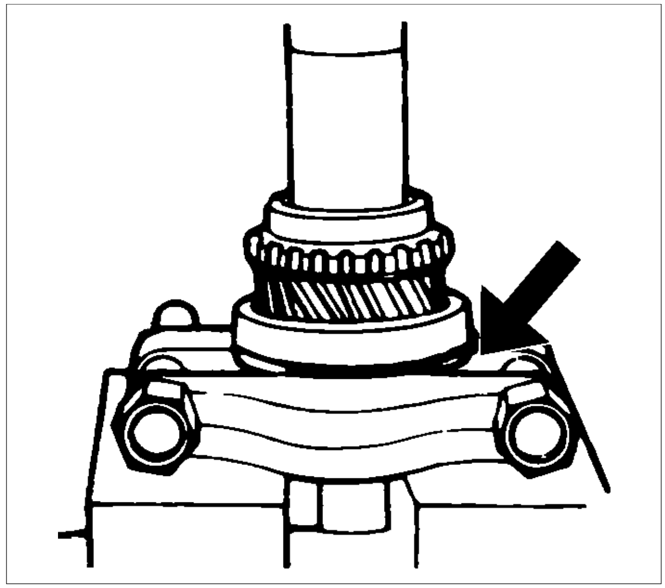
- Use a pair of snap ring pliers to install the snap ring to the mainshaft.

  The snap ring must be fully inserted into the mainshaft snap ring groove.

16. Install the top block ring.

    Apply grease to the needle bearing inner and outer circumferences and install the needle bearing in the top gear shaft.

17. Use a bench press to install the top gear shaft ball bearing to the top gear shaft.



226RS059

The snap ring groove of the ball bearing must be facing the transmission front side.

18. Use a pair of snap ring pliers to install the top gear shaft snap ring to the top gear shaft.

TROUBLESHOOTING

1. ABNORMAL NOISE

1) NOISY IN NEUTRAL

Checkpoint		Trouble Cause	Countermeasure
Gear oil	NG	Insufficient or improper gear oil	Replenish or replace the gear oil
OK			
Flywheel pilot bearing	NG	Worn flywheel pilot bearing	Replace the flywheel pilot
OK			
Bearings (Mainshaft, countershaft, and transfer shaft)	NG	Worn or broken bearing(s)	Replace the bearing(s)
OK			
Gears (Mainshaft, countershaft, reverse idler gear and transfer gears)	NG	Worn or scuffed gear tooth contact surfaces	Replace the gear(s)
OK			
Mainshaft splines Synchronizer clutch hub splines	NG	Worn splines	Replace the main shaft and the synchronizer clutch hub
OK			
Transmission	NG	Transmission misalignment	Realign the transmission

2) NOISY OPERATION

Checkpoint		Trouble Cause	Countermeasure
Gear oil (Metallic rattling)	NG	Insufficient or improper engine oil	Replenish or replace the gear oil
OK			
Bearings (Hissing, thumping or bumping)	NG	Worn or broken bearing(s)	Replace the bearing(s)
OK			
Gears (Growling, humming, or grinding)	NG	Worn, chipped, or cracked gear(s)	Replace the gear(s)
OK			
Gears (Squealing at high speeds)	NG	Free running gears seizing on the thrust face or the inner face	Replace the gear(s)
OK			
Gears (Gear whining)	NG	Lack of backlash between meshing gears	Replace the gear(s)

2. HARD SHIFTING

Checkpoint		Trouble Cause	Countermeasure
Gear oil	NG	Insufficient or improper gear oil	Replenish or replace the engine oil
OK			
Clutch pedal free play	NG	Improper clutch pedal free play	Readjust the clutch pedal free play
OK			
Change lever operation	NG	Hard operating change lever caused insufficient grease	Repair or regrease the change lever assembly
OK			
Change lever play	NG	Worn change lever sliding portions	Repair or replace the applicable parts and regrease
OK			
Shift block sleeve movement	NG	Sleeve movement failure	Repair or replace the sleeve
OK			
Shift rod and quadrant box sliding faces, and other parts	NG	Worn shift rod and/or sliding faces	Replace the shidt rod and/or the quadrant box

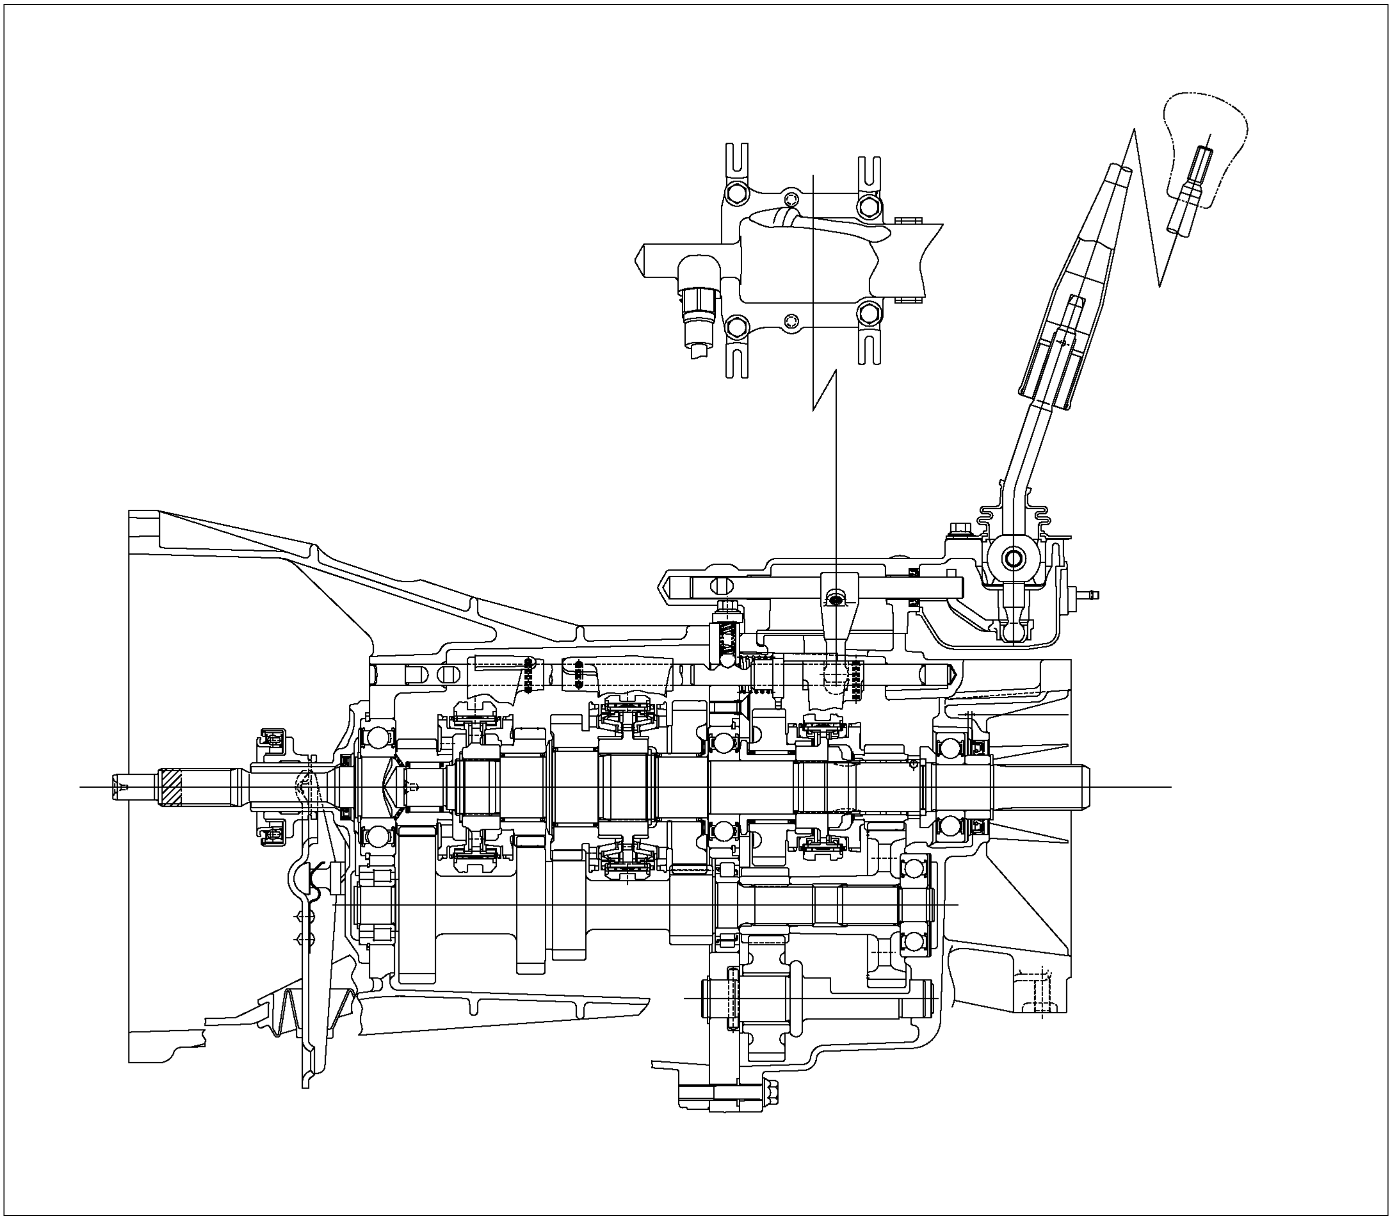
Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLE MENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNECESSARY SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU/GM will call out those fasteners that require a replacement after removal. ISUZU/GM will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

MUA5G/5H/5S Transmission (4×4)



A07R300003

The MUA5G/5H/5S is a constant mesh transmission, synchronized in all speeds. The transmission is designed for a great reduction of the shift effort and the quietest possible operation.

Principle parts of the transmission are the integral clutch housing, the intermediate plate, the rear case, and the gears.

The transmission control box is built into the transmission.

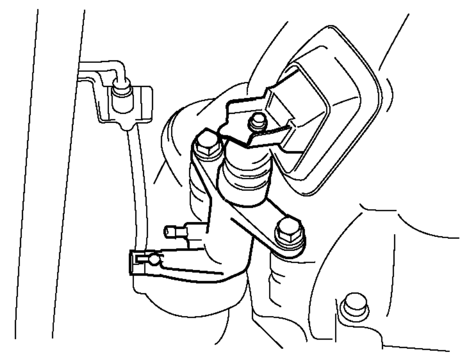
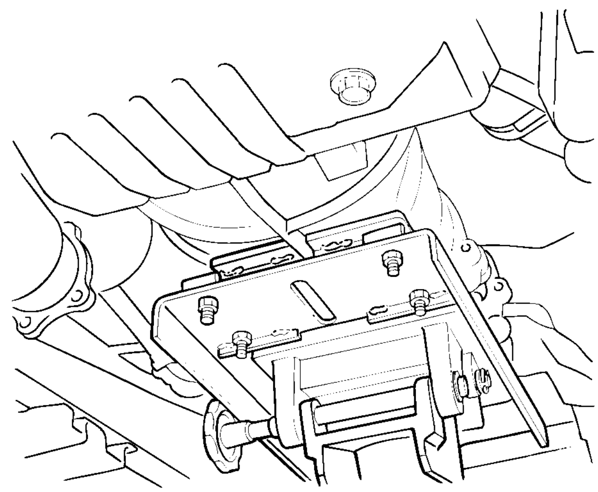
Scan-2

13. Remove the slave cylinder and put it aside.



220LV019

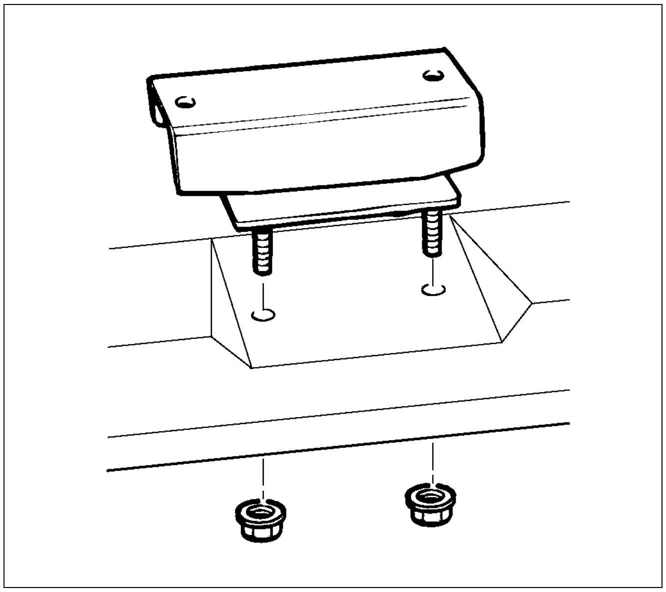
14. Support the transmission with a transmission jack.



220RS0001

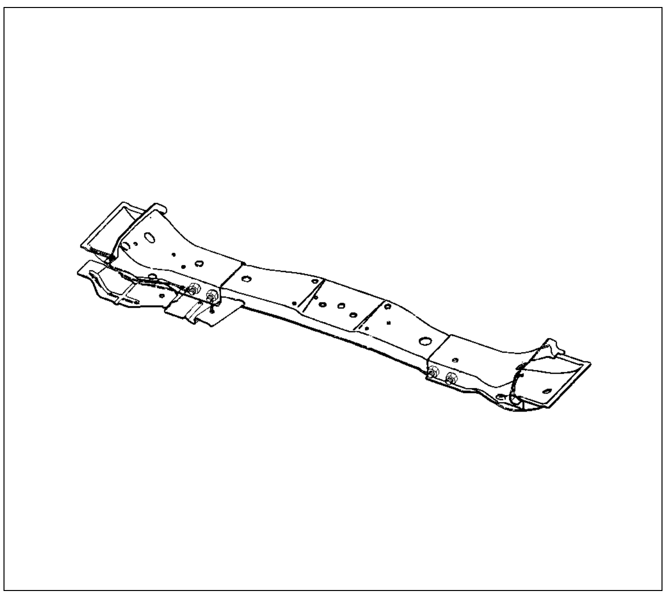
15. Remove the engine rear mount nuts from the transmission crossmember.

16. Remove the engine rear mount bolts fixing transmission.



220R300009

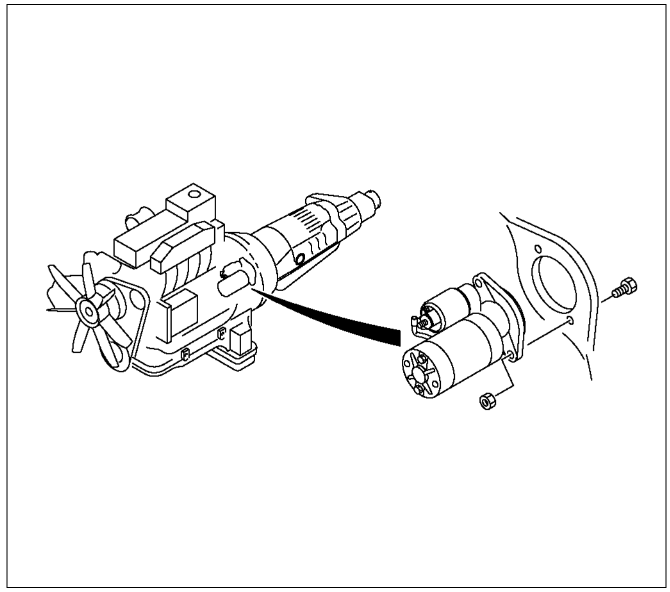
17. Remove the middle part of the transmission crossmember by removing the four fixing bolts and nuts.



501R30007

18. Take out the rear support rubber.

19. Remove the starter. (Diesel engine only)



060L100070

20. Remove the transmission retaining nuts and bolts.

    Remove the transmission assembly from the vehicle.

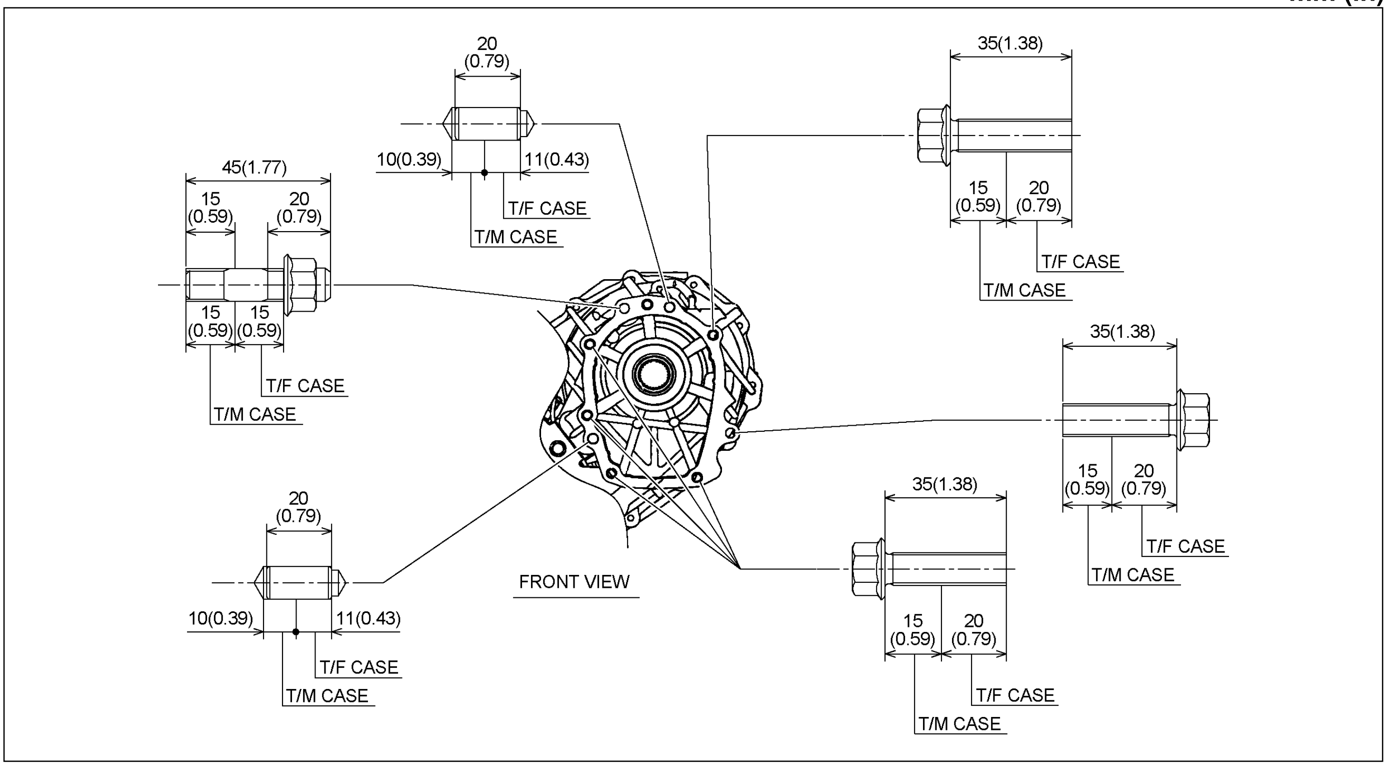
21. Remove the transmission–transfer fixing bolts and nut, and disassemble the transfer from the transmission.

Installation

1. Apply grease (BESCO L2 or equivalent) on the splined portion of the output shaft.
2. Connect the transfer to the transmission.
3. Install the transmission-transfer bolts and nut and tighten them to the specified torque.

   Torque: 41 N·m (4.2 kgf·m/30 lb·ft)

mm (in)



RTW77BMF001501

4. Apply a thin coat of molybdenum disulfide grease to the top gear shaft spline.
5. Slowly operate the transmission jack until the front of the transmission is aligned with the rear of the engine.

   The slope of the engine and the transmission must be the same.
6. Align the top gear shaft with the clutch driven plate spline.
7. Install the transmission assembly to the engine.

   Tighten the transmission nuts and bolts, as shown in the figure.

Diesel engine

N·m (kgf·m/lb·ft)

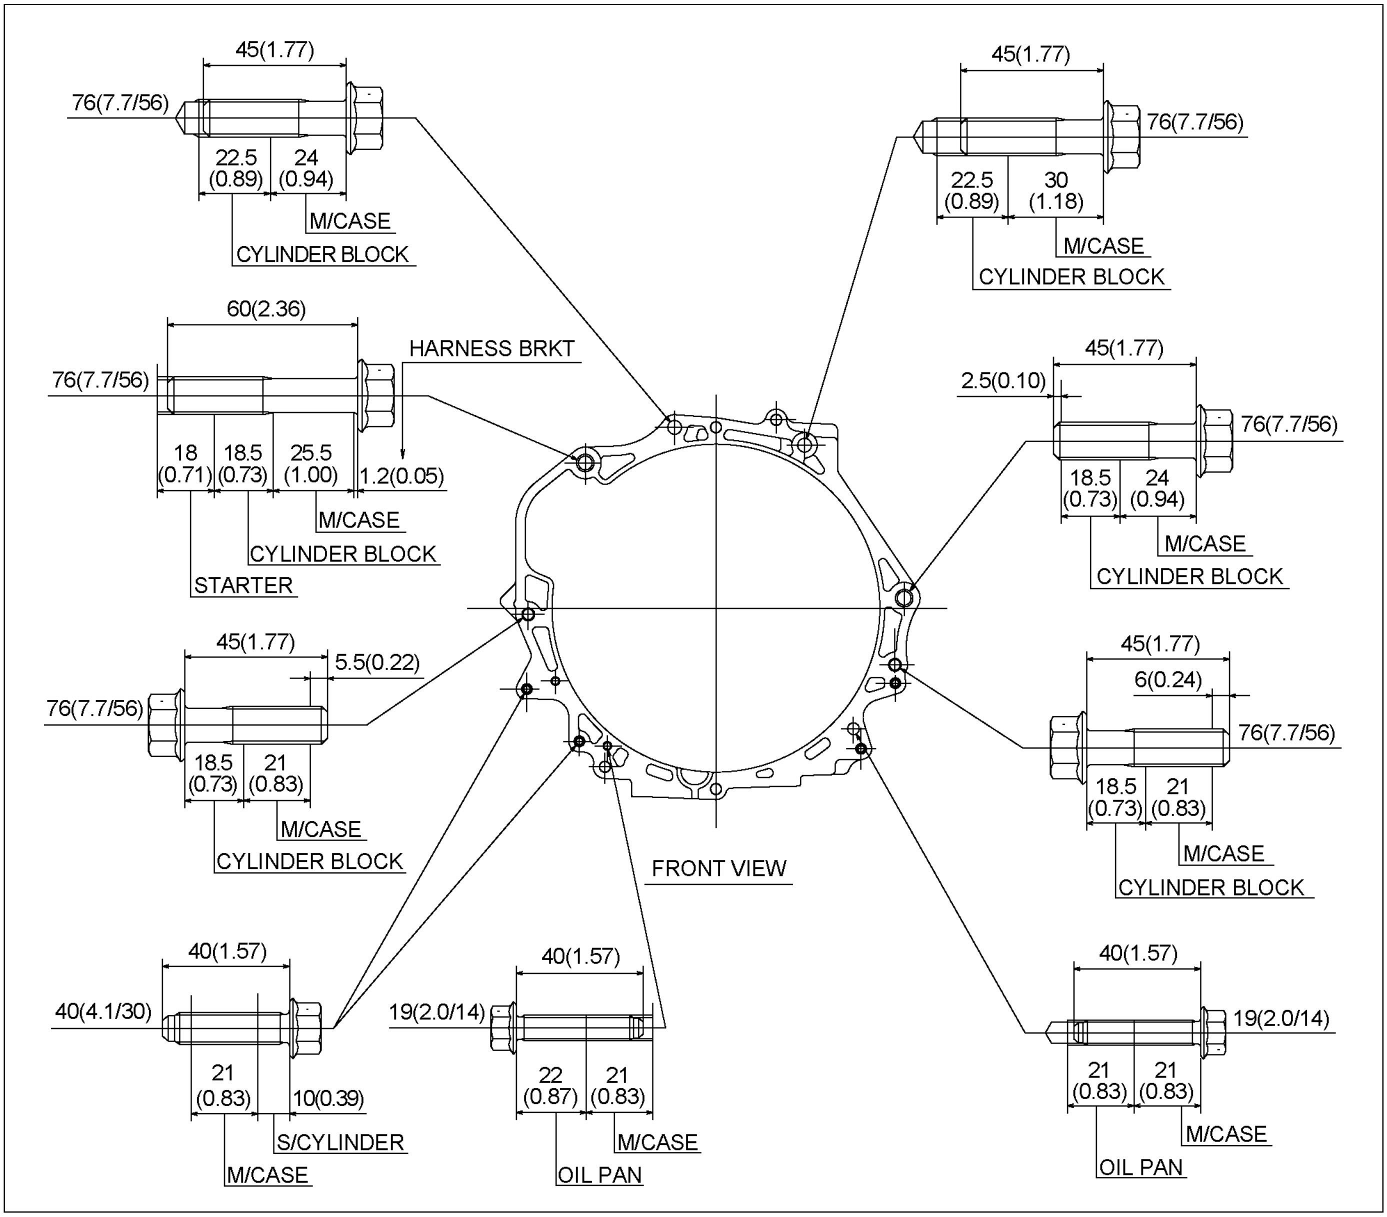
N·m (kgf·m/lb·ft)
mm (in)



8. Install the starter. (Diesel engine)

NOTE: Tighten the lower bolt temporarily.

After installing the fuel pipe assembly, tighten the bolt to the specified torque.

Torque: 76 N·m (7.7 kgf·m/56 lb·ft)

9. Install the rear support rubber on the transmission and tighten the bolts to the specified torque.

Torque: 50 N·m (5.1 kgf·m/37 lb·ft)

10. Install the middle part of transmission crossmember and bolts.

Tighten the nuts to the specified torque.

Torque: 67 N·m (6.8 kgf·m/49 lb·ft)

11. Install the engine rear mount nuts.

Torque: 52 N·m (5.3 kgf·m/38 lb·ft)

Remove the transmission jack from the transmission side.

12. Apply grease to top hole portion of the shift fork.

Install the slave cylinder and tighten the bolts to the specified torque.

Torque: 76 N·m (7.7 kgf·m/56 lb·ft)

13. Install the fuel pipe brackets on the transmission.

Install the fuel pipe assembly to the fuel pipe brackets

Torque: Bolt & Nut	**76 N·m (7.7 kgf·m/56 lb·ft)**
Nut	**37 N·m (3.8 kgf·m/27 lb·ft)**

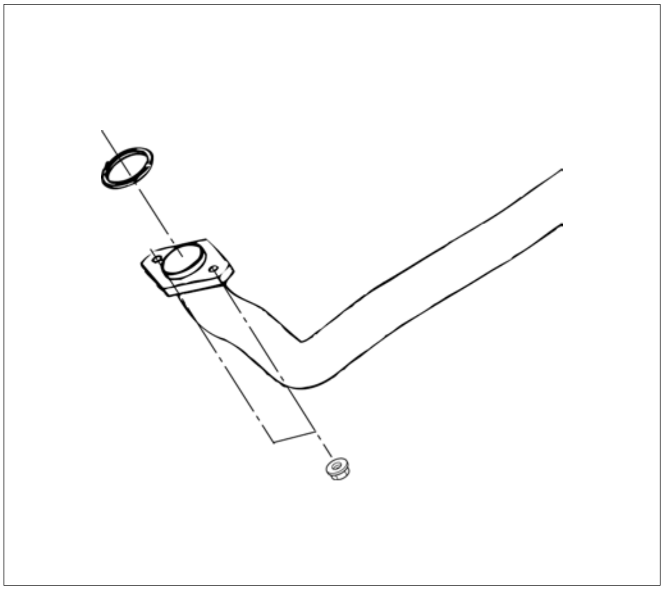
15. Tighten the exhaust pipe fixing nuts to the specified torque. (Diesel engine only)

    Torque: 67 N·m (6.8 kgf·m/49 lb·ft)



RTW67BSH000101

16. Install the front propeller shaft.

    Refer to the section “Front Propeller Shaft”.

17. Install the rear propeller shaft.

    Torque: 59 N·m (6.0 kgf·m/43 lb·ft)

18. Install the center bearing on crossmember.

    Torque: 69 N·m (7.0 kgf·m/51 lb·ft)

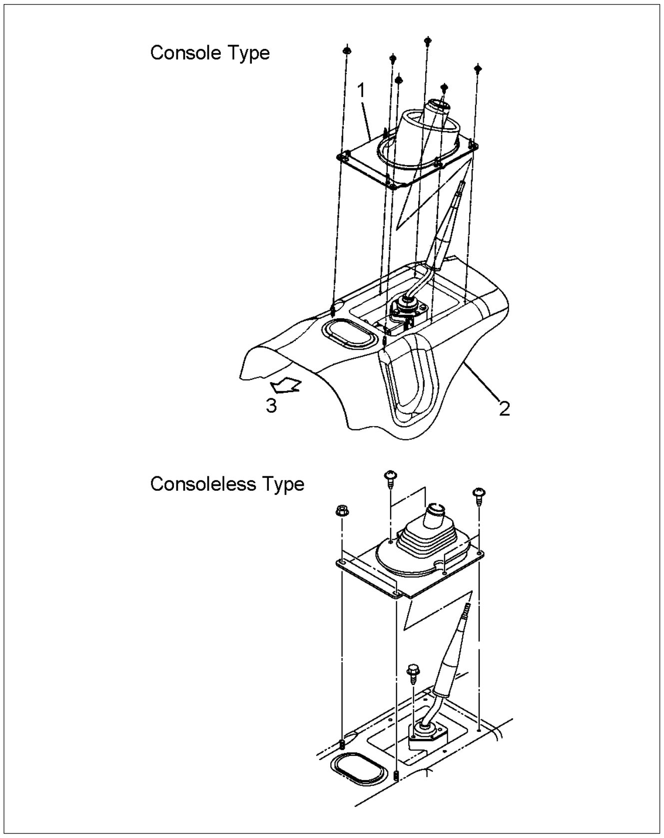
19. Install the gear control lever.

    Torque: 19 N·m (1.9 kgf·m/14 lb·ft)

20. Install the grommet assembly.

    Torque: Screw 1.4 N·m (0.14 kgf·m/12 lb·in)

    Nut 7 N·m (0.7 kgf·m/61 lb·in)



RTW47BMH000101

Legend

(1) Grommet Assembly

(2) Floor Panel

(3) Front

21. Install the front floor console and rear floor console.
22. Install the gear control lever knob.

    To the female thread portion, apply 3 - 4 drops of adhesive (TB1344 or LOCTITE 222 or equiv.) and tighten the transmission knob.

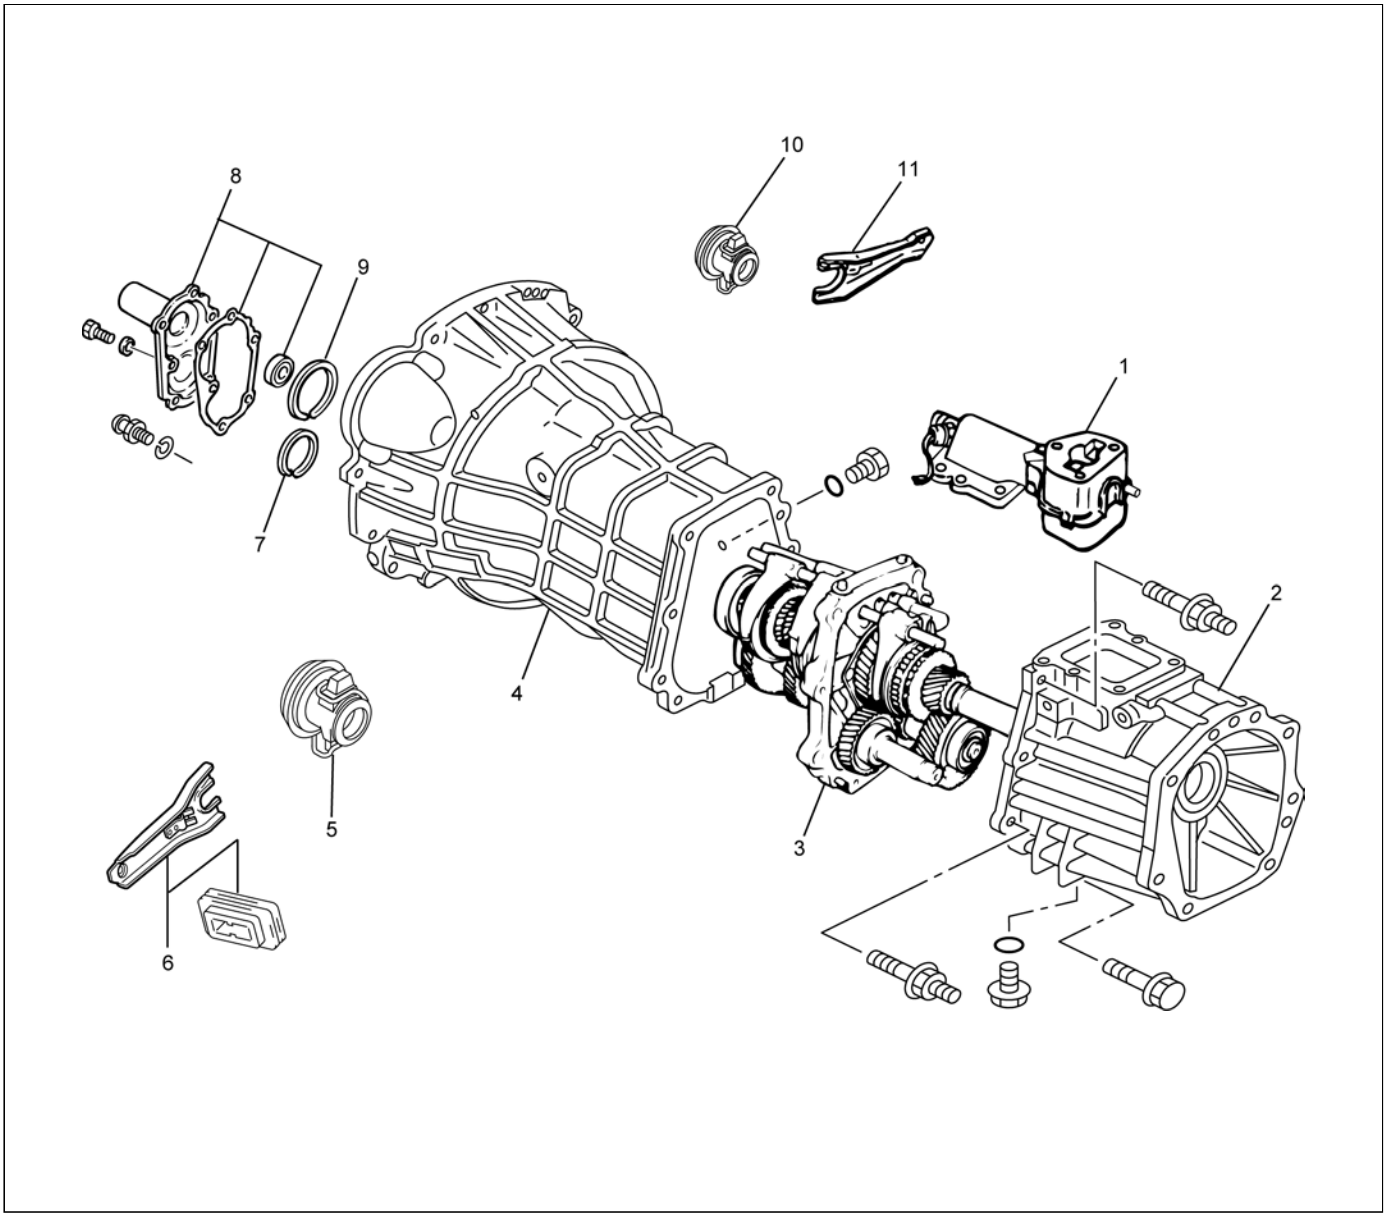
    Torque: 9 N·m (0.9 kgf·m/78 lb·in)

    After tightening to specified torque, rewrench the knob until the direction of the shift pattern is in the due position.

23. Connect the battery ground cable.

Transmission Case

Major Component



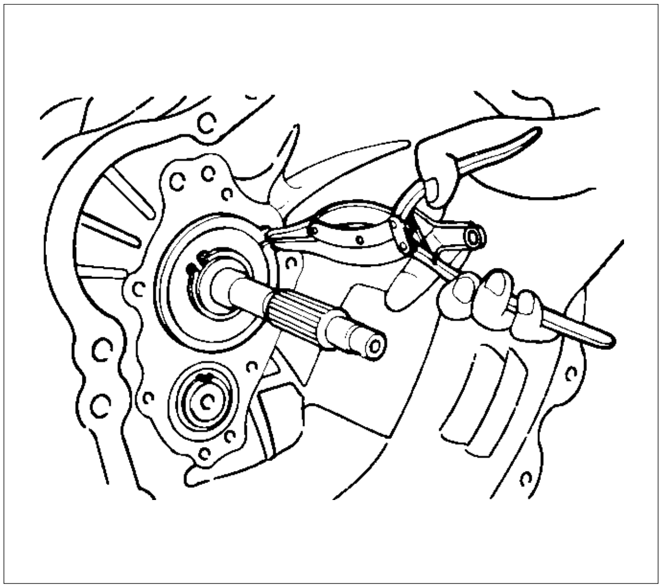
RTW77BLF003701

Legend

(1) Gear Control Box Assembly and Gasket
(2) Rear Case Assembly
(3) Intermediate Plate with Gear Assembly
(4) Transmission Case
(5) Release Bearing (with Spring): Diesel engine
(6) Shift Fork and Cover: Diesel engine
(7) Counter Front Bearing Snap Ring
(8) Front Cover (with Oil Seal)
(9) Top Gear Bearing Snap Ring
(10) Release Bearing: C24SE
(11) Shift Fork: C24SE

Disassembly

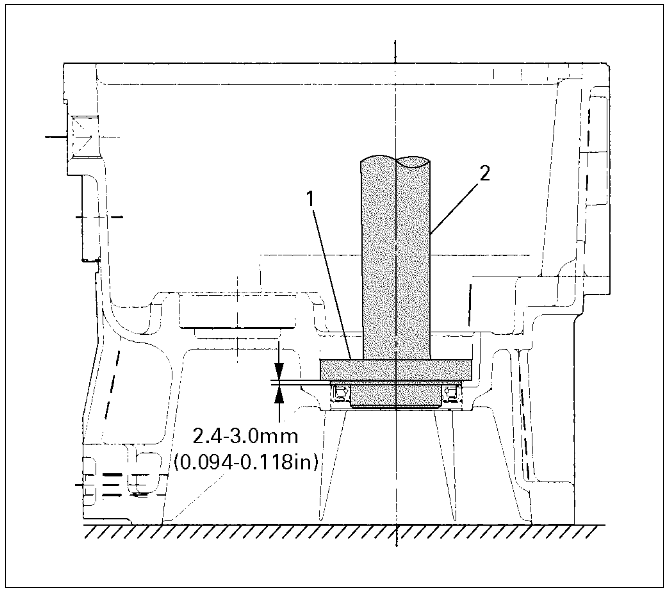
1. Clean the exterior of the unit with solvent.
2. Remove the drain plug from the transmission case and drain the lubricant.
3. Remove the clutch release bearing with spring from the transmission case.
4. Remove the shift fork, and boot.
5. Remove the front cover and gasket from the transmission case.
6. Remove the snap ring fixing counter front bearing.
7. Use a pair of snap ring pliers to remove the snap ring fixing top gear bearing.



226RS001

8. Remove the gear control box assembly.
9. Remove the rear case assembly from the transmission case and intermediate plate.
10. Remove the intermediate plate with gear assembly from the transmission case.

Rear Oil Seal Replacement



220R300025

Legend

(1) Installer 5-8840-2797-0

(2) Grip 5-8840-0007-0

1. Remove the oil seal from the rear case and discard the used oil seal.
2. Apply engine oil to the new oil seal outer surfaces.
3. Apply recommended grease (BESCO L2) or equivalent to the oil seal lip.
4. Use the oil seal installer 5-8840-2797-0 and grip 5-8840-0007-0 to install the oil seal to the rear case.

Reassembly

1. Apply recommended liquid gasket (Three Bond TB1215) or its equivalent to the transmission case, intermediate plate and rear case fitting surfaces.
2. Install the intermediate plate with gear assembly to the transmission case.

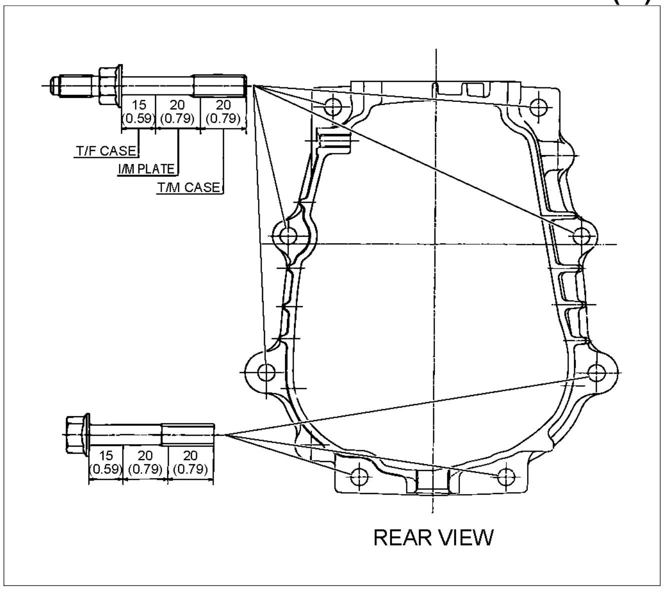
   Pull out the top gear shaft until the ball bearing snap ring groove protrudes from the transmission case front cover fitting face.

   Avoid subjecting the mainshaft to sudden shock or stress.
3. Install the rear case with oil seal on the intermediate plate, with gear, by performing the following steps.
   - Cover the shaft splines with adhesive tape.

     This will prevent damage to the oil seal lip.
   - Tighten the transmission rear case bolts and nuts to the specified torque.

   Torque: 37 N·m (3.8 kgf·m/27 lb·ft)

mm (in)



RTW77BSH008601

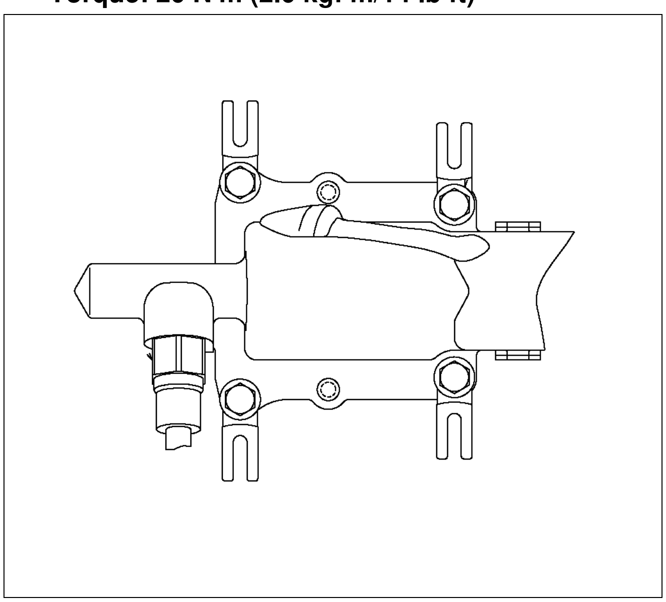
Notes When Tightening the Bolt:

- After cleaning the bolt hole, air dry it thoroughly.
- After cleaning the screw face of a removed or new bolt, dry it thoroughly. Apply recommended liquid gasket (LOCTITE 242) or its equivalent before tightening.

4. Install a new gasket and gear control box assembly.

   Install the harness clips and brackets and then tighten the four new gear control box bolts to the specified torque.

   Torque: 20 N·m (2.0 kgf·m/14 lb·ft)

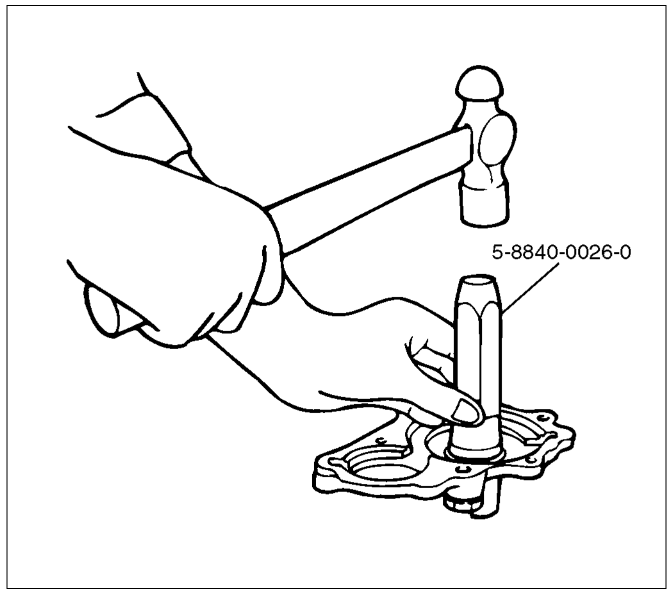


261R300004

5. Install the top gear bearing snap ring and counter front bearing snap ring.
   - Use a pair of snap ring pliers to install the snap rings to the mainshaft and countershaft.
   - The snap rings must be fully inserted into the bearing snap ring groove.
6. Front cover with oil seal.

Front Cover Oil Seal Replacement

- Remove the oil seal from the front cover.
- Apply engine oil to the outer circumference of new oil seal.
- Apply recommended grease to the oil seal lip.
- Use the oil seal installer 5-8840-0026-0 to install the oil seal to the front cover.



220R300002

7. Install a new gasket and front cover to the transmission case.

NOTE: Take care not to damage the oil seal.

Notes When Tightening the Bolt:

- After cleaning the bolt hole, air dry it thoroughly.
- After cleaning the screw face of a removed or new bolt, dry it thoroughly. Apply recommended liquid gasket (LOCTITE 242) or its equivalent before tightening.

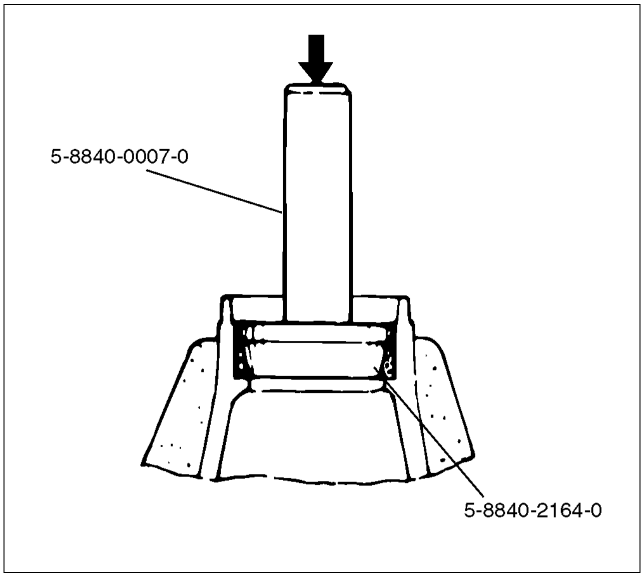
  Tighten the six front cover bolts to the specified torque.

  Torque: 25 N·m (2.6 kgf·m/19 lb·ft)

Reassembly

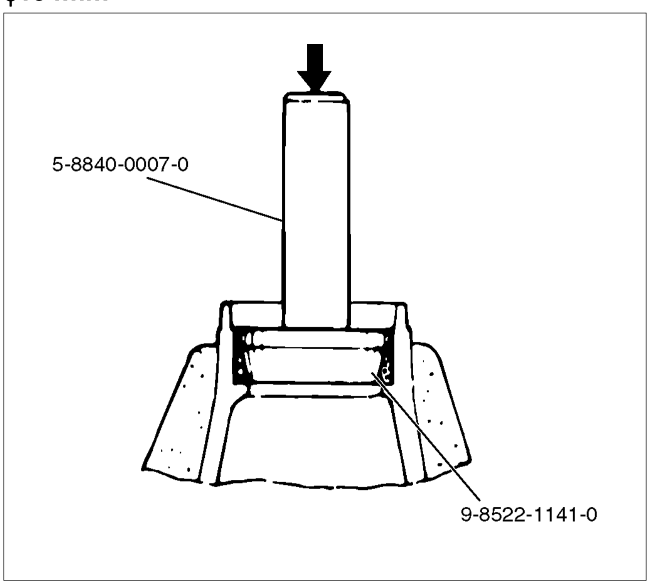
1. Install outer bearing outer race by using installer 5-8840-2164-0 (ϕ220mm), 9-8522-1141-0 (ϕ194 mm) and grip 5-8840-0007-0.

ϕ220mm



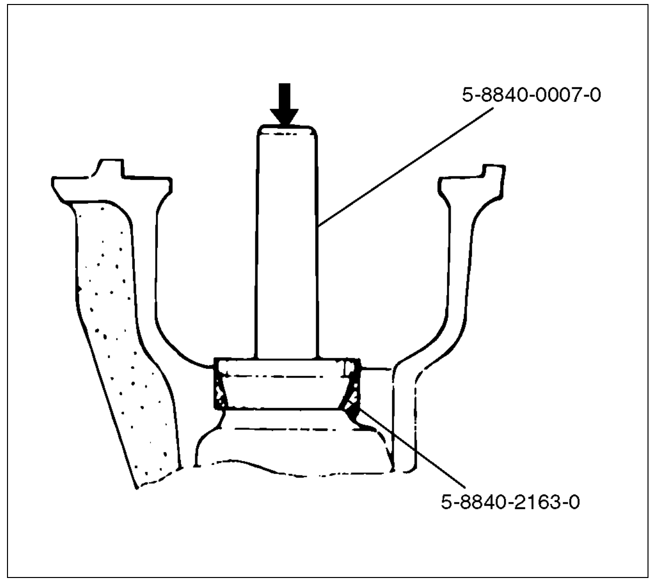
425L100002

ϕ194mm



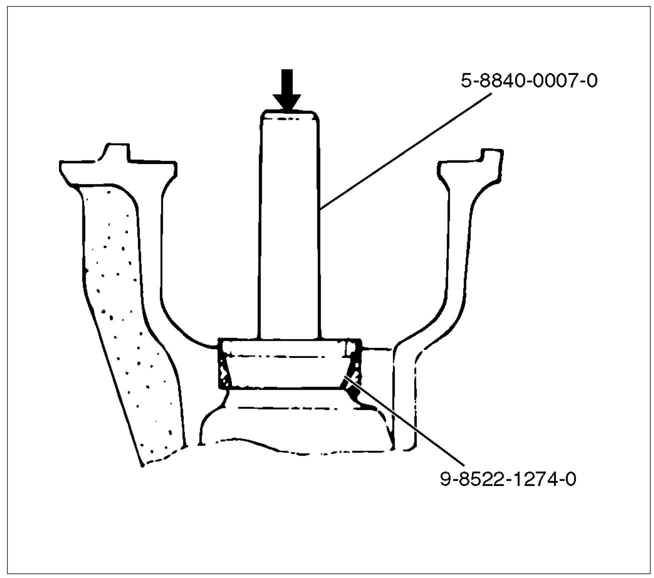
425R300001

2. Install inner bearing outer race by using installer 5-8840-2163-0 (ϕ220mm), 9-8522-1274-0 (ϕ194 mm) and grip 5-8840-0007-0.



425L100003

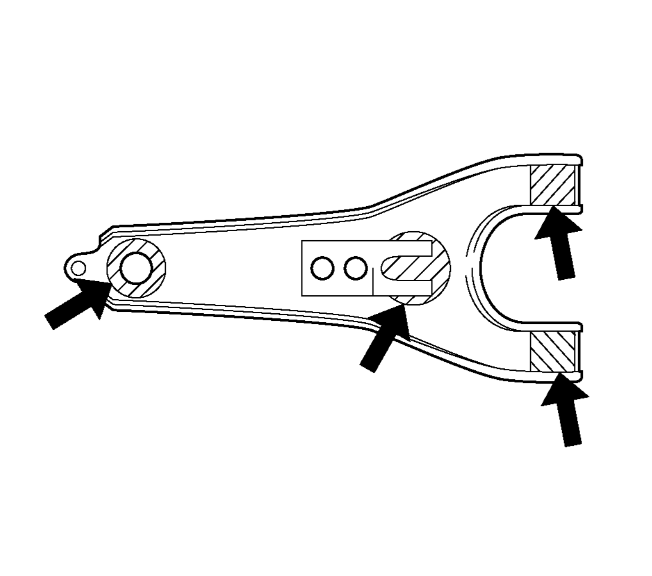
ϕ194mm



425R300002

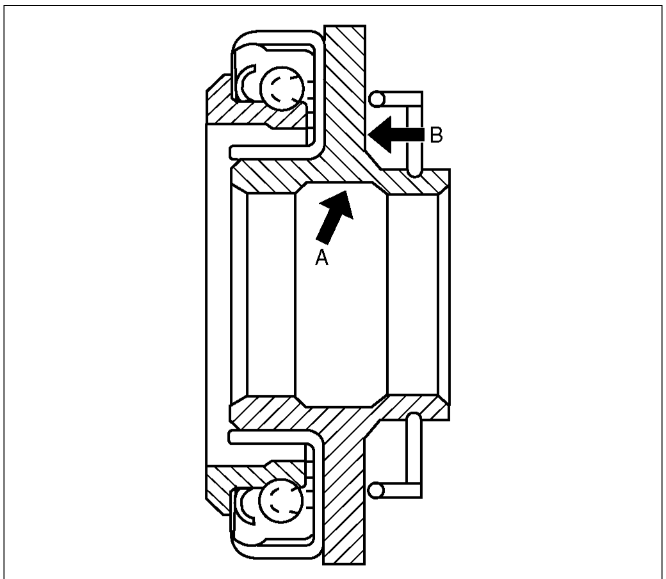
3. Adjust the drive pinion mounting distance as follows:
   a. Apply gear oil to the inner and outer drive pinion bearing. Clean the pinion setting gauge set. Then install the gauge set together with the inner and outer bearings.
      Install gauge plate 5-8840-2166-0 (ϕ220mm) and 5-8840-2087-0 (ϕ194mm) (3), inner pilot 5-8840-0129-0 (ϕ220mm) (2), stud and nut 5-8840-0127-0 (ϕ220mm) and 5-8840-2089-0 (ϕ194mm) (4) and outer pilot 5-8840-2085-0 (ϕ220mm and ϕ194mm) (1) through inner and outer bearings.

8. Apply molybdenum disulfide type grease to the areas shown in the figure and install the shift fork.



F07L100026

9. Pack the inside recess (A) and coat the back (B) of the release bearing with molybdenum disulfide type grease, as shown in the figure.

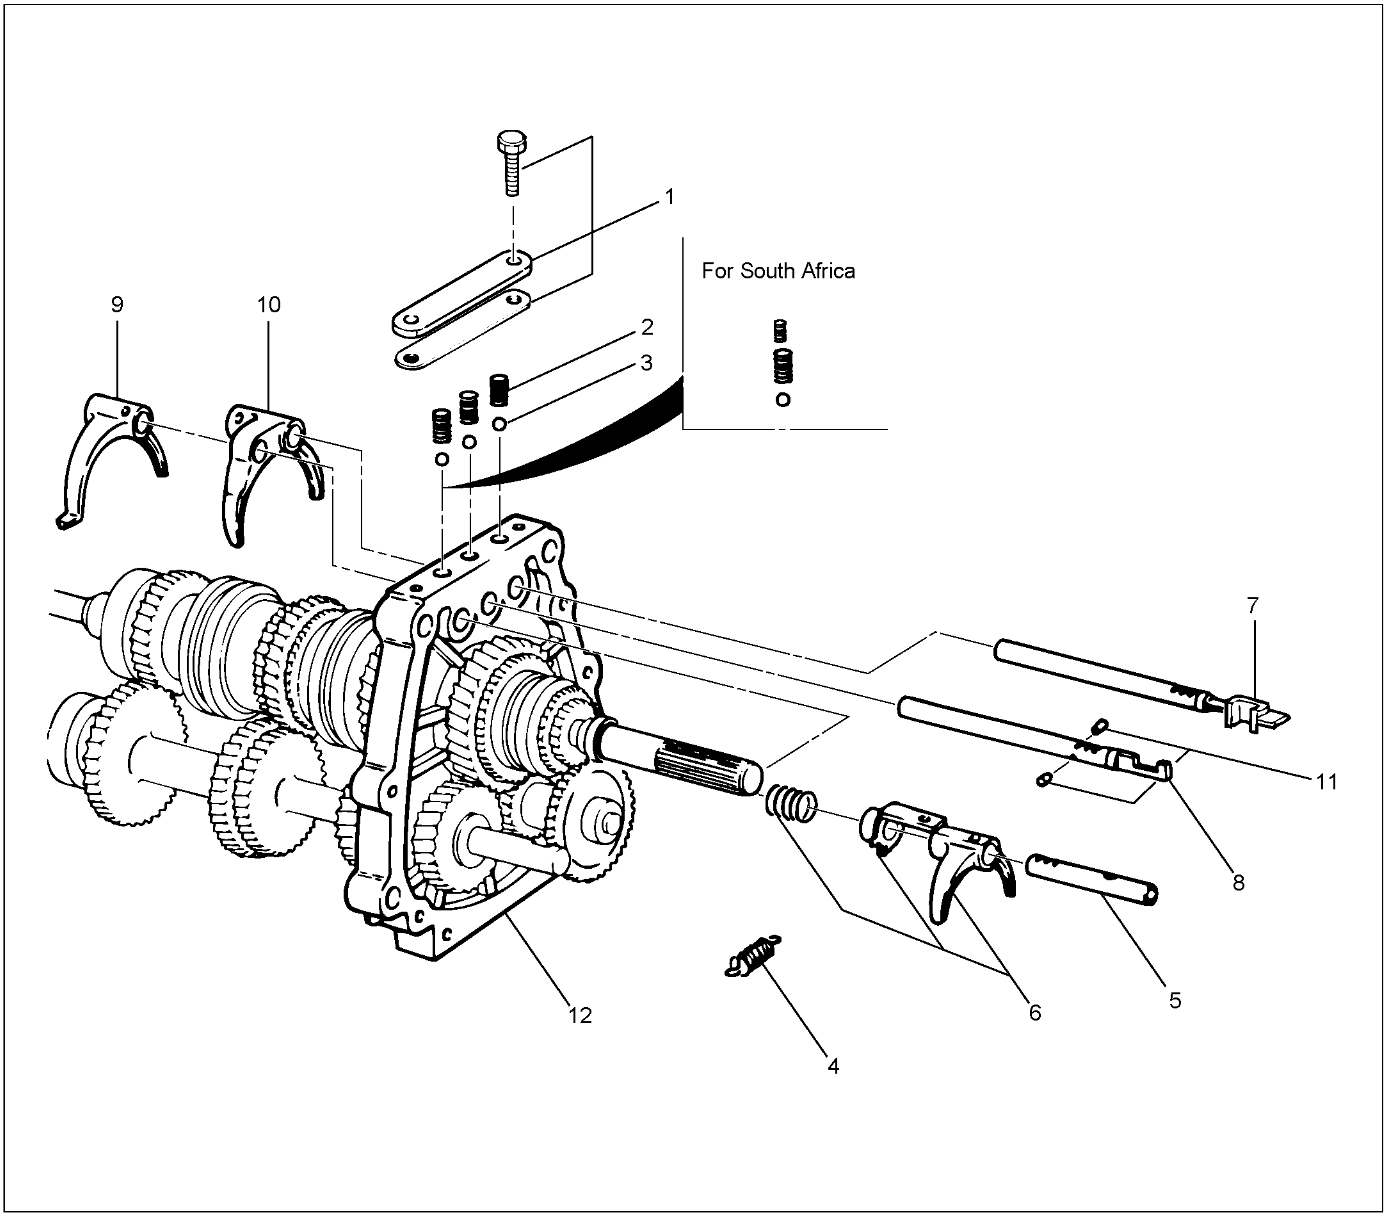


A07RW075

10. Install the release bearing on the front cover, joining it to the shift fork.

Intermediate Plate with Gear Assembly, Detent, Shift Arm, Shift Rod, and Interlock Pin

Disassembled View



RTW57BLF000201

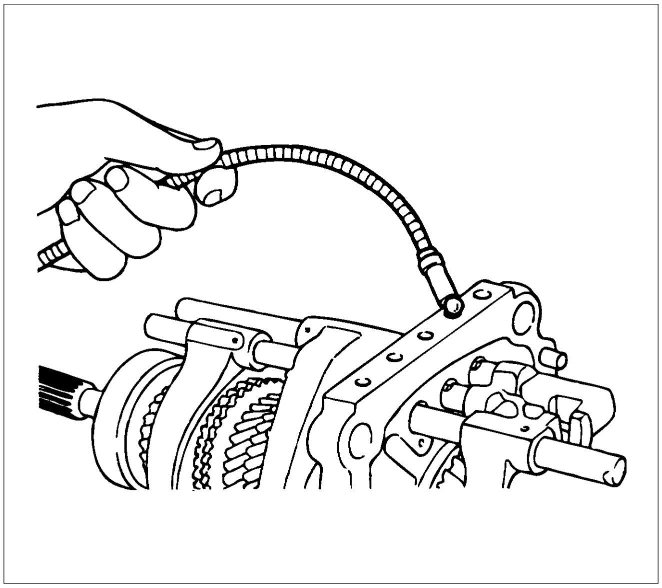
Legend

(1) Detent Spring Plate and Gasket	(7) 1st-2nd Shift Rod
(2) Detent Spring	(8) 3rd-4th Shift Rod
(3) Detent Ball	(9) 3rd-4th Shift Arm
(4) Spring	(10) 1st-2nd Shift Arm
(5) Rev-5th Shift Rod	(11) Interlock Pin
(6) Rev-5th Shift Arm and Reverse Inhibitor	(12) Intermediate Plate and Gear Assembly

Disassembly

1. Remove the detent spring plate and gasket, detent spring and detent ball.

   Use a magnetic hand to remove the detent balls from the intermediate plate.

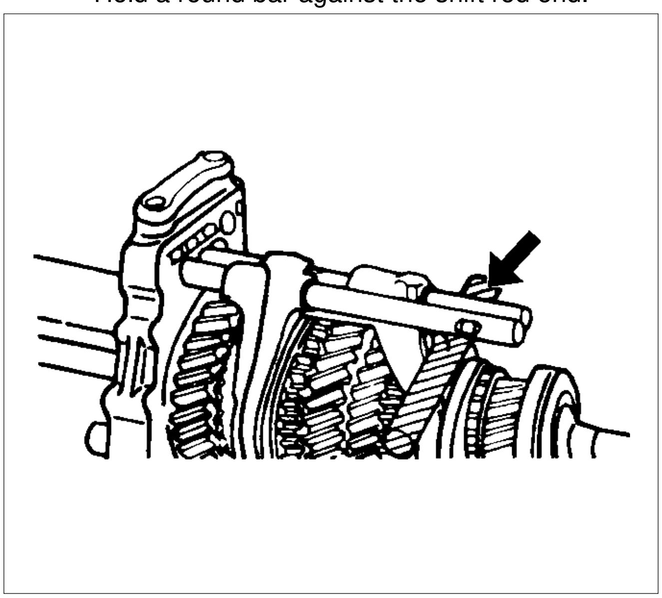


220RS011

2. Remove the spring.
3. Remove the rev-5th shift rod, and rev-5th shift arm and the reverse inhibitor.

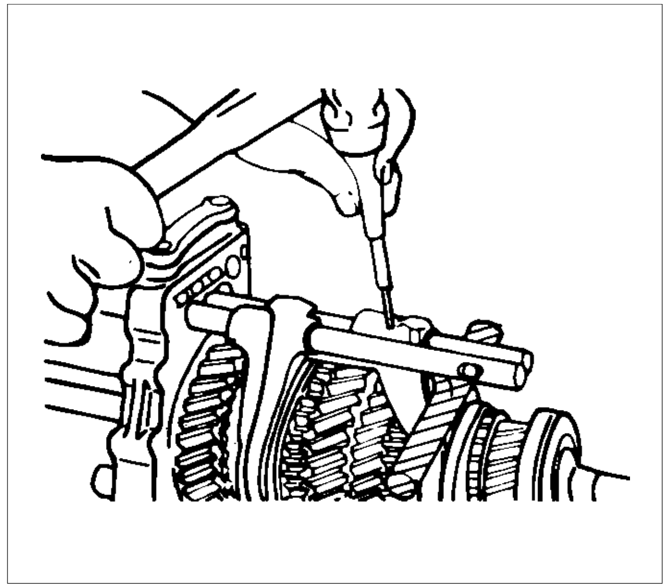
   Remove the 1st-2nd shift rod, 3rd-4th shift rod, 3rd-4th shift arm, and 1st-2nd shift arm.

   - Hold a round bar against the shift rod end.



230RS003

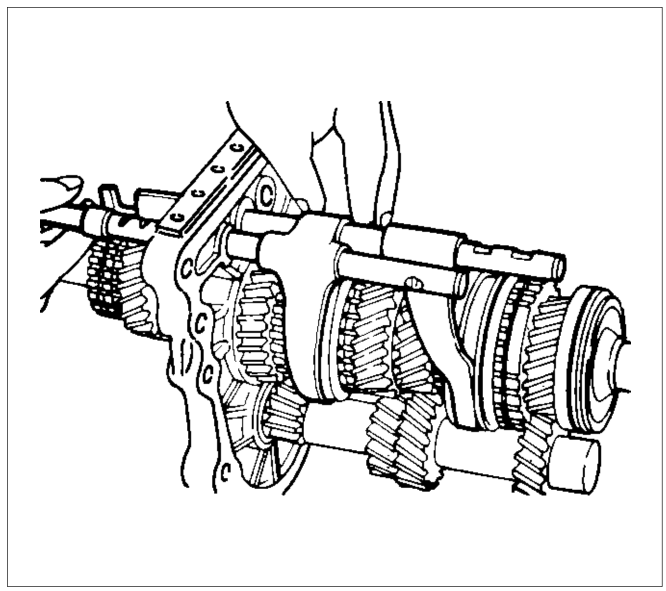
   - Use a spring pin remover to remove the shift arm spring pins from the shift arms and the shift rods.



230RS0004

   - Be careful not to lose the interlock pins, when pulling out the shift rod rearward.

     The interlock pins are located between the shifter rods in the intermediate plate.



230RS0005

   - Remove the rev-5th, 1st-2nd and 3rd-4th shift rods carefully.

4. Remove the interlock pin from intermediate plate and gear assembly.

Inspection and Repair

Make the necessary adjustments and part replacements if excessive wear or damage is discovered during inspection.

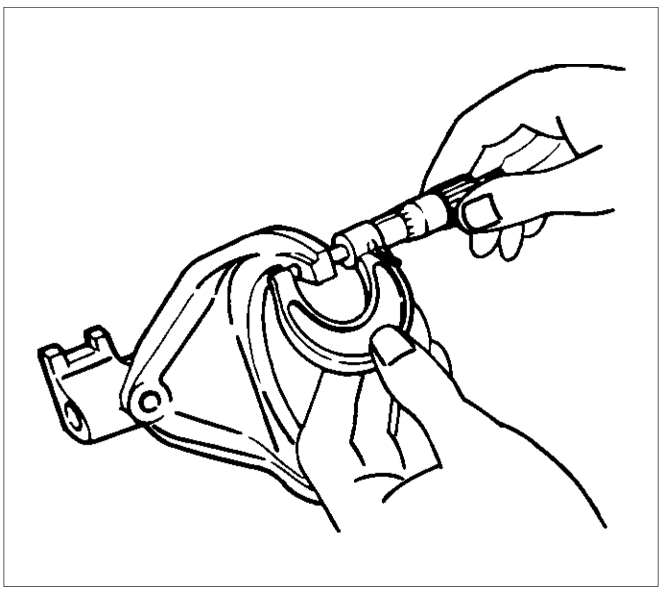
Shift Arm Thickness

- Use a micrometer to measure the shift arm thickness.

  If the measured value is less than the specified limit, the shift arm must be replaced.

Shift Arm Thickness

	Standard	Limit
1st-2nd	9.60 - 9.85 mm (0.378 - 0.388 in)	9.0 mm (0.354 in)
3rd-4th Rev.5th	9.60 - 9.80 mm (0.378 - 0.386 in)	



230RS006

Detent Spring Free Length

- Use a vernier caliper to measure the detent spring free length.

  If the measured value is less than the specified limit, the detent spring must be replaced.

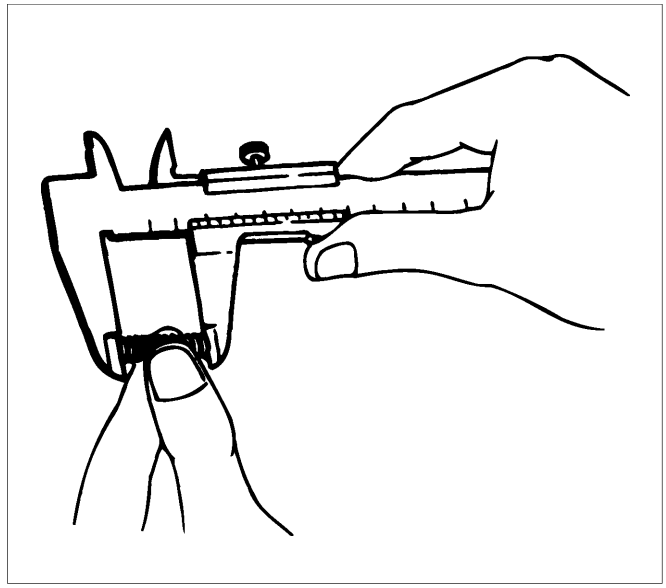
Detent Spring Free Length

Standard	Limit
26.8 mm (1.06 in)	26.2 mm (1.03 in)

SOUTH AFRICA 5th-Rev Only

Detent Spring Free Length

	Standard	Limit
Outer	27.6 mm (1.09 in)	27.0 mm (1.06 in)
Inner	26.6 mm (1.05 in)	26.0 mm (1.02 in)



220RS012

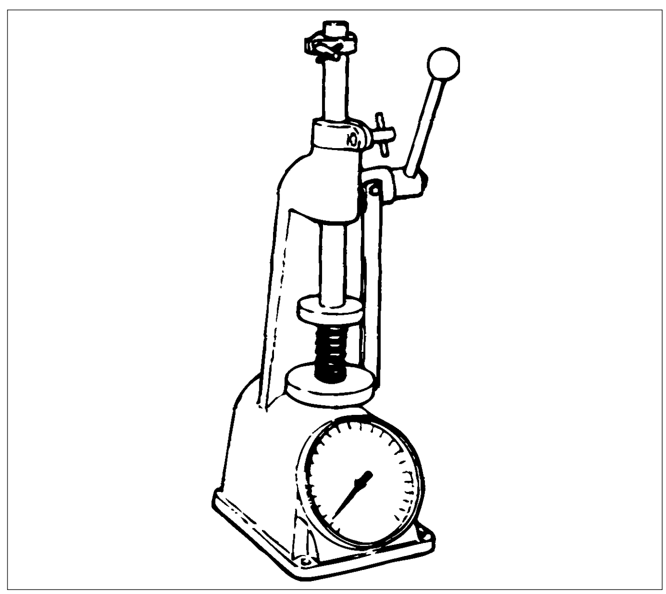
Detent Spring Tension

- Use a spring tester to measure the detent spring tension.

  If the measured value is less than the specified limit, the detent spring must be replaced.

Detent Spring Tension

Compressed height	Standard
20 mm (0.787 in)	87.2 - 97.1 N (19.6 - 21.8 lb)



220RS013

SOUTH AFRICA 5th-RV Only

Detent Spring Free Length

	Compressed	Standard
Outer	20 mm (0.787 in)	93.5 – 103.3 N (21.0 – 23.3 lb)
Inner	20 mm (0.787 in)	26.4 – 36.3 N (5.9 – 8.2 lb)

Reassembly

1. Install the rev-5th shift arm and reverse inhibitor and rev-5th shift rod.
   - Apply oil to the reverse inhibitor inner surface.
   - Install the shift rod in the intermediate plate.
   - Hold a round bar against the shift rod end lower face to protect it against damage.
   - Install a new spring pin.

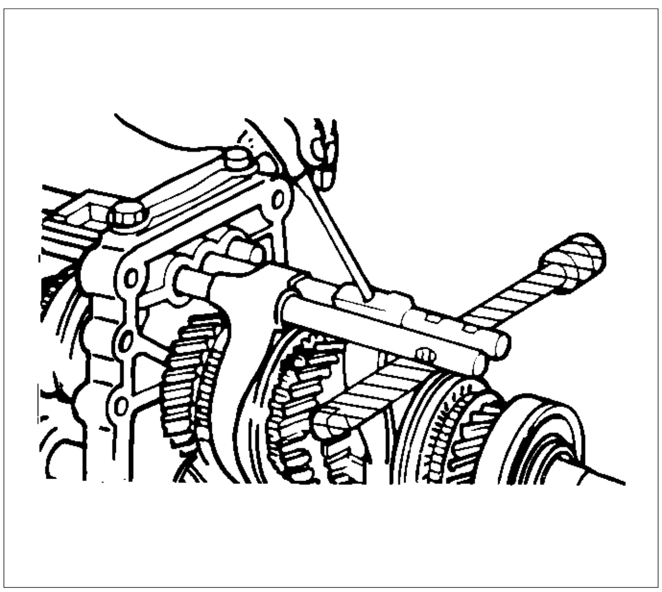
     Never reinstall the used spring pin.
   - Install the interlock pin in the intermediate plate.

     Do not allow the interlock pin to fall from the intermediate plate.
2. Install the 1st-2nd shift arm and 3rd-4th shift arm to the intermediate plate and gear assembly.
3. Install the 3rd-4th shift rod and the 1st-2nd shift rod.
   - Install the interlock pin in the intermediate plate and gear assembly.
   - Install the 3rd-4th shift rod in the intermediate plate.

     Do not allow the interlock pin to fall from the intermediate plate.
   - Install the interlock pin and then the 1st-2nd shift rod in the intermediate plate.

     Do not allow the interlock pin to fall from the intermediate plate.
   - Hold a round bar against the shift rod end lower face to protect it against damage.
   - Install a new spring pin.

     Never reinstall the used spring pin.



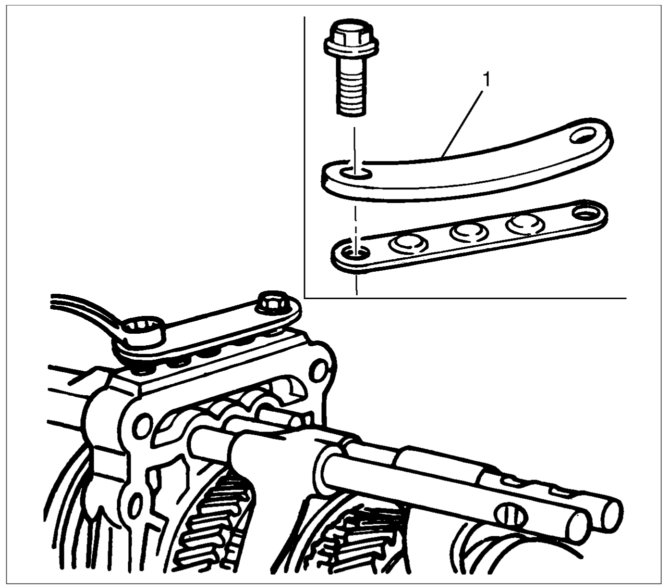
230RS007

4. Install the spring.
5. Put the detent balls in the intermediate plate holes.
   - Apply oil to the detent balls.
6. Install the detent springs and detent spring plate and gasket.

NOTE: For South Africa model, it has double detent spring for Rev-5th shift rod.

- Install a new gasket and the detent spring plate.
- Tighten the detent spring plate bolts to the specified torque.

Torque: 25 N·m (2.5 kgf·m/18 lb·ft)



220RS030

Legend

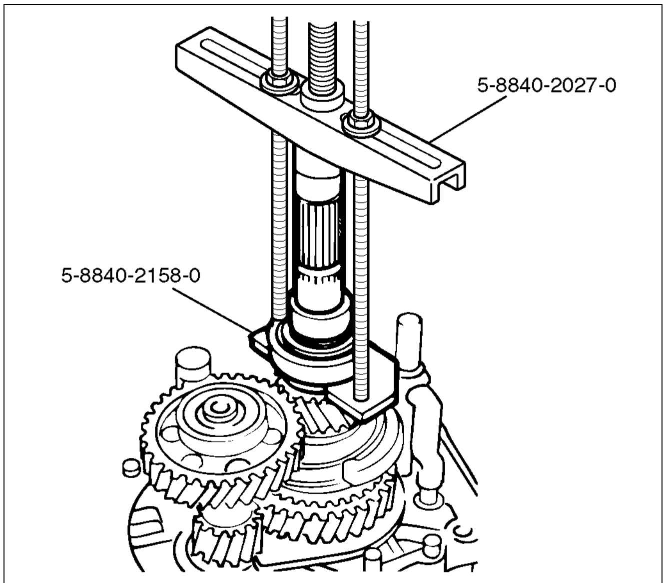
- (26) Bearing Snap Ring
- (27) Intermediate Plate

Disassembly

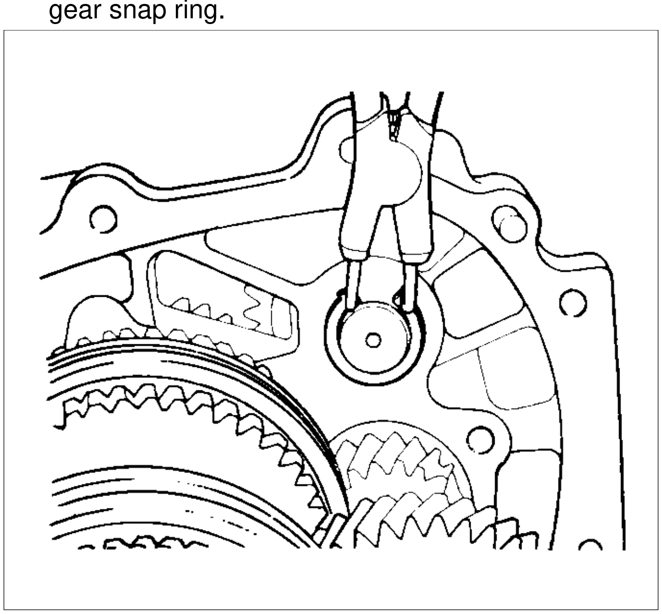
1. Use a pair of snap ring pliers to remove the collar snap ring.
2. Set the mainshaft retainer remover 5-8840-2158-0 and puller 5-8840-2027-0 to the retainer and the mainshaft end.



262RW079

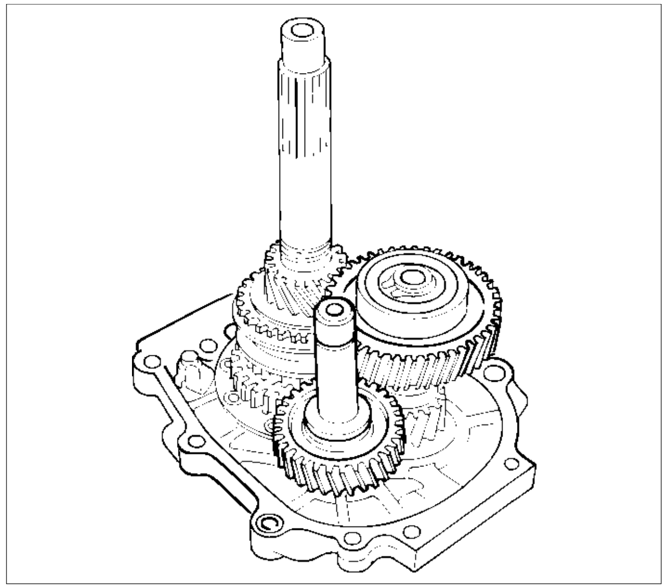
3. Remove the retainer together with the bearing and the oil seal collar.

   The universal puller may be used in place of the retaining ring remover.
4. Remove the thrust plate, thrust washer and lock ball.
5. Use a pair of snap ring pliers to remove reverse idler gear snap ring.



226RS004

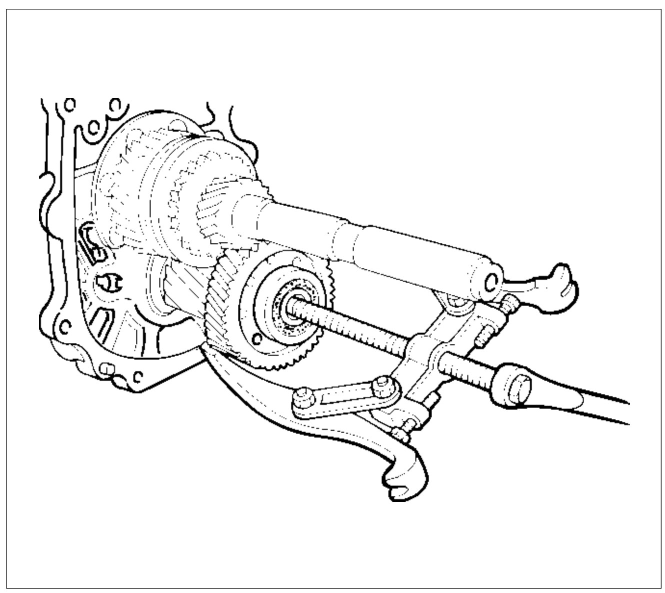
6. Remove the reverse idler gear assembly from the intermediate plate.



226RS005

7. Remove the idle shaft pin, thrust washer, reverse idler gear, and reverse idler shaft.
8. Use a pair of snap ring pliers to remove the snap ring.
9. Attach a universal puller to the counter gear shaft.

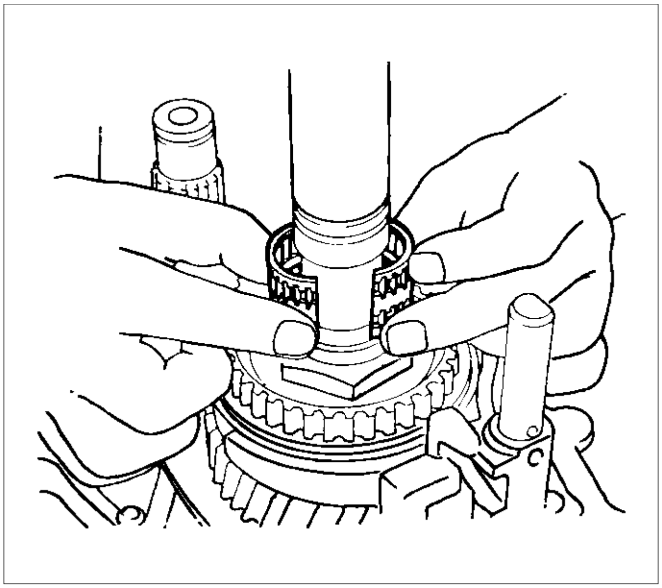
   Use a universal puller to remove the ball bearing and the counter 5th gear.



226RS006

10. Remove the counter reverse gear.

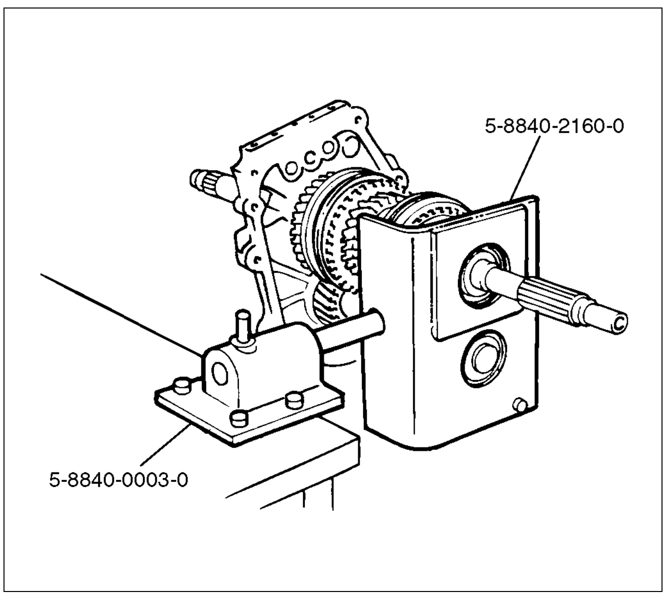
11. Remove the 5th gear, 5th block ring, and needle bearing (2 piece type).



226RS007

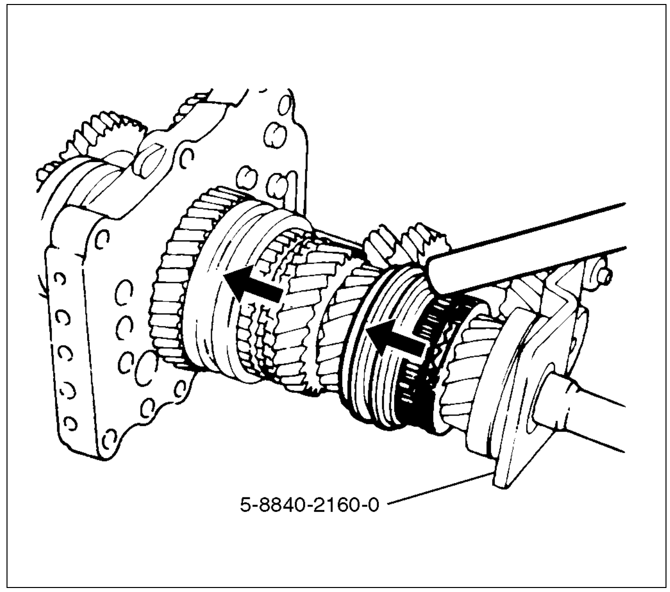
12. Remove the mainshaft nut according to following steps.

Attach the holding fixture 5-8840-2160-0 and base 5-8840-0003-0 to the mainshaft and the counter gear.



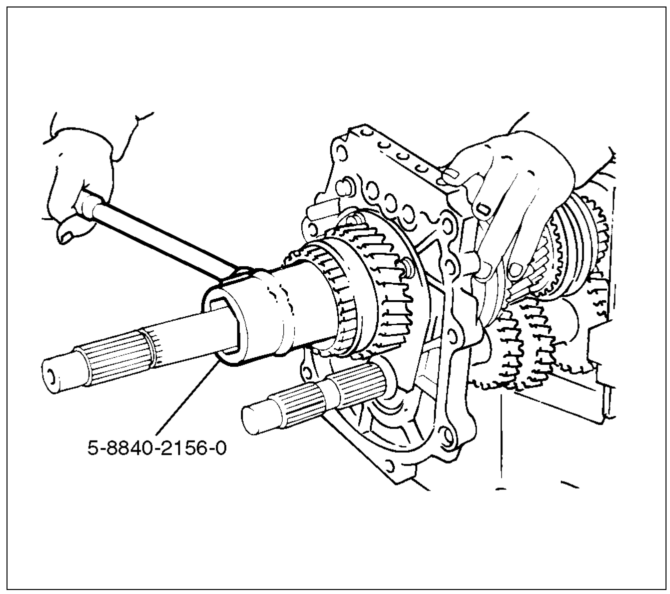
226RW212

- Engage the 3rd-4th synchronizer with the 3rd gear.
- Engage the 1st-2nd synchronizer with the 1st gear.



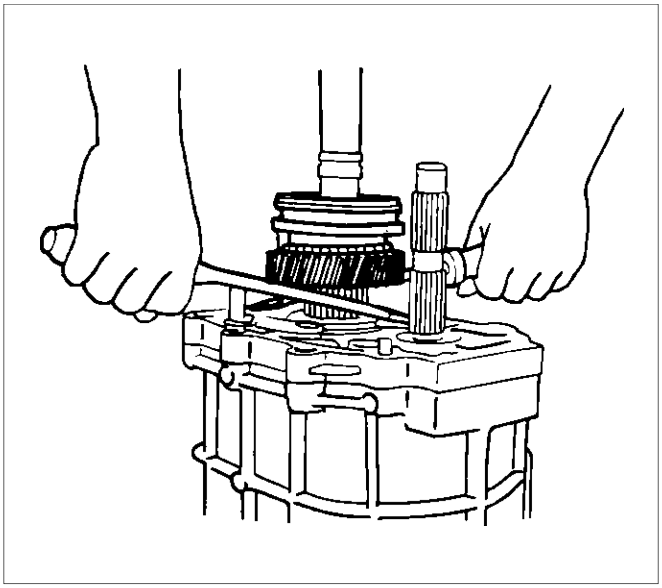
226RW210

- Use the mainshaft nut wrench 5-8840-2156-0 to remove the mainshaft nut.



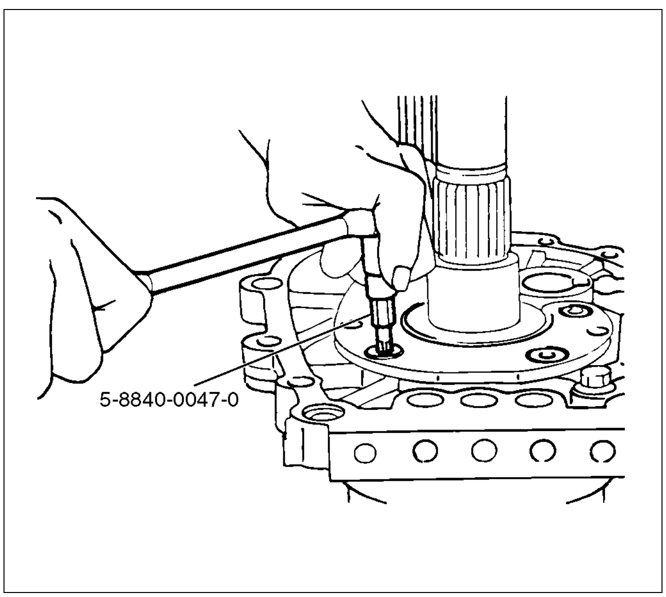
226RW211

13. Use screw drivers between the reverse gear and the bearing plate to remove the Rev-5th synchronizer assembly together with the reverse block ring and reverse gear.



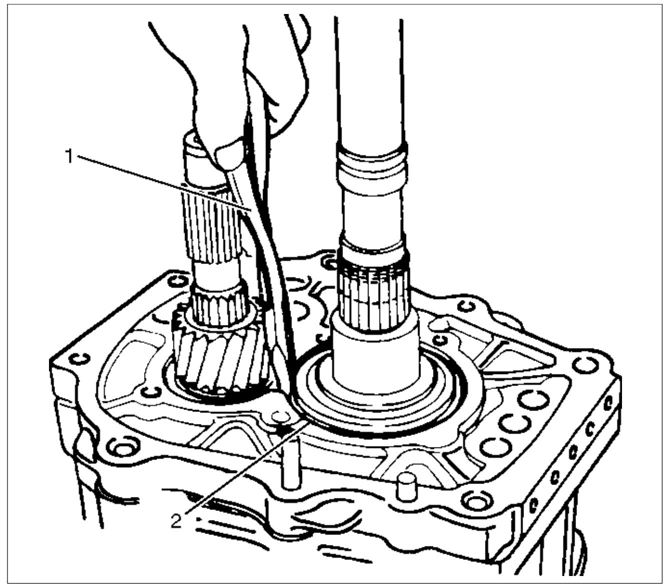
226RS010

14. Remove the needle bearing.
15. Use the torx bit wrench (T- 45) 5-8840-0047-0 to remove the bearing plate and screw from the intermediate plate.



220RW137

16. Use the snap ring pliers (1) to remove the mainshaft bearing snap ring (2).



226RS011

17. Hold the snap ring open with the pliers.

    Push the intermediate plate toward the rear of the transmission to remove it.

    The bearing snap ring will come free.

Inspection and Repair

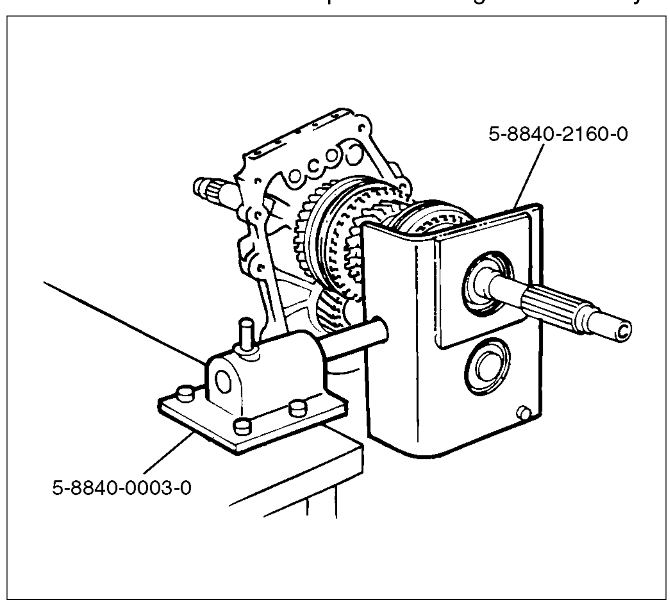
Refer to Top Gear Shaft, Main Gear Shaft, and Counter Gear in this section for inspection and repair.

Reassembly

1. Mesh the counter gear with the mainshaft assembly.

   Set the holding fixture 5-8840-2160-0 to the mainshaft and the counter gear and then install it on the base 5-8840-0003-0.

   Install the intermediate plate on the gear assembly.



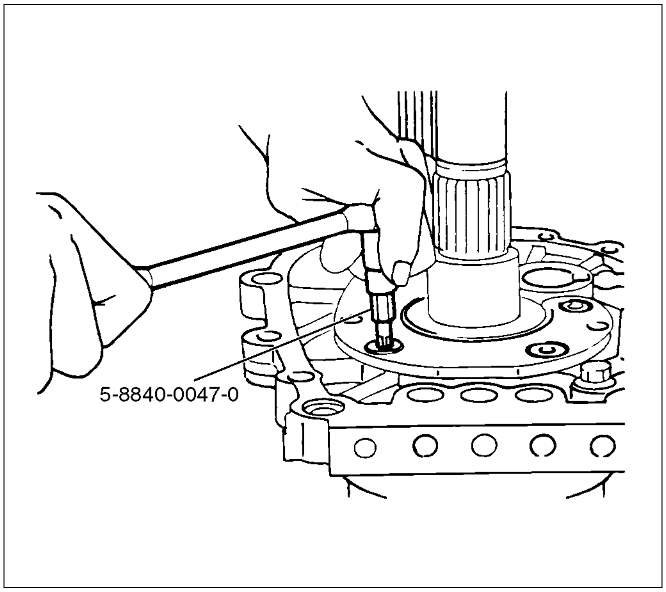
226RW212

2. Install the bearing snap ring.
3. Apply recommended thread locking agents (LOCTITE 242) or equivalent to each of the bearing plate screw threads.

   Install the bearing plate and screw.

   Tighten the screws to the specified torque by using torx bit wrench (T- 45) 5-8840-0047-0.

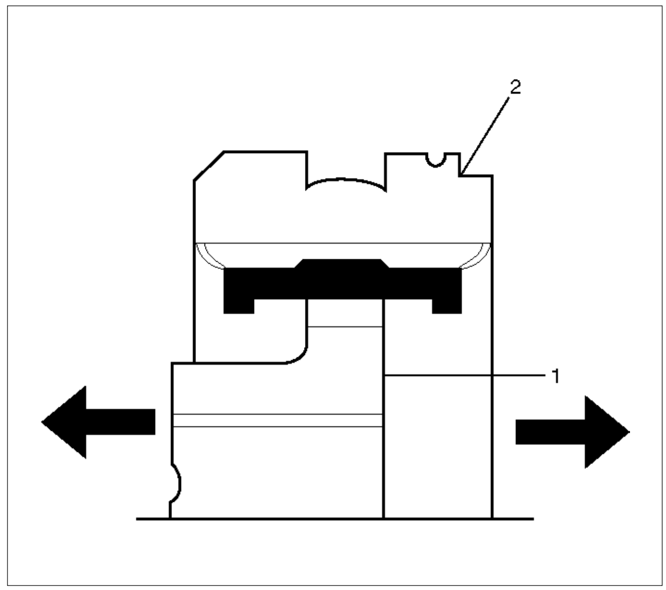
   Torque: 15 N·m (1.5 kgf·m/11 lb·ft)



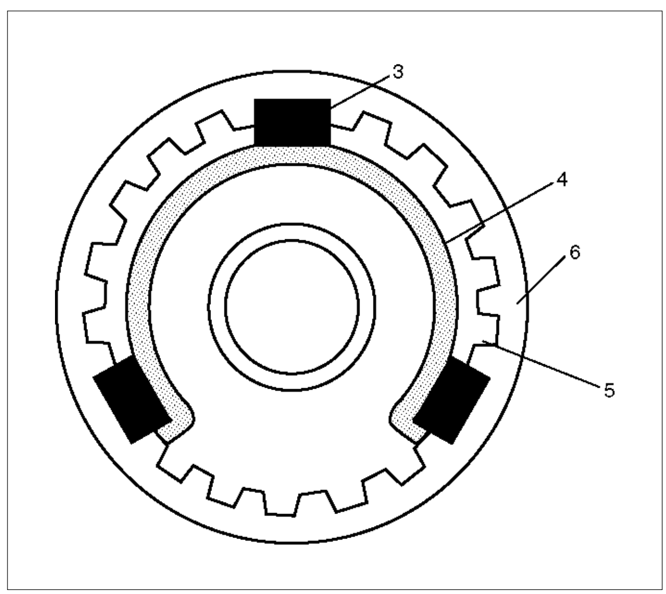
220RW137

4. Install the needle bearing, reverse gear and reverse block ring.
5. Assemble the rev-5th synchronizer assembly by performing the following steps.
   1. Turn the clutch hub face (1) toward the sleeve groove (2) (rear side) on the outer circumference.
   2. Check that the inserts (3) fit snugly into the clutch hub (5) ring insert grooves.
   3. Check that the inserts springs (4) are fitted to the inserts as shown in the illustration.
   4. Check that the clutch hub (5) and the sleeve (6) slide smoothly.
   5. Install the synchronizer assembly to the mainshaft.

   The clutch hub face with the heavy boss must be facing the reverse gear side.

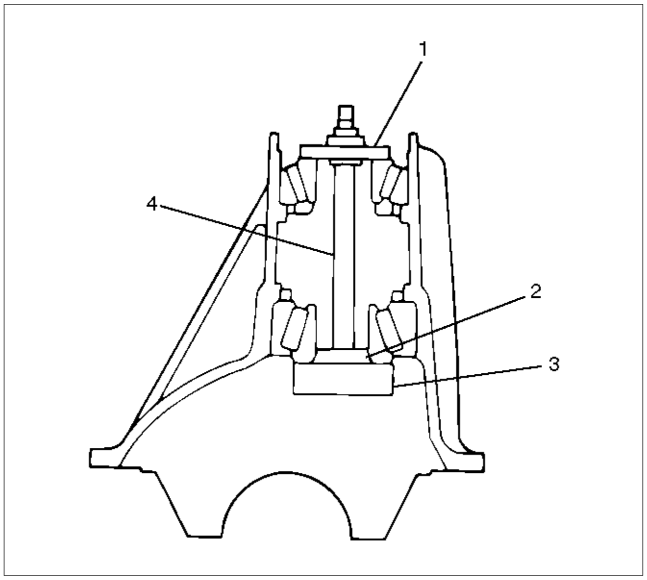


226RS013



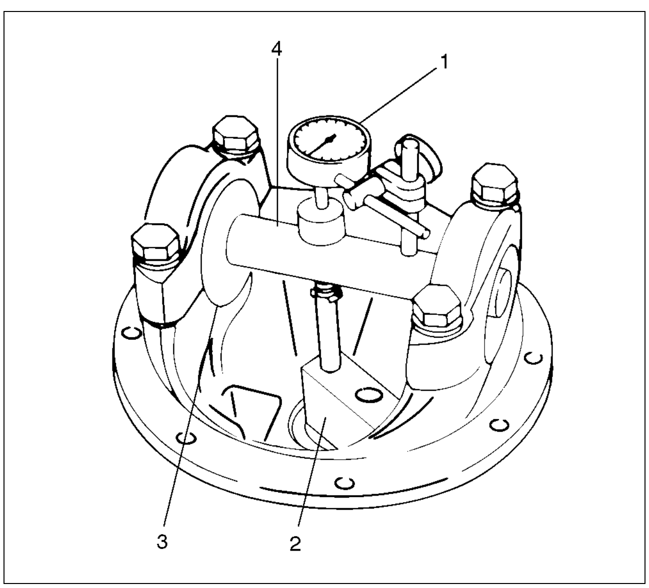
226RS049

b. Tighten the nut to the specified torque.
Torque:
ϕ220mm : 2.7 N·m (0.28 kgf·m/24 lb·in)
ϕ194mm : 2.3 N·m (0.23 kgf·m/20 lb·in)



425RW030

c. Clean the side bearing bores. Place discs and dial indicator on to arbor, and place tool into position in side bearing bores. Install and tighten the bearing caps to the specified torque.
Torque : ϕ220mm : 108N·m (11 kgf·m/80 lb·ft)
ϕ194mm : 94N·m (10 kgf·m/72 lb·ft)



425RW031

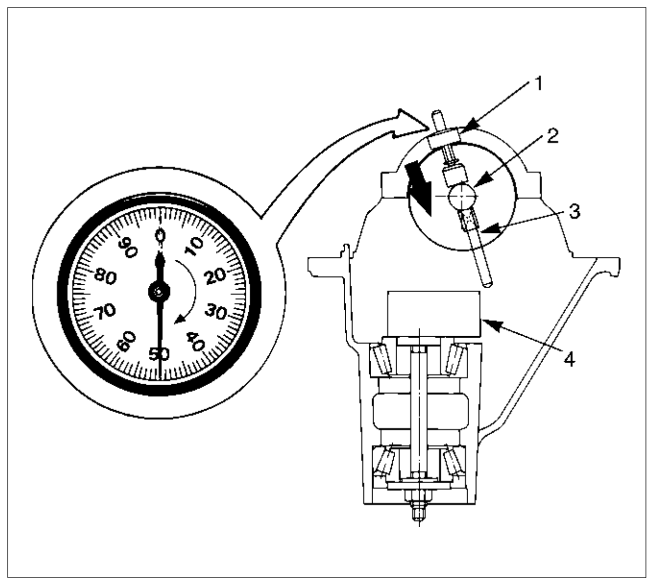
Legend

ϕ220mm
1. Dial Indicator : 5-8840-0126-0
2. Gauge Plate : 5-8840-2166-0
3. Disc (2 pcs.) : 5-8840-2167-0
4. Arbor : 5-8840-0128-0

ϕ194mm
1. Dial Indicator : 5-8840-0126-0
2. Gauge Plate : 5-8840-2087-0
3. Disc (2 pcs.) : 5-8840-2088-0
4. Arbor : 5-8840-0128-0

Note :
The scale on the dial indicator (5-8840-0126-0) is inch unit.

d. Set the dial indicator 5-8840-0126-0 to “0”. Place it on the mounting post of the gauging arbor with the contact button touching the indicator pad. Force the dial indicator downward until the needle has made a half turn clockwise. Tighten down the dial indicator in this position.



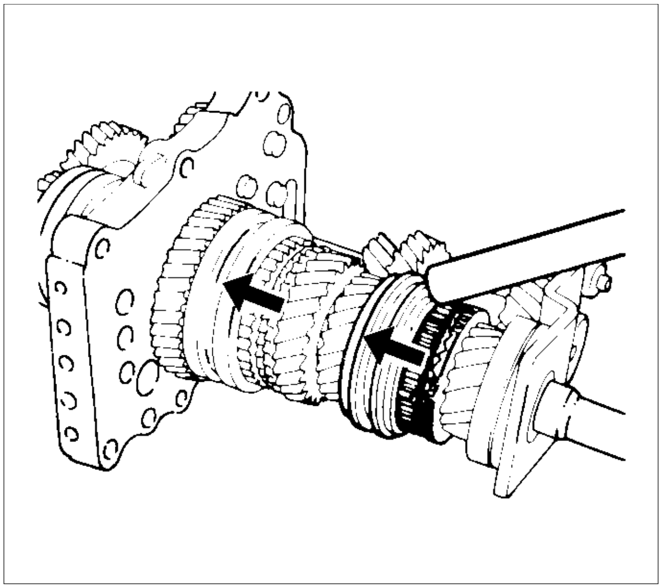
425RS020

Legend

1. Dial Indicator
2. Gauging Arbor
3. Plunger
4. Gauge Plate

e. Position the plunger on the gauge plate. Move the gauging arbor slowly back and forth and locate the position at which the dial indicator shows the greatest deflection. At this point, once again set the dial indicator to “0”.
Repeat the procedure to verify the “0” setting.

6. Mesh the 1st-2nd and 3rd-4th synchronizers with both the 1st and 3rd gears (double engagement).



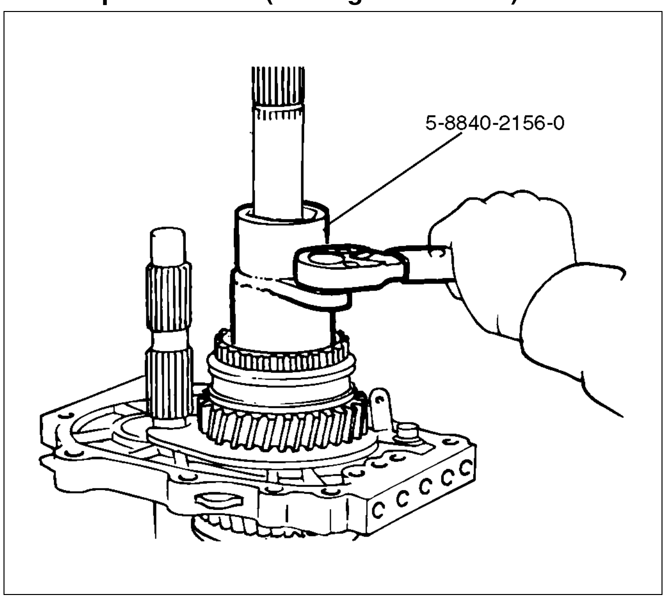
226RS015

This will prevent the mainshaft from turning.

7. Install the new mainshaft hub nut.

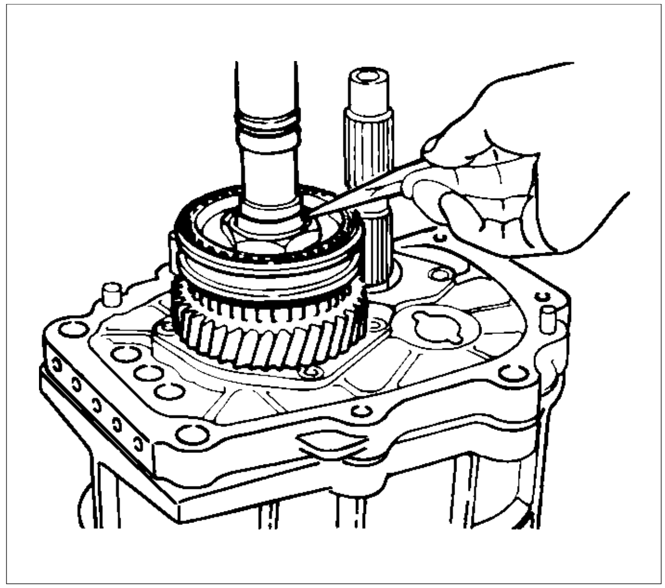
Use the mainshaft nut wrench 5-8840-2156-0 to tighten the mainshaft nut to the specified torque.

Torque: 137 N·m (14.0 kgf·m/101 lb·ft)



226RW214

8. Use a punch to stake the mainshaft nut.

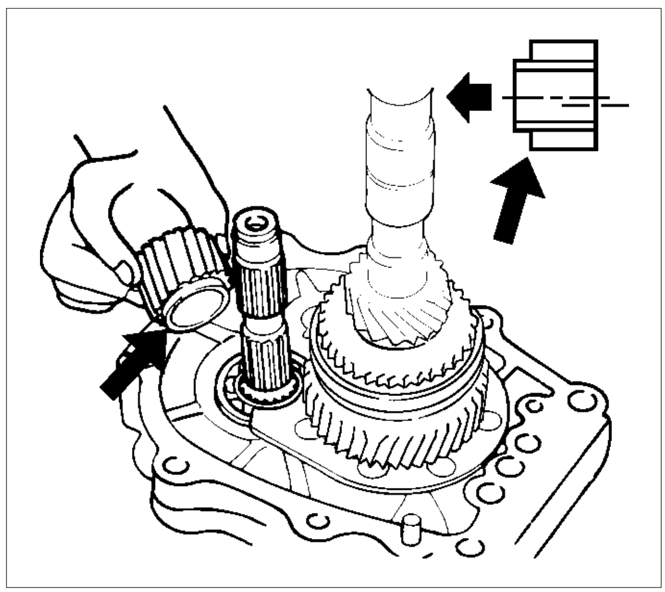


226RW153

9. Install the needle bearing, 5th block ring, and 5th gear.
10. Apply engine oil to the counter reverse gear and the reverse gear.

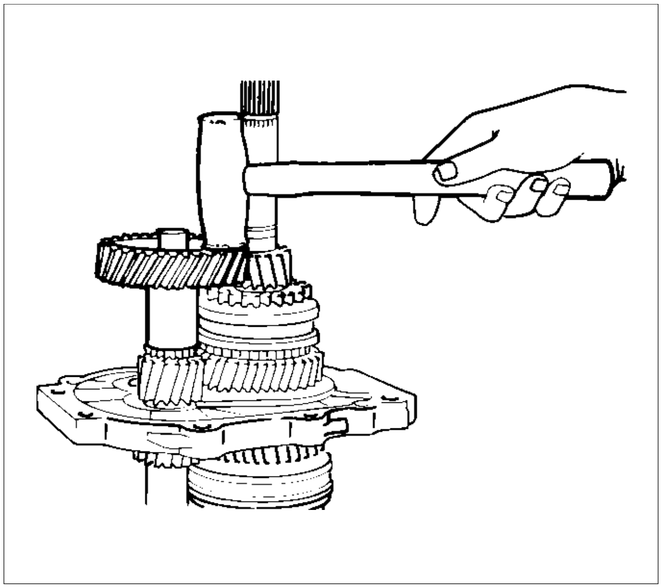
Install the counter reverse gear to the counter shaft.

The reverse gear projection must be facing the intermediate plate.



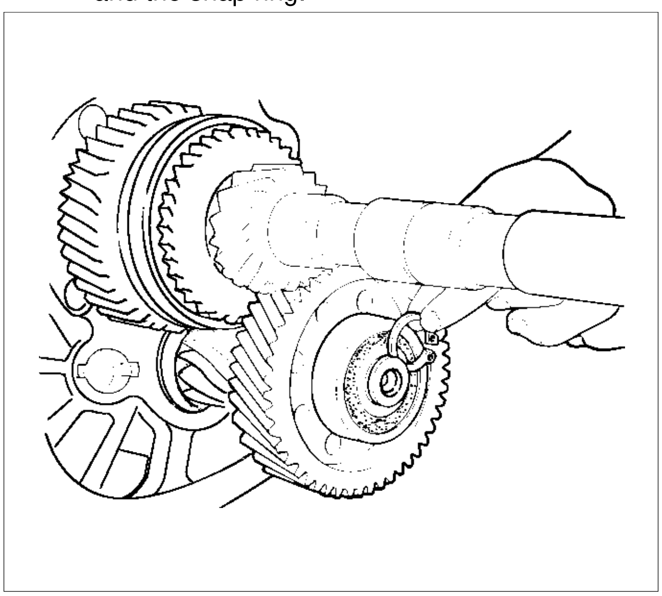
226RW151

11. Install the counter 5th gear to the counter shaft.



226RS019

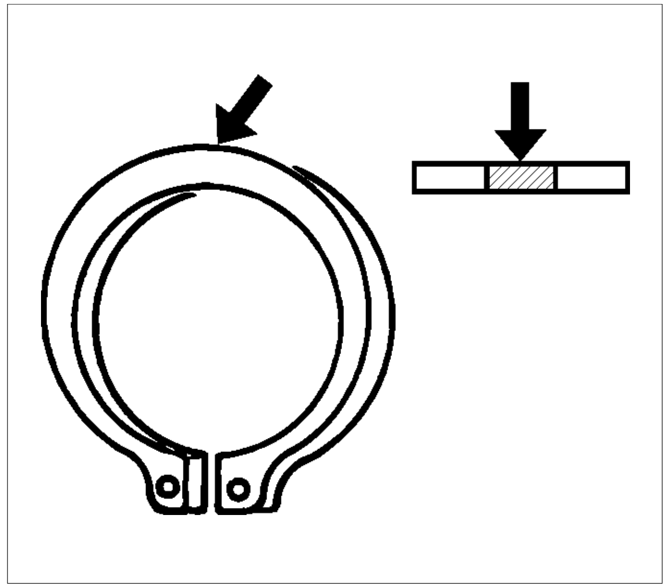
12. Install the ball bearing and bearing snap ring by performing the following steps:
    - Select the snap ring which will provide the minimum clearance between the ball bearing and the snap ring.



226RS020

- There are six snap ring sizes available.

  The snap rings are color‐ coded to indicate their thickness.



226RS021

Ball Bearing and Snap Ring Clearance

Standard: 0 - 0.15 mm (0 - 0.0059 in)

Snap Ring Availability

Thickness	Color Coding
1.1 mm (0.043 in)	White
1.2 mm (0.047 in)	Yellow
1.3 mm (0.051 in)	Blue
1.4 mm (0.055 in)	Pink
1.5 mm (0.059 in)	Green
1.6 mm (0.063 in)	Brown

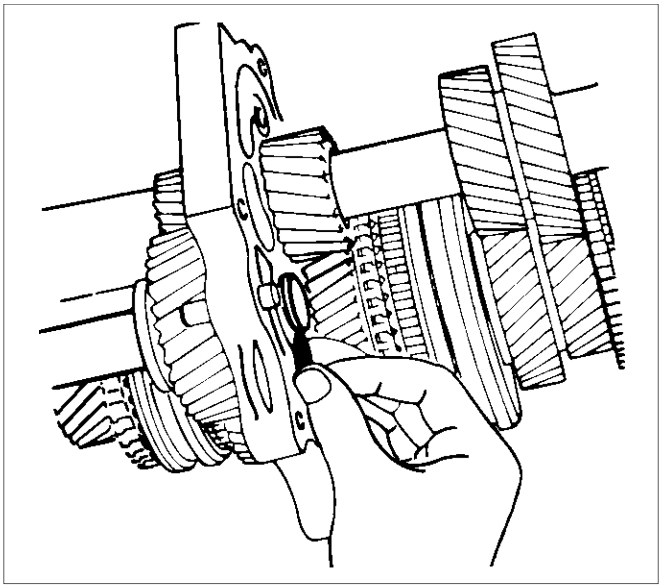
- Use a pair of snap ring pliers to install the snap ring to the counter gear shaft.

  The snap ring must be fully inserted into the counter gear shaft snap ring groove.

13. Assemble the reverse idler shaft, reverse idler gear, thrust washer, and idle shaft pin into the reverse idler gear assembly.

    The thrust washer should be assembled with the oil groove faces to gear side.

14. Select the reverse idler gear snap ring which will provide the minimum clearance between the intermediate plate and the snap ring.



226RS022

- There are three snap ring sizes available.

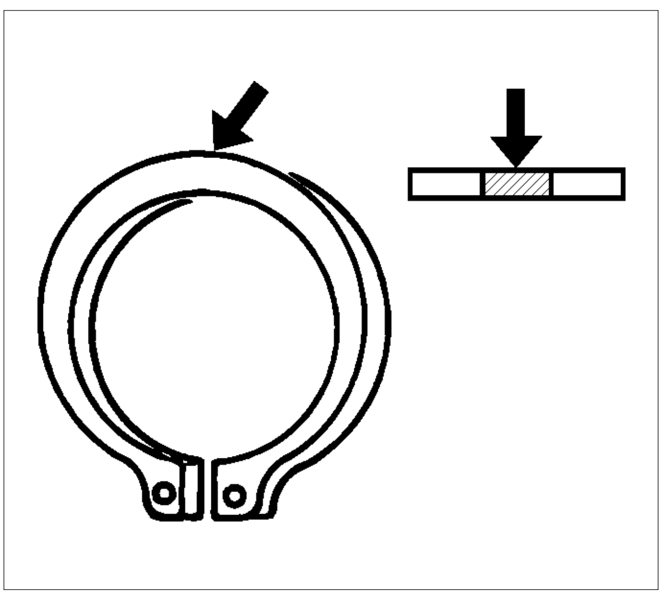
  The snap rings are color-coded to indicate their thickness.

Intermediate Plate and Snap Ring Clearance

Standard: 0 - 0.15 mm (0 - 0.0059 in)

Snap Ring Availability

Thickness	Color Coding
1.2 mm (0.047 in)	White
1.3 mm (0.051 in)	Yellow
1.4 mm (0.055 in)	Blue



226RS021

- Use a pair of snap ring pliers to install the snap ring to the reverse idler shaft.

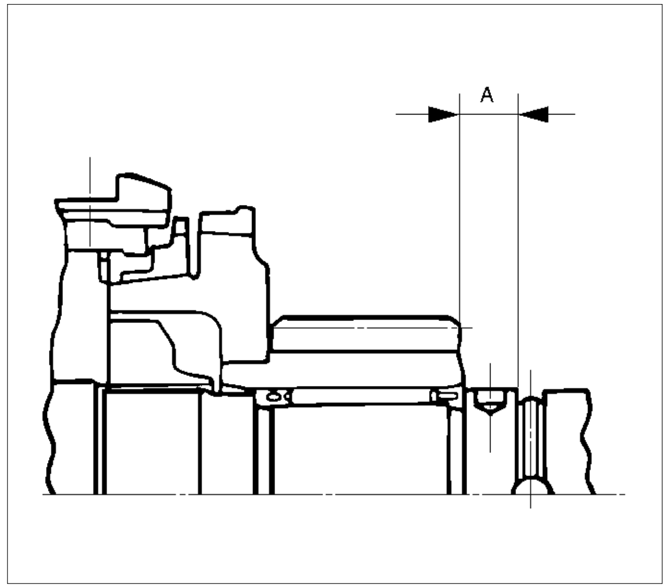
  The snap ring must be fully inserted into the reverse idler shaft snap ring groove.

15. Install the thrust washer and lock ball by performing the following steps:
    - Use a thickness gauge to measure the clearance between the 5th gear and the thrust washer.

5th Gear and Thrust Washer Clearance

Standard: 0.10 - 0.25 mm (0.004 - 0.010 in)

- Measure clearance "A" as shown in the figure.



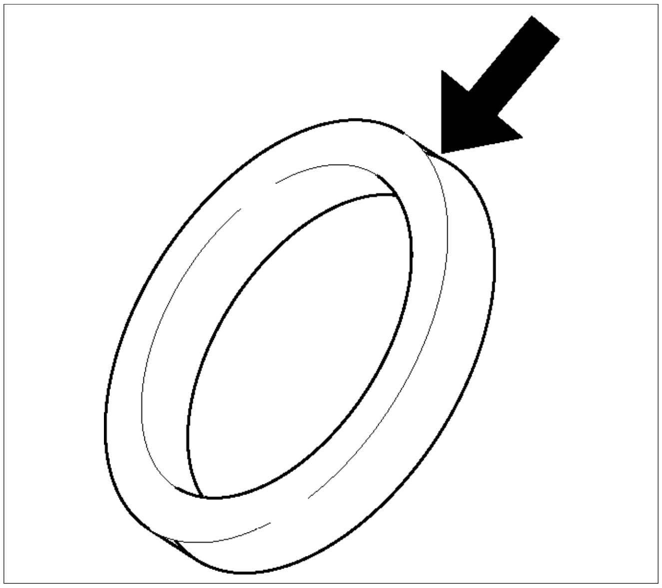
226RS023

- Select an appropriate thrust washer from the chart.
- There are four thrust washer sizes available.

Thrust Washer Availability

Thickness mm (in)	Color Coding	A mm (in)	Clearance mm (in)
7.9 (0.311)	White	8.05 - 8.1 (0.317-0.319)	0.15 - 0.25 (0.006-0.010)
8.0 (0.315)	Yellow	8.1 - 8.2 (0.319-0.323)	0.1 - 0.25 (0.004-0.010)
8.1 (0.319)	Green	8.2 - 8.3 (0.323-0.327)	0.1 - 0.25 (0.004-0.010)
8.2 (0.323)	Blue	8.3 - 8.36 (0.327-0.329)	0.1 - 0.21 (0.004-0.008)

- The thrust washers are color coded to indicate their thickness as shown in the figure.

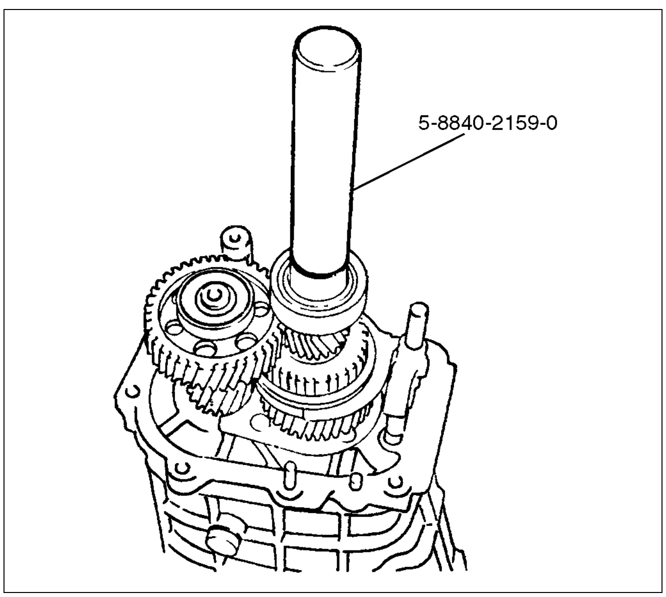


226RS024

- Apply grease to the thrust washer and the lock ball.
- Install the thrust washer and the lock ball.

16. Install the thrust plate and retainer.
17. Apply engine oil to the bearing inner and outer circumference.

    Use the installer 5-8840-2159-0 to install the ball bearing to the mainshaft.



226L100002

18. Apply engine oil to the oil seal collar inner circumference.

    Install the oil seal collar to the mainshaft by using the installer 5-8840-2159-0.
19. Install the oil seal collar snap ring.

Top Gear Shaft, Main Gear Shaft, and Counter Gear Shaft

Disassembled View

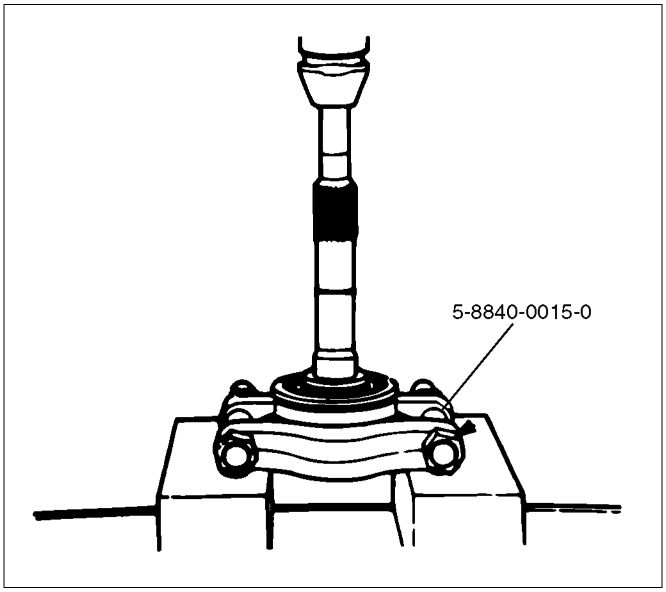
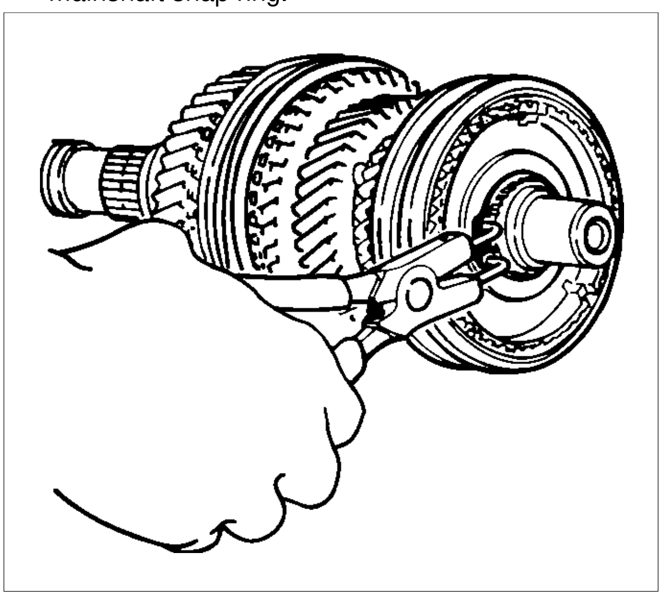
Disassembly

1. Use a pair of snap ring pliers to remove the top gear shaft snap ring.
2. Remove the top gear shaft with ball bearing.
3. Use a bench press and the bearing remover 5-8840-0015-0 to remove the ball bearing.



226RW216

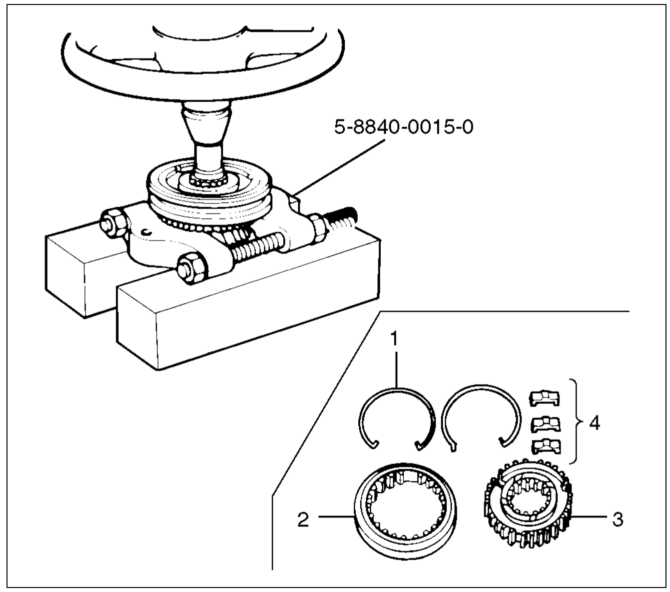
4. Remove the needle bearing and top block ring, mainshaft snap ring.
5. Use a pair of snap ring pliers to remove the mainshaft snap ring.



226RS008

6. Use a bench press and the bearing remover 5-8840-0015-0 to remove the 3rd-4th synchronizer assembly as a set.

   Disassemble the synchronizer assembly.

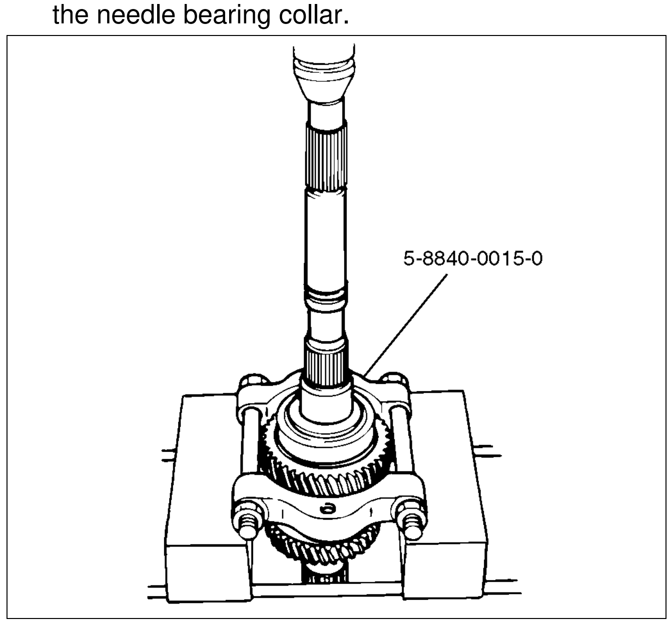


226RW217

Legend

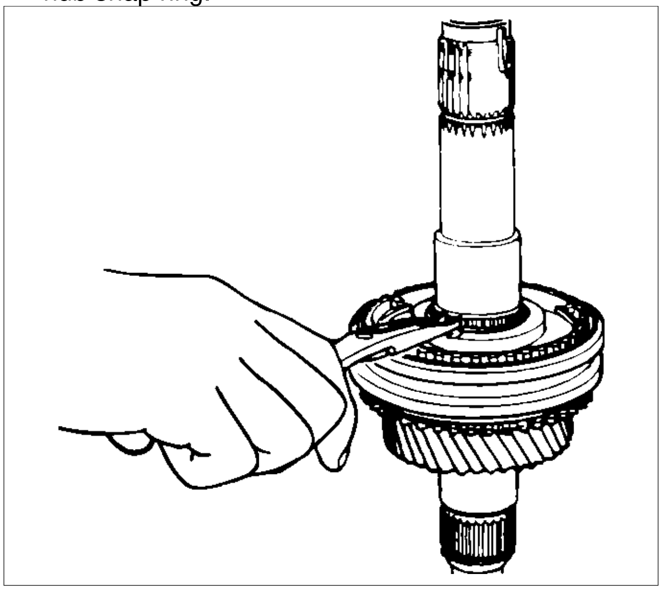
(1) Springs
(2) Sleeve
(3) Clutch Hub
(4) Inserts

7. Remove the 3rd block ring, 3rd gear, and needle bearing.
8. Use a bench press and the bearing remover 5-8840-0015-0 to remove the 1st gear together with the mainshaft ball bearing, 1st gear thrust bearing, and the needle bearing collar.



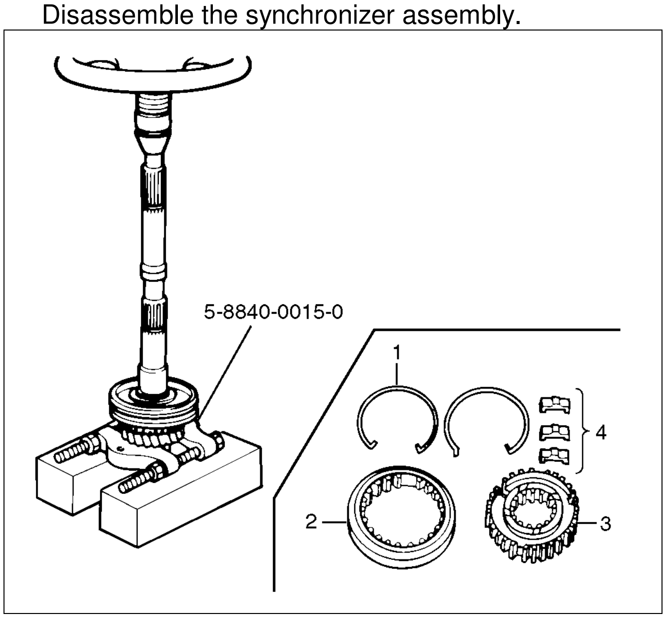
226RW218

9.Disassemble the 1st inside ring, 1st outside ring, and 1st block ring.
10.Remove the needle bearing.
11.Use a pair of snap ring pliers to remove the clutch hub snap ring.



226RS031

12.Use a bench press and the bearing remover 5-8840-0015-0 to remove the 2nd gear together with 1st-2nd synchronizer assembly, 2nd block ring, 2nd outside ring, and inside ring.
Disassemble the synchronizer assembly.

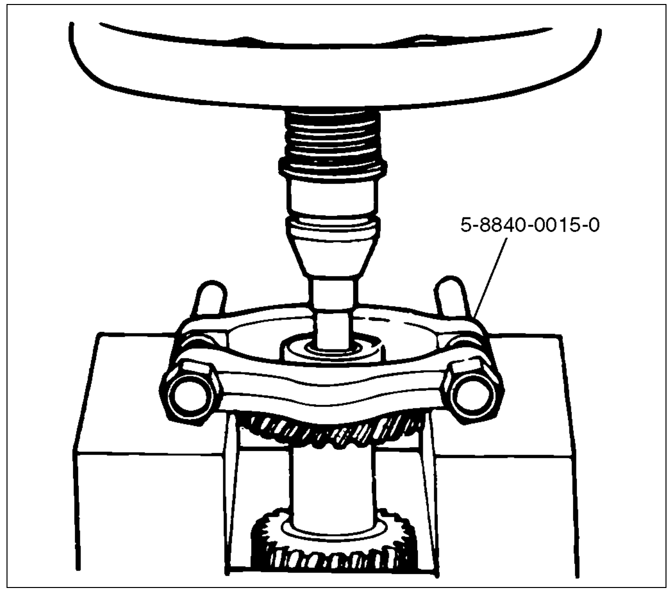


226RW220

Legend

(1) Springs
(2) Sleeve
(3) Clutch Hub
(4) Inserts

13. Remove the needle bearing from the mainshaft.
14. Remove the bearing snap ring.
15. Remove the front roller bearing by performing the following steps.
    - Remove the ring, outer race and bearing assembly by using a bench press and remover 5-8840-0015-0.
    - Remove the inner race by using a bench press and remover 5-8840-0015-0.



226RW219

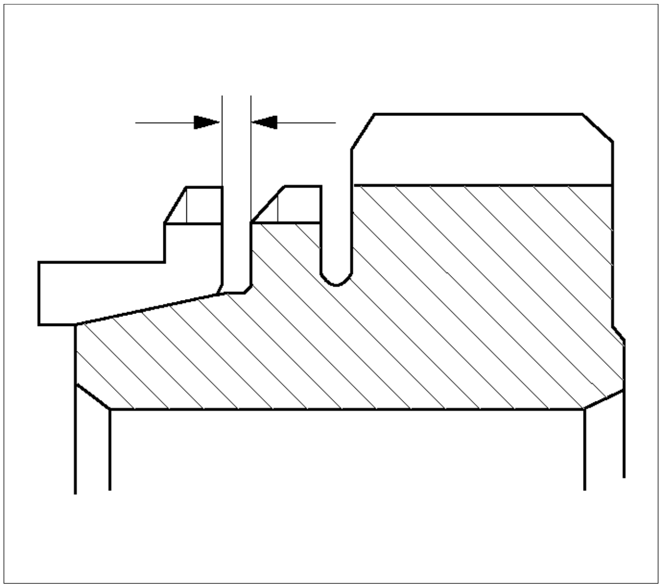
16. Remove the center roller bearing from the counter gear shaft.

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

Block Ring and Dog Teeth Clearance

- Use a thickness gauge to measure the clearance between the block ring and the dog teeth.



226RS035

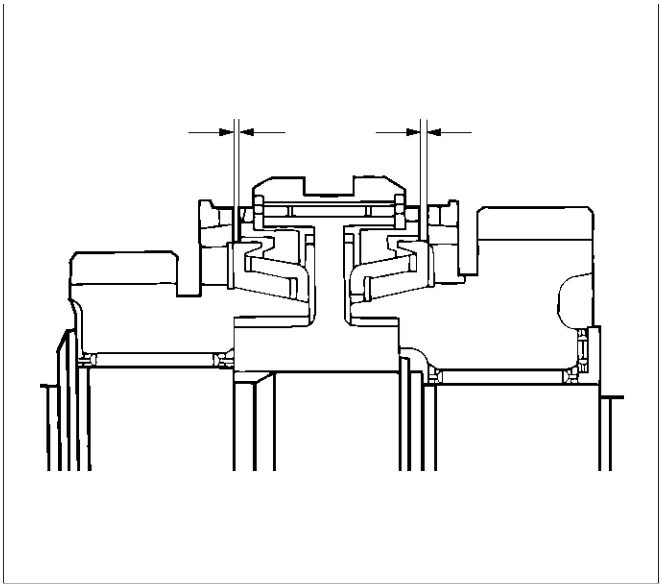
If the measured value exceeds the specified limit, the block ring must be replaced.

Block Ring and Dog Teeth Clearance

Standard	Limit
1.5 mm (0.059 in)	0.8 mm (0.031 in)

1st-2nd Synchronizer (3-CONE)

- Use a thickness gauge to measure the clearance between the block ring and the dog teeth.



226RS036

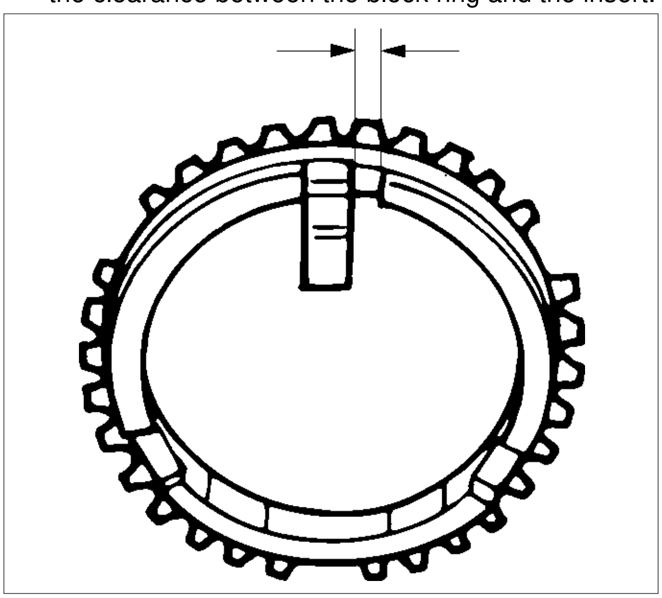
If the measured value exceeds the specified limit, the 1st-2nd synchronizer assembly must be replaced.

Block Ring and Dog Teeth Clearance

Standard	Limit
1.5 mm (0.059 in)	0.8 mm (0.031 in)

Block Ring and Insert Clearance

- Use a vernier caliper or thickness gauge to measure the clearance between the block ring and the insert.



226RS037

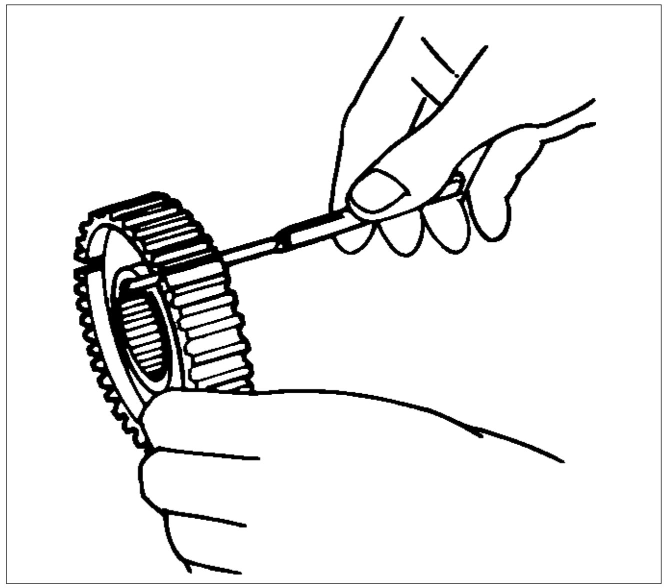
If the measured value exceeds the specified limit, the block ring and the insert must be replaced.

Block and Insert Clearance

	Standard	Limit
3rd-4th	3.46 - 3.76 mm (0.136 - 0.148 in)	4.0 mm (0.157 in)
1st-2nd	3.86 – 4.16 mm (0.152 - 0.164 in)	4.9 mm (0.193 in)
Rev.5th	3.59 - 3.91 mm (0.141 - 0.154 in)	4.1 mm (0.161 in)

Clutch Hub and Insert Clearance

- Use a thickness gauge to measure the clearance between the clutch hub and the insert.

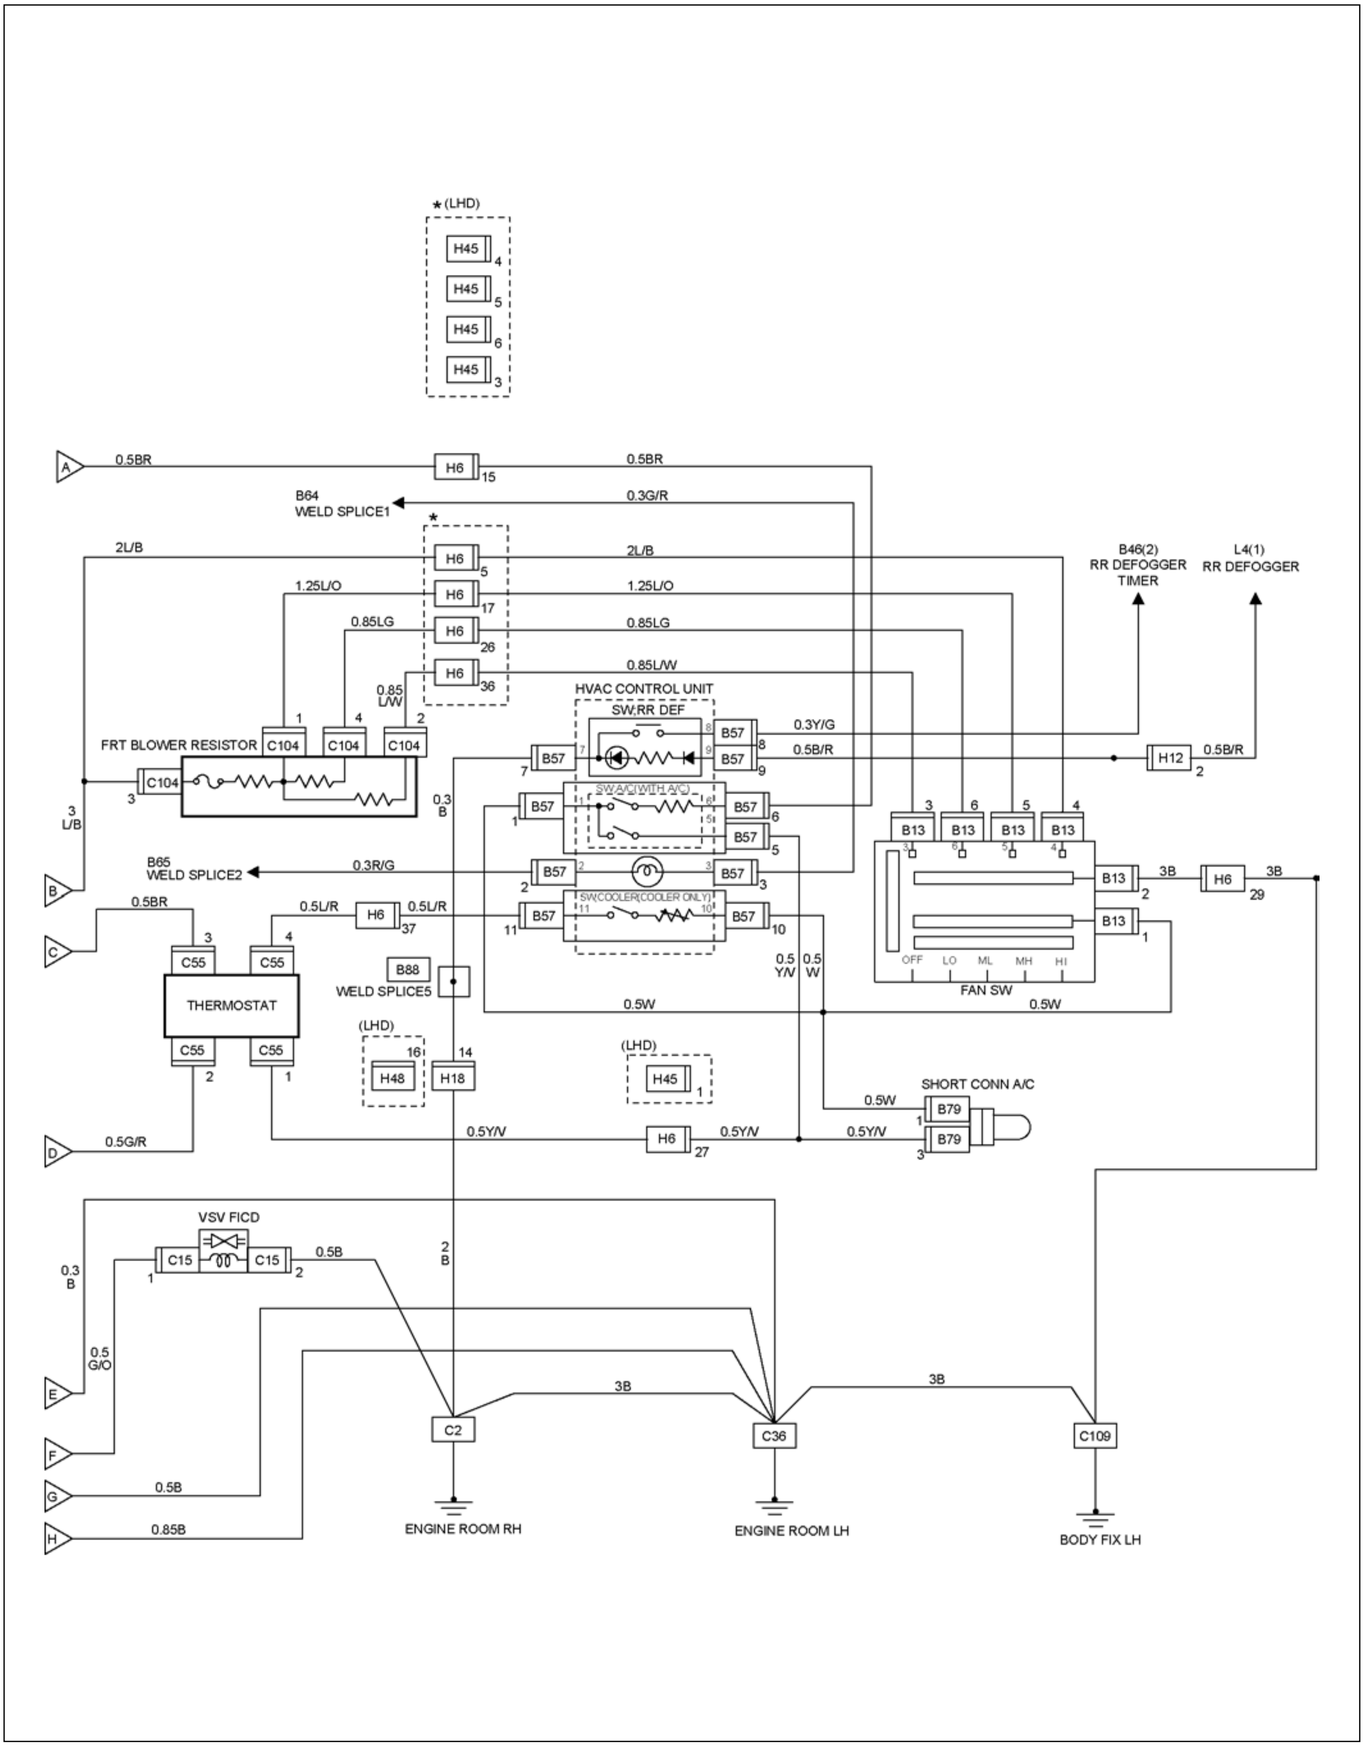


226RS038

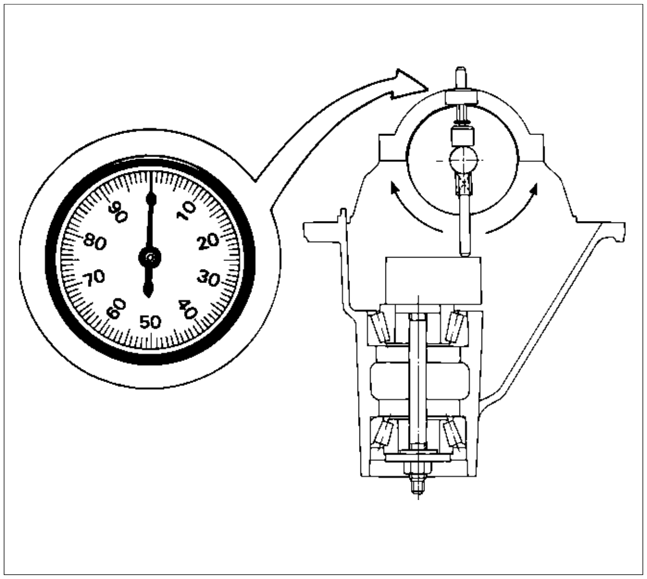
If the measured value exceeds the specified limit, the clutch hub and the insert must be replaced.

Clutch Hub and Insert Clearance

	Standard	Limit
1st-2nd 3rd-4th	0.01 – 0.21 mm (0.0004 - 0.0083 in)	0.3 mm (0.012 in)
Rev-5th	0.09 – 0.31 mm (0.0035 - 0.0122 in)	0.4 mm (0.016 in)

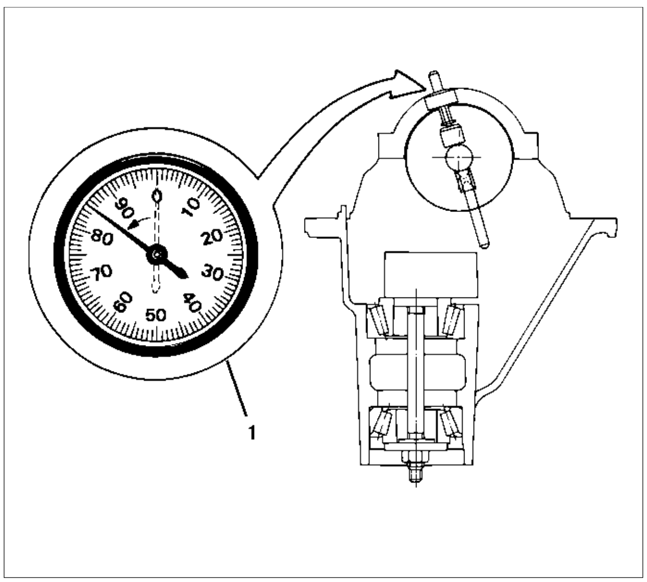


RTW78AXF008301



425RS02

f. After the ZERO setting is obtained, rotate the gauging arbor until the dial indicator rod does not touch the gauging plate. Record the number the dial indicator needle points.

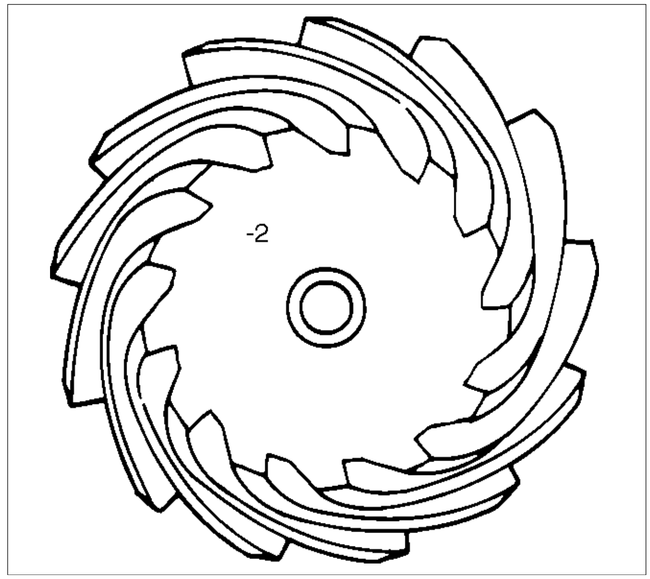


425RS022

Legend

1. Example=Dial indicator reading on 0.085

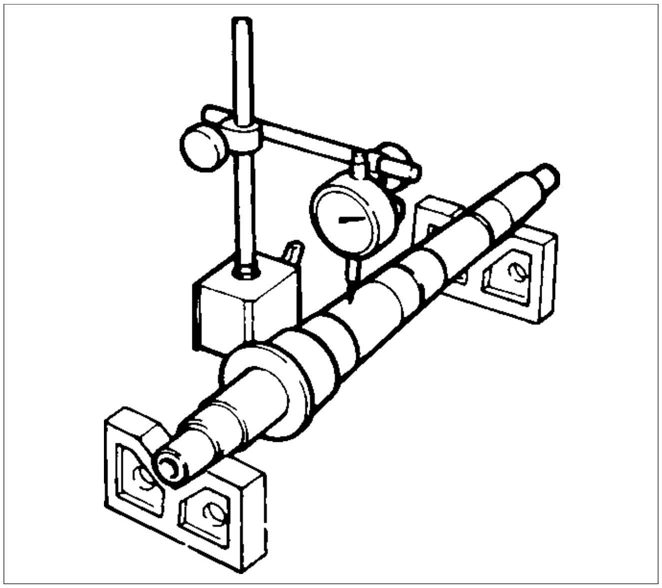
g. Record the pinion depth code on the head of the drive pinion. The number indicates a necessary change in the pinion mounting distance. A plus number indicates the need for a greater mounting distance (which can be achieved by decreasing the shim thickness). A minus number indicates the need for a smaller mounting distance (which can be achieved by increasing the shim thickness). If examination reveals pinion depth code “0”, the pinion is “nominal”.



425RS023

Mainshaft Run-out

- Install the mainshaft to V-blocks.
- Use a dial indicator to measure the mainshaft central portion run-out.



226RS039

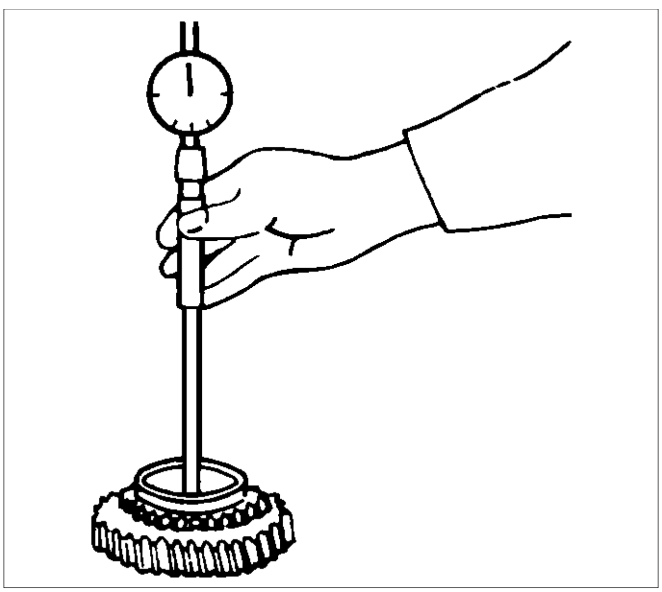
If the measured mainshaft run-out exceeds the specified limit, the mainshaft must be replaced.

Mainshaft Run-out

Limit: 0.05 mm (0.0020 in)

Gear Inside Diameter

- Use an inside dial indicator to measure the gear inside diameter.



226RS040

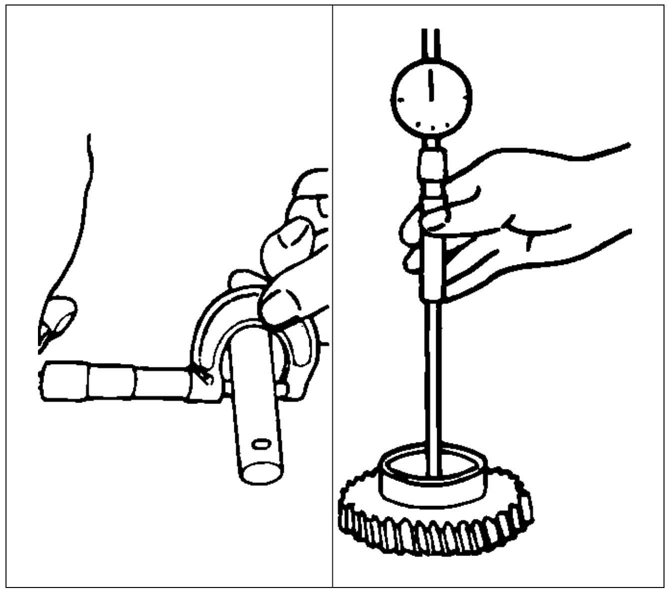
If the measured value is less than the specified limit, the gear must be replaced.

Gear Inside Diameter

	Standard	Limit
1st 3rd	45.000 - 45.013 mm (1.771 - 1.772 in)	45.100 mm (1.776 in)
2nd	52.000 - 52.013 mm (2.047 - 2.048 in)	52.100 mm (2.051 in)
Rev.	48.000 - 48.013 mm (1.889 - 1.890 in)	48.100 mm (1.894 in)
5th	32.000 - 32.013 mm (1.259 - 1.260 in)	32.100 mm (1.246 in)

Reverse Idler Gear and Idler Gear Shaft Clearance

- Use a micrometer to measure the idler gear shaft diameter.
- Use an inside dial indicator to measure the idler gear inside diameter.



226RS041

- Calculate the idler gear and idler gear shaft clearance.

  Idler gear inside diameter-idler gear shaft diameter = idle gear and idler gear shaft clearance.

  If the measured value exceeds the specified limit, the idle gear and/or the idler gear shaft must be replaced

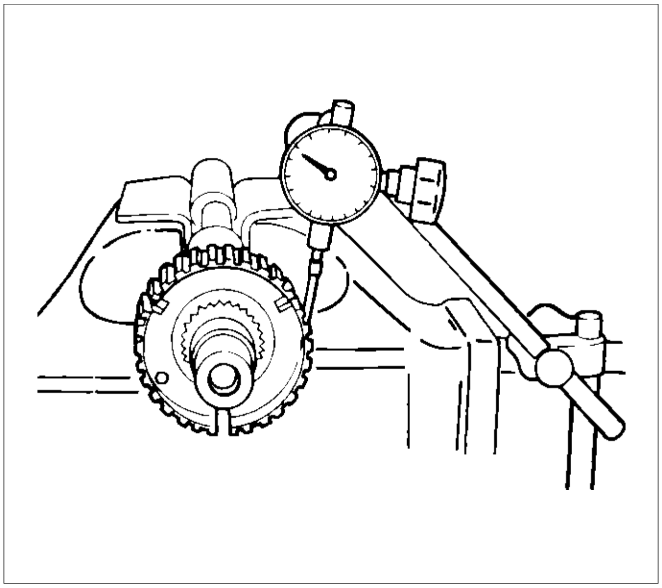
  Idler Gear and Idler Gear Shaft Clearance

  Standard: 0.041 - 0.074 mm (0.0016 -0.0029 in)

  Limit: 0.150 mm (0.0059 in)

Clutch Hub Spline Play

- Set a dial indicator to the clutch hub which requires measuring.



226RS042

- Move the clutch hub as far as possible to the right and left.

  Note the dial indicator reading.

  If the measured value exceeds the specified limit, the clutch hub must be replaced.

Clutch Hub Spline Play

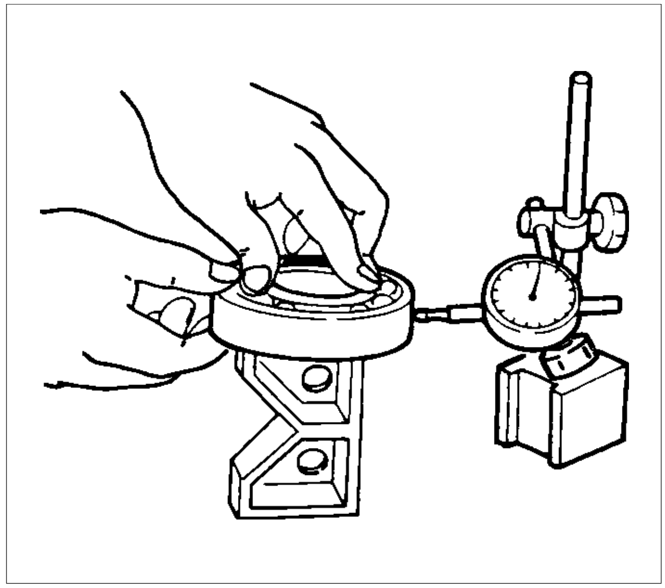
	Standard	Limit
1st-2nd 3rd-4th	0 - 0.1 mm (0 - 0.004 in)	0.2 mm (0.008 in)
Rev. 5th	0 - 0.2 mm (0 - 0.008 in)	0.3 mm (0.012 in)

Ball Bearing Play

- Use a dial indicator to measure the ball bearing play.

  Ball Bearing Play

  Limit: 0.2 mm (0.008 in)

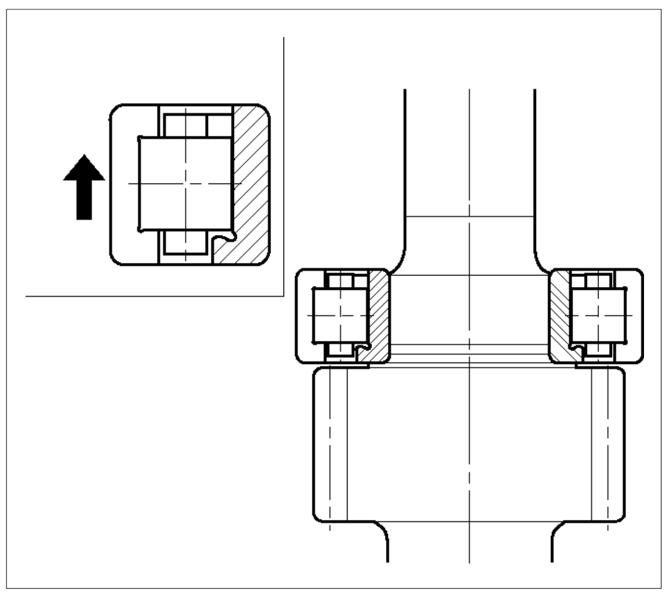


226RS043

Reassembly

1. Install the center roller bearing to the counter gear shaft.
   - Apply engine oil to the bearing inner and outer circumferences.
   - Install the roller bearing in the proper direction.

NOTE: Check that the outer race moves only in the direction of the arrow.

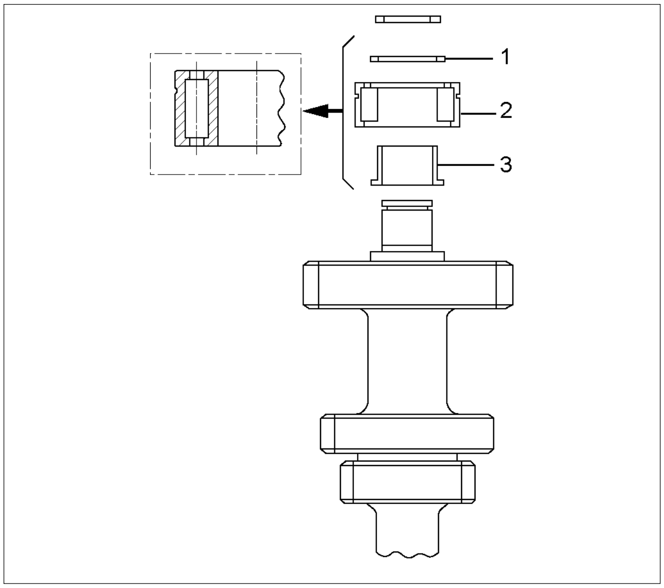


226RS044

2. Install the front roller bearing by performing the following steps.
   - Use the bearing installer 5-8840-2194-0 to install the front roller bearing inner race to the counter gear shaft.
   - Install the outer race and roller assembly.

     The snap ring groove must be facing the transmission front side.

- Use the bearing installer 5-8840-2194-0 to install the ring.



RTW57BSH000101

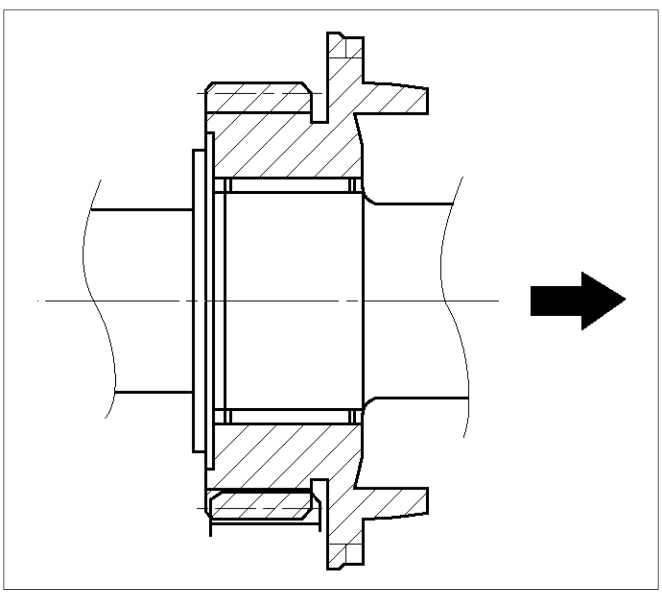
Legend

(1) Ring
(2) Outer Race and Roller Assembly
(3) Inner Race

3. Install the bearing snap ring to the counter gear shaft.
4. Apply engine oil to the needle bearing and the 2nd gear thrust surfaces.

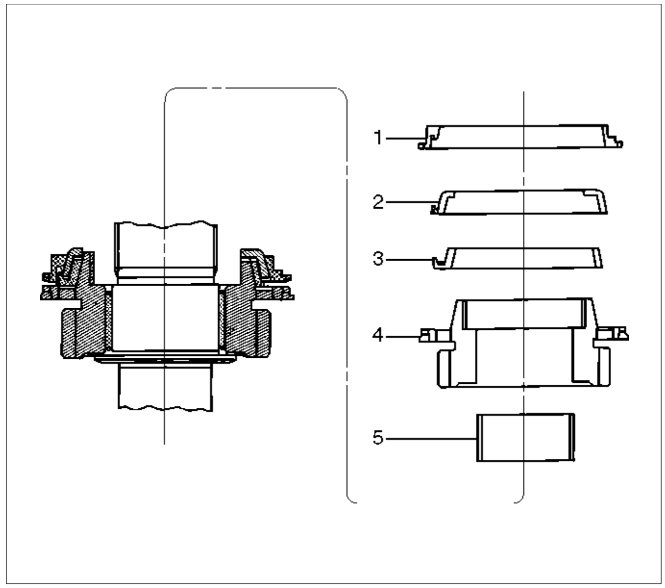
   Install the needle bearing and the 2nd gear to the mainshaft.

   The 2nd gear dog teeth must be facing the transmission rear side.



226RS046

5. Assemble the 2nd inside ring, 2nd outside ring, and the 2nd block ring.
   - Apply engine oil to the synchronizer ring friction surfaces.

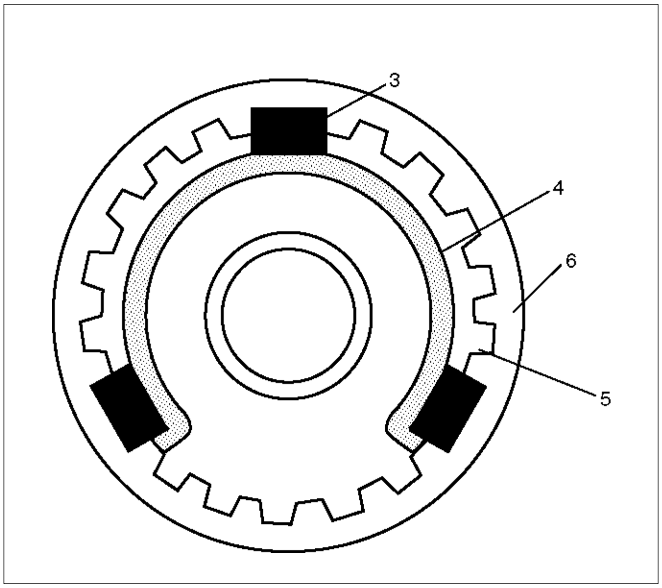


226RS047

Legend

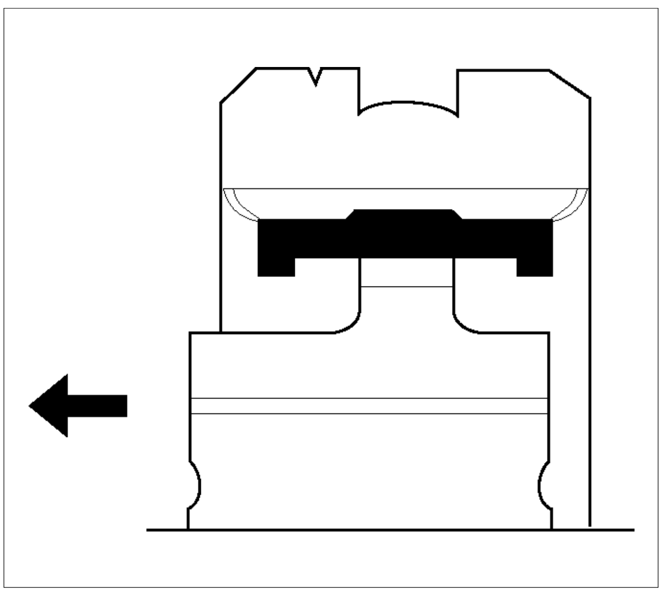
(1) Block Ring
(2) Outside Ring
(3) Inside Ring
(4) 2nd Gear
(5) Needle Bearing

6. Assemble the 1st-2nd synchronizer assembly by performing the following steps:
   1. Check that the inserts (3) fit snugly into the clutch hub (5) insert grooves.
   2. Check that the inserts springs (4) are fitted to the inserts as shown in the illustration.
   3. Check that the clutch hub (5) and the sleeve (6) slide smoothly.



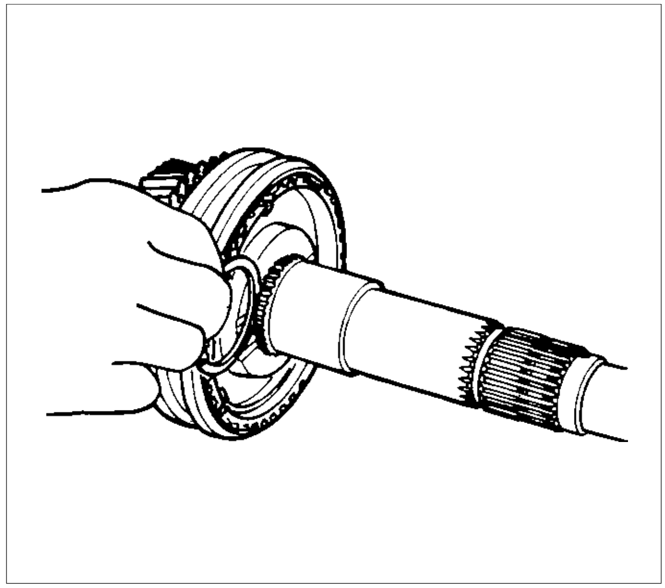
266RS049

7. Install the synchronizer assembly to the mainshaft.
   The clutch hub face (with the heavy boss) must be facing the 2nd gear side.



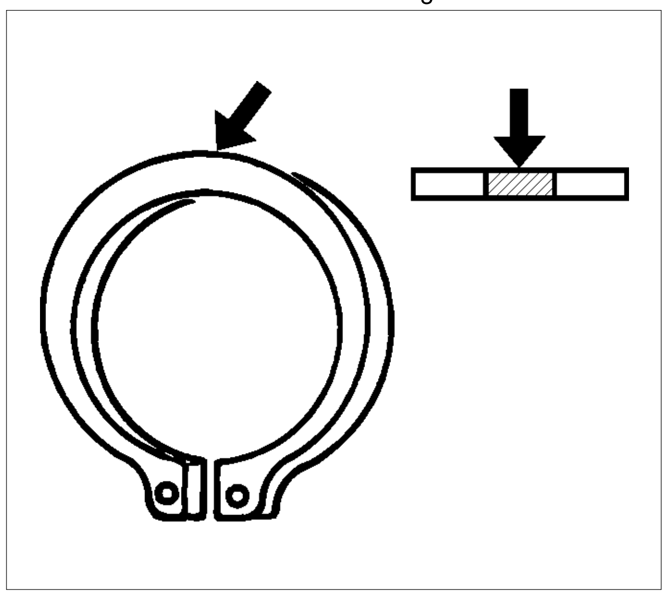
226RS048

8. Install the clutch hub snap ring by performing the following steps:
   - Select the snap ring which will provide the minimum clearance between the 1st-2nd clutch hub and the snap ring.



226RS050

- There are three snap ring sizes available.
- The snap rings are color coded to indicate their thickness as shown in the figure.



226RS021

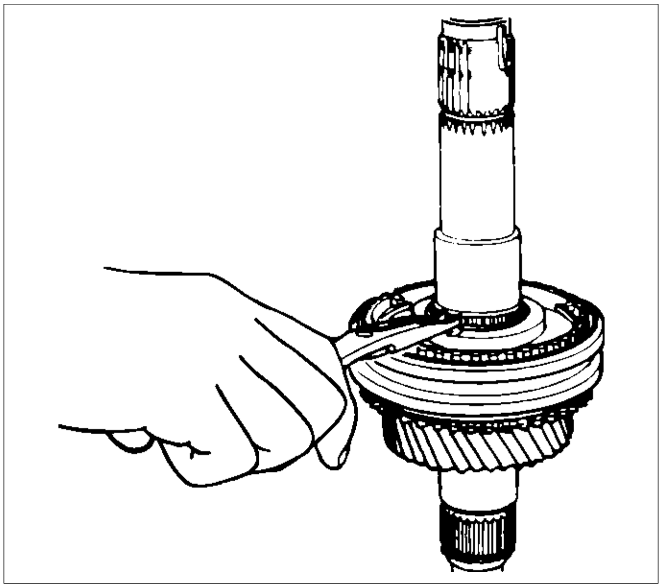
Clutch Hub and Snap Ring Clearance

Standard: 0 - 0.1 mm (0 - 0.004 in)

Snap Ring Availability

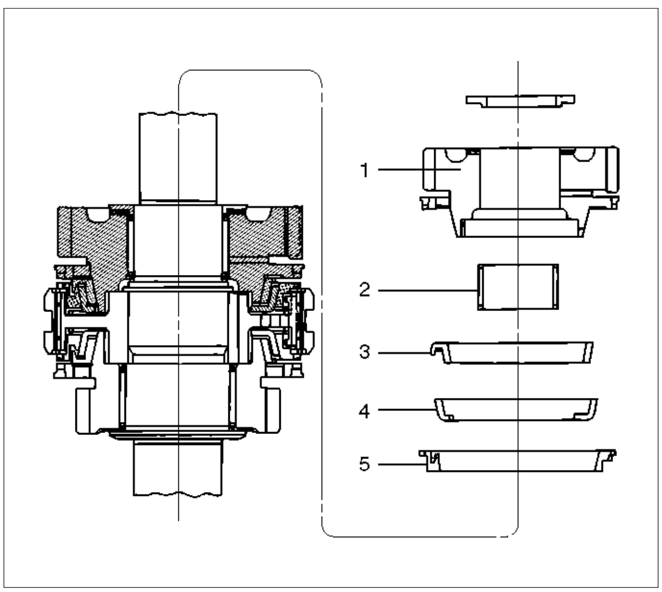
Thickness	Color Coding
1.80 mm (0.071 in)	White
1.85 mm (0.073 in)	Yellow
1.90 mm (0.075 in)	Blue

- Use a pair of snap ring pliers to install the snap ring to the mainshaft.
  The snap ring must be fully inserted into the mainshaft snap ring groove.



226RS031

9. Install the needle bearing, 1st block ring, 1st outside ring, 1st inside ring, and 1st gear.
   - Apply engine oil to the needle bearing, 1st gear thrust surfaces and synchronizer ring friction surfaces.
   - The 1st gear dog teeth must be facing the transmission front side.



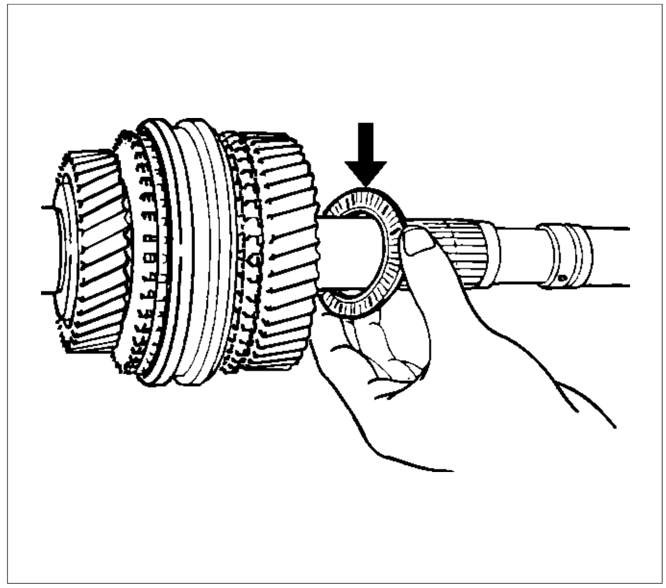
226RS053

Legend

(1) 1st Gear
(2) Needle Bearing
(3) Inside Ring
(4) Outside Ring
(5) Block Ring

10. Install the 1st gear thrust bearing and the race to the main shaft.

    The thrust bearing side must be facing the transmission front side.



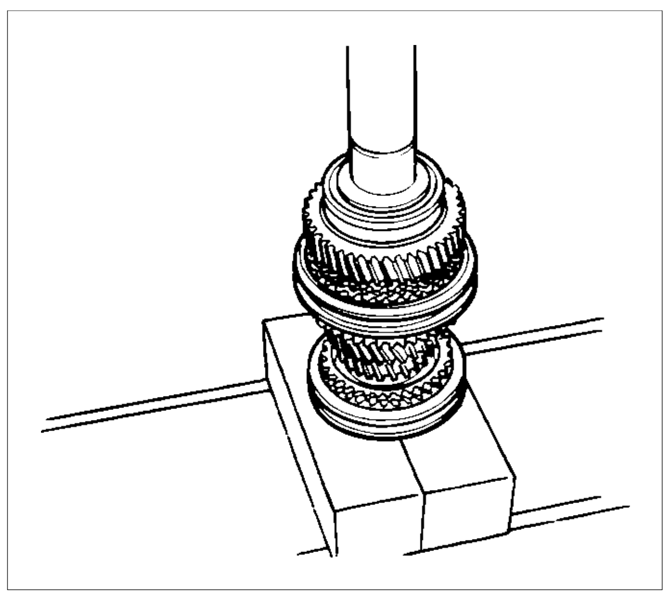
226RS054

11. Apply engine oil to the mainshaft ball bearing and the mainshaft.

    Install the ball bearing and needle bearing collar to the mainshaft.

    The ball bearing snap ring groove must be facing the transmission rear side.

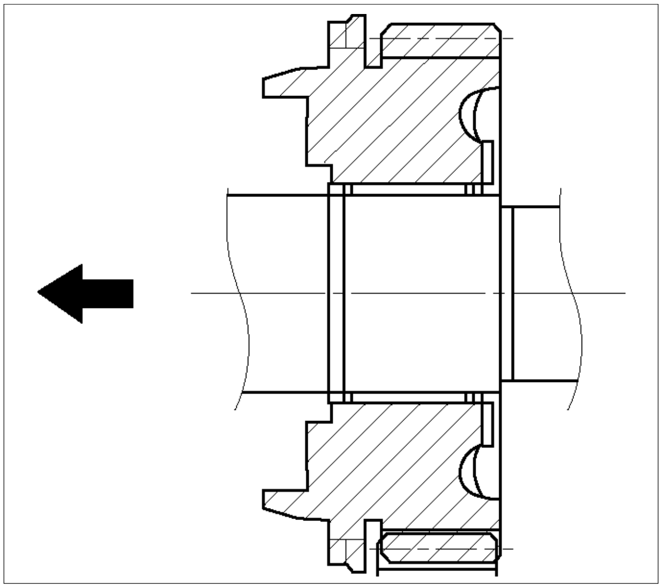
    Use a bench press and installer 9-8522-1165-0 to slowly force the collar into place.



12. Apply engine oil to the needle bearing and the 3rd gear thrust surfaces.

    Install the needle bearing and the 3rd gear to the mainshaft.

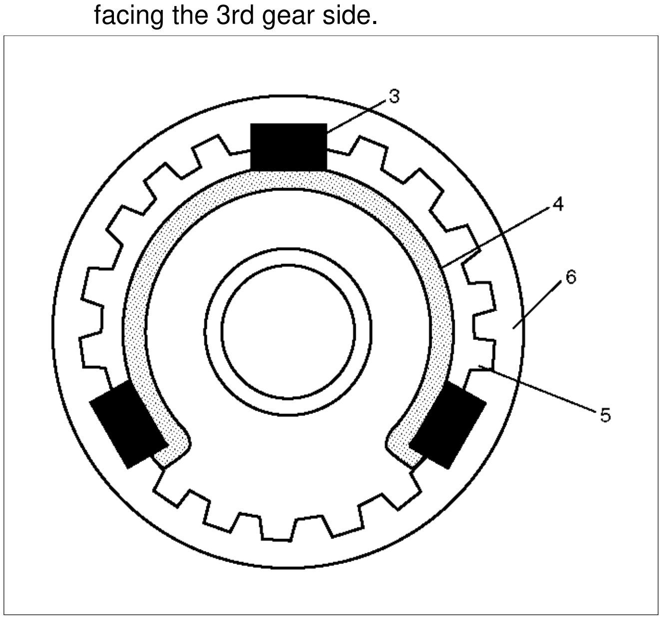
    The 3rd gear dog teeth must be facing the transmission front side.



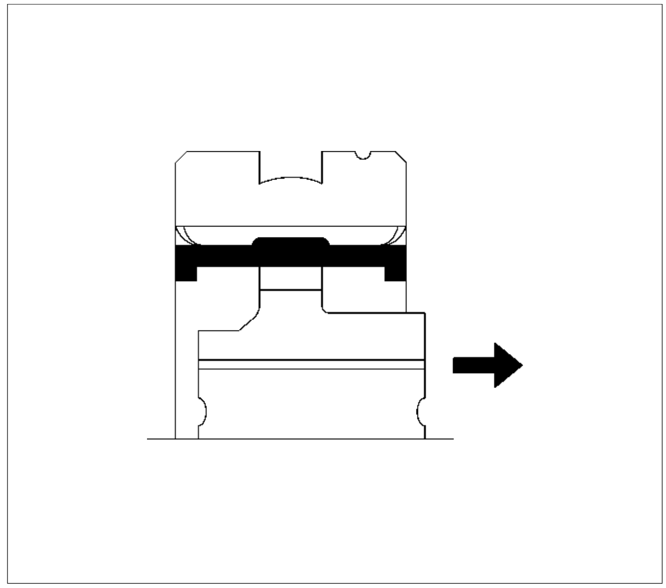
226RS056

13. Install the 3rd block ring.
14. Check and install the 3rd-4th synchronizer assembly by using the following steps:
    1. Check that the inserts (3) fit snugly into the clutch hub insert grooves.
    2. Check that the insert springs (4) are fitted to the inserts as shown in the illustration.
    3. Check that the clutch hub (5) and the sleeve (6) slide smoothly.
    4. Install the synchronizer assembly to the mainshaft.

    The clutch hub face with the heavy boss must be facing the 3rd gear side.



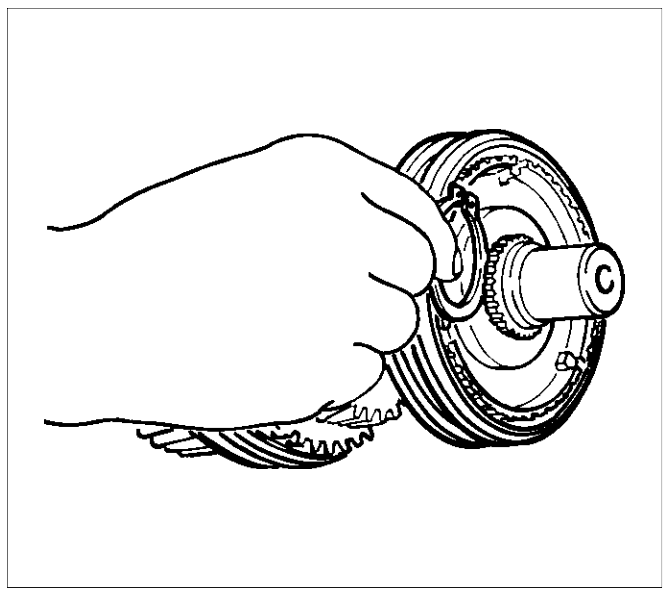
226RS049



226RW221

15. Select and install mainshaft snap ring using the following instructions:

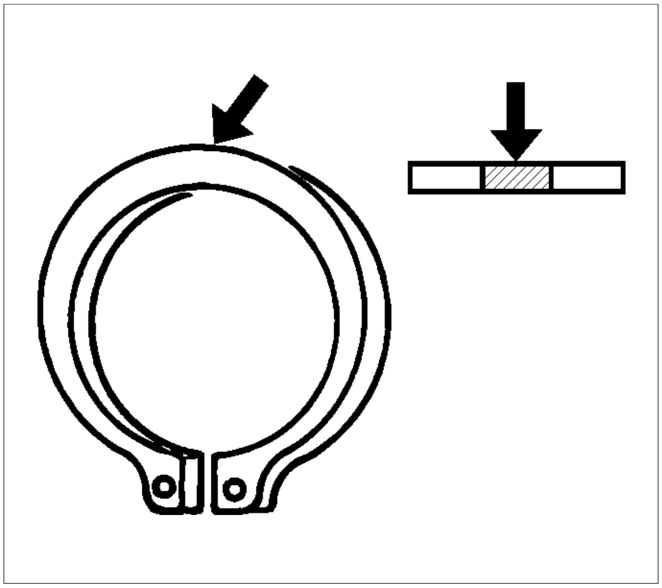
    Select the snap ring which will provide the minimum clearance between the 3rd-4th clutch hub and the snap ring.



226RS058

There are three snap ring sizes available.

The snap rings are color-coded to indicate their thickness, as shown in the figure.



226RS021

Clutch Hub and Snap Ring Clearance

Standard: 0 - 0.1 mm (0 - 0.004 in)

Snap Ring Availability

Thickness	Color Coding
1.80 mm (0.071 in)	White
1.85 mm (0.073 in)	Yellow
1.90 mm (0.075 in)	Blue

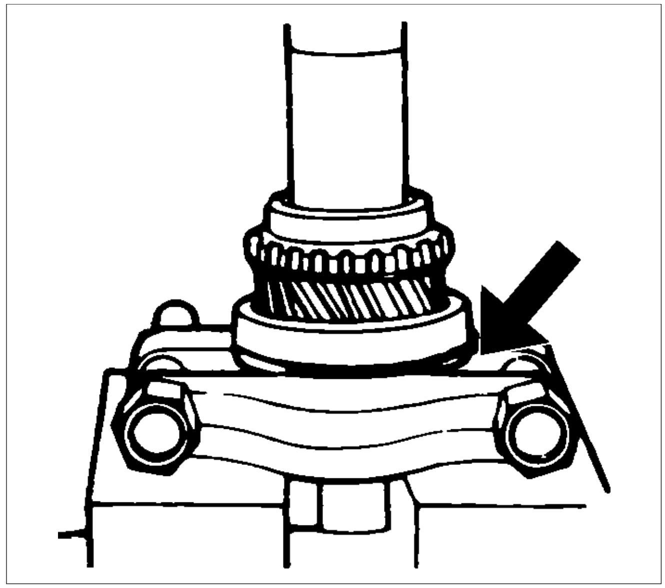
- Use a pair of snap ring pliers to install the snap ring to the mainshaft.

  The snap ring must be fully inserted into the mainshaft snap ring groove.

16. Install the top block ring.

    Apply grease to the needle bearing inner and outer circumferences and install the needle bearing in the top gear shaft.

17. Use a bench press to install the top gear shaft ball bearing to the top gear shaft.



226RS059

The snap ring groove of the ball bearing must be facing the transmission front side.

18. Use a pair of snap ring pliers to install the top gear shaft snap ring to the top gear shaft.

TROUBLESHOOTING

1. ABNORMAL NOISE

1) NOISY IN NEUTRAL

Checkpoint		Trouble Cause	Countermeasure
Gear oil	NG	Insufficient or improper gear oil	Replenish or replace the gear oil
OK			
Flywheel pilot bearing	NG	Worn flywheel pilot bearing	Replace the flywheel pilot
OK			
Bearings (Mainshaft, countershaft, and transfer shaft)	NG	Worn or broken bearing(s)	Replace the bearing(s)
OK			
Gears (Mainshaft, countershaft, reverse idler gear and transfer gears)	NG	Worn or scuffed gear tooth contact surfaces	Replace the gear(s)
OK			
Mainshaft splines Synchronizer clutch hub splines	NG	Worn splines	Replace the main shaft and the synchronizer clutch hub
OK			
Transmission	NG	Transmission misalignment	Realign the transmission

2) NOISY OPERATION

Checkpoint		Trouble Cause	Countermeasure
Gear oil (Metallic rattling)	NG	Insufficient or improper engine oil	Replenish or replace the gear oil
OK			
Bearings (Hissing, thumping or bumping)	NG	Worn or broken bearing(s)	Replace the bearing(s)
OK			
Gears (Growling, humming, or grinding)	NG	Worn, chipped, or cracked gear(s)	Replace the gear(s)
OK			
Gears (Squealing at high speeds)	NG	Free running gears seizing on the thrust face or the inner face	Replace the gear(s)
OK			
Gears (Gear whining)	NG	Lack of backlash between meshing gears	Replace the gear(s)

2. HARD SHIFTING

Checkpoint		Trouble Cause	Countermeasure
Gear oil	NG	Insufficient or improper gear oil	Replenish or replace the engine oil
OK			
Clutch pedal free play	NG	Improper clutch pedal free play	Readjust the clutch pedal free play
OK			
Change lever operation	NG	Hard operating change lever caused insufficient grease	Repair or regrease the change lever assembly
OK			
Change lever play	NG	Worn change lever sliding portions	Repair or replace the applicable parts and regrease
OK			
Shift block sleeve movement	NG	Sleeve movement failure	Repair or replace the sleeve
OK			
Shift rod and quadrant box sliding faces, and other parts	NG	Worn shift rod and/or sliding faces	Replace the shidt rod and/or the quadrant box

Continued on the next page

Checkpoint		Trouble Cause	Countermeasure
Continued from the previous			
OK			
Shift arm and synchronizer sleeve	NG	Worn shift arm and/or synchronizer sleeve groove	Replace the worn parts
OK			
Mainshaft and countershaft thrust play	NG	Worn thrust washer, collar, and/or gear thrust faces	Replace the worn parts
OK			
Synchronizer assembly	NG	Worn synchronizer parts	Replace the worn parts

3. WALKING OR JUMPING OUT OF GEAR

Checkpoint		Trouble Cause	Countermeasure
Change lever play	NG	Insufficient stroke caused by sliding position wear and excessive play	Replace the worn parts
OK			
Detent ball	NG	Worn detent ball	Replace the detent ball
OK			
Detent spring	NG	Detent spring weak or broken	Repair or replace the detent spring
OK			
Shift rod and quadrant box sliding faces	NG	Worn shift rod and/or sliding faces	Replace the shift rod and/or the quadrant box
OK			
Shift arm and synchronizer sleeve	NG	Worn shift arm and/or synchronizer sleeve groove	Replace the worn parts
OK			
Mainshaft and countershaft thrust play	NG	Worn thrust washer, collar, and/or gear thrust faces	Replace the worn parts

Continued on the next page

Continued from the previous page

OK

Checkpoint		Trouble Cause	Countermeasure
Bearings (Mainshaft, countershaft, and individual gears)	NG	Worn or broken bearings(s)	Replace the bearing(s)
OK			
Mainshaft splines Synchronizer clutch hub splines	NG	Worn splines	Replace the main shaft and the synchronizer clutch hub
OK			
Synchronizer assembly	NG	Weak or broken spring	Replace the spring

4. OIL LEAKAGE

Checkpoint		Trouble Cause	Countermeasure
Oil level	NG	Oil level too high	Drain the oil to the correct level
OK			
Gear oil	NG	Improper gear oil	Replace the gear oil
OK			
Drain plug and/or filler plug	NG	Loose plug(s)	Tighten the plug(s) and replenish the oil
OK			
Gaskets	NG	Defective or improperly installed gasket(s)	Replace the gasket(s)
OK			
Air breather	NG	Air breather not installed Air breather clogged	Install the air breather Replace the air breather
OK			
Front cover oil seal	NG	Worn or scratched oil seal	Replace the oil seal
OK			
Rear cover oil seal	NG	Worn or scratched oil seal	Replace the oil seal

Special Tools (4×4)

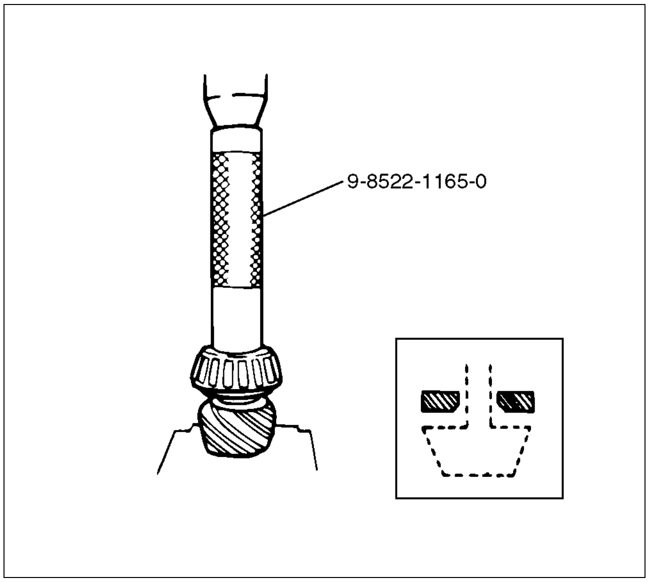
ILLUSTRATION	TOOL NO. TOOL NAME
	**5-8840-2158-0** **(J-37222)** Mainshaft retainer remover
	**5-8840-2027-0** Puller
	**5-8840-2160-0** **(J-37224)** Holding fixture
	**5-8840-0003-0** **(J-3289-20)** Holding fixture base
	**5-8840-2156-0** **(J-37219)** Mainshaft nut wrench
	**5-8840-0047-0** **(J-37225)** Tork bit wrench (T– 45)

ILLUSTRATION	TOOL NO. TOOL NAME
	**5-8840-2159-0** **(J-37223)** Mainshaft end bearing installer
	**5-8840-0015-0** **(J-22912-01)** Bearing remover/installer
	**5-8522-0050-0** **(J-29769)** Rear case oil seal installer
	**5-8840-0026-0** **(J-26540)** Front cover oil seal installer
	**9-8522-1165-0** **(J-6133-01)** Mainshaft collar remover
	**5-8840-0007-0** **(J-8092)** Grip

ILLUSTRATION	TOOL NO. TOOL NAME
 	**5-8840-2194-0** Bearing installer

4. Place the shim on the drive pinion, then install the inner bearing onto the pinion by using installer 9-8522-1165-0 and a press.

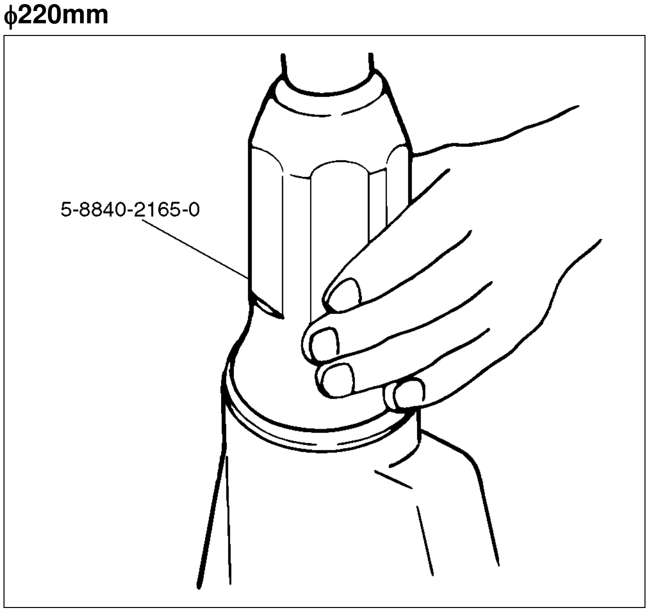
Note:
Do not apply pressure to the roller cage. Apply NOTE: pressure only to the inner race.



425L100008

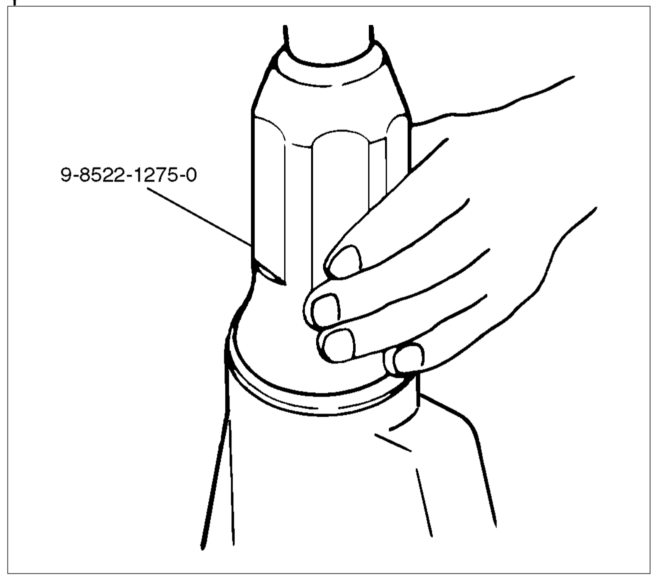
5. Install collapsible spacer. Discard the used collapsible spacer and install a new one.
6. Install drive pinion shaft assembly.
7. Install outer bearing and oil seal.
8. Use oil seal installer 5-8840-2165-0 (ϕ220mm) and 9-8522-1275-0 (ϕ194mm) to install a new oil seal that has grease on seal lip.

ϕ220mm



415RW029

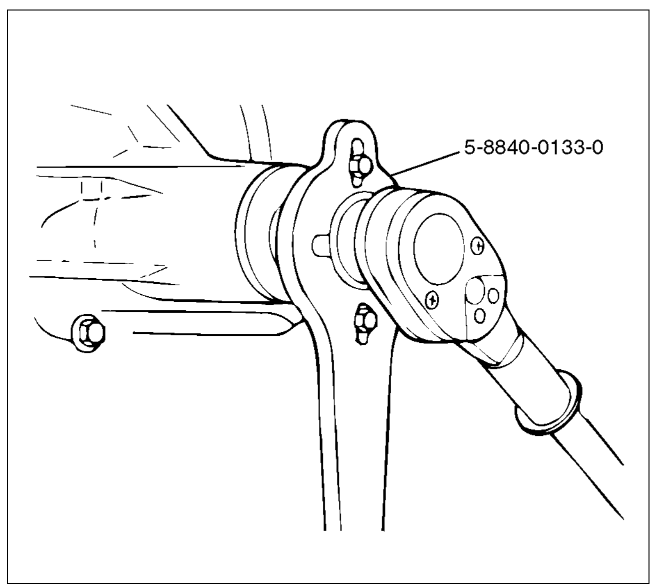
ϕ194mm



415RW024

9. Install flange assembly.
10. Install flange nut.
    a. Apply lubricant to the pinion threads.
    b. Using the pinion flange holder 5-8840-0133-0, tighten the nut only enough to remove the shaft end play.

Note :
Discard used flange nut and install new one.



415RW040

    c. Adjust pinion bearing preload.
    - Measure the bearing preload by using a torque meter and note the scale reading required to rotate the flange.
    - Continue tightening flange nut until the specified starting torque is obtained.

TRANSMISSION/TRANSAXLE

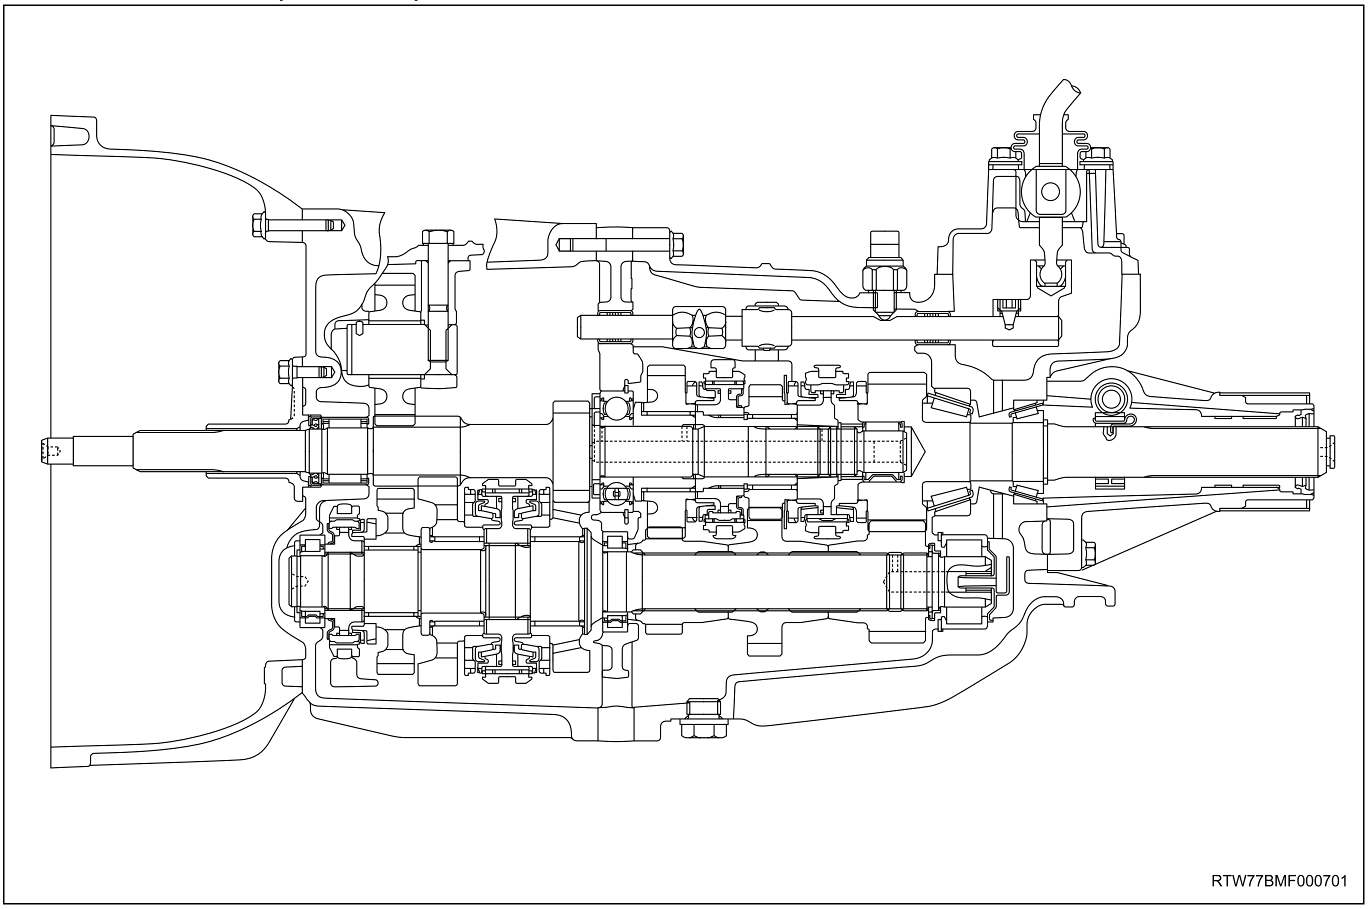
Manual Transmission (MUX)

TABLE OF CONTENTS

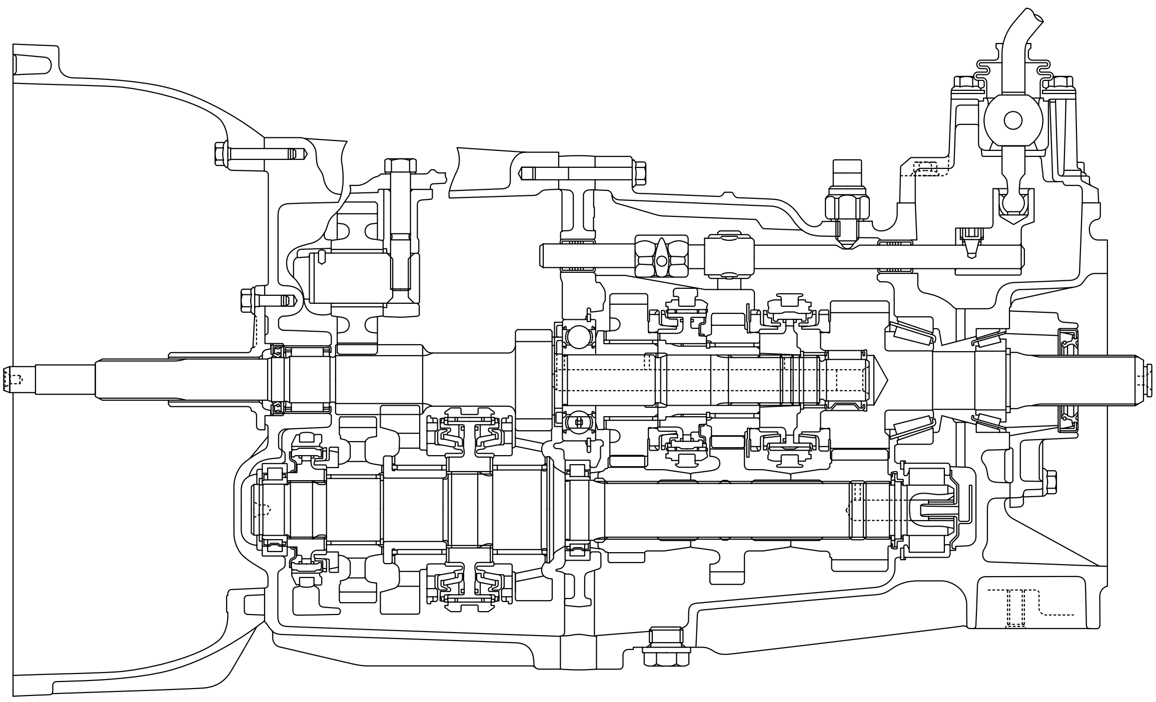
General Description

General Description

MUX5S Transmission(4x2 model)



MUX5S Transmission(4x4 model)



The MUX5S is a constant mesh transmission, synchronized in all speeds.
The transmission is designed for a reduction of the shift effort and the quietest possible operation.
Principle parts of the transmission are the clutch housing, the front case, the intermediate plate, the rear case, the end cover, and the gears.
The transmission control box is built into the transmission.

Troubleshooting

Condition	Possible Cause	Correction
Abnormal Noise (Noisy in Neutral)	Insufficient or improper lubricant	Replenish or replace lubricant
	Flywheel pilot bearing worn or broken	Replace flywheel pilot bearing
	Bearing(s) worn or broken (Input shaft, counter shaft, and output shaft)	Replace bearing(s)
	Gear tooth contact surfaces worn or scuffed (Input shaft, counter shaft, output shaft, and reverse idler gear)	Replace gear(s)
	Spline worn (Input shaft, output shaft, counter shaft, and synchronizer clutch hub)	Replace worn parts
	Transmission misalignment	Realign transmission
Abnormal Noise (Noisy Operation)	Insufficient or improper lubricant (Metallic rattling)	Replenish or replace lubricant
	Bearing(s) worn or broken (Hissing, thumping, or bumping)	Replace bearing(s)
	Gear(s) worn, chipped, or cracked (Growling, humming, or grinding)	Replace gear(s)
	Gears seizing on thrust face or inner face free running (Squealing at high speeds)	Replace gear(s)
	Gears lack of backlash between meshing (Gear whining)	Replace gear(s)
Hard Shifting	Insufficient or improper lubricant	Replenish or replace lubricant
	Improper clutch pedal free play	Readjust clutch pedal free play
	Hard operating of change lever caused insufficient grease	Repair or regrease change lever assembly
	Change lever sliding portions worn	Repair or replace applicable parts and regrease
	Shift block sleeve movement failure	Repair or replace sleeve
	Shift rod and/or quadrant box sliding face worn	Replace worn parts
	Shift arm and/or synchronizer sleeve groove worn	Replace worn parts
	Collar, and/or gear thrust faces worn (Input shaft and counter shaft thrust play)	Replace worn parts
	Synchronizer parts worn	Replace worn parts

Condition	Possible Cause	Correction
Walking or Jumping Out of Gear	Change lever sliding portion worn and excessive play	Replace worn parts
	Shift rod and/or quadrant box sliding faces worn	Replace worn parts
	Shift arm and synchronizer sleeve groove worn	Replace worn parts
	Collar and/or gear thrust faces worn (Input shaft and counter shaft thrust play)	Replace worn parts
	Bearing worn or broken (Input shaft, counter shaft, and individual gears)	Replace bearing(s)
	Input shaft spline, output shaft spline, and synchronizer clutch hub splines worn	Replace input shaft, output shaft, and synchronizer clutch hub
	Synchronizer parts worn or broken	Replace worn or broken parts
	Taper bolt slack	Replace taper bolt
Oil Leakage	Oil level too high	Drain oil to correct level
	Improper lubricant	Replace lubricant
	Drain plug and/or filler plug loose	Tighten plug and replenish lubricant
	Defective or improperly installed gasket (s)	Replace gasket(s)
	Front oil seal worn or scratched	Replace oil seal
	Rear oil seal worn or scratched	Replace oil seal

Main Specifications

Model		MUX5S
Transmission Type		Fully synchronized forward and reverse gears
Control method		Remote control with the gear shift lever on the floor
Gear ratio	1st	4.326
	2nd	2.557
	3rd	1.490
	4th	1.000
	5th	0.790
	Revese	3.942
Transmission oil capacity		3.0 lit. (3.17 US qt)
Type of lubricant		BESCO TRANS AXLE OIL (5W-30 SF)

Fixing Torque

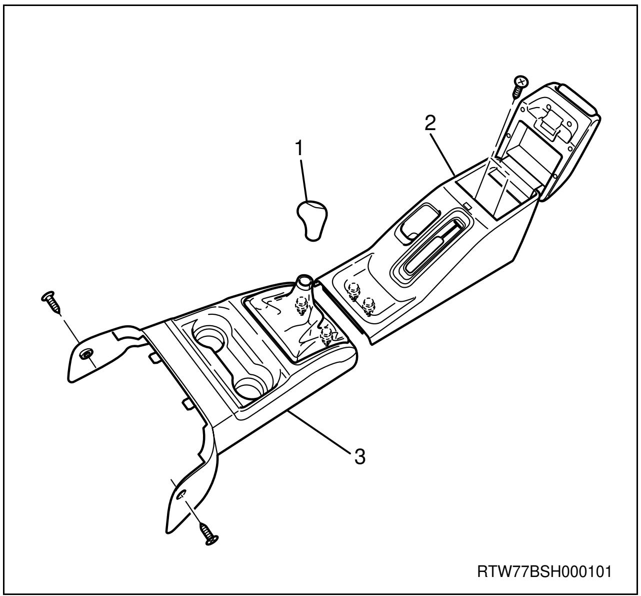
Transmission Assembly

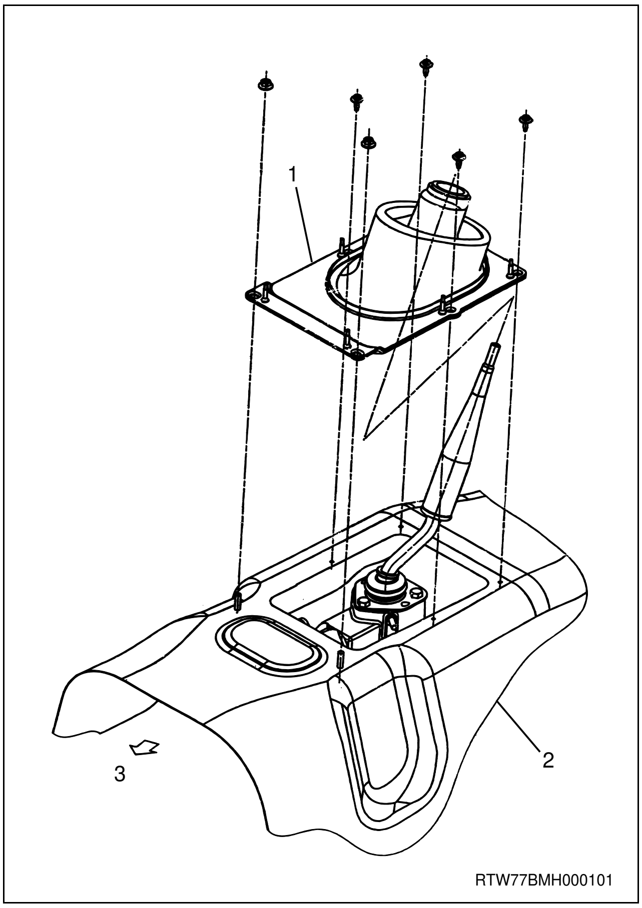
Removal

1. Disconnect battery ground cable.
2. Remove the gear control knob.
3. Remove the rear floor console. (Bucket seat)
   Refer to the section "Floor Console".
4. Remove the front floor console.
   Refer to the section "Floor Console".



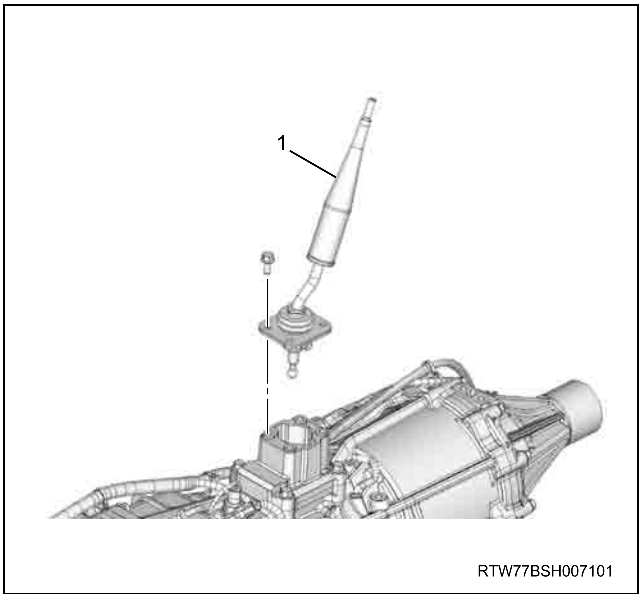
Legend
1. Gear control knob
2. Rear floor console
3. Front floor console

5. Remove the grommet assembly.



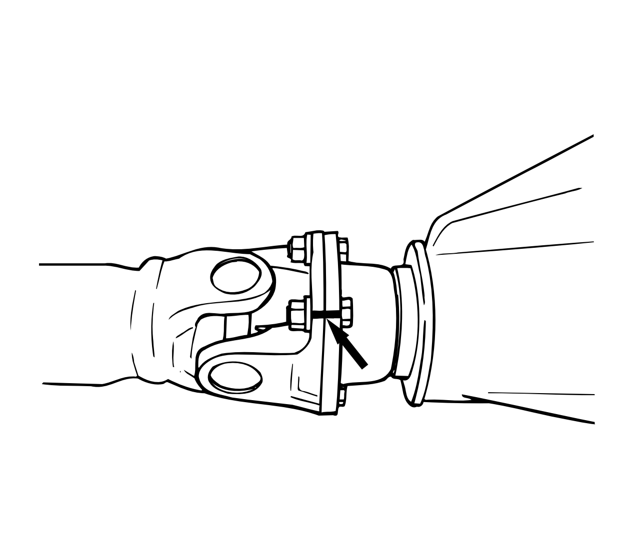
Legend
1. Grommet assembly
2. Floor panel
3. Front

6. Remove the gear control lever (1).



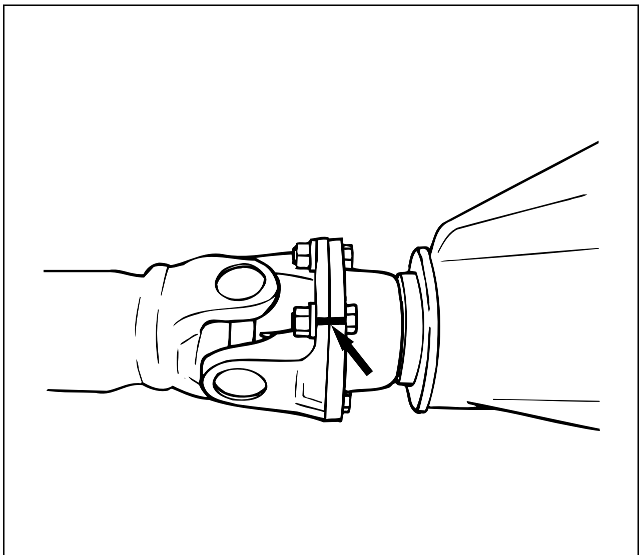
7. Raise and support vehicle with suitable stands.
8. Remove the rear propeller shaft.

- Apply alignment marks on the flange at the differential side.



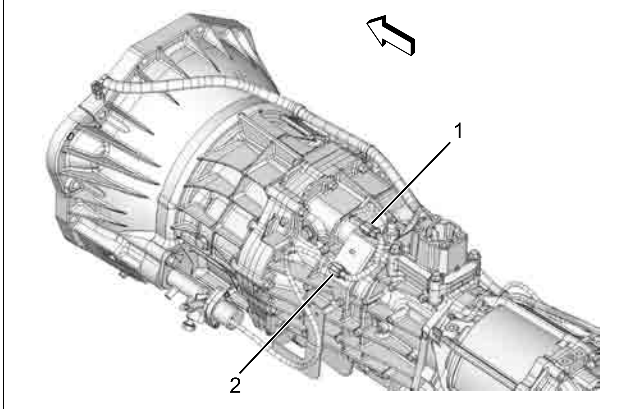
RTW77BSH000201

9. Remove the front propeller shaft. (4x4 model)
   - Apply alignment marks on the flange at both front and rear side.



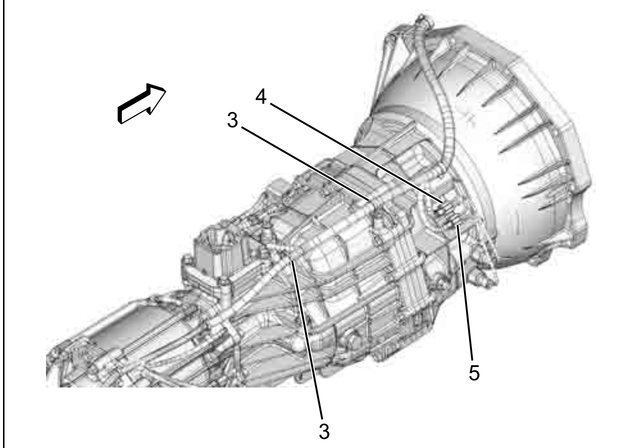
RTW77BSH000201

10. Disconnect the harness connectors and clips on the transmission.



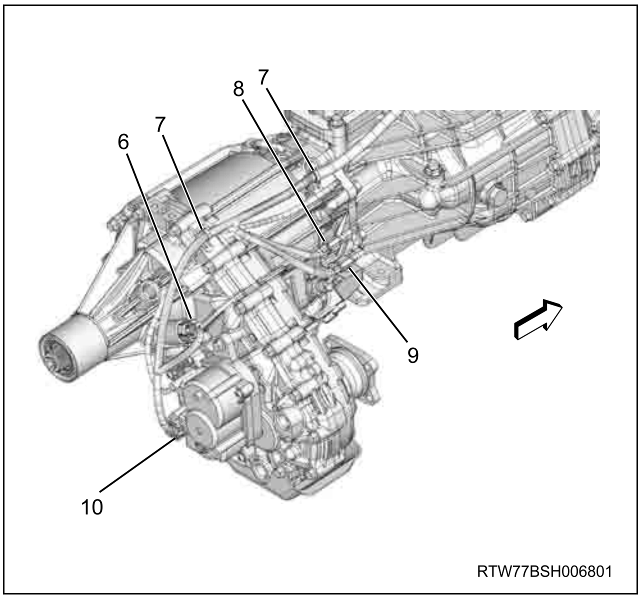
RTW77BSH006601

Legend
1. Neutral switch connector
2. Clutch damper valve connector



RTW77BSH006701

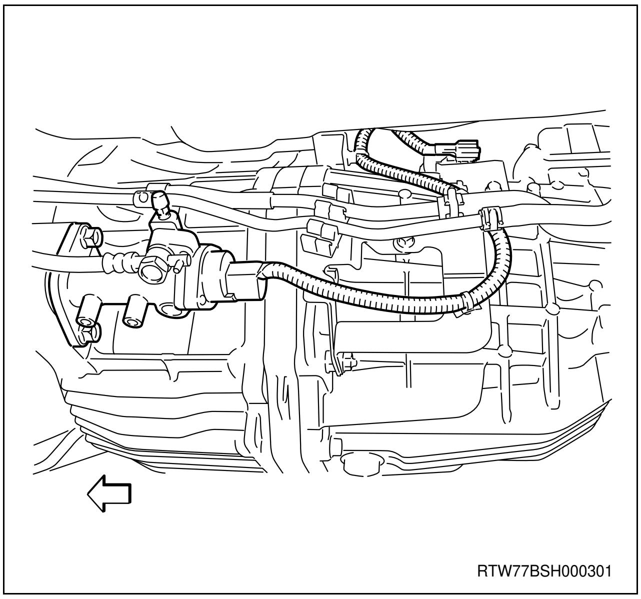
Legend
3. Clip
4. Reverse switch connector
5. 1st switch connector



Legend

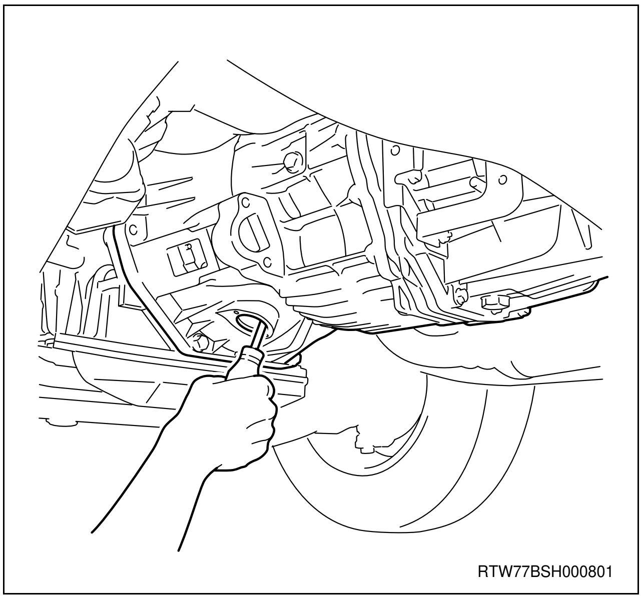
6. Car speed sensor conector
7. Clip
8. 2-4 switch connector (4x4 model)
9. Neutral switch connector (4x4 model)
10. Transfer actuator connector (4x4 model)

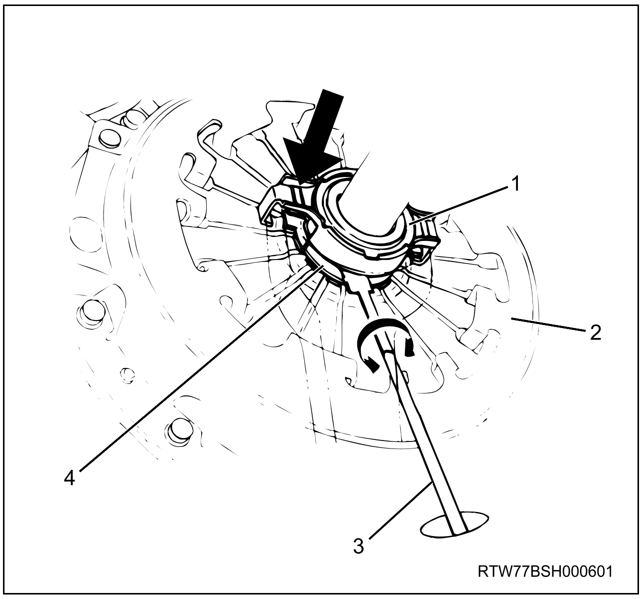
11. Remove the harness bracket fixing bolt on the transmission left side.
12. Remove the slave cylinder fixing bolts.



13. Remove the fuel pipe bracket fixing bolt and disconnect fuel pipe clip.
14. Remove the clutch housing cover and clutch bearing dust cover.
15. Use the remover 5-8840-2291-0 to disconnect the clutch release bearing from the clutch pressure plate.
    a. Pull the shift fork toward the transmission to press the clutch release bearing against the clutch.
    b. Insert the remover between the wedge collar and the release bearing.
    c. Turn the remover to separate the release bearing.

Notice:
Be sure not to insert the remover between the wedge collar and the clutch.





Legend

1. Release bearing
2. Pressure plate assembly
3. Bearing remover : 5-8840-2291-0
4. Wedge collar

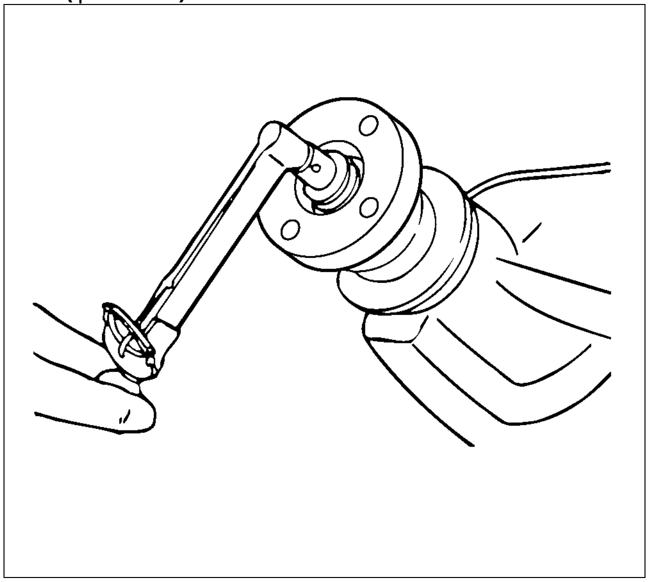
Starting torque :

ϕ220mm : 0.7-1.3 N·m
(0.07-0.13 kgf·m/6-11 lb·in)

ϕ194mm : 0.7-1.1 N·m
(0.07-0.11 kgf·m/6-10 lb·in)

Note :

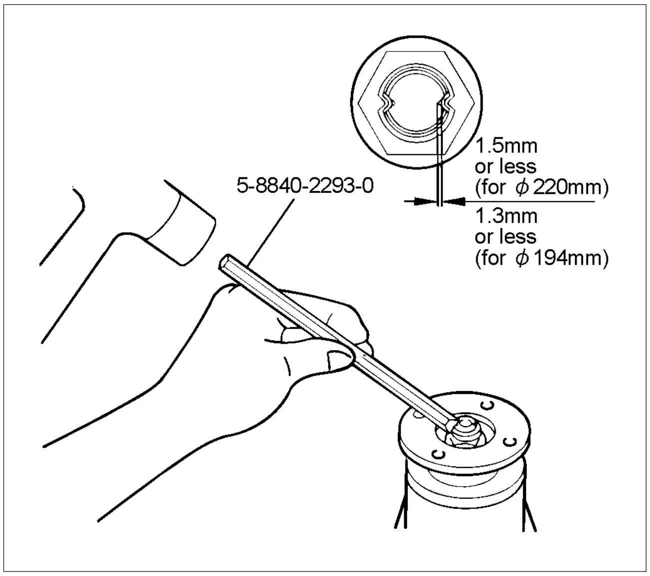
- **Do not overtighten or loosen and then retighten the nut.**
- **Pinion nut torque will be in the range of 245-294 N·m (25-30 kgf·m/181-217 lb·ft) (ϕ220mm) and 177-275 N·m (18-28 kgf·m/130-203 lb·ft) (ϕ194mm).**



425RW018

d. Using punch 5-8840-2293-0, stake the flange nut at two points.

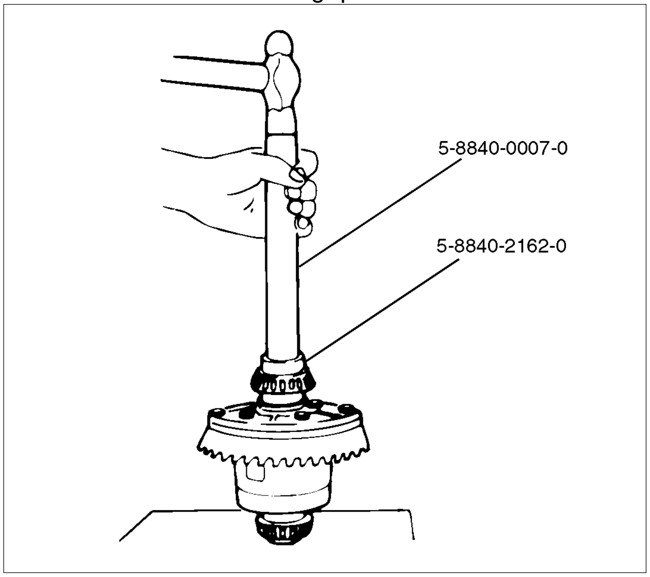
Note :
When staking, be sure to turn the nut to ensure that there is no change in bearing preload. Make sure NOTE: of preload again as instructed in c.



RTW54BSH000901

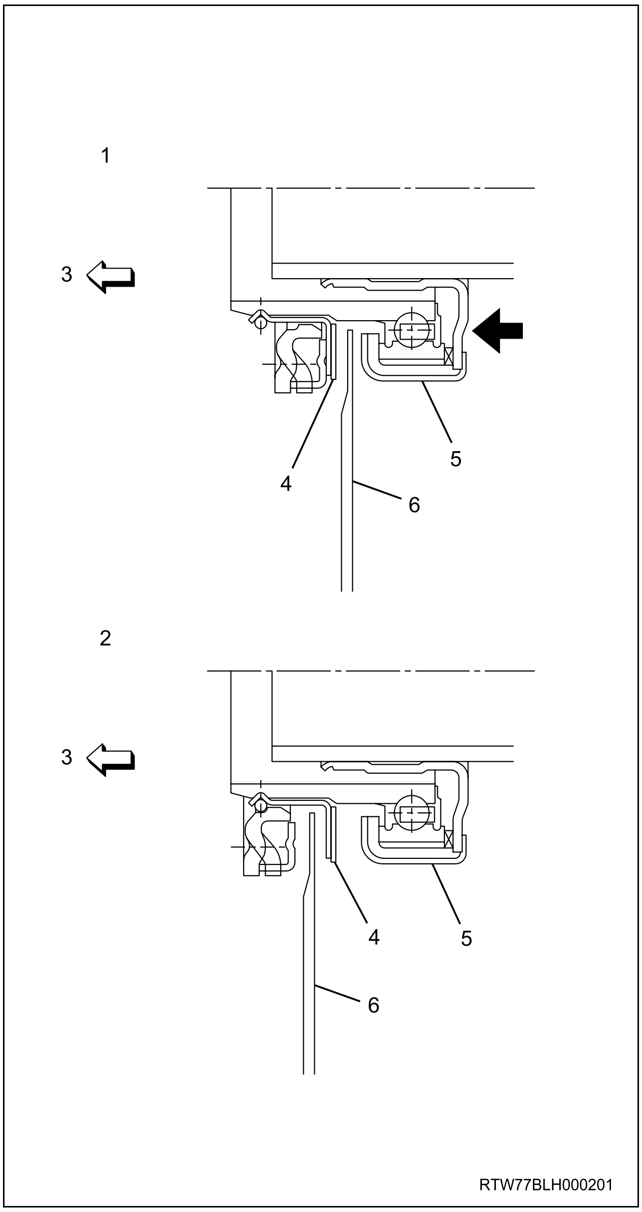
11. Adjust ring gear backlash.

a. Attach the side bearing to the differential assembly without shims by using installer 5-8840-2162-0 and grip 5-8840-0007-0.



425L100010

b. Insert the differential cage assembly with bearing outer races into the side bearing bores of the carrier.

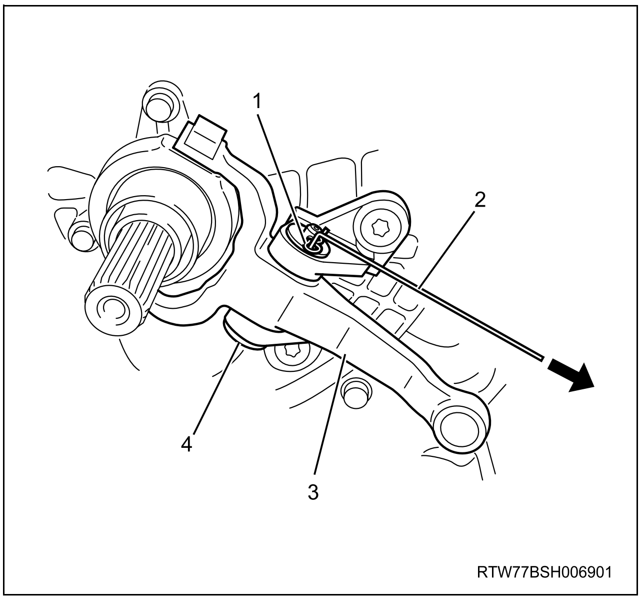


Legend

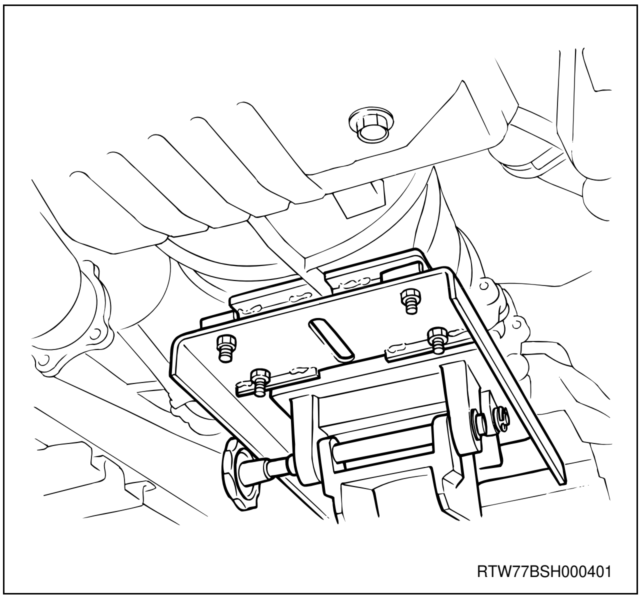
1. Correct procedure
2. Wrong procedure
3. Front
4. Wedge collar
5. Clutch release bearing
6. Bearing remover : 5-8840-2291-0

- When clutch release bearing cannot be removed (For instance, transformation of wedge collar, and other reasons), remove the shift fork in order of the following with a tool of L-type (2) as shown in figure.
  1) Remove the snap pin (1).
  2) Remove the shift fork pin (4).
  3) Remove the shift fork (3).

Notice:
Do not remove by this method usually.
The clutch release bearing or wedge collar might be damaged with the input shaft of transmission at removed the transmission because the clutch release bearing is adhered to clutch.



16. Support transmission assembly (4x2 model) or transmission & transfer assembly (4x4 model) with a transmission jack.



17. Remove the transmission rear mount nuts fixing on crossmember from the transmission crossmember.
18. Remove the transmission crossmember by removing four fixing bolts and nuts.
19. Remove the transmission rear mount.
20. Remove the starter assembly.
21. Disconnect harness clips on the transmission left side.

22. Remove the transmission retaining nuts and bolts. Remove the transmission assembly (4x2 model) or the transmission & transfer assembly (4x4 model) from the vehicle.
23. Remove the transmission-transfer fixing bolts and nut, and disassemble the transfer from the transmission. (4x4 model)

Installation

1. Apply grease (BESCO L-2 or equivalent) on the splined portion of the output shaft.
2. Connect the transfer to the transmission. (4x4 model)
3. Install the transmission-transfer fixing bolts and nut, and tighten them to the specified torque. (4x4 model)

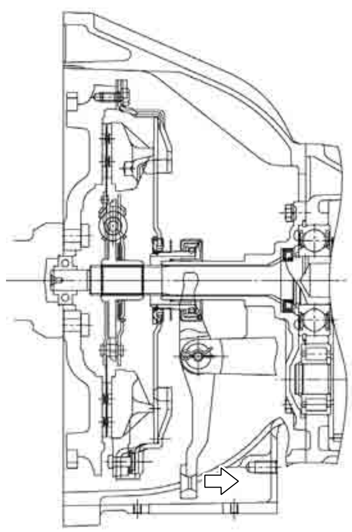
Torque: 41 N·m (4.2 kgf·m/30 lb·ft)

4. Apply a thin coat of molybdenum disulfide grease on the splined portion of the input shaft spline.
5. Slowly operate the transmission jack until the front of transmission is aligned with the rear of the engine.
6. Align the input shaft spline with the clutch driven plate spline.
7. Install the transmission assembly (4x2 model) or the transmission & transfer assembly (4x4 model) to the engine.
   - Tighten the transmission bolts to the specified torque.

Torque: 76 N·m (7.7 kgf·m/56 lb·ft)

8. Apply a force 69 N·m (7 kgf·m/51 lb·ft) to the tip of the shift fork in the direction of the transmission to engine the clutch pressure plate and release bearing.

Notice:
A click sound is heard when the release bearing and the tip of the diaphragm spring engage each other.
Check to see if they are securely engaged by pushing the tip of the shift fork toward the engine side while applying a force of about 25 N·m (2.6 kgf·m/19 lb·ft). If the shift fork will not move, then they are securely engaged.



9. Connect harness clips on the transmission left side.
10. Install the starter assembly.
    - Tighten the starter bolts to the specified torque.

Torque: 94 N·m (9.6 kgf·m/69 lb·ft)

11. Install the transmission rear mount to the transmission.
    - Tighten the transmission rear mount bolts to the specified torque.

Torque: 50 N·m (5.1 kgf·m/37 lb·ft)

12. Install the transmission crossmember by removing four bolts and nuts.
    - Tighten the transmission crossmember bolts to the specified torque.

Torque: 67 N·m (6.8 kgf·m/49 lb·ft)

13. Install the transmission rear mount nuts fixing on crossmember from transmission crossmember.
    - Tighten the transmission rear mount nuts to the specified torque.

Torque: 52 N·m (5.3 kgf·m/38 lb·ft)

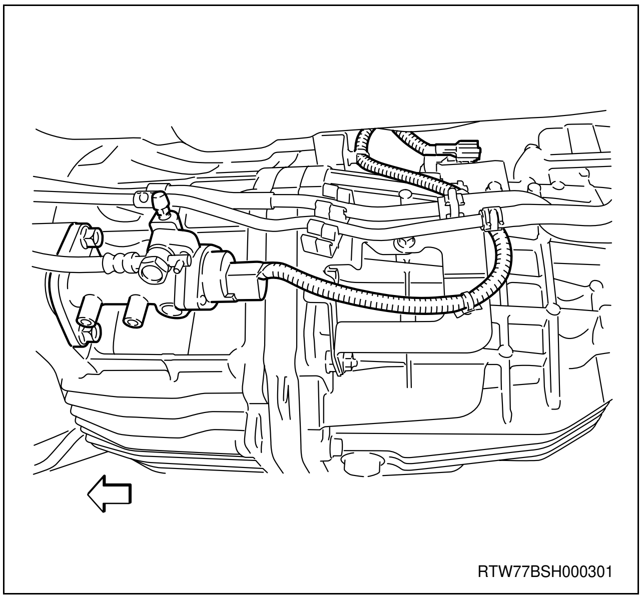
Remove the transmission jack from transmission side.

14. Install the fuel pipe bracket bolt and connect fuel pipe clip.
    - Tighten the fuel pipe bracket bolt to the specified torque.

Torque: 76 N·m (7.7 kgf·m/56 lb·ft)

15. Install the slave cylinder fixing bolts.
    - Tighten the slave cylinder bolts to the specified torque.

Torque: 43 N·m (4.4 kgf·m/32 lb·ft)



16. Install the front propeller shaft. (4x4 model)
    - Tighten the front propeller shaft bolts to the specified torque.

Torque: 59 N·m (6.0 kgf·m/43 lb·ft)

17. Install the rear propeller shaft.
    - Tighten the rear propeller shaft bolts to the specified torque.

Torque

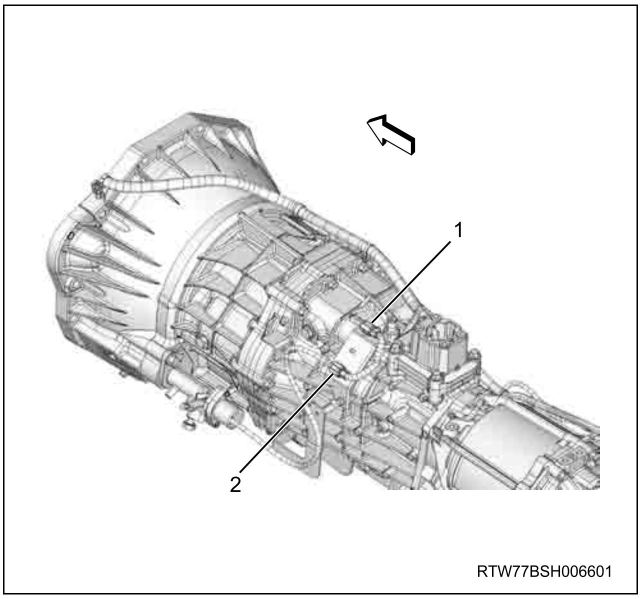
Rear flange: 59 N·m (6.0 kgf·m/43 lb·ft)

Center bearing: 69 N·m (7.0 kgf·m/51 lb·ft)

18. Connect harness clip on the transmission left side bracket.
    Install the harness bracket bolt.
    - Tighten the harness bracket bolt to the specified torque.

Torque: 23 N·m (2.3 kgf·m/17 lb·ft)

19. Connect the harness connectors and clips on the transmission.



Legend
1. Neutral switch connector
2. Clutch damper valve connector

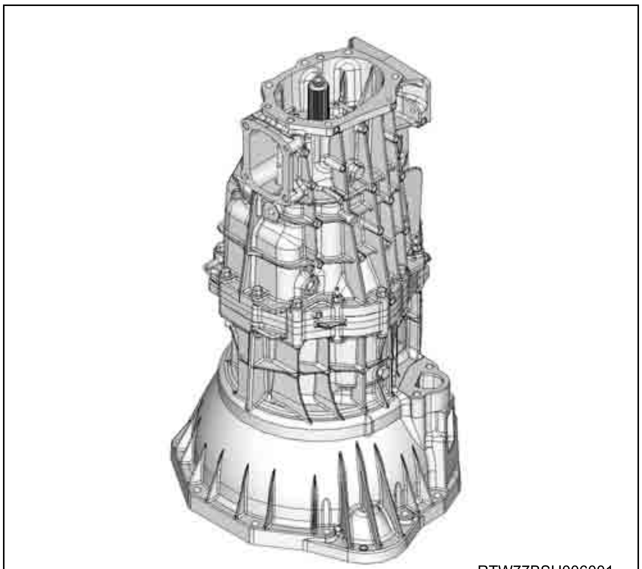
71. Counter shaft assembly

Removal

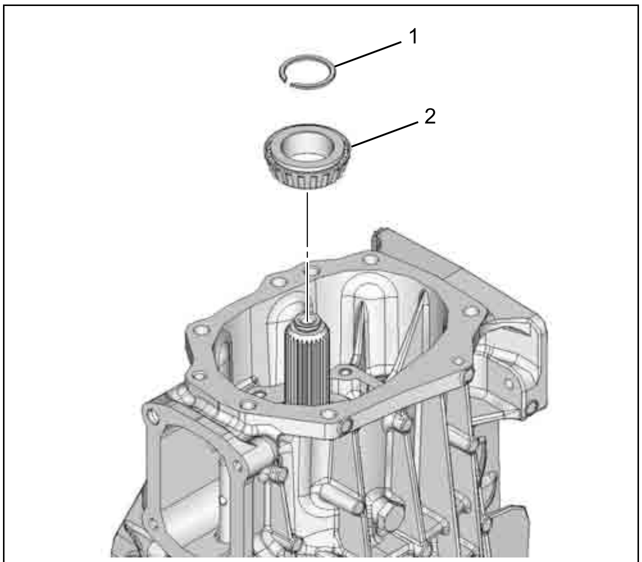
1. Clean the exterior of the unit with solvent.
2. Remove the drain plug with gasket and drain the lubricant.
3. Remove the front cover.
4. In order to protect the front oil seal lip, wrap a tape around the spline portion of the input shaft.
5. Remove the quadrant box and two dowels.
6. Remove the control unit block by performing the following steps.
   a. Push the control unit block ahead.

b. Remove the taper bolt, and discard the used taper bolt.
c. Remove the control unit block.
7. Remove the reverse switch (Connector color Brown), 1st switch (Connector color Gray) and neutral switch (Connector color Brown) with gasket.
Remove the three detent assemblies, and discard the used 5th & reverse detent assemblies.
8. Remove the two harness brackets.
9. Remove the speedometer driven gear and plate. (4x2 model)
10. Remove the end cover assembly.
11. Remove the gear set clip. (4x2 model)
12. Remove the speedometer drive gear. (4x2 model)
13. Stand the transmission assembly.



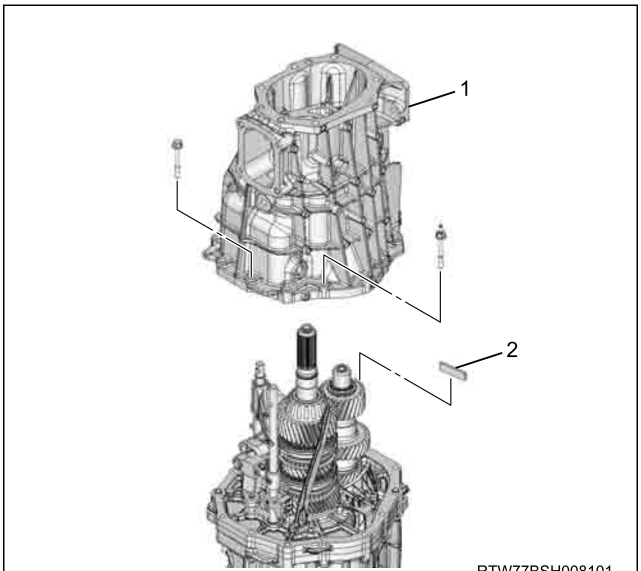
RTW77BSH006001

14. Remove the output shaft snap ring (1).
15. Remove the output rear bearing inner race (2).



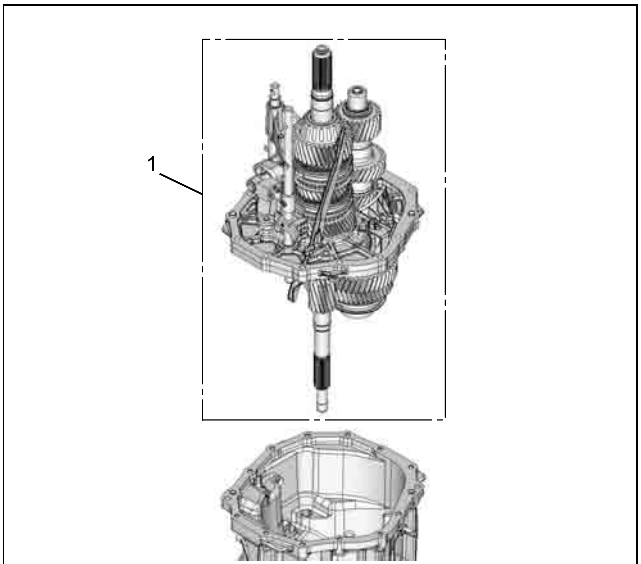
RTW77BSH003901

16. Remove the rear case assembly (1).
17. Remove the magnet (2).



RTW77BSH008101

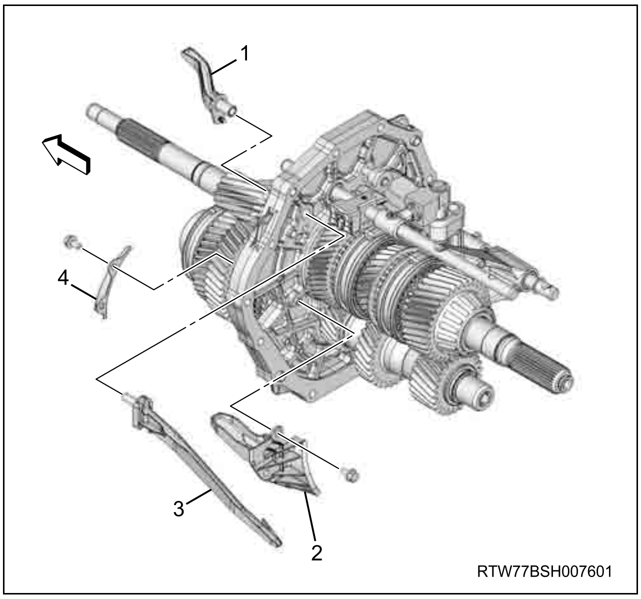
18. Remove the intermediate plate assembly with gear (1) from the front case.



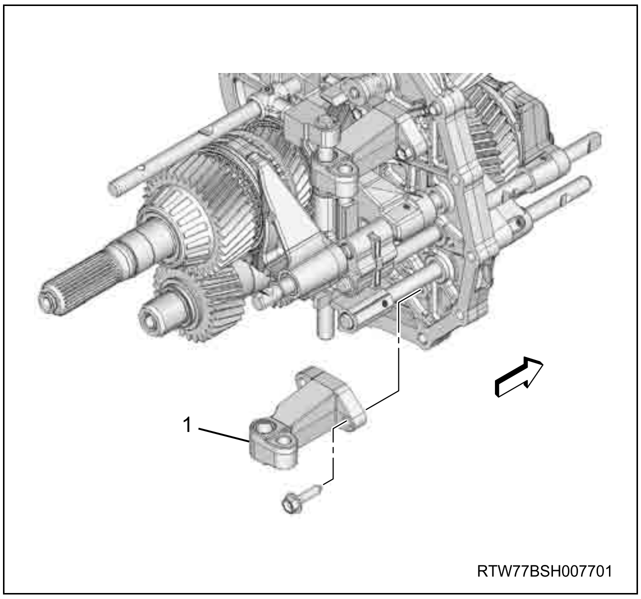
RTW77BSH007501

19. Remove the tape from the spline portion of the input shaft.
20. Remove the front gutter (1) and rear gutter (3), and discard the used gutters.

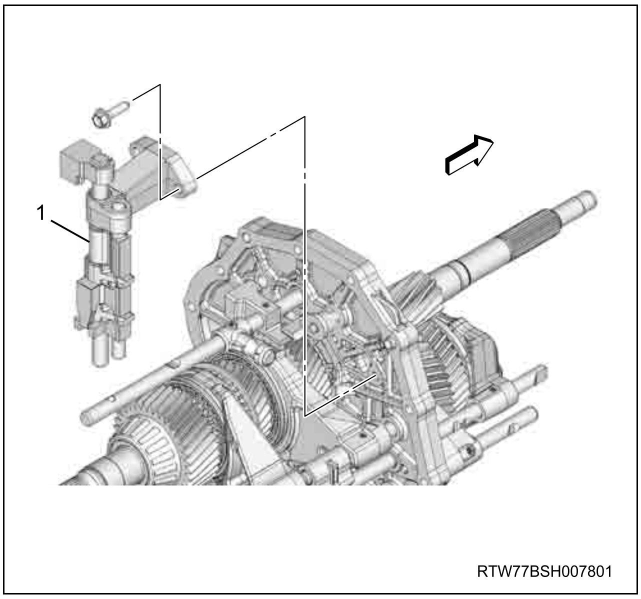
21. Remove the counter 2nd gutter (4) and counter 5th gutter (2).



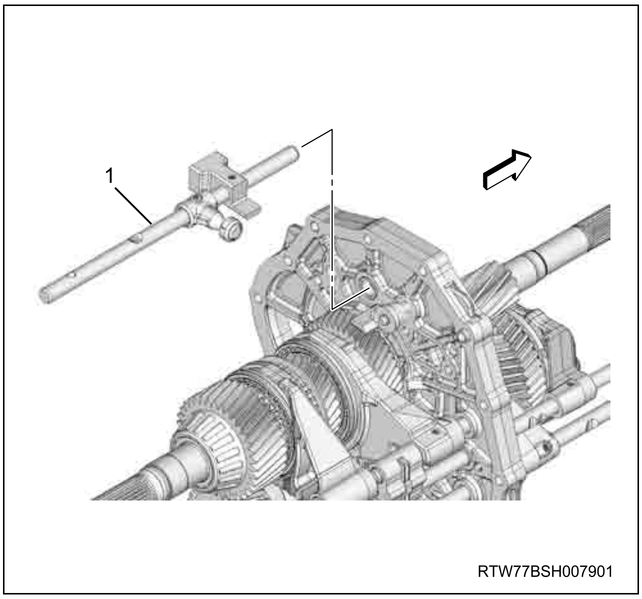
22. Remove the shift rod bracket (1).



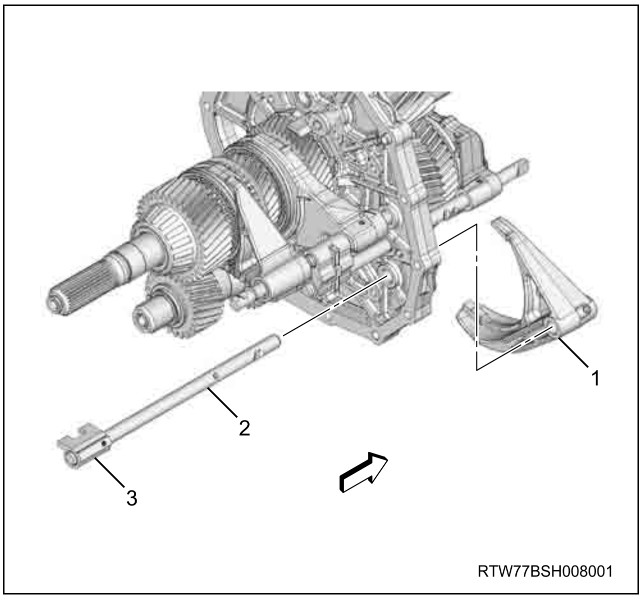
23. Remove the shift & select rod assembly (1).



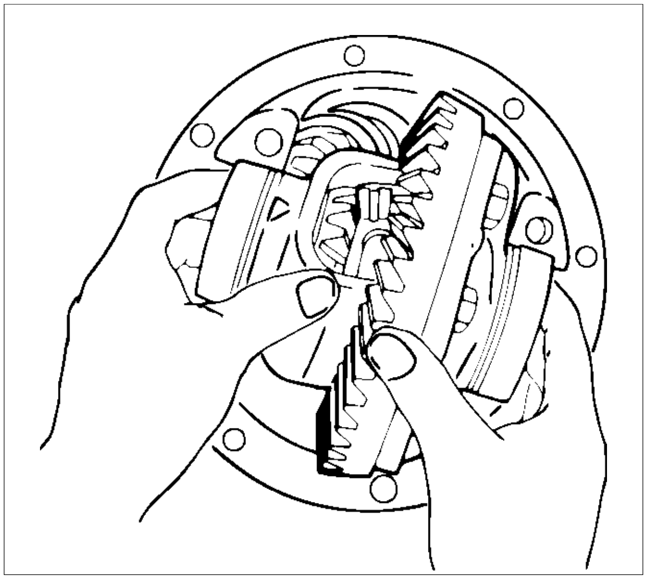
24. Remove the control rod assembly (1).



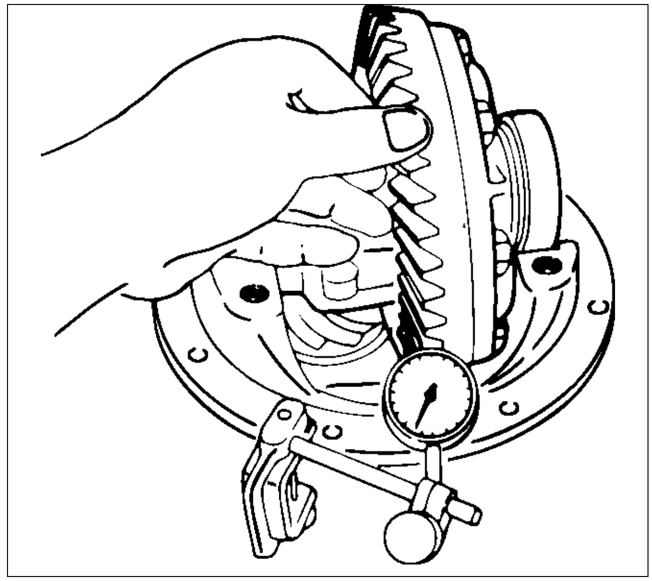
25. Use a spring pin remover to remove the 1st-2nd shift arm spring pin.
26. Remove the shift rod (2) with the 1st-2nd shft block (3).
27. Remove the 1st-2nd shift arm (1).



28. Use a spring pin remover to remove the reverse shift arm spring pin.



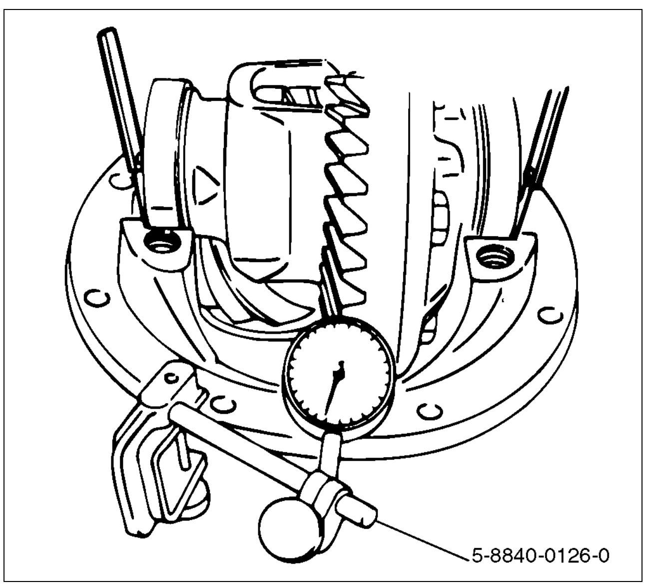
425RS030



425RS032

c. Using two sets of feeler gauges, insert a feeler stock of sufficient thickness between each bearing outer race and the carrier to remove all end play. Make certain the feeler stock is pushed to the bottom of the bearing bores.

   Mount the dial indicator 5-8840-0126-0 on the carrier so that the indicator stem is at right angles to a tooth on the ring gear.



425RW049

d. Adjust feeler gauge thickness from side to side until ring gear backlash is in the specified range.

   Backlash :

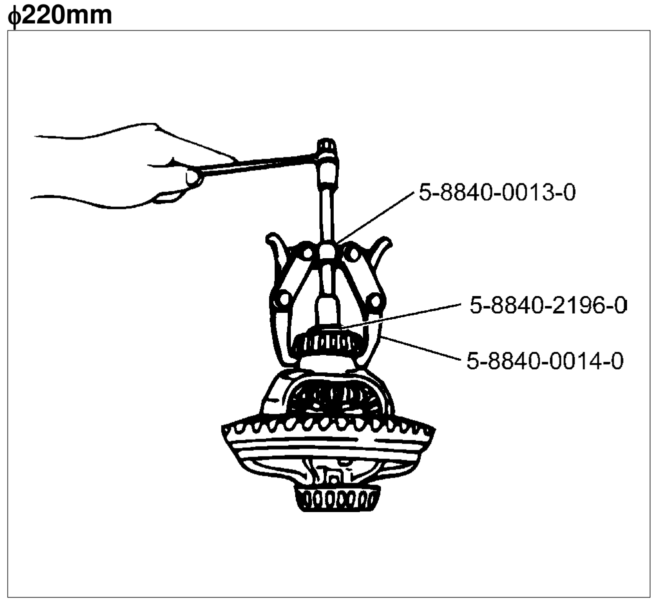
   ϕ220mm : 0.15-0.20 mm (0.006-0.008 in)

   ϕ194mm : 0.13-0.18 mm (0.005-0.007 in)

   With zero end play and correct backlash established, remove the feeler gauge packs, determine the thickness of the shims required and add 0.05 mm (0.002 in) to each shim pack to provide side bearing preload. Always use new shims.

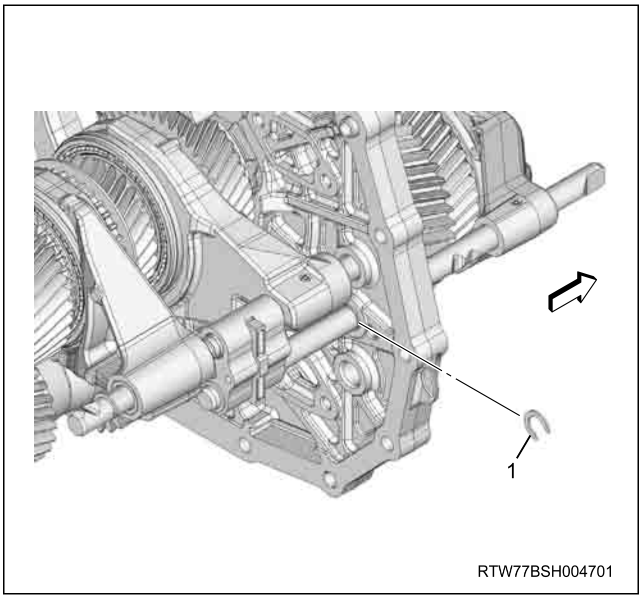
e. Remove side bearing by using remover 5-8840-0013-0 and 5-8840-0014-0 and adapter 5-8840-2196-0 (ϕ220mm) and 9-8521-1743-0 (ϕ194mm).

ϕ220mm

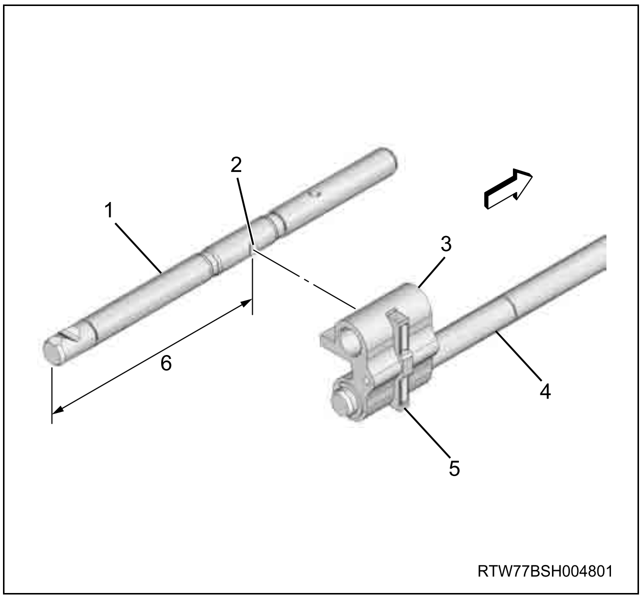


RTW54BSH000101

29. Remove the reverse shift rod snap ring (1).



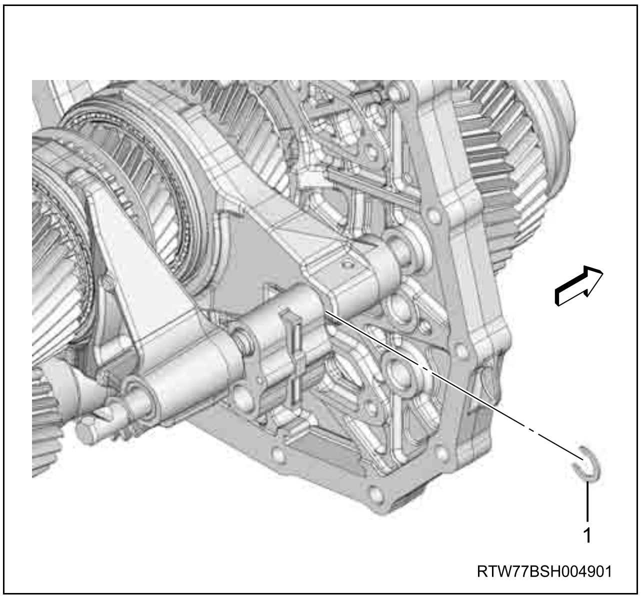
30. The shift block lever is put into the dent of the 3rd-4th-5th shift rod.



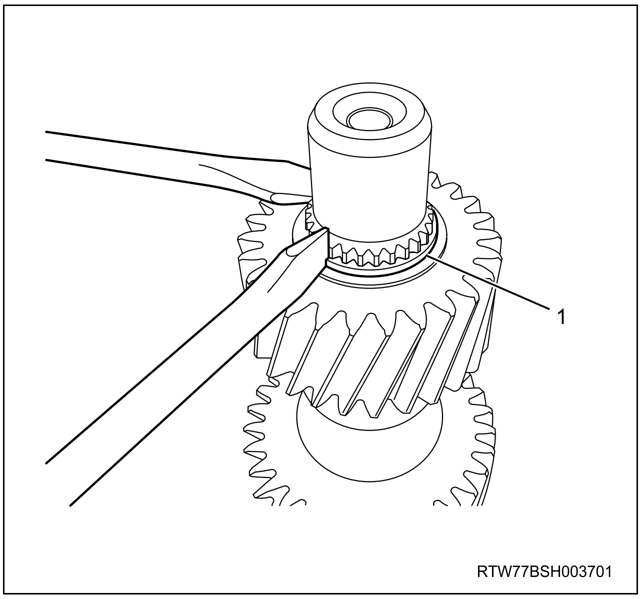
Legend

1. 3rd-4th-5th shift rod
2. Dent of 3rd-4th-5th shift rod
3. 5th-reverse shift block
4. Reverse shift rod
5. Shift block lever
6. 123.5 mm (4.86 in)

31. Remove the reverse shift rod.
32. Remove the reverse shift arm.
33. Use a spring pin remover to remove the 5th shift arm spring pin.
34. Remove the 3rd-4th-5th shift rod snap ring (1).

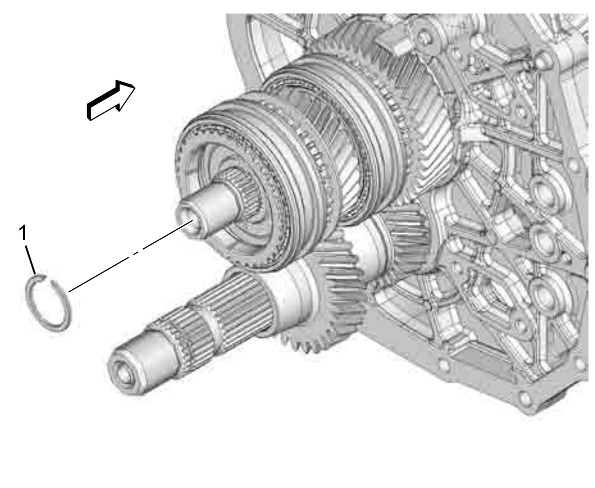


35. Remove the 3rd-4th-5th shift rod.
36. Remove the 5th shift arm.
37. Remove the 5th-reverse shift block assembly.
38. Remove the 3rd-4th shift arm assembly.
39. Remove the output shaft assembly.
40. Remove the rubber seal, and discard the used rubber seal.
41. Remove the counter end snap ring (1).



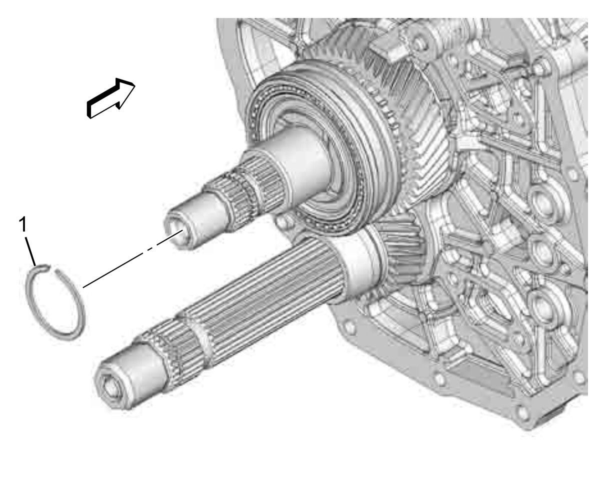
42. Remove the output counter gear.
43. Remove the pilot bearing.
44. Remove the pilot bearing spacer.
45. Remove the 3rd-4th block ring of the output shaft side.
46. Remove the plate spring.

47. Remove the 3rd-4th hub snap ring (1).



RTW77BSH005001

48. Remove the 3rd-4th synchronizer assembly, 3rd-4th block ring of 3rd input gear side, and 3rd input gear assembly.
49. Remove the 3rd input gear needle bearing.
50. Remove the 3rd counter gear.
51. Remove the counter shaft assembly and 5th counter gear from the intermediate plate.
52. Remove the counter middle roller bearing outer race.
53. Remove the 5th hub snap ring (1).



RTW77BSH005101

54. Remove the 5th synchronizer assembly, 5th block ring and 5th input gear assembly.
55. Remove the 5th input gear needle bearing. (2 piece type)
56. Use a pair of snap ring pliers to hold the input middle bearing snap ring open .
Push the input shaft assembly toward the front of the transmission to remove it.
The input middle bearing snap ring will come free.

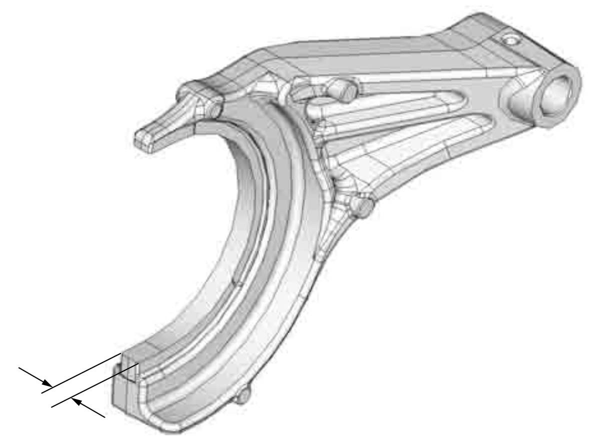
Inspection and Repair

Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

Shift Arm Thickness

Use a micrometer to measure the shift arm thickness.
If the measured value exceeds the specified limit, the shift arm must be replaced.

	Standard	Limit
1st - 2nd 3rd - 4th	9.60 - 9.85 mm (0.378 - 0.388 in)	8.85 mm (0.348 in)
5th	9.60 - 9.85 mm (0.378 - 0.388 in)	9.35 mm (0.368 in)
Reverse	7.85 - 8.10 mm (0.309 - 0.319 in)	7.60 mm (0.299 in)

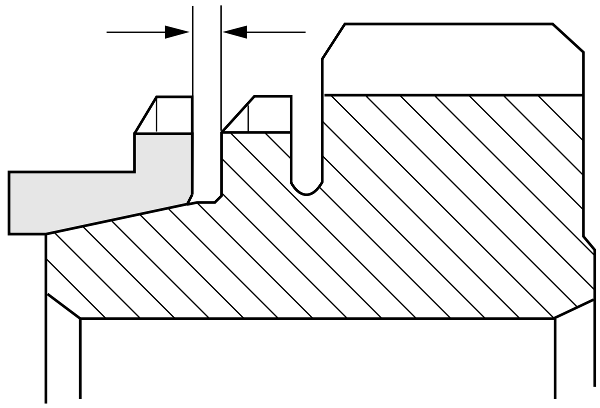


RTW77BSH006401

Block Ring and Dog Teeth Clearance

Use a thickness gauge to measure the clearance between the block ring and the dog teeth.
If the measured value exceeds the specified limit, the block ring must be replaced.

	Standard	Limit
3rd - 4th 5th	1.50 mm (0.059 in)	0.80 mm (0.031 in)

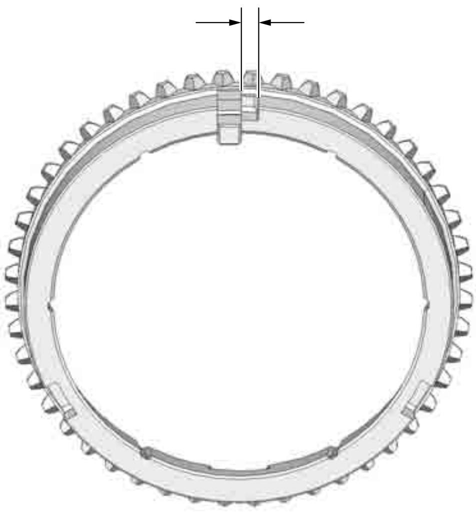


LNW25CSH028401

Block Ring and Insert Clearance

Use a vernier caliper or thickness gauge to measure the clearance between the block ring and insert.
If the measured value exceeds the specified limit, the block ring and insert must be replaced.

	Standard	Limit
3rd - 4th 5th	3.59 - 3.91 mm (0.141 - 0.154 in)	4.10 mm (0.161 in)

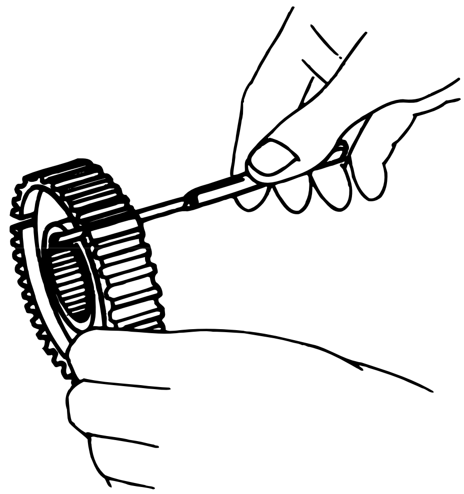


RTW77BSH006501

Clutch Hub and Insert Clearance

Use a thickness gauge to measure the clearance between the clutch hub and insert.
If the measured value exceeds the specified limit, the clutch hub and insert must be replaced.

	Standard	Limit
3rd - 4th 5th	0.09 - 0.31 mm (0.004 - 0.012 in)	0.40 mm (0.016 in)

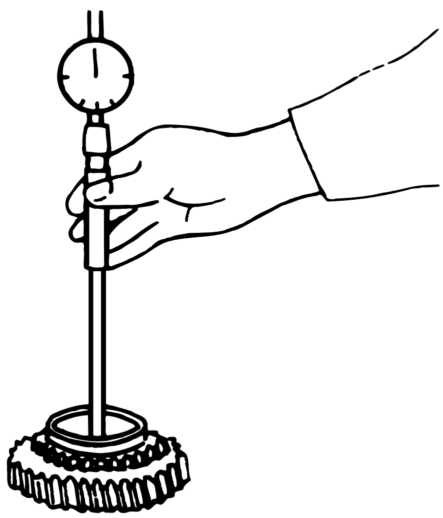


LNW25CSH028701

Gear Inside Diameter

Use an inside dial indicator to measure the gear inside diameter.
If the measured value is less than the specified limit, the gear must be replaced.

	Standard	Limit
3rd	45.000 - 45.016 mm (1.7717 - 1.7723 in)	45.056 mm (1.7739 in)
5th	48.000 - 48.016 mm (1.8898 - 1.8904 in)	48.056 mm (1.8920 in)



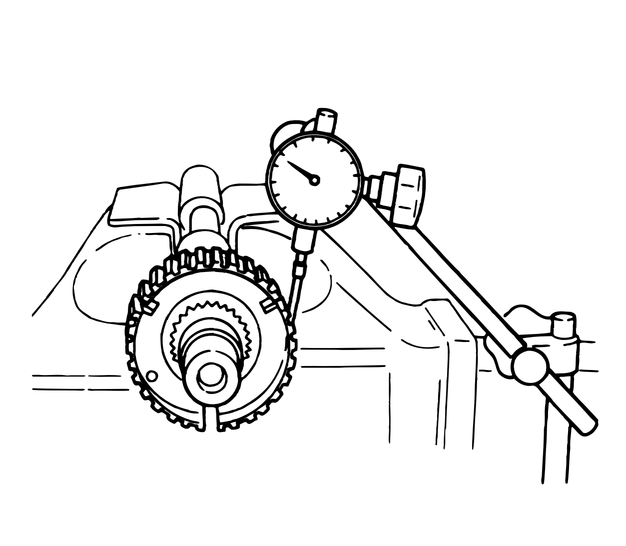
LNW25CSH028901

Clutch Hub Spline Play

- Set a dial indicator to the clutch hub to be measured.
- Move the clutch hub as far as possible to both the right and the left.

Note the dial indicator reading.
If the measured value exceeds the specified limit, the clutch hub must be replaced.

	Standard	Limit
3rd - 4th	0.010 - 0.102 mm (0.0004 - 0.0040 in)	0.15 mm (0.0059 in)
5th	0.009 - 0.104 mm (0.0004 - 0.0041 in)	0.15 mm (0.0059 in)



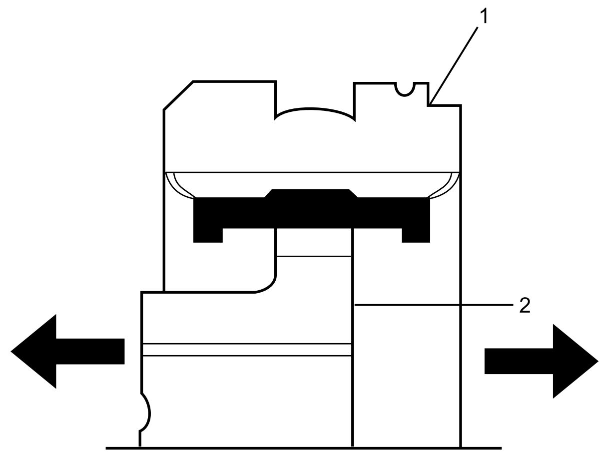
LNW25CSH029101

Counter Gear Spline Play

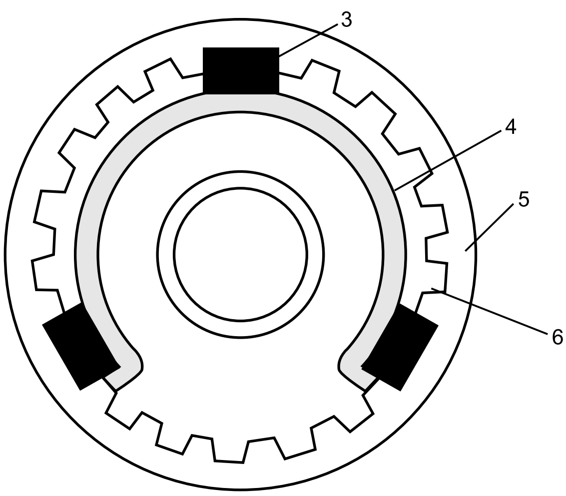
Refer to Counter Shaft Assembly in this section.

Installation

1. Use a pair of snap ring pliers to hold the new input middle bearing snap ring open .
   Install the input shaft assembly to the intermediate plate.
   - Never reinstall the used snap ring.
2. Install the input middle bearing snap ring.
3. Install the 5th input gear needle bearing. (2 piece type)
4. Install the 5th input gear assembly.
   - Apply engine oil to the gear internal surface.
5. Assemble the 5th synchronizer assembly by performing the following steps.
   - Turn the clutch hub face (2) toward the sleeve groove (1) (rear side) on the outer circumference.
   - Check that the inserts (3) fit snugly into the clutch hub (6) ring insert grooves.
   - Check that the inserts springs (4) are fitted to the inserts as shown in the figure.
   - Check that the clutch hub (6) and the sleeve (5) slide smoothly.
   - The insert springs (4) must be set in such a way that the opening of spring faces different direction.



LNW25CSH025601

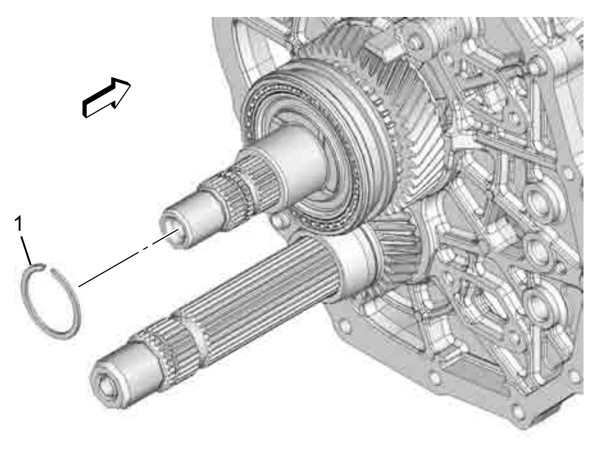


LNW25CSH025701

6. Install the 5th block ring and 5th synchronizer assembly.
7. Install the new 5th hub snap ring (1).
   - Never reinstall the used snap ring.
   - Choose the thickest snap ring among ones which can be assembled.

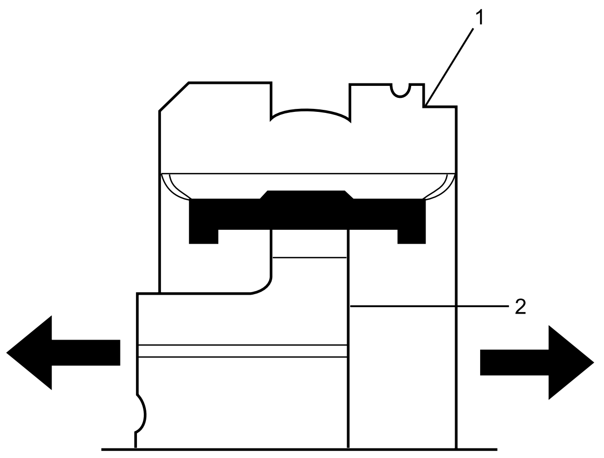
Snap Ring Availability

Thickness	Identification color
1.95 mm(0.077 in)	No color
2.10 mm(0.083 in)	Yellow

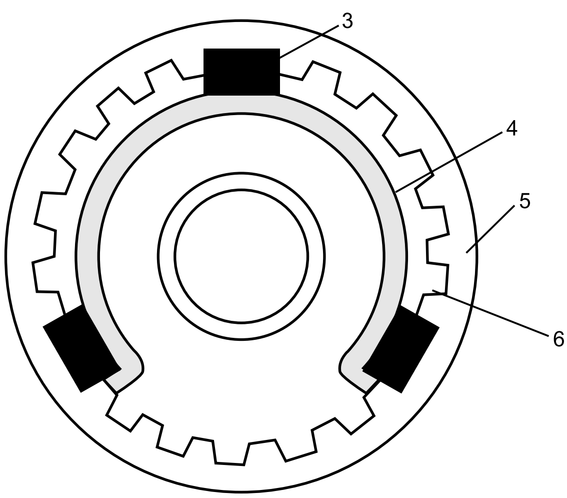


RTW77BSH005101

8. Install the counter middle roller bearing outer race, counter shaft assembly and 5th counter gear to the intermediate plate.
   - Apply engine oil to the gear internal surface.
9. Install the 3rd counter gear.
   - Apply engine oil to the gear internal surface.
10. Iinstall the 3rd input gear needle bearing.
11. Assemble the 3rd-4th synchronizer assembly by performing the following steps.
   - Turn the clutch hub face (2) toward the sleeve groove (1) (rear side) on the outer circumference.
   - Check that the inserts (3) fit snugly into the clutch hub (6) ring insert grooves.
   - Check that the inserts springs (4) are fitted to the inserts as shown in the figure.
   - Check that the clutch hub (6) and the sleeve (5) slide smoothly.
   - The insert springs (4) must be set in such a way that the opening of spring faces different direction.



LNW25CSH025601

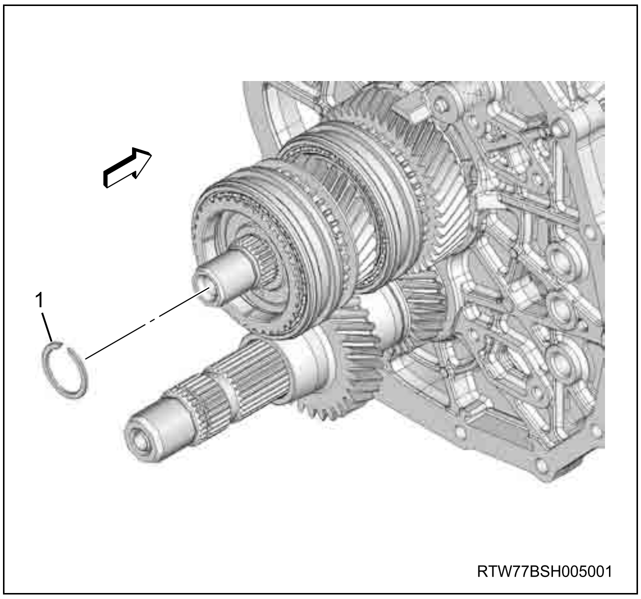


LNW25CSH025701

12. Install the 3rd input gear assembly, 3rd-4th block ring of 3rd input gear side, and 3rd-4th synchronizer assembly.
   - Apply engine oil to the gear internal surface.
13. Install the new 3rd-4th hub snap ring (1).
   - Never reinstall the used snap ring.
   - Choose the thickest snap ring among ones which can be assembled.

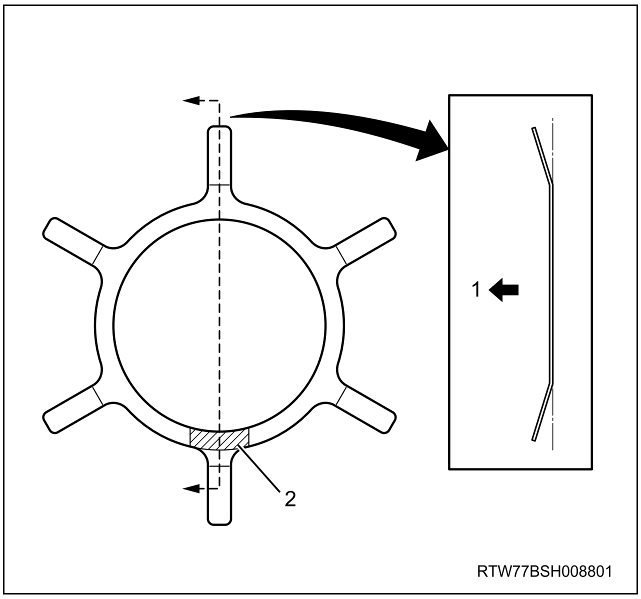
Snap Ring Availability

Thickness	Identification color
1.9 mm(0.075 in)	No color
2.1 mm(0.083 in)	Yellow
2.3 mm(0.091 in)	Pink



14. Install the plate spring.

Notice:
Painted identification color (Blue) side to be Transmission rear side.



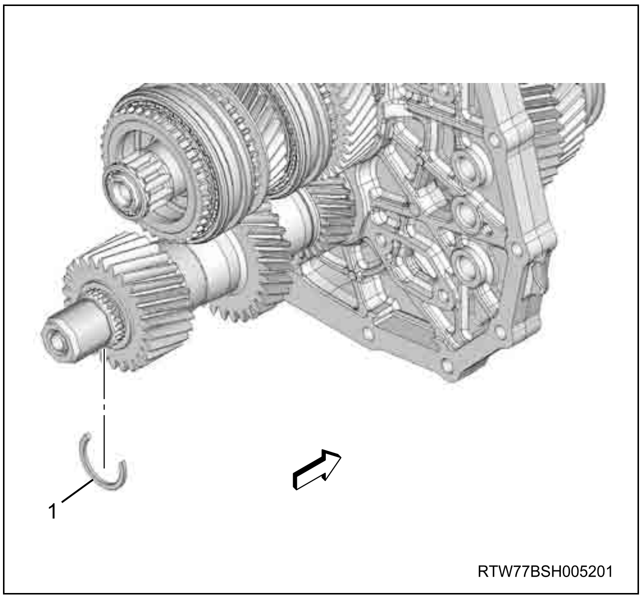
Legend

1. Transmission rear side
2. Painted area of identification color (Blue)

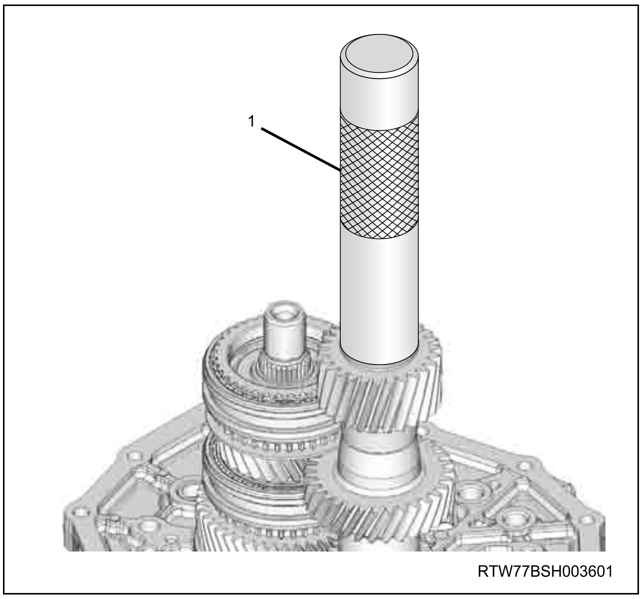
15. Install the 3rd-4th block ring of output shaft side.
16. Install the output counter gear.
    - Apply engine oil to the gear internal surface.
17. Install the new counter end snap ring (1).
    - Never reinstall the used snap ring.
    - Choose the thickest snap ring among ones which can be assembled.

Snap Ring Availability

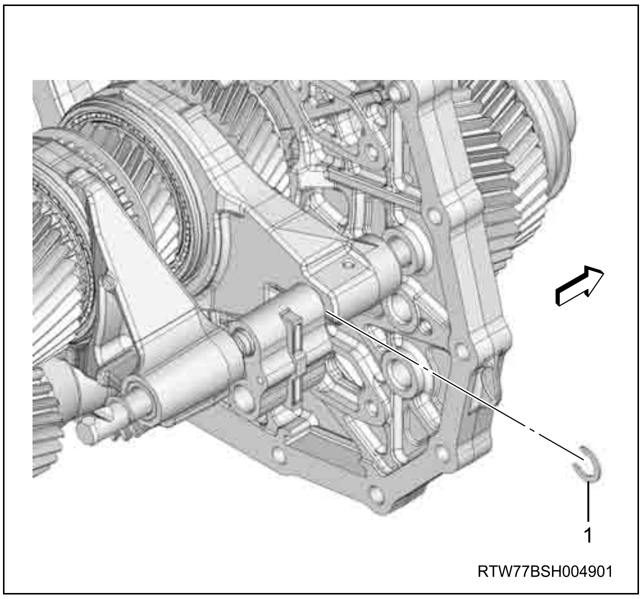
Thickness	Identification color
2.3 mm(0.091 in)	Pink
2.5 mm(0.098 in)	White
2.7 mm(0.106 in)	Green



18. Use the installer 5-8840-2346-0 (1) to install the new rubber seal.
    - Never reinstall the used rubber seal.
    - When seal press fitted, clearance not exists between lip and end surface of gear.



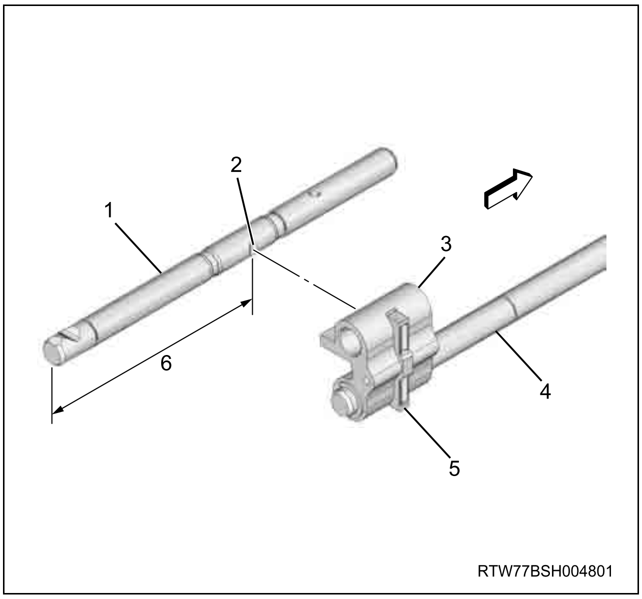
19. Install the pilot bearing spacer.
20. Install the pilot bearing.
    - Apply grease (BESCO L-2 or equivalent) to the bearing roller.
21. Install the output shaft assembly.
22. Install the 3rd-4th shift arm assembly.
23. Install the 5th-reverse shift block assembly.
24. Install the 5th shift arm.
25. Install the 3rd-4th-5th shift rod.
26. Install the new 3rd-4th-5th shift rod snap ring (1).
    - Never reinstall the used snap ring.



27. Install the 5th shift arm new spring pin.
    - Never reinstall the used spring pin.

Notice:
The spring pin must be drive in to this hole end surface surfly.

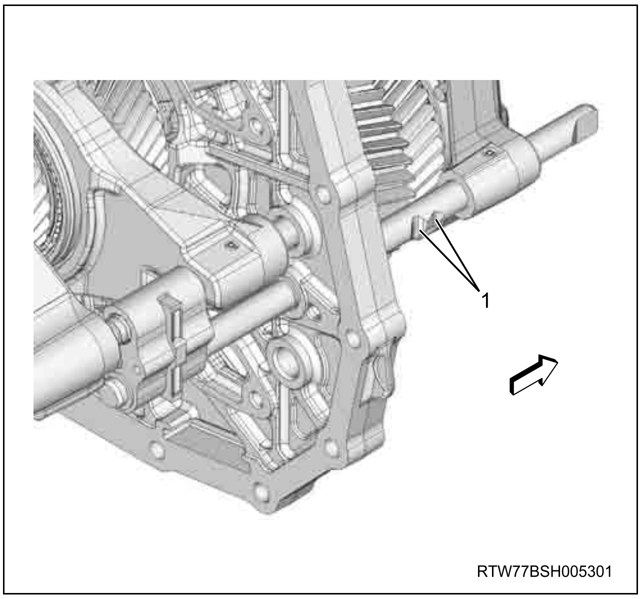
28. Install the reverse shift arm.
29. The shift block lever is put into the dent of the 3rd-4th-5th shift rod.



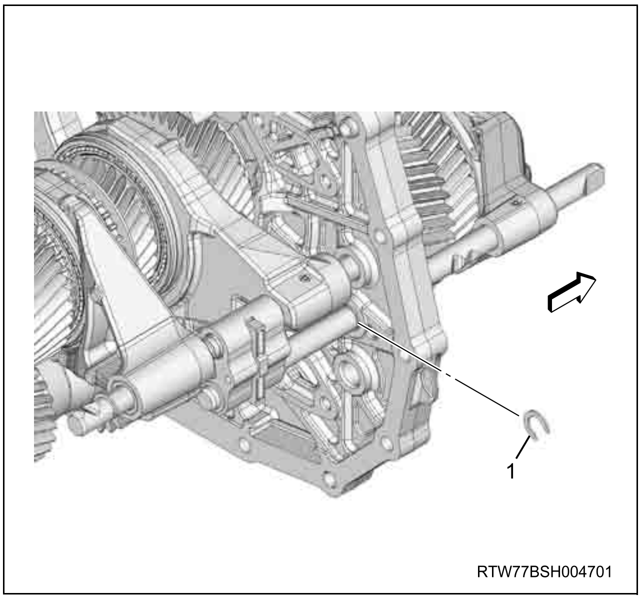
Legend
1. 3rd-4th-5th shift rod
2. Dent of 3rd-4th-5th shift rod
3. 5th-reverse shift block
4. Reverse shift rod
5. Shift block lever
6. 123.5 mm (4.86 in)

30. Install the reverse shift rod.

Notice:
The dents (1) of the shift rod should face outside of the transmission so that the detent of the front case fits them when reassembled.



31. Install the new reverse shift rod snap ring (1).
    - Never reinstall the used snap ring.

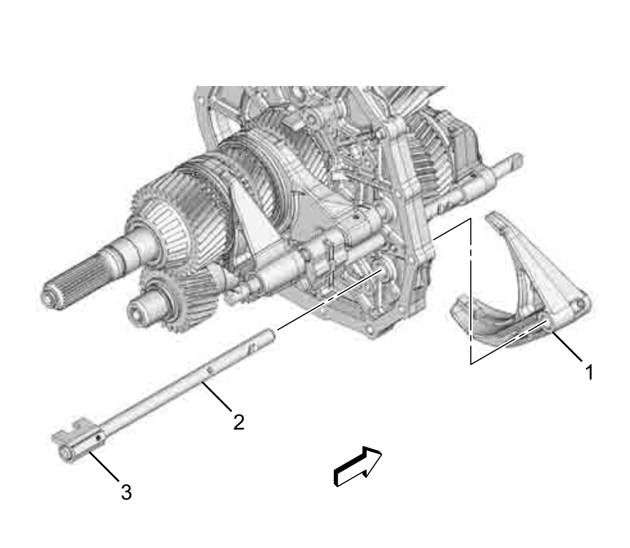


32. Install the reverse shift arm new spring pin.
    - Never reinstall the used spring pin.

Notice:
The spring pin must be drive in to this hole end surface surfly.

33. Install the 1st-2nd shift arm (1).

34. Install the shift rod (2) with the 1st-2nd shft block (3).

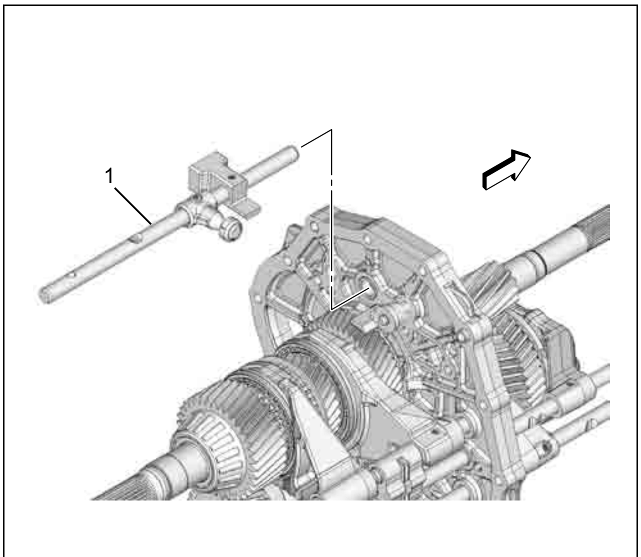


RTW77BSH008001

35. Install the 1st-2nd shift arm new spring pin.
   - Never reinstall the used spring pin.

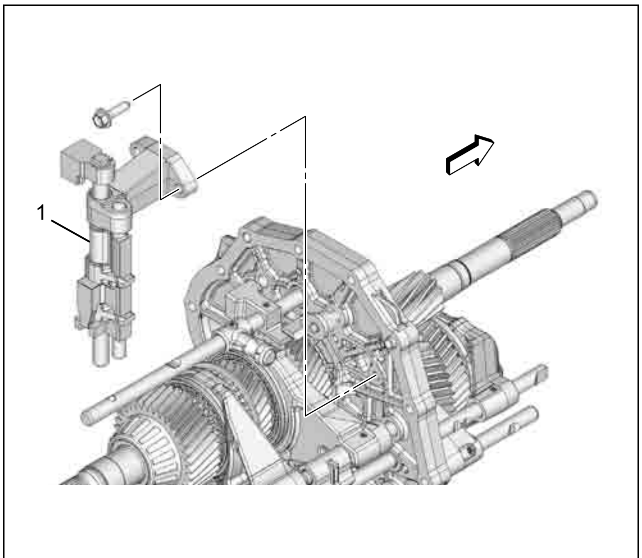
Notice:
The spring pin must be drive in to this hole end surface surfly.

36. Install the control rod assembly (1).



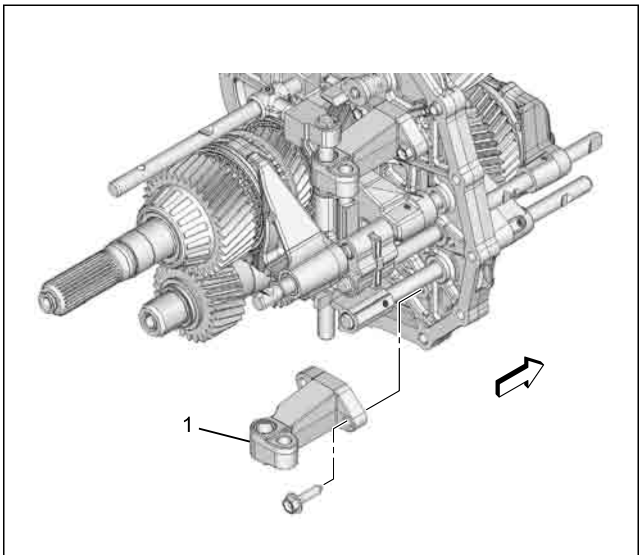
RTW77BSH007901

37. Install the shift & select rod assembly (1) and bolts temporarily.



RTW77BSH007801

38. Install the shift rod bracket (1) and bolts temporarily.



RTW77BSH007701

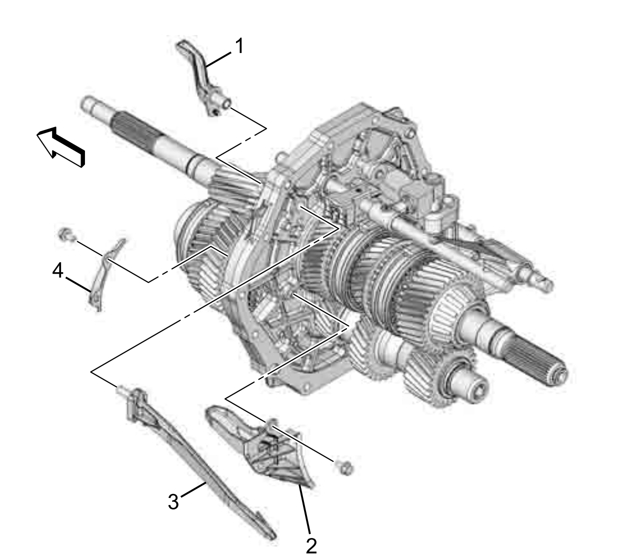
39. Install the bolts to the shift & select rod assembly and shift rod bracket.
   - Tighten the shift & select rod bolts and the shift rod bracket bolts to the specified torque.

Torque: 25 N·m (2.5 kgf·m/18 lb·ft)

40. Install the counter 2nd gutter (4) and counter 5th gutter (2).
   - Tighten the gutter bolts to the specified torque.

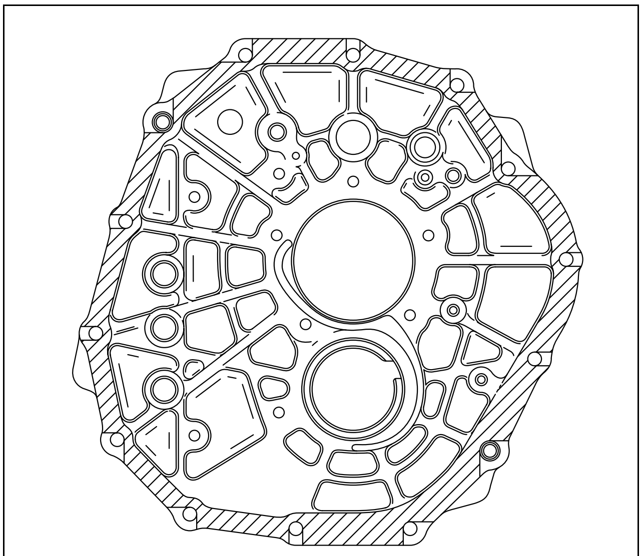
Torque: 9 N·m (0.9 kgf·m/78 lb·in)

41. Install the new front gutter (1) and new rear gutter (3).
   - Never reinstall the used gutters.

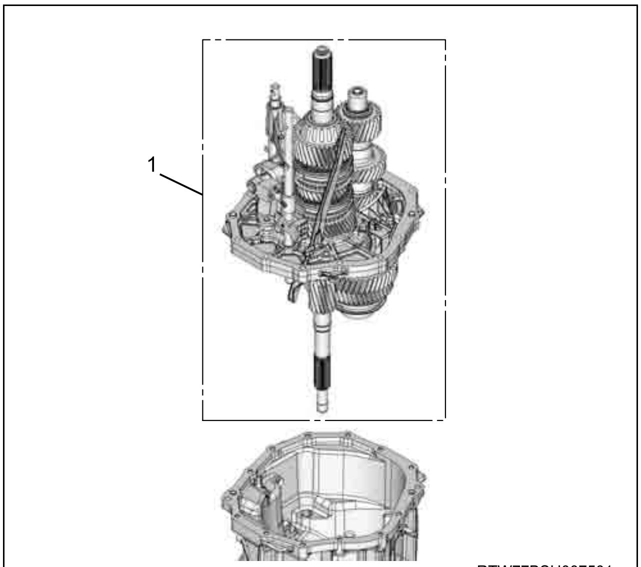


RTW77BSH007601

42. In order to protect the front oil seal lip, wrap a tape around the spline portion of the input shaft.
43. Install the intermediate plate assembly with gear (1) to the front case.
    - Apply recommended liquid gasket (LOCTITE FMD-127 or equivalent) with the width of 3 to 5 mm to the area marked in the figure below.

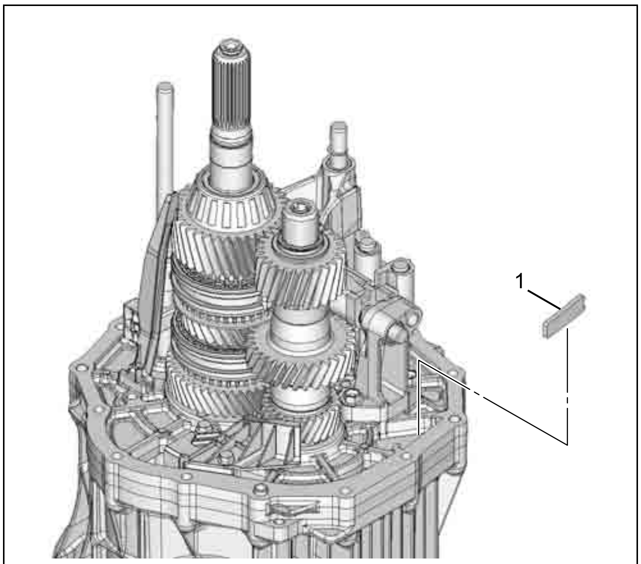


RTW77BSH005801



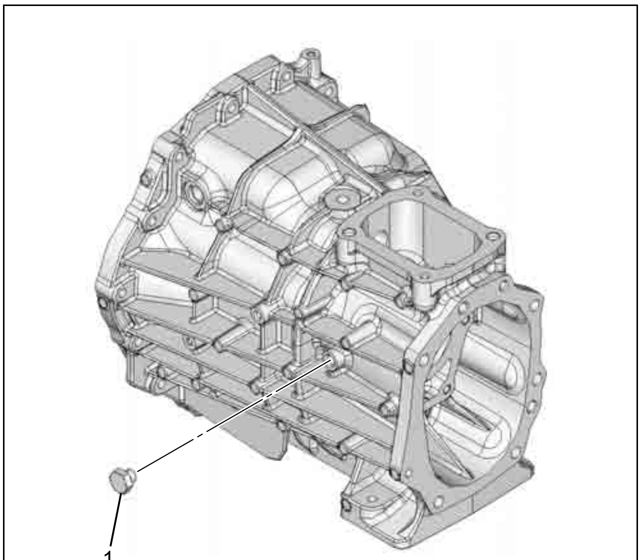
RTW77BSH007501

44. Install the magnet (1).



RTW77BSH008201

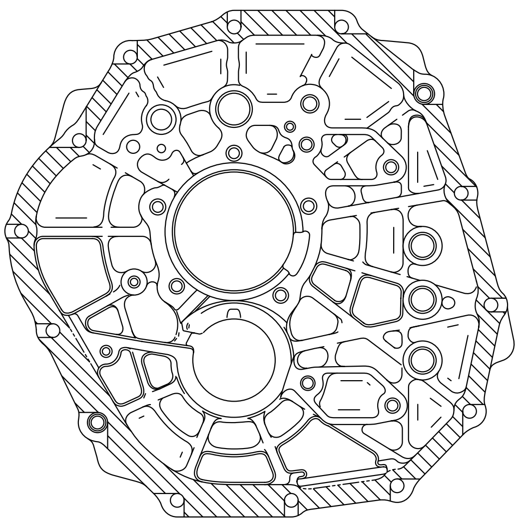
45. Remove the straight plug (1) from the rear case.



RTW77BSH006301

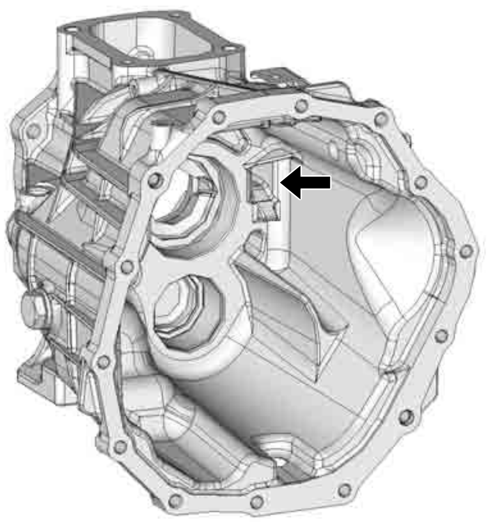
46. Install the rear case assembly.

- Apply recommended liquid gasket (LOCTITE FMD-127 or equivalent) with the width of 3 to 5 mm to the area marked in the figure below.



RTW77BSH005901

Notice:
Be careful of the insertion position of the rear gutter.

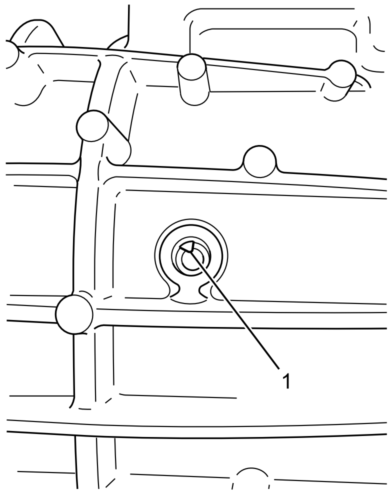


RTW77BSH008301

47. Check whether the rear gutter (1) appears from the straight plug hole.
    Install the new straight plug.
    - Never reinstall the used straight plug.
    - Tighten the straight plug to the specified torque.

Torque: 34 N·m (3.5 kgf·m/25 lb·ft)

Notice:
- If the rear gutter does not appear from the straight plug hole, the rear gutter is not in the right position. Remove and reinstall the rear case.
- When there is no rear gutter in the right position, it becomes lubriciously poor.



RTW77BSH003401

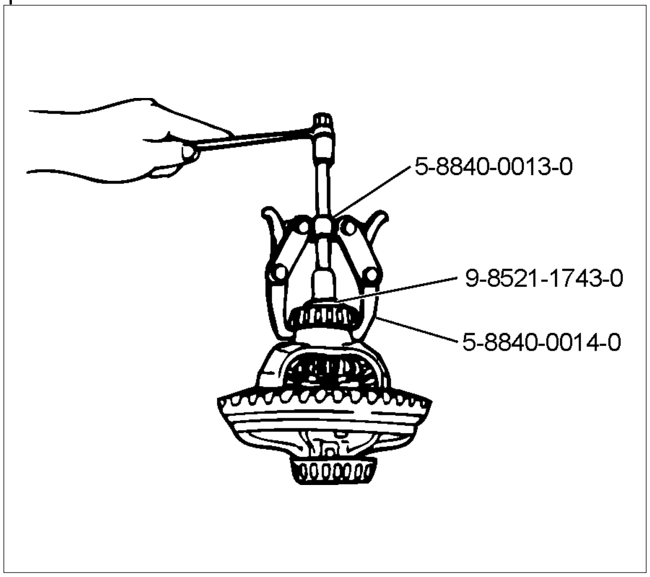
48. Install the rear case bolts.
    - Tighten the rear case bolts to the specified torque.

Torque: 23 N·m (2.3 kgf·m/17 lb·ft)

49. Install the output rear bearing inner race.
50. Use the snap ring selector 5-8840-2849-0 to select the new output shaft snap ring.
    - Never reinstall the used snap ring.

    a. Place the snap ring selector on the output rear bearing.
    b. Join the bolt (2) to the output shaft (4).
    c. Adjust the end of both grips (3) with a bottom of spline and tighten both grips evenly.

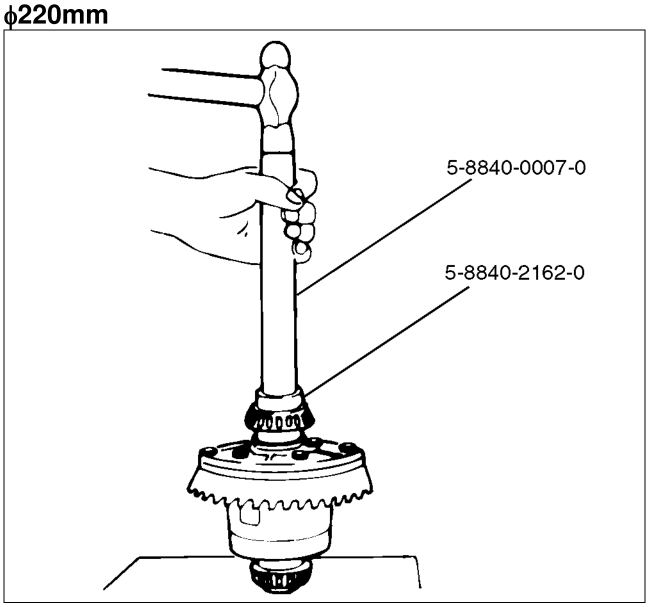
ϕ194mm



RTW54BSH000201

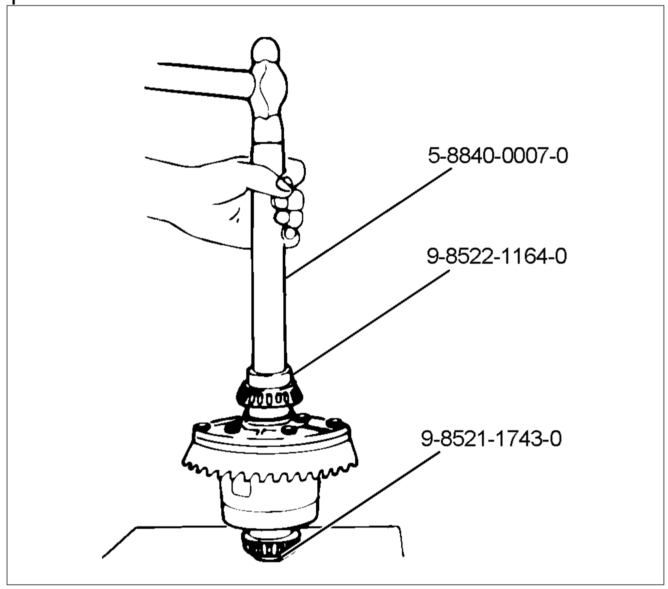
12. Install the side bearings together with the selected shims by using installer 5-8840-2162-0 (ϕ220mm) and 9-8522-1164-0 (ϕ194mm), drive handle 5-8840-0007-0 and pilot 9-8521-1743-0 (ϕ194mm).

ϕ220mm



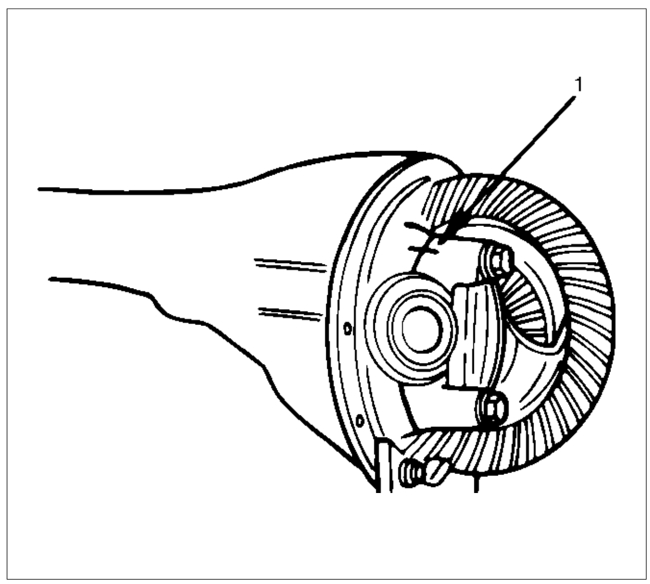
425L100010

ϕ194mm



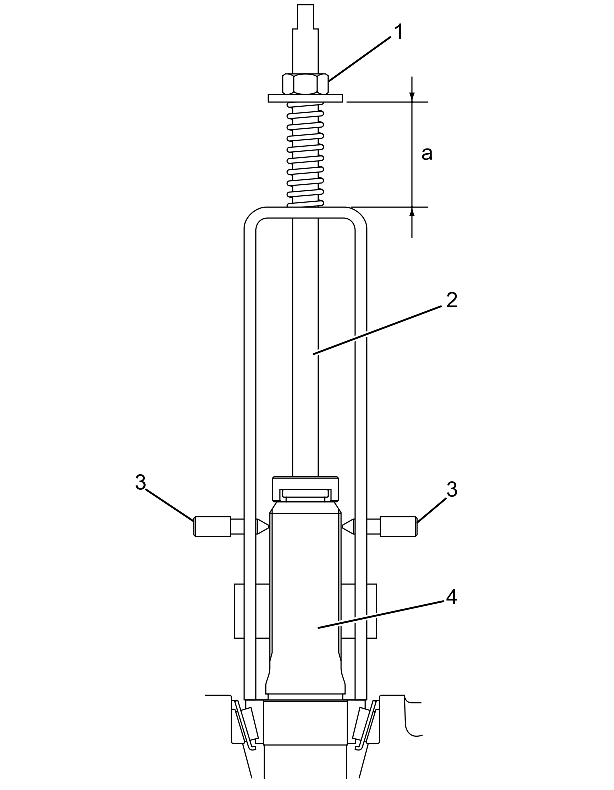
425R300004

13. Install side bearing outer race.
14. Install differential cage assembly.
15. Align the setting marks (1) applied at disassembly then install the bearing cap.



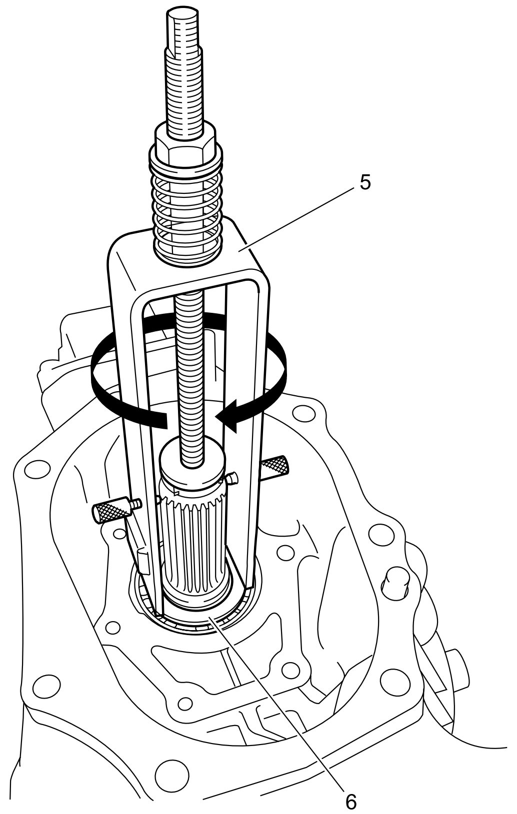
425RS035

d. Tighten the nut (1) till the height of spring reaches 29 mm (1.142 in) (a).



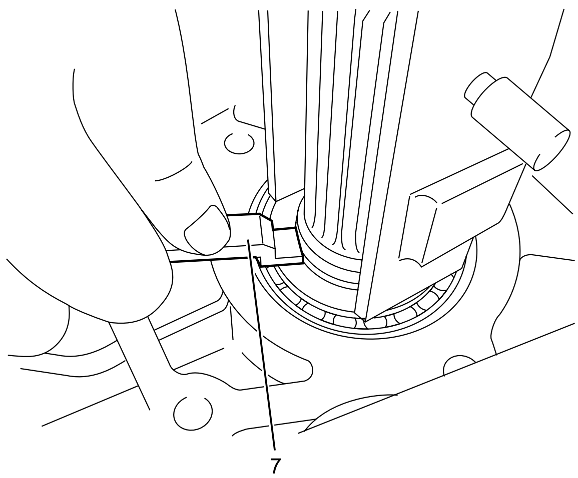
RTW77BMH000201

e. Turn the output shaft rear bearing inner race (6) and the snap ring selector (5) together 16 times or more in order to make the output shaft rear bearing inner and outer race fit well.



RTW77BMH000301

f. Try to insert gauges (7) of six different thickness in turn to the snap ring groove of output shaft.
Select the thickest gauge that could be inserted.



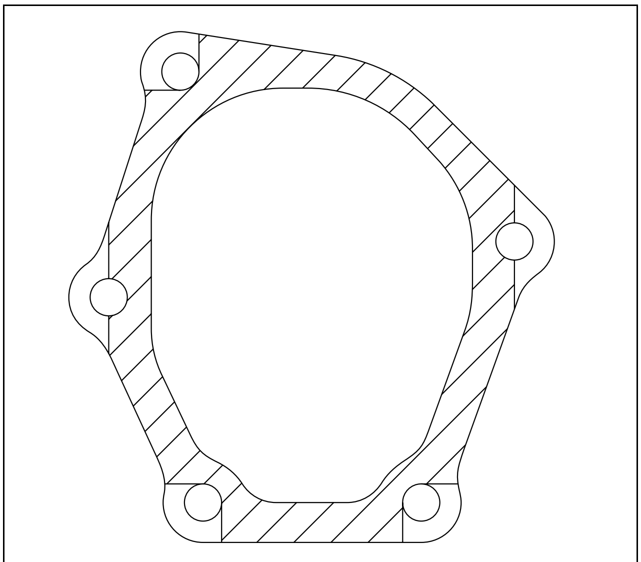
RTW77BSH008401

g. The thickness of the selected gauge shows the thickness of the snap ring to be installed.

Snap Ring Availability

Thickness	Identification color
2.1 mm(0.083 in)	White
2.2 mm(0.087 in)	Blue
2.3 mm(0.091 in)	Green
2.4 mm(0.094 in)	Yellow
2.5 mm(0.098 in)	Orange
2.6 mm(0.102 in)	Black

51. Install the new snap ring to the output shaft.
    - Never reinstall the used snap ring.
52. Install the speedometer drive gear. (4x2 model)
53. Install the gear set clip. (4x2 model)
54. Install the end cover assembly.
    - The gasket must be assembled. (4x2 model)
    - Apply recommended liquid gasket (LOCTITE FMD-127 or equivalent) with the width of 3 to 5 mm to the area marked in the figure below. (4x4 model)



RTW77BSH005601

    - Tighten the end cover bolts to the specified torque.

Torque: 23 N·m (2.3 kgf·m/17 lb·ft)

55. Install the speedometer driven gear and plate. (4x2 model)
56. Install the control rod detent assembly.
    - Tighten the three detent assemblies to the specified torque.

Torque: 30 N·m (3.1 kgf·m/22 lb·ft)

57. Install the new 5th detent assembly and new reverse detent assembly.
    - Never reinstall the used detent assembly.
    - Tighten the three detent assemblies to the specified torque.

Torque: 30 N·m (3.1 kgf·m/22 lb·ft)

58. Install the two harness brackets.

Torque: 8N·m (0.8 kgf·m/69 lb·in)

59. Install the reverse switch (Connector color Brown), 1st switch (Connector color Gray) and neutral switch (Connector color Brown) with gasket.
    - Tighten the three switches to the specified torque.

Torque: 39 N·m (4.0 kgf·m/29 lb·ft)

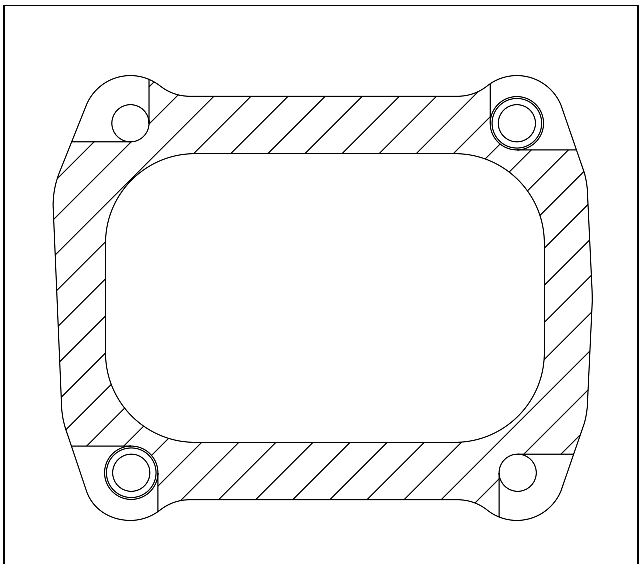
60. Install the control unit block by performing the following steps.
    a. Push the control unit block ahead.
    b. Install the control unit block.
    c. Install the new taper bolt.
        - Never reinstall the used taper bolt.
        - Tighten the taper bolt to the specified torque.

Torque: 47 N·m (4.8 kgf·m/35 lb·ft)

Important:

- Must be checked no flaw to taper bolt.
- Must be checked no jam of foreign body before assembled.
- Must be checked same position upper surface of the taper bolt and the control unit block after assembled.

61. Install the two dowels and quadrant box.
    - Apply recommended liquid gasket (LOCTITE FMD-127 or equivalent) with the width of 3 to 5 mm to the area marked in the figure below.



RTW77BSH005701

    - Tighten the quadrant box bolts to the specified torque.

Torque: 23 N·m (2.3 kgf·m/17 lb·ft)

62. Remove the tape from the spline portion of the input shaft.

63. Install the front cover.
    - Tighten the front cover bolts to the specified torque.

Torque: 23 N·m (2.3 kgf·m/17 lb·ft)

64. After reassembling the transmission, refill the case with the new specified transmission oil.
    a. Install the drain plug with new gasket.
       - Never reinstall the used gasket.
       - Apply engine oil to the new gasket surface.
       - Tighten the drain plug to the specified torque.

Torque: 39 N·m (4.0 kgf·m/29 lb·ft)

    b. Remove the filler plug with gasket.
    c. Refill the case with the new specified transmission oil (BESCO Trans Axle Oil 5W-30 SF) amount 3.0 liters.
    d. Install the filler plug with new gasket.
       - Never reinstall the used gasket.
       - Apply engine oil to the new gasket surface.
       - Tighten the filler plug to the specified torque.

Torque: 39 N·m (4.0 kgf·m/29 lb·ft)

Front Case Assembly

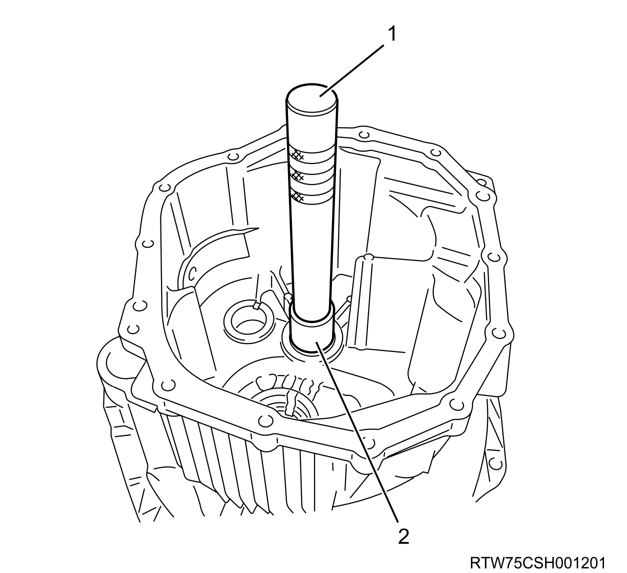
2. Input shaft needle bearing
3. Front case with clutch housing
4. Reverse idler shaft
5. Reverse idler gear assembly
6. Reverse shaft bracket
7. Reverse idler bolt
8. Gasket

Removal

1. Remove the reverse idler bolt with gasket.
2. Remove the reverse shaft bracket and reverse idler gear assembly.
3. Remove the reverse idler shaft with straight pin.

4. Use the installer 5-8840-0125-0 (2) and grip 5-8840-0007-0 (1) to remove the front oil seal and input shaft needle bearing from the front case, and discard the used oil seal.

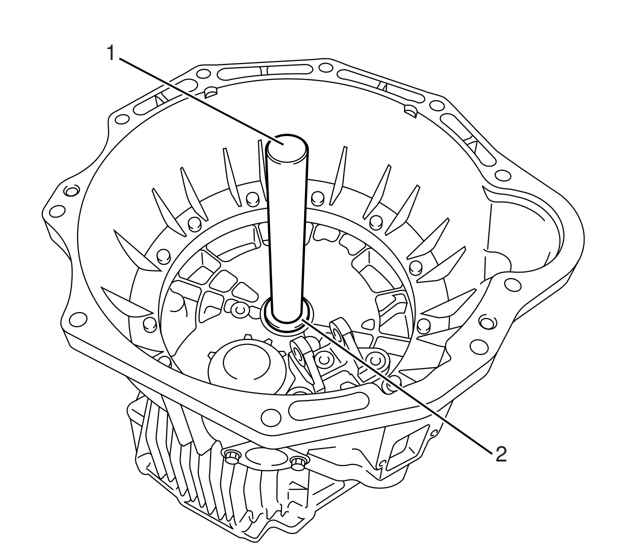


RTW75CSH001201

Installation

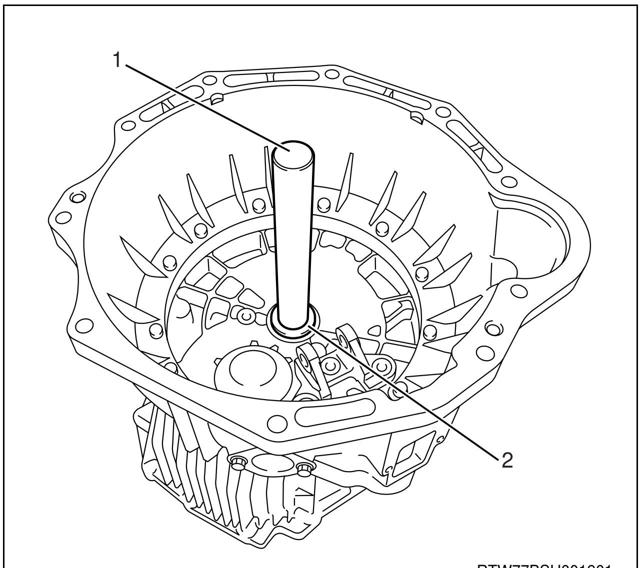
1. Use the installer 5-8840-2846-0 (2) and grip 5-8840-0007-0 (1) to install the input shaft needle bearing to the front case.

Notice:
Please install by making a stamp side into rear.



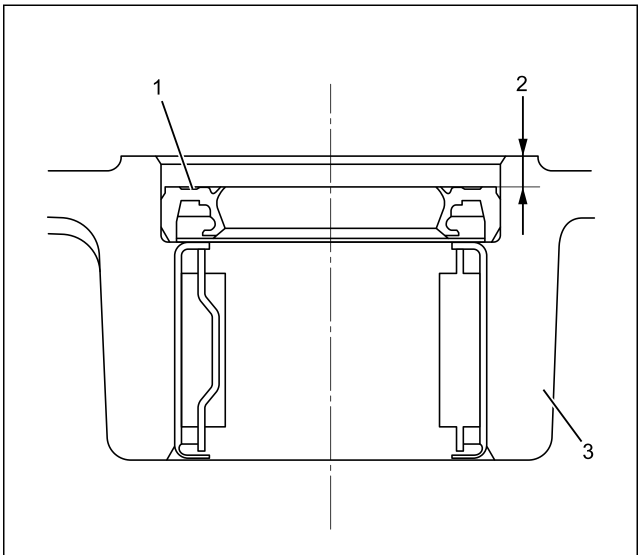
RTW77BSH001901

2. Install the front oil seal.
   a. Use the installer 5-8840-2846-0 (2) and grip 5-8840-0007-0 (1) to install the new front oil seal to the front case.
      - Never reinstall the used oil seal.
      - Apply engine oil to new front oil seal outer surfaces, and apply grease (BESCO L-2 or equivalent) to the oil seal lip.
      - At press fitting the oil seal, to be careful not to inflict lip of it.



RTW77BSH001901

   b. The oil seal must be pressed fit as shown in the figure.



RTW77BSH002001

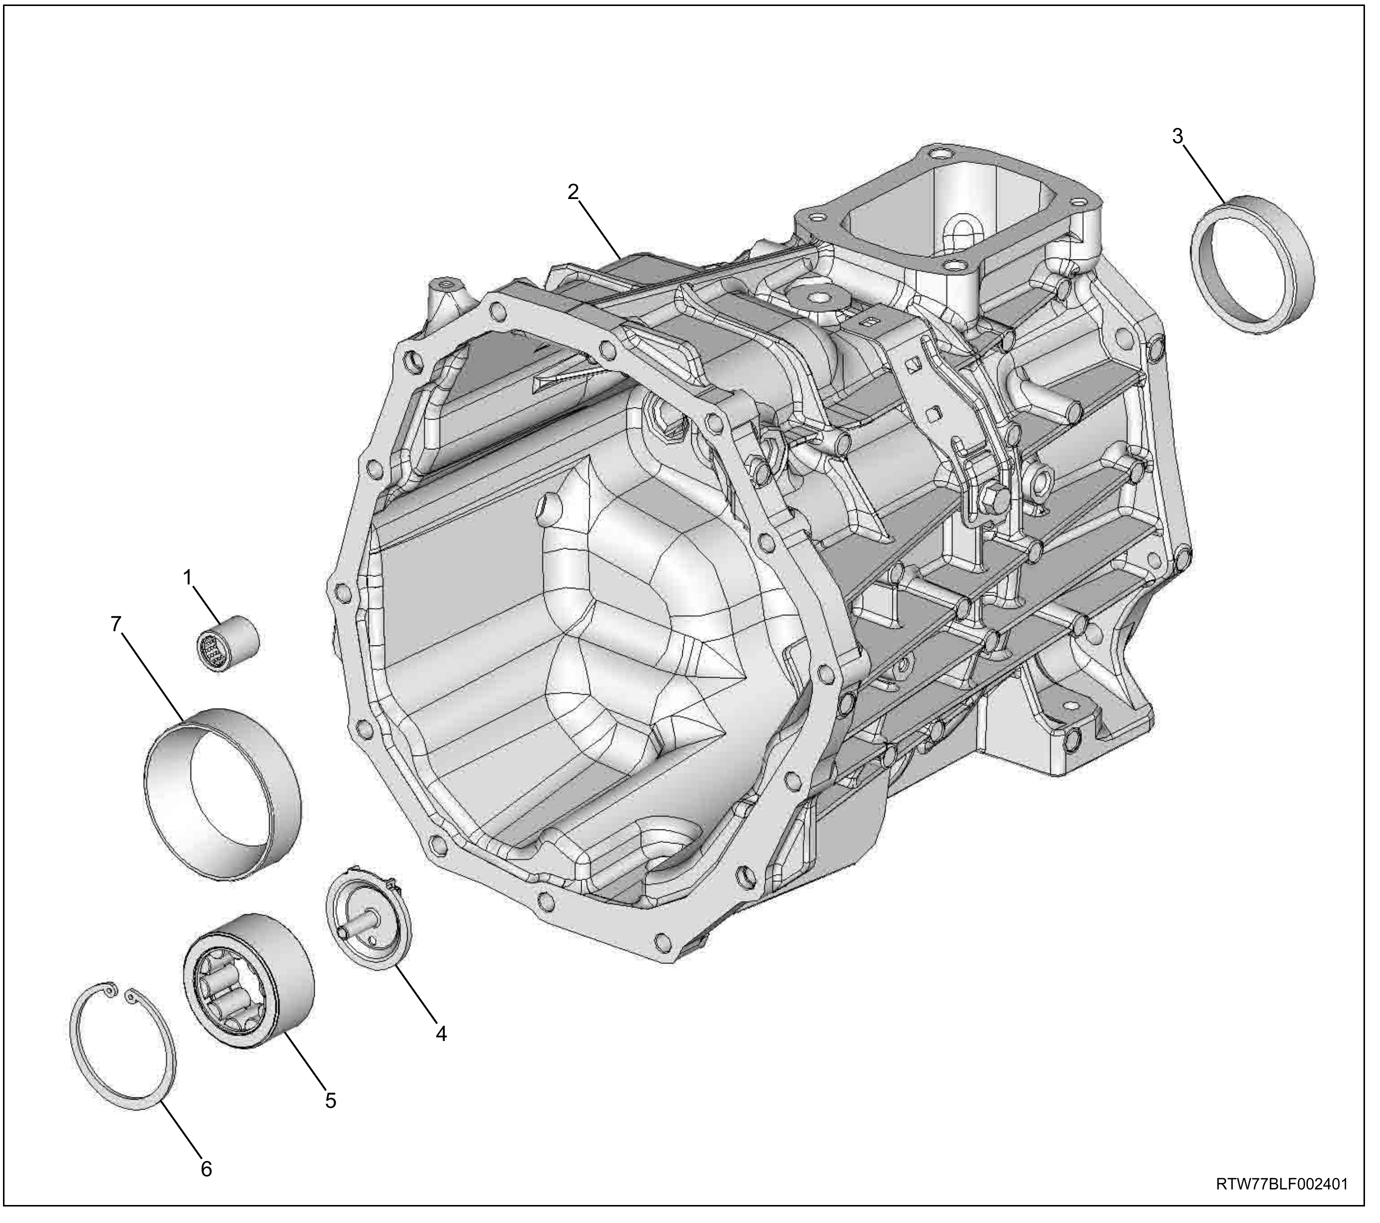
Legend
1. Front oil seal
2. 4 mm (0.157 in)
3. Front case

3. Install the reverse idler shaft with straight pin.
4. Install the reverse idler gear assembly and reverse shaft bracket.
   - Apply engine oil to gear internal surface.
5. Install the reverse idler bolt with gasket.
   - Tighten the reverse idler bolt to the specified torque.

Torque: 83 N·m (8.5 kgf·m/61 lb·ft)

Rear Case Assembly

Component



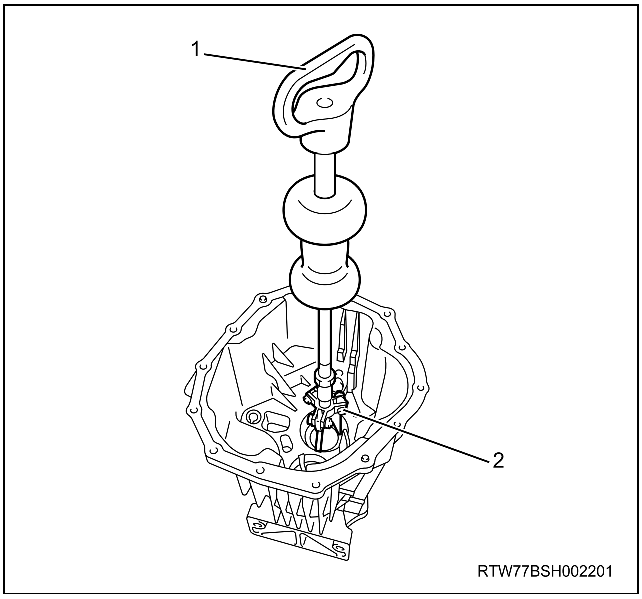
Legend

1. Linear ball bearing
2. Rear case
3. Output rear bearing outer race
4. Oil nozzle
5. Counter end roller bearing
6. Snap ring
7. Output front bearing outer race

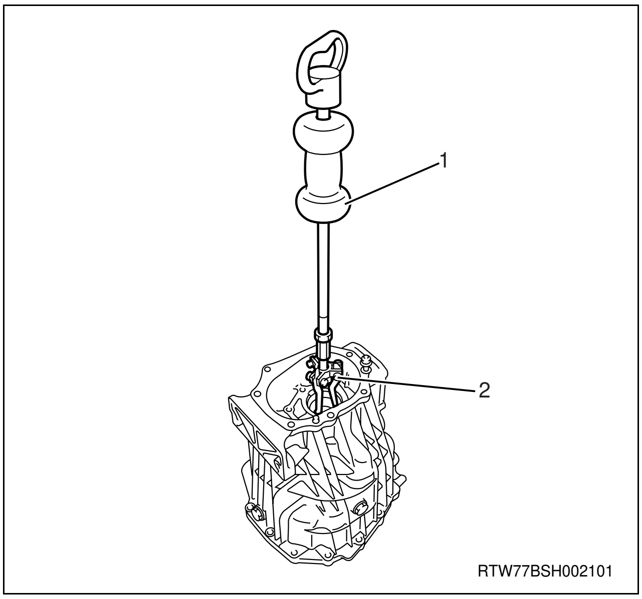
Removal

1. Remove the linear ball bearing from the rear case.
2. Use a pair of snap ring pliers to remove the snap ring from the rear case.
3. Remove the counter end roller bearing from the rear case.
4. Remove the oil nozzle from the rear case.

5. Use the remover 5-8840-2757-0 (2) and sliding hammer 5-8840-0084-0 (1) to remove the output front bearing outer race from the rear case.

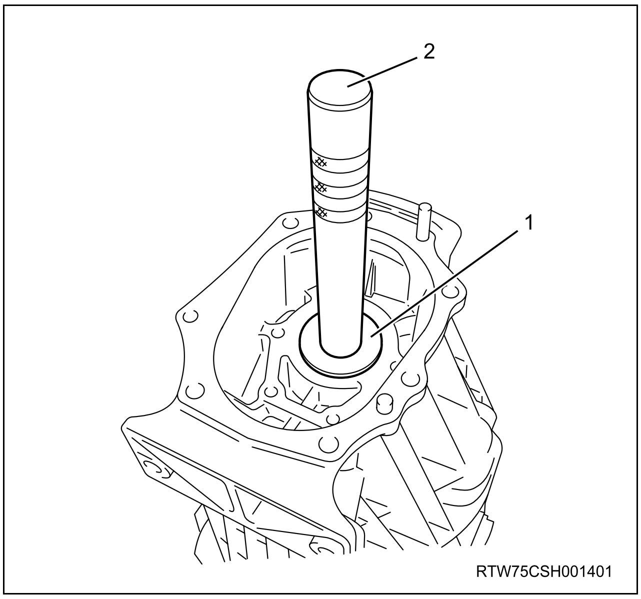


6. Use the remover 5-8840-2757-0 (2) and sliding hammer 5-8840-0084-0 (1) to remove the output rear bearing outer race from the rear case.

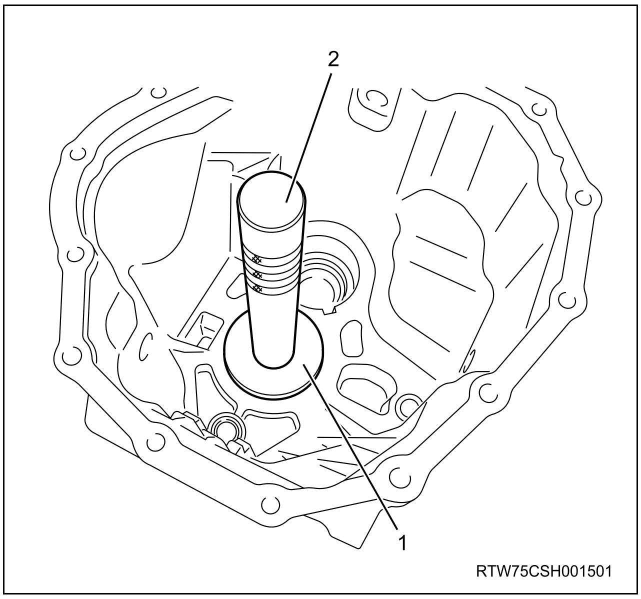


Installation

1. Use the installer 5-8522-0053-0 (1) and grip 5-8840-0007-0 (2) to install the output rear bearing outer race to the rear case.



2. Use the installer 5-8840-2850-0 (1) and grip 5-8840-0007-0 (2) to install the output front bearing outer race to the rear case.



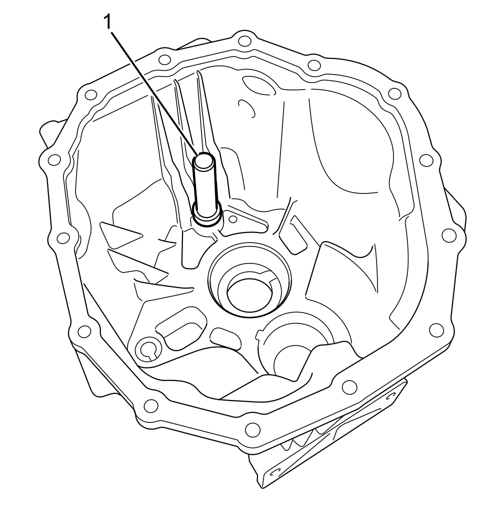
3. Install the oil nozzle to the rear case.

Important:
Convex of oil nozzle must be assembled in guide part of rear case.

4. Install the counter shaft end roller bearing to the rear case.
5. Install the new snap ring to the rear case.
   - Never reinstall the used snap ring.

Notice:
The snap ring must be assembled in groove of rear case surely.

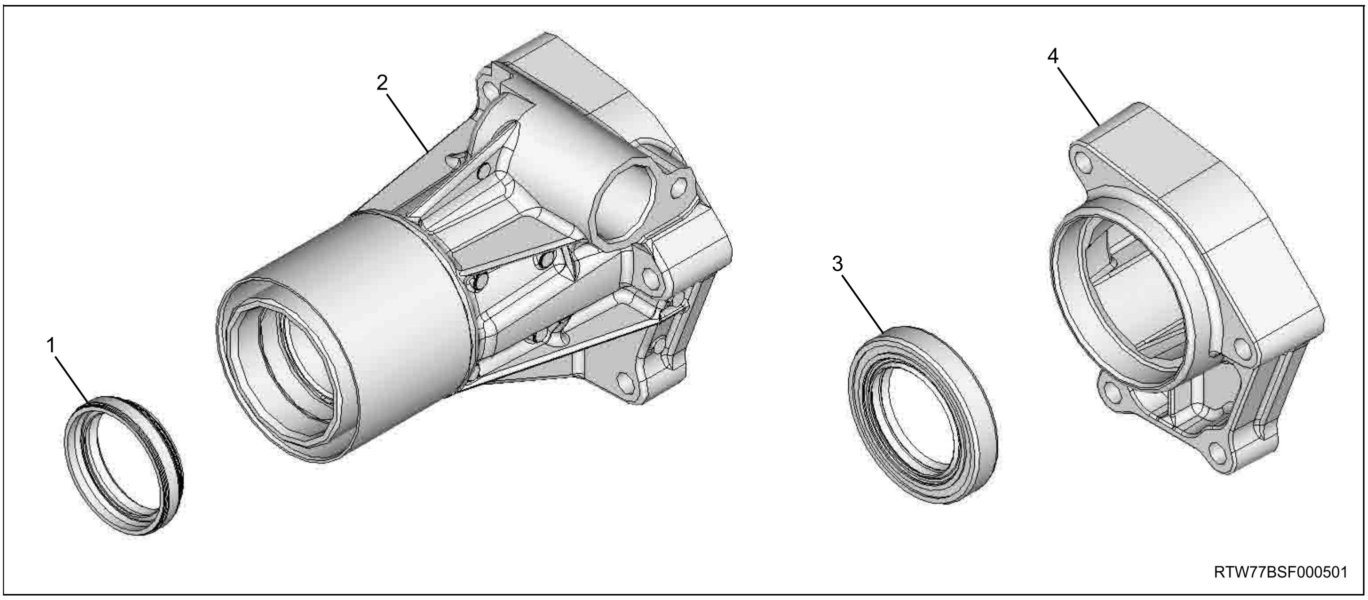
6. Use the installer 5-8840-2848-0 (1) to install the linear ball bearing to the rear case.
   - The linear ball bearing to be pressed fit to front boss side.
   - The linear ball bearing must be pressed at marked side.



RTW77BSH003101

End Cover Assembly

Component



Legend

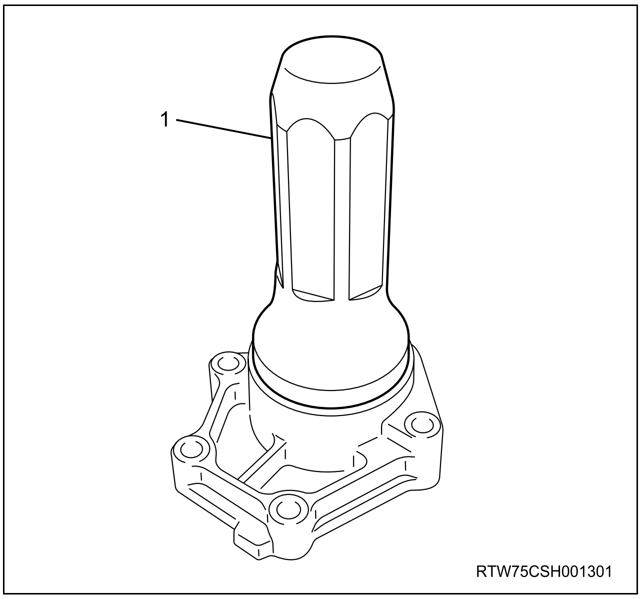
1. Rear oil seal (4x2 model)
2. End cover (4x2 model)
3. Rear oil seal (4x4 model)
4. End cover (4x4 modeel)

Removal

1. Remove the rear oil seal from the end cover, and discard the used oil seal.

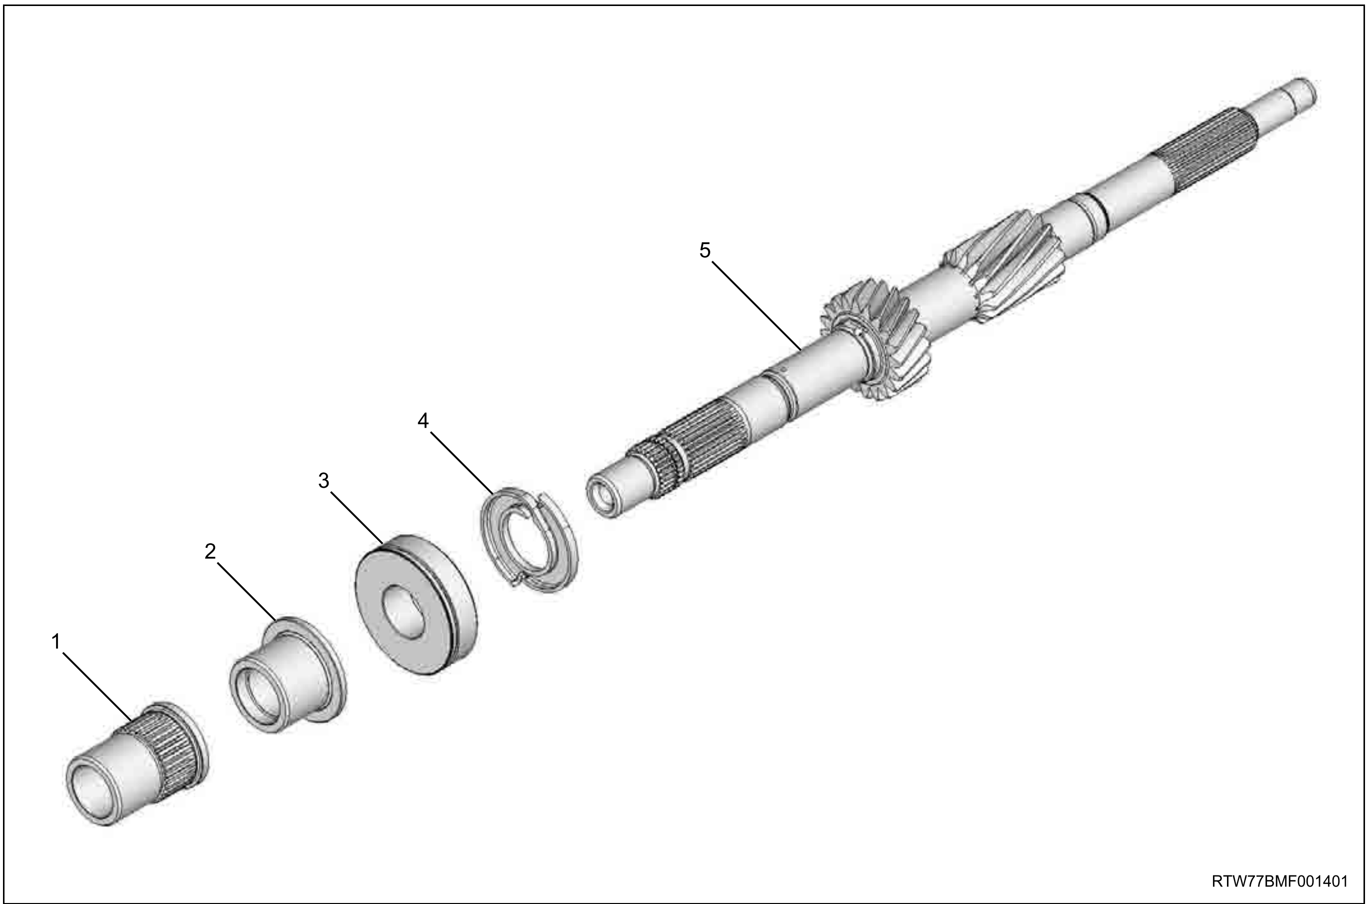
Installation

1. Use the installer 5-8840-2786-0 to install the new rear oil seal to the end cover. (4x2 model)
   Use the installer 5-8840-2282-0 (1) to install the new rear oil seal to the end cover. (4x4 model)
   - Never reinstall the used oil seal.
   - Apply engine oil to new rear oil seal outer surfaces, and apply grease (BESCO L-2 or equivalent) to the oil seal lip.
   - At press fitting the oil seal, to be careful not to inflict lip of it.



Input Shaft Assembly

Component

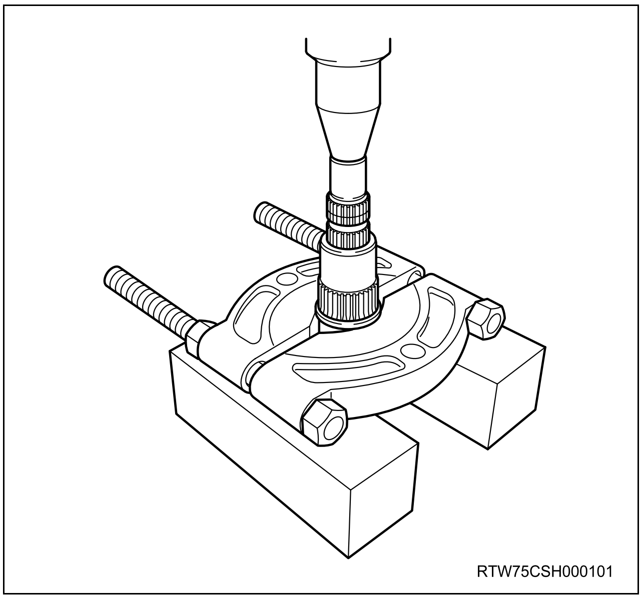


Legend

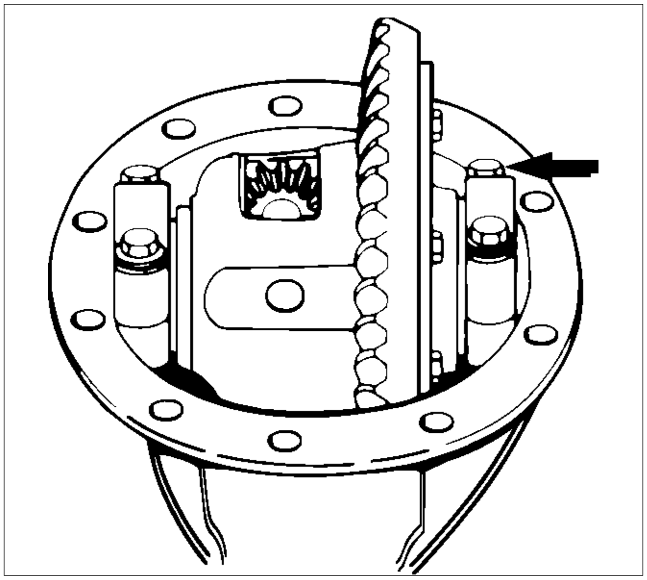
1. 3rd input collar
2. 5th input collar
3. Input middle bearing
4. Oil catch impeller
5. Input shaft

Removal

1. Use a bench press to remove the 3rd input collar from the input shaft.



16. Tighten the bolt to the specified torque.
    Torque :
    ϕ220mm : 108 N·m (11 kgf·m/80 lb·ft)
    ϕ194mm : 98 N·m (10 kgf·m/72 lb·ft)

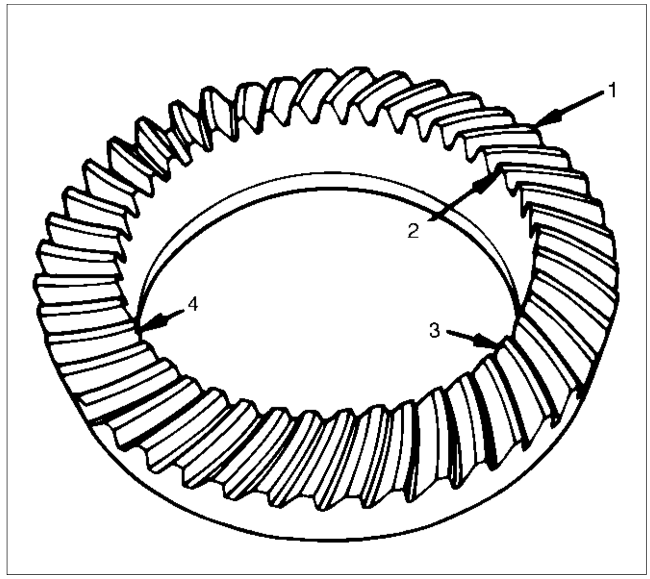


425RS036

- Measure the amount of run-out of the ring gear at its rear face. It should be 0.05 mm (0.002 in) or less

Gear Tooth Contact Pattern Check and Adjustment

1. Apply a thin coat of Prussian blue or equivalent to the faces of the 7–8 teeth of the ring gear. Check the impression of contact on the ring gear teeth and make necessary adjustment as described in illustration if the contact is abnormal.

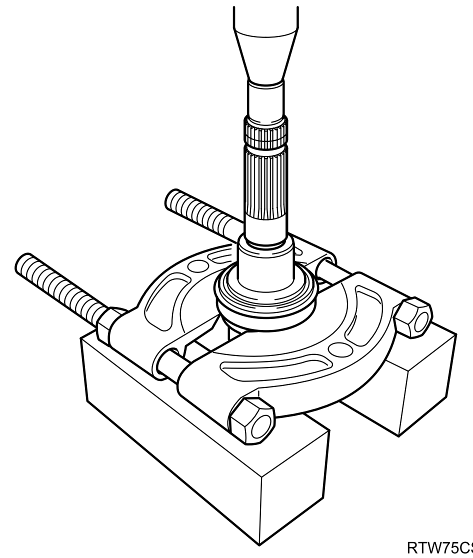


425RS038

Legend

1. Heel
2. Toe
3. Concave Side(Coast)
4. Convex Side(Drive)

2. Use a bench press to remove the 5th input collar and input middle bearing from the input shaft.



RTW75CSH000201

3. Remove the oil catch impeller from the input shaft.

Inspection and Repair

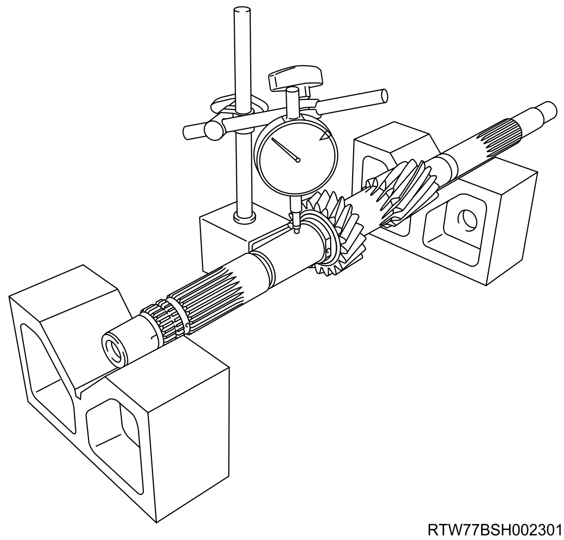
Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

Input Shaft Run-out

- Install the input shaft to V-blocks.
- Use a dial indicator to measure the input shaft central portion run-out.

If the measured input shaft run-out exceeds the specified limit, the input shaft must be replaced.

Limit
0.05 mm (0.002 in)

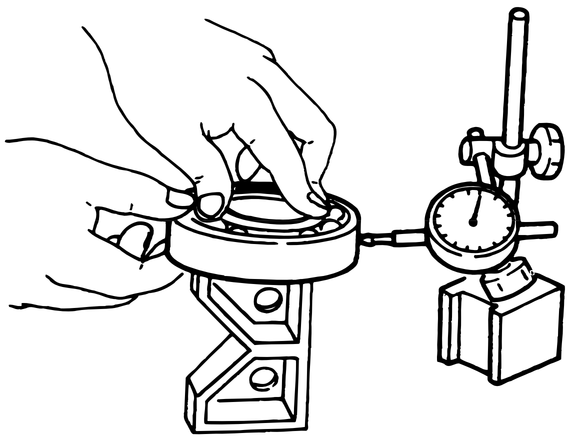


RTW77BSH002301

Ball Bearing Play

Use a dial indicator to measure the ball bearing play.
If the measured value exceeds the specified limit, the ball bearing must be replaced.

Standard	Limit
0 - 0.066 mm (0 - 0.0026 in)	0.1 mm (0.004 in)

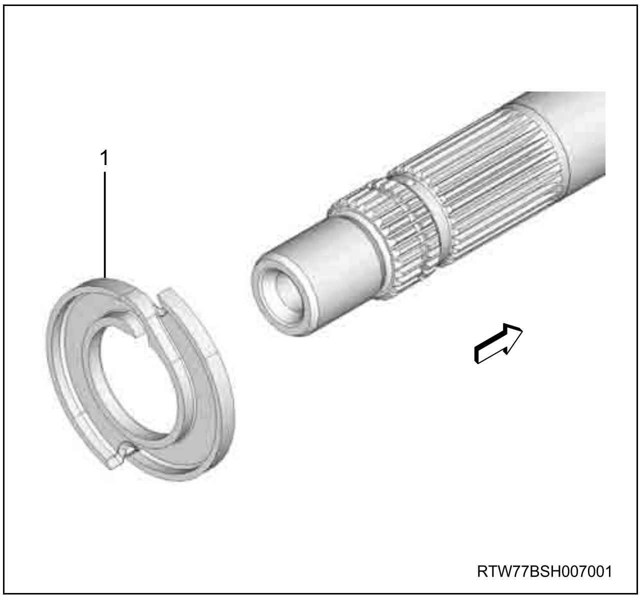


LNW25CSH029201

Installation

1. Install the oil catch impeller (1) to the input shaft.

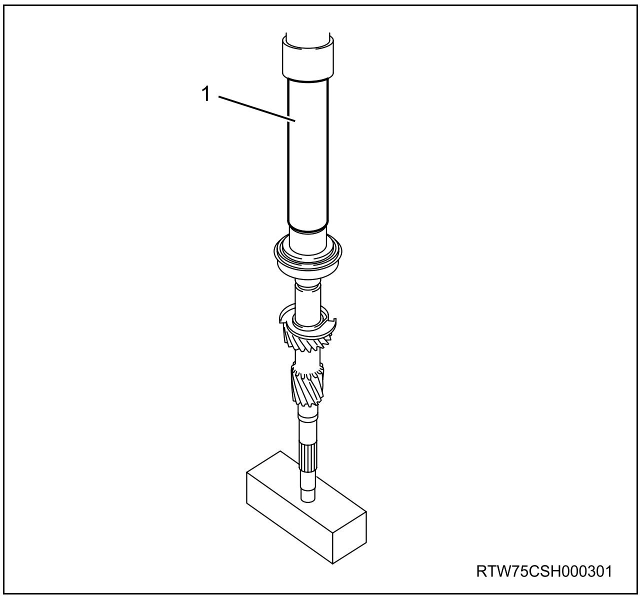
Notice:
Direction of assembling exists. (Groove opening area to be bearing side.)



2. Use a bench press and installer 5-8840-2346-0 (1) to install the 5th input collar and input middle bearing to the input shaft.

Notice:

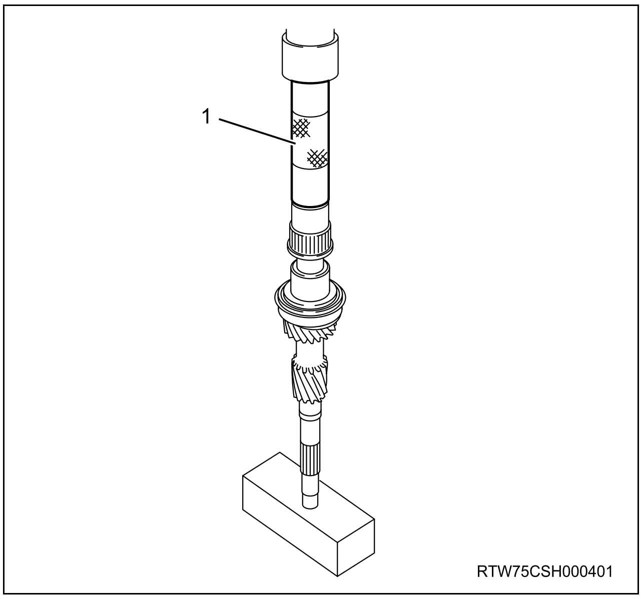
- Direction of assembling exists. (Groove of outside periphery to be collar side.)
- The bearing must be press fitted with end surface of shaft.
- The collar must be press fitted with end surface of bearing.
- The outer race must not be punch. (Inner race to be push.)



3. Use a bench press and installer 5-8840-2346-0 (1) to install the 3rd input collar to the input shaft.

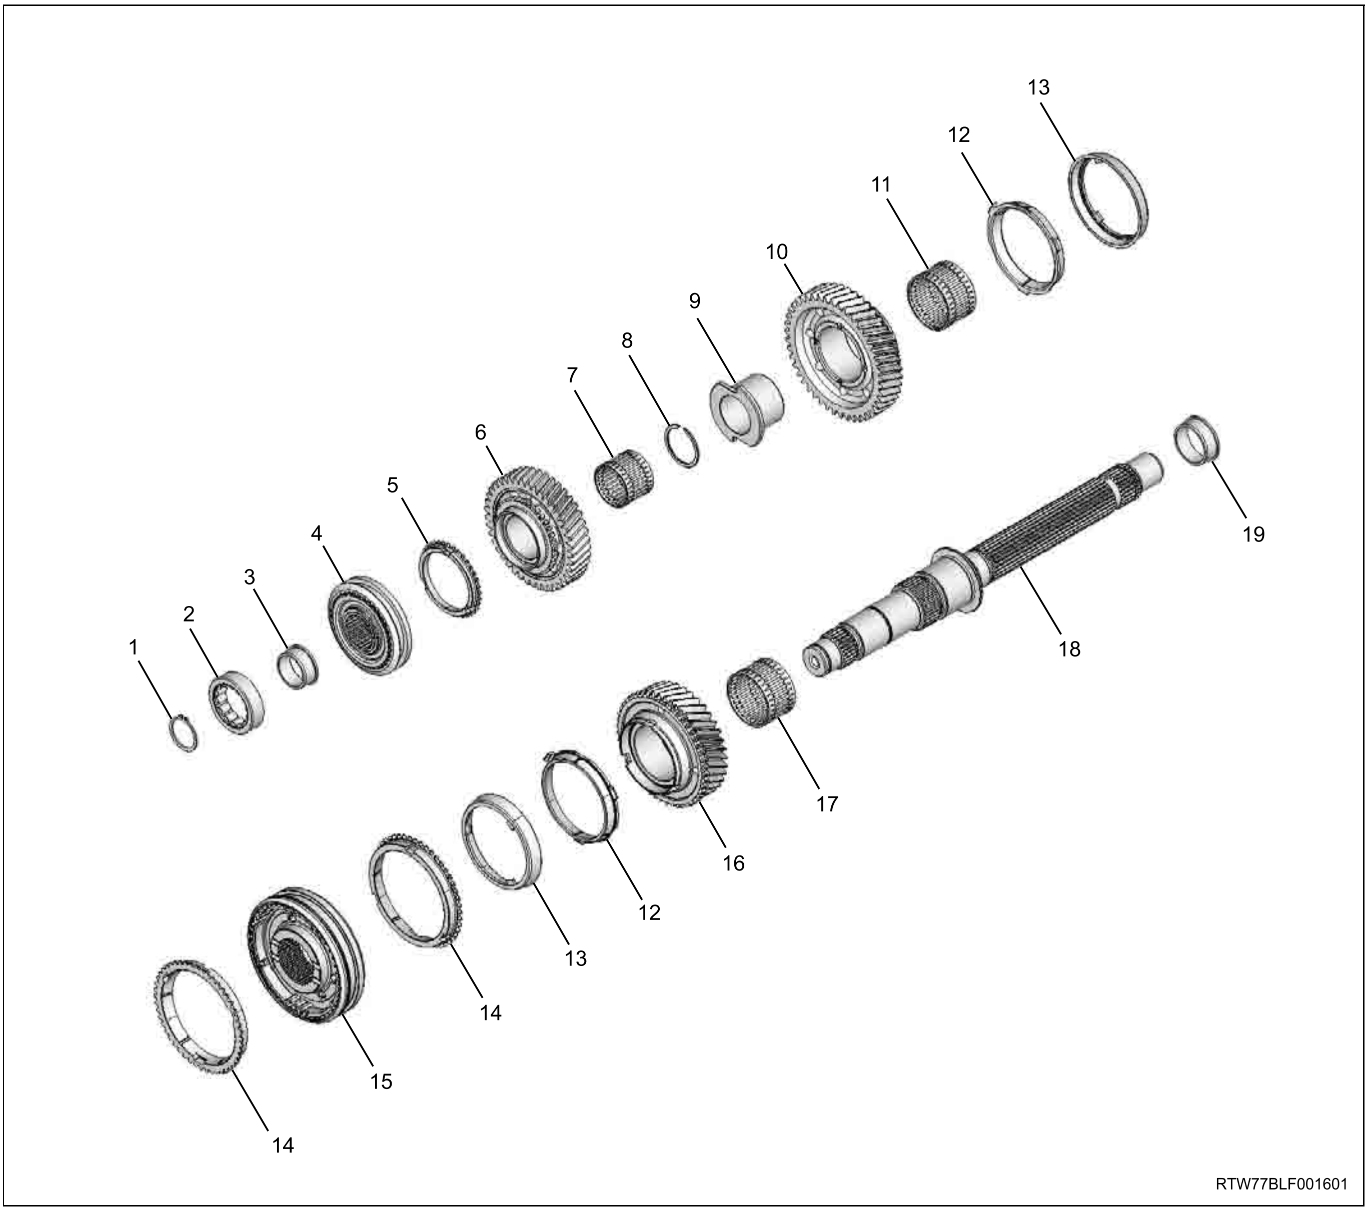
Notice:

The collar must be press fitted with end surface of the 5th collar.



Counter Shaft Assembly

Component



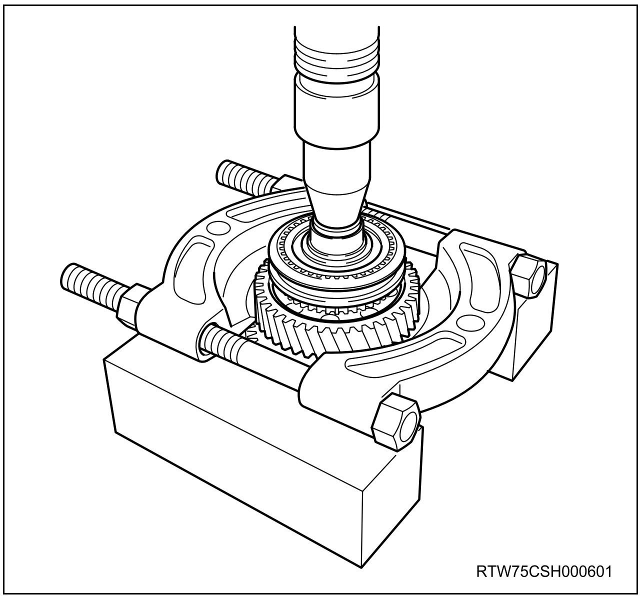
Legend

1. Reverse counter snap ring
2. Counter front roller bearing outer race
3. Counter front roller bearing inner race
4. Reverse synchronizer assembly
5. Reverse block ring
6. Reverse counter gear assembly
7. Reverse counter gear needle bearing
8. 1st counter snap ring
9. 1st counter collar
10. 1st counter gear assembly
11. 1st counter gear needle bearing
12. 1st-2nd inside ring
13. 1st-2nd outside ring
14. 1st-2nd block ring
15. 1st-2nd synchronizer assembly
16. 2nd counter gear assembly
17. 2nd counter gear needle bearing
18. Counter shaft
19. Counter middle roller bearing inner race

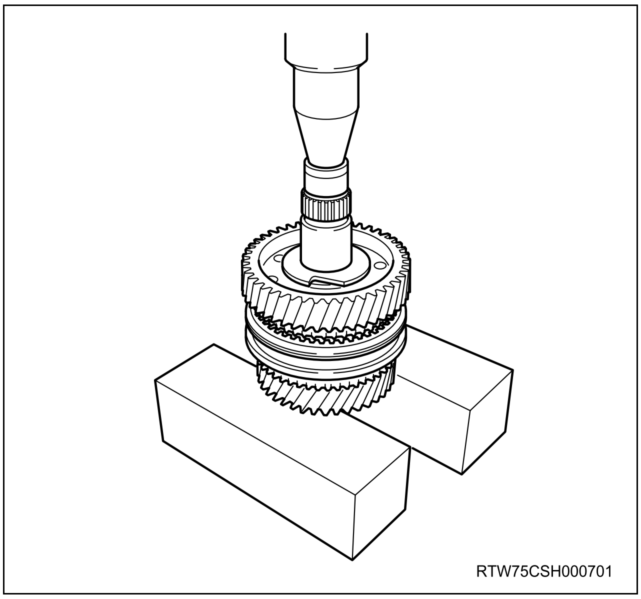
Removal

1. Use a pair of snap ring pliers to remove the reverse counter snap ring.
2. Remove the counter front roller bearing outer race.

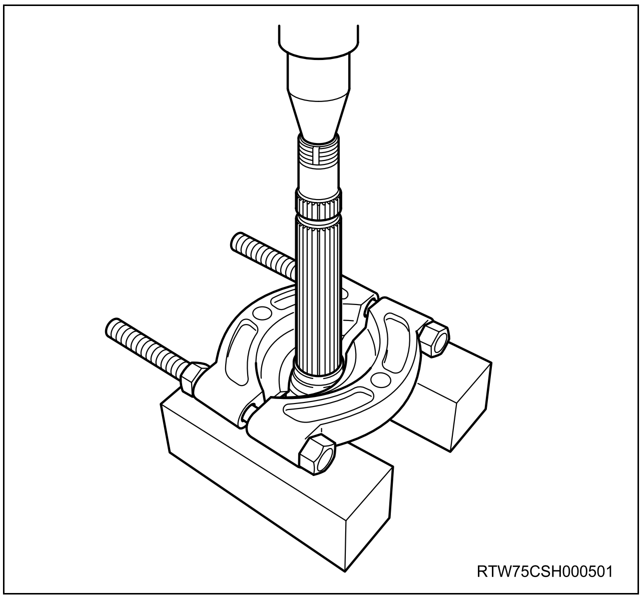
3. Use a bench press to remove the reverse counter gear assembly together with reverse block ring, reverse synchronizer assembly, and counter front roller bearing inner race.



4. Remove the reverse counter gear needle bearing.
5. Remove the 1st counter snap ring.
6. Use a bench press to remove the 2nd counter gear assembly together with 1st-2nd synchronizer assembly, inside ring, outside ring, block ring, 1st counter gear assembly, and 1st counter collar.



7. Use a bench press to remove the counter middle roller bearing inner race.



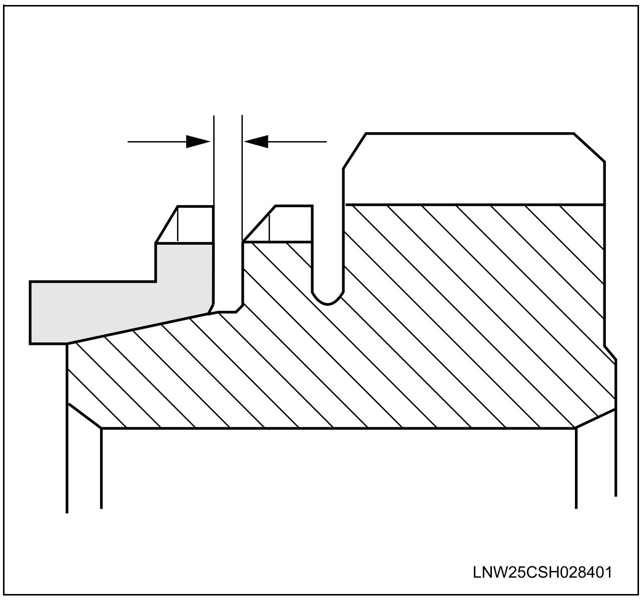
Inspection and Repair

Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

Block Ring and Dog Teeth Clearance

Use a thickness gauge to measure the clearance between the block ring and the dog teeth.
If the measured value exceeds the specified limit, the block ring must be replaced.

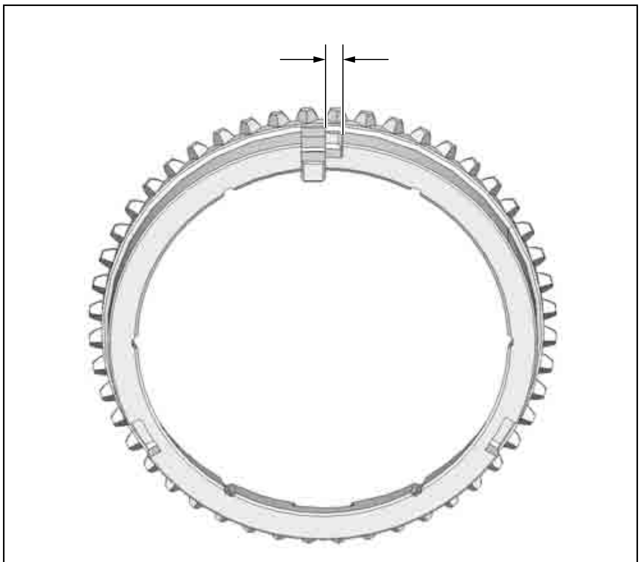
	Standard	Limit
Reverse	1.5 mm (0.059 in)	0.8 mm (0.031 in)



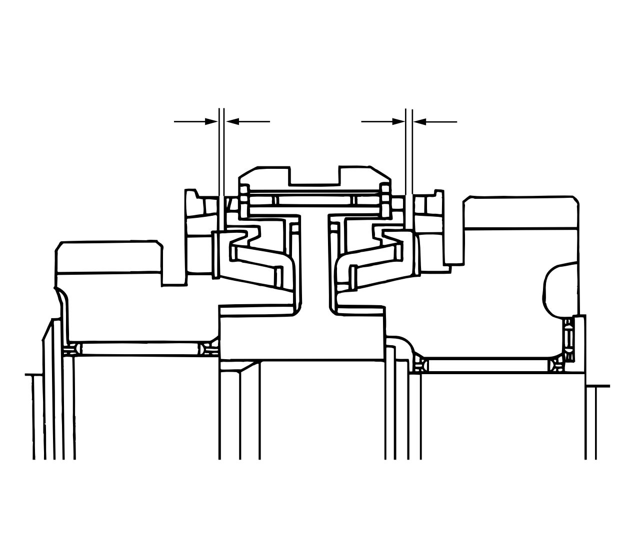
1st-2nd Synchronizer (3-CONE)

Use a thickness gauge to measure the clearance between the block ring and the dog teeth.
If the measured value exceeds the specified limit, the 1st-2nd synchronizer assembly must be replaced.

Standard	Limit
1.5 mm (0.059 in)	0.8 mm (0.031 in)



RTW77BSH006501



LNW25CSH028501

Clutch Hub and Insert Clearance

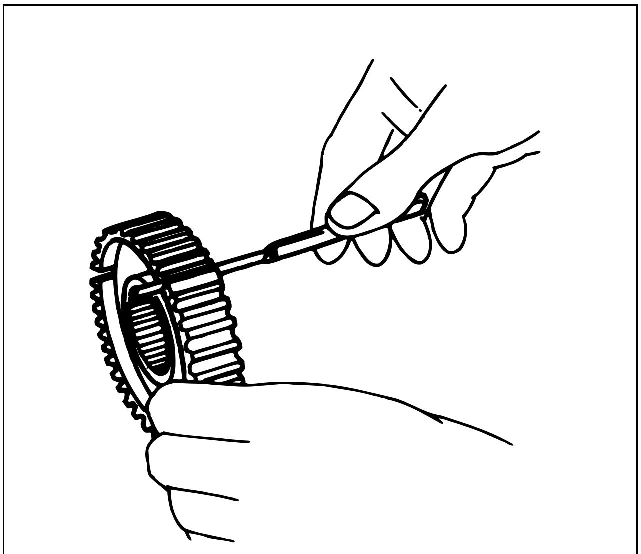
Use a thickness gauge to measure the clearance between the clutch hub and insert.
If the measured value exceeds the specified limit, the clutch hub and insert must be replaced.

	Standard	Limit
1st - 2nd Reverse	0.01 - 0.21 mm (0.0004 - 0.0083 in)	0.3 mm (0.0118 in)

Block Ring and Insert Clearance

Use a vernier caliper or thickness gauge to measure the clearance between the block ring and insert.
If the measured value exceeds the specified limit, the block ring and insert must be replaced.

	Standard	Limit
1st - 2nd	3.86 - 4.16 mm (0.152 - 0.164 in)	4.4 mm (0.173 in)
Reverse	2.16 - 2.46 mm (0.085 - 0.097 in)	2.7 mm (0.106 in)



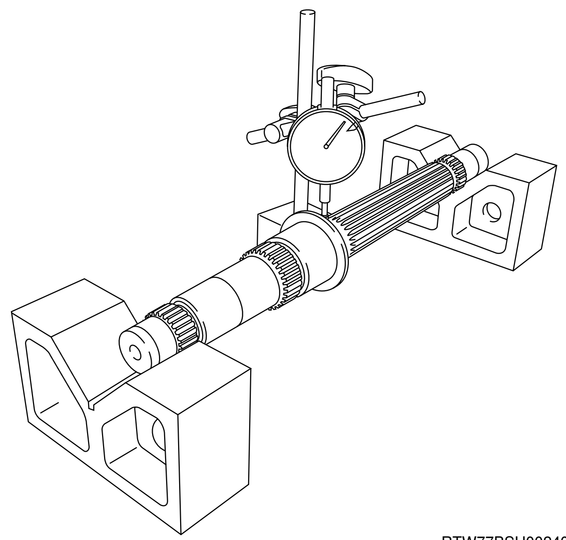
LNW25CSH028701

Counter Shaft Run-out

- Install the counter shaft to V-blocks.
- Use a dial indicator to measure the counter shaft central portion run-out.

If the measured counter shaft run-out exceeds the specified limit, the counter shaft must be replaced.

Limit
0.05 mm (0.002 in)

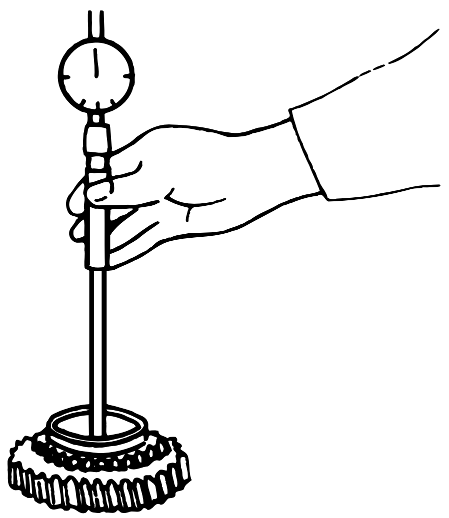


RTW77BSH002401

Gear Inside Diameter

Use an inside dial indicator to measure the gear inside diameter.
If the measured value is less than the specified limit, the gear must be replaced.

	Standard	Limit
1st 2nd	53.000 - 53.019 mm (2.0866 - 2.0874 in)	53.059 mm (2.0889 in)
Reverse	42.000 - 42.019 mm (1.6535 - 1.6543 in)	42.059 mm (1.6559 in)



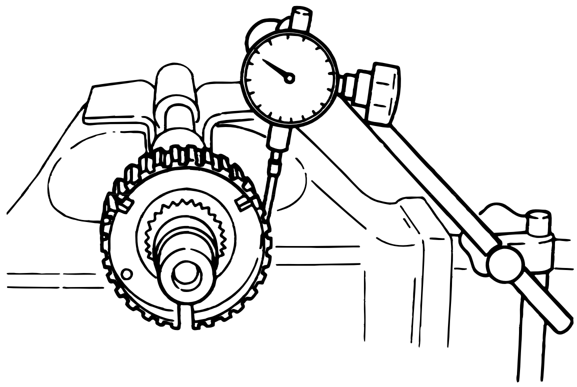
LNW25CSH028901

Clutch Hub Spline Play

- Set a dial indicator to the clutch hub to be measured.
- Move the clutch hub as far as possible to both the right and the left.

Note the dial indicator reading.
If the measured value exceeds the specified limit, the clutch hub must be replaced.

	Standard	Limit
1st - 2nd	0 - 0.04 mm (0 - 0.0016 in)	0.10 mm (0.0039 in)
Reverse	0 - 0.107 mm (0 - 0.0042 in)	0.15 mm (0.0059 in)



LNW25CSH029101

Counter Gear Spline Play

- Set a dial indicator to the gear to be measured.
- Move the gear as far as possible to both the right and the left.

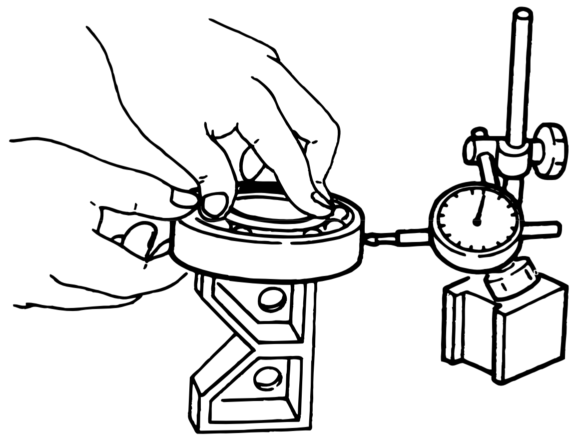
Note the dial indicator reading.
If the measured value exceeds the specified limit, the gear must be replaced.

	Standard	Limit
3rd 5th Output	0.013 - 0.121 mm (0.0005 - 0.0048 in)	0.15 mm (0.0059 in)

Ball Bearing Play

Use a dial indicator to measure the ball bearing play.
If the measured value exceeds the specified limit, the ball bearing must be replaced.

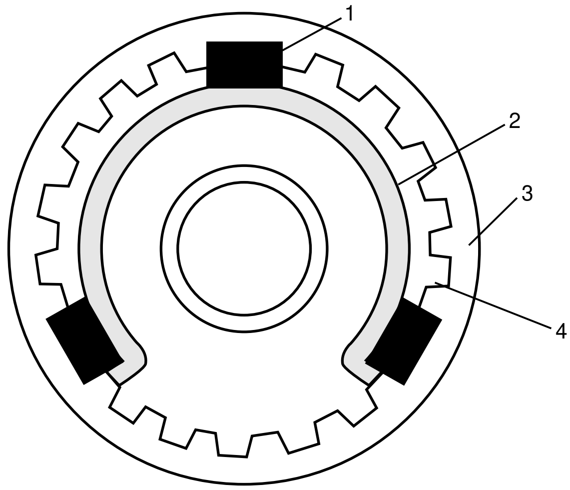
	Standard	Limit
Front	0 - 0.098 mm (0 - 0.0039 in)	0.15 mm (0.0059 in)



LNW25CSH029201

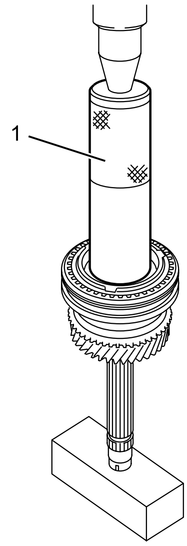
Installation

1. Install the needle bearing, 2nd counter gear assembly, 2nd inside ring, 2nd outside ring, and 2nd block ring.
   - Apply engine oil to the needle bearing and gear internal surface.
2. Assemble the 1st-2nd synchronizer assembly by performing the following steps.
   - Check that the inserts (1) fit snugly into the clutch hub (4) insert grooves.
   - Check that the inserts springs (2) are fitted to the inserts as shown in the figure.
   - Check that the clutch hub (4) and sleeve (3) slide smoothly.
   - The insert springs (2) must be set in such a way that the opening of each spring faces different direction.



LNW45CSH002301

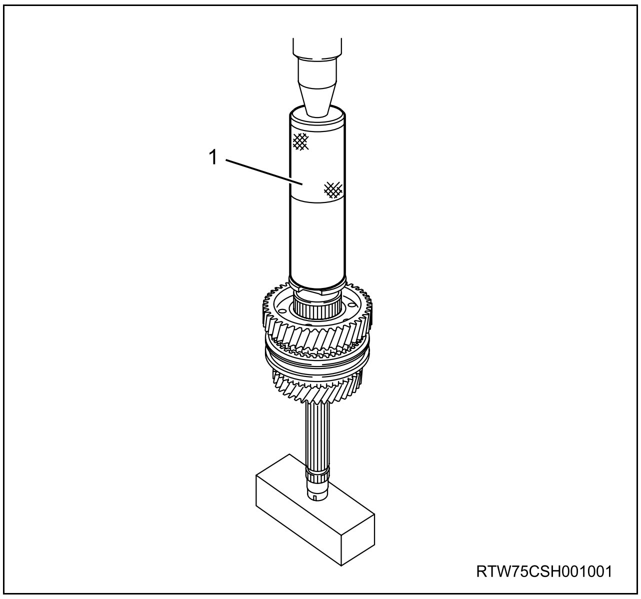
3. Use a bench press and installer 9-8522-1182-0 (1) to install the 1st-2nd synchronizer assembly, 1st block ring, 1st outside ring and 1st inside ring.
   - Apply engine oil to the block ring internal surface.



RTW75CSH000901

4. Install the needle bearing and 1st counter gear assembly.
   - Apply engine oil to the needle bearing and gear internal surface.
5. Use a bench press and installer 9-8522-1182-0 (1) to install the 1st counter collar.

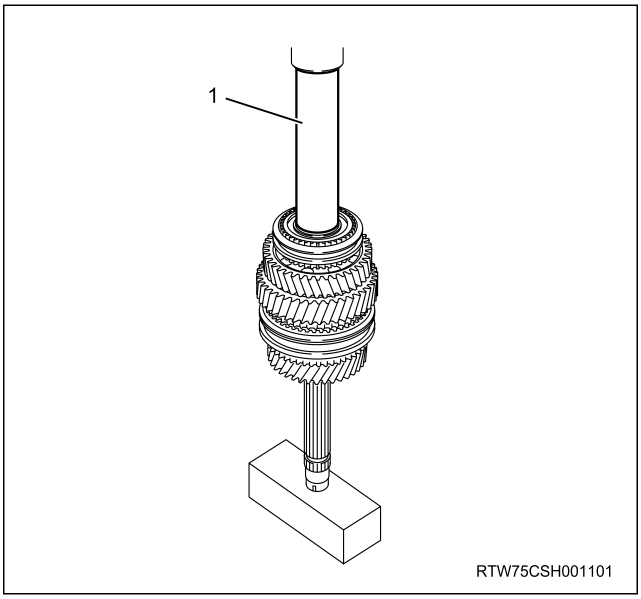
Notice:
The collar must be press fitted with end surface of sleeve & hub.



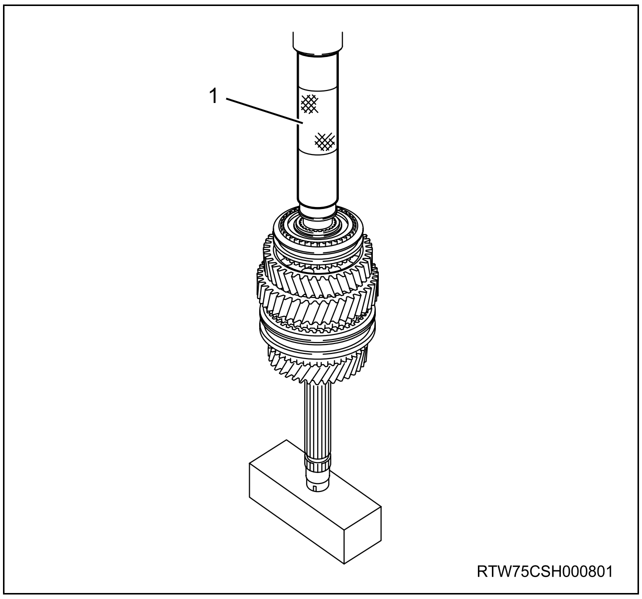
6. Install the new 1st counter snap ring.
   - Never reinstall the used snap ring.

Notice:
The snap ring must be assembled in groove surely.

7. Install the needle bearing, reverse block ring, and reverse counter gear assembly.
   - Apply engine oil to the needle bearing and gear internal surface.
8. Use a bench press and installer 5-8840-2244-0 (1) to install the reverse synchronizer assembly.
   - Apply engine oil to the block ring internal surface.



9. Use a bench press and installer 5-8840-2346-0 (1) to install the counter front roller bearing inner race.



10. Install the counter front roller bearing outer race.
11. Use a pair of snap ring pliers to install the new reverse counter snap ring.
    - Never reinstall the used snap ring.

Notice:
The snap ring must be assembled in groove surely.

12. Install the counter middle roller bearing by performing the following steps.
    a. Use a bench press and installer 5-8840-2847-0 (1) to install the counter middle roller bearing inner race.

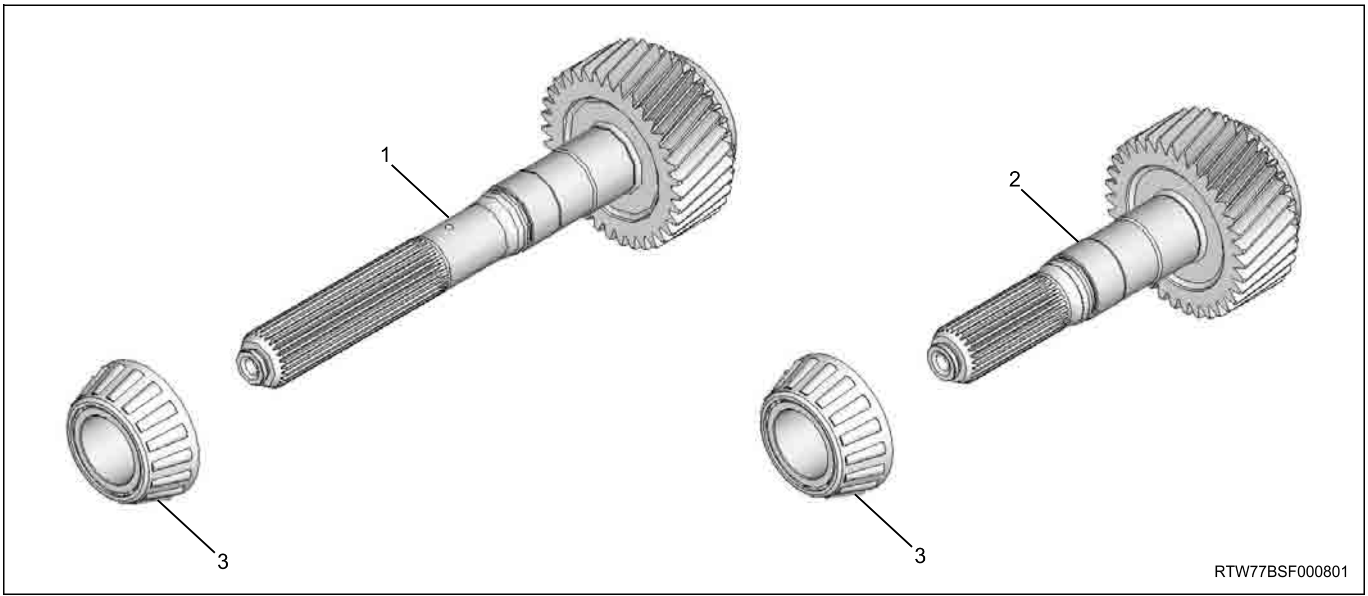
    b. Install the counter middle roller bearing outer race.

Notice:
- Direction of assembling exists. (Flange of inner race to be shaft side.)

- The bearing must be press fitted with end surface of shaft.
- The outer race must not be punch. (Inner race to be punch.)

Output Shaft Assembly

Component

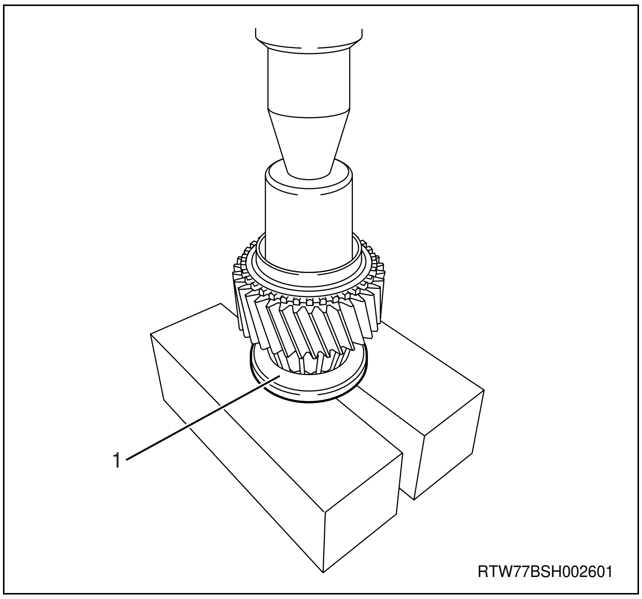


Legend

1. Output shaft (4x2 model)
2. Output shaft (4x4 model)
3. Output front bearing inner race

Removal

1. Break the output front bearing cage with hammer and chisel.
   Remove the output front bearing inner race, and discard the used inner race.



Installation

1. Use a bench press and installer 5-8840-2847-0 (1) to install the output front bearing inner race to the output shaft.
   - Never reinstall the used output front bearing inner race.
   - Apply grease (BESCO L-2 or equivalent) to the bearing roller.

Notice:

- The bearing innner race must be press fitted to end surface of gear.
- The cage must not be push.

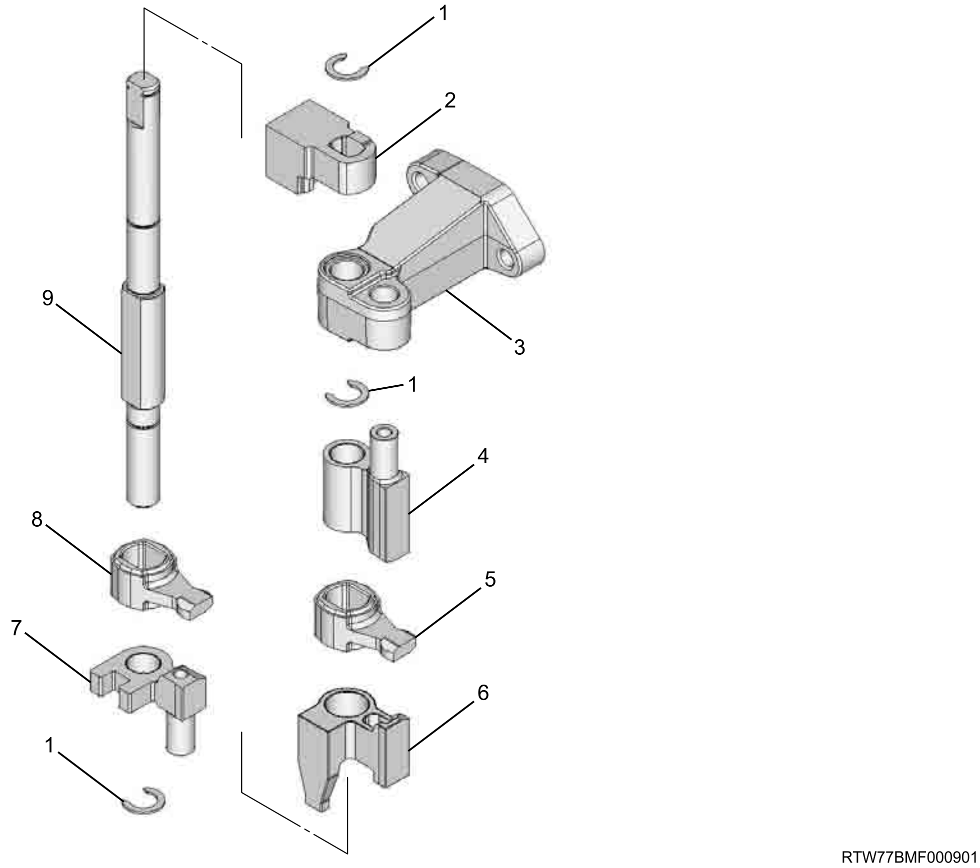
Shift & Select Rod Assembly

Component



Legend

1. Snap ring
2. Shift & select block
3. Shift rod bracket
4. Interlock upper block
5. Internal common upper lever
6. Interlock middle block
7. Interlock lower block
8. Internal common lower lever
9. Shift & select rod

Removal

1. Remove the snap ring from the interlock lower block lower side.
2. Remove the interlock lower block.
3. Remove the internal common lower lever.
4. Remove the interlock middle block.
5. Remove the internal common upper lever.
6. Remove the snap ring from the shift & select block upper side.
7. Removel the shift & select block.
8. Removel the shift rod bracket.
9. Remove the snap ring from the interlock upper block upper side.
10. Remove the interlock upper block.

Installation

1. Install the interlock upper block.
2. Install the new snap ring to the interlock upper block upper side.
   - Never reinstall the used snap ring.

Notice:
The snap ring must be assembled in groove of rod surely.

3. Install the shift rod bracket.
4. Install the shift & select block.
5. Install the new snap ring to the shift & select block upper side.
   - Never reinstall the used snap ring.

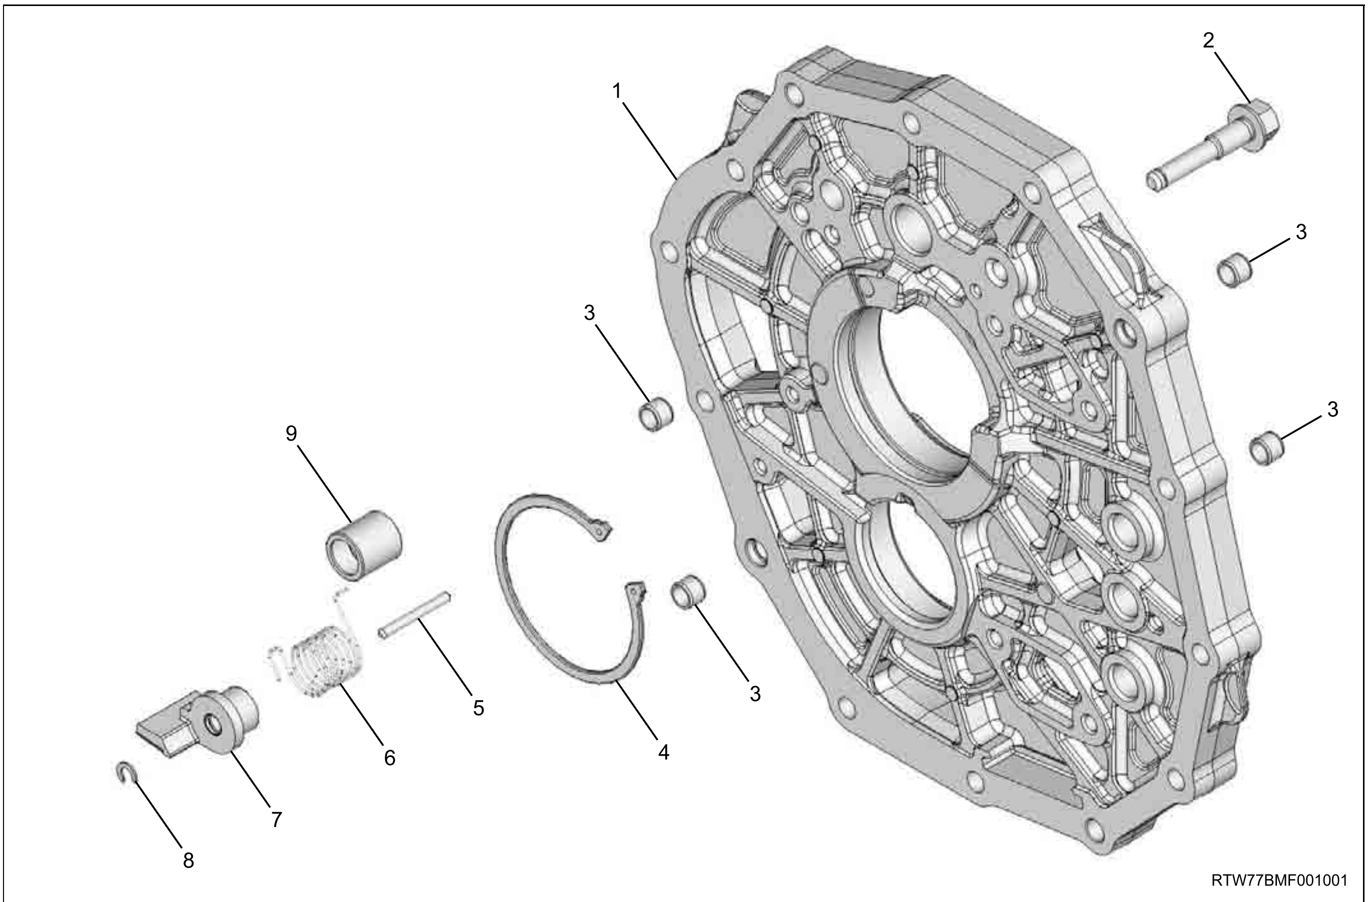
Notice:
The snap ring must be assembled in groove of rod surely.

6. Install the internal common upper lever.
7. Install the interlock middle block.
8. Install the internal common lower lever.
9. Install the interlock lower block.
10. Install the new snap ring to the interlock lower block lower side.
    - Never reinstall the used snap ring.

Notice:
The snap ring must be assembled in groove of rod surely.

Intermediate Plate Assembly

Component



Legend

1. Intermediate plate
2. Reverse inhibitor bolt
3. Dowel
4. Input middle bearing snap ring
5. Straight pin
6. Reverse inhibitor spring
7. Reverse inhibitor
8. Reverse inhibitor snap ring
9. Linear ball bearing

Removal

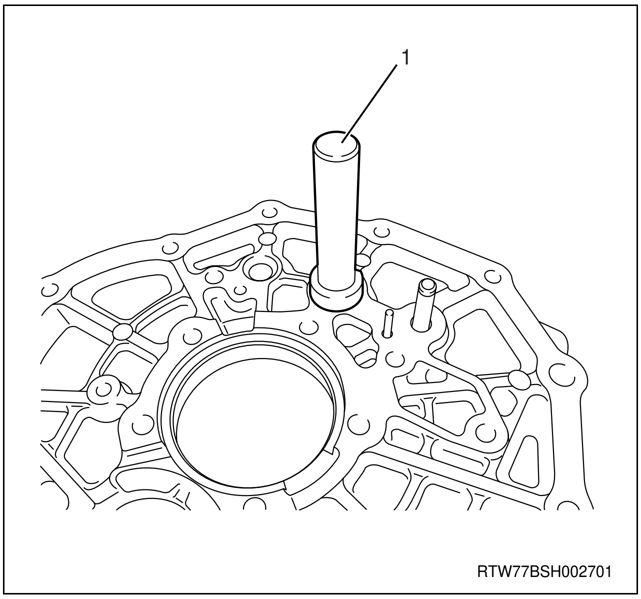
1. Remove the reverse inhibitor snap ring.
2. Remove the reverse inhibitor and spring.
3. Remove the reverse inhibitor bolt.
4. Remove the straight pin.
5. Remove the linear ball bearing.
6. Remove the four dowels.
7. Use a pair of snap ring pliers to remove the input middle bearing snap ring.

Installation

1. Use a pair of snap ring pliers to install the new input middle bearing snap ring.
   - Never reinstall the used snap ring.
2. Install the four dowels.
3. Use the installer 5-8840-2848-0 (1) to install the linear ball bearing.

Notice:

- The bearing to be pressed fit to boss face.
- The bearing must be pressed at marked side.



4. Install the straight pin.
5. Install the reverse inhibitor bolt.
   - Tighten the reverse inhibitor bolt to the specified torque.

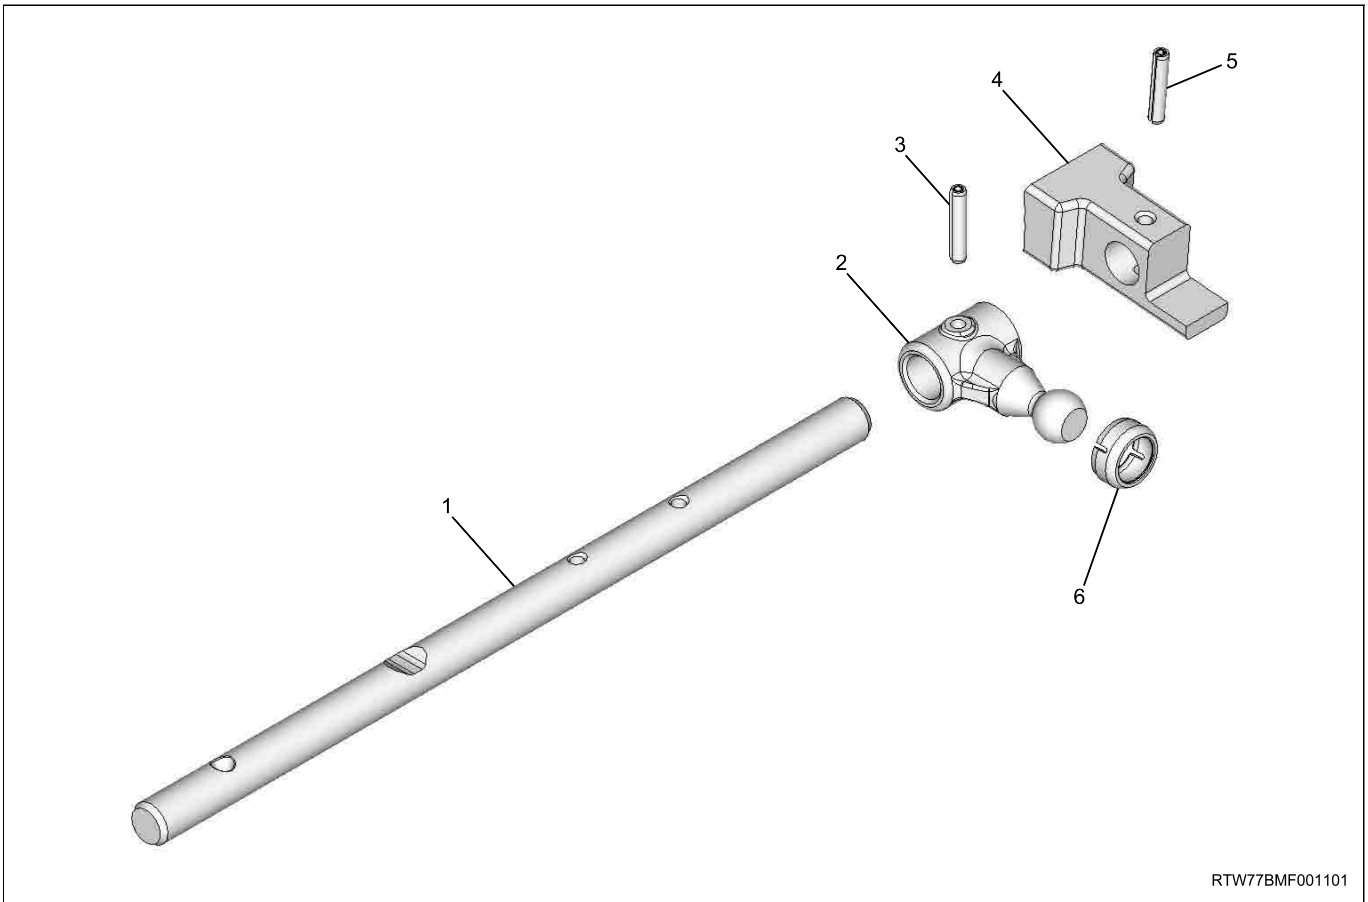
Torque: 36 N·m (3.7 kgf·m/27 lb·ft)

6. Install the reverse inhibitor and spring.
7. Install the new reverse inhibitor snap ring.
   - Never reinstall the used snap ring.

Notice:
The snap ring must be assembled in groove of bolt surely.

Control Rod Assembly

Component



Legend

1. Control rod
2. Control unit lever
3. Control unit lever spring pin
4. Detent shift block
5. Detent shift block spring pin
6. Shift control seat

Removal

1. Remove the shift control seat.
2. Use a spring pin remover to remove the spring pin and the control unit lever.
3. Use a spring pin remover to remove the spring pin and the detent shift block.

Installation

1. Install the detent shift block and the new spring pin.
   - Never reinstall the used spring pin.

Notice:

- When assembled, vertical direction of block exists.
- The spring pin must be drive in to hole of end surface of block surely.

2. Install the control unit lever and the new spring pin.
   - Never reinstall the used spring pin.

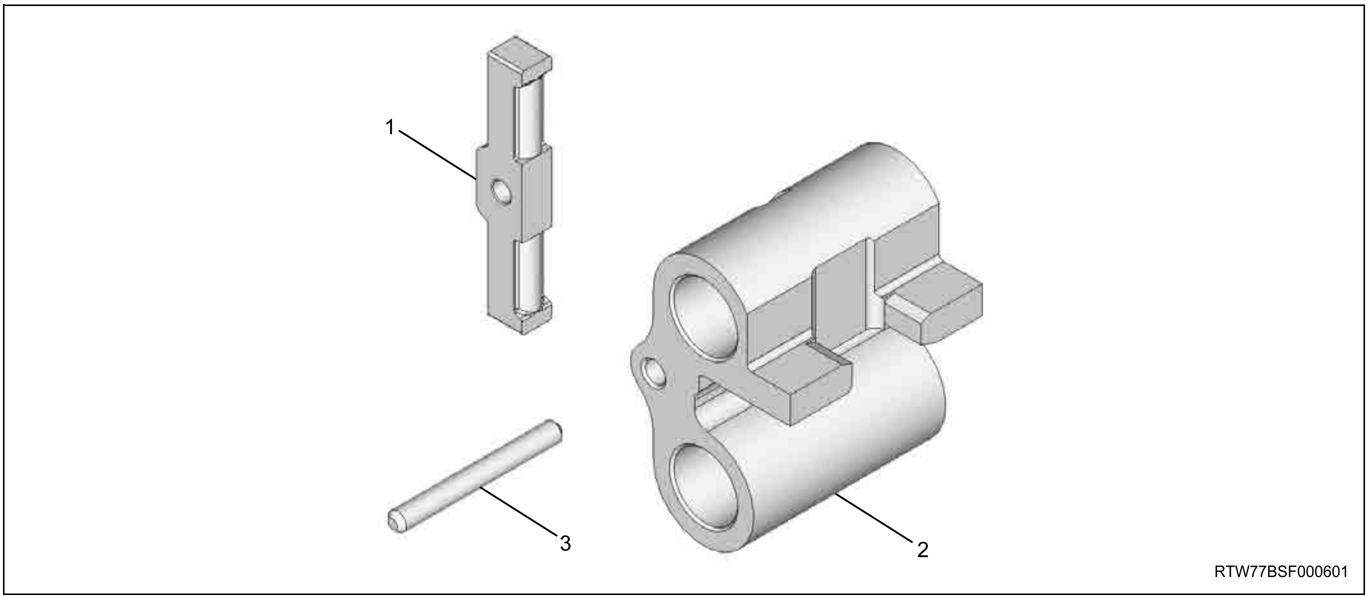
Notice:

The spring pin must be drive in to hole of end surface of lever surely.

3. Install the shift control seat.
   - Apply grease to tip of sphere of lever and seat.

5th-Reverse Shift Block Assembly

Component



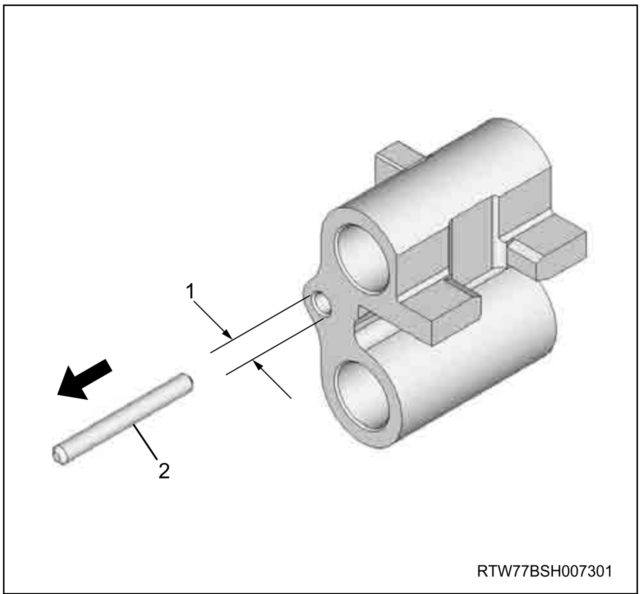
Legend

1. 5th-reverse shift lever
2. 5th-reverse shift block
3. Straight pin

Removal

1. Remove the straight pin and the 5th-reverse shift lever.

Notice:
Make sure to remove the straight pin (2) in the direction of 4.5 mm (0.177 in) diameter bore (1) side.

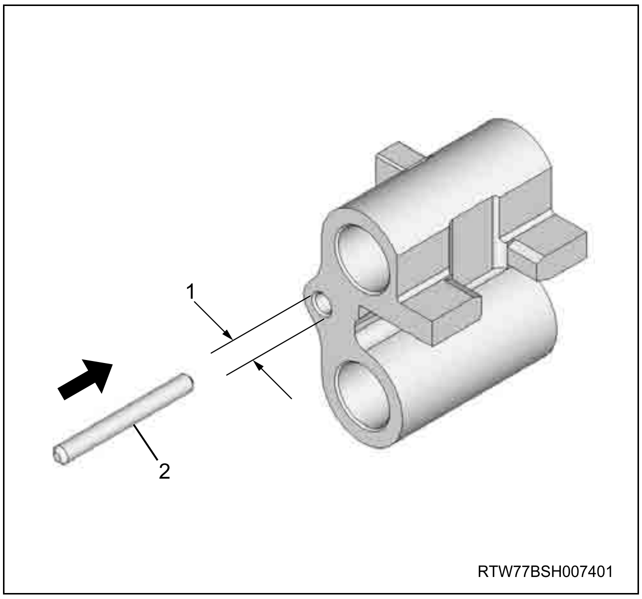


Installation

1. Install the 5th-reverse shift lever and the straight pin.

Notice:

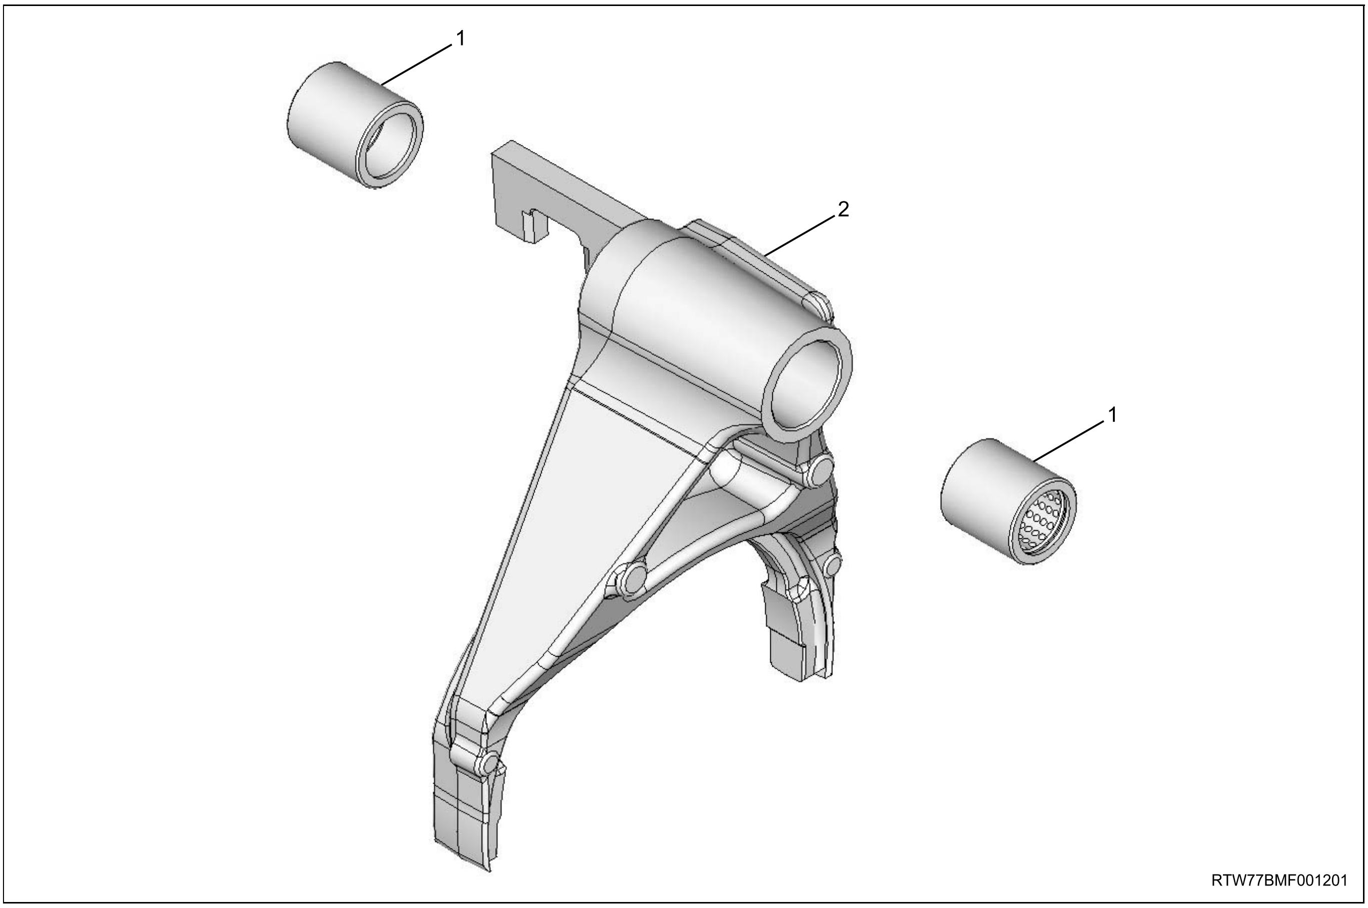
- Install the straight pin (2) from 4.5 mm (0.177 in) diameter bore (1) side, and adjust the setting position to make the end of straight pin flush with the end of the shift block.



- Installation direction of the lever to be not misassembled.

3rd-4th Shift Arm Assembly

Component

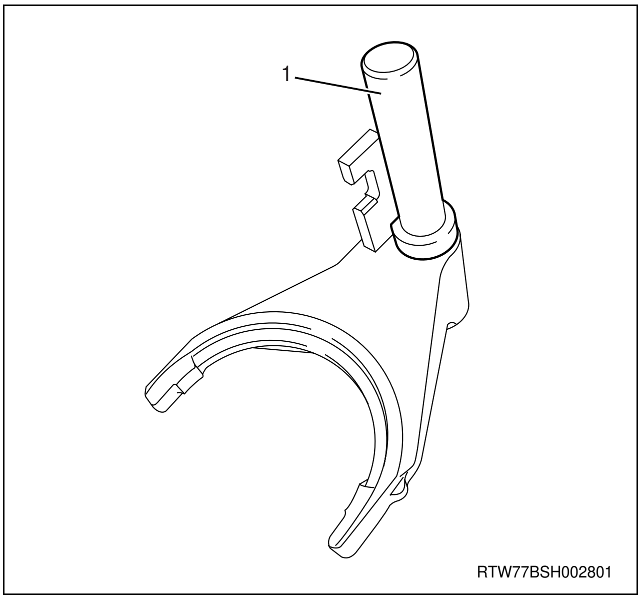


Legend

1. Linear ball bearing
2. 3rd-4th shift arm

Removal

1. Remove the two linear ball bearings.



Installation

1. Use the installer 5-8840-2848-0 (1) to install the two linear ball bearings.

Notice:

- The bearing to be pressed fit to both boss faces.
- The bearing must be pressed at marked side.

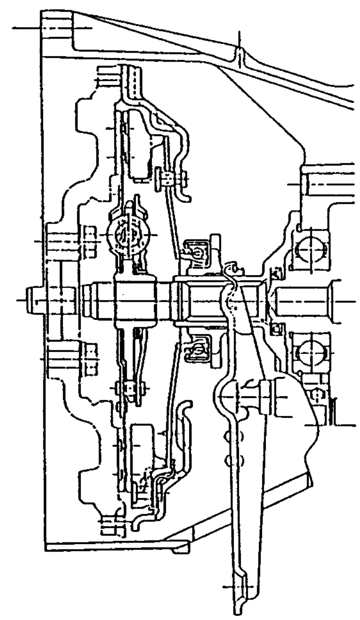
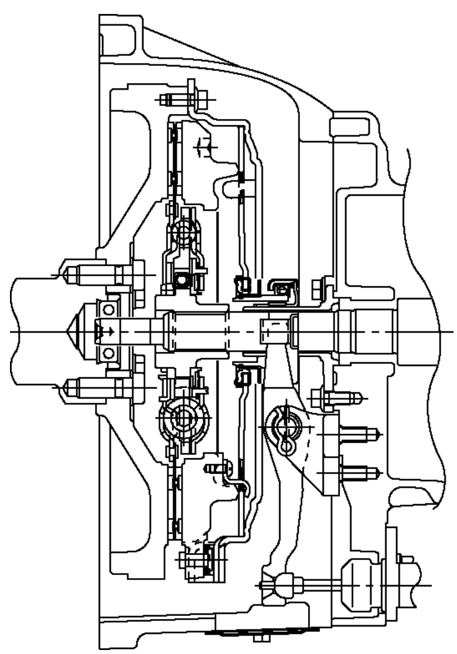
GENERAL DESCRIPTION

PUSH TYPE CLUTCH (MSG and MUA)



PULL TYPE CLUTCH (MUX)

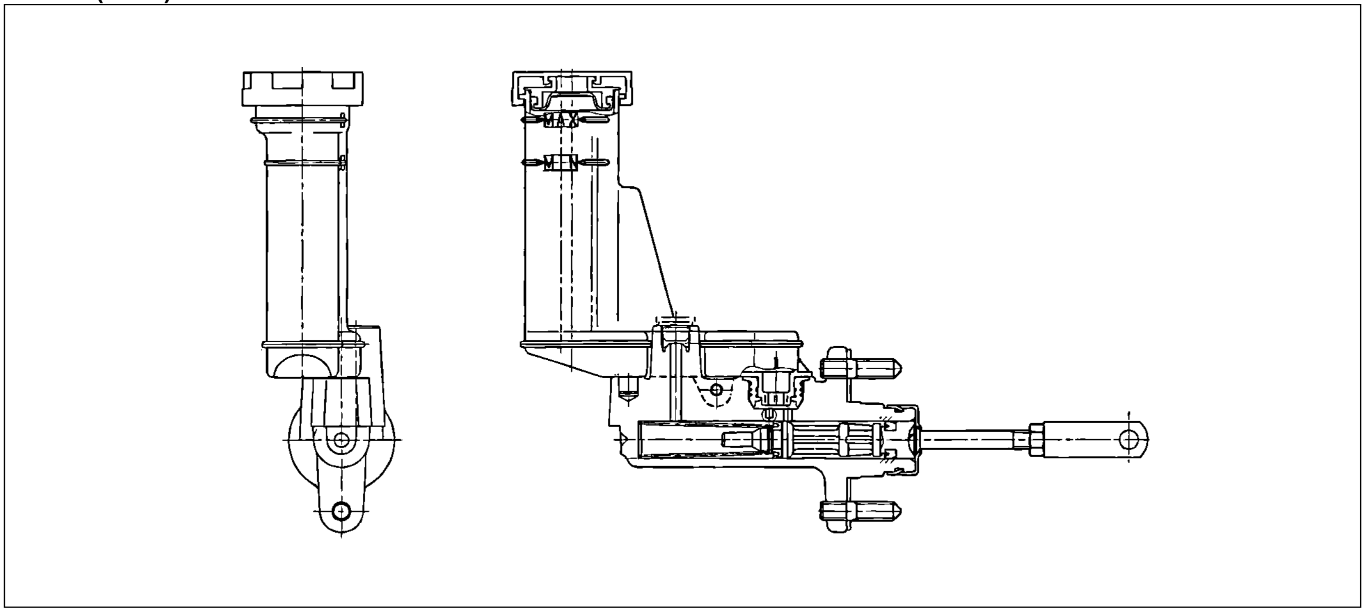


RTW77CSF000601

The clutch assembly consists of the pressure plate, the clutch cover, the diaphragm spring pivot pin and the driven plate assembly.
The clutch pedal is connected to the release bearing through the shift fork.
The driven plate assembly is installed between the flywheel and the pressure plate.
For models with MSG transmission and MUA transmission, the push-type clutch is used.
Diaphragm spring pressure holds the driven plate against flywheel and the pressure plate to provide the friction necessary to engage the clutch.
Depressing the clutch pedal moves the shift fork against the release bearing.
The release bearing forces the diaphragm to overcome the force of the diaphragm spring and separate the driven plate from the flywheel and pressure plate to disengage the clutch.
For model with MUX transmission, the pull-type clutch is used. The pull-type clutch is disengaged by pulling the release lever (release bearing) to disengage the pressure plate.

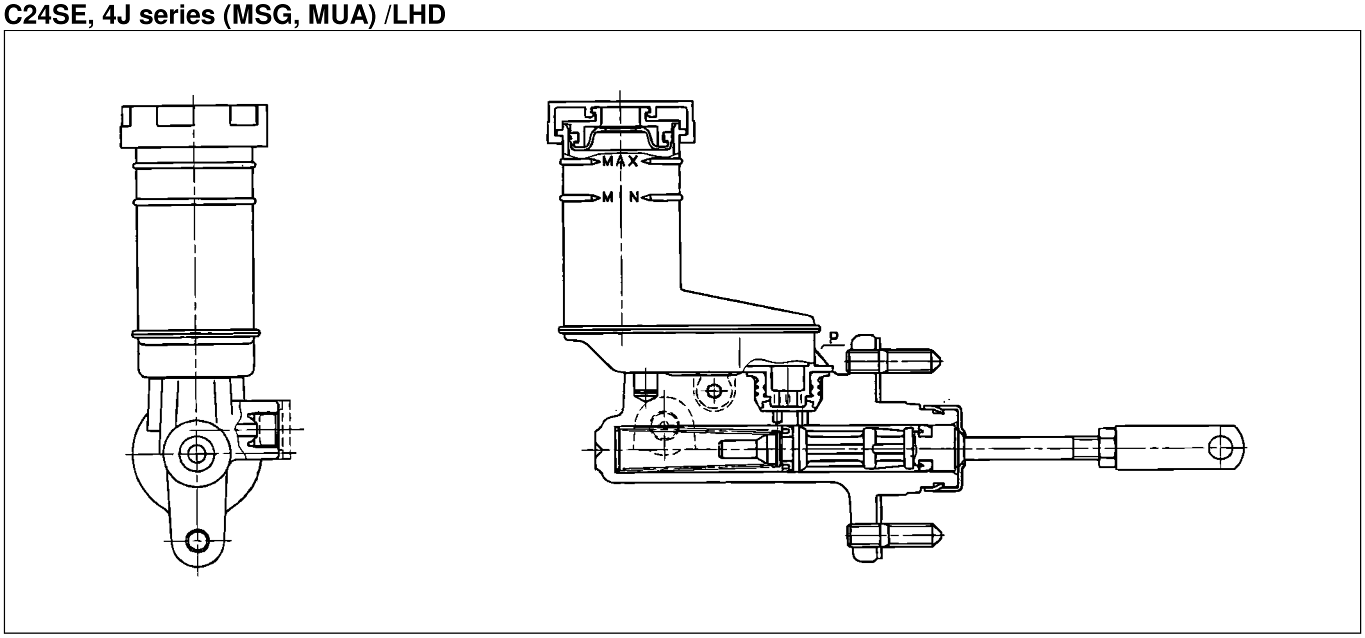
MASTER CYLINDER

C24SE (MUA) /RHD



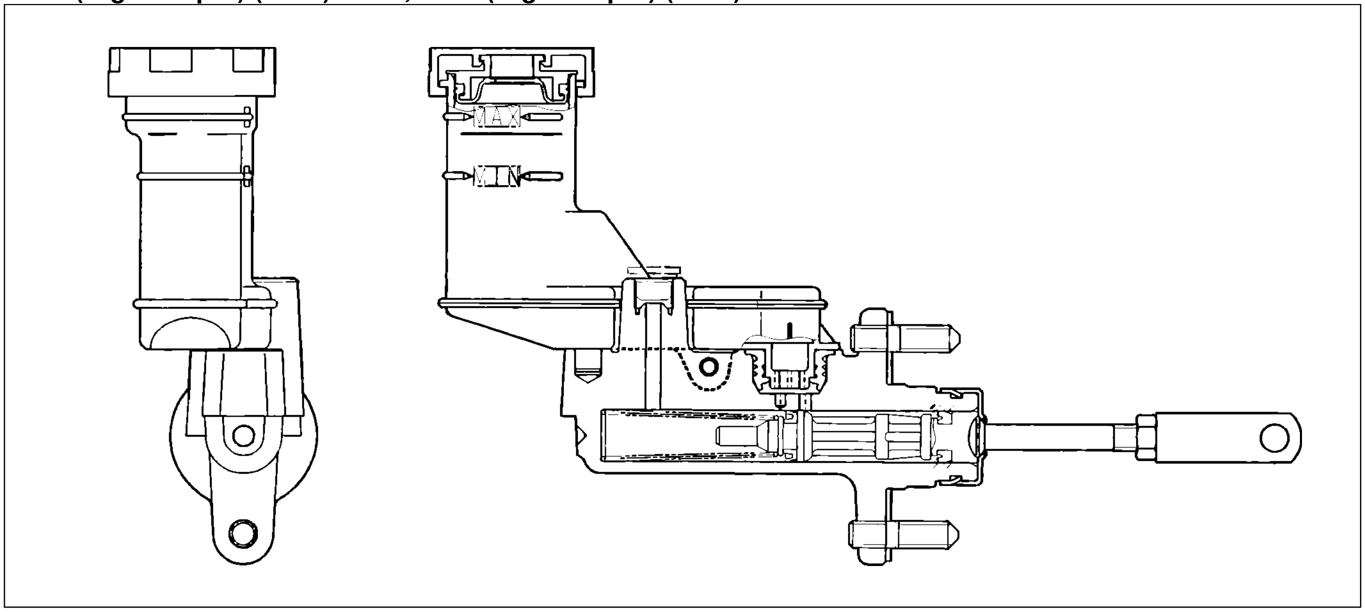
RTW47CSF000501

C24SE, 4J series (MSG, MUA) /LHD



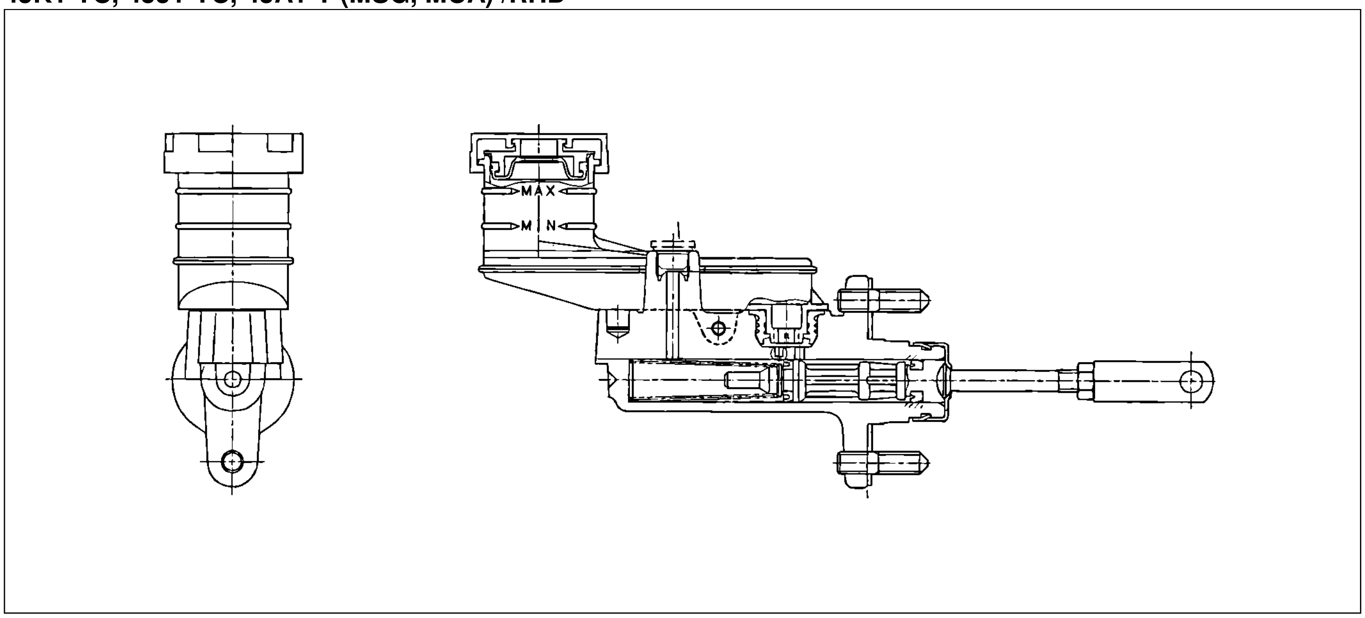
RTW47CSF000201

4JK1 (High Output) (MUA) /RHD, 4JJ1 (High Output) (MUX)



RTW77CSF000101

4JK1-TC, 4JJ1-TC, 4JA1-T (MSG, MUA) /RHD

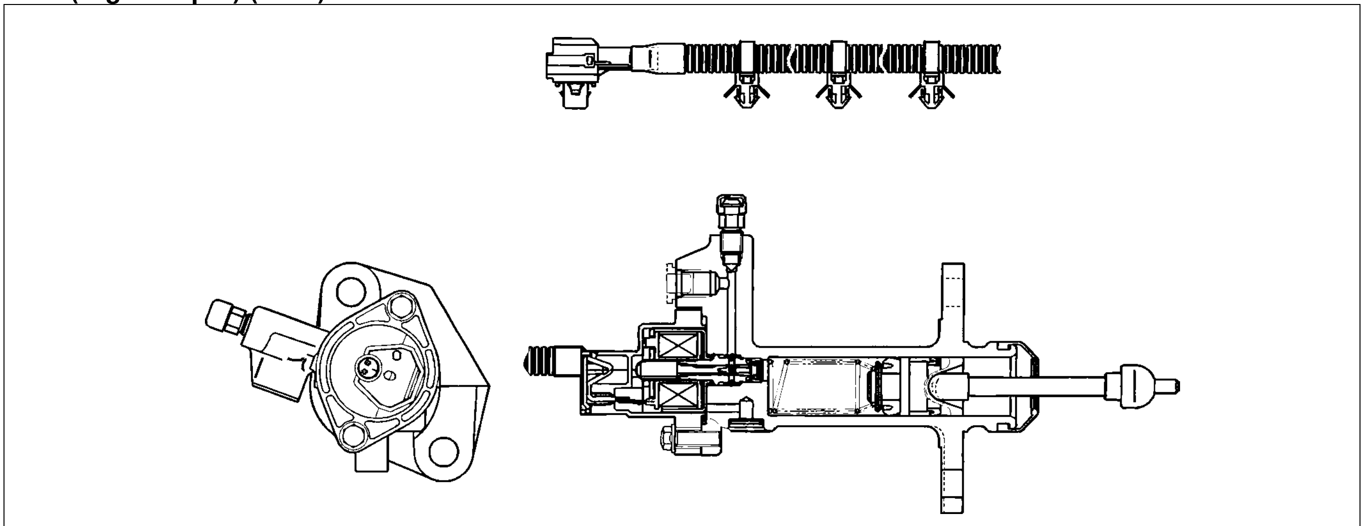


RTW47CSF000401

The master cylinder converts mechanical energy into hydraulic energy.
Depressing the clutch pedal causes the push rod to move against the piston to close the return port.
Clutch fluid is forced out of the master cylinder.
Releasing the clutch pedal causes the return spring to force the piston back to its original position.
The return port is opened and the clutch fluid flows back into the fluid reservoir.
Quickly releasing the clutch pedal will cause the fluid pressure at the return spring side to be lower than the fluid pressure at the push rod side.
This allows the fluid at the push rod side to quickly flow to the return spring side through a port in the piston head.
This equalizes the pressure at both sides of the piston.

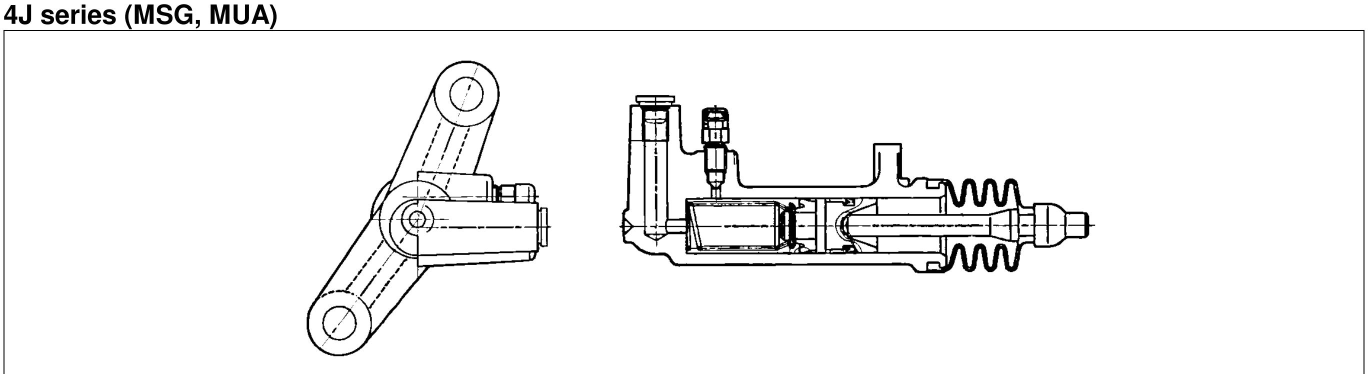
SLAVE CYLINDER

4JJ1 (High Output) (MUX)

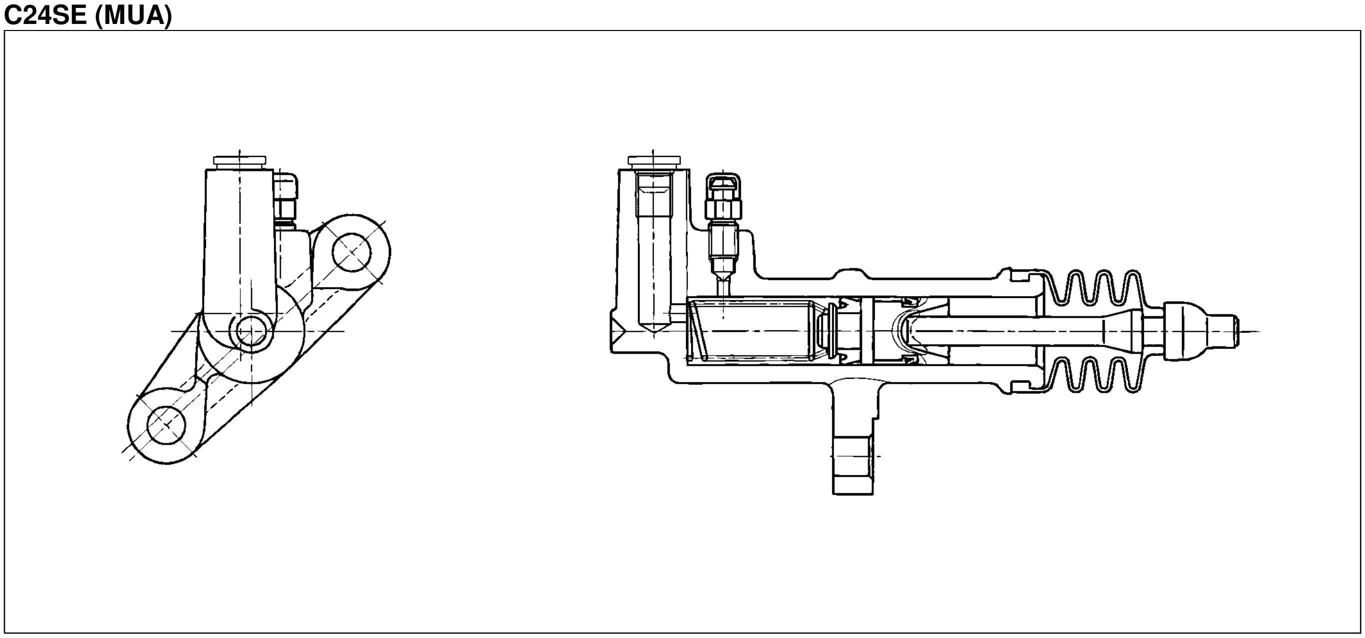


RTW77CSF000701

4J series (MSG, MUA)



C24SE (MUA)

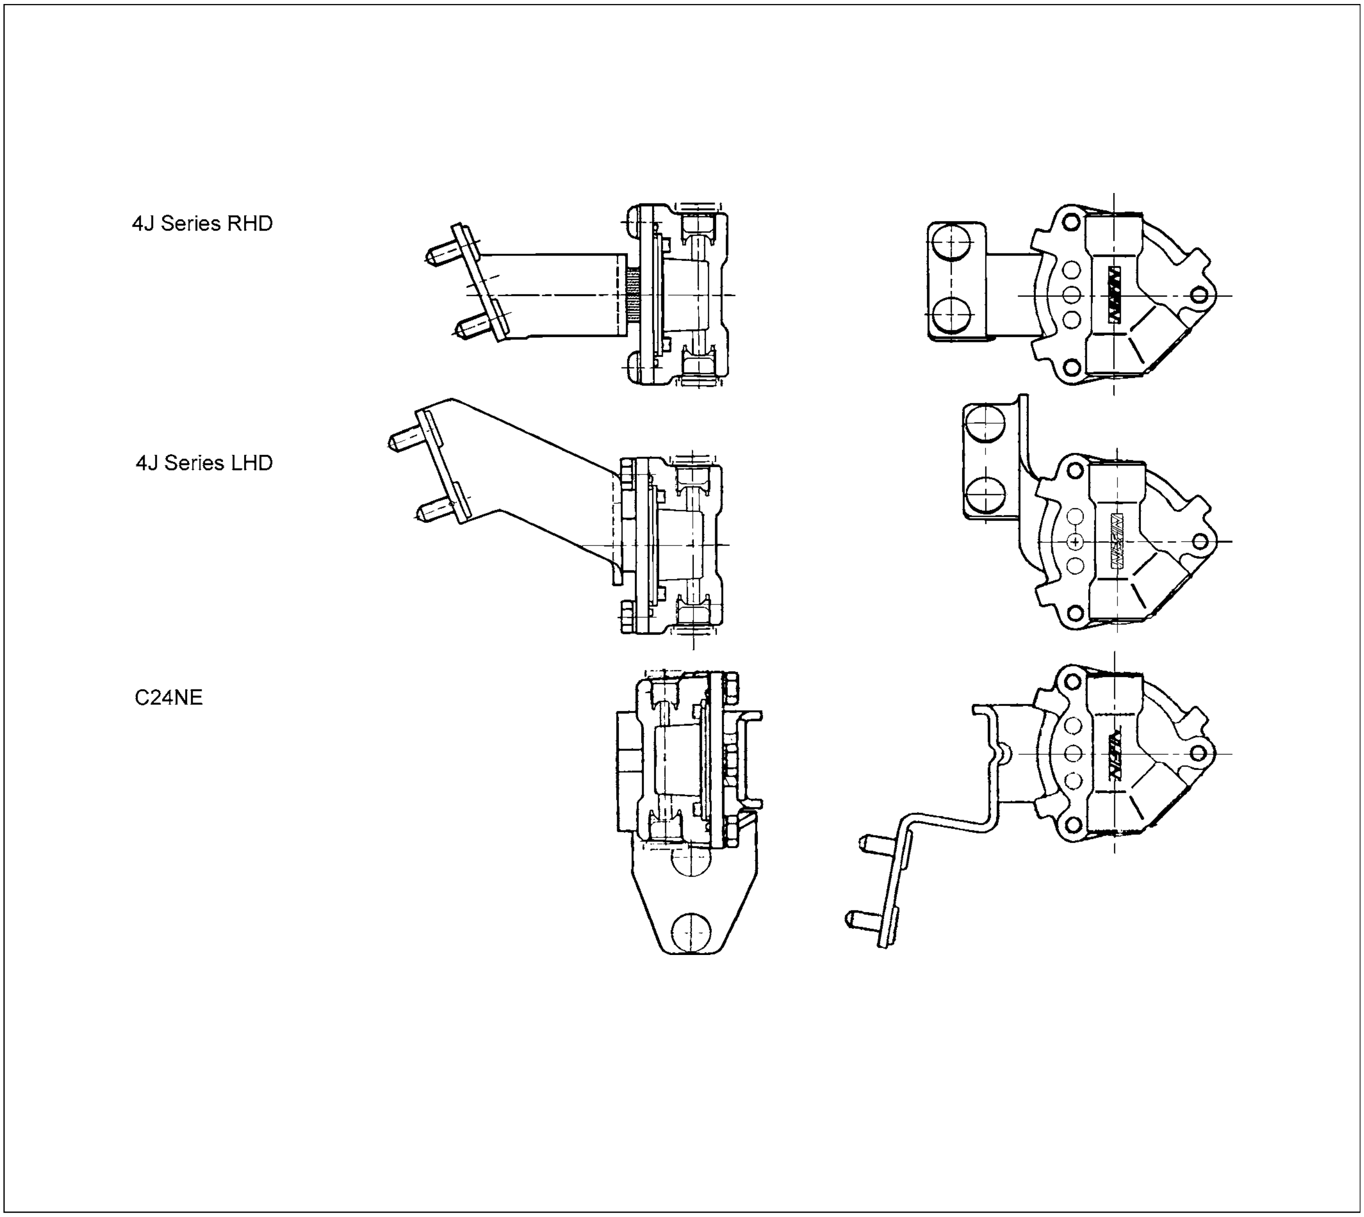


RTW47CSF000301

The slave cylinder converts hydraulic energy into mechanical energy.
Hydraulic fluid supplied by the master cylinder moves the slave cylinder piston to actuate the shift fork.
The mechanical energy produced by the slave cylinder is directly proportional to the diameters of the master cylinder and the slave cylinder.
A bleeder screw is provided to bleed the slave cylinder.

The Clutch Damper Valve is installed in the slave cylinder for MUX.
The Clutch Damper Valve delays return speed of clutch fluid when clutch is being engaged quickly at Low or Reverse, and decreases a shock torque transmitted to drive train.

HYDRAULIC DAMPER CYLINDER

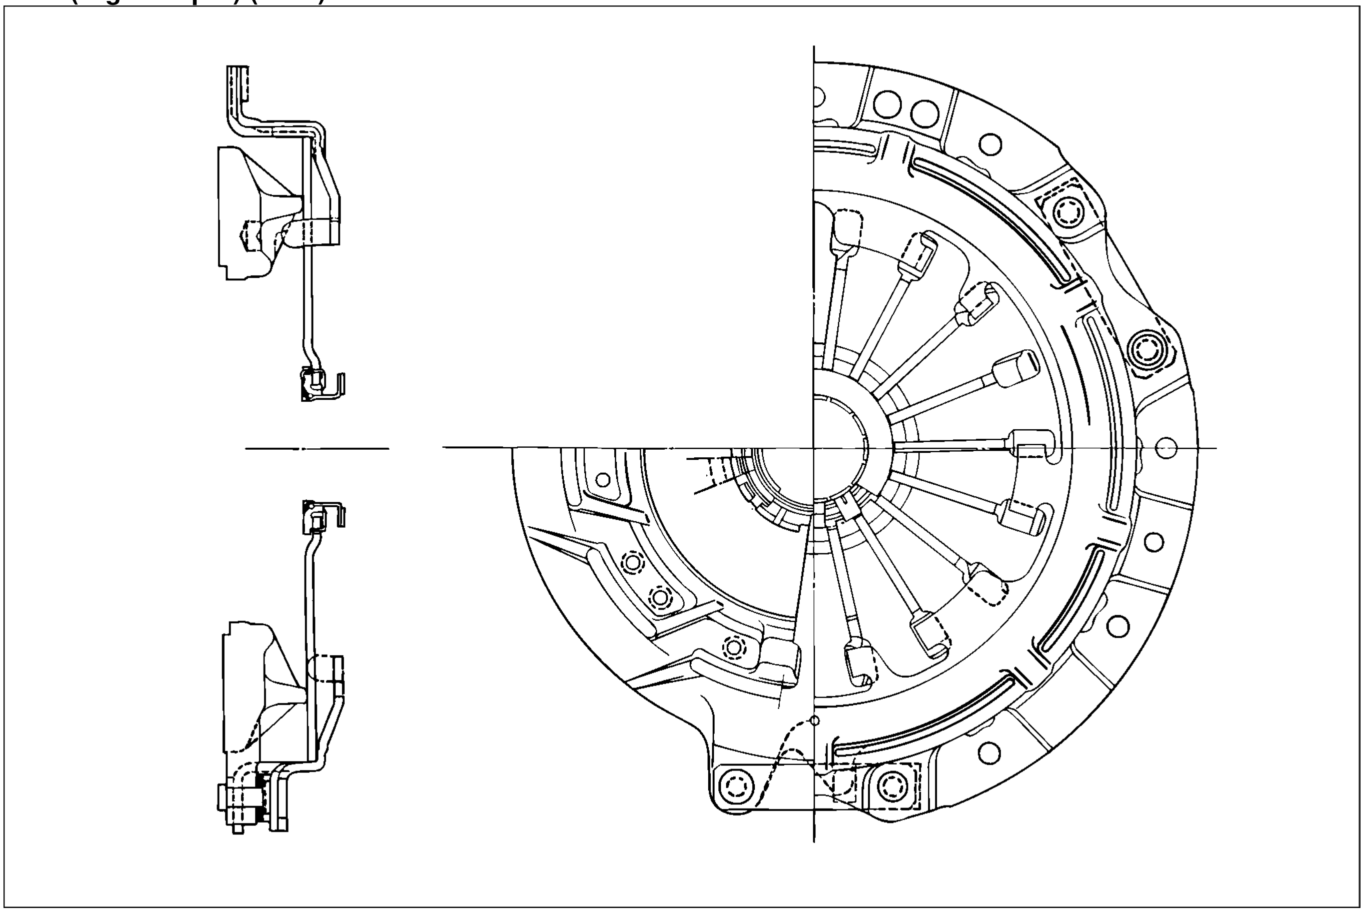


RTW77CMF000401

The hydraulic damper cylinder is installed between the master cylinder and the slave cylinder to smooth out variations in clutch pedal feel.

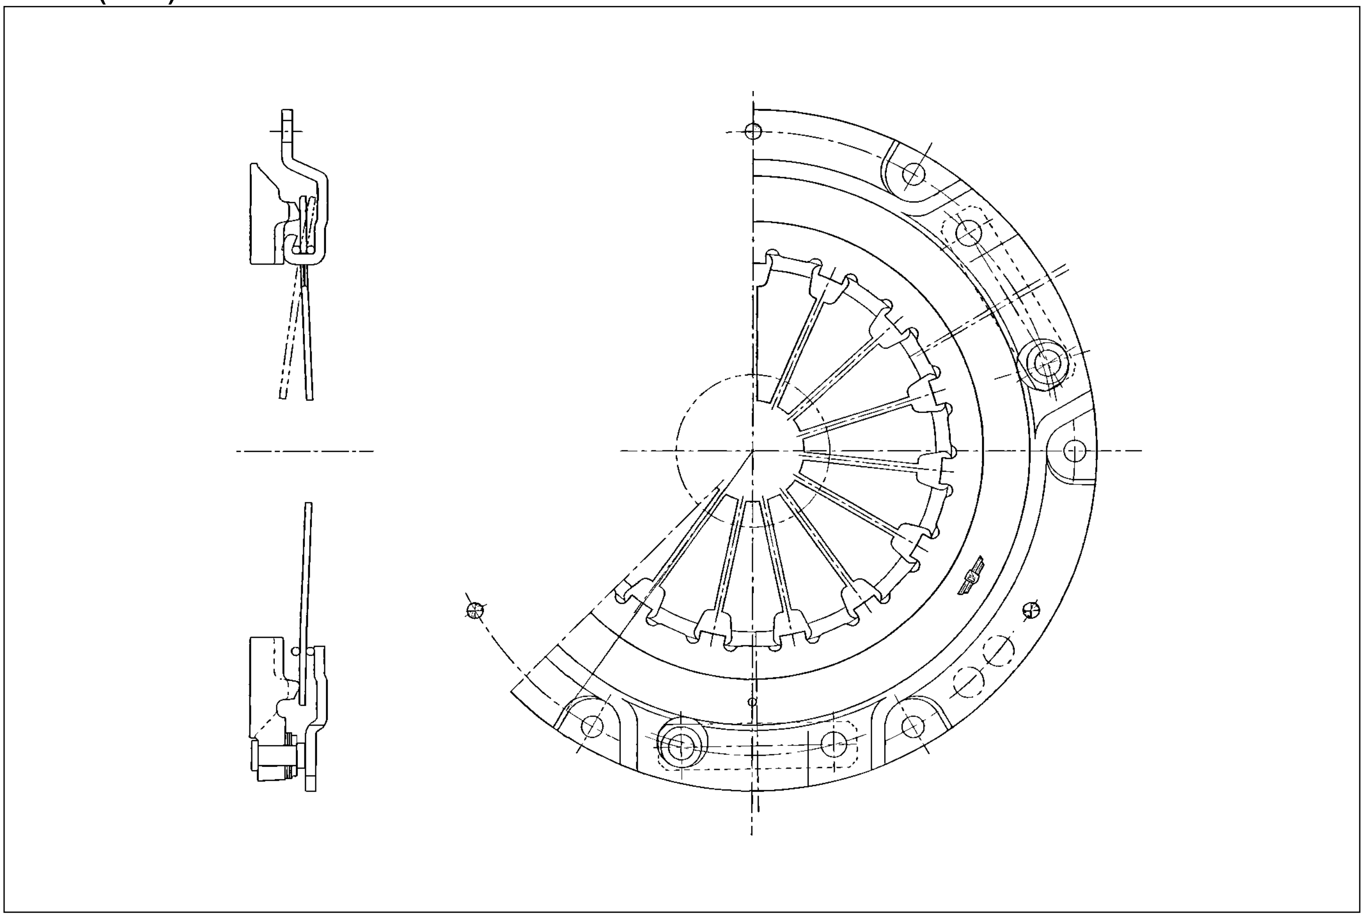
PRESSURE PLATE ASSEMBLY

4JJ1 (High Output) (MUX)



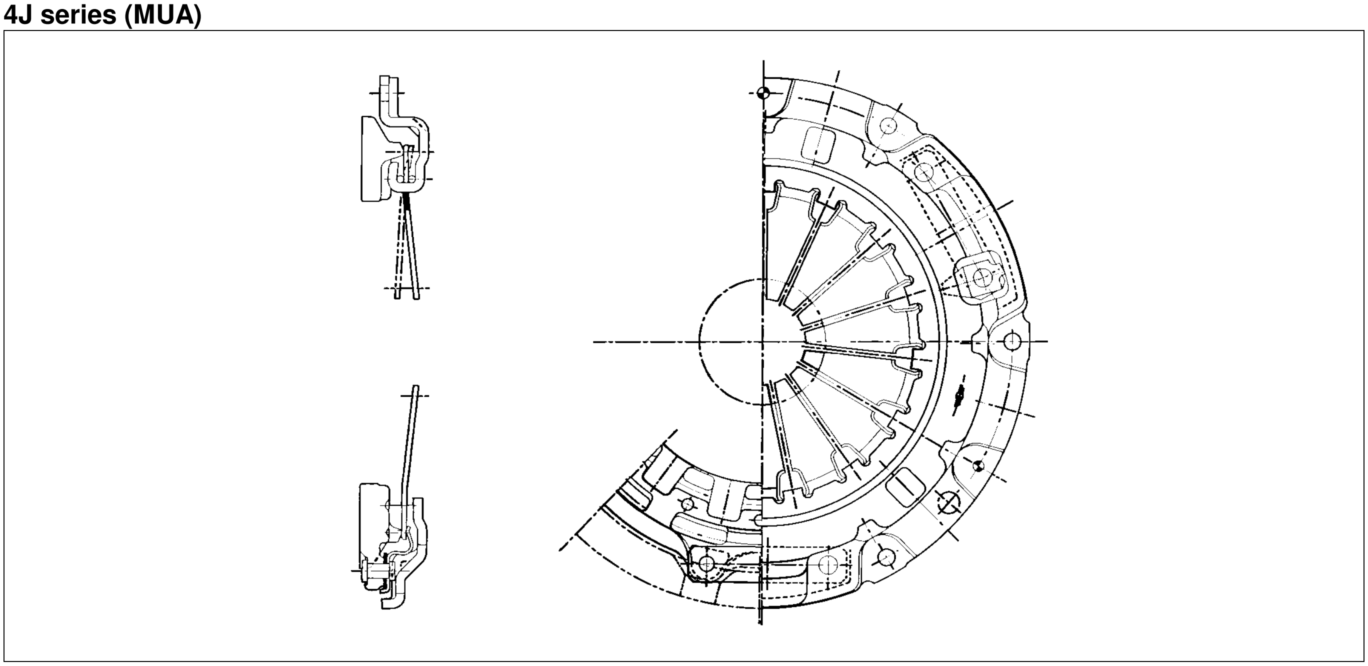
A07RS006

4JA1-T (MSG)



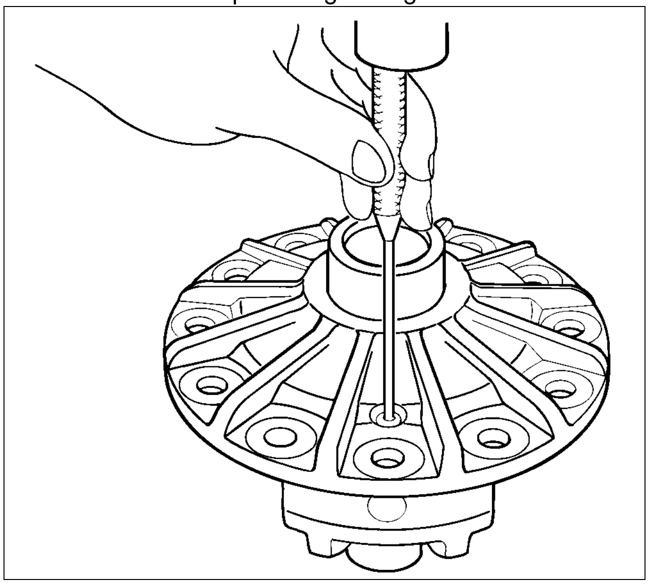
RTW47CMF000101

4J series (MUA)



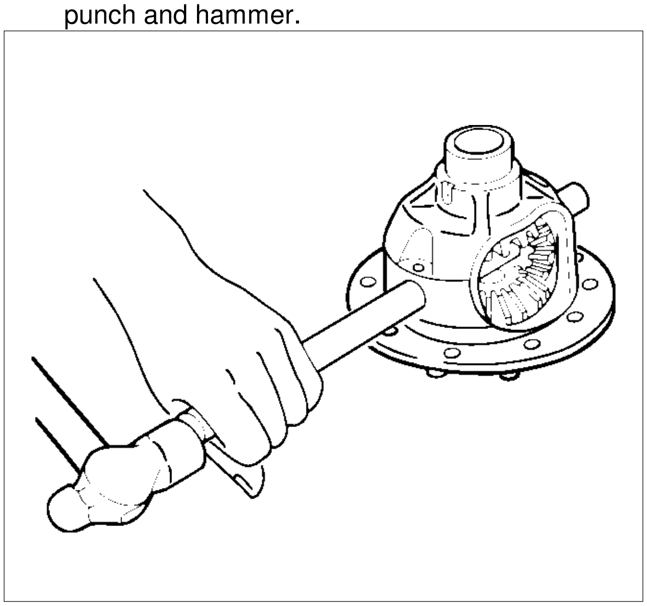
Disassembly

1. Remove bolt.
2. Remove ring gear.
3. Drive out lock pin using a long drift Punch.



425RS042

4. Check the amount of backlash between pinion gear on side gear before removal of cross pin.
   Backlash :
   ϕ220mm : 0.13-0.18 mm (0.005-0.007 in)
   ϕ194mm : 0.10-0.20 mm (0.004-0.008 in)
5. Remove the cross pin by using a brass drift punch and hammer.



425RS043

6. Take out pinion gear, side gear and thrust washer.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal conditions are found through inspection.

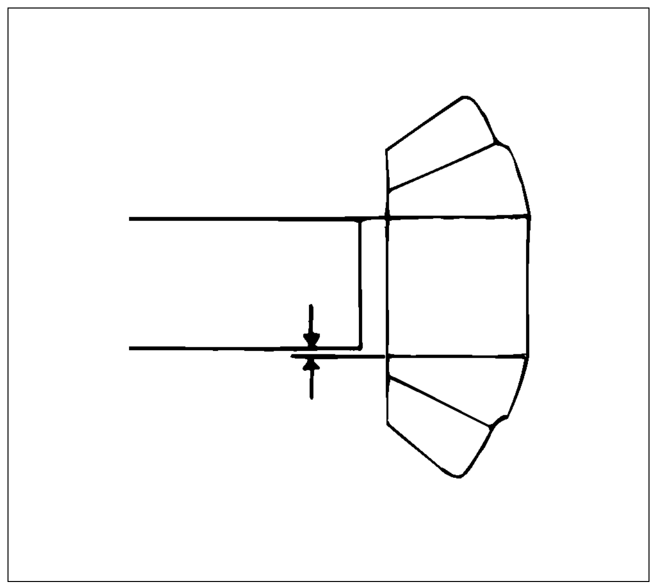
Check the following parts:

- Ring gear, pinion gear
- Bearing
- Side gear, pinion gear, cross pin
- Differential cage, carrier
- Thrust washer
- Oil seal

Clearance between pinion gear and cross pin:

mm (in)

Standard	Limit
0.06 - 0.12 (0.002 - 0.005)	0.2 (0.008)



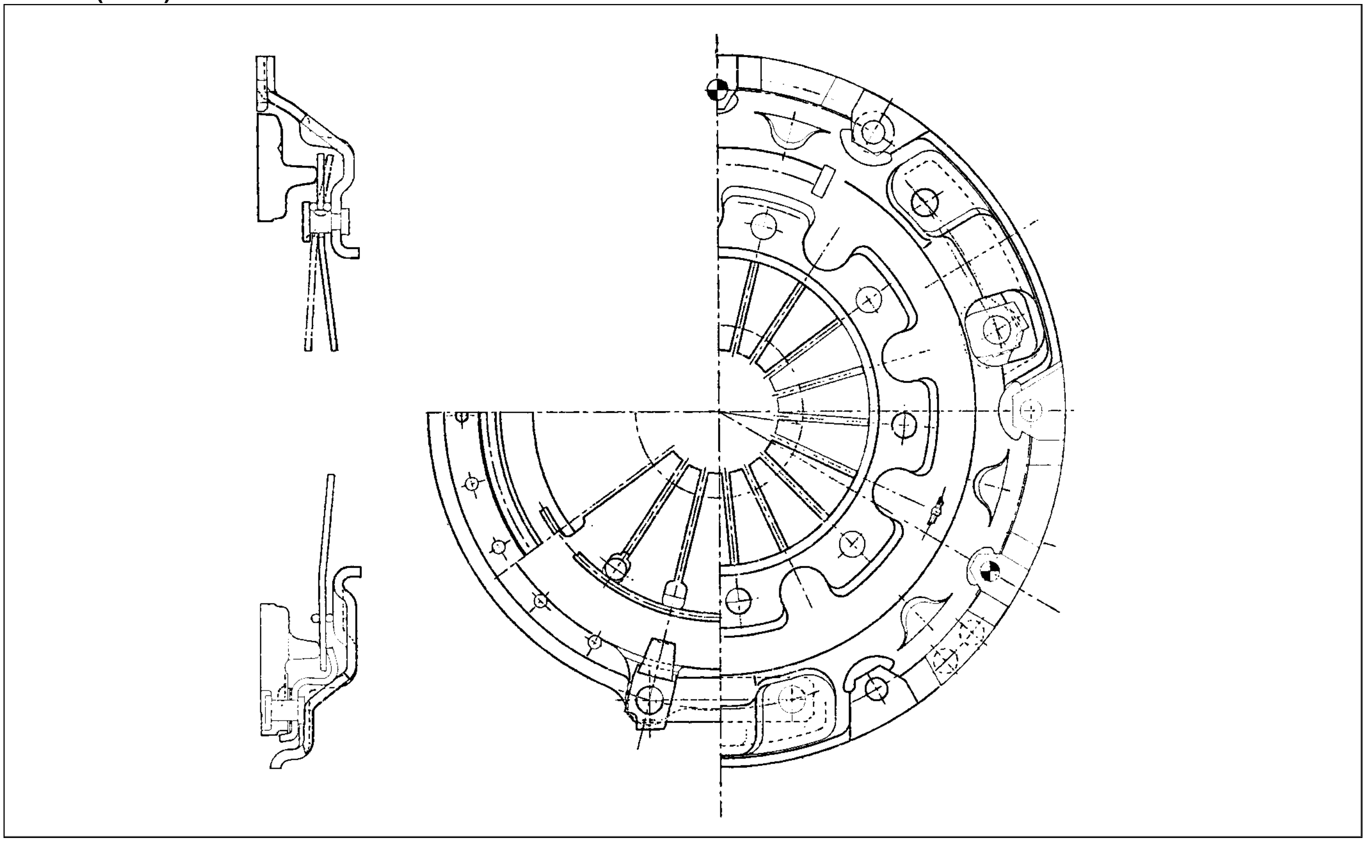
425L100012

Clearance between side gear and differential cage.

mm (in)

	Standard	Limit
ϕ220mm	0.05 - 0.11 (0.002 - 0.004)	0.15 (0.006)
ϕ194mm	0.03 - 0.10 (0.001 - 0.004)	0.15 (0.006)

C24SE (MUA)

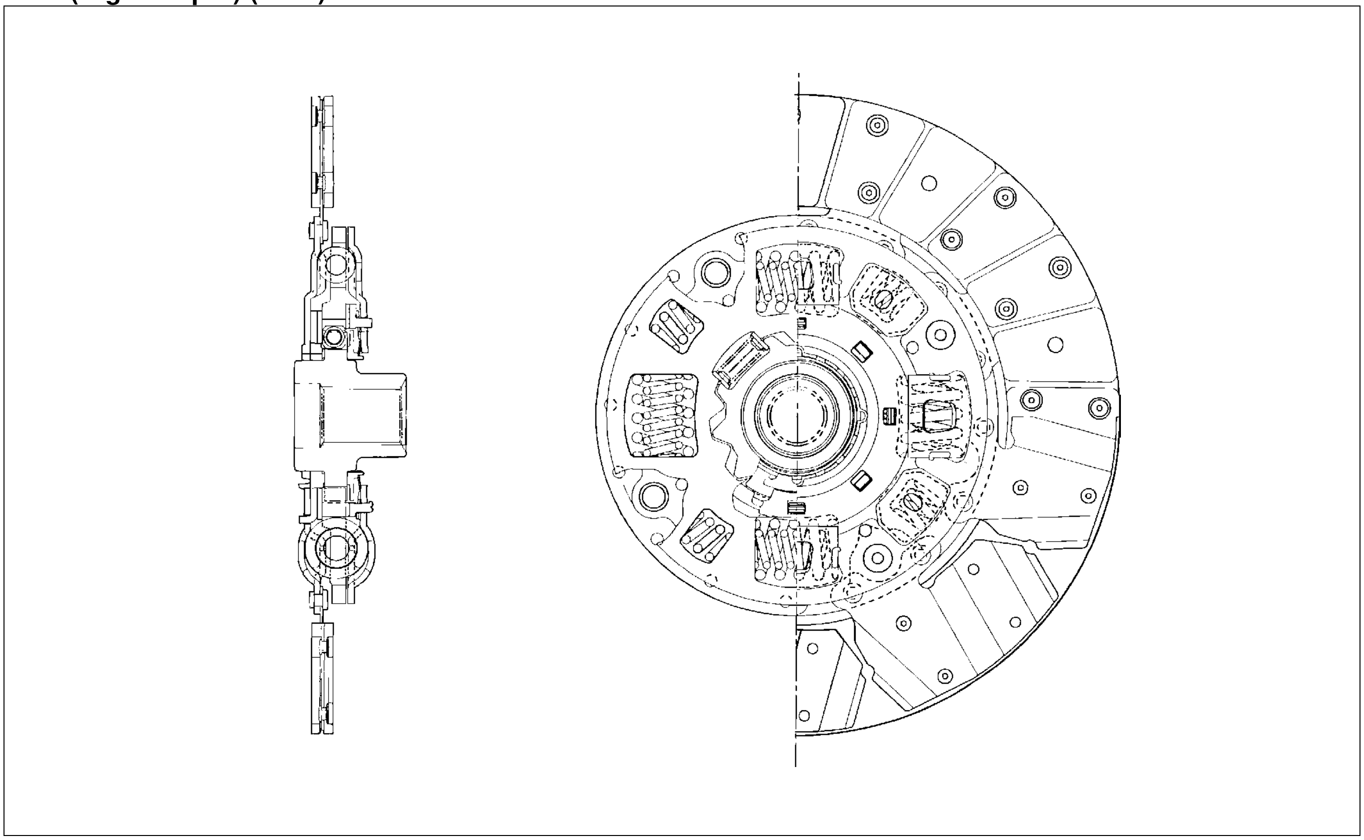


RTW37CMF000101

The pressure plate assembly consists of the clutch cover, the pressure plate with diaphragm spring.
Operating the clutch pedal causes the pressure plate to move in an axial direction to engage and disengage the clutch.

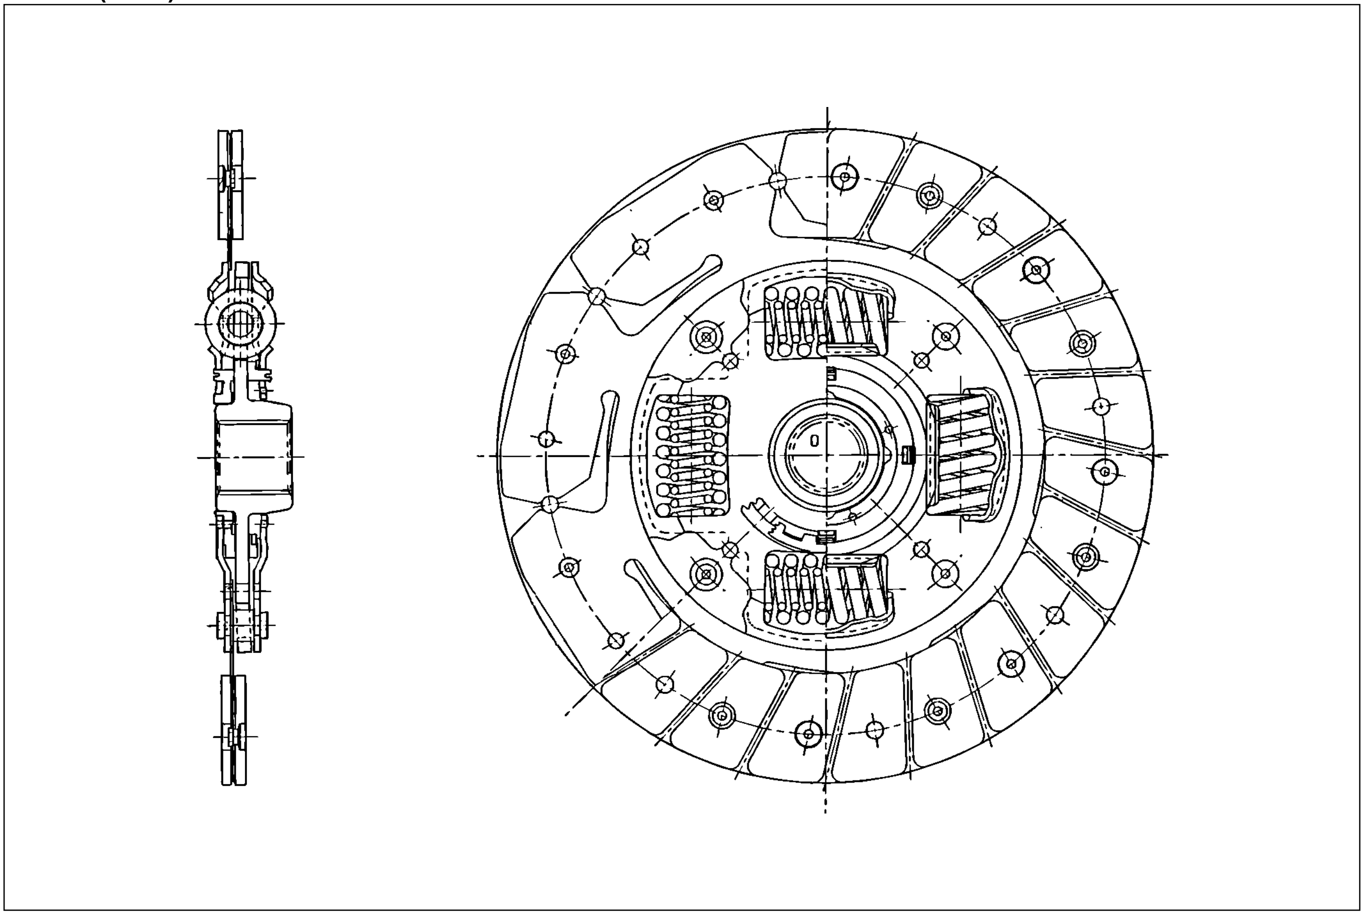
DRIVEN PLATE ASSEMBLY

4JJ1 (High Output) (MUX)



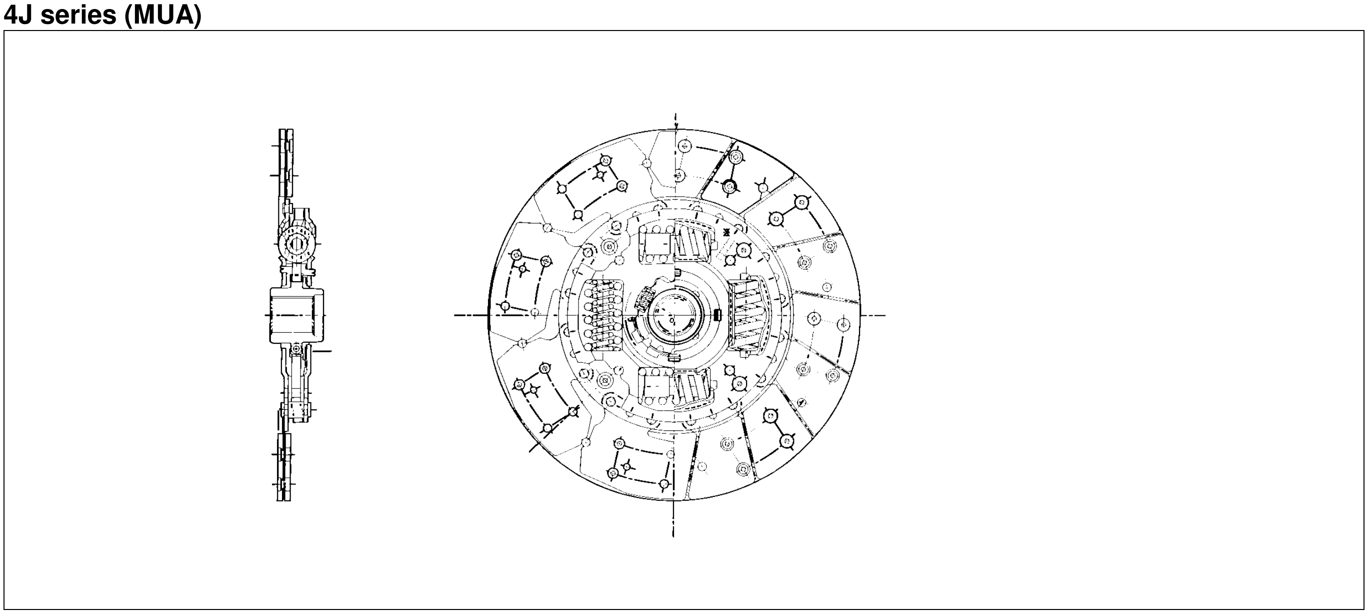
RTW77CMF000501

4JA1-T (MSG)

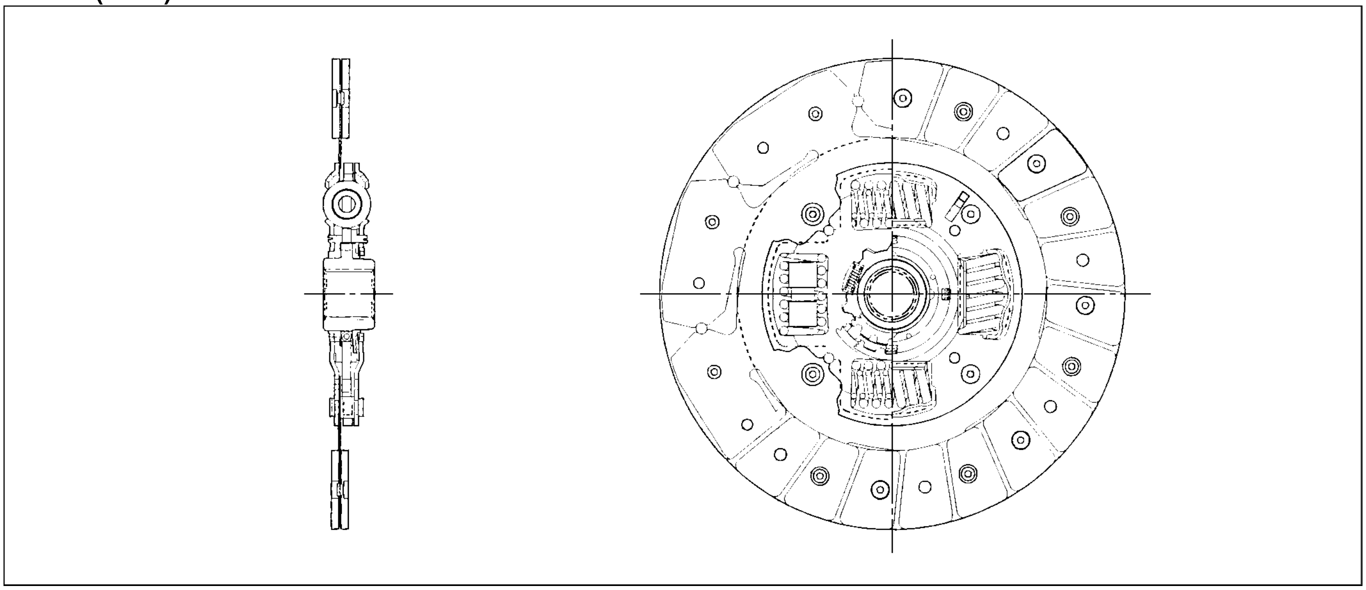


RTW47CMF000401

4J series (MUA)



C24SE (MUA)



RTW37CSF0003

The driven plate assembly consists of the plate and the facing.
The plate consists of the clutch center, the cushioning plate and the torsion springs.
The facing is riveted to both sides of the cushioning plate.
The cushioning plate provides a longer service life by minimizing wear and vibration at the clutch contact surfaces.

TORQUE SPECIFICATION

STANDARD BOLTS

The torque values given in the following table should be applied where a particular torque is not specified.

N·m (kgf·m/lb·ft)

Strength Class		4.8/4T	7T	8.8		9.8/9T
				Refined	Non-Refined	
Bolt Identification		4	7	8	.8	9
Bolt Diameter× Pitch (mm)		 No mark	-			Standard Hex. Head Bolt	M6 × 1.0	6 (0.6 / 52 lb.in)	7 (0.7 / 61 lb.in)	8 (0.8 / 69 lb.in)		-
	M8 × 1.25	13 (1.3 / 113 lb.in)	17 (1.7 / 12)	20 (2.0 / 14)		24 (2.4 / 17)
	M10 × 1.25	27 (2.8 / 20)	37 (3.8 / 27)	42 (4.3 / 31)		50 (5.1 / 37)
	M12 × 1.25	61 (6.3 / 45)	76 (7.8 / 56)	87 (8.9 / 64)		95 (9.7 / 70)
	M14 ×1.5	96 (9.8 / 71)	116 (11.8 / 85)	133 (13.6 / 98)		142 (14.5 / 105)

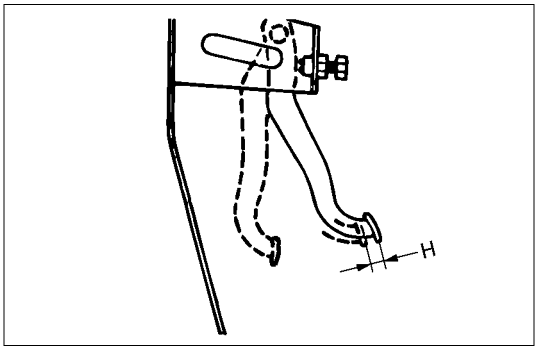
SERVICING

Servicing refers to general maintenance procedures to be performed by qualified service personnel.



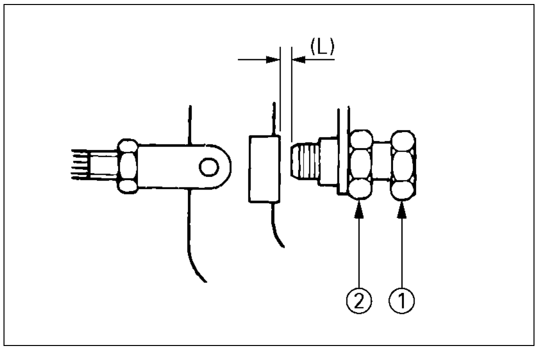
CLUTCH PEDAL PLAY

Inspection

Depress the clutch pedal lightly by hand, and measure to determine if the free play is within the standard value.

Pedal Free Play mm(in)

H	5.0-15.0 (0.2-0.6)



Adjustment of the clutch switch (or stopper bolt)

Turn the clutch switch or stopper bolt ① until the switch bolt or stopper bolt just touches the clutch pedal arm.

Adjust clutch switch or stopper bolt by backing it out half a turn, and measure the clearance (L) between the clutch pedal arm and the clutch switch bolt end or stopper bolt.

Lock the lock nut ②.

Connect clutch switch connector.

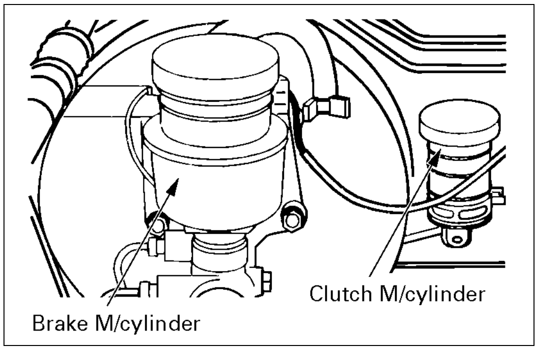
Clutch switch and clutch pedal

Clearance mm(in)

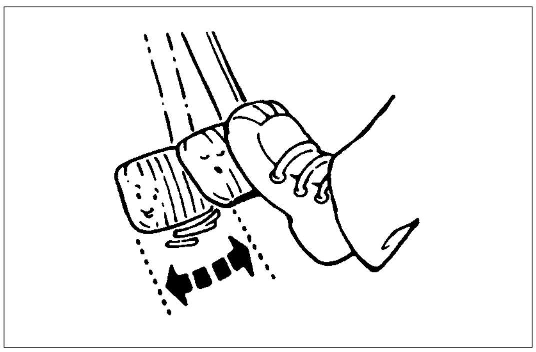
(L)	0.5-1.5 (0.020-0.059)

AIR BLEEDING

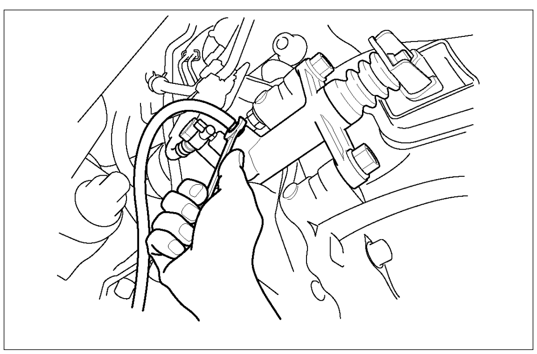
Bleed air from clutch operating cylinder according to the following procedure.
Carefully monitor fluid level at master cylinder during bleeding operation.



1. Set the parking brake.
2. Top up reservoir with recommended brake fluid.



3. Connect a transparent vinyl tube to air bleeder valve.
4. Fully depress clutch pedal several times.



RUW57CSH000201

5. With clutch pedal depressed, open bleeder valve to release air.
6. Close bleeder valve.
7. Repeat steps 5 through 6 above until brake fluid flows from air bleeder valve without air bubbles.
8. Bleed air from clutch damper according to the above procedure.
9. Repeat the above bleeding procedure until the air completely removed.

(4JH1-TC)

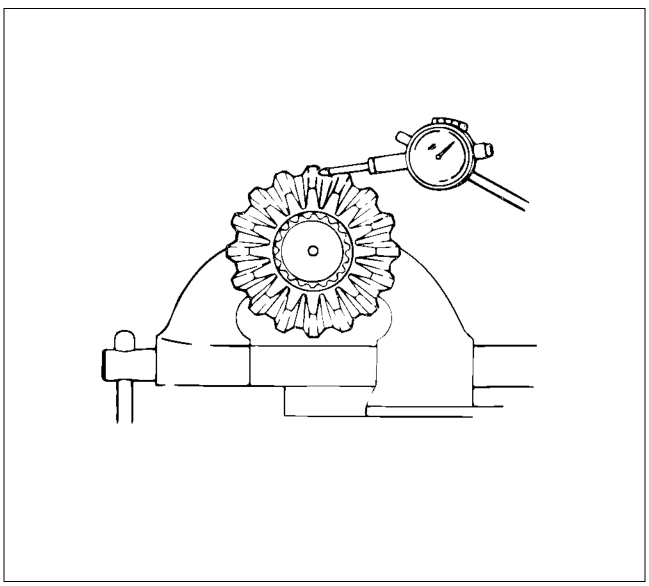
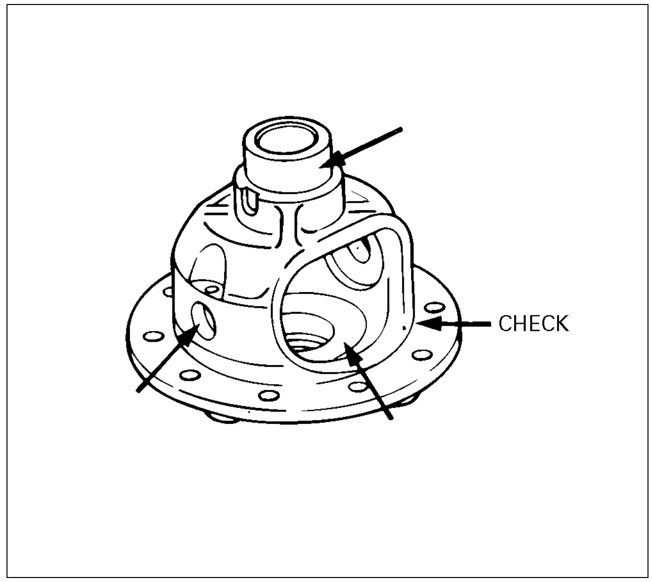
ϕ194mm	0.08 - 0.36 (0.003 - 0.014)	0.5 (0.02)



425L100014

Differential cage

Check the ring gear the side gear fitting faces and the cross pin hole for scores or roughness. Correct as necessary. Slight scores or roughness may be corrected with an oil stone or fine sand paper.



425R300006

Ring gear replacement:

1. The ring gear should always be replaced with the drive pinion as a set.
2. Discard use bolts and install new ones.
3. Apply LOCTITE 271 on bolt from the end of thread to the middle of straight portion.
4. Tighten the fixing bolts in a diagonal sequence as illustrated.

   Torque : 108 N·m (11 kgf·m/80 lb·ft)

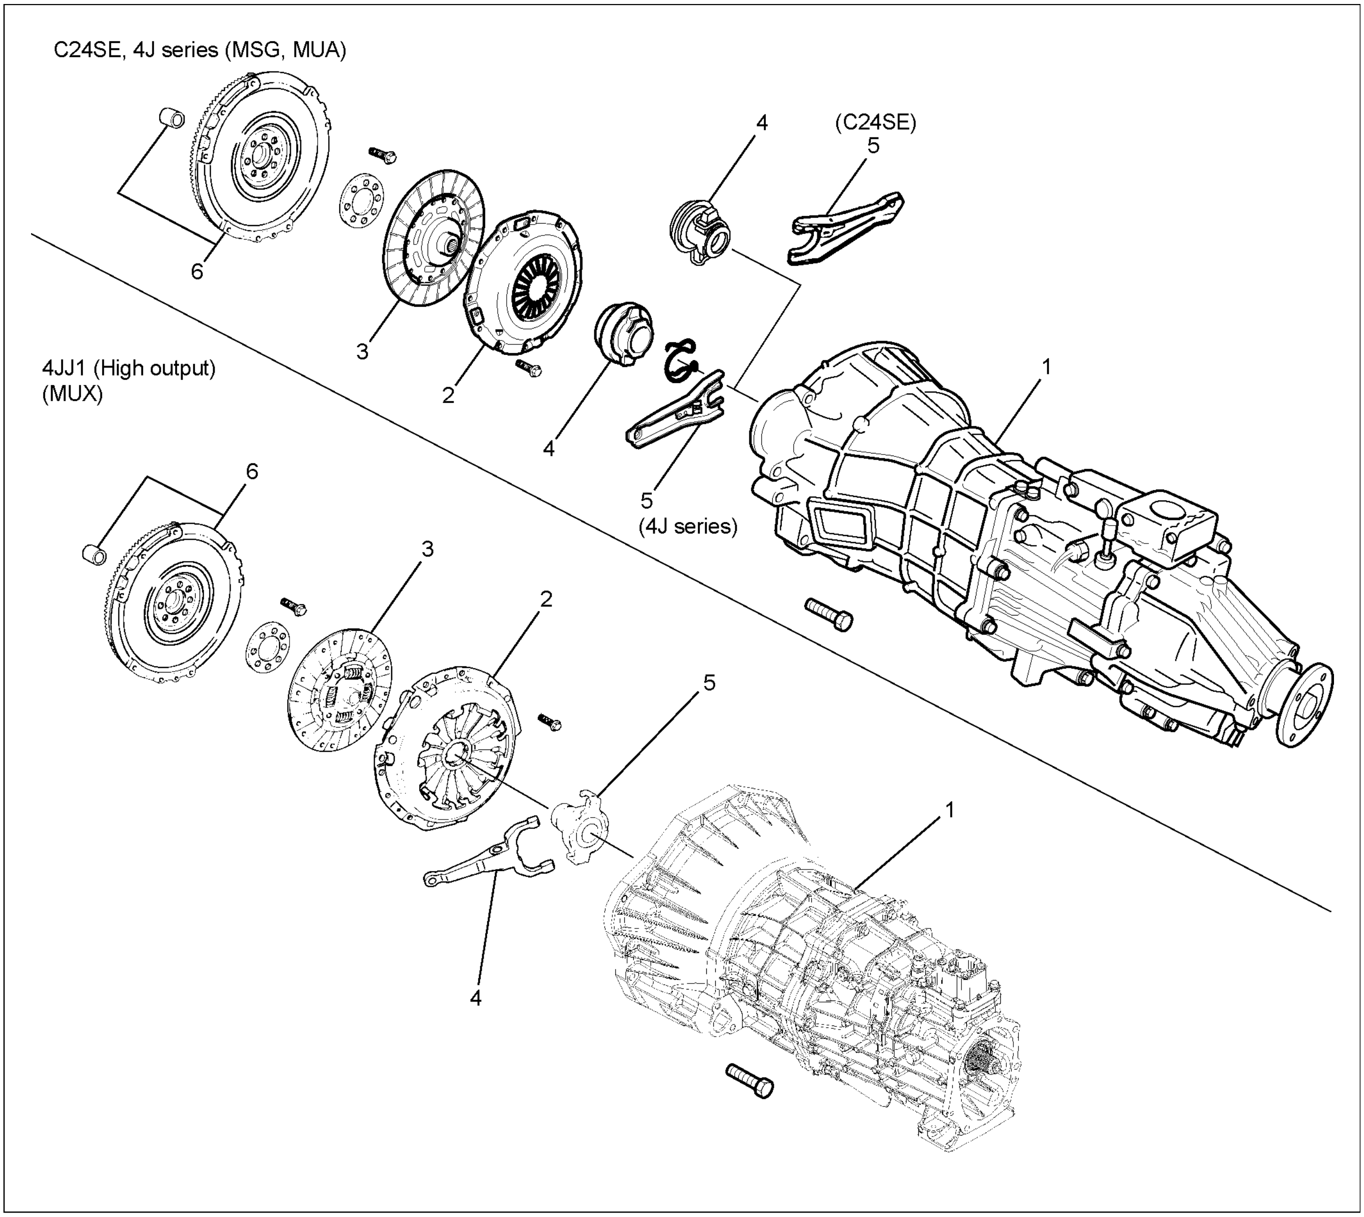
REMOVAL AND INSTALLATION



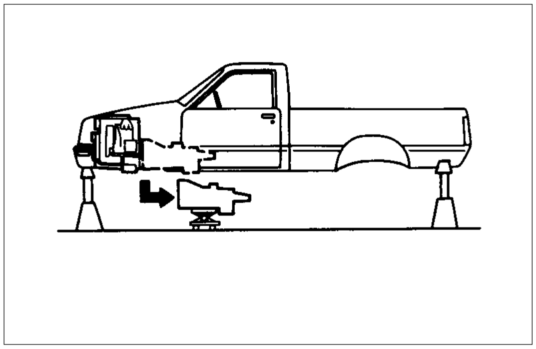
RTW77CLF000501

Removal Steps

▲ 1. Transmission assembly
▲ 2. Pressure Plate assembly
▲ 3. Driven plate assembly
4. Release bearing (MSG, MUA)
▲ 4. Shift fork (MUX)
5. Shift fork (MSG, MUA)
▲ 5. Release bearing (MUX)
6. Flywheel assembly and crank bearing

Installation Steps

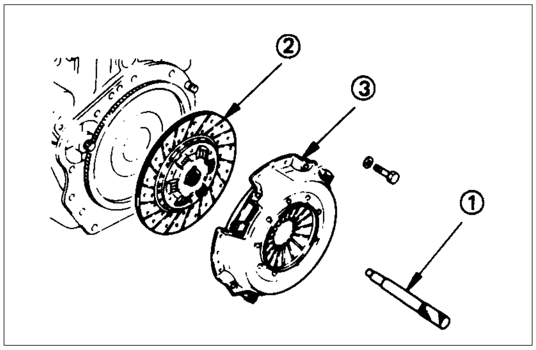
6. Flywheel assembly and crank bearing
5. Shift fork (MSG, MUA)
▲ 5. Release bearing (MUX)
4. Release bearing (MSG, MUA)
▲ 4. Shift fork (MUX)
▲ 3. Driven plate assembly
▲ 2. Pressure Plate assembly
1. Transmission assembly.



Important Operations - Removal

1. Transmission Assembly

Refer to “MANUAL TRANSMISSION” of section 7B and 7B1 for “REMOVAL AND INSTALLATION” procedure.



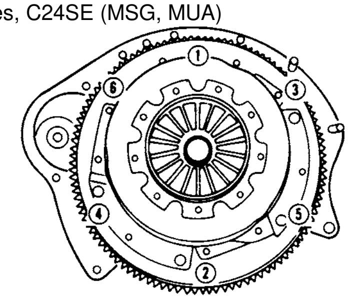
2. Pressure Plate Assembly

3. Driven Plate Assembly

(1) Use the clutch pilot aligner ① to prevent the driven plate assembly ② from falling free.

Clutch Pilot Aligner : 5-8525-3001-0(J-24547)

4J series, C24SE (MSG, MUA)

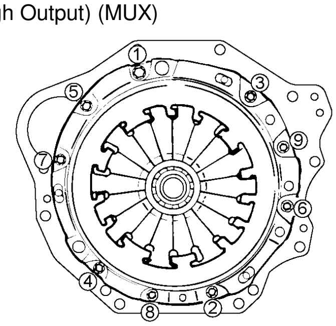


(2) Loosen the clutch cover bolts in the numerical order shown in the illustration.

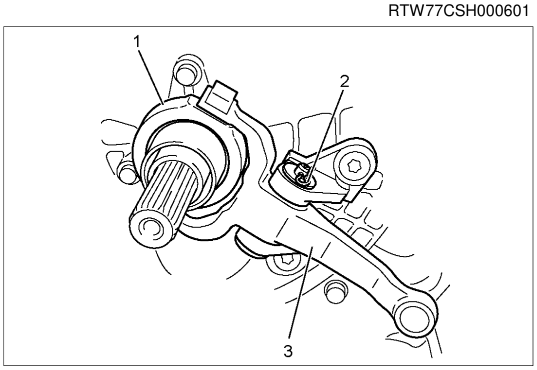
(3) Remove the pressure plate assembly ③ from the flywheel.

(4) Remove the driven plate from the flywheel.

4JJ1 (High Output) (MUX)



RTW77CSH000601



RTW77CSH000801

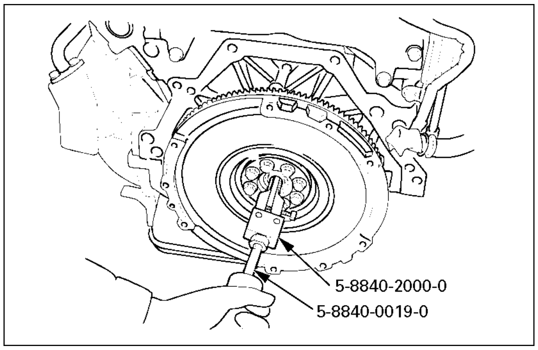
4. Shift Fork (MUX)

5. Release Bearing (MUX)

(1) Remove the shift fork snap pin (2).

(2) Remove the shift fork pin and shift fork (3) from the fulcrum bridge.

(3) Remove the release bearing (1) from the transmission case.



015RW053

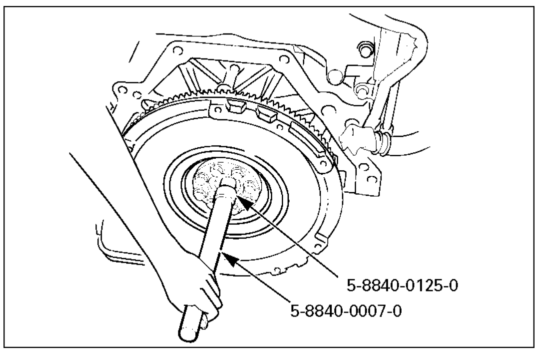
6. Flywheel Assembly and Crank Bearing (MUX)

(1) Remove flywheel assembly and crankshaft bearing. Do not remove except for replacement.

(2) Use the remover 5-8840-2000-0 (J-5822) and sliding hammer 5-8840-0019-0 (J-23907) to remove the crankshaft bearing

Important Operations - Installation

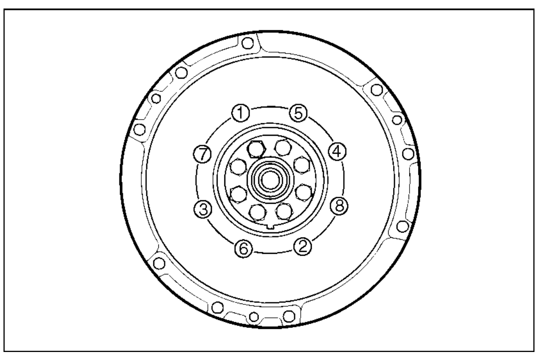
Follow the removal procedure in reverse order to perform the installation procedure.
Pay careful attention to the important points during the installation procedure.



015RW054

6. Flywheel Assembly and Crank Bearing (MUX)

(1) Install flywheel assembly and crankshaft bearing. Use the installer 5-8840-0125-0 (J-26516-A) and driver handle 5-8840-0007-0 (J-8092) to install the crankshaft bearing then clean and lubricate with grease.



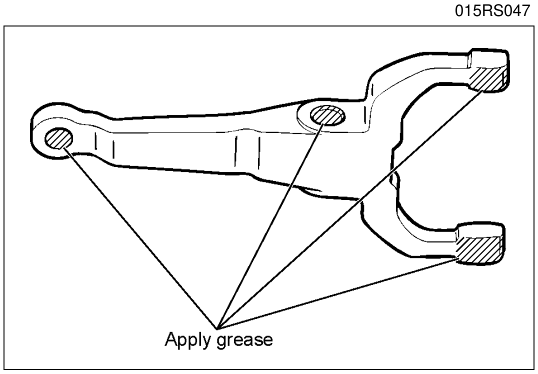
015RS047

(2) Install new flywheel fixing bolts in the order illustrated and tighten them to the specified torque.

N·m (kg·m/lb·ft)

MUX	54 (5.5/40)

NOTE: Do not reuse the bolt and do not apply oil or thread lock to the bolt.

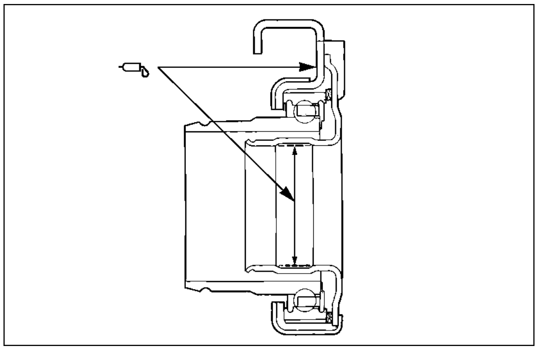


RTW77CSH000701

5. Release Bearing (MUX)

4. Shift Fork (MUX)

(1) Apply molybdenum disulfide type grease to the pin hole inner circumferences and thrust surfaces.



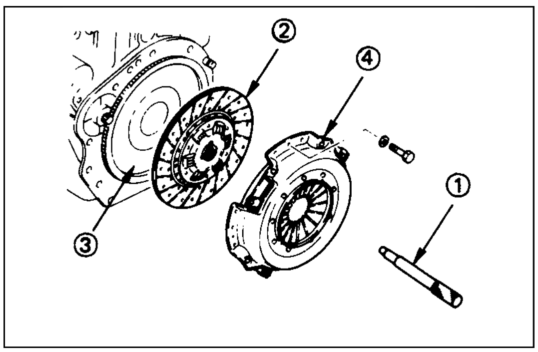
201RW012

(2) Apply molybdenum disulfide type grease to the areas shown in illustration.

(3) Install the release bearing to the transmission front cover.

(4) Install the shift fork to the fulcrum bridge and insert the pin from bottom of the fulcrum bridge.

(5) Install the washer and snap pin.



3. Driven plate Assembly

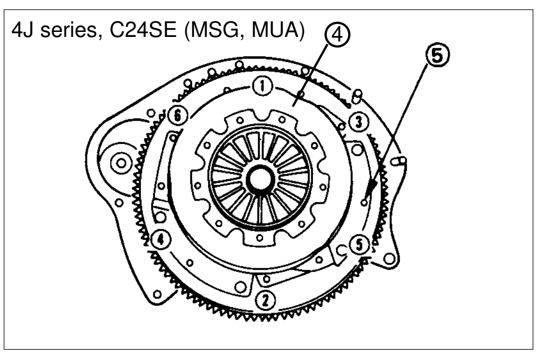
2. Pressure Plate Assembly

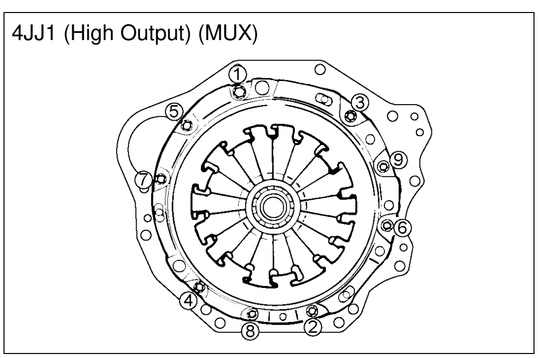
(1) Clean the flywheel surface.

(2) Clean the facing surface.

(3) Use the clutch pilot aligner ① to install the driven plate assembly ② to the flywheel ③.

Clutch Pilot Aligner : 5-8525-3001-0(J-24547)





RTW77CSH000601

(4) Clean the pressure plate surfaces.

(5) Align the pressure plate assembly ④ with the flywheel knock pin ⑤.

(6) Install the pressure plate assembly to the flywheel.

(7) Tighten the clutch cover bolts a little at a time in the numerical order shown in the illustration.

Clutch Cover Bolt Torque	N·m (kgf·m/lb·ft)
18 ± 3 (1.8 ± 0.3 / 13.0 ± 2.2)	

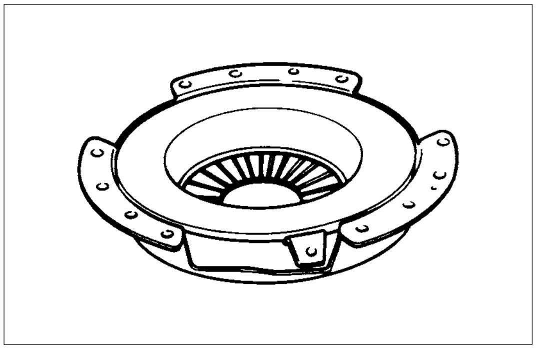
(8) Remove the clutch pilot aligner.

Note:

Do not strike the clutch pilot aligner with a hammer to remove it.

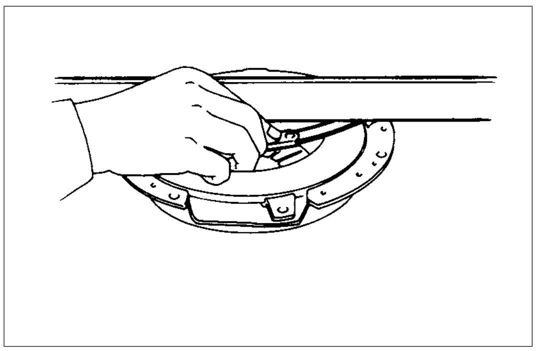
INSPECTION AND REPAIR

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.



PRESSURE PLATE ASSEMBLY

Visually inspect the pressure plate friction surface for excessive wear and heat cracks.
If excessive wear or deep heat cracks are present, the pressure plate must be replaced.

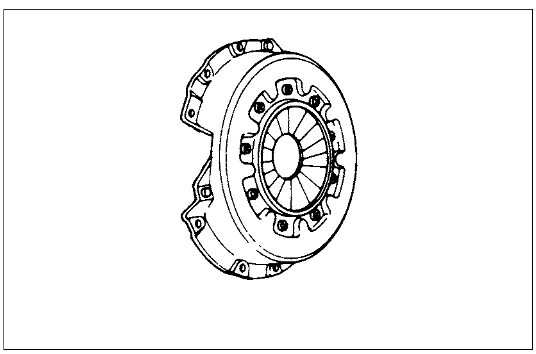


Pressure Plate Warpage

Use a straight edge and a feeler gauge to measure the pressure plate friction surface flatness in four directions.
If any of the measured values exceed the specified limit, the pressure plate must be replaced.

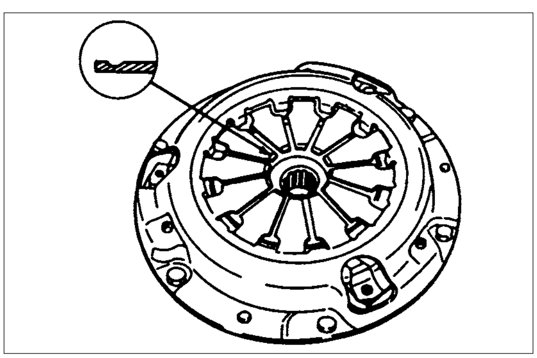
Pressure Plate Warpage mm(in)

Limit
0.3 (0.012)



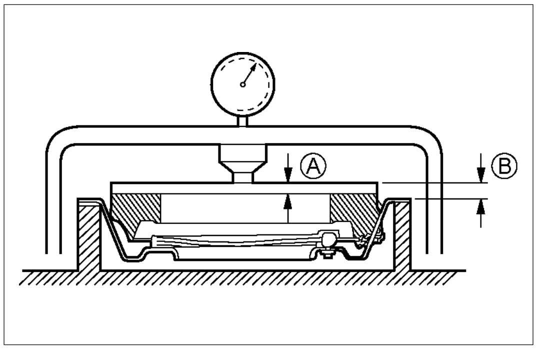
Clutch Cover

Visually inspect the entire clutch cover for excessive wear, cracking , and other damage.
The clutch cover must be replaced if any of these conditions are present.



1. Abrasion, scratches, cracks and deflection of friction face to the disc, loose rivet and wear of ring

- Grind small scratches, or replace the assembly if extreme scratches are found.



RTW67CSH000101

Clutch Set Force

1. Invert the pressure plate assembly.
2. Place a metal sheet “A” on the pressure plate.
3. Compress the pressure plate assembly until the distance “B” becomes specified.

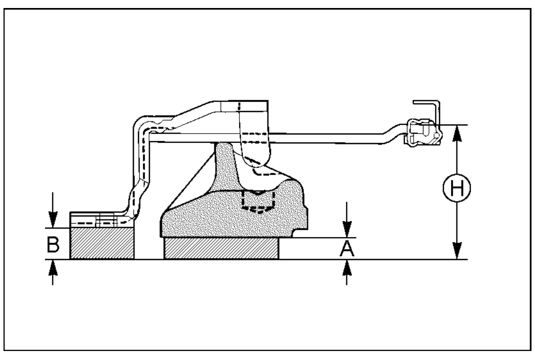
Thickness and Distance mm(in)

	A	B
4JJ1 (High Output) (MUX)	8.3 (0.327)	12 (0.472)
4JA1-T (MSG)	7.8 (0.307)	20 (0.787)
4J series (MUA)	7.8 (0.307)	18 (0.709)
C24SE (MUA)	8.0 (0.315)	7.9 (0.311)

4. Note the pressure plate gauge reading.

Driven Plate Clamping Load N (kg/lb)

	Standard
4JJ1 (High Output) (MUX)	6860 (700/1544)
4JA1-T (MSG)	5070 (517/1140)
4J series (MUA)	6300 (642/1415)
C24SE (MUA)	5500 (561/1237)



RTW37CSH000101

Diaphragm Spring Finger Height

1. Place a new driven plate or the appropriate spacer beneath the pressure plate.
2. Fully compress the pressure plate and diaphragm spring. There are two ways to do this.

- Use a bench press to press down on the assembly from the top.
- Tighten the fixing bolts.

NOTE: Preload on diaphragm spring finger must be 49 - 98 N (11 - 22 lb) in direction of release, when clutch cover assembly is bolted to the flywheel.

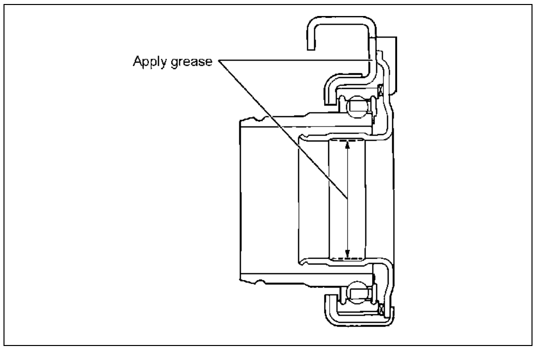
3. Measure the spring height from base to spring tip "H". If the measured value exceeds the specified limit, the pressure plate assembly must be replaced.

Spacer Thickness mm(in)

	A	B
4JJ1 (High Output) (MUX)	8.3 (0.327)	12 (0.472)
4JA1-T (MSG)	7.8 (0.307)	20 (0.787)
4J series (MUA)	7.8 (0.307)	18 (0.709)
C24SE (MUA)	8.0 (0.315)	7.9 (0.311)

Finger Height: Ⓗ

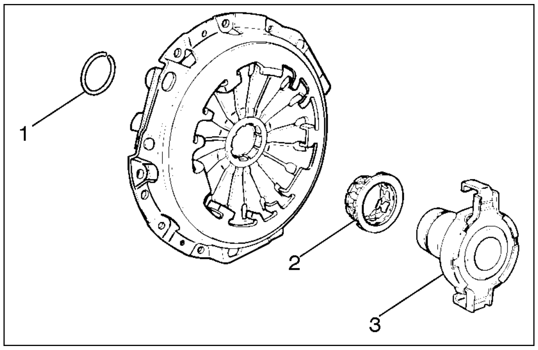
4JJ1 (High Output) (MUX)	49.9-51.9 (1.96-2.04)
4JA1-T (MSG)	31-33 (1.22-1.30)
4J series (MUA)	39-41 (1.54-1.61)
C24SE (MUA)	39-41 (1.54-1.61)



RTW77CSH000301

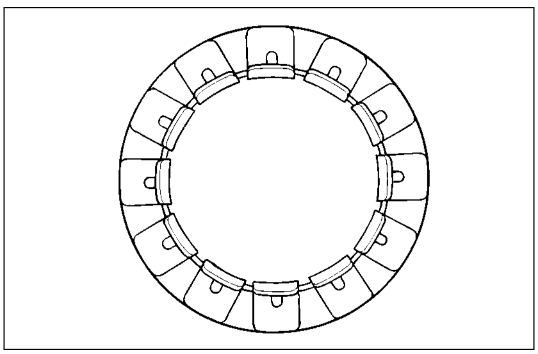
Release Bearing (MUX)

1. Visually check the release bearing for excessive play, noise and breakage.
2. If any of these conditions are discovered, the release bearing must be replaced.
3. Apply molybdenum disulfide grease to the areas shown in illustration.



201RW010-X

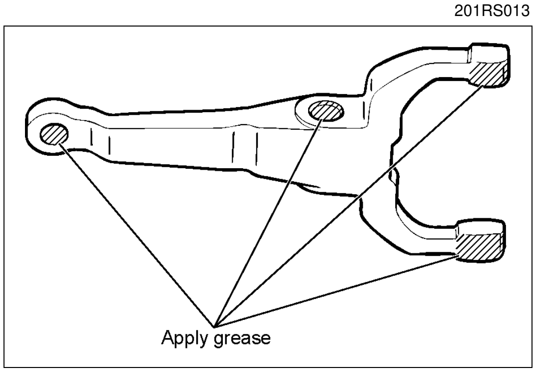
4. When replacing the release bearing (3), replace both the wedge collar (2) and wire ring (1) at the same time.



201RS013

Wedge Collar

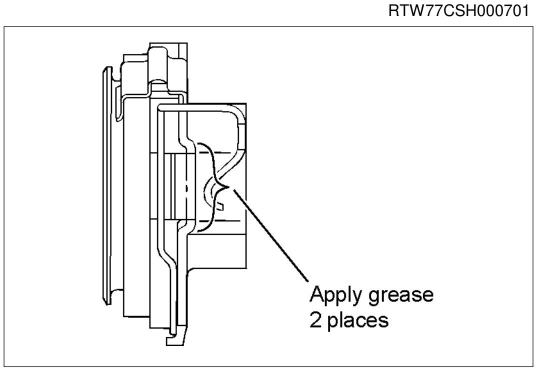
1. Visually check the surfaces of the wedge collar making contact with the release bearing for excessive wear and damage.
2. Replace any exhibiting excessive wear or damage.



RTW77CSH000701

Shift Fork

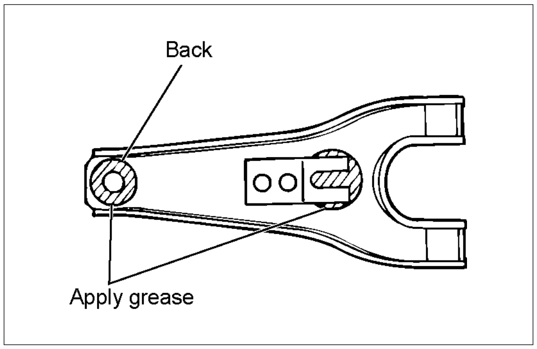
1. Visually check the surfaces of the shift fork making contact with the release bearing for excessive wear and damage.
2. Remove any minor stepping or abrasion from shift fork with an oil stone.
3. Replace any exhibiting excessive wear or damage.
4. Apply molybdenum disulfide grease to the pin hole inner circumferences and thrust surfaces.



RTW57CSH000401

Release Bearing (MSG, MUA)

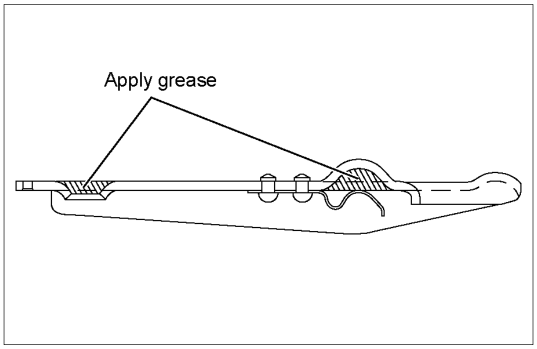
1. Visually inspect the surfaces of the release bearing making contact with the shift fork for excessive wear and damage. Replace any exhibiting excessive wear or damage.
2. Apply multi-purpose type grease (NLGI No.2 or No.3) to contact surface between the release bearing and the shift fork. (Do not apply grease to the sleeve inner face.)



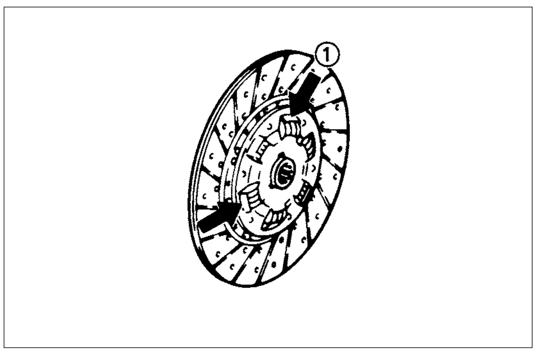
RTW57CSH000201

Shift Fork

1. Visually inspect the surfaces of the shift fork making contact with the release bearing for excessive wear and damage.
2. Remove any minor stepping or abrasion from the release bearing with an oil stone.
   Replace any exhibiting excessive wear or damage.
3. Apply multi-purpose type grease (NLGI No.2 or No.3) to area.

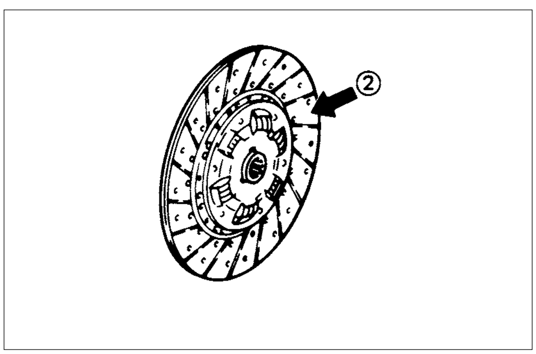


RTW57CSH000501

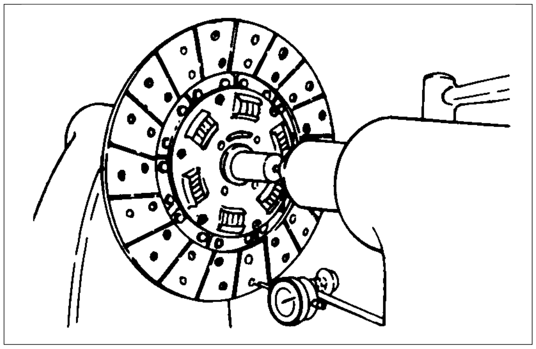


DRIVEN PLATE ASSEMBLY

1. Visually inspect the torsion spring ① for looseness, breakage, and weakening.
   If any of these conditions are discovered, the driven plate assembly must be replaced.



2. Visually inspect the facing surfaces ② for cracking and excessive scorching.
   Visually inspect the facing surfaces for the presence of oil or grease.
   If any of these conditions are discovered, the facing must be cleaned or replaced.
3. Check that the driven plate moves smoothly on the transmission top gear shaft spline.
   Minor ridges on the top gear shaft spline may be removed with an oil stone.

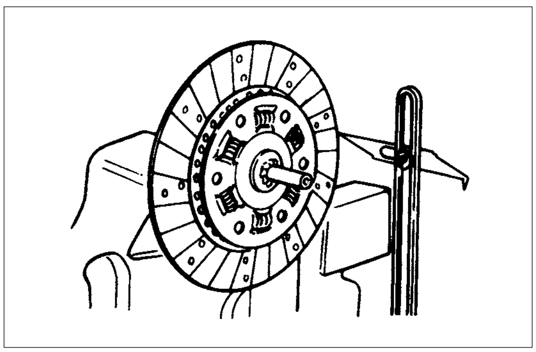


Driven Plate Warpage

1. Insert the clutch pilot aligner into the driven plate splined hub.
   The clutch pilot aligner must be held perfectly horizontal.
   Clutch Pilot Aligner : 5-8525-3001-0
2. Set a dial indicator to the driven plate outside circumference.
3. Slowly turn the driven plate.
   Read the dial indicator as you turn the driven plate.
   If the measured value exceeds the specified limit, the driven plate assembly and/or the facing must be replaced.

Driven Plate Warpage mm(in)

Standard	Limit
0.7 (0.028)	1.0 (0.039)

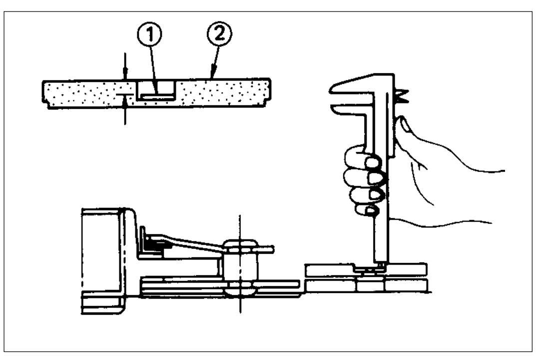


Driven Plate Splined Hub Spline Wear

1. Clean the driven plate splined hub.
2. Install the driven plate to the transmission top gear shaft spline.
3. Set a surface gauge to the driven plate outside circumference.
4. Slowly turn the driven plate counterclockwise.
   Measure the spline rotation play as you turn the driven plate.
   If the measured value exceeds the specified limit, the driven plate assembly must be replaced.

Driven Plate Splined Hub Spline Wear mm(in)

Standard	Limit
0.5 (0.020)	1.0 (0.039)



Rivet Head Depression

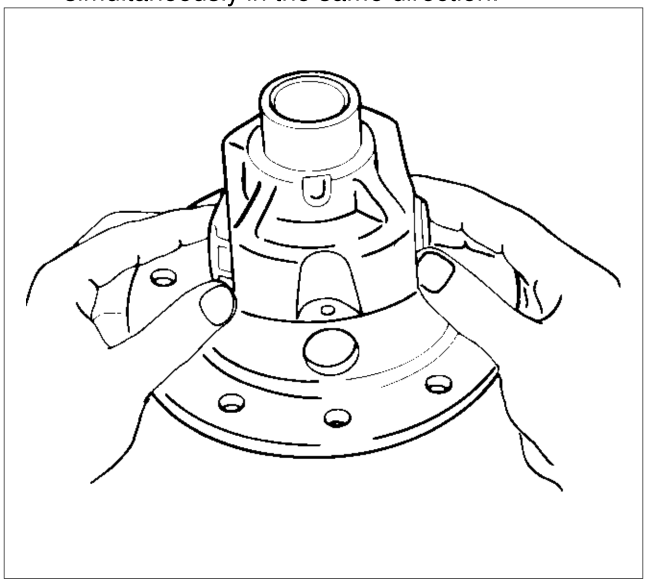
Use a depth gauge or a straight edge with steel rule to measure the rivet head depression ① from the facing surface ②.
Be sure to measure the rivet head depression on both sides of the driven plate.
If the measured value is less than the specified limit, the facing must be replaced.

Rivet Head Depression mm(in)

	Standard		Limit
	Fly wheel side	P/Plate side	
4J series	1.35-1.95 (0.053-0.077)	1.65-2.25 (0.065-0.089)	0.2 (0.008)
C24SE	1.65-2.25 (0.065-0.089)	1.65-2.25 (0.065-0.089)	0.2 (0.008)
4JJ1 (High Output)	1.40-2.00 (0.055-0.079)	1.70-2.30 (0.067-0.091)	0.2 (0.008)

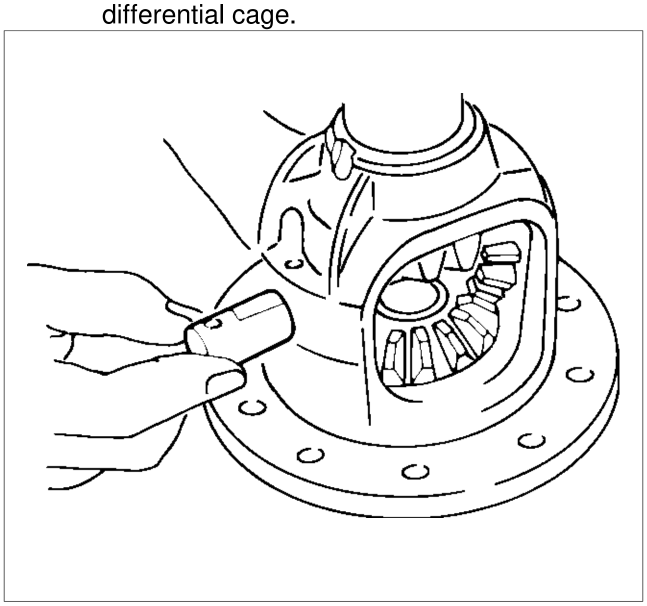
Reassembly

1. Install side gear with thrust washer in differential cage.
2. Install the pinion gear by engaging it with the side gears while turning both pinion gears simultaneously in the same direction.



425RS048

3. Install cross pin.
   - Be sure to install the cross pin so that it is in alignment with the lock pin hole in the differential cage.



425RS049

4. Check the amount of backlash.
   Backlash between the side gear and the pinion gear.

mm (in)

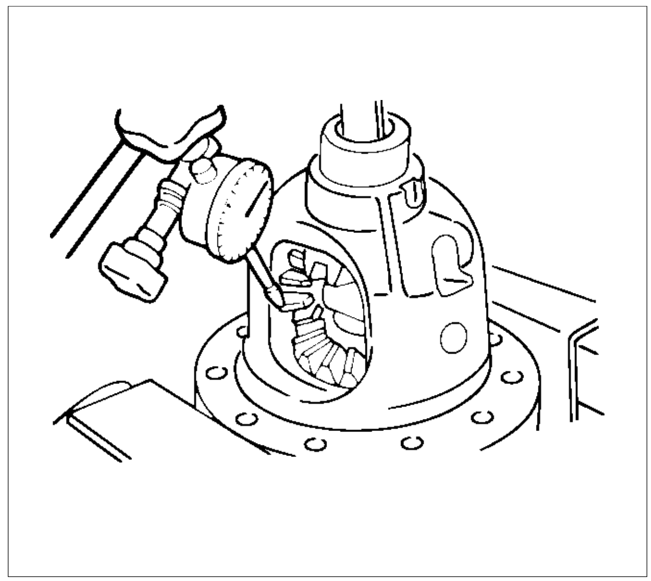
ϕ220mm	0.13-0.18 (0.005-0.007)
ϕ194mm	0.10-0.20 (0.004-0.008)

If the backlash is beyond the limits, adjust with a thrust washer of selected thickness.

Thicknesses of thrust washers available.

Backlash mm (in)

ϕ220 mm	0.80 (0.031)	0.90 (0.035)	1.00 (0.039)	1.10 (0.043)	1.20 (0.047)	1.30 (0.051)
ϕ194 mm	1.00 (0.039)	1.05 (0.041)	1.10 (0.043)			



425RY00008

5. Install lock pin.
   After lock pin installation, stake the case to secure the lock pin.
6. Install ring gear.
   Refer to “Ring gear replacement” on this section.

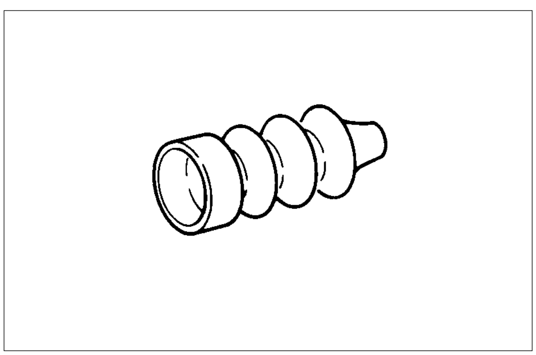
3. Piston and piston cup
4. Spring
5. Cylinder body



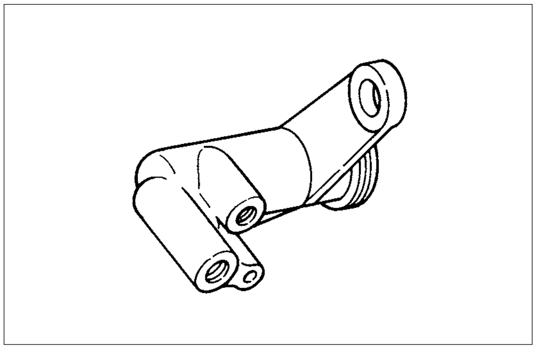
Important Operations

1. Boot

Brake fluid spilled on painted or plastic surfaces will cause serious damage.
Take care not to spill brake fluid.

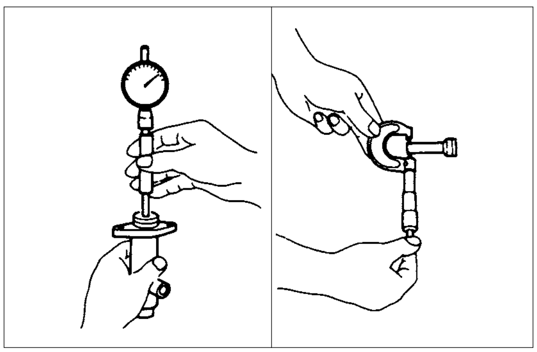
INSPECTION AND REPAIR

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.



Cylinder Body

1. Clean the cylinder body.
2. Check the fluid return port for restrictions and clean it if necessary.



Cylinder Bore and piston Clearance

1. Clean the cylinder body and the piston.
2. Use an inside dial indicator to measure the cylinder bore.
3. Use a micrometer to measure the piston diameter.
4. Calculate the clearance between the cylinder bore and the piston diameter.
   If the clearance exceeds the limit, the entire slave cylinder assembly must be replaced.

Cylinder Bore and Piston Clearance mm(in)

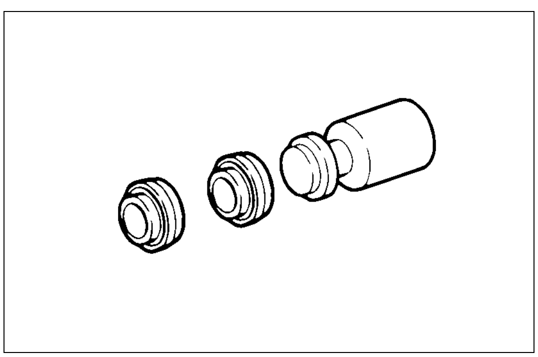
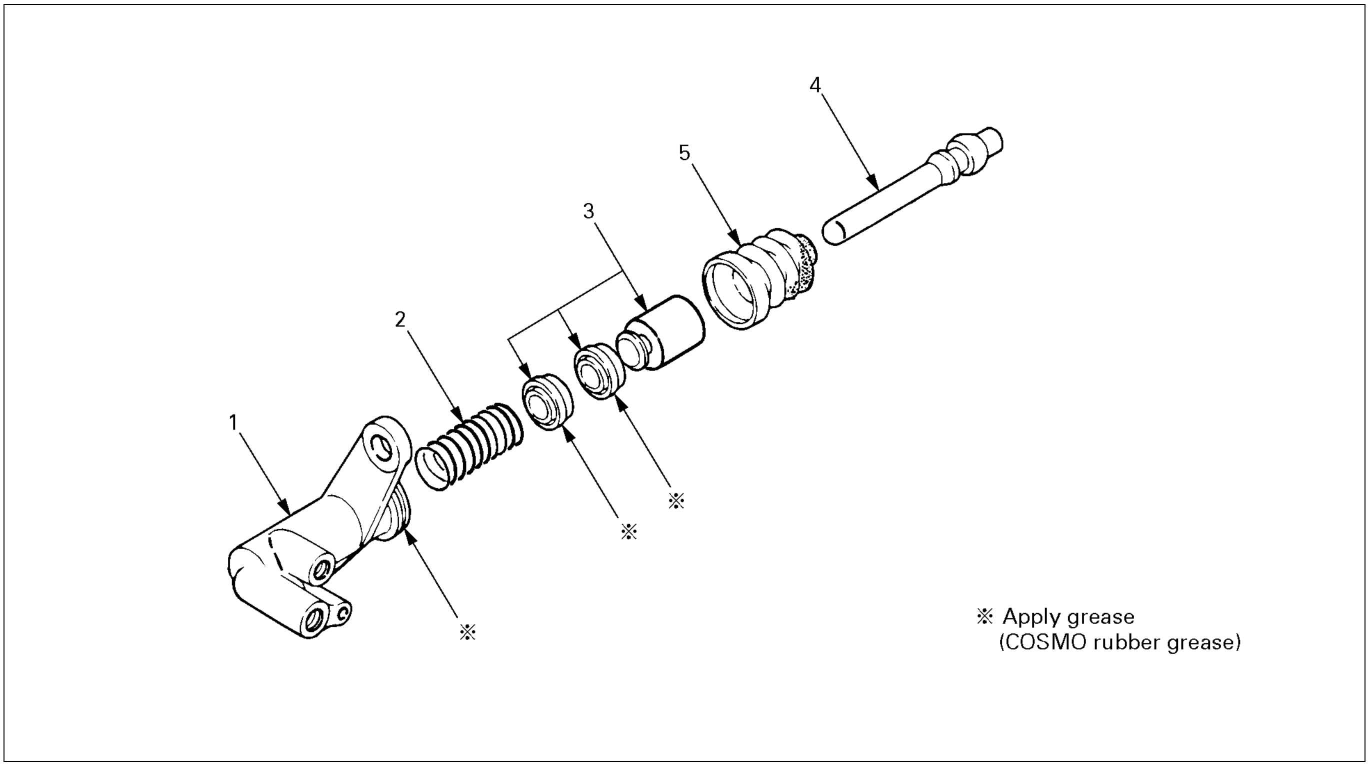
0.07 (0.0028)	0.15 (0.006)



Piston and Piston Cup

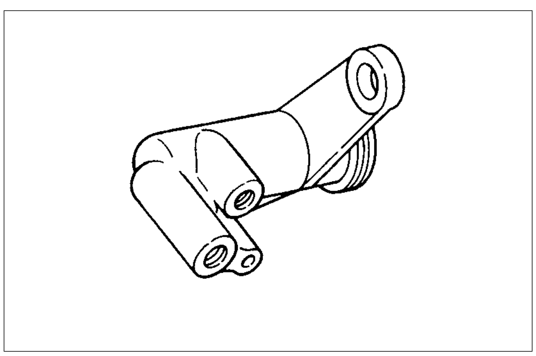
Visually inspect the disassembled piston and piston cup for excessive wear and damage.
Replace the inner parts with new parts (Repair kit A) shown in the illustration.

REASSEMBLY



Reassembly Steps

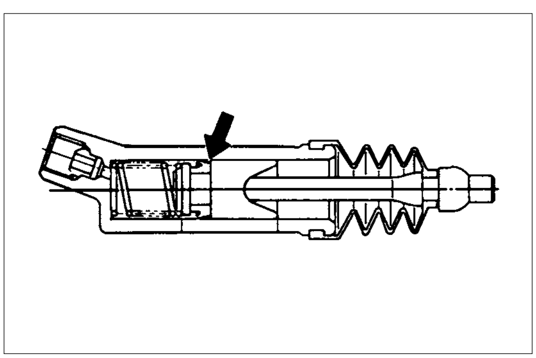
▲ 1. Cylinder body
2. Spring
▲ 3. Piston and piston cup
4. Push rod
5. Boot



Important Operations

1. Cylinder Body

1) Clean the cylinder body.
2) Apply brake fluid to the cylinder bore.

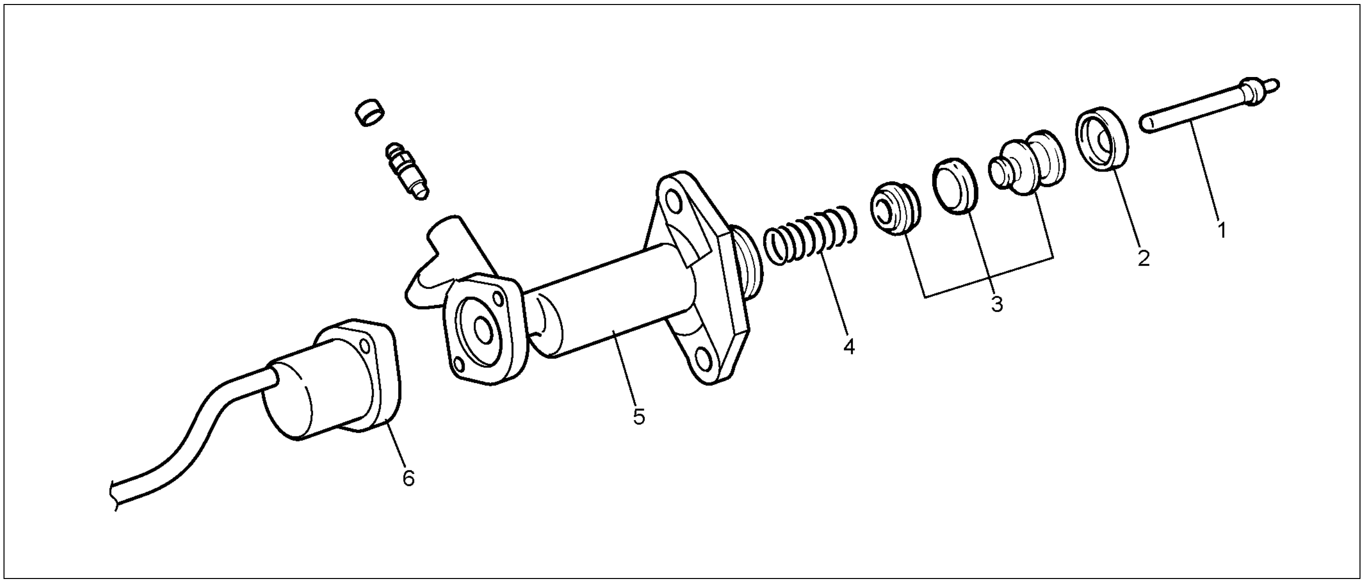


3. Piston and piston Cup

1) Apply brake fluid to the piston and piston cup.
2) Install the cups to the piston.
Note the installation direction of the piston cups in the illustration.
3) Install the piston and piston cup to the cylinder body.

SLAVE CYLINDER (MUX)

DISASSEMBLY



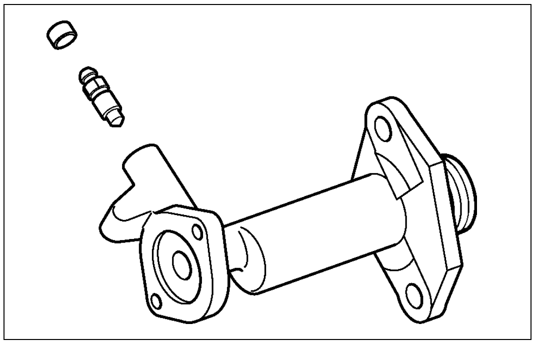
RTW77CSF000501

Disassembly Steps

1. Push rod
2. Boot
3. Piston and piston cup
4. Spring
5. Cylinder body
6. Clutch damper valve

INSPECTION AND REPAIR

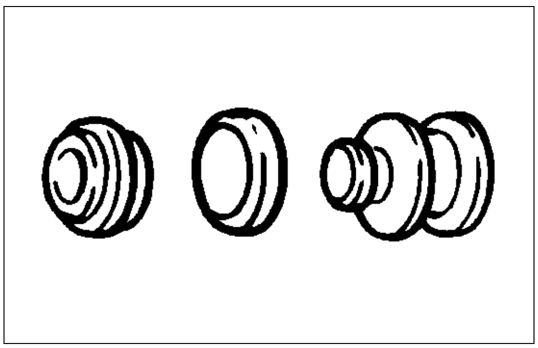
Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.



RTW77CSH000901

Cylinder Body

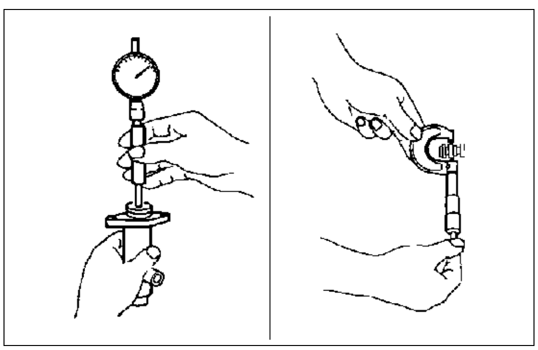
1. Clean the cylinder body.
2. Check the fluid return port for restrictions and clean it if necessary.



206RS004

Piston and Piston Cup

1. Visually inspect the disassembled piston and piston cup for excessive wear and damage.
2. Replace the inner parts with new parts shown in the illustration.



206RS005

3. Measure the clearance between slave cylinder wall and piston.
4. If the measured value exceeds the specified limit, the slave cylinder assembly must be replaced.

mm(in)

Standard	Limit
0.07 (0.0028)	0.15 (0.006)

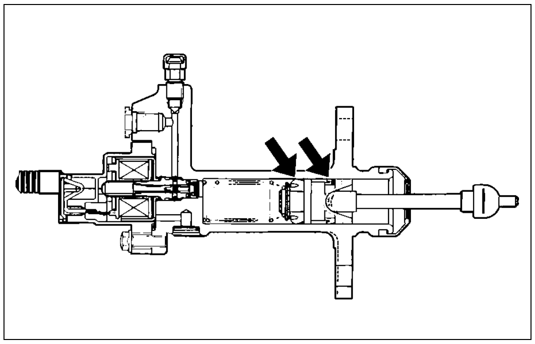
Clutch Damper Valve

1. Visually inspect the entire clutch damper valve housing or connector for cracking and other damage.
   The slave cylinder assembly must be replaced if any of these conditions are present.
2. Measure resistance between terminals.
   Replace slave cylinder assembly if less than standard value.

Standard: 14.3 Ω

REASSEMBLY

To reassemble, follow the disassembly steps in the reverse order, noting the following points:



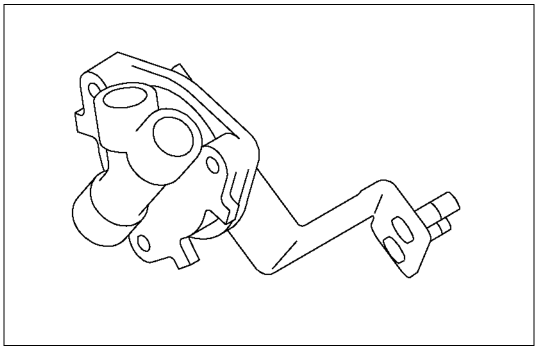
RTW77CSH001001

1. Before installing the parts, apply a thin coat of rubber grease.
2. Install cup in groove in piston with the lip turned to the front of cylinder. Use care so as not to scratch the cylinder.

HYDRAULIC DAMPER CYLINDER

INSPECTION AND REPAIR

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.



Visually check for oil leakage and other damage.
If oil leakage or other damage is discovered during the inspection; the damper cylinder assembly must be replaced as a unit.

TROUBLESHOOTING

Refer to this Section to quickly diagnose and repair clutch problems.
Each troubleshooting chart has three headings arranged from left to right.
(1) Checkpoint (2) Trouble Cause (3) Countermeasure
This Section is divided into five sub-sections:

1. Clutch Slippage
2. Clutch Does Not Release Properly
3. Clutch Shudder
4. Clutch Noise
   1) Clutch pedal Depressed (Clutch Disengaged)
   2) Clutch pedal Not Depressed (Clutch Engaged)
5. Oil Leakage

1. CLUTCH SLIPPAGE

Checkpoint	Result	Problem	Countermeasure
Clutch pedal free play	NG	No push rod play in the master cylinder	Adjust the push rod play
	OK		
Release bearing	NG	Transmission front cover unevenly worn	Repair or replace the transmission front cover
	OK		
Grease or oil adhering to the facing	NG	Too much grease	Clean the related parts and/or replace the facing
	NG	Defective transmission front cover oil seal	Clean the related parts and/or replace the facing Replace the transmission front cover oil seal
	OK		

Continued on the next page

Continued from the previous page

OK

Checkpoint		Problem	Countermeasure
Grease or oil adhering to the facing	NG	Defective crankshaft rear oil seal	Clean the related parts and/or replace the facing Replace the crankshaft rear oil seal
	NG	Release bearing broken	Replace the release bearing
OK			
Facing	NG	Worn facing	Replace the driven plate assembly
OK			
Clutch diaphragm spring	NG	Weak or broken clutch diaphragm spring	Replace the clutch pressure plate assembly

2. CLUTCH DOES NOT RELEASE PROPERLY

Checkpoint	Problem	Countermeasure
Clutch pedal free play	NG: Too much push rod play in the master cylinder	Adjust the push rod play
OK ↓		
Hydraulic circuit	NG: Air in the hydraulic circuit	Bleed the hydraulic circuit
OK ↓		
Driven plate	NG: Driven plate warped or unevenly worn	Replace the driven plate
	NG: Insufficient grease on the spline contact surface of the splined hub	Clean and grease the splined contact surface
	NG: Corrosion or step wear on the top gear shaft spline	Clean or repair the top gear shaft spline Replace the top gear shaft
OK ↓		
Pressure plate	NG: Pressure plate unevenly worn	Replace the pressure plate assembly
OK ↓		

Continued on the next page

Checkpoint		Problem	Countermeasure
Continued from the previous page			
OK			
Flywheel	NG	Flywheel unevenly worn	Repair or replace the flywheel
OK			
Crankshaft pilot bearing	NG	Top gear shaft wobble is causing pilot bearing wear	Replace the pilot bearing

3. CLUTCH SHUDDER

Checkpoint		Problem	Countermeasure
Power train	NG	Poorly connected components causing looseness and abrasion	Tighten the connections Repair or replace the applicable parts
OK			
Pressure plate	NG	Pressure plate unevenly worn	Replace the pressure plate assembly
OK			
Grease or oil adhering to the facing	NG	Too much grease	Clean the related parts and/or replace the facing
	NG	Defective transmission front cover oil seal	Clean the related parts and/or replace the facing Replace the transmission front cover oil seal
	NG	Defective crankshaft rear oil seal	Clean the related parts and/or replace the facing Replace the crankshaft rear oil seal
OK			
Driven plate	NG	Insufficient grease on the spline contact surface of the splined hub	Clean and grease the spline contact surface
	NG	Corrosion or step wear on the top gear shaft spline	Clean or repair the top gear shaft spline Replace the top gear shaft
OK			

Continued on the next page

Continued from the previous page

OK

Checkpoint		Problem	Countermeasure
Driven plate	NG	Loose facing rivets	Replace the driven plate assembly
	NG	Warpage and/or uneven wear	Replace the driven plate assembly
OK			
Flywheel	NG	Flywheel uneven wear	Repair or replace the flywheel

4. CLUTCH NOISE

1) Clutch Pedal Depressed (Clutch Disengaged)

Checkpoint		Problem	Countermeasure
Pedal shaft and sleeve	NG	Insufficient grease at the pedal shaft and sleeve	Clean and grease the pedal shaft and sleeve
	NG	Worn pedal shaft and/or sleeve	Replace the pedal shaft with the sleeve
OK			
Master cylinder piston and push rod contact faces	NG	Insufficient grease at the maser cylinder piston and push rod contact faces	Clean and grease the master cylinder piston and push rod contact faces
OK			
Driven plate	NG	Loose or broken damper spring	Replace the driven plate assembly
OK			
Crankshaft pilot bearing	NG	Insufficient grease at the crankshaft pilot bearing (pilot bearing worn)	Replace the crankshaft pilot bearing

2) Clutch Pedal Not Depressed (Clutch Engaged)

Checkpoint		Problem	Countermeasure
Driven plate damper spring	NG	Weak or broken damper spring	Replace the driven plate
OK			
Crankshaft pilot bearing	NG	Insufficient grease at the crankshaft pilot bearing (pilot bearing worn)	Replace the crankshaft pilot bearing

5. OIL LEAKAGE

Checkpoint		Problem	Countermeasure
Master cylinder	NG	Weak or damaged piston cup	Replace the body sub assembly
OK			
Master cylinder fluid pipe and hose	NG	Loosely connected fluid pipe and/or hose	Tighten the fluid pipe and/or hose connections
OK			
Slave cylinder	NG	Weak or damaged piston cup	Replace the piston cup
OK			
Slave cylinder oil pipe	NG	Loosely connected oil pipe	Tighten the oil pipe connection
OK			
Fluid reservoir	NG	Loosely connected oil pipe	Tighten the oil pipe

SPECIAL SERVICE TOOL

ILLUSTRATION	PART NO.	PART NAME
	5-8525-3001-0 (J-24547)	Clutch pilot aligner
	5-8840-2000-0 (J-5822)	Pilot bearing remover
	5-8840-0019-0 (J-23907)	Sliding hammer

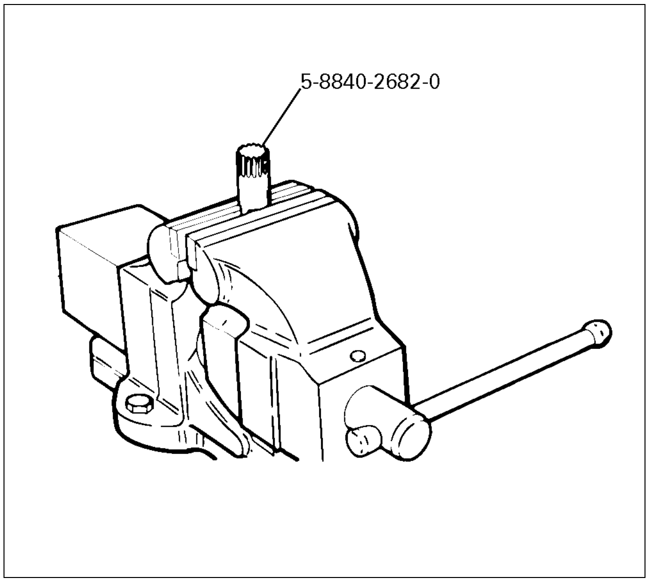
	5-8840-0007-0 (J-8092)	Drive handle

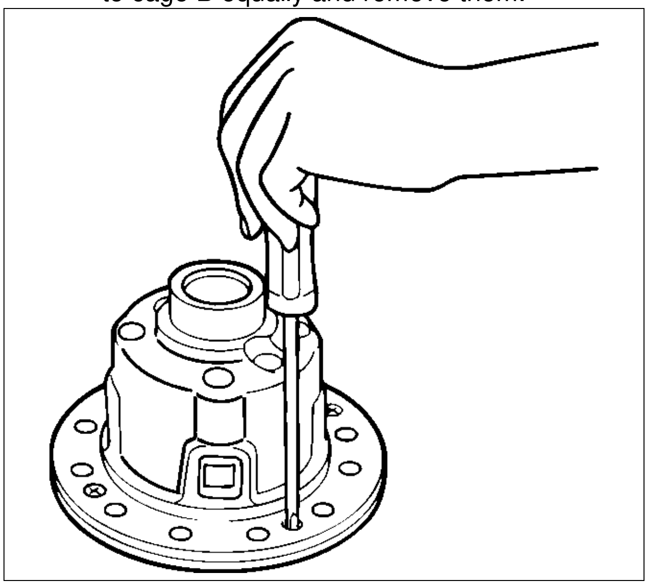
Disassembly

- Prepare a side gear holder : 5-8840-2682-0 as shown in the left figure, clamp it with a stock vice, and set a differential.



425R300008

1. Screw
   - Apply a setting mark to the differential cage A and differential cage B remove the bolt using the press.
   - Loosen four screws fixing differential cage A to cage B equally and remove them.



425RS055

2. Remove differential cage A and B.
3. Remove thrust washer and two spring plates.
4. Remove friction plate and friction disc.
5. Remove friction plate and friction disc.
6. Remove pressure ring and side gear.
7. Remove pinion and pinion shaft.
8. Remove side gear and pressure ring.
9. Remove friction disc and friction plate.
10. Remove friction disc and friction plate.
11. Remove two spring plates and thrust washer.

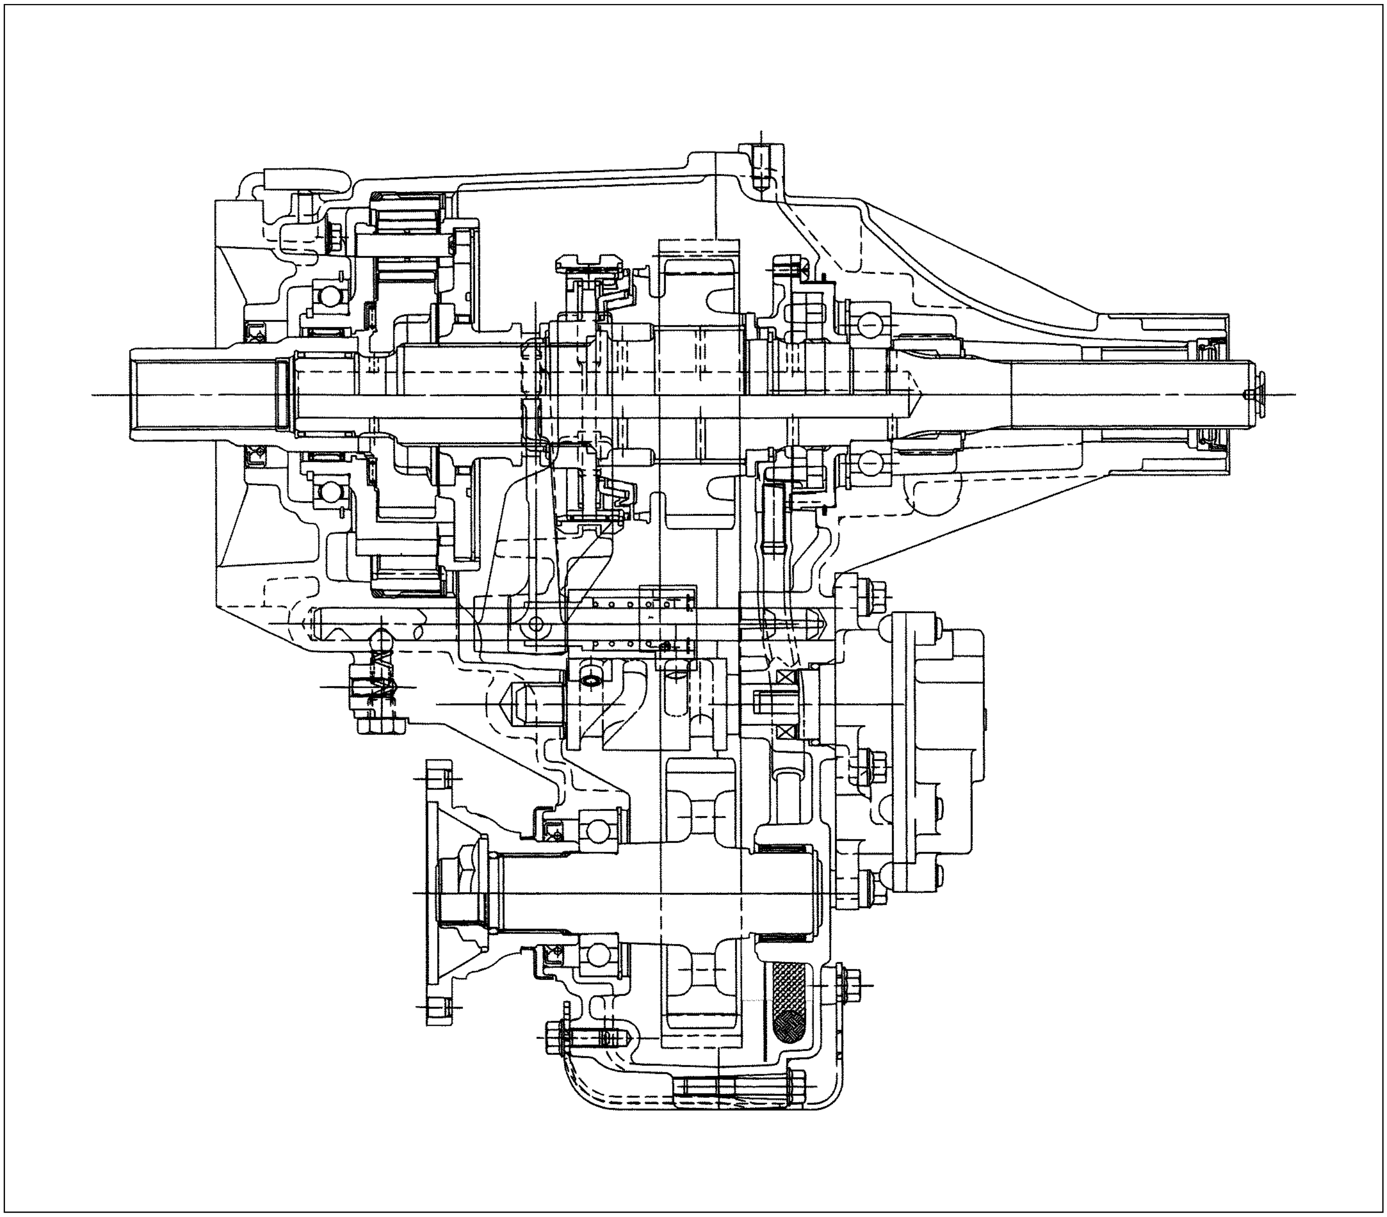
Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNECESSARY SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU/GM will call out those fasteners that require a replacement after removal. ISUZU/GM will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description



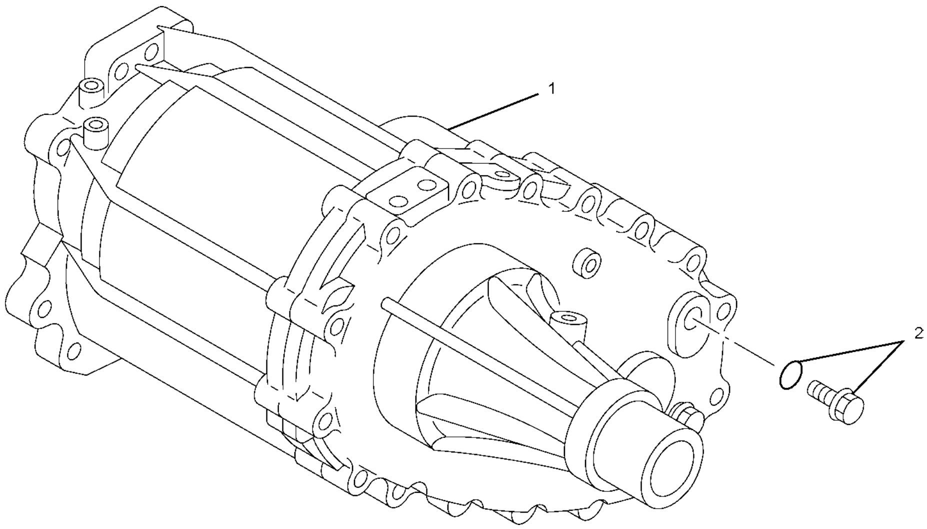
RTW57ALF000301

The transfer case is used to provide a means of providing power flow to the front axle. The transfer case also provides a means of disconnecting the front axle, providing better fuel economy and quieter operation when the vehicle is driven on improved roads where four wheel drive is not required. In addition, the transfer case provides an additional gear reduction when placed in low range, which is useful when difficult off-road conditions are encountered.

Use the 4WD switch on the center cluster panel to select the drive range. The 4WD indicator lamp will be lit when 4WD is selected.

On-Vehicle Service

Transfer Case Oil Level



RTW67DMF000101

Legend

(1) Transfer Case
(2) Filler Plug and O-ring

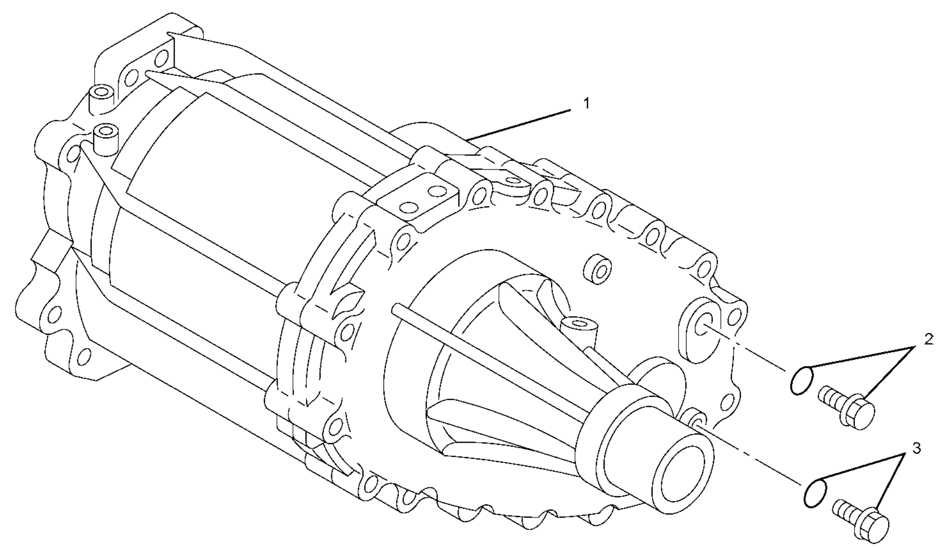
Removal

1. Disconnect the battery ground cable.
2. Rise and support the vehicle with suitable stands.
3. Remove the filler plug and O-ring.
4. Check the oil level reaches the filler hole.
5. If the oil level is low, fill the transfer oil (5W-30) or equivalent to the transfer through the filler hole.

Installation

1. Replace the filler plug and O-ring tighten it to the specified torque.
   Filler plug torque: 39 N·m (4.0 kgf·m/29 lb·ft)
2. Lower the vehicle to the ground.
3. Connect the battery ground cable.

Transfer Case Oil Change



RTW67DMF000201

Legend

(1) Transfer Case
(2) Drain Plug and O-ring
(3) Filler Plug and O-ring

Removal

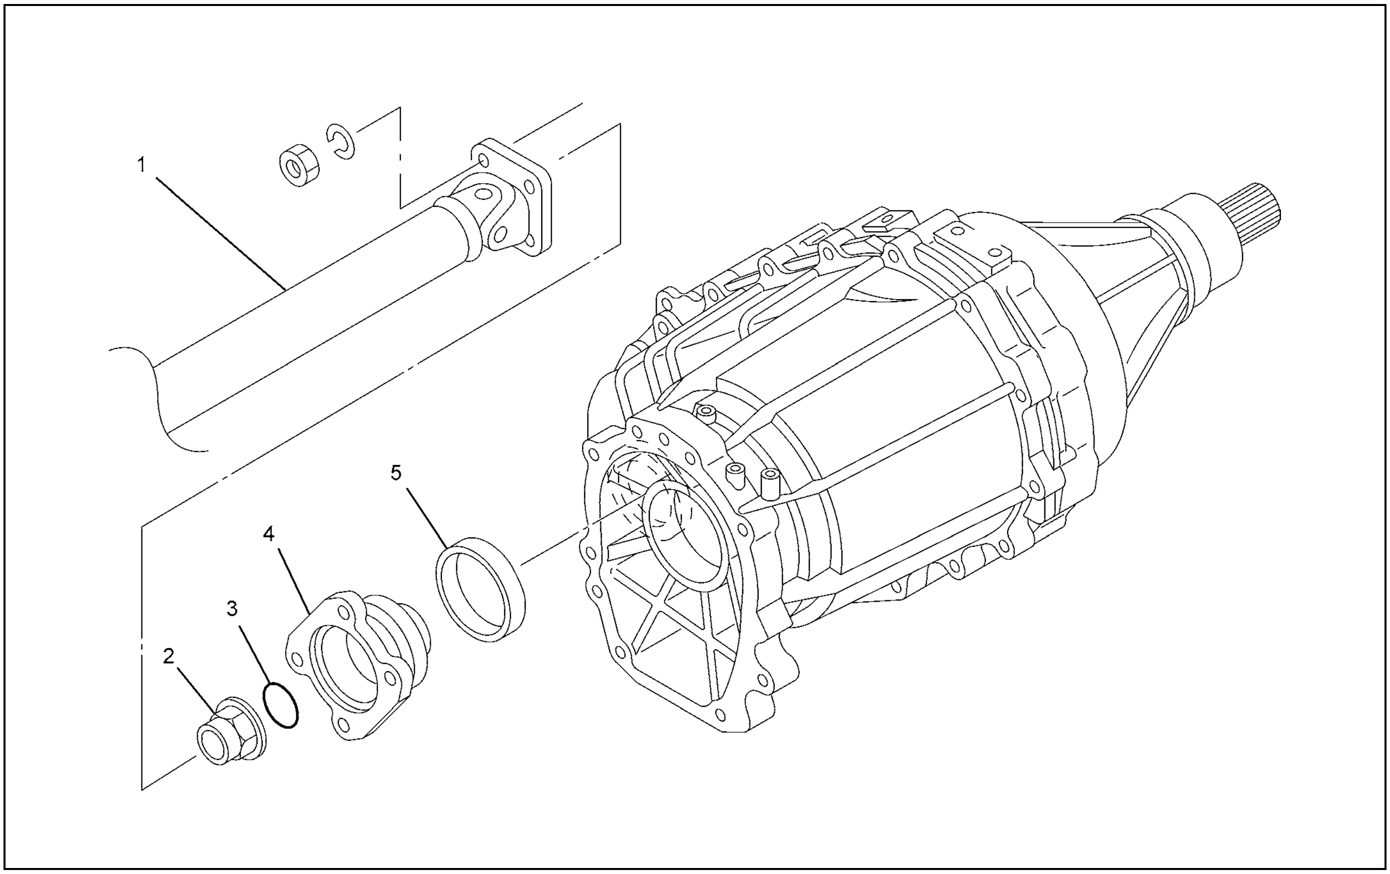
1. Disconnect the battery ground cable.
2. Rise and support the vehicle with suitable stands.
3. Place a suitable sized drain tray under the transfer case.
4. Remove the drain plug and O-ring drain the transfer case oil.
5. Remove the filler plug.

Installation

1. Replace the drain plug and O-ring to the transfer case and tighten it to the specified torque.
   Drain plug torque: 39 N·m (4.0 kgf·m/29 lb·ft)
2. Fill the specified volume of the transfer oil (5W-30) or equivalent to the transfer case through the filler hole.
   Transfer oil volume: 1.3 lit. (1.37 US qt)
3. Replace the filler plug and O-ring tighten it to the specified torque.
   Filler plug torque: 39 N·m (4.0 kgf·m/29 lb·ft)
4. Lower the vehicle to the ground.
5. Connect the battery ground cable.

Transfer Case Front Oil Seal

Transfer Front Oil Seal and Associated Parts



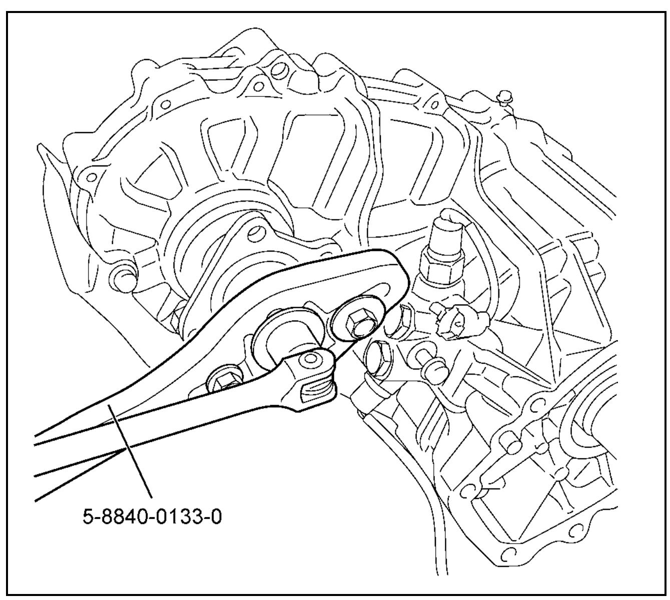
RTW67DMF000301

Legend

(1) Front Propeller Shaft
(2) End Nut
(3) O-ring
(4) Output Flange
(5) Front Oil Seal

Removal

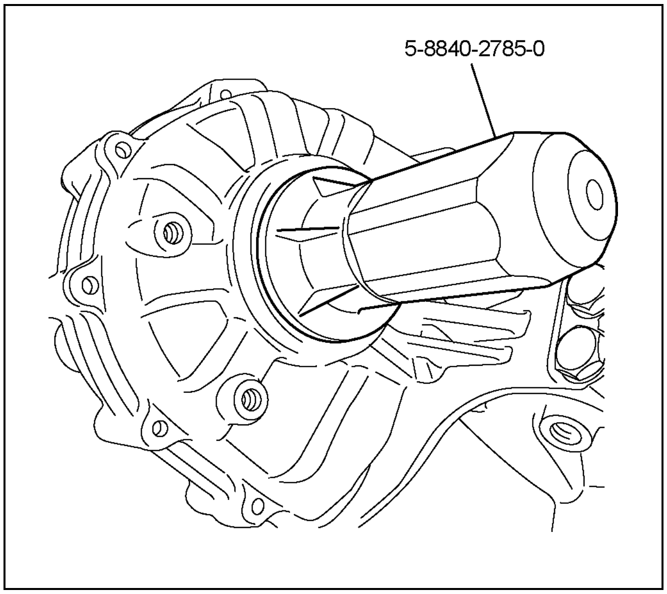
1. Disconnect the battery ground cable.
2. Raise and support the vehicle with suitable stands.
3. Place a suitable sized drain tray under the transfer case.
4. Remove the drain plug and drain the transfer case oil.
5. Remove the filler plug.
6. Remove the front propeller shaft.
7. Use a flange holder (5-8840-0133-0) to remove the end nut from the front output shaft then remove the O-ring and the output flange.
8. Remove the front oil seal from the front cover.



RTW77DSH000201

Installation

1. Thoroughly clean around the oil seal bore in the case and ensure there are no burrs.
2. Apply the engine oil to the new oil seal outer surfaces and apply the recommended grease (BESCO L2) or equivalent to the oil seal lip.
3. Tap the oil seal in to place, use an oil seal installer (5-8840-2785-0) and a soft hammer.

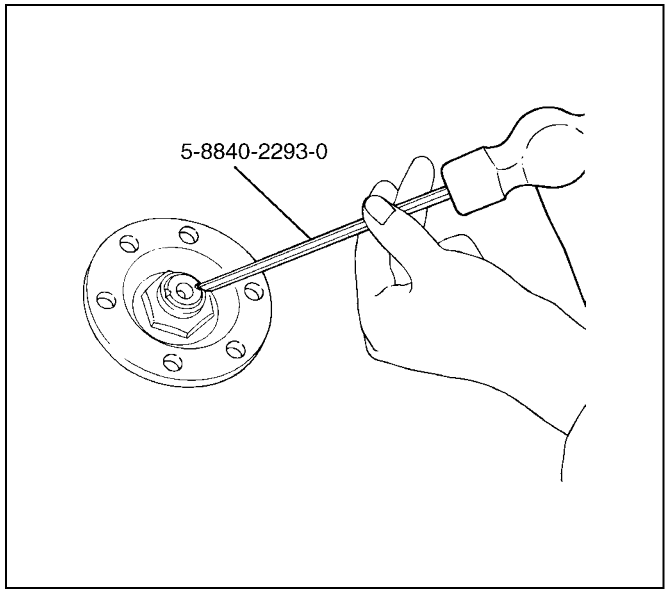


RTW77DSH000301

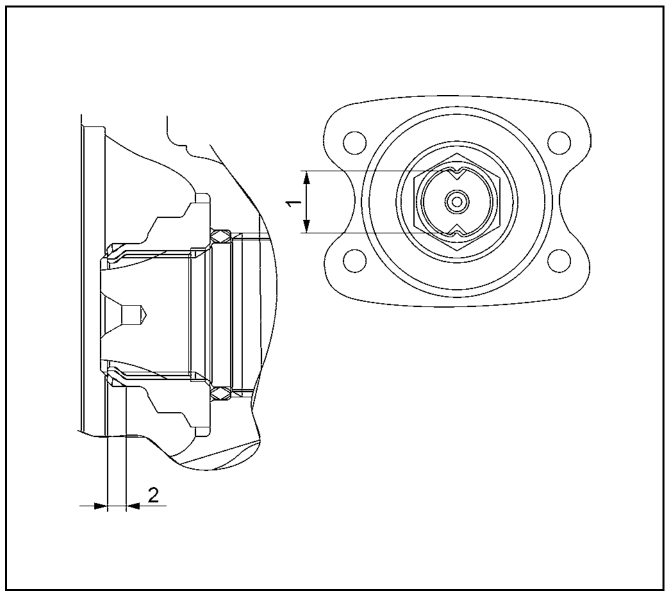
4. Install the output flange to the front output shaft.
5. Apply the engine oil to the new O-ring and install it to the front output shaft.
6. Secure the output flange with a flange holder (5-8840-0133-0).
7. Install the new end nut and tighten them to specified torque.

   Front coupling driver fixing nut torque:
   137 N·m (14.0 kgf·m/101 lb·ft)

8. Use a punch (5-8840-2293-0) to caulk the end nut.



226R300012



RUW34DSH000301

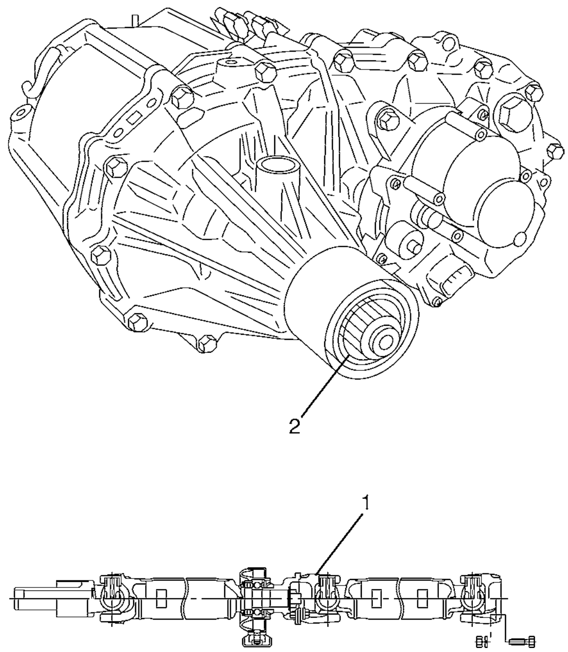
Legend

(1) MAX 26mm (1.02in)
(2) MIN 4mm (0.16in)

9. Install the drain plug to the transfer case and tighten it to the specified torque.
   Drain plug torque: 39 N·m (4.0 kgf·m/29 lb·ft)
   Transfer oil volume: 1.3 lit. (1.37 US qt)
10. Install the filler plug and tighten it to the specified torque:
    Filler plug torque: 39 N·m (4.0 kgf·m/29 lb·ft)
11. Install the front propeller shaft.
    Propeller shaft bolts torque:
    59 N·m (6.0 kgf·m/43 lb·ft)
12. Lower the vehicle to the ground.
13. Connect the battery ground cable.

Transfer Case Rear Oil Seal

Transfer Rear Oil Seal and Associated Parts



220R300018

Legend

(1) Rear Propeller Shaft
(2) Rear Oil Seal

Removal

1. Disconnect the battery ground cable.
2. Raise and support the vehicle with suitable stands.
3. Remove the rear propeller shaft.
4. Remove the oil seal from the transfer case.

Installation

1. Thoroughly clean around the oil seal bore in the transfer case and ensure there are no burrs.
2. Apply the engine oil to the new oil seal outer surfaces and apply the recommended grease (BESCO L2) or equivalent to the oil seal lip.

Inspection and Repair

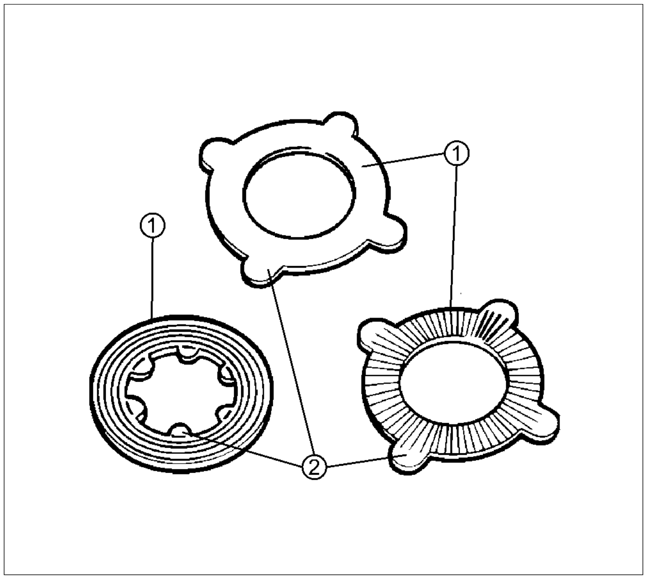
Make all necessary adjustments, repairs, and part replacements if wear, damage, rust or other problems are discovered during inspection.

Visual Check

Inspect the following parts for wear, damage or other abnormal conditions.

- Friction disc
- Friction plate
- Spring plate

① Sliding surface
② Protrusion

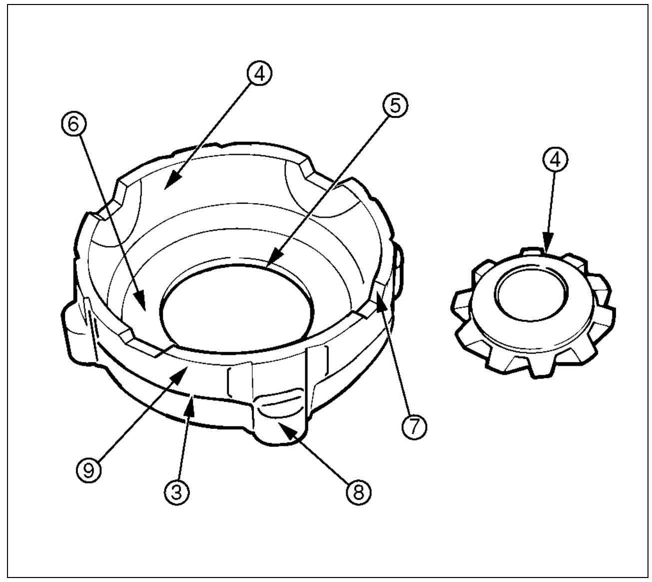


425RS056

Pressure ring

Check the parts for damage or other abnormal conditions.

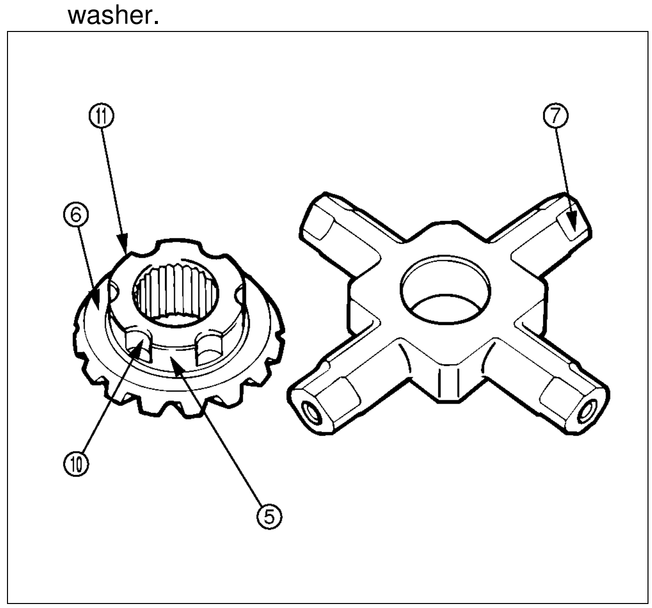
③ Sliding surface for friction disc
If dents or damages are discovered, grind them with oil stone, and repair them with compound on surface plate.
④ Sliding surface of pressure ring inner surface and pinion gear.
⑤ Sliding surface of pressure ring bore and side gear.
⑥ sliding surface of pressure ring and side gear.
⑦ Sliding surface of pressure ring and pinion shaft.
⑧ Mating surface to differential cage A.
⑨ Burrs or dents on sliding surface of pressure ring and rear differential cage should be repaired, using oil stone.



425RY00022

- Thrust Washer

⑩ Groove on side gear circumference small burrs of dens should be repaired, using oil stone.
⑪ Sliding surface between side gear and thrust washer.

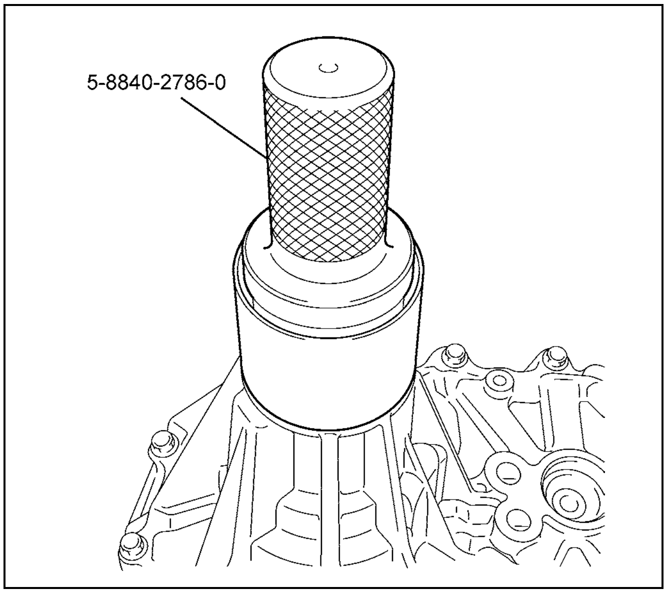


425RY00024

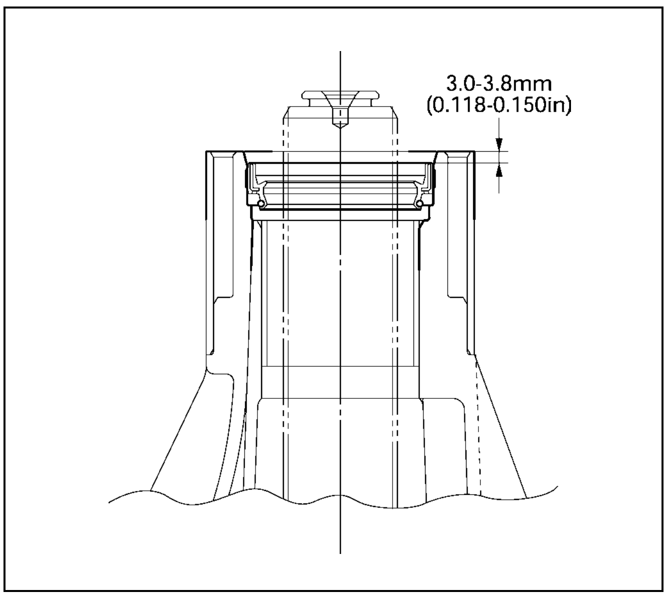
- Differential cage A and B

⑫ Contact surface to spring plate
⑬ Differential cage A and B contact surfaces to thrust washers Small burrs or dents should be repair, using oil stone.

3. Tap an oil seal in to place, use an oil seal installer 5-8840-2786-0 and a soft hammer.



RTW77DSH000401

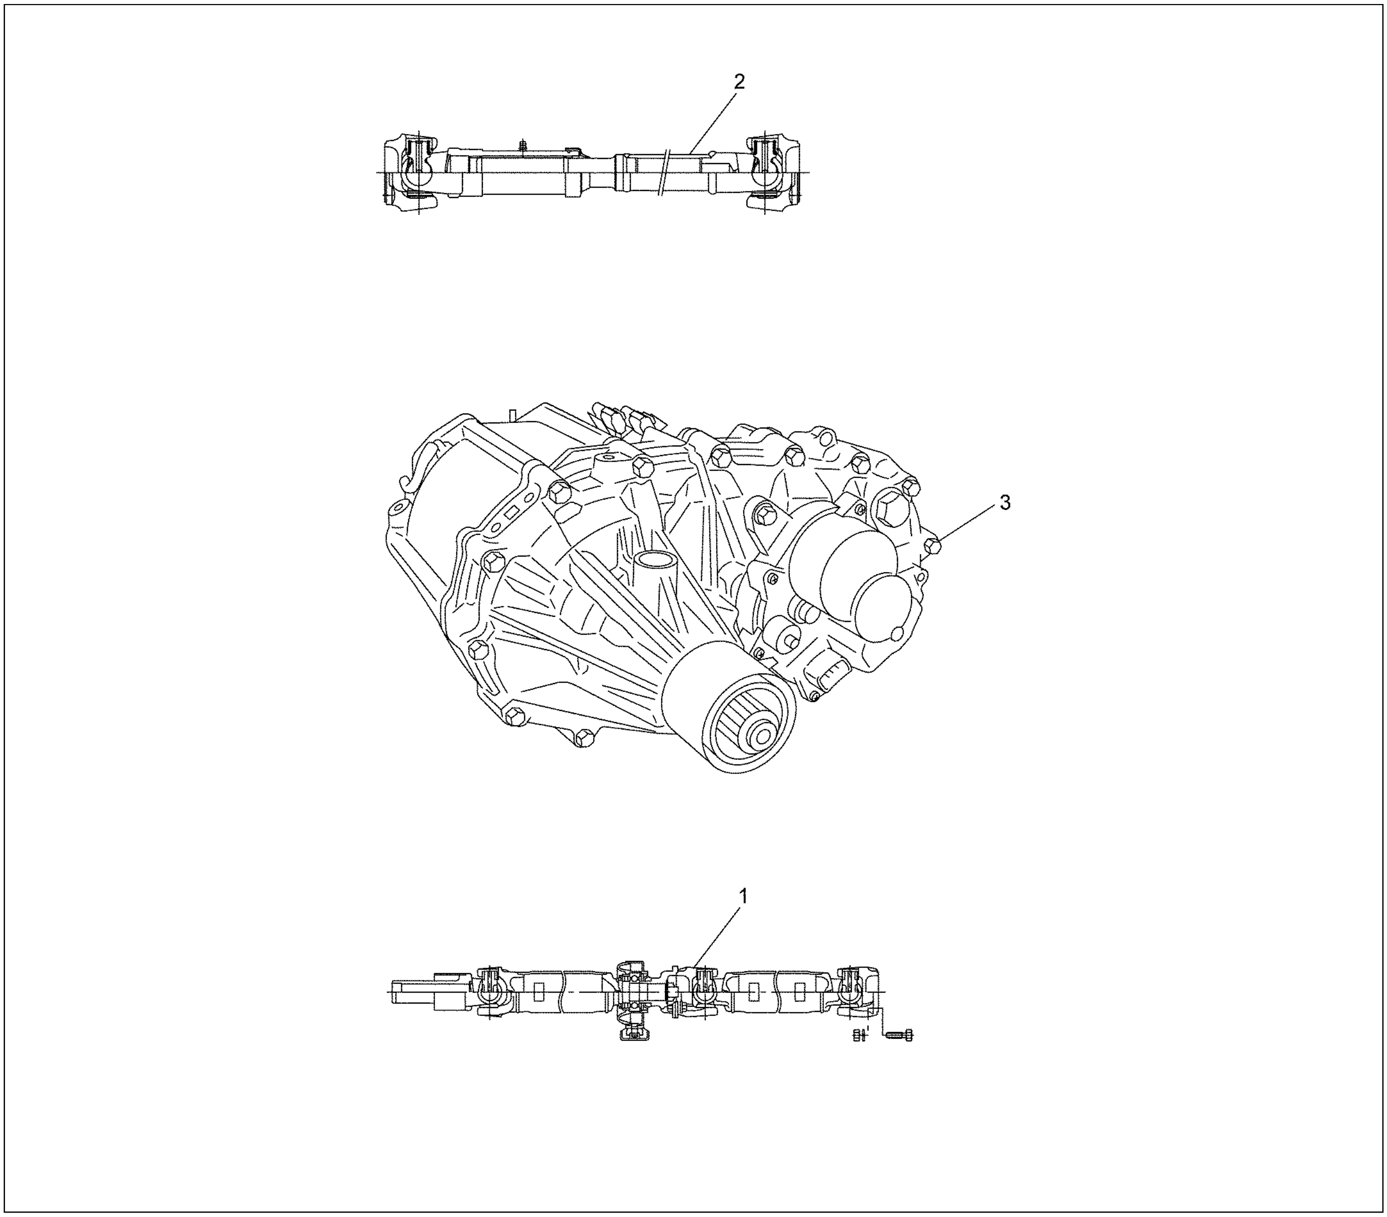


220R300021

4. Install the rear propeller shaft.
   Propeller shaft bolts torque:
   59 N·m (6.0 kgf·m/43 lb·ft)
5. Lower the vehicle to the ground.
6. Connect the battery ground cable.

Transfer Case Assembly

Transfer Case Assembly and Associated Parts



RTW57ALF000201

Legend

(1) Rear Propeller Shaft
(2) Front Propeller Shaft
(3) Transfer Case Assembly

Removal

NOTE: Before removing transmission and transfer assembly from vehicle, change the transfer mode to 2WD using the 4WD push button switch on dash panel.

1. Disconnect battery ground cable.
2. Raise and support vehicle with suitable stands. Drain transfer case fluid.
3. Remove rear propeller shaft and front propeller shaft.

NOTE: Apply alignment marks on the flange at both front and rear sides.

4. Disconnect harness connectors and clip.
   Connector: transfer switch, 2WD-4WD actuator, speed sensor.

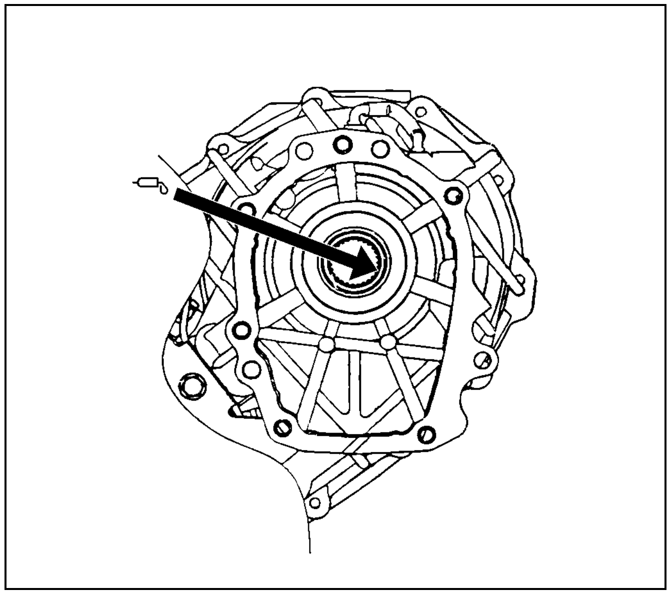
NOTE: Avoid turning the vehicle ignition switch to the ON position when the 2WD-4WD connector is removed (battery connected).

If the ignition switch must be turned to the ON position, the controller must first be removed (memory must be cleared because the CHECK 4WD INDICATOR will light).

5. Remove transfer case assembly from the vehicle.

Installation

1. Apply a thin coat of molybdenum disulfide grease to the input shaft spline as shown in the figure.



260R300001

2. Install transfer case assembly to the transmission.
   Tighten transfer bolts as shown in the figure.

For M/T (MUA, MUX)

N·m (kgf·m/lb·ft)

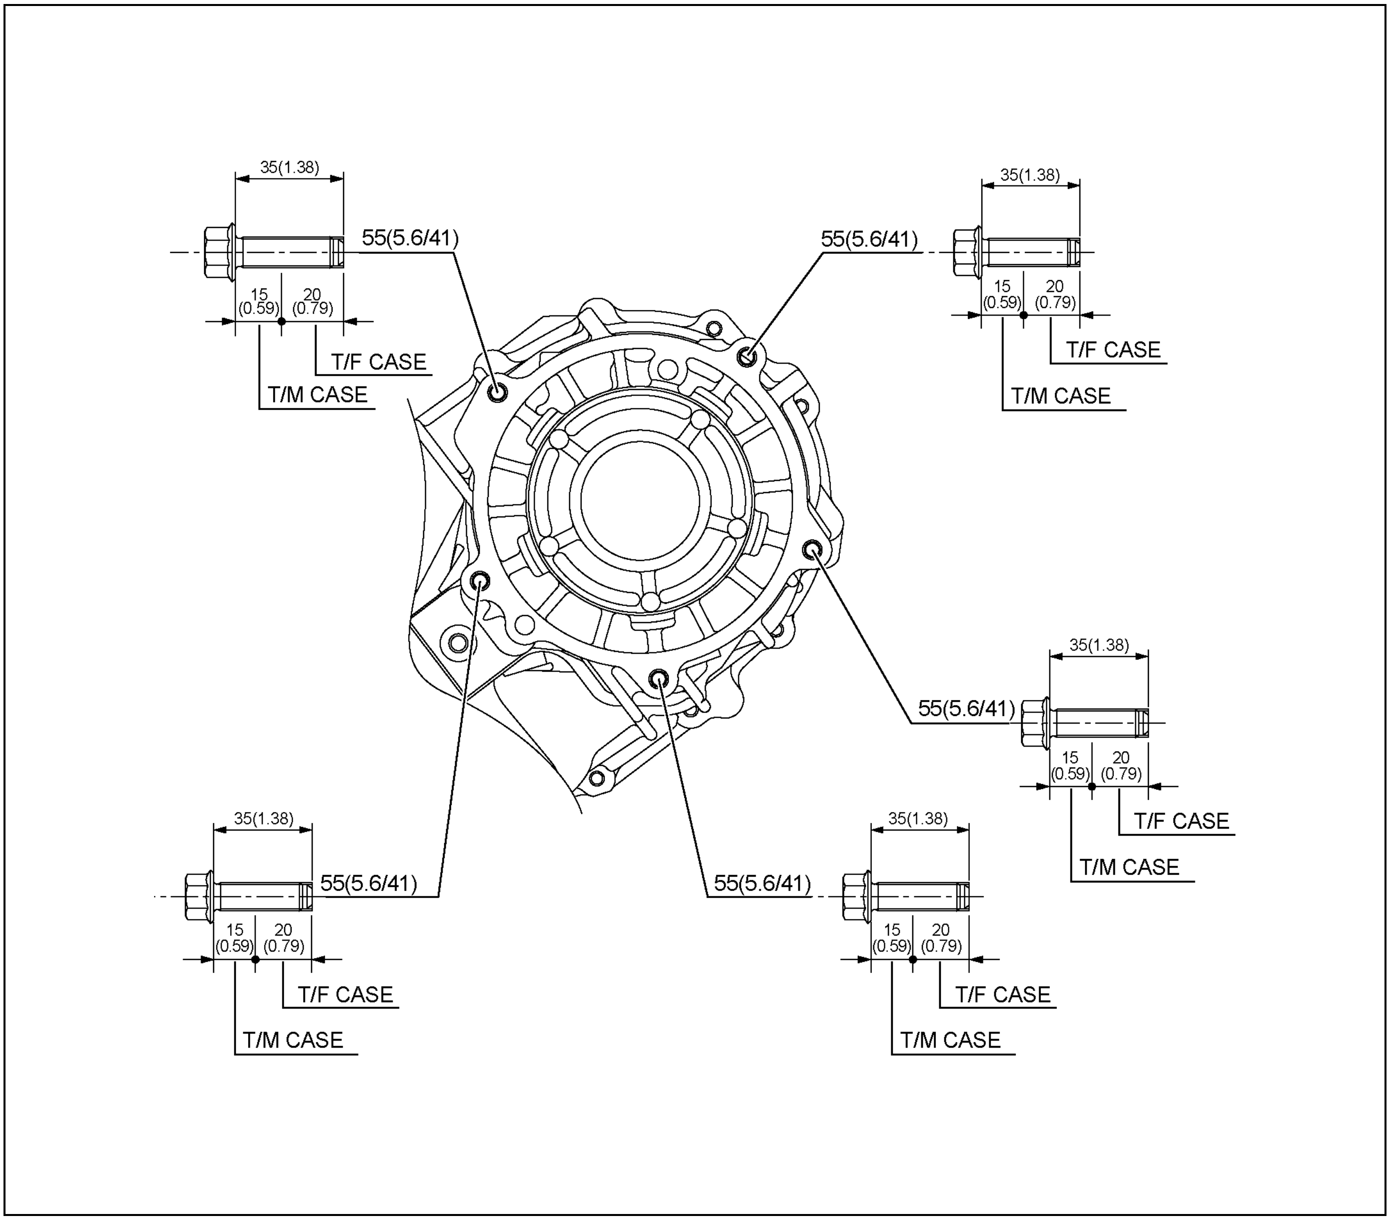
RTW77DLF000301

For M/T (AR-5), A/T (4L60-E)

N·m (kgf·m/lb·ft)
mm (in)

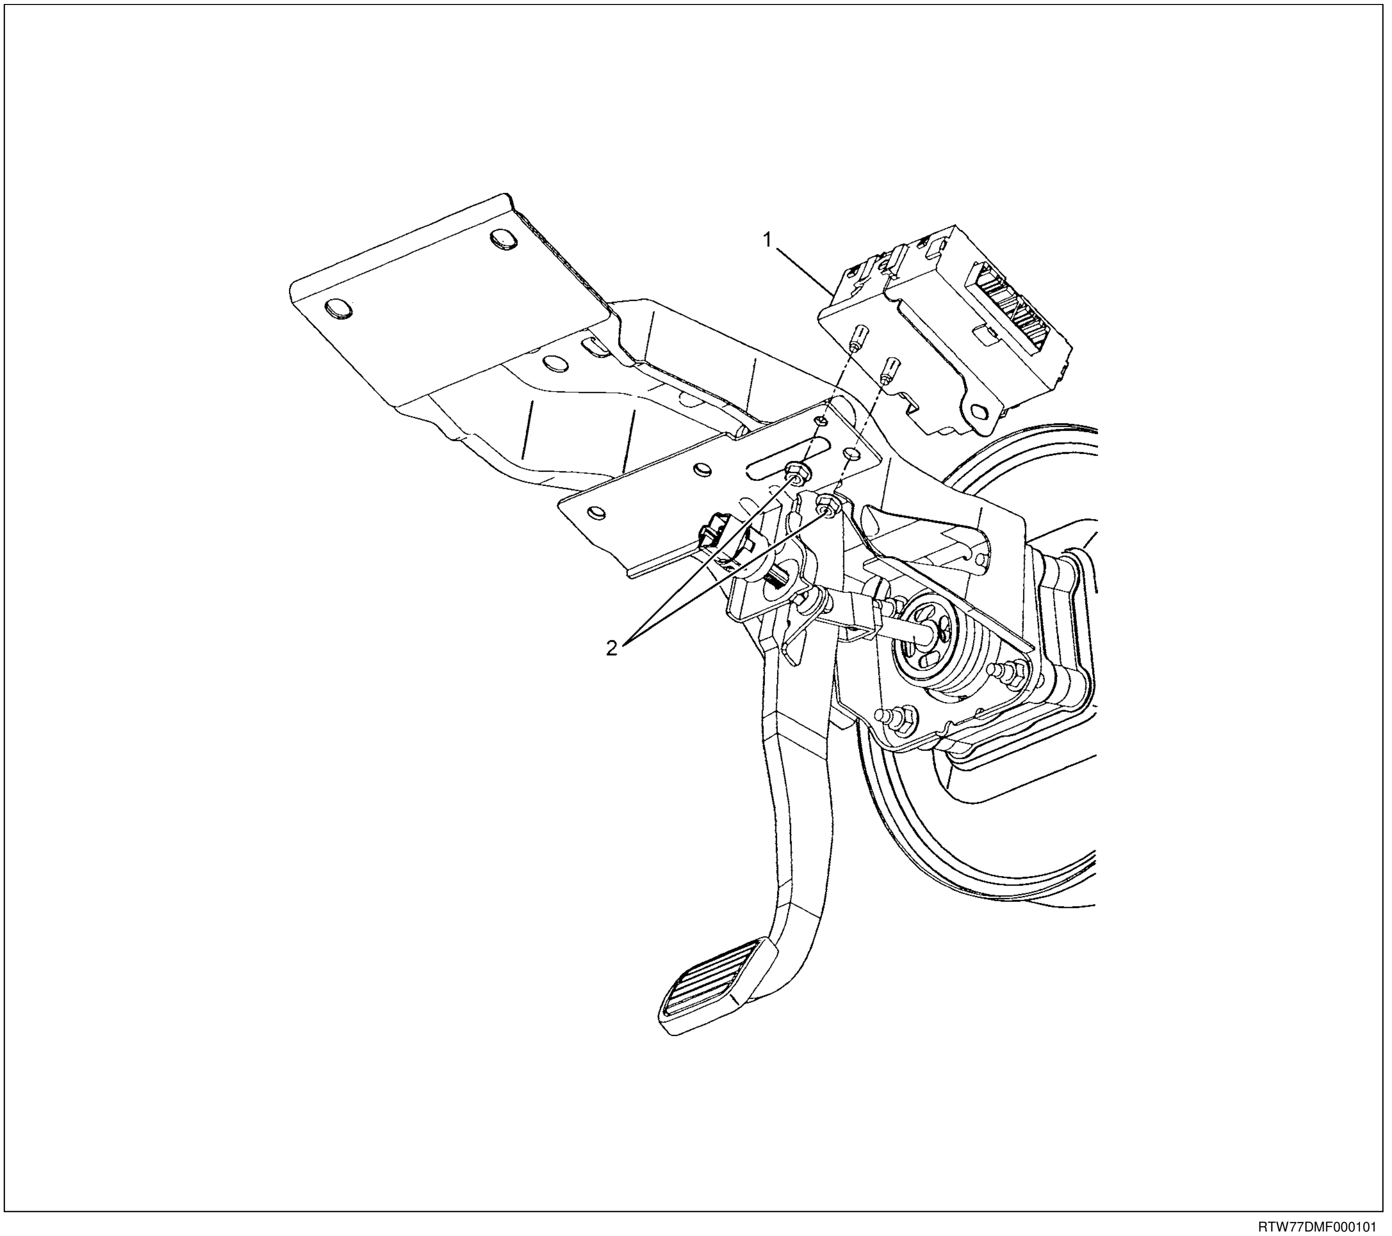


RTW77DLF000401

3. Connect harness connectors and clip.
   Connector: transfer switch, 2WD-4WD actuator, speed sensor.
4. Install rear propeller shaft and front propeller shaft.
   Propeller shaft torque: 59 N·m (6.0 kgf·m/43 lb·ft)

Transfer Control Unit

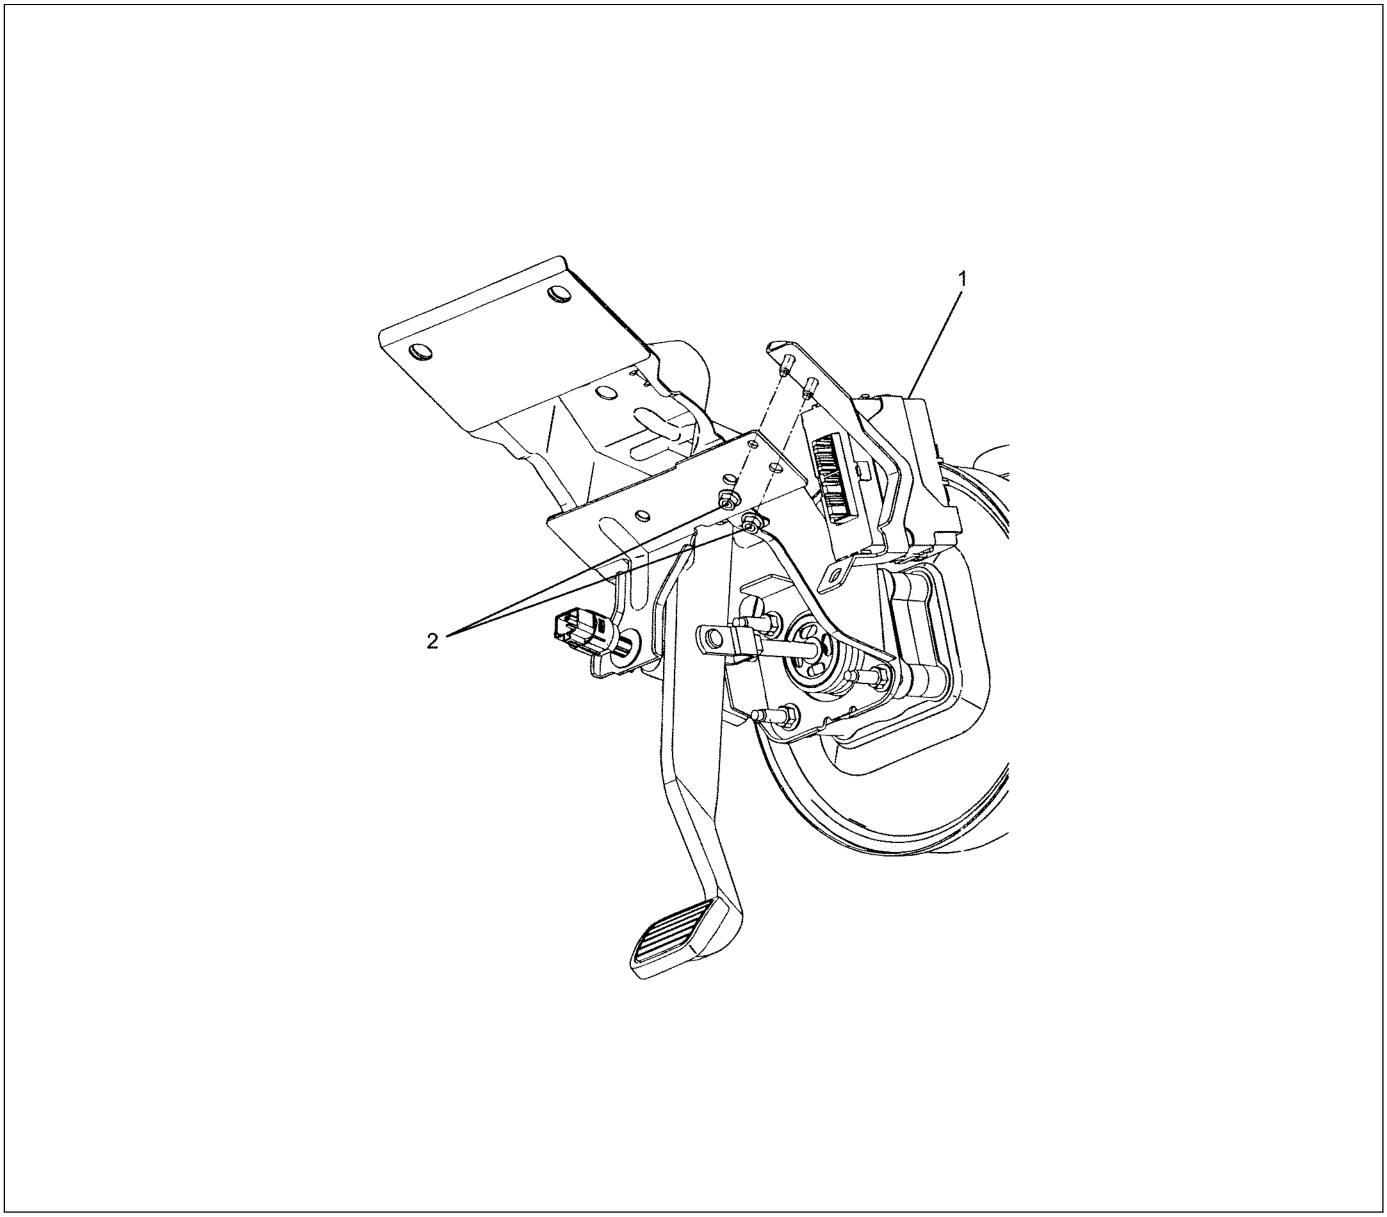
RHD



Legend

(1) Transfer Control Unit
(2) Nut

LHD



RTW77DMF000101

Legend

(1) Transfer Control Unit
(2) Nut

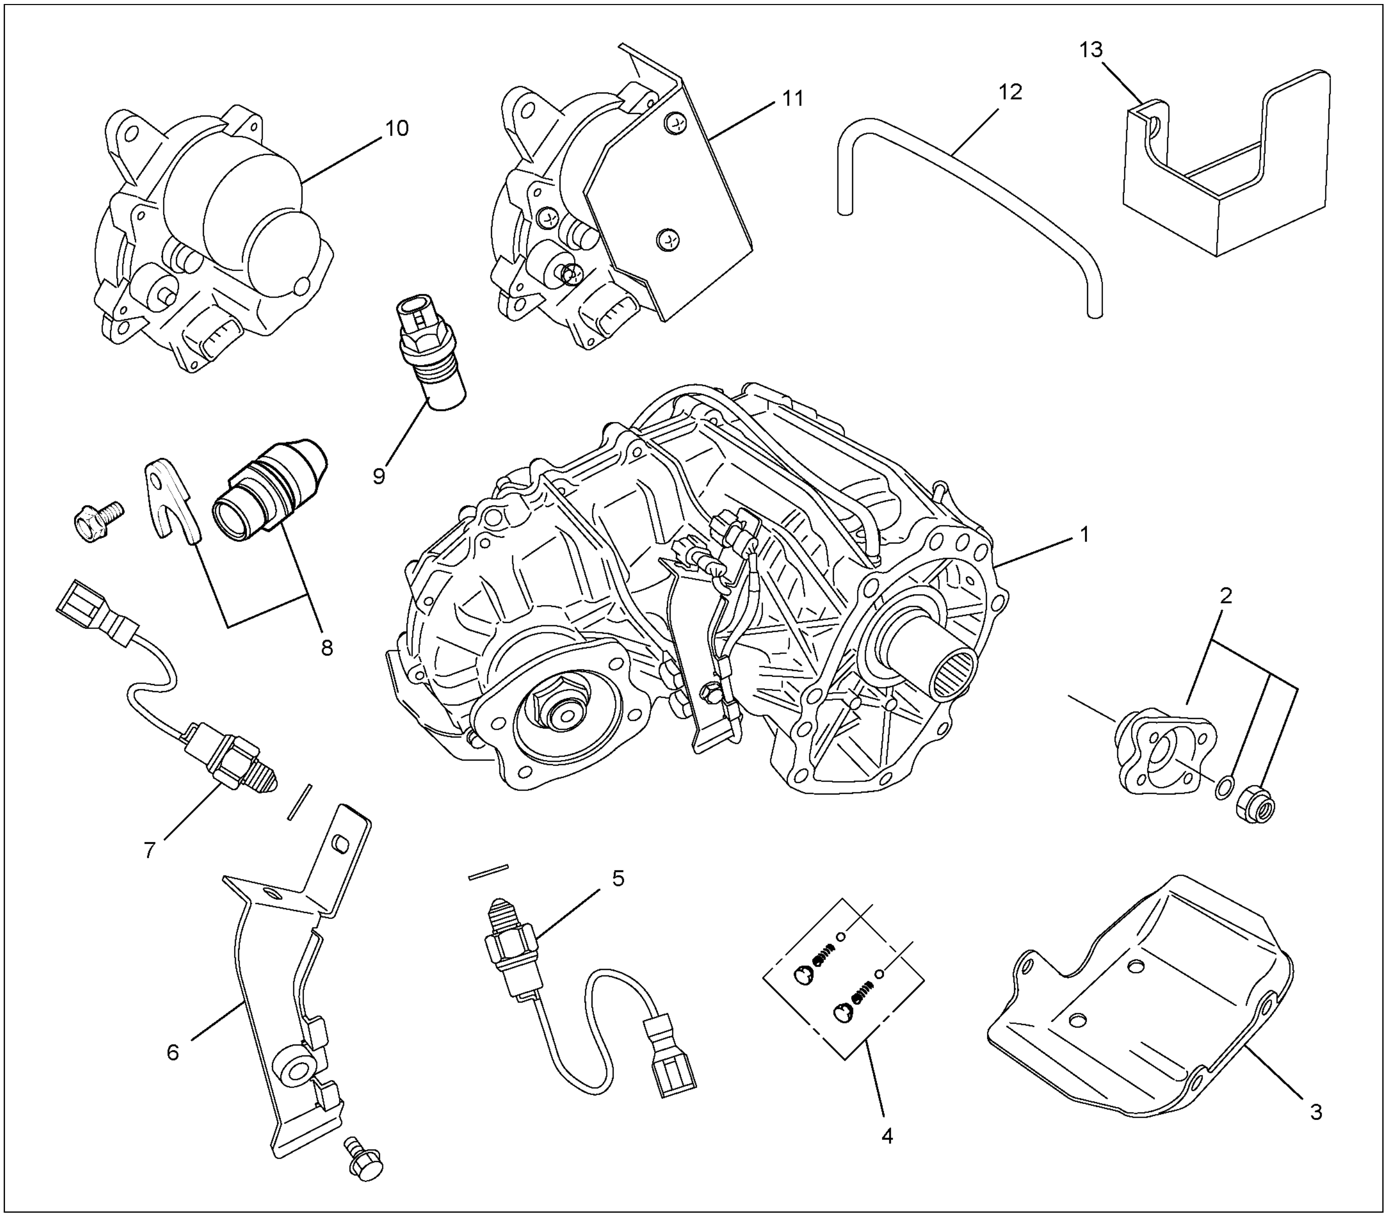
Removal

1. Disconnect the battery ground cable.
2. Disconnect the harness connector from the Transfer control unit.
3. Remove the Transfer control unit.

Installation

1. Install the Transfer control unit.
   Transfer control unit torque:
   7 N·m (0.7 kgf·m/61 lb·in)
2. Connect the harness connector to the Transfer control unit.
3. Connect the battery ground cable.

Transfer Disassembly



RTW67DLF000101

Legend

(1) Transfer Case
(2) Companion Flange, O-ring and Nut
(3) Stoneguard
(4) Detent Plug, Spring and Detent Ball

(8) Speedometer Bushing, Plate and Driven Gear (M/T: MUA, MUX, A/T: JR405E, AW30-40LE)
(9) Speed sensor (M/T: AR-5, A/T: 4L60-E)
(10) Transfer Actuator (Diesel Engine)
(11) Transfer Actuator (Gasoline Engine)
(12) Breather Hose
(13) Heat Protector (Gasoline Engine)

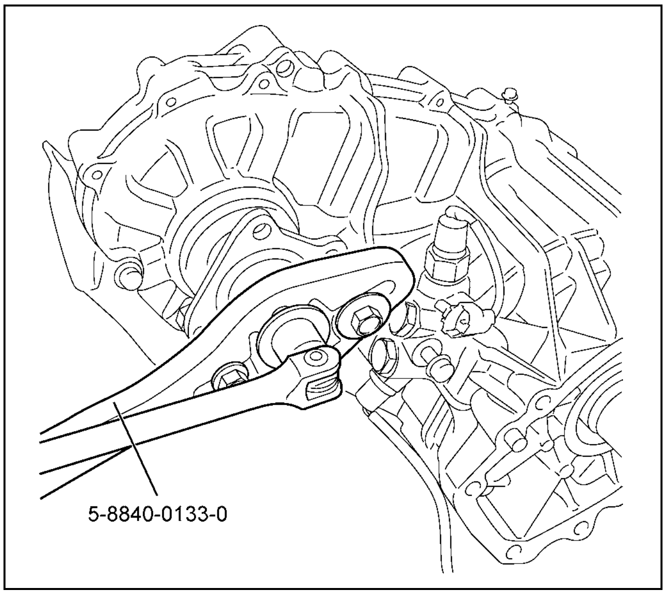
Removal

1. Remove the stoneguard.
2. Remove the drain plug from the transfer case to drain the oil.
3. Remove the parts listed below.

- Speedometer bushing, plate, and speedometer driven gear (M/T: MUA, MUX, A/T: JR405E, AW30-40LE)
- Speed sensor (M/T: AR-5, A/T: 4L60-E)

- Breather hose (Between the transfer case and the transfer actuator assembly)
- Transfer actuator assembly
- Switch bracket
- 2-4 switch assembly (Gray harness cover)
- Neutral switch assembly (Black harness cover)
- Detent plugs, detent springs, and detent balls (2 parts each)

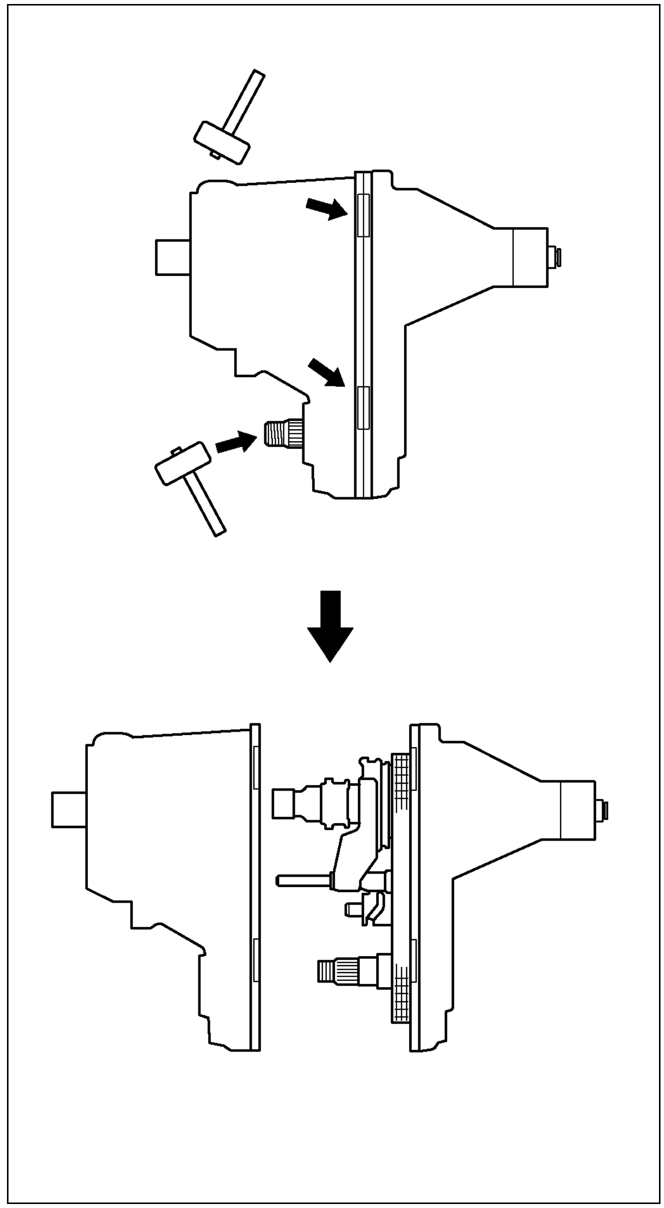
4. Use a flange holder (5-8840-0133-0) to remove the end nut from the front companion flange.



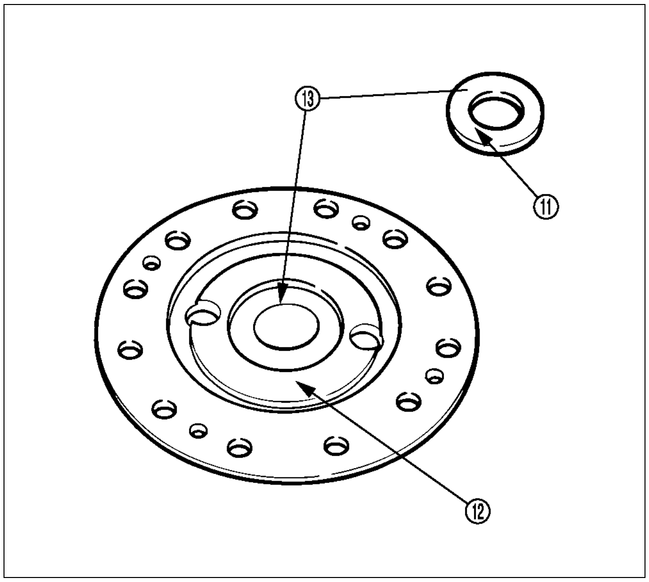
RTW77DSH000201

5. Remove the bolts attaching the rear cover to the transfer case.

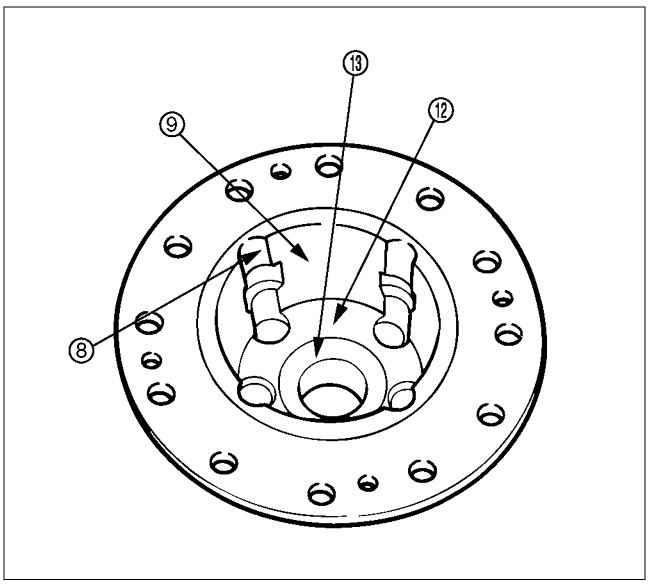
6. Strike the area around the front output shaft head and the rear cover bolt holes with a plastic hammer to remove the rear cover.



220R300022



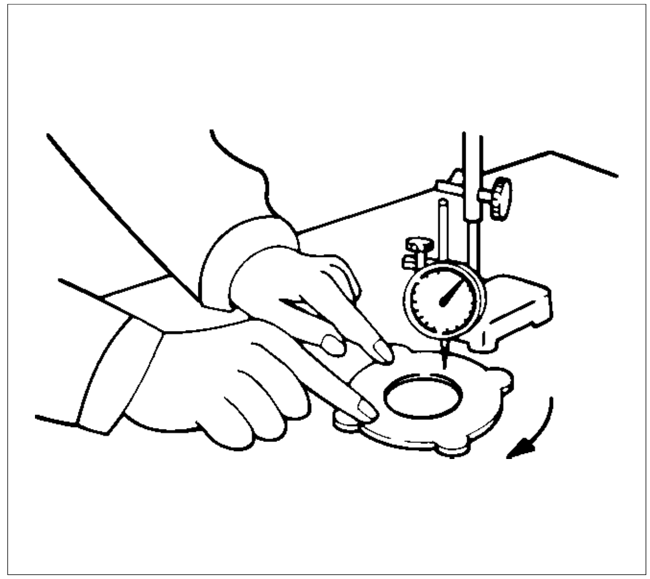
425RY00025



425RY00023

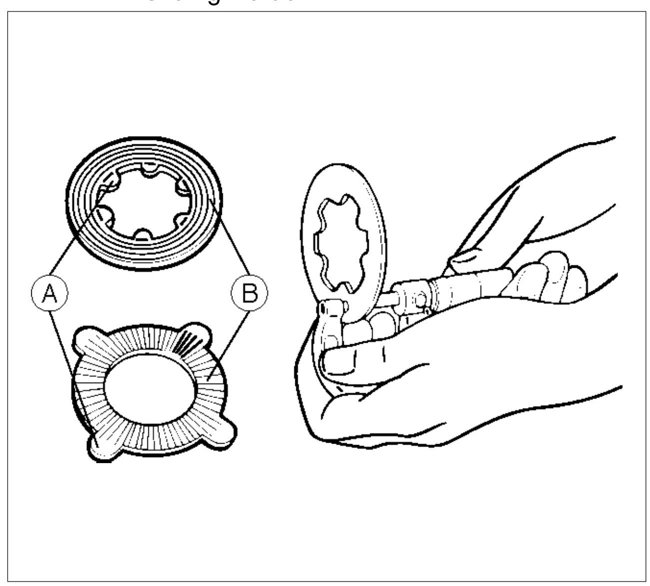
Friction Disc and Friction Plate

- Check friction disc and friction plate for distortion.
  Limit : 0.08 mm



425RS061

- Check friction plate and friction disc for wear.
  Limit : (A-B) 0.1 mm
  A : Protrusion Portion
  B : Sliding Portion



425RS062

- Check thrust washer for wear.
  Limit : 1.3 mm

7. Remove the parts listed below from the rear cover.
   - H-L sleeve
   - H-L shift assembly
   - 2-4 sleeve, synchronizer key, and front synchronizer spring (do not remove the rear spring)
   - 2-4 shift assembly
   - Shift drum and shift shaft
   - Sun gear needle bearing

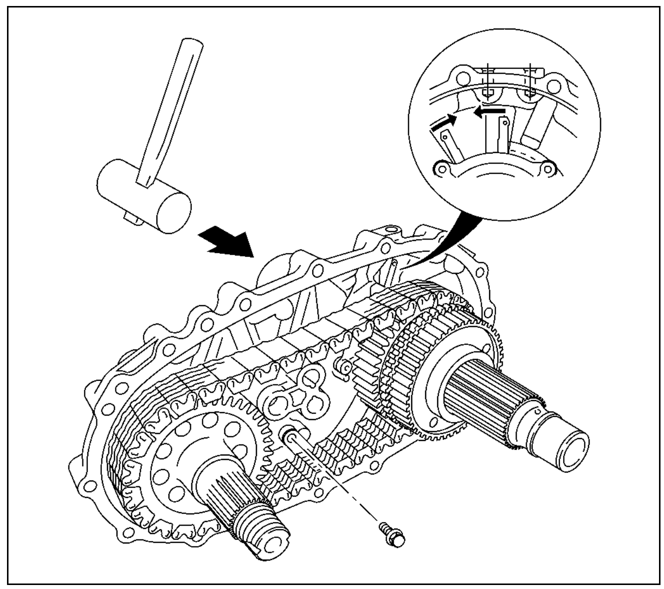
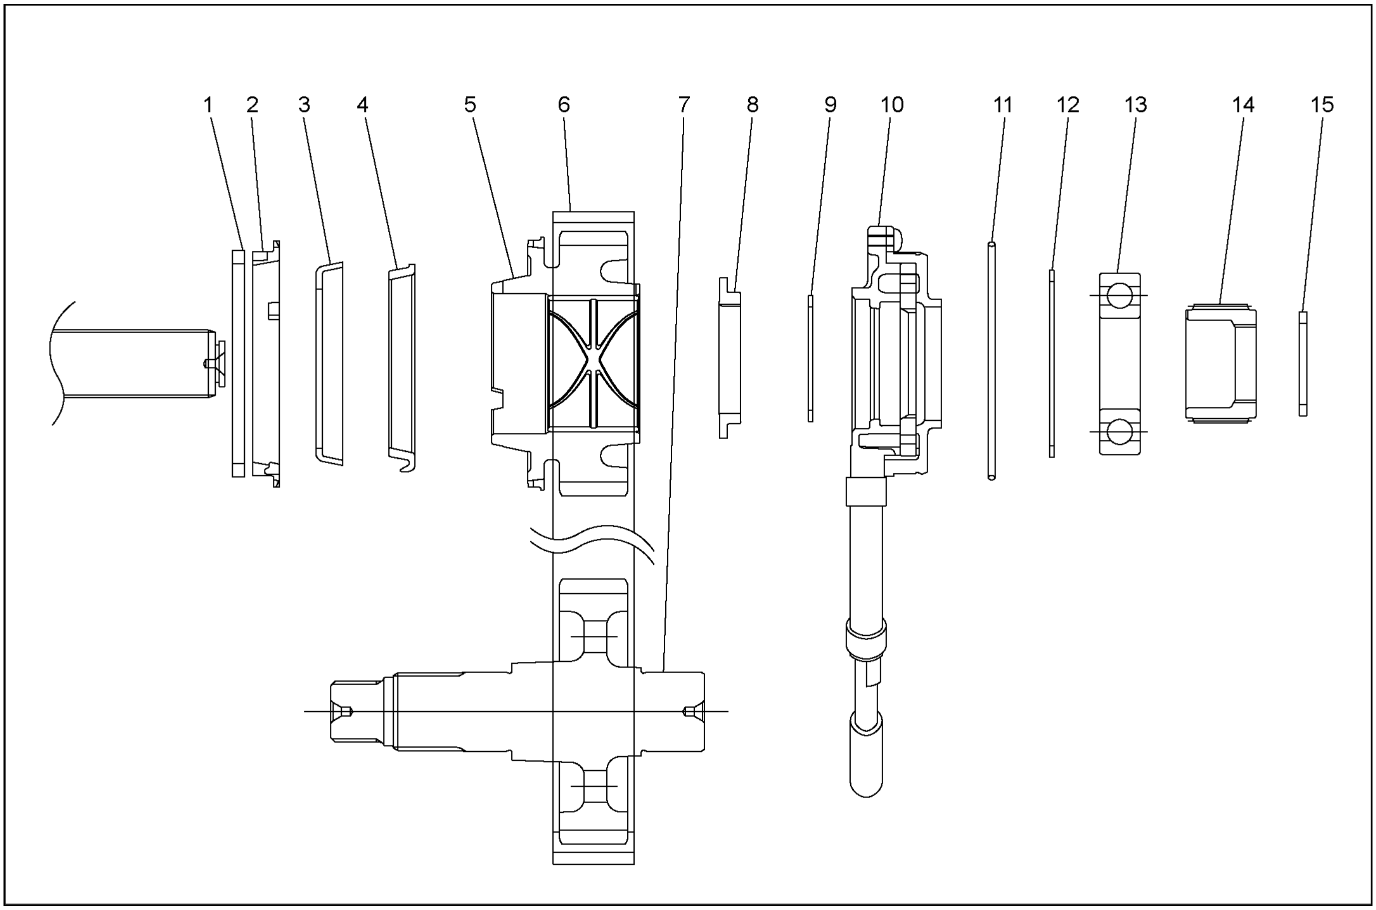
(7) Shift Drum

8. Remove the oil pump strainer fixing bolts from the rear cover.
9. Compress the retaining ring at the rear of the chain. Strike the rear end of the main shaft with a plastic hammer to remove the main shaft, transfer chain, and front output shaft assembly from the rear cover. Be careful not to damage the oil pump strainer.



226R30001

10. Remove the transfer chain and the front output shaft from the main shaft.
11. Remove the main shaft snap ring.
12. Remove the speedometer drive gear, the ball bearings, the retaining ring, and the oil pump assembly.
13. Remove the sprocket snap ring.
14. Remove the thrust washer, the drive sprocket, the inside ring, the outside ring, the block ring, and the rear synchronizer spring.



RTW37DMF000101

Legend

(1) Rear synchronizer spring

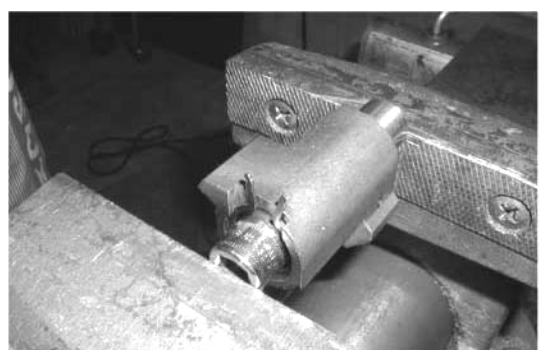
(9) Guide Roller
(10) Spring Pin

H-L Shift Disassembly

1. Remove the guide roller.
2. Use a vise to compress the H-L shift spring (inside the assembly)

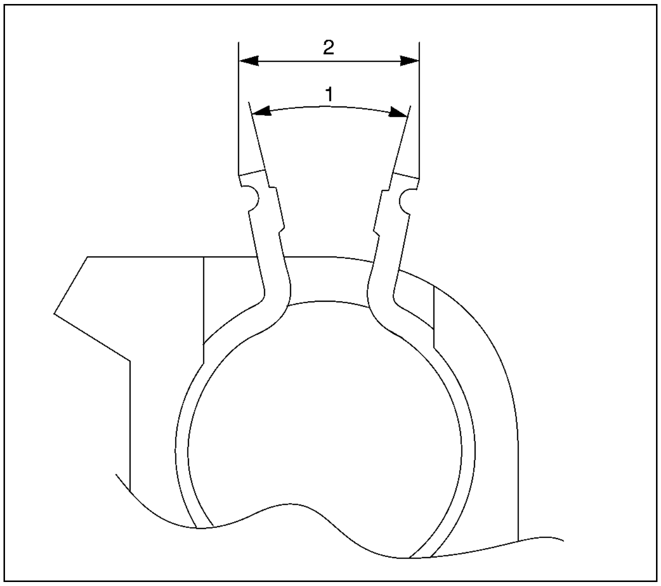
3. Remove the outer snap ring.
4. Remove the shift block assembly from the shift rod.



5. Use a socket and a vise to compress the shift block spring (inside the assembly)
6. Remove the inner retaining ring.
7. Remove the collar (rear)
8. Remove the shift block spring.
9. Remove the collar (front)
10. Remove the shift block assembly
11. Remove the spring pin.
12. Remove the shift arm.

H-L shift reassembly

1. Install the shift arm to the shift rod.
2. Install the spring pin. The top of the pin must be flush with the surrounding surface (no projection).
3. Install the front collar, the spring, and the rear collar to the shift block in that order.
4. Use a socket and a vise to compress the shift block spring.
5. Install the inner retaining ring. Be sure that the arm aperture width is within the specified limit.



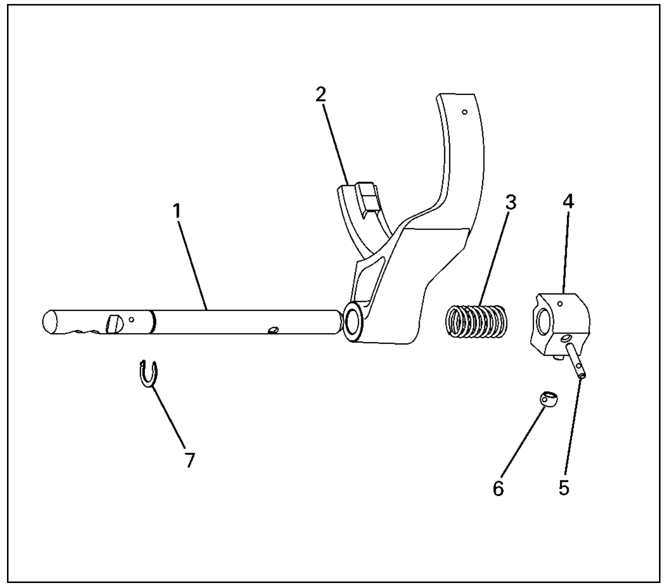
226R300014

Legend

(1) 25.62°
(2) 14.1mm

6. Install the shift lock assembly to the shift rod.
7. Use a socket and a vise to compress the H-L shift spring.
8. Install the outer snap ring.
9. Install the guide roller.

2-4 shift ASM



226R300016

Legend

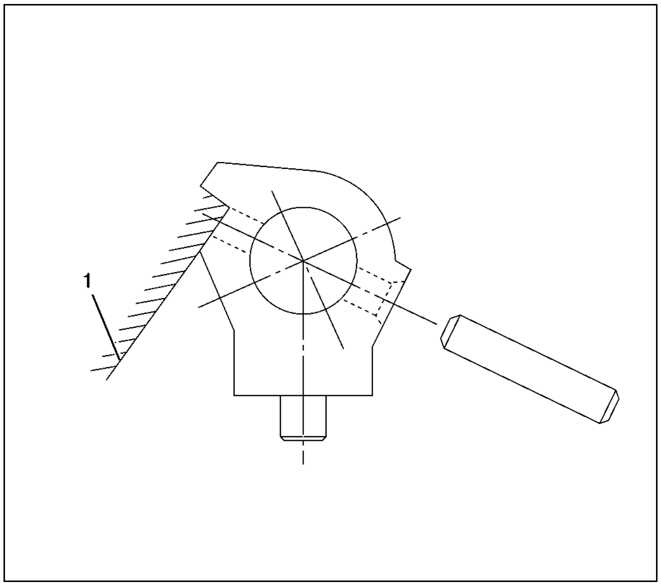
(1) Shift Rod
(2) Shift Arm
(3) Spring
(4) Shift Block Assembly
(5) Spring Pin
(6) Guide Roller
(7) Snap Ring

2-4 shift disassembly

1. Remove the guide roller.
2. Compress the spring and remove the snap ring.
3. Remove the shift arm.
4. Remove the spring.
5. Remove the spring pin.
6. Remove the shift block assembly.
7. Remove the shift rod.

2-4 shift reassembly

1. Install the shift block assembly to the shift rod.
2. Install the spring pin. The head of the pin must not project beyond the surface (1) of the shift block.



226R300015

3. Install the spring.
4. Install the shift arm.
5. Compress the spring and install the snap ring.
6. Install the guide roller.

Oil pump disassembly

1. Remove the clamps securing the screen.
2. Remove the screen.
3. Remove the clamps securing the hose.
4. Remove the hose.

NOTE: To maintain and protect oil pump function, the pump is constructed so that it cannot be disassembled.

Under no conditions attempt to disassemble the pump.

Oil pump reassembly

1. Tighten the clamps to secure the hose.
2. Tighten the clamps to secure the screen.
   NOTE: Be careful in the direction of clamps.

Inspection and Repair

1. Make the necessary repair or parts replacement if wear, damage or any other abnormal conditions are found during inspection.
2. Wash all parts thoroughly in clean solvent. Be sure all old lubricant, metallic particles, dirt, or foreign material are removed from the surfaces of every part. Apply compressed air to each oil feed port and channel in each case half to remove any obstructions or cleaning solvent residue.

Inspection and Repair (Transfer Case Assembly)

When wear, damage, or any other defects are observed during the inspection, the part or parts must be repaired or replaced. Wash all the parts with clean detergent, and check that old oil, metallic particles, dirt, or foreign materials are completely removed. Blow the air into oil holes and grooves to remove foreign materials or residual detergent.

Chain

- Check whether the face that contacts the sprocket is free from excessive wear or damage. If defects are observed, replace the part.
- If the chain interference mark is found on the inside wall of the transfer cover or the chain is so slack that a skipped engagement occurs between the chain and sprocket, replace the chain.

Sprocket

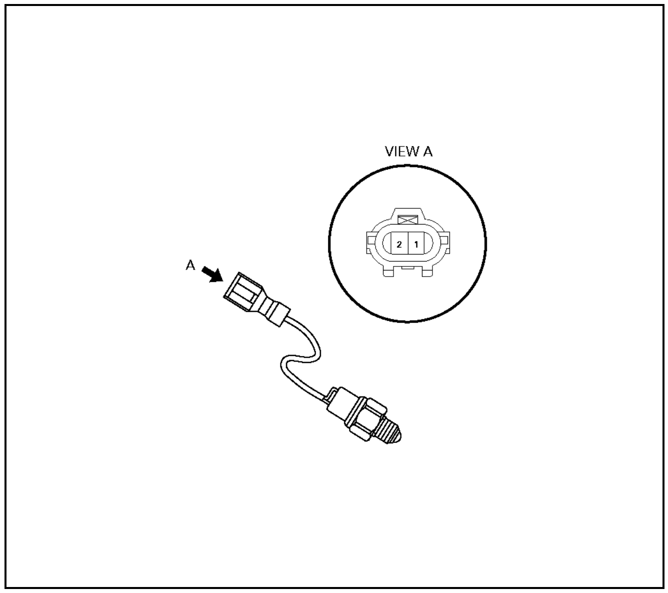
- Check whether the sprocket tooth surface is excessively worn or damaged, and there is evidence of burrs, chipping, wear, or damage on the gear spline. Remove minor flaws or scratches with oil stone. If excessive wear or damage is observed, replace the part.
- If excessive wear or damage is observed on the sprocket inside sliding surface, replace the part.

Gear

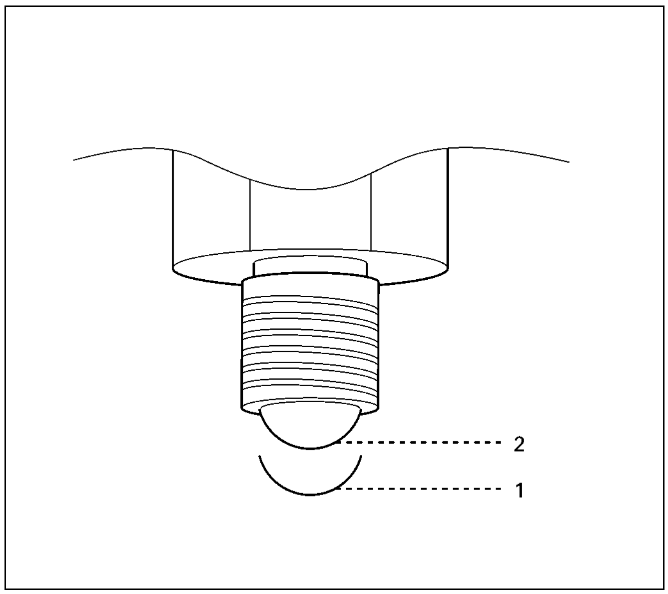
- Check whether the gear tooth surface is excessively worn or damaged, and there is evidence of burrs, chipping, wear, or damage on the gear spline.
- Remove minor flaws or scratches with oil stone. If excessive wear or damage is observed, replace the part.

2-4 and Neutral Switch

- Check the continuity of 2-4 and Neutral switch.
  If defects are observed, replace the 4H and 4L switch.



221R300001



261R300003

Switch Stroke	2-4 Switch Signal	Neutral Switch Signal
	Terminal 1 to 2	Terminal 1 to2
1	Open	Close
2	Close	Open

Oil Pump

- Remove foreign materials from the strainer. If the strainer is damaged, replace it.

If the area into which the shaft is inserted is excessively worn or damaged, replace the oil pump assembly.

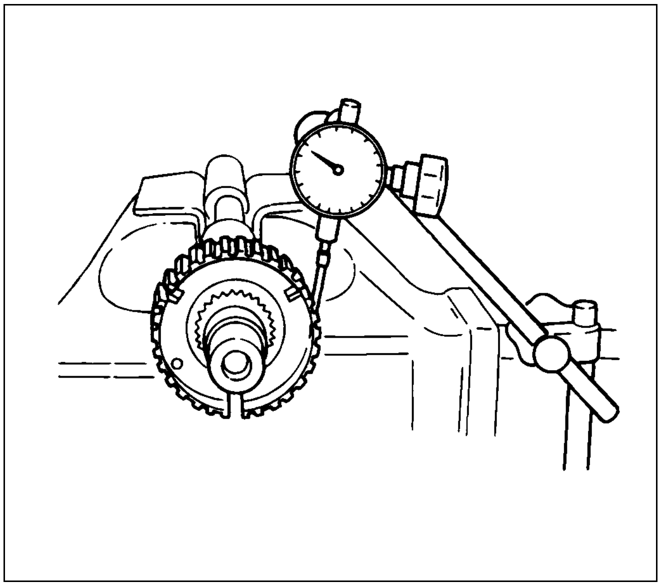
Clutch Hub Spline Play

- Set a dial indicator to the clutch hub to be measured.
- Move the clutch hub as far as possible to both the right and the left.
  Note the dial indicator reading.
- If the measured value exceeds the specified limit, the clutch hub must be replaced.

Clutch hub spline play

Standard: 0-0.1 mm (0-0.004 in)

Limit: 0.2 mm (0.008 in)



226RS042

Bearings

1. Inspect the condition of all the needles and ball bearings. Wash bearings thoroughly in a cleaning solvent. Apply compressed air to the bearings.

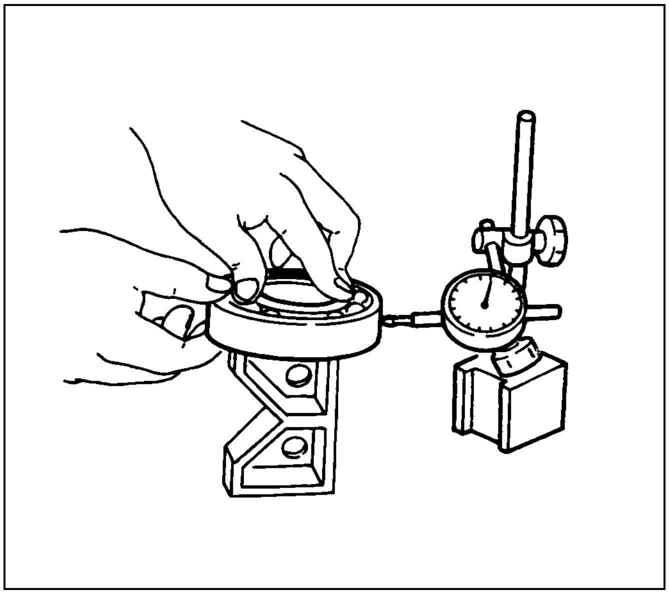
NOTE: Do not allow the bearings to spin. Turn them slowly by hand. Spinning bearings may damage the rollers.

2. Lubricate the bearings with a light oil and check them for roughness by slowly turning the race by hand.

Ball Bearing Play

1. Use a dial indicator to measure the ball bearing play.
2. If the measured value exceeds the specified limit, the ball bearing must be replaced.

Limit: 0.2 mm (0.008 in)



226R3043

Synchronizers

The synchronizer hubs and sliding sleeves are a selected assembly and should be kept together as originally assembled.

Clean synchronizer components with clean solvent and air dry.

Inspect the components for the following:

- Teeth for wear, scuffs, nicks, burrs or breaks.
- Keys and springs for wear, cracks or distortion, replace if these conditions are present.
- If scuffed, nicked or burred conditions cannot be corrected with a soft stone or crocus cloth, replace the component.

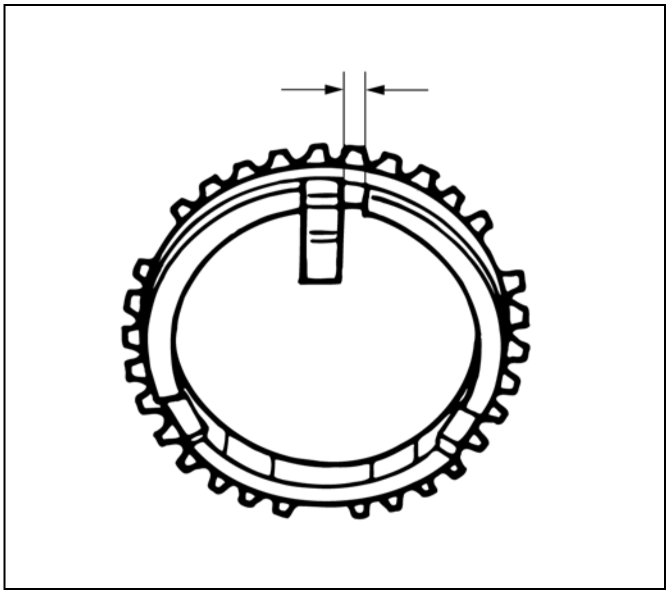
Block Ring and Insert Clearance

1. Use a vernier caliper to measure the clearance between the block ring and the insert.
2. If the measured value exceeds the specified limit, the block ring and the insert must be replaced.

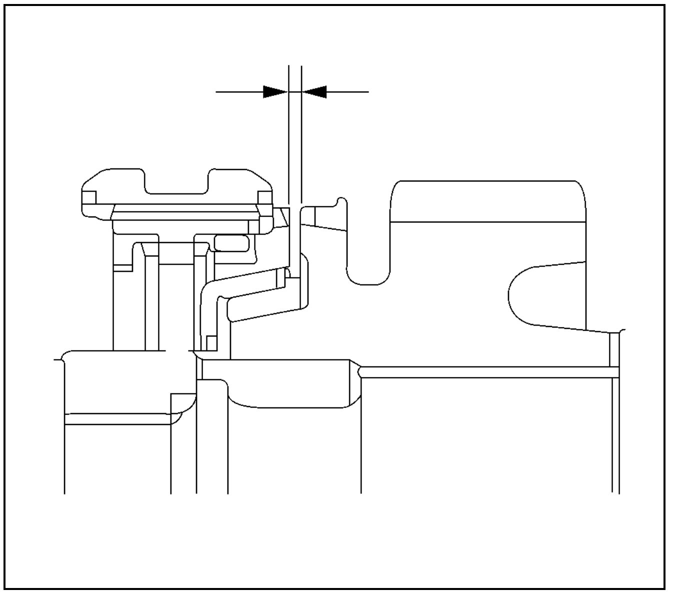
Block ring and insert clearance

Standard: 2.46-2.74 mm (0.097-0.108 in)

Limit: 3.0 mm (0.118 in)



226RS037



226R300019

2WD-4WD Synchronizer (3-Cone)

1. Use a thickness gauge to measure the clearance between the block ring and the dog teeth.
2. If the measured value exceeds the specified limit, the 2WD-4WD synchronizer assembly must be replaced.

Block ring and dog teeth clearance

Standard: 1.5 mm (0.059 in)

Limit: 0.8 mm (0.031 in)

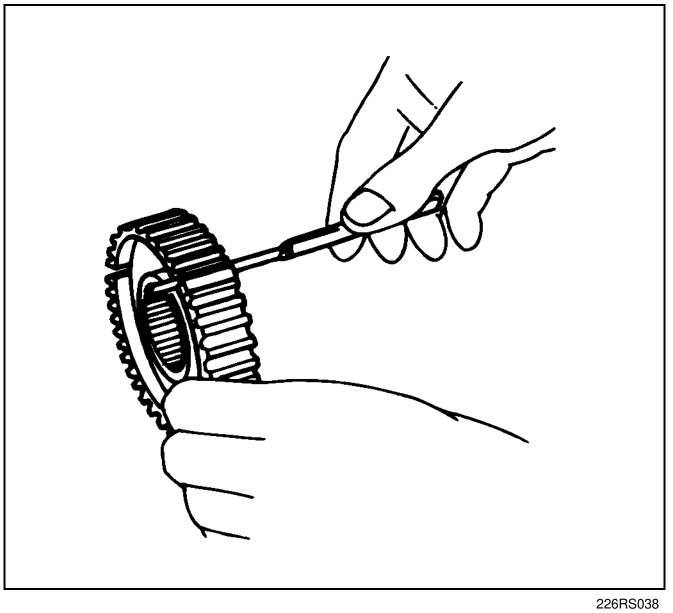
Clutch Hub and Insert Clearance

1. Clutch Hub and Insert Clearance
2. Use a thickness gauge to measure the clearance between the clutch hub and the insert.
3. If the measured value exceeds the specified limit, the clutch hub and the insert must be replaced.

Clutch hub and insert clearance

Standard: 0.01-0.19 mm (0.0004-0.0075 in)

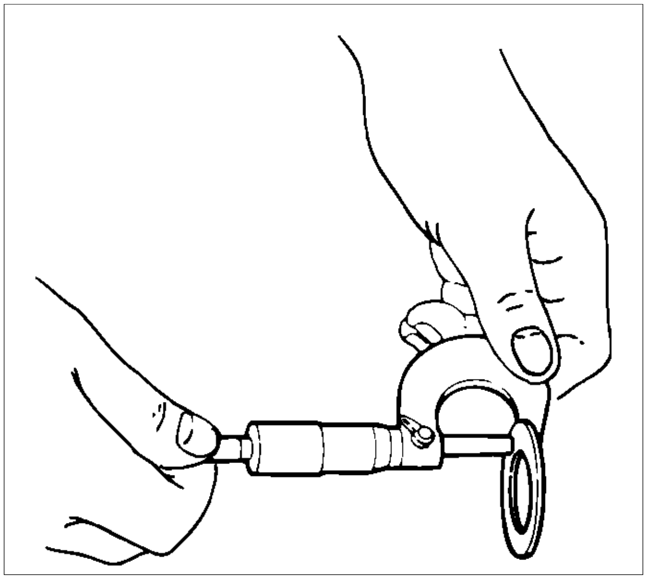
Limit: 0.3 mm (0.012 in)



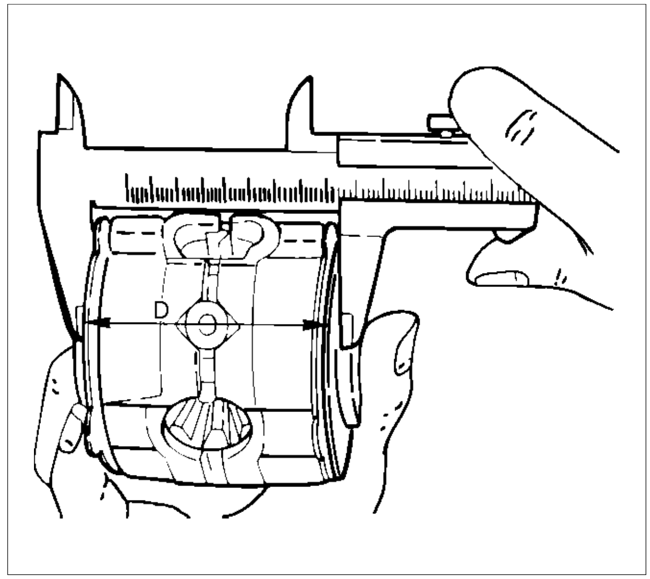
226RS038

Detent Springs

1. Inspect the springs for distortion, cracks or wear. Replace if these conditions are present.



425RS063



425RS065

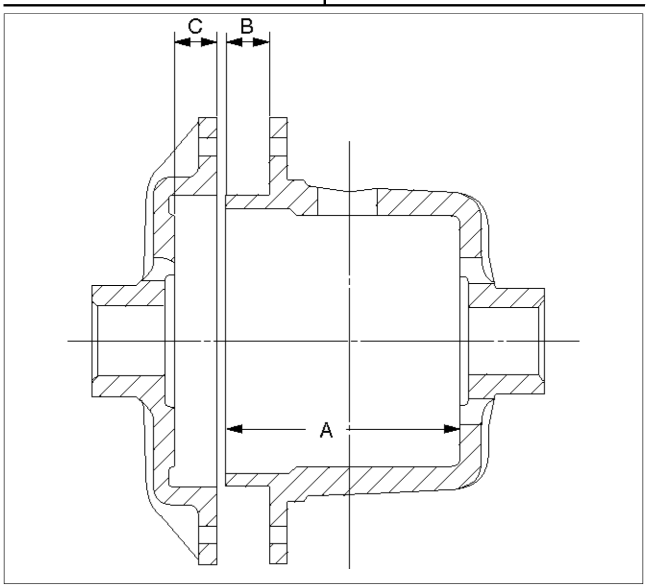
Reassembly

Adjustment of Clearance between Friction Disc and Plate

1. Measuring depth of differential case

mm(in)

Standard (A-B)	80.58 (3.17)
(C)	10.58 (0.42)



425RS064

2. Measuring overall length of pressure ring, friction disc and plate assembly
   - Assemble pinion shaft with pressure ring, then friction disc and plate.
   - Measure length between plates at both ends over V-shape groove. (D)
3. After A, B, C and D dimensions are measured, perform adjustment with the following procedure.
   - Measure spring plate :
     1.75 mm (0.069 in) × 4 pcs (E)
   - Measure thickness of plate spring
     Standard dimension :
     1.75 mm (0.069 in) × 2 pcs (F)
4. Select a friction disc or plate so that ((A-B+C) - (D+E) = 0.06 to 0.20 mm (0.002 to 0.008 in.) and also the difference in total dimension of friction disc and plate and spring plate (left/right side) does not exceed 0.05 mm (0.002 in.).
   Thickness : 1.65, 1.75, 1.85 mm (0.065, 0.069, 0.073 in)

Adjusting Backlash of Side Gear in Axial Direction

1. Measuring depth of differential case

mm(in)

Standard (F-B)	82.03 (3.23)
(G)	12.03 (0.47)

Detent Spring Free Length

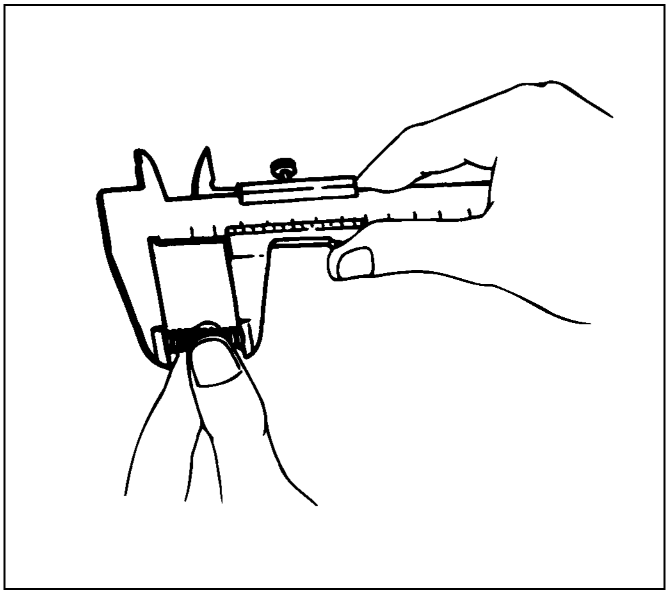
1. Use a vernier caliper to measure the detent spring free length.
2. If the measured value is less than the specified limit, the detent spring must be replaced.

Detent spring free length

Detent ball

Standard: 23.4 mm (0.92 in)

Limit: 22.8 mm (0.90 in)



220RW035

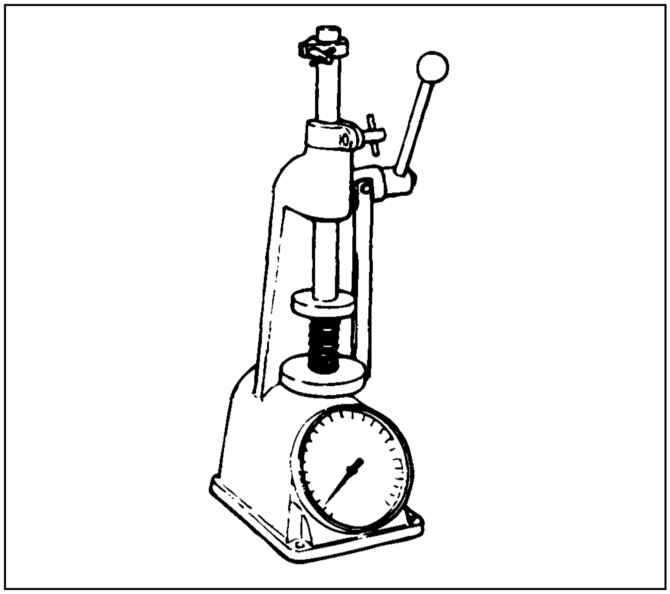
Detent Spring Tension

1. Use a spring tester to measure the detent spring tension.
2. If the measured value is less than the specified limit, the detent spring must be replaced.

Detent ball

Compressed height: 18.7 mm (0.736 in)

Standard: 68.6-88.2 N (7.0-9.0 kg/ 15.4-19.8 lb)



220RS013

Shift Arm

1. Inspect the shift arms for wear, distortion or scoring. Replace if these conditions are present.

Shift Arm Thickness

1. Use a micrometer to measure the shift arm thickness.
2. If the measured value is less than the specified limit, the shift arm must be replaced.

H-L Shift arm thickness

Standard: 7.6-7.85 mm (0.299-0.309 in)

Limit: 7.0 mm (0.276 in)

2-4 Shift arm thickness

Standard: 9.6-9.85 mm (0.378-0.388 in)

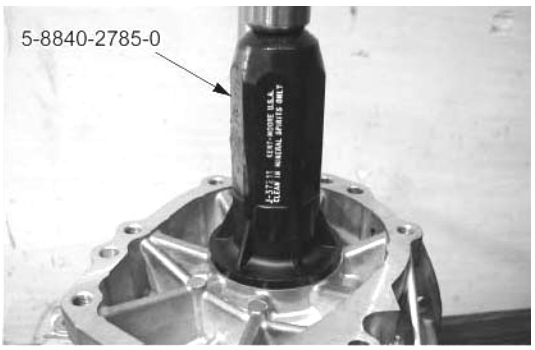
Limit: 9.0 mm (0.354 in)

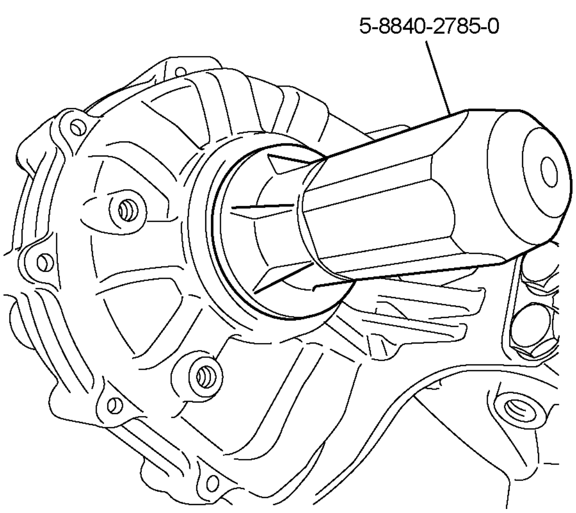
Reassembly

Transfer Reassembly

The rear cover oil seals and the rear output shaft ball bearings cannot be reused. They must be replaced with new ones when the transfer is reassembled.

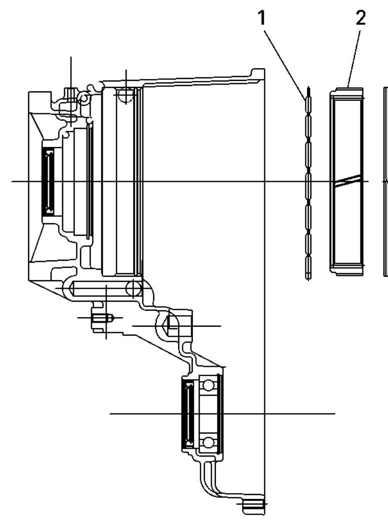
1. Use an oil seal installer (5-8840-2785-0) to press the new input shaft and/or front output shaft oil seals into place (If replacement is required).





RTW77DSH000301

2. Use a press to install the ball bearings to the front output shaft. Be sure that the bearings are fully inserted and then install the snap ring.
3. Install the damper ring and the internal gear to the transfer case. Be sure that the damper ring is between the internal gear and the case.

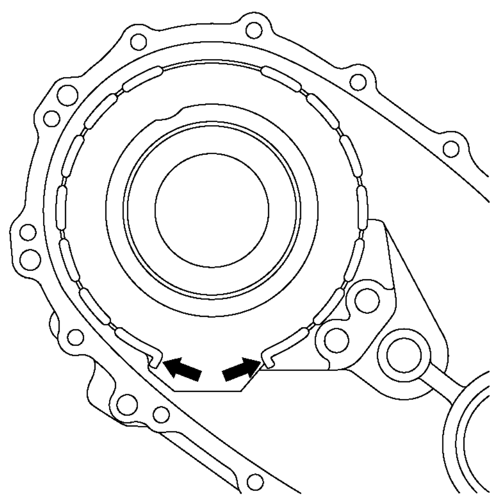


226R300004

Legend

(1) Dumper Ring
(2) Internal Gear
(3) Retaining Ring

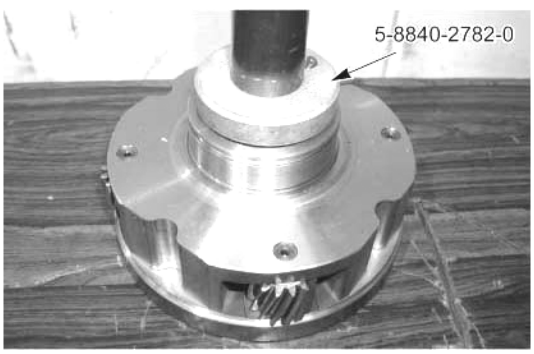
Note the direction of the dumper ring installation as figure.



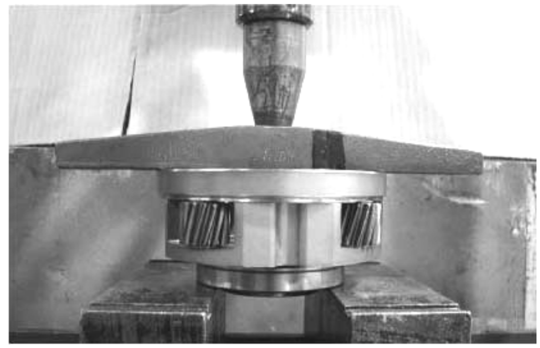
226R300025

4. Use a press and an installer (5-8840-2784-0) to hold the internal gear against the damper ring. Install the retaining ring (spiral type).

5. Use a press and an installer (5-8840-2782-0) to force the needle bearing fully into the carrier and gear assembly.

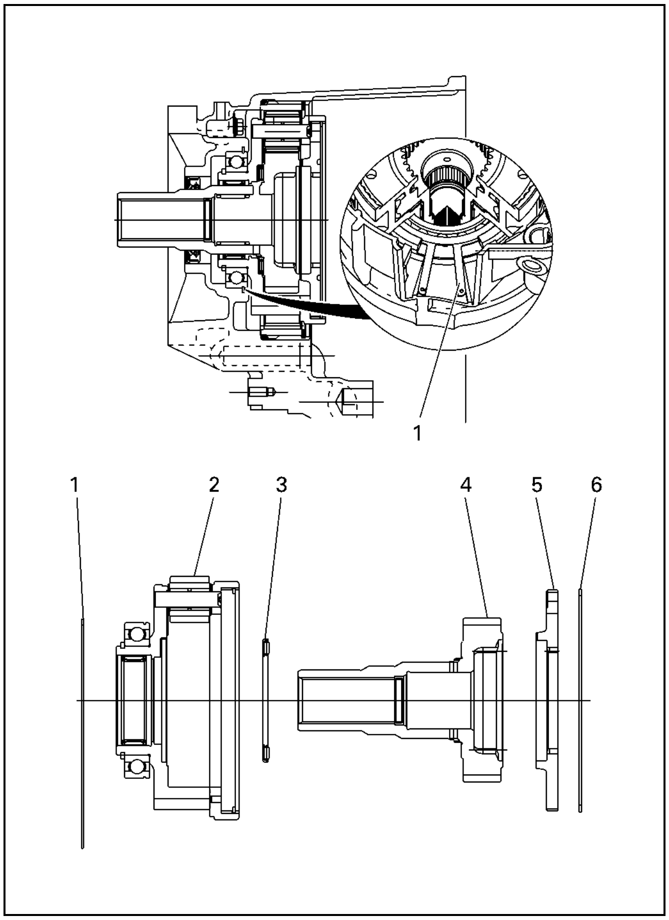


6. Use a press and an appropriate special tool to force the ball bearings fully into the carrier and gear assembly.



7. Install the carrier snap ring.
8. Install the thrust needle bearing, the sun gear input shaft, the needle bearing, the planetary dog teeth, and the dog teeth snap ring to the carrier and gear assembly in that order.
9. Install the outer retaining ring to the transfer case
10. Use a pair of snap ring pliers to install the carrier and gear assembly.

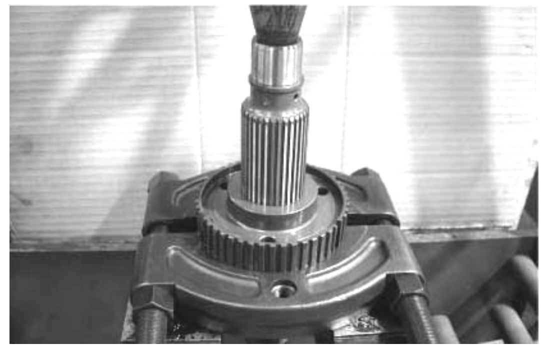
NOTE: Be sure that the outer retaining ring fits snugly in its groove.



Legend

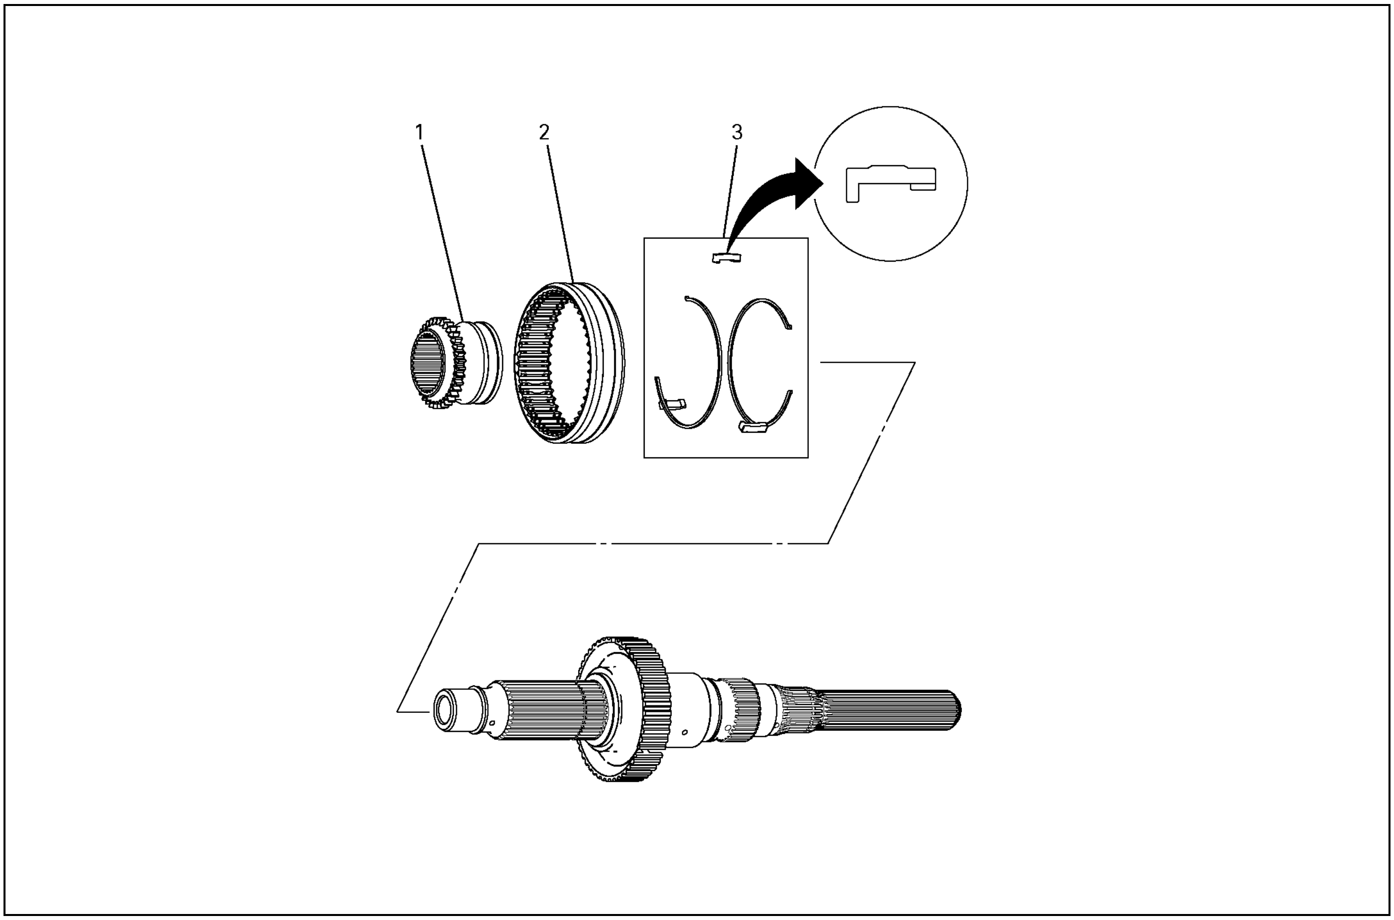
(1) Retaining Ring
(2) Carrier and Gear ASM
(3) Thrust Needle Bearing
(4) Sungear Input Shaft
(5) Planetary Dog Teeth
(6) Dog Teeth Snap Ring

11. Use a press to install the 2-4 hub.



12. Install the hub snap ring.
13. Install the synchronizer key springs, the synchronizer key, and the 2-4 sleeve to the 2-4 hub. The key and the open end of the springs must be facing in the opposite direction.

14.Insert the H-L sleeve into the main shaft.



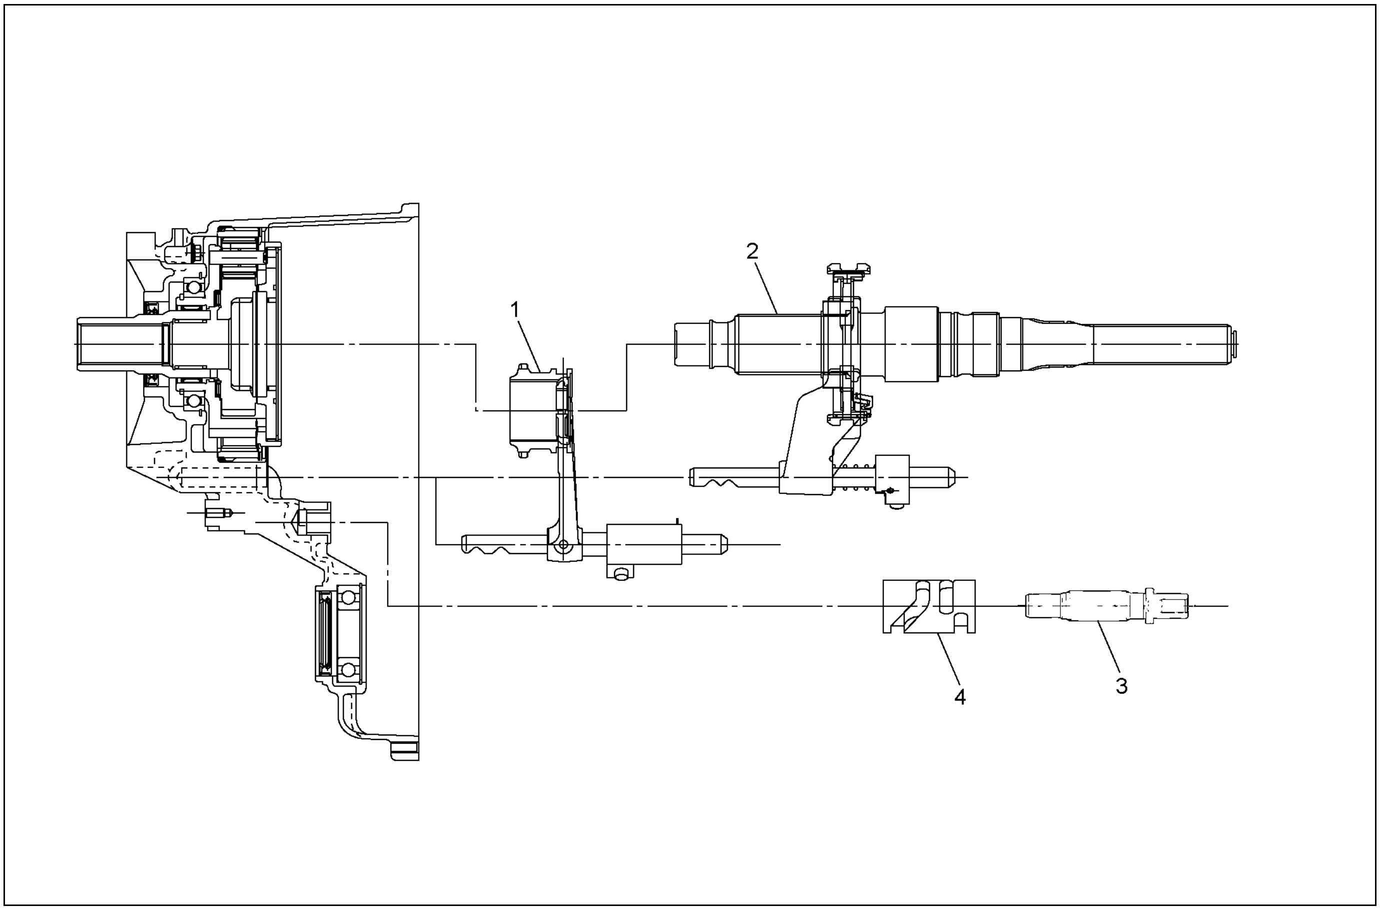
226R300023

Legend

(1) H-L Sleeve
(2) 2-4 Sleeve
(3) Synchronizer Key and Key Spring

15.Install the sleeve to the H-L shift assembly.
16.Install the sleeve to the 2-4 shift assembly.
17.Coat the area around each of the shift assembly insertion holes (transfer case) with transfer oil.
18.Install the main shaft together with the H-L shift assembly and the 2-4 shift assembly to the shift drum.

19.Align the shift shaft splines with the shift drum and install the shafts to the drum.

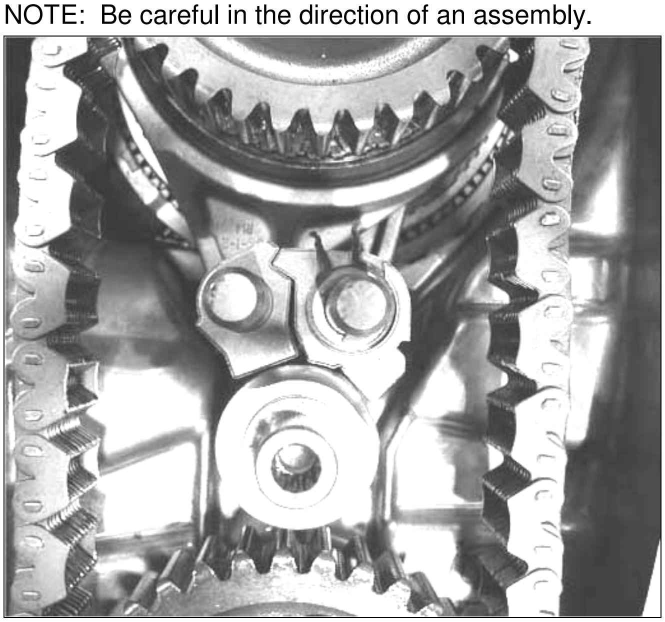


RTW320MF000201

Legend

(1) H-L Sleeve and Shift ASM
(2) 2-4 Sleeve ASM with Main Shaft and Shift ASM
(3) Shift Shaft
(4) Shift Drum

NOTE: Be careful in the direction of an assembly.



P1010041/020124

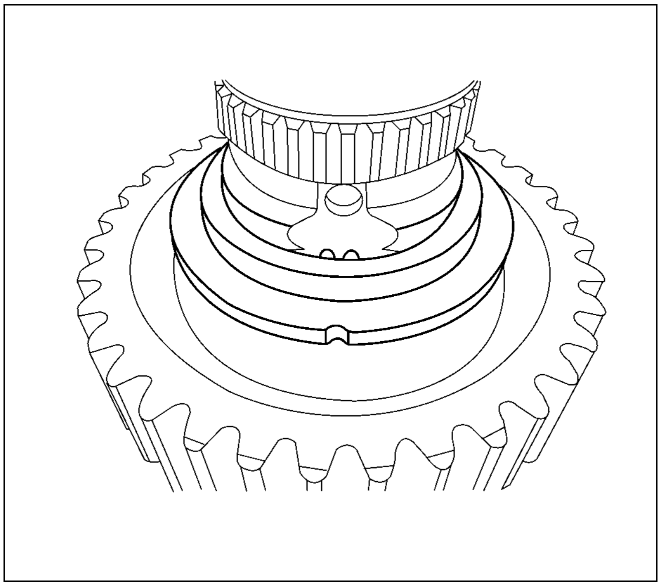
20.Coat the main shaft with oil.

21.Align the block ring, the outside ring, and the inside ring with the 2-4 hub assembly and install them.

22.Assemble the sprocket, transfer chain, and front output shaft.

23.Install the sprocket, transfer chain, and front output shaft to the main shaft and the transfer case.

24. Align the sprocket thrust washer with the main shaft groove and install it.



226R300009

25. Select a snap ring that will allow minimum axial play. Insert it to the main shaft installation groove.

mm (in)

Snap ring thickness	Identification color
2.15 (0.085)	Red
2.10 (0.083)	Not colored
2.05 (0.081)	Blue
2.00 (0.079)	White

(5) Transfer Chain
(6) Front Output Shaft
(7) Thrust Washer
(8) Snap Ring

26. Measure the snap ring external diameter. If the measured diameter is outside the specified range, a larger or smaller snap ring must be used.

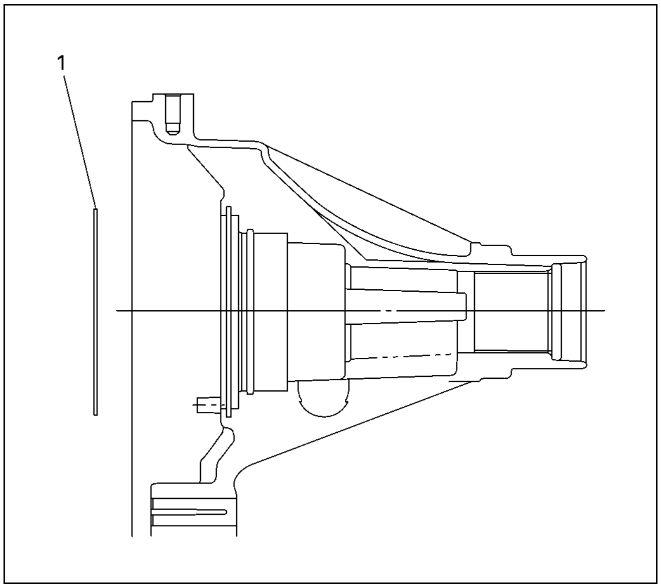
Snap ring outside diameter (Standard):

53.0 ± 0.5 mm (2.09 ± 0.02 in)

27. Position the rear cover so that its mating surfaces are facing up.

28. Use a press and an installer (5-8840-2783-0) to install the front output shaft needle bearing. The installer must be aligned with the bearing manufacturer's name (stamped into the bearing).

29. Install the oil pump wire snap ring to the rear cover.



Legend

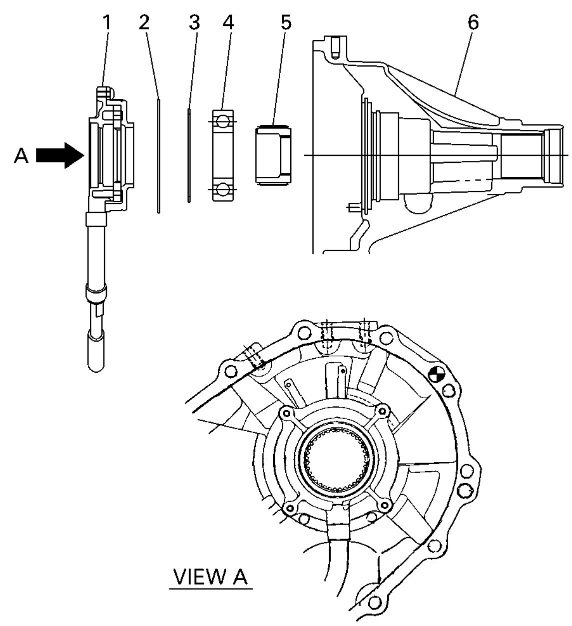
(1) Wire Snap Ring

30. Temporarily install the speedometer drive gear to the inside of the rear cover. Pay close attention to installation direction.
31. Use a press and an installer (9-8522-1268-0) to install the rear output shaft ball bearings. Do not drive the ball bearings into place with a hammer.

32. Install the rear output shaft retaining ring.
33. Place the oil pump in its specified position.
34. Secure the oil pump strainer to the rear cover and tighten the bolts to the specified torque.

Oil pump and rear cover bolt torque:

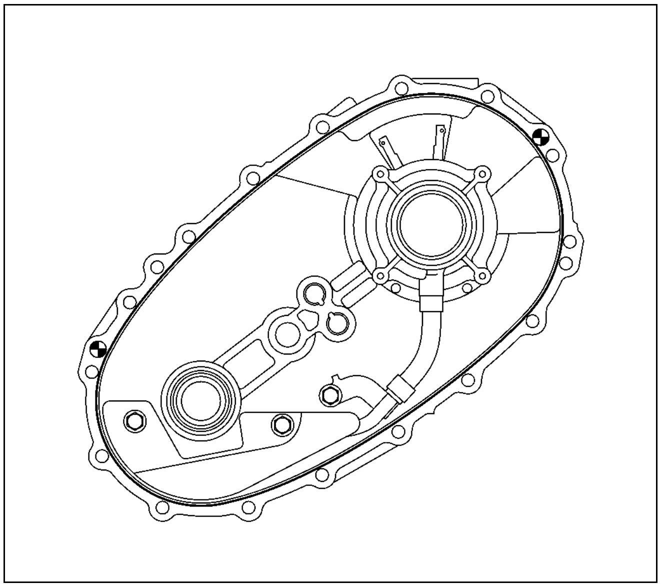
15 N·m (1.5 kgf·m/11 lb·ft)



Legend

(1) Oil Pump Assembly
(2) Wire Snap Ring
(3) Retaining Ring
(4) Ball Bearing
(5) Speedometer Gear Drive Gear
(6) Rear Cover

35. Apply Loctite FMD 127 to the mating surfaces of the rear cover and the transfer case. Be sure that the Loctite is evenly applied to the inside surfaces of the bolt holes with no gaps.



226R300011

36. Install the rear cover to the transfer case and tighten the bolts to the specified torque.

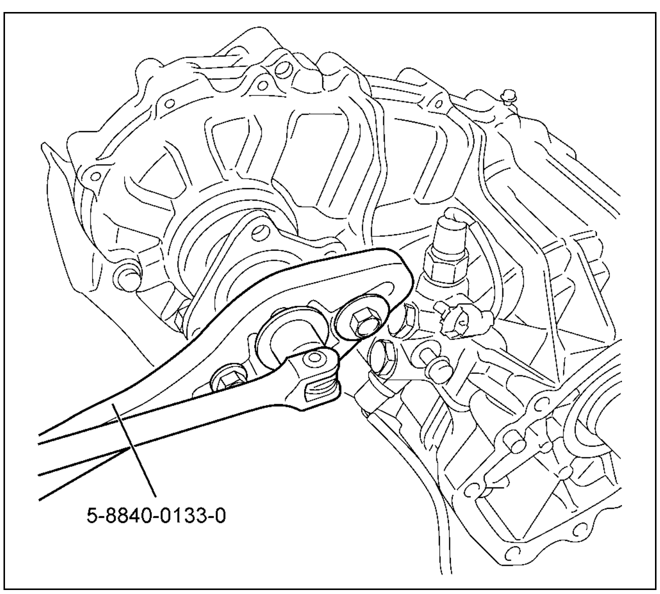
Rear cover and transfer case bolt torque:

22 N·m (2.2 kgf·m/16 lb·ft)

37. Apply engine oil to the companion flange O-ring.
38. Install the O-ring to the front output shaft.
39. Secure the front companion flange with a flange holder (5-8840-0133-0).
40. Install the end nuts and tighten them to the specified torque.

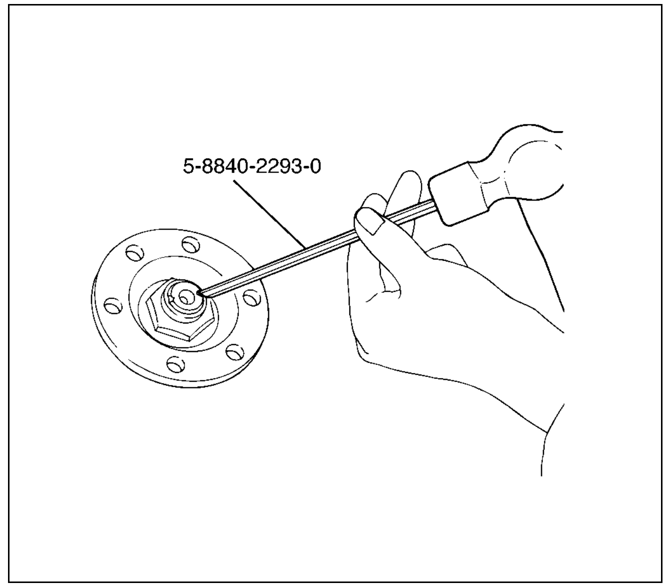
Front companion flange end nut torque:

137 N·m (14.0 kgf·m/101 lb·ft)

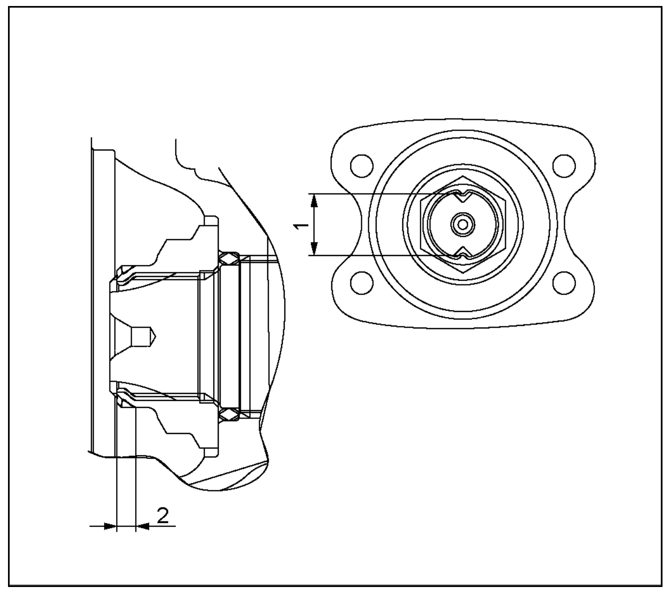


RTW77DSH000201

41. Use a punch (5-8840-2293-0) to caulk the front companion flange end nut.



226R300012



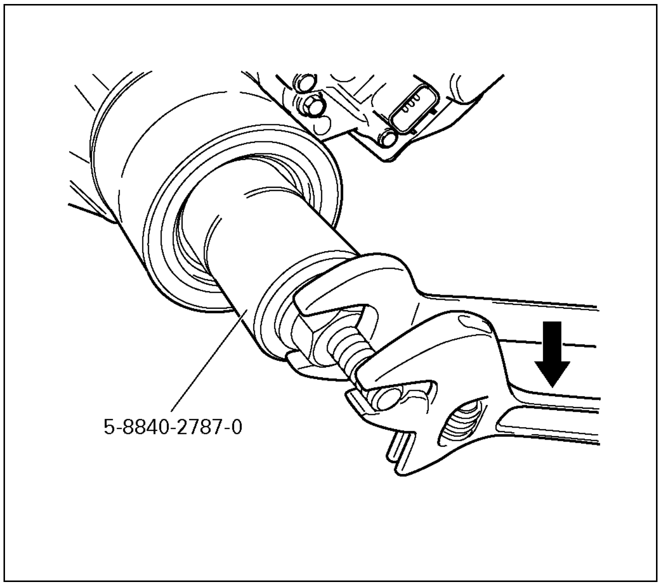
RUW34DSH000301

Legend

(1) MAX 26mm (1.02 in)
(2) MIN 4mm (0.16 in)

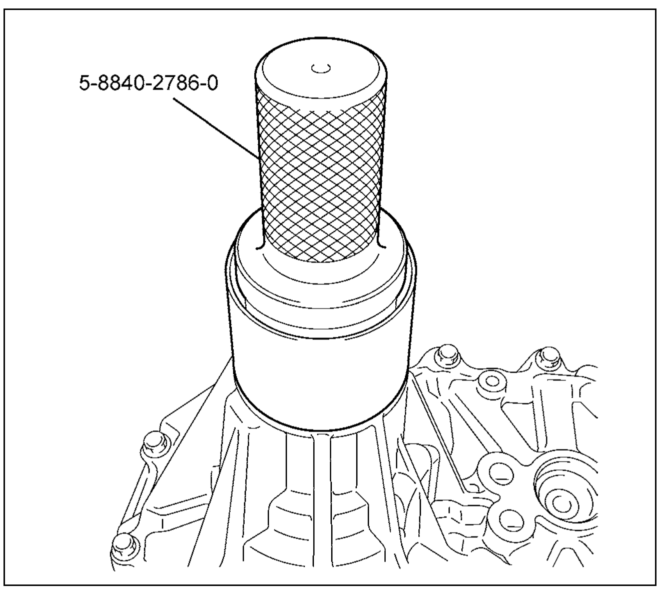
42. Apply Loctite 575 to the threaded portion of the detente plugs.

43.Use an installer (5-8840-2787-0) to install the main shaft end snap ring to the rear output shaft (from the back end of the shaft). Be absolutely sure that the snap ring is seated in the groove.

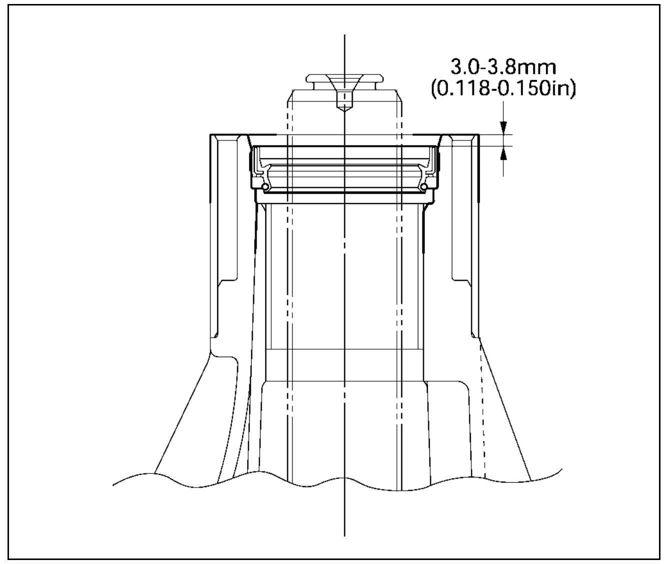


226R300022

44.Use an installer (5-8840-2786-0) to install the rear output oil seal to the rear case.



RTW77DSH000401



220R300021

45.Install the detent balls, the detent springs, and the detent plugs (2 parts each) to the transfer case. Tighten the plugs to the specified torque.

Detent plug torque: 19 N·m (1.9 kgf·m/14 lb·ft)

46.Install the neutral switch (black harness cover) to the transfer case and tighten the bolts to the specified torque.

Neutral switch bolt torque:

39 N·m (4.0 kgf·m/29 lb·ft)

47.Install the 2-4 switch (gray harness cover) to the transfer case and tighten the bolts to the specified torque.

2-4 switch bolt torque: 39 N·m (4.0 kgf·m/29 lb·ft)

48.Install the switch bracket to the transfer case and tighten the bolts to the specified torque.

Switch bracket bolt torque:

15 N·m (1.5 kgf·m/11 lb·ft)

49.Install the transfer actuator assembly to the transfer case and tighten the bolts to the specified torque. The actuator must be installed in the same direction as the shaft.

Transfer actuator assembly bolt torque:

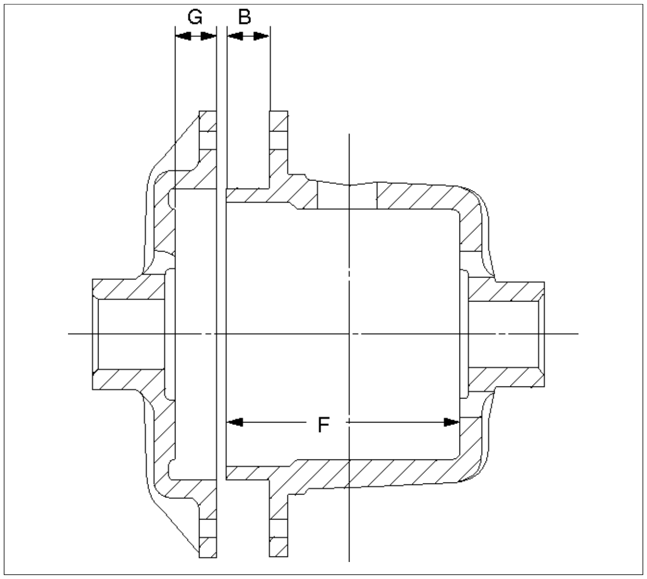
22 N·m (2.2 kgf·m/16 lb·ft)

50.Install the breather hose between the transfer actuator and the transfer case.

51.Install the speedometer driven gear, the speedometer bushing, and the speedometer stay to the transfer case. Tighten the bolts to the specified torque. (M/T: MUA, MUX, A/T: JR405E, AW30-40LE)

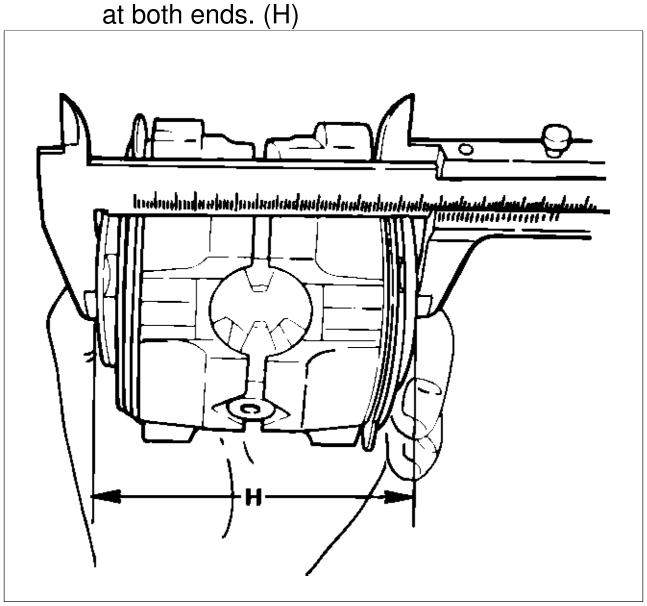
Speedometer bolt torque:

15 N·m (1.5 kgf·m/11 lb·ft)



425RS066

2. Measuring dimension between thrust washers at both ends.
   Assemble side gear, pinion, pinion shaft pressure ring and thrust washer.
   - Eliminate clearance by pushing pressure ring against the pinion shaft in axial direction.
   - Eliminate backlash by connecting side gear to the pinion.
   - Measure dimension between thrust washers at both ends. (H)

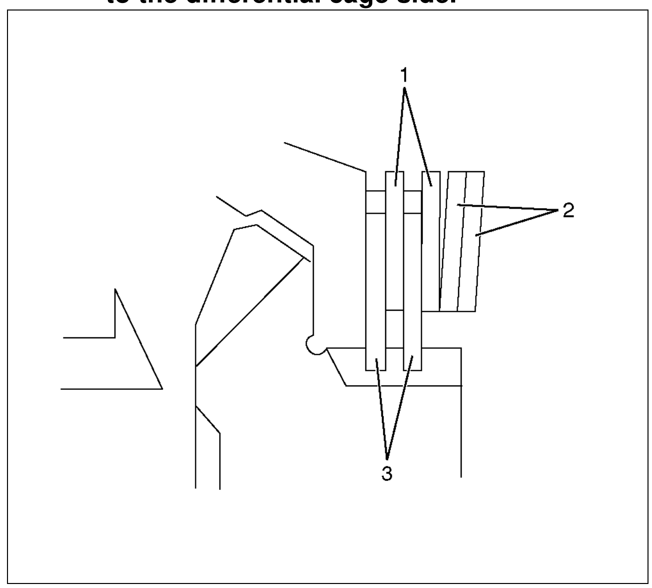


425RS067

3. After each dimension is measured, perform adjustment with the following procedure.
   Adjust so that ((F-B) + G-H) = 0.05 to 0.2 mm (0.002 to 0.008 in). Also, select a proper thrust washer so that the dimension difference from back face of the pressure ring to thrust washer (left/right side) does not exceed 0.05 mm (0.002 in).
   Thickness : 1.5, 1.6, 1.7 mm (0.059, 0.063, 0.067 in)

Note :
When reassembling, sufficiently apply gear oil on every part, especially on sliding surface.

1. **Install thrust washer in differential cage A and B.**
2. **Assemble spring plate, friction plate and friction disc as following illustration.**
   - **Install spring plate with dished side turned to the differential cage side.**



425R300009

Legend

1. Friction Plate
2. Spring Plate
3. Friction Disc

4. Install pressure ring and side gear.
   - Fit two side gears in two pressure rings, one from under a ring and the other from above a ring.
   - Fit two pairs of a friction disc and a friction plate under it on and under these two pressure rings.
5. Set pinion and pinion shaft on differential cage A assembly.
6. Assemble differential cage A and B.
7. Align the setting marks on differential cage A and B and tighten screws in diagonal order evenly.

52. Install the speed sensor to the transfer case and tighten the specified torque. (M/T: AR-5, A/T: 4L60-E)

    Speed sensor torque: 17 N·m (1.7 kgf·m/12 lb·ft)

53. Install the drain plug to the transfer case and tighten it to the specified torque.

    Drain plug torque: 39 N·m (4.0 kgf·m/29 lb·ft)

54. Loosen and remove the filler plug. Add the specified volume of transfer oil (5W-30) or the equivalent to the transfer through the filler hole.

    Transfer oil volume: 1.3 lit. (1.37 US qt)

55. Replace the filler plug and tighten it to the specified torque.

    Filler plug torque: 39 N·m (4.0 kgf·m/29 lb·ft)

56. Install the underguard and tighten the bolts to the specified torque.

    Underguard bolt torque:
    39 N·m (4.0 kgf·m/29 lb·ft)

Main Data and Specifications

General Specifications

TRANSFER CONTROL SYSTEM

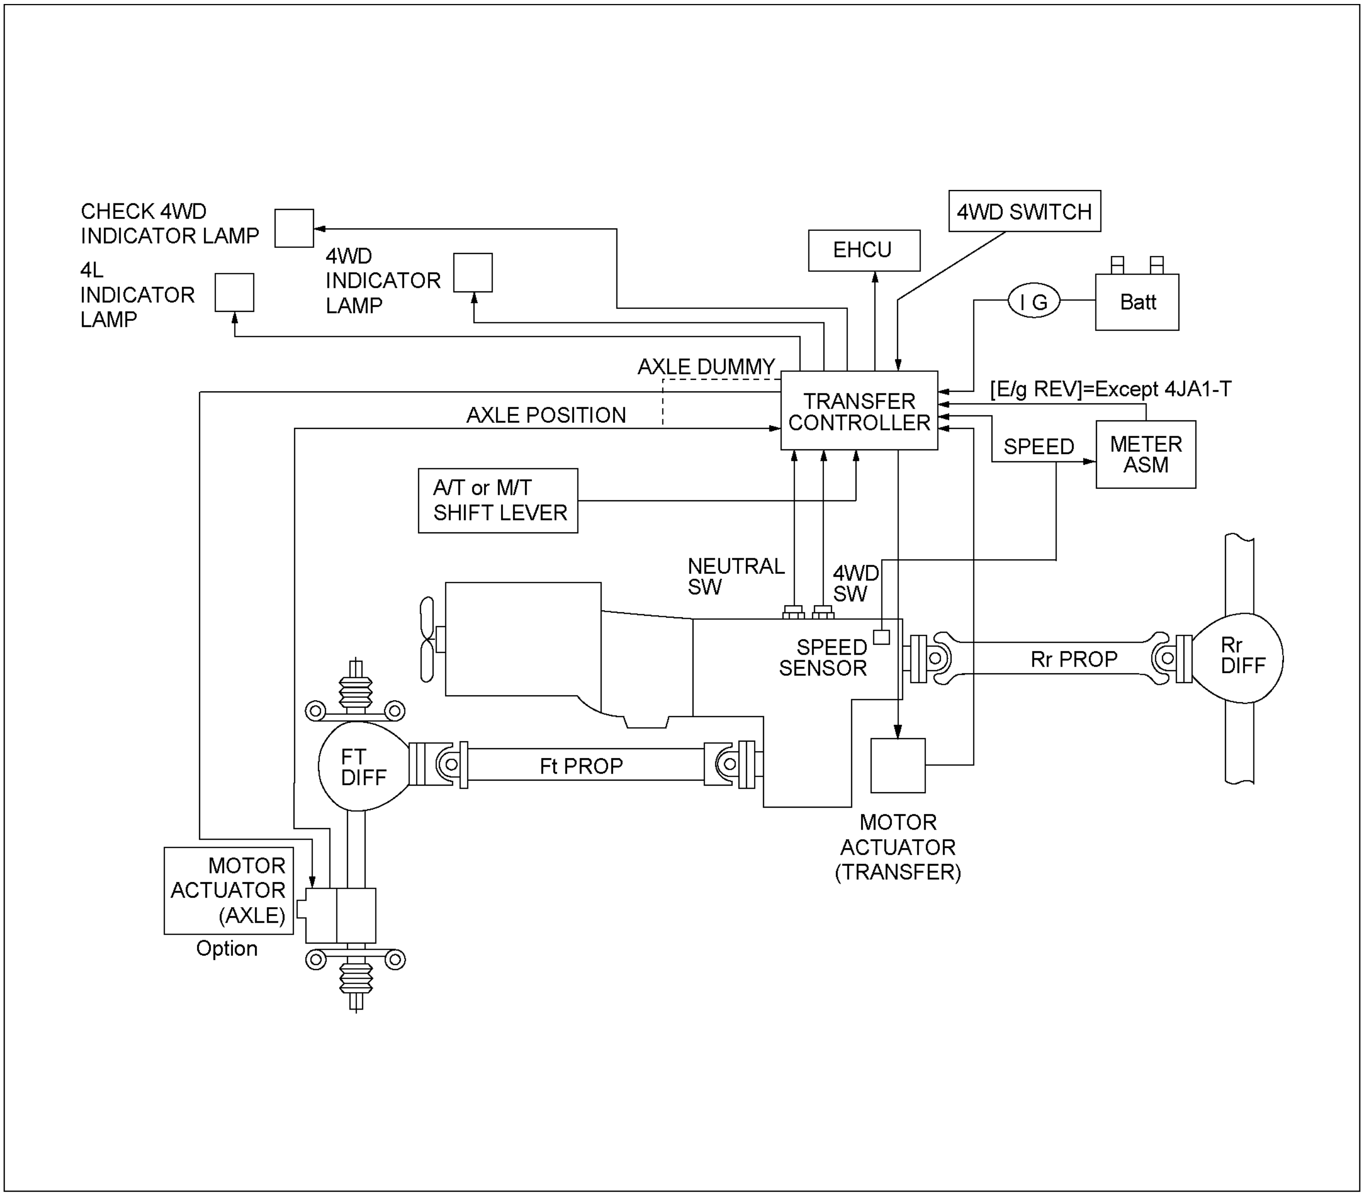
TABLE OF CONTENTS

Service Precaution

WARNING:
THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNECESSARY SRS SYSTEM REPAIRS.

CAUTION:
Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU/GM will call out those fasteners that require a replacement after removal. ISUZU/GM will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description



RTW77DLF000501

Transfer Position and Drive Mode

Three drive modes can be selected through operation of 4WD switch.

Transfer Position	4WD SWITCH	Mode	Drive mode
HIGH	2H	RWD	Rear wheel drive
	4H	4WD (HIGH)	High-speed mechanical lock-up four wheel drive
LOW	4L	4WD (LOW)	Low-speed mechanical lock-up four wheel drive
NEUTRAL	2H & 4L (10 Sec)	NEUTRAL	Towed by other vehicle

Summary of transfer control system

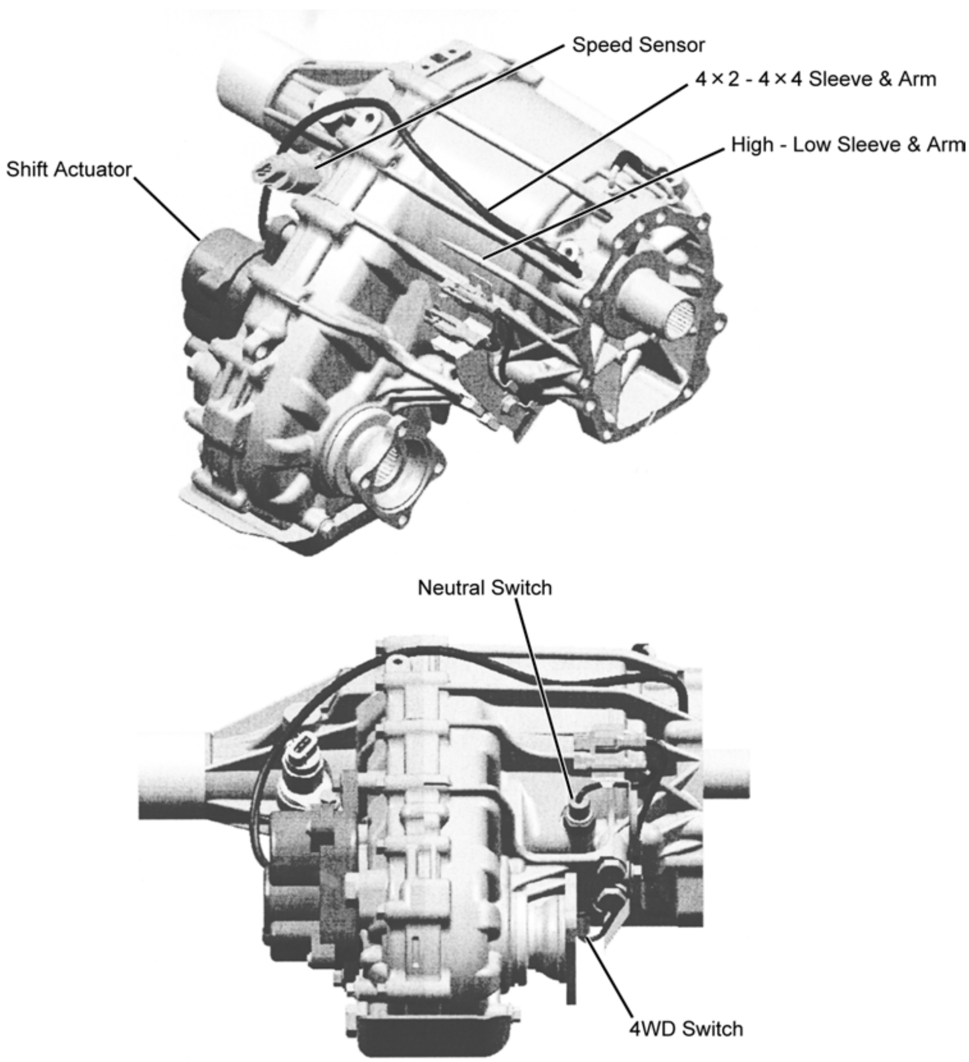
The transfer control system switches between the 2-wheel drive (2H), 4-wheel drive high-speed (4H), 4-wheel drive low-speed (4L), and neutral positions electrically when the driver operates the switches.

This system has following functions.

1. Connection or disconnection of drive force distribution to the front wheel front shaft (axle shaft). (The drive force distribution to the front propeller is connected or disconnected with the motor actuator.)
2. Try to repeat the connection or disconnection of the front wheel drive function as described above.
3. Option: Shift on the fly type only.
   Instruction of connection or disconnection of the drive force transmission between the front wheel axle (axle shaft) and front wheel. (The motor actuator connects or disconnects the left front wheel and front wheel axle (axle shaft).)
4. Shifting of auxiliary transmission gears, connection or disconnection of wheel and engine drive force (4H, 4L, neutral).
5. Operation of the indicator on the instrument panel.
6. Transmission of the position signal to other controllers.

System Components

Parts Location



RTW57DLF000401

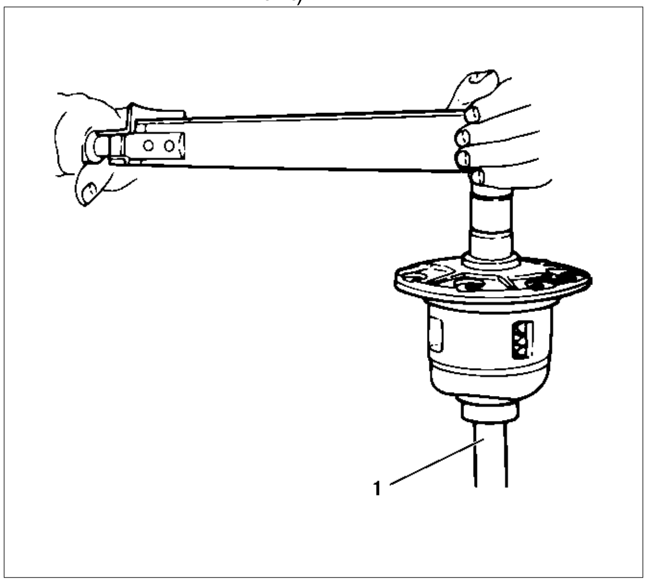
Speed sensor
Revolutions of the rear output shaft are decreased and taken out by the speed/drive/driven gears installed in the transfer case. The number of revolutions is detected with a speed sensor.
About 4/3 pulses per revolution of the shaft are output.

4WD switch
The 4WD switch detects the movement of the shift rod driving the 4×2 - 4×4 sleeve.
PUSH open is achieved with the PUSH open switch when the shift rod is at the 4×2 position.

4×2 - 4×4 sleeve & Arm
The 4×2 - 4×4 sleeve moves directly in the 4×4 direction with

Confirmation of Operation

- Using the side gear holder : 5-8840-2682-0, measure the starting torque of the side gear.
  Starting torque :29-45 N·m (3.0-4.6 kgf·m/22-33 lb·ft)



425RW065

Legend

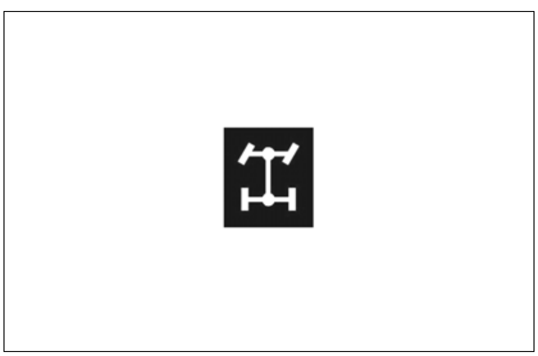
1. Side Gear Holder : 5-8840-2682-0

the 4×2 - 4×4 shift rod. When moving in 4×2 direction, a spring standby mechanism is provided between the rod and sleeve so that the rod is positioned at the 4×2 position, while the sleeve is at the 4×4 position.
This mechanism is provided to protect the shift mechanism from the force and to prevent movement of the sleeve (torsional torque etc. of the drive system). By releasing the preventive force, the sleeve can move to the 4×2 state by the spring force.

Neutral switch
The neutral switch detects the movement of the shift rod driving the high-low sleeve.
PUSH close is achieved with the PUSH close switch when the shift rod is positioned between the High and the Low, at the neutral state.

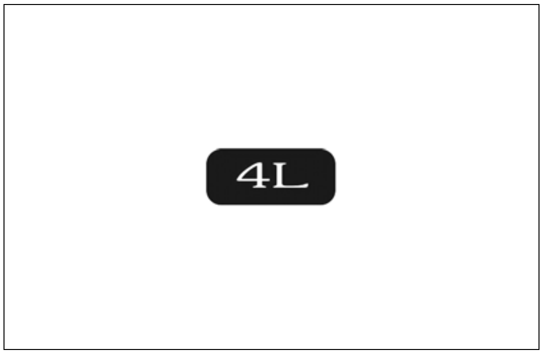
High-Low Sleeve & Arm
The spring standby mechanism is provided for the high-low sleeve in both directions of the high-low shift rod. Therefore, the rod position and the actual sleeve position may be offset in some cases.
This system is provided to protect the shift mechanism from a collision due to coincidence of the high and low phases of the engaged splines. By giving rotational force to the preventing phase coincidence, the splines are moved to the proper engagement position by the spring force.

Shift actuator
The output shaft is rotated by the built-in motor and the transfer position is switched.
Detection (limit) switches to detect the rotating angle of the output shaft that is provided to the actuator at 4 positions.
These are connected to the transfer controller through the vehicle harness to constantly transmit the actuator operating angle and changes in its transfer status.



7B4-PDF2

4WD indicator (in meter panel)
This lamp indicates the following items:
Valve check
Drive condition (2WD-4WD)
Operating condition (2Hz: Actuator in operation, mechanism standby)
Restrictions on operation (4Hz, including indication of interrupted operation due
to excessive load)



7B4-PDF3

4L indicator (in meter panel)
This lamp indicates following items:

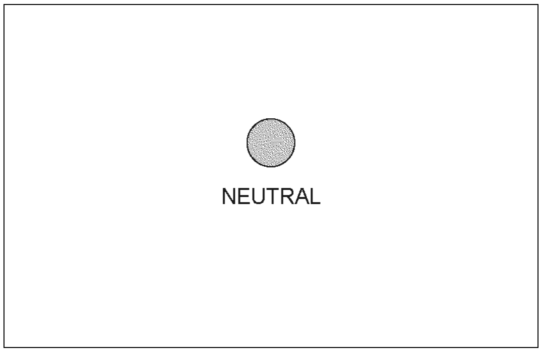
Driving status (High-Low)
Operating status (2Hz: Actuator in operation, mechanism standby)
Restrictions on operation (4Hz)

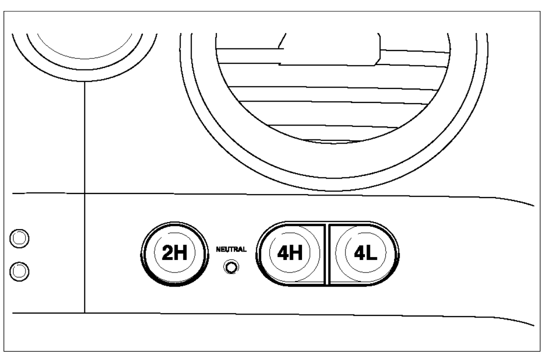


RTW77DSH000601

Neutral indicator (in operation switch panel)
This LED indicates following items:
LED check
Driving status (Neutral)
Operating status (2Hz: Actuator in operation, mechanism standby)
Restrictions on operation (4Hz)

7B4-PDF5

Check 4WD warning light (in meter panel)
This light indicates following items:
Valve check
Faulty actuator limit SW, and circuit related faults with the limit switch



RTW77DSH000501

4WD switch
Switch to transmit a switching command to the 2H, 4H, Neutral, or 4L position.
It comprises 3 PUSH momentary switches. By pushing the 2H and 4L switches for 10 seconds,
operation is changed to the neutral position.
To shift from the neutral to another position, push another switch for 10 seconds.

Method of confirming the actuator position detection (limit) switch

The actuator indicates the continuity condition of combinations, as shown in the list below between the 4 detection (limit) switch pins and the GND pin along the direction of the notch of the output shaft spline. Check that these combinations are as specified.

The middle condition between these positions (4 patterns in the case of 2H-4H) is either of the combinations shown below, depending upon manufacturing variations of the switch plate.

	2H	2H-4H				4H	4H-N		N	N-L	4L
Direction of output shaft notch (outline)	-54° to -29°	-29° to 74°				74° to 110°	110° to 179°		179° to 215°	215° to 285°	285° to 300°

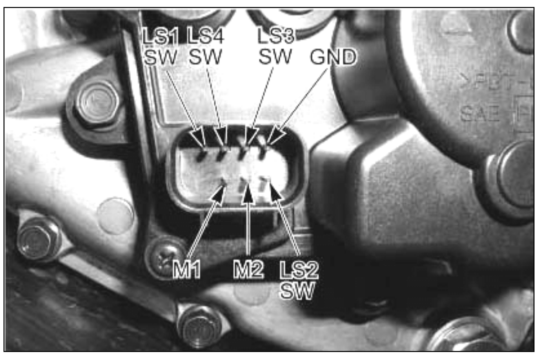
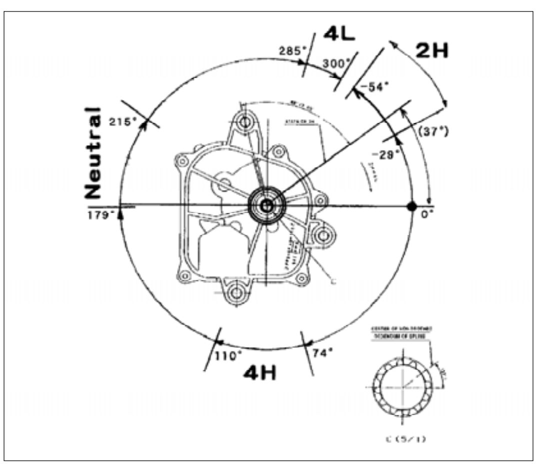
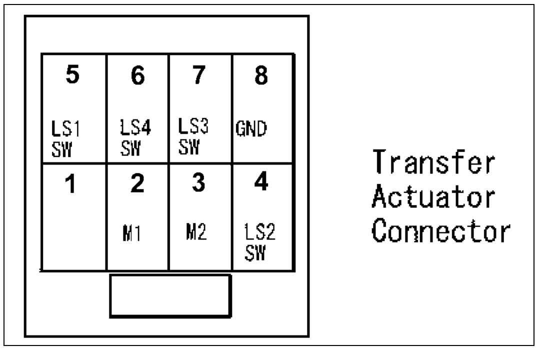
Continuity between each pin and GND pin. (Continuity also exists between CLOSE pins.)

Transfer Actuator Connector





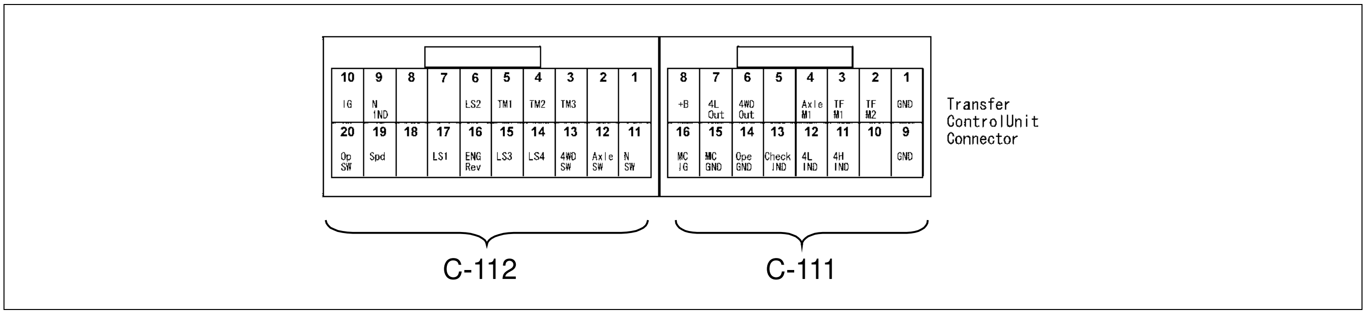
7B4-PDF6



Method of checking the position detection switch harness

Disconnect the vehicle harness connector on the transfer controller side, and the vehicle harness connector on the transfer actuator side as shown in the wiring diagram. Check the continuity between the following connector pins, ensure there is no continuity between those pins and GND or power source.

Check that there is continuity between the GND pin and the vehicle GND on the transfer actuator, and there is no continuity between the GND pin and another power source.



Vehicle harness connector pin No. (connector of mating parts of the harness is shown in this figure)

Name of pin	T/F controller side	T/F actuator side	Remarks
LS1	C-112, 17	5	
LS2	C-112, 6	4	
LS3	C-112, 15	7	
LS4	C-112, 14	6	
GND	C-111, 1, 9	8	

Functions of Switch and indicator Lamp

4L start of operation	On	On	Off	Off	4H position for 0.1 second	1,1,0,1	Closed	Open	Closed	-----
10 second display during limitation	On	Blinking (4HZ)	Off	Off	Open	1,1,0,1	Closed	Open	Closed	No operation during limitation
Go to 4L after 10 seconds	On	On	Off	Off	No operation	1,1,0,1	Closed	Open	Closed	-----

- Under some conditions, a secondary operational indication may be received when the 4Hz operational indication is present.

TROUBLESHOOTING

Refer to this Section to quickly diagnose and repair rear axle problems.

Each troubleshooting chart has three headings arranged from left to right.

(1) Checkpoint

(2) Trouble Cause

(3) Countermeasure

This Section is divided into five sub-sections:

1. Abnormal Rear Axle Noise
   1) Noise when the engine is driving the vehicle
   2) Noise when the vehicle is coasting
   3) Intermittent noise
   4) Noise when the vehicle is turning
   5) Constant noise
2. Vibration
3. Oil Leakage
   1) Differential carrier leakage
   2) Axle case leakage
   3) Axle case to inside hub leakage
   4) Axle case to inside brake drum leakage
4. Power Not Being Transmitted to the Wheels (Propeller Shaft Operation is Normal)

1. ABNORMAL REAR AXLE NOISE

1) Noise when the Engine is Driving the Vehicle

Checkpoint	Trouble Cause	Countermeasure
Rear axle gear oil (NG)	Insufficient gear oil	Replenish the gear oil
(NG)	Wrong or poor grade gear oil	Replace the gear oil
OK ↓ Drive pinion to ring gear backlash (NG)	Too much or too little backlash	Adjust the backlash
OK ↓ Drive pinion end play (NG)	Loose drive pinion bearings	Adjust the drive pinion bearing preload
(NG)	Worn drive pinion bearings	Replace the drive pinion bearings
OK ↓ Differential side bearing (NG)	Loose differential side bearings	Adjust the differential side bearing preload
(NG)	Worn differential side bearings	Replace the differential side bearings
OK ↓

OK			
Differential cage	NG	Loose differential cage bolts	Tighten the differential cage bolts
OK			
Axle case inside	NG	Foreign material in the axle case	Remove the foreign material

Diagnosis

Before determining a trouble (Non-trouble mode)

1. *When shifting from 2H to 4H:*

1-1-1 When the flashing frequency of the 4WD indicator is changed from 2Hz to 4Hz (Shift on the fly)

If the load is too large to shift the gears synchronously, the operation is repeated up to 3 times. If the shifting is not effected after being repeated 3 times, the indicator frequency is changed from 2Hz to 4Hz. At the same time, the actuator condition is changed to 2H, indicator flashes at 4Hz for 10 seconds, and then goes out.
Cause of excessive synchronous shifting load

- Extremely low temperature (the oil viscosity of the front differential increases requiring a large load for synchronization).
- High speed (since the difference of relative revolutions of gears to be shifted synchronously is too large, required work load per unit time becomes larger).

Step 1-1-1:

Stop the vehicle or decrease the speed and operate as required again.

1-1-2 When the flashing frequency of the 4WD indicator is changed from 2Hz to 4Hz (Rigid and free wheel Hub) / Block out of meshing spline in transfer case.

Step 1-1-2:

Run the vehicle forward and backward several meters and operate as required again.

1-2 When the flashing of 4WD indicator at 2Hz continues more than 11.5 seconds (repetition of 3 times of above No.1 is counted) (Shift on the fly)

If there is difference of revolutions and phases between the front wheel and the axle, connecting the front wheel and axle is difficult.
Until shifting in the transfer and connection of the front wheel and axle are completed*, the indicator flashes at a frequency of 2Hz. In the above case, the indicator continues flashing at a frequency of 2Hz until the connection of the front axle is completed. (If the shifting in the transfer is not completed, the flashing frequency is changed to 4Hz (above No.1).)
By correcting the difference of relative revolutions and deviation of phases, the shifting can be completed.

Step 1-2:

While the vehicle is running, check it is safe around the vehicle and then accelerate or decelerate the vehicle while going straight.
When the vehicle is at a stop, run the vehicle forward and backward several meters.

2. *When shifting from 4H to 2H*

2-1 When 4WD indicator continues flashing at 2Hz

When shifting from 4H to 2H, the 4WD indicator continues flashing at 2Hz until separation in the transfer and the separation of the front wheel axle are completed*. When torsional torque is accumulated in the drive system, separation in the transfer and separation of the front axle* is difficult. In such a case, they can be separated by removing the torsional torque of the drive system.

Step 2-1:

While the vehicle is running, check it is safe around the vehicle and then accelerate or decelerate the vehicle while going straight.
When the vehicle is in stop, run the vehicle several meters forward and backward.

∗: Shift on the fly only.

3. *Shifting from 4H to 4L*

3-1 When the 4L indicator flashes at 2Hz

When shifting from 4H to 4L, the 4L indicator continues flashing at 2Hz until shifting in the transfer case is completed. The phases of the engaged splines may sometimes deviate preventing completion of shifting. By correcting the deviation of phases, shifting is completed.

Step 3-1:
(In case of AT): **Set the select bar of the transmission to the D position.**
(In case of MT): **Set the lever of the transmission to a position allowing running and engage the clutch gently.**
At this time, some rotating force acts on the engaged splines, phase is corrected and the engagement is completed.

3-2 When the 4L indicator flashes at 2Hz for 10 seconds and then keeps ON again (AT vehicle)

This condition occurs when torsional torque has been generated between the transmission and road surface and the transfer standby mechanism cannot absorb it completely.

Step 3-2:
Set the select lever of the transmission to the N position. (Stepping on the brake pedal is effective at this time.)

3-3 When the 4L indicator flashes at a frequency of 4Hz

Shifting from 4H to 4L is restricted.
When the vehicle is running, the transmission lever is at the running range and the engine speed is high (L4: 3000rpm or more V6: 2000rpm), the transfer cannot be shifted from 4H to 4L (restriction on operation).

Restriction on operation (Except 4JA1-T)

The 4H, neutral and 4L shifting mechanism has no synchronization function. Therefore, if relative rotations in the mechanism become excessive, shifting exerts adverse influence on the internal mechanism of the transfer. To avoid such a trouble, vehicle condition is detected to restrict the operation (vehicle speed, engine speed and TM position).

Requirement to restrict the speed: Vehicle should be in stop.

Due to the detection logic, time to wait for start of operation may be required.

A/T: If the vehicle is in stop for a long time at the TM running range (D, 1, 2) before operating the AT, waiting time becomes longer (from 1 second to 3 minutes at the maximum).

M/T: If the vehicle is at stop with the clutch stepped on at the T/M running position (1 – R), the time to wait becomes longer.

Waiting time means the time commencing from when other requirements (engine speed and T/M position) are met to permission of the speed restriction. Operation during the waiting time is not permissible.

The waiting time is 1 second at the minimum and increases up to 5 seconds if the above condition continues for 3 minutes. After that, the waiting time increases up to 3 minutes in 2 minute intervals.

When it is clear that the above condition has continued and reduction of waiting time is required, turn on or off the ignition or start and stop the vehicle several meters.

Requirements for permission of restriction on engine speed: Engine speed should be decreased.

The engine speed of 3000rpm (V6: 2000rpm) or below is advisable.

Requirements for permission of restriction on T/M position restriction:

(AT) N range is recommended

(MT) should be at the neutral.

These requirements for permission should all be met before the switch is operated. If the requirements are met after operation, operation is not automatically effected but re-operation is required after permission is given.

Restriction on operation (4JA1-T)

The 4H, neutral and 4L shifting mechanism has no synchronization function. Therefore, if relative rotations in the mechanism become excessive, shifting exerts adverse influence on the internal mechanism of the transfer. To avoid such a trouble, vehicle condition is detected to restrict the operation (vehicle speed, and TM position).

Requirement to restrict the speed: Vehicle should be in stop.

Requirements for permission of restriction on engine speed: Engine speed should be decreased.
The engine speed of 3000rpm or below is advisable.
Requirements for permission of restriction on T/M position restriction:
should be at the neutral.

These requirements for permission should be all met before the switch is operated. If the requirements are met after operation, operation is not automatically effected but re-operation is required after permission is given.

Note: Don't' accelerate engine speed a the time of this operation.

Step 3-3:
Stop the vehicle. (Close the accelerator and decrease the engine speed to below L4: 3000rpm, V6: 2000rpm.)
(In case of AT): Set the transmission select lever to the N position.
(In case of MT): Set the transmission lever to the neutral position. (Stepping on the clutch is recommended.) Push the 4L button.
If shifting operation is not completed (the lamp flashes at 2Hz), perform step 3-1.

4. Shifting from 4L to 4H

4-1 When 4L indicator continues flashing at 2Hz

When shifting from 4L to 4H, the 4L indicator continues flashing at 2Hz until the shifting in the transfer case is completed. Phases of engaged splines may deviate and the operation may not be completed in some cases. Shifting is completed by correcting the deviation of the splines.

Step 4-1: (same as step 3-1)
(In case of AT): Set the transmission select lever to the D position.
(In case of MT): Shift the transmission lever to a position allowing running and engage the clutch gently.

4-2 When the indicator continues flashing at 2Hz for 10 seconds and then keeps on at 4L again (AT vehicle)

This condition occurs when torsional torque has been generated between the transmission and the road surface (use of the parking position on a slope). Resistance against the separation of the driving force cannot be completed by the waiting mechanism of the transfer.
Shifting is also possible by using the brake at the neutral position of the transmission

Step 4-2: (Same procedure as the step 3-2)
Set the transmission select lever to the N position.
(Leaving the brake lever and stepping on it again is recommended.)

4-3 When the 4L indicator flashes at 4Hz

Shifting from 4L to 4H is restricted.
When the vehicle is running, the transmission lever is at the running range, and the engine speed is high, the transfer 4L cannot be shifted to 4H.

Step 4-3: (Same procedure as the step 3-3)

Stop the vehicle (close the accelerator and decrease the engine speed to L4: 3000rpm V6: 2000rpm or below).

(In case of AT): **Set the transmission select lever to the N position.**

(In case of MT): **Set the transmission lever to the neutral position (stepping on the clutch lever is recommended).**

Push the 4H button.

If shifting is not complete (indicator flashes at 2Hz), go to step 4-1.

5. When shifting from 4H or 4L to neutral

(Same procedure is required when shifting from 2H but in such a case, requirements for shifting from 2H to 4H are also applied.)

5-1 Neutral indicator continues flashing at 2Hz

The neutral indicator continues flashing at 2Hz until 4H (4L) is completely separated in the transfer. If torsional torque has accumulated between the transmission and road surface, separation may be difficult.

Step 5-1:

If the operation is not complete, execute step 7 for confirmation.

(In case of AT): **Set the transmission select lever to the D position.
After confirming that the gears are at the neutral position, return the lever to the N position.**

(In case of MT): **Set the transmission lever to a vehicle running position and engage the clutch gently.
After confirming that the gears are at the neutral position, return the lever to the neutral position**

5-2 When the neutral indicator flashes at 4Hz

As in the case of shifting from 4L to 4H, restriction is imposed to the operation from 4L or 4H (including 2H). If the transmission lever is at a running range and engine speed is high (L4: 3000rpm, V6: 2000rpm or more) while the vehicle is running, operation from the 4L or 4H (including 2H) of the transfer to the neutral is impossible (restriction on operation).

Step 5-2:

Stop the vehicle.

(In case of AT): **Set the transmission select lever to the N (or P) position.**

(In case of MT): **Set the transmission lever to the neutral position (at this time, stepping on the clutch is recommended).**

Keep pushing the 2H and 4L button for 10 seconds.

Follow the start procedure for confirmation. (Confirmation of drive force is not transferred; same as in step 5-1)

After the confirmation, set the transmission to the neutral position in the case of MT or to the neutral position in the case of AT.

6. *When shifting from neutral to 2H, 4H or 4L*

6-1 When the 4L indicator or 4WD indicator flashes at 2Hz

Indicator flashing at 2Hz indicates that the engagement of the splines has not completed because of deviation of the spline phases. By eliminating such a deviation, shifting is complete (same as in step 3-1 and 4-1).

6-2 When the 4L indicator or 4WD indicator flashes at 4Hz

As in the case of shifting from 4L to 4H, restriction is imposed to the operation to 4L or 4H (including 2H). If the transmission lever is at a running range and engine speed is high (3000rpm or more) while the vehicle is running, operation from neutral of the transfer to the 4L or 4H (including 2H) is impossible (restriction on operation).

Step 6-2:

Stop the vehicle.

(In case of AT): **Set the transmission select lever to the N (or P) position.**

(In case of MT): **Set the transmission lever to the neutral position (at this time, stepping on the clutch is recommended).**

Keep pushing the 4H or 4L or 2H button for 10 seconds.

Trouble diagnosis based on the operation switch, transfer indicator lamp and operating sound “Check 4WD” indicator ON (operation guard based on the transfer actuator position detection error)

This condition indicates a faulty circuit related with the detection (limit) switches of the system actuator.

Detection (limit) switches detect the actuator operating angle based on their combinations.

The controller monitors transition of the actuator based on the combination of the detection (limit) switch output.

If the transition based on the combinations indicates some trouble, it is memorized, and shifting operation is stopped when the trouble is counted 5 times, and the “Check 4WD” indicator lights up. At this time, the system permits operation to 2H only.

When such a condition occurs, inspection of the transfer shift actuator, checking of the harness related with the detection (limit) switch, and erasure of the memory of the controller is required.

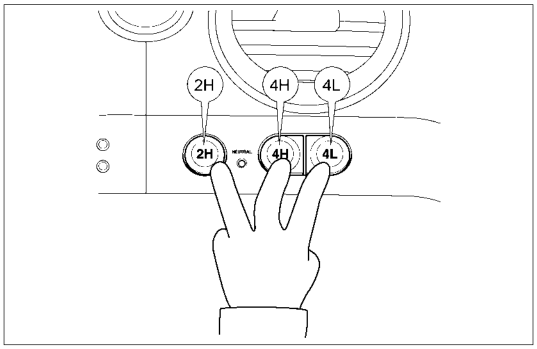
(Refer to the memory erasure procedure for the erasure of the memory.)

At this time, the position indicator may flash at 4Hz. It means that a detection (limit) switch trouble wad detected in the operation process shown by that position indicator (example: 4WD indicator when shifting from 2H to 4H).

Caution:
During trouble diagnosis and correction, do not turn ON the ignition with the harness connector of the transfer actuator disconnected. (Do not disconnect the harness connector of the transfer actuator when the ignition is ON.)
If the controller is connected during this condition, a limit SW trouble is judged and the above-described “Check 4WD” condition occurs.
This can be reset by clearing the memory.
When disconnecting the harness connector of the actuator and turning the ignition ON is required, remove the controller at the same time or remove the IG power fuse of the transfer controller.

Memory erasing procedure

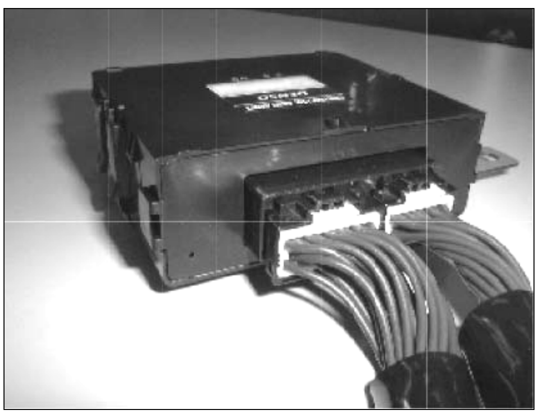
1-1 Memory erasing with operation button

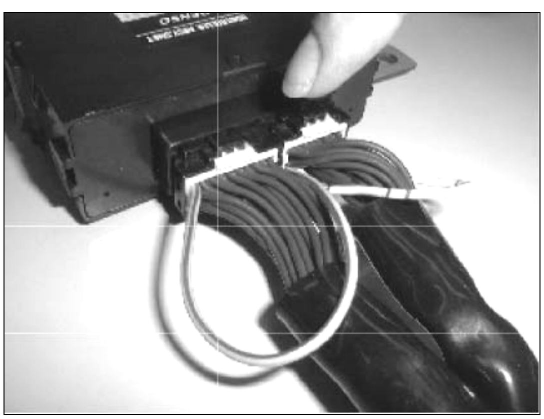


RTW77DSH000101

1. Turn on the ignition.
2. Shift to the “N” position with the vehicle stopped.
3. Simultaneously push the 3 buttons (2H/4H/4L) for 20 seconds.
4. Confirm the “Check 4WD” indicator on the meter panel is OFF.
5. Before erasing the memory, check that the circuit of the T/F actuator position detection harness is normal.

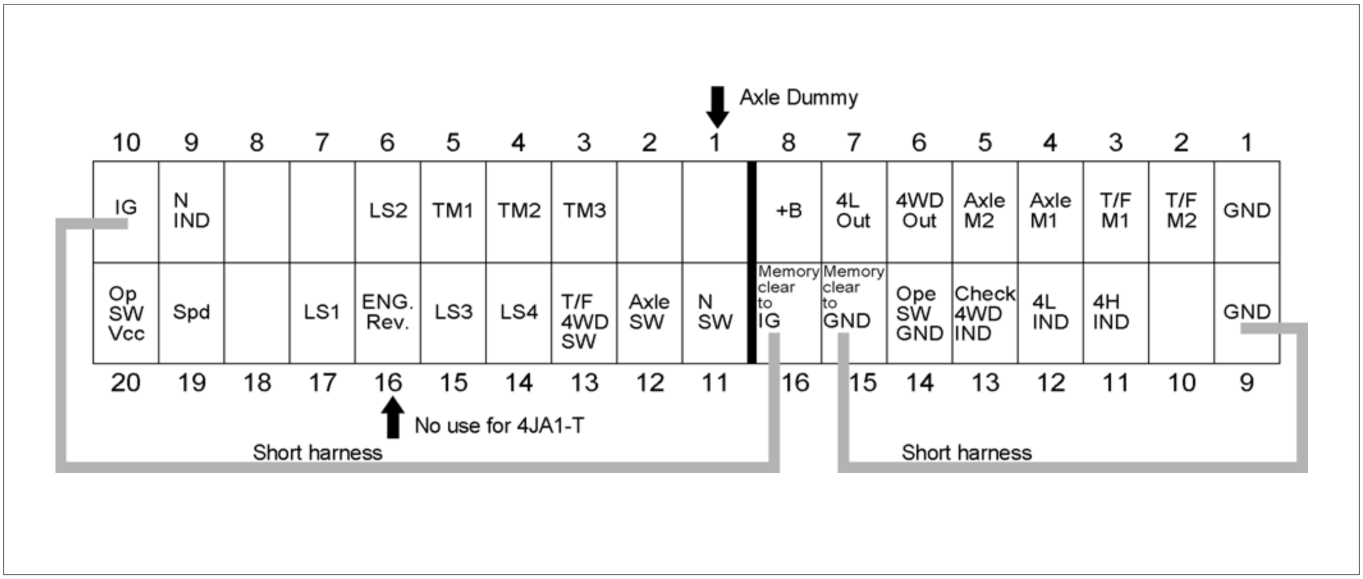
1-2 Memory erasing with short harness (Other procedure)





1. Prepare two pieces of short harness with the end sharpened like a needle (about 20 cm(7.9 in) long).
2. Turn OFF the ignition.
3. Keeping the connector of the transfer controller connected, set the short harness from the back of the connector as illustrated.
4. Turn ON the ignition, wait for 2 seconds, and then turn OFF the ignition after confirming the relay sound.
5. Disconnect the short harness, turn ON the ignition again, and confirm the “Check 4WD” lamp on the meter panel is OFF.
6. Before erasing the memory, check that the circuit of the T/F actuator position detection harness is normal.

Transfer Controller Pin Assignment



RTW77DSF000101

Diagnosis from symptom

Check4WD lighting up

Step	Action	Yes	No
1	Check what was done before the trouble occurred. Was the harness between the transfer controller and actuator disconnected with the ignition kept ON for the purpose of servicing the vehicle? Or, was the ignition turned ON (power supplied to the transfer controller) with the harness of the actuator removed?	If the power is supplied with the actuator not connected, a faulty position detection switch is considered. Clear the memory and trace this chart from the beginning.	Go to step 2.
2	Is the ignition switch ON?	Go to step 3.	Turn the ignition switch ON and trace this chart from the beginning.
3	Does the transfer-related indicators (4WD, 4Lo, Check 4WD, neutral) light up for 2 seconds when the ignition switch is turned ON?	Go to step 4.	Indicator lamp burnt out. Disconnected harness wire. After repairing, trace this chart from the beginning.
4	Has the harness between the Check4WD indicator and transfer controller GND shorted?	GND (body) short of the indicator harness. After repairing, trace this chart from the beginning.	Go to step 5.
5	Check the continuity of harness between the transfer controller and transfer actuator. Check the power short and GND short. Check the GND harness of the transfer actuator. Is a trouble noticed?	Repair the harness, clear the memory and trace this chart from the beginning.	Go to step 6.
6	Check the limit switch of the actuator. Is a trouble noticed?	Failed actuator. Replace the actuator, clear the memory and trace this chart from the beginning.	Clear the memory and trace this chart from the beginning. Failed controller. Replace the controller, clear the memory and trace this chart from the beginning.

To check the operation after completing the repair and clearing the memory, shift between 2H and 4L at least 5 times.

To judge the condition more quickly, ask the customer what happens when the Check4WD lamp lights up.

When the position indicator blinks at a frequency of 4Hz immediately after trouble occurs, the position of failure which the indicator shows may be limited.

(Since it indicates the situation immediately before detection of failure, whether the vehicle is running or at a standstill, the possibility of failure around that point is high.)

Status of the transfer when the Check4WD lights up is not always the same. Immediately after failure occurs, 2H can be operated.

Cannot shift from 2WD to 4H or 4L.

When shifting from 2H to other position, the indicator (4WD, 4Lo, Check4WD, neutral) does not respond.

Step	Action	Yes	No
1	Is the ignition switch ON?	Go to step 2.	Turn the ignition switch ON and trace this chart from the beginning.
2	Does the transfer-related indicators (4WD, 4Lo, Check 4WD, neutral) light up for 2 seconds when the ignition switch is turned ON?	Failed operation switch. Or, Failed controller.	Indicator lamp burnt out. Disconnected harness wire. After repairing, trace this chart from the beginning.

Even after correction step 1-1(*), 4WD indicator blinks at 4Hz and changes to 2H after 10 seconds.

Step	Action	Yes	No
1	Is the ignition switch ON?	Go to step 2.	Turn the ignition switch ON and trace this chart from the beginning.
2	Does the transfer-related indicators (4WD, 4Lo, Check 4WD, neutral) light up for 2 seconds when the ignition switch is turned ON?	Go to step 3.	Indicator lamp burnt out. Disconnected harness wire. After repairing, trace this chart from the beginning.
3	After 2 seconds, check that the Check4WD lamp is ON or OFF. Is the Check4WD lamp OFF?	Go to step 4.	Failed actuator position detection switch (LS1, LS2, LS3, LS4, GND). Short or disconnection of harness of this detection switch. After repairing, trace this chart from the beginning.
4	Press the 4H button. Is sound of relay heard from the transfer control?	Go to step 5.	Failed controller. Replace the controller and trace this chart from the beginning.
5	Is the sound of a running motor heard?	Failed control system of the transfer mechanism. Check and repair and trace this chart from the beginning.	Failed actuator motor. Disconnected controller motor drive output circuit, GND short circuit. +B fuse blown out. Disconnection of that harness. After repairing, trace this chart from the beginning.

*Before determining a trouble (Non-trouble mode)

4) Noise when the Vehicle is Turning

Checkpoint		Trouble Cause	Countermeasure
Rear axle shaft	NG	Worn rear axle shaft splines	Replace the rear axle shaft
OK			
Side gear	NG	Worn side gear	Replace the side gear
OK			
Differential pinion	NG	Worn differential pinion	Replace the differential pinion
OK			
Differential cross pin	NG	Worn differential cross pin	Replace the differential cross pin

Even after the correction step 1-2(*), the 4WD indicator still blinks at 2Hz when shifting from 2H to 4H.

Step	Action	Yes	No
1	Check the air pressure and wear of all the tires. Is any trouble noticed?	After adjusting the air pressure and repairing the worn tires, try the correction step 1-2(*).	Go to step 2.
2	Check the 4WD detection switch on the transfer case, neutral detection switch and each harness. Is a trouble noticed?	4WD detection switch is open or the harness failed. The neutral detection switch is closed or the harness GND is shorted. Replace or repair and then trace this chart from the beginning.	Go to step 3.
3	Is there continuity in the harness between the transfer controller and front axle actuator? Has a body short or disconnection been detected?	Go to step 4.	Body short or disconnection of the harness between the transfer controller and front axle actuator. After repairing, trace this chart from the beginning.
4	Is trouble detected in the axle detection harness between the axle actuator and transfer controller?	Disconnected harness. After repairing trace this chart from the beginning.	Malfunction of axle actuator. Refer to the paragraph of the axle disconnect. After repairing, trace this chart from the beginning.

*Before determining a trouble (Non-trouble mode)

Note:

Vehicles with manual hub and rigid hub don't have axle actuator.

When the above-mentioned procedure is followed, check the harness between the axle dummy output terminal and the axle switch input terminal of the transfer controller, instead of axle actuator.

After operation, indicator of target position blinks for 1.5 sec. at 2Hz, return to 2H condition (4WD indicator going out)

Step	Action	Yes	No
1	Keep pressing the 4H button (about 10 seconds). Does the 4WD indicator blink at 2Hz for 15 seconds and then blink at 4Hz?	Failed actuator motor. Disconnection of controller motor drive output circuit, or GND short. +B fuse blown out. Disconnection of that harness. After repairing, trace this chart from the beginning.	Go to step 2.
2	Press the 4H button. Is the sound of relay heard from the transfer controller?	Go to step 3.	Failed controller. Replace the controller and trace this chart from the beginning.
3	Is the sound of running motor heard?	Failed control system of the transfer mechanism. Check and repair and trace this chart from the beginning.	Failed actuator motor. Disconnection or GND short of controller motor drive output circuit. After repairing, trace this chart from the beginning.

Transfer cannot shift to another position (Except "Check 4WD" failure).

When shifting to another position, indicator (4WD, 4Lo, Check4WD, neutral) does not respond (Current condition keeping).

Step	Action	Yes	No
1	Is the ignition switch ON?	Go to step 2.	Failed indicator and harness (When lighting). After repairing, trace this chart from the beginning.
2	Does the transfer-related indicators (4WD, 4Lo, Check 4WD, neutral) light up for 2 seconds when the ignition switch is turned ON?	Go to step 3.	All indicators are burnt out (Check for GND short circuit between the indicator and transfer controller). Disconnected harness wire. After repairing, trace this chart from the beginning.
3	Press the other positions button. Is the sound of relay heard from under the seat, and the sound of a running motor heard?	Failed controller. After replacing the controller, trace this chart from the beginning.	*Failed operation switch. Or harness for the operation switch has disconnected or shorted.

* The operation switch is an analog type switch which reads the internal composite resistance value at the time of operation. If an abnormal value is detected, it is kept at the home position (The position before operating it).

Even after the correction step 2-1(*), the 4WD indicator still blinks at 2Hz when shifting from 4H to 2H.

Step	Action	Yes	No
1	Check all the tires for air pressure and wear. Is any trouble detected?	After adjusting the air pressure and repairing the worn tires, try the correction step 2-1(*).	Go to step 2.
2	Check the 4WD detection switch on the transfer case and neutral detection switch and each harness. Is a trouble detected?	4WD detection switch is closed or the GND short of harness. The neutral detection switch is closed or the harness GND has shorted. Replace or repair and then trace this chart from the beginning.	Go to step 3.
3	Is there continuity in the harness between the transfer controller and axle actuator? Has a short or disconnection been detected? Is the connection incorrect?	Go to step 4.	Body short, disconnection or incorrect connection of the harness between the transfer controller and actuator. After repairing, trace this chart from the beginning.
4	Is trouble detected in the axle detection harness between the axle actuator and transfer controller?	GND short of harness	Malfunction of axle actuator. Refer to the paragraph of axle disconnect. After repairing, trace this chart from the beginning.

*Before determining a trouble (Non-trouble mode)

Note:
Vehicle with manual hub and rigid hub don’t have axle actuator.
When the above-mentioned procedure is followed, check the harness between the axle dummy output terminal and the axle switch input terminal of the transfer controller, instead of axle actuator.

Though the indicator responds when shifting from 4H to 2H(or other position), it returns to 4H.

Step	Action	Yes	No
1	Is the ignition switch ON?	Go to step 2.	Turn the ignition switch ON and trace this chart from the beginning.
2	Does the transfer-related indicators (4WD, 4Lo, Check 4WD, neutral) light up for 2 seconds when the ignition switch is turned ON?	Go to step 3.	Indicator lamp burnt out. Disconnected harness wire. After repairing, trace this chart from the beginning.
3	After 2 seconds, check if the Check4WD lamp lights up. Is the Check4WD lamp OFF?	Go to step 4.	Failed actuator position detection (limit) switch (LS1, LS2, LS3, LS4, GND). Short or disconnection of harness of this detection switch. Refer to paragraph of Check4WD. After repairing, trace this chart from the beginning.
4	Press the 2H button. Is the sound of relay heard from the transfer controller?	Go to step 5.	Failed controller. Replace the controller and trace this chart from the beginning.
5	Is the sound of a running motor heart?	Failed control system of the transfer mechanism. Check and repair and trace this chart from the beginning.	Failed actuator motor. Disconnection of controller motor drive output circuit or GND short. After repairing, trace this chart from the beginning.

If the motor does not or cannot run at all (stuck transfer mechanism, disconnected motor, failed drive circuit), the lamp blinks at 4Hz when the position is shifted to other position by pressing the button for more 10 seconds (20 seconds in case of neutral position).

From 4H to 4L; Even after the correction step 3-3(*), 4Lo indicator blinks at 4Hz

Step	Action	Yes	No
1	Is the ignition switch ON?	Turn it OFF once.	Go to step 2.
2	Turn ON the ignition switch and check the valve. Do not start the engine. Has the valve check for 2 seconds been completed normally?	Go to step 3.	Refer to the paragraph about the indicator when it does not react when shifted from 2H to 4H. After taking the remedy, trace this chart from the beginning.
3	Shift to 2H. Can be shifted to 2H and then to 4H?	Go to step 4.	Refer to the paragraph about shifting from 2H to 4H. In particular, check if not at the Check4WD condition, return to this chart and trace it from the beginning.
4	Set to N position in case of AT and set to the neutral position in case of MT and check if the lamp blinks at 4Hz after operation.	Failed T/M position switch and harness (failure of TM1 and TM2 harness and their related switches shown in the figure). Incorrect wiring. Repair as required and trace this chart from the beginning.	Shift back to 4H and go to step 5.
5	Start the engine and use the vehicle. Does the speedometer run at this time?	Go to step 6.	Failure of speed sensor or disconnection or short of harness (for the meter). After repairing, trace this chart from the beginning.
6	Check the harness between the transfer controller and speed sensor. (Check the engine rotation detection harness at the same time.) Is any trouble detected?	Failed harness between the transfer controller and speed sensor. After repairing, trace this chart from the beginning. (Repair the engine rotation detection unit, if required.)	Go to step 7.
7	Run the vehicle for several meters, stop it, meet the permission requirements for operation limits. Did you wait for several seconds after the requirements were met?	Failed controller. Replace the controller and trace this chart from the beginning.	You did not wait for enough time. Optimum waiting time is 1 second or maximum 3 minutes, depending on the previous conditions. Refer to the paragraph about operation without failure.

*Before determining a trouble (Non-trouble mode)

From 4L to 4H: After the correction step 4-3(*), 4Lo indicator blinks at 4H.

Step	Action	Yes	No
1	Is the ignition switch ON?	Turn it OFF once.	Go to step 2.
2	Turn ON the ignition switch and check the valve. Do not start the engine. Has the valve check for 2 seconds been completed normally?	Go to step 3.	Refer to the paragraph about the indicator when it does not react when shifted from 2H to 4H. After taking the remedy, trace this chart from the beginning.
3	Can be shifted to 2H and then to 4L?	Go to step 4. (Impossible usually.) Failed controller	In case of Check 4WD, shifting to 2H is possible. Returning to 4L is impossible. Refer to the paragraph about Check4WD.
4	Set to N position in case of AT and set to the neutral position in case of MT and check if the lamp blinks at 4Hz after operation.	Failed T/M position switch and harness (failure of TM1 and TM2 harness and their related switches shown in the figure). Incorrect wiring. Repair as required and trace this chart from the beginning.	Press the operation switch of 4L and go to step 5.
5	Start the engine and use the vehicle. Does the speedometer run at this time?	Go to step 6.	Failure of speed sensor or disconnection or short of harness (for the meter). After repairing, trace this chart from the beginning.
6	Check the harness between the transfer controller and speed sensor. (Check the engine rotation detection harness at the same time.) Is any trouble detected?	Failed harness between the transfer controller and speed sensor. After repairing, trace this chart from the beginning. (Repair the engine rotation detection unit, if required.)	Go to step 7.
7	Run the vehicle for several meters, stop it, meet the permission requirements for operation limits. Did you wait for several seconds after the requirements were met?	Failed transfer controller. Replace the controller and trace this chart from the beginning.	You did not wait for enough time. Optimum waiting time is 1 second or maximum 3 minutes, depending on the previous conditions. Refer to the paragraph about operation without failure.

*Before determining a trouble (Non-trouble mode)

To neutral: After the correction step 5-2(*), neutral indicator blinks at 4Hz.

Check the function between H and L according to the chart for 4L to 4H instead of check for the requirements of neutral.

Step	Action	Yes	No
1	Is the ignition switch ON?	Turn it OFF once.	Go to step 2.
2	Turn ON the ignition switch and check the valve. Do not start the engine. Has the valve check for 2 seconds been completed normally?	Go to step 3.	Refer to the paragraph about the indicator when it does not react when shifted from 2H to 4H (7D1-37). After taking the remedy, trace this chart from the beginning.
3	Can be shifted to 2H and then to 4L?	Go to step 4. (Impossible usually.) Failed controller	Refer to the paragraph about shifting from 2H to 4H. In particular, check if not at the Check4WD condition, return to this chart and trace it from the beginning. In case of Check4WD, shifting to 2H is possible. Returning to 4H is impossible. Refer to the paragraph about Check4WD.
4	Set to N position in case of AT and set to the neutral position in case of MT and check if the lamp blinks at 4Hz after operation.	Failed T/M position switch and harness (failure of TM1 and TM2 harness and their related switches shown in the figure). Incorrect wiring. Repair as required and trace this chart from the beginning.	Shift back to 4H and go to step 5.
5	Start the engine and use the vehicle. Does the speedometer run at this time?	Go to step 6.	Failure of speed sensor or disconnection or short of harness (for the meter). After repairing, trace this chart from the beginning.
6	Check the harness between the transfer controller and speed sensor. (Check the engine rotation detection harness at the same time.) Is any trouble noticed?	Failed harness between the transfer controller and speed sensor. After repairing, trace this chart from the beginning. (Repair the engine rotation detection unit, if required.)	Go to step 7.
7	Run the vehicle for several meters, stop it, meet the permission requirements for operation limits. Did you wait for several seconds after the requirements were met?	Failed controller. Replace the controller and trace this chart from the beginning.	You did not wait for enough time. Optimum waiting time is 1 second or maximum 3 minutes, depending on the previous conditions. Refer to the paragraph about operation without failure.

*Before determining a trouble (Non-trouble mode)

For shifting to neutral, 2H and 4L switches should be pressed at the same time for 10 seconds.
For shifting from neutral to other position, 2H, 4H or 4L switch should be pressed for 10 seconds.
When shifting from neutral to other position, the lamp blinking at 2Hz indicates active condition.
When the lamp keeps blinking at 2Hz, follow the step for the case when the lamp keeps blinking at 2Hz when shifting between positions.

GENERAL INFORMATION

The body and chassis electrical system operates on a twelve volt power supply with negative ground polarity.
The main harness consists of the engine harness, the instrument harness, the body harness, and the chassis harness.
The harnesses use a split corrugated tube to protect the wires from the elements.
Wire size is determined by current flow, circuit length, and voltage drop.
All wires have color-coded insulation.
Wire color-codes are shown in the circuit diagrams.
This makes it easier to trace circuits and to make the proper connections.

Each circuit consists of the following:

5. Power source – The battery and the alternator
5. Wires – To carry electrical current through the circuit
5. Fuses – To protect the circuit against current overload
5. Relays – To protect voltage drop between the battery and the circuit parts and to protect the switch points against burning
5. Switches – To open and close the circuit
5. Load – Any device, such as a light or motor, which converts the electrical current into useful work
5. Ground – To allow the current to flow back to the power source

NOTES FOR WORKING ON ELECTRICAL ITEMS

Battery

BATTERY CABLE

Disconnecting the Battery Cable

5. All switches should be “OFF” position.
5. Disconnect the battery ground cable.
5. Disconnect the battery positive cable.

CAUTION:

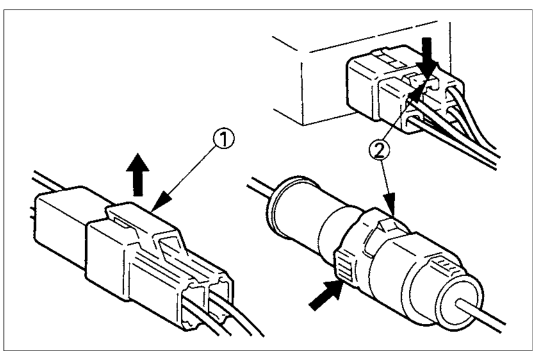
It is important that the battery ground cable be disconnected first.
Disconnecting the battery positive cable first can result in a short circuit.

Connecting the Battery Cable

Follow the disconnecting procedure in the reverse order to connect the battery cables.

CAUTION:

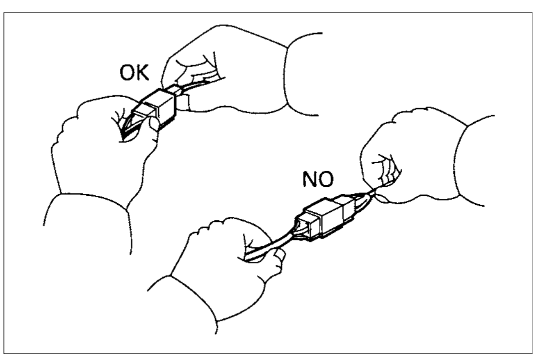
Clean the battery terminal and apply light coat of grease to prevent terminal corrosion.



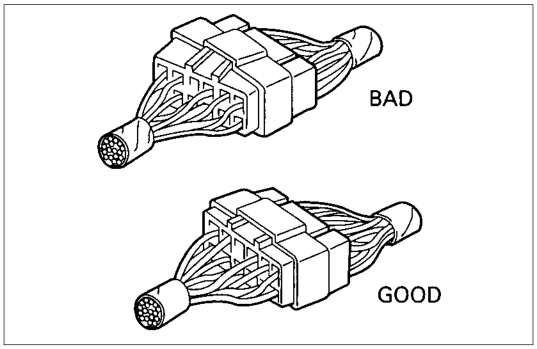
CONNECTOR HANDLING

Disconnecting the Connectors

Some connectors have a tang lock to hold the connectors together during vehicle operation.
Some tang locks are released by pulling them towards you ①.
Other tang locks are released by pressing them forward ②.
Determine which type of tang lock is on the connector being handled.

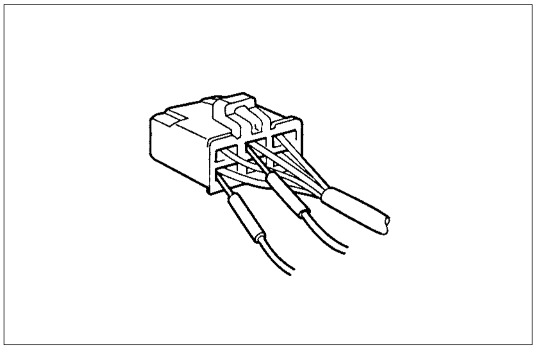


Firmly grasp both sides (male and female) of the connector.
Release the tang lock and carefully pull the two halves of the connector apart.
Never pull on the wires to separate the connectors.
This will result in wire breakage.



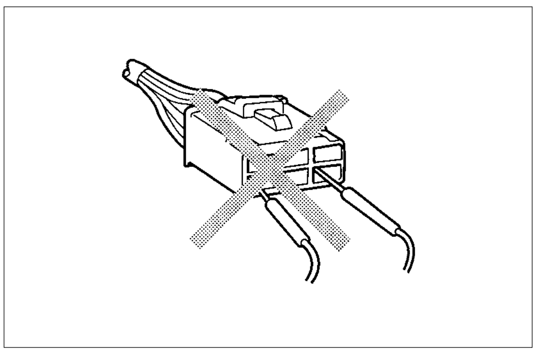
Connecting the Connectors

Firmly grasp both sides (male and female) of the connector.
Be sure that the connector pins and pin holes match.
Be sure that both sides of the connector are aligned with each other.
Firmly but carefully push the two sides of the connector together until a distinct click is heard.

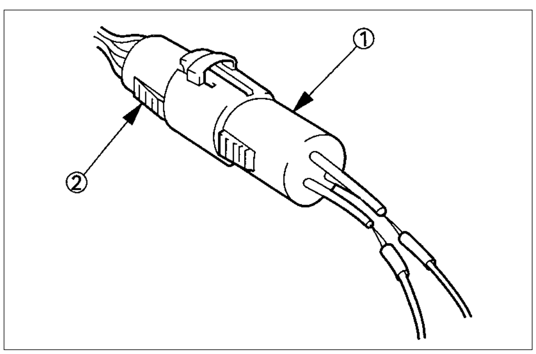


Connector Inspection

Use a circuit tester to check the connector for continuity.
Insert the test probes from the connector wire side.

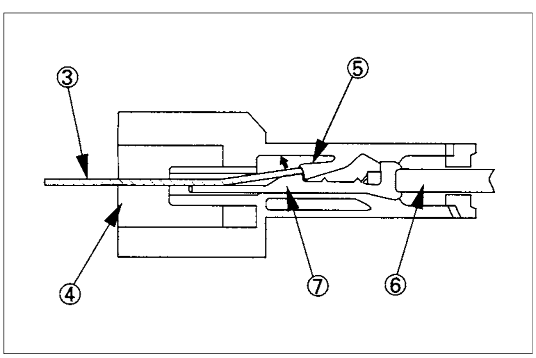


CAUTION
Never insert the circuit tester test probes into the connector open side to test the continuity.
Broken or open connector terminals will result.



Waterproof Connector Inspection

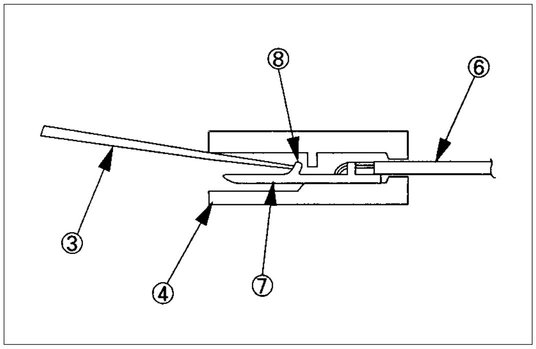
It is not possible to insert the test probes into the connector wire side of a waterproof connector.
Use one side of a connector ① with its wires cut to make the test.
Connect the test connector to the connector ② to be tested.
Connect the test probes to the cut wires to check the connector continuity.



Connector Pin Removal
Connector Housing Tang Lock Type

5. Insert a slender shaft ③ into the connector housing open end ④.
5. Push the tang lock ⑤ up (in the direction of the arrow in the illustration).

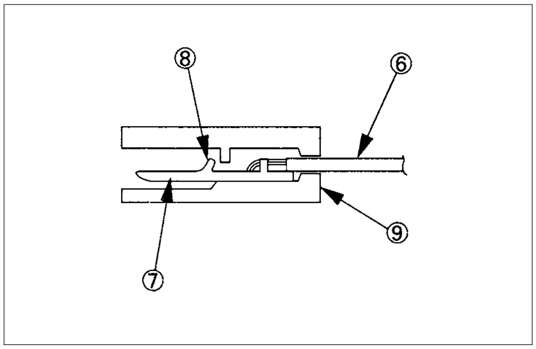
   Pull the wire ⑥ with pin ⑦ free from the wire side of the connector.



Pin Tang Lock Type

5. Insert a slender shaft ③ into the connector housing open end ④.
5. Push the tang lock ⑧ flat (toward the wire side of the connector).

   Pull the wire ⑥ with pin ⑦ free from the wire side of the connector.



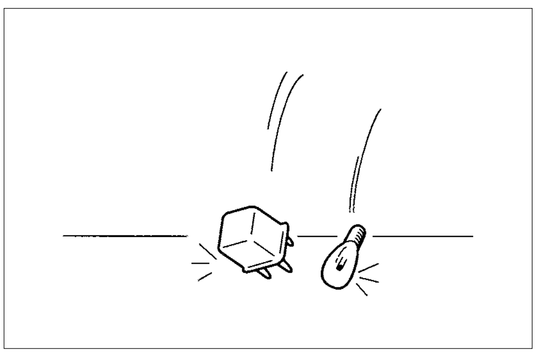
Connector Pin Insertion

5. Check that the tang lock ⑧ is fully up.
5. Insert the pin ⑦ from the connector wire side ⑨.

   Push the pin in until the tang lock closes firmly.
5. Gently pull on the wires ⑥ to make sure that connector pin is firmly set in place.

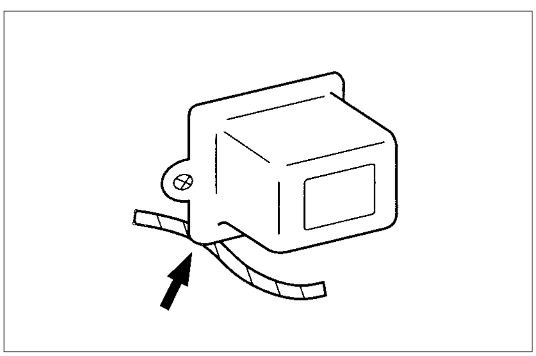
Fuse Replacement

The replacement fuse must have the same amperage specification as the original fuse.
Never replace a burn out fuse with a fuse of a different amperage specification.
Doing so can result in an electrical fire or other serious circuit damage.



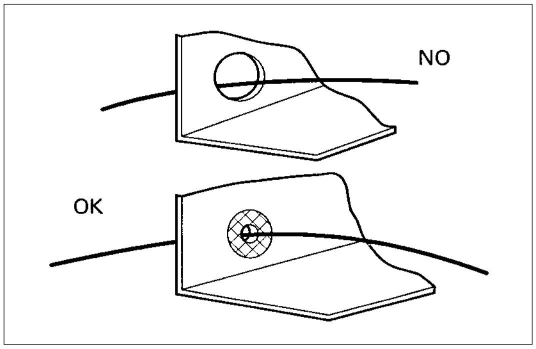
Parts Handling

Be careful for parts handling and any part should not be dropped or thrown, otherwise short circuit or disorder may result.

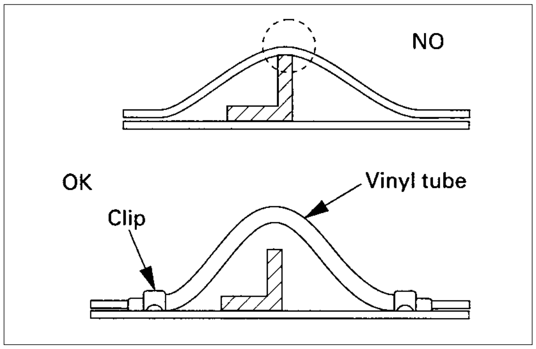


Wiring Harness

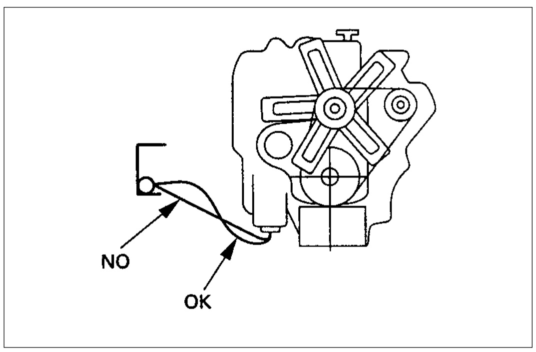
5. When assembling the parts, be careful not to bite or wedge the wiring harness.
5. All electrical connections must be kept clean and tight.



5. Use a grommet or guard tube to protect the wiring harness from contacting a sharp edge or surface.



5. Position the wiring harness with enough clearance from the other parts and guard the wiring harness with a vinyl tube to avoid direct contact.



5. The wiring harness between engine and chassis should be long enough to prevent chafing or damage due to various vibrations.

SPLICING WIRE

Open the Harness

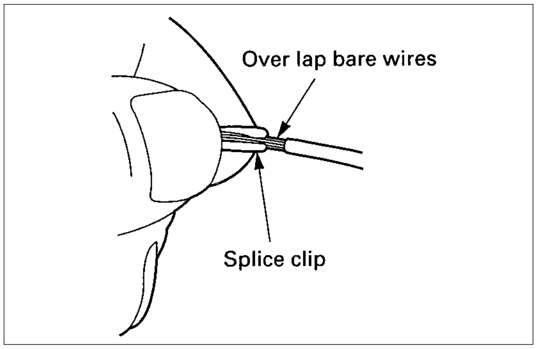
If the harness is taped, remove the tape.
To avoid wire insulation damage, use a sewing “seam ripper” (available from sewing supply stores) to cut open the harness.
If the harness has a black plastic conduit, simply pull out the desired wire.

Cut the wire

Begin by cutting as little wire off the harness as possible.
You may need the extra length of wire later if you decide to cut more wire off to change the location of a splice.
You may have to adjust splice locations to make certain that each splice is at least 1-1/2” (40 mm) away from other splices, harness branches, or connectors.

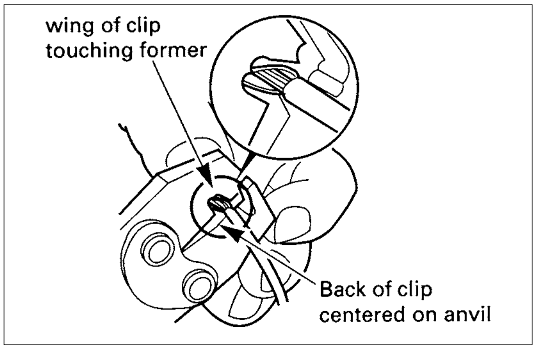
Strip the insulation

When replacing a wire, use a wire of the same size as the original wire.
Check the stripped wire for nicks or cut strands.
If the wire is damaged, repeat the procedure on a new section of wire.
The two stripped wire ends should be equal in length.

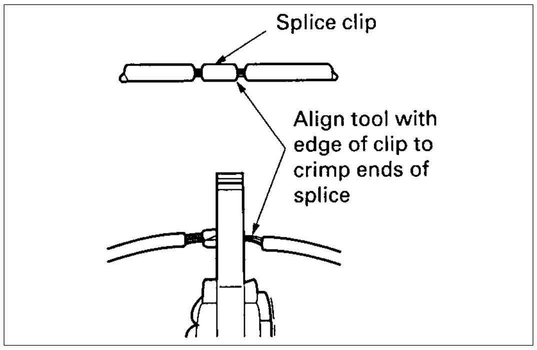


Crimp the Wires

Select the proper clip to secure the splice.
To determine the proper clip size for the wire being spliced, follow the directions included with your clips.
Select the correct anvil on the crimper.
(On most crimpers your choice is limited to either a small or large anvil.)
Overlap the two stripped wire ends and hold them between your thumb and forefinger.
Then, enter the splice clip under the stripped wires and hold it in place.

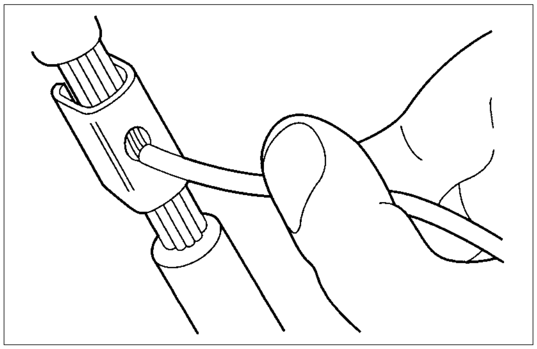


- Open the crimping tool to its full width and rest one handle on a firm flat surface.
- Center the back of the splice clip on the proper anvil and close the crimping tool to the point where the back of the splice clip touches the wings of the clip.
- Make sure that the clip and wires are still in the correct position. Then, apply pressure until the crimping tool closes.



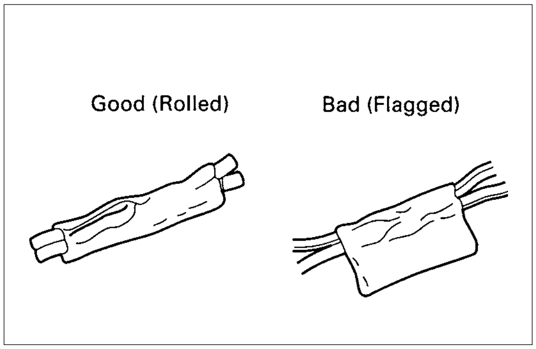
Before crimping the ends of the clip, be sure that:
- The wires extend beyond the clip in each direction.
- No strands of wire are cut loose.
- No insulation is caught under the clip.

Crimp the splice again, once on each end.
Do not let the crimping tool extend beyond the edge of the clip or you may damage or nick the wires.



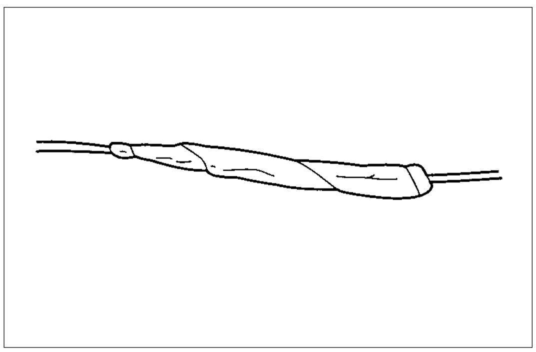
Solder

Apply 60/40 rosin core solder to the opening in the back of the clip.
Follow the manufacturer's instructions for the solder equipment you are using.



Tape the Splice

Center and roll the splicing tape.
The tape should cover the entire splice.
Roll on enough tape to duplicate the thickness of the insulation on the existing wires.
Do not flag the tape.
Flagged tape may not provide enough insulation, and the flagged ends will tangle with the other wires in the harness.



If the wire does not belong in a conduit or other harness covering, tape the wire again.
Use a winding motion to cover the first piece of tape.

SYMBOLS AND ABBREVIATIONS

SYMBOLS

Symbol	Meaning of Symbol	Symbol	Meaning of Symbol
	Fuse		Bulb
	Slow blow fuse		Double filament bulb
	Fusible link wire		Motor
	Switch (Normal open type)		Variable register Rheostat
	Switch		Coil (inductor), solenoid, magnetic valve
	Switch (Normal close type)		Relay (Normal open type)
	Contact wiring		Relay (Normal close type)
	Selection of harness. It displays selecting shared.		
	Battery		Connector
	Diode		Light emitting diode
	Electronic Parts		Reed switch
	Resistor		Condenser
	Speaker		Horn
	Buzzer		Vacuum switching valve
	Circuit breaker		Arrow shows circuit continues to the deferent page
			Arrow shows circuit continues in the same page

2. VIBRATION

Checkpoint		Trouble Cause	Countermeasure
Rear hub bearing	NG	Worn rear hub bearing	Replace the rear hub bearing
OK ↓			
Rear axle shaft	NG	Bent rear axle shaft	Replace the rear axle shaft

ABBREVIATIONS

Abbreviation	Meaning of abbreviation	Abbreviation	Meaning of abbreviation
A	Ampere (S)	kW	Kilowatt
ABS	Anti-lock brake system	LH	Left hand
ASM	Assembly	LWB	Long wheel base

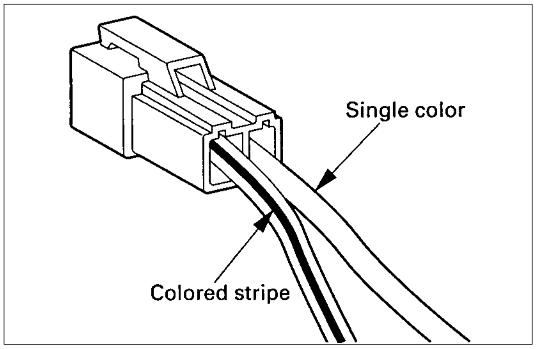
IC	Integrated circuit	W/S	Weld Splice
IG	Ignition		

PARTS FOR ELECTRICAL CIRCUIT



WIRING

Wire Color

All wires have color-coded insulation.
Wires belonging to system's main harness will have a single color.
Wires belonging to a system's sub-circuits will have a colored stripe.
Striped wires use the following code to show wire size and colors.

Example: 0.5 G / R

- R — Red (Stripe color)
- G — Green (Base color)
- 0.5 — Wire size ($0.5mm^2$)

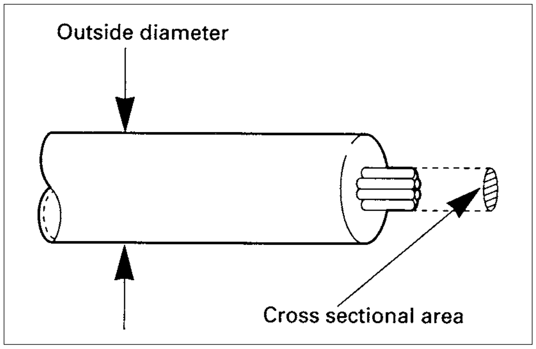
Abbreviations are used to indicate wire color within a circuit diagram.
Refer to the following table.

Wire Color-Coding

Color-Coding	Meaning	Color-Coding	Meaning
B	Black	BR	Brown
W	White	LG	Light green
R	Red	GR	Gray
G	Green	P	Pink
Y	Yellow	SB	Sky blue
L	Blue	V	Violet
O	Orange		

Distinction of Circuit by Wire Base Color

Base color	Circuits	Base color	Circuits
B	Starter circuit and grounding circuit	Y	Instrument circuit
W	Charging circuit	L, O, BR, LG, GR, P, LB, V	Other circuits
R	Lighting circuit		
G	Signal circuit		

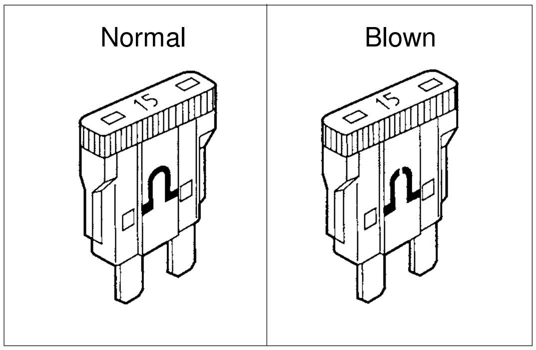


Wire Size

Wire size is specified with the metric gauge system.
The metric gauge system gives the wire size in cross sectional area measured in square millimeters.

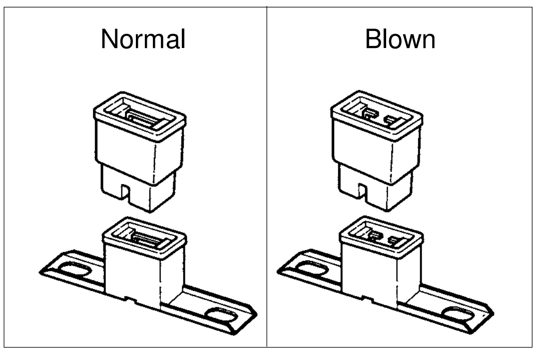
Wire Size Specifications

Nominal size	Cross sectional area (mm^2)	Outside diameter (mm)	Allowable current (A)
0.3	0.372	1.8	9
0.5	0.563	2.0	12
0.85	0.885	2.2	16
1.25	1.287	2.5	21
2	2.091	2.9	28
3	3.296	3.6	37.5
5	5.227	4.4	53
8	7.952	5.5	67
15	13.36	7.0	75
20	20.61	8.2	97



FUSE

Fuses are the most common form of circuit protection used in vehicle wiring.
A fuse is a thin piece of wire or strip of metal encased in a glass or plastic housing.
It is wired in series with the circuit it protects.
When there is an overload of current in a circuit, such as a short of a ground, the wire or metal strip is designed to burn out and interrupt the flow of current.
This prevents a surge of high current from reaching and damaging other components in the circuit.
Determine the cause of the overloaded before replacing the fuse.
Never replace a blown fuse with a fuse of a different amperage specification.
Doing so can result in an electrical fire or other serious circuit damage.
A blown fuse is easily identified.

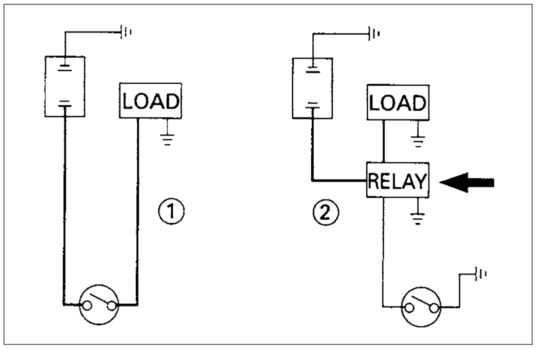


FUSIBLE LINK

The fusible link is primarily used to protect circuits where high amounts of current flow and where is would not be practical to use a fuse.
For example, the starter circuit.
When a current overload occurs, the fusible link melts open and interrupts the flow of current so as to prevent the rest of the wiring harness from burning.
Determine the cause of the overload before replacing the fusible link.
The replacement fusible link must have the same amperage specification as the original fusible link.
Never replace a blown fusible link with fusible link of a different amperage specification.
Doing so can result in an electrical fire or other serious circuit damage.
A blown fusible link is easily identified.

Fusible Link Specifications

Type	Rating	Case Color	Maximum Circuit Current (A)
Connector	30A	Pink	15
Connector	40A	Green	20
Bolted	50A	Red	25
Bolted	60A	Yellow	30
Bolted	80A	Black	40



RELAY

Battery and load location may require that a switch be placed some distance from either component.
This means a longer wire and a higher voltage drop ①. The installation of a relay between the battery and the load reduces the voltage drop ②.
Because the switch controls the relay, amperage through the switch can be reduced.

Relay Specifications and Configurations

Name/ Color	Rated voltage/ Coil resistance	Internal circuit	Name/ color	Rated Voltage/Coil resistance	Internal circuit
1T (MICRO ISO) /Black	12V Approx. 92Ω Minimum operating voltage: 7V at 20°C (77°F)		1M (MINI ISO) /Black	12V Approx. 94Ω Minimum operating voltage: 7V at 20°C (77°F)	1M (MICRO ISO) /Black	12V Approx. 132-3 Ω Minimum operating voltage: 7V at 20°C (77°F)		1M (power)/ Black	12V Approx. 94Ω Minimum operating voltage: 7V at 20°C (77°F)	
* Relay contact shown in the wiring diagram indicates condition before actuation.

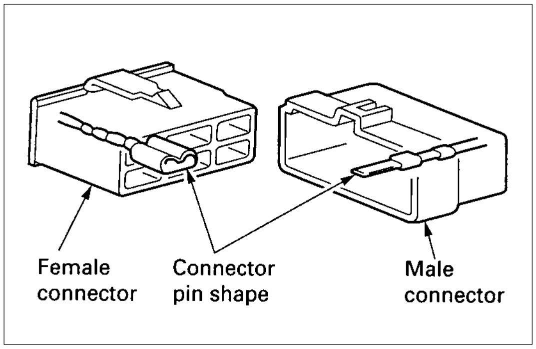
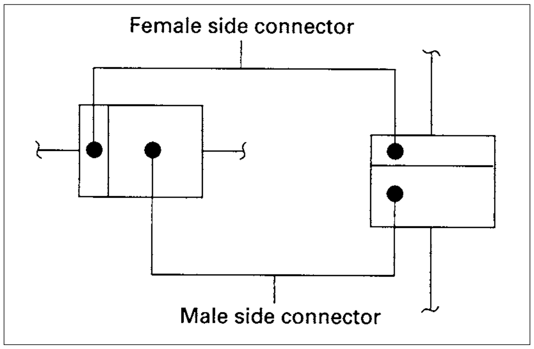
Storage temperature	-40°C~100ßC	

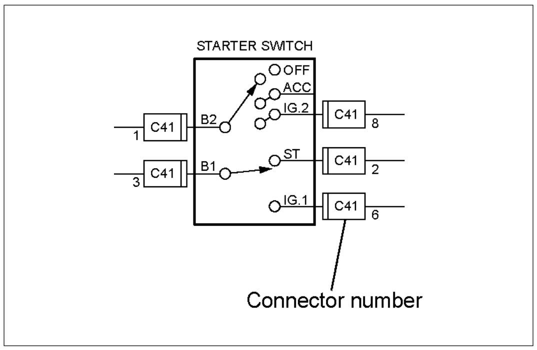
CONNECTOR



The connector pin shape determines whether the connector is male or female.
The connector housing configuration does not determine whether a connector is male or female.

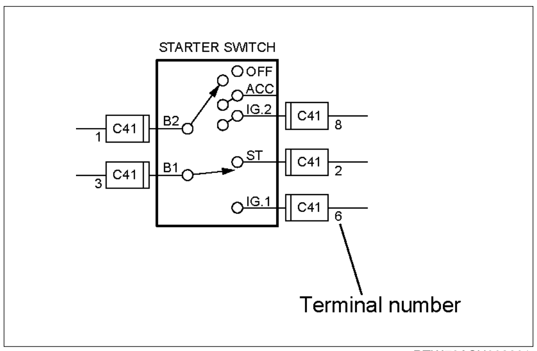


The symbol illustrated in the figure is used as connector in the circuit this section.



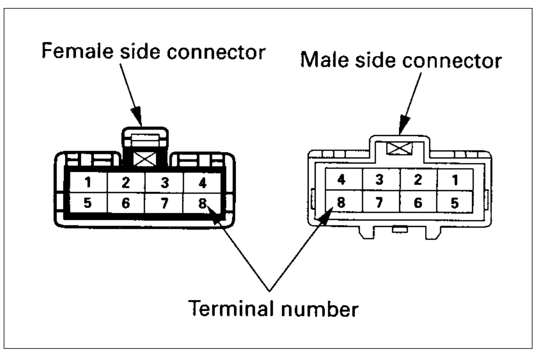
RTW78ASH003101

Connector is identified with a number.



RTW78ASH003201

The applicable terminal number is shown for each connector.



Connector terminal numbers are clearly shown.
Male side connector terminal numbers are in sequence from upper right to lower left.
Female side connector terminal numbers are in sequence from upper left to lower right.

NOTE:

For those connectors on which specific terminal numbers on symbols are shown, the terminal numbers or symbols are used in the circuit diagram, irrespective of the above rule.

Battery-1

BATTERY

Inspection

1. Check the battery terminals ① for corrosion.
2. Check the battery cables ② for looseness.
3. Check the battery case ③ for cracks and other damage.
4. Check the battery electrolyte level.

Battery-2

Battery Replacement

1. Disconnect the battery ground cable ①.
2. Disconnect the battery positive cable ②.
3. Remove the battery clamp ③.
4. Remove the battery

Caution:
It is important that the battery ground cable be removed first.
Removing the battery positive cable first can result in a short circuit.

Jump Starting the Engine with a Booster Battery

The following description assumes that you are using a booster battery mounted on a second vehicle.
The listed steps (with some minor modifications) are also applicable if you are using a naked booster battery or special battery charging equipment.

Caution:
Never push or tow the vehicle in an attempt to start it.
Extensive damage to the emission system and other vehicle parts will result.
(Only catalytic converter vehicle)
Treat both the discharged battery and the booster battery with great care when using jumper cables.
Carefully follow the procedure outlined below.
Always be aware of the dangers of sparking.
Failure to follow the following procedure can result in:

a. Serious personal injury, specially to your eyes.

b. Extensive property damage from a battery explosion, battery acid discharge, or electrical file.

c. Extensive damage to the electronic components of both vehicles.

Do not use a 24 volt booster battery.
Serious damage to the vehicle's electrical system and electronic components will result.

Jump Starting Procedure

1. Set the parking brake on both vehicles.
2. If one or both vehicles is equipped with a manual transmission, place the gear shift in the "NEUTRAL" position.
3. Turn off the ignition on both vehicles.
4. Turn off all vehicle lights and accessories.
5 Be sure that the two vehicles are not touching.
  Attach the end of one jumper cable to the booster battery positive terminal.
6 Attach the other end of the same cable to the discharged battery positive terminal.
7. Once again, check that the booster battery has a 12 volt rating.
8. Attach one end of the remaining booster cable to the booster battery negative terminal.
9. Attach the other end of the booster cable to a solid ground (such as the air conditioner compressor mounting bracket or the alternator mounting bracket) in the engine room of the vehicle with the discharged battery.
10. Be sure that the ground connection is at least 500 mm (20 in) from the discharged battery.

Caution:
Do not attach the booster cable to the discharged battery negative terminal.

11. Start the engine of the vehicle with the booster battery. Check that all unnecessary electrical accessories are off.
12. Start the engine of the vehicle with the discharged battery.
13. Remove the jumper cables in the reverse order to which they were attached.

Caution:
Be absolutely sure to remove the negative jumper cable from the vehicle with the discharged battery first.

3. OIL LEAKAGE

1) Differential Carrier Leakage

Checkpoint	Trouble Cause	Countermeasure
Gear oil level	Too much gear oil	Correct the oil level
Oil seal	Worn or defective oil seal	Replace the oil seal
Air breather	Clogged air breather	Clean the air breather
Differential carrier	Loose bolts	Tighten the bolts to the specified torque
	Liquid gasket seal bed	Reapply the liquid gasket
Ring gear thrust bolt	Loose lock nut and/or liquid	Reapply the liquid gasket and/or tighten the lock nut to the specified torque

READING THE CIRCUIT DIAGRAM

In this manual, each system has its own parts location illustration and circuit diagram.
And connector configurations used in the circuit diagram are shown at the end of this manual.
PARTS LOCATION: The parts location shows the location of the connectors ① and the harnesses ② used in the each system.
CIRCUIT DIAGRAM: The circuit diagram shows the power supply ③, the load or loads ④ and the grounding point(s) ⑤.
CONNECTOR LIST: The connector configuration shows each connector's number ⑥, configuration ⑦ and the pin numbers ⑧, parts name ⑨, connector color ⑩.

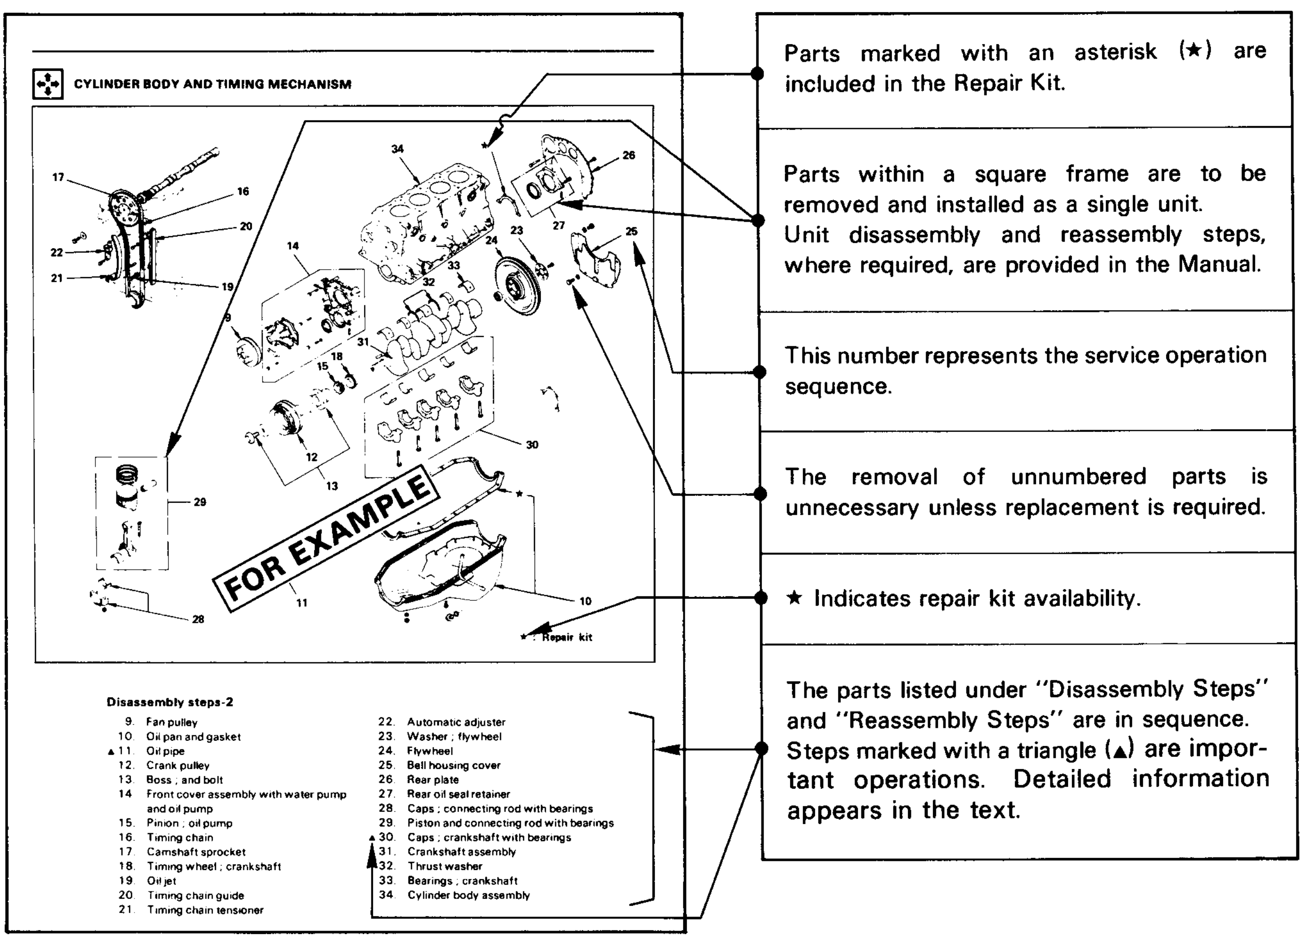
NOTES ON THE FORMAT OF THIS MANUAL

1. Find the applicable section by referring to the index at the front of the Workshop Manual binder.
2. The following technical service information is included in this Section:
    - Identification
    - Maintenance schedules
    - Recommended lubricants
    - Recommended fuels
    - Oil viscosity charts
3. Individual sections of this Workshop Manual are divided into the following categories:
    - Main data and specifications
    - Torque specifications
    - Recommended liquid gasket
    - Loctite application procedure
    - Servicing
    - Removal and installation
    - Disassembly
    - Inspection and repair
    - Reassembly
    - Troubleshooting
4. Each "Major Components" page of this Workshop Manual has an exploded view of the applicable area. A brief explanation of the notation used follows:



(4JJ1-TC Standard Output, 4JJ1-TC High Output, 4JK1-TC High Output LHD MODEL)

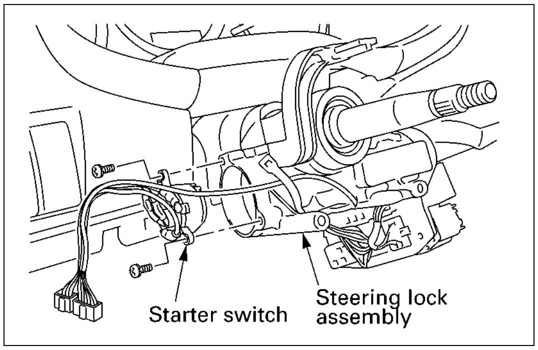
REMOVAL AND INSTALLATION



This illustration is based on RHD model

STARTER SWITCH

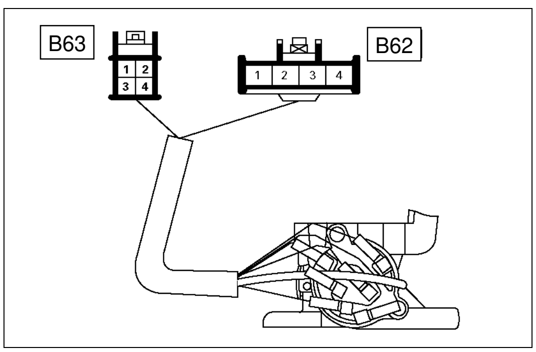
Removal

1. Steering Lock Assembly
   - Refer to Section 3B" STEERING COLUMN" for steering lock assembly removal steps.
2. Starter Switch

Installation

Follow the removal procedure in the reverse order to install the starter switch.

INSPECTION AND REPAIR



STARTER SWITCH

MAIN DATA AND SPECIFICATIONS

FRONT AXLE AND DIFFERENTIAL

Ring gear size mm (in)		ϕ194 (7.6)
Axle tube		
Type		It consists of the duce, a cast iron housing and the Axle tube.
Gear type		Hypoid
Gear ratio	(to 1)	3.583, 3.727, 3.909, 4.100, 4.300, 4.555, 4.777, 5.125
Differential type		Two pinion
Specified gear oil (APL grade)		GL-5
Oil capacity	liter	1.4
	(US/UK gal.)	(0.4/0.31)
Axle shaft type		Constant velocity joint (Barfield joint type and double offset joint).

REMOVAL AND INSTALLATION

ECM (ENGINE CONTROL MODULE); C24SE

Removal

1. Lift both the ECM harness connector locking levers and remove the two harness connectors form the ECM.
2. Remove the four socket head screws securing the ECM to the mounting bracket.
3. Remove the ECM from the engine compartment.

4. Pull out the ECM.
5. Disconnect both red and tan connectors.

Refer to the Section 6E-ENGINE of this Manual.

IMPORTANT: The replacement ECM must be programmed.
"SPS (Service Programming System) and immobilizer programming (if equipped) is/are necessary"

Installation

Follow the removal procedure in the reverse order to install the ECM.

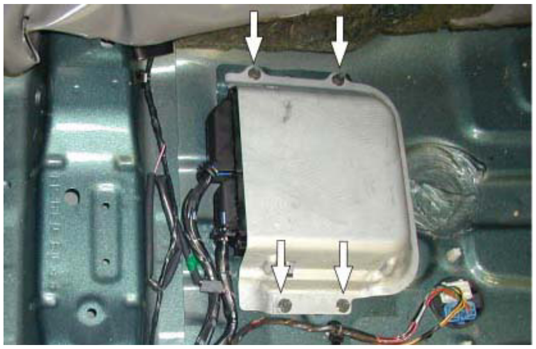
Pay close attention to the important points mentioned in the following paragraphs.

Connector

Be absolutely sure that ECM is securely connected.
This will prevent a poor contact and open circuit.

REMOVAL AND INSTALLATION

ECM (ENGINE CONTROL MODULE); 4JH1-TC



Removal

1. Remove the passenger side front seat – refer to Section 10 CAB.
2. Remove the passenger side front door opening scuff plate.
3. Raise the carpet to gain access to the four hex-head bolts securing the ECM and ECM cover to the floor pan.
4. Remove the four hex-head bolts.
5. Pull the two harness connector locks away from the harness connectors and then remove the connectors form the ECM.
6. Remove the ECM from the vehicle.

Refer to the Section 6E-ENGINE of this Manual.

IMPORTANT: The replacement ECM must be programmed. ***"SPS (Service Programming System) and immobilizer programming (if equipped) is/are necessary"***

Installation

Follow the removal procedure in the reverse order to install the ECM.
Torque passenger seat securing bolts to the specified value – refer to Section 10 CAB
Pay close attention to the important points mentioned in the following paragraphs.

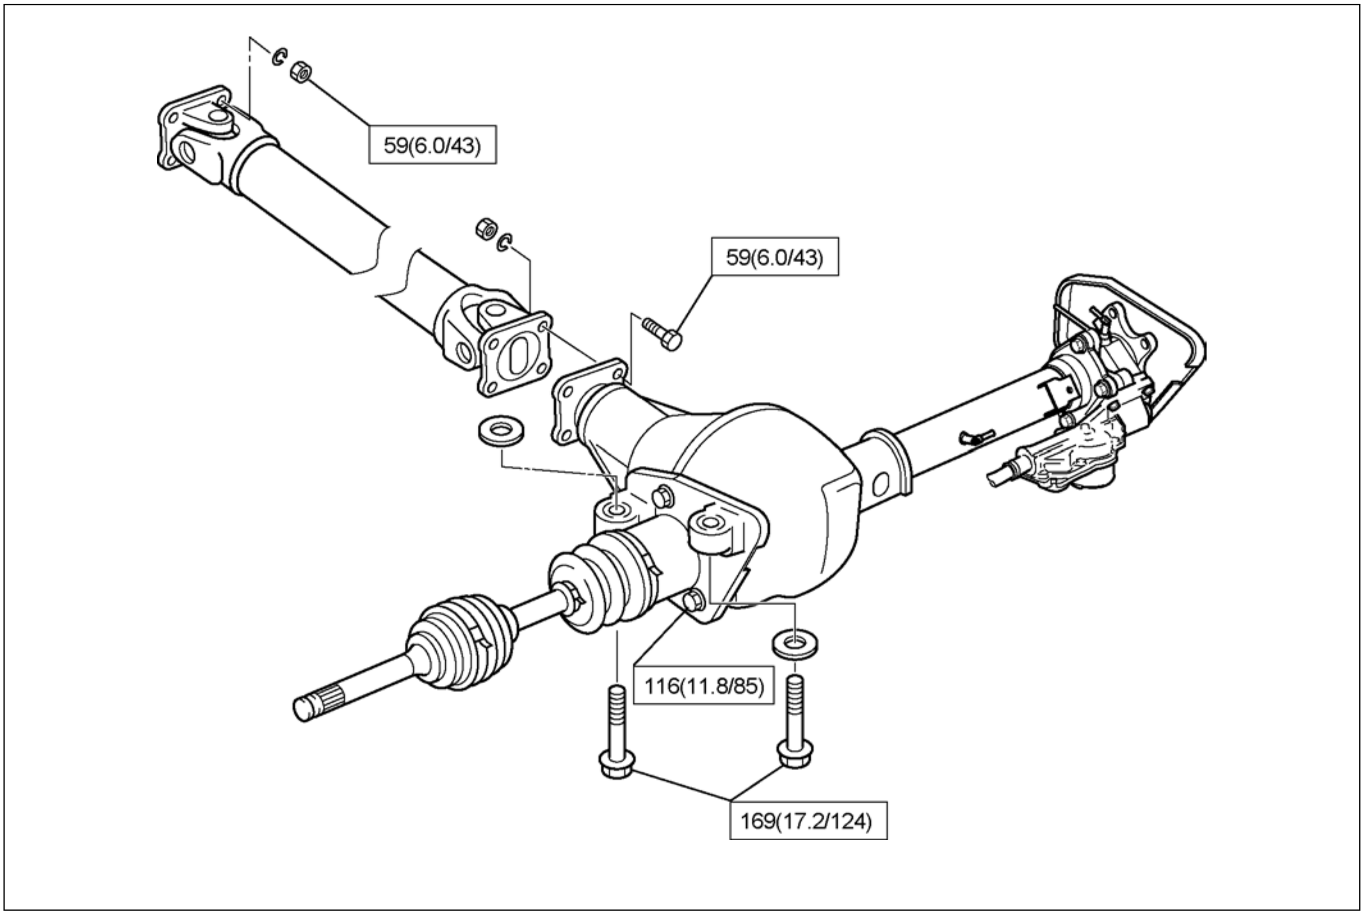
Connector

Be absolutely sure that ECM is securely connected.
This will prevent a poor contact and open circuit.

SPECIAL PARTS FIXING NUTS AND BOLTS

FRONT DRIVE AXLE AND PROPELLER SHAFT

N·m (kgf·m/lb·ft)



RTW74CMF000101

REMOVAL AND INSTALLATION

FUEL GAUGE UNIT AND SENDER ASSEMBLY

Removal

1. Remove the fuel gauge unit and sender assembly.
   Refer to the “ENGINE FUEL” Section 6C of this Manual.

Installation

To install the fuel gauge unit and sender assembly, follow the removal procedure in reverse order.
Pay close attention to the important points mentioned in the following paragraphs.

Rubber Seal

Be absolutely sure that the fuel sender rubber seals are correctly seated.

Connector

Be absolutely sure that the fuel gauge unit connector is securely connected.
This will prevent a poor contact and an open circuit.

TROUBLE SHOOTING

HEADLIGHT

1. Both the headlights (high and low beam) do not light

Checkpoint		Trouble Cause	Countermeasure
Ground point contact (C2), (C36)	NG	Poor ground point contact	Repair the wiring
OK			
Combination switch continuity	NG	Poor switch contact or sw faulty	Repair or replace the combination switch
OK			
Lighting relay	NG	Poor relay contact or relay faulty	Reinstall or replace the lighting relay
OK			
Voltage between 5 X6 - ground and 2 X6 - ground	NG	Open circuit between battery positive terminal and lighting relay	Repair open circuit
OK			
Voltage between 1 B60 - ground	NG	Open circuit between lighting relay and lighting switch	Repair open circuit or connector contact
OK			
Wiring continuity between B60 - C2	NG	Open circuit	Repair open circuit

2. High or low beam does not light on both headlights

Checkpoint		Trouble Cause	Countermeasure
Dimmer·passing switch continuity	NG	Poor switch contact or switch faulty	Repair or replace the combination switch
OK ↓			
Voltage between 4 X4 - ground and 4 B60 - ground	NG	Open circuit between headlight and dimmer·passing switch	Repair open circuit or connector contact

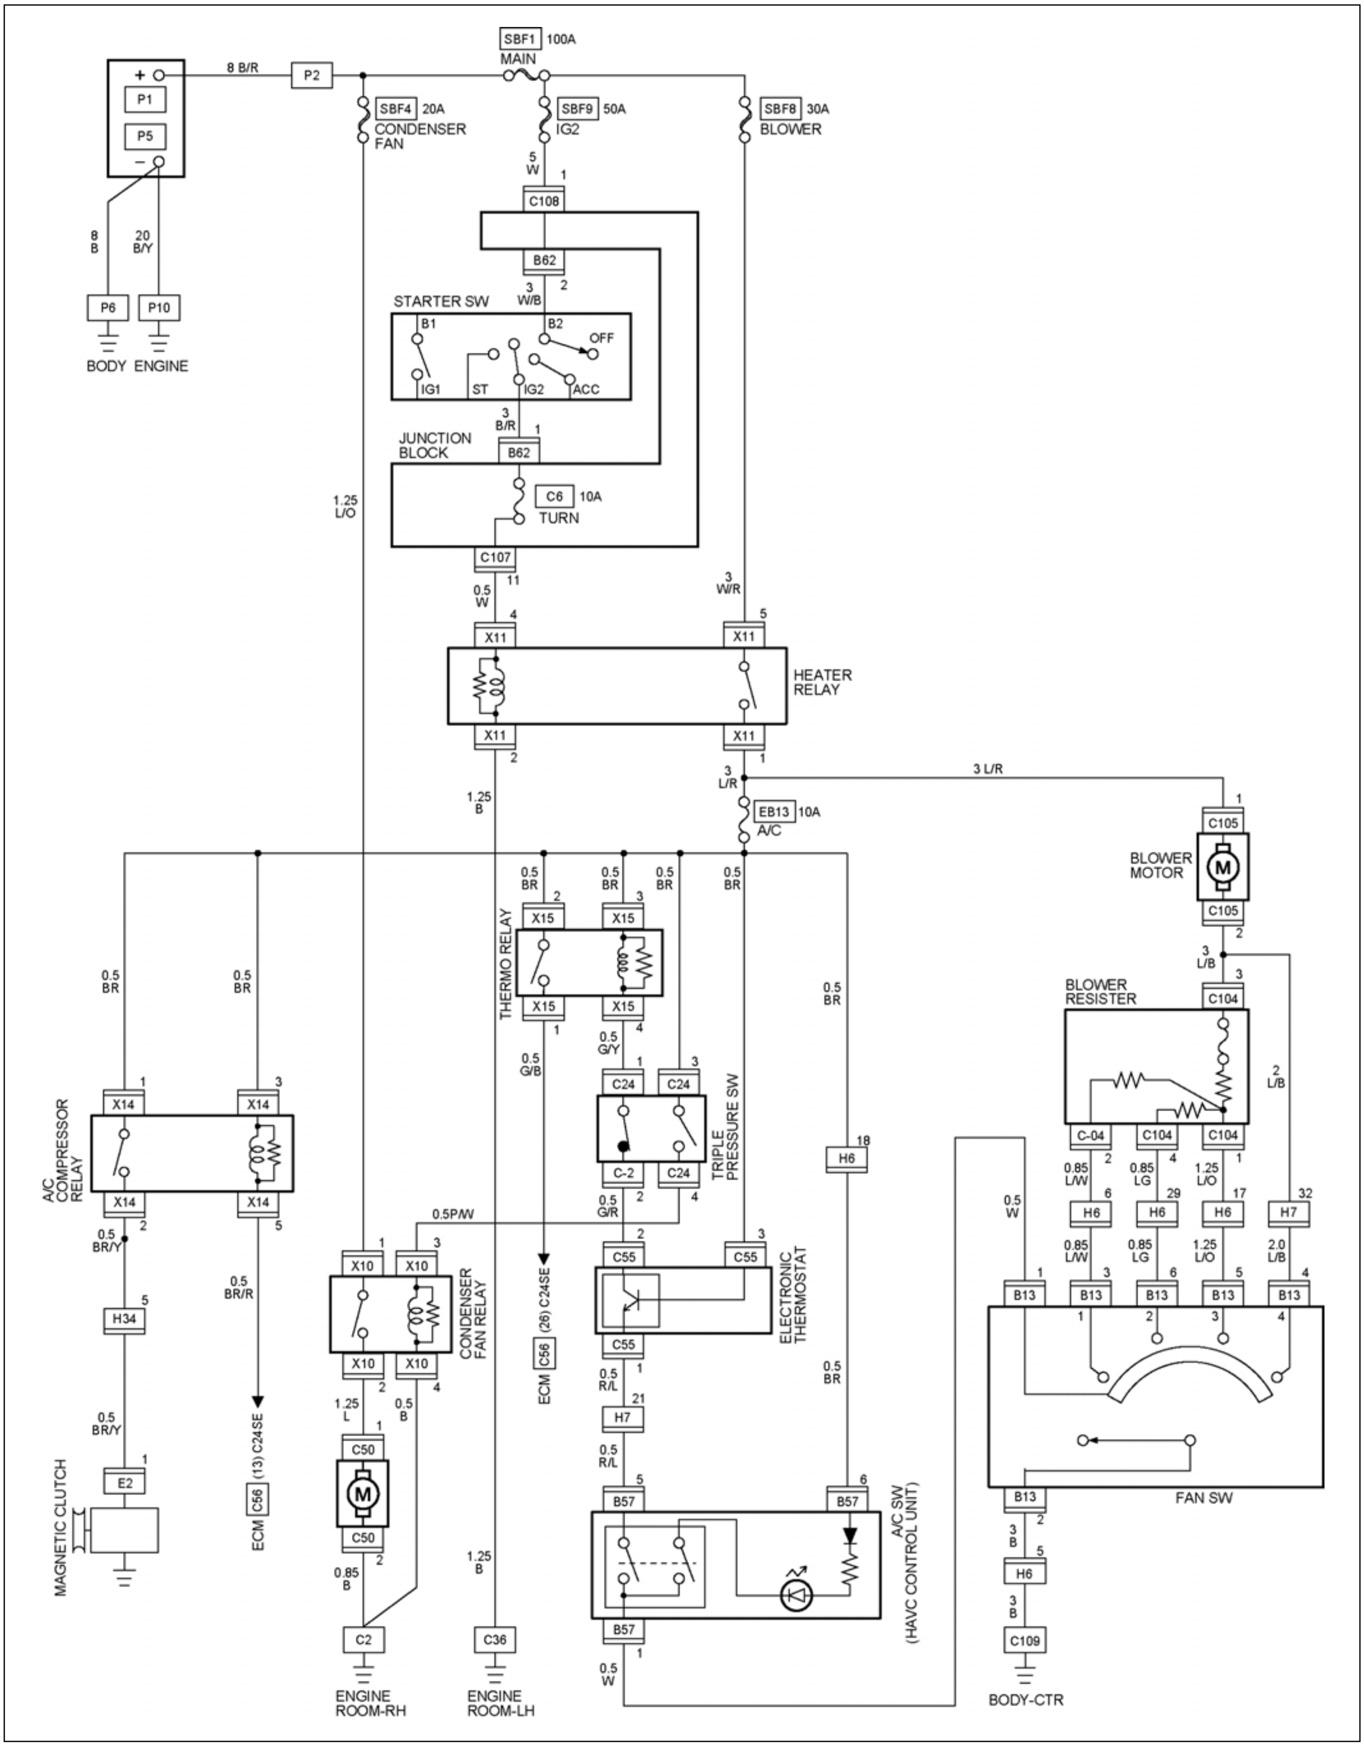
3. RH (or LH) high and low beam does not light

Checkpoint		Trouble Cause	Countermeasure
Fuse No. EB7 (10A) or No. EB8 (10A) (Relay and fuse box) (No. EB7 RH, No. EB8: LH)	NG	Poor installation or blown fuse	Reinstall or replace fuse No. EB7 or No. EB8
OK ↓			
Headlight connector continuity	NG	Blown filament or air leakage	Replace the headlight bulb
OK ↓			
Wiring continuity between connector 3 C19 - fuse No. EB7 or 3 C26 fuse No. EB8	NG	Open circuit and/or poor connector contact	Repair or replace the wire and/or connector

4. High or low beam does not light on one headlight (RH or LH)

Checkpoint		Trouble Cause	Countermeasure
Headlight connector continuity	NG	Blown filament	Replace the headlight assembly
OK ↓			
Wiring continuity between headlight and dimmer·passing switch	NG	Open circuit between headlight and dimmer·passing switch	Repair open circuit or connector contact

C24SE (A/C WITH HEATER)



RTW780XF013701

RECOMMENDED LIQUID GASKET

Type	Brand Name	Manufacture	Remarks
RTV* Silicon Base	ThreeBond 1207B ThreeBond 1207C ThreeBond 1215	Three Bond Three Bond Three Bond	For Engine Repairs For Axle Case Repairs, T/M
Water Base	ThreeBond 1141E	Three Bond	For Engine Repairs
Solvent	ThreeBond 1104 BelcoBond 4 BelcoBond 401 BelcoBond 402	Three bond Isuzu Isuzu Isuzu	For Engine Repairs
Anaerobic	LOCTITE 515 LOCTITE 518	Loctite Loctite	All

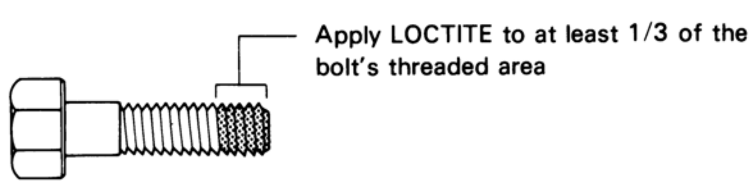
* RTV : Room Temperature Vulcanizer

Note :

1. **It is very important that the liquid gaskets listed above or their exact equivalent be used on the vehicle.**
2. **Be careful to use the specified amount of liquid gasket.**
   Follow the manufacture's instructions at all times.
3. **Be absolutely sure to remove all lubricants and moisture from the connecting surfaces before applying the liquid gasket.**
   The connecting surfaces must be perfectly dry.
4. **LOCTITE 515 and LOCTITE 518 harden upon contact with a metal surface.**
   Do not apply LOCTITE 515 or LOCTITE 518 between two metal surfaces having a clearance of greater than 0.25 mm (0.01 in). Poor adhesion will result.

RECOMMENDED THREAD LOCKING AGENTS

<table>
<tr><th>LOCTITE Type</th><th>LOCTITE Color</th><th>Application Steps</th></tr>
<tr><td>LOCTITE 242</td><td>Blue</td><td rowspan="4">1. Completely remove all lubricant and moisture from the bolts and the female threaded surfaces of the parts to be joined.
The surfaces must be perfectly dry.
2. Apply LOCTITE to the bolts.



3. Tighten the bolts to the specified torque.
4. Wait at least on hour before continuing the installation procedure.</td></tr>
<tr><td>LOCTITE 262</td><td>Red</td></tr>
<tr><td>LOCTITE 270</td><td>Green</td></tr>
<tr><td>LOCTITE 271</td><td>Red</td></tr>
</table>

5. Headlight does not go out

Checkpoint		Trouble Cause	Countermeasure
Lighting relay continuity between connector 1 X6 - 2 X6 (Should be no continuity)	NG	Relay point fused	Replace the lighting relay
OK			
Lighting switch continuity between connector 3 B60 -1 B60 when switch is OFF(Should be no continuity)	NG	point fused or faulty	Replay the combination switch
OK			
Dimmer·passing switch continuity between connector 3 B60 - 1 B60 when switch is not operating (Should be no continuity)	NG	Switch point fused or faulty	Repair or replace the combination switch
OK			
Check if headlight goes out when connector C2, C36 is disconnected	NG	Short circuit	Repair short circuit between 3 X6 - 3 B60 and 5 X2 - 2 B60

6. Insufficient headlight brightness

Checkpoint		Trouble Cause	Countermeasure
Headlight lens	NG	Lens dirty	Clean the light lens
OK			
Headlight bulb	NG	Bulb filament faulty	Replace the headlight bulb
OK			
Dimmer·passing switch Wire continuity between connector 1 B60 - C2	NG	Poor ground point contact	Repair the wiring

7. Passing light does not function when dimmer switch is operated

Checkpoint		Trouble Cause	Countermeasure
Dimmer switch	NG	Poor switch point contact	Repair or replace the dimmer switch
OK			
Voltage between 3 B60 - ground (Should be battery voltage present)	NG	Open circuit	Repair open circuit between 3 X6 - 3 B60

8. Headlight beam does not change when dimmer switch is operated

Checkpoint		Trouble Cause	Countermeasure
Dimmer switch	NG	Loose beam lever or foreign material in switch	Repair or replace the dimmer switch

TAIL LIGHT, LICENSE PLATE LIGHT, CLEARANCE LIGHT

1. All lights do not light

Checkpoint		Trouble Cause	Countermeasure
Fuse No. EB12 (LH) or EB11 (RH) (10A, Relay and fuse box)	NG	Poor fuse contact or blown	Reinstall or replace the fuse No. EB12 (LH), EB11 (RH)
OK			
Lighting switch continuity between connector 2 B60 - 1 B60	NG	Poor switch point or connector contact	Repair or replace the combination switch
OK			
Tail relay	NG	Poor relay contact or relay faulty	Reinstall or replace the tail relay

2. Tail light does not light

Checkpoint		Trouble Cause	Countermeasure
Tail light bulb continuity	NG	Bulb burned out or poor connector contact	Replace the bulb or repair connector contact
OK			
Continuity between connector 3 F5 - 4 F5 (RH) or 3 F6 - 4 F6 (LH)	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

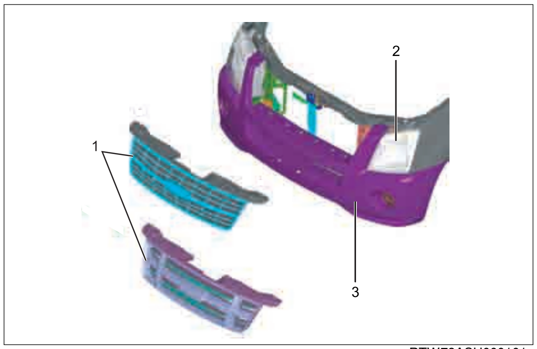
3. License plate light does not light

Checkpoint		Trouble Cause	Countermeasure
License plate light bulb continuity	NG	Bulb burned out or poor connector contact	Replace the bulb or repair connector contact
OK			
Continuity between connector 1 T4 - 2 T4 or 1 T3 - 2 T3	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

4. Clearance light does not light

Checkpoint		Trouble Cause	Countermeasure
Clearance light bulb continuity	NG	Bulb burned out or poor connector contact	Replace the bulb or repair connector contact

LIGHTING SYSTEM
REMOVAL AND INSTALLATION



RTW78ASH000101

FRONT COMBINATION LIGHT (A type)

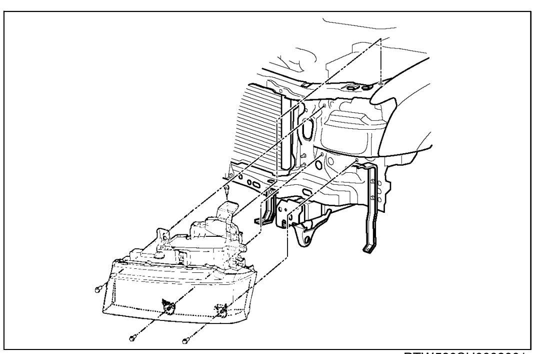
Removal

1. Remove the radiator grille ①.
   Refer to the removal procedure of the RADIATOR GRILLE in Section 2B “SHEET METAL”.
2. Remove the front bumper ③.
   Refer to the removal procedure of the FRONT BUMPER in Section 2A “FRAME AND BUMPER”.
3. Disconnect the headlight connector.
4. Disconnect the clearance light connector.
5. Disconnect the turn signal light connector.
6. Remove the front combination light assembly ②.
   - Remove four fixing screws.

HEADLIGHT ASSEMBLY (B type)

Removal

1. Open the bonnet.
2. Remove the front combination light assembly.
   - Refer to "Front Combination Light Assembly" removal procedure in this section.
3. Remove the radiator grille.
   - Refer to "Radiator grille" removal procedure in 2B section.
4. Remove the front bumper.
   - Refer to "Front Bumper" removal procedure in 2B section.
5. Disconnect headlight bulb connectors.
6. Remove the bolts of headlight assembly.
7. Remove the headlight assembly.



RTW580SH0008001

Installation

To install the front combination light assembly, follow the removal procedure in reverse order.

HEADLIGHT (HALOGEN STD TYPE) (A type)

Removal

1. Remove the head light socket.
2. Remove the headlight dust cover.

3. Slide out the lock spring.

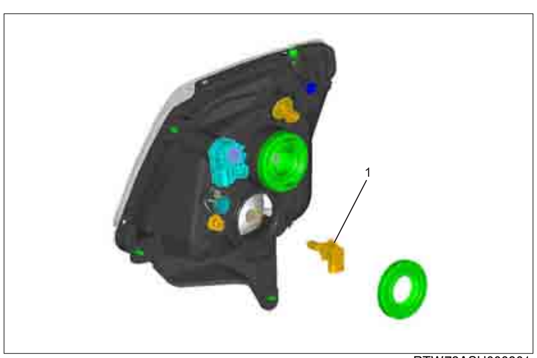
4. Remove the bulb.

RTW78ASH000801

HEADLIGHT (HALOGEN PROJECTOR TYPE)

Removal

1. Remove the head light socket.
2. Remove the headlight dust cover ①.



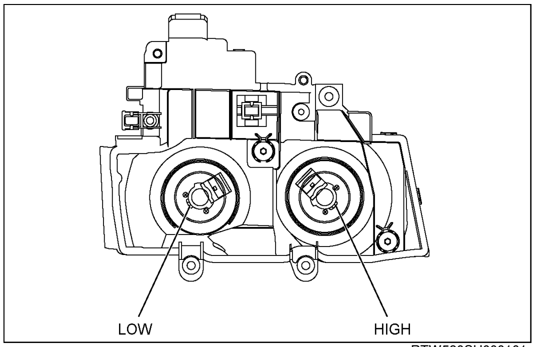
RTW78ASH000901

3. Turn the bulb socket counterclockwise to remove it.
4. Remove the headlight bulb ①.

HALOGEN HEADLIGHT BULB (B type)

Removal

1. Open the bonnet.
2. Disconnect the headlight bulb connectors.
3. Turn the bulb counterclockwise to remove it.



RTW580SH000101

Installation

To install the headlight, follow the removal procedure in reverse order.
Pay close attention to the important points mentioned in the following paragraphs.

Connector

Be absolutely sure that the headlight connector is securely connected.
This will prevent a contact and an open circuit.

Installation

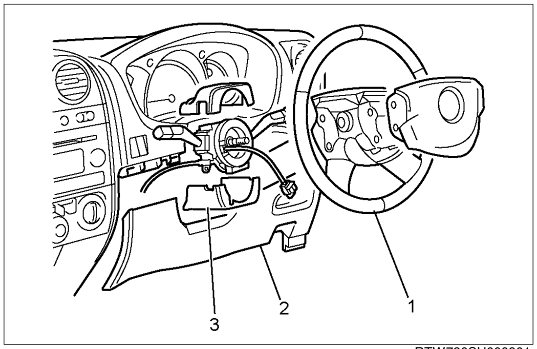
Follow the removal procedure in the reverse order to install the headlight.
Pay close attention to the important points mentioned in the following paragraphs.

Connector

Be absolutely sure that the headlight connector is securely connected.
This will prevent a contact and an open circuit.

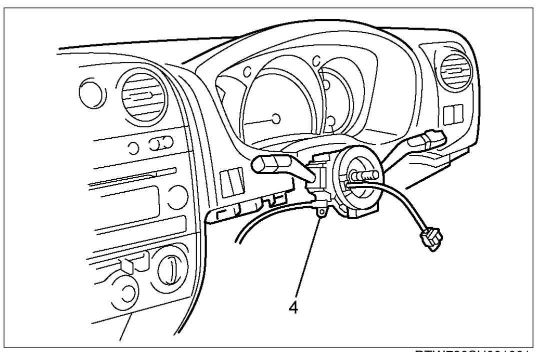
LIGHTING SWITCH

Removal



This illustration is based on RHD model

1. Disconnect the battery ground cable.
2. Remove the steering wheel ①.
   Refer to the “STEERING” Section of this manual.
3. Remove the Instrument panel lower cover ②.
4. Remove the steering column cover ③.



This illustration is based on RHD model

5. Disconnect the connector.
6. Remove the lighting switch ④ from the steering shaft.

Installation

Follow the removal procedure in the reverse order to install the lighting switch.
Pay close attention to the important points mentioned in the following paragraphs.

Connector

Be absolutely sure that the lighting switch connector is securely connected.
This will prevent a poor contact and an open circuit.

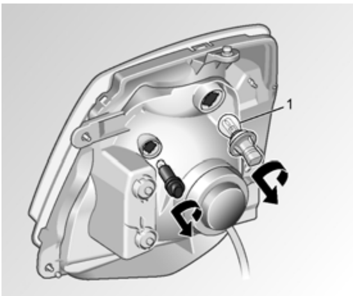
Wire Harness

Do not pinch the wire harnesses between the cluster and the meter hood during the cluster installation procedure.
Wire damage will result.

FRONT TURN SIGNAL LIGHT BULB (A type)

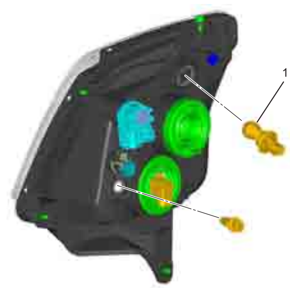
Removal

1. Turn the socket counterclockwise to disconnect it from the front turn signal light housing.
2. Turn the bulb ① counterclockwise to remove it.



HALOGEN STD TYPE

RTW78ASH000201



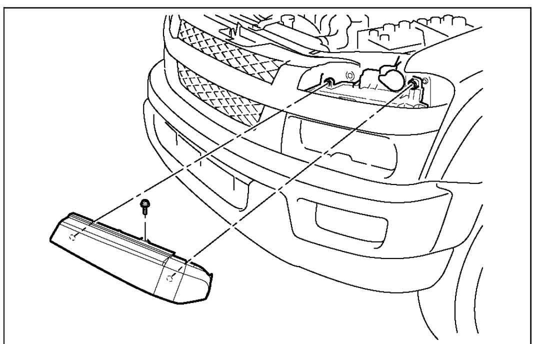
HALOGEN PROJECTOR TYPE

RTW78ASH001001

FRONT COMBINATION LIGHT ASSEMBLY (B type)

Removal

1. Open the bonnet.
2. Remove the bolt of front combination light assembly
3. Disconnect the front combination light harness connector.
4. Remove the front combination light assembly.



RTW580SH000901

Installation

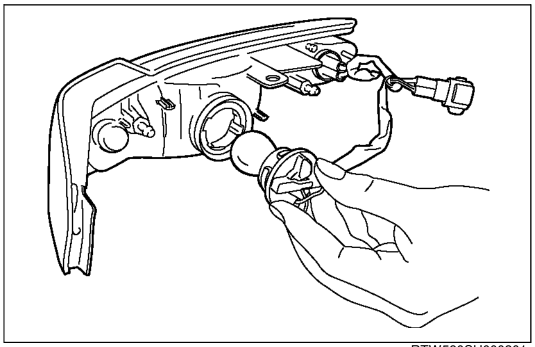
To install the front combination light assembly follow the removal procedure in the reverse order.

Connector

Be absolutely sure that the front combination light harness connector is correctly installed.
This will prevent a poor contact and an open circuit.

FRONT TURN SIGNAL LIGHT BULB

Removal



RTW580SH000201

1. Remove the front combination light assembly.
   - Refer to “FRONT COMBINATION LIGHT ASSEMBLY” removal procedure in this section.
2. Turn the bulb counterclockwise to remove it. (Gray socket side)

Installation

Follow the removal procedure in the reverse order to install the front turn signal light.
Pay close attention to the important points mentioned in the following paragraphs.

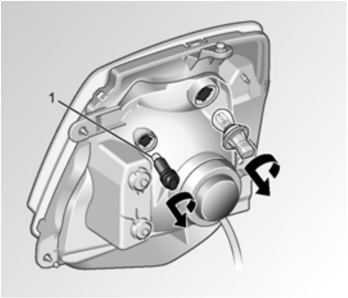
Connector

Be absolutely sure that the clearance light connector is securely connected.
This will prevent a poor contact and an open circuit.

CLEARANCE LIGHT BULB (A type)

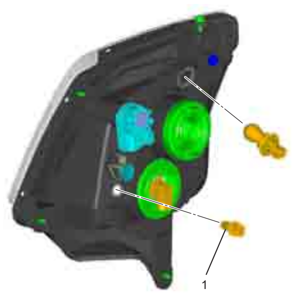
Removal

1. Turn the socket counterclockwise to disconnect it from the clearance light housing.
2. Turn the bulb ① counterclockwise to remove it.



HALOGEN STD TYPE

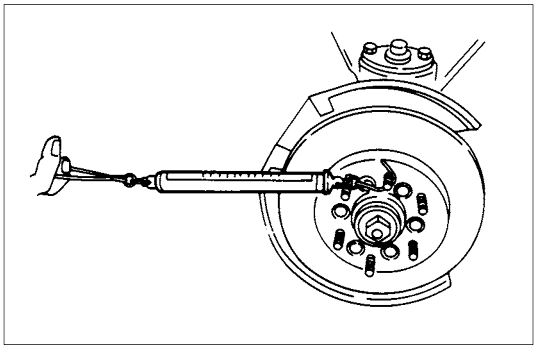
RTW78ASH000301



HALOGEN PROJECTOR TYPE

RTW78ASH001101

SERVICING



Hub Bearing Preload at the Wheel Pin

4×4, 4×2 (High Ride Suspension) Model N (kgf/lb)

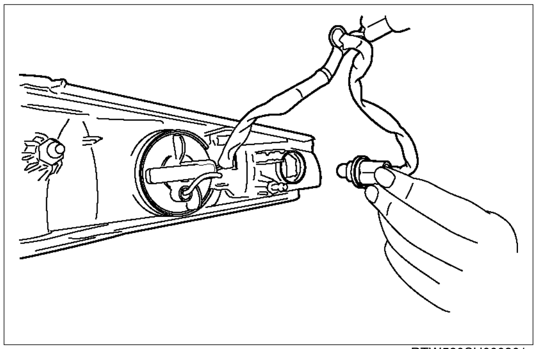
New bearing and New oil seal	22 - 27 (2.2 - 2.8 / 4.9 - 6.2)
Reuse bearing and New oil seal	14 - 20 (1.4 - 2.0 / 3.1 - 4.5)

4×2 (Except High Ride Suspension) Model N (kgf/lb)

New bearing and New oil seal	9.3 - 13.3 (0.95 - 1.36 / 2.09 – 3.00)
Reuse bearing and New oil seal	9.3 - 13.3 (0.95 - 1.36 / 2.09 – 3.00)

CLEARANCE LIGHT BULB (B type)

Removal



RTW580SH000301

1. Remove the front combination light assembly.
   - Refer to “FRONT COMBINATION LIGHT ASSEMBLY” removal procedure in this section.
2. Turn the bulb counterclockwise to remove it. (Black socket side)

Installation

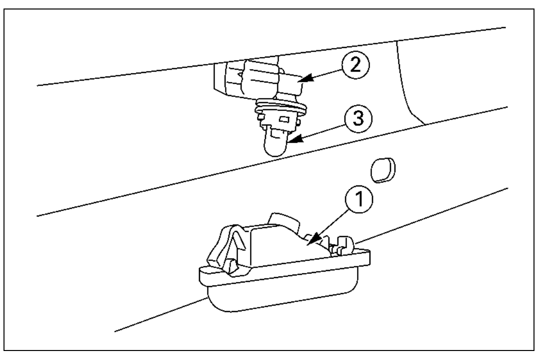
Follow the removal procedure in the reverse order to install the clearance light.
Pay close attention to the important points mentioned in the following paragraphs.

Connector

Be absolutely sure that the clearance light connector is securely connected.
This will prevent a poor contact and an open circuit.

LICENSE PLATE LIGHT

Removal



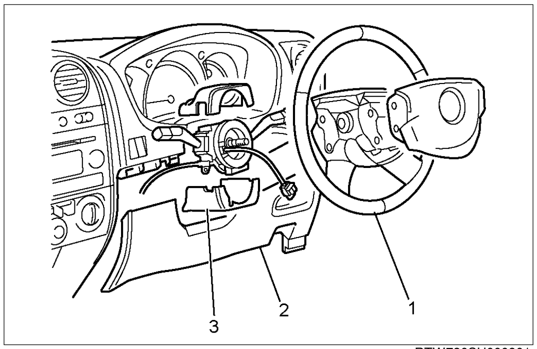
1. Remove the lens cover ① and the connector ②.
2. Pull the bulb ③ to remove it.

Installation

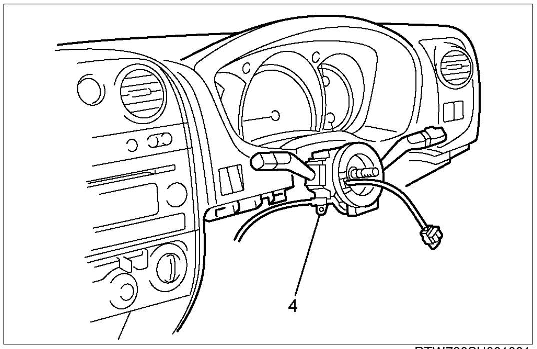
Follow the removal procedure in the reverse order to install the license plate light.
Pay close attention to the important points mentioned in the following paragraphs.

Bulb

Be absolutely sure that the license plate light bulb is correctly installed.
This will prevent a poor contact and open circuit.



RTW780SH000901



RTW780SH001001

HEADLIGHT BEAM SWITCH (COMBINATION SWITCH)

Removal

1. Disconnect the battery ground cable.
2. Remove the screws on the lower part of the steering wheel.
3. Remove the horn pad.
4. Remove the wiring connector.
5. Remove the steering wheel fixing nuts.
6. Remove the steering wheel ①.
   Refer to the "STEERING" Section of this manual.
7. Remove the Instrument panel lower cover ②.
8. Remove the steering column cover ③.
9. Disconnect the connector.
10. Remove the headlight beam switch (lever) from the steering shaft (combination switch).

Installation

Follow the removal procedure in the reverse order to install the headlight beam switch (lever).
Pay close attention to the important points mentioned in the following paragraphs.

Connector

Be absolutely sure that the headlight beam switch connector is securely connected.
This will prevent a poor contact and an open circuit.

Wire Harness

Do not pinch the wire harnesses between the cluster and the meter hood during the cluster installation procedure.
Wire damage will result.

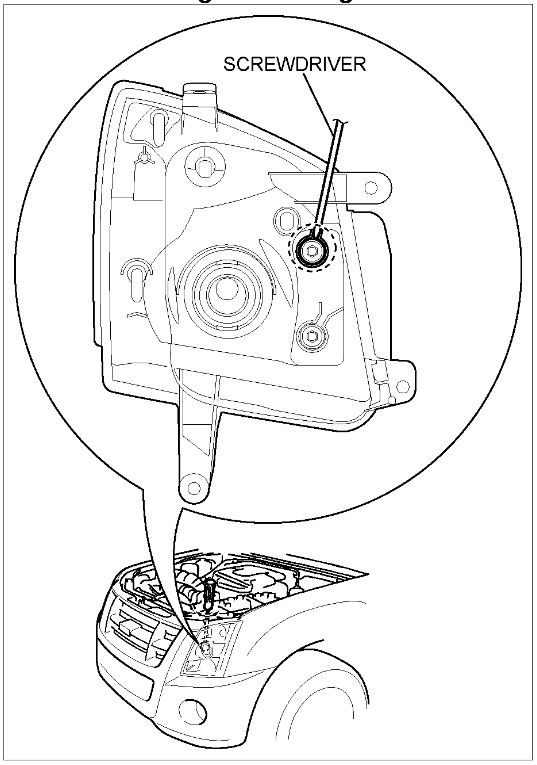
AIMING OF HEADLIGHT

Before adjusting the headlights, park the vehicle on a level surface. Remove any cargo from the vehicle to bring it to curb weight. Check the tire inflation pressures and correct as required. Clean the headlight lenses.

VERTICAL ADJUSTMENT (A type)

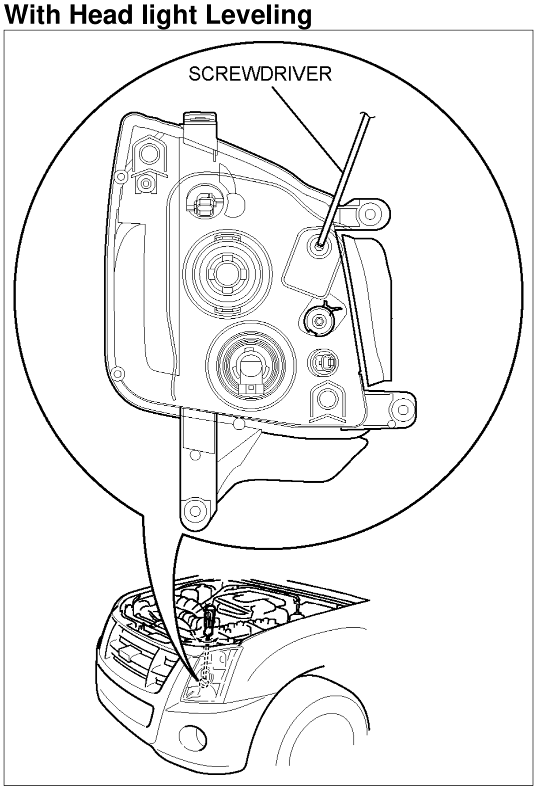
Use a Phillips-head screwdriver with a long shaft. Hold the screwdriver straight up-and-down as shown in the illustration.

Without Head light Leveling



RTW780MH000101

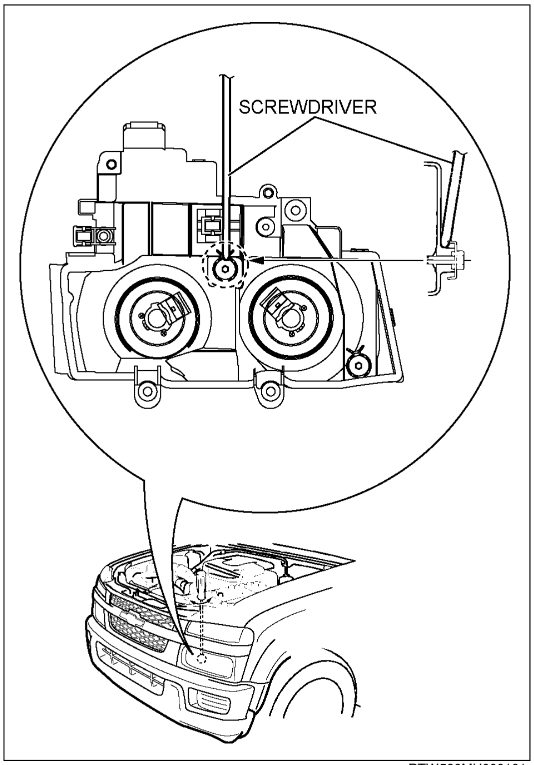
With Head light Leveling



RTW78AMH000101

VERTICAL ADJUSTMENT (B type)

Use a screwdriver with a long shaft. Hold the screwdriver straight up-and-down as shown in the illustration.

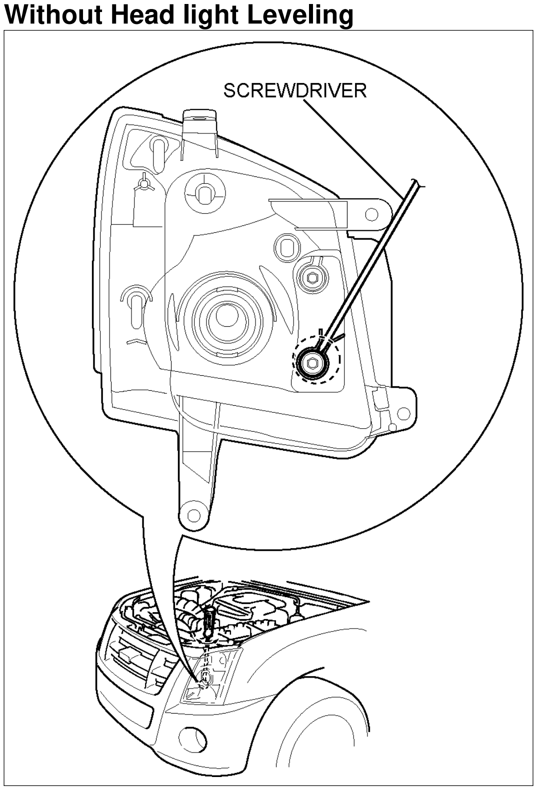


RTW580MH000101

HORIZONTAL ADJUSTMENT (A type)

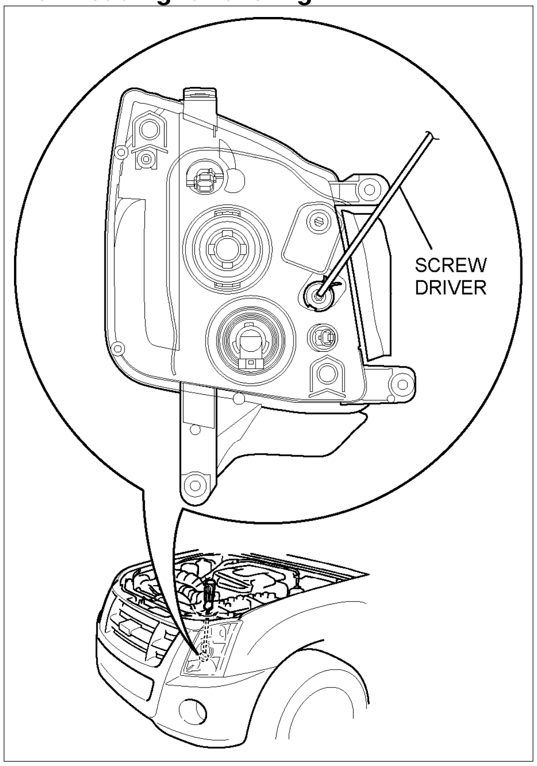
Use a Phillips-head screwdriver with a long shaft. Hold the screwdriver at an angle as shown by the arrow in the illustration.

Without Head light Leveling

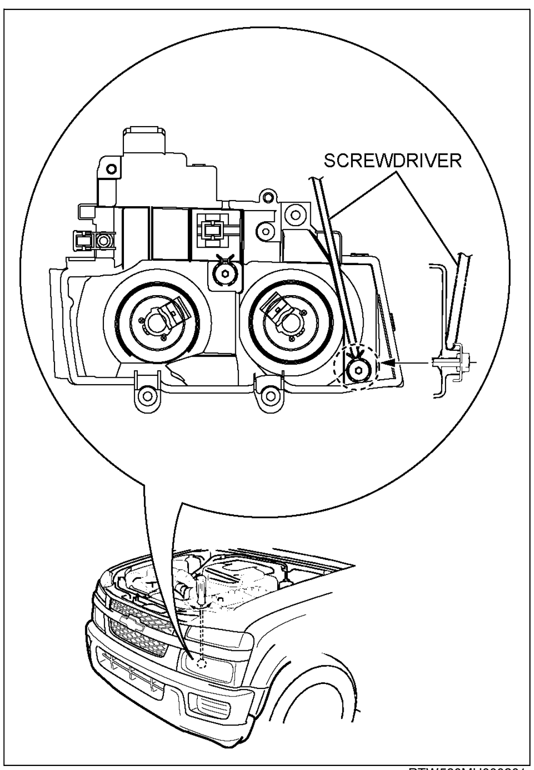


RTW780MH000201

With Head light Leveling



RTW78AMH000201



RTW580MH000201

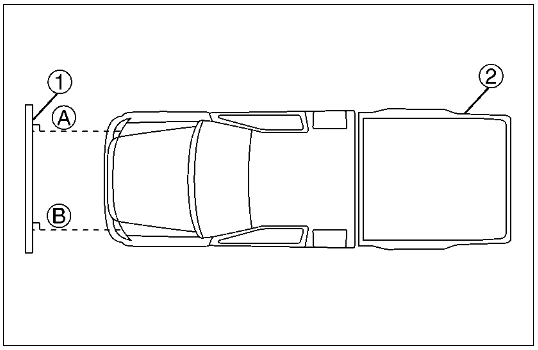
HORIZONTAL ADJUSTMENT (B type)

Use a screwdriver with a long shaft. Hold the screwdriver at an angle as shown by the arrow in the illustration.

Installation

To install, follow the removal steps in the reverse order. Noting the following point:

1. After installing the headlight, be sure to adjust the headlight aim.

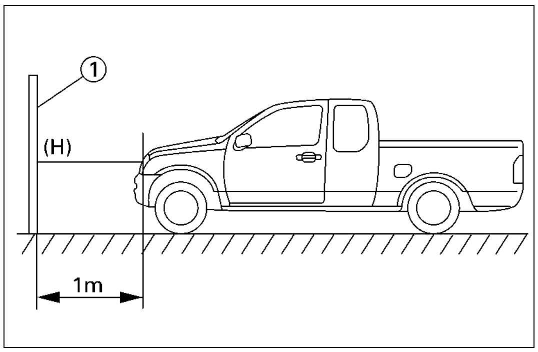


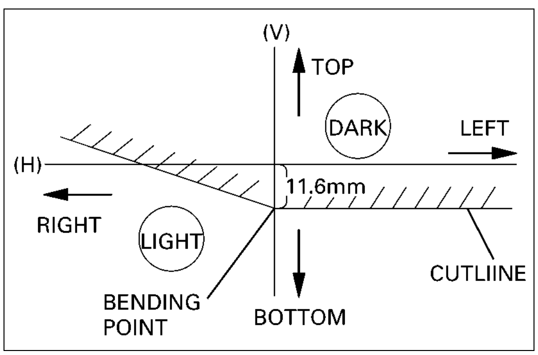
HEADLIGHT ADJUSTMENT

Preparation

Place the vehicle with 1 person in driver seat on a level surface and check to see if the inflation pressure of the tires is correct, the lenses are clean, the battery is sufficiently charged, and adjust to place vehicle by using the screen.

1. Set a vertical screen on a level surface.
2. Toward the screen ① from the bulb center mark of the headlight, extend parallel lines to the floor. Mark point Ⓐ and Ⓑ on the screen at the intersection of parallel line and the screen.
3. Draw vertical lines through point Ⓐ and Ⓑ on the screen.
4. Keep the vehicle ② 1m apart from the screen ①.
5. Draw a horizontal line through point Ⓐ and Ⓑ on the screen ①.





6. Turn the headlight low beam on.
7. Adjust the CUTLINE 11.6 mm below the horizontal line Ⓗ.
8. Adjust the BENDING POINT to the vertical line Ⓥ.

NOTE:

Always adjust vertical adjustment first.

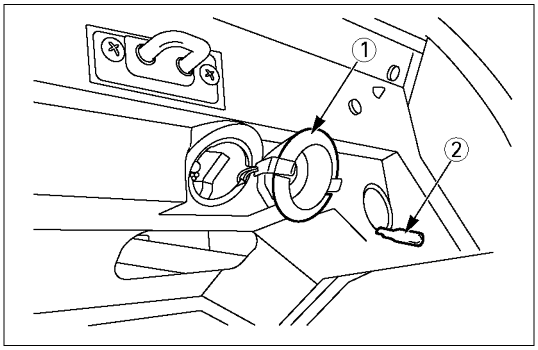
② - ①	Continuity



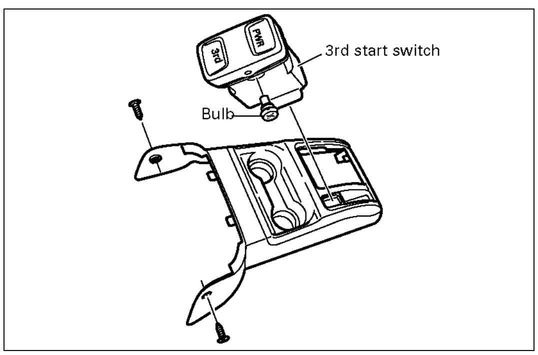
GLOVE BOX ILLUMINATION

Removal

1. Remove the bulb cover ①.
2. Remove the bulb ②.

Installation

To install, follow the removal steps in the reverse order.



POWER/3rd START SW

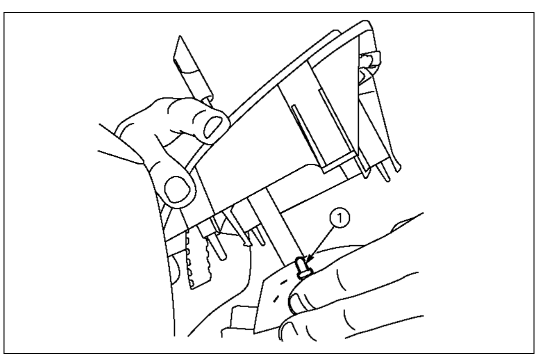
Removal

- Refer to the “Front consol” Section 10 of this manual.

1. Disconnect the battery ground cable.
2. Remove the power/3rd start switch.
3. Remove the bulb.

Installation

To install, follow the removal steps in the reverse order.



A/T LEVER LIGHT BULB

Removal

- Refer to the “Front consol” Section 10 of this manual.

1. Remove the A/T lever cover.
2. Remove the light bulb ①.

Installation

To install, follow the removal steps in the reverse order.

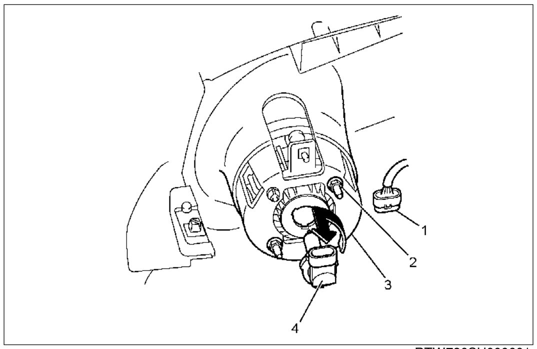
RTW78AXF022901

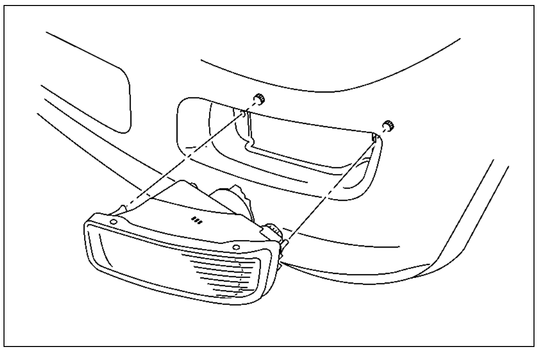


RTW780SH000601

FOG LIGHT (A type)

Removal

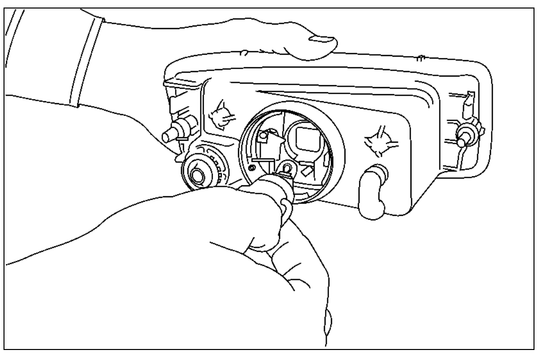
1. Disconnect the fog light connector ①.
2. Remove two attaching nuts ②.
3. Pull the fog light assembly toward the vehicle front to remove it from the holding bracket ③.
4. Remove the bulb with socket.
   - Turn the socket ④ counterclockwise to remove it.
5. Remove the bulb.
   - Release the lock spring.
   - Pull out the bulb.



FOG LIGHT (B type)

Removal

1. Remove the radiator grille.
2. Remove the front bumper
3. Disconnect the fog light connector.
4. Remove the fog light.



5. Remove the bulb from the socket.
   - Remove the cover by turning it counterclockwise out side the lock spring.
   - Remove the bulb.

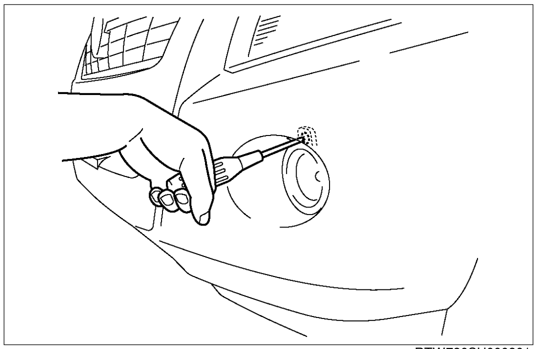
Hold the bulb by the flange when replacing it.
Do not touch the bulb with your hands.

Installation

To install the fog light, follow the removal procedure in reverse order.
Pay close attention to the important points mentioned in the following paragraphs.

Bulb

Be absolutely sure that the fog light bulb is correctly installed.
This will prevent a poor contact and open circuit.

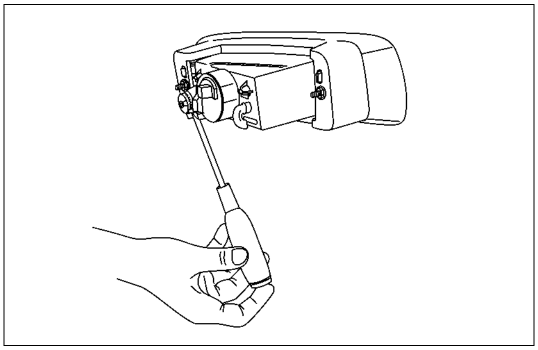


RTW780SH000801

FOG LIGHT ADJUSTMENT (A type)

Vertical Adjustment

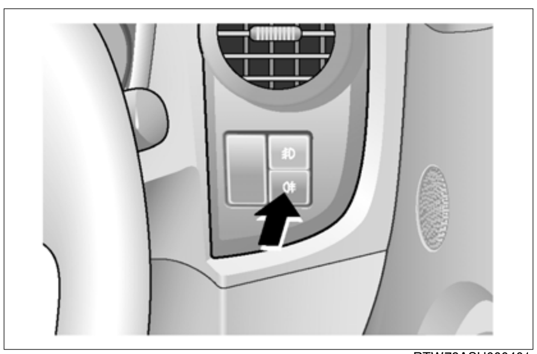
Turn the adjusting screw with a screwdriver to adjust the aim of the fog light vertically.



FOG LIGHT ADJUSTMENT (B type)

Vertical Adjustment

Turn the adjusting screw with a screwdriver to adjust the aim of the fog light vertically.



RTW78ASH000401

FRONT FOG & REAR FOG SWITCH

		TERMINAL / POSITION	5	4	3	2	1	6
FR FOG	‡D	FREE						
		LOCK	○—	—○				
RR FOG	D‡	FREE						
		FULL			○—	—○		

RTW48ASH000401

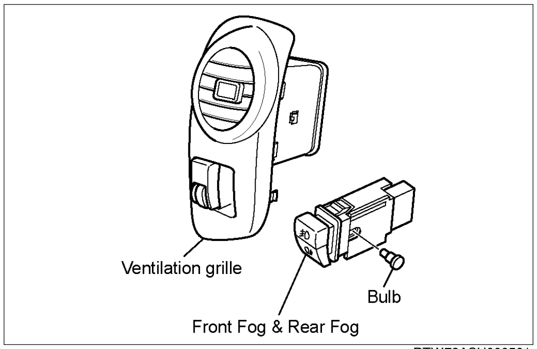
Inspection

Check to see if there is any continuity between the terminals of the front fog light switch.
Replace the switch when the result of inspection is found abnormal.

Removal

Preparation:
Disconnect the battery ground cable.

1. Ventilation grille
2. Harness connector
3. Front fog light & Rear fog light switch
   To remove the switch, push the lock from the back side of the cluster assembly.
4. Remove the bulb.



RTW78ASH000501

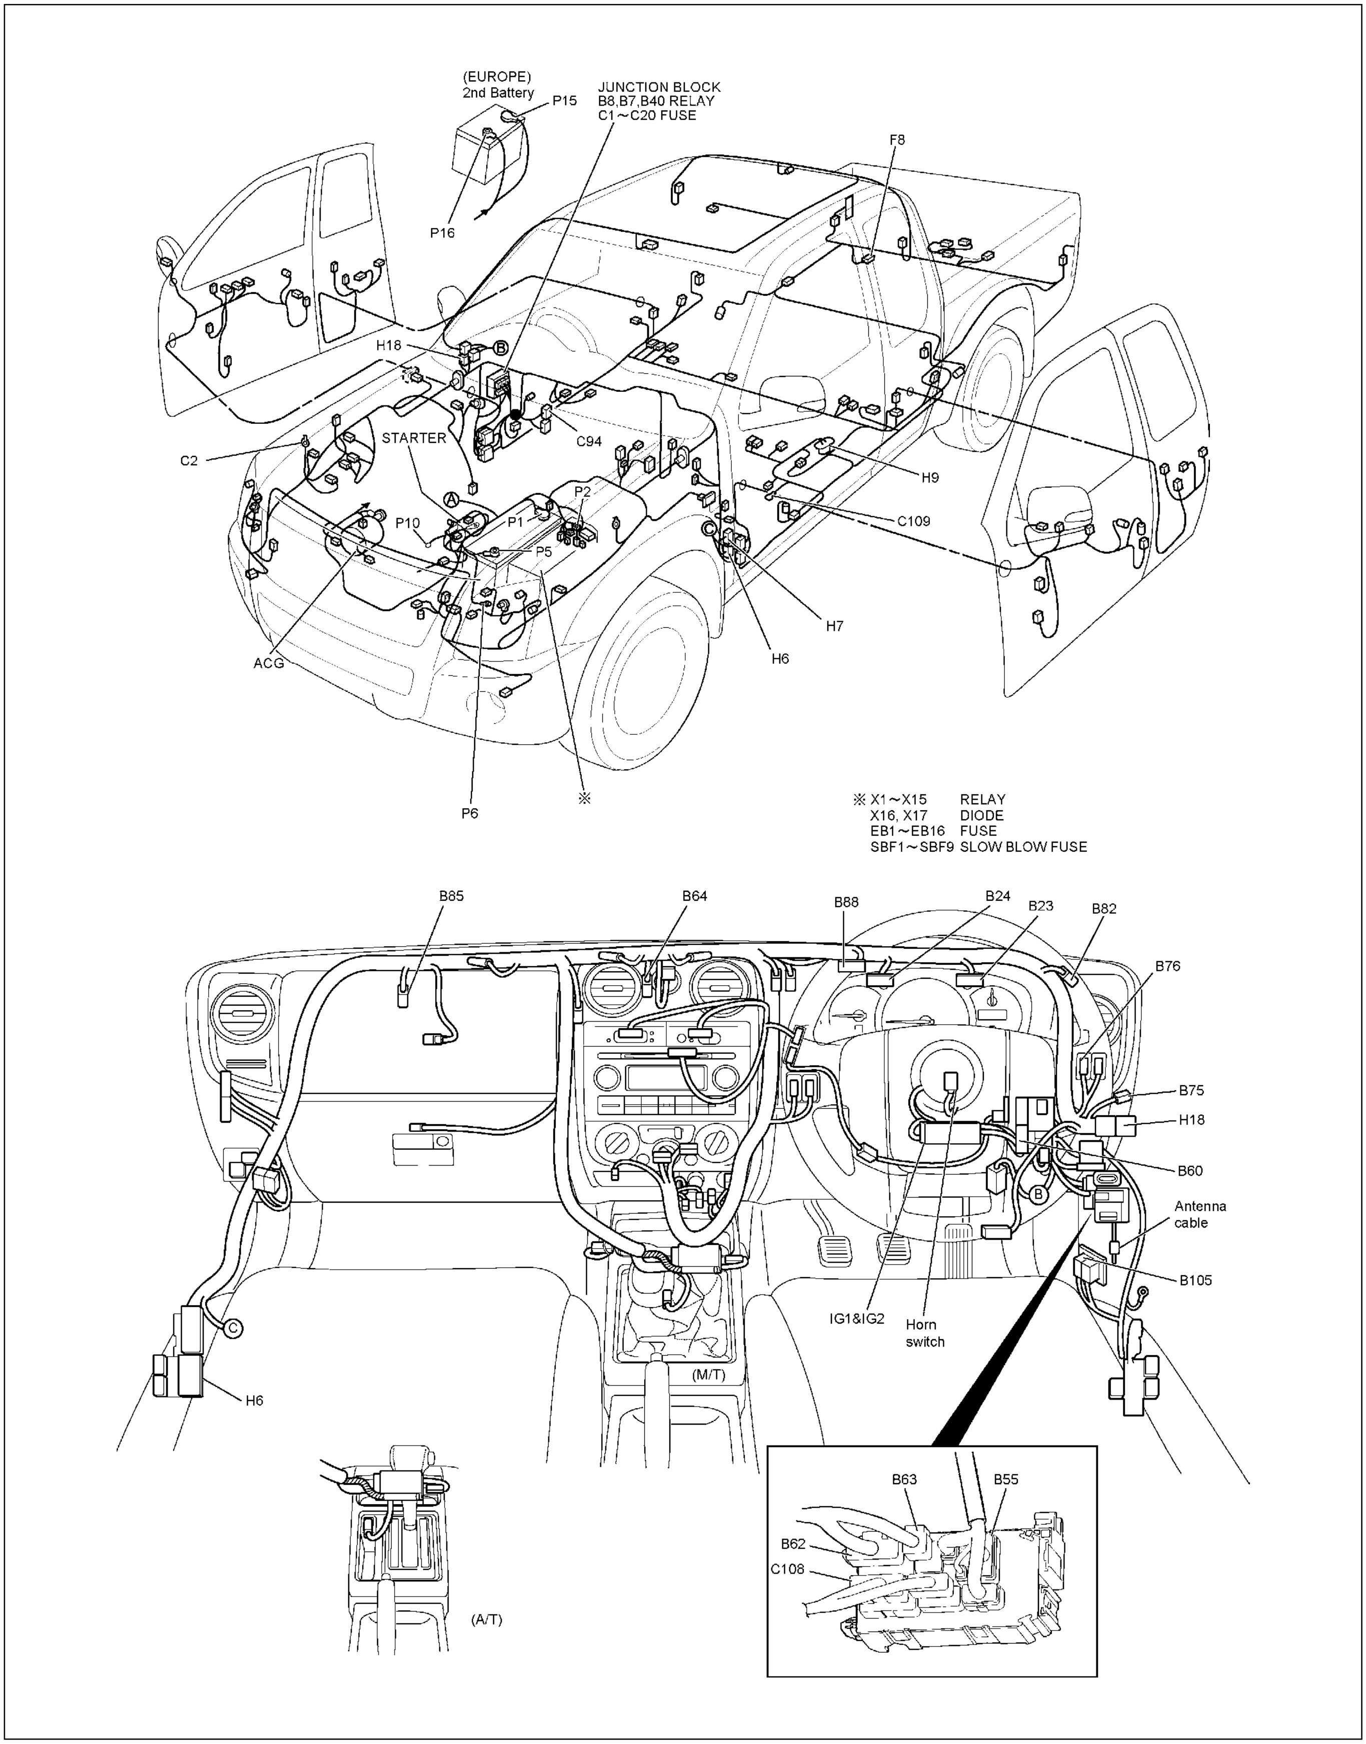
Installation

To install, follow the removal steps in the reverse noting the following point.

1. Push in the switch with your fingers until it locks securely.

REAR FOG LIGHT

PARTS LOCATION (RHD)



RTW78AXF037101 & RTW78AXF043301

PARTS LOCATION (LHD)

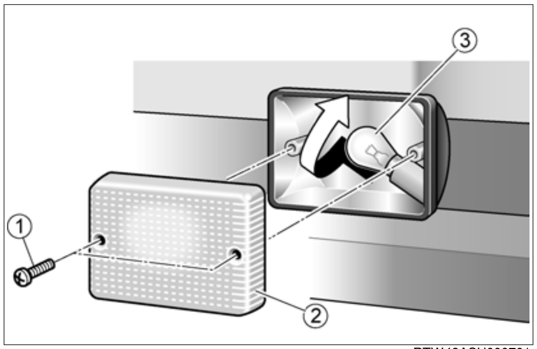
RTW78AXF023101



RTW48ASH000701

REAR FOG LIGHT

Removal

1. Remove the screws ①.
2. Remove the lens cover ②.
3. Rear fog push turn the bulb ③ counterclockwise to disconnect it from the light housing.

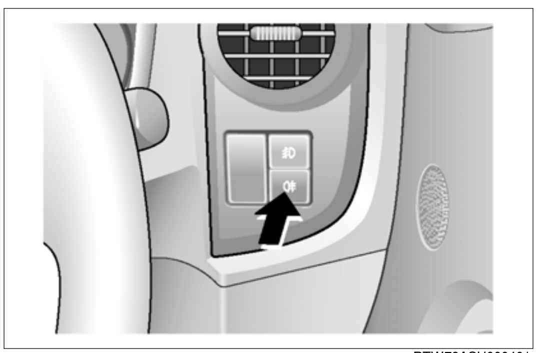
Installation

Follow the removal procedure in the reverse order to install the rear fog light.
Pay close attention to the important points mentioned in the following paragraphs.

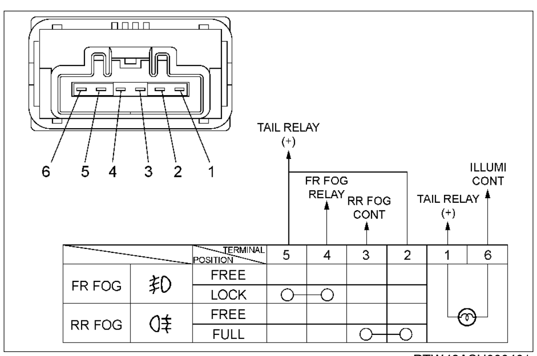
Bulb

Be absolutely sure that the license plate light bulb is correctly installed.
This will prevent a poor contact and open circuit.

FRONT FOG & RR FOG SWITCH



RTW78ASH000401



RTW48ASH000401

Inspection

Check to see if there is any continuity between the terminals of the leveling switch.
Replace the switch when the result of inspection is found abnormal.

Removal

Preparation:
Disconnect the battery ground cable.

1. Ventilation grille
2. Harness connector
3. Front fog light & Rear fog light switch
   To remove the switch, push the lock from the back side of the cluster assembly.
4. Remove the bulb.

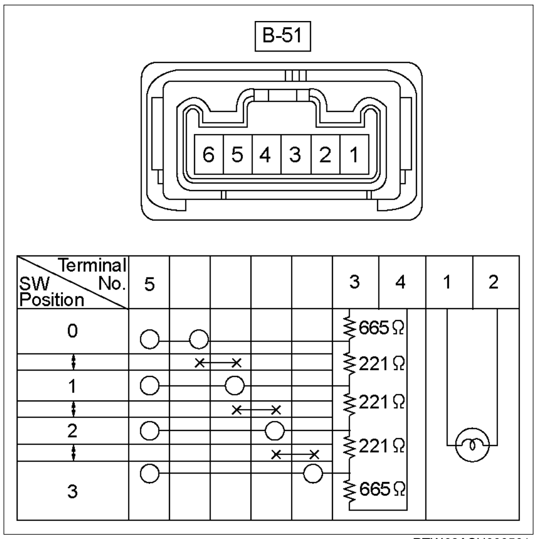
HEADLIGHT LEVELING SWITCH

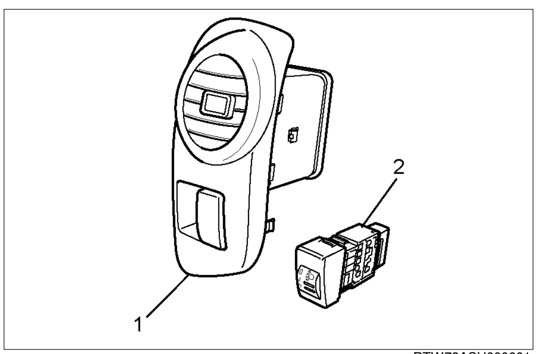
Incorrect beam angle due to load change can be corrected. A four position switch, 0-3, can alter the beam angle through 1.7 degrees on the long wheel base model and 2.17 degrees on the short wheel base model.



RTW68ASH000501

Inspection

Check to see if there is any continuity between the terminals of the leveling switch.
Replace the switch when the result of inspection is found abnormal.



RTW78ASH000601

Removal

Preparation:

Disconnect the battery ground cable.

1. Ventilation grille
2. Harness connector
3. Headlight leveling switch

   To remove the switch, push the lock from the back side of the cluster assembly.

Installation

To install, follow the removal steps in the reverse noting the following point.

1. Push in the switch with your fingers until it locks securely.

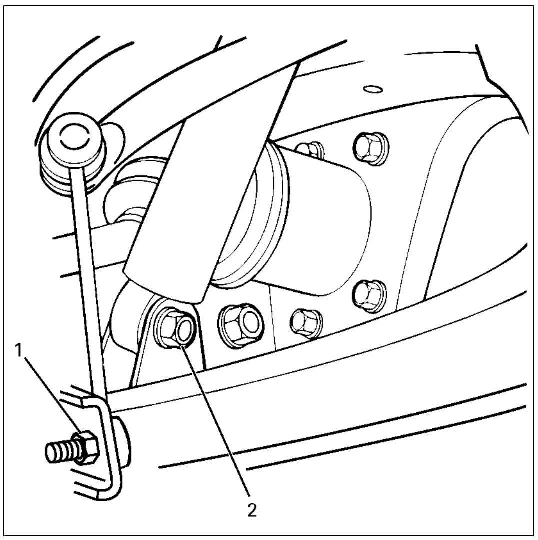
Removal

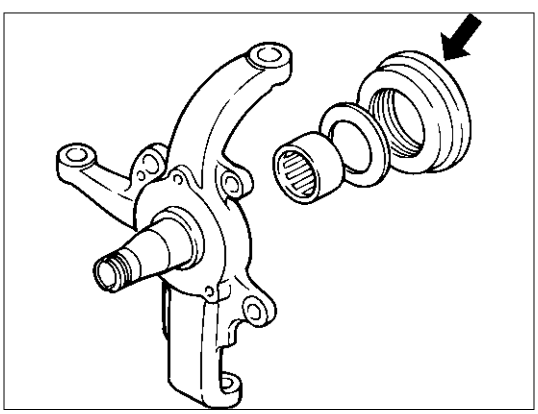
1. Jack up the vehicle and support it using jack stand.
2. Remove the tire and wheel.
3. Remove the stone guard.
4. Remove the brake caliper fixing bolt and hang the caliper. Refer to Disc Brakes in Brake section.
5. Remove the antilock brake system speed sensor.
   Refer to Front Wheel Speed Sensor in Brake section.
6. Remove the hub and disc assembly.
   Refer to Front Hub and Disc in this section.
7. Remove the propeller shaft, refer to Front Propeller Shaft in this section.
8. Loosen the height control arm of the torsion bar, then remove the torsion bar from lower control arm.
   Refer to Torsion Bar in Suspension section.
9. Remove the suspension crossmember.
10. Remove the lower nut (1) of the stabilizer link.
11. Remove the lower bolt and nut (2) of the shock absorber.



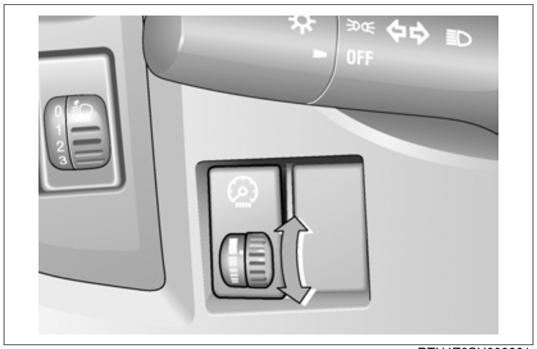
12. Remove the tie-rod end from the knuckle.
    Refer to Power Steering Unit in Steering Section.
13. Disconnect the breather hose of the front axle.
14. Disconnect the actuator connector.
15. Remove the bolts and nuts of the lower control arm (Frame side), then disconnect the lower control arm from frame.
16. Disconnect between the right side upper control arm and the knuckle, then remove the knuckle with lower control arm.

CAUTION :

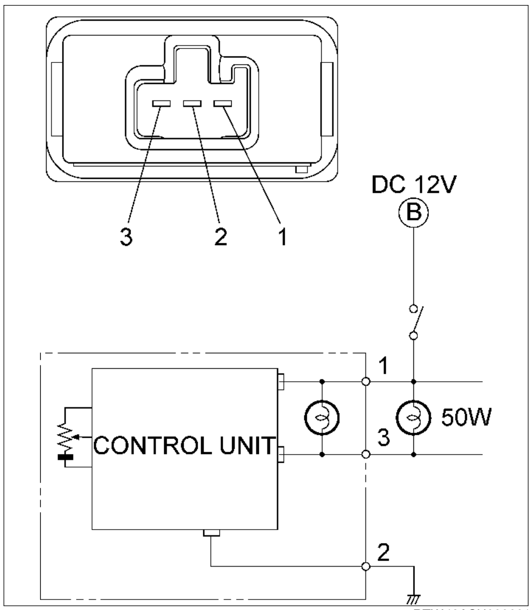
When removing the knuckle, be careful not to damage the oil seal inside of the knuckle.



ILLUMINATION SWITCH



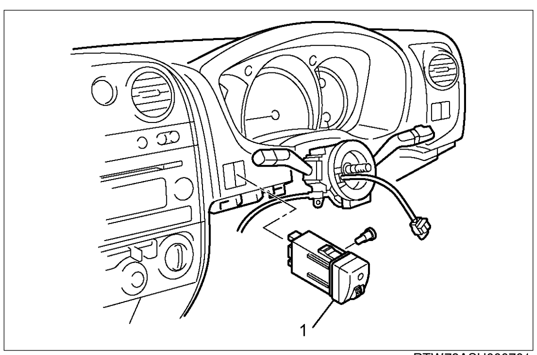
RTU4Z0SH000901



RTW48ASH000601

Inspection

Check to see if there is any continuity between the terminals of the switch.
Replace the switch when the result of inspection is found abnormal.



RTW78ASH000701

Removal

Preparation:
Disconnect the battery ground cable.

1. Instrument panel driver lower cover assembly
   Refer to the removal steps Sec.10
2. Harness switch
3. Illumination control ①
   To remove the switch, push the lock from the back side of the cluster assembly.
4. Remove the bulb.

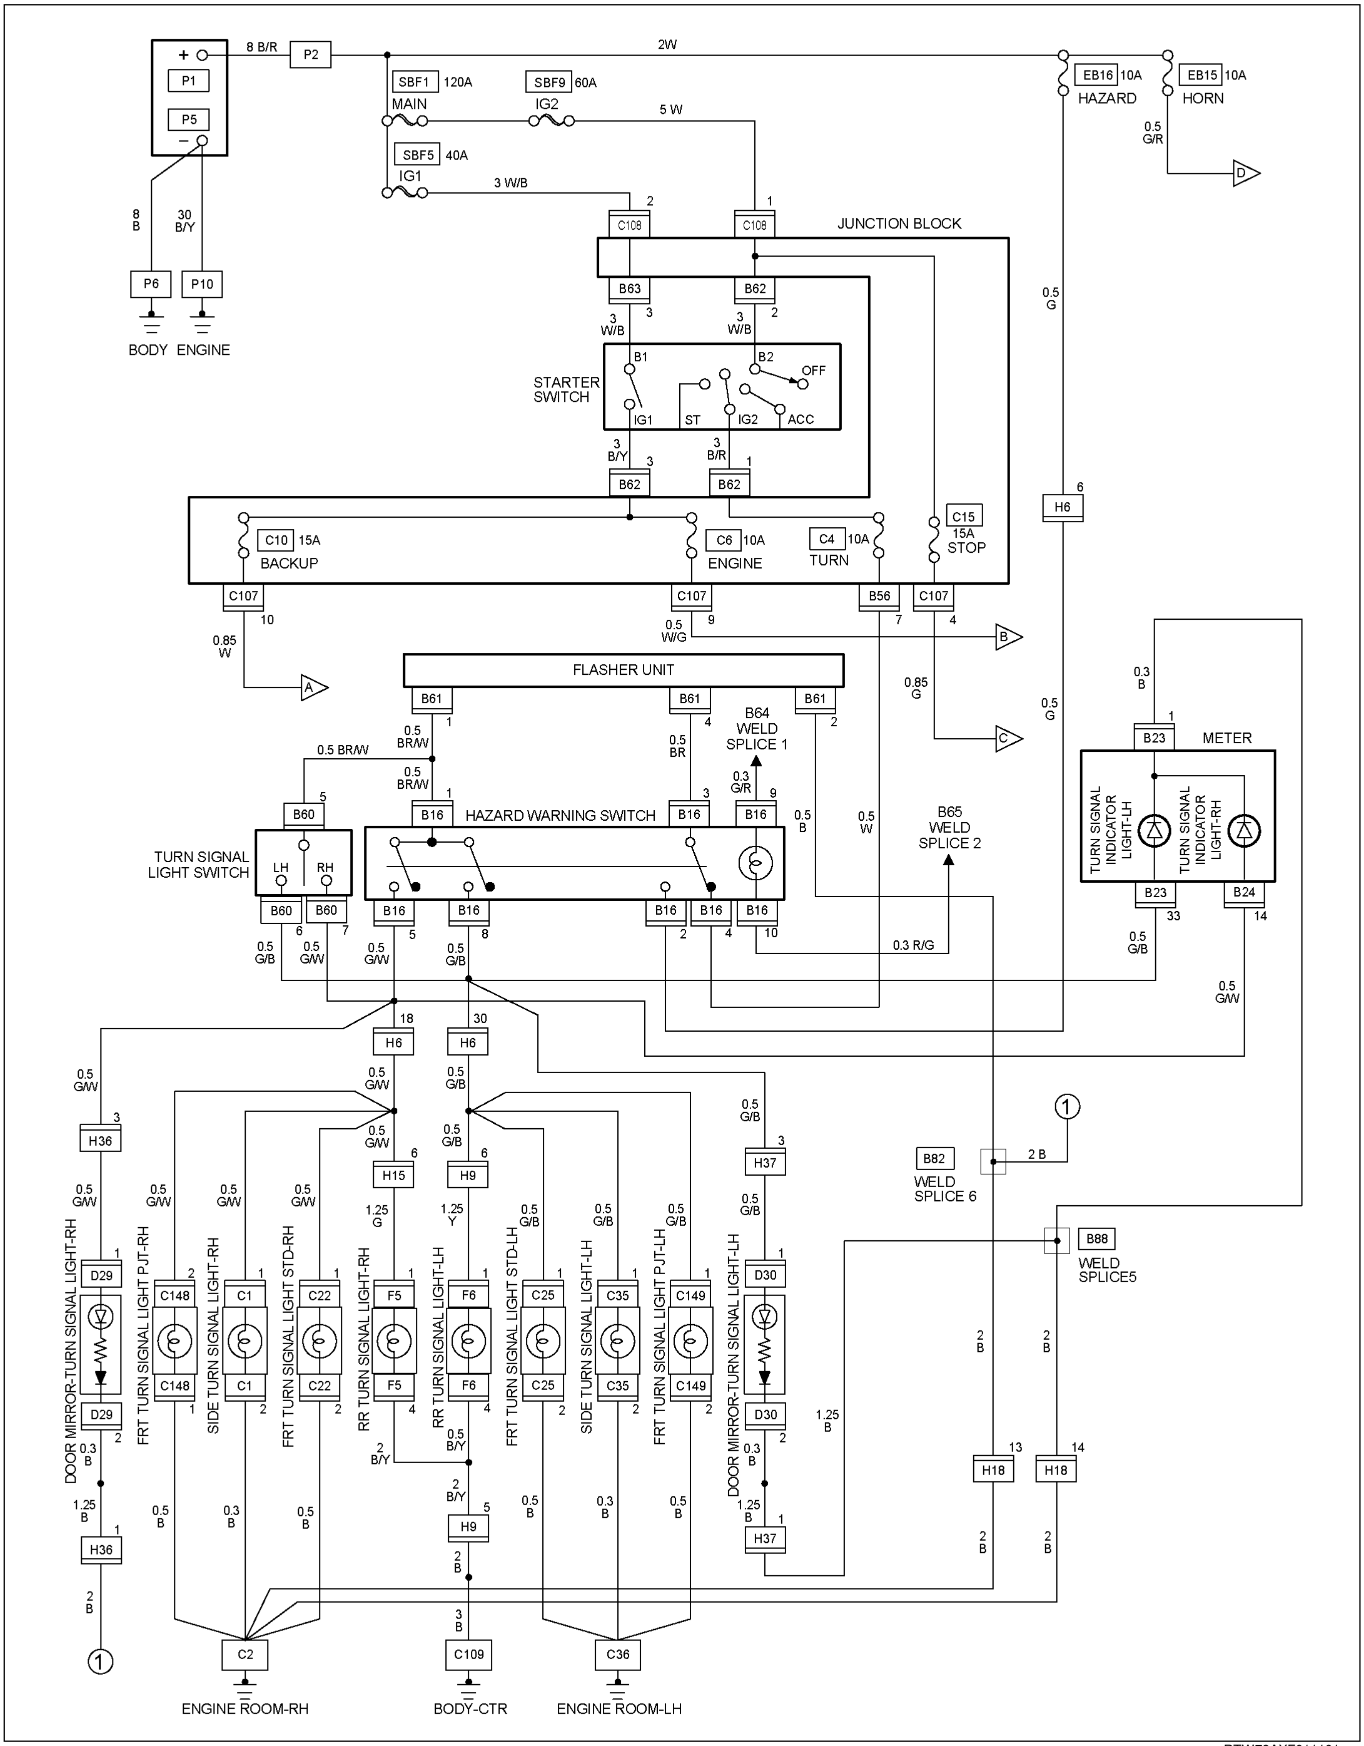
Sheet 1/2



17. Support the differential case by the jack.
18. Remove the front axle mounting bolts and nuts, lower the jack slowly. Remove the left side drive shaft end from the knuckle, then lower the axle assembly from the vehicle.

CAUTION :

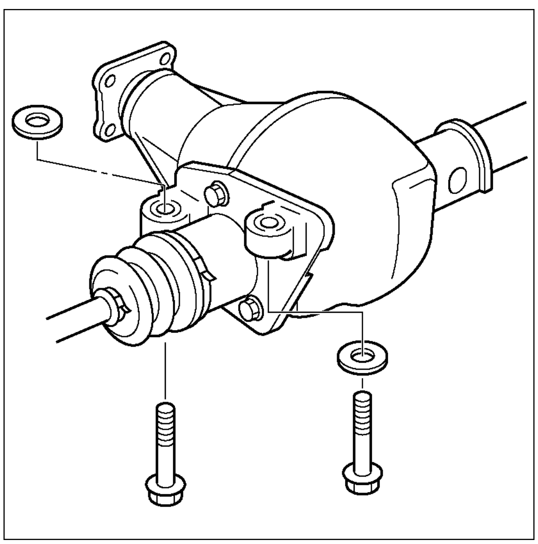
1. **During the work, be sure that the axle assembly is supported securely.**
2. **Be careful not to damage the bellows of the power steering unit by interference.**
3. **Be careful not to damage the breather pipe and breather pip bracket of the shift on the fly by interference.**

Installation

1. Support the differential case by the jack.
2. Jack up the front drive axle assembly, install the left side drive shaft to the knuckle, then install the mount bolts and nuts.

CAUTION :

1. **Be careful not to damage the bellows of the power steering unit by interference.**
2. **Be careful not to damage the breather pipe and breather pip bracket of the shift on the fly by interference.**
3. **When installing the drive shaft to the knuckle, be careful not to damage the oil seal inside of the knuckle.**



RTW34CSH000101

3. Tighten the mounting bolts and nuts to the specified torque.
   Torque : 169 N·m (17.2kgf·m/124 lb·ft)

4. Install the right side knuckle with lower control arm to the upper control arm.
   Refer to Knuckle in Suspension section.

CAUTION :

When insert the drive shaft to the knuckle, be careful not to damage the oil seal inside of the knuckle.

5. Align the bolt hole of the lower control arm, install the bolts and nuts.

TROUBLESHOOTING

STOPLIGHT AND HIGH MOUNTED STOPLIGHT

1. One side of stoplight does not light

Checkpoint		Trouble Cause	Countermeasure
Stoplight bulb continuity	NG	Burned out bulb or poor connector contact	Replace the bulb or repair connector contact
OK			
Continuity between 9 H9 - 2 F6 (LH) (or 2 F5 (RH))	NG	Open circuit or poor connector contact	Repair open circuit or connector contact
OK			
Continuity between C109 - 4 F6 (LH) (or 4 F5 (RH))	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

2. Both sides of stoplight do not light

Checkpoint		Trouble Cause	Countermeasure
Fuse No. SBF-9 (50A, Fuse and Relay box) or 1 C108 - 4 C107 Fuse No. C15 (15A)	NG	Poor fuse contact or blown	Reinstall or replace fuse No. SBF9 (50A or 60A) or 1 C108 - 4 C107 Fuse No. C15 (15A)
OK			
Stop light switch (or brake switch) function	NG	Incorrect the switch installation or adjustment	Adjust the switch installation position
OK			
Voltage between 2 F6 ground or 2 F5 - ground with brake pedal depressed (Should be battery voltage present)	NG	Open circuit or poor connector contact between stoplight switch (or brake switch) and stoplight	Repair open circuit or connector contact

3. High mounted stoplight does not light

Checkpoint		Trouble Cause	Countermeasure
Grounding point C2	NG	Poor grounding point contact	Repair grounding point contact C2
OK			
Continuity between 3 L5 - 1 L5	NG	High mounted stoplight malfunction	Repair or replace the high mounted stoplight
OK			
Voltage between 1 L5 - ground with brake pedal depressed (Should be battery voltage present)	NG	Open circuit or poor connector contact	Repair an open circuit or connector contact between 3 L5 - 13 H18 (RHD) or 10 H48 (LHD)

TURN SIGNAL LIGHT AND HAZARD WARNING LIGHT

1. Turn signal light does not light on both sides (RH and LH)

Checkpoint		Trouble Cause	Countermeasure
Fuse No. EB16 (10A, Fuse box)	NG	Poor fuse contact or blown fuse	Reinstall or replace fuse No. EB16 (10A)
OK			
Short circuit between connector 3 B61 - 1 B61 when turn signal switch operates with starter switch in "ON" position (Turn signal light should be ON)	NG	Flasher unit malfunction	Replace the flasher unit
OK			
Continuity between connector 2 B61 -ground (Should be continuity)	NG	Open circuit or poor connector contact	Repair open circuit or connector contact
OK			
Turn signal switch continuity between connector 5 B60 - 6 B60 and 5 B60 - 7 B60 when turn signal switch operates	NG	Poor switch point contact or faulty switch	Repair or replace the combination switch

2. Turn signal light does not light on one side (RH or LH)

Checkpoint		Trouble Cause	Countermeasure
Turn signal switch continuity	NG	Poor switch point contact or faulty switch	Repair or replace the combination switch
OK			
(RH) Continuity between 1 C22 - 7 B60 (FRT), 1 C1 - 7 B60 (SIDE), 1 F5 - 7 B60 (RR)	NG	Open circuit or poor connector contact	Repair open circuit or connector contact
OK			
(LH) Continuity between 1 C25 - 6 B60 (FRT), 1 C35 - 6 B60 (SIDE), 1 F6 - 6 B60 (RR)	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

3. Hazard warning light does not light

Checkpoint		Trouble Cause	Countermeasure
Fuse No. EB16 (10A, Relay and fuse box)	NG	Poor fuse contact or blown fuse	Reinstall or replace the fuse No. EB-16 (10A)
OK			
Hazard SW. continuity	NG	Hazard SW. malfunction	Repair or replace the hazard SW.
OK			
Voltage between 5 B16 - ground (Should be battery voltage present)	NG	Open circuit or poor connector contact between fuse No. EB16 (10A) - 5 B16	Repair open circuit or connector contact

4. Flashing rate too fast (One side)

Checkpoint		Trouble Cause	Countermeasure
Inspect bulb	NG	Burned out bulb	Replace the bulb or repair open circuit

NOTE :
Adjust the buffer clearance before tighten the bolts and nuts of the lower control arm.

6. Install the breather hose of the front axle.
7. Install the actuator connector of the shift on the fly.
8. Install the tie-rod end of the power steering unit to the knuckle, tighten the nut to the specified torque.
   Torque : 98 N·m (10.0kgf·m/73 lb·ft)
9. Install lower bolts and nuts of the shock absorber, tighten it to the specified torque.
   Torque : 93 N·m (9.5kgf·m/69 lb·ft)
10. Install lower nuts of the stabilizer link, tighten it to the specified torque.
    Torque : 50 N·m (5.1kgf·m/37 lb·ft)
11. Install the suspension crossmember.
12. Install the torsion bar.
    Refer to Torsion Bar in Suspension section.
13. Install the front propeller shaft.
    Refer to Front Propeller Shaft in this section.
14. Install the hub and disc assembly and adjust the bearing preload.
    Refer to Front Hub and Disc in this section.
15. Install the wheel speed sensor of the antilock brake system.
16. Install the brake caliper. Tighten the bolt of the caliper bracket to the specified torque.
    Torque : 226 N·m (23.0kgf·m/166 lb·ft)
17. Install the stone guard.
18. Install the tire and wheel.
19. Lower the vehicle, adjust the trim height.
    Refer to Trim Height Adjustment in Front Alignment section.
20. Tighten the bolts and nuts of the lower control arm to the specified torque.
    Refer to Lower Control Arm in Suspension section.

BACKUP LIGHT

1. Backup light does not light on one side (RH or LH)

Checkpoint		Trouble Cause	Countermeasure
Backup light bulb continuity	NG	Burned out bulb or poor connector contact	Replace the bulb or repair connector contact
OK			
Grounding point	NG	Poor ground contact	Repair grounding point contact

2. Backup light does not light on both sides

Checkpoint		Trouble Cause	Countermeasure
Fuse No. C10 (15A, Fuse box)	NG	Poor fuse contact or blown fuse	Reinstall or replace fuse No. C10 (15A)
OK			
Back up light switch (mode switch) continuity	NG	Poor switch point contact of faulty switch	Repair or replace the switch
OK			
Voltage between 5 $\boxed{F6}$ (5 $\boxed{F5}$) - ground with starter switch ON and shift lever into reverse position (Should be battery voltage present)	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

HORN

1. Both sides of horn do not sound

Checkpoint	Result	Trouble Cause	Countermeasure
Fuse No EB15 (10A, Relay and fuse box)	NG	Poor fuse contact or blown fuse	Reinstall or replace fuse No. EB15 (10A)
OK ↓			
Grounding point	NG	Poor ground contact	Repair the grounding point
OK ↓			
Horn relay	NG	Poor relay contact or faulty horn relay	Reinstall or replace the horn relay
OK ↓			
Voltage between connector 3 X3 - ground or 1 X3 - ground (Should be battery voltage present)	NG	Open circuit or poor connector contact between fuse No. EB15 (10A) and horn relay	Repair open circuit or reconnect the connector
OK ↓			
Remove steering pad and steering wheel			
OK ↓			
Horn switch continuity	NG	Poor switch point contact or faulty switch	Repair or replace the horn switch
OK ↓			
Continuity between 5 X3 - 10 B60 2 X3 - 1 C20 (1 C21)	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

2. One side of horn does not blow

Checkpoint		Trouble Cause	Countermeasure
Horn continuity between connectors	NG	Faulty horn assembly	Replace the horn assembly
OK			
Voltage between 1 $\boxed{C20}$ (1 $\boxed{C21}$) - ground with horn switch depressed (Should be battery voltage present)	NG	Open circuit or poor connector contact	Repair open circuit or reconnect the connector

3. Insufficient horn volume

Checkpoint		Trouble Cause	Countermeasure
Battery condition	NG	Discharged battery	Recharge or replace the battery
OK			
Horn	NG	Stain foreign material in the horn	Clfean and/or remove the foreign material

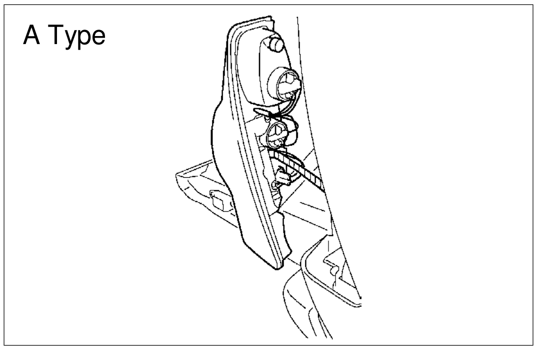
REMOVAL AND INSTALLATION

REAR COMBINATION LIGHT

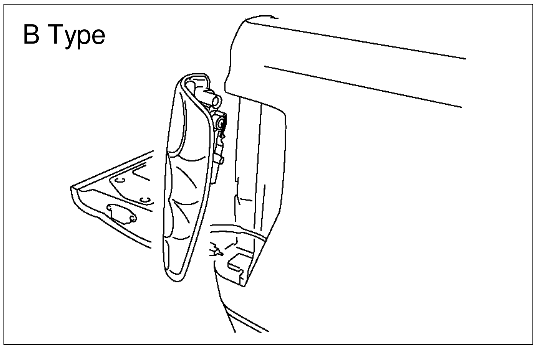
Stoplight

Removal

1. Open the tail gate.
2. Remove the screws of rear combination light.
3. Remove the rear combination light assembly.

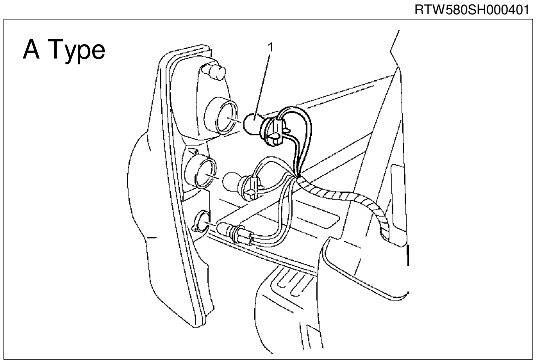


RTW780SH002101

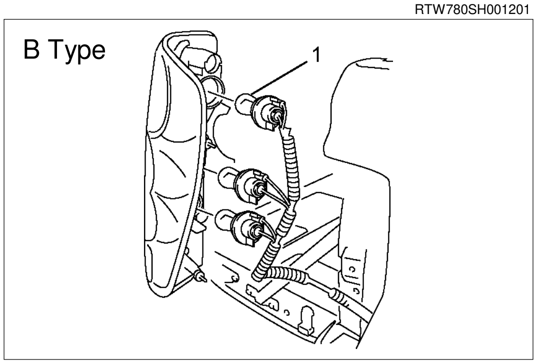


RTW580SH000401

4. Turn the bulb (1) counterclockwise to remove it.



RTW780SH001201



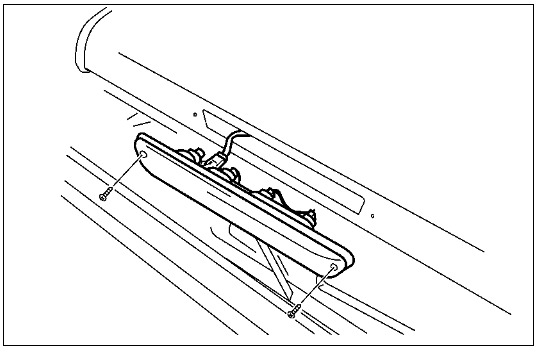
RTW580SH000501

Installation

Follow the removal procedure in the reverse order to install the rear combination light.
Pay close attention to the important points mentioned in the following paragraphs.

Bulb

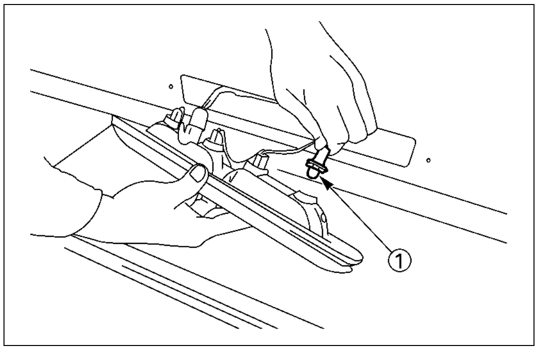
Be absolutely sure that each bulb is correctly installed.
This will prevent a poor contact and an open circuit.



HIGH MOUNTED STOPLIGHT

Remove the bulb socket

1. Remove the high mounted stoplight ASM.
   - Remove the screws.
   - Disconnect the connector.



2. Remove the bulb socket.
   - Turn the bulb ① counterclockwise to remove it.

Installation

Follow the removal procedure in the reverse order to install the rear combination light.
Pay close attention to the important points mentioned in the following paragraphs.

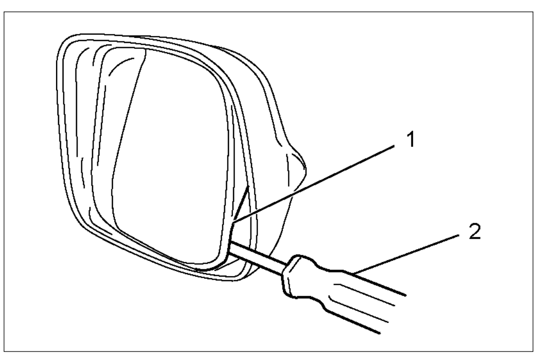
Bulb

Be absolutely sure that each bulb is correctly installed.
This will prevent a poor contact and an open circuit.

DOOR MIRROR - TURN SIGNAL LIGHT

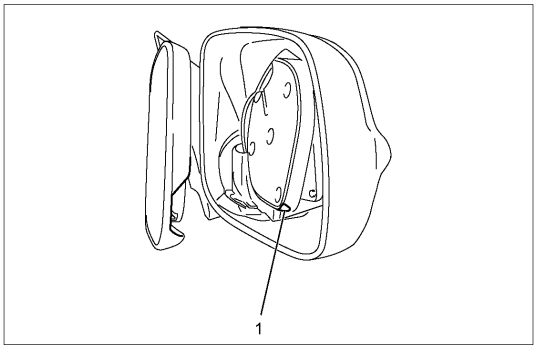
Removal

1. Pull the lower outside corner of the mirror toward you.



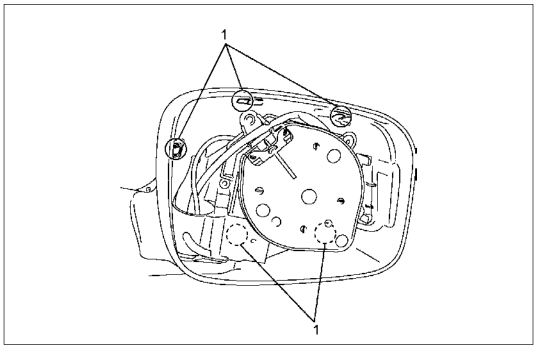
RUW580SH000701

2. Press the blade of an ordinary screwdriver (2) into the mirror outside groove near the mirror base hole (1).



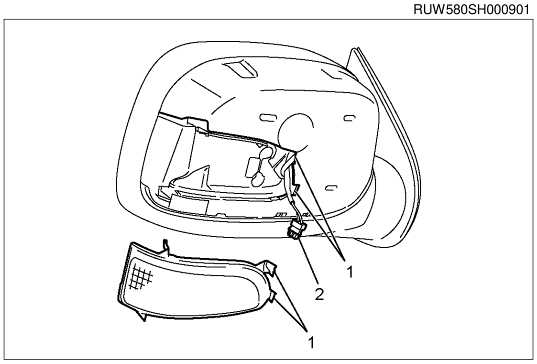
RUW580SH000801

3. Turn the blade of the screwdriver 90 degrees to separate the parts (1).



RUW580SH000901

4. Use an ordinary screwdriver inserted into the inner groove (1) of the outside mirror case to pry off the outside panel (it pasts up on butyl tape). Do this at 5 points around the groove.

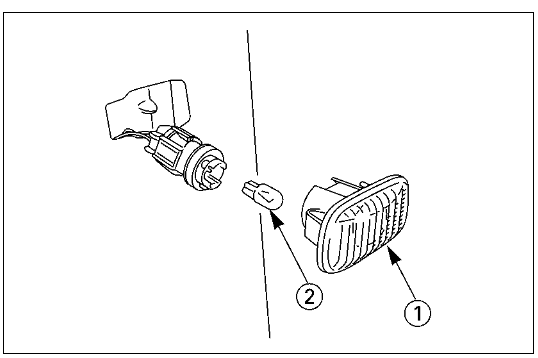


RUW580SH001001

5. Insert an ordinary screwdriver into the inner groove (1) of the door mirror - turn signal light. Pry the light free.
6. Disconnect the connector (2).

Installation

Follow the removal procedure in the reverse order to install the door mirror - turn signal light.
Pay close attention to the important points mentioned in the following paragraphs.



SIDE TURN LIGHT

Removal

1. Remove the lens ①.
   - Pull the light/bulb toward you while pushing the light housing in the rear direction of the vehicle to release its lock.
   - Remove the socket by turning it counterclockwise.
2. Pull the bulb ② to remove it.

Installation

Follow the removal procedure in the reverse order to install the side turn light.
Pay close attention to the important points mentioned in the following paragraphs.

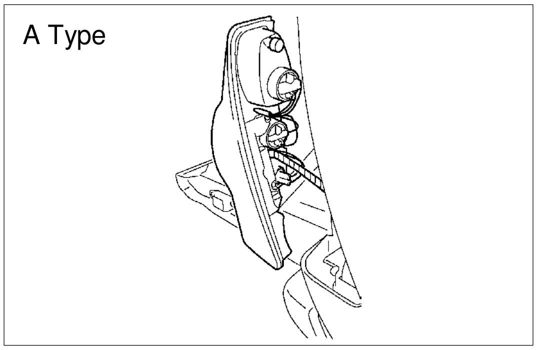
Bulb

Be absolutely sure that the side turn light bulb is correctly installed.
This will prevent a poor contact and an open circuit.

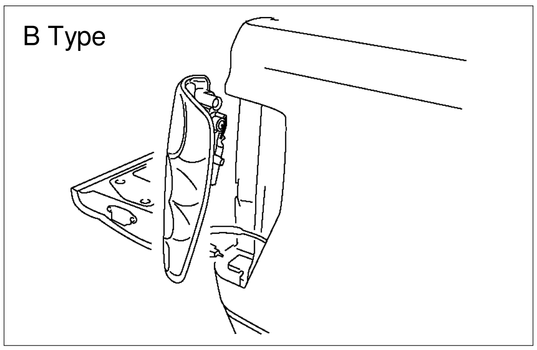
REAR COMBINATION LIGHT

Turn Signal Light

Removal

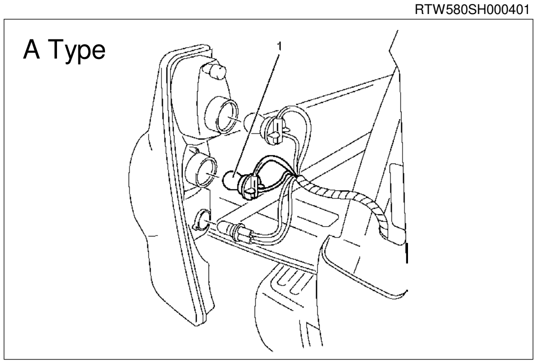


RTW780SH002101

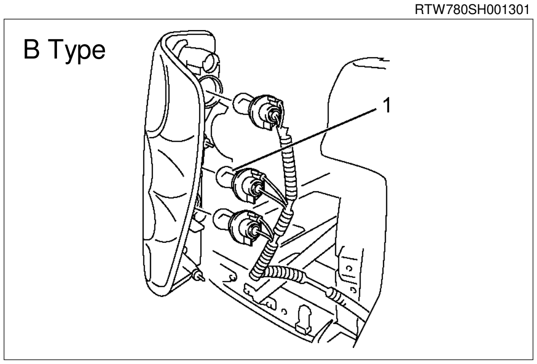


RTW580SH000401

1. Open the tail gate.
2. Remove the screws.
3. Remove the rear combination light assembly.



RTW780SH001301



RTW78ASH002501

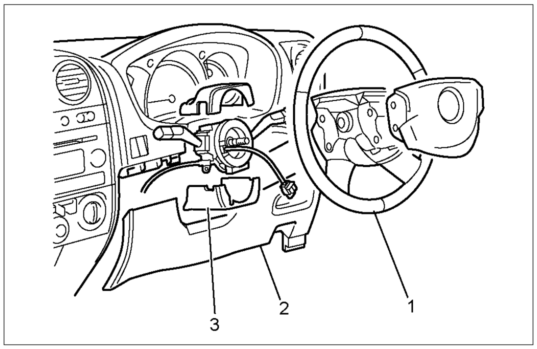
4. Turn the bulb ① counterclockwise to remove it.

Installation

Follow the removal procedure in the reverse order to install the rear combination light.
Pay close attention to the important points mentioned in the following paragraphs.

Bulb

Be absolutely sure that the rear combination light bulb is correctly installed.
This will prevent a poor contact and an open circuit.

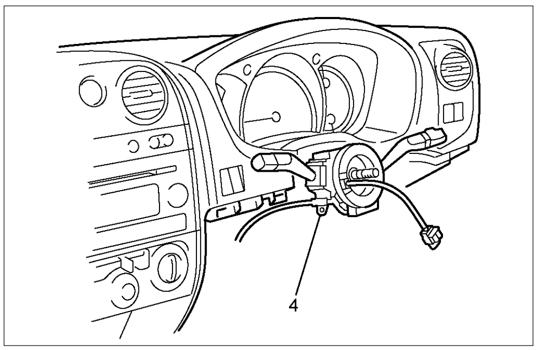


This illustration is based on RHD model

TURN SIGNAL LIGHT SWITCH

Removal

1. Disconnect the battery ground cable.
2. Remove the steering wheel ①.
   Refer to the “STEERING” Section of this Manual.
3. Remove the instruments panel lower cover ②.
4. Remove the steering column cover ③.



This illustration is based on RHD model

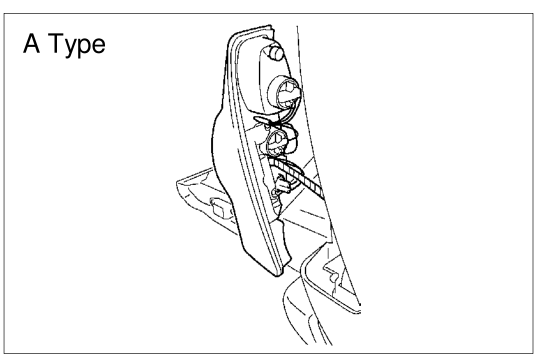
5. Disconnect the connector.
6. Remove the turn signal switch from the steering shaft.

Installation

Follow the removal procedure in the reverse order to install the turn signal switch (lever).
Pay close attention to the important points mentioned in the following paragraphs.

Connector

Be absolutely sure that the turn signal switch connector is securely connected.
This will prevent a poor contact and at an open circuit.

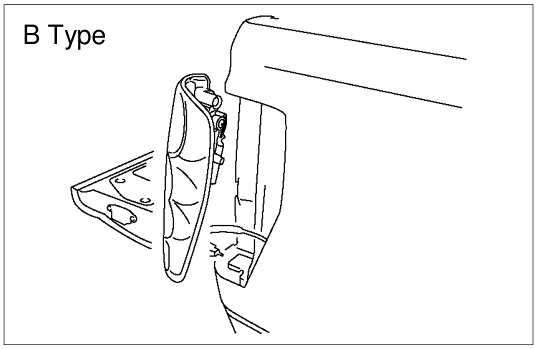


REAR COMBINATION LIGHT

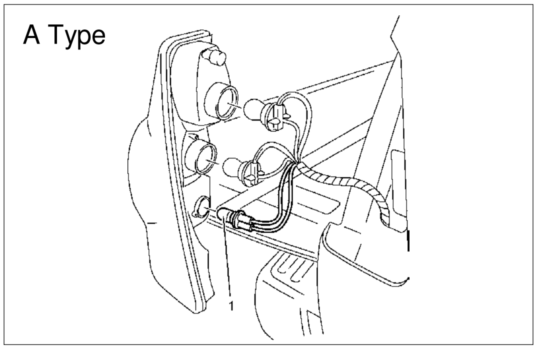
Backup Light

Removal

1. Open the rear gate.
2. Remove the screws.
3. Remove the rear combination light assembly.

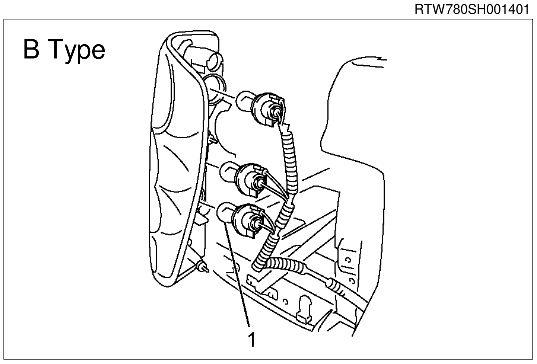


RTW580SH000401



RTW780SH001401

4. Turn the bulb ① counterclockwise to remove it.



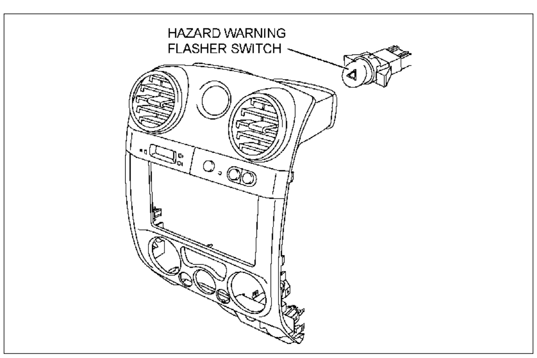
RTW78ASH002601

Installation

Follow the removal procedure in the reverse order to install the rear combination light.
Pay close attention to the important points mentioned in the following paragraphs.

Bulbs

Be absolutely sure that each bulb is correctly installed.
This will prevent a poor contact and an open circuit.



RTW780SH001501
This illustration is based on RHD model

HAZARD WARNING FLASHER SWITCH

Removal

1. Disconnect the battery ground cable.
2. Instrument Panel Cluster Assembly
   - Refer to Section 10 “BODY” for instrument panel cluster assembly removal steps.
3. Hazard Warning Switch
   - Disconnect the switch connector.
   - To remove the switch, push the lock from the back side of the cluster assembly.

Installation

To install, follow the removal procedure in the reverse order.

Connector

Be absolutely sure that the hazard warning flasher switch connector is securely connected.
This will prevent a poor contact and an open circuit.

BACKUP LIGHT SWITCH

Removal

1. Disconnect the battery ground cable.
2. Disconnect the connector ①.
3. Remove the backup light switch from the transmission ②.

Installation

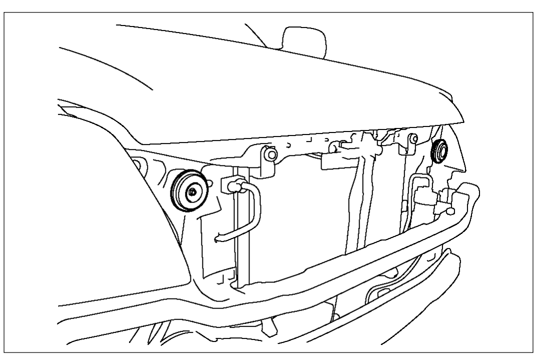
Follow the removal procedure in the reverse order to install the backup light switch.
Pay close attention to the important points mentioned in the following paragraphs.

Backup Light Switch Threads

Apply liquid gasket to the threaded portion and install the backup light switch.

Connector

Be absolutely sure that the backup light connector is securely connected.
This will prevent a poor contact and an open circuit.



HORN

Removal

1. Remove the radiator grille.
   Refer to the “HEADLIGHT” removal procedure.
2. Loosen the horn bolt.
3. Disconnect the horn connector.

Installation

Follow the removal procedure in the reverse order to install the horn.
Pay close attention to the important point mentioned in the following paragraphs.

Connector

Be absolutely sure the horn connector is securely connected.
This will prevent a poor contact and open circuit.

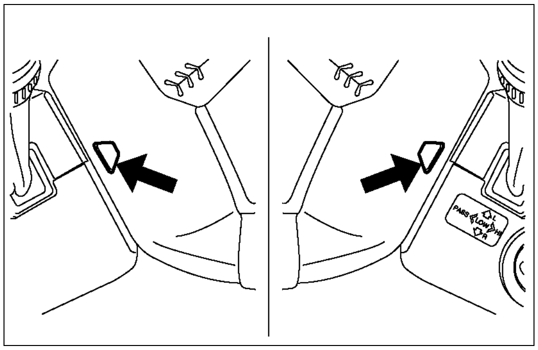
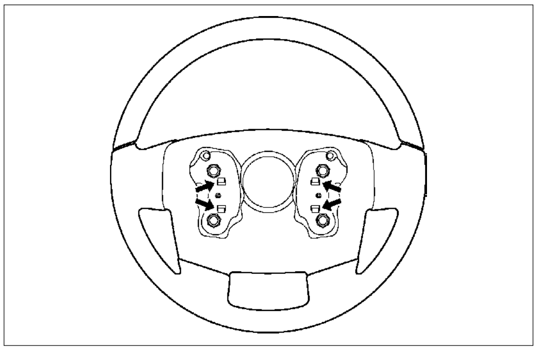
HORN SWITCH

Removal

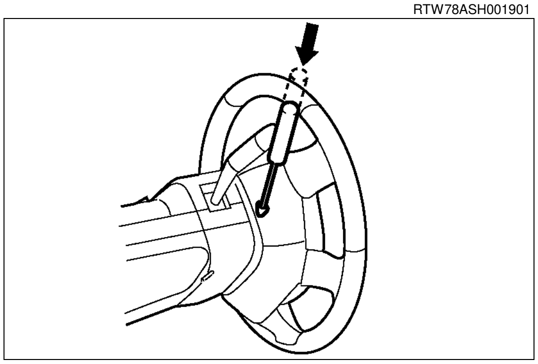


1. Disable the SRS (Refer to “Disabling the SRS” in Section 9A).
2. Insertion hole for pin push bar at below the steering wheel indicated arrow.

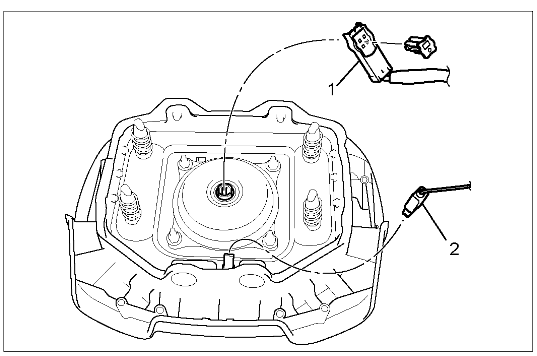


RTW78ASH001901

3. Check the position of the pins in the holes before insert the pin push bar. Push the pin in the direction of the arrow.



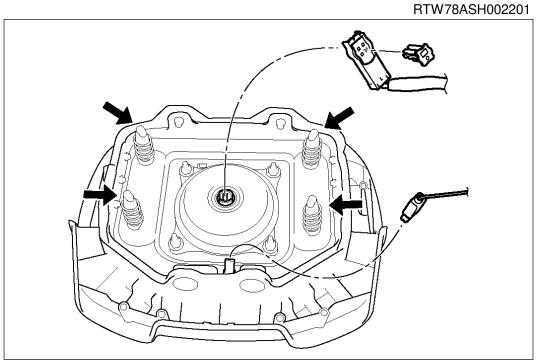
4. Push the four pins using the ϕ5~6 bar for cancel the lock on the four pins.



RTW78ASH002201

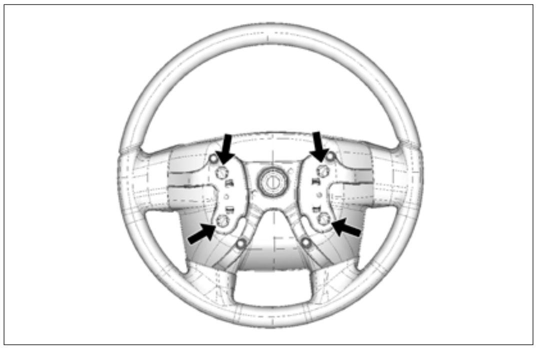
5. Disconnect the SRS air bag connector ① and horn lead connector ② and remove the air bag assembly.
6. Remove the horn switch.

Installation

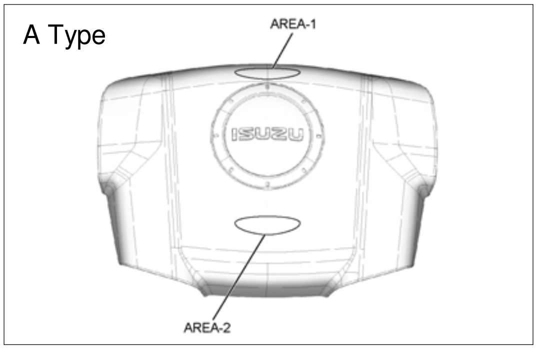


RTW78ASH002401

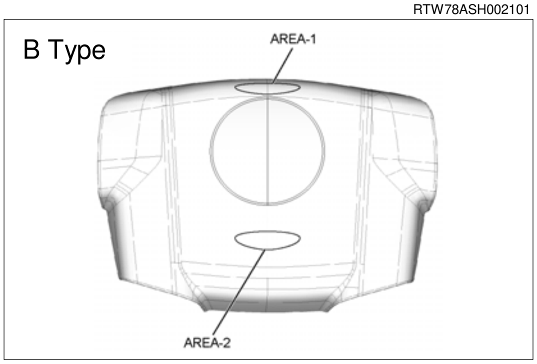
1. Connect the SRS bag connector and horn lead connector.
2. Align each snap stud of the driver air bag to the hole in the steering wheel.



RTW78ASH002001



RTW78ASH002101



RTW780SH003101

3. Push the horn switch area1 and area-2. At that time check the audible noise from each snap stud. (Should be no noise present)
4. Enable the SRS (Refer to “Enabling the SRS” in Section 9A).

Disassembly

NOTE :

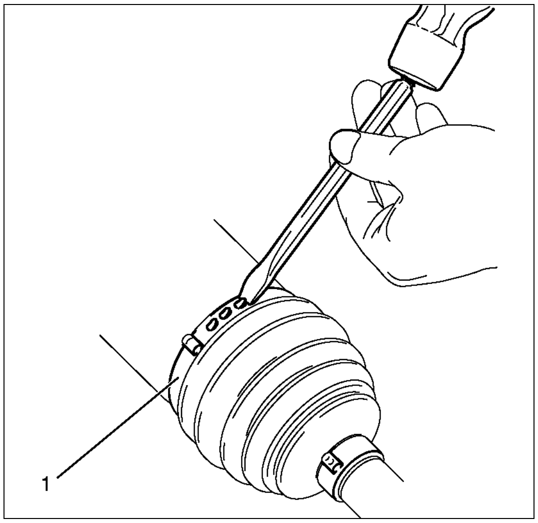
For the left side, follow the same steps as right side.

1. Use a hammer and chisel to remove the 3 pawls (above the large and small boot bands on the DOJ side).

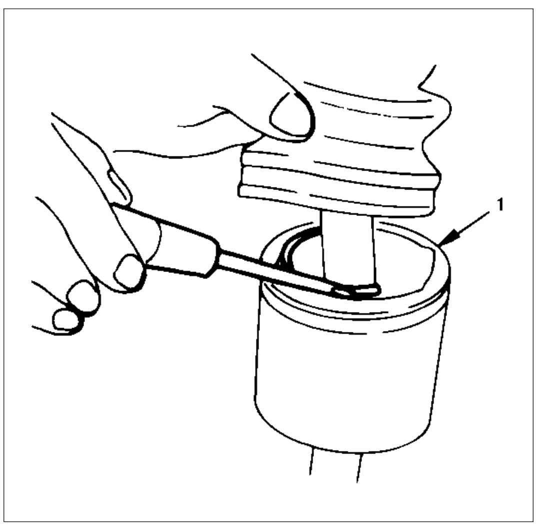
CAUTION :

Take care not to damage the bellows during band removal.

2. Remove band (1).



3. Pry off circlip (1) with a screwdriver or equivalent.



4. Remove drive shaft joint assembly.
5. Remove the six balls (1) with a screwdriver or equivalent.

TROUBLESHOOTING

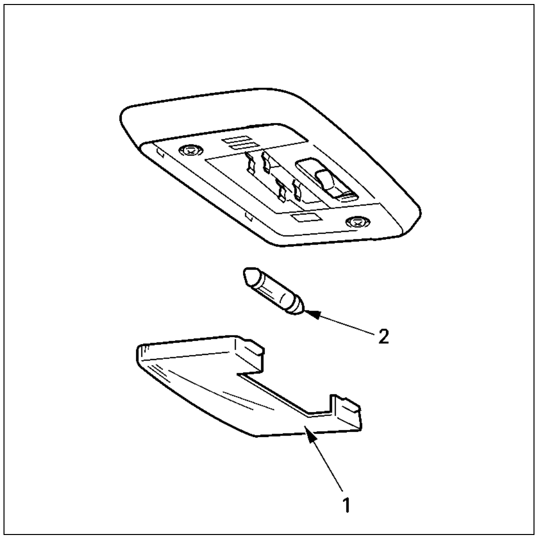
1. Dome light dose not light

Checkpoint		Trouble Cause	Countermeasure
Dome light bulb continuity	NG	Burned out the bulb	Replace the dome light bulb
OK			
Dome light switch function	NG	Switch malfunction	Repair or replace the dome light assembly
OK			
Continuity between connector 5 H12 - 1 L1	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

2. Dome light does not go out

Checkpoint		Trouble Cause	Countermeasure
Door switch function (Both side)	NG	Switch malfunction or foreign material switch	Repair or replace the door switch
OK			
Continuity between connector 2 L1 -ground when shutting the door (Should be no continuity)	NG	Short circuit	Repair short circuit or connector contact

REMOVAL AND INSTALLATION



DOME LIGHT

Removal

1. Remove the dome light lens ① free.
2. Remove two dome light fixing screws.
3. Remove the wiring connector.
4. Remove the dome light.
5. Pull the bulb ② to remove it.

Installation

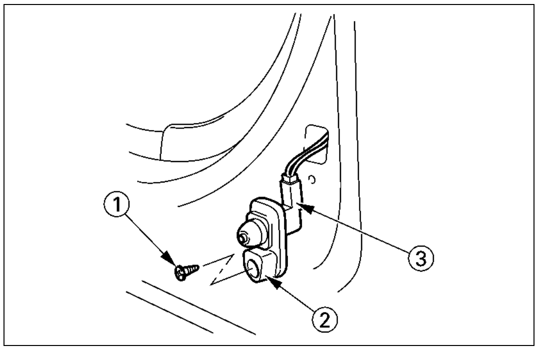
Follow the removal procedure in the reverse order to install the dome light.

Pay close attention to the important points mentioned in the following paragraphs.

Bulb

Be absolutely sure that the dome light bulb is correctly installed.

This will prevent a poor contact and an open circuit.



DOOR SWITCH

Removal

1. Disconnect the battery ground cable.
2. Loosen the screw ①.
3. Remove the door switch ②.
4. Disconnect the door switch connector ③.

Installation

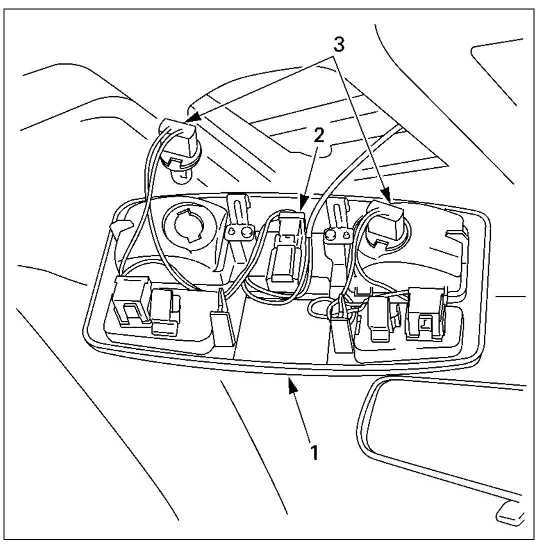
Follow the removal procedure in the reverse order to install the spot light.

Pay close attention to the important points mentioned in the following paragraphs.

Connector

Be absolutely sure that the door switch connector is securely connected.

This will prevent a poor contact and an open circuit.

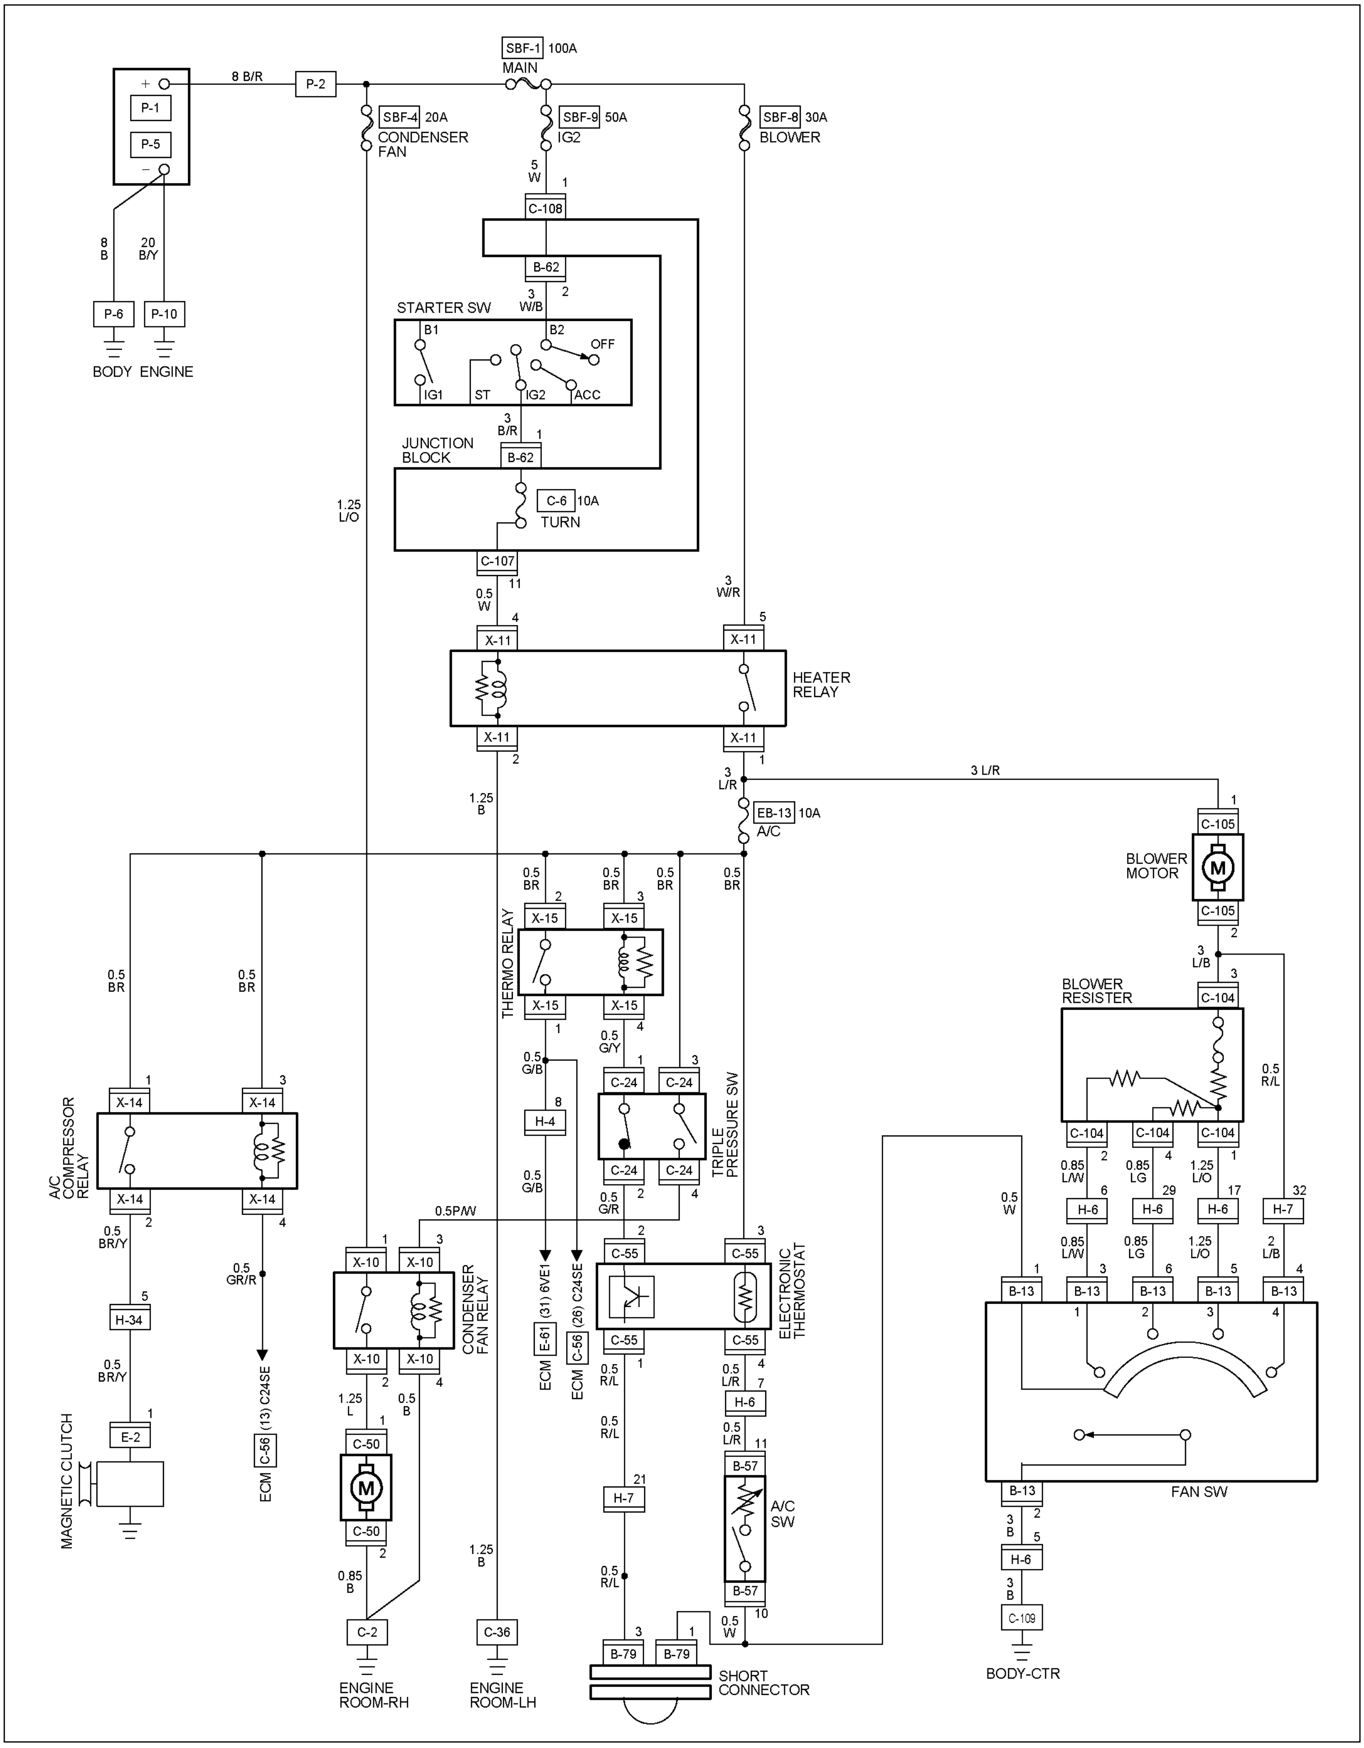


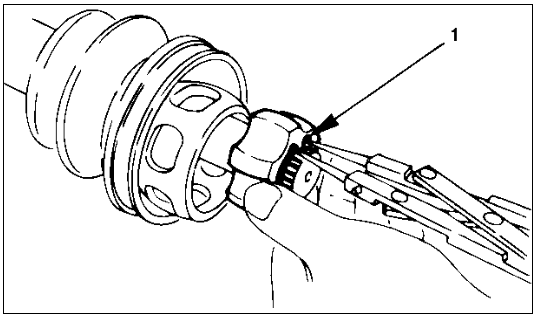
SPOTLIGHT (MAP Light)

Removal

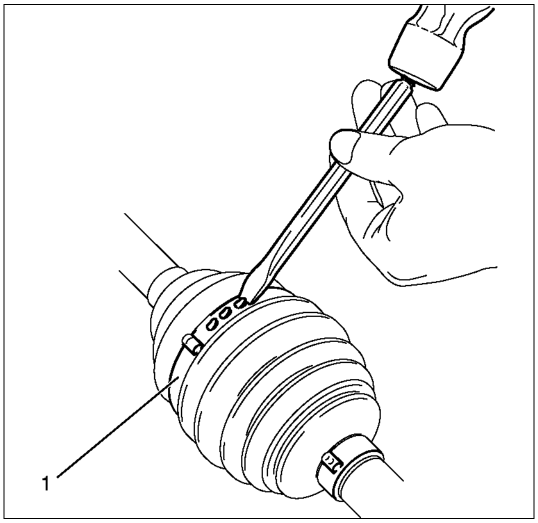
1. Grasp the spotlight housing ① with both hands.
   Pull the housing straight down.
   This will release the clip.
2. Disconnect the connector ②.
3. Turn socket ③ counterclockwise to remove it.

C24SE (COOLER WITHOUT HEATER)





6. Using snap ring pliers, remove the snap ring (1) fastening the ball retainer to the center shaft.
7. Remove ball retainer, ball guide and bellows.



8. Use a hammer and chisel to remove the 3 pawls (above the large and small boot bands on the UJ side).

CAUTION :

Take care not to damage the bellows during band removal.

9. Remove band (1).
10. Remove bellows.
11. Remove dust seal from UJ.
12. Remove UJ shaft assembly.
13. Remove the mounting bracket fixing bolts, and then remove DOJ case assembly from the axle case.
14. Remove snap ring and bearing.
15. Remove snap ring and oil seal.
16. Remove bracket.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage, corrosion or any other abnormal condition are found through inspection.

Check the following parts.

1. Drive shaft joint assembly
2. DOJ case, ball, ball guide, ball retainer
3. Bellows
4. Bearing
5. Dust seal, oil seal

Installation

Follow the removal procedure in the reverse order to install the spot light.

Pay close attention to the important points mentioned in the following paragraphs.

Connector

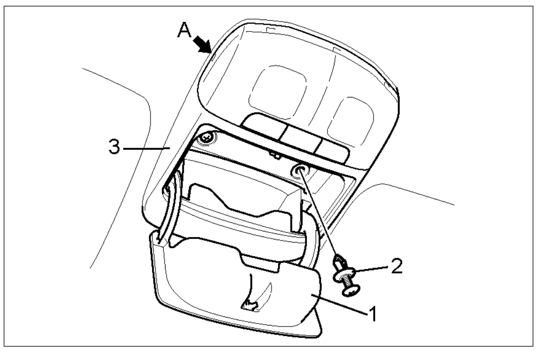
Be absolutely sure that the spot light connector is securely connected.
This will prevent a poor contact and an open circuit.

Bulb

Be absolutely sure that the spot light bulb is correctly installed.
This will prevent a poor contact and an open circuit.

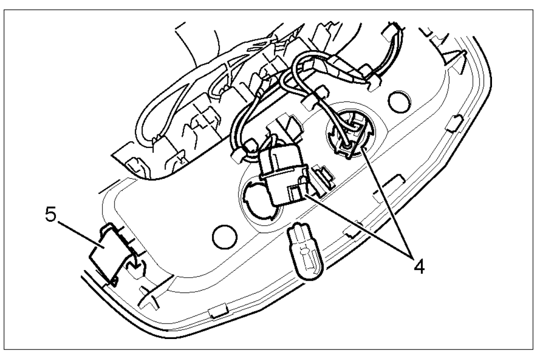
OVER HEAD CONSOLE (MAP Light)

Removal



RUW580SH001501

1. Open the lid (1) and remove the fastener (2).
2. A steel scale equivalent article is inserted in a lens side hook part and the crevice A section with roof lining, a metal clip (5) is pushed in, and a over head consol (3) is removed
3. Disconnect the connector.
4. Push the bulb socket (4) in and turn it counterclockwise to remove it.



RUW580SH001601

Installation

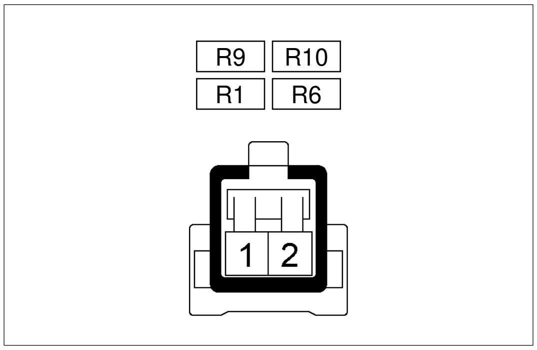
Follow the removal procedure in the reverse order to install the front map light.

Pay close attention to the important points mentioned in the following paragraphs.

Bulb

Be absolutely sure that the front map light bulb is correctly installed.
This will prevent a poor contact and an open circuit.

INSPECTION AND REPAIR



DOOR SWITCH

Door Switch Connections

SW position \ Connector No. / Terminal No.	R9 R10 R1 R6: 1	Body Ground
PUSHED		
RELEASED	○	○

Warning function	Operational conditions
Key left in starter switch	The buzzer sounds when both the key remind switch and the front door switch-driver side are turned on. To stop the sound of the buzzer, turn OFF the starter switch and remove the key from the starter switch.
Lighting switch left on	The buzzer sounds when the starter switch is turned from the “ON” to “OFF” position while the lighting switch is ON position. To stop the sound of the buzzer, turn OFF the lighting switch.

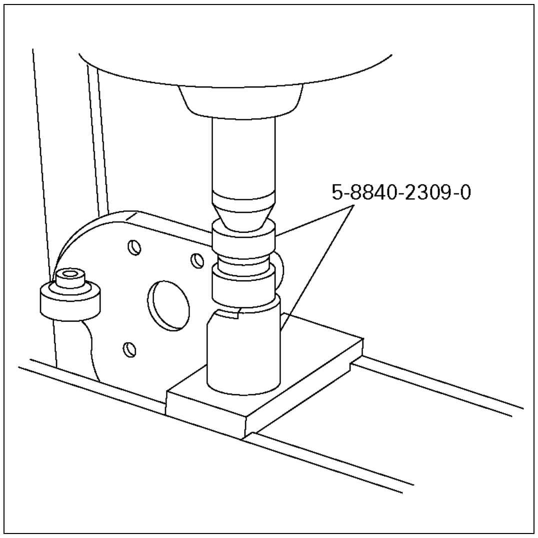
Bushing Replacement

- Remove the bushings using a remover 5-8840-2309-0 and hammer.



- By using installer and base 5-8840-2309-0, press fit the bushings into the bracket.

Reassembly

1. Install DOJ case to bracket.
2. Install oil seal and fix snap ring.
   Discard the used oil seal, snap ring and install a new one.
3. Install bearing and fix snap ring.
   Discard the used snap ring and install a new one.
4. Install bracket to axle case. Tighten the bracket bolt to the specified torque.
   Torque : 116 N·m (11.8kgf·m/85 lb·ft)
5. Apply 135g of the specified grease in UJ.
6. Install dust seal for UJ.
   Discard the used dust seal and install a new one.
7. Apply a thin coat of grease to the shaft for smooth installation then install bellows.

CAUTION :

During bellows assembly, be sure to insert both ends of the bellows into the case and shaft grooves.

TROUBLESHOOTING

WINDSHIELD WIPER

1. Wiper dose not operate at any switch position

Checkpoint		Trouble Cause	Countermeasure
Fuse No. C9 (20A)	NG	Poor fuse contact or blown	Reinstall or replace the fuse No. C9 (20A)
OK			
Voltage between 3 B59 and the ground (Should be battery voltage present)	NG	Open circuit or poor connector contact	Repair open circuit or connector contact
OK			
Continuity in the wiper & washer SW.	NG	SW. malfunction	Replace the wiper & washer SW.
OK			
Grounding point C2 (LHD), C C36 (RHD)	NG	Poor grounding point contact	Repair grounding point contact
OK			
1. Wiper motor function when connecting the motor connector 3 C4 to the battery (+) terminal, and 1 C4 to the (-) terminal (Should the wiper motor rotate at a low speed) 2. Wiper motor function when connecting the motor connector 2 C4 to the battery (+) terminal, 1 C4 to the (-) terminal (Should the wiper motor rotate at a high speed)	NG	Wiper motor malfunction	Replace the wiper motor
OK			
Continuity between 1 C4 and C36 (RHD), C2 (LHD)	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

2. Wiper dose not operate at " INT " position

Checkpoint		Trouble Cause	Countermeasure
Continuity between the wiper & washer SW connector terminals 4 B59 and 2 B59 at the " INT " position	NG	SW. malfunction	Replace the wiper & washer SW.
OK			
Grounding point C36 (RHD), C2 (LHD)	NG	Poor grounding point contact	Repair grounding point contact
OK			
Voltage between the intermittent relay harness side connector terminal 4 C3 and the ground at the "INT" position (Should be battery voltage present)	NG	Open circuit or poor connector contact	Repair open circuit or connector contact
OK			
Intermittent relay function	NG	Relay malfunction	Replace the intermittent relay

3. Wiper does not operate at "LO" position

Checkpoint		Trouble Cause	Countermeasure
Wiper motor function 1. Disconnect the wiper & washer SW. connector 2. Turn the starter SW. on 3. Short-circuit between the wiper & washer SW. harness side connector terminal 3 B59 and 5 B59. 4. Check to see if the wiper motor rotates at a low speed	NG	Wiper motor malfunction	Replace the wiper motor
OK			
Wiper & washer SW. function	NG	SW. malfunction	Replace the wiper & washer SW.

4. Wiper does not operate at “HI” position

Checkpoint		Trouble Cause	Countermeasure
Continuity between the wiper & washer SW. connector terminals 4 B59 at the “HI” position	NG	Open circuit or poor connector contact	Repair open circuit or connector contact
OK			
Wiper motor function when connecting the motor connector 2 C4 to the battery (+) terminal, and 1 C4 to the (-) terminal (Should the wiper motor rotate at a high speed)	NG	Wiper motor malfunction	Replace the wiper motor
OK			
Continuity between 4 B59 and 2 C4	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

5. Rotation of the wiper motor does not stop

Checkpoint		Trouble Cause	Countermeasure
Continuity in the wiper & washer SW.	NG	SW. malfunction	Replace the wiper & washer SW.
OK			
Wiper motor function	NG	Wiper motor malfunction	Replace the wiper motor

6. Auto-stop function of the wiper motor does not operate

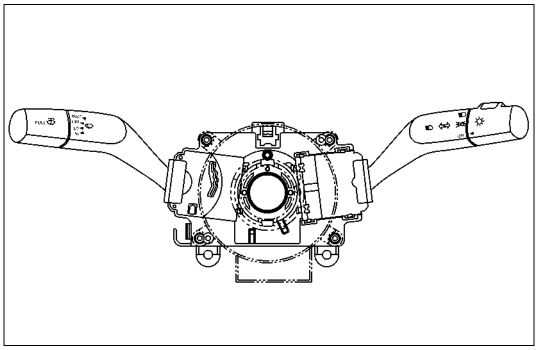
Checkpoint		Trouble Cause	Countermeasure
Continuity between the wiper & washer SW. connector terminals 5 $\boxed{B59}$ and 6 $\boxed{B59}$ at the "OFF" position	NG	Open circuit or poor connector contact	Repair open circuit or connector contact
OK ↓			
Wiper motor function 1. Disconnect the wiper motor connector 2. Connect the motor connector 5 $\boxed{B59}$ to the battery (+) terminal and 1 $\boxed{C4}$ to the (-) terminal, and then change the connection of the battery (+) terminal to the connector 4 $\boxed{C4}$ while the motor rotating at a low speed 3. Check to see if the wiper motor stops at the auto stop position when connecting the connector terminals 3 $\boxed{C4}$ and 1 $\boxed{C4}$ in this condition	NG	Wiper motor malfunction	Replace the wiper motor
OK ↓			
Voltage between the wiper motor harness side connector terminal 4 $\boxed{C4}$ and the ground (Should be battery voltage present)	NG	Open circuit or poor connector contact	Repair an open circuit or a poor connection of the connectors between the fuse No. C9 (20A) and 4 $\boxed{C4}$
OK ↓			
Continuity between the intermittent relay harness side connector 6 $\boxed{C3}$ and the wiper motor harness side connector 6 $\boxed{C4}$	NG	Open circuit or poor connector contact	Repair open circuit or connector contact
OK ↓			
Intermittent relay function	NG	Relay malfunction	Replace the intermittent relay

WASHER

1. Washer motor does not operate

Checkpoint		Trouble Cause	Countermeasure
Fuse No. C9 (20A)	NG	Poor fuse contact or blown	Reinstall or replace the fuse No. C9 (20A)
OK ↓			
Continuity between the wiper & washer SW. side connector terminals 1 B59 and 7 B59 when the washer button is depressed	NG	SW. malfunction	Replace the wiper & washer SW.
OK ↓			
Voltage between the wiper & washer SW. harness side connector terminal 7 B59 and the ground (Should be battery voltage preset)	NG	Open circuit or poor connector contact	Repair or an open circuit or a poor connection of the connectors between the fuse No. C-9 (20A) and 7 B59
OK ↓			
Voltage between the washer motor harness side connector terminal 2 C17 and the ground when the washer button is depressed (Should be battery voltage present)	NG	Open circuit or poor connector contact	Repair or an open circuit or a poor connection of the connectors between 2 C17 and 1 B59
OK ↓			
Grounding point C36	NG	Poor grounding point contact	Repair grounding point C36 contact
OK ↓			
Washer motor function when connecting the motor side connector 2 C17 to the battery (+) terminal, and the connector 1 C17 to the (-) terminal (Should the washer motor rotate)	NG	Motor malfunction	Replace the washer motor
OK ↓			
Continuity between 1 C17 and C36	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

REMOVAL AND INSTALLATION



WIPER AND WASHER SWITCH

Removal

Refer to the removal steps of the LIGHTING SWITCH (COMBINATION SWITCH) in “ LIGHTING “ of this section.

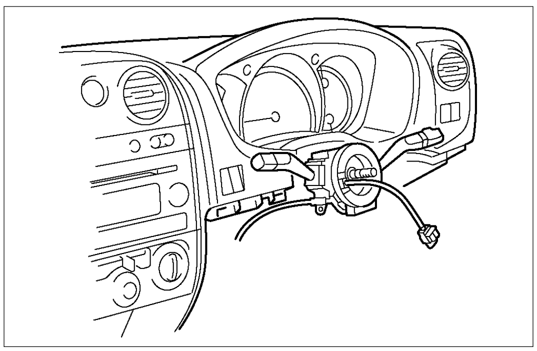
Installation

Follow the removal procedure in the reverse order to install the wiper and washer switch.

Pay close attention to the important points mentioned in the following paragraphs.

Connector

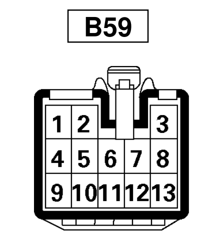
Be absolutely sure that the wiper and washer switch connector is securely connected.
This will prevent a poor contact and an open circuit.



RTW780SH001601

This illustration is based on RHD model

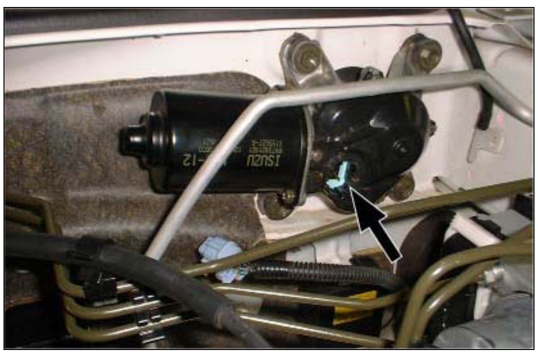
INSPECTION AND REPAIR



Switch side

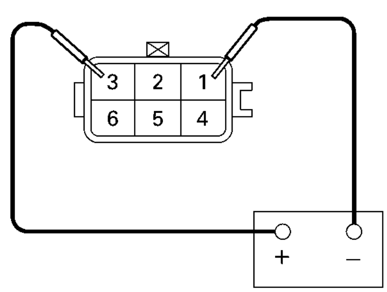
Control Switch Connections

SW position \ Terminal No.	6	3	5	4	2	7	1
Mist		○	○				
Off	○		○				
INT	○	 ○	○		 ○		
Lo		○	○				
Hi		○		○			
Wash						○	○



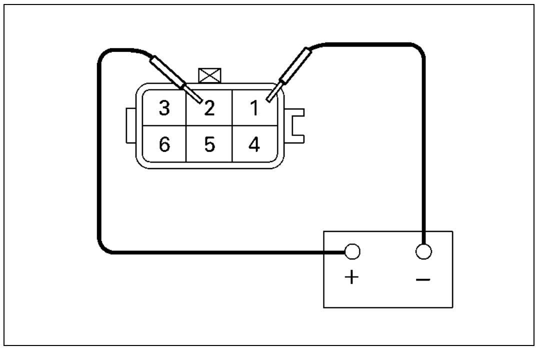
Wiper Motor Inspection

Connector



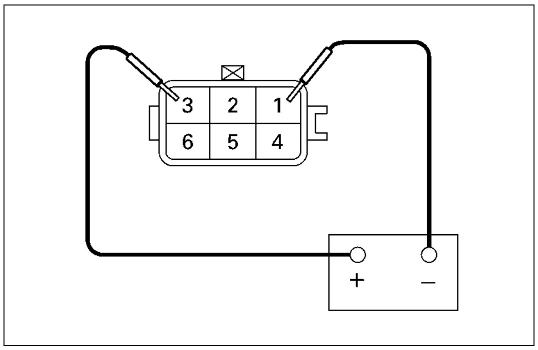
Low Speed Inspection

1. Clamp the wiper motor in a vise.
   The moving parts must be clear of the vise.
2. Connect the connector terminals to the battery.
   Refer to the illustration.
3. Check the wiper motor low speed operation.



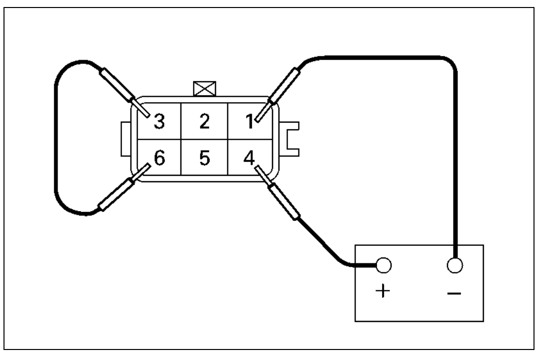
High Speed Inspection

1. Clamp the wiper motor in a vise.
   The moving parts must be clear of the vise.
2. Connect the connector terminals to the battery.
   Refer to the illustration.
3. Check the wiper motor high speed operation.



Auto-Stop Inspection

1. Clamp the wiper motor in a vise.
   The moving parts must be clear of the vise.
2. Connect the connector terminals to the battery.
   Refer to the illustration.
3. Check the wiper motor low speed operation.
4. Disconnect the positive battery terminal.
   This will stop the motor.



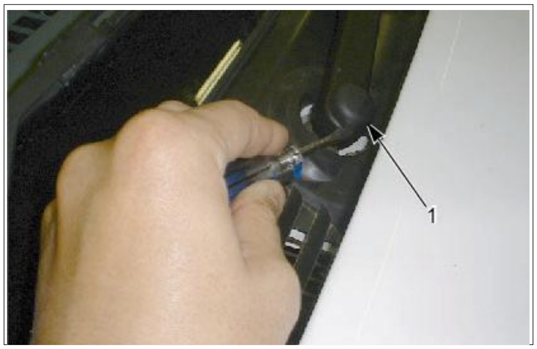
5. Connect the connector terminals No. 3 and No. 6 with a lead wire.
   Refer to the illustration.
6. Reconnect the positive battery terminal to connector terminal No. 4.
   This will restart the motor.
   Refer to the illustration.
7. Check the auto-stop operation.

Washer Motor Inspection

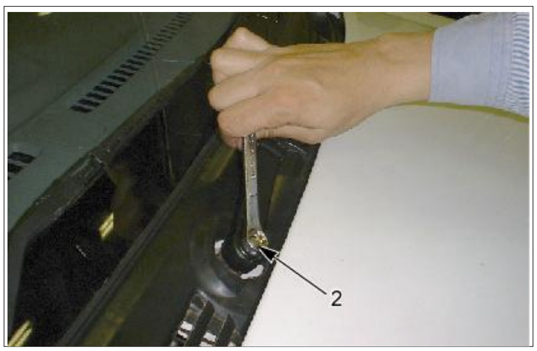
1. Fill the washer tank with washing solution.
2. Disconnect the motor connector.
3. Apply battery voltage to the washer motor connector.
4. Check the washer motor operation.

WIPER MOTOR AND LINKAGE

Removal



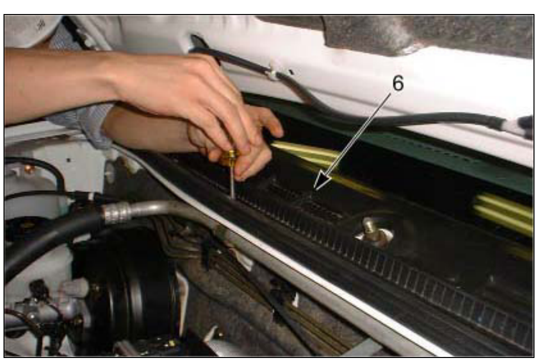
1. Disconnect the wiper arm nut cap ①.



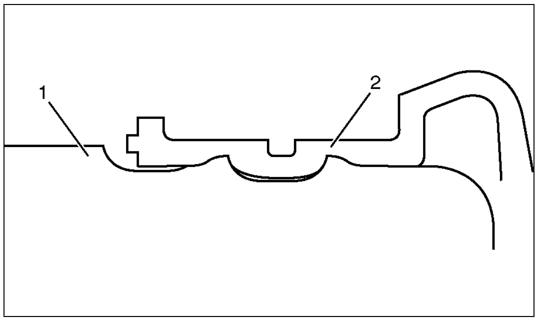
2. Remove the wiper arm nut ②.
3. Remove the wiper arm with blade.

4. Disconnect the wiper motor connector ③.
5. Remove the wiper motor bracket screws ④.

6. Disconnect the wiper motor from the wiper linkage at the crank arm ⑤.

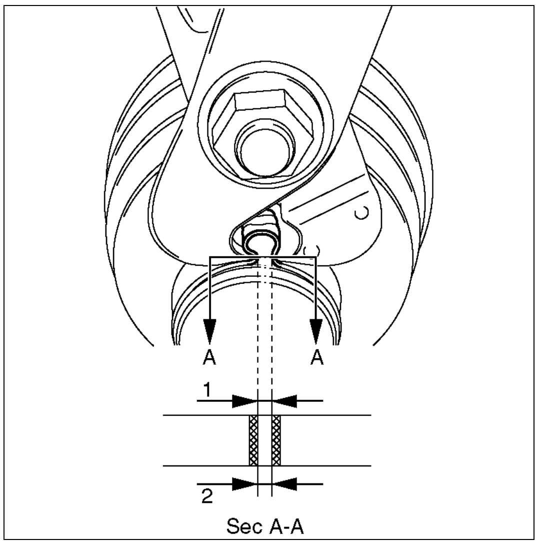


7. Remove the vent cowl cover ⑥.
   - Remove the 6 screw.



Legend

1. UJ Case
2. Bellows

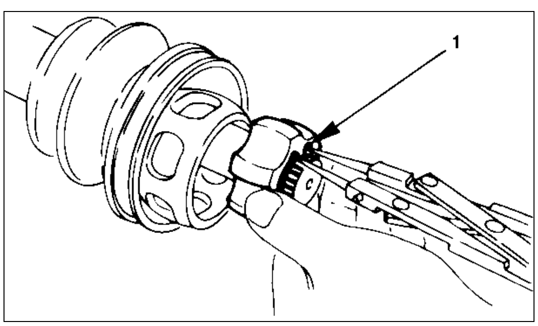


8. Install band. Note the setting direction. After installation, check Standard Caulk Measure.
   Discard the used band and install a new one.
   Use the special tool pliers 5-8840-2745-0 to caulk the band to the specified value.
   For both sides on UJ bellows.

Standard Caulk Measure

- 1.2mm (0.05in) <= (1), (2) <= 4.0mm (0.16in)
- (1) - (2) or (2) - (1) <= 0.4mm (0.016in)

9. Install another bellows and fix band.
   Discard the used band and install a new one.
10. Install the ball guide with the smaller diameter side ahead onto the shaft.
11. Install ball retainer.
12. Using snap ring pliers, install the snap ring (1) securing the ball retainer to the shaft.
    Discard the used snap ring and install a new one.



This illustration is based on RHD model

8. Remove the wiper linkage ⑦ from the access hole.

Installation

Follow the removal procedure in the reverse order to install the wiper motor and linkage.

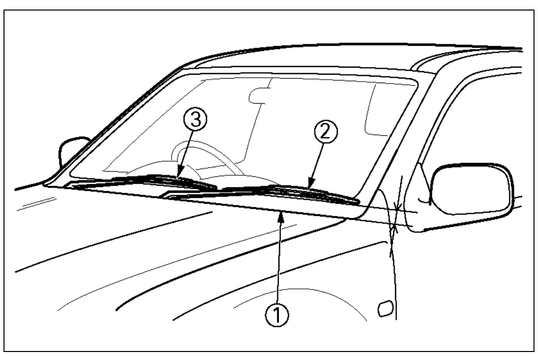
Pay close attention to the important points mentioned in the following paragraphs.

Wiper Linkage

Take care not to scratch the painted surfaces of the body when installing the wiper linkage to the body.

In case crank arm of wiper motor is removed, confirm the position of auto stop prior to reinstall the crank arm to the wiper motor.

Crank Arm Nut Torque	N·m (kg·m/lb ft)
20 – 26 (2.0 – 2.6 / 14.5 – 18.8)	



880R300006

Wiper Blade Position

Confirm the auto stop position of wiper motor prior to the installation of the wiper blade and arm.

The distance between the vent cowl cover rubber seal ① and the wiper blade edge ② is about 52±7.5 mm (2.05±0.3 in) ③ 40±7.5 mm (1.57±0.3 in).

Wiper Arm Nut

Tighten the wiper arm nut to the specified torque.

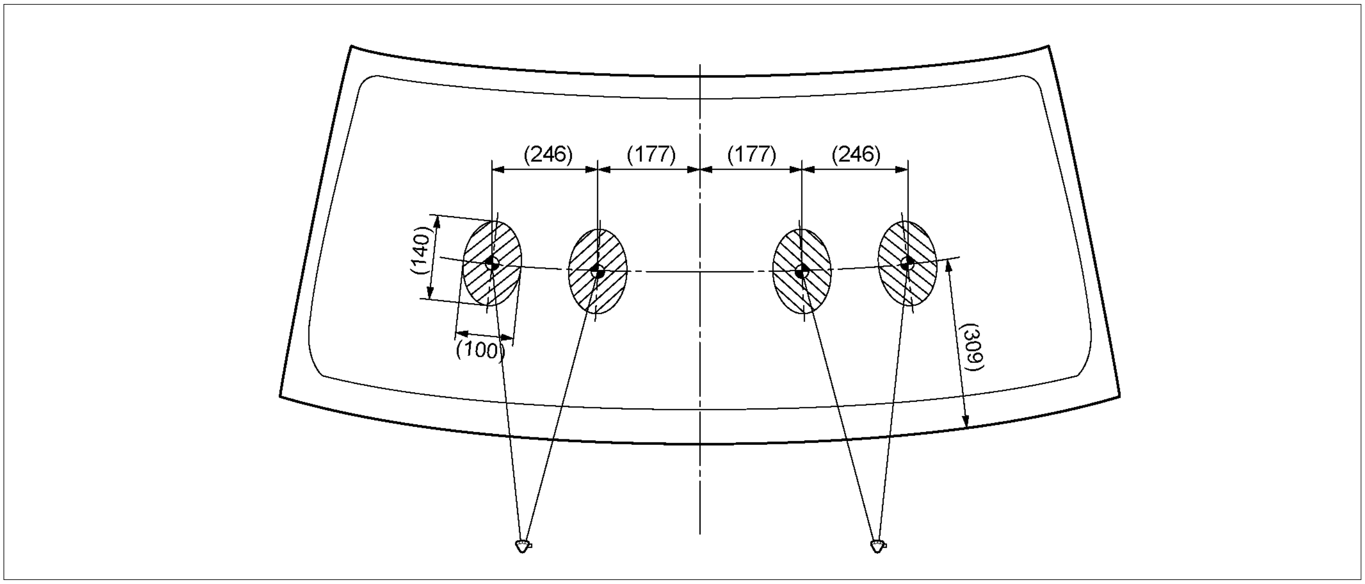
Wiper Arm Nut Torque	N·m (kg·m/lb ft)
27 – 35 (2.75 – 3.57/19.94 – 25.85)	

This illustration is based on RHD model

Windshield Washer Spray

Be sure that the engine hood is completely closed before checking the windshield washer spray adjustment.

Windshield Washer Spray Position: Refer to the illustration.



RTW38DSF000201

Connector

Be absolutely sure that the wiper motor connector is securely connected.

This will prevent a poor contact and an open circuit.

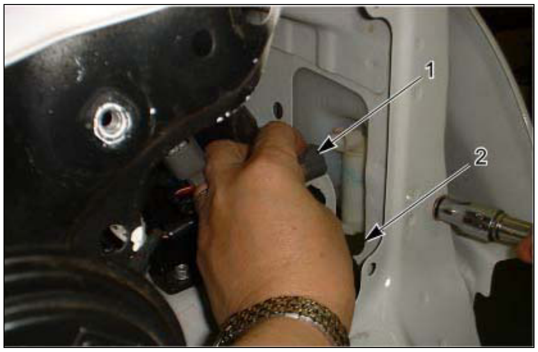
Note:
Windshield wiper arm and blade assembly configurations are different for the right-hand and left-hand side of the vehicle.
Be careful not to confuse the right-hand and left-hand side assemblies.

This illustration is based on RHD model

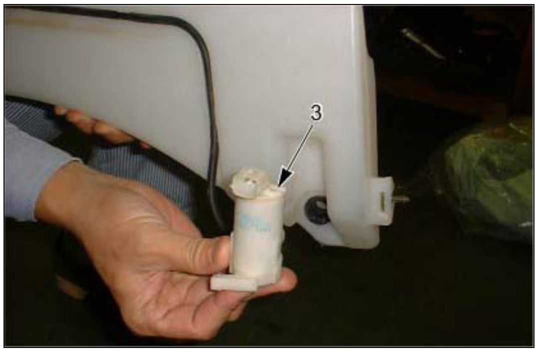
WASHER TANK MOTOR

Removal

1. Remove the head light.
   - Refer to the head light in this manual.
2. Remove the inner liner.
3. Pull out the clip washer filler.
4. Remove the washer tank nuts.



4. Disconnect the connector ①.
5. Disconnect the water hose ②.



6. Pull out the washer tank motor ③.

Installation

Follow the removal procedure in the reverse order to install the washer tank motor.

Pay close attention to the important points mentioned in the following paragraphs.

Connector

Be absolutely sure that the washer tank motor connector is securely connected.

This will prevent a poor contact and an open circuit.

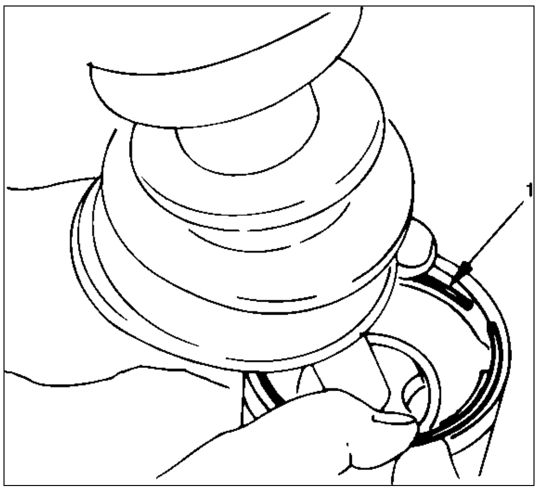
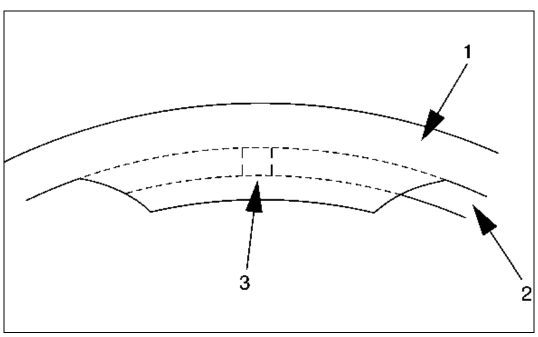
13. Align the track on the ball (1) retainer with the window in the cage, and install the six balls into position.



14. Pack 150g (5.3 oz) of the specified grease in DOJ case, then install drive shaft joint assembly. After reassembly, move the DOJ longitudinally several times to get to fit.
15. Install the circlip (1) so that open ends are positioned away from the ball groove.

    Discard the used circlip and install a new one.



Legend

1. Outer Case
2. Circlip
3. Open Ends

16. Install band. After installation, check that the bellows is free from distortion.

    Discard the used band and install a new one.

    Use the special tool pliers 5-8840-2745-0 to caulk the band to the specified valve.

    For both sides on UJ bellows.

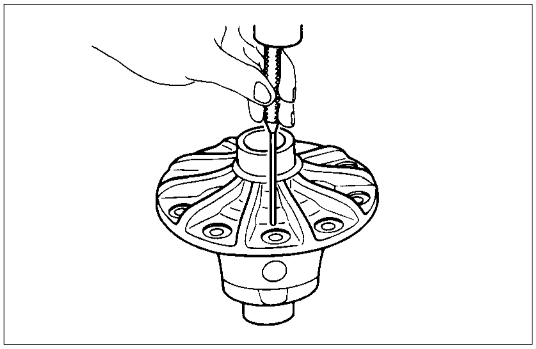
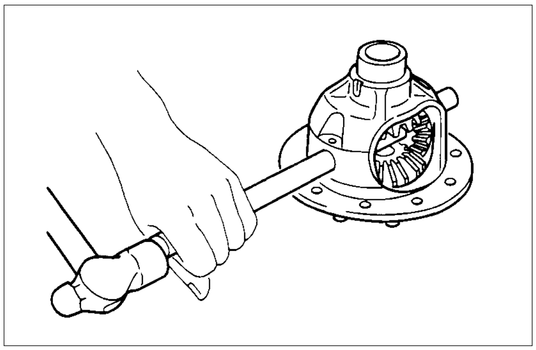
RTW78AXF020601



Important Operations

3. Lock Pin

Break staking on the lock pin using a 5 mm (0.20 in.) diameter drill.

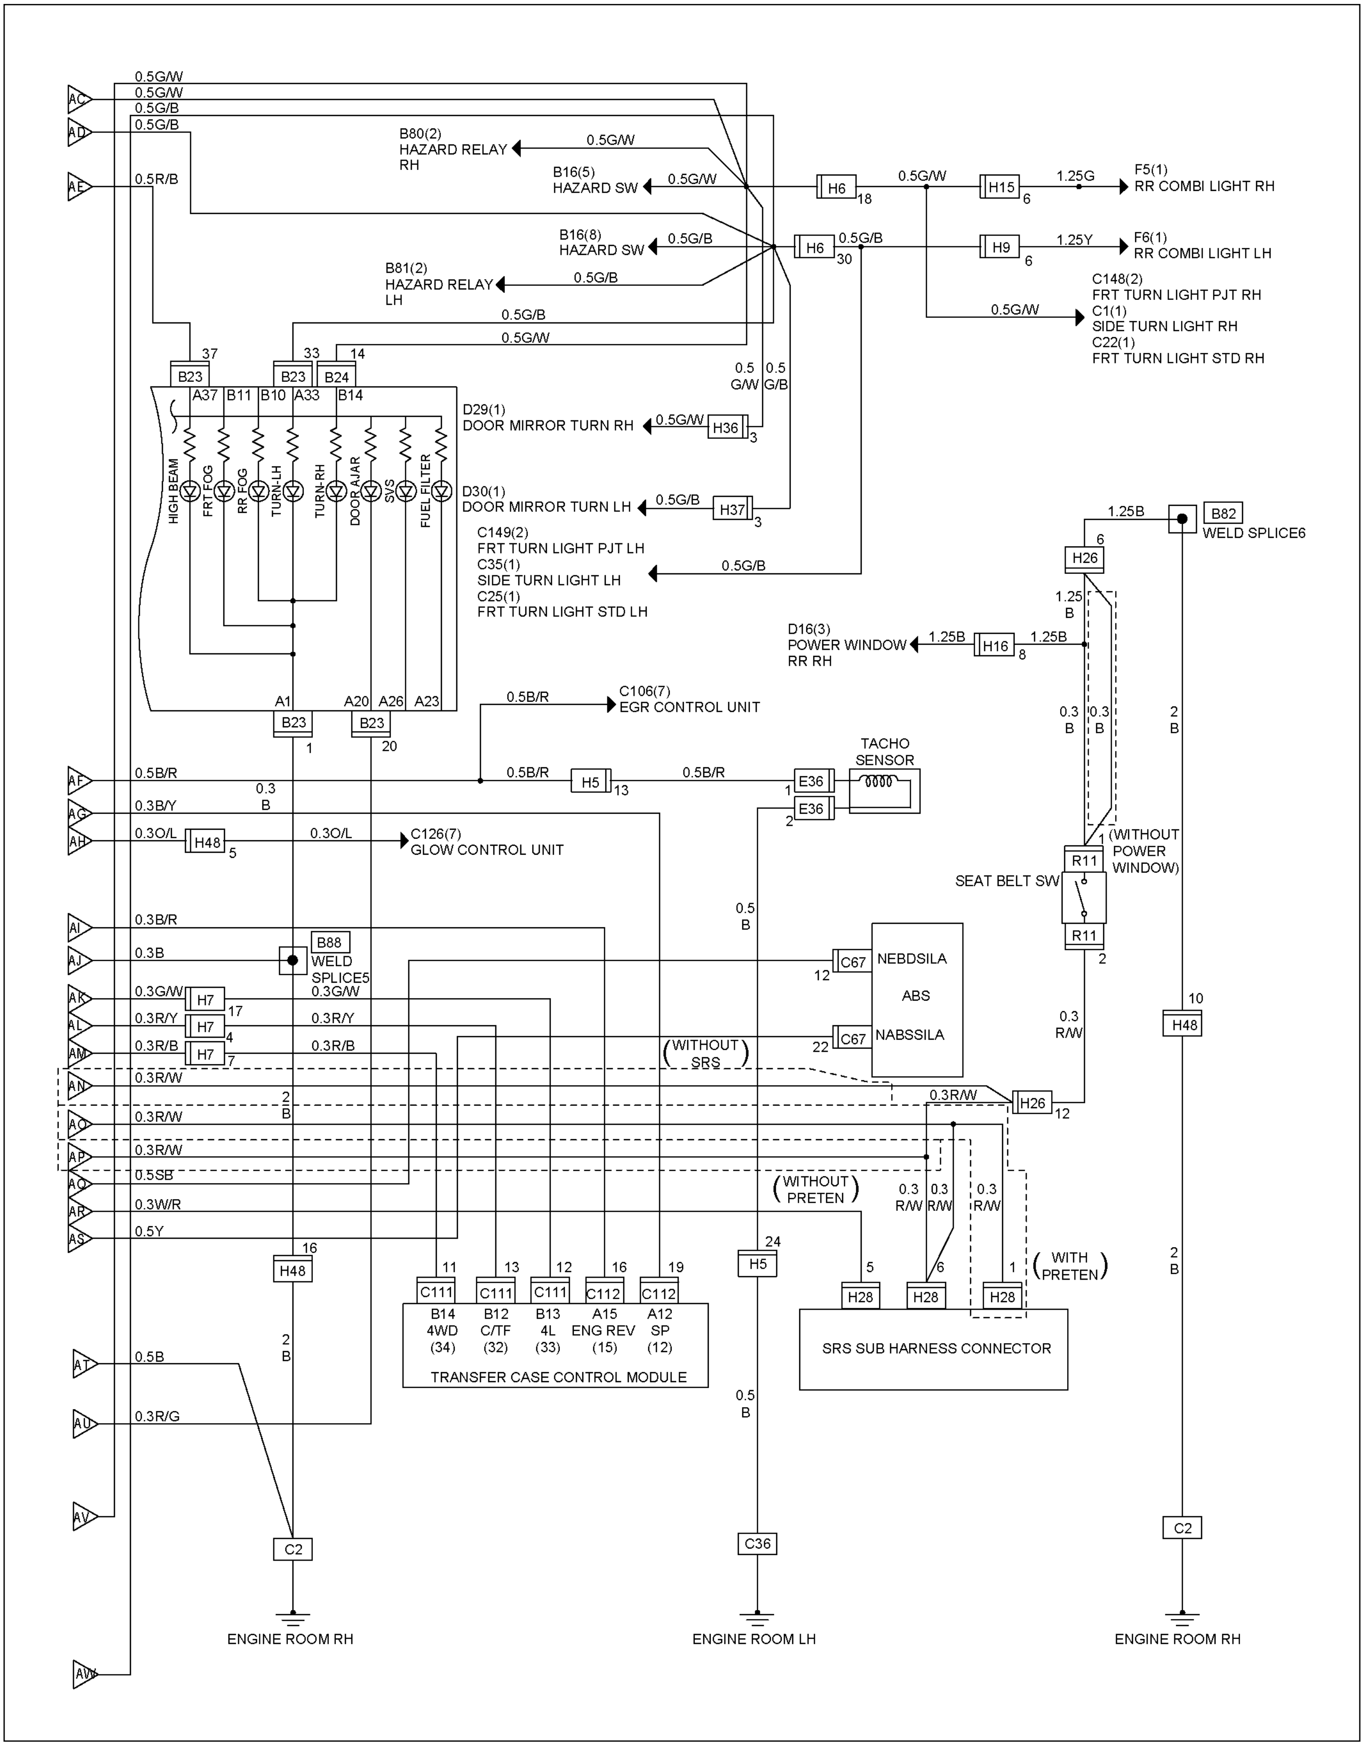


4. Cross Pin

Remove the cross pin using a soft metal rod and a hammer.

CIRCUIT DIAGRAM 4JA1T (L) (LHD)

Sheet 4/4



RTW78AXF020701

TROUBLESHOOTING

SPEEDOMETER

1. Speedometer and odometer do not function

Checkpoint		Trouble Cause	Countermeasure
Check the vehicle speed sensor output (4 pulses/1 rotation)	NG	Vehicle speed sensor malfunction	Replace the vehicle speed sensor
OK ↓			
Continuity between the vehicle speed sensor and the meter, or the fuse C14 (10A) and the ground	NG	Open circuit or poor connector contact	Repair an open circuit in the circuit or a poor connection at the connectors
OK ↓			
Use a meter tester to check the speedometer function	NG	Speedometer malfunction	Replace the case baseboard assy

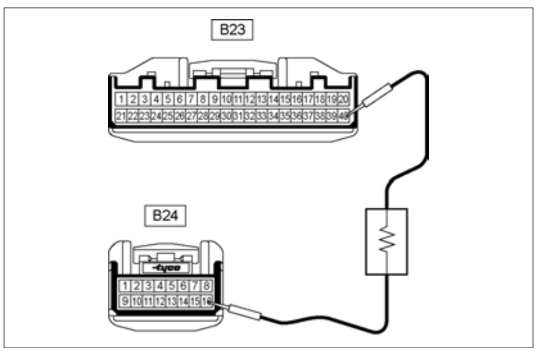
2. Speedometer pointer fluctuates (May be wide fluctuation)

Checkpoint		Trouble Cause	Countermeasure
Check the speed sensor output by using the oscilloscope	NG	Vehicle speed sensor malfunction, or open circuit or poor connector contact	Replace the vehicle speed sensor, or repair an open circuit in the circuit or a connectors
OK ↓			
Use a meter tester to check the speedometer function	NG	Speedometer malfunction	Replace the case baseboard assy

3. Speedometer pointer jumps erratically

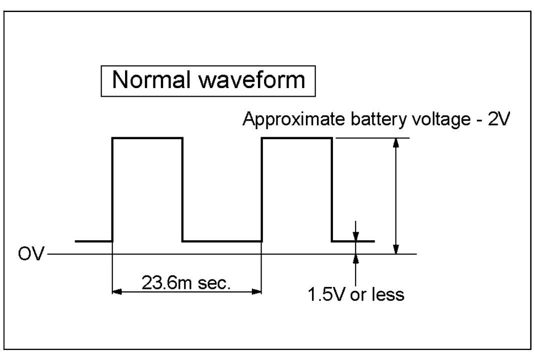
Checkpoint		Trouble Cause	Countermeasure
Check the vehicle speed sensor output by using the oscilloscope	NG	Vehicle speed sensor malfunction, or open circuit or poor connector contact	Replace the vehicle speed sensor, or repair an open circuit in the circuit or a poor connection at the connectors
OK			
Use meter tester to check the speedometer function	NG	Speedometer malfunction	Replace the meter assembly

Inspection of a Waveform by Oscilloscope (Reference)



RTW780SH000101

1. Connect a resistance of 1.3 to 5k ohm (1.4W or more) between the harness side connectors 40 B23 and 16 B24 of the meter.
2. Install a speedometer tester.
3. Turn on the starter SW.



RTW580SH002201

4. Check the waveform at the time when the vehicle speed is at 60km/h.

4. Trip odometer does not reset

Checkpoint		Trouble Cause	Countermeasure
Check at other kilometer figures given by meter tester (Reset should be made to zero kilometer)	NG	Faulty reset mechanism	Replace the meter assembly

TACHOMETER

1. Meter pointer fluctuates
(May be wide fluctuation)

Use a meter tester to check the tachometer function	NG	Tachometer malfunction	—	Replace the meter assembly

TEMPERATURE GAUGE AND THERMO UNIT (4JA1T(L), 4JH1-TC, C24SE)

1. No temperature indicates at all

Checkpoint		Trouble Cause	Countermeasure
Thermo unit continuity between connector 1 E19 (C24SE : 1 E65) and the ground	NG	Thermo unit malfunction	Replace the thermo unit
OK			
Gauge function 1. Disconnect the unit connector then connect 3.4W bulb to wire harness side with ground 2. Check indicating point when starter SW. is ON position (Temperature should indicate)	NG	Gauge malfunction	Replace the case baseboard assy
OK			
Continuity between 1 E19 (C24SE : 1 E65) and 16 B23 (C24SE : 13 B24)	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

2. Temperature gauge incorrect readings in all ranges

Checkpoint		Trouble Cause	Countermeasure
Thermo unit resistance between connector 1 E19 (C24SE: 1 E65) and the ground when disconnecting the connector (Specified resistance should indicate)	NG	Thermo unit malfunction	Replace the thermo unit

ENGINE COOLANT TEMPERATURE GAUGE (4JJ1-TC/4JK1-TC)

Refer to “Inspection and Repair” in this Manual for a detailed description of the coolant temperature gauge self-diagnosis procedure.

1. No engine coolant temperature indicates at all

Checkpoint		Trouble Cause	Countermeasure
Engine coolant temperature sensor continuity between connector 3 E41 and the ground	NG	Engine coolant temperature sensor malfunction	Replace the engine coolant temperature sensor
OK ↓			
Gauge function 1. Disconnect the sensor connector then connect 3.4W bulb to wire harness side with ground 2. Check indicating point when starter SW. is ON position (Temperature should indicate)	NG	Gauge malfunction	Replace the meter assembly
OK ↓			
Continuity between 3 E41 and 16 B23	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

2. Engine coolant temperature gauge incorrect readings in all ranges

Checkpoint		Trouble Cause	Countermeasure
Engine coolant temperature sensor resistance between connector 3 E41 and the ground when disconnecting the connector (Specified resistance should indicate)	NG	The sensor malfunction	Replace the sensor

TEMPERATURE GAUGE AND THERMO UNIT (HFV6)

1. No temperature indicates at all

Checkpoint		Trouble Cause	Countermeasure
PIM (Thermo unit) continuity between connector 8 B96 and the ground	NG	Thermo unit malfunction	Replace the thermo unit
OK ↓			
Gauge function 1. Disconnect the unit connector then connect 3.4W bulb to wire harness side with ground 2. Check indicating point when starter SW. is ON position (Temperature should indicate)	NG	Gauge malfunction	Replace the case baseboard assy
OK ↓			
Continuity between 8 B96 and 16 B23	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

2. Temperature gauge incorrect readings in all ranges

Checkpoint		Trouble Cause	Countermeasure
PIM (Thermo unit) resistance between connector 8 B96 and the ground when disconnecting the connector (Specified resistance should indicate)	NG	Thermo unit malfunction	Replace the thermo unit

FUEL GAUGE AND FUEL TANK UNIT (C24SE, 4JJA1T(L), 4JH1-TC, 4JJ1-TC/4JK1-TC)

1. No fuel level indicates at all

Checkpoint		Trouble Cause	Countermeasure
Tank unit continuity between connector 3 F2 and ground	NG	Open circuit inside the tank unit	Replace the tank unit
OK ↓			
Fuel gauge function 1. Disconnect the tank unit connector then connect 3.4W bulb to wire harness side 2. Check indicating point when starter SW. is ON position (Fuel level should indicate)	NG	Gauge malfunction	Replace the case baseboard assy
OK ↓			
Continuity between connectors 17 B23 (C24SE : 14 B24) and 3 F2	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

2. Fuel gauge gives incorrect readings in all ranges

Checkpoint		Trouble Cause	Countermeasure
Tank unit resistance position with the float at checking points (Specified resistance should indicate)	NG	Tank unit malfunction	Replace the tank unit

FUEL GAUGE AND FUEL TANK UNIT (HFV6)

1. No fuel level indicates at all

Checkpoint		Trouble Cause	Countermeasure
PIM (Tank unit) continuity between connector 17 B96 and ground	NG	Open circuit inside the tank unit	Replace the tank unit
OK ↓			
Fuel gauge function 1. Disconnect the tank unit connector then connect 3.4W bulb to wire harness side 2. Check indicating point when starter SW. is ON position (Fuel level should indicate)	NG	Gauge malfunction	Replace the case baseboard assy
OK ↓			
Continuity between connectors 17 B23 and 17 B96	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

2. Fuel gauge gives incorrect readings in all ranges

Checkpoint		Trouble Cause	Countermeasure
Tank unit resistance position with the float at checking points (Specified resistance should indicate)	NG	Tank unit malfunction	Replace the tank unit

WARNING AND INDICATOR LIGHT

1. When the parking brake lever is pulled, the brake indicator light does not light up

Checkpoint	Result	Trouble Cause	Countermeasure
Brake indicator light bulb continuity	NG	Bulb burned out or loose contact	Replace or reinstall the bulb
OK ↓			
Parking brake SW. installation position and function	NG	Incorrect SW. adjustment or poor SW. point contact	Adjust or replace the parking brake SW.
OK ↓			
Continuity between the parking brake SW. connector 1 C39 (stick type), 1 R4 (lever type), and 4 B23 (C24SE : 9 B23)	NG	Open circuit or poor connector contact	Repair open circuit or connector contact
OK ↓			
Continuity between the parking brake SW. connector 1 C39 (stick type), 1 R4 (lever type) and the ground when the parking brake is operated	NG	Parking brake SW. malfunction	Replace the parking brake SW.

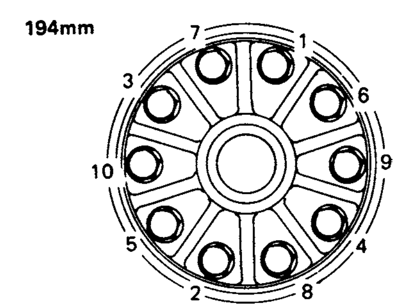
Inspection and Repair

Make all necessary adjustments, repairs, and part replacements if wear, damage, or other problems are discovered during inspection.

- Ring gear, pinion gear
- Bearing
- Side gear, pinion gear, cross pin
- Differential cage, carrier
- Thrust washer
- Oil seal

Visual Check

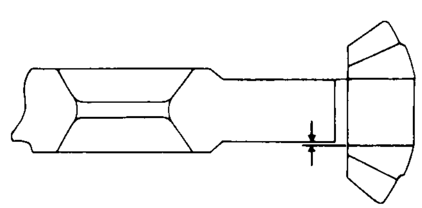
Inspect the following parts for wear, damage, or other abnormal conditions.



Ring Gear Replacement

(1) The ring gear should always be replaced with the drive pinion as a set.
(2) When installing the ring gear, apply LOCTITE 271 or equivalent to the threaded hole and bolt.
(3) Tighten the fixing bolts in a diagonal sequence as illustrated.
(4) Discard used bolts and install new ones.

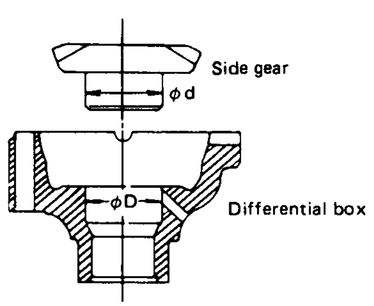
Bolt Torque	N·m (kgf·m/lb·ft)
108 ± 9.8 (11 ± 1/79.6 ± 7.2)	



Clearance Between the Differential Pinion and the Cross Pin

mm(in)

Standard	Limit
0.05 - 0.10 (0.002 - 0.004)	0.2 (0.008)



Clearance Between the Side Gear and the Differential Box

mm(in)

Standard	Limit
0.03 - 0.10 (0.001 - 0.004)	0.15 (0.006)

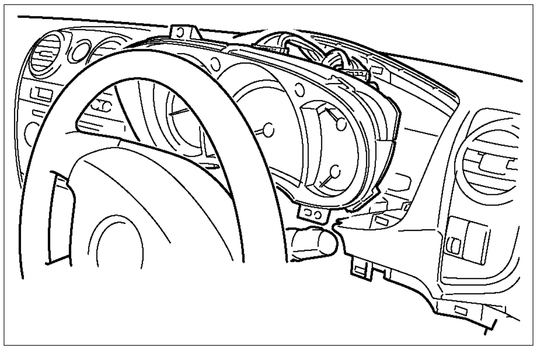
2. When the parking brake lever is released, the indicator light does not go off

Checkpoint		Trouble Cause	Countermeasure
Parking brake SW. installation position and function	NG	Incorrect the parking brake SW. adjustment or parking brake SW. faulty	Adjust the SW. installation position or replace the parking brake SW.
OK ↓			
Check to see if the indicator light goes off when the parking brake SW. connector 1 C39 (stick type), 1 R4 (lever type) is disconnected	NG	Brake fluid level SW. faulty or short circuit	Replace the brake fluid level SW., or repair a short circuit between the parking brake SW. connector 1 C39, 1 R4 and 4 B23 (C24SE : 9 B23) or the brake fluid level SW. connector 2 C37 and 4 B23 (C24SE : 9 B23)

3. Oil pressure warning light does not go off while engine is running

Checkpoint		Trouble Cause	Countermeasure
Engine oil pressure	NG	Refer to ENGINE Section	Refer to ENGINE Section
OK ↓			
Check to see the warning light goes off when the oil pressure SW. connector 1 E1 is disconnected or when the PIM (Oil pressure) connector 6 B96 (HFV6) is disconnected	NG	Short circuit	Repair a short circuit between 1 E1 and 39 B23 (C24SE : 17 B24) or 6 B96 and 39 B23 (HFV6)
OK ↓			
Continuity between the oil pressure SW. connector 1 E1 (HFV6 : 6 B96)and the body ground when the engine is operating	NG	Oil pressure SW. faulty	Replace the oil pressure SW.

REMOVAL AND INSTALLATION



RTW780SH001701

This illustration is based on RHD model

METER ASSEMBLY

Removal

1. Meter Cluster Assembly
   - Refer to the removal steps of “INSTRUMENT PANEL” in Section 10 “CAB”
2. Meter Assembly
   - Remove three screws of the meter assembly.
   - Disconnect the meter connectors.

Installation

Follow the removal procedure in the reverse order to install the meter.

Pay close attention to the important points mentioned in the following paragraphs.

Connector

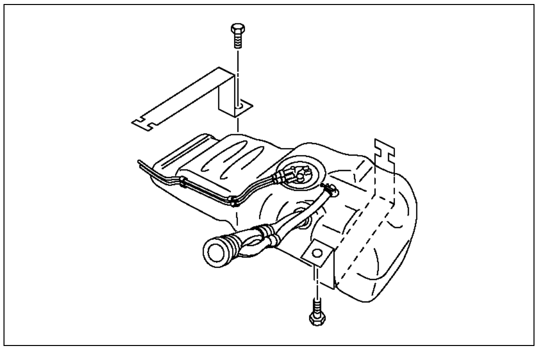
Be absolutely sure that the meter connectors are securely connected.
This will prevent a poor contact and an open circuit.

Wire Harness

Do not pinch the wire harness between the cluster and the meter hood during the meter assembly installation procedure.
Wire damage will result.

Installation

To Install, follow the removal steps in the reverse order.

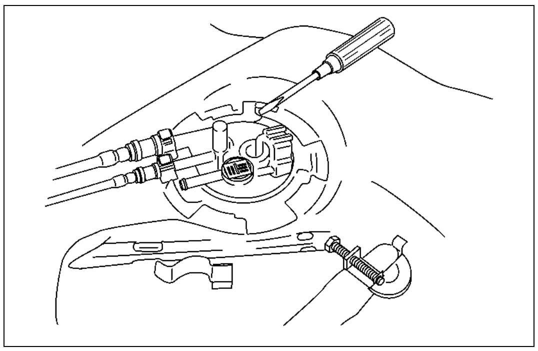


FUEL GAUGE UNIT

Removal

Dismount the fuel tank first, then remove the fuel gauge unit.

1. Remove the rear inner liner -LH
   - Remove the clip
2. Remove the filler neck.
   - Remove the screw
3. Remove the ground with cable.
4. Remove the fuel tank band.
   - Disconnect fuel line quick connectors.
5. Remove the fuel gauge unit from the fuel tank.



Installation

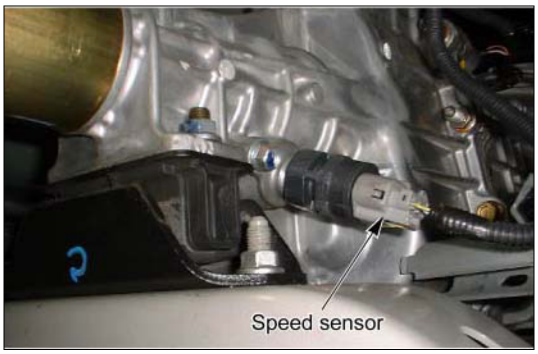
Follow the removal procedure in the reverse order to install the fuel gauge unit.
Pay close attention to the important points mentioned in the following paragraphs.

Rubber Seal

Be absolutely sure that the fuel gauge unit rubber seal is correctly seated.

Connector

Be absolutely sure that the fuel gauge unit connector is securely connected.
This will prevent a poor contact and an open circuit.



VEHICLE SPEED SENSOR (INSTALLED ON THE TRANSMISSION)

Removal

1. Disconnect the connector.
2. Remove the vehicle speed sensor body by rotating it.

Installation

To Install, follow the removal steps in the reverse order, noting the following point.
Tighten the vehicle speed sensor to the specified torque.

Vehicle Speed Sensor Tightening Torque N·m (kg·m/lb.ft)
25 ± 4.9 (2.5 ± 0.5/18 ± 3.6)

80	83.2-85.9
100	104.2-106.9
120	125.2-127.9

Tachometer On-Vehicle Inspection

1. Attach a tune-up tester to the engine.
2. Start the engine.
3. Compare the tachometer reading and the tester reading.
   If the tachometer indication is outside the permissible range, the tachometer must be replaced.
4. Gradually increase and decrease the engine speed.
   Note the movement of the tachometer needle.
   If the needle movement is sluggish, the tachometer must be replaced.

mm(in)

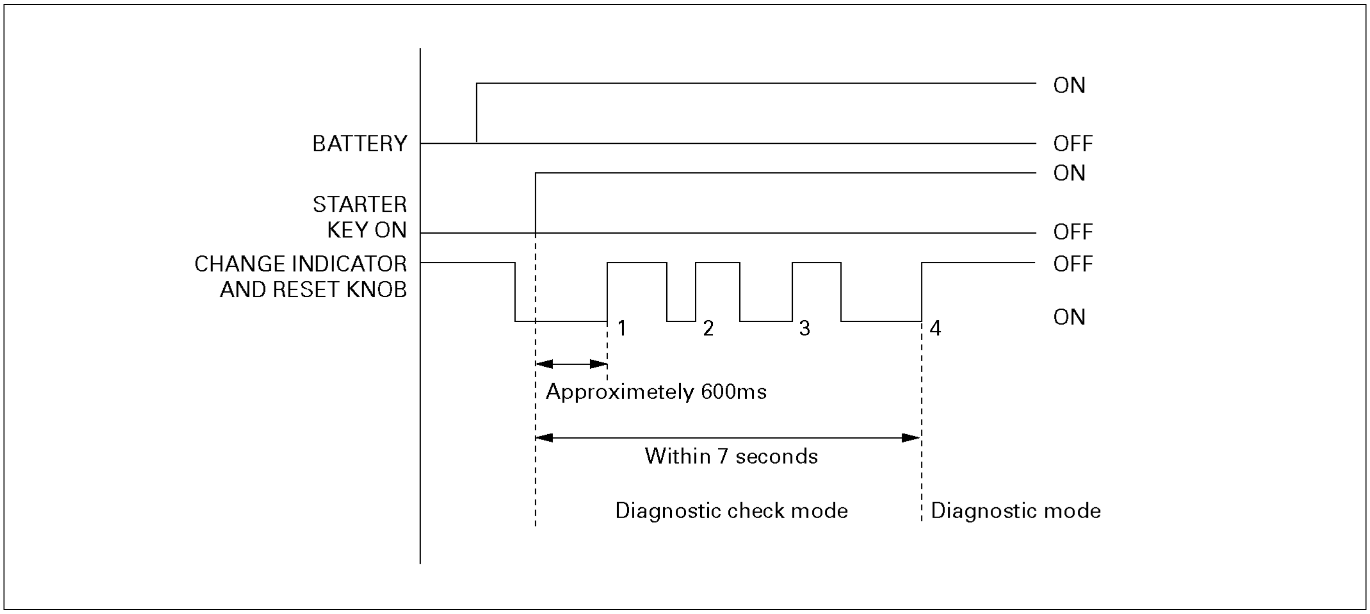
Standard	Limit
0.07 - 0.36 (0.003 - 0.014)	0.25 (0.010)

Tachometer Off-Vehicle Inspection

Remove the tachometer from the meter assembly and measure the resistance value and the current consumption between each terminal.

SELF DIAGNOSTIC FUNCTION

Check that the speedometer, tachometer, fuel gauge, and temperature gauge operate properly.



821R300033

Entering the self-diagnostic mode

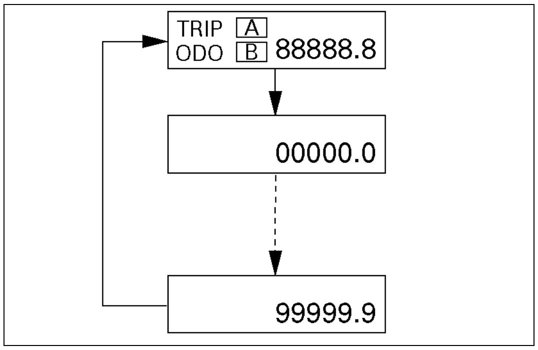
1. Push in and hold the “Change Indicator and Reset” knob.
2. Turn the ignition ON.
3. When the LCD odometer turns ON, release the “Change Indicator and Reset” knob.
4. Push in and release the “Change Indicator and Reset” knob three times in quick succession.

The meter cluster is now in “Self-diagnostic” mode.

NOTE: Steps 2-4 must be performed within 7 seconds.

The meter cluster will not enter “Self-diagnostic” mode if any of the following conditions occur:

1. The “Change Indicator and Reset” knob is not depressed when the ignition is turned ON.
2. The “Change Indicator and Reset” knob is released within 600ms of turning the ignition ON.
3. The “Change Indicator and Reset” knob is not depressed and released three times within 7 seconds.

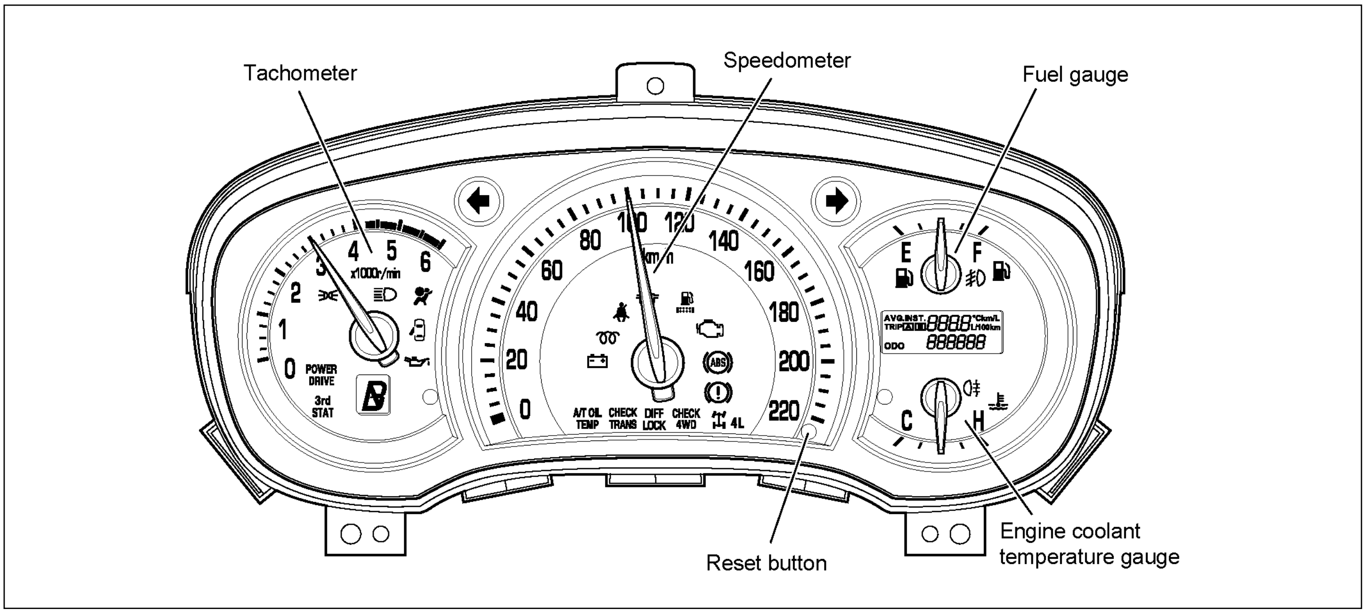


Self –diagnostic mode
LCD condition

- All LCDs are lit during the transition from self-diagnostic decision mode to self-diagnostic mode
- The odometer/trip indicator scrolls throng its entire range approximately once every 600 ms. All digits are lit (segment check indication). This continues until the self-diagnostic mode is terminated.

Meter and gauge indications

Meter and gauge indications with the change indicator and reset knob on (self-diagnostic mode) are as shown in the following table.



RTW78ASF000101

Speedometer	100 kilometers per hour
Tachometer	3,000 rpm
Fuel gauge	Mid-point on the dial
Temperature gauge	

All indications return to zero when the change indicator and reset knob is turned off.
The self-diagnostic mode and the self-diagnostic decision mode are cancelled when the ignition switch is turned to the OFF position. They also cancel when a speed pulse is sensed.
If either of the self-diagnostic modes are cancelled by turning the ignition switch to the OFF position, the diagnostic unit remains in the stand-by condition.
If cancellation occurs when a speed pulse is sensed, the unit remains in the ordinary operating condition.

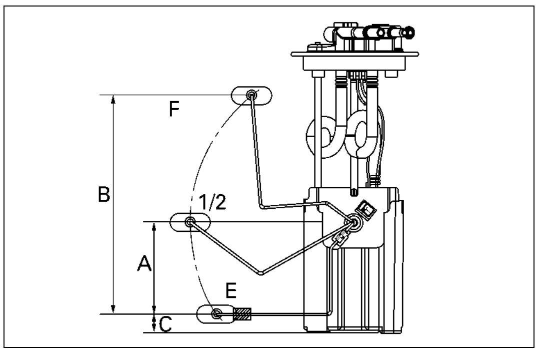
140R300007

Thermo Unit Inspection

INSPECTION

Use a circuit tester to measure the thermo unit resistance. Replace the unit when the result of inspection is found abnormal.

Check condition \ Temperature	60°C (140°F)	115°C (239°F)
Resistance value (Ω)	168 ±3.5	$30.9^{+2.5}_{-2.0}$



041R300002

Fuel Gauge Unit Inspection

Measure the fuel gauge unit resistance between the connector terminals 2 F2 and 3 F2 while shifting the float from "E" to "F" point.

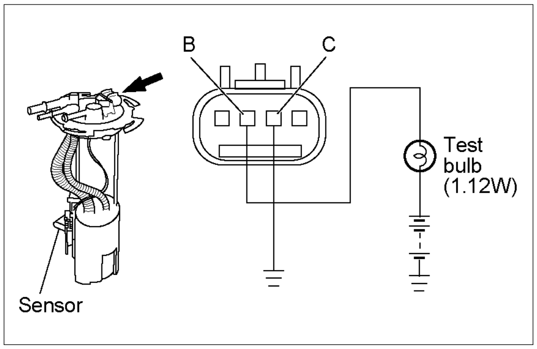
Fuel Tank Resistance

Level	Float position mm	Standard resistance Ω
F (B)	217.5	$17^{+2.2}_{-0.8}$
1/2 (A)	106.6 (4JJ1-TC/4JK1-TC)	45 ± 4.5
	105.1 (C24SE, 4JA1T(L))	
	112.8 (4JH1-TC)	
E (C)	16.2	120 ± 2.0

Low Fuel Indicator Light

1. Disconnect the fuel gauge unit wire connector.
2. Turn the key switch on. Check that the bulb lights.

If operation is not correct, remove and check the bulb or circuit.
or If check whether low fuel turns on fuel input (B-24) at the time of open and key on.
∗ meter is check at low fuel



RTW78ASH001501

Check level sensor operation

1. Remove the fuel gauge unit.
2. Apply battery voltage between terminal (B) and (C) through a 1.12 watt bulb. Check that the bulb lights.

Note:
It will take a short time for the bulb light.

3. Submerge the sensor in fuel. Check that the bulb goes out.

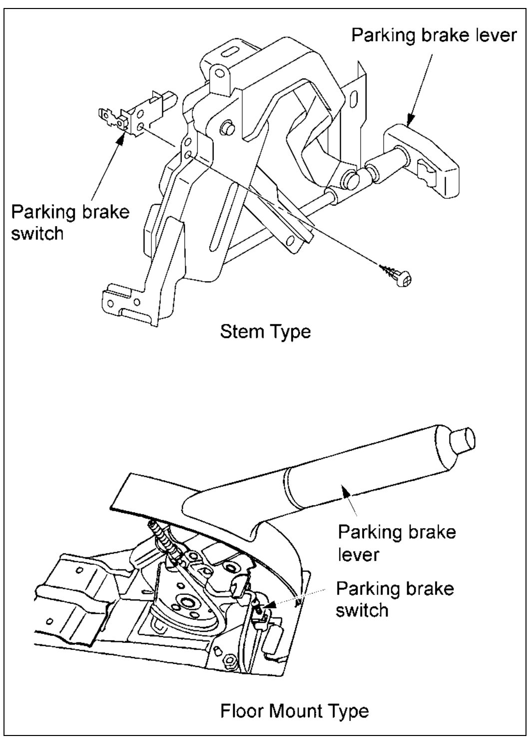
If operation is not correct, replace the fuel tank unit.

BRAKE SYSTEM WARNING LIGHT

The brake system warning light comes on while the parking brake is set and the engine run position.

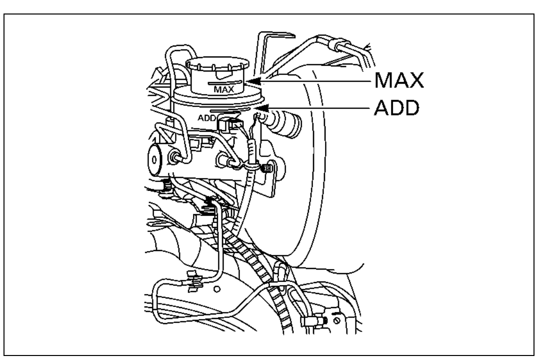
Note:
The parking brake indicator light circuit is designed to prevent driving of the vehicle with the parking brake on. It does not indicate the condition of the parking brake system.

The parking brake switch is in parallel with the brake fluid switch.



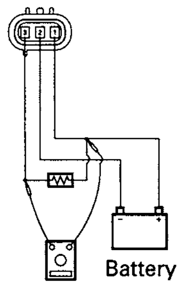
RTW48AMH000101

The brake system warning light also comes on when reservoir brake fluid level falls below the specified limit with the parking brake released and the engine run position.



VEHICLE SPEED SENSOR (INSTALLED ON THE TRANSMISSION)

The speed sensor is installed on the rear portion of the transmission.
The number of pulses generated is four pulses per one rotation of the pinion shaft.



Vehicle Speed Sensor Inspection

1. Connect the vehicle speed sensor connector 1 E44 to the battery (+) terminal and 2 E44 to the (-) terminal.
2. Connect a resistance of 1.3K ohm to 5K ohm (1/4 W or more) between connectors 1 E44 and 3 E44

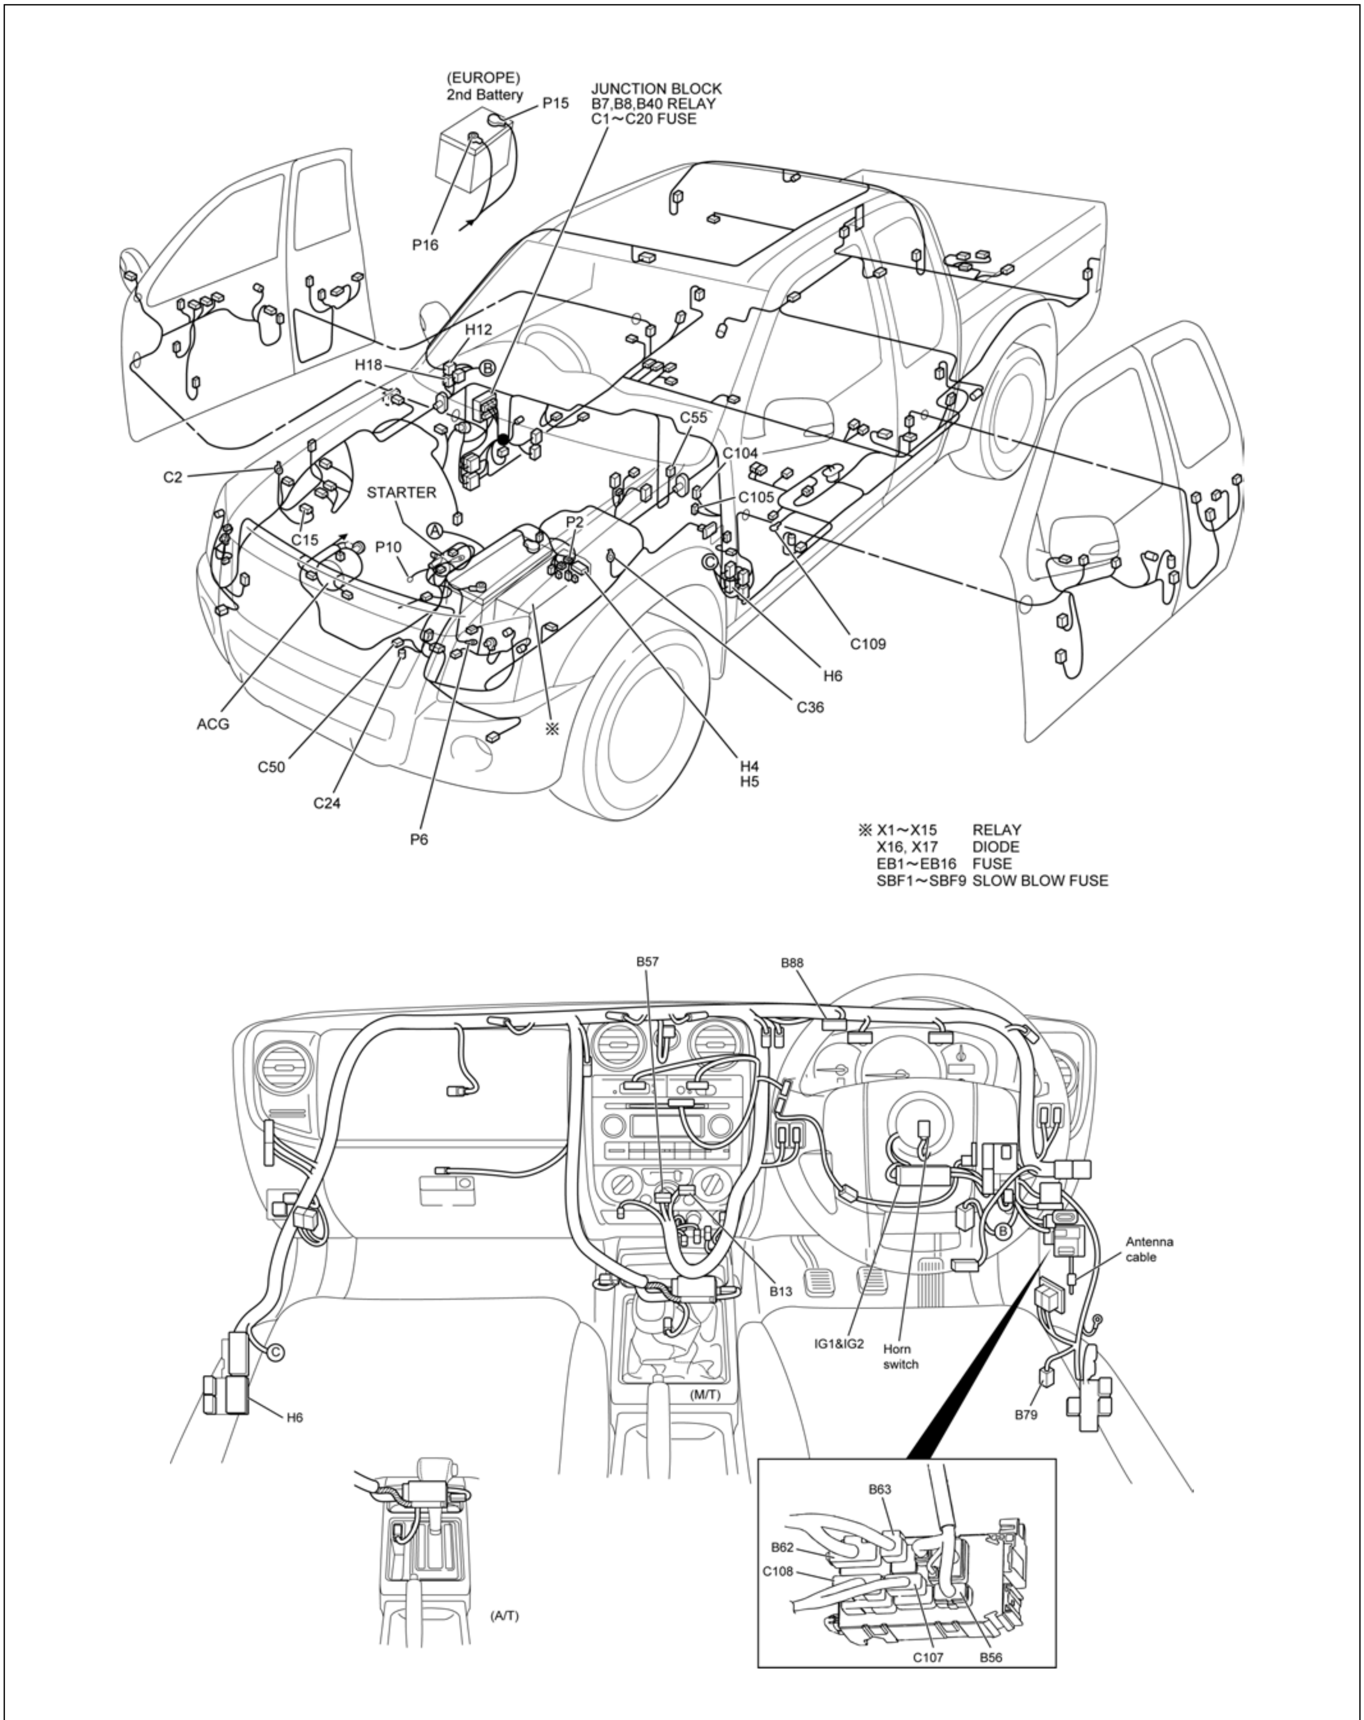
CAUTION:
Be extremely careful not to connect the battery (+) terminal to the connector 3 E44.
This may damage the vehicle speed sensor.

3. Rotate the shaft of the vehicle speed sensor slowly and measure the voltage at the both ends with a digital tester.

The voltage, with one rotation of shaft fluctuates four times in the following range: 10 to 14V - 2V or less.

HEATER AND AIR CONDITIONING

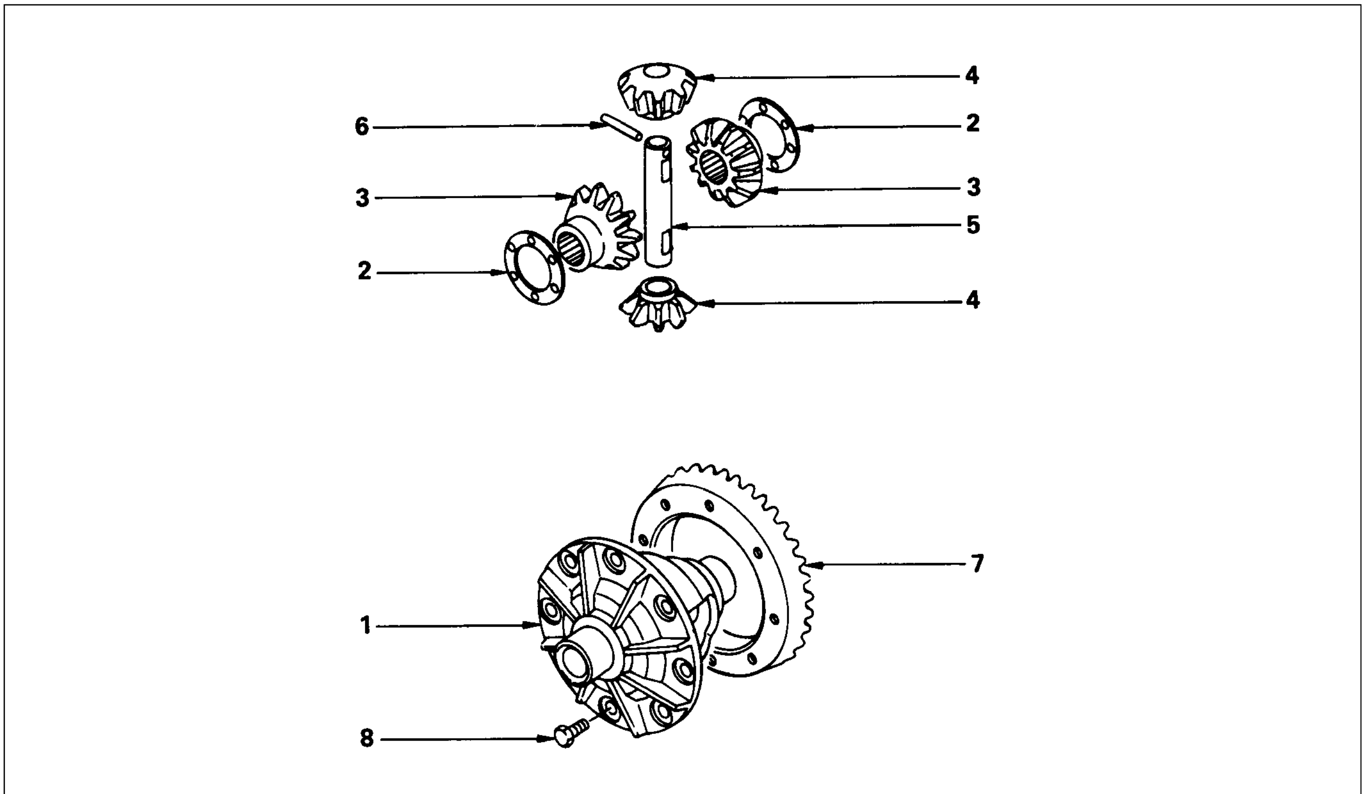
PARTS LOCATION (RHD)



RTW78AXF039101& RTW78AXF045301

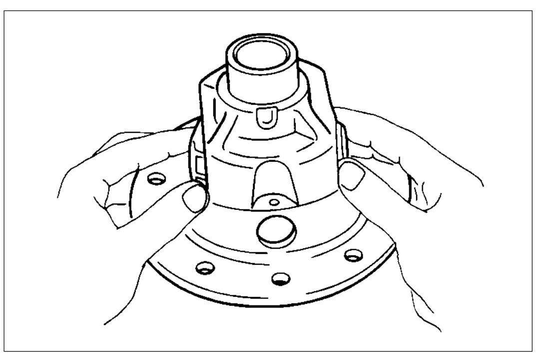
Reassembly

Minor Components



Reassembly Steps

1. Differential cage
2. Thrust washer
3. Side gear
▲ 4. Pinion gear
▲ 5. Cross pin
▲ 6. Lock pin
▲ 7. Ring gear
▲ 8. Bolt



Important Operations

4. Pinion Gear
Install the pinion gear by engaging it with the side gears while turning both pinion gears simultaneously in the same direction.

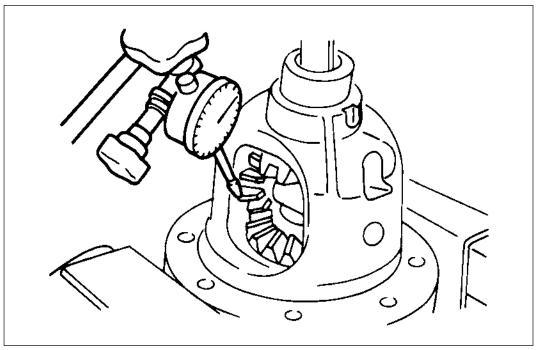
5. Cross Pin

(1) Be sure to install the cross pin so that it is in alignment with the lock pin hole in the differential cage.



(2) Adjust the backlash between the side gear and the pinion gear.

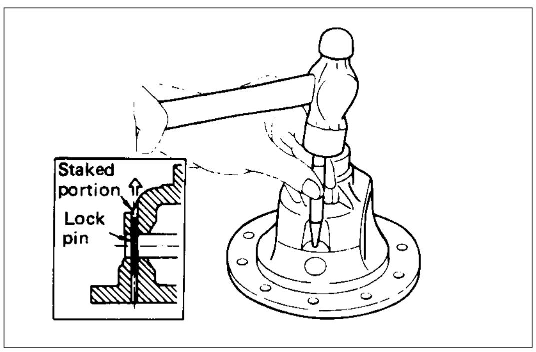
mm(in)

Backlash	0.10 - 0.20 (0.004 - 0.008)

Thickness of thrust washers available

mm(in)

1.00, 1.05, 1.10 (0.039, 0.041, 0.043)

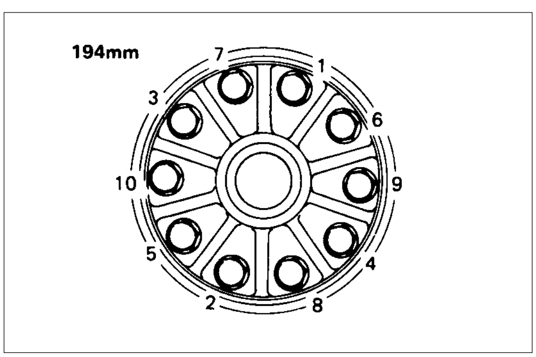


6. Lock Pin

After lock pin installation, stake the cage to prevent discharge of the lock pin.

7. Ring Gear

When installing the ring gear, apply LOCTITE 271 or equivalent to the threaded hole and bolt.



8. Bolt

Tighten the bolts in diagonal sequence as illustrated.

Bolt Torque	N·m (kgf·m/lb·ft)
108 (11.0/80)	

Note :

Discard used bolts and install new ones.

Note that all bolts have a left hand thread.

3. Driver's side door does not get locked (or unlocked)

Checkpoint		Trouble Cause	Countermeasure
Door lock SW. function	NG	SW. malfunction	Replace the door lock SW.

4. FRT passenger's side door does not get locked (or unlocked)

Checkpoint		Trouble Cause	Countermeasure
FRT passenger's side door lock actuator function	NG	Actuator malfunction	Replace the FRT passenger's side door lock actuator

5. RR door-RH does not get locked (or unlocked)

Checkpoint		Trouble Cause	Countermeasure
RR door lock actuator-RH function	NG	Actuator malfunction	Replace the RR door lock actuator-RH

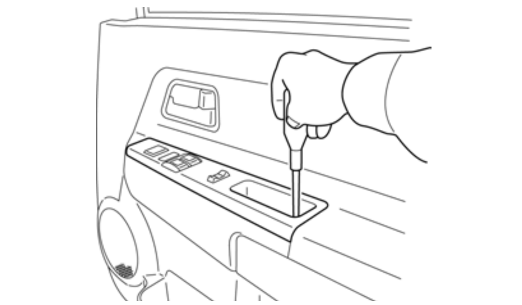
6. RR door-LH does not get locked (or unlocked)

Checkpoint		Trouble Cause	Countermeasure
RR door lock actuator-LH function	NG	Actuator malfunction	Replace the RR door lock actuator-LH

7. Door lock does not operate when operated from the driver's seat side

Checkpoint		Trouble Cause	Countermeasure
Grounding point C2 (RHD), C109 (LHD)	NG	Poor grounding point contact	Repair grounding point C2 contact
OK ↓			
Continuity between the door lock position SW. side connector terminals 1 D4, 5 D4 and 3 D4 or 1 D24 and 2 D24 and 4 D4 when the SW is locked and 2 D4 and 4 D4, 6 D4 and 3 D4 or 3 D4 and 2 D24 when the SW. unlocked	NG	SW. malfunction	Replace the door lock position SW.

REMOVAL AND INSTALLATION



This illustration is based on 2 doors and RHD

RTW780SH002601

DRIVER'S SEAT SIDE POWER WINDOW & DOOR LOCK SWITCH

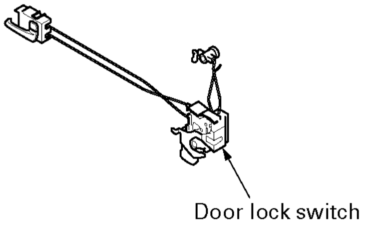
Removal

1. Disconnect the battery ground cable.
2. Removes the screw in pull cup with the screwdriver.
3. Remove the switch bezel by pushing the spring with the tip of a screwdriver.
4. Disconnect the connector.

ATTENTION:
When removing a switch bezel lift from the front of the bezel.
It follows the front with the screwdriver.
The clip can break when lifting from the rear of the bezel.

Installation

To install, follow the removal steps in the reverse order.



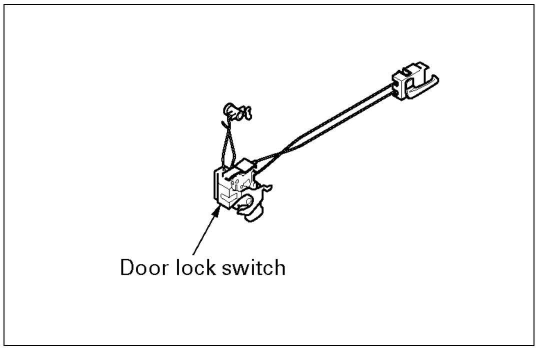
DRIVER'S SIDE DOOR LOCK SWITCH

Removal

1. **Door Lock ASM**
   - Refer to the removal steps of the DOORS in section 10 "BODY".
2. **Door Lock Switch**

Installation

To install, follow the removal steps in the reverse order.



FRT PASSENGER'S SIDE DOOR LOCK ACTUATOR

Removal

1. **Door Lock ASM**
   - Refer to the removal steps of the DOORS in Section 10 "BODY".
2. **Door Lock Actuator**
   - Remove the door lock switch fixing bolts.
   - Disconnect the door lock link rod.
   - Disconnect the door lock switch connector.

Installation

To install, follow the removal steps in the reverse order.

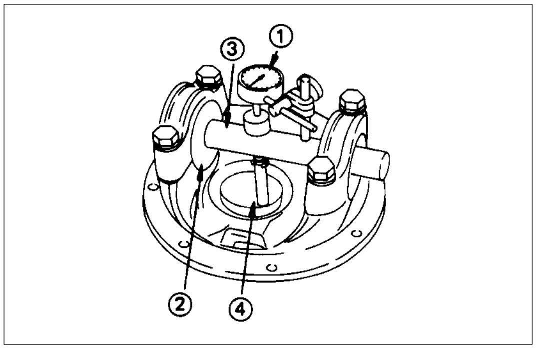
RR DOOR LOCK ACTUATOR-LH & RH

Removal

1. **Door Lock ASM**
   - Refer to the removal steps of the DOORS in section 10 "BODY".
2. **Door Lock Actuator**
   - Remove the actuator fixing bolts.
   - Disconnect the door lock link rod.
   - Disconnect the actuator connector.

Installation

To install, follow the removal steps in the reverse order.



Tighten the nut to the specified torque.

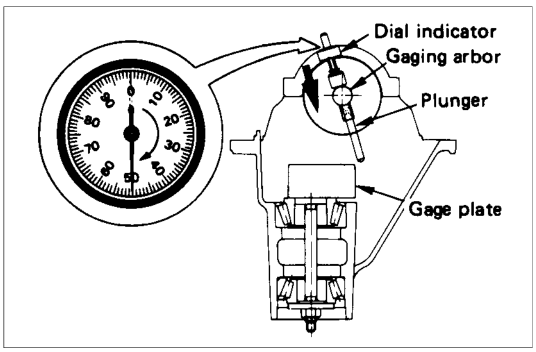
N·m (kgf·m/lb·in)

New bearing	2.3 (0.23/20)
Used bearing	0.98 - 1.18 (0.10 – 0.12/9 – 10)

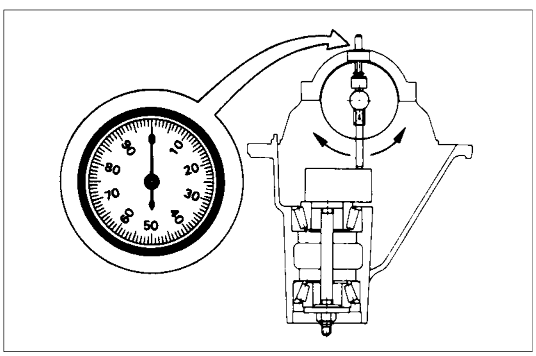
(2) Clean the side bearing bores. Install the dial indicator with the discs and Arbor. Install and tighten the bearing caps to the specified torque.

Torque	N·m (kgf·m/lb·ft)
98 (10.0/72)	

① Dial indicator : 5-8840-0126-0
② Disc (2 pcs.) : 5-8840-2088-0
③ Arbor : 5-8840-0128-0
④ Gage plate : 5-8840-2087-0

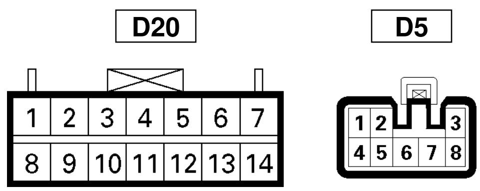


(3) Set the dial indicator to “0”. Place it on the mounting post of the gaging arbor with the contact button touching the indicator pad. Force the dial indicator downward until the needle has made a half turn clockwise. Tighten down the dial indicator in this position.



(4) Position the plunger on the gage plate. Move the gaging arbor slowly back and forth and locate the position at which the dial indicator shows the greatest deflection. At this point, once again set the dial indicator to “0”.
Repeat the procedure to verify the “0” setting.

INSPECTION AND REPAIR



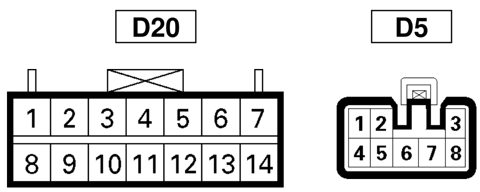
Harness side

Driver's Side Power Window & Door Lock Switch

1. Harness Side Connector Circuit

Check voltage and continuity between the switch harness side connector terminals as shown in the following table.

Terminal No.	Wire color	Connecting to	Check item	Connecting terminal	Check condition		Standard
14 (D20)	L/R	Door lock SW (Lock)	Continuity (Resistance)	14-Ground	Driver's side door	Lock	Continuity
						Unlock	No continuity
13 (D20)	L/Y	Door lock SW (Unlock)		13-Ground	Driver's side door	Lock	No continuity
						Unlock	Continuity
3 (D5)	L/R	Ground		3-Ground	-		Continuity
4 (D5)	L/R	Door lock actuator (Lock)		4-5	-		Continuity (There is some resistance)
5 (D5)	L	Door lock actuator (Unlock)		5-4	-		Continuity (There is some resistance)
1 (D5)	LG/W	Fuse C21 (20A)	Voltage	1- Ground	-		Battery voltage (Approx. 12V)



Harness side

2. Switch Side Connector Circuit

Remove the switch connector, and check continuity and voltage between the switch connector terminals.

(Connect the (+) terminal of the battery to 1 D5 and the (-) terminal to 3 D5.)

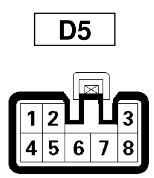
3 D5 - 4 D5 .... Continuity
3 D5 - 5 D5 .... Continuity

(Then, ground 3 D5.)

4 D5 .... Current flow for approx. 1 second

(Disconnect the ground of 14 D20, and ground 13 D20.)

5 D5 .... Current flow for approx. 1 second



Harness side

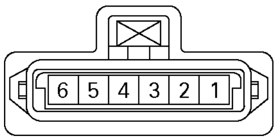
3. Door Lock Operation Test

After confirming that there is continuity between the switch harness side connector terminals 4 D5 and 5 D5, apply the battery voltage to each of the terminals to conduct the operation test.

When the door lock will not operate, check the door lock actuator for any trouble.

Connecting terminals		Operation
5 (L)	4 (L/R)	
⊕	⊖	Unlock
⊖	⊕	Lock

D4



Switch side

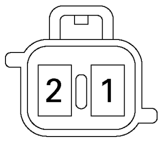
Driver's Side Door Lock Switch

1. Switch Side Connector Circuit

Check continuity between the switch connector terminals

Terminal No. / SW position	1	2	3
Lock	○	○	
Unlock		○	○

D9



Actuator side

Front Passenger's Side Door Lock Actuator

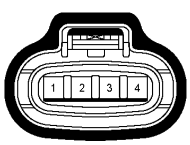
1. Actuator Side Connector Circuit

Apply the battery voltage to the actuator connector terminals to check the operation.

When the door lock actuator is checked on the vehicle and there is no continuity, and when the door lock actuator itself is checked and no trouble is found, check the circuit between the door lock actuator and the driver seat side power window & door lock switch for any failure.

Connecting terminals		Operation
1	2	
⊕	⊖	Lock
⊖	⊕	Unlock

D14 D18



Door lock actuator Rear – RH/LH
Harness side

Rear Door Lock Actuator -LH & RH

1. Actuator Side Connector Circuit

Apply the battery voltage to the actuator connector terminals to check the operation.

When the door lock actuator is checked on the vehicle and there is no continuity, and when the door lock actuator itself is checked and no trouble is found, check the circuit between the door lock actuator and the driver seat side power window & door lock switch for any failure.

Connecting terminals		Operation
1	2

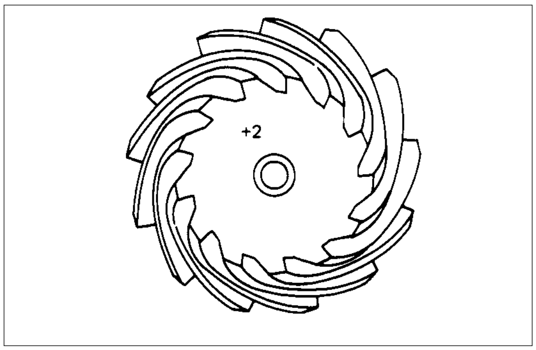
(5) After the ZERO setting is obtained, rotate the gaging arbor until the dial indicator rod does not touch the gaging plate. Record the number the dial indicator needle points to.



(6) Record the pinion depth code on the head of the drive pinion.
The number indicates a necessary change in the pinion mounting distance. A plus number indicates the need for a greater mounting distance (which can be achieved by decreasing the shim thickness). A minus number indicates the need for a smaller mounting distance (which can be achieved by increasing the shim thickness). If examination reveals pinion depth code “0”, the pinion is “nominal”.

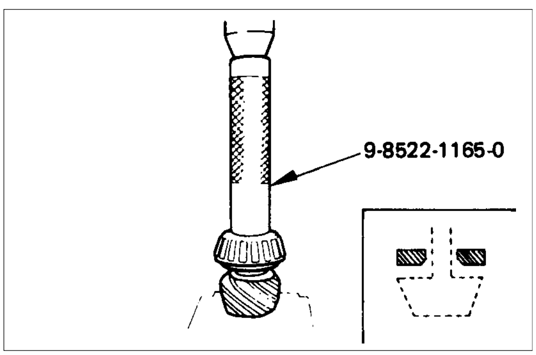
0.005	2.54 (0.1000)	2.56 (0.1008)									
0.006	2.56 (0.1008)										

Note :
When ordering shims, find the part number in the Parts Catalog by using the thickness of the shims listed in the above table.



5. Inner Bearing

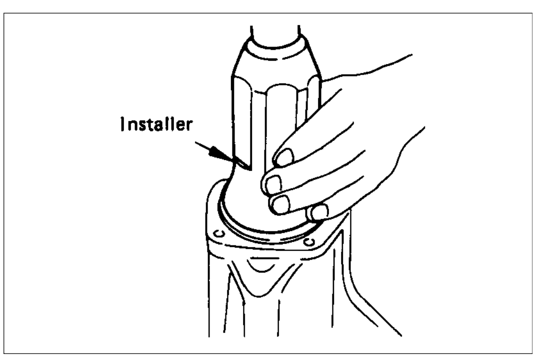
Place the shim on the drive pinion, with the chamfered side turned towards the pinion head then install the inner bearing on to the pinion using an installer and a press.

Installer : 9-8522-1165-0

Note:
Do not apply pressure to the roller cage.
Apply pressure only to the inner race.

6. Collapsible Spacer

Discard the used collapsible spacer and install a new one.

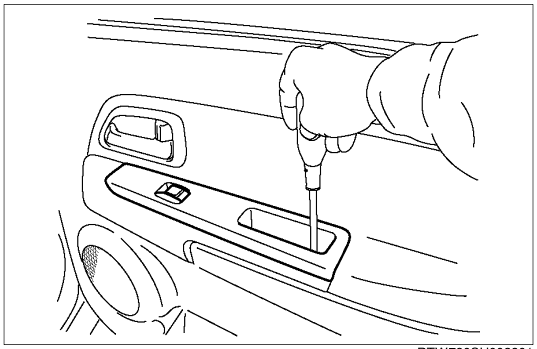


9. Oil Seal

Use oil seal installer to install a new oil seal that has been soaked in rear axle lubricant.

Installer : 9-8522-1275-0

Note :
Take care not to use a rear differential oil seal instead of the front differential oil seal.



RTW780SH002801

REAR POWER WINDOW & DOOR LOCK SWITCH-LH & RH

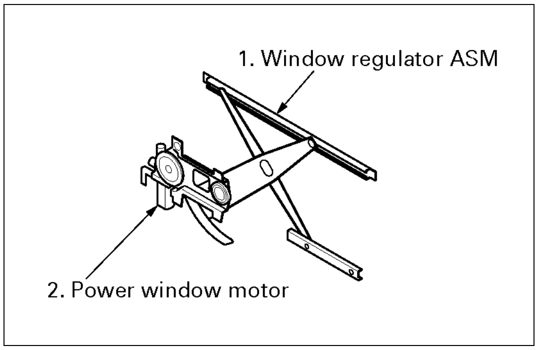
Removal

1. Disconnect the battery ground cable.
2. Remove the screw in the pull cup with the tip of a screwdriver.
3. Remove the switch bezel by pushing the spring with the tip of a screwdriver.
4. Disconnect the connector.

ATTENTION:
When removing a switch bezel lift from the front in the bezel.
It follows the front with the screwdriver.
The clip has broken when lifting from the rear in the bezel.

Installation

To install, follow the removal steps in the reverse order.



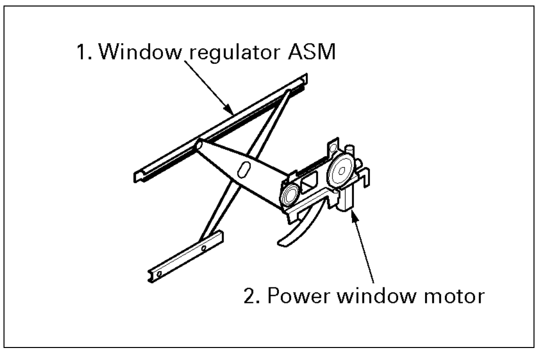
DRIVER'S SIDE POWER WINDOW MOTOR

Removal

1. **Window Regulator ASM**
   - Refer to the removal steps of the WINDOW REGULATOR/POWER WINDOW MOTOR in Section 10 "BODY".
2. **Power Window Motor**
   - Loosen the fixing bolts to remove the power window motor from the regulator.

Installation

To install, follow the removal steps in the reverse order.



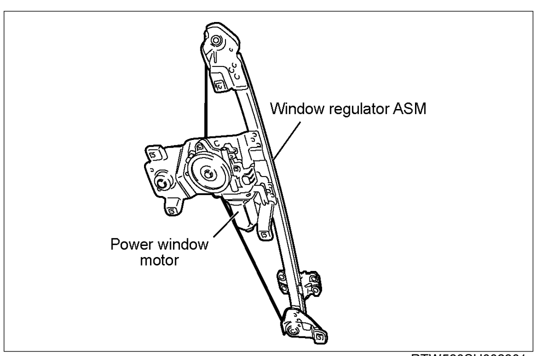
FRONT PASSENGER'S POWER WINDOW MOTOR

Removal

1. Window Regulator ASM
   - Refer to the removal steps of the WINDOW REGULATOR/POWER WINDOW MOTOR in Section 10 "BODY".
2. Power Window Motor
   - Loosen the fixing bolts to remove the power window motor from the regulator.

Installation

To install, follow the removal steps in the reverse order.



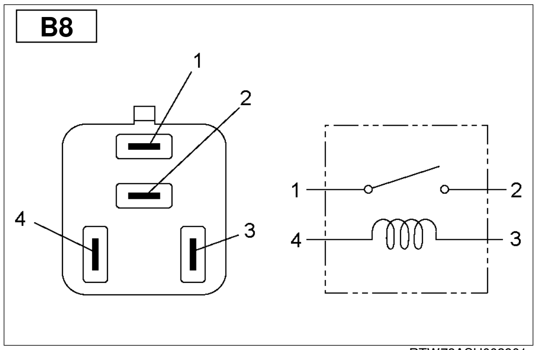
RTW580SH002901

REAR POWER WINDOW MOTOR-LH & RH

Removal and Installation

Refer to the "DRIVER'S SIDE POWER WINDOW MOTOR" removal and installation steps in this section.

INSPECTION AND REPAIR

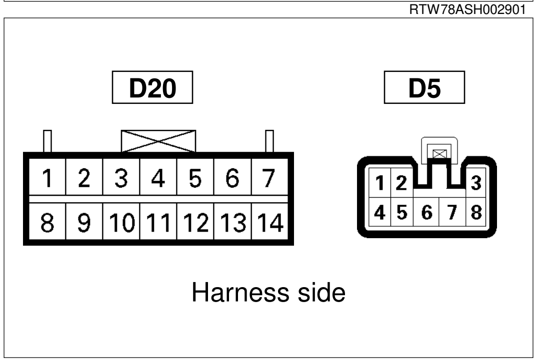


RTW78ASH002901

Power Window Relay

Check continuity between the relay terminals.

②- ① .... No continuity	
(When battery voltage is applied between ③ and ④)	
②- ① .... Continuity	

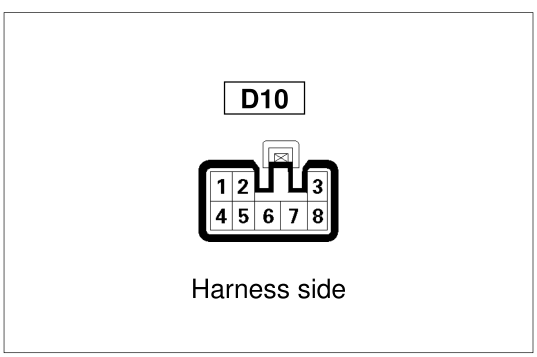


Driver's Side Power Window & Door Lock Switch

1. Harness Side Connector Circuit

Disconnect the switch connector, and check voltage and continuity between the harness side connector terminals as shown in the following table.

Terminal No.	Wire color	Connecting to	Check item	Connectin g terminal	Check condition	Standard
6	G/R	Power window relay	Voltage	6-Ground	Starter SW "ON"	Approx. 12V
7	BR/R	Power window motor	Continuity	7-8	-	Continuity
8	BR/W					
3	B	Ground	Continuity	3-Ground	-	Continuity

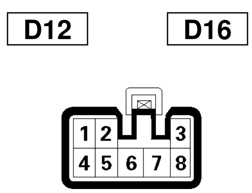


Front Passenger's Power Window Switch

1. Harness Side Connector Circuit

Disconnect the switch connector, and check voltage and continuity between the harness side connector terminals as shown in the following table.

Terminal No.	Wire color	Connecting to	Check item	Connecting terminal	Check condition	Standard
6	G/R	Power window relay	Voltage	6-Ground	Starter SW "ON"	Approx. 12V
8	BR/R	Power window motor	Continuity	8-7	-	Continuity
7	BR/W					
1,3	B	Ground	Continuity	1,3-Ground	-	Continuity

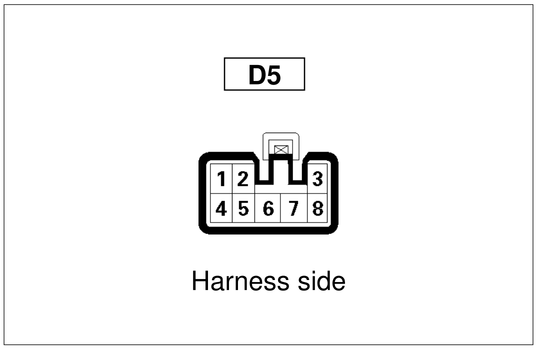


Harness side

Rear Power Window Switch-LH & RH

1. **Harness Side Connector Circuit**
   Disconnect the switch connector, and check voltage and continuity between the harness side connector terminals as shown in the following tables.

D12 (RR-LH)						
Terminal No.	Wire color	Connecting to	Check item	Connecting terminal	Check condition	Standard
6	G/R	Power window relay	Voltage	6-Ground	Starter SW "ON"	Approx. 12V
8	BR/R	Power window motor	Continuity	8-7	-	Continuity
7	BR/W					
3	B	Ground	Continuity	3,4-Ground	-	Continuity
4	B					
D16 (RR-RH)						
Terminal No.	Wire color	Connecting to	Check item	Connecting terminal	Check condition	Standard
6	G/R	Power window relay	Voltage	6-Ground	Starter SW "ON"	Approx. 12V
8	BR/R	Power window motor	Continuity	8-7	-	Continuity
7	BR/W					
3	B	Ground	Continuity	3-Ground	-	Continuity

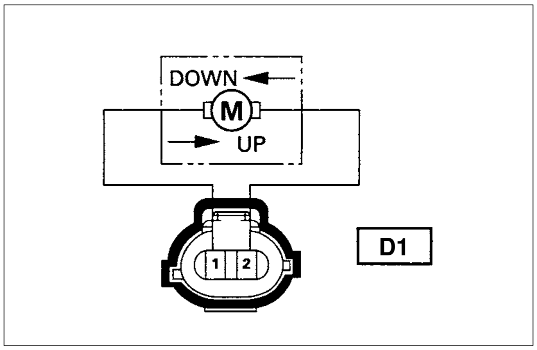


Driver's Side Power Window Motor

1. **Driver's Side Power Window & Door Lock Switch Connector Circuit**

   Disconnect the switch connector, apply the battery voltage (12V) to the harness side connector terminals and check operation.

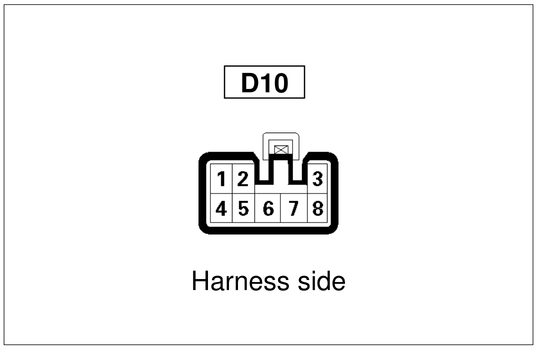
Connecting terminals		Operation direction
7 (BR/R)	8 (BR/W)	
⊖	⊕	DOWN
⊕	⊖	UP



2. **Driver's Side Power Window Motor Connector Circuit**

   Disconnect the switch connector, apply the battery voltage (12V) to the motor side connector terminals and check operation.

Connecting terminals		Operation direction
1	2	
⊕	⊖	DOWN
⊖	⊕	UP

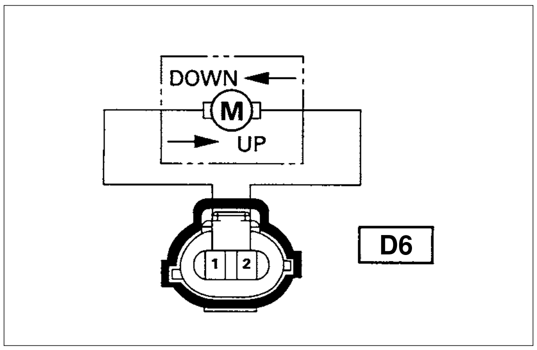


Front Passenger's Power Window Motor

1. Front Passenger's Power Window Switch Connector Circuit

Disconnect the motor connector, apply the battery voltage (12V) to the harness side connector terminals and check operation.

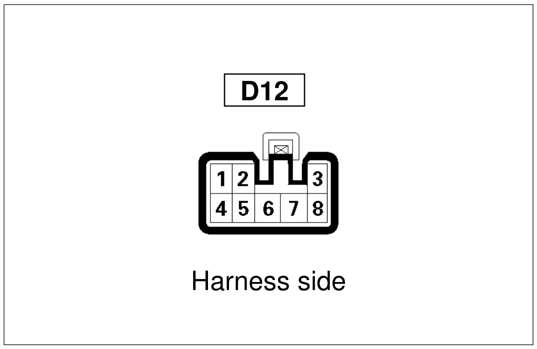
Connecting terminals		Operation direction
8 (BR/R)	7 (BR/W)	
⊝	⊕	DOWN
⊕	⊝	UP



2. Front Passenger's Power Window Motor Connector Circuit

Disconnect the switch connector, apply the battery voltage (12V) to the motor side connector terminals and check operation.

Connecting terminals		Operation direction
1	2	
⊕	⊝	DOWN
⊝	⊕	UP

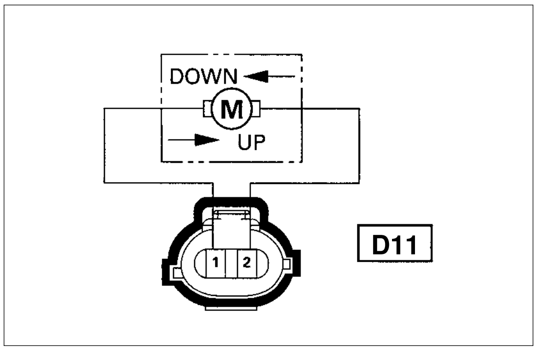


Rear Passenger's Power Window Motor-LH

1. Rear Power Window Switch-LH Connector Circuit

Disconnect the motor connector, apply the battery voltage (12V) to the harness side connector terminals and check operation.

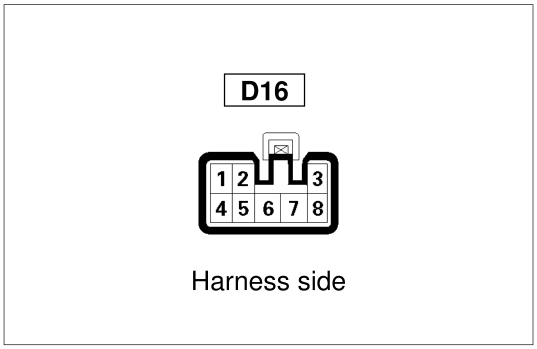
Connecting terminals		Operation direction
8 (BR/R)	7 (BR/W)	
⊖	⊕	DOWN
⊕	⊖	UP



2. Rear Power Window Motor-LH Connector Circuit

Disconnect the switch connector, apply the battery voltage (12V) to the motor side connector terminals and check operation.

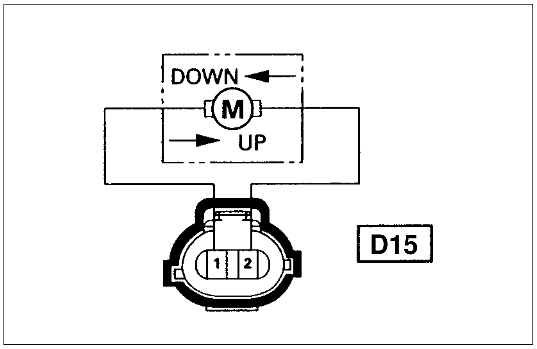
Connecting terminals		Operation direction
1	2	
⊕	⊖	DOWN
⊖	⊕	UP



Rear Power Window Motor-RH

1. **Rear Power Window Switch-RH Connector Circuit**
   Disconnect the motor connector, apply the battery voltage (12V) to the harness side connector terminals and check operation.

Connecting terminals		Operation direction
8 (BR/R)	7 (BR/W)	
⊖	⊕	DOWN
⊕	⊖	UP



2. **Rear Power Window Motor-RH Connector Circuit**
   Disconnect the switch connector, apply the battery voltage (12V) to the motor side connector terminals and check operation.

Connecting terminals		Operation direction

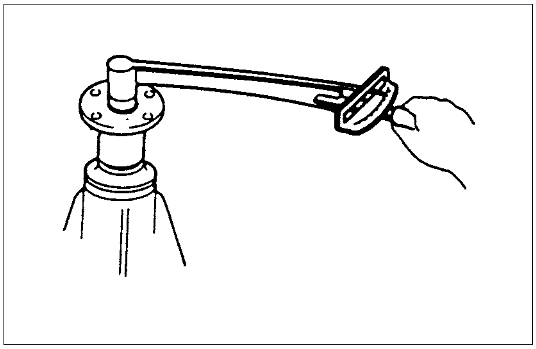
12. Flange Nut and Washer

(1) Apply lubricant to the pinion threads.
(2) Tighten the nut to the specified torque using the pinion flange holder.
Pinion flange holder : 5-8840-0133-0

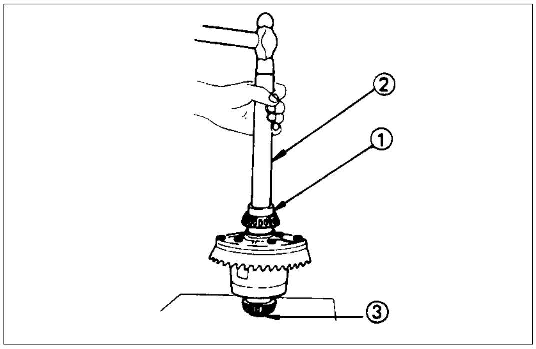
Torque	N·m (kgf·m/lb·ft)
177 - 275 (18 - 28/130 - 202)	

Discard used flange nut and install new one.



(3) Pinion bearing preload
(a) Measure the bearing preload by using a torque meter. Note the scale reading required to rotate the flange.
(b) continue tightening until the specified starting torque is obtained.

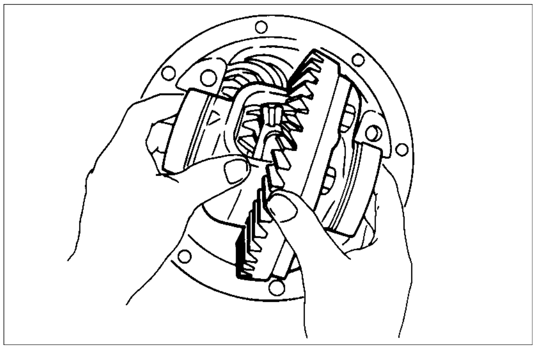
Starting Torque	N·m (kgf·m/lb·in)
0.63 - 1.13 (0.06 – 0.12/5 - 10)	



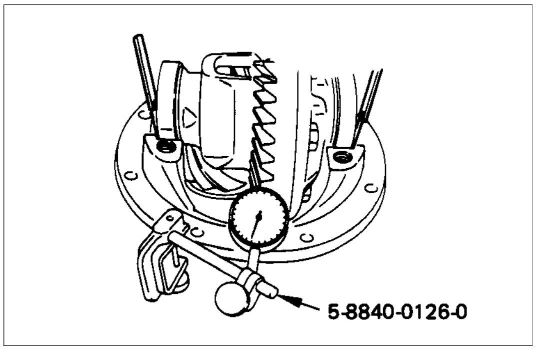
13. Adjust Shim

(1) Attach the side bearing to the differential assembly without shims. Support the opposite side using a pilot to prevent bearing damage.

① Installer : 9-8522-1164-0
② Drive handle : 5-8840-0007-0
③ Pilot : 9-8521-1743-0



(2) Insert the differential cage assembly with bearing outer races into the side bearing bores of the carrier.



(3) Using two sets of feeler gauges, insert a feeler stock of sufficient thickness between each bearing outer race and the carrier to remove all end plat. Make certain the feeler stock is pushed to the bottom of the bearing bores.
Mount the dial indicator on the carrier so that the indicator stem is at right angles to a tooth on the ring gear.
Dial indicator : 5-8840-0126-0

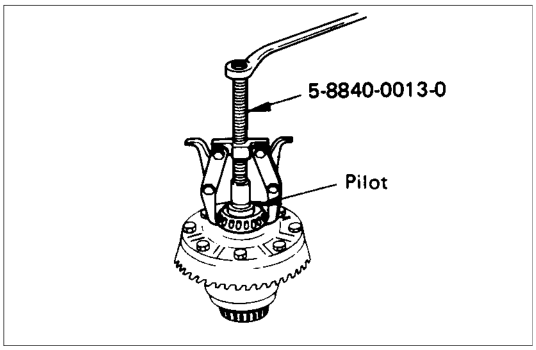
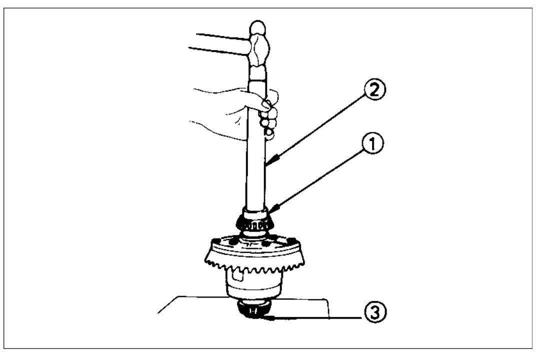
(4) Adjust feeler gauge thickness from side to side until ring gear backlash is in the specified range.

Backlash	mm(in)
0.13 - 0.18 (0.005 - 0.007)	

With zero end play and correct backlash established, remove the feeler gauge packs, determine the thickness of the shims required and add 0.05 mm (0.002 in) to each shim pack to provide side bearing preload. Always use new shims.

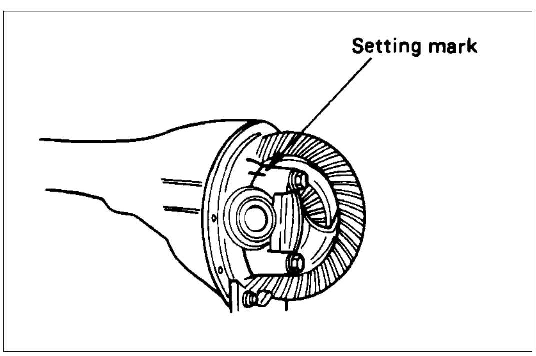


(5) Remove side bearing
Remover : 5-8840-0013-0
Pilot : 9-8521-1743-0



14.Side Bearing
Install the side bearings together with the selected shims.

① Installer : 9-8522-1164-0
② Drive handle : 5-8840-0007-0
③ Pilot : 9-8521-1743-0



17.Bearing Cap
Align the setting marks applied at disassembly.

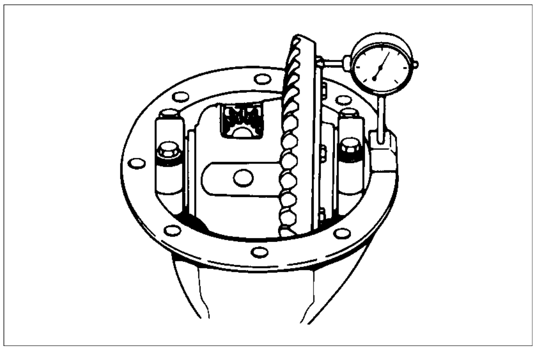
18. Bolt

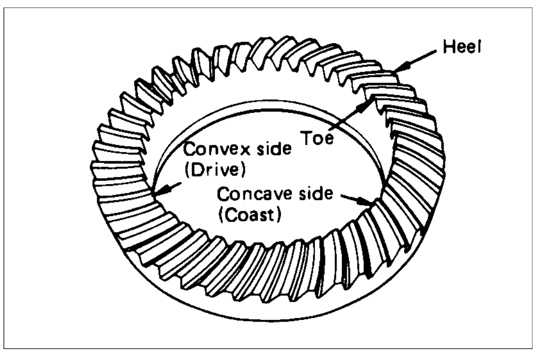
Bolt Torque	N·m (kgf·m/lb·ft)
98 (10.0/72)	



Measure the amount of run-out of the ring gear at its rear face.

mm(in)

Standard	Limit
0.02 (0.001)	0.05 (0.002)



Gear Tooth Contact Pattern Check and Adjustment

Apply a thin coat of prussian blue or equivalent to the faces of the 7 - 8 teeth of the ring gear. Check the impression of contact on the ring gear teeth and make necessary adjustment as described below if the contact is abnormal.

TROUBLESHOOTING

CIGARETTE LIGHTER

1. Lighter does not pop out after being pushed in. It does not become hot.

Checkpoint		Trouble Cause	Countermeasure
Audio system (System should receive power)	NG	Poor Fuse No. C-12 (20A, Fuse box) contact or blown	Reinstall or replace the fuse No. C12 (20A)
OK			
Lighter continuity between center part and outer area	NG	Open circuit or poor connector contact	Replace the lighter
OK			
Voltage between connector 1 B21 and the ground at starter SW. is ACC position (Should be battery voltage present)	NG	Open circuit or poor connector contact	Repair open circuit or connector contact
OK			
Continuity between connector 1 B22 and the ground	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

2. Lighter pops out prematurely before becoming hot

Checkpoint		Trouble Cause	Countermeasure
Lighter and casing	NG	Deformed lighter or casing	Repair or replace the lighter and/or casing

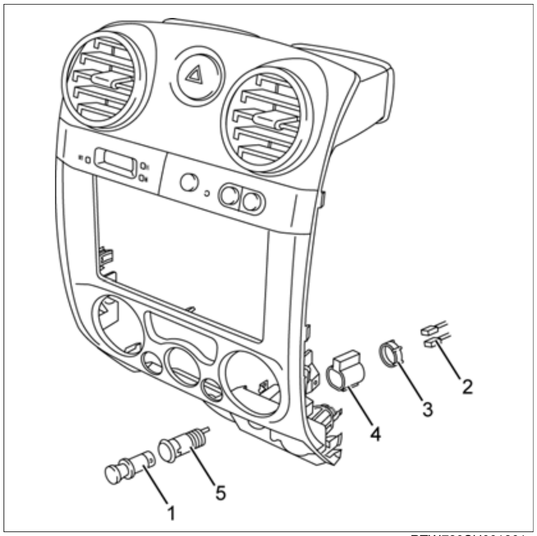
3. Lighter becomes too hot

Checkpoint		Trouble Cause	Countermeasure
Lighter and casing	NG	Deformed lighter and casing	Repair or replace the lighter and/or casing

REMOVAL AND INSTALLATION

AUDIO

Refer to Section 9 “ACCESSORIES” for details.



RTW780SH001801

CIGARETTE LIGHTER

Removal

1. Disconnect the battery ground cable.
2. Remove the center cluster ASM.
3. Remove the lighter ①.
4. Disconnect the connector ②.
5. Loosen the ring nut ③ at the back side.
6. Remove the outer case ④.
7. Remove the lighter holder ⑤ from the bezel.

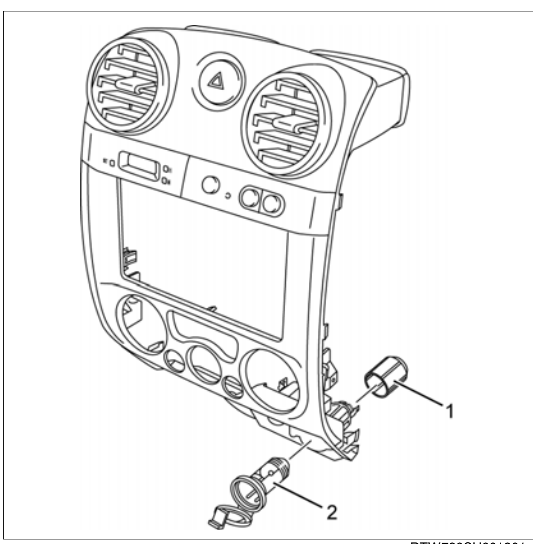
Installation

Follow the removal procedure in the reverse order to install the lighter.

Pay close attention to the important points mentioned in the following paragraphs.

Connector

Be absolutely sure that the lighter connector is securely connected.
This will prevent a poor contact and an open circuit.



RTW780SH001901

ACC SOCKET

Removal

1. Disconnect the battery ground cable.
2. Remove the center cluster ASM.
3. Disconnect the connector.
4. Remove the holder nut ①.
5. Remove the ACC Socket ②

Installation

Follow the removal procedure in the reverse order to install the lighter.

20. Differential Assembly

(1) Clean the faces of the front axle case and differential carrier.

Apply the recommended liquid gasket or its equivalent to the sealing side of the axle case and the carrier.

(2) Attach the differential case and the carrier assembly to the front axle case and tighten the nuts and bolts. The axle case bolt is used for drainage.

Torque	N·m (kgf·m/lb·ft)
26 (2.7/20)	

(3) Install the axle shaft assemblies as instructed earlier in this section under "Axle Shaft Replacement".

(4) Fill the axle case with hypoid gear lubricant, to just below the filler hole.

Lubricant capacity	liter (US/UK gal)
1.4 (0.37/0.31)	

TROUBLESHOOTING

QUICK CHART FOR CHECK POINT

Check Point / Trouble Mode	Fuse C11 (10A)	Door Mirror Control Switch	Door Mirror LH	Door Mirror RH	Cable Harness
1. Mirrors on the both sides do not operate	○	○			○
2. Mirror on the left (or right) side does not operate		○	○	○	○
3. Mirrors on the both sides operate only in the vertical (or horizontal) direction		○			
4. Mirror on the left side operates only in the vertical (or horizontal) direction		○	○		○
5. Mirror on the right side operates only in the vertical (or horizontal) direction		○		○	○

DOOR MIRROR CONTROL SWITCH

1. Mirrors on the both sides do not operate

Checkpoint		Trouble Cause	Countermeasure
Fuse No. C11 (10A, Fuse box)	NG	Poor fuse contact or blown	Reinstall or replace the fuse No. C11 (10A)
OK			
Grounding point C2	NG	Poor grounding point contact	Repair grounding point C2 contact
OK			
Voltage between the door mirror control SW. harness side connector terminal 4 D19 and the ground (Should be battery voltage present)	NG	Open circuit or poor connector contact	Repair an open circuit or a poor connection of the connectors between the fuse No. C11 (10A) and 4 D19
OK			
Continuity between the door mirror control SW harness side connector terminal 8 D19 and C2	NG	Open circuit or poor connector contact	Repair open circuit or connector contact
OK			
Door mirror control SW. function	NG	SW. malfunction	Replace the door mirror control SW.
OK			
Continuity between 7 D19 and 12 H36 (or 12 H37)	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

2. Mirror on the right side does not operate

Checkpoint		Trouble Cause	Countermeasure
Door mirror control SW. function	NG	SW. malfunction	Replace the door mirror control SW.
OK ↓			
Mirror function on the left (or right) side	NG	Mirror malfunction on the left (or right)	Repair or replace the door mirror
OK ↓			
Continuity between 7 D19 and 2 D7 (7 D19 and 2 D2)	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

3. Mirrors on the both sides operate only in the vertical (or horizontal) direction

Checkpoint		Trouble Cause	Countermeasure
Door mirror control SW. function	NG	SW. malfunction	Replace the door mirror control SW.

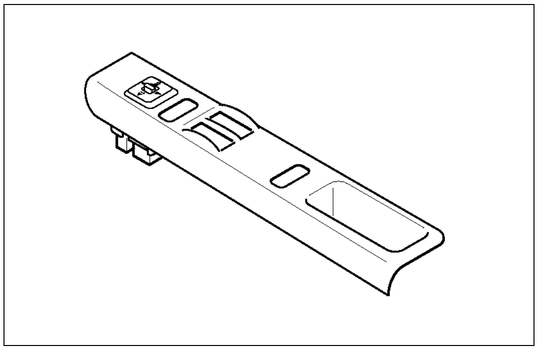
4. Mirror on the left side operates only in the vertical (or horizontal) direction

Checkpoint		Trouble Cause	Countermeasure
Door mirror control SW. function	NG	SW. malfunction	Replace the door mirror control SW.
OK			
Door mirror function	NG	Door mirror malfunction	Repair or replace the door mirror
OK			
Continuity between 4 D19 and 4 D7 (10 D19 and 1 D2)	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

5. Mirror on the right side operates only in the vertical (or horizontal) direction

Door mirror control SW. function	NG	Door mirror control malfunction	Replace the door mirror control SW.
OK			
Door mirror function	NG	Door mirror malfunction	Repair or replace the door mirror
OK			
Continuity between 4 D19 and 4 D2 (10 D19 and 1 D2)	NG	Open circuit or poor connector contact	Repair open circuit or connector contact

REMOVAL AND INSTALLATION



DOOR MIRROR CONTROL SWITCH

Removal

1. **Disconnect the battery ground cable.**
2. **Door trim pad Assembly**
   - Refer to section 10 “BODY” for door trim pad assembly removal steps.
3. **Door Mirror Control Switch**
   Remove the power window switch bezel.
   - Remove the screw.
   - Disconnect the switch connector.
   - To remove the switch panel assembly.

Installation

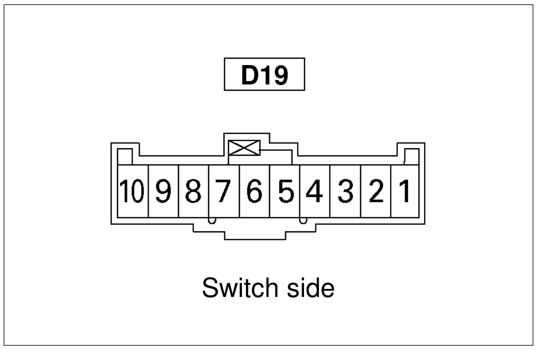
To install, follow the removal steps in the reverse order.

DOOR MIRROR

Removal and Installation

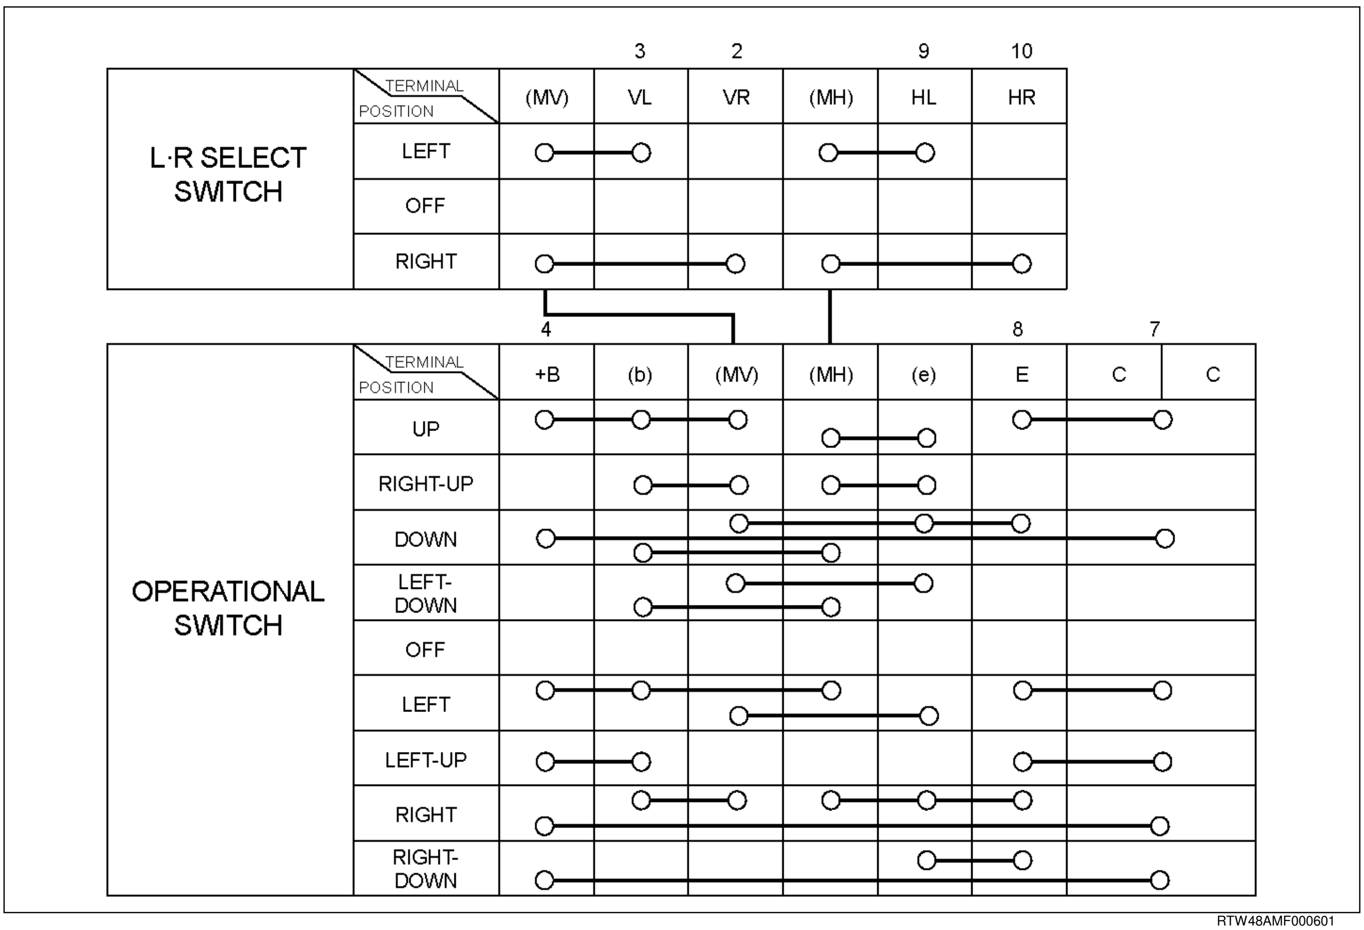
Refer to the DOOR MIRROR in section 10 “BODY”.

INSPECTION AND REPAIR

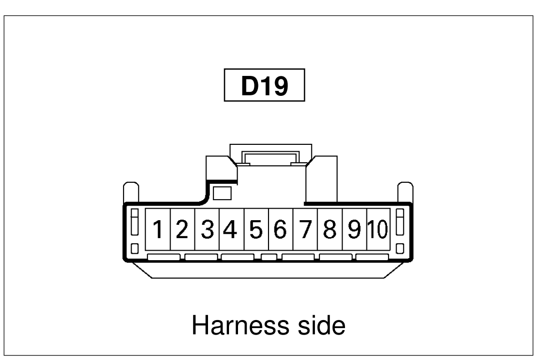


Door Mirror Control Switch

1. **Switch side Connector Circuit**
   Check continuity between the switch connector terminals while operating the door mirror control switch as shown in the following table.



MV, MH, b, and e terminals have internal connections (circuitry).
4-point switch (Will not operate at intermediate positions.)

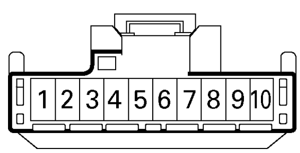


2. **Harness Side Connector Circuit**
   Remove the connector No. D19 of the mirror control switch and check voltage and continuity of the harness side connector.
   - When there is no continuity at the terminal No. 2, 3, 9 and 10, it is considered that the circuit with terminal No. 7 (W/B) is defective.

- When there is no continuity at either one of the circuit No, 5, 7, 8, or 10, the motor in the mirror of the circuit or the circuit itself is defective.

Terminal No.	Wire color	Connection to	Check item	Connecting terminal	Check condition	Standard
7	W/B	LH mirror & RH mirror	Continuity	7-Ground	-	No continuity
4	R/Y	Fuse C11 (10A)	Voltage	4-Ground	Starter SW “ACC” position	Approx. 12V
10	W/R	RH mirror-LH/RH	Continuity	10-7	-	Continuity
2	B/W	RH mirror-Up/Down		2-7	-	
3	B/R	LH mirror-Up/Down		3-7	-	
8	B	Ground		8-Ground	-	
9	W/G	LH mirror-LH/RH		9-7	-	

D19



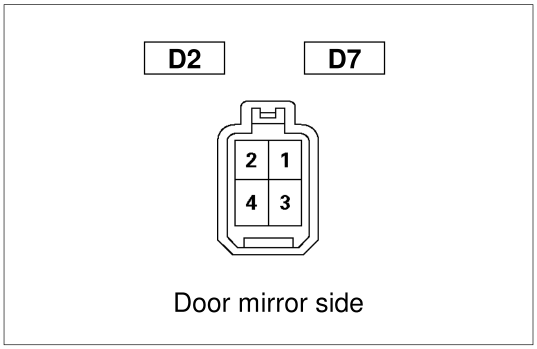
Harness side

Door Mirror

1. Door Mirror Control Switch Connector Circuit

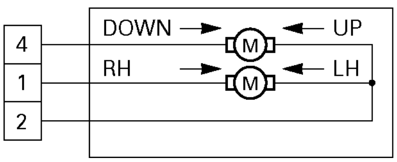
Disconnect the switch connector D19, apply the battery voltage to the harness side connector terminals and check its function.

Mirror \ Connector No. / Terminal No.	D19					Operating direction
	9	10	7	3	2	
Right		+	-			Left
		-	+			Right
			-		+	Up
			+		-	Down
Left	+		-			Left
	-		+			Right
			-	+		Up
			+	-		Down



2. Door Mirror Connector Circuit

Disconnect the door mirror connector, apply the battery voltage to the door mirror side connector (D2 and D7) terminals and check its function.



Connector No. / Terminal No. / Operation	D2 D7		
	1	2	4

TROUBLE SHOOTING

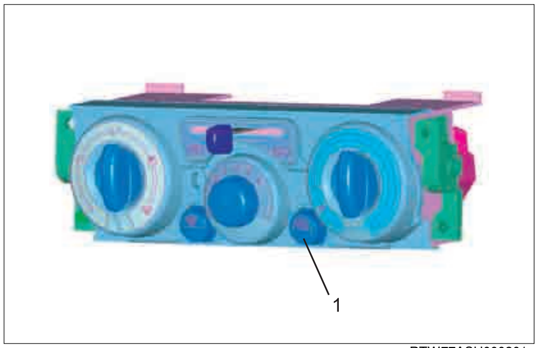
Rear defogger inoperative

Checkpoint		Trouble Cause	Countermeasure
Fuse No. C3 (10A, Fuse box) and 9 B56	NG	Poor fuse contact or blown	Reinstall or replace the fuse No. C7 (10A) and 9 B56
OK			
C18 (20A, Fuse box)	NG	Poor fuse contact or blown	Reinstall or replace the fuse C18 (20A)
OK			
Rear defogger switch function	NG	Switch malfunction	Replace the rear defogger switch
OK			
Rear defogger relay function	NG	Relay malfunction	Replace the rear defogger relay
OK			
Grounding point C2	NG	Poor grounding point contact	Repair grounding point contact
OK			
Voltage between 1 L4 - ground when the starter switch and the rear defogger switch are at on position (should be battery voltage present)	NG	Open circuit or poor connector contact	Repair open circuit or poor connector contact between fuse No. C3 (10A) and 3 B7, C18 (20A) and 1 B7, 2 B7 (3 B55) and 1 L4, 4 B7 (3 B54) and 3 B46 or 1 B46 and C2

Continued on the next page

Checkpoint		Trouble Cause	Countermeasure
Continued from the previous page			
OK			
Continuity between 1 L7 and C2	NG	Open circuit or poor connector contact	Repair open circuit or connector contact between 1 L7 and C2
OK			
Continuity between rear defogger terminals	NG	Broken heat wire of rear defogger	Repair heat wire

REMOVAL AND INSTALLATION



RTW77ASH000201

REAR DEFOGGER SWITCH

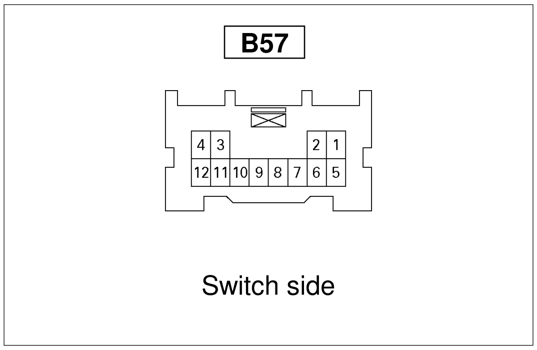
Removal

1. Instrument Panel Cluster Assembly
   - Refer to Section 10 “BODY” for center cluster panel assembly removal steps.
2. Rear Defogger Switch (With HVAC control unit) (1)
   Refer to Section 1 “HVAC” HVAC control unit assembly removal steps.

Installation

Follow the removal procedure in the reverse order to install the rear defogger switch.

INSPECTION AND REPAIR



REAR DEFOGGER SWITCH

Rear Defogger Switch Connections

SW position \ Terminal No.	9	7	8

RTW78ASH002901

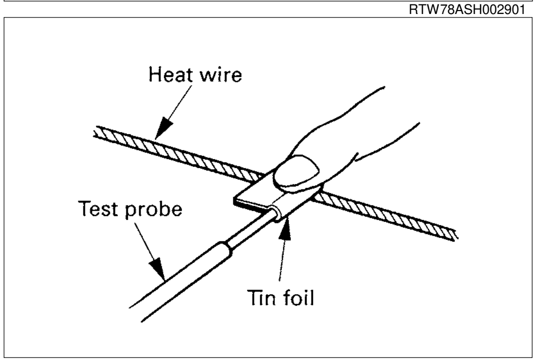
REAR DEFOGGER RELAY

Check continuity between the relay terminals.

②- ① .... No continuity

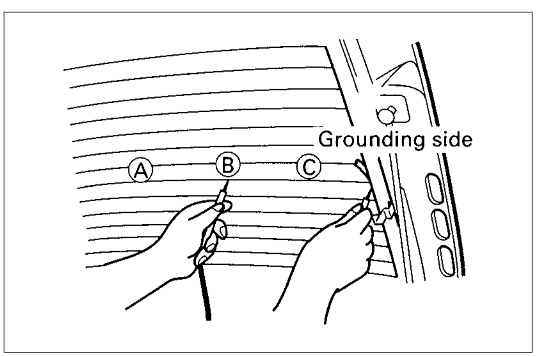
(When battery voltage is applied between ④ and ③)

②- ① .... Continuity

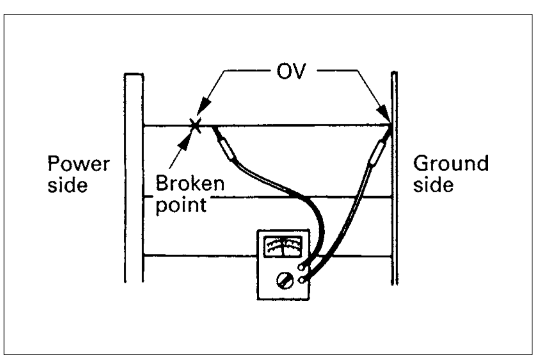


INSPECTION OF REAR DEFOGGER HEAT WIRE

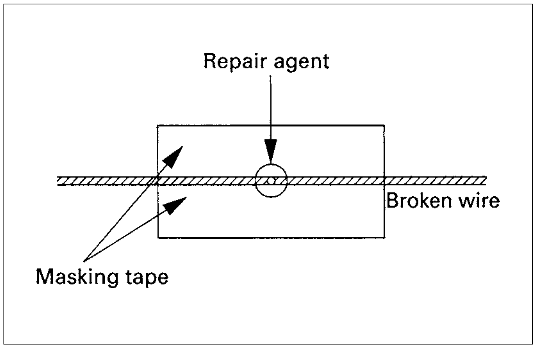
- Heat wires are printed on the inner side of glass. To clean, use a soft cloth and wipe horizontally along the wires.
- Never use glass cleaner or equivalent.
- When measuring voltage, wind a piece of tin foil around the tip of the negative probe and press the foil against the wire with your finger as shown.



(1) Turn the ignition switch on.
(2) Turn the defogger switch on.
(3) Measure the voltage between the three points on the heat wire and the (-) terminal with a voltmeter.
(4) Check that the voltage becomes smaller from Ⓐ to Ⓑ to Ⓒ.

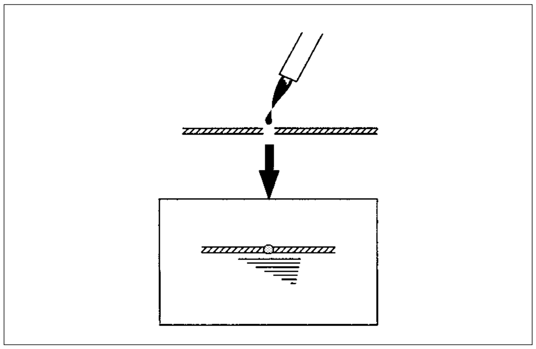


(5) If there is a place where the voltage suddenly changes to 0V, there is a broken wire between there and the power side.
(6) Move the tester probe from the position where the voltage changes to 0V toward the power side and find where the voltage suddenly increases.



REPAIR OF BROKEN HEAT WIRE

(1) Clean broken wire tips with white gasoline.
(2) Place masking tape along both sides of wire to be repaired.



(3) Thoroughly mix the repair agent (Dupont paste No. 4817 or equivalent).
(4) Using a fine tip brush, apply a small amount to the wire.
(5) After a couple of minutes, remove the masking tape.
(6) Allow to stand at least 24 hours.

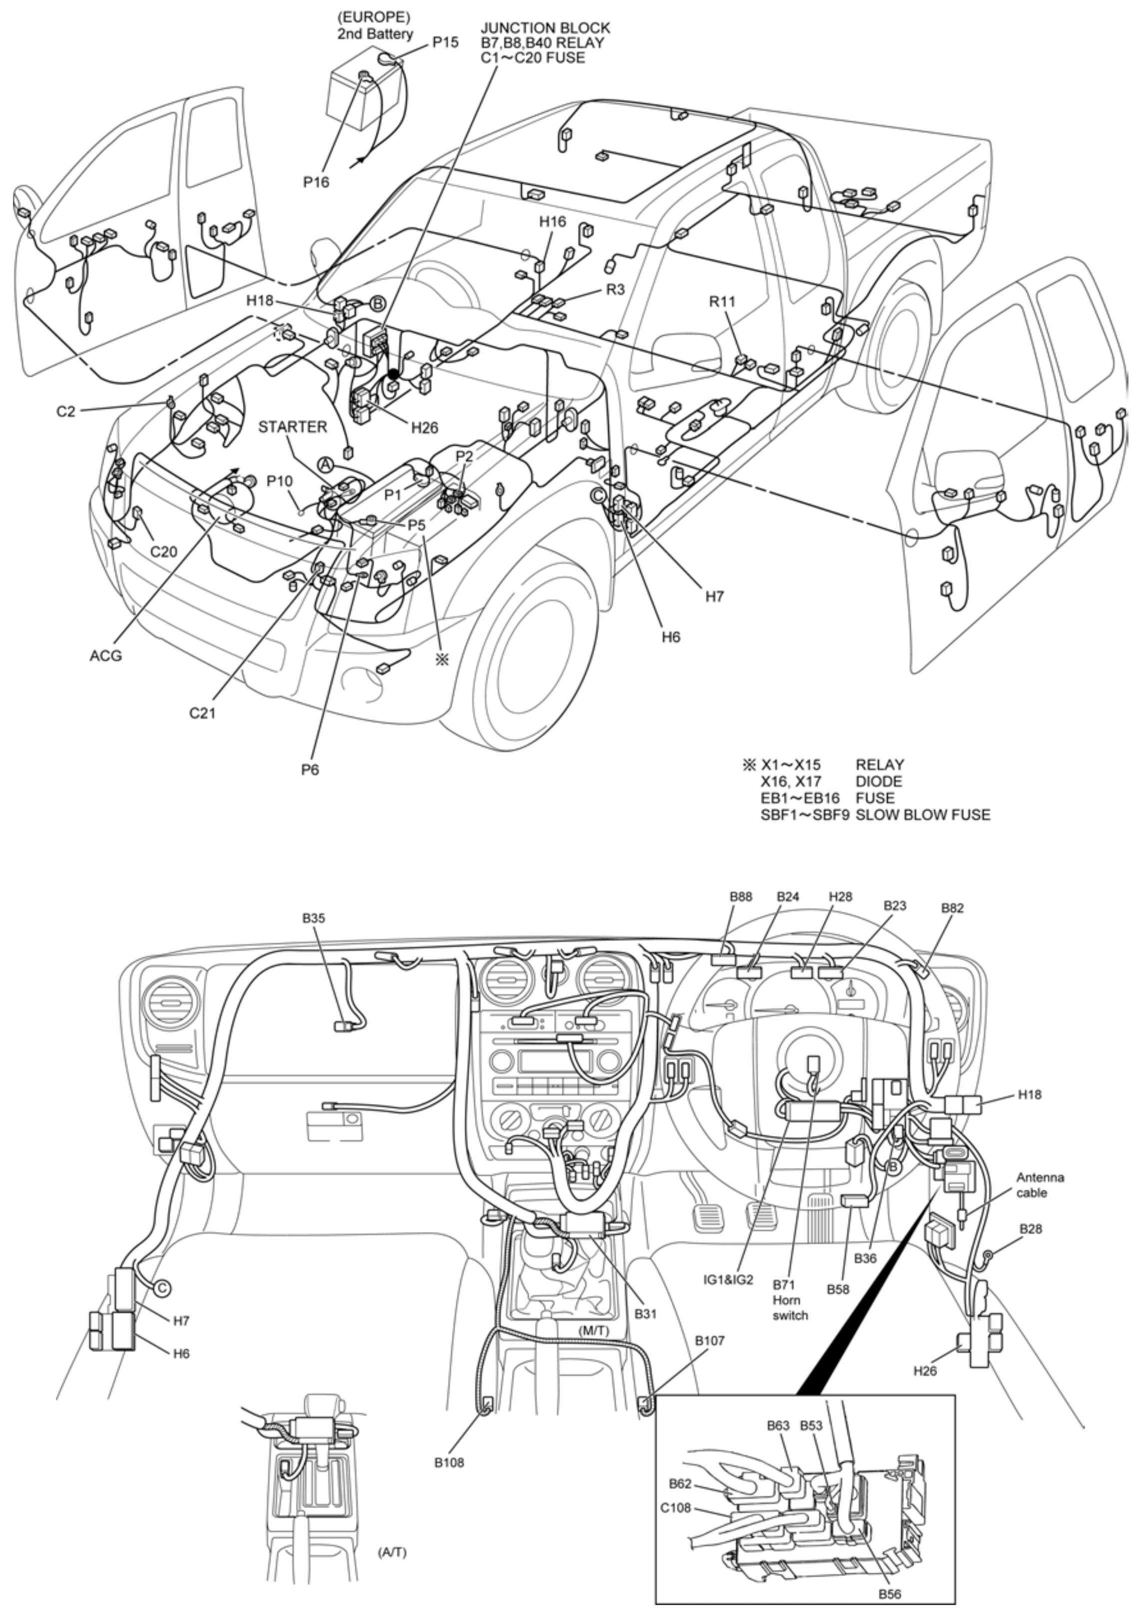
ISUZU KB P190 2007
TO MODEL INDEX

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) -AIR BAG

PARTS LOCATION (RHD)



RTW78AXF040301 & RTW78AXF046501

Important Operations

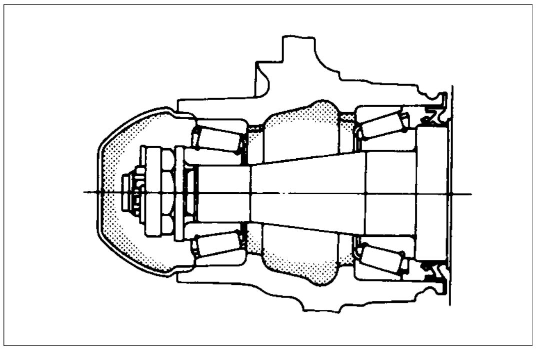
Before removal, jack up the front of vehicle and support frame with jack stands.

2. Brake Caliper

(1) Remove the two bolts from the rear side of the knuckle arm, then remove the brake caliper, with the brake hose attached.

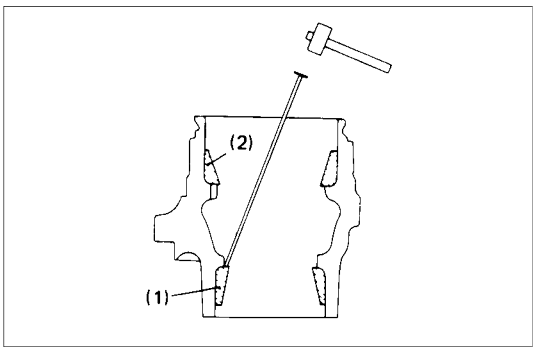
(2) Use a wire etc., for attaching the brake caliper to the upper link.

Refer to the section Brake.



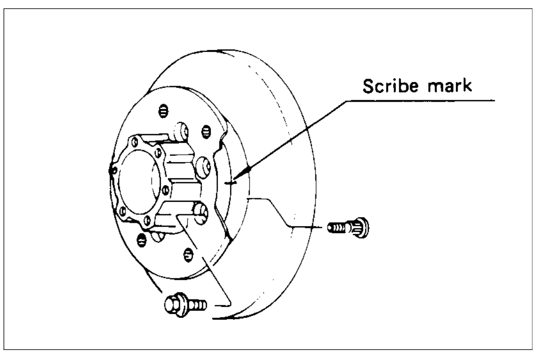
3. Hub Cap

When removing hub cap, exercise care so as not to scratch or distort hub fitting face.



9. Hub and Disc Assembly

Using a brass bar to remove the outer bearing outer race (1), oil seal, inner bearing and inner bearing outer race (2) from the hug.



If necessary, replace the wheel pin in the following manner.

13. Bolt

14. Wheel Pin ; Front Hub

(1) Scribe mark on hub to disc before disassembly to insure proper assembly.

(2) Drive out the ABS sensor rotor using a metal bar and hammer through the two bolt holes.

- Discard the used ABS sensor rotor

Refer to the section Brake.

Inspection and Repair

Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

For inspection and servicing of disc caliper, and relative parts, and ABS parts, refer to section 5 Brakes.

- Hub
- Hub bearing
- Bearing outer race
- Disc
- Oil seal
- Knuckle spindle
- ABS sensor rotor
- Caliper

Visual Check

Check the following parts for wear, damage or other abnormal conditions.

TROUBLESHOOTING

Diagnostic procedure

- Check the operation "Lock / unlock" by using transmitter (remote key) on the vehicle.
- Check the operation "ON / OFF" for Driver side door SW on the vehicle.
- Perform the Keyless entry System Check.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Miss routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at keyless entry control unit-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage.

Check the Electro-Magnetic Interference (EMI)

- Location of vehicle check
  Move the vehicle to a new location and perform the check again.
- Non-OEM Parts.
  Switch is “OFF” or remove the Non-OEM parts and perform the check again.
- Other
  Remove the accessory and another key from key.

Check the other items.

- Battery voltage is low.
- Keyless entry programming functions.
- Registration for security code.
- Ignition switch operation.
- Meter system is malfunction.

Check the operation

Check the operation "Lock / unlock" by using transmitter (remote key) on the vehicle.

Notice

If so equipped the Anti Theft, Refer to ANTI THEFT SYSTEM in 11B Section.

Keyless Entry System Check

Step	Action	Value (s)	Yes	No
1	Check the fuse for the keyless entry power feed circuit. (EB16 10A) If a problem found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 2*
2	1. Check the KCU (Keyless Entry Control Unit) ground circuit for an open, or short to voltage. Also, check the KCU ignition feed circuit for an open or short to ground and the KCU ground circuit for an open. 2. If a problem is found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 3*
3	1. Check the front drive side SW circuit for an open, or short to voltage. 2. If a problem is found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 4*
4	1. Check the operation "Lock / unlock" by using transmitter (Remote key) on the vehicle. Was the problem found?	—	Go to Diagnostic Chart	Go to Diagnostic Aids

ID Code not yet programmed

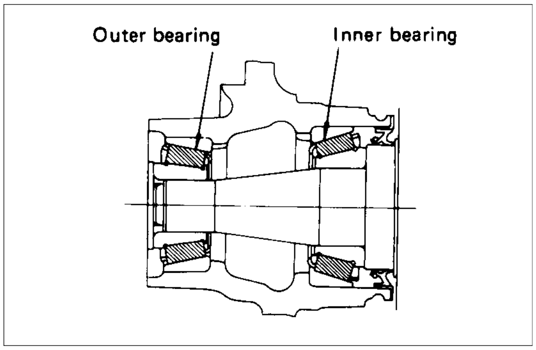
Step	Action	Value (s)	Yes	No
1	Was the Keyless entry System Check performed?	—	Go to *Step 2*	Go to *Keyless entry System Check*
2	Check the key. Is a key peculiar to a vehicle?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the Keyless entry programming functions. • All transmitters (Remote Key). If a problem is found, reprogramming as necessary. (Refer to “ID code new registration”) Was the action complete?	—	Go to *Step 4*	Go to ID code new registration
4	Check the operation "Lock / unlock" by using transmitter (Remote key) on the vehicle. Was the problem found?	—	Go to *Step 5*	Verify repair
5	Recheck the following condition. 1. Non-OEM parts switch is “OFF” or remove the Non-OEM parts. 2. Move the vehicle to a new location. 3. Check the operation "Lock / unlock" by using transmitter (Remote key) on the vehicle. Was the problem found?	—	Go to *Step 6*	Verify repair
6	Replace the Keyless entry control unit (KCU). **IMPORTANT:** The replacement KCU must be programmed the security code. Was the problem found?	—	Go to *Step 7*	Verify repair
7	Replace the key and lock cylinder assembly with Keyless entry system (KCU). **IMPORTANT:** • KCU is not replacing simultaneously. • After replace lock cylinders, perform the following below the items. • Replace the keys and key cylinders. • Program the Keyless entry system. (Refer to “ID code new registration”) Was the action complete?	—	Verify repair	—

No Remote Key Programmed

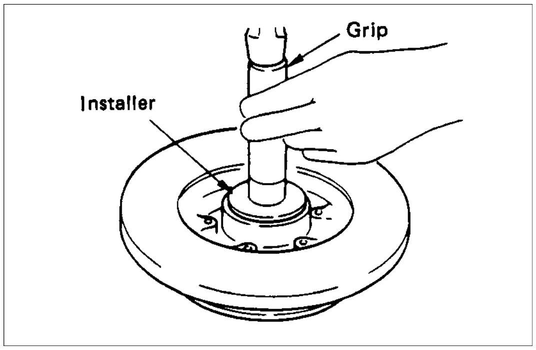
Step	Action	Value (s)	Yes	No
1	Was the Keyless entry System Check performed?	—	Go to *Step 2*	Go to *keyless entry System Check*
2	Check the key. Is a key peculiar to a vehicle?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the keyless entry programming functions. • Transmitter (Remote Key). Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Perform the keyless entry programming functions. • Transmitter (Remote Key). (Refer to “ID code new registration”) Was the action complete?	—	Go to *Step 5*	—
5	Replace the transmitter (Remote Key). **IMPORTANT:** The replacement transmitter (Remote Key) must be programmed the ID code. Was the action complete?	—	Verify repair	—

Door Lock Actuators Short Circuit to Ground

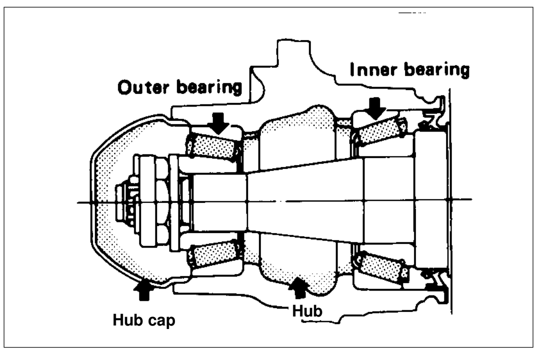
Step	Action	Value (s)	Yes	No
1	Was the Keyless entry System Check performed?	—	Go to *Step 2*	Go to *keyless entry System Check*
2	Check the door lock actuators circuit. 1. Ignition key position is “OFF”. 2. Disconnect the keyless entry control unit (KCU). 3. Check the door lock actuator circuit for short to ground. If the problem found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 3*
3	Check the operation "Lock / unlock" by using transmitter (Remote key) on the vehicle. Was the problem found?	—	Go to *Step 4*	Verify repair
4	Check the door lock actuator. If the problem found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 5*
5	Replace the Keyless entry control unit (KCU). **IMPORTANT:** The replacement KCU must be programmed the security code. Was the problem found?	—	Go to *Step 7*	Verify repair



(2) Install the outer and inner bearing into the hub with fingers.



(3) Install oil seal using special tools.
Discard the used oil seal and install a new one.
Installer : 5-8840-2853-0
Grip : 5-8840-0007-0

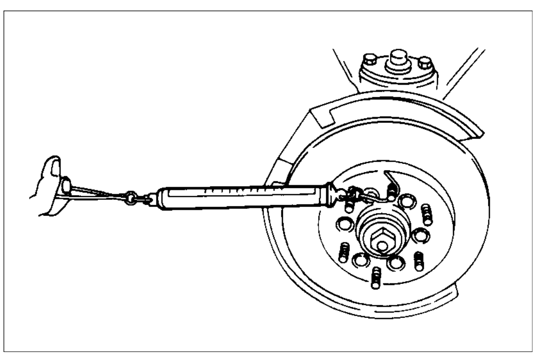


6. Hub and Disc Assembly

12. Hub Cap

Apply grease in the hub and hub cap.

Description	Amount g(oz)
Hub	50 (1.77)
Hub cap	20 (0.71)
Outer bearing	6.5 (0.23)
Inner bearing	12 (0.42)



9. Hub nut

Adjustment of front wheel hub bearing preload

1. Tighten spindle nut to 29 N·m (3.0 kgf·m/22 lb·ft) torque.
2. Turn the hub 2-3 turns and loosen the nut just enough so that it can be turned with the fingers.
3. Turn the nut all the way in with the fingers and check to be sure the hub has no free play.
4. Measure the bearing preload by pulling one of the wheel hub studs with a spring scale.
5. Tighten the spindle nut until specified bearing preload Is obtained.
6. Install the split pin in the nut retainer.
   Discard the used split pin and install a new one.

After reassembling, install the disc brake caliper assembly.

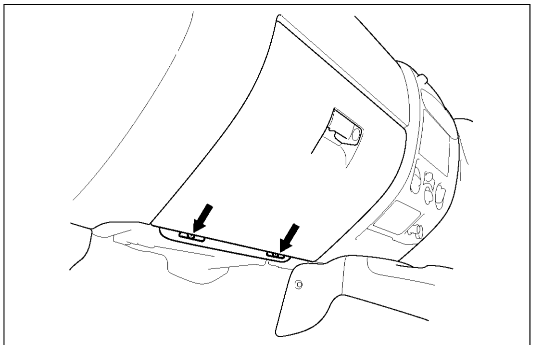
Bearing Preload N (kgf/lb)

New bearing and New oil seal	9.3 - 13.3 (0.95 - 1.36 / 2.09 – 3.00)
Reuse bearing and New oil seal	9.3 - 13.3 (0.95 - 1.36 / 2.09 – 3.00)

KEYLESS ENTRY CONTROL UNIT

Removal

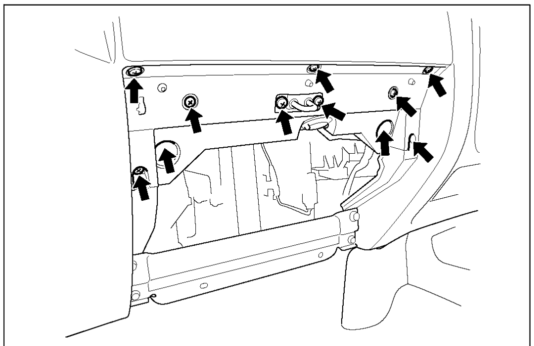
1. Remove the glove box.
2. Disconnect the glove box lamp connector.



This Illustration is based on RHD

RTW580SH001601

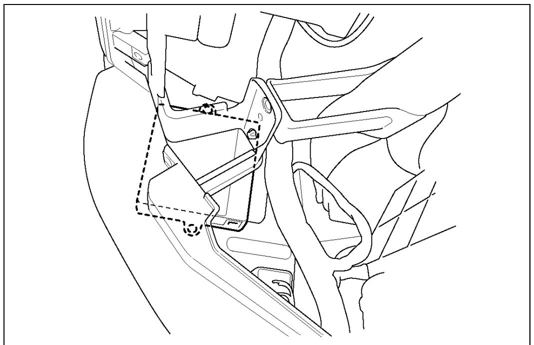
3. Remove the glove box cover.



This Illustration is based on RHD

RTW580SH001701

4. Remove the bolt of antitheft and keyless entry control unit.
5. Disconnect the keyless entry control unit connector.
6. Remove the keyless entry control unit.



This Illustration is based on RHD

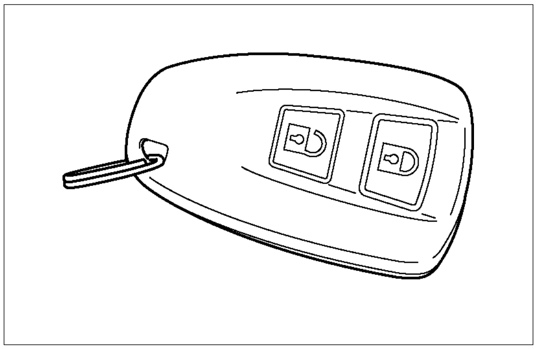
RTW580SH001801

Installation

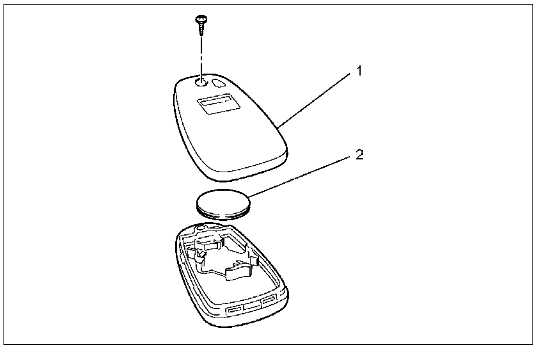
Follow the removal procedure in the reverse order to install the keyless entry control unit.

Connector

Be absolutely sure that the keyless entry control unit harness connector is correctly installed.
This will prevent a poor contact and an open circuit.



RUW580SH001101



RUW580SH003901

Remove Transmitter (Remote Key)

Replacing the battery in the transmitter (remote key)

Replace the battery(2) as soon as the range of the remote control starts to become reduced.

Open the underside of the transmitter (remote key) by removing the battery cover(1) with a screwdriver as shown in the illustration.

Replace the battery, ensuring that it is inserted correctly.

Replace the battery cover so that it engages audibly. Make sure that you dispose of old batteries in accordance with environmental protection regulations.

Keyless Entry System

General Description

The system's main features are summarized as follows.

- Keyless entry with visual feedback
- Highly secure encrypted transmission format incorporating rolling code strategy
- Field programmable remote keys
- Door lock control
- Illuminated entry with fade out
- Illuminated exit
- Remote door lock / ignition key interlock
- Door ajar warning indicator in the cluster

Power Door Lock System

General Description

The circuit consists of the door lock (& power window) switch, door lock actuator for the front and rear door, tailgate lock actuator and the door lock key switch.
The front door lock switch - RH is always provided with the battery voltage.
The key or the inside lock button on both driver's and front passenger's door can activate the lock mechanism of all the doors (including the tailgate).
When the driver's door lock switch or the front passenger's door lock switch is turned on, current flows for about one second to the door lock actuator of each door connected in parallel with the front door lock (& power window) switch - LH to activate the actuator to lock and unlock the doors.

Door Lock Key Switch

Removal and Installation

- Refer to the Front Door Lock Assembly removal and installation steps in this section.

Front Door Lock Actuator

Removal and Installation

- Refer to the Front Door Lock Assembly removal and installation steps in this section.

Rear Door Lock Actuator

Removal and Installation

- Refer to the Rear Door Lock Assembly removal and installation steps in this section.

Tailgate Lock Actuator

Removal and Installation

- Refer to the Tailgate Lock Assembly removal and installation steps in this section.

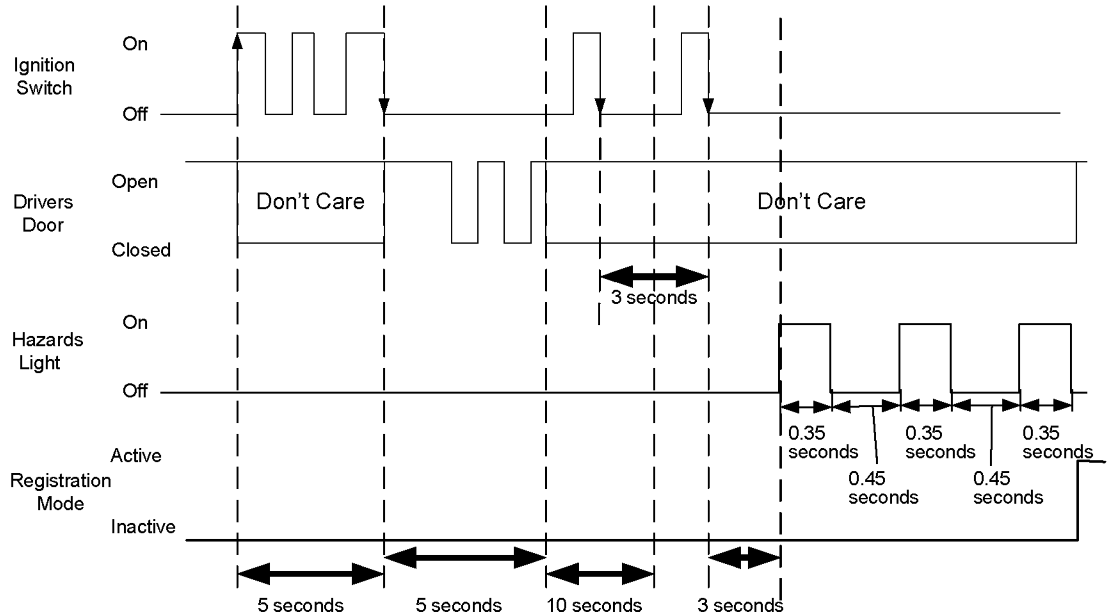
ID Code New Registration

All registered ID codes shall be erased, and a new received
ID code shall be registered instead of old codes.
Carefully read each of the steps before beginning the operation.

Step	Action	Yes	No
1	**NOTE:** Make sure that the all the doors are closed and unlocked. Remove the ignition key from the ignition switch. 1. Open the driver's side door. 2. Insert the ignition key into the starter switch. Is the action complete?	Go to *Step 2*	—
2	Turn the ignition switch to ON position and return it to OFF position three times. **NOTE:** This step must be carried out within five seconds. Is the action complete?	Go to *Step 3*	Go to *Step 1*
3	Close and open the drive's side door twice. **NOTE:** This step must be carried out within five seconds after step 2 is finished. Is the action complete?	Go to *Step 4*	Go to *Step 1*
4	1. Turn the ignition switch to ON position and return it to OFF position twice. **NOTE:** This step must be carried out within ten seconds after step 3 is finished. Is the action complete?	Go to *Step 5*	Go to *Step 1*
5	Operate the lock or unlock button of the transmitter. **NOTE:** Confirm that the system is functioning by pressing the transmitter button to lock and unlock the doors. Listen for the sound of the actuator operation. Is the action complete?	—	Go to *Step 1*



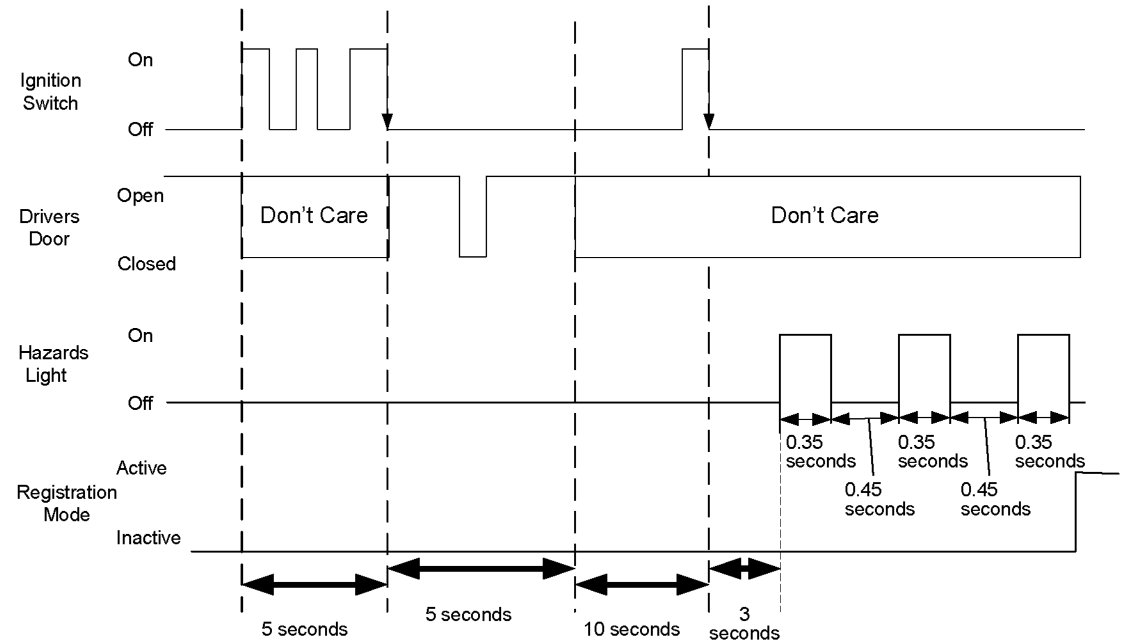
Sequence and timing to enter New Registration Mode

RUW59DMF000101

ID Code Additional Registration

A new received ID code shall be additionally registered with holding registered ID codes. When a total of already registered and newly registered ID code exceeds 4, the oldest one shall be erased.

Step	Action	Yes	No
1	**NOTE:** Make sure that the all the doors are closed and unlocked. Remove the ignition key from the ignition switch. 1. Open the driver's side door. 2. Insert the ignition key into the starter switch. Is the action complete?	Go to *Step 2*	—
2	Turn the ignition switch to ON position and return it to OFF position three times. **NOTE:** This step must be carried out within five seconds . Is the action complete?	Go to *Step 3*	Go to *Step 1*
3	Close and open the driver's side door once. **NOTE:** This step must be carried out within five seconds after step 2 is finished. Is the action complete?	Go to *Step 4*	Go to *Step 1*
4	1. Turn the ignition switch to ON position and return it to OFF position once. Check that the hazard lamp blinks 3 times. **NOTE:** This step must be carried out within ten seconds after step 3 is finished. Is the action complete?	Go to *Step 5*	Go to *Step 1*
5	Operate the lock or unlock button of the transmitter. **NOTE:** Confirm that the system is functioning by pressing the transmitter button to lock and unlock the doors. Listen for the sound of the actuator operation. Is the action complete?	—	Go to *Step 1*



Sequence and timing to enter Additional Registration Mode

Important Operations

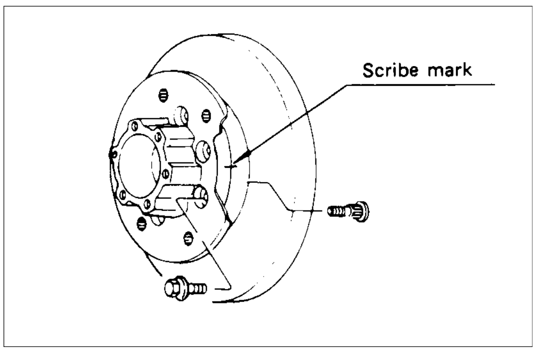
6. Hub nut

Wrench : 5-8840-2117-0

7. Hub and disc assembly

Before disassembly, remove the disc brake caliper assembly and hang it on the frame with wires.

Refer to Section "Brake" for disc brake caliper removal procedure.



12. Bolt

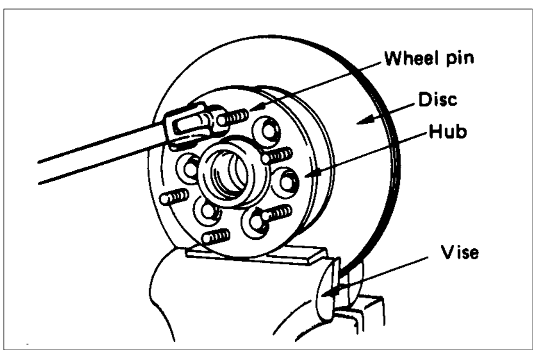
13. Wheel Pin ; Front Hub

(1) Scribe mark on hub to disc before disassembly to insure proper assembly.

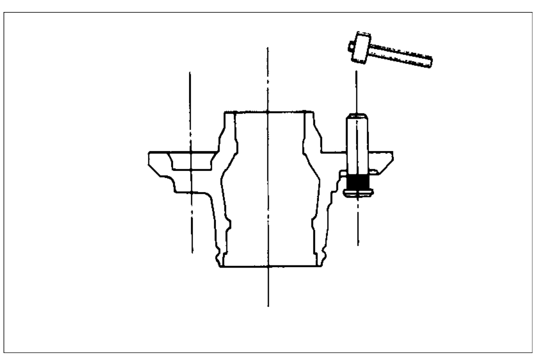
(2) Drive out the ABS sensor rotor using a metal bar and hammer through the two bolt holes.

- Discard the used ABS sensor rotor

Refer to the section Brake.



(3) Clamp hub and disc assembly in vise using protective pads and remove six (6) disc to hub retaining bolts.



(4) Place hub on a suitable work surface and remove wheel studs, as required, using a hammer.

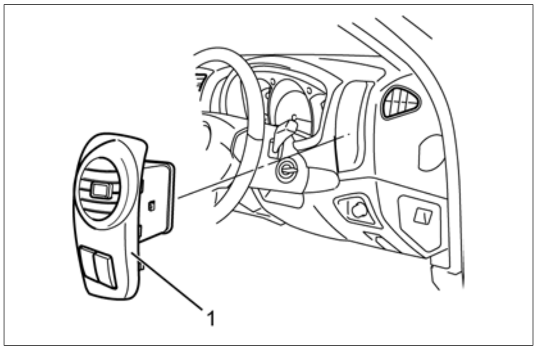
ANTI THEFT INDICATOR

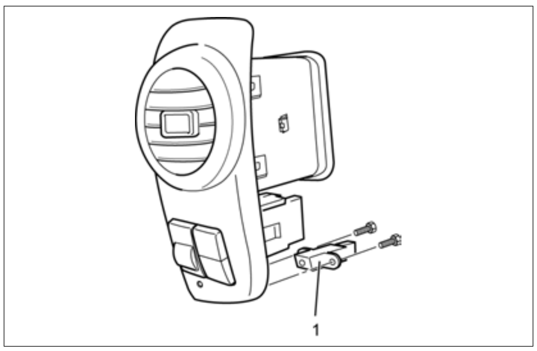
Removal

1. Disconnect the battery ground cable.
2. Remove the side ventilation grille (1).



RTW78ASH001801

3. Disconnect the indicator connector and screw from the backside of the side ventilation grille to remove the anti theft indicator (1).



RTW78ASH001701

Installation

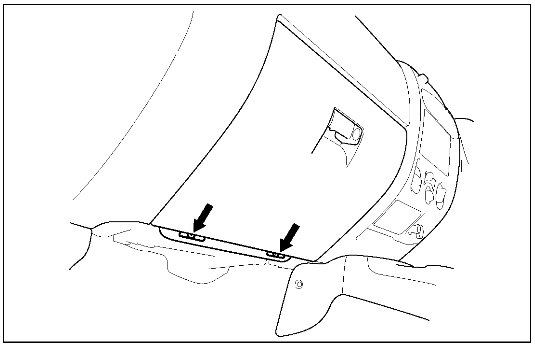
To install, follow the removal steps in the reverse order, noting the following point.

1. Push in the switch with your fingers until it locks securely.

KEYLESS ENTRY CONTROL UNIT

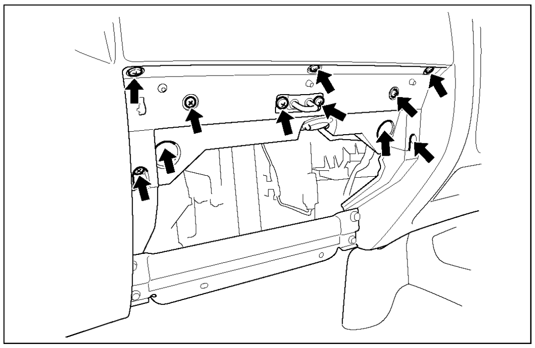
Removal

1. Remove the glove box.
2. Disconnect the glove box lamp connector.



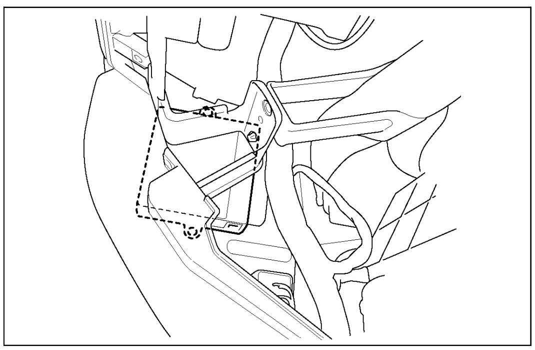
RTW580SH001601

3. Remove the glove box cover.



RTW580SH001701

4. Remove the bolt of antitheft and keyless entry control unit.
5. Disconnect the antitheft and keyless entry control unit connector.
6. Remove the antitheft and keyless entry control unit.



RTW580SH001801

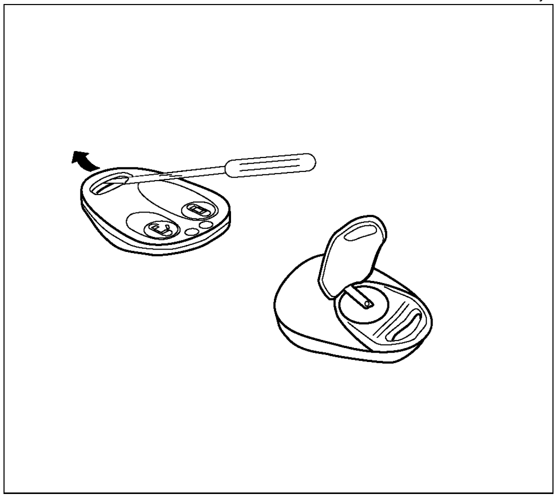
Installation

Follow the removal procedure in the reverse order to install the antitheft and keyless entry control unit.

Connector

Be absolutely sure that the antitheft and keyless entry control unit harness connector is correctly installed.
This will prevent a poor contact and an open circuit.

Remote key



604RW055

Remove Key Assembly

Replacing the battery in the remote control unit

Replace the battery as soon as the range of the remote control starts to become reduced.

Open the underside of the remote control unit by removing the battery cover with a screwdriver as shown in the illustration.

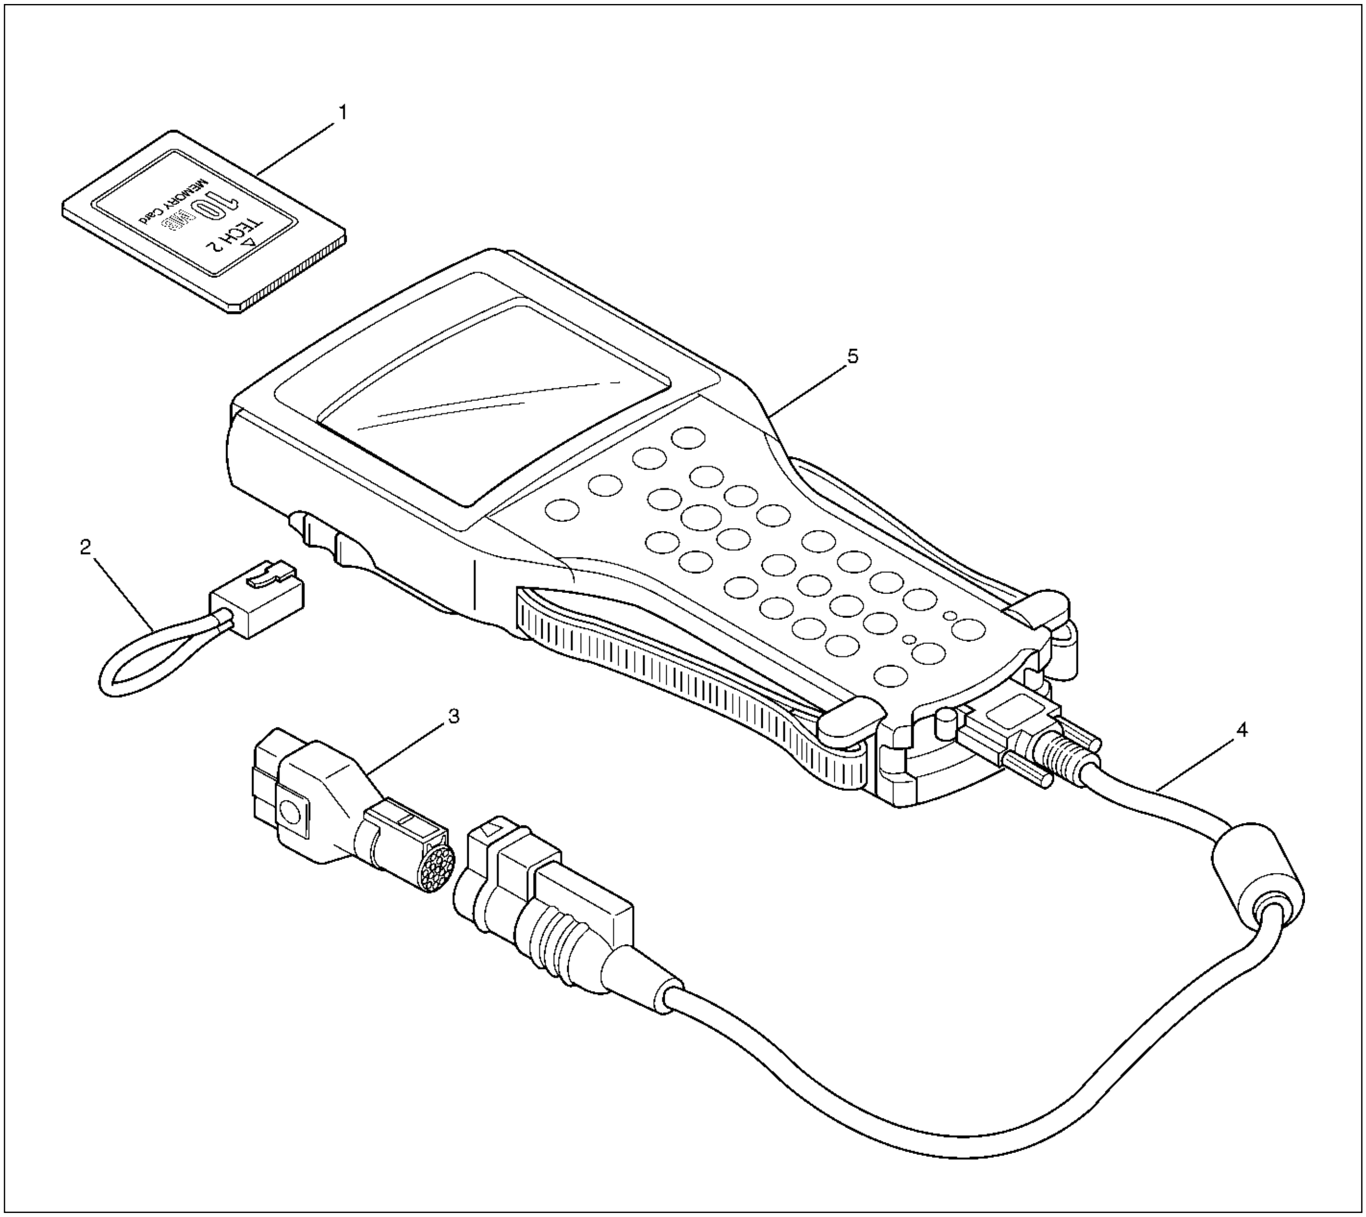
Replace the battery, ensuring that it is inserted correctly.

Replace the battery cover so that it engages audibly. The battery change must be performed within 3 minutes, otherwise the remote control will have to be reprogrammed. Make sure that you dispose of old batteries in accordance with environmental protection regulations.

TECH-2 OPERATION AND PROGRAMING KEYLESS ENTRY

General Description

When the anti-theft and keyless entry control unit and/or the transmitters (remote keys) are replaced, the security codes and/or transmitter ID codes must be programmed by using he Tech-2. The following pages show the procedures to program in regard to the anti-theft and keyless entry system. Please refer to Tech-2 scan tool user’s guide in detail.



901RW180

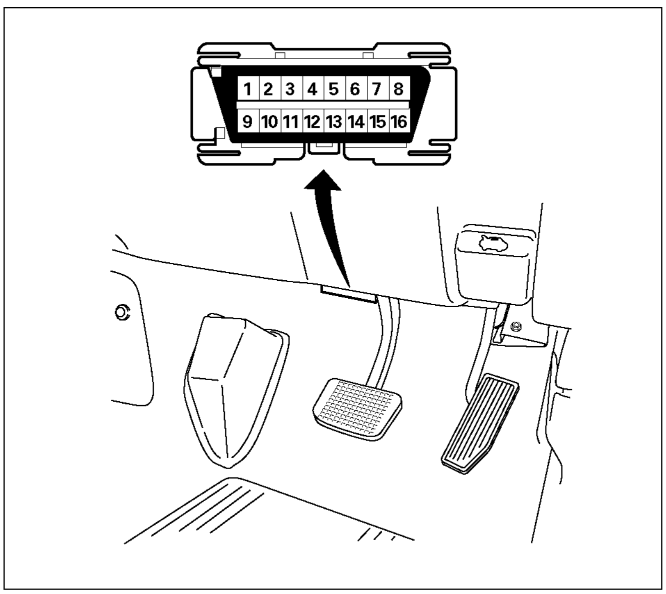
Legend

(1) PCMCIA Card
(2) RS 232 Loop Back Connector
(3) SAE 16/19 Adaptor
(4) DLC Cable
(5) Tech–2

060RW009

Tech-2 Features

1. Tech-2 is a 12volt system. Do not apply 24 volts.
2. After connecting and/or installing the vehicle communication interface (VCI) module, PCMCIA card and data link connector (DLC) to the Tech-2, connect the tool to the vehicle DLC.
3. Make sure the Tech-2 is OFF when removing or installing the PCMCIA card.
4. The Tech-2 has the capability of two snapshot.
5. The PCMCIA card is sensitive to magnetism and static electricity, so care should be taken in the handling of the card.
6. The Tech-2 can not plot a graph when replaying a snapshot.
7. Always return to the Main Menu by pressing the EXIT key several times before shutting down.
8. To clear diagnostic trouble codes (DTCs), open Application Menu and press "Clear DTC ".



060R300015

Getting Started

Before operating the Isuzu PCMCIA card with the Tech-2, the following steps must be performed:

1. The Isuzu System PCMCIA card inserts into the Tech-2.
2. Connect the SAE 16/19 adapter to the DLC cable.
3. Connect the DLC cable to the Tech-2.
4. Mark sure the vehicle ignition is off.
5. Connect the Tech-2 SAE 16/19 adapter to the vehicle DLC.

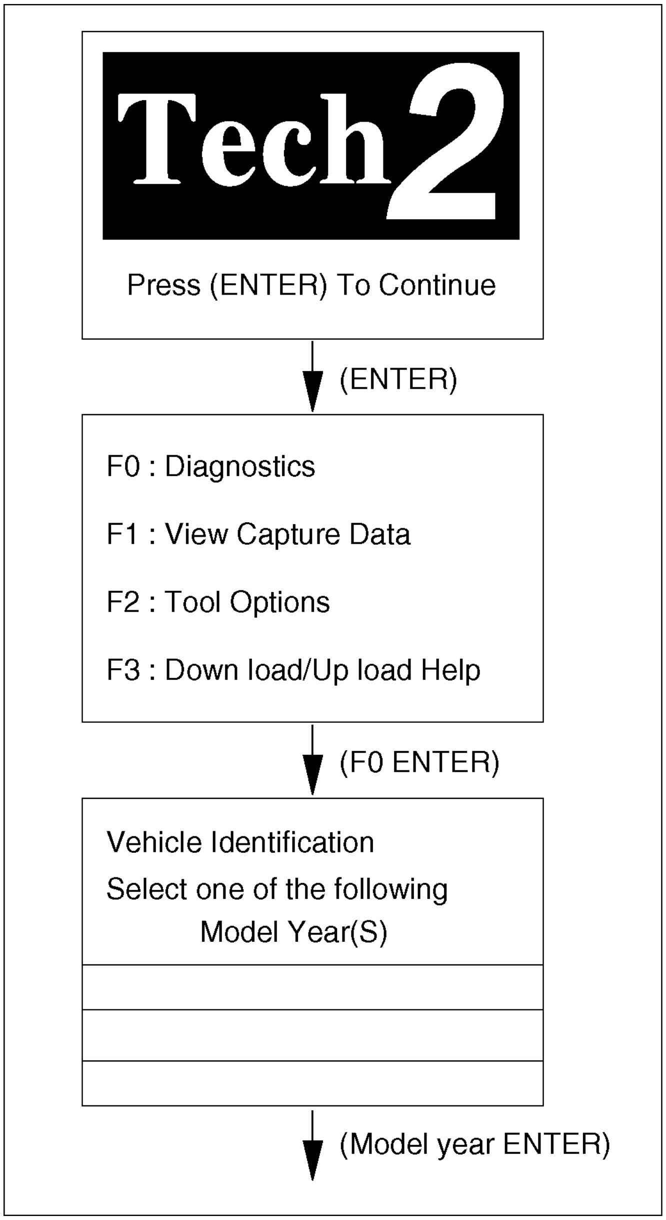
Inspection and Repair

Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.
For inspection and servicing of disc caliper, and relative parts, and ABS parts, refer to Section Brakes.

Visual Check

Check the following parts for wear, damage or other abnormal conditions.

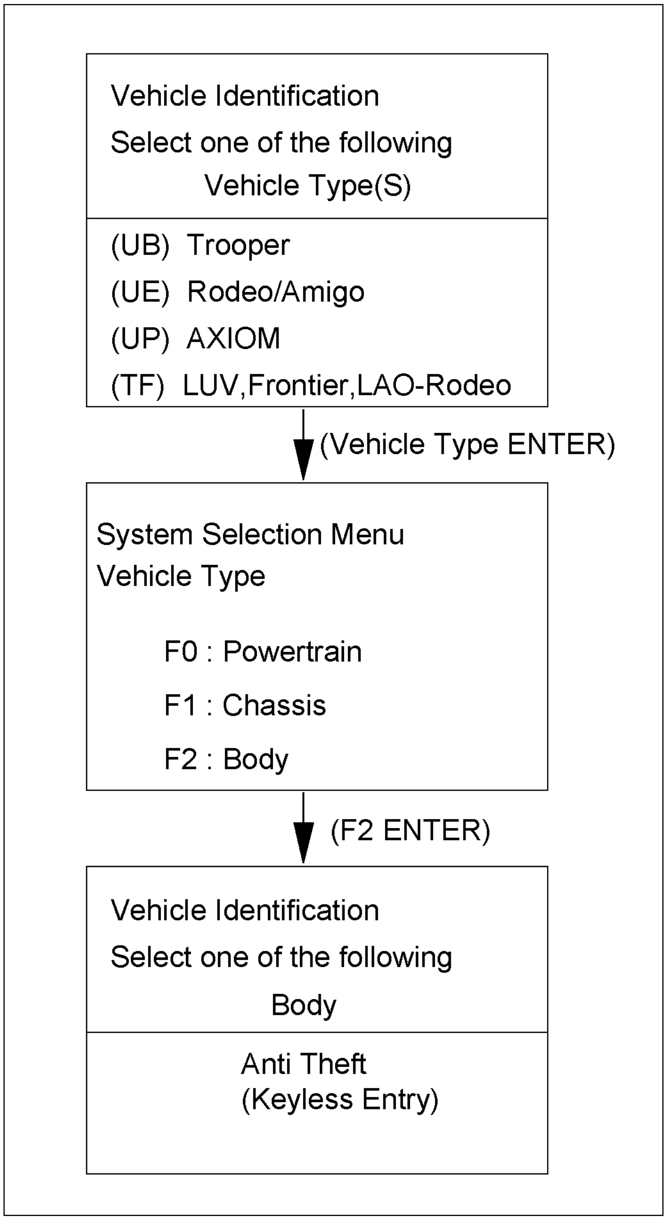
- Hub
- Hub bearing, oil seal
- Knuckle spindle
- Disc
- Caliper
- ABS sensor rotor
- Cap, Hub flange (4×4 model only), Shim (4×4 model only), Snap ring (4×4 model only)



060R100102

Operating Procedure

The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card. Follow the operating procedure.



RTW38DLH000201

Menu

The left table shows witch functions are used for the available equipment versions.
NOTE: Marked items are not applied for keyless entry system.

F0: Diagnostic Trouble Code

- F1: Program Remote Key
- F2: Program Anti Theft Warning
- F3: Program Country Code
- F4: Program Vehicle Option

RTW38DLH000101

DTC

On OBD has three options available in the Tech-2 DTC mode to display the enhanced information available.

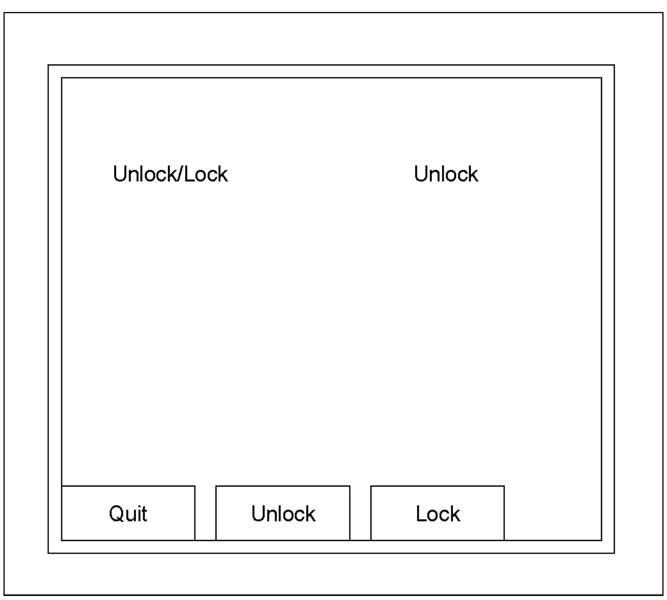
- Read DTC Info Ordered By Priority.
- Read DTC Info As Stored By ECU.
- Clear DTC and Alarm Code Info.

Clear DTC Information

To clear Diagnostic Trouble Codes (DTCs), Use the diagnostic scan tool “Clear DTC Information” function.

Tech-2 Data Display

The Tech-2 data values represent values that would be seen on a normally-keyless entry system.



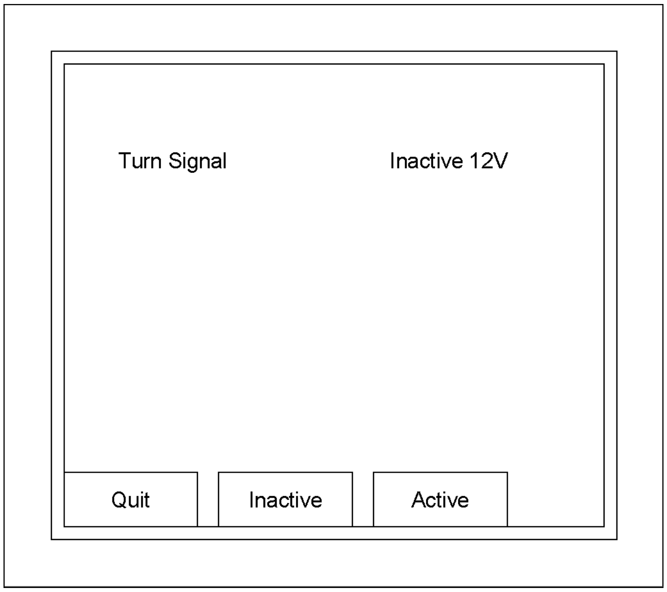
RTW38DSH001601

Actuator Test

Unlock/Lock Test

Check whether opening and closing of a door lock can be performed by operation of Tech-2.

1. Turn the key “OFF”.
2. Turn the key “ON”.
3. Check the display and test menu.
4. Operate the Tech-2.

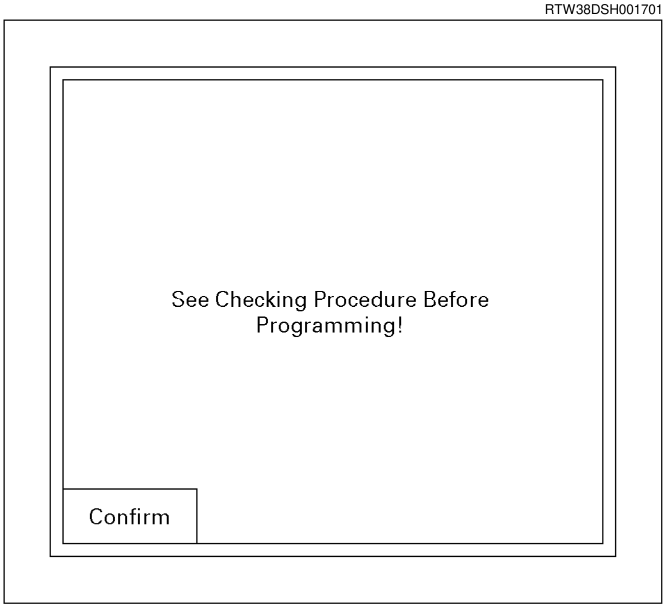


RTW38DSH001701

Turn Signal Test

Check the turn signal lamp lights up by operation of Tech-2.

1. Turn the key “OFF”.
2. Turn the key “ON”.
3. Check the display and test menu.
4. Operate the Tech-2.



060R200289

Programming

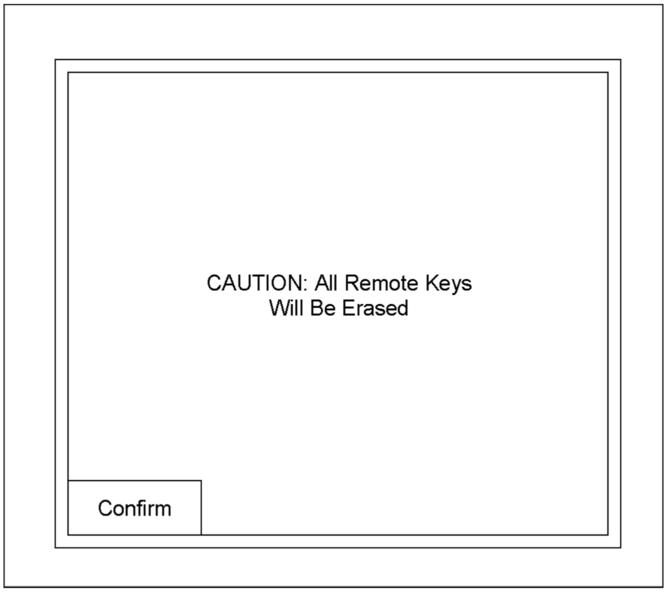
Erase Remove Key

To erase remove control key code in the control unit.

1. Check the display of Tech-2 and press “Confirm” key.

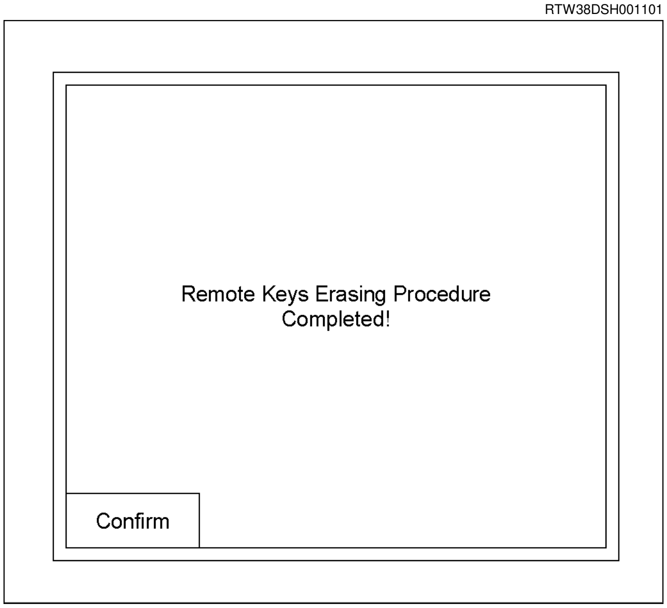
RTW38DSH001001

2. Enter security code.
3. Press “Not Okay” or “Okay” key.



RTW38DSH001101

4. Check the display of Tech-2 and press “Confirm” key.



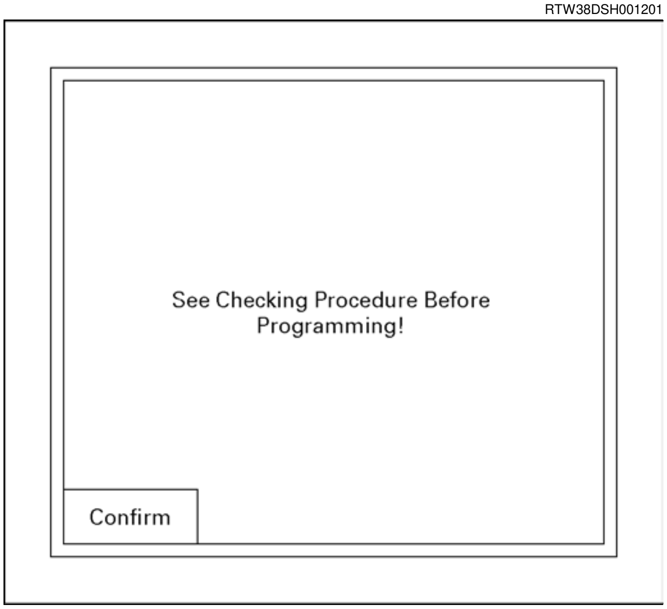
RTW38DSH001201

5. Check the display of Tech-2 and press “Confirm” key.

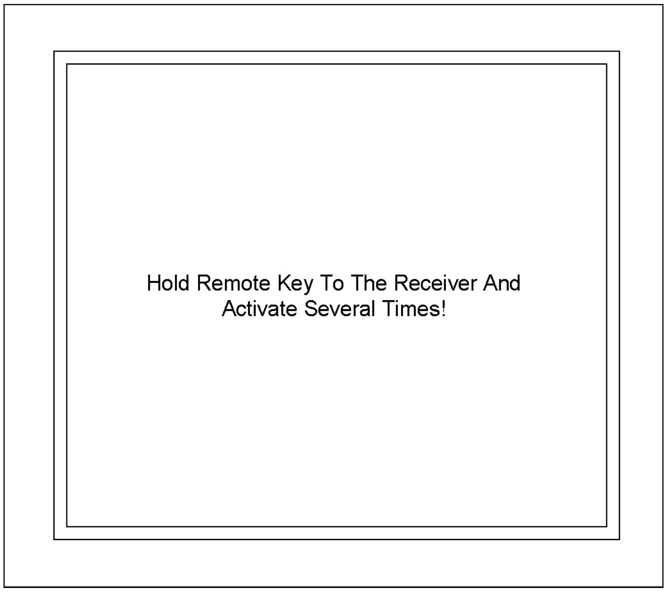
Program Remote Key

To program remote control key code in the control unit.

1. Check the display of Tech-2 and press “Confirm” key.

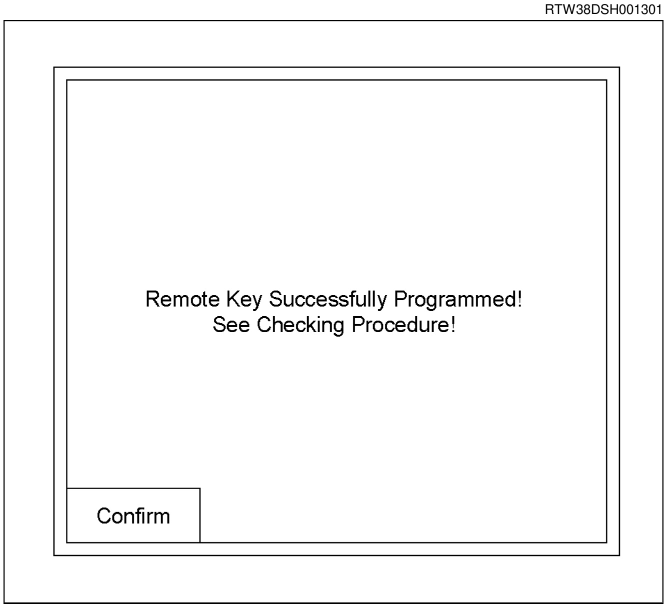


060R200289



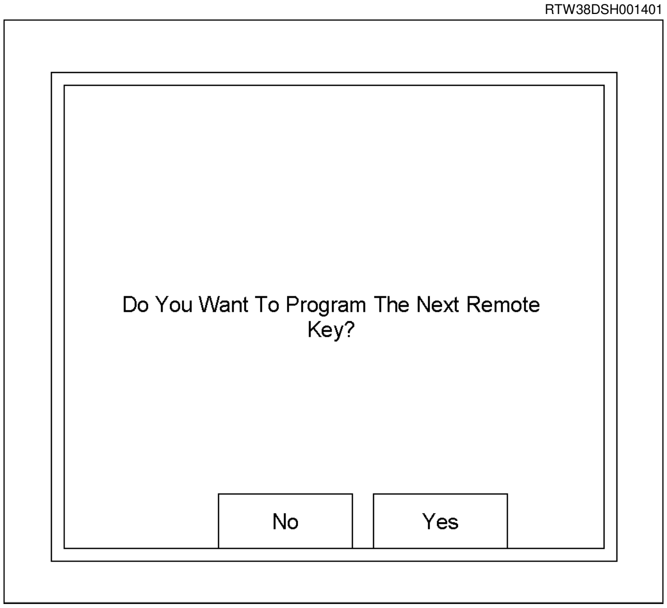
RTW38DSH001301

2. Check the following table in the display of Tech-2.
3. Operate the remote key.



RTW38DSH001401

4. Check the display of Tech-2 and press “Confirm” key.



RTW38DSH001501

5. Check the display of Tech-2 and press “No” or “Yes” key.

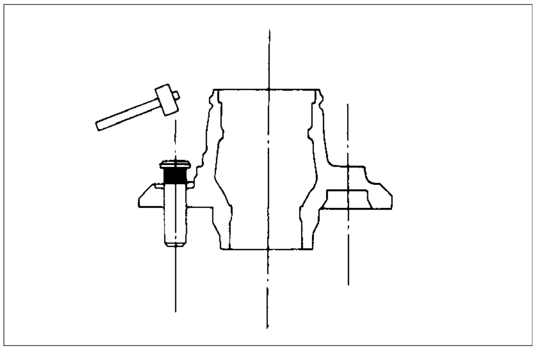
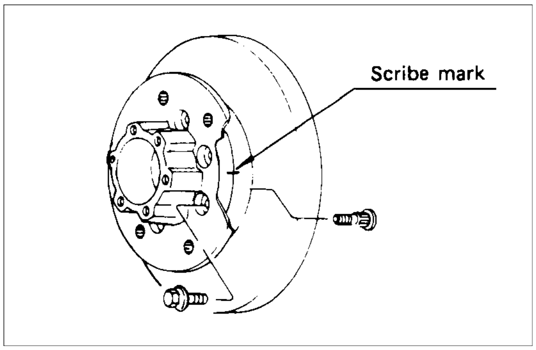
Important Operations



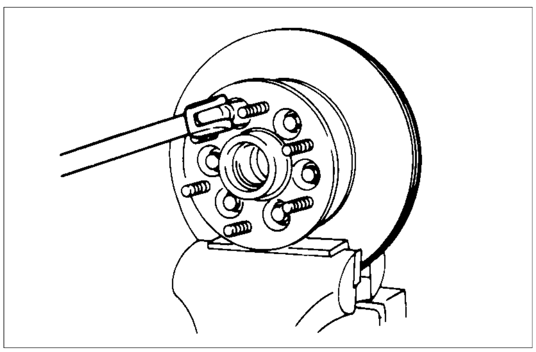
1. Wheel Pin

(1) Place hub on a wood workbench or a block of wood, approx. 6” by 6” to protect the wheel stud ends and threads.

(2) Install wheel stud using a hammer.
Be sure wheel stud is started squarely and seats completely.



(3) Align index marks and install hub to disc.



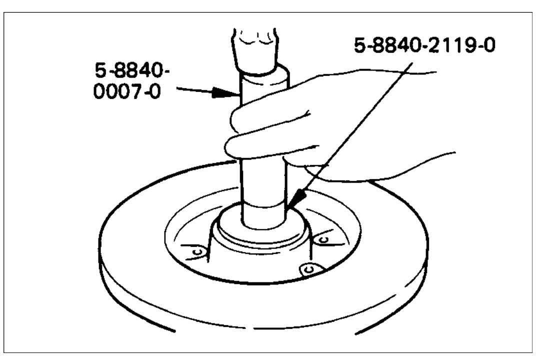
2. Bolt

Torque	N·m (kgf·m/lb·ft)
103 (10.5/76)	

3. ABS sensor rotor

(1) Set a new ABS sensor rotor, if replacement is required.

(2) Install the ABS sensor rotor in the hub, using special tools.
Installer : 5-8840-2789-0
Grip : 5-8840-0007-0
Refer to the section Brake.



4. Inner Bearing

Outer race ; outer bearing

Install the outer race by driving it into the hub.

Installer : 5-8840-2119-0

Grip : 5-8840-0007-0

Preload Adjustment

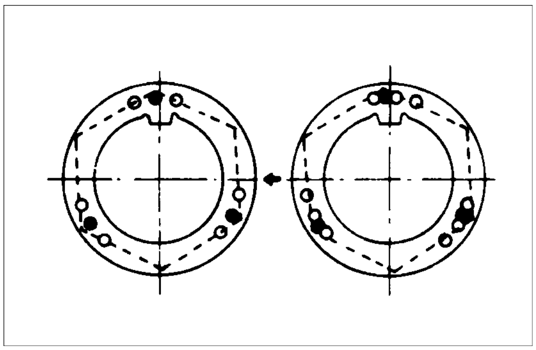
Tighten the hub nut at 29.4 N·m (3 kgf·m / 21.7 lb·ft), then loosen the nut to the full.

Tighten the hub nut at the value given below, using a spring scale on the wheel pin.

Bearing Preload N (kgf/lb)

New bearing and New oil seal	22 - 27 (2.2 - 2.8 / 4.9 - 6.2)
Used bearing and New oil seal	14 - 20 (1.4 - 2.0 / 3.1 - 4.5)

If the measured bearing preload is outside the specifications, adjust it by loosening or tightening the bearing nut.



9. Lock Washer

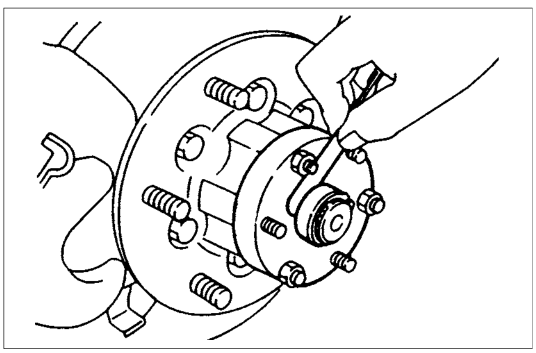
Turn the side with larger diameter of the tapered bore to the vehicle outer side, and attach the washer.

If the bolt holes in the lock plate are not aligned with the corresponding holes in the nut, reverse the lock plate.

If the bolt holes are still out of alignment, turn in the nut just enough to obtain alignment,. Screw is to be fastened tightly so its head may come lower than the surface of the washer.

10.Flange (4×4 model only)

Apply adhesive (LOCTITE 515 or equivalent) to both joining flange faces then install hub flange.



11.Snap ring, shims (4×4 model only)

Adjust the clearance between the flange and the snap ring.

Clearance	mm(in)
0 - 0.2 (0 - 0.008)	

Adjust shims available	mm(in)
0.2, 0.3, 0.5, 1.0 (0.008, 0.012, 0.020, 0.039)

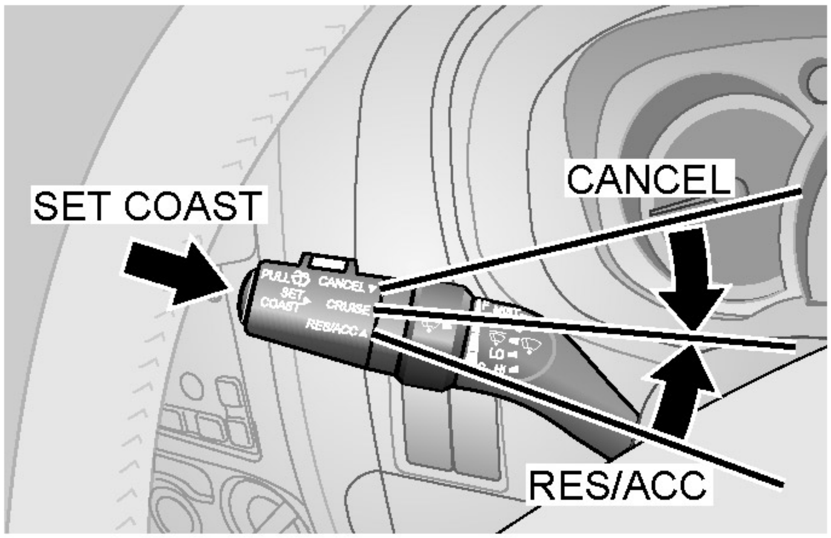
SECTION 8B

CRUISE CONTROL SYSTEM

TABLE OF CONTENTS

General Description

The cruise control keeps the vehicle running at a fixed speed until a signal canceling this fixed speed is received. When the main switch “AUTO CRUISE” is turned on with the vehicle in the running mode, the battery voltage is applied to the control unit (Engine control module). When a signal from the control unit while the vehicle is in this state, the cruise control actuator is activated to operate the system. Also, while the system is operating, the cruise control set indicator light in the meter assembly lights up.



RTU7Z0SH019601

1. SET/COAST Switch Function

1. **Set Function:** When the SET/COAST switch is pressed and released with the main switch on, the speed at which the vehicle is running at that moment is stored in the memory, and the vehicle automatically runs at the stored speed.
2. **COAST-down Function:** When the SET/COAST switch is kept on while the vehicle in running, the vehicle decelerates during that time. The speed at which vehicle is running when the control switch is pressed in the memory, and the vehicle automatically returns to the stored speed.
3. **Tap-down Function:** When the SET/COAST switch is pressed and released instantaneously while the vehicle is running, the vehicle decelerates a mile for each on/off operation. The vehicle speed at which the vehicle was running when the SET/COAST was released last is stored in the memory, and the vehicle automatically returns to this stored speed.

2. RESUME/ACCEL Switch Function

1. **Resume Function:** When the RESUME/ACCEL switch is turned on/off after the system is temporarily deactivated by pressing the brake or clutch pedal while the vehicle is running, the vehicle resumes the speed stored before the system was released, and the vehicle automatically runs at the stored speed.
2. **Accelerate Function:** When the RESUME/ACCEL switch is kept on the vehicle accelerates its speed during that time. The vehicle speed at which the vehicle was running when the switch was turned off is stored in the memory, and the vehicle automatically returns to this speed.
3. **Tap-up Function:** When the RESUME/ACCEL switch is turned on and off instantaneously while the vehicle is running, the vehicle decelerates a mile for each on/off operation. The vehicle speed at which the vehicle was running when the switch was turned off last is stored in the memory, and the vehicle automatically returns to this stored speed.

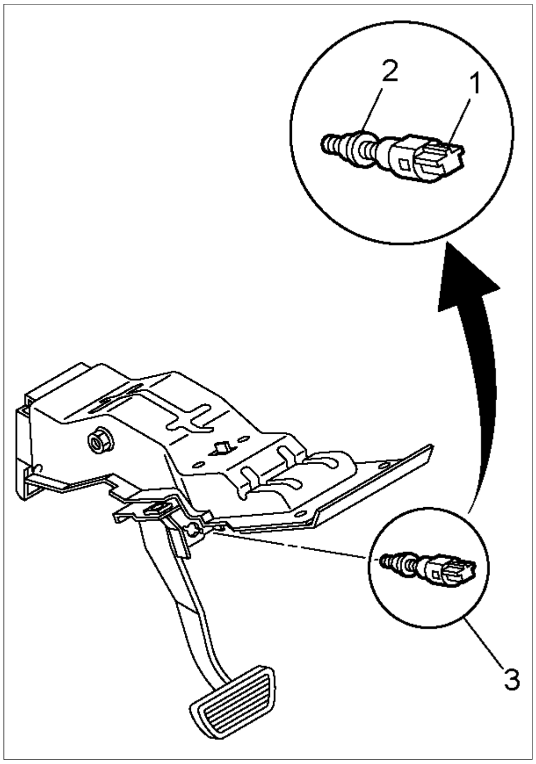
3. CANCEL Function

1. Temporary Cancellation:
   - Brake pedal is pressed.
   - Clutch pedal is pressed. (M/T)
   - Select lever is shifted to any position other than “D”, “3”, “2” or “L”. (A/T)
   - Cancel switch is operated.
   - Vehicle speed exceeds about 20 km/h over the vehicle speed stored in the memory.

Turning the RESUME/ACCEL switch will return the vehicle to the speed stored in the cruise control memory.

2. Complete Cancellation:
   - Starter switch or the main switch is turned off.
   - Fail-safe function is activated.
   - Vehicle speed is about 38 km/h.
   - Speed becomes 20 km/h or less form the speed memorized by control unit.

Brake Switch



RTW3A0MH000101

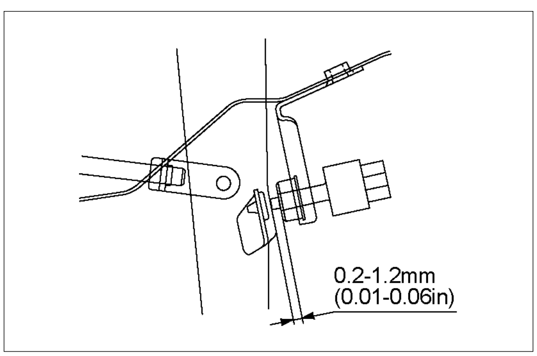
Removal

1. Disconnect the battery ground cable.
2. Remove the brake switch.
   - Disconnect the connector ①.
   - Loosen lock nuts of the switch ②.
   - Remove the switch by turning it ③.

Installation

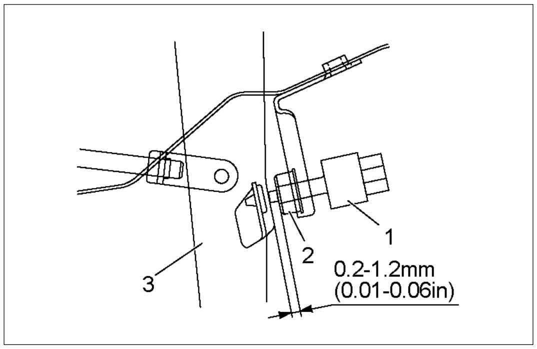
To install, follow the removal procedure in reverse order, noting the following points.

1. Check to see if the brake pedal has been returned by the return spring to the specified position.
2. Turn the switch clock-wise until the tip of the threaded portion of the brake switch contacts the pedal arm.
3. Turn the switch counter-clock-wise until the space between the tip of the threaded portion and the pedal arm is 0.2 to 1.2 mm (0.01-0.06 in) as shown in the figure.



RTW780SH003201

Adjustment



RTW780SH003301

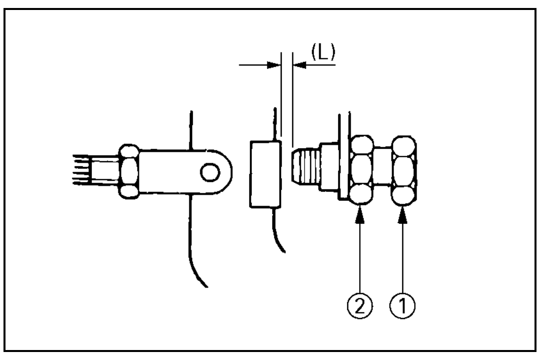
1. Check to be sure that the brake pedal has been completely returned by the return spring.
2. Disconnect the switch connector.
3. Release the lock ② by turning the switch ① counter-clockwise.
4. After doing so, pull the pedal arm ③ to you a little so that the pedal arm is not pushed in.
5. Making the pedal arm not movable with one hand, push in the whole switch with the other hand until the plunger of the switch is pushed in and the switch itself hits the rubber of the pedal arm.
   In the condition, turn the switch clock-wise until "click" sound is made and lock it.
   By doing this, the switch is adjusted at 0.2 to 1.2mm (0.01-0.06 in) clearance.

Clutch Switch

Removal and Installation

Refer to the Clutch Control removal and installation procedure in Clutch section.

Adjustment



1. Turn the clutch switch or stopper bolt ① until the switch bolt or stopper bolt just touches the clutch pedal arm.
2. Adjust clutch switch or stopper bolt by backing it out half a turn, and measure the clearance (L) between the clutch pedal arm and the clutch switch bolt end or stopper bolt.
3. Lock the lock nut ②.
4. Connect the clutch switch connector.

Clutch switch and clutch pedal clearance

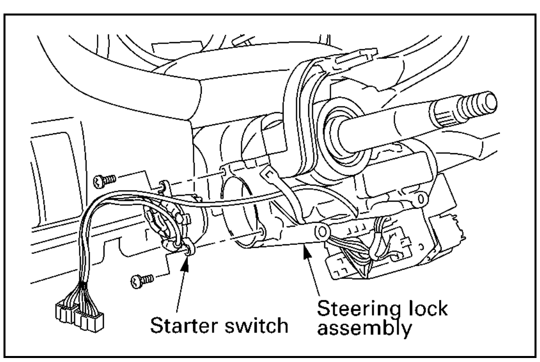
mm (in)

Clearance	0.5-1.5 (0.020-0.059)

Starter Switch

Removal and Installation

Refer to the Starter Switch removal and installation procedure of Start and Charging in Body and Chassis section.

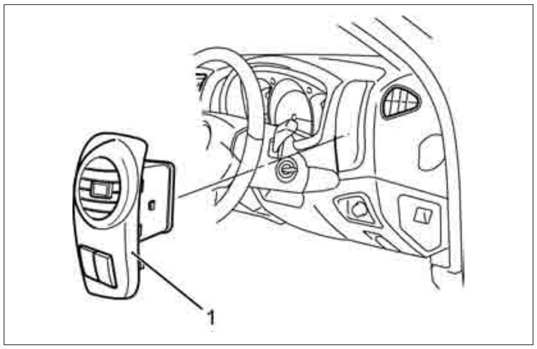


431R300001

Cruise Control Main Switch

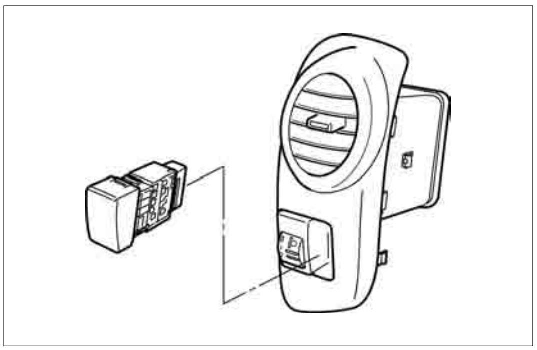
Removal

1. Disconnect the battery ground cable.
2. Remove the side ventilation grille ①.



RTW78ASH001801

3. Disconnect the switch connector and push the lock from the backside of the side ventilation grille to remove the cruise control main switch.



RTW78ASH002301

Installation

To install, follow the removal procedure in reverse order, noting the following point.

1. Push in the switch with your fingers until it locks securely.

Cruise Control Switch (Combination Switch)

Removal and Installation

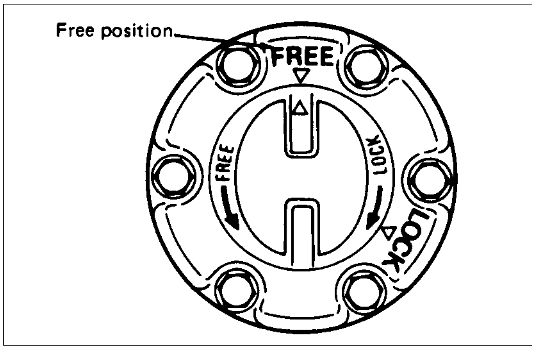
Refer to the Lighting Switch (Combination Switch) removal and installation procedure of Lighting in Body and Chassis section.

SECTION 8C

Cruise Control – HFV6

ATTENTION

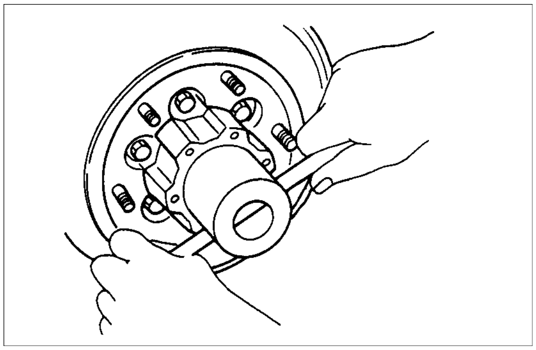
Before performing any Service Operation or other procedure described in this Section, refer to General Information Warnings, Cautions and Notes for correct workshop practices with regard to safety and/or property damage.



Important Operations

1. Bolt

Before removal, shift transfer lever into "2H" position and set free wheeling hub knob into "FREE" position.



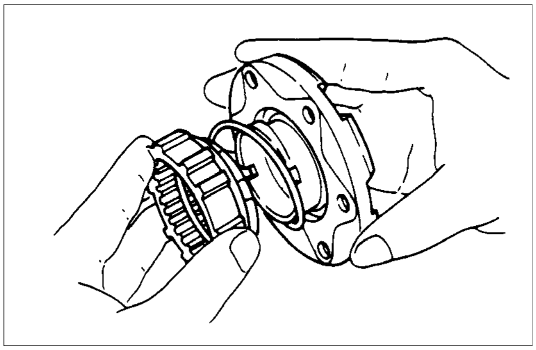
6. Hub nut

Wrench : 5-8840-2117-0

7. Hub and disc assembly

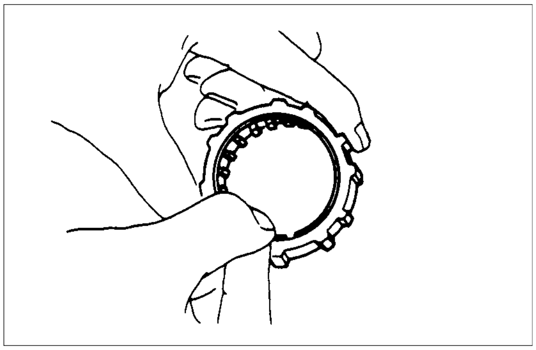
Before disassembly, remove the disc brake caliper assembly and hang it on the frame with wires.

Refer to Section "Brake" for disc brake caliper removal procedure.



14.Clutch Assembly

While pushing follower knob, turn clutch assembly clockwise and then remove clutch assembly from knob.



19.Retaining Spring

Remove retaining spring from clutch assembly by turning it counterclockwise.

1 General Information

A new cruise control system has been introduced due to changes in the powertrain architecture and components. There is no longer a cruise control module; instead the management has been taken over by the engine control module (ECM).

To the user, the system operates as previously, with all controls from the cruise control switch assembly and the cruise control messages presented by the instrument cluster. For vehicles fitted with the HFV6 engine refer to 1.3 System Operation .

CAUTION

The cruise control system now has an additional fail-safe feature. The brake pedal must be pressed in the ignition cycle for the cruise control to be engaged. The cruise control will not engage until this is done.

1.1 WARNINGS, CAUTIONS and NOTES

This Section contains various WARNINGS, CAUTIONS and NOTE statements that you must observe carefully to reduce the risk of death or injury during service, repair procedures or vehicle operation. Incorrect service or repair procedures may damage the vehicle or cause operational faults. WARNINGS, CAUTION and NOTE statements are not exhaustive. GM HOLDEN LTD can not possibly warn of all the potentially hazardous consequences of failure to follow these instructions.

Definition of WARNING, CAUTION and NOTE Statements

Diagnosis and repair procedures in this Section contain both general and specific WARNING, CAUTION and NOTE statements. GM HOLDEN LTD is dedicated to the presentation of service information that helps the technician to diagnose and repair the systems necessary for proper operation of the vehicle. Certain procedures may present a hazard to the technician if they are not followed in the recommended manner. WARNING, CAUTION and NOTE statements are designed to help prevent these hazards from occurring, but not all hazards can be foreseen.

WARNING Defined

A WARNING statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in death or injury. A WARNING statement alerts you to take necessary action or not to take a prohibited action. If a WARNING statement is ignored, the following consequences may occur:

- Death or injury to the technician or other personnel working on the vehicle,
- Death or injury to other people in or near the workplace area, and / or
- Death or injury to the driver / or passenger(s) of the vehicle or other people, if the vehicle has been improperly repaired.

CAUTION Defined

A CAUTION statement immediately precedes an operating procedure or maintenance practice which, if not correctly followed, could result in damage to or destruction of equipment, or corruption of data. If a CAUTION statement is ignored, the following consequences may occur:

- Damage to the vehicle,
- Unnecessary vehicle repairs or component replacement,
- Faulty operation or performance of any system or component being repaired,
- Damage to any system or components which depend on the proper operation of the system or component being repaired,
- Faulty operation or performance of any systems or components which depend on the proper operation or performance of the system or component under repair,
- Damage to fasteners, basic tools or special tools and / or
- Leakage of coolant, lubricant or other vital fluids.

NOTE Defined

A NOTE statement immediately precedes or follows an operating procedure, maintenance practice or condition that requires highlighting. A NOTE statement also emphasises necessary characteristics of a diagnostic or repair procedure. A NOTE statement is designed to:

- Clarify a procedure,
- Present additional information for accomplishing a procedure,
- Give insight into the reasons for performing a procedure in the recommended manner, and / or
- Present information that gives the technician the benefit of past experience in accomplishing a procedure with greater ease.

1.2 System Components

The main components of the electronic cruise control system are:

- cruise control ON / OFF switch (in dash panel).
- cruise control switch assembly (incorporated into wiper and washer switch assembly),
- instrument cluster assembly (cruise set lamp),
- clutch pedal switch assembly (manual transmission vehicles only),
- stop lamp switch assembly,
- powertrain interface module (PIM),
- engine control module (ECM),
- throttle actuator control (TAC) assembly, and
- electrical wiring (incorporated into the main wiring harness).

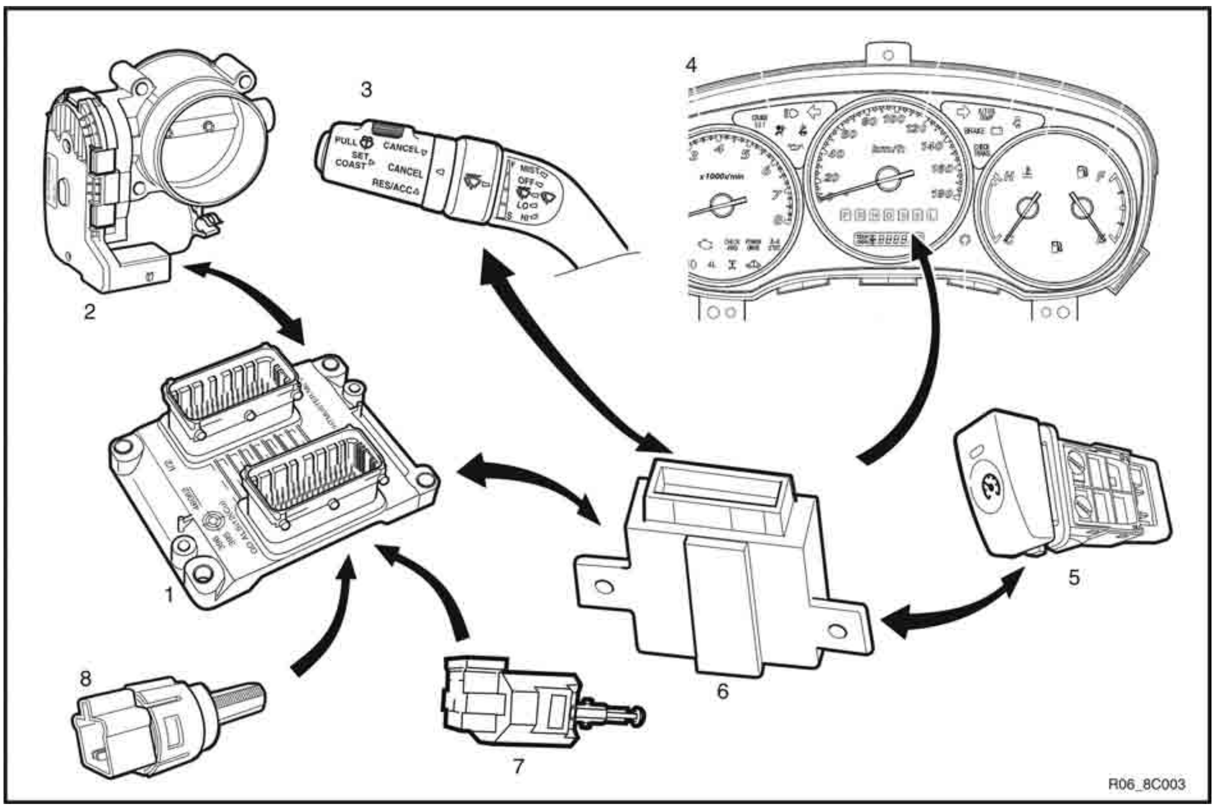


Figure 8C – 1

Legend

1	Engine Control Module	5	Cruise Control ON / OFF Switch
2	Throttle Actuator Control (TAC) Assembly	6	Powertrain Interface Module
3	Cruise Control Switch Assembly	7	Clutch Pedal Switch Assembly (Manual Only)
4	Instrument Cluster Assembly	8	Stop Lamp Switch Assembly

Cruise Control Switch Assembly

The cruise control switch assembly is located on the end of the wiper and washer switch assembly.

- For harness routing from the cruise control switch assembly to the powertrain interface module, refer to 8A Electrical – Body and Chassis.
- For wiring and to see how the switch integrates into the system, refer to 2.3 Wiring Diagrams.

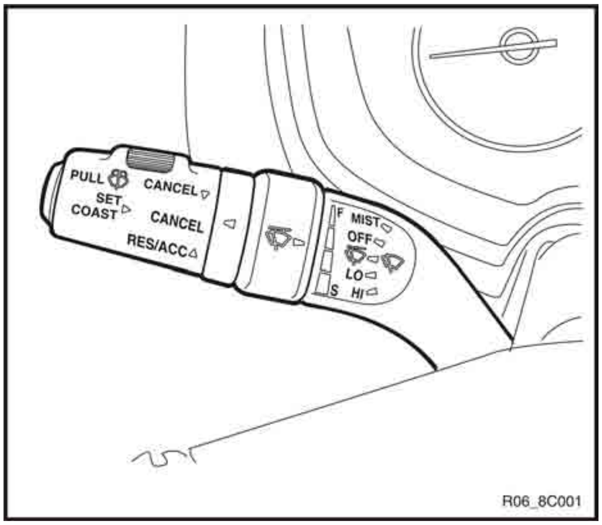

Figure 8C – 2

Instrument Cluster Assembly

The instrument cluster assembly displays the status of the cruise control system as well as other information via the warning indicators.

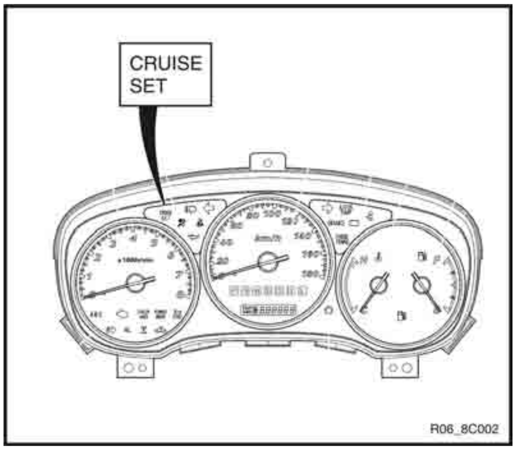

Figure 8C – 3

Clutch Pedal Switch (Manual Only)

This switch assembly is attached to the clutch pedal support bracket. The switch is normally closed when the clutch pedal is at rest, opening when the pedal is pressed. Activation of this switch removes the signal to the ECM, which will then deactivate the cruise control.

Stop Lamp Switch Assembly

The stop lamp switch assembly is located on the brake pedal support bracket. This switch has two sets of contacts with two independent functions. The function of the switch assembly in the cruise control system is to deactivate the cruise control when the brake pedal is pressed as well as an initial safety check of the switch operation prior to activating cruise control.

The stop lamp switch contacts are normally open with the brake pedal at rest and close when the brake pedal is pressed turning on the vehicles brake lamps. These switch contacts also double as the cruise cancel signal for the cruise control operation.

The cruise control initial brake apply signal function switch contacts are normally closed with the brake pedal at rest and open when the brake pedal is pressed. This switch function is a safety requirement of the vehicle as it ensures that the cruise control cannot be activated without the brake pedal first being pressed.

Powertrain Interface Module

The Powertrain Interface Module (PIM) is located on the driver's side, kick trim panel. The purpose of the PIM is to act as an interface between the drivetrain serial data bus (GMLAN protocol) and the body side data bus (UART Bus protocol). All inputs from the cruise control switch assembly are directly wired to the PIM. The PIM then takes these inputs, converts them to GMLAN protocol and sends the messages via the data bus to the engine control module (ECM). The PIM also receives signals for the cruise control system from the ECM. When the ECM activates cruise control, it sends a signal through the PIM (which converts it from GMLAN to UART protocol) to display the various cruise control messages on the instrument cluster assembly.

For further information on the operation of the PIM, refer to 6E1 Powertrain Interface Module – V6.

Engine Control Module

The Engine Control Module (ECM) is mounted on the front of the engine. The role of the ECM is to receive all the inputs from various sensors (vehicle speed (VSS) etc.) and switches to manage the engine. When a request is sent from the cruise control switch assembly via the PIM to the ECM, the ECM will activate cruise control providing given parameters are satisfied. Once the cruise is set, the ECM monitors the vehicle speed and controls the throttle actuator assembly thus controlling the speed of the vehicle.

For further information on the operation of the ECM, refer to 6C1-1 Engine Management – V6 – General Information.

Throttle Actuator Control (TAC) Assembly

The throttle actuator control assembly is located on the front of the inlet manifold. The throttle actuator control assembly receives signals from the ECM and controls the angle of the throttle plate. Refer to 6C1-1 Engine Management – V6 – General Information for further information.

1.3 System Operation

Preliminary Information

Enabled and Disabled

The cruise control is enabled / disabled by pressing the cruise control ON–OFF switch mounted on the lower right hand side of the dash panel. When cruise control is enabled, the cruise control ON–OFF switch illuminates and the cruise control is ready for a speed to be set (cruise control activated). When the cruise control is disabled, the cruise control cannot be activated.

Cruise Enabled

1. The cruise control ON–OFF switch (1) supplies 12 Volts to the Powertrain Interface Module (PIM) when it is pressed.
2. The cruise control ON–OFF switch lamp (2) turns on.

Cruise Disabled

1. When cruise control ON–OFF switch (1) is pressed again, power is removed from the PIM disabling the cruise control.
2. The cruise control ON–OFF switch lamp (2) turns off.

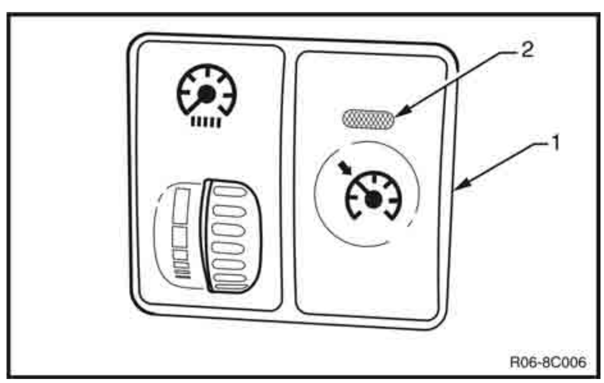

Figure 8C – 4

Activated and Deactivated

When the cruise control is enabled, the vehicle speed must be above 40 km/h and the cruise control switch assembly pressed to SET–COAST, the cruise control will be activated and the vehicle will maintain the set speed. When deactivated by the methods described within this section, the vehicle will no longer maintain the set speed, but the cruise control will still be engaged.

Cruise Active

When the cruise control is activated via the cruise control switch assembly, the cruise set warning lamp will illuminate the instrument cluster assembly.

Cruise Deactivated

Upon receiving a signal to deactivate the cruise control the ECM will provide a signal to the instrument cluster, via the PIM, to inform the user the cruise control is deactivated.

When the cruise control is deactivated via the cruise control switch assembly, the brake pedal, or the clutch pedal, the cruise set warning lamp will turn OFF within the instrument cluster assembly.

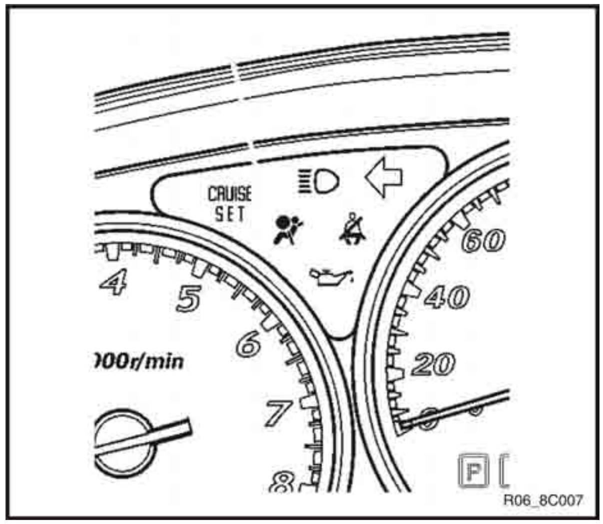

Figure 8C – 5

Enabling the Cruise Control

Refer to 2.3 Wiring Diagrams for the following description.

When the cruise control ON-OFF button is pressed, 12 V is applied to the powertrain interface module (PIM) connector B – 97 pin 14. This informs the PIM the user has requested the cruise control function be engaged or disengaged. This signal is then output by the PIM as GM LAN protocol along the bus to the engine control module (ECM). The ECM recognises the command from the PIM to engage the cruise control. The PIM then provides a ground signal to B – 97 pin 13 the cruise control ON-OFF switch indicator lamp, to inform the user the cruise control is engaged.

Brake Before Cruise

Before the cruise control can be activated the driver must have applied the brakes and the system received a valid response at least once per ignition cycle. If the driver manages to drive the vehicle without having used the brakes before pressing the cruise control ON–OFF button, the cruise control cannot be activated.

Activating the Cruise Control

The user activates the cruise control at a desired speed above 40 km/h by pressing the cruise control switch assembly SET–COAST button. This provides a 12 V signal to the PIM through connector B – 97 pin 15. The PIM then outputs this signal as GM LAN protocol through the data bus to the ECM. If the ECM already has cruise control engaged, upon receipt of the message from the PIM, the ECM will activate cruise control and set the speed. The ECM receives all the various inputs required to maintain the correct speed and then controls the throttle actuator control assembly depending on the load on the engine (ascending or descending hills, etc).

Deactivating the Cruise Control

When the cruise control is activated, it can be deactivated by any of the following:

Pressing the Brake Pedal

When the brake pedal is pressed, two signals are sent directly to the ECM by the circuits from the brake pedal switch assembly. The cruise cancel circuit will open (normally closed) thus dropping the supply voltage from the ECM connector C – 56 pin 46. Simultaneously, the stop lamp circuit will close (normally open) and supply 12 V to the ECM at connector C – 56 pin 10. This is a double redundancy system so that if either switch or circuit from the brake pedal switch assembly fails, the cruise control will still be deactivated.

Pressing the Cruise ON–OFF Button

Pressing the cruise control switch assembly ON–OFF button will send a signal via the PIM to the ECM to deactivate the cruise control.

Rotating the Cruise Control Switch Assembly

Rotating the cruise control switch assembly to the CANCEL position will send a signal via the PIM to the ECM to deactivate the cruise control.

Pressing the Clutch Pedal (Manual Vehicles Only)

When the clutch pedal is pressed, the cruise control cancel circuit will open (normally closed) thus removing the supply voltage from the ECM connector C – 56 pin 53. The ECM then deactivates the cruise control.

Decelerating While Cruise Control is Activated

When the cruise control is activated, the speed can be reduced by pressing and holding the cruise control switch assembly to SET–COAST. When this is done, 12 V is applied to PIM connector B – 97 pin 15. The PIM will then translate the command to GM LAN protocol and sends the request to the ECM to reduce the speed. The ECM will then temporarily disable the cruise control and close the throttle plate. The vehicle should then start to decelerate. Once the operator releases the cruise control switch assembly, the ECM will receive this signal through the PIM and will then set the speed according to the current VSS and maintain that speed.

Resuming a Speed After Cruise Control Has Been Deactivated

If the cruise control system is engaged but deactivated, the last speed at which it was activated can be resumed. Turning the cruise control switch assembly to RES–ACC will apply 12 V to the PIM at connector B – 97 pin 16. The PIM will then translate the command to GM LAN protocol and transmit the request to the ECM. The ECM will then recall the last stored speed at which the cruise control was activated and increase or reduce engine RPM to maintain that speed.

Accelerating While Cruise Control is Activated

Using the Cruise Control Switch Assembly

When the cruise control is active, rotating the cruise control switch assembly to RES–ACC will accelerate the vehicle. The cruise control switch assembly will supply a 12 V signal to the PIM connector B – 97 pin 16, which is continuous as long as the switch is held. While the PIM is receiving the 12 V signal, it will continuously transmit to the ECM to accelerate the vehicle. The ECM will open the throttle plate to accelerate the vehicle. When the desired speed is achieved and the cruise control switch assembly is released, the ECM will maintain the vehicle at that speed.

Pressing the Accelerator Pedal

When the cruise control is active, pressing the accelerator pedal will accelerate the vehicle.

Once pressure is removed from the accelerator pedal, the vehicle will return to the last stored speed at which the cruise control was activated and control the throttle plate to maintain that speed.

2 Diagnostics

2.1 Diagnostic General Information

Basic Knowledge Required

CAUTION

A lack of basic understanding regarding electronics, electrical wiring circuits and use of electrical circuit testing tools when performing the cruise control diagnostic procedures could result in incorrect diagnostic results or damage to components.

A general understanding of basic electronics, electrical wiring circuits and the correct use of the basic electrical circuit testing tools is required to perform the diagnostic procedures detailed in this Section. Refer to 8A Electrical – Body and Chassis Wiring Diagrams for information on electrical circuits.

In addition, a general understanding of the cruise control and its component operation is essential to prevent misdiagnosis and component damage.

Basic Diagnostic Tools Required

CAUTION

Use of incorrect electrical circuit diagnostic tools when performing the cruise control diagnostic procedures could result in incorrect diagnostic results or damage to components.

The following electrical circuit testing tools are required to perform the diagnostic procedures detailed in this Section:

- test lamp,
- digital multimeter with 10 meg ohms impedance, and
- connector test adapter kit Tool No. KM609.

For further information on the use of these tools, refer to 8A Electrical – Body and Chassis Wiring Diagrams.

Tech 2 Data List

The Tech 2 displays the status of certain cruise control system input parameters.

To view the data list:

1 Connect Tech 2 to the data link connector (DLC) and turn on the ignition.

2 On Tech 2 select **Body** / **Powertrain Interface Module** / **Diagnostic Data Display** / **Data List**.

Tech 2 Parameter	Units Displayed	Typical Display Values
Cruise Cancel Switch	Inactive / Active	Inactive
Cruise Resume Switch	Off / Enabled	Off
Cruise Set Switch	Inactive / Active	Inactive
Cruise Main Switch	Inactive / Active	Inactive
Cruise Control Set Lamp	Off / On	Off
Cruise Control On Lamp	Off / On	Off

3 On Tech 2 select **Engine** / **V6 Engine** / **Data Display** / **Data List** / **Cruise Control Data.**

Tech 2 Parameter	Units Displayed	Typical Display Values
Brake Lamp Switch	Inactive / Active	Inactive
Initial Brake Apply Sig	Inactive / Active	Inactive
Cruise Set / Decel Swit	Inactive / Active	Inactive
Cruise Resume / Accelerat	Inactive / Active	Inactive
Cruise Control Disengag	Engine Speed / Brake	Engine Speed

4 On Tech 2 select **Engine** / **V6 Engine** / **Data Display** / **Data List** / **Engine Data 1.**

Tech 2 Parameter	Units Displayed	Typical Display Values
Clutch Pedal Switch	Inactive / Active	Inactive

2.2 Diagnostic Systems Check

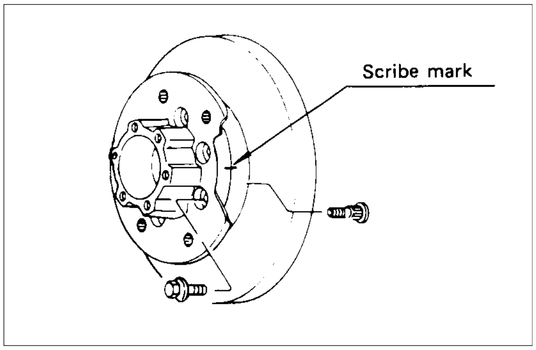
Diagnostic Systems Check

Refer to 2.3 Wiring Diagram to aid in the diagnosis of the cruise control system.

For the cruise control system to work effectively the following systems / components need to be serviceable:

Step	Action	Yes	No
1	Is the fault specifically isolated to this system / module?	Go to Step 2	Go to 6E1 Powertrain Interface Module – V6
2	1 Connect Tech 2 to the DLC. 2 Ignition ON, engine OFF. 3 On Tech 2 select **Body** / **Powertrain Interface Module** / **Diagnostic Trouble codes** / **Read DTCs'.** Are there any set DTC's?	Go to the appropriate DTC table in 6E1 Powertrain Interface Module – V6.	Go to Step 3

Step	Action	Yes	No
3	On Tech 2 select **Engine** / **V6 Engine** / **Diagnostic Trouble codes** / **Read DTCs'.** Are there any set DTC's?	Go to the appropriate DTC table in 6C1-2 Engine Management – V6 – Diagnostics	Go to Step 4
4	Is the instrument cluster assembly functioning correctly?	Go to 2.4 Cruise Control Inoperative / Malfunctioning	Refer to 8A Electrical – Body and Chassis.
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			



12. Bolt

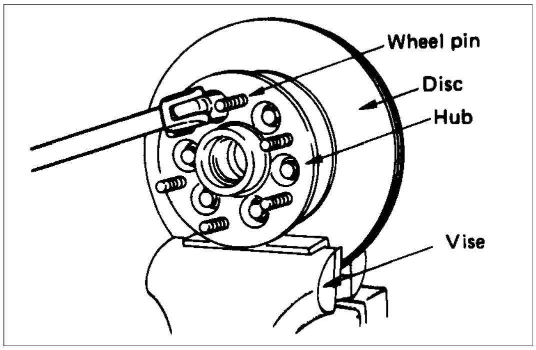
13. Wheel Pin ; Front Hub

(1) Scribe mark on hub to disc before disassembly to insure proper assembly.

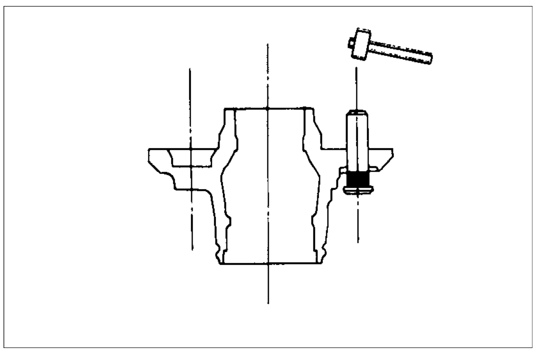
(2) Drive out the ABS sensor rotor using a metal bar and hammer through the two bolt holes.

- Discard the used ABS sensor rotor

Refer to the section Brake.



(3) Clamp hub and disc assembly in vise using protective pads and remove six (6) disc to hub retaining bolts.



(4) Place hub on a suitable work surface and remove wheel studs, as required, using a hammer.

2.4 Cruise Control Inoperative / Malfunctioning

Circuit Description

When the ON-OFF button is pressed, 12 V is applied to the Powertrain Interface Module (PIM) connector B – 97 pin 14. This enables and disables cruise control operation.

Pressing the cruise control switch assembly to SET–COAST button activates the cruise control at a desired speed above 40 km/h. This provides a 12 V signal to the PIM through connector B – 97 pin 15.

Pressing and holding the cruise control switch to SET–COAST provides a 12 V signal to the PIM at connector B – 97 pin 15. Turning the cruise control switch to RES–ACC will apply a 12 V signal to the PIM at connector B – 97 pin 16. Turning the cruise control switch to CANCEL will apply a 12 V signal to the PIM at connector B – 97 pin 17.

Pressing the brake pedal opens the cruise Initial Brake Apply Signal circuit thus removing the supply voltage from the ECM connector C – 56 pin 46. Simultaneously, the stop lamp circuit will close (normally open) and supply 12 V to the ECM at connector C – 56 pin 10. Both these signals must be present so as to ensure the safe operation of the vehicle's cruise cancel function.

Manual Vehicles Only

Pressing the clutch pedal opens the cruise cancel circuit thus removing the supply voltage from the ECM at connector C – 56 pin 53.

For detailed information refer to 3.4 Clutch Pedal Switch (Manual Only) in this Section.

Test Description

The following numbers refer to the step numbers in the diagnostic table:

4–7 Checks the cruise control switch and associated circuits are functioning correctly.

8–9 Checks the brake pedal switch assembly and associated circuit are functioning correctly.

10 Checks the clutch pedal switch assembly and associated circuits are functioning correctly.

11–21 Covers the testing and replacement of system components.

22–28 Checks for intermittent faults in associated circuits and connectors.

Diagnostic Table Notes

1 For all wiring harness fault diagnoses and repairs, refer to 2.3 Wiring Diagrams in this Section.

2 Tech 2 can display a stored history of which system parameter or input caused the cruise control to disengage. This can aid diagnosis of intermittent faults.

Diagnostic Table

Step	Action	Yes	No
1	Did you review the System Operation?	Go to Step 2	Go to 1.3 System Operation
2	Did you read Diagnostic Systems Check ?	Go to Step 3	Go to Diagnostic Systems Check

Step	Action	Yes	No
3	Check the ignition supply circuits to the Stop Lamp Switch assembly connector C – 44 pin 1 is serviceable using a multimeter set to measure voltage, refer to 2.3 Wiring Diagrams in this Section Is there a +12 volt signal present at connector C – 44 pin 1?	Go to Step 4	Replace the faulty fusible link Main, IG2 or Stop Light fuse (refer to Note 1). If either of the fusible links or fuse blows again, repair or replace the faulty circuit (refer to Note 1)
4	1 Connect Tech 2 to the DLC. 2 On Tech 2 select: **Body** / **Powertrain Interface Module** / **Diagnostic Data Display.** 3 Scroll to **Cruise Main Switch.** 4 While monitoring Tech 2, press the cruise control switch ON–OFF button. Does Tech 2 display the following: • **Inactive** and **Active** as the cruise control switch is pressed?	Go to Step 5	Go to Step 11
5	1 Scroll to **Cruise Resume Switch.** 2 While monitoring Tech 2, rotate the cruise control switch. Does Tech 2 display the following: • **Inactive** when the cruise control switch is in the neutral position? • **Res** / **Acc** when the cruise control switch is rotated to the RES–ACC. Position?	Go to Step 6	Go to Step 12
6	1 Scroll to **Cruise Set Switch.** 2 While monitoring Tech 2, press the cruise control switch. Does Tech 2 display the following: • **Inactive** when the cruise control switch is in the neutral position? • **Set** / **Coast** when the cruise control switch is pressed to the SET–COAST position?	Go to Step 7	Go to Step 13
7	1 Scroll to **Cruise Cancel Switch.** 2 While monitoring Tech 2, rotate the cruise control switch. Does Tech 2 display the following: • **Inactive** when the cruise control switch is in the neutral position? • **Cancel** when the cruise control switch is rotated to the CANCEL position?	Go to Step 8	Go to Step 14

Step	Action	Yes	No
8	1 Return to the **Main Menu** on Tech 2. 2 On Tech 2 select: **Engine** / **V6 Engine** / **Data Display** / **Cruise Control Data.** 3 Scroll to **Brake Lamp Switch.** 4 While monitoring Tech 2, press and then release to the brake pedal. Does Tech 2 display the following: • **Active** as the brake pedal is pressed? • **Inactive** when the pedal is released?	Go to Step 9	Go to Step 15
9	1 Scroll to **Initial Brake Apply Sig.** 2 While monitoring Tech 2, press and then release to the brake pedal. Does Tech 2 display the following: • **Inactive** when the pedal is released? • **Active** as the brake pedal is pressed?	Go to Step 10	Go to Step 16
10	**NOTE** This procedure is only required on vehicles fitted with manual transmissions. If the vehicle is fitted with an automatic transmission, go to Step 24. 1 Scroll to **Cruise Control Active**. 2 While monitoring Tech 2, press and then release to the clutch pedal. Does Tech 2 display the following: • **Active** when the pedal is released? • **Inactive** as the clutch pedal is pressed?	Go to Step 30	Go to Step 17
11	Test the cruise control main switch, refer to 3.1 Cruise Control Main Switch Is the cruise control switch serviceable?	Go to Step 22	Go to Step 18
12	Test the cruise control switch assembly, refer to 3.2 Cruise Control Switch Assembly Is the cruise control switch assembly serviceable?	Go to Step 23	Go to Step 18
13	Test the cruise control switch assembly, refer to 3.2 Cruise Control Switch Assembly Is the cruise control switch assembly serviceable?	Go to Step 24	Go to Step 18
14	Test the cruise control switch assembly, refer to 3.2 Cruise Control Switch Assembly Is the cruise control switch assembly serviceable?	Go to Step 25	Go to Step 18
15	Test the stop lamp switch assembly, refer to 3.3 Stop Lamp Switch Assembly. Is the stop lamp switch serviceable?	Go to Step 26	Go to Step 19
16	Test the stop lamp switch assembly, refer to 3.3 Stop Lamp Switch Assembly. Is the stop lamp switch serviceable?	Go to Step 26	Go to Step 20

Step	Action	Yes	No
17	**NOTE** This procedure is only required on vehicles fitted with manual transmissions. If the vehicle is fitted with an automatic transmission go to Step 26. Test the clutch pedal switch, refer to 3.4 Clutch Pedal Switch. Is the clutch pedal switch serviceable?	Go to Step 28	Go to Step 21
18	Replace the faulty cruise control switch assembly with a serviceable item. To replace the switch assembly, refer to 8 B Cruise Control System.	Go to Step 32	—
19	Replace the faulty stop lamp switch, refer to 3.3 Stop Lamp Switch Assembly	Go to Step 32	—
20	Replace the faulty stop lamp switch, refer to 3.3 Stop Lamp Switch Assembly	Go to Step 32	—
21	Replace the faulty clutch pedal switch, refer to 3.4 Clutch Pedal Switch	Go to Step 32	—
22	1 Disconnect the PIM connector B – 97. 2 Using a multimeter set to measure voltage, back probe between the harness connector B – 97 pin 14 and a known ground. 3 With the aid of an assistant, monitor the voltage on the multimeter and press and release the cruise control switch ON–OFF button. • With the button in the rest position, the multimeter should display 0 V. • With the button pressed, the multimeter should display battery voltage. Does the multimeter display as described?	Go to Step 30	Check for short to ground or open circuit. Repair as required (refer to Note 1). Go to Step 32
23	1 Disconnect the PIM connector B – 97. 2 Using a multimeter set to measure voltage, back probe between the harness connector B – 97 pin 16 and a known ground. 3 With the aid of an assistant, monitor the voltage on the multimeter and rotate and release the cruise control switch to RES–ACC position. • With the switch in the rest position, the multimeter should display 0 V. • With the switch rotated, the multimeter should display battery voltage. Does the multimeter display as described?	Go to Step 30	Check for short to ground or open circuit on circuit. Repair as required (refer to Note 1). Go to Step 32

Step	Action	Yes	No
24	1 Disconnect the PIM connector B – 97. 2 Using a multimeter set to measure voltage, back probe between the harness connector B – 97 pin 15 and a known ground. 3 With the aid of an assistant, monitor the voltage on the multimeter and press and release the cruise control switch to SET–COAST button. • With the switch in the rest position, the multimeter should display 0 V. • With the switch pressed, the multimeter should display battery voltage. Does the multimeter display as described?	Go to Step 30	Check for short to ground or open circuit on circuit. Repair as required (refer to Note 1). Go to Step 32
25	1 Disconnect the PIM connector B – 97. 2 Using a multimeter set to measure voltage, back probe between the harness connector B – 97 pin 17 and a known ground. 3 With the aid of an assistant, monitor the voltage on the multimeter and rotate and release the cruise control switch to CANCEL position. • With the switch in the rest position, the multimeter should display 0 V. • With the switch rotated clockwise, the multimeter should display battery voltage. Does the multimeter display as described?	Go to Step 30	Check for short to ground or open circuit on circuit. Repair as required (refer to Note 1). Go to Step 32
26	1 Disconnect the ECM connector C – 56. 2 Using a multimeter set to measure voltage, back probe between the harness connector C – 56 pin 10 and ground. 3 With the aid of an assistant, monitor the voltage on the multimeter and press and release the brake pedal. • With the brake pedal in the rest position, the multimeter should display 0 V • With the brake pedal pressed, the multimeter should display battery voltage Does the multimeter display as described?	Go to Step 30	Check for a blown fuse C-18. Check for short to ground or open circuit Repair as required (refer to Note 1). Go to Step 32
27	1 Disconnect the ECM connector C – 56. 2 Using a multimeter set to measure voltage, back probe between the harness connector C – 56 pin 46 and ground. 3 With the aid of an assistant, monitor the voltage on the multimeter and press and release the brake pedal. • With the brake pedal in the rest position, the multimeter should display battery voltage • With the brake pedal pressed, the multimeter should display 0 V. Does the multimeter display as described?	Go to Step 28	Check for a blown fuse C-10. Check for short to ground or open circuit Repair as required (refer to Note 1). Go to Step 32

Step	Action	Yes	No
28	1 Disconnect the ECM connector C – 56. 2 Using a multimeter set to measure voltage, back probe between the harness connector C – 56 pin 53 and ground. 3 With the aid of an assistant, monitor the voltage on the multimeter and press and release the clutch pedal. • With the clutch pedal in the rest position, the multimeter should display battery voltage • With the clutch pedal pressed, the multimeter should display 0 V Does the multimeter display as described?	Go to Step 31	Check for a blown fuse C-4. Check for short to ground or open circuit Repair as required (refer to Note 2). Go to Step 32
29	Check all associated circuits and connectors for the following: • Loose or damaged connections • Intermittent faults. Refer to the Wiring Diagrams in this Section and repair as required. Was the repair completed?	Go to Step 32	—
30	Replace the PIM, refer to 6E1 Powertrain Interface Module – V6. Was the repair completed?	Go to Step 32	—
31	Replace the ECM module, refer to 6C1-3 Engine Management – V6 Service Operations. Was the repair completed?	Go to Step 32	—
32	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 1
When all diagnosis and repairs are completed, clear all DTCs and check the system for correct operation.			

3 Service Operations

3.1 Cruise Control Main Switch

Remove

To remove the cruise control main switch, refer to 8 B Cruise Control System.

Test

Test the cruise control main switch, using a multimeter set to measure ohms check the continuity.

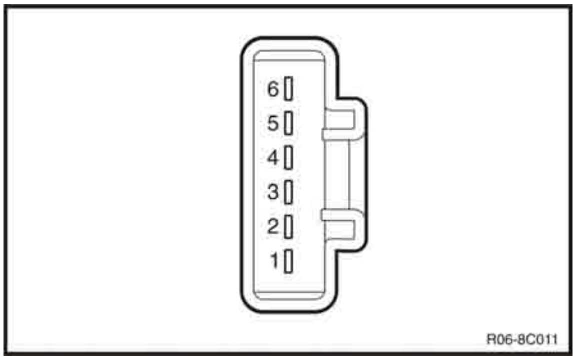

Figure 8C – 8

Terminal Testing

Cruise Control Main Switch		
Switch Terminals	**Switch Position**	**Indication if Switch is Serviceable**
1 and 2	Switch Illumination	Approx. 22 ohms
4 and 6	Cruise Lamp On Illumination	Approx. 22 ohms
4 and 3	Cruise Switch Released	Open circuit
4 and 3	Cruise Switch Pressed	Short circuit

Reinstall

To reinstall the cruise control main switch, refer to 8 B Cruise Control System.

3.2 Cruise Control Switch Assembly

Remove

To remove the cruise control switch assembly, refer to 8 B Cruise Control System.

Test

To test the cruise control switch assembly, use a multimeter to check the continuity.

1. Remove the lower dash trim panel and locate the cruise control switch assembly wiring harness that connects a white 13 pin male plug to a connector sub panel located on the right hand side below of the steering column.
2. Disconnect the 13 pin male plug B – 59 from its mating connector socket.
3. Place the turn signal and cruise control switch assembly into the positions detailed in the following table, refer to Terminal Testing. Position the contacts of the multimeter onto the terminals and take the reading. Compare the multimeter readings with the values in the table.
4. If the switch assembly fails any part of the test, replace the cruise control switch assembly with a serviceable item. To replace the switch assembly, refer to 8 B Cruise Control System.

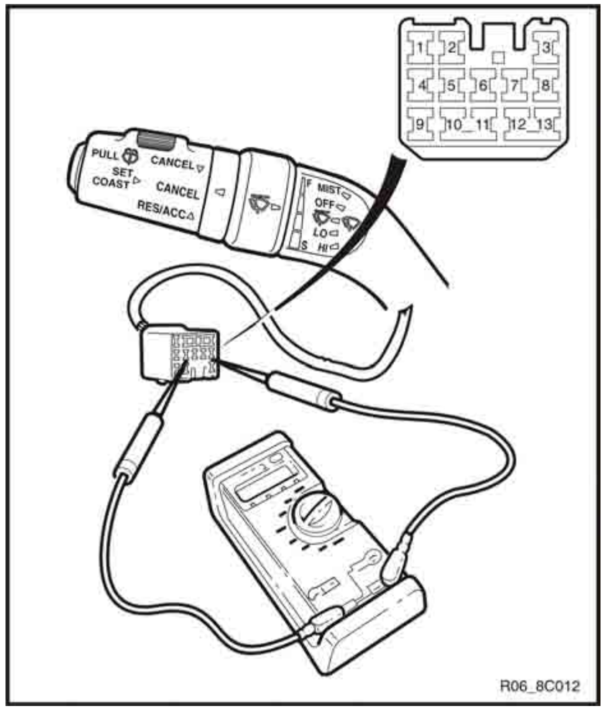

Figure 8C – 9

Terminal Testing

Cruise Control Switch Assembly		
Switch Terminals	**Switch Position**	**Indication if Switch is Serviceable**
11 and 10	CANCEL Applied	Open Circuit
11 and 10	CANCEL Released	Short Circuit
11 and 12	SET–COAST Pressed	Short Circuit
11 and 12	SET–COAST Released	Open Circuit
11 and 9	RES–ACC Applied	Short Circuit
11 and 9	RES–ACC Released	Open Circuit

Reinstall

To reinstall the cruise control switch assembly, refer to 8 B Cruise Control System.

IDLE SPEED-UP CONTROL		Idle speed controlled by solenoid switch (4JA1-T only)

INSPECTION AND REPAIR

Make necessary correction or parts replacement if wear, damage or any other abnormal conditions are found through inspection.

For inspection and servicing of disc caliper, and relative parts, and ABS parts, refer to Section Brakes.

- Hub
- Hub bearing, oil seal
- Knuckle spindle
- Disc
- Caliper
- ABS sensor rotor
- Cap, Hub flange, Shim, Snap ring
- Free wheeling hub parts (Option)
- Clutch, Knob, follower, inner, ring and spring

Visual Check

Check the following parts for wear, damage or other abnormal conditions.

3.3 Stop Lamp Switch Assembly

Remove

1 Press the connector locking tab while pulling on the stop lamp connector (1) and remove from the switch assembly (2).

2 Twist the stop lamp switch assembly (2) anticlockwise a quarter of a turn and pull out of the brake pedal support bracket.

3 If required, remove the plastic clip (3) by pressing the locking tabs on the rear of the clip and pulling from the brake pedal support bracket.

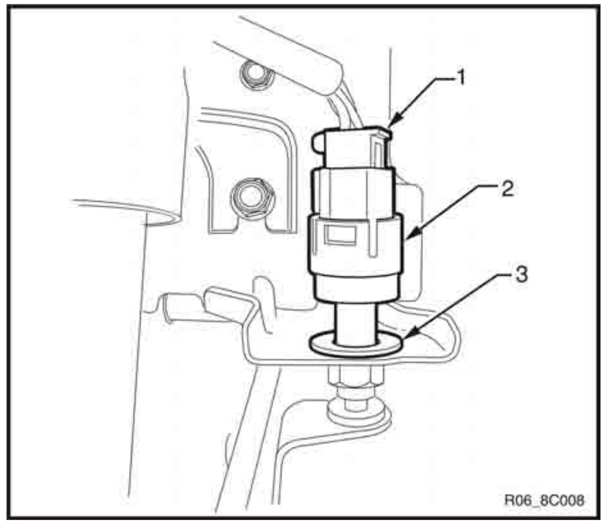

Figure 8C – 10

Test

Terminal Testing

1 Using a multimeter, probe the pins of the switch assembly and compare to the table below.

NOTE

The pins are as follows:

- C44 – pins 1 and 2
- C44 – pins 3 and 4

NOTE

Holding the plunger (5) with tape will help when performing the test with the plunger in the active position (plunger pressed).

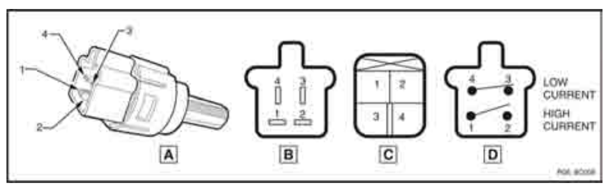

Figure 8C – 11

Plunger Position	Connector C44 – 1 and 2	Connector C44 – 3 and 4
Neutral position (plunger extended)	Open circuit	Continuity
Active position (plunger pressed)	Continuity	Open circuit

Reinstall

1 If removed, install the plastic clip (2) with the arrow pointing upwards, refer to Figure 8C – 11.

2 With the connectors pointing upwards (12 o'clock position), insert the switch assembly (1) into the plastic clip.

3 Ensure the brake pedal is in the rest position.

4 Push the switch assembly (1) so the plunger is pressed and the end switch barrel is against the brake pedal (2).

5 Twist the switch assembly clockwise to lock into place. The distance between the brake pedal and the switch barrel should be 0.7 ± 0.5 mm.

6 Install the wiring connector to the switch assembly.

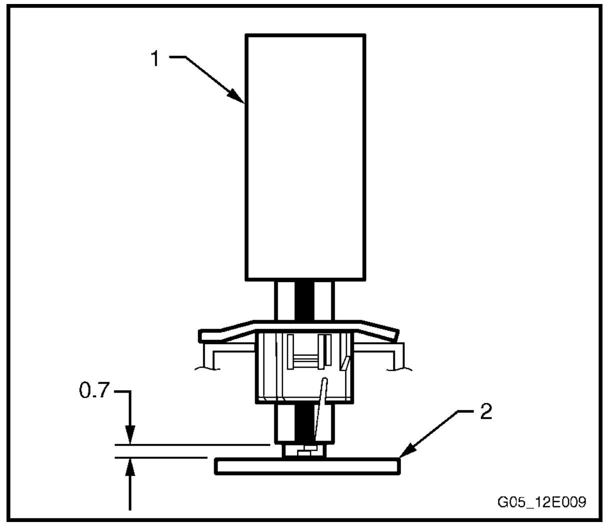

Figure 8C – 12

3.4 Clutch Pedal Switch (Manual Only)

Remove

1 Disconnect the electrical connector (1) from the clutch switch (2).

2 Loosen the lock nut (3) and remove the clutch switch from the pedal bracket.

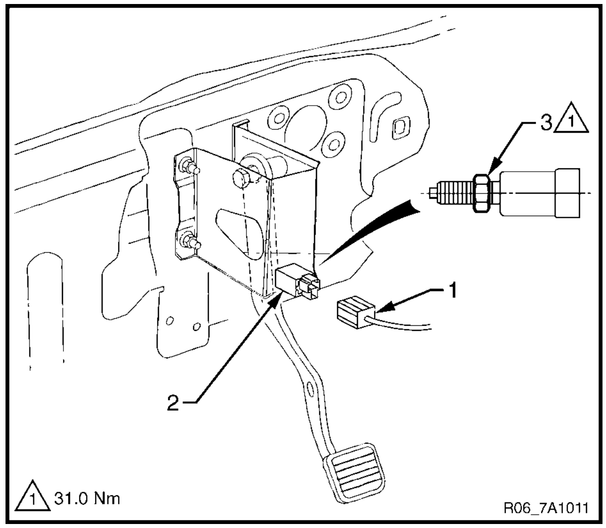

Figure 8C – 13

Test

1 Using a multimeter set to measure ohms, probe the pins (1) of the switch assembly.

2 In the neutral position (plunger extended) there should be an open circuit across the switch.

3 In the active position (plunger extended) there should be a closed circuit across the switch.

4 Replace the switch as per the following reinstall procedure if the tests prove the switch to be faulty.

5 If the test proves the switch to be serviceable, reinstall it as per the following procedure.

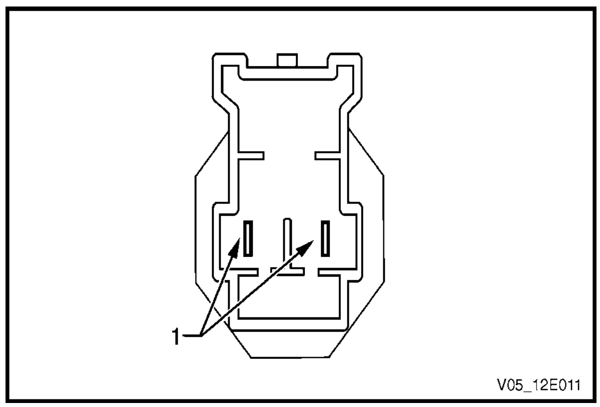

Figure 8C – 14

Reinstall

6 Install the clutch switch (1) as follows:

a Insert the switch into the clutch pedal bracket.

b Rotate the switch clockwise until obtaining the clearance (2) between the pedal (3) and the pedal stoper.

Clutch pedal and pedal stoper clearance specification............................... 0.5 – 1.5 mm

c Tighten the lock nut (4) to the correct torque specification.

Clutch switch lock nut torque specification...31.0 Nm

d Recheck the clutch switch clearance, readjust clearance if required.

NOTE

No adjustment is required for the clutch switch itself.

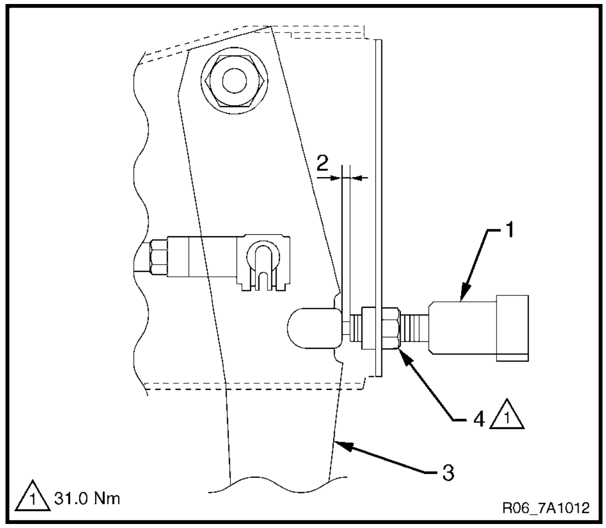

Figure 8C – 15

7 Reconnect the electrical connector to the clutch switch.

8 Verify the operation of the clutch switch by operating the cruise control and checking the clutch switch stops operation of the cruise control when the clutch pedal is pressed.

4 Special Tools

Tool Number	Illustration	Description	Tool Classification
3588		**Digital Multimeter** Previously released as J39200 or equivalent. NOTE: The instrument must have 10 meg ohms impedance and be capable of reading frequencies.	Mandatory
KM-609		**Electronic Kit.** Used in conjunction with a multimeter for measuring voltages and resistances without damaging wiring harness connectors.	Desirable.
70000861		**Tech 2 Diagnostic Scan Tool** Previously released.	Mandatory

Important Operations

1. Spacer

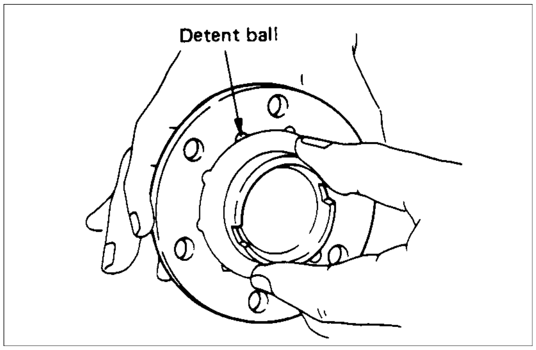
Apply grease to both faces of spacer.

4. Inner Assembly

Apply grease wheel bearing to inside face of ring.

g(oz)

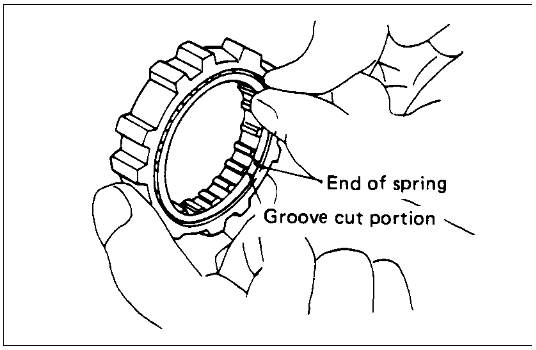
Amount of grease	6 (0.21)



7. Knob

(1) Apply grease Wheel bearing to outer circumference of knob and inner circumference of cover.

(2) Align detent ball to either groove of cover.

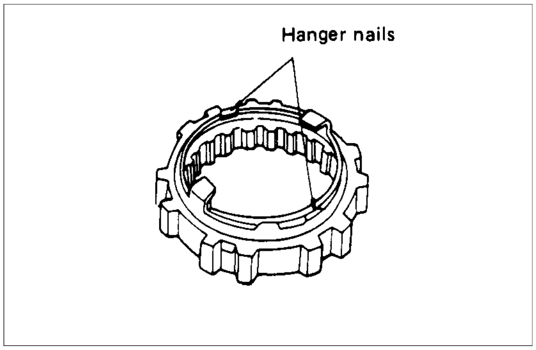


8. Snap Ring

Turn the smoother face to knob side.

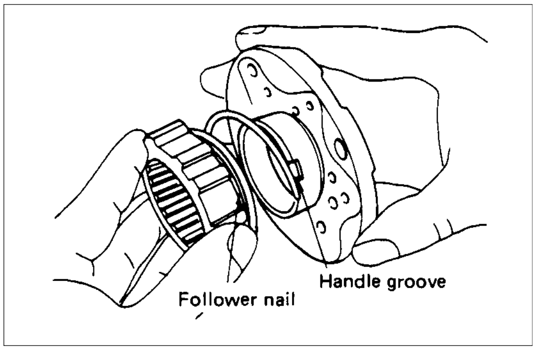
9. Retaining Spring

Align the end of spring to the end of cut portion of clutch spring groove.



10.Follower

Install follower to clutch so that follower nail will come closer to the bent portion of retaining spring by aligning follower stopper nail to outer teeth of clutch. Then, hook retaining spring onto upper portion of hanger nails of follower.



11.Compression Spring

Turn the smaller diameter side to follower.

12.Clutch Assembly

Align follower nail to handle groove, and then assemble clutch with knob by pushing and turning clutch counterclockwise to knob.

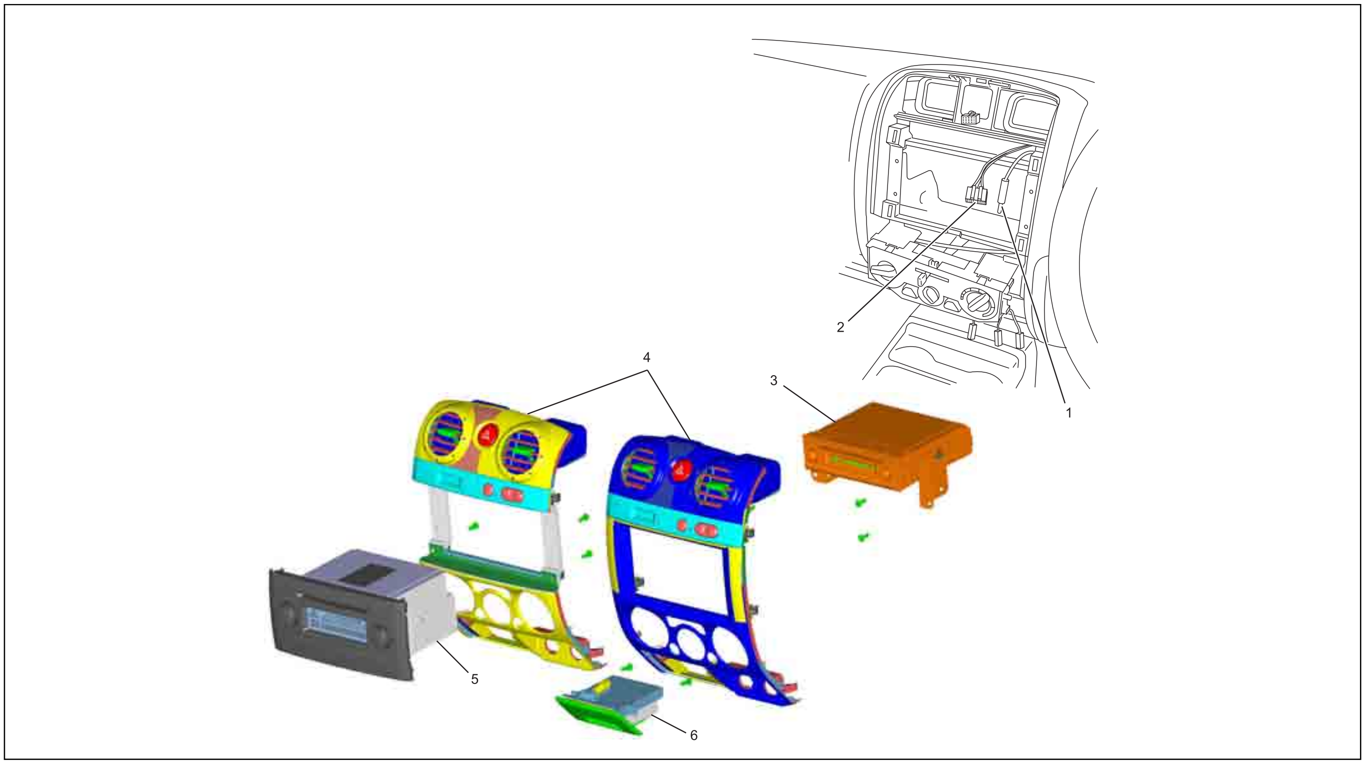
AUDIO

REMOVAL AND INSTALLATION



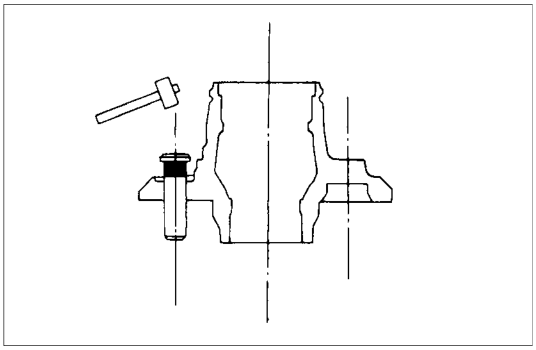
RTW790LF000101

Removal

1. Remove the ash try (6).
2. Remove the center cluster cover assembly (4).
3. Disconnect the connector for the clock, the 4×4 switch, the hazard switch.
4. Remove the 4 screws on the Audio.
5. Disconnect the connector for Audio (2).
6. Disconnect the Antenna feeder plug (1).
7. Pull out the audio (2 DIN: 5, 1 DIN: 3).

Installation

To install, follow the removal steps in the reverse order.

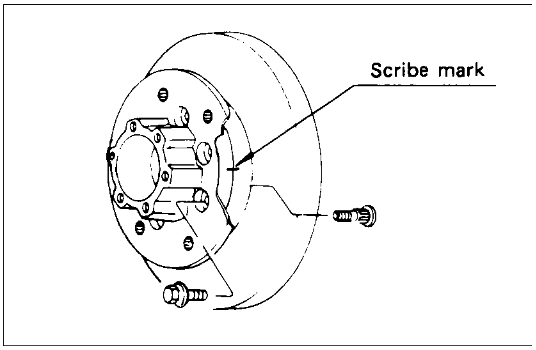


13. Wheel Pin

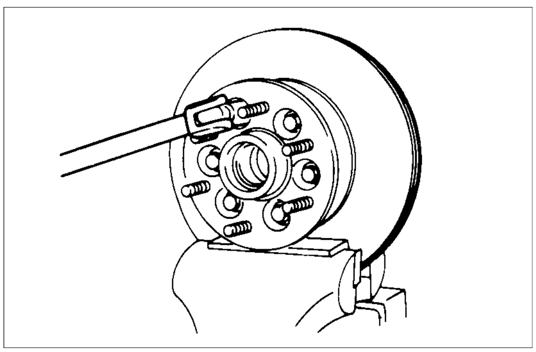
(1) Place hub on a wood workbench or a block of wood, approx. 6” by 6” to protect the wheel stud ends and threads.

(2) Install wheel stud using a hammer.

Be sure wheel stud is started squarely and seats completely.



(3) Align index marks and install hub to disc.



14. Bolt

Torque	N·m (kgf·m/lb·ft)
103 (10.5/76)	

15. ABS sensor rotor

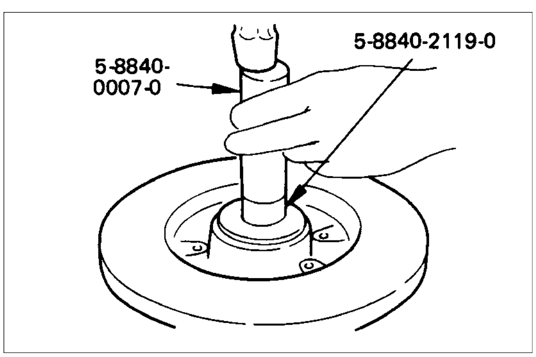
(1) Set a new ABS sensor rotor, if replacement is required.

(2) Install the ABS sensor rotor in the hub, using special tools.

Installer : 5-8840-2789-0

Grip : 5-8840-0007-0

Refer to the section Brake.



16. Inner Bearing

Outer race ; outer bearing

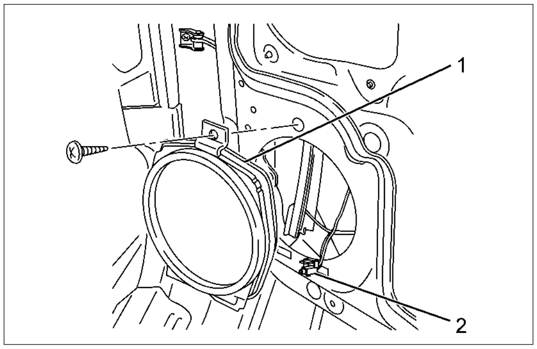
Install the outer race by driving it into the hub.

Installer : 5-8840-2119-0

Grip : 5-8840-0007-0

FRONT SPEAKER

REMOVAL AND INSTALLATION



Removal

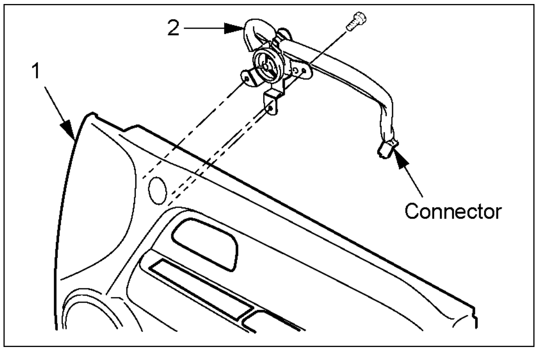
1. Remove the Front Door Trim Panel.
   - Refer to section 10 Cab for door trim panel removal steps.
2. Remove the Front Speaker (1).
   - Remove the screw.
   - Disconnect the connector (2).

Installation

To install, follow the removal steps in the reverse order.

TWEETER

REMOVAL AND INSTALLATION



RTW390SH000101

Removal

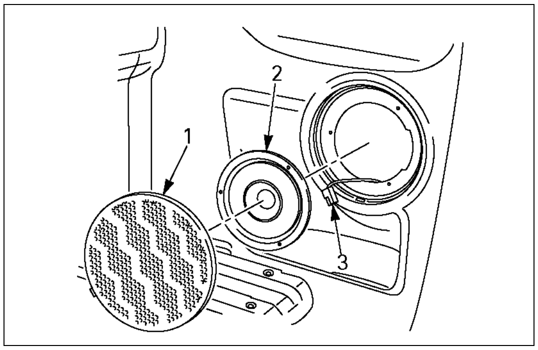
1. Remove the Door Trim Panel (1).
   - Refer to section 10 “FRONT DOOR ASSEMBLY” for door trim panel removal steps.
2. Remove the Tweeter (2).
   - Remove the three screws.
   - Disconnect the connector.

Installation

To install, follow the removal steps in the reverse order.

REAR SPEAKER (EXTEND CAB)

REMOVAL AND INSTALLATION



Removal

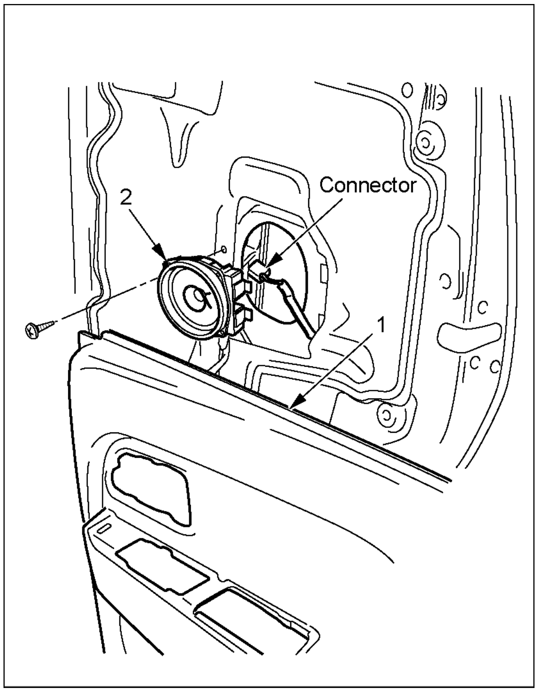
1. Remove the Speaker Grille.
   - Pull the grille (1) to release the locks.
2. Remove the Rear Speaker (2).
   - Remove the three screws.
   - Disconnect the connector (3).

Installation

To install, follow the removal steps in the reverse order.

REAR SPEAKER (CREW CAB)

REMOVAL AND INSTALLATION



RTW390MH000101

Removal

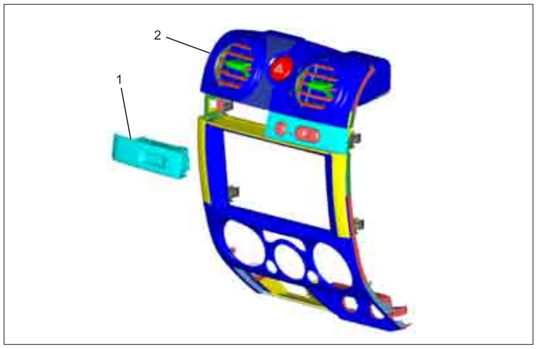
1. Remove the Rear Door Trim Panel (1).
   - Refer to section 10 “REAR DOOR ASSEMBLY” for door trim panel removal steps.
2. Remove the Rear Speaker (2).
   - Remove the screw.
   - Disconnect the connector.

Installation

To install, follow the removal steps in the reverse order.

CLOCK

REMOVAL AND INSTALLATION



RTW790SH000101

Removal

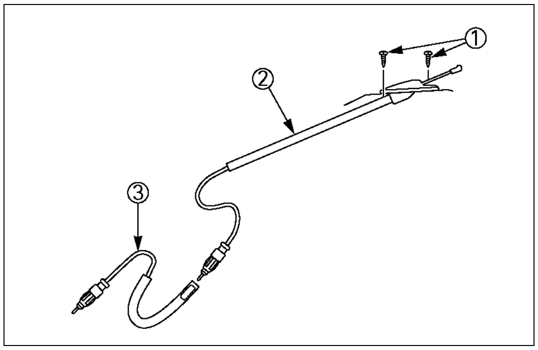
1. Remove the center cluster ASM (2).
2. Disconnect the connector.
3. Remove the clock (1).

Installation

To install, follow the removal steps in the reverse order.

ANTENNA

REMOVAL AND INSTALLATION



Removal

1. Remove the antenna screw ①.
2. Disconnect the feeder cable ③ connector.
3. Remove the antenna cable ②.
4. Pull out the antenna downward.

Remove and install the antenna as illustrated.
The antenna unit is located on the roof panel driver's side.
To install, follow the removal steps in the reverse order.

Installation

To install, follow the removal steps in the reverse order.

SECTION 9A

SUPPLEMENTAL RESTRAINT SYSTEM (SRS)

TABLE OF CONTENTS

PAGE 2 OF 3

PAGE

Service Precaution

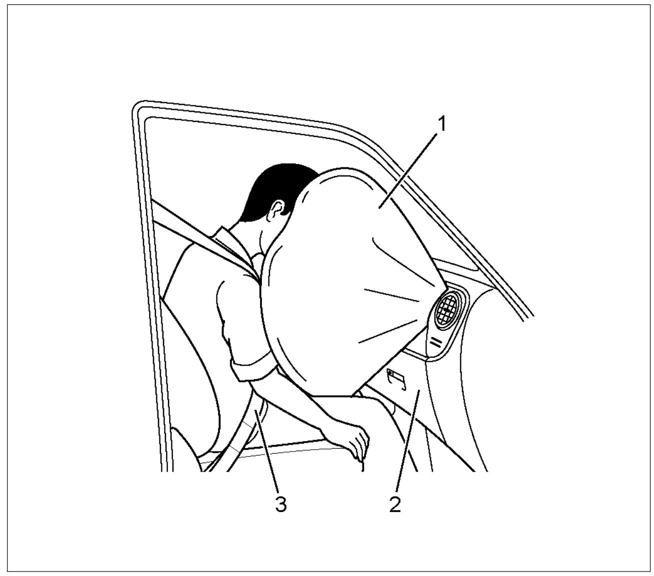
WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING A SERVICE ON, OR NEAR, THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING A SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNECESSARY SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU/GM will call out those fasteners that require a replacement after removal. ISUZU/GM will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

CAUTION: When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. Fasteners that are not reused, and those requiring thread locking compound will be called out. The correct torque value must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

Restraint Devices



RTW79ASH000801

Legend

(1) Deployed Air Bag
(2) Knee Bolster
(3) Seat Belt

The Supplemental Restraint System (SRS) helps supplement the protection offered by the driver and front passenger seat belts by deploying an air bag from the center of the steering wheel and from the front of the passenger side of the instrument panel.

The air bag deploys when the vehicle is involved in a frontal crash of sufficient force up to 30 degrees off the centerline of the vehicle. To further absorb the crash energy there is a knee bolster located beneath the instrument panel for both the driver and passenger, and the steering column is collapsible.

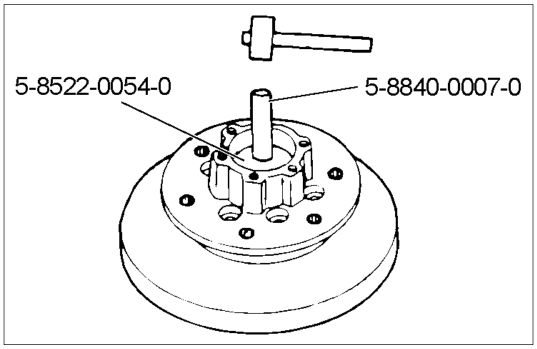
17.Oil Seal
Installer : 5-8840-2854-0
Grip : 5-8840-0007-0
Apply grease (Besco L-2 or equivalent) to the lip portion.
Discard the used oil seal and install a new one.



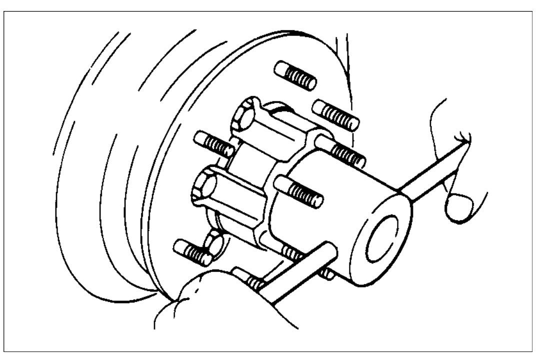
RTW44CSH000201

18.Outer bearing
Outer race ; outer bearing
Install the outer race by driving it into the hub.
Installer : 5-8522-0054-0
Grip : 5-8840-0007-0

19.Hub and Disc Assembly
(1) Apply grease in the hub.
(2) Apply grease (Besco L-2 or equivalent) to the outer and inner bearing.

g(oz)

Hub	35 (1.23)
Outer bearing	10 (0.35)
Inner bearing	15 (0.53)



20.Hub Nut
(1) Turn the place where there is a chamfer in the tapped hole to the outer side, and attach the nut.
Wrench : 5-8840-2117-0

System Description

The SRS consists of the SRS control unit, the driver air bag assembly, the SRS coil assembly, the passenger air bag assembly and the “SRS” warning lamp in the instrument cluster. The SRS control unit, SRS coil assembly (driver side only), driver air bag assembly, passenger air bag assembly and connector wire make up the deployment loops. The function of the deployment loops is to supply current through the air bag assembly, which will cause deployment of the air bags in the event of a frontal crash of sufficient force, up to 30 degrees off the centerline of the vehicle. The air bag assemblies are only supplied enough current to deploy when the SRS control unit detects vehicle velocity changes severe enough to warrant deployment.

The SRS control unit contains a sensing device which converts vehicle velocity change to an electrical signal. The electrical signal generated is processed by the SRS control unit and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SRS control unit will cause current to flow through the air bag assembly deploying the air bags.

Component Description

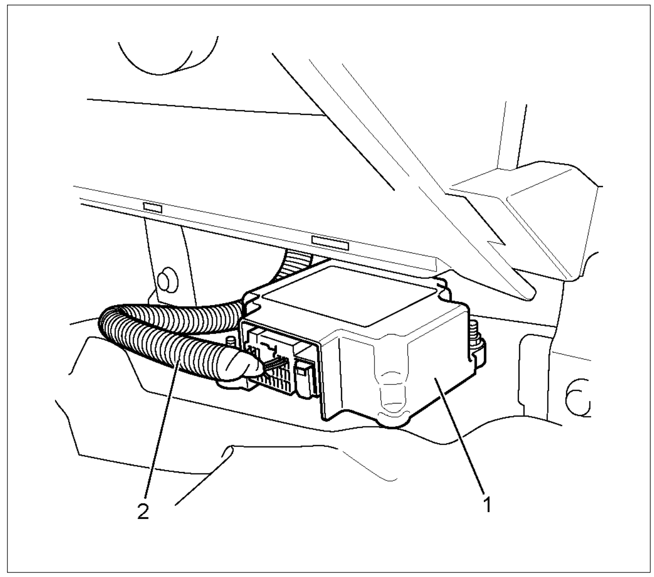
SRS Control Unit

WARNING: DURING SERVICE PROCEDURES, BE VERY CAREFUL WHEN HANDLING A SRS CONTROL UNIT. NEVER STRIKE OR JAR THE SRS CONTORL UNIT. NEVER POWER UP THE SRS WHEN THE SRS CONTROL UNIT IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SRS CONTROL UNIT AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTED TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SRS CONTROL UNIT COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

The SRS control unit is designed to perform the following functions in the SRS:

1. Energy Reserve — The SRS control unit maintains 30–Volt Loop Reserve (30VLR) energy supply to provide deployment energy when ignition voltage is lost in a frontal crash.
2. Frontal Crash Detection — The SRS control unit monitors vehicle velocity changes to detect frontal crashes which are severe enough to warrant deployment.
3. Air Bag Deployment — When a frontal crash of sufficient force is detected, the SRS control unit will cause enough current to flow through the air bag assembly to deploy the air bag.
4. Malfunction Detection — The SRS control unit performs diagnostic monitoring of SRS electrical components and sets a diagnostic trouble code when a malfunction is detected.
5. Frontal Crash Recording — The SRS control unit records information regarding SRS status during frontal crash.
6. Malfunction Diagnosis — The SRS control unit displays SRS diagnostic trouble codes and system status information through the use of a scan tool.
7. Driver Notification — The SRS control unit warns the vehicle driver of SRS malfunctions by controlling the “SRS” warning lamp.

The SRS control unit is connected to the SRS wiring harness by a 52–pin connector. This harness connector uses a shorting clip across certain terminals in the contact area. This shorting clip connects the “SRS” warning lamp to ground when the SRS control unit harness connector is disconnected or CPA (Connector Position Assurance) is not inserted even if completely connected. This will cause the “SRS” warning lamp to come “ON” steady whenever the ignition switch is at the ON or START positions with the SRS control unit disconnected.



RTW79ASH000401

Legend

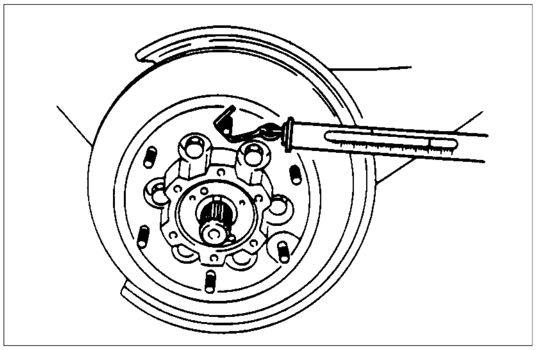
(1) SRS Control Unit
(2) SRS Harness

“SRS” Warning Lamp

Ignition voltage is applied to the “SRS” warning lamp when the ignition switch is at the ON or START positions. The SRS control unit controls the lamp by providing ground with a lamp driver. The “SRS” warning lamp is used in the SRS to do the following:

1. Verify lamp and SRS control unit operation by flashing SEVEN (7) times when the ignition switch is first turned “ON”.
2. Warn the vehicle driver of SRS electrical system malfunctions which could potentially affect the operation of the SRS. These malfunctions could result in nondeployment in case of a frontal crash or deployment for conditions less severe than intended.

The “SRS “ warning lamp is the key to driver notification of SRS malfunctions. For proper lamp operation, refer to the “SRS Diagnostic System Check” in this section.



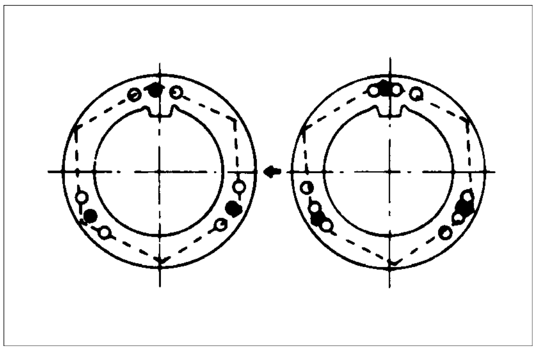
Preload Adjustment

Tighten the hub nut at 29 N·m (3.0 kgf·m / 22 lb·ft), then loosen the nut to the full.

Tighten the hub nut at the value given below, using a spring scale on the wheel pin.

Bearing Preload	N (kgf/lb)
New bearing and New oil seal	22 - 27 (2.2 - 2.8 / 4.9 - 6.2)
Used bearing and New oil seal	14 - 20 (1.4 - 2.0 / 3.1 - 4.5)

If the measured bearing preload is outside the specifications, adjust it by loosening or tightening the bearing nut.

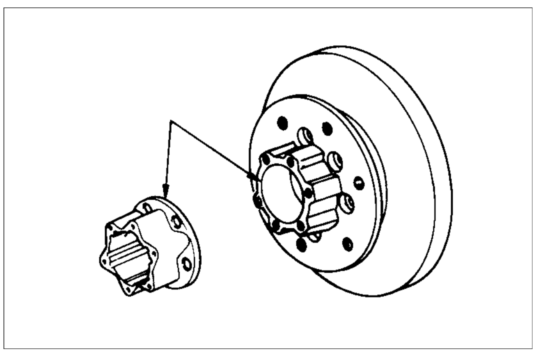


21. Lock Washer

Turn the side with larger diameter of the tapered bore to the vehicle outer side, and attach the washer.

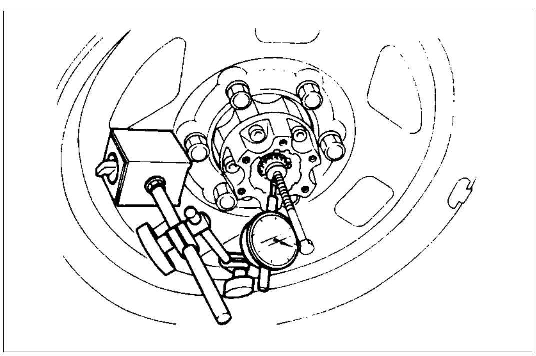
If the bolt holes in the lock plate are not aligned with the corresponding holes in the nut, reverse the lock plate.

If the bolt holes are still out of alignment, turn in the nut just enough to obtain alignment,. Screw is to be fastened tightly so its head may come lower than the surface of the washer.



22. Body Assembly

Apply adhesive (Loctite 515 or equivalent) to the both joining faces.

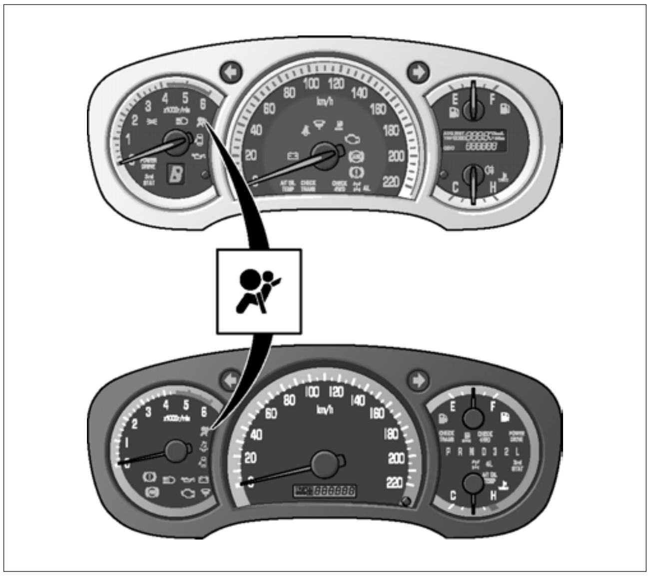


23. Snap Ring and Shims

Adjust the clearance between the free wheeling hub body and the snap ring.

Clearance	mm(in)
0 - 0.2 (0 - 0.08)	

Adjust Shims Available	mm(in)
0.2, 0.3, 0.5, 1.0 (0.008, 0.011, 0.020, 0.039)	



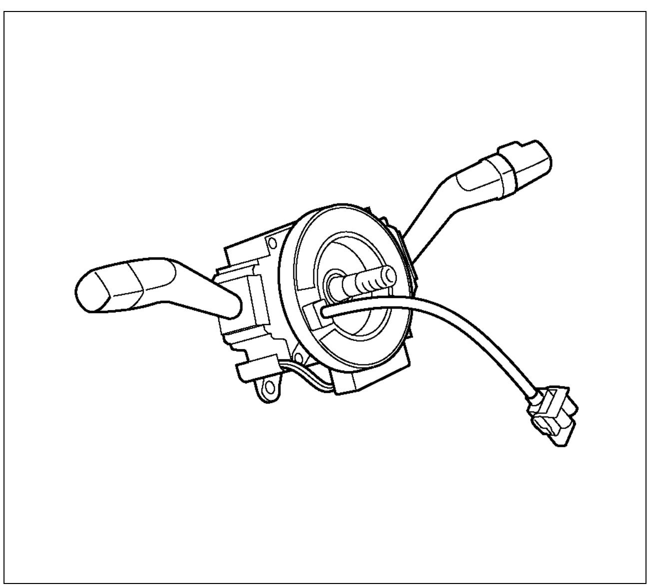
RTW79ASH000501

SRS Coil Assembly

The SRS coil assembly consists of two current carrying coils. This is attached to the steering column and allows rotation of the steering wheel while maintaining continuous contact of the driver deployment loop to the driver air bag assembly.

There is a shorting clip on the yellow connector near the base of steering column which connects the SRS coil to the SRS wiring harness.

The shorting clip shorts to the SRS coil and driver air bag assembly when the yellow connector is disconnected. The circuit to the driver air bag assembly is shorted in this way to help prevent unwanted deployment of the air bag when servicing the steering column or other SRS components.



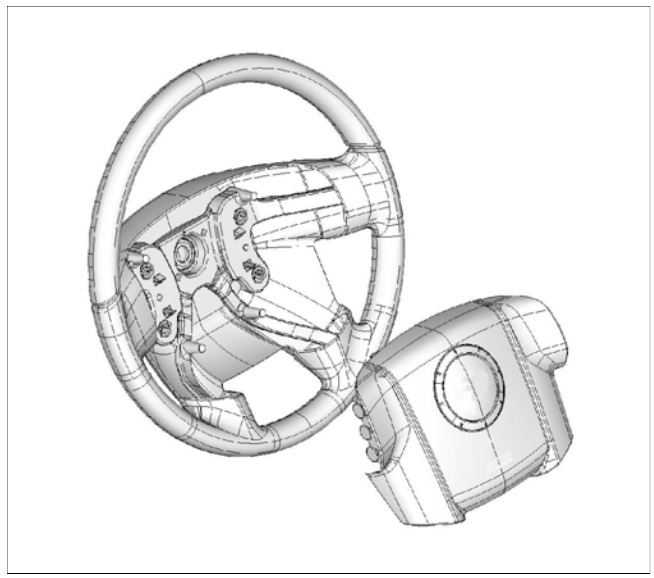
060R300047

Air Bag Assemblies

The air bag assembly consists of an inflatable air bag assembly and an inflator. When the vehicle is in a frontal crash of sufficient force the SRS control unit causes current flow through the deployment loops. Current passing through the inflator ignites the material in the air bag assembly. The gas produced from this reaction rapidly inflates the air bag assembly.

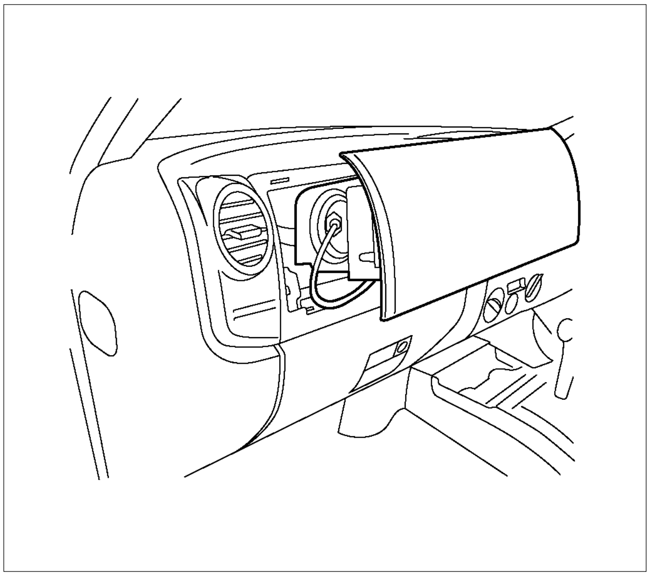
There is a shorting clip on the driver air bag assembly connector which connects the SRS coil assembly. The shorting clip shorts across the driver air bag assembly circuits when the driver air bag assembly connector is disconnected.

The circuit to the driver air bag assembly is shorted in this way to help prevent unwanted deployment of the air bag when servicing the driver air bag assembly, the steering column or other SRS components.



RTW79ASH001001

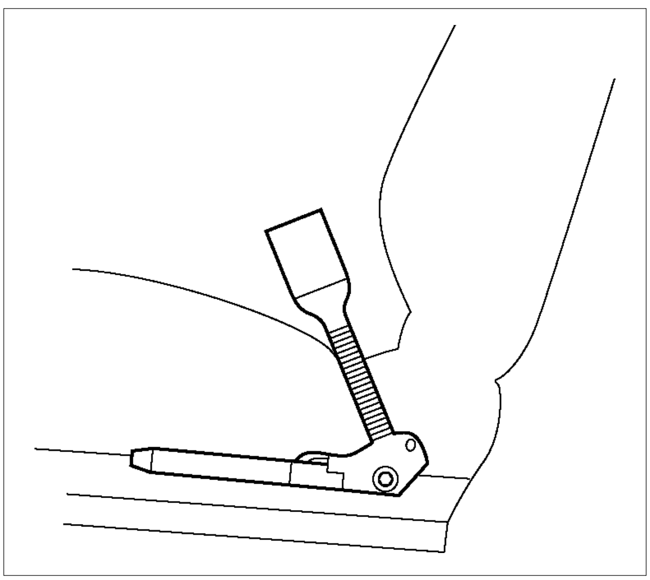
There is a shorting clip on the passenger air bag assembly connector which connects to the SRS harness. The shorting clip shorts across the passenger air bag assembly circuit when the passenger air bag assembly connector is disconnected. The circuit to the passenger air bag assembly is shorted in this way to help prevent unwanted deployment of the air bag when servicing the passenger air bag assembly, the instrument panel or other SRS components.



RTW79ASH000201

Seat Belt with Pretensioner (If so equipped)

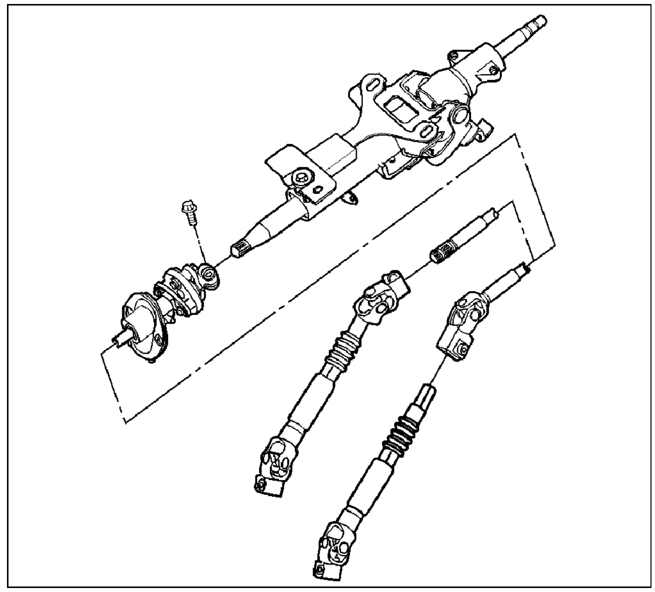
The seat belt comprises a seat belt and a cylinder (a cylinder filled with powder and an ignition device). In cases of frontal collision which cause a shock exceeding a specified level, the controller lets current flow to the inflation circuit. The current ignites the cylinder of the seat belt, producing gas. The gas helps tighten the seat belt to restrain firmly the driver's upper half in his seat.



RTW49JSH000201

Steering Column

The steering column absorbs energy and is designed to compress in a frontal crash to decrease the chance of injury to the driver.



060R300038

Knee Bolster

The knee bolsters are used to absorb energy to protect knees and control the forward movement of the vehicle's front seat occupants during a frontal crash, by limiting leg movement.

Definitions

Air Bag
An inflatable cloth cushion designed to deploy in certain frontal crashes. It supplements the protection offered by the seat belts by distributing the impact load more evenly over the vehicle occupant's head and torso.

Asynchronous
Performed in a non-periodic fashion, (i.e., no defined time or interval).

B+
Battery voltage, (B+) The voltage available at the battery at the time of the indicated measurement. With the key "ON" and the engine not running, the system voltage will likely be between 12 and 12.5 volts. At idle, the voltage may be 14 to 16 volts. The voltage could be as low as 10 volts during engine cranking.

Bulb Check
The SRS control unit will cause the "SRS" warning lamp to flash seven times and then go "OFF" whenever the ignition switch transitions to the ON position from any other ignition switch position and no malfunctions are detected.

"Continuous Monitoring"
Tests are performed by the SRS control unit on the SRS every 100 milliseconds while "Ignition 1" voltage is in the normal operating voltage range at the SRS control unit.

Data Link Connector (DLC)
Formerly "DLC", a connector which allows communication with an external computer, such as a scan tool.

Datum Line
A base line parallel to the plane of the underbody or frame from which all vertical measurements originate.

Deploy
To inflate the air bag.

Deployment Loops
The circuits which supply current to the air bag assemblies to deploy the air bag.

Diagnostic Trouble Code (DTC)
Formerly "Code", a numerical designator used by the SRS control unit to indicate specific SRS malfunctions.

Driver Current Source
An output of the SRS control unit which applies current into the driver air bag assembly circuit during the "Initiator Assembly Resistance Test".

Driver Air Bag Assembly
An assembly located in the steering wheel hub consisting of an inflatable bag, an inflator and an initiator.

EEPROM
Electrically Erasable Programmable Read Only Memory. Memory which retains its contents when power is removed from the SRS control unit.

Ignition Cycle
The voltage at the SRS control unit "Ignition 1" input, with ignition switch "ON", is within the normal operating voltage range for at least ten seconds before turning the ignition switch "OFF".

Ignition 1
A battery voltage (B+) circuit which is only powered when the ignition switch is in the ON, or START position.

Initiator
The electrical component inside the air bag assembly which, when sufficient current flows, sets off the chemical reaction that inflates the air bag.

"Initiator Assembly Resistance Test"
Tests are performed once for each ignition cycle when no malfunctions are detected during "Turn–ON" or "Continuous Monitoring". This test checks for the correct SRS control unit configuration for the vehicle, shorts to "Ignition 1" in the deployment loops, high resistance or opens in the "Driver Side" and "Passenger Side" circuits and measures the resistance of the inflator assembly consisting of 1) Initiators, 2) SRS coil assembly (driver side only), 3) Connectors and associated wiring.

Normal Operating Voltage Range
The voltage measured between the SRS control unit "Ignition 1" terminals and "Ground" terminals is between 9 and 16 volts.

Passenger Current Source
An output of the SRS control unit which applies current into the passenger air bag assembly circuit during the "Initiator Assembly Resistance Test".

Passenger Air Bag Assembly
An assembly located in the front of the passenger side of the instrument panel consisting of an inflatable bag, an inflator and an initiator.

Scan Tool
An external computer used to read diagnostic information from on–board computers via the data link connector.

SRS control unit
SRS control unit which provides reserve energy to the deployment loops, deploys the air bags when required and performs diagnostic monitoring of all SRS components.

Serial Data
Information representing the status of the SRS.

SRS
Supplemental Restraint System.

SRS Coil Assembly
An assembly of two current–carrying coils in the driver deployment loop that allows the rotation of the steering wheel while maintaining the continuous contact of the driver deployment loop to the driver air bag assembly.

SRS Wiring Harness
The wires and connectors that electrically connect the components in the SRS.

"Turn–ON"
Test which the SRS control unit performs on the SRS once during each ignition cycle immediately after "Ignition 1" voltage is applied to the SRS control unit and before "Continuous Monitoring".

Diagnosis

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY–POWERED OR AC–POWERED VOLTMETER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NON-POWERED PROBE–TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

Diagnostic Trouble Codes

The “SRS Diagnostic System Check” must always be the starting point of any SRS diagnosis. The “SRS Diagnostic System Check” checks for proper “SRS” warning lamp operation and checks for SRS diagnostic trouble codes using the scan tool.

1. Current diagnostic trouble codes – Malfunctions that are presently being detected. Current diagnostic trouble codes are stored in RAM (Random Access Memory).
2. History diagnostic trouble codes – All malfunctions detected since the last time the history memory was cleared. History diagnostic trouble codes are stored in EEPROM.

Scan Tool Diagnostics

A scan tool is used to read current and history diagnostic trouble codes and to clear all diagnostic trouble codes after a repair is completed. The scan tool must be updated to communicate with the SRS through a replaceable cartridge before it can be used for SRS diagnostics. To use the scan tool, connect it to the data link connector and turn the ignition switch “ON”. The scan tool reads serial data from the SRS control unit “Serial Data” line terminal “21” to the data link connector terminal “2”.

Use Of Special Tools

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY–POWERED OR AC–POWERED VOLTMETER, OHMMETER, ETC, OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NON-POWERED PROBE–TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT. YOU SHOULD BE FAMILIAR WITH THE TOOLS LISTED IN THIS SECTION UNDER THE HANDLING SRS SPECIAL TOOLS.

You should be able to measure voltage and resistance. You should be familiar with proper use of a scan tool such as the Tech 2 Diagnostic Computer, SRS Driver/Passenger Load Tool 5-8840-2421-0, Connector Test Adapter Kit 5-8840-2835-0 and the DMM (Digital Multimeter) 5-8840-0366-0.

Repairs And Inspections Required After An Accident

If any SRS components are damaged, they must be replaced. If SRS component mounting points are damaged, they must be replaced.

- Never use SRS parts from another vehicle. This does not include remanufactured parts purchased from an authorized dealer; they may be used for SRS repairs.
- Do not attempt to service the SRS control unit, the SRS coil assembly, or the air bag assembly. Service of these items is by replacement only.
- Verify the part number of the replacement air bag assembly.

CAUTION: Never use the air bag assembly from another vehicle or different model year air bag assembly.

Use only a new air bag assembly matched to the TFR/S which is being repaired.

CAUTION: Proper operation of the sensors and supplemental restraint system (SRS) requires that any repairs to the vehicle structure return it to the original production configuration. Deployment requires, at a minimum, replacement of the SRS control unit, air bag assembly and dimensional inspection of the steering column. Any visible damage to the SRS control unit mounting bracket (s) requires replacement, and the steering column must be dimensionally inspected, whether deployment occurred or not.

Accident With Deployment – Component Replacement And Inspections

Certain SRS components must be replaced or inspected for damage after a frontal crash involving air bag deployment. Those components are:

- Air bag assembly
- SRS control unit

CAUTION: Refer to "SRS control unit Replacement Guidelines" below for important information on SRS control unit replacement in both deployment and non-deployment crashes.

- SRS coil assembly — Inspect wiring and connector for any signs of scorching, melting, or damage due to excessive heat. Replace if damaged. Refer to section "SRS Coil Assembly" in this manual.

Accident With or Without Deployment – Component Inspection

Certain SRS system components and rotation parts must be inspected after any crash, whether the air bag has been deployed or not. Those components are:

- Steering column — Refer to Inspection Required "After an Accident" in this manual.
- Knee bolsters and mounting points — Inspect for any distortion, bending, cracking, or other damage.
- I/P steering column reinforcement plate — Inspect for any distortion, bending, cracking, or other damage.
- I/P braces — Inspect for any distortion, bending, cracking, or other damage.
- Seat belts and mounting points — Refer to "Seat Belts" in Section "Seat Belt" of this workshop manual.

SRS Control Unit Replacement Guidelines

SRS control unit replacement policy requires replacement of the SRS control unit after a crash involving air bag deployment when the "SRS Warning Lamp" turned "ON", the "SRS Diagnosis" should be done according to Section "Restraint Control System."

Wiring Damage

If any SRS wire harness is damaged, it should be replaced. Don't repair the SRS harness. It is replacement only.

SRS Connector (Plastic Body And Terminal Metal Pin) Damage

If any connector or terminal in the SRS wire harness (except pigtails) is damaged, it should be replaced.

SRS Wire Pigtail Damage

If the wiring pigtail (a wire or wires attached directly to the device, not by a connector) is damaged, the entire component (with pigtail) must be replaced. Examples of "pigtail" components are the driver air bag assembly, the passenger air bag assembly, and the SRS coil assembly.

On–Vehicle Service

Service Precaution

WARNING: WHEN PERFORMING SERVICE ON OR AROUND SRS COMPONENTS OR SRS WIRING, FOLLOW THE PROCEDURES LISTED BELOW TO TEMPORARILY DISABLE THE SRS. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY OR OTHERWISE UNNECESSARY SRS REPAIRS.

The SRS control unit in Driver–Passenger SRS can maintain sufficient voltage to cause a deployment for up to 15 seconds after the ignition switch is turned "OFF," the battery is disconnected, or the fuse powering the SRS control unit is removed.

Many of the service procedures require removal of the "SRS" fuse, and disconnection of the air bag assembly from the deployment loop to avoid an accidental deployment. If the air bag assembly is disconnected from the deployment loop as noted in the "Disabling the SRS" procedure that follows, service can begin immediately without waiting for the 15 second time period to expire.

Disabling The SRS

Removal

Turn the ignition switch to "LOCK" and remove the key.

1. Remove the SRS fuse "SRS", from the side of the driver's side of the instrument panel fuse block or disconnect the battery.
2. Disconnect the yellow connector at the base of the steering column.
3. Remove the glove box assembly, refer to "Passenger Air Bag Assembly Replacement" in this manual.
4. Disconnect the yellow connector behind the glove box assembly.

CAUTION: With the "SRS" fuse removed and ignition switched "ON", the "SRS" warning lamp will be "ON". This is normal operation and does not indicate an SRS malfunction.

Enabling The SRS

Installation

CAUTION: Never use the air bag assembly from another vehicle or different model year air bag assembly.

Use only a new air bag assembly matched to the TFR/S which is being repaired.

Turn the ignition switch to "LOCK" and remove the key.

1. Connect the yellow connector passenger air bag assembly.
2. Install the glove box assembly. Refer to "Passenger air bag assembly replacement" in this manual.
3. Connect the yellow connector at the base of the steering column.
4. Install the "AIR BAG" fuse "SRS" to the side of the driver's side of the instrument panel fuse block or connect the battery.

Turn the ignition switch to "ON" and verify that the "SRS" warning lamp flashes seven times and then turns to "LOCK". If it does not operate as described, perform the "SRS Diagnostic System Check" in this manual.

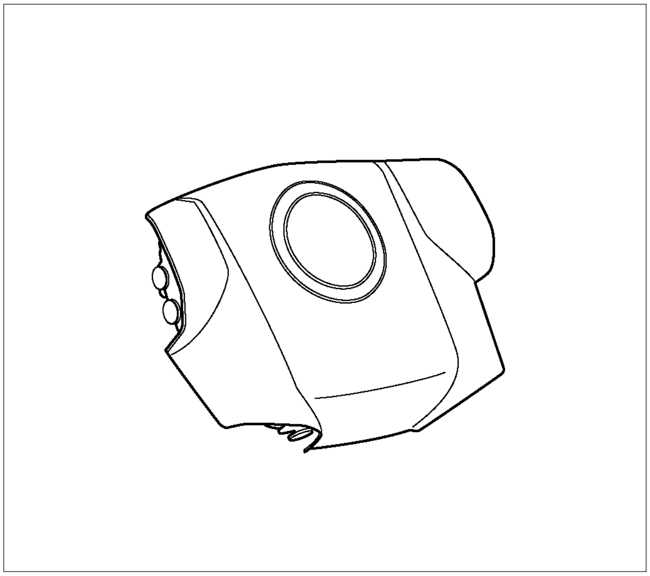
Handling / Installation / Diagnosis

1. The air bag assembly should not be subjected to temperatures above 65°C (150°F).
2. The air bag assembly, and SRS control unit, should not be used if they have been dropped from a height of 100 centimeters (3.28 feet) or more.
3. When the SRS control unit is replaced, it must be oriented with the arrow on the sensor pointing toward the front of the vehicle. It is very important for the SRS control unit to be located flat on the mounting surface, parallel to the vehicle datum line. It is important that the SRS control unit mounting surface is free of any dirt or other foreign material.
4. Do not apply power to the SRS unless all components are connected or a diagnostic chart requests it, as this will set a diagnostic trouble code.
5. The "SRS Diagnostic System Check" must be the starting point of any SRS diagnostics. The "SRS Diagnostic System Check" will verify proper "SRS" warning lamp operation and will lead you to the correct chart to diagnose any SRS malfunctions. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis, and incorrect parts replacement.

Air Bag Assembly Handling / Shipping / Scrapping

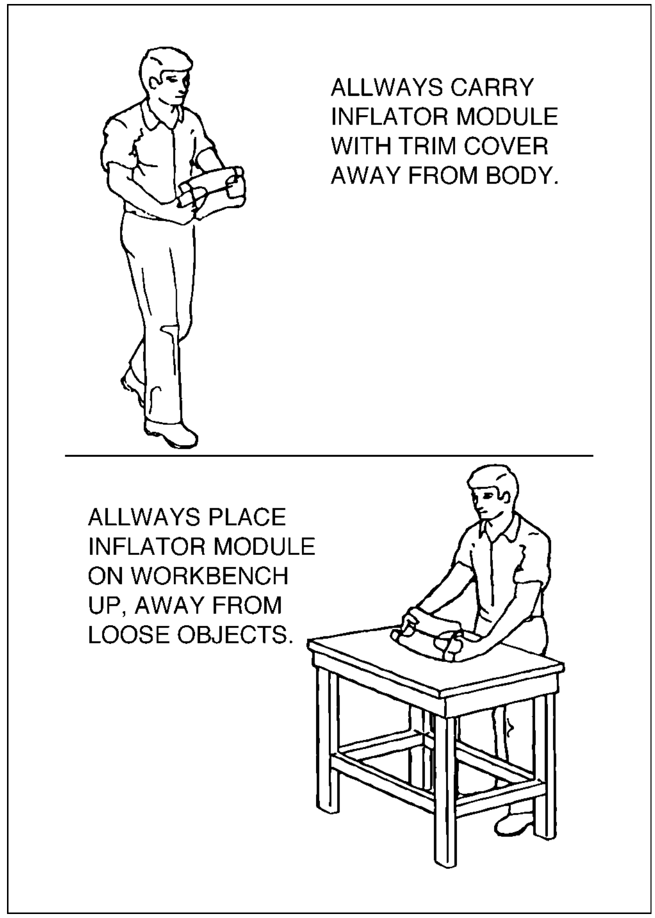
Live (Undeployed) Air Bag Assembly

Special care is necessary when handling and storing a live (undeployed) air bag assembly. The rapid gas generation produced during deployment of the air bag could cause the air bag assembly, or an object in front of the air bag assembly, to be thrown through the air in the unlikely event of an accidental deployment.



RTW79ASH000301

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG OPENING IS POINTED AWAY FROM YOU. IN CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. NEVER CARRY THE AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF THE MODULE.



827RS044

Air Bag Assembly Shipping Procedure For Live (Undeployed) Air Bag Assemblies

Service personnel should refer to the latest Service Bulletins for proper SRS air bag assembly shipping procedures.

Deployed Air Bag Assembly (Driver Side)

You should wear gloves and safety glasses. After the air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and by-products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by-product of the deployment reaction. The sodium hydroxide then quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present.

Air Bag Assembly Scrapping Procedure

During the course of a vehicle's useful life, certain situations may arise which will necessitate the disposal of a live (undeployed) air bag assembly. This information covers proper procedures for disposing of a live air bag assembly.

Before a live air bag assembly can be disposed of, it must be deployed. A live air bag assembly must not be disposed of through normal refuse channels.

WARNING: FAILURE TO FOLLOW PROPER SUPPLEMENTAL RESTRAINT SYSTEM (SRS) AIR BAG ASSEMBLY DISPOSAL PROCEDURES CAN RESULT IN AIR BAG DEPLOYMENT WHICH MAY CAUSE PERSONAL INJURY. AN UNDEPLOYED AIR BAG ASSEMBLY MUST NOT BE DISPOSED OF THROUGH NORMAL REFUSE CHANNELS. THE UNDEPLOYED AIR BAG ASSEMBLY CONTAINS SUBSTANCES THAT CAN CAUSE SEVERE ILLNESS OR PERSONAL INJURY IF THE SEALED CONTAINER IS DAMAGED DURING DISPOSAL. DISPOSAL IN ANY MANNER INCONSISTENT WITH PROPER PROCEDURES MAY BE A VIOLATION OF FEDERAL, STATE, AND / OR LOCAL LAW.

In situations which require deployment of a live air bag assembly, deployment may be accomplished inside or outside the vehicle. The method employed depends upon the final disposition of the particular vehicle, as noted in “Deployment Outside Vehicle” and “Deployment Inside Vehicle” in this section.

Deployment Outside Vehicle (Driver Air Bag Assembly)

Deployment outside the vehicle is proper when the vehicle is to be returned to service. This includes, for example, situations in which the vehicle will be returned to useful service after a functionally or cosmetically deficient air bag assembly is replaced. Deployment and disposal of a malfunctioning air bag assembly is, of course, subject to any required retention period.

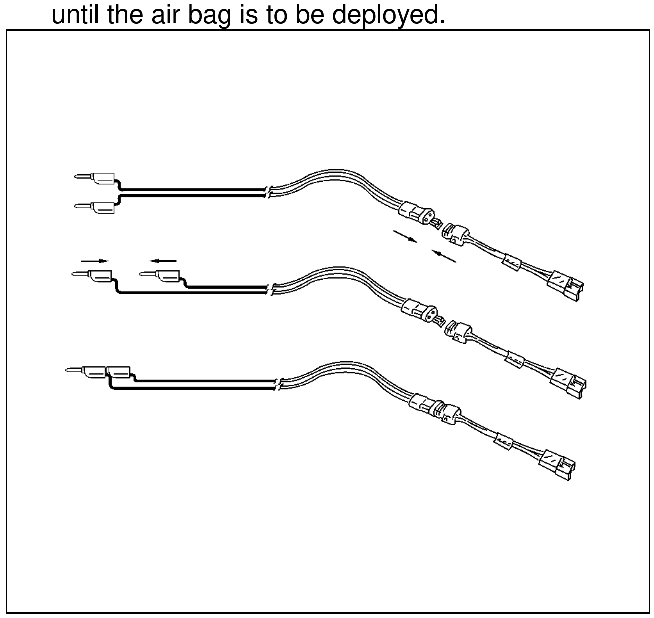
For deployment of a live (undeployed) air bag assembly outside the vehicle, the deployment procedure must be followed exactly. Always wear safety glasses during this deployment procedure until a deployed air bag assembly is scrapped or until an undeployed air bag assembly is shipped. Before performing the procedures you should be familiar with servicing the SRS and with proper handling of the air bag assembly. Procedures should be read fully before they are performed.

The following procedure requires use of a 5-8840-2468-06 SRS deployment harness with appropriate pigtail adapter. Do not attempt the procedure without a 5-8840-2468-0 adapter.

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY. NEVER CONNECT THE DEPLOYMENT HARNESS TO ANY POWER SOURCE BEFORE CONNECTING THE DEPLOYMENT HARNESS TO THE DRIVER AIR BAG ASSEMBLY. DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

NOTE: This information applies only to driver air bag assembly. Refer to “Deployment Outside Vehicle (Passenger Air Bag assembly)” in this section for information on passenger air bag assembly scrapping.

1. Turn the ignition switch to “LOCK”, remove the key and put on safety glasses.
2. Inspect the 5-8840-2468-0 SRS Deployment Harness and appropriate pigtail adapter for damage. If the harness or pigtail adapter is damaged, discard and obtain a replacement.
3. Short the two SRS deployment harness leads together by fully seating one banana plug into the other. The SRS deployment harness shall remain shorted and not be connected to a power source until the air bag is to be deployed.

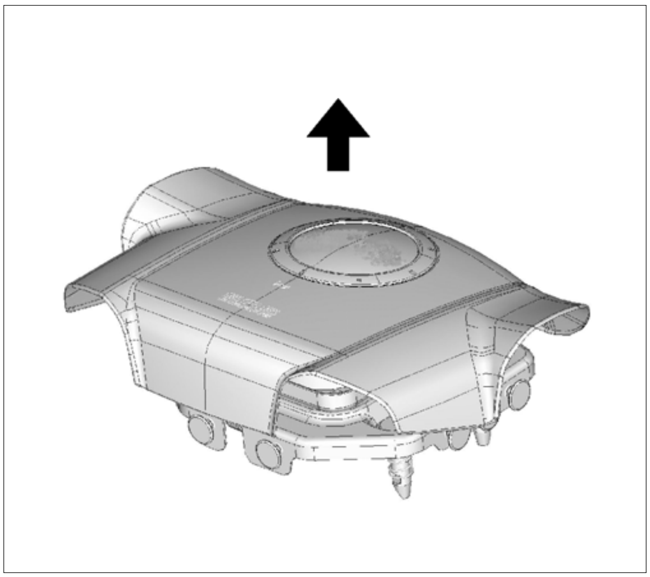


827RS004

4. Connect the appropriate pigtail adapter to the SRS deployment harness.
5. Remove the driver air bag assembly from the vehicle. Refer to “Inflator Module Removal” in this manual.

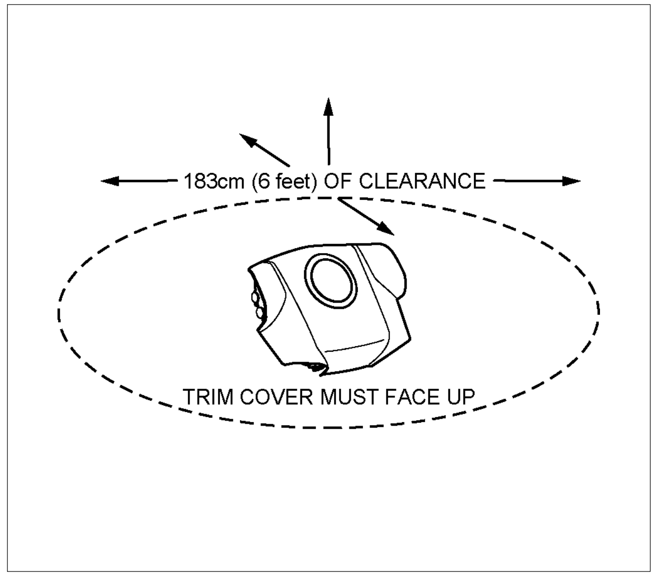
WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE AIR BAG AND TRIM COVER UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

6. Place the driver air bag assembly on a work bench or other surface away from all loose or flammable objects with its trim cover facing up, away from the surface.



RTW79ASH001101

7. Clear a space on the ground about 183 cm (six feet) in diameter where the driver air bag assembly is to be deployed. A paved, outdoor location where there is no activity is preferred. If an outdoor location is not available, a space on the shop floor where there is no activity and there is sufficient ventilation is recommended. Ensure no loose or flammable objects are within the deployment area.

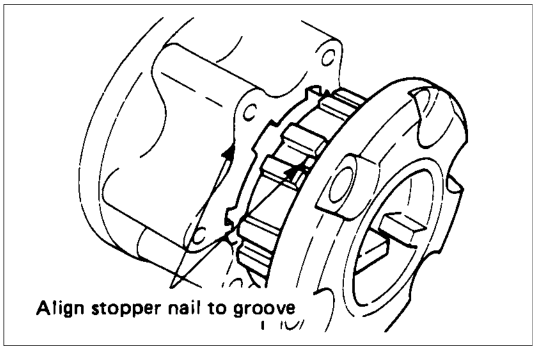


RTW79ASH001201

8. Place the driver air bag assembly, with its trim cover facing up, on the ground in the space just cleared.
9. Stretch the SRS deployment harness and pigtail adapter from the driver air bag assembly to its full length.
10. Place a power source near the shorted end of the SRS deployment harness. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
11. Connect the driver air bag assembly to the pigtail adapter on the SRS deployment harness. The deployment harness shall remain shorted and not be connected to a power source until the air bag is to be deployed. The driver air bag assembly will immediately deploy the air bag when a power source is connected to it.

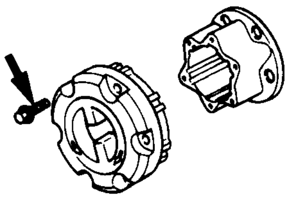
NOTE: Ensure that the pigtail adapter is firmly seated into the driver air bag assembly connector. Failure to fully seat the connectors may leave the shorting bar located in the driver air bag assembly connector functioning (shorted) and may result in no deployment of the driver air bag assembly.

12. Verify that the area around the driver air bag assembly is clear of all people and loose or flammable objects.
13. Verify that the driver air bag assembly is resting with its trim cover facing up.
14. Notify all people in the immediate area that you intend to deploy the driver air bag. The deployment will be accompanied by a substantial noise which may startle the uninformed.
15. Separate the two banana plugs on the SRS deployment harness.



24.Cover Assembly

Align stopper nails to grooves of body.



25.Bolt

Torque	N·m (kgf·m/lb·in)
12 (1.2 / 104)	

- Refer to SECTION 3E "WHEELS AND TIRES" for wheel install procedure.

NOTE: When the air bag deploys, the driver air bag assembly may jump about 30 cm (one foot) vertically. This is a normal reaction of the driver air bag to the force of the rapid gas expansion inside the air bag.

NOTE: When the air bag deploys, the rapid gas expansion will create a substantial noise. Notify all people in the immediate area that you intend to deploy the driver air bag.

WARNING: THE DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT HARNESS TO THE POWER SOURCE SHOULD ALWAYS BE THE LAST STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY.

16. Connect the SRS deployment harness wires to the power source to immediately deploy the driver air bag. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
17. Disconnect the SRS deployment harness from the power source.
18. Short the two SRS deployment harness leads together by fully seating one banana plug into the other.
19. In the unlikely event that the driver air bag assembly did not deploy after following these procedures, proceed immediately with Steps 24 through 26. If 19. the driver air bag assembly did deploy, proceed with Steps 20 through 23.
20. Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed driver air bag assembly. After the air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This power consists primarily of cornstarch (used to lubricate the bag as it inflates) and by-products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by-product of the deployment reaction. The sodium hydroxide then quickly reacts with the atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment.

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE VERY HOT. ALLOW THE INFLATOR MODULE TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE DEPLOYED AIR BAG ASSEMBLY NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN FIRE OR PERSONAL INJURY.

AFTER A DRIVER AIR BAG ASSEMBLY HAS BEEN DEPLOYED, THE METAL CANISTER AND SURROUNDING AREAS OF THE DRIVER AIR BAG ASSEMBLY WILL BE VERY HOT. DO NOT TOUCH THE METAL AREAS OF THE DRIVER AIR BAG ASSEMBLY FOR ABOUT TEN MINUTES AFTER DEPLOYMENT. IF THE DEPLOYED DRIVER AIR BAG ASSEMBLY MUST BE MOVED BEFORE IT IS COOL, WEAR GLOVES AND HANDLE BY THE AIR BAG OR TRIM COVER.

21. Disconnect the pigtail adapter from the driver air bag assembly as soon after deployment as possible. This will prevent damage to the pigtail adapter or SRS deployment harness due to possible contact with the hot driver air bag assembly canister. The pigtail adapter can be reused. They should, however, be inspected for damage after each deployment and replaced if necessary.
22. Dispose of the deployed driver air bag assembly through normal refuse channels after it has cooled for at least 30 minutes.
23. Wash your hands with mild soap and water afterward.

NOTE: The remaining steps are to be followed in the unlikely event that the driver air bag assembly did not deploy after following these procedures.

24. Ensure that the SRS deployment harness has been disconnected from the power source and that its two banana plugs have been shorted together by fully seating one banana plug into the other.
25. Disconnect the pigtail adapter from the driver air bag assembly.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE INFLATOR MODULE UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

26. Temporarily store the driver air bag assembly with its trim cover facing up, away from the surface upon which it rests.

Deployment Outside Vehicle (Passenger Air Bag Assembly)

WARNING: FAILURE TO FOLLOW PROPER SRS AIR BAG ASSEMBLY DISPOSAL PROCEDURES CAN RESULT IN AIR BAG DEPLOYMENT WHICH MAY CAUSE PERSONAL INJURY. UNDEPLOYED AIR BAG ASSEMBLIES MUST NOT BE DISPOSED OF THROUGH NORMAL REFUSE CHANNELS. THE UNDEPLOYED AIR BAG ASSEMBLY CONTAINS SUBSTANCES THAT CAN CAUSE SEVERE ILLNESS OR PERSONAL INJURY IF THE SEALED CONTAINER IS DAMAGED DURING DISPOSAL. DISPOSAL IN ANY MANNER INCONSISTENT WITH PROPER PROCEDURES MAY BE A VIOLATION OF FEDERAL, STATE AND/OR LOCAL LAWS.

Deployment out of the vehicle is proper when the vehicle is to be returned to service. This includes, for example, situations in which a functionally or cosmetically deficient air bag assembly is replaced. Deployment and disposal of an air bag assembly is, of course, subject to any required retention period.

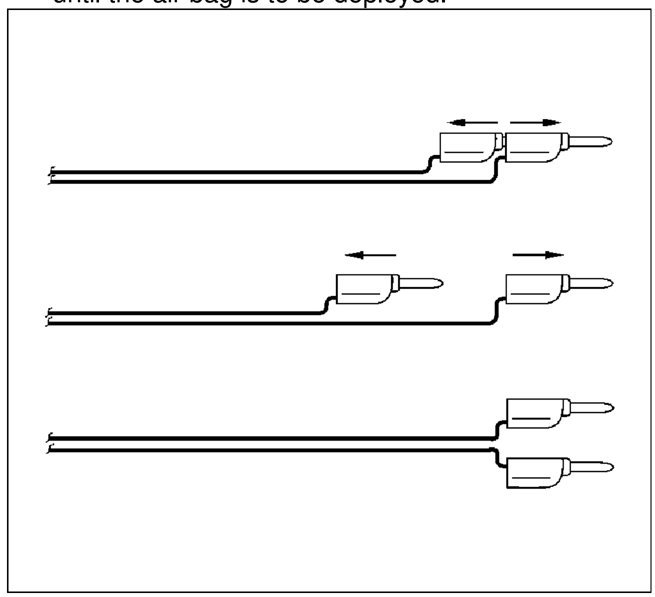
For deployment of a live air bag assembly out of the vehicle, the deployment procedure must be followed exactly. Always wear safety glasses during this deployment procedure until the deployed air bag assembly is scrapped. Before performing the procedures, you should be familiar with servicing the SRS system and with proper handling of the air bag assembly. Procedures should be read fully before they are performed.

The following procedure requires use of a 5-8840-2468-0 SRS Deployment Harness with the appropriate pigtail adapter. The procedure also requires the use of a 5-8840-2420-0 Passenger Side SRS Module Deployment Fixture. Do not attempt this procedure without a 5-8840-2468-0 and adapter, and a 5-8840-2420-0.

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY. NEVER CONNECT THE DEPLOYMENT HARNESS TO ANY POWER SOURCE BEFORE CONNECTING THE DEPLOYMENT HARNESS TO THE AIR BAG ASSEMBLY. THE DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

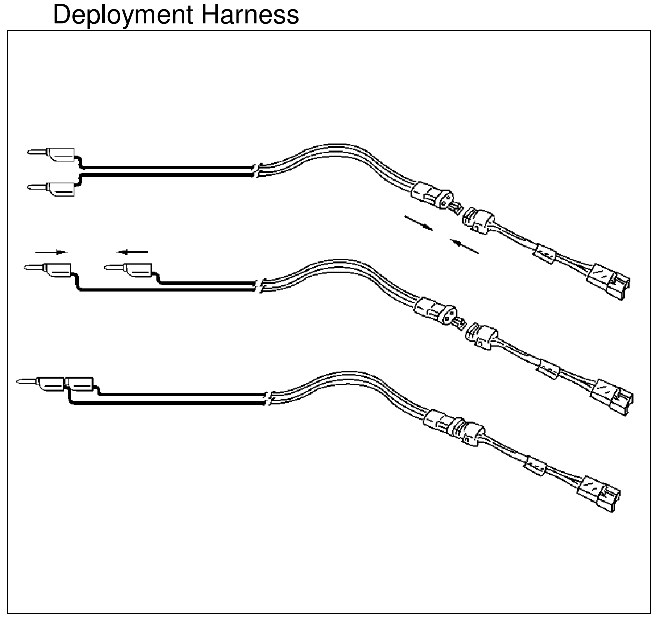
NOTE: This information applies only to passenger air bag assembly. Information for disposing of a live driver air bag assembly can be found in "Deployment Outside Vehicle" (Driver Air Bag Assembly) in this section.

1. Turn the ignition switch to "LOCK", remove the key, and put on the safety glasses.
2. Inspect the 5-8840-2468-0 SRS Deployment Harness and appropriate pigtail adapter for damage. If the harness or pigtail is damaged, discard and obtain a replacement.
3. Short the two SRS Deployment Harness leads together by fully seating one banana plug into the other. The SRS Deployment Harness shall remain shorted and not be connected to a power source until the air bag is to be deployed.



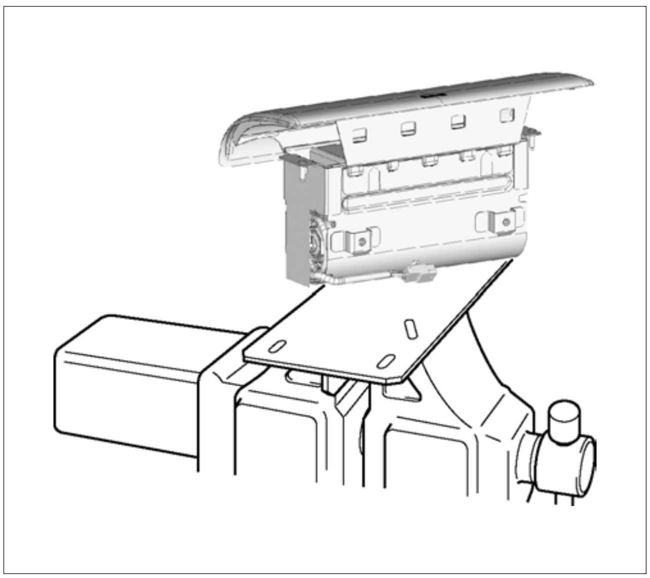
827RS003

4. Connect the appropriate pigtail adapter to the SRS Deployment Harness



827RS004

5. Remove the passenger air bag assembly from the vehicle. Refer to “Passenger Air Bag Assembly Removal “.
6. Clear a space on the ground approximately 183 cm (six feet) in diameter where the fixture with attached air bag assembly is to be placed for deployment. A paved outdoor location where there is no activity is preferred. If an outdoor location is not available, a space on the shop floor where there is no activity and there is sufficient ventilation is recommended. Ensure that no loose or flammable objects are within the deployment area.
7. Place the 5-8840-2420-0 on the bench vise. This is necessary to provide sufficient stabilization of the fixture during deployment.
8. Attach the passenger air bag assembly in the 5-8840-2420-0. The air bag assembly must be mounted such that the bag will deploy upward. SECURELY HAND–TIGHTEN ALL FASTENERS PRIOR TO DEPLOYMENT.



RTW79ASH000601

9. Stretch the SRS Deployment Harness and pigtail adapter from the air bag assembly to its full length.
10. Place a power source near the shorted end of the SRS deployment harness. (Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.)
11. Connect the air bag assembly to the pigtail adapter on the SRS deployment harness. The SRS Deployment Harness shall remain shorted and not be connected to a power source until the air bag is to be deployed. The air bag assembly will immediately deploy the air bag when a power source is connected to it.

NOTE: Ensure that the pigtail adapter is firmly seated into the air bag assembly connector. Failure to fully seat the connectors may leave the shorting bar located in the air bag assembly connector functioning (shorting the deployment circuit) and may result in no deployment of the air bag assembly.

12. Verify that the area around the passenger air bag assembly is clear of all people and loose or flammable objects.
13. Verify that the passenger air bag assembly is firmly and properly in the 5-8840-2420-0.
14. Notify all people in the immediate area of your intention to deploy the passenger air bag assembly. The deployment will be accompanied by a substantial noise which may startle the uninformed.
15. Separate the two banana plugs on the SRS deployment harness.

NOTE: When the air bag deploys, the driver air bag assembly may jump about 30 cm (one foot) vertically. This is a normal reaction of the driver air bag to the force of the rapid gas expansion inside the air bag.

NOTE: When the air bag deploys, the rapid gas expansion will create a substantial noise. Notify all people in the immediate area that you intend to deploy the air bag assembly.

WARNING: THE DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT HARNESS TO THE POWER SOURCE SHOULD ALWAYS BE THE LAST STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED MAY RESULT IN PERSONAL INJURY.

16. Connect the SRS deployment harness wires to the power source to immediately deploy the air bag assembly. Recommended application : 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
17. Disconnect the SRS deployment harness from the power source.
18. Short the two SRS deployment harness leads together by fully seating one banana plug into the other.
19. In the unlikely event that the passenger air bag assembly did not deploy after following these procedures, proceed immediately with Steps 24 through 26. If the passenger air bag assembly deployed as intended, proceed with Steps 20 through 23.

20. The passenger inflator requires no special precaution after deployment. 95% of the particulate emission is potassium chloride (KLC), which is commonly sold as an edible salt-substitute. Even if water is applied, post deployment products are relatively pH neutral. Disposing of the inflator by burying it in a landfill will not produce any hazardous products. As with any dusty environment, safety goggles, dust mask and gloves should be worn.

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE HOT. ALLOW THE AIR BAG ASSEMBLY TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE DEPLOYED INFLATOR MODULE NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN FIRE OR PERSONAL INJURY. AFTER AN AIR BAG ASSEMBLY HAS BEEN DEPLOYED, THE METAL CANISTER AND SURROUNDING AREAS OF THE AIR BAG ASSEMBLY WILL BE HOT. DO NOT TOUCH THE METAL AREAS OF THE AIR BAG ASSEMBLY FOR ABOUT THIRTY MINUTES AFTER DEPLOYMENT. IF THE DEPLOYED AIR BAG ASSEMBLY MUST BE MOVED BEFORE IT IS COOL, WEAR GLOVES AND HANDLE BY THE AIR BAG ITSELF.

21. Disconnect the pigtail adapter from the air bag assembly as soon after deployment as possible to avoid damage to the pigtail adapter or SRS deployment harness from contacting the hot air bag assembly canister. The pigtail adapter and SRS deployment harness are designed to be reused. They should, however, be inspected for damage after each deployment and replaced if necessary.
22. Dispose of the deployed air bag assembly through normal refuse channels after it has cooled for at least 30 minutes.
23. Wash your hands with mild soap and water afterward.

NOTE: The remaining steps are to be followed in the unlikely event that the air bag assembly did not deploy after following the above procedures.

24. Ensure that the SRS deployment harness has been disconnected from the power source and that its two banana plugs have been shorted together by fully seating one banana plug into the other.
25. Disconnect the pigtail adapter from the air bag assembly.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG UP AND AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES MAY RESULT IN PERSONAL INJURY.

26. Temporarily store the air bag assembly with the bag facing up, away from the surface upon which it rests.

Deployment Inside Vehicle (Vehicle Scrapping Procedure)

Deployment inside the vehicle is proper when the vehicle is to be destroyed or salvaged for component parts. This includes, but is not limited to, the following situations:

1. The vehicle has completed its useful life.
2. The vehicle has been damaged beyond repair in a nondeployment type accident.
3. The vehicle has been stripped or damaged beyond repair in a theft.
4. The vehicle will be salvaged for component parts to be used on a vehicle with a different Vehicle Identification Number (VIN) as opposed to being rebuilt with the same VIN. Never use SRS components from another vehicle.

WARNING: FAILURE TO FOLLOW PROPER SRS AIR BAG ASSEMBLY DISPOSAL PROCEDURES CAN RESULT IN AIR BAG DEPLOYMENT WHICH MAY CAUSE PERSONAL INJURY. UNDEPLOYED AIR BAG ASSEMBLIES MUST NOT BE DISPOSED OF THROUGH NORMAL REFUSE CHANNELS. THE UNDEPLOYED AIR BAG ASSEMBLY CONTAINS SUBSTANCES THAT CAN CAUSE SEVERE ILLNESS OR PERSONAL INJURY IF THE SEALED CONTAINER IS DAMAGED DURING DISPOSAL. DISPOSAL IN ANY MANNER INCONSISTENT WITH PROPER PROCEDURES MAY BE A VIOLATION OF FEDERAL, STATE AND/OR LOCAL LAWS.

1. Turn the ignition switch to “LOCK,” remove the key and put on the safety glasses.
2. Remove all loose objects from the front seats.
3. Disconnect the driver air bag assembly yellow connector located at the base of the steering column.
4. Cut the driver air bag assembly yellow harness connector from the vehicle leaving at least 15 cm (six inches) of wire at the connector.

5. Strip 13 mm (1/2 inch) of insulation from the yellow – green and yellow – black wire lead of the connector.
6. Cut two 900 cm (30 feet) deployment wires from 0.8 mm^2 (18 gauge) or thicker multi–strand wire. These wires will be used to fabricate the driver deployment harness.
7. Strip 13 mm (1/2 inch) of insulation from both ends of the wires cut in the previous step.
8. Short the wires by twisting together one end from each. Deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed.

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT WIRES TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT WIRES TO THE AIR BAG ASSEMBLY LEADS. DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

9. Twist together one connector wire lead to one deployment wire. The connection should be mechanically secure.
10. Bend the twisted connection made in the previous step flat and wrap it tightly with electrical tape to insulate and secure.
11. Twist together, bend and tape the remaining connector wire lead to the remaining deployment wire.
12. Connect the deployment harness to the driver air bag assembly yellow connector at the base of the steering column. Route the deployment harness out through the driver's side of the vehicle.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED.

THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT.

Connecting the deployment wires to the power source should always be the final step in the air bag assembly deployment procedure.

Failure to follow procedures in the order listed could result in personal injury.

13. Disconnect the passenger air bag assembly yellow connector located behind the glove box assembly.
14. Cut the passenger air bag assembly harness connector from the vehicle leaving at least 15 cm (six inches) of wire at the connector.
15. Strip 13 mm (1/2 inch) of insulation from the blue–white and pink–blue wire lead of the connector.
16. Cut two 900 cm (30 feet) deployment wires from 0.8 mm^2 (18 gauge) or thicker multi–strand wire. These wires will be used to fabricate the passenger deployment harness.
17. Strip 13 mm (1/2 inch) of insulation from both ends of the wires cut in the previous step.
18. Short the wires by twisting together one end from each. The deployment wires shall remain shorted and not be connected to a power source until the air bag is to be deployed.

WARNING: FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY. NEVER CONNECT DEPLOYMENT WIRES TO ANY POWER SOURCE BEFORE CONNECTING DEPLOYMENT WIRES TO THE AIR BAG ASSEMBLY LEADS. DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. WEAR SAFETY GLASSES THROUGHOUT THIS ENTIRE DEPLOYMENT AND DISPOSAL PROCEDURE.

19. Twist together one connector wire lead to one deployment wire. The connection should be mechanically secure.
20. Bend the twisted connection made in the previous step flat and wrap it tightly with electrical tape to insulate and secure.
21. Twist together, bend and tape the remaining connector wire lead to the remaining deployment wire.
22. Connect the deployment harness to the passenger air bag assembly yellow connector located behind the glove box assembly. Route the deployment harness out through the passenger side of the vehicle.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT WIRES SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

23. Verify that the inside of the vehicle and the area surrounding the vehicle are clear of all people and loose or flammable objects.
24. Stretch the driver and passenger deployment harnesses to their full length.
25. Completely cover the windshield area and front door window openings with a drop cloth, blanket or similar item. This reduces the possibility of injury due to possible fragmentation of the vehicle's glass or interior.
26. Notify all people in the immediate area that you intend to deploy the air bags. The deployment will be accompanied by a substantial noise which may startle the uninformed.
27. Separate the two ends of the driver deployment harness wires.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT WIRES TO THE POWER SOURCE SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

NOTE: When the air bag deploys, the rapid gas expansion will create a substantial noise. Notify all people in the immediate area that you intend to deploy the air bags.

28. Connect the driver deployment harness wires to a power source to immediately deploy the driver air bag assembly. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.
29. Separate the two ends of the passenger deployment harness wires.

WARNING: DEPLOYMENT WIRES SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE AIR BAG IS TO BE DEPLOYED. THE AIR BAG ASSEMBLY WILL IMMEDIATELY DEPLOY THE AIR BAG WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT WIRES TO THE POWER SOURCE SHOULD ALWAYS BE THE FINAL STEP IN THE AIR BAG ASSEMBLY DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

30. Connect the passenger deployment harness wires to a power source to immediately deploy the passenger air bag assembly. Recommended application: 12 volts minimum, 2 amps minimum. A vehicle battery is suggested.(Driver air bag assembly) Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag assembly. After an air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and by-products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by-product of the deployment reaction. The sodium hydroxide then quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment (Passenger air bag assembly) The passenger inflator requires no special precaution after deployment. 95% of the particulate mission is potassium chloride (KLC), which is commonly sold as an edible salt-substitute. Even if water is applied, post deployment products are relatively pH neutral. Disposing of the inflator by burying it in a landfill will not produce any hazardous products. As with any dusty environment, safety goggles, dust mask and gloves should be worn.

WARNING: SAFETY PRECAUTIONS MUST BE OBSERVED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE METAL SURFACES OF THE AIR BAG ASSEMBLY WILL BE VERY HOT. ALLOW THE AIR BAG ASSEMBLY TO COOL BEFORE HANDLING ANY METAL PORTION OF IT. DO NOT PLACE THE HOT DEPLOYED AIR BAG ASSEMBLY NEAR ANY FLAMMABLE OBJECTS. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN FIRE OR PERSONAL INJURY.

After an air bag assembly has been deployed, the metal canister and surrounding areas of the air bag assembly will be very hot. Do not touch the metal areas of the air bag assembly for about 30 minutes after deployment. If the deployed air bag assembly must be moved before it is cool, wear gloves and handle by the air bag or trim cover.

31. Short the driver deployment harness wires by twisting together one end from each. Repeat this procedure for the passenger deployment harness.
32. Carefully remove the drop cloth from the vehicle and clean off any fragments or discard the drop cloth entirely.
33. Disconnect the driver deployment harness and the passenger deployment harness from the vehicle and discard.

34. In the unlikely event that either or both of the air bag assemblies did not deploy after following these procedures, proceed immediately with Steps 36 through 37. If the air bag assembly deployed, proceed to step 35.
35. With both air bags deployed, the vehicle may be scrapped in the same manner as a non–SRS equipped vehicle.

NOTE: The remaining steps are to be followed in the unlikely event that the air bag assembly did not deploy after following these procedures.

36. Remove the undeployed air bag assembly (s) from the vehicle. For driver air bag assembly refer to "Driver Air Bag Assembly Removal" in this manual. For passenger air bag assembly, refer to "Passenger Air Bag Assembly Removal" in this manual.

WARNING: WHEN STORING A LIVE AIR BAG ASSEMBLY OR WHEN LEAVING A LIVE AIR BAG ASSEMBLY UNATTENDED ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN PERSONAL INJURY.

37. Temporarily store the air bag assembly with the air bag opening facing up, away from the surface upon which it rests.

Deployed Air Bag Assembly Handling

Put on a pair of shop gloves and safety glasses to protect your hands and eyes from possible irritation and heat when handling the deployed air bag assembly.

After the air bag assembly has been deployed, the surface of the air bag may contain a powdery residue. This powder consists primarily of cornstarch (used to lubricate the bag as it inflates) and by-products of the chemical reaction. Sodium hydroxide dust (similar to lye soap) is produced as a by product of the deployment reaction. The sodium hydroxide then quickly reacts with atmospheric moisture and is converted to sodium carbonate and sodium bicarbonate (baking soda). Therefore, it is unlikely that sodium hydroxide will be present after deployment.

Service Precautions for SRS Component Service

CAUTION: When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. Fasteners that are not reused, and those requiring a thread locking compound will be called out. The correct torque value must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

WARNING: WHEN PERFORMING SERVICE ON OR AROUND SRS COMPONENTS OR SRS WIRING, FOLLOW THE PROCEDURES LISTED BELOW TO TEMPORARILY DISABLE THE SRS. FAILURE TO FOLLOW PROCEDURES COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY OR OTHERWISE UNNEEDED SRS REPAIRS.

The SRS control unit in the Driver–Passenger SRS can maintain sufficient voltage to cause a deployment for up to 15 seconds after the ignition switch is turned “OFF,” the battery is disconnected, or the fuse powering the SRS control unit is removed.

Many of the service procedures require removal of the “SRS” fuse, and disconnection of the air bag assembly from the deployment loop to avoid an accidental deployment. If the air bag assembly is disconnected from the deployment loop as noted in the “Disabling the SRS” procedure that follows, service can begin immediately without waiting for the 15 second time period to expire.

Disabling The SRS

Removal

Turn the ignition switch to “OFF” and turn the steering wheel so that the vehicle's wheels are pointing straight ahead.

1. Remove the SRS fuse “SRS” from the left dash side lower fuse block or disconnect the battery.
2. Disconnect the yellow connector at the base of steering column.
3. Remove the glove box assembly; Refer to “Passenger air bag assembly replacement” in this section.
4. Disconnect the passenger air bag assembly yellow connector behind the glove box assembly.

CAUTION: With the “SRS” fuse removed and the ignition switch to “ON,” the “SRS” warning lamp will be “ON.” This is normal operation and does not indicate an SRS malfunction.

Enabling The SRS

Installation

Turn the ignition switch to “LOCK” and remove the key.

1. Connect the yellow connector passenger air bag assembly.
2. Install the glove box assembly. Refer to “Passenger Air Bag Assembly Replacement” in this section.
3. Connect the yellow connector at the base of the steering column.
4. Install the “AIR BAG” fuse “SRS” to the left dash side lower fuse block or connect the battery.

Turn the ignition switch to “ON” and verify that the “SRS” warning lamp flashes seven times and then turns to “LOCK”. If it does not operate as described, perform the “SRS Diagnostic System Check” in this section.

Handling / Installation / Diagnosis

1. Air bag assembly should not be subjected to temperatures above 65°C (150°F).
2. Air bag assembly, and SRS control unit should not be used if they have been dropped from a height of 100 centimeters (3.28 feet) or more.
3. When a SRS control unit is replaced, it must be oriented with the arrow on the SRS control unit pointing toward the front of the vehicle. It is very important for the SRS control unit to be located flat on the mounting surface, parallel to the vehicle datum line. It is important that the SRS control unit mounting surface is free of any dirt or other foreign material.
4. Do not apply power to the SRS unless all components are connected or a diagnostic chart requests it, as this will set a diagnostic trouble code.
5. The “SRS Diagnostic System Check” must be the starting point of any SRS diagnostics. The “SRS Diagnostic System Check” will verify proper “SRS” warning lamp operation and will lead you to the correct chart to diagnose any SRS malfunctions. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis, and incorrect parts replacements.

Inspections Required After An Accident

CAUTION: Certain SRS components must be replaced after a frontal crash involving air bag deployment.

In all types of accidents regardless of “Air Bag” deployment, visually inspect all of the following components and replace as required:

– Driver air bag assembly
– Passenger air bag assembly
– Steering wheel
– SRS coil assembly
– Steering column
– Knee bolster and instrument panel mounting attachments
– Driver seat and belt
– Passenger seat and belt
– SRS control unit

The SRS control unit should always be checked according to “SRS Control Unit Replacement Guidelines.”

CAUTION: Refer to “SRS control unit Replacement Guidelines” below for important information on SRS control unit replacement in both deployment and non–deployment crashes.

Inspect the SRS coil assembly wiring and the steering wheel for any sign of scorching, melting, or damage due to excessive heat. If the coil assembly wire or steering wheel is damaged, replace them. The steering column and wheel must be dimensionally checked to determine if they are damaged. Refer to “steering wheel” in this manual.

Never use SRS parts from another vehicle. This does not include remanufactured parts purchased from an authorized ISUZU/GM Retailer; they may be used for SRS repairs.

Do not attempt to repair the SRS control unit, the SRS harness, the SRS coil assembly, the air bag assembly, the steering wheel, or the steering column. Service of these items is replacement only. Verify replacement part numbers.

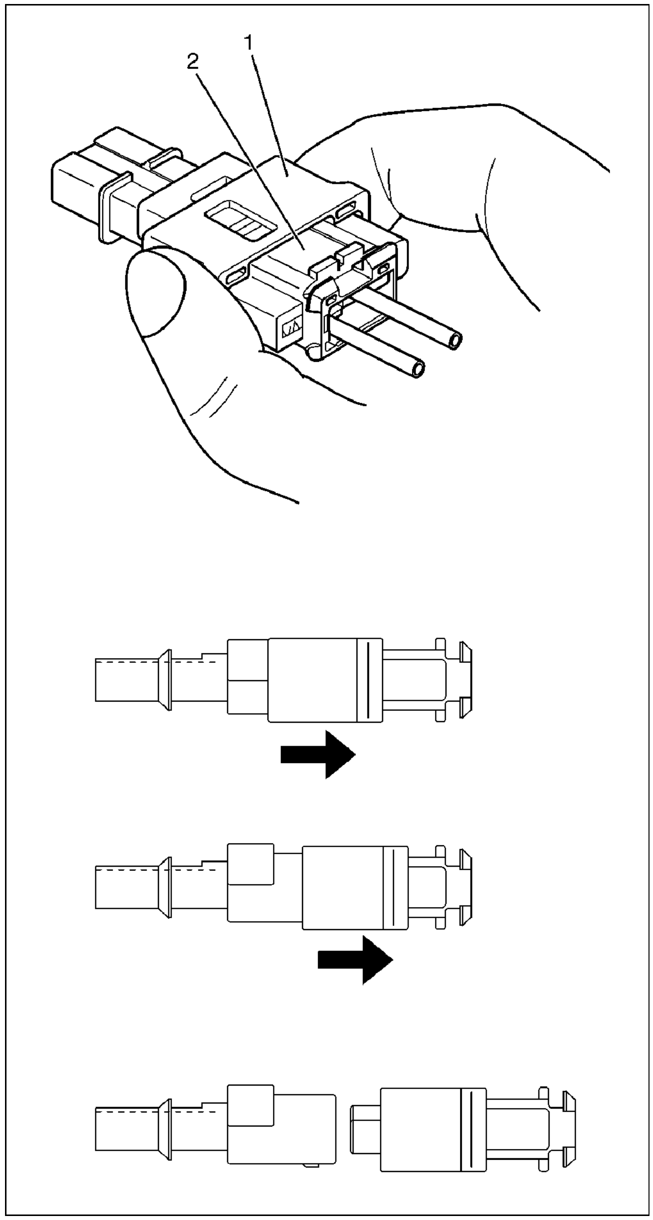
CAUTION: Proper operation of the SRS control unit and the supplemental restraint system (SRS) requires that any repairs to the vehicle structure return it to its original production configuration.

SRS Connectors

CAUTION: The special yellow color connectors are used for the supplemental restraint system-air bag circuit. When removing the cable harness, do not pull the cables otherwise cable disconnection may occur. When connecting the SRS connector, insert the connector completely. Imperfect locking may cause malfunction of the SRS circuit.

Removal

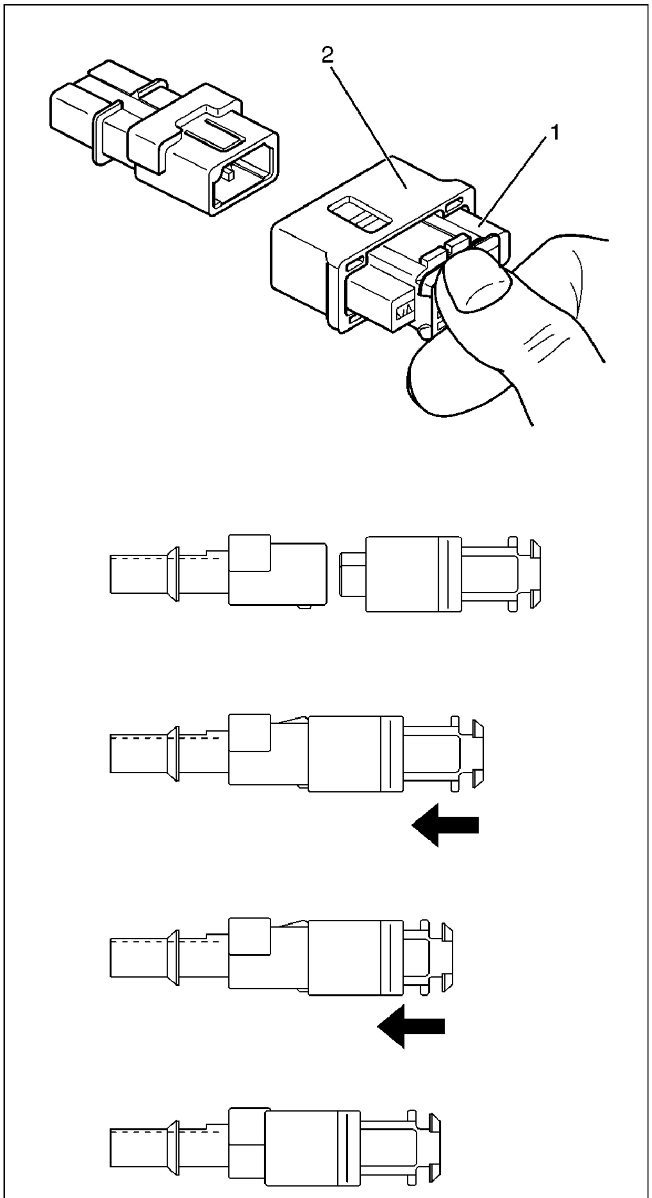
To remove the connector, hold the cover insulator (1) and pull it. The cover insulator slides and the lock will be released. Do not hold the socket insulator (2).



827RW028

Installation

To install the connector, hold the socket insulator (1) and insert it. The cover insulator slides and the connector will be locked. Do not hold the cover insulator (2).



827RW027

TROUBLESHOOTING

Refer to this Section to quickly diagnose and repair front axle problems. Each troubleshooting chart has three headings arranged from left to right.

(1) Checkpoint (2) Trouble Cause (3) Countermeasure

This Section is divided into ten sub-sections:

4×2 Model

1. Wanders and pulls
2. Front wheel shimmy

4×4 Model

1. Oil leak at front axle
2. Oil leak at pinion shaft
3. Noises in front axle drive shaft joint
4. Noises in front axle
5. Wanders and pulls
6. Front wheel shimmy

Propeller shaft

1. Noise
2. Vibration

SRS Control Unit

Service Precautions

WARNING: DURING SERVICE PROCEDURES, BE VERY CAREFUL WHEN HANDLING THE SRS CONTROL UNIT. NEVER STRIKE OR JAR THE SRS CONTROL UNIT. UNDER SOME CIRCUMSTANCES, IT COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY OR IMPROPER OPERATION OF THE SUPPLEMENTAL RESTRAINT SYSTEM (SRS). THE SRS CONTROL UNIT MOUNTING BRACKET BOLTS MUST BE CAREFULLY TORQUED TO ASSURE PROPER OPERATION. NEVER POWER UP THE SRS WHEN THE SRS CONTROL UNIT IS NOT RIGIDLY ATTACHED TO THE VEHICLE. THE SRS CONTROL UNIT COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

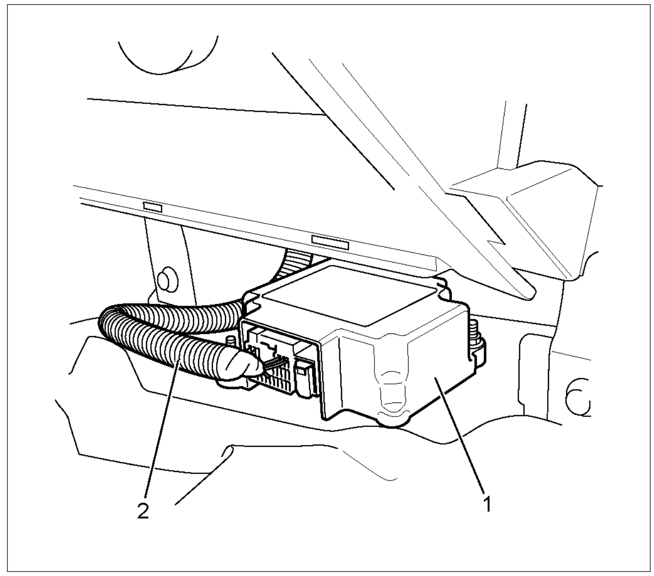
WARNING: PROPER OPERATION OF THE SRS CONTROL UNIT REQUIRES THE SRS CONTROL UNIT TO BE RIGIDLY ATTACHED TO THE VEHICLE STRUCTURE AND THAT THE ARROW ON THE SENSOR BE POINTING TOWARD THE FRONT OF THE VEHICLE.

The SRS control unit is specifically calibrated and is keyed to the SRS control unit location SRS wiring harness. Caution should be used to ensure proper location of the SRS control unit. The keying of the SRS control unit to its location and wiring harness connectors should never be modified in the field.

Removal

1. Disable the SRS (Refer to “Disabling the SRS” in this section).
2. Remove the transmission knob (for M/T) and transfer lever knob.
3. Remove the front console assembly and disconnect the wiring harness connector.
4. Disconnect the SRS control unit harness connector.
5. Remove the three nuts which are fixing the SRS control unit.

   And remove the SRS control unit.



RTW79ASH000401

Legend

(1) SRS control unit

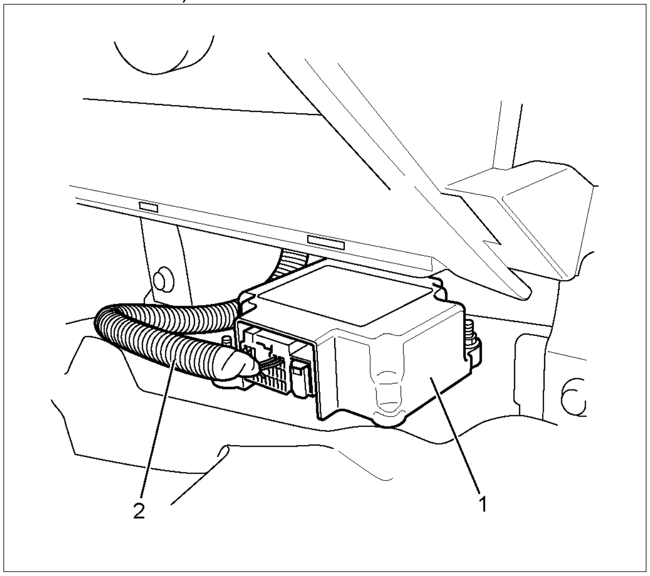
(2) SRS Harness

Installation

1. Install the SRS control unit on the bracket and fixing nuts and tighten the fixing nuts to the specified torque.

   Torque: 7 ± 2 N·m (0.7 ± 0.2 kgf·m/61 lb in)
2. Connect the SRS control unit harness connector.
3. Install the front console.
4. Install the transmission knob (for M/T) and transfer lever knob.

5. Enable the SRS. (Refer to “Enabling the SRS” in this section)



RTW79ASH000401

Driver Air Bag Assembly

Service Precautions

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY–PRODUCT OF THE DEPLOYMENT REACTION THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY THE AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF THE MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING ALIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect the coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

Refer to the “Inflator Module” in the “Power-Assisted Steering System” section.

Installation

Refer to the “Inflator Module” in the “Power-Assisted Steering System” section.

Steering Wheel

Service Precautions

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY–PRODUCT OF THE DEPLOYMENT REACTION THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AN AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF THE MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING ALIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

In the event deployment has occurred, inspect the coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

Refer to the “Steering Wheel” in the “Power-Assisted Steering System” section.

Installation

Refer to the “Steering Wheel” in the “Power-Assisted Steering Wheel” section.

SRS Coil Assembly

Service Precautions

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY–PRODUCT OF THE DEPLOYMENT REACTION THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AN AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF THE MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING ALIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

NOTE: In the event deployment has occurred, inspect the coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

NOTE: The SRS coil is a part of the combination switch assembly, which cannot be replaced separately. Therefore, be sure not to remove the SRS coil from the combination switch assembly.

Refer to the “Combination Switch” in the “Power-Assisted Steering System” section.

Installation

Refer to the “Combination Switch” in the “Power-Assisted Steering System” section.

Steering Column

Service Precautions

WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY–PRODUCT OF THE DEPLOYMENT REACTION THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AN AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF THE MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING ALIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

In the event deployment has occurred, inspect the coil assembly wire for any signs of scorching, melting or any other damage due to excessive heat. If the coil has been damaged, replace it.

Removal

Refer to the “Steering Column” in the “Power-Assisted Steering System” section.

Installation

Refer to the “Steering Column” in the “Power-Assisted Steering System” section.

Passenger Air Bag Assembly

Service Precautions

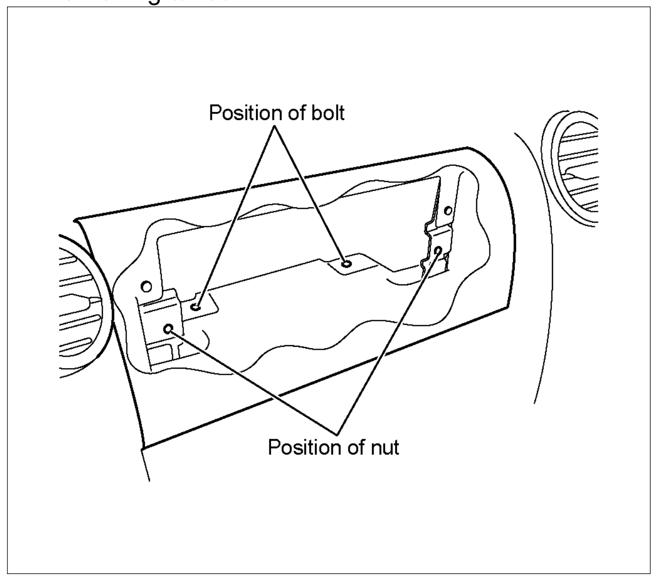
WARNING: SAFETY PRECAUTIONS MUST BE FOLLOWED WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY. AFTER DEPLOYMENT, THE AIR BAG ASSEMBLY SURFACE MAY CONTAIN A SMALL AMOUNT OF SODIUM HYDROXIDE, A BY–PRODUCT OF THE DEPLOYMENT REACTION THAT IS IRRITATING TO THE SKIN AND EYES. MOST OF THE POWDER ON THE AIR BAG ASSEMBLY IS HARMLESS. AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN HANDLING A DEPLOYED AIR BAG ASSEMBLY, AND WASH YOUR HANDS WITH MILD SOAP AND WATER AFTERWARDS.

WARNING: WHEN CARRYING A LIVE AIR BAG ASSEMBLY, MAKE SURE THE BAG AND TRIM COVER ARE POINTED AWAY FROM YOU. NEVER CARRY AN AIR BAG ASSEMBLY BY THE WIRES OR CONNECTOR ON THE UNDERSIDE OF THE MODULE. IN THE CASE OF AN ACCIDENTAL DEPLOYMENT, THE BAG WILL THEN DEPLOY WITH MINIMAL CHANCE OF INJURY. WHEN PLACING ALIVE AIR BAG ASSEMBLY ON A BENCH OR OTHER SURFACE, ALWAYS FACE THE BAG AND TRIM COVER UP, AWAY FROM THE SURFACE. NEVER REST A STEERING COLUMN ASSEMBLY ON THE STEERING WHEEL WITH THE AIR BAG ASSEMBLY FACE DOWN AND COLUMN VERTICAL. THIS IS NECESSARY SO THAT A FREE SPACE IS PROVIDED TO ALLOW THE AIR BAG ASSEMBLY TO EXPAND IN THE UNLIKELY EVENT OF ACCIDENTAL DEPLOYMENT. OTHERWISE, PERSONAL INJURY COULD RESULT.

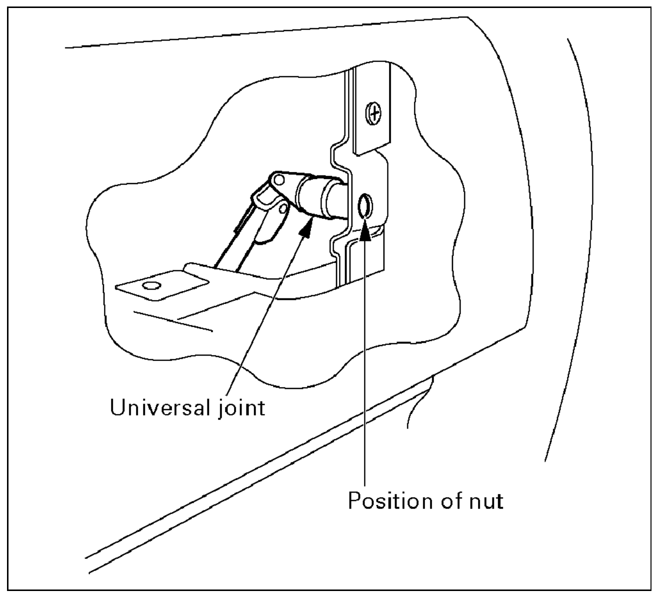
WARNING: IN THE EVENT DEPLOYMENT HAS OCCURRED, INSPECT THE COIL ASSEMBLY WIRE FOR ANY SIGNS OF SCORCHING, MELTING OR ANY OTHER DAMAGE DUE TO EXCESSIVE HEAT. IF THE COIL HAS BEEN DAMAGED, REPLACE IT.

Removal

1. Disable the SRS. (Refer to “Disabling the SRS” in this section)
2. Remove the glove box.
3. Remove the glove box cover.
4. Remove the passenger air bag assembly fixing bolts and nuts. Universal joint is used when removing a nut.



RTW79ASH001301



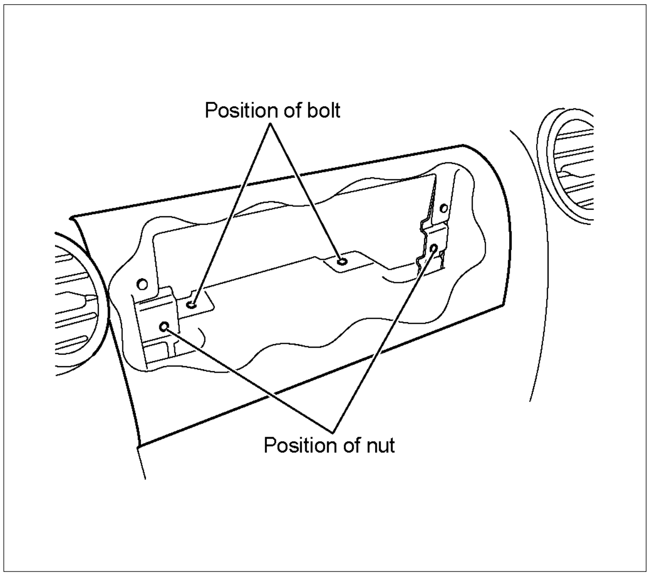
060R300044

5. Remove the passenger air bag assembly.
6. Disconnect the passenger air bag assembly harness connector.

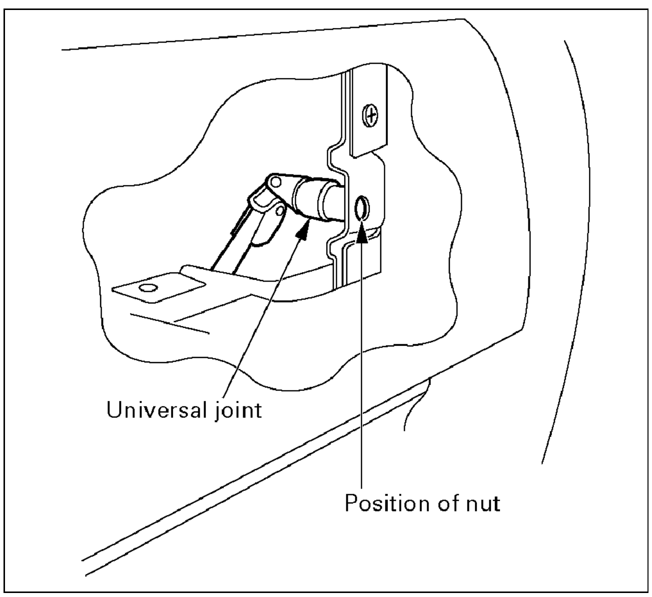
Installation

1. Connect the passenger air bag assembly harness connector.
2. Install the passenger air bag assembly.
3. Install the passenger air bag assembly fixing bolts and nuts. Universal joint is used when removing a nut.

   Torque: 8 N·m (0.8 kgf·m/78 lb in)



RTW79ASH001301



060R300044

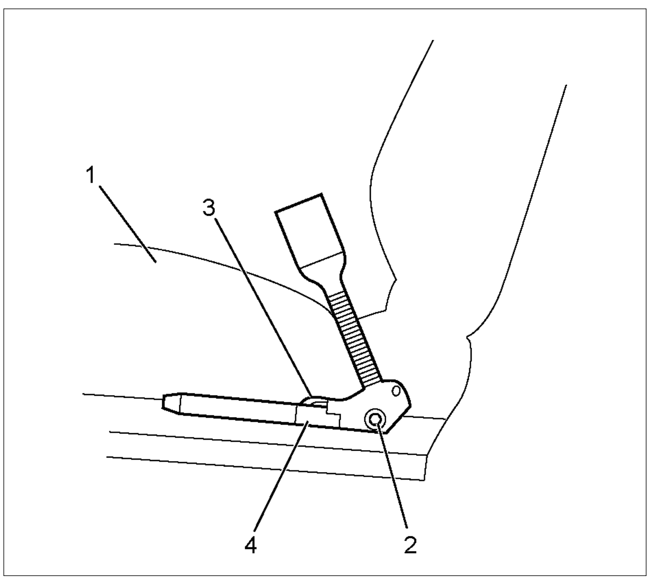
4. Install the glove box cover.
5. Install the glove box.
6. Enable the SRS. (Refer to “Enabling the SRS” in this section)

Pretensioner Seat Belt (If so equipped)

Service Precaution

WARNING: WHEN PERFORMING SERVICE ON OR AROUND THE PRETENSIONER SEAT BELT OR THE PRETENSIONER SEAT BELT WIRING, FOLLOW THE PROCEDURES LISTED BELOW TO TEMPORARILY DISABLE THE PRETENSIONER SEAT BELT.
FAILURE TO FOLLOW PROCEDURES COULD RESULT IN POSSIBLE THE PRETENSIONER SEAT BELT DEPLOYMENT, PERSONAL INJURY OR OTHERWISE UNNEEDED THE PRETENSIONER SEAT BELT REPAIR.
AS A PRECAUTION, WEAR GLOVES AND SAFETY GLASSES WHEN PERFORMING THE PRETENSIONER SEAT BELT. WHEN DEPLOY A LIVE PRETENSIONER SEAT BELT AT OUTSIDE THE VEHICLE, DEPLOYMENT HARNESS SHALL REMAIN SHORTED AND NOT BE CONNECTED TO A POWER SOURCE UNTIL THE PRETENSIONER SEAT BELT IS TO BE DEPLOYED. THE PRETENSIONER SEAT BELT WILL IMMEDIATELY DEPLOY WHEN A POWER SOURCE IS CONNECTED TO IT. CONNECTING THE DEPLOYMENT HARNESS SHOULED ALWAYS BE THE FINAL STEP IN THE PRETENSIONER SEAT BELT DEPLOYMENT PROCEDURE. FAILURE TO FOLLOW PROCEDURES IN THE ORDER LISTED COULD RESULT IN PERSONAL INJURY.

Parts Location



RTW49JSH000301

Legend

(1) Seat
(2) Bolt
(3) Pretensioner Harness
(4) Pretensioner

Removal

1. Turn ignition switch to “LOCK”, remove key.
2. Remove the foot rest located behind the seat.
3. Remove the cover on seat slide.
4. Disconnect the pretensioner connector at the base of the seat.
5. Remove four fixing bolts the seat slide and remove seat.
6. Remove the seat cover.
7. Remove the pretensioner seat belt assembly.

Installation

1. Install the pretensioner seat belt assembly.
2. Install the seat cover.
3. Install the seat on seat slide and four fixing bolts.
4. Connect the yellow pretensioner connector at the base of the seat.
5. Install the cover on seat slide.
6. Install the foot rest located behind the seat.

Main Data and Specifications

Fastener Tightening Specification

Application	N·m	kgf·m	lb·ft/lb·in
SRS control unit	7	0.7	61 lb·in
Steering wheel fixing bolt	35	3.6	26 lb·ft
Steering column (dash panel side fixing bolts)	20	2.0	14 lb·ft
Steering column (Pedal bracket fixing bolt)	20	2.0	14 lb·ft
Steering column (Universal joint fixing bolt)	31	3.2	23 lb·ft
Passenger Air Bag fixing bolt & nut	8	0.8	69 lb·in

4×2 Model

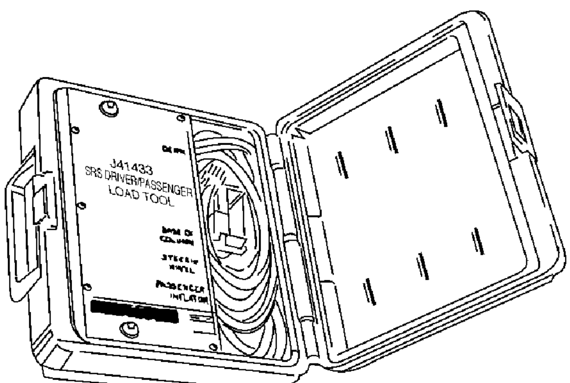
1. WANDERS AND PULLS

Checkpoint		Trouble Cause	Countermeasure
Wheel bearing preload	NG	Too tight	Adjust the wheel bearing preload
OK			
Front alignment	NG	Incorrect	Adjust the front alignment
OK			
Steering unit	NG	Loose or worn	Tighten or replace
OK			
Tire	NG	Worn or improperly inflated	Replace or adjust the inflation
OK			
Suspension	NG	Front or rear suspension parts loose or broken	Tighten or replace

Special Tools

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY–POWERED OR AC–POWERED VOLTMETER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE AN UNPOWERED PROBE–TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

5-8840-2421-0 SRS Driver/Passenger Load Tool



901RS146

The SRS Driver/Passenger Load Tool 5-8840-2421-0 is used only when called for in this section. It is used as a diagnostic aid and safety device to prevent inadvertent air bag assembly deployment.

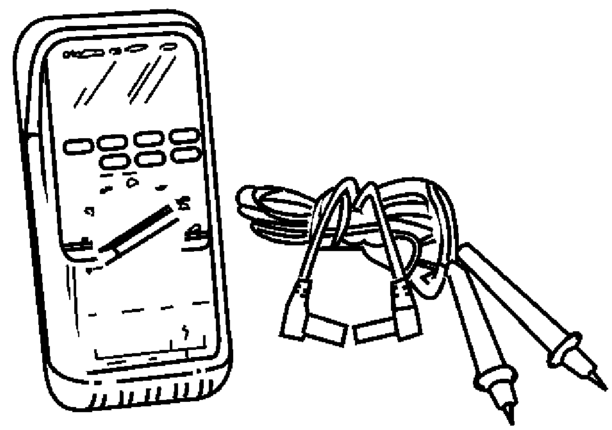
The load tool has three yellow connectors attached to its case.

The three small connectors are electrically functional and serve as resistive load substitutions.

No more than two connectors are used at any time. One of the small connectors is used to substitute for the load of the driver air bag assembly when it is connected at the top of the column to the SRS coil assembly. Another small connector is used to substitute for the load of the driver air bag assembly and the SRS coil assembly when it is connected at the base of the column to the SRS wiring harness. The third small connector is used to substitute for the load of the passenger air bag assembly when connected to the passenger air bag assembly harness connector.

By substituting the resistance of the load tool when called for, a determination can be made as to whether an inflator circuit component is causing system malfunction and which component is causing the malfunction. The load tool should be used only when specifically called for in the diagnostic procedures.

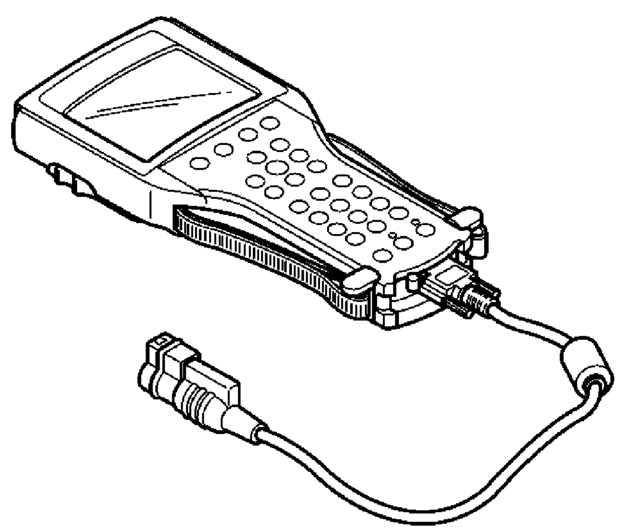
5-8840-0366-0 DMM



901RS163

The 5-8840-0366-0 DMM is the preferred DMM for use in SRS diagnosis and repair. No other DMMs are approved for SRS diagnosis and repair.

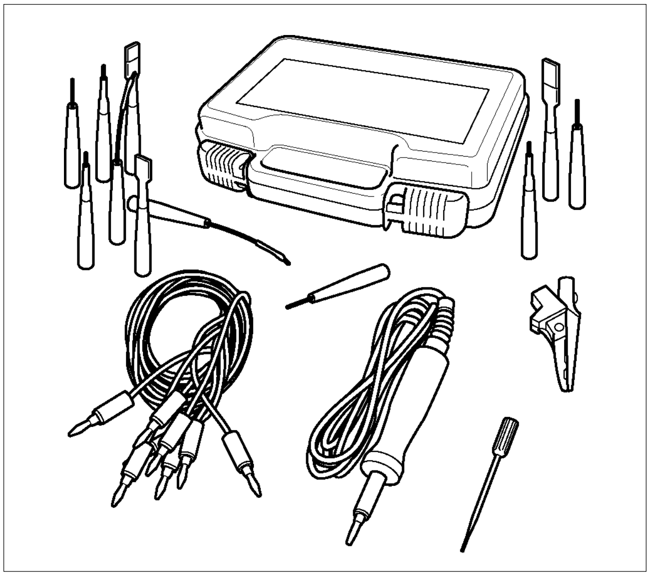
Scan Tool



901RW176

The Tech 2 is used to read and clear SRS Diagnostic Trouble Codes (DTCs). Refer to the Tech 2 Operators Manual for specific information on how to use the Tech 2.

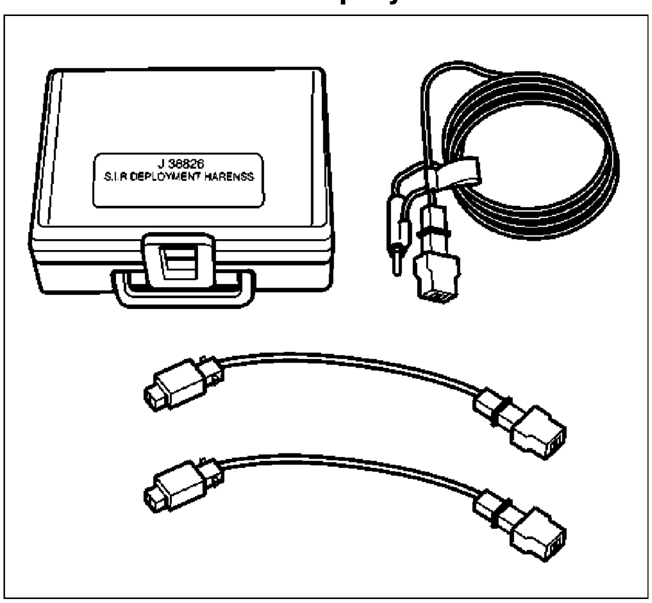
5-8840-2835-0 Connector Test Adapter Kit



AAW0Z0SH020501

The 5-8840-2835-0 Connector Test Adapter Kit must be used whenever a diagnostic procedure requests checking or probing a terminal. Using the appropriate adapter will ensure that no damage to the terminal will occur from the DMM probe, such as spreading or bending. The adapter will also give an idea of whether contact tension is sufficient, helping to find an open or intermittent open due to poor terminal contact.

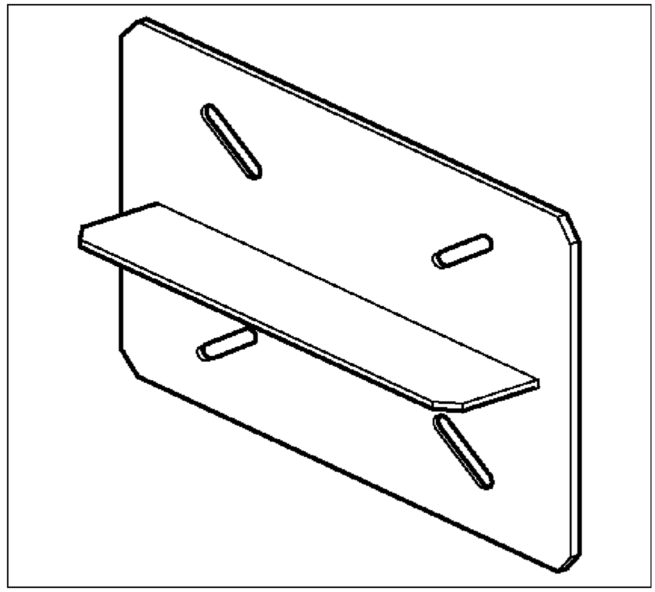
5-8840-2468-0 SRS Deployment Tool



901RW106

The 5-8840-2468-0 SRS Deployment Tool must be used for deployment of the undeployed air bag.

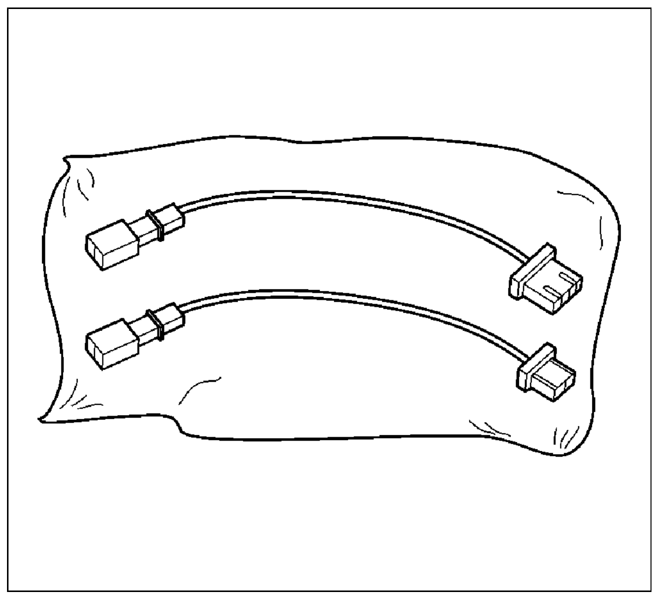
5-8840-2420-0 SRS Deployment Fixture



901RV056

The 5-8840-2420-0 SRS Deployment Fixture must be used for deployment of the undeployed passenger side air bag.

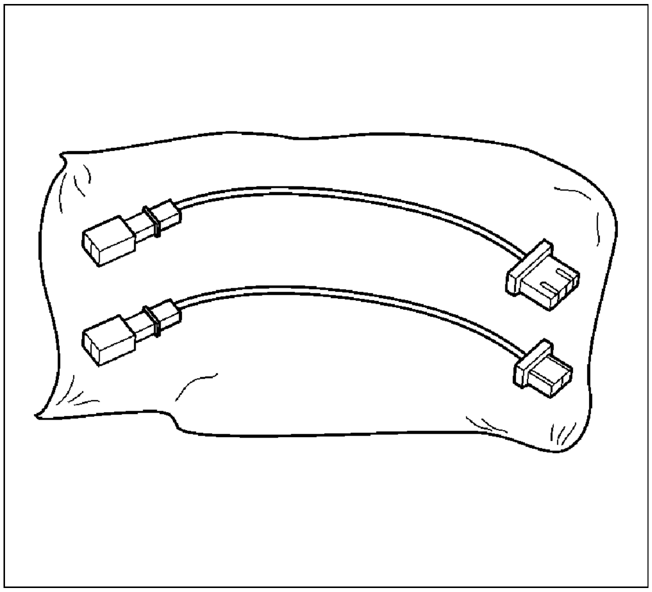
5-8840-2796-0 SRS Adapter for Load Tool



901RW107

The 5-8840-2796-0 SRS Adapter for Load Tool must be used with the 5-8840-2421-0 SRS Driver/Passenger Load Tool.

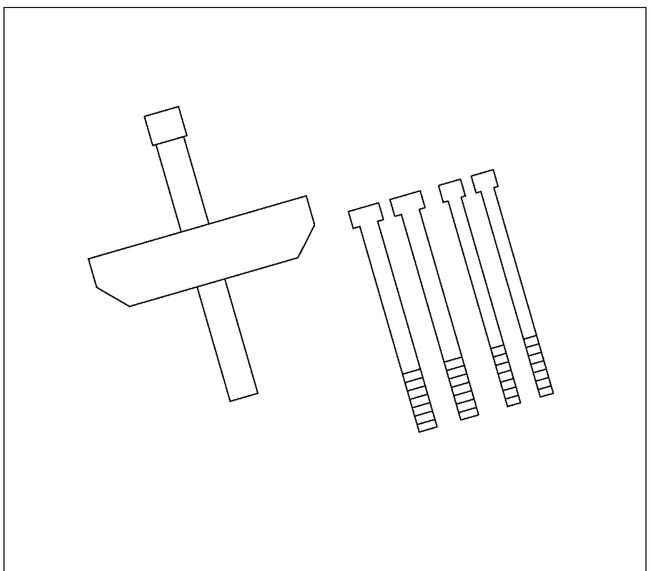
5-8840-2795-0 SRS Adapter for Deployment Tool



901RW107

The 5-8840-2795-0 SRS Adapter for Deployment Tool must be used with 5-8840-2468-0 SRS Deployment Tool.

5-8521-0016-0 Steering Wheel remover



LNW28BSH003101

SECTION 9A1

RESTRAINT CONTROL SYSTEM

TABLE OF CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING A SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING A SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNECESSARY SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU/GM will call out those fasteners that require a replacement after removal. ISUZU/GM will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Diagnostic Information

CAUTION: When fasteners are removed, always reinstall them at the same location from which they were removed. If a fastener needs to be replaced, use the correct part number fastener for that application. If the correct part number fastener is not available, a fastener of equal size and strength (or stronger) may be used. Fasteners that are not reused, and those requiring thread locking compound, will be called out. The correct torque value must be used when installing fasteners that require it. If the above conditions are not followed, parts or system damage could result.

Diagnostic Procedures

WARNING: TO AVOID DEPLOYMENT WHEN TROUBLESHOOTING THE SRS, DO NOT USE ELECTRICAL TEST EQUIPMENT SUCH AS A BATTERY-POWERED OR AC-POWERED VOLTMETER, OHMMETER, ETC., OR ANY TYPE OF ELECTRICAL EQUIPMENT OTHER THAN THAT SPECIFIED IN THIS MANUAL. DO NOT USE A NON-POWERED, PROBE-TYPE TESTER. INSTRUCTIONS IN THIS MANUAL MUST BE FOLLOWED CAREFULLY, OTHERWISE PERSONAL INJURY MAY RESULT.

The diagnostic procedures used in this section are designed to aid in finding and repairing SRS problems. Outlined below are the steps to find and repair SRS problems quickly and effectively. Failure to carefully follow these procedures may result in extended diagnostic time, incorrect diagnosis and incorrect parts replacement.

1. **Perform The “SRS Diagnostic System Check”.**
   The “SRS Diagnostic System Check” should always be the starting point of any SRS diagnostics. The “SRS Diagnostic System Check” checks for proper “SRS” warning lamp operation and checks for SRS trouble codes using both “Flash Code” and “Scan Tool” Methods.
2. **Refer To The Proper Diagnostic Chart As Directed By The “SRS Diagnostic System Check”.**
   The “SRS Diagnostic System Check” will lead you to the correct chart to diagnose any SRS problems. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis and incorrect parts replacement.
3. **Repeat The “SRS Diagnostic System Check” After Any Repair Or Diagnostic Procedures Has Been Performed.**
   Performing the “SRS Diagnostic System Check” after all repairs or diagnostic procedures, will assure that the repair has been made correctly and that no other conditions exist.

Diagnostic Codes

The SRS control unit maintains a history record of all diagnostic codes that have been detected since the SRS codes were last cleared during service.

1. Active Codes - Faults that are presently detected in this ignition cycle. Active codes are stored in RAM (Random Access Memory).
2. History Codes - All faults detected since the last time the history fault memory was cleared. History codes are stored in the EEPROM. (Electronically Erasable Programmable Read only Memory)

How To Read Trouble Codes

All codes (Active and history) can be read (or cleared) by using a scan tool or equivalent.

If a PDT is not available, have the vehicle serviced by a HOLDEN dealer.

How To Clear Trouble Codes

Trouble codes can only be cleared by using a Scan Tool. If a “scan tool” is not available then inform the owner of the stored codes and suggest that the codes are cleared upon the next visit to a ISUZU/GM dealership.

Scan Tool Diagnostics

A scan tool can be used to read current and history codes and to clear all history codes after a repair is complete. The scan tool must be updated to communicate with the SRS through a replaceable cartridge or a manufacturer's update before it can be used for SRS diagnostics. To use the scan tool, connect it to the DLC and turn the ignition switch “ON”. Then follow the manufacturer's directions for communication with the SRS. The scan tool reads serial data from the SRS control unit’s “Serial Data” output (terminal 21) to the DLC (terminal 2).

Basic Knowledge Required

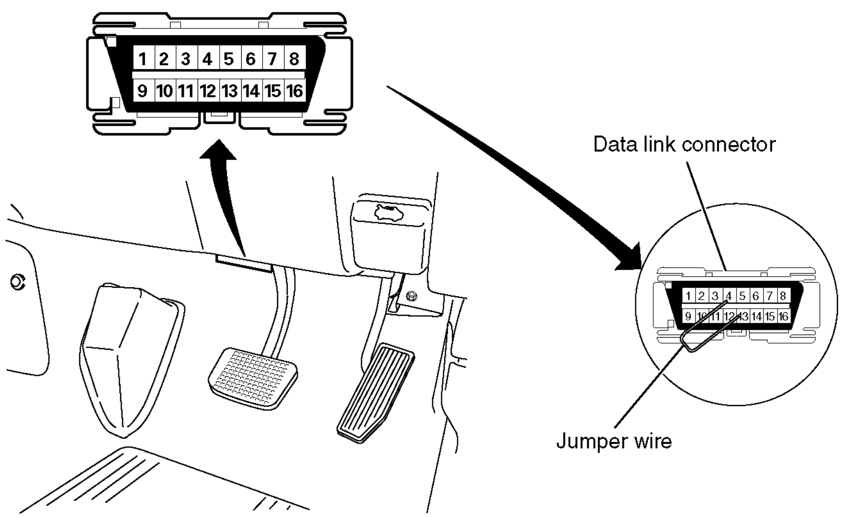
Before using this section of the Service Manual, some basic knowledge is required. Without this knowledge, you will have trouble using the diagnostic procedures in this section. Use care to prevent any harm or unwanted deployment. Read all cautions in the service manual and on warning labels attached to SRS components.

Basic Electrical Circuits

You should understand the basic theory of electricity including series and parallel circuits, and understand the voltage drops across series resistors. You should know the meaning of voltage (volts), current (amps), and resistance (ohms). You should understand what happens in a circuit with an open or a shorted wire. You should be able to read and understand a wiring diagram.

"Flash Code" Diagnostics

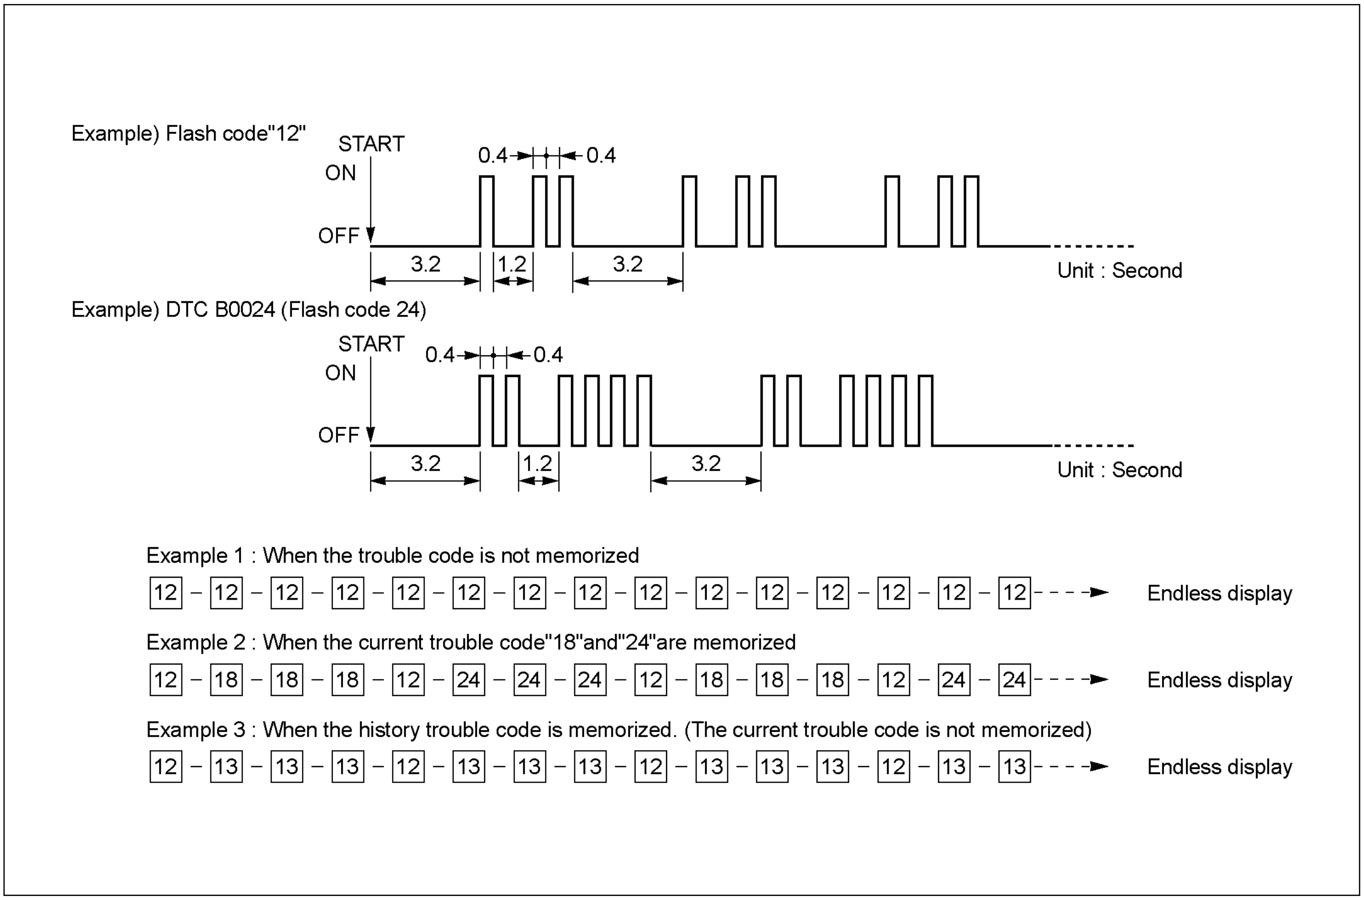
Flash code diagnostics can be used to read active codes and to determine if history codes are present but cannot be used to clear codes or read history codes. Flash code diagnostics is enabled by grounding terminal 4, shorting to terminal 13 of the DLC, with the ignition switched "ON". Grounding terminal 4 of the DLC pulls the "Diagnostics Request" input (Terminal 1) of the SRS control unit low and signals the SRS control unit to enter the flash code diagnostic display mode.



060R300052

The SRS control unit displays the trouble codes by flashing the warning lamp. Each code that is displayed will consist of a number of flashes which represents the tens digit, a 1.2 second pause, followed by a number of flashes which represent the ones digit of the code. Each code is displayed once before moving on to the next code. After all the codes have been displayed, the entire code sequence will be continually repeated until ground is removed from terminal 4 of the DLC.

Two special codes exist when reading in the flash code mode (Flash Code 12 and Flash Code 13). "Flash Code 12" will always be the first code displayed when the flash code mode is enabled. Code 12 is not an indication of an SRS problem but an indication that the flash code mode has been enabled. If there are no active or history codes present, the SRS control unit will display code 12 until ground is removed from the DLC at terminal 4. "Flash Code 13" will be displayed if history codes are present. To read the history codes, a scan tool must be used.



RTW79AMF000101

DATA LIST (Tech 2)

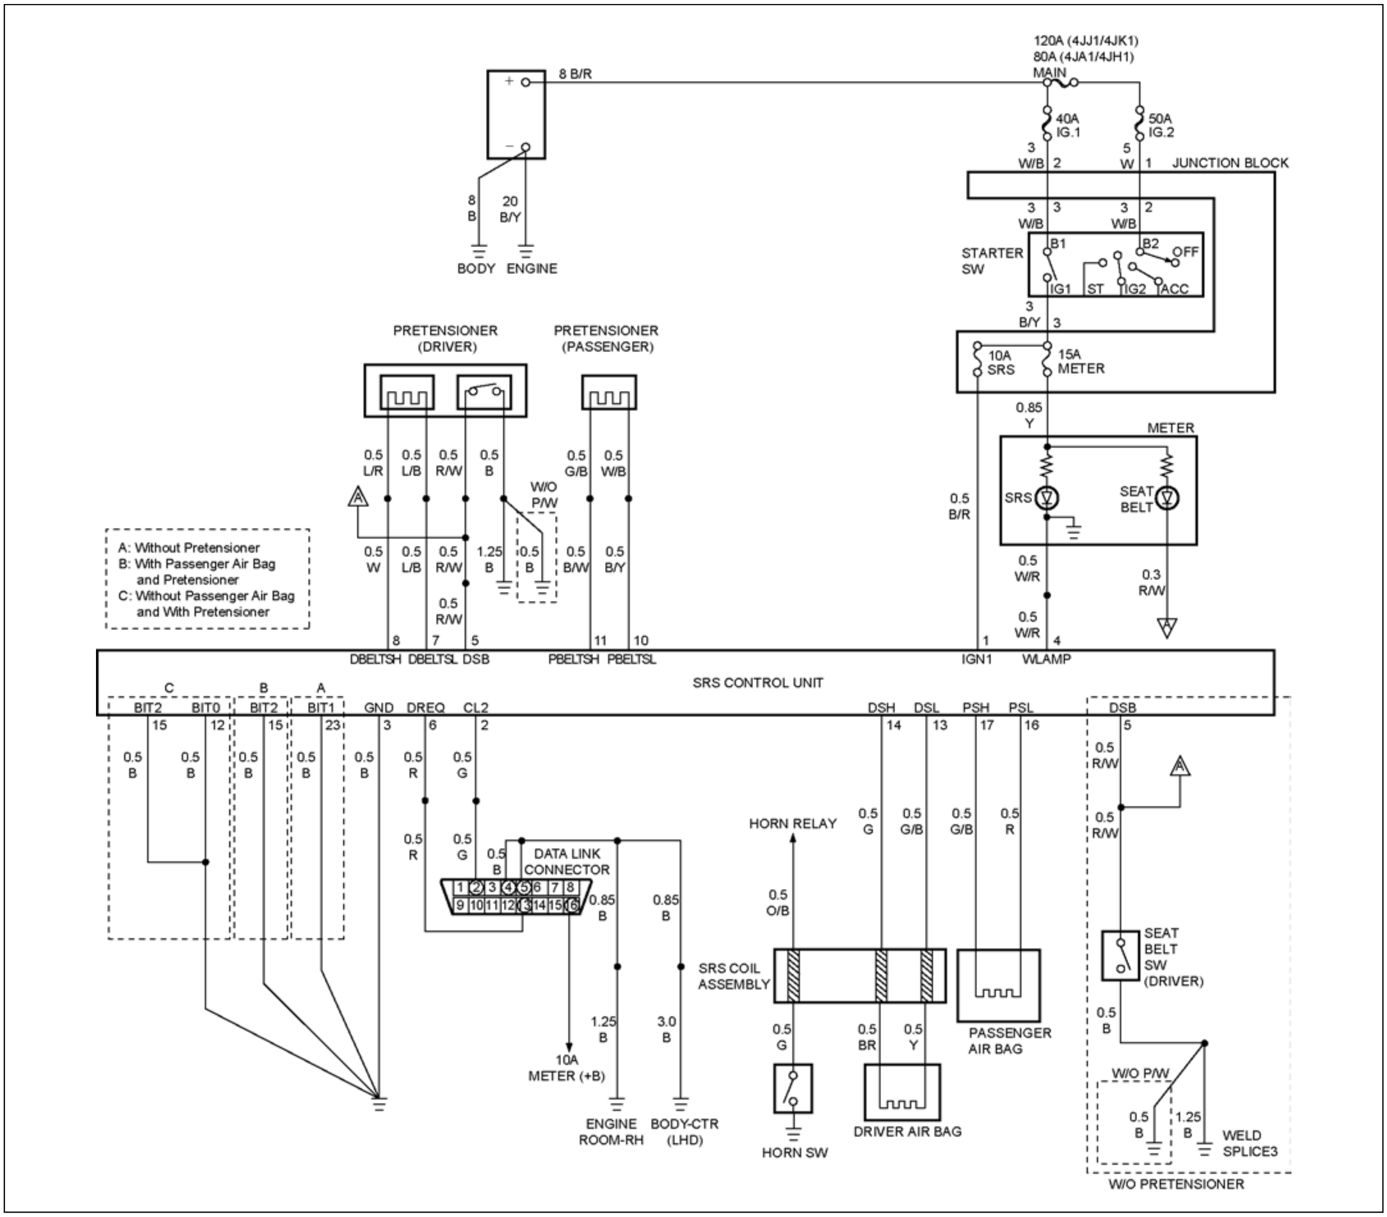
DISPLAY on Tech 2	UNIT	VALUE
Battery Voltage	V	12.0
Driver Airbag Squib Circuit Resistance	Ohm	1.70-4.33
Passenger Airbag Squib Circuit Resistance	Ohm	1.31-3.08
Driver Seatbelt Status	Buckled/ Not Buckled	Buckled/ Not Buckled

Diagnostic Trouble Codes

Choose and trace an appropriate flowchart by the numbers listed below to find fault and repair.

DTC	Flash Code	Description
–	12	Diagnostic Display Mode (Flash Code only)
–	13	Diagnostic Display Mode (Flash Code only)
B0015	15	Passenger Air Bag Squib Circuit High Resistance
B0016	16	Passenger Air Bag Squib Circuit Low Resistance
B0018	18	Passenger Air Bag Squib Circuit Short to GND
B0019	19	Passenger Air Bag Squib Circuit Short to Battery Voltage
B0021	21	Driver Air Bag Squib Circuit High Resistance
B0022	22	Driver Air Bag Squib Circuit Low Resistance
B0025	25	Driver Air Bag Squib Circuit Short to GND
B0026	26	Driver Air Bag Squib Circuit Short to Battery Voltage
B0029	29	Passenger Pretensioner Squib Circuit High Resistance
B0031	31	Passenger Pretensioner Squib Circuit Low Resistance
B0033	33	Passenger Pretensioner Squib Circuit Short to GND
B0034	34	Passenger Pretensioner Squib Circuit Short to Battery Voltage
B0041	41	Driver Pretensioner Squib Circuit High Resistance
B0042	42	Driver Pretensioner Squib Circuit Low Resistance
B0045	45	Driver Pretensioner Squib Circuit Short to GND
B0046	46	Driver Pretensioner Squib Circuit Short to Battery Voltage
B0051	51	Air Bag Squib Circuit Activated (Clash)
B0052	52	Pretensioner Squib Circuit Activated
B0055	55	Vehicle Variant Missing
B0061	61	Warning Lamp Circuit Failure
B0062	62	Battery Voltage Too High
B0063	63	Battery Voltage Too Low
B0071	71	SRS Control Unit Internal Fault

System Schematic



RTW79ALF000301

SRS Diagnostic System Check

The diagnostic procedures used in this section are designed to find and repair SRS malfunctions. To get the best results, it is important to use the diagnostic charts and follow the sequence listed below:

A Perform the “SRS Diagnostic System Check.”
The “SRS Diagnostic System Check” must be the starting point of any SRS diagnostics. The “SRS Diagnostic System Check” checks for proper “SRS” warning lamp operation, the ability of the SRS control unit to communicate through the “Serial Data” line and whether SRS diagnostic trouble codes exist.

B Refer to the proper diagnostic chart as directed by the “SRS Diagnostic System Check.”
The “SRS Diagnostic System Check” will lead you to the correct chart to diagnose any SRS malfunctions. Bypassing these procedures may result in extended diagnostic time, incorrect diagnosis and incorrect parts replacement.

C Repeat the “SRS Diagnostic System Check” after any repair or diagnostic procedures have been preformed.
Performing the “SRS Diagnostic System Check” after all repair or diagnostic procedures will ensure that the repair has been made correctly and that no other malfunctions exist.

2. FRONT WHEEL SHIMMY

Checkpoint		Trouble Cause	Countermeasure
Wheel bearing	NG	Worn or improperly adjusted	Adjust or replace
OK			
Front alignment	NG	Incorrect	Adjust the front alignment
OK			
Ball joint or bush	NG	Worn	Replace the ball joint or bush
OK			
Steering unit	NG	Loose or worn	Tighten or replace
OK			
Tire	NG	Worn or improperly inflated	Replace or adjust the inflation
OK			
Shock absorber	NG	Worn	Replace the shock absorber

Circuit Description

When the ignition switch is first turned “ON”, “Ignition 1” voltage is applied from the “SRS” fuse to the SRS control unit at the “Ignition 1” input terminals “1”. The SRS control unit responds by flashing the “SRS” warning lamp seven times, while performing tests on the SRS.

Notes On System Check Chart

1. The “SRS” warning lamp should flash seven times after the ignition is first turned “ON”.
2. After the “SRS” warning lamp flashes seven times, it should turn to “LOCK”
3. This test checks for the proper operation of the “Serial Data” line. This test will also determine whether history diagnostic trouble codes are stored and, if so, identify them.
4. Improper operation of the “SRS” warning lamp is indicated. This test differentiates between ‘a warning lamp stays “ON” condition’ and ‘a warning lamp does not come “ON” condition’.
5. This test checks for proper operation of the “Serial Data” line. This test will also identify the stored diagnostic trouble codes and whether they are current or history.

Diagnostic Aids

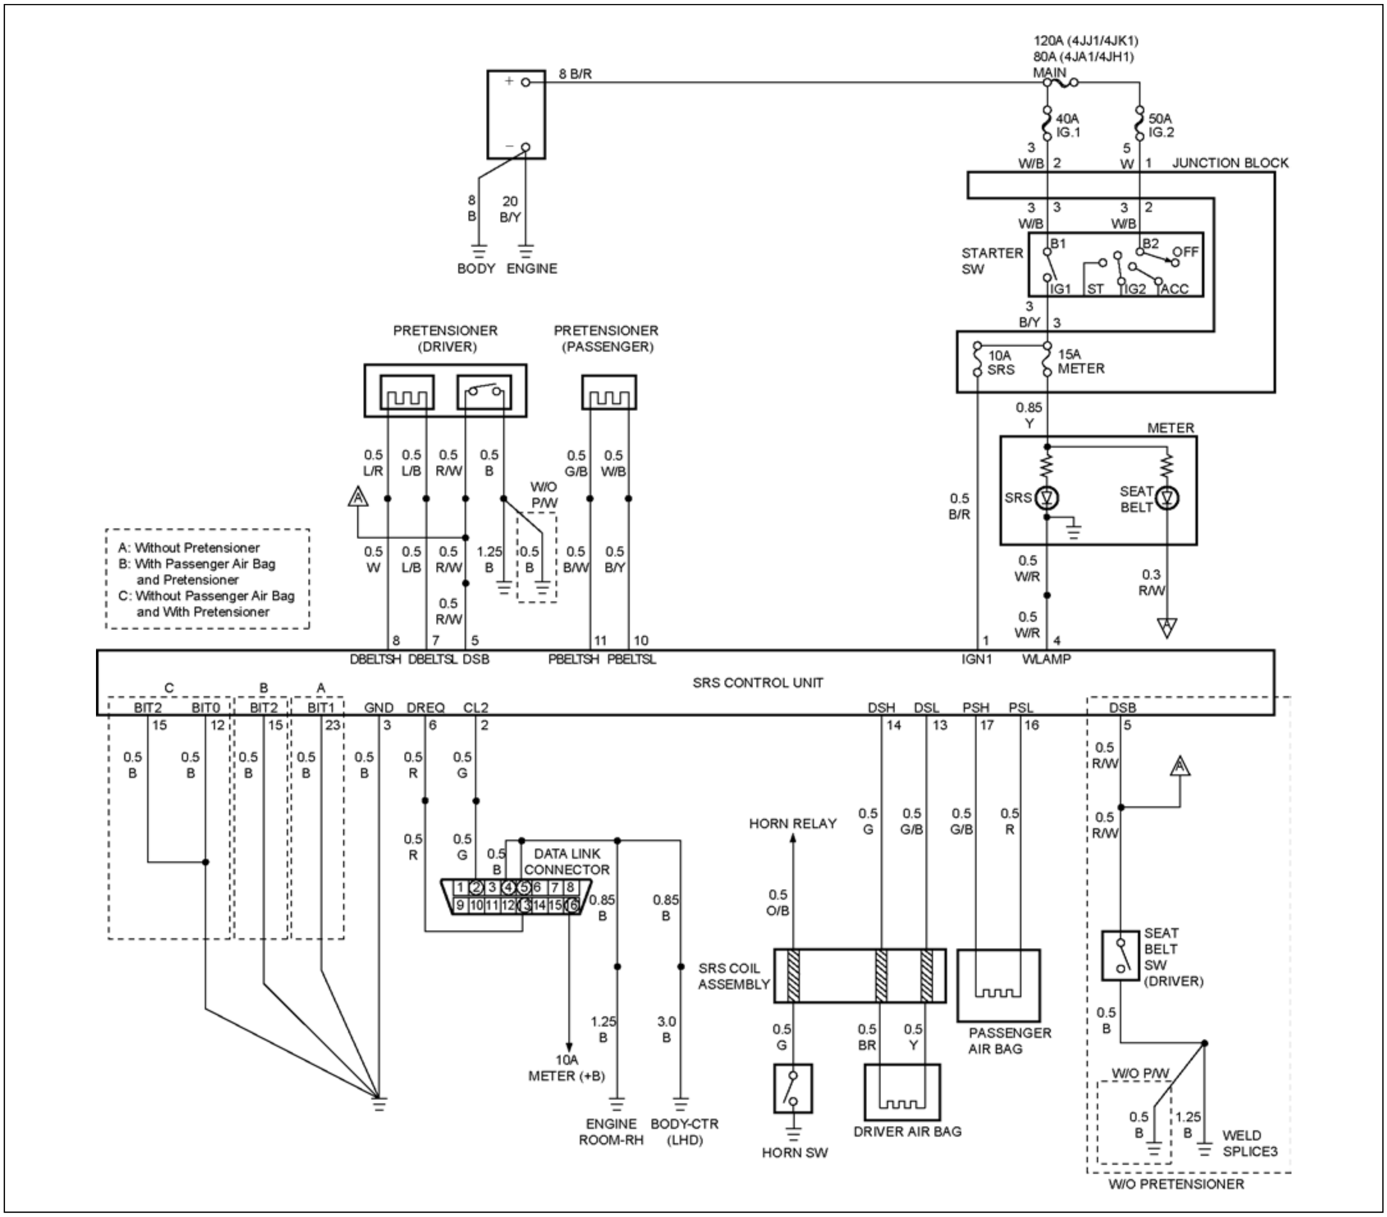
The order in which diagnostic trouble codes are diagnosed is very important. Failure to diagnose the diagnostic trouble codes in the order specified may result in extended diagnostic time, incorrect diagnosis and incorrect parts replacement.

SRS Diagnostic System Check

Step	Action	Yes	No
1	Note the “SRS” warning lamp as the ignition switch is turned “ON”. Does the “SRS” warning lamp flash seven (7) times?	Go to Step 2	Go to Step 3
2	Note the “SRS” warning lamp after it flashed 7 times. Does the “SRS” warning lamp go “OFF”?	Go to Step 4	Go to Step 5
3	Note the “SRS” warning lamp as the ignition switch is turned “ON”. Does the “SRS” warning lamp come “ON” steady?	Go to Chart B.	Go to Chart C.
4	1. Note the “SRS” warning lamp as the ignition switch is turned “ON”. Ignition switch is at “LOCK”. 2. Connect a scan tool to data link connector. 3. Follow direction given in the scan tool instruction manual. Ignition switch is “ON”. 4. Request the SRS diagnostic trouble code display, recode all history diagnostic trouble code(s), specifying as current or history in repair order. Is (are) diagnostic trouble code(s) displayed?	Ignition switch “LOCK”. When DTC B0071 is set, go to DTC B0071 Chart. For all other history codes refer to “Diagnostic Aids” For that specific DTC. A history DTC indicates the malfunction has been repaired or is intermittent.	SRS is functional and free of malfunctions, no further diagnosis is required. If scan tool indicated “NO DATA RECEIVED,” refer to chassis electrical section 8.

Step	Action	Yes	No
5	1. Ignition switch is at “LOCK”. 2. Connect a scan tool to data link connector. 3. Follow directions as given in the scan tool instruction manual. 4. Ignition switch is “ON”. 5. Request the SRS diagnostic trouble code display, Recode all diagnostic trouble code(s), specifying as current or history in repair order. Is (are) diagnostic trouble code (s) displayed?	Ignition switch “LOCK”. When the current DTC is set, go to applicable DTC chart. And then if DTC B0019, B0025, B0051, B0055 or B0071 is set, go to these DTC chart first. When only history DTCs exist, refer to “Diagnostics Aids” for that specific DTC. A history DTC indicates the malfunction has been repaired or is intermittent.	If scan tool indicates “No Data Received,” refer to chassis electrical section 8.

Chart A SRS Control Unit Integrity Check



RTW79ALF000301

Circuit Description

When the SRS control unit recognizes that "Ignition 1" voltage, applied to terminals "1", is greater than 9 volts, the "SRS" warning lamp is flashed 7 times to verify operation. At this time the SRS control unit performs "Turn–ON" tests followed by "Continuous Monitoring" tests. When a malfunction is detected, the SRS control unit sets a current diagnostic trouble code and illuminates the "SRS" warning lamp. The SRS control unit will clear current diagnostic trouble codes and move them to a history file when the malfunction is no longer detected and/or the ignition switch is cycled, except for DTCs B0051 and B0055.

Chart Test Description

Number(s) below refer to step number(s) on the diagnostic chart:

1. This test confirms a current malfunction. If no current malfunction is occurring (history DTC set) the "Diagnostic Aids" for the appropriate diagnostic trouble code should be referenced. The SRS control unit should not be replaced for a history diagnostic trouble code.
2. This test checks for a malfunction introduced into the SRS during the diagnostic process. It is extremely unlikely that a malfunctioning SRS control unit would cause a new malfunction to occur during the diagnostic process.

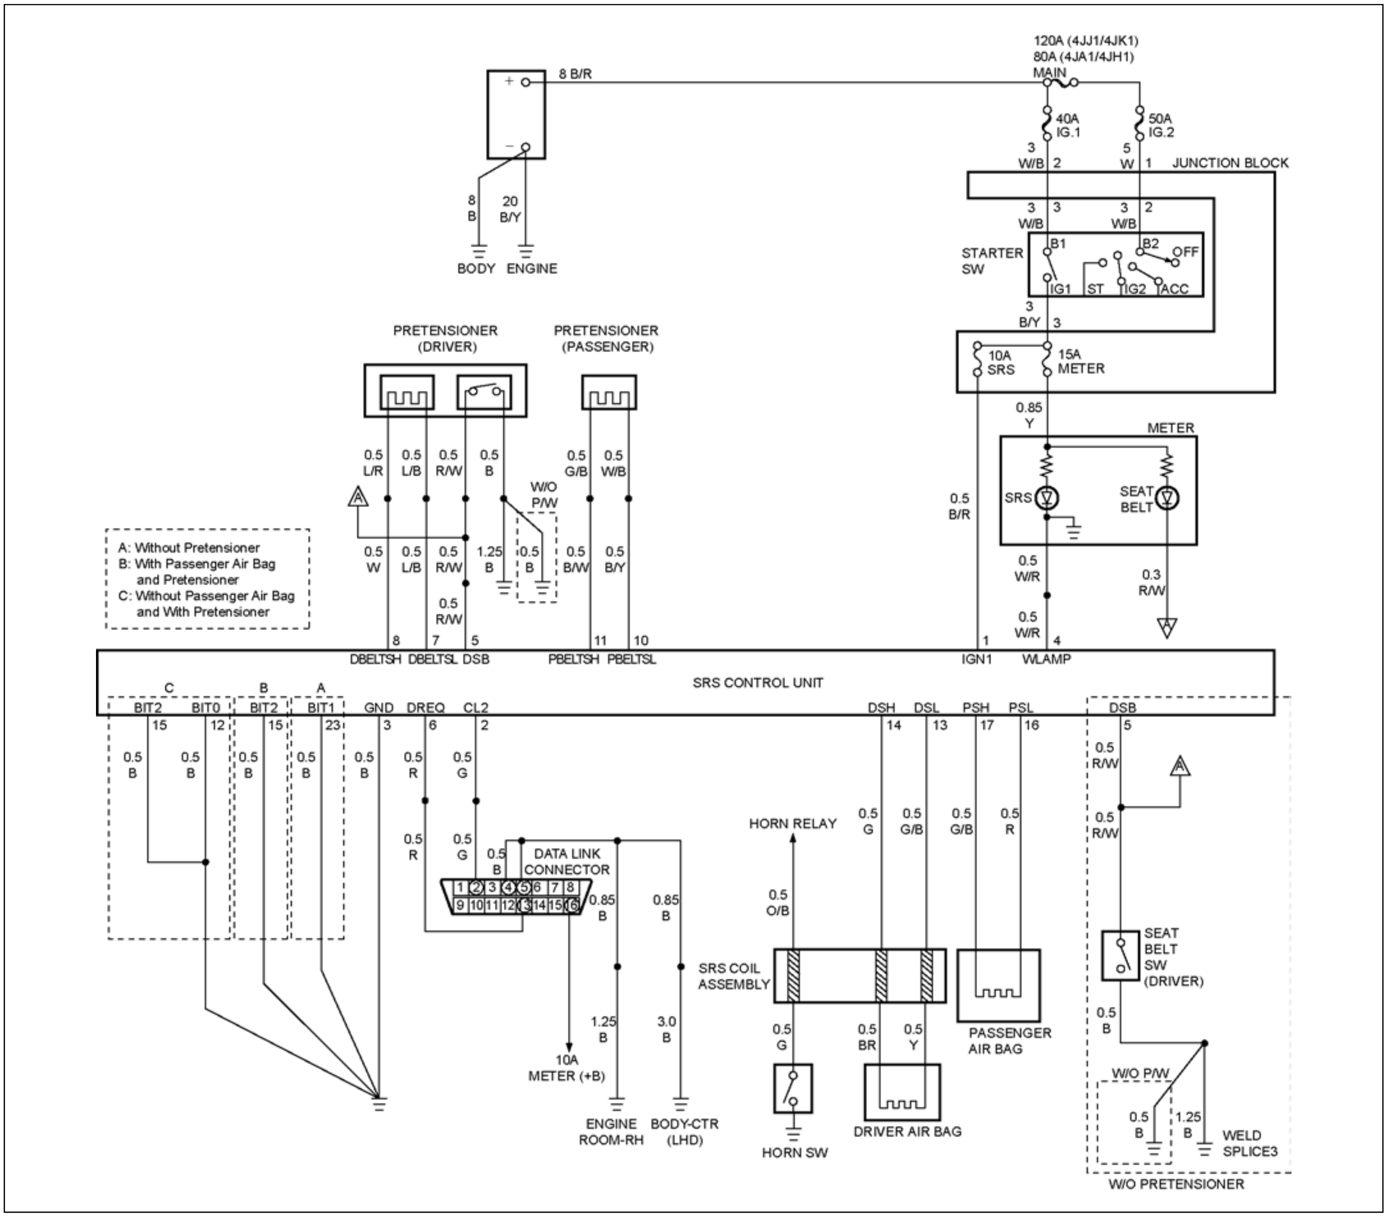
3. When all circuitry outside the SRS control unit has been found to operate properly, as indicated by the appropriate diagnostic chart, then and only then should the SRS control unit be replaced.

Chart A SRS control unit Integrity Check

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SRS CONTROL UNIT. NEVER STRIKE OR JAR THE SRS CONTROL UNIT. NEVER POWER UP THE SRS WHEN THE SRS CONTROL UNIT IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SRS CONTROL UNIT AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SRS CONTROL UNIT COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY

Step	Action	Yes	No
1	1. This chart assumes that the “SRS Diagnostic System Check” and either a symptom chart or a diagnostic trouble code chart diagnosis has been performed. When all circuitry outside the SRS control unit has been found to operate properly, as indicated by the appropriate diagnostic chart, and the symptom or DTC remains current, check the following. 2. Diagnostic procedures must be performed to verify the need for SRS control unit replacement. 3. Ignition switch is at “LOCK”. 4. Reconnect all SRS components and ensure all components are properly mounted. 5. Ensure the ignition switch has been in the “LOCK” position for at least 15 seconds. 6. Note the “SRS” warning lamp as the ignition switch is turned “ON”. Does the warning lamp flash 7 times then go “OFF”?	The symptom or DTC is no longer occurring. Clear SRS diagnostic trouble codes. Repeat “SRS Diagnostic System Check”	Go to Step 2
2	Using a scan tool, request the diagnostic trouble code display. Is the same symptom or DTC occurring that was occurring when the “SRS Diagnostic System Check” was first performed?	Go to Step 3	Ignition switch “LOCK”. Go to the appropriate chart for the indicated malfunction.
3	1. Clear the “SRS Diagnostic Trouble Codes”. 2. Ignition switch is in the “LOCK” position for at least two minutes. 3. Note the “SRS” warning lamp as the ignition switch is turned “ON”. Does warning lamp flash 7 times then go “OFF”?	SRS is functional and free of malfunctions. No further diagnosis is required. Go to Step 4	Ignition switch “LOCK”. Replace SRS control unit. Go to Step 4
4	Reconnect all SRS components, ensure all components are properly mounted. Is this step finished?	Repeat the “SRS Diagnostic System Check”	—

Chart B “SRS” Warning Lamp Comes “ON” Steady



RTW79ALF000301

Circuit Description

When the ignition switch is first turned “ON”, “Ignition 1” voltage is applied from the “METER” fuse to the “SRS”, warning lamp which is connected to “SRS Warning Lamp”, terminal “4”. The “SRS” fuses apply system voltage to the “Ignition 1” inputs, terminals “1”. The SRS control unit responds by flashing the “SRS” warning lamp 7 times. If “Ignition 1” is less than 9 volts, the “SRS” warning lamp will come “ON” solid with no DTCs set.

Chart Test Description

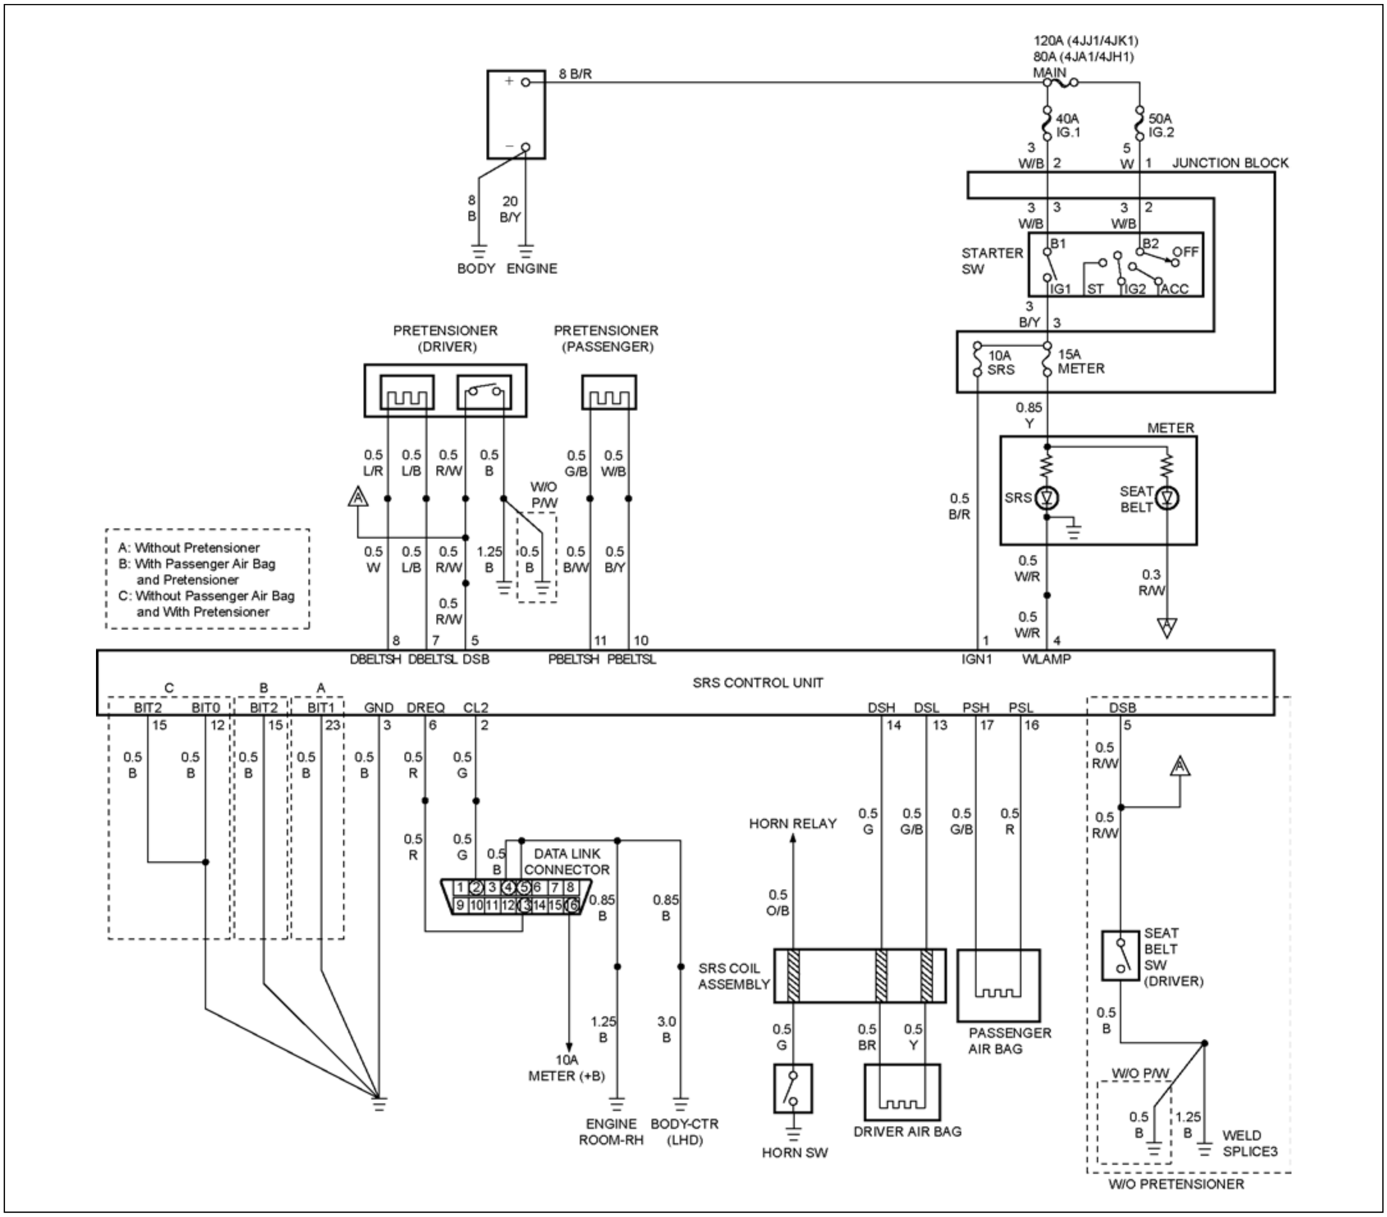
Number(s) below refer to step number(s) on the diagnostic chart:

2. This test checks for an open in the “Ignition 1” circuit to the SRS control unit.
3. This test checks for the voltage of “Ignition 1”.
4. This test determines whether the malfunction is a short to ground in the SRS warning lamp circuit.

Chart B "SRS" warning lamp comes "ON" Steady

Step	Action	Yes	No
1	1. When measurements are requested in this chart use a 5-8840-0366-0DMM with correct terminal adapter from 5-8840-0385-0. 2. Ignition switch is at "LOCK". 3. Connect the scan tool to the data link connector, following directions as given in the scan tool instruction MANUAL. 4. Ignition switch is "ON". 5. Request the SRS diagnostic trouble code display. Does the scan tool indicate "No Data Received"?	Go to Step 2	Go to Step 3
2	1. Ignition switch is at "LOCK". 2. Inspect the SRS control unit harness connector connection to the SRS control unit. Is it securely connected to the SRS control unit?	Ignition switch "LOCK". Replace SRS control unit. Go to Step 5	Connect SRS control unit securely to de–activate shorting clip in SRS control unit harness connector. Go to Step 5
3	Using scan tool, request the SRS data list. Is "ignition" more than 9 volts?	Go to Step 4	Ignition switch "LOCK". Replace SRS control unit. Go to Step 5
4	1. Ignition switch is at "LOCK". 2. Disconnect the SRS coil and the passenger air bag assembly yellow connector located at the base of the steering column and behind the glove box assembly. Disconnect the SRS control unit. 3. Disconnect the connector of the "SRS Warning Lamp" on the instrument cluster. 4. Measure the resistance on the SRS control unit harness connector as follow. ● From terminals "3" and "23" to ground (ground) (without the pretensioner) ● From terminals "3" and "15" to ground (ground) (with the pretensioner and the passenger air bag) ● From terminals "3", "12" and "15" to ground (with the pretensioner and without the passenger air bag) Does 5-8840-0366-0DMM display "OL" (Infinite)?	Go to Chart A	Replace SRS harness. Go to Step 5
5	Reconnect all SRS components and ensure all components are properly mounted. Is this step finished?	Repeat the "SRS Diagnostic System Check"	—

Chart C “SRS” Warning Lamp Does Not Come “ON” Steady



RTW79ALF000301

Circuit Description

When the ignition switch is first turned “ON”, “Ignition 1” voltage is applied from the “METER” fuse to the “SRS” warning lamp which is connected to the “SRS Warning Lamp”, terminal “4”. The “SRS” fuse applies system voltage to the “Ignition 1” inputs, terminals “35”. The SRS control unit responds by flashing the “SRS” warning lamp seven times. If “Ignition 1” is more than 16 volts, the “SRS” warning lamp will still be “OFF” solid with no DTCs set.

Chart Test Description

Number(s) below refer to step number(s) on the diagnostic chart:

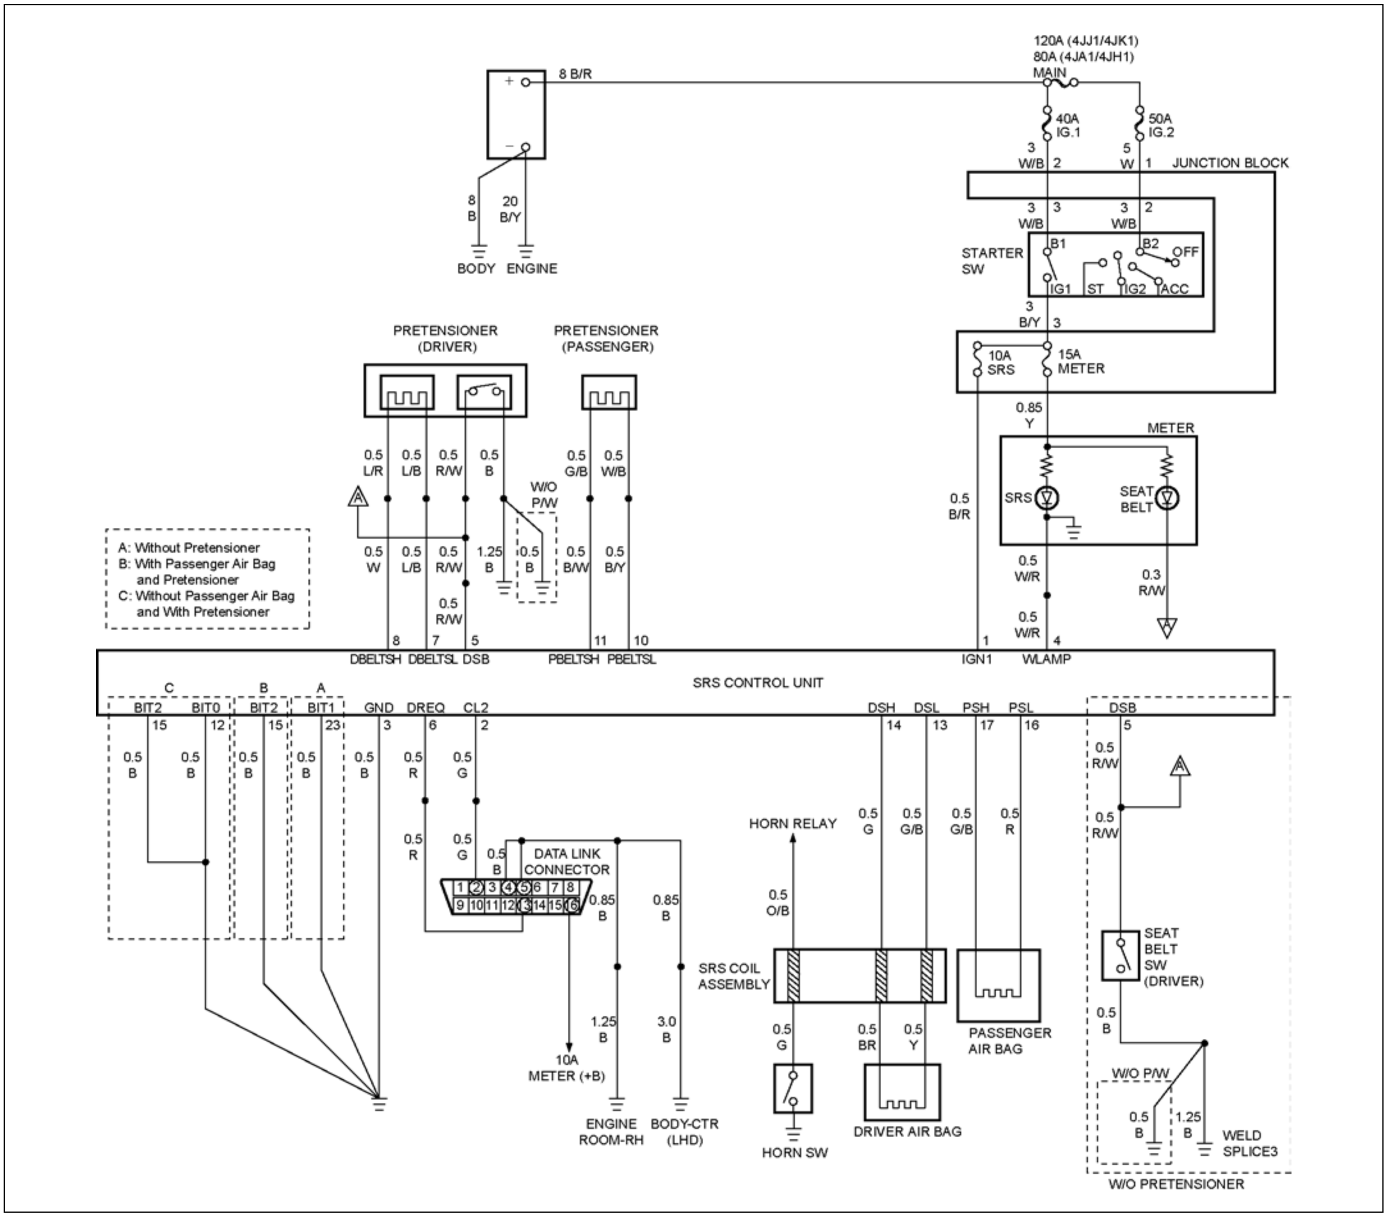
1. This test decides whether power is available to the SRS control unit warning lamp power feed circuit.
2. This test determines whether the voltage is present in the warning lamp circuit.
3. This test determines if the malfunction is in the instrument cluster.
4. This test checks for open in the warning lamp circuitry.
5. This test isolates the SRS warning lamp circuit and checks for a short in the SRS warning lamp circuit to B+.
8. This test checks for a short from the SRS control unit warning lamp power feed circuit to ground.
9. This test determines whether the short to ground is due to a short in the wiring.

Chart C "SRS" Warning Lamp Does Not Come "ON" Steady

Step	Action	Yes	No
1	1. When measurements are requested in this chart, use a 5-8840-0366-0DMM with a correct terminal adapter from 5-8840-0385-0. 2. Ignition switch is at "LOCK". 3. Remove and inspect the "METER" fuse to the "SRS" warning lamp. Is the fuse good?	Go to Step 2	Go to Step 7
2	1. Ignition switch is at "LOCK". 2. Disconnect the SRS coil and passenger air bag assembly yellow connector which is located at the base of the steering column and behind the glove box assembly. 3. Disconnect the SRS control unit. 4. Ignition switch is "ON". 5. Measure the voltage on the SRS control unit harness connector from the terminal "4" to terminal "3" (ground). Is system voltage present on terminal "4"?	Go to Step 4	Go to Step 3
3	1. Ignition switch is at "LOCK". 2. Remove instrument meter cluster. 3. Check for proper connection to instrument cluster at the SRS warning lamp circuit terminal. 4. If ok, then remove and inspect the "AIR BAG" bulb. Is the bulb good?	Go to Step 5	Replace bulb. Go to Step 6
4	1. Ignition switch is at "LOCK". 2. Disconnect instrument meter cluster harness connector. 3. Ignition switch is "ON". 4. Measure the voltage on the SRS control unit harness connector from terminal "4" to terminal "3" (ground). Is the voltage 1 volt or less?	Go to Chart A	Replace SRS harness. Go to Step 6
5	1. Install the bulb. 2. Measure the resistance from the instrument meter cluster harness connector SRS warning lamp circuit terminal to the SRS control unit harness connector terminal "4". Is the resistance 5.0 ohms or less?	Service instrument meter cluster. Install instrument meter cluster. Go to Step 6	Replace SRS harness. Go to Step 6
6	Reconnect all SRS components and ensure all components are properly mounted. Is this step finished?	Repeat the "SRS Diagnostic System Check"	Go to Step 6
7	Perform chart C. Is this step finished?	Go to Step 8	Go to Step 1
8	1. Replace the "METER" fuse. 2. Ignition switch is "ON". Wait 10 Seconds then ignition switch is at "LOCK". 3. Remove and inspect the "METER" fuse. Is the fuse good?	Install "METER" fuse. Go to Step 10	Go to Step 9

Step	Action	Yes	No
9	1. Disconnect the SRS coil and the passenger air bag assembly yellow connectors located at the base of the steering column and behind the glove box assembly. 2. Disconnect the SRS control unit. 3. Replace the “METER” fuse. 4. Ignition switch is “ON”-wait 10 seconds. 5. Ignition switch is at “LOCK”. 6. Remove and inspect the “METER” fuse. Is the fuse good?	Install “METER” fuse. Go to Chart A	Replace SRS harness. Replace “METER” fuse. Go to Step 10
10	Reconnect all the SRS components and ensure all the components are properly mounted. Is this step finished?	Repeat the “SRS Diagnostic System Check”	—

DTC B0015 (Flash Code 15) Passenger Air Bag Squib Circuit High Resistance



RTW79ALF000301

Circuit Description

When the ignition switch is turned to “ON”, the SRS control unit will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “Ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SRS control unit then proceeds with the “Resistance Measurement Test”. The “Passenger Bag Low” terminal “16” is grounded through a resister and the passenger current source connected to the “Passenger Bag High” terminal “17” and allows a known amount of current to flow. By monitoring the voltage difference between the “Passenger Bag High” and “Passenger Bag Low” the SRS control unit calculates the combined resistance of the passenger air bag assembly, harness wiring circuits “Passenger Bag High” and “Passenger Bag Low” connector terminal contact.

DTC Will Set When

The combined resistance of the passenger air bag assembly, harness wiring circuits “Passenger Bag High” and “Passenger Bag Low”, and connector terminal contact is above a specified value. This test is run once for each ignition cycle during the “Resistance Measurement Test” when:

1. No “higher priority faults” are detected during “Turn–ON”,
2. “Ignition 1” voltage is in the specified value.

Action Taken

The SRS control unit turns “ON” the “SRS” warning lamp and sets a diagnostic trouble code.

3. NOISES IN FRONT AXLE DRIVE SHAFT JOINT

Checkpoint		Trouble Cause	Countermeasure
Drive shaft joints and bellows (UJ and DOJ)	NG	Broken or worn	Replace the drive shaft joints and bellows

DTC Will Clear When

Resistance value returns specified resistance value.

DTC Chart Test Description

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SRS control unit.
3. This test verifies proper connection of the yellow connector.
4. This test checks for proper contact and/or corrosion of the yellow connector terminals.
5. This test checks for a malfunctioning passenger air bag assembly.
6. This test determines whether the malfunction is due to a high resistance in the wiring.

Diagnostic Aids

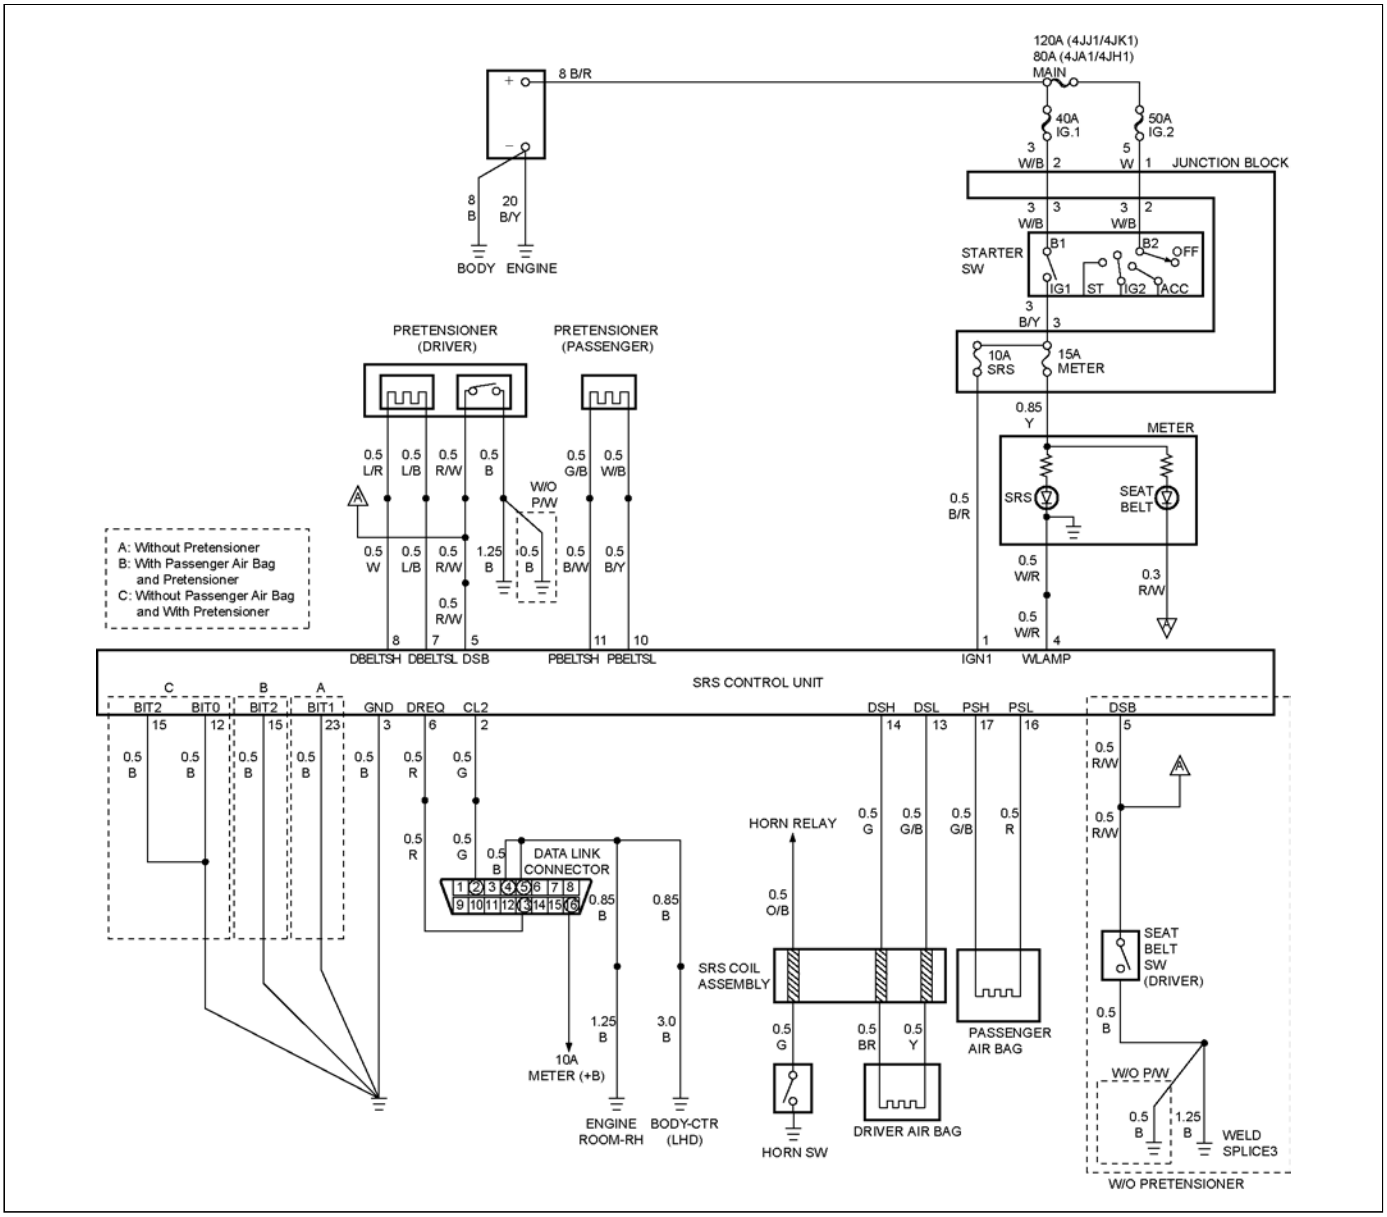
An intermittent condition is likely to be caused by a poor connection at the passenger air bag assembly harness connector terminals “1” and “2”, SRS control unit terminal “17” and “16”, or a poor wire to terminal connection in circuits “Passenger Bag High” and “Passenger Bag Low”. The test for this diagnostic trouble code is only run while the “SRS” warning lamp is performing the bulb check. When the scan tool “Clear Codes” command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC B0015 (Flash Code 15) Passenger Air Bag Squib Circuit High Resistance

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” Performed?	Go to Step 2	Go to The “SRS Diagnostic System Check”
2	1. Check the passenger air bag squib circuit for open. 2. If a problem is found, repair as necessary. Was a problem found?	Verify repair	Go to Step 3
3	1. Ignition switch is at “LOCK”. 2. Make sure the passenger air bag assembly yellow connector located behind the glove box assembly is seated properly. Is the yellow connector connected properly?	Go to Step 4	Seat passenger Air Bag assembly yellow connector properly. Go to Step 7
4	1. Disconnect and inspect the passenger air bag assembly yellow connector located behind the glove box assembly. 2. If OK, reconnect the passenger air bag assembly connector. 3. Ignition switch is “ON”. Is DTC B0015 current?	Go to Step 5	Go to Step 7
5	1. Ignition switch is at “LOCK”. 2. Disconnect the SRS coil and passenger air bag assembly, yellow connector located at the base of the steering column and behind the glove box assembly. 3. Connect a 5-8840-2421-0 SRS driver / passenger load tool and appropriate adapters to the SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch is “ON”. Is DTC B0015 Current?	Go to Step 6	Ignition switch “LOCK”. Replace the passenger air bag assembly. Go to Step 7

Step	Action	Yes	No
6	1. Ignition switch is at “LOCK”. 2. There has been an increase in the total circuit resistance of the passenger inflator deployment loop. 3. Use the high resolution ohmmeter mode of the DMM while checking the circuits “Passenger Bag High” and “Passenger Bag Low”, and the SRS control unit connector terminal “17” and “16”, to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 7	Go to Chart A
7	1. Reconnect all components and ensure all components are properly mounted. 2. Clear the diagnostic trouble codes. Is This step finished?	Repeat the “SRS Diagnostic System Check”	—

DTC B0016 (Flash Code 16) Passenger Air Bag Squib Circuit Low Resistance



RTW79ALF000301

Circuit Description

When the ignition switch is turned to “ON”, the SRS control unit will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “Ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SRS control unit then proceeds with the “Resistance Measurement Test”. The “Passenger Bag Low” terminal “16” is grounded through a resistor and the passenger current source connected to the “Passenger Bag High” terminal “17” and allows a known amount of current to flow. By monitoring the voltage difference between the “Passenger Bag High” and “Passenger Bag Low”, the SRS control unit calculates the combined resistance of the passenger air bag assembly, harness wiring circuits “Passenger Bag High” and “Passenger Bag Low” connector terminal contact.

DTC Will Set When

The combined resistance of the passenger air bag assembly, harness wiring circuits “Passenger Bag High” and “Passenger Bag Low”, and connector terminal contact is above a specified value. This test is run once for each ignition cycle during the “Resistance Measurement Test” when:

1. No “higher priority faults” are detected during “Turn–ON”,
2. “Ignition 1” voltage is in the specified value.

Action Taken

The SRS control unit turns “ON” the “SRS” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When

Resistance value returns to specified resistance value.

DTC Chart Test Description

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SRS control unit.
3. This test verifies connection of the yellow connector.
4. This test checks for proper operation of the shorting clip on the yellow connector.
5. This test checks for a malfunctioning passenger air bag assembly.
6. This test determines whether the malfunction is due to shortening in the wiring.

Diagnostic Aids

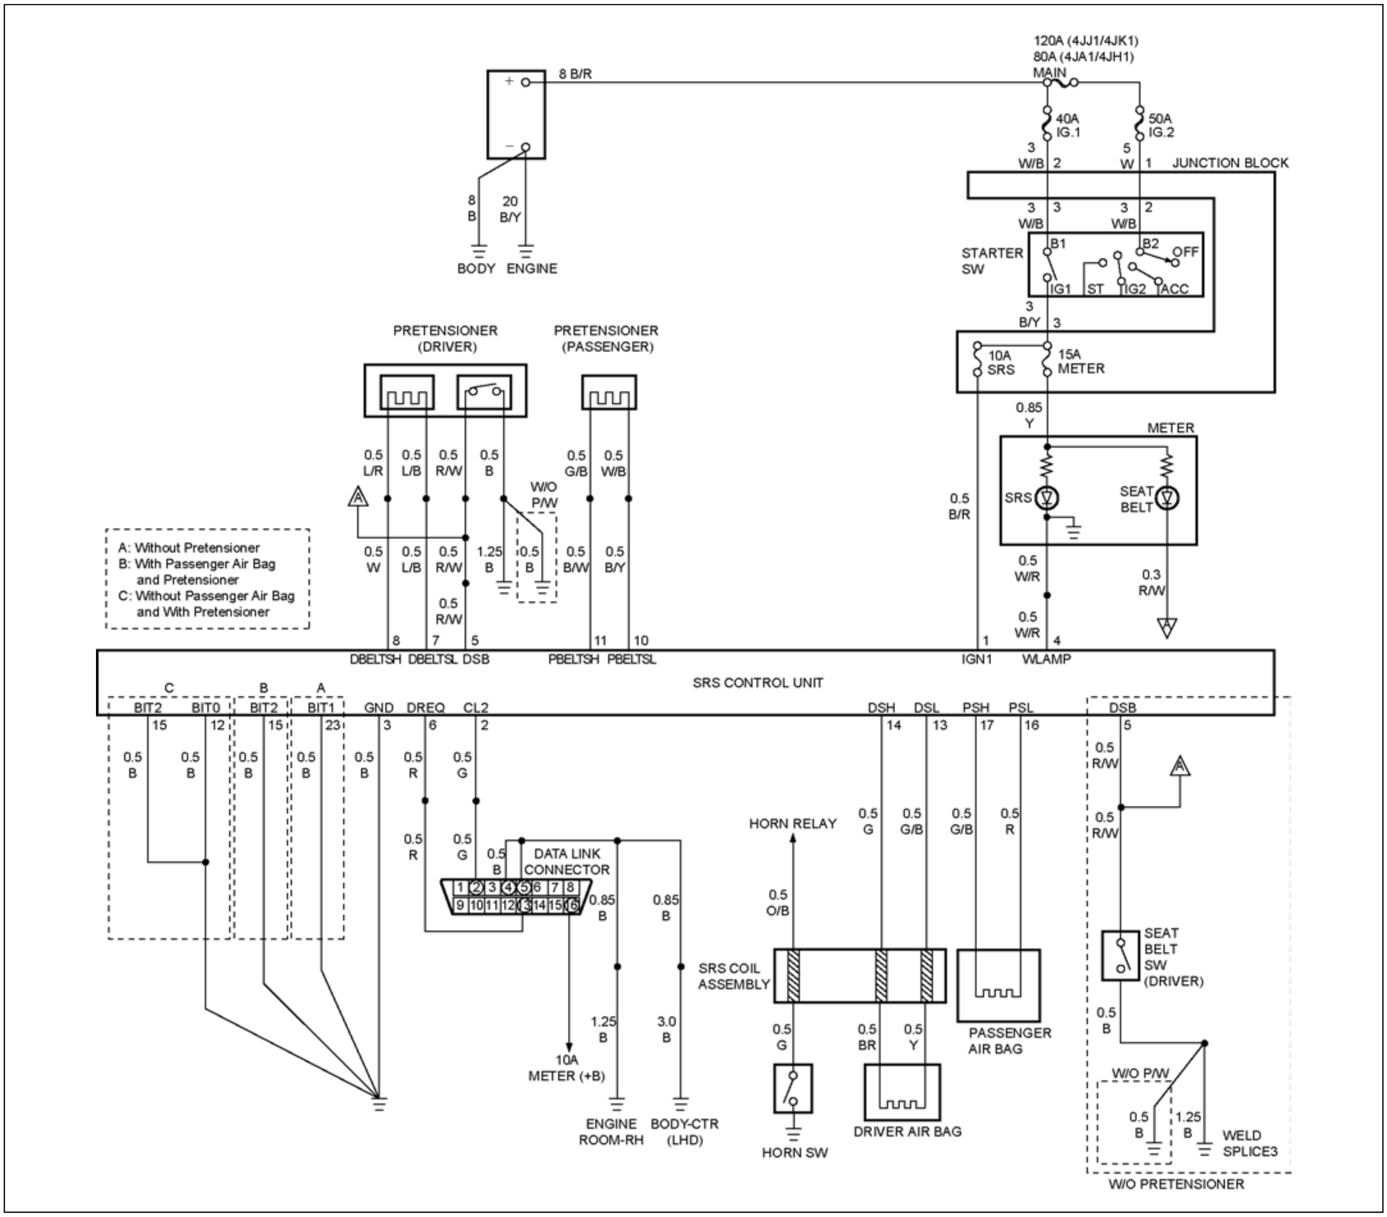
An intermittent condition is likely to be caused by a short between circuits “Passenger Bag High” and “Passenger Bag Low” or a malfunctioning shorting clip on the passenger air bag assembly which would require replacement of the air bag assembly. The test for this diagnostic trouble code is only run while the “SRS” warning lamp is performing the bulb check. When the scan tool “Clear Codes” command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC B0016 (Flash Code 16) Passenger Air Bag Squib Circuit Low Resistance

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Repeat the “SRS Diagnostic System Check”
2	1. Check the passenger air bag squib circuit for short to voltage or short to ground. 2. If a problem is found, repair as necessary. Was a problem found?	Verify repair	Go to Step 3
3	1. Ignition switch is at “LOCK”. 2. Make sure the passenger air bag assembly yellow connector located behind the glove box assembly is seated properly. Is the yellow connector connected properly?	Go to Step 4	Seat passenger air bag assembly yellow connector properly. Go to Step 7
4	1. Disconnect and inspect the passenger air bag assembly yellow connector located behind the glove box assembly. 2. If ok, reconnect the passenger air bag assembly connector. 3. Ignition switch is “ON”. Is DTC B0016 Current?	Go to Step 5	Go to Step 7
5	1. Ignition switch is at “LOCK”. 2. Disconnect the SRS coil and passenger air bag assembly yellow connector located at the base of the steering column and behind the glove box assembly. 3. Connect 5-8840-2421-0 SRS driver/passenger load tool and appropriate adapters to the SRS coil and the passenger air bag assembly harness connectors. 4. Ignition switch is “ON”. Is DTC B0016 current?	Go to Step 6	Ignition switch “LOCK”. Replace the passenger air bag assembly. Go to Step 7

Step	Action	Yes	No
6	1. Ignition switch is at “LOCK”. 2. There has been a decrease in the total circuit resistance of the passenger inflator deployment loop. 3. Use the high resolution ohmmeter mode of the DMM while checking the circuits “Passenger Bag High” and “Passenger Bag Low”, and the SRS control unit connector terminal “17” and “16” to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 7	Go to Chart A
7	1. Reconnect all components and ensure all components are properly mounted. 2. Clear the diagnostic trouble codes. Is this step finished?	Repeat the “SRS Diagnostic System Check”	—

DTC B0018 (Flash Code 18) Passenger Air Bag Squib Circuit Short to GND



RTW79ALF000301

Circuit Description

When the ignition switch is turned “ON”, the SRS control unit will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “Ignition 1”, and the deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SRS control unit monitors the voltages at the “Driver Bag Low” terminal “13” and “Passenger Bag Low” terminal “16” to detect short to ground/+B in the air bag assembly circuits.

DTC Will Set When

“Ignition 1" is within the normal operating voltage range.

The voltage at “Passenger Bag Low" is below a specified value DTC B0018 will set.

Action Taken

The SRS control unit turns “ON” the “SRS” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When

The "Passenger Bag Low" voltage comes to specified voltage.

DTC Chart Test Description

Number(s) below refer to circled number(s) on the diagnostic chart.

2. This test determines whether the SRS control unit is malfunctioning.
3. This test isolates the malfunction to one side of the passenger air bag assembly yellow connector behind the glove box compartment.
4. This test determines whether the malfunction is in the "Passenger Bag High" circuit.
5. This test determines whether the malfunction is in the "Passenger Bag Low" circuit.

Diagnostic Aids

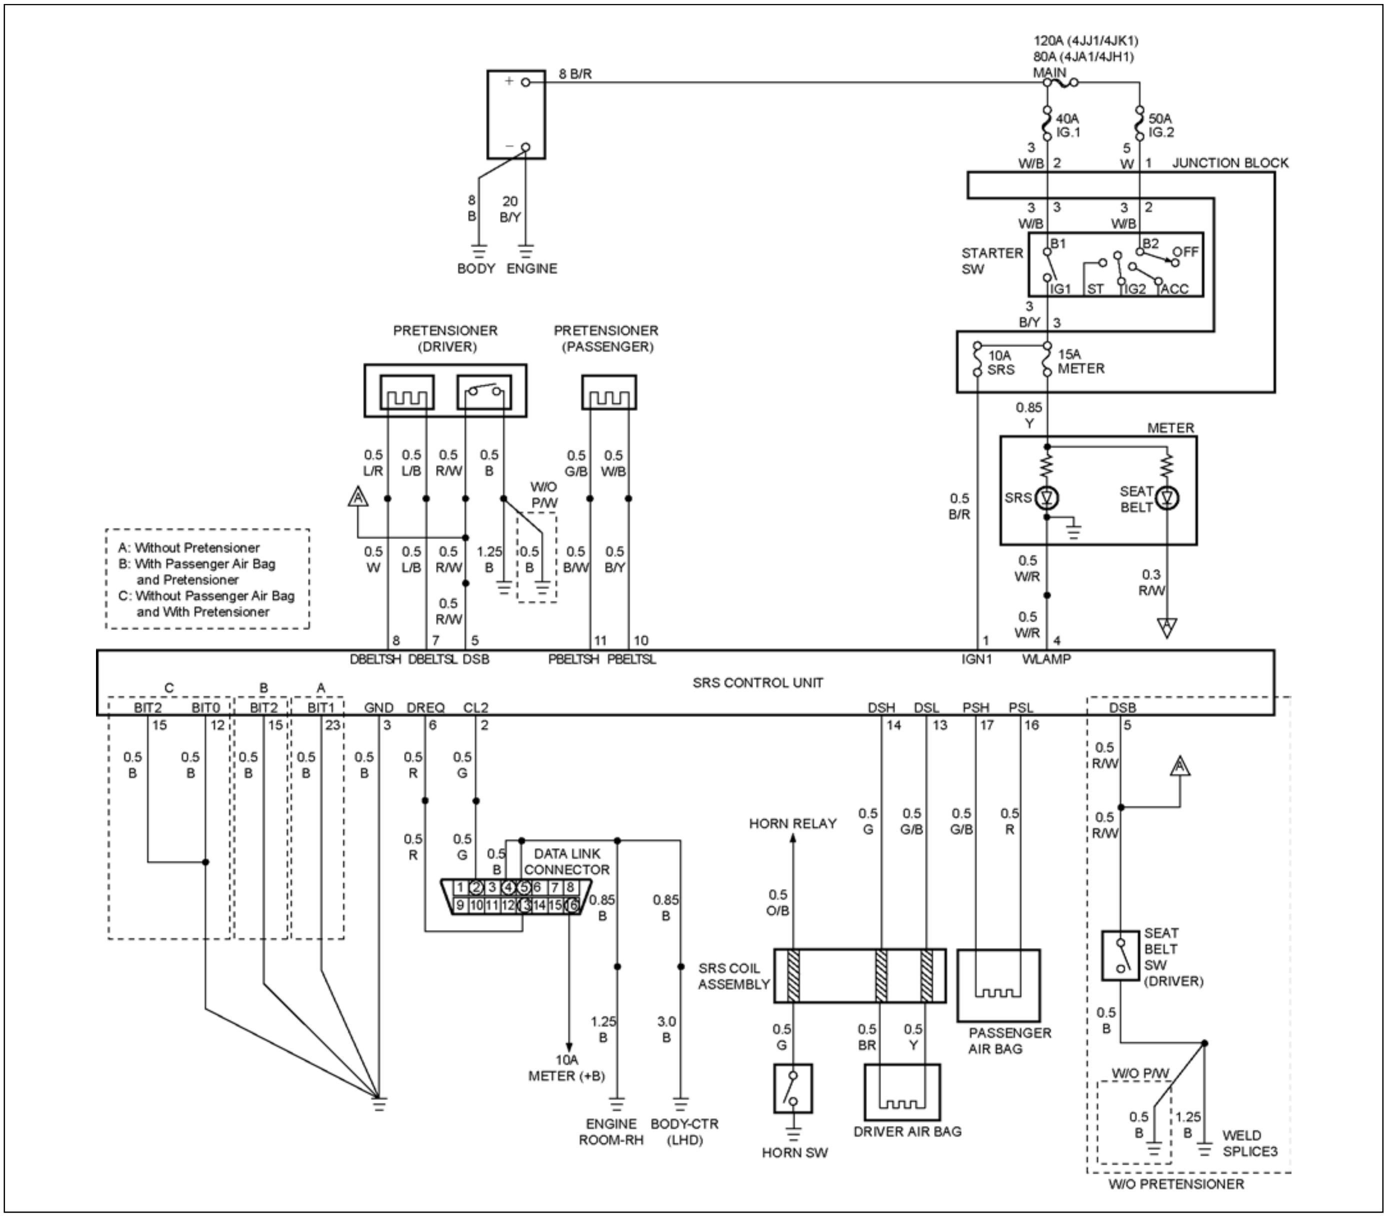
An intermittent condition is likely to be caused by a short to ground/+B in the passenger air bag assembly circuit. Inspect circuits "Passenger Bag High" and "Passenger Bag Low" carefully for cutting or chafing. If the wiring pigtail of the passenger air bag assembly is damaged, the component must be replaced.

DTC B0018 (Flash Code 18) Passenger Air Bag Squib Circuit Short to GND

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check"
2	1. When measurements are requested in this chart use a 5-8840-0366-0 DMM with a correct terminal adapter from 5-8840-2835-0. 2. Ignition switch is at "LOCK". 3. Ignition switch is "ON". 4. Check the passenger air bag squib circuit for a short to ground. Was a problem found?	Go to Step 3	—
3	1. Ignition switch is at "LOCK". 2. Disconnect the passenger air bag assembly yellow connector behind the glove box assembly. 3. Leave the driver air bag assembly connected. 4. Connect the SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to the passenger air bag assembly harness connector. 5. Ignition switch is "ON". Is DTC B0018 current?	Go to Step 4	Ignition switch is at "LOCK". Replace passenger air bag assembly . Go to Step 6
4	1. Ignition switch is at "LOCK". 2. Disconnect the SRS driver /passenger load tool. 3. Measure the resistance on the SRS control unit harness connector as follow. ● From terminals "17" to "3" and "23" (ground) (without the pretensioner) ● From terminals "17" to "3" and "15" (ground) (with the pretensioner) Does 5-8840-0366-0 display "OL" (Infinite)?	Go to Step 5	Replace SRS Harness. Go to Step 6

Step	Action	Yes	No
5	Measure the resistance on the SRS control unit harness connector as follow. ● From terminals "16" to "3" and "23" (ground) (without the pretensioner) ● From terminals "16" to "3" and "15" (ground) (with the pretensioner) Does 5-8840-0366-0 display “OL” (Infinite)?	Go to Chart A	Replace SRS Harness. Go to Step 6
6	1. Reconnect all the components and ensure all components are properly mounted. 2. Clear diagnostic trouble codes. Is this step finished?	Go to the “SRS Diagnostic system Check”	—

DTC B0019 (Flash Code 19) Passenger Air Bag Squib Circuit Short to Battery Voltage



RTW79ALF000301

Circuit Description

When the ignition switch is turned "ON", the SRS control unit will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "Ignition 1", and the deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SRS control unit monitors the voltages at the "Driver Bag Low" terminal "13" and "Passenger Bag Low" terminal "16" to detect short to ground/+B in the air bag assembly circuits.

DTC Will Set When

"Ignition 1" is in the normal operating voltage range.

The voltage at "Passenger Bag Low" is above a specified value,

DTC B0019 will set.

Action Taken

The SRS control unit turns "ON" the "SRS" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When

The SRS control unit is replaced and the "Passenger Bag Low" voltage comes to specified voltage.

DTC Chart Test Description

Number(s) below refer to circled number(s) on the diagnostic chart.

2. This test determines whether the SRS control unit is malfunctioning.
3. This test isolates the malfunction to one side of the passenger air bag assembly yellow connector behind the glove box compartment.
4. This test determines whether the malfunction is in the "Passenger Bag High" circuit.
5. This test determines whether the malfunction is in the "Passenger Bag Low" circuit.

Diagnostic Aids

An intermittent condition is likely to be caused by a short to ground/+B in the passenger air bag assembly circuit. Inspect circuits "Passenger Bag High" and "Passenger Bag Low" carefully for cutting or chafing. If the wiring pigtail of the passenger air bag assembly is damaged, the component must be replaced.

DTC B0019 (Flash Code 19) Passenger Air Bag Squib Circuit Short to Battery Voltage

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check"
2	1. When measurements are requested in this chart use a 5-8840-0366-0 DMM with a correct terminal adapter from 5-8840-2835-0. 2. Ignition switch is at "LOCK". 3. Ignition switch is "ON". 4. Check the passenger air bag squib circuit for a short to voltage, short to ground and open. Was a problem found?	Go to Step 3	—
3	1. Ignition switch is at "LOCK". 2. Disconnect the passenger air bag assembly yellow connector behind the glove box assembly. 3. Leave the driver air bag assembly connected. 4. Connect the SRS driver /passenger load tool 5-8840-2421-0 and appropriate adapter to the passenger air bag assembly harness connector. 5. Ignition switch is "ON". Is DTC B0019 current?	Go to Step 4	Ignition switch is at "LOCK". Replace passenger air bag assembly Go to Step 6
4	Measure the resistance on the SRS control unit harness connector from terminal "17" to terminal "1" (ignition). Does 5-8840-0366-0 display "OL" (Infinite)?	Go to Step 5	Replace SRS Harness. Go to Step 6
5	Measure the resistance on the SRS control unit harness connector from terminal "16" to terminal "1" (ignition). Does 5-8840-0366-0 display "OL" (Infinite)?	Go to Chart A	Replace SRS Harness. Go to Step 6
6	1. Reconnect all the components and ensure all components are properly mounted. 2. Clear diagnostic trouble codes. Is this step finished?	Go to the "SRS Diagnostic system Check"	—

4. NOISES IN FRONT AXLE

Checkpoint		Trouble Cause	Countermeasure
Oil level	NG	Insufficient gear oil	Replenish the gear oil
	NG	Wrong or poor grade gear oil	Replace the gear oil

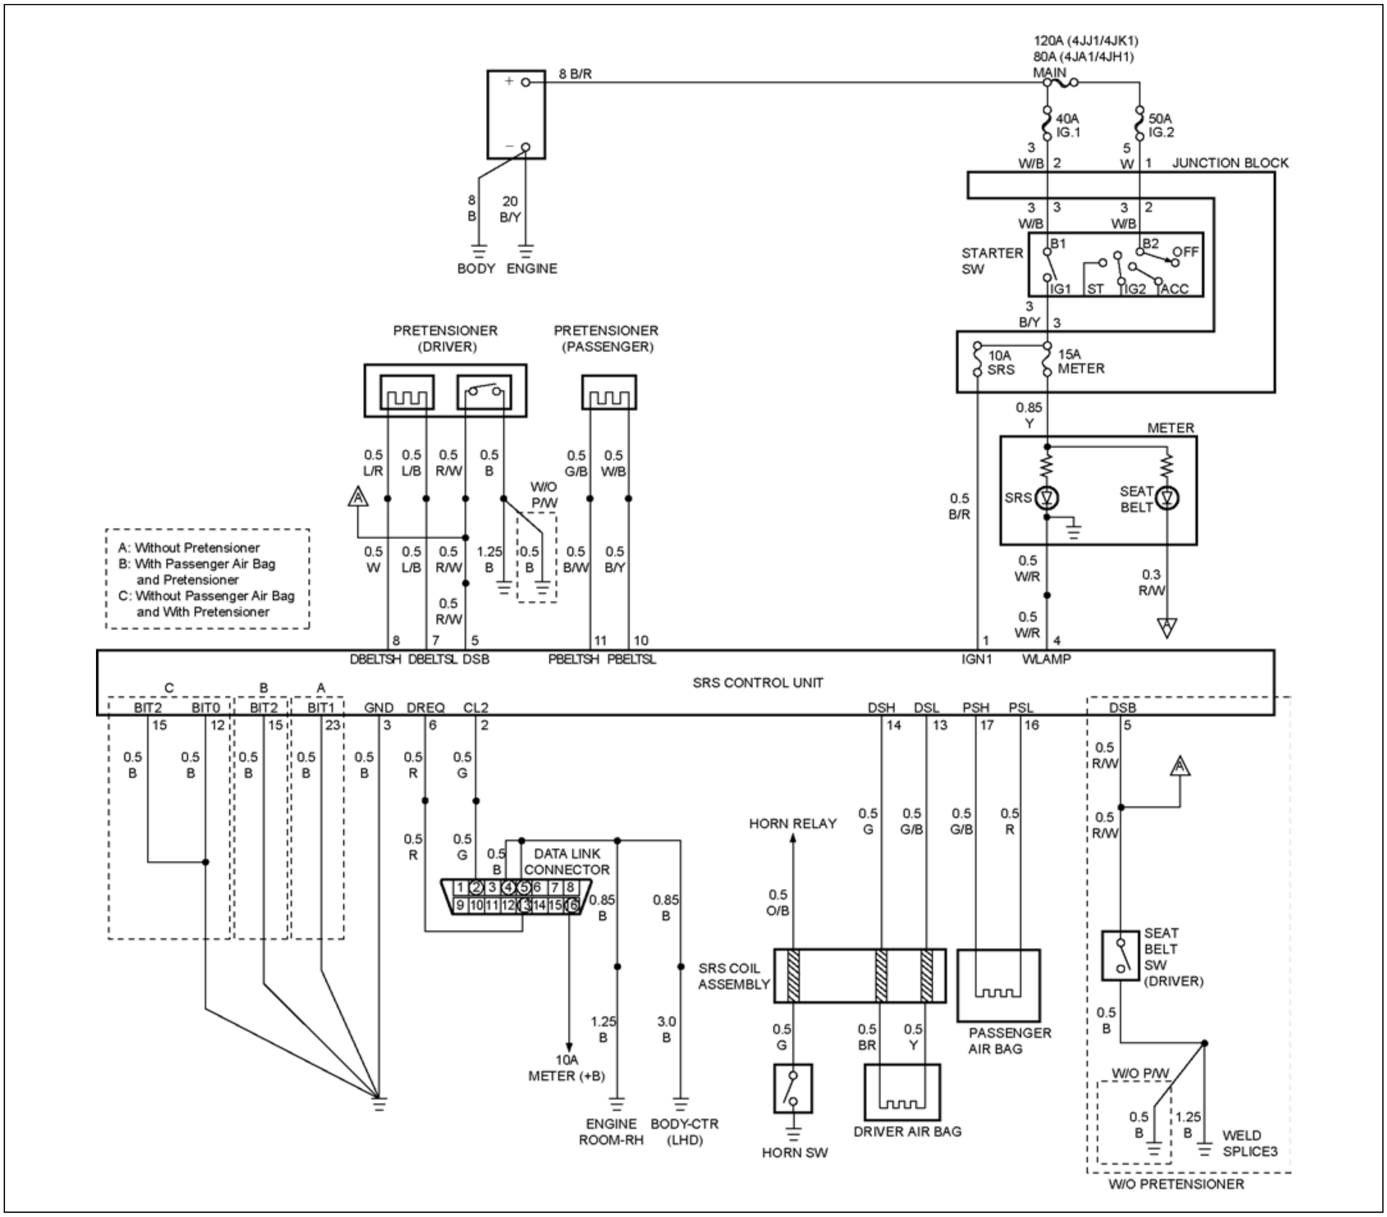
Drive pinion to ring gear backlash	NG	Too much or too little backlash	Adjust the backlash
OK			
Ring gear, pinion gear or side gear	NG	Worn or chipped	Replace the ring gear pinion gear or side gear
OK			
Pinion shaft bearing	NG	Worn	Replace the pinion shaft bearing
OK			
Wheel bearing	NG	Worn	Replace the wheel bearing
OK			
Differential bearing	NG	Loose or worn	Tighten or replace

DTC B0021 (Flash Code 21) Driver Air Bag Squib Circuit High Resistance



RTW79ALF000301

Circuit Description

When the ignition switch is turned “ON”, the SRS control unit will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “Ignition 1”, and deployment loop voltages, are measured to ensure they are within their respective normal voltage ranges.

The SRS control unit then proceeds with the “Resistance Measurement Test”. “Driver Bag Low” terminal “13” is grounded through a current sink and the driver current source connected to “Driver Bag High” terminal “14” allows a known amount of current to flow. By monitoring the voltage difference between “Driver Bag High” and “Driver Bag Low”, the SRS control unit calculates the combined resistance of the driver air bag assembly, SRS coil assembly, harness wiring circuits “Driver Bag High” and “Driver Bag Low” and connector terminal contact.

DTC Will Set When

The combined resistance of the driver air bag assembly, the SRS Coil assembly, the harness wiring circuits “Driver Bag High” and “Driver Bag Low”, and connector terminal contact is above a specified value. This test runs once for each ignition cycle during the “Resistance Measurement Test” when:

1. No “higher priority faults” are detected during “Turn–ON”.
2. “Ignition 1” voltage is in the specified value.

Action Taken

The SRS control unit turns “ON” the “SRS” warning lamp and sets DTC B0021.

DTC Will Clear When

Resistance value returns to specified resistance value.

DTC Chart Test Description

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SRS control unit.
3. This test verifies proper connection of the yellow connector at the base of the steering column.
4. This test checks for proper contact and/or corrosion of the connector terminals at the base of the steering column.
5. This test isolates the malfunction to one side of the SRS coil assembly yellow connector located at the base of the steering column.
6. This test determines whether the malfunction is due to high resistance in the wiring.
7. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

Diagnostic Aids

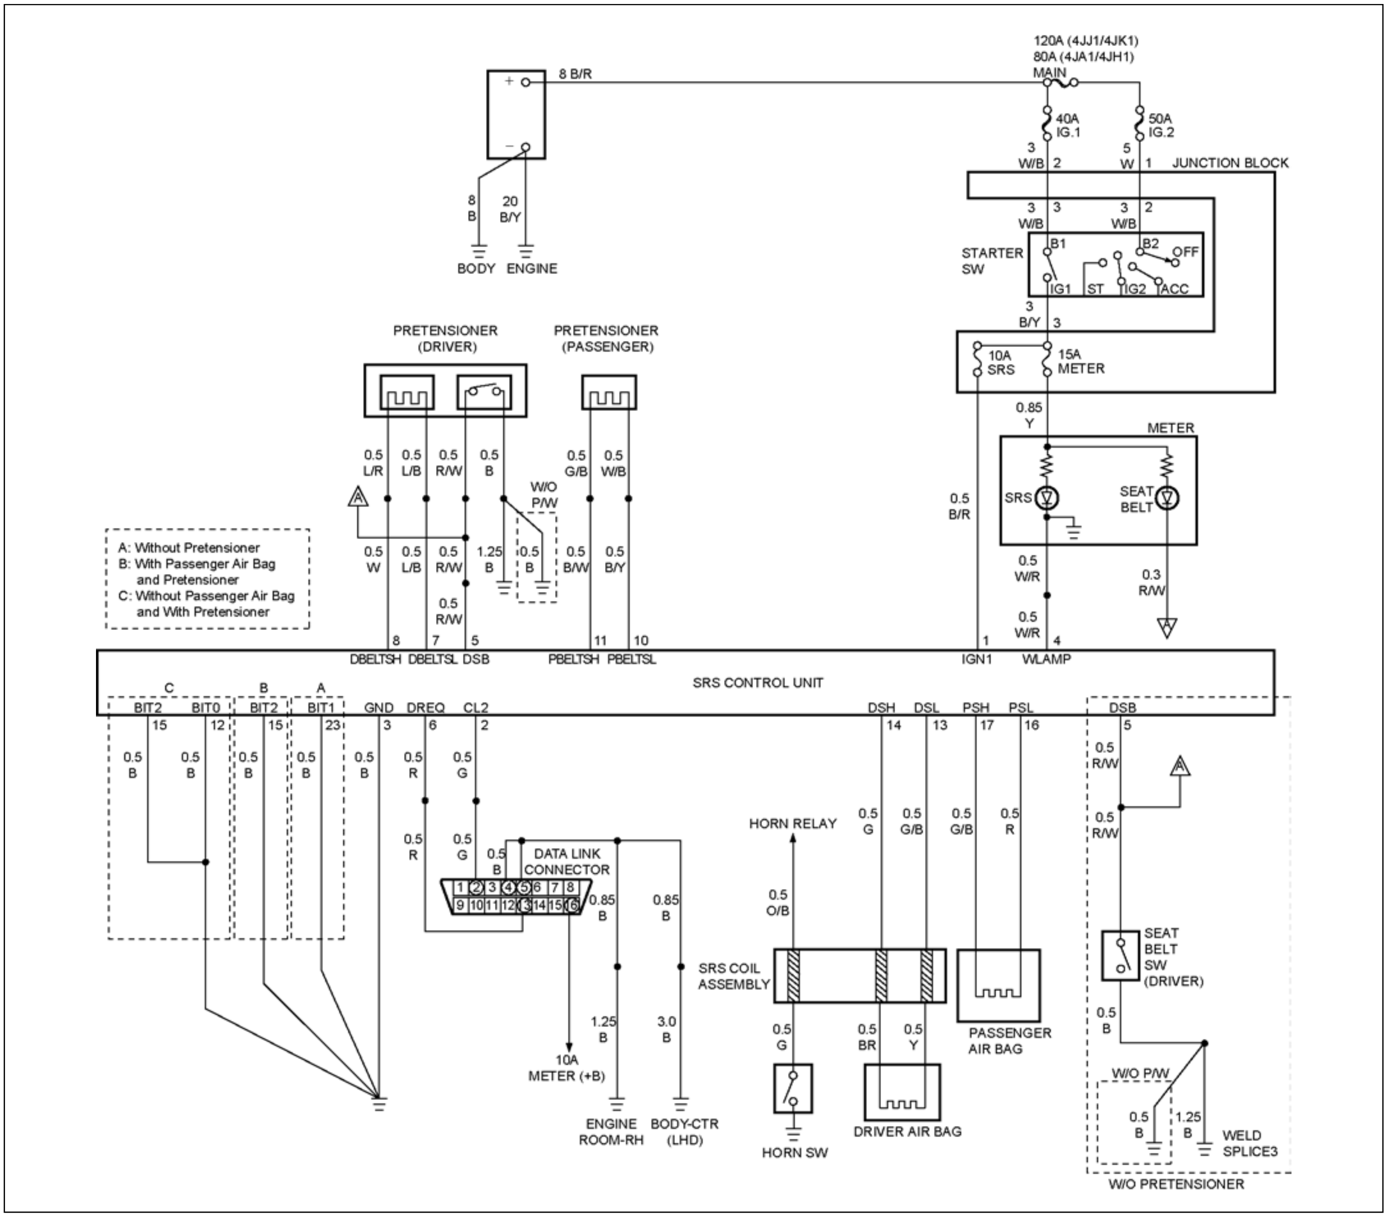
An intermittent condition is likely to be caused by a poor connection at terminals “1” and “2” of the SRS coil connector at the base of the steering column, terminal “1” and “2” of the driver air bag assembly connector at the top of the steering column, the SRS control unit terminals “14” and “13” or a poor wire to terminal connection in circuit “Driver Bag High” or “Driver Bag Low” The test for this diagnostic trouble code is only run while the “SRS” warning lamp is performing the bulb check. When a scan tool “Clear Codes” command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC B0021 (Flash Code 21) Driver Air Bag Squib Circuit High Resistance

Step	Action	Yes	No
1	Perform the “SRS Diagnostic System Check”. Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Repeat the “SRS Diagnostic System Check”
2	1. Check the driver air bag squib circuit for open. 2. If a the problem is found, repair as necessary. Was a problem found?	Verify repair	Go to Step 3
3	1. Ignition switch to “LOCK”. 2. Disconnect the SRS coil assembly yellow connector located at the base of the steering column and check it is seated properly. Is the connector connected properly?	Go to Step 4	Seat SRS coil assembly connector properly. Go to Step 8

Step	Action	Yes	No
4	1. Disconnect and inspect the SRS coil assembly yellow connector located at the base of the steering column. 2. If ok, reconnect the SRS coil assembly yellow connector. 3. Ignition switch is “ON”. Is DTC B0021 current?	Go to Step 5	Go to Step 8
5	1. Ignition switch is at “LOCK”. 2. Disconnect the SRS coil and the passenger air bag assembly, yellow 2–pin connector located at the base of the steering column and behind the glove box assembly. 3. Connect the SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to the SRS coil and the passenger air bag assembly harness connectors. 4. Ignition switch is “ON”. Is DTC B0021 current?	Go to Step 6	Go to Step 7
6	1. Ignition switch is at “LOCK“. 2. There has been an increase in the total circuit resistance of the driver deployment loop. 3. Use the high resolution ohmmeter mode of the DMM while checking circuits “Driver Bag High” and “Driver Bag Low”, and the SRS control unit connector terminal “14” and “13” to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 8	Go to Chart A
7	1. Ignition switch is at “LOCK”. 2. Disconnect the SRS driver / passenger load tool from the SRS coil assembly harness connector. 3. Connect the SRS driver / passenger load tool 5-8840-2421-0 on the top of the steering column. 4. Reconnect the SRS coil assembly harness connector at the base of the steering column. 5. Ignition switch is “ON”. Is DTC B0021 current?	Ignition switch “LOCK”. Replace SRS coil assembly. Go to Step 8	Ignition switch “LOCK”. Replace driver air bag assembly. Go to Step 8
8	1. Reconnect all components and ensure all components are properly mounted. 2. Clear the diagnostic trouble codes. Is this step finished?	Repeat the “SRS Diagnostic System Check”	—

DTC B0022 (Flash Code 22) Driver Air Bag Squib Circuit Low Resistance



RTW79ALF000301

Circuit Description

When the ignition switch is turned “ON”, the SRS control unit will perform tests to diagnose critical malfunctions within itself. Upon passing these tests “Ignition 1”, and deployment loop voltages, are measured to ensure they are within their respective normal voltage ranges.

The SRS control unit then proceeds with the “Resistance Measurement Test”. “Driver Bag Low” terminal “13” is grounded through a current sink and the driver current source connected to “Driver Bag High” terminal “14” allows a known amount of current to flow. By monitoring the voltage difference between “Driver Bag High” and “Driver Bag Low” the SRS control unit calculates the combined resistance of the driver air bag assembly, SRS coil assembly, harness wiring circuits “Driver Bag High” and “Driver Bag Low” and connector terminal contact.

DTC Will Set When

The combined resistance of the driver air bag assembly, SRS Coil assembly, harness wiring circuits "Driver Bag High" and "Driver Bag Low", and connector terminal contact is above a specified value. This test is run once for each ignition cycle during the "Resistance Measurement Test" when:

1. No "higher priority faults" are detected during "Turn–ON"
2. "Ignition 1" voltage is in the specified value.

Action Taken

The SRS control unit turns "ON" the "SRS" warning lamp and sets DTC B0022.

DTC Will Clear When

Resistance value returns to specified resistance value.

DTC Chart Test Description

Number(s) below refer to circled number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SRS control unit.
3. This test verifies proper connection of the yellow connector at the base of the steering column.
4. This test checks for proper operation of the shorting clip in the yellow connector.
5. This test isolates the malfunction to one side of the SRS coil assembly yellow connector located at the base of the steering column.
6. This test determines whether the malfunction is due to shortening in the wiring.
7. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

Diagnostic Aids

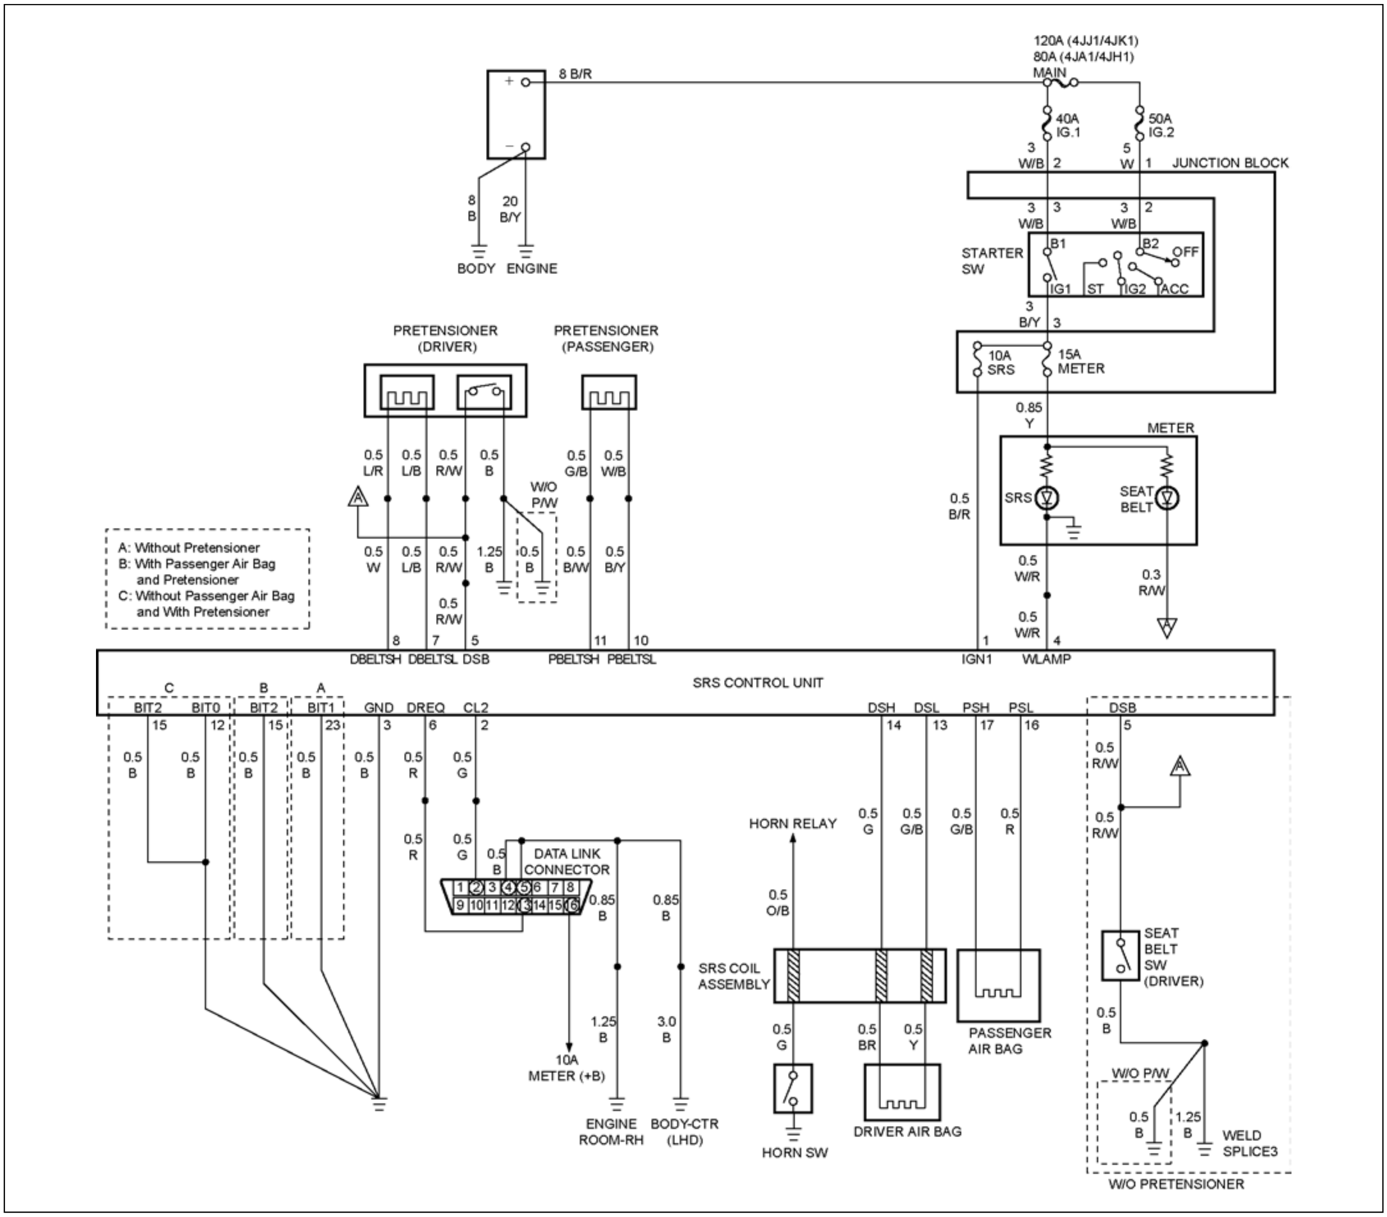
An intermittent condition is likely to be caused by a short between circuit "Driver Bag High" or "Driver Bag Low" and a malfunctioning shorting clip on the driver air bag assembly or the SRS coil assembly which would require replacement of the component. The test for this diagnostic trouble code is only run while the "SRS" warning lamp is performing the bulb check. When the scan tool "Clear Codes" command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC B0022 (Flash Code 22) Driver Air Bag Squib Circuit Low Resistance

Step	Action	Yes	No
1	Perform the "SRS Diagnostic System Check." Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check"
2	1. Check the driver air bag squib circuit for short to voltage or short to ground. 2. If a problem is found, repair as necessary. Was a problem found?	Verify repair	Go to Step 3
3	1. Ignition switch to "LOCK". 2. Make sure the SRS coil assembly yellow connector located at the base of steering column is seated properly. Is the connector connected properly?	Go to Step 4	Seat driver air bag assembly connector properly. Go to Step 8
4	1. Disconnect and inspect the SRS coil assembly yellow connector located at the base of the steering column. 2. If ok, reconnect the SRS coil assembly yellow connector. 3. Ignition switch is "ON". Is DTC B0022 current?	Go to Step 5	Go to Step 8

Step	Action	Yes	No
5	1. Ignition switch is at “LOCK”. 2. Disconnect the SRS coil and passenger air bag assembly, yellow connector located at the base of the steering column and behind the glove box assembly. 3. Connect the SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to the SRS coil and passenger air bag assembly harness connectors. 4. Ignition switch is “ON”. Is DTC B0022 current?	Go to Step 6	Go to Step 7
6	1. Ignition switch to “LOCK”. 2. There has been a decrease in the total circuit resistance of the driver deployment loop. 3. Use the high resolution ohmmeter mode of the DMM while checking circuits “Driver Bag High” and “Driver Bag Low”, and the SRS control unit connector terminal “14” and “13” to locate the root cause. Was a fault found?	Replace SRS harness. Go to Step 8	Go to Chart A
7	1. Ignition switch is at “LOCK”. 2. Disconnect the SRS driver / passenger load tool from the driver air bag assembly harness connector. 3. Connect the SRS driver / passenger load tool 5-8840-2421-0 to the top of the steering column connector. 4. Reconnect the SRS coil assembly harness connector at the base of the steering column. 5. Ignition switch is “ON”. Is DTC B0022 current?	Ignition switch “LOCK”. Replace SRS coil assembly. Go to Step 8	Ignition switch “LOCK”. Replace driver air bag assembly. Go to Step 8
8	1. Reconnect all components and ensure all components are properly mounted. 2. Clear the diagnostic trouble codes. Is this step finished?	Go to the “SRS Diagnostic System Check”	—

DTC B0025 (Flash Code 25) Driver Air Bag Squib Circuit Short to GND



RTW79ALF000301

Circuit Description

When the ignition switch is turned “ON”, the SRS control unit will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “Ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SRS control unit monitors the voltage at “Driver Bag Low” terminal “13” and “Passenger Bag Low” terminal “16” to detect shorts to ground/+B in the air bag assembly circuits.

DTC Will Set When

“Ignition 1" is within the normal operating voltage range.

The voltage at “Driver Bag Low" is below a specified value DTC B0025 will set.

Action Taken

The SRS control unit turns “ON” the “SRS” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When

The “Driver Bag Low" voltage comes to specified voltage.

DTC Chart Test Description

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the SRS control unit is malfunctioning.
3. This test isolates the malfunction to one side of the SRS coil assembly yellow 2–pin connector at the base of the steering column.
4. This test determines whether the malfunction is in the “Driver Bag High” circuit.
5. This test determines whether the malfunction is in the “Driver Bag Low” circuit.
6. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

Diagnostic Aids

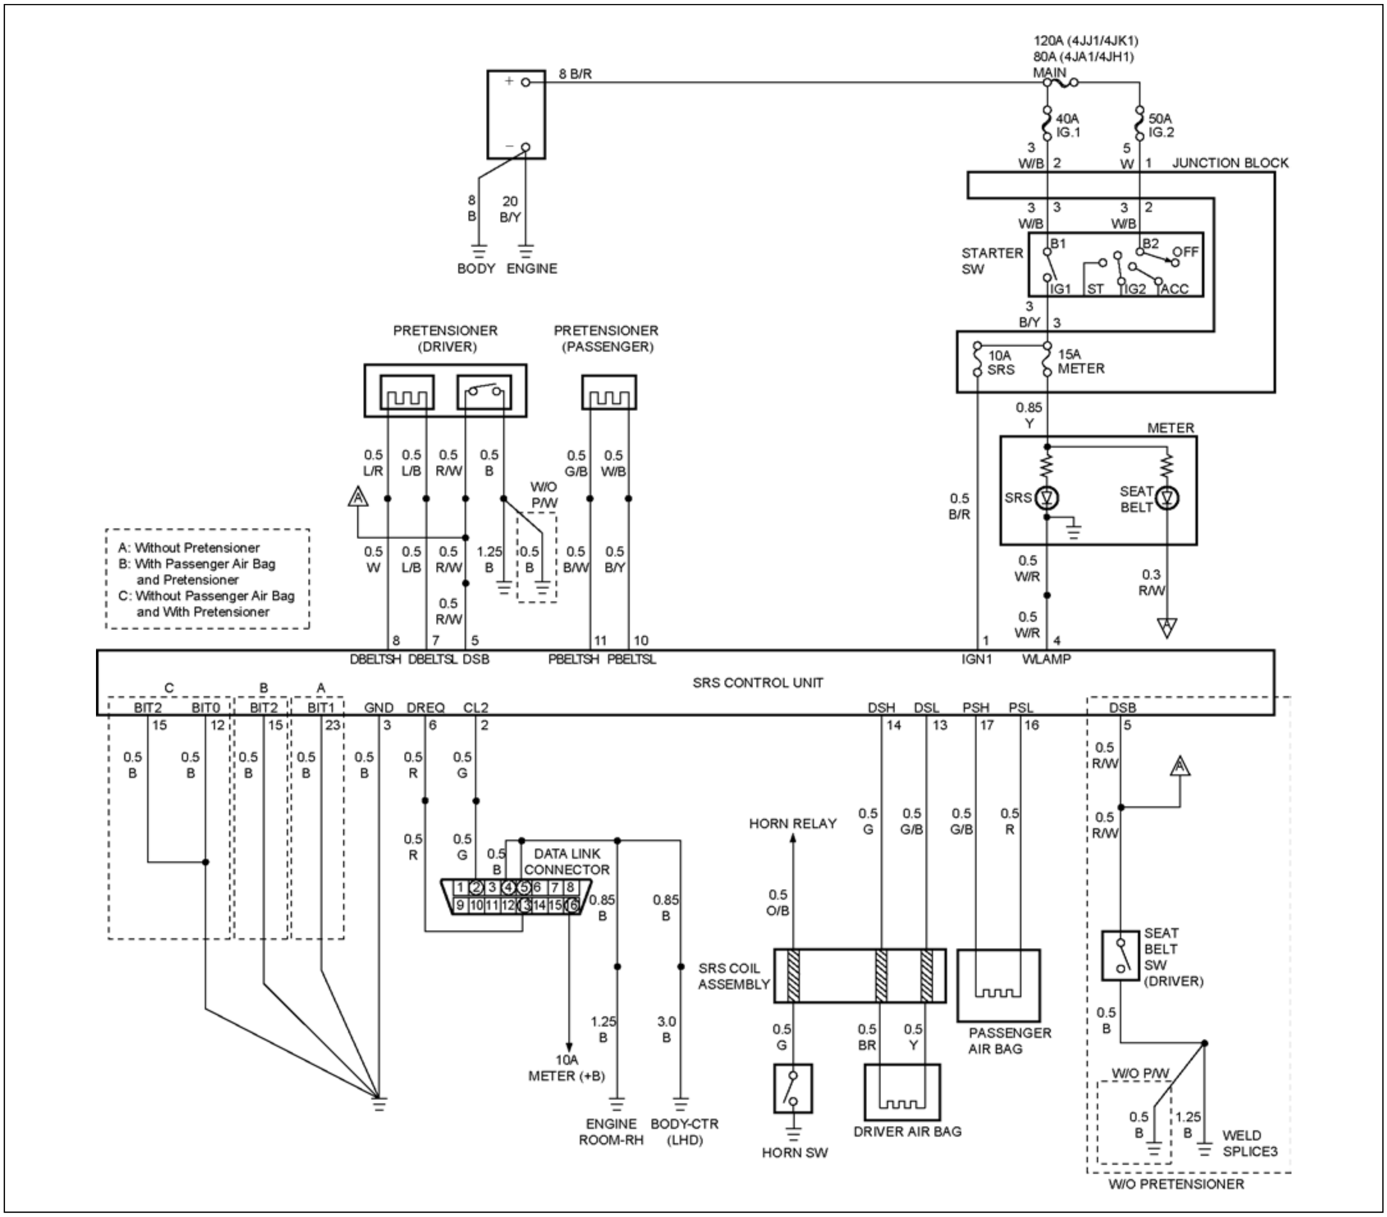
An intermittent condition is likely to be caused by a short to ground/+B in the driver air bag assembly circuit. Inspect circuits “Driver Bag High” and “Driver Bag Low” carefully for cutting or chafing.

DTC B0025 (Flash Code 25) Driver Air Bag Squib Circuit Short to GND

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check”
2	1. When measurements are requested in this chart use a 5-8840-0366-0 DMM with a correct terminal adapter from 5-8840-2835-0. 2. Ignition switch is at “LOCK”. 3. Ignition switch is “ON”. 4. Check the driver air bag squib circuit for short to voltage or short to ground and open. Was a problem found?	Go to Step 3	—
3	1. Ignition switch is at “LOCK”. 2. Disconnect the SRS coil assembly yellow connector located at base of the steering column. Leave the passenger air bag assembly connected. 3. Connect the SRS driver /passenger load tool 5-8840-2421-0 and appropriate adapter to the SRS coil assembly harness connector. 4. Ignition switch is “ON”. Is DTC B0025 current?	Go to Step 4	Go to Step 6
4	1. Ignition switch is at “LOCK”. 2. Disconnect the SRS control unit. 3. Disconnect the SRS driver /passenger load tool. 4. Measure the resistance on the SRS control unit harness connector as follow. ● From terminals "14" to "3" and "23" (ground) (without the pretensioner) ● From terminals "14" to "3" and "15" (ground) (with the pretensioner and the passenger air bag) ● From terminals "14" to "3", "12" and "15" (ground) (with the pretensioner and without the passenger air bag) Does 5-8840-0366-0 display “OL” (infinite)?	Go to Step 5	Replace SRS harness. Go to Step 7

Step	Action	Yes	No
5	Measure the resistance on the SRS control unit harness connector as follow. ● From terminals "13" to "3" and "23" (ground) (without the pretensioner) ● From terminals "13" to "3" and "15" (ground) (with the pretensioner and the passenger air bag) ● From terminals "13" to "3", "12" and "15" (ground) (with the pretensioner and without the passenger air bag) Does 5-8840-0366-0 display “OL” (infinite)?	Go to Chart A	Replace SRS harness. Go to Step 7
6	1. Ignition switch is at “LOCK”. 2. Disconnect the SRS driver /passenger load tool 5-8840-2421-0 from the SRS coil assembly harness connector. 3. Connect the SRS driver /passenger load tool 5-8840-2421-0 and appropriate adapter to the driver air bag assembly harness connector. located at top of the steering column connector. 4. Reconnect the SRS coil assembly harness connector at the base of the steering column. 5. Ignition switch is “ON”. Is DTC B0025 current?	Ignition switch is at “LOCK”. Replace SRS coil assembly. Go to Step 7	Ignition switch is at “LOCK”. Replace driver air bag assembly. Go to Step 7
7	1. Reconnect all components and ensure all components are properly mounted. 2. Clear the diagnostic trouble codes. Is this step finished?	Go to the “SRS Diagnostic System Check”	—

DTC B0026 (Flash Code 26) Driver Air Bag Squib Circuit Short to Battery Voltage



RTW79ALF000301

Circuit Description

When the ignition switch is turned “ON”, the SRS control unit will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “Ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SRS control unit monitors the voltage at “Driver Bag Low” terminal “13” and “Passenger Bag Low” terminal “16” to detect shorts to ground/+B in the air bag assembly circuits.

DTC Will Set When

“Ignition 1" is in the normal operating voltage range.
The voltage at “Driver Bag Low" is above a specified value,
DTC B0026 will set.

Action Taken

The SRS control unit turns “ON” the “SRS” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When

The SRS control unit is replaced and the “Driver Bag Low" voltage comes to specified voltage.

5. WANDERS AND PULLS

Checkpoint	Trouble Cause	Countermeasure
Wheel bearing preload	NG: Too tight	Adjust the wheel bearing preload
OK ↓ Front alignment	NG: Incorrect	Adjust the front alignment
OK ↓ Steering unit	NG: Loose or worn	Tighten or replace
OK ↓ Tire	NG: Worn or improperly inflated	Replace or adjust the inflation
OK ↓ Suspension	NG: Front or rear suspension parts loose or broken	Tighten or replace

DTC Chart Test Description

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the SRS control unit is malfunctioning.
3. This test isolates the malfunction to one side of the SRS coil assembly yellow 2–pin connector at the base of the steering column.
4. This test determines whether the malfunction is in the “Driver Bag High” circuit.
5. This test determines whether the malfunction is in the “Driver Bag Low” circuit.
6. This test determines whether the malfunction is in the SRS coil assembly or the driver air bag assembly.

Diagnostic Aids

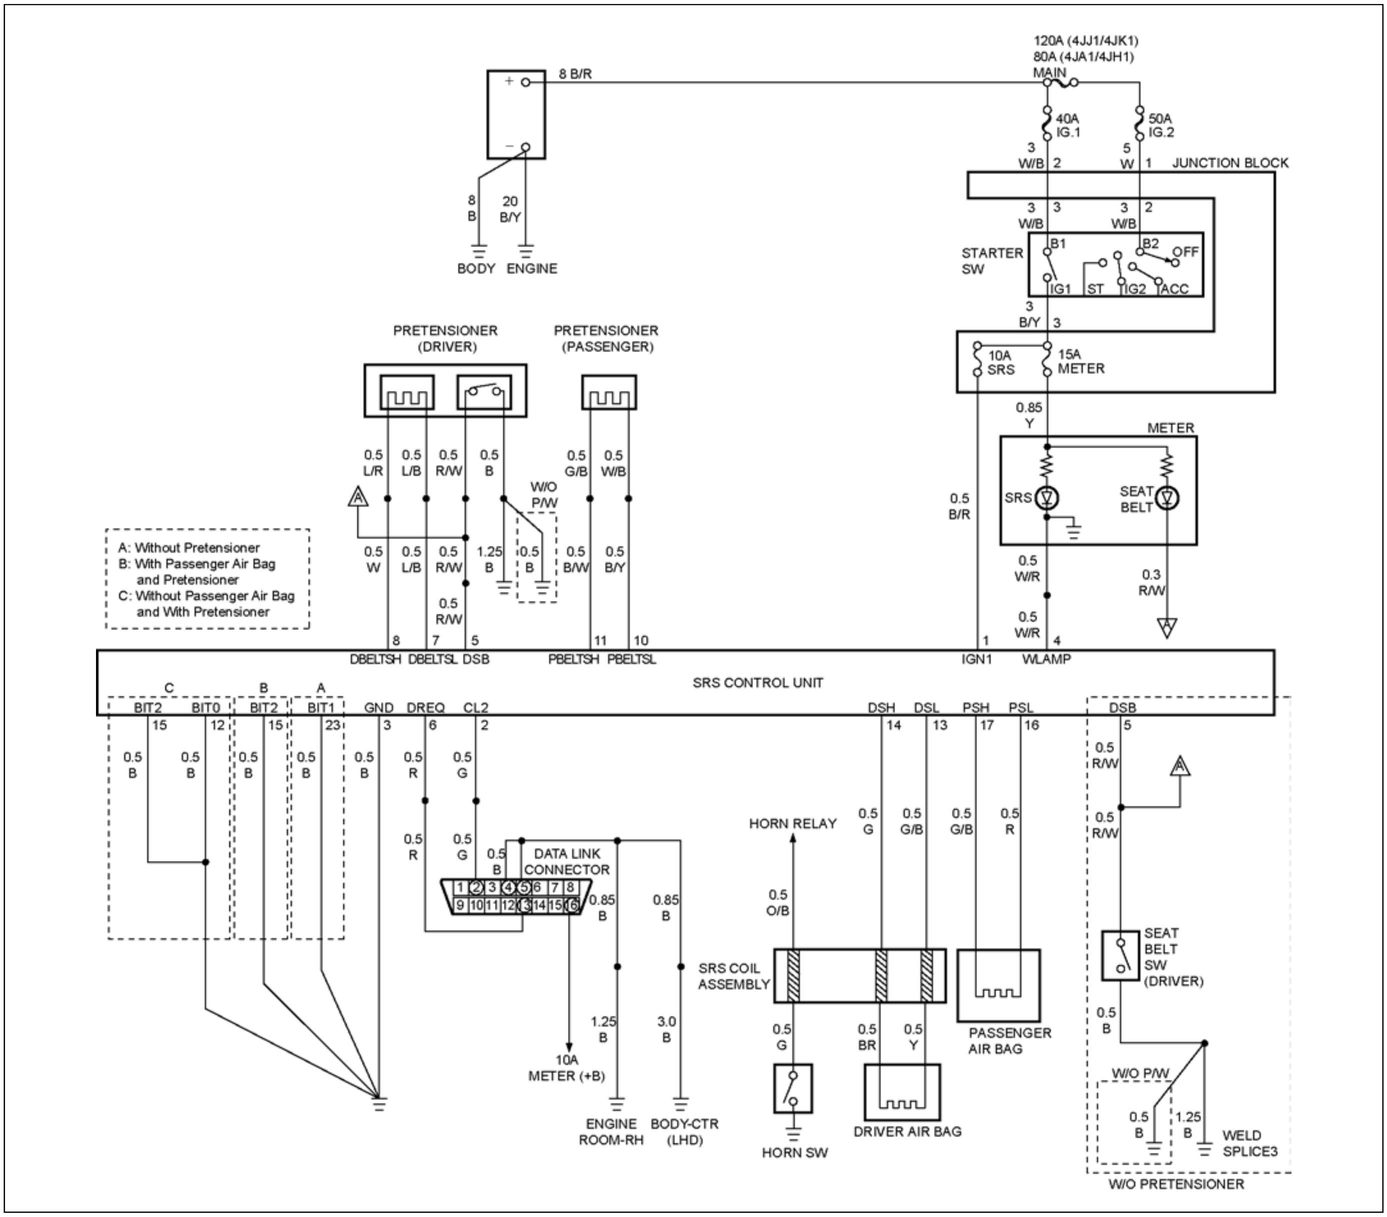
An intermittent condition is likely to be caused by a short to ground/+B in the driver air bag assembly circuit. Inspect circuits “Driver Bag High” and “Driver Bag Low” carefully for cutting or chafing.

DTC B0026 (Flash Code 26) Driver Air Bag Squib Circuit Short to Battery Voltage

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check”
2	1. When measurements are requested in this chart use a 5-8840-0366-0 DMM with a correct terminal adapter from 5-8840-2835-0. 2. Ignition switch is at “LOCK”. 3. Ignition switch is “ON”. 4. Check the driver air bag squib circuit for short to voltage or short to ground and open. Was a problem found?	Go to Step 3	—
3	1. Ignition switch is at “LOCK”. 2. Disconnect the SRS coil assembly yellow connector located at base of the steering column. Leave the passenger air bag assembly connected. 3. Connect the SRS driver /passenger load tool 5-8840-2421-0 and appropriate adapter to the SRS coil assembly harness connector. 4. Ignition switch is “ON”. Is DTC B0026 current?	Go to Step 4	Go to Step 6
4	Measure resistance on SRS control unit harness connector from terminal “14” to terminal “1” (ignition). Does 5-8840-0366-0 display “OL” (infinite)?	Go to Step 5	Replace SRS harness. Go to Step 7
5	Measure the resistance on the SRS control unit harness connector from terminal “13” to terminal “1” (ignition). Does 5-8840-0366-0 display “OL” (infinite)?	Go to Chart A	Replace SRS harness. Go to Step 7

Step	Action	Yes	No
6	1. Ignition switch is at "LOCK". 2. Disconnect the SRS driver /passenger load tool 5-8840-2421-0 from the SRS coil assembly harness connector. 3. Connect the SRS driver /passenger load tool 5-8840-2421-0 and appropriate adapter to the driver air bag assembly harness connector. located at top of the steering column connector. 4. Reconnect the SRS coil assembly harness connector at the base of the steering column. 5. Ignition switch is "ON". Is DTC B0026 current?	Ignition switch is at "LOCK". Replace SRS coil assembly. Go to Step 7	Ignition switch is at "LOCK". Replace driver air bag assembly. Go to Step 7
7	1. Reconnect all components and ensure all components are properly mounted. 2. Clear the diagnostic trouble codes. Is this step finished?	Go to the "SRS Diagnostic System Check"	—

DTC B0029 (Flash Code 29) Passenger Pretensioner Squib Circuit High Resistance



RTW79ALF000301

Circuit Description

When the ignition switch is turned “ON”, the SRS control unit will perform tests to diagnose critical malfunctions within itself. Upon passing these tests “Ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SRS control unit then proceeds with the “Resistance Measurement Test”. “Passenger Pretensioner Low” terminal “10” is grounded through a resister and the passenger current source connected to “Passenger Pretensioner High” terminal “11” allows a known amount of current to flow.

By monitoring the voltage difference between “Passenger Pretensioner High” and “Passenger Pretensioner Low” the SRS control unit calculates the combined resistance of the passenger pretensioner assembly, harness wiring circuits “Passenger Pretensioner High” and “Passenger Pretensioner Low” connector terminal contact.

DTC Will Set When

The combined resistance of the passenger air pretensioner assembly, harness wiring circuits "Passenger Pretensioner High" and "Passenger Pretensioner Low", and connector terminal contact is above a specified value. This test is run once each ignition cycle during the "Resistance Measurement Test" when:

1. No "higher priority faults" are detected during "Turn–ON",
2. "Ignition 1" voltage is in the specified value.

Action Taken

SRS control unit turns "ON" the "AIR BAG" warning lamp and sets a diagnostic trouble code.

DTC Will Clear When

The ignition switch is at "LOCK".

DTC Chart Test Description

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SRS control unit.
3. This test verifies proper connection of the yellow connector.
4. This test checks for proper contact and/or corrosion of the yellow connector terminals.
5. The test checks for a malfunctioning passenger pretensioner assembly.
6. This test determines whether the malfunction is due to high resistance in the wiring.

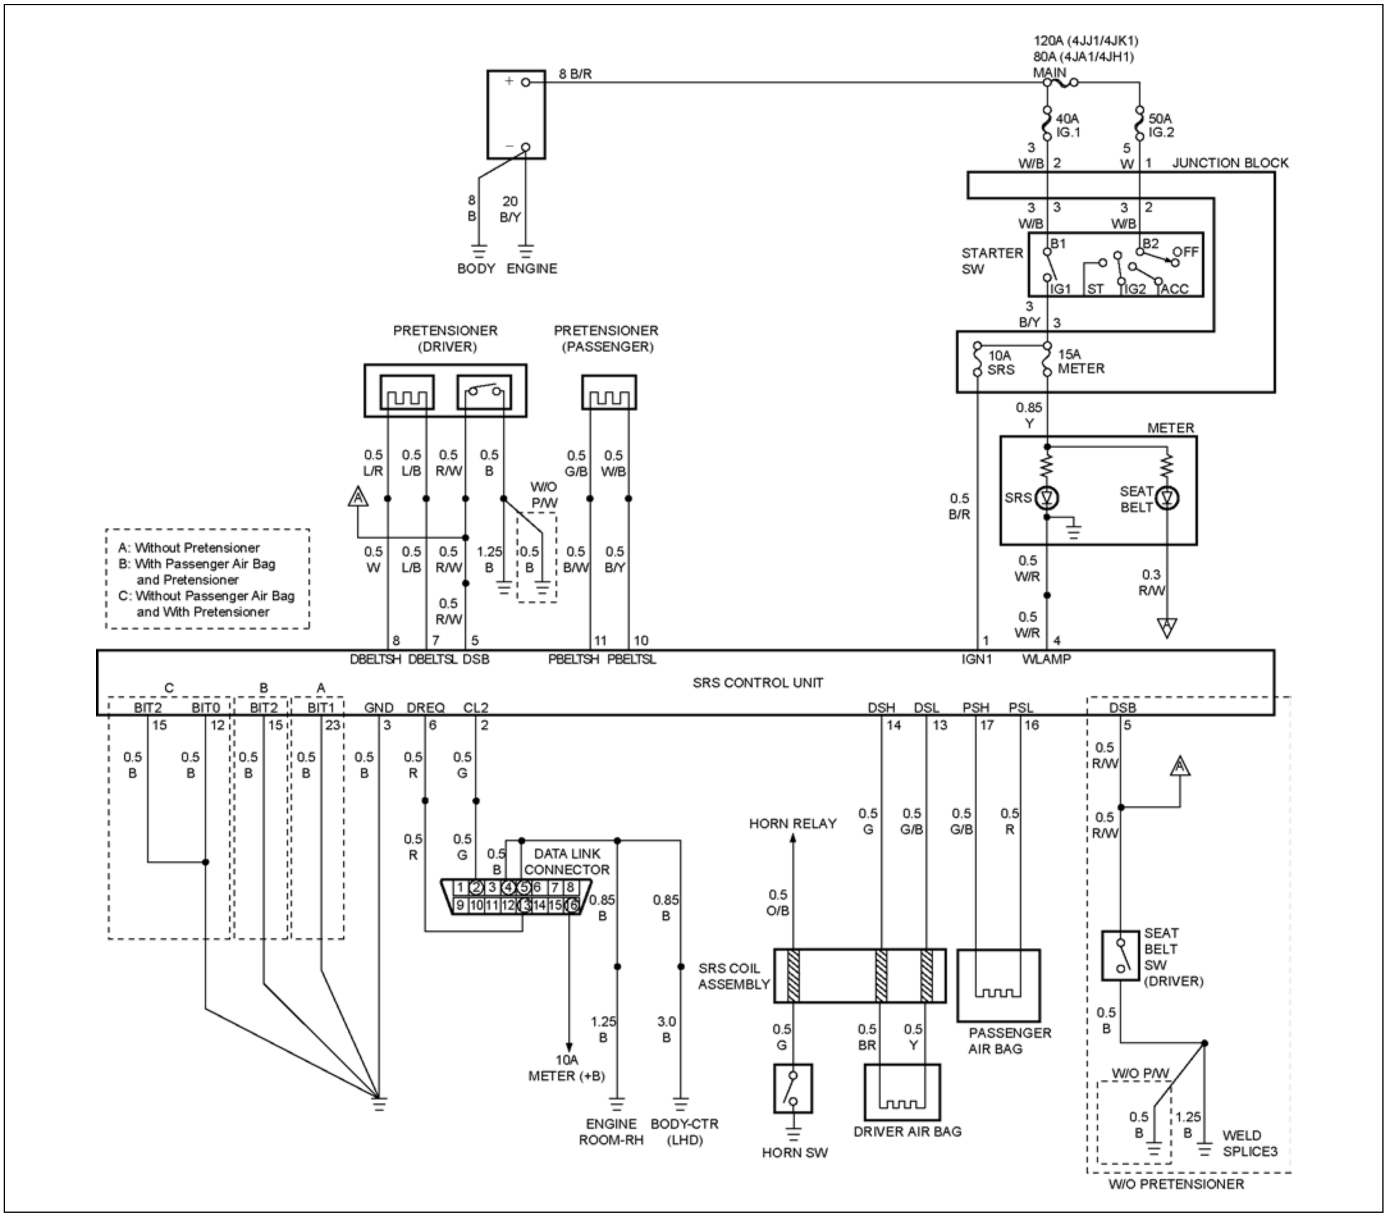
Diagnostic Aids

An intermittent condition is likely to be caused by a poor connection at the passenger pretensioner assembly harness connector terminals "1" and "2", SRS control unit terminal "11" and "10", or a poor wire to terminal connection in circuits "Passenger Pretensioner High" and "Passenger Pretensioner Low". This test for this diagnostic trouble code is only run while the "AIR BAG" warning lamp is performing the bulb check. When a scan tool "Clear Codes" command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC B0029 (Flash Code 29) Passenger Pretensioner Squib Circuit High Resistance

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” Performed?	Go to Step 2	Go to The “SRS Diagnostic System Check”
2	1. Check the passenger pretensioner circuit for open. 2. If the problem found, repair as necessary. Was a problem found?	Verify repair	Go to Step 3
3	1. Ignition switch is at “LOCK”. 2. Make sure the passenger air bag assembly yellow connector located at the base of the passenger seat. Is the yellow connector connected properly?	Go to Step 4	Seat passenger pretensioner assembly yellow connector properly. Go to Step 7
4	1. Disconnect and inspect the passenger pretensioner assembly yellow connector located at the base of the passenger seat. 2. If ok, reconnect the passenger pretensioner assembly connector. 3. Ignition switch “ON”. Is DTC B0029 current?	Go to Step 5	Go to Step 7
5	1. Ignition switch is at “LOCK”. 2. Disconnect passenger pretensioner assembly, yellow connector located at the base of the passenger seat. 3. Connect 5-8840-2421-0 SRS driver / passenger load tool and appropriate adapters to passenger pretensioner assembly harness connectors. 4. Ignition switch “ON”. Is DTC B0029 Current?	Go to Step 6	Ignition switch is at “LOCK.” Replace the passenger pretensioner assembly. Go to Step 7
6	1. Ignition switch is at “LOCK”. 2. There has been an increase in the total circuit resistance of the passenger loop. 3. Use the high resolution ohmmeter mode of the DVM while checking circuits “Pasenger Pretensioner High” and “Passenger Pretensioner Low”, and SRS control unit connector terminal “11” and “10” to locate the root cause. Was a fault found?	Replace SRS harness or repair chassis harness. Go to Step 7	Go to Chart A
7	1. Reconnect all components ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was This step finished?	Repeat the “SRS Diagnostic System Check”	—

DTC B0031 (Flash Code 31) Passenger Pretensioner Squib Circuit Low Resistance



RTW79ALF000301

Circuit Description

When the ignition switch is turned “ON”, the SRS control unit will perform tests to diagnose critical malfunctions within itself. Upon passing these tests “Ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges. The SRS control unit then proceeds with the “Resistance Measurement Test”. “Passenger Pretensioner Low” terminal “10” is grounded through a resistor and the passenger current source connected to “Passenger Pretensioner High” terminal “11” allows a known amount of current to flow.

By monitoring the voltage difference between “Passenger Pretensioner High” and “Passenger Pretensioner Low”, the SRS control unit calculates the combined resistance of the passenger air bag assembly, harness wiring circuits “Passenger Pretensioner High” and “Passenger Pretensioner Low” connector terminal contact.

DTC Will Set When

The combined resistance of the passenger pretensioner assembly, harness wiring circuits “Passsenger Pretensioner High” and “Passenger Pretensioner Low”, and connector terminal contact is above a specified value. This test is run once each ignition cycle during the “Resistance Measurement Test” when:

1. No “higher priority faults” are detected during “Turn–ON”,
2. “Ignition 1” voltage is in the specified value.

Action Taken

SRS control unit turns “ON” the “AIR BAG” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When

The ignition switch is turned “LOCK”.

DTC Chart Test Description

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SRS control unit.
3. This test verifies connection of the yellow connector.
4. This test cheeks for proper operation of the shorting clip in the yellow connector.
5. The test checks for a malfunction passenger pretensioner assembly.
6. This test determines whether the malfunctioning is due to shortening in the wiring.

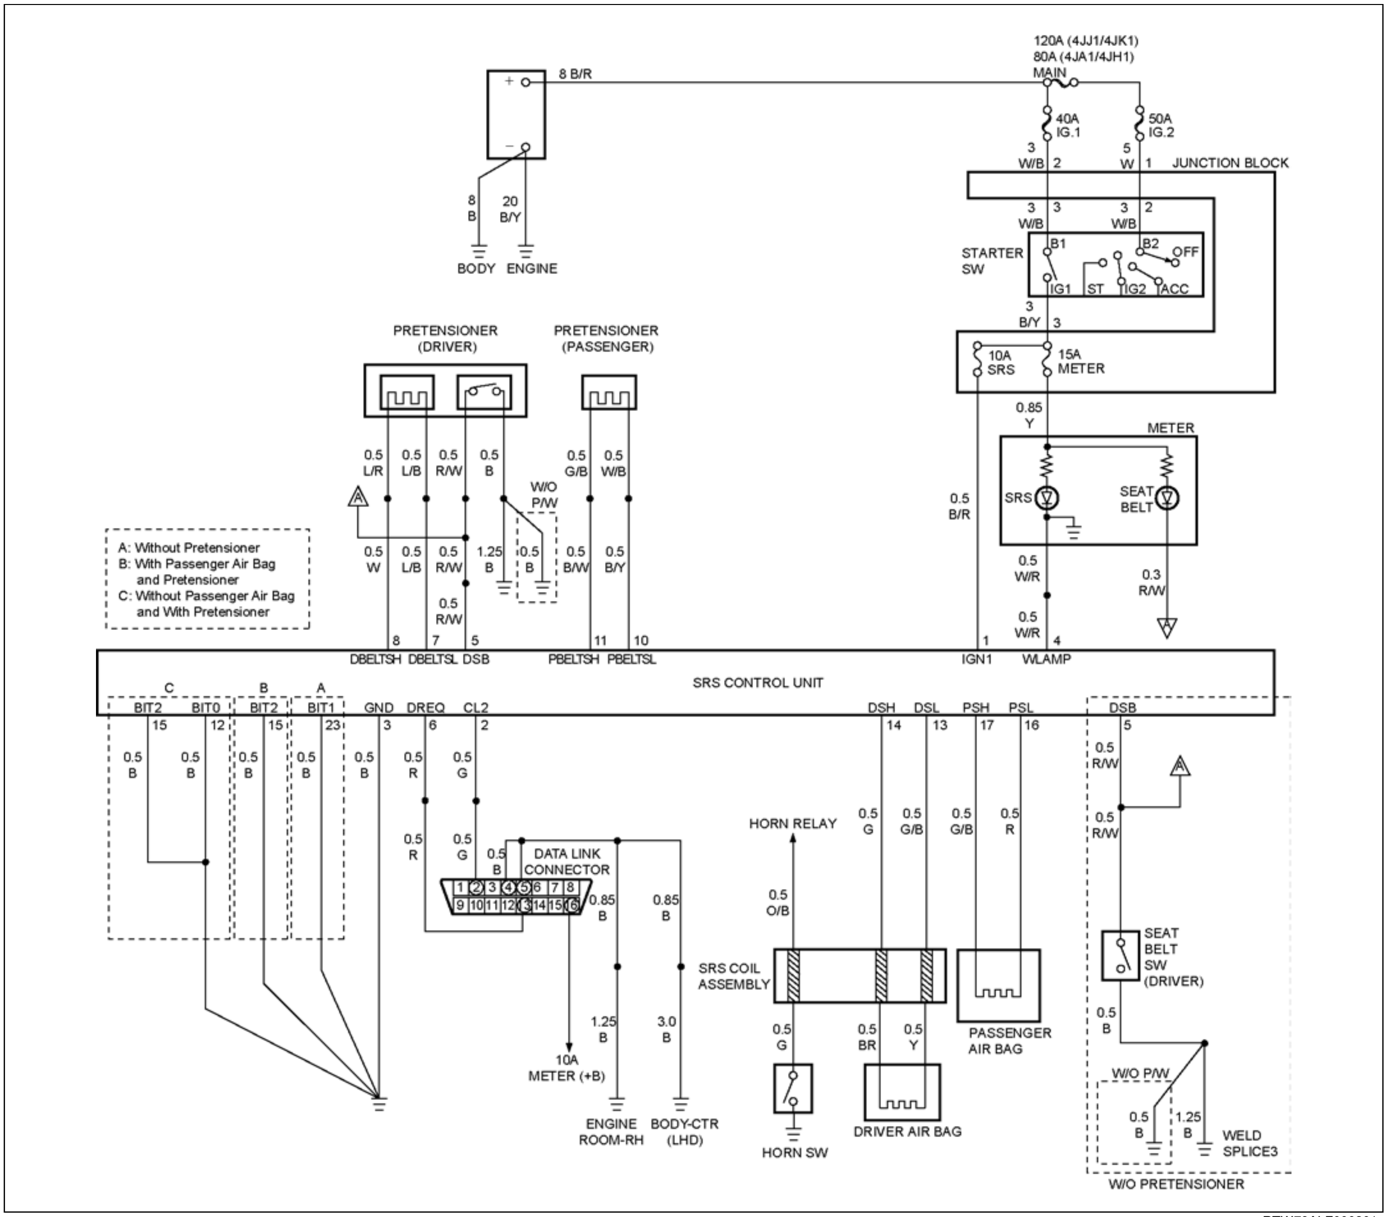
Diagnostic Aids

An intermittent condition is likely to be caused by a short between circuits “Passenger Pretensioner High” and “Passenger Pretensioner Low” or a malfunctioning shorting clip on the passenger pretensioner assembly which would require replacement of the pretensioner assembly. The test for this diagnostic trouble code is only run while “AIR BAG” warning lamp is performing the bulb check. When a scan tool “Clear Codes” command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC B0031 (Flash Code 31) Passenger Pretensioner Squib Circuit Low Resistance

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Repeat the "SRS Diagnostic System Check"
2	1. Check the passenger pretensioner squib circuit for short to valtage or short to ground. 2. If the broblem found, repair as necessary. Was a problem found?	Verify repair	Go to Step 3
3	1. Ignition switch is at "LOCK". 2. Make sure the passenger air bag assembly yellow connector located at the base of the passenger seat. Is the yellow connector connected properly?	Go to Step 4	Seat passenger pretensioner assembly yellow connector properly. Go to Step 7
4	1. Disconnect and inspect the passenger air bag assembly yellow connector located at the base of the passenger seat. 2. If ok, reconnect the passenger air bag assembly connector. 3. Ignition switch is at "ON". Is DTC B0031 Current?	Go to Step 5	Go to Step 7
5	1. Ignition switch is at "LOCK". 2. Disconnect SRS coil and passenger pretensioner assembly, yellow connector located at the base of the passenger seat. 3. Connect 5-8840-2421-0 SRS driver/passenger load tool and appropriate adapters to passenger pretensioner assembly harness connectors. 4. Ignition switch is at "ON". Is DTC B0031 current?	Go to Step 6	Ignition switch is at "OFF". Replace the passenger pretensioner assembly. Go to Step 7
6	1. Ignition switch is at "LOCK". 2. There has been a decrease in the total circuit resistance of the passenger inflator deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking circuits "Passenger pretensioner High" and "Passenger Pretensioner Low", and SRS control unit connector terminal "11" and "10" to locate the root cause. Was a fault found?	Replace SRS harness or repair chassis harness. Go to Step 7	Go to Chart A
7	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the "SRS Diagnostic System Check"	—

DTC B0033 (Flash Code 33) Passenger Pretensioner Squib Circuit Short to GND



RTW79ALF000301

Circuit Description

When the ignition switch is turned “ON”, the SRS control unit will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “Ignition 1”, and pretensioner loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SRS control unit monitors the voltages at “Driver Pretensioner Low” terminal “7” and “Passenger Pretensioner Low” terminal “10” to detect short to ground/+B in the pretensioner assembly circuits.

DTC Will Set When

“Ignition 1" is in the normal operating voltage range.

The voltage at “Passenger Pretensioner Low " is below a specified value,

DTC B0033 will set.

Action Taken

SRS control unit turns “ON” the “SRS” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When

The “Passenger Pretensioner Low " voltage comes to specified voltage.

DTC Chart Test Description

Number(s) below refer to circled number(s) on the diagnostic chart.

2. This test determines whether the SRS control unit is malfunctioning.
3. This test isolates the malfunction to one side of the passenger pretensioner assembly yellow connector at the base of the passenger seat.
4. This test determines whether the malfunction is in “Passenger Pretensioner High” circuit.
5. This test determines whether the malfunction is in “Passenger Pretensioner Low” circuit.

Diagnostic Aids

An intermittent condition is likely to be caused by a short to ground in the passenger pretensioner assembly circuit. Inspect circuits “Passenger Pretensioner High” and “Passenger Pretensioner Low” carefully for cutting or chafing. If the wiring pigtail of the passenger pretensioner assembly is damaged, the component must be replaced. A careful inspection of “Passenger Pretensioner High” and “Passenger Pretensioner Low”, including the passenger pretensioner assembly pigtail is essential to ensure that the replacement SRS control unit will not be damaged.

DTC B0033 (Flash Code 33) Passenger Pretensioner Squib Circuit Short to GND

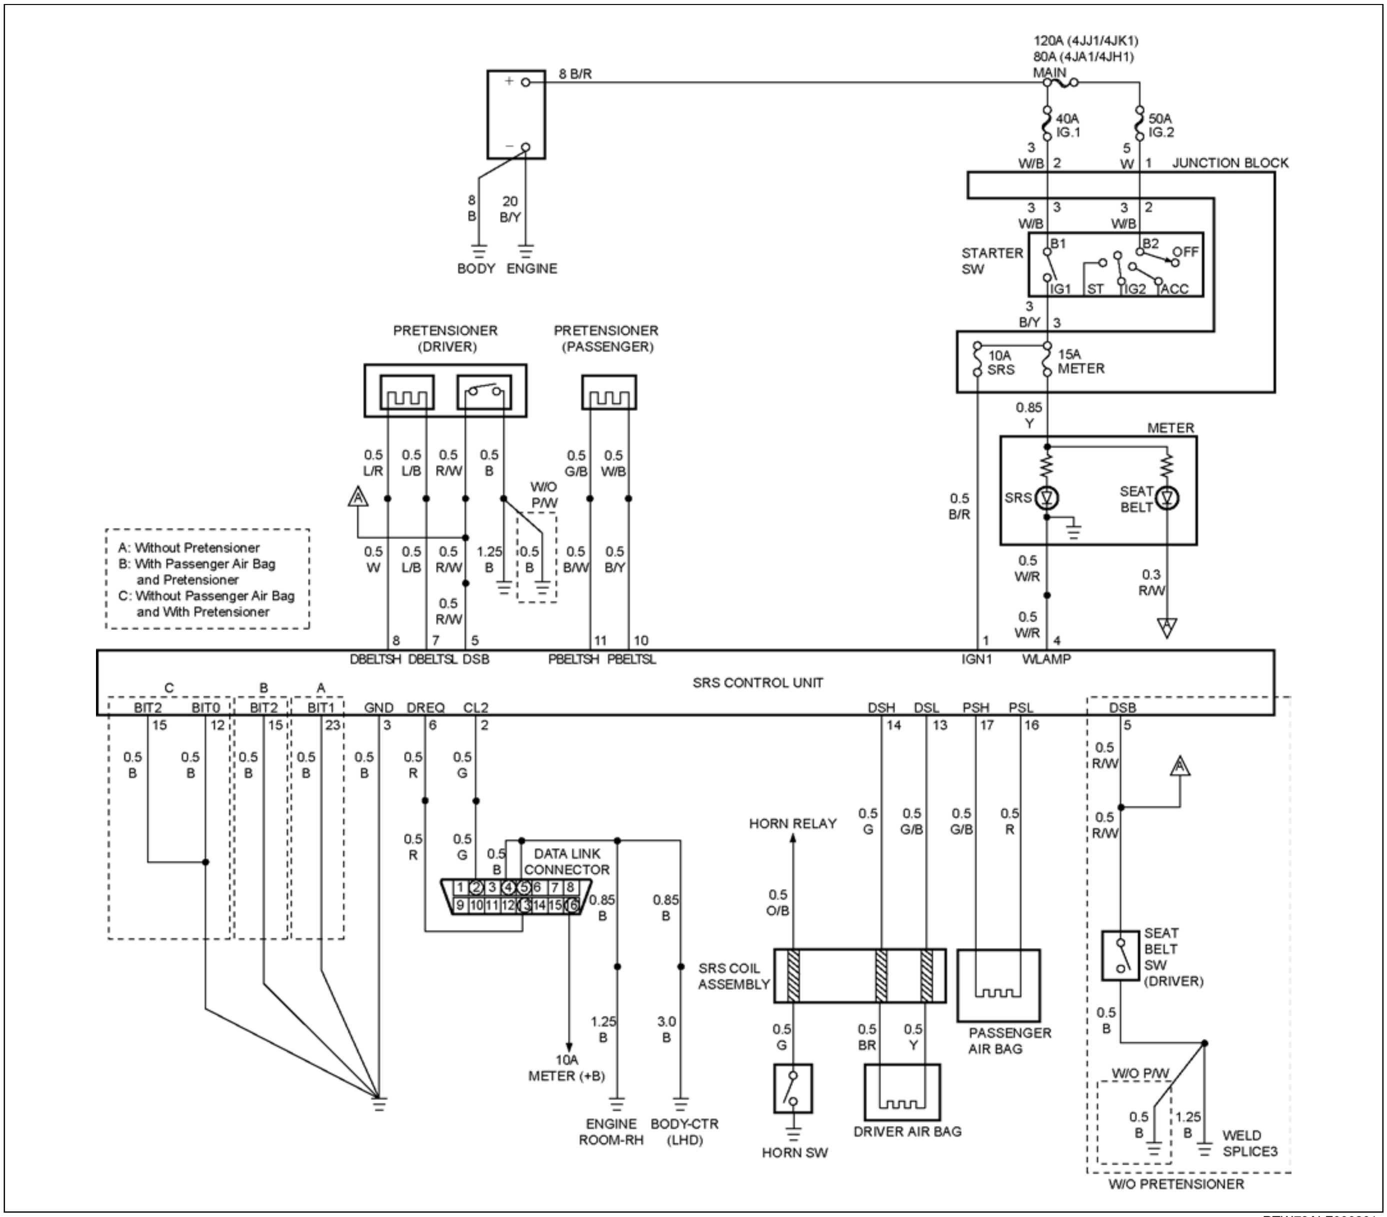
Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check”
2	1. When measurements are requested in this chart use a 5-8840-0366-0 DMM with a correct terminal adapter from 5-8840-2835-0. 2. Ignition switch is at “LOCK”. 3. Ignition switch is “ON”. 4. Check the passenger pretensioner air bag squib circuit for short to ground. Was a problem found?	Go to Step 3	—
3	1. Ignition switch is at “LOCK”. 2. Disconnect passenger pretensioner assembly yellow connector at the base of the passenger seat. 3. Leave driver air bag assembly connected. 4. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to passenger air bag assembly harness connector. 5. Ignition switch is at “ON”. Is DTC B0033 current?	Go to Step 4	Ignition switch is at “LOCK”. Replace passenger pretensioner assembly . Go to Step 6
4	1. Ignition switch is at “LOCK”. 2. Disconnect the SRS driver /passenger load tool. 3. Measure the resistance on the SRS control unit harness connector as follow. ● From terminals "11" to "3" and "15" (ground) (with the passenger air bag) ● From terminals "11" to "3", "12" and "15" (ground) (without the passenger air bag) Does 5-8840-0366-0 display “OL” (Infinite)?	Go to Step 5	Replace SRS Harness. Go to Step 6

6. FRONT WHEEL SHIMMY

Checkpoint	Trouble Cause	Countermeasure
Wheel bearing	Worn or improperly adjusted	Adjust or replace
Front alignment	Incorrect	Adjust the front alignment
Ball joint or bush	Worn	Replace the ball joint or bush
Steering unit	Loose or worn	Tighten or replace
Tire	Worn or improperly inflated	Replace or adjust the inflation
Shock absorber	Worn	Replace the shock absorber

Step	Action	Yes	No
5	Measure the resistance on the SRS control unit harness connector as follow. ● From terminals "10" to "3" and "15" (ground) (with the passenger air bag) ● From terminals "10" to "3", "12" and "15" (ground) (without the passenger air bag) Does 5-8840-0366-0 display “OL” (Infinite)?	Go to Chart A	Replace SRS Harness. Go to Step 6
6	1. Reconnect all the components and ensure all components are properly mounted. 2. Clear diagnostic trouble codes. Is this step finished?	Go to the “SRS Diagnostic system Check”	—

DTC B0034 (Flash Code 34) Passenger Pretensioner Squib Circuit Short to Battery Voltage



RTW79ALF000301

Circuit Description

When the ignition switch is turned “ON”, the SRS control unit will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “Ignition 1”, and pretensioner loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SRS control unit monitors the voltages at “Driver Pretensioner Low” terminal “7” and “Passenger Pretensioner Low” terminal “10” to detect short to ground/+B in the pretensioner assembly circuits.

DTC Will Set When

“Ignition 1" is in the normal operating voltage range.

The voltage at “Passenger Pretensioner Low " is above a specified value,

DTC B0034 will set.

Action Taken

SRS control unit turns “ON” the “SRS” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When

The "Passenger Pretensioner Low " voltage comes to specified voltage.

DTC Chart Test Description

Number(s) below refer to circled number(s) on the diagnostic chart.

2. This test determines whether the SRS control unit is malfunctioning.
3. This test isolates the malfunction to one side of the passenger pretensioner assembly yellow connector at the base of the passenger seat.
4. This test determines whether the malfunction is in "Passenger Pretensioner High" circuit.
5. This test determines whether the malfunction is in "Passenger Pretensioner Low" circuit.

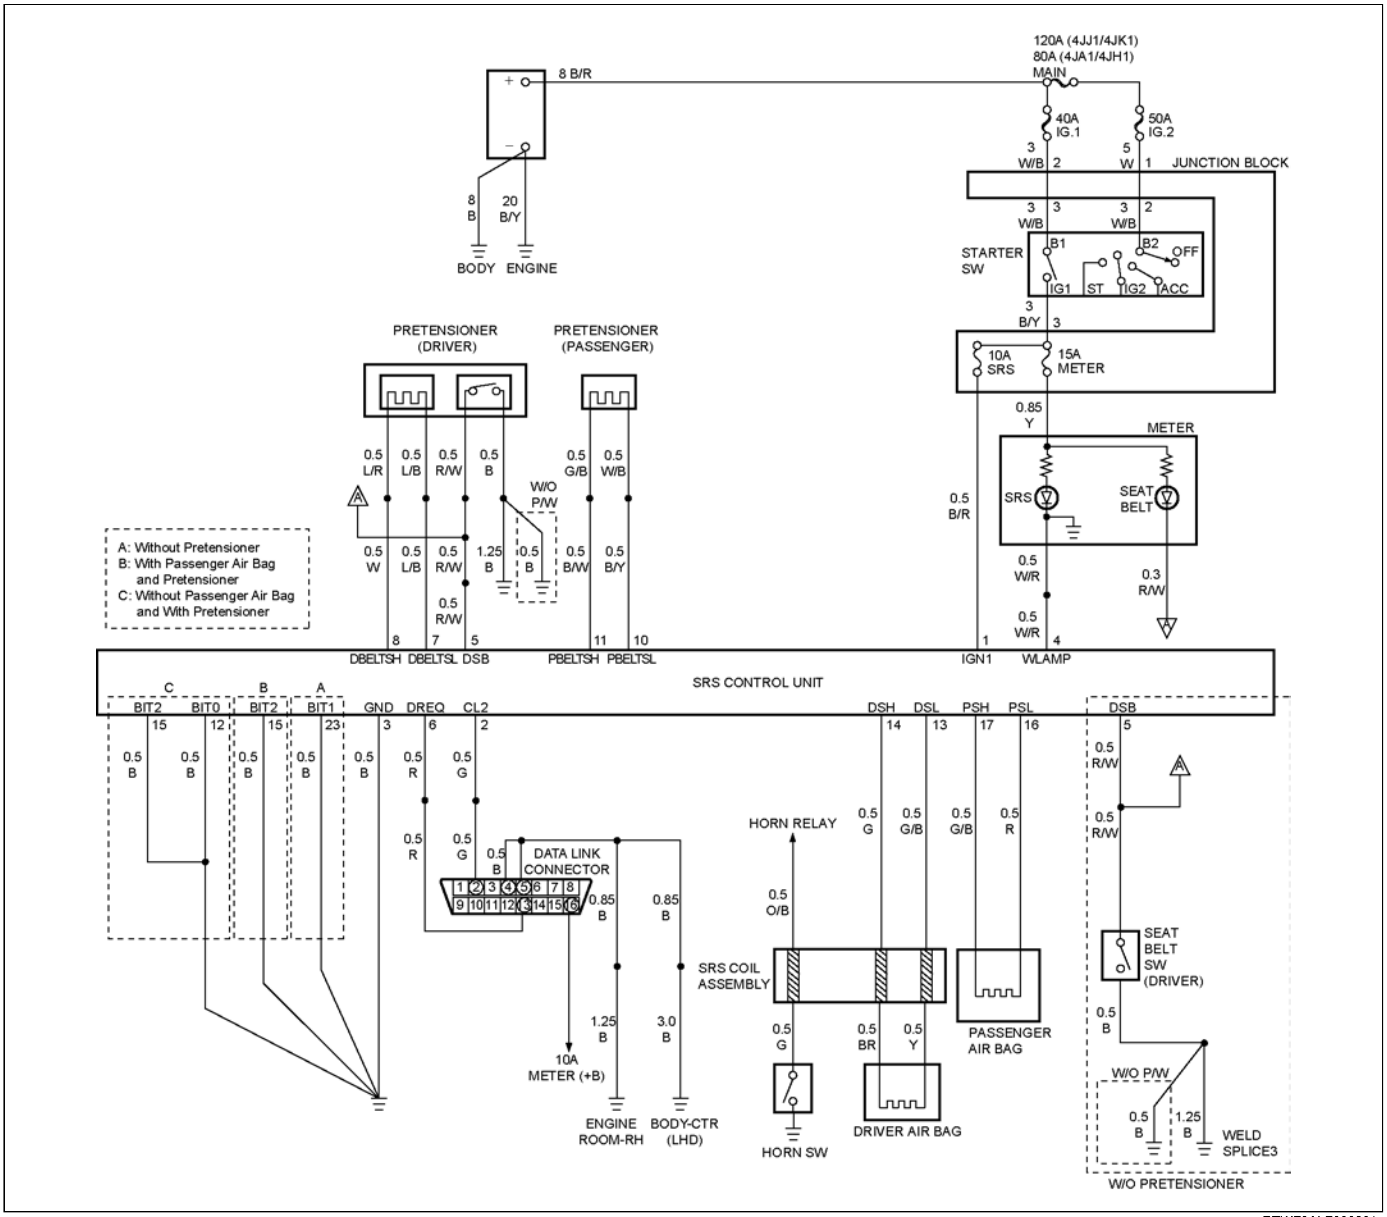
Diagnostic Aids

An intermittent condition is likely to be caused by a short to +B in the passenger pretensioner assembly circuit. Inspect circuits "Passenger Pretensioner High" and "Passenger Pretensioner Low" carefully for cutting or chafing. If the wiring pigtail of the passenger pretensioner assembly is damaged, the component must be replaced. A careful inspection of "Passenger Pretensioner High" and "Passenger Pretensioner Low", including the passenger pretensioner assembly pgtail is essential to ensure that the replacement SRS control unit will not be damaged.

DTC B0034 (Flash Code 34) Passenger Pretensioner Squib Circuit Short to Battery Voltage

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check"
2	1. When measurements are requested in this chart use a 5-8840-0366-0 DMM with a correct terminal adapter from 5-8840-2835-0. 2. Ignition switch is at "LOCK". 3. Ignition switch is "ON". 4. Check the passenger air bag squib circuit for a short to voltage. Was a problem found?	Go to Step 3	—
3	1. Ignition switch is at "LOCK". 2. Disconnect passenger pretensioner assembly yellow connector at the base of the passenger seat. 3. Leave driver air bag assembly connected. 4. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to passenger air bag assembly harness connector. 5. Ignition switch is at "ON". Is DTC B0034 current?	Go to Step 4	Ignition switch is at "LOCK". Replace passenger pretensioner assembly . Go to Step 6
4	Measure the resistance on the SRS control unit harness connector from terminal "11" to terminal "1" (ignition). Does 5-8840-0366-0 display "OL" (Infinite)?	Go to Step 5	Replace SRS Harness. Go to Step 6
5	Measure the resistance on the SRS control unit harness connector from terminal "10" to terminal "1" (ignition). Does 5-8840-0366-0 display "OL" (Infinite)?	Go to Chart A	Replace SRS Harness. Go to Step 6
6	1. Reconnect all the components and ensure all components are properly mounted. 2. Clear diagnostic trouble codes. Is this step finished?	Go to the "SRS Diagnostic system Check"	—

DTC B0041 (Flash Code 41) Driver Pretensioner Squib Circuit Low Resistance



RTW79ALF000301

Circuit Description

When the ignition switch is turned “ON”, the SRS control unit will perform tests to diagnose critical malfunctions within itself. Upon passing these tests “Ignition 1”, and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SRS control unit then proceeds with the “Resistance Measurement Test” “Driver Pretensioner Low” terminal “7” is grounded through a current sink and the driver current source connected to “Driver Pretensioner High” terminal “8” allows a known amount of current to flow. By monitoring the voltage difference between “Driver Pretensioner High” and “Driver Pretensioner Low” the SRS control unit calculates the combined resistance of the driver pretensioner assembly, harness wiring circuits “Driver Pretensioner High” and “Driver Pretensioner Low” and connector terminal contact.

DTC Will Set When

The combined resistance of the driver pretensioner assembly, harness wiring circuits “Driver Pretensioner High” and “Driver Pretensioner Low”, and connector terminal contact is above a specified value. This test is run once each ignition cycle during the “Resistance Measurement Test” when:

1. No “higher priority faults” are detected during “Turn–ON”
2. “Ignition 1” voltage is in the specified value.

Action Taken

SRS control unit turns “ON” the “AIR BAG” warning lamp and sets DTC B0041.

DTC Will Clear When

The ignition switch is turned “LOCK”.

DTC Chart Test Description

Number(s) below refer to circled number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SRS control unit.
3. This test verifies proper connection of the yellow connector at the base of the driver seat.
4. This test checks for proper operation of the shorting clip in the yellow connector.
5. This test isolate the malfunction to one side of the SRS coil assembly yellow connector located at the base of the driver seat.
6. This test determines whether the malfunction is due to shortening in the wiring.
7. This test determines whether the malfunction is in the driver pretensionerassembly.

Diagnostic Aids

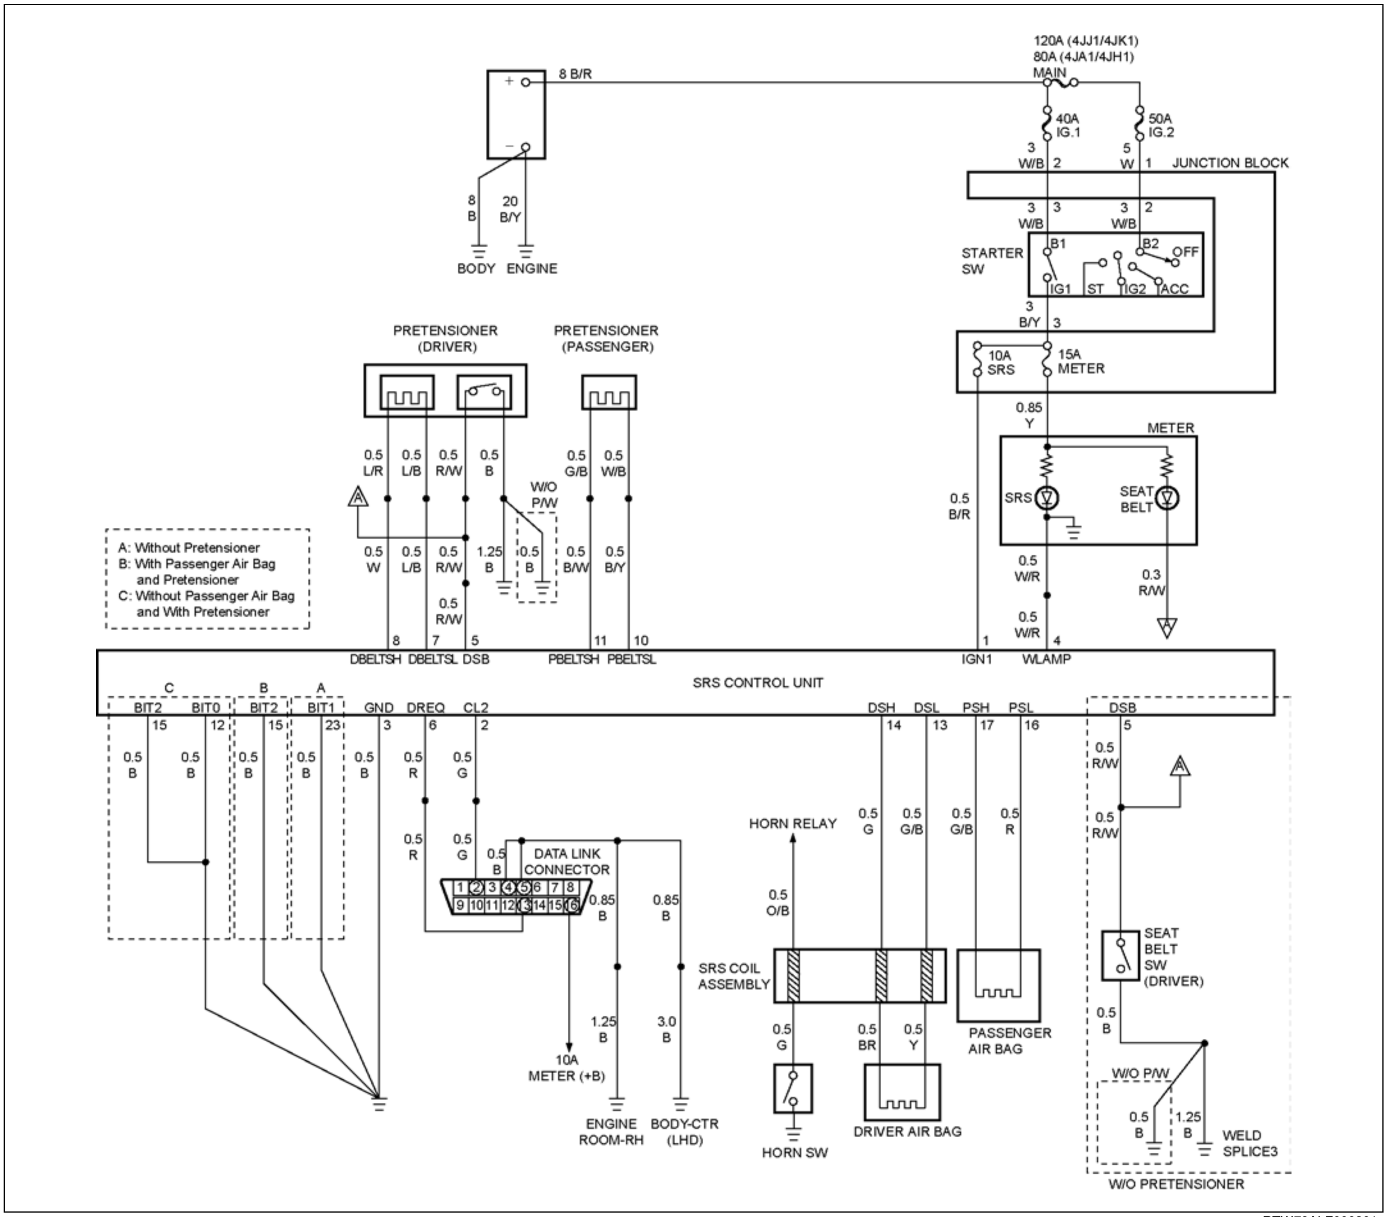
An intermittent condition is likely to be caused by a short between circuit “Driver Pretensioner High” or “Driver Pretensioner Low” or a malfunctioning shorting clip on the driver pretensioner assembly which would require replacement of the component. The test for this diagnostic trouble code is only run while the “AIR BAG” warning lamp is performing the bulb check. When a scan tool “Clear Codes” command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC B0041 (Flash Code 41) Driver Pretensioner Squib Circuit Low Resistance

Step	Action	Yes	No
1	Perform the “SRS Diagnostic System Check.” Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check”
2	1. Check the driver pretensioner squib circuit for short to voltage or short to ground. 2. If the problem found, repair as necessary. Was a problem found?	Verify repair	Go to Step 3
3	1. Ignition switch is at “LOCK”. 2. Make sure the pretensioner assembly yellow connector located at the base of the driver seat connected properly. Is the connector connected properly?	Go to Step 4	Seat driver pretensioner assembly connector properly. Go to Step 8

Step	Action	Yes	No
4	1. Disconnect and inspect the pretensioner yellow connector located base of the driver seat. 2. If ok, reconnect the Pretensioner assembly yellow connector. 3. Ignition switch “ON.” Is DTC B0041 current?	Go to Step 5	Go to Step 8
5	1. Ignition switch is at “LOCK”. 2. Disconnect deive pretensioner assembly, yellow connector located at the base of the driver seat. 3. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to drive pretensioner assembly harness connectors. 4. Ignition switch “ON”. Is DTC B0041 current?	Go to Step 6	Go to Step 7
6	1. Ignition switch is at “LOCK”. 2. There has been a decrease in the total circuit resistance of the driver deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking circuits “Driver Pretensioner High” and “Driver Pretensioner Low”, and SRS control unit connector terminal “8” and “7” to locate the root cause. Was a fault found?	Replace SRS harness or repair chassis harness. Go to Step 8	Go to Chart A
7	1. Ignition switch is at “LOCK”. 2. Disconnect SRS driver / passenger load tool from driver pretensioner assembly harness connector. 3. Connect SRS driver / passenger load tool 5-8840-2421-0 to the top of steering column connector. 4. Reconnect pretensioner harness connector as the base of the driver seat. 5. Ignition switch is at “ON”. Is DTC B0041 current?	Ignition switch is at “OFF”. Replace SRS coil assembly. Go to Step 8	Ignition switch is at “LOCK”. Replace driver pretensioner assembly. Go to Step 8
8	1. Reconnect all components, ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Go to the “SRS Diagnostic System Check”	—

DTC B0042 (Flash Code 42) Driver Pretensioner Squib Circuit High Resistance



RTW79ALF000301

Circuit Description

When the ignition switch is turned "ON", the SRS control unit will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, "Ignition 1", and deployment loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SRS control unit then proceeds with the "Resistance Measurement Test" "Driver Pretensioner Low" terminal "7" is grounded through a current sink and the driver current source connected to "Driver Pretensioner High" terminal "8" allows a known amount of current to flow. By monitoring the voltage difference between "Driver Pretensioner High" and "Driver Pretensioner Low", the SRS control unit calculates the combined resistance of the driver pretensioner assembly, SRS coil assembly, harness wiring circuits "Driver Pretensioner High" and "Driver Pretensioner Low" and connector terminal contact.

DTC Will Clear When

The ignition switch is turned “LOCK”.

DTC Will Set When

The combined resistance of the driver pretensioner assembly, harness wiring circuits “Driver Pretensioner High” and “Driver Pretensioner Low”, and connector terminal contact is above a specified value. This test run once each ignition cycle during the “Resistance Measurement Test” when:

1. No “higher priority faults” are detected during “Turn–ON”
2. “Ignition 1” voltage is in the specified value.

Action Taken

SRS control unit turns “ON” the “AIR BAG” warning lamp and sets DTC B0042.

DTC Chart Test Description

Number(s) below refer to step number(s) on the diagnostic chart:

2. This test determines whether the malfunction is in the SRS control unit.
3. This test verifies proper connection of the yellow connector at the base of the driver seat.
4. This test checks for proper contact and/or corrosion of the connector terminals at the base of the driver seat.
5. This test isolate the malfunction to one side of the SRS coil assembly yellow connector located at the base of the driver seat.
6. This test determines whether the malfunction is due to high resistance in the wiring.
7. This test determines whether the malfunction is in the driver pretensioner assembly.

Diagnostic Aids

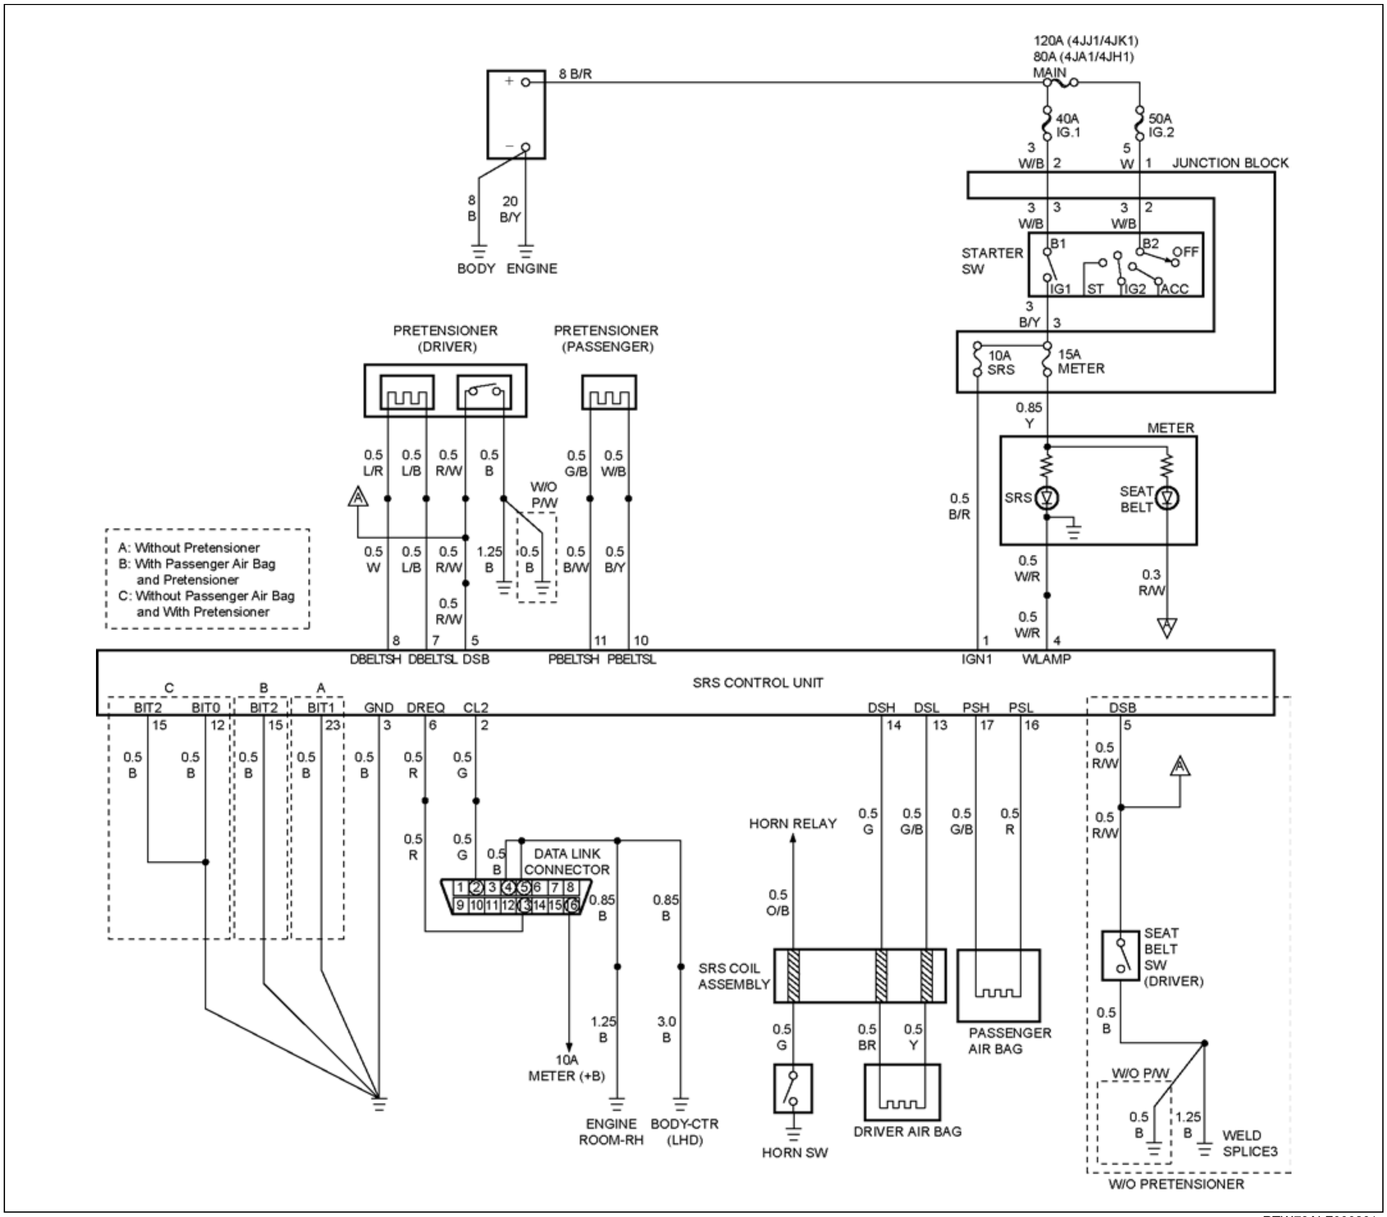
An intermittent condition is likely to be caused by a poor connection at the drive pretensioner harness connector terminals “1” and “2”, SRS control unit terminals “8” and “7”, or a poor wire to terminal connection in circuit “Driver Pretensioner High” or “Driver Pretensioner Low” The test for this diagnostic trouble code is only run while the “AIR BAG” warning lamp is performing the bulb check. When a scan tool “Clear Codes” command is issued and the malfunction is still present, the DTC will not reappear until the next ignition cycle.

DTC B0042 (Flash Code 42) Driver Pretensioner Squib Circuit High Resistance

Step	Action	Yes	No
1	Perform the “SRS Diagnostic System Check”. Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Repeat the “SRS Diagnostic System Check”
2	1. Check the driver pretensioner squib circuit for open. 2. If the problem found repair as necessary. Was a problem found?	Verify repair	Go to Step 3
3	1. Ignition switch is at “LOCK”. 2. Disconnect SRS coil assembly yellow connector located at base of the driver seat. Is the connector connected properly?	Go to Step 4	Seat pretensioner assembly connector properly. Go to Step 8

Step	Action	Yes	No
4	1. Disconnect and inspect the pretensioner assembly yellow connector located base of the driver seat. 2. If ok, reconnect the pretensioner yellow connector. 3. Ignition switch is at “ON”. Is DTC B0042 current?	Go to Step 5	Go to Step 8
5	1. Ignition switch is at “LOCK”. 2. Disconnect diver pretensioner assembly, yellow connector located at the base of driver seat. 3. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to driver pretensioner assembly harness connectors. 4. Ignition switch is at “ON”. Is DTC B0042 current?	Go to Step 6	Go to Step 7
6	1. Ignition switch is at “LOCK“. 2. There has been a increase in the total circuit resistance of the driver deployment loop. 3. Use the high resolution ohmmeter mode of the DVM while checking circuits “Driver Pretensioner High” and “Driver Pretensioner Low”, and SRS control unit connector terminal “8” and “7” to locate the root cause. Was a fault found?	Replace pretensioner harness. Go to Step 8	Go to Chart A
7	1. Ignition switch is at “LOCK”. 2. Disconnect pretensioner load tool from pretensioner assembly harness connector. 3. Connect pretensioner load tool 5-8840-2421-0 and appropriate adapter to driver pretensioner assembly harness connector. 4. Reconnect pretensioner harness connector as the base of the driver seat. 5. Ignition switch is at “ON”. Is DTC B0065 current?	Ignition switch is at “LOCK”. Replace pretensioner assembly. Go to Step 8	Ignition switch is at “LOCK”. Replace driver pretensioner assembly. Go to Step 8
8	1. Reconnect all components ensure all component are properly mounted. 2. Clear diagnostic trouble codes. Was this step finished?	Repeat the “SRS Diagnostic System Check”	—

DTC B0045 (Flash Code 45) Driver Pretensioner Squib Circuit Short to GND



RTW79ALF000301

Circuit Description

When the ignition switch is turned “ON”, the SRS control unit will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “Ignition 1”, and pretensioner loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SRS control unit monitors the voltages at “Driver Pretensioner Low” terminal “7” and “Passenger Pretensioner Low” terminal “10” to detect short to ground/+B in the pretensioner assembly circuits.

DTC Will Set When

“Ignition 1" is in the normal operating voltage range.

The voltage at “Driver Pretensioner Low " is below a specified value,

DTC B0045 will set.

Action Taken

SRS control unit turns “ON” the “SRS” warning lamp and sets a diagnostic trouble code.

PROPELLER SHAFT

1. NOISE

Checkpoint		Trouble Cause	Countermeasure
Yoke spline	NG	Damaged or worn	Replace
OK			
Spider bearing	NG	Worn or jammed	Replace

2. VIBRATION

Checkpoint		Trouble Cause	Countermeasure
Shaft runout	NG	Incorrect	Replace
OK			
Shaft balance	NG	Unbalance	Adjust
OK			
Transmission rear housing bushing, transfer case housing bushing	NG	Worn	Replace
OK			
Yoke spline	NG	Jammed	Replace

DTC Will Clear When

The “Driver Pretensioner Low " voltage comes to specified voltage.

DTC Chart Test Description

Number(s) below refer to circled number(s) on the diagnostic chart.

2. This test determines whether the SRS control unit is malfunctioning.
3. This test isolates the malfunction to one side of the driver pretensioner assembly yellow connector at the base of the driver seat.
4. This test determines whether the malfunction is in “Driver Pretensioner High” circuit.
5. This test determines whether the malfunction is in “Driver Pretensioner Low” circuit.

Diagnostic Aids

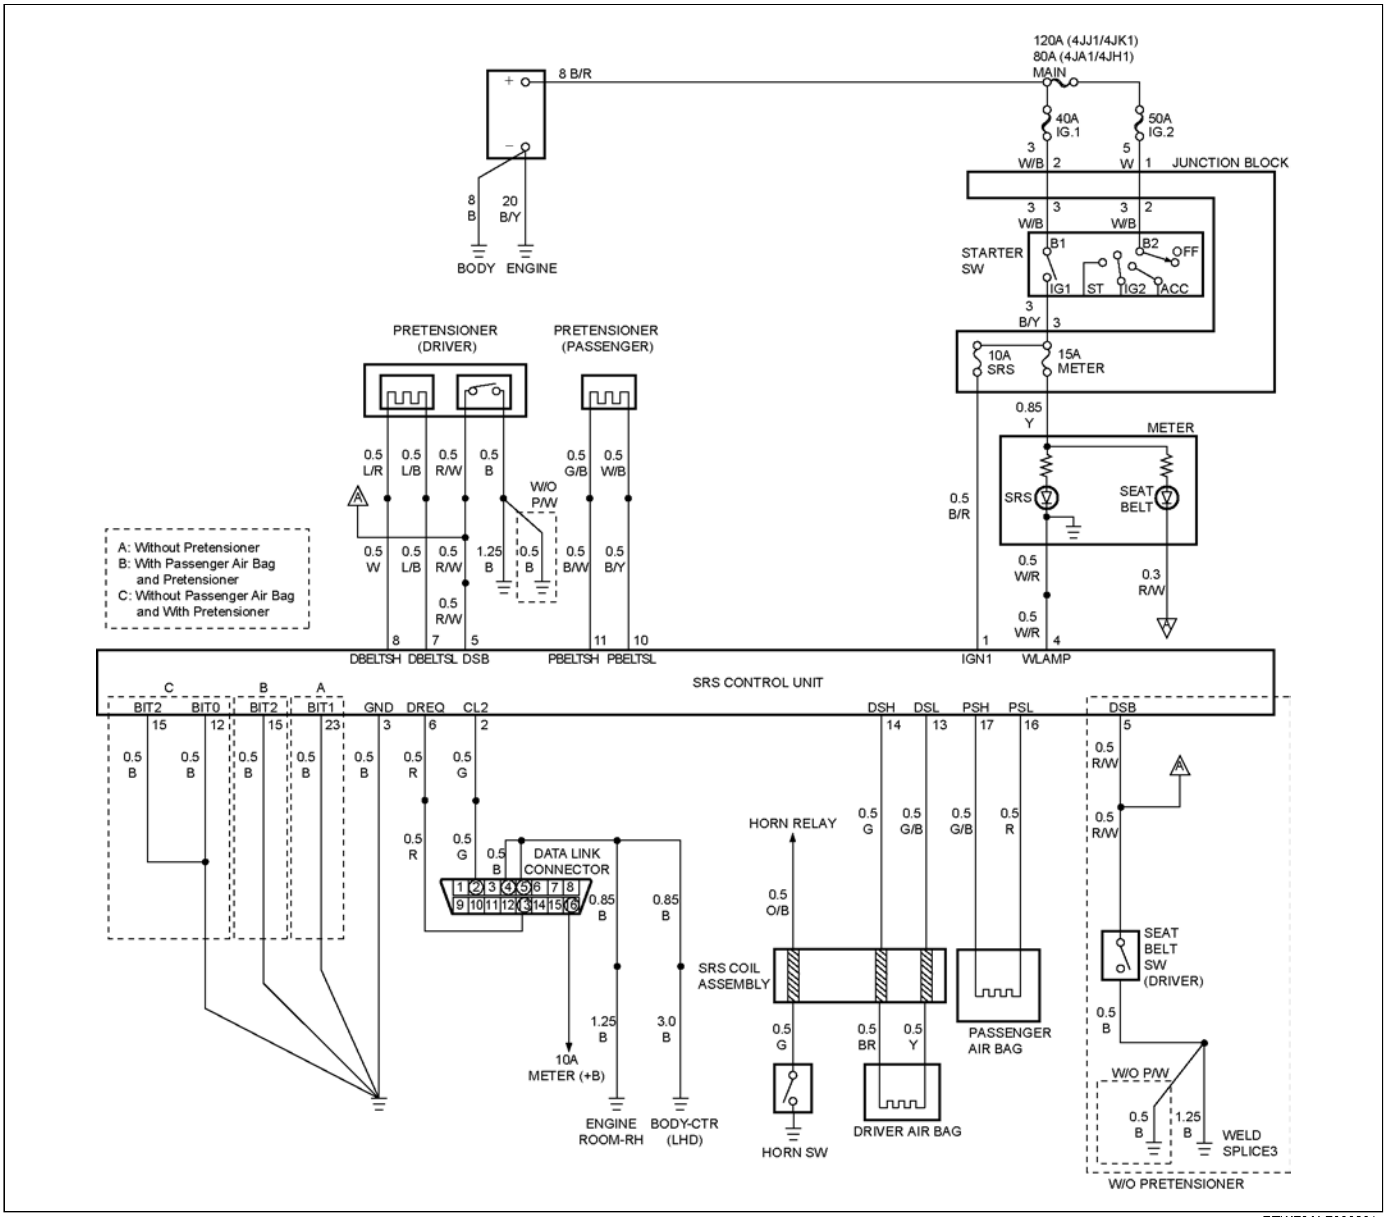
An intermittent condition is likely to be caused by a short to ground in the driver pretensioner assembly circuit. Inspect circuits “Driver Pretensioner High” and “Driver Pretensioner Low” carefully for cutting or chafing. If the wiring pigtail of the driver pretensioner assembly is damaged, the component must be replaced. A careful inspection of “Driver Pretensioner High” and “Driver Pretensioner Low”, including the driver pretensioner assembly pigtail is essential to ensure that the replacement SRS control unit will not be damaged.

DTC B0045 (Flash Code 45) Driver Pretensioner Squib Circuit Short to GND

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check”
2	1. When measurements are requested in this chart use a 5-8840-0366-0 DMM with a correct terminal adapter from 5-8840-2835-0. 2. Ignition switch is at “LOCK”. 3. Ignition switch is “ON”. 4. Check the driver pretensioner air bag squib circuit for short to ground. Was a problem found?	Go to Step 3	—
3	1. Ignition switch is at “LOCK”. 2. Disconnect driver pretensioner assembly yellow connector at the base of the driver seat. 3. Leave driver air bag assembly connected. 4. Connect SRS driver / driver load tool 5-8840-2421-0 and appropriate adapter to driver air bag assembly harness connector. 5. Ignition switch is at “ON”. Is DTC B0045 current?	Go to Step 4	Ignition switch is at “LOCK”. Replace driver pretensioner assembly . Go to Step 6
4	1. Ignition switch is at “LOCK”. 2. Disconnect the SRS driver /driver load tool. 3. Measure the resistance on the SRS control unit harness connector as follow. ● From terminals "8" to "3" and "15" (ground) (with the passenger air bag) ● From terminals "8" to "3", "12" and "15" (ground) (without the passenger air bag) Does 5-8840-0366-0 display “OL” (Infinite)?	Go to Step 5	Replace SRS Harness. Go to Step 6

Step	Action	Yes	No
5	Measure the resistance on the SRS control unit harness connector as follow. ● From terminals "7" to "3" and "15" (ground) (with the passenger air bag) ● From terminals "7" to "3", "12" and "15" (ground) (without the passenger air bag) Does 5-8840-0366-0 display “OL” (Infinite)?	Go to Chart A	Replace SRS Harness. Go to Step 6
6	1. Reconnect all the components and ensure all components are properly mounted. 2. Clear diagnostic trouble codes. Is this step finished?	Go to the “SRS Diagnostic system Check”	—

DTC B0046 (Flash Code 46) Driver Pretensioner Squib Circuit Short to Battery Voltage



RTW79ALF000301

Circuit Description

When the ignition switch is turned “ON”, the SRS control unit will perform tests to diagnose critical malfunctions within itself. Upon passing these tests, “Ignition 1”, and pretensioner loop voltages are measured to ensure they are within their respective normal voltage ranges.

The SRS control unit monitors the voltages at “Driver Pretensioner Low” terminal “7” and “Passenger Pretensioner Low” terminal “10” to detect short to ground/+B in the pretensioner assembly circuits.

DTC Will Set When

“Ignition 1" is in the normal operating voltage range.

The voltage at “Driver Pretensioner Low " is above a specified value,

DTC B0046 will set.

Action Taken

SRS control unit turns “ON” the “SRS” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When

The "Driver Pretensioner Low " voltage comes to specified voltage.

DTC Chart Test Description

Number(s) below refer to circled number(s) on the diagnostic chart.

2. This test determines whether the SRS control unit is malfunctioning.
3. This test isolates the malfunction to one side of the driver pretensioner assembly yellow connector at the base of the driver seat.
4. This test determines whether the malfunction is in "Driver Pretensioner High" circuit.
5. This test determines whether the malfunction is in "Driver Pretensioner Low" circuit.

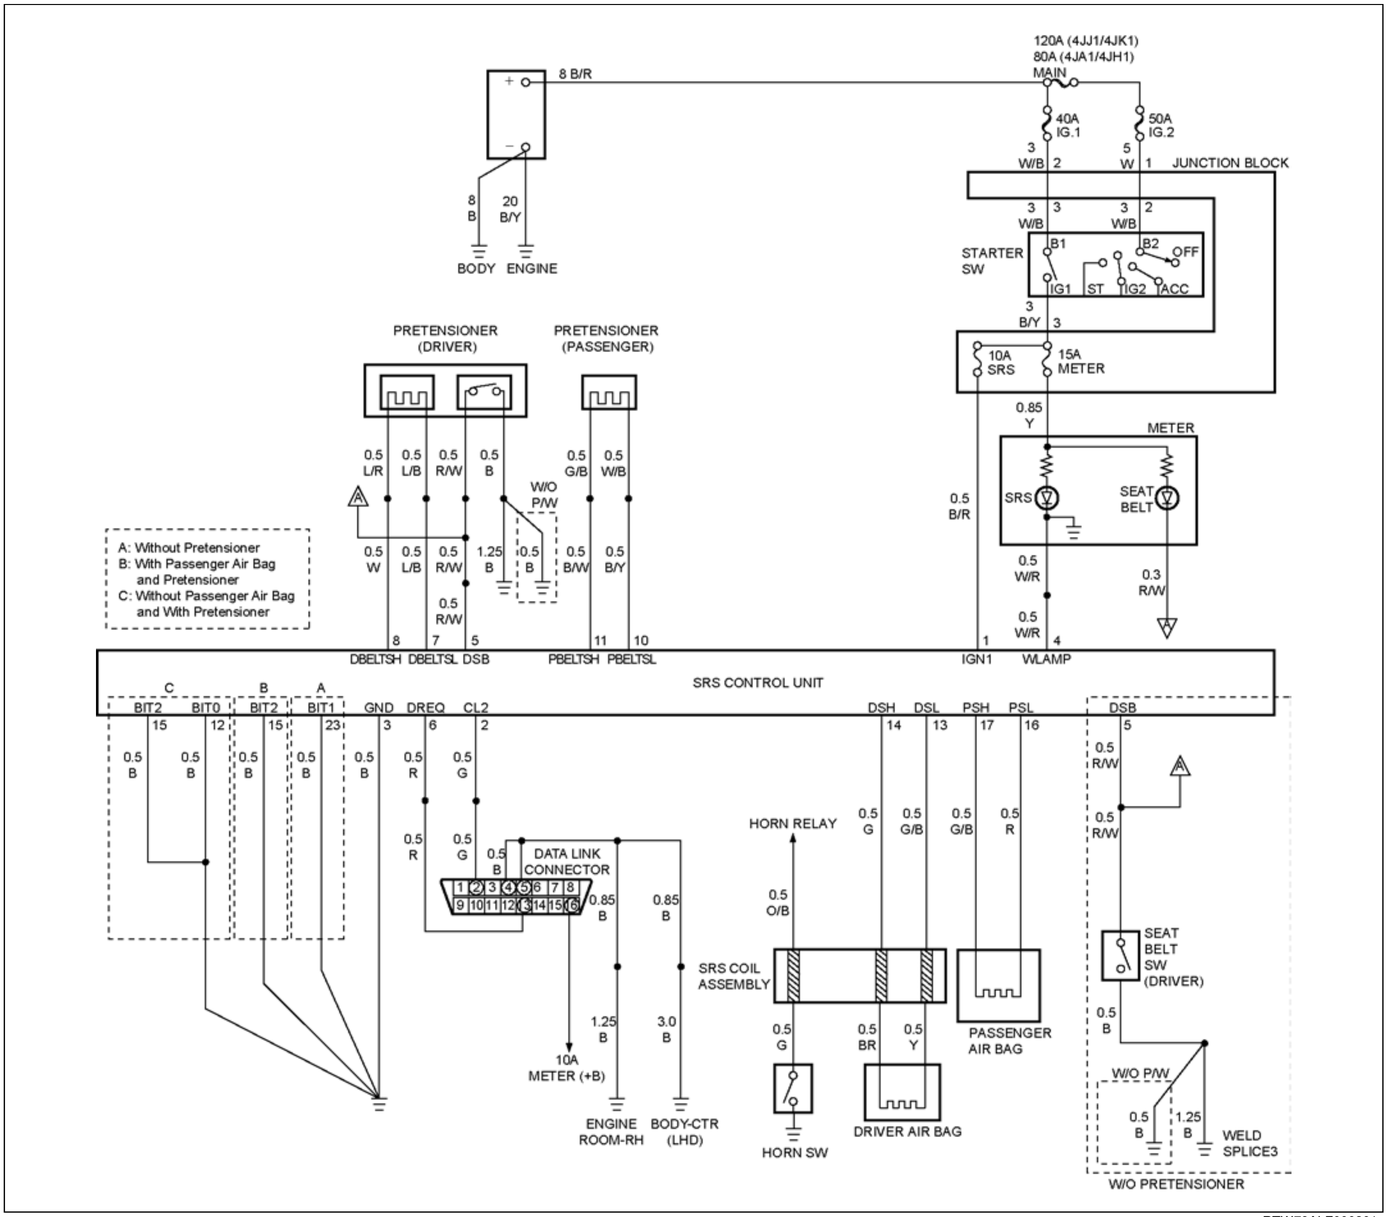
Diagnostic Aids

An intermittent condition is likely to be caused by a short to +B in the driver pretensioner assembly circuit. Inspect circuits "Driver Pretensioner High" and "Driver Pretensioner Low" carefully for cutting or chafing. If the wiring pigtail of the driver pretensioner assembly is damaged, the component must be replaced. A careful inspection of "Driver Pretensioner High" and "Driver Pretensioner Low", including the driver pretensioner assembly pgtail is essential to ensure that the replacement SRS control unit will not be damaged.

DTC B0046 (Flash Code 46) Driver Pretensioner Squib Circuit Short to Battery Voltage

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check"
2	1. When measurements are requested in this chart use a 5-8840-0366-0 DMM with a correct terminal adapter from 5-8840-2835-0. 2. Ignition switch is at "LOCK". 3. Ignition switch is "ON". 4. Check the driver air bag squib circuit for a short to voltage. Was a problem found?	Go to Step 3	—
3	1. Ignition switch is at "LOCK". 2. Disconnect driver pretensioner assembly yellow connector at the base of the driver seat. 3. Leave driver air bag assembly connected. 4. Connect SRS driver / passenger load tool 5-8840-2421-0 and appropriate adapter to driver air bag assembly harness connector. 5. Ignition switch is at "ON". Is DTC B0046 current?	Go to Step 4	Ignition switch is at "LOCK." Replace driver pretensioner assembly . Go to Step 6
4	Measure the resistance on the SRS control unit harness connector from terminal "8" to terminal "1" (ignition). Does 5-8840-0366-0 display "OL" (Infinite)?	Go to Step 5	Replace SRS Harness. Go to Step 6
5	Measure the resistance on the SRS control unit harness connector from terminal "7" to terminal "1" (ignition). Does 5-8840-0366-0 display "OL" (Infinite)?	Go to Chart A	Replace SRS Harness. Go to Step 6
6	1. Reconnect all the components and ensure all components are properly mounted. 2. Clear diagnostic trouble codes. Is this step finished?	Go to the "SRS Diagnostic system Check"	—

DTC B0051 (Flash Code 51) Air Bag Squib Circuit Activated (Crash)



RTW79ALF000301

Circuit Description

The SRS control unit contains a sensor which converts vehicle velocity changes to an electrical signal. The electrical signal generated is processed by the SRS control unit and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SRS control unit will cause current to flow through the air bag assembly deploying the air bags and causing DTC B0051 to set.

DTC Will Set When

The SRS control unit detects a frontal crash, up to 30 degrees off the centerline of the vehicle, of sufficient force to warrant deployment of the air bags.

Action Taken

SRS control unit turns “ON” the “SRS” warning lamp and records “Crash Data”, and sets a diagnostic trouble code.

DTC Will Clear When

The SRS control unit is replaced.

DTC Chart Test Description

Number(s) below refer to step number(s) on the diagnostic chart:

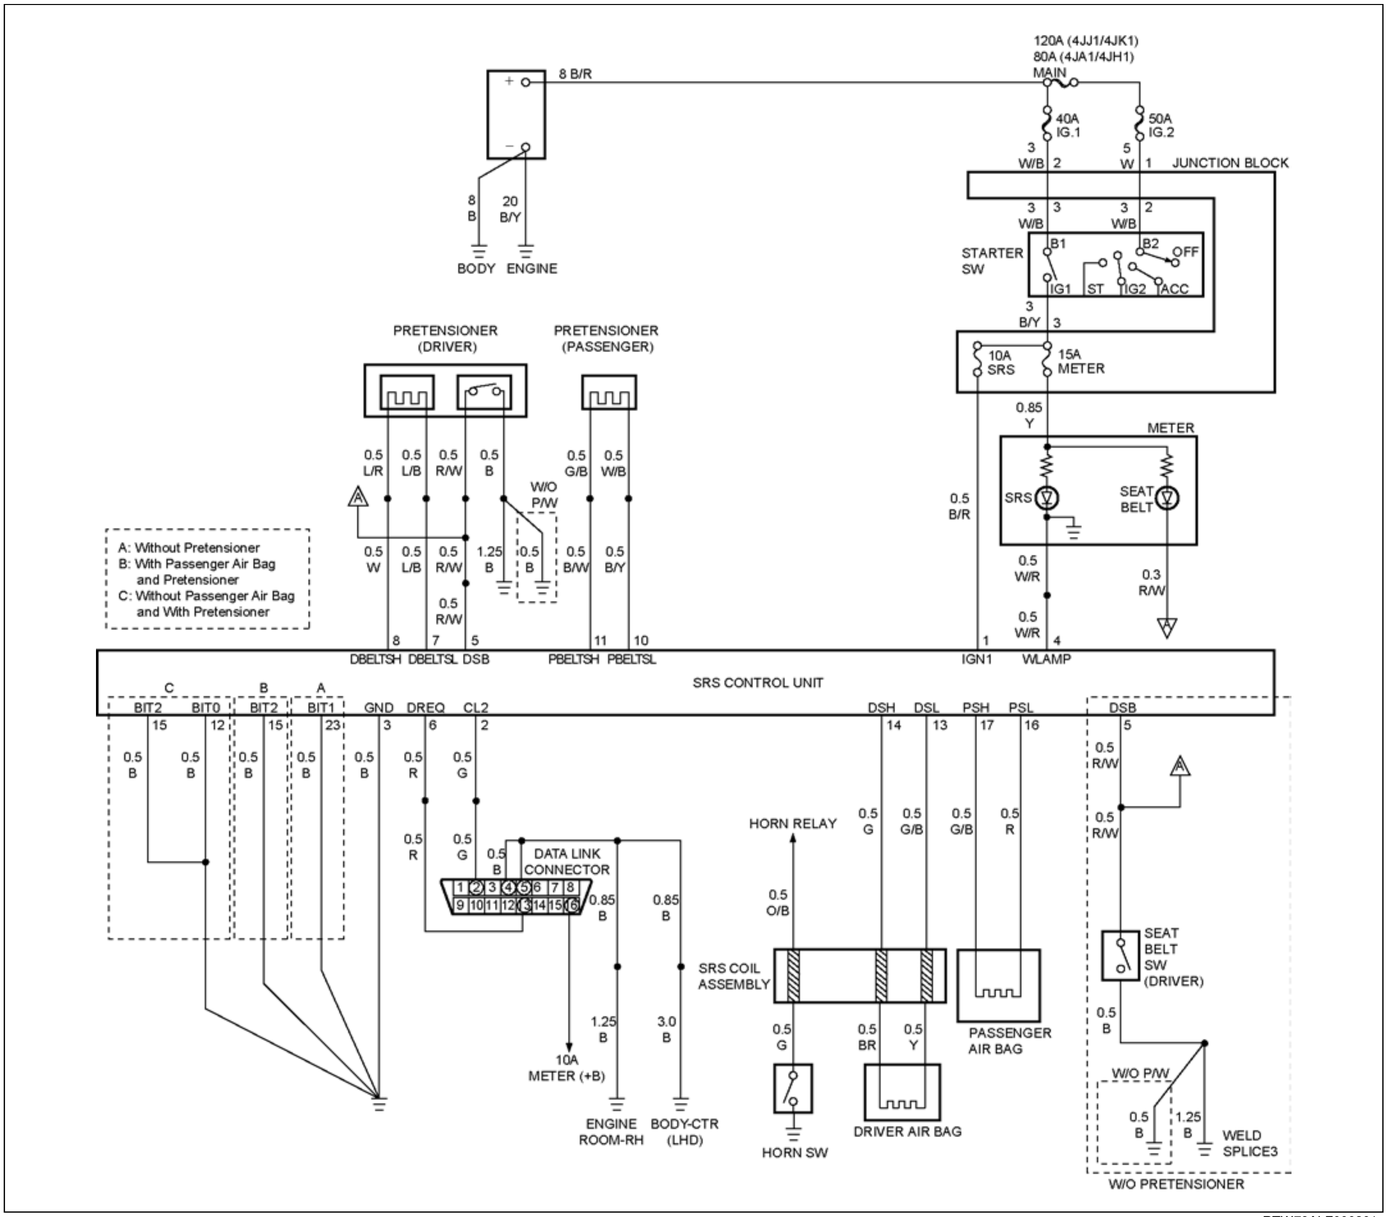
2. If the air bag assembly(s) has not deployed, DTC B0051 may have been falsely set.
3. If DTC B0051 has set with no signs of frontal impact, the diagnostic trouble code has been falsely set.

DTC B0051 (Flash Code 51) Air Bag Squib Circuit Activated (Crash)

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SRS CONROL UNIT. NEVER STRIKE OR JAR THE SRS CONTROL UNIT. NEVER POWER UP THE SRS WHEN THE SRS CONTROL UNIT IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SRS CONTROL UNIT AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SRS CONTROL UNIT COULD BE ACTIVATED AND CAUSE DEPLOYMENT RESULTING IN PERSONAL INJURY.

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2.	Go to the “SRS Diagnostic System Check”
2	Ignition switch is at “LOCK”. Have air bag assemblies been deployed?	Replace components and perform inspections as directed in “repairs and inspections required after an accident” in this section. clear diagnostic trouble codes. Repeat “SRS Diagnostic System Check”	Go to Step 3
3	Inspect the front of the vehicle and undercarriage for signs of impact. Were signs of impact found?	Replace components and perform inspections as directed in “Repairs and Inspections Required After An Accident” in this section. Clear diagnostic trouble codes. Repeat “SRS Diagnostic System Check”	Ignition switch “LOCK”. Replace SRS control unit. Reconnect all SRS system components, ensure all components are properly mounted. Repeat “SRS Diagnostic System Check”

DTC B0052 (Flash Code 52) Pretensioner Squib Circuit Activated (Crushed)



RTW79ALF000301

Circuit Description

The SDM contains a sensing device which converts vehicle velocity changes to an electrical signal. The electrical signal generated is processed by the SDM and then compared to a value stored in memory. When the generated signal exceeds the stored value, the SDM will cause current to flow through the pretensioner seat belt deploying the pretensioner seat belt and causing DTC B0052 to set.

DTC Will Set When

The SRS control unit detects a frontal crash, up to 30 degrees off the centerline of the vehicle, of sufficient force to warrant deployment of the pretensioner seat belt.

Action Taken

SRS control unit turns “ON” the “SRS” warning lamp and records “Crash Data”, and sets a diagnostic trouble code.

DTC Will Clear When

The SRS control unit is replaced.

DTC Chart Test Description

Number(s) below refer to step number(s) on the diagnostic chart:

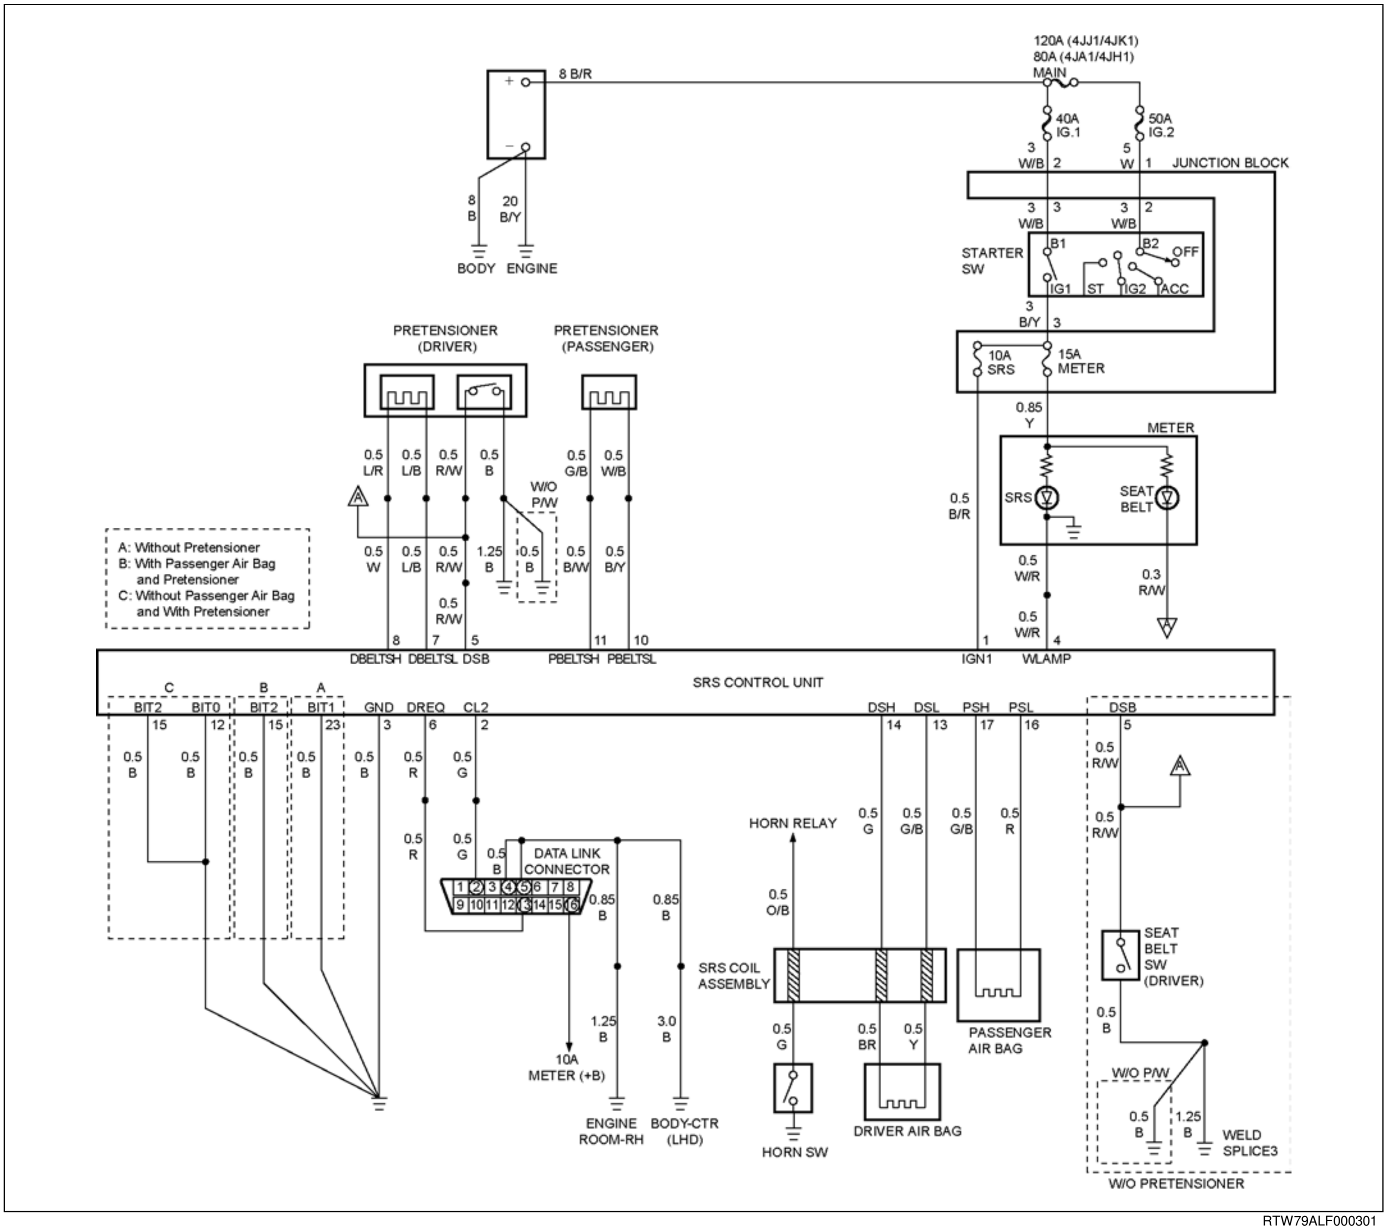
2. If the pretensioner seat belt assemblies have not deployed, DTC B0052 may have been falsely set.
3. If DTC B0052 has set with no signs of frontal impact, the diagnostic trouble code has been falsely set.

DTC B0052 (Flash Code 52) Pretensioner Squib Circuit Activated (Crash)

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SRS CONROL UNIT. NEVER STRIKE OR JAR THE SRS CONTROL UNIT. NEVER POWER UP THE SRS WHEN THE SRS CONTROL UNIT IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SRS CONTROL UNIT AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SRS CONTROL UNIT COULD BE ACTIVATED AND CAUSE DEPLOYMENT AND RESULTING IN PERSONAL INJURY.

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2.	Go to the “SRS Diagnostic System Check”
2	Ignition switch “LOCK”. Have the pretensioner seat belt assemblies been deployed?	Replace components and perform inspections as directed in “repairs and inspections required after an accident” in this section. clear diagnostic trouble codes. Repeat “SRS Diagnostic System Check”	Go to Step 3
3	Inspect the front of the vehicle and undercarriage for signs of impact. Were signs of impact found?	Replace components and perform inspections as directed in “Repairs and Inspections Required After An Accident” in this section. Clear diagnostic trouble codes. Repeat “SRS Diagnostic System Check”	Ignition switch is at “LOCK”. Replace SRS control unit. Reconnect all SRS system components, ensure all components are properly mounted. Repeat “SRS Diagnostic System Check”

DTC B0055 (Flash Code 55) Vehicle Variant Missing



Circuit Description

DTC B0055 will be set, if either the SRS control unit or the SRS control unit harness is not genuine parts.

The correct conditions of terminals on the SRS control unit and the SRS harness are as follows.

	Terminal No.			
	12	15	23	26
Without Pretensioner	-	-	used	-
With Pretensioner	-	used	-	-
With Pretensioner and Without Passenger Air Bg	used	used	-	-

DTC Will Set When

- Without the pretensioner:
  Terminals "12", "15" and "26" are shorted to ground.
  Terminal "23" is open (harness is not connected).
- With the pretensioner:
  Terminals "12", "23" and "26" are shorted to ground.
  Terminal "15" is open (harness is not connected).
- With the pretensioner and without the passenger air bag:
  Terminals "23" and "26" are shorted to ground.
  Terminals "12" and "15" are open (harness is not connected).

It is DTC set, if non genuine SRS control unit is installed with the SRS harness genuine part, or incase of terminal "12", "15", "23" and "26" are abnormal condition with the SRS control unit genuine part.

Action Taken

The SRS control unit turns “ON" the “SRS" warning lamp and sets a DTC B0055.

But if there is abnormal condition with the SRS control unit and/or SRS harness, the DTC is not set.

DTC Will Clear When

DTC B0055 can be cleared only by using the scan tool.

Diagnostic Aids

Ensure that terminal "12" is shorted to ground on the SRS harness. Terminal "15", "23" and "26" are open circuit.

DTC B0055 (Flash Code 55) Vehicle Variant Missing

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check”
2	1. Ignition switch is at “LOCK”. 2. Disconnect the SRS control unit. 3. Inspect the SRS control unit harness for the following condition. ● Without the pretensioner: - The wiring harness is not connected on terminal "23" - The wiring harness is connected on terminals "12", "15" and "26" ● With the pretensioner: - The wiring harness is not connected on terminal "15" - The wiring harness is connected on terminals "12", "23" and "26" ● Without the pretensioner and without the passenger air bag: - The wiring harness is not connected on terminals "12" and "15" - The wiring harness is connected on terminals "23" and "26" Was a problem found?	Replace the SRS control unit harness. Go to Step 3	Replace the SRS control unit. Go to Step 3
3	1. Reconnect all components and ensure all components are properly mounted. 2. Clear the diagnostic trouble codes. Is this step finished?	Go to the “SRS Diagnostic System Check”	—

SPECIAL SERVICE TOOL

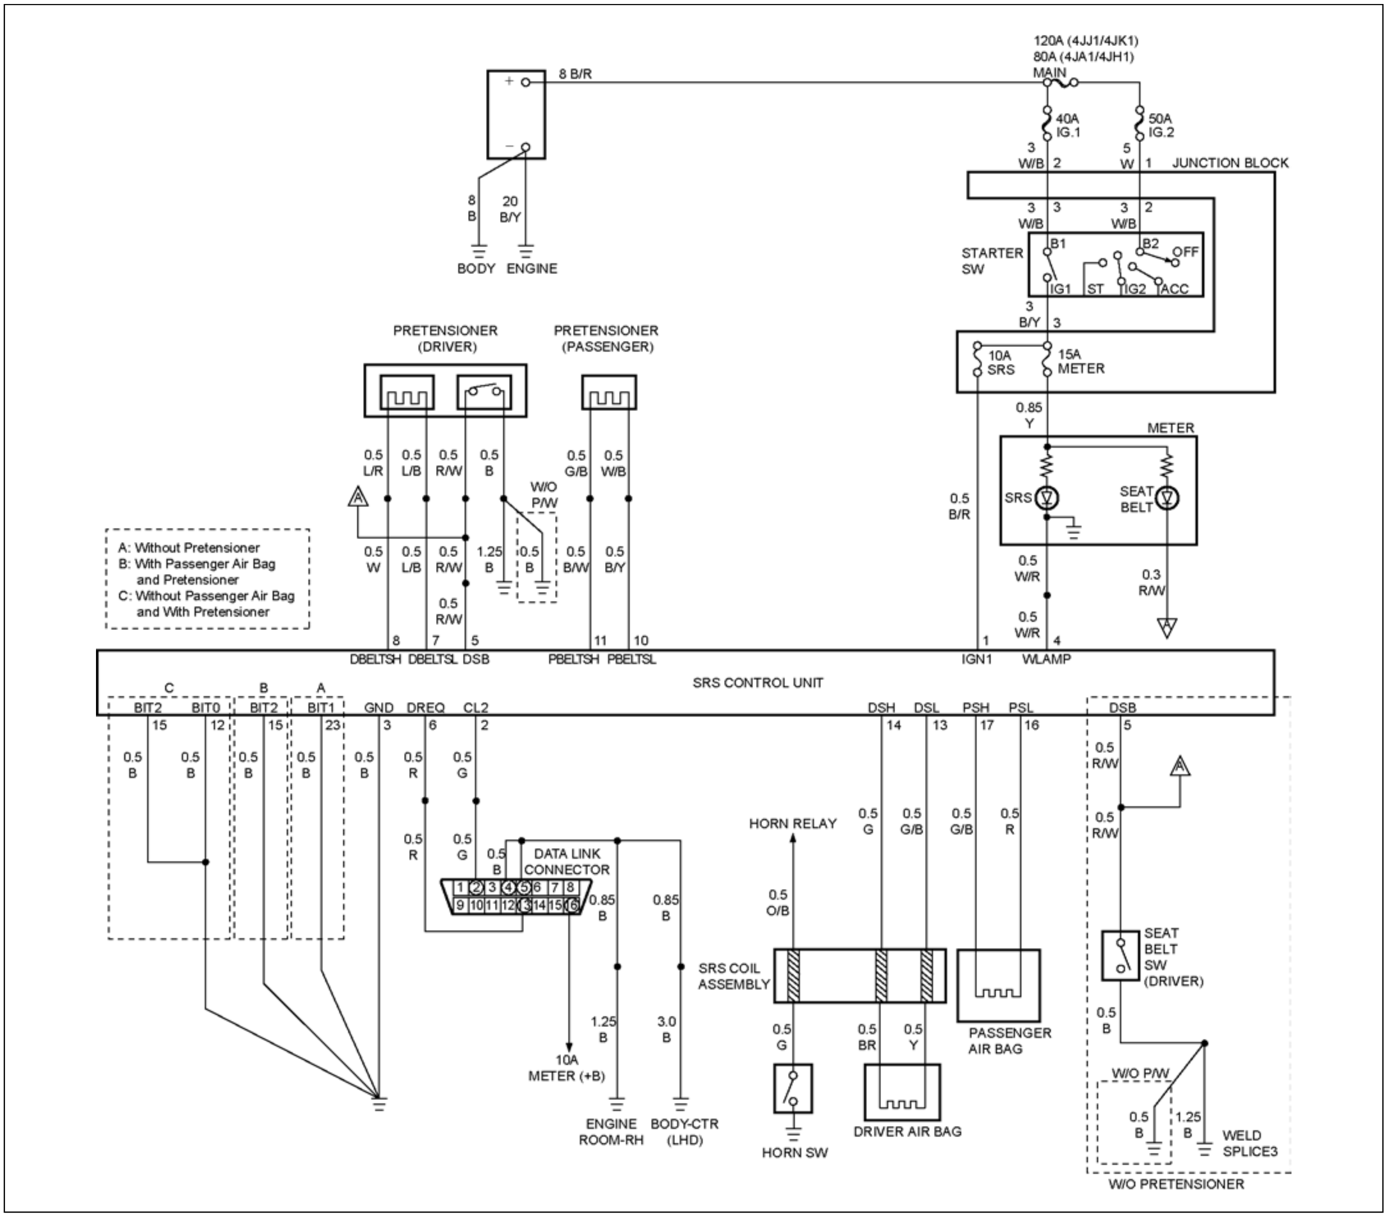
DTC B0061 (Flash Code 61) Warning Lamp Circuit Failure



RTW79ALF000301

Circuit Description

When the ignition switch is first turned “ON”, “Ignition 1” voltage is applied from the “METER” fuse to the “SRS” warning lamp which is connected to “SRS" warning lamp, terminal “4”. The “SRS” fuse applies system voltage to the “Ignition 1” inputs, terminal “1”. The SRS control unit responds by flashing the “SRS” warning lamp 7 times. The SRS control unit monitors the “SRS Warning Lamp" terminal "4" for conditions that are incorrect for the commanded state of the "SRS" warning lamp.

For example, a failure condition exists if the SRS control unit detects low voltage when the "SRS" warning lamp is commanded OFF, or high voltage when the "SRS" warning lamp is commanded ON. If the SRS control unit detects an improper voltage on the “SRS Warning Lamp" terminal "4", DTC B0061 will set.

DTC Will Set When

The SRS control unit try to turn "ON" the "SRS" warning lamp but the battery voltage is not supplied to terminal "4".

The SRS control unit try to turn "OFF" the "SRS" warning lamp but the battery voltage is supplied to terminal "4".

Action Taken

If circuits of the “SRS" warning lamp power supply and ground are normal condition, the SRS control unit turns “ON” the “SRS” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When

The malfunction is no longer occurring and the ignition is turned to “LOCK”.

DTC Chart Test Description

Number(s) below refer to step number(s) on the diagnostic chart:

4. This test determines whether the SRS control unit is malfunctioning
5. This test determines whether the malfunction is in the “SRS Warning Lamp” circuit.
7. This test determines whether the SRS control unit is malfunctioning
8. This test determines whether the malfunction is in the “SRS Warning Lamp” circuit.
9. This test determines whether the malfunction is in the power supply circuit of the "SRS" warning lamp.

Diagnostic Aids

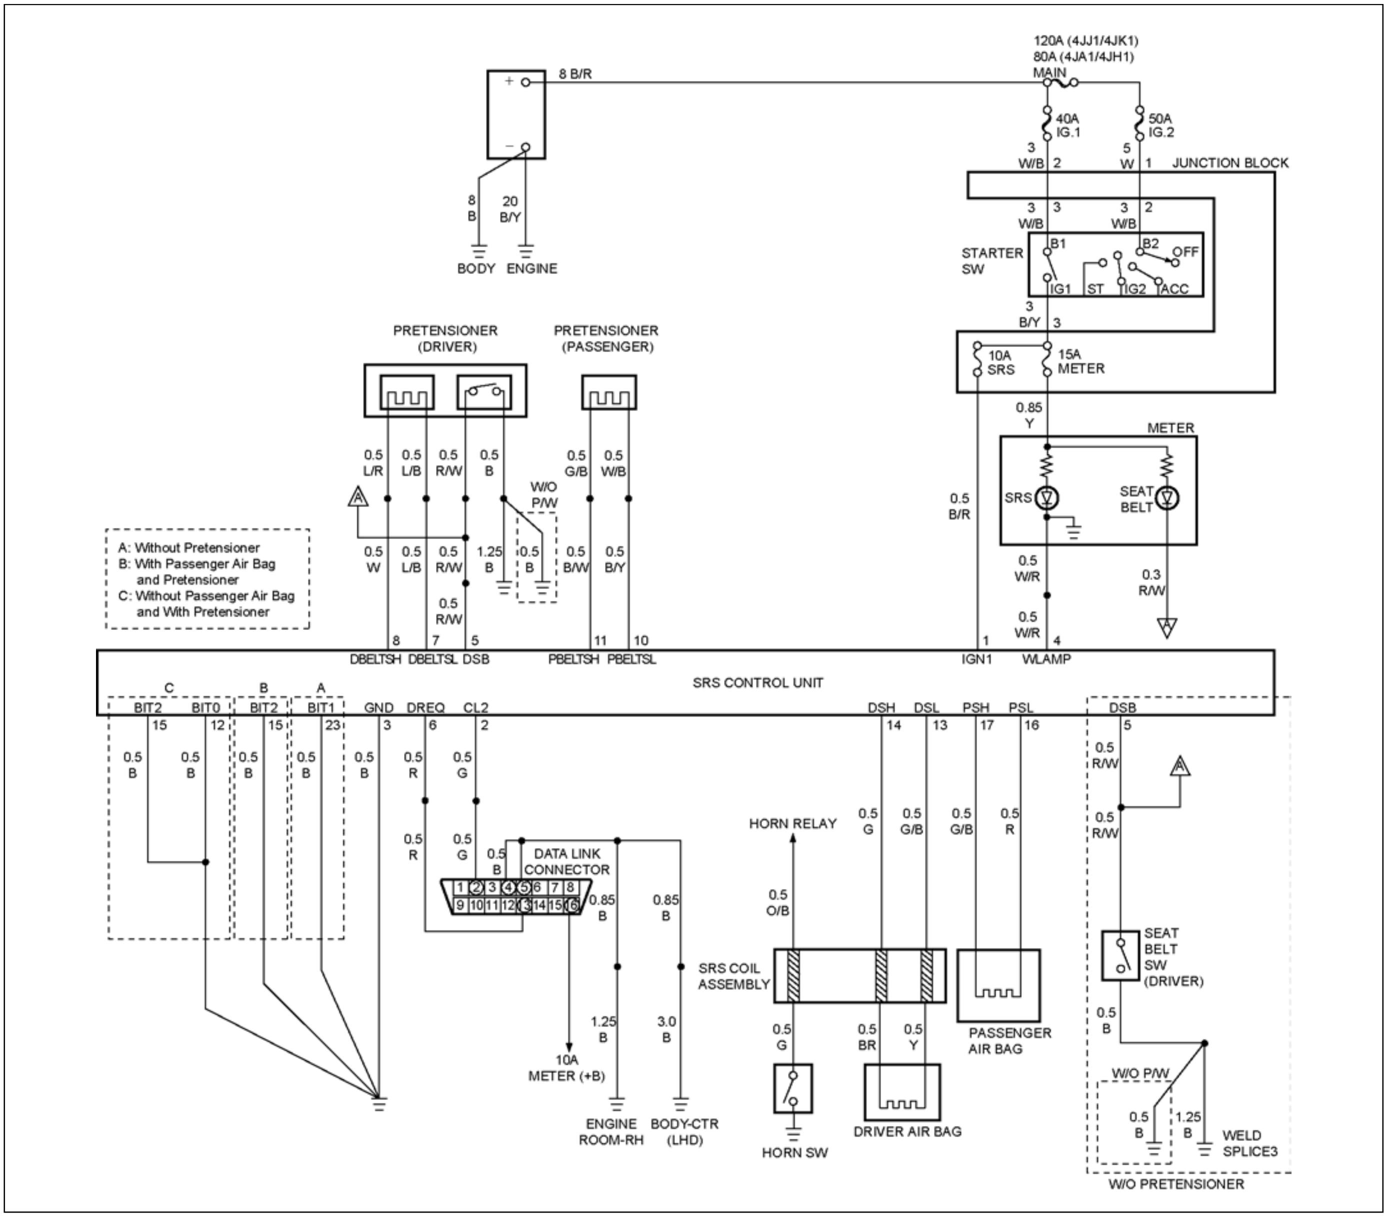
The warning lamp turns “ON" without relation SRS control unit, and turn the warning lamp “OFF" due to electric current to SRS control unit.

DTC B0061 (Flash Code 61) Warning Lamp Circuit Failure

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check”
2	1. Ignition switch is at “ON”. 2. Note the “SRS” warning lamp. Does the “SRS” warning lamp flash seven 7 times?	Repeat the “SRS Diagnostic System Check”	Go to Step 3
3	Did the “SRS” warning lamp come “ON” steady at Step 2?	Go to Step 4	Go to Step 6
4	1. Ignition switch is at “LOCK”. 2. Disconnect the SRS control unit. 3. Ignition switch is at “ON”. 4. Note the “SRS” warning lamp. Does the “SRS” warning lamp go “OFF”?	Ignition switch is at “LOCK”. Replace the SRS control unit . Go to Step 10	Go to Step 5
5	Measure the resistance on the SRS control unit harness connector as follow. ● From terminals "4" to "3" and "23" (ground) (without the pretensioner) ● From terminals "4" to "3" and "15" (ground) (with the pretensioner and the passenger air bag) ● From terminals "4" to "3", "12" and "15" (ground) (with the pretensioner and without the passenger air bag) Does 5-8840-0366-0 display “OL” (infinite)?	Service instrument meter cluster. Install instrument meter cluster. Go to Step 10	Replace the SRS harness. Go to Step 10
6	1. Ignition switch is at “LOCK”. 2. Remove and inspect “METER” fuse to the “SRS” warning lamp. Is the fuse good?	Go to Step 7	Replace the "METER" fuse. Go to Step 10
7	1. Disconnect the SRS control unit. 2. Ignition switch is at “ON”. 3. Measure the voltage on the SRS control unit harness connector from terminal “4” to terminal “3” (ground). Is system voltage present on terminal “4”?	Ignition switch is at “LOCK”. Replace the SRS control unit. Go to Step 10	Go to Step 8

Step	Action	Yes	No
8	1. Ignition switch is at “LOCK”. 2. Measure the resistance from the instrument meter cluster harness connector "SRS" warning lamp circuit terminal to the SRS control unit harness connector terminal “4”. Is the resistance 5.0 ohms or less?	Go to Step 9	Replace the SRS harness. Go to Step 10
9	1. Disconnect the instrument meter cluster harness connector. 2. Measure the resistance from the "METER" fuse to the instrument meter cluster harness connector "SRS" warning lamp power supply circuit terminal. Is the resistance 5.0 ohms or less?	Service instrument meter cluster. Install instrument meter cluster. Go to Step 10	Replace the "SRS" warning lamp power supply circuit harness. Go to Step 10
10	1. Reconnect all components and ensure all components are properly mounted. 2. Clear the diagnostic trouble codes. Is this step finished?	Go to the “SRS Diagnostic System Check”	—

DTC B0062 (Flash Code 62) Battery Voltage Too High



RTW79ALF000301

Circuit Description

When the ignition switch is turned “ON", the SRS control unit judge to "Ignition 1" voltage is normal or not.

DTC Will Set When

The "Ignition 1" voltage is above 21.4V.

Action Taken

The SRS control unit turns “ON” the “SRS” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When

The “Ignition 1" voltage comes to below 16.5V.

DTC Chart Test Description

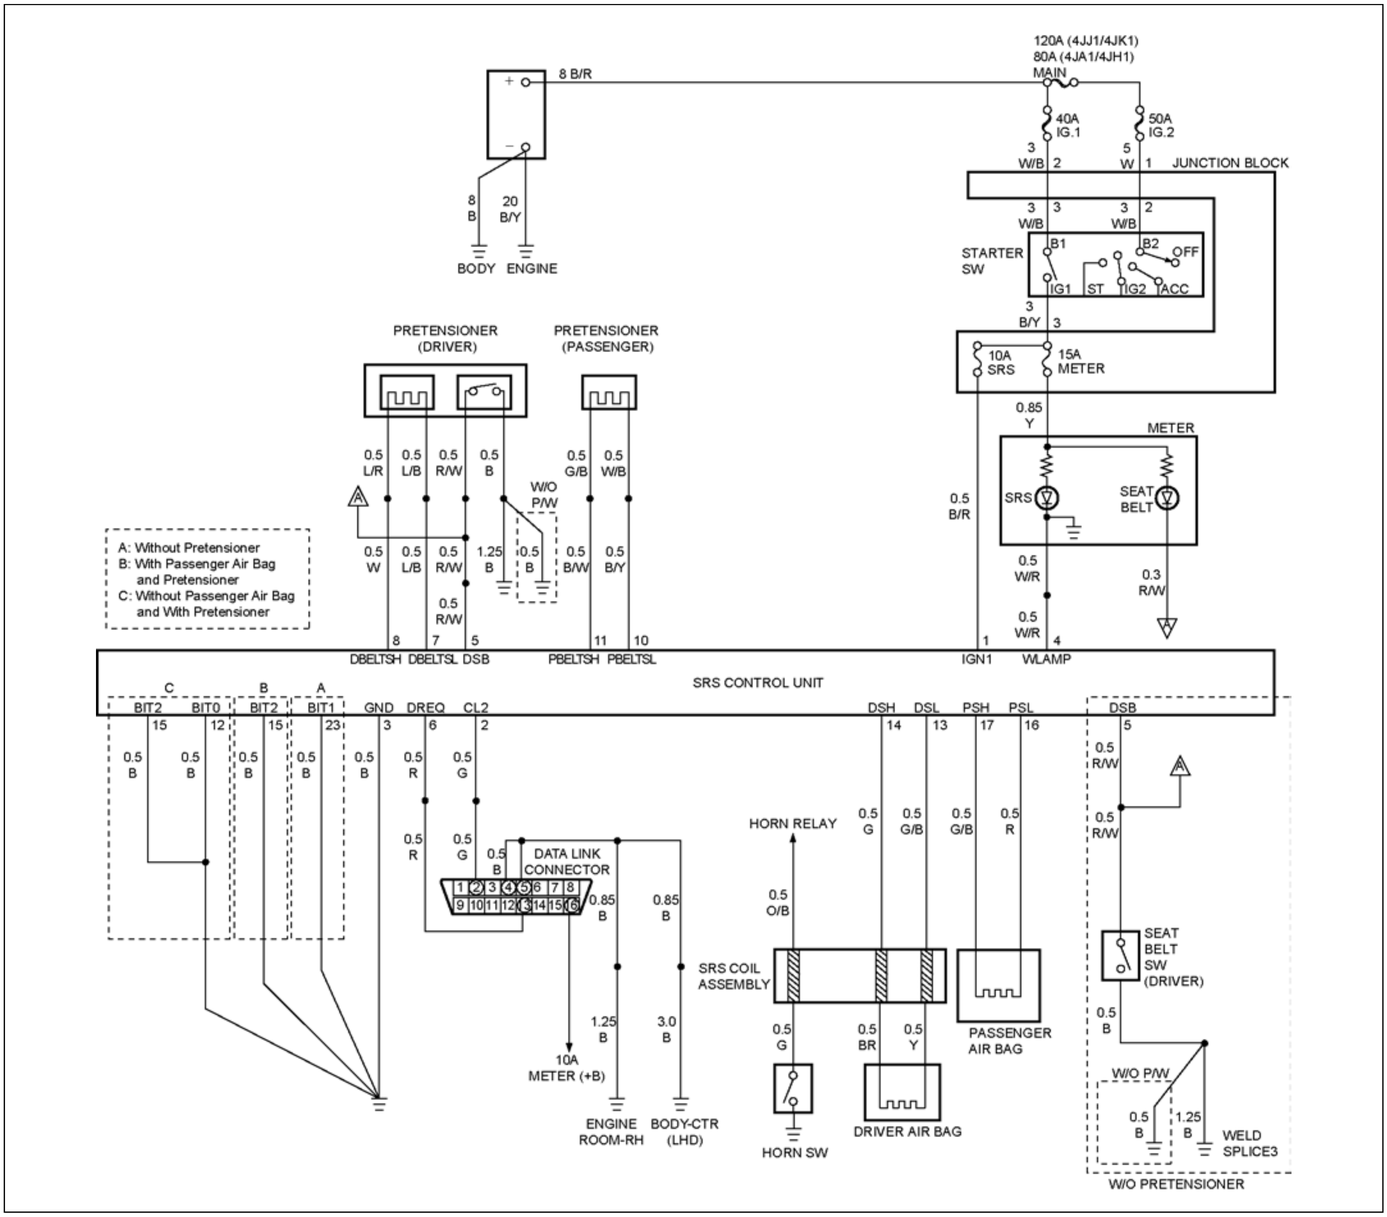
Number(s) below refer to circled number(s) on the diagnostic chart.

2. This test determines whether the SRS control unit is malfunctioning.

DTC B0062 (Flash Code 62) Battery Voltage Too High

Step	Action	Yes	No
1	Was the "SRS Diagnostic System Check" performed?	Go to Step 2	Go to the "SRS Diagnostic System Check"
2	1. Ignition switch is at "LOCK". 2. Disconnect the SRS control unit. 3. Ignition switch "ON". 4. Measure voltage on SRS control unit harness connector from terminal "1" to terminal "3" (ground). Is voltage on terminal "1" below 16.5V?	Ignition switch is at "LOCK". Replace the SRS control unit. Go to Step 3	Inspect the Charging System. Refer to the "Engine Electrical" section. Go to Step 3
3	1. Reconnect all the components and ensure all components are properly mounted. 2. Clear diagnostic trouble codes. Is this step finished?	Go to the "SRS Diagnostic system Check"	—

DTC B0063 (Flash Code 63) Battery Voltage Too Low



RTW79ALF000301

Circuit Description

When the ignition switch is turned “ON", the SRS control unit judge to "Ignition 1" voltage is normal or not.

DTC Will Set When

The "Ignition 1" voltage is below 7.2V.

Action Taken

The SRS control unit turns “ON” the “SRS” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When

The “Ignition 1" voltage comes to above 10.6V.

DTC Chart Test Description

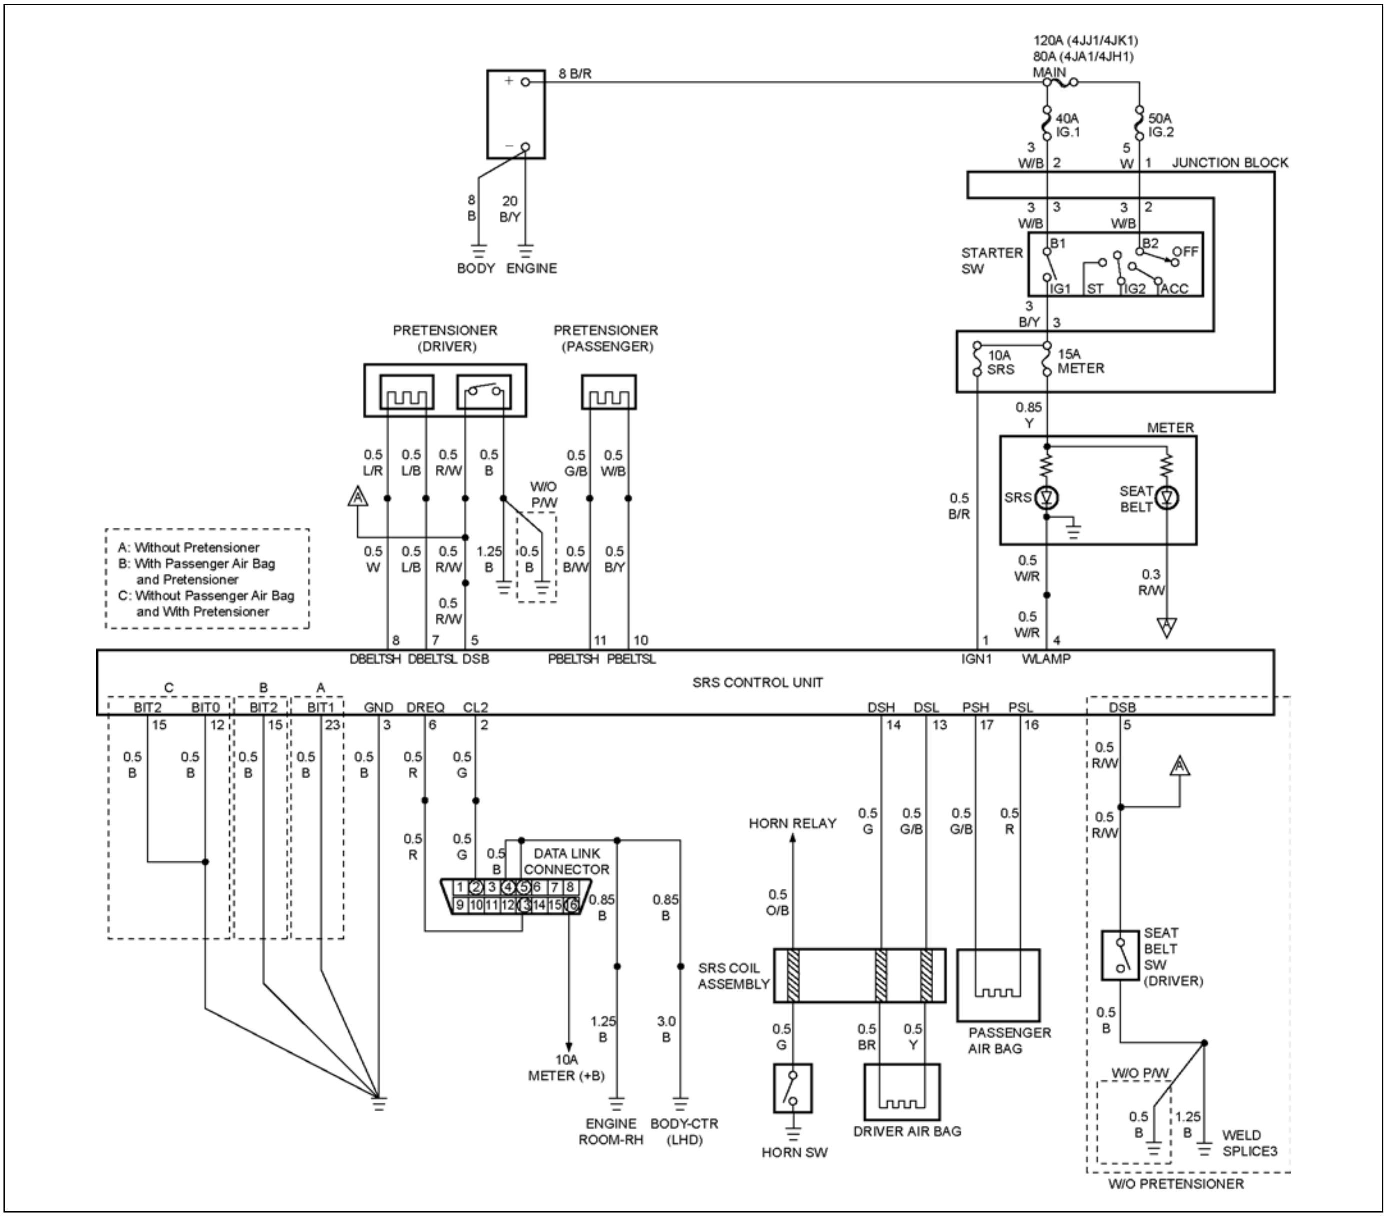
Number(s) below refer to circled number(s) on the diagnostic chart.

4. This test determines whether the malfunction is in the “Ignition 1” circuit.
5. This test determines whether the malfunction is in the “Ignition 1” circuit.

DTC B0063 (Flash Code 63) Battery Voltage Too Low

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Go to Step 2	Go to the “SRS Diagnostic System Check”
2	1. Ignition switch is at “LOCK”. 2. Disconnect the SRS control unit. 3. Ignition switch “ON”. 4. Measure voltage on SRS control unit harness connector from terminal “1” to terminal “3” (ground). Is voltage on terminal “1” above 10.6V?	Go to Step 5	Go to Step 3
3	1. Ignition switch is at “LOCK”. 2. Remove and inspect “SRS” fuse to the “Ignition 1”. Is fuse good?	Go to Step 4	Replace the "SRS" fuse. Go to Step 6
4	1. Ignition switch is at “LOCK”. 2. Measure resistance from "SRS" fusel to SRS control unit harness connector terminal “1”. Is resistance 5.0 ohms or less?	Inspect the Charging System. Refer to the "Engine Electrical" section. Go to Step 6	Replace the SRS harness. Go to Step 6
5	1. Remove the "SRS" fuse. 2. Measure the resistance on the SRS control unit harness connector as follow. ● From terminals "1" to "3" and "23" (ground) (without the pretensioner) ● From terminals "1" to "3" and "15" (ground) (with the pretensioner and the passenger air bag) ● From terminals "1" to "3", "12" and "15" (ground) (with the pretensioner and without the passenger air bag) Does 5-8840-0366-0 display “OL” (Infinite)?	Ignition switch is at “LOCK”. Replace the SRS control unit. Go to Step 6	Replace SRS Harness. Go to Step 6
6	1. Reconnect all the components and ensure all components are properly mounted. 2. Clear diagnostic trouble codes. Is this step finished?	Go to the “SRS Diagnostic system Check”	—

DTC B0071 (Flash Code 71) SRS Control Unit Internal Fault



RTW79ALF000301

Circuit Description

DTC B0071 is an indication of a potential internal SRS control unit malfunction and will set if any of the following conditions are detected:

1) Microprocessor energy reverse time failure.
2) EEPROM read / write failure.
3) ROM check sum.
4) Calibration check sum fault.
5) Inflators reserve voltage low.
6) Inflators electronic sensor active signal not detected during commanded deployment.
7) QSDD (High-side/Low-side) FET failure.
8) Frontal accelerometer failure.
9) Phase lock loop lost lock.
10) QSDD communication fault.

DTC Will Set When

Any of the above indicated malfunctions are detected by the SRS control unit. The malfunctions described above are tested mainly during “Continuous Monitoring” and some are run each ignition cycle.

Action Taken

SRS control unit turns “ON” the “SRS” warning lamp and sets a diagnostic trouble code.

DTC Will Clear When

The SRS control unit is replaced.

DTC B0071 (Flash Code 71) SRS Control Unit Internal Fault

WARNING: DURING SERVICE PROCEDURES. BE VERY CAREFUL WHEN HANDLING A SRS CONTROL UNIT. NEVER STRIKE OR JAR THE SRS CONTROL UNIT. NEVER POWER UP THE SRS WHEN THE SRS CONTROL UNIT IS NOT RIGIDLY ATTACHED TO THE VEHICLE. ALL SRS CONTROL UNIT AND MOUNTING BRACKET FASTENERS MUST BE CAREFULLY TORQUED AND THE ARROW MUST BE POINTING TOWARD THE FRONT OF THE VEHICLE TO ENSURE PROPER OPERATION OF THE SRS. THE SRS CONTROL UNIT COULD BE ACTIVATED WHEN POWERED WHILE NOT RIGIDLY ATTACHED TO THE VEHICLE WHICH COULD CAUSE DEPLOYMENT AND RESULT IN PERSONAL INJURY.

CAUTION: If DTC B0071 can not be cleared by Tech2, it is necessary to replace the SRS control unit.

Step	Action	Yes	No
1	Was the “SRS Diagnostic System Check” performed?	Ignition switch “LOCK”. Replace SRS control unit. Repeat the “SRS Diagnostic System Check”	Go to the “SRS Diagnostic System Check”

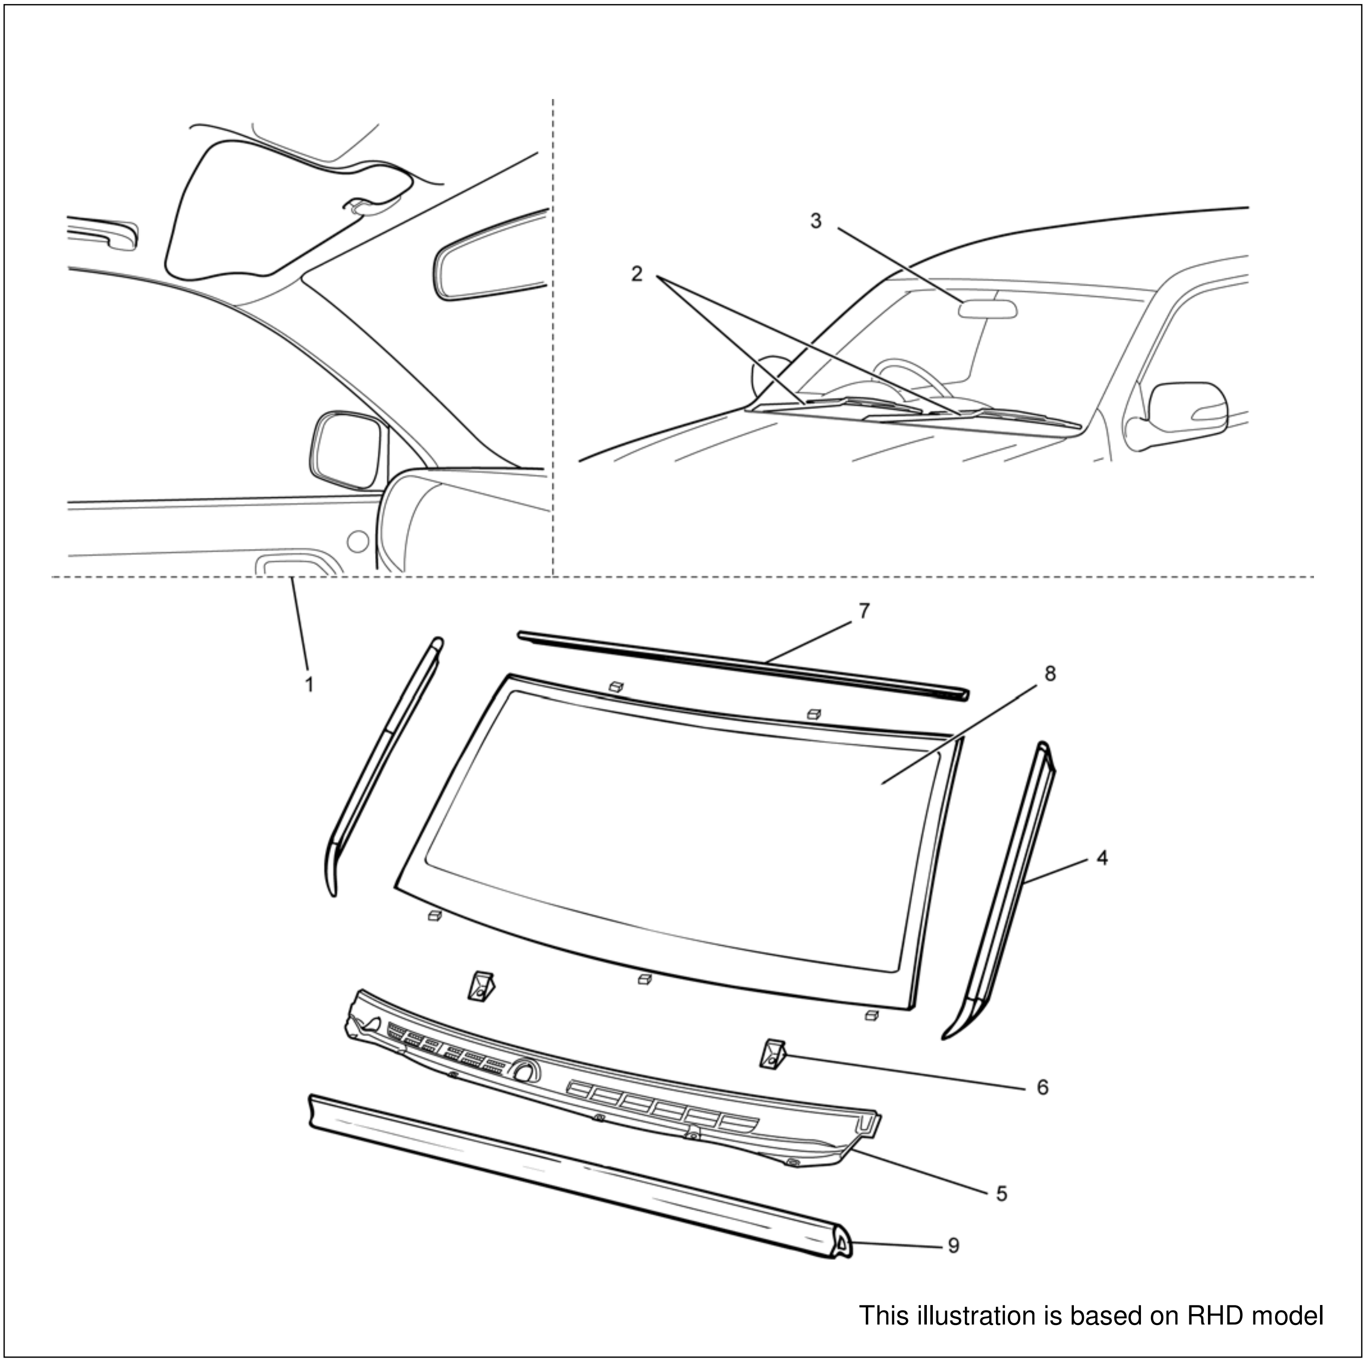
WINDSHIELD

REMOVAL AND INSTALLATION

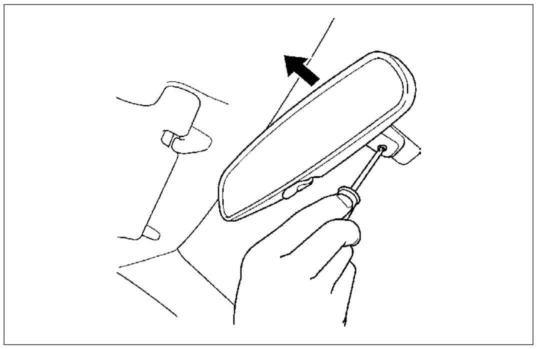


Removal Steps

1. Interior trim panels (Front side) /Headlining/Instrument panel assembly
2. Wiper arm assembly
▲ 3. Room mirror
4. Side molding
5. Vent cowl cover
6. Windshield stopper
7. Upper molding
▲ 8. Windshield
9. Engine hood rear seal

Installation Steps

▲ 9. Engine hood rear seal
▲ 8. Windshield
7. Upper molding
6. Windshield stopper
5. Vent cowl cover
4. Side molding
3. Room mirror
▲ 2. Wiper arm assembly
1. Interior trim panels (Front side) /Headlining/Instrument panel assembly

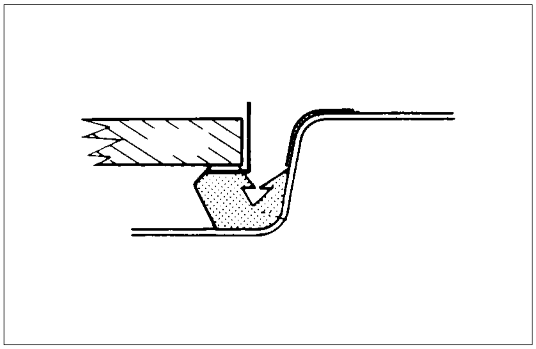


RUW5A0SH002901

Important Operations - Removal

3. Room Mirror

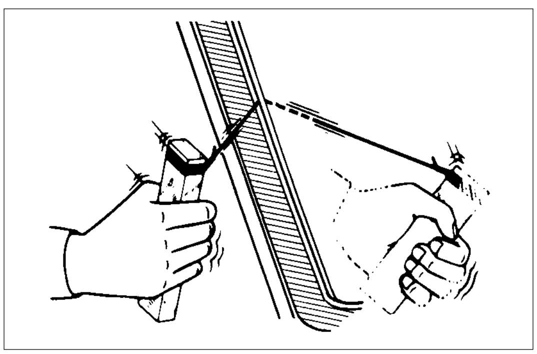
Remove the screw and pull the room mirror to the upper side.



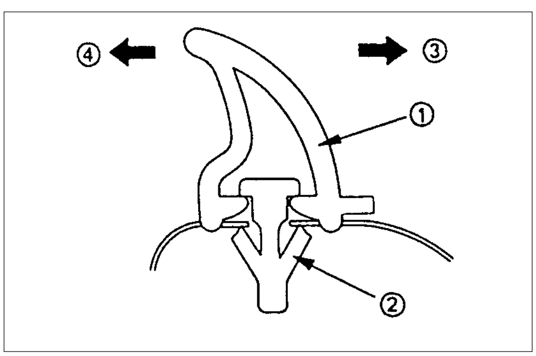
8. Windshield

Remove the windshield, carefully following the steps listed below:

1) Use a knife to cut through part of the adhesive caulking material.
2) Secure one end of a piece of steel piano wire (0.02 inches in diameter) to a piece of wood that can serve as a handle.
3) Use a pair of needle nose pliers to insert the other end of the piano wire through the adhesive caulking material at the edge of the windshield.
4) Secure the other end of the piano wire to another piece of wood.



5) With the aid of an assistant, carefully move the piano wire with a sawing motion to cut through the adhesive caulking material around the entire circumference of the windshield.
6) Lift the windshield from the body.
7) Clean any remaining adhesive caulking material from the area of the body which holds the windshield.
8) Use a soft rag and unleaded gasoline to wipe off any adhesive remaining on the windshield.

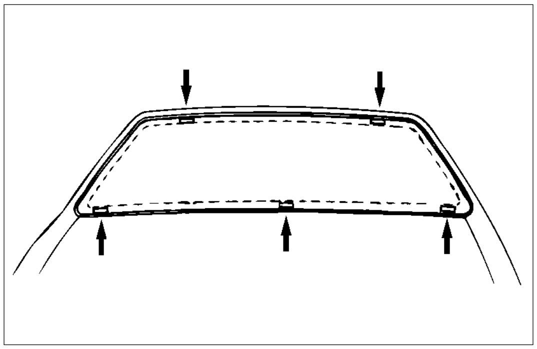


Important Operations - Installation

9. Engine Hood Rear Seal

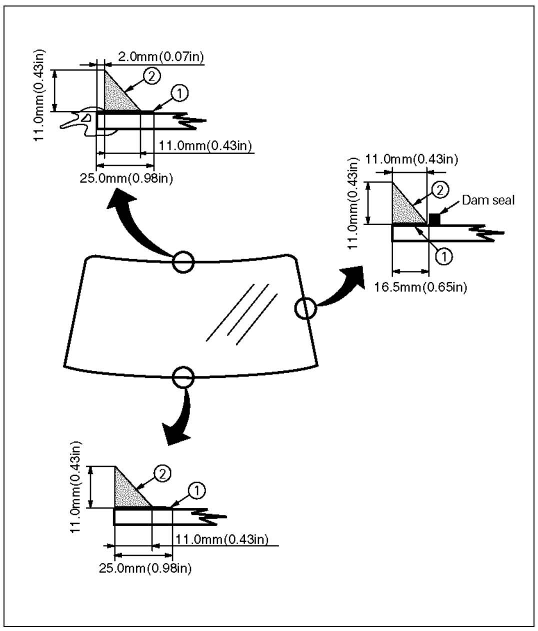
Install the engine hood rear seal as shown in the illustration.

① : Seal
② : Clip
③ : Rear (windshield side)
④ : Front

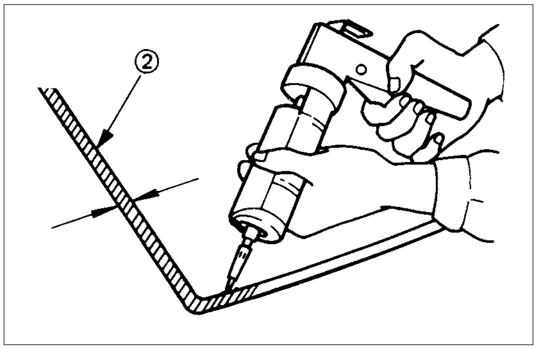


8. Windshield

1) Clean the windshield bonding surface.
2) Use a soft rag and unleaded gasoline to wipe off any adhesive remaining on the body.
3) Mount the body windshield as shown in the illustration. Attach spacers at five locations.
   - Always use new spacers.
4) Install the windshield upper molding.
   - Peel off the tear-away paper from the windshield upper molding, and start applying it with one end of the windshield and cut away the surplus at the other end of the windshield for length adjustment.
   - Always use new upper molding.
5) Temporarily install the windshield support.



6) Apply primer ① Sunstar #435-98 or equivalent to the body side bonding surface. The primer should extend at least 25 mm (0.98 in).
   Apply primer Sunstar #435-40 or equivalent to the windshield side bonding surface.
   The primer should extend 16.5 mm (0.65 in) and 25 mm (0.98 in) from end of the windshield.

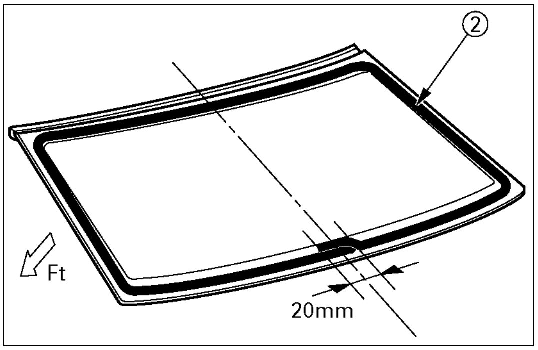


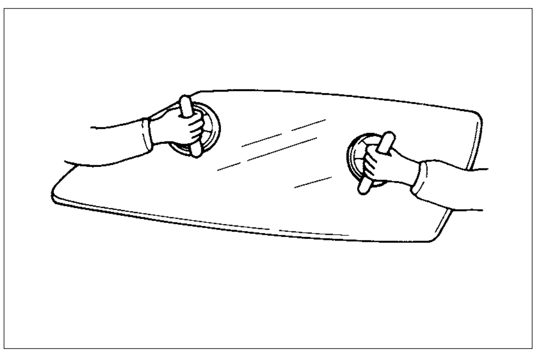
7) Apply the windshield sealing adhesive ②.
   If you are using an air gun, air pressure should be maintained at 147 - 294 kPa.
   After drying the primer completely, apply a sealing adhesive (Sunstar #557 or equivalent) along the edge of the windshield so that the sealing adhesive has a 20 mm (0.79 in) junction at the middle of the base of the windshield.

Note :

Open time (1 min. or more) should be set after application of the primer.

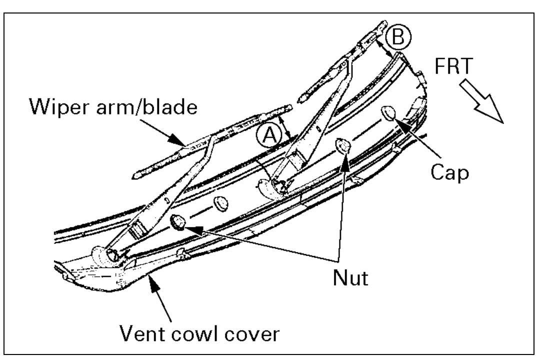
Bonding shall be done within 5 minutes after the sealing adhesive has been applied.





8) Adjust the setting of the windshield with suction discs.
   Set the windshield with sealing adhesive applied to the entire circumference on the body panel. Specifically, adjust the windshield support with the upper molding making contact with the body panel, press the windshield, and tighten the windshield support.

9) Use unleaded gasoline and a soft cloth to wipe away any excess adhesive.
   Cure the bonding at a temperature of 20 - 30°C (68 - 86°F) for twenty-four hours.
   Check that the windshield does not leak water.



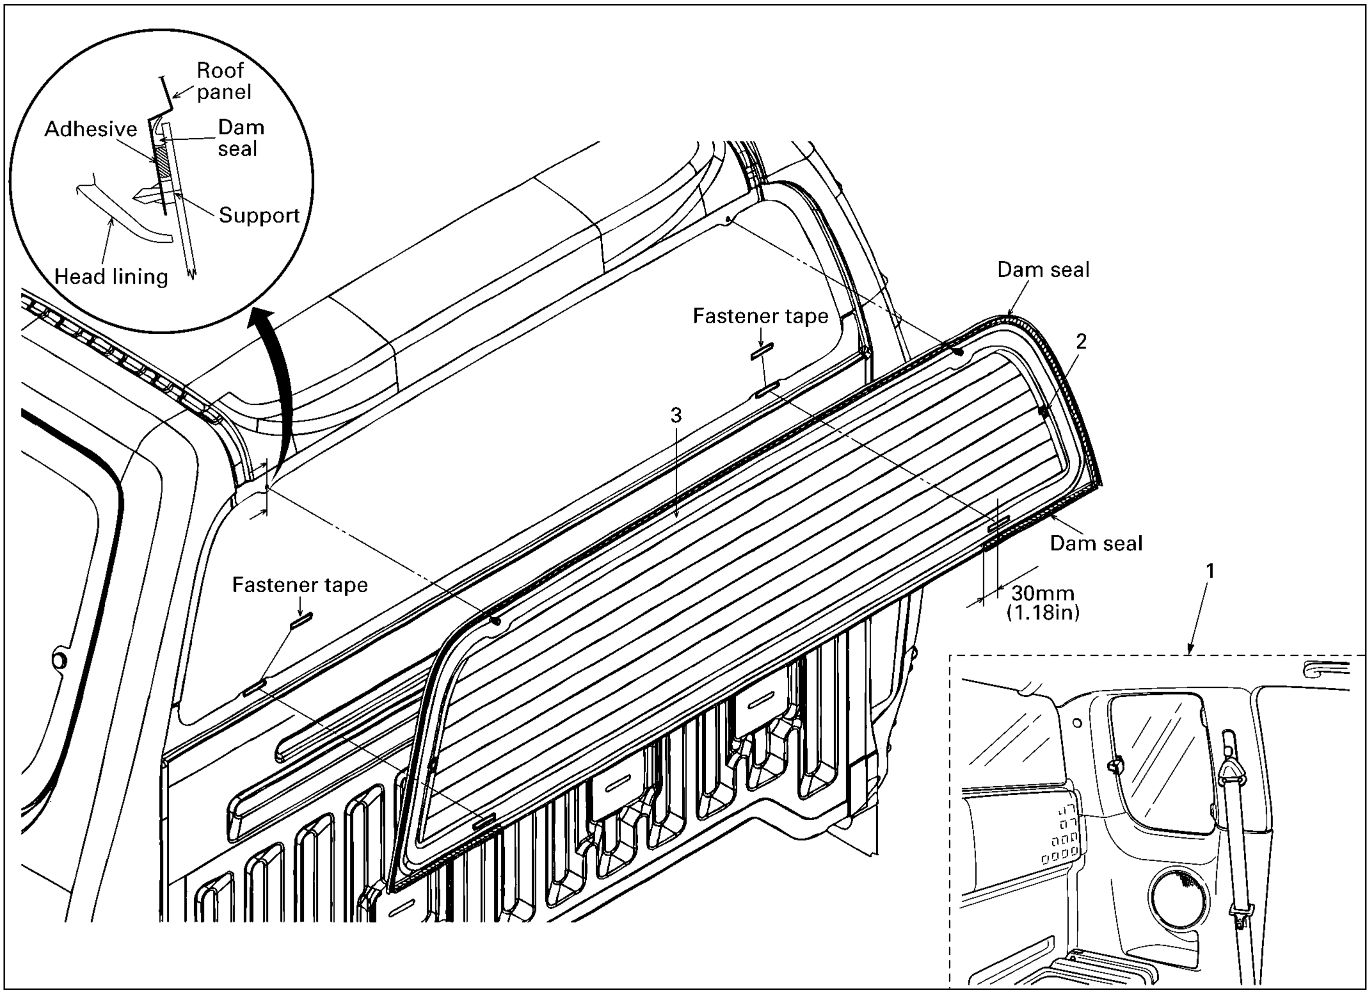
2. Wiper Arm Assembly

- Set the wiper arm/blade so that the tips of both blades are positioned to the specified value of Ⓐ and Ⓑ from the upper edge of the cowl cover as shown in the figure.
  Ⓐ 40 mm (1.57 in)
  Ⓑ 52 mm (2.05 in)
- Tighten the wiper arm assembly fixing nuts to the specified torque.

Torque	N·m (kgf·m/lb·ft)
31 (3.2/23)	

REAR WINDOW ASSEMBLY

REMOVAL AND INSTALLATION



Removal Steps

1. Interior trim panels/Headlining
2. Rear defogger connector (W/Rear defogger)

▲ 3. Rear window

Installation Steps

▲ 3. Rear window

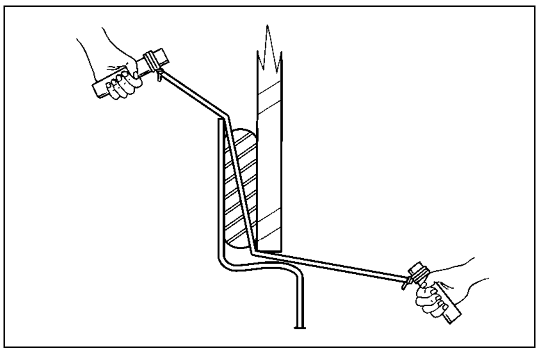
2. Rear defogger connector (W/Rear defogger)
1. Interior trim panels/Headlining

Important Operation - Removal

3. Rear Window

Remove the rear window, carefully following the steps listed below :

1) Use a knife to cut through part of the adhesive caulking material.
2) Secure one end of a piece of steel piano wire (0.02 inches in diameter) to a piece of wood that can serve as a handle.
3) Use a pair of needle nose pliers to insert the other end of the piano wire through the adhesive caulking material at the edge of the rear window.
4) Secure the other end of the piano wire to another piece of wood.

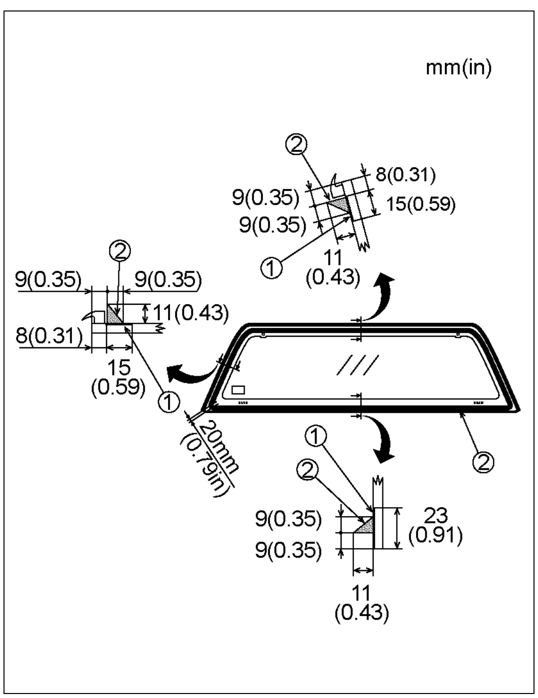


5) With the aid of an assistant, carefully move the piano wire with a sawing motion to cut through the adhesive caulking material around the entire circumference of the rear window.
6) Lift the rear window from the body.
7) Clean any remaining adhesive caulking material from the area of the body which holds the rear window.
8) Use a soft rag and unleaded gasoline to wipe off any adhesive remaining on the rear window.

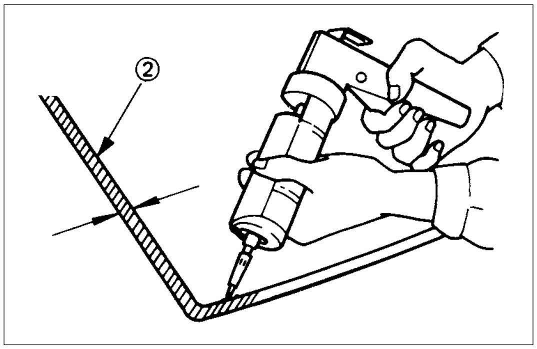
Important Operation - Installation

3. Rear Window

1) Clean the rear window bonding surface.
2) Use a soft rag and unleaded gasoline to wipe off any adhesive remaining on the body.
3) Install the fastener tape to the body panel flange.



4) Apply primer ① Sunster #435-98 or equivalent to the body side bonding surface.
Apply primer Sunstar #435-40 or equivalent to the rear window side bonding surface.
The primer should extend 23 mm (0.91 in.) from the end of the rear window.



5) Apply the rear window sealing adhesive ②.

If you are using an air gun, air pressure should be maintained at 147 – 294 kPa.

After drying the primer completely, apply a sealing adhesive (Sunstar #557 or equivalent) along the edge of the rear window so that the sealing adhesive has a 20 mm (0.79 in.) junction at left corner of the base of the rear window.

Note:

Open time (1 min. or more) should be set after application of the primer.

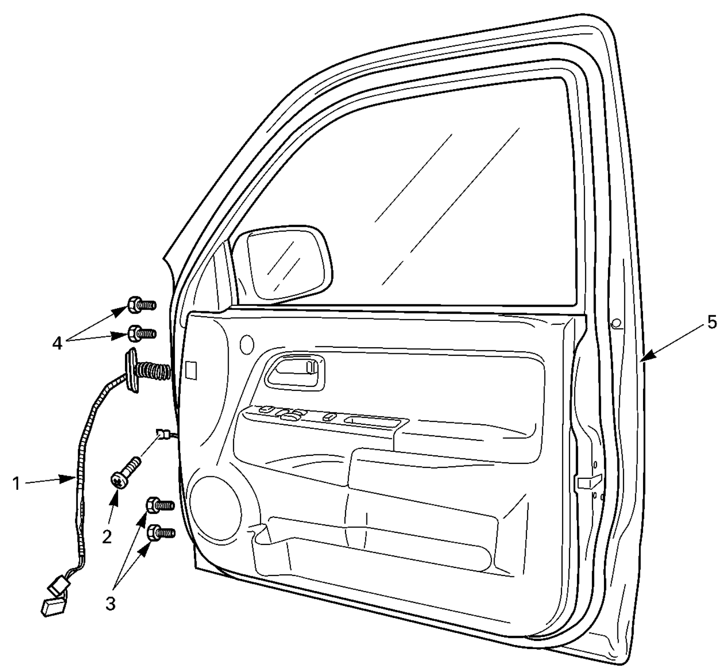
Bonding shall be done within 5 minutes after the sealing adhesive has been applied.

6) Insert the rear window supports into the panel and then push the rear window against the panel to fix it in place. Wipe away any adhesive that oozes out around the edges.

7) Check that the rear window does not leak water.

FRONT DOOR ASSEMBLY

REMOVAL AND INSTALLATION



This illustration is based on RHD model

Removal Steps

▲ 1. Door harness
▲ 2. Check arm screw
▲ 3. Lower hinge bolt

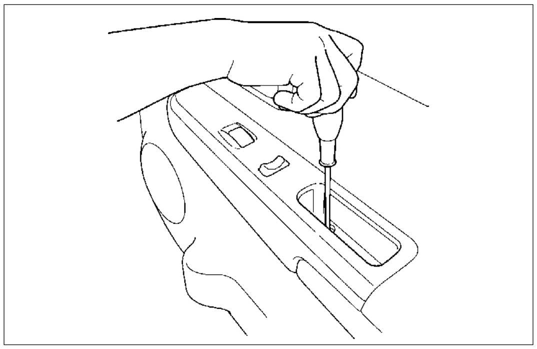
	5-8840-2789-0	ABS sensor rotor installer
	9-8522-1270-0	Inner bearing installer (for 2WD)

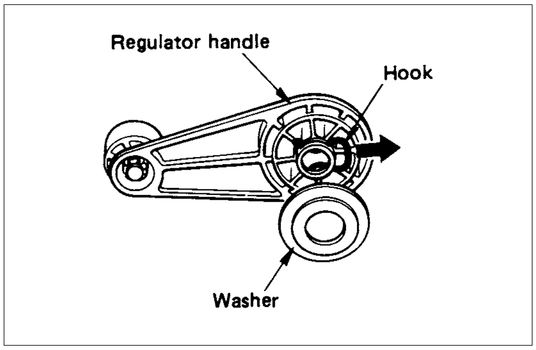
Important Operations



RUW5A0SH002201

1. Switch Bezel/Window Regulator Handle

- Remove the 2 screws and disconnect the connectors.



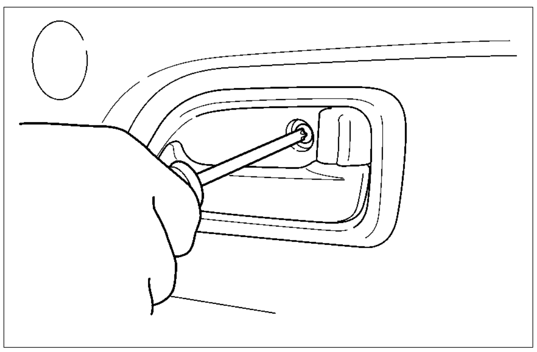
- To remove the regulator handle, remove the clip at the root of the handle by using wire.

2. Power Window Switch

- Remove the 2 screws.

3. Bezel

- Remove the screw.



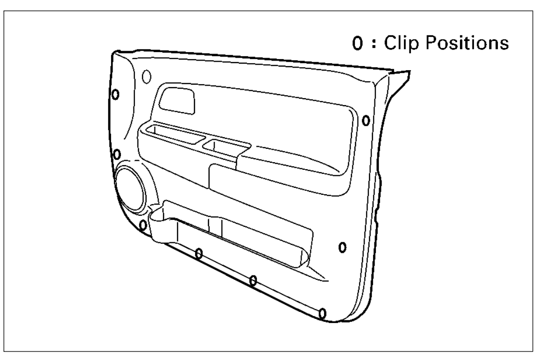
RUW5A0SH002301

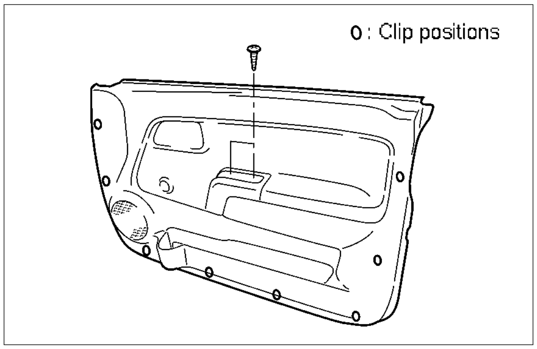
4. Door Mirror Cover

- Pull out the upper clip, and then take out the cover upward.

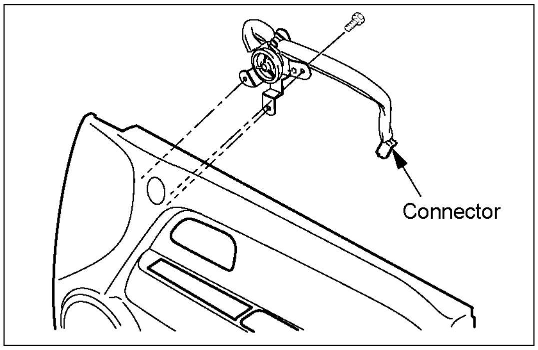
5. Door Trim Panel

- Pull out the trim panel at the 8 clip positions (Power window type).





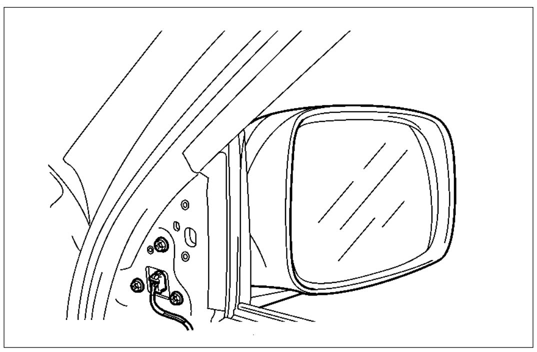
- Remove the 2 screws and pull out the trim panel at the 8 clip positions (Window regulator handle type).



RTW3A0SH000701

6. Tweeter (Required option)

- Disconnect the tweeter harness connector and remove the 3 screws.



7. Door Mirror Assembly

- Remove 3 fixing bolts and then remove the connector.

8. Outer Waste Seal

9. Bracket

10. Speaker Assembly

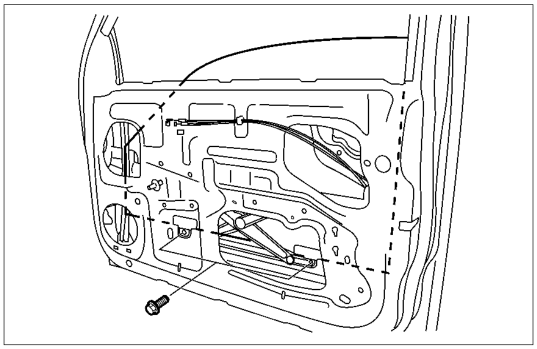
- Remove the fixing screw and then remove the connector.

11. Waterproof Sheet

- Take care not to damage the sheet when peeling it off.

12. Inside Lever

- Disconnect the door lock cables.



13. Window Glass

- Remove 2 bolts through the access hole and pull out the window glass upward.

14. Window Regulator/Power Window Regulator

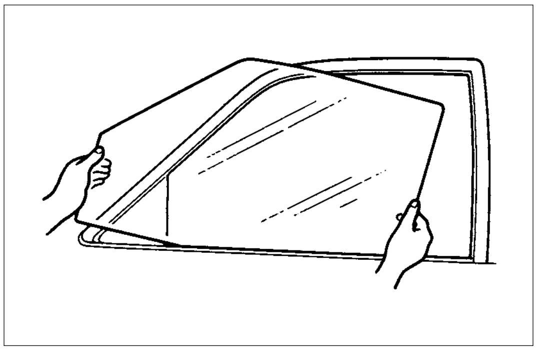
- Remove the 4 fixing bolts and the 2 fixing nuts.
- Disconnect the power window motor connector.

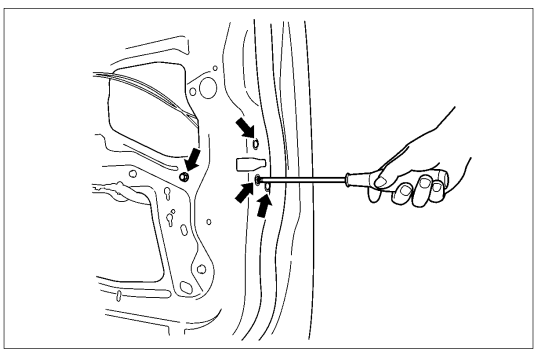
15. Glass Run

- Pull it out from the door frame of the channel.

16. Glass Run Rear Channel

- Remove the bolt.
- Bolt is removed after removing door lock cylinder switch harness. (Expect European Countries)





17. Door Lock Assembly

- Disconnect the lock cable from the anti rattler.
- Remove the 3 fixing screws and the bolt.
- Disconnect the linkage at the outside handle and the lock cylinder.
- Disconnect the harness connector.

18. Outside Handle Protector (EUROPE)

- Remove the fixing bolt from the outside handle.

19. Outside Handle

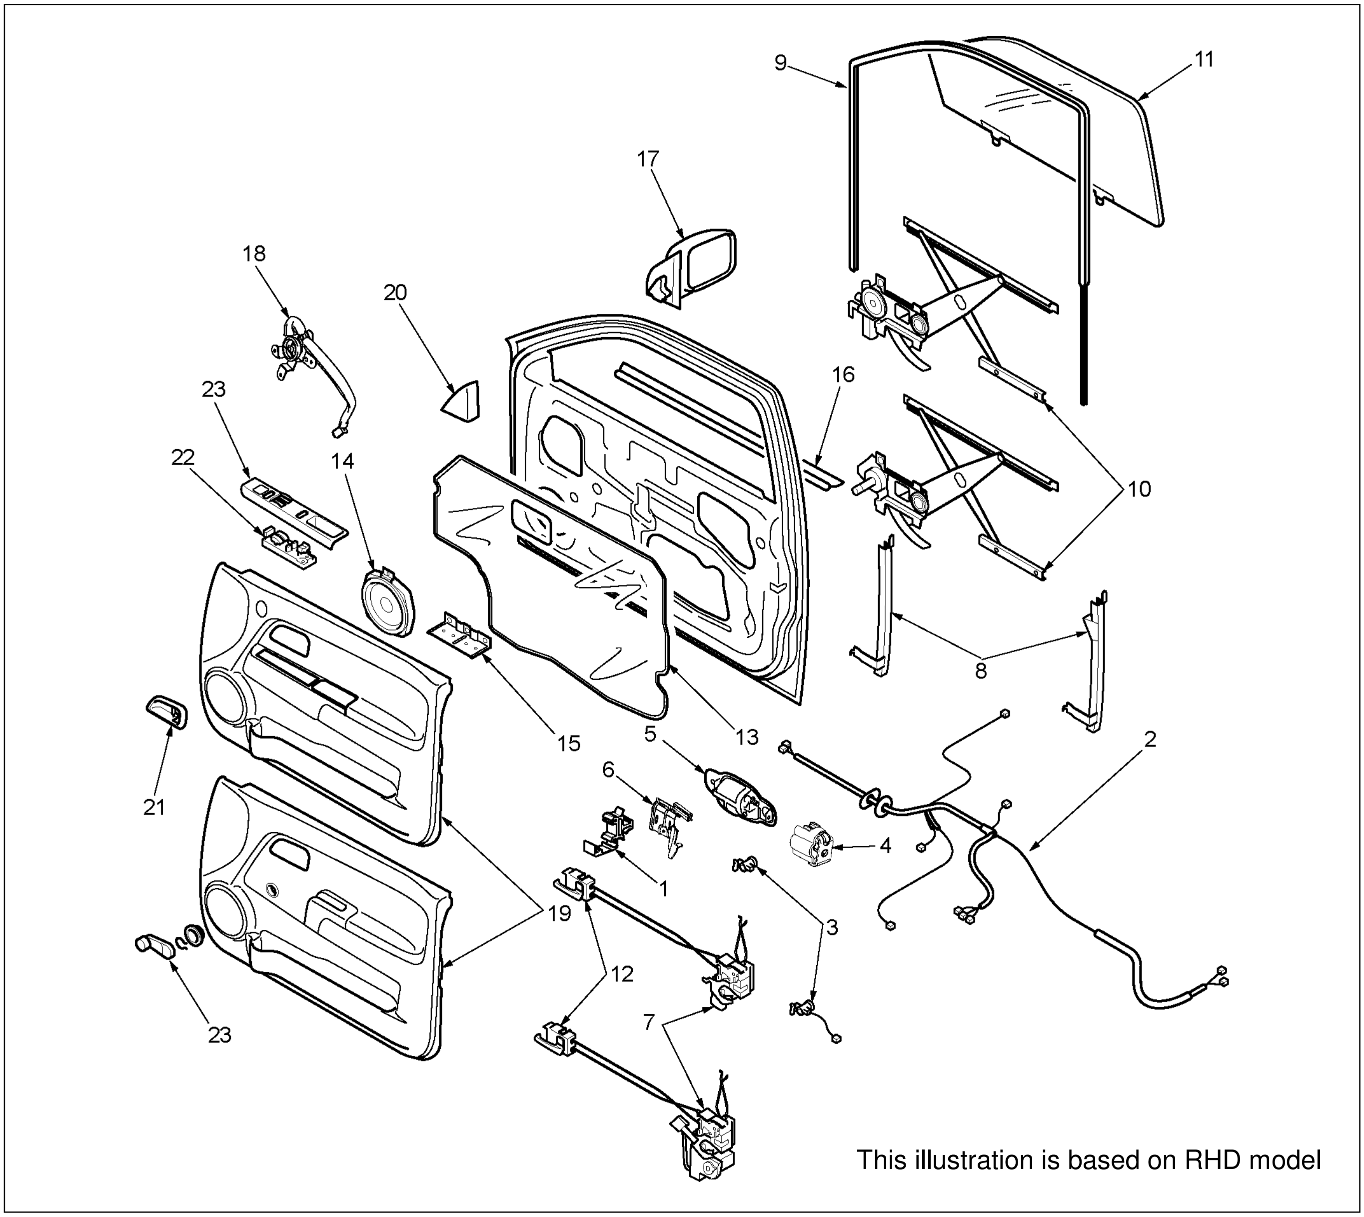
20. Door Lock Cylinder Protector (EUROPE)

- Remove the fixing bolt from the outside handle.

21. Door Lock Cylinder

- Remove the 2 fixing bolts from the outside handle.

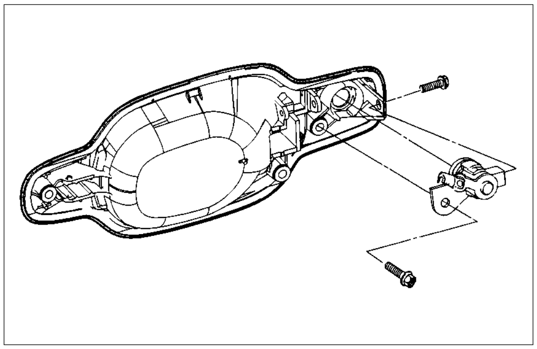
REASSEMBLY



RTW4A0LF000801

Reassembly Steps

1. Anti rattler
2. Door harness assembly
▲ 3. Door lock cylinder / Door lock cylinder with door lock switch (European Countries)
▲ 4. Door lock cylinder protector (EUROPE)
▲ 5. Outside handle
▲ 6. Outside handle protector (EUROPE)
7. Door lock assembly / Door lock assembly with super lock
8. Glass run rear channel / Glass ran rear channel with Door lock control or Anti theft (European Countries)
9. Glass run
10. Window regulator / Power window regulator
▲ 11. Window glass
12. Inside lever
13. Waterproof sheet
14. Speaker assembly
15. Bracket
16. Outer waste seal
17. Door mirror assembly
18. Tweeter (Required option)
19. Door trim panel
20. Door mirror cover
21. Bezel
22. Power window switch
▲ 23. Switch bezel / Window regulator handle



Important Operations

3. Door Lock Cylinder

- Tighten the door lock cylinder fixing bolts to the specified torque.

Torque	N·m (kgf·m/lb·in)
9 (0.9/78)	

4. **Door Lock Cylinder Protector (EUROPE)**

- Tighten the door lock cylinder protector fixing bolt to the specified torque.

Torque	N·m (kgf·m/lb·in)
9 (0.9/78)	

5. Outside Handle

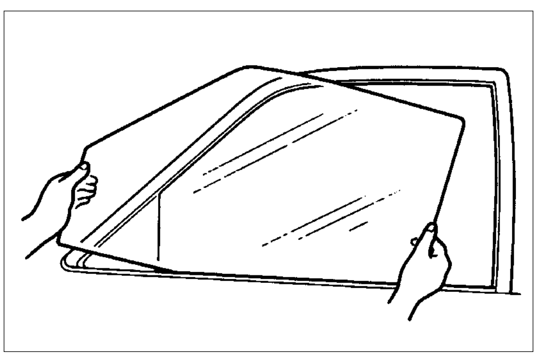
- Tighten the outside handle fixing bolts to the specified torque.

Torque	N·m (kgf·m/lb·in)
9 (0.9/78)	

6. Outside Handle Protector (EUROPE)

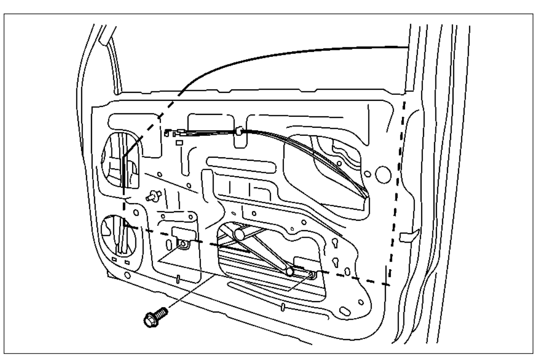
- Tighten the outside handle protector fixing bolt to the specified torque.

Torque	N·m (kgf·m/lb·in)
9 (0.9/78)	

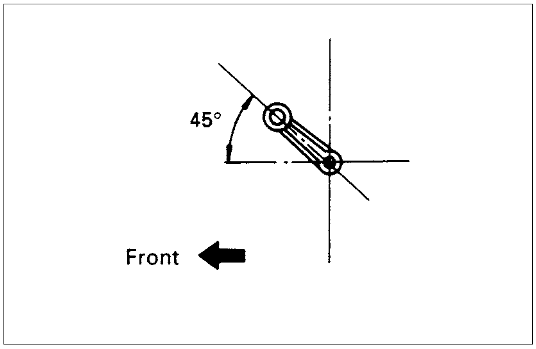


11.Window Glass

- Insert the window glass into position by tilting it as necessary, then set it against the channel of the window regulator.



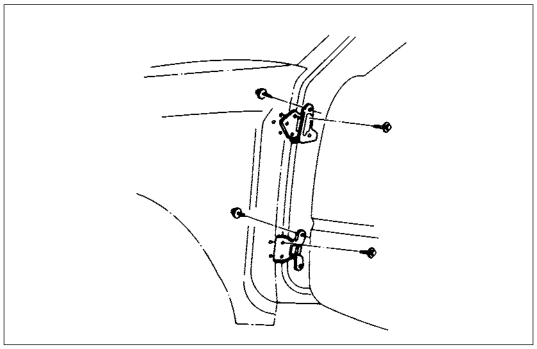
- Attach the window glass to the window regulator with the 2 bolts.



23. Window Regulator Handle

- Install the regulator handle as illustrated when closing the window glass.

ADJUSTMENT (FRONT)



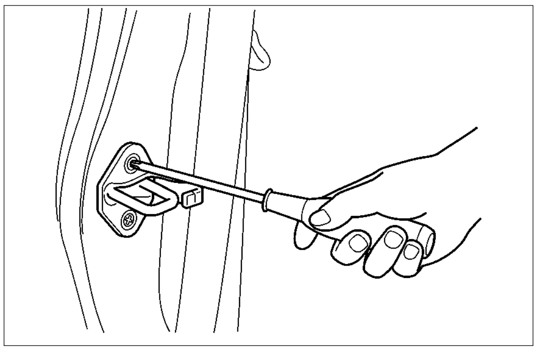
Door Hinge

Door alignment can be obtained by moving the door hinges.

Prior to adjustment, remove the fender and set the door temporarily.

Loosen the hinge to door bolts when adjusting steps between the door and body.

Loosen the hinge to body bolts to adjust the clearance between the door and body.



RUW5A0SH003201

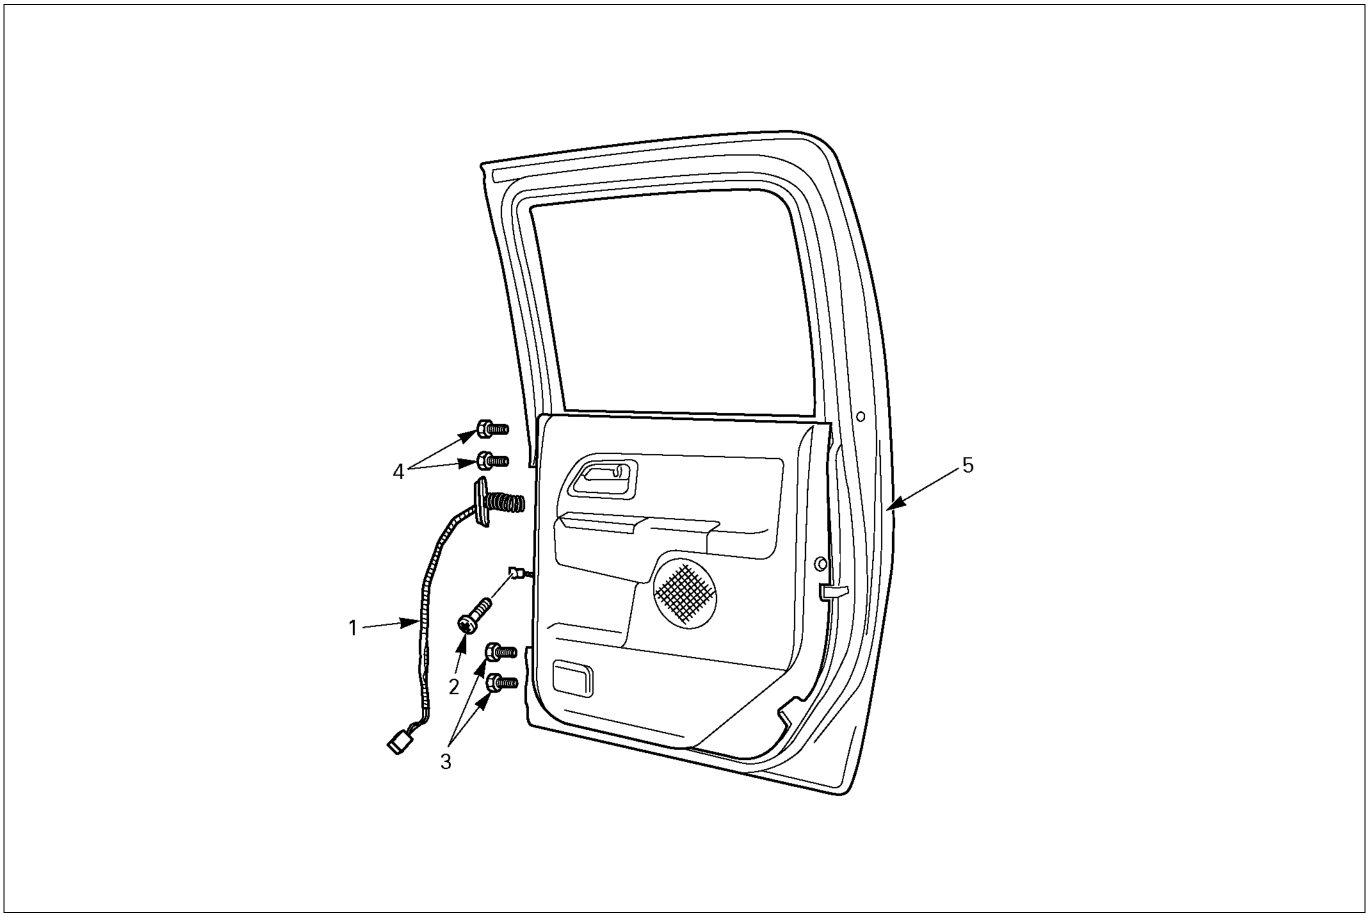
Door Striker

Loosen the striker screws and adjust the position of the striker by holding a piece of wood against the striker and tapping it with a hammer.

To obtain correct adjustment, move the position of the striker vertically so that the lower face of the dovetail becomes parallel to the striker.

REAR DOOR ASSEMBLY (CREW CAB)

REMOVAL AND INSTALLATION

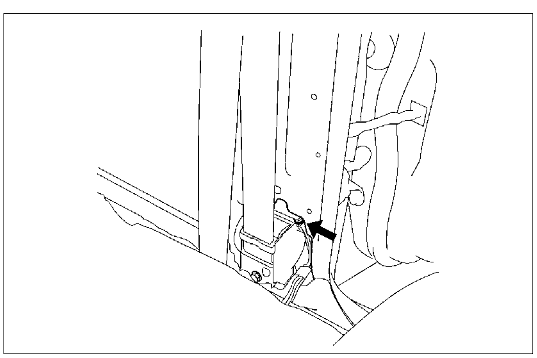


Removal Steps

▲ 1. Door harness
▲ 2. Check arm screw
▲ 3. Lower hinge bolt
4. Upper hinge bolt
5. Door assembly

Installation Steps

5. Door assembly
4. Upper hinge bolt
▲ 3. Lower hinge bolt
▲ 2. Check arm screw
1. Door harness



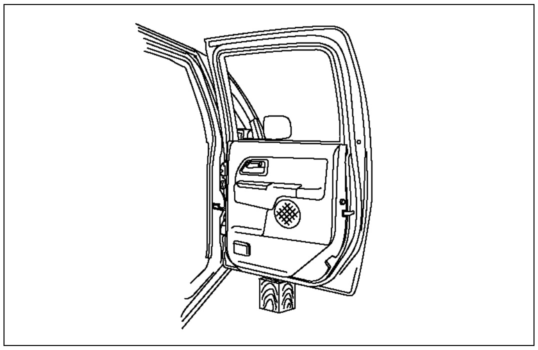
RUW5A0SH003301

Important Operations - Removal

1. Door Harness

Remove the center pillar lower trim cover and disconnect the door harness connector.

2. Check Arm Screw



3. **Lower Hinge Bolt**
Position a wood block under the door for protection and support the door assembly with hands at removal or installation.

Important Operations – Installation

3. Lower Hinge Bolt; Hinge to Door

Torque	N·m (kgf·m/lb·ft)
34 (3.5/25)	

2. Check Arm Screw; Check Arm to Body

Torque	N·m (kgf·m/lb·ft)

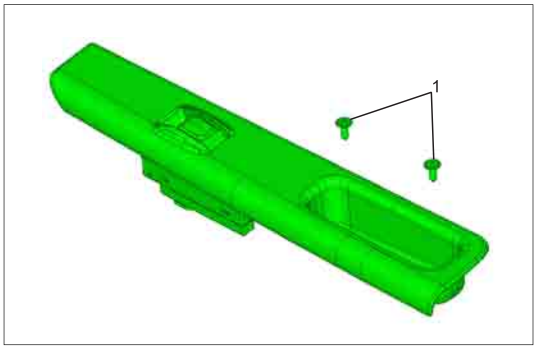
SECTION 4C2

SHIFT ON THE FLY SYSTEM

TABLE OF CONTENTS

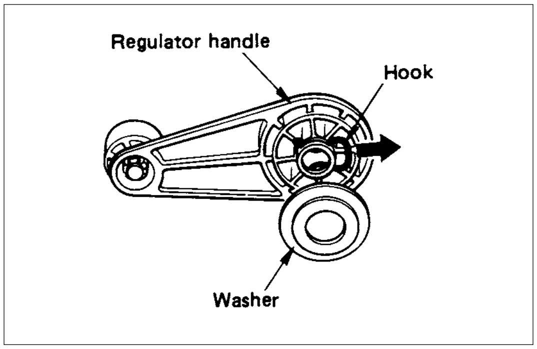
Important Operations



RTW7A0SH000401

1. Power Window Switch/Window Regulator Handle

- Remove the 2 screws (1) and pry out the power window switch and disconnect the connector.



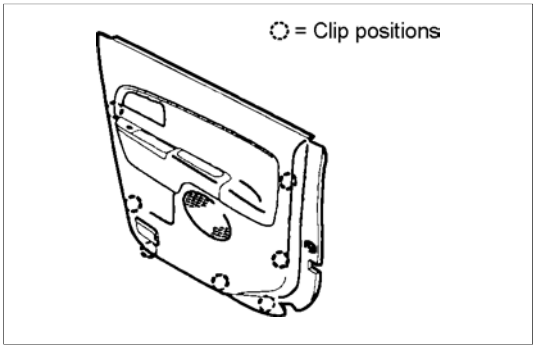
- To remove the regulator handle, remove the clip at the root of the handle using a wire.

2. Bezel

- Remove the screw.

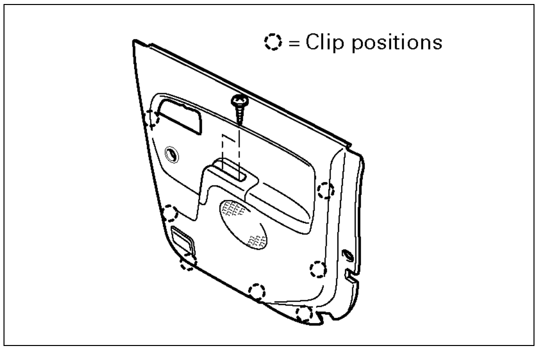
3. Door Trim Panel

- Pull out the trim panel at the 7 clip positions (Power window type).



RTW7A0SH000501

- Remove the 2 screws and pull out the trim panel at the 7 clip positions (Window regulator handle type).



4. Bracket

5. Speaker assembly

- Remove the fixing bolt and then remove the connector.

6. Waterproof Sheet

- Take care not to damage the sheet when peeling it off.

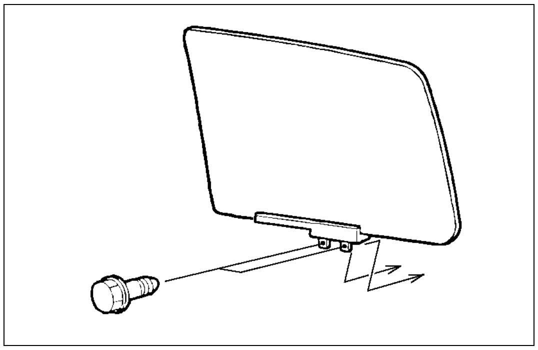
7. Inside Lever

- Disconnect the door lock cables.

8. Outer Waste Seal

9. Glass Run Rear Channel

- Remove the bolt.



10. Window Glass

- Remove 2 bolts through the access hole and pull out the window glass upward.

11. Window Regulator/Power Window Regulator

- Remove the 5 fixing bolts.
- Disconnect the power window motor connector.

12. Glass Run

- Pull it out from the door frame of the channel.

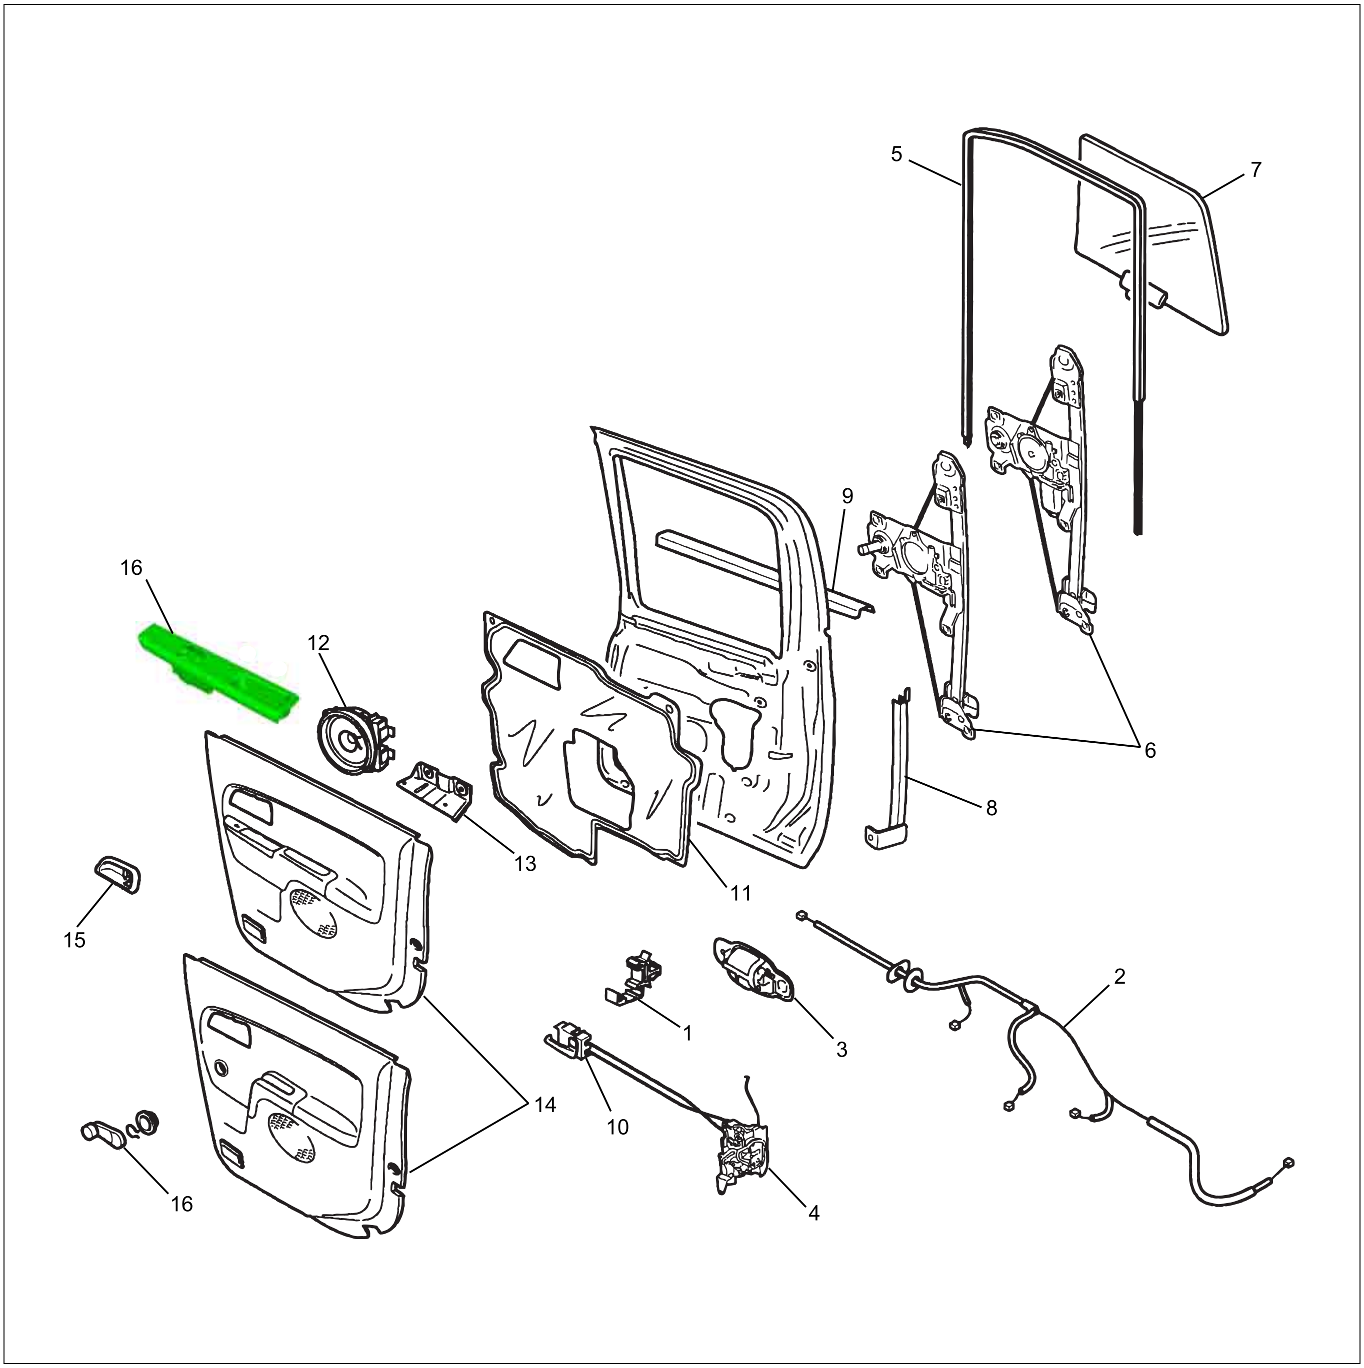
13. Door Lock Assembly

- Disconnect the lock cable from the anti rattler.
- Remove the 3 fixing screws and the bolt.
- Disconnect the linkage and harness connector.

14. Outside Handle

- Remove the 2 fixing bolts.

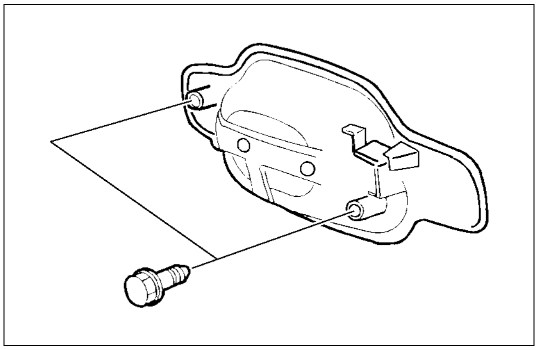
REASSEMBLY



RTW7A0LF001001

Reassembly Steps

1. Anti rattler
2. Door harness assembly
▲ 3. Outside handle
4. Door lock assembly
5. Glass run
6. Window regulator/Power window regulator
7. Window glass
8. Glass run rear channel
9. Outer waste seal
10. Inside lever
11. Waterproof sheet
12. Speaker assembly
13. Bracket
14. Door trim panel
15. Bezel
▲ 16. Power window switch/Window regulator handle

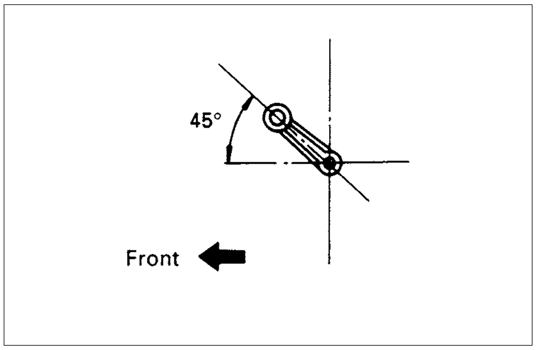


Important Operations

3. Outside Handle

- Tighten the outside handle fixing bolts to the specified torque.

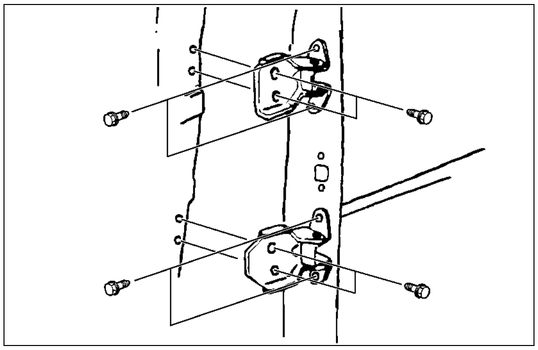
Torque	N·m (kgf·m/lb·in)
9 (0.9/78)	



16. Window Regulator Handle

- Install the regulator handle as illustrated when closing the window glass.

ADJUSTMENT (REAR)



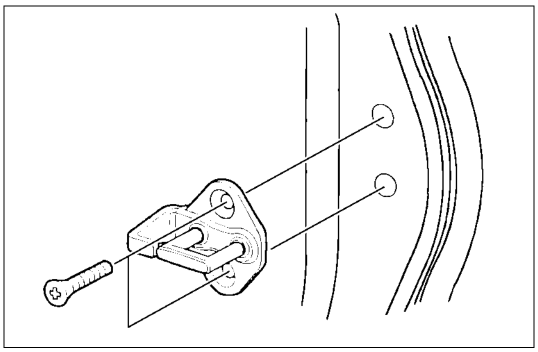
Door Hinge

Door alignment can be obtained by moving door hinges.

Prior to adjustment, set the door temporarily.

Loosen the hinge to door bolts when adjusting steps between the door and body.

Loosen the hinge to body bolts to adjust the clearance between the door and body.



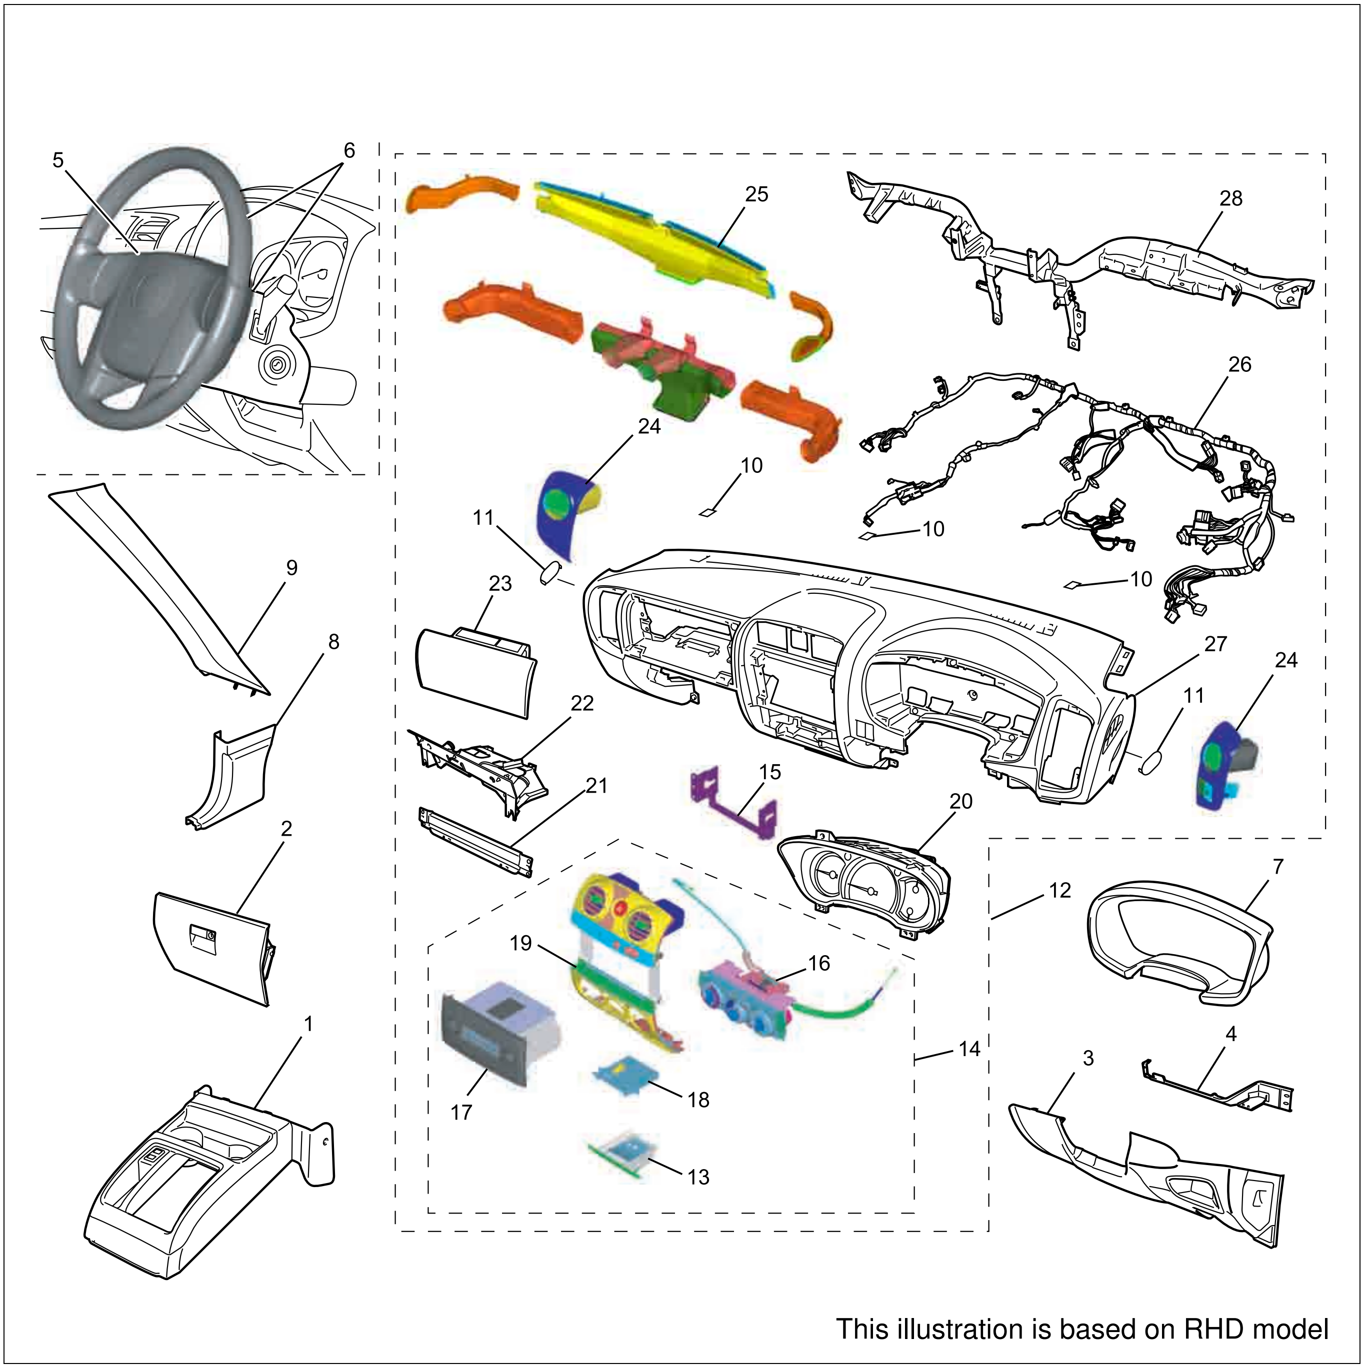
Door Striker

Loosen the striker screws and adjust the position of the striker by holding a piece of wood against the striker and tapping it with a hammer.

To obtain correct adjustment, move the position of the striker vertically so that the lower face of the dovetail becomes parallel to the striker.

INSTRUMENT PANEL

REMOVAL



RTW7A0LF001301

Disassembly Steps

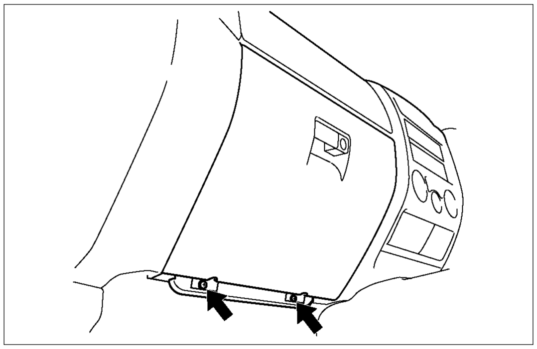
- ▲ 1. Front console assembly
- ▲ 2. Glove box
- ▲ 3. Instrument panel driver lower cover assembly
- ▲ 4. Driver knee bolster assembly
- ▲ 5. Driver air bag
- ▲ 6. Steering wheel/ steering cowl
- 8. Dash side trim cover
- 9. Front pillar trim cover
- 10. Front cover
- 11. Side cover
- ▲ 12. Instrument panel assembly & Cross beam
- ▲ 13. Ashtray case

▲ 7. Meter cluster assembly
15. Audio bracket
▲ 16. Control lever assembly
17. Audio assembly
▲ 18. Ashtray bracket
19. Center cluster
20. Meter assembly
21. Passenger lower bracket
22. Glove box cover
▲ 14. Center cluster assembly
▲ 23. Passenger air bag (if so equipped)
▲ 24. Side ventilation grille
▲ 25. Vent duct assembly/Defroster nozzle assembly
26. Instrument harness assembly
▲ 27. Instrument panel assembly
28. Cross beam

Important Operations

1. Front Console Assembly

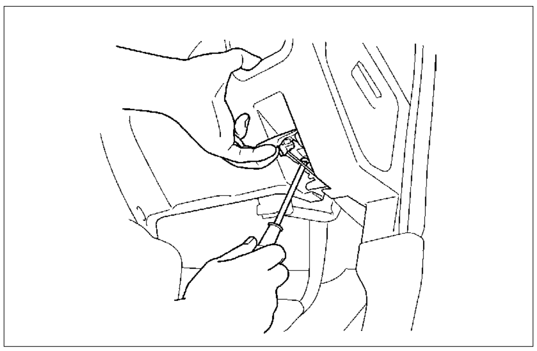
- Refer to Floor Consol in this section.



RTW6A0SH000101

2. Glove Box

- Remove 2 fixing screws and pull on the handle.



RTW6A0SH000201

3. Instrument Panel Driver Lower Cover Assembly

1) Remove the engine hood opener 2 fixing screws.
2) Remove the lower cover one fixing screw.
3) Pull out the cover (Stick type parking brake only).
4) Pull out the lower cover assembly.

4. Driver Knee Bolster Assembly

- Remove 4 fixing bolts.

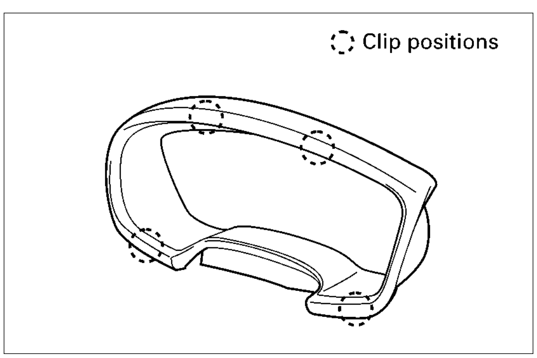
Caution:

For precautions on installation or removal of the SRS-air bag system, refer to section 9 “Supplemental Restraint System (SRS) - AIR BAG”

5. Driver Air Bag

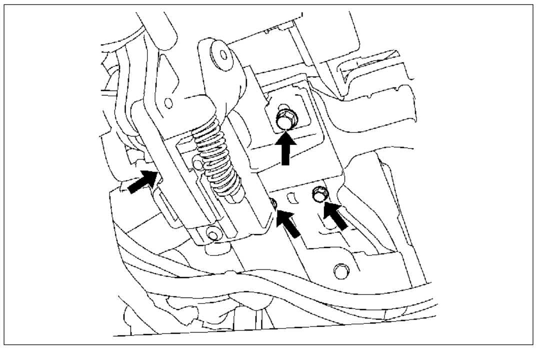
6. Steering Wheel/Steering Cowl

- Refer to Section 3B “STEERING COLUMN” for steering lock assembly removal steps.



7. Meter Cluster Assembly

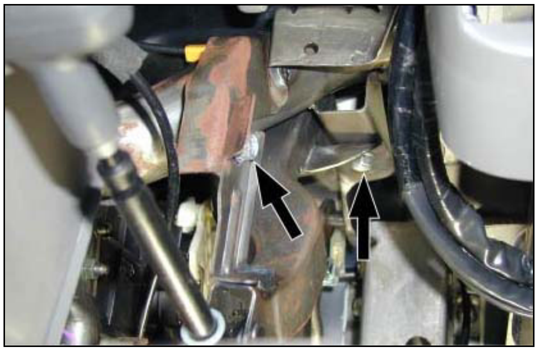
- Pull out the 4 clip positions.



RUW5A0SH002701

12.Instrument Panel Assembly & Cross Beam

1) Remove the two bolts fixing the steering column to the cross beam and the two bolts fixing the brake pedal bracket to the cross beam.

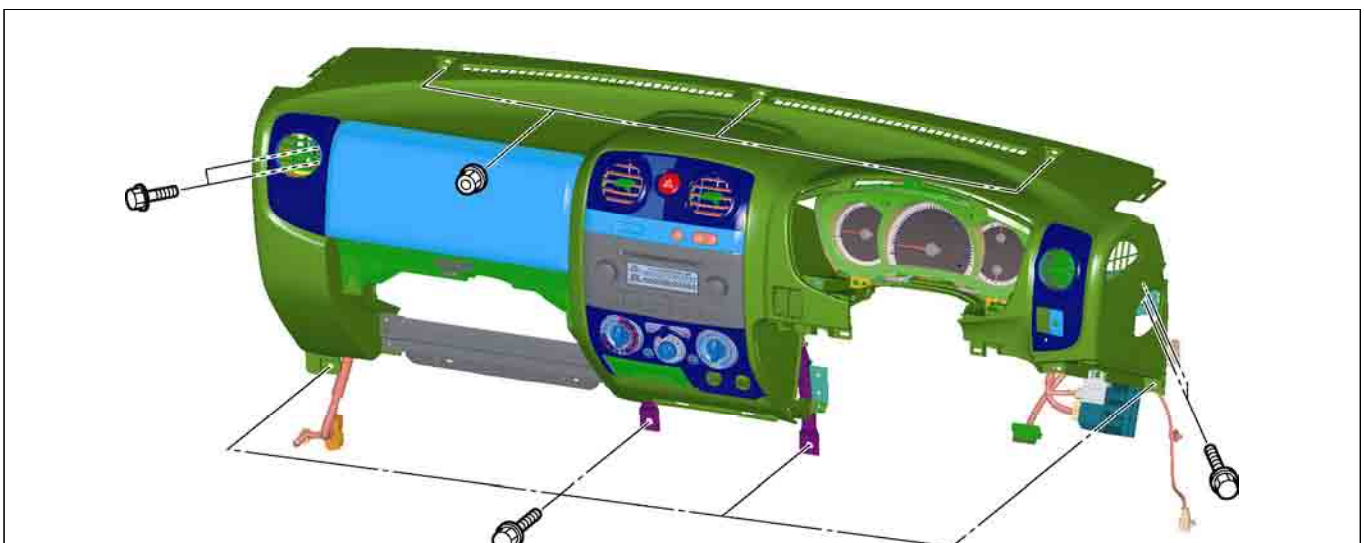


2) Remove the two bolts fixing the parking brake bracket to the cross beam (Stick type parking brake only).

3) Disconnect the control cables at the blower unit and vent unit.

4) Remove the fasteners fixing the instrument panel and cross beam assembly and the body panel.

5) Disconnect the instrument harness connectors.



This illustration is based on RHD model

RTW7A0SF000201

RTW7A0SH000301

13.Ashtray Case

- Pull out the ashtray case.

14.Center Cluster Assembly

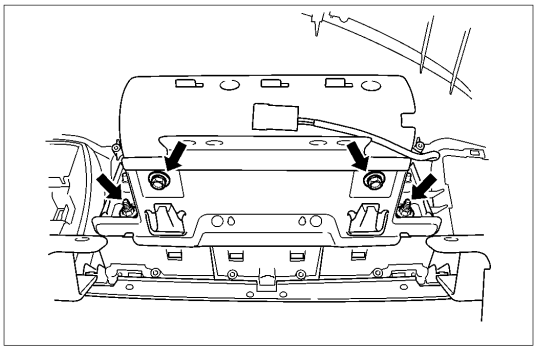
1) Pull out the cluster at the 8 clip positions.
2) Disconnect the cigarette lighter, accessory socket, hazard switch, clock and 4WD switch connectors.

16.Control Lever Assembly

- Remove the 2 fixing screws.

18.Ashtray Bracket

- Remove the 3 fixing screws and illumination connector.



RTW6A0SH000301

Caution:

For precautions on installation or removal of the SRS-air bag system, refer to section 9 "Supplemental Restraint System (SRS) - AIR BAG".

23.Passenger Air Bag

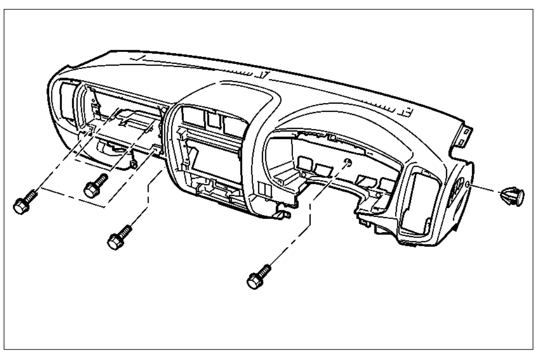
- Remove 2 fixing bolts, 2 fixing nuts and connector.

24.Side Ventilation Grille.

- Pull out the grilles and disconnect the switch connector (Driver’s side).

25.Vent Duct Assembly/Defroster Nozzle Assembly

- Refer to section 1 “HVAC” for the defroster nozzle and ventilation duct removal steps.



27.Instrument Panel Assembly

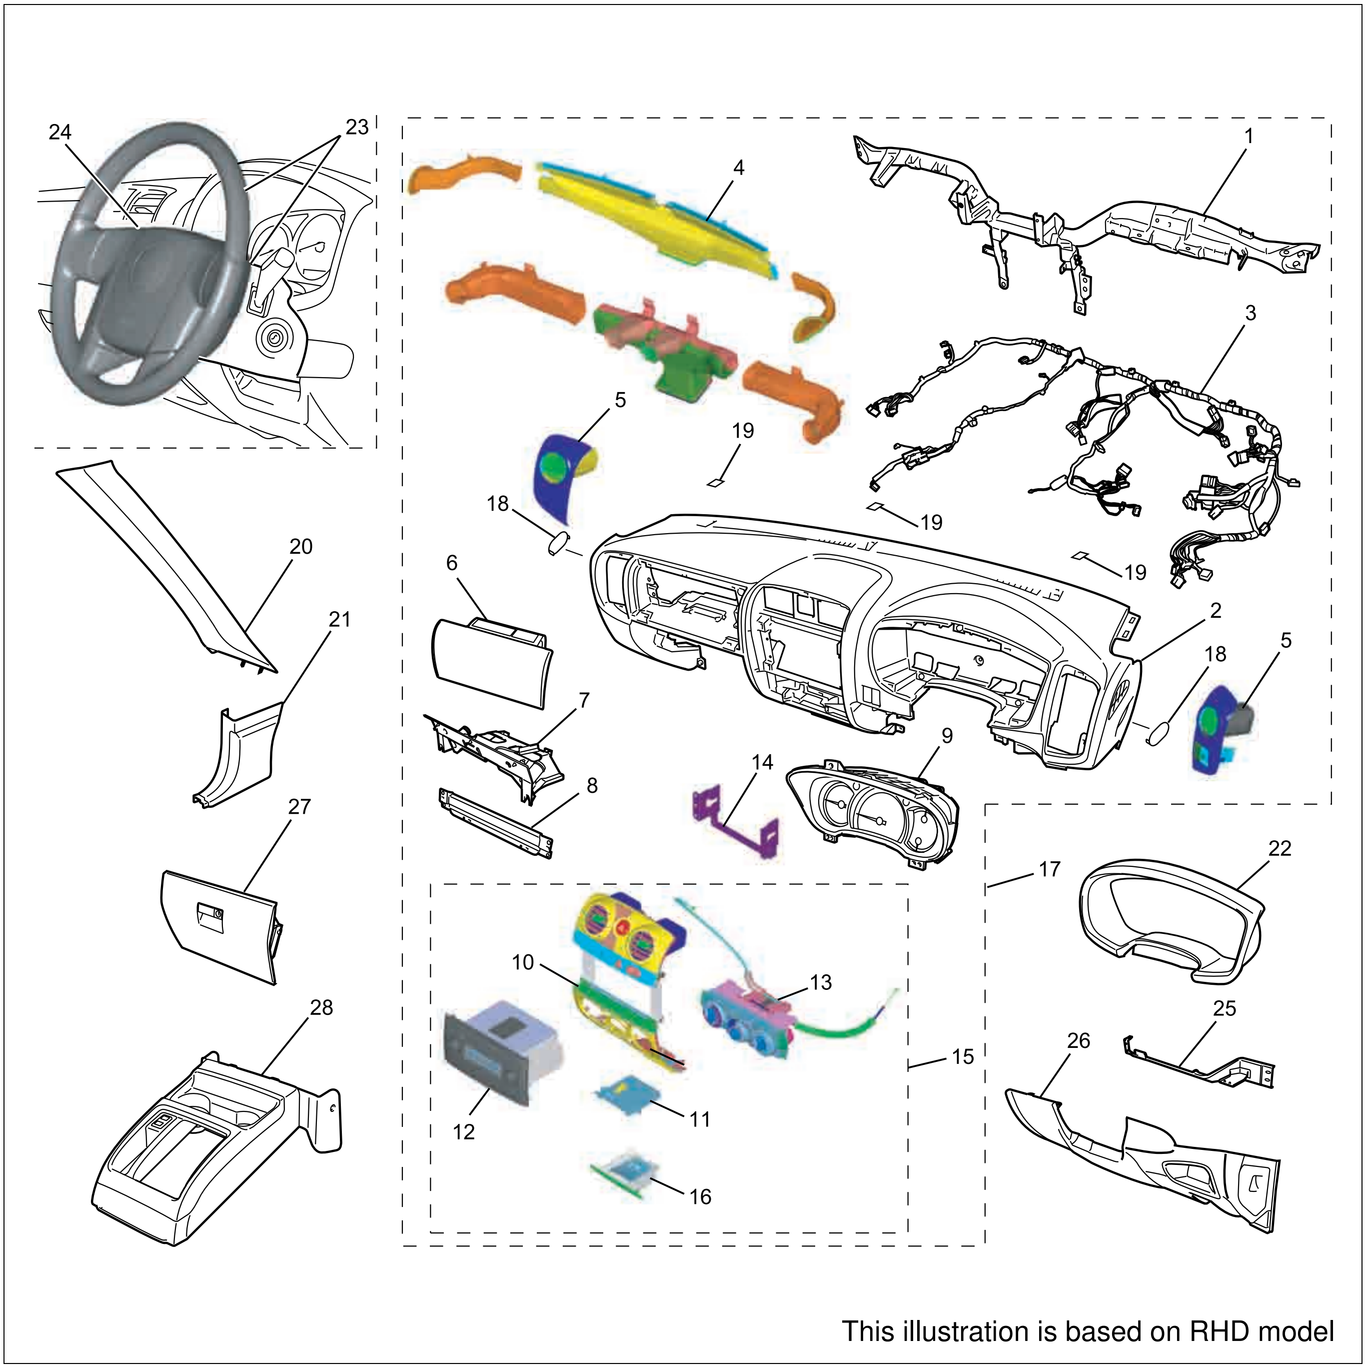
- Remove the clip and 6 fixing bolts.

SERVICE PRECAUTION

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU/GM will call out those fasteners that require a replacement after removal. ISUZU/GM will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

INSTALLATION



RTW7A0LF001401

Installation Steps

1. Cross beam
2. Instrument panel assembly
3. Instrument harness assembly
4. Vent duct assembly/Defroster nozzle assembly
5. Side ventilation grille
6. Passenger air bag
7. Glove box cover
8. Passenger lower bracket
9. Meter assembly

B Bolt: Pedal Bracket to Cross Beam

Torque	N·m (kgf·m/lb·ft)
15 (1.5/11)	

3) C Bolt: Parking Brake Bracket to Cross Beam

Torque	N·m (kgf·m/lb·ft)
15 (1.5/11)	

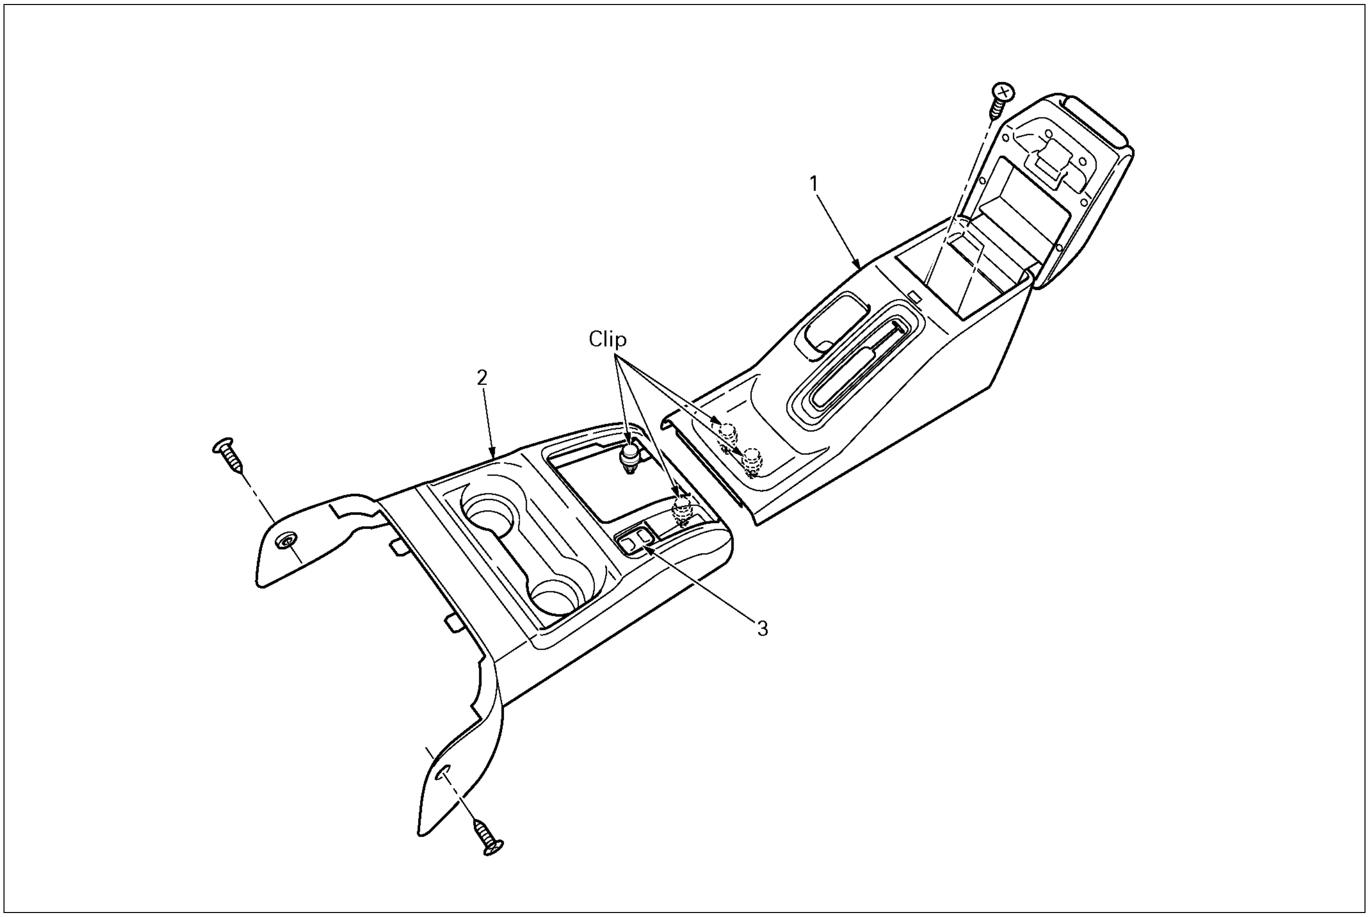
23.Steering Wheel/Steering Cowl

- Tighten the steering wheel fixing nut to the specified torque.

Torque	N·m (kgf·m/lb·ft)
34 (3.5/25)	

FLOOR CONSOLE

REMOVAL AND INSTALLATION



A/T Model

Removal Steps

▲ 1. Rear floor console (Bucket seat model only)
▲ 2. Front floor console
3. 3rd start switch

Installation Steps

3. 3rd start switch
2. Front floor console
1. Rear floor console (Bucket seat model only)

Important Operations - Removal

1. Rear Floor Console (Bucket Seat Model Only)

1) Open the rear console lid and remove 2 screws.

2) Pull out the front part of the rear console at the 2 clip positions.

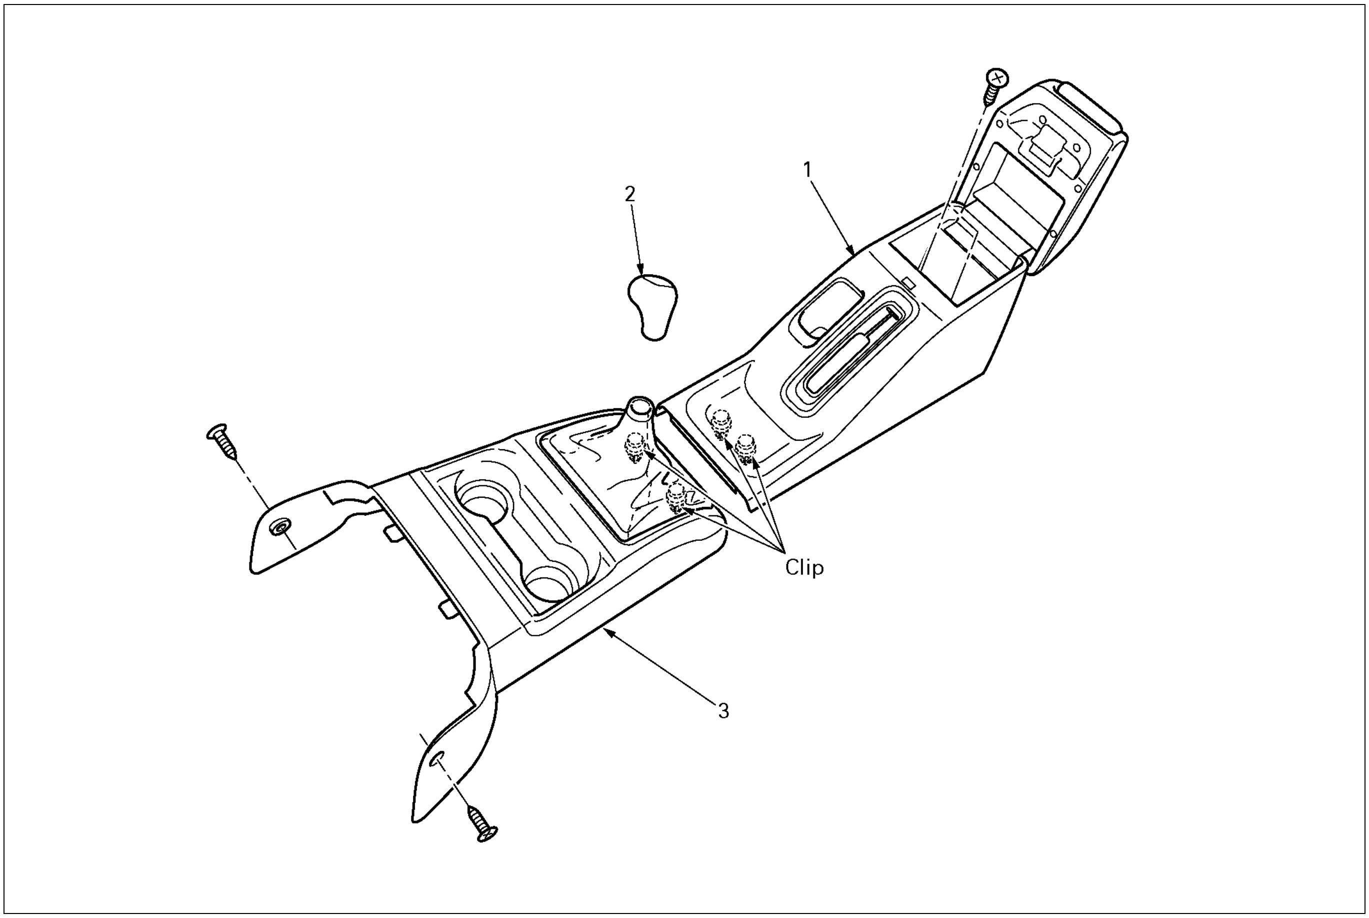
2. Front Floor Console

1) Remove the 2 screws.

2) Pull out the rear part of the front console at the 2 clip positions and disconnect the switch connecter.

3) Remove the front console by pull it out rear-ward.

REMOVAL AND INSTALLATION



M/T Model

Removal Steps

▲ 1. Rear floor console (Bucket seat model only)
2. Shift knob
▲ 3. Front floor console

Installation Steps

3. Front floor console
2. Shift knob
1. Rear floor console (Bucket seat model only)

Important Operations - Removal

1. Rear Floor Console (Bucket Seat Model Only)

1) Open the rear console lid and remove 2 screws.

2) Pull out the front part of the rear console at the 2 clip positions.

3. Front Floor Console

1) Remove the 2 screws.

2) Pull out the rear part of the front console at the 2 clip positions.

3) Remove the front console by pulling it out rear ward.

SHIFT ON THE FLY SYSTEM

Outline of Shift on The Fly System

The shift on the fly system switches between 2 wheel drive (2WD) and 4 wheel drive (4WD) electrically by driver's pressing the 4WD switch (push button type) on instrument panel.

This system controls below operations.

1. Shifting the transfer front output gear (Connecting to, and disconnecting from, front propeller shaft by motor actuator).
2. Retrial of shifting the transfer front output gear.
3. Connecting front wheels to, and disconnecting them from, the front axles by axle motor actuator.
4. Indicator on instrument panel.
5. 4WD out signal to other Electronic Hydraulic Control Unit.

System Diagrams

Installation Steps

8. Headlining
7. Dome light
6. Coat hook
5. Hole cover
4. Assist grip
3. Spot light/Over head console
2. Sun visor/Sun visor holder
1. Interior trim panels

Important Operations - Removal

1. Interior Trim Panels

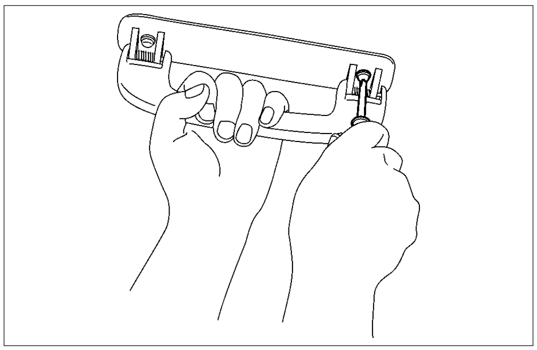
- Refer to Interior Trim Panels in this section.

2. Sun visor/Sun visor Holder

1) Remove the 2 screws fixing the sun visor.
2) Remove the screw fixing the sun visor holder.

3. Spot Light/Over Head Console

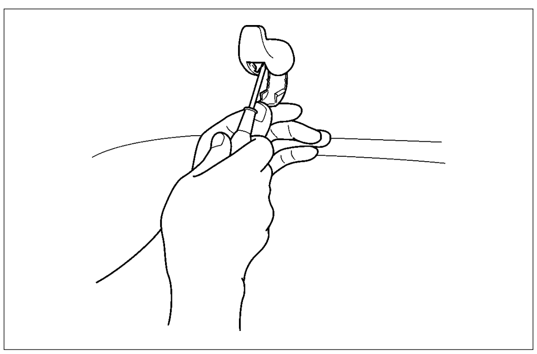
- Refer to section 8 Spot Light.
- Refer to section 8 Over Head Console.



RUW5A0SH003401

4. Assist Grip

- Remove the 2 fixing screws.



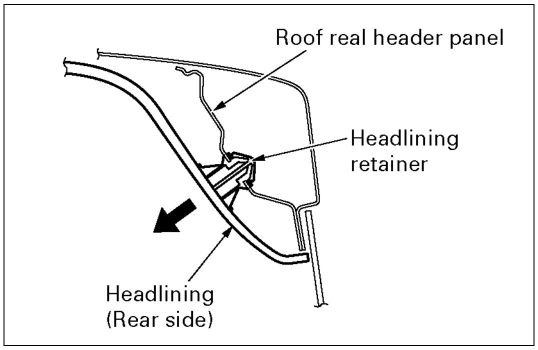
RUW5A0SH003501

6. Coat Hook

- Open the cover and remove the fixing screw.

7. Dome Light

- Refer to Section 8 Dome Light.



8. Headlining

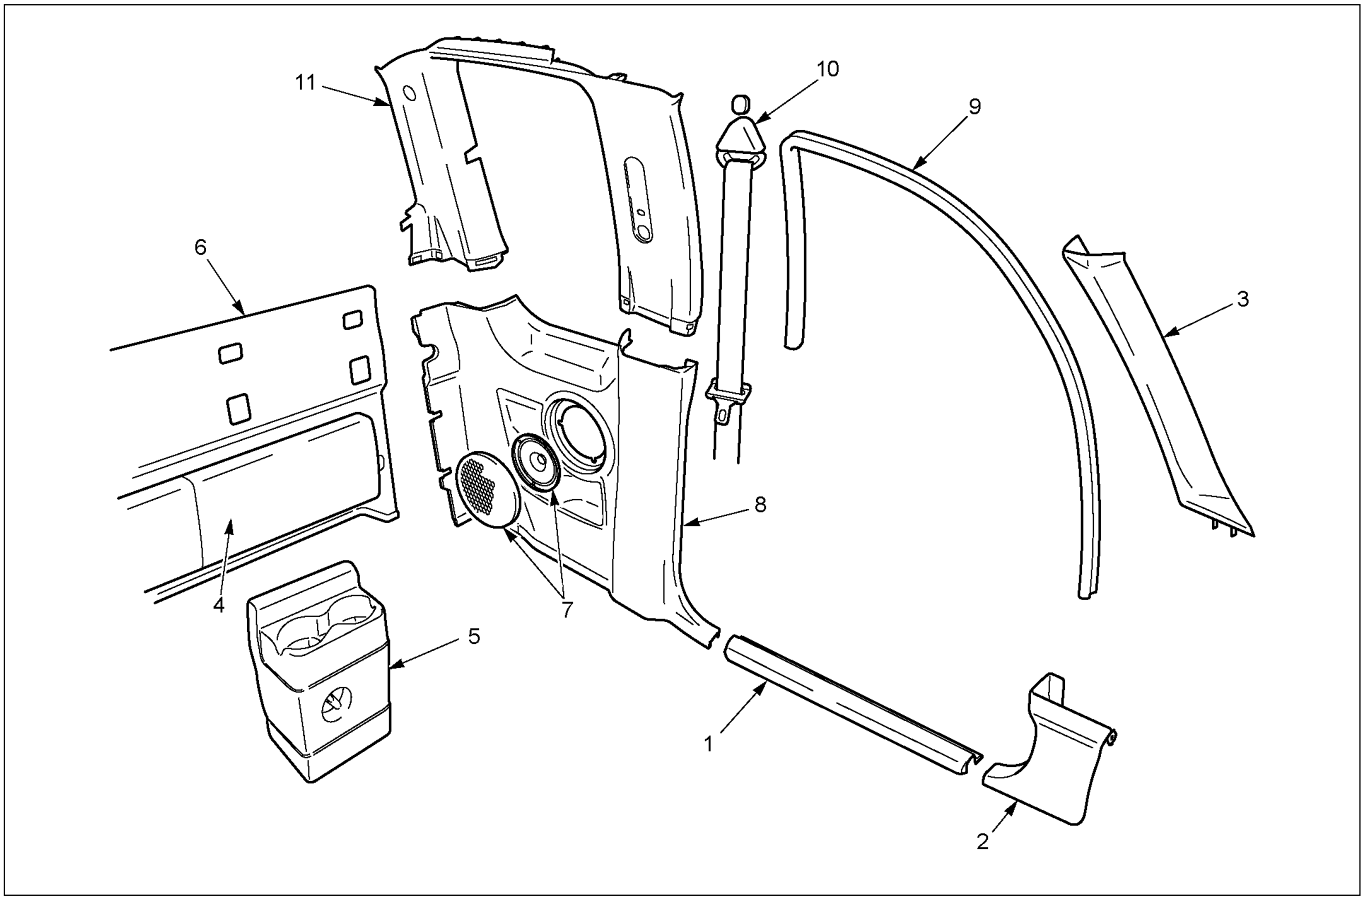
- Pull out the headlining with the retainer from the roof rear header panel in the direction shown in the illustration.

Note :

Removal steps (2-7) can be removed from the headlining in any order.

INTERIOR TRIM PANELS

REMOVAL AND INSTALLATION



RTW3A0MF001301

Extend Cab Model

Removal Steps

1. Sill plate
2. Dash side trim cover
3. ▲ Front pillar trim cover
4. ▲ Rear upper cushion
5. Jack cover
6. ▲ Rear end trim cover
7. ▲ Rear speaker grille/Rear speaker
8. ▲ Body side rear lower trim cover
9. Door finisher
10. ▲ Tongue side seat belt
11. ▲ Body side rear upper trim cover

Installation Steps

11. Body side rear upper trim cover
10. ▲ Tongue side seat belt
9. Door finisher
8. Body side rear lower trim cover
7. Rear speaker grille/Rear speaker
6. ▲ Rear end trim cover

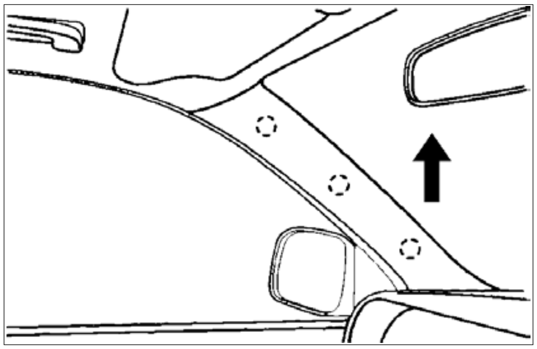
2. Dash side trim cover
1. Sill plate

Important Operations - Removal

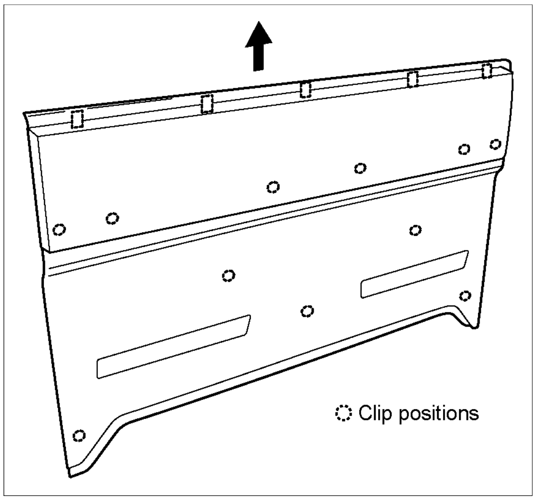


RTW710SH000501

3. Front Pillar Trim Cover

- Turn up the finisher and pry the trim cover clips free from the body panel.

  Remove the trim cover by pulling upward on the lower part of it.



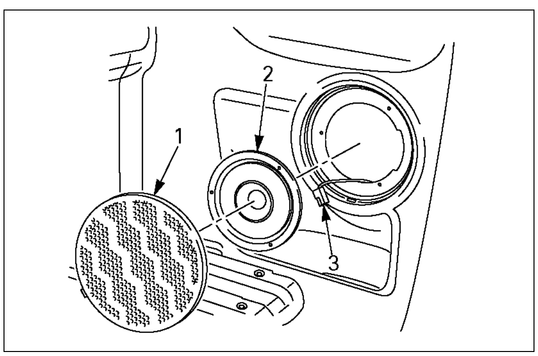
RTW5A0SH000601

4. Rear Upper Cushion

- Slide the upper cushion upward to remove it.

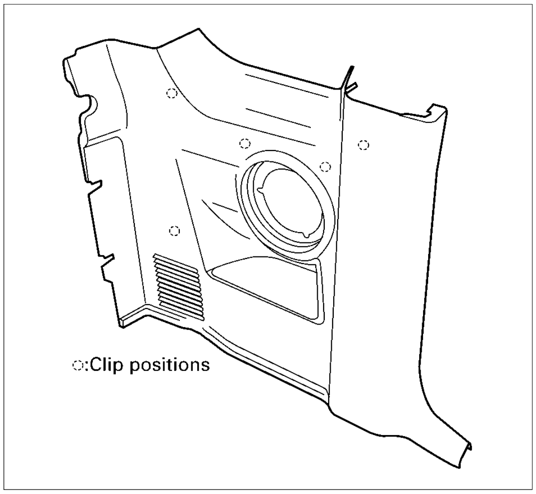
6. Rear End Trim Cover

- Pry the trim cover clips free from the body panel, and slide the trim cover upward to remove it.



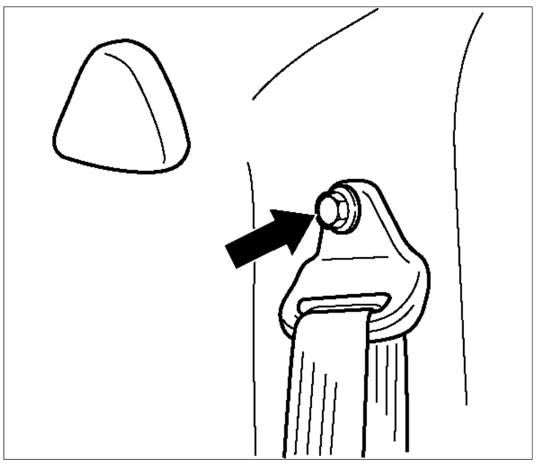
7. Rear Speaker Grille/Rear Speaker

1) Remove the rear speaker grille (1).
2) Remove the 3 screws fixing the rear speaker (2) and disconnect the connector (3).



8. Body Side Rear Lower Trim Cover

- Pry the trim cover clips free from the body panel.

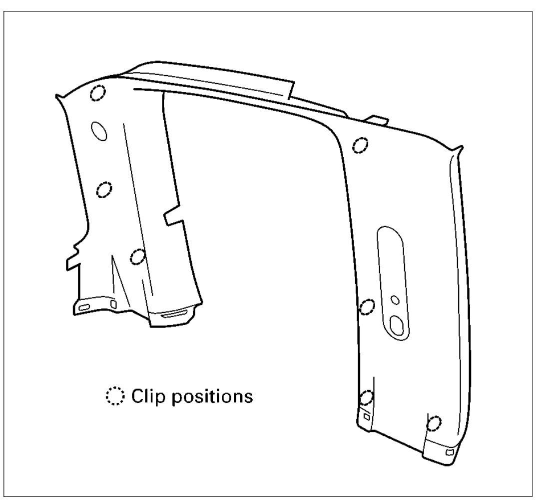


RTW5A0SH000501

10. Tongue Side Seat Belt

1) Pull out the adjuster knob.
2) Remove the through ring anchor cover and remove the seat belt upper anchor bolt.

- Insert the blade of an ordinary screwdriver into the gap between the D-ring back surface and the cover. Carefully pry the D-ring latches open. Remove the cover.



11. Body Side Rear Upper Trim Cover

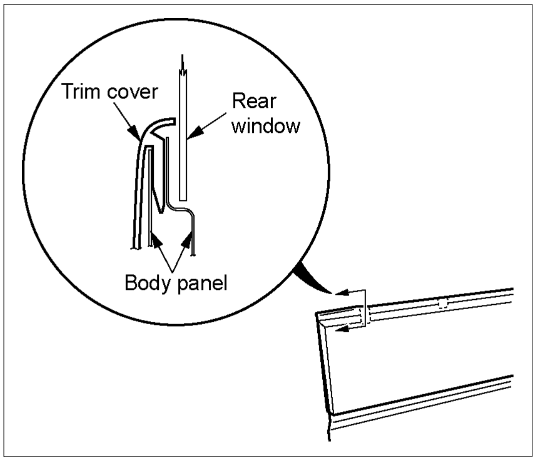
- Pry the trim cover clips free from the body panel.

Important Operations - Installation

10. Tongue Side Seat Belt

- Tighten the seat belt upper anchor bolt to the specified torque.

Torque	N·m (kgf·m/lb·ft)
40 (4.1/30)	



RTW5A0SH000701

6. Rear End Trim Cover

- Insert the hooks on the back upper portion of the trim cover to the body panel.

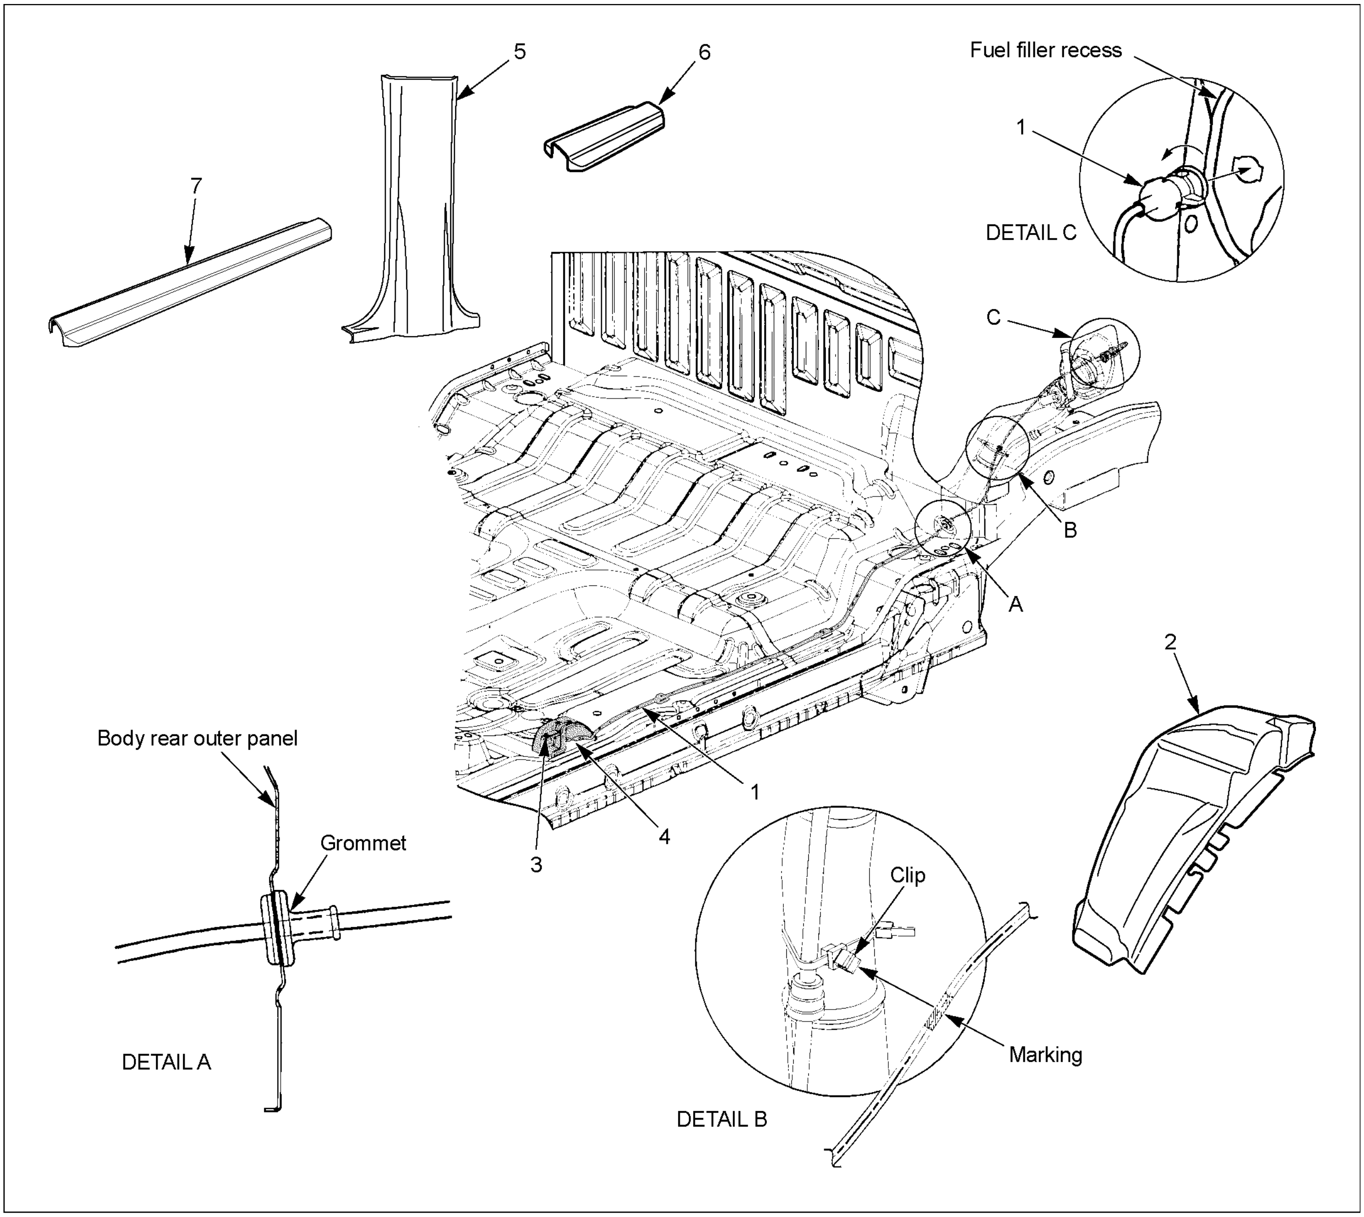
INSTALLATION (CREW CAB LHD MODEL)



Installation Steps

▲ 1. Fuel filler lid cable assembly
2. Rear wheel housing extension panel
3. Fuel filler lid opener lever
4. Fuel filler lid opener cover
5. Center pillar lower trim cover
6. Rear sill plate
7. Front sill plate

Important Operation - Installation

1. Fuel Filler Lid Cable Assembly

- Install the cable holder of the cable assembly to the recess and push the grommet in to the back panel. Fix the clips to the appointed places.

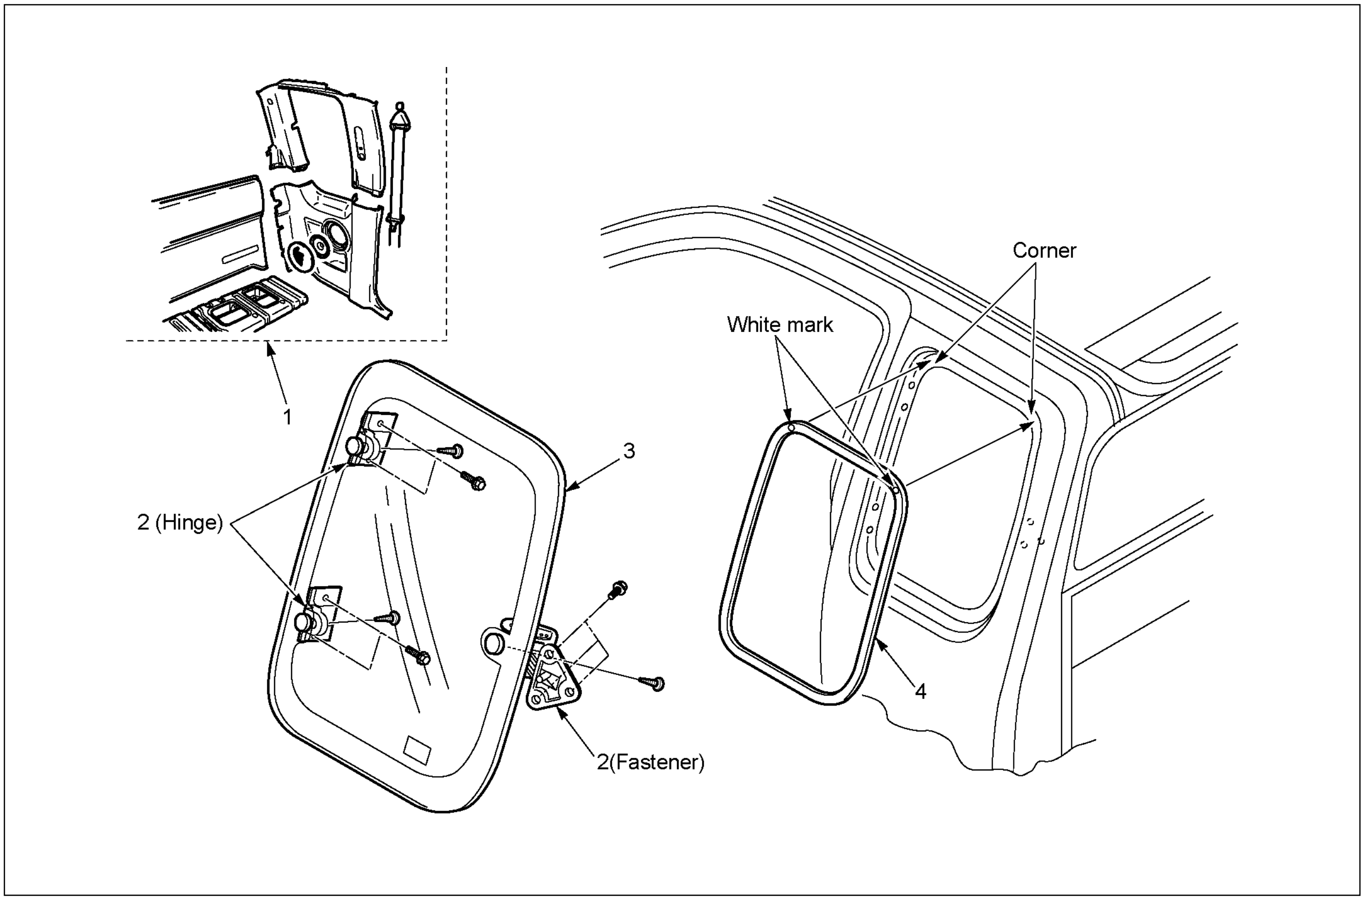
Note:

To install, follow the removal steps in the reverse order, noting the following points.

- **Do not make an extreme curve on the cable.**
- **Install the cable from inside the cab.**

QUARTER GLASS (EXTEND CAB)

REMOVAL AND INSTALLATION



RTW5A0MF000501

Removal Steps

▲ 1. Body side rear trim covers
2. Hinge/Fastener
3. Quarter glass
4. Weather strip

Installation Steps

▲ 4. Weather strip
3. Quarter glass
2. Hinge/Fastener
1. Body side rear trim covers

Important Operation - Removal

1. Body Side Rear Trim Covers

- Refer to Interior Trim Panels in this section.

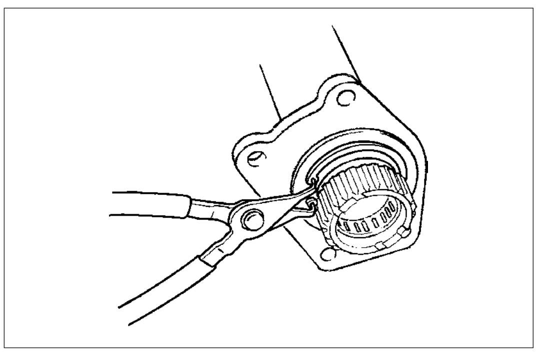
Important Operation – Installation

4. Weather Strip

- Install the weather strip by aligning the corners with a white mark to the upper corners on the body panel.

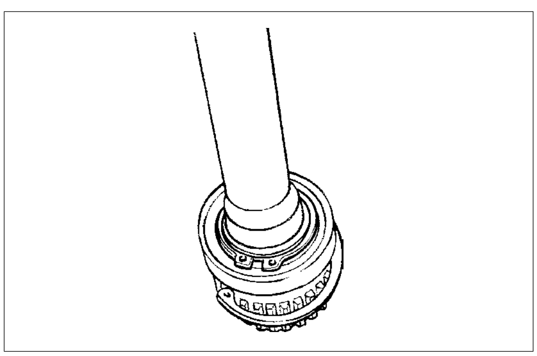
Disassembly

1. **Filler Plug**
   Remove filler plug and packing and drain oil.
2. **Bolt**
   Loosen mounting bracket fitting bolts and remove front axle drive shaft from front axle case.
3. **Front Axle Drive Shaft (LH side)**
4. **Bolt**
   Loosen actuator ASM fitting bolts.
5. **Actuator Assembly**
   Draw out actuator ASM.
6. **Bolt**
   Remove hosing fitting bolts.
7. **Housing**
8. **Sleeve**
9. **Clutch Gear**
10. **Snap Ring**
    Remove snap ring from front axle case by using a snap ring pliers.

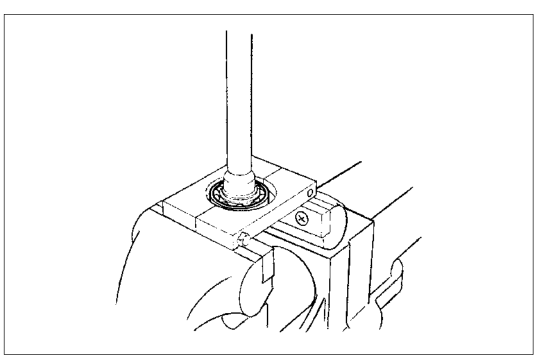


412RW017

11. **Inner Shaft**
    Take out inner shaft from front axle case.
12. **Snap Ring**
    Remove snap ring from inner shaft by using a snap ring pliers.



412RW016



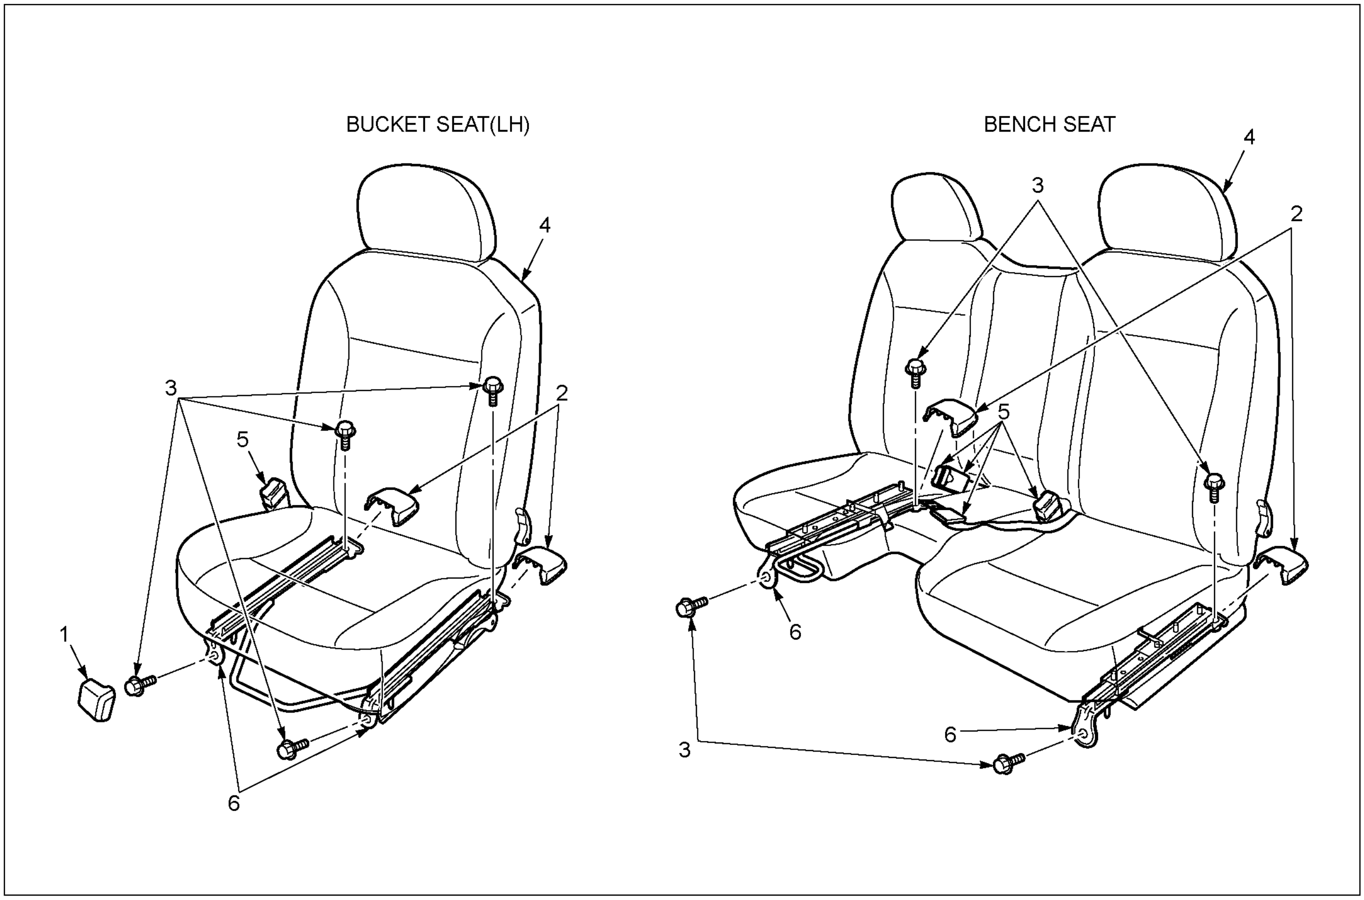
412RW015

13. **Inner Shaft Bearing**
    Remove inner shaft bearing by using a special tool and press.
    Remover : 5-8840-2197-0

NOTE:
Be careful not to damage the shaft.

FRONT SEAT

REMOVAL AND INSTALLATION



Removal Steps

- ▲ 1. Front cover
- 2. Rear cover
- 3. Bolt
- ▲ 4. Seat assembly
- ▲ 5. Buckle side seat belt/center seat belt
- 6. Seat adjuster

Installation Steps

- 6. Seat adjuster
- ▲ 5. Buckle side seat belt/center seat belt
- 4. Seat assembly
- ▲ 3. Bolt
- 2. Rear cover
- 1. Front cover

Important Operations - Removal

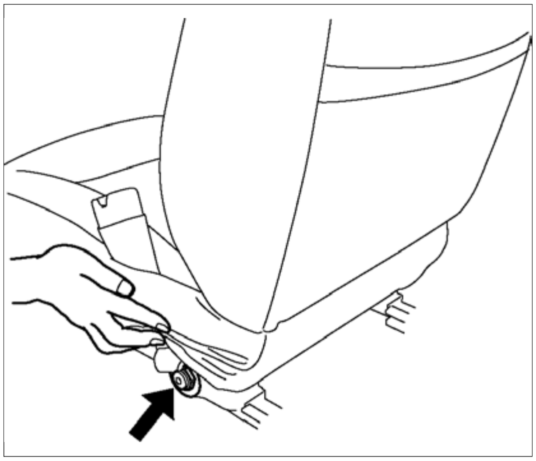
1. Front Cover

- While pushing the cover downward, pull it.

4. Seat Assembly

- Disconnect the seat belt warning harness connector (Driver's side only).

5. Buckle Side Seat Belt/Center Seat Belt



RUW7A0SH000201

- Remove the seat belt fixing screw and the warning harness connector clip (Bucket seat model).

- Remove the seat belt fixing screws and the warning harness connector clip (Bench seat model).

Important Operations – Installation

5. Buckle Side Seat Belt/Center Seat Belt

- Tighten the seat belt fixing screws to the specified torque.

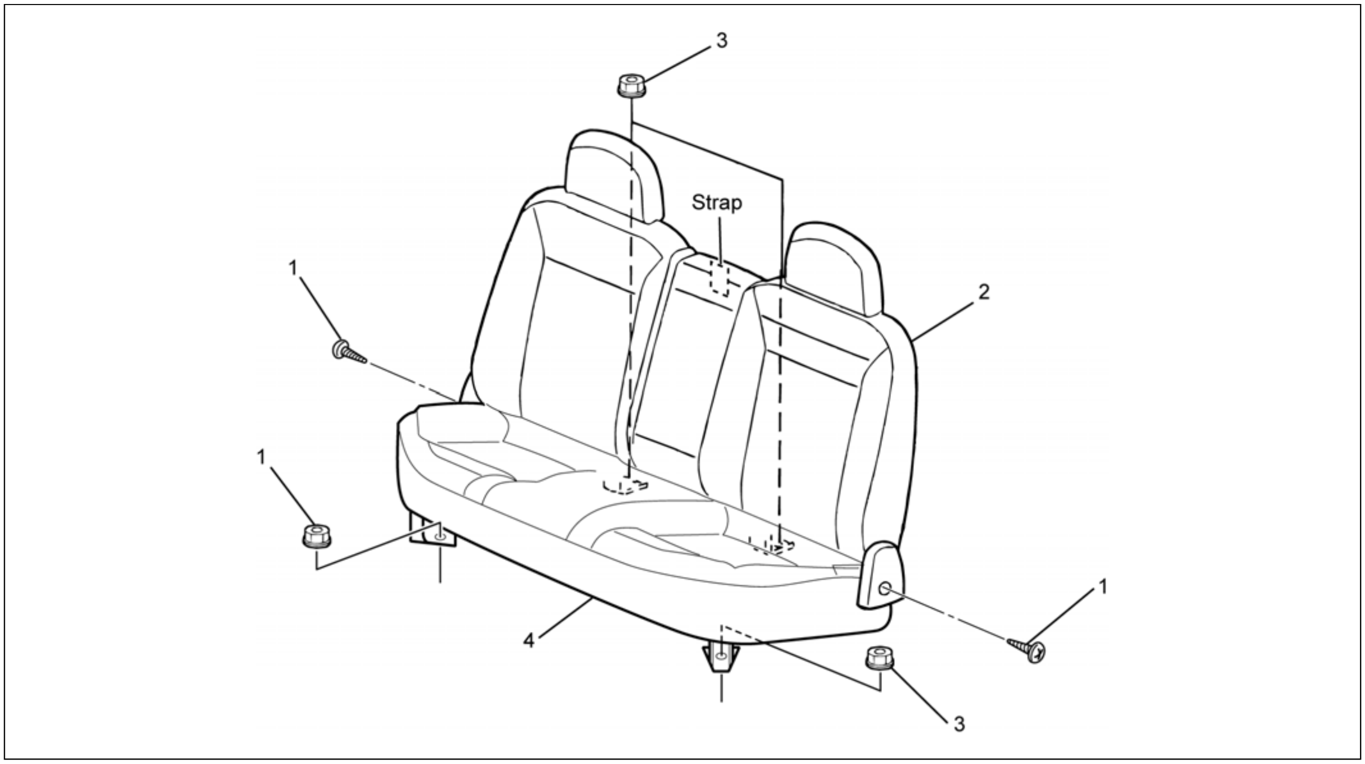
Torque	N·m (kgf·m/lb·ft)
40 (4.1 / 30)	

3. Bolt: Seat Assembly to Floor Panel

Torque	N·m (kgf·m/lb·ft)
40 (4.1 / 30)	

REAR SEAT (CREW CAB)

REMOVAL AND INSTALLATION



RTW7A0MF000801

Removal Steps

1. Screw
2. ▲ Rear seat back
3. Nut
4. Rear seat cushion

Installation Steps

4. Rear seat cushion
3. ▲ Nut
2. ▲ Rear seat back
1. Screw

Important Operation - Removal

2. Rear Seat Back

- Pull the strap in trim cover to release the seat back from the rear panel.

Important Operations - Installation

3. Nut

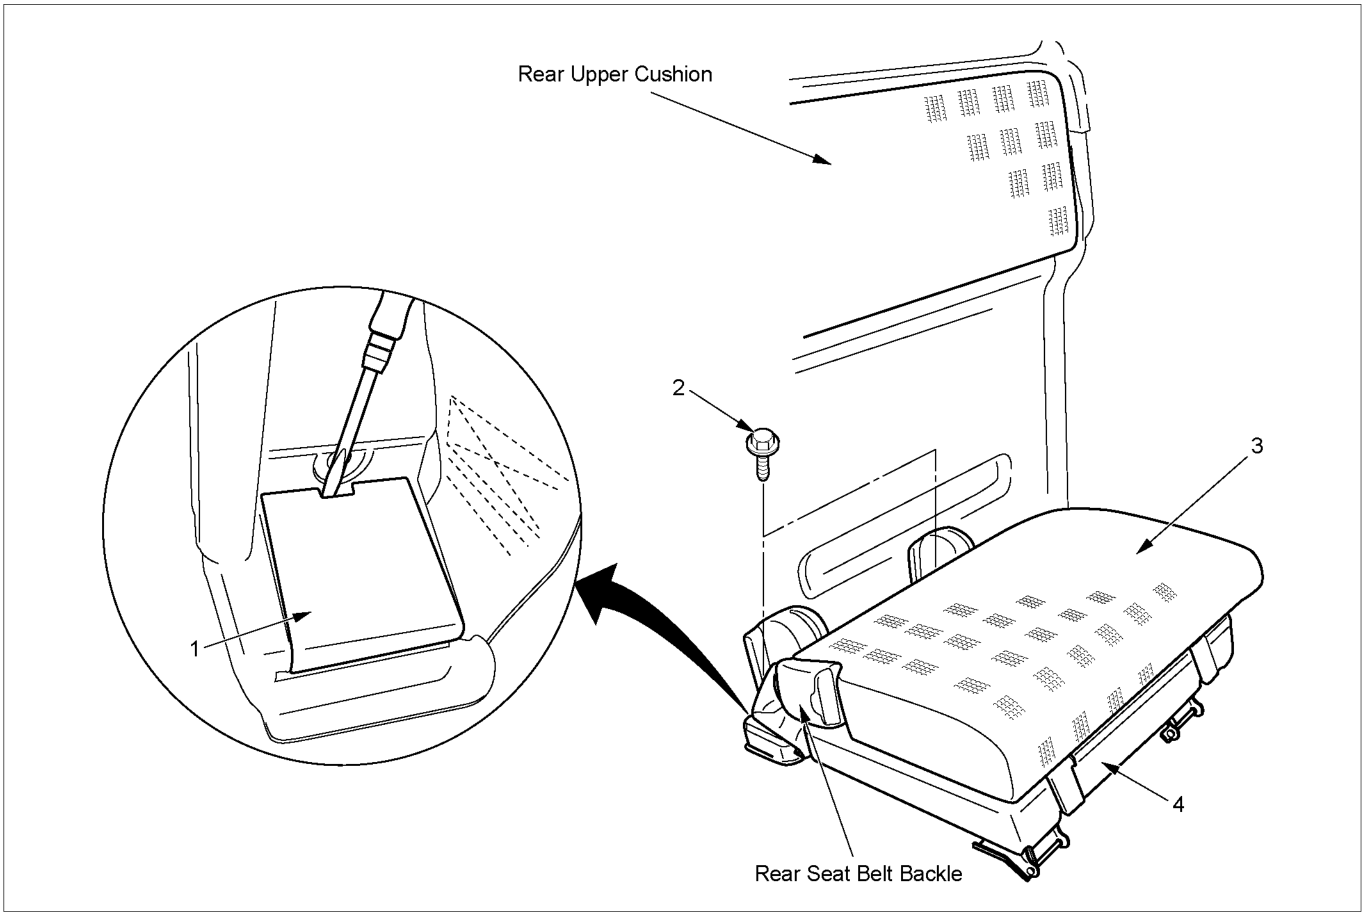
Torque	N·m (kgf·m/lb·ft)
40 (4.1 / 30)	

2. Rear Seat Back

- Lock the seat back to the rear panel and insert the strap into the trim cover.

JUMP SEAT (EXTEND CAB)

REMOVAL AND INSTALLATION



RTW3A0MF001201

412RS045

14.Needle Bearing

Remove needle bearing from inner shaft by using a special tool.

Remover : 5-8840-0027-0

Sliding hammer : 5-8840-0084-0

NOTE:

Be careful not to damage the shaft.

15.Oil Seal

Remove oil seal from front axle case.

NOTE:

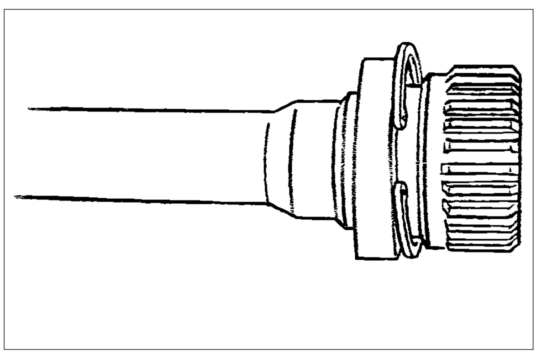
Be careful not to damage the front axle case.

Inspection and Repair

Inspect the removed parts. If there are abnormalities such as wear and damage, take corrective action or replace.

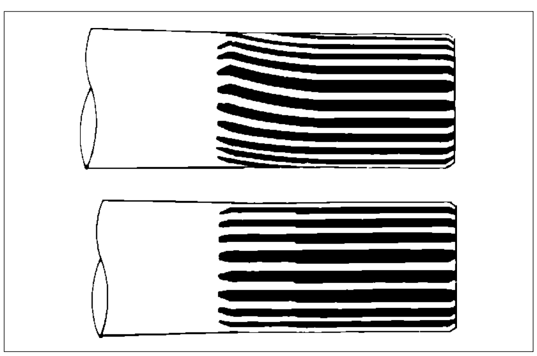
Visual Check

- Check and see if the inner shaft has such abnormalities as wear and damage.



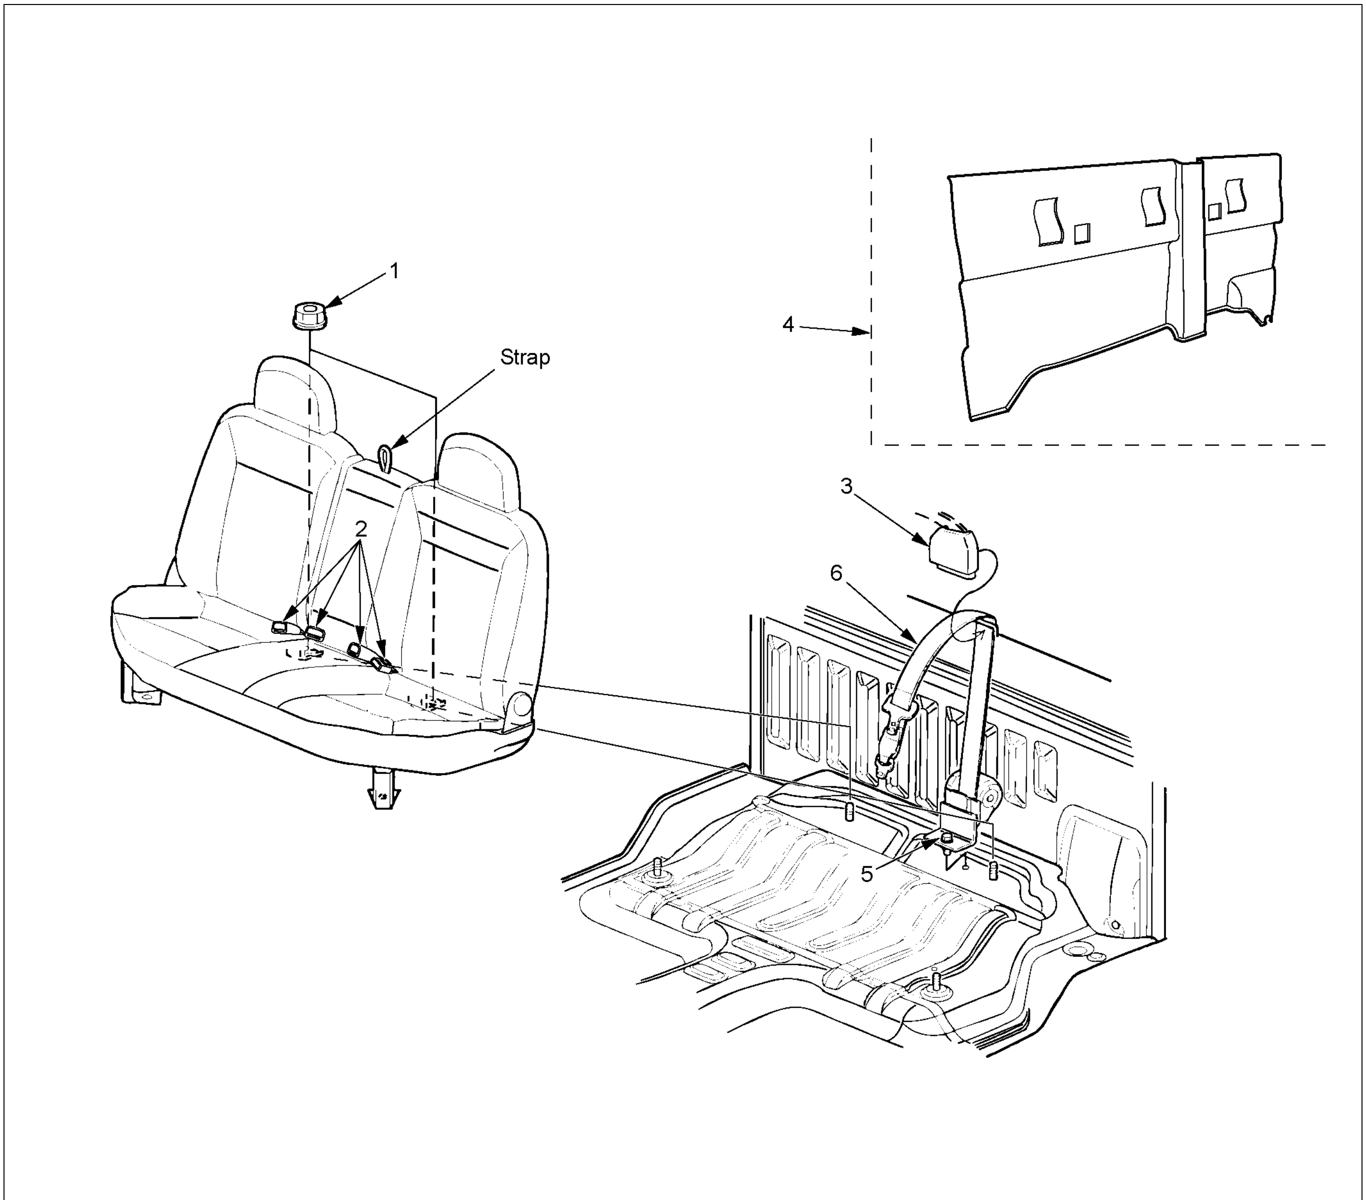
412RW014

- When inspecting the inner shaft, be sure to check and see if its splined part is twisted, worn, or cracked. If so, replace with a new shaft. In case such an abnormality in its gear part (a slide with sleeve), replace the shaft.



412RS008

REMOVAL AND INSTALLATION (REAR CENTER SEAT BELT/REAR SEAT BELT BACKLE)



RTW3A0LF000901

Removal Steps

1. Nut
2. Rear seat belt buckle

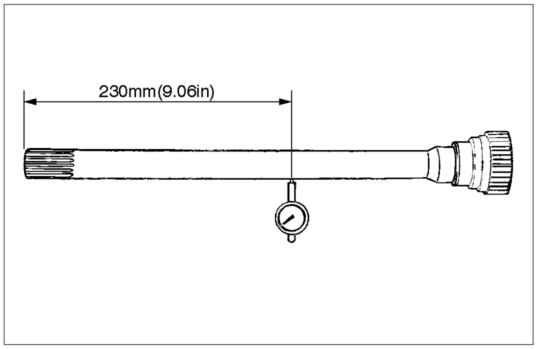
6. ▲ Tail gate hinge
5. ▲ Tail gate
4. Tail gate link
3. ▲ Tail gate lock assembly
2. ▲ Outside handle assembly
1. Hole cover plate



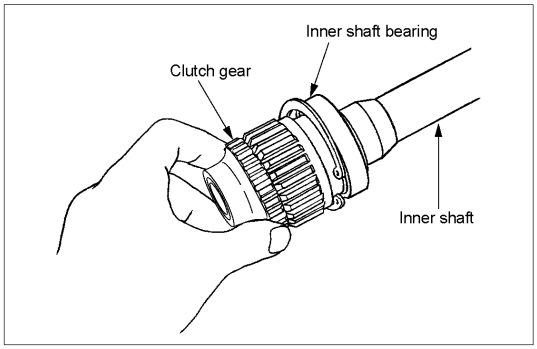
412RS026

Inner Shaft Run-Out

With both end centers supported, rotate the shaft slowly and measure deflection with a dial gauge.

Inner Shaft Run-Out (Limit) mm (in)
0.5 (0.02)

NOTE:
Do not heat the shaft to correct its bend.



RTW440SH000101

Inner Shaft Bearing

Inspect the state of inner shaft bearing. If any abnormality such as smooth less is found, replace with a new inner shaft bearing.

Insert a clutch gear and check the state of needle bearing.

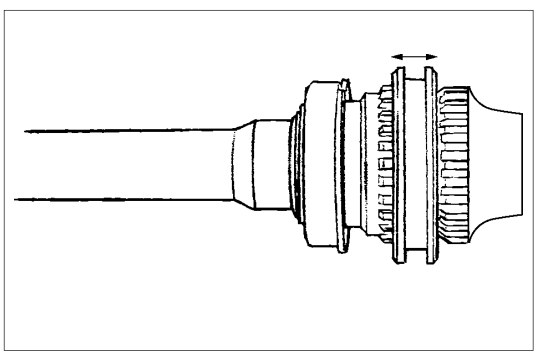
If there is an abnormality such as smooth less, replace the needle bearing.

Sleeve

Visual Check

Check and see that there is not wear, damage, or checking in the sleeve.

NOTE:
Close inspection of the groove and inner gear are required because those are important parts.



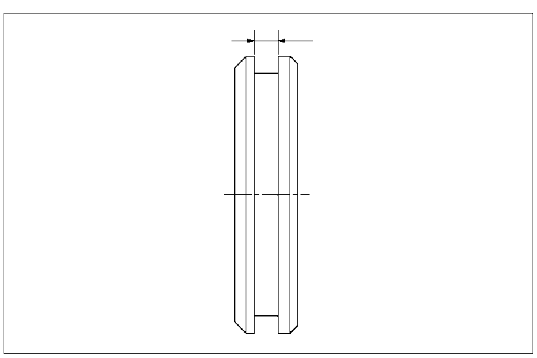
412RW011

Functional Check

Operate the sleeve with the inner shaft combined with the clutch gear.

If smooth less is felt, replace the sleeve.

NOTE:
Gear oil should be applied to the contact surface of gear.

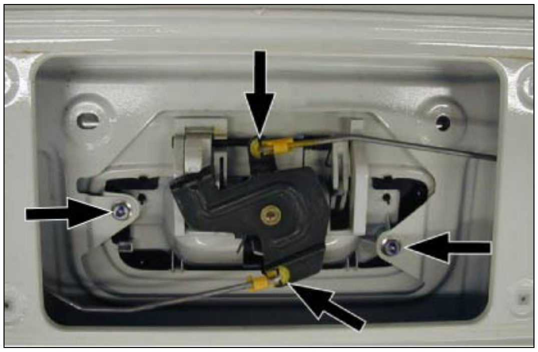


412RW022

Dimensional Check

Check the width of sleeve center groove.

Sleeve Center Groove (Limit) mm (in)
7.1 (0.28)



Important Operations - Removal

2. Outside handle assembly

- Disconnect the lock link and remove the 2 fixing bolts.

5. Tail Gate

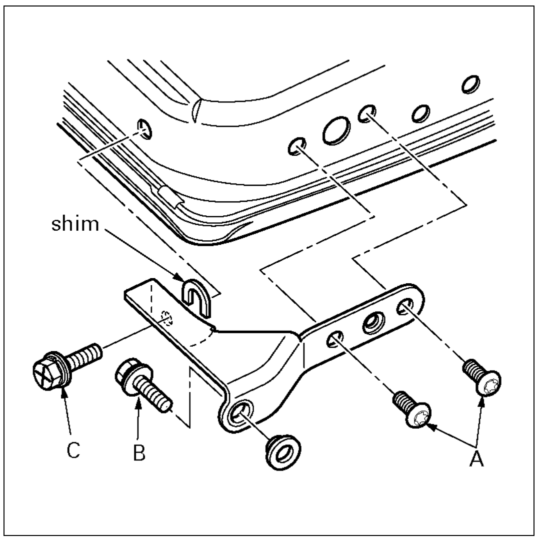
1) Removing the tailgate assembly may require two people.
2) Remove the tailgate hinge fixing bolts.

Important Operations - Installation

7. Tail Gate Lock Striker

- Tighten the lock striker fixing bolts to the specified torque.

Torque	N·m(kgf·m/lb·ft)
15 (1.5 / 11)	



6. Tail Gate Hinge

- Tighten the hinge fixing bolts to the specified torque.

Diagnostic Information and Procedures

Diagnostic Starting Point - Immobilizer Controls

Begin the system diagnosis with Diagnostic System Check - Immobilizer Controls. The Diagnostic System Check - Immobilizer Controls will provide the following information:

- The identification of the control modules which command the system.
- The ability of the control modules to communicate through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTCs) and the their statuses.

The use of the Diagnostic System Check - Immobilizer Controls will identify the correct procedure for diagnosing the system and where the procedure is located.

Diagnostic System Check - Immobilizer Controls

Description

The Diagnostic System Check - Immobilizer Controls is an organized approach to identifying a condition that is created by a malfunction in the electronic immobilizer control system. The Diagnostic System Check must be the starting point for any immobilizer system concern. The Diagnostic System Check directs the service technician to the next logical step in order to diagnose the concern. Understanding and correctly using the diagnostic table reduces diagnostic time, and prevents the replacement of good parts.

Test Description

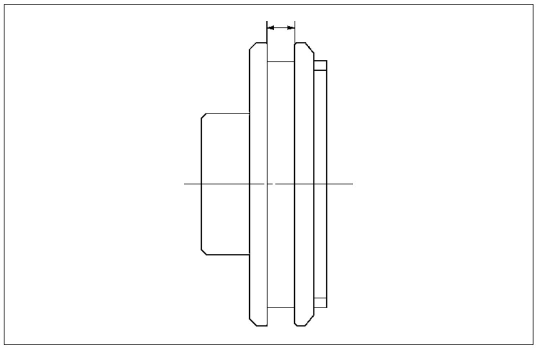
The numbers below refer to the step numbers on the diagnostic table.
2. Lack of communication may be because of a partial or a total malfunction of the serial data circuit.
6. The presence of DTCs which begin with U, indicate that some other module is not communicating.
9. If there are other modules with DTCs set, refer to the DTC list. The DTC list directs you to the appropriate diagnostic procedure.

Important:

- DO NOT perform this diagnostic if there is not an immobilizer system concern, unless another procedure directs you to this diagnostic.
- Before you proceed with diagnosis, search for applicable service bulletins.
- Unless a diagnostic procedure instructs you, DO NOT clear the DTCs.
- Ensure the battery has a full charge.
- Ensure the battery cables (+) (-) are clean and tight.
- Ensure the ICU ground is clean, tight, and in the correct location.
- Ensure the ICU harness connector is clean and correctly connected.
- Ensure the ICU terminals are clean and correctly mating.
- Ensure the immobilizer security information is correctly programmed into the ICU, ECM and PIM.
- Ensure the ICU is correctly installed to the steering lock.
- Ensure objects does not block transponder key in the steering lock.
- Ensure another transponder key is not attached to the key ring.

Diagnostic System Check - Immobilizer Controls

Step	Action	Value(s)	Yes	No
1	Install a scan tool. Does the scan tool turn ON?	—	Go to Step 2	Go to Scan Tool Does Not Power Up
2	1. Turn ON the ignition, with the engine OFF. 2. Attempt to establish communication with the listed control modules. • ICU • Engine control module (ECM) • Powertrain interface module (PIM) • Transmission control module (TCM) (AISIN A/T or 4L-60E) Does the scan tool communicate with all the listed control modules?	—	Go to Step 3	Go to Scan Tool Does Not Communicate with CAN Device



RTW440SH000201

Clutch Gear

Visual Check

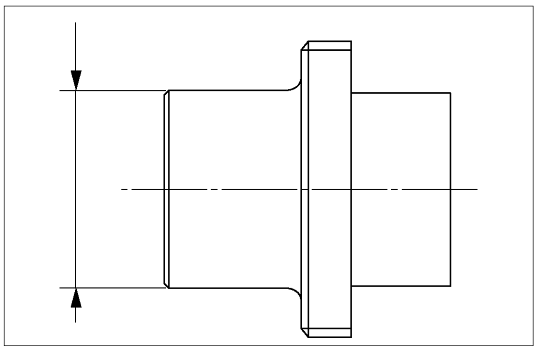
Check and see the there is not wear, damage, crack, or any other abnormality in the clutch gear.

Functional Check

If there is an abnormality such as smooth less when operated in combination with sleeve, replace the clutch gear.

NOTE:

When inspection, gear oil should be applied to the contact surface of gear.



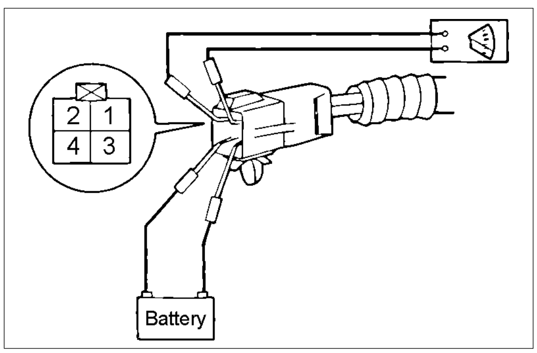
RTW440SH000301

Dimensional Check

Make sure of the size illustrated.

Clutch Gear Out Side Diameter (Limit) mm (in)

36.98 (1.46)



RTW440SH000501

Actuator

Visual Check

Check and see that there is no damage, cracking, or other abnormality.

Functional Check

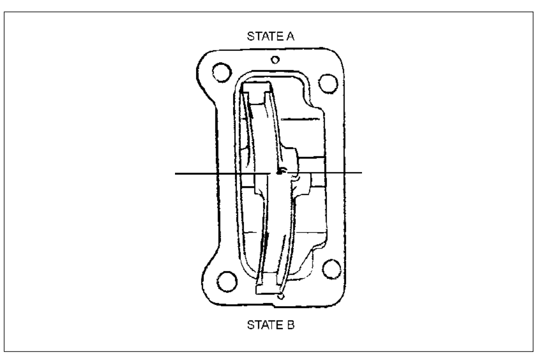
Make sure of function with voltage (12V) applied to terminal ③, ④ and set the tester to terminal ①, ② in accordance with the table below.

State	Port ③	Port ④	Port ①, ② Conducting	Function
A	+	–	○	C
B	–	+	×	D

If there is an abnormality, replace the actuator as an assembly.

NOTE:

Be careful not to permit the entry of water or dust into the ports of the actuator.
Do not open the actuator cover, if the actuator will be reused.



RTW440SH000401

Step	Action	Value(s)	Yes	No
3	Observe the Ignition Status parameter on the immobilizer data display function. Does the scan tool indicate ON and OFF with each ignition switch transition?	—	Go to Step 5	Go to Step 4
4	Repair the open circuit or high resistance between the Meter (10A) fuse and the ICU (pin 9 of B-109). Check Meter (10A) fuse first. Did you complete the repair?	—	Go to Step 5	—
5	Select the DTC display function for the following control modules: • ICU • ECM • PIM • TCM (AISIN A/T or 4L-60E) Does the scan tool display any DTCs?	—	Go to Step 6	Go to Step 12
6	Does the scan tool display DTCs which begin with a U or other control module communication fault DTCs?	—	Go to Applicable DTC	Go to Step 7
7	Does the scan tool displays ICU DTC B0001?	—	Go to Applicable DTC	Go to Step 8
8	Does the scan tool displays ICU DTCs B0002 or B0012?	—	Go to Applicable DTC	Go to Step 9
9	Is there any other code in any controller that has not been diagnosed?	—	Go to Applicable DTC	Go to Step 10
10	Is the customer's concern with the engine?	—	Go to Diagnostic System Check - Engine Controls	Go to Step 11
11	Is the customer's concern with the transmission?	—	Go to Diagnostic System Check - Transmission Controls	Go to Step 12
12	Attempt to crank the engine. Does the engine crank?	—	Go to Step 13	Problem is relating to starting system. Refer to the applicable diagnostic chart in starting system section
13	Attempt to start the engine. Does the engine start and idle?	—	System OK	Go to Engine Cranks but Does Not Run in engine control section

Scan Tool Data List

The Immobilizer Scan Tool Data List contains all immobilizer related parameters that are available on the scan tool. Use the Immobilizer Scan Tool Data List only after the following is determined:

- The Immobilizer Controls - Diagnostic System Check is completed.
- On-board diagnostics are functioning properly.

A scan tool that displays faulty data should not be used. Use of a faulty scan tool can result in misdiagnosis and unnecessary parts replacement.

Only the parameters listed below are referenced in this service manual for use in diagnosis.

Scan Tool Parameter	Units Displayed	Typical Data Value
Operating Conditions: Ignition switch ON/ Two transponder keys programmed		
Ignition Status	On/ Off	On
Transponder Key	Transponder Key 1 to 5/ Invalid/ Not Programmed Key/ No Transponder Key	Transponder Key 1 or 2
Transponder Status	Correct Transponder-Key/ Wrong Transponder-Key/ New Transponder-Key/ No Transponder Detected	Correct Transponder-Key
Transponder-Key 1 Status	Programmed/ Not Programmed	Programmed
Transponder-Key 2 Status	Programmed/ Not Programmed	Programmed
Transponder-Key 3 Status	Programmed/ Not Programmed	Not Programmed
Transponder-Key 4 Status	Programmed/ Not Programmed	Not Programmed
Transponder-Key 5 Status	Programmed/ Not Programmed	Not Programmed
Security Code Programmed	Yes/ No	Yes
Security Wait Time	Inactive/ Time (hour: minute: second)	Inactive
While Security Lock	Inactive/ Active	Inactive

Scan Tool Data Definitions

This information will assist in immobilizer problems. Always perform the Diagnostic System Check - Immobilizer Controls first. The Diagnostic System Check will confirm proper system operation.

Ignition Status
This parameter displays the state of the ignition switch input to the ICU. On indicates the ignition switch is turned ON position.

Transponder Key
This parameter displays the state of the transponder key in the steering lock. Transponder Key 1 to 5 indicates a correctly programmed transponder key is used. The number 1 to 5 indicates which transponder key is used. Invalid indicates an incorrect key is in used. Not Programmed Key indicates a non-programmed new transponder key is used. No Transponder Key indicates ICU does not recognize a transponder key.

Transponder Status
This parameter displays the state of the transponder key in the steering lock. Correct Transponder-Key indicates a correctly programmed transponder key is used. Wrong Transponder-Key indicates an incorrect key is in used. New Transponder-Key indicates a non-programmed new transponder key is used. No Transponder Detected indicates ICU does not recognize a transponder key.

Transponder-Key 1 to 5 Status
This parameter displays the state of number of programmed transponder key(s). Programmed indicates transponder key 1 to 5 is correctly programmed. The number 1 to 5 indicates programmed order.

Security Code Programmed
This parameter displays the state of the security code programming. Yes indicates a security code is correctly programmed. No indicates a security code is not programmed.

Security Wait Time

This parameter displays the security wait time length in the ICU. Inactive indicates not in security wait time. Time indicates under security wait time. This wait time stage will prevent any further attempts to enter the security code until the wait time has elapsed. The wait time will increase each time an incorrect security code is entered. Note that this parameter is not count downed. It keeps displaying the same time until that wait time has elapsed. The ignition switch must be kept at ON position during the wait time period.

While Security Lock

This parameter displays the state of the security wait time. Inactive indicates not in security wait time. Active indicates under security wait time.

Scan Tool Does Not Power Up

Circuit Description

The data link connector (DLC) is a standardized 16-cavity connector. Connector design and location is dictated by an industry wide standard, and is required to provide the following:

- Scan tool power battery positive voltage at terminal 16.
- Scan tool power ground at terminal 4.
- Common signal ground at terminal 5.

The scan tool will power up with the ignition OFF. Some modules however, will not communicate unless the ignition is ON.

Schematic Reference: Immobilizer Controls Schematics

Connector End View Reference: ICU Connector End View

Circuit/ System Testing Scan Tool Does Not Power Up

Step	Action	Value(s)	Yes	No
1	**Important**: Make sure the scan tool works properly on another vehicle before using this chart. 1. Turn OFF the ignition. 2. Inspect the Meter (+B) (10A) fuse in the cabin fuse block. Is the Meter (+B) (10A) fuse open?	—	Go to Step 2	Go to Step 3
2	Replace the Meter (+B) (10A) fuse. If the fuse continues to open, repair the short to ground on one of the circuits that is fed by the Meter (+B) (10A) fuse or replace the shorted attached component. Did you complete the repair?	—	Go to Step 7	—
3	1. Check each circuit at the data link connector (DLC) (B-58) for a backed out, spread or missing terminal. 2. Repair the terminal as necessary. Did you find and complete the repair?	—	Go to Step 7	Go to Step 4
4	Connect a test lamp between the +B circuit (pin 16 of B-58) at the DLC and a known good ground. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 5
5	Repair the open in the battery voltage circuit to the DLC. Did you complete the repair?	—	Go to Step 7	—
6	1. Test each ground circuit at the DLC (pins 4 and 5 of B-58) for an open circuit or high resistance. 2. Repair the circuit(s), clean or tighten ground as necessary. Did you find and correct the condition?	—	Go to Step 7	Go to Intermittent Conditions
7	1. Connect the scan tool to the DLC. 2. Attempt to turn ON the scan tool. Does the scan tool ON?	—	System OK	Go to Step 1

Scan Tool Does Not Communicate with CAN Device

Circuit Description

The engine control module (ECM), transmission control module (TCM) (AISIN A/T only) and ICU all communicate with the scan tool over the controller area network (CAN) link. The ECM, TCM, ICU and the data recording module (DRM) communicate with each other over the same CAN link. (4JK1/ 4JJ1)
The ECM, TCM, powertrain interface module (PIM) and ICU all communicate with the scan tool over the CAN link. (HFV6)

Diagnostic Aids

The following conditions will cause a loss of CAN serial data communication between the ECM, TCM and PIM or between the scan tool and any control module:

- A CAN serial data circuit open
- A CAN serial data circuit shorted to ground
- A CAN serial data circuit shorted to voltage
- An internal condition within a module or connector on the CAN serial data circuit, that causes a short to voltage or ground to the CAN serial data circuit

Schematic Reference: Immobilizer Controls Schematics

Connector End View Reference: ICU Connector End View

Circuit/ System Testing Scan Tool Does Not Communicate with CAN Device (4JK1/ 4JJ1)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Immobilizer Controls?	—	Go to Step 2	Go to Diagnostic System Check - Immobilizer Controls
2	**Important**: Make sure the CANdi module is not malfunctioning. When functioning properly, the CANdi module LED will be flashing. In the event of a problem, the LED will be continually illuminated or not illuminated. 1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Attempt to establish communication with the listed control modules. • Immobilizer Control Unit (ICU) • Engine control module (ECM) • Transmission control module (TCM) (AISIN A/T only) Does the scan tool communicate with any of the listed control modules?	—	Go to Step 3	Go to Step 7
3	Does the scan tool communicate with the ECM?	—	Go to Step 4	Go to Diagnostic System Check - Engine Controls
4	**Notice:** If no AISIN automatic transmission is installed, skip to Step 5. Does the scan tool communicate with the TCM?	—	Go to Step 5	Go to Diagnostic System Check - Transmission Controls
5	Does the scan tool communicate with the ICU?	—	Go to Step 6	Go to Lost Communication with The Immobilizer Control Unit (ICU)

Step	Action	Value(s)	Yes	No
6	Test the CAN Low and High serial data circuit for an intermittently short to ground, intermittently short to voltage or short circuit each other. Then, test the CAN Low and High serial data circuit for an intermittently open (based on which control module did not communicate) at the connection in the circuit. Did you find and correct the condition?	—	Go to Step 17	System OK
7	1. Inspect for an intermittent, for poor connections and for corrosion at the data link connector (DLC) (pins 6 and 14 of B-58) 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 17	Go to Step 8
8	**Notice:** If no data recording module (DRM) is installed, skip to Step 9. 1. Turn OFF the ignition. 2. Disconnect the DRM C-139 harness connector. 3. Turn ON the ignition, with the engine OFF. 4. Attempt to communicate with the ECM, TCM and ICU. Does the scan tool communicate with the ECM, TCM and ICU?	—	Go to Step 13	Go to Step 9
9	1. Turn OFF the ignition. 2. Reconnect the DRM C-139 harness connector if disconnected. 3. Disconnect the ECM J1 (E-90) and J2 (C-58) harness connectors. 4. Turn ON the ignition, with the engine OFF. 5. Attempt to communicate with the TCM and ICU. Does the scan tool communicate with the TCM and ICU?	—	Go to Step 14	Go to Step 10
10	**Notice:** If no AISIN automatic transmission is installed, skip to Step 11. 1. Turn OFF the ignition. 2. Reconnect the ECM J1 (E-90) and J2 (C-58) harness connectors. 3. Disconnect the TCM C-94 and C-95 harness connectors. 4. Turn ON the ignition, with the engine OFF. 5. Attempt to communicate with the ECM and ICU. Does the scan tool communicate with the ECM and ICU?	—	Go to Step 15	Go to Step 11

Step	Action	Value(s)	Yes	No
11	1. Turn OFF the ignition. 2. Reconnect the ECM J1 (E-90) and J2 (C-58) harness connectors if disconnected. 3. Reconnect the TCM C-94 and C-95 harness connectors if disconnected. 4. Disconnect the ICU B-109 harness connector. 5. Turn ON the ignition, with the engine OFF. 6. Attempt to communicate with the ECM and TCM. Does the scan tool communicate with the ECM and TCM?	—	Go to Step 16	Go to Step 12
12	Repair the open circuit, short to ground, short to voltage or short circuit each other on the CAN Low or High serial data circuit between the DLC and ECM, TCM, ICU or DRM. Did you complete the repair?	—	Go to Step 17	—
13	Replace the DRM. Refer to DRM Replacement. Did you complete the replacement?	—	Go to Step 17	—
14	**Important**: Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 17	—
15	**Important**: Replacement TCM must be programmed. Replace the TCM. Refer to TCM Replacement. Did you complete the replacement?	—	Go to Step 17	—
16	**Important**: Replacement ICU must be programmed. Replace the ICU. Refer to ICU Replacement. Did you complete the replacement?	—	Go to Step 17	—
17	Attempt to establish communication with the ECM, TCM and ICU. Does the scan tool communicate with the ECM, TCM and ICU?	—	System OK	Go to Step 2

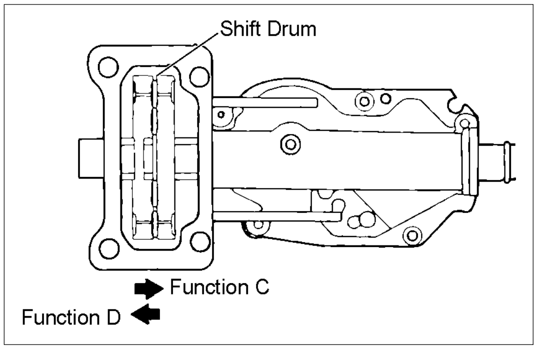
Circuit/ System Testing Scan Tool Does Not Communicate with CAN Device (HFV6)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Immobilizer Controls?	—	Go to Step 2	Go to Diagnostic System Check - Immobilizer Controls

Step	Action	Value(s)	Yes	No
2	**Important:** Make sure the CANdi module is not malfunctioning. When functioning properly, the CANdi module LED will be flashing. In the event of a problem, the LED will be continually illuminated or not illuminated. 1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Attempt to establish communication with the listed control modules. • Immobilizer Control Unit (ICU) • Engine control module (ECM) • Transmission control module (TCM) • Powertrain Interface module (PIM) Does the scan tool communicate with any of the listed control modules?	—	Go to Step 3	Go to Step 8
3	Does the scan tool communicate with the PIM?	—	Go to Step 4	Go to Diagnostic System Check - Powertrain Interface Module
4	Does the scan tool communicate with the ECM?	—	Go to Step 5	Go to Diagnostic System Check - Engine Controls
5	**Notice:** If no automatic transmission is installed, skip to Step 6. Does the scan tool communicate with the TCM?	—	Go to Step 6	Go to Diagnostic System Check - Transmission Controls
6	Does the scan tool communicate with the ICU?	—	Go to Step 7	Go to Lost Communication with The Immobilizer Control Unit (ICU)
7	Test the CAN Low and High serial data circuit for an intermittently short to ground, intermittently short to voltage or short circuit each other. Then, test the CAN Low and High serial data circuit for an intermittently open (based on which control module did not communicate) at the connection in the circuit. Did you find and correct the condition?	—	Go to Step 20	System OK
8	1. Inspect for an intermittent, for poor connections and for corrosion at the data link connector (DLC) (pins 6 and 14 of B-58). 2. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 9
9	1. Turn OFF the ignition. 2. Disconnect the ECM C-56 and E-60 harness connectors. 3. Turn ON the ignition, with the engine OFF. 4. Attempt to communicate with the TCM, PIM and ICU. Does the scan tool communicate with the TCM, PIM and ICU?	—	Go to Step 16	Go to Step 10

Step	Action	Value(s)	Yes	No
10	**Notice:** If no automatic transmission is installed, skip to Step 11. 1. Turn OFF the ignition. 2. Reconnect the ECM C-56 and E-90 harness connectors. 3. Disconnect the TCM C-96 harness connector. 4. Turn ON the ignition, with the engine OFF. 5. Attempt to communicate with the PIM and ICU. Does the scan tool communicate with the PIM and ICU?	—	Go to Step 13	Go to Step 11
11	1. Turn OFF the ignition. 2. Reconnect the ECM C-56 and E-90 harness connectors if disconnected. 3. Reconnect the TCM C-96 harness connector if disconnected. 4. Disconnect the PIM B-96 and B-97 harness connectors. 5. Turn ON the ignition, with the engine OFF. 6. Attempt to communicate with the ICU. Does the scan tool communicate with the ICU?	—	Go to Step 14	Go to Step 12
12	1. Turn OFF the ignition. 2. Reconnect the PIM B-96 and B-97 harness connectors. 3. Disconnect the ICU B-109 harness connector. 4. Turn ON the ignition, with the engine OFF. 5. Attempt to communicate with the ECM, TCM and PIM. Does the scan tool communicate with the ECM, TCM and PIM?	—	Go to Step 19	Go to Step 15
13	1. Test the CAN Low and High circuits between the ECM (pins 23 and 55 of C-56) and the TCM (pins 6 and 7 of C-96) for the following conditions: • A short to ground • A short to battery or ignition voltage • A short circuit each other 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 17
14	1. Test the CAN Low and High circuits between the PIM (pins 7 and 9 of B-97) and the TCM (pins 37 and 38 of C-96) or ECM (pins 23 and 55 of C-56) for the following conditions: • A short to ground • A short to battery or ignition voltage • A short circuit each other 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 20	Go to Step 18

Step	Action	Value(s)	Yes	No
15	Repair the open circuit, short to ground, short to voltage or short circuit each other on the CAN Low or High circuits between the DLC and PIM or ICU. Did you complete the repair?	—	Go to Step 20	—
16	**Important:** Replacement ECM must be programmed and learned. Replace the ECM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 20	—
17	**Important:** Replacement TCM must be programmed. Replace the TCM. Refer to ECM Replacement. Did you complete the replacement?	—	Go to Step 20	—
18	**Important:** Replacement PIM must be programmed. Replace the PIM. Refer to PIM Replacement. Did you complete the replacement?	—	Go to Step 20	—
19	**Important:** Replacement ICU must be programmed. Replace the ICU. Refer to ICU Replacement. Did you complete the replacement?	—	Go to Step 20	—
20	Attempt to establish communication with the ICU, ECM, TCM and PIM. Does the scan tool communicate with the ICU, ECM, TCM and PIM?	—	System OK	Go to Step 2



RTW440SH000601

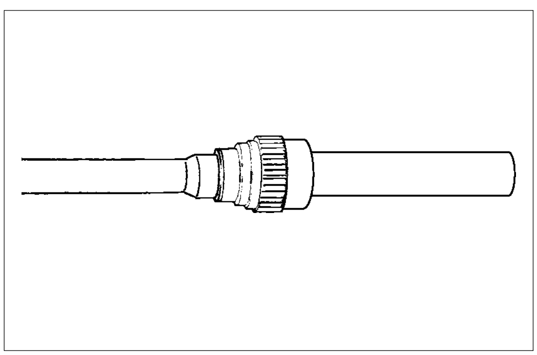
Reassembly

15. Oil seal

Install the new oil seal which has been immersed in differential gear oil, by using an oil seal installer.

Installer 5-8840-2407-0

Grip 5-8840-0007-0



412RS051

14. Needle Bearing

Force a new needle bearing into inner shaft by using a special tool.

Installer : 5-8840-2408-0

Grip : 5-8840-0007-0

Lost Communication with The Immobilizer Control Unit (ICU)

Circuit Description

The engine control module (ECM), transmission control module (TCM) (AISIN A/T only) and ICU all communicate with the scan tool over the controller area network (CAN) link. The ECM, TCM, ICU and the data recording module (DRM) communicate with each other over the same CAN link. (4JK1/ 4JJ1)

The ECM, TCM, powertrain interface module (PIM) and ICU all communicate with the scan tool over the CAN link. (HFV6)

Schematic Reference: Immobilizer Controls Schematics

Connector End View Reference: ICU Connector End View

Circuit/ System Testing Lost Communication with The Immobilizer Control Unit (ICU)

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Immobilizer Controls?	—	Go to Step 2	Go to Diagnostic System Check - Immobilizer Controls
2	Attempt to establish communication with the ICU. Does the scan tool communicate with the ICU?	—	Go to Intermittent Conditions	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the scan tool from the data link connector (DLC) if connected. 3. Measure the resistance across the CAN Low and High circuits by probing the DLC (pins 6 and 14 of B-58). Is the resistance within the specified value (parallel resistance of the 120Ω resistor in the ECM and the 120Ω resistor in the ICU should be 60Ω)?	50 to 70 Ω	Go to Step 5	Go to Step 4
4	1. Test the CAN Low and High circuits between the ICU (pins 5 and 6 of B-109) and the data link connector (DLC) (pins 6 and 14 of B-58) for an open circuit or high resistance. 2. Repair the circuit(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 9
5	1. Turn OFF the ignition. 2. Disconnect the ICU harness connector. 3. Connect a test lamp between the battery voltage feed circuit (pin 1 of B-109) and a known good ground. Does the test lamp illuminate?	—	Go to Step 6	Go to Step 7
6	Connect a test lamp across the battery voltage feed circuit and the ground circuit (pins 1 and 3 of B-109) Does the test lamp illuminate?	—	Go to Step 9	Go to Step 8
7	Repair the open circuit or high resistance between the Meter (+B) (10A) fuse and the ICU (pin 1 of B-109). Did you complete the repair?	—	Go to Step 11	—
8	Repair the open circuit or high resistance between the ICU (pin 3 of B-109) and ground terminal. Did you complete the repair?	—	Go to Step 11	—

Step	Action	Value(s)	Yes	No
9	1. Turn OFF the ignition. 2. Disconnect the ICU harness connector. 3. Inspect for an intermittent, for poor connections and for corrosion at the harness connector of the ICU (pins 1, 3, 5 and 6 of B-109) 4. Repair the connection(s) as necessary. Did you find and correct the condition?	—	Go to Step 11	Go to Step 10
10	**Important**: Replacement ICU must be programmed. Replace the ICU. Refer to ICU Replacement. Did you complete the replacement?	—	Go to Step 11	—
11	1. Turn OFF the ignition. 2. Reconnect all previously disconnected fuse or harness connector(s). 3. Turn the ignition ON, with the engine OFF. 4. Attempt to establish communication with the ICU. Does the scan tool communicate with the ICU?	—	System OK	Go to Step 3

Diagnostic Trouble Code (DTC) List

DTC	DTC Descriptor
B0001	Replace Electronic Control Unit (ECU)
B0002	Immobilizer Not Programmed
B0003	Transponder Key Problem
B0004	Immobilizer Coil Circuit
B0007	No Engine Request Received
B0008	Wrong Transponder Key
B0009	No Transponder Key Programmed
B0010	Unknown Transponder Key
B0012	Default Transponder Detected
B0013	Previously Erased Transponder
B0014	Secret Key Error
U0100	Lost Communication With ECM

DTC B0001

Description

This diagnostic applies to internal microprocessor integrity conditions within the ICU.

Condition for Setting the DTC

- The ECM detects a faulty writing in its internal electrically erasable & programmable read only memory (EEPROM).

Action Taken When the DTC Sets

- The engine will fail to run if the fault occurs before starting the engine.

Condition for Clearing the DTC

- A current DTC clears once ignition cycle has occurred without the fault recurring.
- A history DTC will clear after 50 consecutive ignition cycles, if the condition for malfunction is no longer present.
- Use a scan tool to clear the DTC.

Circuit/ System Testing DTC B0001

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Immobilizer Controls?	—	Go to Step 2	Go to Diagnostic System Check - Immobilizer Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	**Important**: Replacement ICU must be programmed. Replace the ICU. Refer to ICU Replacement. Did you complete the replacement?	—	Go to Step 4	—
4	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC B0002

Description

The electrically erasable programmable read only memory (EEPROM) memorizes immobilizer security code and transponder key information. If the ICU detects immobilizer security code is not programmed into the ICU, this DTC will set.

Condition for Setting the DTC

- The ICU detects that the security code is not programmed.

Action Taken When the DTC Sets

- The engine will fail to run if the fault occurs before starting the engine.

Condition for Clearing the DTC

- A current DTC clears once ignition cycle has occurred without the fault recurring.
- A history DTC will clear after 50 consecutive ignition cycles, if the condition for malfunction is no longer present.
- Use a scan tool to clear the DTC.

Diagnostic Aids

- Non-programmed ICU sets this DTC.

Circuit/ System Testing DTC B0002

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Immobilizer Controls?	—	Go to Step 2	Go to Diagnostic System Check - Immobilizer Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	Program immobilizer security information into the ICU. Refer to Resetting and Programming Guidelines in this section. Did you complete the programming?	—	Go to Step 4	—
4	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC B0003

Description

When the ignition switch is ON, the ICU begins authentication of the transponder key in the steering lock through the antenna coil. Once the ICU transmits a signal, the transponder must send back a specific response signal. If the ICU never receives a response signal from the transponder, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ICU does not receive a response signal from the transponder key.

Action Taken When the DTC Sets

- The engine will fail to run if the fault occurs before starting the engine.

Condition for Clearing the DTC

- A current DTC clears once ignition cycle has occurred without the fault recurring.
- A history DTC will clear after 50 consecutive ignition cycles, if the condition for malfunction is no longer present.
- Use a scan tool to clear the DTC.

Diagnostic Aids

- Electromagnetic interference may affect intermittent condition.
- An antenna coil problem may set this DTC.
- Objects that block transponder key in the steering lock may set this DTC.
- Another key that is attached to the key ring may affect this DTC to set.
- If the ignition switch has been turned ON without transponder key this DTC sets.

Circuit/ System Testing DTC B0003

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Immobilizer Controls?	—	Go to Step 2	Go to Diagnostic System Check - Immobilizer Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Is DTC B0004 also set?	—	Go to DTC B0004	Go to Step 3
3	1. Inspect the transponder key(s) and the ICU for the following conditions: • Physical damage of transponder key(s) or ICU • Improper installation of ICU • Improper transponder key • Objects such as key ring or metal that touch transponder key or antenna coil • Objects such as key ring or metal that cover transponder key or antenna coil 2. Repair the condition(s) as necessary. Did you find and correct the condition?	—	Go to Step 8	Go to Step 4
4	Inspect all programmed transponder key while observing the Transponder Key parameter with a scan tool. Is there a transponder key that indicates No Transponder Key when ignition switch is ON?	—	Go to Step 5	Go to Diagnostic Aids
5	Does only specific transponder key indicate No Transponder Key?	—	Go to Step 6	Go to Step 7

Step	Action	Value(s)	Yes	No
6	**Important**: Replacement transponder key must be programmed. Replace the transponder key that indicates No Transponder Key at Step 4. Refer to Resetting and Programming Guidelines in this section. Did you complete the replacement?	—	Go to Step 8	—
7	**Important**: Replacement ICU must be programmed. Replace the ICU. Refer to ICU Replacement. Did you complete the replacement?	—	Go to Step 8	—
8	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 9
9	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC B0004

Circuit Description

An antenna coil is a part of the ICU and it is located around steering key lock cylinder. An antenna coil is energized when the ICU is performing an authentication of the transponder key. If the ICU detects an open circuit or short circuit on the antenna coil circuit, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ICU detects an open circuit or short circuit on the antenna coil circuit.

Action Taken When the DTC Sets

- The engine will fail to run if the fault occurs before starting the engine.

Condition for Clearing the DTC

- A current DTC clears once ignition cycle has occurred without the fault recurring.
- A history DTC will clear after 50 consecutive ignition cycles, if the condition for malfunction is no longer present.
- Use a scan tool to clear the DTC.

Diagnostic Aids

- Improper installation of ICU will set this DTC.

Circuit/ System Testing DTC B0004

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Immobilizer Controls?	—	Go to Step 2	Go to Diagnostic System Check - Immobilizer Controls
2	1. Inspect the ICU for the following conditions: • Physical damage of ICU • Improper installation of ICU 2. Repair or replace as necessary. Did you find and correct the condition?	—	Go to Step 4	Go to Step 3
3	**Important**: Replacement ICU must be programmed. Replace the ICU. Refer to ICU Replacement. Did you complete the replacement?	—	Go to Step 5	—
4	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 5
5	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC B0007

Circuit Description

When the transponder key authentication is completed, the ICU begins authentication of the ECM. The ECM transmits a specific request signal to the ICU and the ICU sends back a response signal to the ECM. Both communication signals are carried out via a controller area network (CAN) communication bus. If the ICU does not detect a request signal from the ECM, this DTC will set.

Condition for Setting the DTC

- The ICU does not receive a request signal from the ECM.

Action Taken When the DTC Sets

- The engine will fail to run if the fault occurs before starting the engine.

Condition for Clearing the DTC

- A current DTC clears once ignition cycle has occurred without the fault recurring.
- A history DTC will clear after 50 consecutive ignition cycles, if the condition for malfunction is no longer present.
- Use a scan tool to clear the DTC.

Diagnostic Aids

- Electromagnetic interference may affect intermittent condition.
- If the ignition switch is cycled (ON > OFF > ON) rapidly, this DTC may set but engine starts. This is normal and a current DTC clears once ignition cycle has been normally occurred.

Circuit/ System Testing DTC B0007

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Immobilizer Controls?	—	Go to Step 2	Go to Diagnostic System Check - Immobilizer Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Select the Engine in the system selection menu. 5. Attempt to communicate with the ECM via the Engine Data table. Does the scan tool communicate with the ECM?	—	Go to Step 3	Go to Diagnostic System Check - Engine Controls
3	Monitor the ECM DTC Information with a scan tool. Is DTC U0001 set?	—	Go to DTC U0001 in Engine Control Section	Go to Step 4
4	Refer to Scan Tool Does Not Communicate with The CAN Device in this section. Did you complete the action?	—	Go to Step 5	—
5	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 6
6	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC B0008

Description

When the ignition switch is ON, the ICU begins authentication of the transponder key in the steering lock through the antenna coil. Once the ICU transmits a signal, the transponder must send back a specific response signal. If the ICU receives a wrong response signal from the transponder, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ICU receives a wrong response signal from the transponder key.

Action Taken When the DTC Sets

- The engine will not start if the fault occurs before starting the engine.

Condition for Clearing the DTC

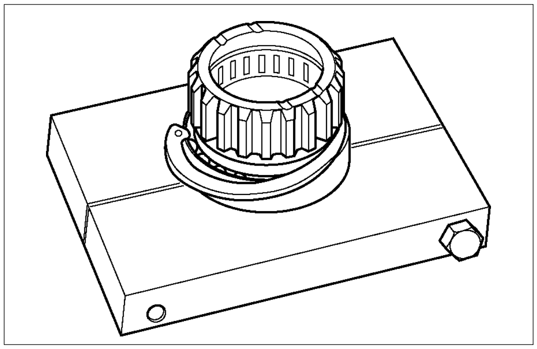
- A current DTC clears once ignition cycle has occurred without the fault recurring.
- A history DTC will clear after 50 consecutive ignition cycles, if the condition for malfunction is no longer present.
- Use a scan tool to clear the DTC.

Diagnostic Aids

- If the transponder key or ICU is transferred (swapped) from another vehicle, this DTC will set.

Circuit/ System Testing DTC B0008

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Immobilizer Controls?	—	Go to Step 2	Go to Diagnostic System Check - Immobilizer Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Is DTC B0009 also set?	—	Go to DTC B0009	Go to Step 3
3	Inspect all programmed transponder keys while observing the Transponder Key parameter with a scan tool. Is there a transponder key that indicates Invalid when ignition switch is ON?	—	Go to Step 4	Go to Diagnostic Aids
4	Does only specific transponder key indicate Invalid?	—	Go to Step 5	Go to Step 6
5	**Important**: Replacement transponder key must be programmed. Replace the transponder key that indicates Invalid at Step 3. Refer to Resetting and Programming Guidelines in this section. Did you complete the replacement?	—	Go to Step 7	—
6	**Important**: Replacement ICU must be programmed. Replace the ICU. Refer to ICU Replacement. Did you complete the replacement?	—	Go to Step 7	—
7	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 8
8	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK



412RS044

13. Inner Shaft Bearing

- Place a new snap ring in inner shaft.
- Force a new inner shaft bearing into the inner shaft.

Installer : 5-8840-2197-0

12.Snap Ring

NOTE;

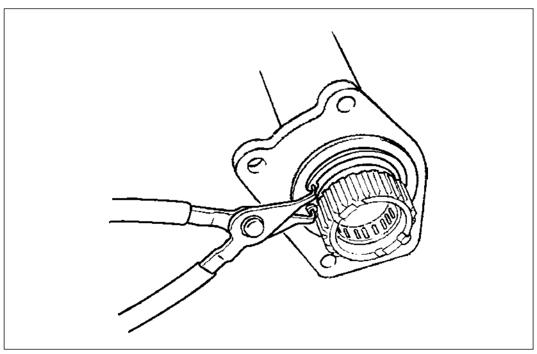
Be careful not to damage the inner shaft.

11.inner Shaft

- Clean the housing contact surface of the front axle case.
- Insert inner shaft assembly into the front axle case.

NOTE:

Be careful not to damage oil seal.



412RW017

10.Snap Ring

Install snap ring in the groove of front axle case.

NOTE:

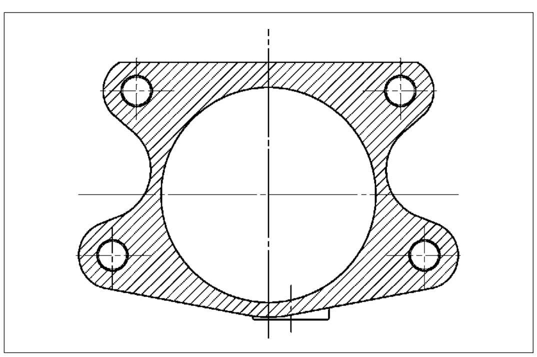
Be sure to install the snap ring properly.

9. Clutch Gear

Apply differential gear oil to clutch oil.

8. Sleeve

Apply differential gear oil to sleeve.



412RW023

7. Housing

- Clean contact surface with the front axle and actuator mounting surface.
- Apply liquid gasket to the contact surface on the front axle case and install in the housing.

6. Bolt

Tighten bolts to specified tightening torque.

Housing Bolt Torque	N·m (kgf·m/lb·ft)
75 (7.6/55)	

DTC B0009

Description

The electrically erasable programmable read only memory (EEPROM) memorizes immobilizer security code and transponder key information. If the ICU detects any transponder key is not programmed into the ICU, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ICU detects any transponder key is not programmed.

Action Taken When the DTC Sets

- The engine will fail to run if the fault occurs before starting the engine.

Condition for Clearing the DTC

- A current DTC clears once ignition cycle has occurred without the fault recurring.
- A history DTC will clear after 50 consecutive ignition cycles, if the condition for malfunction is no longer present.
- Use a scan tool to clear the DTC.

Circuit/ System Testing DTC B0009

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Immobilizer Controls?	—	Go to Step 2	Go to Diagnostic System Check - Immobilizer Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Is DTC B0002 also set?	—	Go to DTC B0002	Go to Step 3
3	Program transponder key information into the ICU. Refer to Resetting and Programming Guidelines in this section. Did you complete the programming?	—	Go to Step 4	—
4	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC B0010

Description

When the ignition switch is ON, the ICU begins authentication of the transponder key in the steering lock through the antenna coil. Once the ICU transmits a signal, the transponder must send back a specific response signal. If the ICU receives an unknown response signal from the transponder, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ICU receives an unknown response signal from the transponder key.

Action Taken When the DTC Sets

- The engine will not start if the fault occurs before starting the engine.

Condition for Clearing the DTC

- A current DTC clears once ignition cycle has occurred without the fault recurring.
- A history DTC will clear after 50 consecutive ignition cycles, if the condition for malfunction is no longer present.
- Use a scan tool to clear the DTC.

Diagnostic Aids

- Non-programmed transponder key sets this DTC.

Circuit/ System Testing DTC B0010

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Immobilizer Controls?	—	Go to Step 2	Go to Diagnostic System Check - Immobilizer Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Is DTC B0009, B0012 or B0013 also set?	—	Go to Applicable DTC	Go to Step 3
3	Inspect all programmed transponder keys while observing the Transponder Key parameter with a scan tool. Is there a transponder key that indicates Invalid when ignition switch is ON?	—	Go to Step 4	Go to Diagnostic Aids
4	Does only specific transponder key indicate Invalid?	—	Go to Step 5	Go to Step 7
5	Program transponder key information into the ICU. Refer to Resetting and Programming Guidelines in this section. Did you find and correct the condition?	—	Go to Step 8	Go to Step 6
6	**Important**: Replacement transponder key must be programmed. Replace the transponder key that indicates Invalid at Step 3. Refer to Resetting and Programming Guidelines in this section. Did you complete the replacement?	—	Go to Step 8	—
7	**Important**: Replacement ICU must be programmed. Replace the ICU. Refer to ICU Replacement. Did you complete the replacement?	—	Go to Step 8	—
8	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 9

Step	Action	Value(s)	Yes	No
9	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC B0012

Description

When a transponder key is replaced or added, transponder key information must be programmed into the ICU. If the ICU detects a default transponder key, this DTC set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ICU detects a non-programmed (new) transponder key.

Action Taken When the DTC Sets

- The engine will fail to run if the fault occurs before starting the engine.

Condition for Clearing the DTC

- A current DTC clears once ignition cycle has occurred without the fault recurring.
- A history DTC will clear after 50 consecutive ignition cycles, if the condition for malfunction is no longer present.
- Use a scan tool to clear the DTC.

Circuit/ System Testing DTC B0012

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Immobilizer Controls?	—	Go to Step 2	Go to Diagnostic System Check - Immobilizer Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Step 4
3	Program transponder key information into the ICU. Refer to Resetting and Programming Guidelines in this section. Did you complete the programming?	—	Go to Step 4	—
4	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC B0013

Description

When the ignition switch is ON, the ICU begins authentication of the transponder key in the steering lock through the antenna coil. Once the ICU transmits a signal, the transponder must send back a specific response signal. If the ICU receives a response signal that was previously erased transponder key, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ICU detects a previously erased transponder key.

Action Taken When the DTC Sets

- The engine will fail to run if the fault occurs before starting the engine.

Condition for Clearing the DTC

- A current DTC clears once ignition cycle has occurred without the fault recurring.
- A history DTC will clear after 50 consecutive ignition cycles, if the condition for malfunction is no longer present.
- Use a scan tool to clear the DTC.

Diagnostic Aids

- This DTC is caused by a transponder key that was previously erased by some reason.

Circuit/ System Testing DTC B0013

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Immobilizer Controls?	—	Go to Step 2	Go to Diagnostic System Check - Immobilizer Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	Program transponder key information into the ICU. Refer to Resetting and Programming Guidelines in this section. Did you complete the programming?	—	Go to Step 4	—
4	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC B0014

Description

When the transponder key authentication is completed, the ICU begins authentication of the ECM. The ECM transmits a specific request signal to the ICU and the ICU sends back a response signal to the ECM. Both communication signals are carried out via a controller area network (CAN) communication bus. If the ICU receives a wrong request signal from the ECM, this DTC will set.

Condition for Running the DTC

- The ignition switch is ON.

Condition for Setting the DTC

- The ICU detects a wrong request signal from the ECM.

Action Taken When the DTC Sets

- The engine will fail to run if the fault occurs before starting the engine.

Condition for Clearing the DTC

- A current DTC clears once ignition cycle has occurred without the fault recurring.
- A history DTC will clear after 50 consecutive ignition cycles, if the condition for malfunction is no longer present.
- Use a scan tool to clear the DTC.

Diagnostic Aids

- Non-programmed ECM may set this DTC.
- If the ECM is transferred (swapped) from another vehicle, this DTC will set.

Circuit/ System Testing DTC B0014

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Immobilizer Controls?	—	Go to Step 2	Go to Diagnostic System Check - Immobilizer Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Monitor the DTC Information with a scan tool. Does the DTC fail this ignition?	—	Go to Step 3	Go to Diagnostic Aids
3	Program immobilizer security information into the ECM. Refer to Resetting and Programming Guidelines in this section. Did you complete the programming?	—	Go to Step 4	—
4	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition. Did the DTC fail this ignition?	—	Go to Step 3	Go to Step 5
5	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

DTC U0100

Circuit Description

When the transponder key authentication is completed, the ICU begins authentication of the ECM. The ECM transmits a specific request signal to the ICU and the ICU sends back a response signal to the ECM. Both communication signals are carried out via a controller area network (CAN) communication bus. The ICU monitors CAN operational status by expecting a constant flow of messages from the ECM. If the ICU fails to send an expected message to the ECM, this DTC will set.

Condition for Setting the DTC

- The ICU detects that the CAN Bus OFF status.

Action Taken When the DTC Sets

- The engine will fail to run if the fault occurs before starting the engine.

Condition for Clearing the DTC

- A current DTC clears once ignition cycle has occurred without the fault recurring.
- A history DTC will clear after 50 consecutive ignition cycles, if the condition for malfunction is no longer present.
- Use a scan tool to clear the DTC.

Diagnostic Aids

- Electromagnetic interference may affect intermittent condition.
- Any communication fault with the ECM may set this DTC.

Circuit/ System Testing DTC U0100

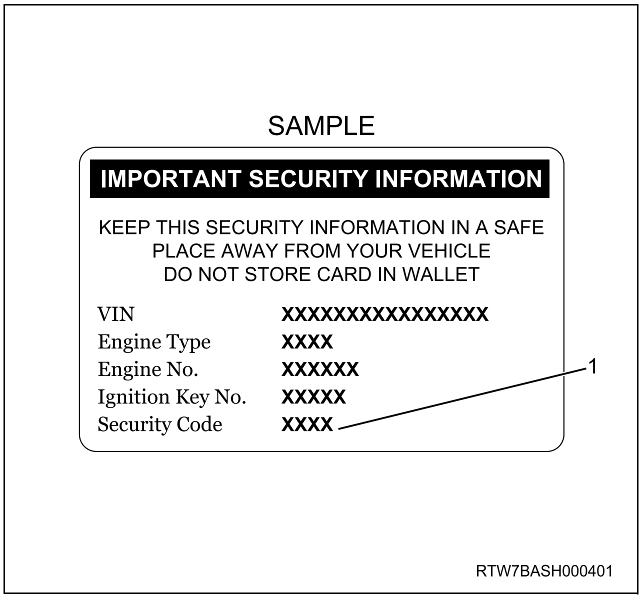
Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Immobilizer Controls?	—	Go to Step 2	Go to Diagnostic System Check - Immobilizer Controls
2	1. Install a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition, with the engine OFF. 4. Select the Engine in the system selection menu. 5. Attempt to communicate with the ECM via the Engine Data table. Does the scan tool communicate with the ECM?	—	Go to Step 3	Go to Diagnostic System Check - Engine Controls
3	Monitor the ECM DTC Information with a scan tool. Is DTC U0001 set?	—	Go to DTC U0001 in Engine Control Section	Go to Step 4
4	Refer to Scan Tool Does Not Communicate with The CAN Device in this section. Did you complete the action?	—	Go to Step 5	—
5	1. Clear the DTCs with a scan tool. 2. Turn OFF the ignition for 30 seconds. 3. Turn ON the ignition. Did the DTC fail this ignition?	—	Go to Step 2	Go to Step 6
6	Observe the DTC Information with a scan tool. Are there any DTCs that you have not diagnosed?	—	Go to DTC List	System OK

Resetting and Programming

Resetting and Programming Guidelines

Notice: The security information must be programmed when the ICU, ECM, PIM or transponder key(s) is replaced, or transponder key(s) is added.

Vehicle Security Information Card (If issued)



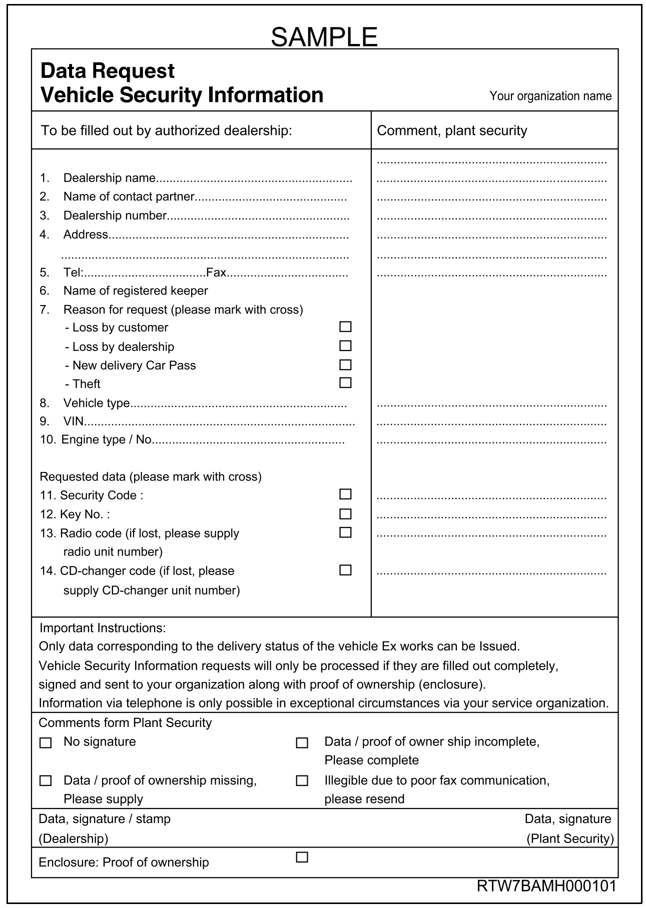
RTW7BASH000401

When performing ICU, ECM, PIM or transponder key(s) resetting or programming functions using a scan tool, you will be prompted to enter four digits of security code (1). This information is found on the vehicle security information card issued with the vehicle when new. If the card is unavailable, contact a distributor's service department to obtain the relevant security code. For new owners, distributor or dealership must provide vehicle security information card that has identification numbers of owner's vehicle immobilizer system. This information is very important in case of repair or transponder key is lost. It is necessary to provide following items in your responsibility.

- Vehicle security information card to a new owner.
- Blank vehicle security information card it is for reissue.
- Instruction to your dealership how to use it.

Your organization must keep security code for all vehicles as confidential data. In case of vehicle security information card is lost, the data can be requested from a distributor's service department. This request will only be processed if accompanied by the enclosed form and proof of ownership. Once the data is received, it can be entered in a blank card and given to the customer. The unused card should be destroyed. Instructions on filling out the Data Request Vehicle Security Information Card as follows.

- The data requested under items 1 to 10 must be provided completely, including the authorized dealership number, the vehicle identification number (VIN) and engine type/ number.
- Complete the form by entering data and signature/ authorized dealership stamp and send it along with proof of ownership to address provided in the form.
- The requested data will be sent by fax to dealership that made the request after your organization has confirmed that the information is correct.



SAMPLE

Data Request
Vehicle Security Information — Your organization name

To be filled out by authorized dealership:	Comment, plant security
1. Dealership name............	....
2. Name of contact partner............	....
3. Dealership number............	....
4. Address............	....
....	....
5. Tel:............Fax............	....
6. Name of registered keeper	
7. Reason for request (please mark with cross)	
- Loss by customer ☐	
- Loss by dealership ☐	
- New delivery Car Pass ☐	
- Theft ☐	
8. Vehicle type............	....
9. VIN............	....
10. Engine type / No............	....
Requested data (please mark with cross)	
11. Security Code : ☐	....
12. Key No. : ☐	....
13. Radio code (if lost, please supply radio unit number) ☐	....
14. CD-changer code (if lost, please supply CD-changer unit number) ☐	....

Important Instructions:
Only data corresponding to the delivery status of the vehicle Ex works can be Issued.
Vehicle Security Information requests will only be processed if they are filled out completely, signed and sent to your organization along with proof of ownership (enclosure).
Information via telephone is only possible in exceptional circumstances via your service organization.

Comments form Plant Security
☐ No signature ☐ Data / proof of owner ship incomplete, Please complete
☐ Data / proof of ownership missing, Please supply ☐ Illegible due to poor fax communication, please resend

Data, signature / stamp (Dealership) — Data, signature (Plant Security)

Enclosure: Proof of ownership ☐

RTW7BAMH000101

Security Code

The security code is required when performing ICU, ECM, PIM or transponder key(s) resetting or programming functions. When a scan tool requests the security code to be entered, and an incorrect code is entered, the ICU, ECM or PIM will go into a security wait time stage. This wait time stage will prevent any further attempts to enter the security code until the wait time has elapsed. Should a second incorrect security code be entered after the initial wait time has elapsed, the ICU, ECM or PIM will go into a second wait time stage. The wait time will increase each time an incorrect code is entered. When the correct code is entered the wait time will rest back to its original value of 10 seconds.

- Stage 1 = 10 seconds
- Stage 2 = 10 seconds
- Stage 3 = 10 minutes
- Stage 4 = 20 minutes
- Stage 5 = 40 minutes

- Stage 6 = 80 minutes (1 hour 20 minutes)
- Stage 7 = 160 minutes (2 hours 40 minutes)
- Stage 8 = 320 minutes (5 hours 20 minutes)
- Stage 9 = 640 minutes (10 hours 40 minutes)
- Stage 10 = 1280 minutes (21 hours 20 minutes)

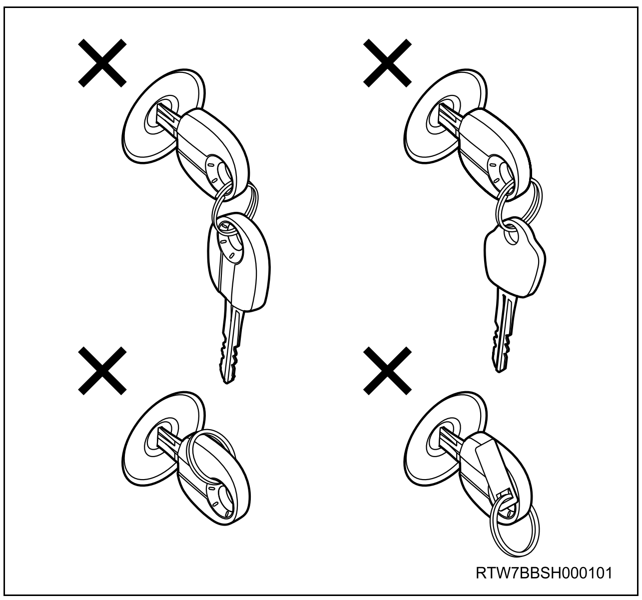
Notice: The ignition switch must be kept at ON position during the wait time period.

Transponder Key

Normally two or three transponder keys are provided with a vehicle when new. Maximum five transponder key can be provided by additional programming if owner requests additional key(s).

Notice: During programming of the new transponder key(s), an authentication code is programmed into the transponder chip and it cannot be reprogrammed again. Once this programming has been performed, the transponder keys cannot be installed in any other vehicle.

Notice: Keep away another key, another transponder key, key number plate or other metal items from the transponder key that is going to program. Otherwise, transponder key(s) programming may be failed.



Transponder Key Erasing Procedure must be done whenever the following condition is met:

- Owner lost transponder key(s)

Notice: If an owner lost transponder key, currently programmed transponder key(s) information must be erased from an ICU memory to avoid vehicle theft. Because information on all key(s) is erased at the same time by this procedure, reprogram remaining key(s) and/or program new key(s).

Transponder Key Programming Procedure must be done whenever any of the following conditions are met:

- Diagnostic chart instructs you to replace transponder key(s)
- Diagnostic chart instructs you to program transponder key(s)
- Transponder keys are erased and to do reprogramming
- Owner requests additional key(s)

ICU Resetting Procedure must be done whenever any of the following conditions are met:

- Diagnostic chart instructs you to replace ICU
- ICU replacement without spare parts

Notice: When an ICU has been installed into a vehicle, it must be security linked to the ECM/ PIM using the programming procedure. Once this linking has been performed, the ICU cannot be installed in any other vehicle, unless the security linking between both modules have been reset using the resetting procedure in an ORIGINAL vehicle before transferring (swapping) to the complaint vehicle.

ICU Programming Procedure must be done whenever any of the following conditions are met:

- Diagnostic chart instructs you to program ICU
- New ICU is installed
- ICU is reused that was reset in an original vehicle

ECM Resetting Procedure must be done whenever any of the following conditions are met:

- Diagnostic chart instructs you to replace ECM
- ECM replacement without spare parts

Notice: When an ECM has been installed into a vehicle, it must be security linked to the ICU/ PIM using the programming procedure. Once this linking has been performed, the ECM cannot be installed in any other vehicle, unless the security linking between both modules have been reset using the resetting procedure in an ORIGINAL vehicle before transferring (swapping) to the complaint vehicle.

ECM Programming Procedure must be done whenever any of the following conditions are met:

- Diagnostic chart instructs you to program ECM
- New ECM is installed
- ECM is reused that was reset in an original vehicle

PIM Resetting Procedure must be done whenever any of the following conditions are met:

- Diagnostic chart instructs you to replace PIM
- PIM replacement without spare parts

Notice: When a PIM has been installed into a vehicle, it must be security linked to the ICU/ ECM using the programming procedure. Once this linking has been performed, the PIM cannot be installed in any other vehicle, unless the security linking between both modules have been reset using the resetting procedure in an ORIGINAL vehicle before transferring (swapping) to the complaint vehicle.

PIM Programming Procedure must be done whenever any of the following condtions are met:

- Diagnostic chart instructs you to program PIM
- New PIM is installed
- PIM is reused that was rest in an original vehicle

ICU & PIM Programming Procedure must be done whenever any of the following condition is met:

- New or resued ICU and PIM are installed at the same time

ECM & PIM Programming Procedure must be done whenever any of the following condition is met:

- New or reused ECM and PIM are installed at the same time

ICU & ECM Programming Procedure must be done whenever any of the following condition is met:

- New or reused ICU and ECM are installed at the same time (transponder key(s) also replaced)

ICU, ECM & PIM Programming Procdure must be done whenever any of the following condition is met:

- New or reused ICU, ECM and PIM are installed at the same time (transponder key(s) also replaced)

Notice: During programming of the new transponder key(s), an authentication code is programmed into the transponder chip and it cannot be reprogrammed again. When replacing both ICU and ECM at the same time, a new authentication code to be programmed into the newly installed ECM is based on information of newly installed ICU. However, the transponder keys cannot be reprogrammed therefore it must be replaced. Do not replace the ICU and the ECM at the same time to avoid needless transponder key(s) replacement simultaneously unless complete damaging was encountered (e.g. both modules cannot be communicated with a scan tool).

Transponder Key Erasing Procedure

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Additional Functions > Erase Transponder Keys.
4. The on-screen displays a message "See Checking Procedure Before Programming!", then press Confirm.
5. Input four digits of correct security code that belongs to this vehicle and follow the on-screen instructions.

Notice: An incorrect security code input causes a security wait time.

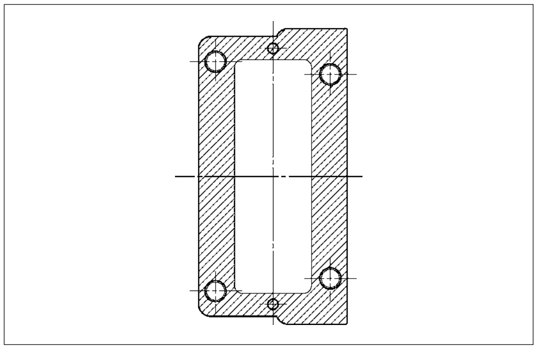
6. The on-screen displays a message "Caution All Transponder Keys Will Be Erased!", then press Confirm.
7. Operate the ignition switch by following the on-screen instructions.
8. The on-screen displays a message "Erase Transponder Keys Erasing Completed Successfully!" if transponder erasing has been completed, then press Confirm.
9. Turn OFF the ignition for 30 seconds.
10. Verify the engine fails to run using all transponder key(s).

Transponder Key Programming Procedure

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Programming > Program Transponder Keys.
4. In order to get a programming approval, the on-screen displays a message to user. Get programming approval from the TIS 2000 using the following procedure:
   a. Connect a scan tool to the terminal that installed TIS 2000 with the latest software and the hardware key is plugged into port.
   b. Turn ON the scan tool and keep at title screen.
   c. Launch the TIS application.
   d. Select the Security Access at the main screen.
   e. Highlight "Tech 2" on the Diagnostic Tool Selection screen and click "Next".
   f. Click "Close" on the Security Access Enabled screen.
   g. Turn OFF the scan tool.
   h. Disconnect the scan tool from the terminal.
5. Reinstall a scan tool to the vehicle.
6. Turn ON the ignition, with the engine OFF.
7. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Programming > Program Transponder Keys.
8. The on-screen displays a message "See Checking Procedure Before Programming!", then press Confirm.
9. Input four digits of correct security code that belongs to this vehicle and follow the on-screen instructions.

Notice: An incorrect security code input causes a security wait time.

10. Operate the ignition switch by following the on-screen instructions.



5. Actuator

- Clean the actuator contact surface with the housing.
- Apply liquid gasket to the contact surface on the actuator side.
- Align shift arm with the groove of sleeve and install the actuator.

4. Bolt

Tighten bolts to specified torque.

Actuator Bolt Torque	N·m (kgf·m/lb·in)
9 (0.9/78)	

3. Front Axle Drive Shaft (LH side)

2. Bolt

- Install front axle drive shaft and mounting bracket.
- Tighten fitting bolts to specified tightening torque.

Bolt Torque	N·m (kgf·m/lb·ft)
116 (11.8/85)	

1. Filler Plug

- Pour specified amount of differential gear oil.

Front Differential Oil Capacity	liter (US/UK gal)
1.4 (0.37/0.31)	

Actuator Housing Oil Capacity	liter (US/UK gal)
0.12 (0.03/0.03)	

- Install filler plug through packing and tighten to specified torque.

Filler Plug Torque	N·m (kgf·m/lb·ft)
78 (8.0/58)	

Notice: Keep away another key, another transponder key, key number plate or other metal items from the transponder key that is going to program.

11. The on-screen displays a message "Program more Transponder Keys?" If all transponder key(s) has been programmed, press No and go to next step. If more transponder key(s) need to be programmed, press Yes and repeat from previous step.
12. The on-screen displays a message "Program Transponder Keys Programming Completed Successfully!" if all transponder key(s) programming has been completed, then press Confirm.
13. Turn OFF the ignition for 30 seconds.
14. Verify the engine starts using all programmed transponder key(s).

ICU Resetting Procedure

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Additional Functions > Reset Immobilizer.
4. The on-screen displays a message "See Checking Procedure Before Programming!", then press Confirm.
5. Input four digits of correct security code that belongs to this vehicle and follow the on-screen instructions.

Notice: An incorrect security code input causes a security wait time.

6. The on-screen displays a message "Warning Engine will not start after Reset!", then press Confirm.
7. The on-screen displays a message "Reset Immobilizer Reset Completed Successfully!" if ICU resetting has been completed, then press Confirm.
8. Turn OFF the ignition for 30 seconds.
9. Verify the engine fails to run using all transponder key(s).

ICU Programming Procedure

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Programming > Program Immobilizer Function or Immobilizer Link To ECM/ PIM.
4. In order to get a programming approval, the on-screen displays a message to user. Get programming approval from the TIS 2000 using the following procedure:
   a. Connect a scan tool to the terminal that installed TIS 2000 with the latest software and the hardware key is plugged into port.
   b. Turn ON the scan tool and keep at title screen.
   c. Launch the TIS application.
   d. Select the Security Access at the main screen.
   e. Highlight "Tech 2" on the Diagnostic Tool Selection screen and click "Next".
   f. Click "Close" on the Security Access Enabled screen.
   g. Turn OFF the scan tool.
   h. Disconnect the scan tool from the terminal.
5. Reinstall a scan tool to the vehicle.
6. Turn ON the ignition, with the engine OFF.
7. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Programming > Program Immobilizer Function or Immobilizer Link To ECM/ PIM.
8. The on-screen displays a message "See Checking Procedure Before Programming!", then press Confirm.
9. Select "Immobilizer Installed" or select "Imoobilizer Replaced" Yes.
10. Select "PIM or ECM Replaced" No, if displayed.
11. Input four digits of correct security code that belongs to this vehicle and follow the on-screen instructions. The on-screen instruction may repeat twice.

Notice: An incorrect security code input causes a security wait time.

12. Input 17 digits of correct VIN that is based on stamped VIN or affixed VIN plate on this vehicle.
13. Operate the ignition switch by following the on-screen instructions.

Notice: Keep away another key, another transponder key, key number plate or other metal items from the transponder key that is going to program.

14. The on-screen displays a message "Program more Transponder Keys?" If all transponder key(s) has been programmed, press No and go to next step. If more transponder key(s) need to be programmed, press Yes and repeat from previous step.
15. The on-screen displays a message "Programming Successfully!" if ICU and all transponder key(s) programming has been completed, then press Confirm.
16. Turn OFF the ignition for 30 seconds.
17. Verify the engine starts using all programmed transponder key(s).

ECM Resetting Procedure

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.

3. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Additional Functions > Reset Engine Control Module. (4JK1/4JJ1)
   Select Diagnostics > Appropriate vehicle identification > Engine > V6 Engine > Programming > Reset ECU. (HFV6)
4. The on-screen may display a message "See Checking Procedure Before Programming!", then press Confirm.
5. Input four digits of correct security code that belongs to this vehicle and follow the on-screen instructions.

Notice: An incorrect security code input causes a security wait time.

6. The on-screen displays a message "Warning! Engine will not start after Reset!", then press Reset.
7. The on-screen displays a message "Reset Successfully!" if ECM resetting has been completed, then press Confirm.
8. Turn OFF the ignition for 30 seconds.
9. Verify the engine fails to run using all transponder key(s).

ECM Programming Procedure

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Programming > Program Immobilizer Function or Immobilizer Link To ECM/ PIM.
4. In order to get a programming approval, the on-screen displays a message to user. Get programming approval from the TIS 2000 using the following procedure:
   a. Connect a scan tool to the terminal that installed TIS 2000 with the latest software and the hardware key is plugged into port.
   b. Turn ON the scan tool and keep at title screen.
   c. Launch the TIS application.
   d. Select the Security Access at the main screen.
   e. Highlight "Tech 2" on the Diagnostic Tool Selection screen and click "Next".
   f. Click "Close" on the Security Access Enabled screen.
   g. Turn OFF the scan tool.
   h. Disconnect the scan tool from the terminal.
5. Reinstall a scan tool to the vehicle.
6. Turn ON the ignition, with the engine OFF.
7. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Programming > Program Immobilizer Function or Immobilizer Link To ECM/ PIM.
8. The on-screen may display a message "See Checking Procedure Before Programming!", then press Confirm.
9. Select "Imoobilizer Replaced" No and select "PIM or ECM Replaced" Yes, if displayed.
10. Input four digits of correct security code that belongs to this vehicle and follow the on-screen instructions. The on-screen instruction may repeat twice.

Notice: An incorrect security code input causes a security wait time.

11. Select "Engine Controller Installed" or select "ECM Replaced".
12. Operate the ignition switch by following the on-screen instructions.
13. The on-screen displays a message "Programming Successfully!" if ECM programming has been completed, then press Confirm.
14. Turn OFF the ignition for 30 seconds.
15. Verify the engine starts using all transponder key(s).

PIM Resetting Procedure

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > Appropriate vehicle identification > Body > Powertrain Interface Module > Security > Reset PIM.
4. Input four digits of correct security code that belongs to this vehicle and follow the on-screen instructions.

Notice: An incorrect security code input causes a security wait time.

5. The on-screen displays a message "Warning! Engine will not start after Reset!", then press Reset.
6. The on-screen displays a message "Reset Completed Successfully!" if PIM resetting has been completed, then press Confirm.
7. Turn OFF the ignition for 30 seconds.

PIM Programming Procedure

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Programming > Immobilizer Link To ECM/ PIM.
4. In order to get a programming approval, the onscreen displays a message to user. Get programming approval from the TIS 2000 using the following procedure:

a. Connect a scan tool to the terminal that installed TIS 2000 with the latest software and the hardware key is plugged into port.
b. Turn ON the scan tool and keep at title screen.
c. Launch the TIS application.
d. Select the Security Access at the main screen.
e. Highlight "Tech 2" on the Diagnostic Tool Selection screen and click "Next".
f. Click "Close" on the Security Access Enabled screen.
g. Turn OFF the scan tool.
h. Disconnect the scan tool from the terminal.

5. Reinstall a scan tool to the vehicle.
6. Turn ON the ignition, with the engine OFF.
7. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Programming > Immobilizer Link To ECM/ PIM.
8. Select "Immobilizer Replaced" No and select "PIM or ECM Replaced" Yes.
9. Input four digits of correct security code that belongs to this vehicle and follow the on-screen instructions. The on-screen instruction repeats twice.

Notice: An incorrect security code input causes a security wait time.

10. Select "PIM Replaced".
11. Operate the ignition switch by following the on-screen instructions.
12. The on-screen displays a message "Programming Successfully!" if PIM programming has been completed, the press Confirm.

ICU & PIM Programming Procedure

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Programming > Immobilizer Link To ECM/ PIM.
4. In order to get a programming approval, the onscreen displays a message to user. Get programming approval from the TIS 2000 using the following procedure:
   a. Connect a scan tool to the terminal that installed TIS 2000 with the latest software and the hardware key is plugged into port.
   b. Turn ON the scan tool and keep at title screen.
   c. Launch the TIS application.
   d. Select the Security Access at the main screen.
   e. Highlight "Tech 2" on the Diagnostic Tool Selection screen and click "Next".
   f. Click "Close" on the Security Access Enabled screen.
   g. Turn OFF the scan tool.
   h. Disconnect the scan tool from the terminal.
5. Reinstall a scan tool to the vehicle.
6. Turn ON the ignition, with the engine OFF.
7. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Programming > Immobilizer Link To ECM/ PIM.
8. Select "Immobilizer Replaced" Yes and select "PIM or ECM Replaced" Yes.
9. Input four digits of correct security code that belongs to this vehicle and follow the on-screen instructions. The on-screen instruction repeats twice.

Notice: An incorrect security code input causes a security wait time.

10. Select "PIM Replaced".
11. Input 17 digits of correct VIN that is based on stamped VIN or affixed VIN plate on this vehicle.
12. Operate the ignition switch by following the onscreen instructions.

Notice: Keep away another key, another transponder key, key number plate or other metal items from the transponder key that is going to program.

13. The on-screen displays a message "Program more Transponder Keys?" If all transponder key(s) has been programmed, press No and go to next step. If more transponder key(s) need to be programmed, press Yes and repeat from previous step.
14. The on-screen displays a message "Programming Successfully!" if ICU, PIM and all transponder key(s) programming has been completed, the press Confirm.
15. Turn OFF the ignition for 30 seconds.
16. Verify the engine starts using all programmed transponder key(s).

ECM & PIM Programming Procedure

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Programming > Immobilizer Link To ECM/ PIM.
4. In order to get a programming approval, the onscreen displays a message to user. Get programming approval from the TIS 2000 using the following procedure:
   a. Connect a scan tool to the terminal that installed TIS 2000 with the latest software and the hardware key is plugged into port.
   b. Turn ON the scan tool and keep at title screen.
   c. Launch the TIS application.
   d. Select the Security Access at the main screen.

   e. Highlight "Tech 2" on the Diagnostic Tool Selection screen and click "Next".
   f. Click "Close" on the Security Access Enabled screen.
   g. Turn OFF the scan tool.
   h. Disconnect the scan tool from the terminal.
5. Reinstall a scan tool to the vehicle.
6. Turn ON the ignition, with the engine OFF.
7. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Programming > Immobilizer Link To ECM/ PIM.
8. Select "Immobilizer Replaced" No and select "PIM or ECM Replaced" Yes.
9. Input four digits of correct security code that belongs to this vehicle and follow the on-screen instructions. The on-screen instruction repeats twice.

Notice: An incorrect security code input causes a security wait time.

10. Select "PIM and ECM Replaced".
11. Operate the ignition switch by following the on-screen instructions.
12. The on-screen displays a message "Programming Successfully!" if ECM and PIM programming has been completed, the press Confirm.

ICU & ECM Programming Procedure

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Programming > Program Immobilizer Function or Immobilizer Link To ECM/ PIM.
4. In order to get a programming approval, the on-screen displays a message to user. Get programming approval from the TIS 2000 using the following procedure:
   a. Connect a scan tool to the terminal that installed TIS 2000 with the latest software and the hardware key is plugged into port.
   b. Turn ON the scan tool and keep at title screen.
   c. Launch the TIS application.
   d. Select the Security Access at the main screen.
   e. Highlight "Tech 2" on the Diagnostic Tool Selection screen and click "Next".
   f. Click "Close" on the Security Access Enabled screen.
   g. Turn OFF the scan tool.
   h. Disconnect the scan tool from the terminal.
5. Reinstall a scan tool to the vehicle.
6. Turn ON the ignition, with the engine OFF.
7. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Programming > Program Immobilizer Function or Immobilizer Link To ECM/ PIM.
8. The on-screen may display a message "See Checking Procedure Before Programming!", then press Confirm.
9. Select "Immobilizer and ECM Installed" or select "Immobilizer Replaced" Yes.
10. Select "PIM or ECM Replaced" Yes, if displayed.
11. Input four digits of correct security code that belongs to this vehicle and follow the on-screen instructions. The on-screen instruction repeats twice.

Notice: An incorrect security code input causes a security wait time.

12. Select "ECM Replaced" if displayed.
13. Input 17 digits of correct VIN that is based on stamped VIN or affixed VIN plate on this vehicle.
14. Operate the ignition switch by following the on-screen instructions.

Notice: Keep away another key, another transponder key, key number plate or other metal items from the transponder key that is going to program.

15. The on-screen displays a message "Program more Transponder Keys?" If all transponder key(s) has been programmed, press No and go to next step. If more transponder key(s) need to be programmed, press Yes and repeat from previous step.
16. The on-screen displays a message "Programming Successfully!" if ICU, ECM and all transponder key(s) programming has been completed, then press Confirm.
17. Turn OFF the ignition for 30 seconds.
18. Verify the engine starts using all programmed transponder key(s).

ICU, ECM & PIM Programming Procedure

1. Install a scan tool.
2. Turn ON the ignition, with the engine OFF.
3. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Programming > Immobilizer Link To ECM/ PIM.
4. In order to get a programming approval, the onscreen displays a message to user. Get programming approval from the TIS 2000 using the following procedure:
   a. Connect a scan tool to the terminal that installed TIS 2000 with the latest software and the hardware key is plugged into port.
   b. Turn ON the scan tool and keep at title screen.
   c. Launch the TIS application.
   d. Select the Security Access at the main screen.

e. Highlight "Tech 2" on the Diagnostic Tool Selection screen and click "Next".
f. Click "Close" on the Security Access Enabled screen.
g. Turn OFF the scan tool.
h. Disconnect the scan tool from the terminal.

5. Reinstall a scan tool to the vehicle.
6. Turn ON the ignition, with the engine OFF.
7. Select Diagnostics > Appropriate vehicle identification > Body > Immobilizer > Programming > Immobilizer Link To ECM/ PIM.
8. Select "Immobilizer Replaced" Yes and select "PIM or ECM Replaced" Yes.
9. Input four digits of correct security code that belongs to this vehicle and follow the on-screen instructions. The on-screen instruction repeats twice.

Notice: An incorrect security code input causes a security wait time.

10. Select "PIM and ECM Replaced".
11. Input 17 digits of correct VIN that is based on stamped VIN or affixed VIN plate on this vehicle.
12. Operate the ignition switch by following the onscreen instructions.

Notice: Keep away another key, another transponder key, key number plate or other metal items from the transponder key that is going to program.

13. The on-screen displays a message "Program more Transponder Keys?" If all transponder key(s) has been programmed, press No and go to next step. If more transponder key(s) need to be programmed, press Yes and repeat from previous step.
14. The on-screen displays a message "Programming Successfully!" if ICU, ECM, PIM and all transponder key(s) programming has been completed, the press Confirm.
15. Turn OFF the ignition for 30 seconds.
16. Verify the engine starts using all programmed transponder key(s).

Repair Instructions

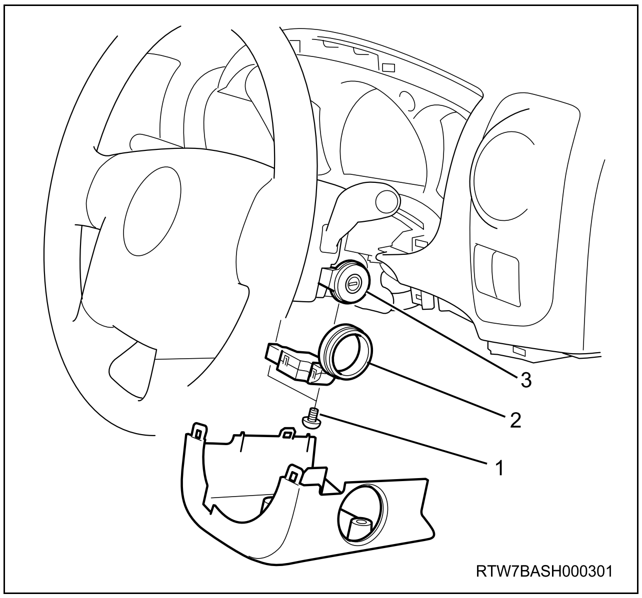
Immobilizer Control Unit (ICU) Replacement

Resetting ICU

Reset immobilizer security information in the old ICU. Refer to Resetting and Programming Guidelines in this section. If the old ICU cannot be communicated with a scan tool, go to the next procedure.

Removal Procedure

1. Disconnect the negative battery cable.
2. Remove the steering column cover.
3. Disconnect the ICU harness connector.
4. Loose screws (1) and remove the ICU (2) from the steering lock(3).



Installation Procedure

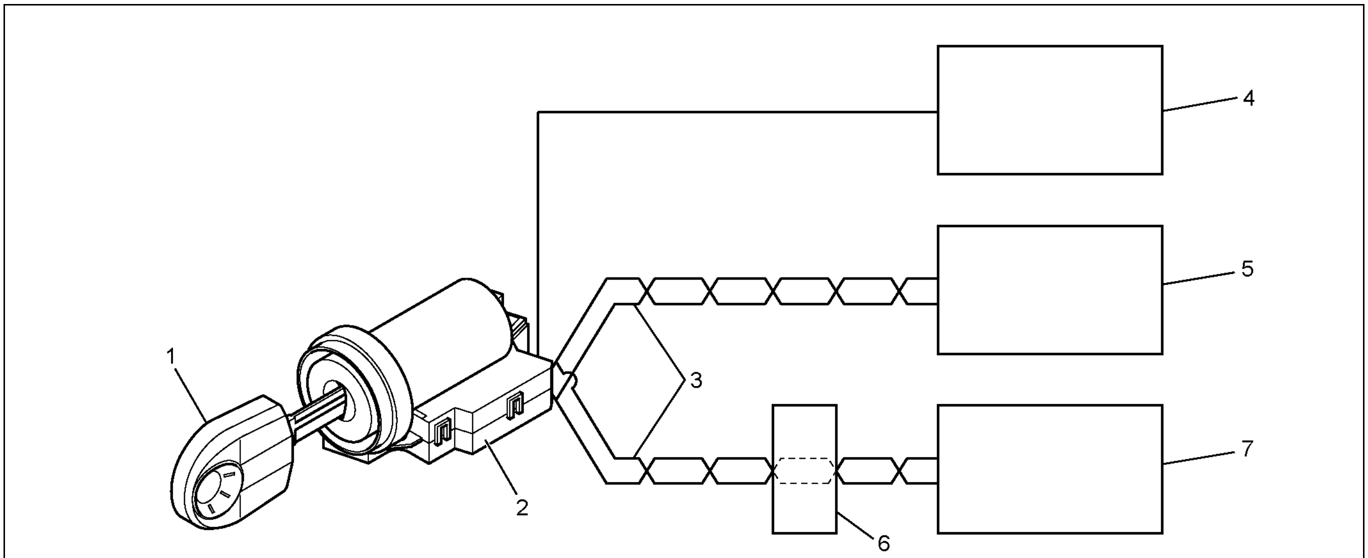
1. Install the ICU (2) to the steering lock (3) and tighten screws (1).
2. Connect the ICU harness connector.
3. Install the steering column cover.
4. Connect the negative battery cable.

Programming ICU

Program immobilizer security information into the ICU. Refer to Resetting and Programming Guidelines in this section.

Description and Operation

Immobilizer System Description



RTW7BASF000301

Legend

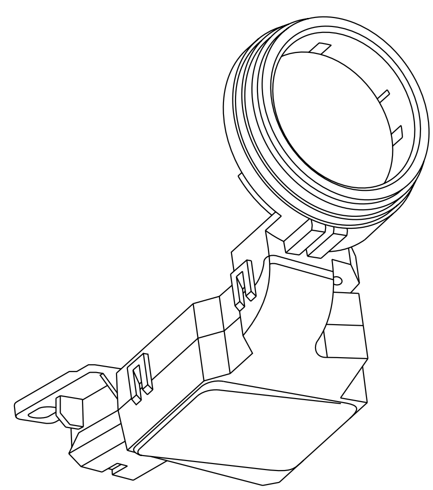
1. Transponder key
2. ICU
3. Controller area network (CAN) communication bus lines
4. Anti-theft control unit (with anti-theft system)
5. Engine control module (ECM) (4JK1/ 4JJ1)
6. Powertrain interface module (PIM)
7. Engine control module (ECM) (HFV6)

The immobilizer controls engine starting along with the engine control module (ECM). The main system components are the ICU, the ECM, the PIM (HFV6) and the transponder key. The immobilizer system is activated (immobilized) by an incorrectly programmed or non-programmed transponder key, the ICU or the ECM. While this system is activated, the ECM controls the fuel injection system and starter cut relay in order to fail to engine running. A typical engine starting sequence is below.

1. When the ignition switch is ON, the ICU begins authentication of the transponder key in the steering lock. The ICU transmits a specific request signal to the transponder key and the transponder key sends back a response signal to the ICU. Both communication signals are carried out via antenna coil.
2. Because the anti-theft system alarms if a key or other methods unlock the door, when the transponder key is correctly authenticated the ICU transmits an alarm cancel (disarm) signal to the anti-theft control unit. (With anti-theft system)
3. After the transponder key authentication is completed, the ICU begins authentication of the ECM. The ECM transmits a specific request signal to the ICU and the ICU sends back a response signal to the ECM. Both communication signals are carried out via a controller area network (CAN) communication bus.
4. After the ECM authentication is completed, the ECM enables engine running.

Immobilizer System Componenet Description

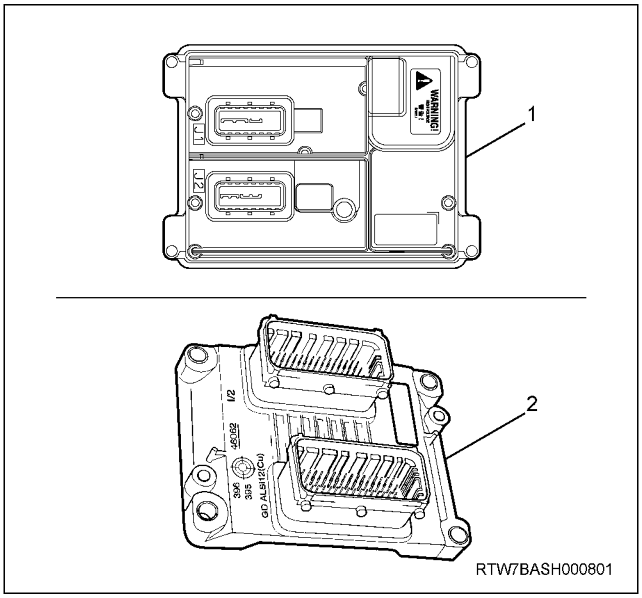
Immobilizer Control Unit (ICU)



RTW7BASH000101

The ICU is installed to the steering lock. The ICU controls the immobilizer system by authentication of the transponder key and the ECM. An antenna coil is a part of the ICU and it is located around steering key lock cylinder. An antenna coil is energized when the ICU is performing an authentication of the transponder key.

Engine Control Module (ECM)

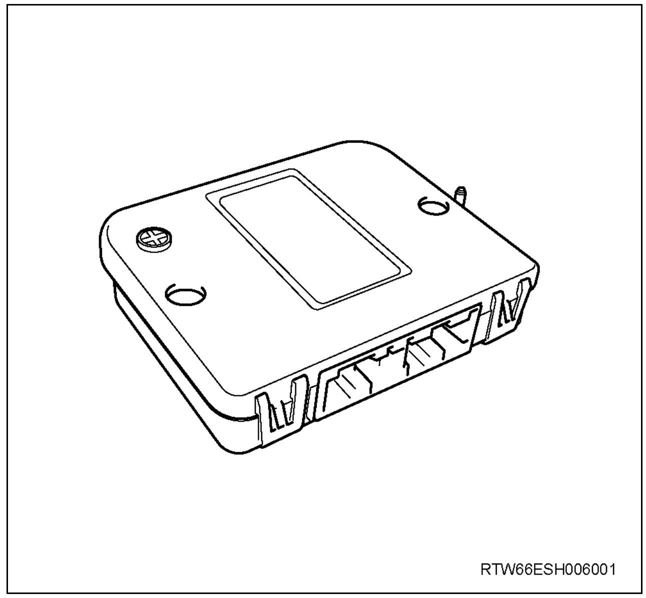


Legend

1. ECM (4JK1/ 4JJ1)
2. ECM (HFV6)

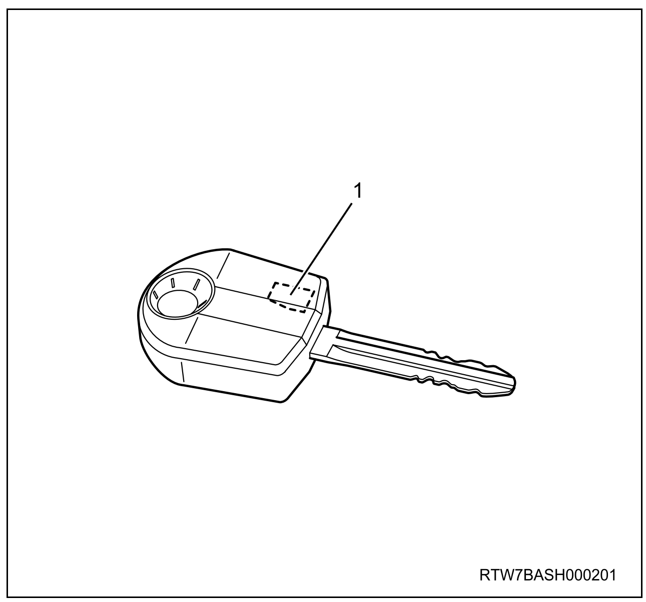
The ECM is located inside of engine compartment via mounting bracket and is behind air cleaner case (4JK1/ 4JJ1) or attached to the engine (HFV6). The ECM mainly controls the engine control and also exchanges a request signal and a response signal to an ICU. If fault occurs on immobilizer system, the ECM sets DTC(s) and illuminates the service vehicle soon (SVS) lamp or the malfunction indicator lamp (MIL).

Powertrain Interface Module (PIM)



The PIM is located behind the driver's side lower hinge pillar trim. The PIM acts as the communication gateway between the CAN communication protocol and other protocol. The PIM converts analog signals from some switches into serial data. The PIM upon inputs received from the ECM, TCM and ICU controls the operation of instruments and indicator lamps. (HFV6)

Transponder Key



Legend

1. Transponder chip

The transponder key accommodates a transponder chip in the grip portion. The transponder keys have no conventional power supply. The transponder chip is energized via a radio wave supplied from an antenna coil fitted around the steering lock cylinder. Only transponder key that is correctly programmed key is possible to engine run. Maximum five transponder keys can be provided by additional programming.

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The immobilizer system consists of the four major components which are Engine Control Module (ECM), Immobilizer Control Unit (ICU), transponder, and scan tool (Tech-2).

This system can be activated by a correctly programmed transponder and starter switch is set to OFF.

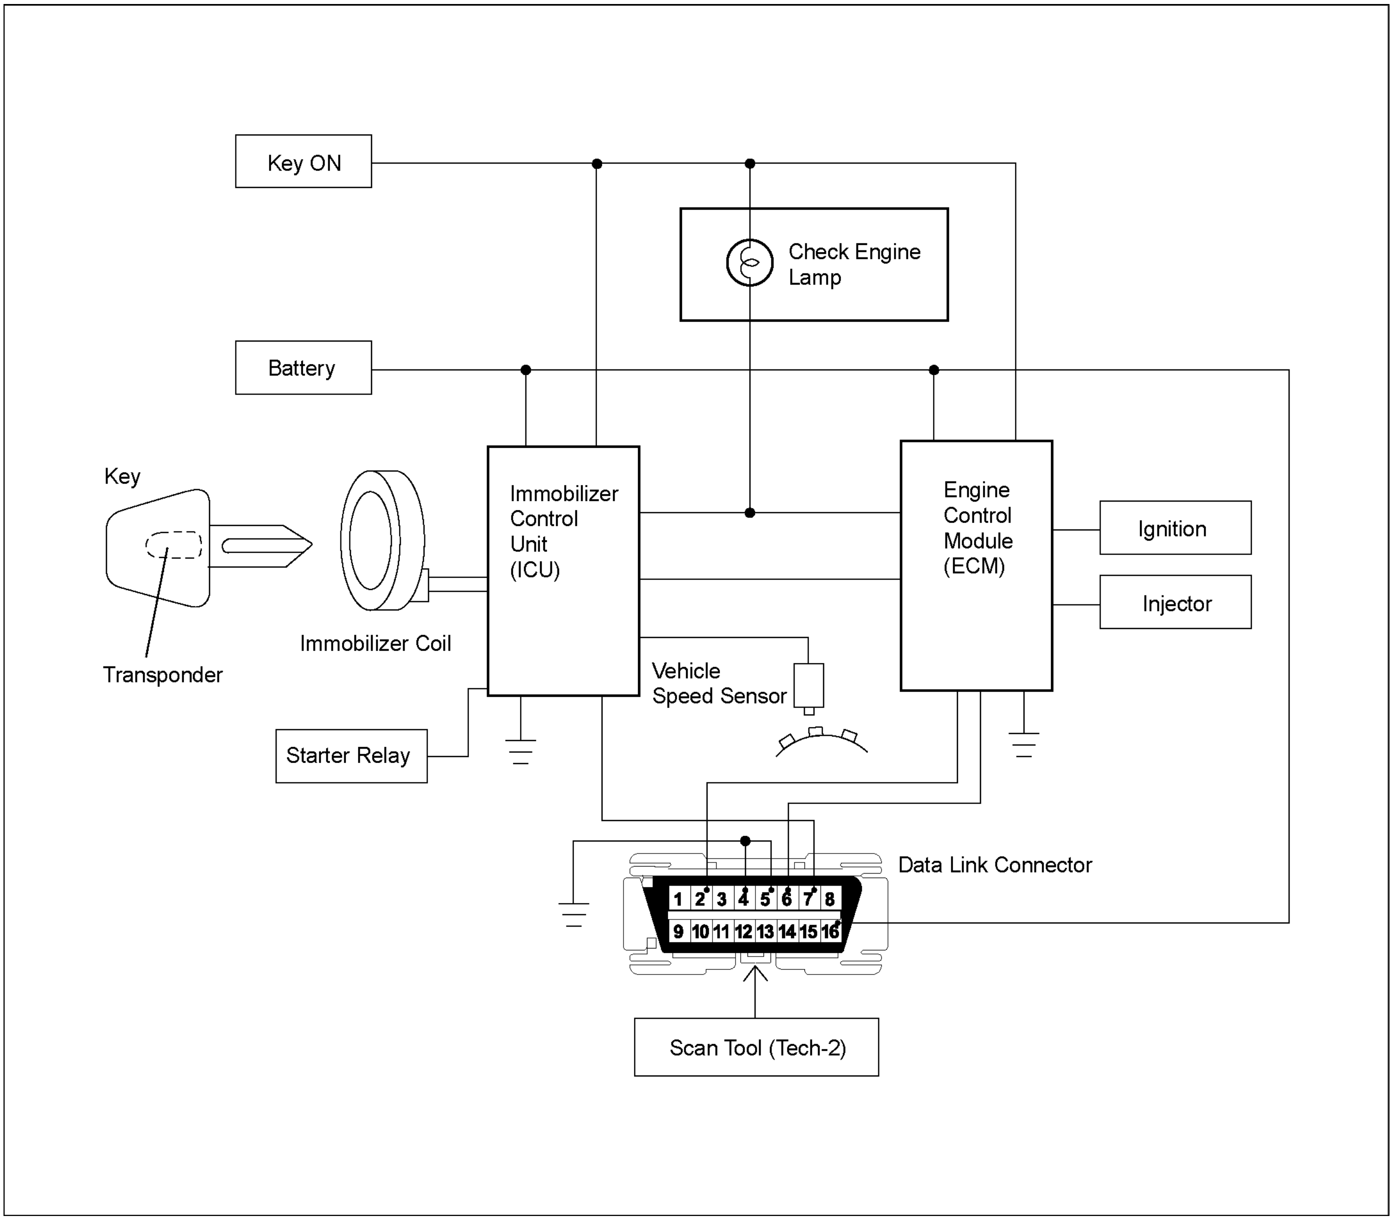
This system can be deactivated by a correctly programmed transponder key connected with a correctly programmed ECM and a correctly programmed ICU.

While the system is on :

The starter cut off relay deactivates function of starter, and the fuel injector power source is deactivated also.

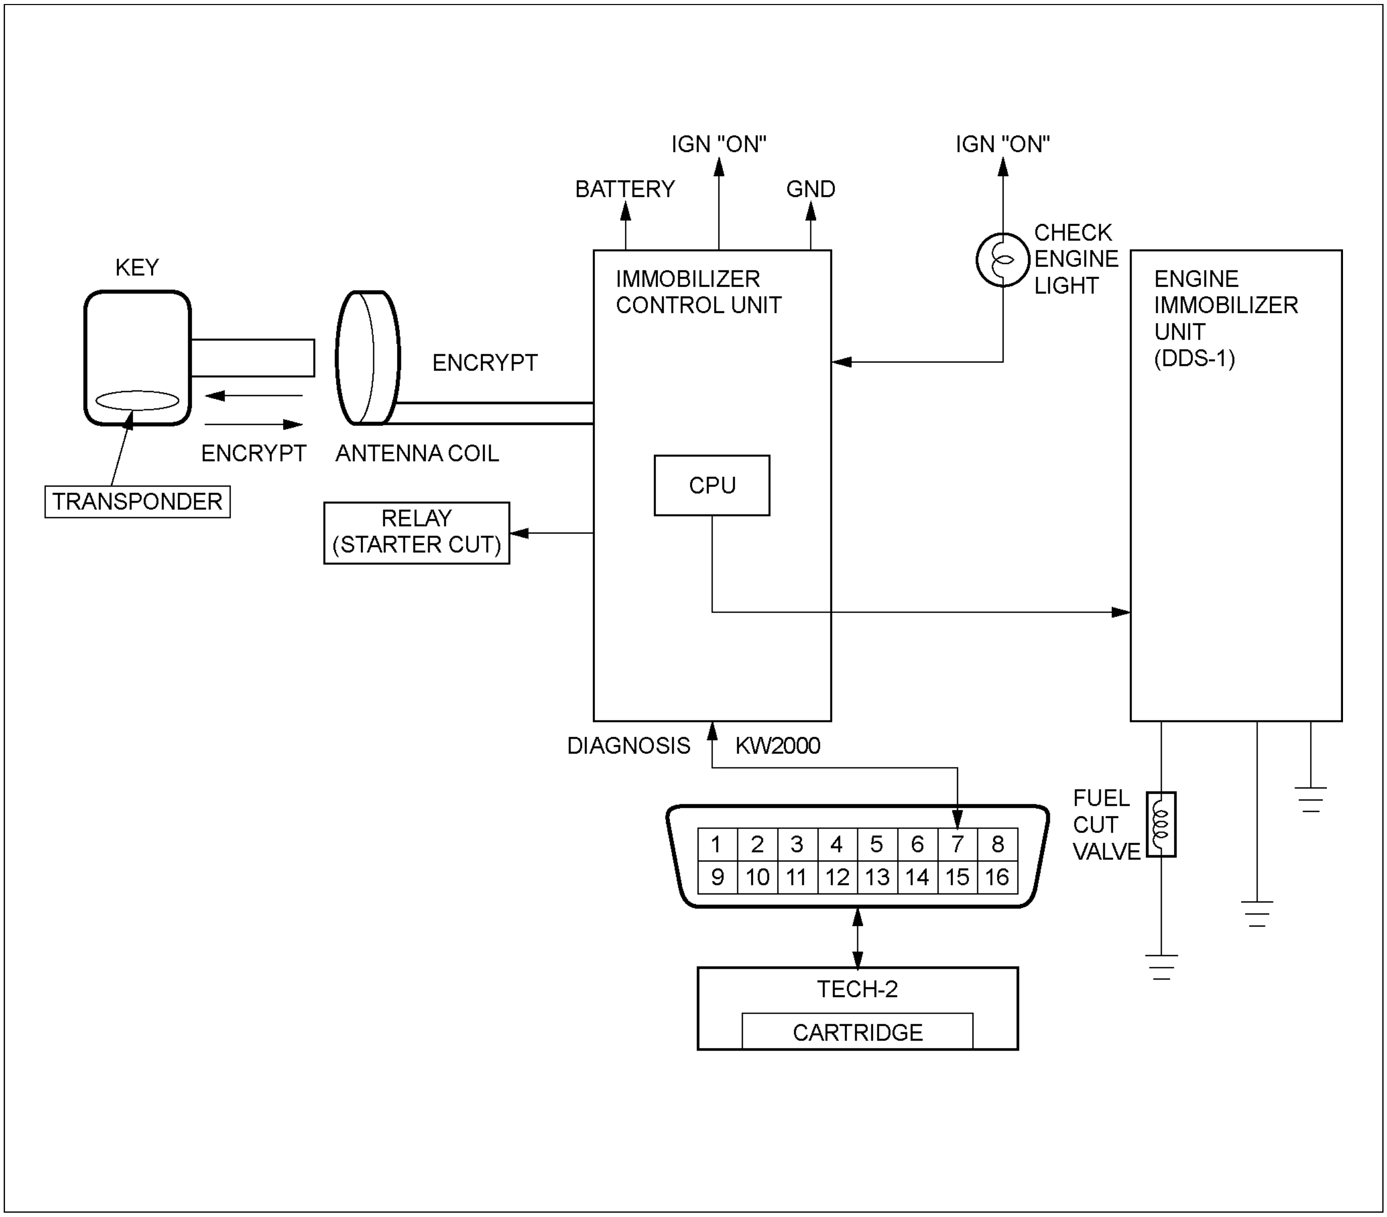
- Check Engine lamp is flashing.
- Warning buzzer is operating.
  (With antitheft system)

- **Gasoline Engine (C24SE)**



LTW3BALF000101

Diesel Engine With Engine Immobilizer Unit (4JA1-T Mechanical Control Engine)



RAW4B0LF000101

What happens without proper transponder operation?

One of the function of transponder is to deactivate or activate starter function. If the proper transponder is not used, starter cannot be operated. Because starter relay stays off, cranking engine is not possible.

After the starter relay is activated, transponder signal triggers to let ICU calculate by transponder address signal and immobilizer algorithm.

When the result matches with necessary condition, it makes injector power source be activated.

If transponder does not send correct signal, ICU and ECM do not activate injector system on.

Therefore the vehicle cannot be operated.

No proper transponder is available, what should be done for the system?

When any proper transponder is not available, a new transponder should be programmed. Up to 5 transponders can be provided with a scan tool (Tech-2) and by proper procedure.

In addition to the absence of proper transponder, it may happen particular secret code to the particular vehicle is missing. In this case, the secret code must be provided by your organization.

Otherwise transponder cannot be programmed in any way.

If the essential for a scan tool (Tech-2) for programming and proper software for Tech-2 are not available, there is no permanent way to fix system. Temporary replace with new ECM, new ICU and new transponder without any secret code can make the system be deactivated, but it does not last long. Such a replacement does not solve any condition. Even after replacement, the system is activated automatically in short time and then no operation of the vehicle can be made in any way.

Tech-2 should be provided in your organization.

Caution to the operation

If an attempt is made to start the engine while the immobilizer system is activated, the check engine lamp flashes and the engine will not start.

Summary of operation

Switch on: Set the ignition and starter switch to OFF.

(Activate)

Switch off: Set the ignition and starter switch to ON by using the transponder key. (Deactivate)

What your organization should provide for your customer

• Car Pass

For a new owner, your dealership must hand Car Pass card, which has identification numbers of new owner's vehicle immobilizer system. This information is very important in case of repair or lost of transponder.

The followings are necessary items provided by your responsibility.

1) Car pass with identification for a new owner
2) Blank car pass card when it is for reissue
3) Instruction to dealers how to use car pass card

• Security code management

Your organization must keep security codes for all vehicles as confidential data. Once the security codes are lost, anybody who have the security code can access immobilizer system. Your organization has responsibility of any missing vehicles caused by stolen security code.

• Essential tool (Scan tool : Tech-2)

Your dealership must have Tech-2, and Tech-2 updated software for immobilizer system.

B-7	Communication: carry on line from ECM to ICU (Check engine lamp)
B-8	Communication: carry on line from ICU to ECM (Communication line W)

Immobilizer control unit (ICU); Mechanical Control Engine (4JA1-T)

Immobilizer control unit (ICU) permits engine starting, when the security code which compares the security code registered into the transponder (key) and the security code registered into ICU, and is similarly registered into ICU and engine immobilizer unit (DDS-1) is compared and it is judged that it is normal. When the code registered into the key is unusual, and when not recognizing a security code, engine immobilizer unit does not permit starting of engine by the fuel cut valve on the fuel pump.

The engine immobilizer unit is located with fuel cut valve on fuel pump 4JA1-T engine.

The immobilizer control unit decides whether there is an abnormality the security code based on the engine immobilizer unit security code.

When the problem found, the engine immobilizer unit stops fuel supply by the fuel cut valve.

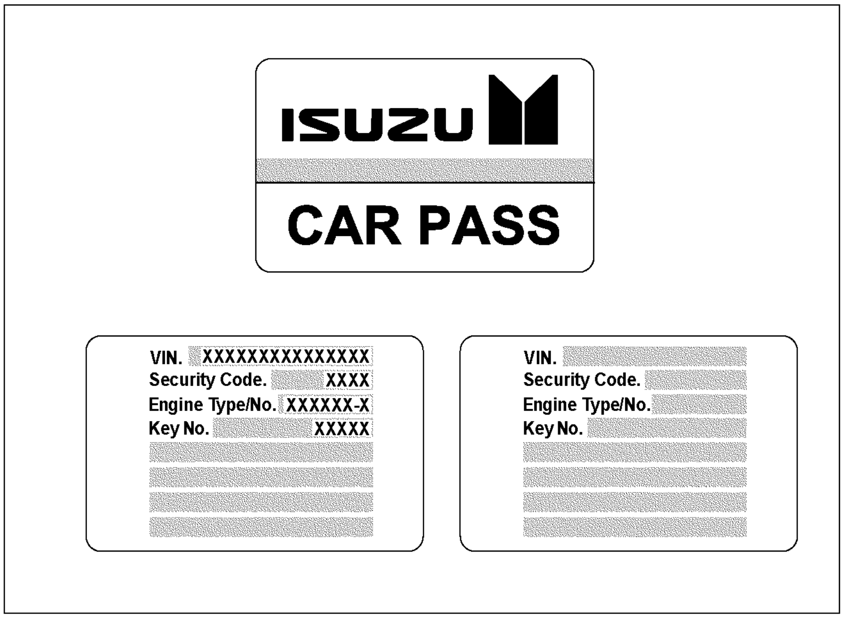
Car Pass Card

Issue of a car pass card is based on distributer. A car pass card is issued to the customer on delivery of the vehicle along with the other papers.



RUW38HMF000201

Notes:

This car pass card is an important document and must be treated with the same care as the vehicle papers.

It must not be kept in the vehicle. The customer must present the car pass card for operations involving the immobilizer or the engine control unit.

Loss of car pass card

If the car pass card is lost, the data can be requested from your proper organization name. This request will only be processed if accompanied by the enclosed form and proof of ownership. Once the data is received, it can be entered in a blank car pass and given to the customer.

The unused car pass should be destroyed.

Instructions on Filling Out the form "Data request, car pass"

To be provided by the dealership.

The data requested under items 1-10 must be provided completely, including the authorized dealership number, the vehicle Identification number (VIN) and engine type/number (Engine type/No).

Mark missing data / desired data with a cross:

- Security code (for diagnosis and programming with Tech-2)
- Mechanical key Number

Complete the form by entering the data and signature/authorized dealership stamp and send it along with proof of ownership (Vehicle ID or invoice) to address provided in the form. The requested data will be sent by Fax to the dealership that made the request after your organization has confirmed that the info is corrected.

Important Instructions

Only data corresponding to the delivery status of the vehicle can be issued. Car pass data requests will only be processed if the first column is filled out completely.

Signed and sent to your organization along with proof of ownership.

Information via telephone is only possible in exceptional circumstances via your service organization.

As for the delivery of new vehicles, the customer must be informed about all features of the car pass that are relevant to vehicle security, for example, that the car pass card should be kept in a safe place(not in the vehicle) and should be presented when an authorized your organization name workshop is visited, The exact phrasing can be found in the relevant Owner's Manual.

Data Request
Car Pass

Your organization name

To be filled out by authorized dealership:	Comment, plant security
	....
1. Dealership name..	....
2. Name of contact partner..	....
3. Dealership number..	....
4. Address..	....
....	....
5. Tel:.................................Fax.................................	....
6. Name of registerde keeper	
7. Reason for request (please mark with cross)

RUW38HXF000201

Important information on Programming

Security code

The security code protects the immobilizer control unit against unauthorized programming and data access from Tech-2. The security code consists of a 4 digit code number and is programmed into the immobilizer control unit and Engine Control Module (ECM).

New control units are not programmed with a security code.

If the control units are replaced, the security code entered in the car pass, transponder ID, etc.

Must be programmed into the new control unit with Tech-2.

The security code can only be programmed with Tech-2 once and must therefore be performed with great care.

Once programmed, the security code cannot be overwritten. An already used immobilizer can be reused in a different car by initializing the immobilizer. After that you can program the security code again. For initializing command you need the current security code.

If the immobilizer control unit is returned, always enclosed the security code that is allocated to that control unit. If this is not done, we can not process the case and the warranty will not be recognized.

Entering a code

If the Tech-2 display requests that the

- security code
- mechanical key number
- Vehicle Identification No.

be entered, process as follows;

To input a digit you need to use the up and down buttons of the Tech-2. By using the numeric buttons the according digit will be displayed at the current position and the cursor will move to the next position.

For letters you need to use the up and down buttons of the Tech-2. The up and down key might be used for digits as well. By using the up and down buttons the displayed digit or letter will be increased or decreased.

To move to the next position you need to use the move-to-right-button.

With the two buttons, move-to-right and move-to-left you can select the position of number you want to change.

This will allow you to correct a wrong number.

After the number is completed you need to press the Enter button to accept the number. Correction is now no longer possible.

Use the OKAY soft key to program the number and the NOT OKAY soft key to abort the programming.

Transponder (Key)

• If a transponder key is lost:

If a transponder key is lost, all transponder keys in the immobilizer control system must be erased. Transponder keys can be ordered via the "Your proper organization name such as part and accessory department" as previously by providing the mechanical key number.

The mechanical key number is provided on the car pass card.

Thereafter, existing and new transponder keys are programmed consecutively using Tech-2. The vehicle can then no longer be started using lost key.

• 5 transponder keys can be provided:

Each transponder has different Identifications. If a customer wants more than 2 transponder keys, maximum 5 transponder keys can be provided by additional programming by Tech-2.

• If a new ignition key with different mechanical key number needs to be installed:

If installation of an ignition lock with a different mechanism key number is necessary (an ignition lock which belongs to the mechanical key number has to be ordered first), all transponder keys must first be erased and the two transponder keys which belong to the ignition lock that is now installed must be programmed.

The new mechanical key number must be programmed now into the immobilizer. The mechanical key number in the car pass is to be changed as well.

Important:

After successful programming, the engine control can only be used for vehicles with immobilizer and transponder.

Faults that occur in connection with the immobilizer control unit are recognized by the engine control unit and as long as "IMMOBILOZER" is not programmed, are indicated by a flashing of the check engine lamp.

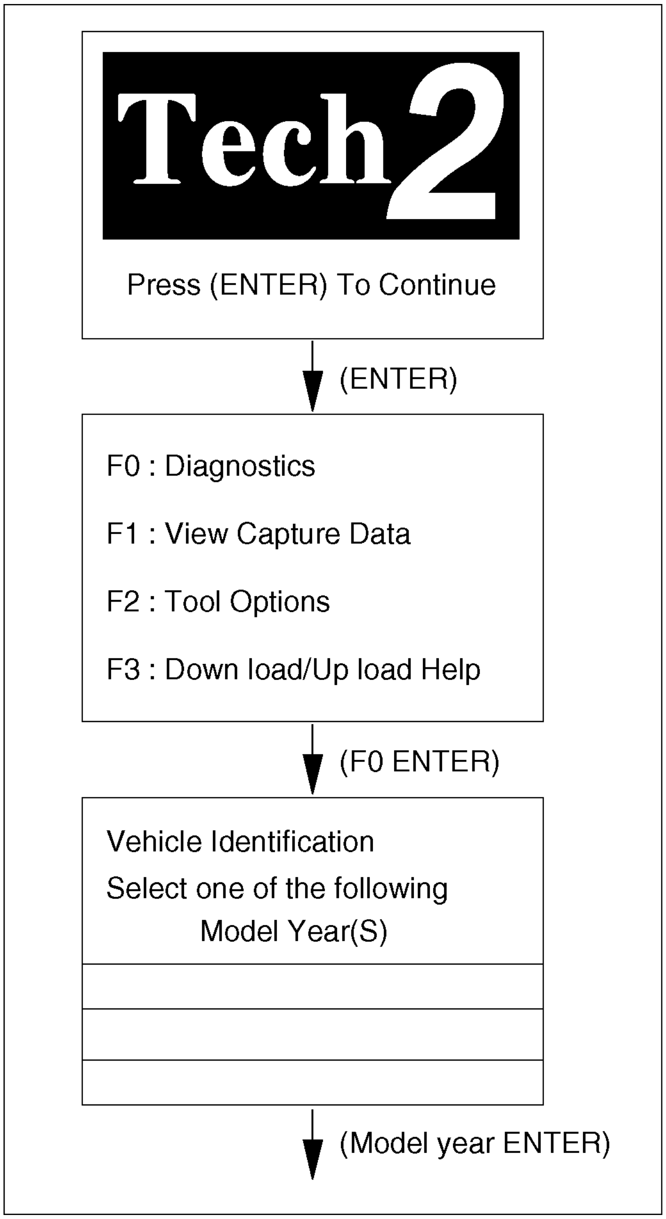
If the immobilizer and engine control unit are replaced at the same time, the immobilizer control unit must be programmed first before the "IMMOBILIZER" function in the engine control unit can be activated.

Tech 2 Scan Tool

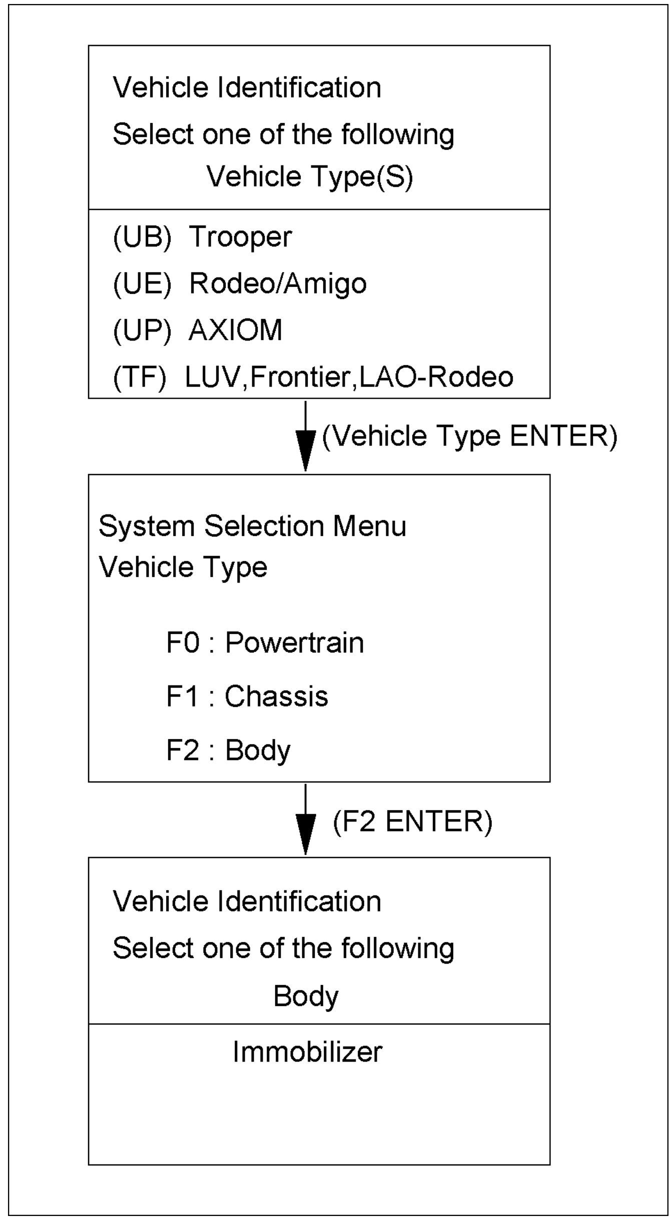
Operating Procedure

The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card.

Follow the operating procedure below.



060R100102



LTW3BALH000101

Menu

The following table shows which functions are used for the available equipment versions.

F0: Diagnostic Trouble Codes
- F0: Read DTC Info Ordered By Priority
- F1: Read DTC Info As Stored By ECU
- F2: Clear DTC Information

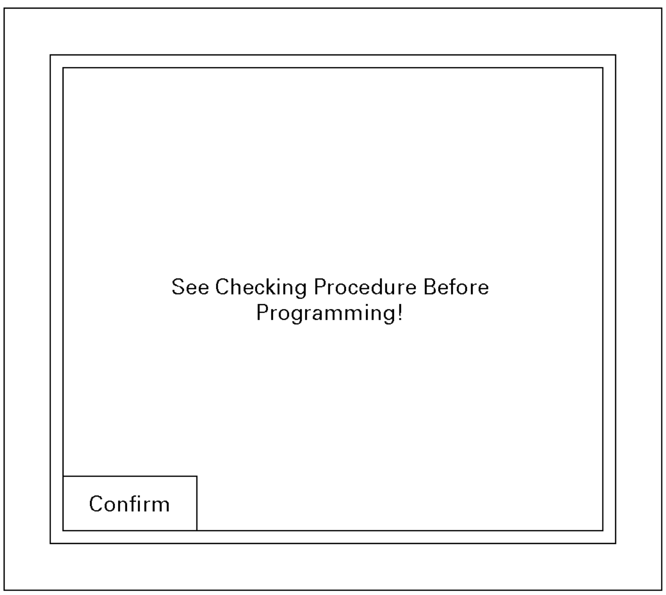
F1: Data Display

F2: Snap Shot

F3: Additional Function
- F0: Read ECU Identification
- F1: Reset Immobilizer
- F2: Reset Engine Control Module
- F3: Erase Transponder–Keys

F4: Programming
- F0: Program Immobilizer Function
- F1: Program Transponder–Keys

NOTE: Before going to programming process, Tech-2 indicates instruction as follows.



060R200289

DTC

On OBD has two options available in the Tech 2 DTC mode to display the enhanced information available.

- Read DTC Info Ordered By Priority
- Read DTC Info As Stored By ECU

Clear DTC Information

To clear Diagnostic Trouble Codes (DTCs), use the diagnostic scan tool "clear DTC information" function.

Tech-2 Data Display

Use the Tech 2 Data Values only after the On-Board Diagnostic System Check has been completed, no DTC(s) were noted, and you have determined that the on-board diagnostics are functioning properly.

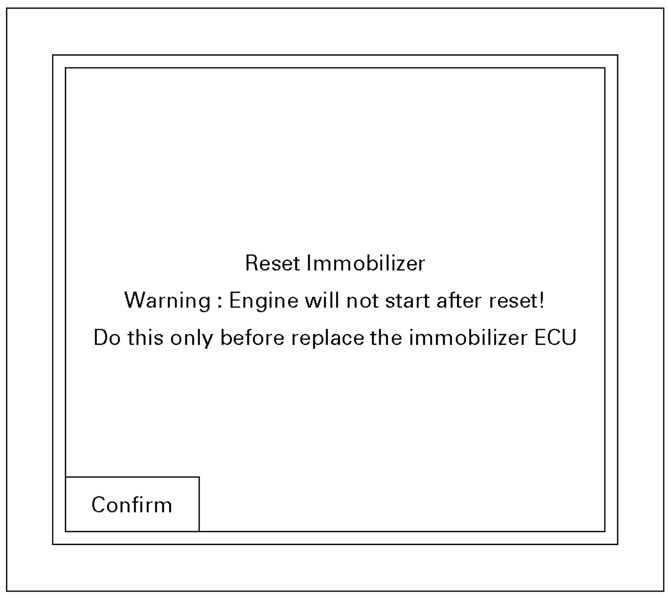
The Tech 2 data values represent values that would be seen on a normally-immobilizer system.

Check Vehicle Identification Number (VIN)

1. Select "Body" and "Immobilizer".
2. Select "Additional Function" and "Read ECU Identification".
3. Shows up VIN on tech-2 display.

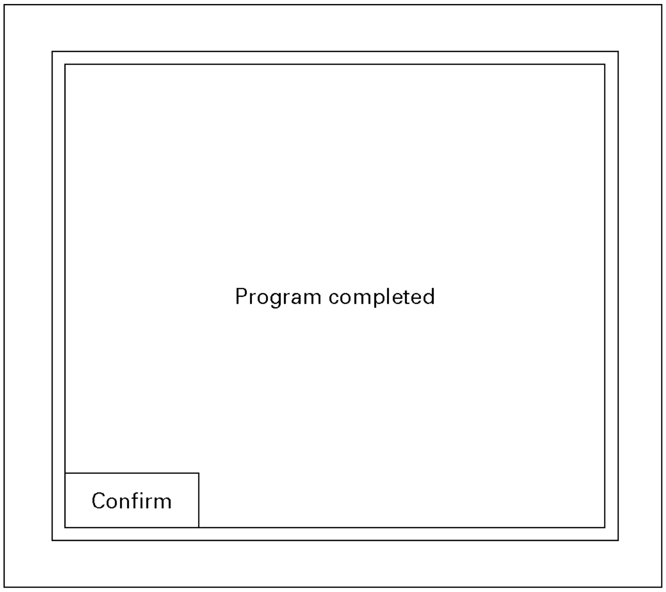
Reset Immobilizer (Reset Immobilizer Control Unit)

1. Select "Body" and "Immobilizer".
2. Select "Additional Function" and "Reset Immobilizer".
3. Enter the security code and press Confirm.
4. Reset Immobilizer screen shows up with warning. See the following screen.



060R200279

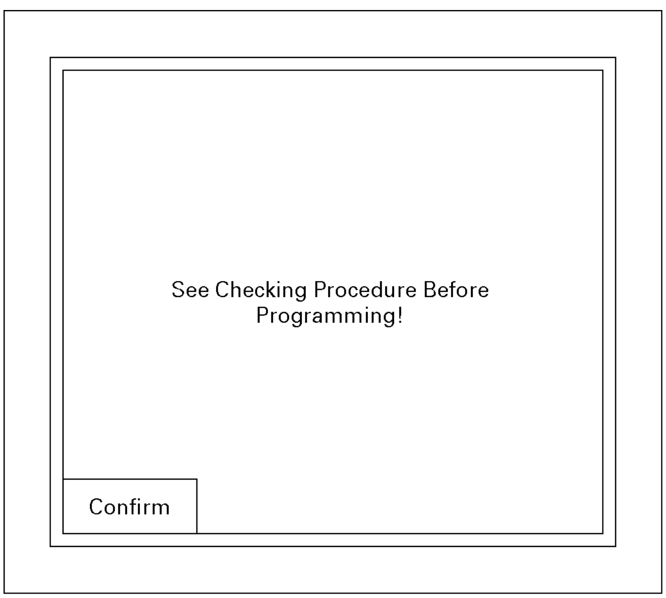
5. When reset is completed, the following screen shows up.



060R200278

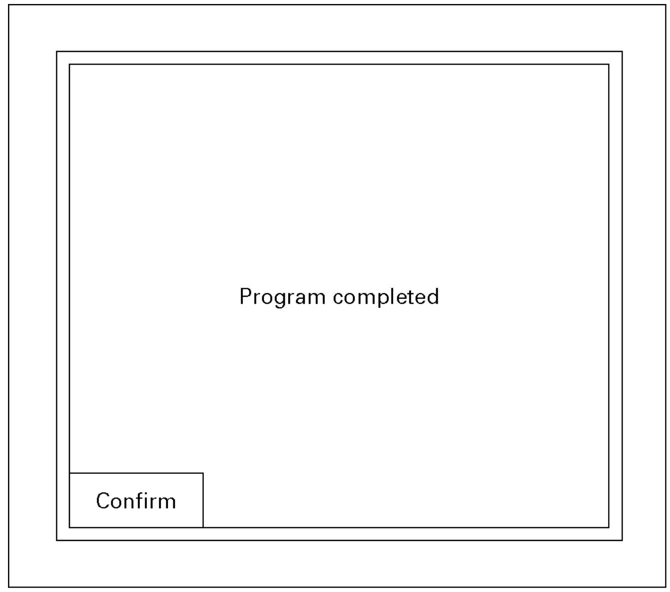
Reset Engine Control Module (Reset ECM)

1. Select "Body" and "Immobilizer".
2. Select "Additional Function" and "Reset Engine Control Module".
3. The following screen shows up.



060R200289

4. Confirm the following screen shows up.
5. Input the security code, then press the soft key of "Not Okay" or "Okay".
6. The following screen shows up.
7. Programming is completed.



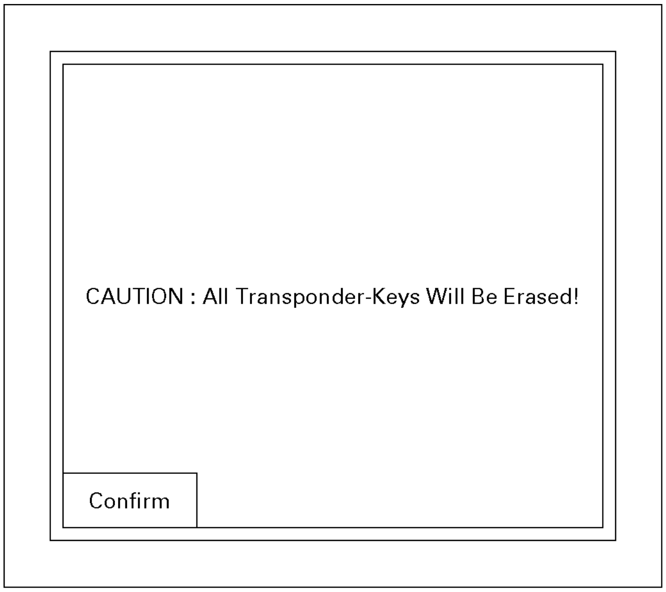
060R200278

8. When the procedure is completed waits 10 seconds and then turn the Key on.
   The fail lamp begins to flash.
9. Turn the ignition on, then engine dose not run.
10. Reset is completed.

Erase transponder key

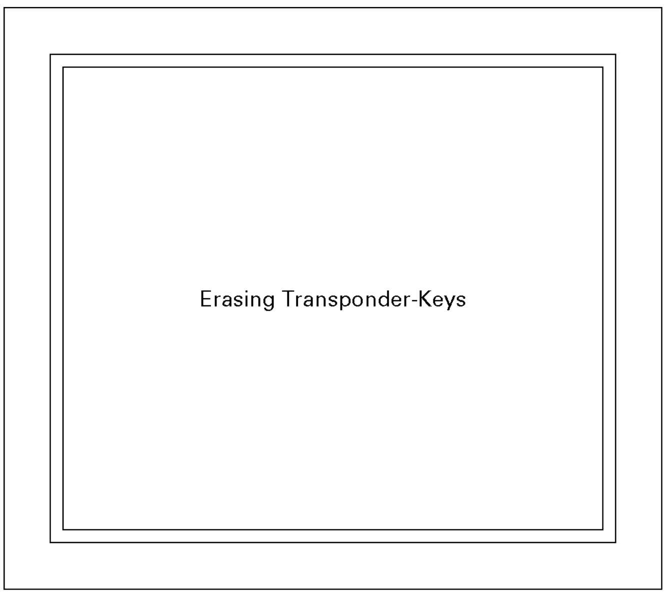
1. Select "Body" and "Immobilizer".
2. Select "Additional Function” and "Erase Transponder-Keys".
3. See immobilizer status on Tech-2 screen and type security code. If the status dose not allow the programming, only immobilizer status is displayed.
4. See illustration of caution.

• **CAUTION**



060R200286

• **Erase**



060R200285

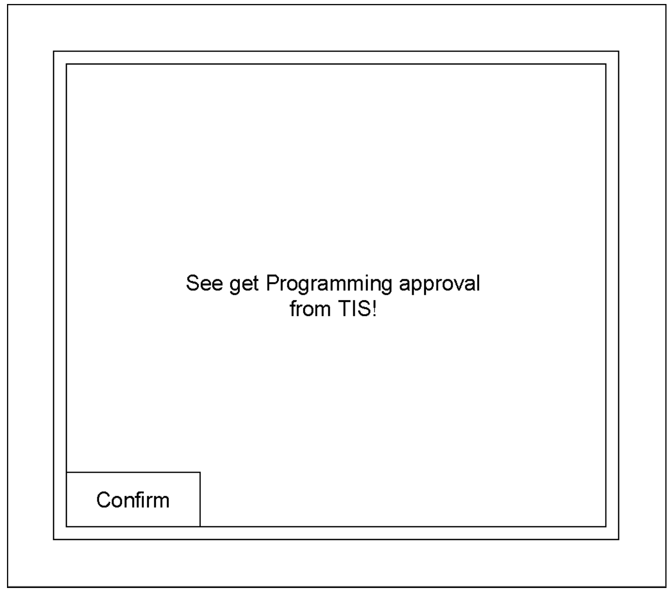
4. See programming result on display.

Programming Immobilizer Function

Caution:

1) Do not replace ICU and ECM at the same time
2) Change ICU at first or ECM and other one change follows.

1. Select "Body" and "immobilizer".
2. Select "Programming" on Tech-2 display.
3. Check the display, then press the "Confirm" key.



LTW3BASH000401

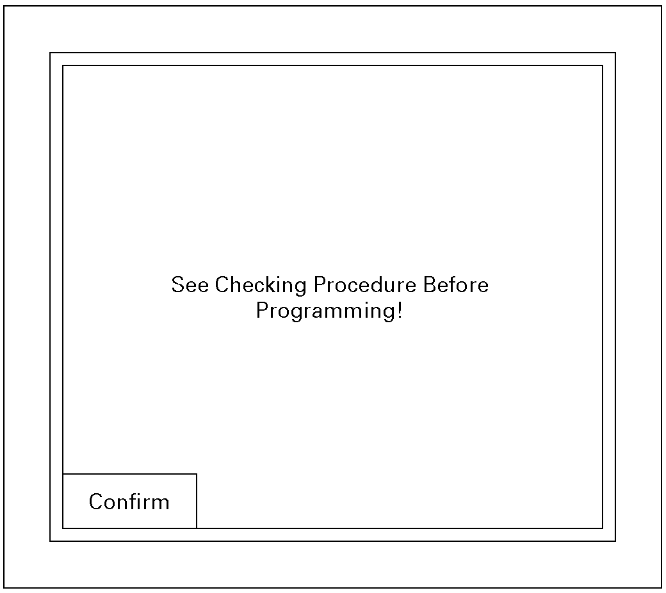
4. Install the "Hardware Key" on PC.
5. Connect RS232 cable to the PC and Tech2.
6. Turn on the PC, then start software "TIS 2000".
7. Select "Security Access" in the TIS 2000 screen.

SECTION 5

BRAKES

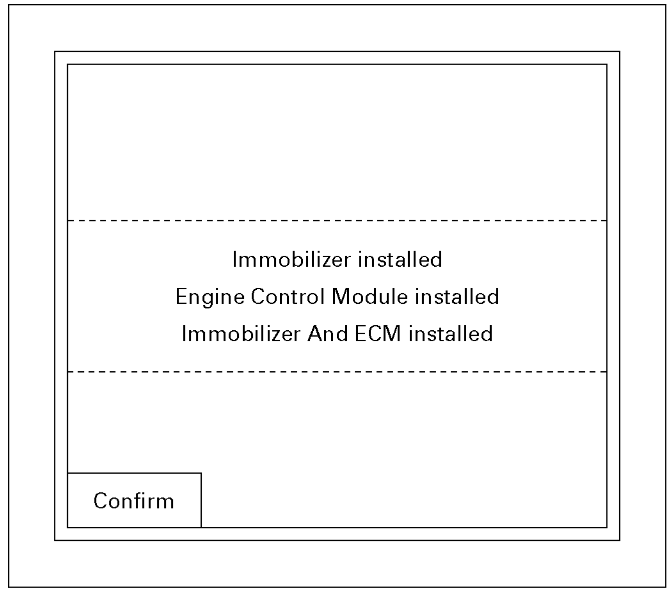
TABLE OF CONTENTS

8. Select "Next" in the TIS 2000 screen and wait a few seconds.
9. When programming is enabled (Approved), then press "close" in the TIS 2000 screen.
   (Finish the "TIS 2000" operation.)
10. Select "Program Immobilizer Function" on Tech-2 display.
11. The following screen shows up.



060R200289

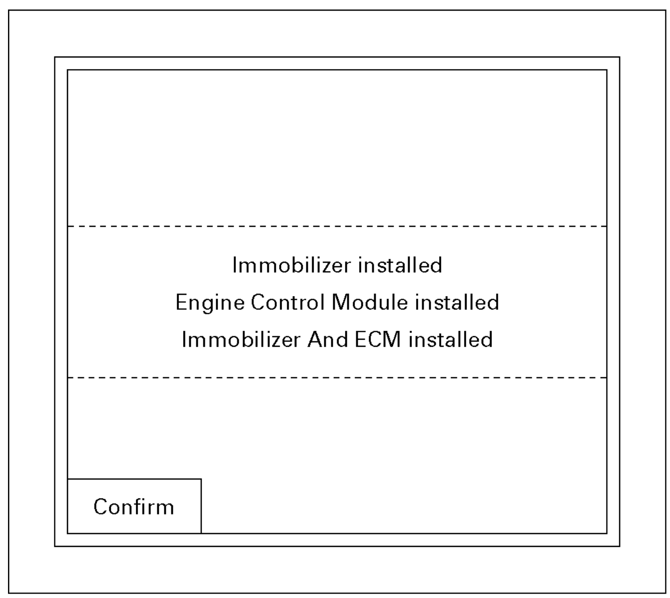
12. Confirm the following screen shows up.
13. Input the security code, then press the soft key of "Not Okay" or "Okay".
14. Select the engine type then, press "Enter" key.
15. Input a program option, by moving the cursor on the selection, then press "Enter" key.
    - Programming ICU
    - Programming ECM
    - Programming ICU and ECM



060R200283

Programming ICU

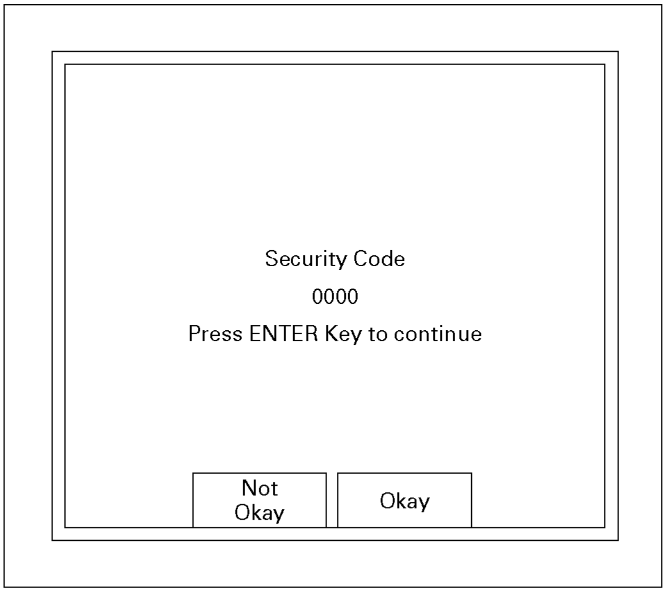
1. Follow Programming Immobilizer Function steps 1 through 14.
2. Input a program option, by moving the cursor on the selection, then pres "Enter" key.



060R200283

3. Enter the security code.

4. Input the security code, then press the soft key of "Okay" or "Not Okay".

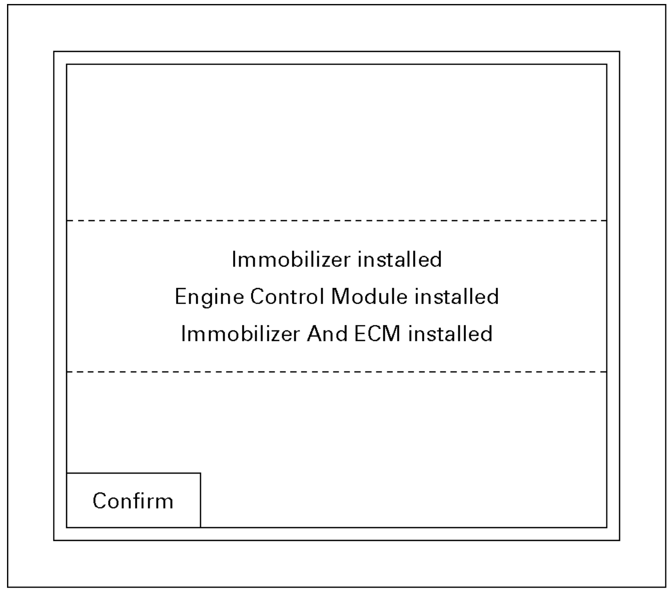


060R200284

5. Enter VIN.
6. Enter Mechanical key number.
7. Turn ON ignition.
8. Select an engine system.
9. See the programming result.
   Tech-2 displays the result of programming as the following.
   Follow those instructions
   - Selected Programming is not possible due to wrong System Status!
   - Immobilizer Not Programmed!
   - Immobilizer Already Programmed!
   - ECM Not Programmed!
   - ECM Already Programmed!
10. Transponder key must be reprogrammed, because all transponder information is erased.
    When ICU is programmed. See Transponder programming.

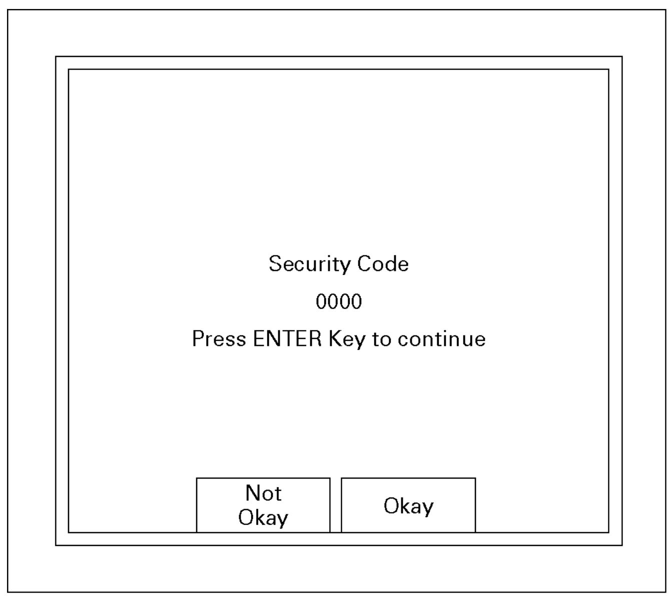
Programming ECM

1. Follow Programming Immobilizer Function steps 1 through 14.
2. Input a program option, by moving the cursor on the selection, then pres "Enter" key.



060R200283

3. Enter the security code.
4. Input the security code, then press the soft key of "Okay" or "Not Okay".



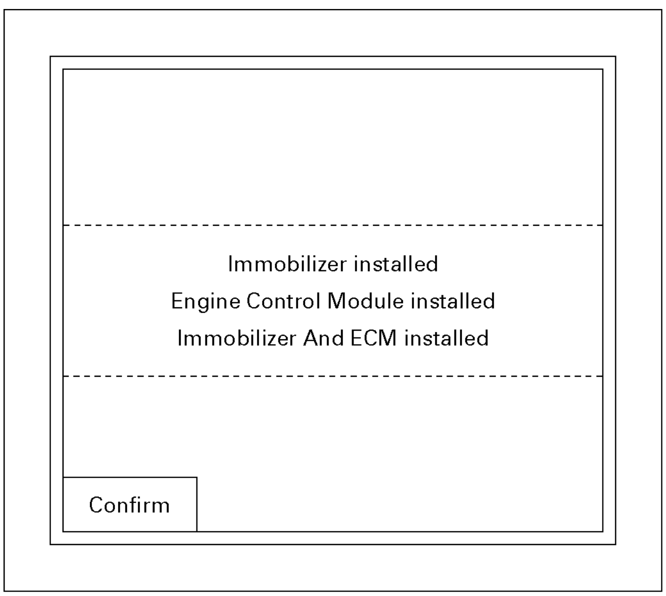
060R200284

5. Turn on the Ignition.
6. Select an Engine system.

7. See the display of programming result.
   Tech-2 displays the result of programming as the following.
   Follow those instructions
   - Selected Programming is not possible due to wrong System Status!
   - Immobilizer Not Programmed!
   - Immobilizer Already Programmed!
   - ECM Not Programmed!
   - ECM Already Programmed!
8. Transponder key must be reprogrammed, because all transponder information is erased. When ICU is programmed. See Transponder programming.

Programming ICU and ECM

1. Follow Programming Immobilizer Function steps 1 through 14.
2. Input a program option, by moving the cursor on the selection, then press "Enter" key.



060R200283

3. Enter the security code.
4. Input the security code, then press the soft key of "Okay" or "Not Okay".

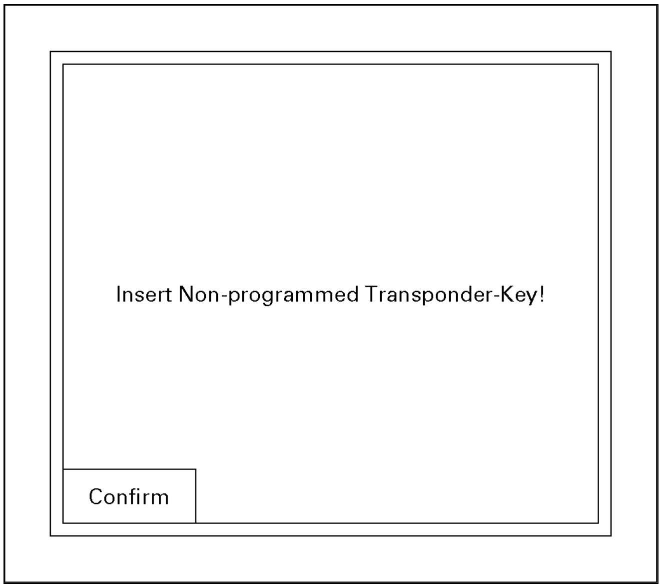
060R200284

5. Input the security code.
6. Enter VIN.
7. Enter Key No.
8. Select an engine system.
   See programming result display and follow instructions of the display.
9. Transponder key must be reprogrammed, because all transponder information on ICU is erased when ICU is programmed. See Transponder programming.
10. Follow Programming ECM steps 2 through 8.

Transponder program

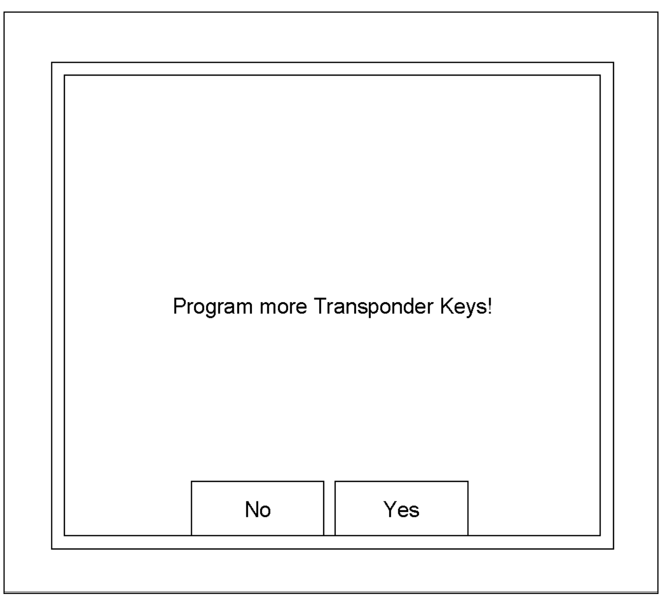
1. Select "Body" and "Immobilizer".
2. Select "Programming" and "Program Transponder-Keys".
   (Follow Programming Immobilizer Function steps 1 through 14.)
3. See immobilizer status on Tech-2 screen, and enter security code. If the status does not allow the programming, only immobilizer status is displayed.

4. Insert Non-programmed Transponder-key and press soft key of "Confirm".



060R200288

5. "Turn On ignition key", is displayed if the ignition is off.
6. The transponder status is displayed if the status does not allow the programming.
7. When programming starts "Programming Transponder - key!" is displayed.
8. Turn off Ignition key.
9. Turn On Ignition key.
10. If the programming was not successful, the transponder status is only displayed.
11. To program more illustration press soft key.



RUW38SH000601

12. See programming result.

Data List

No.	Strings		Note
1	Ignition Status	On 12V /Off 0V	
2	Transponder-Key	Transp. Key #	The number of the key currently programmed
3	Transponder Status	Correct/Incorrect TP-Key	
4	Transponder-Key 1 Status	Programmed / Not Programmed	
5	Transponder-Key 2 Status	Programmed / Not Programmed	
6	Transponder-Key 3 Status	Programmed / Not Programmed	
7	Transponder-Key 4 Status	Programmed / Not Programmed	
8	Transponder-Key 5 Status	Programmed / Not Programmed	
9	Immobilizer signal	Transmitted / Not Transmitted	
10	Engine Request	Received / Not Received	
11	Vehicle Speed Output	Veh. Speed signal	
12	Immobilizer Relay	Active 0V / Inactive 12V	
13	Security Wait Time	Active / Inactive	

Diagnostic procedure

- Once the cause of DTC is repaired or gone, engine can be operated normally, and present DTC becomes history code.
- History code is canceled by no repeat failure on 25 consequence ignition key on afterward.
- History code cannot be canceled by battery connector disconnected.

Clearing Diagnostic Trouble Codes

IMPORTANT: Do not clear DTCs unless directed to do so by the service information provided for each diagnostic procedure. When DTCs are cleared, the Failure Record data which may help diagnose an intermittent fault will also be erased from memory.

Verifying Vehicle Repair

Verification of vehicle repair will be more comprehensive for vehicles with immobilizer system diagnostic. Following a repair, the technician should perform the following steps:

1. Review and record the Fail Records for the DTC which has been diagnosed.
2. Clear DTC(s).
3. Operate the vehicle within conditions noted in the Fail Records.
4. Monitor the DTC status information for the DTC which has been diagnosed until the diagnostic test associated with that DTC runs.

Following these steps are very important in verifying repairs on immobilizer systems. Failure to follow these steps could result in unnecessary repairs.

Diagnostic Aids

Check the condition for system parts.

- Installation condition, poor connection, damage, system parts malfunction. Harness, Fuse, Relay, Immobilizer coil (antenna), Key, Meter, Immobilizer control unit (ICU), Engine control module (ECM).

NOTE: Breakage of immobilizer fuse does not operate immobilizer system. Check engine lamp flashes at this time.

Check the Electro-Magnetic Interference (EMI)

- Location of vehicle check
  Move the vehicle to a new location and perform the check again.
- Non-OEM Parts.
  Switch is "OFF" or remove the Non-OEM parts and perform the check again.
- Other
  Remove the accessory and another key from key.

Check the other items.

- Battery voltage is low.
- Immobilizer programming functions.
  Must be programmed immobilizer system.
- Registration for security code, immobilizer control unit parts number.
- Key switch operation.
  Immobilizer system may detect a history DTC by the timing of ON-OFF of a key switch.
- Active the immobilizer system.
- Keyless entry system is malfunction.
- Anti theft system is malfunction.

Check the operation

Check the operation "Lock / unlock" by using transmitter (key) on the vehicle.

Diagnostic Trouble Code (DTC) list with ECM

• Immobilizer Control Unit (ICU)

DTC	Description	Note
B0001	REPLACE ELECTRONIC CONTROL UNIT (ECU) (IMMOBILIZER FAULT)	This error code appears if a RAM /ROM Error was detected or the EEPROM is defect.
B0002	IMMOBILIZER NOT PROGRAMMED	Immobilizer control unit is not programmed.
B0003	TRANSPONDER KEY PROBLEM	･Reading of Transponder information failed with ignition on transponder has a fault. ･Hardware fault in reading circuit.
B0004	IMMOBILIZER COIL CIRCUIT (ANTENNA COIL FAULT)	Immobilizer coil has a fault.
B0005	COMMUNICATION LINE W VOLTAGE LOW	Short circuit to ground or open circuit.
B0006	COMMUNICATION LINE W VOLTAGE HIGH	Short circuit to 12V.
B0007	NO ENGINE REQUEST RECEIVED	No ECM Challenge.
B0008	WRONG TRANSPONDER KEY	Incorrect security code response received.
B0009	NO TRANSPONDER KEY PROGRAMMED	Transponder security code table empty
B0010	UNKNOWN TRANSPONDER KEY	Transponder security code not valid.

• Engine Control Module (ECM: Gasoline Engine {C24SE})

DTC	Description	Note
P1626	No Response From Immobilizer	Refer to Engine Control system section
P1631	Received Response Was Not Correct	Refer to Engine Control system section
P1648	Received Incorrect Security Code	Refer to Engine Control system section
P1649	Security Code & Security Key Not Programmed	Refer to Engine Control system section

Diagnostic Trouble Code (DTC) list with Engine Immobilizer Unit (4JA1-T Diesel Engine)

• **Engine Immobilizer Unit**

Code (DTC)	Description	Detecting Condition
B0011	TRANSPONDER KEY PROBLEM	Transponder code unsuccessfully read 5 consecutive time. (No completely read in 500ms transponder code)
B0012	WRONG TRANSPONDER KEY	Immobilizer program no executed.
B0013	IMMOBILIZER NOT PROGRAMMED	Processing program no executed.
B0014	NO TRANSPONDER KEY PROGRAMMED	Processing to save the transponder key in the control unit not Executed.
B0015	FREQUENCY SIGNAL Lo	Lo level (less than 2.5) input during the Hi level was being output to the communication line.
B0016	FREQUENCY SIGNAL Hi (Diesel)	Hi level (more than 2.5v) input during the Lo level was being output to the communication line.
B0023	ANTENNA COIL OPEN	Antenna coil not connected.
B0024	WRONG TRANSPONDER RESPONSE	Transponder response signal with challenge is wrong.
B0055	EEPROM ERROR	Write and read cannot be correctly made to and from the EEPROM in the control unit.

IMMOBILIZER SYSTEM CHECK

Step	Action	Value(s)	Yes	No
1	1. Key position is "ON," engine "OFF." 2. Observe the check engine lamp. Note: When a key switch is turned ON, check engine lamp will turn on and a check engine lamp will be turned off after a few seconds. Is the check engine lamp "ON"?	—	Go to *Step 2*	Go to *"No Immobilizer warning lamp"*
2	1. Key position is "ON," engine "OFF." 2. Observe the check engine lamp. Note: When a key switch is turned ON, check engine lamp will turn on and a check engine lamp will be turned off after a few seconds. Is the check engine lamp "OFF"? (Check engine lamp does not flash)	—	Go to *Step 3*	Go to *"Immobilizer warning lamp on steady"*
3	1. Key position is "OFF." 2. Install a scan tool. 3. Key position is "ON." 4. Attempt to display immobilizer data with the scan tool. Does the scan tool display immobilizer data?	—	Go to *Step 9*	Go to *Step 4*
4	1. Key position is "OFF," disconnect the immobilizer control unit (ICU). 2. Check the DLC (Data Link Connector) circuit for an open, short to ground, or short to voltage. Also, check the DLC ignition feed circuit for an open or short to ground and the DLC ground circuit for an open. Was a problem found?	—	Go to *Step 5*	Go to *Step 6*
5	Repair or replace the DLC (Data Link Connector) circuit. Was the action complete?	—	Go to *Step 3*	—
6	1. Check the ICU circuit for an open, short to ground, or short to voltage. Also, check the ICU ignition feed circuit for an open or short to ground and the ICU ground circuit for an open. 2. If a problem is found, repair as necessary. Was a problem found?	—	Go to *Step 7*	Go to *Step 8*
7	Repair or replace the ICU ignition feed and ground circuits. Was the action complete?	—	Go to *Step 3*	—
8	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the immobilizer data by the scan tool. Was the action complete?	—	Go to *Step 3*	—
9	Select "Display DTCs" with the scan tool. Are any DTCs stored?	—	Go to *Step 10*	Go to *Step 13*

Step	Action	Value(s)	Yes	No
10	Review and record for scan tool Failure Records data and DTCs. Was the action complete?	—	Go to *Step 11*	—
11	Following the DTC is stored. Are there DTC B0001 or B0055 stored?		Go to *applicable DTC table after* Go to *Step 12*	Go to *Step 12*
12	Clear the DTCs by "Clear the Information "with scan tool. Did the DTCs Cleared?	—	Go to *Step 12*	—
13	Select "Display DTCs" with the scan tool. Are any DTCs stored?	—	Go to *applicable DTC table*	Go to *Step 14*
14	1. Key position is "ON," engine "OFF." 2. Observe the check engine lamp. Note: If a key switch is turned ON, check engine lamp will turn on and a check engine lamp will be turned off after a few seconds. Is the check engine lamp "flash"?	—	Go to Step 15	Go to *Step 20*
15	Check the engine control system. If a problem is found, repair as necessary. (Refer to section 6E: system check and DTCs) **IMPORTANT:** The replacement ECM must be programmed the immobilizer data by scan tool. (Except 4JA1-L Engine) Was the action complete?	—	Go to *Step 16*	—
16	Check the key. Is a key peculiar to a vehicle?	—	Go to *Step 18*	Go to *Step 17*
17	Change into a peculiar key. **IMPORTANT:** If replace the key, after replace lock cylinders, perform the following below the items. • Replace the keys and key cylinders. • Program the immobilizer system. (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 18*	—
18	Check the immobilizer programming functions. • Immobilizer control unit (ICU). • Engine control module (ECM). • Transponder (Key). If a problem is found, repair as necessary. (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 19*	—
19	Operate the DTCs by "Clear the Information" with scan tool. Was the action complete?	—	Go to *Step 20*	—
20	Attempt to start the engine. Did the engine start?	—	System OK	Refer to *Diagnostic Aids*

SECTION 5A

BRAKE CONTROL SYSTEM

TABLE OF CONTENTS

NO IMMOBILIZER WARNING LAMP

Step	Action	Value(s)	Yes	No
1	Check the meter fuse for the instrument cluster ignition feed circuit. Is the fuse normal?	—	Go to *Step 3*	Go to *Step 2*
2	Replace the fuse. Is the action complete?	—	Verify repair Go to *Step 3*	—
3	1. Key position is "OFF". 2. Disconnect the meter. 3. Disconnect the engine control module (ECM). 4. Check the circuit between meter and ECM for an open, short to round, or short to voltage. Also, check the meter circuit for an open or short to ground and the DLC ground circuit for an open. Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Repair or replace the meter circuit. Was the action complete?	—	Go to *Step 5*	—
5	1. Key position is "ON," engine "OFF." 2. Observe the check engine lamp. Is the check engine lamp "ON"?	—	Go to *Step 6*	Go to *Step 7*
6	Repair or replace the meter. Was the action complete?	—	Go to *Step 7*	—
7	1. Key position is "OFF". 2. Check the check engine lamp bulb. Is the check engine lamp bulb normal?	—	Go to *Step 9*	Go to *Step 8*
8	Replace the check engine lamp bulb. Is the action complete?	—	Verify repair Go to *Step 9*	—
9	1. Key position is "OFF". 2. Connect the meter. 3. Connect the engine control module (ECM). 4. Key position is "ON". 5. Observe the check engine lamp. Note: If a key switch is turned ON, check engine lamp will turn on and a check engine lamp will be turned off after a few seconds. Is the check engine lamp "ON"?	—	Verify repair	Go to *Step 10*
10	Replace the engine control module (ECM). **IMPORTANT:** The replacement ICU must be programmed the immobilizer data by scan tool. Was the action complete?	—	Verify repair	—

CHECK IMMOBILIZER WARNING LAMP ON STEADY

Step	Action	Value(s)	Yes	No
1	1. Key position is "OFF". 2. Disconnect the immobilizer control unit (ICU). 3. Disconnect the engine control module (ECM). 4. Key position is "ON," engine "OFF." 5. Observe the check engine lamp. Is the check engine lamp "ON"?	—	Go to *Step 2*	Go to *Step 5*
2	1. Key position is "OFF". 2. Disconnect the meter. 3. Key position is "ON," engine "OFF." 4. Observe the check engine lamp. Is the check engine lamp "ON"?	—	Go to *Step 3*	Go to *Step 4*
3	Repair or replace the meter. Was the action complete?	—	Verify repair Go to *Step 5*	—
4	Repair or replace the meter circuit. (Between meter and ICU/ECM) Was the action complete?	—	Verify repair Go to *Step 5*	—
5	Check the immobilizer control unit (ICU) circuit. 1. Ignition "OFF," disconnect the ICU. 2. Check the ICU circuit for an open, short to ground, or short to voltage. Also, check the ICU ignition feed circuit for an open or short to ground and the ICU ground circuit for an open. Was a problem found?	—	Go to *Step 6*	Go to *Step 7*
6	Repair or replace the immobilizer unit (ICU) circuit. Was the action complete?	—	Verify repair Go to *Step 7*	—
7	1. Key position is "OFF". 2. Connect the meter. 3. Connect the immobilizer control unit (ICU). 4. Connect the engine control module (ECM). 5. Key position is "ON". 6. Observe the check engine lamp. Is the check engine lamp "ON"?	—	Verify repair	Refer to *Diagnostic Aids*

B0001 REPLACE ELECTRONIC CONTROL UNIT (ECU) (IMMOBILIZER FAULT)

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to *Immobilizer System Check*
2	Recheck the DTC. 1. Key position is “OFF”. 2. Install the scan tool on vehicle. 3. Key position is “ON”. 4. Check the DTC on scan tool. Is DTC B0001 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the immobilizer control unit (ICU) circuit. 1. Ignition "OFF," disconnect the ICU. 2. Check the ICU circuit for an open, short to ground, or short to voltage. Also, check the ICU ignition feed circuit for an open or short to ground and the ICU ground circuit for an open. Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Repair or replace the immobilizer unit (ICU) circuit. Was the action complete?	—	Verify repair	—
5	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

B0002 IMMOBILIZER NOT PROGRAMMED

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to Immobilizer System Check
2	Check the immobilizer programming functions. • Immobilizer control unit (ICU). If a problem is found, repair as necessary. (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 3*	Go to *Step 5*
3	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on scan tool. Is DTC B0002 stored?	—	Go to *Step 4*	Verify repair
4	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—
5	Check the immobilizer programming functions. • Engine control module (ECM). • Immobilizer control unit (ICU). If a problem is found, repair as necessary. (Refer to "Important information on Programming") Was the action complete?	—	Verify repair	Go to *Step 6*
6	Replace the key and lock cylinder assembly and immobilizer system (ICU and ECM). **IMPORTANT:** • ICU and ECM are not replacing simultaneously. • After replace lock cylinders, perform the following below the items. • Program the immobilizer system. (Refer to "Important information on Programming") Was the action complete?	—	Verify repair	—

B0003 TRANSPONDER KEY PROBLEM

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to *Immobilizer System Check*
2	Check the key. Is a key peculiar to a vehicle?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the immobilizer programming functions. • All transponder (Key). If a problem is found, repair as necessary. (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 4*	Go to *Step 5*
4	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Is DTC B0003 stored?	—	Go to *Step 5*	Verify repair
5	Recheck the DTC. 1. Non-OEM parts switch is "OFF" or remove the Non-OEM parts. 2. Remove the accessory and another key from key. 3. Move the vehicle to a new location. 4. Key position is “OFF” and keep the position for more than 30 seconds. 5. Key position is “ON”. 6. Check the DTC on scan tool. Is DTC B0003 stored?	—	Go to *Step 6*	Verify repair
6	Check the immobilizer coil (antenna) circuit. 1. Key position is “OFF”. 2. Disconnect the immobilizer control unit (ICU). (immobilizer coil circuit : 3 pin connector) 3. Check the immobilizer coil circuit for an open, short to ground, or short to voltage. Also, check the ICU ignition feed circuit for an open or short to ground and the ICU ground circuit for an open. Was a problem found?	—	Go to Step 7	Go to *Step 8*
7	Repair or replace the immobilizer coil (antenna) circuit. Was the action complete?	—	Verify repair	—
8	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Is DTC B0003 stored?	—	Go to *Step 9*	Verify repair

Step	Action	Value(s)	Yes	No
9	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Go to *Step 10*	—
10	Check the immobilizer programming functions. • Immobilizer control unit (ICU). • All transponder (Key). If a problem is found, repair as necessary. (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 11*	—
11	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Is DTC B0003 stored?	—	Go to *Step 12*	Verify repair
12	Replace the transponder (Key). **IMPORTANT:** The replacement transponder (key) must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

B0004 IMMOBILIZER COIL CIRCUIT (ANTENNA COIL FAULT)

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to *Immobilizer System Check*
2	Check the immobilizer coil (antenna) circuit. 1. Key position is “OFF”. 2. Disconnect the immobilizer control unit (ICU). (immobilizer coil circuit : 3 pin connector) 3. Check the immobilizer coil circuit for an open, short to ground, or short to voltage. Also, check the ICU ignition feed circuit for an open or short to ground and the ICU ground circuit for an open. Was a problem found?	—	Go to *Step 3*	Go to *Step 4*
3	Repair or replace the immobilizer coil (antenna). Was the action complete?	—	Verify repair	—
4	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Is DTC B0004 stored?	—	Go to *Step 5*	Verify repair
5	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

B0005 COMMUNICATION LINE W VOLTAGE LOW

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to *Immobilizer System Check*
2	Recheck the DTC. 1. Key position is “OFF”. 2. Install the scan tool on vehicle. 3. Key position is “ON”. 4. Check the DTC on scan tool. Is DTC B0005 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the immobilizer communication W line circuit. 1. Key position is “OFF”. 2. Disconnect the immobilizer control unit (ICU). 3. Disconnect the engine control module (ECM). 4. Check the immobilizer communication W line circuit for an open, short to ground, or short to voltage. Also, check the ICU and ECM ignition feed circuits for an open or short to ground and the ICU and ECM ground circuit for an open. Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Repair or replace the immobilizer communication W line circuit. Was the action complete?	—	Verify repair	—
5	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

B0006 COMMUNICATION LINE W VOLTAGE HIGH

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to *Immobilizer System Check*
2	Recheck the DTC. 1. Key position is "OFF". 2. Install the scan tool on vehicle. 3. Key position is "ON". 4. Check the DTC on scan tool. Is DTC B0006 stored?	—	Go to Step 3	Refer to *Diagnostic Aids*
3	Check the immobilizer communication W line circuit. 1. Key position is "OFF". 2. Disconnect the immobilizer control unit (ICU). 3. Disconnect the engine control module (ECM). 4. Check the immobilizer communication W line circuit for an open, short to ground, or short to voltage. Also, check the ICU and ECM ignition feed circuits for an open or short to ground and the ICU and ECM ground circuit for an open. Was a problem found?	—	Go to Step 4	Go to *Step 5*
4	Repair or replace the immobilizer communication W line circuit. Was the action complete?	—	Verify repair	—
5	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

B0007 NO ENGINE REQUEST RECEIVED

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to *Immobilizer System Check*
2	Recheck the DTC on ICU. 1. Key position is “OFF”. 2. Install the scan tool on vehicle. 3. Key position is “ON”. 4. Check the DTC on scan tool. Is DTC B0007 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the immobilizer communication line circuit. 1. Key position is “OFF”. 2. Disconnect the immobilizer control unit (ICU). 3. Disconnect the engine control module (ECM). 4. Check the immobilizer communication line circuit for an open, short to ground, or short to voltage. Also, check the ICU and ECM ignition feed circuits for an open or short to ground and the ICU and ECM ground circuit for an open. Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Repair or replace the immobilizer communication line circuit. Was the action complete?	—	Verify repair	—
5	Recheck the DTC on ICU. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Is DTC B0007 stored?	—	Go to *Step 6*	Verify repair
6	Recheck the DTC on ECM. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Are below DTCs stored? P1649 (C24SE)	—	Go to *Step 7*	Go to *Step 9*
7	Perform the immobilizer programming functions. (Refer to "Important information on Programming") • Engine control module (ECM). Was the action complete?	—	Go to *Step 8*	Go to *Step 11*
8	Recheck the DTC on ECM. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Are below DTCs stored? P1649 (C24SE)	—	Go to *Step 11*	Go to *Step 12*

Step	Action	Value(s)	Yes	No
9	Check the immobilizer programming functions. • Engine control module (ECM). If a problem is found, repair as necessary. (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 10*	Go to Step 11
10	Recheck the DTC on ECM. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on scan tool. Are below DTCs stored? P1649 (C24SE)	—	Go to Step 11	Go to *Step 12*
11	Replace the engine control module (ECM). **IMPORTANT:** The replacement ECM must be programmed the security data by scan tool. Was the action complete?	—	Go to *Step 12*	—
12	Recheck the DTC on ECM. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on scan tool. Are below DTCs stored? P1626 (C24SE)	—	Go to *Step 13*	Go to *Step 2*
13	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

B0008 WRONG TRANSPONDER KEY

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to *Immobilizer System Check*
2	Check the key. Is a key peculiar to a vehicle?	—	Go to Step 3	Refer to *Diagnostic Aids*
3	Check the immobilizer programming functions. • Transponder (Key). Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Perform the immobilizer programming functions. • Transponder (Key). (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 5*	—
5	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on scan tool. Is DTC B0008 stored?	—	Go to *Step 6*	Verify repair
6	Replace the transponder (Key). **IMPORTANT**: The replacement transponder (key) must be programmed the security data by scan tool. Was the action complete?	—	Go to Step 7	—
7	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on scan tool. Is DTC B0008 stored?	—	Go to *Step 8*	Verify repair
8	Replace the immobilizer control unit (ICU). **IMPORTANT**: The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

B0009 NO TRANSPONDER KEY PROGRAMMED

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to *Immobilizer System Check*
2	Check the key. Is a key peculiar to a vehicle?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the immobilizer programming functions. • Transponder (Key). Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Perform the immobilizer programming functions. • Transponder (Key). (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 5*	—
5	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Is DTC B0009 stored?	—	Go to *Step 6*	Verify repair
6	Replace the transponder (Key). **IMPORTANT:** The replacement transponder (key) must be programmed the security data by scan tool. Was the action complete?	—	Go to *Step 7*	—
7	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Is DTC B0009 stored?	—	Go to *Step 8*	Verify repair
8	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

B0010 UNKNOWN TRANSPONDER KEY

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to *Immobilizer System Check*
2	Check the key. Is a key peculiar to a vehicle?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the immobilizer programming functions. • Transponder (Key). Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Perform the immobilizer programming functions. • Transponder (Key). (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 5*	—
5	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on scan tool. Is DTC B0010 stored?	—	Go to *Step 6*	Verify repair
6	Replace the transponder (Key). **IMPORTANT:** The replacement transponder (key) must be programmed the security data by scan tool. Was the action complete?	—	Go to *Step 7*	—
7	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on scan tool. Is DTC B0010 stored?	—	Go to *Step 8*	Verify repair
8	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

B0011 TRANSPONDER KEY PROBLEM (Only 4JA1-T Engine)

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to Immobilizer System Check
2	Check the key. Is a key peculiar to a vehicle?	—	Go to *Step 3*	Refer to Diagnostic Aids
3	Check the immobilizer programming functions. • All transponder (Key). If a problem is found, repair as necessary. (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 4*	Go to Step 5
4	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Is DTC B0011 stored?	—	Go to *Step 5*	Verify repair
5	Recheck the DTC. 1. Non-OEM parts switch is "OFF" or remove the Non-OEM parts. 2. Remove the accessory and another key from key. 3. Move the vehicle to a new location. 4. Key position is “OFF” and keep the position for more than 30 seconds. 5. Key position is “ON”. 6. Check the DTC on scan tool. Is DTC B0011 stored?	—	Go to *Step 6*	Verify repair
6	Check the immobilizer coil (antenna) circuit. 1. Key position is “OFF”. 2. Disconnect the immobilizer control unit (ICU). (immobilizer coil circuit : 3 pin connector) 3. Check the immobilizer coil circuit for an open, short to ground, or short to voltage. Also, check the ICU ignition feed circuit for an open or short to ground and the ICU ground circuit for an open. Was a problem found?	—	Go to *Step 7*	Go to *Step 8*
7	Repair or replace the immobilizer coil (antenna) circuit. Was the action complete?	—	Verify repair	—
8	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Is DTC B0011 stored?	—	Go to *Step 9*	Verify repair

Step	Action	Value(s)	Yes	No
9	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Go to *Step 10*	—
10	Check the immobilizer programming functions. • Immobilizer control unit (ICU). • All transponder (Key). If a problem is found, repair as necessary. (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 11*	—
11	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Is DTC B0011 stored?	—	Go to *Step 12*	Verify repair
12	Replace the transponder (Key). **IMPORTANT:** The replacement transponder (key) must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

B0012 WRONG TRANSPONDER KEY (Only 4JA1-T Engine)

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to *Immobilizer System Check*
2	Check the key. Is a key peculiar to a vehicle?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the immobilizer programming functions. • Transponder (Key). Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Perform the immobilizer programming functions. • Transponder (Key). (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 5*	—
5	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on scan tool. Is DTC B0012 stored?	—	Go to *Step 6*	Verify repair
6	Replace the transponder (Key). **IMPORTANT**: The replacement transponder (key) must be programmed the security data by scan tool. Was the action complete?	—	Go to *Step 7*	—
7	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on scan tool. Is DTC B0012 stored?	—	Go to *Step 8*	Verify repair
8	Replace the immobilizer control unit (ICU). **IMPORTANT**: The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

B0013 IMMOBILIZER NOT PROGRAMMED (Only 4JA1-T Engine)

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to Immobilizer System Check
2	Check the immobilizer programming functions. • Immobilizer control unit (ICU). If a problem is found, repair as necessary. (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 3*	Go to *Step 5*
3	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Is DTC B0013 stored?	—	Go to *Step 4*	Verify repair
4	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—
5	Check the immobilizer programming functions. • Engine control immobilizer unit. • Immobilizer control unit (ICU). If a problem is found, repair as necessary. (Refer to "Important information on Programming") Was the action complete?	—	Verify repair	Go to *Step 6*
6	Replace the key and lock cylinder assembly and immobilizer system (ICU and Engine immobilizer unit). **IMPORTANT:** • ICU and Engine immobilizer unit are not replacing simultaneously. • After replace lock cylinders, perform the following below the items. • Program the immobilizer system. (Refer to "Important information on Programming") Was the action complete?	—	Verify repair	—

B0014 NO TRANSPONDER KEY PROGRAMMED (Only 4JA1-T Engine)

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to *Immobilizer System Check*
2	Check the key. Is a key peculiar to a vehicle?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the immobilizer programming functions. • Transponder (Key). Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Perform the immobilizer programming functions. • Transponder (Key). (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 5*	—
5	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on scan tool. Is DTC B0014 stored?	—	Go to *Step 6*	Verify repair
6	Replace the transponder (Key). **IMPORTANT:** The replacement transponder (key) must be programmed the security data by scan tool. Was the action complete?	—	Go to *Step 7*	—
7	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on scan tool. Is DTC B0014 stored?	—	Go to *Step 8*	Verify repair
8	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

B0015 FREQUENCY SIGNAL LOW (Only 4JA1-T Engine)

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to *Immobilizer System Check*
2	Recheck the DTC. 1. Key position is "OFF". 2. Install the scan tool on vehicle. 3. Key position is "ON". 4. Check the DTC on scan tool. Is DTC B0015 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the immobilizer communication W line circuit. 1. Key position is "OFF". 2. Disconnect the immobilizer control unit (ICU). 3. Disconnect the Engine immobilizer unit. 4. Check the immobilizer communication W line circuit for an open, short to ground, or short to voltage. Also, check the ICU and Engine immobilizer unit ignition feed circuits for an open or short to ground and the ICU and Engine immobilizer unit ground circuit for an open. Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Repair or replace the immobilizer communication W line circuit. Was the action complete?	—	Verify repair	—
5	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

B0016 FREQUENCY SIGNAL HIGH (Only 4JA1-L Engine)

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to Step 2	Go to Immobilizer System Check
2	Recheck the DTC. 1. Key position is "OFF". 2. Install the scan tool on vehicle. 3. Key position is "ON". 4. Check the DTC on scan tool. Is DTC B0016 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the immobilizer communication W line circuit. 1. Key position is "OFF". 2. Disconnect the immobilizer control unit (ICU). 3. Disconnect the engine control module (Engine immobilizer unit). 4. Check the immobilizer communication W line circuit for an open, short to ground, or short to voltage. Also, check the ICU and Engine immobilizer unit ignition feed circuits for an open or short to ground and the ICU and Engine immobilizer unit ground circuit for an open. Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Repair or replace the immobilizer communication W line circuit. Was the action complete?	—	Verify repair	—
5	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

B0023 IMMOBILIZER COIL CIRCUIT (ANTENNA COIL FAULT) (Only 4JA1-T Engine)

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to *Immobilizer System Check*
2	Check the immobilizer coil (antenna) circuit. 1. Key position is “OFF”. 2. Disconnect the immobilizer control unit (ICU). (immobilizer coil circuit : 3 pin connector) 3. Check the immobilizer coil circuit for an open, short to ground, or short to voltage. Also, check the ICU ignition feed circuit for an open or short to ground and the ICU ground circuit for an open. Was a problem found?	—	Go to *Step 3*	Go to *Step 4*
3	Repair or replace the immobilizer coil (antenna). Was the action complete?	—	Verify repair	—
4	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Is DTC B0023 stored?	—	Go to *Step 5*	Verify repair
5	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

B0024 WRONG TRANSPONDER KEY (Only 4JA1-T Engine)

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to *Immobilizer System Check*
2	Check the key. Is a key peculiar to a vehicle?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the immobilizer programming functions. • Transponder (Key). Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Perform the immobilizer programming functions. • Transponder (Key). (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 5*	—
5	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Is DTC B0024 stored?	—	Go to *Step 6*	Verify repair
6	Replace the transponder (Key). **IMPORTANT**: The replacement transponder (key) must be programmed the security data by scan tool. Was the action complete?	—	Go to *Step 7*	—
7	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Is DTC B0024 stored?	—	Go to *Step 8*	Verify repair
8	Replace the immobilizer control unit (ICU). **IMPORTANT**: The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

B0055 EEPROM ERROR

Step	Action	Value(s)	Yes	No
1	Was the "Immobilizer System Check" performed?	—	Go to *Step 2*	Go to *Immobilizer System Check*
2	Recheck the DTC. 1. Key position is “OFF”. 2. Install the scan tool on vehicle. 3. Key position is “ON”. 4. Check the DTC on scan tool. Is DTC B0055 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the immobilizer control unit (ICU) circuit. 1. Ignition "OFF," disconnect the ICU. 2. Check the ICU circuit for an open, short to ground, or short to voltage. Also, check the ICU ignition feed circuit for an open or short to ground and the ICU ground circuit for an open. Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Repair or replace the immobilizer unit (ICU) circuit. Was the action complete?	—	Verify repair	—
5	Replace the immobilizer control unit (ICU). **IMPORTANT:** The replacement ICU must be programmed the security data by scan tool. Was the action complete?	—	Verify repair	—

SECTION 11B

ANTITHEFT SYSTEM

TABLE OF CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNEEDED SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU will call out those fasteners that require a replacement after removal. ISUZU will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (Paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

The Antitheft system consists of the four major components which are Antitheft Control Unit (ACU), Antitheft horn, key (remote key), and scan tool (Tech-2).

This system can be activated by a correctly programmed key (remote key) and starter switch is set to OFF.

This system can be deactivated by a correctly programmed key (remote key) connected with a correctly programmed ACU and a correctly programmed ICU.

When the vehicle doors, and engine hood are locked, the antitheft alarm system is designed to protect your vehicle and valuables from theft.

Any attempt to forcibly open any door, the engine hood without using the vehicle key (or remote control) will cause the hazard lights to flash on and off and the horn to sound intermittently. This will continue for 30 seconds (Hazard lamp flash; For 5 minutes) before the system automatically shuts itself off.

Please operate the door either the key lock or remote key after closing all doors to arm the alarm system.

Miss waning will be detected when the passenger door is opened with locked condition and then this door is closed.

During the first 10 seconds:

- LED lights up; Test, switch - on delay
- LED rapidly flashes (2Hz); Door, bonnet, open or system fault

After approx. 10 seconds:

- LED slowly flashes; System on (0.5Hz)

RTU7Z0SH019101

Activating the anti-theft system

1. When the key switch is turned to the ACC position or removed from the starter switch.
2. Closing and locking all the doors by the keylock or remote key, and the engine hood will cause the indicator light to come on.
3. Approximately 10 seconds later, the indicator light will slow flash. The anti-theft system is now in operation.

Antitheft system alarm operating conditions

When the antitheft system is engaged, the alarm will operate under the following condition;

1. Whenever some forcibly attempts to open a door, the engine hood without using the key.
2. Whenever someone unlocks a door with door lock knob.
3. Whenever the engine hood release handle is operated.

Function of a keyless entry system

With a keyless entry system the car can be locked or unlocked from any position around the car up to a specified distance, by using the potable radio remote transmitter inside key (remote key).

Status LED

While the system is in delay the alarm system is active and LED flashes at 0.5Hz with or without activated interior protection.

Hazard relay

The hazard warning lights will be activated by an external relay. The output is low active.

Switches

All switches to ground. This makes it possible for failure analysis to detect a short circuit or a broken wire to each switch. To use this feature it is necessary to place a 1.8kΩ resistor in parallel to the required switch.

Receiver

The receiver is integrated into the control unit.

To lower the idle current the receiver is equipped with a standby mode. The antenna is integrated on the printed circuit board.

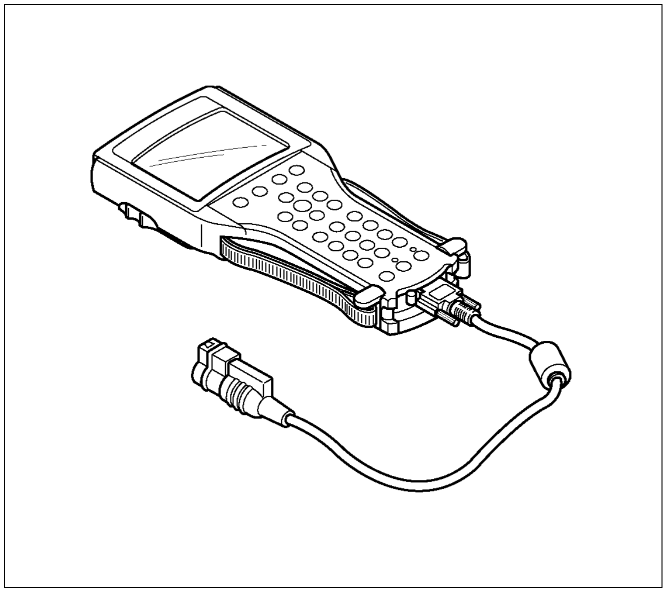
Depending on the mounting position of the control unit the antenna can be connected externally.

Range of communication

The range of communication between remote key and receiver is intended to be least 3 m from centre of the car.

Diagnosis

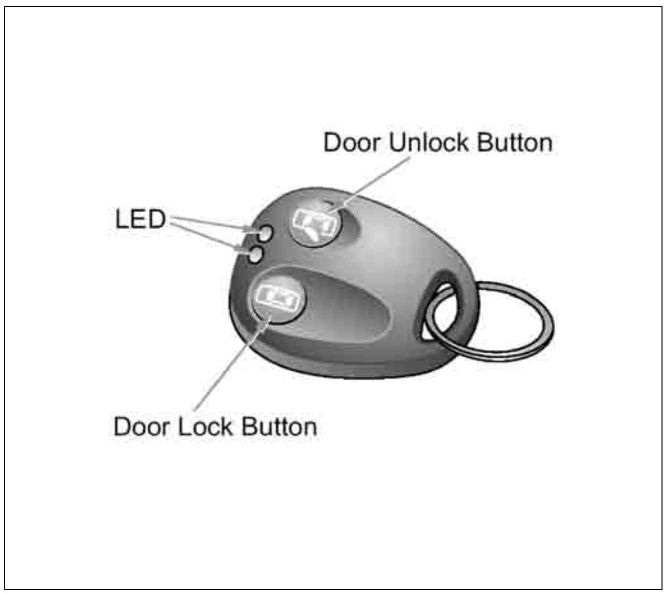
For diagnostic purpose the communication with an internal diagnostic device (Tech-2) is possible.



901RW176

Transmitter (into remote key)

- Electronics integrated in remote key container for TFR/TFS.
- Antenna integrated in remote key container.
- Frequency band is 433.92 MHz.
- Two function buttons (Door lock/Door unlock)
- Two status LED for TF (Door lock/Door unlock)



OM

Transmitter (into remote key) power

The transmitted power is less than 10 m W.

Battery life time for transmitter power

The minimum life time of battery is 2 years with 15 lock/unlock cycles per day.

While the battery is changed, the data retention will be at least 3 minutes without pressing a button.

Super lock

(Mechanical anti-theft locking system)

To Lock:

All doors must be closed; press the lock button on the remote control unit again within 10 seconds after locking or turn key in driver's door lock towards rear of vehicle again within 10 seconds after locking, then turn it back to the vertical position and remove.

Lock buttons on all doors are positioned such that doors cannot be opened.

To unlock:

Press unlock button on remote key or turn key in driver's door lock towards front of vehicle, then turn it back to the vertical position and remove. If the key is used, antitheft alarm sound operate which continues until ignition switch turn ON. If a problem is found, open the driver door as necessary.

No proper transmitter is available, what should be done for the system?

When any proper transmitter is not available, a new transmitter should be programmed. Up to 5 transmitters can be provided with a scan tool (Tech-2) and by proper procedure.

In addition to the absence of proper transmitter, it may happen particular secret code to the particular vehicle is missing. In this case, the secret code must be provided by your organization.

Otherwise transmitter cannot be programmed in any way.

If the essential for a scan tool (Tech-2) for programming and proper software for Tech-2 are not available, there is no permanent way to fix system. Temporary replace with new ACU, new ICU and new transmitter without any secret code can make the system be deactivated, but it does not last long. Such a replacement does not solve any condition. Even after replacement, the system is activated automatically in short time and then no operation of the vehicle can be made in any way.

Tech-2 should be provided in your organization.

- **Security code management**

Your organization must keep security codes for all vehicles as confidential data. Once the security codes are lost, anybody who have the security code can access antitheft system. Your organization has responsibility of any missing vehicles caused by stolen security code.

- **Essential tool (Scan tool: Tech-2)**

Your dealership must have Tech-2, and Tech-2 updated software for immobilizer system.

General Description

EHCU has controlled ABS (Anti-lock Brake System) and EBD (Electronic Brake-force Distribution System). ABS works on all four wheels. EBD system works on rear 2 wheels. A combination of wheel speed sensor and Electronic Hydraulic Control Unit (EHCU) can determine when a wheel is about to stop turning and adjust brake pressure to maintain best braking.

This system helps the driver maintain greater control of the vehicle under heavy braking conditions.

Note: The Electronic Hydraulic Control Unit (EHCU) comprises the Hydraulic Unit (H/U) and Control Unit.

Important information on Programming

Security code

The security code protects the antitheft control unit against unauthorized programming and data access from Tech-2. The security code consists of a 4 digit code number and is programmed into the antitheft Control Module (ACU).

New control units are not programmed with a security code.

If the control units are replaced, the security code entered in the transmitter (into remote key).

Must be programmed into the new control unit with Tech-2.

The security code can only be programmed with Tech-2 once and must therefore be performed with great care.

Once programmed, the security code cannot be overwritten. An already used antitheft can be reused in a different car by initializing the antitheft. After that you can program the security code again. For initializing command you need the current security code.

If the antitheft control unit is returned, always enclosed the security code that is allocated to that control unit. If this is not done, we can not process the case and the warranty will not be recognized.

Entering a code

If the Tech-2 display requests that the

- security code
- Vehicle Identification No.
- Country code (Select 213 Germany in all items)

be entered, process as follows;

To input a digit you need to use the up and down buttons of the Tech-2. By using the numeric buttons the according digit will be displayed at the current position and the cursor will move to the next position.

For letters you need to use the up and down buttons of the Tech-2. The up and down key might be used for digits as well. By using the up and down buttons the displayed digit or letter will be increased or decreased.

To move to the next position you need to use the move-to-right-button.

With the two buttons, move-to-right and move-to-left you can select the position of number you want to change.

This will allow you to correct a wrong number.

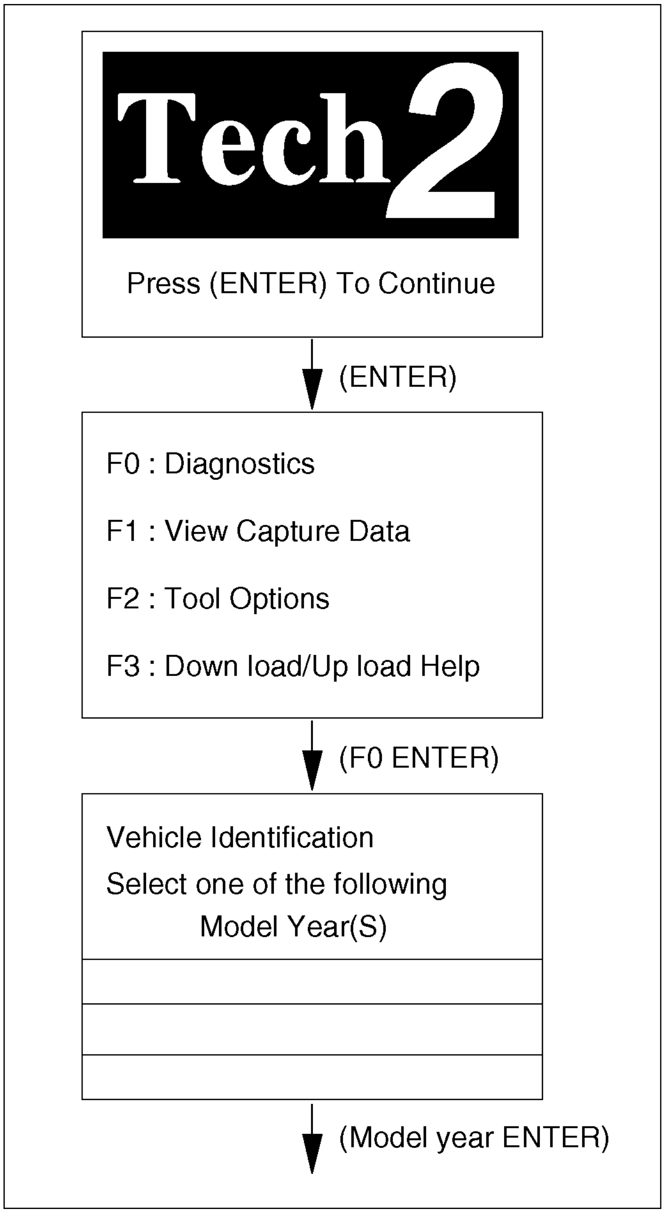
After the number is completed you need to press the Enter button to accept the number. Correction is now no longer possible.

Use the OKAY soft key to program the number and the NOT OKAY soft key to abort the programming.

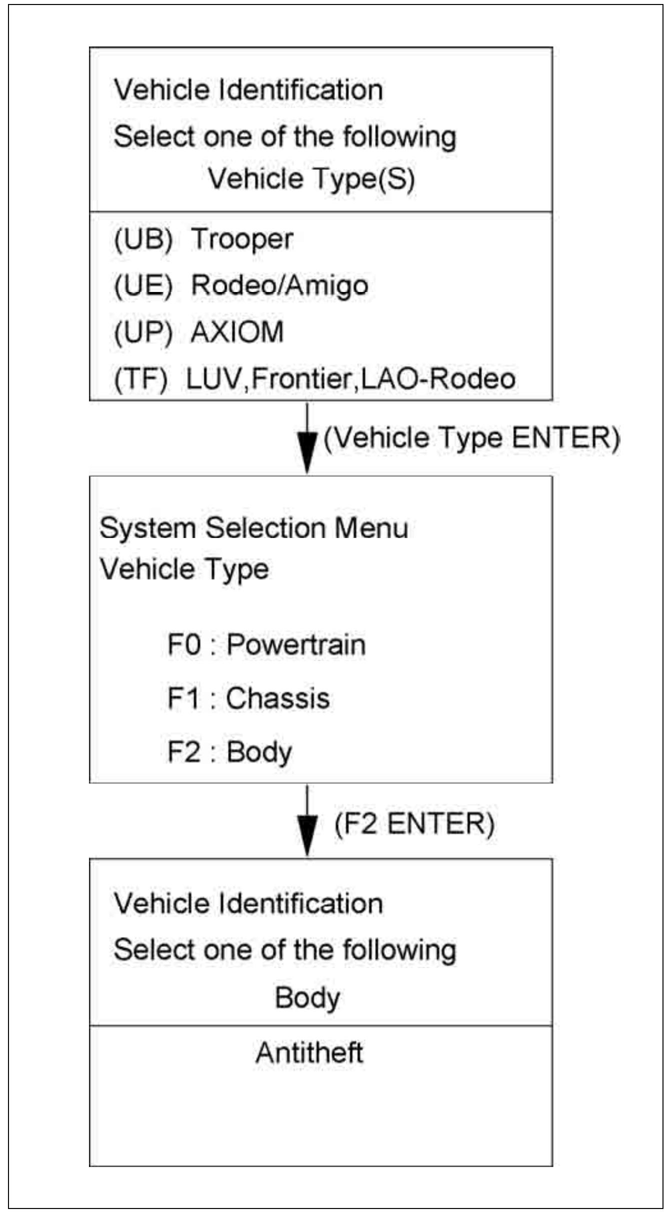
Tech-2 Scan Tool

Operating Procedure

The power up screen is displayed when you power up the tester with the Isuzu systems PCMCIA card.
Follow the operating procedure below.



060R100102



RAW4B0LH000101

Menu

The following table shows which functions are used for the available equipment versions.

F0: Diagnostic Trouble Codes
- F0: Read DTC Info Ordered By Priority
- F1: Read DTC Info As Stored By ECU
- F2: Clear DTC Information
- F3: Read Alarm Codes

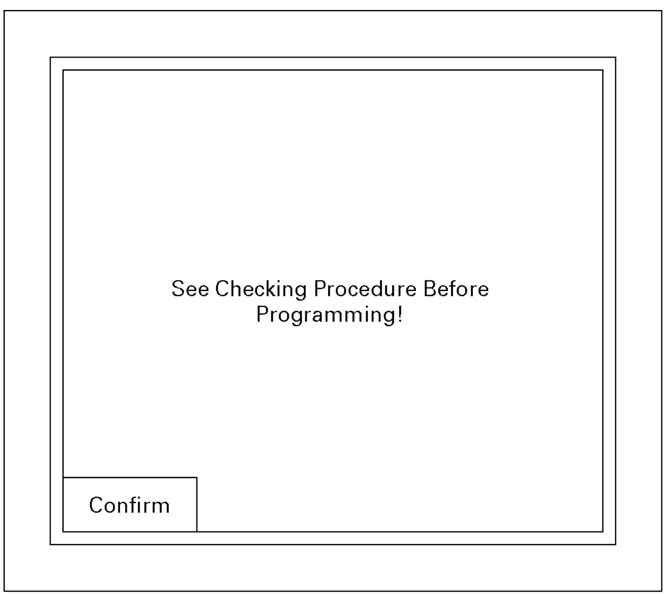
F1: Data Display

F2: Snap Shot

F3: Actuator Test
- F0: Unlock/Lock Test
- F1: Arm/Disarm Signal Test
- F2: Horn Signal Test
- F3: Turn Signal Test
- F4: Theft LED Test

F4: Programming
- F0: Erase Remote Keys
- F1: Program Remote Keys
- F2: Program Anti Theft Warning
- F3: Program Country Code
- F4: Program Vehicle Options

NOTE: Before going to programming process, Tech-2 indicates instruction as follows.



060R200289

DTC

On OBD has two options available in the Tech 2 DTC mode to display the enhanced information available.

- Read DTC Info Ordered By Priority
- Read DTC Info As Stored By ECU

Clear DTC Information

To clear Diagnostic Trouble Codes (DTCs), use the diagnostic scan tool "clear DTC information" function.

Tech-2 Data Display

Use the Tech 2 Data Values only after the On-Board Diagnostic System Check has been completed, no DTC(s) were noted, and you have determined that the on-board diagnostics are functioning properly.

The Tech 2 data values represent values that would be seen on a normally-immobilizer system.

Actuator Test

The actuator tests are used to check abnormalities in the antitheft control system.

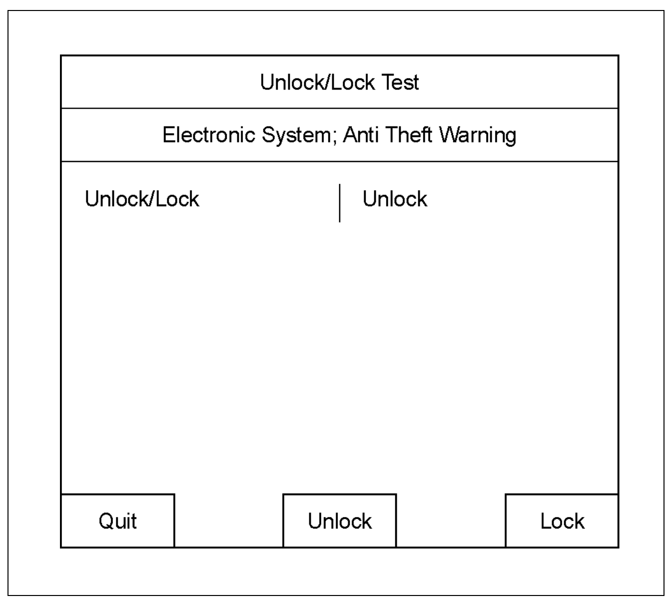
The actuators are operated by the ECU based on the Tech-2 command signal.

Observe the actuators to check abnormalities in the antitheft system.

Unlock/Lock Test

The unlock/lock test is used to check abnormalities in the door lock control system.

1. Select “Body” and “Antitheft”.
2. Select ”Actuator Test” and “Unlock/Lock Test”.
3. Observe the door lock function.
4. Press the lock bottom.
5. Press the unlock bottom.

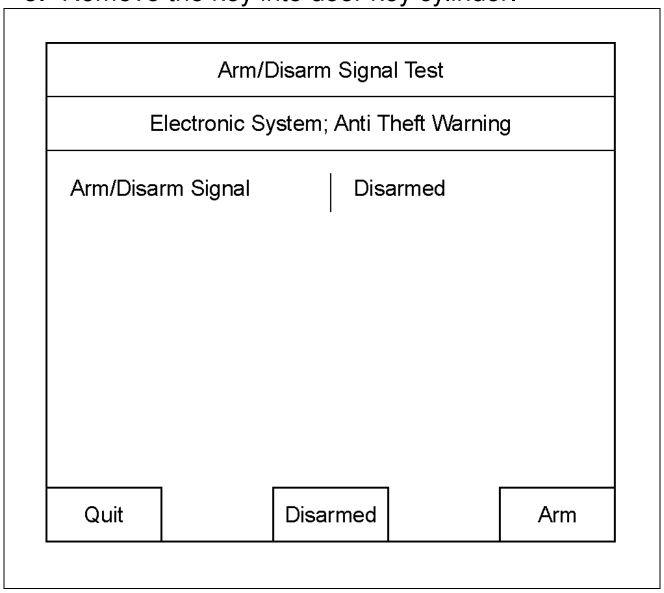


060R200279

Arm/Disarm Signal Test

Arm/Disarm signal test is used to check abnormalities in arm/disarm signal circuit.

1. Select “Body” and “Antitheft”.
2. Select “Actuator Test” and “Arm/Disarm Signal Test”.
3. Observe the data list.
4. Insert the key into door key cylinder.
5. Remove the key into door key cylinder.

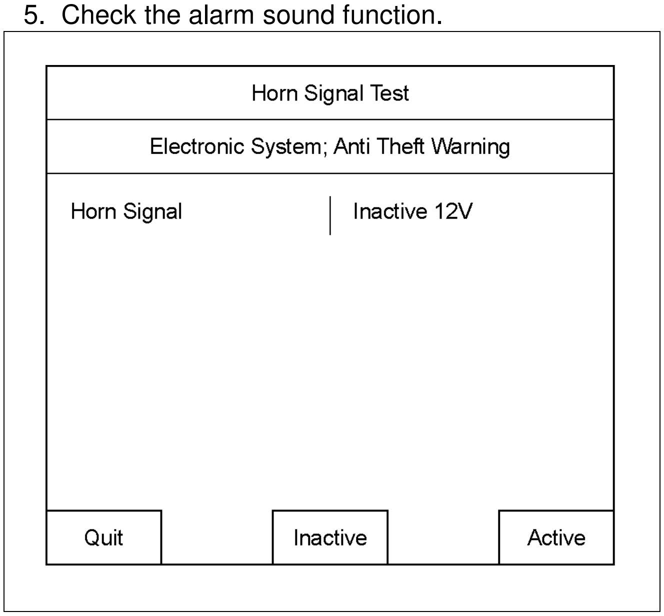


RAW4B0SH000201

Horn Signal Test

Horn signal test is used to check abnormalities in horn signal circuit.

1. Select “Body” and “Antitheft”.
2. Select “Actuator Test” and “Horn Signal Test”.
3. Observe the alarm sound.
4. Push “active bottom”.
5. Check the alarm sound function.

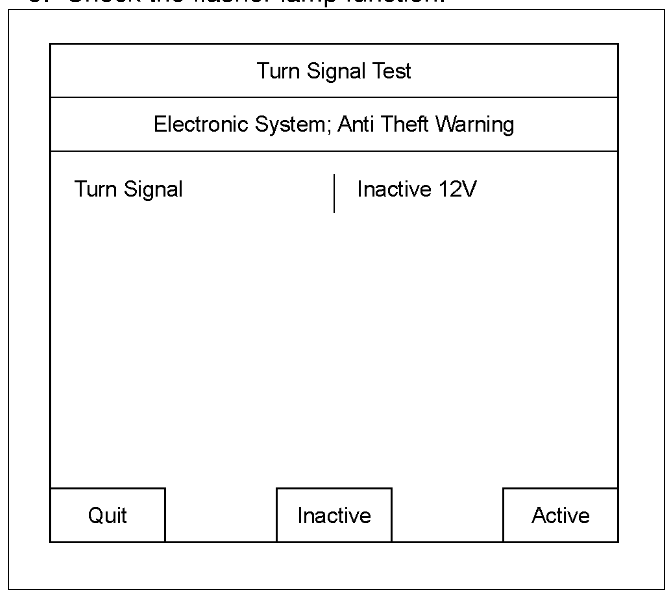


RAW4B0SH000301

Turn Signal Test

Turn signal test is used to check abnormalities in turn signal circuit.

1. Select “Body” and “Antitheft”.
2. Select “Actuator Test” and “Turn Signal Test”.
3. Observe the flasher lamp.
4. Push “active bottom”.
5. Check the flasher lamp function.

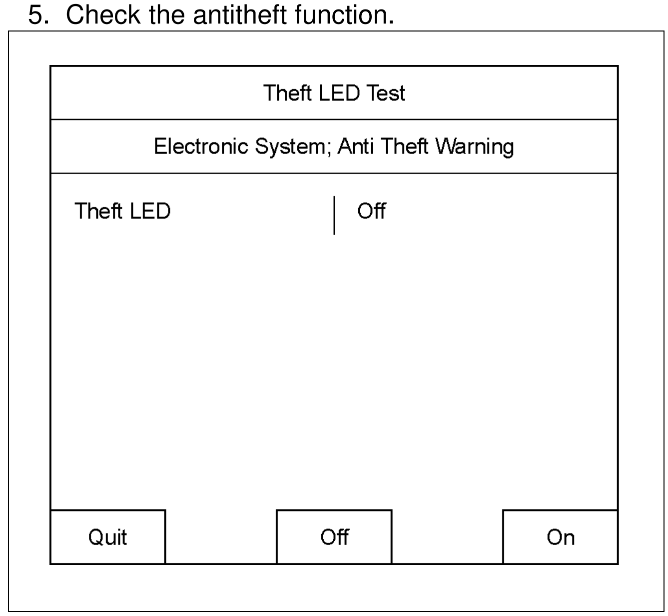


RAW4B0SH000401

Theft LED Test

Theft LED test is used to check abnormalities in theft LED signal circuit.

1. Select “Body” and “Antitheft”.
2. Select “Actuator Test” and “Turn Signal Test”.
3. Observe the antitheft LED.
4. Push “active bottom”.
5. Check the antitheft function.



RAW4B0SH000501

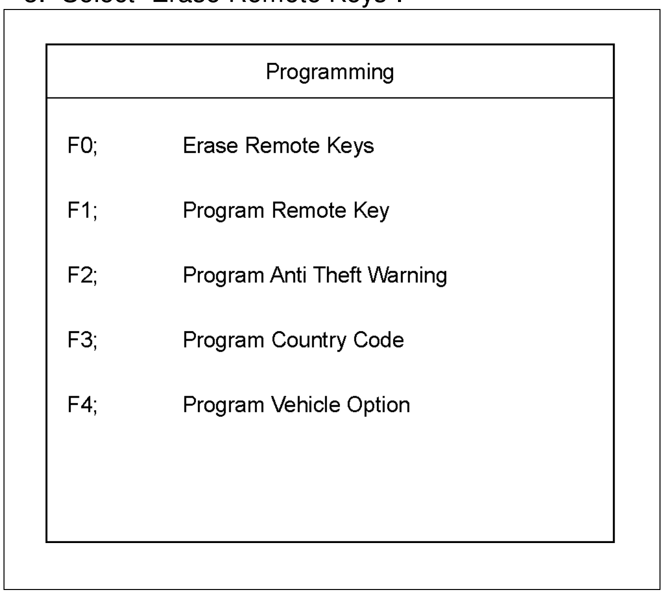
Programming

Programming antitheft function is used to input security code for the antitheft system by tech 2.

If the remote key or ECU replaced, program as necessary.

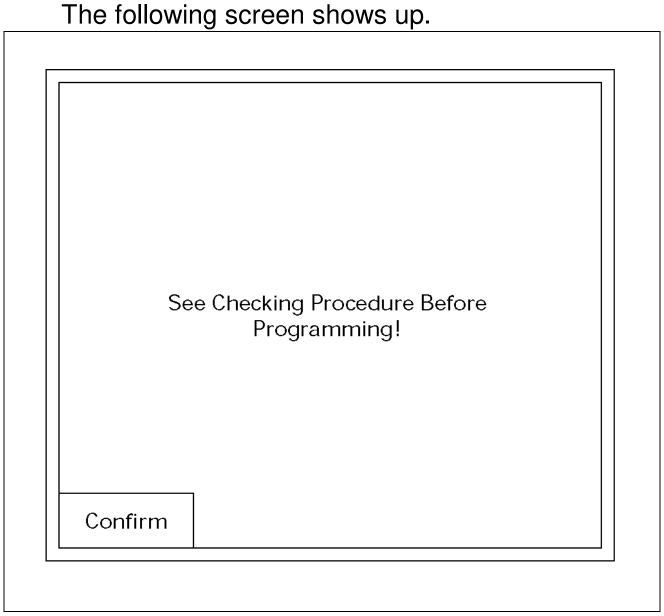
Erase Remote Keys

1. Select “Body” and “Antitheft”.
2. Select “Programming”.
3. Select “Erase Remote Keys”.



RAW4B0SH000601

The following screen shows up.



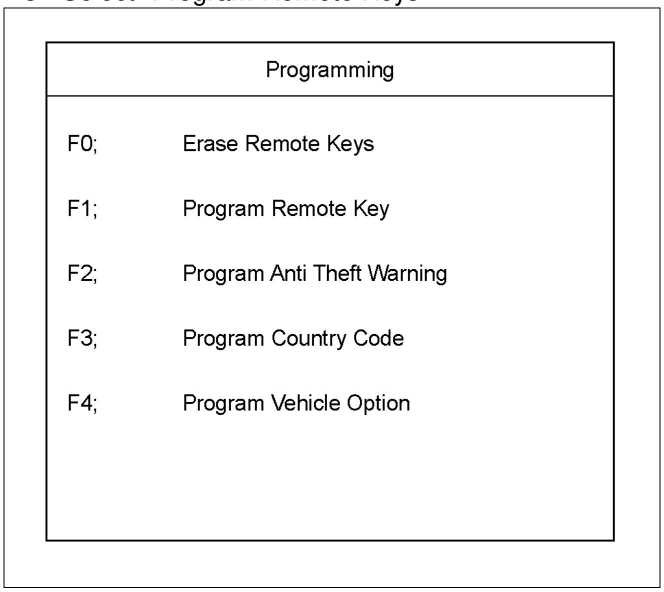
060R200289

4. Confirm the following screen shows up.

060R200284

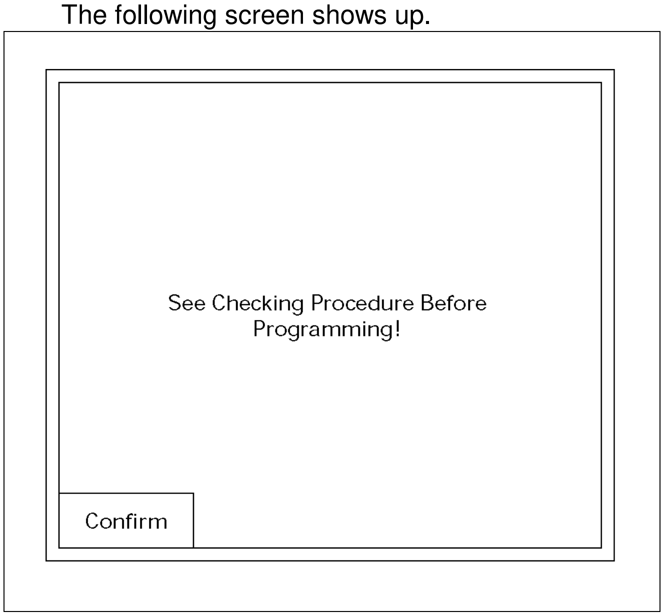
Program Remote Keys

1. Select “Body” and “Antitheft”.
2. Select “”Programming”.
3. Select “Program Remote Keys”.



RAW4B0SH000601

The following screen shows up.



060R200289

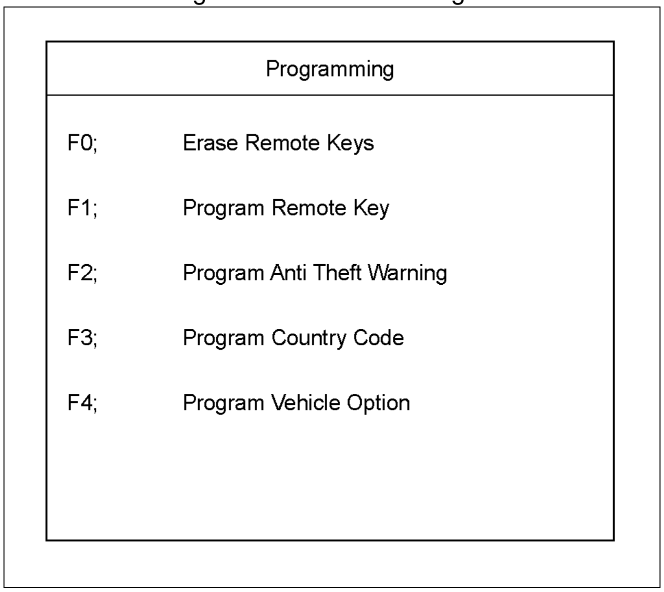
4. Confirm the following screen shows up.

060R200284

5. Input the security code.

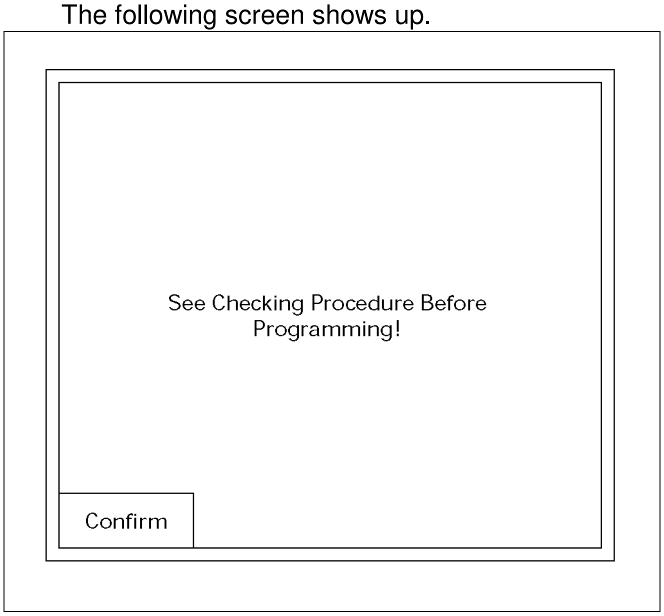
Program Antitheft Warning

1. Select “Body” and “Antitheft”.
2. Select “Programming”.
3. Select “Program Antitheft Warning”.



RAW4B0SH000601

The following screen shows up.



060R200289

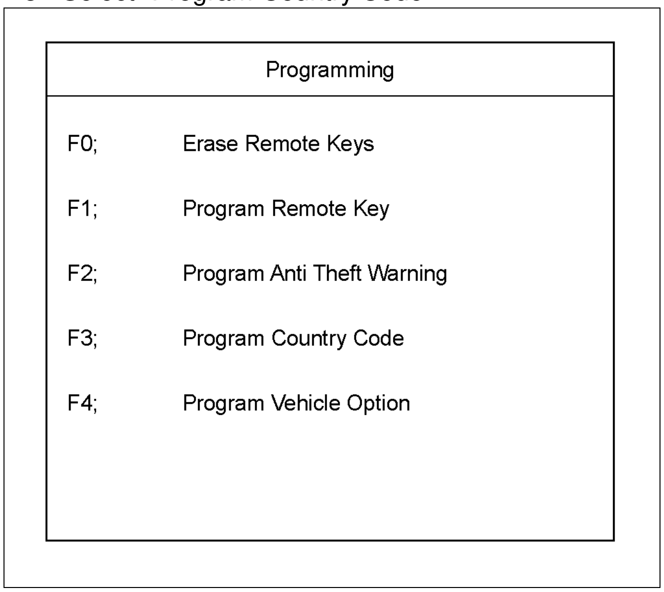
4. Confirm the following screen shows up.

060R200284

5. Input the security code.

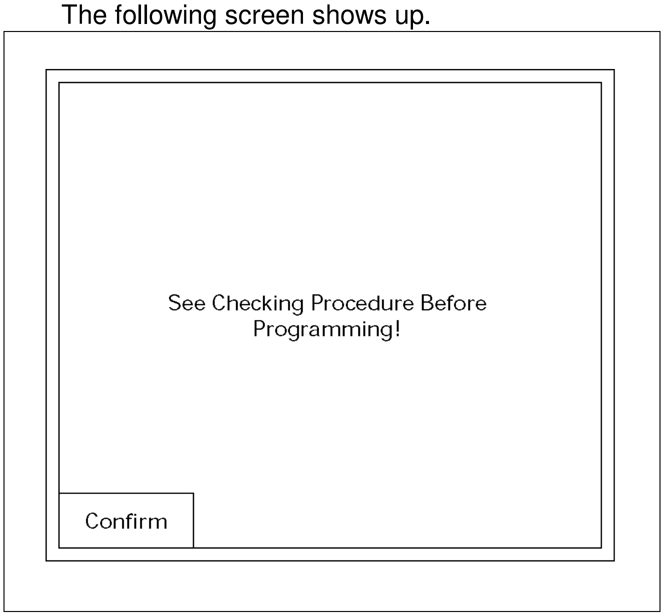
Program Country Code

1. Select “Body” and “Antitheft”.
2. Select “Programming”.
3. Select “Program Country Code”.



RAW4B0SH000601

The following screen shows up.



060R200289

4. Confirm the following screen shows up.

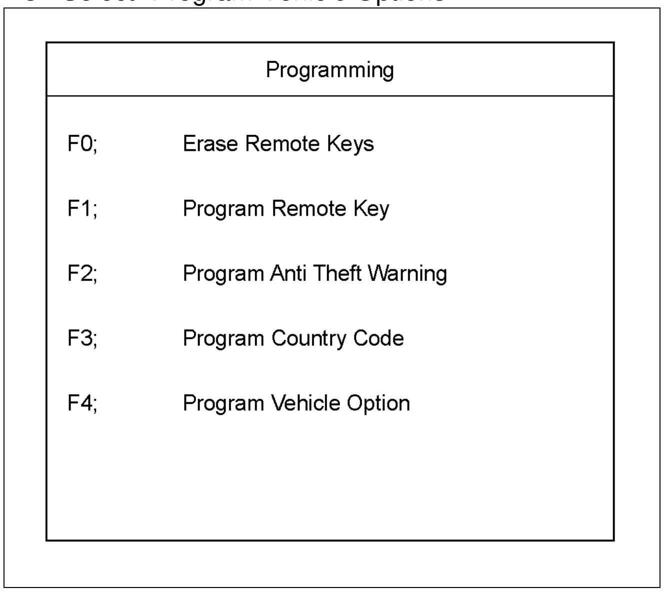
060R200284

5. Input the security code.

- Select 213 Germany in all items.

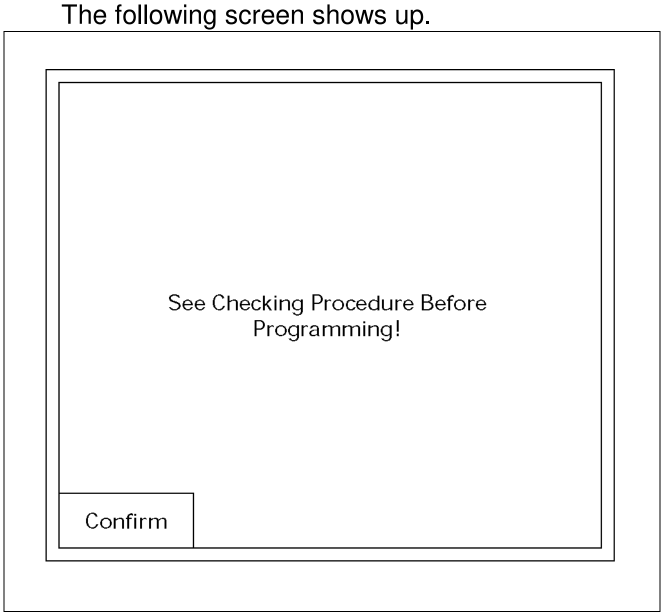
Program Vehicle Options

1. Select “Body” and “Antitheft”.
2. Select “Programming”.
3. Select “Program Vehicle Options“.



RAW4B0SH000601

The following screen shows up.



060R200289

4. Confirm the following screen shows up.

060R200284

5. Input the vehicle options.

Tech-2 Data List

No.	Data List	Units
1	Battery Voltage	V
2	'KEY-IN' Status	ON/OFF
3	CDLS-Motor Voltage (Central Door Locking System)	V
4	Accident Sensor (Crash Sensor)	Active/Inactive
5	Remote Key	Active/Inactive
6	Remote-Key Detected	Remote Key No.
7	Key Function Detected	Lock/Unlock
8	Prev. Detected Remote-Key (Previously)	Remote Key No.
9	Previously Key Function	Lock/Unlock
10	Remote-Key 1 Status	In Range/Not Programmed
11	Remote-Key 2 Status	In Range/Not Programmed
12	Remote-Key 3 Status	In Range/Not Programmed
13	Remote-Key 4 Status	In Range/Not Programmed
14	Remote-Key 5 Status	In Range/Not Programmed
15	Front Door Unlock Switch	Active/Inactive
16	Front Door Lock Switch	Active/Inactive
17	Front Door Lock Status	Active/Inactive
18	Auto Door Unlock Switch	Active/Inactive
19	Auto Door Lock Switch	Active/Inactive
20	Auto Door Lock Status	Active/Inactive
21	Trunk Signal Switch	*Not used Open/Closed

Diagnosis

Diagnostic procedure

- Once the cause of DTC is repaired or gone, engine can be operated normally, and present DTC becomes history code.
- History code is canceled by no repeat failure on 25 consequence ignition key on afterward.
- History code cannot be canceled by battery connector disconnected.

Clearing Diagnostic Trouble Codes

IMPORTANT: Do not clear DTCs unless directed to do so by the service information provided for each diagnostic procedure. When DTCs are cleared, the Failure Record data which may help diagnose an intermittent fault will also be erased from memory.

Verifying Vehicle Repair

Verification of vehicle repair will be more comprehensive for vehicles with immobilizer system diagnostic. Following a repair, the technician should perform the following steps:

1. Review and record the Fail Records for the DTC which has been diagnosed.
2. Clear DTC (s).
3. Operate the vehicle within conditions noted in the Fail Records.
4. Monitor the DTC status information for the DTC which has been diagnosed until the diagnostic test associated with that DTC runs.

Following these steps are very important in verifying repairs on immobilizer systems. Failure to follow these steps could result in unnecessary repairs.

Diagnostic Aids

An intermittent may be caused by the following:

- Poor connections.
- Miss routed harness.
- Rubbed through wire insulation.
- Broken wire inside the insulation.

Check for the following conditions:

- Poor connection at ACU-Inspect harness connectors for backed out terminals, improper mating, broken locks, improperly formed or damaged terminals, and poor terminal to wire connection.
- Damaged harness-Inspect the wiring harness for damage.

  If the harness appears to be OK, observe the data display on the Tech2 while moving connectors and wiring harnesses related to the switch or actuator.
  A change in the display will indicate the location of the fault.
  If DTC cannot be duplicated, the information included in the Failure Records data can be useful in determined vehicle mileage since the DTC was last set.
  If it is determined that the DTC occurs intermittently, performing the DTC Diagnostic Chart may isolate the cause of the fault.

NOTE: Breakage of antitheft fuse does not operate antitheft system. Check LED lamp flashes at this time.

Check the Electro-Magnetic Interference (EMI)

- Location of vehicle check
  Move the vehicle to a new location and perform the check again.
- Non-OEM Parts.
  Switch is "OFF" or remove the Non-OEM parts and perform the check again.
- Other
  Remove the accessory and another key from key.

Check the other items.

- Battery voltage is low.
- Antitheft programming functions.
  Must be programmed antitheft system.
- Registration for security code, antitheft control unit parts number.
- Key switch operation.
  Antitheft system may detect a history DTC by the timing of ON-OFF of a key switch.
- Active the antitheft system.
- Keyless entry system is malfunction.
- Immobilizer system is malfunction.

Check the operation

Check the operation "Lock / unlock" by using transmitter (key) on the vehicle.

Diagnostic Trouble Code (DTC) List For Antitheft

DTC	Description
13	Security code not yet programmed
14	No remote key programmed
16	Door lock actuators short circuit to ground
20	Broken wire to door lock actuators
21	Remote key 1 with random code out of capture range
22	Remote key 2 with random code out of capture range
23	Remote key 3 with random code out of capture range
24	Remote key 4 with random code out of capture range
25	Remote key 5 with random code out of capture range
28	Input immobilizer short circuit to ground
29	Broken wire to immobilizer
31	Actuator driver door defect
32	Actuator passenger door defect
36	Broken wire to driver door
37	Broken wire to passenger door
41	Driver door switch unlock defect
42	Driver door switch lock defect
43	Driver door switch dead lock defect
44	Passenger door switch lock defect
45	Passenger door switch unlock defect
47	Battery voltage for door lock actuators is missing
50	A/D converter defect or battery voltage less than 9 volt
51	EEPROM defect
52	EEPROM not programmed by ISUZU
55	Control unit defect
123	Output flasher short circuit to ground or broken wire
125	Output alarm horn broken wire

Antitheft System Check

Step	Action	Value (s)	Yes	No
1	1. Key position is "ACC", shut all doors and bonnet. 2. Observe the antitheft lamp. Note: When a key switch is "ACC", antitheft lamp will turn on and a antitheft lamp (LED) will be flashing after 10 seconds. Is the antitheft lamp "ON" or flashing?	—	Go to *Step 2*	Go to *"No antitheft lamp"*
2	1. Key position is "ON", engine "OFF". 2. Observe the antitheft lamp. 3. Key position is turned "ACC". 4. Check the antitheft lamp will be turned flashing and lamp will be turned ACC after 10 seconds. Is the antitheft lamp flashing?	—	Go to *DTC table*	Go to *Step 3*
3	1. Key position is "OFF". 2. Install the Tech-2. 3. Key position is "ON" or "OFF". 4. Attempt to display antitheft data with the Tech-2. Does the Tech-2 display antitheft data?	—	Go to *Step 9*	Go to *Step 4*
4	1. Key position is "OFF", disconnect the antitheft control unit (ACU). 2. Check the DLC (Data Link Connector) circuit for an open, short to ground, or short to voltage. Also, check the DLC ignition feed circuit for an open or short to ground and the DLC ground circuit for an open. Was a problem found?	—	Go to *Step 5*	Go to *Step 6*
5	Repair or replace the DLC (Data Link Connector) circuit. Was the action complete?	—	Go to *Step 3*	—
6	1 Check the ACU ground circuit for an open, or short to voltage. Also, check the ACU ignition feed circuit for an open or short to ground and the ACU ground circuit for an open. 2 If a problem is found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 7*
7	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the antitheft data by Tech-2. Was the action complete?	—	Go to *Step 8*	—
8	Select "Display DTCs" with the Tech-2. Are any DTCs stored?	—	Go to applicable DTC table	—
9	1 Observe the antitheft data list on Tech-2. 2 If a problem is found, repair as necessary. Was the problem found?	—	System OK	Go to *applicable section*

No Antitheft Lamp

Step	Action	Value (s)	Yes	No
1	Check the fuse for the antitheft power feed circuit. (10A) If a problem found, repair as necessary. Was the problem found? Is the action complete?	—	Verify repair	Go to *Step 2*
2	1. Check the ACU ground circuit for an open, or short to voltage. Also, check the ACU ignition feed circuit for an open or short to ground and the ACU ground circuit for an open. 2. If a problem is found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 3*
3	1. Check the antitheft lamp LED circuit for an open, or short to voltage. 2. If a problem is found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 4*
4	1. Key position is “OFF”. 2. Install the Tech-2. 3. Key position is “ACC” or “OFF”. 4. Observe to display lamp data with the Tech-2. Does the Tech-2 display antitheft lamp data ON?	—	Go to *Step 5*	Go to *Step 6*
5	Replace the antitheft lamp.	—	Verify repair	—
6	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the antitheft data by Tech-2. Was the action complete?	—	Verify repair	—

DTC 13 Security Code not yet programmed

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *Antitheft System Check*
2	Check the key. Is a key peculiar to a vehicle?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the Antitheft programming functions by Tech-2. • All transmitters (Remote Key). If a problem is found, reprogramming as necessary. (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 4*	Go to *Step* 5
4	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on Tech-2. Is DTC 13 stored?	—	Go to *Step 5*	Verify repair
5	Recheck the DTC. 1. Non-OEM parts switch is "OFF" or remove the Non-OEM parts. 2. Remove the accessory and another key from key. 3. Move the vehicle to a new location. 4. Key position is "OFF" and keep the position for more than 30 seconds. 5. Key position is "ON". 6. Check the DTC on Tech-2. Is DTC 13 stored?	—	Go to *Step 6*	Verify repair
6	Replace the Antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Is DTC 13 stored?	—	Go to *Step 7*	Verify repair
7	Replace the key and lock cylinder assembly with Antitheft system (ACU). **IMPORTANT:** • ACU is not replacing simultaneously. • After replace lock cylinders, perform the following below the items. • Replace the keys and key cylinders. • Program the Antitheft system. (Refer to "Important information on Programming") Was the action complete?	—	Verify repair	—

DTC 14 No Remote Key Programmed

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Check the key. Is a key peculiar to a vehicle?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the antitheft programming functions. • Transmitter (Remote Key). Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Perform the antitheft programming functions. • Transmitter (Remote Key). (Refer to “Important information on Programming”) Was the action complete?	—	Go to *Step 5*	—
5	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on the Tech-2. Is DTC 14 stored?	—	Go to *Step 6*	Verify repair
6	Replace the transmitter (Remote Key). **IMPORTANT:** The replacement transmitter (Remote Key) must be programmed the security data by the Tech-2. Was the action complete?	—	Go to *Step 7*	—
7	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on the Tech-2. Is DTC 14 stored?	—	Go to *Step 8*	Verify repair
8	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 16 Door Lock Actuators Short Circuit to Ground

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Check the door lock actuators circuit. 1. Key position is “OFF”. 2. Disconnect the antitheft control unit (ACU). 3. Check the door lock actuator circuit for short to ground. If the problem found, repair as necessary. Was a problem found?	—	Verify repair	Go to *Step 3*
3	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on the Tech-2. Is DTC 16 stored?	—	Go to *Step 4*	Verify repair
4	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 20 Broken wire to door lock actuators

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “ON”. 4. Check the DTC on the Tech-2. Is DTC 20 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the door lock actuator circuit. 1. Key position is “OFF”. 2. Disconnect the antitheft control unit (ACU). 3. Disconnect the door lock motor. 4. Check the antitheft/door lock motor line circuit for an open, short to ground. Also, check the ignition feed circuits for an open or short to ground and the ACU ground circuit for an open. Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Repair or replace the antitheft/door lock motor circuit. Was the action complete?	—	Verify repair	—
5	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the tech2. Was the action complete?	—	Verify repair	—

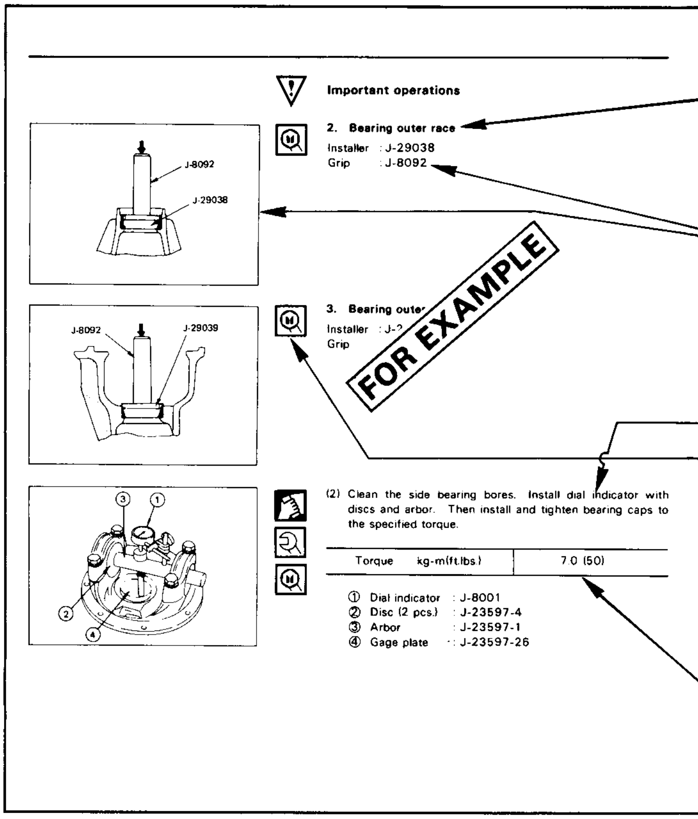
DTC 21 Remote Key 1 With Random Code Out Of Capture Range

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Check the key. Is a key peculiar to a vehicle?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the antitheft programming functions to the peculiar key with the Tech-2 • Transmitter (Remote Key). Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Perform the antitheft programming functions. • Transmitter (Remote Key). (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 5*	—
5	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on the Tech-2. Is DTC 21 stored?	—	Go to *Step 6*	Verify repair
6	Replace the transmitter (Remote Key). **IMPORTANT:** The replacement transmitter (Remote Key) must be programmed the security data by Tech-2. Was the action complete?	—	Go to *Step 7*	—
7	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on the Tech-2. Is DTC 21 stored?	—	Go to *Step 8*	Verify repair
8	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 22 Remote Key 2 With Random Code Out Of Capture Range

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Check the key. Is a key peculiar to a vehicle?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the antitheft programming functions to the peculiar key with the Tech-2 • Transmitter (Remote Key). Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Perform the antitheft programming functions. • Transmitter (Remote Key). (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 5*	—
5	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on the Tech-2. Is DTC 22 stored?	—	Go to *Step 6*	Verify repair
6	Replace the transmitter (Remote Key). **IMPORTANT:** The replacement Transmitter (Remote Key) must be programmed the security data by Tech-2. Was the action complete?	—	Go to *Step 7*	—
7	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on the Tech-2. Is DTC 22 stored?	—	Go to *Step 8*	Verify repair
8	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

5. Below is a sample of the Workshop Manual text following the " Major Components " page.
   A brief explanation of the notation used follows:



This is the item shown in the illustration. It is marked with a triangle (▲) on the "Major Components" page.

Special or recommended tools are identified by the tool name and/or number. The illustration shows how the tool is to be used.

Letters and numbers within a circle refer to identically labeled parts or measurements in the illustraion.

This symbol indicates the type of service operation to be performed. A more detailed explanation of the various symbols follows.

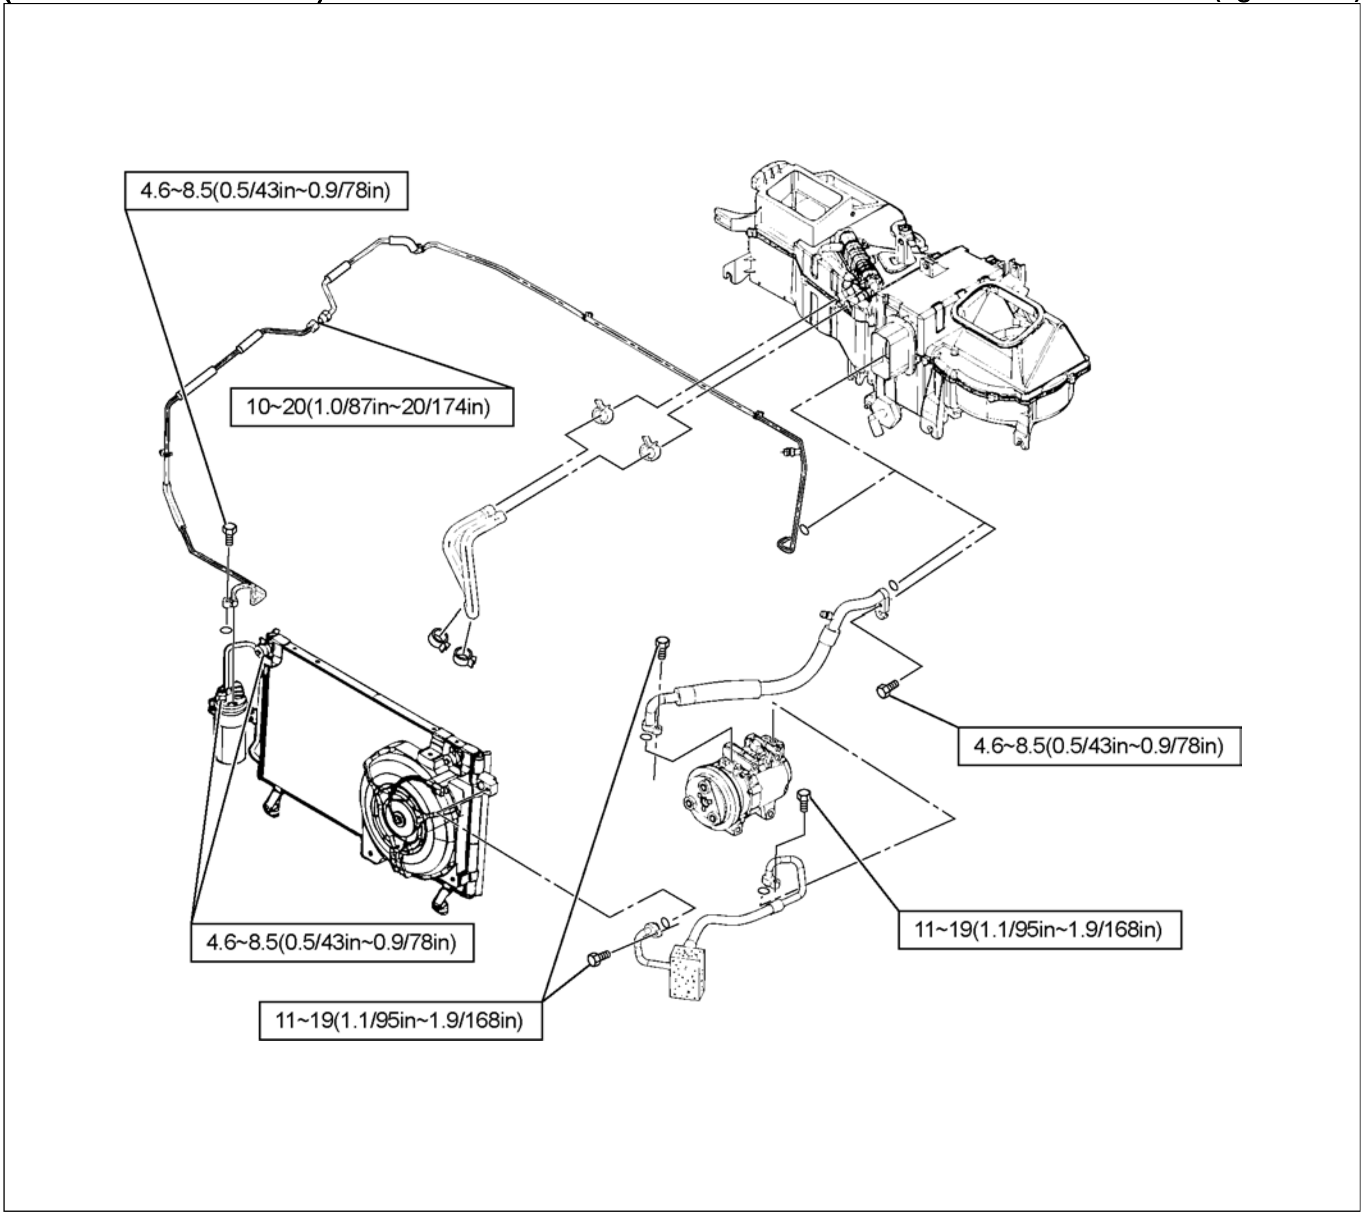
This table gives important service specifications and data.

6. The following symbols appear throughout the Workshop Manual.
   They tell you at a glance the type of service operation to perform.

- ········ Removal
- ········ Installation
- ········ Disassembly
- ········ Reassembly
- ········ Alignment
- ········ Directional indication
- ········ Inspection
- ········ Measurement
- .... Torque angle method
- ········ Adjustment
- ········ Cleaning
- ········ Important operation requiring extra care
- ········ Specified torque
- ········ ISUZU special tool(s) required or recommended
- ········ Other special tool(s) required or recommended
- ········ Lubrication (Oil)
- ········ Lubrication (Grease)
- ········ Liquid gasket application

(C24SE RHD MODEL)

N·m (kgf·m/lb·in)



RTW710LF003501

Normal Braking

During normal (non anti-lock) braking, the solenoid valve has current flow.

Brake fluid travels through the center of the inlet valve around the outlet valve then to the brake pistons.

DTC 23 Remote Key 3 With Random Code Out Of Capture Range

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Check the key. Is a key peculiar to a vehicle?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the antitheft programming functions to the peculiar key with the Tech-2 • Transmitter (Remote Key). Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Perform the antitheft programming functions. • Transmitter (Remote Key). (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 5*	—
5	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on the Tech-2. Is DTC 23 stored?	—	Go to *Step 6*	Verify repair
6	Replace the Transmitter (Remote Key). **IMPORTANT:** The replacement Transmitter (Remote Key) must be programmed the security data by Tech-2. Was the action complete?	—	Go to *Step 7*	—
7	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on the Tech-2. Is DTC 23 stored?	—	Go to *Step 8*	Verify repair
8	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 24 Remote Key 4 With Random Code Out Of Capture Range

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Check the key. Is a key peculiar to a vehicle?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the antitheft programming functions to the peculiar key with the Tech-2 • Transmitter (Remote Key). Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Perform the antitheft programming functions. • Transmitter (Remote Key). (Refer to "Important information on Programming") Was the action complete?	—	Go to *Step 5*	—
5	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on the Tech-2. Is DTC 24 stored?	—	Go to *Step 6*	Verify repair
6	Replace the transmitter (Remote Key). **IMPORTANT:** The replacement transmitter (Remote Key) must be programmed the security data by Tech-2. Was the action complete?	—	Go to *Step 7*	—
7	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on the Tech-2. Is DTC 24 stored?	—	Go to *Step 8*	Verify repair
8	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 25 Remote Key 5 With Random Code Out Of Capture Range

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Check the key. Is a key peculiar to a vehicle?	—	Go *to Step 3*	Refer to *Diagnostic Aids*
3	Check the antitheft programming functions to the peculiar key with the Tech-2 • Transmitter (Remote Key). Was a problem found?	—	Go to Step 4	Go to *Step 5*
4	Perform the antitheft programming functions. • Transmitter (Remote Key). (Refer to “Important information on Programming”) Was the action complete?	—	Go to *Step 5*	—
5	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on the Tech-2. Is DTC 25 stored?	—	Go to *Step 6*	Verify repair
6	Replace the transmitter (Remote Key). **IMPORTANT:** The replacement transmitter (Remote Key) must be programmed the security data by Tech-2. Was the action complete?	—	Go to *Step 7*	—
7	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on the Tech-2. Is DTC 25 stored?	—	Go to *Step 8*	Verify repair
8	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 28 Input Immobilizer short circuit to ground

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “ON”. 4. Check the DTC on the Tech-2. Is DTC 28 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the driver door locking motor function. line circuit. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “ON”. 4. Check the antitheft/Immobilizer communication line circuit for short to voltage, short to ground. Also, check the ICU and ACU ignition feed circuits for an open or short to ground and the ICU and ACU ground circuit for an open. Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Repair or replace the antitheft/Immobilizer communication line circuit. Was the action complete?	—	Verify repair	—
5	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 29 Broken Wire To Immobilizer

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is “OFF”. 2. Install the scan tool on vehicle. 3. Key position is “ON”. 4. Check the DTC on the Tech-2. Is DTC 29 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the antitheft/immobilizer communication line circuit. 1. Key position is “OFF”. 2. Disconnect the antitheft control unit (ACU). 3. Disconnect the immobilizer control unit (ICU). 4. Check the antitheft/Immobilizer communication line circuit for an open, short to ground. Also, check the ICU and ACU ignition feed circuits for an open or short to ground and the ICU and ACU ground circuit for an open. Was a problem found?	—	Go to *Step 4*	Go to *Step 5*
4	Repair or replace the antitheft/Immobilizer communication line circuit. Was the action complete?	—	Verify repair	—
5	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 31 Actuator Driver Door Defect

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “ON”. 4. Check the DTC on the Tech-2. Is DTC 31 stored?	—	Go to *Step 3*	Refer to *Diagnostic* Aids
3	Check the driver door locking motor function. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “OFF”. 4. Observe to display locking motor data with the Tech-2. 5. Turn ON by driver door lock. Does the Tech-2 display ON voltage?	—	Go to *Step 4*	Go to *Step 5*
4	1. Key position is “OFF”. 2. Observe to display unlocking motor data with the Tech-2. 3. Turn OFF by driver door lock. Does the Tech-2 display ON voltage?	—	Refer to *Diagnostic Aids, and then go to step 5*	Go to *Step 5*
5	1. Check the driver door locking motor circuit for an open, short to ground, or short to voltage. Also, check the motor connector for damage. 2. If a problem found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 6*
6	1. Repair or replace the driver door locking motor. 2. Check the DTC on the Tech-2. Is DTC 31 stored?	—	Go to *Step 7*	Verify repair
7	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 32 Actuator Passenger Door Defect

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “ON”. 4. Check the DTC on the Tech-2. Is DTC 32 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the passenger locking motor function. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “OFF”. 4. Observe to display locking motor data with the Tech-2. 5. Turn ON by passenger door lock. Does the Tech-2 display ON voltage?	—	Go to *Step 4*	Go to *Step 5*
4	1. Key position is “OFF”. 2. Observe to display unlocking motor data with the Tech-2. 3. Turn OFF by passenger door lock. Does the Tech-2 display ON voltage?	—	Refer to *Diagnostic Aids*, and then go to *step 5*	Go to *Step 5*
5	1. Check the passenger door locking motor circuit for an open, short to ground, or short to voltage. Also, check the motor connector for damage. . If a problem found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 6*
6	1. Repair or replace the passenger door locking motor. 2. Check the DTC on the Tech-2. Is DTC 32 stored?	—	Go to *Step 7*	Verify repair
7	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 36 Broken Wire To Driver Door

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check" performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “ON”. 4. Check the DTC on the Tech-2. Is DTC 36 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the driver door lock function. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “OFF”. 4. Observe to display door lock data with the Tech-2. 5. Turn ON by driver door lock. Does the Tech-2 display Closed?	—	Go to *Step 4*	Go to *Step 5*
4	1. Key position is “ON”. 2. Observe to display door lock data with the Tech-2. 3. Turn OFF by driver door lock. Does the Tech-2 display Open ?	—	Refer to *Diagnostic Aids*, and then go to *step 5*	Go to *Step 5*
5	1. Check the driver door lock circuit for an open, short to ground, or short to voltage. Also, check the motor connector for damage. 2. If a problem found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 6*
6	1. Repair or replace the driver door lock. 2. Check the DTC on the Tech-2. Is DTC 36 stored?	—	Go to *Step 7*	Verify repair
7	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 37 Broken Wire To Passenger Door

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is "OFF". 2. Install the Tech-2 on vehicle. 3. Key position is "ON". 4. Check the DTC on the Tech-2. Is DTC 37 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the passenger door lock function. 1. Key position is "OFF". 2. Install the Tech-2 on vehicle. 3. Key position is "OFF". 4. Observe to display door lock data with the Tech-2. 5. Turn ON by passenger door lock. Does the Tech-2 display Closed ?	—	Go to *Step 4*	Go to *Step 5*
4	1. Key position is "ON". 2. Observe to display door lock data with the Tech-2. 3. Turn OFF by passenger door lock. Does the Tech-2 display Open ?	—	Refer to *Diagnostic Aids*, and then go to *step 5*	Go to *Step 5*
5	1. Check the passenger door lock circuit for an open, short to ground, or short to voltage. Also, check the motor connector for damage. 2. If a problem found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 6*
6	1. Repair or replace the passenger door lock. 2. Check the DTC on the Tech-2. Is DTC 37 stored?	—	Go to *Step 7*	Verify repair
7	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 41 Driver Door Lock Switch Unlock Defect

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “ON”. 4. Check the DTC on the Tech-2. Is DTC 41 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the driver door lock function. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “OFF”. 4. Observe to display door lock switch data with the Tech-2. 5. Turn ON by driver door lock. Does the Tech-2 display Closed?	—	Go to *Step 4*	Go to *Step 5*
4	1. Key position is “OFF”. 2. Observe to display door lock data with the Tech-2. 3. Turn OFF by driver door lock. Does the Tech-2 display Open ?	—	Refer to *Diagnostic Aids*, and then go to *step 5*	Go to *Step 5*
5	1. Check the driver door lock switch circuit for an open, short to ground, or short to voltage. Also, check the door lock connector for damage. 2. If a problem found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 6*
6	1. Repair or replace the driver door lock switch. 2. Check the DTC on the Tech-2. Is DTC 41 stored?	—	Go to *Step 7*	Verify repair
7	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

BACK TO CHAPTER INDEX

TO MODEL INDEX

Pressure Isolation (Pressure Maintain)

The electronic-hydraulic control unit is activated when the brakes are applied.

If the information from the wheel speed sensors indicates excessive wheel deceleration (imminent lockup), the first step in the anti-lock sequence is to isolate the brake pressure being applied by the brake pedal.

The microprocessor in the Control Unit sends a voltage to the coil to energize and close the outlet valve. This prevents any additional fluid pressure applied by the brake pedal from reaching the wheel. With the outlet valves closed, unnecessary increase in the brake pressure is prevented.

DTC 42 Driver Door Lock Switch lock Defect

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is "OFF". 2. Install the Tech-2 on vehicle. 3. Key position is "ON". 4. Check the DTC on the Tech-2. Is DTC 42 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the driver door lock function. 1. Key position is "OFF". 2. Install the Tech-2 on vehicle. 3. Key position is "OFF". 4. Observe to display door lock switch data with the Tech-2. 5. Turn ON by driver door lock. Does the Tech-2 display Closed?	—	Go to *Step 4*	Go to *Step 5*
4	1. Key position is "OFF". 2. Observe to display door lock data with the Tech-2. 3. Turn OFF by driver door lock. Does the Tech-2 display Open ?	—	Refer to *Diagnostic Aids*, and then go to *step 5*	Go to *Step 5*
5	1. Check the driver door lock switch circuit for an open, short to ground, or short to voltage. Also, check the door lock connector for damage. 2. If a problem found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 6*
6	1. Repair or replace the driver door lock switch. 2. Check the DTC on the Tech-2. Is DTC 42 stored?	—	Go to *Step 7*	Verify repair
7	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 43 Driver Door Lock Switch Super lock Defect

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is "OFF". 2. Install the Tech-2 on vehicle. 3. Key position is "ON". 4. Check the DTC on the Tech-2. Is DTC 43 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the driver door lock function. 1. Key position is "OFF". 2. Install the Tech-2 on vehicle. 3. Key position is "OFF". 4. Observe to display door lock switch data with the Tech-2. 5. Turn ON by driver door lock. Does the Tech-2 display Closed?	—	Go to *Step 4*	Go to *Step 5*
4	1. Key position is "OFF". 2. Observe to display door lock data with the Tech-2. 3. Turn OFF by driver door lock. Does the Tech-2 display Open?	—	Refer to *Diagnostic Aids*, and then go to *step 5*	Go to *Step 5*
5	1. Check the driver door lock switch circuit for an open, short to ground, or short to voltage. Also, check the door lock connector for damage. 2. If a problem found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 6*
6	1. Repair or replace the driver door lock switch. 2. Check the DTC on the Tech-2. Is DTC 43 stored?	—	Go to *Step 7*	Verify repair
7	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 44 Passenger Door Lock Switch lock Defect

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “ON”. 4. Check the DTC on the Tech-2. Is DTC 44 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the passenger door lock function. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “OFF”. 4. Observe to display door lock switch data with the Tech-2. 5. Turn ON by passenger door lock. Does the Tech-2 display Closed?	—	Go to *Step 4*	Go to *Step 5*
4	1. Key position is “OFF”. 2. Observe to display door lock data with the Tech-2. 3. Turn OFF by passenger door lock. Does the Tech-2 display Open ?	—	Refer to *Diagnostic Aids*, and then go to *step 5*	Go to *Step 5*
5	1. Check the passenger door lock switch circuit for an open, short to ground, or short to voltage. Also, check the door lock connector for damage. 2. If a problem found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 6*
6	1. Repair or replace the passenger door lock switch. 2. Check the DTC on the Tech-2. Is DTC 44 stored?	—	Go to *Step 7*	Verify repair
7	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 45 Passenger Door Lock Switch Unlock Defect

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is "OFF". 2. Install the Tech-2 on vehicle. 3. Key position is "ON". 4. Check the DTC on the Tech-2. Is DTC 44 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the passenger door lock function. 1. Key position is "OFF". 2. Install the Tech-2 on vehicle. 3. Key position is "OFF". 4. Observe to display door lock switch data with the Tech-2. 5. Turn ON by passenger door lock. Does the Tech-2 display Closed ?	—	Go to *Step 4*	Go to *Step 5*
4	1. Key position is "OFF". 2. Observe to display door lock data with the Tech-2. 3. Turn OFF by passenger door lock. Does the Tech-2 display Open ?	—	Refer to *Diagnostic Aids,* and then go to *step 5*	Go to *Step 5*
5	1. Check the passenger door lock switch circuit for an open, short to ground, or short to voltage. Also, check the door lock connector for damage. 2. If a problem found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 6*
6	1. Repair or replace the passenger door lock switch. 2. Check the DTC on the Tech-2. Is DTC 45 stored?	—	Go to *Step 7*	Verify repair
7	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 47 Battery Voltage For Door Lock Actuators Is Missing

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “ON”. 4. Check the DTC on the Tech-2. Is DTC 47 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the antilock system voltage. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “ON”. 4. Observe to display system voltage data with the Tech-2. Is the voltage near the specified value ?	—	Go to *Step 5*	Go to *Step 4*
4	1. Key position is “OFF”. 2. Check the battery voltage. 3. If a problem found, repair as necessary. (Chage battery) Was the problem found?	—	Verify repair	Refer to *Diagnostic Aids*
5	Check the door lock motor output voltage. 1. Key position is “OFF”. 2. Connect a digital volt meter to measure voltage. between ACU terminal 7 and body ground. 3. Key position is “ON”. 4. Observe to display voltage with the DVM. 5. Door lock ON. Is the voltage near the specified value ?	—	Go to *Step 6*	Go to *Step 7*
6	1. Check the door lock motor circuit for an open, short to ground, or short to voltage. Also, check the door lock motor connector for damage. 2. If a problem found, repair as necessary. Was the problem found?	—	Verify repair	—
7	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 50 A/D Converter Defect Or Battery Voltage Less Than 9 Volt

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is "OFF". 2. Install the Tech-2 on vehicle. 3. Key position is "ON". 4. Check the DTC on the Tech-2. Is DTC 50 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Check the antilock system voltage. 1. Key position is "OFF". 2. Install the Tech-2 on vehicle. 3. Key position is "ON". 4. Observe to display system voltage data with the Tech-2. Is the voltage near the specified value ?	—	Go to *Step 6*	Go to *Step 4*
4	1. Key position is "OFF". 2. Check the battery voltage. 3. If a problem found, repair as necessary. (Chage battery) Was the problem found?	—	Verify repair	Go to *Step 5*
5	1. Check the ignition feed circuit for an open, short to ground. Also, check the ACU ground circuit for damage. 2. If a problem found, repair as necessary. Was the problem found?	—	Verify repair	Refer to *Diagnostic Aids*
6	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 51 EEPROM Defect

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “ON”. 4. Check the DTC on the Tech-2. Is DTC 51 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 52 EEPROM Not Programmed By ISUZU

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Check the antitheft programming functions for EOL information with the Tech-2. Was a problem found?	—	Go to *Step 3*	Go to *Step 4*
3	Perform the antitheft programming functions. • IOL information (Refer to “Important information on Programming”) Was the action complete?	—	Go to *Step 4*	—
4	Recheck the DTC. 1. Key position is “OFF” and keep the position for more than 30 seconds. 2. Key position is “ON”. 3. Check the DTC on scan tool. Is DTC 52 stored?	—	Go to *Step 5*	Verify repair
5	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

DTC 55 Control unit defect

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is "OFF" and keep the position for more than 30 seconds. 2. Key position is "ON". 3. Check the DTC on scan tool. Is DTC 55 stored?	—	Go to *Step 3*	Verify repair
3	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the tech2. Was the action complete?	—	Verify repair	—

DTC 123 Output flasher short circuit to ground or broken wire

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is "OFF". 2. Install the tech2 on vehicle. 3. Key position is "ON". 4. Check the DTC on the tech2. Is DTC 123 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	1. Check the flasher circuit for an open, short to ground, or short to voltage. Also, check the flasher connector for damage. 2. If a problem found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 4*
4	Check the flasher function. 1. Key position is "OFF". 2. Connect a jumper wire between ACU terminal 28 and body ground. 3. Key position is "ON". 4. Observe to operate flasher lamp. If the problem found about the flasher lamp circuit, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 5*
5	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the tech2. Was the action complete?	—	Verify repair	—

Pressure Reduction

Once the brake pressure is isolated, it must be reduced to allow the wheels to unlock. This is accomplished by dumping a portion of the brake fluid pressure into the accumulator.

The microprocessor activates the normally closed outlet valve to open, allowing fluid from the wheels to be dumped into the accumulator. This is done with very short activation pulses opening and closing the outlet valve passageway. Brake pressure is reduced at the wheel and allows the wheel to begin rotating again. The fluid from the brake piston is stored in the accumulator against spring pressure and a portion of this fluid also primes the pump.

The outlet valves are operated independently to control the deceleration of the wheel.

DTC 125 Output Alarm Horn Broken Wire

Step	Action	Value (s)	Yes	No
1	Was the Antitheft System Check performed?	—	Go to *Step 2*	Go to *antitheft System Check*
2	Recheck the DTC. 1. Key position is “OFF”. 2. Install the Tech-2 on vehicle. 3. Key position is “ON”. 4. Check the DTC on the Tech-2. Is DTC 125 stored?	—	Go to *Step 3*	Refer to *Diagnostic Aids*
3	1. Check the alarm horn circuit for an open, short to ground, or short to voltage. Also, check the alarm horn connector for damage. 2. If a problem found, repair as necessary. Was the problem found?	—	Verify repair	Go to *Step 4*
4	Check the alarm horn function. 1. Key position is “OFF”. 2. Connect a jumper wire between ACU terminal 5 and body ground. 3. Key position is “ON”. 4. Observe to operate sound with the alarm horn. If the problem found about the alarm horn, replace as necessary. Was the problem found?	—	Verify repair	Go to *Step 5*
5	Replace the antitheft control unit (ACU). **IMPORTANT:** The replacement ACU must be programmed the security data by the Tech-2. Was the action complete?	—	Verify repair	—

Brake Release

At the end of the anti-lock stop, when the brake pedal is released, the pump will remain running for a short time to help drain any fluid from the accumulator. As this fluid returns into the system, the spring forces the piston back to its original position.

The inlet valve opens and fluid may return to the master cylinder. Conventional braking is then resumed.

System Components

Electronic Hydraulic Control Unit (EHCU), four Wheel Speed Sensors, two Warning Lamps, and G sensor.

Electronic Hydraulic Control Unit (EHCU)

The EHCU consists of ABS control circuits, fault detector, and a fail-safe. It drives the EHCU according to the signal from each sensor, cancelling ABS to return to normal braking when a malfunction has occurred in the ABS.

The EHCU has a self-diagnosing function which can indicate faulty circuits during diagnosis.

The EHCU is mounted on the engine compartment rear left side. It consists of a motor, solenoid valves and a fail safe relay.

Solenoid Valves: Reduces or holds the caliper fluid pressure for each front brake or both rear brakes according to the signal sent from the EHCU.

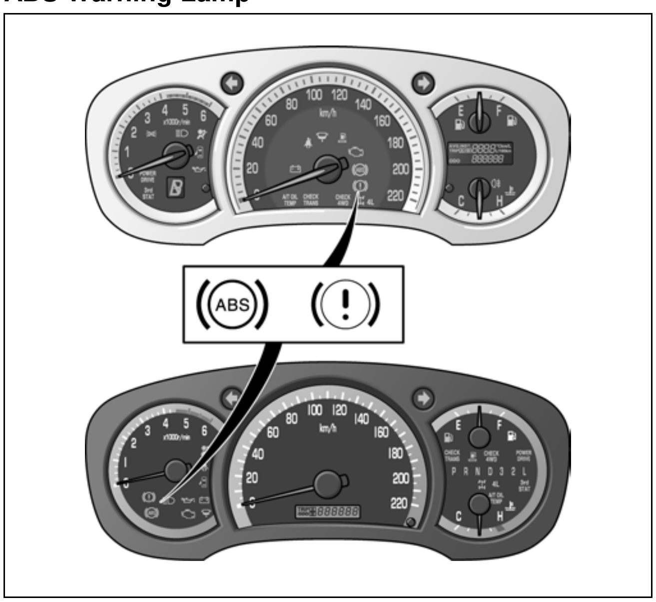
Buffer chamber: Temporarily holds the brake fluid that returns from the front and rear brake so that pressure of front brake can be reduced smoothly.

Motor: Drives the pump according to the signal from EHCU.

Fail safe Relay: When failure occurs in ABS.

The power supply to solenoid Valve is cut.

ABS Warning Lamp



RTW75ASH000101

Vehicles equipped with the Anti-lock Brake System have an amber “ABS” warning lamp on the instrument panel. The “ABS” warning lamp will illuminate if a malfunction in the Anti-lock Brake System is detected by the Electronic Hydraulic Control Unit (EHCU). In the case of an electronic malfunction, the EHCU will turn “ON” the “ABS” warning lamp and disable the anti-lock braking function.

The “ABS” warning lamp will turn “ON” for approximately three seconds after the ignition switch is in the “ON” position.

If the “ABS” warning lamp stays “ON” after the ignition switch is in the “ON” position, or comes “ON” and stays “ON” while driving, the Anti-lock Brake System should be inspected for a malfunction according to the diagnostic procedure.

Wheel Speed Sensor (WSS)

It consists of a sensor and a rotor. The sensor is attached to the knuckle on the front wheels and to the rear wheels.

The rotor is press-fit in the axle shaft.

G Sensor

The G sensor detects the vehicle deceleration speed and sends a signal to the EHCU. In 4WD operation, all four wheels may be decelerated in almost the same phase, since all wheels are connected mechanically.

This tendency is noticeable, particularly on roads with low friction coefficient, and the ABS control is adversely affected.

The G sensor judges whether the friction coefficient of the road surface is low or high, and changes the EHCU's operating system to ensure ABS and EBD control.

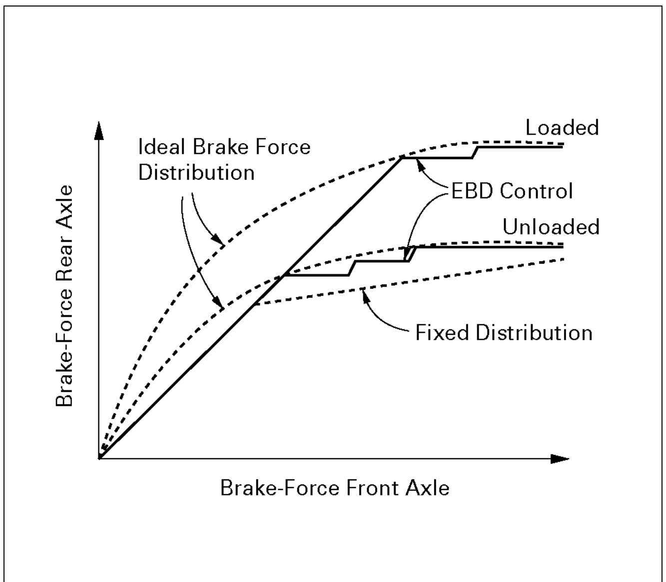
Normal and Anti-lock Braking

Under normal driving conditions, the Anti-lock Brake System functions the same as a standard power assisted brake system. However, with the detection of wheel lock-up, a slight bump or kick-back will be felt in the brake pedal. This pedal “bump” will be followed by a series of short pedal pulsations which occurs in rapid succession. The brake pedal pulsation will continue until there is no longer a need for the anti-lock function or until the vehicle is stopped. A slight ticking or popping noise may be heard during brake applications when the anti-lock feature is being used.

When the anti-lock feature is being used, the brake pedal may rise even as the brakes are being applied. This is also normal. Maintaining a constant force on the pedal will provide the shortest stopping distance.

Electronic Brake-force Distribution (EBD) System

ABS has the EBD function. EBD is a function which controls braking force distribution of a front wheel and a rear wheel, and makes brake fluid pressure of a rear wheel the optimal. If the rate of slip of a rear wheel becomes greater compared to a front wheel, the brake fluid pressure of a rear wheel will be controlled in order to perform braking force distribution between the front and rear wheels. EBD enables the braking power of a rear wheel to always be utilized for the maximum according to the load change concerning the back axis according to the vehicle's loading state (No luggage, loading, etc.), deceleration, etc. Brake fluid pressure control to a rear wheel is performed by the EBD function which uses the ABS function without the mechanical proportioning valve.



C05L300016

Brake Pedal Travel

Vehicles equipped with the Anti-lock Brake System may be stopped by applying normal force to the brake pedal. Although there is no need to push the pedal beyond the point where it stops or holds the vehicle, by applying more force the pedal will continue to travel toward the floor.

This extra brake pedal travel is normal.

General Diagnosis

General Information

ABS problems can be classified into two types, those which can be detected by the ABS warning lamp and those which can be detected as a vehicle abnormality by the driver.

In either case, locate the fault in accordance with the "BASIC DIAGNOSTIC FLOWCHART" and repair.

Please refer to Section 5C for the diagnosis of mechanical troubles such as brake noise, brake judder (brake pedal or vehicle vibration felt when braking), uneven braking, and parking brake trouble.

ABS Service Precautions

Required Tools and Items:

- Box Wrench
- Brake Fluid
- Special Tool

Some diagnosis procedures in this section require the installation of a special tool.

5-8840-0366-0 High Impedance Multimeter

When circuit measurements are requested, use a circuit tester with high impedance.

Computer System Service Precautions

The Anti-lock Brake System and Electronic Brake-force Distribution interfaces directly with the Electronic Hydraulic Control Unit (EHCU) which is a control computer that is similar in some regards to the Engine Control Module. These modules are designed to withstand normal current draws associated with vehicle operation. However, care must be taken to avoid overloading any of the EHCU circuits. In testing for opens or shorts, do not ground or apply voltage to any of the circuits unless instructed to do so by the appropriate diagnostic procedure. These circuits should only be tested with a high impedance multimeter 5-8840-0366-0 or special tools as described in this section. Power should never be removed or applied to any control module with the ignition in the “ON” position.

Before removing or connecting battery cables, fuses or connectors, always turn the ignition switch to the “OFF” position.

General Service Precautions

The following are general precautions which should be observed when servicing and diagnosing the Anti-lock Brake System and/or other vehicle systems. Failure to observe these precautions may result in Anti-lock Brake System and Electronic Brake-force Distribution damage.

- If welding work is to be performed on the vehicle using an electric arc welder, the EHCU and valve block connectors should be disconnected before the welding operation begins.
- The EHCU and valve block connectors should never be connected or disconnected with the ignition “ON”.

Note:

- If only rear wheels are rotated using jacks or drum tester, the system will diagnose a speed sensor malfunction and the “ABS and Brake” warning lamp will illuminate. But actually no trouble exists. When the DTC is not detected and the ABS and BRAKE warning lamp is on, “How to erase code” is performed and an ABS and BRAKE warning lamp are off.

If the battery has been discharged

The engine may stall if the battery has been completely discharged and the engine is started via jumper cables. This is because the Anti-lock Brake System (ABS) and Electronic Brake-force Distribution (EBD) System requires a large quantity of electricity. In this case, wait until the battery is recharged, or set the ABS and EBD to a non-operative state by removing the fuse for the ABS. After the battery has been recharged, stop the engine and install the ABS fuse. Start the engine again, and confirm that the ABS warning Lamp does not light.

Note on Intermittents

As with virtually any electronic system, it is difficult to identify an intermittent failure. In such a case duplicating the system malfunction during a test drive or a good description of vehicle behavior from the customer may be helpful in locating a “most likely” failed component or circuit. The symptom diagnosis chart may also be useful in isolating the failure. Most intermittent problems are caused by faulty electrical connections or wiring. When an intermittent failure is encountered, check suspect circuits for:

- Suspected harness damage.
- Poor mating of connector halves or terminals not fully seated in the connector body (backed out).
- Improperly formed or damaged terminals.

Test Driving ABS Complaint Vehicles

If there has been an abnormality in the lighting pattern of the “ABS” warning lamp, the fault can be located in accordance with the “DIAGNOSIS BY “ABS” WARNING LAMP ILLUMINATION PATTERN”. Although such problems can be detected by the driver as a vehicle symptom, it is still necessary to perform a test drive following the test procedure mentioned below, in order to reproduce the symptom for problem diagnosis on a symptom basis:

1. Start the engine and make sure that the “ABS” W/L goes OFF. If the W/L remains ON, it means that the Diagnostic Trouble Code (DTC) is stored. Therefore, read the code and locate the fault.

Note: The DTC cannot be cleared if the vehicle speed does not exceed about 10km/h (6mph) at DTC, even though the repair operation is completed.

2. Start the vehicle and accelerate to about 30 km/h (19 mph) or more.
3. Slowly brake and stop the vehicle completely.
4. Then restart the vehicle and accelerate to about 40 km/h (25 mph) or more.
5. Brake at a time so as to actuate the ABS and stop the vehicle.
6. Be cautious of abnormality during the test. If the W/L is actuated while driving, read the DTC and locate the fault.
7. If the abnormality is not reproduced by the test, make best efforts to reproduce the situation reported by the customer.
8. If the abnormality has been detected, repair in accordance with the “SYMPTOM DIAGNOSIS”.

Note:

- Be sure to perform a test drive on a wide, even road with light traffic.
- If an abnormality is detected, be sure to suspend the test and start trouble diagnosis at once.

"ABS" Warning Lamp

When ABS and problems occur that actuate the "ABS" warning lamp, the code corresponding to the problem is stored in the EHCU. Only ordinary braking is available when the ABS is deactivated. Even when the "ABS" warning lamp is actuated, if the starter switch is set ON after setting it OFF once, the EHCU checks up on the entire system. If there is no abnormality, the EHCU judges ABS to work correctly and the warning lamp is lit normally, even though the problem code is stored.

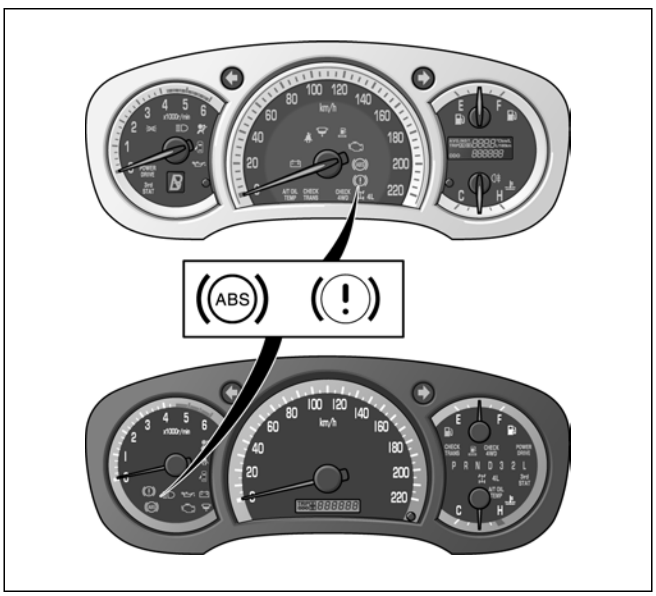
NOTE: Illumination of the "ABS" warning lamp indicates that anti-lock braking is no longer available. Power assisted braking without anti-lock control is still available.

Normal Operation

"ABS " Warning Lamp

When the ignition is first moved from "OFF" to "RUN", the amber "ABS" warning lamp will turn "ON". The "ABS" warning lamp will turn "ON" during engine starting and will usually stay "ON" for approximately three seconds after the ignition switch is returned to the "ON" position. The warning lamp should remain "OFF" at all other times.

Brake (EBD) Warning Lamp



RTW75ASH000101

Vehicles equipped with the EBD (Electronic Brake-force Distribution) System have a "Brake" warning lamp on the instrument panel.

If the ABS warning lamp and Brake warning lamp are turned "ON", then EBD has failed. (Parking brake switch is "OFF")

In the following conditions, the EBD warning lamp is "ON".

- Starter switch is "ON", engine "OFF".
  (Parking brake switch is "OFF")

If engine is started, then EBD warning lamp is "OFF".
(Parking brake switch is "OFF")

RTW710LF003701

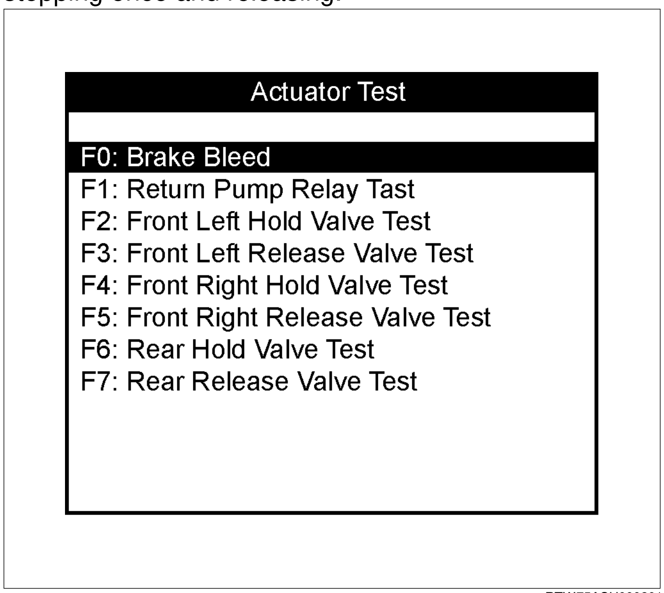
Actuator Test

There are 8 different menus available for this test.

The state of each circuit can be tested by using these menus. Especially when DTC cannot be detected, a faulty circuit can be diagnosed by testing each circuit by means of these menus.

Even when DTC has been detected, the circuit tests using these menus could help discriminate between a mechanical fault and an electrical fault.

In all cases test condition; Engine stops with the key turned to the "ON" position. To be more specific, the test is conducted with the brake pedal stepped on after stepping once and releasing.



RTW75ASH000201

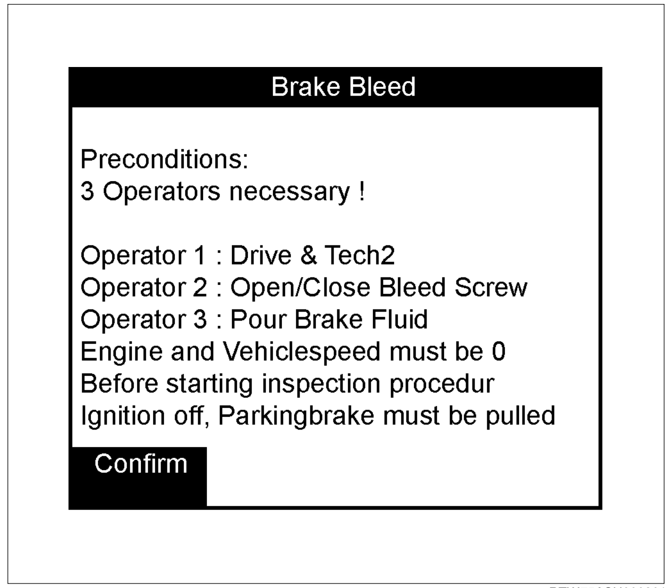
Brake Bleed

Purpose: The purpose of this command is air bleeding of brakes line.

Using the Tech 2 at following operation.

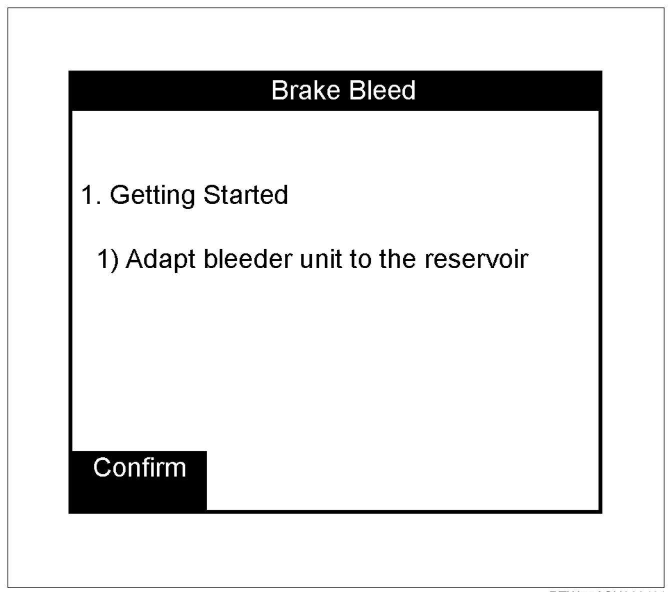
Air Bleeding procedure:

1. Connect the Tech 2 with the vehicle, and select "Actuator Test" menus.
2. Select a "Brake Bleed" menu from the "Actuator Test" menus.



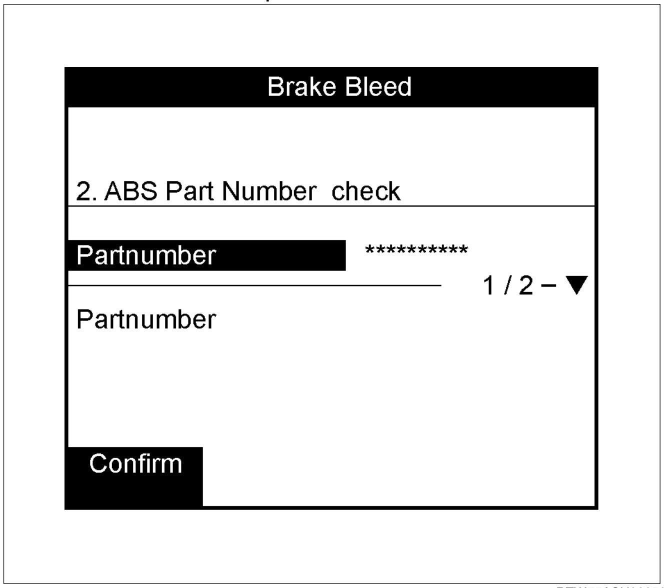
RTW75ASH000301

3. According to indication of Tech 2 press the "Confirm".



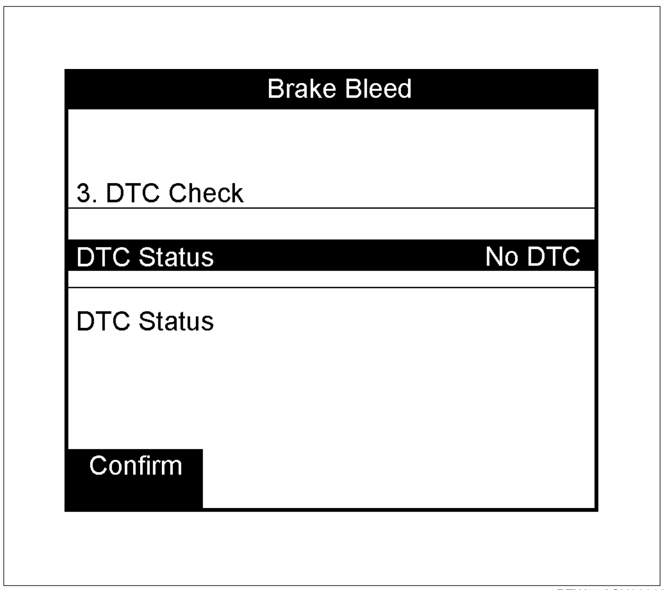
RTW75ASH000401

4. Check the EHCU part number. Press the "Confirm".



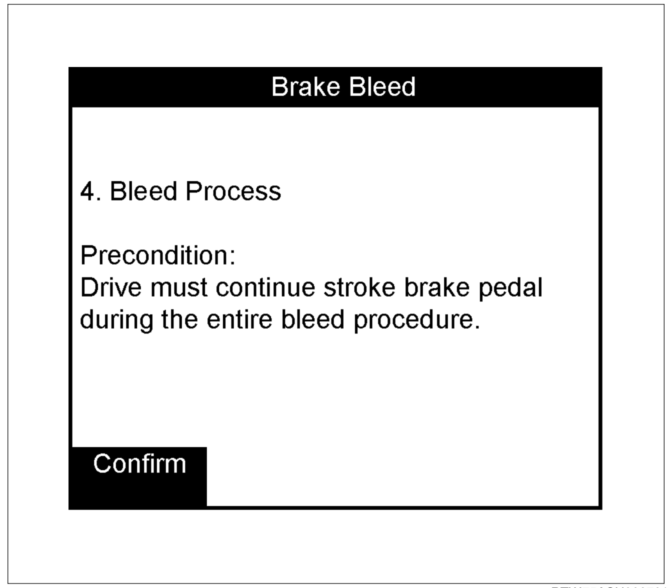
RTW75ASH000501

5. Check a DTC is not detected. Press the "Confirm".



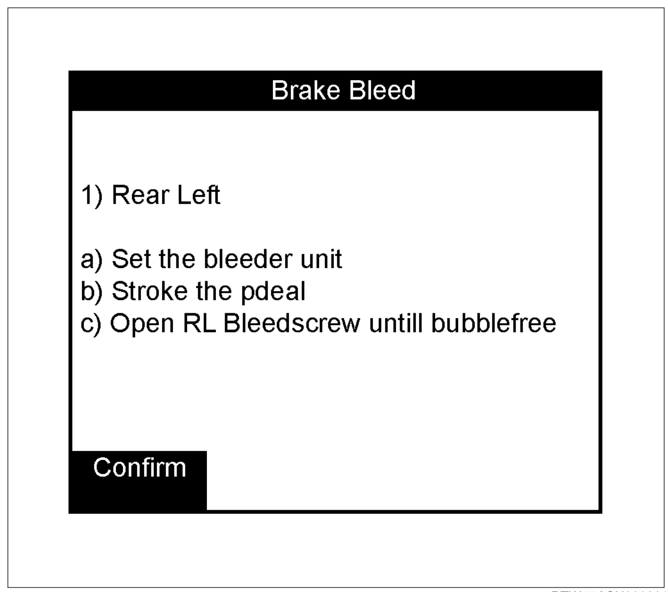
RTW75ASH000601

6. According to indication of Tech 2 press the "Confirm".



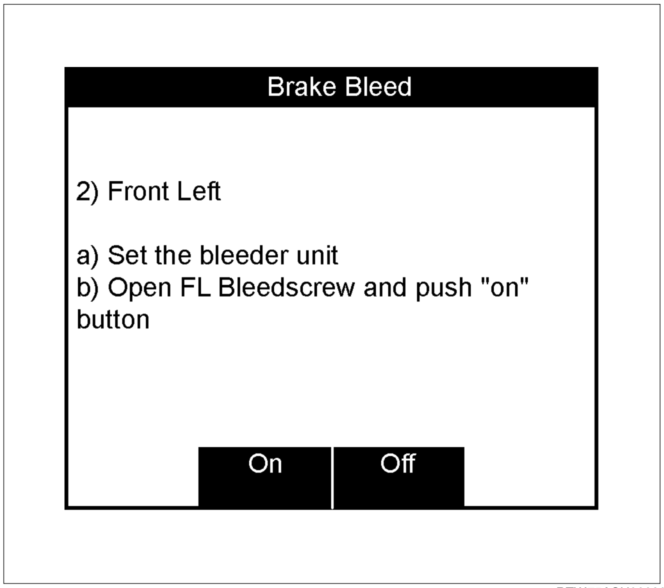
RTW75ASH000701

7. According to indication of Tech 2 press the "Confirm".



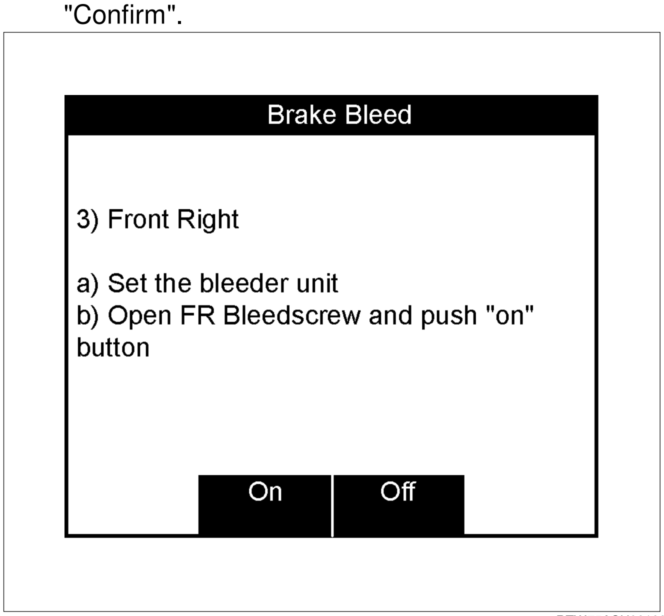
RTW75ASH000801

8. According to indication of Tech 2 press the "Confirm".



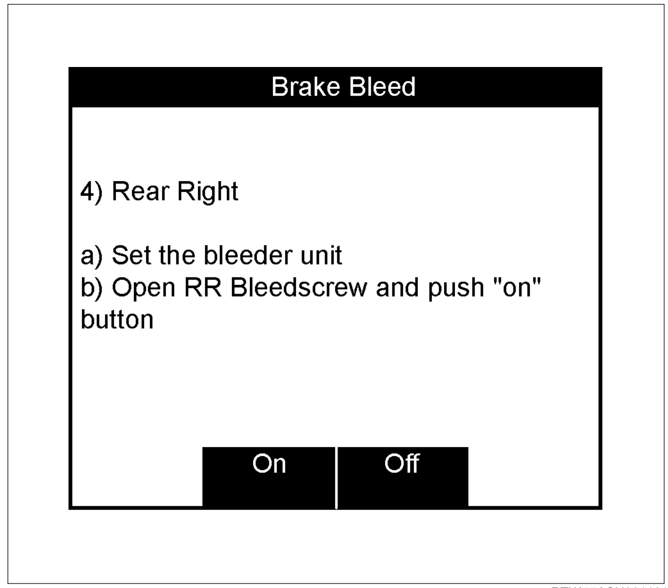
RTW75ASH000901

9. According to indication of Tech 2 press the "Confirm".



RTW75ASH001001

10. According to indication of Tech 2 press the "Confirm".



RTW75ASH001101

Return Pump Relay Test

Test condition: Engine stops with the key turned to the "ON" position. To be more specific, the test is conducted with the brake pedal stepped on after stepping once and releasing.

Test Procedure:

1. Connect the Tech 2 with the vehicle, and select "Actuator Test" menus.
2. Select a " Return Pump Relay Test " menu from the "Actuator Test" menus.

The circuit is normal if the pump motor is operated in accordance with Tech 2 instruction.

Front Left Hold Valve Test

Purpose: The purpose of this test is to detect brake pipe and valve line harness wire for incorrect connections and valve problem.

This test will help you confirm the result of your repair service including the removal/ reinstallation of brake pipe, valve line harness and valve.

Test conditions: The ignition key is in the "ON" position with the four wheels lifted up. The brake pedal is stepped on, released and stepped on again with the parking brake released.

Test Procedure:

1. Connect Tech 2 with the vehicle, and select "Actuator Test" menus.
2. Select a "Front Left Hold Valve Test" menu from the "Actuator Test" menus.
3. Step on the brake pedal.

4. Release the brake pedal.
5. Make sure that the front left hold solenoid valve "ON" aimed at by Tech 2 and the wheel locked position are the same.

If different, check brake pipe, valve line harness wiring and hydraulic unit. Repair is needed if abnormality is found.

Front Left Release Valve Test

Purpose: The purpose of this test is to detect brake pipe and valve line harness wire for incorrect connections and valve problem.

This test will help you confirm the result of your repair service including the removal/ reinstallation of brake pipe, valve line harness and valve.

Test conditions: The ignition key is in the "ON" position with the four wheels lifted up. The brake pedal is stepped on, released and stepped on again with the parking brake released.

Test Procedure:

1. Connect Tech 2 with the vehicle, and select "Actuator Test" menus.
2. Select a "Front Left Release Valve Test" menu from the "Actuator Test" menus.
3. Step on the brake pedal.
4. Make sure that the front left release solenoid valve "ON" aimed at by Tech 2 and the wheel released position are the same.

If different, check brake pipe, valve line harness wiring and hydraulic unit. Repair is needed if abnormality is found.

Front Right Hold Valve Test

Purpose: The purpose of this test is to detect brake pipe and valve line harness wire for incorrect connections and valve problem.

This test will help you confirm the result of your repair service including the removal/ reinstallation of brake pipe, valve line harness and valve.

Test conditions: The ignition key is in the "ON" position with the four wheels lifted up. The brake pedal is stepped on, released and stepped on again with the parking brake released.

Test Procedure:

1. Connect Tech 2 with the vehicle, and select "Actuator Test" menus.
2. Select a "Front Right Hold Valve Test" menu from the "Actuator Test" menus.
3. Step on the brake pedal.
4. Release the brake pedal.
5. Make sure that the front right hold solenoid valve "ON" aimed at by Tech 2 and the wheel locked position are the same.

If different, check brake pipe, valve line harness wiring and hydraulic unit. Repair is needed if abnormality is found.

Front Right Release Valve Test

Purpose: The purpose of this test is to detect brake pipe and valve line harness wire for incorrect connections and valve problem.

This test will help you confirm the result of your repair service including the removal/ reinstallation of brake pipe, valve line harness and valve.

Test conditions: The ignition key is in the "ON" position with the four wheels lifted up. The brake pedal is stepped on, released and stepped on again with the parking brake released.

Test Procedure:

1. Connect Tech 2 with the vehicle, and select "Actuator Test" menus.
2. Select a "Front Right Release Valve Test" menu from the "Actuator Test" menus.
3. Step on the brake pedal.
4. Make sure that the front right release solenoid valve "ON" aimed at by Tech 2 and the wheel released position are the same.

If different, check brake pipe, valve line harness wiring and hydraulic unit. Repair is needed if abnormality is found.

Rear Hold Valve Test

Purpose: The purpose of this test is to detect brake pipe and valve line harness wire for incorrect connections and valve problem.

This test will help you confirm the result of your repair service including the removal/ reinstallation of brake pipe, valve line harness and valve.

Test conditions: The ignition key is in the "ON" position with the four wheels lifted up. The brake pedal is stepped on, released and stepped on again with the parking brake released.

Test Procedure:

1. Connect Tech 2 with the vehicle, and select "Actuator Test" menus.

2. Select a "Rear Hold Valve Test" menu from the "Actuator Test" menus.
3. Step on the brake pedal.
4. Release the brake pedal.
5. Make sure that the rear hold solenoid valve "ON" aimed at by Tech 2 and the wheel locked position are the same.

If different, check brake pipe, valve line harness wiring and hydraulic unit. Repair is needed if abnormality is found.

Rear Release Valve Test

Purpose: The purpose of this test is to detect brake pipe and valve line harness wire for incorrect connections and valve problem.

This test will help you confirm the result of your repair service including the removal/ reinstallation of brake pipe, valve line harness and valve.

Test conditions: The ignition key is in the "ON" position with the four wheels lifted up. The brake pedal is stepped on, released and stepped on again with the parking brake released.

Test Procedure:

1. Connect Tech 2 with the vehicle, and select "Actuator Test" menus.
2. Select a "Rear Release Valve Test" menu from the "Actuator Test" menus.
3. Step on the brake pedal.
4. Make sure that the rear release solenoid valve "ON" aimed at by Tech 2 and the wheel released position are the same.

If different, check brake pipe, valve line harness wiring and hydraulic unit. Repair is needed if abnormality is found.

Data List (Tech 2)

The data displayed by DATA LIST are as follows:

Strings	Units	Description
FL Wheel Speed (Front Left)	Km/h (MPH)	Start the vehicle and make sure of linear change in each wheel speed.
FR Wheel Speed (Front Right)	Km/h (MPH)	
RL Wheel Speed (Rear Left)	Km/h (MPH)	
RR Wheel Speed (Rear Right)	Km/h (MPH)	
Brake Switch	On/Off	Brake switch is “On” when brake pedal is stepped on.
4 Wheel Drive Status	2 Wheel Drive/ 4 Wheel Drive	
ABS Warning lamp	On/Off	To be “Off” usually
EBD Warning Lamp	On/Off	To be “Off” usually
ABS State	On/Off	To be “Off” usually
Valve Relay Command	Active/Inactive	To be “Active” usually
Return Pump Relay Command	Active/Inactive	To be “Inactive” usually
EBD State		
DTC Status	No DTC/ DTCs Set	To be “No DTC” usually
FL Release Solenoid Commanded (Front Left)	Active/Inactive	Each valve is “Active” when each valve is operated.
FL Hold Solenoid Commanded (Front Left)	Active/Inactive	
FR Release Solenoid Commanded (Front Right)	Active/Inactive	
FR Hold Solenoid Commanded (Front Right)	Active/Inactive	
Rear Release Solenoid Valve Commanded	Active/Inactive	
Rear Hold Solenoid Valve Commanded	Active/Inactive	
FL Release Solenoid Feedback (Front Left)	Active/Inactive	
FL Hold Solenoid Feedback (Front Left)	Active/Inactive	
FR Release Solenoid Feedback (Front Left)	Active/Inactive	
FR Hold Solenoid Feedback (Front Left)	Active/Inactive	
Rear Release Solenoid Feedback	Active/Inactive	
Rear Hold Solenoid Valve Feedback	Active/Inactive	
Deceleration Sensor	V	2.0~3.0V when vehicle speed is 0km/h (flat place)
Battery Voltage	V	The voltage value currently supplied to EHCU

Diagnostic Trouble Codes

Choose and trace an appropriate flowchart by the numbers listed below to find the fault and repair.

Note:
A DTC cannot be erased when the DTC is present.

DTC (Flash Code)	Description	Warning Lamp		System Control		Main Items
		ABS	Brake (EBD)	ABS	EBD	
- (12)	Normal Condition	×	×	○	○	-

DTC (Flash Code)	Description	Warning Lamp		System Control		Main Items
		ABS	Brake (EBD)	ABS	EBD	
C0277 (77)	System Voltage Low	○	○	×	×	Battery, Wiring or EHCU (less than 8V)
		○	×	×	○	Battery or Wiring (less than 10V)
C0278 (78)	System Voltage High	○	○	×	×	Battery or Wiring EHCU
C0282 (82)	4 Wheel Drive State Input Signal Failure	○	×	×	○	Wiring
C0285 (85)	Control Module Vehicle Options Incorrect	○	×	×	○	Vehicle (Sensor or EHCU)

*A : When three or more failures are detected, the EBD warning lamp is "ON" and control is canceled.

*B : The ABS lamp is “OFF” when the ABS lamp is “ON” after a repair, until the vehicle’s speed becomes more than 10km/h (6mph) in the following ignition cycle and failure is not detected.

Diagnosis By “ABS” Warning Lamp Illumination Pattern

In the event that there is abnormality in the “ABS” Warning Lamp Illumination Pattern while the key is in the “ON” position or if the warning lamp is actuated during driving, the fault should be diagnosed on an illumination pattern basis as follows:

No.	Condition	“ABS” Warning Lamp Illumination Pattern	Diagnostic
1	Warning Lamp is actuated normally		Normal
2	Warning Lamp is not lit		Warning Lamp lighting circuit trouble. Go to No ABS Warning Lamp.
3	Warning Lamp remains ON		Diagnostic trouble codes are stored. Display diagnostic trouble codes and diagnose on a code basis according to the flow charts. If diagnostic trouble codes are not stored, it means warning lamp lighting circuit or meter trouble. Go to ABS warning Lamp On Steady.
4	Warning Lamp is actuated while driving		Diagnostic trouble codes are stored. Display diagnostic trouble codes and diagnose on a code basis according to the flow charts.

Diagnostic Trouble Codes (DTCs)

When the warning lamp in the meter remains ON, the EHCU stores the fault identification and disables the ABS.

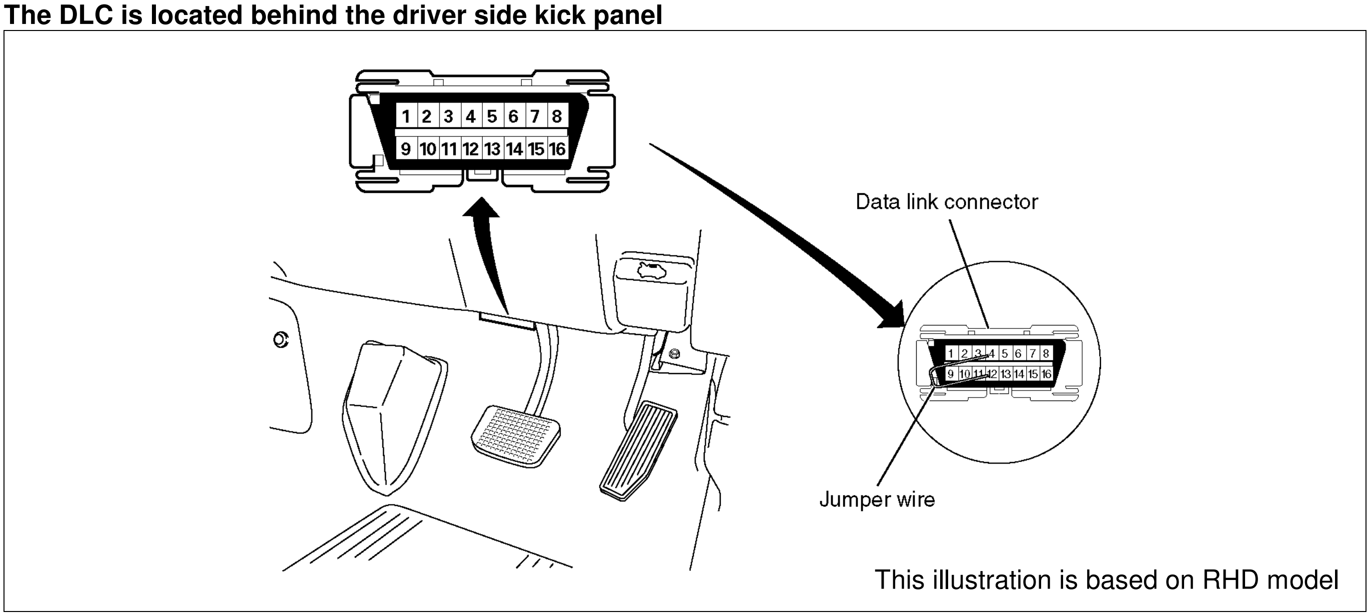
How to display and erase DTCs:

Note:

- DTCs can be displayed also by TECH 2 use "Diagnostic Trouble Codes" mode.

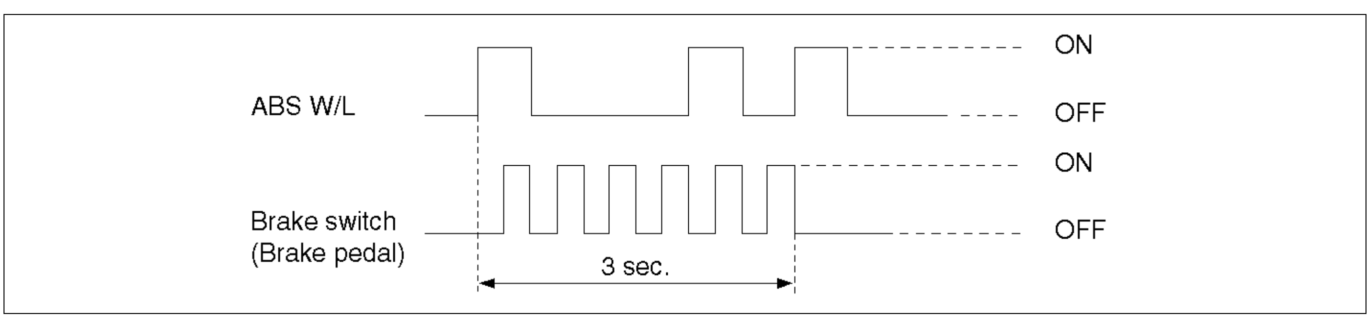
1. How to start DTC display:
   - Confirm that the vehicle has come to a complete stop (with the wheels standing still) and that the brake pedal is not depressed. (Unless these two conditions are satisfied, the DTC display cannot be started.)
   - With IGN OFF, connect #12 terminal with #4 terminal or # 5 terminal (GND) . Then turn IGN ON.

The DLC is located behind the driver side kick panel



350L300005

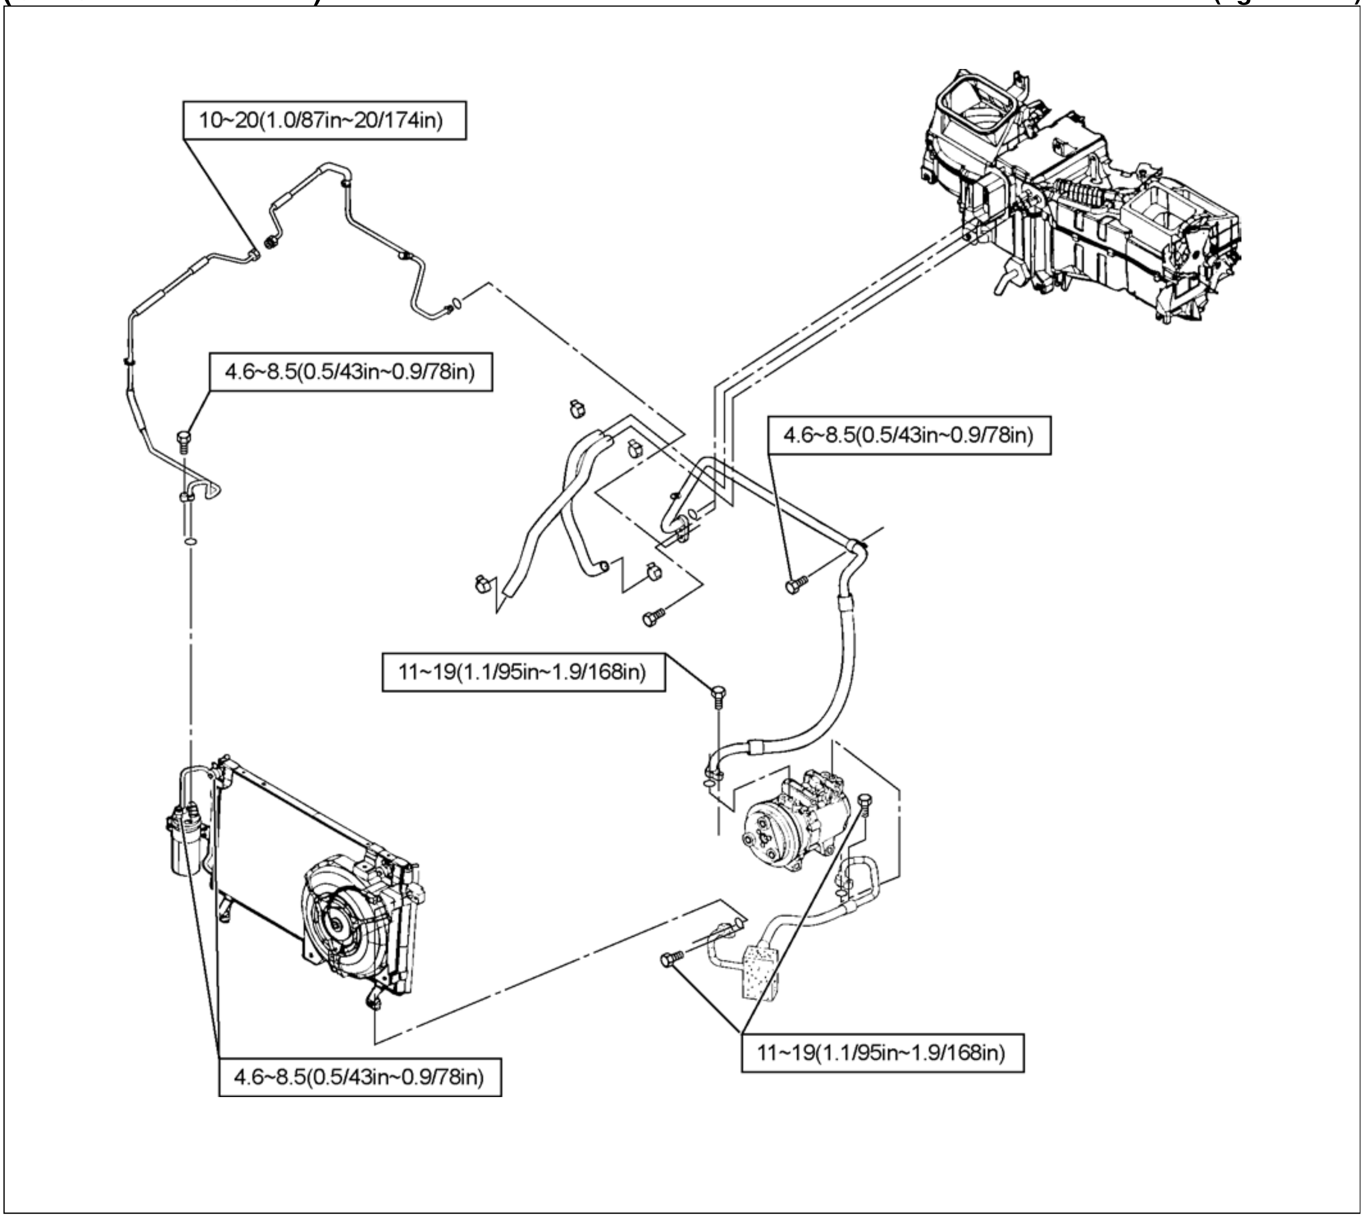
   - Keep #12 terminal connected with #4 terminal or # 5 terminal (GND) during DTC display. (If #12 terminal is separated from #4 terminal or # 5 terminal (GND) during display, display will stop.)
2. DTC display:
   - DTC is displayed by blinking warning lamp.
   - Double-digit display.
   - First, normal DTC 12 is displayed three times and then any other DTCs are displayed three times. (If no other DTCs have been stored, the display of DTC 12 will be repeated.)
3. How to erase code:
   - Conduct brake switch ON/OFF operation 6 or more times within 3 seconds of self-diagnosis startup.
   - The code cannot be erased if more than 3 seconds have passed since self-diagnosis startup, or if self-diagnosis has started with brake switched on (brake pedal depressed).



B05RW0005

(C24SE LHD MODEL)

N·m (kgf·m/lb·in)

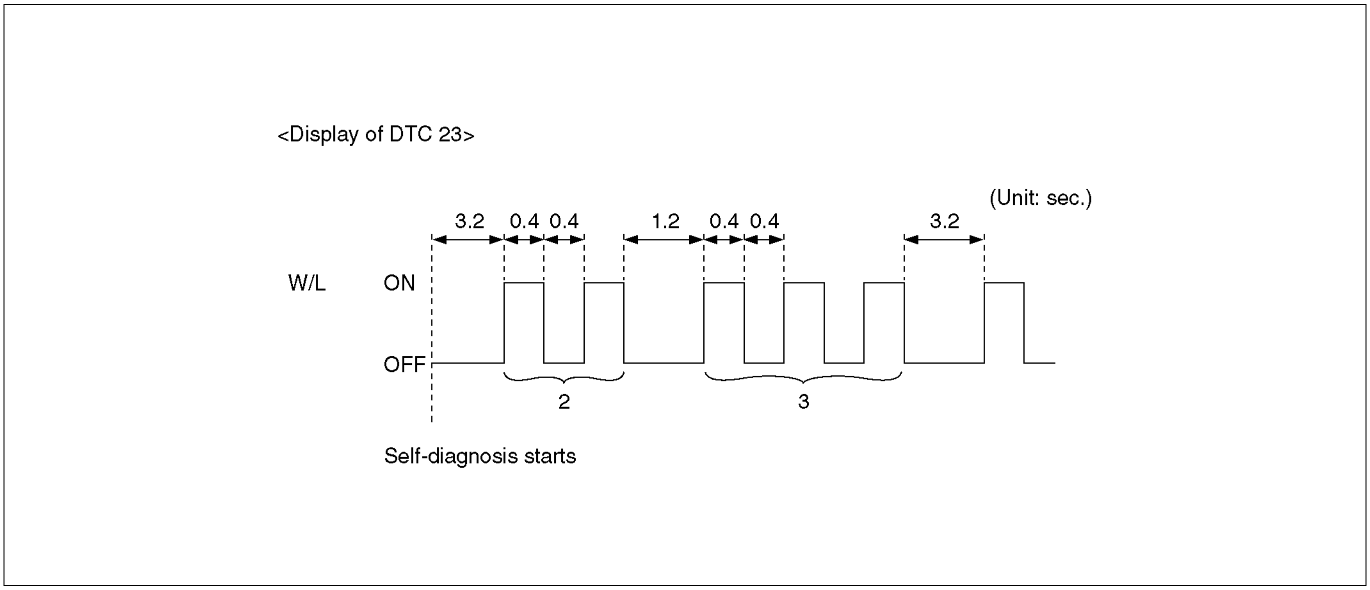


RTW710LF003801

4. Notes
- If the following should occur during Diagnostic Trouble Code (DTC) display, the display will be discontinued. After initial check, the status that is under the control of ABS will be returned :
  – The vehicle starts (The wheels turn) or the brake pedal is depressed.
- Up to 3 different codes can be stored.
- If the ABS should turn OFF due to an intermittent defect, the system will be restored at the next key cycle, if the initial check finds no abnormality (when IGN is switched from OFF to ON).

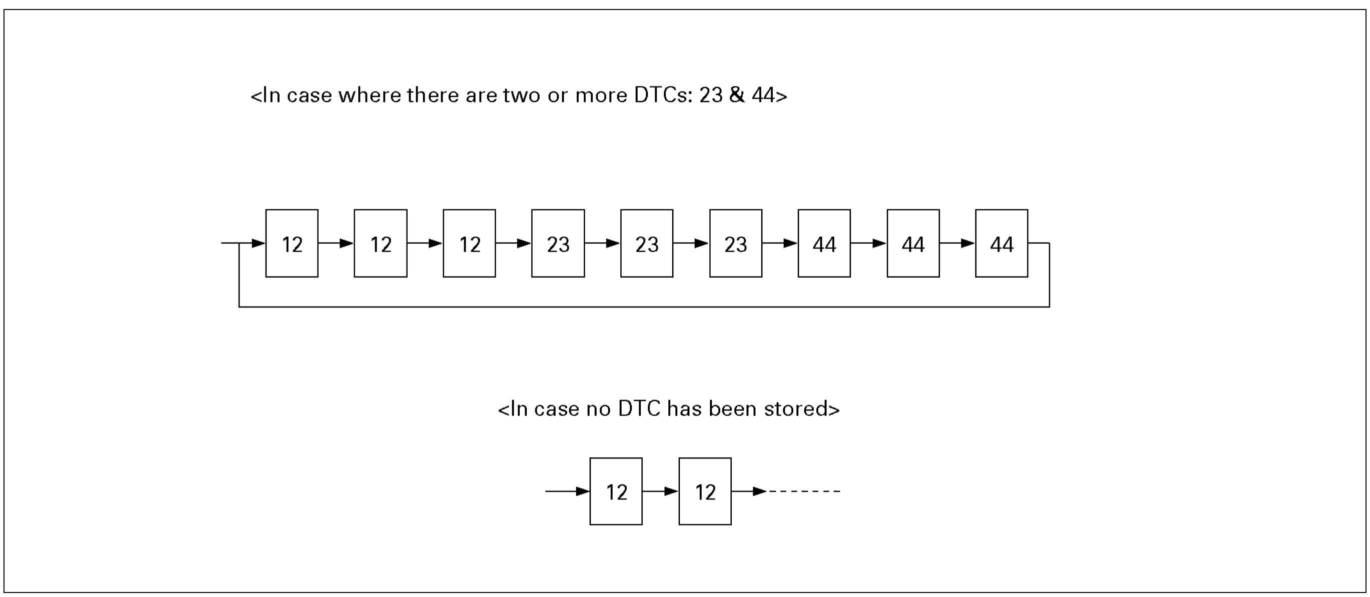
5. An example of DTC display

Display of DTC 23



B05R100001

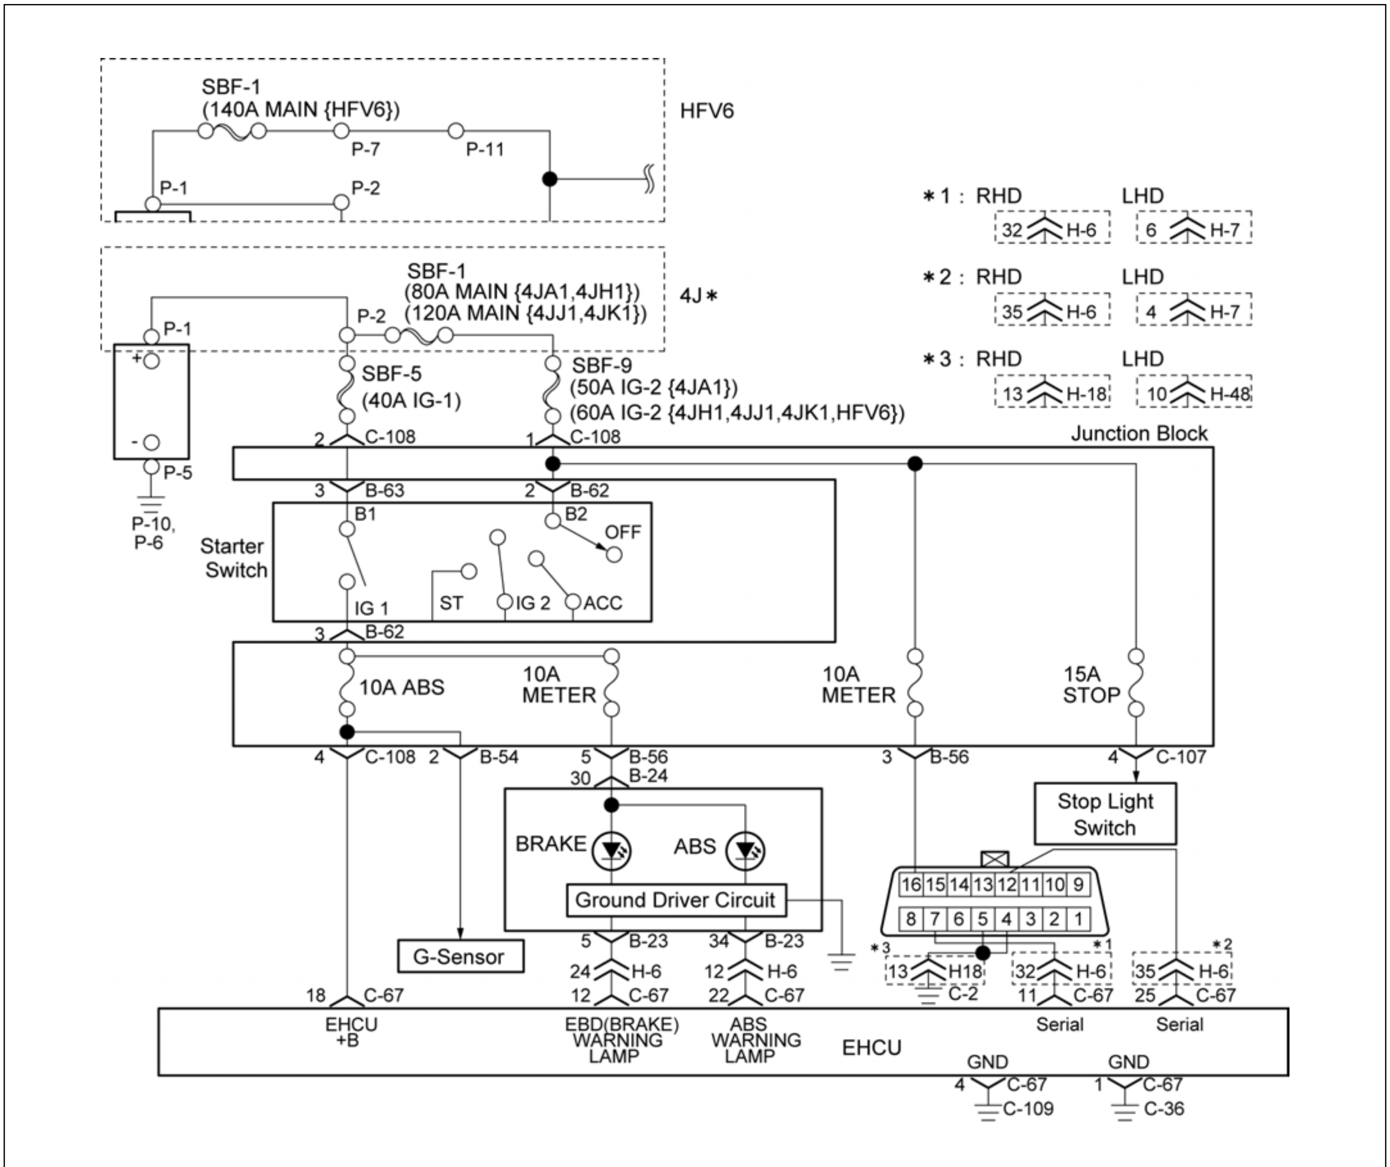
After displaying DTC 12 three times, one DTC after another is displayed. DTC is displayed in numeric order.



C05L300017

The DTC 12 is displayed repeatedly.

Basic Diagnostic Flow Chart



RTW75ALF000201

Step	Action	Value(s)	Yes	No
1	1. Ignition “ON”, engine “OFF”. 2. Observe the ABS warning lamp. Note: If the starter switch is turned ON, the ABS warning lamp will turn on and then turn off after 3 seconds. Is the ABS warning lamp “ON”?	-	Go to Step 2	Go to “No ABS warning lamp”
2	1. Ignition “OFF”. 2. Install Tech 2. 3. Ignition “ON”. 4. Attempt to display ABS data with the Tech 2. Does the Tech 2 display ABS data?	-	Go to Step 5	Go to Step 3

Step	Action	Value(s)	Yes	No
3	1. Ignition “OFF”, disconnect the EHCU. 2. Check the DLC (Data Link Connector) circuit for an open, short to ground, or short to voltage. Also, check the DLC ignition feed circuit for an open or short to ground and the DLC ground circuit for an open. 3. If a problem is found, repair as necessary. Was a problem found?	-	Go to Step 2	Go to Step 4
4	1. Check the EHCU circuit for an open, short to ground, or short to voltage. Also, check the EHCU ignition feed circuit for an open or short to ground and the EHCU ground circuit for an open. 2. If a problem is found, repair as necessary. Was a problem found?	-	Go to Step 2	Go to Step 11
5	Select “Display DTCs” with the Tech 2. Are any DTCs stored?	-	Go to Step 6	Go to Step 10
6	Review and record for Tech 2 Failure Records data and DTCs. Is the action complete?	-	Go to Step 7	-
7	The DTC is then stored. Is this DTC C0271 stored?	-	Go to applicable DTC table after Go to step 8	Go to Step 8
8	Clear the DTCs by “Clear the Information“ with Tech 2. Did the DTCs clear?	-	Go to Step 9	-
9	Select “Display DTCs” with the Tech 2. Are any DTCs stored?	-	Go to applicable DTC table	Go to Step 10
10	Review and record for Tech 2 data. Is the action complete?	-	Go to Symptom Diagnosis and Go to Basic Inspection Procedure	-
11	Replace the EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification; 2WD Model or 4WD Model) Is the action complete?	-	Verify repair	-

Basic Inspection Procedure

1. Basic Inspection of Service Brake

Step	Action	Value(s)	Yes	No
1	Is the fluid level normal?	-	Go to Step 2	Replenish with fluid Go to Step 2
2	Does fluid leak?	-	Repair Go to Step 3	Go to Step 3
3	Is the booster function normal?	-	Go to Step 4	Repair Go to Step 4
4	Is the pad and rotor normal?	-	Go to Step 5	Repair Go to Step 5
5	Reconnect all components. Ensure all components are properly mounted. Is this step finished?	-	Finished	Go to Step 5

2. Ground Inspection

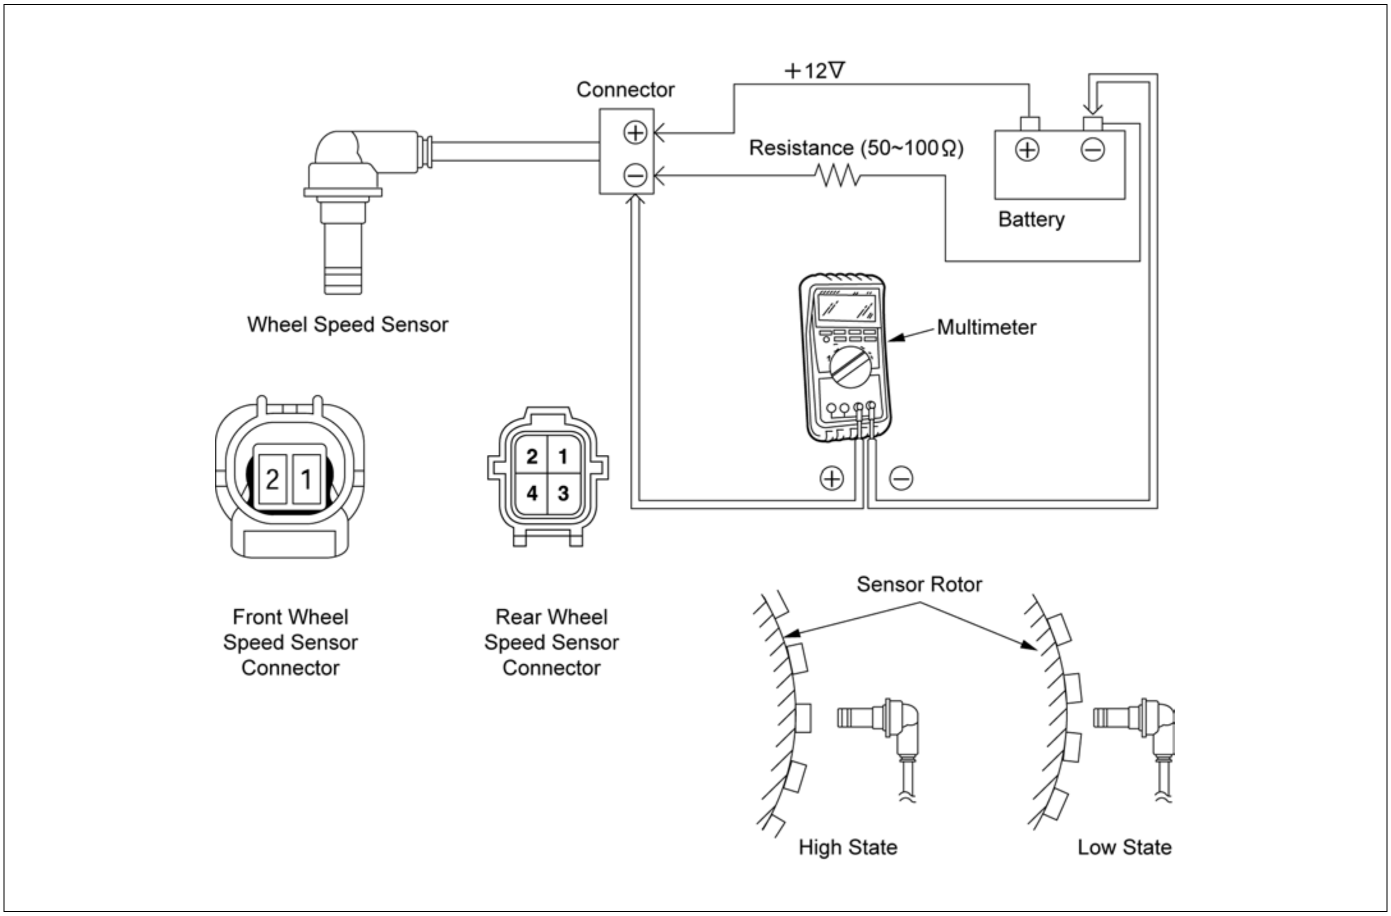
Step	Action	Value(s)	Yes	No
1	Are ABS related ground points normal?	-	Go to Step 2	Repair Go to Step 2
2	Reconnect all components. Ensure all component are properly mounted. Is this step finished?	-	Finished	Go to Step 2

Wheel Speed Sensor Inspection Procedure

Procedure

1. Ignition "OFF".
2. Disconnect each of the wheel speed sensors.
3. Connect the resistance (50Ω~100Ω) as follows.
4. Check the voltage at sensor harness connector.

Note: Voltage measurement is performed in the phase where the wheel speed sensor is installed in vehicles.



RTW75AMF000701

Connector Pin-outs

・Front Wheel Speed Sensor

1	(+) (+12V)
2	(-) (signal)

・Rear Wheel Speed Sensor

1	LH (+) (+12V)
2	LH (-) (signal)
3	RH (+)(+12V)
4	RH (-) (signal)

Output Value

High State	0.7~1.4V (±30%)
Low State	0.4~0.7V (±30%)

Symptom Diagnosis

The symptoms that cannot be indicated by warning lamp can be divided into the following six categories:

1. ABS works frequently but vehicle does not decelerate.
2. Uneven braking occurs while ABS works.
3. The wheels are locked.
4. Brake pedal feel is abnormal.
5. Braking sound (from EHCU) is heard while not braking.
6. No ABS warning lamp

These are all attributable to problems which cannot be detected by EHCU self-diagnosis. Use the customer complaint and a test to determine which symptom is present.

ABS Works Frequently But Vehicle Does Not Decelerate

Step	Action	Value(s)	Yes	No
1	Is braking force distribution normal between front and rear of vehicle?	-	Go to Step 2	Repair brake parts. Go to Step 7
2	Are axle parts installed normally?	-	Go to Step 3	Repair axle parts. Go to Step 7
3	Is there play in each or any wheel speed sensor?	-	Repair wheel speed sensor. Go to Step 7	Go to Step 4
4	Is there damage, or powered iron sticking to each or any wheel speed sensor/sensor rotor?	-	Replace wheel speed sensor or sensor rotor. Go to Step 7	Go to Step 5
5	Is the speed sensor of each wheel output normal?	-	Go to Step 6	Replace wheel speed sensor or repair harness. Go to Step 7
6	Is the 4WD control system function normal?	-	2-4WD Repair or Go to Step 7	Repair or replace 2-4WD control System. Go to Step 7
7	Reconnect all components, ensure all components are properly mounted. Is this step finished?	-	Repeat the “Basic diagnostic flow chart”	Go to Step 7

Uneven Braking Occurs While ABS Works

Step	Action	Value(s)	Yes	No
1	Is there play in each or any sensor?	-	Repair. Go to Step 5	Go to Step 2
2	Damage or powdered iron sticking to each or any sensor/sensor rotor?	-	Repair. Go to Step 5	Go to Step 3
3	Is the output normal for each sensor?	-	Go to Step 4	Replace sensor or repair harness. Go to Step 5
4	Is brake pipe connecting order correct? Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification; 2WD Model or 4WD Model)	-	Replace EHCU. Go to Step 5	Reconnect brake pipe correctly. Go to Step 5
5	Reconnect all components, ensure all components are properly mounted. Is this step finished?	-	Repeat the “Basic diagnostic flow chart”	Go to Step 5

The Wheels Are Locked

Step	Action	Value(s)	Yes	No
1	Is ABS working?	-	Go to Step 2	Go to Step 4
2	Is vehicle speed under 5 km/h?	-	Go to Step 3	Normal.
3	Is the output for each normal?	-	Go to Step 4	Replace sensor or repair harness. Go to Step 6
4	Is 2-4WD system function normal?	-	Go to Step 5	Replace 2-4WD control unit or repair harness. Go to Step 6
5	Is EHCU grounded properly? Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification; 2WD Model or 4WD Model)	-	Replace EHCU. Go to Step 6	Repair. Go to Step 6
6	Reconnect all components, ensure all components are properly mounted. Is this step finished?	-	Repeat the “Basic diagnostic flow chart”	Go to Step 6

Brake Pedal Feed Is Abnormal

Step	Action	Value(s)	Yes	No
1	Is the stop light actuated when the brake pedal is depressed?	-	Go to Step 2	Go to Step 3
2	1. Turn the ignition switch off. 2. Disconnect EHCU connector. Is the check voltage for EHCU connector terminals when brake pedal is depressed than battery voltage?	-	Go to Step 4	Harness NG between stop light SW and EHCU. Go to Step 6
3	Is stop light fuse normal?	-	Go to Step 5	Replace stop light fuse. Go to Step 6
4	Is the check continuity between EHCU connector to body grounded?	-	Go to Step 6	Repair body grounded harness. Go to Step 6
5	Is stop light switch operation normal?	-	Repair stop light harness. Go to Step 6	Replace stop light switch. Go to Step 6
6	Reconnect all components, ensure all components are properly mounted. Is this step finished?	-	Repeat the “Basic diagnostic flow chart”	Go to Step 6

Braking Sound (From EHCU) Is Heard While Not Braking

Step	Action	Value(s)	Yes	No
1	Is this the first vehicle start after engine start?	-	It is self checking sound Normal.	Go to Step 2
2	Is vehicle speed at 15 km/h or 30 km/h?	-	It is self checking sound Normal.	Go to Step 3
3	Check for the following condition: • At the time of shift down or clutch operation. • At the time of low road friction drive (ice or snow on road) or rough road drive. • At the time of high-speed turn. • At the time of passing curb. • At the time of operating electrical equipment switches. • At the time of racing the engine. Did it occur under any of the conditions above?	-	ABS may sometimes be actuated even when brake pedal is not applied.	Go to Step 4
4	Is there play in each or any sensor/wheel speed sensor rotor?	-	Repair. Go to Step 7	Go to Step 5
5	Damage or powdered iron sticking to each or any sensor/wheel speed sensor rotor?	-	Repair. Go to Step 7	Go to Step 6
6	Is each sensor normal? Note: Check the EHCU type for specification, the EHCU is replaced. (Specification; 2WD or 4WD Model)	-	Check harness/ connector for suspected disconnection If no disconnection is found, replace EHCU Go to Step 7	Repair. Go to Step 7
7	Reconnect all components, ensure all components are properly mounted. Is this step finished?	-	Repeat the “Basic diagnostic flow chart”	Go to Step 7

No ABS Warning Lamp

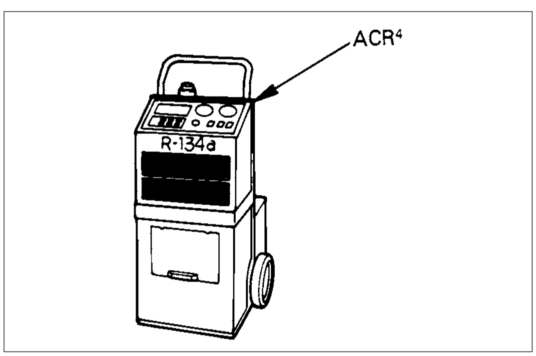
Step	Action	Value(s)	Yes	No
1	Check the meter fuse for the instrument cluster ignition feed circuit. Is the fuse OK?	-	Go to Step 3	Go to Step 2
2	Replace the fuse. Is the action complete?	-	Verify repair Go to Step 3	-
3	1. Ignition "OFF", disconnect the EHCU. 2. Ignition "ON", engine "OFF". 3. Observe the ABS warning lamp. Is the ABS warning lamp "ON"?	-	Go to Step 5	Go to Step 4
4	Repair or replace the meter circuit or meter. Is the action complete?	-	Verify repair	-
5	1. Check the EHCU circuit for an open, short to ground, or short to voltage. Also, check the EHCU ignition feed circuit for an open or short to ground and the EHCU ground circuit for an open. 2. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 6
6	1. Ignition "OFF", reconnect the EHCU. 2. Ignition "ON",engine "OFF". 3. Observe the ABS warning lamp. Is the ABS warning lamp "ON"?	-	Verify repair	Go to Step 7
7	Replace EHCU. Note: Check the EHCU type for specification, the EHCU is replaced. (Specification; 2WD or 4WD Model) Is the action complete?	-	Verify repair	-

ON-VEHICLE SERVICE

PRECAUTIONS FOR REPLACEMENT OR REPAIR OF AIR CONDITIONING PARTS

There are certain procedures, practices and precautions that should be followed when servicing air conditioning systems:

- Keep your work area clean.
- Always wear safety goggle and protective gloves when working on refrigerant systems.
- Beware of the danger of carbon monoxide fumes caused by running the engine.
- Beware of discharged refrigerant in enclosed or improperly ventilated garages.
- Always disconnect the negative battery cable and discharge and recover the refrigerant whenever repairing the air conditioning system.
- When discharging and recovering the refrigerant, do not allow refrigerant to discharge too fast; it will draw compressor oil out of the system.
- Keep moisture and contaminants out of the system. When disconnecting or removing any lines or parts, use plugs or caps to close the fittings immediately.
  Never remove the caps or plugs until the lines or parts are reconnected or installed.
- When disconnecting or reconnecting the lines, use two wrenches to support the line fitting, to prevent from twisting or other damage.
- Always install new O-rings whenever a connection is disassembled.
- Before connecting any hoses or lines, apply new specified compressor oil to the O-rings.
- When removing and replacing any parts which require discharging the refrigerant circuit, the operations described in this section must be performed in the following sequence:

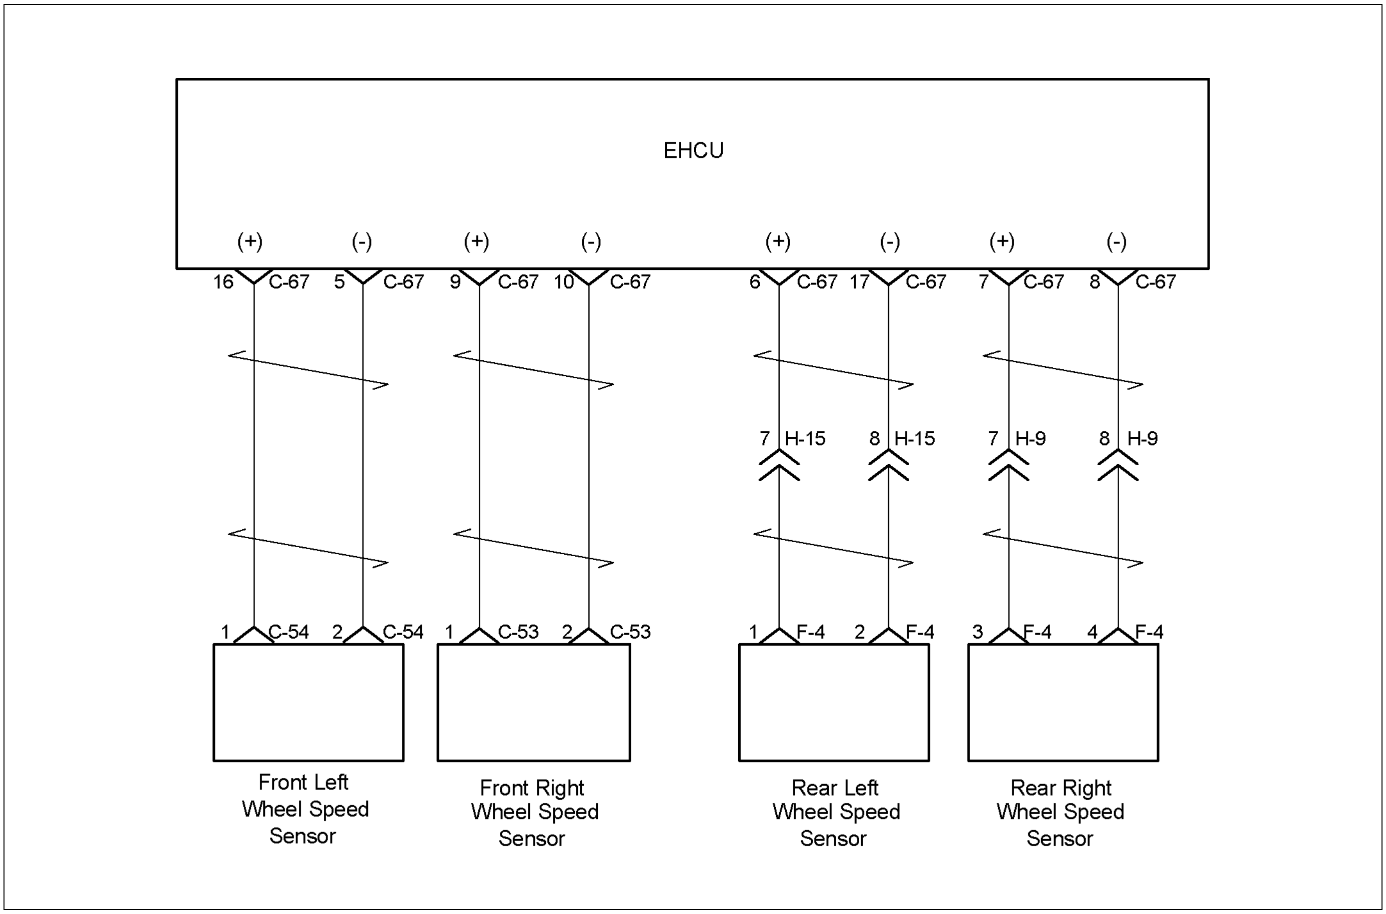


1) Using the ACR4 (HFC-134a Refrigerant Recovery/ Recycling/Recharging/System) or equivalent to thoroughly discharge and recover the refrigerant.
   ACR4 (115V 60Hz) : 5-8840-0629-0 (J-39500-A)
   ACR4 (220-240V 50/60Hz)
   : 5-8840-0630-0 (J-39500-220A)
   ACR4 (220-240V 50/60Hz Australian model)
   : 5-8840-0631-0 (J-39500-220ANZ)
2) Remove and replace the defective part.
3) After evacuation, charge the air conditioning system and check for leaks.

ABS Warning Lamp ON Steady

Step	Action	Value(s)	Yes	No
1	1. Check the ABS warning lamp lighting circuit for a short. 2. If a problem found, repair as necessary. Was a problem found?	-	Go to Step 3	Go to Step 2
2	1. Check the ABS warning lamp lighting circuit at the meter for a short. Refer to METER, WARNING LIGHT AND INDICATOR LIGHT in 8 section. 2. If a problem is found, repair or replace the meter. Was a problem found?	-	Go to Step 3	Go to Step 4
3	1. Connect all connectors. 2. Ignition “ON”, engine “OFF”. 3. Wait for about 10 seconds. 4. Observe the ABS warning lamp. Is the ABS warning lamp turned “OFF”?	-	Verify repair	Go to Step 4
4	Replace EHCU. Note: Check the EHCU type for specification, the EHCU is replaced. (Specification; 2WD or 4WD Model) Is the action complete?	-	Verify repair	-

DTC C0221 (Flash Code 21) Front Right Wheel Speed Sensor Short Circuit or Circuit Open

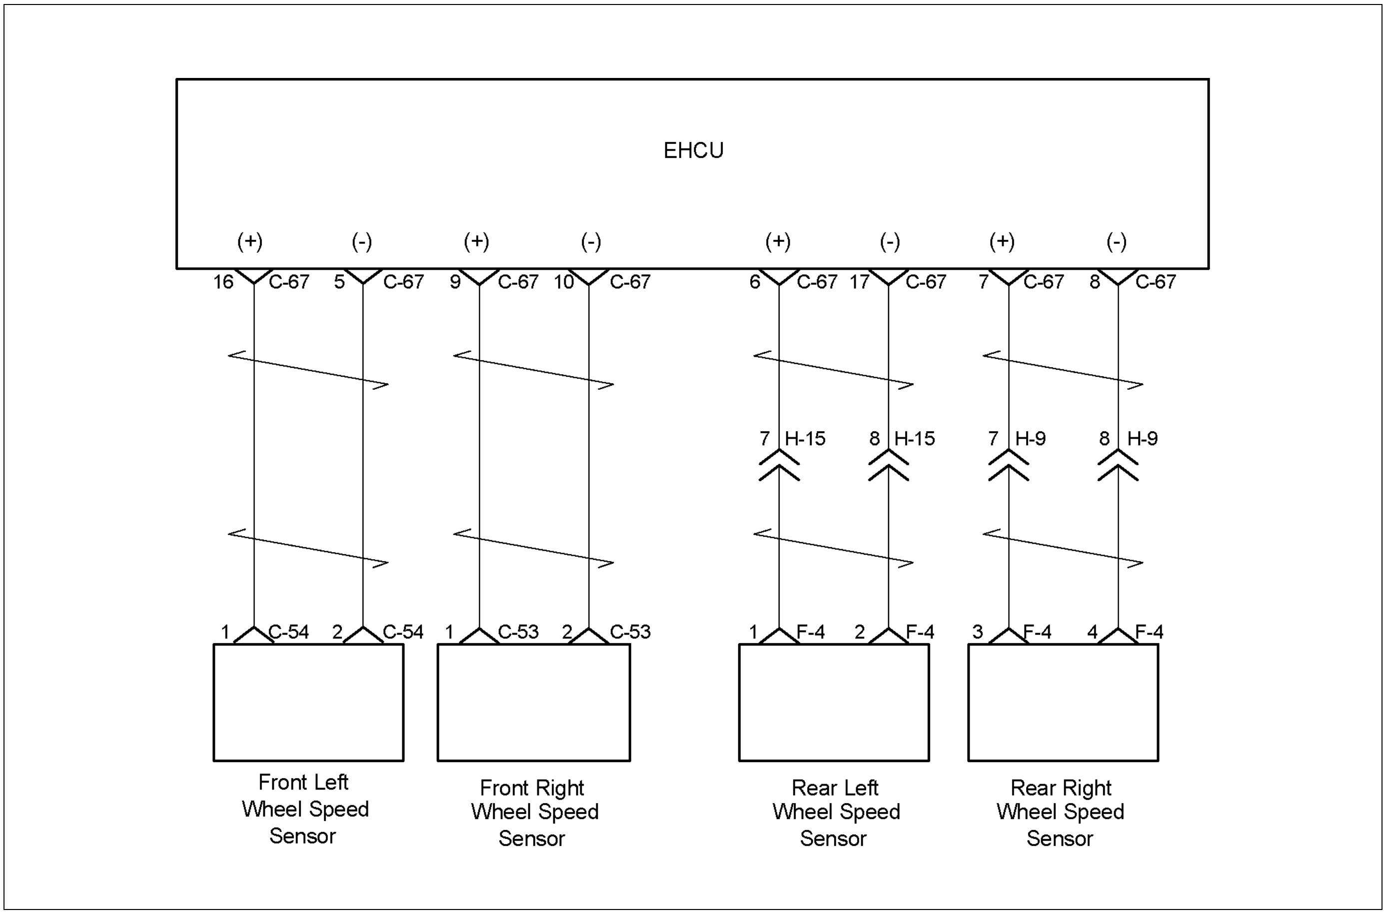


RTW75AMF001301

Step	Action	Value(s)	Yes	No
1	Were the steps of the “Basic Diagnostic Flow Chart” performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Check for a poor connection at the front right wheel speed sensor harness connector. 2. Check installation condition for front right wheel speed sensor. 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3
3	1. Ignition “OFF”, disconnect the EHCU and front right wheel speed sensor. 2. Check the circuit between EHCU and front right wheel speed sensor. (Circuit for an open, short to ground, or short to voltage.) 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Replace front right wheel speed sensor. 2. Select “Display DTCs” with the Tech 2. Note: Perform the various tests (actuator test, test run, brake test, etc.) then observe the DTC with a Tech 2. Are any DTCs stored?	-	Go to Step 5	Verify repair
5	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0222 (Flash Code 22) Front Right Wheel Speed Sensor Signal Malfunction

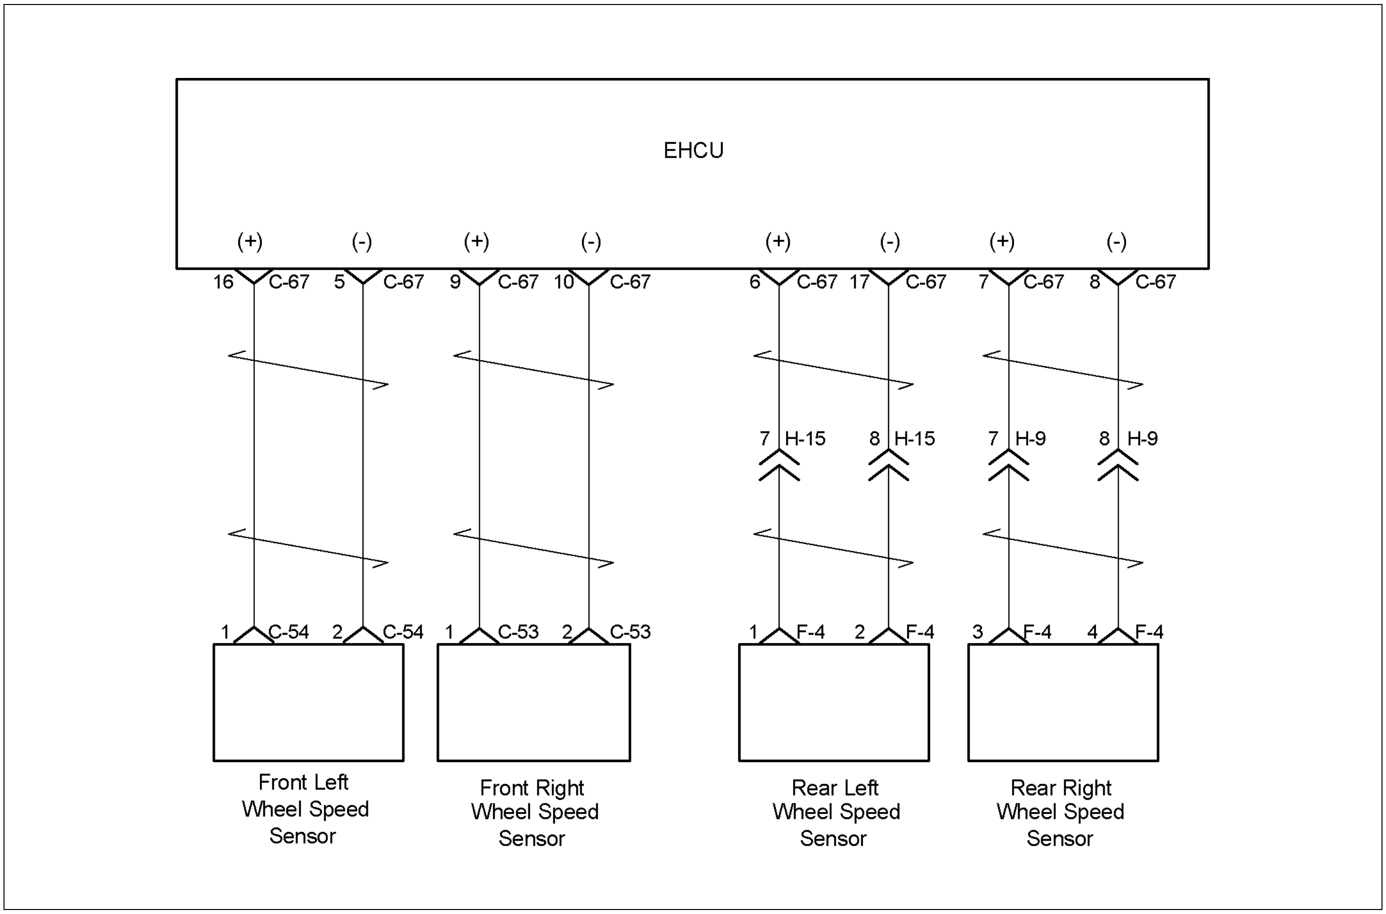


RTW75AMF001301

Step	Action	Value(s)	Yes	No
1	Were the steps of the “Basic Diagnostic Flow Chart” performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Check the tire for the following conditions. • Tire specification • Wear of the outer surface 2. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3
3	**Note:** This DTC is set when certain tire is rotated alone. Has certain tire been rotated alone by performing for lift-up or roller tester?	-	Verify repair	Go to Step 4
4	Is the front right wheel bearing rattling?	-	Go to Step 11	Go to Step 5
5	Is the front right wheel speed sensor or the sensor rotor rattling?	-	Go to Step 12	Go to Step 6
6	Is iron powder attached to the front right wheel speed sensor or the sensor rotor?	-	Go to Step 13	Go to Step 7

Step	Action	Value(s)	Yes	No
7	Check the front right wheel speed sensor. Refer to "Wheel Speed Sensor Inspection procedure" Was a problem found?	-	Go to Step 10	Go to Step 8
8	Does the sensor rotor have missing tooth or saw-toothed?	-	Go to Step 14	Go to Step 9
9	1. Clear the DTC. 2. Test run the vehicle, and check the DTC. Is the DTC displayed repeatedly?	-	Go to Step 18	Go to Step 17
10	Is the wheel speed sensor damaged or saw-toothed?	-	Go to Step 15	Go to Step 16
11	Adjust the preload of the wheel bearing. Is the action complete?	-	Verify repair	-
12	Repair or replace the front right speed sensor or the sensor rotor. Is the action complete?	-	Verify repair	-
13	Repair the front right speed sensor or the sensor rotor. Is the action complete?	-	Verify repair	-
14	Replace the sensor rotor. Is the action complete?	-	Verify repair	-
15	Replace the front right wheel speed sensor. Is the action complete?	-	Verify repair	-
16	Repair or replace the front right speed sensor circuits. Is the action complete?	-	Verify repair	-
17	Check the connection btween the EHCU and the front right wheel speed sensor and repair as necessary Refer to "Note on Intermittents". Is the action complete?	-	Verify repair	-
18	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0225 (Flash Code 25) Front Left Wheel Speed Sensor Short Circuit or Circuit Open

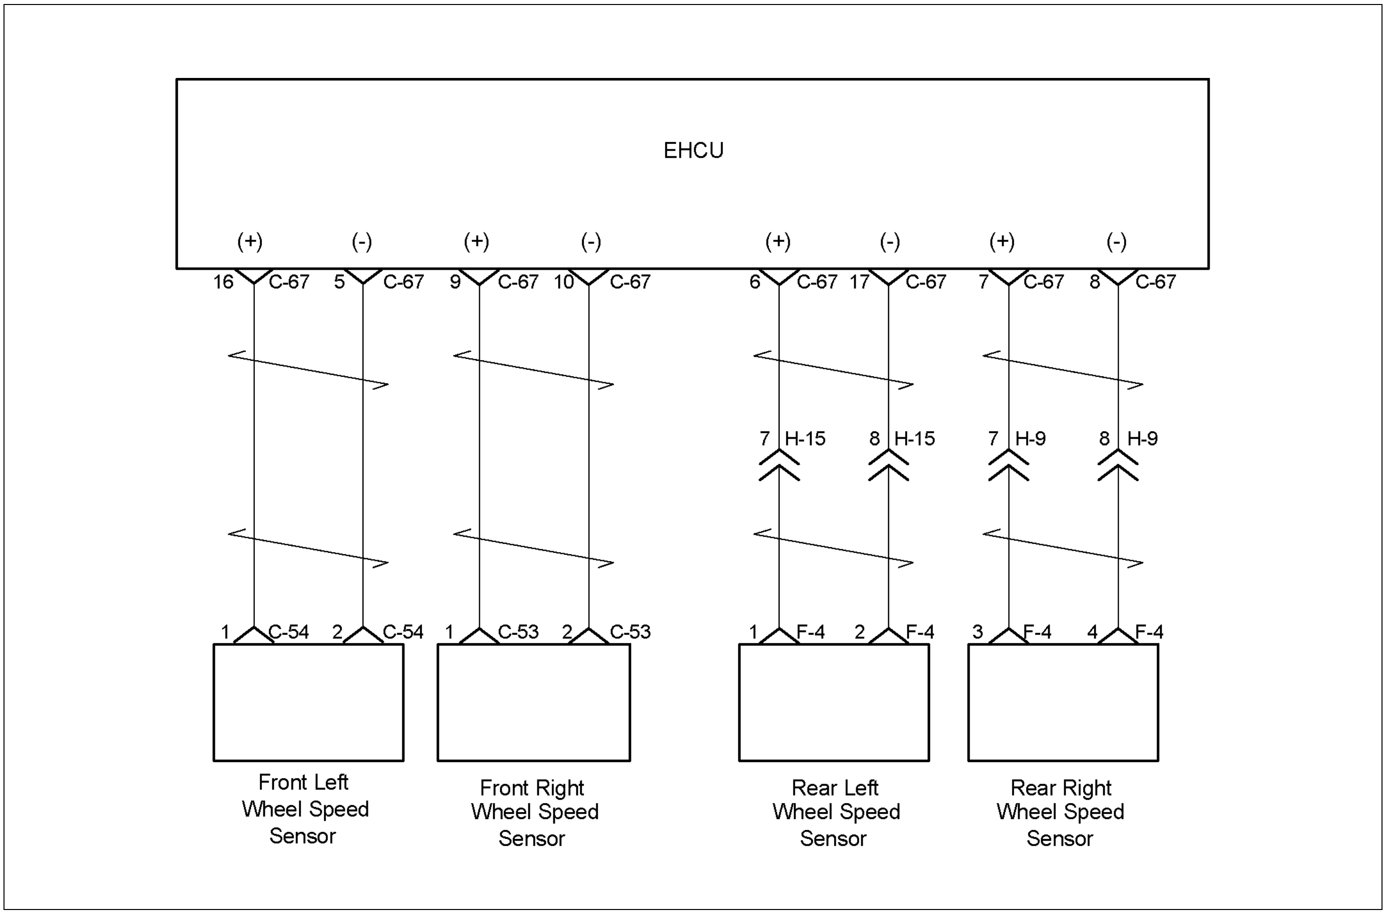


RTW75AMF001301

Step	Action	Value(s)	Yes	No
1	Were the steps of the “Basic Diagnostic Flow Chart” performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Check for a poor connection at the front left wheel speed sensor harness connector. 2. Check installation condition for front left wheel speed sensor. 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3
3	1. Ignition “OFF”, disconnect the EHCU and front left wheel speed sensor. 2. Check the circuit between EHCU and front left wheel speed sensor. (Circuit for an open, short to ground, or short to voltage.) 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Replace front left wheel speed sensor. 2. Select "Display DTCs" with the Tech 2. Note: Perform the various tests (actuator test, test run, brake test, etc.) then observe the DTC with a Tech 2. Are any DTCs stored?	-	Go to Step 5	Verify repair
5	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0226 (Flash Code 26) Front Left Wheel Speed Sensor Signal Malfunction

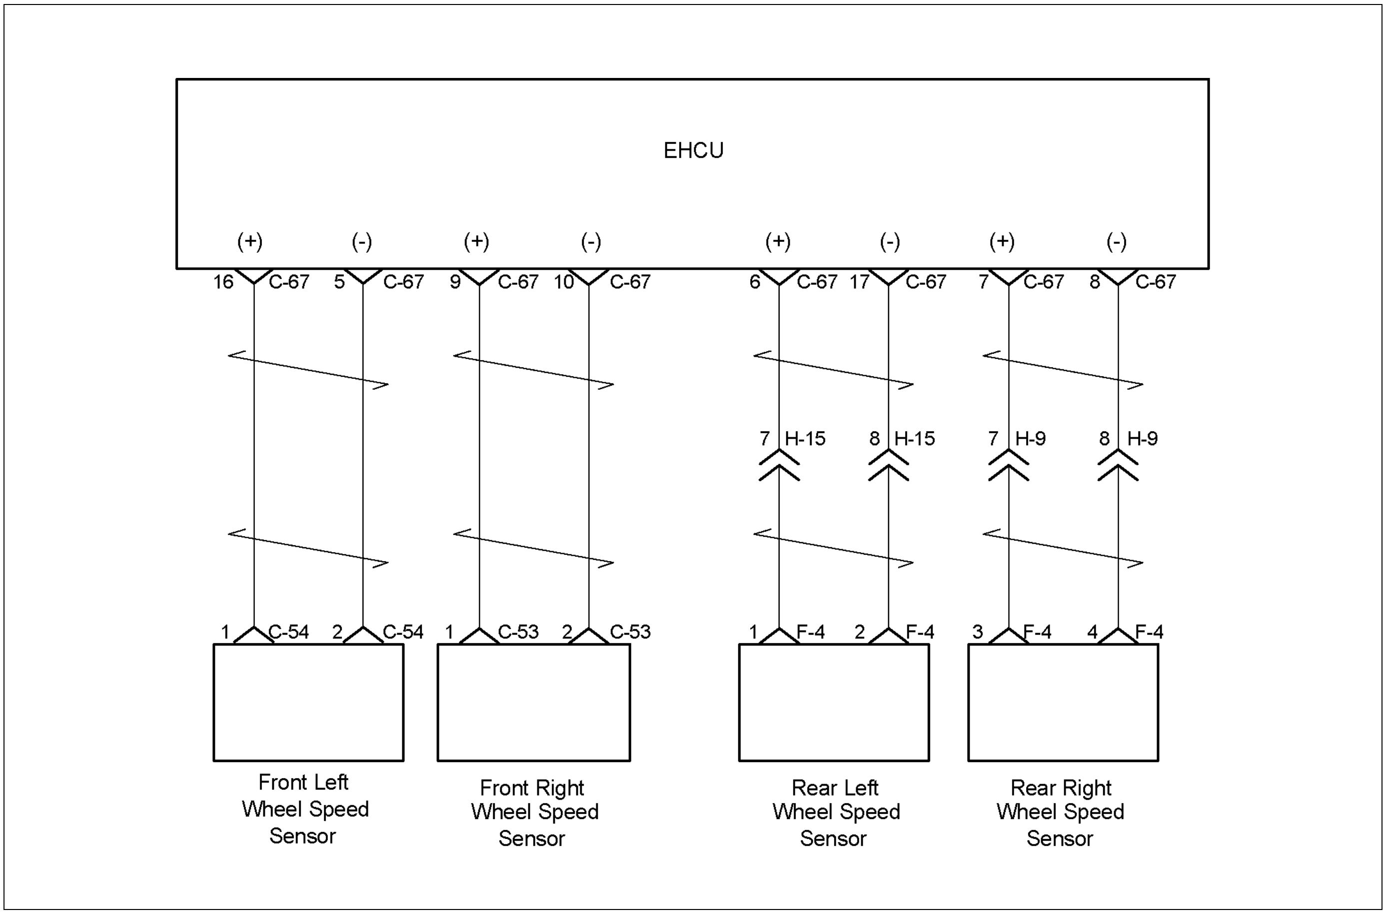


RTW75AMF001301

Step	Action	Value(s)	Yes	No
1	Were the steps of the “Basic Diagnostic Flow Chart” performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Check the tire for the following conditions. • Tire specification • Wear of the outer surface 2. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3
3	**Note:** This DTC is set when certain tire is rotated alone. Has certain tire been rotated alone by performing for lift-up or roller tester?	-	Verify repair	Go to Step 4
4	Is the front right wheel bearing rattling?	-	Go to Step 11	Go to Step 5
5	Is the front right wheel speed sensor or the sensor rotor rattling?	-	Go to Step 12	Go to Step 6
6	Is iron powder attached to the front left wheel speed sensor or the sensor rotor?	-	Go to Step 13	Go to Step 7

Step	Action	Value(s)	Yes	No
7	Check the front left wheel speed sensor. Refer to "Wheel Speed Sensor Inspection procedure" Was a problem found?	-	Go to Step 10	Go to Step 8
8	Does the sensor rotor have missing tooth or saw-toothed?	-	Go to Step 14	Go to Step 9
9	1. Clear the DTC. 2. Test run the vehicle, and check the DTC. Is the DTC displayed repeatedly?	-	Go to Step 18	Go to Step 17
10	Is the wheel speed sensor damaged or saw-toothed?	-	Go to Step 15	Go to Step 16
11	Adjust the preload of the wheel bearing. Is the action complete?	-	Verify repair	-
12	Repair or replace the front left speed sensor or the sensor rotor. Is the action complete?	-	Verify repair	-
13	Repair the front left speed sensor or the sensor rotor. Is the action complete?	-	Verify repair	-
14	Replace the sensor rotor. Is the action complete?	-	Verify repair	-
15	Replace the front left wheel speed sensor. Is the action complete?	-	Verify repair	-
16	Repair or replace the front left speed sensor circuits. Is the action complete?	-	Verify repair	-
17	Check the connection btween the EHCU and the front left wheel speed sensor and repair as necessary Refer to "Note on Intermittents". Is the action complete?	-	Verify repair	-
18	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0231 (Flash Code 31) Rear Right Wheel Speed Sensor Short Circuit or Circuit Open

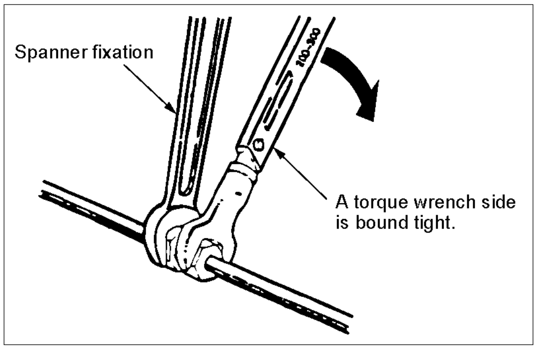


RTW75AMF001301

Step	Action	Value(s)	Yes	No
1	Were the steps of the "Basic Diagnostic Flow Chart" performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Check for a poor connection at the rear right wheel speed sensor harness connector. 2. Check installation condition for rear right wheel speed sensor. 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3
3	1. Ignition "OFF", disconnect the EHCU and rear right wheel speed sensor. 2. Check the circuit between EHCU and rear right wheel speed sensor. (Circuit for an open, short to ground, or short to voltage.) 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 4

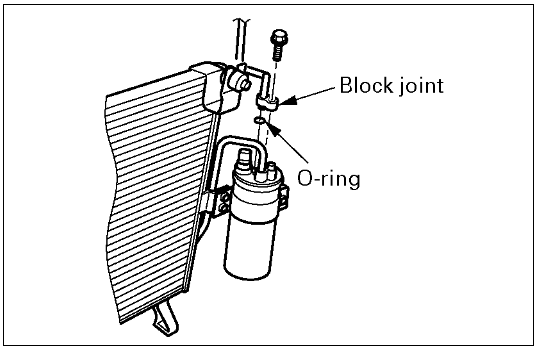
REPAIR OF REFRIGERANT LEAKS

Refrigerant Line Connections

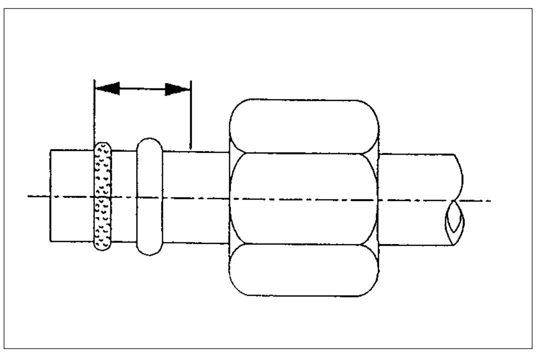


RTW410SH000101

Install new O-ring, if required. When disconnecting or connecting lines, use two wrenches to prevent the connecting portion from twisting or becoming damaged.

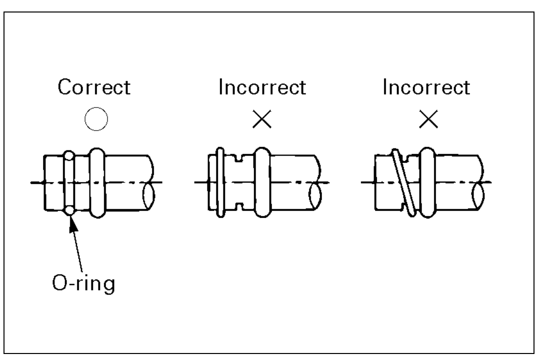


When connecting the refrigerant line at the block joint, securely insert the projecting portion of the joint portion into the connecting hole on the unit side and secure with a bolt.



Apply specified compressor oil to the O-rings prior to connecting.

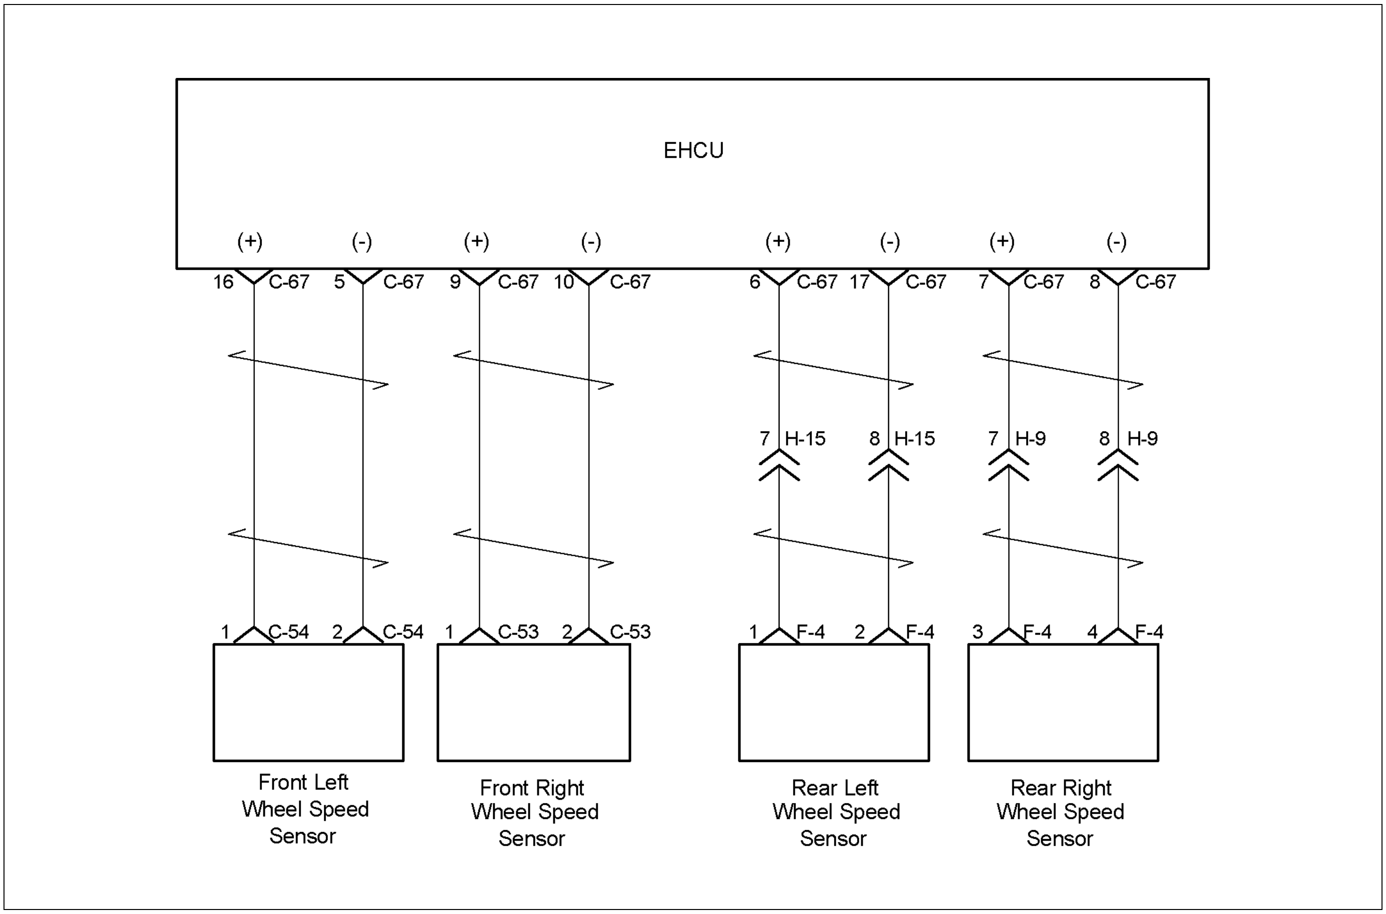
CAUTION:
Compressor (PAG) oil to be used varies according to compressor model. Be sure to apply oil specified for the model of compressor.



O-rings must be closely aligned with raised portion of refrigerant line.

Step	Action	Value(s)	Yes	No
4	1. Replace rear right wheel speed sensor. 2. Select “Display DTCs” with the Tech 2. Note: Perform the various tests (actuator test, test run, brake test, etc.) then observe the DTC with a Tech 2. Are any DTCs stored?	-	Go to Step 5	Verify repair
5	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0232 (Flash Code 32) Rear Right Wheel Speed Sensor Signal Malfunction

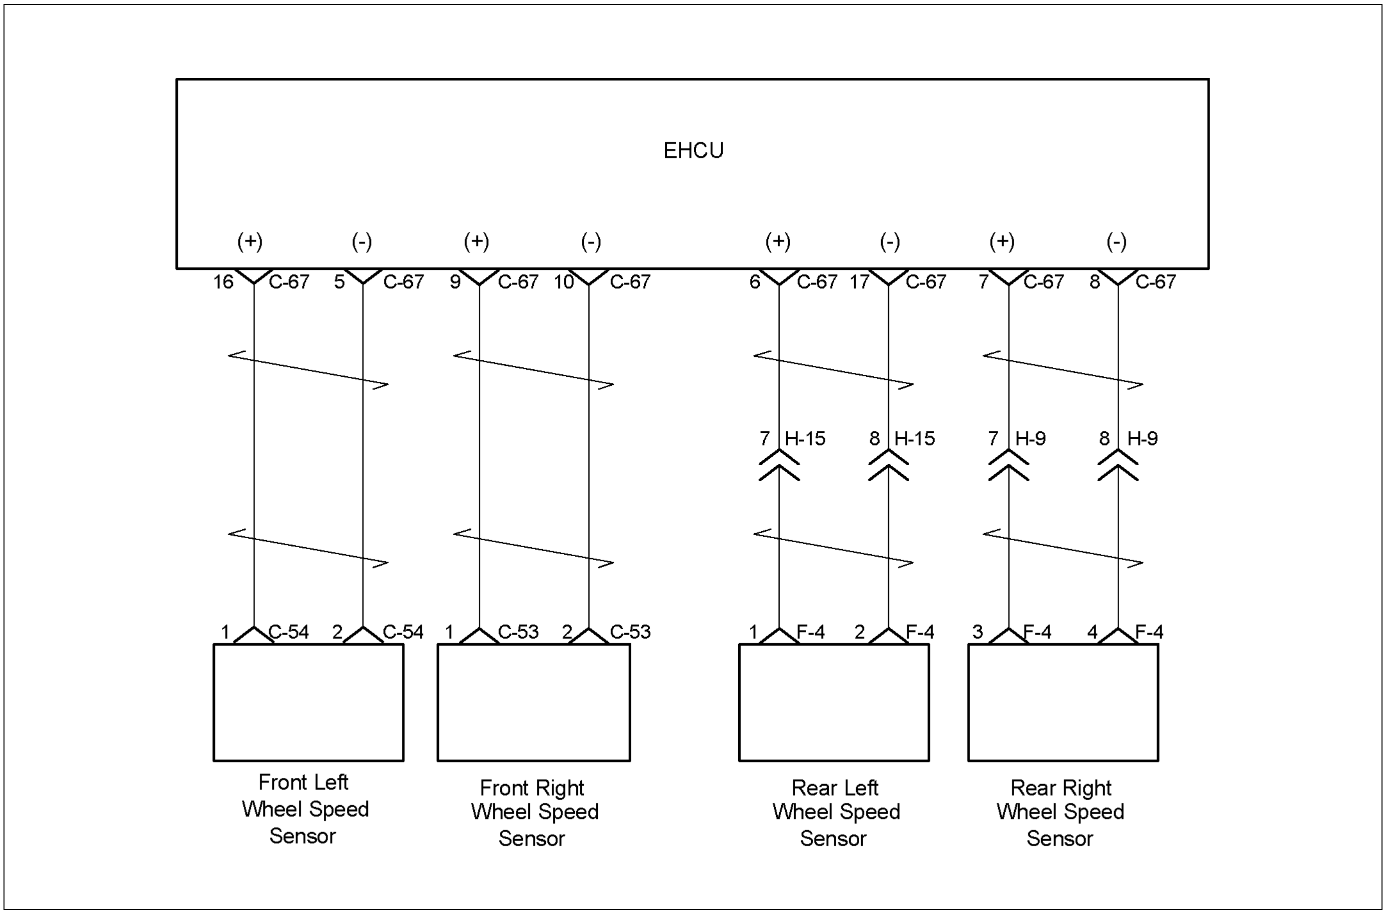


RTW75AMF001301

Step	Action	Value(s)	Yes	No
1	Were the steps of the "Basic Diagnostic Flow Chart" performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Check the tire for the following conditions. • Tire specification • Wear of the outer surface 2. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3
3	**Note:** This DTC is set when certain tire is rotated alone. Has certain tire been rotated alone by performing for lift-up or roller tester?	-	Verify repair	Go to Step 4
4	Is the rear right wheel bearing rattling?	-	Go to Step 11	Go to Step 5
5	Is the rear right wheel speed sensor or the sensor rotor rattling?	-	Go to Step 12	Go to Step 6
6	Is iron powder attached to the rear right wheel speed sensor or the sensor rotor?	-	Go to Step 13	Go to Step 7

Step	Action	Value(s)	Yes	No
7	Check the rear right wheel speed sensor. Refer to "Wheel Speed Sensor Inspection procedure" Was a problem found?	-	Go to Step 10	Go to Step 8
8	Does the sensor rotor have missing tooth or saw-toothed?	-	Go to Step 14	Go to Step 9
9	1. Clear the DTC. 2. Test run the vehicle, and check the DTC. Is the DTC displayed repeatedly?	-	Go to Step 18	Go to Step 17
10	Is the wheel speed sensor damaged or saw-toothed?	-	Go to Step 15	Go to Step 16
11	Repair or replace the wheel bearing. Is the action complete?	-	Verify repair	-
12	Repair or replace the rear right speed sensor or the sensor rotor. Is the action complete?	-	Verify repair	-
13	Repair the rear right speed sensor or the sensor rotor. Is the action complete?	-	Verify repair	-
14	Replace the sensor rotor. Is the action complete?	-	Verify repair	-
15	Replace the rear right wheel speed sensor. Is the action complete?	-	Verify repair	-
16	Repair or replace the rear right speed sensor circuits. Is the action complete?	-	Verify repair	-
17	Check the connection btween the EHCU and the rear right wheel speed sensor and repair as necessary Refer to "Note on Intermittents". Is the action complete?	-	Verify repair	-
18	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0235 (Flash Code 35) Rear Left Wheel Speed Sensor Short Circuit or Circuit Open

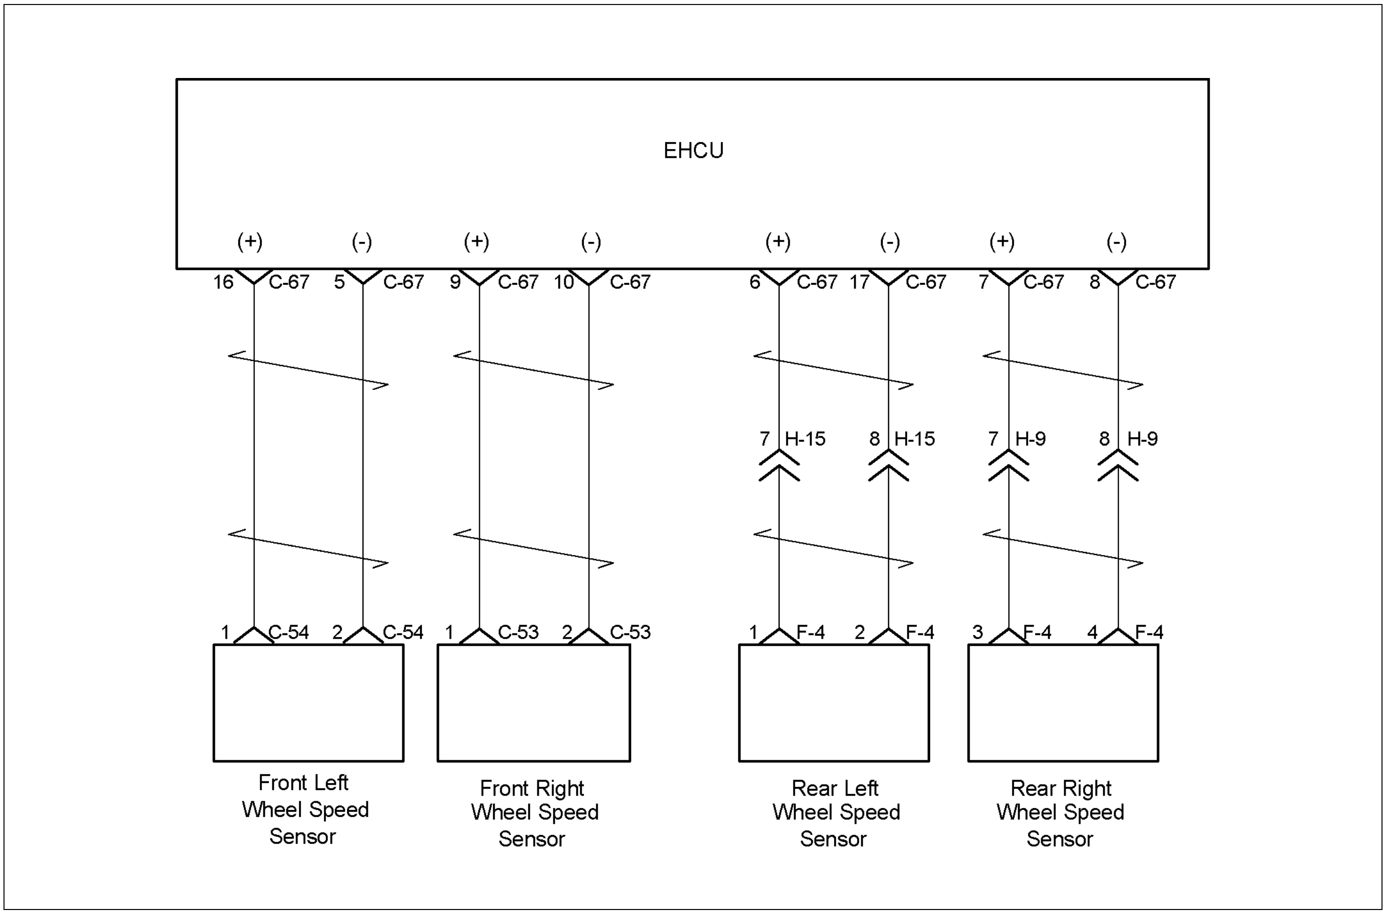


RTW75AMF001301

Step	Action	Value(s)	Yes	No
1	Were the steps of the “Basic Diagnostic Flow Chart” performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Check for a poor connection at the rear left wheel speed sensor harness connector. 2. Check installation condition for rear left wheel speed sensor. 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3
3	1. Ignition “OFF”, disconnect the EHCU and rear left wheel speed sensor. 2. Check the circuit between EHCU and rear left wheel speed sensor. (Circuit for an open, short to ground, or short to voltage.) 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 4

Step	Action	Value(s)	Yes	No
4	1. Replace rear left wheel speed sensor. 2. Select "Display DTCs" with the Tech 2. Note: Perform the various tests (actuator test, test run, brake test, etc.) then observe the DTC with a Tech 2. Are any DTCs stored?	-	Go to Step 5	Verify repair
5	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0236 (Flash Code 36) Rear Left Wheel Speed Sensor Signal Malfunction



RTW75AMF001301

Step	Action	Value(s)	Yes	No
1	Were the steps of the “Basic Diagnostic Flow Chart” performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Check the tire for the following conditions. • Tire specification • Wear of the outer surface 2. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3
3	**Note:** This DTC is set when certain tire is rotated alone. Has certain tire been rotated alone by performing for lift-up or roller tester?	-	Verify repair	Go to Step 4
4	Is the rear left wheel bearing rattling?	-	Go to Step 11	Go to Step 5
5	Is the rear left wheel speed sensor or the sensor rotor rattling?	-	Go to Step 12	Go to Step 6
6	Is iron powder attached to the rear left wheel speed sensor or the sensor rotor?	-	Go to Step 13	Go to Step 7
7	Check the rear left wheel speed sensor. Refer to "Wheel Speed Sensor Inspection procedure" Was a problem found?	-	Go to Step 10	Go to Step 8

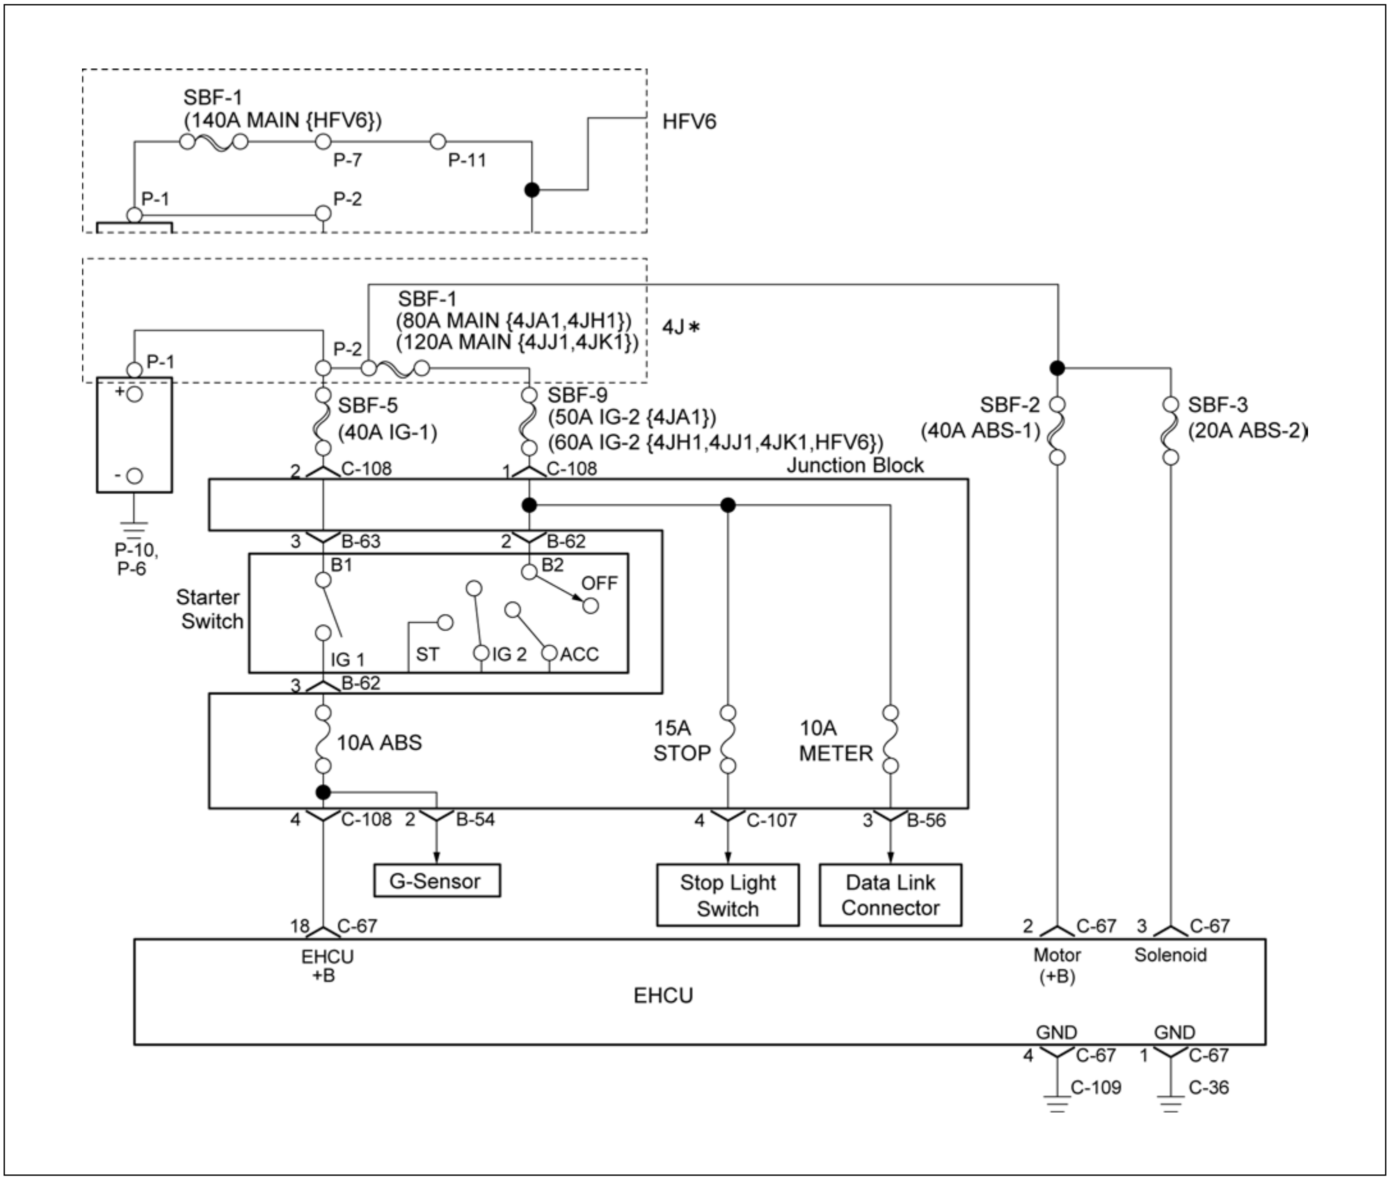
Step	Action	Value(s)	Yes	No
8	Does the sensor rotor have missing tooth or saw-toothed?	-	Go to Step 14	Go to Step 9
9	1. Clear the DTC. 2. Test run the vehicle, and check the DTC. Is the DTC displayed repeatedly?	-	Go to Step 18	Go to Step 17
10	Is the wheel speed sensor damaged or saw-toothed?	-	Go to Step 15	Go to Step 16
11	Repair or replace the wheel bearing. Is the action complete?	-	Verify repair	-
12	Repair or replace the rear left speed sensor or the sensor rotor. Is the action complete?	-	Verify repair	-
13	Repair the rear left speed sensor or the sensor rotor. Is the action complete?	-	Verify repair	-
14	Replace the sensor rotor. Is the action complete?	-	Verify repair	-
15	Replace the rear left wheel speed sensor. Is the action complete?	-	Verify repair	-
16	Repair or replace the rear left speed sensor circuits. Is the action complete?	-	Verify repair	-
17	Check the connection btween the EHCU and the rear left wheel speed sensor and repair as necessary Refer to "Note on Intermittents". Is the action complete?	-	Verify repair	-
18	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0238 (Flash Code 38) Front Speed Sensor Correlation

Step	Action	Value(s)	Yes	No
1	Were the steps of the "Basic Diagnostic Flow Chart" performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Check for the tire size of each wheels. 2. If the tire size is different, replace the tire. 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3
3	1. Check for the gear ratio of a front axle differential gear and a rear axle differential gear. 2. If the gear ratio is different, repair the gear ratio. 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 4
4	Select "Display DTCs" with the Tech 2. Note: Perform the various tests (actuator test, test run, brake test, etc.) then observe the DTC with a Tech 2. Are any DTCs stored?	-	Go to Step 5	Verify repair
5	1. Check for a poor connection at the wheel speed sensor harness connector. 2. Check installation condition for wheel speed sensor. 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 6
6	1. Check condition for sensor rotor. 2. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 7
7	1. Ignition "OFF" disconnect the EHCU and wheel speed sensor. 2. Check the circuit between EHCU and wheel speed sensor. (short ground, or short to voltage) 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 8
8	1. Ignition "OFF". 2. Check the EHCU circuit for an open, short to ground, or short to voltage. Also, check the EHCU ignition feed circuit for an open or short to ground and the EHCU ground circuit for an open or short to voltage. 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 9
9	1. Ignition "ON", engine "OFF". 2. Select "Display DTCs" with the Tech 2. Note: Perform the various tests (actuator test, test run, brake test, etc.) then observe the DTC with a Tech 2. Are any DTCs stored?	-	Go to Step 10	Verify repair

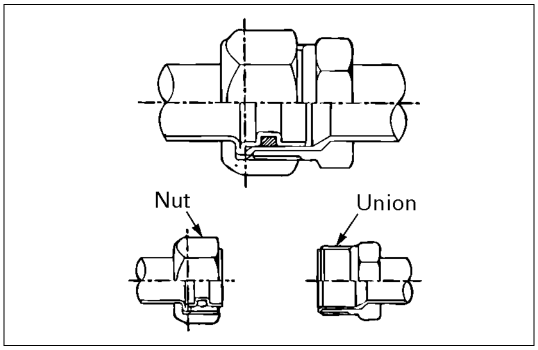
Step	Action	Value(s)	Yes	No
10	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification; 2WD model or 4WD model) Was the action complete?	-	Verify repair	-

DTC C0241 (Flash Code 41) Front Right Hold Solenoid Valve Circuit
DTC C0242 (Flash Code 42) Front Right Release Solenoid Valve Circuit



RTW75ALF000301

Step	Action	Value(s)	Yes	No
1	Were the steps of the “Basic Diagnostic Flow Chart” performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Ignition “OFF”. 2. Check the EHCU circuit for an open, short to ground, or short to voltage. Also, check the EHCU ignition feed circuit for an open or short to ground and the EHCU ground circuit for an open or short to voltage. 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3



Insert nut into union. First tighten nut by hand as much as possible. Then, tighten nut to specified torque.
(Refer to "Special Parts Fixing Nuts and Bolts" in this section)

LEAK AT REFRIGERANT LINE CONNECTIONS

1) Check the torque on the refrigerant line fitting and, if too loose, tighten to the specified torque.
   - Use two wrenches to prevent twisting and damage to the Line.
   - Do not over tighten.
2) Perform a leak test on the refrigerant line fitting.
3) If the leak is still present, discharge and recover the refrigerant from the system.
4) Replace the O-rings.
   - O-rings cannot be reused. Always replace with new ones.
   - Be sure to apply specified compressor oil to the new O-rings.
5) Retighten the refrigerant line fitting to the specified torque.
   - Use two wrenches to prevent twisting and damage to the line.
6) Evacuate, charge and retest the system.

LEAK IN THE HOSE

If the compressor inlet or outlet hose is leaking, the entire hose must be replaced. Refrigerant hose must not be cut or spliced for repair.

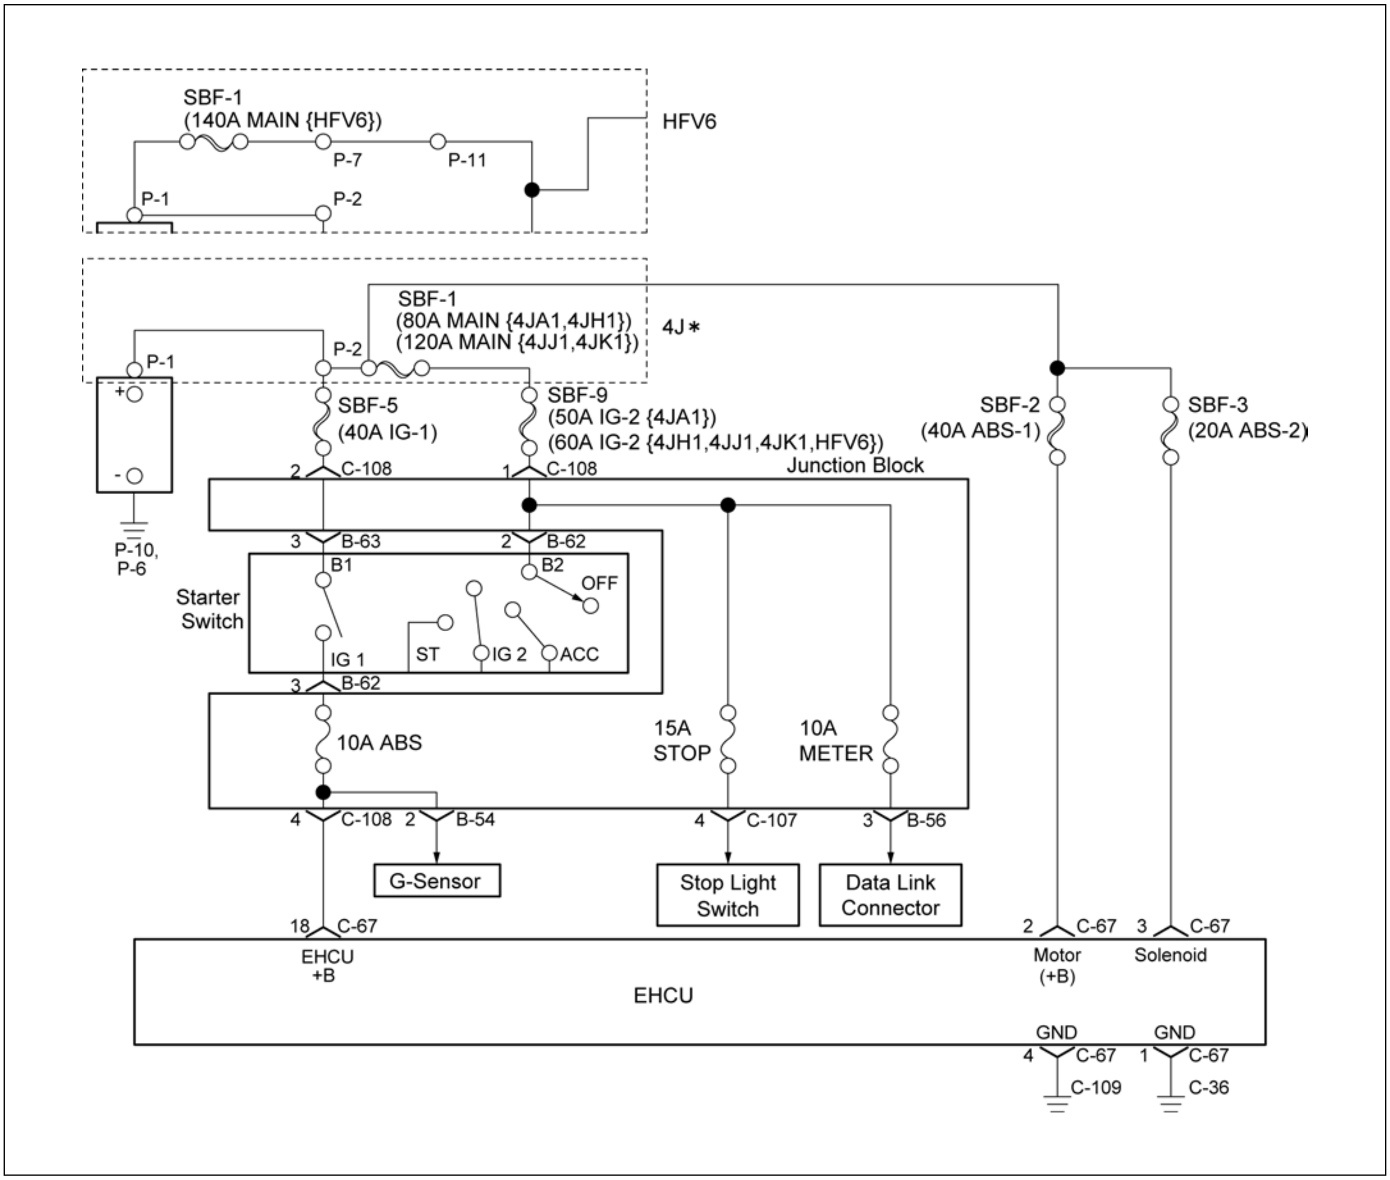
1) Locate the leak.
2) Discharge and recover the refrigerant.
3) Remove the hose assembly.
   - Cap the open connections at once.
4) Connect the new hose assembly.
   - Use two wrenches to prevent twisting or damage to the hose fitting.
   - Tighten the hose fitting to the specified torque.
5) Evacuate, charge and test the system.

COMPRESSOR LEAKS

If leaks are located around the compressor shaft seal or shell, replace or repair the compressor.

Step	Action	Value(s)	Yes	No
3	1. Ignition "ON", engine "OFF". 2. Select "Display DTCs" with the Tech 2. Note: Perform the various tests (actuator test, test run, brake test, etc.) then observe the DTC with a Tech 2. Are any DTCs stored?	-	Go to Step 4	Verify repair
4	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0245 (Flash Code 45) Front Left Hold Solenoid Valve Circuit
DTC C0246 (Flash Code 46) Front Left Release Solenoid Valve Circuit

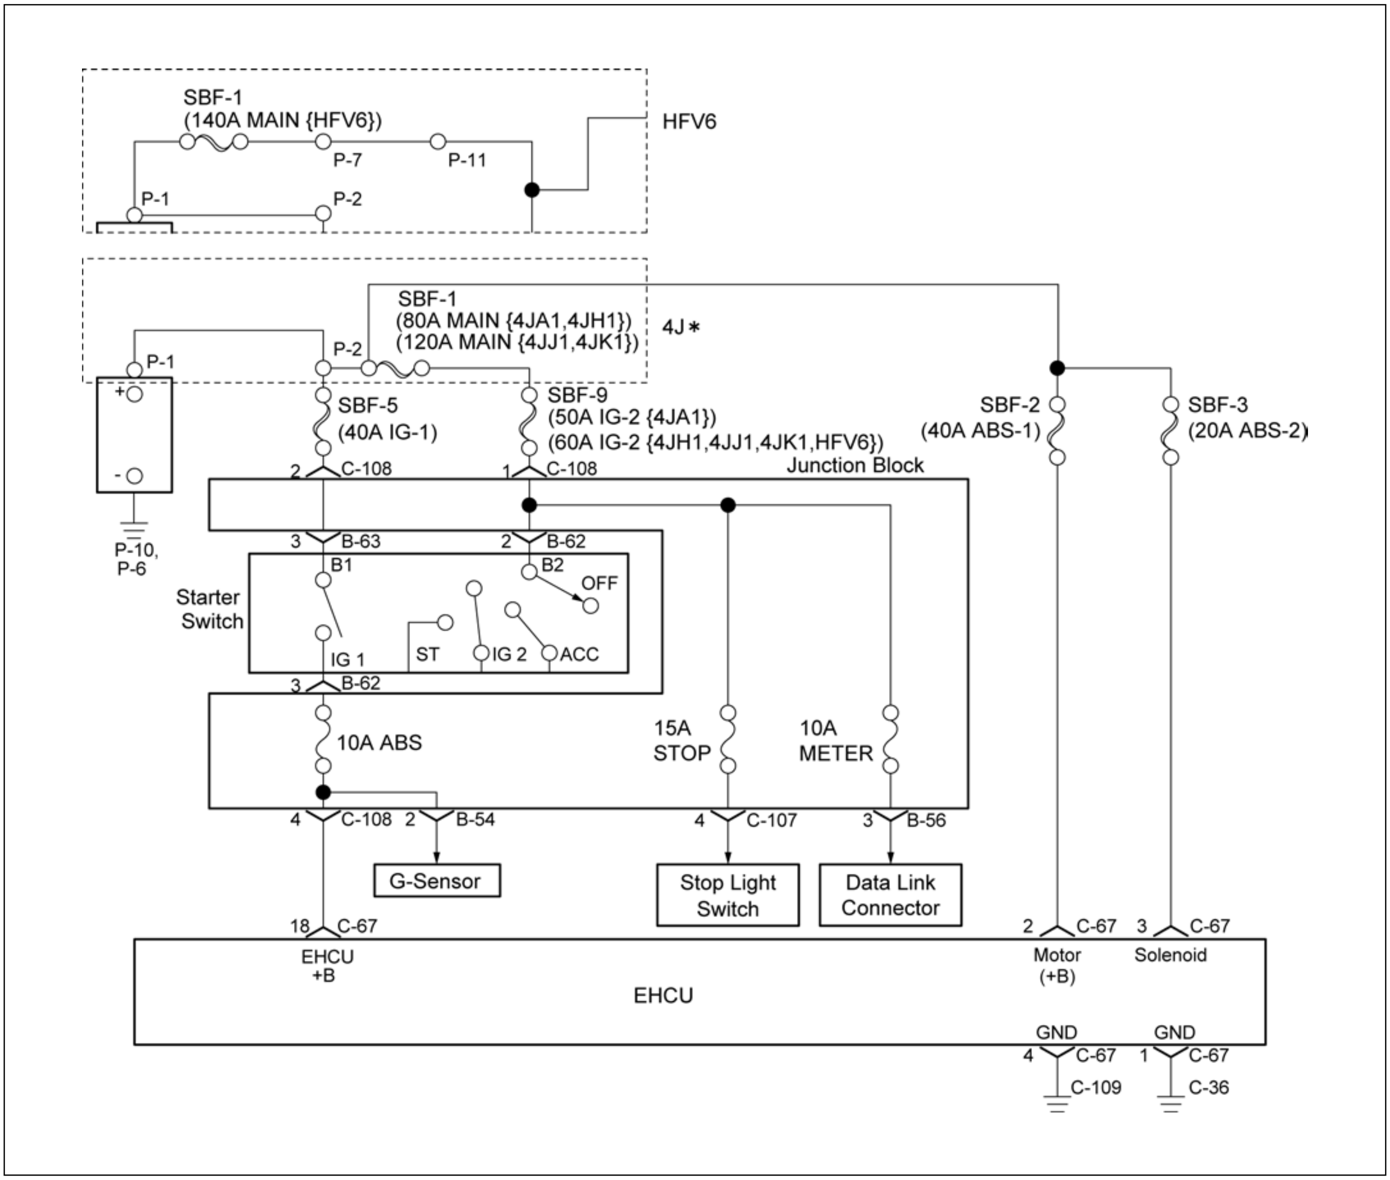


RTW75ALF000301

Step	Action	Value(s)	Yes	No
1	Were the steps of the “Basic Diagnostic Flow Chart” performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Ignition “OFF”. 2. Check the EHCU circuit for an open, short to ground, or short to voltage. Also, check the EHCU ignition feed circuit for an open or short to ground and the EHCU ground circuit for an open or short to voltage. 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3

Step	Action	Value(s)	Yes	No
3	1. Ignition "ON", engine "OFF". 2. Select "Display DTCs" with the Tech 2. Note: Perform the various tests (actuator test, test run, brake test, etc.) then observe the DTC with a Tech 2. Are any DTCs stored?	-	Go to Step 4	Verify repair
4	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0251 (Flash Code 51) Rear Hold Solenoid Valve Circuit
DTC C0252 (Flash Code 52) Rear Release Solenoid Valve Circuit

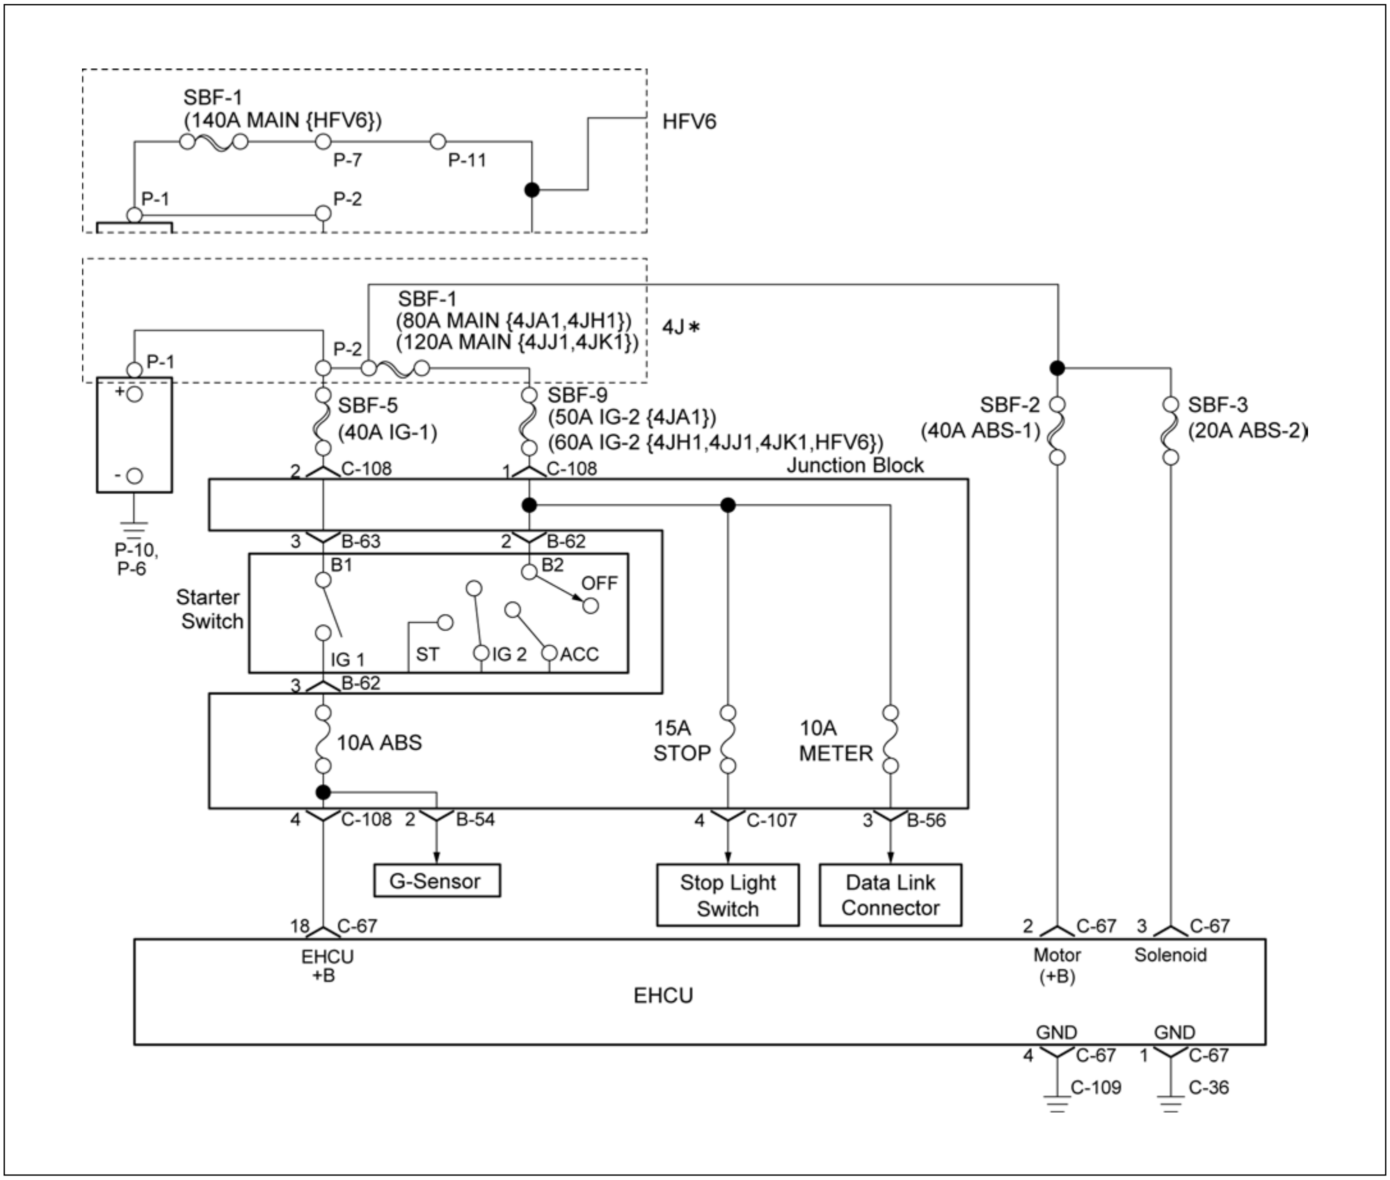


RTW75ALF000301

Step	Action	Value(s)	Yes	No
1	Were the steps of the “Basic Diagnostic Flow Chart” performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Ignition “OFF”. 2. Check the EHCU circuit for an open, short to ground, or short to voltage. Also, check the EHCU ignition feed circuit for an open or short to ground and the EHCU ground circuit for an open or short to voltage. 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3

Step	Action	Value(s)	Yes	No
3	1. Ignition “ON”, engine “OFF”. 2. Select “Display DTCs” with the Tech 2. Note: Perform the various tests (actuator test, test run, brake test, etc.) then observe the DTC with a Tech 2. Are any DTCs stored?	-	Go to Step 4	Verify repair
4	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0265 (Flash Code 65) Valve Relay Circuit Malfunction

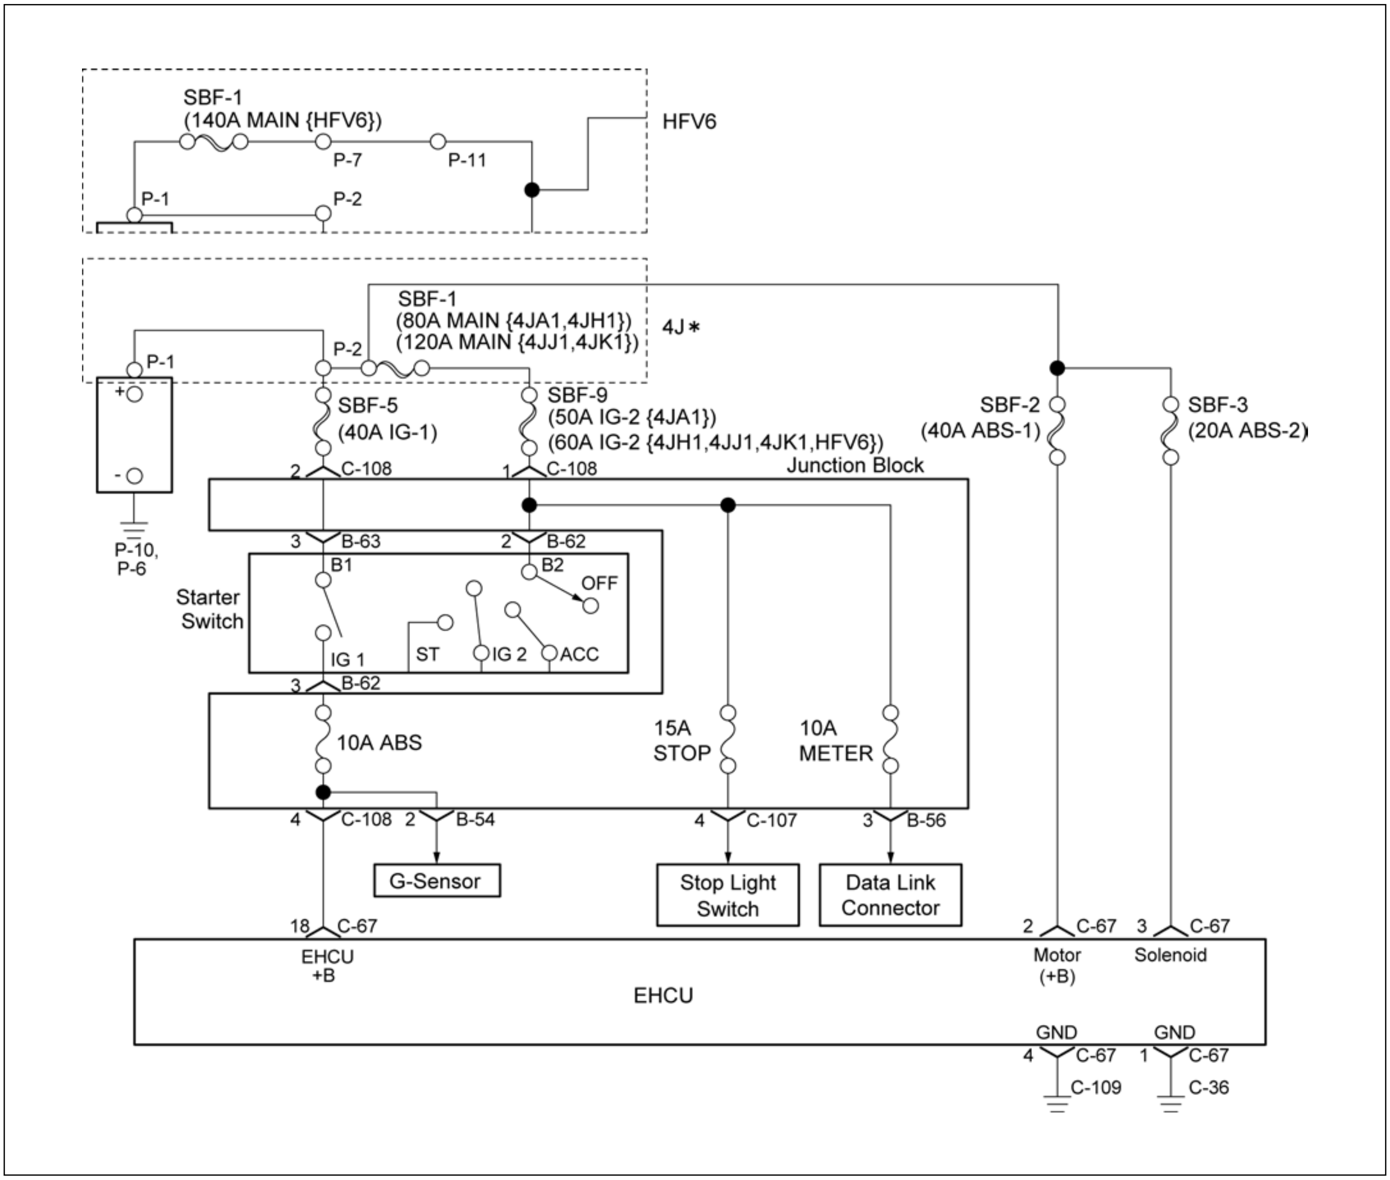


RTW75ALF000301

Step	Action	Value(s)	Yes	No
1	Were the steps of the “Basic Diagnostic Flow Chart” performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Ignition “OFF”. 2. Check the EHCU circuit for an open, short to ground, or short to voltage. Also, check the EHCU ignition feed circuit for an open or short to ground and the EHCU ground circuit for an open or short to voltage. 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3

Step	Action	Value(s)	Yes	No
3	1. Ignition "ON", engine "OFF". 2. Select "Display DTCs" with the Tech 2. Note: Perform the various tests (actuator test, test run, brake test, etc.) then observe the DTC with a Tech 2. Are any DTCs stored?	-	Go to Step 4	Verify repair
4	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0267 (Flash Code 67) Return Pump Circuit Malfunction

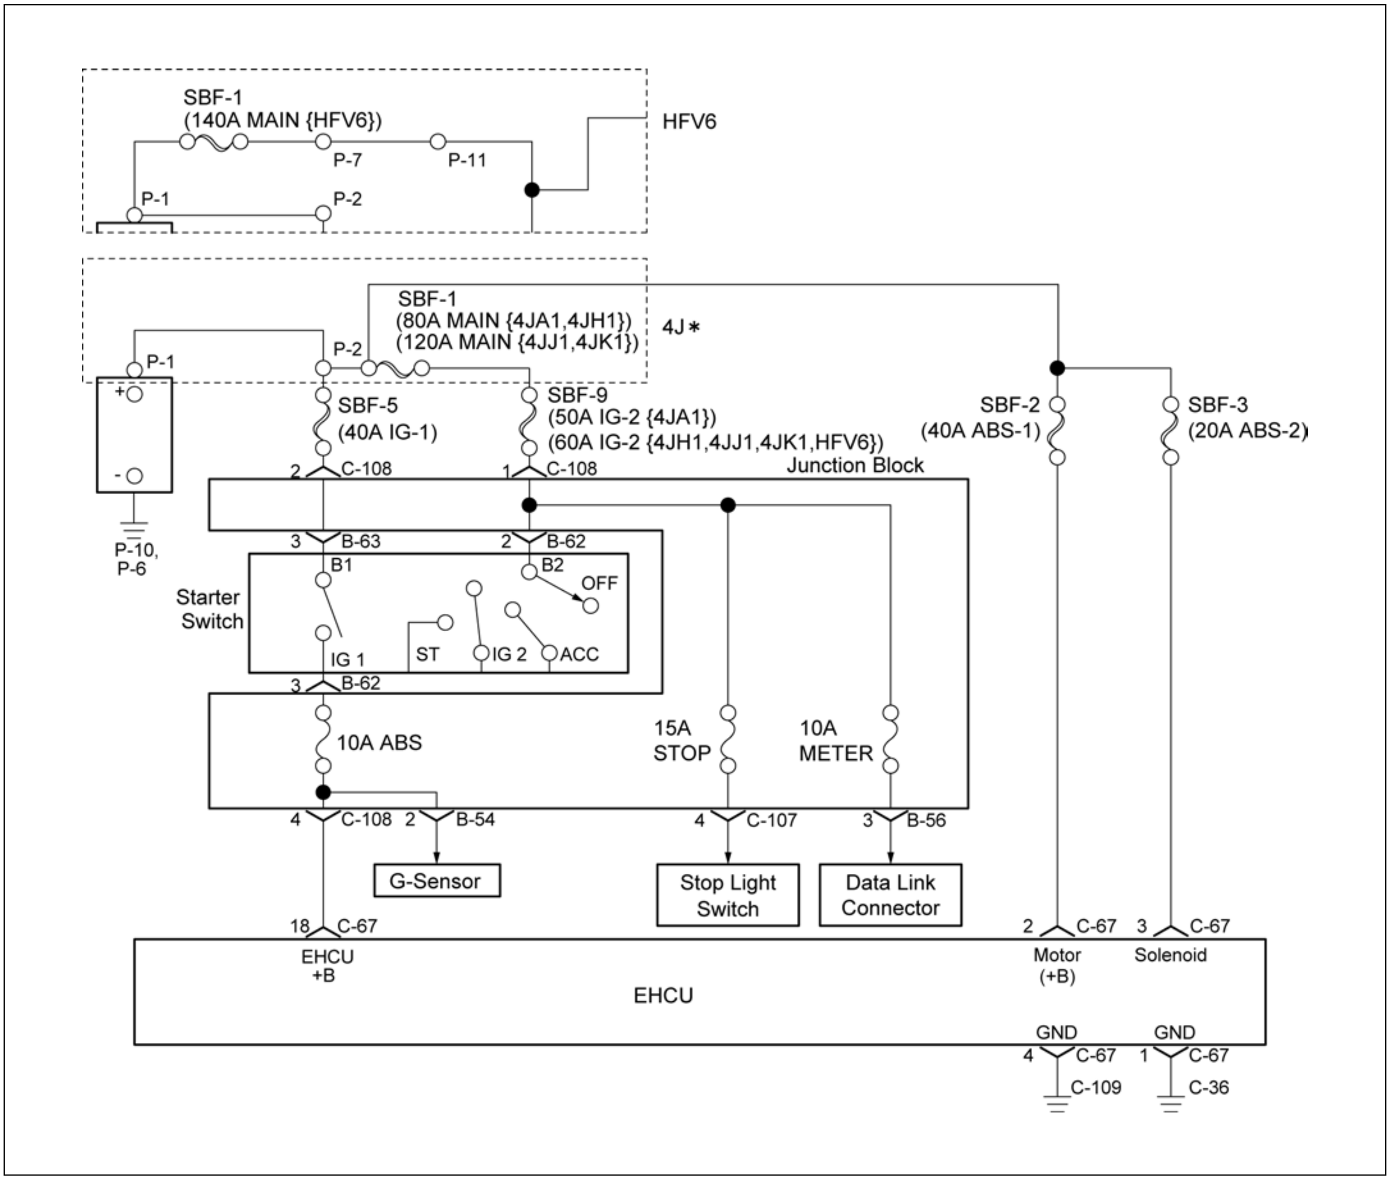


RTW75ALF000301

Step	Action	Value(s)	Yes	No
1	Were the steps of the “Basic Diagnostic Flow Chart” performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Ignition “OFF”. 2. Check the EHCU circuit for an open, short to ground, or short to voltage. Also, check the EHCU ignition feed circuit for an open or short to ground and the EHCU ground circuit for an open or short to voltage. 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3

Step	Action	Value(s)	Yes	No
3	1. Ignition “ON”, engine “OFF”. 2. Select “Display DTCs” with the Tech 2. Note: Perform the various tests (actuator test, test run, brake test, etc.) then observe the DTC with a Tech 2. Are any DTCs stored?	-	Go to Step 4	Verify repair
4	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0271 (Flash Code 71) ECU Malfunction



RTW75ALF000301

Step	Action	Value(s)	Yes	No
1	Were the steps of the "Basic Diagnostic Flow Chart" performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Ignition "OFF". 2. Check the EHCU circuit for an open, short to ground, or short to voltage. Also, check the EHCU ignition feed circuit for an open or short to ground and the EHCU ground circuit for an open or short to voltage. 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3

RECOVERY, RECYCLING, EVACUATION AND CHARGING

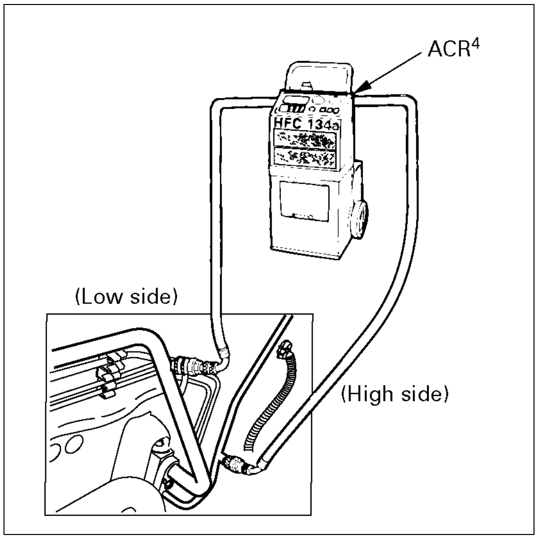
Handling Refrigerant-134a (HFC-134a)

Air conditioning systems contain HFC-134a.
This is a chemical mixture, which requires special handling procedures to avoid personal injury.

- Always wear safety goggles and protective gloves.
- Always work in a well-ventilated area. Do not weld or steam clean on or near any vehicle-installed air conditioning lines or components.
- If HFC-134a should come in contact with any part of the body, flush the exposed area with cold water and immediately seek medical help.
- If it is necessary to transport or carry any container of HFC-134a in a vehicle, do not carry it in the passenger compartment.
- If it is necessary to fill a small HFC-134a container from a large one, never fill the container completely. Space should always be allowed above the liquid for expansion.
- Keep HFC-134a containers stored below 40°C (104°F).

WARNING

- **SHOULD HFC-134a CONTACT YOUR EYE(S), CONSULT A DOCTOR IMMEDIATELY.**
- **DO NOT RUB THE AFFECTED EYE(S). INSTEAD, SPLASH QUANTITIES OF FRESH COLD WATER OVER THE AFFECTED AREA TO GRADUALLY RAISE THE TEMPERATURE OF THE REFRIGERANT ABOVE THE FREEZING POINT.**
- **OBTAIN PROPER MEDICAL TREATMENT AS SOON AS POSSIBLE. SHOULD THE HFC-134a TOUCH THE SKIN, THE INJURY MUST BE TREATED THE SAME AS SKIN WHICH HAS BEEN FROSTBITTEN OR FROZEN.**



F06R300012

REFRIGERANT RECOVERY

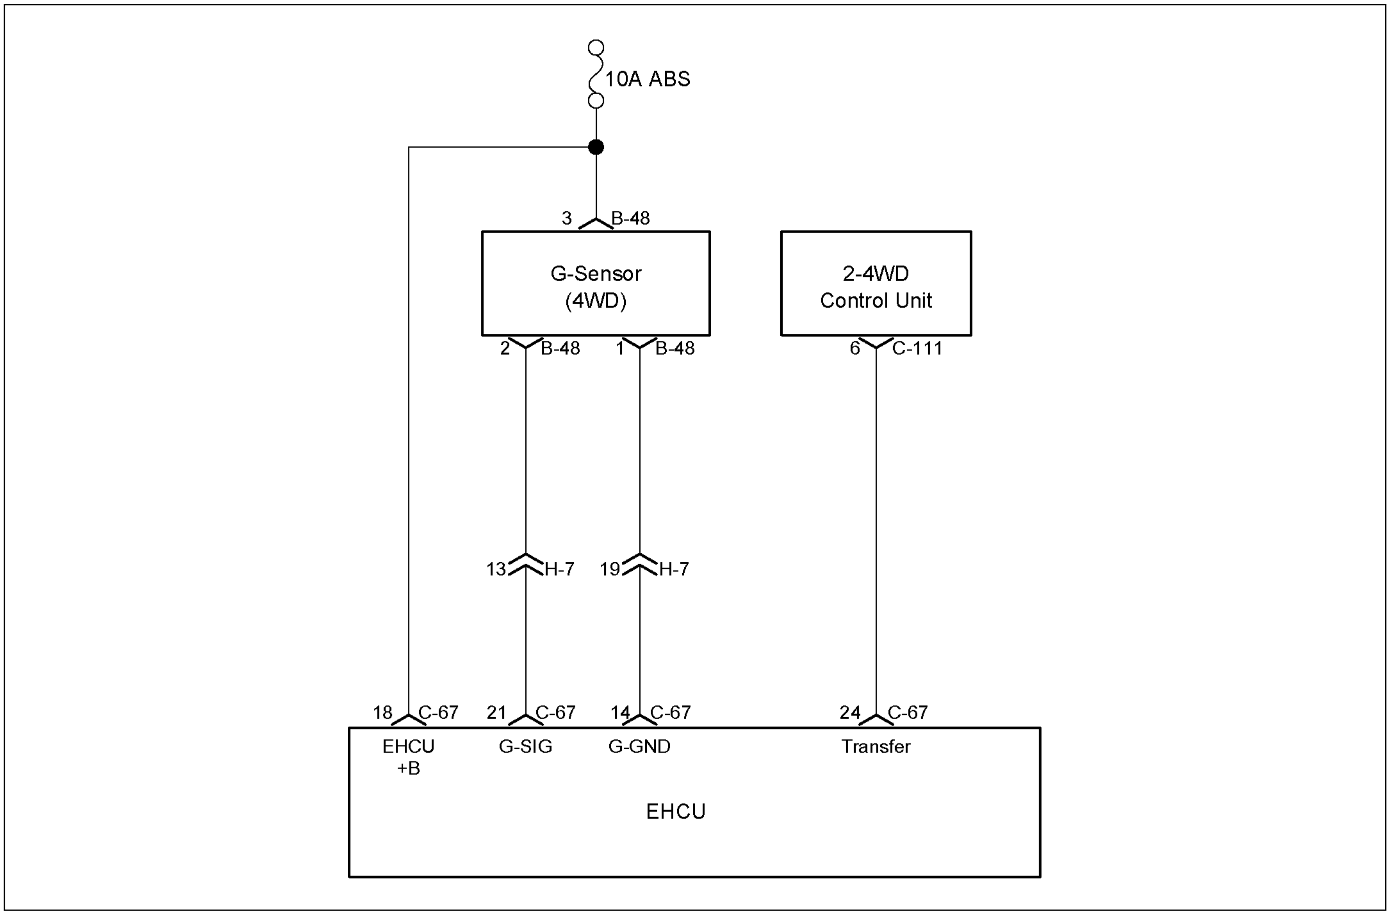
The refrigerant must be discharged and recovered by using ACR^4 (HFC-134a Refrigerant Recovery/Recycling/Recharging/ System) or equivalent before removing or installing air conditioning parts.

ACR^4 (115V 60Hz) :5-8840-0629-0 (J-39500-A)
ACR^4 (220-240V 50/60Hz)
: 5-8840-0630-0 (J-39500-220A)
ACR^4 (220-240V 50/60Hz Australian model)
: 5-8840-0631-0 (J-39500-220ANZ)

1) Connect the high and low charging hoses of the ACR^4 (or equivalent) as shown.
2) Recover the refrigerant by following the ACR^4 Manufacturer's Instructions.
3) When a part is removed, put a cap or a plug on the connecting portion so that dust, dirt or moisture cannot get into it.

3	1. Ignition "ON", engine "OFF". 2. Select "Display DTCs" with the Tech 2. Note: Perform the various tests (actuator test, test run, brake test, etc.) then observe the DTC with a Tech 2. Are any DTCs stored?	-	Go to Step 4	Verify repair
4	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0276 (Flash Code 76) G Sensor Malfunction

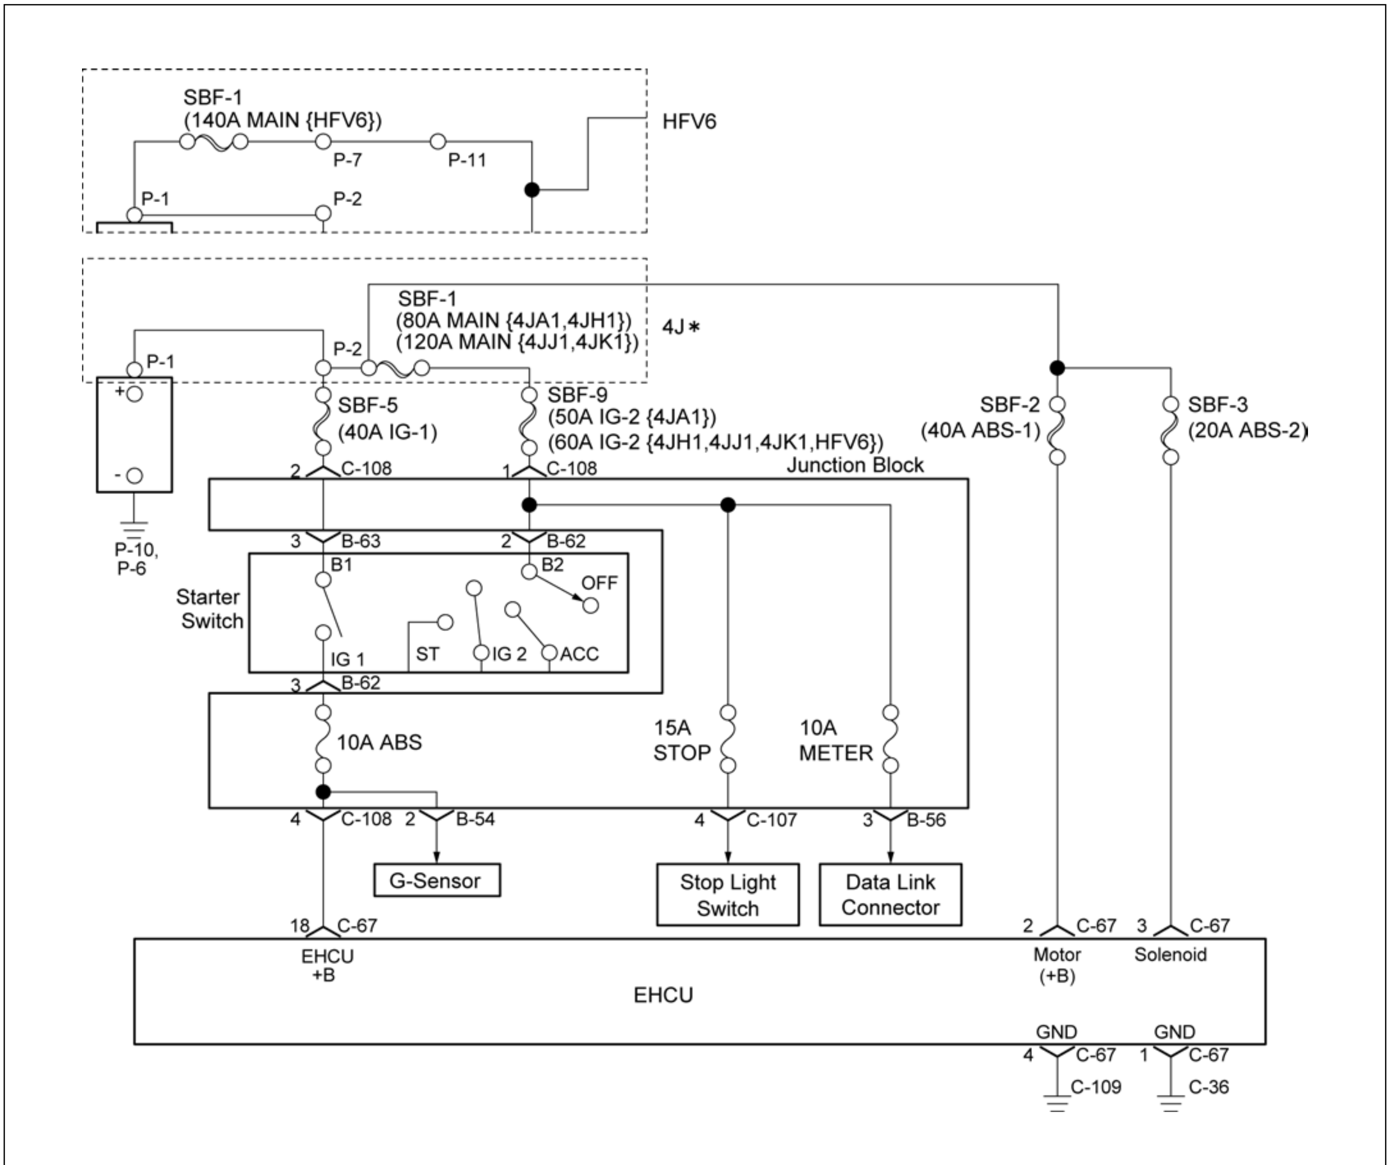


RTW75AMF001501

Step	Action	Value(s)	Yes	No
1	Were the steps of the "Basic Diagnostic Flow Chart" performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Check for a poor connection at the G sensor harness connector. 2. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3
3	1. Ignition "OFF", disconnect the G sensor and EHCU. 2. Ignition "ON", engine "OFF". 3. Check the supply voltage to G sensor. Was the value normal?	Battery Voltage	Go to Step 5	Go to Step 4
4	Repair or replace the power supply circuit. Is the action complete?	-	Verify repair	-
5	1. Check the circuit between EHCU and G sensor. (Check circuit for an open, short to ground, or short to voltage.) 2. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 6

Step	Action	Value(s)	Yes	No
6	1. Remove the G sensor. 2. Reconnect G sensor and EHCU 3. Install the Tech 2. 4. Ignition "ON", engine "OFF". 5. Observe the G sensor reading on Tech 2. If G sensor inclines, reading voltage will change. Is the reading voltage between specified values?	1.0 - 4.0V	Go to Step 7	Go to Step 8
7	1. Ignition "OFF". 2. Install the G sensor. 3. Install the Tech 2. 4. Ignition "ON", engine "OFF". 5. Select "Display DTCs" with the Tech 2. Are any DTCs stored?	-	Go to Step 8	Verify repair
8	1. Replace G sensor. 2. Select "Display DTCs" with the Tech 2. Note: Perform the various tests (actuator test, test run, brake test, etc.) then observe the DTC with a Tech 2. Are any DTCs stored?	-	Go to Step 9	Verify repair
9	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0277 (Flash Code 77) System Voltage Low
DTC C0278 (Flash Code 78) System Voltage High

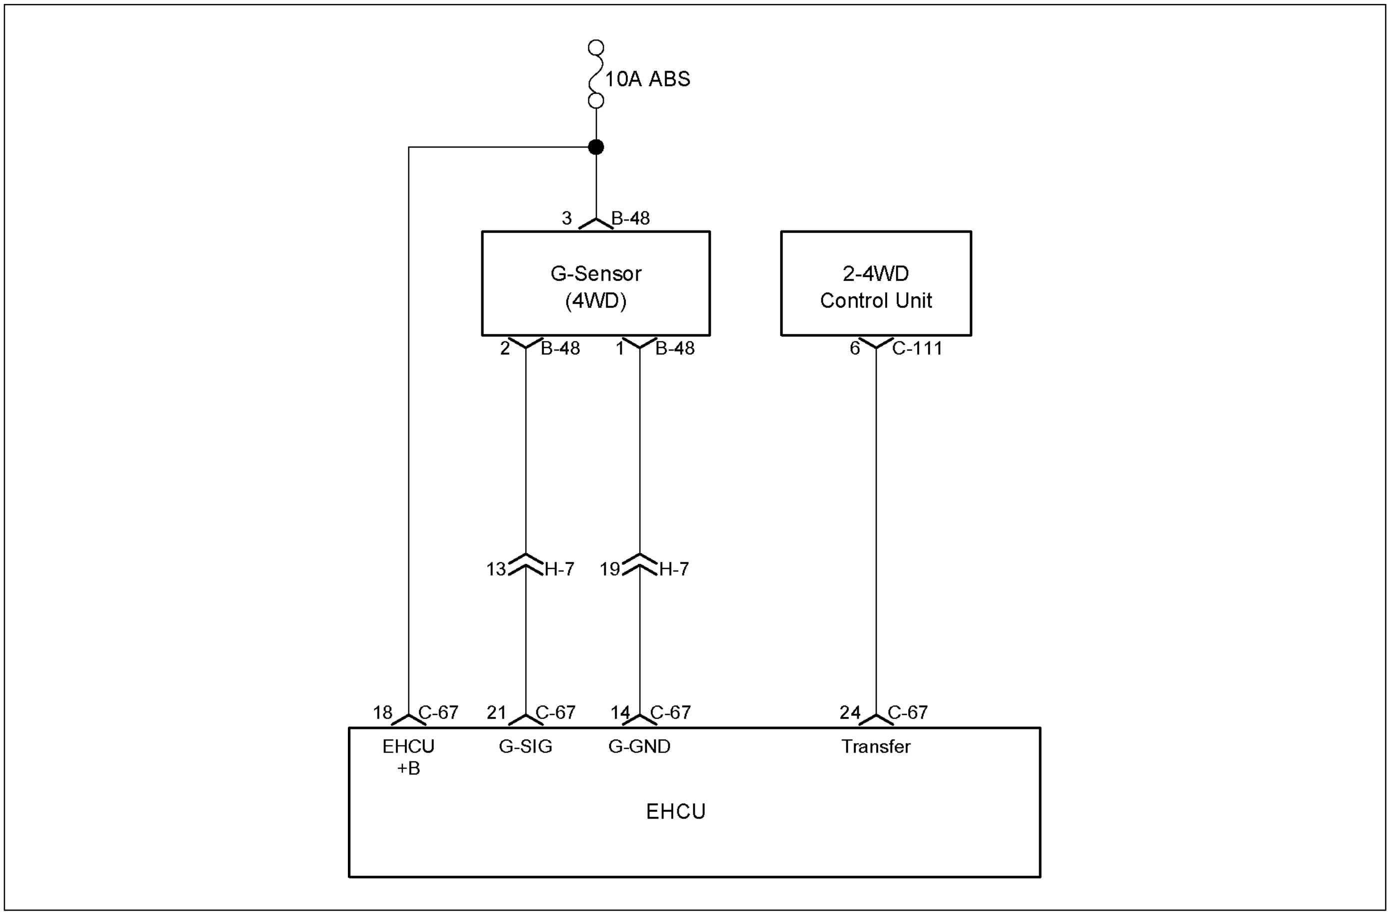


RTW75ALF000301

Step	Action	Value(s)	Yes	No
1	Were the steps of the “Basic Diagnostic Flow Chart” performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Check for a poor connection at EHCU 2. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3
3	1. Ignition “OFF”, disconnect EHCU. 2. Ignition “ON”, engine “OFF”. 3. Check the supply voltage to EHCU. Is the value normal?	Battery Voltage	Go to Step 5	Go to Step 4
4	Repair or replace the power supply circuit. Is the action complete?	-	Verify repair	-

Step	Action	Value(s)	Yes	No
5	1. Check the power supply circuit. (Check circuit for an open, short to ground, or short to voltage.) 2. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 6
6	1. Ignition “ON”, engine “OFF”. 2. Select “Display DTCs” with the Tech 2. Note: Perform the various tests (actuator test, test run, brake test, etc.) then observe the DTC with a Tech 2. Are any DTCs stored?	-	Go to Step 7	Verify repair
7	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0282 (Flash Code 82) 4 Wheel Drive State Input Signal Failure

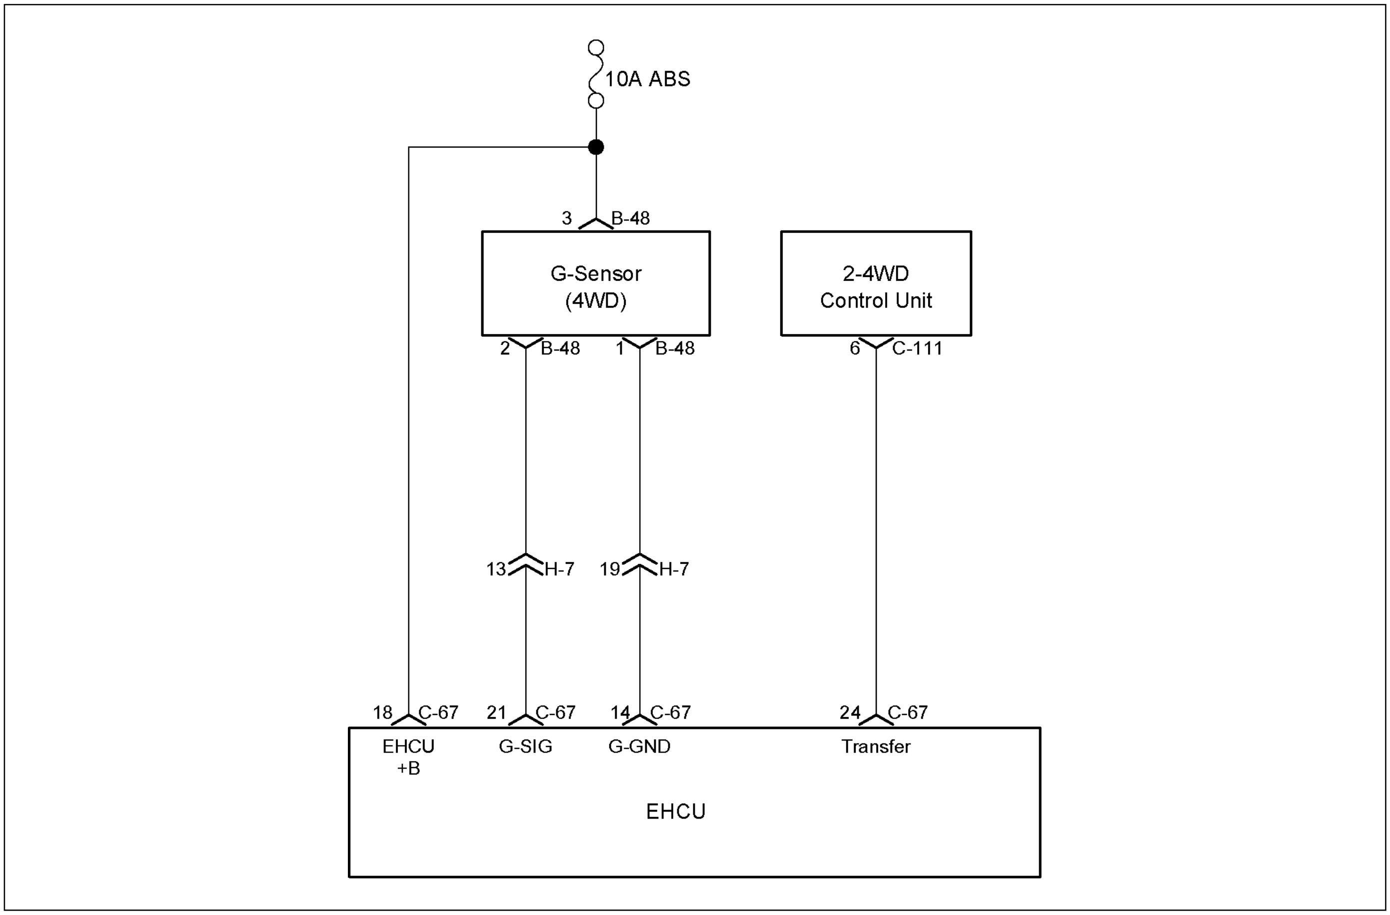


RTW75AMF001501

Step	Action	Value(s)	Yes	No
1	Were the steps of the "Basic Diagnostic Flow Chart" performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Check for a poor connection at EHCU and 2-4WD control unit. 2. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 3
3	1. Ignition "OFF", disconnect the EHCU and 2-4WD control unit. 2. Check the circuit between EHCU and 2-4WD control unit. (Circuit for an open, short to ground, or short to voltage.) 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 4
4	1. Check the 2-4WD Control system. 2. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 5

Step	Action	Value(s)	Yes	No
5	1. Ignition "OFF". 2. Connect 2-4WD control unit. 3. Disconnect EHCU. 4. Ignition "ON," engine "OFF." 5. Install the high impedance digital multimeter. 6. Check the transfer (2-4WD control unit) signal value. (Battery voltage is more than 10V.) Was the value normal?	Transfer 2WD Mode: 8.3Hz (±15%) Transfer 4WD Mode: 4.2Hz (±15%)	Go to Step 7	Go to Step 6
6	Replace 2-4WD control unit. Is the action complete?	-	Go to Step 7	-
7	1. Ignition “ON”, engine “OFF”. 2. Select “Display DTCs” with the Tech 2. Note: Perform the various tests (actuator test, test run, brake test, etc.) then observe the DTC with a Tech 2. Are any DTCs stored?	-	Go to Step 8	Verify repair
8	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

DTC C0285 (Flash Code 85) Control Module Vehicle Options Incorrect



RTW75AMF001501

Step	Action	Value(s)	Yes	No
1	Were the steps of the “Basic Diagnostic Flow Chart” performed?	-	Go to Step 2	Go to Basic Diagnostic Flow Chart
2	1. Ignition “OFF”. 2. Check for vehicle type and EHCU type. (Vehicle type : 2WD or 4WD) 3. Check that the EHCU type is the same as the vehicle type. If the EHCU type differs from the vehicle type, EHCU is replaced. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Go to Step 3	-
3	1. Check for vehicle type. (Vehicle type : 2WD or 4WD) Is vehicle type 2WD?	-	Go to Step 4	Go to Step 5

Step	Action	Value(s)	Yes	No
4	1. Ignition "OFF". 2. Check for a poor condition at the EHCU harness connector. 3. Check the EHCU circuit for an open, short to ground, or short to voltage. Also, check the EHCU ignition feed circuit for an open or short to ground and the EHCU ground circuit for an open or short to voltage. 4. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair	Go to Step 9
5	1. Ignition "OFF", disconnect the EHCU and G sensor. 2. Check the circuit between EHCU and G sensor. (short to ground, or short to voltage.) 3. If a problem is found, repair as necessary. Was a problem found?	-	Verify repair Go to Step 6	Go to Step 6
6	1. Remove the G sensor. 2. Reconnect G sensor and EHCU 3. Install the Tech 2. 4. Ignition "ON", engine "OFF". 5. Observe the G sensor reading on Tech 2. If G sensor inclines, reading voltage will change. Is the reading voltage between specified values?	1.0 – 4.0 V	Go to Step 7	Go to Step 8
7	1. Ignition "OFF". 2. Install the G sensor. 3. Install the Tech 2. 4. Ignition "ON", engine "OFF". 5. Select "Display DTCs" with the Tech 2. Are any DTCs stored?	-	Go to Step 8	Verify repair
8	1. Replace G sensor. 2. Select "Display DTCs" with the Tech 2. Note: Perform the various tests (actuator test, test run, brake test, etc.) then observe the DTC with a Tech 2. Are any DTCs stored?	-	Go to Step 9	Verify repair
9	Replace EHCU. Note: Check the EHCU type for specification, when the EHCU is replaced. (Specification ; 2WD model or 4WD model) Is the action complete?	-	Verify repair	-

EVACUATION OF THE REFRIGERANT SYSTEM

NOTE:
Explained below is a method using a vacuum pump. Refer to the ACR^4 (or equivalent) Manufacturer's Instructions when evacuating the system with ACR^4 (or equivalent).

Air and moisture in the refrigerant will cause problems in the air conditioning system.
Therefore, before charging the refrigerant, be sure to evacuate air and moisture thoroughly from the system.

1) Connect the gauge manifold.
   - High-pressure valve (HI) - Discharge-side
   - Low-pressure valve (LOW) - Suction-side
2) Discharge and recover the refrigerant.
3) Connect the center hose of the gauge manifold set to the vacuum pump inlet.
4) Operate the vacuum pump, open shutoff valve and then open both hand valves.
5) When the low-pressure gauge indicates approx. 100kPa (750 mmHg/30 inHg), continue the evacuation for 5 minutes or more.
6) Close both hand valves and stop the vacuum pump.
7) Check to ensure that the pressure does not change after 10 minutes or more.
   - If the pressure changes, check the system for leaks.
   - If leaks occur, retighten the refrigerant line connections and repeat the evacuation steps.
8) If no leaks are found, again operate the vacuum pump for 20 minutes or more. After confirming that the gauge manifold pressure is at 100 kPa (750 mmHg/30 inHg), close both hand valves.
9) Close positive shutoff valve.
   Stop the vacuum pump and disconnect the center hose from the vacuum pump.

SECTION 5B

ANTI-LOCK BRAKE SYSTEM

TABLE OF CONTENTS

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNECESSARY SRS SYSTEM REPAIRS.

CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU/GM will call out those fasteners that require a replacement after removal. ISUZU/GM will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

Electronic Hydraulic Control Unit

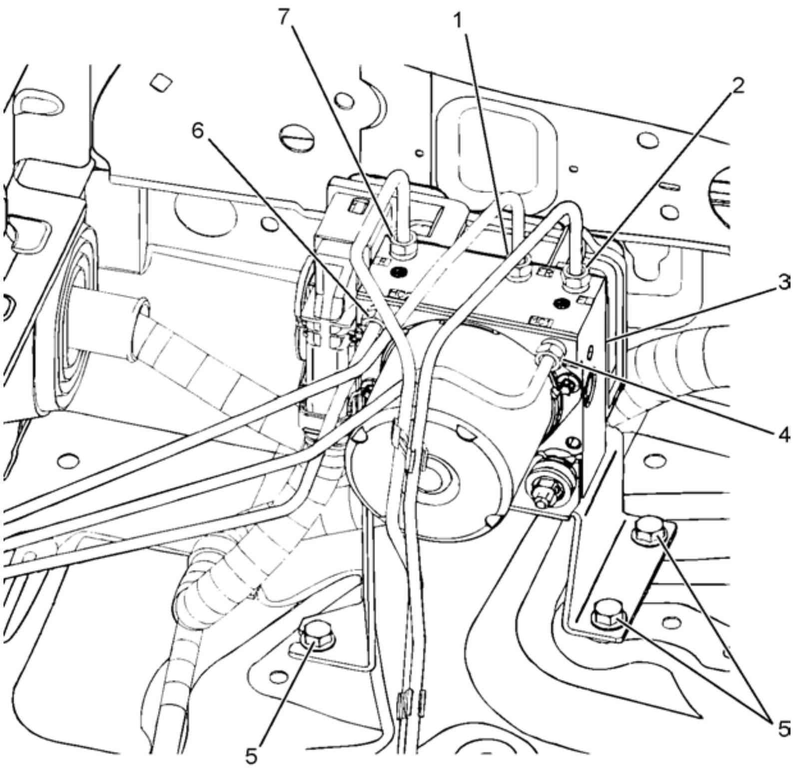
Electronic Hydraulic Control Unit and Associated Parts



RTW75BMF000301

Legend

(1) Flare Nut to front right wheel cylinder
(2) Flare Nut to front left wheel cylinder
(3) Electronic Hydraulic Control Unit (EHCU)
(4) Flare Nut from master cylinder front
(5) Bolt
(6) Flare Nut from master cylinder rear
(7) Flare Nut to rear wheel cylinder

Removal

1. Disconnect the harness connector.
2. Loosen five flare nuts and remove brake pipes.
   - After disconnecting brake pipe, cap or tape the openings of the brake pipe to prevent the entry of foreign matter.
3. Remove three bracket fixing bolts.

Installation

1. Install EHCU and tighten the bolt to the specified torque.
   Torque: 8 N·m (0.8 kgf·m /69 lb·in)
2. Tighten the flare nuts to the specified torque.
   Torque: 16 N·m (1.6 kgf·m /12 lb·ft)
3. Connect the harness connector.

- (5) Bolt: Cable to Upper Link

Removal

1. Remove speed sensor connector at connector portion.
2. Remove sensor fixing bolt (4).
3. Remove cable fixing bolts and nut (4×2).
4. Disconnect the arrow mark locks of the cable clips.
5. Remove the speed sensor assembly.

Inspection and Repair

1. Check the speed sensor head for presence of foreign materials; remove any dirt, etc.
2. Check the head for damage; replace speed sensor if necessary.
3. Check the speed sensor cable for short or open circuit, and replace with a new one if necessary.
   To check for cable short or open, bend or stretch the cable while checking for continuity.

Installation

1. Install the speed sensor in the knuckle and take care not to hit the speed sensor head during installation.
2. Install speed sensor fixing bolt and tighten the fixing bolt to the specified torque.
   Torque: 8 N·m (0.8 kgf·m /69 lb·in)
3. Connect the cable clips at the arrow mark places.
4. Install the cable fixing bolt and tighten the fixing bolt to the specified torque.
   Torque:
   Bolt 8 N·m (0.8 kgf·m /69 lb·in)

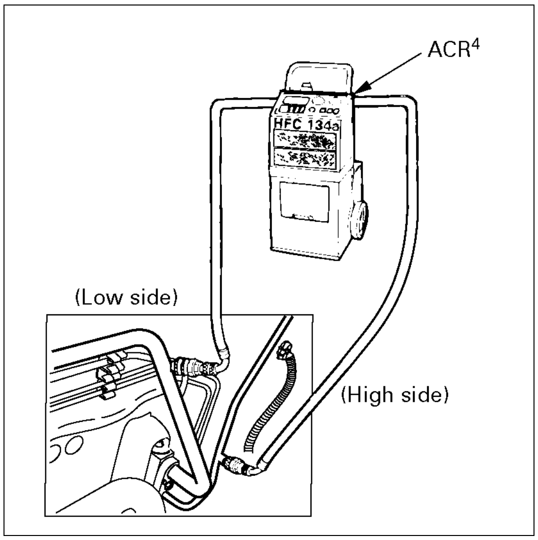
NOTE: Confirm that the cable is not twisted when connecting the speed sensor cable.

5. Connect the speed sensor connector.

CHARGING THE REFRIGERANT SYSTEM

There are various methods of charging refrigerant into the air conditioning system.
These include using the ACR^4 (HFC-134a Refrigerant Recovery/ Recycling/Recharging/System) or equivalent and direct charging with a manifold gauge charging station.

ACR^4 (115V 60Hz) : 5-8840-0629-0 (J-39500-A)
ACR^4 (220-240V 50/60Hz)
: 5-8840-0630-0 (J-39500-220A)
ACR^4 (220-240V 50/60Hz Australian model)
: 5-8840-0631-0 (J-39500-220ANZ)



F06R300012

Charging procedure

- **ACR^4 (or equivalent) method**

For the charging of refrigerant recovered by ACR^4, follow the Manufacturer's Instruction.

(8) Speed Sensor

Removal

1. Disconnect the harness connector.
2. Remove the cable fixing bolt.
3. Disconnect the cable fixing clips (arrow marked).
4. Remove the speed sensor fixing bolts and speed sensor.

Inspection and Repair

1. Check speed sensor head for presence of foreign materials; remove any dirt, etc.
2. Check the head for damage, and replace speed sensor if necessary.

3. Check speed sensor cable for short or open, and replace with a new one if necessary. To check for cable short or open, bend or stretch the cable while checking for continuity.

Installation

1. Install the speed sensor.
2. Tighten the sensor fixing bolts to the specified torque.
   Torque: 8 N·m (0.8 kgf·m / 69 lb·in)
3. Connect the cable fixing clips (arrow marked).
4. Install the cable fixing bolts and tighten it to the specified torque.
   Torque: 8 N·m (0.8 kgf·m / 69 lb·in)
5. Connect the harness connector.

Front Sensor Rotor

Front Sensor Rotor and Associated Parts

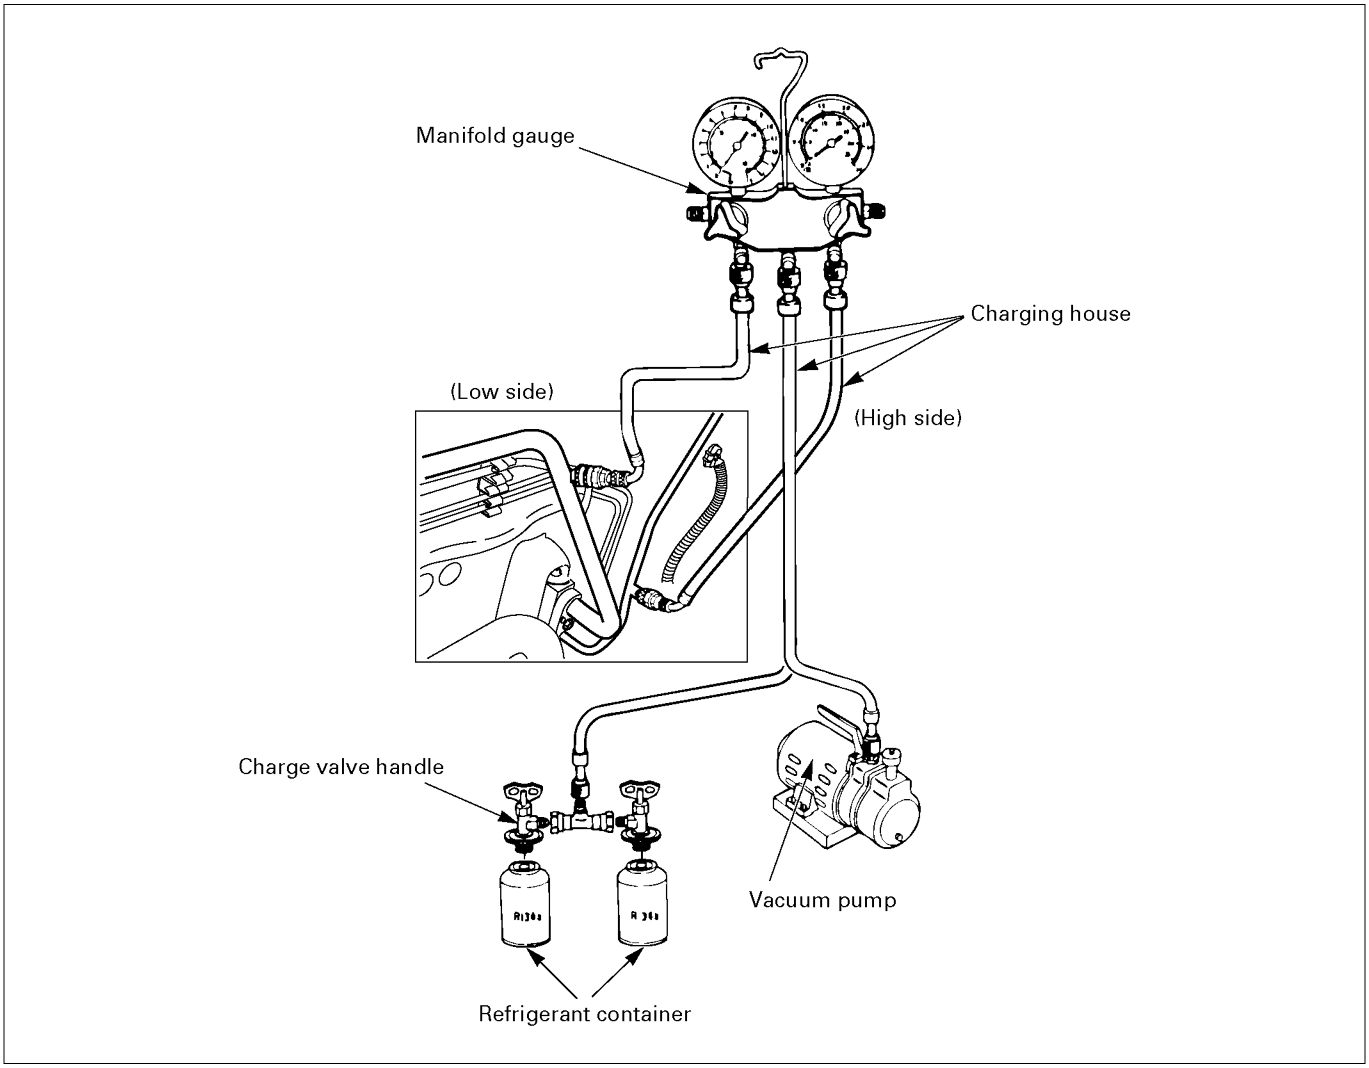
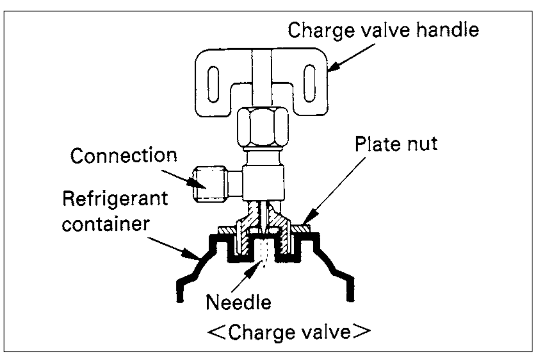
7. Measurement criteria are defined by the terms "standard" and "limit".
   A measurement falling within the "standard" range indicates that the applicable part or parts are serviceable.
   "Limit" is an absolute value.
   A measurement falling outside the "limit" indicates that the applicable part or parts must be repaired or replaced.
8. Components and parts are listed in the singular form throughout the Workshop Manual.
9. The following directional criteria are used throughout the Workshop Manual:
   Front:
   The cooling fan side of the engine.
   Right:
   The right-hand side of the engine viewed from the flywheel.
   Left:
   The left-hand side of the engine viewed from the flywheel.
   Rear:
   The flywheel side of the engine.
   Cylinder numbers are counted from the front of the engine towards the rear.
   The engine's rotation is clockwise viewed from the front of the engine.



F06R300013



- **Direct charging with a manifold gauge charging station method.**

Handling the charging valve handle when installing refrigerant container.

1) Before attaching the charge valve to the refrigerant container, turn the charge valve handle counterclockwise until the needle is fully retracted.
2) Turn the plate nut counterclockwise until it reaches its highest position relative to the charge valve.
3) Install the charge valve onto the refrigerant container.
4) Turn the plate nut clockwise and connect the center hose of the manifold gauge to the charge valve.
5) Tighten the plate nut sufficiently by hand. Then turn the charge valve handle clockwise to lower the needle and bore a hole in the refrigerant container.
6) Turn the charge valve handle counterclockwise to raise the needle. The refrigerant in the refrigerant container is charged into the air conditioning system by the operation of the manifold gauge.

- **Be absolutely sure not to reuse the emptied**

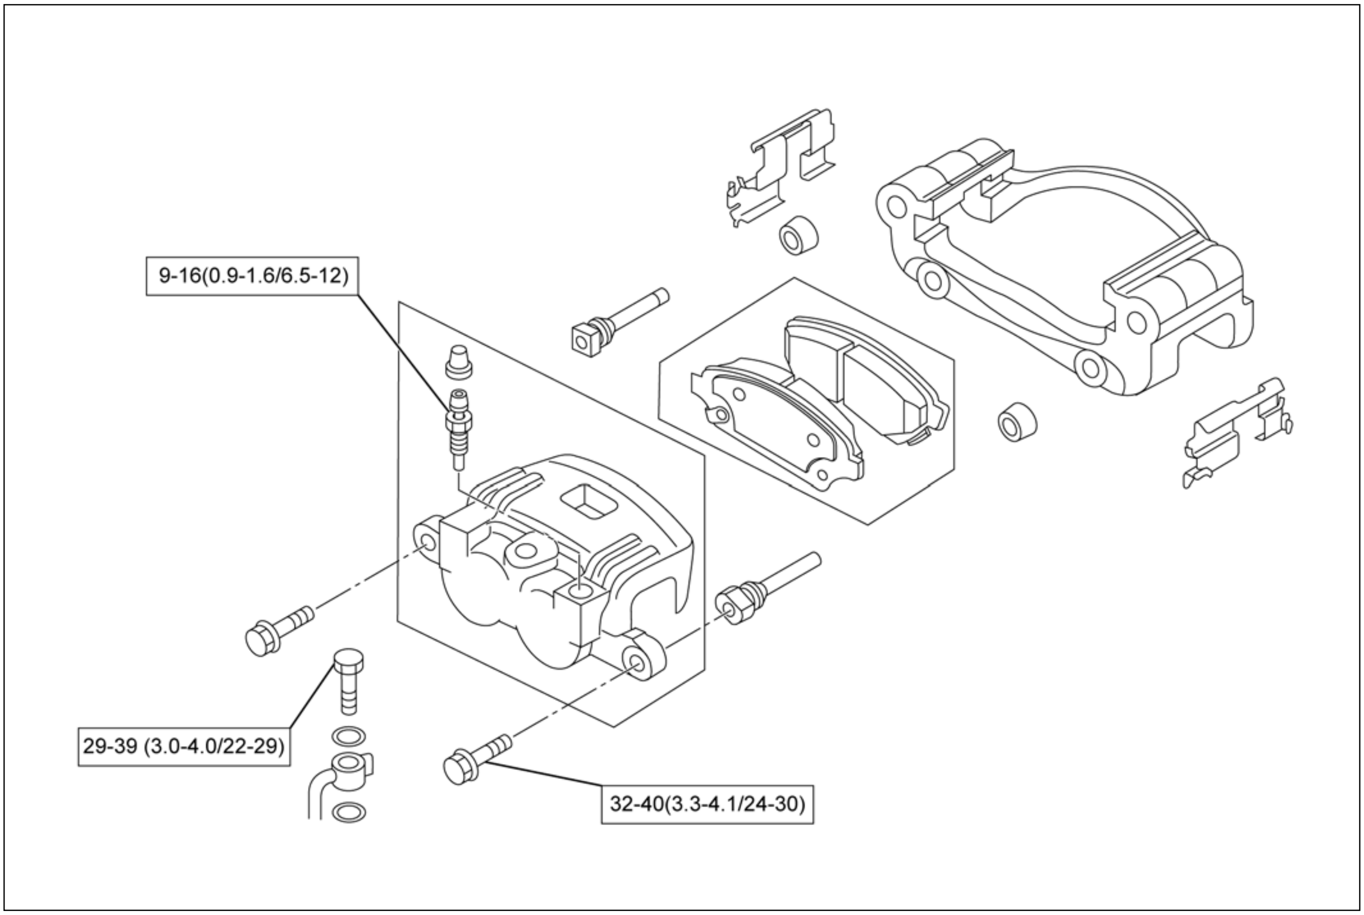
FRONT WHEEL BRAKE

N·m (kgf·m/lb·ft)



RTW55CMF000401

refrigerant container.

1) Make sure the evacuation process is correctly completed.
2) Connect the center-hose of the manifold gauge to the refrigerant container.
   - Turn the charge valve handle counterclockwise to purge to the charging line and purge any air exiting in the center-hose of the manifold gauge.
3) Open the low-pressure hand valve and charge the refrigerant about 200 g (0.44 lbs.).
   - Make sure the high-pressure hand valve is closed.
   - Avoid charging the refrigerant by turning the refrigerant container upside down.
4) Close the low-pressure hand valve of the manifold gauge.
   - Check to ensure that the degree of pressure does not change.
5) Check the refrigerant leaks by using a HFC-134a leak detector.
   - If a leak occurs, repair the leak connection, and start all over again from the first step of evacuation.
6) If no leaks are found, open the low-pressure hand valve of the manifold gauge. Then continue charging refrigerant to the system.
   - When charging the system becomes difficult:
     (1) Run the engine at Idling and close the all vehicle doors.
     (2) A/C switch is "ON".
     (3) Set the fan control knob (fan switch) to its highest position.
     (4) Set air source selector lever to “RECIRC”

WARNING
BE ABSOLUTELY SURE NOT TO OPEN THE HIGH-PRESSURE HAND VALVE. SHOULD THE HIGH-PRESSURE HAND VALVE BE OPENED, THE HIGH-PRESSURE REFRIGERANT GAS WOULD FLOW BACKWARD, AND THIS MAY CAUSE THE REFRIGERANT CONTAINER TO BURST.

7) When the refrigerant container is emptied, use the following procedure to replace it with a new refrigerant container.
   (1) Close the low-pressure hand valve.
   (2) Raise the needle upward and remove the charge valve.
   (3) Reinstall the charge valve to the new refrigerant container.
   (4) Purge any air existing in the center hose of the manifold gauge.

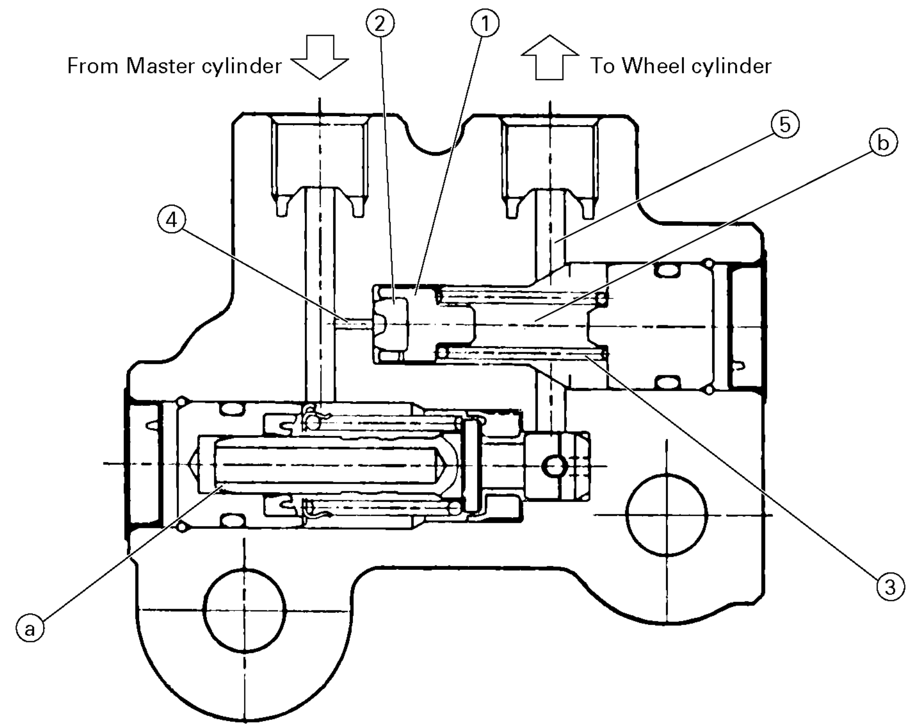
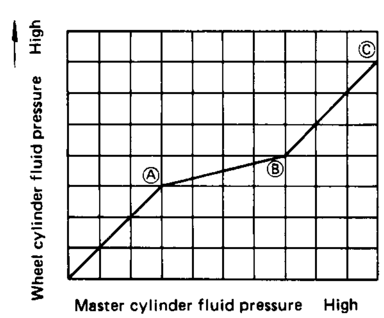
SERVICING

BLEND PROPORTIONING VALVE (IF SO EQUIPPED)





Structure and Operation

- **Structure**

  Side ⓐ shows P-valve; side ⓑ shows bypass valve.
  Bypass valve seals the routes ④ and ⑤ using the seal ② at the piston ① end.
  In addition, spring ③ presses against the piston ①, and in order to seal out the route ④ and route ⑤ sufficiently, spring ③ presses seal ② against cylinder end surface.
  The left figure is a characteristic curve diagram.

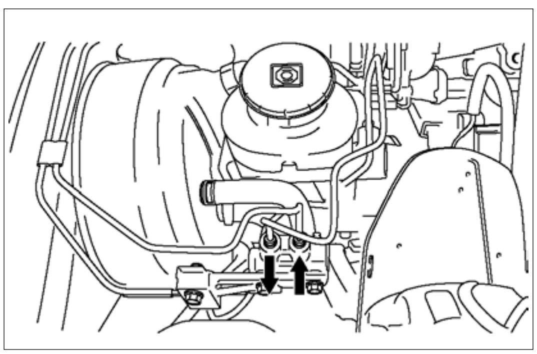
- **Operation**

  The operation of the P-valve by the master cylinder pressure is unchanged up to the brake points Ⓐ and Ⓑ.

  If master cylinder fluid pressure penetrates into the second break point Ⓑ, the fluid pressure pressing against the seal ②, (which isolated route ④ and route ⑤), passing the route ④ of the master cylinder side, overcomes the operating force of the spring ③ + fluid pressure affecting the seal ② of the wheel cylinder, and presses the piston ① to the right side, resulting in the opening of the routes ④ and ⑤, and canceling of the P-valve operation.

  Then, because the master cylinder fluid pressure and the wheel cylinder fluid pressure, up to the point Ⓒ, operate on the identical surface of the seal ②, both have identical ascending ratios.

  However, because of the operation of spring ③ in the wheel cylinder side, wheel cylinder fluid pressure operates to preserve the balance against the master cylinder fluid pressure on the lower level with the difference in pressure resulting from this spring.



RTW75CSH001601

Valve Maintenance

In the case of a fluid leak or other abnormality, the faulty valve should be replaced.
The valve is set up at the engine room.

Note:

The blend proportioning valve is not repairable and must be replaced as a complete assembly.

8) Charge the system to the specified amount and then close the low-pressure hand valve.

Refrigerant Amount g(lbs)

4JA1-T, 4JH1-TC, C24SE	720 (1.59)
4JJ1-TC (Standard Output) 4JJ1-TC (High Output) 4JK1-TC (High Output)	650 (1.43)

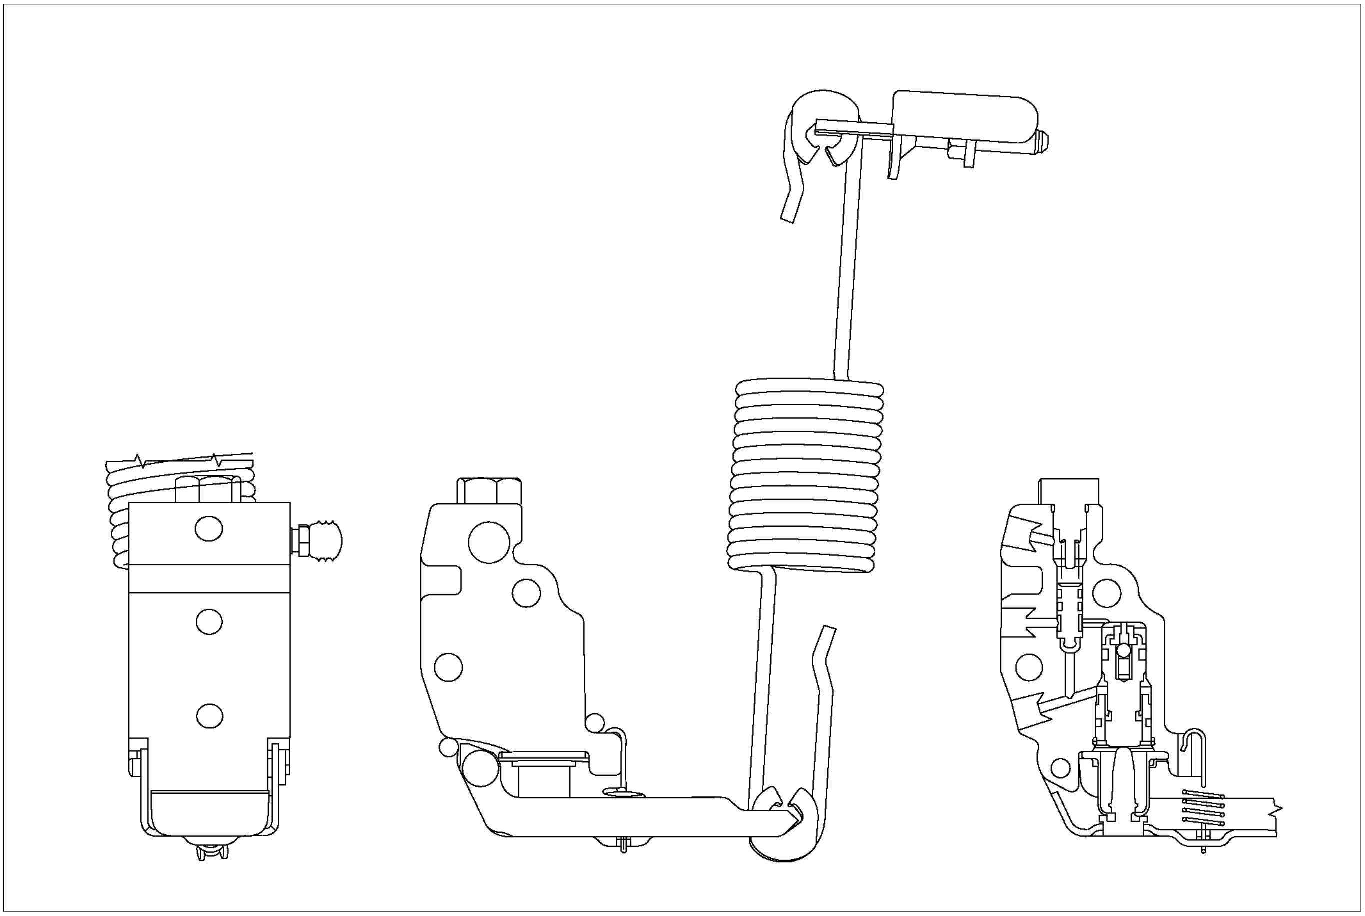
9) Check for refrigerant leaks by using a HFC-134a leak detector.
   - A fully charged system is indicated by the sight glass on the receiver/drier being free of any bubbles (Refer to "Reading Sight Glass").
   - Check the high and low pressure value of the manifold gauge. (Refer to “CHECKING REFRIGERANT SYSTEM WITH MAINFOLD GAUGE” in SERVICE INFORMATION.)

Immediately after charging refrigerant, both high and low pressures are slightly high and to the left of the gauge, but they settle down to the guide pressure valves as shown below:

- Ambient temperature; 30~35°C (86~95°F)
- Guide pressure
  High-pressure side;
  Approx. 1373~1670 kPa (14~17 kg/cm^2 / 199~242 psi)
  Low-pressure side;
  Approx. 127~245 kPa (1.3~2.5 kg/cm^2 / 18~36 psi)

10) Close the low pressure hand valve and charge valve of the refrigerant container.
11) Stop the air conditioning and the engine.
12) Disconnect the high and low pressure hoses from the manifold gauge fittings.

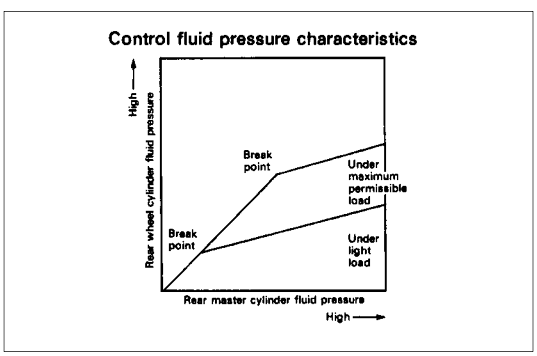
LOAD SENSING PROPORTIONING VALVE (LSPV)



RTW35CMF000101

Structure and Operation

The following is an explanation of the structure and operation of the spring type load sensing device.
This device controls the fluid pressure to the rear brakes in accordance with changes in rear axle load (vertical displacements of the rear axle springs).

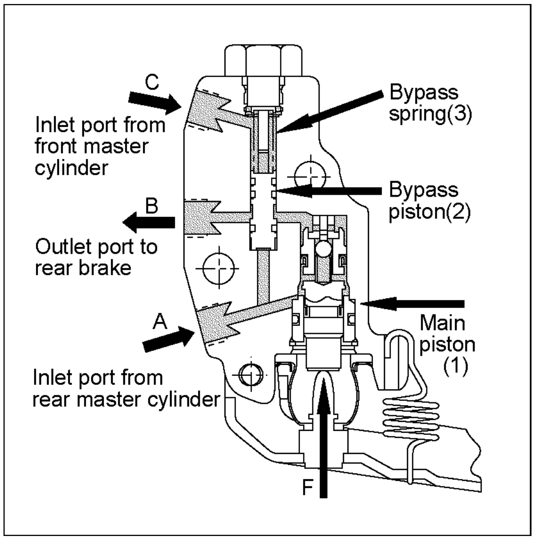


- **Structure**

  This device consists of a load sensing spring and a valve.

  The valve is mounted through a bracket to the frame.

  One end of the load sensing spring is fixed to the valve at the frame and the other end to the rear axle housing through a bracket.



RTW35CSH001001

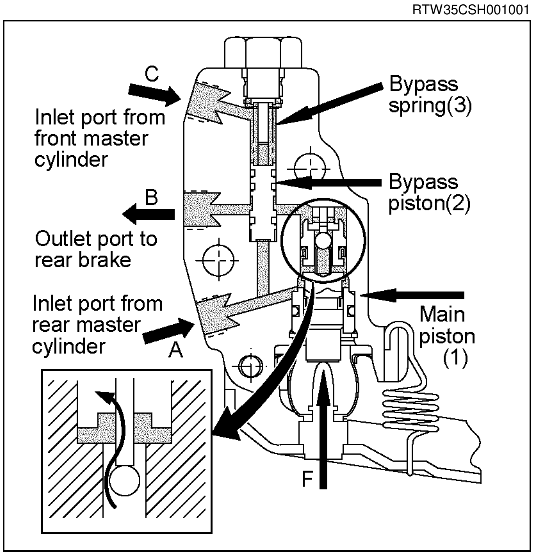
- **Operation**

1) Outline

When the LSPV (Load Sensing Proportioning Valve) detects a change in load weight, the load sensing spring stretches.

Its reaction force is transmitted to the bottom of the load sensing valve to secure an optimum rear wheel cylinder fluid pressure break point in proportion to the actual load weight.

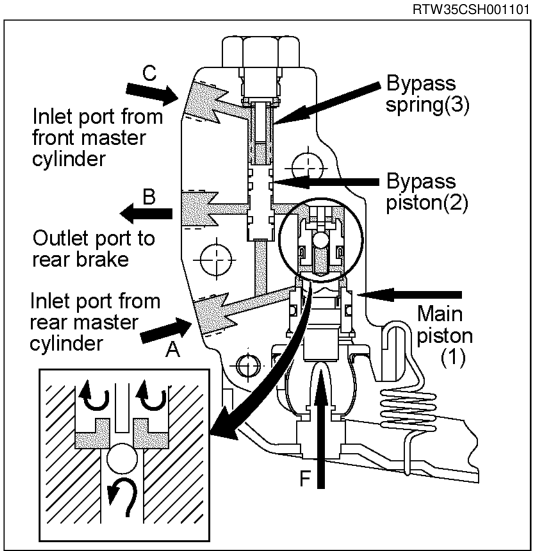
Besides, if the front brake system should fail, the device is designed to prevent the master cylinder fluid pressure from decreasing and to apply it directly to the rear wheel cylinder to obtain a sufficient braking performance.



RTW35CSH001101

2) Bellow cutting point.

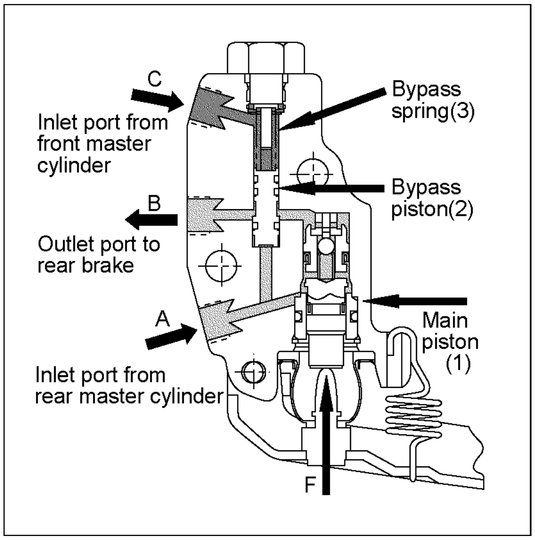
The Force (F) keeps the main piston (1) the rest position. The inlet pressure (A) and outlet pressure (B) are the same as well as the inlet pressure (C) from front master cylinder. The bypass piston (2) is kept on rest position by equilibrium of the pressures (A) and (C) and the bypass spring load (3).



RTW35CSH001201

3) Cutting point.

The cutting point is given by relation between force (F), that is the load applied by suspension of the vehicle and the main piston area (1). The cutting point is achieved when the force generated by hydraulic pressure is upper than the force (F) given by the load suspension. The main piston (1) moves from the rest position closing the valve. In this moment the inlet pressure (A) is upper than the outlet pressure (B). The bypass piston (2) continues on the rest position by equilibrium of (A) and (C) pressure.



RTW35CSH001301

4) Failure on front master cylinder.

In case of failure on front master cylinder the pressure on the inlet port (C) drop to zero. The pressure from inlet port (A) acts on the bypass piston (2) and move it by comprising of bypass spring (3). It makes possible the communication between the inlet port (A) to outlet port (B) through the bypass system. The outlet pressure (B) reaches the inlet pressure (A) and the LSPV is bypassed.

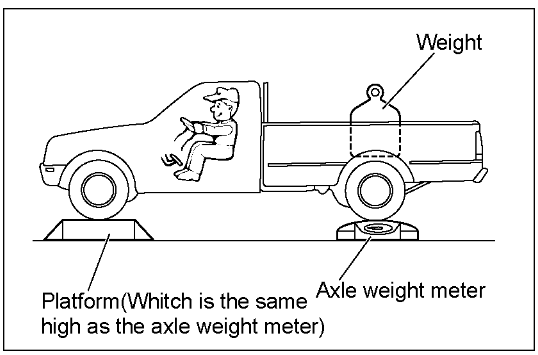
Valve Maintenance

In the case to fluid lead or other a abnormalities, faulty valve should be replaced.

Note:

The load sensing proportioning valve is not repairable and must be replaced as a completed assembly.

LOAD SENSING PROPORTIONING VALVE (LSPV) ADJUSTMENT



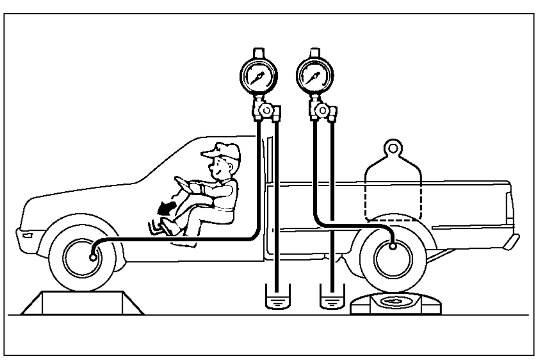
RTW35CSH000301

1. Fluid Pressure Measurement
   1) Rear axle weight adjustment

      With an axle weight meter, adjust the rear axle weight with a person sitting in the driver's seat and a weight loaded in the rear body.

N (kg/lb)

MODEL	Adjustment value
4 × 2	7845 (800/1764)
4 × 2 HIGH RIDE 4 × 4	9316 (950/2095)

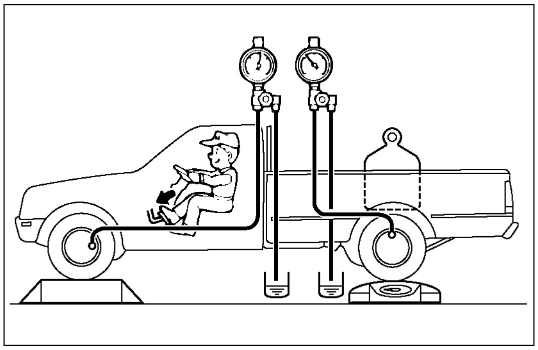


RTW35CSH000101

   2) Installation of a fluid pressure gauge

      Remove the air bleeder of the left hand wheel front and rear brakes. Bleed air out of the fluid pressure gauge with the measurement hose of the fluid pressure gauge installed.

Pressure Tester: Brake oil (Fluid pressure gauge)
5-8840-2190-0

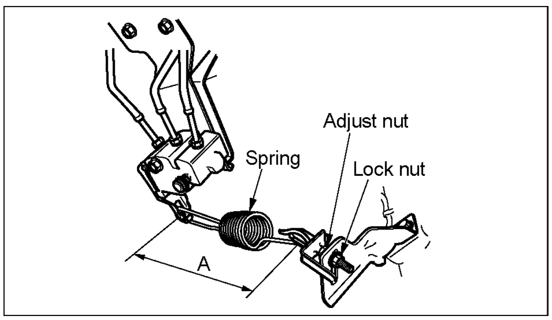


RTW35CSH000201

3) Rear wheel cylinder fluid pressure measurement

Step on the brake pedal until the fluid pressure of the front wheel cylinder gets to 9.8Mpa (100kg/cm^2), and check the rear wheel cylinder fluid pressure. (Read the value of the front wheel cylinder fluid pressure 2 seconds after the measurement. When measuring the LSPV fluid pressure, keep the brake pedal pressed down without stepping it down twice or releasing it.)

Rear Wheel Cylinder Fluid Pressure	MPa (kg/cm^2)
2WD	6.77±0.83 (69.0±8.5)
2WD (With High Ride Suspension), 4WD	6.77±0.83 (69.0±8.5)



RTW35CSH000401

2. Oil Pressure Adjustment

1) LSPV spring length adjustment

Loosen the adjust nut of the LSPV spring joint, and adjust the length of the LSPV spring.

When the oil pressure is insufficient, turn the adjust nut clockwise to extend the span “A”. When the oil pressure is too high, turn the adjust nut counterclockwise to reduce the span “A”.

2) After adjustment, tighten the lock nut securely.

Lock Nut Torque	N·m (kgf·m/lb·ft)
11-20 (1.1-2.0/8-14)	

Filling Master Cylinder Reservoir

CAUTION:
Use only specified brake fluid. Do not use any fluid which contains a petroleum base. Do not use a container which has been used for petroleum based fluids or a container which is wet with water. Petroleum based fluid will cause swelling and distortion of rubber parts in the hydraulic brake system. Water mixed with brake fluid lowers the fluid boiling point. Keep all fluid containers capped to prevent contamination.
Always fill the master cylinder reservoir when the engine is cold.
Never allow the brake fluid to come in contact with the painted surfaces.
The master cylinder reservoir must be kept properly filled to ensure adequate reserve and to prevent air and moisture from entering the hydraulic system. However, because of expansion due to heat absorbed from the brakes and the engine, the reservoir must not be overfilled. Thoroughly clean reservoir cap before removal to avoid getting dirt into reservoir. Add fluid as required to bring level to the "MAX" mark on the reservoir tank. Use "DOT 3" Hydraulic Brake Fluid.

Leakage of Brake Fluid

With engine idling, set shift lever in the neutral position and continue to depress brake pedal at a constant pedal application force.
Should the pedal stroke become deeper gradually, leakage from the hydraulic pressure system is possible.
Make sure by visual check that there is no leak.

BLEEDING OF THE BRAKE HYDRAULIC CIRCUIT

If air enters the bake lines, it will cause poor brake action.
Therefore, bleeding should be performed if the brakes have been used with the level of brake fluid in the reservoir excessively low or if brake pipes have been disconnected in the course of brake servicing.
The bleeding operation calls for co-operative action of 2 persons.

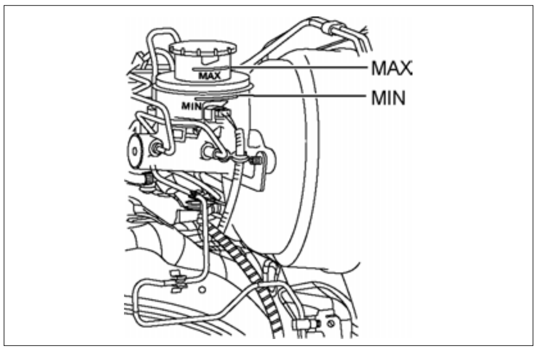
- Set the parking brake firmly while bleeding.
- Perform bleeding operation with ENGINE RUNNING, to prevent damage to push rod seal.
  Make sure exhaust is suitably ventilated.
- Bleed the hydraulic system with the fluid reservoir filled to the specified level.
- Bleed the system starting with the rear wheel cylinder farthest from the master cylinder.

A bleeding operation is necessary to remove air from the hydraulic brake system whenever air is introduced into the hydraulic system. It may be necessary to bleed the hydraulic system at all four brakes if air has been introduced through a low fluid level or by disconnecting brake pipes at the master cylinder. If a brake pipe is disconnected at one wheel, only that wheel cylinder/caliper needs to be bled. If the pipes are disconnected at any fitting located between the master cylinder and brakes, then the brake system served by the disconnected pipe must be bled.

1. Set the parking brake completely, then start the engine.

NOTE:
The vacuum booster will be damaged if the bleeding operation is performed with the engine off.

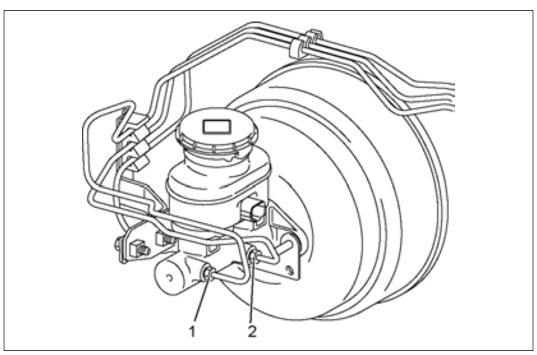
2. Remove the master cylinder reservoir cap.
3. Fill the master cylinder reservoir with brake fluid. Keep the reservoir at least half full during the air bleeding operation.
4. Always use new brake fluid for replenishment.
5. In replenishing brake fluid, take care that air bubbles do not enter the brake fluid.



RTW75CSH001701

When the master cylinder is replaced or overhauled, first bleed the air from the master cylinder, then from each wheel cylinder and caliper following the procedures described below.

Bleeding the Master Cylinder



RTW75CSH001801

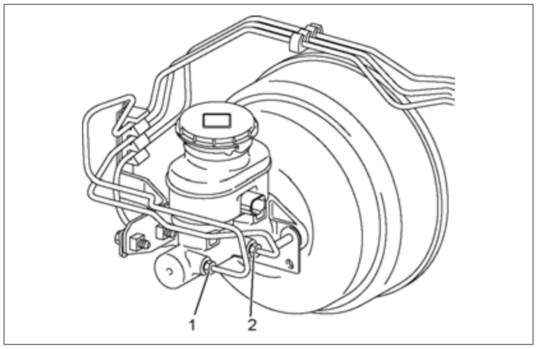
6. Disconnect the rear wheel brake pipe (1) from the master cylinder.
   Check the fluid level and replenish as necessary. If replenished, leave the system for at least one minute.
7. Depress the brake pedal slowly once and hold it depressed.
8. Completely seal the delivery port of the master cylinder with your finger, where the pipe was disconnected, then release the brake pedal slowly.
9. Release your finger from the delivery port when the brake pedal returns completely.
10. Repeat steps 7 through 9 until the brake fluid comes out of the delivery port during step 7.

NOTE: Do not allow the fluid level in the reservoir to go below the half-way mark.

11. Reconnect the brake pipe (1) to the master cylinder and tighten the pipe.
12. Depress the brake pedal slowly once and hold it depressed.
13. Loosen the rear wheel brake pipe (1) at the master cylinder.
14. Retighten the brake pipe, then release the brake pedal slowly.

15.Repeat steps 12 through 14 until no air comes out of the port when the brake pipe is loosened

NOTE: Be very careful not to allow the brake fluid to come in contact with painted surfaces.



RTW75CSH001801

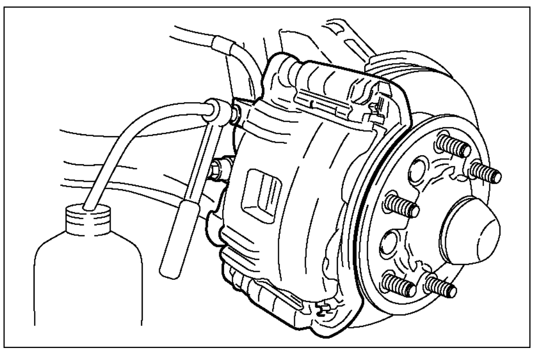
16.Bleed the air from the front wheel brake pipe connection (2) by repeating steps 6 through 15.

Bleeding the Caliper

17.Bleed the air from each wheel in the order listed below:

- Right rear wheel cylinder
- Left rear wheel cylinder
- Left front caliper
- Right front caliper

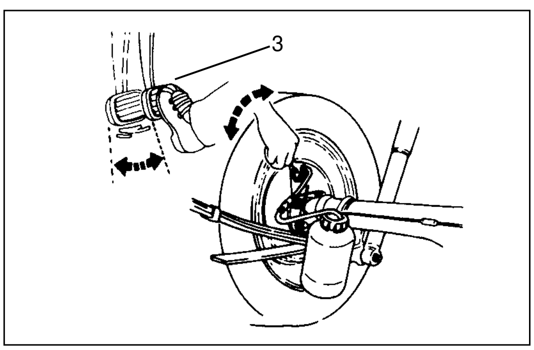
Conduct air bleeding from the wheels in the above order. If no brake fluid comes out, it suggests that air is mixed in the master cylinder. In this case, bleed air from the master cylinder in accordance with steps 6 through 16, and then bleed air from the caliper or wheel cylinder.



RTW35CSH000501

18.Place the proper size box end wrench over the bleeder screw.

19.Cover the bleeder screw with a transparent tube, and submerge the free end of the transparent tube in a transparent container containing brake fluid.



5042

20.Pump the brake pedal (3) slowly three times (once/sec), then hold it depressed.

21.Loosen the bleeder screw until fluid flows through the tube.

22.Retighten the bleeder screw.

23.Release the brake pedal slowly.

24.Repeat steps 20 through 23 until the air is completely removed.

It may be necessary to repeat the bleeding procedure 10 or more times for front wheels and 15 or more times for rear wheels.

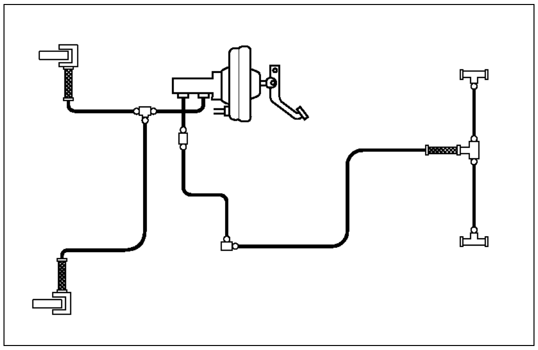
25.Go to the next wheel in the sequence after each wheel is bled.

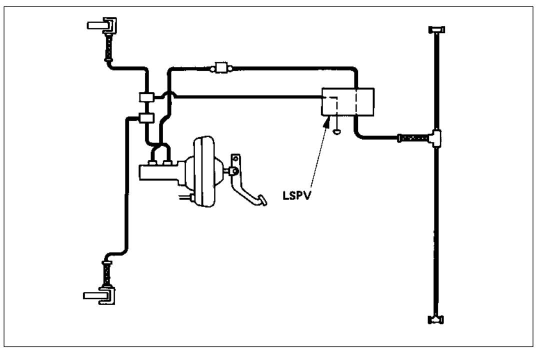
Be sure to monitor reservoir fluid level.

26.Depress the brake pedal to check if you feel “sponginess” after the air has been removed from all wheel cylinders and calipers.

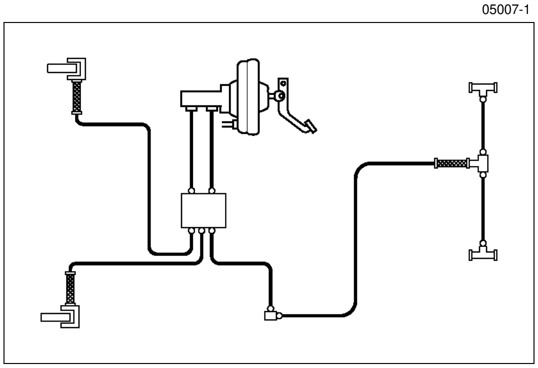
If the pedal feels “spongy” the entire bleeding procedure must be repeated.

27. After the bleeding operation is completed on each individual wheel, check the level of the brake fluid in the reservoir and replenish up to the “MAX" level as necessary.
28. Attach the reservoir cap.
29. Stop the engine.





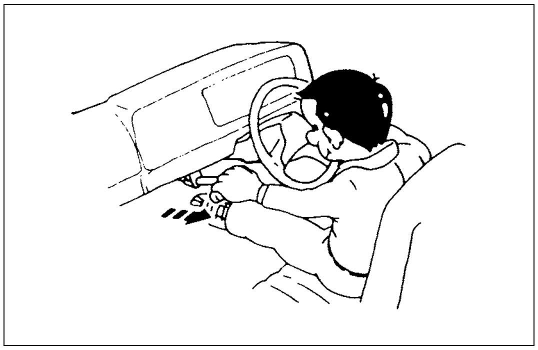
05007-1



BRAKE LINE (HOSES AND PIPES)

- Inspect all hoses and pipes for wear, bending, chafing, cracks, dents, or any other damage.
  Make necessary correction or replace parts if these abnormal conditions are found through inspection.
- All hoses, pipes and joints can be damaged easily.
  Do not allow the hose to become excessively twisted and bent when working with them, and pay special attention to all the brake lines not to damage them when repairing or replacing other parts (axle, suspension, etc).
- Inspection for leakage should be performed by depressing the brake pedal fully.
  If leakage is apparent at the circumference of joints, retighten or replace these parts.
  This procedure must be performed whenever brake lines are installed.
- After disconnecting the hoses and pipes, cap or tape the openings to prevent entry of foreign material.

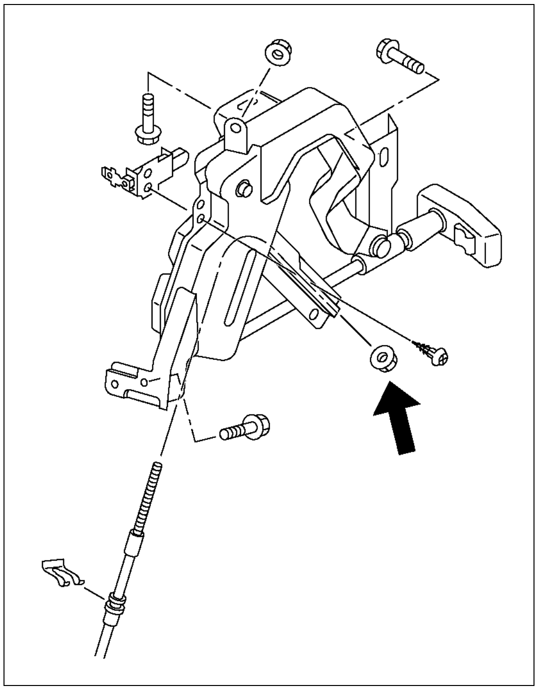
ADJUSTMENT PROCEDURE OF SERVICE AND PARKING BRAKE



Stick type

All brakes are self-adjusting.
Brakes are adjusted by repeated stepping on the brake pedal.
(After stepping on the pedal and releasing it, the rear brake auto-adjuster, produces a clicking sound.
The same operation should be repeated until the sound disappears.)
Take the following steps after overhauling the rear brake assembly.

1. Move the parking brake lever to its fully released position.



311R300007

2. Parking cable must be loosened sufficiently.
   (Loosen the adjust nut and the lock nut.)
3. Repeat stepping on the brake pedal firmly and releasing it until the clicking sound can no longer be heard.
   If the difference between the brake drum inside diameter of the brake shoes is adjusted to be 0.5 mm, the number of times for depressing the brake pedal can be reduced.
4. Remove the drum.
   Measure the brake drum inside diameter and diameter of the brake shoes.

Shoe Clearance	mm (in)
0.25 - 0.40 (0.0098 - 0.0157)	

   If incorrect, check the brake auto-adjusting system.
5. Turn the adjuster nut so that the parking brake lever travels 10 notches when pulled up with a force 30 kg (66 lbs.).
6. Make sure there is no brake drag.

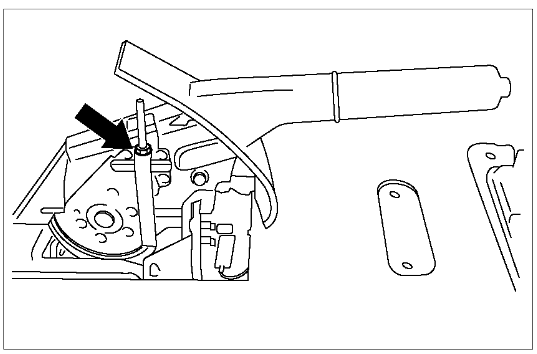
Floor mount type

All brakes are self-adjusting.
Brakes are adjusted by repeated stepping on the brake pedal. (After stepping on the pedal and releasing it, the rear auto-adjuster, in the rear brake, produces a clicking sound.
The same operation should be repeated until the sound disappears.)
Take the following steps after overhauling the rear brake assembly.

1. Move the parking brake lever to its fully released position.
2. Parking cable must be loosened sufficiently.
   (Loosen the adjust nut and the lock nut.)
3. Repeat stepping on the brake pedal firmly, and releasing it until the clicking sound can no longer be heard.
   If the difference between the brake drum inside diameter of the brake shoes is adjusted to be 0.5 mm (0.020 in), the number of times for depressing the brake pedal can be reduced.
4. Remove the drum.
   Measure the brake drum inside diameter and diameter of the brake shoes.

Shoe Clearance	mm (in)
0.25 - 0.40 (0.010 - 0.016)	

If incorrect, check the brake auto-adjusting system.



RUW55CSH000301

5. Turn the adjuster nut so that the parking brake lever travels 7 notches when pulled up with a force 294N (30 kg / 66 lb).
6. Make sure there is no brake dragging.

Reading Sight Glass

High and low pressure pipe temperature	The high pressure pipe is hot and the low pressure pipe is cold. There is a distinct difference in temperature between them.	The high pressure pipe is warm and the low pressure pipe is cool. There is no great difference in temperature between them.	There is little difference in temperature between the high pressure pipe and the low pressure pipe.	The high pressure pipe is hot and the low pressure pipe is slightly warm. There is a difference in temperature between them.
Sight glass condition	Almost transparent. A flow of bubbles can be seen, but they disappear when the throttle is opened. 	A flow of bubbles always can be seen. It appears sometimes transparent, and sometimes frothy. 	Something like fog faintly can be seen. 	Even at idle with the fan at "HI" (with the window fully open), the bubbles cannot be seen. Air conditioning cycle condition	OK	NG (Not enough refrigerant)	NG (Almost no refrigerant)	NG (Too much refrigerant)

The sight glass provides accurate diagnosis only under the following conditions.
If the vehicle can be tested under these conditions, check the sight glass appearance and compare to the chart.

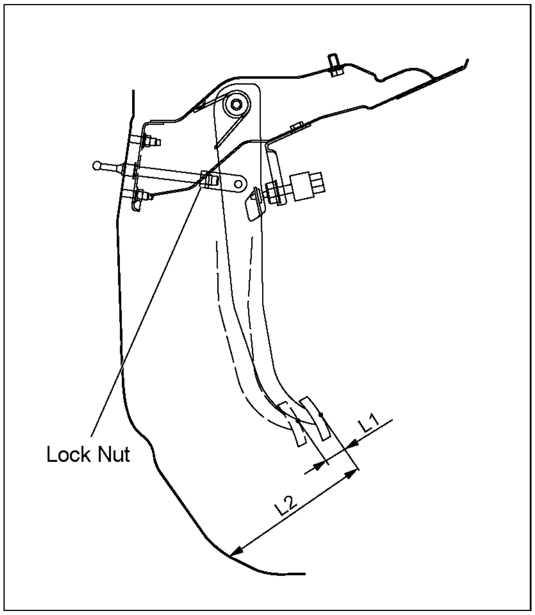
* Engine speed Idling
* A/C switch "ON"
* Blower fan operating at highest speed
* Air source selector lever at "RECIRC"
* Temperature control knob at coldest position
* Ambient temperature below 35°C (95°F) and humidity below 70% (See NOTE 1)
* High side pressure less than 1470 kPa (15 kg/cm^2 / 213 psi) (See NOTE 2)

NOTE 1
If the vehicle cannot be moved to a testing location that meets these specifications, then the sight glass cannot be used for diagnosis. You must discharge and recover the refrigerant, then recharge the system with the specified amount of refrigerant. Then continue checking the system performance.

NOTE 2
If the high side pressure is greater than stated, the sight glass cannot be used for diagnosis. You must discharge and recover the refrigerant, then recharge the system with the specified amount of refrigerant. Then continue checking system performance.

ADJUSTMENT PROCEDURE OF BRAKE PEDAL

The push rod serves as the brake pedal stopper when the pedal is fully released.
Brake pedal height adjustment should be performed as follows.



RTW35CSH000601

Brake Pedal - Height

Measure the brake pedal height after making sure the pedal is fully returned by the pedal return spring.

Note:
Pedal height (L2) must be measured after starting the engine and increasing the revolution several times by stepping on the accelerator pedal.

mm (in)

Pedal free play (L1)	6 - 10 (0.24 - 0.39)	
Height (L2)	M/T	174 - 186 (6.85 - 7.32)
	A/T	176 - 188 (6.93 - 7.40)

Note:
Pedal free play must be measured after turning off the engine and stepping on the brake pedal firmly five times or more.

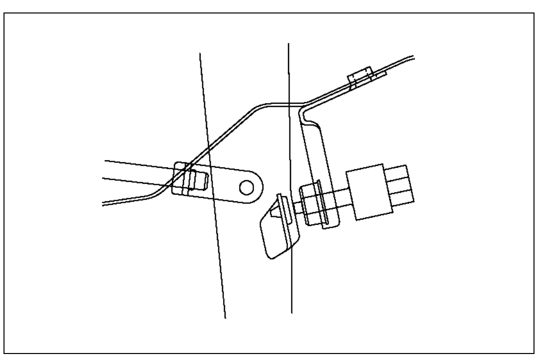
If the measured value deviates from the above range, adjust the brake pedal as follows:

a) Disconnect the stop lamp switch.
b) Loosen the lock nut on the push rod.
c) Adjust the brake pedal to the specified height by rotating the push rod in the appropriate direction.

Lock Nut Torque	N·m (kgf·m/lb·ft)
15 - 25 (1.5 – 2.5 / 11 - 18)	

d) Install the stop lamp switch.

Note:
Pedal height (L_2) must be 57 mm (2.24 in.) or more when applying about 50 kg (110.25 lbs.) of stepping force.



331R300005

How to connect the CLEVICE of the BOOSTER ROD with the PEDAL ARM and how to adjust the PEDAL SW.
After connecting the CLEVIS of the BOOSTER ROD to the PEDAL ARM, adjust the PEDAL SW mounted (PDA) to the PEDAL BRACKET using the procedure explained below.

1. Set the hole of the CLEVIS of the BOOSTER & M/CYL ROD with the hole in the PEDAL ARM.
2. Enter the PIN; PUSH ROD to the PEDAL to the holes from the left side of the PEDAL.
3. Enter and fix the PIN; SNAP PIN FIX to the DITCH of the PIN; PUSH ROD to PEDAL from right side of the PEDAL.
4. Release the LOCK by turning the SWITCH counter-clock-wise.

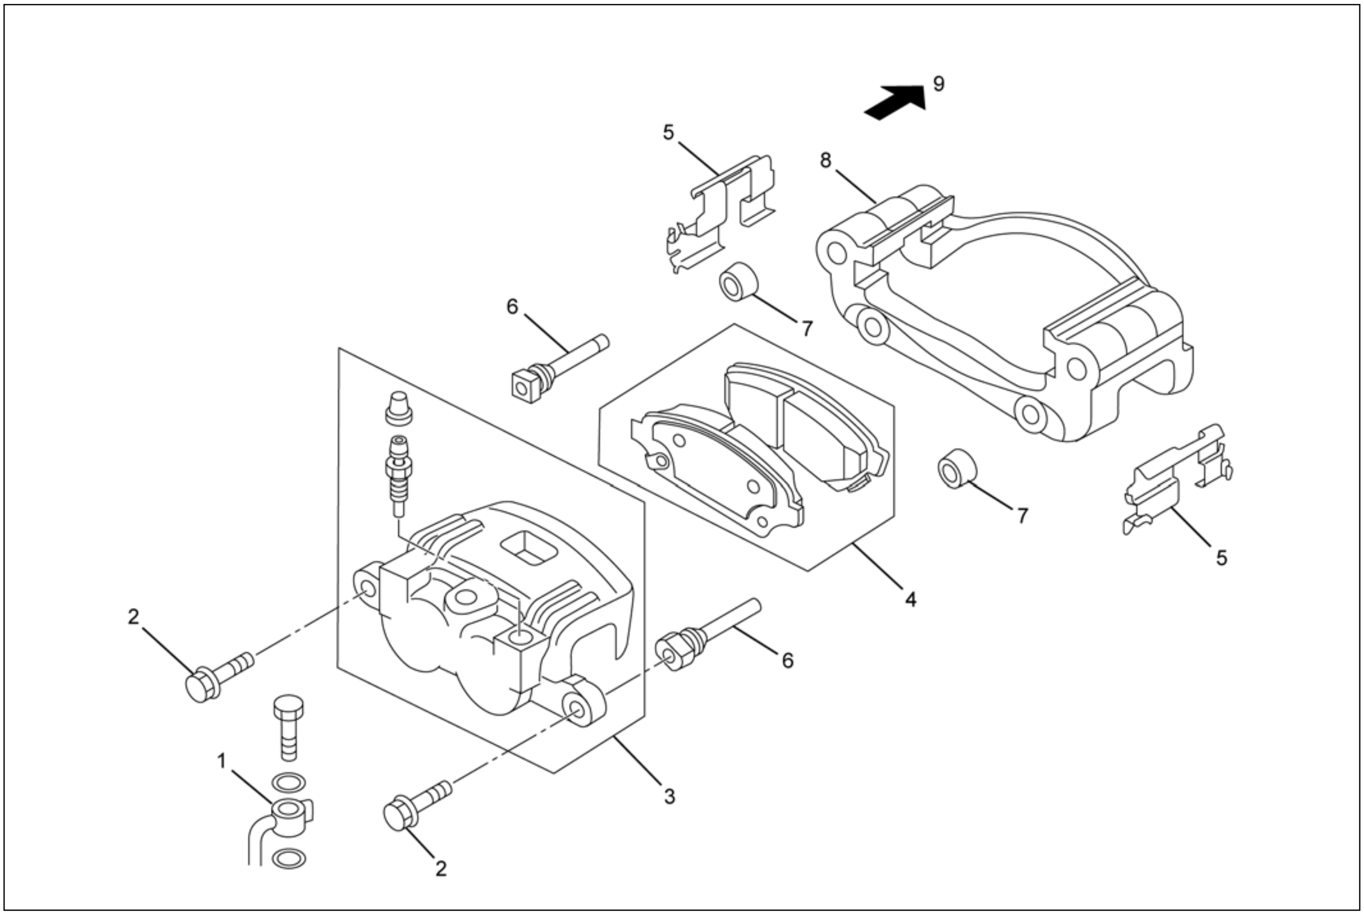
5. Pull the PEDAL ARM a little towards you so that the PEDAL ARM is not pushed in.
6. Holding the PEDAL ARM still with one hand, push in the whole SWITCH with the other hand until the PLUNGER of the SWITCH is pushed in and the SWITCH itself hits the RUBBER of the PEDAL ARM.

   In this condition, turn the SWITCH clock-wise until a “click” sound is heard and lock it.

   By doing this the SWITCH is adjusted at 0.7±0.5 mm (0.028 ± 0.020 in) clearance.

FRONT DISC BRAKE ASSEMBLY

REMOVAL AND INSTALLATION



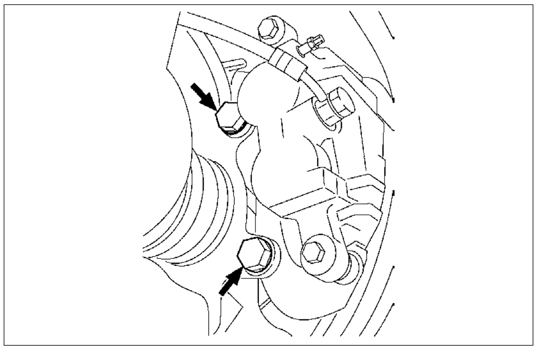
RTW55CMF000501

Removal Steps

▲ 1. Brake flexible hose
▲ 2. Lock bolt
3. Caliper assembly
▲ 4. Pad assembly with shim
5. Clip; pad
6. Slide pin
7. Boot
▲ 8. Support bracket
▲ 9. Front hub and disc assembly

Installation Steps

▲ 9. Front hub and disc assembly
▲ 8. Support bracket
▲ 7. Boot
▲ 6. Slide pin
▲ 5. Clip; pad
4. Pad assembly with shim
3. Caliper assembly
▲ 2. Lock bolt
▲ 1. Brake flexible hose

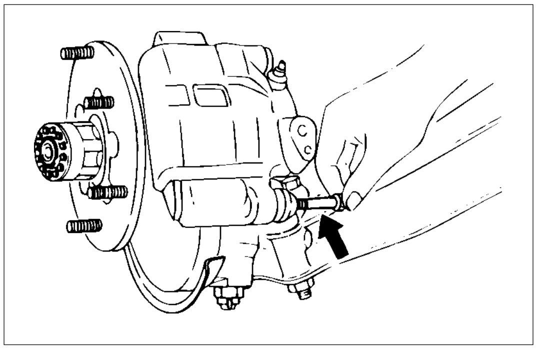


RUW55CSH000101

Important Operations - Removal

1. Brake Flexible hose

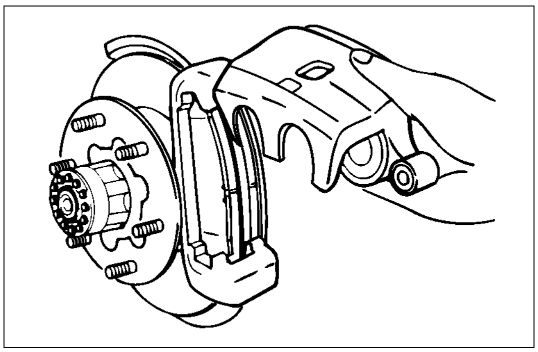
Remove the bolt and gasket and disconnect the brake flexible hose from the caliper.
After disconnecting the flexible hose, cap or tape the openings to prevent entry of foreign material.



RUW55CSH001501

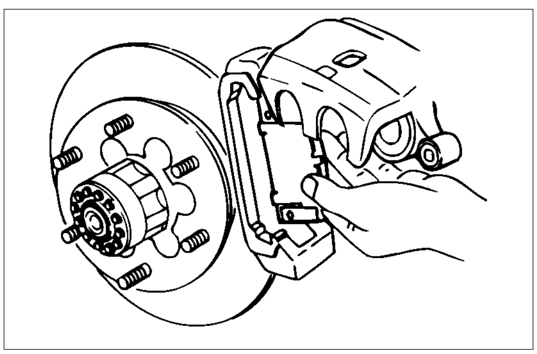
2. Lock Bolt

Remove the lock bolt from the caliper.



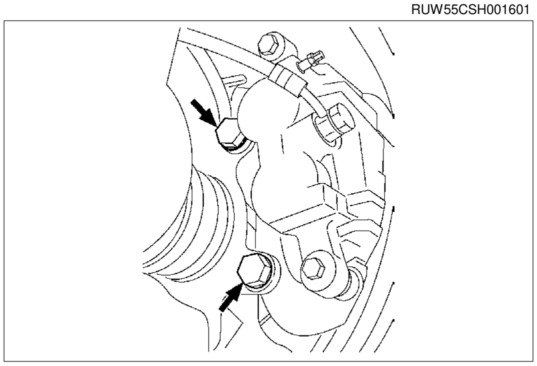
4. Pad Assembly with Shim

Rotate the caliper upward.



RUW55CSH001601

Mark the lining locations if they are to be reinstalled.



RUW55CSH000101

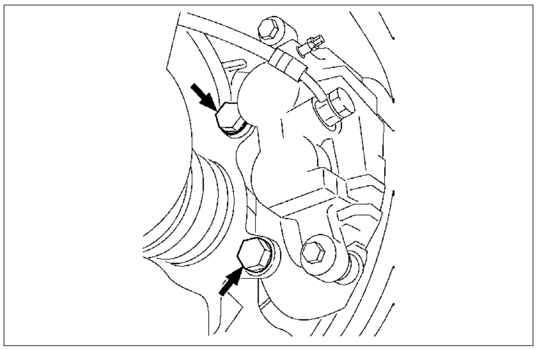
8. Support Bracket

Take care not to damage the brake flexible hose when removing the support bracket.

9. Front Hub and Disc Assembly
For the removal procedure, refer to Section 4C "FRONT WHEEL DRIVE".

Important Operations - Installation

9. Front Hub and Disc Assembly
For the installation procedure, refer to the front hub and disc reassembly procedure in Section 4C "FRONT WHEEL DRIVE".



RUW55CSH000101

8. Support Bracket

Torque	N·m (kgf·m/lb·ft)
206 - 245 (21.0 – 25.0 / 152 - 181)	

Set up the clip and pad before installation of the support bracket.

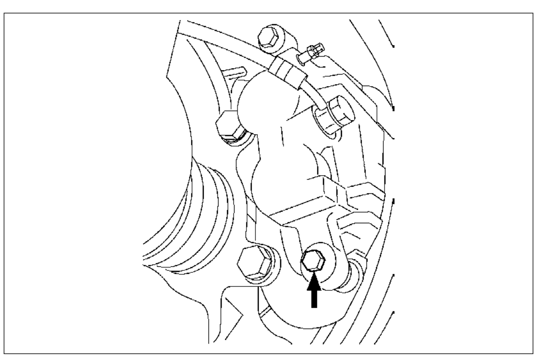
7. Boot

6. Slide Pin

- Be sure to install the boots to the slide pin and the support bracket securely.
- Apply rubber grease to the sliding surface of the slide pin before installation of the slide pin. (Don't use mineral type grease.)

1) Assemble a slide pin boot to a slide pin.
2) Use 0.6g to apply grease to the slide pin entirely as shown bellow.
3) Insert the slide pin to the housing and make sure the boot is also inserted to the housing tightly.

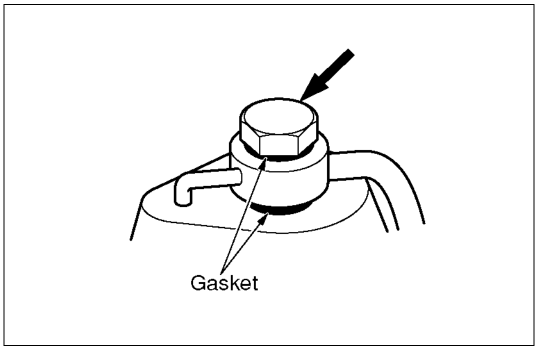
5. Clip; Pad
Install new parts if necessary.



RUW55CSH000201

2. Lock Bolt

Torque	N·m (kgf·m/lb·ft)
32 - 40 (3.3 – 4.1 / 24 - 30)	



1. Brake Flexible Hose

Attach the bolt and new gasket

Torque	N·m (kgf·m/lb·ft)
29 -39 (3.0 - 4.0 / 22 - 29)	

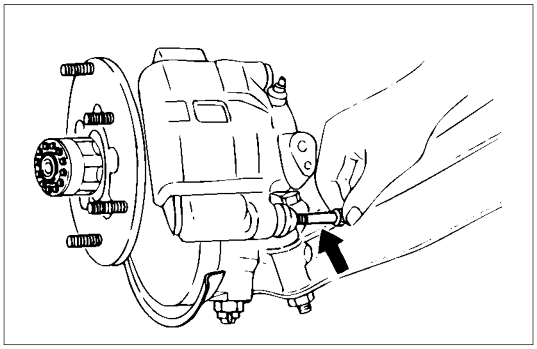
After installation, the bleeding and replenishing procedure must be performed.

Wipe the circumference of the hose clean.

Note:

- **Always use new gaskets.**
- **Be sure to put the hooked edge of the flexible hose end into the anti-rotation cavity.**

REMOVAL AND INSTALLATION OF DISC PAD



RUW55CSH001501

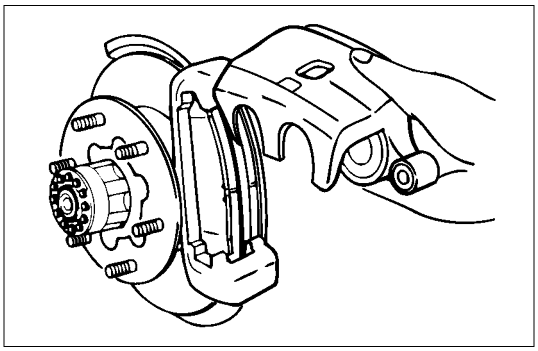
Removal Steps

1. Lock Bolt

Remove the lock bolt from the caliper.

Note:

Don't remove the brake hose from the caliper when replacing pads.

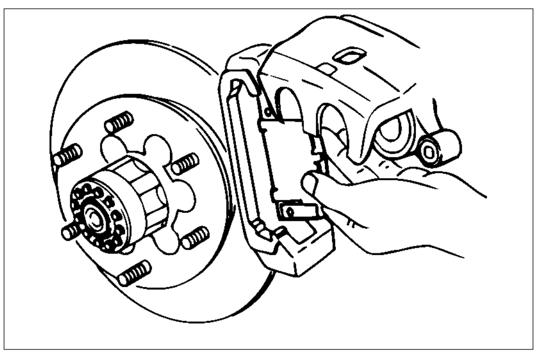


2. Rotate the Caliper Upward

Remove the caliper from the support bracket and move the caliper to the upper link or the frame.

Note:

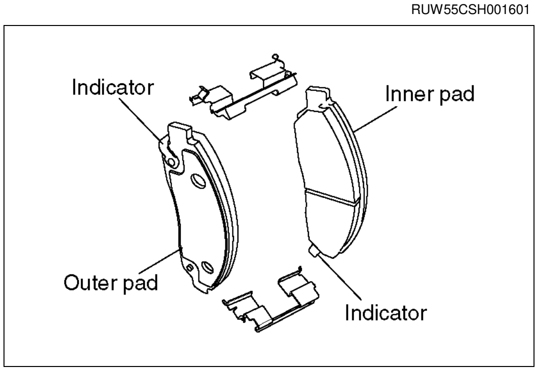
While caliper is removed from the support bracket, never step on the brake pedal or the piston will protrude rapidly.



RUW55CSH001601

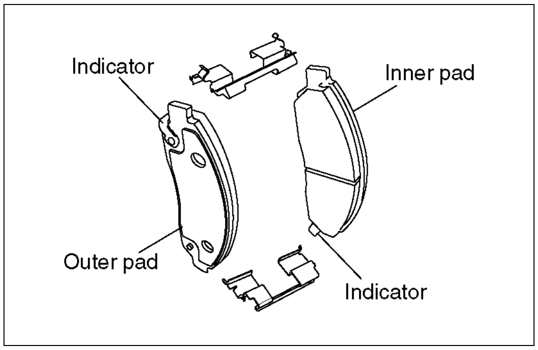
3. Pad Assembly with Shim

Remove the pad assembly with the shim.
Mark the pad locations if they are to be reinstalled.



4. Clip; Pad

Discard the used clip and install a new one.

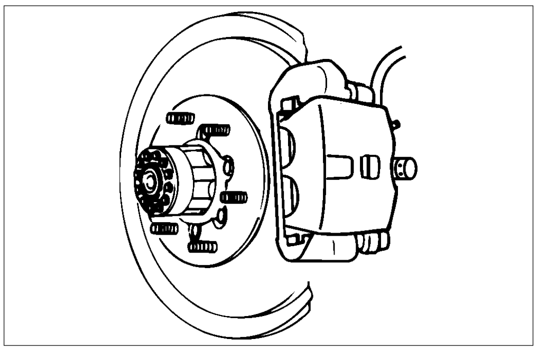


Installation Steps

1. Clip; Pad

2. Pad Assembly with Shim

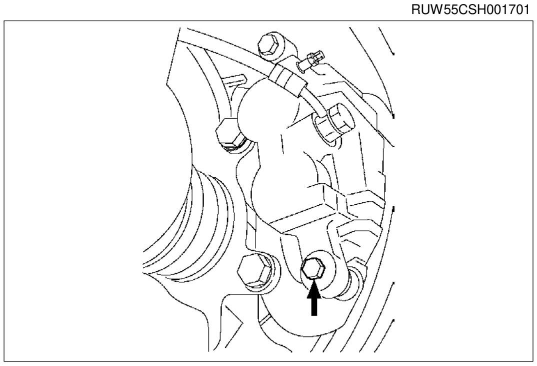
After attaching the pad assembly with the shim to the support bracket, position the wear indicator to the lower side of the inner pad and position the wear indicator to the upper side of the outer pad.



RUW55CSH001701

3. Caliper Assembly

Lower the caliper into its original position.
Do not damage the flexible hose by twisting or pulling it.



RUW55CSH000201

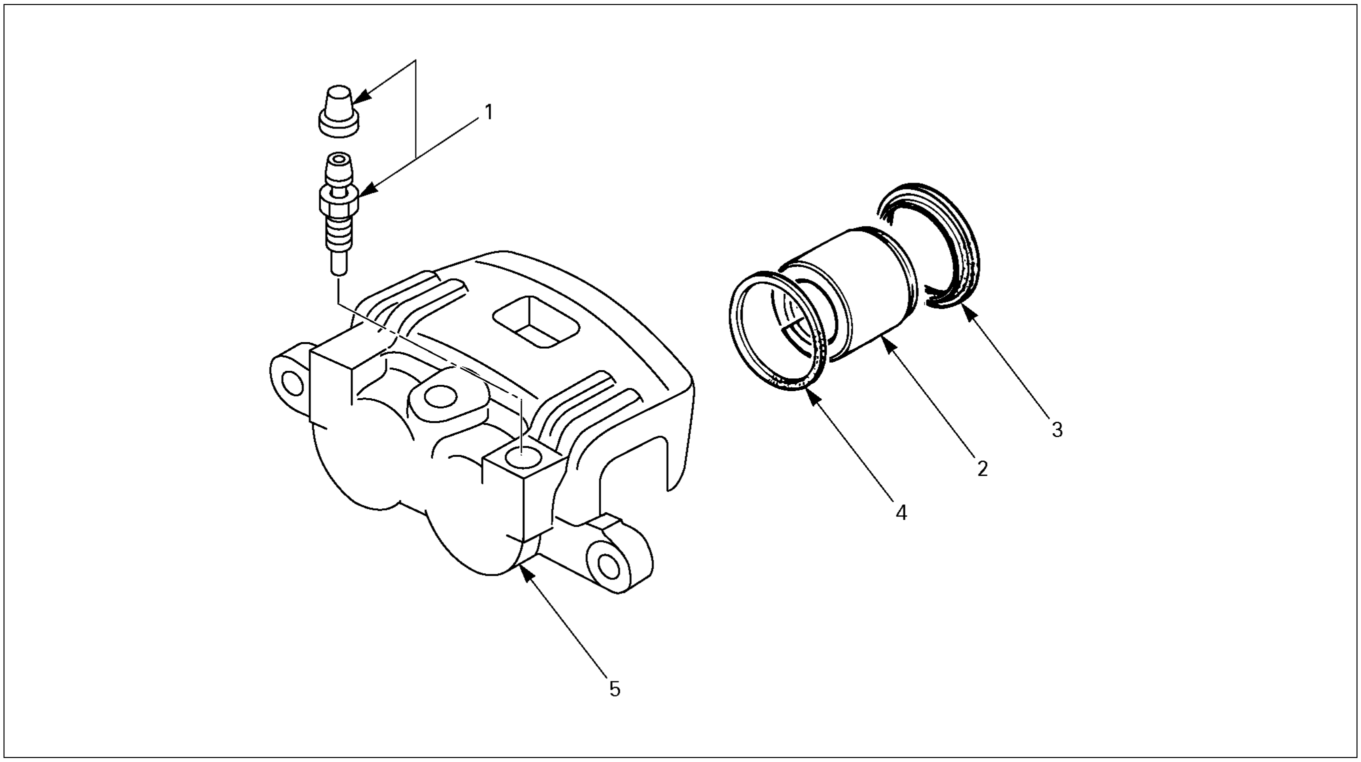
4. Lock Bolt

Attach the lock bolt to the caliper.

Torque	N·m (kgf·m/lb·ft)
32 - 40 (3.3 – 4.1 / 24 - 30)	

DISASSEMBLY

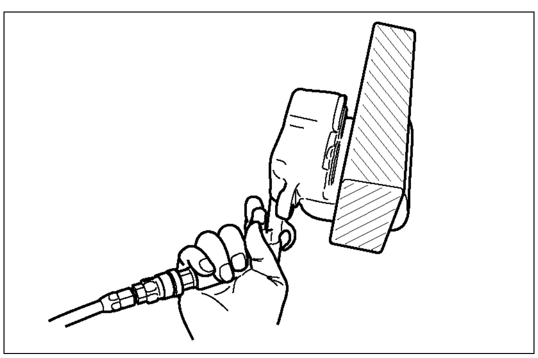
CALIPER ASSEMBLY



Disassembly Steps

1. Bleeder with cap
▲ 2. Piston
3. Dust seal; piston
4. Ring seal
5. Body; caliper

Important Operations



2. Piston (with Ring Seal)

Insert a block of wood into the caliper and force out the piston by blowing compressed air into the caliper at the flexible hose attachment.

This procedure must be done prior to removal of the dust seal.

CAUTION:

Do not place your fingers in front of the piston in an attempt to catch or protect it when applying compressed air.

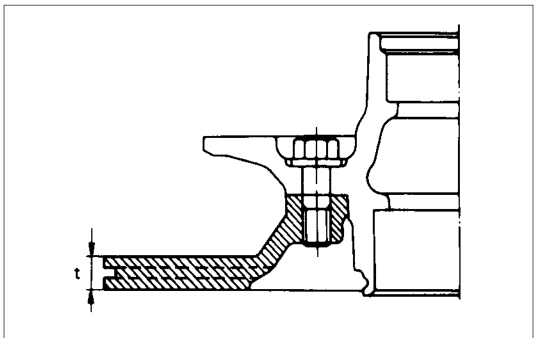
INSPECTION AND REPAIR

Make necessary correction or parts replacement if wear damage or any other abnormal conditions are found through inspection.

- Rotor
- Caliper body
- Cylinder bore
- Piston
- Support bracket
- Lock bolt
- Guide pin

Visual Check

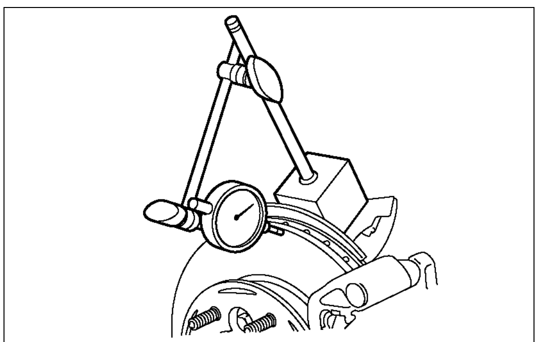
Inspect the following parts for wear, bending, distortion, cracking, corrosion, or other abnormal conditions.



Rotor

- Thickness (t) mm (in)

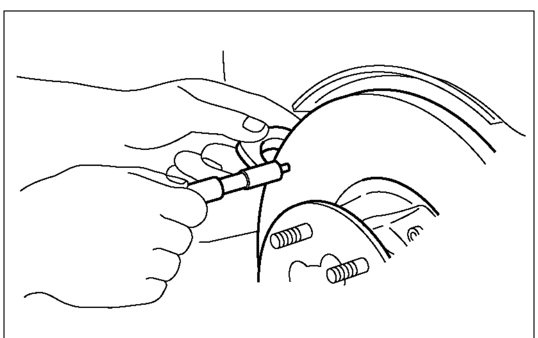
	Standard	Replacement thickness (Discard)
4×2 (Except HIGH RIDE)	26.0 (1.024)	24.6 (0.969)
4×2 (HIGH RIDE) 4×4	27.0 (1.063)	25.6 (1.008)



- Run out

Limit mm (in)
0.075 (0.0029)

Before inspection, adjust the wheel bearing correctly.
Using a dial gauge, measure the run-out at the 10 mm inside position from the rotor out-side edge of the disc pad contact surface.



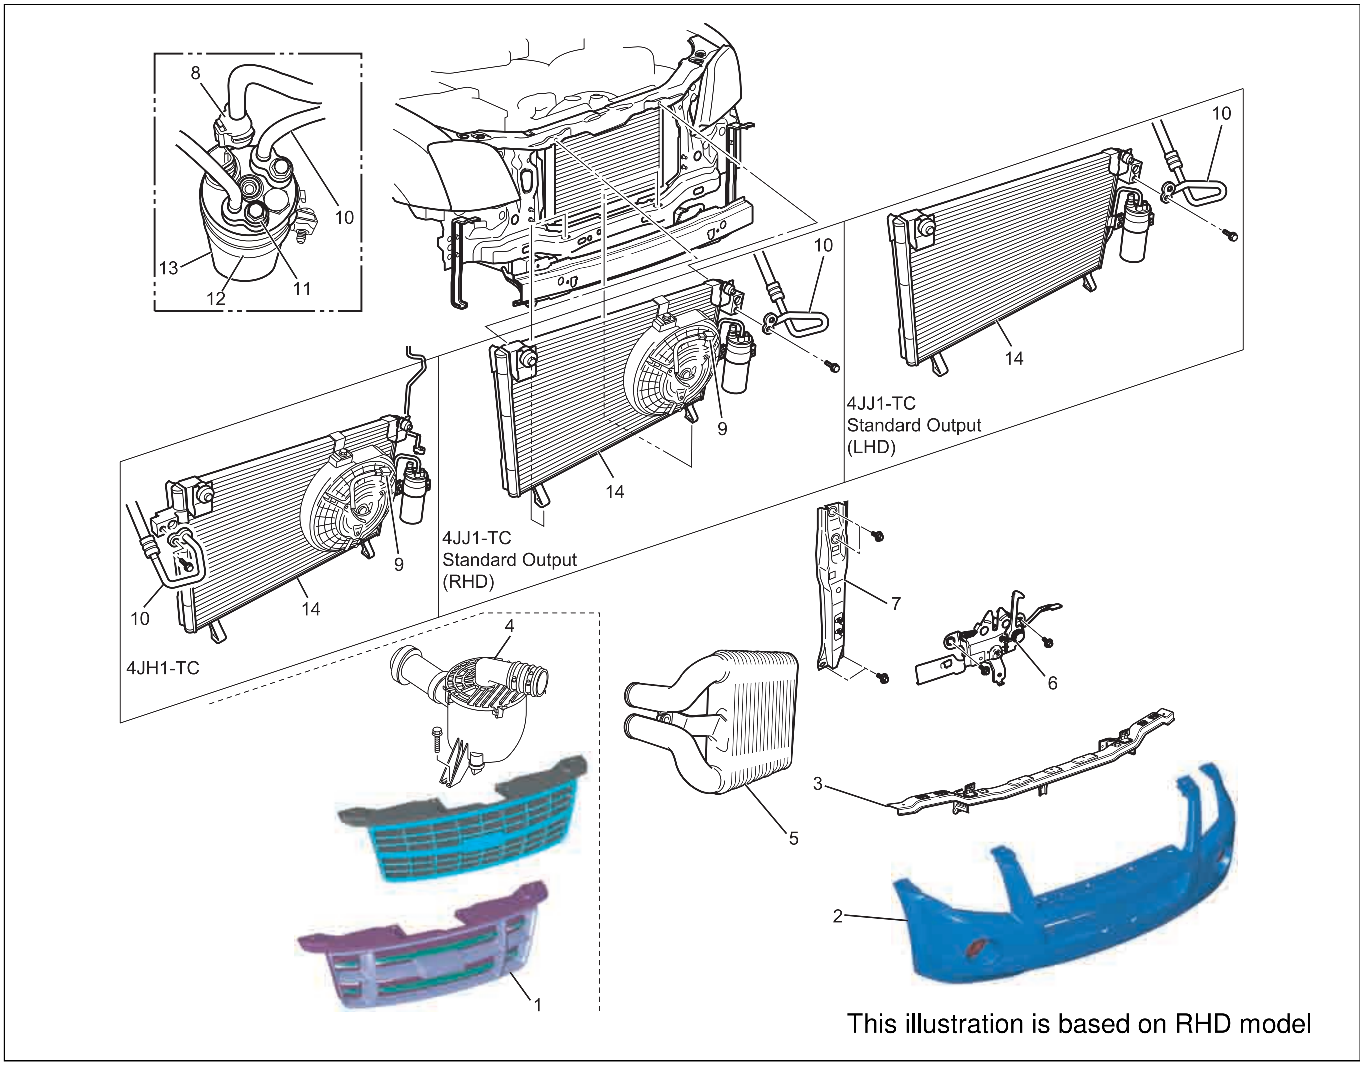
- Parallelism (Total circumferential thickness variation)

Limit mm (in)
0.023 (0.0009)

Contact surface must be within 0.023 mm at the 10 mm inside position from rotor-out side edge.
(Measurement; should be measured at more than 8 positions in circumferential direction.)

CONDENSER

REMOVAL AND INSTALLATION (4JH1-TC, 4JJ1-TC Standard Output)

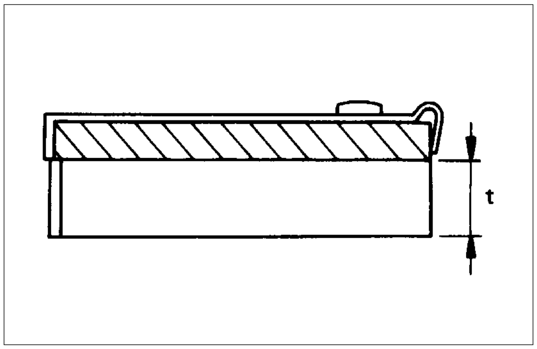


Removal Steps

1. Radiator grille
2. Front bumper fascia
    - Refer to SECTION 2A "FRONT BUMPER"
3. Front bumper impact support assembly
    - Refer to SECTION 2A "FRONT BUMPER"
4. Air cleaner assembly
5. Inter cooler
    - Refer to SECTION 6A "INTER COOLER"
6. Engine hood lock
7. Engine hood front end stay
8. Pressure switch connector
9. Condenser fan connector
10. Refrigerant line
11. Refrigerant line
12. Receiver/drier bracket
13. Receiver/drier
14. Condenser assembly

Installation Steps

14. Condenser assembly
13. Receiver/drier
12. Receiver/drier bracket
11. Refrigerant line
10. Refrigerant line
9. Condenser fan connector
8. Pressure switch connector
7. Engine hood front end stay
6. Engine hood lock
5. Inter cooler
    - Refer to SECTION 6A "INTER COOLER"
4. Air cleaner assembly
3. Front bumper impact support assembly
    - Refer to SECTION 2A "FRONT BUMPER"
2. Front bumper fascia
    - Refer to SECTION 2A "FRONT BUMPER"
1. Radiator grille



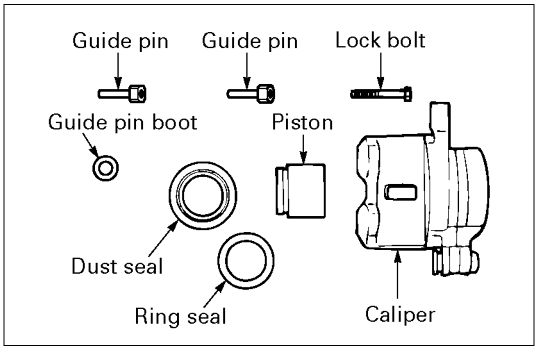
Thickness of Disc Pad

Thickness (t) mm (in)

Standard	Limit
10.0 (0.394)	1.8 (0.071)

Replace the front disc pad whenever the pad wear indicator makes a squeaking noise or when the pad is worn to within 1.8 mm of the shoe table.

All four brake pads should be replaced together.



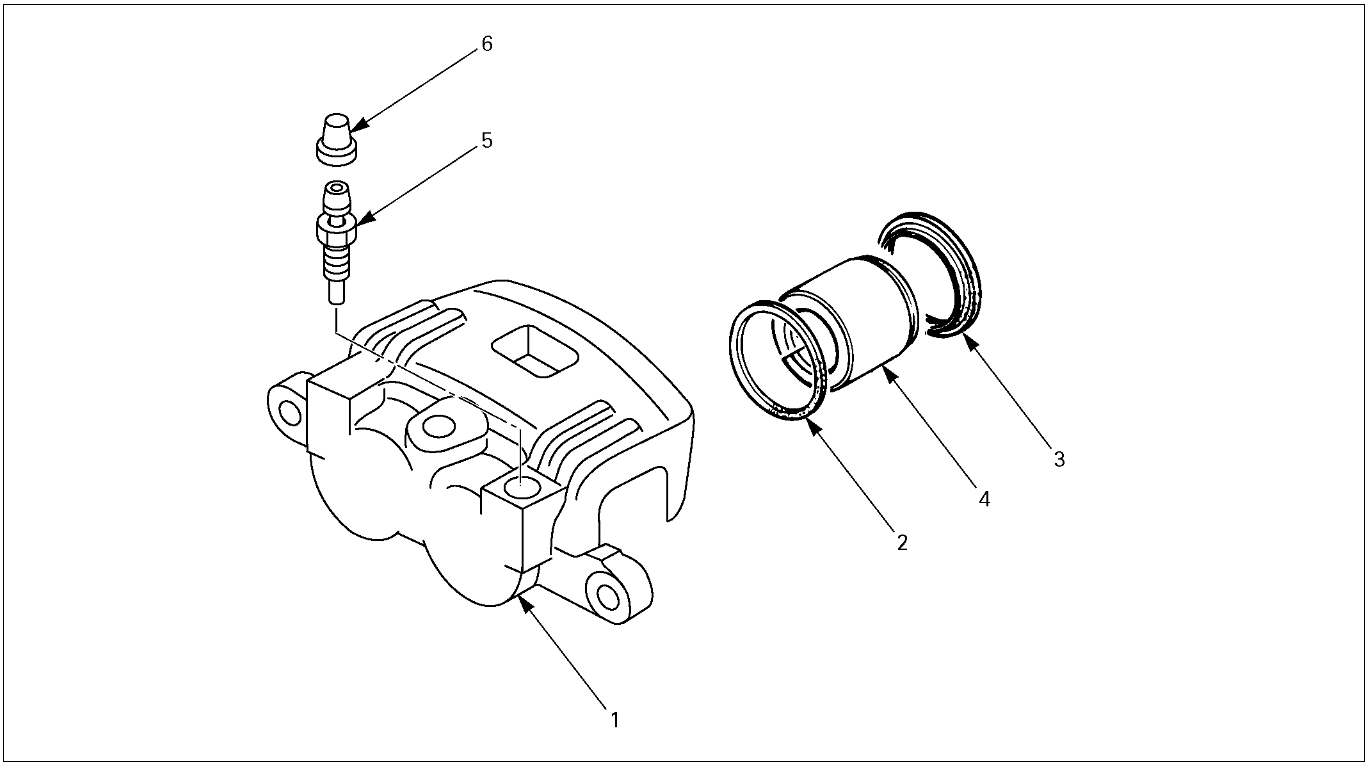
302R300019

Seal and Boot

The dust seal, dust boot and ring seal should be replaced each time the caliper is overhauled.
Discard these used rubber parts.

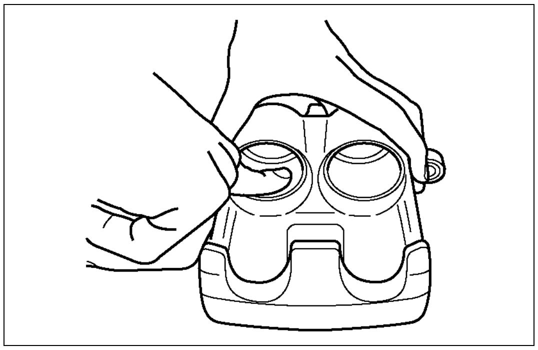
REASSEMBLY

CALIPER ASSEMBLY



Reassembly Steps

▲ 1. Body; caliper
▲ 2. Ring seal
▲ 3. Dust seal; piston
▲ 4. Piston
▲ 5. Bleeder
▲ 6. Cap



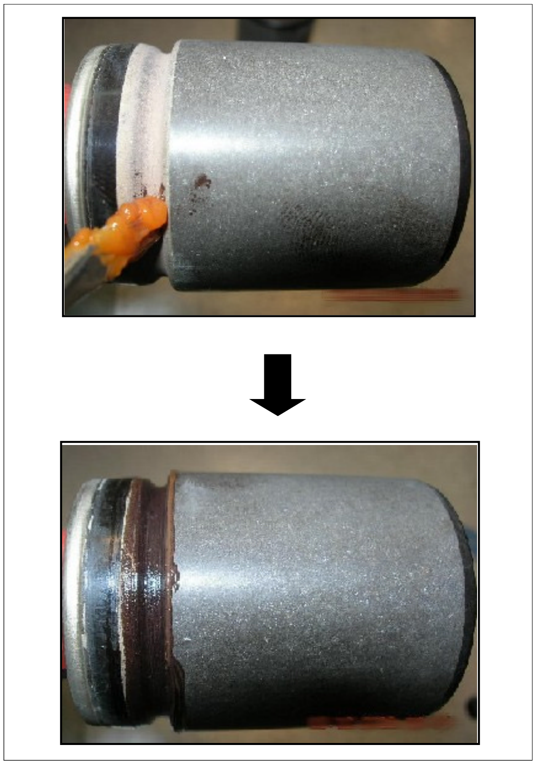
Important Operations

1. Body; Caliper

2. Ring Seal

Apply clean brake fluid to the ring seal and cylinder wall, then insert the ring seal into the cylinder.

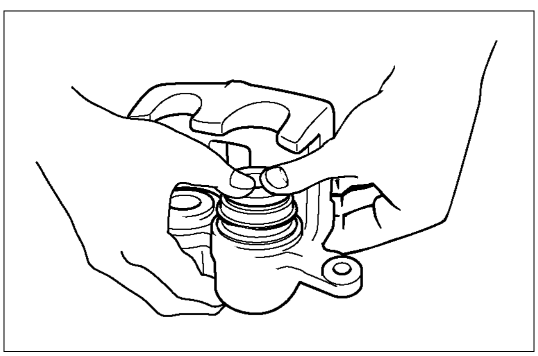
Ensure that the piston ring seal are not twisted in the caliper bore grooves.



3. Dust seal; Piston

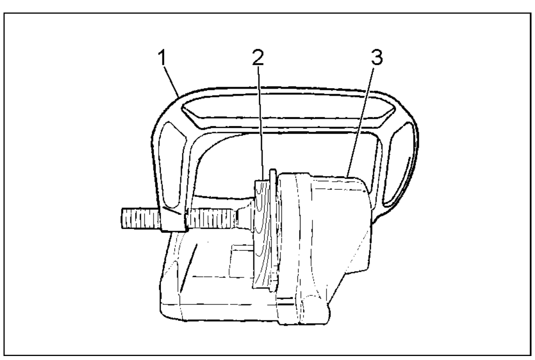
- Apply grease to piston groove and dust seal boot.
  1) Make sure a piston and its groove area are free from dust.
  2) Use 0.5g to apply grease to groove area thoroughly using a brush or finger.
     Make sure color of groove changes as shown bellow after apply grease.

  3) After assembling a dust seal boot to the piston, apply 1.5g to contact area of the piston and the dust seal boot as shown in the picture bellow.



4. Piston

Apply clean brake fluid to the piston, and attach the caliper.
When inserting the piston into the cylinder, use finger pressure only. Do not use a mallet or other impact tool, since damage to the cylinder wall or ring seal can result.
The movement of a caliper piston into a caliper bore should be smooth and even. If a caliper piston is frozen or difficult to move to the bottom, the caliper requires overhaul or replacement.



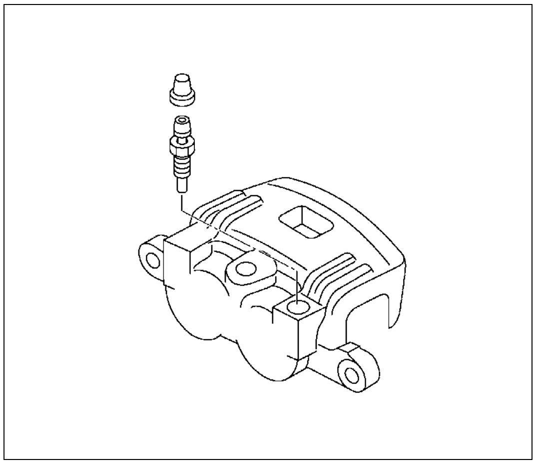
RTW35CSH000701

When not entering with a finger, insert a discarded inner brake pad (2) or block of wood in front of the pistons. Using 2 large C-clamps (1) installed over the body of the caliper (3) and against the brake pad or block of wood, slowly move the pistons evenly into the bores.
Insert the dust seal ring into the dust seal.

CAUTION:

Pistons made of plastic material.

Do not hit the piston with a hammer etc. and don't grasp the face of the piston with pliers.



5. Bleeder

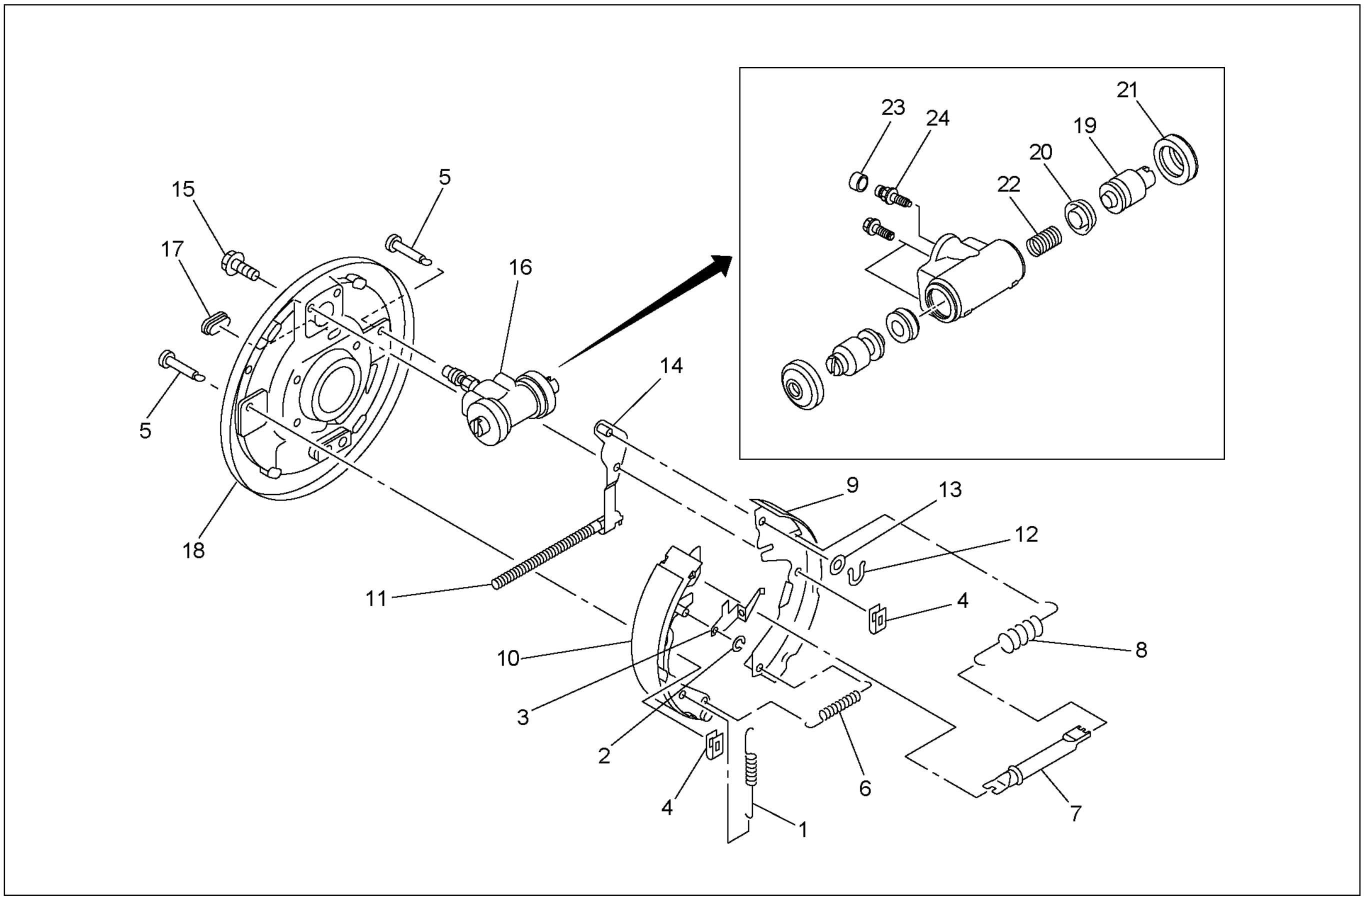
Torque	N·m (kgf·m/lb·ft)
9 – 16 (0.9 – 1.6 / 6.5 – 12)	

6. Cap

REAR DRUM BRAKE ASSEMBLY

DISASSEMBLY

First, disassemble the brake drum. Then disassemble the rear brake assembly.
Refer to the “REAR AXLE” section for the brake drum disassembly procedure.



RTW75CMF001001

MAJOR COMPONENTS

Disassembly Steps

1. Spring; adjuster
2. Ring; Adjuster lever
3. Lever; adjuster

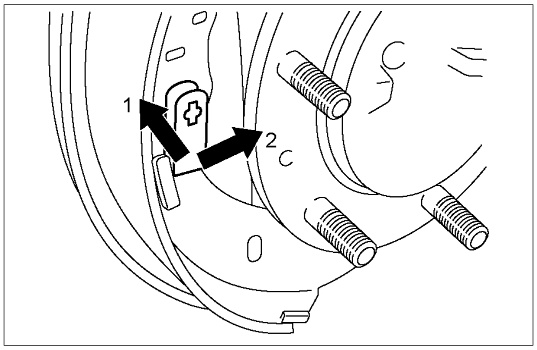
Disassembly Steps

Wheel Cylinder Assembly

19. Piston assembly
20. Cup; piston
21. Boot; piston
22. Return spring
23. Cap; bleeder
24. Bleeder

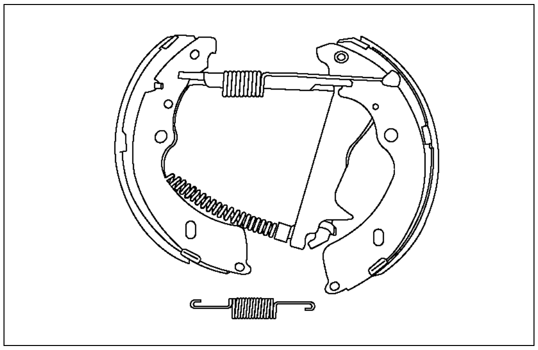


RUW55CSH000401

Important Operations

4. Spring; shoe hold

Push the shoe hold spring toward the brake shoe and hold it (1). Rotate the spring to remove it from the shoe hold pin (2).



6. Spring; shoe to shoe, lower

Slide the brake shoes and lower spring toward the ground. Remove the lower spring.

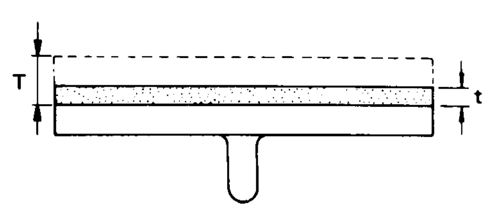
INSPECTION AND REPAIR

Make necessary correction or parts replacement if wear damage or any other abnormal conditions are found through inspection.

- Brake drum
- Back plate
- Brake lining
- Wheel cylinder body
- Piston
- Piston cup
- Return spring

Visual check

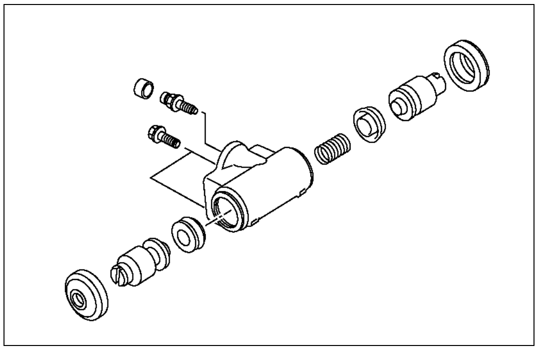
Inspect the following parts for wear scuffs, scratches, corrosion, stains, deterioration, or other abnormal conditions.



Thickness of the Brake Lining

Thickness mm (in)

	standard (T)	Limit (t)
4×2, 4×4	5.0 (0.197)	1.0 (0.039)

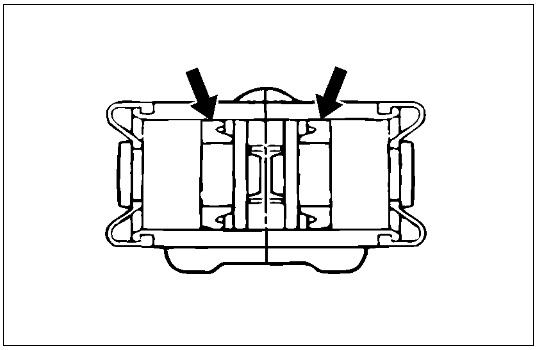


Clean wheel Cylinder Parts

Always use clean brake fluid to clean wheel cylinder parts.

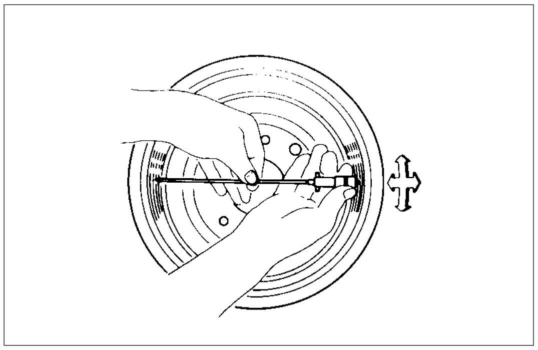
Note:

Do not use mineral based cleaning solvents such as gasoline, kerosene, acetone, paint thinner, or carbon tetrachloride.



Piston Cups

Inspect the piston cups for wear, distortion, fatigue or other abnormal conditions.



Measuring the Brake Drum

mm (in)

		Standard	Limit
4×2 (Except HIGH RIDE)	Inside diameter	254 (10.000)	255.5 (10.059)
	Run out	0.08 (0.003)	0.15 (0.006)
4×2 (HIGH RIDE) 4×4	Inside diameter	295 (11.614)	296.5 (11.673)
	Run out	0.08 (0.003)	0.15 (0.006)

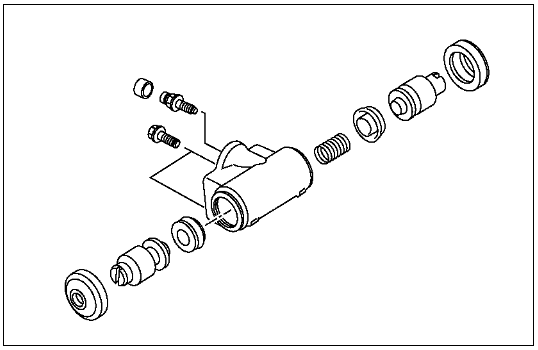
19. Spring; shoe to shoe; lower
▲20. Lever; adjuster
▲21. Ring; Adjuster lever
▲22. Spring; shoe hold
▲23. Pin; shoe hold
24. Spring; adjuster

Important Operations

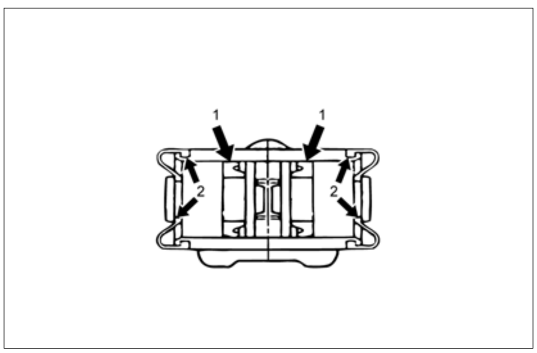
Note:

- Wash the disassembled parts in clean brake fluid.
- Use compressed air to clean the ports.
- Protect the disassembled part surfaces from contamination by dust and other foreign material.
- Before reassembly, check the part surfaces for contamination with dust or other foreign material.
- Be sure to replace the designated parts with new ones.



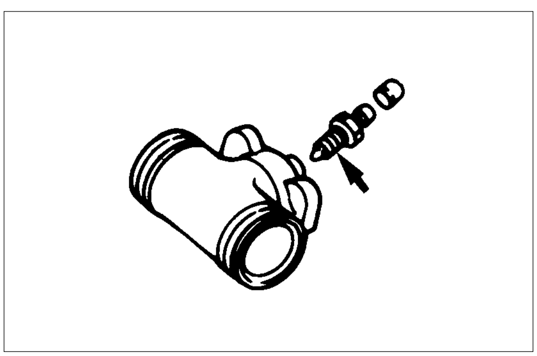
1. Piston Assembly

Install new piston cups on each piston so that the flared end of the cups are turned to the inboard side of the pistons.
Attach the return spring and the boot to the piston.
Be sure to use new piston cup and boot.



RTW55CSH000201

- Apply brake fluid to the pistons and the inner face of the boots.
- Note the direction of piston cup (1).
- Apply rubber grease to the boots (2) as shown in the illustration.



5. Bleeder

Torque	N·m (kgf·m/lb·in)
6 - 8 (0.6 – 0.8 / 52 - 69)

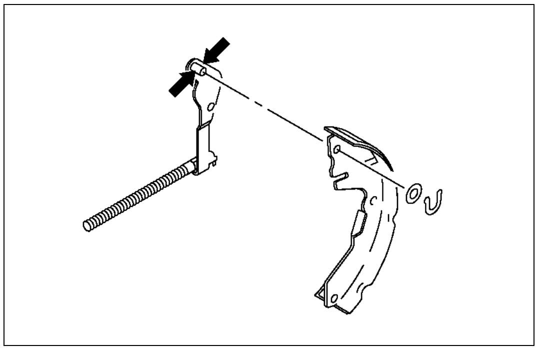
14 - 18 (1.4 – 1.8 / 122 - 156)	



308R300008

11.Shoe; leading

- Be sure to use new spring; shoe hold.

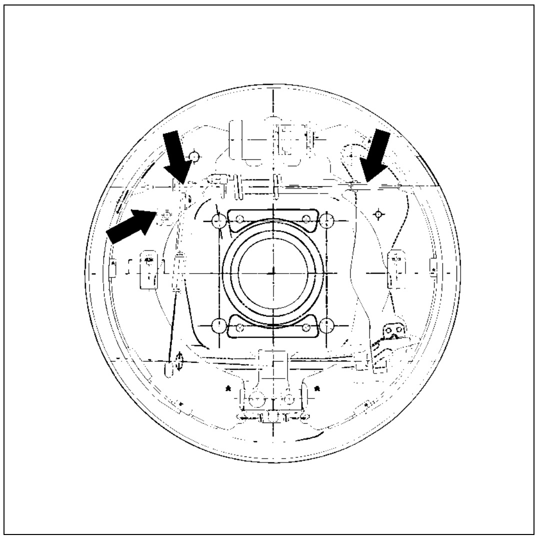
12.Lever; parking

13.Washer; lever

14.Retainer

Install the lever, the washer and the retainer to the leading brake shoe.

- Apply grease to the sliding surfaces of the lever and brake shoe.
- Be sure to use new retainer and washer.



305R300009

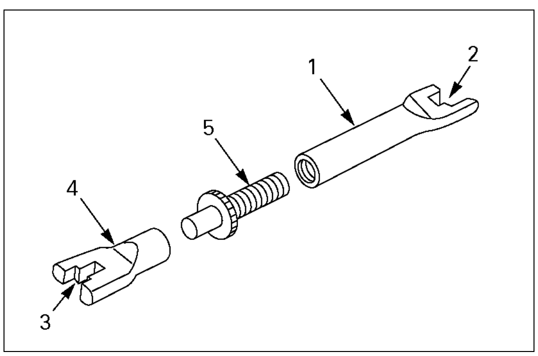
16.Shoe; trailing

- Be sure to use new spring; shoe hold.

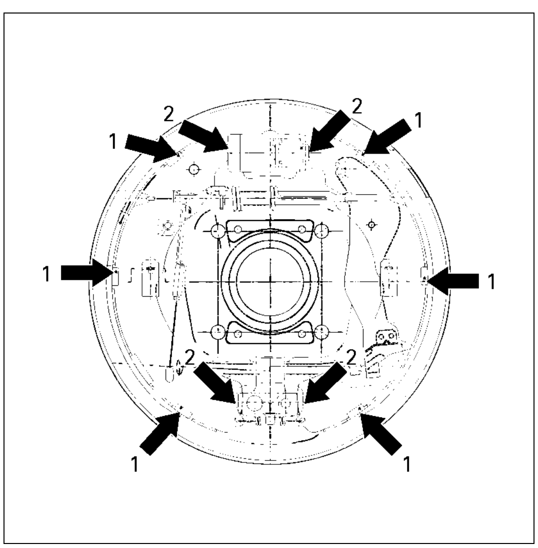
17.Spring; shoe to shoe, upper

18.Adjuster assembly

1. Apply grease to each of the parts shown in the illustration before installing the brake shoe.
   - Lever; adjuster-shoe
   - Adjuster-shoe



2. Clean the adjuster bolt (5) and the adjuster rods (1) (4). Apply grease to the threaded portion of the adjuster bolt.
3. Install the adjuster rod to the adjuster bolt.
4. Apply grease to the adjuster arm ends (2) (3). Set the spring upper to the adjuster arm, then install them to the brake shoe.



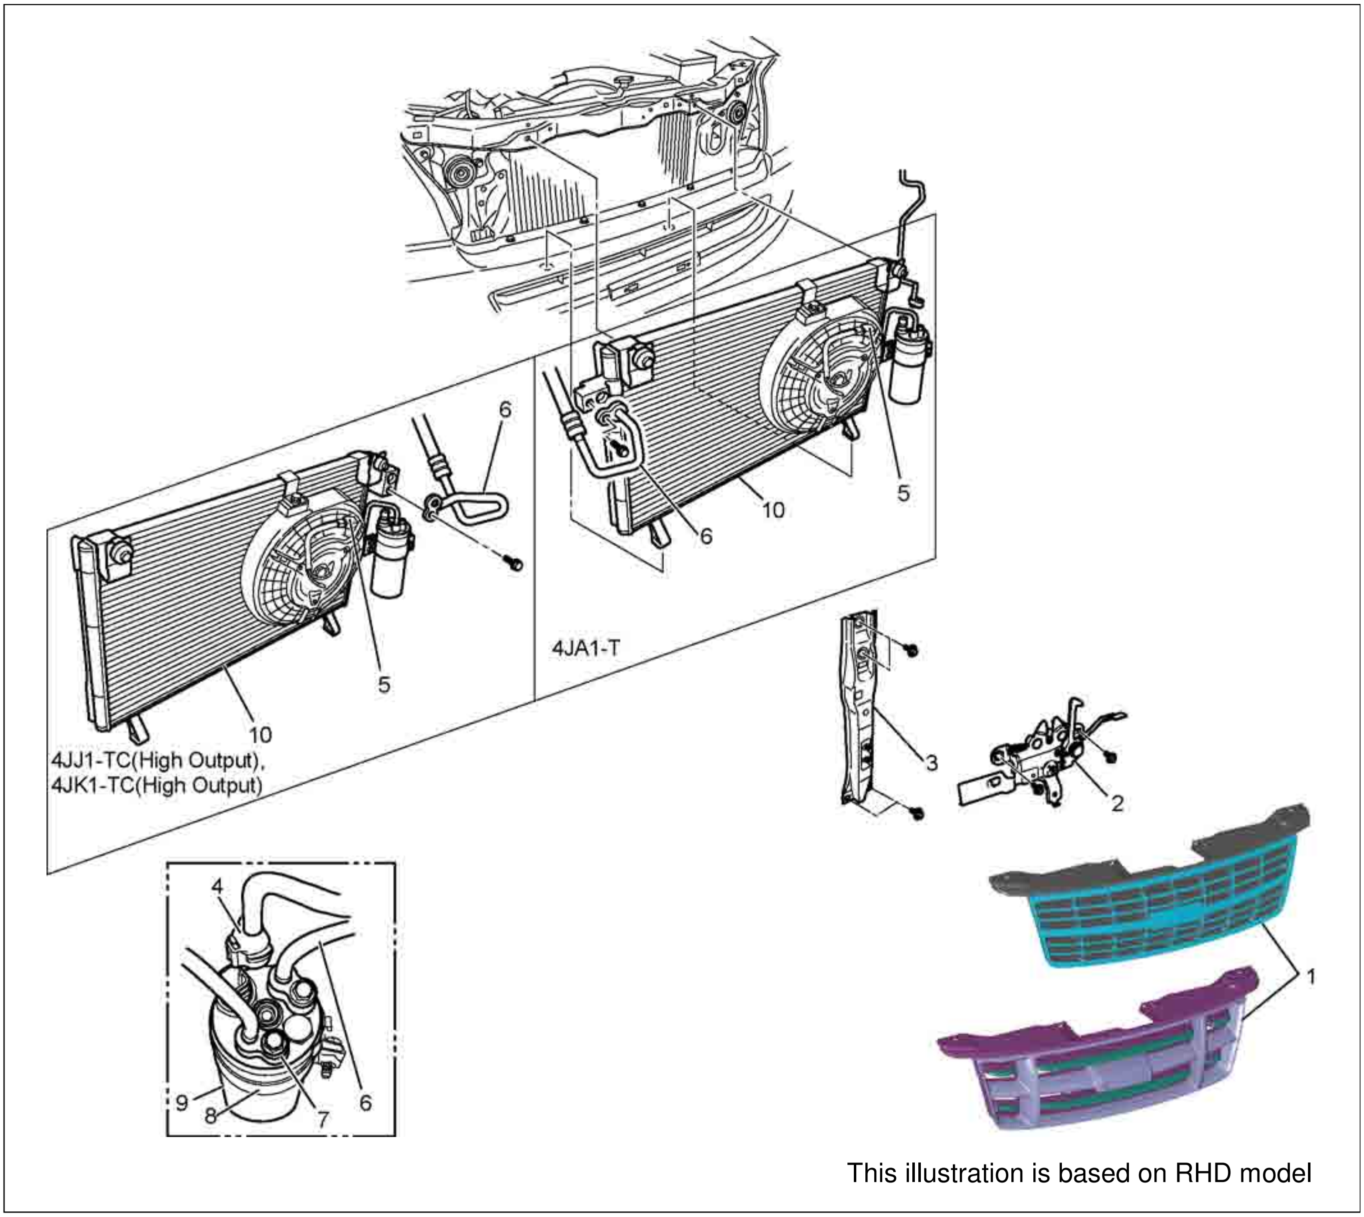
305R300010

5. Before setting the brake shoes, apply grease to the back plate portions (1) contacting the brake shoe edge as shown in the illustration.
6. Apply grease to the wheel cylinder parts contacting the brake shoe (2).
7. Install the brake shoe.

Note:

- Be careful not to damage the wheel cylinder dust cover.
- Do not allow the wheel cylinder piston to fly free.

REMOVAL AND INSTALLATION (4JJ1-TC High Output, 4JK1-TC High Output, 4JA1-T)



RTW710LF001501

Removal Steps

1. Radiator grille
2. Engine hood lock
3. Engine hood front end stay
4. Pressure switch connector
5. Condenser fan connector
6. Refrigerant line
7. Refrigerant line
8. Receiver/drier bracket

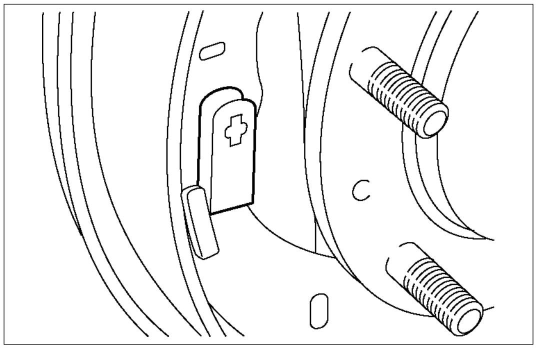
5. Condenser fan connector
4. Pressure switch connector
3. Engine hood front end stay
2. Engine hood lock
1. Radiator grille

20. Lever; adjuster

21. Ring; Adjuster lever

- Apply grease to the lever adjuster sliding surface. Install the lever adjuster and the ring to the shoe; trailing.
- Be sure to use a new ring.

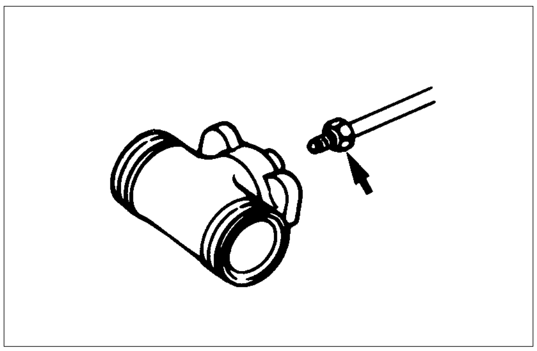


RUW55CSH000501

22. Spring; shoe hold

23. Pin; shoe hold

- Install the brake drum.
- Install the rear wheel.
- If the wheel cylinder has been removed, the brake system must be bled.
- Pump the brake pedal 10 times. Check that there is little or no stroke length variation as the pedal is pumped.
- Adjust the lining clearance.



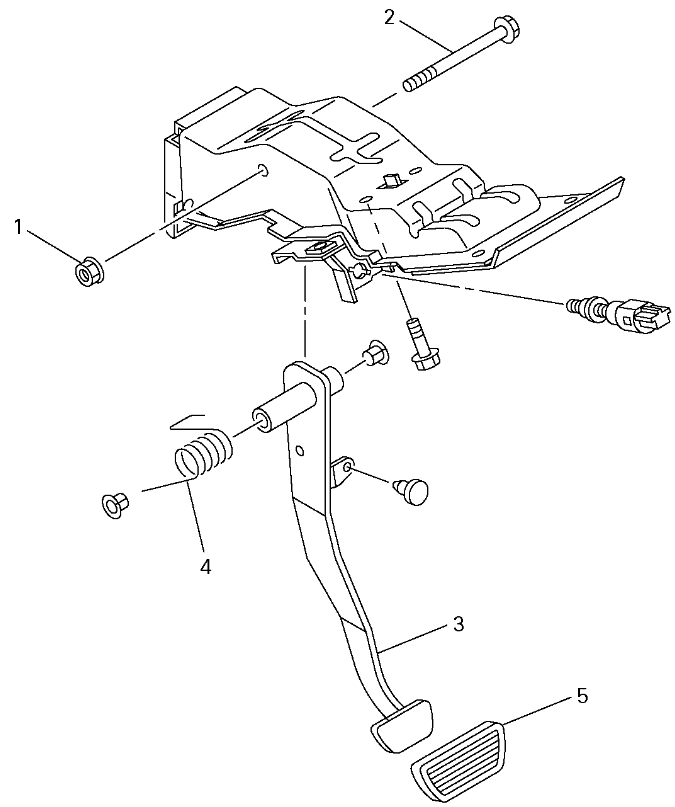
- Brake Line

Torque	N·m (kgf·m/lb·ft)
13 - 19 (1.3 - 1.9 / 9 - 14)	

BRAKE CONTROL

REMOVAL AND INSTALLATION

BRAKE PEDAL ASSEMBLY



This illustration is based on the RHD model

310R300001

Removal Steps

1. Nut; Fulcrum pin
2. Pin; Fulcrum, pedal to bracket
3. Pedal arm
4. Return spring
5. Pedal pad

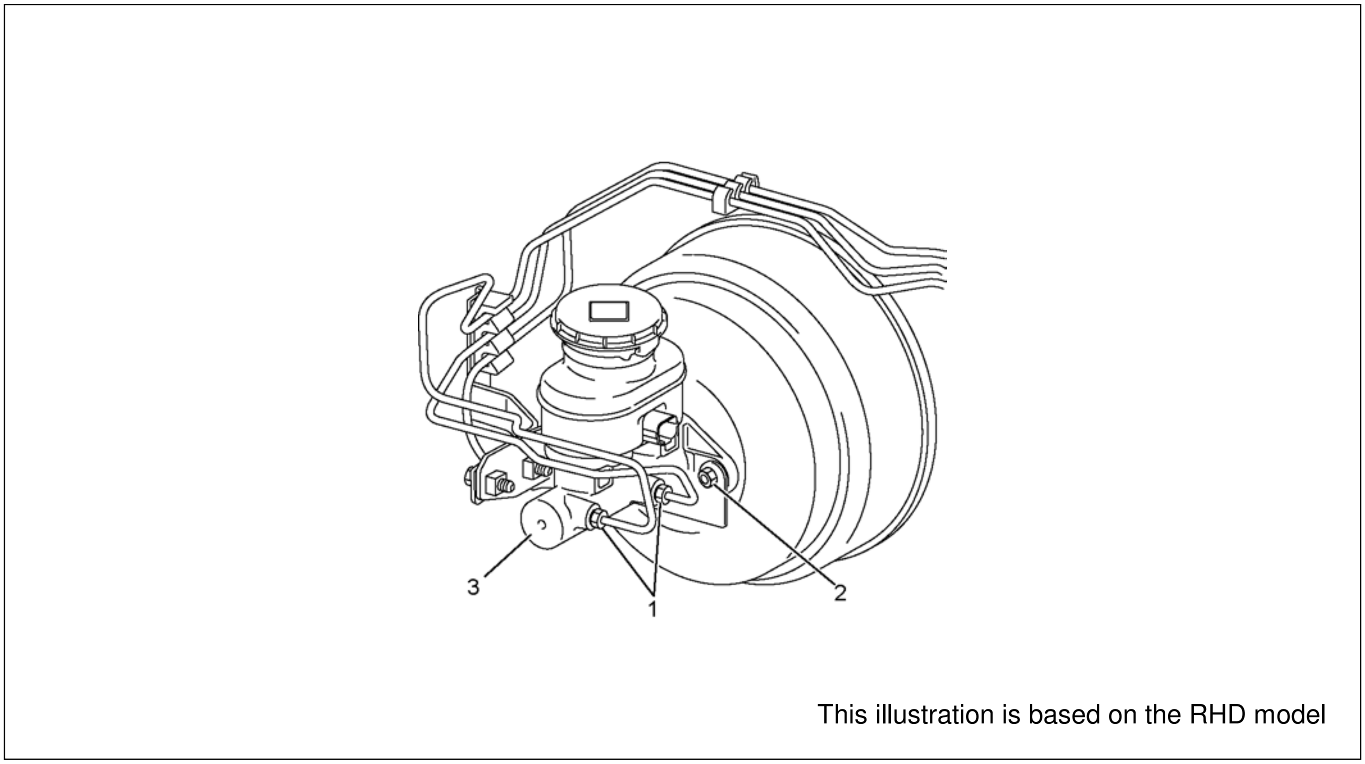
Installation steps

To install, follow the removal procedure in reverse order.
Before installation, apply grease to the entire circumference of the fulcrum pin (2).
Refer to “SERVICING” in this section for adjustment procedure of brake pedal.

MASTER CYLINDER

REMOVAL AND INSTALLATION

MASTER CYLINDER ASSEMBLY



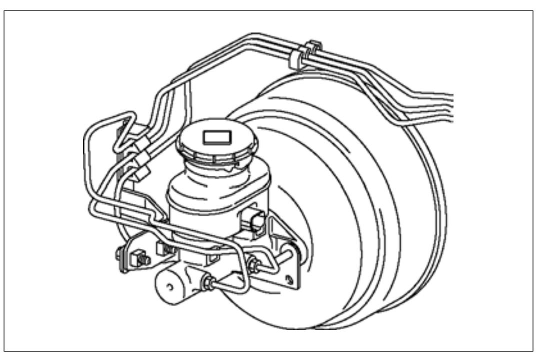
RTW75CMF000901

Removal Steps

▲ 1. Brake line
2. Nut; Master cylinder to vacuum booster
3. Master cylinder assembly

Installation Steps

3. Master cylinder assembly
▲ 2. Nut; Master cylinder to vacuum booster
▲ 1. Brake line



RTW75CSH002701

Important Operation - Removal

1. Brake Line

Be very careful not to spill brake fluid on the painted surface. Damage to the painted surface will result.

Important Operation - Installation

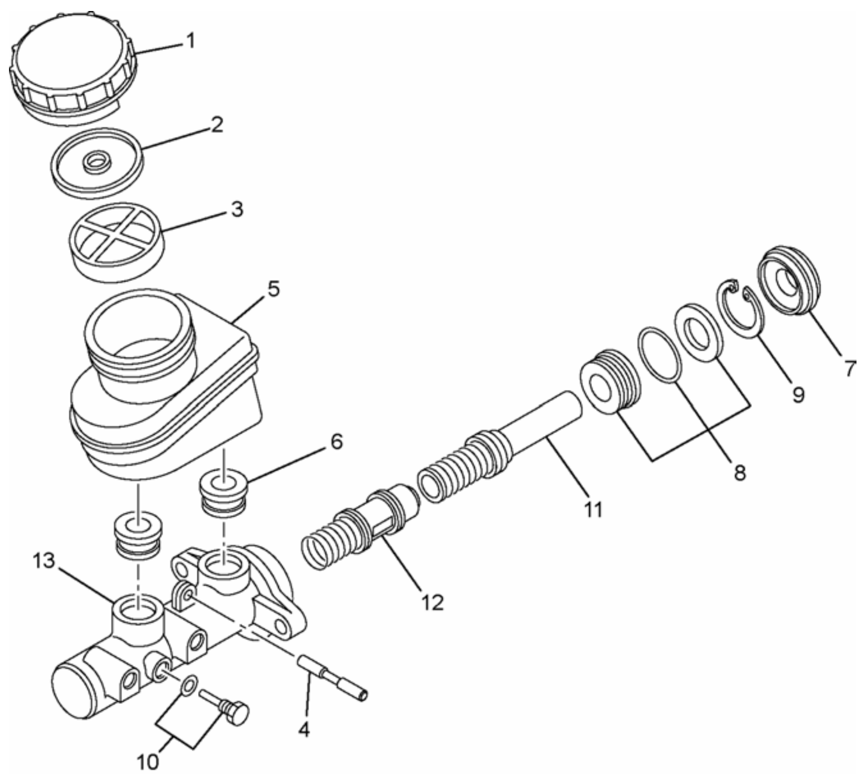
2. Nut; Master Cylinder to Vacuum Booster

Torque	N·m (kgf·m/lb·ft)
10 – 16 (1.0 – 1.6 / 7 – 12)	

1. Brake Line

Torque	N·m (kgf·m/lb·ft)
13 – 19 (1.3 – 1.9 / 9 – 14)	

DISASSEMBLY



RTW75CMF000701

Disassembly Steps

1. Cap
2. Diaphragm
3. Filter
4. Pin
5. Reservoir tank
6. Grommet

▲ 7. Front seal

8. Guide assembly

▲ 9. Snap ring

▲ 10. Stopper bolt and gasket

▲ 11. Primary piston

▲ 12. Secondary piston

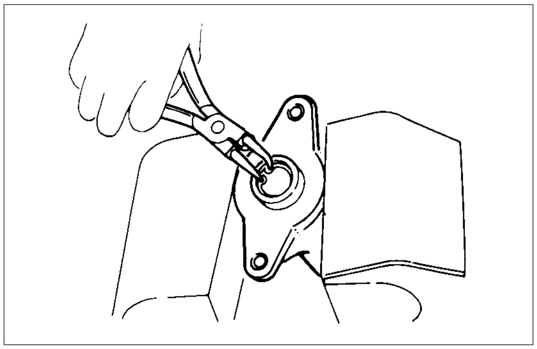
13. Cylinder body

Note:

- Be sure to replace the designated with new ones.
- Wash the disassembled parts in clean brake fluid.
- Use compressed air to clean the ports.
- Do not allow dirt and dust to contaminate the disassembled parts.

Important Operations

When disassembling, inspecting or reassembling the master cylinder assembly, take care not to bring the parts into contact with mineral oil or dust. Wash the piston cups only with brake fluid. Do not use gasoline or other mineral-base cleaning solvents.



7. Front Seal

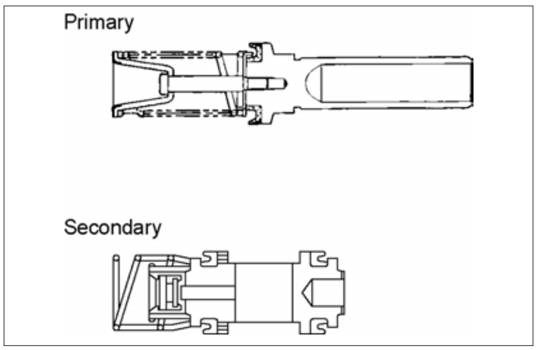
Front seal remain in the vacuum booster side, when removing master cylinder.

9. Snap Ring

Remove the snap ring from the cylinder body with pushing in the primary and secondary pistons.

10.Stopper Bolt and Gasket

Remove the stopper bolt from the cylinder body with pushing in the primary and secondary pistons.



RTW75CSH002201

11.Primary Piston

12.Secondary Piston

Don't remove the spring from the piston.

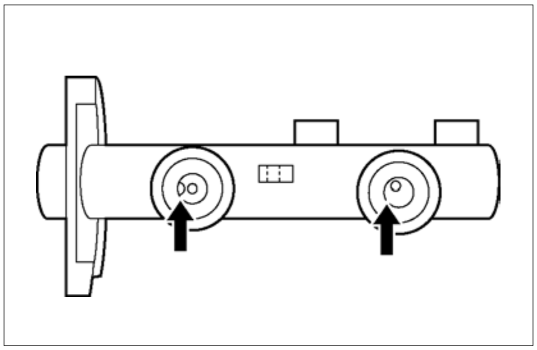
INSPECTION AND REPAIR

Make necessary correction or parts replacement if wear damage or any other abnormal conditions are found through inspection.

- Cylinder body inside face
- Piston
- Piston cup
- Return port, Supply port
- Return spring
- Guide assembly (O-ring, Cup)
- Front seal

Visual Check

Inspect the following parts for wear, distortion, cuts, nicks, corrosion, or other abnormal conditions.

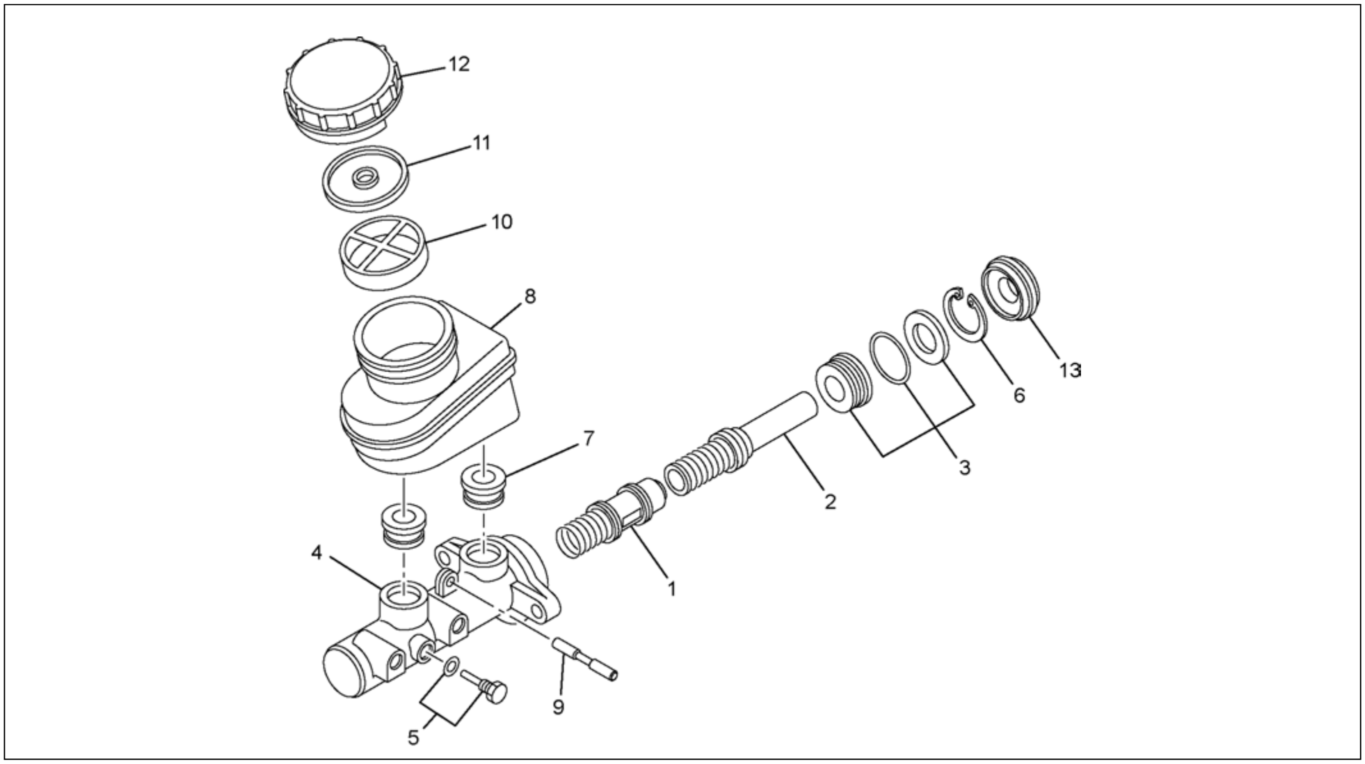


RTW75CSH002401

Return Port

Check the return port for obstructions and if necessary, clean with a tag wire.
Blow away foreign matter with compressed air.

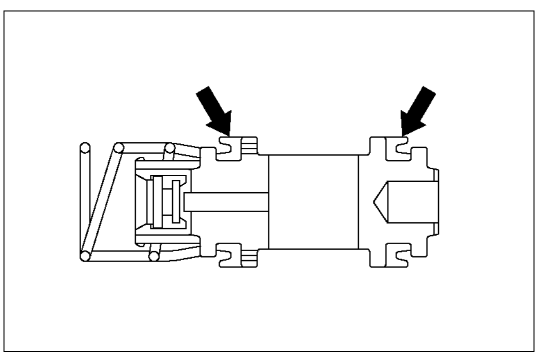
REASSEMBLY



RTW75CMF000801

Reassembly Steps

- ▲ 1. Secondary piston
- ▲ 2. Primary piston
- ▲ 3. Guide assembly
- ▲ 4. Cylinder body
- ▲ 5. Stopper bolt and gasket
- ▲ 6. Snap ring
- ▲ 7. Grommet
- ▲ 8. Reservoir tank
- ▲ 9. Pin
- ▲ 10. Filter
- ▲ 11. Diaphragm
- ▲ 12. Cap
- ▲ 13. Front seal

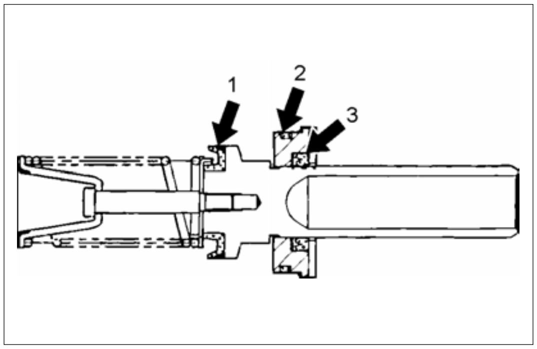


1. Secondary Piston

Lubricate the piston cups on the secondary piston assemblies with brake fluid.

Note:

Be sure to use a new piston.



RTW75CSH002301

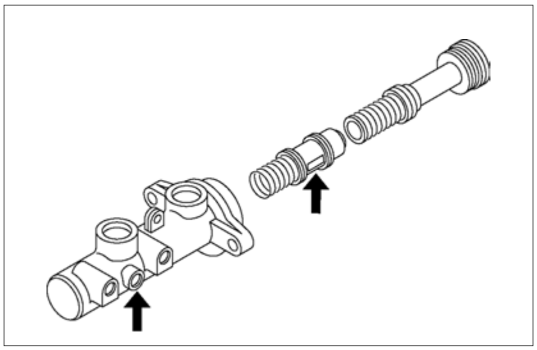
2. Primary Piston

Lubricate the piston cup on the primary piston assemblies with brake fluid (1).

Note:
Be sure to use a new piston.

3. Guide Assembly

Lubricate the O-ring of guide assembly with brake fluid (2) and the cup of guide assembly with rubber grease (3) (0.2 ~ 0.3g).



RTW75CSH002001

4. Cylinder Body

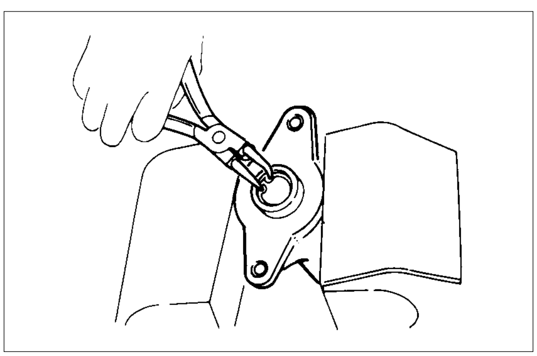
Install the secondary piston and the primary piston to the cylinder body.

Note:
The secondary piston long hole and the cylinder body stopper bolt hole must be aligned at installation.

5. Stopper Bolt and Gasket

Install the stopper bolt to the cylinder body (the piston long hole must be aligned with the cylinder body installation hole). Tighten the bolts to the specified torque.

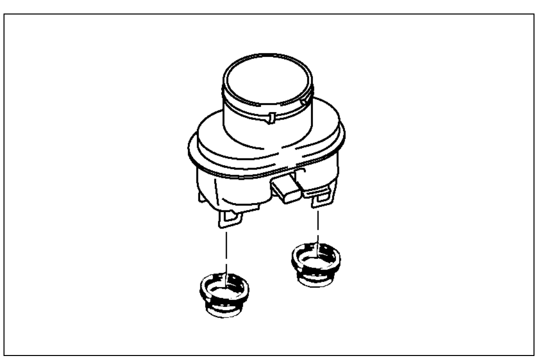
Torque	N·m (kgf·m/lb·in)
2 - 3 (0.2 - 0.3 / 17 - 26)	



6. Snap Ring

Press down on the primary piston and install the snap ring to the cylinder body groove.

Note:
Be sure to use new snap ring.



7. Grommet

1. Install the grommets to the reservoir tank.

Note:
Be sure to use are new grommets.

2. Install the reservoir tank to the cylinder body.

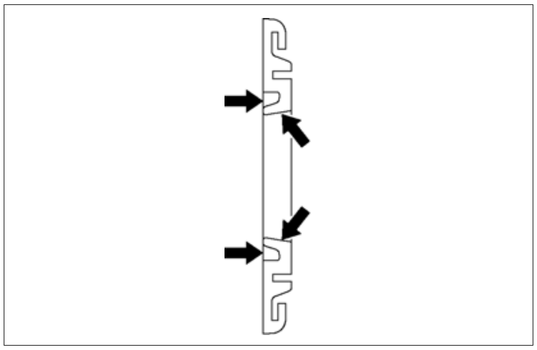
8. Reservoir Tank

9. Pin

10. Filter

11. Diaphragm

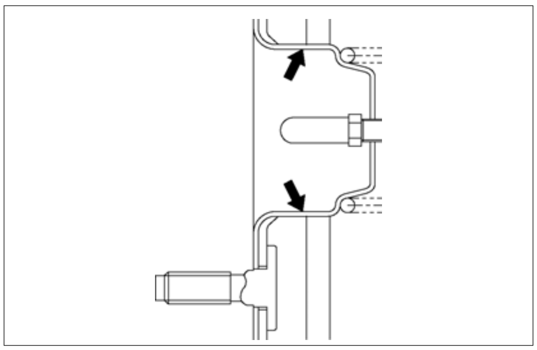
12. Cap



RTW75CSH002501

13. Front Seal

1. Lubricate the front seal with silicon grease (0.3 ~ 0.5g).

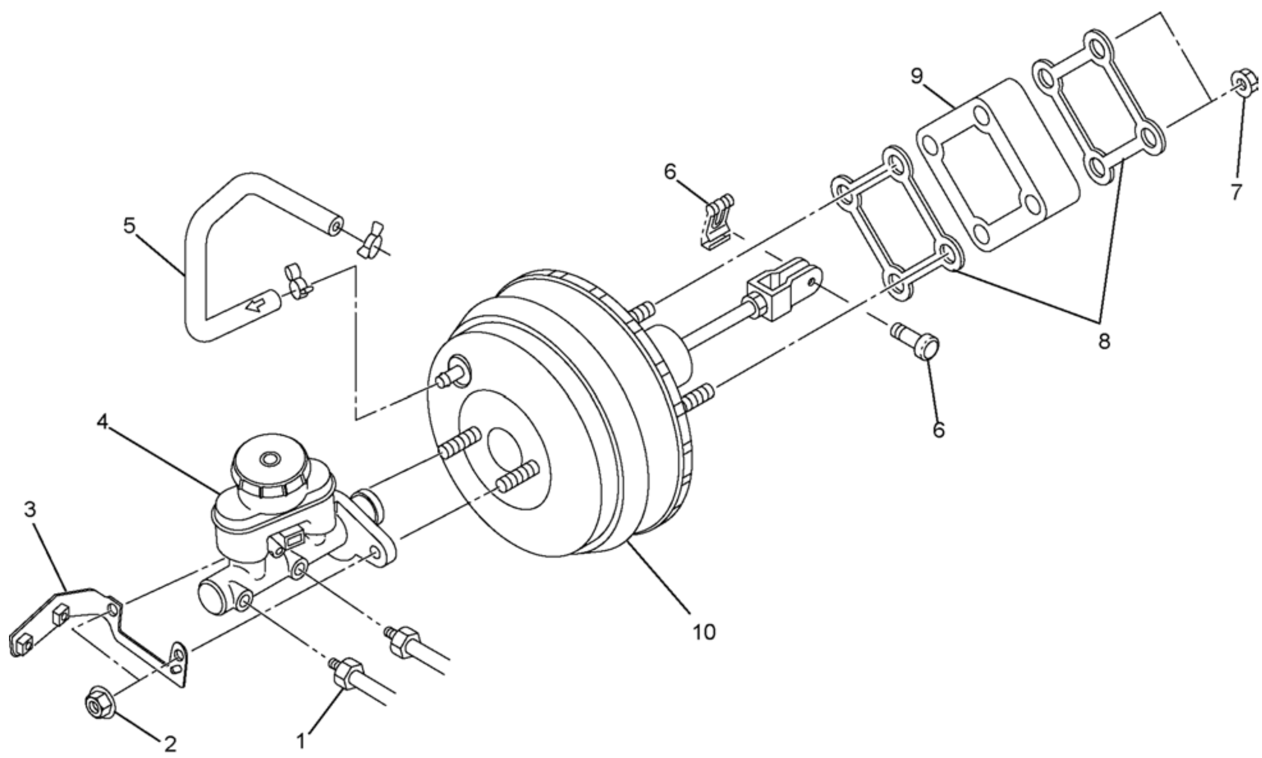


RTW75CSH002601

2. Lubricate the front cylinder shell of vacuum booster with silicon grease (0.2g).

VACUUM BOOSTER

REMOVAL AND INSTALLATION



RTW75CMF000501

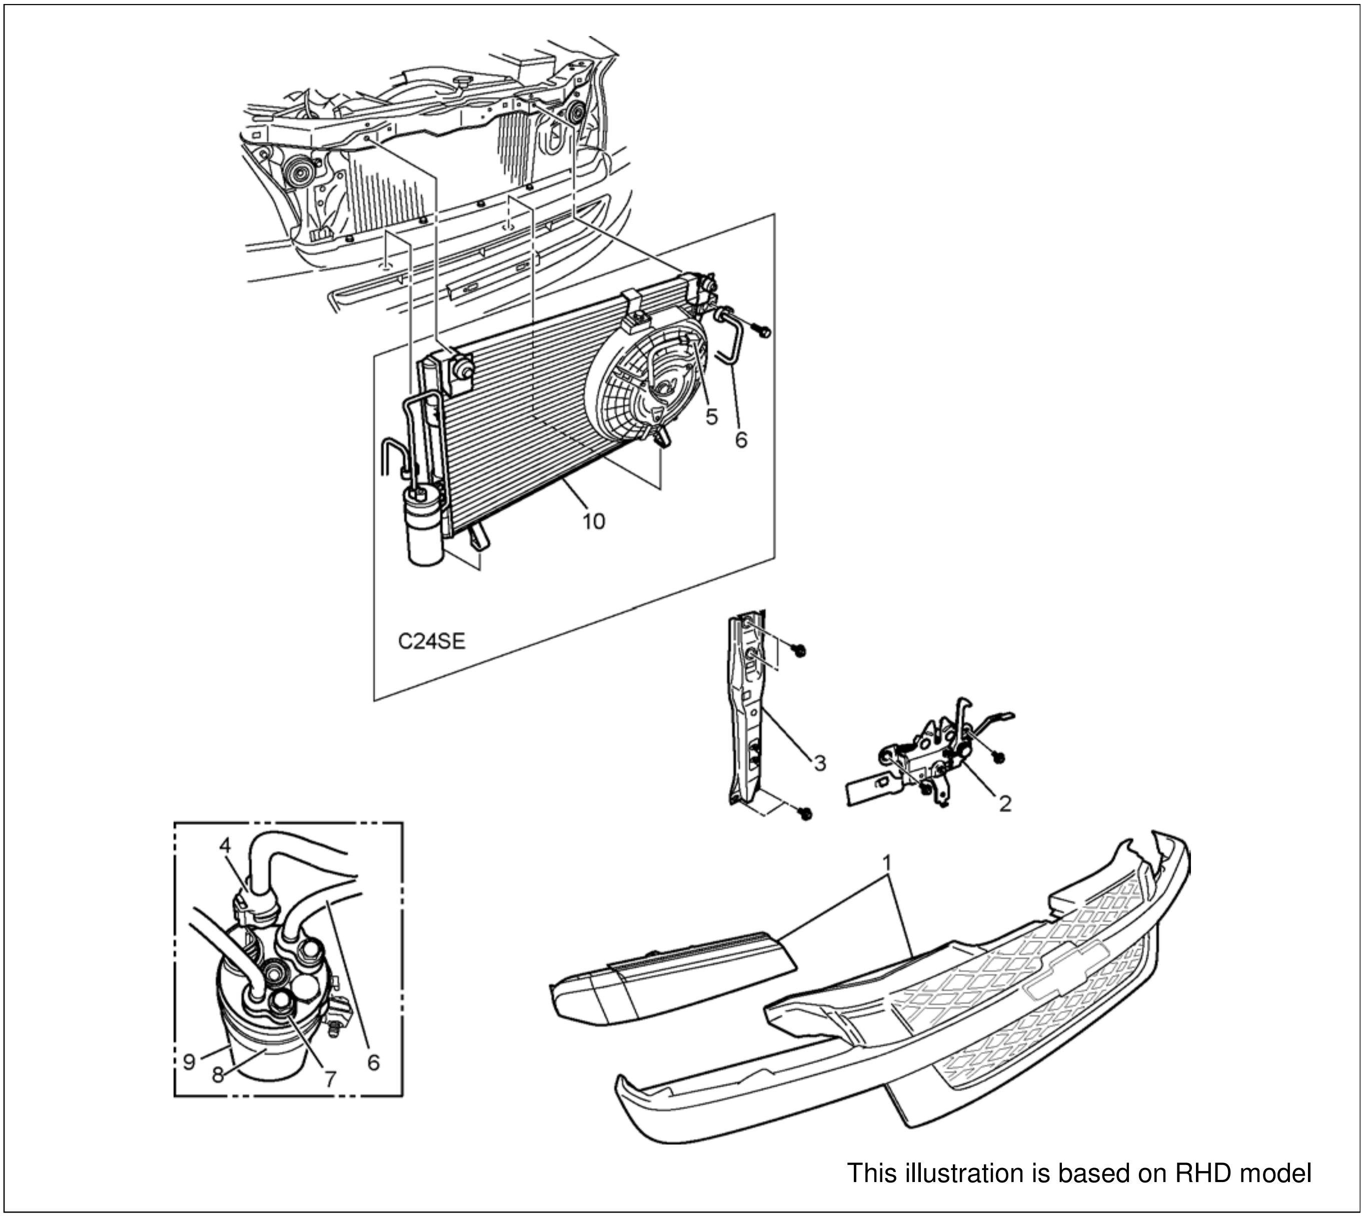
Removal Steps

- ▲ 1. Brake pipe
- ▲ 2. Master cylinder fixing nut
- ▲ 3. Bracket
- ▲ 4. Master cylinder assembly
- 5. Vacuum hose
- 6. Snap pin
- 7. Vacuum booster fixing nut
- 8. Gasket
- 9. Spacer
- 10. Vacuum booster assembly

Installation Steps

- ▲ 10. Vacuum booster assembly
- ▲ 9. Spacer
- ▲ 8. Gasket
- ▲ 7. Vacuum booster fixing nut
- ▲ 6. Snap pin
- ▲ 5. Vacuum hose
- 4. Master cylinder assembly
- 3. Bracket
- 2. Master cylinder fixing nut
- 1. Brake pipe

REMOVAL AND INSTALLATION (C24SE)

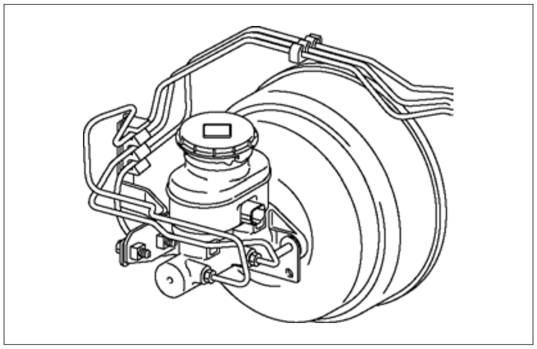


Removal Steps

1. Radiator grille
2. Engine hood lock
3. Engine hood front end stay
4. Triple pressure switch connector
5. Condenser fan connector
6. Refrigerant line
7. Refrigerant line
8. Receiver/drier bracket
9. Receiver/drier
10. Condenser assembly

Installation Steps

10. Condenser assembly
9. Receiver/drier
8. Receiver/drier bracket
7. Refrigerant line
6. Refrigerant line
5. Condenser fan connector
4. Pressure switch connector
3. Engine hood front end stay
2. Engine hood lock
1. Radiator grille



RTW75CSH002701

Important Operation-Removal

1. Brake pipe

When hurdling, be careful not to spill brake fluid over the painted surfaces, as damage to the paint finish will result.

2. Master Cylinder Fixing Nut

3. Bracket

4. Master Cylinder Assembly

NOTE:

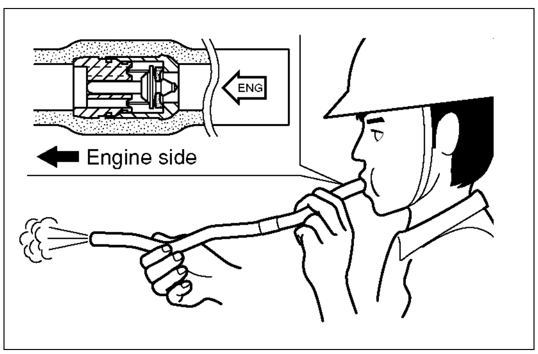
When removing the master cylinder from the vacuum booster, be sure to get rid of the internal negative pressure of the vacuum booster (by, for instance, disconnecting the vacuum hose) in advance.

If any negative pressure remains in the vacuum booster, the piston may possibly come out when the master cylinder is being removed, letting the brake fluid run out.

While removing the master cylinder, do not hold the piston as it can be easily pulled out.

Inspection and Repair

Vacuum Hose (The built in check valve)



360R300002

1) Inspect the check valve, which is installed inside the vacuum hose.
2) Blow air into the hose from the booster side as shown in the illustration. The air should pass freely through the hose.
3) Blow air into the hose from the engine side. The check valve should close to block the passage of air. The vacuum hose and built-in check valve must be replaced as a set if either is found to be defective.

Important Operation-Installation

10. Vacuum Booster Assembly

Note:

- Adjustment of push rod of vacuum booster is not carried out. When vacuum booster is damaged it exchanges for a new article. (Push rod is adjusted)
- Measurement of primary piston position by the side of master cylinder is unnecessary.

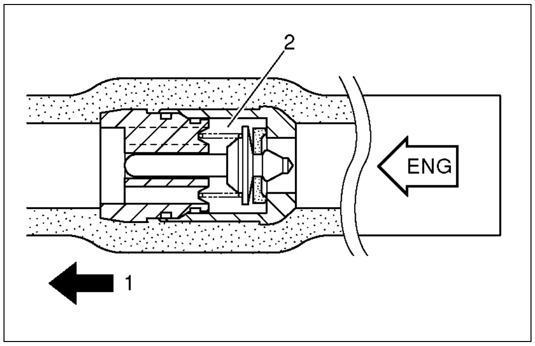
9. Spacer

8. Gasket

7. Vacuum Booster Fixing Nut

6. Snap Pin

Install the vacuum booster assembly to the dash panel and pedal mounting bracket.



360r300003

5. Vacuum Hose

The check valve (2) is built-in to the vacuum hose.

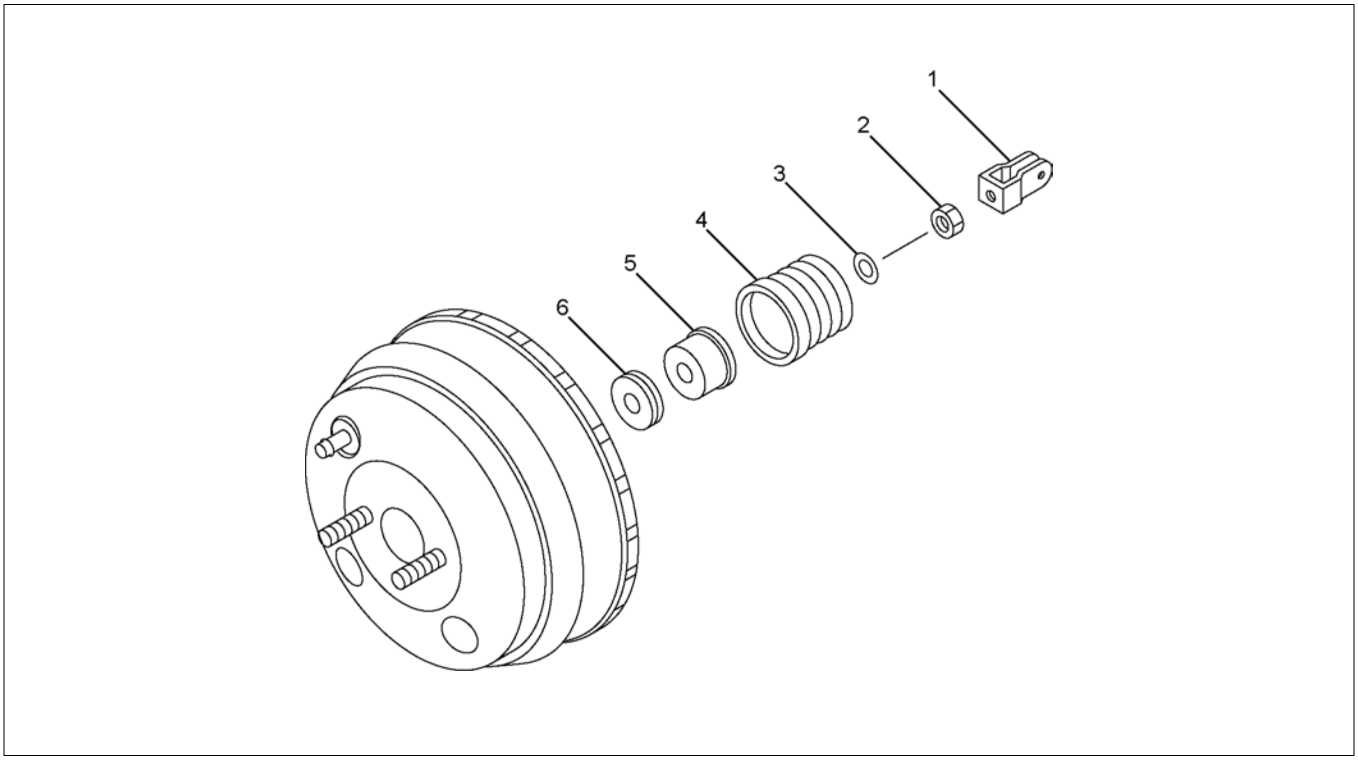
When installing the vacuum hose make sure that the arrow on the hose is facing the engine (1).

Note:

- Do not apply oil to the vacuum hose.
- Installation direction is very important. The booster will not operate if the vacuum hose is installed in the wrong direction.

DISASSEMBLY

VACUUM BOOSTER ASSEMBLY

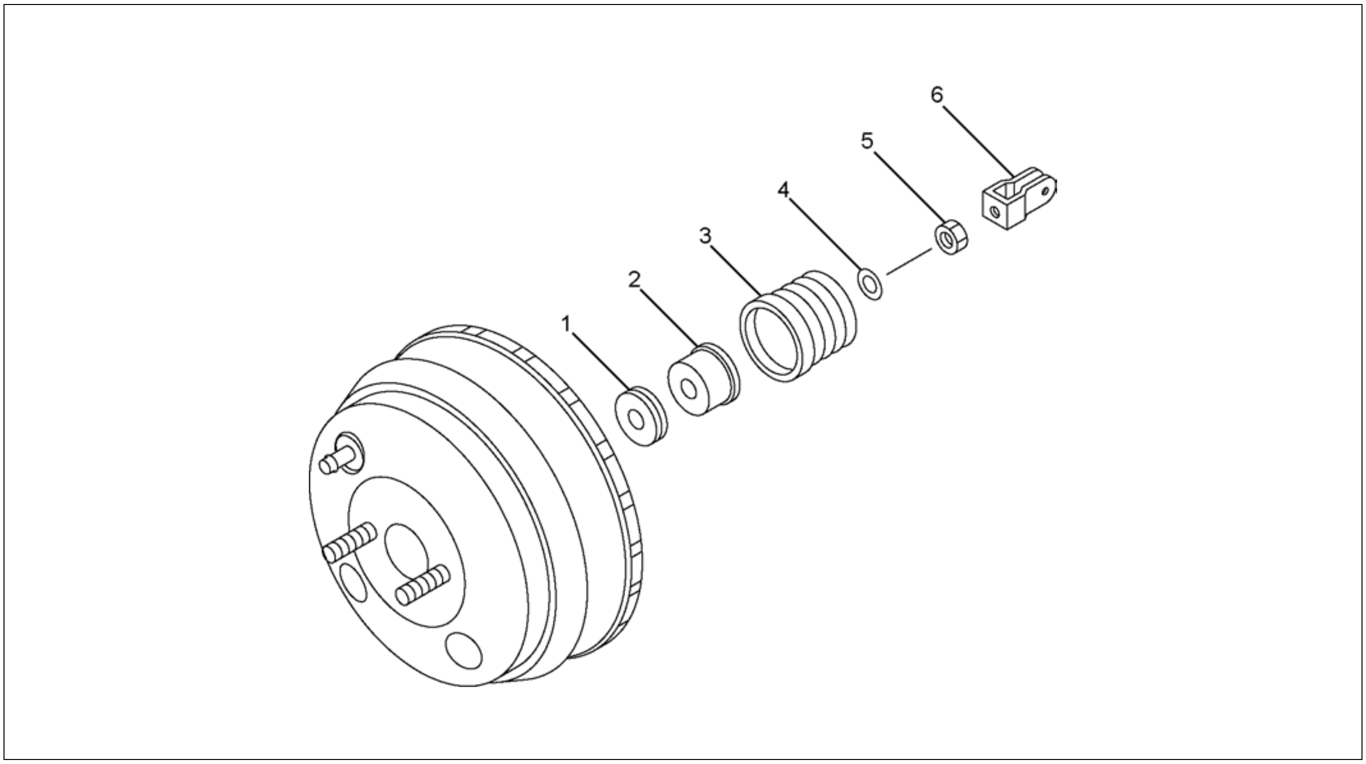


Disassembly Steps

1. Clevis; Yoke
2. Nut; VLV rod
3. Retainer; Guard
4. Guard; VLV body
5. Silencer
6. Filter

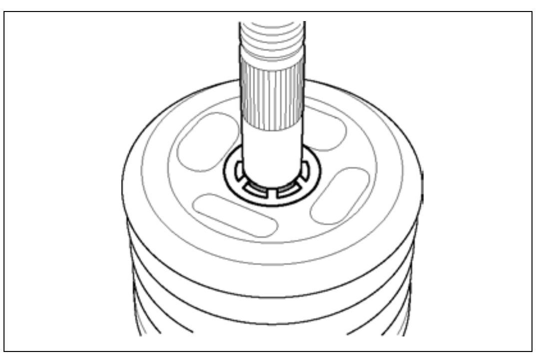
REASSEMBLY

VACUUM BOOSTER ASSEMBLY



Reassembly Steps

1. Filter
2. Silencer
3. Guard; VLV body
▲ 4. Retainer; Guard
▲ 5. Nut; VLV rod
▲ 6. Clevis; Yoke



RTW75CSH002901

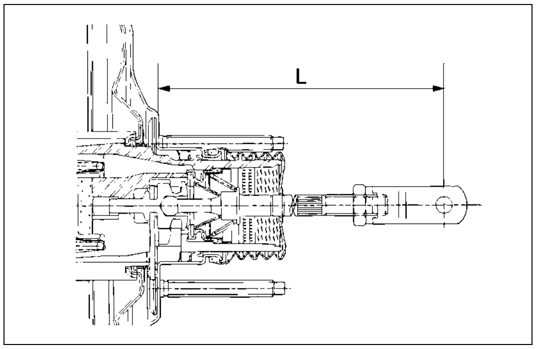
Important Operations

4. Retainer; Guard

Ensure that the lug of the inner surface is fitted into the groove of the ROD.

5. Nut; VLV Rod

Install the nut.



RTW75CSH002801

6. Clevis; Yoke

Assemble such that the distance from the rear of the vacuum booster assembly to the center of the clevis yoke hole is within the range of the reference values.

Distance		mm (in)
L	RHD	147.9 - 148.9 (5.823 - 5.862)
	LHD	160.7 - 161.7 (6.327 - 6.366)

Upon assembling the clevis yoke, tighten the nut to the specified torque.

Torque N·m (kgf·m/lb·ft)
15 - 25 (1.5 - 2.5 / 11 - 18)

SECTION 5D

PARKING BRAKE SYSTEM

TABLE OF CONTENTS

Service Precaution

Service Precaution

WARNING: THIS VEHICLE HAS A SUPPLEMENTAL RESTRAINT SYSTEM (SRS). REFER TO THE SRS COMPONENT AND WIRING LOCATION VIEW IN ORDER TO DETERMINE WHETHER YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING. WHEN YOU ARE PERFORMING SERVICE ON OR NEAR THE SRS COMPONENTS OR THE SRS WIRING, REFER TO THE SRS SERVICE INFORMATION. FAILURE TO FOLLOW WARNINGS COULD RESULT IN POSSIBLE AIR BAG DEPLOYMENT, PERSONAL INJURY, OR OTHERWISE UNNECESSARY SRS SYSTEM REPAIRS.

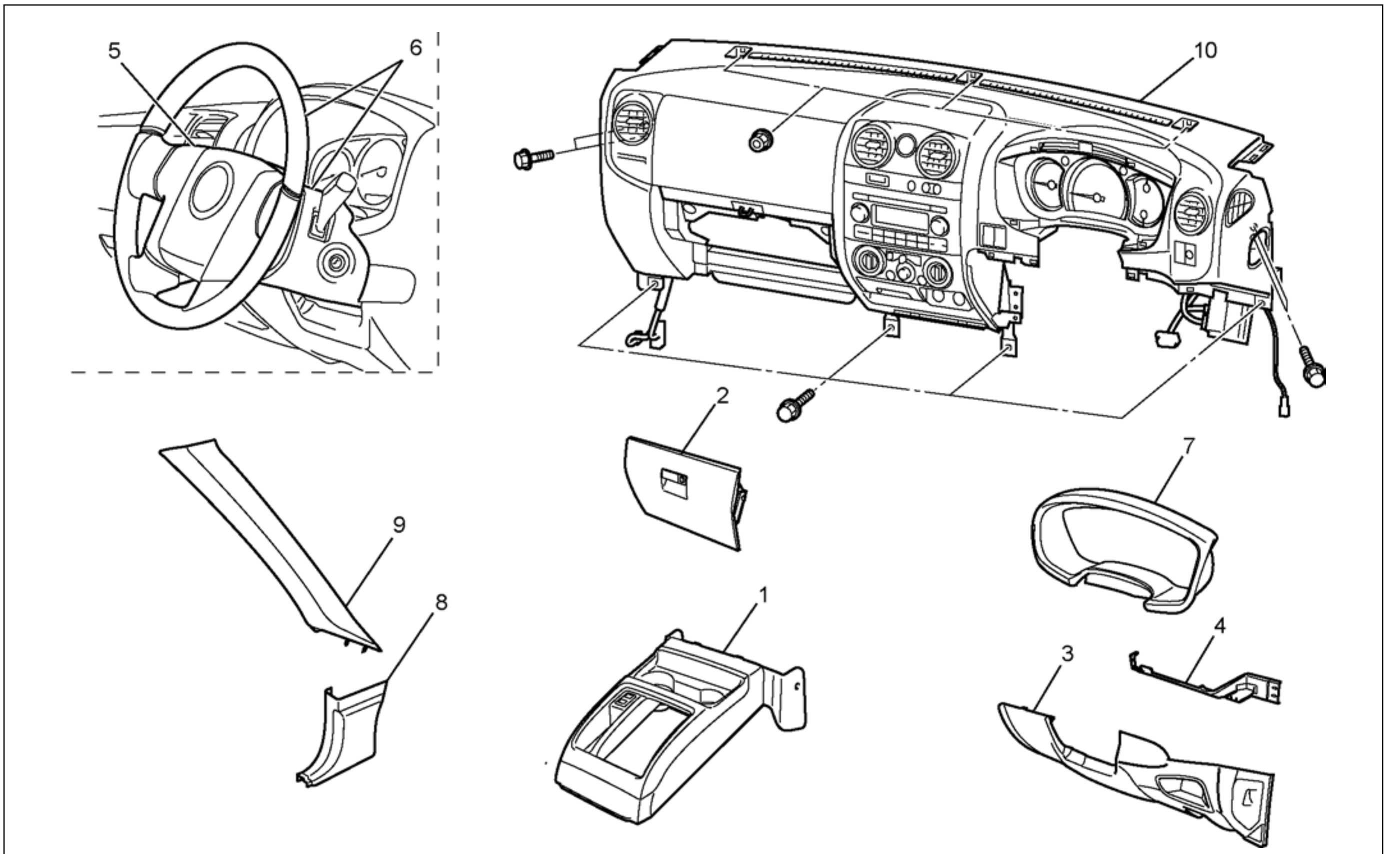
CAUTION: Always use the correct fastener in the proper location. When you replace a fastener, use ONLY the exact part number for that application. ISUZU/GM will call out those fasteners that require a replacement after removal. ISUZU/GM will also call out the fasteners that require thread lockers or thread sealant. UNLESS OTHERWISE SPECIFIED, do not use supplemental coatings (paints, greases, or other corrosion inhibitors) on threaded fasteners or fastener joint interfaces. Generally, such coatings adversely affect the fastener torque and the joint clamping force, and may damage the fastener. When you install fasteners, use the correct tightening sequence and specifications. Following these instructions can help you avoid damage to parts and systems.

General Description

Pulling up the parking brake lever by hand will set the parking brake. By means of a ratchet type lock, the lever can be held in that position until it is released. The position of the lever is transmitted through cable/lever systems to the rear wheels. These parts are designed to obtain sufficient braking force even when parking on slopes. When the parking brake is set, or when the ignition SW is in the “ON” position, the brake warning light illuminates. The rear wheel parking brake is a leading-trailing brake (mechanical inside expansion type) built in the rear drum brake. Parking brake adjustment is made through the adjusting hole (bored through back plate). Parking brake lever stroke should be adjusted to 8–14 notches with 294N (30 kg / 66 lb) (bench seat) or 6–9 notches with 294N (30 kg / 66 lb) (bucket seat). Refer to “Parking Brake Adjustment” in this section.

Parking Brake Lever

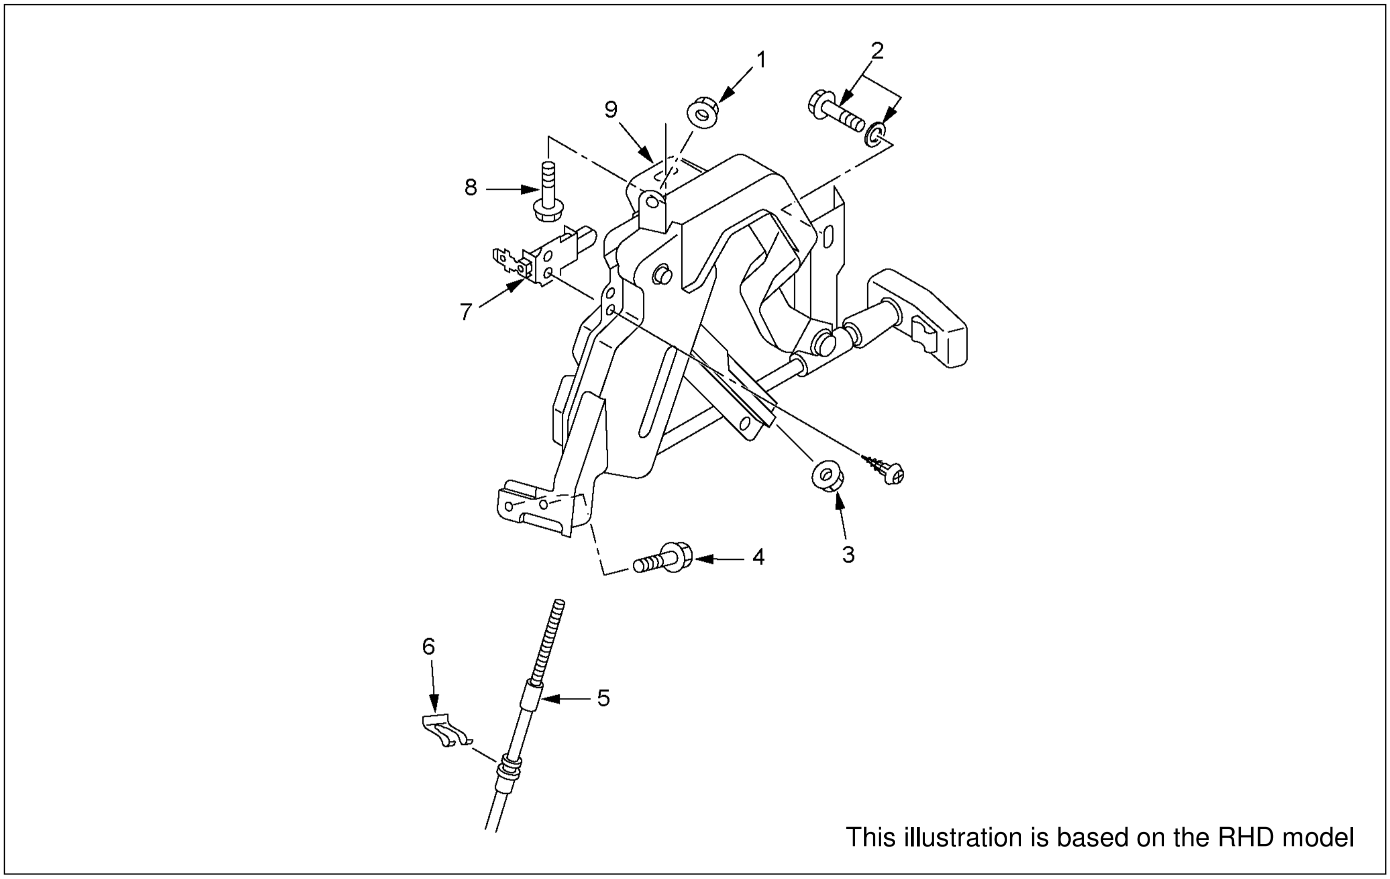
Parking Brake Lever Assembly and Associated Parts (Bench Seat)



RTW75DMF000101

Legend

(1) Front Console Assembly
(2) Glove Box
(3) Instrument Panel Driver Lower Cover Assembly
(4) Driver Knee Bolster Assembly
(5) Driver Air Bag
(6) Steering Wheel/Steering Cowl
(7) Meter Cluster Assembly
(8) Dash Side Trim Cover
(9) Front Pillar Trim Cover
(10) Instrument Panel Assembly & Cross Beam



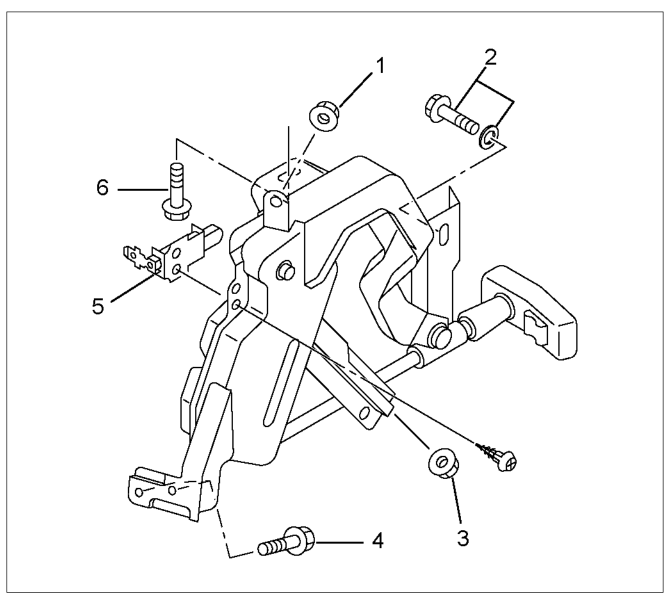
RTW35DLH000101

Legend

(1) Nut
(2) Bolt and Washer
(3) Adjust Nut
(4) Bolt
(5) Front Parking Brake Cable
(6) Clip
(7) Switch
(8) Bolt
(9) Parking Lever Assembly

Removal

1. Remove instrument panel assembly & cross beam in legend numbers order.
   Refer to section 10.
2. Bolts (2)(6) are already removed in step 1.
3. Remove adjust nut (3).
4. Pull out clip and take out front parking brake cable from parking lever assembly.
5. Remove bolts (4) and nut (1) and take out parking lever assembly.
6. Remove switch (5).



RTW65BSH000101

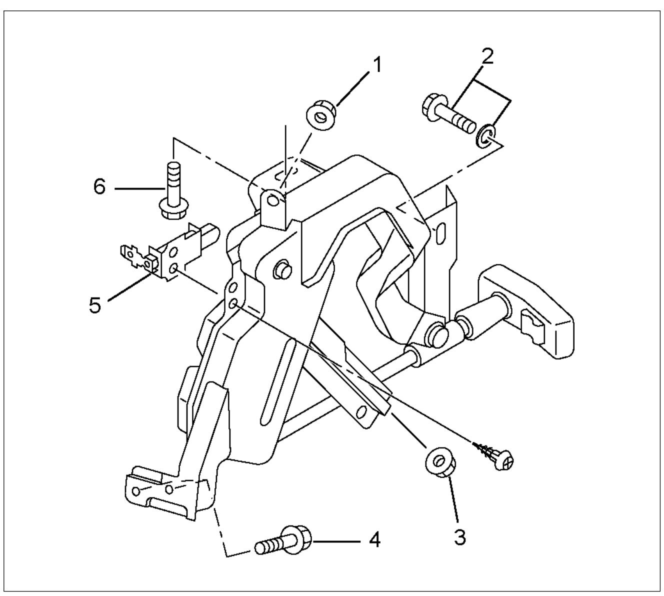
Installation

1. Install switch (5).

   Torque: 1.5 N·m (0.15 kgf·m/13 lb·in)
2. Set parking lever assembly.
3. Install bolts (4) and nut (1) and tighten them to the specified torque.

   Torque: 15 N·m (1.5 kgf·m/11 lb·ft)
4. Set front parking brake cable in parking lever assembly.
5. Drive clip into the outer cable groove of front parking brake cable at the outside of parking lever assembly.
6. Drive adjust nut (3) on the front end of front parking brake cable so that front ends of rear parking brake fit into the rear end (equalizer) of front cable.
7. Install instrument panel assembly & cross beam. Refer to section 10.
8. Install bolts (2)(6) and tighten them to the specified torque.

   Torque: 15 N·m (1.5 kgf·m/11 lb·ft)
9. Install all parts removed. Refer to section 10.
10. When the parking brake cable is replaced, pull the parking brake lever with a force equivalent to operating force: 490 N (50 kg/110 lb), 10 times for conditioning.
11. Adjust nut (3) so that the lever goes through 8–14 notches, when pulled with an operation force of 294 N (30 kg/66 lb) and check brake for no drag.



RTW65BSH000101

Front Parking Brake Cable

Front Parking Brake Cable and Associated Parts (Bench Seat)

RTW35DMF000101

Legend

(1) Adjust Nut
(2) Clip
(3) Bolt
(4) Bolt
(5) Parking Brake Cable T-end
(6) Front Parking Brake Cable

Removal

1. Remove seat assembly and seat adjuster.
   Refer to section 10.
2. Turn over the carpet so that front parking brake cable appears.
3. Remove adjust nut.
4. Pull out clip and take out front parking brake cable.
5. Remove bolt.
6. Disconnect parking brake cable T-ends from front parking brake cable.
7. Take out front parking brake cable through the floor hole.

Installation

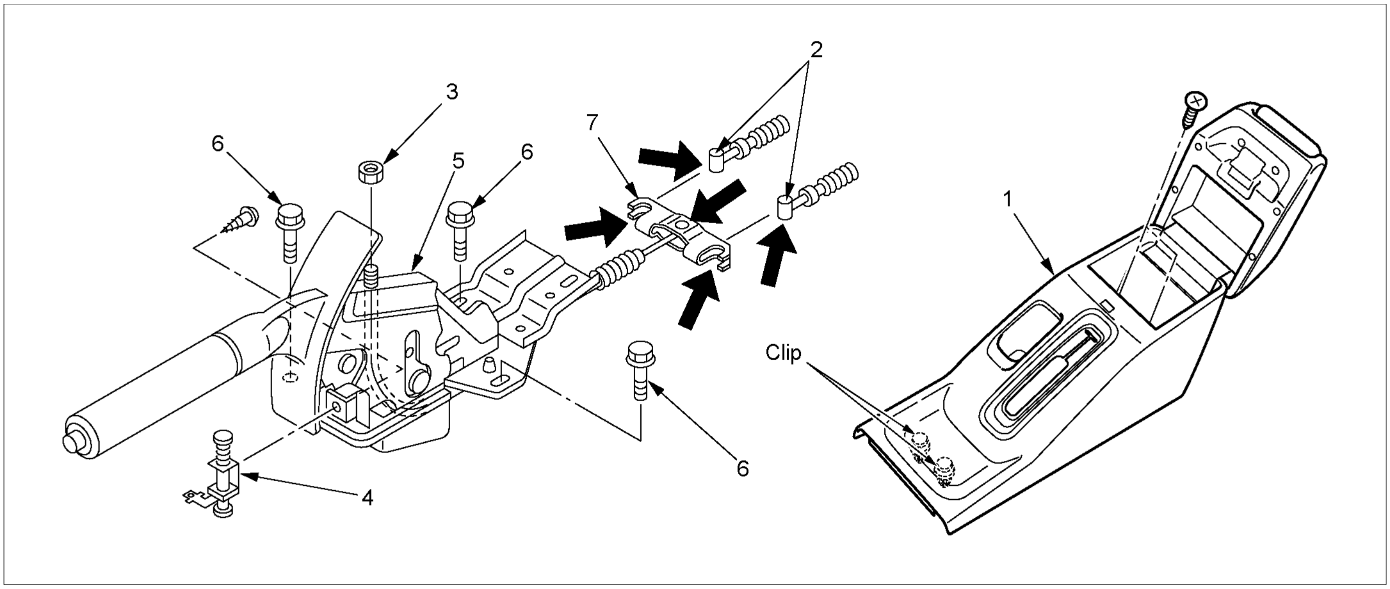
1. Apply grease (multipurpose type grease) to the connecting portion of parking brake cable T-end and front parking brake equalizer (arrow mark).
2. Let rear end (equalizer) of front parking brake cable enter the floor hole and connect it with parking brake rear cable T-end.
3. Set front parking brake cable in the parking lever assembly.
4. Drive clip into the outer cable groove of front parking brake cable at the outside of the parking lever assembly.
5. Install bolt on the floor and tighten to the specified torque.

Torque: 15 N·m (1.5 kgf·m/11 lb·ft)

6. Drive adjust nut on the front end of front parking brake cable so that parking brake cable T-end fits into the rear end (equalizer) of front cable.
7. Fit the carpet on the floor.
8. Install seat adjuster and seat assembly.
   Refer to section 10.
9. Pull parking brake lever with a force equivalent to operating force: 490 N (50 kg/110 lb), 10 times for conditioning.
10. Adjust nut so that parking brake lever goes through 8–14 notches, when pulled with an operation force of 294 N (30 kg/66 lb).
11. Check brake for no drag.

Parking Brake Lever

Parking Brake Lever Assembly and Associated Parts (Bucket Seat)



Legend

(1) Rear Floor Console
(2) Parking Brake Cable T-end
(3) Adjust Nut
(4) Switch
(5) Parking Brake Lever Assembly
(6) Bolt
(7) Equalizer

Removal

1. Remove rear floor console.
   Refer to section 10.
2. Loosen adjust nut.
3. Remove bolt.
4. Remove switch.
5. Disconnect parking brake cable T-end from parking brake lever assembly.
6. Take out parking brake lever assembly.

Installation

1. Apply grease (multipurpose type grease) to the connecting portion of parking brake rear cable T-end and parking brake lever equalizer. (arrow mark).
2. Connect parking brake rear cable T-end to equalizer.
3. Install switch.
4. Tighten the parking brake lever fixing bolt to the specified torque.

   Torque: 15 N·m (1.5 kgf·m/11 lb·ft)
5. Drive adjust nut on parking brake assembly so that parking brake cable T-end fits into equalizer.
6. Install rear floor console.
   Refer to section 10.
7. Pull parking brake lever with a force equivalent to operating force: 490 N (50 kg/110 lb), 10 times for conditioning.
8. Adjust nut so that parking brake lever goes through 6–9 notches, when pulled with an operation force of 294 N (30 kg/66 lb).
9. Check brake for no drag.

Parking Brake Rear Cable

Parking Brake Rear Cable and Associated Parts

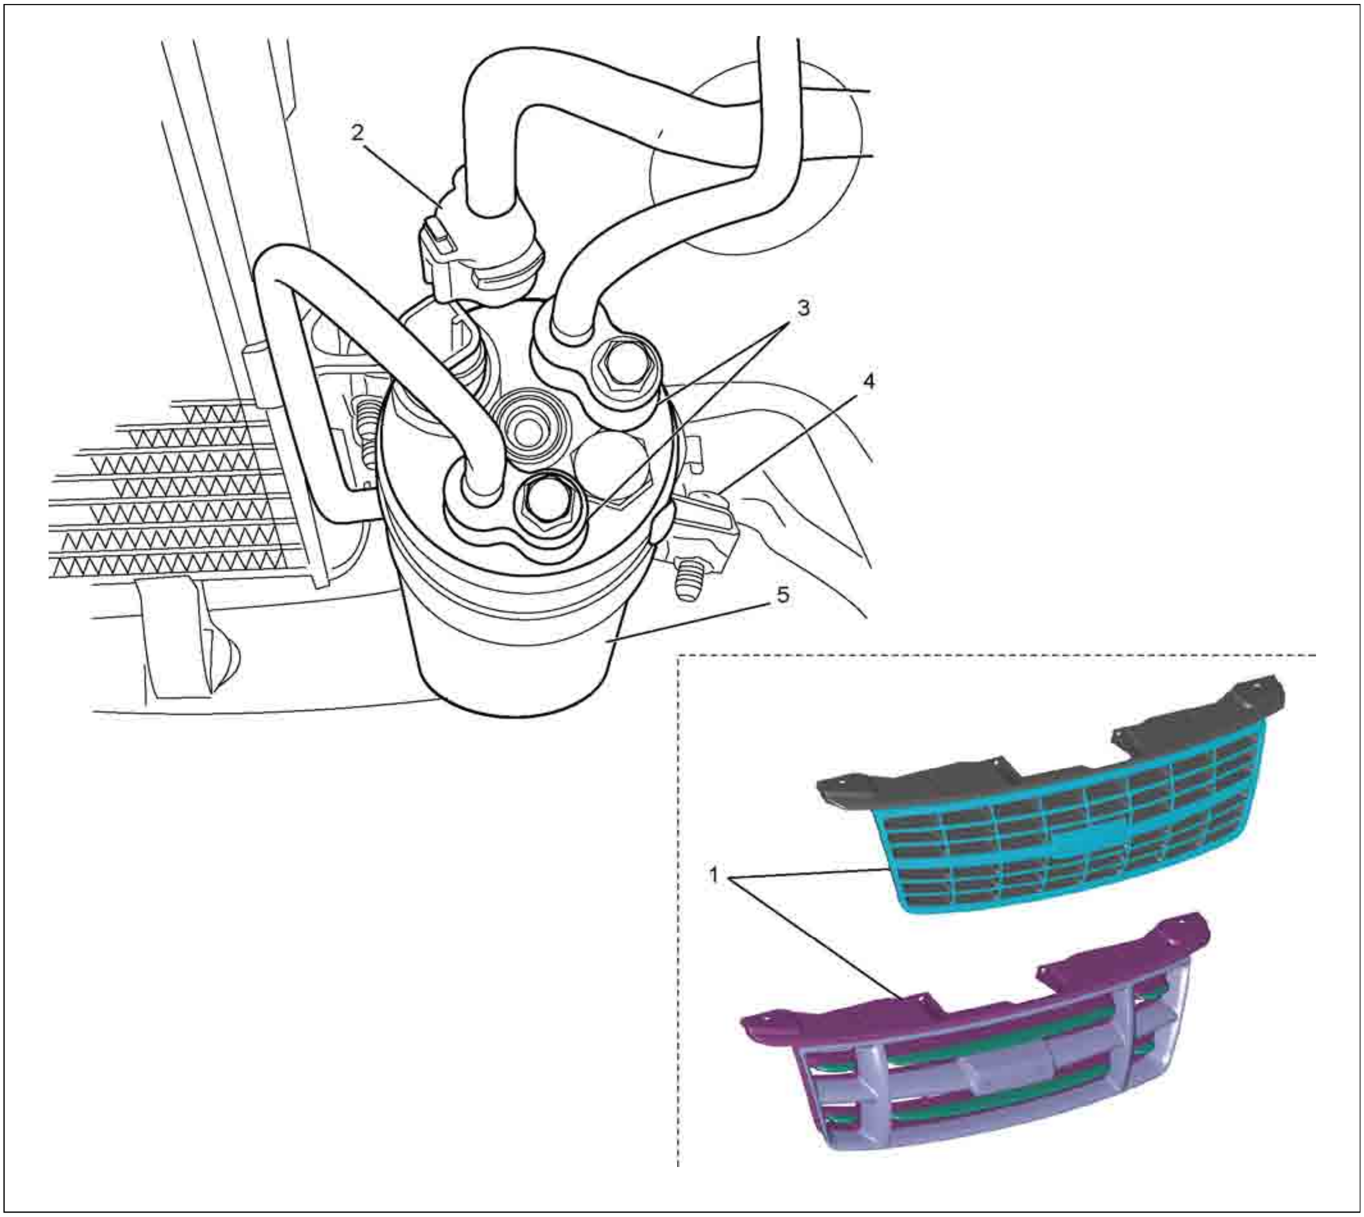
RECEIVER / DRIER

REMOVAL AND INSTALLATION



RTW710LF000801

Removal Steps

1. Radiator grille
2. Pressure switch connector
3. Refrigerant line
4. Bracket bolt
5. Receiver/drier

Installation Steps

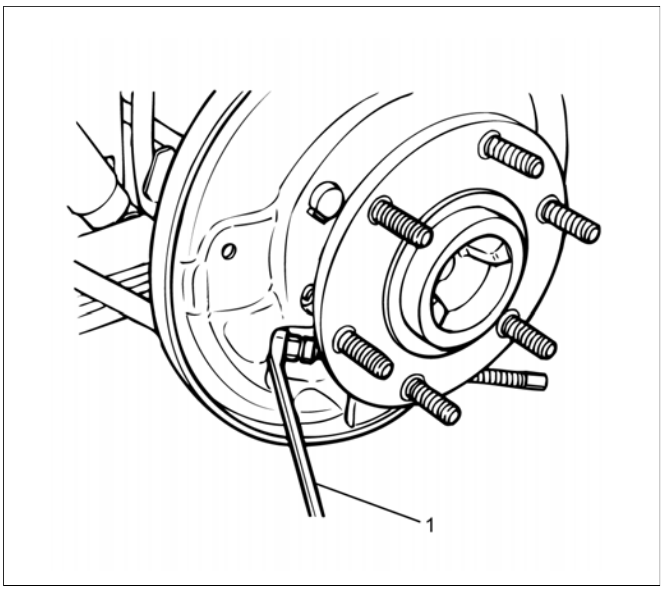
5. Receiver/drier
4. Bracket bolt
3. Refrigerant line
2. Pressure switch connector
1. Radiator grille

Removal

1. Remove wheel and tire.
2. Remove brake drum.
3. Remove tension pin and shoe clamp spring.
4. Remove return spring.
5. Remove shoe assembly with parking brake lever.
6. Remove shoe assembly with adjuster lever and spring.
7. Remove parking brake inner cable from parking brake lever.
8. Use offset box wrench (12 mm hex.) to compress locking lugs on the cable, then remove parking brake outer cable from back plate.

NOTE: Do not twist or bend the cable too much.

A damaged cable will cause poor operation or a cable break down.



RTW55CSH000301

Legend

(1) Offset Box Wrench (12 mm hex)

9. Remove nut to fix the cable on the leaf spring.
10. Take out parking brake rear cable from the back plate.
11. Remove parking brake cable bolt and nut.
12. Disconnect T-end from the equalizer of front cable.

Installation

NOTE: Be sure to use a new shoe clamp spring and a new adjuster lever clip.

1. Apply grease (multipurpose type grease) to the connecting portion of the rear cable and equalizer. (arrow mark).
2. Install parking brake outer cable in back plate and inner cable in parking brake lever.
3. Install return spring.
4. Install shoe clamp spring and tension pin.
5. Install shoe assembly with adjuster lever, shoe assembly with parking brake lever and spring. ---- snap action
6. Install nut and tighten it to the specified torque.

   Torque: 7 N·m (0.7 kgf·m/61 lb·in)
7. Connect T-end with equalizer through outer cable retainer.
8. Install parking brake cable nut and tighten it to the specified torque.

   Torque: 15 N·m (1.5 kgf·m/11 lb·ft)
9. Install parking brake cable bolt and tighten it to the specified torque.

   Torque: 7 N·m (0.7 kgf·m/61 lb·in)
10. Install brake drum.
11. Install wheel and tire.
12. Pull parking brake lever with a force equivalent to operating force: 490 N (50 kg/110 lb), 10 times for conditioning.
13. Adjust parking brake lever adjusting nut so that parking brake lever goes through 6-9 notches (Bucket Seat) or 8–14 notches (Bench Seat), when pulled with an operation force of 294 N (30 kg/66 lb).
14. Check brake for no drag.

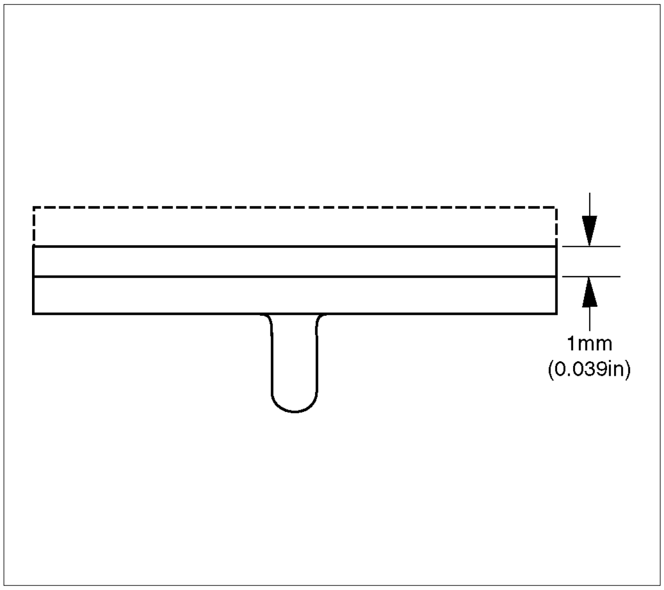
Inspection and Repair

Brake Lining Inspection

Check the shoe assemblies for wear by removing the brake drum.

Replace the shoe assemblies if the lining thickness is less than 1.0 mm (0.039 in).

Minimum limit: 1.0 mm (0.039 in)



308RS004

Parking Brake Adjustment

NOTE: All brakes are self-adjusting. Brakes are adjusted by repeated stepping on the brake pedal. (After stepping on the pedal and releasing it, the rear brake auto-adjuster produces a clicking sound. The same operation should be repeated until the sound disappears.)

Take the following steps after overhauling the rear brake assembly.

1. Move the parking brake lever to its fully released position.
2. Parking brake cable must be loosened sufficiently. (Loosen the adjust nut.)
3. Repeat stepping on the brake pedal firmly, and releasing it until the clicking sound can no longer be heard.
   If the difference between the brake drum inside diameter and the brake shoes external diameter is adjusted to be 0.4 mm (0.0157 in), the number of times for depressing the brake pedal can be reduced.
4. Remove the drum. Measure the brake drum inside diameter and the brake shoes external diameter.
   Total shoe clearance: 0.4 mm (0.0157 in)
   If incorrect, readjust the brake shoe clearance.
5. Rotate the adjust nut of hand brake lever until all slack disappears from the cable. Set the adjust nut.
6. After the rear brake shoe/drum gap has been adjusted, perform parking brake cable adjustment.
7. Turn the adjusting nut so that the parking brake lever travels 6–9 notches (Bucket Seat) or 8–14 notches (Bench Seat) when pulled up with a force of 294 N (30 kg/66 lb).
8. Make sure there is no brake dragging.

Main Data and Specifications

General Specifications

Type	Leading-Trailing
Drum inside diameter	254 mm (10 in) or 295 mm (11.6 in)
Parking brake lever stroke	6–9 notches; Bucket Seat 8–14 notches; Bench Seat When pulled with a force of 294 N (30 kg/66 lb)

TROUBLESHOOTING

TABLE OF CONTENTS

Basic Inspection Procedure

Follow the under inspection procedure, when the problem vehicle comes workshop.

Step	Inspection point	Inspection result	YES	NO
1	Check the check engine lamp	Is the check engine lamp turn ON ?	Go to *section 6E "On Board Diagnostic (OBD) System Check"*	Go to *Step 2*
2	The battery fluid level and the gravity	Was the problem found?	Re-charge the battery or replace the battery	Go to *Step 3*
3	The engine coolant capacity	Was the problem found?	Replenish the engine coolant	Go to *Step 4*
4	The engine oil level	Was the problem found?	Replenish the engine oil	Go to *Step 5*
5	The air cleaner element	Was the problem found?	Clean or replace	Go to *Step 6*
6	The piping fixing condition (oil, vacuum and fuel piping)	Was the problem found?	Return normal condition	Go to *Step 7*
7	The drive belt tension and break	Was the problem found?	Re-adjust the tension or replace	Go to *Step 8*
8	Go to *section 6E "On Board Diagnostic (OBD) System Check"*	Was the problem found?	Verify repair	Go to *Step 9*
9	Go to *mechanical troubleshooting chart*	Was the problem found?	Verify repair	—

1. Hard Starting

Inspect the following items before diagnosis.

1. The battery conditions.
   The terminal connection condition.
   The battery charge condition or battery power weakness.
2. The fan belt loosen or broken.
3. The main fuse condition (open or not).
4. Fuel quantity level.

1–1 Starter motor inoperative

Step	Action	Value(s)	Yes	No
1	Check the starter switch. Does the starter switch work?	—	Go to *Step 2*	Repair or replace the starter switch
2	Check the starter relay. Does the starter relay work?	—	Go to *Step 3*	Repair or replace the starter relay
3	Check the magnetic switch. Does the magnetic switch work?	—	Go to *Step 4*	Repair or replace the magnetic switch
4	Check the pinion gear condition on the starter motor. Was the condition normal?	—	Go to *Step 5*	Replace the pinion gear
5	Check the brush wear or brush spring weakness. Was the condition normal?	—	Replace the starter motor assembly	Repair or replace the brush or brush spring

1-2 Starter motor operates but engine does not turn over

Step	Action	Value(s)	Yes	No
1	Check the engine internal seizure. Was the engine seized?	—	Repair or replace seized parts	Check other DTC by Tech 2 and go to indicated DTC

1-3 Engine turn over but does not start engine

Incase of the fuel not being delivered to the injection pump

Step	Action	Value(s)	Yes	No
1	Check clogged, damaged the fuel piping or the connector loosen. Was any problem found?	—	Repair replace problem parts.	Go to *Step 2*
2	Was the over flow valve on the fuel filter closed?	—	Repair replace the over flow valve	Go to *Step 3*
3	Was the fuel filter element clogged?	—	Replace the fuel filter element	Go to *Step 4*
4	Was the fuel line air bled?	—	Go to *Step 5*	Bleed the air
5	Are any DTC stored?	—	Go to *indicated DTC*	Solved

Incase of the fuel is being delivered to the injection pump

Step	Action	Value(s)	Yes	No
1	Was the water contain in the fuel?	—	Replace the fuel	Go to *Step 2*
2	Was the fuel line air bled?	—	Go to *Step 5*	Bleed the air
3	Was the injection spray condition complete?	—	Go to *Step 4*	Replace the injection nozzle
4	Was the injection nozzle injection starting pressure OK?	(See below)	Go to *Step 5*	Replace the injection nozzle
5	Was the injection nozzle sticking?	—	Replace the injection nozzle	Go to *Step 6*
6	Are any DTC stored?	—	Go to *indicated DTC*	Solved

Injection nozzle opening pressure
1st = 19.5 MPa (199 kg/cm^2, 2828 psi)

1. Air duct

2. Unstable Idling

Step	Action	Value(s)	Yes	No
1	Was the fuel line air bled completely?	—	Go to *Step 3*	Bleed the air
2	Was the fuel line leakage or blockage found?	—	Repair or replace relation parts.	Go to *Step 4*
3	Was the water contained in the fuel?	—	Replace the fuel	Go to *Step 5*
4	Was the fuel filter element clogged?	—	Replace the fuel filter element	Go to *Step 6*
5	Was the injection starting pressure or the injection spray condition OK?	(See below)	Go to *Step 7*	Replace the injection nozzle
6	Was the injection nozzle sticking?	See *Step 6*	Replace the injection nozzle	Go to *Step 8*
7	Check the throttle valve condition. Was the idling port clogged in the throttle valve?	—	Repair or replace the throttle valve	Go to *Step 9*
8	Was the valve clearance improper adjusted?	0.4 mm (0.016 in) both intake and exhaust valves	Adjust the valve clearance	Go to *Step 10*
9	Was the compression pressure OK?	3,040 kPa (31 kg/cm^2, 441 psi) at 200rpm	Go to *Step 11*	Readjust the valve clearance or replace the cylinder head gasket or cylinder liner or piston or piston ring or valve and valve seat
10	Are any DTC stored?	—	Go to *indicated DTC*	Solved

Injection nozzle opening pressure
1st = 19.5 MPa (199 kg/cm^2, 2828 psi)

3. Insufficient Power

Step	Action	Value(s)	Yes	No
1	Was the air cleaner element condition OK? (Clogged or not)	—	Go to *Step 2*	Clean or replace the air cleaner element.
2	Was the intake air leakage found from intake system?	—	Repair or replace the intake air system.	Go to *Step 3*
3	Was the fuel filter element condition OK? (Clogged or not)	—	Go to *Step 4*	Clean or replace the fuel filter element.
4	Check the fuel injection pipes. Does the injection pipes have obstruction or any damage?	—	Repair or replace the fuel injection pipes.	Go to *Step 5*
5	Was the water contained in the fuel?	—	Replace the fuel	Go to *Step 6*
6	Was the injection nozzle pressure or spray pattern normal?	—	Go to *Step 7*	Readjust the injection nozzle pressure or replace the nozzle.
7	Was the compression pressure OK?	3.0 MPa (31.0 kg/cm^2, 441 psi) at 200 rpm	Go to *Step 8*	Readjust the valve clearance or replace the cylinder head gasket or cylinder liner or piston or piston ring or valve and valve seat
8	Was the exhaust pipe clogged?	—	Repair or replace the exhaust pipe.	Go to *Step 9*
9	Was the exhaust gas leakage found from exhaust system?	—	Repair or replace the exhaust system.	Go to *Step 10*
10	Was the waste gate control actuator hose broken or cracked?	—	Replace the hose.	Go to *Step 11*
11	Was the waste gate working completely?	—	Go to *Step 12*	Replace the turbocharger assembly.
12	Was turbocharger working completely?	—	Go to *Step 13*	Replace the turbocharger assembly.
13	Are any DTC stored?	—	Go to *indicated DTC*	Solved

4. Excessive Fuel Consumption

Step	Action	Value(s)	Yes	No
1	Was the air cleaner element clogged?	—	Clean or replace the air cleaner element.	Go to *Step 2*
2	Was the air leakage found from the air intake side of the turbocharger?	—	Repair or replace the air intake side of the turbocharger.	Go to *Step 3*
3	Was the turbocharger working completely?	—	Go to *Step 4*	Replace the turbocharger
4	Was there the fuel leakage?	—	Repair or replace the fuel leakage part.	Go to *Step 5*
5	Was the compression pressure OK?	3.0 MPa (31.0 kg/cm^2, 441 psi) at 200 rpm	Go to *Step 6*	Readjust the valve clearance or replace the cylinder head gasket or cylinder liner or piston or piston ring or valve and valve seat
6	Was the injection nozzle pressure or spray pattern normal?	—	Go to *Step 7*	Replace the injection nozzle
7	Are any DTC stored?	—	Go to *indicated DTC*	Solved

5. Excessive Oil Consumption

Step	Action	Value(s)	Yes	No
1	Does the air cleaner element conditon OK? (Clogged or not)	—	Go to *Step 2*	Clean or replace the air cleaner element
2	Does PCV (Positive Crankcase Ventilation) Valve has problem?	—	Repair or replace the relation parts.	Go to *Step 3*
3	Was the oil pressure value more than normal value?	Less than 588 kPa (6.0 kg/cm^2, 85 psi)	Repair or replace the oil relief valve	Go to *Step 4*
4	Inspect the front and rear crankshaft oil seal. Was the oil leakage found?	—	Replace the failure part.	Go to *Step 5*
5	Was the oil leakage found from any gasket?	—	Replace the wrong gasket	Go to *Step 6*
6	Inspect the valve stem seal, the valve stem and the valve guide for worn. Were any worn found?	—	Replace the worn part.	Go to *Step 7*
7	Was the oil leakage found from the turbocharger oil seal?	—	Replace the oil seal.	Go to *Step 8*
8	Was the oil drain pipe of the turbocharger restricted?	—	Repair or replace the oil drain pipe.	Go to *Step 9*
9	Was the oil drain passage in the turbocharger center housing restricted?	—	Clean the center housing	Go to *Step 10*
10	Does turbine wheel has any impact damage?	—	Replace the turbocharger	Go to *Step 11*
11	Are any DTC stored?	—	Go to *indicated DTC*	Solved

6. Overheating

Step	Action	Value(s)	Yes	No
1	Was the engine coolant level OK?	—	Go to *Step 2*	Replenish the coolant
2	Was the water leakage or the radiator restriction found? (Include radiator cap)	—	Repair or replace the leakage part.	Go to *Step 3*
3	Was the fan belt slippage found?	—	Tension or replace the fan belt.	Go to *Step 4*
4	Was the fan clutch working completely?	—	Go to *Step 5*	Replace the fan clutch assembly.
5	Was the oil leakage found from fan clutch?	—	Replace the fan clutch assembly	Go to *Step 6*
6	Was the thermostat working normally?	—	Go to *Step 7*	Replace the thermostat.
7	Was the water pump working OK?	—	Go to *Step 8*	Replace the water pump assembly.
8	Was the restriction by the foreign materials in the cooling system found? For example, clog the water hose between the cylinder body and radiator etc..	—	Clean or replace the clog part.	Go to *Step 9*
9	Was the water leakage found from the sealing cap on the cylinder body?	—	Replace the sealing cap or replace the cylinder body.	Go to *Step 10*
10	Are any DTC stored?	—	Go to *indicated DTC.*	Solved

7. White Exhaust Smoke

Step	Action	Value(s)	Yes	No
1	Was the compression pressure OK?	3.0 MPa (31.0 kg/cm^2, 441 psi) at 200 rpm	Go to *Step 2*	Readjust the valve clearance or replace the cylinder head gasket or cylinder liner or piston or piston ring or valve and relation parts.
2	Was the PCV (Positive Crankcase Ventilation) valve working completely?	—	Go to *Step 3*	Repair or replace the PCV valve.
3	Was the turbocharger working completely?	—	Go to *Step 4*	Replace the turbocharger.
4	Are any DTC stored?	—	Go to *indicated DTC*	Solved

8. Dark Exhaust Smoke

Step	Action	Value(s)	Yes	No
1	Was the air cleaner element normal condition?	—	Go to *Step 2*	Clean or replace the air cleaner element
2	Was the EGR valve sticking?	—	Replace the EGR valve	Go to *Step 3*
3	Was the injection nozzle pressure or the injection spray pattern OK?	—	Go to *Step 4*	Replace the injection nozzle
4	Was the oil leakage found from the turbocharger oil seal?	—	Replace the oil seal	Go to *Step 5*
5	Was the oil drain pipe of the turbocharger restricted?	—	Repair or replace the oil drain pipe	Go to *Step 6*
6	Was restricted the oil drain passage in the turbocharger center housing restricted?	—	Clean the center housing	Go to *Step 7*
7	Does turbine wheel has any impact damage?	—	Replace the turbocharger	Go to *Step 8*
8	Does PCV (Positive Crankcase Ventilation) Valve has problem?	—	Repair or replace the relation parts	Go to *Step 9*
9	Are any DTC stored?	—	Go to *indicated DTC*	Solved

9. Oil Pressure Does Not Rise

Step	Action	Value(s)	Yes	No
1	Was the oil pressure warning lamp working OK?	—	Go to *Step 2*	Replace the oil pressure warning lamp
2	Does the oil filter element clog?	—	Replace the oil filter element	Go to *Step 3*
3	Does the relief valve open?	—	Repair or replace the relief valve	Go to *Step 4*
4	Does the oil strainer clog?	—	Clean or replace the oil strainer	Go to *Step 5*
5	Was the oil pump working OK? (The pump related parts worn etc.)	—	Go to *Step 6*	Repair or replace the oil pump.
6	Was the rocker arm and/or relation parts worn?	—	Replace the rocker arm and/or relation parts	Go to *Step 7*
7	Was the camshaft and/or relation parts worn?	—	Replace the camshaft and/or relation parts	Go to *Step 8*
8	Was the crankshaft and/or relation parts worn?	—	Replace the crankshaft and/or relation parts	Go to *Step 9*
9	Are any DTC stored?	—	Go to *indicated DTC*	Solved

Table of pressure unit

Pressure	kPa (kg/cm^2)	100 (1.0)	980 (10.0)
Resistance	ohm	81	30
Electric current	A	63.5	106.7

10. Abnormal Engine Noise

10–1 Engine knocking

Step	Action	Value(s)	Yes	No
1	Was the injection nozzle pressure or injection spray pattern OK?	—	Go to *Step 2*	Replace the injection nozzle
2	Was the compression pressure OK?	3.0 MPa (31.0 kg/cm², 441 psi) at 200 rpm	Go to *Step 3*	Replace the cylinder head gasket or piston ring
3	Are any DTC stored?	—	Go to *indicated DTC*	Solved

10–2 Gas leakage noise

Step	Action	Value(s)	Yes	No
1	Was the exhaust pipe loose or broken?	—	Retighten or replace the exhaust pipe	Go to *Step 2*
2	Was the exhaust manifold loose?	—	Retighten or replace the exhaust manifold. Or replace the exhaust manifold gasket	Go to *Step 3*
3	Was the injection nozzle loose?	—	Retighten or replace the injection nozzle fixing bolt	Go to *Step 4*
4	Was the cylinder head gasket broken?	—	Replace the cylinder head gasket	Go to *Step 5*
5	Are any DTC stored?	—	Go to *indicated DTC*	Solved

10–3 Continuous noise

Step	Action	Value(s)	Yes	No
1	Was the fan belt tension OK?	9 – 13 mm (0.35 – 0.51 in)	Go to *Step 2*	Adjust the fan belt tension.
2	Was the cooling fan loose?	—	Tighten the cooling fan	Go to *Step 3*
3	Was noise coming from the generator?	—	Repair or replace the generator and/or the vacuum pump	Go to *Step 4*
4	Was noise coming from the water pump?	—	Replace the water pump	Go to *Step 5*
5	Was noise coming from the cylinder head cover?	—	Readjust the valve clearance.	Go to *Step 6*
6	Are any DTC stored?	—	Go to *indicated DTC*	Solved

10-4 Slapping noise

Step	Action	Value(s)	Yes	No
1	Was noise coming from the cylinder head cover?	—	Go to *Step 2*	Go to *Step 4*
2	Were valve clearances correct?	0.4 mm (0.016 in) both intake and exhaust	Adjust the valve clearances	Go to *Step 3*
3	Were the rocker arms damaged?	—	Replace the rocker arms	Go to *Step 4*
4	Was the flywheel fixing bolt loose?	—	Tighten the fixing bolt.	Go to *Step 5*
5	Was noise coming from the cylinder body?	—	Go to *Step 6*	Go to *Step 10*
6	Inspect the crankshaft bearing and/or crankshaft. Was the crankshaft bearing and/or crankshaft worn?	—	Replace the worn parts	Go to *Step 7*
7	Inspect the connecting rod bearing and/or crankpin. Was the connecting rod bearing and/or crankpin worn?	—	Replace the worn parts	Go to *Step 8*
8	Inspect the connecting rod small end bushing and/or piston pin. Was the connecting rod small end bushing and/or piston pin worn?	—	Replace the worn parts	Go to *Step 9*
9	Inspect the piston and/or cylinder liner. Was the piston and/or cylinder liner worn or damaged?	—	Replace the worn or damaged parts	Go to *Step 10*
10	Are any DTC stored?	—	Go to *indicated DTC*	Solved

10-5 Excessive turbocharger noise

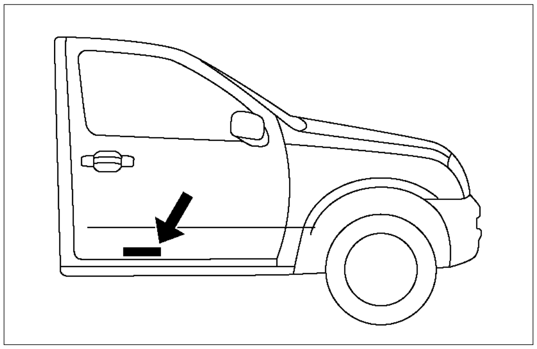
The vibration noise (the air aspiration noise) occurred when turbocharger rotates, it is normal condition of the turbocharger, no necessary any actions.

Step	Action	Value(s)	Yes	No
1	Was the excessive noise coming from the turbocharger?	—	Go to *Step 2*	Go to *Step 10*
2	Inspect the fixing bolts and bands. Was any problem found?	—	Tighten the loose parts	Go to *Step 3*
3	Was the intake or exhaust system gasket damaged?	—	Replace the damaged gasket.	Go to *Step 4*
4	Inspect rotation parts condition. Was the turbine wheel rotation rough?	—	Replace the turbocharger.	Go to *Step 5*
5	Inspect the turbine wheel. Was the turbine wheel rubbing against housing?	—	Replace the turbocharger.	Go to *Step 6*
6	Was the turbine wheel damaged?	—	Replace the turbocharger.	Go to *Step 7*
7	Were there carbon deposits in the turbine or compressor housing?	—	Clean or replace the turbocharger.	Go to *Step 8*
8	Inspect the oil supply condition. Was the oil feed pipe clogged?	—	Repair or replace the oil feed pipe.	Go to *Step 9*
9	Was the turbine shaft bearing worn?	—	Replace the turbocharger.	Go to *Step 10*
10	Are any DTC stored?	—	Go to *indicated DTC*	Solved

11. Rotating Part Wear of Turbocharger

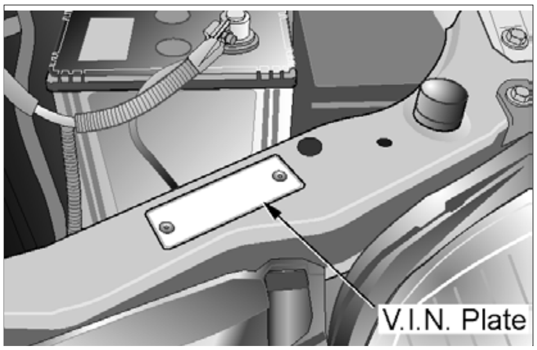
Step	Action	Value(s)	Yes	No
1	Inspect engine oil. Was it contaminated with foreign materials?	—	Replace the engine oil	Go to *Step 2*
2	Was the recommended engine oil grade/viscosity being used?	API CD or ISUZU genuine/ 10W–30	Go to *Step 3*	Replace the engine oil
3	Was the oil feed pipe restricted?	—	Clean or replace the oil feed pipe	Go to *Step 4*
4	Was the oil seal of turbocharger defective?	—	Replace the oil seal	Go to *Step 5*
5	Was the center housing oil drain passage clogged?	—	Clean center housing or replace the turbocharger	Go to *Step 6*
6	Was there oil sludge and/or coking on the turbine shaft?	—	Replace the turbocharger	Go to *Step 7*
7	Are any DTC stored?	—	Go to *indicated DTC*	Solved

IDENTIFICATION



CHASSIS NUMBER

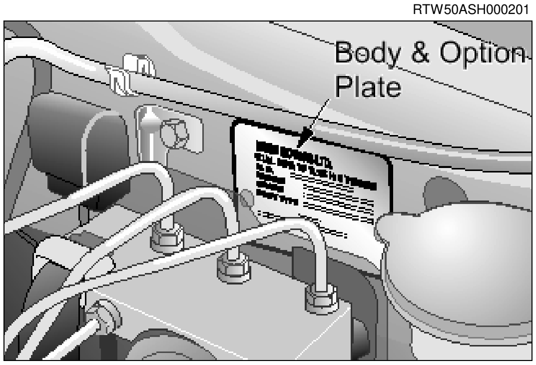
The chassis number is stamped on the right-hand side of the chassis side member under the right door.



RTW50ASH000201

VEHICLE IDENTIFICATION PLATE

The vehicle identification plate is attached to the upper face of the radiator sill in the engine compartment.



BODY AND OPTION IDENTIFICATION PLATE

The body and option plate shows body style, body serial number, paint and trim colour combination, paint number, engine transmissions, axle ratio options and built date. The built date is defined as 'the date of manufacture' by the calendar month and year in which the body shell and power train sub-assemblies are co-joined or moved from the production line.

Important Operations - Installation

7. Bolt; Compressor to Bracket

N·m (kgf·m/lb·ft)

Torque	44 (4.5/33)

6. Refrigerant Line

N·m (kgf·m/lb·in)

Torque	11~19 (1.1/95~1.9/168)

5. Drive Belt

Refer to SECTION 6A “COOLING SYSTEM”.

12. Oil Leakage from Turbocharger

Step	Action	Value(s)	Yes	No
1	Inspect the oil leakage area. Was the oil feed pipe eye bolt loose or the gasket broken?	—	Tighten the eye bolt or replace the gasket.	Go to *Step 2*
2	Were the V band fixing faces tight?	—	Tighten band or replace the turbocharger	Go to *Step 3*
3	Was there oil leakage from the flange of the turbine housing?	—	Replace the turbocharger	Go to *Step 4*
4	Was there oil leakage from the flange of compressor housing?	—	Tighten the bolt and/or hose clamp.	Go to *Step 5*
5	Are any DTC stored?	—	Go to *indicated DTC*	Solved

13. Insufficient Acceleration and/or Lack of Power due to turbocharger

Step	Action	Value(s)	Yes	No
1	Inspect the air or exhaust route. Was the air and/or exhaust gas piping loose?	—	Tighten flange bolts or hose clamp.	Go to *Step 2*
2	Inspect the work of waste gate valve control. Was there rust on the linkage rod or pin of the waste gate valve?	—	Replace the turbocharger	Go to *Step 3*
3	Was air leakage found from the actuator piping?	—	Repair or replace the actuator pipe or hose/	Go to *Step 4*
4	Inspect the inside of the turbocharger. Was the turbine shaft end nut loose?	—	Replace the turbocharger	Go to *Step 5*
5	Were the turbine blades bent?	—	Replace the turbocharger	Go to *Step 6*
6	Was the turbine wheel rubbing against housing?	—	Replace the turbocharger	Go to *Step 7*
7	Are any DTC stored?	—	Go to *indicated DTC*	Solved

14. Battery Charging and Noise Problem

Visual/physical check the following items before diagnosis.
The drive belt tension.
The battery terminals connection condition.
The ground connection condition.
The generator and the battery fastener condition.
The battery fluid level and specific gravity.

14-1 Battery No Charging

Step	Action	Value(s)	Yes	No
1	Was "Visual/Physical Check" performed.	—	Go to *Step 2*	Go to *visual/physical check*
2	Inspect the brush contact condition on the generator. Was there poor contact between the brush and the slip ring?	—	Repair or replace the brush and/or the slip ring.	Go to *Step 3*
3	Inspect the stator coil on the generator. Was there an open circuit or the scorching on the stator coil?	—	Replace the stator coil.	Go to *Step 4*
4	Inspect the rotor coil on the generator. Was there an open circuit or the scorching on the rotor coil?	—	Replace the rotor coil.	Go to *Step 5*
5	Inspect the rectifier on the generator. Was the rectifier defective?	—	Replace the rectifier	Go to *Step 6*
6	Inspect the IC regulator. Was the IC regulator defective?	—	Replace the IC regulator.	Go to *Step 7*
7	Are any DTC stored?	—	Go to *indicated DTC.*	Solved

14-2 Battery Overcharging

Step	Action	Value(s)	Yes	No
1	Was "Visual/Physical Check" performed.	—	Go to *Step 2*	Go to *visual/physical check*
2	Inspect the terminal circuit. Were the B and F terminals shorted?	—	Repair the short circuit.	Go to *Step 3*
3	Check the regulating voltage. Was the IC regulator voltage excessive?	—	Replace the IC regulator.	Go to *Step 4*
4	Are any DTC stored?	—	Go to *indicated DTC.*	Solved

14-3 Battery Under Charging

Step	Action	Value(s)	Yes	No
1	Was "Visual/Physical Check" performed.	—	Go to *Step 2*	Go to *visual/physical check*
2	Inspect the brush contact condition on the generator. Was there intermittent contact between the brush and the slip ring?	—	Repair or replace the brush holder assembly.	Go to *Step 3*
3	Inspect the rotor coil on the generator. Was there a short circuit in the rotor coil?	—	Repair or replace the rotor coil.	Go to *Step 4*
4	Inspect the stator coil on the generator. Was there an open circuit or the short circuit on the stator coil?	—	Repair or replace the stator coil.	Go to *Step 5*
5	Inspect the rectifier on the generator. Was the rectifier defective?	—	Replace the rectifier	Go to *Step 6*
6	Inspect the IC regulator on the generator. Was the IC regulator defective?	—	Replace the IC regulator.	Go to *Step 7*
7	Was the electrical load excessive?	—	Replace more higher capacity generator.	Go to *Step 8*
8	Are any DTC stored?	—	Go to *indicated DTC.*	Solved

14-4 Battery Unstable Charging Current

Step	Action	Value(s)	Yes	No
1	Was "Visual/Physical Check" performed.	—	Go to *Step 2*	Go to *visual/physical check*
2	Inspect the brush contact condition on the generator. Was there poor contact between the brush and the slip ring?	—	Repair or replace the brush and/or the slip ring.	Go to *Step 3*
3	Inspect the rotor coil on the generator. Was there the short circuit or an open circuit in the rotor coil?	—	Repair or replace the rotor coil.	Go to *Step 4*
4	Inspect the stator coil on the generator. Was there an open circuit or the short circuit in the stator coil?	—	Repair or replace the stator coil.	Go to *Step 5*
5	Inspect the connection between the rectifier and stator coil on the generator. Was there a loose connection between the rectifier and stator coil ?	—	Repair the loose connection.	Go to *Step 6*
6	Inspect the IC regulator on the generator. Was the IC regulator defective?	—	Replace the IC regulator.	Go to *Step 7*
7	Are any DTC stored?	—	Go to *indicated DTC.*	Solved

14-5 Charging System Noise

Step	Action	Value(s)	Yes	No
1	Was "Visual/Physical Check" performed.	—	Go to *Step 2*	Go to *visual/physical check*
2	Was there intermittent noise or continuous noise and that could be identified clearly by increasing and decreasing engine speed?	—	Replace the bearing.	Go to *Step 3*
3	Was there a growling sound and does this sound stop when the connector was disconnected?	—	Replace the stator coil.	Go to *Step 4*
4	Was intermittent sound heard when the generator was running?	—	Replace the brush and/or slip ring.	Go to *Step 5*
5	Was frictional sound heard when generator was running?	—	Clean the slip ring or replace the brush.	Go to *Step 6*
6	Are any DTC stored?	—	Go to *indicated DTC.*	Solved

15. Starter Motor Problem

Visual/physical check the following items before diagnosis.
The battery terminals connection condition.
The ground connection condition.
The starter motor or the battery fastener condition.
The battery fluid level and specific gravity.

15-1 Starter motor pinion engages to ring gear but engine does not turn over

Step	Action	Value(s)	Yes	No
1	Was "Visual/Physical Check" performed.	—	Go to *Step 2*	Go to *visual/physical check*
2	Check the contact condition between the brush and the commutator. Was the brush and the commutator contact intermittent?	—	Replace the brush or repair the commutator.	Go to *Step 3*
3	Were the brush and the commutator contact faces dirty?	—	Clean contact face	Go to *Step 4*
4	Was the pinion clutch slipped?	—	Replace the pinion clutch	Go to *Step 5*
5	Inspect the armature field coil. Was there an open circuit or a short circuit in the armature field coil?	—	Repair or replace the armature field coil.	Go to *Step 6*
6	Are any DTC stored?	—	Go to *indicated DTC.*	Solved

15-2 Incorrect pinion and ring gear engagement

Step	Action	Value(s)	Yes	No
1	Was "Visual/Physical Check" performed.	—	Go to *Step 2*	Go to *visual/physical check*
2	Inspect the pinion and the ring gear teeth. Were the pinion and/or the ring gear teeth worn or broken?	—	Replace the wron parts.	Go to *Step 3*
3	Inspect the pinion gear return movement. Was the pinion gear return movement incorrect?	—	Adjust or replace the movement parts.	Go to *Step 4*
4	Are any DTC stored?	—	Go to *indicated DTC.*	Solved

15-3 Starter motor continues to run after the starter switch is turned off

Step	Action	Value(s)	Yes	No
1	Was “Visual/Physical Check" performed.	—	Go to *Step 2*	Go to *visual/physical check*
2	Inspect the magnetic switch contact point. Was the contact point seized?	—	Repair or replace the magnetic switch.	Go to *Step 3*
3	Inspect the starter switch. Was the starter switch defective?	—	Replace the starter switch.	Go to *Step 4*
4	Are any DTC stored?	—	Go to *indicated DTC.*	Solved

15-4 Excessive commutator sparking

Step	Action	Value(s)	Yes	No
1	Was “Visual/Physical Check" performed.	—	Go to *Step 2*	Go to *visual/physical check*
2	Inspect the contact condition between the brush and the commutator. Was the brush and the commutator contact intermittent?	—	Replace the brush or repair the commutator.	Go to *Step 3*
3	Was there the slag accumulation on the contact face?	—	Clean the contact face or replace the brush.	Go to *Step 4*
4	Was the brush holder loose?	—	Repair the brush holder	Go to *Step 5*
5	Inspect the commutator. Was there excessive wear or pitting?	—	Repair or replace the commutator.	Go to *Step 6*
6	Was there loose the solder on the commutator?	—	Clean and repair	Go to *Step 7*
7	Inspect the armature shaft. Was the run-out of armature shaft outside the standard value due to worn bearing ?	—	Replace the bearing	Go to *Step 8*
8	Are any DTC stored?	—	Go to *indicated DTC.*	Solved

SECTION 6A

ENGINE MECHANICAL

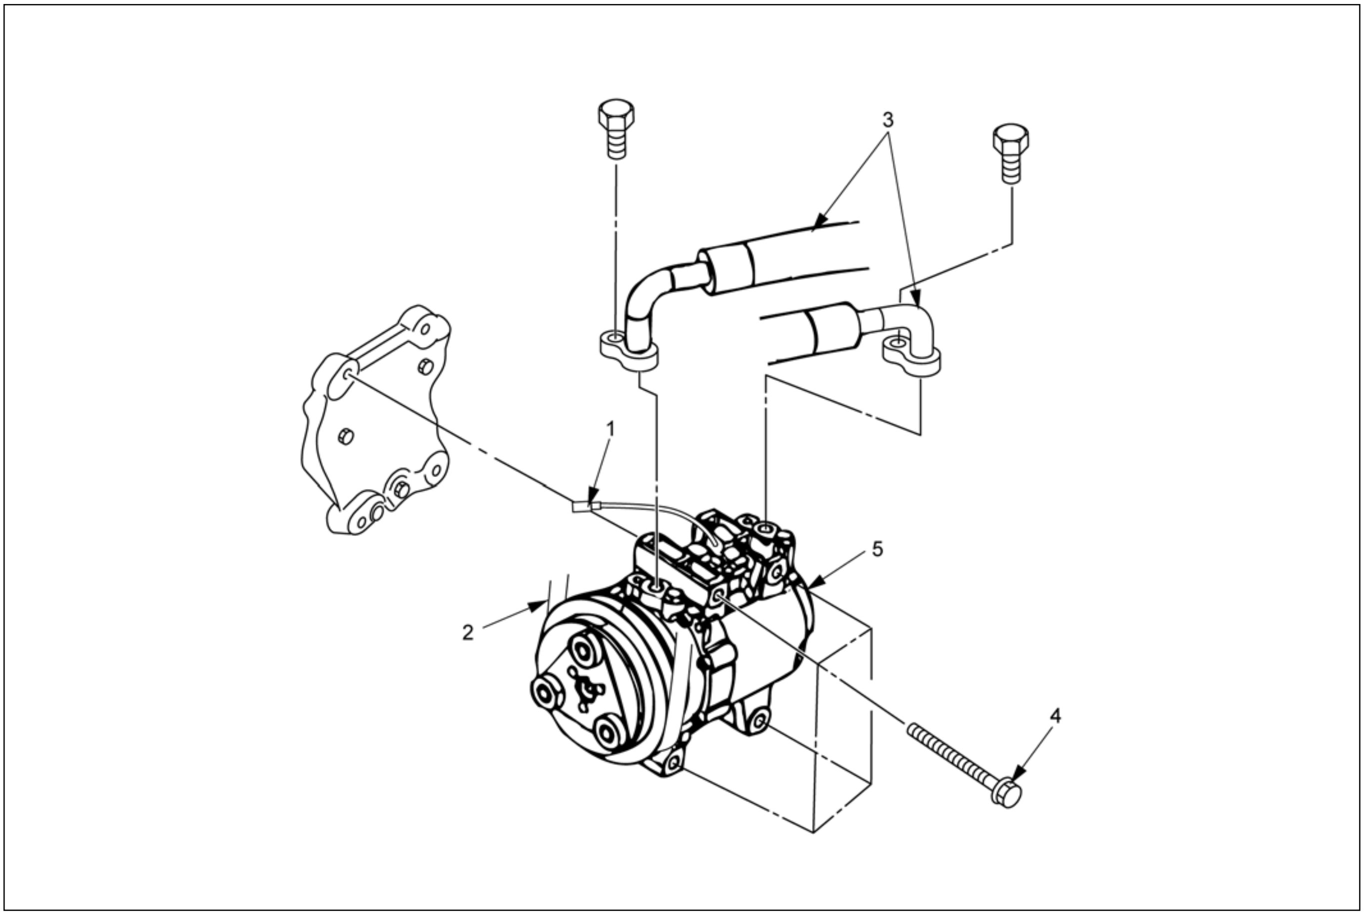
TABLE OF CONTENTS

PAGE

MAIN DATA AND SPECIFICATIONS

Item \ Engine model		4JA1T (L)	4JA1TC
Engine type		Four-cycle, overhead valve, water cooled	
Combustion chamber type		Direct injection	
Cylinder liner type		Dry type, chrome plated	
Timing gear train system		Gear drive	
No. of cylinders-bore × stroke	mm (in)	4 – 93 × 92 (3.66 × 3.62)	
No. of piston rings		Compression ring: 2 / Oil ring: 1	
Total piston displacement	cm^3 (in^3)	2,499 (152.4)	
Compression ratio (to 1)		18.5	
Compression pressure	MPa (kg/cm^2/psi)	3.0 (31.0/441) – 200 rpm	
Engine weight (dry)	kg (lb)	Approximately 239 (527)	
Fuel injection order		1 – 3 – 4 - 2	
Fuel injection timing BTDC	deg	8	-
Specified fuel type		JIS No. 2, DIN/EN590, GB252-1944 Diesel fuel	
Idling speed	rpm	730 ± 25 (A/C Off) 780 ± 25 (A/C ON)	
Valve clearances (At cold): Intake	mm (in)	0.4 (0.016)	
Exhaust	mm (in)	0.4 (0.016)	
Intake valves Open at (BTDC)	deg	24.5	
Close at (ABDC)	deg	55.5	
Exhaust valves Open at (BBDC)	deg	54.0	
Close at (ATDC)	deg	26.0	
Fuel system			
Injection pump type		BOSCH distributor VE type	BOSCH distributor VP44 type
Governor type		Mechanical (Half all speed type)	Electronically controled
Injection nozzle type		Hole with 5 orifices	
Injection nozzle opening pressure	MPa (kg/cm^2/psi)	1st 19.1 (195 / 2,773) 2nd (Reference) 25.5~27.0 (260~275 / 3,702~3,920)	1st 19.0 (194 / 2,755) 2nd (Reference) 34.0~35.5 (347~362 / 4,936~5,154)
Main fuel filter type		Cartridge paper element and water separator	
Lubricating system			
Lubricating method		Pressure circulation	
Specified engine oil (API grade)		ISUZU genuine 10W – 30 (API CD of ACEA B2/B3)	

REMOVAL AND INSTALLATION (4JJ1-TC Standard Output, 4JJ1-TC High Output, 4JK1-TC High Output)



RTW510MF000201

Removal Steps

1. Magnetic clutch harness connector
2. Drive belt
3. Refrigerant line
4. Bolt; compressor to bracket
5. Compressor assembly

Installation Steps

5. Compressor assembly
▲ 4. Bolt; compressor to bracket
▲ 3. Refrigerant line
▲ 2. Drive belt
1. Magnetic clutch harness connector

Item / Engine model		4JA1T (L)	4JA1TC
Cooling system			
Water pump type		Centrifugal	
Thermostat type		Wax pellet with jiggle valve	
Air cleaner type		Dry paper element	Viscous paper element
Battery type/voltage × No. of units		80D26L × 1	
		95D31L × 1 (OPT)	
Generator capacity	V-A	12 – 60	
		12 – 80	
Starter motor output	V-kW	12 – 2.3

MAIN DATA AND SPECIFICATIONS

Item / Engine model		4JH1TC
Engine type		Four-cycle, overhead valve, water cooled
Combustion chamber type		Direct injection
Cylinder liner type		Dry type, chrome plated
Timing gear train system		Gear drive
No. of cylinders-bore × stroke	mm (in)	4 – 95.4 × 104.9 (3.76 × 4.13)
No. of piston rings		Compression ring: 2 / Oil ring: 1
Total piston displacement	liter	2,999
Compression ratio (to 1)		18.3
Compression pressure	MPa (kg/cm^2/psi)	3.0 (31.0/441) – 200 rpm
Engine weight (dry)	kg (lb)	MT: Approximately 249 (549)
		AT: Approximately 236 (520)
Fuel injection order		1 – 3 – 4 - 2
Specified fuel type		JIS No.2, DIN/EN590, GB252-1944 Diesel fuel
Idling speed	rpm	700 ± 25 (A/C OFF)
		800 ± 25 (A/C ON)
Valve clearances (At cold): Intake	mm (in)	0.4 (0.016)
Exhaust	mm (in)	0.4 (0.016)
Intake valves Open at (BTDC)	deg	24.5
Close at (ABDC)	deg	55.5
Exhaust valves Open at (BBDC)	deg	54.0
Close at (ATDC)	deg	26.0
Fuel system		
Injection pump type		BOSCH distributor VP44 type
Injection nozzle type		Hole with 5 orifices
Injection nozzle opening pressure		
	MPa (kg/cm^2/psi)	1st 19.5 (199/2,828)
		2nd (Reference) 34.3~35.8 (350~365/4,980~5,197)
Main fuel filter type		Cartridge paper element and water separator
Lubricating system		
Lubricating method		Pressure circulation
Specified engine oil (API grade)		ISUZU genuine 10W – 30 (API CD of ACEA B2/B3)
Oil pump type		Gear
Oil filter type		Cartridge paper element
Oil capacity	lit (US/UK gal)	6.2 (1.64/1.36) (For 4 × 2)
		7.0 (1.85/1.54) (For 4 × 4)
Oil cooler type		Water cooled

Item \ Engine model	4JH1TC
Cooling system	
Water pump type	Centrifugal
Thermostat type	Wax pellet with jiggle valve
Air cleaner type	Dry paper element (except for Euro3 spec) Viscous paper element (for Euro3 spec)
Battery type/voltage × No. of units	80D26L × 1 95D31L × 1 (OPT) 75D26R × 2 (OPT for EC, MT) 80D26R × 2 (OPT for EC, AT)
Generator capacity V-A	12 – 60/12 – 80
Starter motor output V-kW	12 – 2.3
Turbocharger model	*IHI RHF5
Turbine type	Mixed flow type Radial-inflow
Compressor type	Backward & rake type Radial-outflow

*IHI: Ishikawajima-Harima Heavy Industries., Ltd.

TORQUE SPECIFICATION

STANDARD BOLTS

The torque values given in the following table should be applied whenever a particular torque is not specified.

RECOMMENDED LIQUID GASKET

Type	Brand Name	Manufacturer	Remarks
RTV* Silicon Base	ThreeBond 1207B ThreeBond 1207C	Three Bond Three Bond	
Water Base	ThreeBond 1141E ThreeBond 1215	Three Bond Three Bond	
Solvent	ThreeBond 1104 Belco Bond 4 Belco Bond 401 Belco Bond 402	Three Bond Isuzu Isuzu Isuzu	
Anaerobic	LOCTITE 515 LOCTITE 518 LOCTITE 262	Loctite Loctite Loctite	Recommended for transaxle repairs

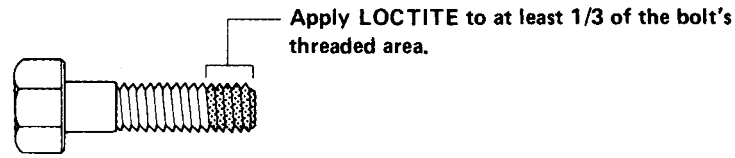
* RTV : Room Temperature Vulcanizer

Note:

1. **It is very important that the liquid gaskets listed above or their exact equivalent be used on the vehicle.**
2. **Be careful to use the specified amount of liquid gasket.**
   Follow the manufacturer's instructions at all times.
3. **Be absolutely sure to remove all lubricants and moisture from the connecting surfaces before applying the liquid gasket.**
   The connecting surfaces must be perfectly dry.
4. **LOCTITE 515 and LOCTITE 518 harden upon contact with a metal surface.**
   Do not apply LOCTITE 515 or LOCTITE 518 between two metal surfaces having a clearance of greater than 0.25 mm (0.01 in). Poor adhesion will result.

LOCTITE APPLICATION PROCEDURE

<table>
<tr><th>LOCTITE Type</th><th>LOCTITE Color</th><th>Application Steps</th></tr>
<tr><td>LOCTITE 242</td><td>Blue</td><td rowspan="4">1. Completely remove all lubricant and moisture from the bolts and the female threaded surfaces of the parts to be joined.
The surfaces must be perfectly dry.
2. Apply LOCTITE to the bolts.



3. Tighten the bolts to the specified torque.
4. Wait at least one hour before continuing the installation procedure.</td></tr>

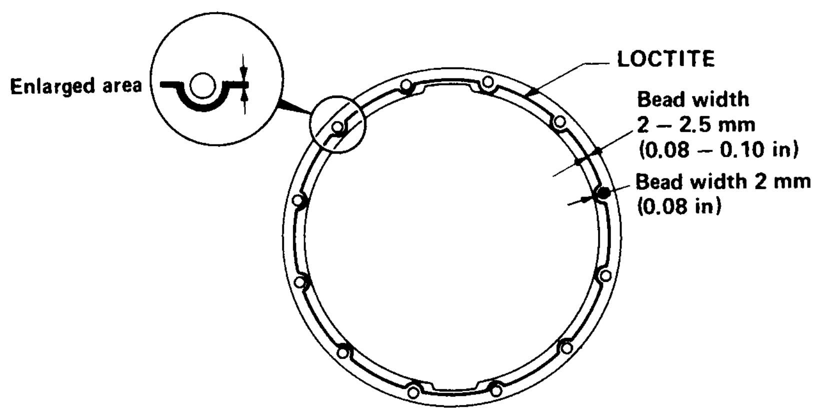
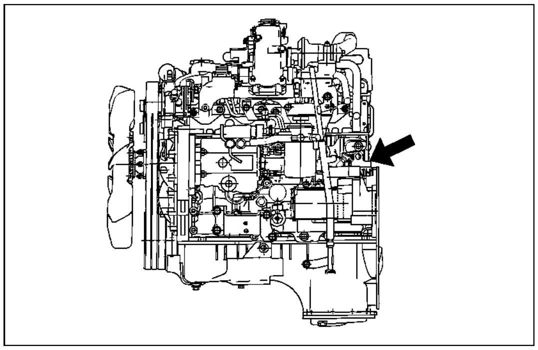
<tr><td>LOCTITE 271</td><td>Red</td></tr>
<tr><td>LOCTITE 515</td><td>Violet</td><td>1. Completely remove lubricant and moisture from the connecting surfaces.
The surfaces must be perfectly dry.
2. Apply a 2.0 – 2.5 mm bead of LOCTITE to one of the connecting surfaces.
There must be no gaps in the bead.



3. Tighten the bolts to the specified torque.
4. Let the joined parts set for at least thirty minutes.</td></tr>
</table>

SERVICING

Servicing refers to general maintenance procedures to be performed by qualified service personnel.



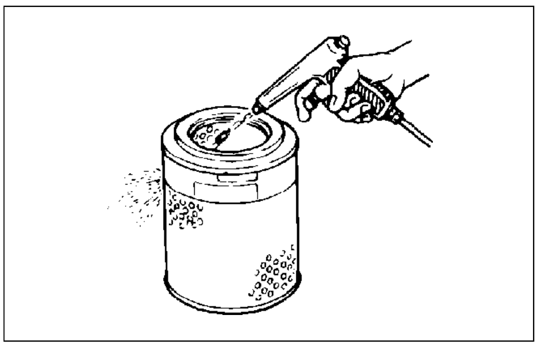
RTW36ASH000401

MODEL IDENTIFICATION

Engine Serial Number

The engine number is stamped on the rear left hand side of the cylinder body.

The engine number is stamped in the plate in front of the engine room as well.



130RY00003

AIR CLEANER

Element cleaning procedures will vary according to the condition of the element.

Dust Fouled Element (Except wet type element)

Rotate the element with your hand while applying compressed air to the inside of the element. This will blow the dust free.

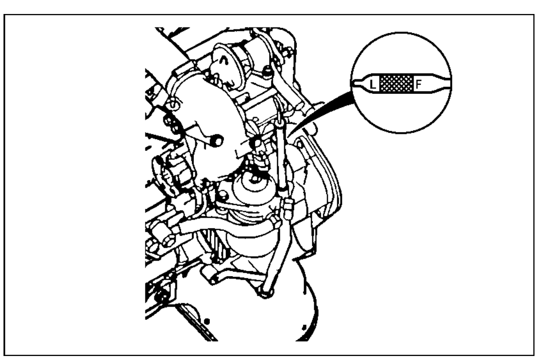
Compressed air pressure	kPa (kg/cm^2 /psi)
392 – 490 (4 – 5/57 – 71)	

6A-6

LUBRICATING SYSTEM

Main Oil Filter (Cartridge Type Paper Element) Replacement Procedure

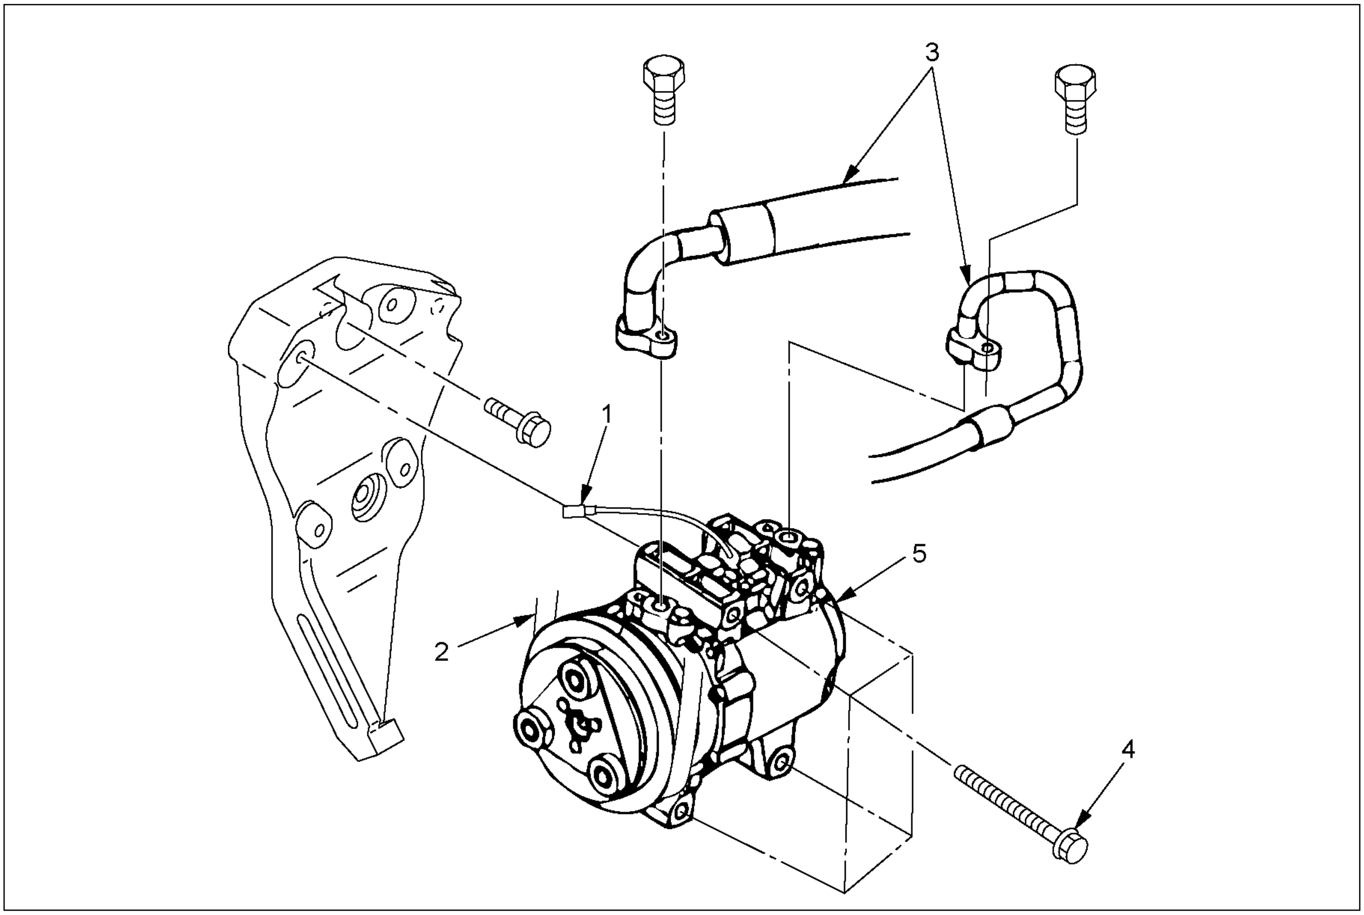
1. Drain the engine oil.
2. Retighten the drain plug.
3. Loosen the used oil filter by turning it counterclockwise with a filter wrench.
   Filter Wrench: 5-8840-0200-0



RTW36ASH000101

4. Clean the oil cooler fitting face. This will allow the new oil filter to seat properly.
5. Apply a light coat of engine oil to the filter O-ring.
6. Turn in the new oil filter until the filter O-ring is fitted against the sealing face.
7. Use the filter wrench to turn in the filter an additional 2/3 turns.
   Filter Wrench: 5-8840-0200-0
8. Check the engine oil level and replenish to the specified level if required.

REMOVAL AND INSTALLATION (C24SE)



RTW310MF000401

Removal Steps

1. Magnetic clutch harness connector
2. Drive belt
3. Refrigerant line
4. Bolt; compressor to bracket
5. Compressor assembly

Installation Steps

5. Compressor assembly
▲ 4. Bolt; compressor to bracket
▲ 3. Refrigerant line
▲ 2. Drive belt
1. Magnetic clutch harness connector

Replenished Engine Oil MAX lit (US/UK gal)

Condition / Model	Engine Dry	With oil filter replacement	Without oil filter replacement
4 × 2 4 × 4 (4JA1L/TC)	6.2 (1.64/1.36)	5.2 ~ 4.2 (1.37 ~ 1.11 / 1.14 ~ 0.92)	4.5 ~ 3.5 (1.19 ~ 0.93 / 0.99 ~ 0.77)
4 × 2 (4JH1TC)	6.2 (1.64/1.36)	5.2 ~ 4.2 (1.37 ~ 1.11 / 1.14 ~ 0.92)	4.5 ~ 3.5 (1.19 ~ 0.93 / 0.99 ~ 0.77)

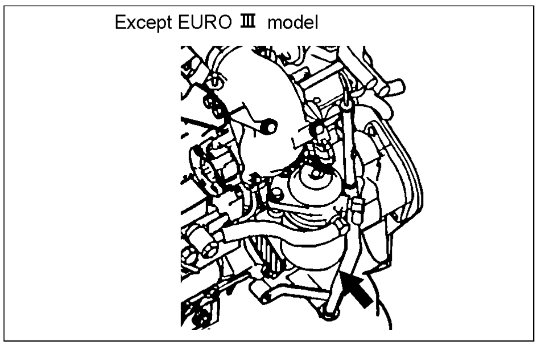
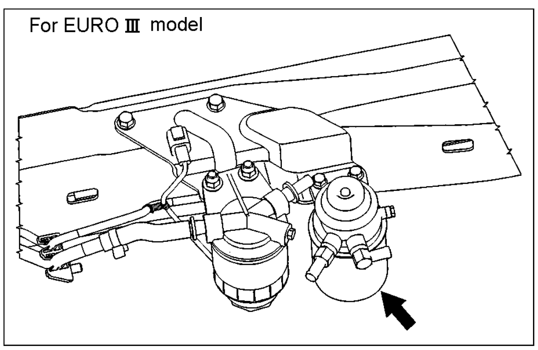
9. Start the engine and check for oil leakage from the main oil filter.

FUEL SYSTEM

Fuel Filter Replacement Procedure



RTW66ASH003201

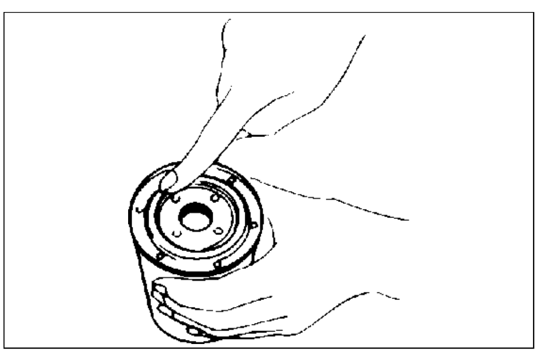


RTW66ASH003301

1. Remove the fuel filter by turning it counterclockwise with a filter wrench.
   Filter Wrench: 5-8840-0253-0 (J-22700)

Note:

Be careful not to spill the fuel in the filter cartridge.

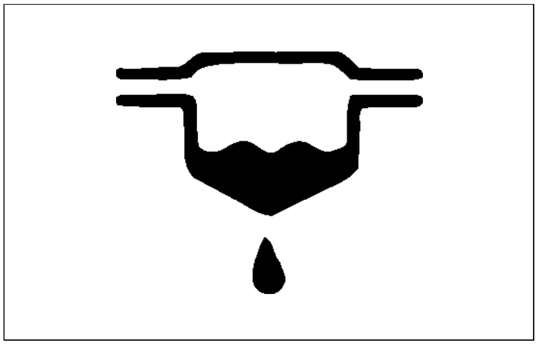


041RY00009

2. Clean the fuel filter cartridge fitting faces.
   This will allow the new fuel filter to seat properly
3. Apply a light coat of engine oil to the O-ring.
4. Turn in the fuel filter until the sealing face comes in contact with the O-ring.
5. Turn in the fuel filter an additional 2/3 of a turn with a filter wrench.
   Filter Wrench : 5-8840-0253-0 (J-22700)
6. Operate the priming pump until the air discharged completely from fuel system.
7. Start the engine and check for fuel leakage.

Note:

The use of an ISUZU genuine fuel filter is strongly recommended.

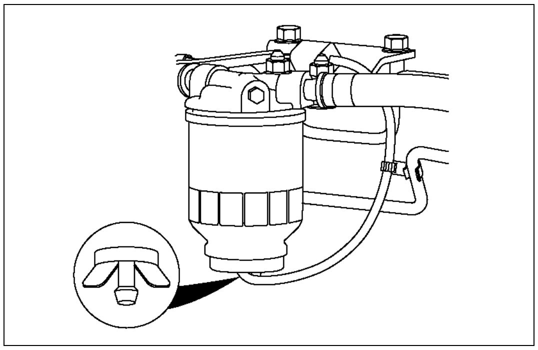


041RY00011

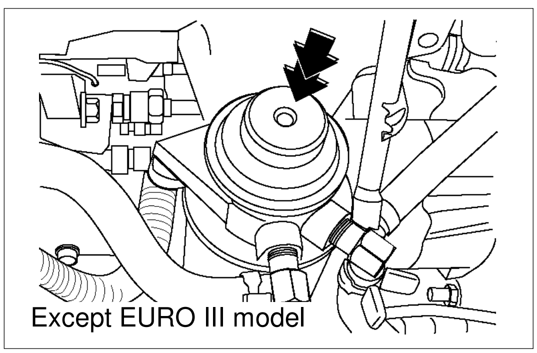
Draining Procedure

The indicator light will come on when the water level in the water separator exceeds the specified level.

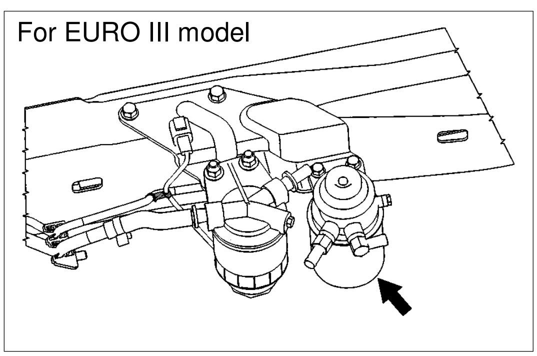
Drain the water and foreign material from the water separator (inside chassis frame) with the following procedure.



1. Place the drain pan under the drain plug.
2. Loosen the drain plug and drain water.
3. After draining the water, tighten the drain plug.
4. Operate the priming pump on the fuel filter several times and check for fuel leakage.
5. Check the water separator indicator light. It should be off.



RTW46ASH002901



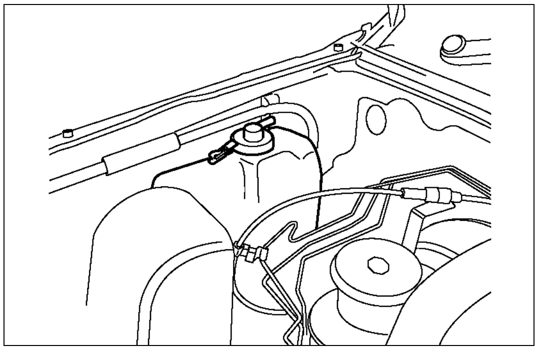
RTW46ASH000501

Air Bleeding

1. Operate the priming pump until strong resistance is felt.
2. Wait 1 minute, and operate the priming pump until strong resistance is felt.
3. Once more wait, and operate the priming pump until strong resistance is felt.
4. Turn the ignition switch to the "ON" position. Wait until the glow indicator lamp turns off.
5. Turn the ignition switch to the "START" position and crank the engine until it starts.
6. If the engine does not start, repeat Step 3 - 5.
7. Allow the engine to idle for 3 minutes to bleed air completely form the fuel system and check for fuel leakage.

Note:

Insufficient air bleeding may cause the Diagnostic Trouble Code (DTC) store or improper engine performance.



111R300001

COOLING SYSTEM

Coolant Level

Check the coolant level and replenish the radiator reserve tank as necessary.

If the coolant level falls below the "MIN" line, carefully check the cooling system for leakage. Then add enough coolant to bring the level up to the "MAX" line.

Engine coolant Filling up procedure

1. Make sure that the engine is cool.

Warning:

When the coolant is heated to a high temperature, be sure not to loosen or remove the rediator cap. Otherwise you might get scalded by hot vapor or boiling water.

To open the radiator cap, put a piece of thick cloth on the cap and loosen the cap slowly to reduce the pressure when the coolant has become cooler.

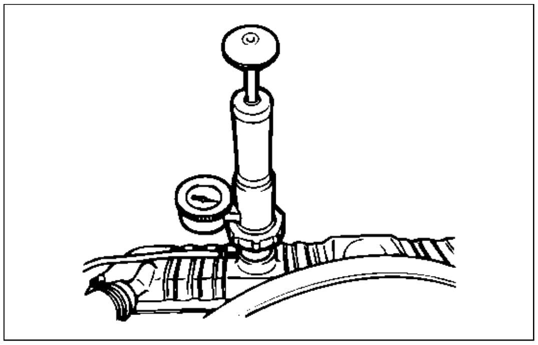
2. Open rediator cap pour coolant up to filler neck
3. Pour coolant into reservoir tank up to "MAX" line
4. Tighten radiator cap and start the engine. After idling for 2 to 3 minutes, stop the engine and reopen radiator cap. If the water level is lower, replenish.
5. After replenish the coolant tighten radiator cap, warm up the engine at about 2000 rpm. Set heater adjustment to the highest temperature position, and let the coolant circulate also into heater water system.
6. Check to see the thermometer, continuously idling 5 minutes and stop the engine.
7. When the engine has been cooled, check filler neck for water level and replenish if required. Should extreme shortage of coolant is found, check the coolant system and reservoir tank hose for leakage.
8. Pour coolant into the reservoir tank up to "MAX" line.

Engine Coolant Total Capacity Lit (U.S / UK gal)

4JA1 / TC	9.4 (2.5 / 2.1)
4JH1TC	M/T: 10.1 (2.7 / 2.2) A/T: 10.0 (2.6 / 2.2)

Mixing Ratio (Anti-Freeze Solution/Water)

50 %

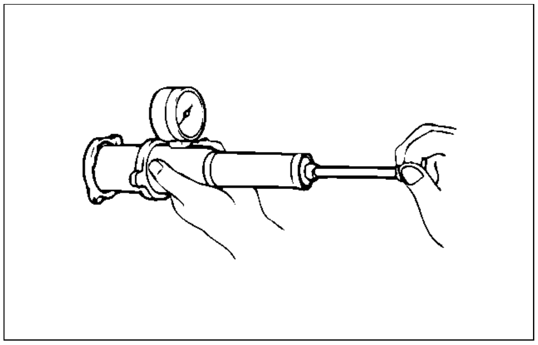


030LX003

Cooling System Inspection

Install a radiator filler cap tester to the radiator. Apply testing pressure to the cooling system to check for leakage. The testing pressure must not exceed the specified pressure.

Testing Pressure	kPa(kg/cm^2 /psi)
150 (1.5/21)	



030LX002

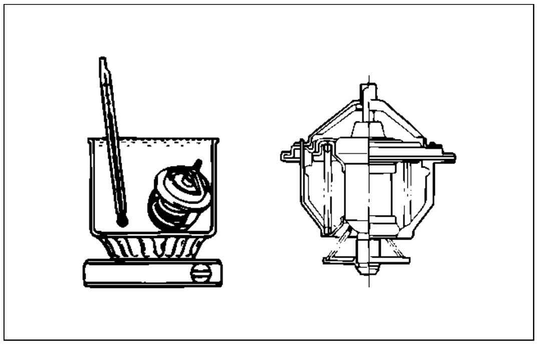
Radiator Cap Inspection

The radiator filler cap is designed to maintain coolant pressure in the cooling system at 103 kPa(1.05 kg/cm^2, 15psi).

Check the radiator filler cap with a radiator filler cap tester. The radiator filler cap must be replaced if it fails to hold the specified pressure during the test procedure.

Radiator Cap Valve Opening Pressure	kPa(kg/cm^2 /psi)
90 – 120 (0.9 – 1.2/13 – 17)	

Negative Valve (Reference)	kPa(kg/cm^2 /psi)
1.9 – 4.9 (0.02 – 0.05/0.28 – 0.71)	



030LX014

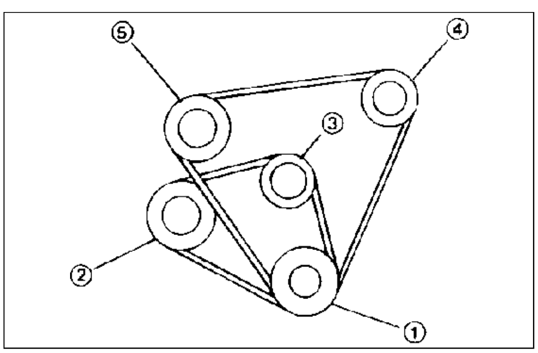
Thermostat Operating Test

1. Completely submerge the thermostat in water.
2. Heat the water.
   Stir the water constantly to avoid direct heat being applied to the thermostat.
3. Check the thermostat initial opening temperature.

Thermostat Initial Opening Temperature	°C (°F)
82 (180)	
Oil Cooler Thermo Valve	°C (°F)
76.5 (170)	
EGR Cooler Thermo Valve	°C (°F)
40 (104)	

4. Check the thermostat full opening temperature.

Thermostat Full Opening Temperature	°C (°F)
95 (203)	
Oil Cooler Thermo Valve	°C (°F)
90 (194)	
EGR Cooler Thermo Valve	°C (°F)
55 (131)	
Valve Lift at Fully Open position	mm (in)
9.5 (0.37)	
Oil Cooler Thermo Valve	mm (in)
4.5 (0.18)	
EGR Cooler Thermo Valve	mm in)
3.5 (0.14)	

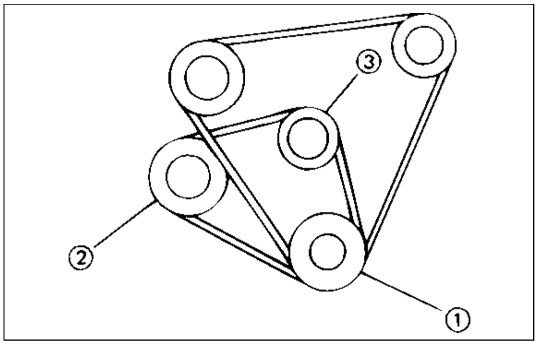


033RY00002

Drive Belt Adjustment

Check drive belts for wear or damage, and replace with new ones as necessary. Check belts for tension, and adjust as necessary.

1 Crankshaft damper pulley
2 Generator pulley
3 Cooling fan pulley
4 Oil pump pulley or idler pulley
5 Compressor pulley or idler pulley



033RY00003

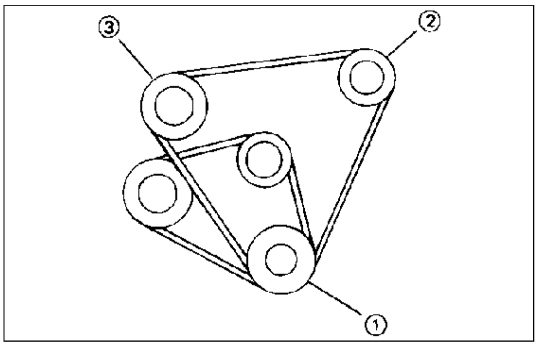
Cooling Fan Pulley Drive Belt

Fan belt tension is adjusted by moving the generator.

Depress the drive belt mid-portion with a 98N (10 kg/22 lb) force.

Cooling Fan Drive Belt Deflection	mm (in)
New belt	4 - 7 (0.16 - 0.28)
Reuse belt	6 - 9 (0.24 - 0.35)

1 Crankshaft damper pulley
2 Generator pulley
3 Cooling fan pulley



033RY00004

A/C Compressor Drive Belt

Compressor belt tension is adjusted by moving the P/S pumppulley.

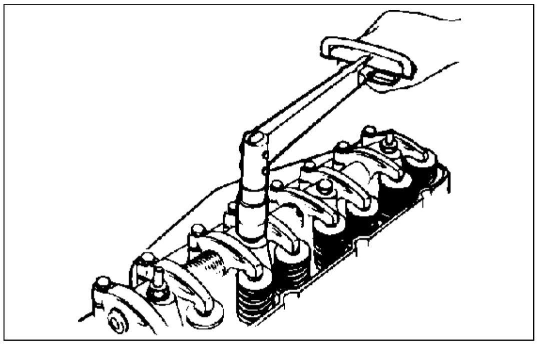
Depress the drive belt mid-portion with a 98N (10 kg/22 lb) force.

A/C Compressor Drive Belt Deflection	mm (in)
New belt	9 - 10 (0.35 - 0.39)
Reuse belt	12 - 13 (0.47 - 0.51)

1 Crankshaft damper pulley
2 P/S pump pulley
2 A/C Compressor pulley

VALVE CLEARANCE ADJUSTMENT

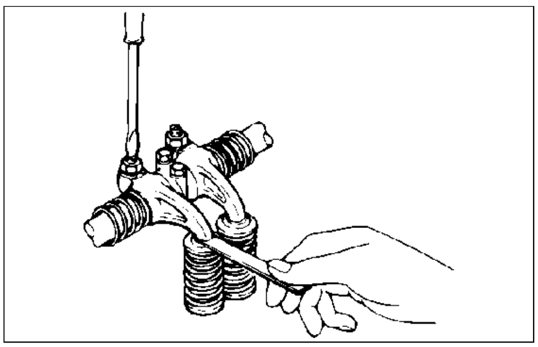
1. Bring the piston in either the No. 1 cylinder or the No. 4 cylinder to TDC on the compression stroke by turning the crankshaft until the crankshaft damper pulley TDC line is aligned with the timing pointer.



014RY00014

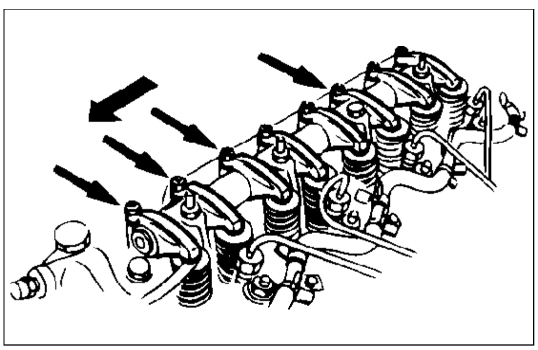
2. Check the rocker arm shaft bracket nuts for looseness.
   Tighten any loose rocker arm shaft bracket nuts before adjusting the valve clearance.

Rocker Arm Shaft Bracket Nut Torque	N·m (kg·m /lb·ft)
54 (5.5/40)	



014RY00015

8. Check for play in the No. 1 intake and exhaust valve push rods.
   If the No. 1 cylinder intake and exhaust valve push rods have play, the No. 1 piston is at TDC on the compression stroke.
   If the No. 1 cylinder intake and exhaust valve push rods are depressed, the No. 4 piston is at TDC on the compression stroke.

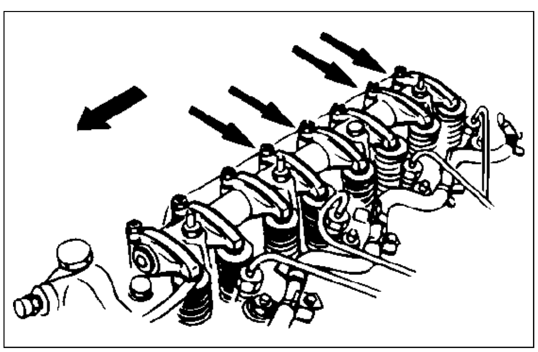


014RY00016

Adjust the No.1 or the No. 4 cylinder valve clearances while their respective cylinders are at TDC on the compression stroke.

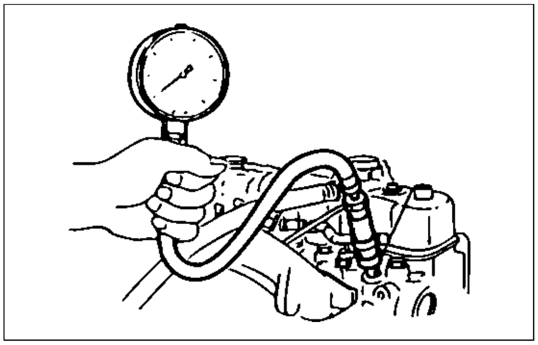
Valve Clearance (At Cold)	mm (in)
0.4 (0.016)	

9. Loosen each valve clearance adjusting screw as shown in the illustration.
10. Insert a feeler gauge of the appropriate thickness between the rocker arm and the valve stem end.



014RY00017

11. Turn the valve clearance adjusting screw until a slight drag can be felt on the feeler gauge.
12. Tighten the lock nut securely.
13. Rotate the crankshaft 360°.
14. Realign the crankshaft damper pulley TDC notched line with the timing pointer.
15. Adjust the clearances for the remaining valves as shown in the illustration.



F06XL056

COMPRESSION PRESSURE MEASUREMENT

1. Start the engine and allow it to idle until the coolant temperature reaches 70 – 80 °C (158 – 176 °F).
2. Remove the following parts.
   - Leak off pipe
   - Injection nozzle holder bracket
   - Injection nozzle holder
3. Install the following parts.
   - Set the adapter and compression gauge (SST) to the No.1 cylinder injection nozzle hole.
   - Injection nozzle holder bracket

Injection nozzle holder bracket Bolt Torque

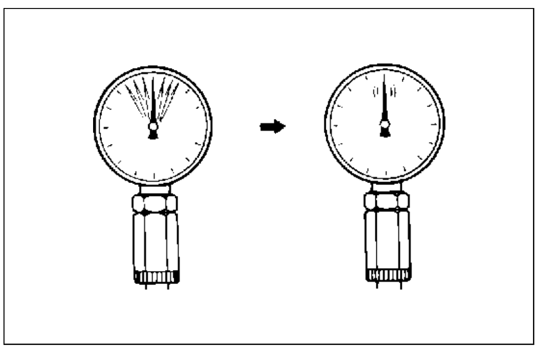
N·m (kg·m /lb·ft)

37 (3.8/27)

Compression Gauge: 5-8840-2675-0

Adapter; Compression Gauge: 5-8531-7001-0

4. Turn the engine over with the starter motor and take the compression gauge reading.



901R100003

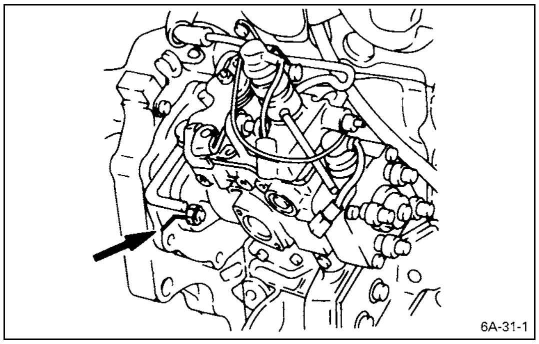
Compression Pressure MPa (kg/cm^2 /psi) at 200 rpm

Standard	Limit
3.0 (31.0/441)	2.1 (21.7/309)

5. Repeat the procedure (Steps 3 and 4) for the remaining cylinders.

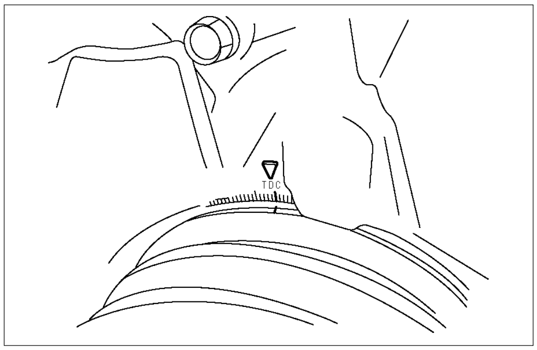
   If the measured value is less than the specified limit, refer to “Troubleshooting” in this Manual.

INJECTION TIMING ADJUSTMENT (4JA1T(L) only)



6A-31-1

1. Check that the notched line on the injection pump flange is aligned with the front plate or the timing gear case notched line.

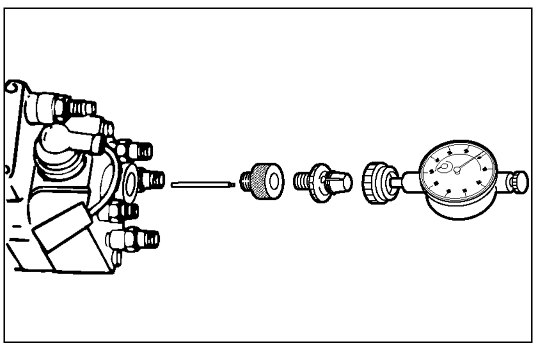


RTW46ASH000601

2. Bring the piston in the No. 1 cylinder to TDC on the compression stroke by turning the crankshaft until the crankshaft pulley TDC line is aligned with the timing mark.

Note:

Check for play in the No. 1 intake and exhaust valve push rods.
If the No. 1 cylinder intake and exhaust valve push rods have play, the No. 1 piston is at TDC on the compression stroke.



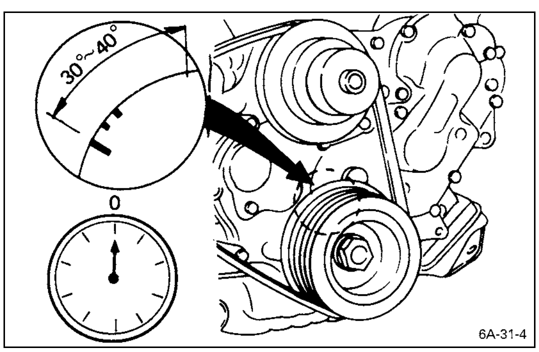
RTW36ASH002101

3. Disconnect the injection pipe from the injection pump
4. Remove one bolt from the distributor head.
5. Install the adapter set, togather with static timing gauge.

   The probe of the gauge should be depressed inward approximately 2 mm (0.079 in).

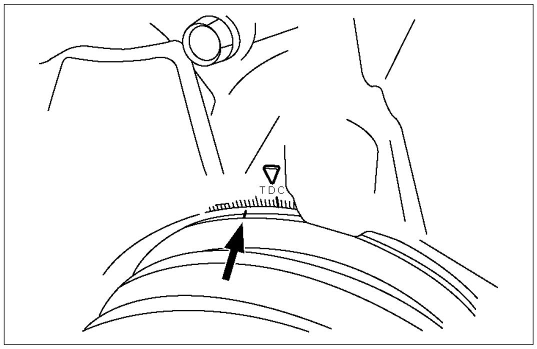
   Static Timing Gauge: 5-8840-0145-0 (J-28827)

   Adapter Set: Static Timing Gauge: 5-8840-2834-0



6A-31-4

6. Rotate the crankshaft to bring the piston in the No. 1 cylinder to a point 30 - 40° BTDC.
7. Set the timing gauge needle to zero.
8. Move the crankshaft pulley slightly in both directions to check that the gauge indication is stable.



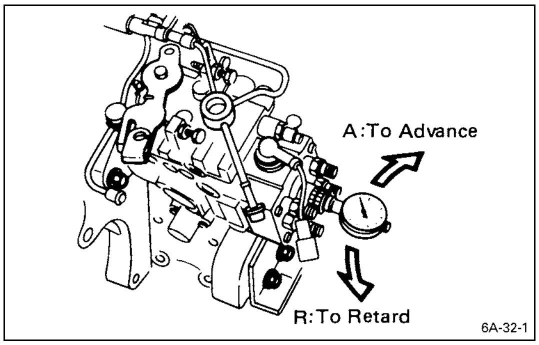
RTW46ASH000701

9. Turn the crankshaft clockwise and read the gauge indication when the crankshaft pulley timing mark (8°) is aligned with the pointer.

Injection Timing : BTDC 8° ± 2°

Standard Reading	mm (in)
0.5 (0.02)	

If the injection timing is outside the specified range, continue with the following steps.



6A-32-1

10. Loosen the injection pump fixing nuts and bracket bolts.
11. Adjust the injection pump setting angle.

When large than standard value	When smaller than standard value
R	A

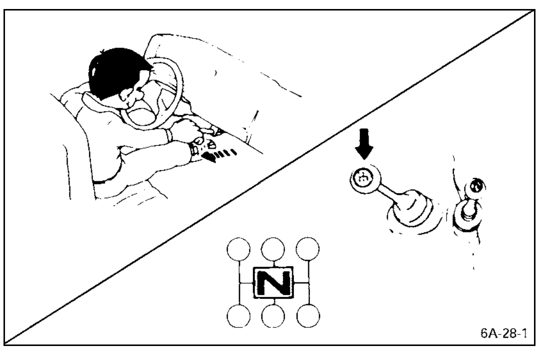
A: Move the injection pump toward the engine.
R: Move the injection pump away from the engine.

12. Install the distributor head bolt.

Distributor head bolt torque	N·m (kg·m /lb·ft)
29 (3.0/22)	

ENGINE CONTROL (4JA1T(L) only)

Idling Speed Adjustment



6A-28-1

1. Set the vehicle parking brake and chock the drive wheels.
2. Place the transmission in neutral.
3. Start the engine and allow it to idle until the coolant temperature reaches 70 - 80°C (158 - 176°F).
4. Disconnect the engine control cable from the control lever.
5. Set a tachometer to the engine.
6. Check the engine idling speed.
   If the engine idling speed is outside the specified range, it must be adjusted.

Engine Idling Speed : 730 ± 25 rpm

Important Operations - Installation

4. Bolt; Compressor to Bracket

N·m (kgf·m/lb·ft)

Torque	44 (4.5/33)

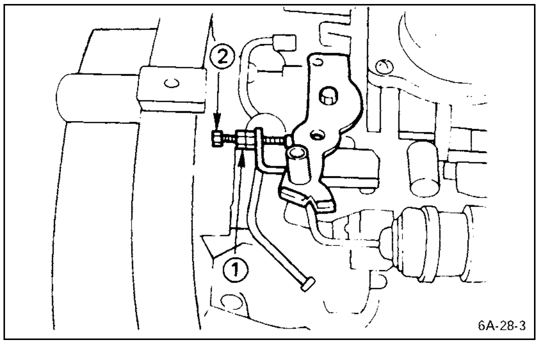
3. Refrigerant Line

N·m (kgf·m/lb·in)

Torque	11~19 (1.1/95~1.9/168)

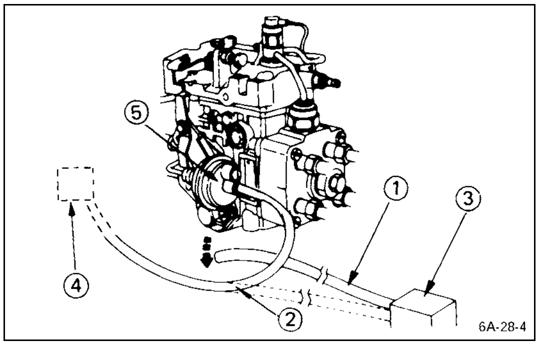
2. Drive Belt

Refer to SECTION 6A "V-BELT TENSION OF ALTERNATER".



Idling Speed Adjustment

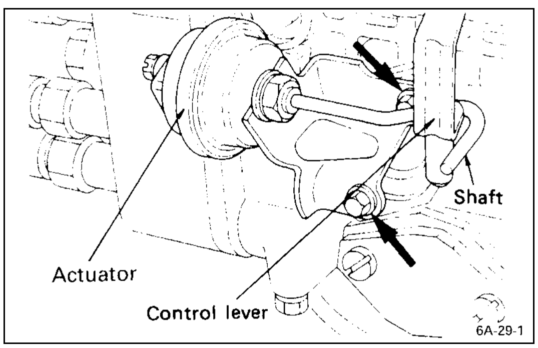
1. Loosen the idling set screw lock nut ① on the injection pump idling set bolt.
2. Adjust the idling speed to the specified range by turning the idling set bolt ②.
3. Lock the engine set nut ① with the idling set bolt lock nut.
4. Check that the idling control cable is tight (free of slack). If required, remove the slack from the cable.



Fast Idling Speed Inspection

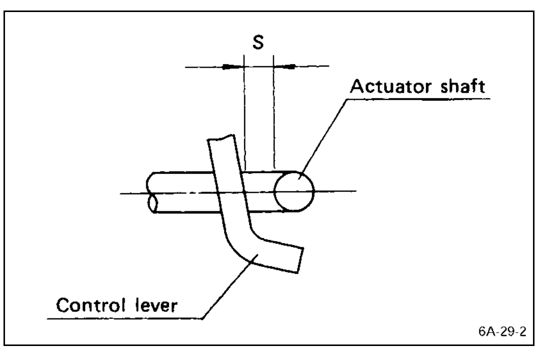
1. Set tachometer to the engine.
2. Disconnect the vacuum hose ① from the fast idle actuator ⑤ on the injection pump.
3. Disconnect the other vacuum hose ② from the vacuum switching valve ③ and connect it to the fast idle actuator ⑤.
   The vacuum line will now be connected directly from the vacuum pump ④ to the fast idle actuator.
4. Check the engine fast idling speed.
   If the engine idling speed is outside the specified range, it must be adjusted.

Fast Idling Speed	rpm
850 ± 25	



Fast Idling Speed Adjustment

1. Loosen the fast idle actuator bracket bolts.

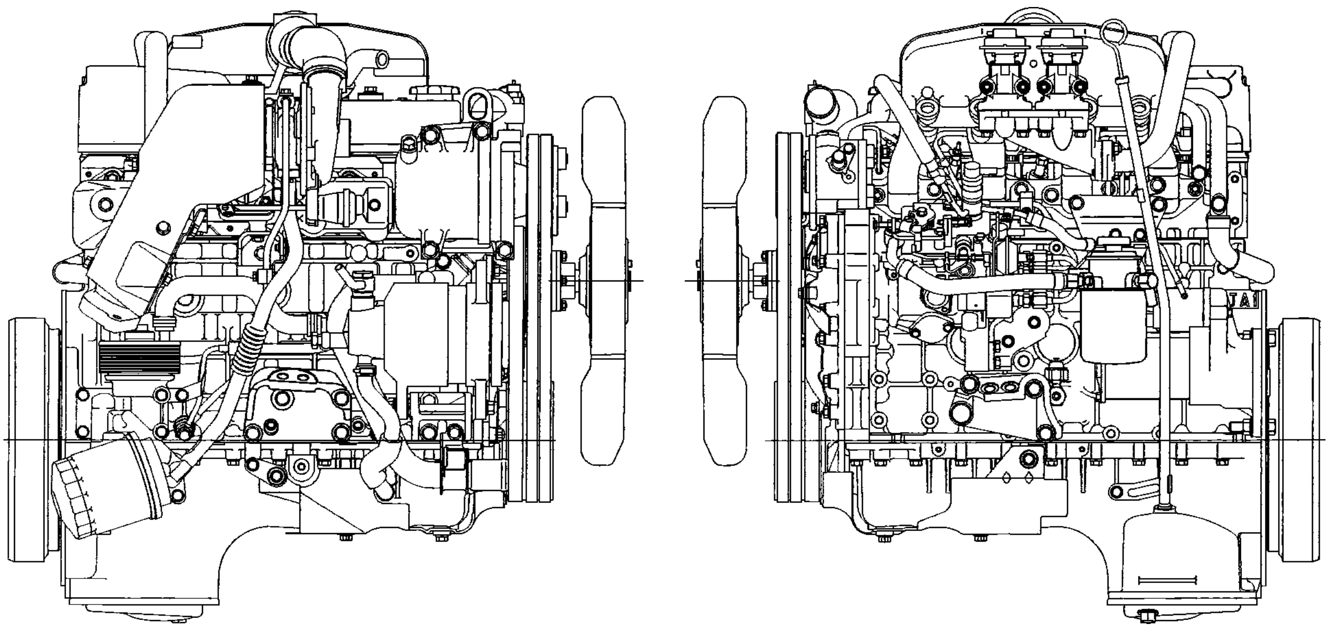


2. Adjust the fast idling speed by moving the actuator bracket, so that the clearance “S” can be 1 ~ 2 mm (0.04 ~ 0.08 in.).
3. Tighten the bracket bolts.

Accelerator Control Cable Adjustment

Refer to Sec. 6H-6 (Accelerator Control)

GENERAL DESCRIPTION



RTW46AMF000401

The 4J series automotive diesel engine has special designed combustion chambers in the piston. This design provides superior fuel economy over a wide range of driving conditions.
Auto-thermatic pistons with cast steel struts are used to reduce thermal expansion and resulting engine noise when the engine is cold.
Chrome plated dry type cylinder liners provide the highest durability.
The laminated steel sheet cylinder head gasket is very durable and, to increase the head gasket reliability.
The crankshaft has been tufftrided to provide a longer service life. Because the crankshaft is tufftrided, it cannot be reground.
The 4JA1T(L) engine is equipped with the BOSCH VE-Type distributor injection pump.
The 4JH1TC and 4JA1TC engine is equipped with the BOSCH VP44-Type distributor injection pump.
The engine is turbocharger equipped.

REMOVAL AND INSTALLATION

Read this section carefully before performing any removal and installation procedure. This section gives you important points as well as the order of operation. Be sure that you understand everything in this section before you begin.

Removal

P1010011

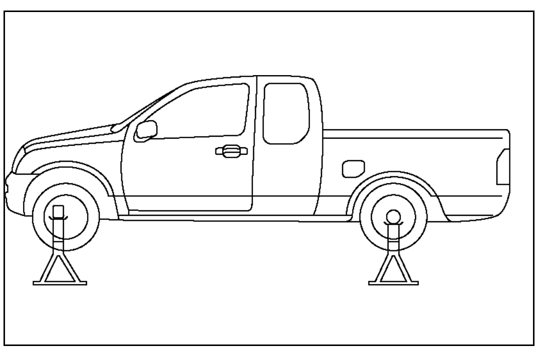
1. Battery

1) Disconnect the battery cable and the grounding cable from the battery terminals.
2) Remove the battery clamp. Take care not to accidentally short the battery with the wrench or some other tool.
3) Remove the battery.
4) Disconnect the battery cable at the starter motor and the ground cable at the cylinder body.

P1010002

2. Engine Hood

Apply setting marks to the engine hood and the engine hood hinges before removing the engine hood. This will facilitate reinstallation of the engine hood to its original position.



F06R300006

3. Supporting the Vehicle

1) Jack up the vehicle.
2) Place chassis stands at the front and the rear of the vehicle.

4. Under cover (for 4x4 model)

5. Rear propeller shaft

1) Remove the propeller shaft flange yoke at the rear differential.
2) Remove the center bearing retainer bolts.
3) Remove the propeller shaft together with the center bearing from the transmission mainshaft spline.

6. Front propeller shaft (for 4x4 model)

Remove the spline yoke flange bolt at the transfer output shaft.

Do not allow the spline yoke to fall away from the front propeller shaft.

If the spline yoke should fall away from the front propeller shaft, align the setting marks on the spline yoke and the propeller shaft to reassemble the two marks. The setting marks are punched circles approx. 3mm (0.12 in) in diameter.

7. Clutch slave cylinder (for M/T model)

8. ATF pipe (for A/T model)

9 Shift control cable (for A/T model)

10. Transmission sensor harness

Remove the vehicle speed sensor connector, inhibitor switch connector (A/T), ATF temperature sensor connector, back up light switch connector (M/T) from transmission.

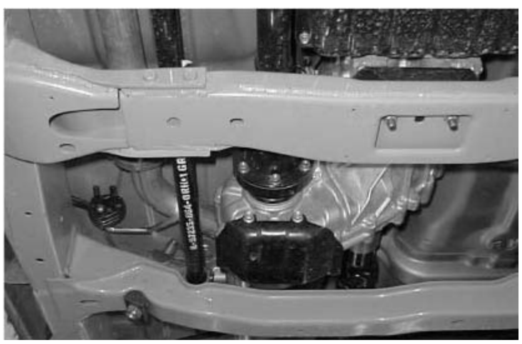
11. Breather hose (for A/T model)

12. Transmission shift lever (for M/T model)

Remove the shift lever from the floor.

13. Transfer shift lever (for 4x4 model)

Remove the shift lever from the floor.



P1010025

14. Transmission member

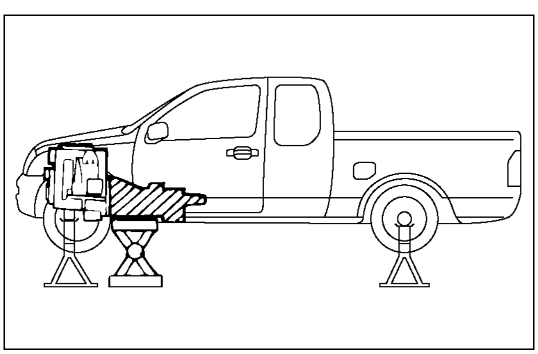
1) Support the transmission with the transmission jack.
2) Remove the transmission member mounting bolts fixing the transmission member to the chassis frame.

15. Torque converter bolt (for A/T model)

1) Remove the under cover under the torque converter housing.
2) Rotate the flywheel by using tire lever or some other tool, and then remove the torque converter bolts.

16. Transmission coupling bolt

1) Support the engine with the garage jack.
2) Use the jack to slightly lower the transmission.
3) Remove the transmission coupling bolts.



F06R300007

17. Transmission (and transfer)

Separate the transmission (and transfer) from the engine.Take care not to damage the transmission, the engine, and their related parts..

P1010009

18. Radiator

1) Drain the engine coolant.
2) Remove the reservoir hose.
3) Remove the upper and lower hose.
4) Remove the fan guide.
5) Remove the radiator.

P1010034

19. Fan

20. Air cleaner

1) Remove the MAF sensor connector (4JA1TC/4JH1TC) from air cleaner duct.
2) Remove the air cleaner duct and the air cleaner box from engine room.
3) Remove the two air ducts from inter cooler (4JA1TC/4JH1TC).

21. Power Steering Pump

Loosen the power steering pump adjust plate bolt, then remove the power steering pump assembly. Place the power steering pump assembly along with piping on the body side.

22. Air conditioner compressor

1) Remove air compressor magnet connector.
2) Remove the air conditioner compressor. Place the air conditioner compressor along with piping on the body side.

23. Engine Control Cable

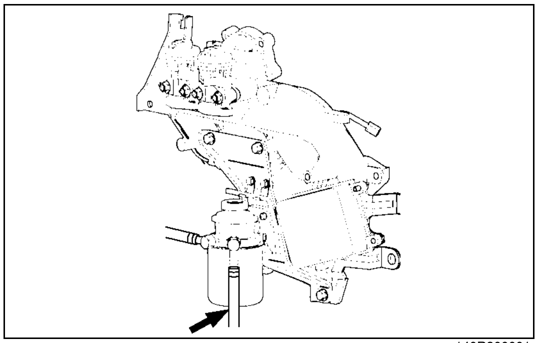
Remove the engine control cable from its bracket (4JA1TC/4JH1TC) or the injection pump (4JA1T(L)).

24. Vacuum Piping

Remove the vacuum pipe from the vacuum pump, the EGR valve, injection pump FICD (4JA1T(L)).

25. Engine Harness

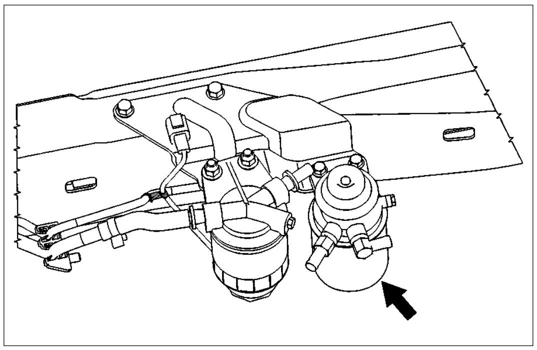
1) Remove following connectors from engine.
   - TPS connector
   - Oil pressure switch connector
   - Thermo switch connector
   - Injection pump connector
   - Engine earth
   - Thermometer unit connector
   - TDC sensor
2) Remove the clips fixing engine harness.



140R300001

26. Fuel Hose

Remove the fuel hose from the fuel filter (Except EURO III).



RTW46ASH000501

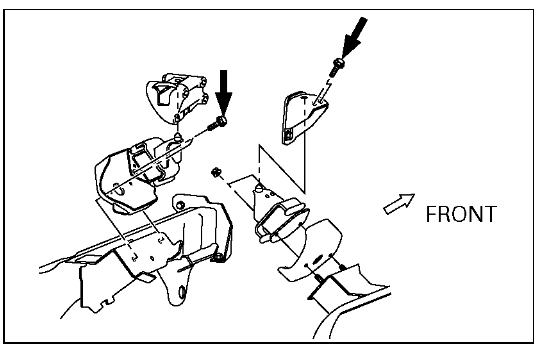
Remove the fuel hose from injection pump (EURO III only).

27. Exhaust Pipe

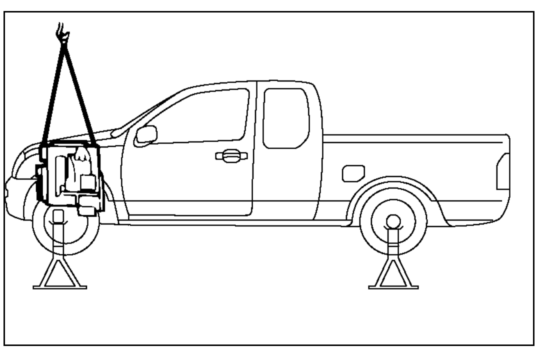
Remove the front exhaust pipe bolts and separate the exhaust manifold and the front exhaust pipe.

28. Engine Assembly

1) Remove two right side engine foot bolts.
2) Remove two left side engine mount bolts.
3) Use the hoist to lift the engine from the engine compartment.



022R300002



F06R300008

Installation

To reassemble, follow the removal steps in the reverse order.

Coolant Replenishment

Warning:

When the coolant is heated to a high temperature, be sure not to loosen or remove the rediator cap.

Otherwise you might get scalded by hot vapor or boiling water.

To open the radiator cap, put a piece of thick cloth on the cap and loosen the cap slowly to reduce the pressure when the coolant has become cooler.

1. Open rediator cap pour coolant up to filler neck
2. Pour coolant into reservoir tank up to "MAX" line
3. Tighten radiator cap and start the engine. After idling for 2 to 3 minutes, stop the engine and reopen radiator cap. If the water level is lower, replenish.
4. After replenish the coolant tighten radiator cap, warm up the engine at about 2000 rpm. Set heater adjustment to the highest temperature position, and let the coolant circulate also into heater water system.
5. Check to see the thermometer, continuously idling 5 minutes and stop the engine.
6. When the engine has been cooled, check filler neck for water level and replenish if required. Should extreme shortage of coolant is found, check the coolant system and reservoir tank hose for leakage.
7. Pour coolant into the reservoir tank up to "MAX" line.

Coolant Capacity lit (US/UK gal)

4JA1 / TC	9.4 (2.5 / 2.1)
4JH1TC	M/T: 10.1 (2.7 / 2.2) A/T: 10.0 (2.6 / 2.2)

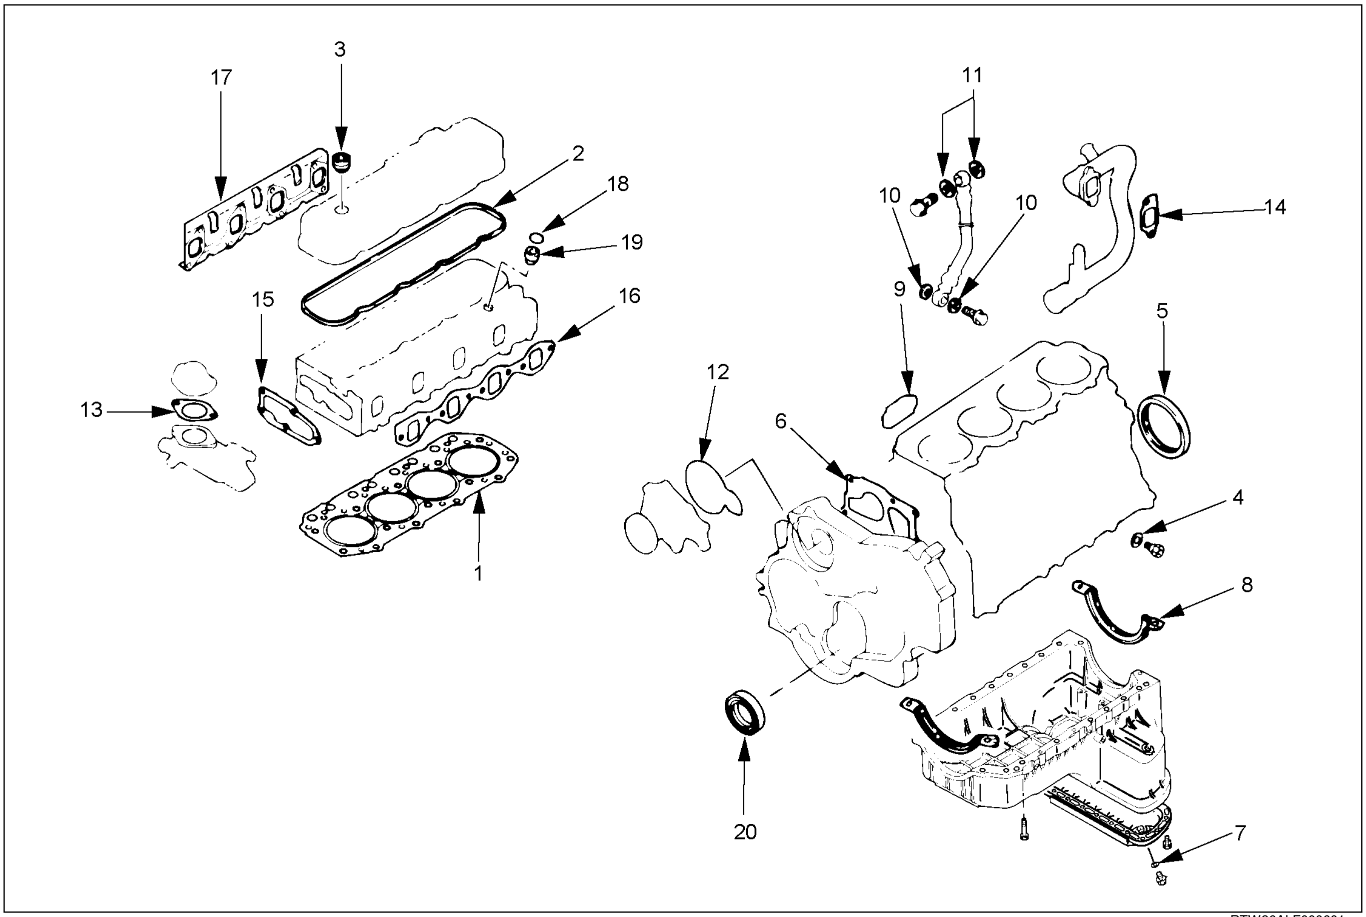
Engine Warm-Up

After completing the required maintenance procedures, start the engine and allow it to idle until it is warm.

Check the following:

1. Engine idling speed.
2. Engine noise level.
3. Engine lubricating system and cooling system. Carefully check for oil and coolant leakage.
4. Clutch engagement.
5. Transmission operation.
6. Indicator warning light operation.

ENGINE REPAIR KIT



RTW36ALF000601

Removal Steps

1. Cylinder head gasket
2. Head cover gasket
3. Head cover cap nut gasket
4. Drain cock gasket
5. Crankshaft rear oil seal
6. Gear case gasket
7. Oil pan drain plug gasket
8. Oil pan gasket
9. Oil filter gasket
10. Joint bolt gasket
11. Vacuum pump gasket
12. Water pump O-ring
13. Water outlet pipe gasket
14. Intake pipe gasket
15. Thermostat housing gasket
16. Intake manifold gasket
17. Exhaust manifold gasket
18. Nozzle holder O-ring
19. Nozzle holder gasket
20. Crankshaft front oil seal

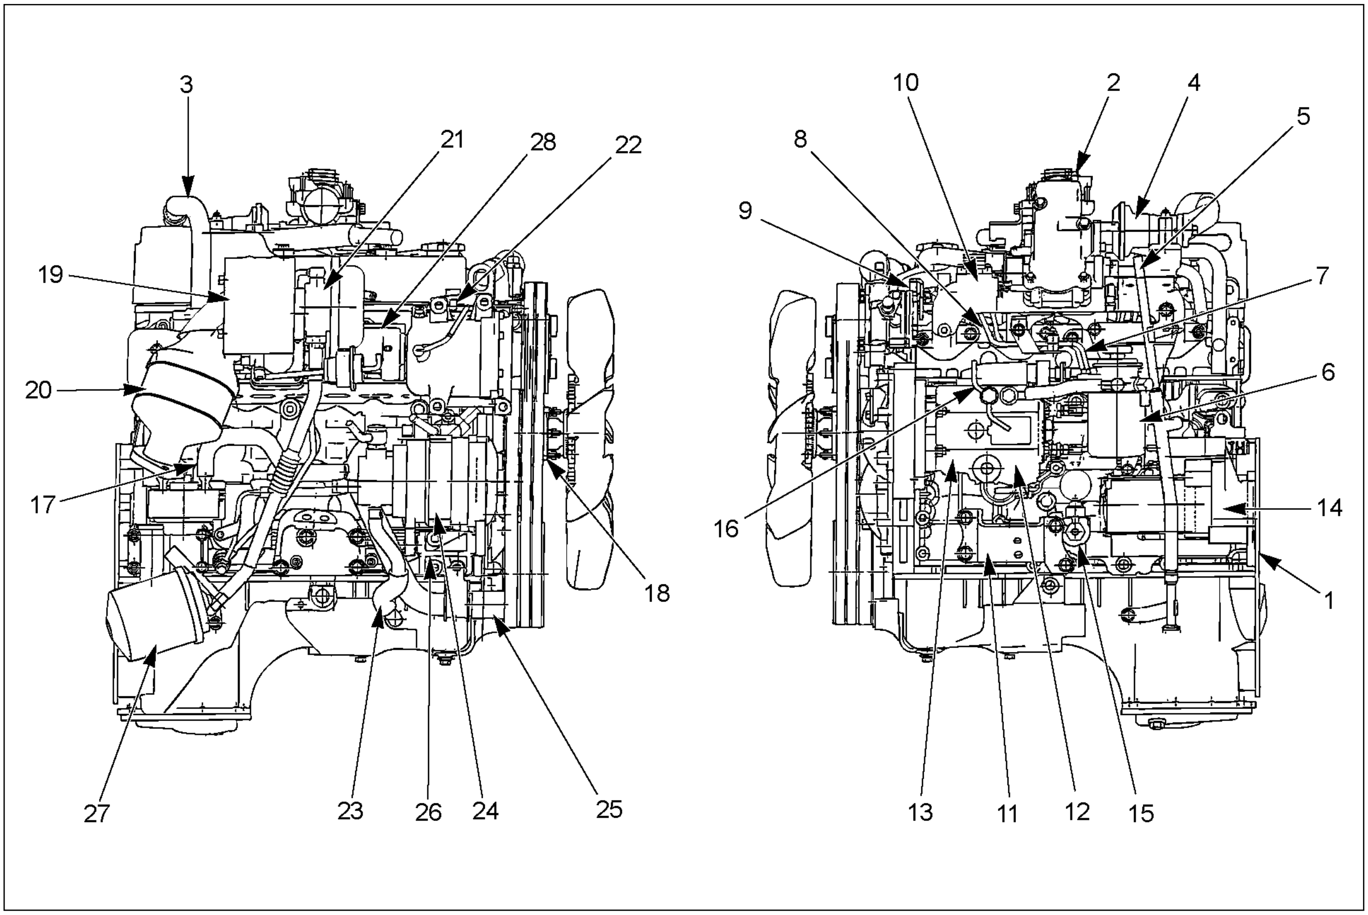
NOTE

Discard all O-rings, gaskets, and seals removed at disassembly and replace them with new ones. Reuse of these parts will result in oil, water, and gas leakage.

ENGINE OVERHAUL

REMOVAL

EXTERNAL PARTS



RTW36AMF000401

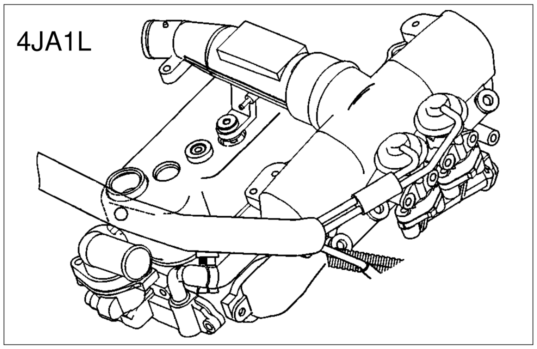
Removal Steps

1. Clutch Assembly or Flex Plate
2. Intake Pipe and Throttle Body
3-1. EGR Pipe
3-2. EGR cooler (EURO III model only)
4. EGR Valve
5. Oil Level Gauge
6. Fuel Filter Assembly (Except EURO III)
7. Fuel Filter Bracket (Except EURO III)
8. Fuel Injection Pipe with Clip
9. Power Steering Oil Pump Bracket
10. Intake Manifold
11. Engine Mounting Bracket and Foot
12. Injection Pump Cover
13. Injection Pump
14. Starter Motor
15. Oil Pressure Warning Switch
16. Fuel Leak Off Pipe
17. Oil Cooler Water Pipe
18. Cooling Fan Pulley
19. Heat Protector
20. Catalytic Converter
21. Turbocharger
22. Compressor Bracket
23. Vacuum Pump Oil Return Hose
24. Generator and Adjusting Plate
25. Water Inlet Pipe
26. Generator Bracket
27. Oil Cooler with Oil Filter
28. Exhaust Manifold

Removal

1. Clutch Assembly or Flex Plate

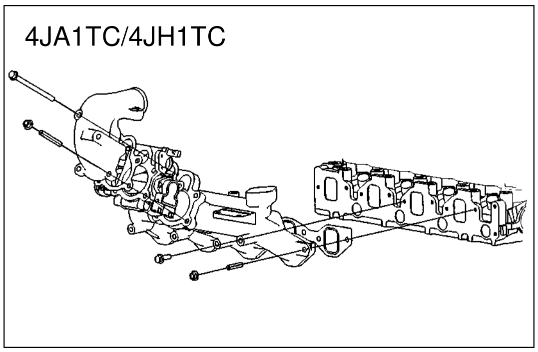
Remove the clutch assembly or the flex plate.



RTW46ASH000801

2. Intake Pipe and Throttle Body (4JA1TC/4JH1TC only)

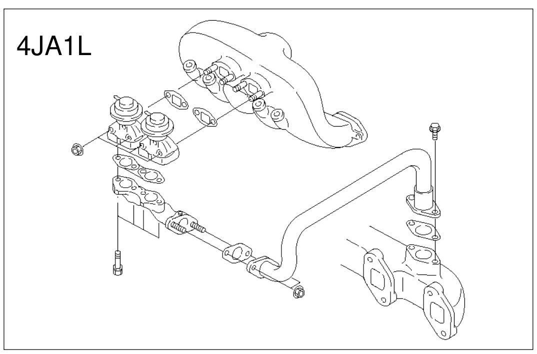
1) Loosen hose clamp between turbocharger and intake duct.
2) Remove the rubber hose.
3) Remove the intake pipe and the throttle body. (4JA1TC/4JH1TC only)



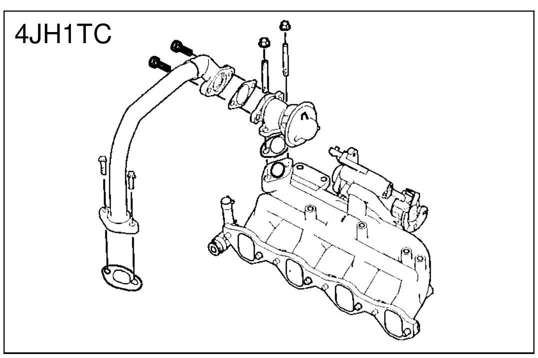
RTW36ASH000201

3-1. EGR Pipe

1) Remove two bolts from the exhaust manifold.
2) Remove two nuts from the EGR valve adapter.
3) Remove the EGR pipe with gaskets.



025R100008



RTW36ASH000301

3-2. EGR Cooler (EURO III model only)

GENERAL REPAIR PROCEDURE

OIL SPECIFICATION

- The HFC-134a system requires a synthetic (PAG) compressor oil.
- Compressor (PAG) oil varies according to compressor model. Be sure to use oil specified for the model of compressor.

Specified Compressor Oil
DH-PR

HANDLING OF OIL

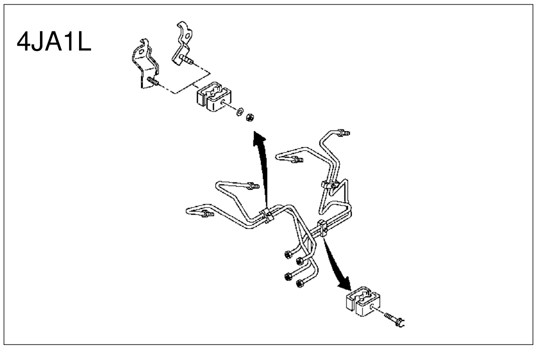
- The oil should be free from moisture, dust, metal powder, etc.
- Do not mix with other oil.
- The water content in the oil increases when exposed to the air. After use, seal oil from air immediately.
- The compressor oil must be stored in steel containers, not in plastic containers.

COMPRESSOR OIL CHECK

The Oil used to lubricate the compressor is circulating with the refrigerant.
Whenever replacing any component of the system or a large amount of gas leakage occurs, add oil to maintain the original amount of. oil.

Oil Capacity

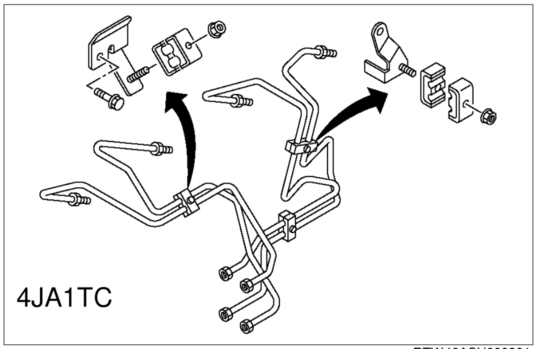
Capacity total in system	CR-14	180 cm^3 (5.07 Imp fl oz)
Compressor (Service parts) charging amount	CR-14	180 cm^3 (5.07 Imp fl oz)



RTW46ASH001001

4. EGR Valve

1) Remove four nuts and remove the EGR valve assembly from the intake manifold.
2) Remove four bolts and remove the adapter from the EGR valve assembly.



RTW46ASH000901

5. Oil Level Gauge

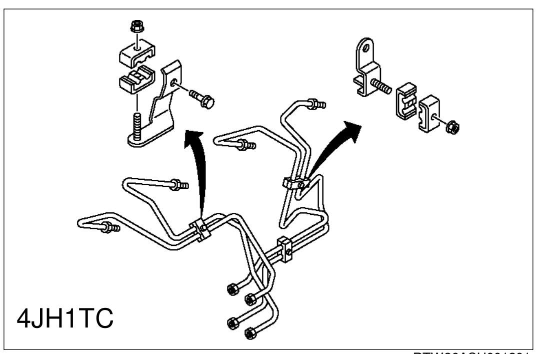
1) Disconnect PCV hose.
2) Remove two bolts and remove the engine oil level gauge.

6. Fuel Filter Assembly (Except EURO III model)

1) Disconnect fuel hose.
2) Remove two bolts and remove the fuel filter.

7. Fuel Filter Bracket (Except EURO III model)

Remove three bolts and remove the fuel filter bracket with leak pipe.



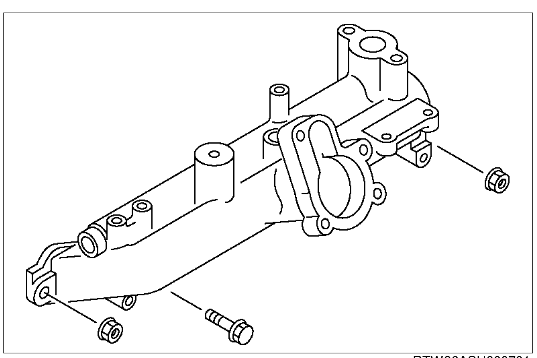
RTW36ASH001201

8. Fuel Injection Pipe with Clip

1) Loosen the injection pipe sleeve nuts at pump side and nozzle side.
   Do not apply excessive force to the injection pipes.
2) Loosen the injection pipe clips.
3) Remove the injection pipe.

NOTE:

Plug the delivery holder ports with the caps to prevent the entry of foreign material.



RTW36ASH000701

9. Power Steering Oil Pump Bracket

10. Intake Manifold

1) Disconnect the PCV hose from the cylinder head cover.
2) Remove the intake manifold with gasket.

11. Engine Mounting Bracket and Foot

12. Injection Pump Cover

13. Injection Pump

Refer to section 6C-19 (Injection Pump)

14. Starter Motor

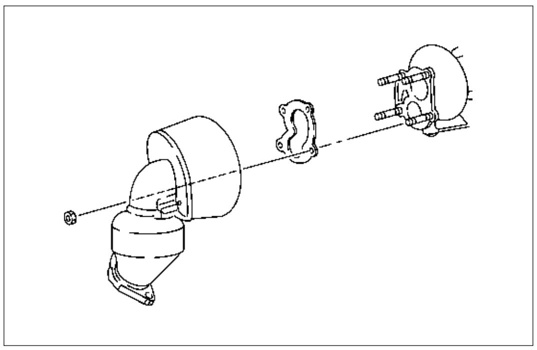
15. Oil Pressure Warning Switch

16. Fuel Leak Off Pipe

17. Oil Cooler Water Pipe

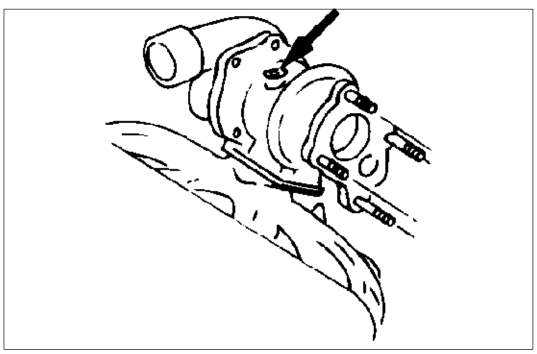
18. Cooling Fan Pulley

19. Heat Protector



027R100007

20. Catalytic Converter



037RY00001

21. Turbocharger

1) Disconnect the water hose between thermostat housing cover and turbocharger.
2) Disconnect the water hose between water inlet pipe and turbocharger.
3) Remove the oil feed pipe.
4) Remove the oil return pipe.
5) Remove the turbocharger and the gasket.

NOTE:

Plug the turbocharger body oil ports and water ports after removing the turbocharger assembly to prevent the entry of foreign material.

22. Compressor Bracket

23. Vacuum Pump Oil Return Hose

24. Generator and Adjusting Plate

25. Water Inlet Pipe

26. Generator Bracket

27. Oil Cooler with Oil Filter

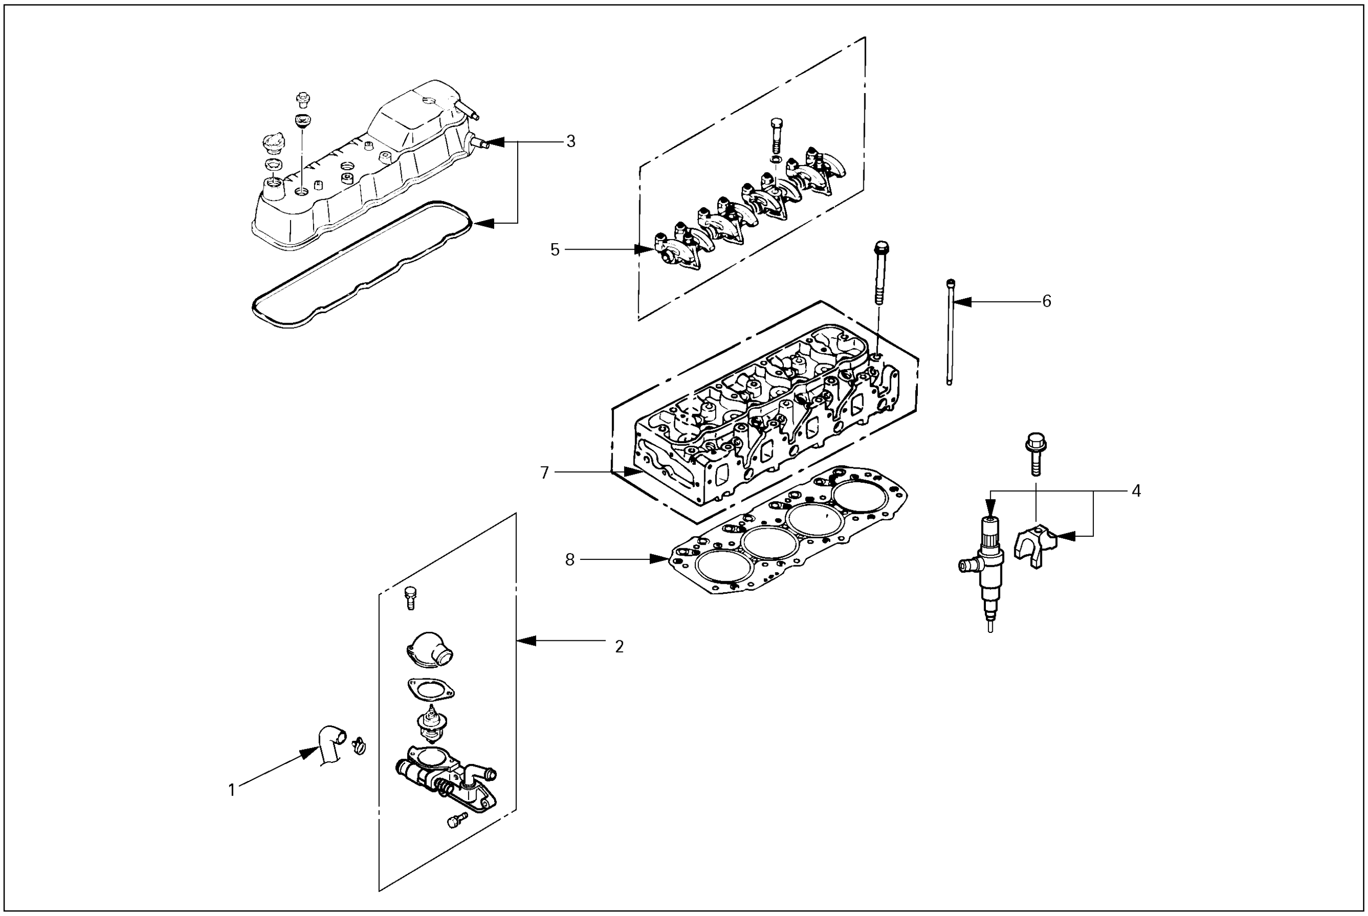
28. Exhaust Manifold

1

DISASSEMBLY

INTERNAL PARTS

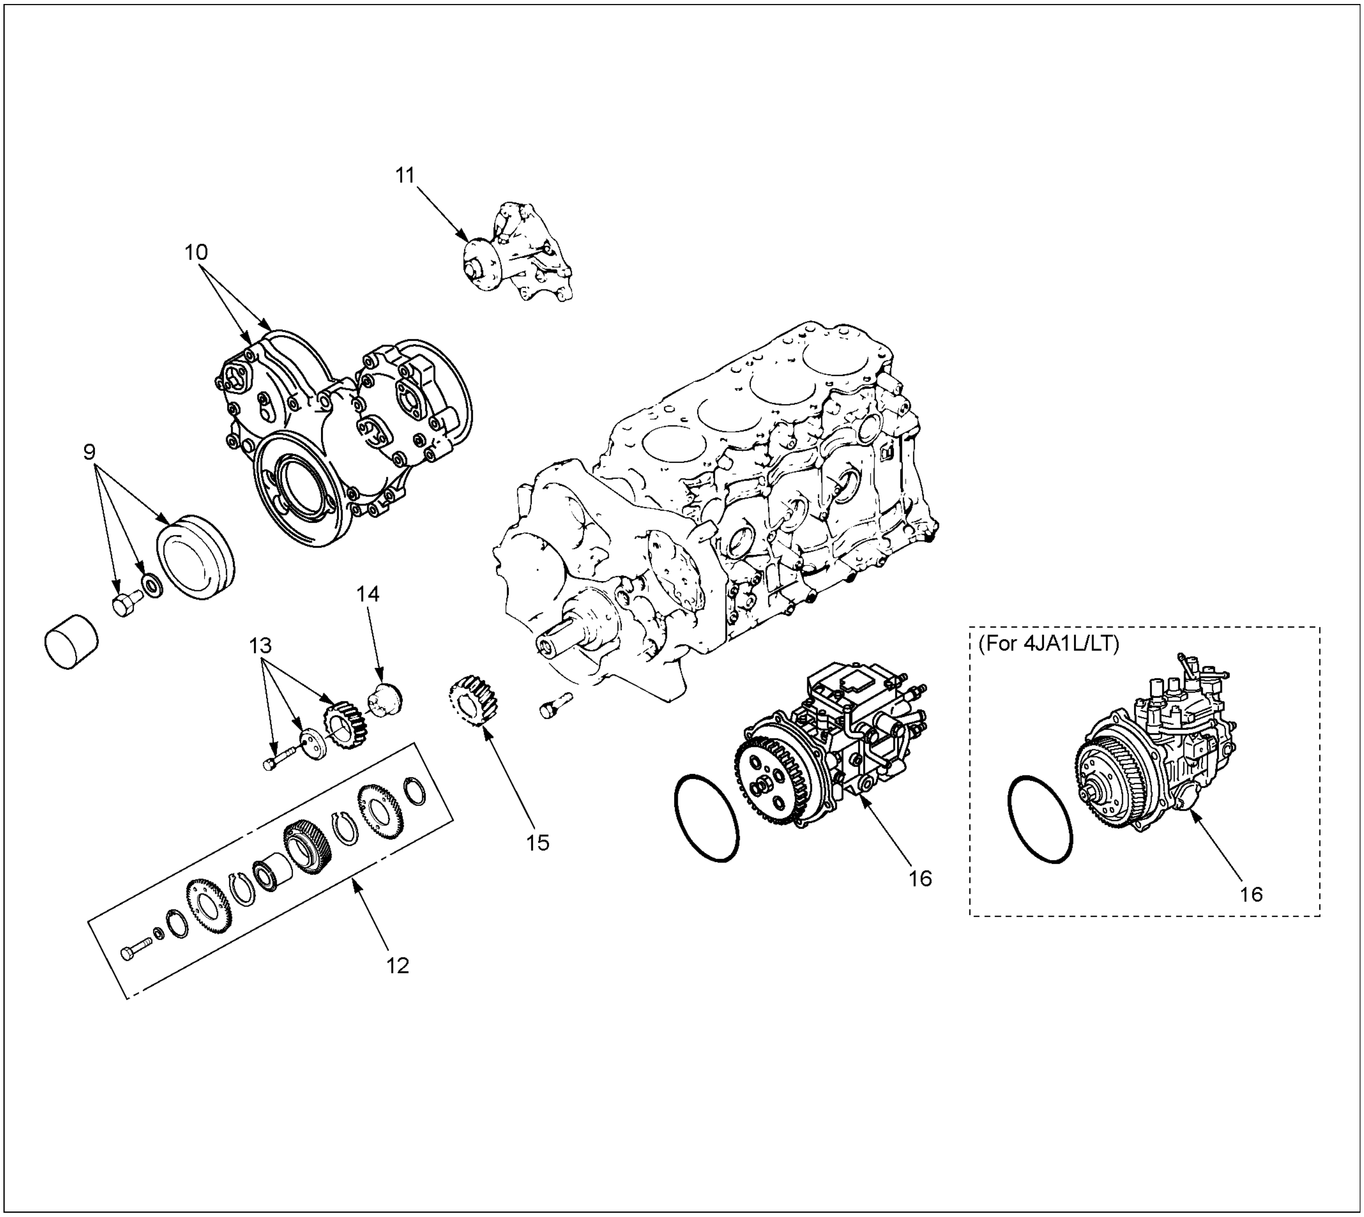
MAJOR COMPONENTS



011R300001

Disassembly Steps-1

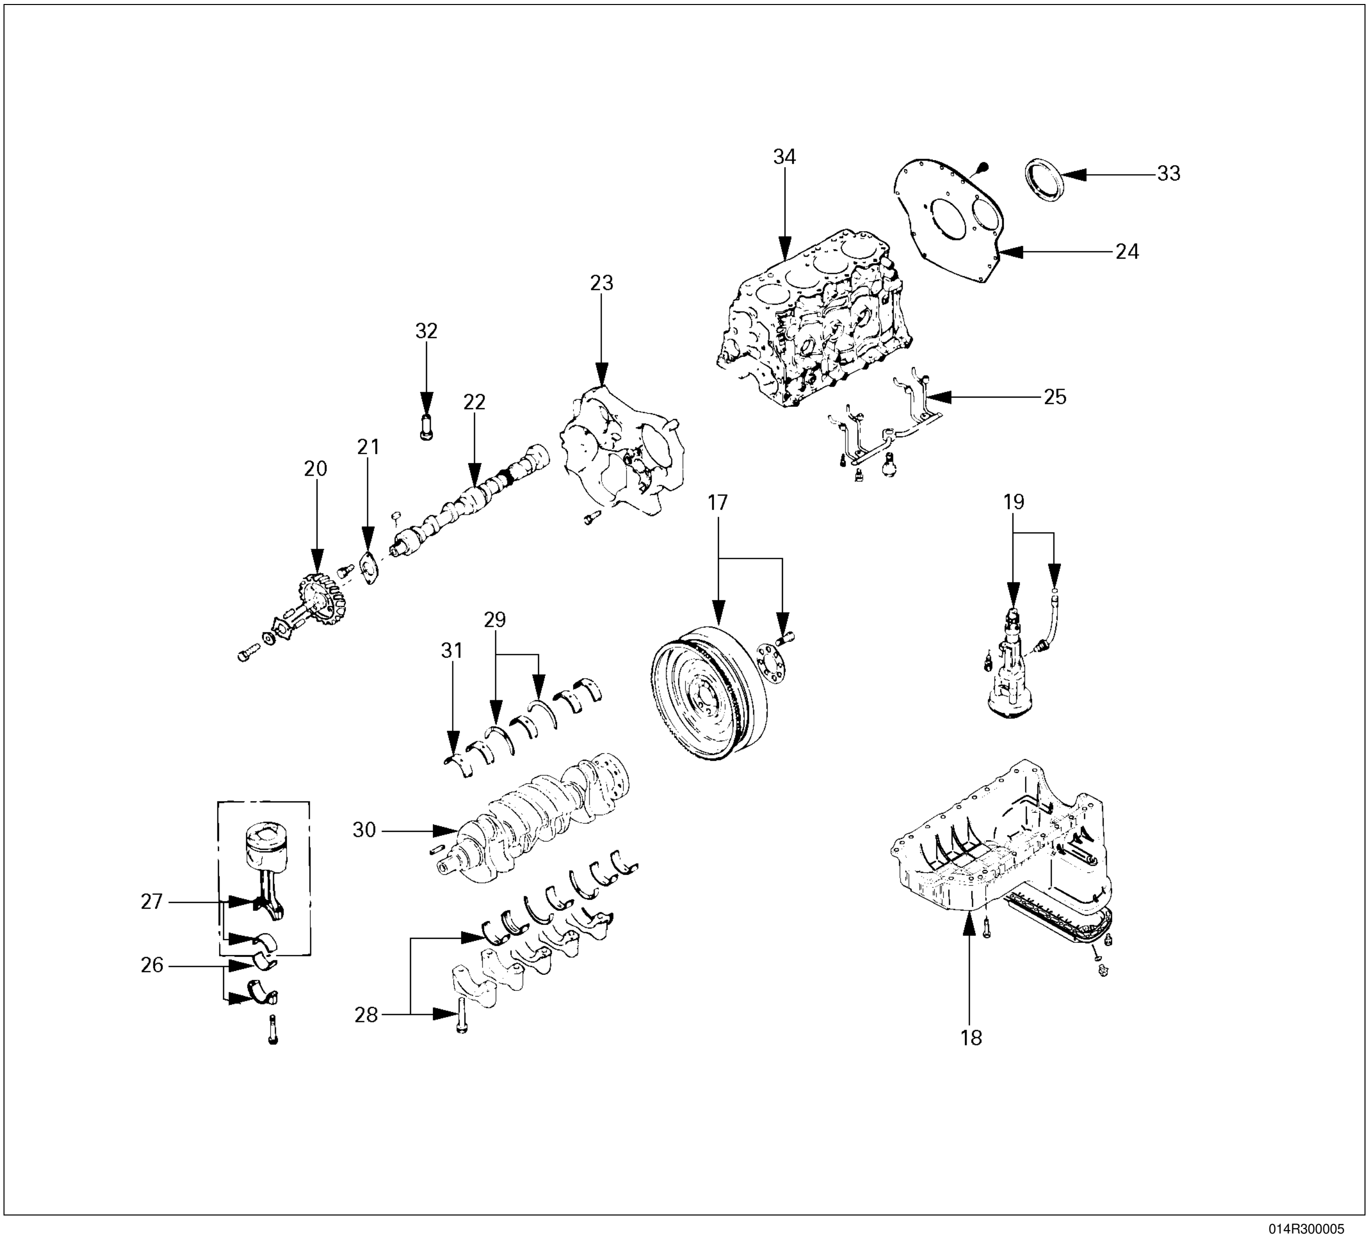
1. Water bypass hose
2. Thermostat housing with thermo switch
3. Cylinder head cover
4. Injection nozzle and bracket
5. Rocker arm shaft and rocker arm
6. Push rod
7. Cylinder head
8. Cylinder head gasket



RTW46ALF000101

Disassembly Steps-2

9. Crankshaft damper pulley
10. Timing gear case cove
11. Water pump
12. Idle gear "B" and shaft
13. Idle gear "A"
14. Idle gear shaft
15. Crankshaft timing gear
16. Injection pump

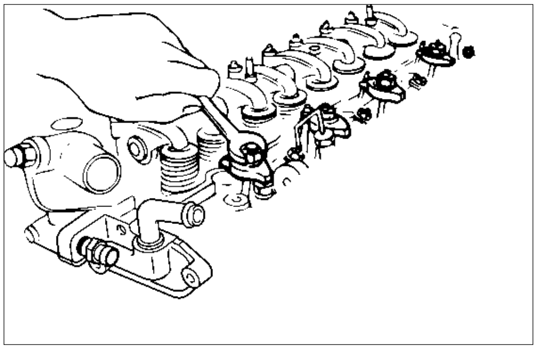


Disassembly Steps-3

17. Flywheel
18. Crank case
19. Oil pump with oil pipe
20. Camshaft timing gear
21. Camshaft thrust plate
22. Camshaft
23. Timing gear case
24. Cylinder body rear plate
25. Piston cooling oil jet
26. Connecting rod bearing cap with lower bearing
27. Piston and connecting rod with upper bearing
28. Crankshaft bearing cap with lower bearing
29. Crankshaft thrust bearing
30. Crankshaft
31. Crankshaft upper bearing
32. Tappet
33. Crankshaft rear oil seal
34. Cylinder body

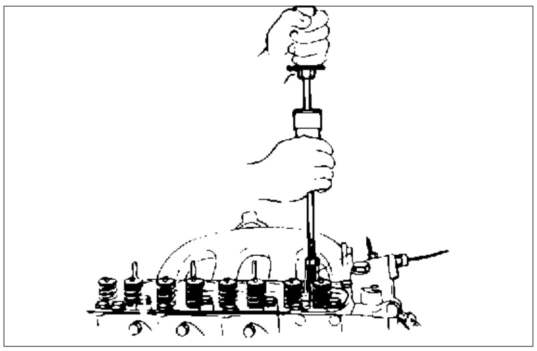
Disassembly

1. **Water Bypass Hose**
2. **Thermostat Housing with Thermo Switch**
3. **Cylinder Head Cover**
4. **Injection Nozzle and Bracket**



011R100002

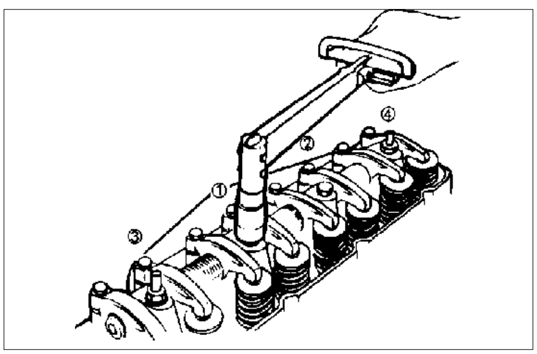
   1. Remove the injection nozzle bracket bolts.



011RY00005

   2. Use the injection nozzle remover and the sliding hammer to remove the injection nozzle together.

Injection Nozzle Remover: 5-8840-2723-0
Sliding Hammer: 5-8840-0019-0



011RY00006

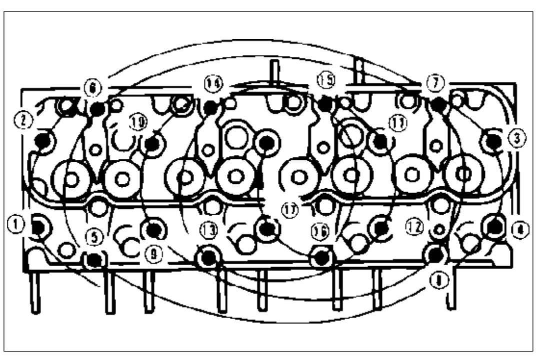
5. **Rocker Arm Shaft and Rocker Arm**

   Loosen the rocker arm shaft bracket bolts in numerical order a little at a time.

Note:

Failure to loosen the rocker arm shaft bracket bolts in numerical order a little at a time will adversely affect the rocker arm shaft.

6. **Push Rod**



011RY00007

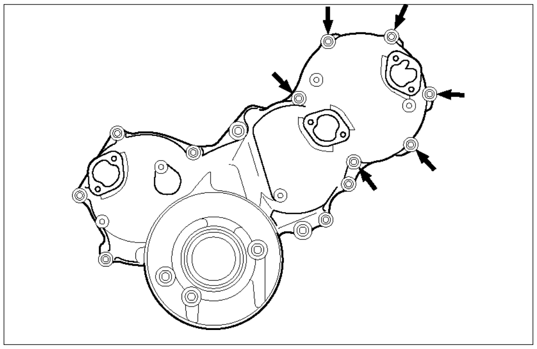
7. **Cylinder Head**

   Loosen the cylinder head bolts in numerical order a little at a time.

Note:

Failure to loosen the cylinder head bolts in numerical order a little at a time will adversely affect the cylinder head lower surface.

8. **Cylinder Head Gasket**
9. **Crankshaft Damper Pulley**

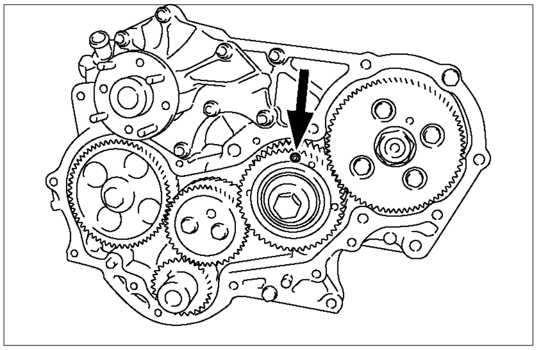


020L200006

10. Timing Gear Case Cover

The timing gear case is tightened together with the injection pump at the 6 points indicated by the arrows in the illustration.

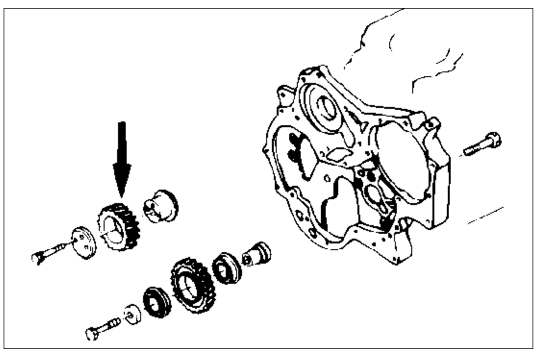
11. Water Pump



020L200020

12. Idle Gear B and shaft

Before removing the idle gear B, install bolt (M6,L=30) to the hole marked with an arrow in the illustration to hold the scissor gear in place.



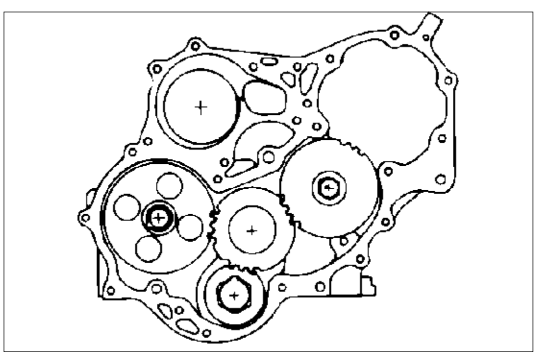
020RY00019

13. Idler Gear "A"

1. Measure the camshaft timing gear backlash and the crankshaft timing gear backlash before removing the idler gear.
2. Measure the idler gear end play before removing the idler gear.

NOTE:

Refer to the following items for details on the backlash and end play measurement procedures.



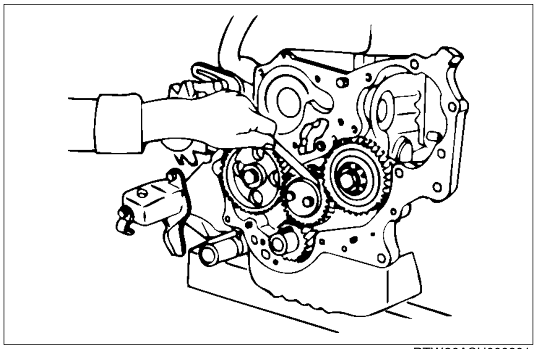
020RY00020

Timing Gear Backlash Measurement

1. Set a dial indicator to the timing gear to measured. Hold both the gear to be checked and the adjusting gear stationary.
2. Move the gear to be checked as far as possible to both the right and the left.
   Take the dial indicator reading.
   If the measured value exceeds the specified limit, the timing gear must be replaced.

Timing Gear Backlash mm (in)

Standard	Limit
0.10 - 0.17 (0.0039 - 0.0067)	0.30 (0.012)



RTW36ASH000801

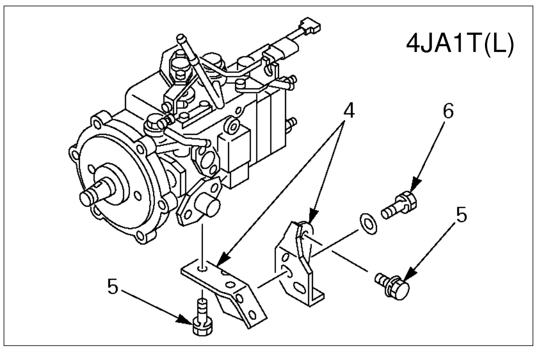
Idler Gear "A" End Play Measurement

Insert a feeler gauge between the idler gear and the thrust collar to measure the gap and determine the idler gear end play.

If the measured value exceeds the specified limit, the thrust collar must be replaced.

Idler Gear End Play mm (in)

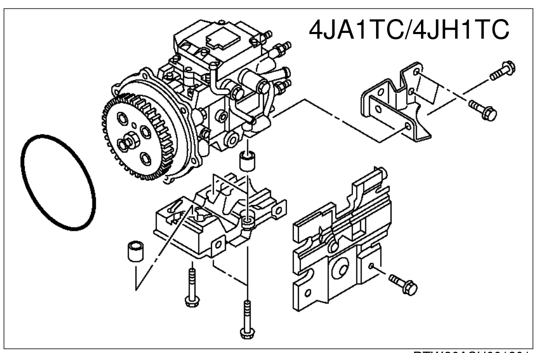
Standard	Limit
0.07 (0.0028)	0.2 (0.0079)



040R300009

14. Idle Gear Shaft

15. Crankshaft Timing Gear



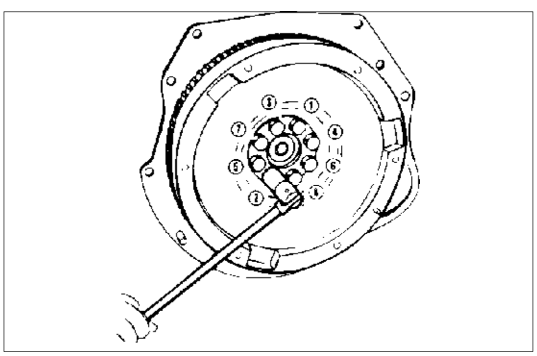
RTW36ASH001301

16. Injection Pump

1. Remove the injection pump cover (4JA1TC/4JH1TC only).
2. Remove the injection pump bracket.
3. Pull the injection pump along with the injection pump timing gear free toward the rear of the engine.

NOTE:

Plug the injection pump delivery ports with the caps to prevent the entry of foreign material.



015RY00001

17. Flywheel

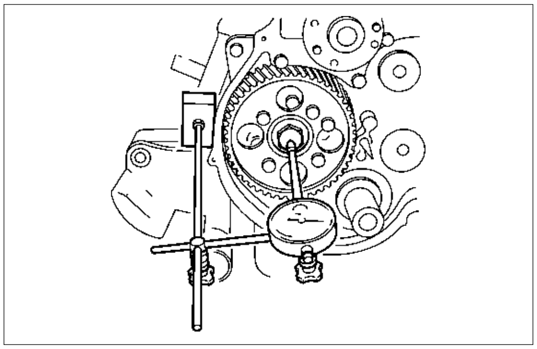
Loosen the flywheel bolts in numerical order a little at a time.

Use the gear stoper to stop the flywheel gear.

Gear stoper: 5-8840-0214-0

18. Crank Case

19. Oil Pump With Oil Pipe



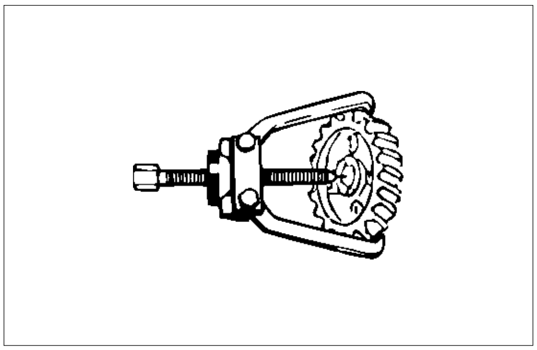
014RT0001

20. Camshaft Timing Gear

1. Use a dial indicator to measure the camshaft end play. This must be done before removing the camshaft gear.
   If the camshaft end play exceeds the specified limit, the thrust plate must be replaced.

Camshaft End Play mm (in)

Standard	Limit
0.050 - 0.114 (0.002 - 0.0044)	0.20 (0.008)



901R100008

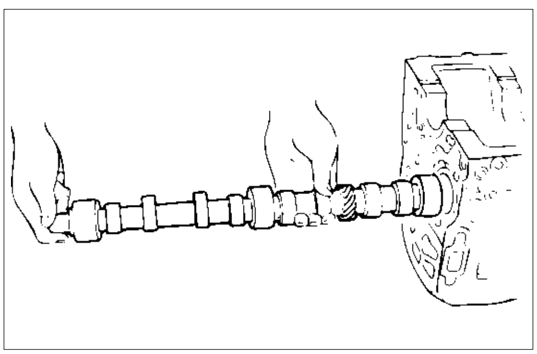
2. Remove the camshaft timing gear bolt from the camshaft.

Note:

Hold the camshaft stationary to prevent the camshaft from turning.

3. Remove the sensor rotor plate.
4. Use the universal puller to pull out the camshaft timing gear.
   Universal Puller: 5-8521-0002-0
5. Remove the thrust plate.

21. Camshaft Thrust Plate



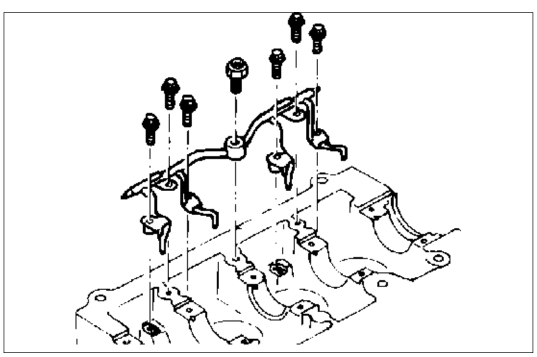
014RY00019

22. Camshaft

Jiggle the camshaft with your hand as you pull it free from the front of the engine.

23. Timing Gear Case

24. Cylinder Body Rear Plate



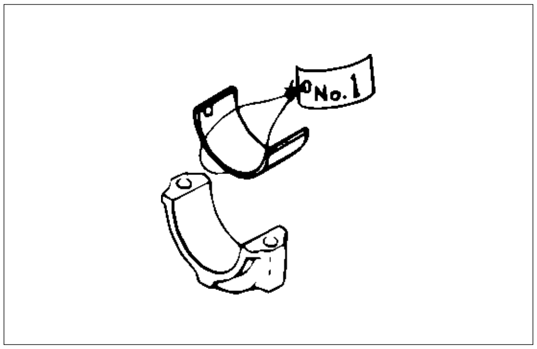
052RY00001

25. Piston Cooling Oil Jet

The oiling jet uses thin steel tubing which is easily bent.

Accidental contact between the oiling jet and the cylinder body, piston, or a tool will damage the oiling jet.

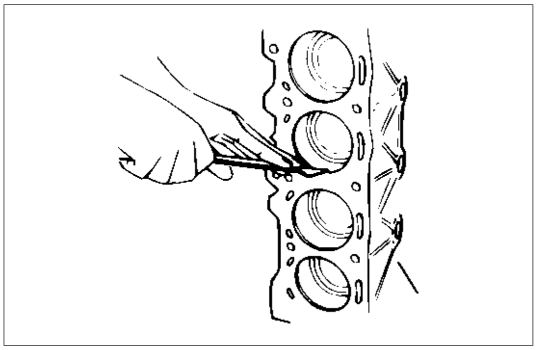
Never attempt to repair a damaged oiling jet. Replace it with a new one.



014LX056

26. Connecting Rod Bearing Cap with Lower Bearing

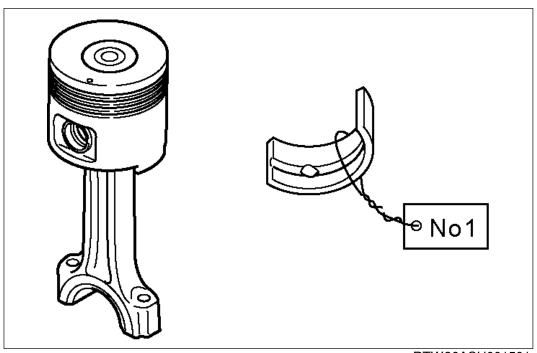
If the connecting rod lower bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.



015LX018

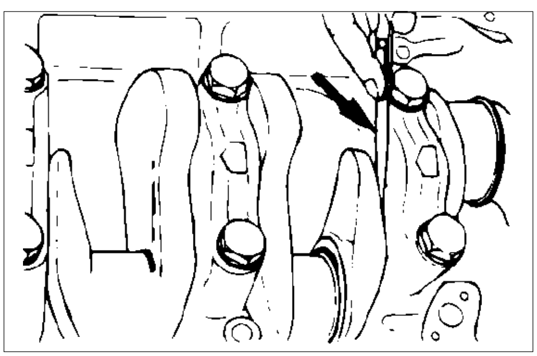
27. Piston and Connecting Rod with Upper Bearing

1. Remove carbon deposits from the upper portion of the cylinder wall with a scraper before removing the piston and connecting rod.
2. Move the piston to the top of the cylinder and tap it with a hammer grip or a similar object from the connecting rod lower side to drive it out.



RTW36ASH001501

If the connecting rod upper bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.



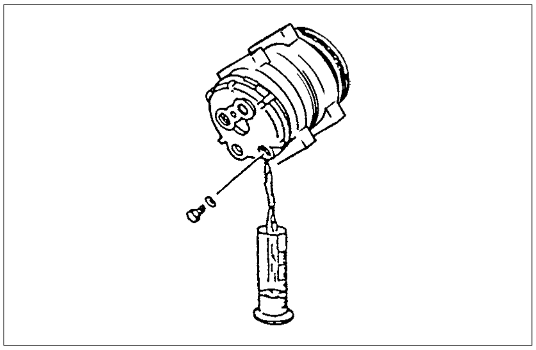
015RY00002

28. Crankshaft Bearing Cap with Lower Bearing

1. Measure the crankshaft end play at the center journal of the crankshaft.
   Do this before removing the crankshaft bearing caps.
   If the measured value exceeds the specified limit, the crankshaft thrust bearing must be replaced.

Crankshaft End Play mm (in)

Standard	Limit
0.10 (0.004)	0.30 (0.012)



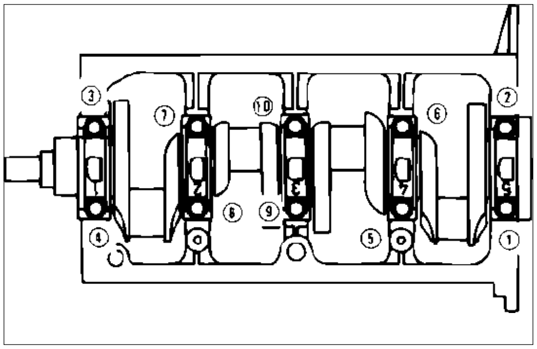
Checking and Adjusting for Used Compressor

(1) Perform Oil return operation.
(Refer to "Oil Return Operation" in this section.)
(2) Discharge refrigerant and remove the compressor.
(3) Drain the compressor oil and measure the extracted oil with a measuring cylinder.
(4) Check the compressor oil for contamination.
(Refer to "Contamination of Compressor Oil" in this section.)
(5) Adjust oil level following the procedure below.

Type	Collected Amount	Charging Amount
CR-14	more than 90 cm^3 (2.53 Imp fl oz)	same as collected amount
	less than 90 cm^3 (2.53 Imp fl oz)	90 cm^3 (2.53 Imp fl oz)

(6) Install the compressor, then evacuate, charge and perform oil return operation.
(7) Check system operation.

When it is impossible to perform oil return operation, the compressor oil should be checked in the following order:
(1) Discharge refrigerant and remove the compressor.
(2) Drain the compressor oil and measure the extracted oil with a measuring cylinder.
(3) Check the oil for contamination.
(4) If more than 90 cm^3 (2.53 Imp fl oz) for CR-14 type is extracted from the compressor, supply same amount of oil to the compressor to be installed.
If the amount of oil extracted is less than 90 cm^3 (2.53 Imp fl oz) for CR-14 type recheck the compressor oil in the following order:
(5) Supply 90 cm^3 (2.53 Imp fl oz) for CR-14 type oil to the compressor and install it onto the vehicle.
(6) Perform oil return operation.
(7) Remove the compressor and recheck the amount of oil.
(8) Adjust the compressor oil.

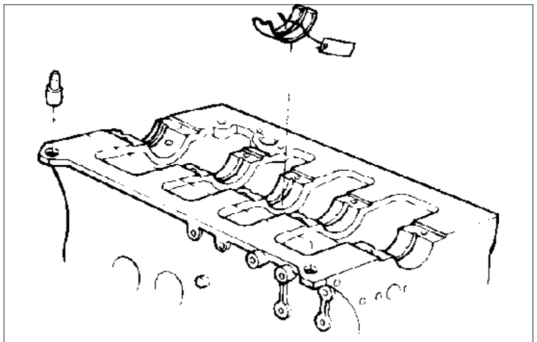


015RY00003

2. Loosen the crankshaft bearing cap bolts in numerical order a little at a time.
   If the crankshaft bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.

29. Crankshaft Thrust Bearing

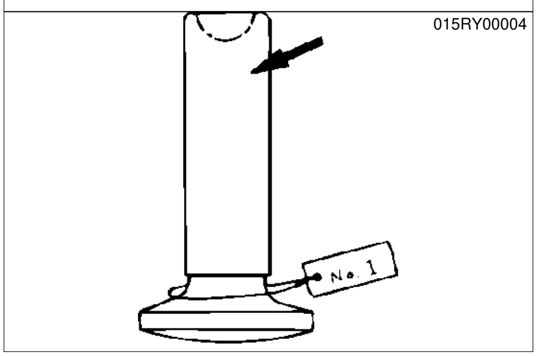
30.Crankshaft



015RY00004

31. Crankshaft Upper Bearing

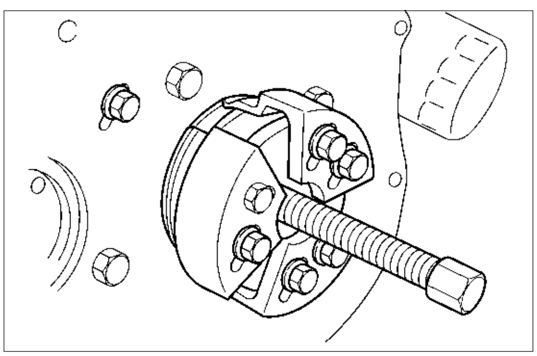
If the crankshaft upper bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.



015RY00005

32. Tappet

If the tappets are to be reinstalled, mark their fitting positions by tagging each tappet with the cylinder number from which it was removed.



015LV002

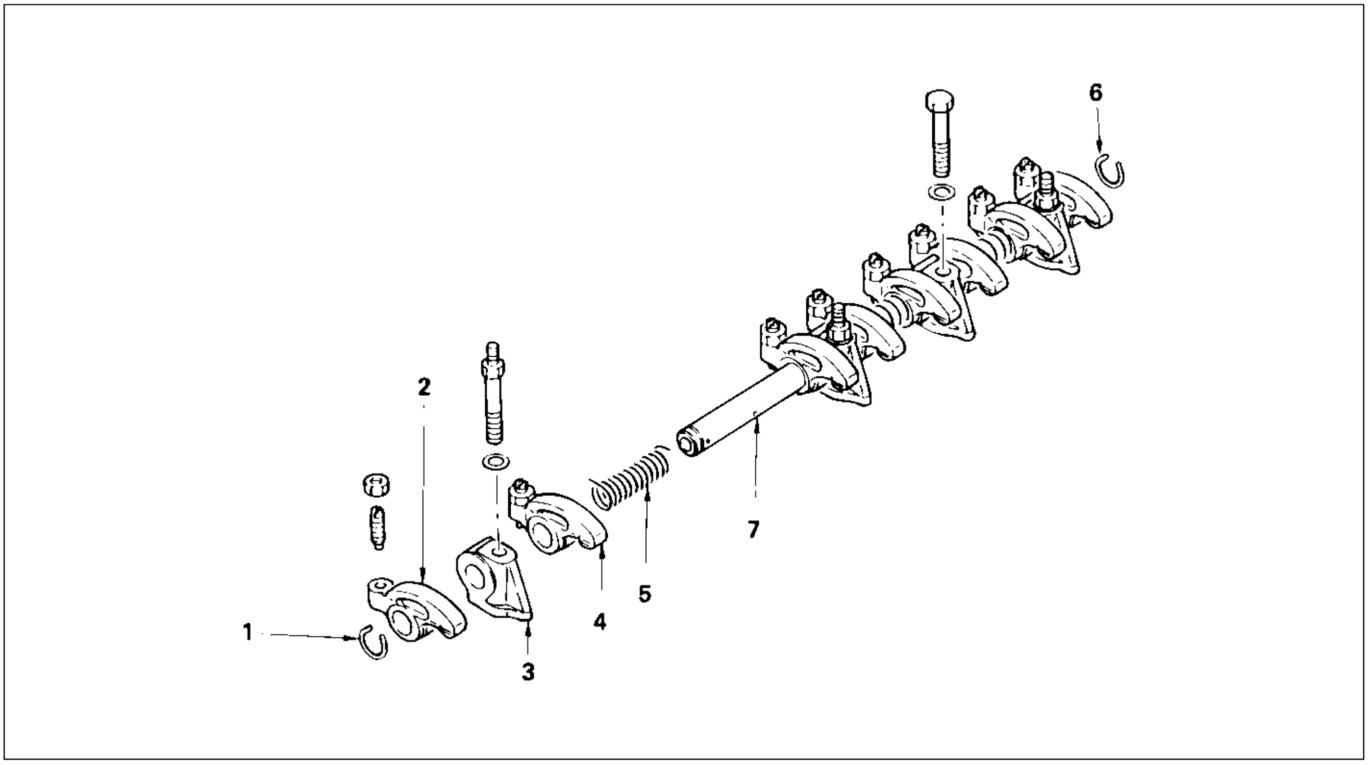
33. Crankshaft Rear Oil Seal

- With the oil seal pushed in deep, install the special tool as shown in the illustration and remove the oil seal.
  Oil Seal Remover: 5-8840-2360-0

34. Cylinder Body

MINOR COMPONENTS

ROCKER ARM SHAFT AND ROCKER ARM

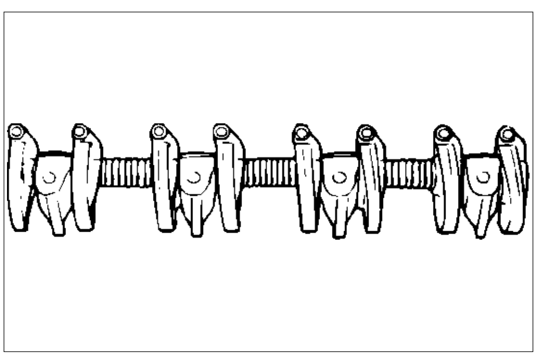


011RY00009

Disassembly Steps

1. Rocker arm shaft snap ring
2. Rocker arm
3. Rocker arm shaft bracket
4. Rocker arm
5. Rocker arm shaft spring
6. Rocker arm shaft snap ring
7. Rocker arm shaft

Disassembly



011RY00010

1. Rocker Arm Shaft Snap Ring

2. Rocker Arm

3. Rocker Arm Shaft Bracket

1. Use a pair of pliers to remove the snap rings.
2. Remove the rocker arms.
3. Remove the rocker arm shaft brackets.
   If the rocker arms and rocker arm shaft brackets are to be reinstalled, mark their installation positions by tagging each rocker arm and rocker arm shaft bracket with the cylinder number from which it was removed.

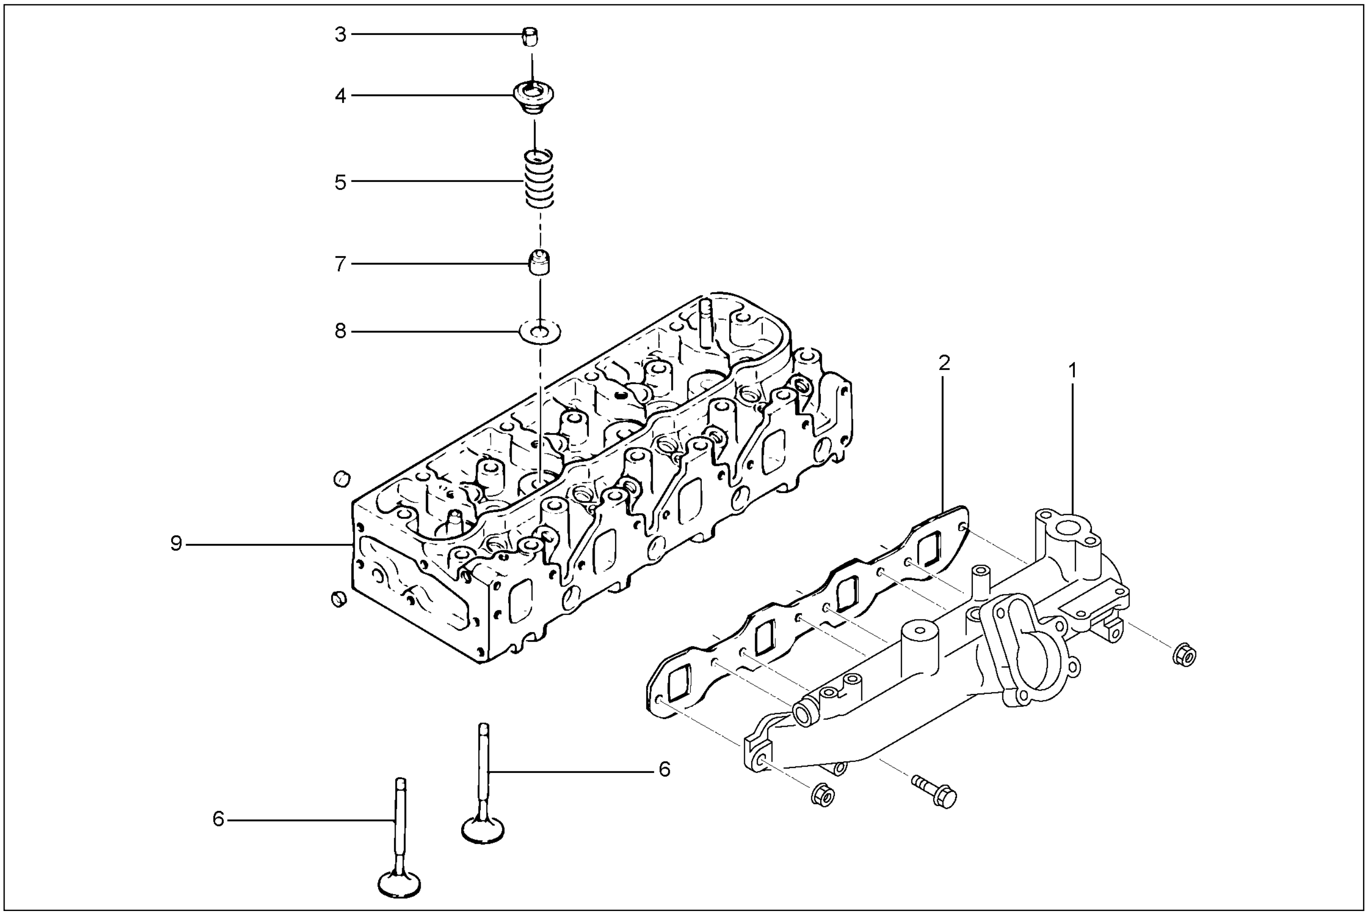
4. Rocker Arm

5. Rocker Arm Shaft Spring

6. Rocker Arm Shaft Snap Ring

7. Rocker Arm Shaft

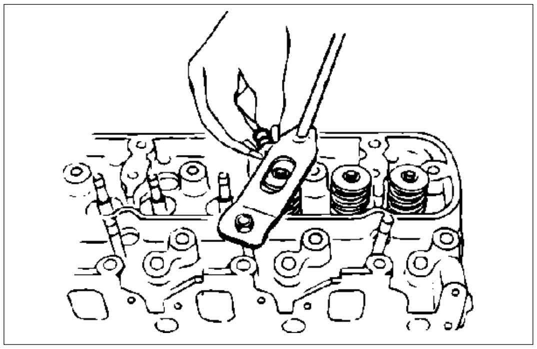
CYLINDER HEAD



RTW46ALF001201

Disassembly Steps

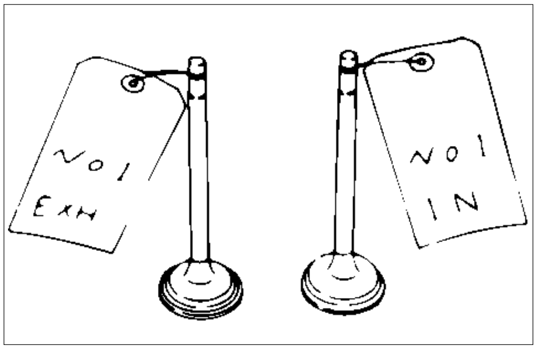
1. Intake manifold
2. Intake manifold gasket
3. Split collar
4. Valve spring upper seat
5. Valve spring
6. Intake and exhaust valve
7. Valve stem oil seal
8. Valve spring lower seat
9. Cylinder head



011RY00011

Disassembly

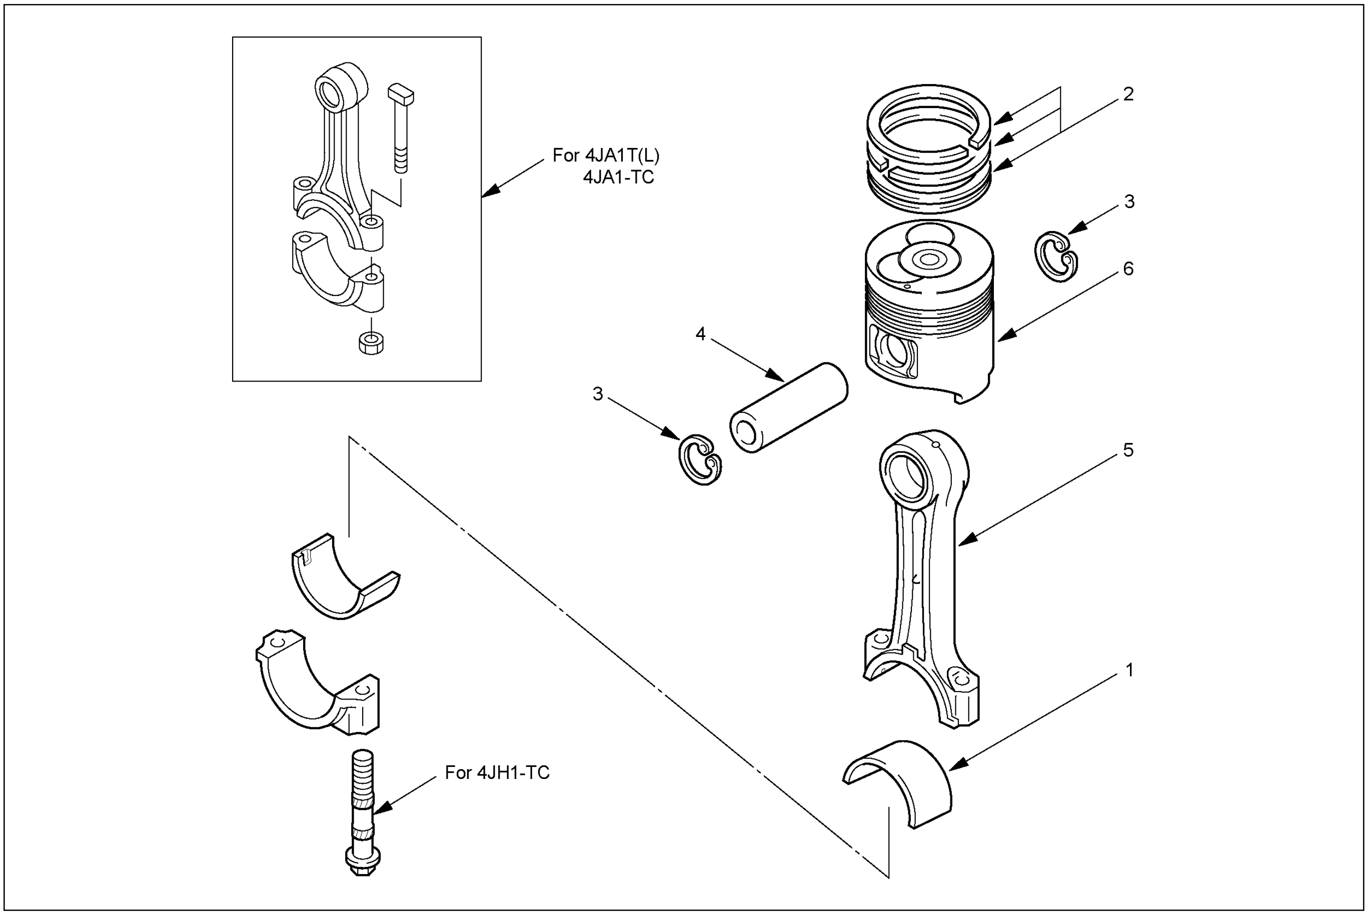
1. **Intake Manifold**
2. **Intake Manifold Gasket**
3. **Split Collar**
   1. Place the cylinder head on a flat wooden surface.
   2. Use the spring compressor to remove the split collars. Do not allow the valve to fall from the cylinder head.
      Spring Compressor: 9-8523-1423-0
4. **Valve Spring Upper Seat**
5. **Valve Spring**



011LX022

6. **Intake and Exhaust Valve**
   If the intake and exhaust valves are to be reinstalled, mark their installation positions by tagging each valve with the cylinder number from which it was removed.
   If the intake and exhaust valves are to be replaced, the valve guides must also be replaced.
7. **Valve Stem Oil Seal**
8. **Valve Spring Lower Seat**
9. **Cylinder Head**

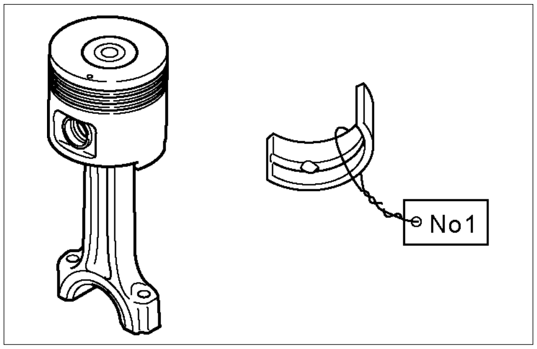
PISTON AND CONNECTING ROD



RTW46ALF000301

Disassembly Steps

1. Connecting rod bearing
2. Piston ring
3. Piston pin snap ring
4. Piston pin
5. Connecting rod
6. Piston

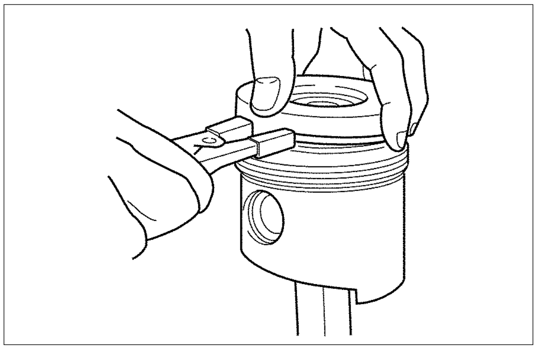


RTW36ASH001501

Disassembly

1. Connecting Rod Bearing

If the connecting rod bearings are to be reinstalled, mark their fitting positions by tagging each bearing with the cylinder number from which it was removed.



015RW041

2. Piston Ring

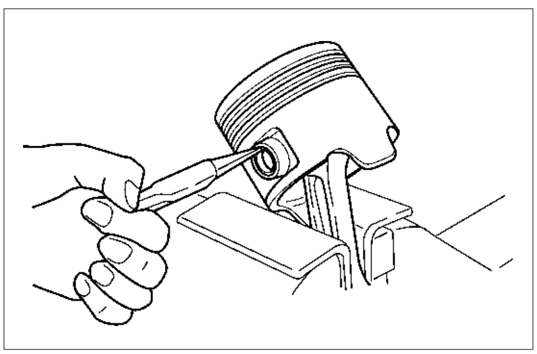
1. Clamp the connecting rod in a vise.

   Take care not to damage the connecting rod.

2. Use a piston ring replacer to remove the piston rings.

   Piston Ring Replacer

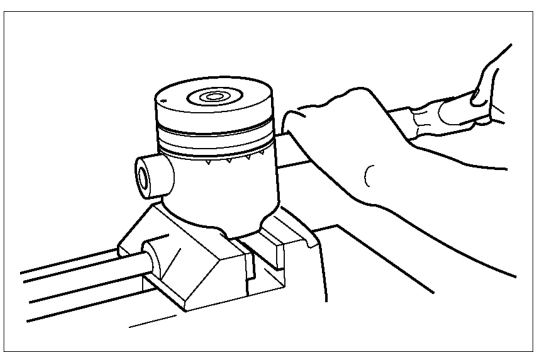
   Do not attempt to use some other tool to remove the piston rings. Piston ring stretching will result in reduced piston ring tension.



F06MV015

3. Piston Pin Snap Ring

Use a pair of pliers to remove the piston pin snap rings.



RTW36ASH001601

4. Piston Pin

5. Connecting Rod

6. Piston

Tap the piston pin out with a hammer and a brass bar.

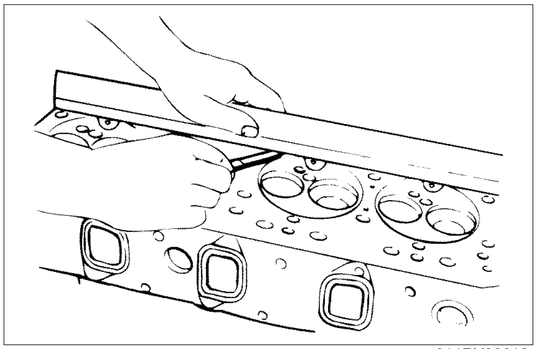
If the pistons and piston pins are to be reinstalled, mark their installation positions by tagging each piston and piston pin with the cylinder number from which it was removed.

INSPECTION AND REPAIR

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

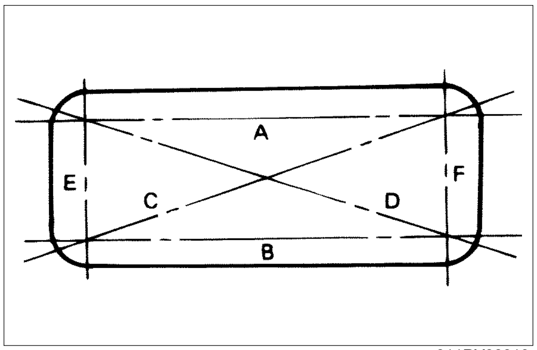
CYLINDER HEAD

Cylinder Head Lower Face Warpage



011RY00012

1. Use a straight edge and a feeler gauge to measure the four sides and the two diagonals of the cylinder head lower face.
2. The cylinder head lower surface warpage is more than the limit, it should be replaced.

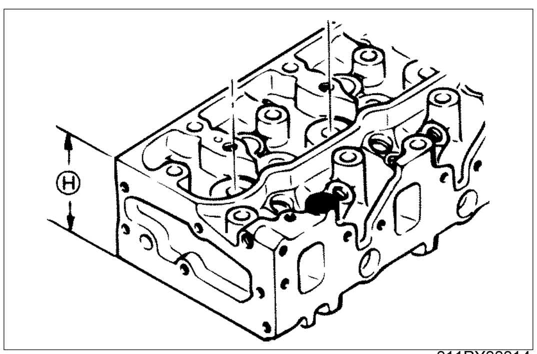


011RY00013

Cylinder Head Lower Face Warpage mm (in)

Standard	Limit
0.05 (0.002) or less	0.20 (0.0079)

NOTE:
The cylinder head lower face cannot be reground.



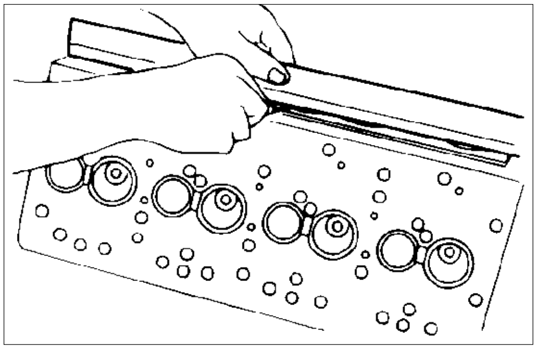
011RY00014

Cylinder Head Height (H) (Reference) mm (in)

Standard
91.95 – 92.05 (3.620 – 3.624)

Positive Crankcase Ventilation (PCV) Valve

1. Remove PCV valve assembly from cylinder head cover.
2. Inspect the diaphragm for broken.
3. Inspect the spring for broken or weaken.
4. If find any abnormal condition, replace the PCV valve assembly.



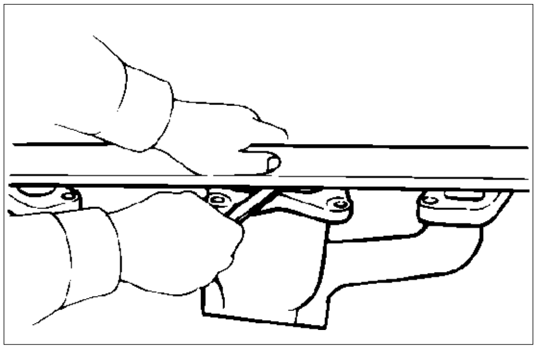
027RY00001

Manifold Fitting Face Warpage

Use a straight edge and a feeler gauge to measure the manifold cylinder head fitting face warpage.
Regrind the manifold cylinder head fitting surfaces if the measured values are greater than the specified limit but less than the maximum grinding allowance.
If the measured values exceed the maximum grinding allowance, the cylinder head must be replaced.

Manifold Fitting Face Warpage mm (in)

Standard	Limit	Maximum Grinding Allowance
0.05 (0.002) or less	0.20 (0.008)	0.40 (0.016)



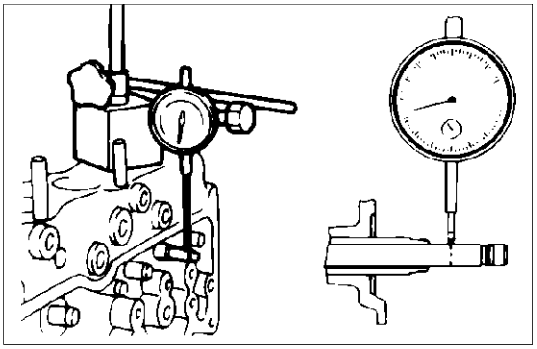
027RY00002

Exhaust Manifold Warpage

Use a straight edge and a feeler gauge to measure the manifold cylinder head fitting face warpage.
If the measured values exceed the specified limit, the manifold must be replaced.

Exhaust Manifold Warpage mm (in)

Standard	Limit
0.05 (0.002) or less	0.20 (0.008)



011RY00022

Valve Stem and Valve Guide Clearance

Measuring Method-I

1. With the valve stem inserted in the valve guide, set the dial indicator needle to "0".
2. Move the valve head from side to side.

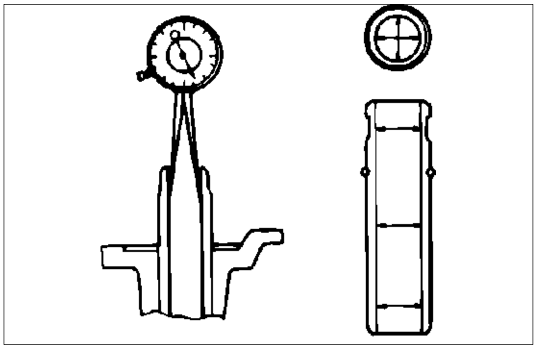
   Read the dial indicator.

   Note the highest dial indication.

   If the measured values exceed the specified limit, the valve and the valve guide must be replaced as a set.

Valve Stem Clearance mm (in)

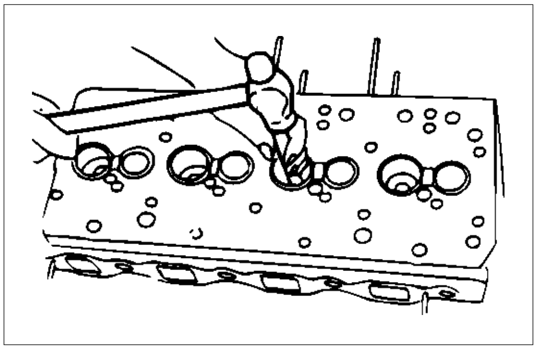
	Standard	Limit
Intake Valve	0.039 - 0.071 (0.0015 - 0.0028)	0.200 (0.008)
Exhaust Valve	0.064 - 0.096 (0.0025 - 0.0038)	0.250 (0.0098)



011RY00023

Measuring Method-II

1. Measure the valve stem outside diameter.
   Refer to the Item "Valve Stem Outside Diameter".
2. Use a caliper calibrator or a telescoping gauge to measure the valve guide inside diameter.

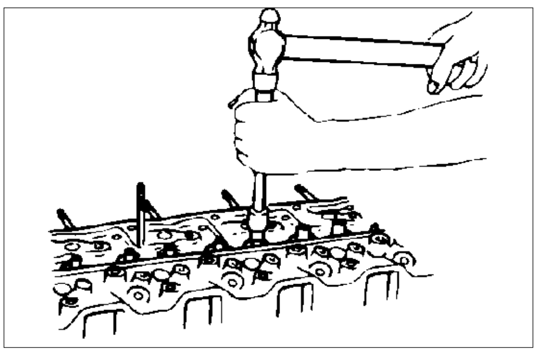


011LX029

Valve Guide Replacement

Valve Guide Removal

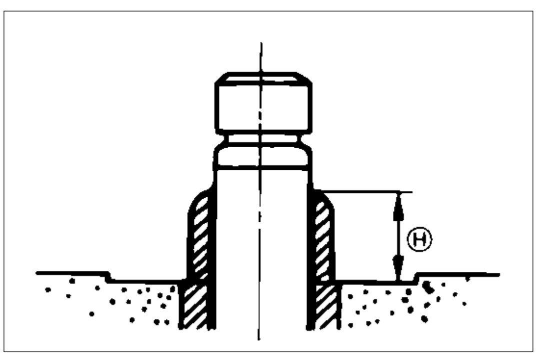
Use a hammer and the valve guide replacer to drive out the valve guide from the cylinder head lower face.
Valve Guide Replacer: 9-8523-1212-0



011RY00024

Valve Guide Installation

1. Apply engine oil to the valve guide outer circumference.
2. Attach the valve guide installer to the valve guide.
3. Use a hammer to drive the valve guide into position from the cylinder head upper face.
   Valve Guide Replacer: 9-8523-1212-0



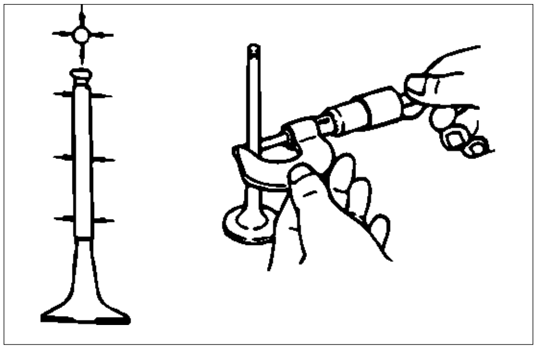
011RY000025

4. Measure the height of the valve guide upper end from the upper face of the cylinder head.

Valve Guide Upper End Height (H) (Reference)	mm (in)
12.8-13.2 (0.50-0.52)	

NOTE:

If the valve guide has been removed, both the valve and the valve guide must be replaced as a set.



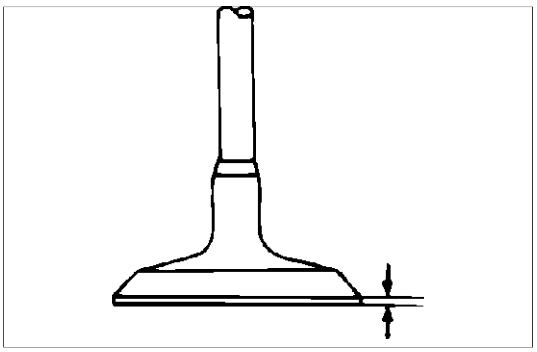
011LX027

Valve Stem Outside Diameter

Measure the valve stem diameter at three points.
If the measured value is less than the specified limit, the valve and the valve guide must be replaced as a set.

Valve Stem Outside Diameter mm (in)

	Standard	Limit
Intake Valve	7.946 - 7.961 (0.3128 - 0.3134)	7.880 (0.3102)
Exhaust Valve	7.921 - 7.936 (0.3119 - 0.3124)	7.850 (0.3090)



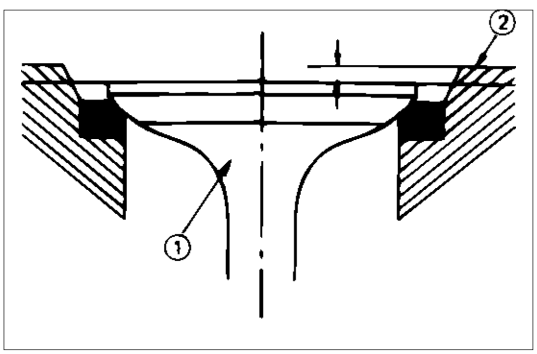
014RY00020

Valve Thickness

Measure the valve thickness.
If the measured value is less than the specified limit, the valve and the valve guide must be replaced as a set.

Intake and Exhaust Valve Thickness mm (in)

		Standard	Limit
4JA1T (L)		1.8 (0.07)	1.5 (0.06)
4JA1TC, 4JH1TC	Inlet	1.34 (0.054)	1.1 (0.045)
	Exhaust	1.36 (0.055)	



014RY00021

Valve Depression

1. Install the valve (1) to the cylinder head (2).
2. Use a depth gauge or a straight edge with steel rule to measure the valve depression from the cylinder head lower surface.
   If the measured value exceeds the specified limit, the valve seat insert must be replaced.

Valve Depression mm (in)

	Standard	Limit
4JA1T(L)	0.72 (0.029)	1.28 (0.050)
4JA1TC, 4JH1TC	1.17 (0.048)	1.67 (0.068)

Checking and Adjusting for Compressor Replacement

180 cm^3 (5.07 Imp fl oz) of oil is charged in compressor (service parts). So it is necessary to drain the proper amount of oil from the new compressor.

1) Perform oil return operation.
2) Discharge refrigerant and remove the compressor.
3) Drain the compressor oil and measure the extracted oil.
4) Check the compressor oil for contamination.
5) Adjust oil level as required.

Amount of oil drained From used compressor	Draining amount of oil From new compressor
less than 90 cm^3 (2.53 Imp fl oz)	Some as drained amount
more than 90 cm^3 (2.53 Imp fl oz)	90 cm^3 (2.53 Imp fl oz)

6) Evacuate, charge and perform oil return operation.
7) Check system operation.

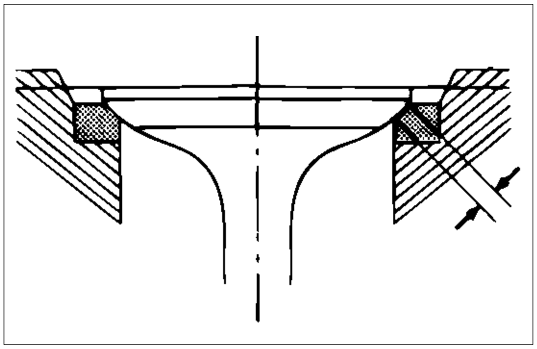
CONTAMINATION OF COMPRESSOR OIL

Unlike engine oil, no cleaning agent is added to the compressor oil. Even is the compressor runs for a long period of time (approximately 1 season), the oil never becomes contaminated as long as there is nothing wrong with the compressor or its method of use.

Inspect the extracted oil for any of the following conditions:

- The capacity of the oil has increased.
- The oil has changed color to red.
- Foreign substances, metal powder, etc., are present in the oil.

If any of these conditions exists, compressor oil is contaminated. Whenever contaminated compressor oil is discovered, the receiver/drier must be replaced.



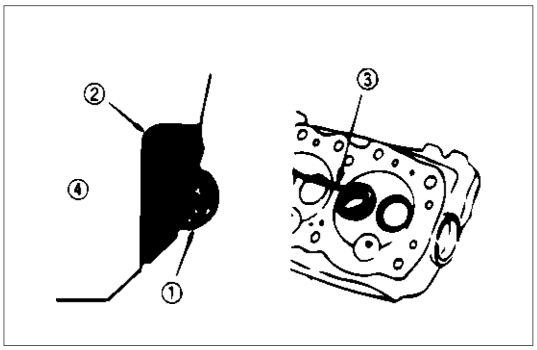
014RY00027

Valve Contact Width

1. Check the valve contact faces for roughness and unevenness. Make smooth the valve contact surfaces.
2. Measure the valve contact width.
   If the measured value exceeds the specified limit, the valve seat insert must be replaced.

Valve Contact Width mm (in)

	Standard	Limit
Intake	1.7 (0.067)	2.2 (0.087)
Exhaust	2.0 (0.079)	2.5 (0.078)

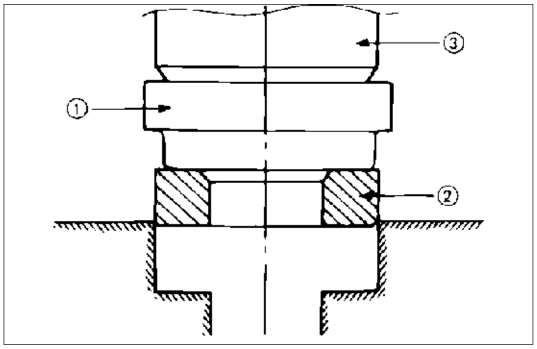


011LX039

Valve Seat Insert Replacement

Valve Seat Insert Removal

1. Arc weld the entire inside circumference (1) of the valve seat insert (2).
2. Allow the valve seat insert to cool for a few minutes.
   This will invite contraction and make removal of the valve seat insert easier.
3. Use a screwdriver (3) to pry the valve seat insert free.
   Take care not to damage the cylinder head (4).
4. Carefully remove carbon and other foreign material from the cylinder head insert bore.



014RY00026

Valve Seat Insert Installation

1. Carefully place the attachment (1) (having a smaller outside diameter than the valve seat insert) on the valve seat insert (2).

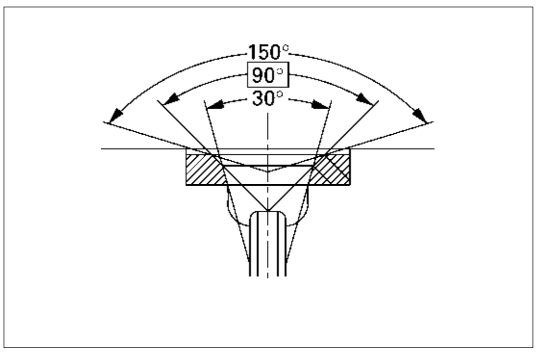
   NOTE:

   The smooth side of the attachment must contact the valve seat insert.

2. Use a bench press (3) to gradually apply pressure to the attachment and press the valve seat insert into place.

   NOTE:

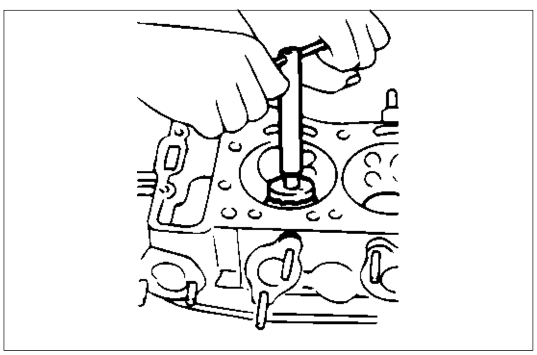
   Do not apply an excessive amount of pressure with the bench press. Damage to the valve seat insert will result.



011LX063

Valve Seat Insert Correction

1. Remove the carbon from the valve seat insert surface.
2. Use a valve cutter (15°, 45°, and 75° blades) to minimize scratches and other rough areas. This will bring the contact width back to the standard value.
   Remove only the scratches and rough areas. Do not cut away too much. Take care not to cut away unblemished areas of the valve seat surface.



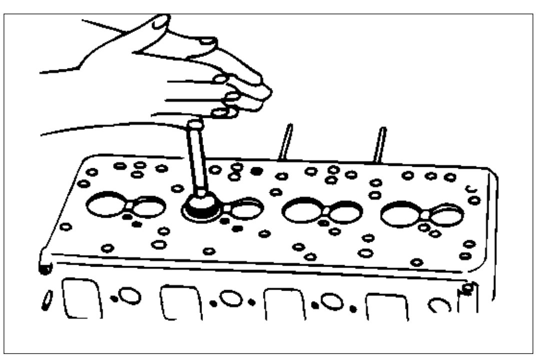
011LX037

Valve Seat Angle	Degree
45	

NOTE:

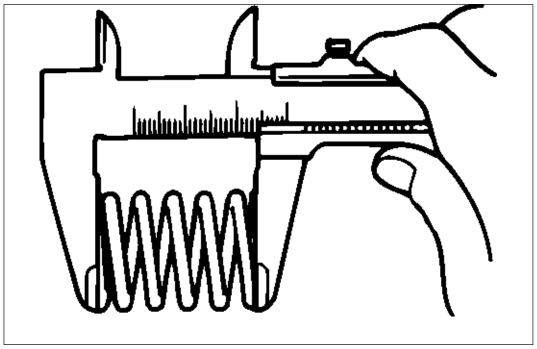
Use an adjustable valve cutter pilot.

Do not allow the valve cutter pilot to wobble inside the valve guide.



011LX038

3. Apply abrasive compound to the valve seat insert surface.
4. Insert the valve into the valve guide.
5. Turn the valve while tapping it to fit the valve seat insert.
6. Check that the valve contact width is correct.
7. Check that the valve seat insert surface is in contact with the entire circumference of the valve.



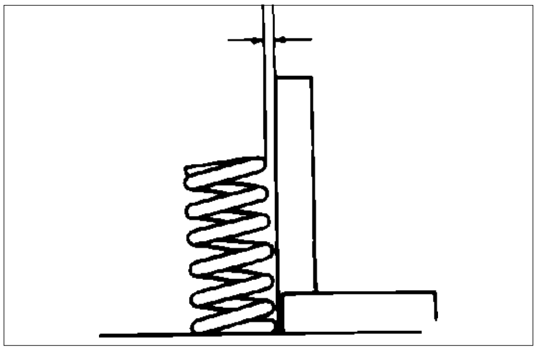
011LX024

Valve Spring Free Height

Use a vernier caliper to measure the valve spring free height.
If the measured value is less than the specified limit, the valve spring must be replaced.

Spring Free Height mm (in)

		Standard	Limit
4JA1T (L) 4JA1TC, 4JH1TC	Single spring	48.0 (1.89)	47.1 (1.85)



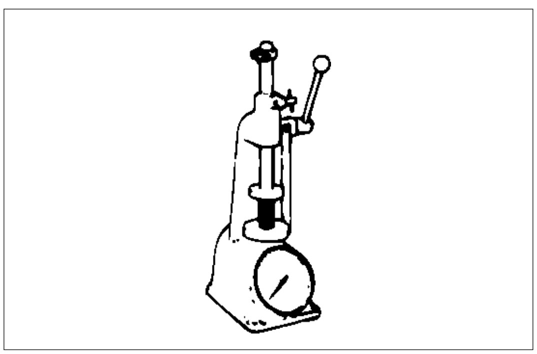
014RY00025

Valve Spring Squareness

Use a surface plate and a square to measure the valve spring squareness.
If the measured value exceeds the specified limit, the valve spring must be replaced.

Spring Squareness mm (in)

		Limit
4JA1T (L) 4JA1TC, 4JH1TC	Single spring	1.7 (0.070)



011LX026

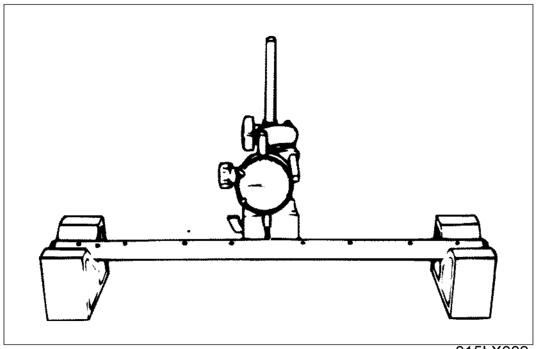
Valve Spring Tension

Use a spring tester to measure the valve spring tension.
If the measured value is less than the specified limit, the valve spring must be replaced.

Valve Spring Tension N (kg/lb)

		Compressed Height	Standard	Limit
4JA1T (L) 4JA1TC, 4JH1TC	Single spring	38.9mm (1.53in)	296.0 (30.2/66.4)	257.7 (26.3/57.9)

ROCKER ARM SHAFT AND ROCKER ARM



015LX008

Rocker Arm Shaft Run-Out

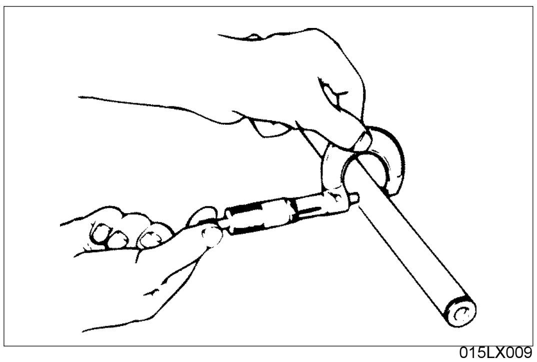
1. Place the rocker arm shaft on a V-block.
2. Use a dial indicator to measure the rocker arm shaft central portion run-out.

   If the run-out is very slight, correct the rocker arm shaft run-out with a bench press. The rocker arm must be at cold condition.

   If the measured rocker arm shaft run-out exceeds the specified limit, the rocker arm shaft must be replaced.

Rocker Arm Shaft Run-Out mm (in)
Limit
0.3 (0.012)

Rocker Arm Shaft Outside Diameter

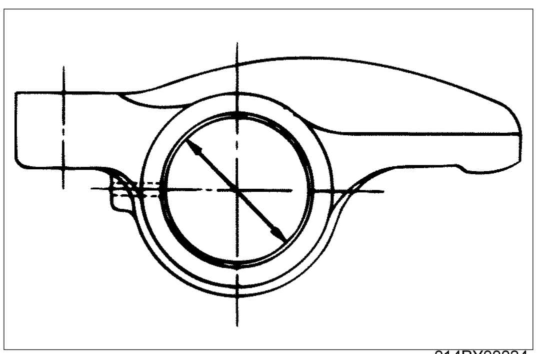


015LX009

Use a micrometer to measure the rocker arm fitting portion outside diameter.
If the measured value is less than the specified limit, the rocker arm shaft must be replaced.

Rocker Arm Shaft Outside Diameter	mm (in)
Standard	Limit
18.98–19.00 (0.747–0.748)	18.90 (0.744)

Rocker Arm Shaft and Rocker Arm Clearance



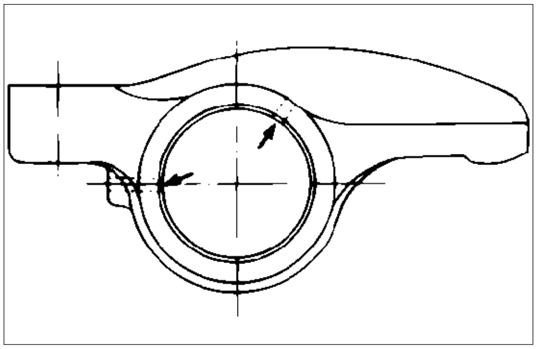
014RY00024

1. Use either a vernier caliper or a dial indicator to measure the rocker arm inside diameter.

Rocker Arm Inside Diameter	mm (in)
Standard	Limit
19.010–19.030 (0.748–0.749)	19.100 (0.752)

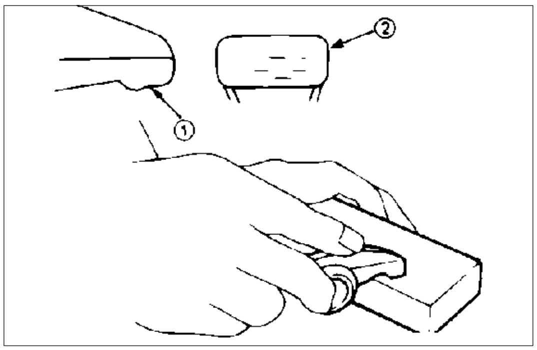
2. Measure the rocker arm shaft outside diameter.
   If the measured value exceeds the specified limit, replace either the rocker arm or the rocker arm shaft.

Rocker Arm Shaft and Rocker Arm Clearance	mm (in)
Standard	Limit
0.01–0.05 (0.0004–0.0020)	0.20 (0.008)



014RY00024

3. Check that the rocker arm oil port is free of obstructions.
   If necessary, use compressed air to clean the rocker arm oil port.



014RY00023

Rocker Arm Correction

Inspect the rocker arm valve stem contact surfaces for step wear (1) and scoring (2).

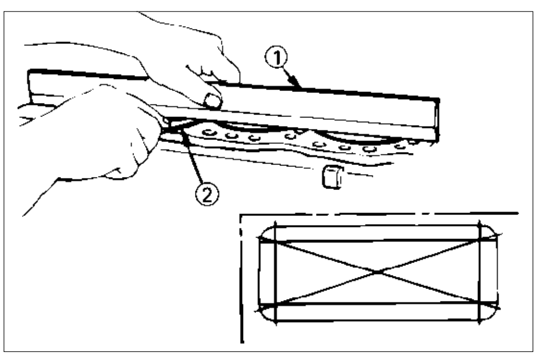
If the contact surfaces have light step wear or scoring, they may be honed with an oil stone.

If the step wear or scoring is severe, the rocker arm must be replaced.

CYLINDER BODY

Cylinder Body Upper Face Warpage

1. Remove the cylinder body dowel.
2. Remove the cylinder liner.
   Refer to "Cylinder Liner Replacement".

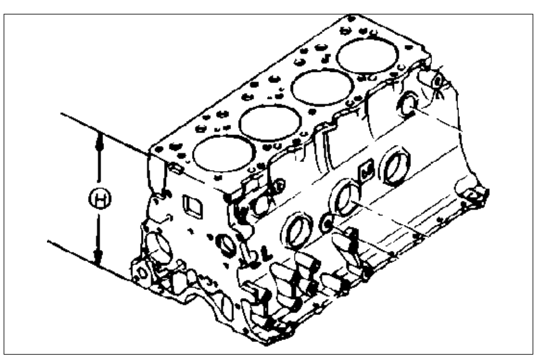


012R100001

3. Use a straight edge (1) and a feeler gauge (2) to measure the four sides and the two diagonals of the cylinder body upper face.
   If the measured values exceeds the limit, the cylinder body must be replaced.

Cylinder Body Upper Face Warpage mm (in)

Standard	Limit
0.05 (0.002) or less	0.20 (0.008)

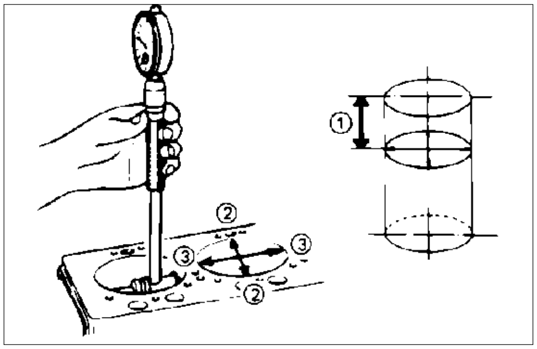


012RY00009

Cylinder Body Height (H) (Reference) mm (in)

Standard
4JA1T(L), 4JA1TC : 244.945-245.055 (9.6435-9.6478)
4JH1TC : 269.945-270.055 (10.6277-10.6320)

4. Reinstall the cylinder liner.
   Refer to "Cylinder Liner Replacement".
5. Reinstall the cylinder body dowel.



012RY00010

Cylinder Liner Bore Measurement

Use a cylinder indicator to measure the cylinder bore at measuring point (1) in the thrust (2-2) and axial (3-3) directions of the crankshaft.

Measuring Point (1): 20 mm (0.79 in)

If the measured value exceeds the specified limit, the cylinder liner must be replaced.

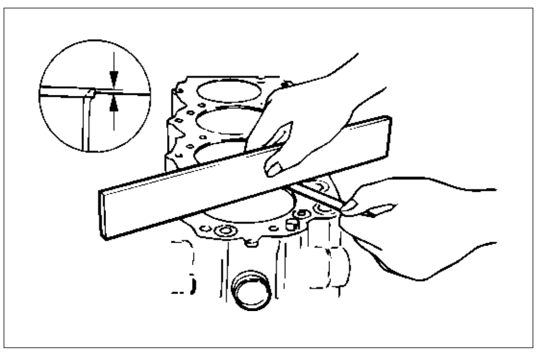
Cylinder Liner Bore mm (in)

	Standard	Limit
4JA1T(L), 4JA1TC	93.00 (3.6614)	93.08 (3.6646)
4JH1TC	95.40 (3.7559)	95.48 (3.7590)

NOTE:

The inside of the dry type cylinder liner is chrome plated. It cannot be rebored or honed.

If the inside of the cylinder liner is scored or scorched, the cylinder liner must be replaced.



012LX016

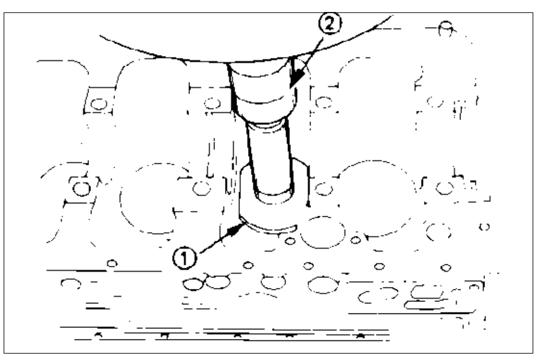
Cylinder Liner Projection Inspection

1. Hold a straight edge along the top edge of the cylinder liner to be measured.
2. Use a feeler gauge to measure each cylinder liner projection.

Cylinder Liner Projection mm (in)

Standard
0-0.1 (0-0.004)

The difference in the cylinder liner projection height between any two adjacent cylinders must not exceed 0.03 mm (0.0012 in).



012RY00012

Cylinder Liner Replacement

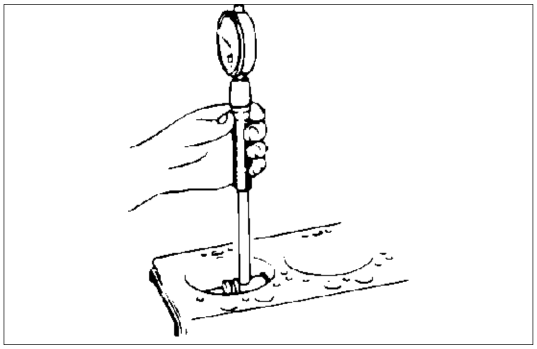
Cylinder Liner Removal

1. Insert the cylinder liner remover (1) into the cylinder body (from the lower side of the cylinder body) until it makes firm contact with the cylinder liner.

   Cylinder Liner Remover : 5-8840-2039-0 (4JA1L/TC)
   : 5-8840-2304-0 (4JH1TC)
2. Use a bench press (2) to slowly force the cylinder liner from the cylinder body.

   NOTE:

   Take care not to damage the cylinder body upper face during the cylinder liner removal procedure.
3. Measure the cylinder body upper face warpage.
   Refer to "Cylinder Body Upper Face Warpage".



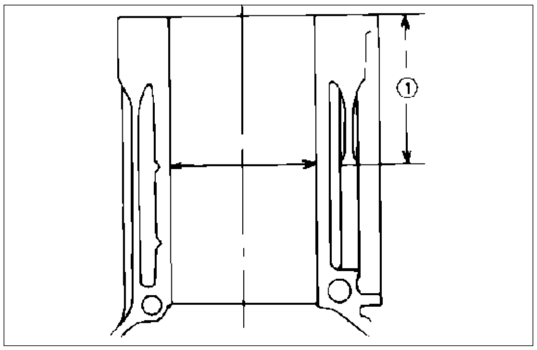
012RY00013

Cylinder Liner Grade Selection

Subtract the average cylinder body bore from the average cylinder liner outside diameter to obtain the fitting interference.

Fitting Interference	mm (in)
Standard	
-0.0010*-0.019 (-0.00004*-0.0007)	

* A minus (-) value indicates that the cylinder body bore is smaller than the liner outside diameter.



012RY00014

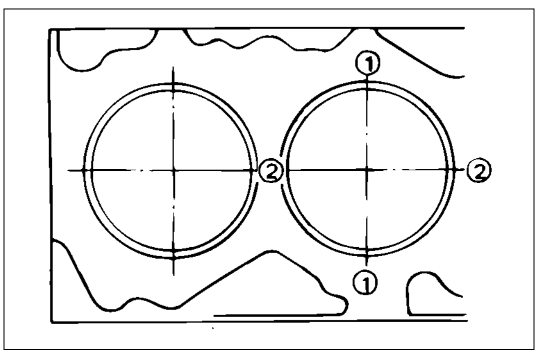
Cylinder Body Bore Measurement

1. Take measurements at measuring point (1) across positions 1-1 and 2-2.

   Measuring Point (1):

   4JA1T(L), 4JA1TC : 13,48,83,118,153 mm (0.51,1.89,3.27,4.65,6.02 in)

   4JH1TC : 18,53,88,123,158 mm (0.71,2.09,3.46,4.84,6.22 in)



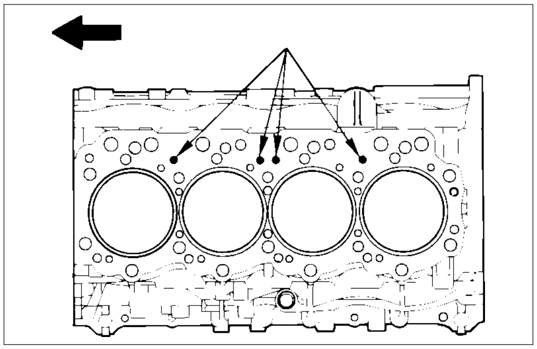
012R300001

Cylinder Liner Grade Selection and Standard Fitting Interference

Accurately measured fitting interference and proper cylinder liner grade selection are extremely important.

If the cylinder liner fitting interference is too small, engine cooling efficiency will be adversely affected.

If the cylinder liner fitting interference is too large, it will be difficult to insert the cylinder liner into the cylinder body.



012RY00022

A mark was stamped on the upper side of the cylinder block during production to indicate the correct liner.

The liner grade (i.e.1.2.3.4) is indicated in metal stamp.

Cylinder Liner Grade

4JA1T (L), 4JA1TC mm (in)

Liner Outside Grade	Cylinder Body Bore Diameter	Liner Outside Diameter	Liner Bore Grade	Service Liner Bore Measurement
1	95.001-95.010 (3.7402-3.7405)	95.011-95.020 (3.7406-3.7409)	AX	93.035-93.050 (3.6628-3.6634)

			CX	95.451-95.466 (3.7579-3.7585)

012RY00017

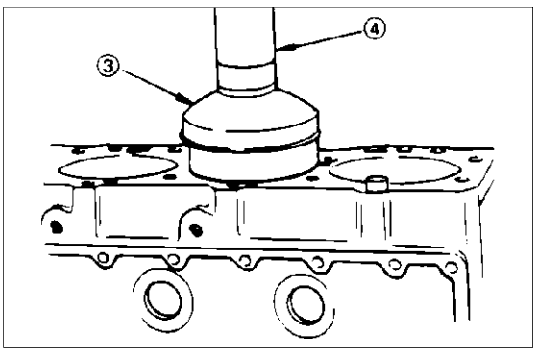
Cylinder Liner Installation

1. Cylinder Liner Installation Using The Special Tool
   1. Use new kerosene or diesel oil to thoroughly clean the cylinder liners and bores.
   2. Use compressed air to blow-dry the cylinder liner and bore surfaces.

NOTE:

All foreign material must be carefully removed from the cylinder liner and the cylinder bore before installation.

3. Insert the cylinder liner (1) into the cylinder body (2) from the top of the cylinder body.



012RY00018

4. Set the cylinder liner installer (3) to the top of the cylinder liner.
   Cylinder Liner Installer : 5-8840-2040-0 (4JA1L/TC)
   : 5-8840-2313-0 (4JH1TC)
5. (3) is directly beneath the bench press shaft center (4).

NOTE:

Check that the cylinder liner is set perpendicular to the bench press and that there is no wobble.

6. Use the bench press to apply a seating force of 4,900 N (500 kg/1,100 lb) to the cylinder liner.
7. Apply a force of 24,500 N (2,500 kg/5,500 lb) to fully seat the cylinder liner.
8. After installing the cylinder liner, measure the cylinder liner projection.
   Refer to "Cylinder Liner Projection Inspection".

Piston Grade Selection

Measure the cylinder liner bore after installing the cylinder liner. Then select the appropriate piston grade for the installed cylinder liner.

1. Measure the cylinder liner bore.
   Refer to "Cylinder Liner Bore Measurement"

Cylinder Liner Bore (Service Part) Grade mm (in)

	Grade	Bore measurement
4JA1T(L) 4JA1TC	AX	93.035-95.050 (3.6628-3.6634)
	CX	93.051-95.066 (3.6634-3.6640)
4JH1TC	AX	95.435-95.450 (3.7573-3.7579)
	CX	95.451-95.466 (3.7579-3.7585)

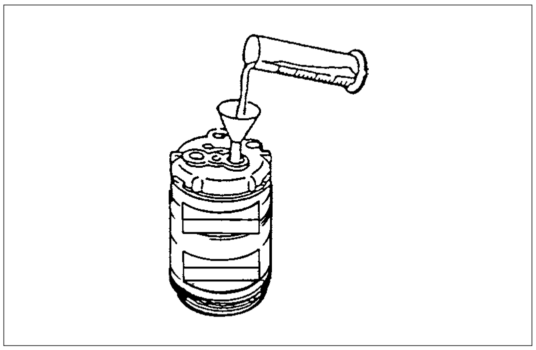
NOTE:
It is most important that the correct piston grade be used. Failure to select the correct piston grade will result in engine failure. Always measure the cylinder bore and select the correct piston grade.

OIL RETURN OPERATION

There is close affinity between the oil and the refrigerant. During normal operation, part of the oil recirculates with the refrigerant in the system.

When checking the amount of oil in the system, or replacing any component of the system, the compressor must be run in advance for oil return operation. The procedure is as follows:

1) Open the all doors and engine hood.
2) Start the engine and A/C switch is "ON" and Set the fan control knob at its highest position.
3) Run the compressor for more than 20 minutes between 800 and 1,000 rpm in order to operate the system.
4) Stop the engine.

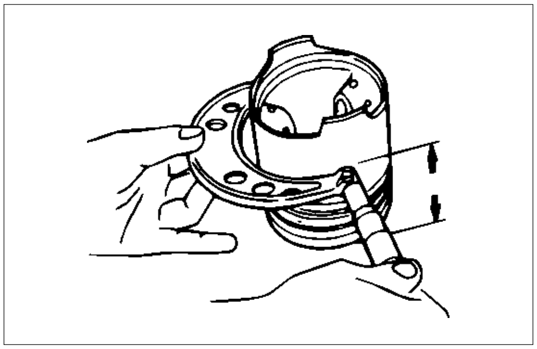


REPLACEMENT OF COMPONENT PARTS

When replacing system component parts, supply the following amount of oil to the component parts to be installed.

Component parts to be installed	Amount of oil
Evaporator	50 cm^3 (1.41 Imp fl oz)
Condenser	30 cm^3 (0.84 Imp fl oz)
Receiver/drier	30 cm^3 (0.84 Imp fl oz)
Refrigerant line (One piece)	10 cm^3 (0.28 Imp fl oz)

Refrigeration oil must be replenished if more than two parts are removed at the same time. After installing these components, check compressor oil.



015LX021

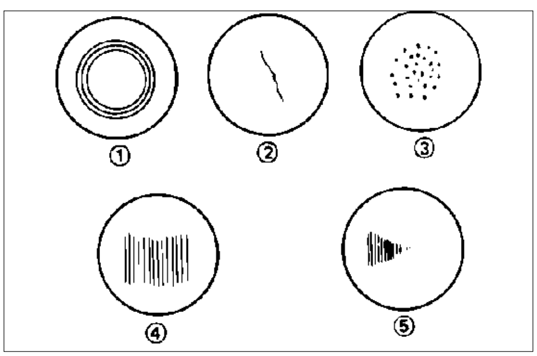
2. Measure the piston diameter.

Piston Measuring Point	mm (in)
4JA1T(L) 4JA1TC	78 (3.07)
4JH1TC	70 (2.76)

Piston Grade (Service Part)		mm (in)
4JA1T(L) 4JA1TC	AX	92.949 - 92.964 (3.6549 - 3.6600)
	CX	92.965 - 92.980 (3.6600 - 3.6606)
4JH1TC	AX	95.359 - 95.374 (3.7542 - 3.7548)
	CX	95.375 - 95.390 (3.7548 - 3.7555)

Cylinder Liner and Piston Clearance	mm (in)
4JA1T(L) 4JA1TC	0.041-0.071 (0.0016-0.0027)
4JH1TC	0.047-0.065 (0.0019-0.0026)

NOTE:
Cylinder liner kit clearances are preset. However, the cylinder liner installation procedure may result in slight decreases in cylinder liner clearances. Always measure the cylinder liner clearance after installation to be sure that it is correct.



014RY00028

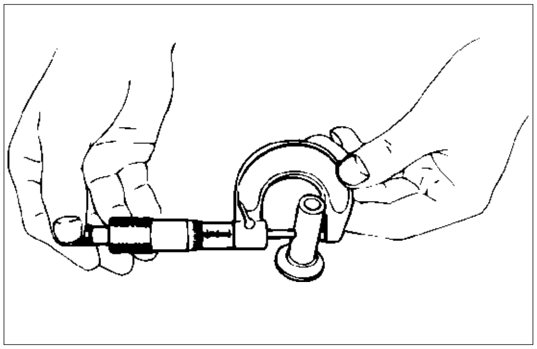
TAPPET AND PUSH ROD

Visually inspect the tappet contact surfaces for pitting, cracking, and other abnormal conditions. The tappet must be replaced if any of these conditions are present.

Refer to the illustration at the left.

1. Normal contact
2. Cracking
3. Pitting
4. Irregular contact Uneven contact
5. Irregular contact One-sided contact

NOTE:
The tappet surfaces are spherical. Do not attempt to grind them with an oil stone or similar tool in an effort to repair the tappet. If the tappet is damaged, it must be replaced.



014RY00029

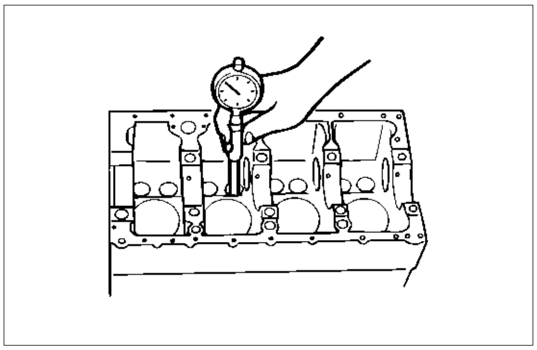
Tappet Outside Diameter

Measure the tappet outside diameter with a micrometer.

If the measured value is less than the specified limit, the tappet must be replaced.

Tappet Outside Diameter mm (in)

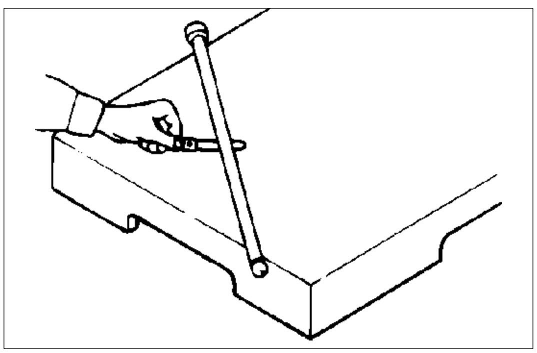
Standard	Limit
12.97 - 12.99 (0.510 - 0.511)	12.95 (0.510)



012LX014

Tappet and Cylinder Body Clearance mm (in)

Standard	Limit
0.01 - 0.046 (0.0004 - 0.0018)	0.10 (0.004)



014RY00031

Push Rod Curvature

1. Lay the push rod on a surface plate.
2. Roll the push rod along the surface plate and measure the push rod curvature with a thickness gauge.

   If the measured value exceeds the specified limit, the push rod must be replaced.

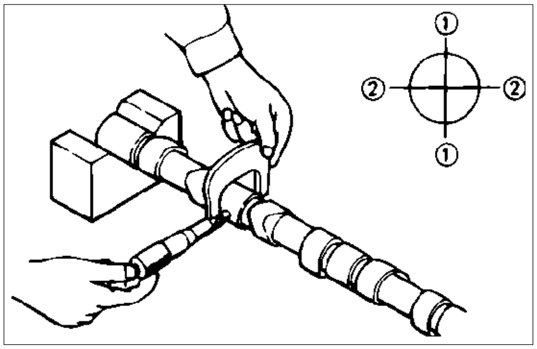
Pushrod Curvature mm (in)

Limit
0.3 (0.012)

3. Visually inspect both ends of the push rod for excessive wear and damage. The push rod must be replaced if these conditions are discovered during inspection.

CAMSHAFT

Visually inspect the journals, the cams, the oil pump drive gear, and the camshaft bearings for excessive wear and damage. The camshaft and the camshaft bearings must be replaced if these conditions are discovered during inspection.



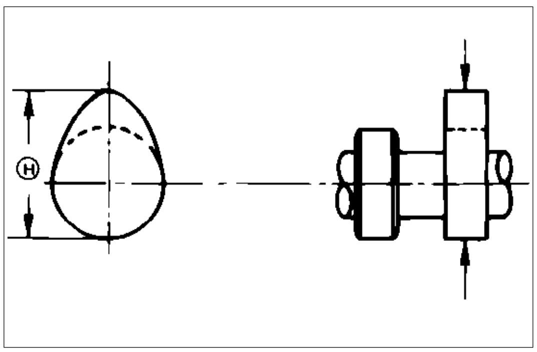
014RY00032

Camshaft Journal Diameter

Use a micrometer to measure each camshaft journal diameter in two directions (1 and 2). If the measured value is less than the specified limit, the camshaft must be replaced.

Camshaft Journal Diameter mm (in)

Standard	Limit
49.945 - 49.975 (1.9663 - 1.9675)	49.60 (1.953)



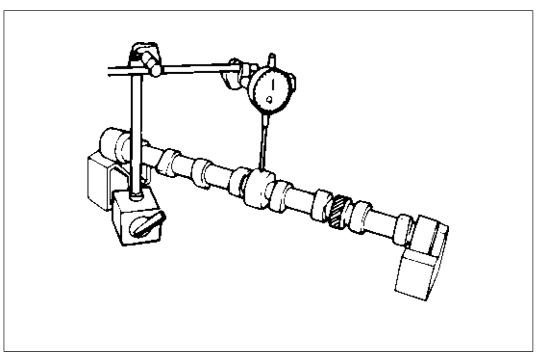
014RY00033

Cam Height

Measure the cam height (H) with a micrometer. If the measured value is less than the specified limit, the camshaft must be replaced.

Cam Height (H) mm (in)

Standard	Limit
42.016 (1.6542)	41.65 (1.640)



014LX092

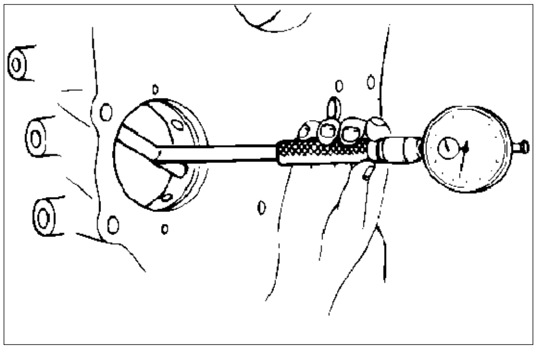
Camshaft Run-Out

1. Mount the camshaft on V-blocks.
2. Measure the run-out with a dial indicator.

   If the measured value exceeds the specified limit, the camshaft must be replaced.

Camshaft Run-Out mm (in)

Standard	Limit
0.02 (0.0008)	0.10 (0.004)



014RY00034

Camshaft and Camshaft Bearing Clearance

Use an inside dial indicator to measure the camshaft bearing inside diameter.

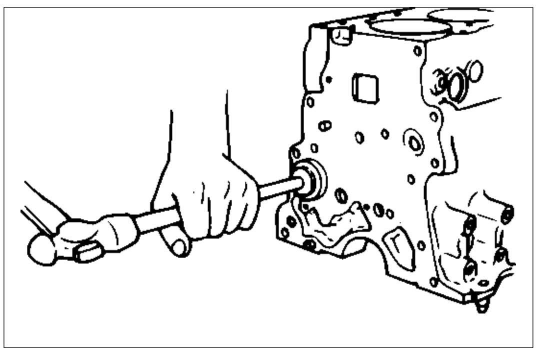
Crankshaft Bearing Inside Diameter mm (in)

Standard	Limit
50.00 - 50.03 (1.968 - 1.970)	50.08 (1.972)

If the clearance between the camshaft bearing inside diameter and the journal exceeds the specified limit, the camshaft bearing must be replaced.

Camshaft Bearing Clearance mm (in)

Standard	Limit
0.055 (0.0022)	0.12 (0.005)



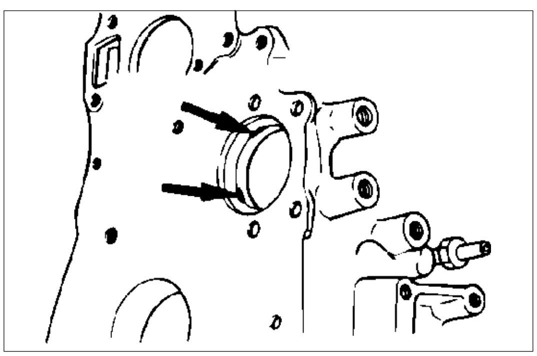
014RY00035

Camshaft Bearing Replacement

Camshaft Bearing Removal

1. Remove the cylinder body plug plate.
2. Use the bearing replacer to remove the camshaft bearing.

Bearing Replacer: 5-8840-2038-0



014RY00036

Camshaft Bearing Installation

1. Align the bearing oil holes with the cylinder body oil holes.
2. Use the replacer to install the camshaft bearing.

Bearing Replacer: 5-8840-2038-0

CRANKSHAFT AND BEARING

Inspect the surface of the crankshaft journals and crankpins for excessive wear and damage.

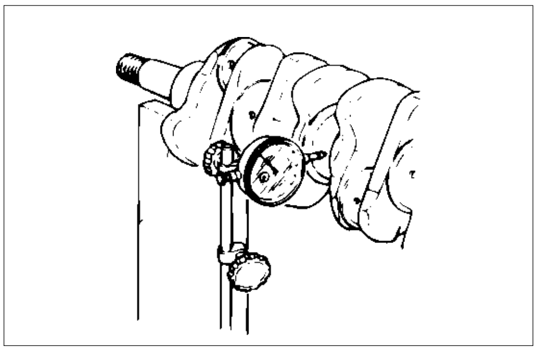
Inspect the oil seal fitting surfaces for excessive wear and damage.

Inspect the oil ports for obstructions.

NOTE:

To increase crankshaft strength, tufftriding (Nitrizing Treatment) has been applied. Because of this, it is not possible to regrind the crankshaft surfaces.

Therefore, under size bearing are not available.



015LX061

Crankshaft Run-Out

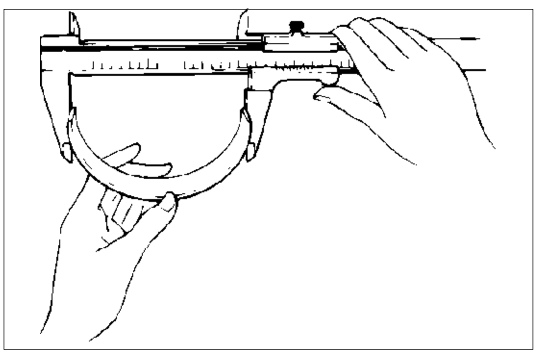
1. Set a dial indicator to the center of the crankshaft journal.
2. Gently turn the crankshaft in the normal direction of rotation.

   Read the dial indicator as you turn the crankshaft.

   If the measured value exceeds the specified limit, the crankshaft must be replaced.

Crankshaft Run-Out mm (in)

Standard	Limit
0.05 (0.002) or less	0.08 (0.003)



015RY00007

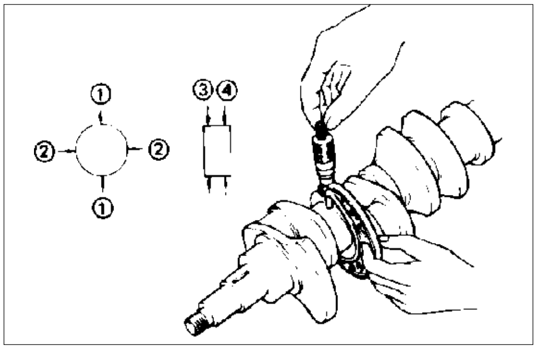
Bearing Spread

Use a vernier caliper to measure the bearing spread.

If the measured value is less than the specified limit, the bearing must be replaced.

Bearing Spread mm (in)

		Limit
Creankshaft Bearing	4JA1T (L), 4JA1TC	64.5 (2.54)
	4JH1TC	74.5 (2.93)
Connecting Rod Bearing		56.5 (2.22)



015RY00008

Crankshaft Journal and Crankpin Diameter

1. Use a micrometer to measure the crankshaft journal diameter across points 1 - 1 and 2 - 2.
2. Use the micrometer to measure the crankshaft journal diameter at the two points (3 and 4).
3. Repeat Steps 1 and 2 to measure the crankpin diameter.

   If the measured values are less than the specified limit, the crankshaft must be replaced.

Crankshaft Journal and Diameter mm (in)

	Standard	Limit
4JA1T (L), 4JA1TC	59.921-59.928 (2.3591-2.3594)	59.91 (2.3586)
4JH1TC	69.917-69.932 (2.7526-2.7532)	69.91(2.7524)

Crankpin Diameter mm (in)

Standard	Limit

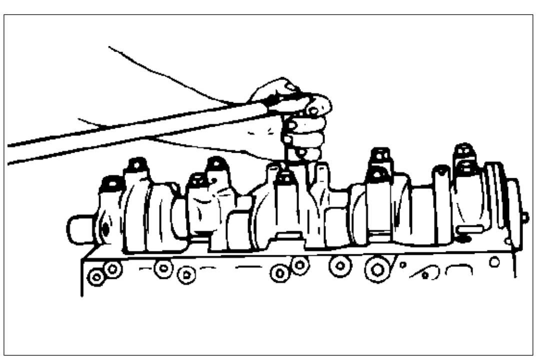
015RY00012

Clearance Measurements (With Plastigage)

Crankshaft Journal and Bearing Clearance

1. Clean the cylinder body, the journal bearing fitting surface, the bearing caps, and the bearings.
2. Install the bearings to the cylinder body.
3. Carefully place the crankshaft on the bearings.
4. Rotate the crankshaft approximately 30° to seat the bearing.
5. Place the Plastigage (arrow) over the crankshaft journal across the full width of the bearing.
6. Install the bearing caps with the bearing.



015RY00013

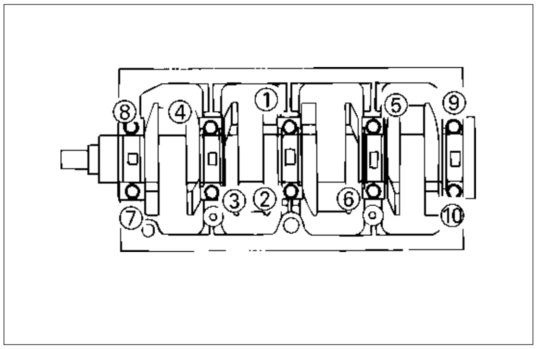
7. Tighten the bearing caps to the specified torque.

Crankshaft Bearing Cap Bolt Torque mm (in)

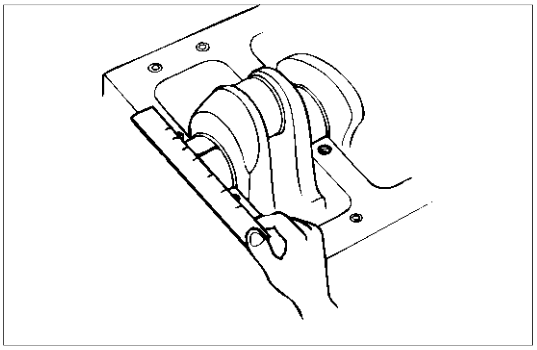
167 (17/123)

Do not allow the crankshaft to turn during bearing cap installation and tightening.

8. Remove the bearing cap.



015LX129



015LX060

9. Compare the width of the Plastigage attached to either the crankshaft or the bearing against the scale printed on the Plastigage container.

   If the measured value exceeds the limit, perform the following additional steps.

   1. Use a micrometer to measure the crankshaft outside diameter.
   2. Use an inside dial indicator to measure the bearing inside diameter.

      If the crankshaft journal and bearing clearance exceeds the limit, the crankshaft and/or the bearing must be replaced.

Crankshaft Journal and Bearing Clearance mm (in)

Standard	Limit
0.032 - 0.077 (0.0013 - 0.0030)	0.110 (0.0043)

Crankpin and Bearing Clearance

1. Clean the crankshaft, the connecting rod, the bearing cap, and the bearings.
2. Install the bearing to the connecting rod and the bearing cap.

   Do not allow the crankshaft to move when installing the bearing cap.
3. Prevent the connecting rod from moving.
4. Attach the Plastigage to the crankpin.

   Apply engine oil to the Plastigage to keep it from falling.
5. Install the bearing cap and tighten it to the two step of anglar tihtening method.

   Do not allow the connecting rod to move when installing and tightening the bearing cap.

Connecting Rod Bearing Cap Bolt Torque N·m (kg·m/lb ft)

4JA1T (L), 4JA1TC	78-88 (8.0/57 – 9.0/65)
4JH1TC	1st step ; 29.0–29.2 (3.00/22.0–3.01/22.2)
	2nd step ; 45°-60°

6. Remove the bearing cap.
7. Compare the width of the Plastigage attached to either the crankshaft or the bearing against the scale printed on the Plastigage container.

   If the measured value exceeds the specified limit, perform the following additional steps.

   1. Use a micrometer to measure the crankpin outside diameter.
   2. Use an inside dial indicator to measure the bearing inside diameter.

      If the crank pin and bearing clearance exceeds the specified limit, the crankshaft and/or the bearing must be replaced.

Crankpin and Bearing Clearance mm (in)

	Standard	Limit
4JA1T (L), 4JA1TC	0.029-0.066 (0.0011-0.0026)	0.100 (0.0039)
4JH1TC	0.029-0.083 (0.0011-0.0033)	0.100 (0.0039)

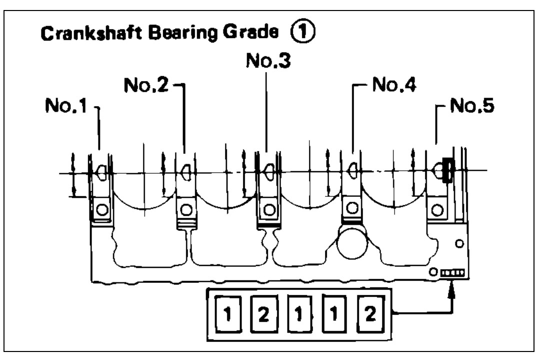
CRANKSHAFT BEARING SELECTION

Crankshaft bearing selection is based on the measured diameters of the crankshaft journals and the bearing inserts.

Match the crankshaft bearing housing grade marks and the crankshaft journal grade marks in the table below to determine the correct crankshaft bearing size.

Crankshaft Bearing Housing Grade Mark Position

Crankshaft bearing housing grade marks 1, 2 or 3 are stamped on the rear right hand side of the cylinder body.

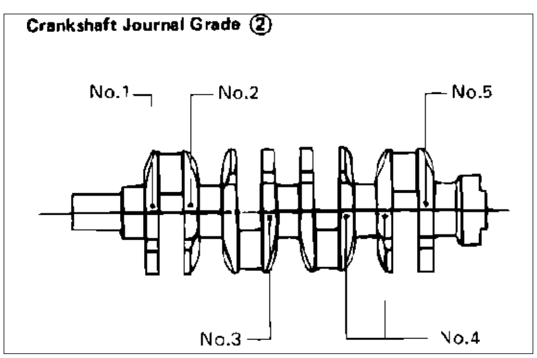


015LX060

Crankshaft Journal Grade Mark Position

The crankshaft journal grade marks (1 or -, 2 or --, 3 or ---) are stamped on each crankshaft journal web.

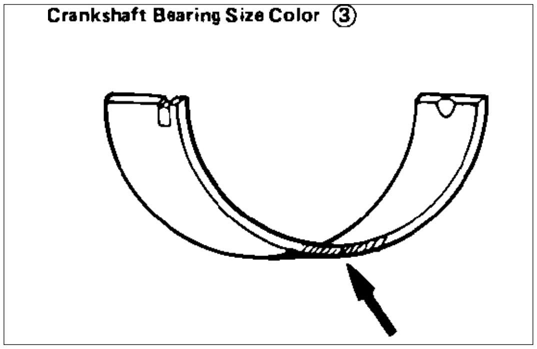
The crankshaft journal and bearing clearance must be the same for each position after installation of the crankshaft and the crankshaft bearings.



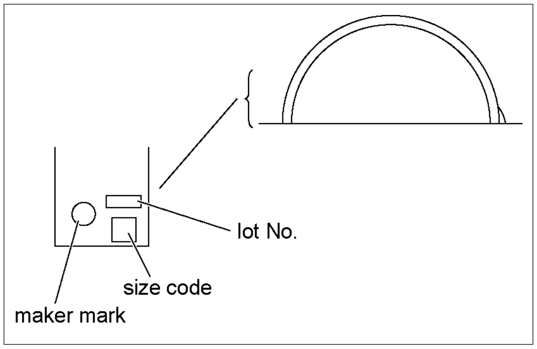
015RY00016

NOTE:

The crankshaft journal mark No. 4 is stamped on crankshaft No. 4 journal web front side or rear side.



015RY00017



RTW46ASH002501

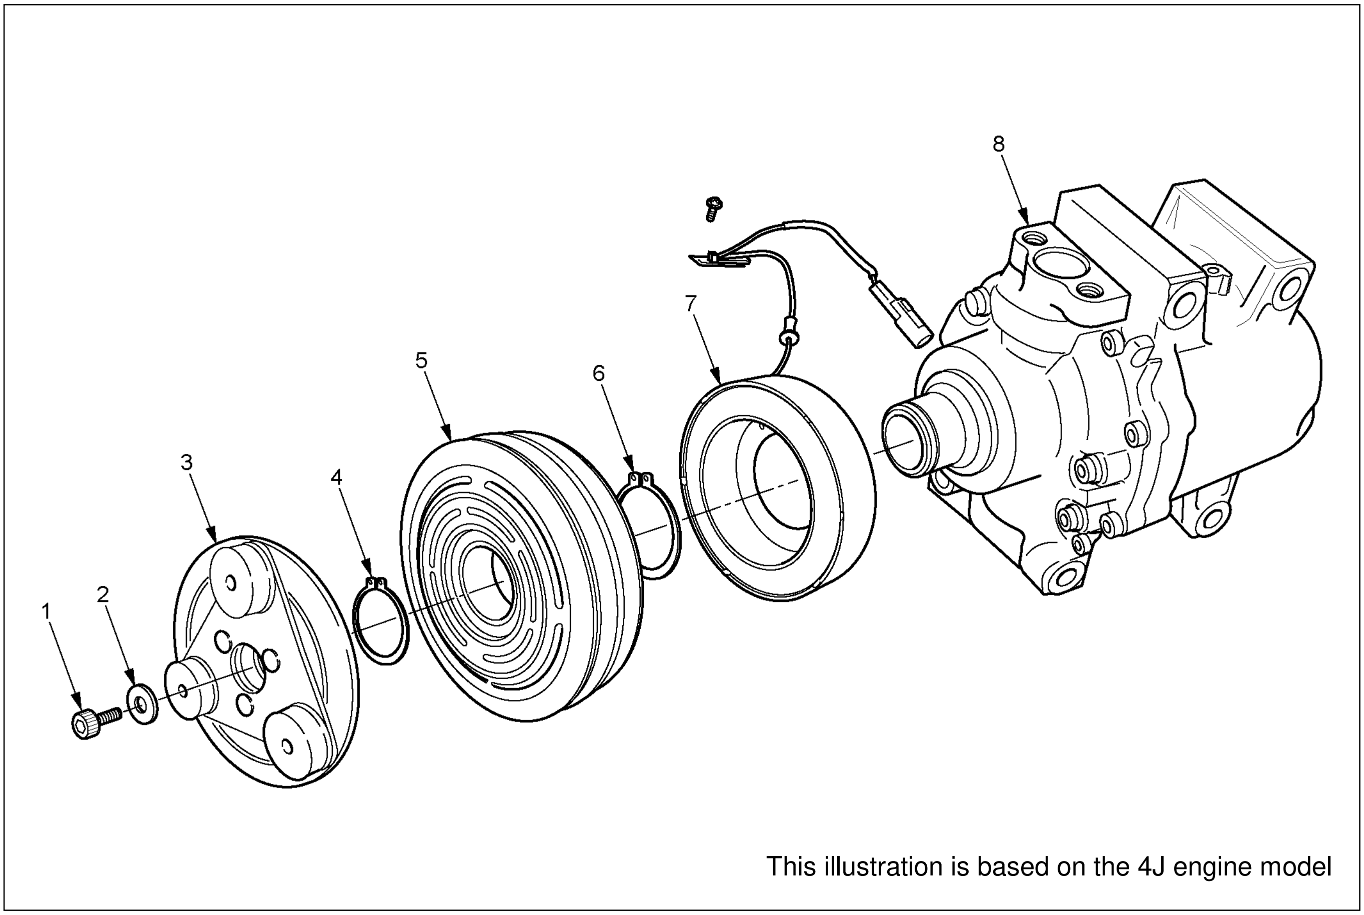
DISASSEMBLY

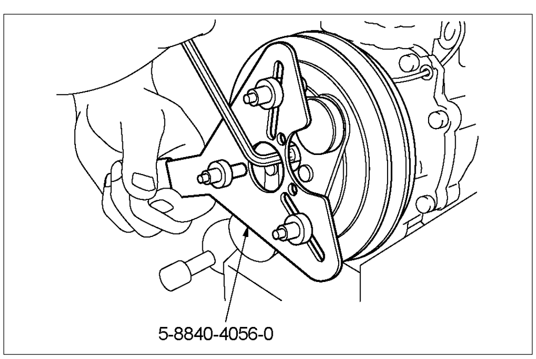


RTW510MF000301

Disassembly Steps

- ▲ 1. Drive plate bolt
- 2. Plain washer
- ▲ 3. Drive plate
- 4. Snap ring
- ▲ 5. Pulley assembly
- ▲ 6. Snap ring
- 7. Field coil
- 8. Compressor

Important Operations - Disassembly



RTW510SH000701

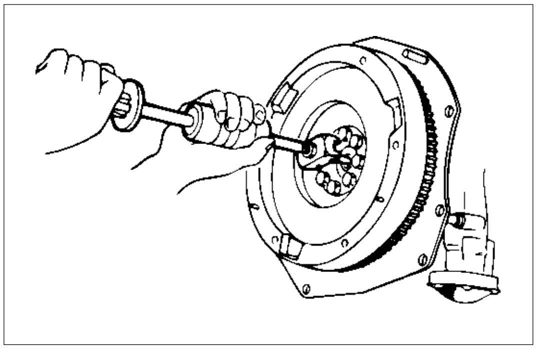
1. Drive Plate Bolt

Using drive plate holder to prevent the drive plate from rotating, then remove the bolt.

Drive Plate Holder: 5-8840-4056-0 (J-37872)

CRANKSHAFT PILOT BEARING

Check the crankshaft pilot bearing for excessive wear and damage and replace it if necessary.



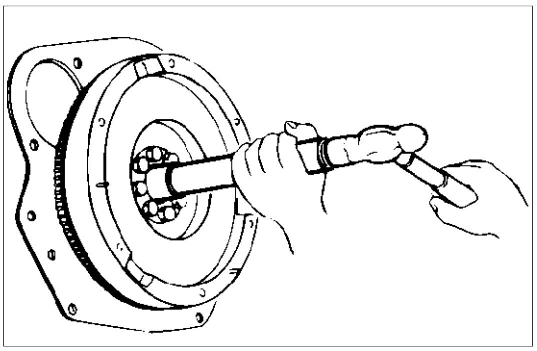
015RY00018

Crankshaft Pilot Bearing Replacement

Crankshaft Pilot Bearing Removal

Use the pilot bearing remover to remove the crankshaft pilot bearing.

Pilot Bearing Remover: 5-8840-2000-0
Sliding Hammer: 5-8840-0019-0



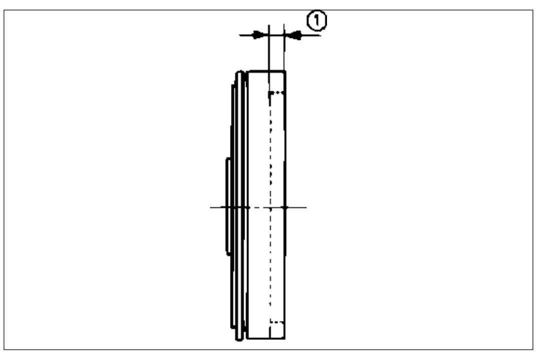
015RY00010

Crankshaft Pilot Bearing Installation

1. Place the crankshaft pilot bearing right angle across the crankshaft bearing installation hole.
2. Tap around the edges of the crankshaft pilot bearing outer races with a brass hammer to drive the bearing into the crankshaft bearing installation hole.

   Pilot Bearing Installer: 5-8522-0024-0

NOTE:
Strike only the crankshaft pilot bearing outer race with the hammer. Do not strike the bearing inner race. Bearing damage and reduced bearing service life will result.



015RY00019

FLYWHEEL AND RING GEAR

Flywheel

1. Inspect the flywheel friction surface for excessive wear and heat cracks.
2. Measure the flywheel friction surface depth.

   If the measured value is within the specified limit, the flywheel may be reground.

   If the measured value exceeds the specified limit, the flywheel must be replaced.

Flywheel Friction Surface Depth (1) mm (in)

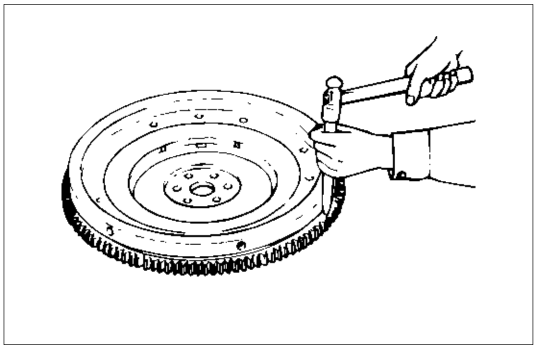
	Standard	Limit
4JA1T (L), 4JA1TC	20 (0.7874)	21 (0.8267)
4JH1TC	18 (0.7087)	19 (0.7480)

Ring Gear

Inspect the ring gear.

If the ring gear teeth are broken or excessively worn, the ring gear must be replaced.

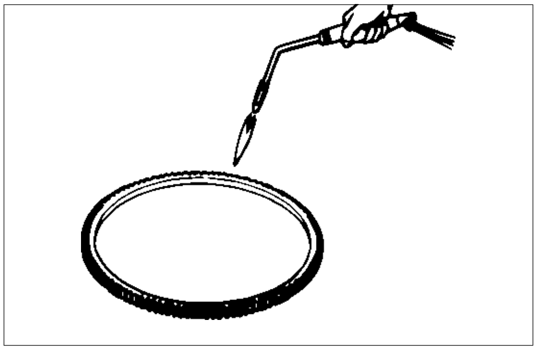
Ring Gear Replacement



020LX008

Ring Gear Removal

Strike around the edges of the ring gear with a hammer and chisel to remove it.



020LX009

Ring Gear Installation

1. Heat the ring gear evenly with a gas burner to invite thermal expansion.

   Do not allow the temperature of the gas burner to exceed 200°C (390°F).

2. Install the ring gear when it is sufficiently heated.

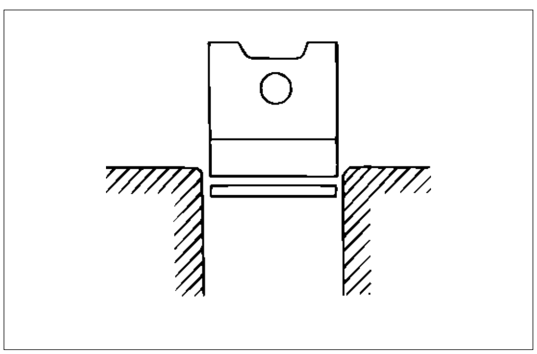
   The ring gear must be installed with the chamfer facing the clutch.

PISTON

Piston Grade Selection and Cylinder Bore Measurement

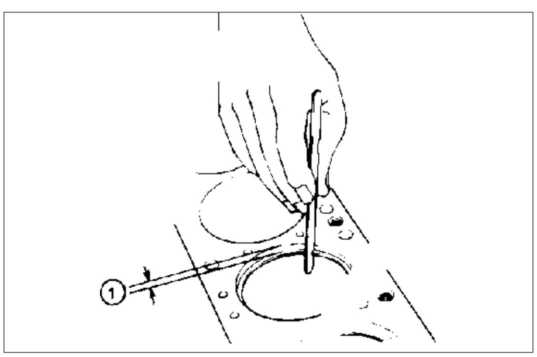
Refer to the Section "Cylinder Body", Item "Cylinder Liner Bore Measurement" for details on piston grade selection and cylinder liner bore measurement.

Piston Ring Gap



015LX023

1. Insert the piston ring horizontally (in the position it would assume if it were installed to the piston) into the cylinder liner.



015RY00020

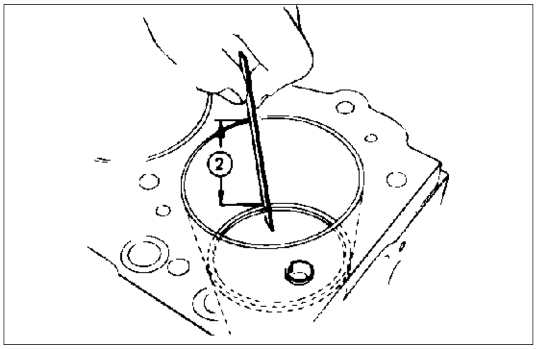
2. Push the piston ring into the cylinder bore until it reaches the measuring point 1 or 2 where the cylinder liner bore is the smallest.

   Do not allow the piston ring to slant to one side or the other. It must be perfectly horizontal.

   Measuring Point 1 10 mm (0.4 in)

   or

   Measuring Point 2 120 mm (4.7 in)



015RY00021

3. Use a feeler gauge to measure the piston ring gap.
   If the measured value exceeds the specified limit, the piston ring must be replaced.

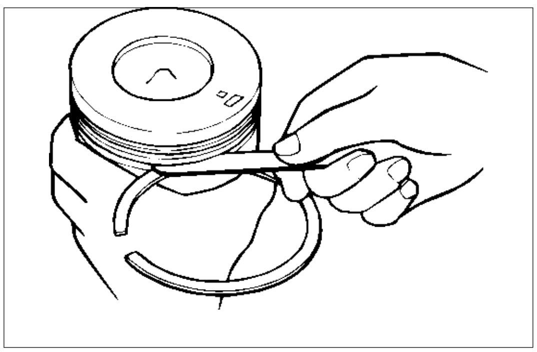
Piston Ring Gap mm (in)

4JA1T (L), 4JA1TC

	Standard	Limit
1st Compression Ring	0.3-0.3 (0.0118-0.0197)	1.5 (0.059)
2nd Compression Ring		
Oil Ring	0.250-0.450 (0.0098-0.0177)	

4JH1TC

	Standard	Limit
1st Compression Ring	0.3-0.5 (0.0118-0.0197)	1.5 (0.059)
2nd Compression Ring		
Oil Ring	0.250-0.450 (0.0098-0.0177)	



015LX025

Piston Ring and Piston Ring Groove Clearance

Use a feeler gauge to measure the clearance between the piston ring and the piston ring groove at several points around the piston.

If the clearance between the piston ring and the piston ring groove exceeds the specified limit, the piston ring must be replaced.

Piston Ring and Piston Ring Groove Clearance mm (in)

4JA1T (L), 4JA1TC

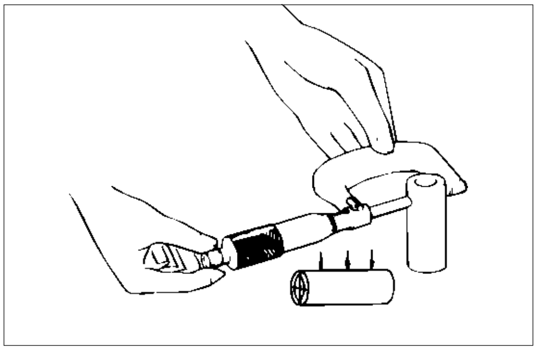
	Standard	Limit
1st Compression Ring	0.09-0.125 (0.0035-0.0049)	0.15 (0.0059)
2nd Compression Ring	0.05-0.085 (0.0020-0.0033)	
Oil Ring	0.03-0.070 (0.0012-0.0028)	

4JH1TC

	Standard	Limit
1st Compression Ring	0.09-0.130 (0.0035-0.0051)	0.15 (0.0059)
2nd Compression Ring	0.05-0.090 (0.0020-0.0035)	
Oil Ring	0.03-0.070 (0.0012-0.0028)	

4. Visually inspect the piston rings.

If a piston ring groove is damaged or distorted, the piston must be replaced.



015LX026

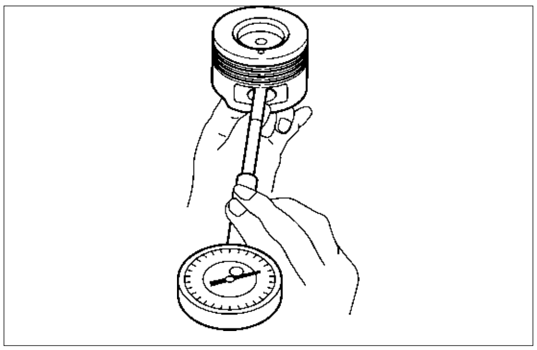
Piston Pin Diameter

Use a micrometer to measure the piston pin diameter at several points.

If the measured value is less than the specified limit, the piston pin must be replaced.

Piston Pin Diameter mm (in)

Standard	Limit
30.995-31.000 (1.2202-1.2204)	30.97 (1.2193)



015RW048

Piston Pin and Piston Clearance

Use and inside dial indicator to measure the piston pin hole (in the piston).

Piston Pin Hole mm (in)

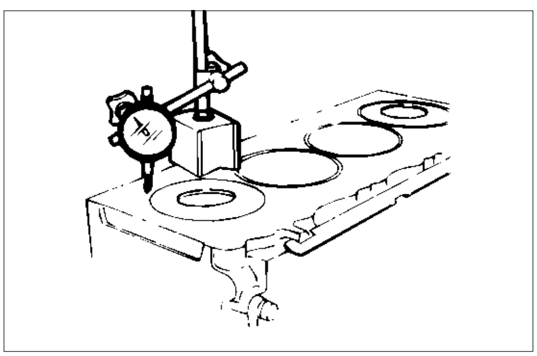
4JA1T (L)	0.002-0.015 (0.00008-0.0006)
4JA1TC, 4JH1TC	0.005-0.018 (0.0002-0.0007)



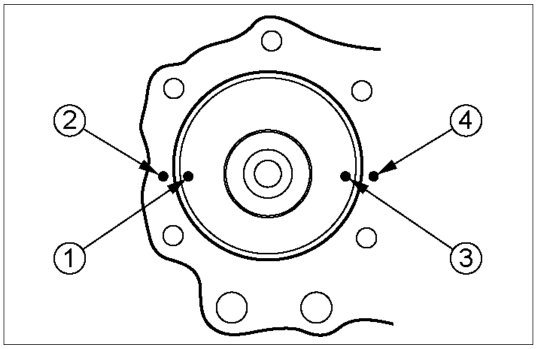
011LX011

CYLINDER HEAD GASKET SELECTION

Cylinder head gasket is determined by the piston head projection from the cylinder body upper surface, in order to improve engine performance.

Three types of gasket are provided by the difference of thickness. Select the adequet one out of three grades of gasket, according to the following procedure.

Before measurement, clear off carbon from the piston head and cylinder body surface and also clean the place where a gasket was installed.

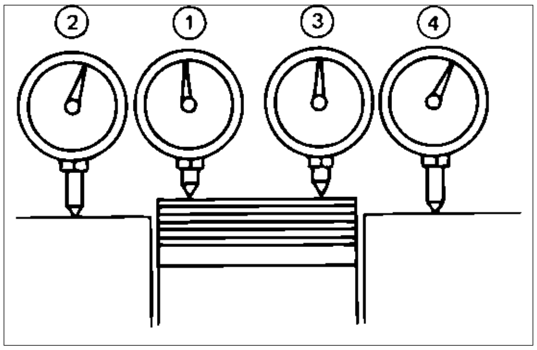


RTW36ASH001701

Piston Head Projection Measuring Point

1. Use a dial indicator to measure the piston projection amount.
2. Refer to the illustration for the piston head projection measuring positions.

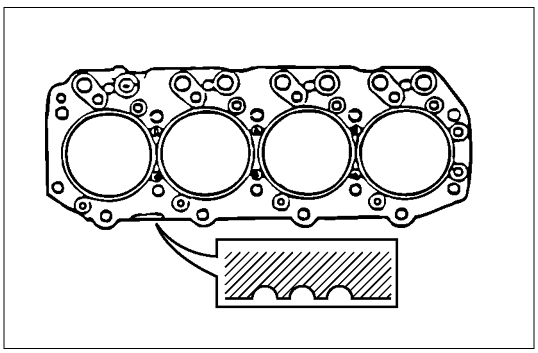
   All measuring positions should be as close as possible to the cylinder liner.



011RY00027

3. Measure the points 1, 2, 3, 4 and obtain two differences 1-2 and 3-4 on each cylinder.

   Calculate the average value of the piston head projection on each cylinder.
4. Obtain the maximum value in the four cylinders.
5. Determine the gasket grade required to the maximum value described above in accordance with the following table.



011RY00030

Cylinder Head Gasket Combination mm (in)

Cylinder Head Gasket Combination

4JA1T (L), 4JA1TC mm (in)

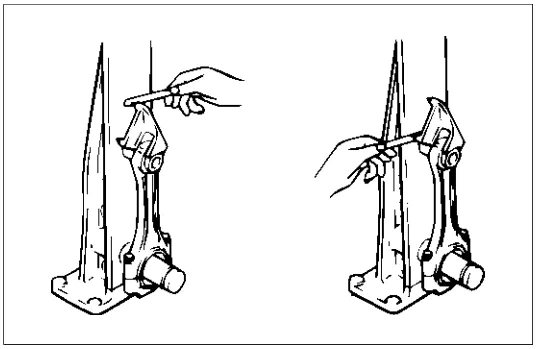
C		0.315-0.365 (0.0124-0.0144)	1.4 (0.5512)

NOTE:

Difference of the each piston projection and must be equal or within 0.1 mm (0.004 in).



015LX034

CONNECTING ROD

Connecting Rod Alignment

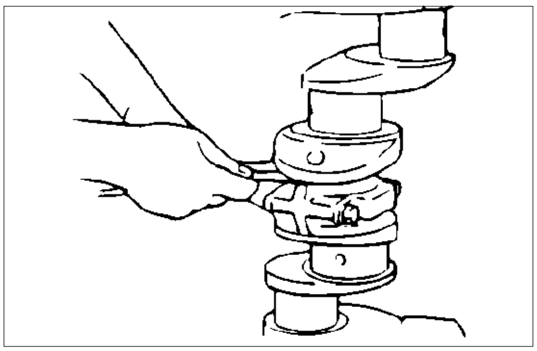
Use a connecting rod aligner to measure the distortion and the parallelism between the connecting rod big end hole and the connecting rod small end hole.

If either the measured distortion or parallelism exceed the specified limit, the connecting rod must be replaced.

Connecting Rod Alignment Per Length of 100 mm (3.94 in)

mm (in)

	Standard	Limit
Distortion	0.08 (0.003) or Less	0.20 (0.008)
Parallelism	0.05 (0.002) or Less	0.15 (0.006)



011RY00029

Connecting Rod Side Face Clearance

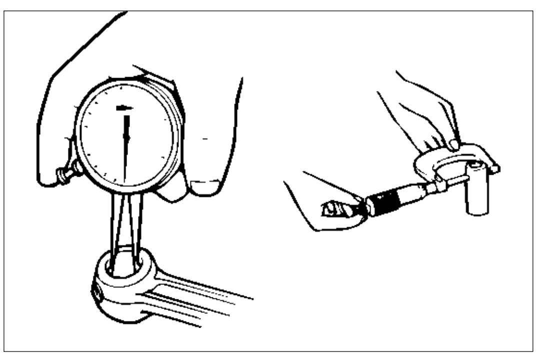
1. Install the connecting rod to the crankpin.
2. Use a feeler gauge to measure the clearance between the connecting rod big end side face and the crankpin side face.

   If the measured value exceeds the specified limit, the connecting rod must be replaced.

Connecting Rod Big End and Crankpin Side Face Clearance

mm (in)

Standard	Limit
0.23 (0.009)	0.35 (0.014)



015LX028

Piston Pin and Connecting Rod Small End Bushing Clearance

Use a caliper calibrator and a dial indicator to measure the piston pin and connecting rod small end bushing clearance.

If the clearance between the piston pin and the connecting rod small end bushing exceeds the specified limit, replace the piston pin and/or the connecting rod.

Piston Pin and Connecting Rod Small End Bushing Clearance

mm (in)

	Standard	Limit

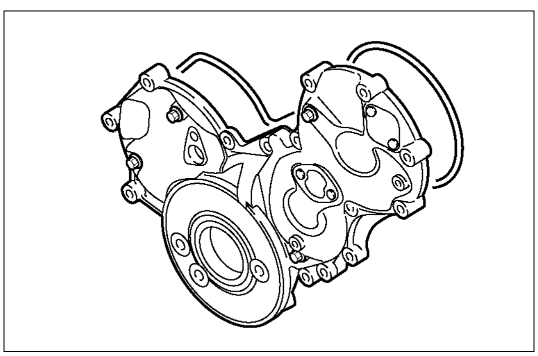
TIMING GEAR CASE COVER



020R300004

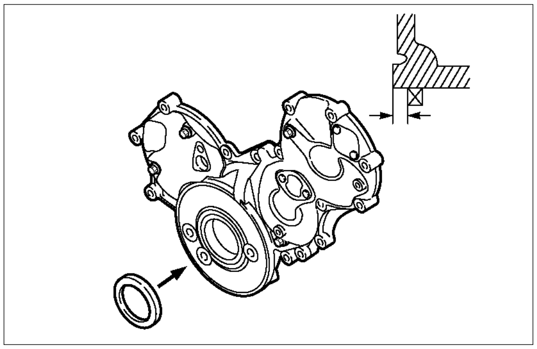
Replace the crankshaft front oil seal if it is excessively worn or damaged.

Crankshaft Front Oil Seal Replacement

Oil Seal Removal

Use a plastic hammer and a screwdriver to tap around the oil seal to free it from the gear case cover.

Take care not to damage the oil seal lip surfaces.



020R300005

Oil Seal Installation

Use the special tool to install the front oil seal.

Front Oil Seal Installer: 5-8840-2361-0

1. With the oil seal attached to the sleeve, insert it into the front end section of the crankshaft.
2. With the oil seal end section attached securely to the crankshaft, tighten up the center bolt until the sleeve hits the front end reference plane of the crankshaft securely.
3. Remove the sleeve.
4. With the seal pressed in, check the dimension of the oil seal section.

Standard Dimension = 1.0 ± 0.03mm

NOTE:

Install the oil seal after assembling the timing pulley housing. The oil seal lip section is applied with oil.

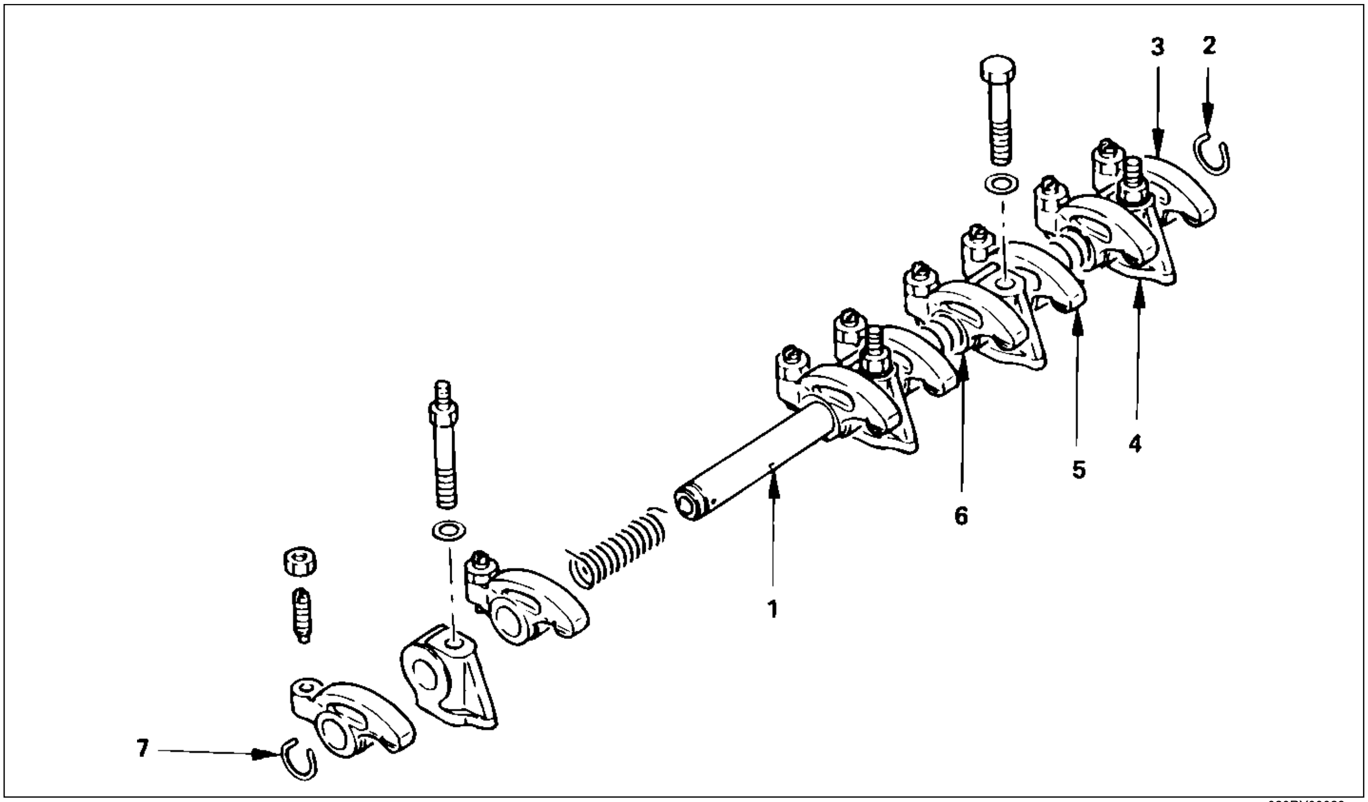
Take notice of the press-in direction of the oil seal.

REASSEMBLY

INTERNAL PARTS

MINOR COMPONENT

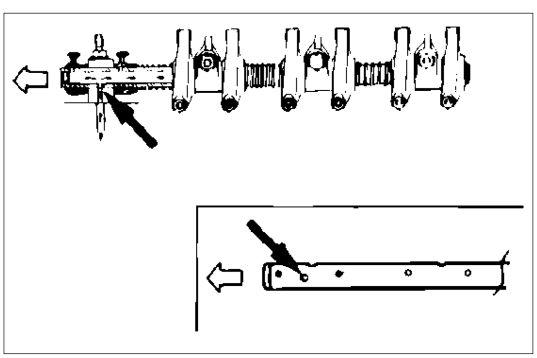
ROCKER ARM SHAFT AND ROCKER ARM



020RY00029

Reassembly Steps

1. Rocker arm shaft
2. Rocker arm shaft snap ring
3. Rocker arm
4. Rocker arm shaft bracket
5. Rocker arm
6. Rocker arm shaft spring
7. Rocker arm shaft snap ring

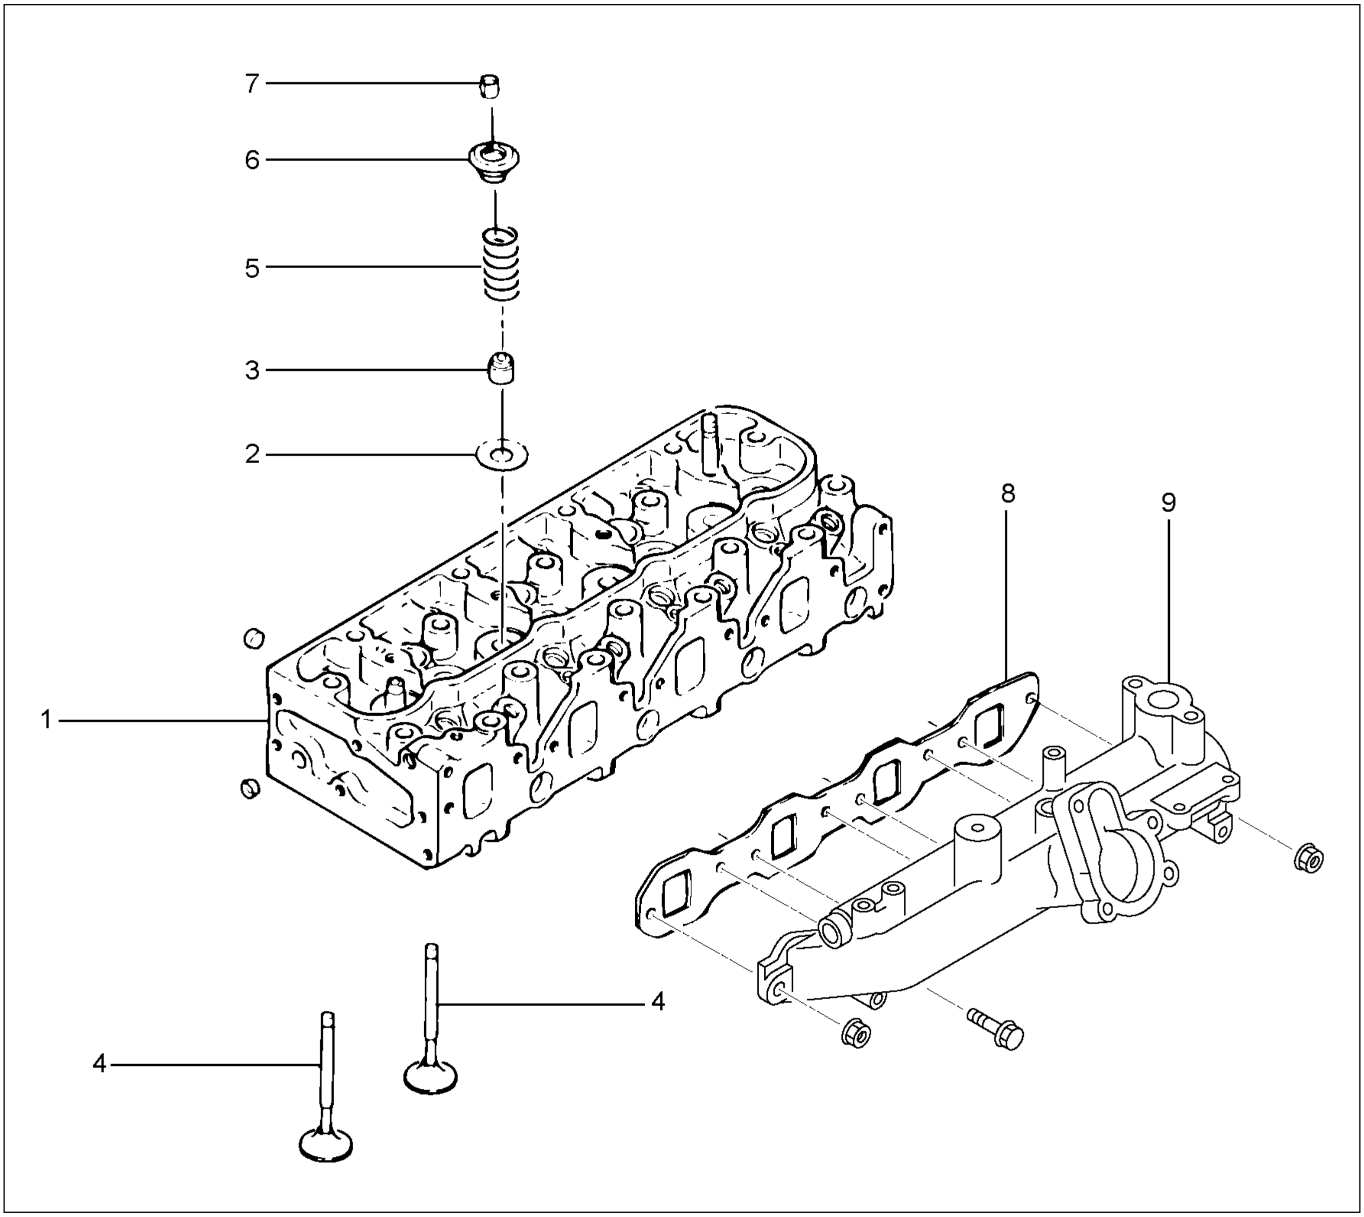


014RY00037

Reassembly

1. **Rocker Arm Shaft**
   1. Position the rocker arm shaft with the large oil hole (4 ϕ) facing the front of the engine.
   2. Install the rocker arm shaft together with the rocker arm, the rocker arm shaft bracket, and the spring.
2. **Rocker Arm Shaft Snap Ring**
3. **Rocker Arm**
4. **Rocker Arm Shaft Bracket**
5. **Rocker Arm**
6. **Rocker Arm Shaft Spring**
7. **Rocker Arm Shaft Snap Ring**

CYLINDER HEAD



RTW46ALF001301

Reassembly Steps

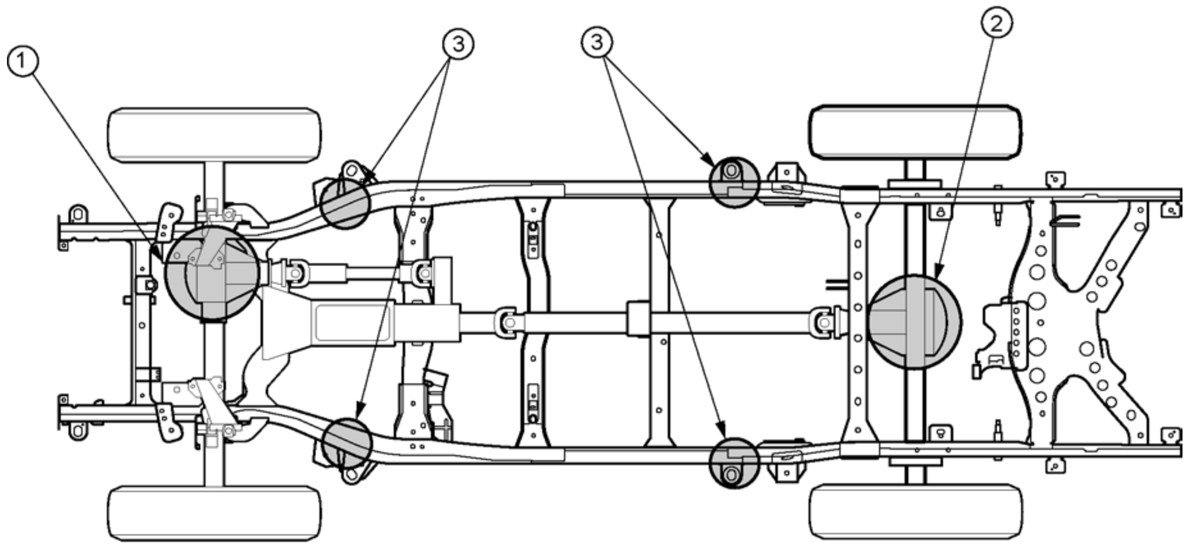
1. Cylinder head
2. Valve spring lower seat
3. Valve stem oil seal
4. Intake and exhaust valve
5. Valve spring
6. Valve spring upper seat
7. Split collar
8. Intake manifold gasket
9. Intake manifold

LIFTING INSTRUCTIONS

If a lifting device other than the original jack is used, it is most important that the device be applied only to the correct lifting points. (See the illustration.) Raising the vehicle from any other point may result in serious damage.

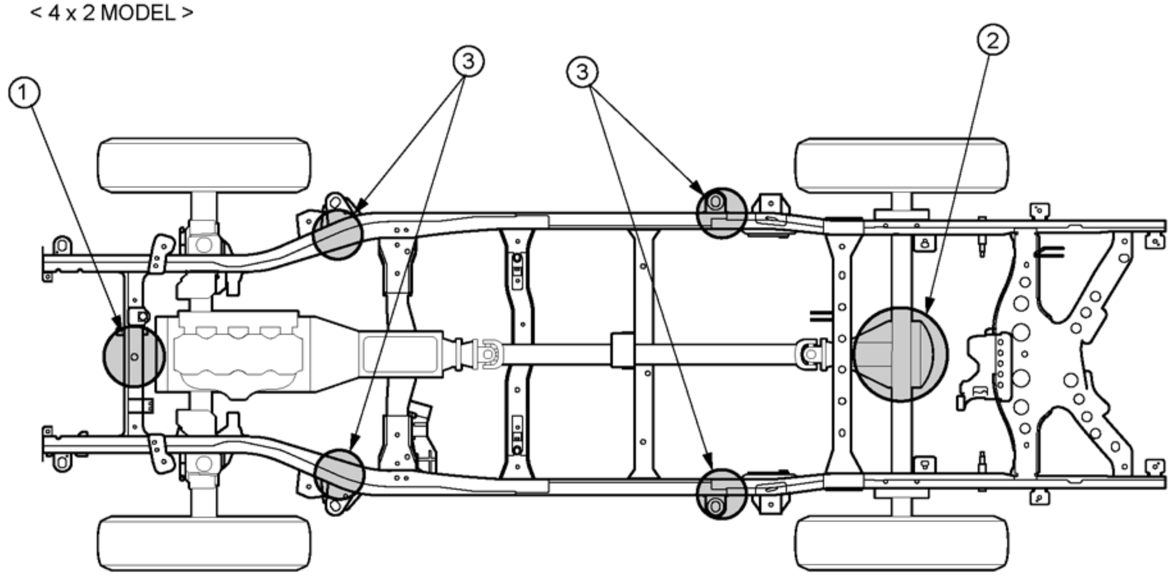
Lifting Points and Supportable Point-Locations

< 4 x 4 MODEL >



1. Front axle center
2. Rear axle center
3. Side frame

< 4 x 2 MODEL >



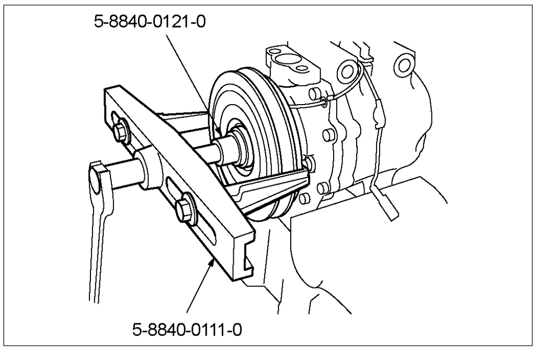
1. 1st cross member center
2. Rear axle center
3. Side frame

RTW50AXF000201

3. Drive Plate

Remove the drive plate.

If the frictional surface shows signs of damage due to excessive heat, the drive plate and pulley should be replaced.



RTW510SH000801

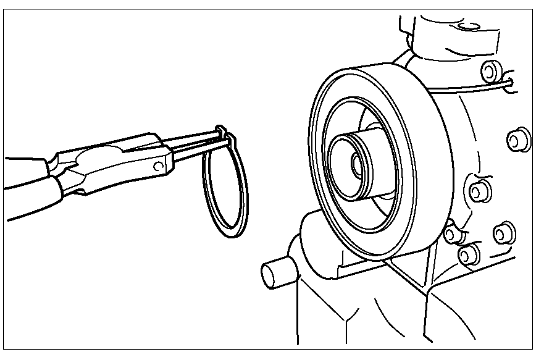
5. Pulley Assembly

Using pulley puller pilot and pulley puller to remove the pulley assembly.

Pulley Puller Pilot: 5-8840-0121-0 (J-33943)

Pulley Puller: 5-8840-0111-0 (J-8433)

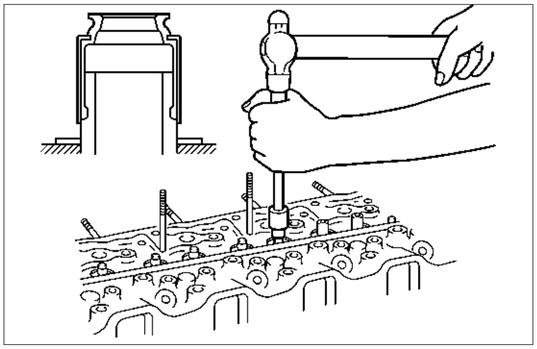
Check the appearance of the pulley assembly. If the frictional surface of the pulley shows signs of excessive grooving due to slippage, both the pulley and drive plate should be replaced. The frictional surfaces of the pulley assembly should be cleaned with a suitable solvent before reinstallation.



RTW510SH000901

6. Snap ring

Using snap ring pliers to remove the snap ring.

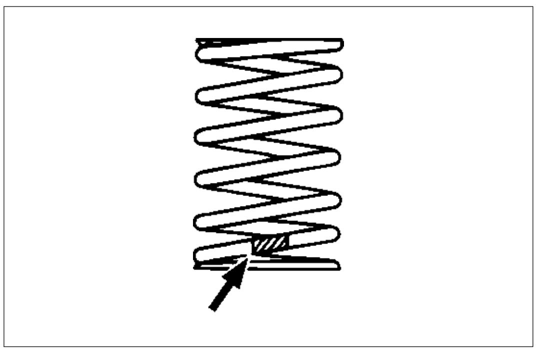


011RW027

Reassembly

1. **Cylinder Head**
2. **Valve Spring Lower Seat**
3. **Valve Stem Oil Seal**
   1. Apply a coat of engine oil to the oil seal inner face.
   2. Use an oil seal installer to install the oil seal to the valve guide.

      Oil Seal Installer: 5-8840-2033-0
4. **Intake and Exhaust Valve**
   1. Apply a coat of engine oil to each valve stem before installation.
   2. Install the intake and exhaust valves.
   3. Turn the cylinder head up to install the valve springs.Take care not to allow the installed valves to fall free.

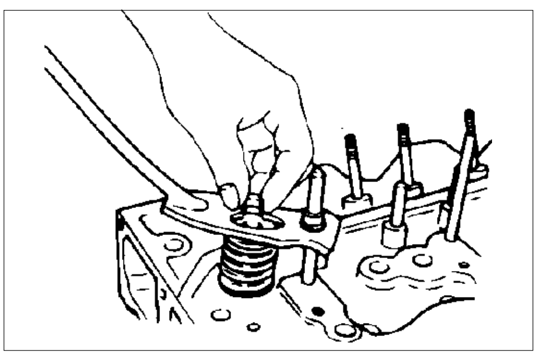


011LX055

5. **Valve Spring**

   Install the valve spring with their fine pitched end (painted) facing down.

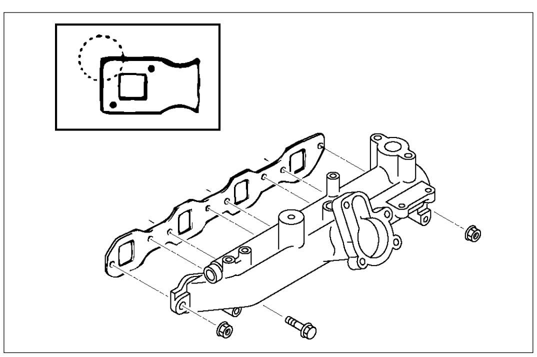
6. **Valve Spring Upper Seat**



014RY00039

7. **Split Collar**
   1. Use the spring compressor to compress the valve spring into position.

      Spring Compressor: 9-8523-1423-0
   2. Install the split collars to the valve stem.
   3. Set the split collars by tapping around the head of the collar with a rubber hammer.



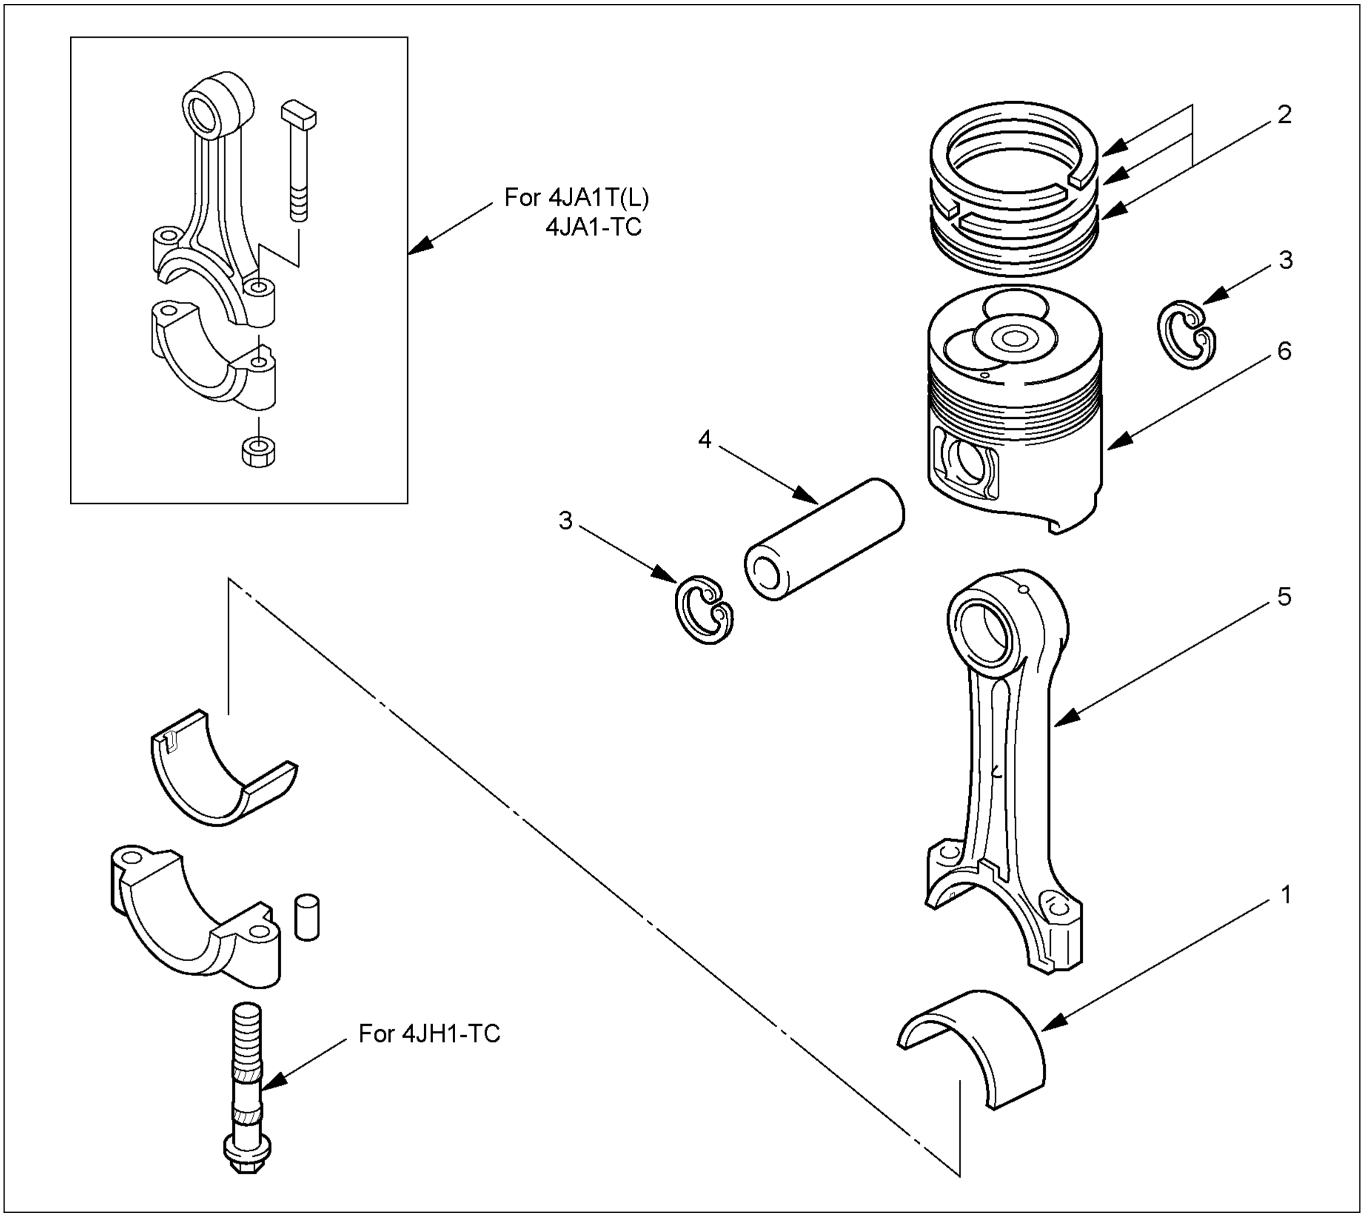
RTW46ASH002301

8. **Intake manifold gasket**
9. **Intake manifold**
   1. Install the manifold gasket with the end having the sharp corners facing the rear of the engine.
   2. Install the intake manifold to the cylinder head.
   3. Tighten the manifold bolt/nuts to the specified torque.

Manifold Bolt/Nut Torque N·m(kg·m/lbft)

Bolt	19 (1.9/14)
Nut	24 (2.4/17)

PISTON AND CONNECTING ROD

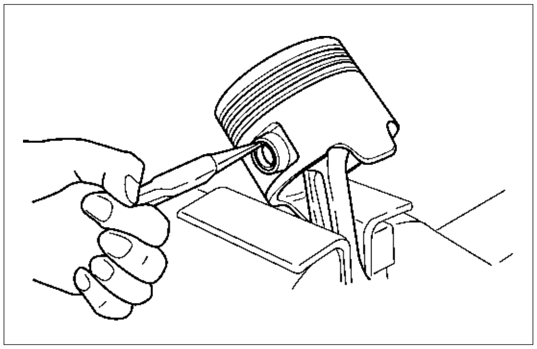


RTW46ALF000301

Reassembly Steps

1. Piston
2. Connecting rod
3. Piston pin snap ring
4. Piston pin
5. Piston pin snap ring
6. Piston ring
7. Connecting rod bearing

Reassembly

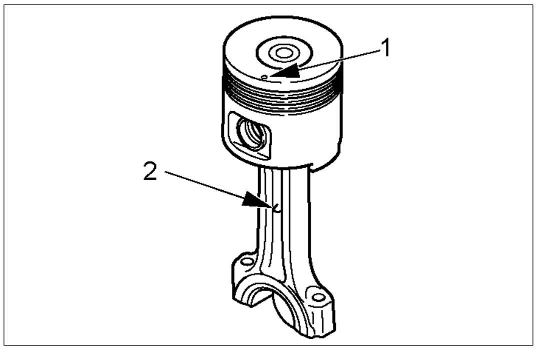


F06MV015

1. Piston

2. Connecting Rod

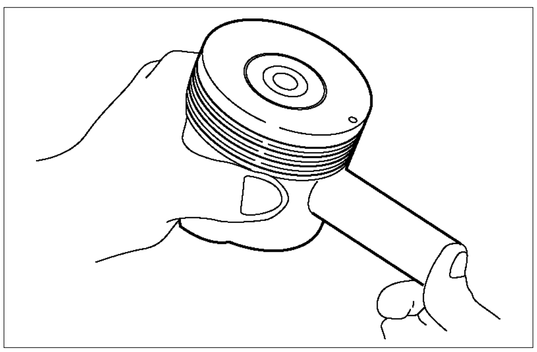
1. Clamp the connecting rod in a vise.Take care not to damage the connecting rod.
2. Use a pair of pliers to install the piston pin snap ring to the piston.



RTW36ASH001801

Install the piston to the connecting rod so that the piston head front mark (1) and the connecting rod mark (2) are facing in the same direction.

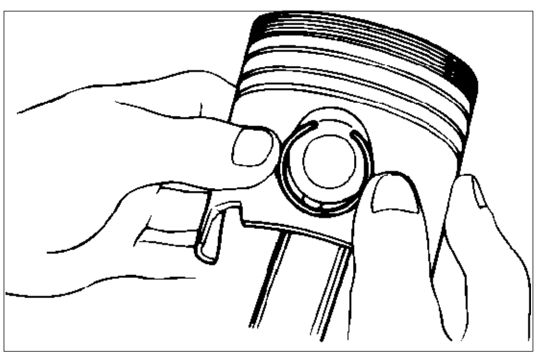
3. Piston Pin Snap Ring



RTW36ASH001901

4. Piston Pin

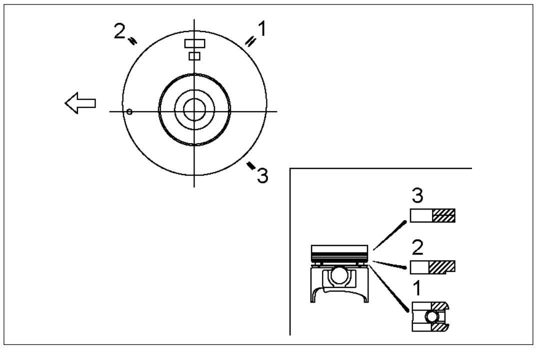
1. Apply a coat of engine oil to the piston pin and the piston pin hole.
2. Use your fingers to force the piston pin into the piston until it makes contact with the snap ring.



015R100001

5. Piston Pin Snap Ring

1. Use your fingers to force the piston pin snap ring into the piston snap ring groove.
2. Check that the connecting rod moves smoothly on the piston pin.



RTW36ASH002001

6. Piston Ring

1. Use a piston ring replacer to install the three piston rings.

   Piston Ring Replacer

   Install the piston rings in the order shown in the illustration.

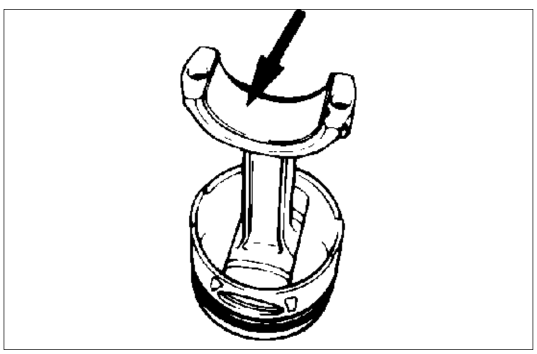
   1. Oil ring
   2. 2nd compression ring
   3. 1st compression ring

NOTE:

Install the compression rings with the stamped side facing up.

Insert the expander coil into the oil ring groove so that there is no gap on either side of the expander coil before installing the oil ring.

2. Apply engine oil to the piston ring surfaces.
3. Check that the piston rings rotate smoothly in the piston ring grooves

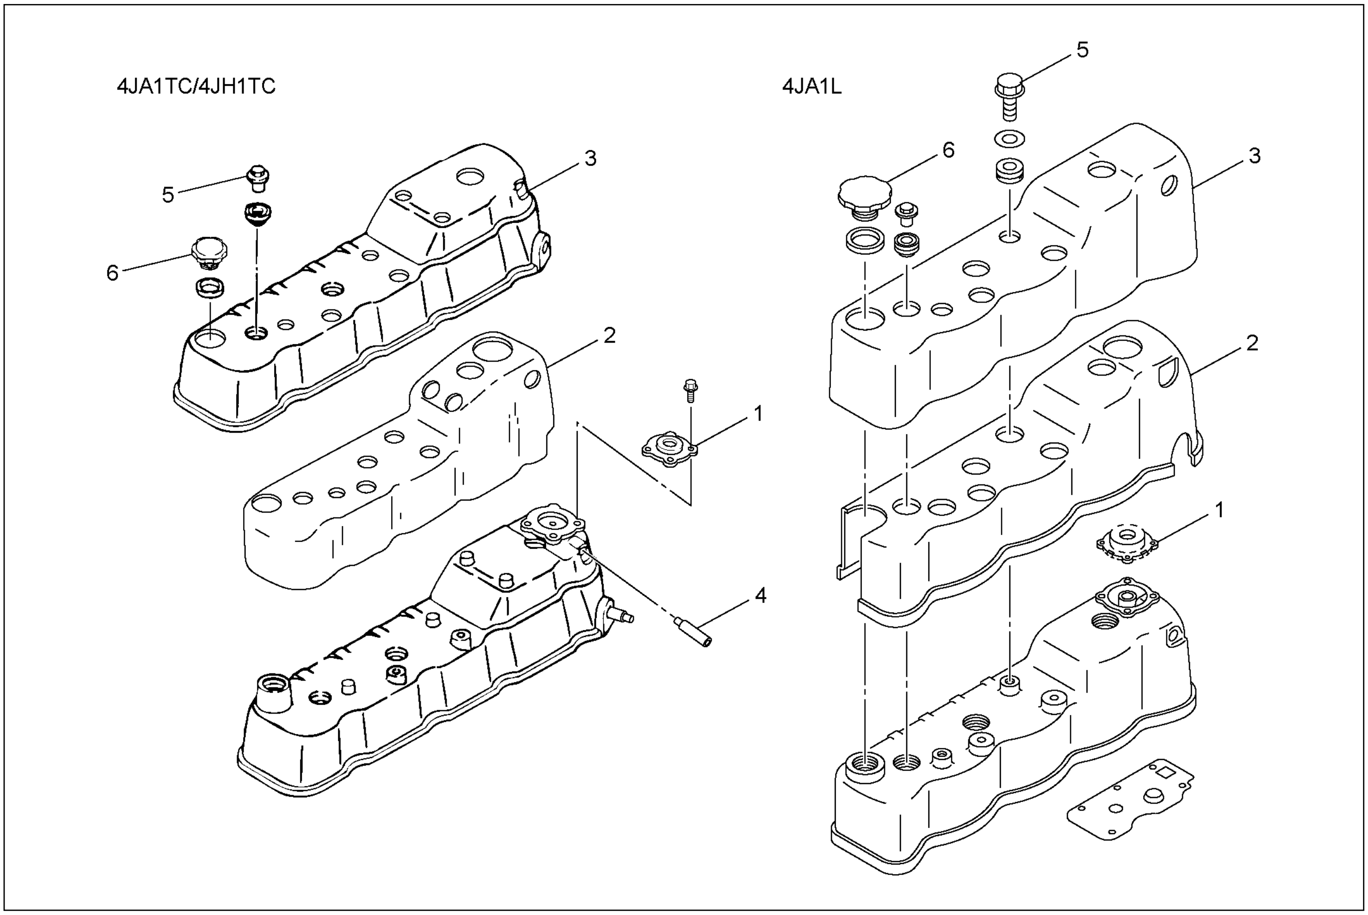


015R100006

7. Connecting Rod Bearing

Carefully wipe any oil or other foreign material from the connecting rod bearing back face and the connecting rod bearing fitting surface.

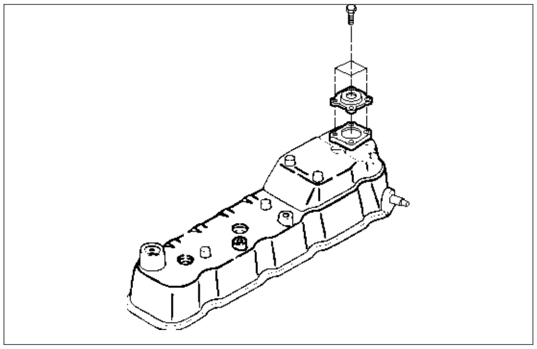
POSITIVE CRANKCASE VENTILATION (PCV) VALVE



RTW46AMF000101

Reassembly Steps

1. Positive Crankcase Ventilation (PCV) Valve
2. Rubber space
3. Cylinder head insulator cover
4. Breather pipe
5. Fixing bolt
6. Oil filler cap



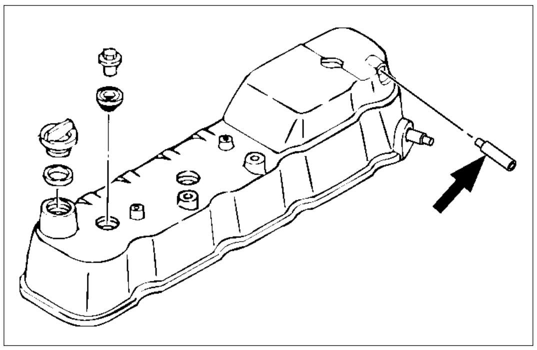
010R100014

Reassembly

1. **PCV Valve**
   Install the PCV valve and tighten the bolts to specified torque.

PCV Valve Bolts Torque	N·m(kg·m/lb in)
2 (0.2/17)	

2. **Rubber Spacer**
3. **Cylinder Head Insulator Cover**



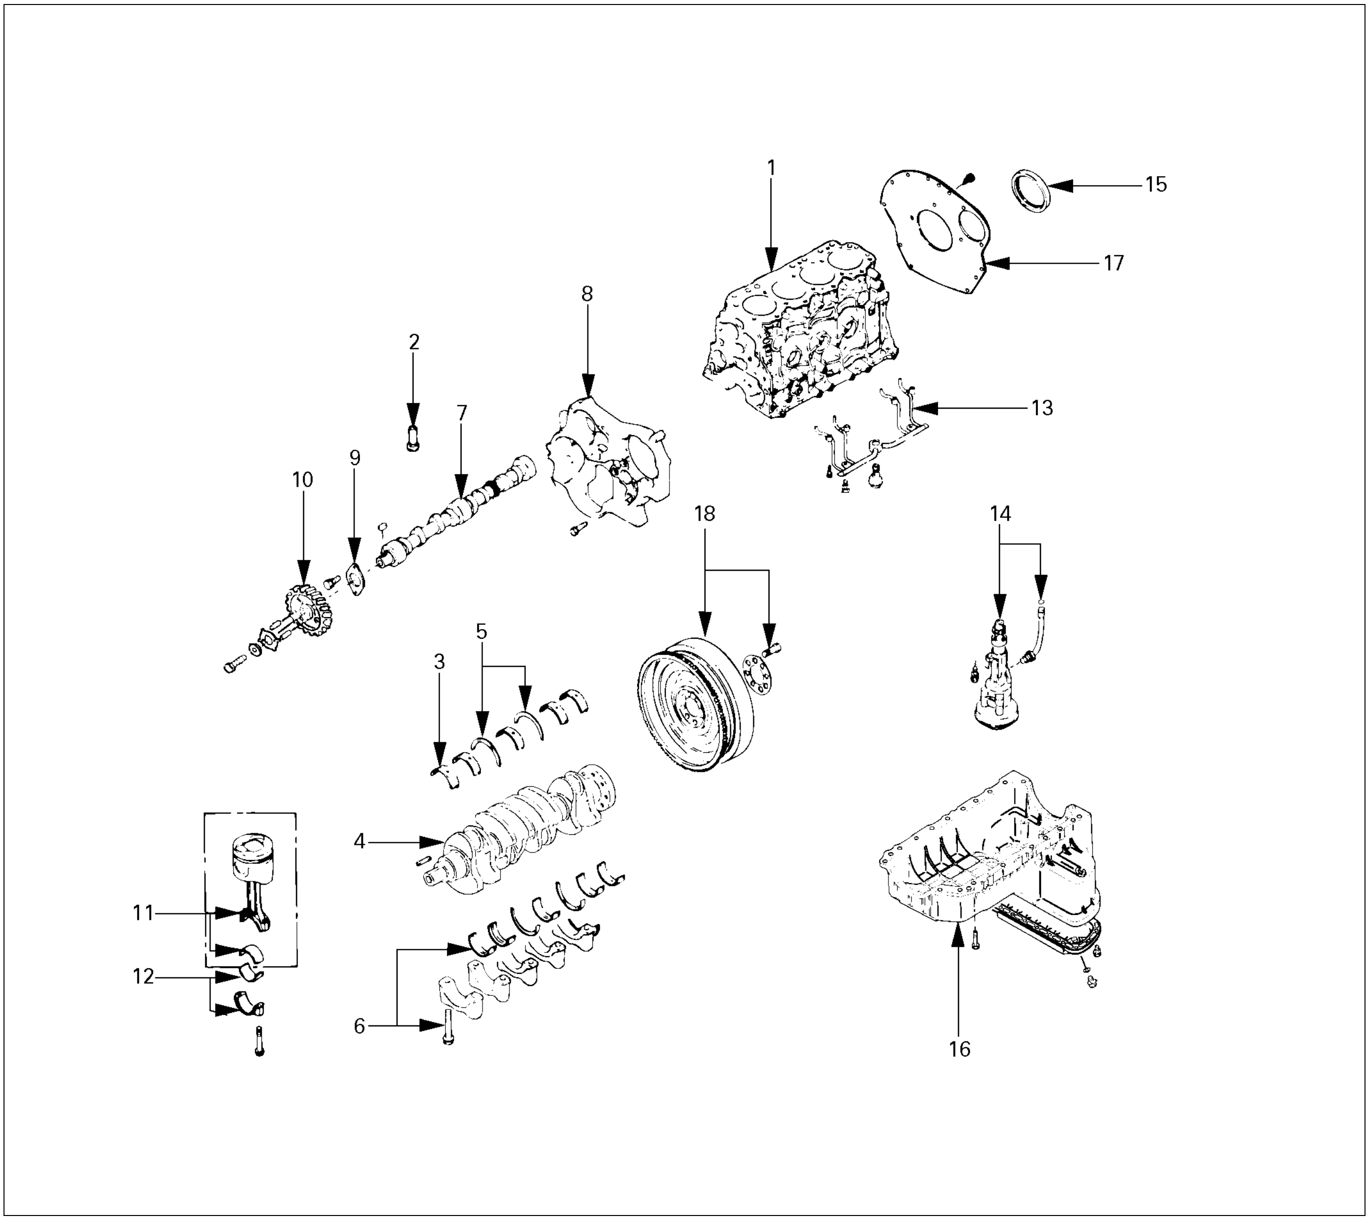
RTW36ASH001401

4. **Breather Hose**
   Apply LOCTITE 262 or equivalent to the new breather pipe.
   Do not reuse the breather pipe.
5. **Fixing Bolt**

Fixing Bolt Torque	N·m(kg·m/lb in)
19 (1.9/14)	

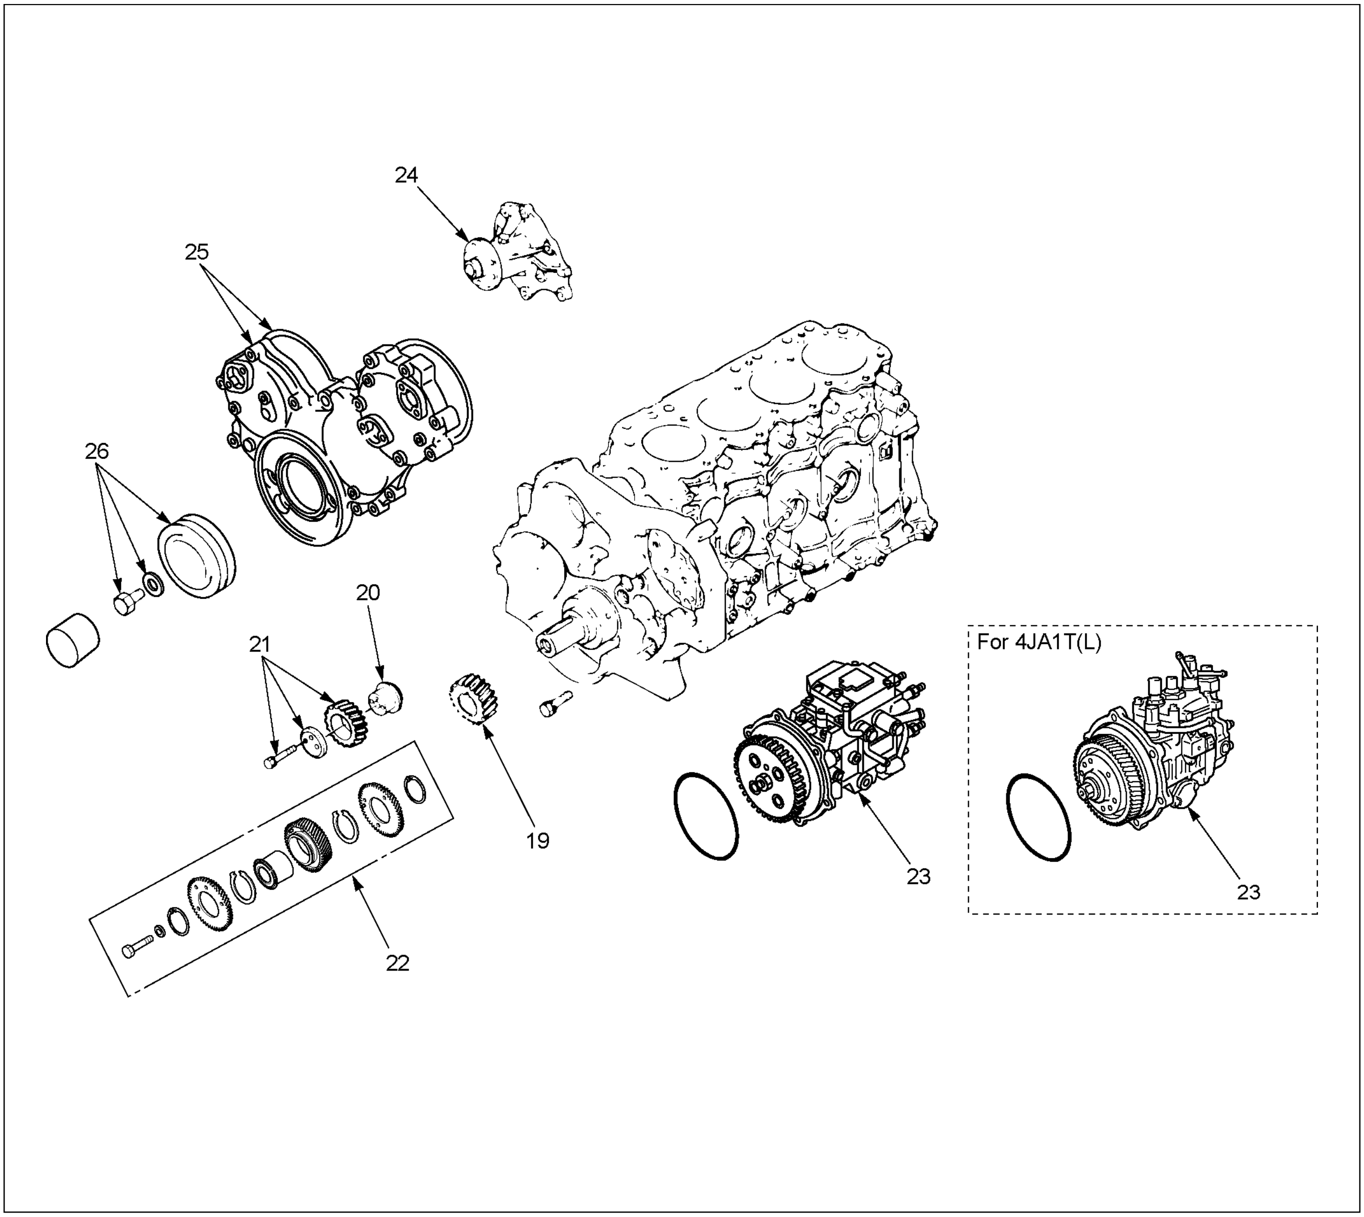
6. **Oil Filler Cap**

MAJOR COMPONENT



Reassembly Steps-1

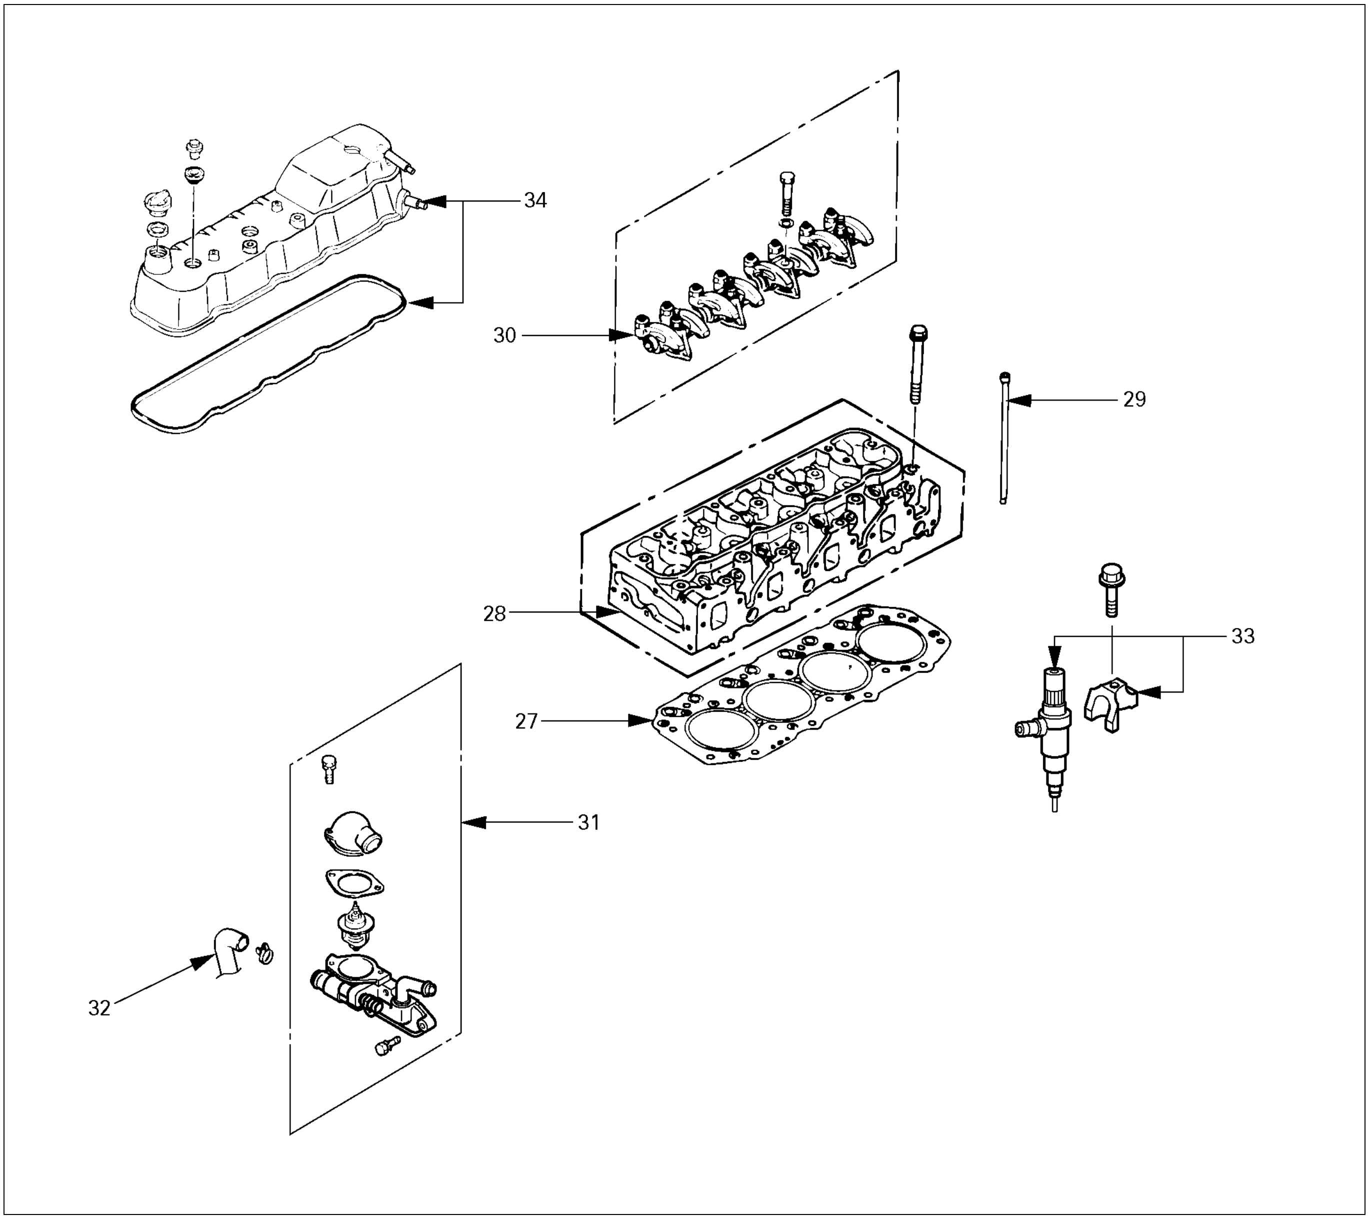
1. Cylinder body
2. Tappet
3. Crankshaft upper bearing
4. Crankshaft
5. Crankshaft thrust bearing
6. Crankshaft bearing cap with lower bearing
7. Camshaft
8. Timing gear case
9. Camshaft thrust plate
10. Camshaft timing gear
11. Piston and connecting rod with upper bearing
12. Connecting rod bearing cap with lower bearing
13. Piston cooling oil pipe
14. Oil pump with oil pipe
15. Crankshaft rear oil seal
16. Crank case
17. Cylinder body rear plate
18. Flywheel



RTW46ALF000501

Reassembly Steps-2

19. Crankshaft timing gear
20. Idler gear shaft
21. Idler gear "A"
22. Idler gear "B" and shaft
23. Injection pump
24. Water pump
25. Timing gear case cover
26. Crankshaft damper pulley

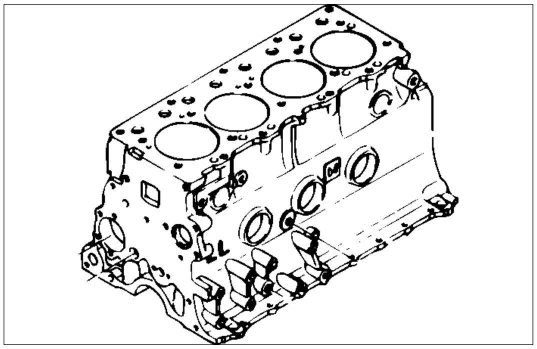


011R300002

Reassembly Steps-3

27. Cylinder head gasket
28. Cylinder head
29. Push rod
30. Rocker arm shaft and rocker arm
31. Thermostat housing with thermo switch
32. Water by-pass hose
33. Injection nozzle and bracket
34. Cylinder head cover with gasket

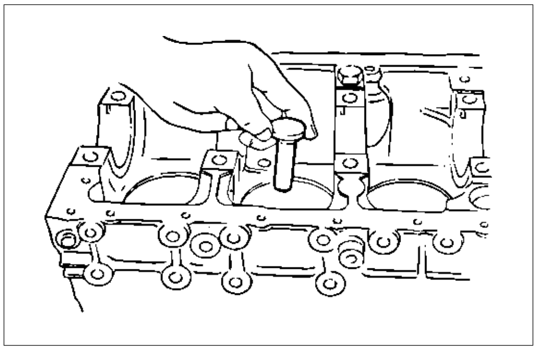
Reassembly



015R100003

1. Cylinder Body

Use compressed air to thoroughly clean the inside and outside surfaces of the cylinder body, the oil holes, and the water jackets.



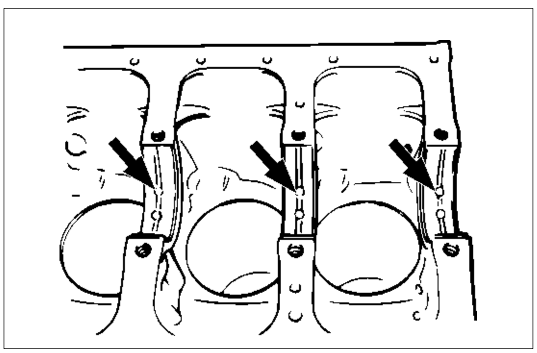
014LX088

2. Tappet

1. Apply a coat of engine oil to the tappet and the cylinder body tappet insert holes.
2. Locate the position mark applied at disassembly (if the tappet is to be reused).

NOTE:

The tappet must be installed before the camshaft installation.



015LX125

3. Crankshaft Upper Bearing

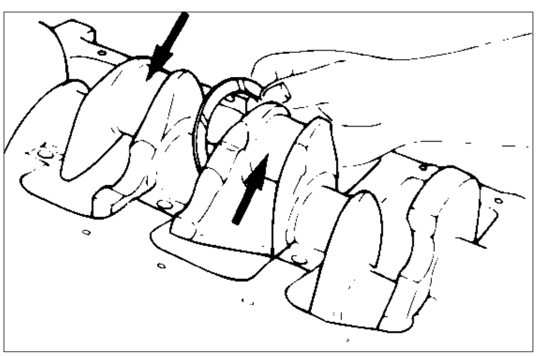
The crankshaft upper bearings have an oil hole and an oil groove. The lower bearings do not.

1. Carefully wipe any foreign material from the upper bearing.

NOTE:

Do not apply engine oil to the bearing back faces and the cylinder body bearing fitting surfaces.

2. Locate the position mark applied at disassembly if the removed upper bearings are to be reused.

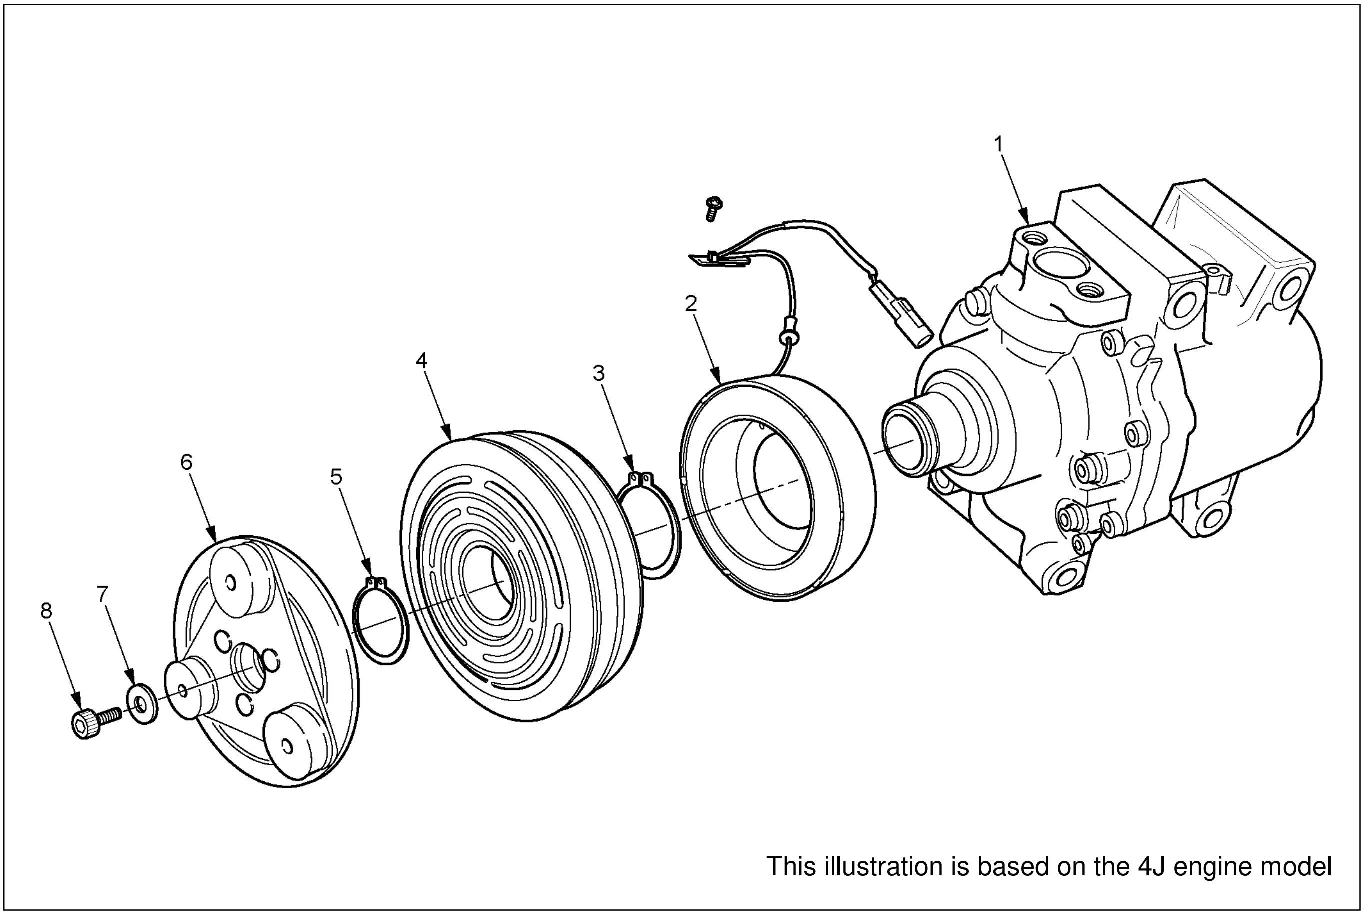


015R100004

4. Crankshaft

Apply an ample coat of engine oil to the crankshaft journals and the crankshaft bearing surfaces before installing the crankshaft.

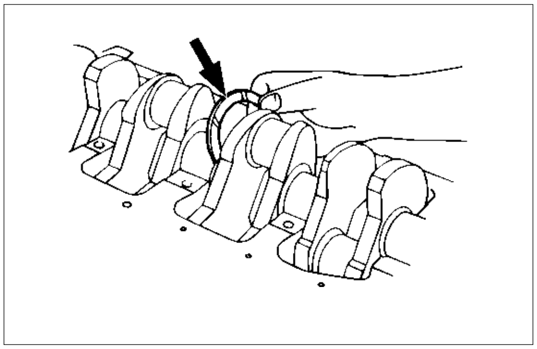
REASSEMBLY



RTW510MF000401

Reassembly Steps

1. Compressor
▲ 2. Field coil
3. Snap ring
▲ 4. Pulley assembly
2. Snap ring
3. Drive plate
7. Plain washer
▲ 8. Drive prate bolt



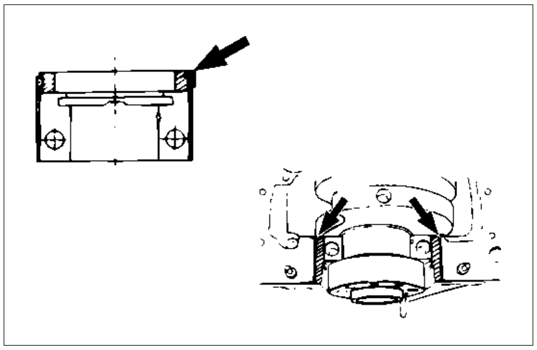
015LX115

5. Crankshaft Thrust Bearing

Apply an ample coat of engine oil to the thrust bearings before installation.

Install the thrust bearings to the crankshaft center journal.

The thrust bearing oil grooves must be facing the sliding faces.



015LX127

6. Crankshaft Bearing Cap With Lower Bearing

Before the crankshaft bearing installation, select the appropriate bearings in accordance with the description in CRANK BEARING SELECTION of INSPECTION AND REPAIR.

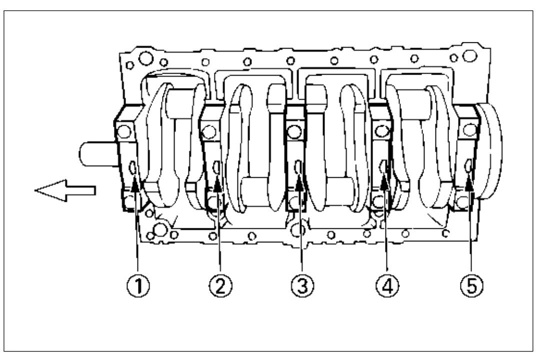
1. Apply the recommended liquid gasket or its equivalent to the No. 5 crankshaft bearing cap cylinder body fitting surfaces at the points shown in the illustration.

NOTE:

Be sure that the bearing cap fitting surface is completely free of oil before applying the liquid gasket. Three bond 1207B Do not allow the liquid gasket to obstruct the cylinder thread holes and bearings.

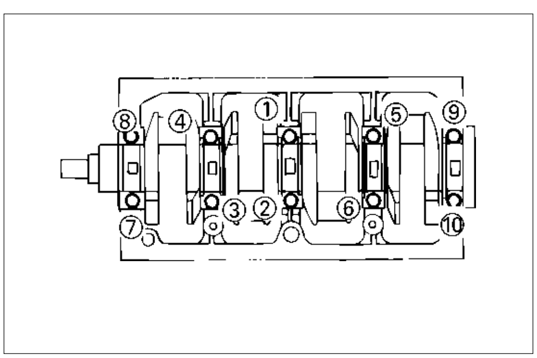
ThreeBond 1207B is a fast-drying liquid gasket.

Tighten the bearing caps immediately after applying the gasket.



015LX128

2. Install the bearing caps with the bearing cap head arrow mark facing the front of the engine.The bearing cap numbers must be facing up.
3. Apply engine oil to the crankshaft bearing cap bolts.

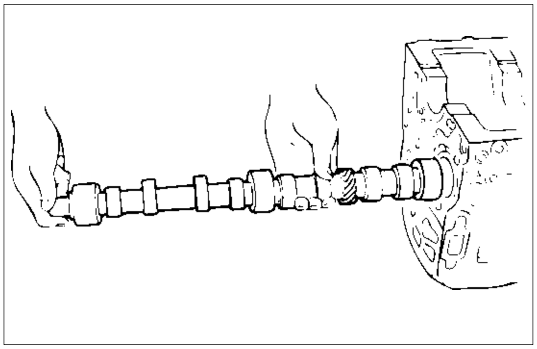


015LX129

4. Tighten the crankshaft bearing cap bolts to the specified torque a little at time in the sequence shown in the illustration.

Crankshaft Bearing Cap Torque	N·m(kg·m/lbft)
167 (17/123)	

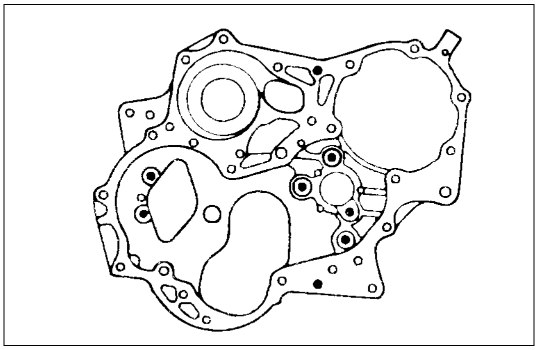
5. Check to see the crankshaft turns smoothly by rotating it manually.



014RY00019

7. Camshaft

1. Apply a coat of engine oil to the camshaft and the camshaft bearings.
2. Install the camshaft to the cylinder body.
   Take care not to damage the camshaft bearings.

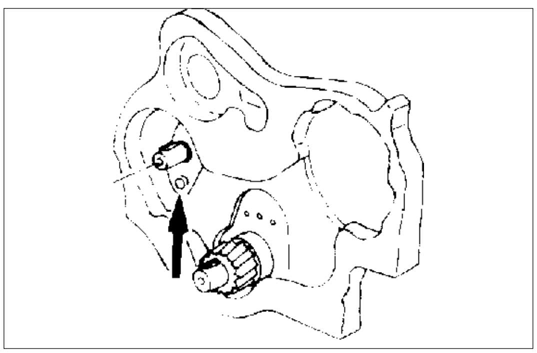


020R300003

8. Timing Gear Case

Tighten the timing gear case with timing gear case gasket to the specified torque.

Timing Gear Case Bolt Torque	N·m(kg·m/lbft)
19 (1.9/14)	

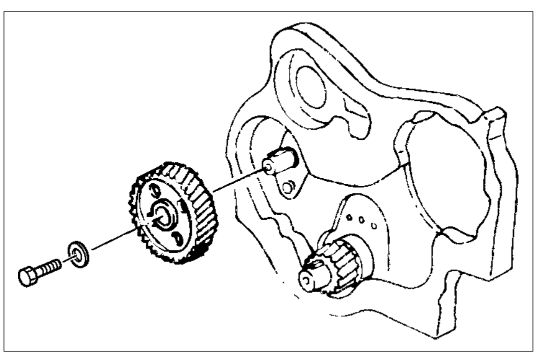


020RY00032

9. Camshaft Thrust Plate

Install the thrust plate to the cylinder body and tighten the thrust plate bolts to the specified torque.

Thrust Plate Bolt Torque	N·m(kg·m/lbft)
19 (1.9/14)	

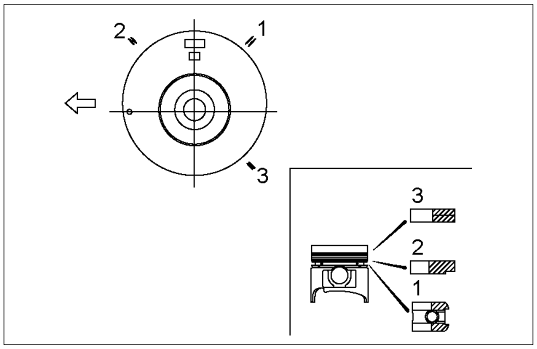


RTW36ASH000901

10. Camshaft Timing Gear

1. Install the camshaft timing gear to the camshaft. The timing gear mark must be facing outward.
2. Tighten the timing gear to the specified torque.

Timing Gear Bolt Torque	N·m(kg·m/lbft)
110 (11.2/82)	

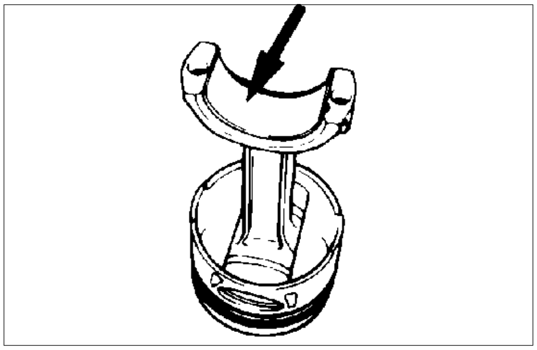


RTW36ASH002001

11. Piston and Connecting Rod with Upper Bearing

12. Connecting Rod Bearing Cap with Lower Bearing

1. Apply a coat of engine oil to the circumference of each piston ring and piston.
2. Position the piston ring gaps as shown in the illustration.
   1. Oil ring
   2. 2nd compression ring
   3. 1st compression ring



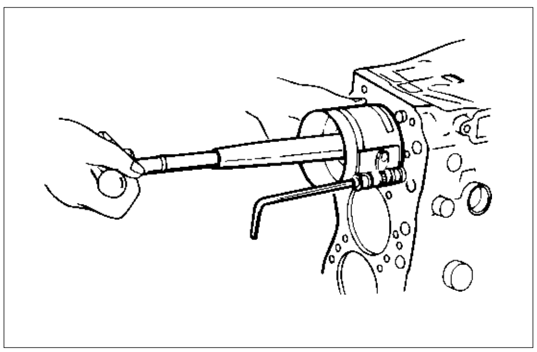
015R100006

3. Apply a coat of molybdenum disulfide grease to the two piston skirts.

   This will facilitate smooth break-in when the engine is first started after reassembly.

4. Apply a coat of engine oil to the upper bearing surfaces.

5. Apply a coat of engine oil to the cylinder wall.

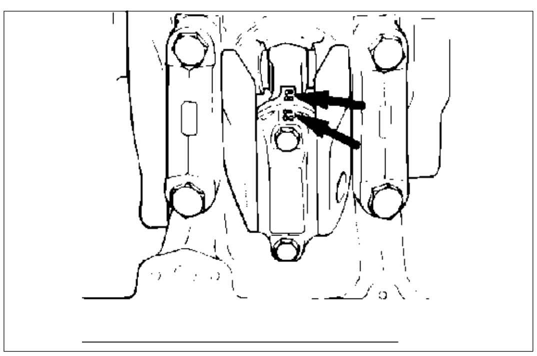


015LX096

6. Position the piston head front mark so that it is facing the front of the engine.
7. Use the piston ring compressor to compress the piston rings.

   Piston Ring Compressor: 5-8840-9018-0
8. Use a hammer grip to push the piston in until the connecting rod makes contact with the crankpin.

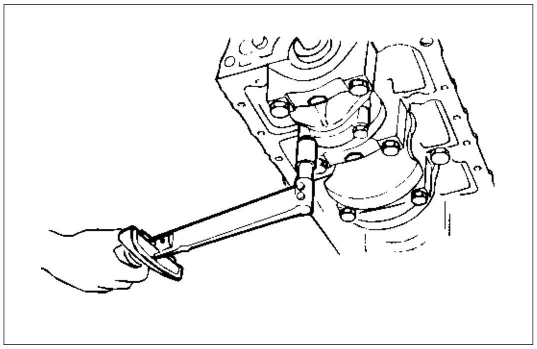
   At the same time, rotate the crankshaft until the crankpin is at BDC.



015R100007

9. Align the bearing cap cylinder number marks and the connecting rod cylinder number marks.

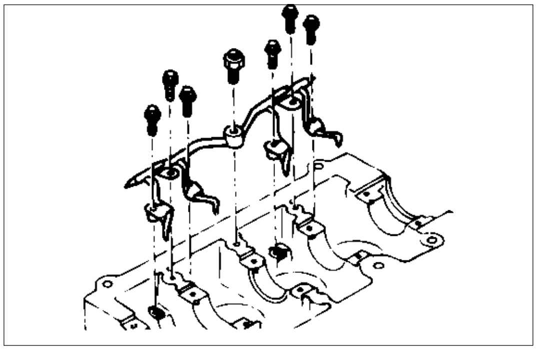
   The cylinder number marks must be turned toward the exhaust manifold.



015LX130

10. Apply a coat of engine oil to the threads and setting faces of each connecting rod cap bolt.
11. Tighten the connecting rod caps to the two step of anglar tigthen method.

Connecting Rod Bearing Cap Bolt Torque	N·m (kg·m/lb ft)
4JA1T (L), 4JA1TC	78-88 (8.0/57 – 9.0/65)
4JH1TC	1st step; 29.0–29.2 (3.00/22.0–3.01/22.2)
	2nd step; 45°-60°



052LX010

13. Piston Cooling Oil Jet

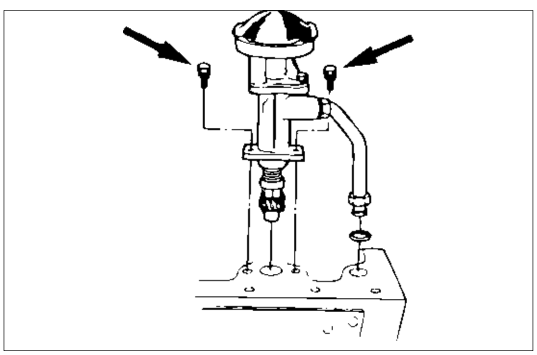
1. Install the piston cooling oil jet to the cylinder body.
2. Tighten the oil jet bolts and relief valve to the specified torque.

Oil Jet Bolt Torque	N·m(kg·m/lb ft)
M8 × 1.25	19 (1.9/14)
M6 × 1.00	8 (0.8/6)

Relief Valve Torque N·m(kg·m/lb ft)
29 (3.0/22)

NOTE:

Check that there is no interference between the piston and the oiling jet by slowly rotating the crankshaft.



051R100004

14. Oil Pump with Oil Pipe

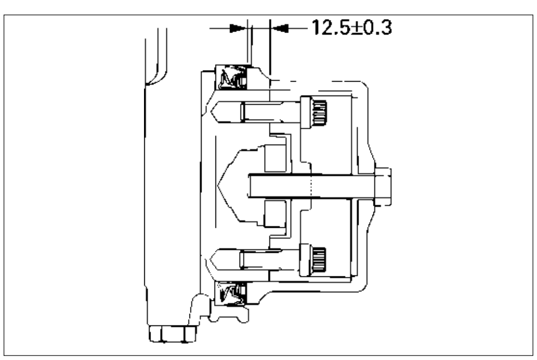
Apply a coat of the molybdenum disul fide and engine oil enough on the pinion gear.

Install the oil pump with the oil pipe and tighten the bolts to the specified torque.

Oil Pump Bolt Torque N·m(kg·m/lb ft)
19 (19/14)

NOTE:

Take care not to damage the O-rings when tightening the oil pipe bolts.

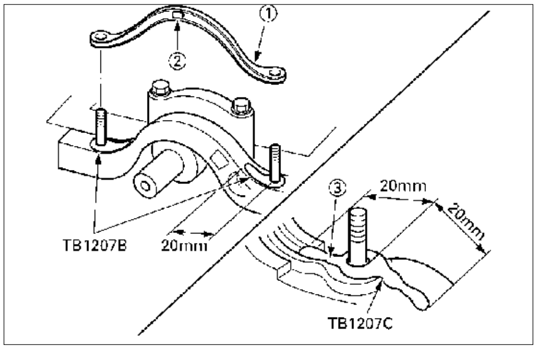


015LX112

15. Crankshaft Rear Oil Seal

Use a oil seal install to install the crankshaft rear oil seal.

Oil Seal Installer: 5-8840-2359-0



013RW012

16. Crank Case

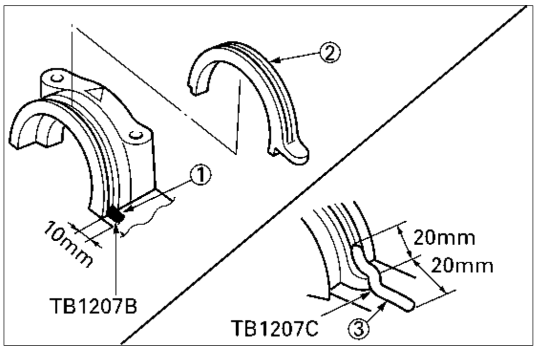
1. Apply the recommended liquid gasket (Three bond 1207B) or its equivalent to arch gasket fitting surface as shown in the illustration.
2. Install the crankcase front gasket (1) to the timing gear case arches.

   The gasket projection (2) must be facing forward.

NOTE:

ThreeBond 1207B is a fast-drying liquid gasket.

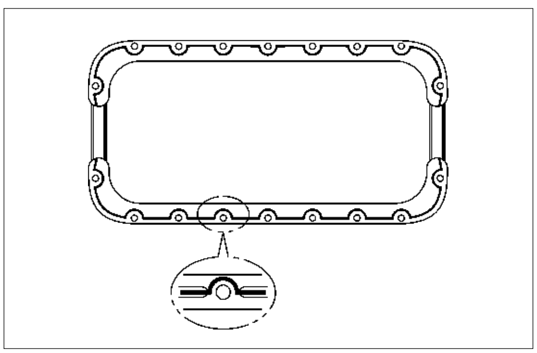
Install the arch packing to the crankcase immediately aftter applying the gasket.



013RW011

3. Install the rear arch gasket (2) to the No. 5 bearing cap. Use your fingers to push the arch gasket into the bearing cap groove.Take care not to scratch the arch gasket outer surface.

   Also apply the recommended liquid gasket (1207C) or its equivalent to arch gasket fitting area as indicated in the illustration.

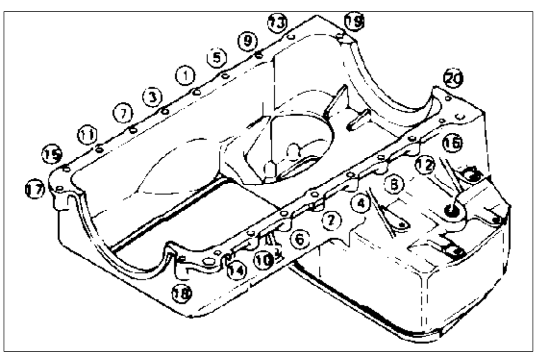


013LV003

4. Apply the recommended liquid gasket or its equivalent to groove of the crankcase fitting surface as shown in the illustration.

NOTE:

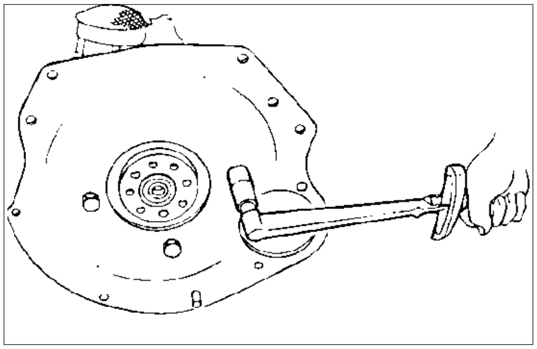
Be sure that the crank case fitting surface is completely free of oil and dust before applying the liquid gasket.



013R100001

5. Install the crank case to the cylinder body.
6. Tighten the crank case bolts to the specified torque a little at a time in the sequence shown in the illustration.

Crank Case Bolt Torque	N·m(kg·m/lbft)
19 (1.9/14)	

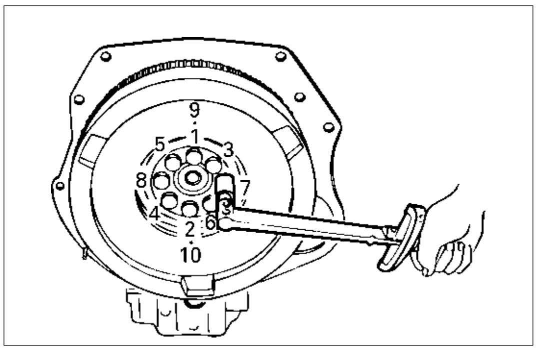


020R100001

17. Cylinder Body Rear Plate

1. Align the rear plate with the cylinder body knock pins.
2. Tighten the rear plate to the specified torque.

Rear Plate Torque	N·m(kg·m/lbft)
82 (8.4/61)	



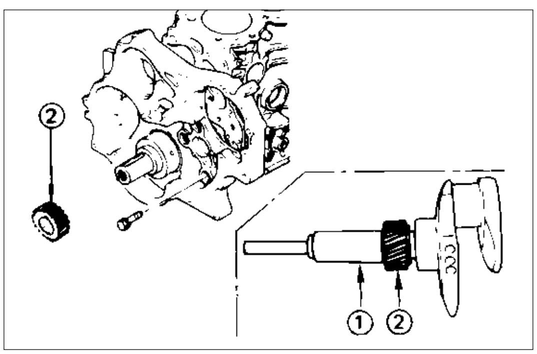
015LX113

18. Flywheel

1. Apply a coat of engine oil to the threads of the flywheel bolts.
2. Align the flywheel with the crankshaft dowel pin.
3. Tighten the flywheel bolts in the numerical order shown in the illustration.

Gear stoper: 5-8840-0214-0

Flywheel Bolt Torque	N·m(kg·m/lbft)
118 (12/87)	



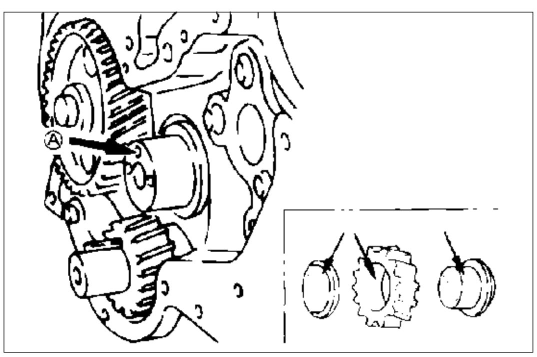
020RY00034

19. Crankshaft Timing Gear

Use the crankshaft timing gear installer (1) to install the crankshaft timing gear (2).

The crankshaft timing gear setting mark must be facing outward.

Crankshaft Timing Gear Installer: 9-8522-0020-0



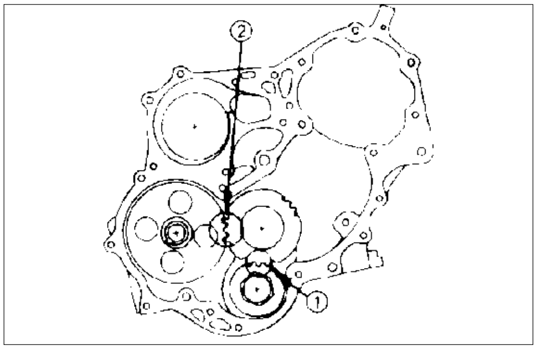
020RY00035

20. Idler Gear Shaft

21. Idler Gear "A"

1. Turn the crankshaft clockwise to set the DTC of the No.1 piston.
2. Apply engine oil to the idler gear and the idler gear shaft.

   The idler gear shaft oil hole (A) must be facing up.
3. Position the idler gear setting marks so that they are facing the front of the engine.

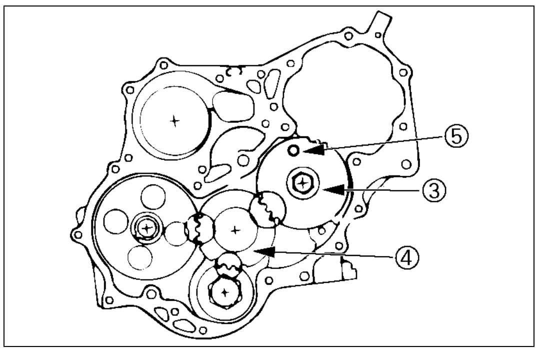


020RY00036

4. Align the idler gear setting mark with the crankshaft timing gear (1) setting mark.
5. Align the idler gear setting mark with the camshaft timing gear (2) setting mark.
6. Install the thrust collar and bolts to the cylinder body through the shaft.

   The thrust collar oil hole must be facing up, and the thrust collar chamfered must be outward.
7. Tighten the idler gear bolt to the specified torque.

Idler Gear "A" Bolt Torque	N·m(kg·m/lbft)
30 (3.1/22)	

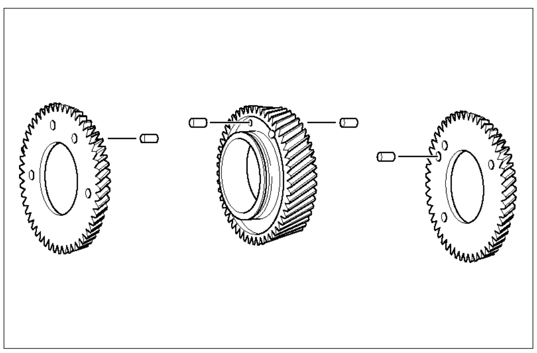


020R300006

22. Idler Gear "B" and Shaft

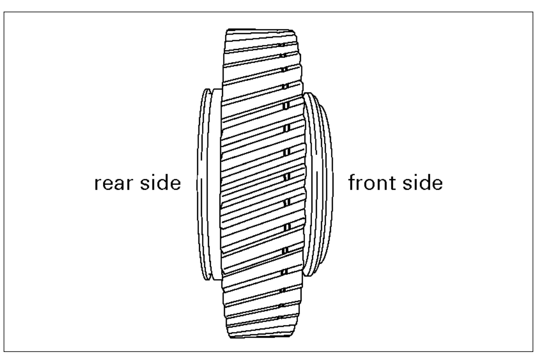
1. Apply engine oil to the idler gear and the idler gear shaft.
2. Align the idler gear "B" (3) setting mark with the idler gear "A" (4) setting mark.
3. Tighten the idler gear bolt to the specified torque.
4. Be sure to remove the lock bolt (5) from idle gear “B”.

Idler Gear "B" Bolt Torque	N·m(kg·m/lbft)
76 (7.7/56)	



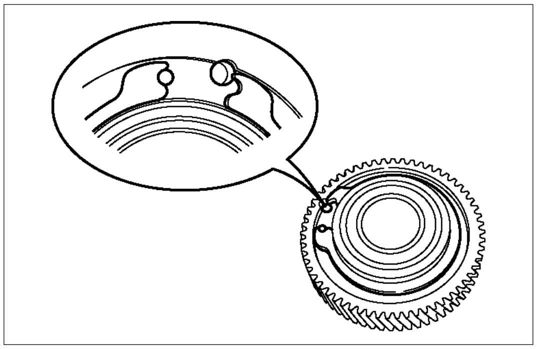
020L200019

5. If the idle gear "B" is disassembled, reassemble in the following procedure.
   1) Drive pins into the main gear, the front gear, and the rear gear.



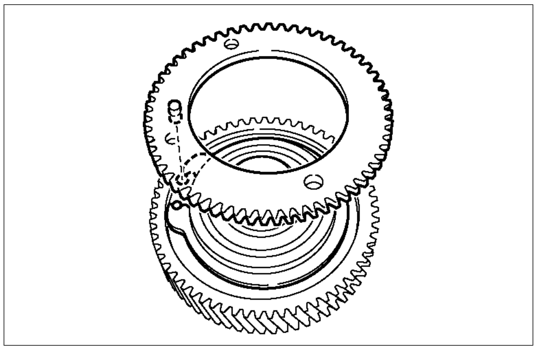
020L200007

   2) Install the main gear bearing from the front side of the main gear (the side with the groove).
   3) Place the main gear in a vise with copper plate so that the rear side of the main gear facing up.



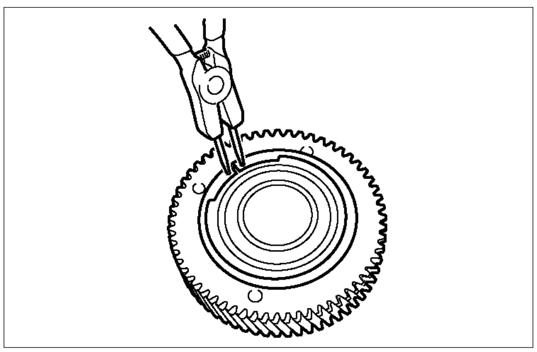
RTW31BSH000101

4) Set the spring as shown in the illustration.



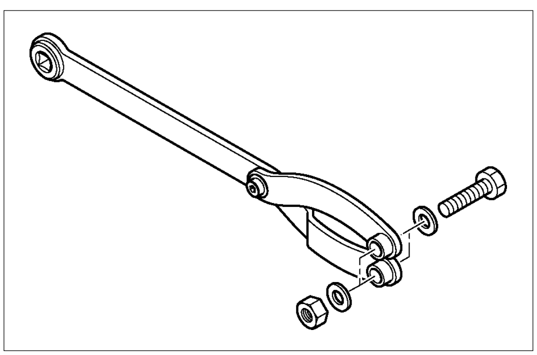
RTW31BSH000201

5) Position the rear gear so that the pin is aligned with the receiving end of the spring.



RTW31BSH000301

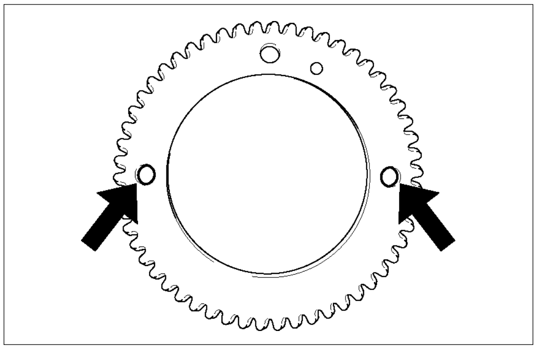
6) Install the snap ring to the main gear groove.



RTW31BSH000501

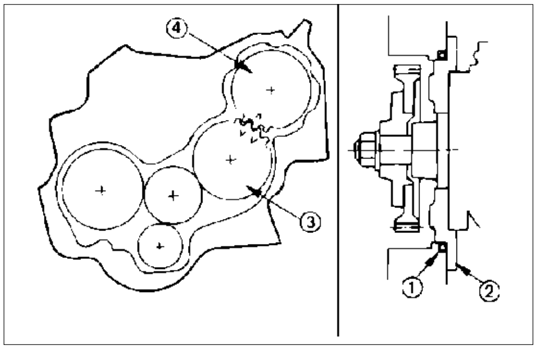
7) Install suitable bolts, nuts and washers to special tool as shown in the illustration to rotate the scissors gear.

End yoke holder: 5-8840-2447-0



RTW31BSH000401

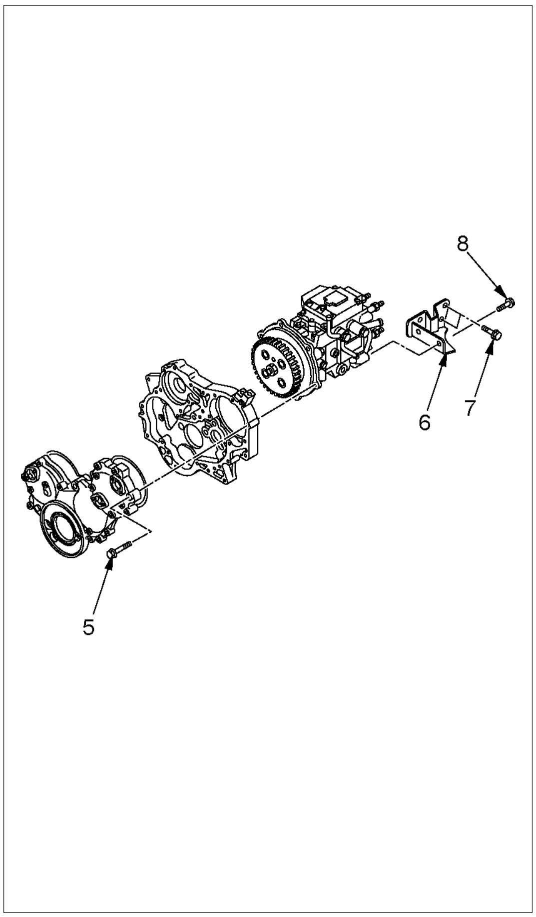
8) Insert the bolts of the special tool into the rear gear setting hole. Rotate the rear gear to mesh the teeth of main gear and rear gear.
9) Insert a lock bolt (M6 × 1 L=30) into scissors gear fixing hole to prevent the scissors gear from turning.
10) Place the main gear in a vise with copper plate so that the front side of the main gear facing up.
11) Repeat steps 4 to 8 to install the front gear.
12) Lock the front gear, the main gear, and the rear gear with lock bolt (inserted at Step 8).



020RY00039

23. Injection Pump

1. Install the O-ring (1) to the injection pump flange (2).
2. Attach the noise insulator rubber to the cylinder body .
3. Install the injection pump to the timing gear case.Align the idler gear "B" (3) mark with the injection pump timing gear (4) mark.



RTW36AMH000101

4JA1TC/4JH1TC:

4. Tighten the injection pump bolts (5) to the specified torque.

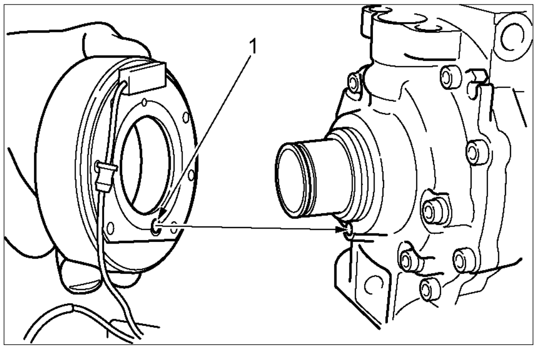
Injection Pump Bolt Torque	N·m(kg·m/lbft)
19 (1.9/14)	

5. Install the injection pump bracket (6) and the bracket bolts (7) and (8) to the cylinder body.
   Temporarily tighten the bracket bolts.
6. Tighten the bracket bolts (7) to the specified torque.
7. Tighten the bracket bolt (8) to the specified torque.

NOTE:
Tighten the bracket bolt (7) first.

Injection Pump Bracket Bolt Torque	N·m(kg·m/lbft)
19 (1.9/14)	

Important Operations - Reassembly

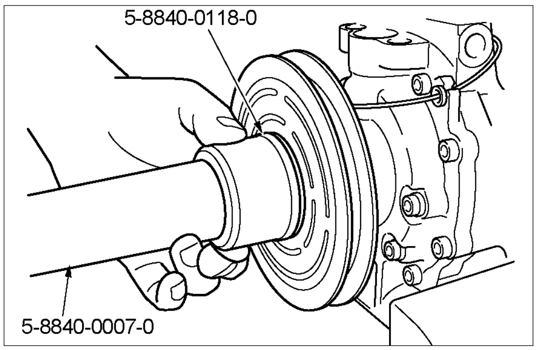


RTW510SH001001

2. Field Coil

Installation field coil.

- Align the located portion (1) of the clutch coil and compressor.



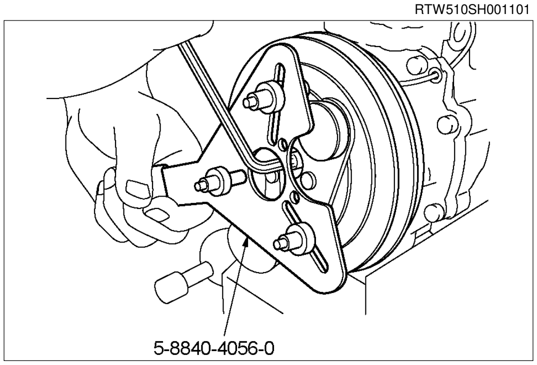
RTW510SH001101

4. Pulley Assembly

Using pulley installer and drive handle to install the pulley assembly.

Pulley Installer: 5-8840-0118-0 (J-33940)

Drive Handle: 5-8840-0007-0 (J-8092)



RTW510SH000701

8. Drive Plate Bolt

Using drive plate holder to prevent the drive plate from rotating.

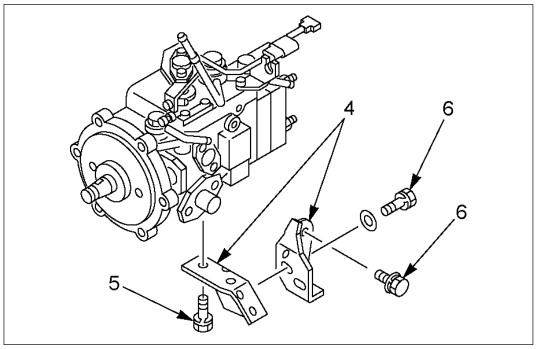
Drive Plate Holder: 5-8840-4056-0 (J-37872)

Tighten the bolt to the specified torque.

N·m (kgf·m/lb·in)

Torque	13 (1.3/113)

After tightening the bolt, check to be sure the pulley rotates smoothly.



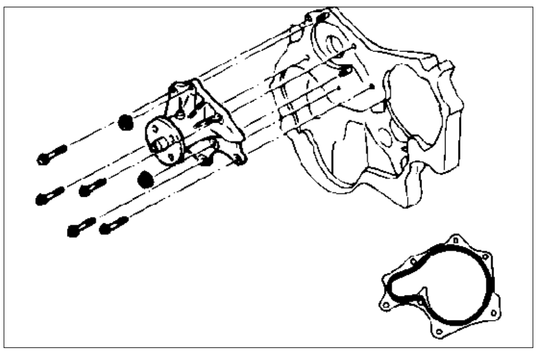
RTW46ASH002201

4JA1T(L):

4. Tighten the injection pump bolts to the specified torque.
5. Install the injection pump bracket (4) and the bracket bolts (5) and (6) to the cylinder body. Temporarily tighten the bracket bolts.
6. Tighten the bracket bolts (5) to the specified torque.
7. Tighten the bracket bolts (6) to the specified torque.

Injection pump Bracket Bolt Torque (6)	N·m(kg·m/lbft)
19 (1.9/14)	

Injection pump Bracket Bolt Torque (5)	N·m(kg·m/lbft)
40 (4.1/30)	

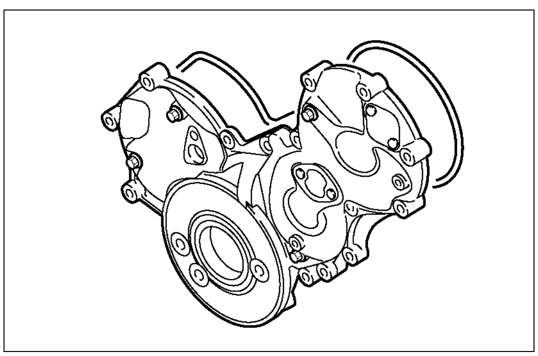


030RY00007

24. Water Pump

1. Apply the recommended liquid gasket or its equivalent to the water pump at the position shown in the illustration.
   Do not apply an excessive amount of liquid gasket.
2. Tighten the water pump bolts to the specified torque.

Water Pump Bolt Torque	N·m(kg·m/lbft)
20 (2.0/14)	

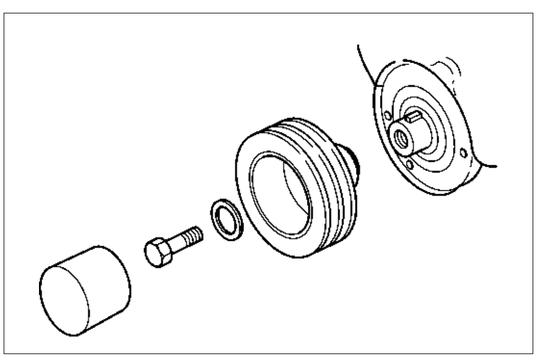


020R300004

25.Timing Gear Case Cover

1. Align the gear case with the timing gear case knock pin and then install the timing gear case cover.
2. Tighten the gear case cover bolts to the specified torque.

Gear Case Cover Bolt Torque	N·m(kg·m/lbft)
M8	19 (1.9/14)
M12	76 (7.7/56)



014R100014

26. Crankshaft Damper Pulley

Tighten the crankshaft damper pulley bolt to the specified torque.

Note:

Hold the flywheel ring gear stationary to prevent the crankshaft from turning when tightening the damper pulley bolt.

Crankshaft Damper Pulley Bolt Torque	N·m(kg·m/lbft)
206 (21/152)	

Take care not to damage the crankshaft damper pulley boss.

27. Cylinder Head Gasket

The cylinder head gasket "TOP" mark must be facing up.

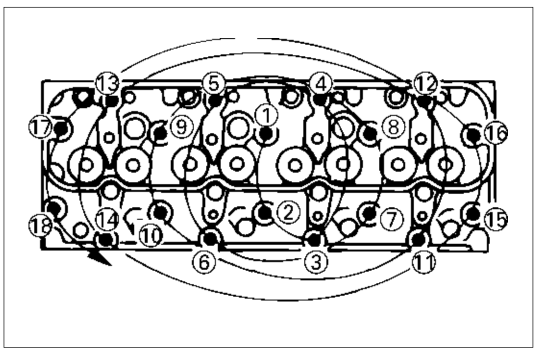
NOTE:

Before the gasket installation, measure the piston head projection and select the appropriate head gasket.

Refer to "INSPECTION AND REPAIR", "Cylinder Head Gasket Selection".

28. Cylinder Head

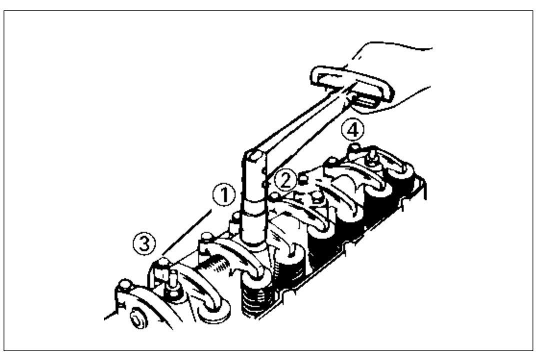
1. Align the cylinder body dowels and the cylinder head dowel holes.
   Carefully place the cylinder head on the cylinder head gasket.
2. Apply a coat of engine oil to the cylinder head bolt threads and setting faces.



011LX073

3. Tighten the cylinder head bolts in three steps of anglar tightening methed.
   Follow the numerical sequence shown in the illustration.

Cylinder Head Bolt Torque	N·m(kg·m/lbft)
1st step	49 (5.0/36)
2nd step	60° - 75°
3rd step	60° - 75°

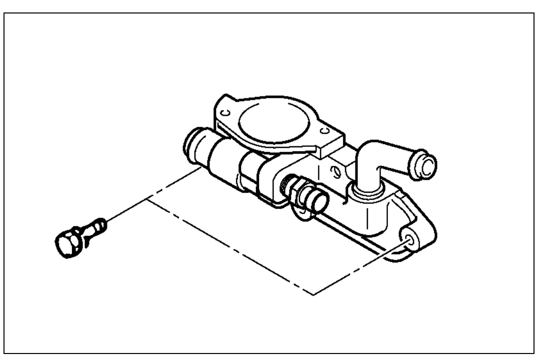


014LX083

30. Rocker Arm Shaft and Rocker Arm

Tighten the rocker arm shaft bracket bolts in the numerical order shown in the illustration.

Rocker Arm Shaft Braket Bolt Torque	N·m(kg·m/lbft)
54 (5.5/40)	

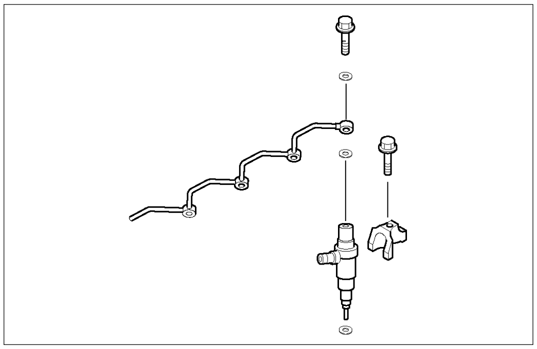


031R300002

31. Thermostat Housing

1. Install the thermostat housing.
2. Tighten the thermostat housing bolts to the specified torque.

Thermostat Housing Bolt Torque	N·m(kg·m/lbft)
19 (1.9/14)	

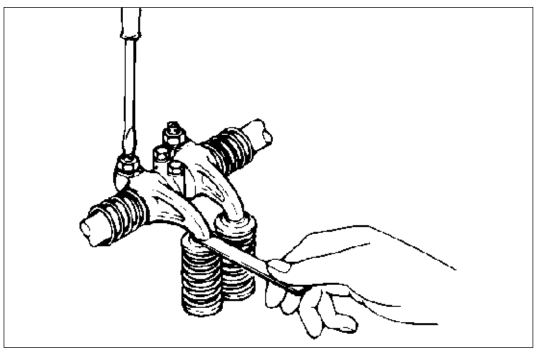


RTW46ASH001201

33. Injection Nozzle Holder

1. Install the injection nozzle gasket and the O-ring to the injection nozzle holder.
   Be sure that the O-ring fits snugly in the injection nozzle groove.
2. Install the nozzle holder toghther with the nozzle holder bracket to the cylinder head.
3. Tighten the nozzle holder bracket bolt to the specified torque.

Injection Nozzle Holder Bracket Bolt Torque	N·m(kg·m/lbft)
37 (3.8/28)	

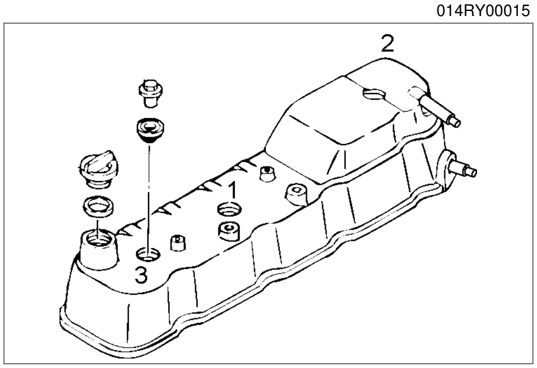


014RY00015

Note on Valve Clearance Adjustment

Valve clearances must be adjusted before the cylinder head cover is reinstalled.Refer to "Valve Clearance Adjustment" in the "Servicing" Section of this manual.

Valve Clearance (At Cold)	mm(in)
0.4 (0.0157)	



RTW46ASH001101

34. Cylinder Head Cover

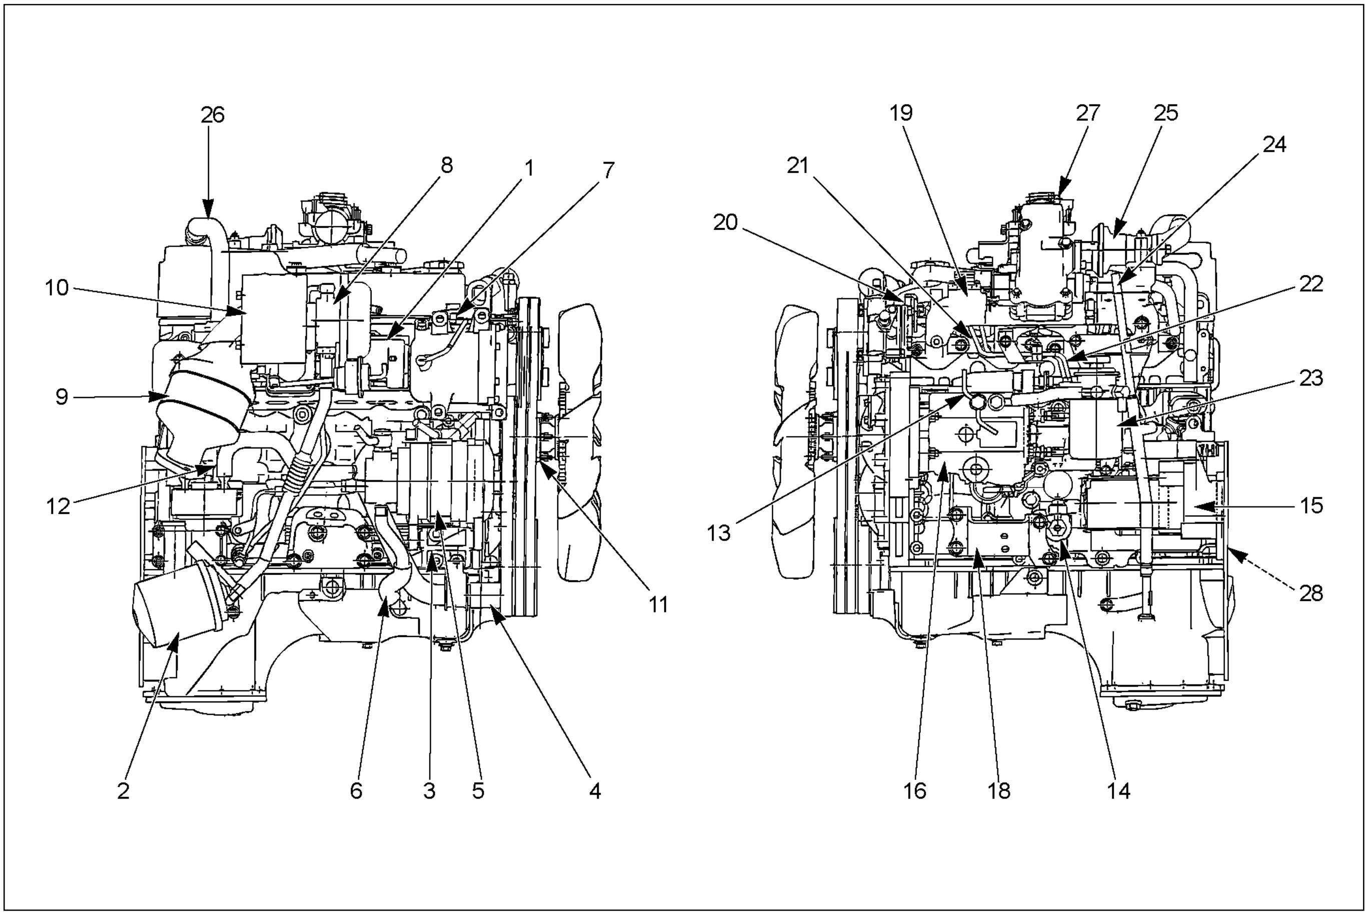
1. Apply engine oil to the rocker arm and the valve spring.
2. Install the cylinder head cover gasket to the head cover. Check to see that the head cover gasket has no loose areas.
3. Tighten the cylinder head cover nuts in the numerical order shown in the illustration.

Cylinder Head Cover Bolt Torque	N·m(kg·m/lbft)
13 (1.3/9.4)	

4. Connect the positive crankcase ventilation (PCV) hose to the cylinder head cover.

INSTALLATION

EXTERNAL PARTS



RTW36AMF000701

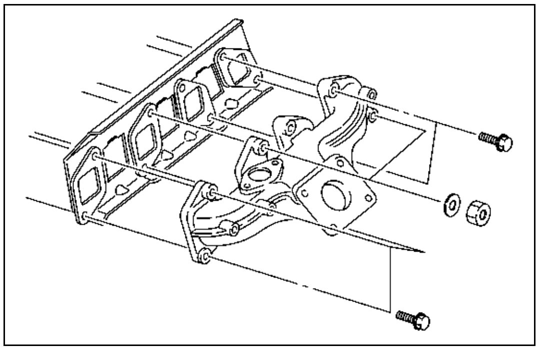
Installation Steps

1. Exhaust Manifold
2. Oil Cooler with Oil Filter
3. Generator Bracket
4. Water Inlet Pipe
5. Generator and Adjusting Plate
6. Vacuum Pump Oil Return Hose
7. Compressor Bracket
8. Turbocharger
9. Catalytic Converter
10. Heat Protector
11. Cooling Fan Pulley
12. Oil Cooler Water Pipe
13. Fuel Leak Off Pipe
14. Oil Pressure Warning Switch
15. Starter Motor
16. Injection Pump
17. Injection Pump Cover
18. Engine Mounting Bracket and Foot
19. Intake Manifold
20. Power Steering Oil Pump Bracket
21. Fuel Injection Pipe with Clip
22. Fuel Filter Bracket (Except EURO III)
23. Fuel Filter Assembly (Except EURO III)
24. Oil Level Gauge
25. EGR Valve

26-1. EGR Pipe

26-2. EGR Cooler (EURO III model only)

27. Intake Pipe and Throttle Body (4JA1TC/4JH1TC only)
28. Clutch Assembly or Flex Plate



027R100003

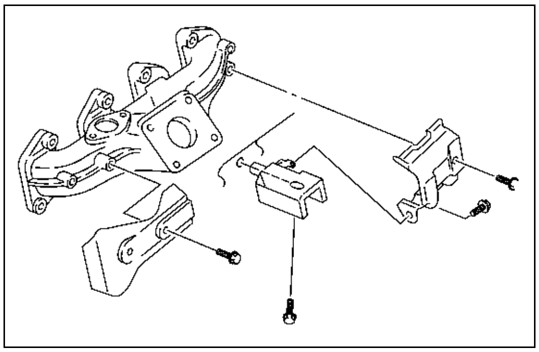
Installation

1. Exhaust Manifold

1) Install the exhaust manifold to the cylinder head with the manifold gasket.
2) Tighten the exhaust manifold bolts and nuts to the specified torque a little at a time.

Exhaust Manifold Bolt and Nuts

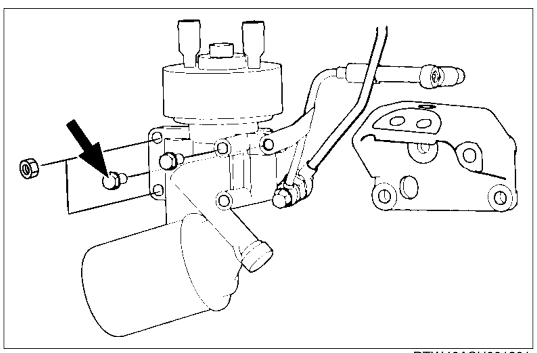
Torque	N·m(kg·m/lb ft)
24 (2.4/17)	



027R100004

3) Install the exhaust manifold bracket to the manifold and the cylinder body.

Manifold Bracket Bolt Torque	N·m(kg·m/lb ft)
19 (1.9/14)	



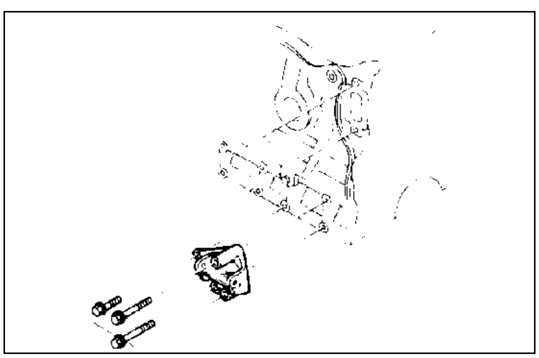
RTW46ASH001301

2. Oil Cooler with Oil Filter

1) Install the O-ring to the oil filter body flange groove.
2) Install the oil filter body to cylinder block and tighten to the specified torque.

Oil Filter Body Bolt and Nut

Torque	N·m(kg·m/lb ft)
BOLT 19 (1.9/14) NUT 24 (2.4/17)	

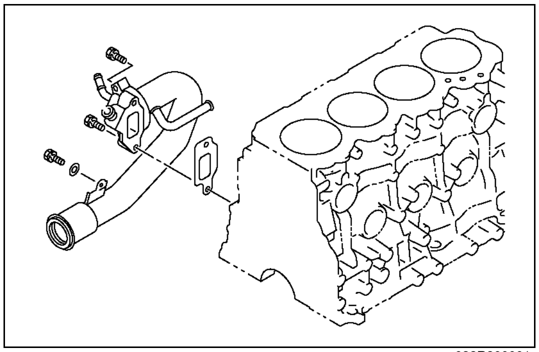


066RY00001

3. Generator Bracket

Install the generator bracket to the cylinder body and tighten the bracket bolts to the specified torque.

Bracket Bolt Torque	N·m(kg·m/lb ft)
40 (4.1/30)	

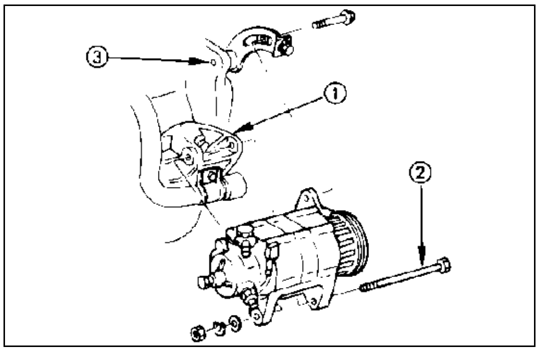


032R300001

4. Water Inlet Pipe

1) Tighten the water inlet pipe bolts to the specified torque.

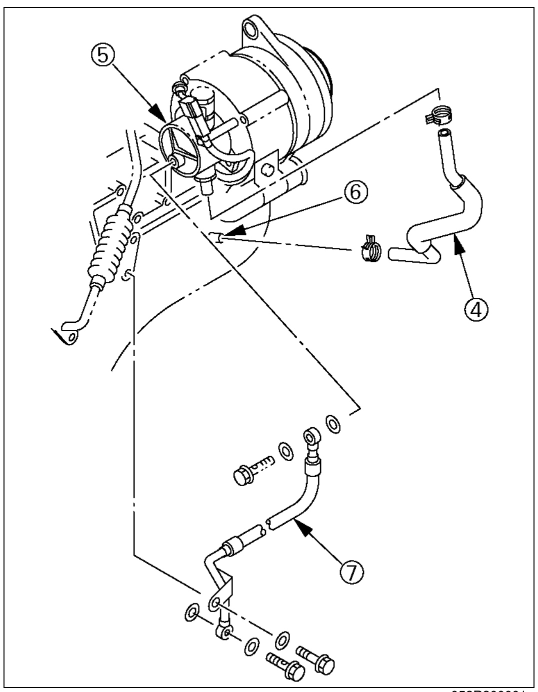
Suction Pipe Bolt Torque	N·m(kg·m/lb ft)
19 (1.9/14)	



066RY00002

5. Generator and Adjusting Plate

1) Install the generator to the bracket (1).
2) Temporarily tighten the generator bolt (2) and adjusting plate bolts (3).
   The bolts will be finally tightened after installation of the cooling fan drive belt.

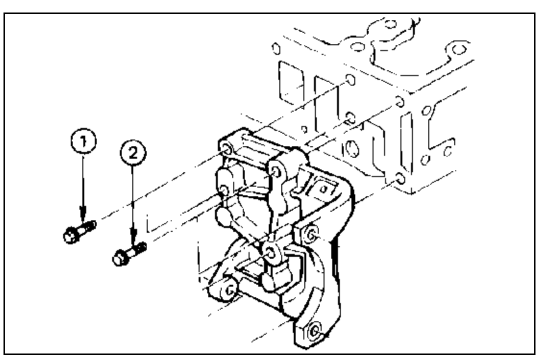


052R300001

3) Connect the vacuum pump rubber hose (4) to the vacuum pump (5), and the oil pan (6).

6. Vacuum Pump Oil Return Hose

Connect the vacuum oil pipe (7) to the vacuum pump, and the cylinder body

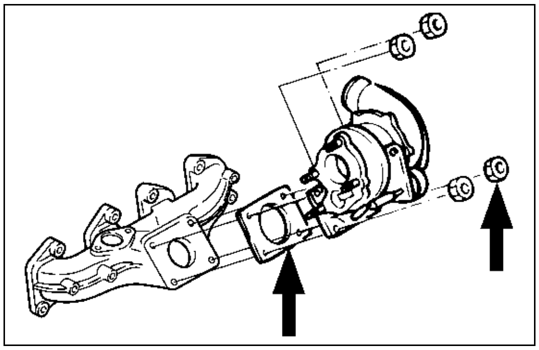


042RY00003

7. Compressor Bracket

1) Install the compressor bracket to the cylinder head.
2) Tighten the bracket bolts to the specified torque.

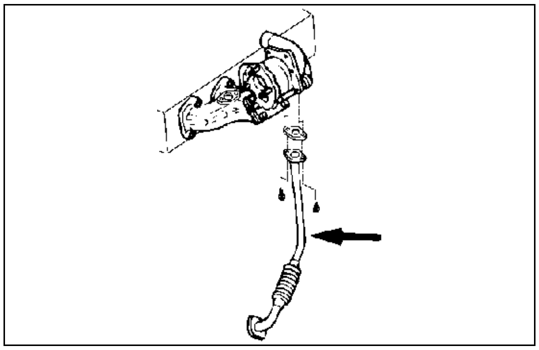
Bracket Bolt Torque	N·m(kg·m/lb ft)
M8×1.25	19 (1.9/14)
M10×1.25	40 (4.1/30)



027R100002

8. Turbocharger

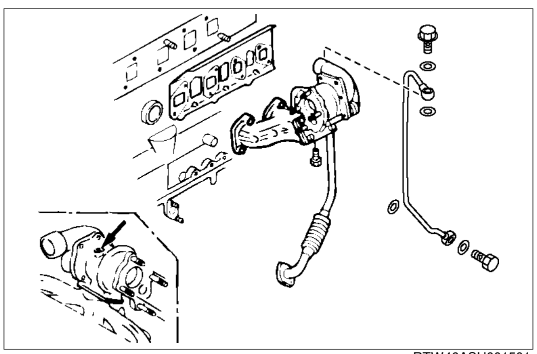
1) Install the turbocharger and the gasket.
2) Temporarily tighten the turbocharger nuts at this time. They will be fully tightened after the installation of the turbocharger oil pipe.
   Always install new nuts and new gasket.



036R100001

3) Install the oil return pipe with gasket to the turbocharger.
4) Tighten the turbocharger oil return pipe to the specified torque.

Bracket Bolt Torque N·m(kg·m/lb ft)
8 (0.8/6)

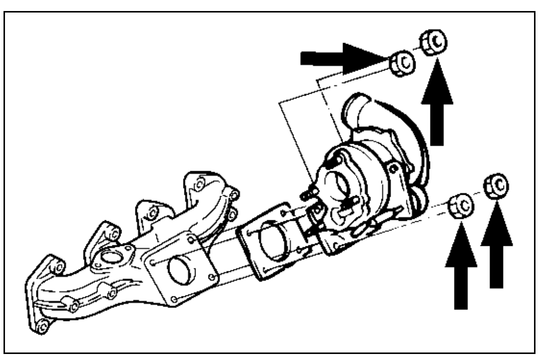


RTW46ASH001501

5) Before installing the oil feed pipe, supply 10 - 20 cc of clean engine oil to the turbocharger center housing through the oil feed opening.
6) Turn the rotating assembly with your hand to thoroughly lubricate the internal parts.
7) Tighten the oil feed pipe to the specified torque.

Turbocharger Oil Feed Pipe Joint

Bolt Torque	N·m(kg·m/lb ft)
M10×1.5	22 (2.25/16)
M14×1.5	54 (5.5/40)



027R100005

8) Tighten the turbocharger nut to the specified torque.

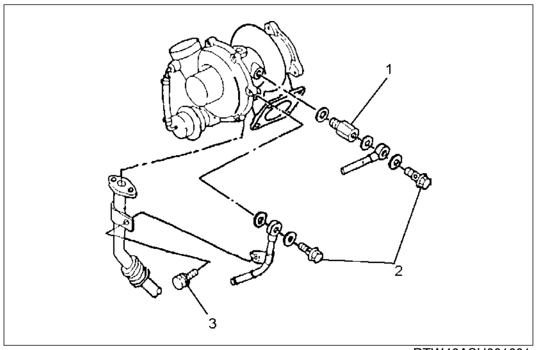
Turbocharger Nut Torque N·m(kg·m/lb ft)
27 (2.7/20)

9) Install the water feed adapter (1) with the gaskets to turbocharger and tighten to the specified torque.

Adapter Torque	N·m(kg·m/lb ft)
39 (4.0/29)	

10) Install the water feed pipe with the gaskets and tighten to the specified torque.

Water Return Pipe Torque	N·m(kg·m/lb ft)
39 (4.0/29)	



RTW46ASH001601

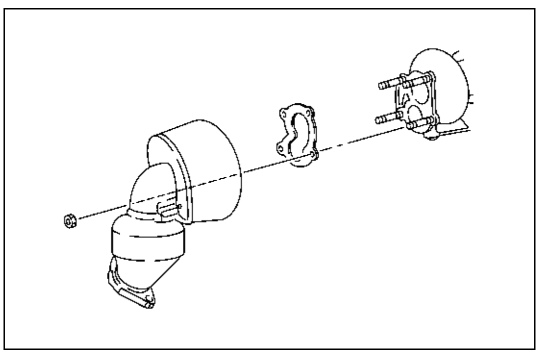
11) Install the water return pipe with the gaskets and tighten to the specified torque.

Water Return Torque	N·m(kg·m/lb ft)
39 (4.0/29)	

12) Clamp the water feed pipe to the oil return pipe of the turbocharger.

Fixing Bolt (3) Torque	N·m(kg·m/lb ft)
8 (0.8/6)	

13) Install the hoses for the water feed and return.



027R100007

9. Catalytic Converter

Install the catalytic converter with gasket and tighten the nut to the specified torque.

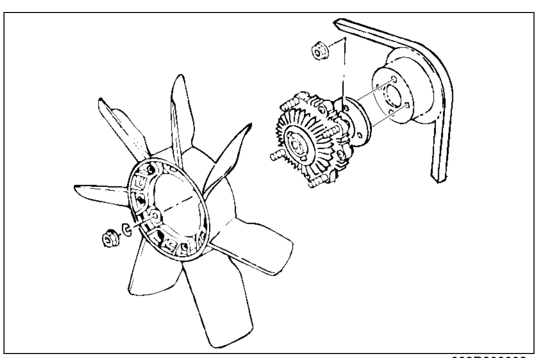
Catalytic converter Nut Torque	N·m(kg·m/lb ft)
27 (2.7/20)	

Do not install the catalytic converter, if drop down it.

10. Heat Protector

Install the heat protector and tighten the bolt to the specified torque.

Heat Protector Bolt Torque	N·m(kg·m/lb ft)
9 (0.9/6.5 lb in)	



033R300002

11. Cooling Fan Pulley

1) Install the cooling fan pulley to the water pump.
2) Tighten the cooling fan pulley nuts to the specified torque.

Pulley Nut Torque	N·m(kg·m/lb ft)
8 (0.8/6)	

12. Oil Cooler Water Pipe

13. Fuel Leak Off Pipe

14. Oil Pressure Warning Switch

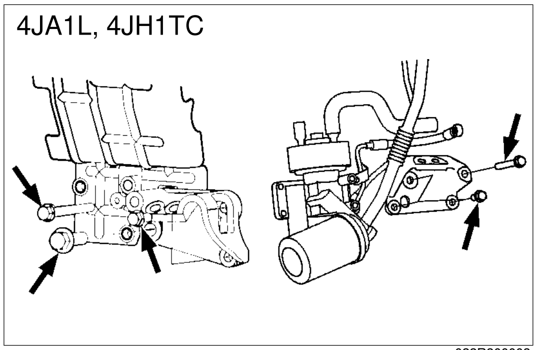
15. Starter Motor

Tighten the starter motor bolts to the specified torque.

Starter Motor Bolt Torque N·m(kg·m/lb ft)
85 (8.7/63)

16. Injection Pump

17. Injection Pump Cover (4JA1TC/4JH1TC only)



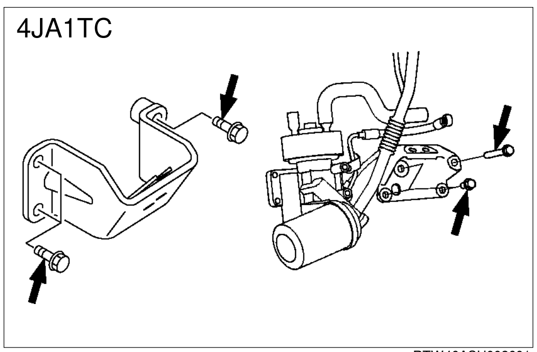
022R300003

18. Engine Foot

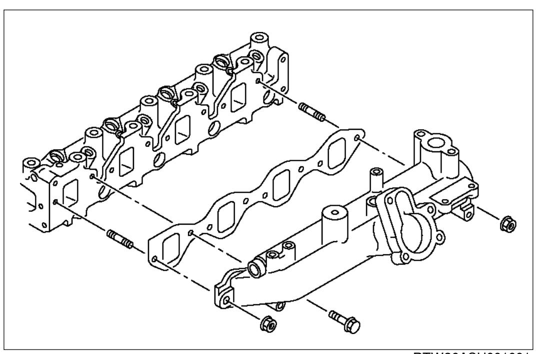
Install the engine foot to the cylinder body and tighten the bracket bolts to the specified torque.

Engine Foot Bolt Torque N·m(kg·m/lb ft)

Right Side	M10×1.25	40 (4.1/30)
Left Side	M10×1.25	40 (4.1/30)
	M14×1.50	127 (13/93)



RTW46ASH002601



RTW36ASH001001

19. Intake Manifold

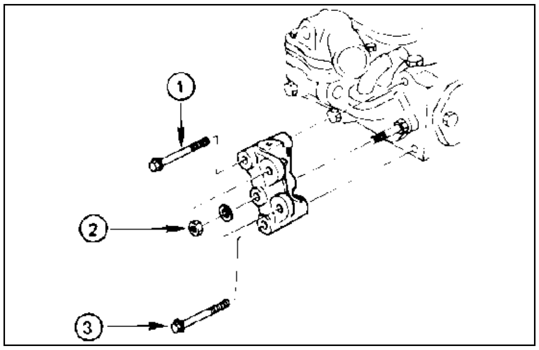
1) Install the manifold gasket to the intake manifold.
2) Connect the intake rubber hose to the intake duct.
3) Tighten the intake manifold bolts and the flange nuts to the specified torque.

Intake Manifold Bolt Torque N·m(kg·m/lb ft)
19 (1.9/14)

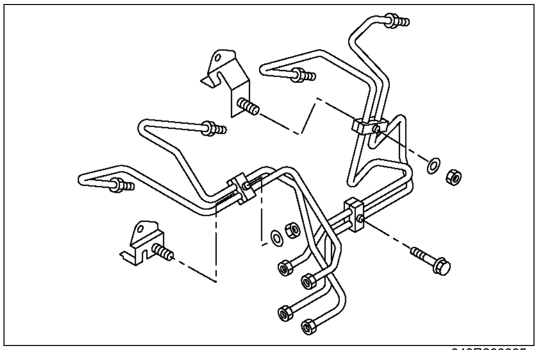
Intake Manifold Flange Nut Torque N·m(kg·m/lb ft)
24 (2.4/18)

4) Connect the PCV hose to the cylinder head cover.

5) Install the fan drive belt and adjust the belt tension referring SERVICING of this section



431RY00013



040R300005

20. Power Steering Oil Pump Bracket

Oil Pump Braket Nut and Bolt Torque N·m(kg·m/lb ft)

①	M10×1.25	37 (3.8/28)
② ③	M8×1.25	18 (1.8/13) (Bolt ID:8)

21. Fuel Injection Pipe with Clip

1) Temporarily tighten the injection pipe sleeve nut.
2) Set the clip in the illustrated position.

Note:
Make absolutely sure that the clip is correctly positioned.
An improperly positioned clip will result in injection pipe breakage and fuel pulsing noise.

3) Tighten the injection pipe sleeve nut to the specified torque.

Torque

Injection Pump Side (4JA1TC/4JH1TC) N·m(kg·m/lb ft)

40 (4.1/30)

Injection Pipe Sleeve Nuts N·m(kg·m/lb ft)

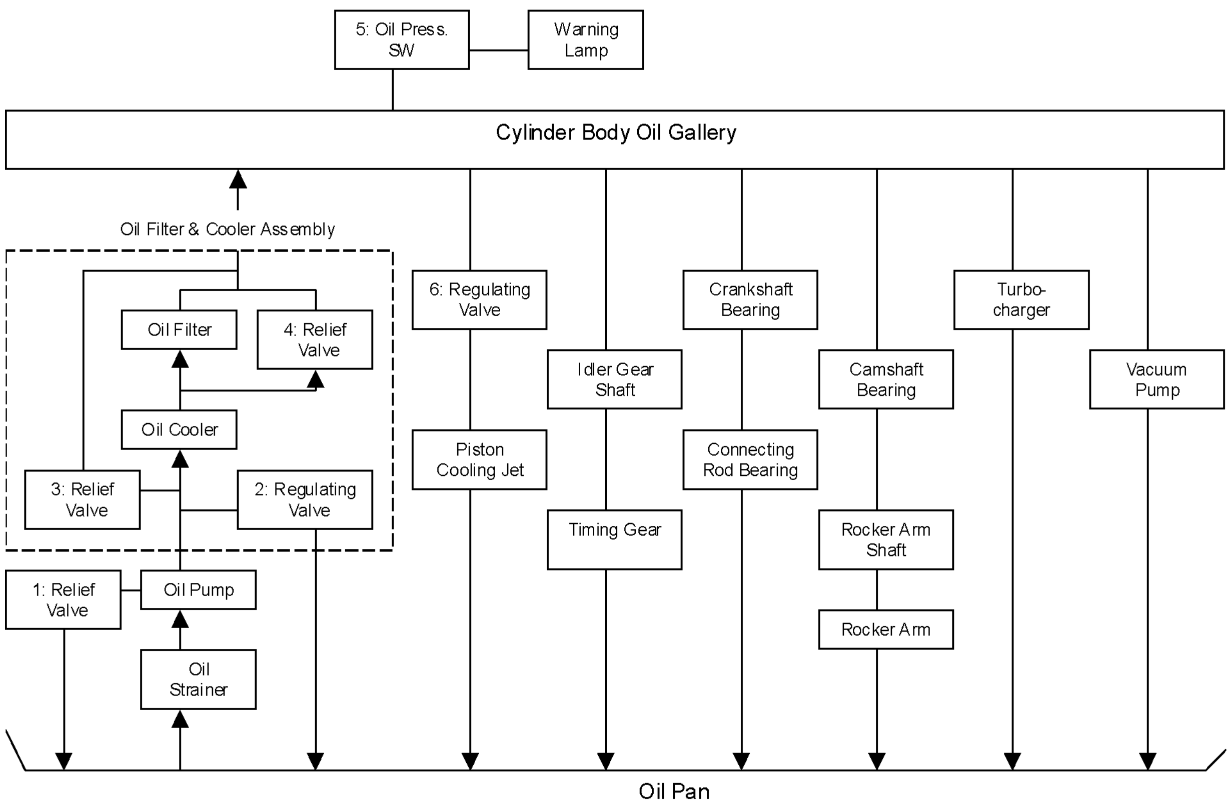
LUBRICATION SYSTEM

LUBRICATING OIL FLOW



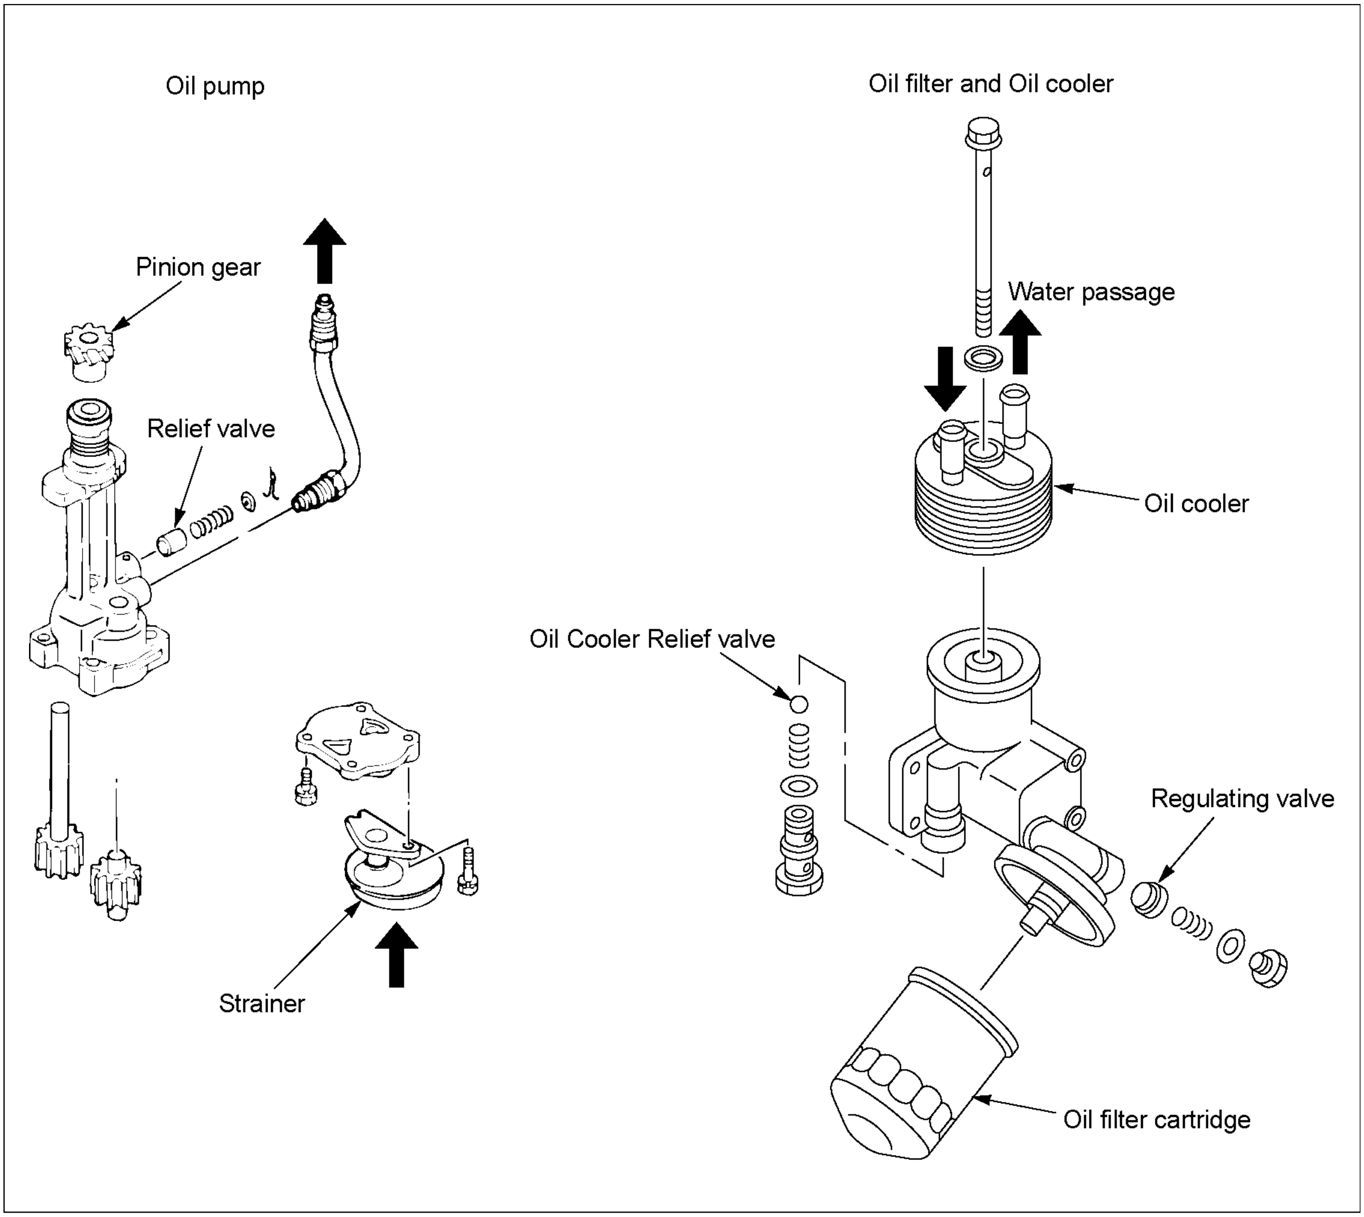
1. Oil Pump Relief Valve Operating Pressure: 6.2 - 7.8 kg/cm^2 (608 – 764 kPa)
2. Regulating Valve Operating Pressure: 5.7 - 6.3 kg/cm^2 (558.6 - 617.4 kPa)
3. Oil Cooler Relief Valve Opening Pressure: 2.8 - 3.4 kg/cm^2 (270 – 330 kPa)
4. Oil Filter Relief Valve Opening Pressure: 0.8 - 1.2 kg/cm^2 (78.4 - 117.6 kPa)
5. Oil Pressure Switch Operating Pressure: 0.3 - 0.5 kg/cm^2 (29.4 - 49.0 kPa)
6. Regulating Valve: 1.8 - 2.2 kg/cm^2 (176 – 216 kPa)

The 4J series engine has a full flow type lubricating system.

Lubricating oil is pumped from the oil pump to the cylinder body oil gallery through the oil cooler and the oil filter. It is then delivered to the vital parts of the engine from the cylinder body oil gallery.

Oiling jets installed on the cylinder body spray engine oil to the piston backside faces to achieve maximum piston cooling effect.

OIL PUMP AND OIL FILTER

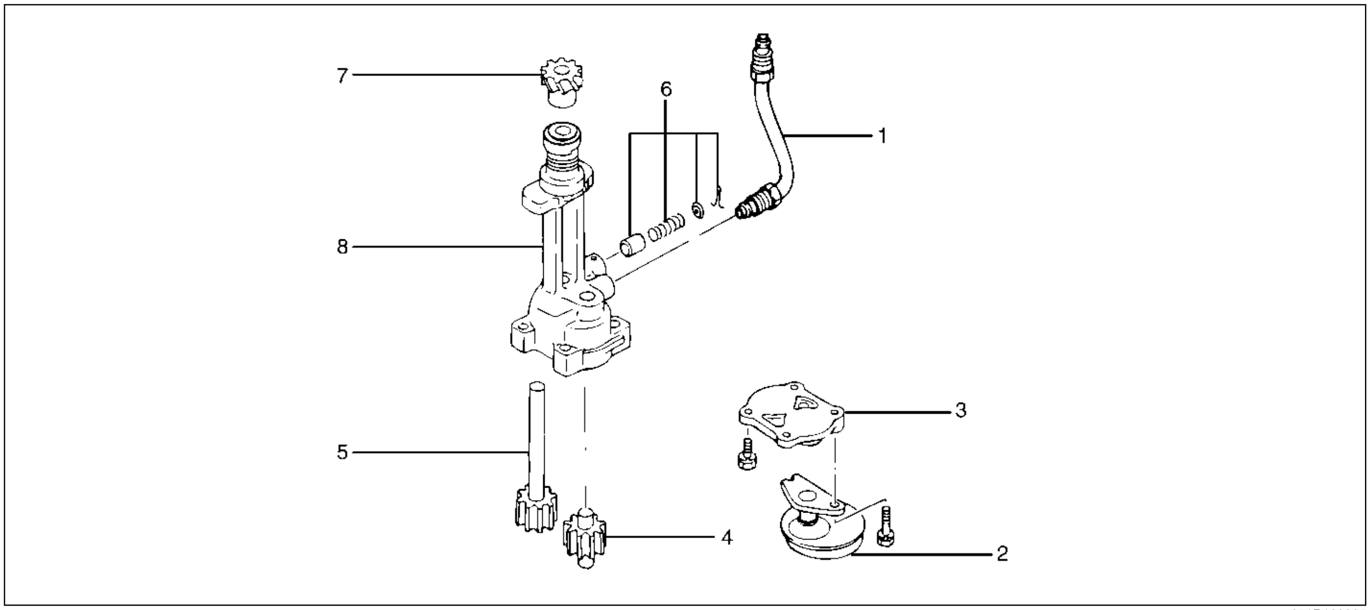


RTW46ALF001501

The 4J series engine is equipped with a gear type oil pump.
The oil filter and the water cooled oil cooler integrated a single unit to increase the cooling effect.

OIL PUMP

DISASSEMBLY



051R100005

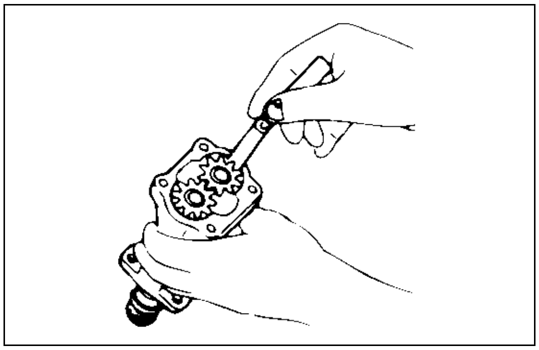
Disassembly Steps

1. Oil pipe
2. Strainer
3. Pump cover
4. Driven gear with bushing
5. Driven gear
6. Relief valve assembly
7. Pinion gear
8. Oil pump body

Disassembly procedure is shown in the illustration above numerical order.

INSPECTION AND REPAIR

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.



051RY00001

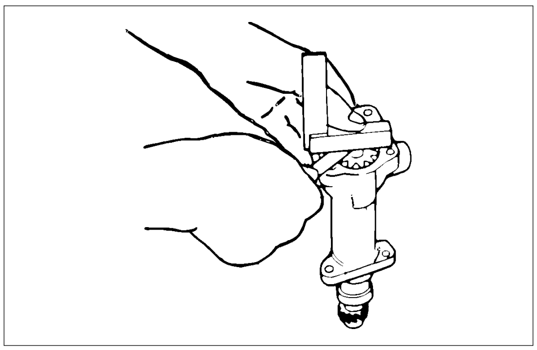
Gear Teeth and Body Inner Wall Clearance

Use a feeler gauge to measure the clearance between the gear teeth and the body inner wall.

If the clearance between the gear teeth and the body inner wall exceeds the specified limit, either the gear or the body must be replaced.

Gear Teeth and Body Inner Wall Clearance mm (in)

Standard	Limit
0.14 (0.0055)	0.20 (0.0079)



RTW46ASH002701

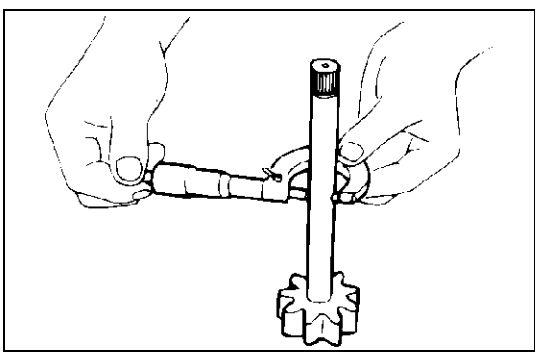
Gear and Body Clearance

Use a feeler gauge to measure the clearance between the body and the gear.

If the clearance between the gear and the body exceeds the specified limit, the body must be replaced.

Gear and Body Clearance mm (in)

Standard	Limit
0.06 (0.024)	0.15 (0.0059)



051RY00003

Drive Shaft and Oil Pump Body Clearance

Use a micrometer to measure the drive shaft outside diameter.

Use an inside dial indicator to measure the pump body inside diameter.

If the clearance between the drive shaft and the oil pump body exceeds the specified limit, the oil pump assembly must be replaced.

Drive Shaft and Oil Pump Body Clearance mm (in)

Standard	Limit
0.04 (0.0016)	0.20 (0.0079)

REASSEMBLY

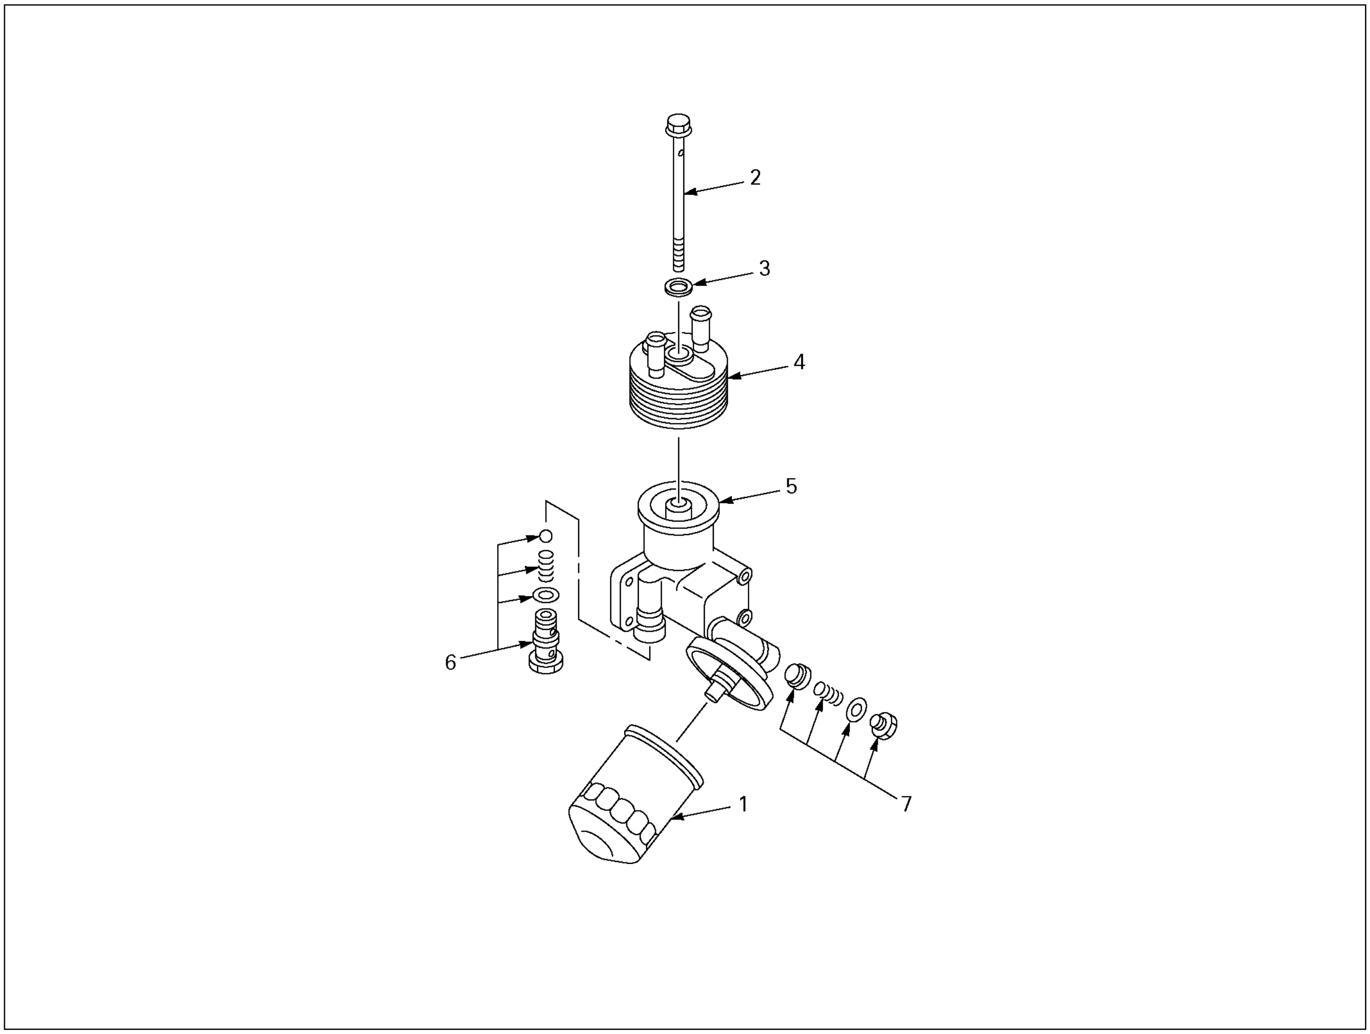
Reassembly Steps

1.	Oil pump body	5.	Pinion gear
2.	Drive gear	6.	Strainer
3.	Driven gear	7.	Relief valve assembly
4.	Pump cover	8.	Oil pipe

Reassembly procedure is shown in the illustration above numerical order.
Pump cover fixing bolts torque: 16 N·m (1.6 kg·m/12 lb ft)

OIL FILTER AND OIL COOLER

DISASSEMBLY



050R300004

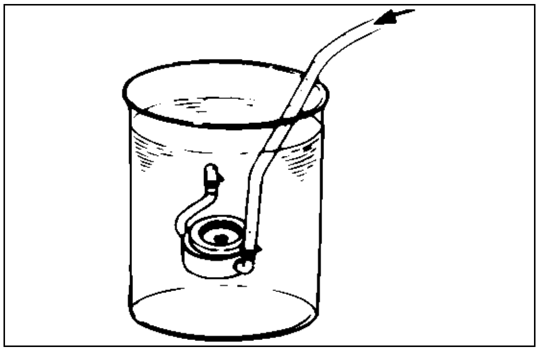
Disassembly Steps

1. Oil filter cartridge
2. Bolt
3. Gasket
4. Oil cooler
5. Body
6. Oil cooler relief valve
7. Regulating valve

Disassembly procedure is shown in the illustration above numerical order.

INSPECTION AND REPAIR

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.



050RY00002

Oil Cooler

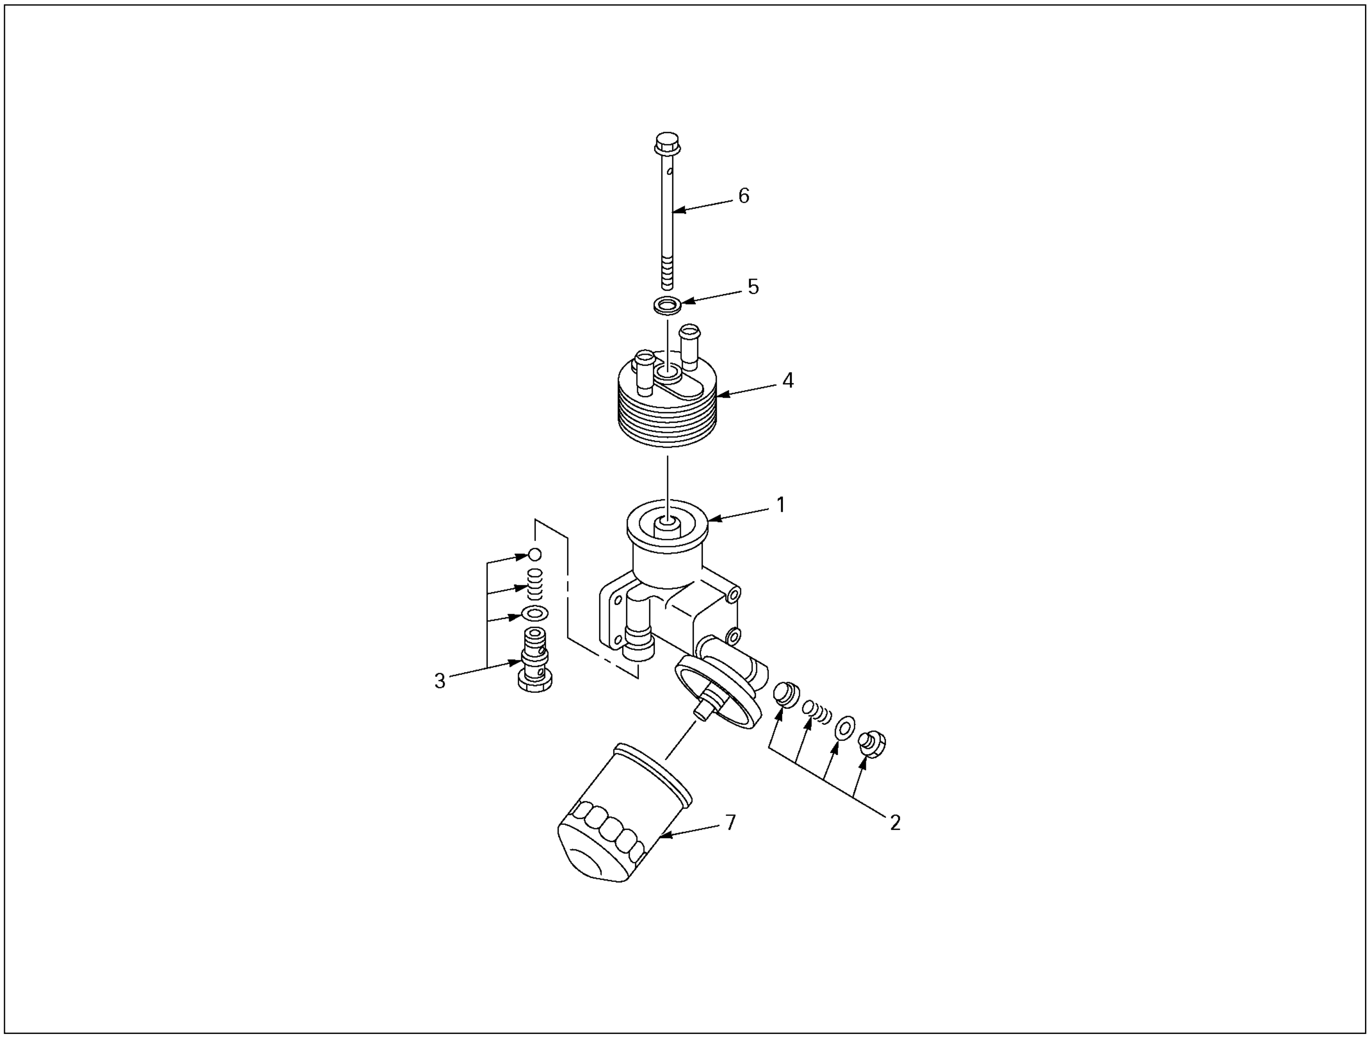
Water Leakage at Water Passage

1. Plug one side of the oil cooler water passage.
2. Submerge the oil cooler in water.
3. Apply compressed air (200kPa (2kg/cm^2 / 28psi)) to the other side of the oil cooler water passage.

If air bubbles rise to the surface, there is water leakage.

Should be replaced oil cooler assembly.

REASSEMBLY

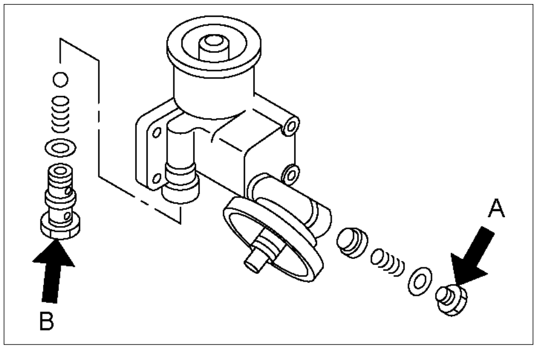


050R300003

Reassembly Steps

1. Body
2. Regulating valve
3. Oil cooler relief valve
4. Oil cooler
5. Gasket
6. Bolt
7. Oil filter cartridge

Reassembly procedure is shown in the illustration above numerical order.



RTW46ASH001701

Important Operations – Removal

2. Instrument Panel Assembly and Cross Beam.

Refer to SECTION 10 “INSTRUMENT PANEL”.

4. Evaporator or Duct

Refer to “EVAPORATOR” or “DUCT” in this section.

Important Operation - Installation

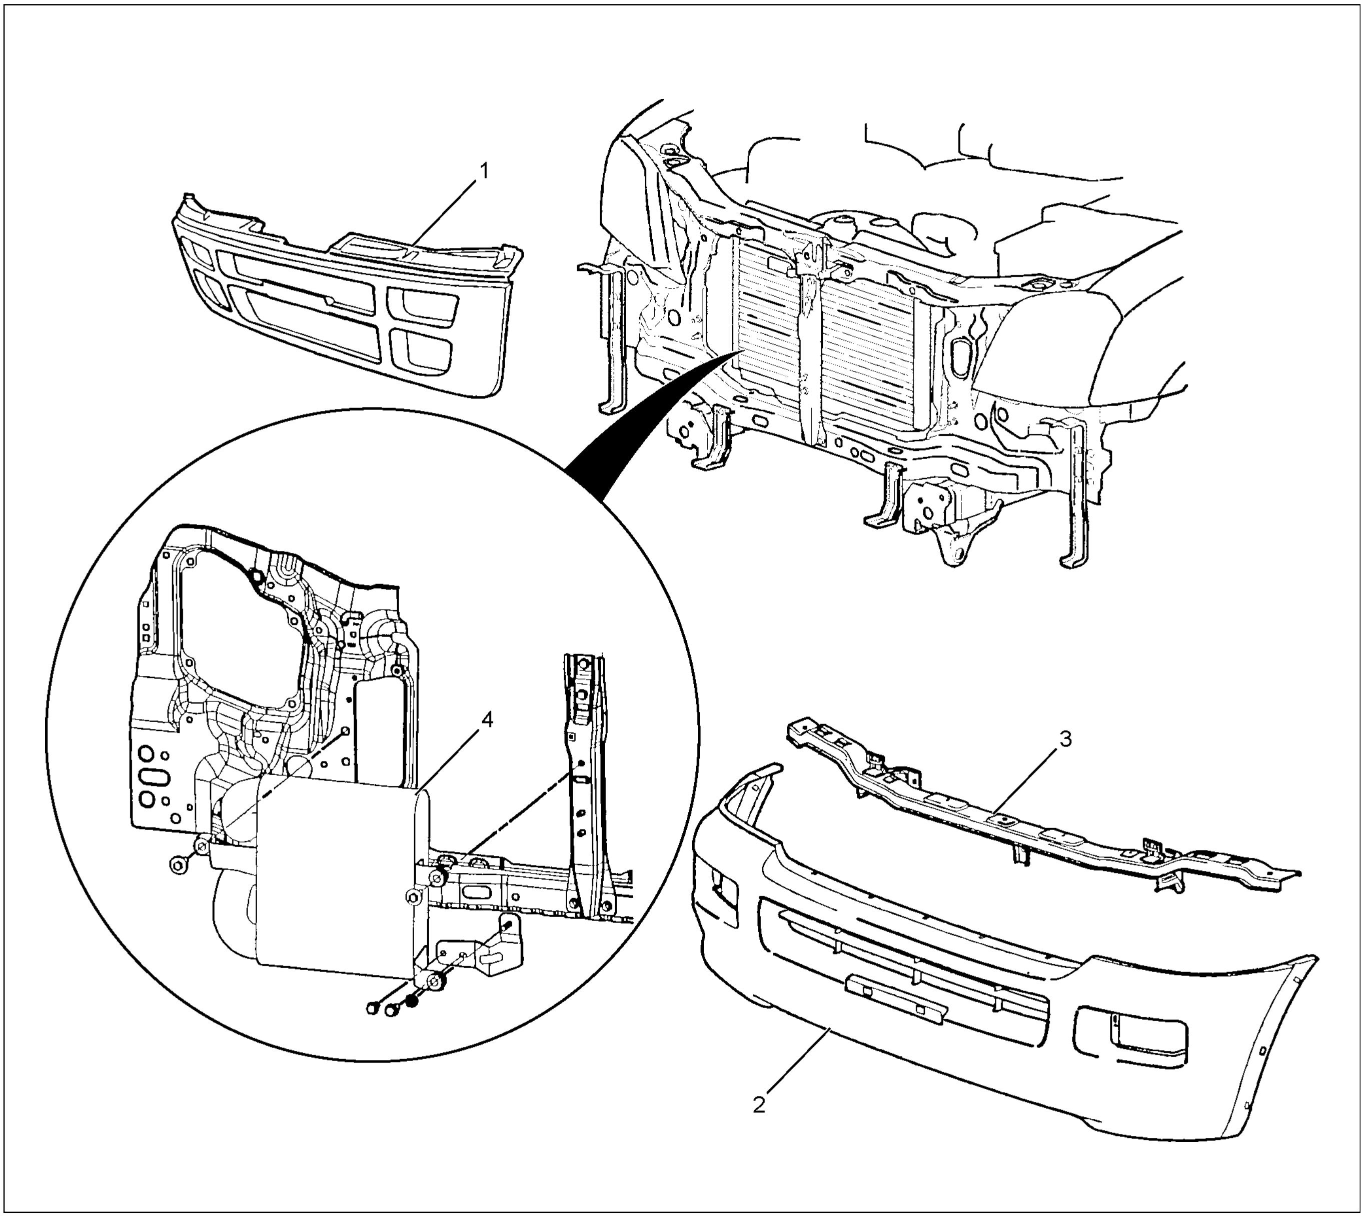
2. Instrument Panel Assembly and Cross Beam

Adjust the heater control cables.

Refer to "CONTROL LEVER ASSEMBLY" in this section.

INTER COOLER

REMOVAL AND INSTALLATION



RTW46ALF001001

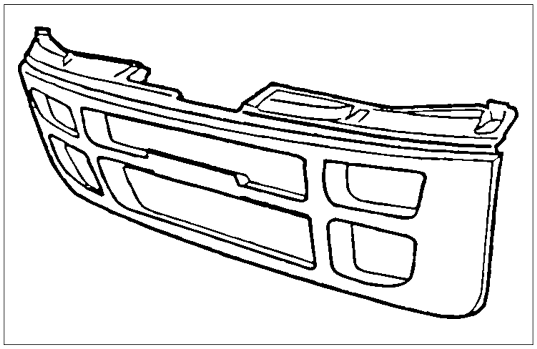
Removal Steps

1. Radiator grille
2. Front bumper fascia
3. Front bumper inpact support assembly
4. Inter cooler

Installation Steps

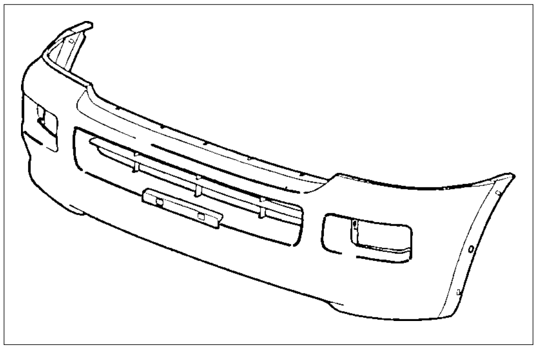
4. Inter cooler
3. Front bumper inpact support assembly
2. Front bumper fascia
1. Radiator grille

Removal



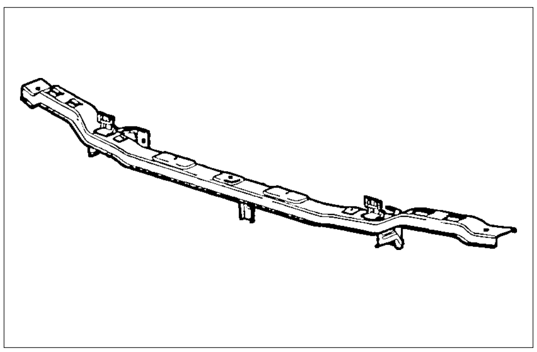
RTW36ASH000601

1. **Radiator Grille**
   - Refer to removal procedure in Sheet Metal section.



RTW36ASH000501

2. **Front Bumper Fascia**
   - Remove the nine clips and four screws.
   - Disconnect the fog light harness connectors.



RTW46ASH002101

3. **Front Bumper Impact Support Assembly**
   - Remove the nut and two bolts.

4. **Inter Cooler**
   - Remove the nut and two bolts.
   - Disconnect the air hose.

Installation

4. **Inter Cooler**
   - Tighten the nut and two bolts.

3. **Front Bumper Impact Support Assembly**
   - Tighten the nut and two bolts.

2. **Front Bumper Fascia**
   - Install the nine clips and four screws.
   - Connect the fog light harness connectors.

1. **Radiator grille**
   - Refer to installation procedure in Sheet Metal section.

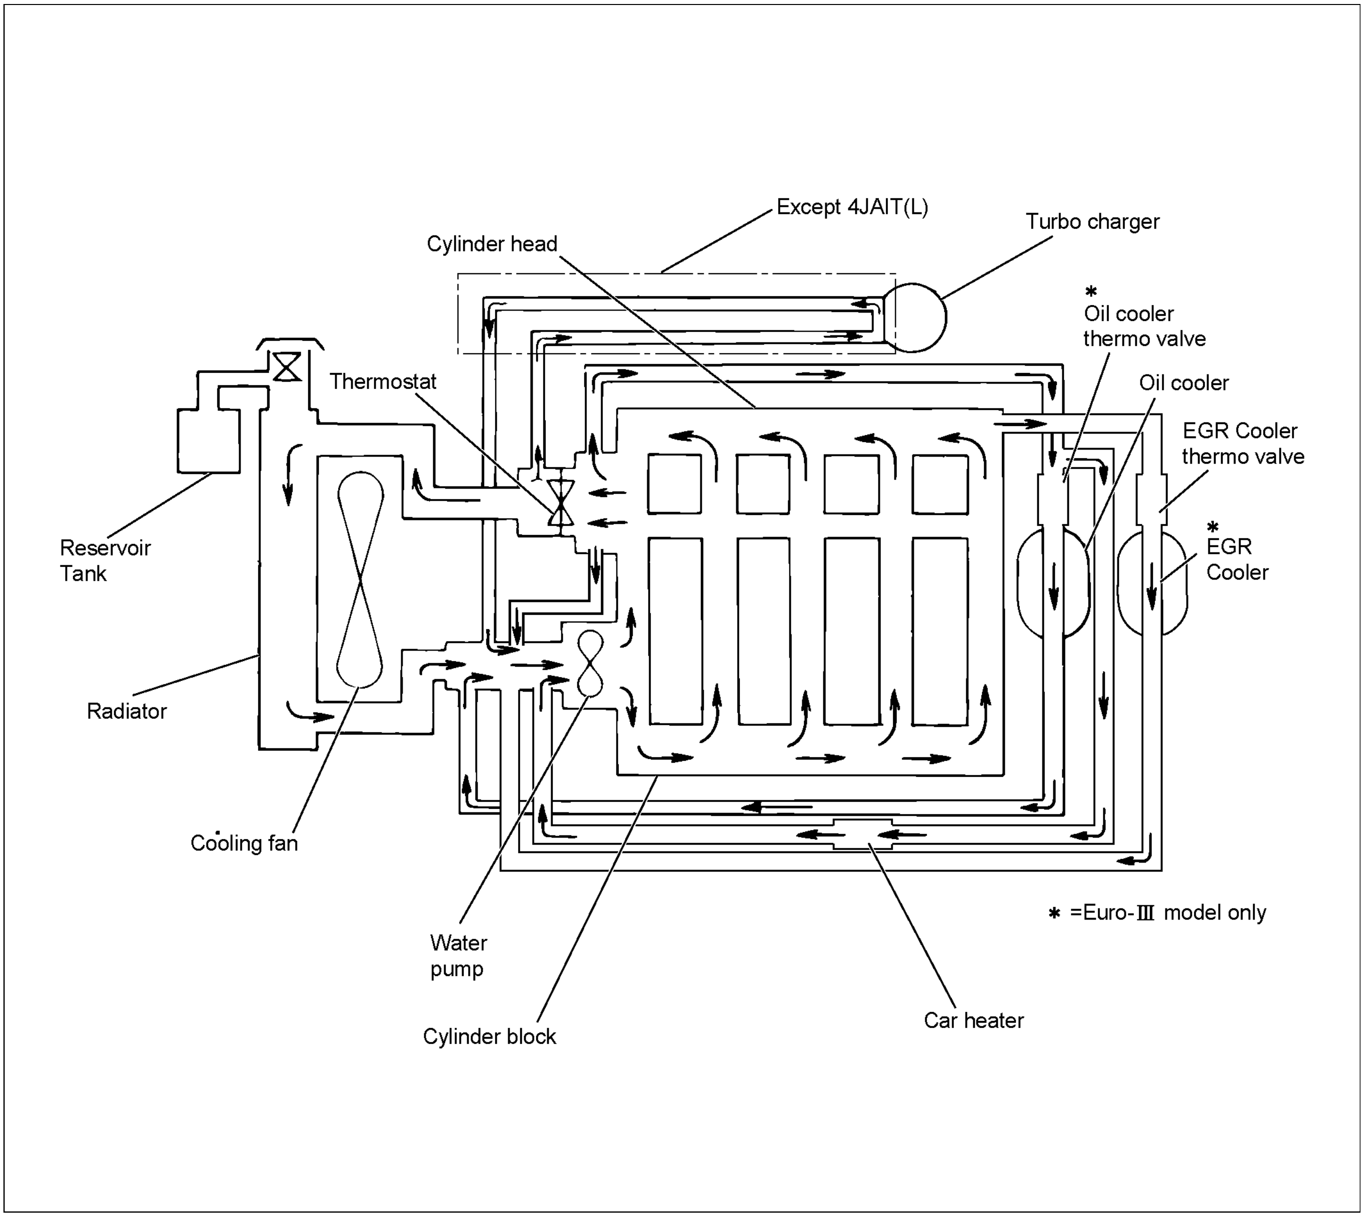
Heat radiation area		11.63 m^2 (1.081ft^2)	
Radiator front area		0.28m^2 (0.026 ft^2)	
Radiator dry weight		52 N (5.3 kg/11.7 lb)	53 N (5.4 kg/11.9 lb)
Radiator cap valve opening pressure		93.3 ~ 122.7 kPa (13.5 ~ 17.8 psi)	
Engine coolant capacity		2.4 lit (5.1 U.S pint)	2.3 lit (4.9 U.S pint)
Engine coolant total capacity		10.1 lit (21.3 U.S pint)	10.0 lit (21.1 U.S pint)

GENERAL DESCRIPTION

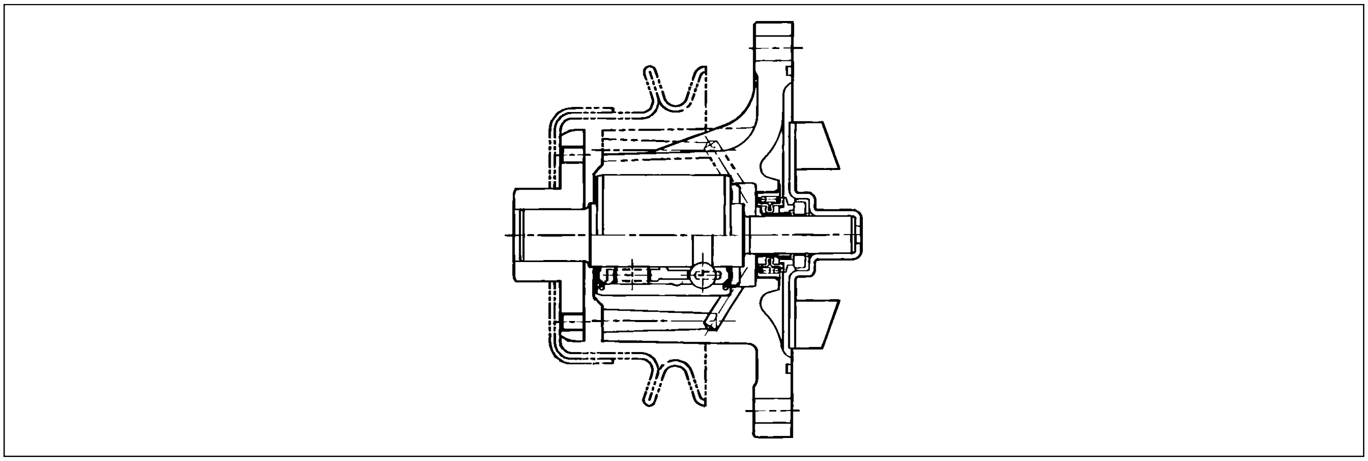
COOLANT FLOW



RTW66ALF000101

The engine cooling system consists of the radiator, the water pump, the cooling fan, and the thermostat.
To quickly increase cold engine coolant temperature for smooth engine operation, the coolant is circulated by the water pump and thermostat through the bypass hose and back to the cylinder body. The coolant does not circulate through the radiator.
When the coolant temperature reaches specified value, the thermostat will begin to open and a gradually increasing amount of coolant will circulate through the radiator.
The thermostat will be fully open when the coolant temperature reaches specified value. All of the coolant is now circulating through the radiator for effective engine cooling.

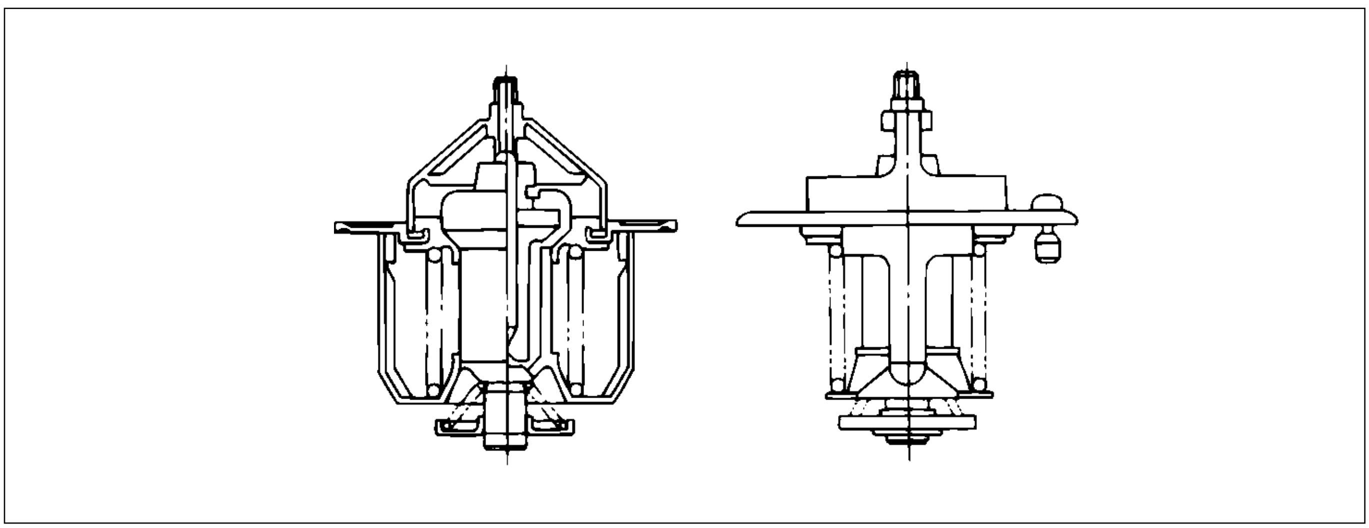
WATER PUMP



RTW46ASF000101

A centrifugal type water pump forcefully circulates the coolant through the cooling system.
The water pump is not disassembled type.

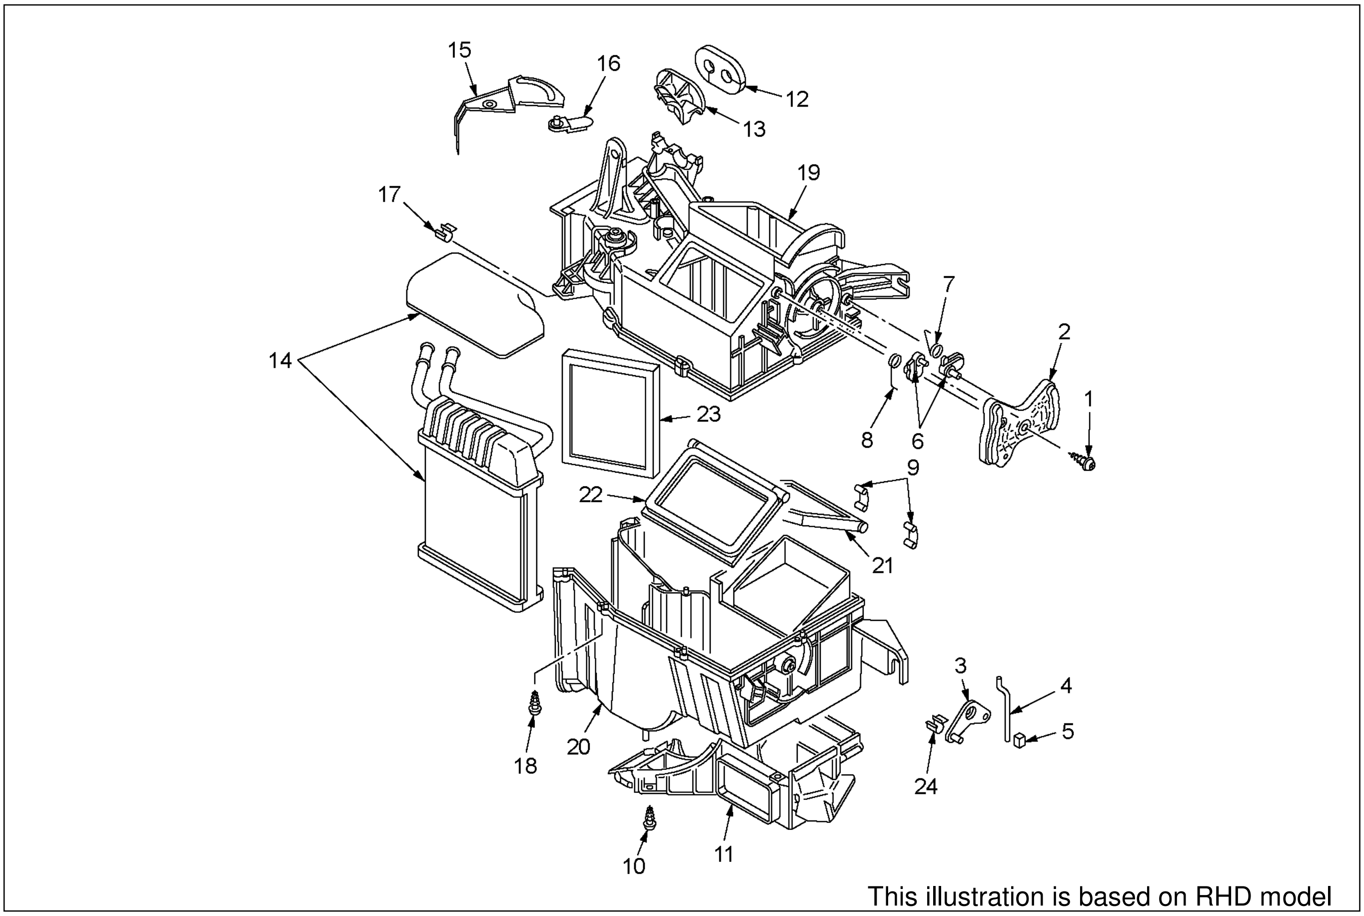
THERMOSTAT



030RY00005

A wax pellet type thermostat is used.
The jiggle valve accelerates engine warm-up.

DISASSEMBLY AND REASSEMBLY



Disassembly Steps

1. Attaching screw
2. Main link-side
3. Sub link-side
4. Mode rod
5. Holder rod
6. Mode lever
7. DEF/FOOT-spring
8. VENT-spring
9. Heater box clip
10. Attaching screws
11. Foot duct
12. FOD H/Pipes seal
13. Heater core clamp
14. Heater core

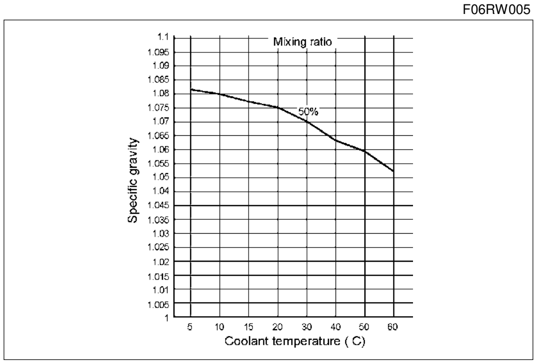
110RS001

Mixing ratio

$$= \frac{\text{Antifreeze solution (Lit/gal.)}}{\text{Antifreeze solution (Lit/gal.)} + \text{Water (Lit/gal.)}}$$

F06RW005



PTW46BSH000201

RADIATOR

The radiator is a tube type with corrugated fins. In order to raise the boiling point of the coolant, the radiator is fitted with a cap in which the valve is operated at 93.3 ~ 122.7 kPa (13.5 ~ 17.8 psi) pressure. (No oil cooler provided for M/T)

Antifreeze Solution

NOTE: Antifreeze solution + Water = Total cooling system capacity.

Total Cooling System Capacity Lit (US / UK gal)

9.4 (2.5/21) 4JA1L/TC

M/T 10.1 (2.7/2.2) 4JH1TC

A/T 10.0 (2.6/2.2) 4JH1TC

See section 0B *MAINTENACE AND LUBRICATION*.

NOTE:

To maintain the corrosion resistance of the aluminum radiator, water and antifreeze must be combined in a 1:1 solution (50% antifreeze and 50% water)

DIAGNOSIS

Engine Cooling Trouble

Symptom	Possible Cause	Action
Engine overheating	Low Engine Coolant level	*Replenish*
	Thermo meter unit faulty	*Replace*
	Faulty thermostat	*Replace*
	Faulty Engine Coolant temperature sensor	*Repair or replace*
	Clogged radiator	*Clean or replace*
	Faulty radiator cap	*Replace*
	Low engine oil level or use of improper engine oil	*Replenish or change oil*
	Clogged exhaust system	*Clean exhaust system or replace faulty parts*
	Faulty Throttle Position sensor	*Replace throttle valve assembly*
	Open or shorted Throttle Position sensor circuit	*Repair or replace*
	Damaged cylinder head gasket	*Replace*
Engine overcooling	Faulty thermostat	*Replace*
Engine slow to warm–up	Faulty thermostat	*Replace*
	Thermo unit faulty	*Replace*

Draining and Refilling Cooling System

Before draining the cooling system, inspect the system and perform any necessary service to ensure that it is clean, does not leak and is in proper working order. The engine coolant (EC) level should be between the “MIN" and “MAX" lines of reserve tank when the engine is cold. If low, check for leakage and add EC up to the “MAX" line.
There should not be any excessive deposit of rust or scales around the radiator cap or radiator filler hole, and the EC should also be free from oil.
Replace the EC if excessively dirty.

P1010064

1. Completely drain the cooling system by opening the drain plug at the bottom of the radiator.
2. Remove the radiator cap.

WARNING: To avoid the danger of being burned, do not remove the cap while the engine and radiator are still hot. Scalding fluid and steam can be blown out under pressure.

3. Disconnect all hoses from the EC reserve tank.
   Scrub and clean the inside of the reserve tank with soap and water. Flush it well with clean water, then drain it. Install the reserve tank and hoses.
4. Refill the cooling system with the EC using a solution that is at least 50 percent antifreeze.

Procedure for filling with coolant (in case of full change)

- Make sure that the engine is cool.
- Open radiator cap pour coolant up to filler neck.
- Pour coolant into reservoir tank up to “MAX" line.
- Tighten radiator cap and start the engine. After idling for 2 to 3 minutes, stop the engine and reopen radiator cap. If the water level is lower, replenish.

WARNING: When the coolant is heated to a high temperature, be sure not to loosen or remove the radiator cap. Otherwise you might get scalded by not vapor or boiling water. To open the radiator cap, put a piece of thick cloth on the cap and loosen the cap slowly to reduce the pressure when the coolant has become cooler.

- After tightening radiator cap, warm up the engine at about 2000 rpm. Set heater adjustment to the highest temperature position, and let the coolant circulate also into heater water system.
- Check to see the thermostat has opened through the needle position of water thermometer, conduct a 5–minute idling again and stop the engine.
- When the engine has been cooled, check filler neck for water level and replenish if required. Should extreme shortage of coolant is found, check the cooling system and reservoir tank hose for leakage.
- Pour coolant into the reservoir tank up to “MAX" line.

WATER PUMP

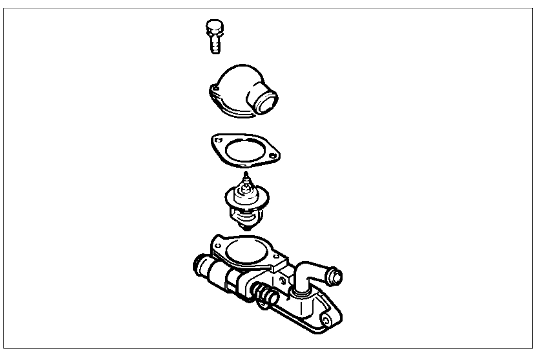
REMOVAL AND INSTALLATION

Read this Section carefully before performing any removal and installation procedure. This Section gives you important points as well as the order of operation. Be sure that you understand everything in this Section before you begin.

Removal

1. Radiator Upper Hose

1) Partially drain the engine coolant.
2) Remove the radiator upper hose.



031R300003

2. Water Outlet Pipe

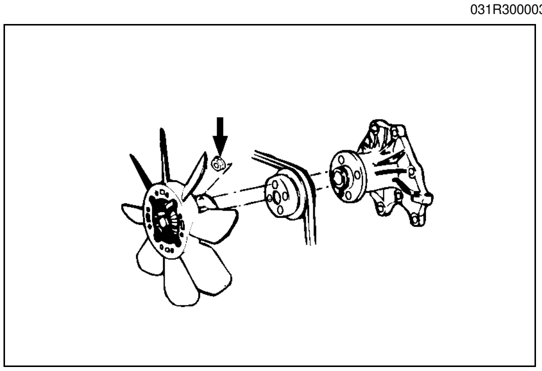
1) Disconnect the turbocharger-cooling pipe from outlet pipe.
2) Loosen the fixing bolt and remove the water outlet bolt.

3. Thermostat

Remove the thermostat from the thermostat housing.

Take care not to damage the thermostat.

4. Upper Fan Shroud



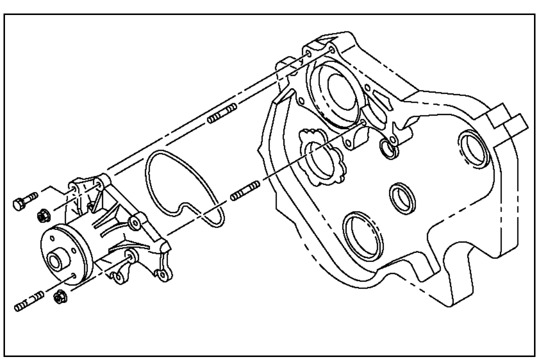
030R300001

5. Fan and Fan Clutch

1) Loosen the fan clutch nuts.
2) Remove the fan together with the fan clutch. Take care not to damage the radiator core.

6. Fan Drive Belt and Pulley

1) Loosen the tension adjust bolt on the generator.
2) Remove the fan drive belt with the fan pulley.



030R300002

7. Water Pump

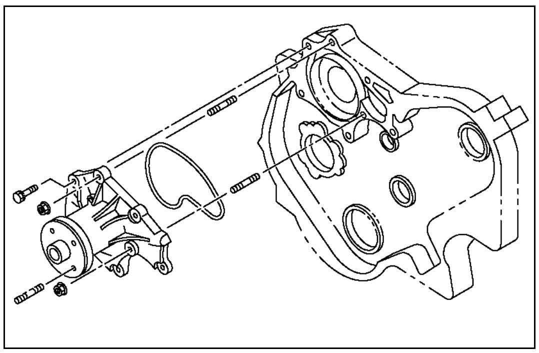
1) Remove the water pump bolts.
2) Remove the water pump.

Inspection and Repair

The water pump is not disassembled type.

Make necessary parts replacement if extreme wear or damage is found during inspection. Should any of the following problems occur, the entire water pump assembly must be replaced.

- Cracks in the water pump body
- Coolant leakage from the seal unit
- Excessive radial play or abnormal noise in the fan center when rotate by hand
- Excessive thrust play in the fan center (Standard play: less than 0.2mm)
- Cracks or corrosion in the impeller



030R300002

Installation

1. Water Pump

1) Install the water pump with new gasket.

2) Tighten bolts and nuts to specified torque.

Water Pump Bolt/Nut Torque	N·m(kg·m/lb ft)
20 (2.0/14)	

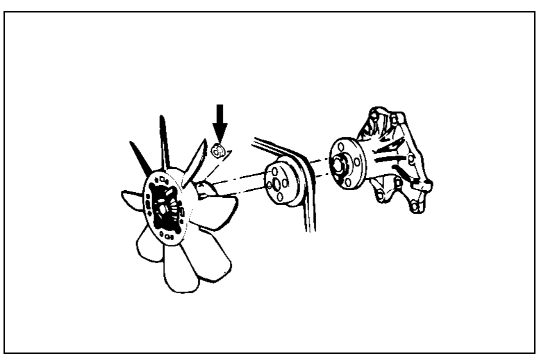
2. Fan Drive Belt and Pulley

1) Install the fan drive belt and fan pulley.

2) Apply tension to the fan drive belt by moving the generator.

3) Apply a force of 98N(10kg/22 lb) to the drive belt mid-portion to check the drive belt deflection.

Fan Drive Belt Deflection	mm (in)
New belt: 4-7(0.16-0.28) Reuse belt: 6-9(0.24-0.35)	



030R300001

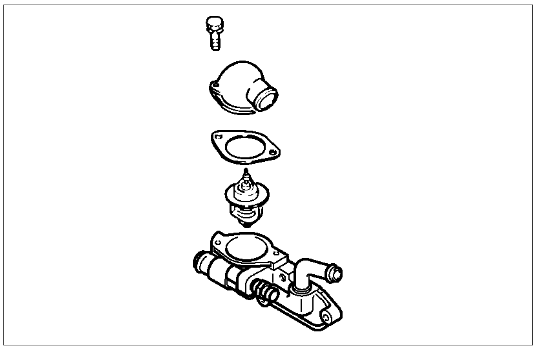
3. Fan and Fan Clutch

1) Install the fan and fan clutch to pulley.

2) Tighten the nuts to specified torque.

Fan Clutch Nut Torque	N·m(kg·m/lb in)
8(0.8/69)	

4. Upper Fan Shroud



031R300003

5. Thermostat

Install the thermostat to the thermostat housing.

6. Water Outlet Pipe

1) Install the water outlet pipe with new gasket to the thermostat housing.
2) Tighten the outlet pipe bolt to specified torque.

Outlet Pipe Bolt Torque	N·m(kg·m/lb ft)
19(1.9/14)	

3) Connect the turbocharger-cooling pipe to outlet pipe.

7. Radiator Upper Hose

1) Connect the radiator upper hose to the water outlet pipe.
2) The knob of clamp shall be dircted to holizonal side.
3) Replenish the engine coolant.

THERMOSTAT

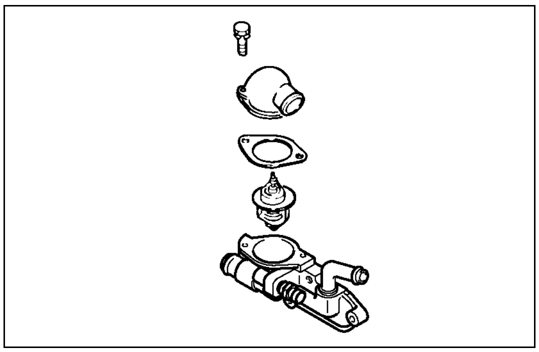
REMOVAL AND INSTALLATION

Read this Section carefully before performing any removal and installation procedure. This Section gives you important points as well as the order of operation. Be sure that you understand everything in this Section before you begin.

Removal

1. Radiator Upper Hose

1) Partially drain the engine coolant.
2) Remove the radiator upper hose.



031R300003

2. Water Outlet Pipe

3) Disconnect the turbocharger-cooling pipe from outlet pipe.
4) Loosen the fixing bolt and remove the water outlet bolt.

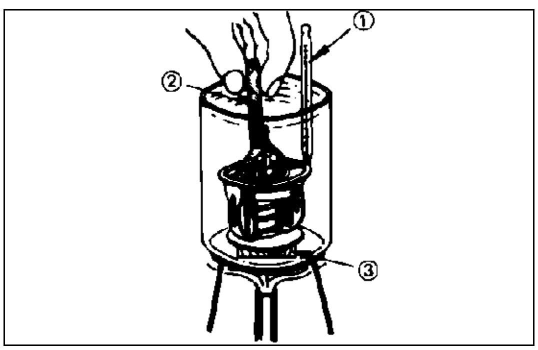
3. Thermostat

Remove the thermostat from the thermostat housing.

Take care not to damage the thermostat.

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.



031RY00005

Operating Test of Thermostat

1. Completely submerge the thermostat in water.
2. Heat the water.
   Stir the water constantly to avoid direct heat being applied to the thermostat.
3. Check the thermostat initial opening temperature.

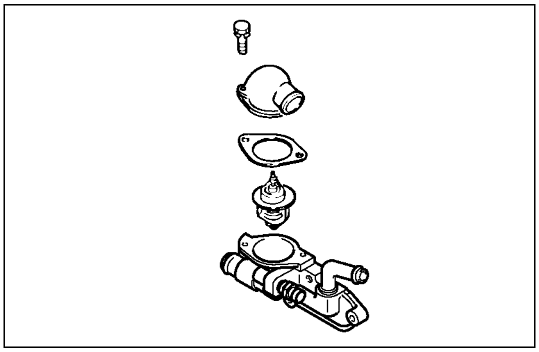
Thermostat Initial Opening Temperature	°C (°F)
82 (180)	

4. Check the thermostat full opening temperature.

Thermostat Full Opening Temperature	°C (°F)
95 (203)	

Valve Lift At Fully Open Position	mm (in)
9.5 (0.37)	

① Thermometer
② Agitating rod
③ Wooden piece



031R300003

Installation

1. Thermostat

Install the thermostat to the thermostat housing.

2. Water Outlet Pipe

3) Install the water outlet pipe with new gasket to the thermostat housing.
4) Tighten the outlet pipe bolt to specified torque.

Outlet Pipe Bolt Torque	N·m(kg·m/lb ft)
19(1.9/14)	

5) Connect the turbocharger-cooling pipe to outlet pipe.

3. Radiator Upper Hose

1) Connect the radiator upper hose to the water outlet pipe.
2) The knob of clamp shall be directed to holizonal side.
3) Replenish the engine coolant.

RADIATOR

REMOVAL AND INSTALLATION

Radiator and Associated Parts

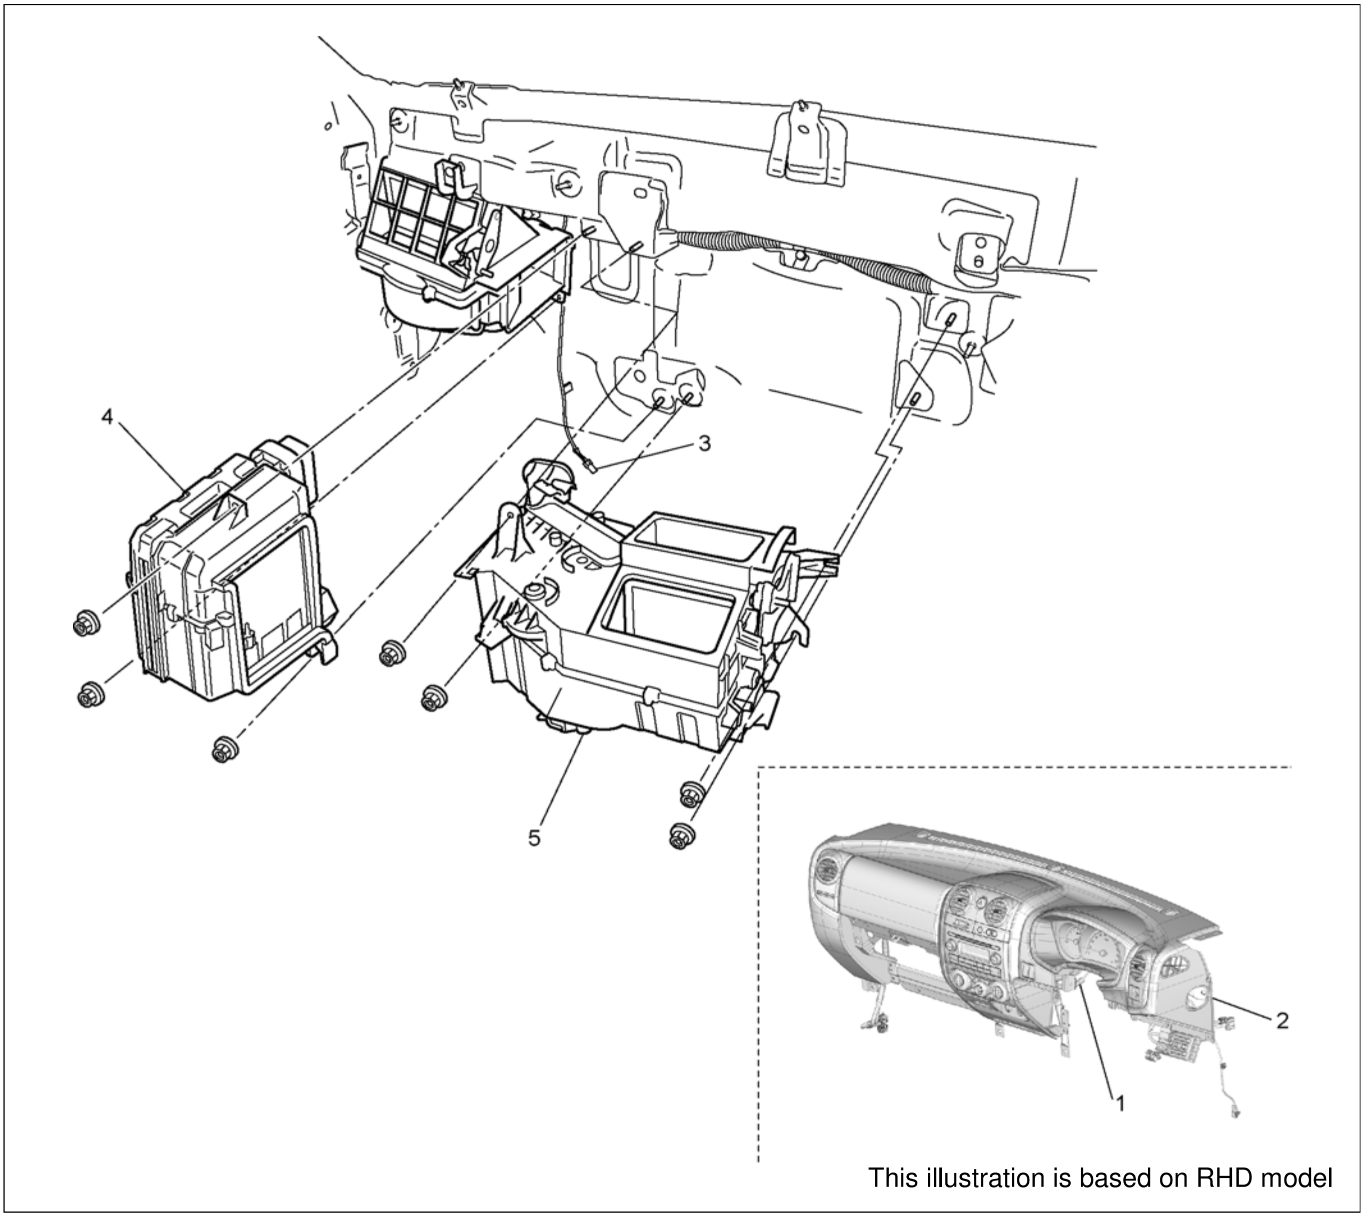
VENT UNIT (WITHOUT HEATER)

REMOVAL AND INSTALLATION



RTW710LF002801

Removal Steps

1. Control cable
▲2. Instrument panel assembly and cross beam
3. Electronic thermostat connector
▲4. Evaporator or duct
5. Vent unit

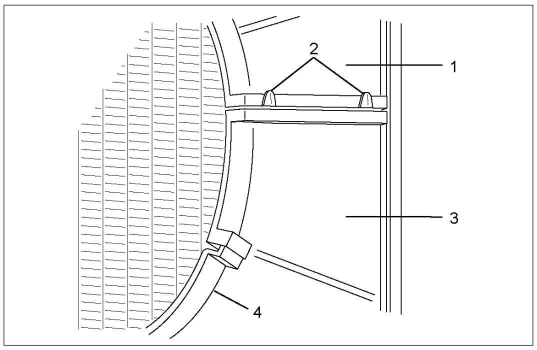
Installation steps

5. Vent unit
4. Evaporator or duct
3. Electronic thermostat connector
▲2. Instrument panel assembly and cross beam
1. Control cable

Removal

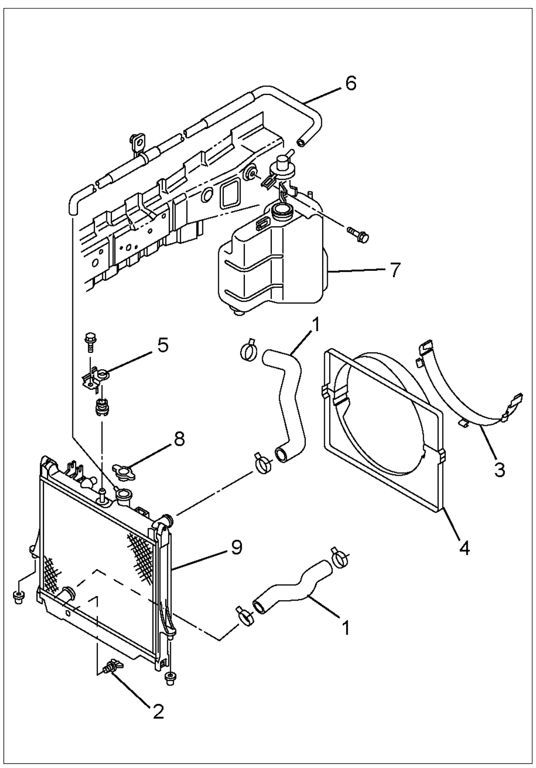
P1010064

1. Disconnect battery ground cable.
2. Loosen a drain plug to drain EC.
3. Disconnect oil cooler hose on automatic transmission (A/T).
4. Disconnect radiator inlet hose and outlet hose from the engine.



PTW46BSH000101

5. Remove fan guide(1), clips(2) on both sides and the bottom lock, then remove lower fan guide(3) with fan shroud(4).
6. Disconnect the reserve tank hose(6) from radiator.



RTW36BMH000101

7. Remove bracket(5).

8. Lift up and remove the radiator assembly with hose, taking care not to damage the radiator core with a fan blade.

Inspection and Repair

Make the necessary adjustments, repairs, and part replacements if excessive wear or damage is discovered during inspection.

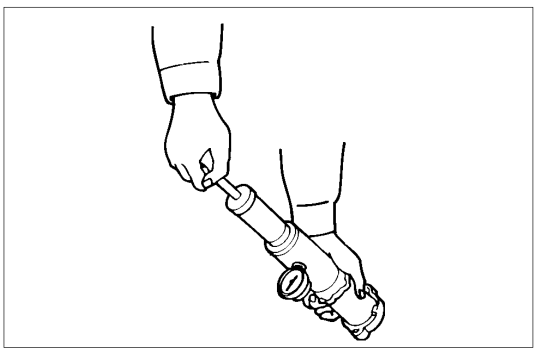
Radiator Cap

Measure the valve opening pressure of the pressurizing valve with a radiator filler cap tester.
Replace the cap if the valve opening pressure is outside the standard range.

Valve opening pressure kPa (psi) 93.3 ~ 122.7 (13.5 ~17.8)

Cap tester: 5–8840–0277–0
Adapter: 5–8840–2603–0
Check the condition of the vacuum valve in the center of the valve seat side of the cap. If considerable rust or dirt is found, or if the valve seat cannot be moved by hand, clean or replace the cap.

Valve opening vacuum kPa (psi) 1.96 ~ 4.91 (0.28 ~ 0.71)



110RS006

Radiator Core

1. A bent fin may result in reduced ventilation and overheating may occur. All bent fins must be straightened. Pay close attention to the base of the fin when it is being straightened.
2. Remove all dust, bugs and other foreign material.

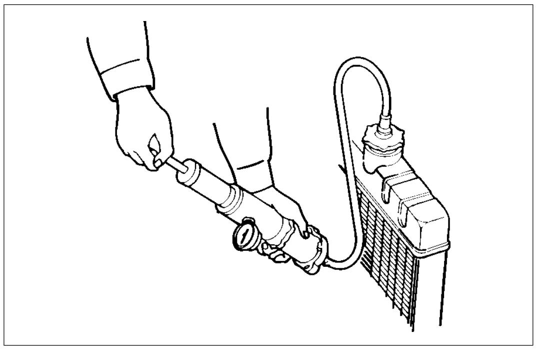
Flushing the Radiator

Thoroughly wash the inside of the radiator and the engine coolant passages with cold water and mild detergent. Remove all signs of scale and rust.

Cooling System Leakage Check

Use a radiator cap tester to force air into the radiator through the filler neck at the specified pressure of 196 kPa (28.5 psi) with a cap tester:

- Leakage from the radiator
- Leakage from the coolant pump
- Leakage from the water hoses

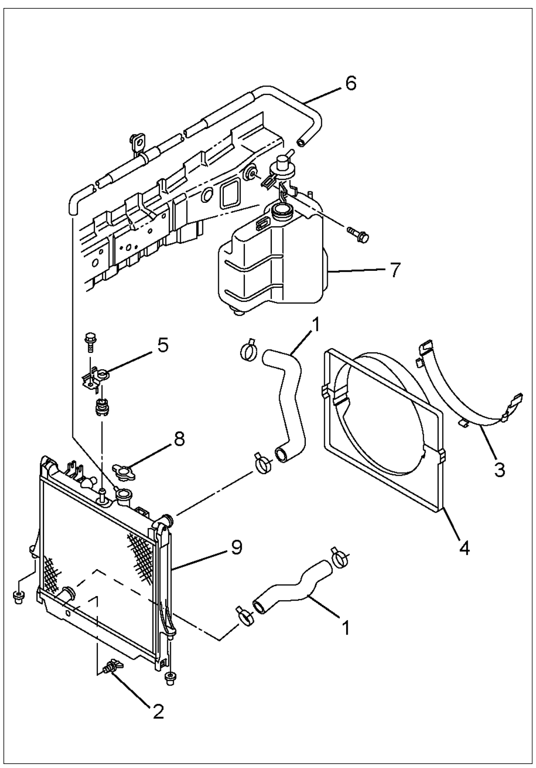


110RS005

- Check the rubber hoses for swelling.

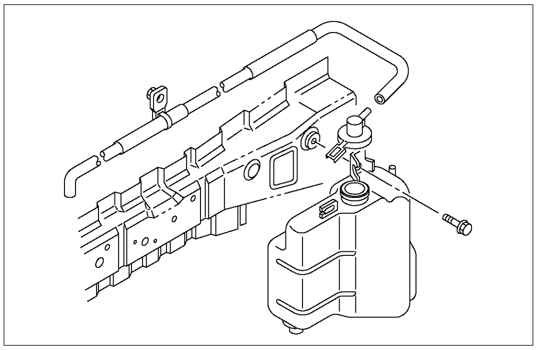
Installation

1. Install radiator assembly (9) with hose, taking care not to damage the radiator core with a fan blade.
2. Support the radiator upper tank with the bracket (5) and secure the radiator.
3. Connect reserve tank hose (6).
4. Install lower fan guide (3).
5. Connect radiator inlet hose and outlet hose (1) to the engine.



RTW36BMH000101

6. Connect oil cooler hose to automatic transmission.
7. Connect battery ground cable.



RTW36BSH000101

8. Pour engine coolant up to filler neck of radiator, and up to MAX mark of reserve tank.

   Important operation (in case of 100% engine coolant change) procedure for filling with engine coolant.

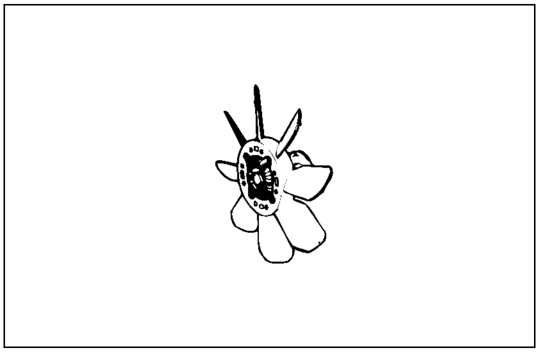
Engine coolant change

Refer to 6B-8 (Draining and Refilling Cooling System).

FAN CLUTCH WITH COOLING FAN

INSPECTION AND REPAIR

Make necessary correction or parts replacement if wear, damage or any other abnormal condition are found through inspection.



033R300001

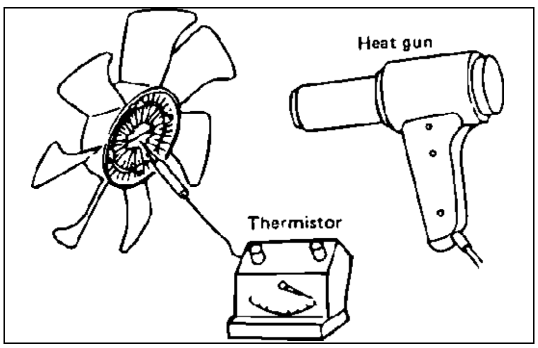
Visually inspect for damage, leak (sillicon grease) or other abnormal conditions.

1. Inspection (on-vehicle)

1) Turn the fan clutch by hand when in a low temperature condition before starting the engine, and confirm that it can be turned readily.

2) Start the engine to warm it up until the temperature at the fan clutch portion gets to around 80°C. Then stop the engine and confirm that the fan clutch can be turned with considerable effort (clutch torque) when turned by hand.

If the fan clutch rotates more readily, however, this indicates that the silicone grease is leaking internally. Replace the fan clutch with a new one.



033RY00011

2. Inspection (in unit)

Warm up the bimetal of the fan clutch by using the heat gun until the temperature gets to about 80°C when measured with the thermistor. Then confirm that the fan clutch can be turned with considerable effort (clutch torque).

If the fan clutch retates more readily at this time, this indicates that the silicone grease is leaking internally.

Replace the fan clutch with a new one.

SPECIAL TOOLS

Illustration	Tool Number	Tool Name

FUEL SYSTEM

TABLE OF CONTENTS

MAIN DATA AND SPECIFICATIONS

Item	Description		
	4JA1T (L)	4JA1TC	4JH1TC
Injection pump type	Bosch distributor VE type	Bosch distributor VP44 type	
Governor type	Mechanical variable (Half speed oil pressure)	Electrical controled	
Timer type	Oil pressure	Electrical controled	
Fuel feed pump type	Vane with input shaft		
Injection nozzle type	Hole type		
Number of injection nozzle orifices	5		
Injection nozzle orifices			
Inside diameter mm (in)	0.19 (0.0075)	0.17 (0.0067)	0.21 (0.0083)
Injection nozzle designed operating pressure MPa (kg/cm^2) 1st	19.1 (195)	19.0 (194)	19.5 (199)
2nd	25.0 (255)	33.5 (328)	33.8 (331)
Main fuel filter type	Disposable cartridge paper element		

Precautions

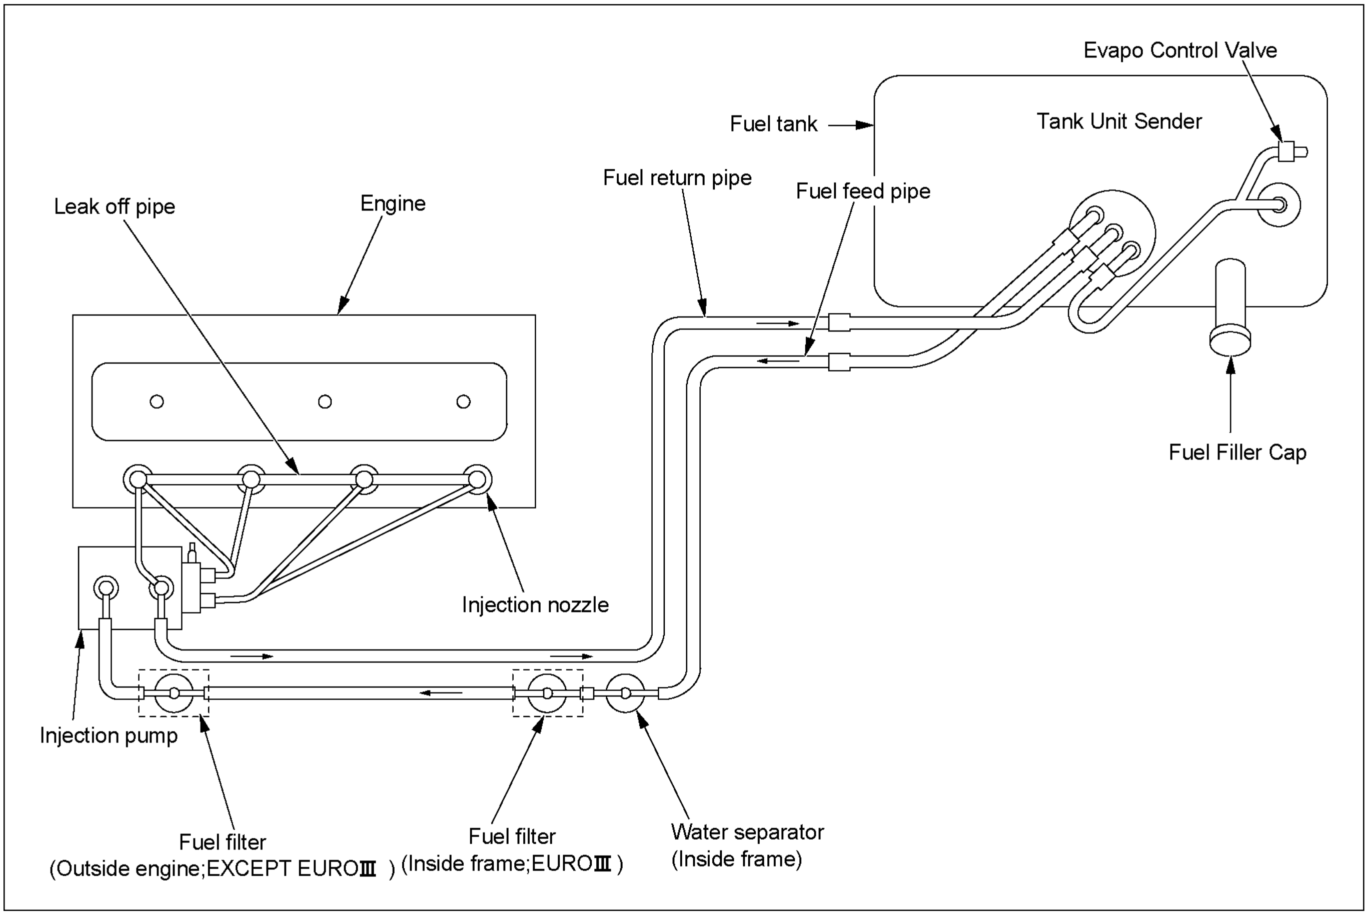
When working on the fuel system, there are several things to keep in mind:

- **Any time the fuel system is being worked on, disconnect the negative battery cable except for those tests where battery voltage is required.**
- **Always keep a dry chemical (Class B) fire extinguisher near the work area.**
- **Replace all pipes with the same pipe and fittings that were removed.**
- **Clean and inspect “O” rings. Replace if required.**
- **Always relieve the line pressure before servicing any fuel system components.**
- **Do not attempt repairs on the fuel system until you have read the instructions and checked the pictures relating to that repair.**
- **Adhere to all Notices and Cautions.**

NOTE:
Injection nozzle adjustment is possible only on the 4JA1L engine.

GENERAL DESCRIPTION

FUEL FLOW



RTW66CMF000101

The fuel system consists of the fuel tank, the fuel filter, the water separator, the injection pump, and the injection nozzle.
The fuel from the fuel tank passes through the water separator and the fuel filter where water particles and other foreign material are removed from the fuel.
Fuel, fed by the injection pump plunger, is delivered to the injection nozzle in the measured volume at the optimum timing for efficient engine operation.

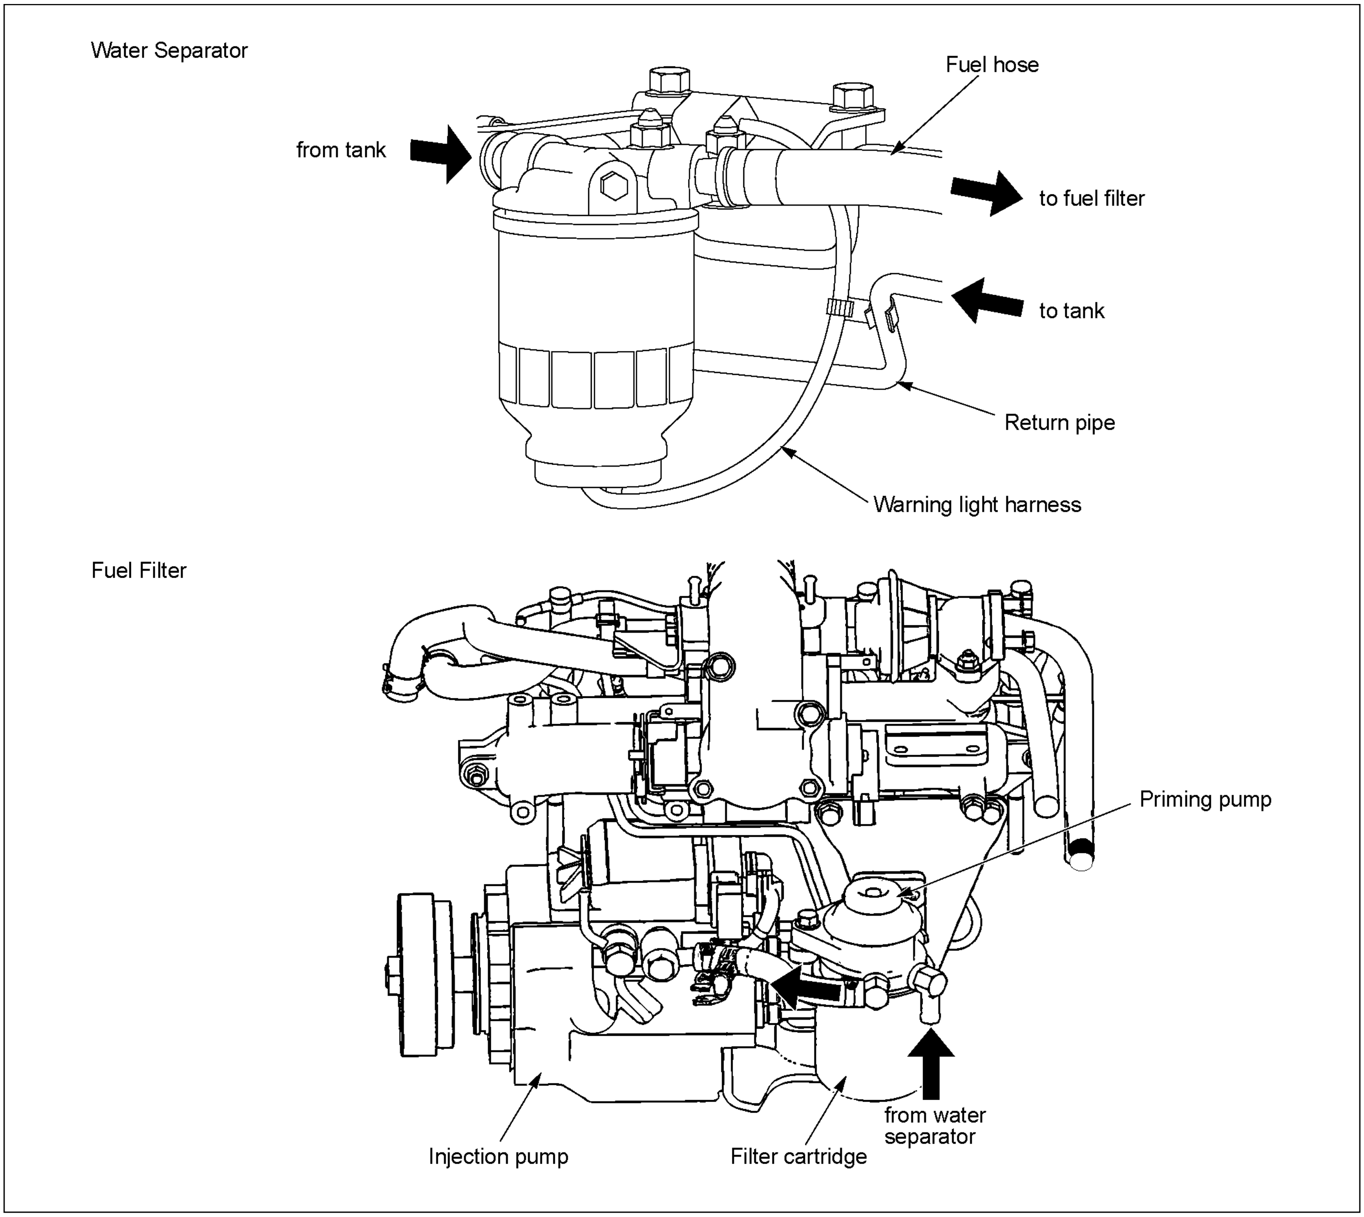
NOTE:

1. **If it find abnormal condition on the fuel injector, refer to section 6E ENGINE DRIVEABILITY AND EMISSIONS.**
2. **Do not contain "Additive for water drain" with fuel.**

FUEL FILTER AND WATER SEPARATOR

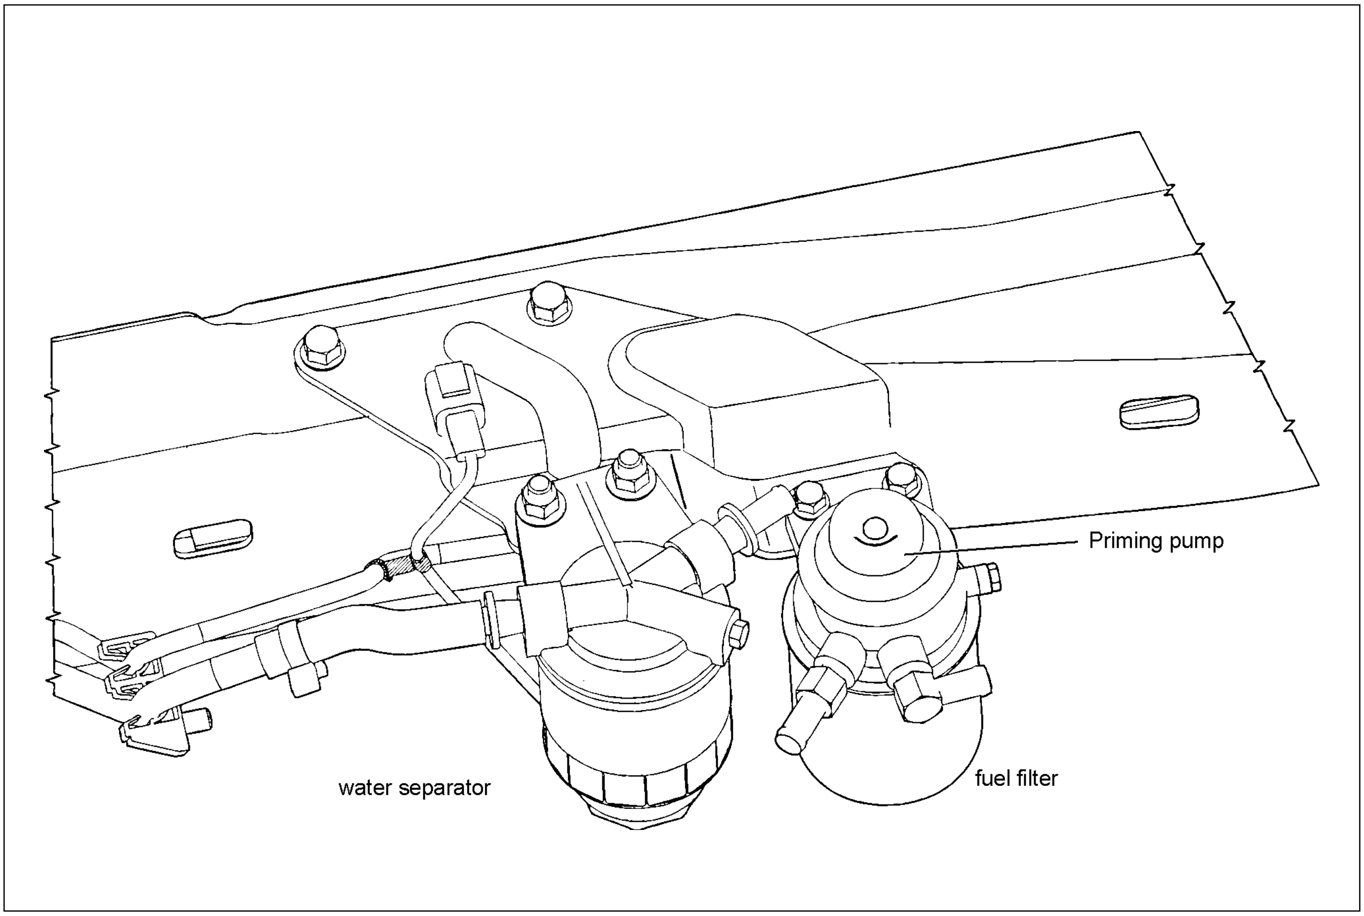
As the inside of the injection pump is lubricated by the fuel which it is pumping, the fuel must be perfectly clean. The fuel filter and the water separator remove water particles and other foreign material from the fuel before it reaches the injection pump.
The water separator has an internal float. When the float reaches the specified level, a warning light comes on to remind you to drain the water from the water separator.
A diaphragm type priming pump is installed at the top of the fuel filter. It is used during the air bleeding procedures.

(Except EURO III model)



RTW36CLF000701

For EURO III model



RTW46AMF000201

Important Operations - Removal

2. Instrument Panel Assembly and Cross Beam.

Refer to SECTION 10 “INSTRUMENT PANEL”.

4. Evaporator or Duct

Refer to “EVAPORATOR” or “DUCT” in this section.

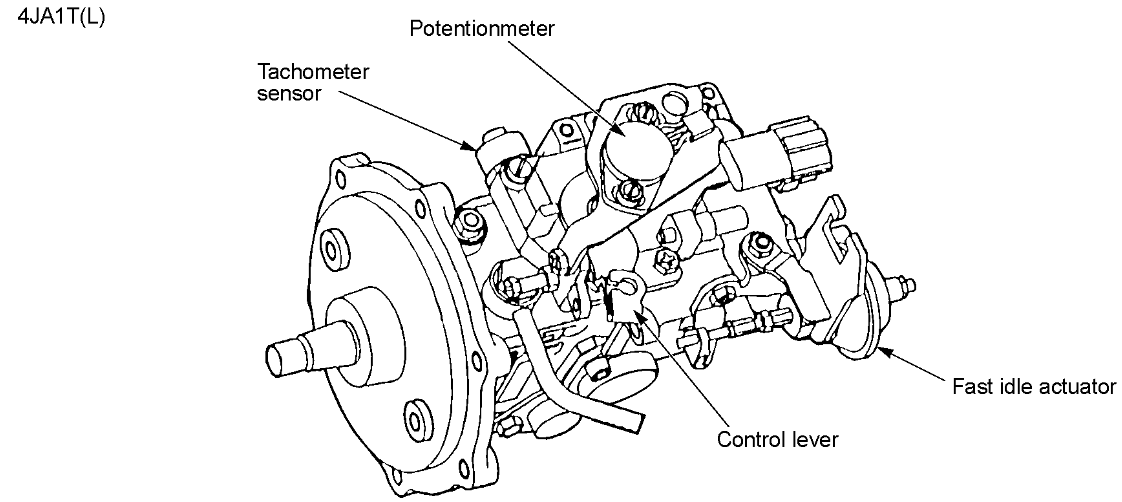
Important Operation - Installation

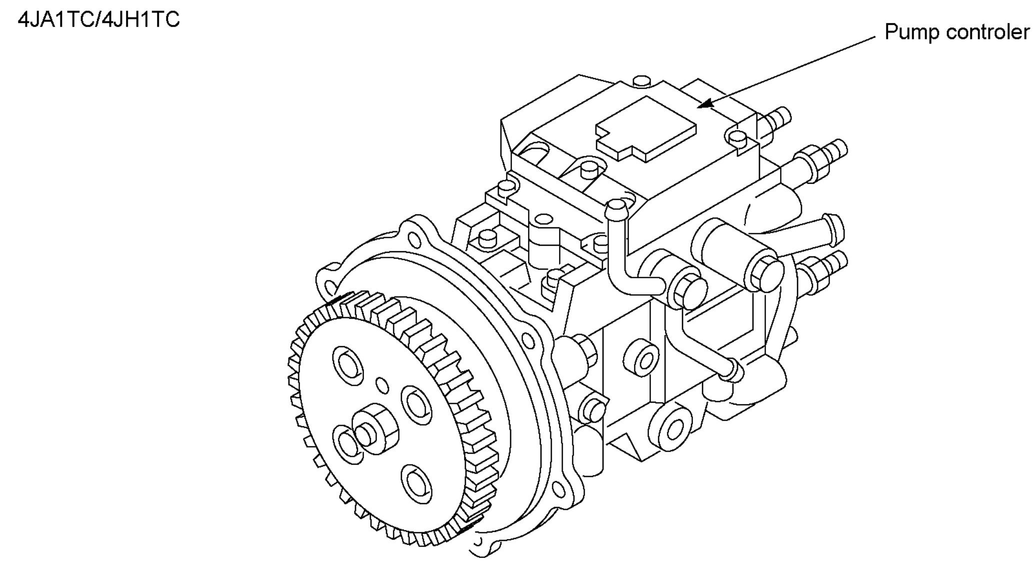
2. Instrument Panel Assembly and Cross Beam

Adjust the heater control cables.

Refer to “CONTROL LEVER ASSEMBLY” in this section.

INJECTION PUMP





RTW46CLF000201

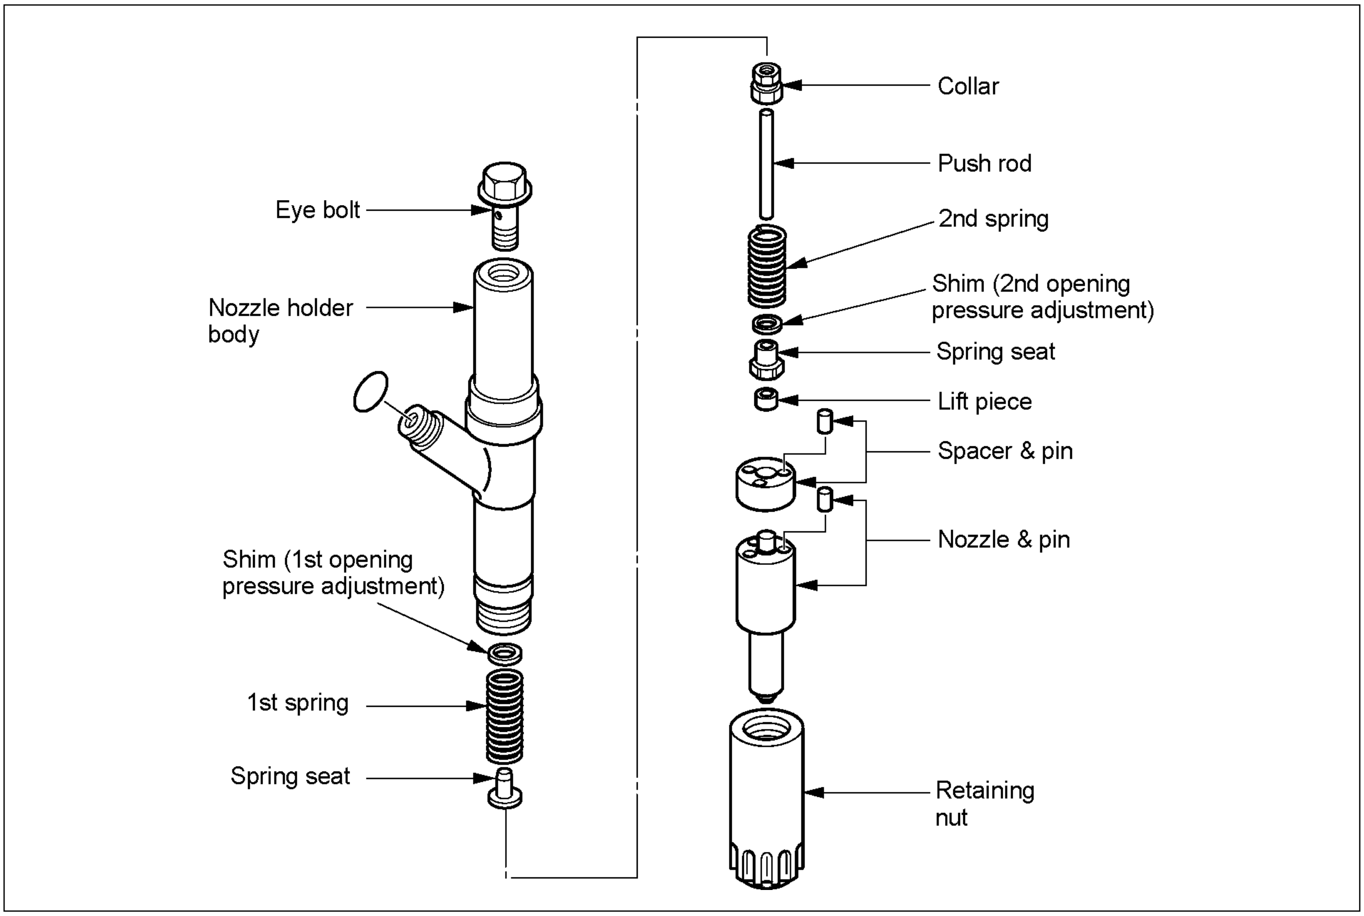
4JA1T(L):

A Bosch Distributor Type Injection Pump is used. A single reciprocating/revolving plunger delivers the fuel uniformly to the injection nozzles, regardless of the number of cylinders.
The governor, the injection timer, and the feed pump are all contained in the injection pump housing. The injection pump is compact, light weight, and provides reliable high-speed operation.
The vacuum-type fast idle actuator increases the engine idling speed to provide the additional power required to operate the air conditioner.
Fast idler diaphragm movement is caused by changes in the negative pressure created by the engine's vacuum pump.
The diaphragm motion is transferred to the injection pump control lever to increase or decrease the idling speed.

4JA1TC/4JH1TC:

The Bosch VP44 injection pump is electronically controlled. The pump controller combine to injection pump.
Signals from the pump controller are sent to the engine control module (ECM). In response to these signals, the ECM selects the optimum fuel injection timing and volume for the existing driving conditions.

INJECTION NOZZLE (4JA1L)



RTW76CMF000301

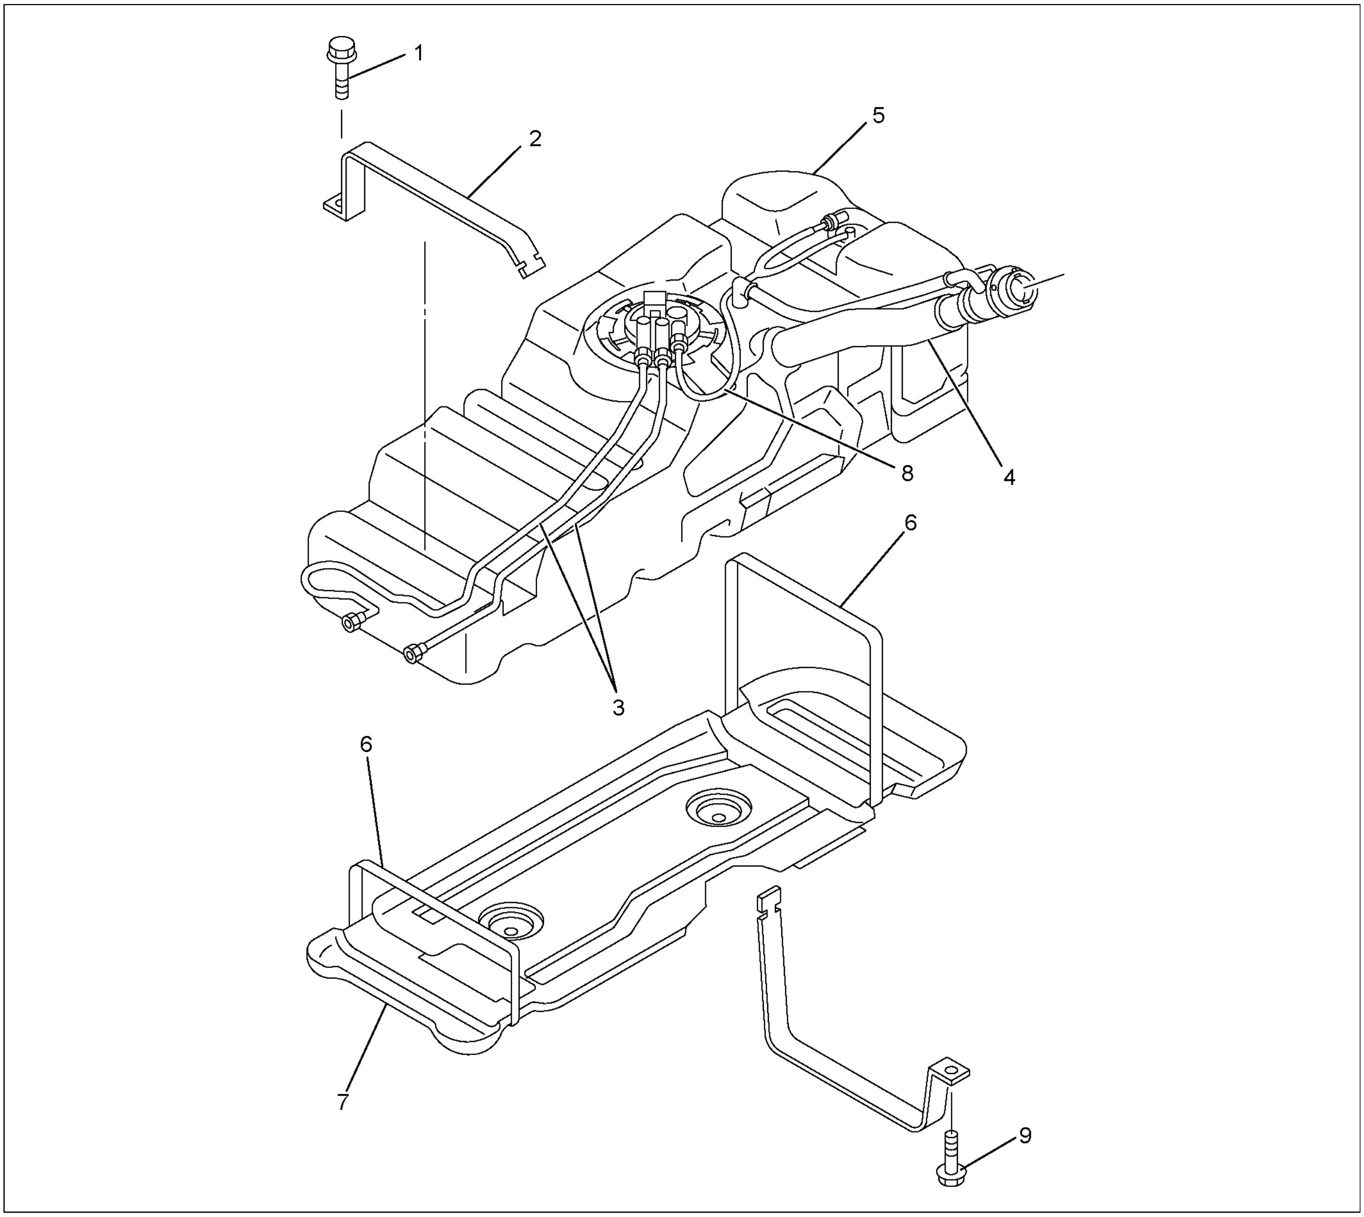
NOTE:

- Injection nozzle adjustment is possible only on the 4JA1L engine.

A hole (with 5 orifices) type injection nozzle. It consists of the nozzle body and the needle valve assembly.
The injection nozzle assembly sprays pressurized fuel from the injection pump into the combustion chamber through the nozzle body injection orifice.

FUEL TANK

Fuel Tank and Associated Parts



RTW46CLF000801

Legend

1. Bolt; Fuel Tank
2. Fuel Tank Band
3. Fuel Tube/Quick Connector
4. Fuel Filler Hose
5. Fuel Tank
6. Under Shield Band (only specified model)
7. Under Shield (only specified model)
8. Evapo Pipe (only specified model)
9. Bolt; Fuel Tank

Removal

CAUTION: When repair to the fuel system has been completed, start engine and check the fuel system for loose connection or leakage. For the fuel system diagnosis, see Section "Driveability and Emission".

1. Disconnect battery ground cable.
2. Loosen slowly the fuel filler cap.

NOTE: Be careful not to spouting out fuel because of change the pressure in the fuel tank.

NOTE: Cover opening of the filler neck to prevent any dust entering.

3. Jack up the vehicle.
4. Support underneath of the fuel tank with a lifter.
5. Remove the inner liner of the wheel house at rear left side.
6. Remove fixing bolt of the filler neck from the body.
7. Disconnect the quick connector (3) of the fuel tube from the fuel pipe.

NOTE: Cover the quick connector to prevent any dust entering and fuel leakage.

NOTE: Refer to "Fuel Tube/Quick Connector Fittings" in this section when performing any repairs.

8. Remove fixing bolt (1) of the tank band and remove the tank band (2).
9. Disconnect the pump and sender connector on the fuel pump and remove the harness from weld clip on the fuel tank.
10. Lower the fuel tank (5).

NOTE: When lower the fuel tank from the vehicle, don't scratch each hose and tube by around other parts.

Installation

1. Raise the fuel tank.

NOTE: When raise the fuel tank to the vehicle, don't scratch each hose and tube by around other parts.

2. Connect the pump and sender connector to the fuel pump and install the harness to weld clip on the tank.

NOTE: The connector must be certainly connected against stopper.

3. Install the tank band and fasten bolt.

Torque	N·m (kg·m / lb ft)
68 (6.9 / 50)	

NOTE: The anchor of the tank band must be certainly installed to guide hole on frame.

4. Connect the quick connector of the fuel tube to the fuel pipe and the evapo tube from evapo joint connector.

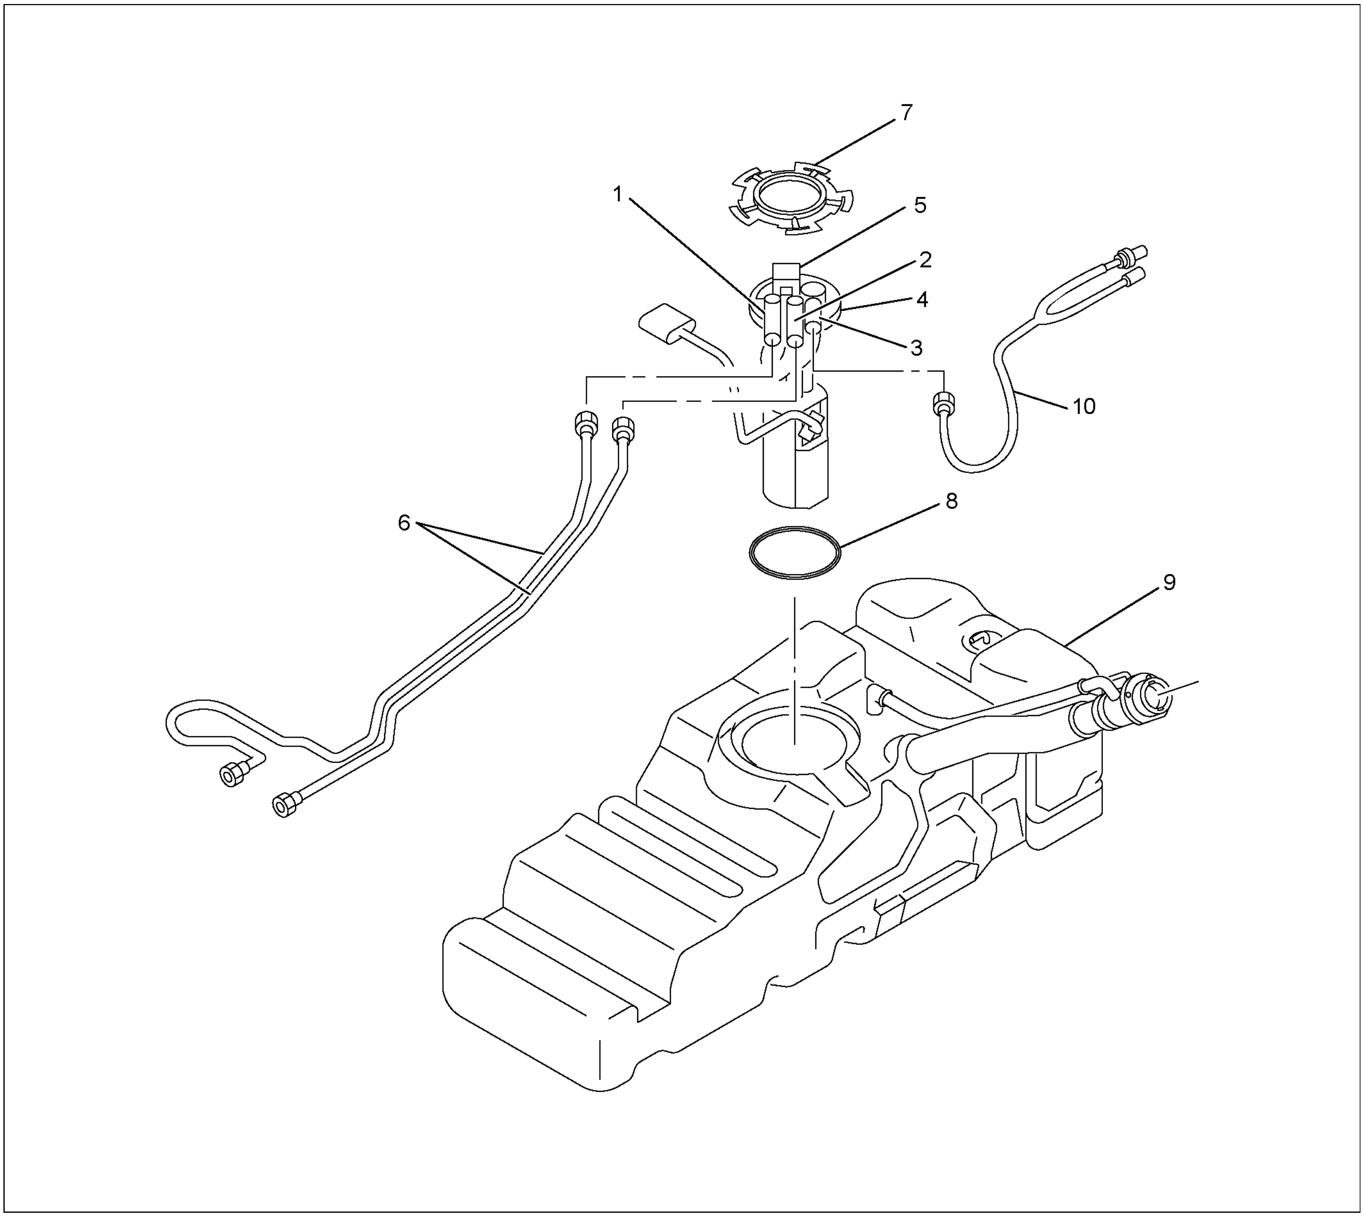
NOTE: Pull off the left checker on the fuel pipe.

NOTE: Refer to "Fuel Tube/Quick Connector Fittings" in this section when performing any repairs.

5. Install the filler neck to the body with bolt.
6. Install the inner liner of the wheel house at rear left side.
7. Remove lifter from the fuel tank.
8. Lower the vehicle.
9. Tigten the filler cap until at least three clicks.
10. Connect the battery ground cable.

FUEL GAUGE UNIT

Fuel Gauge Unit and Associated Parts



RTW46CLF000901

Legend

1. Fuel Feed Port
2. Fuel Return Port
3. Fuel Emission Port
4. Fuel Gauge Unit and Sender Assembly
5. Connector; Fuel Gauge Unit
6. Fuel Tube/Quick Connector
7. Retainer Ring (Fuel Gauge Unit Lock)
8. Seal; Fuel Gauge Unit
9. Fuel Tank Assembly
10. Evapo Tube/Quick Connector

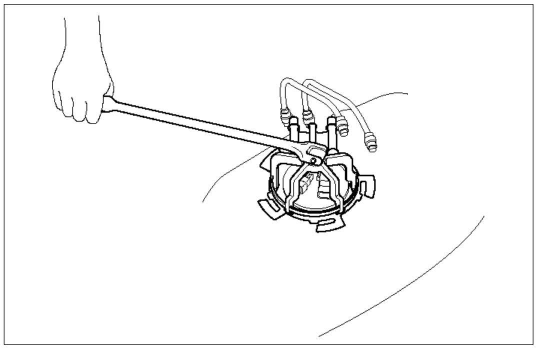
Removal

CAUTION: When repair to the fuel system has been completed, start engine and check the fuel system for loose connection or leakage. For the fuel system diagnosis, see Section “Driveability and Emission".

1. Remove fuel tank assembly (9). Refer to “Fuel Tank Removal" in this section.
2. Disconnect the quick connector (6) of the fuel tube from fuel gauge unit.
3. Disconnect the quick connector (10) of the evapo tube from fuel gauge unit.
3. Remove the retainer ring (7) from the fuel tank with the removal tool 5-8840-2602-0.
4. Remove slowly the fuel gauge unit (4) from the fuel tank as no bend float arm.

NOTE: Cover opening for the fuel gauge unit on fuel tank to prevent any dust entering.

5. Discard fuel gauge unit seal (8) because it cannot be reusable.



140R100035

Installation

1. Clean the seal surface of the fuel tank and the fuel gauge unit.

NOTE: If there is dust on the seal surface, it becomes cause of fuel leak.

2. Install the new fuel gauge unit seal (8) to opening of the fuel tank as along the groove.
3. Install slowly the fuel gauge unit (4) into the fuel tank as no bend float arm.
4. Set flange of the fuel gauge unit on fuel gauge unit seal as mating convexity of the fuel gauge unit and reentrant of the fuel tank.
5. Lock slowly the retainer ring (7) to the fuel tank with the remover tool 5-8840-2602-0.
6. Connect the quick connector (10) of the evapo tube from fuel gauge unit.
7. Connect the quick connector (6) of the fuel tube to to gauge unit.

NOTE: Pull off the left ckecker of the fuel pipe.

NOTE: Refer to “Fuel Tube/Quick Connector Fittings” in this section when performing any repairs.

8. Check leak.

Methed of leak check.

(1) Plug end of quick connector and breather hose (Pull off the breather hose from fuel tank) and tighten fuel filler cap until at least one click are heard.

(2) Apply water soap around the fuel gauge unit seal area.

(3) Pressure air into the fuel tank from end of breather pipe at 5psi (34.3 kPa/2.8kgf/cm^2) over 15 seconds.

(4) Verify no bubbles around the fuel gauge unit seal area.

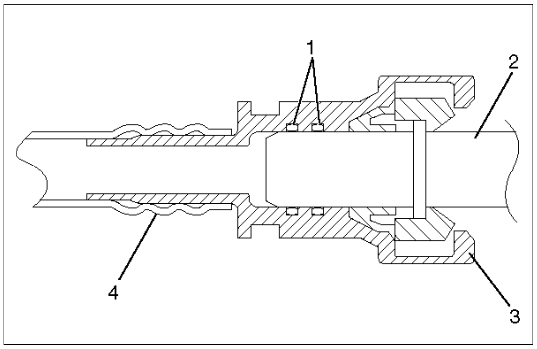
9. Install the fuel tank assembly (9).

NOTE: Refer to “Install the fuel tank” in this section.

FUEL TUBE / QUICK – CONNECTOR FITTINGS

Precautions

- Do not light a match or create a flame.
- Keep flames away from your work area to prevent flammable materials from catching fire.
- Disconnect battery ground cable to prevent electrical shorts.
- Pre-treat piping system or associated parts from thermal damage or from spattering when welding or similar heat-generating work.



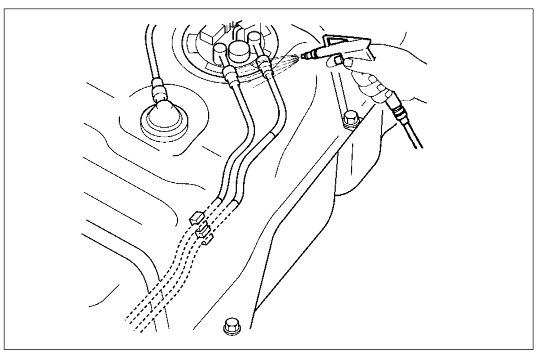
140R100032

Legend

(1) O-ring
(2) Port
(3) Connector
(4) Plastic Tube

Cautions During Work

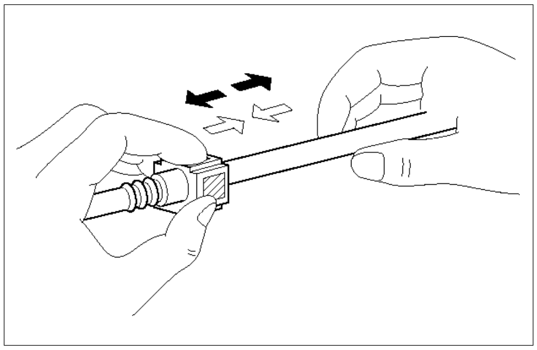
Do not expose the assembly to battery electrolyte or do not wipe the assembly with a cloth used to wipe off spilt battery electrolyte.
Piping that has been splattered with battery electrolyte or battery electrolyte soaked cloth that was wiped on the piping cannot be used.



141R100002

Removal

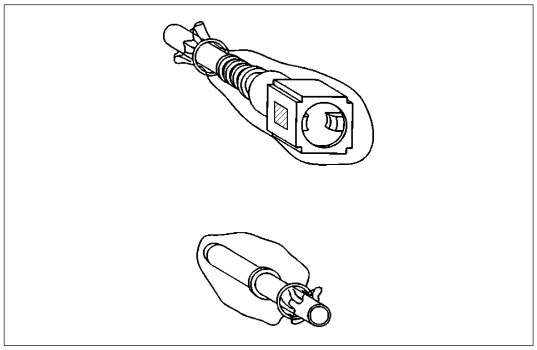
1. Open the fuel cap to relieve the fuel pressure in the tank.
   Use compressed air to remove any dirt on the fuel quick connect fittings prior to disconnecting the fittings.
   When disconnecting the fuel pipe, cover the area with a cloth to prevent fuel from splashing as the fuel pipe may still have some pressure in it.



140R100037

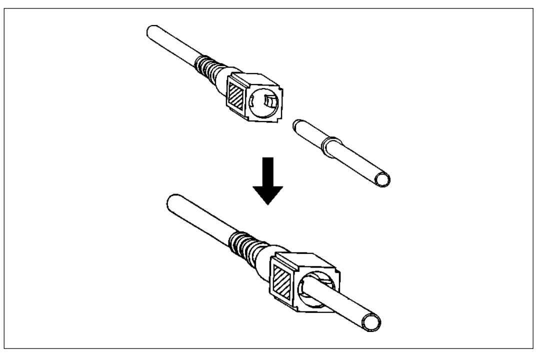
2. For removal of the quick connector, hold the quick connector in one hand, and pull out the connector with the other hand while pressing the square relieve button of the connector, as illustrated.

NOTE: Do not use tools of any kind. Only use bare hands when disconnecting the connector. Use a lubricant (light oil) and/or push and pull the connector until the pipe is disconnected.



140R100028

Cover the connectors that was removed with a plastic bag, to prevent dust or rain water from entering.



140R100036

Reuse of Quick–Connector

- Replace the port and connector if scratch, dent or crack is found.
- Remove any dirt build up on the port when installing the connector. Replace the connector, if there is any forms of rust, dent, scratch.
- After cleaning the port, insert it straight into the connector until it clicks. After it clicks, try pulling at 49N (5kgf) it out to make sure that it is not drawn and is securely locked.

Assembling Advice

By applying engine oil or light oil to the pipe, port makes pipe assembly easier. The pipe assembly should take place immediately after applying oil (to prevent dust from sticking to the pipe surface – which may decrease sealing ability).

Test/Inspection After Assembling

1. Reconnect the battery negative cable.
2. Start the engine and observe the engine idle speed. The presence of dirt in the fuel system may affect the fuel injection system.
3. Check for fuel leakage from the connector.

DISASSEMBLY AND REASSEMBLY

FILLER NECK

Removal

1. Remove the fuel tank.

NOTE: Refer to "Fuel Tank" in this section.

2. Put a marking the following point as the filler neck assembly is restored.
   - Each joint area of the hose (to restore axial direction and insertion length of the hose)
   - Each fasten area of the clamp (to restore axial direction and position of the clamp)
   - Each bolt in the clamp (to restore fasten length of bolt in the clamp)
   - The band clip (to restore position and fasten length of the band clip)

NOTE: Cover end of each hose and pipe to prevent any dust entering.

Installation

1. Align each marking and restore the following point.
   - Each joint area of the hose (Restore axial direction and insertion length of the hose)
   - Each fasten area of the clamp (Restore axial direction and position of the clamp)
   - Each bolt in the clamp (Restore fasten length of bolt in the clamp)

Torque	N·m (kg·m / lb ft)
	2.5 (0.25 / 21.7)

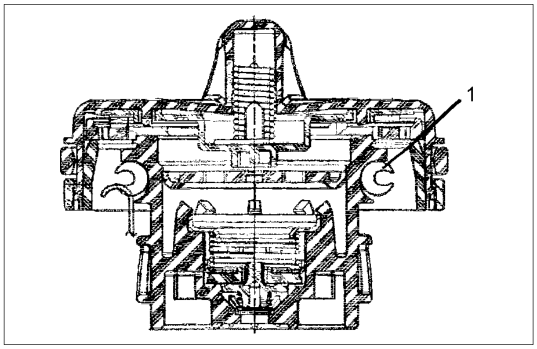
filler neck side except flat deck model.

   - The band clip (Restore position and fasten length of the band clip)

2. Install the fuel tank.

NOTE: Refer to "Fuel Tank" in this section.

FUEL FILLER CAP



RTW46CSH000301

Legend

1. Seal Ring

General Description

A vacuum valve and pressure valve are built into the fuel filler cap which adjusts the fuel pressure in the fuel tank to prevent fuel tank damage.

Inspection

The fuel filler cap must be inspected for seal condition.
The fuel filler cap must be replaced if found defective

CAUTION: A replacement fuel filler cap must be the same as the original. The fuel filler cap valve was designed primarily for this application and must be replaced with the same type or decreased engine performance may occur.

INJECTION PUMP

REMOVAL AND INSTALLATION

Read this Section carefully before performing any removal and installation procedure. This Section gives you important points as well as the order of operation. Be sure that you understand everything in this Section before you begin.

Removal

1. **Battery**
   Remove the battery from the battery tray.

P1010011

2. **Drive Belt**
   1) Loosen the adjust bolt of the power steering pump pulley.
   2) Remove the drive belt.
3. **Power Steering Pump Assembly**

P1010003

4. **Accelerator Control Cable**
   Disconnect the accelerator cable from the intake throttle.
5. **Vacuum Hose**
   Disconnect the vacuum hose from the EGR valve and the intake throttle.
6. **Fan**

6C-4

7. Power Steering Pump Bracket

8. Throttle Position Sensor Harness Connector (4JA1TC/4JH1TC only)

Disconnect the harness connector from the throttle position sensor.

9. Oil Level Gauge

10. Fuel Pipe

1) Disconnect the fuel hoses from the fuel filter or priming pump.
2) Disconnect the fuel hoses from the injection pump.

6C-5

11. Fuel Filter Assembly (Except EURO III model)

12. Fuel Filter Bracket (Except EURO III model)

13. Leak Off Hose

Disconnect the leak off hose at the injection pump.

14. Injection Pipe Clip

15. Injection Pipe

1) Loosen the injection pipe sleeve nuts at the delivery valve side and the injection nozzle side.

Note:

Do not apply excessive force to the injection pipes.

2) Loosen the injection pipe clip.
3) Remove the injection pipes.

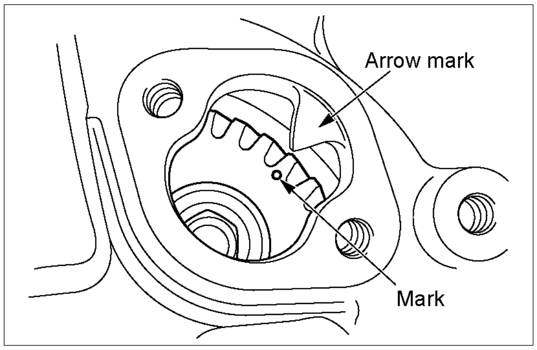
Note:

Plug the delivery holder ports with the caps to prevent the entry of foreign material.

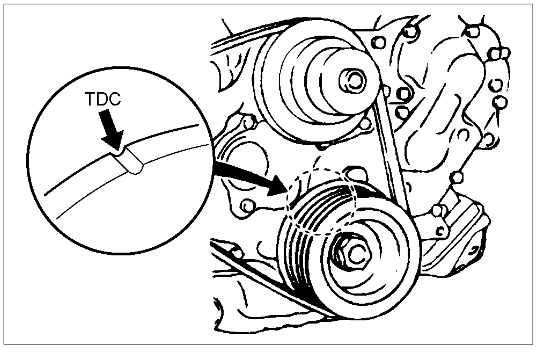
16. Intake Manifold

1) Remove the EGR valve from the intake manifold and EGR pipe.
2) Loosen the intake rubber hoses clip.
3) Loosen the intake manifold bolts and nuts.

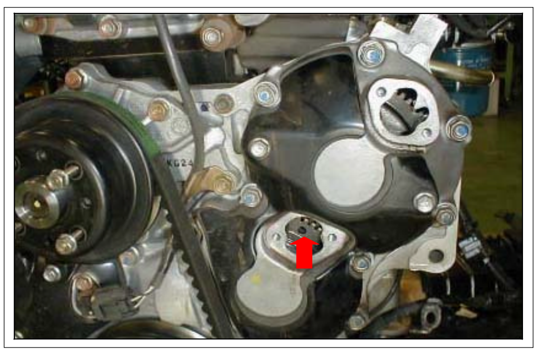
17. Injection Pump Cover (4JA1TC/4JH1TC only)



020L200017



RTW46CSH000201



6C-7

18. Timing Check Hole Cover

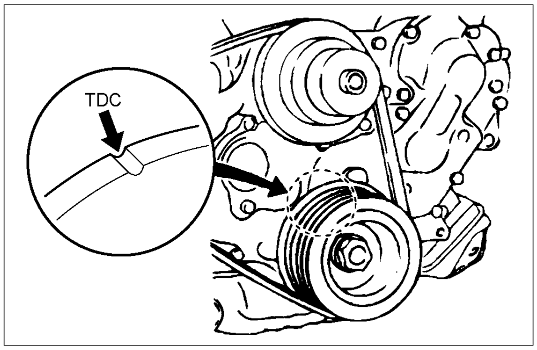
1) Remove the timing check hole cover.
2) For ease in reinstalling the injection pump, align the timing mark on the timing gear case cover by turning the crankshaft using wrench.
   And bring the piston in the No.1 cylinder to TDC on the compression stroke by turning the crankshaft until the crankshaft pulley TDC line aligned with the timing mark.

Note:

If the check hole cover is reinstalled with the lock bolt still in place, the crank pulley will not turn.

3) Insert the lock bolt (M6 x 30) into the scissors gear idle gear “B” fixing hole to prevent the scissors gear from turning.

29. Injection Pump Bracket
20. Injection Pump



RTW46CSH000201

6C-7

Installation

1. Injection Pump

1) Install the injection pump gear (When gear is removed).

Injection Pump Gear Nut	N·m (kg·m/lb ft)
64 (6.5 / 47)	

2) Bring the piston in the No.1 cylinder to TDC on the compression stroke by turning the crankshaft until the crankshaft pulley TDC line aligned with the timing mark.

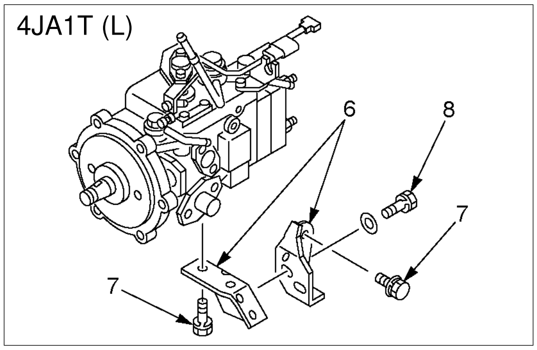
3) Install the injection pump to the timing gear case with align the timing mark on the pump gear to the arrow mark on the timing gear case cover.

4) Check that the setting marks of the injection pump gear and the idler gear B are aligned.

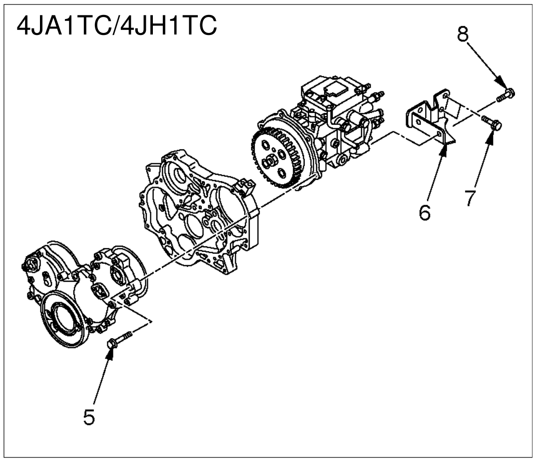
5) Remove the lock bolt (M6 × 30) from the idle gear “B”.

6) Tighten the injection pump fixing bolts to the specified torque.

Injection Pump Bolts Torque	N·m (kg·m/lb ft)
19 (1.9 / 14)	



RTW46CSH000101



RTW36AMH000101

2. Injection Pump Bracket

1) Install the injection pump bracket (6) and the bracket bolts (7) and (8) to the cylinder body. Temporarily tighten the bracket bolts.

2) Tighten the bracket bolts (7) to the specified torque.

3) Tighten the bracket bolts (8) to the specified torque.

Note:

Tighten the bracket bolt (8) first.

Injection Pump Bracket Torque	N·m(kg·m / lb ft)
(8) 19 (1.9 / 14)	
(7) 40 (4.1 / 30)	

3. Timing Check Hole Cover

Install the timing check hole cover and tighten bolts to the specified torque.

Timing Check Hole Cover Bolts

Torque	N·m(kg·m / lb ft)
8 (0.8 / 69)	

4. Injection Pump Cover (4JA1TC/4JH1TC only)

5. Intake Manifold

1) Install the intake manifold with gasket.

Intake Manifold Bolts

Torque	N·m(kg·m / lb ft)
19 (1.9 / 14)	

Intake Manifold Nuts Torque	N·m(kg·m / lb ft)
24 (2.4 / 17)	

2) Install the EGR valve to the intake manifold and EGR pipe temporarily.

3) Tighten the nuts and bolts to the specified torque

Torque	N·m (kg·m/lb ft)
Nuts	24 (2.4/17)
Bolts	27 (2.8/20)

6. Injection Pipe

Install the injection pipe.

Injection Pipe Torque	N·m(kg·m / lb ft)
29 (3.0 / 22)	
Nozzle Side (4JA1TC/4JH1TC)	N·m(kg·m / lb ft)
29 (3.0 / 22)	
Pump Side (4JA1TC/4JH1TC)	N·m(kg·m / lb ft)
40 (4.1 / 30)	

7. Injection Pipe Clip

Install the injection pipe clip.

Note:

Make absolutely sure that the clip is correctly positioned.

Injection Pipe Clip Torque	N·m(kg·m / lb in)
8 (0.8 / 69)	

8. Leak Off Pipe and Leak Off Hose

Install the leak off pipe to injection nozzle and connect the leak off hose to the injection pump.

9. Fuel Filter Bracket (Except EURO III model)

Install the fuel filter bracket and tighten bolts to the specified torque.

Fuel Filter Bracket Bolts Torque	N·m(kg·m / lb ft)
21 (2.1 / 15)	

10. Fuel Filter Assembly (Except EURO III model)

Install the fuel filter assembly to bracket and tighten bolts to the specified torque.

Fuel Filter Assembly Bolts Torque	N·m(kg·m / lb ft)
21 (2.1 / 15)	

11. Fuel Pipe

1) Connect the fuel hoses to the fuel filter or priming pump.
2) Connect the fuel hoses to the injection pump.

12. Oil Level Gauge

Install the oil level gauge and tighten bolts to the specified torque.

Oil Level Gauge Bolts Torque	N·m(kg·m / lb ft)
M8: 19 (1.9 / 14) M6: 8 (0.8/6 lb in)	

13. Throttle Position Sensor Harness Connector (4JA1TC/4JH1TC only)
Reconnect the harness connector to the throttle position sensor.

14. Power Steering Pump Bracket

15. Fan

16. Vacuum Hose
Connect the vacuum hose to the EGR valve and the intake throttle.

	Euro under	Euro I	Euro II	Euro III
4JA1L	without	with	with	Not used
4JA1TC	Not used	Not used	Not used	With cooler (EGR cooler)
4JH1TC	without	with	with	With (EGR cooler)

17. Accelerator Control Cable
1) Connect the accelerator cable to the injection pump (4JA1T) the intake throttle. (4JA1TC/4JH1TC only)

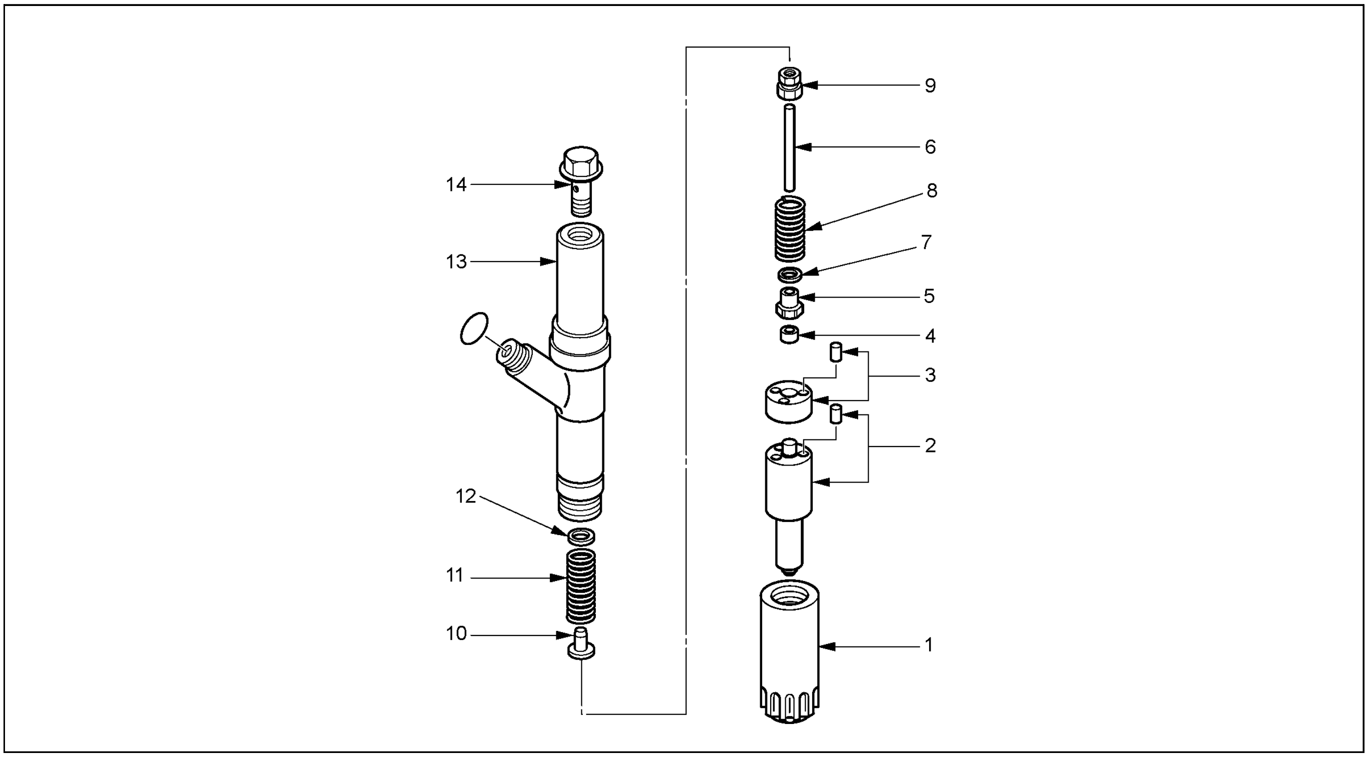
18. Power Steering Pump Assembly

19. Drive Belt
Install the drive belt and adjust the belt tension.

20. Battery

INJECTION NOZZLE (4JA1L)

DISASSEMBLY



RTW76CMF000401

Disassembly Steps

1. Retaining nut
2. Nozzle & pin
3. Spacer & pin
4. Lift Piece
5. Spring seat
6. Push rod
7. Shim (Second nozzle opening pressure adjustment)
8. Second spring
9. Collar
10. Spring seat
11. First spring
12. Shim (First nozzle opening pressure adjustment)
13. Nozzle holder body
14. Eye bolt

Important Operations

Injection nozzle adjustment is possible only on the 4JA1L engine.

The two-spring nozzle holder has been developed to reduce NOx (Nitrogen Oxides) and particulates from direct injection diesel engine exhaust.

Before disassembly remove carbon deposit from nozzle and nozzle holder using a wire brush and wash the outside nozzle holder assembly.

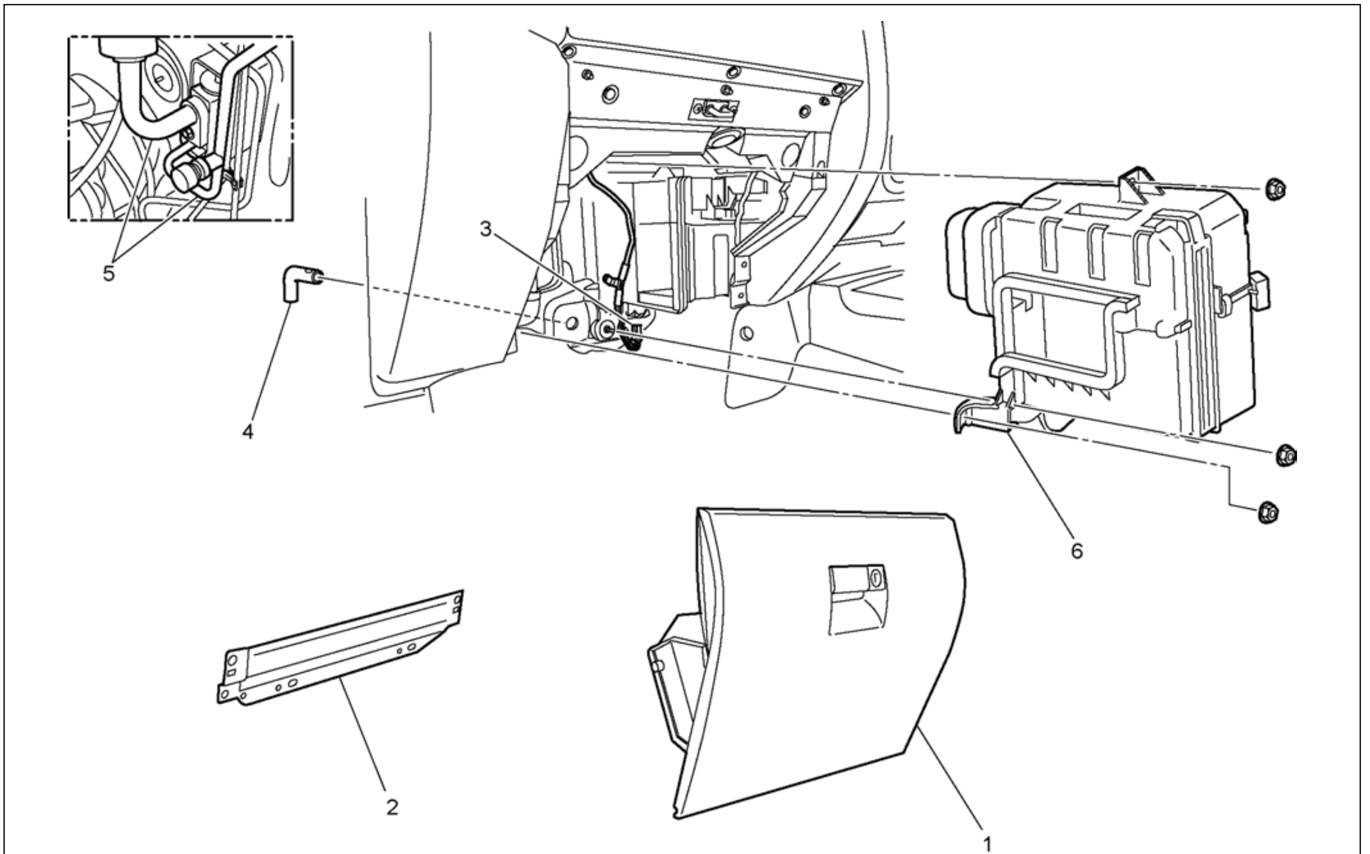
Caution:

Do not touch nozzle holes with the wire brush during cleaning it.

Disassemble the nozzle holder assembly to numerical order.

EVAPORATOR (WITH A/C)

REMOVAL AND INSTALLATION



This illustration is based on RHD model

RTW710LF003001

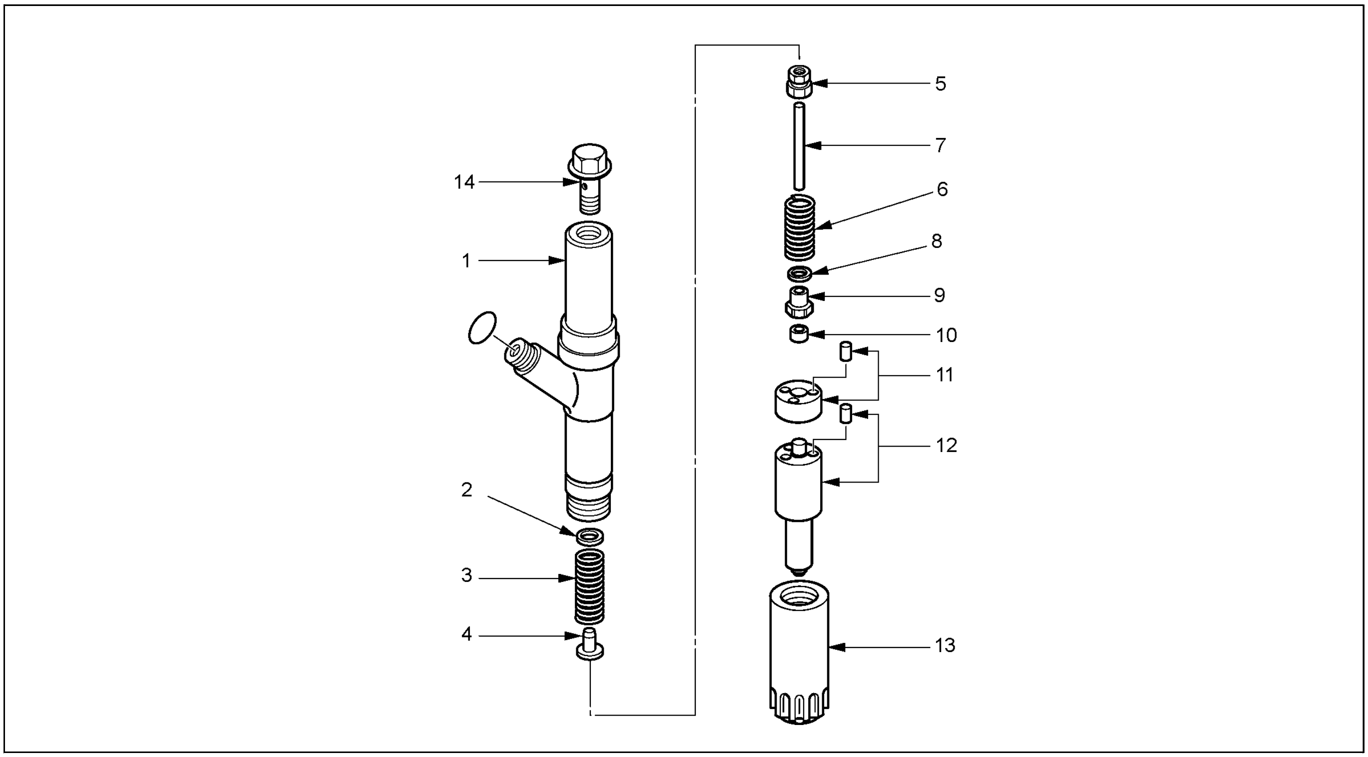
Removal Steps

1. Glove box
2. Passenger lower bracket
3. Electronic thermostat connector
4. Drain hose
5. Refrigerant line
6. Evaporator assembly

Installation Steps

6. Evaporator assembly
5. Refrigerant line
4. Drain hose
3. Electronic thermostat connector
2. Passenger lower bracket
1. Glove box

REASSEMBLY



RTW76CMF000501

Reassembly Steps

1. Nozzle holder body
2. Shim (First opening pressure adjustment)
3. First spring
4. Spring seat
5. Collar
6. Second spring
7. Push rod
8. Shim (Second opening pressure adjustment)
9. Spring seat
10. Lift Piece
11. Spacer & pin
12. Nozzle & pin
13. Retaining nut
14. Eye bolt

Important Operations

The nozzle holder is adjusted as the components are reassembled in the sequence above.

As adjustment of the two-spring nozzle holder is made in hundredths of a millimeter, clean the parts thoroughly in light oil to completely remove any dirt or foreign matter.

REASSEMBLY AND ADJUSTMENT PROCEDURE

1	First nozzle opening pressure adjustment	Adjust the first nozzle opening pressure using the shim.
2	Full needle valve lift confirmation	Confirm the full needle valve lift in accordance with the closed method.
3	Pre-lift confirmation	Confirm pre-lift in accordance with the closed method. **CAUTION:** **If not as specified, replace the nozzle assembly, lift piece, pins and spacer using the nozzle service kit.**
4	Second nozzle opening pressure confirmation	Confirm the second nozzle opening pressure in accordance with the closed method.
5	Second nozzle opening pressure adjustment	Adjust the second nozzle opening pressure using the shim.
6	Final inspection	Confirm the condition of the fuel spray with the nozzle and nozzle holder assembled.

First nozzle opening pressure adjustment

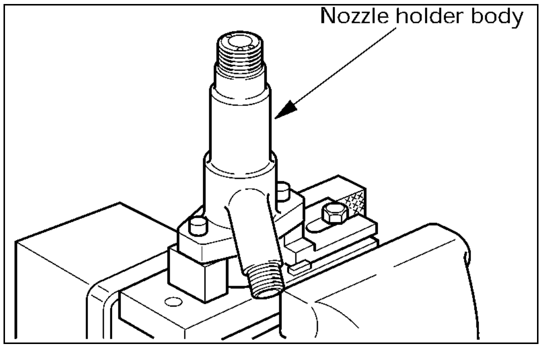
Nozzle needle valve full-lift	0.25 mm (0.0098 in)
Nozzle needle valve pre-lift	0.04 mm(0.0016 in) at 20,000 kPa (2901 psi, 204 kg/cm^2)
Nozzle pressure	
4JA1T(L) 1st Stage	19.1 MPa (2759 psi, 194 kg/cm^2)
2nd Stage	25.5-27.0 MPa (3768-3911 psi, 260-275 kg/cm^2)

NOTE: Only 4JA1L can perform adjustment of a nozzle.

Injection Nozzle Adjustment

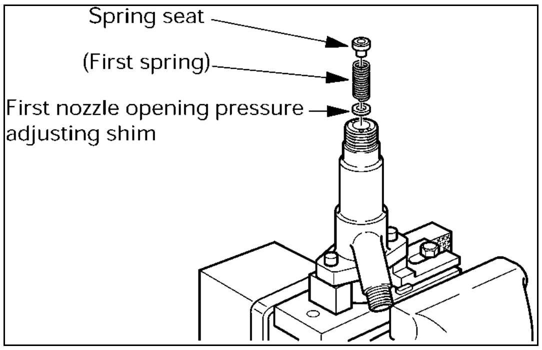
First nozzle opening pressure adjustment

1.Clamp the nozzle holder in a vise.



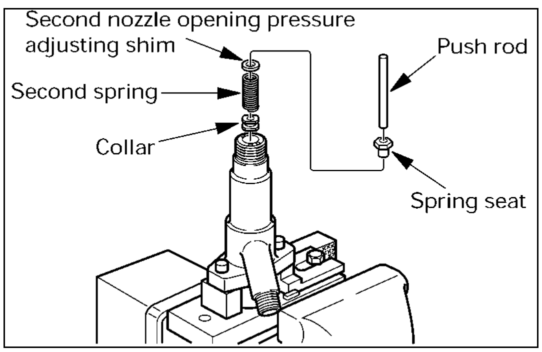
040MV015.tif

2. Install the shim, first spring and spring seat in the nozzle holder.



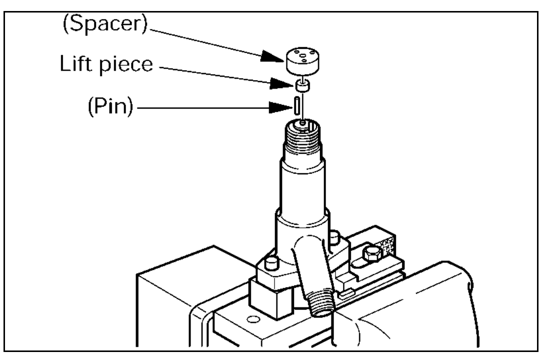
040MV016.tif

3. Install the collar, second spring, shim, spring seat and pushrod in the nozzle holder.

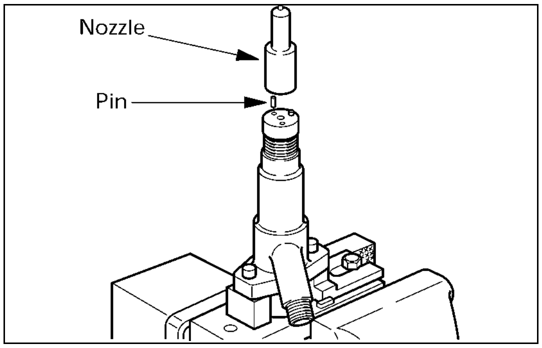


040MV017.tif

4. Install the pins, lift piece and spacer in the nozzle holder.

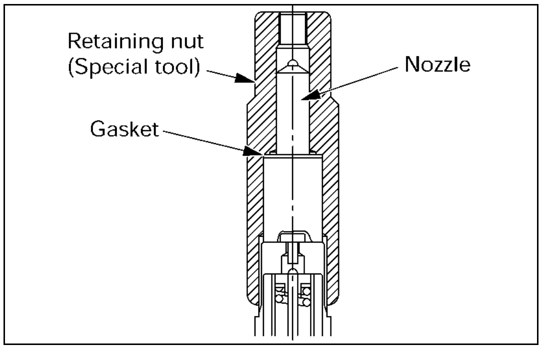


040MV018.tif



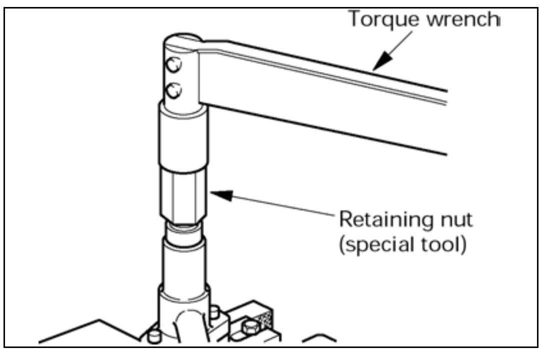
040MV019.tif

5. Install the pins in the spacer.
6. Install the nozzle on the spacer.



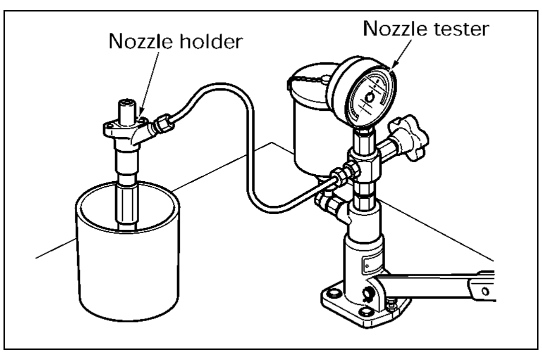
040MV010.tif

7. Hand-tighten the adjustment retaining nut together with the gasket to the nozzle holder.
   Retaining nut: 157892-3200 (Bosch AS)
   Gasket: 157892-5100 (Bosch AS)
   (Bosch AS = Bosch Automotive Systems Corporation)



040MV014-1.tif

8. Tighten the adjustment retaining nut to the specified torque.
   Torque: 5.1 kg·m (36.9 lb·ft/50 N·m)

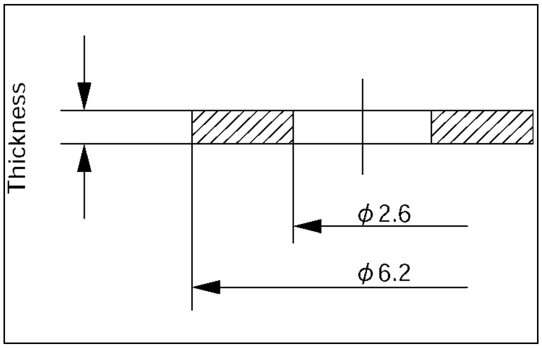


040MV030.tif

9. Set the nozzle holder to the nozzle tester.
10. Operate the nozzle tester and measure the first nozzle opening pressure.
11. If the first nozzle opening pressure is not as specified, disassemble the nozzle holder and replace the shim until the pressure is as specified.

CAUTION:

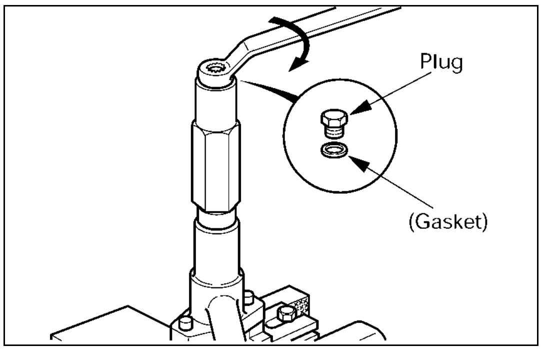
- **Use a micrometer to measure shim thickness.**



040LX010.tif

- First nozzle opening pressure adjusting shims

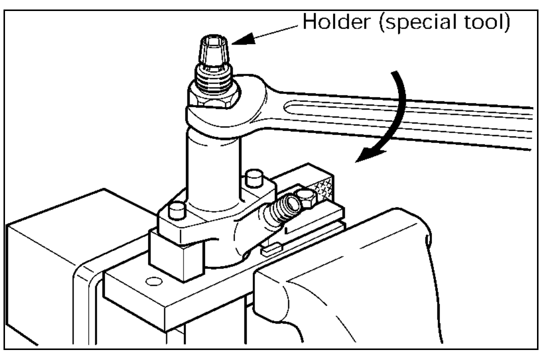
Parts No. (ISUZU)	Thickness (mm)
115349-0420	0.40
115349-0430	0.50
115349-0440	0.52
115349-0450	0.54
115349-0460	0.56
115349-0470	0.58
115349-0480	0.60
115349-0490	0.70



040MV013.tif

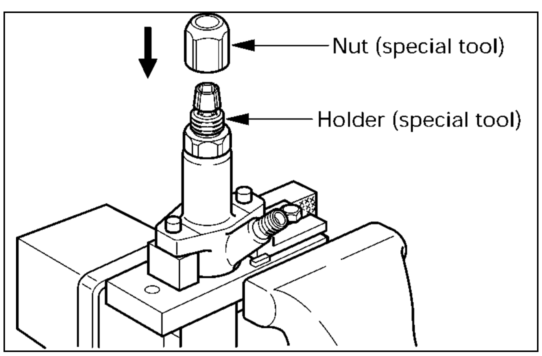
Full needle valve lift confirmation

1. Install the gasket and plug on the adjustment retaining nut.
   Gasket: 026508-1140 (Bosch AS)
   8-9422-7602-0 (ISUZU)
   Plug: 157892-1600 (Bosch AS)



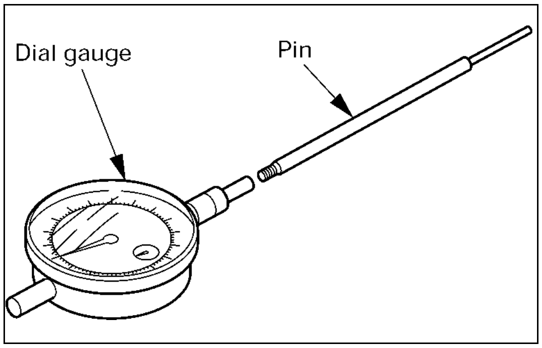
040MV012.tif

2. Position the nozzle holder with the nozzle facing down and install the dial gauge holder on the nozzle holder.
   Dial gauge holder: 157892-5000 (Bosch AS)



040MV011.tif

3. Install the nut on the dial gauge holder.
   Nut: 157892-1000 (Bosch AS)



040MV029.tif

4. Install the pin to the dial gauge.

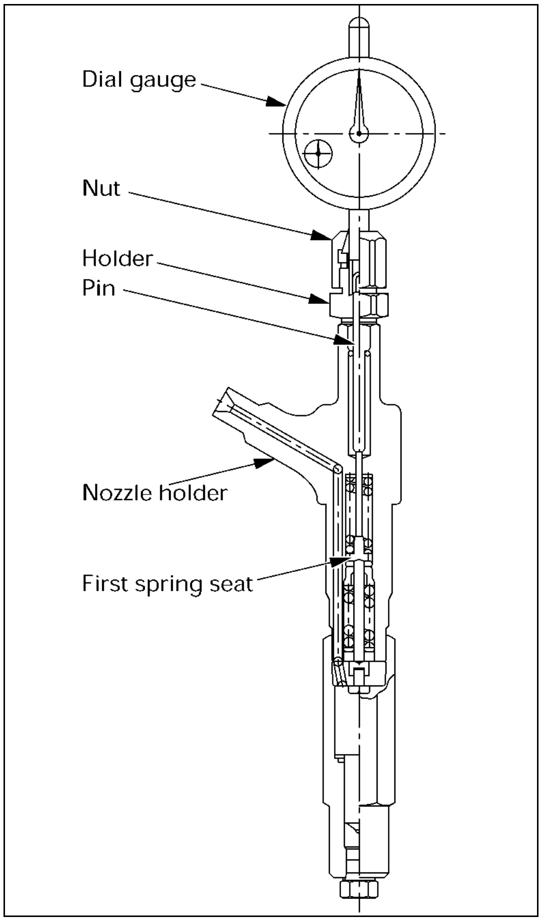
Note:

The lengths of the pins do not include the threaded portions.

Pin (L=100 mm): 157892-5200 (Bosch AS)

Dial gauge: 157954-3800 (Bosch AS)

185317-0150 (ISUZU)

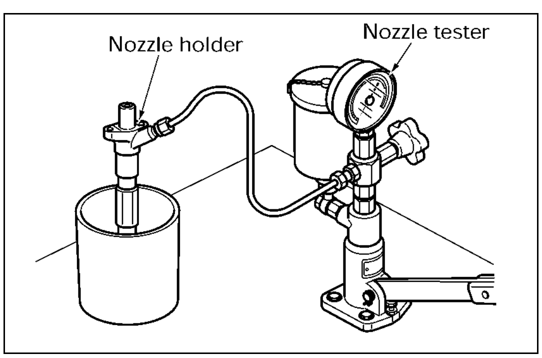


040MV009.tif

5. Secure the dial gauge to the nozzle holder using the nut so that the pin contacts the tip of the first spring seat.

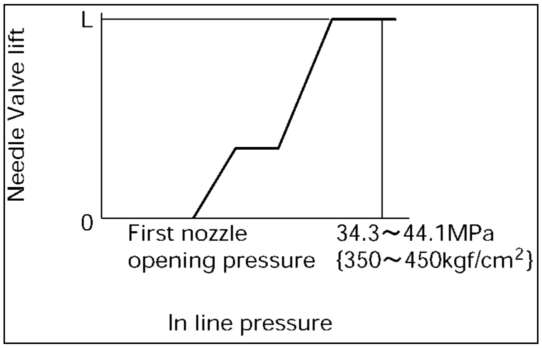
CAUTION:

- **Secure the dial gauge so that a stroke of 2 mm can be measured.**
- **Do not over-tighten the nut as the dial gauge shaft may jam. (Confirm from the dial gauge that the shaft moves smoothly.)**



040MV030.tif

6. Set the nozzle holder to the nozzle tester and put needle to zero on the dial gauge.
7. Operate the nozzle tester to bleed any air from inside the retaining nut and to confirm that no fuel leaks.



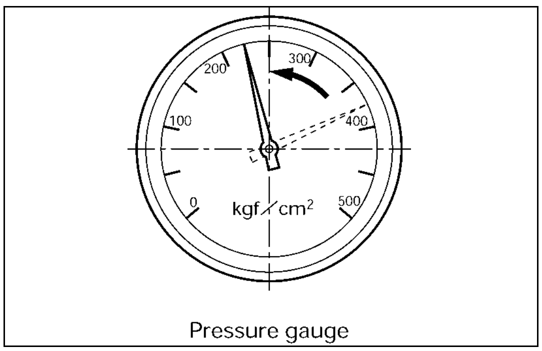
040MV008.tif

8. Operate the nozzle tester and increase the in-line pressure to 34.3 - 44.1 MPa (350 - 450 kg/cm^2) so that the nozzle's needle valve moves through its full lift.
   Record full lift 'L'. (Read dial gauge)

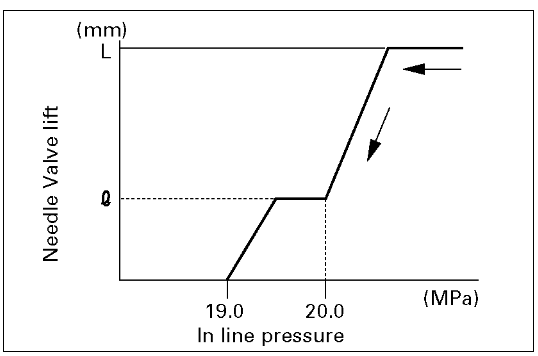
Nozzle Full Lift	mm (in)
0.25 ± 0.02 (0.0098 ± 0.00008)	

Note:

The above operation is used to determine whether the nozzle seat is worn and whether the nozzle assembly is in good condition.



040MV007.tif



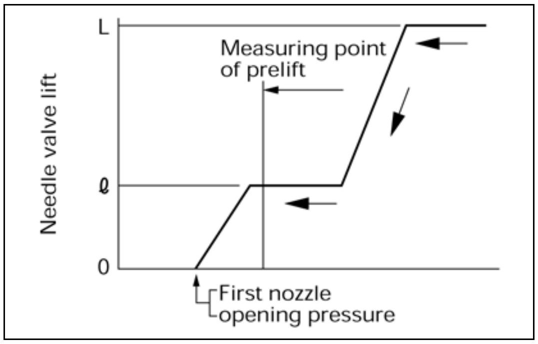
040R300008

Pre-lift confirmation

1. With the needle valve at full lift, release the nozzle tester handle.

   Note:

   The in-line pressure will decrease and needle valve lift (as indicated on the dial gauge) will also decrease a little.



040H100007

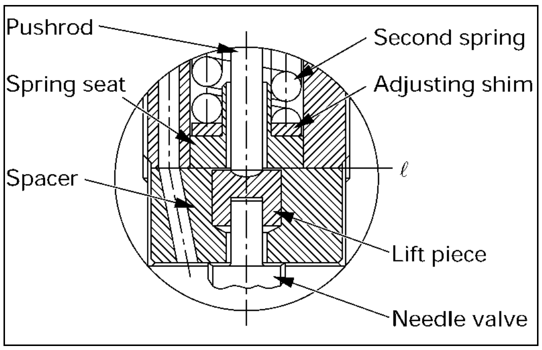
2. Read the needle valve “pre-lift” point from the dial gauge indication (once the needle valve has descended when the second spring has stopped operating).

Pre-lift measuring point:
Read the dial gauge at first nozzle opening pressure +approx 1 MPa (10 kg/cm^2).

Pre-lift mm

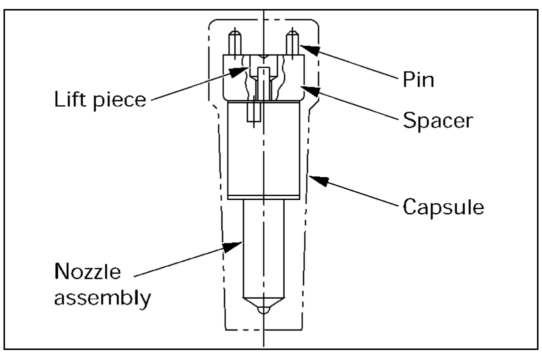
	Pressure Mpa (psi/ kg/cm^2)	Lift mm (in)
4JA1T(L)	20.1 (2,858/205)	0.04 (0.0016)

Note:
This point can be found while the pressure is decreasing.



040MV005.tif

3. Confirm that pre-lift is as specified.

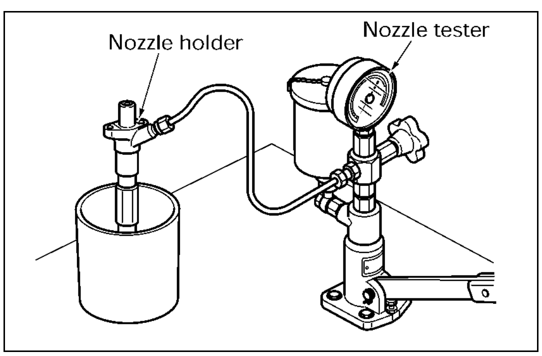


040MV031.tif

4. If pre-lift is not as specified, replace the pins, lift piece, spacer and nozzle assembly as a set with the service kit.

Service kit

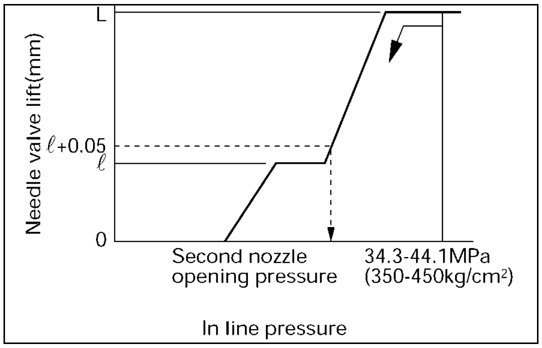
105017-2990 (Bosch AS)
897302-3070 (ISUZU)



040MV030.tif

Second nozzle opening pressure confirmation

1. After pre-lift confirmation, operate the nozzle tester to increase in-line pressure to 34.3 - 44.1 MPa (350 - 450 kg/cm^2) so that the nozzle’s needle valve moves through its full lift.

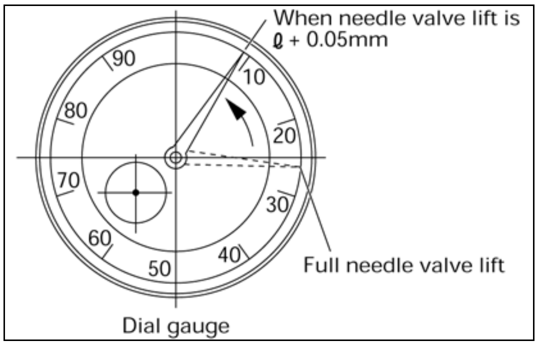


040MV022.tif

2. Release the nozzle tester handle so that in-line pressure decreases.

Note:

The in-line pressure will decrease and needle valve lift (as indicated on the dial gauge) will also decrease a little.

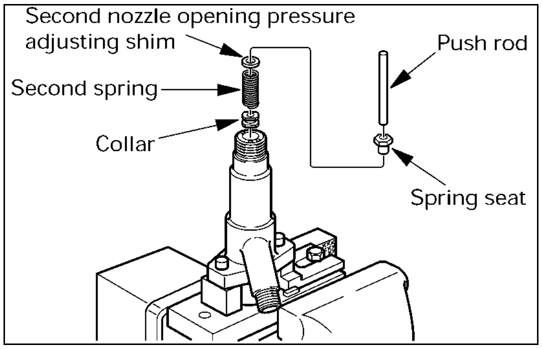


040M100006

3. Then, read the pressure gauge indication (second nozzle opening pressure) the instant that the dial gauge indicates the specified needle valve lift (usually pre-lift + 0.05 mm).

Second Nozzle Opening Pressure

	Pressure Mpa (psi/ kg/cm^2)	Lift mm (in)
4JA1T(L)	25.5-27.0 (3768-3911/260-275)	0.09 (0.0035)



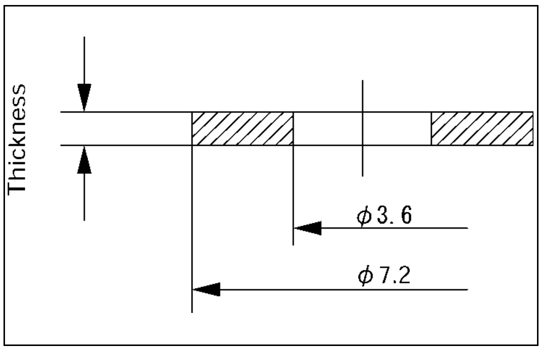
040MV017.tif

Second nozzle opening pressure adjustment

If the second nozzle opening pressure is not as specified, disassemble the nozzle from the nozzle holder and replace the shim until the pressure is as specified.

CAUTION:

- **Because the second opening pressure changes when the first opening pressure changes, the second opening pressure must be adjusted when the first opening pressure changes.**
- **Use a micrometer to measure shim thickness.**
- **Use some combination of 3 adjusting shims to adjust the pressure.**



040LX009.tif

- Second nozzle opening pressure adjusting shims

Part No. (ISUZU)	Thickness (mm)	Part No. (ISUZU)	Thickness (mm)
897116-0290	0.10	897116-0380	0.53
897116-0320	0.20	897116-0390	0.54
897116-0330	0.30	897116-0400	0.55
897116-0340	0.40	897116-0410	0.56

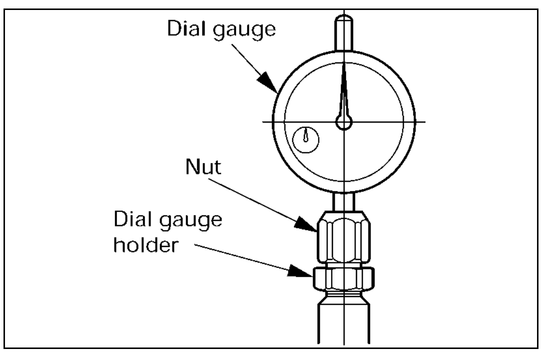
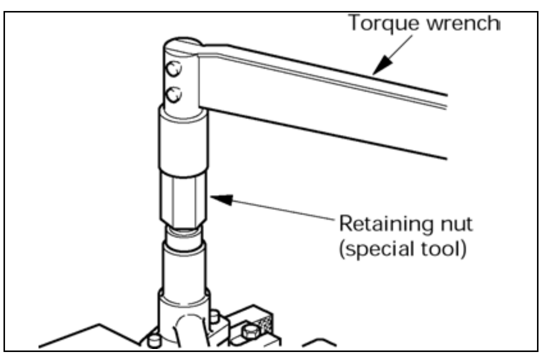
897116-0360	0.51	897116-0430	0.58
897116-0370	0.52	897116-0440	0.59



040MV028.tif

Final inspection

1. Remove the dial gauge, nut and dial gauge holder.



040MV014-1.tif

2. Remove the adjustment retaining nut and gasket.
3. Install the original retaining nut, confirm that the pins are inserted fully into the nozzle, and then hand-tighten the retaining nut. Then, tighten the original retaining nut to the specified torque.

   Torque: 7.0 kg·m (50.6 lb·ft/69 N·m)
